b. By precipitating a *soluble salt of nickel* with *caustic potassa.* Hydrated. An ash-gray powder, freely soluble in acids forming the ordinary *salts of nickel.*

2. (*Sesquioxide of Nickel, Peroxide of do.*) By passing *chlorine* through *water* holding the *hydrated protoxide* in suspension; or by mixing a *salt of nickel* with *bleaching powder.* An insoluble, black powder, which is decomposed by heat.

NICKEL (Sulphate of). Syn. *Nickelii Sulphas,*—Lat. From *carbonate* or *oxide of nickel* and *dilute sulphuric acid,* as the *acetate.* Green prismatic crystals, soluble in 3 parts of cold water. With the sulphates of potassa and ammonia it forms beautiful double salts.

NICKEL SILVER. See *German Silver.*

NICOTIANINE. Syn. *Tobacco Camphor; Oleum Tabaci Volatile,*—Lat. From *tobacco leaves,* by distillation along with *water.* Its odour and action strongly resemble those of tobacco. 6 *lb.* of leaves only yield 11 gr., which float on the surface of the distilled water. See *Oils.*

NICOTINE. Syn. *Nicotia, Nicotina,*—Lat. A volatile base discovered by Reiman and Posselt in *tobacco.*

Prep. (Ortigosa.) Infuse *tobacco leaves* for 24 hours in *water acidulated with sulphuric acid,* strain, evaporate to a syrup, add $\frac{1}{8}$th of its volume of a *strong solution of potassa,* and distil in an oil bath at 288°, occasionally adding a little *water* to assist the process, and prevent the too great concentration of the solution of potassa in the retort; next saturate the distilled product with *oxalic acid,* evaporate to dryness, digest in *boiling absolute alcohol,* evaporate the resulting *tincture* to a syrup, and decompose the *oxalate of nicotine* thus obtained, by adding *caustic potassa* to it in a close vessel, and agitate the mass with *ether,* repeating the process with *more ether* until *all* the nicotine is dissolved out; lastly, distil the mixed *ethereal solutions* in an oil-bath. At first ether comes over, then water, and, lastly, *nicotine,* which towards the end of the process assumes a yellowish tint.

2. (Schloesing.) This chiefly differs from the preceding by directing the concluding distillation to be conducted in a retort, by the heat of an oil-bath, at the temperature of 284° Fahr., in a *current of hydrogen,* for 12 hours; after which, by raising the heat

to 356° Fahr., the nicotine distils over pure, drop by drop.

Prop., &c. Nicotine is a colourless, volatile liquid; highly acrid and pungent; smelling strongly of tobacco; boiling at 375° Fahr. (482°,—Pereira); soluble in water, ether, alcohol and oils; and combining with the acids forming salts, many of which are crystallizable. It is a frightful poison; $\frac{1}{4}$th of a drop will kill a rabbit; a single drop will kill a large dog. Nicotine is the substance which was employed by the Count Bocarmé for the purpose of poisoning his brother-in-law, Gustave Fougnies, the particulars of which were developed in the the celebrated trial, in Belgium, of that nobleman, in 1851. Good Virginia and Kentucky tobacco, dried at 212° Fahr., contain from 6% to 7% of nicotine; Havannah tobacco (*cigars*) less than 2%. (Schloesing.)

NIGELLINE. A yellowish liquid obtained by Rensch from the seeds of the *nigella sativa* (Linn.) or *fennel flower*. It is obtained by digestion in *rectified spirit*, distilling the *tincture*, separating the *reddish brown* from the *lighter portion* of the product, agitating the latter with *ether*, and then with *water*, adding to the liquid when decanted, a little *subacetate of lead*, filtering, and treating it with *sulphuretted hydrogen*; the *aqueous liquid* is then filtered, and gently evaporated, to expel moisture.

NIGHTMARE. Syn. *Ephialtes*,—Lat. The *common causes* of nightmare are indigestion and the use of narcotic and intoxicating substances. Its *prevention* consists in the selection of proper food, and in duly attending to the state of the stomach and bowels. Heavy and late suppers should be particularly avoided, as well as all articles of diet that are of difficult digestion, or apt to induce flatulency. When it arises from strong drink, tobacco, or opium, these should be abandoned, or employed in smaller quantities. A teaspoonful of *spirit of sal-volatile*, *magnesia*, or *bicarbonate of soda*, taken in a glass of *cold water* on going to bed, is a good and simple preventive. In cases accompanied by restlessness, a few drops of laudanum or tincture of henbane may be added. An occasional aperient is also excellent. See *Chamomile*.

NIGHTSHADE (Deadly). Syn. *Belladonna*,—Ph. L. E. & D. "The leaf, fresh and dried," (leaves and root,—Ph. D.) of "*atropa belladonna*, Linn." "Oval, acute, very perfect, glabrous, when bruised exhaling a disagreeable odour. The herb which grows spontaneously in hedges and uncultivated places is to be preferred to that which is cultivated in gardens." (Ph. L.)

Belladonna is a powerful narcotic, and is used as an anodyne, antispasmodic, and discutient, in a variety of diseases,—neuralgia, arthritic pains, migratory rheumatic pains, spasmodic rigidity and strictures, angina pectoris, hooping-cough, fevers, phthisis, &c.; also as a prophylactic of scarlet fever, as a resolvent in enlarged and indurated glands, to produce dilation of the pupil, &c., &c. *Dose.* Of the powder, commencing with 1 gr., gradually and cautiously increased until dryness of the throat, or dilation of the pupil occurs, or the head is affected. See *Atropia*.

The properties of *black* or common *garden nightshade* (solanum nigrum,—*Linn.*) are nearly similar to those of the above, but are greatly weaker.

NIGHTSHADE (Woody). Syn. *Bittersweet; Dulcamara*,—Ph. L. E. & D. The "new shoots (*caules*)" of "*solanum dulcamara*, Linn." "It is to be collected in autumn, after the leaves have fallen." (Ph. L.) Diaphoretic, diuretic, and (in large doses) narcotic. See *Decoction of Dulcamara*.

NIHIL. *See Oxide of Zinc.*

NIOBIUM. See *Tantalum*.

NIPPLES (Sore). The most common form of this affection is that termed "*chapped nipples*," by nurses. As a *preventive* measure, the part may be moistened morning and evening, for some weeks before the period of lactation, with a little *rum* or *brandy*, which is more effective if *slightly* acidulated with a few drops of *dilute sulphuric acid*. Some persons employ *tincture of tolu*, or *compound tincture of benzoin* (Friar's balsam) for this purpose.

When *chaps*, *cracks*, or like sores, arising from lactation, are once developed, one of the safest and most effective remedies is *tincture of catechu* applied 3 or 4 times a day, by means of a camel-hair pencil.

The celebrated nostrum of Liebert for cracked nipples, "*Cosmétique infaillible et prompt contre les gerçures ou crevasses aux seins et autres*," is a lotion formed of 10 gr. of *nitrate of lead* dissolved in 1 fl. oz. of *rose water*, and tinged with a little *cochineal*. The parts are moistened with the liquid, and are then covered with fine *leaden nipple-shields*, two of which are provided for the purpose. This is repeated soon after each time the child leaves the breast; and the nipple is *carefully* washed with a soft sponge and lukewarm water, and gently dabbed dry with a very soft towel, before the infant is again applied to it. This remedy is very successful, and has acquired great popularity and patronage in Brussels, Paris, Frankfort, and other parts. It must be recollected,

however, that all applications of an active or poisonous nature should be employed with the greatest possible caution, as, unless unusual care is taken, a portion of the remedy may remain concealed within the delicate pores of the skin, and be sucked off by the infant, to the serious disturbance of its health.

NITRANILINE. This substance is obtained by acting on *nitrobenzol* with a mixture of *fuming nitric acid* and *oil of vitriol; binitrobenzol* is formed, which is dissolved in *alcohol*, and the resulting solution subjected to the reducing action of *ammonia* and *sulphuretted hydrogen*, as described under *aniline*. Nitraniline forms yellow, acicular crystals, little soluble in cold water, but freely soluble in alcohol and ether. Its salts are crystallizable.

NITRANISIC ACID. A sparingly soluble, yellowish-white, semicrystalline powder, formed by the action of *nitric acid* on *oil of aniseed*.

NITRANISIDE. A resinous substance, produced by the action of *fuming nitric acid* on *oil of aniseed*.

NITRARIA. See *Nitrate of Potassa*.

NITRATE. Syn. *Nitras*,—Lat. A salt of nitric acid. The nitrates are very easily prepared by the direct solution of the *base*, or its *oxide*, or *carbonate*, in *nitric acid*, which, in most cases, should be previously diluted with *water*. By evaporation, with the usual precautions, they may be obtained either in the pulverulent or crystalline form.

The *nitrates* are *characterized* by deflagrating when thrown on red-hot coal, or when heated in contact with inflammable substances. See *Nitric Acid*, and the *respective bases*.

NITRE. See *Nitrate of Potassa*.

NITRIC ACID. Syn. *Azotic Acid; Acidum Nitricum*,—Ph. L. E. & D. *A. Nitrosum*,—Ph. L. 1788. *Spiritus Nitrici Glauberi*,—Ph. L. 1746. *Solutive Water*, *Spirit of Nitre*, *Glauber's do.*,—Obs. var. An acid compound of nitrogen and oxygen, of which the *aquafortis* of the shops is a crude and weaker form.

Prep. 1. (Ph. E., and Ph. L. 1836.) *Purified nitre* (dried) and *sulphuric acid*, equal parts; mix in a glass retort, and distil with a moderate heat, from a sand-bath (or *naked gas-flame*,—Ph. E.) into a cool receiver, as long as the fused materials continue to evolve vapours. "The pale-yellow acid thus obtained may be rendered colourless (if desired) by *gently* heating it in a retort." (Ph. E.) Sp. gr. 1·500. In the present Ph. L. this acid is included in the materia medica. (See *below*.)

2. (Ph. D.) The *nitrate of potassa* is dissolved in *water*, the solution precipitated with a little *nitrate of silver*, filtered, evaporated to dryness, weighed, and then treated as above.

3. (Wholesale.) *Nitre* (dry), 168 *lb.*, in the state of coarse powder, is introduced into a cold *cylindrical iron retort*, which it will only half fill, and after the lid is luted on, and the connection made with the condensers, *oil of vitriol* (sp. gr. 1·845), 93 *lb.*, is slowly poured in through an aperture provided for the purpose, and the charge is worked off with a gradually increased heat. The condensing apparatus consists of a series of 5 or 6 double-necked glass or salt-glazed stoneware bottles, about $\frac{1}{8}$th part filled with cold water, and the whole arrangement is similar to that figured in the engraving at page 61. The product of this process is the strongest brown and fuming *nitrous acid* of commerce (*aquafortis, fuming nitric acid; acidum nitrosum; acidum nitricum fumans*), and has usually the sp. gr. 1·45. It is rendered *colourless* by gently heating it in a glass retort, when it forms *commercial nitric acid*, (sp. gr. 1·37 to 1·4.) By omitting the *water* in the receivers, an acid of fully 1·500 is obtained.

Prop. Pure liquid nitric acid is colourless, highly corrosive, and possesses powerful acid and oxygenizing properties. The sp. gr. of the strongest liquid acid is variously stated by different authorities. According to some, it may be obtained as high as 1·55 (Davy, Kirwin, &c.), or 1·62 (Proust); while, according to others, 1·503 to 1·510 is the greatest density at which it can be procured, (Phillips, Gay-Lussac, &c.) Thénard fixes the greatest density at 1·513; Millon at 1·521; and Ure, at 1·51 to 1·52. When of the sp. gr. 1·5, it boils at 210°; when of 1·45, at 240°; when of 1·42, at 253°; and when of 1·40, at 246° Fahr. (Ure.) According to others, acid of 1·42 boils at 248° Fahr. Acid of less density than 1·42, parts with water and gradually becomes stronger by boiling; but acid of higher sp. gr. than 1·42 is weakened by exposure to heat. When exposed to intense cold, liquid nitric acid freezes. It is rapidly decomposed, with loss of oxygen, by contact with most organic, and many metallic and non-metallic bodies. In many cases these reactions occur with considerable violence, and the production of light and heat.

Pur. The nitric acid of commerce is generally contaminated by *hydrochloric acid*, *nitrous acid*, *sulphuric acid*, or *chlorine*, or by their *soda* or *potassa salts*, and, occasionally, *iodine*, together with an

excess of water. The last is readily detected by the sp. gr., and the others by the appropriate tests. "Free from colour. Sp. gr. 1·42. Exposed to the air, it emits very acrid vapours. Totally volatilized by heat. Diluted with 3 times its volume of water, it gives no precipitate with either nitrate of silver or chloride of barium. 100 gr. of this acid (sp. gr. 1·42) are saturated by 161 gr. of crystallized carbonate of soda." (Ph. L.) "100 gr. of this acid (sp. gr. 1·50) will saturate about 217 gr. of crystallized carbonate of soda." (Ph. L. 1836.) The Ph. E. states the density of *commercial nitric acid* is 1·380 to 1·390. "If diluted with distilled water, it precipitates but *slightly*, or not all, with solution of nitrate of baryta or nitrate of silver." The best *double aquafortis* of the shops (*aquafortis duplex*) has usually the sp. gr. 1·36; and the *single aquafortis* (*aquafortis simplex*), the sp. gr. 1·22.; but both are commonly sold at much lower strengths.

Tests.—1. It stains the skin yellow.—2. When mixed with a little hydrochloric acid or sal ammoniac, it acquires the power of dissolving gold leaf.—3. When mixed with dilute sulphuric acid, and poured on a few fragments of zinc or iron in a tube, the evolved gas burns with a greenish white flame. (Balmain.)—4. Substitute alcohol for zinc in the last test. (Maitland.)—5. Morphia, brucia, and strychnia, give it a red colour, which is heightened by ammonia in excess.—6. When placed in a tube, and a solution of protosulphate of iron is cautiously added, a dark colour is developed at the line of junction, which is distinctly visible when only $\frac{1}{21000}$th part of nitric acid is present. (Derbanius de Richemont.) This test may be often conveniently modified by dropping into the liquid a minute crystal of protosulphate of iron; the fluid immediately surrounding this crystal, then acquires a dark brown colour, which disappears upon simple agitation of the fluid, or by heating it.—7. When mixed with a weak solution of sulphate of indigo, and heated, the colour is destroyed.—8. When saturated with carbonate of potash or soda, and evaporated to dryness, the residuum deflagrates when thrown on burning coals.—9. When the mixture of a nitrate with cyanide of potassium, in powder, is heated on a piece of platinum, a vivid deflagration follows, attended with *distinct* ignition and detonation. (Fresenius.)

The *nitrates* may all be tested as above by first adding a small quantity of pure sulphuric acid, which will liberate the nitric acid of the salt.

Estim. The strength of nitric acid is usually estimated by its sp. gr.; but when very great accuracy is required, it may be more correctly ascertained by the amount of carbonate of soda, or other salt of known composition which is required to neutralize it. To render the assay trustworthy, it must be in all cases, also tested to detect the presence of impurities. See *Acidimetry* and *below*:—

TABLE *of Nitric Acid*. By DR. URE.

Ant., &c. See *Acids.*

Uses. Nitric acid is employed in assaying, to dye *silks* and *woollens yellow*, to form various salts, and in the manufacture of oxalic acid. In *medicine*, it is used as a caustic to corns and warts; and in doses of 1 to 10 drops in a tumbler of water, in liver complaints, fevers, dyspepsia, syphilis, to remove the effects of mercury, or as a substitute for that drug, &c. *Externally*, it is employed in the form of baths, lotions, and ointment. Dr. Collier declares a strong lotion of nitric acid to be almost specific in lepra, and several other kindred skin diseases.

Concluding Remarks. The common source of nitric acid is nitrate of potassa, but it may also be obtained from other nitrates by a similar process. *Nitrate of soda* is frequently used instead of nitrate of potash, and is more convenient in some respects, as the residuum is more easily dissolved out of the retort or cylinder. The residuum of the common process with nitre (*sal enixum*) is chiefly employed as a flux by the glass-houses, and as a source of potash in the manufacture of alum. On the *small scale* the first of the above formulæ will be found convenient for obtaining a pure acid. A powerful argand's lamp, or a charcoal chauffer, with the little apparatus figured at page 574, will be found to answer well. When a common retort and receiver are employed, *no luting* of any kind must be used.

By proper management *nitre* yields more than ⅔ of its weight of *pure nitric acid*, sp. gr. 1·500; and *nitrate of soda*, its own weight of acid, sp. gr. 1·4.

By the patent process of M. Mallet, dried *nitrate of soda* is decomposed by dried or monohydrated boracic acid, by heating the two together. The products are liquid nitric acid, which distils over, and biborate of soda (*borax*) which remains in the retort.

The crude coloured nitric acid of commerce (*aquafortis*) was originally prepared by distilling a mixture of *nitre* and *copperas*, and is still sometimes obtained in this way.

The nitric acid of commerce may be freed from the impurities alluded to above by one or other of the following methods:

1. By the addition of a little *nitrate of silver*, as long as it produces any cloudiness, and, after repose, decanting the clear acid, and rectifying it at a heat under 212°. To ensure a perfectly colourless product, a small portion of pure *black oxide of manganese* should be put into the retort." (Murray.)

2. By agitating the acid with a little *red oxide of lead*, and then rectifying it, as before.

3. By adding 1% of *bichromate of potassa* to the acid before rectifying it. This answers well for acid not stronger than sp. gr. 1·48.

4. By rectification at a gentle heat, rejecting the first portion that comes over, receiving the middle portion as genuine acid, and leaving a residuum in the retort. (Ure.)

According to Phillips, Ure, and others, the strongest liquid nitric acid is a *monohydrate;* that of the sp. gr. 1·503 to 1·504, a *sesquihydrate;* that of 1·486, a *binhydrate;* and that of 1·42, a *quadrihydrate;* or containing respectively, 1, 1½, 2, and 4 atoms of water.

NITRIC ACID (Anhydrous). This interesting substance was first obtained in a separate form by M. Deville in 1849.

Prep. (M. Deville.) *Nitrate of silver* is dried by exposure to a current of *dry carbonic acid* at a temperature of 356° Fahr., and the tube containing it is then immersed in a water bath heated to 203° Fahr.; pure dry *chlorine gas* is next passed through the apparatus, and, as soon as the reaction commences, the temperature is reduced to 154° or even 136°, but not lower; the production of crystals in the receiver, which must be cooled by a powerful freezing mixture, soon commences; lastly, the liquid portion of the product is removed by a current of *dry carbonic acid* gas.

Prop., &c. Colourless prismatic crystals, which melt at 86° Fahr., boil at about 115°, and at 122° begin to suffer decomposition; added to water much heat is generated; it rapidly attacks organic bodies, even caoutchouc; sometimes it explodes spontaneously. The process for its preparation is tedious and difficult.

NITRIC ACID (Dilute). *Acidum Nitricum Dilutum*,—Ph. L. E. & D. *Prep.* 1.

(Ph. L.) *Nitric acid* (sp. gr. 1·42), 3 fl. oz.; *distilled water*, 17 fl. oz.; mix. Sp. gr. 1·082. "1 fl. oz. is saturated by 154 gr. of the crystals of carbonate of soda." It contains about 12% of pure anhydrous nitric acid.

2. (Ph. E.) *Nitric acid* (1·500), 1 fl. oz.; *distilled water*, 9 fl. oz. Or, *commercial nitric acid* (1·390), 1 fl. oz. 5½ dr.; *water*, 9 fl. oz. Sp. gr. 1·077. It contains 11·16% of pure dry nitric acid.

3. (Ph. D.) *Nitric acid* (1·500), 4 fl. oz.; *water*, 29 fl. oz. Contains about 9·7% of pure acid. The above are *used* for convenience in dispensing. *Dose*. 15 drops to ½ fl. dr., or more. The above must not be confounded with the *acidum nitricum dilutum*, Ph. D. 1826, which had the sp. gr. 1·280; nor with the following:—

4. (Henry's.) Sp. gr. 1·143; equal in saturating power to *hydrochloric acid* sp. gr. 1·074, and *sulphuric acid*, 1·135. *Used* in assaying.

NITRIC ACID (Fuming). Syn. *Acidum Nitricum Fumans*,—Lat. The red fuming *nitrous* or *nitric acid* of commerce is simply *nitric acid* loaded with *nitrous* or *hyponitric acid*. (See those articles.) That of the Ph. Bor. is distilled from *nitre*, 2 parts; *oil of vitriol*, 1 part.

NITRIC ACID (Oxygenized). See *Acids*.

NITRIC OXIDE. See *Binoxide of Nitrogen*.

NITRILE-BASES. Artificial organic bases, in which the hydrogen of ammonia is replaced by other radicals.

NITRITE. Syn. *Nitris*,—Lat. See *Nitrous Acid*.

NITRO-BENZAMIDE. A substance formed by treating *nitro-benzoic ether* with *ammonia*. See *Oxamide*.

NITRO-BENZOIC ACID. Prepared by boiling *benzoic acid* for several hours in *fuming nitric acid*, or until red fumes cease to be evolved. It closely resembles benzoic acid in character, but differs from it in constitution.

NITRO-BENZOLE. *Prep*. By treating *benzole* with *strong fuming nitric acid*, with heat; after the violence of the reaction is over, the liquid is diluted with *water*, and the heavy, oily fluid which separates, is collected, washed, and dried.

Prop., &c. Yellowish; very sweet; smells of bitter almonds; insoluble in water; little affected by reagents; boils at 415° Fahr.; sp. gr. 1·209. Heated with an alcoholic solution of caustic potassa, and the mixture submitted to distillation, it yields a red, oily liquid, from which large red crystals of "*azobenzole*" separate. These are nearly insoluble in water, freely soluble in alcohol and ether, melt at 150° Fahr., and boil at 380° Fahr. *Binitrobenzole* is made by dissolving *benzole* in a mixture of equal volumes of the *strongest nitric* and *sulphuric acids*, and boiling the liquid for a few minutes; the crystals (*binitrobenzole*) which form as it cools are insoluble in water, but are freely soluble in alcohol.

NITRO-CHLORONICENE. Obtained by treating *chloronicene* with *strong fuming nitric acid*. Crystallizable.

NITRO-COCCUSIC ACID. Obtained by acting on a mixture of *carminic acid* and *oxalic acid* with *nitric acid*. It forms magnificent yellow rhombic plates, which are soluble in water, alcohol, and ether.

NITRO-CUMIC ACID. From *cumic acid*, as *nitro-benzoic acid*.

NITRO-CUMOL. From *cumol*, as *nitro-benzole*.

NITRO-HYDROCHLORIC ACID. Syn. *Nitro-muriatic Acid; Aqua Regia, Acidum Nitro-hydrochloricum, A. Nitro-muriaticum*,—Lat. *Eau Régale*,—Fr. *Prep*. 1. (Ph. D. 1826.) *Nitric acid*, 1 part; *hydrochloric acid*, 2 parts, (both by measure;) mix in a refrigerated bottle, and keep the mixture in a cold and dark place. *Used* to dissolve gold and platinum; and in *medicine*, in liver complaints, syphilis, the exanthemata, &c., either *internally*, in doses of 5 to 15 drops in water, or *externally*, as a foot or knee-bath. It is also occasionally employed as a caustic.

2. (*Aqua regia with sal ammoniac.*) *Nitric acid* (sp. gr. 1·2), 16 fl. oz.; *sal ammoniac*, 4 *oz.*; dissolve. Occasionally used by dyers; does not keep well.

3. (*Dyer's aquafortis.*) Colourless *nitric acid* (sp. gr. 1·17), 10 *lb.*; *hydrochloric acid* (sp. gr. 1·19), 1 *lb.*; mix. *Used* by dyers. "It dissolves tin without oxidizing it." (?)

NITRO-LEUCIC ACID. Colourless, acicular crystals, formed by dissolving *leucine* in *nitric acid*, evaporating for crystals, and purifying these by re-solution in *water* and recrystallization.

NITRO-MECONIC ACID. Formed by the action of *strong nitric acid* on *meconine*, at a gentle heat. By solution in hot water, it is obtained in yellow crystals as the liquid cools.

NITRO-NAPHTHALASE. A substance formed, with other products, by the action of *nitric acid* on *naphthaline*.

NITRO-PHENASIC ACID. Obtained by distilling a *mixture* of *phenyl-alcohol* and *very dilute nitric acid*. Superb, yellow, acicular crystals, forming beautiful

yellow salts with the alkalies, and a red one with oxide of silver.

NITRO-PHENESIC ACID. *Prep.* The portion of *crude coal oil* which boils between 360° and 400° Fahr. is *very carefully* mixed in a large open vessel with a little more than an equal weight of *nitric acid* of the sp. gr. 1·42, and, after the reaction is over, the resulting brownish-red substance is washed with *water*, boiled in a *dilute solution of ammonia*, and the liquid filtered whilst hot; the filtrate, on cooling, deposits crystals of *nitro-phenesate of ammonia*; these are purified by re-solution and re-crystallization, after which the salt is dissolved in *water*, decomposed by *dilute nitric acid*, and the product crystallized from *alcohol*.

Prop., &c. Odourless; bitter; sparingly soluble in water; freely soluble in alcohol; melts at about 220° Fahr.; its salts are either yellow or orange, are mostly soluble, and are very beautiful.

NITRO-PHENISIC ACID. From the *brown matter* left on the filter in the last process, purified by solution and crystallization. It is identical with *carbazotic* or *picric acid*.

NITRO-PRUSSIDES. A series of salts discovered by Dr. Playfair, and obtained by the action of *nitric acid* on the *ferrocyanides* and *ferridcyanides*. See *Nitro-prusside of Sodium*.

NITRO-SACCHARIC ACID. A peculiar crystallized acid, formed by the union of *nitric acid* with the *saccharine matter obtained by the action of sulphuric acid on gelatine*.

NITRO-SALICYLAMIDE. Crystalline, yellowish-white needles, obtained by treating *salicylamide* with *strong fuming nitric acid*.

NITRO-SALICYLIC ACID. By acting on *salicine* with *strongest nitric acid*, with heat; or, by gently heating *salicylous acid* with moderately strong *nitric acid*, washing the mass with water, dissolving it in *alcohol*, and crystallizing. Small golden-coloured crystals; with the alkalies it forms crystallizable *nitrosalicylates*. It is identical with *anilic acid*.

NITRO-SULPHURIC ACID. *Prep.* From *nitre*, 1 part; dissolved in *sulphuric acid*, 9 parts. *Used* to separate the silver from the copper and solder of old plated goods. At about 200° Fahr. it readily dissolves the *first*, but scarcely acts on copper, lead, or tin, unless diluted, or assisted by a much higher temperature.

NITRO-TOLUOLE. From *toluole*, as *nitro-benzole*, which it closely resembles. A solid, crystallizable substance (*binitro-toluole*) is at the same time formed.

NITRO-TOLUYLIC ACID. From *toluylic acid*, as *nitro-benzoic acid*.

NITRO-XYLOLE. From *xylole*, as *nitro-benzole*.

NITROGEN. Syn. *Azote, Mephitic Air, Phlogisticated do.; Nitrogenium, Azotum*, —Lat. A gaseous substance discovered by Rutherford in 1772, and found to be a constituent of the atmosphere by Lavoisier and Scheele in 1775. It has hitherto resisted all attempts at decomposition, and is, therefore, considered to be a chemical element. (See Chem. v. 3.) It is found both in the organic and inorganic kingdoms of nature; it forms about $\frac{4}{5}$ths, or 79% of the bulk of the atmosphere, enters largely into the composition of most animal substances, and is a constituent of gluten, the alkaloids, and other vegetable principles.

Prep. 1. A small piece of *phosphorus* is placed in a capsule floating on the surface of the water of the pneumatic trough, and after setting it on fire a gas or bell-jar is inverted over it; as soon as the combustion is over, and the fumes have subsided, the residual gas is washed by agitation with *recently boiled distilled water*, or with a *solution of pure potassa*. It may be dried by either letting it stand over *fused chloride of calcium*, or, what is better, by passing it through *concentrated oil of vitriol*. Nearly pure.

2. A porcelain tube is filled with *copper turnings*, or, preferably, with *spongy copper* (obtained by reducing the oxide with hydrogen), and is then heated to redness, a stream of *dry atmospheric air* being at the same time directed through it. By repeating the process with the same air, the product is rendered *quite pure*.

3. *Chlorine gas* is passed into a *solution* of *pure ammonia*; the evolved gas, after being dried, is *pure nitrogen*.

4. (Corenwinder.) From *solution of nitrite of potassa*, 1 volume; *concentrated solution of sal ammoniac*, 3 vols.; gently heated together in a flask, and the evolved gas passed through *sulphuric acid*. Pure.

5. From *nitrite of ammonia* exposed to heat in a retort.

6. From *lean flesh* digested in *nitric acid*, at a gentle heat.

Prop., &c. Pure nitrogen is a colourless, odourless, tasteless gas, neither combustible nor capable of supporting combustion or respiration. It is neutral to test-paper, does not affect lime-water, and is only slightly absorbed by pure water. Its sp. gr. is 0·9722 (Dumas and Liebig; 0·976 Ber-

zelius); 100 cubic inches, at 60° Fahr., and 30 inches of the barometer, weigh 30·14 gr. (29·7 gr.,—Ure.) In *analysis* it is recognised by its purely negative qualities, and by its forming *nitric acid*, when mixed with oxygen and exposed to the electric spark; or when a jet of hydrogen is burnt in the mixed gases. The nitric acid thus formed may be tested in the way described under that article. See *Nitric Acid, Organic Substances, &c.*

NITROGEN (Chloride of). Syn. *Terchloride of Nitrogen.* This compound was discovered by Dulong, in 1811, but its nature was first accurately determined by Sir H. Davy.

Prep. (Liebig.) Dissolve *hydrochlorate of ammonia*, 1 *oz.*, in *hot water*, 12 or 14 *oz.*, and as soon as the temperature has fallen to 90° Fahr., invert a wide-mouthed glass bottle full of chlorine over it. The gas is gradually absorbed, the solution acquires a yellow colour, and in the course of 15 to 20 minutes yellow oil-like globules of *chloride of nitrogen* form upon the surface of the liquid, and ultimately sink to the bottom. The globules as they descend should be received in a small *leaden saucer*, placed under the mouth of the bottle for the purpose.

Prop., &c. Chloride of azote is one of the most *dangerous explosive compounds* known, and should consequently be only prepared in *very small quantities* at a time. Both its discoverer and Sir H. Davy met with severe injuries while experimenting on it. Its sp. gr. is 1·653; it volatilizes at 160° Fahr., and between 200° and 212° fulminates violently. Contact with combustible bodies at ordinary temperatures immediately causes detonation. The explosive power of this compound seems to exceed that of every known substance, not even excepting fulminating silver. A minute globule, no larger than a grain of mustard-seed, placed on a platina spoon, and touched with a piece of phosphorus stuck on the point of a penknife, immediately explodes, and shivers the blade into fragments, at the same time that the vessel that contains it is broken to pieces. Olive oil, naphtha, and oil of turpentine have a similar effect.

NITROGEN (Iodide of). Syn. *Teriodide of Nitrogen.* A dark-brown or black insoluble powder, which is most safely and conveniently prepared by saturating *alcohol* (sp. gr. 0·852) with *iodine*, adding a large quantity of the strongest *pure liquor of ammonia*, and agitating the mixture; *water* must now be added, when *iodide of nitrogen* will be precipitated, and must be *carefully* washed with *cold distilled water.*

Prop., &c. It detonates violently as soon as it becomes dry, by the *slightest* pressure or friction, even that of a feather, and often spontaneously; but the explosion is scarcely so powerful as that of the chloride of nitrogen. It also explodes whilst moist, though less readily. It should only be prepared in *very small quantities* at a time. Recent researches induce the belief that both the above compounds contain hydrogen.

NITROGEN (Oxides of). Nitrogen forms 5 distinct compounds with oxygen—2 *oxides*, and 3 *acids;* containing, respectively, 1, 2, 3, 4, and 5 equivalents of *oxygen* to 1 of *nitrogen.*

NITROGEN (Protoxide of). Syn. *Nitrous Oxide, Laughing Gas, Dephlogisticated Nitrous Air; Nitrogenii Protoxydum,*—Lat. *Prep.* From *fused nitrate of ammonia* introduced into a glass retort, or a flask furnished with a bent tube, and then exposed over a spirit-lamp or charcoal-chauffer, to a temperature of about 380° Fahr.; the evolved gas may be collected in bladders, gas bags, a gazometer, or in the pneumatic trough over warm water.

Prop., &c. Colourless; possesses an agreeable odour, and a sweetish taste; at 45°, under a pressure of 50 atmospheres, it is liquid; this, when exposed under the receiver of a powerful air-pump, changes into a snow-like solid; at—150° Fahr., it is a transparent, colourless, crystalline body; it supports combustion, and is absorbed by cold water. Sp. gr. 1·525 (1·527,—Ure); 100 cubic inches weigh 47·29 gr. (49·6 gr., —Ure.) Its most remarkable property is its action on the system when inspired. A few deep inspirations are usually succeeded by a pleasing state of excitement, and a strong propensity to laughter and muscular exertion, which soon subside, without being followed by languor or depression. Its effects, however, vary with different constitutions. A sailor that lately took this gas at a public exhibition, immediately drew his knife, and stabbed one of the company. From 4 to 12 quarts may be breathed with safety. It produces temporary insensibility to pain, like chloroform or ether; but its use is dangerous when affections of the heart, lungs, or brain are present.

Obs. No particular caution is required in preparing the above compound, except the use of too much heat. The temperature should be so arranged as to keep the melted mass in a state of gentle ebullition, and should not be allowed, under any circum-

stances, to exceed about 500° Fahr. Should white fumes appear within the retort after the evolution of the gas has commenced, the heat should be at once lowered, as when heated to about 600° nitrate of ammonia explodes with violence.

Nitrous oxide may also be made in the same way, from crystallized nitrate of ammonia, or by exposing nitric oxide for some days over iron filings, but, without great care, the product is not always fit for respiration. *When pure*, it is colourless, has an agreeable odour, and does not affect solution of nitrate of silver.

NITROGEN (Binoxide of). Syn. *Nitric Oxide, Nitrous Gas, Deutoxide of Nitrogen; Nitrogenii Binoxydum*,—Lat. *Prep.* By pouring *nitric acid*, sp. gr. 1·2, on *metallic copper*, under the form of *turnings, clippings*, or *wire*. Effervescence ensues, and *nitrous gas* is evolved, and may be collected over water or mercury in the pneumatic trough. The residual liquid yields crystals of *nitrate of copper* on evaporation.

Prop., &c. A colourless, tasteless, inodorous, *irrespirable*, and incombustible gas. In contact with free oxygen, it produces dense orange or red vapours of nitrous acid, which are freely absorbed by water. It is absorbed by a solution of protosulphate of iron, which it turns of a deep-brown or nearly black colour, which is removed by boiling. Sp. gr. 1·039; 100 cubic inches weigh about 32¼ gr. (36·66,—Ure.)

NITROGEN (Phosphuret of). A snow-white powder, formed by heating *chloride of phosphorus* which has been previously saturated with *dry ammoniacal gas*. (Rose.)

NITROGEN (Sulphuret of). A greenish-yellow mass, obtained by the action of *water* on a *compound of chloride of sulphur and ammonia*. (Soubeiran.)

NITROUS ACID. Syn. *Hyponitric Acid; Peroxide of Nitrogen*,—Graham; *Acidum Nitrosum*,—Lat. *Prep.* 1. Distil perfectly *dry nitrate of lead* in a coated glass retort, connected with a glass receiver placed in a *freezing mixture*, and furnished with a safety tube.

2. (Ure.) By distilling *strong fuming nitric acid* at the lowest possible temperature, and rectifying what comes over.

Prop., &c. A pungent, acid, corrosive liquid, colourless below zero, but yellow, or orange-coloured at higher temperatures; sp. gr. 1·42; boiling point, 82° Fahr. It is a powerful oxidizing agent. When mixed with water, it is decomposed. A mixture of nitrous and nitric acids forms the fuming nitric acid (*aquafortis*) of commerce. It possesses the power of forming salts in only a limited degree. The compounds commonly called *nitrites* are compounds of hyponitrous acid with the bases. A true *nitrite of lead* has, however, been formed by M. Peligot, by digesting nitrate of lead with metallic lead. "The *hyponitrous* and *nitrous* are two acids remarkable for containing *no* water in their composition; *nitrite of potassa* may be obtained by heating nitre to redness, and removing it from the fire before the decomposition is complete." (Ure.) See *Hyponitrous Acid, &c*,

NITROUS GAS. See *Binoxide of Nitrogen.*

NITROUS OXIDE. See *Protoxide of Nitrogen.*

NODE. Syn. *Nodus*,—Lat. A hard tumour proceeding from a bone, and caused by the swelling of its external membrane. The bones of the leg, forehead, and fore-arm, are those most commonly attacked. Nodes are generally accompanied with considerable pain, and often with caries and loss of vitality.

NOLI ME TANGERE. See *Lupus.*

NOMENCLATURE (Chemical). The following information will doubtless prove useful to many of our readers, as serving to explain terms which are necessarily of frequent occurrence in this work:—

Acids.—a. When a substance produces only *one* acid compound with oxygen, the name of this acid is formed by adding the termination *-ic* to that of the *radical*, or to the leading or characteristic portion of it; as, *sulphuric acid*, an acid of sulphur. This is latinized by changing -ic into *-icum;* as, *acidum sulphuricum.—b.* When a body forms *two* acid compounds with oxygen, the name of the one containing the *smaller* proportion of that substance ends in *-ous;* as, *arsenious acid*, which contains 1 equivalent of arsenic with *three* of oxygen; *arsenic acid*, containing 1 eq. of arsenic with *five* of oxygen. In this case the Latin name ends in *-osum;* as *acidum arsenio*sum. *—c.* When a substance forms *more* than *two* acids with oxygen, the preposition *hypo-* (below *or* under) is prefixed to the name of the acid in *-ous* or *-ic* next above it; as, hypo*nitrous acid.—d.* When a new acid compound of a substance is discovered, containing *more* oxygen than another acid of the same substance already known, the name of which ends in -ic, the prefix *per-* or *hyper-* is added; as, per*iodic acid.* This may be illustrated by the compounds of oxygen and chlorine:—

		Chlorine.	*Oxygen.*
Hypochlorous acid	(*acidum hypochlorosum*) contains	1 equiv.	1 equiv.
Chlorous „	(„ *chlorosum*) „	1 „	3 „
Hypochloric „	(„ *hypochloricum*) „	1 „	4 „
Chloric „	(„ *chloricum*) „	1 „	5 „
Perchloric *or* Hyperchloric „	(„ *perchloricum*) „	1 „	7 „

Oxides. The names of these have, in general, reference to the number of equivalents of oxygen which they contain. When a metal or base forms only *one* basic compound with oxygen, this compound is simply called the *oxide* of such base; but as most substances form *more* than one compound with oxygen, certain prefixes are introduced to express the proportions. In such cases it is always found that one out of the number has a strongly-marked basic character, and contains 1 equivalent of each of its constituents. This is called the *oxide* or *protoxide*, and forms the standard to which those both above it and below it are referred. Thus:—

	Metal or *base.*	*Oxygen.*
Suboxide or dioxide (*suboxydum, dioxydum*) contains	2 equiv.	1 equiv.
Oxide or protoxide (*oxydum, protoxydum*) „	1 „	1 „
Sesquioxide (*sesquioxydum*) . . „	1 „	1½ „
Binoxide or deutoxide (*binoxydum, deutoxydum*) . . . . . „	1 „	2 „
Teroxide or tritoxide (*teroxydum, tritoxydum*) . . . . . „	1 „	3 „
Peroxide or superoxide (*peroxydum*) . . „	That containing the *largest* proportion of oxygen.	

Salts.—a. The name of the salt of an acid in *-ic* ends in *-ate*, and is Latinized by *-as;* as, *carbonate of lime, sulphate of protoxide of iron, calcis carbonas, &c.—b.* The name of the salt of an acid in *-ous* ends in *-ite*, and is Latinized by *-is;* as *hypochlorite of soda, sodæ hypochloris.* For the sake of brevity the word oxide in speaking of the ordinary metallic salts is omitted, and we simply say *sulphate of iron, acetate of lead,* &c.—*c.* The preceding names are presumed to refer to neutral compounds. In *acid salts* the prefixes noticed above, are added to express the equivalent proportions of the acid; as *binacetate, sesquisulphate,* &c.—*d.* In *basic salts*, or those in which the base is in excess, the prefix *sub-* or *di-* is employed, in the way before pointed out; as *diacetate of lead, subnitrate of mercury,* &c. In many cases the previous terms are used with the word "*basic*" added, by which the number of equivalents of *base* instead of *acid* are indicated; as, *sesquibasic acetate of lead, tribasic do.*

Non-metallic bodies, &c. The names of the compounds formed by the union of the *non-metallic elements*, and certain other bodies, with the metals and with each other, either terminate in *-ide*, Latinized by *-idum*, or in *-uret*, Latinized by *-uretum;* as, *arsen*ide or *arseni*uret (*arseni*dum, *arseni*uretum), *bromide* or *bromuret, carbide* or *carburet, chloride* or *chloruret, cyanide* or *cyanuret, fluoride* or *fluoruret, hydride* or *hydruret, iodide* or *ioduret, sulphide* or *sulphuret,* &c. The *first* of these terminations is the now prevailing one among English scientific chemists; the *second* is that commonly adopted on the Continent. The prefixes already noticed are also employed here:—

		Sulphur.	*Potassium.*
Sulphide, sulphuret, *or* protosulphuret of potassium,	contains	1 equiv.	1 equiv.
Sesquisulphide *or* sesquisulphuret	„ „	1½ „	1 „
Bisulphide *or* deutosulphuret	„ „	2 „	1 „
Tersulphide *or* trisulphuret	„ „	3 „	1 „
Quadrisulphide *or* quadrisulphuret	„ „	4 „	1 „
Pentasulphide *or* pentasulphuret	„ „	5 „	1 „
Persulphide, persulphuret, *or* supersulphuret	„	Applied to that containing the *largest* quantity of sulphur.	

Metals. The names of the metals (those of them at least that have been given during the present century) end in *-ium* or (less frequently) in *-um;* as, *potass*ium, *sod*ium, *pla-*

tinum. The Latin names of several of the non-metallic elementary bodies also end in *-ium;* as, *iodinium*, *nitrogenium*, &c.

Alkaloids. The names of the organic bases end either in *-ia*, *-na*, or *-ine;* as, *morphia*, *quina*, *strychnine*. These terminations are now limited, as much as possible, to substances exhibiting basic properties, but were formerly very loosely applied.

The *Latin genitive* or *possessive* of the *above* compounds in—

-as	is	-atis
-is	,,	-itis
-icum	,,	-ici
-osum	,,	-osi
-idum	,,	-idi
-etum	,,	-eti
-ium	,,	-ii
-um	,,	-i
-ia, -a, -na	,,	-æ.

Ex. Acetas (acetate), *acetatis* (of acetate); arsenis, *arsenitis;* citricum, *citrici;* arseniosum, *arseniosi;* iodidum, *iodidi;* sulphuretum, *sulphureti;* sodium, *sodii;* platinum, *platini;* morphia, *morphiæ;* quina, *quinæ;* narcotina, *narcotinæ*. The genitives of common names vary with the termination. Most of those ending in *-a* make *-æ*, and most of those in *-us* and *-um* make *-i;* but there are many exceptions, among which *cornu* (a horn) and *spiritus* (spirit), which are unaltered in the genitive singular, may be mentioned as examples.

NONPAREILS. See *Sugar Plums*.

NORFOLK FLUID. *Prep*. Take of *linseed oil*, 3 pints; *black rosin*, ½ *lb.;* *yellow wax*, 12 *oz.;* melt, and add of *neat's-foot oil*, 1 quart; *oil of turpentine*, 1 pint. *Used* to preserve and soften leather.

NORIUM. An unexamined metal, the oxide of which, according to Svanberg, exists in certain varieties of *zircon*.

NOSTRUMS. See *Patent Medicines*, *&c*.

NOVARGENT. *Prep*. From *recently precipitated chloride of soda* by dissolving it in a solution of either *hyposulphite of soda* or of *cyanide of potassium*. *Used* chiefly to restore old plated goods. The liquid is rubbed over the metal to be coated with a little prepared chalk, and the part is afterwards polished off with a piece of soft leather. A *powder* recently sold under the same name is formed by mixing the preceding article with chalk, and drying the mass. It is made into a paste with a little water, spirit of wine, or gin, before applying it.

NOVAURUM. From a *solution of neutral terchloride of gold*, as the last.

NOYAU. Syn. *Créme de Noyau*. This is a pleasant nutty-tasted liqueur, but from the large proportion of prussic acid which it contains, a small quantity only should be taken at a time.

Prep. 1. *Bitter almonds* (bruised), 3 *oz.;* *spirit* (22 u. p.), 1 quart; *sugar*, 1 *lb.;* (dissolved in) *water*, ¾ pint; macerate for 10 days, frequently shaking the vessel, then allow it to repose for a few days, and decant the clear portion.

2. As the last, but substituting *apricot* or *peach kernels* (with the shells, bruised), for the almonds.

3. To either of the above, add of *coriander seed* and *ginger*, of each, bruised, 1 dr.; *mace* and *cinnamon*, of each, ½ dr.

4. (*Wholesale*.) To *plain cordial*, at 54 to 60 u. p., containing 3 *lb*. of *sugar* per gallon, add, gradually, *essence of bitter almonds*, q. s. to flavour.

5. (*Créme de noyau de Martinique*.) *Loaf sugar*, 24 *lb.: water*, 2½ gall.; dissolve, add of *proof spirit*, 5 gall.; *orange-flower water*, 3 pints; *bitter almonds* (bruised), 1 *lb.;* *essence of lemons*, 2 *dr.;* as above. See *Liqueurs*.

NURSERY. "A plot of ground, or an entire garden, set apart for the propagation of plants, more particularly of trees and shrubs. The situation ought to be open and airy, and the soil of an average quality, neither too heavy nor too light, so as to adapt it to the majority of plants." (Loudon.)

NURSING. Milk is the natural food of the mammalia during the earlier period of their existence. It contains all that is necessary for the nourishment of their bodies, and on it they thrive and grow. Its secretion only actively commences at the time when it is required for the sustenance of the offspring, and it either materially lessens in quantity, or wholly disappears, as soon as the necessity of its existence has passed away, and the little being who depended on it has acquired sufficient age and strength to exist on cruder aliment. The nursing mother when in a state of perfect health, and properly supplied with a sufficiency, without excess, of nutritious food, elaborates this secretion in the fittest condition to ensure the health and vigour of her offspring. Her bosom is the fountain whence flows the beauty and stamina of the future adult, and whilst giving strength and life to another, she increases and prolongs her own.

The milk of women *varies* with the food,

health, age, &c., of the nurse. That produced from a *mixed animal* and *vegetable diet*, neither acesces nor coagulates spontaneously, like cows' milk; and when gently evaporated in an open vessel, "the last drop continues thin, sweet, and bland." Acids and rennet, however, coagulate it readily, and so does the gastric juice of the infant, as shown by the condition in which it is often ejected by the latter. The milk of a woman who lives wholly on *vegetable food* acesces and coagulates with equal readiness, and in a precisely similar manner to cows' milk. The quality of the milk also varies with the *progress of digestion*. Within the first hour or two after a meal it is thin and serous, and then gradually improves in richness and flavour, until at about the fourth or fifth hour, it possesses these qualities in the highest degree. This then is the period at which the infant should be applied to the breast, which, according to the present habits of society, would be during the hour immediately preceding each meal, except the breakfast. After about the fifth or sixth hour the milk gradually loses its peculiar colour and odour, until towards the tenth or twelfth hour after eating food it becomes yellowish, bitter, and often nauseous; and in this condition is frequently refused by the infant. This points out the impropriety of a nurse fasting longer than 4 to 5 hours, except during the night, when the period may be extended to 7 or 8 hours, but *never* longer. The *time after accouchement* is *another matter* that influences the character of human milk in respect of its wholesomeness for the infant. The milk secreted soon after delivery is very thin and serous, but in the course of a few days it becomes thicker, richer, and more nutritious; and a gradual change in the same direction proceeds during the usual period of suckling. When the mother suckles her own infant, or the "age of the milk," as the nurses say, corresponds to that of the child, all goes on well; bnt, when the former much exceeds the latter, the reverse is the case. Thus, it is found that an infant is incapable of completely digesting the milk of a nurse whose own child is much older than itself; and that an infant of a few weeks old will often starve on the milk intended by nature for one several times its age. It is, therefore, necessary, in selecting a wet-nurse, to be certain that her condition, in this respect, closely corresponds to that of the mother of the infant, or that it does not differ, on this point, more than 3 or 4 weeks. In respect of the use of high-flavoured or *improper food* and *beverages, medicine, &c.*, it appears that all these substances immediately affect the milk, and impart to it more or less of their peculiar flavour and properties; and, except with remedies administered under medical advice, in nearly all cases prove injurious to the infant. The *diet* of a *nurse* should be nutritious and succulent, and its healthy digestion should be promoted by exercise and pure air. Strong liquors, more especially spirits, act like slow poisons on the infant, and their habitual use by a nurse should, therefore, be considered as a positive disqualification for the duties of her office. The care of the mother or wet-nurse should be particularly directed to the maintenance of her own health and equanimity, by which both the health and good temper of the infant will be, as far as possible, ensured. A grieving, irritable, or angry mother, forces her bad qualities on her offspring, in the shape of fits, convulsions, or hopeless marasmus. See *Infancy*, *Milk*, *&c.*

NUTMEG. Syn. *Myristicæ Nucleus*, *Nucista*, *Nux Moschata*, *N. Myristica*, *N. Aromatica*; *Myristica*,—Ph. L. "The shelled seed of *myristica officinalis* (Linn.; *m. moschata*,—Thunberg), or *nutmeg-tree*." (Ph. L.) It is chiefly used as a spice and condiment, but is also esteemed as an aromatic in flatulency and diarrhœa. *Dose.* Half a teaspoonful, or more, grated. The distilled and expressed oils (*oleum myristicæ*) are also officinal.

NUTRITION. The phenomena of life are accompanied by the constant and unceasing waste of the materials of which the animal body is composed. Every act of volition, every exertion of muscular power, every functional action of the organism, whether perceptible, or imperceptible and involuntary, every play of chemical affinity and decomposition, even thought itself, occasions the disorganization and destruction, as living matter, of a portion of ourselves. But the process of respiration, and the various important changes with which it is connected, tends, more than all the other vital functions, to waste the substance of the body, the temperature of which it is its special office to support. This loss, this change, which commences with life and terminates only with death, is compensated for by the constant renewal of the whole frame by the deposition and assimilation, or organization, of matter from the blood, which thus becomes gradually thinner and impoverished, unless, in its turn, it receives a corresponding supply of its vital elements. This it does from the food, which, by the functions of digestion, is converted into

chyle, and, after being taken up by the lacteals, passes into the blood, of which it then becomes a part, and after being animalized, and rendered similar to the being it is designed to nourish, by the peculiar action of the vital affinities, it attaches itself to those organs or tissues the loss of which it is intended to supply. This constitutes nutrition.

The *food* of *animals*, or rather, the nutritious portion of that food on which we live, is wholly organic matter, and is either directly or indirectly, produced by the powers of vegetation from the inorganic world. The plant elaborates food for the herbivora, and these, in their turn, serve as food for the flesh-eating animals. In both cases the leading alimentary principles are the same; the difference is in their proportions. *Flesh* is identical in composition with blood, and with the body of the animal that blood is destined to nourish. It abounds in albumen, caseine, and fibrine. The *vegetable substances* used as food also contain nitrogenized principles of a precisely similar character and chemical constitution to those found in flesh, and which we are, therefore, bound to believe are absolutely the same. The *gluten* of wheat, when purified from gliadine, presents all the characteristics of pure fibrine. The *albumen* extracted from *vegetable juices* when coagulated by heat, cannot be distinguished from the boiled white of egg in a divided condition. The *emulsive principle* of almonds, peas, beans, and many of the oily seeds, bears the most striking resemblance to the caseine of milk. When a mixture of this substance with water is heated, it does not coagulate, but a skin forms on the surface; the addition of alcohol or acetic acid coagulates it immediately, and when it is mixed with a little sugar, it soon curdles, becomes sour, and undergoes the lactic fermentation. In all this it precisely resembles milk. Further, all these substances dissolve in a solution of caustic potassa, and the filtered solutions, when treated with excess of acid, give precipitates of proteine. These facts clearly show that the leading nitrogenized principles of animal bodies pre-exist in vegetables, and that the substances employed as food must have the same, or nearly the same chemical composition as the body itself. The striking contrast of *animal* and *vegetable food*, as far as this point is concerned, is more apparent than real. The actual difference between the two is to be found in the existence of a large quantity of non-nitrogenized matter (*sugar*, *starch*, *&c.*) in the last, which is not contained in the other—matter which abounds in carbon, and which, by its combustion in the system, serves to support the animal heat at a less sacrifice of the organic fabric. In the flesh-eating animal, the waste of the organic tissues is very rapid, and the tax upon the vital energies proportionate; for the temperature of its body is kept up, for the most part, by the burning of the nitrogenized matter of which these tissues are composed.

The *process* of *digestion* is that by which the available portions of the food are reduced to a form adapted for absorption by the vessels by which it is introduced into the system. In the flesh-eating animal this process is extremely simple, and consists in the mere comminution of the food by the teeth, and its reduction to the liquid state in the stomach, after which, from the nature of its composition, it is nearly all taken up, and at once conveyed into the blood. In the herbivora, however, the process of digestion is much more complicated, and occupies a longer period. Besides the ordinary principles of flesh, their food contains starch, sugar, gum, &c., mixed with much inert vegetable fibre and other useless substances from which it must be separated. The *first* of these supply materials for the waste and growth of the body, the *second* meet the requirements of respiration, and the *last* pass unaltered through the alimentary canal.

The *nature* of the *digestive process* is not clearly established. The principal objects effected appear to be the conversion of starch, coagulated albumen, fibrine, caseine, &c., into a liquid form. It is known that the saliva contains a peculiar principle resembling diastase, capable of transmuting starch into sugar, and that when a little starch is held in the mouth for a short time, this change actually occurs. It is also known that the gastric juice contains a peculiar organic principle named *pepsin*, and that this substance, in conjunction with *dilute hydrochloric acid*, which is likewise present in the stomach, possesses the property of dissolving the albuminous principles of food. These changes occur whenever these conditions are established out of the body; and, hence, it is inferred that the process of digestion is effected by similar means. Of this, however, there is no direct evidence.

The *use* of *food*, as already noticed, is two-fold. It supplies the materials of nutrition to balance the waste of the tissues continually taking place in the body, and it conveys into the system those elements

which, by their chemical combinations, produce heat. To effect these purposes in the most beneficial manner, the food should not only be sufficient in quantity, but the proportions of its nitrogenized and carbonaceous principles should bear such relations to each other as to amply meet the demands of the system for each, without the existence, however, of an undue excess of either. When a larger supply of amylaceous or oleaginous matter is taken in the food than is necessary for the ordinary requirements of respiration, an unusual quantity of carbon accumulates in the system, and by its union with oxygen, a corresponding proportion of animal heat is generated. But the *whole* of this *carbon* is not got rid of by the process of respiration alone; some is deposited as fat in the tissues and bones; a large quantity is separated as a saccharine and fatty emulsion, by the liver; some is disposed of in the formation of the hair and unctuous substance of the skin; and some is eliminated by the skin, as carbonic acid gas. The *nitrogenous principles* of the food play an equally important part in the animal economy. These form compounds in the blood and in the tissues, which are of a stimulant nature, and hence are very proper to assist in the development of heat; but when these substances are produced in excess, they act as causes of irritation, and, indeed, are so violent in their effects, as sometimes to occasion death. The kidneys and the skin are the organs by which these offensive nitrogenous compounds are eliminated from the body; their detention or imperfect removal is a constant source of disease.

When the muscular movements of a healthy animal are restrained, a genial temperature kept up, and an ample supply of food containing much amylaceous or oily matter given, an *accumulation* of *fat* in the system rapidly takes place; this is well seen in the case of stall-fed cattle. On the other hand, when food is deficient, and much exercise is taken, *emaciation* results. These effects are ascribed to differences in the activity of the respiratory function. In the first instance, the heat-food is supplied faster than it is consumed, and hence accumulates in the form of fat; in the second, the conditions are reversed, and the creature is kept in a state of leanness by its rapid consumption. The fat of an animal appears to be a provision of nature for the maintenance of life during a certain period under circumstances of privation. Hence it is, that a lean animal suffers more from cold than a fat one, and is also sooner starved.

"The *origin* of *fat* in the animal body has recently been made the subject of much animated discussion: on the one hand it was contended that satisfactory evidence exists of the conversion of starch and saccharine substances into fat, by separation of carbon and oxygen, the change somewhat resembling that of the vinous fermentation: it was argued, on the other side, that oily or fatty matter is invariably present in the food supplied to the domestic animals, and that this fat is merely absorbed and deposited in the body in a slightly modified state. The question has now been decided in favour of the first of these views, which was enunciated by Professor Liebig, by the very chemist who formerly advocated the second opinion. By a series of very beautiful experiments, MM. Dumas and Milne Edwards proved that bees exclusively feeding upon sugar, were still capable of producing wax, which was pointed out as a veritable fact."

Dr. Prout has grouped all nutritive substances into four classes, which he terms *aqueous*, *saccharine*, *albuminous*, and *oleaginous*. The *first* of these needs no elucidation. Water is an abundant and necessary constituent of the body, and an universal component of our food. The *saccharine class* is derived from the vegetable kingdom, the *albuminous* chiefly from the animal, and the *oleaginous* from both. "A diet," says Dr. Prout, "to be complete, must contain more or less of all the four staminal principles; such at least must be the diet of the higher classes of animals, and especially of man."

Professor Liebig, the leading chemico-physiologist of the present day, has divided the principles found in food into two classes:—*plastic elements of nutrition*, or flesh-and-blood-making principles; and *elements of respiration*, or those which by their decomposition or combustion in the system generate heat. They are as follows:—

Elements of Nutrition. (Plastic or Nitrogenous.)	*Elements of Respiration.* (Heat-producing.)
Animal flesh	Fat
Blood	Starch
Vegetable albumen	Gum
,, caseine	Cane sugar
,, fibrine.	Grape ,,
	Milk ,,
	Pectine
	Alcohol.

According to Mr. Brande the *average quantity of solid digestible matter* in 1000

parts of the substances named below, and dried at 212° Fahr., is—

Almonds	650	Milk	72
Apples	170	Morels	896
Apricots	260	Mutton	290
Barley	920	Oats	742
Beef	260	Pears	160
Beet-root	148	Peaches	200
Blood	215	Plums	290
*Bones	510	Pork	240
Brain	200	†Potatoes	260
Cabbage	73	†Rice	880
Carrots	98	Rye	792
Cherries	250	Sole	210
Chicken	270	Strawberries	100
Cod	210	Tamarinds	340
Cucumber	25	Turnips	42
Grapes	270	Veal	250
Gooseberries	190	Wheat	950
Haddock	180	White of egg	140
Melon	30		

* Of this more than one half is earthy matter.
† Chiefly *starch*.

In an admirable lecture on the "*food of man*," recently delivered at the Royal Institution, by Dr. Lyon Playfair, the comparative ignorance under which we labour regarding the quantity of the different proximate constituents of aliments necessary for man's sustenance, even in his healthy and normal condition, was strikingly exemplified. "If the question were asked—*How much carbon should an adult man consume daily?*—there would be scarcely more than one reliable answer, viz., that 'the soldiers of the body-guard of the Duke of Darmstadt eat about 11 oz. each of *carbon* in their daily supply of food.' Liebig, on whose observations this assertion rests, states the quantity to be larger than this, but the figures here given are founded on a re-calculation from the new food-tables. If again the question were asked—*How much flesh-forming matter supports an adult man in a normal condition?*—no positive answer could be given. Even as respects the relation between the carbon in the flesh-forming matter and that of the heat-givers, we have no reliable information. It is true that certain theoretical conclusions on this head have been drawn from the composition of flour, but no real statistical answer deduced from actual experience exists.

"When we inquire into the cause of our ignorance on these points, it is found that the progress to knowledge is surrounded with difficulties. Neither chemistry nor physiology is in a sufficiently advanced state to grapple satisfactorily with the subject of nutrition. For example, we know that *albumen* in an egg is the starting-point for a whole series of tissues; that out of the egg comes feathers, claws, fibrine, membranes, cells, blood-corpuscles, nerves, &c., but only the result is known to us; the intermediate changes and their causes are quite unknown. After all, this is but a rude and unsatisfactory knowledge. Hence, when we approach the subject it is only to deal with very rough generalities. Admitting that the experience of man in diet is worth something, it is possible to arrive at some conclusions by the *statistical* method—that is, by accepting experience in diet and analysing that experience. Take, for example, the one general line of Pauper Diet for the English counties placed in the table below. The mode of arriving at the result of experience, in the case of paupers, was to collect it from *every* workhouse in the kingdom, and then to reduce it to *one* line. But the labour of this is immense. In the *preparation* of this *one line* the following work had to be performed in acquiring the data:—

Number of Unions applied to	542
Number of explanatory letters sent to them	700
Number of calculations to reduce the results	47,696
Number of additions of the above calculations	6,868
Number of extra hours, *beyond the office hours*, paid to a clerk for the reduction	1,248."

The lecturer then briefly alluded to the conditions in nutrition, which must be borne in mind in looking at these results. "It was now admitted that the heat of the body was due to the combustion of the non-nitrogenized ingredients of the food. Man inspires annually about 7 cwt. of *oxygen*, and about *one fifth* of this burns some constituent, and produces heat. The whole carbon in the blood would thus be burned away in about three days, unless new fuel were introduced as food. The amount of food necessary depends upon the number of respirations, the rapidity of the pulsations, and the relative capacity of the lungs. Cold increases the number of respirations, and heat diminishes them." "Beccaria, in 1742, pointed to the close resemblance between these ingredients of flesh, and asked, '*Is it not true that we are composed of the same substances which serve as our nourishment?*' In fact the simplicity of this view is now generally acknowledged; and albumen, gluten, caseine, &c., are now recognized as flesh-formers, in the same sense that any animal aliment is."

a Public Dietaries. *b* MULDER. *c* Special Return obtained. *d* LIEBIG. *e* Special Returns obtained. *f* Special Returns obtained. *g* The 6 Dietaries recommended as equivalent by the Poor Law Commissioners. *h* Specially reduced from all the Unions in 1851. *i* Special Returns. *j* Convicted Prisoners exceeding 7 days, but not exceeding 21 days. *k* Convicted Prisoners, Hard Labour, exceeding 21 days, but not more than 6 weeks. *l* Convicted Prisoners, Hard Labour, above 6 weeks and not more than 4 months. *m* Convicted Prisoners, Hard Labour, for terms exceeding 4 months. *n* Solitary Confinement. *o* From information supplied from the India House. *p* These probably represent extreme cases, mentioned by the following authorities: — Ross, 1835, p. 448. Parry, 1823, p. 413. Cochrane, p. 255. Saritcheff. Barrow, pp. 152, 258. Richardson, *vide* Agric. Cyc. art. *Diet.* *q* Gloucestershire and Dorsetshire. See Agric. Cyclopædia. *r* Dharwar, Bombay—Return in Bombay Prison Dietaries.

The old mode of estimating the value of dietaries, by merely giving the total number of ounces of solid food used daily or weekly, and quite irrespective of its composition, was shown to be quite erroneous; and an instance was given of an agricultural labourer in Gloucestershire, who, in the year of the potato famine, subsisted chiefly on *flour*, consuming 163 ounces weekly, which contained 26 ounces of *flesh-formers*. When potatoes cheapened, he returned to a potato-diet, and now ate 321 ounces weekly, although his true nutriment in flesh-formers was only about 8 or 10 ounces. The lecturer showed this, by calling attention to the six pauper dietaries formerly recommended, to the difference between the salt and fresh meat dietary of the sailor, &c., all of which, relying on absolute weight alone, had in reality no relation in equivalent nutritive value. Taking the *soldier* and *sailor* as examples of healthy adult men, we should find that they consumed weekly about 35 ounces of *flesh-formers*, and 70 to 74 ounces of *carbon;* the relation of the *carbon in the flesh-formers* to that in the *heat-givers* being as 1 to 3. If the dietaries of the *aged* were contrasted with this, it would be found that they consumed less *flesh-formers*, but rather more *heat-givers;* the relation of carbon in the former to that of the latter being as about 1 to 5. The *young boy*, about ten or twelve years of age, consumed about 17 ounces weekly, or about one-half that taken by the adult man; the *carbon* being about 58 ounces weekly, and the relation of the two carbons being nearly as 1 to 5½. The circumstances under which persons are placed influence these proportions considerably. In *workhouses* and *prisons* the warmth renders less necessary a large amount of food-fuel to the body; while the relative amount of labour determines the greater or less amount of flesh-formers. Accordingly it is observed, that the latter are increased to the prisoners exposed to hard labour. From the quantity of flesh-formers in food, we may estimate approximatively the rate of change in the body. Now a man weighing 140 *lb.*, has about 4 *lb.* of *flesh* in *blood*, 27½ *lb.* in his *muscular substance*, *&c.*, and about 5 *lb.* of *nitrogenous matter* in the *bones*. These 37 *lb.* would be received in food in about eighteen weeks; or, in other words, that period might represent the time required for the change of the tissues, if all changed with equal rapidity, which is, however, not at all probable.

"All the *carbon* taken as food is not burned in the body, part of it being excreted with the waste matter. Supposing the respirations to be 18 per minute, a man expires about 8·59 *oz.* of *carbon* daily; the remainder of the carbon appearing in the excreted matter."

During his lecture, Dr. Playfair explained how the tables elucidated the various admixtures of food common to cookery, and how they might even be made to bear on certain national characteristics, which were in no small degree influenced by the aliments of different nations.

NUX VOMICA. Syn. *Koochla Nut*, *Poison do.*, *Vomit do.*; *Nuces Vomicæ*; *Nux Vomica*,—Ph. L. E. & D. "The seed of *strychnos nux vomica*, Linn." (Ph. L.) This drug is chiefly known as a violent excitant of the cerebro-spinal system. In *small doses*, frequently repeated, it is tonic, diuretic, and, occasionally, laxative; in *slightly larger* ones, it is emetic; and, in *large doses*, it is an energetic and fearful poison. *Dose.* 1 to 5 or 6 gr.; in paralysis, nervous affections, impotence, chronic dysentery, chronic diarrhœa, &c. Its frequent use is *said* to render the system proof against the poison of serpents. See *Strychnia*, its active principle.

OAK. The common British oak is the *quercus rober* of Linnæus (*q. pedunculata*,—Willd.), and must be distinguished from the quercus sessiliflora, another variety of oak which is abundant in some parts of England, and is occasionally sold for it by the timber-dealers. The wood of the oak is more durable than that of any other tree, and "for at once supporting a weight, resisting a strain, and not splintering by a cannon shot, it is superior to every other kind." It, nevertheless, "warps and twists much in drying; and, in seasoning, shrinks about 1-32nd of its width." Foreign oak is less durable, but more brittle and workable. The bark (*oak bark*; *quercûs cortex*; *quercus*,—Ph. L. E. & D.) is used as an astringent and febrifuge, in *doses* of 15 to 30 gr., frequently; an astringent decoction is also made of it, but its chief employment is in tanning leather. The peculiar appearance of *old oak* or "*wainscoting*" is given to the new wood by exposing it whilst *very slightly* damp to the fumes of ammonia.

OAT. Syn. *Avena*,—Lat. The common cultivated oat is the *avena sativa* (Linn.), a gramineous plant, of which there are several varieties, as the *avena sativa alba*, or *white oat*; *a. s. nigra*, or *black oat*; the *potato oat*, &c. Other species are also

cultivated, as *avena nuda* (Linn.), *pilcorn*, or *naked oat*; *a. strigosa*, or *Spanish oat*, &c. The seed (*oats*; *caryopsides*, *semina avenæ cruda*) form the common *horse-corn* of this country, but in the northern parts of the country it is extensively used as food for man. The husked grain constitutes *groats*, and its meal "*oatmeal*." The latter does not form a dough with water, as wheaten meal or flour does.

Oats consist of from 24% to 28% of *husk*, and 74% to 78% of grain. According to M. Payen they contain of starch 60·59%; *azotized matter*, 14·39%; saccharine and gummy matter, 9·25%; fatty matter, 5·50%; cellulose, 7·06%; silica and saline matter, 3·25%. The *husk* contains between 6 and 7% of saline matter. (Prof. Norton.) The *ash* is 2·18%, and consists of potassa and soda, 26·18%; lime, 5·95%; magnesia, 9·95%; oxide of iron, 0·40%; phosphoric acid, 43·84%; sulphuric acid, 10·45%; chlorine, 0·26%; silica, 2·67%; alumina, 0·06%. (Johnston.)

The *yield* of *oats* is from 20 bushels per acre in *poor soils*, up to 60, 70, and even 80 bushels per acre in *rich soils*. The *weight* per bushel varies from 35 to 45 *lb.*, and the product in *meal* is about one-half the weight of the oats.

A large proportion of the oats given to horses passes off undigested. It has hence been proposed to prevent this loss, by either coarsely *bruising* them in a mill, or by pouring *boiling water* over them, and allowing them to macerate till cold, when they are to be given to the horses without straining off the water. It is stated on good authority, that oats thus treated will not only fatten quicker, but go twice as far as without preparation. The "*oat bruiser*" manufactured by the firm of Mary Wedlake and Co.,—the parties who so pertinaciously inquire through the medium of the public prints, "*Do you bruise your oats yet?*"—is unequalled for this purpose, and quickly reimburses the purchaser for the sum expended on it.

OATMEAL. Syn. *Avenæ Farina*; *F. ex Seminibus Avenæ*,—Ph. D. Of *thirty* samples of oatmeal examined by the 'Lancet Sanitary Commissioner,' no fewer than *sixteen* samples, or *more than one-half* were *adulterated*. The substance generally used for this purpose is *barley meal*, which is only half the price of oatmeal. That supplied to the army, navy, the workhouses, &c., is also very commonly adulterated with whiting, plaster of Paris, or ground bones. These frauds are readily detected by the microscope.

OBESITY. Syn. *Obesitas*, *Polysarcia*, —Lat. Unhealthy or troublesome fatness or corpulency. Sometimes the secretion of fat, and its accumulation in the adipose membrane, is almost as rapid as that of water in anasarca; on which account some of the old writers have called obesity a *dropsy of fat*. Persons in easy circumstances, of indolent habits, who live freely, and who are of a cheerful and contented disposition, are those most liable to obesity. The *treatment* consists in the *very gradual* reduction of the diet, until it falls rather below the average quantity required by a healthy adult; the *very gradual* disuse of fermented liquors, more especially beer; the *gradual* abridgement of the time devoted to repose, until it does not exceed 5 or 6 hours; the employment of several hours daily in exercise in the open air, at first moderate, but increased day by day in energy, until it becomes laborious; and, lastly, arousing the mind from a state of lethargy to one of active or even harassing employment.

In some few cases the accumulation of fat has been enormous. Bright, of Maldon, weighed 728 *lb.*; Daniel Lambert, of Leicester, 739 *lb.*; a girl, 4 years old, noticed in the 'Phil. Trans.,' 1813, weighed 256 *lb.*

Persons affected with obesity are generally short-lived.

OCHRES. These are native earthy compounds of clay, coloured with oxide of iron, with frequently a little chalk, or magnesia. The differences in the colour arise partly from the quantity of iron present, and partly from the state of oxidation in which the iron is found. Several varieties are known in commerce—*Brown ochre*, *French do.*, *Oxford do.*, *red do.*, *Roman do.*, *Yellow do.* All these, with the exception of the first and fourth, have a yellow colour. *Armenian bole*, *Indian red*, *Venetian do.*, and *Spanish brown*, are also ochres.

All the ochres are darkened by calcination. The *yellow ochres* acquire a red or reddish-brown colour by this treatment. The pigment called "*light red*," is thus prepared from yellow ochre.

OD. The name given by Baron von Reichenbach to the peculiar force or power which he presumes to exist in light, heat, and electricity, in crystals, living persons, and in all material substances generally, of acting on the nervous system, and which forms a part of animal magnetism or mesmerism. This name he also employs as a termination; as *crystallod*, *biod*, *photod*, &c.; according to the assumed source of this power.

ODONTALGIA. See *Toothache*.

ODORAMENTS. Syn. *Odoramenta*,—Lat. Substances employed in medicine on account of their odour. They differ from disinfectants, in only disguising, but not destroying noxious vapours, &c. *Ammonia*, *strong vinegar*, and *pastilles*, furnish the most familiar examples of this class of substances. See *Disinfectants*, *Perfumes*, *&c.*

ODORINE. The name given by Unverdorben to one of the products of the rectification of the *volatile oil of bones*. It is basic, and has a highly empyreumatic odour.

ODOUR. The emanation of an odoriferous or scent-giving body. See *Perfumes*.

ŒDEMA. A swelling or puffiness, arising from water or serum collecting in the cellular membranes. It is a local or minor species of dropsy.

ŒNANTHIC ACID. *Prep.* By digesting *œnanthic ether* with a *hot solution of caustic potassa*, alcohol distils over, and a solution of *œnanthate of potassa* remains in the retort; this is decomposed by warm *dilute sulphuric acid*, and the oily liquid (*crude œnanthic acid*) which separates, is purified by repeated washings with *warm water*.

Prop., *&c.* An inodorous, oily liquid, having an acid reaction, and dissolving readily in spirit, and in alkaline solutions forming *alkaline œnanthates*. Below about 77° Fahr., it assumes a buttery consistence. See *Œnanthic Ether*.

ŒNANTHYLIC ACID. A peculiar compound, possessing acid properties, and an aromatic odour, obtained by Mr. Tilly, by the action of *nitric acid* on *castor oil*.

ŒNOTHIONIC ACID. See *Sulphovinic Acid*.

OFFICINAL. Syn. *Officinalis*,—Lat. A term applied to substances or medicines ordered in the Pharmacopœia.

OFFSET. A young sprout or bulb from the root of a plant, when removed for the purpose of propagation. One of the commonest and most successful methods of multiplying plants is by *Offsets*.

OIL COLOURS (in Cakes). *Prep.* The *colours* (which are the ordinary pigments used in oil) are ground to a proper consistence with *oil of turpentine* holding about $\frac{1}{6}$th of its weight of *gum mastic* in solution; the levigated mass is allowed to dry and harden; it is next placed on the stone over a slow charcoal fire, and ground with a mixture of 3 parts of *spermaceti* and 1 part of *poppy oil*, after which the whole is allowed to cool slowly, and when it has acquired a proper consistence is pressed into moulds, and set aside to harden.

OIL COLOURS (in Foil, Bladders, or Bottles). As the last, omitting the spermaceti, and reducing the consistence with *pale drying-oil*. Both of the above are *used* by artists; rubbed down with poppy, nut, or linseed oil, and turpentine as required.

OIL GAS. A mixture of several gaseous hydrocarbons, obtained by passing *oil* through red-hot tubes, or by allowing it to fall, in drops, on red-hot stones or bricks arranged in an iron retort, or other suitable apparatus. One gall. of *whale oil* yields 90 to 100 cubic feet of *gas*, which affords a more brilliant light than that given by coal-gas, and burns about three times as long. It further possesses the advantage of being free from sulphur, and hence, during its combustion, does not produce fumes or vapours containing *oil of vitriol*, which are so injurious to the lungs, and destructive to the colours and texture of delicate fabrics exposed to their action.

OILS. Syn. *Olea*,—Lat.; *Huiles*,—Fr. Oils are either compounds of carbon and hydrogen (*hydrocarbons*), or of carbon, hydrogen, and oxygen (*oxyhydrocarbons*), derived from the animal or vegetable kingdom, and are chiefly distinguished by a certain degree of consistence (*unctuosity*), insolubility in water, and power of supporting combustion with flame.

Oils are *divided* into two great classes,—*fixed* or *fatty oils*, and *volatile* or *essential oils*. Almond, castor, and olive oil, are examples of the *first*, and the oils or essences of bergamotte, lavender, lemons, and turpentine, of the *other*. The term *oil* is also rather loosely applied to various *empyreumatic products* of the distillation of organic bodies, and to several *unctuous mixtures* in *perfumery* and *pharmacy*, as well as by *liquoristes* to their richer cordials. (See *below*.)

OILS (Compound). See *Oils* (Medicated), *Oils* (in Perfumery), &c.

OILS (Drying). All the fixed oils have an attraction more or less powerful for oxygen, and, by exposure to the air, they either become hard and resinous, or they only thicken slightly, and become sour and rancid. Those which exhibit the first property in a marked degree, as the oils of linseed, poppy, rape, and walnut, are called *drying oils*, and are used as vehicles for colours in painting. The others are frequently termed *glutinous* or *non-drying oils*.

The *resinifying* or *drying property* of oils is greatly increased by boiling them, either alone, or along with some *litharge*, *sugar of lead*, or *white vitriol*, when the product forms the "*boiled oil*" or "*drying oil*" (*oleum dessicativum*) of commerce. The efficacy of the process, according to Liebig,

depends on the elimination of substances which impede the oxidation of the oil. The following formulæ are adopted for this purpose :—

1. *Linseed oil*, 1 gall. ; *powdered litharge*, ¾ *lb.* ; simmer, with frequent stirring, until a pellicle begins to form, remove the scum, and when it has become cold and has settled, decant the clear portion. Dark coloured; used by house-painters.

2. *Linseed oil* and *water*, of each, 1 quart; *white vitriol*, in powder, 2 *oz.* ; boil to dryness. Paler than the last.

3. *Pale linseed* or *nut oil*, 1 pint ; *litharge* or *dry sulphate of lead*, in fine powder, 2 *oz.* ; mix, agitate frequently for 10 days, then set the bottle in the sun or a warm place to settle, and decant the clear portion. Very pale.

4. *Linseed oil*, 100 gall. ; *calcined white vitriol*, in fine powder, 7 *lb.* ; mix in a clean copper boiler, heat the whole to 285° Fahr., and keep it at that temperature, with constant stirring, for at least one hour; then allow it to cool, in 24 hours decant the clear portion, and in 3 or 4 weeks more rack it for use. *Used* for varnishes.

5. (Liebig.) *Sugar of lead*, 1 *lb.*, is dissolved in *rain water*, ½ gall. ; *litharge*, in fine powder, 1 *lb.*, is then added, and the mixture is gently simmered until only a whitish sediment remains; *levigated litharge*, 1 *lb.*, is next diffused through *linseed oil*, 2½ gall., and the mixture is gradually added to the *lead solution*, previously diluted with an equal bulk of *water ;* the whole is now stirred together for some hours, with heat, and is, lastly, left to clear itself by exposure in a warm place. The *lead solution* which subsides from the oil, may be used again for the same purpose, by dissolving in it another *lb.* of *litharge*, as before.

6. (Wilks.) Into *linseed oil*, 236 gall., pour *oil of vitriol*, 6 or 7 *lb.*, and stir the two together for 3 hours ; then add a mixturse of *fuller's earth*, 6 *lb.* ; and *hot lime*, 14 *lb.*, and again stir for 3 hours ; next put the whole into a copper, with an equal quantity of *water*, and boil for about 3 hours; lastly, withdraw the fire, and when the whole is cold, draw off the water, run the oil into any suitable vessel, and let it stand for a few weeks before using it. Patent.

7. Mix *nut* or *pale linseed oil* with about an equal measure of *snow* or *powdered ice*, and keep it for 2 months at a freezing temperature. *Used* by artists.

8. (Allg. Polytech. Zeitung.) *Binoxide of manganese* (in coarse powder, but not dusty), 1 part ; *nut* or *linseed oil*, 10 parts ; mix, and keep the whole gently heated and frequently stirred for 24 to 36 hours, or until the oil begins to turn reddish. Recommended for zinc paint, but is equally adapted for other purposes for which boiled oil is employed.

Obs. There is often a difficulty in obtaining the oils "*bright*" after boiling or heating them with the lead solutions ;— the best way, on the *small scale*, is either to filter them through coarse woollen filtering paper, or to expose the bottle for some time to the sun or in a warm place. On the *large scale*, the finer oils of this kind are often filtered through Canton-flannel bags. The litharge and sulphate of lead used in the above processes, may be again rendered available for the same purpose, by washing them in hot water, to remove adhering mucilage.

OILS (Empyreumatic). Syn. *Olea Empyreumatica*,—Lat. Oily fluids obtained by the dry distillation of various animal and vegetable substances. When the *ingredients* are of a liquid or pasty nature, or become so when heated, they are usually mixed with about *twice their weight of sand, powdered glass*, or other like substance, to divide them, and thus expose them more effectually to the action of the fire. Care must also be taken to provide a well-cooled receiver, which must be furnished with a tube to carry off the non-condensable gases liberated at the same time as the oil. The *products of the first distillation* are generally *purified* by rectification, either alone, or along with *water*. In general they require to be preserved from the light and air.

The following are principal substances belonging to this class :—

Oil of Aloes, Aloetic Oil ; Oleum Aloeticum,—Lat. 1. From *socotrine* or *hepatic aloes* distilled along with *sand*.

2. (*Batavian*,— Cadet de Gassicourt.) *Olive oil*, 1 lb ; *hepatic aloes* and *myrrh*, of each, in powder, 2 oz. ; *olibanum*, ½ oz. ; distil in a sand-bath, from a stone-ware retort. *Used* as an external vermifuge for children ; a portion is rubbed 2 or 3 times a day over the umbilical regions.

Oil of Amber ; Oleum Succini,—Lat. From *coarse pieces* of *amber* distilled in an iron retort, either alone, or reduced to powder and mixed with *sand*. The oil is separated from the *fætid liquor* and *succinic acid* which passes over, and rectified along with about 6 times its volume of *water*, by a gentle heat. It then forms "*rectified oil of amber*" (*oleum succini*,— Ph. L. 1836, *o. s. rectificatum*,—Ph. D. 1826, *o. s. purissimum*, Ph. E. 1841.) *Prod.* 20%.

Prop., &c. It has a pale yellow colour; a strong, ungrateful odour; and a hot acrid taste; heat and air blacken and thicken it; it boils at 186° Fahr. Sp. gr. 0·758 at 75° Fahr. It is antispasmodic, rubefacient, and stimulant. *Dose.* 5 to 12 drops, made into an emulsion with mucilage; in hysteria, epilepsy, and convulsive affections. *Externally*, as a friction, either alone or combined with laudanum or sweet oil, in rheumatism, tic douloureux, hooping-cough, &c.

Oil of Amber (Oxygenized); *Oleum Succini Oxydatum*,—Lat. See *Factitious Musk.*

Animal Oil (Fœtid or Empyreumatic); *Oil of Hartshorn, Dippel's Oil; Oleum Animale Empyreumaticum, Ol. Cornu Cervi, Ol. Dippelii*,—Lat. Chiefly obtained as a secondary product in the manufacture of bone-black. Fœtid and dark coloured. *Used* chiefly to make *lamp black.* (See *below.*)

Animal Oil (Ethereal); *Rectified Oil of Hartshorn; Oleum Animale Æthereum, Ol. Cornu Cervi Rectificatum, Loco Olei Animalis Dippelii*,—Lat. 1. A finer kind of animal oil made by slowly distilling *oil of hartshorn*, and collecting only the first portion that comes over. Pale and limpid. Exposure to light discolours it.

2. (Ph. Bor.) *Fœtid animal oil* distilled in a sand-bath, and the product rectified with *four times* its volume of *water.* White, limpid, fragrant. Light discolours it.

Prop., &c. Antispasmodic, anodyne, and diaphoretic. *Dose.* 5 to 30 drops, in water; in large doses, it acts as an irritant poison. According to Unverdorben it contains *four* distinct salifiable bases,—*ammoline, animine, odorine*, and *olanine.*

Oil of Asphaltum; Oleum Asphalti,—Lat. From *powdered asphaltum, washed sand*, and *dry salt*, equal parts; the product is *rectified*, as before. Stimulant; closely resembles mineral naphtha.

Oil of Benzoin, Oil of Benjamin; Oleum Benzoini,—Lat. From the *residuum* of the *process of making benzoic acid.* It is *used* to dress mock Russia leather.

Oil of Birch; Oleum Betulæ,—Lat. From the *inner bark* of the *birch*, by heating it in an earthen pot with a hole in the bottom, to allow the oil to flow through into another jar sunk in the ground and luted to it. Thick, balsamic, fragrant. *Used* chiefly to dress Russia leather.

Oil of Bones (Empyreumatic); *Oleum Ossium*,—Lat. See *Animal Oil.*

Oil of Box-wood; Oleum Buxi, Ol. B. Empyreumaticum,—Ph. L. 1746. From *box-wood sawdust.* Reputed resolvent; anodyne, antispasmodic, and diaphoretic. *Dose.* 5 to 20 drops; in convulsions, epilepsy, gonorrhœa, &c. *Externally*, in toothache, &c.

Oil of Bricks; Oleum Lateritium,—Ph. L. 1746. From *olive oil*, mixed with *brick dust*, and distilled; or, from *hot bricks* steeped in *olive oil*, then broken to pieces, and distilled.

Oil of Bricks (Factitious); *Oleum Lateritium Factitium*,—Lat. From *linseed oil*, 1 *lb.*; *oil of turpentine*, ½ *lb.*; *oil of bones* or of *hartshorn*, and *Barbadoes tar*, of each, 1 *oz.*; simply stirred well together. This is generally substituted for the preceding in the shops.

Oil of Cade; Oleum Cadinum,—Lat. *Huile de Cade*,—Fr. From the *juniperus oxycedrus* or *Languedoc juniper.* Used as oil of tar, which is commonly sold for it.

Oil of Coal, Coal Oil. From the gas-works. See *Naphtha.*

Oil of Earthworms; Oleum Lumbricorum Empyreumaticum.—Lat. From *linseed oil, earthworms*, and *dry sand*, equal parts. Now obsolete. See *page* 856.

Oil of Guaiacum; Oleum Guaiaci, Ol. G. Empyreumaticum,—Lat. From *guaiacum shavings* or *raspings.* Reputed balsamic, pectoral, and resolvent.

Oil of Hartshorn. Bone oil and rectified bone oil are commonly sold for it, but are inferior to it. See *Animal Oil.*

Oil of Hemlock (Empyreumatic); *Pyroconia, Oleum Conii Empyreumaticum*,—Lat. From the herb. Does not possess the narcotic properties of the plant.

Oil of Lettuce (Empyreumatic); *Oleum Lactucæ Empyreumaticum*,—Lat. From *garden lettuce* (lactuca sativa).

Paper Oil, Rag Oil; Pyrothonide; Oleum Chartæ,—Lat. On the *small scale* by burning *paper* on a cold tin-plate, and collecting the oil; on the *large scale*, by the destructive distillation of *paper* or *linen rags.* In baldness, tooth-ache, ear-ache, &c.

Rag Oil. See *above.*

Rock Oil. See *Naphtha* and *Petroleum.*

Oil of Soot; Oleum Fuliginis,—Ph. L. 1746. From *wood soot.* Fœtid; reputed antispasmodic and nervine.

Oil of Tar, Spirit of do.; Oleum Pini, O. P. Rubrum, O. Tædæ; O. Picis Liquidæ,—Lat. By simple distillation from *wood-tar.* Reddish and strong scented. By one or more rectifications it becomes colourless and limpid. It soon gets thick. *Used* in ringworm and several other skin diseases, made into an ointment with lard. It is *poisonous* if swallowed in large doses.

Oil of Tobacco (Empyreumatic); *Oleum Tabaci Empyreumaticum*,—Ph. U. S. From

tobacco, in coarse powder, gradually heated in a green-glass retort to dull redness, and kept at that temperature as long as any oil passes over; the oily portion is then separated from the water in the receiver, and kept for use. Highly narcotic and poisonous.

Oil of Wax; Oleum Ceræ,—Lat. From *bees' wax* and *sand* distilled together; the product is rectified once or oftener. Reputed diuretic. *Dose.* 3 to 6 drops.

OILS (Fixed). Syn. *Fat Oils, Unctuous do.; Olea Fixa, Olea Expressa*,—Lat. *Huiles Grasses*,—Fr. The fixed oils are compounds of carbon, hydrogen, and oxygen (*oxyhydrocarbons*) obtained from the organic kingdom, and characterised by their insipidity, unctuosity, insolubility in water, and being lighter than that fluid. *Olive oil*, which is obtained from the *vegetable* kingdom, and *spermaceti oil*, which is obtained from the *animal* kingdom, may be taken as types of the rest.

The *fixed oils* are chiefly found in the *fruit* and *seeds* of *plants*, and in thin membranous cells, forming what is called the adipose tissue, in the *bodies of animals*. According to their consistence, they may be classed into *oils, butters*, and *tallows*.

Prop., &c. Among the *best known-properties* of the *fixed oils* are—the permanent stain they give to paper, which they render translucid; their non-volatility at the ordinary temperature of the atmosphere, or at that of boiling water, or indeed, at any temperature insufficient for their decomposition; their constantly floating on the surface of water when added to it; and, lastly, their great repugnance to mix with that fluid. Some of them, as *palm oil*, and *cocoa-nut oil*, are solid at ordinary temperatures; but the majority are fluid, unless they have been considerably cooled, when they separate into *two portions*,—the one *solid*, consisting chiefly of *stearine*, and the other *liquid*, consisting chiefly of *oleine*. Nearly all of them, when exposed to the air absorb oxygen rapidly, and either gradually harden, or become rancid and nauseous. From the *first* are selected the *drying oils* used by painters; the *last* are used as food, in cookery, and for machinery, lamps, &c. The whole of these oils, when heated to the boiling-point (500° to 600° Fahr.) suffer decomposition, yielding various hydrocarbons; and when suddenly exposed to a red heat, they furnish a gaseous product (*oil gas*), which was formerly employed for illumination. It is owing to this property of oil and liquid fats, that candles and lamps give their light. The wick is a *gas-producing apparatus* in miniature. With the caustic alkalies and water, the fixed oils unite to form *soap*. When some of these oils are absorbed by porous bodies, and thus expose a vastly increased surface to the air, they absorb oxygen with such rapidity as to generate a considerable degree of heat. Paper, tow, cotton, wool, straw, shavings, &c., slightly embued with oil, and left in a heap, freely exposed to the air or sun, often spontaneously inflame. In this way many extensive fires have arisen. The above is more particularly the case with *linseed, rape, nut*, and *olive oil*. The first, made into a paste with manganese, rapidly becomes hot, and ultimately inflames spontaneously.

"When oil is distilled, as soon as it begins to boil, a large quantity of gas is disengaged, consisting of a mixture of *carburetted hydrogen* and *oxide of carbon*. The *first product* of the distillation is a yellow-coloured, very odorous substance, of a moderate consistence, very soluble in alcohol, reddening strongly the tincture of litmus, and forming a true soap with dilute liquor of potassa. It may be regarded as a mixture of the acetic, sebacic, oleic, and margaric acids, empyreumatic oil, a volatile oil slightly odorous, and a peculiar volatile matter, very fetid, not acid, soluble in water; and which excites coughing and tears in the operator when the receiver is opened. The *second product* is a light-green fluid, which becomes brown on exposure to the air; has a slight empyreumatic odour, but does not excite coughing or tears. It does not redden tincture of litmus; alcohol, even when aided by heat, dissolves a very small portion only of it, and it is not affected by potassa. It burns like an essential oil, and is volatilized, without change, in close vessels. The *third product* is an orange-red, solid, transparent substance, inodorous and insipid; breaking with a waxy fracture, melting at a heat above 212° Fahr.; and dissolving in hot alcohol, from which it is precipitated unaltered on cooling. Ether is its proper solvent. (*Ann. de Chim. et de Phys.* xxx, 1—20.)

The *specific gravities* of the fixed oils range between 0·865 and 0·970, water being 1·000.

Prep. The *fixed oils*, except where otherwise directed, are obtained from the *bruised* or *ground fruit* or *seed*, by means of powerful pressure, in screw or hydraulic presses, and are then either allowed to clarify themselves by subsidence, or are filtered. Both methods are frequently applied to the same oil. In *some cases* the impurities are re-

moved by ebullition with water, and subsequent separation of the pure oil. Heat is frequently employed to increase the liquidity of the oil, and thus lessen the difficulty of its expulsion from the mass. With this object the bruised mass, placed in bags, is commonly exposed to the heat of steam, and then pressed between heated plates of metal. This is always necessary with the butyraceous oils.

Another method is by boiling the *bruised seed* in water, and skimming off the oil as it rises to the surface. This is the plan adopted for castor oil in the West Indies.

In a few cases, for medicinal purposes, the *bruised mass* is mixed with ½ its weight, or an equal weight of *alcohol* or *ether*, and after 24 hours' digestion, the whole is submitted to pressure, and the alcohol or ether removed by distillation at a gentle heat. The first menstruum is commonly employed for *croton oil* on the Continent; the second, for that of *ergot of rye*.

Purif. Several methods are adopted for *refining* or *purifying oils*, among which are the following:—

1. The *oil* is violently agitated along with 1½ to 2% of *concentrated sulphuric acid*, when it assumes a greenish colour, and after about a fortnight's repose, deposits much colouring matter, becomes paler, and burns with greater brilliancy, particularly if well washed with *steam* or *hot water*, and clarified by subsequent repose, or by filtration. This answers well for most of the recently expressed *vegetable oils*. It also greatly improves most of the *fish oils*.

2. A modification of the last method, is to well mix the *acid* with the *oil*, then to "blow" *steam* through the mixture for some time, and afterwards to otherwise proceed as before.

3. Fish oil (*whale, seal, &c.*) is purified by—

a. Violently agitating it with *boiling water* or *steam*, by placing it in a deep vessel with a perforated bottom through which *high-pressure steam* is forced for some time; it is afterwards clarified by repose, and filtered through *coarse charcoal*.

b. The *oil* is violently agitated with a boiling hot and strong *solution of oak bark*, to remove albumen and gelatine, and next with *high-pressure steam* and *hot water;* it is, lastly, dried and filtered.

c. The *oil*, gently heated, is stirred for some time with about 1% of good *chloride of lime*, previously made into a *milk* by trituration with *water;* about 1½% of *oil of vitriol*, diluted with 20 times its weight of *water*, is then added, and the agitation renewed and maintained for at least 2 hours; it is, lastly, well washed with *steam* or *hot water*.

d. Mr. Davidson treats the oil, first with a *strong solution of tan*, next with *water* and *chloride of lime*, then with *dilute sulphuric acid*, and, lastly, with *hot water*.

e. Mr. Dunn's method, which is very effective, and admirable on account of its simplicity, is to heat the *oil* by steam to from 180° to 200° Fahr., and then to force a *current of air* of corresponding temperature through it, under a flue or chimney, until it is sufficiently bleached and deodorized; it is, *lastly*, either at once filtered or is previously washed with *steam* or *hot water*.

f. Another method, formerly very generally adopted and still in use, is to violently agitate the *oil* for some time with very strong *brine*, or with a mixed *solution of blue vitriol* and *common salt*, and then either to allow it to clarify by repose, or to filter it through *freshly burnt charcoal*.

4. *Almond, castor, linseed, nut, olive, rape*, and some other *vegetable oils*, are readily bleached by either—

a. Exposure in glass bottles to the *sun's rays*, on the "leads" or roofs of houses, or in any other suitable position, open to the south-east and south. This is the method employed by *druggists* and *oilmen* to whiten their *castor* and *linseed oils*. 14 to 21 days' exposure to the sun in clear weather during summer is usually sufficient for *castor oil* when contained in 2 to 4-quart pale green-glass bottles (preferably the former), and covered with white gallipots inverted over them. The oil is filtered before exposing it to the light, as, if only in a slight degree opaque, it does not bleach well. Almond and olive oil, are when thus treated, apt to acquire a slight sulphurous smell; but this may be removed by filtration through a little *animal charcoal*, or still better, by washing the oil with *hot water*.

b. Another method employed to decolour these oils is to heat them in a *wooden, tinned*, or *well-glazed earthen vessel* along with some dry *filtering powder* (1 to 2 *lb.* per gall.), with agitation for some time, and, lastly, to filter them in the usual manner through an *oil-bag*. In this way the West-end perfumers prepare their "*white almond oil*" (*oleum amygdalæ album*), and their "*white olive oil*" (*oleum olivæ album*). Formerly, *freshly burnt animal* was used

for this purpose, and is still so employed by some houses.

5. Mr. Bancroft refines *oils* for *machinery* and *lubricating purposes* generally, by agitating them with a *lye* of *caustic soda* of the sp. gr. 1·2. A sufficient quantity is known to have been added when, after repose, a portion begins to settle down clear at the bottom. About 4% to 8% is commonly required for *lard oil* and *olive oil*. After 24 hours' repose, the clear supernatant oil is decanted from the soapy sediment, and filtered.

6. Not only the *oils* above referred to, but *all* other *oils* and *fats* may be rendered perfectly colourless by the use of a little *chromic acid;* or, what is the same, by a *mixture* of a *solution of bichromate of potassa* and sufficient *sulphuric, hydrochloric*, or *nitric acid*, to seize on all the alkali, and thus liberate the chromic acid.

7. *Palm oil* and *cocoa-nut oil* are generally refined and bleached by either chromic acid or chlorine, or by heat:—

a. The *butyraceous oil* is liquefied by heat in a wooden vessel, and 7% to 9% of good *chloride of lime*, previously made into a smooth cream with *water*, is added, and the whole assiduously stirred until the ingredients appear united; the mixture is then allowed to cool, and is next cut up into small lumps, which are exposed to a free current of air for 2, 3, or even 4 weeks; these are melted in a *wooden vessel* heated by high pressure steam circulating through *leaden pipes*, or in a cast-iron boiler lined with *lead*, and an equal weight of *oil of vitriol* (diluted with about 20 times its weight of water) is poured in, and the whole gently boiled until the oil is decoloured and runs clear; the fire is then moderated, and the whole allowed to settle; lastly, the fire is removed, and the oil is left to cool very slowly.

b. The process with *chromic acid* has been already noticed, but is more fully explained *below.*

c. The *oil* heated to the temperature of about 250° Fahr. is exposed to the action of *high-pressure steam*, which is continuously "blown" through it for 10 or 12 hours, or even longer. The process is greatly facilitated by the introduction of some *chromic acid.*

8. Mr. Watt's *methods* of *purifying fats* and *oils* are very effective, more especially for those intended for illumination. They are as follows:—

a. (For *fish oils.*) Each ton is boiled for ½ an hour with *caustic soda*, ½ *lb.*, previously made into a *weak lye* with *water;* or steam is blown through the mixture for a like period; *oil of vitriol*, ½ *lb.*, diluted with 6 times its weight of *water* is next added, the whole again boiled for 15 minutes, and allowed to settle for an hour or longer, when the clear oil is run off from the water and sediment into the bleaching tubs; here *solution* of *bichromate of potash*, 4 *lb.*, in *oil of vitriol*, 2 *lb.*, previously diluted with *water*, q. s., together with a little *nitric acid*, and some *oxalic acid*, are added, and after thorough admixture of the whole by blowing steam through it, *strong nitric acid*, 1 *lb.*, diluted with *water*, 1 quart, is poured in, and the boiling continued for ½ an hour longer; a *small quantity* of *naphtha* or *rectified spirit of turpentine* is then mixed in, and the oil is, finally, well washed with *hot water*, and left to settle.

b. (For *palm oil.*) The *oil* is melted by the heat of steam, and after it has settled and cooled down to about 130° Fahr., is carefully decanted from the water and sediment into the steaming tubs; here a *mixture* of a *saturated solution of bichromate of potash*, 25 *lb.*, and *oil of vitriol*, 8 or 9 *lb.*, is added, and after thorough admixture, *hydrochloric acid*, 50 *lb.*, is poured in; the whole is then constantly stirred until it acquires a uniform greenish colour, or is sufficiently decoloured, a little more of the bleaching materials being added if the latter is not the case, after which it is allowed to repose for half an hour to settle; it is next run into a wooden vat, where it is washed, &c., as before.

c. (For *vegetable oils.*) These are treated with a *solution of chromic acid*, or with a *solution of bichromate of potassa*, or some *mineral acid*, as noticed at (6). For *colza*, *linseed*, *mustard*, *nut*, and *rape oil*, a little *hydrochloric acid* is added; but for *almond*, *castor*, *olive oil*, and *poppy oil*, no such addition (at least in excess) is required.

9. *Rancid oils* and *fats* are *recovered* by boiling them for about 15 minutes with a little *water* and *calcined magnesia;* or, by filtering them through *freshly burnt charcoal.*

In reference to the above processes, it may be useful to remark, that *chlorine*, the common bleacher and deodorizer of other substances, cannot be well employed directly in the purification of oils, as certain chemical reactions occur when these substances are brought together, which increase the colour, instead of removing it, and are often otherwise injurious. The same remarks apply to the use of the *chlorides*,

which frequently fails in unskilful hands, and is, indeed, of questionable utility, except, perhaps, in the case of palm oil. Even *charcoal* exerts little of its usual energy on the oils, and whilst it removes or lessens their offensive odour, sometimes increases their colour. The addition of 1% or 2% of very pure and recently rectified *naphtha* or *oil of turpentine* (camphine) to lamp oil is a real improvement, since it increases its combustibility and its illuminative power.

Oils for *medical purposes*, as castor oil, cod-liver oil, &c., must not be subjected to any process beyond mere clarification by subsidence, filtration through Canton flannel or porous paper, or, at the utmost, washing with warm water, as otherwise their active and valuable properties, if not wholly removed, will be considerably lessened. See *Filtration*.

Pur. The *fixed oils* vary greatly in their *value*, and hence the constant inducement which leads the unprincipled dealer to adulterate the more expensive ones with those of a similar character, but of an inferior kind or grade. Various methods are adopted to detect these frauds, among which the following are the most valuable of those capable of general application. Others referring to individual oils will be found under the respective heads.

1. (From the *Odour.*) The method of applying this test, is to *heat* a few drops of the *oil under examination* in a small *porcelain*, *platinum*, or *silver spoon* or *capsule* (a *watch-glass* answers well), and to carefully compare the odour evolved with that arising from a known pure sample of the same kind and quality of the oil similarly treated. The odour of the two, when each is pure, is precisely alike, and immediately suggests the plant or animal from which it has been obtained. The presence of *linseed*, *nut*, *rape*, *seal*, *train*, or *whale oil*, is thus readily detected, and the imperfections of the sample, even if pure, rendered much more perceptible.

2. (From the *Density.*)—*a.* According to M. Penot, *every oil* supposed to come from the *same plant*, or the *same animal*, has *its own particular density*, which, at the same temperature, *never deviates* more than a *few thousandths*. To apply this test, the relative density or specific gravity of the sample must be determined. This may be done by means of a *thousand-grain bottle* or an ordinary *areometer;* or, more conveniently, by an *elaïometer* or *oleometer* constructed and graduated for the purpose. Fischer's *elaïometer* or *oil-balance* is much employed on the Continent for this purpose, and is a very useful instrument. On the *large scale*, the weight of an *accurately-measured* imperial gallon of the oil may be taken.

b. M. Laurot, an eminent Parisian chemist, a short time since observed that, the variations of the density of an oil from adulteration is rendered much more apparent when it is examined in a heated state. To render this discovery practically available, he plunges an *elaïometer*, graduated for the given temperature, into a *small tin cylinder* nearly filled with the *oil*, and then places this in a vessel containing *boiling water;* as soon as the whole has acquired a uniform temperature, he observes the point on the scale of the instrument at which it floats. This point for

colza oil is	0°
fish oil	83°
poppy oil	124°
hempseed oil	136°
linseed oil	210°

c. By employing a *specific-gravity bottle* or *small glass globe*, fitted with a *stopper* in which is hermetically fixed a *capillary tube* of about 8 or 9 inches in length, we may apply the above principle of M. Laurot with the greatest accuracy. This little apparatus is filled with the *oil*, and then immersed in *boiling water* for a sufficient length of time for it to acquire that temperature; it is then removed and weighed. The smallest adulteration is in this way immediately detected.

When the *density of the given sample* has been taken, and the name of the oil used to adulterate it is known, the quantity of the latter present may be approximatively determined from the specific gravities by the common method of alligation. (See *page* 799.)

3. (*Sulphuric acid Test.*)—*a.* Heidenreich was the first person who gave a useful and general application to the reactions which occur when *oil of vitriol* is mixed with the *fatty oils*. As soon as these substances are placed together, very intense chemical action commences, the temperature of the mixture rises, and the mass becomes coloured. These changes are sufficiently varied in the case of the different oils to furnish us with the means of identifying many of them, and of determining their purity. The *method* of M. Heidenreich is to lay a *plate of white glass* over a sheet of *white paper;* on the glass he places 10 or 15 *drops of oil*, and then adds to it a *small* drop of *concentrated sulphuric*

acid (oil of vitriol). The appearances which follow differ with the character of the fatty oil examined, and whether the acid is allowed to act on the oil undisturbed (*without stirring*), or the two are *stirred* together with a glass rod. In many cases, as with tallow oil, a *peculiar odour* as well as a change of colour is developed, and a further means of detection supplied. M. Heidenreich has minutely described these reactions, which, for the most part, closely resemble those given in the table p. 485. It is necessary, however, in order to ensure great accuracy, to compare the effects of the reagent on the sample, with those which it produces on pure oil of the same kind and character under precisely similar circumstances.

b. M. Penot, who has followed up the researches of M. Heidenreich with considerable success, recommends the employment of 20 *drops of oil*, instead of only 10 or 15; and the use of *a small capsule* of *white porcelain*, instead of a plate of glass. He also employs a *saturated solution of bichromate of potash* in *sulphuric acid*, which he uses in the same proportion as before; but in this case, the *oil* and the *reagent* are always stirred together.

The observations of M. Penot have been repeated in many cases by ourselves, and the results, with additions, and re-arranged, are given in the *table* opposite.

"By perusing this table, it will be observed that the same oil does not, under all circumstances, yield precisely similar results with the same reagent. This depends on the place of their growth, their age, and the manner of pressing. If, however, any oil be examined comparatively with a perfectly pure one, the proof of adulteration may be rendered, if not certain, at least probable, by noting the difference. Thus I obtained, by adding 1 part of either whale-train or linseed oil, or oleic oil, to 10 parts of rapeseed oil, the following results:—

Name of oil.	Reagents.		
	Sulphuric Acid.		Solution of Bichromate of Potash.
	Not Stirred.	*Stirred.*	*Stirred.*
Rape oil with whale-train oil	More red ground than with rape oil	Brownish-olive coloured	Small reddish lumps on a gray ground
Rape oil with linseed oil	No perceptible difference from the rape oil	Olive coloured	Small and more numerous red lumps on a very dark-green ground
Rape oil with oleine or oleic acid	No perceptible difference from the rape oil	Greenish-brown	Small brownish lumps on an olive-coloured ground

"The adulteration being ascertained as far as is possible, the oil is then tested by endeavouring to discover the adulterating oil, either by reagents, or by its odour when gently heated, as before described. This having been found out, small quantities of the suspected oil are added to a perfectly pure oil of the kind under examination. Every mixture is then tested by the reagents, until precisely similar results are obtained as those yielded by the oil under examination. Thus the proportions of the two mixed oils will be discovered by approximation." (M. Penot.) A *simpler method* of finding the *proportions* of the so mixed oils is referred to above.

4. (*Increase of Temperature.*) M. Maumené proposed the increase of temperature arising from the admixture of *mono-hydrated sulphuric acid* (oil of vitriol, sp. gr. 1·845) with the fatty oils as a test of their purity, but a sufficient number of observations have not yet been made to furnish data for a general application of this method. According to MM. Faisst and Knauss, who have lately re-examined the subject, the following are the results when 15 *grammes of oil* are mixed with 5 *grammes of the acid:*

	Rise of Temperature.
Almond oil	72.5°
Olive „	68·0°
Poppy „	127·0°
Rape or colza oil	100·0°
Linseed oil (*with Nordhausen or fuming acid only*) . . .	133·0°

The above method is less liable to error

Action of one drop *of the* REAGENT *on* twenty drops *of* OIL.

Name of Oil.	Reagents.		
	Sulphuric Acid.		Saturated Solution of *Bichromate of Potash* in Sulphuric Acid.
	Not stirred.	*Stirred.*	*Stirred.*
Almond oil	Greenfinch-yellow, with orange spots	Dirty green	Yellowish, small lumps
Castor oil	Yellow, with slight spots	Little reaction	Slightly green
*Cod-liver oil	Deep purple in the centre, rapidly turning brown, whilst violet or purple clouds or streaks spread out towards the circumference, the colour of which remains unaltered for some minutes after the central portion has turned nearly black	Deep purple, passing into purple-brown, reddish-brown, and gradually deepening to an intense brown, approaching black	Reddish-brown clots, changing to a clear bright green
Hemp-seed oil	Small brown lumps or clots on a yellow ground	Greenish brown	Small yellow lumps or clots on a green ground
Linseed oil (*from the Upper Rhine*)	Dark reddish-brown	Brown small lumps on a gray ground	Brown small lumps, on an almost colourless ground
,, (*from Paris*)	Reddish-brown, less dark coloured	Brown clots on a green ground	Brown small lumps on a green ground
,, (*English*)	Chestnut-brown	Brown clots on a greenish-gray ground	Brown lumps on a greenish-gray ground
Liver train-oil	Dark red	Dark red	Dark red
Madia-sativa oil	Slightly reddish-brown underneath a thin grayish film	Olive green	Light-brown small lumps on an olive-coloured ground
Black-mustard oil	Bluish green	Olive green	Olive brown
Neatsfoot oil	Yellow slight spots	Dirty brown	Brown spots on a brownish ground
Nut oil (*recent*)	Yellowish brown	Clotted, dark-brown	Small brown lumps or clots
,, (*one year old*)	Yellow	Dirty brown, less dark-coloured	Small brown lumps
,, (*still older*)	Orange yellow	Dirty brown	Small brownish lumps
Oleine, oleic acid, lard, or tallow-oil	Reddish spots, with reddish circles	Reddish brown	Bright chestnut-colour
Olive oil	Yellow	Dirty brown	Olive brown
,, (*another sample*)	Orange yellow	Brownish gray	Brown
,, (*from fermented olives*)	Orange yellow	Brownish gray	Brown
Poppy oil (*recent cold drawn*)	Yellow spots	Olive brown	Small yellow lumps on a white ground
,, (*recent*, expressed with slight heat)	Greenish-yellow spots	Olive brown, turning more on the green	Small yellow lumps on a greenish-gray ground
,, (*one year old, expressed with heat*)	Greenish spots	Olive green	Small yellow lumps on a green ground
Rape or colza oil (*trade*)	Yellowish-brown streaks surrounded by a bluish-green ring	Brownish, turning on the olive green	Yellow small lumps on a green ground
,, (*recent*)	Green	Bluish green	Yellow small lumps on a green ground
,, (*one year old*)	Green	Bluish green	Yellow lumps on a brighter green ground
,, (*one year old, rough hot-pressed*)	Green	Olive green	Small yellow lumps, more numerous, on an olive-green ground
Whale train-oil	Small reddish lumps on a brownish ground	Resembles wine-lees	Small bright chestnut-coloured lumps on a brown ground.

* Finest sample of *pale oil* (*oleum morrhuæ*,—Ph. L.), prepared by Messrs. Chas. Fox & Co., of Newfoundland. *Dorse oil*, and other *fish oils* sold under the name of "*light-brown cod-liver oil*," exhibit much slighter reactions, which closely resemble those of *liver-train* and *whale-train oil*.

when a larger quantity of the substances are thrown together.

5. The *presence* of *fish oil* in the *vegetable oils* may be readily detected by passing a *stream of chlorine* through them; the pure vegetable oils are not materially altered, but a mixture of the two turns dark-brown or black.

The *following* are the *principal fixed oils* met with in *commerce*, or which are objects of interest or utility:—

Oil of Almonds; Oleum Amygdalæ,—Ph. L. *Ol. Amygdalarum*,—Ph. D. *Ol. Amygdali Communis*,—Ph. E. "The oil expressed from the kernels." (Ph. L.) "Bruise the fresh almonds in a stone mortar, then put them into a hempen sack, and express the oil, without heat." (Ph. E.) The *oil of almonds* of *commerce* is obtained from either the *bitter* or *sweet almond*, but chiefly from the first, on account of their less value, and the marc being employed in the manufacture of essential oil.

Prop., &c. Oil of almonds is bland, demulcent, emollient, and nutritious; possesses a purely oleaginous taste, and is one of the most agreeable of the fixed oils; when taken in quantity it is mildly laxative; it is little affected by cold, and congeals with difficulty; is soluble in 25 parts of cold, and 6 parts of boiling alcohol; ether dissolves it freely. Sp. gr. 0·915 to 0·918. *Av. Prod.* Sweet almonds, 46%; bitter do., 41%.

Pur. It is extensively adulterated with *poppy*, *nut*, and *teel oil*, and not unfrequently with *refined rape* or *colza oil*. (See *above*.)

Oil of Appleseed. From the "pips" of the *fruit* of any of the numerous species of *pyrus malus* (Linn.) Resembles poppy oil.

Oil of Bay, Expressed do. do.; *Oleum Lauri, Ol. Laurinum*,—Lat. 1. By expression from either *fresh* or *dried bayberries*, as castor oil. Limpid; insipid.

2. (*Oil of Bay*, by decoction; *Butter of do.; Oleum Lauri Nobilis, Ol. L. Verum*,—Lat. From the *berries*, by *boiling* them in *water*, and skimming off the oil. Green, buttery; chiefly imported from Italy. *Used* by the vulgar in bruises, sprains, rheumatism, deafness, &c. *Prod.* 20%.

Oil of Beech; Oleum Fagi,—Lat. From the *nuts* of *fagus sylvatica* (Linn.) or *beech mast*. Clear; keeps well; when washed with hot water it is used for salads, and burnt in lamps. Sp. gr. 0·9225. *Prod.* 16%.

Oil of Belladonna; Oleum Belladonnæ Seminum, O. B. Baccæ,—Lat. From the *seeds* or *berries* of *atropa belladonna* or *deadly nightshade*. Yellow; insipid. *Used* for lamps in Swabia and Wurtemburg, and as an application to bruises. The *marc* is *poisonous*. It freezes at 34° Fahr. Sp. gr. 0·9250.

Oil of Ben, Oil of Behen; Oleum Balatinum. From the *seed* or *nuts* of *moringa aptera* and *m. pterygosperma* (ben nuts). Scentless, colourless; keeps long without growing rank; by standing it separates into two parts, one of which freezes with difficulty, and is hence much used in perfumery.

Oil of Cacao, Butter of do.; Oleum Cacao Concretum, Butyrum Cacao,—Lat. From the seeds of *theobroma cacao*, or *chocolate nuts*, gently heated over the fire, and then decorticated, and pressed between hot iron plates. Sp. gr. 0·892.

Oil of Camelina. From the *seeds* of *camelina sativa* or *wild gold of pleasure* (sesamum seeds). Drying. Sp. gr. 0·9252.

Oil of Carapa; Oleum Carapæ,—Lat. From the *fruit* of *carapa guianensis*. Rubefacient, vermifuge. *Used* to make the hair grow, &c.

Castor Oil; Oleum Castorei; Ol. Ricini,—Ph. L. E. & D. *Oil of Palma Christi, Ol. de Kerva, Ol. Kervinum*,—Obs. var. "The oil prepared by heat, or by pressure, from the seed" of "*ricinus communis*, Linn." (Ph. L.) or *Mexican oil-bush*.

The *best* castor oil (*cold-drawn castor oil; oleum ricini sine igne*) is *prepared* by pressing the *shelled* and *crushed fruit* (seed) in hemp bags, in an hydraulic press, and heating the oil thus obtained along with *water* in *well-tinned* vessels, until the water boils, and the albumen and gum separate as a scum; this is carefully removed, and the oil, as soon as it has become cold, is filtered through *Canton flannel*, and put into canisters. The *commoner kinds* are prepared by gently heating the *crushed seeds*, and pressing them whilst hot. *Another method*, sometimes adopted, is to put the *crushed seed* into loose bags, to boil these in *water*, and to skim off the floating oil.

Prop. It is the most viscid of all the fixed oils; when pure, it mixes in all proportions with alcohol and ether, and also dissolves, to a certain extent, in rectified spirit, but a portion of the oil separates on standing. Camphor and benzoic acid increase its solubility in spirit. By long exposure to the air, it becomes rancid, thick, and is ultimately transformed into a transparent yellow mass; light hastens these changes. Exposed to cold, a solid, white, crystalline fat (*margaritine*) separates from the liquid portion, and when cooled to 0° it congeals into a yellow transparent

mass, which does not again liquefy until the temperature rises to about 18° Fahr. Sp. gr. 0·9611 to 0·9612, at 60°; 0·9690, at 55° (Saussure); 0·9575, at 77° (Saussure.) *Prod.* 38 to 40%, (62%,—Ure).

Pur. Castor oil is sometimes adulterated with rape oil, or with lard oil, a fraud which may be detected by its diminished density; and when the added oil exceeds 33%, by its insolubility in its own weight of alcohol of 0·820. In many cases *croton oil* is added to increase the purgative quality of the mixture. A compound of this kind is vended in gelatine capsules under the name of "*concentrated castor oil*," the use of which is fraught with danger. "I have heard of several cases in which very violent and dangerous effects were produced by these capsules." (Pereira.) The best is imported from the East Indies in tin canisters. The oil obtained from the seeds of *ricinus viridis* (Willd.), or *lamp-oil seeds*, is often mixed with or sold for castor oil.

Uses, &c. Castor oil is an exceedingly useful mild purgative, particularly when abdominal irritation should be avoided, as in inflammations of the stomach and bowels, pregnancy, surgical operations, &c. *Dose.* 2 fl. dr. to 1 fl. oz.

Cherry-stone Oil. From the *kernels* of *prunus cerasus*. Sp. gr. 0·9239.

Chestnut Oil. From the *nuts* of *æsculus hippocastinum* or *horse chestnut*. Sp. gr. 0·9270. *Prod.* 6%.

Cocoa-nut Oil; Cocoa-nut Butter; Oleum Cocois Nuciferæ,—Lat. By expression from the *kernels* of the *cocoa nut*, or *fruit* of the *cocos nucifera*. White, hard. *Used* for soap and candles. (See *p.* 269.)

Cod-liver Oil, Cod-fish Oil; Oleum Jecoris Aselli, Ol. Gadi, Ol. G. Morrhuæ; Oleum Morrhuæ,—Ph. L. "The *oil* prepared from the *liver* of *gadus morrhua*, Linn." (Ph. L.)

The common *cod-liver oil* of *commerce* drains from the *livers* of the *cod-fish* when freely exposed to the sun, and just beginning to putrefy. It is dark-coloured, strong, and nauseous, and is now chiefly employed in this country by the curriers, for dressing leather. It is the *oleum jecoris aselli fuscum* of Continental writers. Formerly, the less fœtid varieties of this crude oil, after the impurities were removed either by subsidence or filtration, constituted the only cod-liver oil used in medicine. As its employment as a remedy increased, its revolting flavour, and its great tendency to permanently disorder the stomach and bowels, was found, however, to be a serious obstacle to its general use. It was observed, that the oil, as it exists in the liver of the cod, is bland, and nearly colourless, and has only a slight fishy but not a disagreeable flavour. The attention of parties interested was therefore immediately directed to the subject, and improved methods of obtaining the oil were suggested, and ere long adopted on the *large scale*. Mr. Donovan recommended the *fresh livers* to be heated in a water-bath to 192° Fahr., and then to be placed in cloths and pressed. The oil which separates from the liquid mass thus obtained, after defecation by repose for some days in a cold place, and filtration, is pale, and of excellent quality. This plan, slightly modified according to circumstances, is that now generally employed.

For the following description we are indebted to Messrs. Charles Fox and Co., of Newfoundland, Scarborough, and London, the eminent manufacturers and importers of *true* cod-liver oil:—

"The Newfoundland fisheries are entirely carried on in small boats, principally by the hand-line system, and quite close to the shore. The boats go out early in the morning, and return about four o'clock in the afternoon. The fish, on landing, are handed over to a 'fish-room keeper,' whose duty it is to split and open the fish, and to deposit the livers in small tubs, holding 17 or 18 gallons each. These tubs are soon afterwards collected from the different 'fish-rooms,' and conveyed to the manufactory. The livers are here thrown into tubs filled with *clean cold water*, and after being well washed and jerked over, are placed on galvanized iron-wire sieves to drain. They are next put into covered steam-jacket-pans, and submitted to a gentle heat for about three-quarters of an hour, after which the steam is turned off, cold air again admitted, and the whole allowed to repose for a short time, during which the livers subside, and the oil separates, and floats on the top. The oil is then skimmed off into tin vessels, and passed through flannel strainers into tubs, where it is left to subside for about 24 hours. From these the *purer upper portion of oil* is run into a *very deep* galvanized iron cistern, and again left to clarify itself by defecation for a few days. It is now further refined, by carefully passing it through clean and very stout moleskin filters, under pressure. The transparent filtered oil is received in a clean, galvanized iron cistern, containing a pump, from which the casks are filled for exportation. The latter, before being filled, are carefully seasoned and cleaned, to prevent

their imparting either flavour or colour to the pure oil." "Sometimes we receive 14 tons of cod-livers a night."

The superiority of the oil prepared as above, consists essentially in every part of the process of extraction being performed whilst the *livers* are *fresh*, and in *no chemical means* being adopted to give the oil a factitious appearance. Its *natural* pale colour is thus preserved from contamination, and its medicinal virtues maintained intact.

Messrs. Charles Fox and Co. prepared, by the above method, about 22,000 gallons of oil, in 1853, and nearly the same quantity in 1854; all of which was imported into this country, and was immediately recognized by the respectable portion of the trade as of the very finest quality. We have chemically examined six different samples of this oil, and we have tested its efficacy by taking it ourselves for a long period; and we have, therefore, the more confidence in stating, that the preference given to it, wherever it is known, is well deserved. Its taste is so little different from other oil, that we have frequently eaten it with salad; whilst during its use we were able to detect iodine in the urine, a point in which we failed with "light-brown oil," even when taken in much larger doses.

Pur., &c. "The *finest oil*," remarks Dr. Pereira, "is that which is most *devoid of colour*, *odour*, and *flavour*. The oil, as contained in the cells of the fresh liver, is nearly *colourless*, and the brownish colour possessed by ordinary cod-liver oil, is due to colouring matters derived from the decomposing (putrefying) hepatic tissues and fluids; or from the action of the air on the oil (age). Chemical analysis lends *no support* to the opinion, at *one time* entertained, that the brown oil was superior, as a therapeutical agent, to the pale oil. Chemistry has *not* discovered any substance in the brown oil that would confer on it superior activity as a medicine. On the other hand, the disgusting odour and flavour, and nauseating qualities of the brown oil, preclude its repeated use. Moreover, there is reason to suspect that, if patients could conquer their aversion to it, its free use, like that of other rancid and empyreumatic fats, would disturb the digestive functions, and be attended with injurious effects." (*Elem. Mat. Med., &c.*, 3d edit., iii, 2239.)

Among the tests of *purity*, that generally relied on is known as the "*sulphuric acid test*." (See p. 843-4.)

To detect the presence of *combined iodine*, which is now generally considered as one of the leading medicinal constituents of pure cod-liver oil, the sample is saponified by trituration with a little *caustic potassa* and *hot water*, the resulting soap cautiously incinerated, the ashes digested with *water*, and the whole thrown on a filter. The usual tests for iodine may be then applied to the filtered liquid.

The *presence* of *iodine artificially added*, is best detected by agitating the *oil* with a little *rectified spirit*, and then testing this last for iodine. Or, a little solution of *starch* and a few drops of *sulphuric* or *nitric acid* may be at once added to the oil, when a blue colour will be developed if iodine has been mixed with the sample.

The sp. gr. of the *pale oil* is 0·9230 to 0·9238; of the *light-brown oil*, 0·9240 to 0·9245; of the *dark-brown oil*, 0·9290 to 0·9315. The density is, however, apt to vary a little with the quantity of moisture present.

Uses, &c. Cod-liver oil is a most valuable medicine in a great variety of diseases, more especially in glandular indurations and enlargements, scrofula, phthisis, rheumatism, gout, certain cutaneous diseases, amenorrhœa, chlorosis, caries, rickets, &c. To be of service, however, its use must be continued for several weeks, and the oil must be recent. *Dose.* 1 to 2 table-spoonfuls, 3 or 4 times daily, or oftener.

Obs. Since the unfortunate year 1843, when De Jongh published, at Leyden, his "*Disquisitio comparativa chemico-medica de tribus olei jecoris aselli speciebus*," the press has been continually burdened with remarks and controversies on the relative merits of "*pale*," "*pale-brown*," and "*brown*," cod-liver oil. In an excellent paper, recently read by Mr. Mercer, before the Pharmaceutical Society, that gentleman places the question in its proper position. "De Jongh quotes several authorities as to what constitutes the distinction between the three varieties of oil referred to, and the conclusion he arrives at from their testimony, is that 'the *clear pale oil* is obtained by spontaneous flow from the putrescent livers; the *brown*, by the boiling or roasting of these livers; and the *light brown* is a clear pale oil, which has stood long on the (putrid) livers, or has got *old* in the warehouse.' In the analysis of these three varieties given by De Jongh, little difference can be observed. They all contain about 96% of oleic and margaric acids, and glycerine, the constituents of all oils and fats. The remaining 4% is made up by small portions of the butyric and acetic acids, the elements of bile, iodine, bromine, &c. The conclusion De Jongh draws from these ana-

lyses is, that the '*light-brown* and the *pale oil* agree in *every* respect much more than the brown, by which *it is established* that the *light brown* is only *a pale oil which has become old.*' Proceeding in his investigations, he tries their comparative medicinal value, and for this purpose selects three sets of *six* patients each, and (to the astonishment of Mr. Mercer) he found that the palm of superiority was carried off, *not* by the *light brown* which De Jongh *now* proclaims preferable to all others, but by the *brown*, obtained, as he tells us, by '*boiling* or *roasting* the *putrescent livers* of the fish.' This De Jongh accounts for by observing that 'according to his analysis, the brown contains a little more biliary matter and butyric acid than either of the others,' and 'it is therefore,' he says, 'fair to assume that the brown oil owes its greater power to the biliary matter and butyric acid which exists in it in much larger proportions than in the lighter coloured oils.' Yet, strange to say, by referring to his own published analysis, the *pale brown oil* which he *now recommends*, does *not* contain even a *trace* of *butyric acid.* Altogether De Jongh shows such a slight difference to exist between the chemical composition and medical effects of the three oils, that the question naturally arises—Is it not possible that he may have failed in discovering their active principles? This clearly appears to have been the case. Instead of cod-liver oil having a similar constitution to other ordinary fats and oils, with the addition of small quantities of biliary and inorganic matter superadded, Winckler, an eminent German chemist, has shown that it possesses a chemical composition *differing from all other fatty oils hitherto employed in medicine*, and that in cod-liver oil *glycerine* is replaced by the *oxide of propyle.* The generation of *propylamine* which is met with in the normal urine and perspiration, takes place *only in cod-liver oil* on the addition of ammonia, and in no other officinal fatty oil; and hence the place of cod-liver oil in the materia medica cannot be supplied by any other oil."

The discovery of Winckler has not been questioned, and when we see that De Jongh failed to detect the presence of such an important substance as *propyle*, a characteristic which distinguishes cod-liver oil from all other oils, and professed to have discovered substances in it which other first-class chemists have failed to detect, we cannot place much reliance in the other results of his analysis or experiments. Indeed, his published analyses of cod-liver oil appear to smell more of the lamp than of the laboratory, of which not the least feeble proof is furnished by the fact of his giving his proportions to the *fifth* figure of decimals, or 100,000ths, results which could only have been obtained on paper.

Further, in the British pharmacopœias it is distinctly stated that this oil is to be obtained from the livers of the *true* or common cod (*gadus morrhua*,—Ph. L.; *gadus vulgaris*,—Ph. D.); and in order to ensure this, the colleges have given it a name (*oleum morrhuæ*) indicative of the species from which it is to be prepared. In this the colleges have acted judiciously, for not only is the oil obtained from this source of much more regular constitution, but it is also *richer* in all those substances that render it valuable as a remedy than the oil obtained from *any other* member of the family gadidæ. This fact any person disposed to *honestly* and *practically* investigate the subject will inevitably discover; and to such only we address ourselves. A distinction in the species was known even in the time of Pliny. The only commercial sources of this oil can therefore be found where the *true cod-fish* is abundant. The number which frequent our coasts is comparatively insignificant; but on the coasts of Newfoundland, and on the "banks" in close proximity to it, they exist in myriads. We have ourselves seen there, at one time within the reach of our telescope, hundreds of boats and vessels loaded with men busily engaged in hook-and-line cod-fishing; and the rapidity with which they drew their victims from "the vasty deep" was truly astonishing. No other livers but those of the *true cod* can be obtained for the preparation of oil in Newfoundland—a fact well known to every scientific, and to every practical man who has resided there, or who is familiar with the subject. The "*light-brown oil*" now so much "puffed by advertisement," is obtained from variable species of gadidæ common to the northern seas, where the true cod is scarcely known. De Jongh himself declares that "the Bergen (Norwegian) oil is principally obtained from three species, viz., the *Dorse* (gadus callarias), the *Coal-fish* (gadus carbonarius), and the *Pollack* (gadus pollachius); but *chiefly* from the *first.*" None from *gadus morrhua!* Can the druggist, therefore, be justified in the substitution of this *dorse oil* for the *cod-liver oil* ordered in our national pharmacopœias? The answer is—the *two* are *dissimilar*,—and on no one point is the respectable portion of the medical profession more agreed, than that the *substitution*

of *one substance* for *another* is *unjustifiable.* Decency has lately compelled even the vendors of "*light-brown*" to omit the words, "*oleum jecoris aselli*" from the head of their lengthy advertisements, and they *now* declare "*light brown*" to be "extracted from the liver of the *dorse* (gadus callarias), a *species* of cod-fish caught at the great fishery of the Loffoden Isles, Norway." The "phosphate of *chalk*" (!), another specimen of De Jongh's chemistry, has also been recently transmuted into "phosphate of *lime.*"

A short time since we were congratulating ourselves that the "*testimonialists*" —happily forming a small portion only of the medical profession—exhausted with their exertions on behalf of *gutta percha, revalenta, galvanic chains,* and *bitter beer,* had permanently abandoned their labours, and that the whole system had been crushed by the admirable exposé in the '*Medical Circular*' of the notorious "*pale-ale puff.*" We find, however, that we were mistaken, and that the "*certificate-mongers*" only "rested on their oars" to recover breath and recruit their energies, before assisting to keep up by their efforts pretensions as manifestly absurd as those of the Holloways and the Morisons. Surely a Mr. Hunt, who seriously asserts that—*one* drachm of the so-called *light-brown oil* is equal to *four* drachms of *pale oil,* must either be a wag, or have dipped his pen in the inkstand of the learned Baron Munchausen, since even his employers make no such pretensions; whilst De Jongh himself gives his evidence precisely the other way. The dictum of Dr. Cowan, another testimonialist, that the remedial power of a medicine is in direct proportion to its nauseousness, is certainly unsupported by experience.

In conclusion, we beg to withdraw any remarks made by us some time ago on the subject of cod-liver oil, which we most positively assert referred to the *pale-brown oil,* and the *common brown oil* and the *bleached white oil* of the shops, and were entirely based on assurances and representations which we afterwards found to be *false.* At the date referred to, we had not seen, much less examined, the *pure pale oil* that has since been brought into the market, the process for obtaining which had not then been even patented. We have since carefully and laboriously investigated the subject, and the results of this investigation are embodied in the above remarks.

(Those interested in this important question in connexion with sanitation and the cure of disease, will do well to read '*Ancient and Modern Fish Tattle,*' and '*Cod Proper, and Newfoundland Fisheries,*' by Dr. Badham; '*Yarrell on British Fishes,*' ii, 151, &c.; and various articles which have appeared from time to time on the subject in the '*Pharmaceutical Journal,*' and in the '*Chemist.*')

Cod-liver Oil (Sir James Murray's). The *oil,* is placed in silver cylinders, and agitated with dry *carbonic acid gas,* under a pressure of 200 *lb.* to the inch. Patent. The object is to deodorize the oil, and to disguise its nauseous flavour. It is, therefore, only applicable to the *pale brown* and *brown oils.*

Colza Oil; Oleum de Colza. From the *seeds* of *brassica campestris oleifera,* or *colsa de printemps,* a variety of brassica campestris (Linn.) It may be regarded as a superior sort of rape oil. Burns well in lamps, especially after being refined. Sp. gr. 0·9136. *Prod.* 39%.

Cornilberry-tree Oil. From *cornus sanguinea.* Glutinous.

Cotton Seed; Oleum Gossipii Seminum,—Lat. From the *seed* of *gossipium Barbadense.* Drying.

Croton Oil; Oleum Crotonis,—Ph. E. *Ol. Tiglii,*—Ph. L. From the *shelled seeds* of *croton tiglium* or *Molucca grains.* Imported chiefly from the East Indies. It is one of the most powerful cathartics known, and acts when either swallowed or merely placed in the mouth. *Externally,* it is rubefacient and counter-irritant, often causing a crop of painful pustules, like tartar emetic. *Dose.* 1 to 2 drops, on sugar; in apoplexy, &c. It is poisonous in larger doses. Sp. gr. 0·947 to 0·953. *Prod.* Unshelled seeds, 22% to 23%; shelled do., 32% to 35%.

Pure croton oil is soluble in an equal volume of alcohol of 0·796, but in 2 or 3 days about 96% of the oil separates. In France the marc is exhausted with alcohol, and the oil thus obtained is added to that previously obtained from the same seeds by expression. The East Indian oil (*ol. crotonis exoticum*) is usually of a pale yellow; that pressed in England (*ol. crotonis Anglicanum*) is much darker.

Oil of Cucumber; Oleum Cucurbitæ,—Lat. From the *seeds* of *cucurbita pepo* or *squash,* and the *c. melopepo* or *pumpkin.* Pale; *used* in lamps; and, sometimes, as a soothing application to piles. Sp. gr. 0·9231. *Prod.* 24%.

Oil of Cyper-grass. From the *roots* of *cyperus esculenta.* Glutinous. Sp. gr. 0·9180.

Oil of Eggs; Oleum Ovi, O. O. Vitelli, O. Ovorum,—Lat. From the *yelks of eggs*, gently heated until they coagulate and the moisture has evaporated, and then pressed or broken up, digested in *boiling rectified spirit*, the tincture filtered whilst hot, and the spirit distilled off. Bland; emollient. The common plan is to fry the yelks hard; but the oil is then darker coloured and stronger. The P. Cod. orders them to be exhausted with *ether*, by displacement. Formerly, commonly used to "kill" quicksilver, and still held in great esteem in some parts of England for sore nipples and excoriations. *Prod.* 10 to 12 eggs yield 1 *oz.* See *Mixed Oils.*

Oil of Garden Cress; Oleum Lepidii Sativi,—Lat. From the *seed.* Drying. Sp. gr. 0·9240. *Prod.* 54%.

Oil of Garden Spurge; Oleum Lathyris, Ol. Euphorbiæ L.,—Lat. From the *seeds* of *euphorbia lathyris* or *garden spurge.* Cathartic. *Dose.* 3 to 8 drops. Sp. gr. 0·9281. *Prod.* 39% to 41%. Croton oil mixed with 6 times its weight of nut or rape oil is usually sold for it.

Oil of Gingelie, Oil of Sesamum, Benne Oil, Teel do., Tel do.; Oleum Sesami,—Lat. From the *seeds* of *sesamum orientale* (Willd.) or *gingelly.* Pale; bland. *Used* in salads, paints, &c.; also to adulterate oil of almonds. *Prod.* 46%.

Gourd Oil. See *Cucumber Oil.*

Oil of Ground Nuts. From the *nuts* of *arachis hypogæa.* Glutinous.

Oil of Hemp; Oleum Cannabis,—Lat. From the *seed* of *cannabis sativa* (Linn.) or *common hemp.* Mawkish. Sometimes used for frying, but chiefly for paints, soaps, &c. Freely soluble in boiling alcohol; does not thicken until cooled to 5° Fahr. Sp. gr. 0·9276. *Prod.* 18 to 24%.

Oil of Henbane Seed; Oleum Hyoscyami Expressum,—Lat. From *hyoscyamus niger*, or *common henbane.* Glutinous. Sp. gr. 0·9130.

Indayaçu Oil, Oil of Anda Gomesii; Oleum Andæ,—Lat. From the *seeds.* Purgative. *Dose.* 15 to 30 drops, on sugar. It acts mildly, without exciting nausea or vomiting, and is regarded by many practitioners as preferable to castor oil. It is said to be extremely efficacious in weakness of the lymphatic system, and in general dropsy. (Lindley.)

Oil of Jatropha; Oleum Jatrophæ, Ol. J. Curcadis, Ol. Infernale,—Lat. var. From the *seeds* of *jatropha curcas.* Somewhat resembles croton oil. *Used* for lamps in the East Indies.

Oil of Julienne. From the *seeds* of *hesperis matronalis* or *dame's violet.* Drying. Sp. gr. 0·9281.

Kundah Oil, Tallicoonah do.; Oleum Touloucounæ,— Lat. From the *fruit* of *carapa touloucouna.* Rancid, nauseous, vermifuge, rubefacient, emetic, and purgative. Chiefly used in lamps.

Lard Oil, Tallow do., Oleine, Oleic Acid; Oleum Adipis,—Lat. By separating the *oleine* of lard from the *stearine* by means of *boiling alcohol.* Only applicable where spirit is cheap. The product is, however, excellent. The *crude oleic acid* or *lard oil* of *commerce*, is chiefly obtained as a secondary product in the manufacture of stearine. It is purified by agitation with sulphuric acid, and subsequently steaming it, or washing it with hot water. Burns well in lamps, if the wick-tube is kept cool. Sp. gr. 0·9003.

Linseed Oil; Oleum Lini,—Ph. L. E. & D. 1. (*Cold-drawn linseed oil; Oleum lini sine igne.*) From the *seed* of *linum usitatissimum* (Linn.) or *common flax*, bruised or crushed, and then ground and expressed without heat. Pale, insipid, viscous; does not keep so well as the next. *Prod.* 17% to 20%.

2. As the last, but employing a steam heat of about 200° Fahr. Amber-coloured; less viscous than the last; congeals at 2°; soluble in 5 parts of boiling and 40 parts of cold alcohol. Both are drying and cathartic. *Dose.* 1 to 2 oz.; in piles, &c. Chiefly used in paints, varnishes, &c. Sp. gr. 0·9347. *Prod.* 22% to 27%.

Boiled Linseed Oil. See *Oils* (Drying).

Oil of Mace (Expressed). See *Oil of Nutmegs* (Expressed).

Oil of Madia Sativa; Oleum Madi,—Lat. From the *seeds* of *madia sativa.* Pleasant flavoured. *Prod.* 18% to 20%.

Oil of Mustard; Oleum Sinapis,—Lat. From *sinapis alba* or *white mustard*, but chiefly from *sinapis arvensis, s. chinensis, s. dichotorna, s. glauca, s. ramosa,* and *s. tori.* Sweet. *Used* for the table. Sp. gr. 0·9142 (0·9160,—Ure). *Prod.* 36%.

Oil of Black Mustard; Oleum Sinapis Nigri,—Lat. From the "*hulls*" of *black-mustard seed.* Viscid, stimulant. *Used* in rheumatism. Sp. gr. 0·9168 to 0·9170.

Oil of Wild Mustard; Oleum Raphani,—Lat. From the *seed* of *raphanus raphanistrum* (Linn.) or *jointed charlock* or *wild mustard. Prod.* 30%.

Oil of Myrtle; Oleum Myrteum,—Lat. From the berries. Butyraceous, fragrant.

Neat's-foot Oil, Nerve do., Trotter do.; Oleum Bubulum, Ol. Nervinum, Axungia Pedum Tauri,—Lat. From *neat's feet* and *tripe*, by boiling them in *water*, and skim-

ming off the oil. Does not thicken by age. *Used* to soften leather and to fry fritters.

Oil of Nettle-tree. From the *kernels* of *celtis Australis* (Willd.) or *nettle-tree.* Burnt in lamps.

Nickar Oil. From the *nuts* of *guilandina bonducella* (Linn.) or *gray nickar-tree.*

Nut Oil, Hazel-nut do.; Oleum Nucis, Ol. Coryli,—Lat. From the *kernels* of *corylus avellana* (Linn.) or *hazel-nut tree.* Pale, mild tasted, drying; superior to linseed oil for paints and varnishes. It is commonly sold for oil of almonds and oil of ben, and is extensively employed to adulterate both. Walnut oil is also frequently sold for nut oil. Sp. gr. 0·9260. *Prod.* 60% (Ure).

Oil of Nutmeg (Expressed); *Expressed Oil of Mace, Butter of do.; Oleum Myristicæ* (Concretum),—Ph. L. *Myristicæ Adeps,*—Ph. E. *M. Butyrum, Ol. Myristicæ Expressum, O. Moschatæ, O. Nucistæ,* —Lat. var. "The concrete oil expressed from the *seed* of *myristica officinalis,*—Linn." (Ph. L.), or *common nutmeg.* The *nutmegs* are beaten to a paste, enclosed in a bag, exposed to the *vapour of hot water,* and then pressed between heated iron plates. Orange coloured, fragrant, spicy; butyraceous, or solid. It is a mixture of the fixed and volatile oils of the nutmeg. When discoloured and hardened by age it is called *Banda soap* (ol. macis in massis). When *pure* it is soluble in 4 parts of boiling alcohol, and in 2 parts of ether. It has been used in rheumatism and palsy, but is now chiefly employed for its odour and aromatic qualities. From the East Indies. *Prod.* 17% to 20%.

Olive Oil, Salad do., Sweet do.; Oleum Olivarum; Ol. Olivæ,—Ph. L. E. & D. *O. O. Fixum,*—Ph. E. 1839. The "oil expressed from the fruit" of "*olea Europæa,* Linn." (Ph. L.), or *common olive.* Four different methods are employed to obtain the oil from the fruit:—

1. (*Virgin Oil; O. O. Virgineum; Huile Vierge.*) From *olives,* carefully garbled, either spontaneously or only by slight pressure, in the *cold.* That yielded by the pericarp of the fruit is the finest.

2. (Ordinary "*Fine oil.*") This is obtained by either pressing the *olives,* previously crushed and mixed with *boiling water,* or by pressing, at a gentle heat, the olives from which the virgin oil has been obtained. The above processes furnish the finer salad oils of commerce. The cake which is left is called "*grignon.*"

3. (*Second quality.*) By allowing the *bruised fruit* to ferment before pressing it. Yellow; darker than the preceding; but mild and sweet tasted. Much used for the table.

4. (*Gorgon.*) By fermenting and boiling the *pressed cake* or *marc* in *water,* and skimming off the oil. Inferior.

Oil of the infernal regions (*oleum omphacinum*) is a very inferior quality of oil, which is skimmed off the surface of the water in the reservoirs into which the waste water which has been used in the above operations is received, and allowed to settle. The last two are chiefly used for lamps, and in soap-making, &c.

Of the *principal varieties* of *olive oil* known in commerce, and distinguished by the place of their production—*Provence Oil* (oleum Provinciale) is the most esteemed; *Florence Oil* and *Lucca Oil* are also of very fine quality; *Genoa Oil* comes next, and then *Gallipoli Oil,* which forms the mass of what is used in England; *Sicily Oil,* which has a slightly resinous flavour, is very inferior; and *Spanish Oil* is the worst imported.

Prop., &c. Olive oil is a nearly inodorous, pale greenish-yellow, unctuous fluid, with a purely oleaginous taste, peculiarly grateful to the palate of those who relish oil. It does not suffer active decomposition at a heat not exceeding 600° Fahr.; and when cooled to 36° it congeals into a granular solid mass. It is very slightly soluble in alcohol, but its solubility is increased by admixture with castor oil. It is soluble in 1½ parts of ether. When pure it has little tendency to become rancid. Sp. gr. 0·9170 to 0·9173; 0·9192, at 53½° (Saussure); 0·9176, at 59° (Heidenreich); and 0·9109, at 77° Fahr. (Saussure). *Prod.* 32%; of which 21% is furnished by the pericarp, and the remainder, which is inferior, by the seed and woody matter of the fruit.

Pur. Olive oil, with the exception of that of almonds, being the most costly of the ordinary fixed oils of commerce, is, consequently, the one most subject to adulteration. Nut, poppy, rape, and lard oil, are those most commonly used for this purpose. Refined tallow oleine, including that obtained from the "knacker's yards" of Paris, is said to have been used in the same way. The addition of any other oil to olive oil renders it far less agreeable to the palate, and, by increasing its tendency to rancidity, much more likely to offend and derange the stomach and bowels of those who consume it. Parties who indulge themselves in the use of this luxury would, therefore, do well to ascertain that what they purchase is *pure.* When this is the case, and the oil is also fresh, it is most wholesome as an article of food or as a condiment.

In an extensive examination which we made into the quality of the article sold in London and its neighbourhood under the name of *olive* or *salad oil*, for the proprietors of the Medical Circular, we found that only *a few* of them were of *first-rate quality*, and that barely *one half* of them were even of really good quality; *one* out of every *twelve* was of a very doubtful description; *one fifth* of them had acquired more or less rancidity by exposure or age; whilst more than *one third* of the whole number of samples examined were adulterated with oils of an inferior and cheaper description. The old-fashioned Florence flask-oil was found to be the one least meddled with. (Med. Circ., i, 350-2.)

The *detection* of the *sophistication* of *salad oil* is a matter of no great difficulty. The palate of the connoisseur will readily perceive the slightest variation in the quality of his favorite condiment. Other methods, however, of a more accurate and certain description, and of more general application, are adopted. Amongst these, in addition to those mentioned above, are the following:—

a. When *pure olive oil* is shaken in a phial, only half filled, the "*bead*" or *bubbles* rapidly disappear; but if the sample has been mixed with poppy or other oil, the bubbles continue longer before they burst.

b. Olive oil congeals at 36° Fahr., and is *completely* solidified, when a small bottle, containing it, is surrounded by ice, or a freezing mixture; but when mixed with poppy oil, it remains partly liquid, even when the latter forms only 1-4th of the mass; if more than 1-3rd of poppy oil is present, it does not solidify at all, unless cooled much below the freezing-point of water.

c. (Ph. E.) When olive oil is "carefully mixed with $\frac{1}{12}$th part of its volume of a solution of 4 oz. of *mercury* in 8 fl. oz. 6 dr. of *nitric acid* (sp. gr. 1·500), it becomes in 3 or 4 hours, like a firm fat, without *any* separation of *liquid oil*."

d. M. Pontet recommends the *mercurial solution* to be made by dissolving 6 parts of *mercury*, in $7\frac{1}{2}$ parts of *nitric acid* (sp. gr. 1·35), without heat; of this solution he adds 1 part to every 48 parts of the *oil*, and well shakes the mixture every 30 minutes, until it begins to solidify. This it does after about 7 hours in summer, and 4 or 5 hours in winter, and when the oil is pure, it will have formed, in 24 hours, a mass so hard, that some little force must be employed to thrust a glass rod into it. The other edible oils do not furnish a hard mass with nitrate of mercury. The solidity of the mass is exactly in proportion to the quantity of foreign oil present. When the sophistication is equal to 1-8th of the whole, a distinct liquid layer separates; when the mixture contains $\frac{1}{2}$ its volume of an inferior oil, *one half* only of the mixture becomes *solid*, and the *other half* continues liquid. A temperature of about 90° Fahr., is the best to cause the oil and coagulum to separate then perfectly from each other. When the oil has been adulterated with *animal oil*, the mixture solidifies in about five hours; but in this case the coagulum consists of the animal oil, whilst the olive oil floats on the surface, and may be decanted for further examination. This coagulum, on being heated, exhales the well-known odour of rancid fat or melted tallow.

e. M. Boudet has discovered that it is only the hyponitrous acid (*hyponitric?*) in the above mercurial test-liquor, that acts on olive oil. He has hence adopted a mixture of 1 gr. of *hyponitrous acid* with 3 gr. of *nitric acid*, which he finds is capable of solidifying 200 gr. of *olive oil* in about 78 minutes. The only fixed oils which this *test-liquid* solidifies, are those of *sweet almonds*, *filberts*, and *colza*. The *drying oils* (except castor-oil) are not hardened by it. The presence of poppy oil is easily detected by its retarding effect; $1\frac{0}{0}$ of it retards the solidification at least 40 minutes. Each of these oils require different lengths of time to become solid, and exhibit different colours during the reaction. The results, when 100 parts of the *given oils* were treated by a mixture of 9 parts of *nitric acid* and 1 part of *hyponitrous acid*, are given below:—

Names.	Colours developed by the action of the test.	Time required for Solidification (*in minutes*).
Acajou oil . .	Lemon-yellow . . .	40
Almond oil . .	Dingy-white . . .	160
Castor oil . . .	Golden-yellow . . .	603
Colza oil . . .	Yellowish-brown . .	2400
Filbert oil . .	Greenish-blue . . .	103
Olive oil . . .	Greenish-blue . . .	73

Uses, &c. The dietetical uses of olive oil are well known. In Spain and Italy it is commonly employed as a substitute for butter. It is highly nutritious, but is digested with difficulty by some persons, and hence should be avoided by the dyspeptic. Like almond oil, it is occasionally employed as a laxative and vermifuge, and is, perhaps, one of the mildest known. In pharmacy it is extensively employed in the preparation of cerates, liniments, ointments, and plasters. *Dose.* For an adult, ½ to 1 wine-glassful as a mild aperient; for an infant, ½ to 1 tea-spoonful, mixed up with an equal quantity of honey, syrup of roses, or syrup of violets. The white fibrous sediment which forms in the recently expressed oil, is the "*amurca*" of Pliny, and was formerly highly esteemed in medicine.

Olive-oil Droppings, Sweet-oil do. The "foots" or "deposits," and the "drippings" of the casks, cisterns, and utensils. *Used* for machinery, making soap, &c.

Olive Oil (Oxygenated); *Oleum Olivæ Oxygenatum*,—Ph. Batav. *Olive oil*, 16 oz., is placed in a receiver surrounded with *ice* or *very cold water*, and *chlorine* is slowly transmitted through it for several days, or until it becomes thick and viscid, after which it is well washed with *warm water*.

Palm Oil, Palm Butter; Oleum Palmæ, Ol. Cocois Butyraceæ,—Lat. From *elais guineensis, cocos butyracea*, or *oil palm*. Orange or red-coloured; butyraceous or solid; smells of violets; unchanged by alkalies; bleached by sun-light, age, exposure, chlorine, chromic acid, and oil of vitriol; melts at 117½° Fahr. Sp. gr. 0·968. Demulcent. *Used* to colour and scent ointments, pommades, &c.; but chiefly to make soap and candles. From Africa.

Oil of Pine Nuts; Oleum Nucis Pini,—Lat. From the *kernels* of *pinus pinea* (Willd.) or stone pine. *Prod.* 31%.

Oil of Pine-tops; Oleum Cacuminum Pini,—Lat. From the *pinus abies* or *Norway spruce fir*. Drying. Sp. gr. 0·9285.

Piney Oil, Piney Tallow, Pænoe do. From *vateria Indica* (Linn.) or *pænoe tree*. Resinous flavoured, fragrant; made into candles. Sp. gr. 0·926.

Oil of Pistachio Nuts. From the *kernels* of *pistacia vera*, var. β. (Linn.) Sweet and pale. *Used* for salads and emulsions. *Prod.* 34%.

Oil of Plum-stones. From the *kernels* of *prunus domestica* (Linn.) or *common plum*. Burnt in lamps in Wurtemburg. Sp. gr. 0·9127. *Prod.* 31%.

Poppy Oil; Oliete, Huile Blanche; Oleum Papaveris,—Lat. From the *seeds* of *papaver somniferum* (Linn.) or *white poppy*. Sweet; pale; dries and keeps well. *Used* for salads, paints, and soaps; also (extensively) to adulterate almond oil, for the inferior qualities of which it is frequently sold. It does not freeze until cooled to 0° Fahr. Sp. gr. 0·9243 to 0·9245. *Prod.* 48% to 54%.

Oil of Prune-stones; Oleum Lapidum Prunorum,—Lat. Closely resembles oil of almonds, but soon gets rancid. Congeals at 16° Fahr. Sp. gr. 0·9127. *Prod.* 30%.

Oil of Radish Seed. From *raphanus sativus oleifer*, a variety of raphanus sativus (Linn.) Sp. gr. 0·9187. *Prod.* 42%.

Rape Oil, Brown do.; Oleum Rapæ,—Lat. From the *seed* of *brassica napus*, (Linn.; *cole* or *rape*,) and from *brassica campestris*, (Linn.; *wild navew* or *rape*.) Originally exclusively from *brassica rapa* (Linn.), the *true rape* or *wild turnip*. Glutinous; buttery at 25° Fahr. Dries slowly; makes soft soaps, and good ointments, but bad plasters; smokes much in burning, unless well refined. Sp. gr. 0·9135 to 0·9136. *Prod.* 32%.

Rape Oil (Refined); *Pale Rape Oil; Oleum Rapæ Refinum, Ol. R. Album*,—Lat. From *crude rape oil*, by agitating it with about 2% of *oil of vitriol*, previously diluted with about twice its weight of *water*, and after 10 or 12 days' repose, decanting the clear oil, and filtering it through Canton flannel or felt. The quality is improved by washing it with hot water or steam, before filtration. *Used* for lamps, blacking, and machinery; also extensively employed to adulterate both almond and olive oil. It forms the common "*sweet oil*" of the oilmen and druggists. Sp. gr. 0·9136 to 0·9140.

Summer Rapeseed Oil. From the *seed* of *brassica præcox*. Sp. gr. 0·9138 to 0·9139. *Prod.* 32%.

Oil of Sabadilla; Oleum Cebadillæ,—Lat. From *cebadilla* or the *seeds* of *asagræa officinalis*. Greenish.

Oil of Sassafras Nuts; Oleum Pichurium, Ol. P. Fabarum,—Lat. From the *seeds* or *nuts* of *nectandra puchury* and *aydendron cujumary*. White, butyraceous. *Prod.* 10%.

Seal Oil; Oleum Phocæ,—Lat. From the *hood seal*, and *harp seal*, and other species of phocidæ. *Pale seal oil* is that which drains from the blubber before putrefaction commences, and forms about 60% of the whole quantity of oil obtained. It is very clear, free from smell, and when recently prepared, not unpleasant in its taste. *Refined seal oil* is the last washed and filtered. Ranks close after sperm oil. *Brown* or *dark seal oil* is that which subsequently

drains from the putrid mass. It is very strong-scented and nauseous, and smokes in burning. Both are used for lamps and dressing leather. A full-grown seal yields 8 to 12 gall. of oil; a small one, 4 to 5 gall.

Oil of Sesamum. See *Oil of Gingelie.*

Shark-liver Oil. The *lightest* of the fixed oils. Sp. gr. 0·865 to 0·867.

Skate Oil; Oleum Raiæ,—Lat. From the *livers* of *raia batis* (Linn.) or *common skate*, as cod-liver oil; also from *raia rhinobatus* or *white skate*, and *raia clavata*, or thornback. Often sold for and mixed with cod-liver oil.

Spermaceti Oil, Sperm do.; Oleum Cetacei,—Lat. From the "*head matter*" of *physeter macrocephalus* or *spermaceti whale*, a species once common in all the principal seas, but now chiefly confined to the Southern Ocean. It is very limpid, smells little, and burns well; and has long been reputed the best oil for lamps and machinery, as it does not thicken by age or friction. It is frequently adulterated with refined seal oil. Sp. gr. 0·875.

Spindle-tree Oil. From *euonymus Europæus* (Linn.) Glutinous, emetic, and purgative. Sp. gr. 0·9380.

Sunflower Oil; Oleum Helianthi,—Lat. From the *seeds* of *helianthus annuus* and *h. perennis.* Clear, pale yellow, tasteless; thickens at 60° Fahr. *Used* for salads and lamps. Sp. gr. 0·9261. *Prod.* 15%.

Oil of Tea; Oleum Theæ,—Lat. From the *seeds* of *camellia sesanqua* and *c. oleifera;* not from any species of thea.

Teel Oil. See *Gingelie Oil.*

Tobacco Seed Oil; Oleum Tabaci (Expressum),—Lat. From the *seeds* of *nicotiana tabacum* (Linn.) or *true tobacco plant.* Pale; dries well; equal to nut oil. Its production has recently been carried on with considerable success in some parts of Russia. Sp. gr. 0·9232.

Oil of Touloucouna. See *Kundah Oil.*

Walnut Oil; Oleum Juglandis, Ol. Nucis J.,—Lat. From the *kernels* of the nuts of *juglans regia* (Linn.) or common walnut tree. Soon gets rank; dries well. *Used* in paints, and occasionally in plasters. When "*cold drawn*" and washed, it is sometimes eaten with salads. Sp. gr. 0·9260 to 0·9262. *Prod.* 48% to 52%.

Oil of Wax, Butter of Wax; Oleum Ceræ;—Lat. From *bees' wax* by quick distillation in a close vessel. Butyraceous. By rectification along with *quicklime* it yields a *liquid oil.*

Oil of Weld. From the *seed* of *reseda luteola* (Linn.) or *dyer's weld.* Sp. gr. 0·9358.

Whale Oil, Train do., Whale-train do.; Oleum Balænæ, Ol. Ceti,—Lat. From the blubber of the *balæna mysticetus* (Linn.) or the *common* or *Greenland whale*, by heat. Coarse; stinking. *Southern whale oil* is the best. *Used* for lamps, machinery, &c. Sp. gr. 0·9231. *Product* per fish, about 1½ ton for each foot of bone.

Oil of Wheat; Oleum Tritici,—Lat. From bruised *Colne wheat*, with heat. In chilblains, ringworm, and several other skin diseases.

Oil of Wine-stones, Grape-stone Oil; Oleum Vitis Viniferæ Lapidum,—Lat. From the *seeds* of *grapes*, separated from the marc. Pale yellow, bland, emollient. *Used* for salads and lamps. Sp. gr. 0·9202. *Prod.* 14% to 18%.

*** The numbers given above, under "*products,*" unless when otherwise stated, refer to the respective fruits, kernels, nuts, seeds, &c., deprived of their husks, pods, shells, and every other portion destitute of oil.

OILS (Medicated). Syn. *Olea Cocta, O. Infusa, O. Medicata,*—Lat. These are prepared by infusion or decoction. The *bruised ingredients* are either simply digested in 2 to 4 times their weight of *olive oil* for some days, or they are *gently* boiled in it until they become dry and crisp, great care being taken that the heat towards the end of the process is not greater than that of boiling water. As soon as the process is complete, the oil is allowed to drain from the ingredients, which are then (if necessary) submitted to the action of the press. The product is commonly run through flannel or a hair sieve whilst still warm, after which it is allowed to repose for a week or ten days, when the clear portion is decanted from the dregs. The *green* or *recent plants* are usually employed for this purpose, but, in many cases, the *dried plants*, reduced to powder, and digested for 6 or 8 hours in the *oil*, at the heat of hot water, with frequent agitation, yield a much more valuable product. They are nearly all employed as external applications only. (See *below.*)

Oil of Adder's Tongue; Oleum Ophioglossi,—Lat. From the *herb*, as oil of belladonna. A popular vulnerary.

Oil of Ants; Oleum Formicarum,—Lat. From *ants*, 1½ oz.; *olive oil*, ¼ pint; digested together at a gentle heat for 24 hours. Stimulant, rubefacient, and aphrodisiac. Niemann directs a much stronger oil. Obsolete in this country.

Oil of Balsam Apple; Oleum Balsaminæ,—Lat. From the *fruit*, deprived of the

seed, digested, with heat, in 4 times its weight of *oil.* *Used* as a vulnerary balsam.

Oil of Belladonna; Oleum Belladonnæ,—P. Cod. From the *fresh leaves*, bruised, 1 part; *olive oil*, 4 parts; digested together at a gentle heat until the moisture is evaporated; the oil is then strained off, with pressure, and filtered.

Oil of Cantharides; Oleum Cantharidis, Ol. Cantharidibus,—P. Cod. 1839. From *Spanish flies* (powdered), 1 part; *olive oil*, 8 parts; as oil of belladonna. Stimulant and rubefacient. *Used* as a dressing to indolent sores, blisters, &c.; and in dropsy, rheumatism, gout, &c. *Oil of the Oil-beetle* (meloe proscarabæus,—Linn.) is prepared in a similar manner.

Oil of Capsicum; Oleum Capsici,—Dr. Turnbull. From *powdered capsicum* or *Cayenne pepper*, 4 oz.; *olive oil*, 1 pint; digested together for 6 hours, with heat, and strained. Stimulant; rubefacient; in colic, cholera, &c.

Oil of Chamomile; Oleum Anthemidis, Ol. Chamæmeli,—Lat. From the *dried flowers* (rubbed to pieces), 1 part; *olive oil*, 8 parts; digested together, with heat, for 6 hours. Stimulant, emollient, and vermifuge.

Oil of Colocynth; Oleum Colocynthidis,—Lat. From the *pulp*, as oil of chamomile. Diuretic. In dropsy, neuralgia, rheumatism, worms, &c.

Oil of Earthworms; Oleum Lumbricorum,—Ph. E. 1744. From *earthworms* (washed), ½ ℔; *olive oil*, 1½ pint; *white wine*, ½ pint; boiled gently to dryness, and then pressed, and strained. Formerly thought to possess many virtues; now obsolete. *Oil of mucilages* is now sold for it.

Oil of Elder-flowers, White Oil of Elder; Oleum Sambuci Album, Ol. Sambucinum,—P. Cod. From the *flowers*, as oil of chamomile. Emollient and discussive.

Oil of Elder-leaves, Green Oil, Green Oil of Elder, Oil of Swallows; Oleum Viride, Ol. Sambuci Viride,—Lat. *Prep.* 1. *Green elder leaves*, 1 *lb.*; *olive oil*, 1 quart; boil gently until the leaves are crisp, press out the oil, and again heat it till it turns green.

2. As before, but by maceration, at a heat under 212° Fahr. More odorous than the last.

3. *Elder leaves*, 1 cwt.; *linseed oil*, 3 cwt.; as No. 1.

Obs. The last form is the one usually employed on the *large scale.* It is generally coloured with verdigris, ½ *lb.* to the *cwt.*, just before putting it into the casks, and whilst still warm; as, without great skill and a very large quantity of leaves, the deep-green colour so much admired by the ignorant, cannot be given to it. The oil is got from the leaves by allowing them to drain in the pan or boiler (with a cock at the bottom) kept well heated. Emollient; in great repute among the vulgar as a liniment, in a variety of affections.

Oil of Fenugreek; Oleum Fœnugræci,—P. Cod. From the *seeds*, as oil of cantharides or of chamomile. Emollient and resolvent.

Oil of Foxglove; Oleum Digitalis,—P. Cod. From the *fresh leaves*, as oil of belladonna. *Used* as an application to chronic ulcers and indurations, painful swellings, &c. As usually met with, it is nearly inert.

Oil of Garden Nightshade; Oleum Solani,—P. Cod. From the *leaves*, as oil of belladonna. Anodyne and discussive.

Oil of Garlick; Oleum Allii Infusum,—Lat. From *garlic*, as oil of belladonna. *Used* as a liniment in deafness, diarrhœa, infantile convulsions, palsy, rheumatism, &c.

Green Oil; Oleum Viride,—Lat. From *bay leaves, origanum, rue, sea wormwood,* and *elder leaves*, of each, 2½ *oz.*; *olive oil*, 1 quart; as oil of elder. Detergent, stimulant, and resolvent. Green oil of elder is now usually sold for it.

Oil of Hemlock; Oleum Conii,—P. Cod. As oil of belladonna. Anodyne and emollient; in painful ulcers, glandular tumours, &c.

Oil of Henbane; Oleum Hyoscyami,—P. Cod. As oil of belladonna. *Used* as the last, in various painful local affections.

Oil of Juniper (by Infusion); *Oleum Juniperi Infusum,*—Lat. From the *crushed berries*, as oil of belladonna. Diuretic and vulnerary; in frictions, &c.

Oil of Lilies; Oleum Liliorum,—Ph. L. 1746. From *white lilies*, 1 ℔; *olive oil*, 3 ℔; as oil of belladonna. Emollient; used to soften and ripen tumours, indurations, &c.

Oil of Melilot; Oleum Meliloti,—Lat. As the last, avoiding much heat. Emollient and resolvent.

Oil of Mucilages; Oleum Mucilaginum, Ol. cum Mucilaginibus,—Lat. 1. (Ph. L. 1746.) *Marshmallow root*, ½ ℔; *linseed* and *fenugreek seed*, of each, bruised, 3 oz.; *water*, 1 quart; boil 1 hour, add of *olive oil*, 2 quarts, and boil until the water is consumed.

2. *Fenugreek seeds*, 8 *oz.*; *linseed oil*, 1 quart; infuse a week, and strain. Once a highly popular emollient application in various local affections.

Oil of Mudar; Oleum Mudaris,—Lat. From *mudar bark* (in coarse powder), 1 dr.; *warm olive oil*, ¼ pint; digest 24 hours and

strain. *Used* as an application to cutaneous ulcers, the bites of venomous animals, &c.; and as a friction in worms.

Oil of Opium, Anodyne Oil, Opiated do.; Oleum Opiatum,—Lat. From *opium* (in powder), 1 dr.; *olive oil*, 2½ fl. oz.; digest at a gentle heat, with frequent agitation, for 5 or 6 hours. The powder should be rubbed in a mortar with a few drops of the oil before adding the remainder. As a local anodyne. The above is the only reliable formula for this preparation. Others are extant, but whilst the products of several are much stronger, those from others have only 1-5th or 1-6th the strength.

Oil of Pellitory; Oleum Pyrethri,—Lat. From bruised *pellitory root*, as oil of belladonna. *Used* as the last.

Oil of Black Pepper (by Infusion); *Oleum Piperis Infusum*,—Lat. From *black pepper*, in coarse powder, as oil of capsicum. Stimulant and rubefacient; in frictions.

Oil of Poison Oak; Oleum Rhois Toxicodendri,—Lat. From the *leaves*, as oil of belladonna. Externally; in paralysis, &c.

Oil of Rhubarb; Oleum Rhei,—Lat. From *rhubarb* (in powder), 1 part; *oil of almonds*, 8 parts; digested together in a gentle heat for 4 hours, and strained, with expression. As an application to indolent ulcers, and as a friction over the abdomen in diarrhœa, English cholera, &c., or as a laxative when the stomach will not bear medicine.

Oil of Roses; Oleum Rosæ, Ol. Rosaceum, Ol. R. Infusum, Ol. Rosatum,—Lat. From the *fresh petals*, pulled to pieces, crushed, and digested for 2 or 3 days in the sun, or a warm situation, in 4 times their weight of *olive oil*, and then pressed; the process being repeated with fresh roses. Ph. E. 1744 and P. Cod. are nearly similar. *Almond, ben*, or *olive oil*, coloured with *alkanet*, and scented with *attar of roses*, is now almost universally sold for it. *Used* for the hair.

Oil of Rue; Oleum Rutæ (Infusum),—P. Cod. From *fresh rue*, bruised, as oil of chamomile. Reputed antispasmodic, emmenagogue, stimulant, and vermifuge. In frictions.

Oil of St. John's Wort; Oleum Hyperici,—Ph. L. 1746. *Ol. H. Simplex, Balsamum H., &c.*,—Lat. var. From the *flowers*, 1 part; *olive oil*, 6 parts; digested together until the oil is well coloured. Antispasmodic, stimulant, and resolvent. A mixture of equal parts of *rape oil* and *green elder oil* is usually sold for it.

Oil of Scammony; Oleum Scammonii; Ol. Purgans,—Van Mons. From *scammony* (in powder), 1 dr.; *hot oil of almonds*, 3 fl. oz.; triturate together until cold, and the next day decant the clear portion. *Dose.* ½ to 1 table-spoonful.

Oil of Scorpions; Oleum Scorpionum,—Lat. From *live scorpions*, 30 in number; *almond oil*, 2 lb; exposed to the sun or in a warm place for 40 days, and then filtered. Centipedes are commonly substituted for scorpions. Formerly reputed emollient, diaphoretic, and rubefacient. Obsolete. The druggists now sell for it a mixture of *rape oil* and *oil of turpentine*, in which a little *cantharides* has been infused.

Oil of Stramonium; Oleum Stramonii,—P. Cod. From the *leaves* of *thorn apple* or *stramonium*, as oil of belladonna. Anodyne and discussive; as an application to painful tumours, joints, &c.

Oil of Tobacco (by Infusion); *Oleum Tabaci, Ol. T. Infusum*,—Lat. From *fresh tobacco leaves* (bruised), like oil of chamomile. As an application in ringworm, irritable ulcers, pediculi, &c.; and as a friction in itch, neuralgia, painful indurations, &c. It must be used with extreme caution, as it is poisonous.

Oil of Toothwort; Oleum Squamariæ,—Lat. From the *herb* of *lathræa squamaria* (Linn.), as oil of St. John's wort. Astringent and vulnerary. This must not be confounded with another preparation sometimes called *oil of toothwort* (*oleum plumbaginis Europææ*), and which has been occasionally used in itch, as the latter is acrid and apt to cause much irritation.

Oil of Wormwood; Oleum Absinthii,—Ph. E. 1744. From the *fresh herb*, as oil of lilies. The P. Cod. and Ph. Wurtem. order only 1 part of the *herb* to 8 parts of *oil*. Applied to the abdomen in dyspepsia, diarrhœa, heartburn, worms, &c. It is seldom used in this country.

OILS (Mixed). Syn. *Compound Oils; Olea Composita, Olea Mixta*,—Lat. Under these names are commonly included various mixtures of oils and other substances that possess an unctuous appearance. When not otherwise stated, they are *prepared* by simply agitating the ingredients together, and after a sufficient time decanting the clear portion, which, in some cases, is then filtered. A few of them only possess any importance. Some of them are highly esteemed as remedies among the vulgar, and the use of others is confined to veterinary medicine.

The following include most of the mixed oils of the shops, to which the names of a few other compounds, which are frequently called *oils* by the ignorant, are added, for

the purpose of facilitating a reference to them:—

Acoustic Oil, Ear Oil; Oleum Acousticum; Ol. Terebinthinæ Acousticum,—Mr. Maule. From *oil of turpentine*, 1 part; *oil of almonds*, 6 parts; mix. In atonic deafness, accompanied with induration of the wax. 1 or 2 drops are poured into the ear, or on a piece of cotton wool, which is then gently placed in it.

Ammoniated Oil. See *Liniments.*

Bezoar Oils. See *Wedel's Oil.*

Black Oil; Oleum Nigrum,—Lat. 1. *Oil of turpentine*, 1 pint; *rape oil*, 3 pints; *oil of vitriol*, ¼ *lb.*; agitate well together with care; then add of *Barbadoes tar*, 3 *oz.*; again agitate well, and in 10 days decant the clear portion. *Linseed oil* is preferred for the above by many persons.

2. (Mr. Percivall.) *Sweet oil*, 1 pint; *oil of turpentine*, 2 *oz.*; mix, add gradually of *oil of vitriol*, 1¼ *oz.*, again mix, and leave the bottle open until the next day. Detersive, stimulant. Used by farriers for mange, &c.

British Oil, Common Oil of Petre; Oleum Britannicum, Ol. Petræ Vulgare,—Lat. From *oil of turpentine*, 1 quart; *Barbadoes tar*, 1 *lb.*; *oils of rosemary* and *origanum*, of each, 1 *oz.* Stimulant. Formerly reputed to possess the most astonishing virtues.

Camphorated Oil; Oleum Camphoratum,—Lat. This is the *liniment of camphor* noticed at *page* 699. A little *oil of turpentine* is commonly added to that used in veterinary medicine.

Oil of Camphor (Nitric); *Oleum Camphoræ Nitricatum; Ol. C. Nitricum*,—Fee. From *camphor*, 3½ dr., dissolved, without heat, in *nitric acid*, 1 oz.; and the oil which separates after repose decanted. Soluble in alcohol; decomposed by water. See *Nitrate of Camphor* and *Oils* (Volatile).

Carron Oil. See *Lime Liniment.*

Chabert's Oil, Chabert's Empyreumatic do.; Oleum Chaberti, Ol. contra Tæniam Chaberti,—Lat. *Oil of turpentine*, 3 parts; *Dippel's animal oil*, 1 part; mix, and distil 3 parts. It must be preserved from the air and light. *Used* in tapeworm. *Dose.* 1 to 2 tea-spoonfuls, in water, night and morning, until 5 or 6 fl. oz., or more, have been taken; a cathartic being given every third day.

Darby's Oil. A mixture of *oil of amber*, *Barbadoes tar*, and *balsam of sulphur*, equal parts.

Driffield Oils. From *Barbados tar*, 1½ *oz.*; *oil of turpentine*, ¼ pint; *linseed oil*, 1 pint; mix, add (carefully) of *oil of vitriol*, 1½ *oz.*, agitate well, and in a few days decant the clear portion.

Exeter Oil; Oleum Excestrense,—Ph. L. 1677. From *castor*, *euphorbium*, *mustard*, and *pyrethrium*, of each, bruised, 1 oz.; digested in *green elder oil*, 1 pint, for 10 days. Another very old formula has 31 ingredients. The following is the one now generally employed:—*Green oil of elder*, 1 pint; *oil of turpentine*, ¼ pint; *oil of origanum*, 1 *oz.*

Furniture Oil, Mahogany do., Oil Stain. 1. From *refined linseed oil*, 1 pint; *alkanet root*, ¼ *oz.*; digested together in a warm place until the former is sufficiently coloured, when it is poured off and strained.

2. *Pale boiled oil*, 1 pint; *bees' wax*, ¼ *lb.*; melted together and coloured as before. Gives a superior polish, which becomes very tough by age.

3. *Linseed* or *boiled oil*, 1 pint; *Venice turpentine* (pure), 6 *oz.*; as before. The above are used for mahogany and other dark-coloured woods.

4. (Pale.)—*a.* As the preceding, omitting the *alkanet.*

b. From *nut oil*, ¾ pint; *bees' wax* (finest), 3 *oz.*; melted together.

c. To the last, add of *copal varnish*, 3 or 4 *oz.* The last three are employed for pale woods. They are all applied by means of a rag, and are "polished off" with a "woollen rubber" or "furniture-brush." A little *strong vinegar*, or a *few drops* of *hydrochloric acid*, are sometimes added. See *Pastes*, *Polishes*, and *Revivers.*

Hair Oil. See *Oils* (Perfumed).

Oil and Hartshorn. See *Liniment of Ammonia.*

Iron Oil; Oleum Ferri, Ol. Martis,—Lat. The old name for the liquid formed when *sesquichloride of iron* is allowed to deliquesce by free exposure to the air. It is excessively caustic and corrosive.

Lime Oil. See *Chloride of Calcium.*

Macassar Oil. See *Oils* (Perfumed).

Oil for Machinery. See *Oils* (Fixed).

Oil of Male Fern, Peschier's do.; Oleum Filicis Maris, Ol. F. Peschieri, Extractum Filicis Æthereum, Balsamum F. Æ.,—Lat. var. By evaporating the *ethereal tincture* of the *rhizomes* (or the buds) *of male fern.* *Prod.* 1 lb. of rhizomes yield 1½ oz. of a thick, black oil. (Soubeiran.) By employing *hot alcohol* the product little exceeds ⅓rd of that obtained by ether, and is regarded as less valuable as a remedy. *Dose.* ½ to 1 dr., made into an electuary or boluses with powdered sugar, followed, in about an hour, by a full dose of castor oil. In tape-worm. It is in high repute on the

Continent, but has proved less successful against the tape-worm of this country.

Marrow Oil. From *clarified beef-marrow*, 1 part; *oil of almonds*, 3 parts; melted together, and strained through muslin. It is usually scented with *ambergris*, *cassia*, or *mace*, and slightly tinged with *palm oil* or *annotta*. *Used* for the hair.

Marshall's Oils. From *linseed oil* and *rape oil*, of each, 1 *lb.*; *green oil* and *oil of turpentine*, of each, ½ *lb.*; *oil of origanum*, ½ fl. oz.; *oil of vitriol*, ¼ *oz.*; well shaken together.

Mixed Oils; Oleum Mixtum Commune,—Lat. From *linseed oil* and *green oil*, of each, 1 *lb.*; *oil of turpentine*, ½ *lb.*; *Barbados tar* and *balsam of sulphur*, of each, 2 *oz.*; *oils of spike* and *origanum*, of each, 1 *oz.* Stimulant and rubefacient. *Used* by farriers for sprains, &c. See *Stamford's Oils* (below).

Neat's-foot Oil. See *Oils* (Fixed).

Newmarket Oils. From *oils of linseed*, *turpentine*, and *St. John's wort*, of each, 3 *lb.*; *oil of vitriol*, 1½ *oz.*; well shaken together, and the clear portion decanted in a few days. A favorite remedy for sprains in horses.

Nine Oils, Old Mixed-oils; Oleum ex Omnibus. From *train oil*, 1 gall.; *oil of turpentine*, 1 quart; *oil of amber* and *oil of bricks*, of each, 5 *oz.*; *oil of spike* and *oil of origanum*, of each, 2 *oz.*; *Barbados tar*, 2½ *lb.*; *oil of vitriol*, 2 *oz.*; *camphorated spirit*, ½ pint; mixed together as the last. A favorite remedy with provincial farriers.

Oil of Petre; Oleum Petræ Vulgare,—Lat. From *oil of turpentine*, 1 pint; *Barbados tar*, ½ *lb.*; *oils of rosemary* and *origanum*, of each, ½ *oz.* Stimulant. *Used* by farriers.

Phosphorated Oil; Oleum Phosphoratum,—Lat. 1. (Ph. Bor.) *Phosphorus* (dried and sliced small), 6 gr.; *oil of almonds*, 1 oz.; mix, place the phial in hot water, agitate for some time, and when cold, decant the clear oil from the undissolved phosphorus.

2. (Magendie.) *Phosphorus* (sliced), ½ dr.; *almond oil*, 1 oz.; macerate in the dark, with frequent agitation, for 14 days, then, after repose, decant the clear portion, and aromatize it with a little *essence of bergamotte*.

Obs. A fl. oz. of oil dissolves rather less than 5 gr. of pure phosphorus. The large excess ordered in the second formula must be merely for the purpose of increasing the extent of surface acted on. It is, however, with the other precautions given, quite unnecessary. The products of both formulæ have the same strength. *Dose.* 5 to 10 or 12 drops, in milk, barley water, or gruel, or made into an emulsion; in chronic rheumatism, gout, &c., and as a powerful, diffusible stimulant in various diseases with debility and general prostration of the vital powers, &c. *Externally*, as a friction. It is chiefly to the presence of phosphorus that cod-liver oil owes its wonderful remedial power in these affections.

Quitter Oil.—1. *Red precipitate*, 2 dr.; *aquafortis*, 1 *oz.*; dissolve, add of *olive oil*, *oil of turpentine*, and *rectified spirit*, of each, 2 *oz.*; and agitate well and frequently for 3 or 4 hours.

2. *Ointment of nitrate of mercury* (Ph. L.), 1 part; *nut oil*, 3 parts; melt together, and stir until the mixture is cold. *Used* by farriers for quitters, &c.

Radley's Oils. From *Barbados tar*, ½ *lb.*; *linseed oil* and *oil of turpentine*, of each, ¼ pint; gently warmed, and shaken together.

Oil of Roses. See *Oils* (Medicated, Perfumed, and Volatile).

Shaving Oil. See *Essence of Soap.*

Sheldrake's Oil. From pale *boiled nut-oil* and *copal varnish*, equal parts, melted together by the heat of *hot water*, and, when perfectly mixed, placed aside in a bottle for a week to settle, after which the clear portion is decanted. *Used* by artists to grind their colours in, to brighten them.

Oil of Spike, Factitious do., Farrier's do. From *oil of turpentine*, 1 quart; *Barbados tar*, 1½ *oz.*; *alkanet root*, ½ *oz.*; digested together for a week. *Used* as a stimulating liniment by farriers.

Oil of Spike (Painter's).—1. From *rectified oil of turpentine*, 3 pints; *oil of lavender*, 1 pint; mix.

2. *Oil of turpentine* (warm), 5 parts; *lavender oil bottoms* (genuine), 3 parts; agitate well together, and in a fortnight decant the clear portion. *Used* by artists and enamellers.

Stamford's Oils, Lord Stamford's Mixed do. Dissolve *camphor*, 1 *oz.*, in *rectified spirit of wine*, ¼ pint; add *oil of origanum*, 2 *oz.*; *oil of turpentine*, ½ pint; *green elder oil*, 2 *lb.*; and agitate until mixed. The *rectified spirit* is now generally omitted, the camphor being dissolved in the green oil by aid of heat before adding the other ingredients. Stimulant. *Used* by farriers.

Sulphurated Oil. See *Balsam of Sulphur.*

Three Oils; Oleum de Tribus, — Van Mons. *Oils of bricks*, *lavender*, and *turpentine*, equal parts. As a stimulant liniment.

Oil of Vitriol. See *Sulphuric Acid.*

Oil of Vitriol (Sweet). See *Ethereal Oil* (*p.* 881).

Ward's Oils, Ward's White Oils. From *powdered camphor, rape oil, oil of turpentine, rectified spirit,* and *liquor of potassa,* equal parts, agitated together for some time, and again before use. *Beef brine* was formerly used instead of liquor of potassa.

Watchmaker's Oil. Prepared by placing a clean *strip* or *coil of lead* in a small white-glass bottle filled with *pure almond* or *olive oil,* and exposing it to the sun's rays at a window for some time, till a curdy matter ceases to be deposited, and the oil has become quite limpid and colourless. *Used* for fine work; does not become thick by age. See *Oleine.*

Wedell's Oil, Bezoar Oil; Oleum Bezoardicum,—Lat. From *nut oil,* ¼ pint; *camphor,* ½ oz.; dissolve by a gentle heat, and when cold, add of *essence of bergamot,* 1 dr.; and let it stand over a little *alkanet root,* until sufficiently coloured.

White Oils, White Egg-oils.—1. *Yelks of eggs,* 4 in number; *oil of turpentine,* ¼ pint; mix, add of *liquor of ammonia,* 3 fl. oz.; *oil of origanum,* ½ oz.; *soaper's lye,* ¼ pint; *water,* ¾ pint; agitate well, and strain through a coarse hair sieve.

2. *Rape oil,* ¾ pint; *liquor of ammonia* and *oil of turpentine,* of each, 3 *oz.*; agitate until they form a milk.

3. (Redwood.) *Whites and yelks of* 2 *eggs; oil of turpentine,* 1½ *oz.;* triturate together, add of *Goulard's extract,* ½ *oz.,* mix, next add of *distilled vinegar,* 1½ pint; and, lastly, of *rectified spirit,* 1½ *fl. oz.* Stimulant and detergent. *Used* by farriers.

Worm Oil (Canine); *Oleum Vermifugum Caninum.* From *oil of turpentine* and *castor oil,* equal parts; tinged yellow with a little *palm oil* or *annotta. Dose,* for a middle-sized dog, ½ *oz.,* repeated in 2 or 3 hours if it does not operate.

OILS (in Perfumery). Syn. *Scented Oils; Olea Fixa Odorata,*—Lat. The oils which usually form the basis of these articles are those of *almonds, ben,* or *olives;* but others are occasionally used. The methods adopted for their preparation vary with the nature of the substances whose fragrance it is intended to convey to the oil. The Continental perfumers employ three different processes for this purpose, which they technically distinguish by terms indicative of their nature. These are as under:—

1. A sufficient quantity of the *essential oil of the plant,* or of the *concentrated essence* of the substance, if it does not furnish an oil, is added to the *fixed oil* which it is desired to perfume, until the latter becomes agreeably fragrant; the whole is then allowed to repose for a few days, and, if any sediment falls (which should not be the case when the ingredients are pure), the clear portion is decanted into another bottle. When *alcoholic essences* are thus employed, the *fixed oil* should be gently warmed, and the admixture made in a *strong bottle,* so as to permit of it being corked and well agitated with safety; and in this case the agitation should be prolonged until the whole has become quite cold. In this way, all the ordinary *aromatized* and *perfumed oils* of the *English druggists* and *perfumers,* as those of *bergamotte, cassia, cloves, lavender, lemon, millefleurs, neroli, nutmeg, oranges, roses, &c.,* are made; but those of a few of the more delicate flowers, and of certain other substances, can only be prepared of the "*first quality*" by one or other of the processes described below.

In general, 1 to 1½ *dr.* of the pure *essential oils,* or 3 to 4 *fl. dr.* of the *alcoholic essences,* are found sufficient to render 1 *pint* of *oil* agreeably fragrant. ½ *dr.* of pure *attar of roses* is, however, enough for this purpose, owing to the very powerful character of its perfume; but even a less quantity than this is commonly employed, on account of its costliness, the deficiency being made up by a mixture of the *oils* of *rhodium, rosemary,* and *bergamotte.* Most of the oils of this class are intended for hair cosmetics.

2. (By "*Infusion.*") *Dry substances,* after being reduced to powder, or sliced very small,—*flowers* or *petals,* after being carefully selected, and picked from the stems and other scentless portions,—and *soft* or *unctuous matters,* as ambergris, civet, or musk, after being rubbed to a paste with a little oil, either with or without the addition of about twice their weight of *clean sand* or *powdered glass,* to facilitate the reduction, are digested in the *fixed oil* for about 1 hour, at a gentle heat obtained by means of a water bath, continual stirring being employed all the time; the mixture is then removed from the heat, covered up, and left to settle until the next day, when the clear portion is decanted into clean bottles. When *flowers* are employed, the free oil is drained off, and the remainder obtained by the action of a press. The process is then *repeated* with *fresh flowers,* 5 or 6 times, or even oftener, until the oil is sufficiently perfumed. For *ambergris, musk,* or *civet,* the digestion is generally

continued for 15 to 20 days, during which time the vessel is either freely exposed to the sunshine, or kept in an equally warm situation.

The "first quality" of the *oils* of *ambergris, balsam of Peru, benzoin, cassia, cinnamon, civet, orange-flowers, orris, roses, styrax*, and *vanilla*, are made by infusion.

3. (By "*the flowers.*")—*a.* Upon an *iron frame* a piece of *white spongy cotton cloth* is stretched, and then moistened with almond or olive oil, usually the latter; on the cloth is placed a thin layer of the fresh-plucked flowers; another frame is similarly treated, and in this way a pile of them is made. In 24 or 30 hours, the flowers are replaced by *fresh ones*, and this is repeated every day or every other day, until 7 or 8 different lots of flowers have been consumed, or the oil is sufficiently loaded with their odour. The *oil* is then obtained from the *cotton cloth* by powerful pressure, and is placed aside in bottles to settle, ready to be decanted into others for sale. Sometimes thin layers of *cotton wool*, slightly moistened with *oil*, are employed instead of cotton cloth.

The *oils* of *honeysuckle, jasmin* or *jessamine, jonquil, may-blossom, myrtle-blossom, narcissus, tuberose, violet*, and, in general, of all the more delicate flowers, are prepared in the above manner.

b. The *native perfumers* of India prepare their scented oils of *bela, chumbul, jasmin, &c.*, in the following manner:—A layer of the *scented flowers*, about 4 inches thick, and 2 feet square, is formed on the ground; over this is placed a layer of moistened *tel* or *sesamum seeds*, 2 inches thick, and on this another 4-inch layer of *flowers*. Over the whole a sheet is thrown, which is kept pressed down by weights attached round the edges. The *flowers* are replaced with *fresh ones* after the lapse of 24 hours, and the process is repeated a *third*, and even a *fourth* time, when a very highly scented oil is desired. The *swollen sesamum seeds*, rendered fragrant by contact with the flowers, are then submitted to the action of the press, by which their bland oil is obtained strongly impregnated with the aroma of the flowers. The expressed oil is then set aside in *dubbers* (bottles made of untanned hides) to settle. We have employed *poppy seed* in this country, in a similar manner, with great success.

c. The *flowers* are crushed in a mortar or mill, with *one half* their weight of *blanched sweet almonds*, and the next day the mass is gently heated and submitted to the action of a powerful press; the liquid thus obtained is allowed to repose for a week, when the upper portion of oil is decanted and filtered. This plan is occasionally adopted in this country for the *oils of roses*, and of a few other flowers. (See *below.*)

The solution of a few grains of *benzoic acid*, or of *gum benzoin* (preferably the first) in any of the above oils, will materially retard the accession of rancidity, if it does not prevent it altogether. (See *p.* 448.)

The oils of the last two classes (2 and 3) are chiefly used to impart their respective odours to the simple oils, pommades, &c.; and in the manufacture of *scented spirits* or *esprits*. The following formulæ are given as examples of both classes of preparations:—

Oil of Ambergris. From *ambergris*, 2 dr.; *oil*, 1 pint; by infusion.

Oil of Benzoin. From *gum benzoin*, 7 dr.; *oil*, 1 pint; by infusion.

Oils for the Hair; Huiles Antiques. These are numerous. All those scented with the simple perfumes are prepared in the way explained under *class* 1 (above). The selection depends entirely upon the judgment of the operator, or the fancy of the purchaser. In general, a mixture of two or three perfumes is preferred in these countries, to the pure fragrance of any single flower, and a grossness of taste is exhibited in these matters which surprises our Continental neighbours, and the inhabitants of Italy more particularly. Some of these oils are coloured. A RED tinge is given to them by allowing the oil to stand for a few hours over a little *alkanet root* (2 dr. to the pint) before scenting it. The application of a gentle heat facilitates the process. YELLOW and ORANGE are given by a little *annotta* or *palm oil*; and GREEN, by steeping a little *green parsley* or *lavender* in them for a few days; or by dissolving 2 or 3 dr. of *gum guaiacum* in each pint, by the aid of heat, and when cold, decanting the clear portion. *Huile antique au jasmin, huile antique à la fleurs d'oranges, huile antique à la rose, huile antique à la tuberose, huile antique à la violette, &c.*, are simple oils flavoured with the respective perfumes or their preparations.—*Huile antique rouge à la rose* is the ordinary oil of roses coloured with alkanet root.—*Huile antique verte* is simple oil coloured green as above, and scented.—*Huile antique aux mille fleurs* is so scented with several perfumes that none predominate. A mixture of bergamotte, lemons, lavender, neroli, pimento, and ambergris or musk, is commonly employed for the purpose.

Macassar Oil, Huile de Macassar.—1. (Rowland's.) *Oil of ben* or *almonds* (red-

dened by alkanet root), 1 pint; *oils of rosemary* and *origanum* (white), of each, 1 dr.; *oil of nutmeg* and *attar of roses*, of each, 15 drops; *neroli*, 6 drops; *essence of musk*, 3 or 4 drops.

2. (De Naquet.) *Oil of ben*, 1 quart; *nut oil*, 1 pint; *rectified spirit*, ¼ pint; *essence of bergamotte*, 3½ dr.; *tincture of musk, esprit de Portugal*, of each, 2 dr.; *otto of roses*, ½ dr.; *alkanet root*, q. s. to colour.

Marrow Oil (Perfumed).—1. *Simple marrow oil* (see *p.* 859) scented at will.

2. (Fluide de Java.) *Marrow oil*, coloured with a little *palm oil*, and scented.

3. (Huile Comogene.) *Marrow oil*, 4 *oz.*; *spirit of rosemary*, 1½ *oz.*; *oil of nutmeg*, 12 drops.

4. (Huile Philocome d'Aubril.) *Cold-drawn nut oil* and *marrow oil*, equal parts; scent, at will, q. s.

5. (Huile de Phénix.) *Clarified beef marrow, lard, pale nut oil*, and *expressed oil of mace*, of each, 4 oz.; melt together by the heat of *hot water*, strain through linen into a warm *stone mortar*, add of *oils of cloves, lavender, mint, rosemary, sage*, and *thyme*, of each, ½ dr.; *rectified spirit*, 1 oz., in which has been dissolved by a gentle heat, *balsam of tolu*, 4 dr.; *camphor*, 1 dr.; triturate until the whole is cold, and then put it into bottles. All the above are used to make the hair grow, and to prevent it falling off.

Oil of Musk. From *grain musk*, 1 dr.; *ambergris*, ½ dr.; *oil of lavender*, 20 drops; *oil*, 1 pint; by infusion. A *second quality* is made by working the same ingredients, after the oil is poured from them, with ¾ pint of *fresh oil*. This also applies to *oil of ambergris* and *huile royale*.

Oil of Musk and Ambergris; Huile Royale. From *ambergris*, 2 dr.; *grain musk*, ½ dr.; *oils* of *cassia, lavender, neroli*, and *nutmeg*, of each, 10 drops; *oil*, 1 pint; by infusion. (See *above*.)

Oil of Styrax. From *liquid styrax* (pure), 5 dr.; *oil of nutmeg*, 10 drops; *ambergris*, 6 gr.; *oil*, 1 pint; by infusion.

Oil of Vanilla; Huile à la Vanille. From purest *olive* or *almond oil*, 1½ pint; *vanilla*, (finest, in powder), 2 *oz.*; *oil of bergamotte*, 1 dr.; *attar of roses* (finest), 15 drops; by infusion.

OILS (Volatile). Syn. *Olea Destillata, Olea Distillata, Olea Essentialia, Olea Volatilia*,—Lat. *Huiles Volatiles*,—Fr. The volatile oils are an extensive and important class of bodies, derived from the vegetable kingdom, and found in almost every part of the majority of the plants which produce them, except the cotyledons of the seeds, in which, in general, the fixed oils are exclusively stored up. Their presence confers upon flowers, leaves, fruit, seeds, roots, bark, and woods, their peculiar and characteristic odours; but among these they are not equally distributed in the same individual, and are often altogether absent from some of them. To them we are indebted for our most delightful perfumes, and our choicest spices and aromatics. Some of them are found to possess valuable medicinal properties, and others are invested with the highest possible interest on account of their peculiar chemical constitution, and the reactions which occur when they are brought into contact with other bodies.

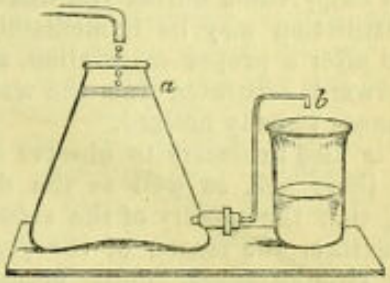
The *volatile oils* are often called "*Essences*," and the same loose and unmeaning term is also commonly applied to their alcoholic solutions.

Prop. The volatile or essential oils are usually more limpid and less unctuous than the fixed oils; but some of them are butyraceous or crystalline. Nearly all of them consist of two or more oils, differing in their sp. gr. and boiling points, one of which is generally liquid,—the other, in some cases, crystalline. All of them, when perfectly pure, are colourless, though before rectification nearly the whole of them have a pale-yellow tint, and some of them are brown, blue, or green. Their odour is that of the plants which yield them, and is usually powerful; their taste is pungent and burning. They mix in all proportions with the fixed oils, dissolve freely in both alcohol and ether, and are sparingly soluble in water, forming "*perfumed*" or "*medicated waters.*" Their boiling point usually ranges between 310° and 325° Fahr., and is always considerably higher than that of water. They resist saponification, and (excepting *oil of cloves*) do not combine with the salifiable bases. The name "*Starkey's soap*" applied to the substance formed by adding oil of turpentine, drop by drop, to caustic soda, and triturating the two together in a mortar, until the mixture acquires the consistence of soap, is a misnomer. Their density fluctuates a little on either side of water. The *lightest oil* is that of citrons (sp. gr. 0·847), and the *heaviest*, that of sassafras (sp. gr. 1·096). When cooled sufficiently they all solidify. The common temperature of the atmosphere is sufficient for this with some of them, as the oils of roses and aniseed; whilst others require to be cooled below the freezing point of water before they assume the solid form. In this state they appear to consist of a crystalline or semi-crystalline substance

(*stearopténe*, *stearessence*), and a fluid portion (*eleopténe*, *oleiessence*). The two may be separated by pressing the concrete oil between the folds of bibulous paper, in the cold. The first corresponds to the margarine of the fixed oils. By exposure to the air they rapidly absorb oxygen, and become partially converted into resin. This is the cause of the deposit that usually forms in them (especially in the expressed oil of orange) when kept in an ill-corked vessel. The solid crystalline matter which separates from them when kept in closed vessels is *stearopténe*.

Var. These are too ill-defined and indistinct to admit of a useful application. Chemically considered, the *essential oils* may be divided into three great classes:—

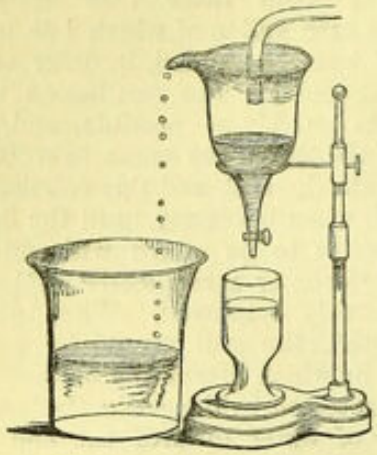
1. *Oils* composed of *carbon* and *hydrogen* only, of which oil of turpentine may be regarded as the type. These are characterised by being less soluble in rectified spirit and in water than the other essential oils. The *oils* of *bergamot*, *capivi*, *cubebs*, *elemi*, *hops*, *juniper*, *lemons*, *orange-peel*, *pepper*, the *grass oil* of India, the *laurel oil* of Guiana, and some others, belong to this class.



2. *Oils* containing *carbon*, *hydrogen*, and *oxygen*, including most of those used in medicine and perfumery. These are more soluble in rectified spirit and in water than those containing carbon and hydrogen only. According to Saussure their solubility in alcohol is in direct proportion to the quantity of oxygen which they contain. To this class belong the *oils* of *almonds*, *aniseed*, *cassia*, *cedar-wood*, *cinnamon*, *cumin*, *jasmin*, *lavender*, *meadow-sweet* (spiræa ulmaria), *orange flowers*, *pennyroyal*, *peppermint*, *spearmint*, *rosemary*, *rose-petals*, *valerian*, *winter green* (gaultheria procumbens), and others too numerous to mention.

3. *Oils* containing *sulphur*. These are characterised by their extreme pungency, suffocating odour, vesicating power, property of blacking silver, and being decomposed by contact with most other metallic bodies. The *oils* of *assafœtida*, *black mustard seed*, *garlic*, and *onions*, are of this kind; but only the second and third of these have been minutely examined.

Prep. The volatile oils are generally procured by *distilling* the odoriferous substances along with water; but in a few instances they are obtained by *expression*, and still more rarely by the *action of alcohol*.



According to the common method of proceeding, *substances* which *part freely* with *their oil*, are put into the still along with about *an equal weight* of *water*, and are at once submitted to distillation. Those *substances* which *give out their oil* with *difficulty*, are first soaked for 24 hours, or longer, in about *twice their weight of water*, to each gallon of which 1 *lb.* of *common salt* has been added, in order to raise its boiling point. The distillation is conducted as quickly as possible, and, when one half the water has come over, it is returned into the still, and this cohobation is repeated, when necessary, until the distilled water ceases to be mixed with oil. The heat of *steam* or a *salt-water bath* should be preferably employed. When a naked fire is used, the still should be deep and narrow, by which means the bottom will be better protected by the gradually decreasing quantity of water towards the end of the process, and empyreuma prevented. When the distilled water is to be repeatedly cohobated on the ingredients, a convenient and economical plan is to so arrange the apparatus that, after the water has separated from the oil in the receiver, it shall flow back again into the still. An ordinary *worm-tub*, or other like condensing apparatus, may be employed; but in the case of those oils which readily solidify, the temperature of the water in the condenser must not fall below about 55° Fahr.

The mixed vapours which pass over condense and fall as a milky-looking liquid into the receiver. This separates after a time into two portions, one of which is a solution of a part of the newly eliminated oil in water, and the other is the oil itself. The latter either occupies the upper or the lower portion of the receiver, according as its specific gravity is less or greater than that of distilled water. The separation of the oil and water is effected by allowing the mixed liquids to drop into a "*Florentine receiver*" (see *engr.*) when the oil is the *lighter* of the two, by which means the latter accumulates at *a*, and the water flows over by the spout *b*.

The same receiver may be employed for oils *heavier* than water, by reversing the

arrangement; but a glass "*separator*" (see *engr.*) is, in general, found more convenient. In this case the oil accumulates at the bottom of the vessel, and may be drawn off by the stop-cock provided for the purpose.

The *essential oils of lemons* and *oranges* of commerce, and of some other fruits, are chiefly obtained by submitting the yellow rind to powerful pressure; but in this way they are not so white, nor do they keep so well as when distilled, although in the case of the fruits referred to, the oils are more fragrant than when prepared by any other method.

The *London College* has excluded the usual directions for the preparation of the essential oils from their present pharmacopœia, on the ground, we suppose, that these substances are seldom prepared by the druggist or apothecary, or at all on the *small scale.*

"The *fruit* of *anise*, *caraway*, and *juniper*, the *flowers* of *chamomile*, *lavender*, and *elder*, the *berries* of *allspice*, the *tops* of *rosemary*, and the *entire recent plants* of the *other herbs*, are to be employed." "Put any one of these into an alembic, then pour in as much *water* as will cover it, and distil the *oil* into a large vessel, kept cool." (Ph. L. 1836.)

The *Edinburgh College* directs — "As much water only is to be employed as will prevent empyreuma during the distillation. The distillation may be immediately commenced after a proper maceration, and the oil afterwards separated from the water" in the manner already noticed.

"It is also necessary to observe in preparing these *oils*, as well as the distilled waters, that the quality of the substances, their texture, the season of the year, and similar circumstances, must occasion so many differences, that it is scarcely possible to give any certain and general rules which shall strictly apply to every example. Many things, therefore, must be regulated by the judgment of the operator."

The *Dublin College* directs the *vegetable substances* to be macerated in the *still* with about 5 times their weight of *water*, for 24 hours, when one half of the water is to be drawn over. The oil having been separated from this in the usual manner, it is to be returned to the still, and the same quantity drawn over, as before, from which the oil must again be separated.

Chevallier gives the *following rules* for the distillation of *essential oils*:—

1. Operate upon *as large quantities as possible*, in order to obtain a *greater product*, and one of *finer quality*.
2. Conduct the distillation *rapidly*.
3. Divide the substances *minutely*, in order to *facilitate* the *extrication* of the oil.
4. Employ *only sufficient water* to prevent the matter operated on *from burning*, and the product from being contaminated with empyreuma.
5. For *substances* whose oil is *heavier* than water, *saturate* or *nearly saturate the water in the still* with *common salt*, to raise the boiling-point, and thus to enable the vapour to carry over *more oil.*
6. Employ, when possible, *water which has been already distilled from off the same substances*, and has thus become saturated with oil.
7. For *oils naturally fluid*, keep the water in the refrigeratory cool; but for *those oils which easily become solid*, preserve it at 80° to 90° Fahr. (?)

To the above may be added:

8. Collect the oil as soon as possible after it separates from the water with which it passes over, and in its subsequent treatment *keep it*, as much as possible, *from free contact with the air.*

Dr. Ure remarks, "The *narrower* and *taller* the *alembic* is, within certain limits, the *greater* will be the *proportion of oil* relative to that of the aromatic water, from like proportions of aqueous and vegetable matter employed." "Some place the *plants* in *baskets*, and suspend these immediately over the bottom of the still, under the water, or above its surface in the steam; but the *best mode*, in my opinion, is to *stuff* an *upright cylinder* full of the plants, and to *drive down through them steam* of any desired force, its tension and its temperature being further regulated by the size of the outlet-orifice leading to the condenser. The cylinder should be made of strong copper, tinned inside, and encased

in the worst conducting species of wood, such as soft deal or sycamore."

The *newly-distilled oils* may be separated from adhering water, which frequently renders them partially opake or "cloudy," by repose in a temperature between 60° and 70° Fahr., and subsequent decantation; but to render them *quite dry* (anhydrous) it is necessary to let them stand over some fragments of *fused chloride of calcium*. This is not, however, required with the commercial oils.

The *rectification* of the *volatile oils* is commonly performed without water, by the careful application of a heat just sufficient to make them flow over pretty rapidly, so that they may be kept heated for as short a time as possible. One half, or at most two thirds only, is drawn off; that left in the retort being usually mixed with raw oil intended to be sold in that state. This method often leads to much loss and disappointment, and we have known more than one rather dangerous explosion result from its use. A better plan is to rectify the oil from *strong brine*, and then to separate any adhering water, either by repose or chloride of calcium.

Pres. Volatile oils should be preserved in well-closed and nearly-full bottles, in the shade, and should be opened as seldom as possible. By age they darken, lose much of their odour, increase in density, and become thick and clammy. It is then necessary to distil them, by which the undecomposed portion is separated from the resin. Agitation along with *animal charcoal* will restore their clearness and original colour, but nothing more.

Pur. The *essential* or *volatile oils* of *commerce* are very frequently adulterated with the *fatty oils*, *resins*, *spermaceti*, or *alcohol*, or with *other essential oils* of a cheaper kind or lower grade. The presence of the *first three* of these may be readily detected by placing a drop of the suspected oil on a piece of *white paper*, and exposing it for a short time to heat. If the oil is pure it will entirely evaporate; but if adulterated with one of these substances, a greasy or translucent stain will be left on the paper. These substances also remain *undissolved* when the oil is agitated with thrice its volume of *rectified spirit*.

The *presence* of *alcohol* may be detected by agitating the *oil* with a few small pieces of *dried chloride of calcium*. These remain unaltered in a pure essential oil, but dissolve in one containing alcohol, and the resulting solution separates, forming a distinct stratum at the bottom of the vessel. When only a very little alcohol is present, the pieces merely change their form, and exhibit the action of the solvent on their angles or edges, which become more or less obtuse or rounded.

Another test for *alcohol* in the *essential oils* is the *milkiness* occasioned by agitating them with a *little water*, as well as the loss of volume of the oil when it separates after repose for a short time.

A *more delicate test* of *alcohol* in the essential oils than either of the preceding, is *potassium*, as employed by M. Beral:—12 *drops* of the *oil* are placed on a *perfectly-dry watch-glass*, and a piece of *potassium*, about the size of an ordinary pin's head, set in the middle of it. If the small fragment of metal retains its integrity for 12 or 15 *minutes*, *no alcohol* is present; but if it disappears after the lapse of 5 *minutes*, the oil contains at least 4% of *alcohol*, and if it disappears in less than 1 *minute*, it contains not less than 25% of *alcohol*.

This species of adulteration is very common, as it is a general practice of the druggists to add a little of the *strongest rectified spirit* to their oils to render them transparent, especially in cold weather. *Oil of cassia* is nearly always treated in this way.

The *admixture* of an *inferior essential oil* with one more *costly*, may be best detected by pouring a drop or two on a piece of *porous paper* or *cloth*, and shaking it in the air, when, if occasionally smelled to, the difference of the odour at the beginning and the end of the evaporation will show the adulteration, especially if the added substance is turpentine. The presence of the *latter* may also be detected by agitating the *oil* with *rectified spirit*, when it will remain undissolved.

The *purity* of *essential oils* may likewise, in many cases, be determined by taking their sp. gr.; or, with still greater accuracy and convenience, by measuring their *index of refraction*, as suggested by Dr. Wollaston. A single drop of oil is sufficient for the application of the last method.

The adulteration of a *heavy oil* with a *light one*, or the *reverse*, may be detected by agitating the suspected oil with *water*, when, in most cases, the two will separate and form distinct strata.

Uses, &c. The volatile oils are chiefly used by *perfumers* and *rectifiers*, and in *medicine*. Some of the cheaper kinds are largely employed as *vehicles for colours*, and in the manufacture of *varnishes*. The *dose* of the *aromatic* and *carminative oils*, is from 1 to 10 drops, on sugar, or dissolved

in a little weak spirit. This does *not* apply to *oil of bitter almonds*, the dose of which is ¼ to ½ a drop.

The following list includes a short notice of nearly all the volatile oils which have been examined, as well as of some other substances of a similar character, which commonly pass under the name:—

Oil of Alliaria. From the *roots* of *alliaria officinalis* (Andrz.) or *sauce-alone.* Identical with the oil of *black mustard.*

Oil of Allspice. See *Oil of Pimento.*

Oil of American Arbor Vitæ; Huile Cedre Blanc. From the *fresh tops* of *thuja occidentalis* (Willd.) or *American arbor-vitæ tree.* Yellow; fragrant; stimulant. *Used* in frictions for rheumatism. *Prod.* 1½ to 2% (nearly).

Oil of Angelica. From the *dried root* of *angelica archangelica. Prod.* 0·25% (fully).

Oil of Aniseed; Oleum Anisi,—Ph. L. E. & D. *Ol. Essentiale Anisi,*—Ph. L. 1788. From the *fruit* (seeds) of *pimpinella anisum.* Nearly colourless. It is very frequently adulterated with one or other of the cheaper oils, in which case spermaceti or camphor is added to it, to make it "candy." When pure it congeals into a solid crystalline mass on being cooled to 50° Fahr., and does not melt again until heated to about 63°. Treated with *iodine* it quickly congeals into a solid hard mass, with a perceptible increase of temperature, and the development of orange-coloured and gray fumes. Sulphuric acid, with heat, turns it of a rich purple-red colour, and the compound soon afterwards becomes inspissated and hard (*resinified*). In alcohol of 0·806 it is soluble in all proportions, but rectified spirit (0·838) dissolves only 42% of this oil. Sp. gr. (*recent*) 0·9768; (*one year old*) 0·9853 to 0·9855; (*old*) 0·9856 to 0·9900. The *foreign oil* is generally the heaviest.

Oil of aniseed is carminative and pectoral; and both itself and preparations have long been in favour with the masses in coughs, colds, &c. In preparing it care must be taken that the temperature of the water in the receiver and refrigerator does not fall lower than about 68° Fahr. *Prod.* (From the dried fruit of commerce) av. 2% (nearly).

Oil of Star-anise, Badian Oil; Oleum Badiani, Ol. Anisi Stellati,—Lat. From the *capsules* of *illicium anisatum* or *star-anise.* It continues liquid at 35½° Fahr. This, and its weaker reaction with iodine, distinguish it from the preceding compound, which it is commonly used to adulterate. *Prod.* 2% (fully).

Apple Oil, Valerianate of Oxide of Amyle. This is one of the newly discovered artificial "*fruit oils.*" It is formed during the preparation of *valerianic acid* from *potato oil*, and is recognized by the offensive odour of rotten apples evolved during the process. By treating the *crude product* of the distillation with a *solution of pure potassa*, the valerianic acid is removed, and the *volatile oil* obtained nearly pure. Dissolved in *rectified spirit* it forms the new "*Apple Essence*" now so much employed as a flavouring ingredient for confectionery and liqueurs. See *Essences.*

Oil of Arnica; Oleum Arnicæ, Ol. A. Radicum,—Lat. From the *roots* of *arnica montana.* Yellowish-brown. Sp. gr. 0·940. *Prod.* 16 *lb.* yielded 1 *oz.* of oil. The oil from the *flowers of arnica* is blue.

Oil of Asarabacca; Oleum Asari, Ol. Asari Liquidum,—Lat. From the *roots* of *asarum Europæum.* Yellow; glutinous. Two butyraceous oils pass over at the same time.

Oil of Assafœtida; Oleum Assafœtidæ, —Lat. From the *gum resin.* Contains sulphur, and probably phosphorus. Very fœtid and volatile.

Oil of Balm; Oleum Melissæ, — Lat. From the *herb* (melissa officinalis). Pale yellow, fragrant. Sp. gr. 0·970 to 0·975. *Prod.* 100 *lb.* of the *fresh flowering herb* yielded ¼ *oz.* of oil. (M. Raybaud.) A mixture of oil of lemons and rosemary is commonly sold for it.

Oil of Balsam of Peru. See *Cinnameine.*

Oil of Bergamot, Bergamot, Essence of do.; Oleum Bergamii, Ol. Bergamotæ, — Lat. By expression from the *yellow portion* of the *rind* of the fruit of *citrus bergamia* or *bergamot orange.* Pale greenish-yellow; highly fragrant. It is obtained purer by distillation, but its perfume is then slightly less delicate. Sp. gr. 0·875 to 0·885. *Prod.* The rind of 100 bergamot oranges yielded by distillation nearly 3 *oz.* of oil. (M. Raybaud.)

Oil of bergamot is frequently adulterated with rectified spirit, or with the oils of lemons, oranges, or turpentine. The presence of these substances may be detected in the manner explained at page 865, as well as by the altered density of the oil. Pure bergamot oil is *much more* soluble in rectified spirit than either of the others, and is further distinguished from them by its free solubility in liquor of potassa, forming a clear solution.

Oil of Bitter Almonds, Essence of do.; Oleum Amygdalæ Amaræ, Ol. A. Essentiale, —Lat. From the *ground cake of bitter*

almonds from which the fixed oil has been expressed. The common plan is to soak the cake (crumbled to fragments) for about 24 hours in twice its weight of water, to which ⅓rd or ¼th of its weight of *common salt* has been added, and then to submit the whole to distillation, allowing the first half of the water that passes over to deposit its oil, and to run back again into the still. Pale golden-yellow; colourless when rectified; tastes and smells strongly nutty, like peach-kernels. It consists of 85% to 90% of *hydruret of benzoyle* and 8% to 12% of *hydrocyanic acid*, with a variable quantity of *benzoic acid* and *benzoine*. The density varies a little with the age of the oil, and the temperature and rapidity with which it has been distilled. Sp. gr. (*recent*) 1·0525; (*trade crude oil*) 1·079, (Mr. G. Wippel); (*old*) 1·081, (1·0836,—Pereira.) "Essential oil of almonds, free from adulteration, should have a sp. gr. at most of 1·052." (Ure.) According to Prof. Redwood, the density may vary from 1·0524 to 1·0822. The *light oil* contains the most hydruret of benzoyle, and the *heavy oil* the most benzoine. *Prod.* From less than 0·2 to 0·5%.

Pur. This oil is very generally adulterated with cheaper oils, and in nearly every case with alcohol. When it is pure—Mixed with *oil of vitriol* it strikes a *clear* crimson-red colour, without visible decomposition.—Mixed with an *alcoholic solution of potassa*, crystals are eliminated.—*Iodine* dissolves only partially and slowly in it, without further visible results.—*Chromate of potassa* does not affect it.—*Nitric acid* (sp. gr. 1·42) causes no immediate reaction, and in the course of 3 or 4 days crystals of benzoic acid begin to appear; but if only 8% or 10% of alcohol or rectified spirit is present, a violent effervescence speedily commences, and nitrous fumes are evolved. By using *nitric acid*, sp. gr. 1·5, the smallest quantity of alcohol may be detected.

Obs. This oil does not pre-exist in the almond, but is formed by the action of amygdaline on emulsine, in the presence of water. It is essentially a mixture of hydruret of benzoyle and prussic acid, and, owing to the presence of the last substance, is highly poisonous. It is occasionally employed as a substitute for hydrocyanic acid in medicine; but its principal consumption is as a flavoring ingredient and a perfume by cooks, confectioners, liquoristes, and perfumers. For this purpose it is dissolved in rectified spirit. See *Essences*. *Dose.* ¼ to 1 drop.

An oil closely resembling that from bitter almonds is obtained by distillation from the leaves of the peach and cherry-laurel, the bark of the plum-tree, the bruised kernels of cherries, plums, and peaches, the "pips" of apples, and from several other vegetable substances that possess a nutty odour and flavour.

Oil of Almonds (Non-poisonous). This is simply the ordinary *oil of commerce* freed from hydrocyanic acid, and is intended to be substituted for the crude, poisonous oil for domestic purposes. Unfortunately, the purified essence does not keep well, and is often converted after a few months into little else than a solution of benzoic acid, almost devoid of the usual odour and flavour of the bitter almond. "No wonder then, under such circumstances, that the public preferred the preparations they had been accustomed to, which were not so liable to change." (Redwood.) The following methods have been adopted for this purpose:—

1. (Liebig.) Agitate the *crude distilled oil* with *binoxide of mercury*, in slight excess, and after a few days' contact, rectify the oil from a little *fresh binoxide of mercury*. The product is quite pure, when the process is properly managed. The bicyanide of mercury thus formed may be either employed as such, or reconverted into *oxide of mercury* and *hydrocyanic acid*.

2. (Mr. Mackay.) *Commercial oil of almonds*, 1 *lb.*; *fresh-slaked lime*, q. s. to form a milk-like liquid; afterwards add of *liquor of potassa*, 1½ *lb.*; *water*, 3 pints; agitate occasionally for 48 hours, then distil over the oil, and rectify it from a *fresh* mixture of *lime* and *potassa*.

3. (Redwood.) The *oil* is mixed with an equal quantity of *water*, and the mixture is digested in a water-bath with *red oxide of mercury*, and small quantities of *fresh-slaked lime* and *protochloride of iron*, with as little access of air as possible; as soon as decomposition of the acid has taken place, the whole is introduced into a *copper retort*, and submitted to distillation. The *product* is *perfectly free* from hydrocyanic acid. The first process is, however, the simplest, cheapest, and best.

Prop., &c. Sp. gr. 1·051. (Mr. G. Wippell.) That of pure, colourless hydruret of benzoyle is 1·043; it boils at 356° Fahr.; is soluble in 35 parts of water, and in all proportions in alcohol and ether. Exposed to the air it greedily absorbs oxygen, and becomes converted into a mass of crystallized benzoic acid. The "purified oil of almonds" does the same, only less rapidly.

Oil of Almonds (Artificial); *Essence of Mirbane, Nitrobenzole.* The preparation of

this article on the *small scale* is explained at *page* 824. It is now extensively prepared as a substitute for the oil of almonds obtained by distillation. The following is Messrs. Mansfield's process :—The *apparatus* consists of a large glass worm, the upper end of which is divided into two branches, gradually dilating so as to form two funnel-shaped tubes. Into *one* of these *concentrated nitric acid* is poured, and into the other *benzole*, which need not, for this purpose, be chemically pure. These bodies meet at the point of junction of the two tubes, and the rate of their flow is regulated by any appropriate means. Chemical reaction instantly takes place, and the new compound is cooled by its passage through the worm, which is refrigerated for the purpose. It has then only to be washed with water or a very weak solution of carbonate of soda for the process to be complete. The *product* has the sp. gr. 1·209, boils at 415° Fahr., has an intensely sweet taste, and an odour closely resembling, but not actually identical with that of oil of bitter almonds. Unlike genuine oil of almonds or hydruret of benzoyle, it is insoluble in water, and does not distil without suffering partial decomposition. It is chiefly used to scent soaps, and to adulterate the genuine oil. The *benzole* for this purpose is obtained from coal-tar. See *Benzonitrile* and *Nitrobenzole*.

Brandy Oil. See *Grape Oil.*

Oil of Buchu; Oleum Barosmæ, Ol. Diosmæ. Yellow, lighter than water; smells of the leaves.

Oil of Cajeput, Cajaputi Oil, Kyapootie do.; Oleum Cajuputi,—Ph. L. E. & D. From the *dried leaves* of the *malaleuca leucadendron* (Linn.); or according to some from *m. minor.* (Smith.) Colourless, when pure, (that of commerce is usually green;) odorous; aromatic; taste, hot and penetrating. Its odour has been compared to a mixture of those of camphor and cardamoms. It boils at 343° Fahr. Sp. gr. 0·925 to 0·927. When rectified, about $\frac{3}{4}$ths of the quantity passes over *colourless*, and has the density 0·897; the remaining portion is *green*, and has the density 0·920 to 0·925. Its green colour is derived from chloride of copper, the presence of which may be recognized by the red precipitate occasioned by agitating the oil with a solution of ferrocyanide of potassium. (Guibourt.) From the East Indies.

Pure oil of cajeput is slightly soluble in water; entirely and freely soluble in alcohol; dissolves iodine; and when dropped on water rapidly diffuses itself over the surface, and soon completely evaporates. A spurious kind, made of oil of rosemary, flavoured with camphor and the oils of peppermint and cardamoms, and coloured with verdigris, is occasionally met with in the shops.

Oil of cajeput is a powerful antispasmodic and diffusible stimulant. *Dose.* 3 to 6 drops, on sugar; in cholera, colic, epilepsy, hysteria, rheumatism, spasms, toothache, &c.

Oil of Camphor; Oleum Camphoræ, Ol. C. Volatile,—Lat. Obtained from incisions in the *wood* of the *camphor tree* of Borneo and Sumatra (*dryobalanops aromatica* or *camphora*), in which it exists in cavities in the trunk; also by *distillation* from the *branches* of the *laurus camphora* or *laurel* (true) *camphor tree.* Colourless, when rectified. Sp. gr. 0·910. *Prod.* 60 *lb.* of the crude brown oil yields 40 *lb.* of *pure white oil*, and 20 *lb.* of *camphor.* It rapidly oxidizes in the air. *Used* to scent soap.

Oil of Camphor (Nitric). See *Mixed Oils.*

Oil of Caraway; Oleum Carui,—Ph. L. E. & D. *Ol. C. Essentiale,*—Ph. L. 1788. From the *seeds of carum carui.* Nearly colourless; aromatic; carminative. Sp. gr. 0·940; (*old*) 0·946 to 0·950. *Prod.* Av. 5% (nearly). It is frequently adulterated with oil of cumin.

Oil of Cardamoms; Oleum Cardamomi, Ol. C. Essentiale,—Lat. From the *seed* of *elettaria cardamomum* (Maton), or *true cardamom.* Colourless; fragrant; carminative. Sp. gr. 0·943. *Prod.* 5% (nearly). The *capsules* (lesser cardamoms) yield only about 1% of oil. (M. Raybaud.)

Oil of Carline Thistle; Oleum Carlinæ, Ol. C. Radicis, — Lat. From the *root.* Odorous; heavier than water.

Oil of Cascarilla; Oleum Cascarillæ,—Lat. From the *bark* of *croton eleuteria* (Swartz.) or *cascarilla tree.* Very fragrant. *Prod.* 0·4% to 0·75%.

Oil of Cassia, Oil of China Cinnamon; Oleum Cassiæ,—Ph. E. From *cassia buds*, or from *cassia bark.* Golden yellow; aromatic; fragrant. It is generally adulterated with rectified spirit. Nitric acid converts the pure oil into a crystalline mass. Sp. gr. 1·071 to 1·073; (*old*) 1·078 to 1·090. *Prod.* From the *buds*, 1% (barely); from the *bark* of commerce, 0·75%. It is frequently sold for oil of cinnamon.

Oil of Cebadilla, Oil of Sabadilla; Oleum Cebadillæ, — Lat. A green butyraceous matter, obtained from *asagræa officinalis.*

Oil of Cedar-wood. From the *wood* of *pinus cedrus*, or *larix cedrus.* It consists of two hydrocarbons. One, a volatile liquid (*cedrene*), and the other, a solid, crystalline compound containing oxygen. *Prod.* 0·2 to 0·25%.

Oil of Cedrat, Essence of Cedra; Oleum Cedri, Ol. Citri Finum,—Lat. From the *exterior yellow rind* of the *fruit* of *citrus medica* (Risso), or *citrons*, either by expression or distillation, as oil of begamot. The first portion of oil that comes over is colourless; the latter portion, greenish. Very fragrant. Sp. gr. 0·847. *Prod.* 100 citrons yield nearly 1 fl. oz. of pale, and ½ fl. oz. of green oil.

Oil of Celery Seed; Oleum Apii,—Lat. From the *fruit* (seed) of *apium graveolens* (Linn.) Diuretic; stimulant. *Prod.* ¾ to 1% (nearly).

Oil of Chamomile, Oil of Roman do.; Oleum Anthemidis,—Ph. L. E. & D. *Ol. Chamæmeli; Ol. C. Florum,*—Ph. L. 1721. *Ol. Essentiale ex Floribus C.,*—Ph. L. 1746. From the *flowers* of *anthemis nobilis* (Linn.) In the Ph. L. *English oil of chamomile* ("anthemidis oleum, Anglicum") is ordered. Blue; turns yellow and brown by exposure and age; odour characteristic. Sp. gr., *English* (from the flowers), 0·9083; *foreign*, 0·9289. *Prod.* Fresh flowers, 0·1% (barely); recently dried (finest commercial), 0·5%; av. of 6 dried samples, 0·25% (nearly). If much water is employed, even the above small quantities of oil will not be obtained.

Oil of chamomile is reputed antispasmodic, tonic, and stomachic. 1 to 3 drops on a lump of sugar, taken just before retiring to rest, is an excellent preventive of nightmare, and will frequently induce quiet sleep where more active substances have failed. Unfortunately the oil of the shops is generally either adulterated or old, and commonly both, in which case the oil acts as an irritant. A common plan is to mix it with old oil of lemons, a fraud which may be detected by the lessened density of the oil, and by its diminished solubility in rectified spirit.

Oil of Cherry-laurel; Oleum Lauro-cerasi,—Lat. From the *leaves* of *prunus lauro-cerasus* (Linn.), or *common laurel*. Closely resembles oil of almonds, but is said to be weaker. Like that substance it is powerfully *poisonous*. *Prod.* 100 *lb.* fresh leaves (*undeveloped*, June), 10·13 *oz.*; do. (*half-grown*, June), 7·2 *oz.*; do. (*full-grown*, 8 weeks on tree, July), 4·96 *oz.*; do. (*do.*, 3 months on tree, Sep.), 7·04 *oz.*; do. (15 months on tree), 2·24. (Christison.)

Oil of Chervil; Oleum Chærophylli,—Lat. From the bruised *fresh herb*, macerated for 2 or 3 days in *salt-and-water*, and then distilled.

Oil of Cinchona; Oleum Cinchonæ,—Lat. From *cinchona bark*. Butyraceous; smells of the bark. 20 *lb.* yield only 2 gr. (Trommsdorff.) *The odour of bark* is imitated by a solution of turmeric in potash, and by chloride of iron.

Oil of Cinnamon, Hydruret of Cinnamyle, Hydride of do.; Oleum Cinnamomi,—Ph. L. E. & D. *Ol. C. Veri.* From the *bark* of *laurus cinnamomum* (Linn.; *cinnamomum zeylanicum,*—Nees), macerated for several days in *salt-and-water*, and then distilled. Yellowish or red; very aromatic; both odour and taste resemble that of the bark. Sp. gr. 1·035. *Prod.* 11 *lb.* yielded 1 *oz.*; 100 *lb.* yielded 1·56 *oz.* (M. Raybaud.)

Pur. Oil of cinnamon, owing to its high price, and the consequent premium for its adulteration, can scarcely be obtained pure from the shops of this country. Oil of cassia and highly rectified spirit are the substances usually employed for this purpose. The increased sp. gr. resulting from the *first*, and the diminished sp. gr. from the *second*, afford ready means of detecting these frauds. The presence of oil of cassia may also be detected by an experienced person by the odour, which differs a *little* from that of pure oil of cinnamon. Oil of cassia is less limpid than oil of cinnamon, and it stands a greater degree of cold without becoming turbid or congealing. "Wine-yellow, when recent; cherry-red, when old: odour, purely cinnamomic; nitric acid converts it nearly into a uniform crystalline mass." (Ph. E.) During this reaction the odour of bitter almonds is perceptible. Both oil of cassia and oil of cinnamon are thus converted into a brown balsam; with oil of cassia, however, a brisk decomposition occurs sooner, and at a slighter heat. It also forms a crystalline compound with ammonia. These reactions, unfortunately, are not characteristic. "The most distinguishing characteristic of the cinnamon oils is, perhaps, their relation to the alcoholic solution of caustic potash. Both dissolve in it *readily* and *clear*, with a reddish yellowish-brown colour; after some time, however, the solution becomes *very turbid*, and a rather heavy undissolved oil precipitates, when the solution gradually becomes clear again." (Ure.) The palest oil is considered the best.

Obs. Oil of cinnamon is chiefly imported from Ceylon, where it is distilled from bark that is unfit for exportation. The *dark coloured oil* is usually rectified, when two *pale oils* are obtained; one *lighter*, and the other *heavier* than water; but 10% of oil is lost by the process. The oil distilled from the *root* of the tree (*ol. cinnamomi radicis*) is much weaker than that from the bark. The oil from the *leaves* (*ol. c. foliorum*),

also imported from Ceylon, smells of cloves, but has a less density than oil of cloves.

Oil of cinnamon consists essentially of *hydruret of cinnamyle*, but, unless when very recently prepared, it also contains a variable proportion of cinnamic acid, formed by the oxidation of the hydruret.

Oil of Citrons, Essence of do.; Oleum Citri,—Lat. From the *lees* of *citron juice*; or, from the *peels*, as oil of lemons or bergamot. The last generally goes by the name of *oil of cedrat*. Both are fragrant. (See above.)

Oil of Citron-flowers; Oleum Citri Florum,—Lat. Amber-coloured; highly fragrant. *Prod.* 60 *lb.* yield 1 *oz.*

Oil of Cloves, Essence of do.; Oleum Caryophyllorum; Ol. Caryophylli,—Ph. L. E. & D. *Ol Eugeniæ C.*,—Ph. D. 1826. From the *unexpanded flowers* (cloves) of the *caryophyllus aromaticus* (Linn.) or *Molucca clove-tree*, soaked for some time in salt-and-water, and then submitted to distillation; the distilled water, after having deposited its oil, being returned 3 or 4 times into the still, and again "worked off" from the same materials. Nearly colourless, when recent, gradually becoming pale-yellow, and ultimately light-brown by age; highly aromatic, with the characteristic odour and flavour of cloves. It is the least volatile of all the essential oils. Sp. gr. 1·055 to 1·061. *Prod.* 16% to 22%.

Pur. Oil of cloves is frequently adulterated with inferior essential oils, especially with those of pimento, pinks, and clove-gilly-flowers, and occasionally, with castor-oil. —1. *Pure oil of cloves* forms a butyraceous coagulum when shaken with pure *liquor of ammonia*, which crystallizes after fusion by a gentle heat.—2. Treated with an *alcoholic solution of potassa*, it entirely congeals into a crystalline mass, with *total loss* of its characteristic odour.—3. Shaken with an equal volume of strong *caustic soda lye*, it forms, on repose, a mass of delicate lamellar crystals.—4. *Solution of chromate of potassa* converts it into brown flakes, whilst the salt loses its yellow colour. — 5. *Chlorine* turns it first *green*, and then brown and resinous.—6. *Nitric acid* turns it red, and a reddish-brown solid mass is formed; with heat it converts it into oxalic acid.—7. It dissolves freely in *sulphuric acid* (oil of vitriol), yielding a transparent, deep-reddish brown solution, without any visible decomposition.—8. Mixed, *gradually*, with about ⅓rd of its weight of *oil of vitriol*, an acid liquor is formed, together with a resin of a rich purple colour, which, after being washed, is hard and brittle, and forms a red tincture with rectified spirit, which is precipitated of a blood-red colour by water.—9. It dissolves *iodine* freely, without any marked reaction.—10. It dissolves *santaline* freely.

Obs. In the distillation and rectification of clove oil, a heavy oil, sp. gr. 1·079 (*Clovic acid, Eugenic acid, Caryophyllic acid*), comes over first, followed by a light oil, sp. gr. 0·918, (*clove hydrocarbon*); by rectification much of the light oil is lost, and the product becomes denser. (1·361,—Bonastre.)

Cognac Oil. See *Oil of Grape Spirit.*

Oil of Copaiba, Oil of Capivi; Oleum Copaibæ,—Ph. L. & E.—1. (Ph. E.) *Balsam of capivi*, 1 oz.; *water*, 1½ pint; distil, returning the water into the still, until oil ceases to pass over.

2. (*Wholesale.*) From the *crude oil* which separates during the manufacture of "*specific solution of copaiba*" and "*soluble capivi*," by distillation along with a little salt-and-water.

Pur., &c. Colourless, when pure; that of commerce has frequently a greenish tinge, derived from the copper utensils; odour, not disagreeable when recent. Sp. gr. 0·876 to 0·878. *Prod.* 50% to 55%. When adulterated with oil of turpentine, its solubility in rectified spirit is greatly diminished, and the solution is turbid. *Dose.* 10 to 15 drops, in sugar; in the usual cases in which copaiba is ordered.

Oil of Coriander; Oleum Coriandri,—Lat. From the *seeds* of *coriandrum sativum*. Yellowish; aromatic; carminative. *Prod.* (Dried fruit) 5½ to 6%.

Corn Oil. The name given by Mulder to a peculiar fatty compound found in the *fusel oil* of the distilleries of Holland. It has a very powerful odour, resembling that of some of the umbelliferous plants, and is unaffected by caustic potassa. See *Fusel Oil.*

Oil of Cubebs; Oleum Cubebarum; Ol. Cubebæ,—Ph. E. & D. From the *fruit* of *piper cubeba*, or *cubebs*, coarsely ground. Aromatic; hot; and bitter tasted; odour, that of the fruit; colourless, when pure. Sp. gr. 0·929. *Prod.* 9% to 11%.

Pur., &c. When pure, *iodine* has little action on this oil, and immediately gives it a violet colour, without any very marked reaction; *nitric acid* turns it opaque, and the mixture changes to a pale red when heated; *sulphuric acid* turns it of a crimson-red. When *adulterated* with *oil of turpentine*, both its viscidity, solubility in rectified spirit, and its density, are lessened; when mixed with *castor oil*, it leaves a greasy

stain on paper.—*Dose.* 10 to 15 drops, in the usual cases in which cubebs in substance is given.

Oil of Cumin; Oleum Cumini, Ol. Cymini, —Lat. From the *fresh fruit* (seed) of *cuminum cyminum* or *cumin.* Pale yellow; smells and tastes strongly of the seeds. Sp. gr. 0·975. *Prod.* 2½ to 3%.

Obs. Oil of cumin is a mixture of two oils differing in volatility, and which may be separated by careful distillation. The more volatile one has been named *cymol;* the other, *cuminol.*

Oil of Dill; Oleum Anethi,—Ph. L. & E. From the bruised *fruit* (seed) of *anetheum graveolens.* Pale yellow; odour, that of the fruit; taste, hot and pungent; carminative. Sp. gr. 0·881 to 0·882. *Prod.* 4% (nearly).

Oil of Elder, Attar of Elder Flowers; Oleum Sambuci,—Ph. L. 1836. From *elder flowers* (sambucus nigra). Butyraceous; odour not very marked.

Oil of Elemi; Oleum Elemi,—Lat. From the resin. Isomeric with oil of turpentine.

Oil of Ergot, Ethereal do. do.; Oleum Ergotæ, Ol. E. Æthereum, Ol. Secalis Cornuti,—Lat. Prepared by evaporating the *ethereal tincture* at a very gentle heat, and, preferably, allowing the last portion of the ether to escape by spontaneous evaporation. Brownish-yellow; lighter than water; soluble in ether and liquor of potassa; only partly soluble in alcohol. It appears to be a mixture of volatile and fixed oil, with some resinous matter. *Dose.* 10 to 20 drops, in hemorrhages; 10 to 12 drops every 3 or 4 hours, in diarrhœa; 20 to 50 drops, as a parturifacient, &c. *Externally,* in rheumatism, toothache, &c.

Obs. The above is the oil of ergot now employed in medicine. It must not be confounded with other preparations occasionally called by the same name, but which differ from it in character. Among the latter are the following:—

a. A *fixed oil* obtained by distilling off the spirit from the *alcoholic tincture.* It has the odour of rancid fish-oil, and the distilled spirit has also a putrid odour.

b. A *fixed oil,* obtained from *coarsely powdered ergot* by strong pressure between iron plates, at a heat of about 212° Fahr. It is fluid, coloured, smells strongly of the drug, but is nearly destitute of its leading qualities. Both the preceding contain some volatile oil and resinous matter.

c. An *empyreumatic oil* obtained by distilling ergot *per se.* It is light-brown, viscid, acrid, and nauseous.

d. A *volatile oil,* obtained by digesting *powdered ergot* in *liquor of potassa* at 125° Fahr., diluting the saponaceous mass thus formed, with one-half to an equal weight of *water,* neutralizing the alkali with *dilute sulphuric acid,* and then submitting the whole to distillation in a chloride of sodium or oil bath. It is white, adhesive, butyraceous, and tasteless. It appears a product, rather than a simple educt.

e. This is the *ethereal oil,* first described, in its purest form. It is colourless, translucent, oily, and acrid-tasted, with the odour of ergot; it has a high boiling-point, at which it suffers partial decomposition, but may be volatilized at a lower temperature, like the other oils. By long exposure to heat it thickens and partly solidifies; light and air darken it; it is lighter than water; very slightly soluble in water, but sufficiently so to impart to it its peculiar odour; it is soluble in pure alcohol, in ether, the volatile and fixed oils, alkaline lyes, liquor of ammonia, creasote, and naphtha. The dilute mineral acids clear it, but do not produce any marked reaction.

Ethereal Oil. See *Oil of Wine.*

Oil of Fennel; Oleum Fœniculi,—Ph. L. *Ol. F. Officinalis,*—Ph. E. & D. *Ol. F. Dulcis.* From the *fruit* or *seed* of *fœniculum dulce* or *sweet fennel* (Ph. L.) Colourless; odour that of the plant; tastes hot and sweetish; congeals at 50° Fahr.; carminative and stomachic. It consists of two oils; the one solid and identical with that of oil of aniseed. When treated with nitric acid it affords benzoine. Sp. gr. 0·997. *Prod.* Dried fruit (*of commerce*), 3% to 3·5%. The *flowering herb* yields 0·35% of a similar oil.

Obs. The oil of fennel of the shops is the product of the fruit of *fœniculum vulgare,* or common, wild, or bitter fennel (*anethum fœniculum,*—Linn.) It closely resembles that of sweet fennel, but is scarcely so agreeable either in taste or smell. According to Dr. Ure, it does not congeal until cooled to 14° Fahr. (?) It is chiefly used to scent soaps.

Fruit Oils, Fruit Essences. The highly interesting artificial productions of this kind, which attracted so much attention in the Great Exhibition of 1851, are noticed under the heads *Apple Oil, Bitter Almond do., Jargonell-pear do., Pine-apple do., &c.*

Fusel Oil, Fousel do., Fuselol; Potato Oil, Oil of Potato Spirit; Grain Oil. This is the common name given to the offensive, strong-smelling oil produced along with alcohol during the fermentation of grain, potatoes, &c., on the large scale, and which gives the peculiar and disagreeable flavour

and odour to raw whiskey. It is found chiefly in the last portion of the spirit which passes over, called the "*feints*," to which it imparts its characteristic odour and flavour. By rectifying the *feints* at a very gentle heat, most of the alcohol and water first pass over together with only a little fusel oil, whilst the latter forms the residuum in the still. The names of *grain-spirit oil*, *marc-brandy oil*, *potato-spirit oil*, &c., are given to the *crude oil* thus obtained, according to its source. In each case it essentially consists of *hydrated oxyde of amyle* (noticed at page 65), but trifling and variable quantities of other organic compounds are mixed with it, which slightly modify its character, more particularly its odour and flavour. The *oil of potato-spirit* is the purest form of *crude fusel oil*.

The exertions of the distiller are directed, as much as possible, to lessen the formation of fusel oil during the fermentation of his worts, and to eliminate, during the distillation and rectification of his liquors, the greatest possible proportion of that with which they may be contaminated.

Fusel oil is a nearly colourless volatile liquid, with a rather high boiling-point, a durable, penetrating, offensive smell, and an acrid burning taste; when swallowed, it occasions nausea, giddiness, headache, &c.; in slightly larger quantities, vomiting, delirium, oppressive respiration, and lessened sensibility to pain; its vapour also produces these effects. In quantity, it is a narcotic poison. The greater intoxicating power of whiskey, more especially that from raw grain, than other spirit, is due to the larger quantity of fusel oil which it contains. This appears to be well known to the lower class of *whiskey drinkers* in these countries, and to the consumers of *corn brandy* in some of the northern parts of Europe. The last are said to frequently demand to be served with "a glass of good fusel." In England, fusel oil is chiefly used for lamps and varnishes. See *Corn*, *Grain*, and *Potato Oil*, *Amyle*, *Distillation*, &c.

Fusel Oil (Purified); *Amylic Alcohol*; *Alcohol Amylicum*,—Ph. D. Introduce the *ordinary fusel oil* of the distilleries into a small still or retort, connected with a condenser, and apply heat; as soon as the oil begins to flow over, unmixed with water, the receiver should be changed, and the distillation resumed, and carried nearly to dryness; the product in the second receiver, and the oily matter which separates from the water in the first receiver, are to be reserved for use. It is employed in the preparation of *valerianate of soda*, Ph. D. Pure *amylic alcohol* can only be obtained by the process given at page 55.

Oil of Galbanum, *Oleum Galbani*,—Ph. Bor. From *galbanum*, 2 lb; *water*, 16 fl. oz.; distilled together. Yellow; resembles oil of assafœtida, but milder.

Oil of Garlic; *Sulphuret of Allyle*, *Sulphide of do.* From the bruised *bulbs* or "*cloves*" of *allium sativum* (Linn.) or *garlic*. It possesses the peculiar odour, taste, and other properties of the bulbs in a highly exalted degree. When a mixture of oil of black mustard and sulphuret of potassium is exposed in a sealed glass-tube to a temperature above that of 212° Fahr., *sulphocyanide of potassium* and *garlic oil* are formed. On the other hand, when the compound of garlic oil and bichloride of mercury (formed by adding to an alcoholic solution of the oil a like solution of the bichloride) is gently heated with sulphocyanide of potassium, *mustard oil*, with all its characteristic properties, are called into existence.

Oil of Garlic (Artificial). See *above*.

Oil of Gaultheria. See *Oil of Partridge Berry*.

Oil of Gentian; *Oleum Gentianæ*,—Lat. From the *root*. Butyraceous; smells strongly of gentian. 3 cwt. yield 1 dr. (barely).

Oil of Geranium. The oil of commerce which passes under this name is imported from the East Indies, and is not obtained from any species of geranium or pelargonium. A small quantity of a highly fragrant oil may, however, be obtained from the herbaceous portions of some of the cultivated varieties of the latter.

Oil of Ginger; *Oleum Zingiberis*, — Lat. From the *dried root* (rhizome) of *zingiber officinale* (Roscoe) or *ginger* of commerce. Bluish-green; possesses a less agreeable odour than that of good ginger, without any pungency. *Prod.* $\frac{11}{16}$ of $1\frac{0}{0}$ (M. Raybaud.)

Oil of Grain-spirit, *Grain Oil*. Two distinct substances are found in spirit distilled from fermented grain; one of which is butyraceous and highly offensive (*corn oil* of Mulder—?), the other liquid (*crude fusel oil*). The relative proportions of these substances to each other, and to the spirits which they contaminate, vary with the materials and the management of the process. The *grain oil* of the *London rectifiers*, consists chiefly of fusel or potato oil, mixed with alcohol and water, and with small and variable proportions of solid ethyle and amyle

compounds of certain fatty acids (œnanthic and margaric?). The latter are said to be similar to the butyraceous matter before referred to, as well as the solid fat of the whiskey-distilleries conducted on the old plan. According to Mr. Rowney, the fusel oil of the Scotch distilleries contains capric acid. See *Corn Oil, Fusel Oil, &c.*

Grape Oil, Brandy do., Cognac do. This is sulphate of oxide of amyle. It is *prepared* by dissolving the *fusel oil of marc-brandy* in *strong rectified spirit*, and then adding a sufficient quantity of *concentrated sulphuric acid* to form a sulphate; alcohol and excess of acid is removed by washing the newly-formed compound with water. Dissolved in rectified spirit, it forms "*brandy essence*," which is used to impart the Cognac flavour to *plain spirit*. See *Essences* and *Oil of Marc-brandy*.

Grass Oil. Several of the grasses (*gramineæ*) yield fragrant volatile oils, among the most remarkable of which are those obtained from *andropogon nardus, a. schœnanthus* and *anthoxanthum odoratum*. See *Grass Oil* (of Namur), *Oil of Lemon-grass, Oil of Spring-grass, &c.*

Grass Oil (of Namur); *India Grass-oil.* From *andropogon calamus aromaticus* (Royle), supposed to have been the "sweet cane" and "rich aromatic reed from a far country," of Scripture; formerly supposed to be obtained from *andropogon ivrandcusa.* Stimulant and highly fragrant.

Oil of Guiana-laurel. Isomeric with oil of turpentine, but differs from it in its physical properties.

Oil of Hemlock; Oleum Conii Volatile, —Lat. Smells of the plant. It is said not to be poisonous when distilled at a low temperature.

Oil of Hops; Oleum Lupuli,—Lat. From *commercial hops* by distillation along with *water*. It may also be collected during the brewing of beer. Odorous; acrid; narcotic; soluble in water; becomes resinous by exposure and age. Sp. gr. 0·910. Chiefly used to increase the aroma and flavour of old or damaged hops.

Oil of Horse-mint; Oleum Monardæ,— Ph. U. S. From the *fresh herb* of *monarda punctata*, a plant indigenous in the U. S. of America. Dark amber-coloured; fragrant; pungent; carminative; rubefacient; and vesicant.

Oil of Horse-radish; Oleum Armoraciæ, Lat. From the *fresh roots* of *cochlearia armoracia* (Linn.) or *common horse-radish.* Pale yellow; heavier than water; acrid; vesicant; identical with that from black mustard. *Prod.* 0·5% (nearly.)

Oil of Hyssop; Oleum Hyssopi,—Lat. From the *flowering herb* of *hyssopus officinalis.* Aromatic; stimulant. *Prod.* 0·25 to 0·33%.

Oil of Jargonelle Pear. See *Pear Oil.*

Oil of Jasmin (Volatile); *Oil of Jessamine; Oleum Jasmini, Ol. J. Volatile,*—Lat. From the *flowers* of *jasminum grandiflorum* (Linn.), carefully picked, by placing them in alternate layers with *cotton wadding* imbued with *olive oil*, in any suitable vessel, and renewing the flowers till the fixed oil becomes strongly odorous, and then distilling the wadding along with a *little water.* The *volatile oils* of *hyacinths, jonquil, tuberose, violets*, and most of the more delicate flowers, are obtained in the same way. *Used* in perfumery. From the East Indies.

Oil of Juniper; Oleum Juniperi,—Ph. L. E. & D. *Ol. è baccis, J.,*—Ph. L., 1721. *O. Essentiale è b. J.,*—Ph. L., 1746. From either the *wood, tops*, or *berries*, preferably the last. The berries should be chosen *fully grown*, but still *slightly green*, and should be bruised before being placed in the still. In the Ph. L., English oil of juniper (*ol. juniperi, Anglicum*) is ordered. Colourless, or very pale greenish-yellow; odour and taste, sweet and terebinthinate; rather viscid; soluble in rectified spirit; rendered opaque and resinous by exposure and age. It is reputed carminative and diaphoretic, and possesses powerful diuretic properties. Sp. gr. 0·911 (*English*, 0·8688, *Foreign*, 0·8834,—Brande). *Prod.* Green berries, 0·25%; ripe, do. (*one year old*), ¾ to 1% (fully).

Pur. It is frequently adulterated with oil of turpentine, a fraud readily discovered by the lessened density, viscidity, and solubility in rectified spirit, of the oil.

Obs. Oil of juniper consists of two oils,— *one*, white and most volatile, sp. gr. 0·8393; the *other*, dark-coloured and less volatile, sp. gr. 0·8784; together with some resin left in the retort.

Krumholz Oil; Oleum Templinum,—Lat. From *Hungarian balsam*, a terebinthinate exudation from the *pinus pumilio* (Willd.), or *mountain pine* of Southern Europe. Fragrant; golden-yellow; tastes oily, acidulous, and resinous.

Oil of Laurel (Volatile); *Oil of Sweet Bay; Oleum Lauri Volatile, Ol. L. Essentiale,*—Lat. From either the *berries* or *leaves* of *laurus nobilis* (Linn.) or *sweet bay-tree.* Pale-yellow, clear, odorous, aromatic, stimulant, and narcotic. Sp. gr. 0·871. *Prod.* From the leaves, ¾ to 1% (fully).

Oil of Laurel (Native); *Laurel Turpentine; Oleum Lauri Æthereum Nativum*,—Lat. From incisions in the *bark* of *azeyte de sassafras*. Sp. gr. 0·8631. From Demerara. Resembles the oils of the balsamic turpentines.

Oil of Lavender, Essence of do.; *Oleum Lavandulæ*,—Ph. L. *Ol. L. Veræ*,—Ph. E. & D. *Ol. L. Spicæ; Ol. L. Essentiale*,—Ph. L., 1788. *Ol. L. Florum*,—Ph. L., 1726. The "oil (*oleum lavandulæ, Anglicum*) distilled from the flowers" of "*lavandula vera* (*l. spica*, var. *a.*, Linn.)"—Ph. L. Very pale lemon-yellow; highly fragrant; taste, warm and not disagreeable; carminative, antispasmodic, and stimulant. Sp. gr. 0·877 to 0·905. According to Mr. Brande, the sp. gr. of the oil obtained from the flowers only, is 0·8960; that from the *whole plant*, 0·9206. The lightest is esteemed the best. *Prod.* Flowers, 1½ to 2% (nearly). The whole of the *flowering herb* is commonly distilled. According to Raybaud, the herb, after flowering (Sept.), yields the most oil.

Pur. Alcohol is the substance commonly used to adulterate this oil; but, occasionally, oil of bergamot is used for the same purpose. If the density is below 0·87, there is reason to suspect adulteration. When pure,—1. *Sulphuric acid* turns it reddish-brown, and the reaction is accompanied by strong inspissation.—2. It fulminates quickly and violently with iodine, and the thick syrupy residue possesses a pungent, acid, balsamic odour. The oils of the other labiate plants fulminate much less powerfully with iodine. The presence of alcohol weakens but does not destroy the action of this test, unless it is added in an equal volume, when only a lively effervescence, and a disengagement of orange-coloured vapours are produced by the iodine, without fulmination.—3. *Santaline* is nearly insoluble in pure oil of lavender, and exerts no marked action on it, but is freely soluble in oil of lavender adulterated with alcohol or rectified spirit.

Obs. English oil of lavender possesses the purest fragrance; and of this, the variety known as "*Mitcham oil of lavender*," from the place of its preparation, is esteemed the best. The *foreign oil* (*ol. l. latifoliæ*) is distilled from *lavandula latifolia* or *French lavender*, and is inferior. This last is improved by rectification. See *Oil of Spike*.

Oil of Lemons, Essence of do.; *Oleum Limonis, Ol. Limonum*,—Ph. L. E. & D., From the *yellow portion of the rind*, grated, placed in hair bags, and exposed to powerful pressure; also by distillation, but the product is then less agreeably fragrant and sweet, but keeps better. Nearly colourless; odour that of the fruit. Sp. gr. 0·8752 to 0·8785. *Expressed oil*, 0·8517, *distilled do.*, 0·847, at 72° Fahr., (Ure). *Prod.* 100 lemons yield, by *expression*, 1¾ to 2 *oz.* (nearly); by *distillation*, 1¼ to 1½ *oz.*

Pur. Commonly adulterated with oil of turpentine, and occasionally with nut or poppy oil. These may be detected in the manner already explained. When pure, it is soluble in all proportions in absolute alcohol, but rectified spirit only dissolves 16% of it. It also boils at 148° Fahr., whereas oil of turpentine boils at 312°, and mixtures of the two, at intermediate temperatures, depending on the proportions.

Oil of Lemon Grass, Essence of do., Indian Grass-oil. From *andropogon schœnanthus* (Linn.), the *camel's hair, lemon-grass*, or *sweet rush* of Arabia. Pale yellow; powerfully fragrant. From India.

Oil of Lemon Thyme; Huile de Tain; Oleum Serpylli,—Lat. From the *fresh flowering-herb* of *thymus serpyllum* (Linn.), the *lemon* or *wild thyme* of our hills and pastures. Very fragrant. *Used* to scent soaps, &c. Sp. gr. 0·867. *Prod.* 100 *lb.* yields 2½ to 5½ *oz.* of oil. When pure, it is scarcely affected by iodine, but solution of chromate of potassa acts on it with energy.

Oil of Lettuce; Oleum Lactucæ Virosæ,—Lat. From *lactuca virosa* (Linn.) or *strong-scented wild lettuce*. Closely resembles the odorous matter of opium.

Oil of Limes; Oleum Limettæ,—Lat. From the *rind* of the *fruit* of *citrus medica acida*, or *limes*, as oil of lemons, which it somewhat resembles. *Prod.* 100 limes yield 2¼ to 2½ *oz.* of oil.

Oil of Lovage; Oleum Levistici,—Lat. From the *leaves* or *fruit* of *ligusticum levisticum* (Linn.) or *lovage*. Pale yellow, aromatic, carminative. *Prod.* Fresh herb, 0·1% to 0·15%.

Oil of Mace (Essential); *Oleum Macidis, O. M. Essentiale, O. M. Stillatitium*,—Lat. From the *arillus* of *myristica officinalis* (*commercial mace*). Nearly colourless; fragrant; lighter than water; closely resembles oil of nutmeg. Sp. gr. 0·945. *Prod.* 4½ to 9%.

Oil of Marc-brandy, Fusel Oil of do., Oil of Grape Spirit. Obtained after the spirit (*marc brandy*) has passed over, during the distillation of the fermented residuum of expressed grapes. Limpid; odorous; acrid; offensive; soon turns yellow in the air; soluble in 1000 parts of water, and in all proportions in rectified spirit; 6 or 7 drops will spoil a hogshead of brandy. According

to M. Balard this oil is a compound of potato oil and œnanthic ether.

Oil of Marjoram, Oil of Sweet do.; *Oleum Marjoranæ; Ol. Origani M.*,—Ph. E. From the *fresh flowering-herb* of *origanum marjorana*, or *sweet* or *knotted marjoram*. Pale yellow; odorous; tonic; stimulant. Sp. gr. 0·925 (0·940,—Baumé). *Prod.* 0·33 to 0·5%. See *Oil of Origanum*.

Oil of Meadow-sweet; Oleum Spirææ Ulmariæ,—Lat. From the *flowers* or *flowering-tops* of *spiræa ulmaria* (Linn.) or common *meadow-sweet*. This oil is a native *hydruret* or *hydride of salicyle*. It is yellow, sweet-scented, and slightly soluble in water, which then strikes a deep violet-colour with the sesquisalts of iron. It boils at 385° Fahr. Sp. gr. 1·172. (See *below*.)

Oil of Meadow-sweet (Artificial); *Hydrosalicylic Acid, Salicylous Acid*. This is prepared as follows:—*Salicine*, 1 part, is dissolved in *distilled water*, 10 parts, and being placed in a glass retort, *bichromate of potassa* (in powder), 1 part, is added, followed by *oil of vitriol*, 2½ parts, previously diluted with 4 times its weight of *water*; a gentle heat is next applied to the retort, and after the first effervescence resulting from the mutual reaction of the ingredients is over, the heat is increased, and the mixture is distilled for the oil in the usual manner. The *product* is absolutely identical with the natural oil of meadow-sweet. (See *above*.)

Oil of Milfoil; Oleum Millefolii,—Lat. From the *flowers* of *achillæa millefolium* (Linn.) or *yarrow*. Blue. Sp. gr. 0·852. *Prod.* 14 *lb.* of the *dry flowers* yielded 3 dr. of oil.

Mixed Oils (Essential); *Olea Mixta Essentialia*. From the *oils* of *bergamotte* and *lemons*, of each, 1 *oz.*; *oils* of *lavender* and *pimento*, of each, ½ *oz.* *Used* to scent "*sal volatile drops*," *smelling bottles*, &c.

Oil of Mustard (Volatile); *Sulphocyanide of Allyle; Oleum Sinapis Nigræ, Ol. S. Essentiale*,—Lat. From the *seeds* of *sinapis nigra* (Linn.) or *black mustard*, as oil of bitter almonds. Nearly colourless; intensely acrid, pungent, rubefacient, and vesicant; slightly soluble in water; boils at 289° Fahr. It contains sulphur. Sp. gr. 1·035 to 1·038; 1·015, at 68° Fahr. *Prod.* Av. 0·5% (fully).

Obs. This oil, like that of bitter almonds, does not pre-exist in the seed, but is the result of the action of *myronic acid* on a peculiar substance, *myrosine*, in the presence of water. Oil of black mustard has been used as a stimulant or counter-irritant in palsy, &c.; and the distilled water, or a solution of the oil in water, is said to be an excellent and cleanly remedy for the itch.

Oil of Myrrh; Oleum Myrrhæ, O. M. Essentiale,—Lat. Colourless; thin; heavier than water; stimulant; smells strongly of the drug.

Oil of Myrtle (Volatile); *Essence of do.*; *Oleum Myrtæ Essentiale*,—Lat. From the *flowers* and *leaves* of *myrtus communis*. 100 *lb.* of the *fresh leaves* yield 2½ to 5 *oz.*

Oil of Namur Grass. See *Grass Oil*.

Oil of Narcissus, Essence of Jonquil; Oleum Narcissi,—Lat. As oil of jasmine. Delightfully odorous.

Oil of Neroli. See *Oil of Orange-flowers*.

Oil of Nutmeg (Volatile); *Oleum Myristicæ*,—Ph. E. & Ph. L., 1836. *Ol. M. Moschatæ*,—Ph. D. From the *officinal nutmeg* or *kernel of the fruit of myristica moschata* (m. officinalis,—*Linn.*). Nearly colourless; odour and flavour that of the fruit, but more powerful. By agitation with water it is separated into *two* oils,—one *lighter*, the other *heavier* than water; the last is butyraceous. Sp. gr. 0·948. *Prod.* 4½ to 7%. It is reputed to make the hair grow, and to prevent baldness.

Oil of Onions. From the *bulbs* of *allium cepa* (Linn.) or *common onion*. Contains sulphur, and smells strongly of the herb.

Oil of Orange, Essence of do.; *Oleum Aurantii, Ol. Aurantiorum, Ol. A. Corticis*,—Lat. From the *yellow portion* of the *rind* of either the *Seville* or *sweet orange*, preferably of the last; as oil of bergamot or lemons. Closely resembles oil of lemons, but is more agreeably fragrant. The expressed oil is very apt to become opaque and deposit a stearescence, especially in cold weather, unless well kept from the air. Sp. gr. 0·875. *Prod.* 100 fruits yield 4 to 5 *oz.*

Oil of Orange-berries; Essence de petit grain; Oleum Aurantii Baccæ,—Lat. Does not keep well. (See *below*.)

Oil of Orange-flowers, Neroli, Oil of do., Essence of do.; *Oleum Naphæ, Ol. Aurantii Florum; Aurantii Oleum*,—Ph. E. & D. From the *flowers* of either the *bitter* (Seville) or *sweet orange* (citrus vulgaris *or* c. aurantium, *Risso*), by distillation with water. That from the first is said to be preferred, but there does not appear any actual difference between the two. Very fluid; lighter than water, in which it is slightly soluble; it is delightfully aromatic and fragrant; but the odour differs slightly from that of the flowers. *Prod.* 100 *lb.* of flowers gathered in May or Dec. yield 3 to 6 *oz.* of oil; 6 cwt. of the *fresh* flowers yielded 1 *lb.* of oil.

Pur. Neroli is commonly adulterated

with alcohol or essence de petit grain, and generally with both of them. The presence of the first is easily determined (see *above*); that of the *second* can only be discovered by comparing the odour evolved during the evaporation of a drop of the suspected oil placed on a piece of white paper, with a like drop of pure neroli similarly treated.

Oil of Orange-leaf; Essence de petit grain; Oleum Aurantii Folii,—Lat. From the *leaves* of either the *bitter* or *sweet orange*; that from the first being preferred. Constitutes the best *essence de petit grain*. Delightfully fragrant. Extensively used to adulterate oil of neroli, and is itself commonly sophisticated with both alcohol and oil of orange-berries. (See *above*.)

Oil of Seville Orange, Essence of Bitter do. From the rind of the *bigarade* or *bitter orange* (citrus bigaradia). It scarcely, if at all, differs from the oil of the sweet orange (citrus aurantium); but has the advantage of keeping better. The two are not distinguished from each other in commerce.

Oil of Origanum; Oleum Origani,—Ph. L., 1836, & Ph. D., 1826. *Ol. O. Essentiale*, —Ph. L., 1788. *O. O. Herbæ*,—Ph. L., 1721. From the *flowering herb* of *origanum vulgare* (Linn.) or *common* or *winter marjoram*. Pale yellow colour; fragrant; acrid, pungent, and rubefacient. Sp. gr. 0·927 (0·940, —Baumé). *Prod.* 0·5% to 0·75%. The dark-coloured "oil of origanum" of the shops, is obtained from thymus vulgare. The "oil of origanum,"—Ph. E., is oil of origanum marjorana. See *Oils* of *Marjoram*, *Thyme*, and *Lemon Thyme*.

Oil of Orris, Essence of Violet; Oleum Iridis,—Lat. From the *dried rhizomes* of *iris Florentina* (Linn.) or *Florentine orris root*. Fragrant. Sold for *oil* and *essence of violets*.

Oil of Parsley; Oleum Petroselini,—Lat. From the *fresh herb* or *dried fruit* (seed) of *apium petroselinum* (Linn.) or *garden parsley*. Yellowish; smells strongly of the plant. It consists of two oils, separable by agitation with water, one of which is concrete, and melts at 86° Fahr.; the other, liquid. *Prod.* Herb, 0·50 to 1% (nearly); dried fruit, 1¼ to 2% (nearly).

Oil of Partridge Berry, Oil of Wintergreen, Methylo-salicylic Ether, Salicylate of Oxide of Methyle; Oleum Gaultheriæ,—Ph. U. S. From the *leaves* or the *whole plant* of *gaultheria procumbens* (Linn.), a herb common in North America, and otherwise known by the names—*Box-berry*, *chequer-berry*, *partridge-berry*, *mountain tea*, *winter-green*, &c. Pale yellow, growing brown by exposure and age; aromatic; sweet; highly pungent; when diluted, agreeably fragrant; mixed with a dilute solution of potassa it solidifies to a crystalline mass of *gaultherate of potassa*, from which the oil may be again separated by the addition of an acid. It is the heaviest of all the essential oils. Sp. gr. 1·173. Boils at 412°, and, when purified, at 435° Fahr.

Oil of partridge-berry, dissolved in rectified spirit, is in common use in the United States of America as an antispasmodic, carminative, diuretic, emmenagogue, and stimulant; chiefly as an adjunct to mixtures, &c.; and also with the view of increasing the flow of milk during lactation. It is likewise extensively used in perfumery, and is an object of great interest to the organic chemist on account of its peculiar constitution and reactions.

Oil of Partridge-berry (Artificial). See *Salicine* and *Salicylic Acid*.

Pear Oil, Oil of Jargonelle Pear; Birnöl. This preparation, which attracted so much attention in the Great Exhibition of 1851, is simply *acetate of oxide of amyle* (amylo-acetic ether), the preparation of which has been already noticed. (See *p.* 64.) To render it quite free from water and sulphurous odour, it should be agitated with *dried chloride of calcium*, and then rectified from a *little litharge*. Dissolved in rectified spirit, it is much used as a flavoring ingredient by confectioners and liquoristes. See *Essences*, &c.

Oil of Pennyroyal; Oleum Pulegii,—Ph. L. *Ol. Menthæ P.*,—Ph. E. & D. and Ph. L. 1836. *Ol. P. Essentiale*,—Ph. L. 1788. *Ol. P. Herbæ*,—Ph. L. 1721. From the *flowering herb* of *mentha pulegium* (Linn.), or the common *pennyroyal* of our gardens. Pale yellow, growing reddish-yellow by age and exposure; antispasmodic, carminative, and emmenagogue. Boils at 395° Fahr. Sp. gr. 0·925 to 0·931. *Prod.* ¾ to 1%.

Oil of American Pennyroyal; Oleum Hedeomæ,—Ph. U. S. From *hedeoma pulegioides* (cunila *or* melissa pulegioides,—*Linn.*), as the last. Light yellow; closely resembles oil of pennyroyal, for which it passes in the U. S. Sp. gr. 0 945 to 0·948.

Oil of Pepper, Oil of Black do.; Oleum Piperis, Ol. P. Nigri,—Lat. From *bruised black pepper* (piper nigrum). Colourless, turning yellow; odorous; pungent; not so hot as the spice. Sp. gr. 0·9932. *Prod.* 1·25% to 1·5%. *White pepper* (of commerce), 1% (barely).

Oil of Peppermint; Oleum Menthæ Piperitæ,—Ph. L. E. & D. *Ol. Essentiale M.*

Piperitidis,—Ph. L. 1788. From the *fresh flowering herb* of *mentha piperita*, or *garden peppermint*. Nearly colourless, or at most a very pale greenish-yellow; powerfully odorous; tastes pungent, at the same time imparting a sensation of coldness to the tongue and palate. Boils at 365° Fahr. Sp. gr. 0·902 to 0·905. *Prod.* Fresh flowering herb, 0·25% to 0·4%; dried do., 1% to 1·25% (fully). In a warm dry season, 5 *lb.* of the *fresh flowering herb* yield 1 *oz.* of oil; in a wet and unfavorable one, 11 *lb.* yield barely the same quantity.

Pur. The oil of commerce usually contains fully a third part of rectified spirit, and is also frequently adulterated with the oils of rosemary, spearmint, and turpentine. When pure—1. It is soluble in its own weight of rectified spirit.—2. Mixed with 1-4th its volume of *nitric acid*, a rich purple-red colour is developed.—3. *Chromate of potash*, in solution, turns it of a deep reddish-brown colour, and converts it into a soft coagulum, which assumes a flaky form when divided with a glass rod, whilst the solution of the salt loses its yellow colour or becomes greenish-yellow. — 4. With *iodine* it forms a homogeneous mass, *without* fulmination. If it explodes with iodine it contains turpentine. The yellowish, resinous oil, sold under the name of "*American*" or "*crude oil of peppermint*," consists chiefly of oil of turpentine, and on evaporation leaves a residuum of pine resin.

Obs. English oil of peppermint is the best, a fact clearly shown by its price in the market being so greatly above that of the imported oil. The oil distilled at Mitcham, in Surrey (*Mitcham oil of peppermint*), is the most esteemed. It has usually a very pale-greenish colour, which is often imitated by steeping a leaf or two of green mint or parsley in the oil. Old dark-coloured oils are commonly bleached by exposure to the light, to the destruction of a portion of their other properties.

Oil of peppermint is stimulant, antispasmodic, and carminative, and has always been a favorite remedy in flatulence, nausea, vomiting, loss of appetite, cramp of the stomach, colic, griping pains, diarrhœa, the the early stage of cholera, &c. *Dose.* 1 to 3 drops, on sugar.

Oil of Petroleum (Volatile); *Oleum Petrolei Volatile*,—Lat. From *native petroleum*, distilled with about twice its weight of *water*. Stimulant and resolvent; in gout, paralysis, &c. See *Naphtha, Petroleum, &c.*

Oil of Pimento, Oil of Allspice; Oleum Pimentæ,—Ph. L. E. & D. From the *bruised fruit* of *eugenia pimenta* (De Cand.; *myrtus pimenta*,—Linn.), *allspice* or *Jamaica pepper*. Pale yellow, growing reddish-brown by age; odour, a combination of that of cloves and cassia; taste, pungent. Sp. gr. 1·021. *Prod.* 5% to 8%.

Obs. Oil of pimento contains two oils,—one (*light*) which distils over first, and another (*pimentic acid*) which comes over afterwards. When pure, *nitric acid* turns it red, with active effervescence, and the assumption of a rusty brown colour. It combines with the salifiable bases in a nearly similar manner to oil of cloves. It is much used in perfumery, especially in hair cosmetics.

Oil of Pimpernel; Oleum Pimpinellæ,—Lat. From the *root* of *sanguisorba officinalis* or *pimpernel*. Blue; carminative.

Pine-apple Oil. This is another *artificial essential oil* which dates its commercial importance from the Great Exhibition of 1851. It is essentially *butyric ether*, and may be regarded as simply the crude form of that substance. On the *large scale* it is prepared by saponifying *butter* or *crude butyric acid* with a *strong lye* of *caustic potassa*, and dissolving the resulting soap in the smallest possible quantity of *hot alcohol;* to the solution is added a mixture of *alcohol* and *oil of vitriol* in excess, and the whole is then submitted to distillation as long as the product has an aromatic fruity odour; the product is rectified from *dried chloride of calcium* and a *little litharge*. Dissolved in rectified spirit it is much used as a flavoring substance by confectioners and liquoristes. See *Butyric Ether, Essences, &c.*

Oil of Potato Spirit; Potato Oil, Fusel Oil, Hydrated Oxide of Amyle (Crude). Obtained by continuing the distillation after most of the *spirit* has passed over. It is purified by agitating it with *water* and then rectifying it from *dried chloride of calcium*. Colourless; limpid; odour strong and peculiar; taste, hot, bitter, and persistent; cooled below 0° Fahr. it congeals like oil of aniseed; slightly soluble in water, to which it imparts the property of frothing when shaken; soluble in alkaline lyes; freely soluble in alcohol; chlorine turns it green; oil of vitriol turns it crimson, and the liquid is precipitated yellow by water; boils at 257° Fahr. Sp. gr. 0·821 to 0·823. It burns with a clear white flame, and is now much used for lamps and varnishes. It is narcotic, but not in so great a degree as the oil of grain-spirit. It is a highly interesting compound on account of its constitution and its relation with the *amyl-series*,

and its use in the preparation of *amylic alcohol* and *valerianic acid*. See *Fusel Oil*, *Amyle*, &c.

Oil of Ravensara; Oleum Ravensaræ,—Lat. From the *roots* of *ravensara aromatica*. Chiefly used to adulterate oil of cloves, which it somewhat resembles.

Oil of Rhodium; Oleum Rhodii,—Lat. From the *wood* of *convolvulus scoparius* (Linn.), or the *root* of *genista Canariensis* (Linn.), both of which are known as Canary rosewood, and furnish lignum rhodium. Very fluid and limpid; pale yellow; soon darkens by age and exposure; tastes bitter and aromatic; has a modified odour of roses. Chiefly used as a substitute for otto of roses in cheap perfumery, and to adulterate it. *Oil of sandal-wood* is frequently sold for it. *Prod.* 0·1% to 0·16%. Resinous old wood yields the most oil. See *Oil of Roses*.

Oil of Roses; Oleum Rosæ,—Lat. 1. From the *petals* of *rosa sempervirens* (Linn.), or the *musk rose*, as oil of cloves, observing to keep the water in the worm-tub at 85° Fahr., and afterwards subjecting the water in the receiver to refrigeration. Resembles otto of roses, of which it is merely a variety. *Prod.* $\frac{1}{20}$ to $\frac{1}{16}$ of 1%.

2. *Attar of Roses, Otto of do.; Oleum Rosæ*,—Ph. E. From the *petals* of *rosa centifolia* and *r. sempervirens*, Linn. (damask and musk rose), principally the first, by saturating the water, by returning it repeatedly on *fresh flowers*, and then exposing it to a low temperature. In the *East Indies* it is obtained by stratifying *gingilie seeds* in alternate layers with *rose petals*, for some days, and repeating the arrangement with fresh roses till the seeds are saturated, when the oil is expressed and distilled along with water. In the neighbourhood of *Mecca*, the *rose leaves* are macerated in *salt-and-water* for 2 or 3 days, and then distilled, the water being received in separate receivers at different parts of the process. The water is afterwards exposed in porous earthenware vessels, tied over with linen, in trenches dug in the earth, and over which moistened straw is thrown, when in a short time the otto separates and floats on the surface.

Prop., &c. Colourless, or nearly so; odour, intense, penetrating, and diffusive, and in a concentrated state far from pleasant, but when dilute, very agreeable; taste, bland and sweetish; when pure it congeals at 80° and does not re-melt until heated to fully 85° Fahr.; 1000 parts of alcohol of 0·806, dissolve only 7 parts of otto at 57° Fahr., and only 33 parts, at 72°. Sp. gr. 0·832 at 90°, to water 1·000 at 60° Fahr. *Prod.* 100 *lb.* of roses yield 2 to 3 dr.

Pur. Otto of roses is frequently adulterated with the oils of rhodium, sandal-wood, and geranium, and with camphor; and occasionally with spermaceti, to give the spurious compound the usual crystalline appearance. The following are reliable tests:—1. Pure otto has a *bland, sweet taste;* if it is bitter it contains oil of rhodium or sandal-wood; if it is pungent or "bites" the palate, it contains either oil of geranium or camphor, and probably both; if it imparts an unctuous sensation, it contains spermaceti.—2. Exposed for some hours to the *fumes* of a small quantity of *iodine* under a bell-glass in the cold, pure otto remains white, and continues so when exposed to the air; an adulterated sample, on the contrary, becomes yellow or brown, and afterwards, on exposure to the air, continues to darken in colour, until it becomes of a deep-brown, or even perfectly black, according to the quantity of foreign oil present. A single drop may be thus tested.—3. (Guibourt.) *One* or *two drops* of the *suspected oil* are put into a *watch-glass;* the same number of drops of *concentrated sulphuric acid* are added; and the two fluids are mixed with a glass-rod. All the oils are rendered more or less brown by this proceeding; but—*Otto of roses* retains the purity of its odour,—*Oil of geranium* acquires a strong and disagreeable odour which is perfectly characteristic,—the odour of the *oil of rhodium* is increased, and becomes somewhat unctuous, and, in general, it acquires an odour distinctly like that of cubebs. (Journ. de Pharm.)

Oil of Rosemary; Oleum Anthos, Ol. Rorismarini; Ol. Rosmarini,—Ph. L. E. & D. *Ol. Rorismarini Essentiale*,—Ph. L. 1788. *Ol. R. Herbæ*,—Ph. L. 1721. From the *flowering tops of rosmarinus officinalis* (Linn.) In the Ph. L. English oil of rosemary (*ol. rosmarini, Anglicum*) is ordered. Colourless; strongly fragrant, but scarcely agreeable unless compounded; carminative and stimulant. Boils at 365° Fahr. Sp. gr. 0·910; recent, 0·897; *rectified*, 0·8887. *Prod.* $\frac{3}{4}$ to 1% (nearly).

Pur., &c. It is frequently adulterated with oil of turpentine. When pure it dissolves in all proportions in spirit of 0·830. By age it deposits a crystalline stearoptène and acquires a terebinthinate odour. It is chiefly used as a stimulant in liniments, hair oil, pomatums, &c.

Oil of Rosewort, Oil of Rose-root; Oleum Rhodiolæ,—Lat. From the *roots* of *rhodiola rosea* (Linn.) Yellowish; odour

resembles that of oil of rhodium, for which it is often sold, as well as the *distilled water* for rose water. 1½ *lb.* yields about 1 dr.

Oil of Rue; Oleum Rutæ,—Ph. L. & E. & Ph. D. 1826. The "oil distilled from the *flowering herb*" of "*ruta graveolens*, Linn." (Ph. L.), or common *rue*. Pale yellow, turning brown by age, and depositing a brownish, resinous sediment; congeals at about 40° Fahr.; acrid; bitter; odour, that of the plant; stimulant, antispasmodic, and emmenagogue. Sp. gr. 0·909 to 0·911. *Prod.* ¼ to 1% (nearly). According to Raybaud, the recent *dried seeds* yield fully four times as much oil as the flowering herb.

Pur. Nearly always adulterated. When pure,—1. It forms a clear solution with *rectified spirit*.—2. It does not form a camphor with *gaseous hydrochloric acid*.—3. *Iodine* dissolves in it slowly, without any apparent reaction, beyond a darkening and a slight increase of viscidity.—4. It is unaffected by a *solution* of *chromate of potassa*.—5. *Nitric acid* very slowly changes it into a greenish-yellow liquid balsam.—6. If it forms a reddish-brown solution with *liquor of potassa* and a still darker one with *oil of vitriol*, or if it fulminates with *iodine*, it is adulterated with the oil of some labiate plant.—7. It is more soluble in both rectified spirit and water than any of the oils used to adulterate it.

Oil of Saffron; Oleum Croci, — Lat. Yellow; heavier than water; acrid, pungent, and narcotic; decomposed by exposure to light and age, with the formation of a white solid matter, which is lighter than water.

Oil of Sage; Oleum Salviæ,—Lat. From the *herbaceous portion* of *salvia officinalis* (Linn.) or *common sage*.

Oil of Sandal wood; Oleum Santali, Ol. S. Albi,—Lat. From the *wood* of *sirium myrtifolium* (santalum album,—*Linn.*) or *sandal tree*, and preferably from that of Malabar. It has an odour somewhat resembling that of oil of rhodium, for which it is commonly used; also used to adulterate otto of roses. *Prod.* 9 *lb.* yield 1 *oz.*; 100 *lb.* yield 5 *oz.* (Raybaud).

Oil of Sarsaparilla; Oleum Sarzæ,—Lat. From the *root bark*, distilled along with *salt-and-water*. Acrid; odour and flavour same as the root.

Oil of Sassafras; Volatile Oil of do., Oleum Sassafras,—Ph. E., & Ph. D. 1826. *Ol. Lauri S., Ol. S. Officinalis*,—Lat. var. From bruised *sassafras chips*, the sliced root of *laurus sassafras* (Linn.), as oil of cloves. Pale yellow; highly odorous; hot, pungent, rubefacient, and stimulant; reputed alterative, sudorific, and diuretic, and, as such, occasionally given in rheumatism, cutaneous affections, &c. Sp. gr. 1·094 to 1·096. *Prod.* 1½ to 2% (fully),

Pur., &c.—1. If the density is lower than 1·094, it is adulterated.—2. *Nitric acid* acts on this oil, at first slowly, merely turning it of an orange-red, but afterwards with violence, and a reddish-brown resin is formed.—3. Mixed with about one-half its weight of *sulphuric acid*, a green colour is at first developed, which, by heat, is changed to a blood-red. A large quantity of sulphuric acid acts at once violently, white fumes are given off, and mere charcoal is left.—4. With *iodine* it forms a permanently clear solution, or at least one that remains so for some time.—5. By *agitation* with *water* it separates into *two* oils; one lighter, the other heavier than that fluid.

Oil of Savine; Oleum Juniperi Sabinæ, Ol. Sabinæ,—Ph. E. & D. From the *fresh tops* or *leaves* of *juniperus sabina* (Linn.) or *common savine*. Pale yellow; limpid; acrid, pungent, and stimulant. It possesses the general properties of the plant in a highly exalted degree. Sp. gr. 0·915. *Prod.* Fresh herb, 1·25 to 1·5%; dried do. (*recent*), 2½ to 3%. *Dose.* 2 to 6 drops, as an anthelmintic, diaphoretic, and emmenagogue. Its use must be carefully avoided during pregnancy, or disease of the abdominal viscera.

Pur., &c. It is less frequently adulterated than the other volatile oils. Its high sp. gr. and free solubility in rectified spirit, offer the means of detecting the presence of either oil of turpentine or alcohol, the substances occasionally added to it. A *mixture* of equal parts of *oil of savine* and *oil of vitriol*, by distillation from *milk of lime*, furnishes an oil apparently identical with "*oil of thyme*." (Winckler.)

Oil of Senna; Oleum Sennæ Volatile,—Lat. Possesses the nauseous odour and flavour of the leaves, and, as well as the *distilled water*, is purgative.

Oil of Spearmint, Oil of Mint, Oil of Green do.; Oleum Menthæ Viridis, — Ph. L. E. & D. *Ol. M. Sativæ; Ol. Essentiale Menthæ S.*, —Ph. L. 1788. *Ol. Herbæ M.*, — Ph. L. 1721. From the *flowering herb* of *mentha viridis* (Linn.) or *garden* or *spearmint*. Pale yellow; reddened by age; odour and general properties resemble those of oil of peppermint, but it is less grateful. It boils at 320° Fahr. Sp. gr. 0·915 (0·9394,—Brand). *Prod.* 0·2% to

0·25%. Its common adulterants are alcohol and oil of turpentine.

Oil of Spike (True), *Foreign Oil of Lavender; Oleum Spicæ, Ol. S. Verum, Ol. Stæchadis, Ol. Lavandulæ S.*—Lat. *Huile d'Aspic*,—Fr. From *lavandula spica* (De Cand.) and *l. stæchas* (Linn.), or *French lavender*. It differs from English oil of lavender by its darker green colour and inferior odour. From France. *Used* by artists to mix their colours in, and to make varnishes. Oil of turpentine scented with lavender is commonly sold for it. *Prod.* From *l. spica* (fresh), ¾ to 1½%; *l. stæchas* (dried), ¾ to 1% (fully).

Oil of Spikenard; Oleum Nardi,—Lat. From *andropogon nardus* (Linn.), or *Indian spikenard*. Highly fragrant; smells like cyperus.

Oil of Spring Grass; Oleum Anthoxanthi Odorati,—Lat. From *anthoxanthum odoratum* (Linn.) or *sweet-scented vernal grass*. It is this oil gives the very agreeable odour to new hay.

Oil of Sweet Fennel. See *Oil of Fennel.*

Oil of Sweet Flag; Oleum Acori, Ol. A. Aromatici,—Lat. From the *rhizomes* or *roots* of *acorus calamus* (Linn.) or *sweet flag*. Yellow; agreeably fragrant. *Used* to scent snuff, aromatic vinegar, &c. *Prod.* Fresh rhizomes, ¾ to 1%; dried (*recent*), 1 to 1·25%.

Oil of Tansy; Oleum Tanaceti,—Lat. From the *flowering herb* of *tanacetum vulgare* (Linn.) or *tansy*. Pale greenish-yellow; very odorous; bitter; aromatic. Sp. gr. 0·946 to 0·950. *Prod.* Fresh, 0·25 to 0·5%; dried (*recent*), ¾ to 1% (fully).

Oil of Thyme; Oleum Thymi; Oil of Origanum, Oleum Origani (of the shops). From the *flowering herb* of *thymus vulgaris* (Linn.) or *garden thyme*. Nearly colourless; the *imported oil* has a reddish colour, which it loses by rectification; very fragrant; acrid, hot tasted, stimulant, and rubefacient; boils at 354° Fahr. Sp. gr. 0·867 to 0·875. *Prod.* 0·5% to 0·75%.

Obs. This is the dark-coloured *oil of origanum* of the shops. It is frequently adulterated with oil of turpentine. It is occasionally used in toothache and in stimulating liniments; but its chief consumption is in perfumery, more particularly for hair oils, pomatums, and hair-washes, as it is reputed to make the hair grow, and to prevent baldness.

Oil of Tobacco (Volatile). From the *leaves* of *nicotiana tabacum* (Linn.) or the *tobacco plant*. Concrete. See *Nicotianine.*

Oil of Turpentine, Spirit of do., Essence of do.; Turps; Camphene, Camphine, Spiritus Terebinthinæ, Essentia T.; Oleum Terebinthinæ,—Ph. L. & D. *Ol. T. Purificatum*,—Ph. E., & Ph. L. 1836. *Ol. Volatile Pini purissimum*, — Ph. E. 1839. *Ol. T. Rectificatum*,—Ph. L. 1824. *Ol. T. Æthereum*,—Ph. L. 1746. The oil of turpentine of commerce is obtained by distilling strained *American turpentine* along with *water*. The *residuum* in the still is "*rosin*." The *product* in *oil* varies from 14% to 16%. The Colleges order it to be "*rectified*" before being employed for medicinal purposes. This is effected by redistilling it along with 3 or 4 times its volume of *water*, observing not to draw over quite the whole. The portion remaining in the retort (*balsam of turpentine*) is viscid and resinous. A *better plan* is to well-agitate it with an equal measure of *liquor of potassa* or *milk of lime* before rectifying it. This is the plan adopted for the *camphine* used for lamps. By agitating "crude oil of turpentine" with about 5% of *sulphuric acid* diluted with twice its weight of water, and after repose and decantation, rectifying it from 5 or 6 times its volume of the strongest *lime-water*, a very pure and nearly scentless oil may be obtained. Dr. Nimmo recommends oil of turpentine to be purified by agitation with ⅛th part of *rectified spirit*, after repose to decant the spirit, and to repeat the process 3 or 4 times. The product retains, however, fully ⅛th part of spirit in solution, and hence this method is objectionable, except for medicinal purposes, for which, according to Dr. Garrod, it is better than the oil purified by rectification. The "*sweet spirits of turpentine*" (spiritus terebinthinæ dulcis) vended of late years in the shops, is simply the common oil which has been agitated with, and rectified from, somewhat dilute sulphuric acid.

Prop. Pure oil of turpentine is colourless; limpid; very mobile; neutral to test-paper; has an odour neither powerful nor disagreeable when recently prepared, but becoming so by exposure to the air; dissolves ⅛th part of alcohol of 0·830; is soluble in 6 parts of ether, and in 7½ parts of rectified spirit; hot strong alcohol dissolves it freely, but the greater part separates in globules as the liquid cools. Oil of vitriol chars it, and strong nitric acid attacks it violently, even with flame. It congeals at 14°, and boils at 312° Fahr. Sp. gr. 0·867; that of the *oil of the shops* varies from 0·872 to 0·878. It possesses a very high refractive power. At 72° it absorbs 163 times its volume of hydrochloric acid gas (if kept cool), and in 24 hours from 26% to 47% of crystals (*Kind's camphor*) separate.

These have a camphoraceous odour, and after being washed with water, and sublimed along with some dry chalk, lime, or charcoal, assume the form of a white, translucent, flexible, crystalline mass, which is volatile, soluble in alcohol, and possesses a considerable resemblance to camphor. A nearly similar substance is produced by the action of oxygen gas on oil of turpentine.

Uses, &c. Oil of turpentine is extensively used in the manufacture of varnishes and paints; and under the name of *camphine*, to burn in lamps. For the last purpose it must be newly rectified and preserved from the air. By exposure it rapidly absorbs oxygen, resin is formed, its density increases, and it gives a dull fuliginous flame. In *medicine* it is employed as a diaphoretic, diuretic, stimulant, vermifuge, &c. *Dose.* 6 to 30 or 40 drops; in rheumatism, hemicrania, &c., 1 fl. dr., every four hours, in combination with bark or capsicum; in tapeworm, 3 fl. dr. to 1 fl. oz., either alone or combined with a little syrup of orange-peel, every 8 hours, until the worm is expelled. The common *symptoms* of *large doses* of this *oil* are dizziness, and a species of temporary intoxication, and occasionally, nausea and sickness, which subside after two or three alvine evacuations, leaving no other effect, when the oil is pure, than a certain degree of languor for a few hours. In *tape-worm*, a little castor oil may be advantageously combined with the second and subsequent doses. Oil of turpentine imparts a violet odour to the urine. For this purpose even the inhalation for a few minutes of the fumes from a small portion sprinkled on a piece of paper, or from a newly-painted surface, is sufficient. To *prevent loss* by *evaporation* and *resinification*, this oil should be kept in tin cans or glass bottles. For store vessels, closely-covered tin cisterns are the best. To *prevent accidents* it is proper to caution the operator of the extremely penetrating and inflammable nature of the vapour of this oil, even in the cold. During the process of its distillation, without the greatest precautions are taken, an explosion is almost inevitable.

Oil of Valerian; Oleum Valerianæ,—Ph. Bor. From the *root* of *valeriana officinalis* (Linn.), or *wild valerian*. Yellowish; viscid; lighter than water; smells strongly of the plant. By exposure to the air, it is partly converted into valerianic acid, and more readily so under the influence of an alkali. In its usual form it consists of *valerole*, *bornéene*, and *valerianic acid*. It is powerfully antispasmodic, emmenagogue, tonic, and stimulant, and, in large doses, narcotic. *Dose.* 2 to 6 drops; in epilepsy, hysteria, hemicrania, hypochondriasis, low fevers, &c. *Prod.* $1\frac{1}{4}$ to $2\frac{0}{0}$ (nearly).

Oil of Verbena; Oleum Verbenæ. From the *fresh flowering herb* of *verbena odorata*. *Prod.* $0{\cdot}2\frac{0}{0}$ to $0{\cdot}5\frac{0}{0}$. The *oil of verbena* of the shops is imported from India, and is obtained from *andropogon schænanthus*, (Linn.) See *Oil of Lemon Grass.*

Oil of Wine, Heavy do., Sweet do., Ethereal Oil, Oily Ethereal Liquor, Sulphatic Ether, Sulphate of Ether and Etherole; Oleum Æthereum,—Ph. L. *Oleum Vini,*—Ph. L. 1788. *Liquor Æthereus Oleosus,*—Ph. D. 1826. This is an artificial production which for convenience may be included under this head.

1. (Ph. L.) *Rectified spirit*, 2 pints, and *sulphuric acid*, 36 fl. oz., are cautiously mixed together in a glass retort, and submitted to distillation until a black froth appears, when the retort is immediately removed from the fire (*sand heat*); the lighter, supernatant liquor, is next separated from the fluid in the receiver, and exposed to the air for 24 hours; it is then agitated with a mixture of *liquor of potassa* and *water*, of each, 1 fl. oz., or q. s., and when sufficiently washed, is, lastly, separated from the aqueous liquid from which it has subsided. The formula of the Ph. L. 1836, is nearly similar.

2. (Ph. D.) *Rectified spirit* and *oil of vitriol* (commercial), of each, $1\frac{1}{2}$ pint; as the last, employing a Liebig's condenser, and a capsule for the exposure to the air; the oil is then transferred to a *moistened* paper-filter, and washed with a *little cold water*, to remove any adhering acid.

3. (Ph. D. 1826.) From the *residuum in the retort* after the *process of preparing ether*, distilled to one half, by a moderate heat, and the oil treated as before.

4. From *rectified spirit* (sp. gr. 0·833), 2 parts; *oil of vitriol*, 5 parts; mix and distil, as before; wash the product with *distilled water*, and free it from adhering water, and undecomposed alcohol by exposure in the vacuum of an air pump, between two open capsules, the one containing *hydrate of potassa*, and the other *concentrated sulphuric acid.* Pure.

5. By distilling a *mixture* of *ether* and *oil of vitriol*, and treating the product as before.

6. By the *destructive distillation* of dry *sulphovinate of lime:* the product is freed from alcohol, &c., by washing it. This process yields the largest product.

Prop., &c. An oily liquid, nearly colourless, neutral, with an aromatic taste, and an

odour resembling that of oil of peppermint. It is insoluble in water, but freely soluble in both alcohol and ether; boiling water converts it into *light* or *sweet oil of wine*; with an alkaline solution, this effect is produced with even greater facility. After being kept for some months it becomes viscid, and prismatic crystals (*stearoptène*) form in it, which are fusible and volatile, and soluble in alcohol and ether; in sulphuric acid these dissolve forming a pink solution, and in nitric acid a deep red one. Sp. gr. 1·05 (Hennel & Ph. L.); 1·13 (Serullas). Boils at 540° Fahr. "Dropped into water it sinks, the form of the globule being preserved." (Ph. L.) *Prod.* 1·25 to 1·5%; 33 *lb.* of rectified spirit, and 64 *lb.* of oil of vitriol, yield 17 *oz.* of this oil. (Hennel.)

Uses. Oil of wine is reputed anodyne, but is only used in the preparation of other compounds. See *Compound Spirit of Ether*, &c.

Oil of Wine (Light); *Sweet Oil of Wine.* See *Etherine*, *Etherole*, and *above*.

Wood Oil (of India). From the *chloroxylon Swietenia* (De Cand.), the tree which yields the *satin-wood* of the cabinet-makers. Another wood oil (*Gunjun balsam*) is obtained by incision from *dipterocarpus trinervis*, and other allied species. This balsam yields about 38% of a volatile oil by distillation, which in its general properties closely resembles oil of capivi. (O'Shaughnessey.)

Oil of Wormseed; Oleum Chenopodii,—Ph. U. S. From the *seeds* of *chenopodium anthelminticum* (Linn.; *chenopodium*, Ph. U.S.), or *Jerusalem oak* or *American wormseed.* Light yellow, or greenish; powerfully anthelmintic. Sp. gr. 0·908. *Dose.* For an adult, 25 to 30 drops, in sugar, honey, or milk, night and morning, for 3 or 4 days, followed by a good dose of castor oil, or some other suitable purgative.

Oil of Wormwood; Oleum Absinthii,—Lat. From the herbaceous portion of *artemisia absinthium* (Linn.) or *common wormwood;* green or brownish-green; odorous; acrid; bitter; stomachic. Sp. gr. 0·9703 (Brisson); 0·9720 (Pereira); 0·9725 (Brandes). *Prod.* Fresh herb (*picked*), ¼ to ⅓%; dry herb (*a year old*), ½% (fully); do. (*recent*), ¾ to 1% (fully).

Pur. That of the shops is nearly always either adulterated or partly spoiled by age; hence the discrepancies in the densities given for this oil by different authorities. A specimen of this oil distilled by ourselves from the green plant, had the sp. gr. 0·9712; but after being kept for 12 months it had increased to 0·9718. Nitric acid of 1·25, colours the pure oil first *green*, then *blue*, and, lastly, *brown.* The positive character of these reactions is in direct proportion to the purity and freshness of the sample.

OILY EMULSION. See *Emollient Linctus.*

OILY ETHEREAL LIQUOR. See *Oil of Wine.*

OINTMENT. Syn. *Unguentum*,—Lat. Any soft, fatty substance applied to the skin by inunction. The term is now commonly restricted to those which are employed in medicine.

Ointments (*unguenta*) differ from cerates chiefly in their consistence, and in wax not being a constant or essential constituent; and they are *made* and *used* in a nearly similar manner to that class of preparations. Their *proper degree* of *solidity* is that of good butter, at the ordinary temperature of the atmosphere. When the *active ingredients* are *pulverulent substances* nothing can be more suitable to form the body of the ointment than *good fresh lard*, free from salt; but when they are fluid or semi-fluid, *prepared suet*, or a *mixture* of *suet* and *lard*, will be necessary to give a due consistence to the compound. In some instances *wax* is ordered for this purpose. *Another excellent vehicle* for the more active ingredients, is a simple ointment formed by melting together 1 part of pure *white wax* with about 4 parts of *olive oil.* The use of the last excludes the possibility of the irritation sometimes occasioned by the accession of rancidity, when inferior lard is employed. In a *few* cases *butter* is employed to form the body of the ointment.

Some ointments are made from *recent vegetable substances* by *infusion* or *coction*, in the manner adopted for *medicated oils*, and explained at *page* 855.

The *precautions* to be used in the *choice* of *lard* are noticed at *p.* 675. Lard is now included in the Materia Medica of the London College. In the new Ph. D. lard for medicinal use (*adeps suillus præparatus*, Ph. D.) is ordered to be prepared by melting it in twice its weight of *boiling water*, stirring it constantly for some time, then setting the mixture aside to cool; and, lastly, separating the fat when it has solidified.

Ointments are best *preserved* by keeping them in salt-glazed earthen or stone-ware jars covered with tin foil, in a cool situation.

The *accession* of *rancidity* in ointments

and other unctuous preparations, may be greatly retarded, if not wholly prevented, by previously dissolving in the fat about 2% of *gum-benzoin*, in fine powder, or a rather less quantity of *benzoic acid*, by the aid of heat. This addition renders the ointment peculiarly soothing to irritable or highly sensitive skins. *Poplar buds* act in a similar manner.

The *formulæ* for all the more *useful* and *generally employed ointments* are given below. Those not included in the list may be prepared of the proper strength for all ordinary purposes, by combining about 12 to 15 times the *medium dose* of the *particular medicinal* with 1 *oz.* of *lard* or *simple ointment*. For *substances* which possess *little activity*, ½ to 1 dr. per oz., or even more, may be taken. See *Cerate*, *Fat*, *&c.*

OINTMENT (Acetate of Lead). Syn. *Unguentum Plumbi Acetatis*,—Ph. E. & D. *Ung. Cerussæ Acetatæ*,—Ph. L. 1788. *Ung. Saturninum*,—Ph. L. 1746. *Prep.* 1. (Ph. E.) *Acetate of lead*, in fine powder, 1 oz.; *simple ointment*, 20 oz.; mix them thoroughly (by trituration).

2. (Ph. D.) *Ointment of white wax*, 1 *lb.*; melt by a gentle heat, then add, gradually, of *acetate of lead*, in very fine powder, 1 *oz.*, and stir the mixture until it concretes.

Obs. A useful cooling, astringent, and desiccative ointment. For the formula of Ph. L. see *Cerates*.

OINTMENT (Acetic). See *Vinegar Ointment*.

OINTMENT (Aconite). Syn. *Unguentum Aconiti*,—Lat. *Prep.* (Dr. Turnbull.) *Alcoholic extract of aconite*, 1 part; *lard*, 2 parts; carefully triturated together. In neuralgia, &c.

OINTMENT (Aconite, — Ammoniated). Syn. *Unguentum Aconiti Ammoniatum*,—Lat. *Prep.* (Turnbull.) *Ammoniated extract of aconite*, 1 part; *lard*, 3 parts. In neuralgia, paralysis, old rheumatic affections, &c. The use of the above preparations of aconite requires the greatest caution. They are intended as substitutes for *ointment of aconitina*, a still more dangerous preparation.

OINTMENT (Aconitina). Syn. *Unguentum Aconitinæ*, — Lat. *Prep.* 1. (Dr. Garrod.) *Pure aconitina*, 1 gr.; *lard*, 1 dr.; mix by careful trituration.

2. (Dr. Turnbull.) *Aconitina*, 2 gr.; *rectified spirit*, 6 or 7 drops; triturate together, then add of *lard*, 1 dr., and mix well.

Use, *&c.* As a topical benumber in neuralgic affections, rheumatic pains, &c. Its application generally occasions considerable tingling, and sometimes redness of the part to which it is applied, followed by temporary loss of sensation in the skin, and the cessation of the pain. For slight cases, Dr. Paris formerly employed only 1 gr. to the oz. Owing to the intensely poisonous nature of aconitina, this ointment must be both *prepared* and *used* with great caution, and must never be applied to an abraded surface. It is seldom employed, owing to its extreme costliness. See *Aconitina* (and *above*).

OINTMENT (Ague). See *Anti-periodic Ointment*.

OINTMENT (Albinolo's). See *Patent Medicines*.

OINTMENT (Alkaline). Syn. *Unguentum Alkalinum*, — Lat. *Prep.* 1. (Biett.) *Carbonate of soda*, 2 dr.; *fresh-slaked lime*, 1 dr.; *powdered opium*, 2 gr.; *lard*, 2 oz.; mix by trituration. In prurigo, ringworm, and some other cutaneous affections.

2. (Cazenave.) *Carbonate of potassa*, 1 dr.; *lard*, 1 oz. In psoriasis, lepra, and scorbutic eruptions.

3. (Devergie.)—*a.* From *carbonate* (not sesquicarbonate) *of soda*, 10 to 15 gr.; *lard*, 1 oz. In lichen.

b. From *carbonate of soda*, 20 to 30 gr.; *lard*, 1 oz. In ichthyosis, lepra, psoriasis, and some other scaly skin diseases.

c. From *carbonate of soda*, ½ to 1 dr.; *lard*, 1 oz. In porrigo favosa, especially when occurring in adults.

4. (Soubeiran.) *Carbonate of soda*, 1 to 2 dr.; *wine of opium*, 1 fl. dr.; *lard*, 1 oz. In any of the above affections, when there is much pain or irritation.

Obs. Carbonate of potassa is thought to be preferable to carbonate of soda, when the above affections occur in scorbutic habits. A little *camphor* is also occasionally added.

OINTMENT (Alum). Syn. *Unguentum Aluminis*,—Lat. *Prep.* 1. *Alum*, in very fine powder, 1 dr.; *lard*, 1½ oz. In piles.

2. To the last add of *powdered opium*, 7 gr. In piles, when there is much pain.

OINTMENT (Ammoniacal). Syn. *Unguentum Ammoniacale*, *Ung. Ammoniæ*,—Lat. *Liparole d'Ammoniaque*, *Pommade de Gondret*,—Fr. *Prep.* 1. (P. Cod.) *Suet* and *lard*, of each, 1 oz.; melt in a strong wide-mouthed bottle, add of *liquor of ammonia* (sp. gr. 0·923), 2 oz., at once close the bottle, and agitate it until its contents concrete. As little heat as possible should be employed, to prevent unnecessary loss of ammonia.

2. (Gondret.) *Lard*, 3 parts; *suet*, 2 parts;

almond oil, 1 part; *strong liquor of ammonia*, 6 parts; mix, as before. Rubefacient, vesicant, and counter-irritant. Smeared over the skin, and covered so as to prevent evaporation, it raises a blister in 5 or 6 minutes. Its general effects and uses are similar to those of *compound liniment of ammonia*. (See *page* 698.)

OINTMENT (Carbonate of Ammonia). Syn. *Unguentum Ammoniæ Carbonatis, Ung. A. Sesquicarbonatis*,—Lat. *Prep.* From *sesquicarbonate of ammonia*, 1 dr.; *lard*, 9 dr. An excellent application to painful joints, indolent tumours, scrofulous sores, &c.

OINTMENT (Ammonio-chloride of Mercury). Syn. *White Precipitate Ointment; Unguentum Hydrargyri Ammonio-chloridi*, —Ph. L. *Ung. H. Precipitati Albi*,—Ph. L. 1824. *Ung. Precip. A.*,—Ph. E. *Ung. H. Submuriatis Ammoniati*,—Ph. D. 1826. *Prep.* 1. (Ph. L.) *Ammonio-chloride of mercury*, 2 dr.; *lard*, 3 oz.; triturate together.

2. (Ph. E.) As the last, but employing heat.

Uses, &c. Alterative; detergent; stimulant. In itch, scald-head, and various other skin diseases; in inflammation of the eyes; as an application to scrofulous and cancerous tumours; to destroy vermin on the body; &c. It "may be safely used" (in small quantities) "on infants." (A. T. Thomson.)

OINTMENT (Anglo-Saxon). *Prep.* Heat *olive oil*, 1 pint, and *bees' wax*, ¼ *lb.*, until the mixture acquires a reddish-brown colour; then add *red lead* (levigated), ¼ *lb.*, and continue the heat, with constant stirring; when the union appears complete, add of *amber* and *burnt alum*, of each, in fine powder, ½ *oz.*; lastly, when considerably cooled, add of *powdered camphor*, 3 dr. As a dressing to foul ulcers.

OINTMENT (Anodyne). See *Ointments of Opium, Hemlock, &c.*

OINTMENT (Anthracokali). Syn. *Pommade de Anthracokali; Unguentum do.*,—Lat. *Prep.* (Dr. Polya.) *Anthracokali*, in very fine powder, 1 part; *lard*, 30 parts.

Obs. Said to have been tried by Dr. Gibert at the Hôpital St. Louis, in 24 cases of cutaneous disease, many of which were cured, and in all the symptoms were ameliorated.

OINTMENT (Antiherpetic). Syn. *Unguentum Antiherpeticum*,—Lat. *Prep.* 1. (Alibert.) *Red sulphuret of mercury*, 3 dr.; *powdered camphor*, 1 dr.; *lard*, 3 oz.

2. (Chevallier.) *Subsulphate of mercury*, 2 dr.; *chloride of lime*, 3 dr.; *almond oil*, 6 dr.; *lard*, 2 oz. In herpes or tetters.

OINTMENT (Antimonial). See *Ointment of Potassio-tartrate of Antimony.*

OINTMENT (Antiperiodic). Syn. *Unguentum Antiperiodicum, Ung. Febrifugum*, —Lat. *Prep.* 1. *Disulphate of quinine*, 1½ dr.; *saccharine carbonate of iron*, 1 dr.; *oil of cajeput*, 30 drops; *fresh butter*, 1 oz.

2. (Antonini.) *Sulphate of quinine*, 1 oz.; *rectified spirit* and *sulphuric acid*, of each, q. s.; *lard*, 4 oz.

Uses, &c. About ¼ *oz.* of either of the above to be rubbed on the vertebral regions once every 2 or 3 hours for 3 or 4 days, in intermittent fevers, more especially in those accompanied by vomiting; or, into the epigastrium, in cholera, diarrhœa, or dysentery. (Journ. de Chimie Méd.)

OINTMENT (Aromatic). Syn. *Balsamum Stomachale Wackeri, Unguentum Aromaticum*,—Lat. *Prep.* (Ph. Austr. 1836.) *Simple ointment*, 2½ lb; *yellow wax* and *oil of laurel*, of each, 3 oz.; melt together, and when considerably cooled, add of *oils of juniper, mint, lavender*, and *rosemary*, of each, 2 dr. Anodyne, balsamic, and stimulant.

OINTMENT (Arsenical.) Syn. *Ointment of White Arsenic, Unguentum Arsenicale, Ung. Arsenici, U. Acidi A.*,—Lat. *Prep.* 1. *Arsenious acid* (levigated), 3 gr.; *lard* or *simple ointment*, 1 oz. In lepra, psoriasis, malignant whitlows, &c.

2. (Hosp. F.) *Levigated white arsenic*, 15 to 20 gr.; *lard*, 1 oz. As a dressing for cancerous sores.

3. (Soubeiran.) *White arsenic*, 1 dr.; *lard* and *spermaceti ointment*, of each, 6 dr. In malignant cancer. The above must be carefully prepared, and used with great caution. See *Cerates.*

OINTMENT (Arseniate of Iron). Syn. *Unguentum Ferri Arseniatis*,—Lat. *Prep.* 1. (Carmichael.) *Arseniate of iron*, ½ dr.; *phosphate of iron*, 2 dr.; *spermaceti ointment*, 6 dr.

2. (Dr. Pereira.) *Arseniate of iron*, ½ dr.; *lard*, 1½ oz. In cancer.

OINTMENT (Astringent.) Syn. *Unguentum Astringens*,—Lat. *Prep.* Triturate *powdered catechu*, 1½ dr., with *boiling water*, 2 fl. dr., add, gradually, of *spermaceti ointment* (melted), 1¼ oz., and continue the trituration until the mass concretes. An excellent dressing for ill-disposed sores and ulcers, especially during hot weather. See the several *lead ointments, Ointment of Galls, &c.*

OINTMENT (Atropia). Syn. *Unguentum Atropiæ*,—Lat. *Prep.* 1. *Atropia*, 1½ gr.;

simple ointment, 1 dr.; mix by careful trituration.

2. (Dr. Brookes.) *Atropia*, 5 gr.; *lard*, 3 dr.; *otto of roses*, 1 drop. In neuralgia, rheumatic pains, &c., when the affection is not deeply seated.

OINTMENT (Bailey's). See *Itch Ointment.*

OINTMENT (Balsam of Peru). Syn. *Unguentum Balsami Peruviani*, — Lat. *Prep.* 1. *Lard* or *spermaceti ointment*, 1 oz.; *balsam of Peru*, 1 dr.; melt together by the heat of boiling water, stir for 5 or 6 minutes, allow it to settle, and pour off the clear portion. In chaps and abrasions.

2. (*Ung. B. P. Compositum*,—Copland.) *Lard*, 1 oz.; *white wax*, ¼ oz.; *balsam of Peru*, 1 dr.; melt as before, and when nearly cold, add of *oil of lavender* 10 or 12 drops. As the last, and to restore the hair.

OINTMENT (Banyer's). Syn. *Compound Alum Ointment; Unguentum Aluminis Compositum, Ung. Calomelanos, Ung. Banyeri*,— Lat. *Prep.* From *burnt alum* and *calomel*, of each, 1½ oz.; *carbonate of lead* or *litharge* (levigated), 2 oz.; *Venice turpentine*, ½ ℔; *lard*, 2 ℔; carefully triturated together. In milk-scald, porrigo, &c.

OINTMENT (Bark). See *Ointment of Cinchona.*

OINTMENT (Basilicon). Syn. *Basilicon, Yellow do.*; *Unguentum Basilicum; Ung. B. Flavum*,—Ph. L. 1746. *Prep.* (Ph. L. 1746.) *Olive oil*, 16 fl. oz.; *yellow wax*, *yellow resin*, and *Burgundy pitch*, of each, 1 ℔; melt, remove the vessel from the fire, and stir in of *common turpentine*, 3 oz. This form is still occasionally employed in some shops, but is generally superseded by the *resin cerate* and *resin ointment* of the pharmacopœias. A nearly similar preparation, under the name of basilicon ointment, is contained in the Ph. Bor. 1847.

OINTMENT (Basilicon,—Black). See *Ointment of Pitch.*

OINTMENT (Basilicon,—Green). Syn. *Unguentum Basilicum Viride*,—Ph. L. 1746. *Prep.* (Ph. L. 1746.) *Prepared verdigris*, 1 oz.; *yellow basilicon*, 8 oz.; *olive oil*, 3 fl. oz. Detergent. *Used* to keep down fungous growths, to dress syphilitic ulcers, &c. See *Cerate* and *Ointment of Verdigris.*

OINTMENT (Bateman's). See *Itch Ointment.*

OINTMENT (Bay-leaves). See *Laurel Ointment.*

OINTMENT (Belladonna). Syn. *Unguentum Belladonnæ*, — Ph. L. *Prep.* 1. (Ph. L.) *Extract of belladonna* (deadly nightshade), 1 dr.; *lard*, 1 oz.; mix by trituration.

2. (Soubeiran.) *Fresh belladonna leaves* (bruised), 1 part; *lard*, 2 parts; simmer together until the leaves become crisp, and, after digestion for a short time longer, strain with pressure.

Uses, &c. As a local anodyne, in painful and indolent tumours, nervous irritations, &c. Also as an application to the neck of the uterus in cases of rigidity. (Chaussier.)

OINTMENT (Belladonna,—Compound). Syn. *Unguentum Belladonnæ Compositum*, —Lat. *Prep.* 1. (W. Cooley.) *Compound iodine ointment*, 7 dr.; *extract of belladonna*, 1 dr. Powerfully discutient. A most excellent application to all glandular tumours and indurations, buboes, &c., which it is desirable to disperse, instead of mature; more especially when there is much pain. It is particularly suitable to cases occurring on shipboard, and when its application (at least twice a day) is accompanied with the internal use of the mixture of iodine and gold (see *Antiscrofulous mixture*, page 793). This treatment has seldom failed, even when the parties were dieted chiefly on salt food.

2. (M. Debreyne.) *Extract of belladonna* and *lard*, of each, 3 dr.; *powdered opium*, ½ dr. As an external anodyne and benumber, more especially in neuralgia, painful cancerous tumours, &c. A small piece is to be applied to the part, and the friction continued for 6 or 8 minutes. The above preparations are useless, unless the extract employed is recent, and of good quality.

OINTMENT (Bichloride of Mercury). Syn. *Unguentum Hydrargyri Bichloridi, Ung. H. Oxymuriatis*,—Lat. *Prep.* 1. From *corrosive sublimate*, 2 to 5 gr.; rub it to powder in a glass or Wedgewood-ware mortar, add of *rectified spirit* 6 or 7 drops, or q. s.; again triturate; lastly add, gradually, of *spermaceti ointment* (reduced to a cream-like state by heat), 1 oz., and continue the trituration until the whole concretes. *Used* as a stimulant, detergent, and discutient application in various local affections; in lepra, porrigo, acne, &c., and as a dressing to syphilitic and some other ulcers.

2. (Ph. Chirur.) *Corrosive sublimate*, 10 gr.; *yelk of* 1 *egg; lard*, 1 oz. As a dressing.

3. (*Pommade de Cirillo*,—P. Cod.) *Corrosive sublimate*, 1 dr.; *lard*, 1 oz. Caustic; must not be confounded with the preceding.

OINTMENT (Bismuth). Syn. *Unguentum Bismuthi*,—Lat. *Prep.* 1. *Trisnitrate of bismuth*, 1 dr.; *simple ointment*, 1 oz.

2. (Fuller.) *Trisnitrate of bismuth*, 1 dr.; *spermaceti ointment*, 19 dr. In itch, and some chronic cutaneous diseases.

OINTMENT (Blistering). See *Ointment of Cantharides* and *Veterinary Medicine.*

OINTMENT (Blue). This is the vulgar name in England of mercurial ointment. On the Continent, an ointment made of *smalts* and *Goulard water*, is commonly so called.

OINTMENT (Borax). Syn. *Unguentum Boracis*,—Lat. *Prep.* From *borax* (in very fine powder), 1 dr.; *simple ointment* or *lard*, 7 dr. In excoriations, chaps, &c.

OINTMENT (Bromide of Potassium). Syn. *Unguentum Potassii Bromidi, Ung. Potassæ Hydrobromatis*,—Lat. *Prep.* (Magendie.) *Bromide of potassium*, ½ dr.; *lard*, 1 oz. Resolvent; in bronchocele, scrofula, &c.

OINTMENT (Bromine). Syn. *Unguentum Brominii, Ung. B. Compositum*,—Lat. *Prep.* (Magendie.) *Bromide of potassium*, 20 gr.; *bromine*, 6 to 12 drops; *lard*, 1 oz. As the last, but more active.

OINTMENT (Brown). Syn. *French Poor-man's Friend; Unguentum Fuscum, Ung. Hydrargyri, F.*,—Lat. *Prep.* (P. Cod.) *Nitric oxide of mercury* (levigated), ½ dr.; *resin ointment*, 1 oz. In ophthalmia (cautiously), after the inflammatory stage is over; as an application to sore legs, &c.

OINTMENT (Cadmium). Syn. *Unguentum Cadmii, Ung. C. Sulphatis*,—Lat. *Prep.* (Radius.) *Sulphate of cadmium*, 1 to 2 gr.; *pure lard*, 1 dr.; carefully triturated together. In specks on the cornea.

OINTMENT (Calamine). Syn. *Unguentum Calaminæ*,—Ph. D. 1826. *Ung. Lapis Calaminaris, Ung. Zinci Carbonatis Impuri, Ceratum Epuloticum*,—Lat. var. *Prep.* (Ph. D. 1826.) *Prepared calamine*, 1 ℔; *ointment of yellow wax*, 5 ℔. Desiccative and healing. This is the old Dublin form for *Turner's cerate.* (See *p.* 221.)

OINTMENT (Calomel). Syn. *Unguentum Calomelanos, Ung. Hydrargyri Chloridi*,—Lat. *Prep.* From *calomel*, 1 dr.; *lard* or *simple ointment*, 1 oz.

Obs. "Were I required to name a local agent preeminently useful in skin diseases generally, I should fix on this. It is well deserving a place in the Pharmacopœia." (Pereira.) Dr. Underwood uses *elder-flower ointment* as the vehicle.

OINTMENT (Calomel, — Compound). Syn. *Unguentum Calomelanos Compositum*,—Lat. *Prep.* (Dr. A. T. Thomson.) *Calomel*, 1 dr.; *tar ointment*, 4 dr.; *spermaceti ointment*, 1 oz. In lepra.

OINTMENT (Camphor). Syn. *Unguentum Camphoræ*,—Lat. *Prep.* 1. *Camphor*, 1 to 2 dr.; *lard*, 1 oz.; dissolve by a gentle heat and stir until the mass is nearly cold. Stimulant and anodyne; in prurigo, psoriasis, &c.

2. (*Compound.*)—*a.* From *powdered opium*, ½ dr.; *powdered camphor*, 1½ dr.; *lard*, 1¼ oz.; mix by trituration. As an anodyne friction in rheumatic pains, swelled joints, colic, &c.

b. (Ferriar.) *Camphor* and *powdered mustard*, of each, 1 dr.; *soap* (soft?), ½ oz.; *resin ointment*, 1 oz. As a friction in lumbago, &c.

OINTMENT (Cantharides). *Unguentum Cantharidis, Ung. Pulveris C.*,—Ph. E. *Ung. Epispasticum Fortius*,—P. E. 1817. *Prep.* (Ph. E.) *Resin ointment*, 7 oz.; melt, add of *cantharides* (in fine powder), 1 oz., and stir until the whole is nearly cold. See *Cerates* (and *below.*)

OINTMENT (Cantharides). Syn. *Unguentum Cantharidis*,—Ph. L. D. & U. S. *Ung. Infusi C.*,—Ph. E. *Ung. Lyttæ*,—Ph. L. 1809. *Ung. Epispasticum Mitius*,—Ph. E. 1817. *Prep.* 1. (Ph. L.) *Cantharides* (in very fine powder), 3 oz.; *distilled water*, 12 fl. oz.; mix, boil to one-half, to the strained liquid add of *resin cerate*, 1 ℔, and evaporate to a proper consistence.

2. (Ph. E.) *Powdered cantharides*, 1 oz.; *boiling water*, ¼ pint; infuse one night (12 hours), strain with expression, add of *lard*, 2 oz., and boil until the water is expelled; then add *bees' wax* and *resin*, of each, 1 oz., and when these are liquefied, remove the vessel from the fire, and further add of *Venice turpentine*, 2 oz.

3. (Ph. D.) *Liniment of Spanish flies*, 8 fl. oz.; *white wax*, 3 *oz.*; *spermaceti*, 1 *oz.*; melt together with a gentle heat, and stir until it concretes.

Obs. The above preparations are frequently called "*blister ointment*" or "*epispastic ointment.*" They are used to keep blisters open after they have been produced by stronger compounds. The last three compounds are regarded as milder than the first, which contains the flies in substance. The P. Cod. contains an ointment (*ung. epispasticum flavum*) which is weaker than the above, prepared by digesting the *bruised flies* in *lard*, for 3 hours, over a water bath; about ⅛th part of *wax* is next added to the strained fat, which is then coloured with *turmeric*, and scented with *oil of lemon.* See *Pommades.*

OINTMENT (Cantharidine). Syn. *Unguentum Cantharidinæ*,—Lat. *Prep.* (Soubeiran.) *Cantharidine*, 1 gr.; *white wax*, 1 dr.; *lard*, 7 dr.; mix thoroughly. (See *above.*)

OINTMENT (Capsicum). Syn. *Unguentum Capsici*,—Lat. *Prep.* (Dr. Turnbull.) *Tincture of capsicum* (pure), q. s.; gently evaporate it until it begins to gelatinize, then mix the extract with twice its

weight of *lard*. As a powerful stimulant and rubefacient. When very freely used, it vesicates.

OINTMENT (Carbonate of Ammonia). See *Ammoniacal Ointments*.

OINTMENT (Carbonate of Lead). Syn. *White Lead Ointment; Unguentum Plumbi Carbonatis*,—Ph. E. & D. *Ung. Cerussæ*,—Ph. D. 1807. *Ung. Album*,—Ph. E. 1744. *Prep.* 1. (Ph. E.) *Carbonate of lead*, 1 oz.; *simple ointment*, 5 oz.; mix thoroughly.

2. (Ph. D.) *Carbonate of lead*, 3 *oz.*; *ointment of white wax*, 1 *lb.*; mix with heat.

Uses, &c. Cooling; desiccative. Useful to promote the healing of excoriated parts and slight ulcerations. The *camphorated white ointment* of old pharmacy (*ung. album camphoratum*,—Ph. L. 1744) was made by adding 40 gr. of *camphor* to the first of the above.

OINTMENT (Catechu). Syn. *Unguentum Catechu*,—Lat. *Prep.* From *alum*, 1 *oz.*; *catechu*, 3 *oz.* (both in very fine powder); added to *olive oil*, ½ pint, and *yellow resin*, 4 *oz.*, previously melted together. *Used* to dress ulcers in hot climates, where the ordinary fat ointments are objectionable; also in this country during hot weather. See *Astringent Ointment*.

OINTMENT (Charcoal). Syn. *Unguentum Carbonis*,—Lat. *Prep.* 1. *Resin ointment*, 10 dr.; *recently burnt charcoal* (levigated), 3 dr. As a dressing to foul ulcers, especially those of the legs.

2. (Caspar.) *Lime-tree charcoal* and *dried carbonate of soda*, of each, 2 dr.; *rose ointment*, 1 oz., or q. s. In scald-head.

3. (Radius.) *Animal charcoal* (recent), 1 part; *mallow ointment*, 2 parts. As a friction in glandular enlargements and indurations, as a dressing to fœtid ulcers, &c.

OINTMENT (Cherry-laurel). Syn. *Unguentum Lauro-cerasi*,—Lat. *Prep.* (Soubeiran.) *Essential oil of cherry-laurel*, 1 dr.; *lard*, 1 oz. To alleviate the pain in cancer, neuralgia, and other local affections.

OINTMENT (Chilblain). Syn. *Unguentum ad Perniones*,—Lat. *Prep.* 1. From *made mustard* (very thick), 2 parts; *almond oil* and *glycerine*, of each, 1 part; triturated together. To be applied night and morning.

2. (Cottereau.) *Acetate of lead, camphor*, and *cherry-laurel water*, of each, 1 dr.; *tar*, 1½ dr.; *lard*, 1 oz.

3. (Devergie.) *Creasote* and *goulard's extract*, of each, 12 drops; *extract of opium*, 1½ gr.; *lard*, 1 oz. Twice or thrice daily.

4. (*Giacomini's.*) *Sugar of lead*, 2 dr.; *cherry-laurel water* (distilled), 2 fl. dr.; *lard*, 1 oz.

5. (Linnæus.) *Balsam of Peru*, 1 dr.; *hydrochloric acid*, 2 dr.; *spermaceti ointment*, 2½ oz.

6. (Swediaur.) Same as *Swediaur's paste*. See p. 237.

7. (*Vance's.*) See *Chilblains*.

8. (*Wahler's*) See *Chilblains*.

OINTMENT (Chloride of Calcium). Syn. *Unguentum Calcii Chloridi, Ung. Calcis Muriatis*,—Lat. *Prep.* (Sundelin.) *Chloride of calcium* (dry), 1 dr.; *strong vinegar*, 40 gr.; *foxglove* (recent, in fine powder), 2 dr.; *lard*, 1 oz. In bronchocele, scrofulous tumours, &c.

OINTMENT (Chloride of Lead). Syn. *Unguentum Plumbi Chloridi*,—Lat. *Prep.* (Mr. Tuson.) *Chloride of lead*, 1 part; *simple cerate*, 8 parts; carefully triturated together. In painful cancerous ulcerations and neuralgic tumours. See *Chloride of Lead*.

OINTMENT (Chloride of Lime). See *Ointment of Hypochlorite of Lime*.

OINTMENT (Chloride of Mercury). See *Ointments of Calomel* and *Bichloride of Mercury*.

OINTMENT (Chlorine). Syn. *Unguentum Chlorinii*,—Lat. *Prep.* (Augustin.) *Chlorine water*, 1 part; *lard*, 8 parts; well triturated together. In itch, lepra, ringworm, fœtid ulcers, &c.

OINTMENT (Chloriodide of Mercury). Syn. *Unguentum Hydrargyri Chloriodidi*,—Lat. *Prep.* (M. Recamier.) *Chloriodide* (iodo-bichloride) *of mercury*, 3 gr.; *lard*, 5 dr. Recommended as a powerful discutient or resolvent.

OINTMENT (Chloroform). Syn. *Unguentum Chloroformi*,—Lat. *Prep.* (M. Louis.) *Chloroform*, 1 dr.; *simple ointment*, 1 oz. In neuralgia and rheumatic pains, &c. It must be kept in a stoppered wide-mouthed phial.

OINTMENT (Cinchona). Syn. *Ointment of Bark; Unguentum Cinchonæ*,—Lat. *Prep.* (Biett.) *Red cinchona bark* (in very fine powder), and *almond oil*, of each, 1 part; *beef marrow* (prepared), 3 parts. In the variety of scald-head termed porrigo decalvans. A little oil of mace or tar is a useful addition.

OINTMENT (Citrine). See *Ointment of Nitrate of Mercury*.

OINTMENT (Cocculus Indicus). Syn. *Unguentum Cocculi*,—Ph. E. *Prep.* (Ph. E.) *Kernels* of *cocculus Indicus*, 1 part; beat them to a smooth paste in a mortar, first alone, and next with a little lard; then further add of *lard*, q. s., so that it may be equal to 5 times the weight of the kernels.

Used to destroy pediculi, and in scald-head, &c.

OINTMENT (Cod-liver Oil). Syn. *Unguentum Olei Morrhuæ, Ung. O. Jecoris Aselli*,—Lat. *Prep.* 1. *Cod-liver oil* (pale and recent), 7 parts; *white wax* and *spermaceti*, of each, 1 part; melted together. In ophthalmia and opacity of the cornea, either alone or combined with a little citrine ointment; as a friction or dressing for scrofulous indurations and sores; in rheumatism, stiff joints, and in several skin diseases. It often succeeds in porrigo or scald-head when all other remedies have failed. Scented with oil of nutmeg and balsam of Peru, it forms an excellent pommade for strengthening and restoring the hair.

2. (Deschamps.) *Caustic soda*, 1 oz.; *hot water*, 2½ oz.; dissolve, add of *cod-liver oil*, 8 fl. oz., and agitate briskly. It may be afterwards melted with a little *white wax*, if not consistent enough.

OINTMENT (Colocynth). Syn. *Unguentum Colocynthidis*,—Lat. *Prep.* (Chrestien.) *Colocynth pulp* (in very fine powder), 1 part; *lard*, 8 parts. *Used* in frictions on the abdomen as a hydragogue purgative, in mania, dropsy, &c.

OINTMENT (Cosmetic). Syn. *Unguentum Cosmeticum*,—Lat. *Pommade de la Jeunesse*,—Fr. *Prep.* (Quincey.) *Spermaceti*, 3 dr. (better, 4½ dr.); *oil of almonds*, 2 oz.; melt together, and, when cooled a little, stir in of *trisnitrate of bismuth*, 1 dr.; and lastly, of *oil of rhodium*, 6 drops. In itch, and some other cutaneous eruptions; but chiefly as a pommade for the hair. Its frequent use is said to turn the latter black.

OINTMENT (Creasote). Syn. *Unguentum Creasoti*,—Ph. L. E. D. & U. S. *Prep.* 1. (Ph. L.) *Creasote*, ½ fl. dr.; *lard*, 1 oz.; triturate together.

2. (Ph. E.) *Lard*, 3 oz.; melt it by a gentle heat, add of *creasote*, 1 dr., and stir the mixture until it is nearly cold.

3. (Ph. D.) *Creasote*, 1 fl. dr.; *ointment of white wax*, 7 *dr.*; as the last.

Uses, &c. In several skin diseases, especially ringworm; as a friction in tic douloureux; a dressing for scalds and burns; an application to chilblains, &c., &c.

OINTMENT (Croton Oil). Syn. *Unguentum Crotonis*,—Lat. *Prep.* 1. *Croton oil*, 15 to 30 drops; *lard* (softened by heat), 1 oz.; mix well. This is the usual and most useful strength to prepare this ointment. Rubefacient and counter-irritant; in rheumatism and various other diseases. When rubbed repeatedly on the skin it produces redness and a pustular eruption. It also often affects the bowels by absorption. The only advantage it possesses over other preparations of the class, is the rapidity of its action.

2. (*Rubefacient Pommade*,—Caventou.) *White wax*, 1 part; *lard*, 5 parts; melt together, and when quite cold mince it small, add of *croton oil*, 2 parts, and mix by trituration. Stronger than the last.

OINTMENT (Cyanide of Mercury). Syn. *Unguentum Hydrargyri Cyanidi*, — Lat. *Prep.* 1. (Cazenave.) *Bicyanide of mercury*, 8 gr.; *lard*, 1 oz.; carefully triturated together.

2. (Pereira.) *Bicyanide of mercury*, 10 to 12 gr.; *lard*, 1 oz. As a dressing for scrofulous and syphilitic ulcers, &c.; as an application in psoriasis, moist tetters, and some other skin diseases, &c. Biett orders the addition of a few drops of essence of lemon.

OINTMENT (Cyanide of Potassium). Syn. *Unguentum Potassii Cyanidi*, — Lat. *Prep.* (Cazenave.) *Cyanide of potassium*, 12 gr.; *oil of almonds*, 2 dr.; triturate, add of *cold cream* (dry), 2 oz., and mix by careful trituration. As an anodyne in neuralgia, rheumatism, swelled joints, &c.; also as a friction over the spine in hysteria, and over the epigastrium in gastrodynia, &c.

OINTMENT (Delphine). Syn. *Unguentum Delphiniæ*,—Lat. *Prep.* (Dr. Turnbull.) *Delphine* or *delphinia*, 10 to 30 gr.; *olive oil*, 1 dr.; *lard*, 1 oz.; mix as the last. *Used* as a friction in rheumatism, and the other cases in which veratrine is employed.

OINTMENT (Depilatory). Syn. *Unguentum Depilatorium*,—Lat. See *Pommade Epilatoire* (*p.* 324).

OINTMENT (Desiccative). Syn. *Drying Ointment, Unguentum Desiccativum, Ung. Exsiccans*,—Lat. See the *Ointments* of *Calamine, Lead, Zinc, &c.*

OINTMENT (Detergent). Syn. *Unguentum Detergens*,—Lat. The ointments of nitrate of mercury, nitric oxide of mercury, tar, verdigris, &c., when not too strong, come under this head.

OINTMENT (Digestive). Syn. *Unguentum Digestivum*,—Lat. *Prep.* 1. (P. Cod.) *Venice turpentine*, 2 oz.; *yelks* of 2 *eggs*; mix, and add of *oil of St. John's wort* (see *p.* 857), ½ oz.

2. (*Digestif Animé*,—P. Cod.) As the last, with an equal weight of *liquid styrax*.

3. (*Digestif Mercuriel*,—P. Cod.) As No. 1, with an equal weight of *mercurial ointment*.

4. (*Ung. D. Viride*,—Dr. Kirkland.) *Bees' wax, gum elemi*, and *yellow resin*, of each,

1 oz.; *green oil*, 6 oz.; melt them together, and when considerably cooled, add of *oil of turpentine*, 2 dr.

OINTMENT (Edinburgh). Two compounds are known under this name:—1. (*Brown.*) From *black basilicon*, 6 parts; *milk of sulphur*, 2 parts; *sal ammoniac*, 1 part.

2. (*White.*) From *white hellebore*, 3 *oz.*; *sal ammoniac*, 2 *oz.*; *lard*, 1 *lb.* Both are used in itch.

OINTMENT (Eggs). Syn. *Unguentum Ovorum*,—Lat. *Prep.* 1. *Yelk of* 1 *egg*; *honey* and *fresh linseed oil*, of each, 1 oz.; *balsam of Peru*, ½ dr.; mix well.

2. (Soubeiran.) *Bees' wax*, 4 dr.; *oil of almonds*, 1½ oz.; *yelk of* 1 *egg*. As an emollient and soothing dressing to excoriations, irritable ulcers, &c.

OINTMENT (Egyptian). *Prep.* (Giordano.) *Burnt alum*, 1 part; *verdigris*, 10 parts; *strong vinegar*, 14 parts; *purified honey* (thick), 32 parts; mix by heat and agitation. As a detergent application to foul ulcers. It is a modification of the *unguentum Ægyptiacum* of old pharmacy.

OINTMENT (Elder-flower). Syn. *White Elder-ointment*; *Unguentum Sambuci Florum*; *Ung. Sambuci*,—Ph. L. *Prep.* 1, (Ph. L.) *Elder flowers* and *lard*, of each. 1 ℔; boil them together until the flowers become crisp, then strain, with pressure, through a linen cloth. The same precautions must be observed as are necessary in the preparation of the *medicated oils*, by infusion. (See *p.* 855.) Emollient; less white and odorous than the following:—

2. (*Wholesale.*) Take of *lard* (hard, white, and sweet), 25 *lb.*; *prepared mutton suet*, 5 *lb.*; melt them in a well-tinned copper or earthen vessel, add of *elder-flower water*, 3 gall., agitate briskly for about ½ an hour, and set it aside; the next day gently pour off the water, re-melt the ointment, and add of *benzoic acid*, 5 dr.; *otto of roses*, 20 drops; *oil of bergamot* and *oil of rosemary*, of each, 1 dr.; again agitate well, let it settle for 10 minutes, and then pour off the clear portion into pots for sale. Very agreeable, and keeps well.

Obs. The last formula is the one now generally adopted by the large wholesale houses.

OINTMENT (Elder-leaf). Syn. *Elder Ointment*, *Green do.*; *Unguentum Viride*, *Ung. Sambuci Viride*; *Ung. Sambuci*,—Ph. D. 1826. *Ung. Sambucinum*,—Ph. L. 1746. *Prep.* 1. (Ph. D. 1826.) *Fresh elder-leaves* (bruised), 3 ℔; *suet*, 4 ℔; *lard*, 2 ℔; boil together, as above.

2. (Ph. L. 1746.) *Green oil*, 3 ℔; *bees' wax*, 10 oz.; melt together. Does not "grain."

3. (*Wholesale.*) Good *fresh lard*, 1 cwt.; *fresh elder leaves*, 56 *lb.*; boil till crisp, strain off the oil, put it over a slow fire, add hard *prepared mutton-suet*, 14 *lb.*, and gently stir it until it acquires a bright green colour.

Obs. The above ointment is reputed to be emollient and cooling, and has always been a great favorite with the common people. Both elder-flower and elder-leaf ointment are, however, unnecessary preparations. "They are vestiges of the redundant practice of former times." (A. T. Thomson.) The first and last formulæ are those now almost exclusively employed in trade. The ointment should be allowed to cool very slowly, and after its temperature has fallen a little, and it begins to thicken, it should not be stirred, in order that it may "*grain*" well, as a granular appearance is much admired. It is a common practice to add powdered verdigris to deepen the colour, but then the ointment does not keep well. This dangerous fraud may be detected in the manner noticed under *Savine Cerate* (p. 224).

OINTMENT (Elemi). Syn. *Unguentum Elemi*,—Ph. L. & D. *Ung. E. Compositum*,—Ph. L. 1824. *Ung. è Gummi Elemi* or *Linimentum Arcæi*,—Ph. L. 1721. *Balsam of Arcæus*, *Ointment of do.*, *Balsamum Arcæi*,—Obs. var. *Prep.* 1. (Ph. L.) *Elemi*, 3 oz.; *suet*, 6 oz.; melt them together, remove the vessel from the fire, and stir in of *common turpentine*, 2½ oz.; *olive oil*, ½ fl. oz.; lastly, strain the whole through a linen cloth.

2. (Ph. D.) *Resin of elemi*, 4 *oz.*; *ointment of white wax*, 1 *lb.*; melt them together, strain through flannel, and stir the mixture constantly until it concretes.

Uses, &c. Stimulant and digestive. It is frequently employed to keep open issues and setons, and as a dressing for old and ill-conditioned sores. The *ung. elemi cum ærugine* of St. George's Hospital is made by adding 1 dr. of *finely powdered verdigris* to every 6 oz. of the ointment.

OINTMENT (Escharotic). Syn. *Unguentum Escharoticum*,— Lat. *Prep.* 1. (Sir B. Brodie.) *Bichloride of mercury*, 1 dr.; *nitric oxide of mercury*, *sulphate of copper*, and *verdigris*, of each, 2 dr. (all in very fine powder); *lard*, q. s. See *Arsenical Ointment* and *Cerate*.

OINTMENT (Eye). Syn. *Eye Salve*, *Unguentum Ophthalmicum*,—Lat. *Prep.* 1. (Dr. Collier.) *Burnt alum*, ½ dr.; *powdered opium*, 20 gr.; *olive oil*, 1 fl. dr.; *sperma-*

ceti ointment, 2 dr. In inflammation of the eyelids, purulent ophthalmia, &c.

2. (W. Cooley.) *Chloride of barium*, 6 gr.; *calomel*, 10 gr.; *simple ointment*, 1 oz.; *otto of roses*, 1 or 2 drops. In scrofulous ophthalmia.

3. (Dessault.) *Nitric oxide of mercury*, *carbonate of zinc*, *acetate of lead*, and *dried alum*, of each, 1 dr.; *corrosive sublimate*, 10 gr.; *rose ointment*, 1 oz. In chronic ophthalmia, profuse discharges, &c.; in general diluted.

4. (Dupuytren.) *Red oxide of mercury*, 10 gr.; *sulphate of zinc*, 20 gr.; *lard*, 2 oz. For chronic inflammation of the eyelids, chronic ulcers, &c.

5. (Fricke.) *Nitrate of silver*, 10 gr.; *zinc ointment*, 2 dr.; *balsam of Peru*, ½ dr. In ulceration of the cornea, and in acute, purulent, and chronic ophthalmia, &c., employing great caution in its use.

6. (Guthrie.) *Spermaceti ointment*, 1 dr.; *solution of diacetate of lead*, 15 drops; *nitrate of silver*, 2 to 10 gr. As the last, and in cases wherein a direct caustic action is desired. The stronger ointment often occasions intense pain.

7. (Hufeland.) *Black oxide of mercury*, 2 gr.; *spermaceti cerate* and *walnut oil*, of each, 1 dr. In chronic affections of the eyes or eyelids, particularly in those of a syphilitic character.

8. (Janin.) *Ammonio-chloride of mercury*, 1 dr.; *tutty* and *bole*, of each, 2 dr.; *lard*, 1 oz. In debility of the conjunctiva, in chronic inflammation with excessive secretion, &c.

9. (*Marshall's.*) See *Cerates.*

10. (Parker.) *Iodine*, 1 gr.; *iodide of potassium*, 5 gr.; *simple ointment*, 3 dr. In scrofulous ophthalmia, thickening of the conjunctiva, opacity of the cornea, &c.

11. (Pellier.) *Nitric-oxide of mercury* and *carbonate of zinc*, of each, 1½ dr.; *tutty*, ½ dr.; *red sulphuret of mercury*, 20 gr.; *lard*, 2 oz.; *balsam of Peru*, 15 drops. In specks in the eye arising from small ulcers which have healed up; in excessive defluxions, &c.

12. (Ratier.) *Liquor of diacetate of lead*, ½ dr.; *wine of opium*, 1 dr.; *lard*, 5 dr. In excoriations, and the variety of chronic ophthalmia popularly termed "blear eye."

13. (*Regent's.*) *Acetate of lead* and *red precipitate*, of each, 1 dr.; *camphor*, 6 gr.; *washed fresh-butter*, 2½ oz. As the last, and in chronic ulcerations.

14. (Singleton's *Golden Ointment.*) According to Dr. Paris, this compound consists of *lard* medicated with *orpiment* (native yellow sulphuret of arsenic). There appears, however, to be some mistake in this, as that sold us under the name had nearly the same composition as the *ointment of nitric oxide of mercury* of the pharmacopœia. It did not contain even a trace of either arsenic or sulphur. The action of this nostrum, and the reputation which it has acquired, fully justify this conclusion.

15. (*Smellome's.*) From *verdigris* (levigated), ½ dr.; *olive oil*, 1 fl. dr.; triturate together, add of *yellow basilicon*, 1 oz., and again triturate until it begins to concrete. A popular nostrum, sometimes useful in chronic inflammation and ulcerations of the eyelids, &c., especially in those of a scrofulous character.

16. (Spielmann.) *Acetate of lead*, 20 gr.; *spermaceti cerate*, 5 dr.; *compound tincture of benzoin*, 40 gr. Cooling; desiccative. In inflamed eye-lids, excoriations, &c.

17. (Thomson.) *Levigated oxide of zinc*, 1 dr.; *lard*, 9 dr.; *wine of opium*, 20 drops. In chronic ophthalmia depending on want of tone in the vessels and integuments of the eye.

18. (Velpeau.) *Precipitated sesquioxide of iron* (recent, but dry), ½ dr.; *lard*, 5 dr.; *oil of almonds*, 1 fl. dr.; *balsam of Peru*, 15 drops. As the last, especially in "blear eye."

19. (Ware.) *Wine of opium*, 1 fl. dr.; *simple ointment*, 3 dr. In ophthalmia, after the inflammatory symptoms have subsided, and the vessels remain red and turgid.

20. (St. Yve.) *Fresh butter* (washed), 1 oz.; *white wax*, 1 dr.; *camphor*, 15 gr.; melt by a gentle heat, and when cooled a little, add of *red precipitate* (levigated), ½ dr.; *oxide of zinc*, 20 gr. In chronic inflammation of the coats of the eye, or of the eye-lids, specks on the cornea, &c.

Obs. The ingredients entering into the composition of all the above ointments must be reduced to the state of impalpable powder before mixing them; and the incorporation should be made by long trituration in a Wedgwood-ware mortar, or preferably, for those that contain substances that are very gritty, by levigation on a porphyry slab, with a muller. The most serious consequences, even *blindness*, have resulted from the neglect of these precautions. They should all be employed in exceedingly small quantities at a time, and they should be very carefully applied by means of a camel-hair pencil or a feather; and, in general, not until acute inflammation has subsided. The stronger ones, in most cases, require dilution with an equal weight, to twice their weight of lard or simple

ointment, and should only be used of their full strength under proper medical advice. Various other formulæ for *ophthalmic ointments* will be found under the names of their leading ingredients.

OINTMENT (Figwort). See *Ointment* (Scrophularia).

OINTMENT (Foxglove). Syn. *Unguentum Digitalis*,—Lat. *Prep.* 1. From *fresh foxglove*, as *ointment of hemlock*, Ph. L. As an application to chronic ulcers, glandular swellings, &c.

2. (M. Rudemacher.) *Extract of foxglove*, 2 dr.; *lard*, 1 oz. In croup; spread on lint, and applied as a plaster to the throat.

OINTMENT (Fuligokali). See *Fuligokali*.

OINTMENT (Galls). Syn. *Unguentum Gallæ*,—Ph. D. *Ung. Gallarum*.—Ph. D. 1826. *Prep.* (Ph. D.) *Gall-nuts* (in very fine powder), 1 *dr.*; *ointment of white wax*, 7 *dr.*; rub them together until a uniform mixture is obtained. An excellent application to piles, either alone or mixed with an equal quantity of zinc ointment; also highly useful in ring-worm of the scalp.

OINTMENT (Galls,—Compound). Syn. *Ointment of Galls and Opium*; *Unguentum Gallæ Opiatum*; *Ung. Gallæ Compositum*,—Ph. L. *Ung. Gallæ et Opii*,—Ph. E. *Prep.* 1. (Ph. L.) *Gall nuts* (very finely powdered), 6 dr.; *powdered opium*, 1½ dr.; *lard*, 6 oz.; rub them together.

2. (Ph. E.) *Galls*, 2 dr.; *opium*, 1 dr.; *lard*, 1 oz.; as the last.

Uses, *&c.* A most valuable astringent and anodyne in blind piles, slight cases of prolapsus ani, &c. Some practitioners add 1 dr. of *camphor*. The ointment of the Ph. E. is much the strongest.

OINTMENT (Galls with Morphia). Syn. *Unguentum Gallæ et Morphiæ*,—Lat. *Prep.* (Dr. Paris.) *Morphia*, 2 gr.; *olive oil* (hot), 2 fl. dr.; triturate, add of *zinc ointment* (Ph. L.), 1 oz.; *powdered galls*, 1 dr.; and mix thoroughly. In piles. The quantity of galls should be doubled.

OINTMENT (Garlic). Syn. *Unguentum Allii*,—Lat. *Prep.* 1. *Fresh garlic* (bruised), 2 parts; *lard*, 3 parts; simmer together for ½ an hour, and then strain with expression. Rubbed on the abdomen in chronic diarrhœa and colic, and over the chest and spine in hooping-cough.

2. (Beasley.) *Fresh garlic* and *lard*, equal parts; beaten together. Applied to the feet in hooping-cough.

OINTMENT (Giacomini's). See *Chilblain Ointment*.

OINTMENT (Gold). Syn. *Unguentum Auri*,—Lat. *Pommade d'Or*,—Fr. *Prep.* 1. (Legrand.) *Gold* (in powder), 12 gr.; *lard*, 1 oz. As a dressing for syphilitic ulcers, and as a friction in glandular indurations, &c.; also endermically.

2. (Magendie.) *Amalgam of gold*, 1 dr.; *lard*, 1 oz. For endermic use, chiefly. When the surface becomes dry, the ointment of terchloride of gold is to be substituted as a dressing. In rheumatic pains, neuralgia, &c.

OINTMENT (Golden). See *Eye Ointment*, *Citrine do.*, *&c.*

OINTMENT (Gondret's). See *Ammoniacal Ointment*.

OINTMENT (Goulard's). Syn. *Unguentum Goulardi*, *Ung. Lithargyri Acetatis*,—Lat. *Prep.* (Ph. Chirur.) *Goulard's extract*, 1 dr.; *simple ointment*, 2 oz. See *Cerates* (*p.* 222).

OINTMENT (Green). See *Elder Ointment*.

OINTMENT (Hellebore). Syn. *Ointment of White Hellebore*; *Unguentum Veratri*,—Ph. L. 1836 & Ph. D. 1826. *Ung. Hellebori Albi*,—Ph. L. 1788. *Prep.* (Ph. L. 1836.) *White hellebore* (in very fine powder), 2 oz.; *lard*, 8 oz.; *oil of lemons*, 20 drops. In itch, lepra, ringworm, &c.; and to destroy insects in the hair of children. It should be used with caution, and preferably, diluted with an equal weight of lard.

OINTMENT (Hellebore,—Compound). Syn. *Unguentum Veratri Compositum*,—Lat. *Prep.* 1. (Rayer.) *White hellebore*, 1 oz.; *sal ammoniac*, ½ oz.; *lard*, 8 oz. *Used* as the last.

2. See *Compound Sulphur Ointment*, Ph. L.

OINTMENT (Hemlock). Syn. *Unguentum Conii*,—Ph. L., and Ph. D. 1826. *Prep.* 1. (Ph. L.) *Fresh hemlock leaves* and *lard*, of each, 1 ℔; boil them together (very gently) until the leaves become crisp, then strain through linen, with pressure. See *Medicated Oils* (*p.* 855).

2. *Extract of Hemlock*, 1 dr.; *lard*, 9 dr.; triturate together.

Uses, *&c.* As a local anodyne in neuralgic and rheumatic pains, glandular enlargements, painful piles, &c.; and as a dressing to painful and irritable ulcers, cancerous sores, &c.

OINTMENT (Henbane). Syn. *Unguentum Hyoscyami*,—Lat. *Prep.* 1. *Fresh henbane leaves*, 1 ℔; *lard*, 2 ℔; boil until nearly crisp.

2. (Taddei.) *Extract of henbane*, 1 dr.; *lard*, 1 oz. Anodyne; in painful piles, sores, &c., as the last.

OINTMENT (Holloway's). See *Patent Medicines.*

OINTMENT (Hops). Syn. *Unguentum Lupuli,*—Lat. *Prep.* (Swediaur.) *Hops* (commercial), 2 oz.; *lard*, 10 oz.; as extract of hemlock, Ph. L. In painful piles and cancerous sores.

OINTMENT (Hydriodate of Ammonia). Syn. *Unguentum Ammoniæ Hydriodatis,*—Lat. *Prep.* From *hydriodate of ammonia*, ½ dr.; *simple ointment*, 1 oz. *Used* chiefly as an application to scrofulous tumours and ulcers, in irritable subjects.

OINTMENT (Hydriodate of Potassa). See *Ointment of Iodide of Potassium.*

OINTMENT (Hydrochloric Acid). Syn. *Unguentum Acidi Hydrochlorici,*—Lat. *Prep.* (Dr. Corrigan.) *Hydrochloric acid*, 1 dr.; *simple ointment*, 1 oz. As a dressing for scald-head, after the scabs have been removed by emollient liniments or poultices.

OINTMENT (Hypochloride of Sulphur). Syn. *Unguentum Sulphuris Hypochloridi,*—Lat. *Prep.* (Dr. Copland.) *Hypochloride of sulphur*, 1 dr.; *simple ointment*, 1 oz. It is generally scented with oil of almonds. *Used* in psoriasis inveterata, and some other skin diseases.

OINTMENT (Hypochlorite of Lime). Syn. *Unguentum Calcis Hypochloritis, Ung. C. Chlorinatæ,*—Lat. *Prep.* 1. From *chlorinated lime* (chloride of lime), 1 dr.; *lard*, 1 oz.; carefully triturated together. In scrofulous swellings, goiture, chilblains, indolent glandular tumours, &c.

2. *Chlorinated lime*, 1 dr.; *powdered foxglove*, 2 dr.; *simple ointment*, 2 oz. As an application to fœtid and malignant ulcers, &c.

OINTMENT (Iodide of Arsenic). Syn. *Unguentum Arsenici Iodidi,*—Lat. *Prep.* (M. Biett.) *Iodide of arsenic*, 2 to 3 gr.; *lard*, 1 oz.; carefully triturated together. In lepra, psoriasis, &c.; and in corroding tubercular diseases. It should be used with caution, and not more than ½ dr. applied at once.

OINTMENT (Iodide of Barium). Syn. *Ointment of Hydriodate of Baryta; Unguentum Barii Iodidi, Ung. Barytæ Hydriodatis,*—Lat. *Prep.* (Magendie.) *Iodide of barium*, 3 to 4 gr.; *lard*, 1 oz. As a friction to scrofulous swellings and indurations. The usual proportions are now 5 gr. to the oz.

OINTMENT (Iodide of Lead). Syn. *Unguentum Plumbi Iodidi,*—Ph. L. & D. *Prep.* 1. (Ph. L.) *Iodide of lead*, 1 oz.; *lard*, 8 oz.; rub them together.

2. (Ph. D.) *Iodide of lead* (in fine powder), 1 *dr.*; *ointment of white wax*, 7 *dr.* An excellent application to scrofulous tumours and swelled glands, especially when accompanied with pain.

OINTMENT (Iodide of Mercury). Syn. *Ointment of Protiodide of Mercury; Unguentum Hydrargyri Iodidi,*—Ph. L. *Prep.* 1. (Ph. L.) *White wax*, 2 oz.; *lard*, 6 oz.; melt them together, add of *iodide* (protiodide) *of mercury*, 1 oz., and rub them well together.

2. (Magendie.) *Iodide of mercury*, 20 gr.; *lard*, 1½ oz.

Uses, &c. In tubercular skin diseases, as a friction in scrofulous swellings and indolent granular tumours, and as a dressing for ill-conditioned ulcers, especially those of a scrofulous character.

OINTMENT (Biniodide of Mercury). Syn. *Ointment of Red Iodide of Mercury; Unguentum Hydrargyri Biniodidi; Ung. H. Iodidi Rubri,*—Ph. D. *Prep.* 1. (Ph. D.) *Red iodide of mercury*, 1 dr.; *ointment of white wax*, 7 dr.; mix by careful trituration.

2. (Soubeiran.) *Biniodide of Mercury*, 20 gr.; *lard*, 1½ oz.

Uses, &c. Similar to those of the preceding, but it is much more stimulant, and is regarded as better adapted for obstinate syphilitic sores. Largely diluted with lard or almond oil it is applied to the eyes in like cases.

OINTMENT (Iodide of Potassium). Syn. *Ointment of Hydriodate of Potassa; Unguentum Potassii Iodidi,*—Ph. L. & D. *Prep.* 1. (Ph. L.) *Iodide of potassium*, 2 dr.; dissolved in *boiling distilled water*, 2 fl. dr.; *lard* (softened by heat), 2 oz.: triturate together until united.

2. (Ph. D.) *Iodide of potassium*, 1 *dr.*; *distilled water*, ½ fl. dr.; *ointment of white wax*, 7 *dr.*; as before.

3. (Magendie.) *Iodide of potassium*, 1 dr.; *lard*, 12 dr.

4. (Le Gros.) *Iodide*, ½ dr.; *lard*, 1 oz.

Uses, &c. As a friction in scrofula, bronchocele, glandular enlargements, indurations, &c.; as a dressing to scrofulous ulcers, as an application in scrofulous ophthalmia, and in most of the other applications in which the employment of iodine is indicated. The last formula has been successfully employed by M. Le Gros in itch.

Obs. The strength of this ointment, as prescribed by different parties, varies greatly, the proportions of the iodide ranging from $\frac{1}{32}$ to $\frac{1}{8}$th of the whole, to adapt it to particular cases. When other ingredients are added, the iodide must be used in a perfectly dry state, and in fine

powder, instead of being dissolved in water. This is particularly necessary when it is to be mixed with mercurial ointment.

OINTMENT (Iodide of Sulphur). Syn. *Unguentum Sulphuris Iodidi*,—Ph. L. *Prep.* 1. (Ph. L.) *Iodide of sulphur* (in fine powder), ½ dr.; *lard*, 1 oz.; mix by trituration.

2. (Cazenave.) *Iodide of sulphur*, 12 to 15 gr.; *lard*, 1 oz.

Uses, &c. As a local stimulant and alterative, in the chronic forms of lepra, lupus, porrigo, psoriasis, itch, &c. A few drops of oil of cloves or nutmeg are commonly added.

OINTMENT (Iodide of Zinc). Syn. *Ointment of Hydriodate of Zinc; Unguentum Zinci Iodidi, Ung. Z. Hydriodatis*,—Lat. *Prep.* 1. From *iodide of zinc*, 12 gr.; *simple ointment*, 1 oz. In scrofulous excoriations, and in the chronic ophthalmia of scrofulous subjects, arising from a relaxed state of the tissues and vessels.

2. (Dr. Ure.) *Iodide of zinc*, 1 dr.; *lard*, 1 oz. As a friction to glandular tumours and indurations, and as a dressing to flabby and obstinate scrofulous ulcers.

OINTMENT (Iodine). Syn. *Unguentum Iodinii*,—Ph. U. S. and Ph. D. 1826. *Prep.* 1. (Ph. D. 1826.) *Iodine*, 20 gr.; *lard*, 1 oz.

2. (Ph. U. S.) *Iodine*, 20 gr.; *rectified spirit*, 20 drops; rub them together, then add of *lard*, 1 oz. (See *below*.)

OINTMENT (Iodine,—Compound). Syn. *Ointment of Ioduretted Iodide of Potassium; Unguentum Potassii Iodidi Ioduretum; Ung. Iodinii Compositum*,—Ph. L. & D. *Ung. Iodinii*,—Ph. E. *Prep.* 1. (Ph. L.) *Iodide of potassium* (in very fine powder), 1 dr. *lard*, 2 oz.; mix, then add of *iodine*, ½ dr., dissolved in *rectified spirit*, 1 fl. dr., and mix all together.

2. (Ph. E.) *Iodine*, 1 dr.; *iodide of potassium*, 2 dr.; rub them together, then gradually add of *lard*, 4 oz.

3. (Ph. D.) *Pure iodine*, ½ *dr.*; *iodide of potassium*, 1 *dr.*; rub them well together in a glass or porcelain mortar, then gradually add of *ointment of white wax*, 14½ *dr.*, and continue the trituration until a uniform ointment is obtained.

Uses, &c. An excellent friction in goiture, and in enlarged or indurated glands or tumours, more especially those of a scrofulous character; in the quantity of ½ to 1 dr., night and morning. It may be advantageously combined with extract of belladonna in the incipient bubo of scrofulous subjects, and in the early stages of cancer; and with an equal weight of mercurial ointment as a friction in cases of enlarged liver and spleen, and ovarian dropsy. It is generally regarded as stronger and more efficacious than the simple ointment.

OINTMENT (Iodo-bichloride of Mercury). Syn. *Unguentum Hydrargyri Iodo-bichloridi*,—Lat. *Prep.* From *iodo-bichloride of mercury*, 16 gr.; *simple ointment*, 1 oz. Discutient; probably one of the most powerful known in syphilitic cases complicated with scrofula.

OINTMENT (Iodo-hydrargyrate of Potassa). Syn. *Unguentum Potassæ Iodo-hydrargyratis*,—Lat. *Prep.* 1. (Lamothe.) *Iodohydrargyrate of potassa*, 20 gr.; *lard*, 1 oz.

2. (Puche.) *Biniodide of mercury* and *iodide of potassium*, of each, 8 gr.; *lard*, 1 oz. As a powerful stimulant discutient; in tumours, inflammatory sore throat, &c.

OINTMENT (Iodo-narcotic). Syn. *Unguentum Iodo-narcoticum*,—Lat. *Prep.* (Purvis.) *Iodine*, 20 gr.; *iodide of potassium*, 2 dr.; *oil of tobacco* (by infusion), 1½ dr.; *lard*, 3 dr. To relax rigid muscles.

OINTMENT (Ipecacuanha). Syn. *Unguentum Ipecacuanhæ*,—Lat. *Prep.* (Dr. Turnbull.) *Ipecacuanha* (in fine powder), 2 dr.; *olive oil*, 2 fl. dr.; *lard* or *simple ointment*, 4 dr. Counter-irritant; when frequently employed as a friction it occasions an eruption, but one of a milder character than that from either croton oil or tartar emetic.

OINTMENT (Issue). Syn. *Unguentum ad Fonticulos*,—Lat. *Prep.* (Golding Bird.) *Ointment of cantharides* (Ph. L.), 1½ oz.; *tartar emetic* (in impalpable powder), 8 gr.; *spermaceti ointment*, 2 oz. As a stimulating application to issues, to promote the discharge. See *Elemi Ointment*, *Cerates*, *Plasters*, *&c.*

OINTMENT (Itch.) Syn. *Unguentum Antipsoricum*,—Lat. Several excellent formulæ for itch ointments will be found under the names of their leading ingredients. The following are additional ones, including some nostrums:—

1. (*Bailey's.*) From *alum*, *nitre*, and *sulphate of zinc*, of each, in very fine powder, 1½ *oz.*; *vermilion*, ½ *oz.*; mix, add gradually of *sweet oil*, ¼ pint; triturate together until perfectly mixed, then further add of *lard* (softened by heat), 1 *lb.*, with *oils of aniseed*, *lavender*, and *origanum*, q. s. to perfume.

2. (Bateman.) *Carbonate of potassa*, ½ oz.; *rose water*, 1 fl. oz.; *red sulphuret of mercury*, 1 dr.; *oil of bergamot*, ½ fl. dr.; *sublimed sulphur* and *hog's lard*, of each, 11 oz.; mix them. (Bateman, *Cutan. Dis-*

eases.) The nostrum vended under the name is made as follows:—*Carbonate of potash*, 1 oz.; *vermilion*, 3 dr.; *sulphur*, 1 *lb.*; *lard*, 1½ *lb.*; *rose-water*, 3 fl. oz.; *oil of bergamot*, 1½ dr.

3. (French Hosp.) *Chloride of lime*, 1 dr.; *rectified spirit*, 2 fl. dr.; *sweet oil*, ½ fl. oz.; *common salt* and *sulphur*, of each, 1 oz.; *soft soap*, 2 oz.; *oil of lemons*, 20 drops. Cheap, effectual, and inoffensive.

4. (De la Harpe.) *Sulphur*, 2 oz.; *powdered white hellebore*, ½ oz.; *sulphate of zinc*, ¼ do.; *soft soap*, 4 oz.; *lard*, 8 oz.

5. (*Jackson's.*) From *palm oil, flowers of sulphur*, and *white hellebore*, of each, 1 part; *lard*, 2 parts.

6. (*Nugent's.*) From *white lead*, 2 *oz.*; *orris root*, 1 *oz.*; *corrosive sublimate*, in very fine powder, ½ *oz.*; *palm oil*, 4 *oz.*; *lard*, 1¼ *lb.*

7. (Ph. E. 1744.) *Elecampane root* and *sharp-pointed dock* (rumex acutus,—Linn.), of each, bruised, 3 oz.; *water*, 1 quart; *vinegar*, ¾ pint; boil to one-half, add of *water-cress*, 10 oz.; *lard*, 4 ℔; boil to dryness, and strain with expression; to the strained liquid add of *bees' wax* and *oil of bays*, of each, 4 oz.; and stir the mixture until nearly cold.

8. (*Ung. A. Comp.*,—Ph. E. 1744.) To each ℔ of the last, add of *strong mercurial ointment*, 2 oz.

9. (Robertson.) *Soft soap*, 1 *oz.*; *rum*, 1 tablespoonful; *chloride of lime* (dry and good), ¼ *oz.*; mix, and add of *lard*, 2 *oz.*

10. (Swediaur.) *Stavesacre* (in powder), 1 oz.; *lard*, 3 oz.; digest with heat for 3 hours, and then strain. The formula of the Ph. Bruns. is nearly similar. Very useful in itch; also to destroy pediculi.

11. (Thomson.) *Chloride of lime* and *common salt*, of each, in fine powder, 1 dr.; *soft soap*, 1 oz.; *rectified spirit*, 2 fl. dr.; mix, add of *lard*, 1 oz.; and *lastly*, of *strong vinegar*, 3 fl. dr. Very cleanly and effective; but should not be made in quantity, as it does not keep well.

12. (Voght.) *Chloride of lime* (dry), 2 dr.; *burnt alum*, 3 dr.; *lard*, 9 dr. To be mixed with an equal quantity of *soft soap* at the time of fusing it.

Obs. The products of the preceding formulæ are used by *well rubbing* them into the part affected, night and morning, as long as necessary; the number of applications required depending greatly on the manner in which this is done.

OINTMENT (Ivy). Syn. *Unguentum Hederæ*,—Lat. *Prep.* From the *leaves* of *common ivy*, by infusion, as ointment of henbane. *Used* as an application to soft corns, in itch, and as a dressing to indolent ulcers and issues.

OINTMENT (Juniper-tar.) *Unguentum Olei Pyroligni Juniperi, Ung. Cadinum*,—Lat. *Prep.* (Eras. Wilson.) *Lard* and *suet*, of each, 6 parts; *bees' wax*, 4 parts; liquefy by heat, and add of *pyroligneous oil of juniper* (huile de cade), 16 parts; with a few drops of any *fragrant essential oil*, to conceal the smell. In ringworm, and as a stimulant ointment in some other skin diseases.

OINTMENT (Kirkland's). See *Compound Lead Ointment.*

OINTMENT (Lard). Syn. *Unguentum Adipis*,—Ph. L. 1788. *Ung. Pomatum*,—Ph. L. 1746. *Ung. Simplex*, Ph. E. 1744. *Prep.* (Ph. L. 1788.) *Prepared lard*, 2 ℔; melt, add of *rose-water*, 3 fl. oz.; beat the two well together, then set the vessel aside, and when the whole is cold separate the congealed fat. A simple emollient. See *Elder Ointment.*

OINTMENT (Laurel). Syn. *Laurine Ointment; Unguentum Laurinum, Ung. Lauri Nobilis*,—Lat. *Prep.* 1. (Ph. Lusit.) *Suet* (softened by heat), 8 oz.; *laurel oil* (expressed oil of bay), 1 ℔; *oil of turpentine*, 1½ oz. This is the "*nervine balsam*" and "*nervine ointment*" of the shops in the Peninsula, and in some other parts of Southern Europe. The Ph. Bat., 1805, added ½ oz. of *rectified oil of amber.*

2. (P. Cod.) *Fresh bay leaves* and *berries* (bruised), of each, 1 ℔; *lard*, 2 ℔; as *hemlock ointment*, Ph. L. Highly esteemed on the Continent as a stimulating friction, in bruises, sprains, stiff joints, &c.; and in deafness.

3. (Trade.) From *fresh bay leaves*, 2 *lb.*; *bay berries*, 1 *lb.*; *neat's-foot oil*, 5 pints; boil as last; to the *strained oil* add of *hard suet*, 3 *lb.*; *true oil of bay*, ¼ *lb.*; and allow it to cool very slowly, in order that it may "*grain*" well. Sold for *laurel ointment* and *common oil of bay.*

OINTMENT (Lead). Syn. *Unguentum Plumbi, Ung. Lithargyri, Ung. Nutritum*,—Lat. *Prep.* (P. Cod.) *Litharge*, 3 oz.; *distilled vinegar*, 4 oz.; *olive oil*, 9 oz.; mix with heat, and stir until they combine. See *Acetate of Lead, Carbonate of do.*, and *Goulard Ointments* (and *below*). Camphor, morphia, and opium, are common additions to lead ointment, when an anodyne effect is desirable.

OINTMENT (Lead,—Compound). Syn. *Neutral Ointment, Higgin's do., Kirkland's do.; Unguentum Neutrale; Ung. Plumbi Compositum*,—Ph. L. *Prep.* (Ph. L.) *Lead plaster*, 3 ℔; *olive oil*, 18 fl. oz.; mix by a gentle heat, and add of *prepared chalk*, 6 oz.;

lastly, add of *dilute acetic acid*, 6 fl. oz., and stir well until the mass has cooled. As a dressing in indolent ulcers, "but its utility is doubtful." (Dr. Garrod.)

Obs. It will be observed that the College has slightly modified the old formula of this ointment. The vinegar is now the last ingredient added to the mass. "Gradually add the chalk, separately mixed with the vinegar, the effervescence being finished, and stir," &c. (Ph. L. 1836.)

OINTMENT (Le Mort's). *Carbonate of lead, corrosive sublimate, litharge,* and *Venice turpentine*, of each, 1 *oz.; alum*, ½ *oz.; lard*, ½ *lb.; vermilion*, q. s. to colour.

OINTMENT (Lupuline). Syn. *Unguentum Lupulinæ*,—Lat. *Prep.* (Soubeiran.) *Lupuline*, 1 part; *lard*, 3 parts; digest by the heat of a water-bath for 5 or 6 hours, and strain. As an anodyne dressing to cancerous ulcers, and as a friction to swollen and painful joints.

OINTMENT (Lycopodium). Syn. *Unguentum Lycopodii*, — Lat. *Lycopodium*, 1 dr.; *balsam of Peru*, ½ dr.; *simple ointment*, 1 oz. In chaps and excoriations.

OINTMENT (Mace). Syn. *Unguentum Macidis*,—Lat. *Prep.* From *mace* (beaten to a paste), and *palm oil*, of each, 1 *lb.; purified beef-marrow*, 3 *lb.;* gently melted together, and strained. Emollient and stimulant; chiefly *used* as a *pommade* for the hair. Sold for "*common oil of mace.*"

OINTMENT (Marshmallow). Syn. *Unguentum Althææ, Dialthææ*,—Lat. *Prep.* 1. (Ph. L. 1746.) *Oil of mucilages*, 2 ℔; *bees' wax*, ½ ℔; *yellow resin*, 3 oz.; melt them together, then add of *Venice turpentine*, ½ oz., and stir the mixture until it concretes.

2. (*Wholesale.*) From *palm oil*, ½ *lb.; yellow rosin*, 1¼ *lb.; bees' wax*, 2¼ *lb.; pale linseed oil*, 9 *lb.* (say 1 gall.); melt together, and stir until it is nearly cold.

Uses, &c. Emollient and stimulant; seldom used in regular practice, but in great repute amongst the common people. Linseed oil is now almost universally substituted for the oil of mucilages.

OINTMENT (Master-wort). Syn. *Pommade Anti-cancéreuse de Milius; Unguentum Imperatoriæ*, — Lat. *Prep.* (Mr. Beasley.) *Powdered master-wort* (imperatoria ostruthium,—Linn.), 1½ oz.; *tincture of master-wort*, 1 oz.; *lard*, 2 oz.

OINTMENT (Mercurial). Syn. *Strong Mercurial Ointment, Blue do., Neapolitan do.; Unguentum Hydrargyri*,—Ph. L. E. & D. *Ung. Hyd. Fortius*,—Ph. L. 1836. *Ung. Cæruleum*,—Ph. L. 1721. *U. C. Fortius*,—Ph. L. 1746. *Prep.* (Ph. L. & E.) *Mercury*, 1 ℔; *lard*, 11½ oz.; *suet*, ½ oz.; rub the mercury with the suet and a little of the lard, until globules are no longer visible; then add the remaining lard, and triturate all together.

2. (Ph. D.) *Pure mercury* and *lard*, of each, 1 *lb.;* as before.

Pur., &c. The stronger mercurial ointment of the shops is usually made with a less quantity of mercury than that ordered by the Colleges, and the colour is brought up with finely ground *blue black*, or *wood charcoal.* This fraud may be detected by its inferior sp. gr., and by a portion being left undissolved when a little of the ointment is treated, first with *ether* or *oil of turpentine*, to remove the fat, and then with *dilute nitric acid*, to remove the mercury. When made according to the instructions of the Ph., its sp. gr. is not less than 1·781 at 60° Fahr. It "is not well prepared so long as metallic globules may be seen in it with a magnifier of 4 powers." (Ph. E.) When rubbed on a piece of bright copper or gold, it should *immediately* give it a coating of metallic mercury, and a silvery appearance.

The "*Ung. hyd. fort.*" of the wholesale houses is generally made of *mercury*, 12 *lb.; suet*, 1½ *lb.;* and *lard*, 16½ *lb.* It thus contains only ⅓ instead of ½ of its weight of mercury. That of the same parties labelled "*Ung. hyd., partes æquales*," is prepared with *mercury*, 12 *lb.; suet*, 1½ *lb.; lard*, 13½ *lb.*

Uses. This ointment is chiefly used to introduce mercury into the system when the stomach is too irritable to bear it; in syphilis, hepatic affections, hydrocephalus, &c. For this purpose ½ to 1 dr. is commonly rubbed into the inside of one of the thighs until every particle of the ointment disappears. This operation is repeated night and morning, until the desired effect is produced, and should be, if possible, performed by the patient himself. During its administration the patient should avoid exposure to cold, and the use of fermented or acidulous liquors, and his diet should consist chiefly of toast, broth, gruel, milk-and-water, and other inoffensive matters. This ointment is now frequently employed to prevent the "*pitting*" in smallpox; and, diluted with 3 or 4 times its weight of lard, in several skin diseases, as a dressing for ulcers, to destroy pediculi, &c. Camphor is often added to this ointment, to increase its activity. With the addition of a little extract of belladonna, or hydrochlorate of ammonia, it forms an excellent anodyne and

resolvent friction in painful syphilitic tumours and glandular enlargements.

Obs. The preparation of mercurial ointment according to the common plan is a process of much labour and difficulty, and usually occupies several days. The instructions in the pharmacopœias are very meagre and unsatisfactory, and, so far as details go, are seldom precisely carried out. Employers grumble, and operatives become impatient when they find the most assiduous trituration apparently fails to hasten the extinction of the globules, and the whole affair is voted an "intolerable bore," which all desire to be rid of. To facilitate matters, various tricks are resorted to, and various contraband additions are often clandestinely made. Among the articles referred to, *sulphur* and *turpentine* are those which have been longest known, and, perhaps, most frequently employed for the purpose; but the first spoils the colour, and the other the consistence of the ointment; whilst both impart to it more or less of their peculiar and respective odours. On the Continent *oil of eggs* was formerly very generally used for the purpose, and is even now occasionally so employed. Nearly half a century ago, the father of the writer of this article clearly showed that the difficulty might be satisfactorily overcome by simply triturating the quicksilver with $\frac{1}{8}$ to $\frac{1}{4}$th of its weight of *old mercurial ointment*, before adding the lard; and that the effective power of this substance was in direct proportion to its age, or the length of time it had been exposed to the air. His plan was to employ the "bottoms" and "scrapings" of the store pots for the purpose. At a later period (1814-5) Mr. Higginbottom, of Northampton, repeated this recommendation, and at length the plan has been imported into the pharmacopœia Borussica. About thirteen years since we re-opened an investigation of the subject, which extended over several months, during which we satisfied ourselves of the accuracy of the assertion of M. Roux, that the mercury in mercurial ointment exists entirely, or nearly so, in the metallic state, and not in the form of oxide, as was generally assumed. We succeeded in preparing an excellent sample of mercurial ointment by agitating *washed suet* and *quicksilver* together *in vacuo*. The quantity of oxide present at any time in this ointment is variable and accidental, and is largest in that which has been long prepared; but in no case is it sufficient to materially discolour the fat after the metallic mercury is separated from it. We were led to conclude that the property alluded to, possessed by old ointment, depends solely on the peculiar degree of consistence or viscidity of the fat present in it, and on the loss of much of the thoroughly greasy, "anti-attritive" character, possessed by the latter in a recent state. In practically working out this idea, we obtained pure fats (*magnetic adeps; sevum præparatum*) which, without any addition, were capable of reducing, in a *few minutes*, 8, 16, 32, and even 48 times their weight of mercury. We also found that the formula of the pharmacopœia might be adopted, and that a perfect ointment might be readily obtained by skilful management in from $\frac{1}{2}$ an hour to an hour, even without these resources. All that was necessary was to employ a *very gentle* degree of heat, by either performing the operation in a warm apartment, or by allowing the mortar to remain filled with warm water for a short time before using it. *Suet* or *lard*, reduced either by *gentle warmth*, or by the addition of a little *almond oil* to the consistence of a *thick* cream, so that it will hang to the pestle without running from it, will readily extinguish 7 or 8 times its weight of running mercury by simple trituration. The exact temperature must, however, be hit upon, or the operation fails. This fact was afterwards noticed in the *Ann. de Chim.*, and some other journals.

M. Pomonti has proposed a method of preparing *strong mercurial ointment*, which, modified to suit the English operator, is as follows:—*Fresh lard*, 8 parts; *solution of nitre* (see below), 1 part; mix by trituration, add of *mercury*, 32 parts, and again triturate. The globules disappear after a few turns of the pestle, but reappear in a few minutes, and then again disappear to return no more. When this happens, the trituration is to be continued for a few minutes longer, when *lard*, 24 parts, is to be rubbed in, and the ointment at once put into pots. It is said that the globules are so completely extinguished as to escape detection, even when the ointment is examined by a microscope of low power. The Solution.—*Nitre*, 100 gr.; *water*, 1 fl. oz.; dissolve. This quantity is sufficient for a kilogramme of mercury. See *Ointment of Oxide of Mercury*.

OINTMENT (Mercurial,—Milder). Syn. *Milder Blue Ointment*, *Trooper's do.*, *Unction*; *Unguentum Hydrargyri Mitius*,—Ph. L. 1836, & Ph. D. 1826. *Ung. Cæruleum Mitius*,—Ph. L. 1745. *Prep.* (Ph. L. 1836.) *Stronger mercurial ointment*, 1 lb; *lard*, 2 lb.

Uses, &c. In the itch and several other cutaneous diseases, as a dressing to syphilitic ulcers, to destroy pediculi on the body, &c. *Each drachm* contains 10 gr. of *mercury*. That of the shops generally contains considerably less.

OINTMENT (Mercurial,—with Soap). Syn. *Savon Mercuriel; Unguentum Hydrargyri Saponaceum, Ung. H. Alkalizatum,* —Lat. *Prep.* 1. (Draper.) *Mercurial ointment* (softened by a gentle heat), 1 oz.; *hydrate of potassa*, 1 dr., dissolved in *water*, ½ fl. oz.; triturate them together until the mass solidifies.

2. (Swediaur.) *Milder mercurial ointment*, 8 parts; *soft soap*, 2 parts; *camphor*, 1 part. In periostitis, engorgements of the testicles, soft corns, &c.

OINTMENT (Mezereon). Syn. *Unguentum Merzerei,*—Lat. *Prep.* 1. (Hamb. Cod.) *Alcoholic extract of mezereon*, 2 dr.; dissolve in *rectified spirit*, q. s., add it to *white wax*, 1 oz.; *lard*, 8 oz.; and mix by a gentle heat.

2. (P. Cod.) *Mezereon* (dried root-bark), 4 oz.; moisten it with *rectified spirit*, bruise it well, and digest it for 12 hours, at the heat of boiling water, in *lard*, 14½ oz.; then strain with pressure, and allow it to cool slowly; lastly separate it from the dregs, remelt it, and add of *white wax*, 1½ oz. *Used* as a stimulating application to blistered surfaces and indolent ulcers.

OINTMENT (Mustard). Syn. *Unguentum Sinapis,*—Lat. *Prep.* 1. *Flour of mustard*, ¾ oz.; *water*, 1 fl. oz; mix, and add of *resin cerate*, 2 oz.; *oil of turpentine*, ½ oz. Rubefacient and stimulant. As a friction in rheumatism, &c.

2. (Frank.) *Flour of mustard*, 3 oz.; *oil of almonds*, ½ fl. oz.; *lemon juice*, q. s. In sun-burn, freckles, &c.

OINTMENT (Naphthaline). Syn. *Unguentum Naphthalinæ,*—Lat. *Prep.* (Emery.) *Naphthaline*, ½ dr.; *lard*, 7½ dr. In dry tetters, lepra, psoriasis, &c.

OINTMENT (Neapolitan). See *Mercucurial Ointment.*

OINTMENT (Nervine). Syn. *Balsamum Nervinum, Unguentum N.,* — Lat. *Prep.* 1. (*Baume Nerval,*—P. Cod.) *Expressed oil of mace* and *ox-marrow*, of each, 4 oz.; melt by a gentle heat, and add of *oil of rosemary*, 2 dr.; *oil of cloves*, 1 dr.; *camphor*, 1 dr.; *balsam of tolu*, 2 dr.; (the last two dissolved in) *rectified spirit*, 4 dr. In rheumatism, &c.

2. (Ph. E. 1744.) *Fresh leaves* of *male southernwood, marjoram, mint, pennyroyal, rosemary*, and *rue*, of each, 6 oz.; *neat's-foot oil*, 4 pints; *beef suet*, 3 lb; boil until the herbs are crisp, then strain with pressure, and add of *oil of bays*, 10 oz. Green coloured. Once a popular stimulant application in various local affections.

OINTMENT (Neutral). See *Compound Lead Ointment.*

OINTMENT (Nitrate of Mercury). Syn. *Citrine Ointment, Yellow do., Mercurial Balsam; Unguentum Hydrargyri Nitratis,* —Ph. L. & D. *Ung. H. N.*, or *Ung. Citrinum,*—Ph. E. *Ung. H. Supernitratis,*—Ph. D. 1807. *Prep.* 1. (Ph. L.) *Mercury*, 2 oz.; *nitric acid* (sp. gr. 1·42), 4 fl. oz.; dissolve, and mix the solution, *whilst still hot*, with *lard*, 1 lb, and *olive oil*, 8 fl. oz., melted together.

2. (Ph. E.) *Mercury*, 4 oz.; *nitric acid*, (sp. gr. 1·500), 8 fl. oz. 6 fl. dr.; dissolve by a gentle heat, add the liquid to *lard*, 15 oz.; *olive oil*, 32 fl. oz.; melted together, and whilst the whole are still hot, and mix them thoroughly. "If the mixture does not froth up, increase the heat a little until this takes place. Keep the ointment in earthenware vessels, or in glass vessels, secluded from the air." This admirable formula is a modification of that originally introduced into pharmacy by the late Dr. Duncan, of Edinburgh.

3. (Ph. D.) *Mercury*, 1 *oz.; nitric acid* (1·500), 1 fl. oz.; (diluted with) *water*, ½ fl. oz.; dissolve by a gentle heat, and add the liquid to *lard*, 4 *oz.; olive oil*, 8 fl. oz.; melted together and still hot; next "let the temperature of the mixture be raised so as to cause effervescence, and then, withdrawing the heat, stir the mixture with a porcelain spoon until it concretes on cooling."

4. (Ph. L. 1836.) *Mercury*, 1 oz.; *nitric acid* (1·500), 11 fl. dr.; *lard*, 6 oz.; *olive oil*, 4 fl. oz.; as No. 1 (above).

5. (P. Cod.) *Mercury*, 3 parts; *nitric acid* (1·321), 6 parts; *lard* and *oil*, of each, 24 parts; as above.

6. (Ph. U. S.) *Mercury*, 1 oz.; *nitric acid* (1·42), 14 fl. oz.; *lard*, 3 oz.; *fresh neat's-foot oil*, 9 fl. oz.; mix the mercurial solution with the melted fat and oil at 200° Fahr.

Uses, &c. Detergent and stimulant. In ringworm, herpes, itch, porrigo, psoriasis, and some other chronic skin diseases; in various chronic affections of the eyes, especially chronic inflammation and ulceration of the eyelids, "blear eye," &c. It "may almost be regarded as specific in psorophthalmia, in the purulent ophthalmia of infants producing ectropium (eversion of the eyelids), and in ulcerations of the tarsi (edges of the eyelids)." (A. T. Thomson.)

M M M

As a dressing to old ulcers, more especially those of a syphilitic character, it is superior to all the other ointments containing mercury; in sore legs, assisted by the internal use of the *pill of soap with opium* (pil. saponis cum opio), it often acts like a charm when all other modes of treatment have failed. For most of these purposes it should be diluted with from *twice* to *seven times* its weight of some simple fatty matter. One of the principal reasons why this ointment is in less general use than its merits deserve, is the very inferior quality of that vended in the shops under the name, arising from almost every druggist preparing some "mess" of his own, instead of adhering to the College formulæ.

Obs. Ointment of nitrate of mercury, faithfully prepared according to the instructions in the pharmacopœia, possesses a rich golden-yellow colour, and a buttery consistence, and keeps well. Unfortunately, clumsy and careless operators, who regard the pharmacopœia as a foolish book, which it is quite unnecessary to look into, often fail in their attempts to produce an article of good quality. The difficulty is immediately surmounted by employing *pure ingredients*, in the *proportions ordered*, and *mixing* them at the *proper temperature*. The acid should be of the full strength, or, if somewhat weaker than that directed, an equivalent quantity should be employed. A slight excess of acid is not injurious, rather the contrary; but a deficiency of acid, in all cases, more or less damages the quality of the product. If, on stirring the mercurial solution with the melted lard and oil, the mixture does *not* froth up, the heat should be increased a little, as *without* a *violent frothing* and *reaction* take place, the ointment will not turn out of good quality, and will rapidly harden and lose its colour. The most favorable temperature for the union of the ingredients is from 185° to 200° Fahr., and in no case should it exceed 212°; whilst below 180° Fahr., the reactions are feeble and imperfect. This is the whole mystery of the process; and it is surprising that the preparation of this ointment, which is not at all difficult, and which had been previously satisfactorily explained by both Duncan and Phillips, should have so long engaged the attention of the pharmaceutical periodicals.

Stone-ware or *glass vessels* must *alone* be *employed* in the *preparation* of this ointment, and the stirrers or spatulas should be either of glass or white deal. The best plan is to keep the whole exclusively for the purpose, and when out of use to preserve them from dust and dirt. (See *below*.)

OINTMENT (Nitrate of Mercury,—Milder). Syn. *Milder Citrine Ointment; Unguentum Hydrargyri Nitratis Mitius*,—Ph. L. *Ung. H. N. M.*, or *Ung. Citrinum M.*,—Ph. E. *Prep.* 1. (Ph. L.) *Ointment of nitrate of mercury*, 1 oz.; *lard*, 7 oz.; rub them together. "This ointment is to be used recently prepared."

2. (Ph. E.) As the *stronger ointment*, Ph. E., but using a *triple proportion* of *oil* and *lard*.

Uses, &c. See *above*.

OINTMENT (Nitrate of Silver). Syn. *Unguentum Argenti Nitratis*,—Lat. *Prep.* 1. (M. Jobert.) *Nitrate of silver*, 2, 4, or 6 parts; *lard*, 20 parts. These ointments are respectively numbered 1, 2, and 3, and are used in white-swelling.

2. (Macdonald.) *Nitrate of silver*, 1 part; *lard*, 7 to 8 parts. To smear bougies, in gonorrhœa, &c.

3. (Mackenzie.) *Nitrate of silver*, 5 gr.; *lard*, 1 oz. In purulent and chronic ophthalmia, ulcers on the cornea, &c.

4. (Velpeau.) *Nitrate of silver*, 1 gr.; *lard*, 1 dr. In acute ophthalmia, &c. The above compounds require to be used with caution.

OINTMENT (Nitric Acid). Syn. *Oxygenized Fat; Pommade d'Alyon; Unguentum Oxygenatum; Ung. A. Nitrici*,—Ph. D. 1826. *Ung. A. Nitrosi*,—Ph. E. 1817. *Prep.* 1. (Ph. D. 1826.) *Olive oil*, 1 ℔; *lard*, 4 oz.; melt them together, add, gradually, of *nitric acid* (sp. gr. 1·500), 5½ fl. dr., and stir the mixture constantly with a glass rod until it concretes.

2. (Ph. E. 1817.) *Lard*, 1 ℔; melt, add of *nitrous acid*, 6 dr.; expose it to a medium heat in a water bath, with agitation, for 15 minutes, then remove the vessel from the bath, and stir the mixture with a glass rod until it becomes firm.

Uses, &c. In itch, porrigo, and some other chronic skin-diseases; and as a dressing for syphilitic and herpetic ulcers, old sores, &c. It is frequently employed as a substitute for the ointment of nitrate of mercury, which it somewhat resembles in appearance; but it is less active and useful. The product of the last formula has an agreeable yellow colour, and keeps well. It is occasionally sold for citrine ointment, but the fraud may be detected by its not turning gray when it is kept heated for some time, and by its not imparting a silvery appearance to a piece of bright copper when rubbed on it.

OINTMENT (Nitric Oxide of Mercury).

Syn. *Red Precipitate Ointment; Unguentum Hydrargyri Nitrico-oxydi*,—Ph. L. *Ung. Hyd. Oxydi*,—Ph. E. *Ung. H. O. Rubri*,—Ph. D. *Ung. H. Subnitratis*,—Ph. D. 1807. *Prep.* 1. (Ph. L.) *White wax*, 2 oz.; *lard*, 6 oz.; mix by heat, add of *nitric oxide of mercury*, in very fine powder, 1 oz.; and rub them together.

2. (Ph. E.) *Nitric oxide of mercury*, 1 oz.; *lard*, 8 oz.; mix by trituration.

3. (Ph. D.) *Red oxide of mercury* (nitric oxide), 1 *dr.*; *ointment of white wax*, 7 *dr.*; as the last.

Uses, &c. An excellent stimulant application to indolent and foul sores, ulcers, &c.; and, when diluted, as an eye ointment in chronic inflammation and ulceration of the eyes and eyelids, and especially in psorophthalmia; also in specks on the cornea, and the other affections noticed under *ointment of nitrate of mercury*. It forms the basis of numerous quack medicines.

OINTMENT (Obstetrical). Syn. *Pommade Obstetricale; Unguentum Obstetricum*,—Lat. *Prep.* 1. (Chaussier.) *Extract of belladonna*, 1 dr.; *water*, 2 dr.; *lard*, 1 oz. To promote the dilation of the os uteri.

2. (*Pommade pour le toucher.*) From *yellow wax* and *spermaceti*, of each, 1 oz.; *olive oil*, 16 oz.; melt them together, strain, add of *solution of caustic soda*, 1 fl. oz.; and stir until the whole is nearly cold.

OINTMENT (Opium). Syn. *Unguentum Opiatum; Ung. Opii*,—Ph. L. *Prep.* 1. (Ph. L.) *Powdered opium*, 20 gr.; *lard*, 1 oz.; mix by trituration. As a simple anodyne friction or dressing.

2. (Augustin.) *Opium*, 2 dr.; *ox-gall*, 2 oz.; digest 2 days, strain, and add of *melted lard*, 2 oz.; *oil of bergamot*, 10 drops.

3. (Brera.) *Opium*, 1 dr.; *gastric juice of a calf*, ½ oz.; digest 24 hours, and add of *melted lard*, 1 oz.

OINTMENT (Oxide of Lead). See *Lead Ointment*.

OINTMENT (Oxide of Manganese). Syn. *Unguentum Manganesii Oxydi, Ung. M. Binoxydi*,—Lat. *Prep.* 1. *Black oxide of manganese* (levigated), 1 dr.; *lard*, 1 oz.; mix by patient trituration. As a friction in scrofulous swellings and indurations; and in itch, scald-head, chilblains, &c.

2. (W. Cooley.) *Binoxide of manganese*, 1 dr.; *sulphur*, 2 dr.; *lard*, 9 dr.; *cajeput oil*, 15 drops. As the last; also as a friction in rheumatism, swelled joints, &c., and in porrigo, and some other skin diseases.

OINTMENT (Oxide of Mercury). Syn. *Ointment of Gray Oxide of Mercury; Unguentum Hydrargyri Oxydi; Ung. Hyd. Protoxydi; U. H. O. Cinerei*,—Ph. E. 1817. *Prep.* 1. (Ph. E. 1817.) *Gray oxide of mercury*, 1 oz.; *lard*, 3 oz.; triturate together. Formerly proposed as a substitute for mercurial ointment, but in practice it has been found useless as a friction, owing to the unctuous matter only being absorbed, whilst the oxide is left on the surface. This objection does not apply to the following preparations:—

2. (Donovan.) *Gray oxide of mercury*, 20 gr.; *lard*, 1 oz.; mix, and expose them to the temperature of 320° Fahr. for 2 hours, constantly stirring. Gray coloured. It may also be made from the *nitric* or *red oxide* in the same way, by keeping the ointment heated to about 300° for some hours. Cleaner and stronger than *Ung. Hyd. Fort.*, Ph. L.

3. (Tyson.) *Black oxide of mercury* (prepared by decomposing precipitated calomel with liquors of potassa and ammonia), 2 oz.; *lard*, 1 lb; triturate together. Inferior in activity to the last. It closely resembles in appearance a fine sample of mercurial ointment.

OINTMENT (Binoxide of Mercury). Syn. *Unguentum Hydrargyri Binoxydi, Ung. H. Oxydi Rubri*,—Lat. *Prep.* 1. (Cazenave.) *Binoxide of mercury*, 30 gr.; *camphor*, 5 gr.; *lard*, 1 oz. Closely resembles *ointment of nitric oxide of mercury*, over which it, perhaps, possesses some advantage from the oxide being in a more minutely divided state.

OINTMENT (Oxide of Silver). *Unguentum Argenti Oxydi*,—Lat. *Prep.* (Serre.) *Oxide of silver*, 16 to 20 gr.; *lard*, 1 oz. As a dressing for scrofulous and syphilitic sores, &c.

OINTMENT (Oxide of Zinc). Syn. *Zinc Ointment; Unguentum Zinci*,—Ph. L. E. & D. *Ung. Oxydi Zinci*,—Ph. E. 1839. *Nihil Album Ointment, Ung. de Nihilo*,—Obs. *Prep.* 1. (Ph. L.) *Oxide of zinc*, 1 oz.; *lard*, 6 oz.; mix them together.

2. (Ph. E.) *Oxide of zinc*, 1 oz.; *simple liniment* (Ph. E.), 6 oz.

3. (Ph. D.) *Ointment of white wax*, 12 *oz.*; melt it by a *gentle* heat, add of *oxide of zinc*, 2 *oz.*; and stir constantly until the mixture concretes.

Uses, &c. Astringent, desiccative, and stimulant; in excoriations, burns, various skin diseases attended by profuse discharges, in chronic inflammation of the eyes depending on relaxation of the vessels, in sore nipples, indolent sores, ringworm of the scalp, &c. It is an excellent and very useful preparation. See *Tutty Ointment*.

OINTMENT (Pepper). Syn. *Unguentum*

Piperis Nigri,—Ph. D., 1826. *Prep.* 1. *Black pepper* (bruised), 1 oz.; *lard*, 2 oz.; *suet*, 1 oz.; digest together in a covered vessel, by the heat of a water bath, for 6 hours, then strain, with pressure, add of *expressed oil of mace*, 2 dr., and stir until the mixture concretes. In piles, itch, as a friction in rheumatism, &c.

2. (Ph. D. 1826.) *Black pepper* (in fine powder), 4 oz.; *lard*, 1 lb.; mix. In scald-head, &c.

OINTMENT (Phosphoric Acid). Syn. *Unguentum Acidi Phosphorici*,—Lat. *Prep.* (Soubeiran.) *Phosphoric acid*, 1 dr.; *lard* (softened by heat), 1 oz.; triturate carefully together. As a friction in caries, osseous tumours, &c.

OINTMENT (Phosphorus). Syn. *Unguentum Phosphori*, *Ung. Phosphoratum*,—Lat. *Prep.* (P. Cod.) *Phosphorus*, 1 dr.; *lard*, 6 oz. 3 dr.; melt them together (in a wide-mouthed bottle) by the heat of a water bath, remove the vessel from the heat, and shake it briskly until the ointment concretes. As a friction in gout, chronic rheumatism, and several skin diseases.

OINTMENT (Picrotoxine). Syn. *Unguentum Picrotoxinæ*,—Lat. *Prep.* (Jäger.) *Picrotoxine*, 10 gr.; *lard*, 1 oz. In ringworm of the scalp; and to destroy pediculi. It should be used with care.

OINTMENT (for Piles). Syn. *Unguentum Hæmorrhoidale*, *Ung. Anti-hæmorrhoidale*,—Lat. *Prep.* 1. *Burnt alum* and *oxide of zinc*, of each, ½ dr.; *lard*, 7 dr.

2. (Bories.) *Acetate of lead*, 15 gr.; *freshly burnt cork*, ½ oz.; *washed fresh butter*, 2 oz.; triturate well together.

3. (W. Cooley.) *Morphia*, 8 gr.; *melted spermaceti ointment*, 1 oz.; triturate together until solution is complete, then add of *galls* (in impalpable powder), 1½ dr.; *essential oil of almonds* (genuine crude), 12 to 15 drops; and stir until the mass concretes. In painful piles, prolapsus, &c. It is not only very effective, but does not soil the linen so much as most other ointments.

4. (Dr. Gedding.) *Carbonate of lead*, 4 dr.; *sulphate of morphia*, 15 gr.; *stramonium ointment*, 1 oz.; *olive oil*, q. s. When there is much pain and inflammation.

5. (Sir H. Halford.) *Ointment of nitrate of mercury* and *oil of almonds*, equal parts, triturated together.

6. (Mazzini.) *Nitrate of morphia*, 15 gr.; *citrine ointment*, 1 dr.; *fresh butter*, 1 oz. As the last.

7. (Vallez.) *Extract of elder leaves*, ½ dr.; *burnt alum*, 16 gr.; *poplar ointment*, 1 oz. For other formulæ see the *respective names* of their leading ingredients.

8. (Mr. Ware.) *Camphor*, 1 dr.; *simple ointment*, 1 oz.; dissolve by heat, add of *powdered galls*, 2 dr.; mix well, further add of *tincture of opium*, 2 fl. dr., and stir until the whole is cold. In flabby mucous, and painful piles.

9. (Zanin.) *Spermaceti ointment*, 1 oz.; *powdered galls*, 1 dr.; *powdered opium*, 18 gr.; *solution of diacetate of lead*, 1 fl. dr. When there is both pain and inflammation.

OINTMENT (Pitch). Syn. *Black Basilicon*, *Ointment of Black Pitch*; *Ung. Picis*,—Ph. L. *Ung. Picis Nigræ*,—Ph. L. 1836. *U. Resinæ Nigræ*,—Ph. L. 1809. *U. Picis Aridæ*,—Ph. L., 1788. *U. Basilicum Nigrum* or *U. Tetrapharmacum*,—Ph. L. 1746. *Prep.* (Ph. L.) *Black pitch*, *resin*, and *bees' wax*, of each, 11 oz.; *olive oil*, 1 pint; melt together, strain through a linen cloth (and stir until the mass concretes).

Uses, &c. Stimulant and detergent; very useful in indolent ulcerations, scald-head, and various foul eruptions. In itch and psoriasis, and other scaly skin diseases, a little sulphur is commonly added to it.

OINTMENT (Platinum). Syn. *Unguentum Platini*—Lat. *Prep.* (Hœfer.) *Bichloride of platinum*, 15 gr.; *extract of belladonna*, ½ dr.; *lard*, 1 oz. As a dressing for painful indolent ulcers.

OINTMENT (Plumbago). Syn. *Unguentum Graphitis*, *Ung. Plumbaginis*,—Lat. *Prep.* From *pure plumbago* (black lead), 1½ dr.; *lard*, 1 oz. As a dressing to ulcers, and in certain skin diseases.

OINTMENT (Plunket's). *Prep.* (Original formula.) *Crowsfoot*, 1 handful; *dog's fennel*, 3 sprigs; pound well, add of *flowers of sulphur* and *white arsenic*, of each, 3 thimblefuls; beat them well together, form the mass into boluses, and dry them in the sun. For *use*, powder them; and mix the powder with *yelk of egg*, spread a *little* on a small piece of *pig's bladder* (size of half a crown), and apply it to the sore, where it must remain until it falls off by itself. *Poisonous;* in cancer; with great caution.

OINTMENT (Pomatum). See *Lard Ointment*.

OINTMENT (Poplar Buds). Syn. *Unguentum Populeum*,—Lat. *Prep.* 1. *Fresh poplar buds* (bruised), 1 part; *lard*, 4 parts; boil until crisp, and strain. It never gets rancid. Emollient and stimulant.

2. (*Compound*,—P. Cod.) *Poplar buds*, 12 oz.; *fresh leaves* of *belladonna*, *common nightshade* (solanum nigrum), *henbane*, and *poppies*, of each, 8 oz.; *lard*, 4½ lb; as the last. Emollient, stimulant, and anodyne.

OINTMENT (Potassio-tartrate of Antimony). Syn. *Antimonial Ointment, Tartar Emetic do.; Unguentum Antimonii Potassio-tartatris*,—Ph. L. *Ung. A. Tartarizati*,—Ph. D. *Ung. Antimoniale*,—Ph. E. *Ung. Tartari Emetici*,—Ph. D. 1826. *Prep.* 1. (Ph. L. & E.) *Potassio-tartrate of antimony*, rubbed to a very fine powder, 1 oz.; *lard*, 4 oz.; mix by trituration.

2. (Ph. D.) *Tartar emetic*, in very fine powder, 1 *dr.*; *ointment of white wax*, 7 *dr.*

Uses, &c. Counter-irritant; in phthisis, chronic rheumatism, certain liver affections, and other deep-seated pains and diseases. A portion, about the size of a nut, is rubbed on the skin night and morning, until a crop of pustules is produced. The part should be well rubbed with a coarse towel, so as to be reddened, before applying the ointment. The product of the Dublin formula is of only half the strength of those of the other colleges.

Obs. Before adding the tartar emetic to the lard it should be reduced to the state of an impalpable powder. The precipitated salt (see *p.* 76) is the best for this purpose. As the pustules formed by this ointment permanently mark the skin, it should only be applied to those parts of the person which are covered by the dress.

OINTMENT (Purgative). See *Ointment of Colocynth, Worm do., &c.*

OINTMENT (Quinine). Syn. *Unguentum Quiniæ, Ung. Quiniæ Sulphatis*,—Lat. *Prep.* 1. *Sulphate of quinine*, 1 dr.; *lard*, 3 dr. In the agues of children.

2. (Beasley *ex* Antonini.) *Sulphate of quinine*, 1 dr.; *alcohol* (rectified *spirit*), 2 dr.; *sulphuric acid*, 10 drops; dissolve, and mix it with *lard*, ½ oz. In malignant intermittents; 2 to 4 dr. at a time, rubbed into the groin or axilla.

OINTMENT (Red Sulphuret of Mercury). Syn. *Unguentum Hydrargyri Bisulphureti, Ung. Hyd. Sulphureti Rubri*,—Lat. *Prep.* 1. (Alibert.) *Red sulphuret of mercury*, 1 dr.; *camphor*, 20 gr.; *simple ointment*, 1 oz. In herpes, applied twice a day.

2. (Collier.) *Bisulphuret of mercury*, 1½ dr.; *sal ammoniac*, ½ dr.; *lard*, 1 oz.; *rose water*, 1 fl. dr. In several skin diseases, to diminish the itching, destroy pediculi, &c.

3. (Radius.) As the last, with 1 oz. more *lard*.

OINTMENT (Resin). Syn. *Yellow Basilicon; Unguentum Resinæ*,—Ph. D. *Ung. R. Albæ*,—Ph. D. 1826. *Ung. Resinosum*,—Ph. E. *Prep.* 1. (P. D.) *Yellow wax*, ¼ *lb.*; *yellow resin*, in coarse powder, ½ *lb.*; *prepared lard*, 1 *lb.*; melt them together by a gentle heat, strain the mixture, whilst hot, through flannel, and stir it constantly until it concretes.

2. (Ph. E.) *Bees' wax*, 2 oz.; *resin*, 5 oz.; *lard*, 8 oz.

Obs. A useful stimulant dressing to foul and indolent ulcers. For the corresponding preparation of the Ph. L., see *Resin Cerate*.

OINTMENT (Resolvent). See *Discutient Ointment*.

OINTMENT (Ringworm). *Unguentum contra-tineam*,—Lat. *Prep.* 1. *Carbonate of soda*, 1 part; *fresh-slaked lime*, 4 parts; *lard*, 120 parts.

2. *Ointment of nitrate of mercury*, 1 dr.; *tar ointment* and *lard*, of each, ½ oz.

3. (Henke.) *Hydrochloric acid*, 1 fl. dr.; *juniper-tar ointment*, ½ oz.; *marshmallow do.*, 1 oz.

4. (Pereira.) *Tar*, 3 dr.; *lard*, 1½ oz.; melt them together, and stir in of *acetic acid* (Ph. L.), 2 fl. dr.

5. (Thompson.) *Carbonate of soda* and *sulphuret of potassium*, of each, 1 dr.; *creasote*, ½ dr.; *lard*, 1¼ oz.

Obs. The hair must be cut off close, and the part washed clean before each application. For other forms, see *above*.

OINTMENT (Rose). Syn. *Rose Pommade, Rose Lip-salve; Unguentum Rosæ, Ung. Rosatum*,—Lat. *Prep.* 1. (P. Cod.) *Washed lard* (melted), and *roses* (centif.), of each, 2 ℔; mix, and in 2 days remelt the mass, and press out the fat; to this last add of *fresh roses*, 2 ℔, and repeat the process; lastly, colour it with alkanet root, if required red.

2. (*Ung. Aquæ Rosæ*,—Ph. U. S.) This is *spermaceti ointment* melted and beaten up with about ⅔rds of its weight of *rose water* until they congeal. Both the above are simple emollients. The last is an officinal "cold cream."

OINTMENT (Rust's). *Calcined alum*, 1½ dr.; *camphor*, ½ dr.; *powdered opium*, 20 gr.; *balsam of Peru*, 1 dr.; *lead ointment*, 5 dr.; triturate together. In chilblains, frostbites, frosted limbs, &c.

OINTMENT (Sabadilline). Syn. *Unguentum Sabadillinæ*,—Lat. *Prep.* (Dr. Turnbull.) *Sabadilline*, 15 to 20 gr.; *lard*, 1 oz. Intended as a substitute for *ointment of veratria*.

OINTMENT (Savine). Syn. *Unguentum Sabinæ*,—Ph. L. & D. *Ceratum Sabinæ*,—Ph. L. 1836. *Prep.* 1. (Ph. L.) *White wax*, 3 oz.; *lard*, 1 ℔; melt them together, mix in of *fresh savine* (bruised), ½ ℔, and press through a linen cloth.

2. (Ph. D.) *Savine tops*, dried and in fine powder, 1 *dr.*; *ointment of white wax*, 7 dr.; mix by trituration. For the formula of the Ph. E., the uses, &c., see *Cerates*.

OINTMENT (Scrophularia). Syn. *Unguentum Scrophulariæ*,—Lat. *Prep.* (Ph. D. 1826.) *Green leaves of knotted rooted fig-wort* and *lard*, of each, 2 lb; *prepared suet*, 1 lb; boil till crisp, and strain with pressure. In ringworm, "burnt-holes" (*pemphigus gangrenosus* of children), impetigo, and some other cutaneous diseases; also as an application to piles, painful swellings, &c. In the second it is said to be almost specific.

OINTMENT (Simple). Syn. *Ointment of White Wax; Simple Dressing; Unguentum Simplex*,—Ph. E. *Ung. Ceræ Albæ*,—P. D. *Prep.* 1. (Ph. E.) *Olive oil*, 5½ fl. oz.; *white wax*, 2 oz.; melted together, and stirred whilst cooling.

2. (Ph. D.) *Prepared lard*, 4 *lb.*; *white wax*, 1 *lb.*; as the last.

Obs. The above are mild emollients, useful in healthy ulcers, excoriations, &c.; but chiefly as forming the basis for other ointments. The corresponding preparation of the Ph. L. is *spermaceti ointment*. See *Lard Ointment*, &c.

OINTMENT (Singleton's). See *Eye Ointments*.

OINTMENT (Smallpox). Syn. *Unguentum Ectroticum*,—Lat. *Prep.* 1. *Mercurial ointment*, 1½ oz.; *bees' wax* and *black pitch*, of each, ½ oz.; *expressed oil of mace*, 2 dr.; mixed together by a very gentle heat.

2. (M. Briquet.) *Mercurial ointment*, 4 parts; *powdered starch*, 1 part.

3. (M. Tourriere.) *Iodide of potassium* (dry and in fine powder), 1 part; *expressed oil of mace*, 2 parts; *black resin*, 4 parts; *mercurial ointment*, 8 parts. *Used* to prevent the "*pitting*" of the pustules. See *Smallpox*.

OINTMENT (Smellome's). See *Eye Ointments*.

OINTMENT (Soap). See *Cerates*.

OINTMENT (Soap, — Camphorated). Syn. *Unguentum Saponis Camphoratum*,—Lat. *Prep.* (Hamb. Cod.) *White soap* (scraped), 1 *lb.*; *water*, ½ *lb.*; dissolve by heat, add of *olive oil*, 5 *oz.*; and when the mixture has partly cooled, further add of *camphor*, 1 *oz.*, previously dissolved by heat in *olive oil*, 1 *oz.*; lastly, stir until the mass concretes. As an anodyne and stimulating friction in various local affections, as chaps, chilblains, rheumatism, &c.

OINTMENT (Sodio-Chloride of Gold). Syn. *Pommade de Muriate d'Or et de Soude; Unguentum Auri Sodio-chloridi*,—Lat. *Prep.* (Magendie.) *Sodio-chloride of gold*, 10 gr.; *lard*, 4 dr. In scrofulous and syphilitic swellings, indurations, ulcers, &c.

OINTMENT (Spermaceti). Syn. *Emollient Dressing, Simple Ointment, White do.; Unguentum Cetacei*,—Ph. L. & D. *Ung. Spermatis Ceti*,—Ph. L. 1788 & Ph. D. 1807. *Ung. Album, Linimentum A.*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Spermaceti*, 5 oz.; *white wax*, 14 dr.; *olive oil*, 1 pint or q. s.; melt them together by a gentle heat, and stir the mixture until cold.

2. (Ph. D.) *White wax*, ½ *lb.*; *spermaceti*, 1 *lb.*; *prepared lard*, 3 *lb.*; as the last.

Uses, &c. As an emollient and healing application or dressing to abrasions, excoriations, blistered surfaces, healthy ulcers, chilblains, chops, &c. In *trade* the Dublin formula, with *double the amount* of *lard*, is commonly employed. See *Lard Ointment, Simple do., &c.*

OINTMENT (Squills). Syn. *Unguentum Scillæ*,—Lat. *Prep.* 1. (Brera.) *Squills* (in very fine powder), 1 dr.; *mercurial ointment*, 2 dr.

2. (Hufeland.) *Squills*, 1 oz.; *liquor of potassa*, 2 fl. oz.; reduce to a mucilage by boiling, then add of *lard*, 2 oz. or q. s. As a resolvent friction to indolent tumours and indurations.

OINTMENT (Stavesacre). Syn. *Unguentum Staphisagriæ*,—Lat. *Prep.* (Swediaur.) *Powdered stavesacre*, 1 oz.; *lard*, 3 oz.; melt together, digest 3 or 4 hours, and strain. A very cleanly remedy for itch, and to destroy pediculi on the person. A similar ointment is much used by farriers.

OINTMENT (Stramonium). Syn. *Unguentum Stramonii*,—Lat. *Prep.* 1. Fresh *thorn-apple leaves*, 1 part; *lard*, 4 parts; as ointment of hemlock.

2. (Pereira.) *Powdered leaves*, 1 oz.; *lard*, 4 oz.; mix by trituration.

3. (Ph. U. S.) *Extract of stramonium*, 1 dr.; *lard*, 1 oz.; as the last.

Uses, &c. To dress irritable ulcers, and as an application to painful piles.

OINTMENT (Strychnine). Syn. *Unguentum Strychniæ*,—Lat. *Prep.* 1. (Bouchardat.) *Strychnia*, 16 gr.; *lard*, 1 oz.; carefully triturated together.

2. (Wendt.) *Nitrate of strychnia*, 6 gr.; *lard*, 1 oz.; as last. Both are *used* as a friction in paralysed parts, &c. From the extremely poisonous character of strychnine it should be used with caution.

OINTMENT (Subacetate of Copper). See *Verdigris Ointment*.

OINTMENT (Subsulphate of Mercury).

Syn. *Unguentum Hydrargyri Subsulphatis*, —Lat. *Prep.* 1. (Alibert.) *Turpeth mineral*, ½ dr.; *lard*, 1 oz.

2. (Biett.) *Turpeth mineral*, 1 dr.; *sulphur*, 2 dr.; *lard*, 2 oz.; *oil of lemons*, 15 drops. In herpes, porrigo, and the scaly skin diseases.

OINTMENT (Sulphate of Iron). Syn. *Unguentum Ferri Sulphatis*,—Lat. *Prep.* (Velpeau.) *Sulphate of iron*, 1½ dr.; *simple ointment*, 1 oz. In erysipelas.

OINTMENT (Sulphate of Manganese). Syn. *Unguentum Manganesii Sulphatis*,—Lat. *Prep.* From *sulphate of manganese*, 1 dr.; *lard* or *simple ointment*, 1 oz. Alterative and discutient; in similar cases to those in which mercurial ointment is employed.

OINTMENT (Sulphate of Zinc). Syn. *Unguentum Zinci Sulphatis*,—Lat. *Prep.* (Scarpa.) *Sulphate of zinc* (in very fine powder), 1 dr.; *lard*, 1 oz. In some chronic skin diseases attended with a lax state of the tissues, and as a dressing to scrofulous tumours after they have separated and the abscess has been discharged.

OINTMENT (Sulphur). Syn. *Unguentum Sulphuris*,—Ph. L. E. & D. *Ung. è Sulphure*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Sulphur*, ½ lb; *lard*, 1 lb. In the Ph. L. 1836, *oil of bergamot*, 40 drops, were added.

2. (Ph. E.) *Sulphur*, 1 oz.; *lard*, 4 oz.

3. (Ph. D.) *Sulphur*, 1 *lb.*; *lard*, 4 *lb.*

Uses, &c. In itch, scald-head, &c., in the first of which it is specific. It should be well rubbed in every night until the disease is cured; "but not more than one fourth part of the body should be covered with it at a time." (A. T. Thomson.)

OINTMENT (Sulphur, — Compound). Syn. *Itch Ointment; Unguentum Sulphuris Compositum*,—Ph. L. *Prep.* (Ph. L.) *Nitrate of potassa* (powdered), 40 gr.; *white hellebore* (powdered), 10 dr.; *sulphur* and *soft soap*, of each, 4 oz.; *lard*, 1 lb; rub them together.

2. (Ph. L. 1836.) *Sulphur* and *soft soap*, of each, 6 oz.; *white hellebore*, 2 oz.; *nitre*, 1 dr.; *lard*, 1½ lb; *oil of bergamotte*, 30 drops.

3. (P. Cod.) *Alum* and *sal ammoniac*, of each, ½ oz.; *sulphur*, 8 oz.; *lard*, 16 oz.

Uses, &c. In itch, as the last. They are all more efficacious than the simple ointment, but owing to the presence of white hellebore, that of the Ph. L. is apt to cause irritation in persons with delicate skins. See *Itch Ointment*.

OINTMENT (Sulphuret of Mercury). See *Ointment of Red Sulphuret of Mercury*.

OINTMENT (Sulphuret of Potassium). Syn. *Unguentum Potassii Sulphureti*,—Lat. *Prep.* 1. *Sulphuret of potassium* (dry and in fine powder), 1 dr.; *lard*, 9 dr. Alibert adds 1 dr. of *carbonate of soda*.

2. *Sulphuret of potassium*, 2½ dr.; *lard* and *soft soap*, of each, 1 oz.; *olive oil*, ½ oz. In several chronic skin diseases, as itch, psoriasis, ringworm, lepra, eczema, &c.

OINTMENT (Sulphuret of Sodium). Syn. *Unguentum Sodii Sulphureti*,—Lat. *Prep.* (Swediaur.) *Sulphuret of sodium*, 3 dr.; *lard*, 1½ oz. In itch, for which it is very cleanly and effective. The last two ointments are most powerful when recently prepared.

OINTMENT (Sulphuric Acid). Syn. *Unguentum Acidi Sulphurici*,—Lat. *Prep.* 1. (Dr. Duncan.) *Sulphuric acid*, 1 dr.; *lard*, 2 oz.

2. (Ph. D. 1826.) *Sulphuric acid*, 1 dr.; *lard*, 1 oz.; mix.

Uses, &c. Black, fœtid; in itch. It is now seldom used. With oil of turpentine it has been used as a stimulating liniment in rheumatism. An ointment made of 1½ dr. of *dilute sulphuric acid* to 1 oz. of *lard*, is a good application in prurigo.

OINTMENT (Sultana). *Spermaceti* and *white wax*, of each, ¼ *oz.*; *oil of almonds* and *butter of cacao*, of each, ¼ *lb.*; melt together, add of *balsam of Peru*, 1 dr., stir constantly for a few minutes, and after it has settled pour off the clear portion; to this add of *orange-flower water*, 2 fl. dr., and stir the mixture constantly until it concretes. A very agreeable species of cold cream.

OINTMENT (Tannate of Lead). Syn. *Unguentum Plumbi Tannatis*,—Lat. *Prep.* 1. *Tannate of lead*, 1½ dr.; *powdered camphor*, 20 gr.; *spermaceti ointment*, 7 dr. In inflamed piles, &c.

2. (Sundelin.) *Decoction of oak bark*, 6 fl. oz.; *solution of diacetate of lead*, 1½ oz.; mix, collect and drain the precipitate, and mix it, whilst still moist, with *lard*, 1 oz.; *camphor*, 10 gr. In bed-sores.

OINTMENT (Tannin). Syn. *Unguentum Tannini, Ung. Acidi Tannici*,—Lat. *Prep.* (Richard.) *Tannin*, 2 dr.; *water*, 2 fl. dr.; triturate them together, then add of *lard*, 1½ oz. Astringent and hæmostatic. In piles, prolapsus, &c. It is a very cleanly and effective application.

OINTMENT (Tar). Syn. *Unguentum Picis Liquidæ*,—Ph. L. E. & D. *Ung. Picis*,—Ph. L. 1788. *Ung. è Pice*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Tar* and *suet*, of each, 1 lb; melt them together, and press the mixture through a linen cloth.

2. (Ph. E.) *Tar*, 5 oz.; *bees' wax*, 2 oz.; melt together, and stir the mixture briskly until it concretes.

3. (Ph. D.) *Tar*, ½ pint; *yellow wax*, 4 *oz.*; as the last.

Uses, &c. As a detergent application in ringworm, scald-head, scabby eruptions, foul ulcers, &c. It should be, in general, at first diluted with half of its weight of lard or oil.

OINTMENT (Tartar Emetic). See *Ointment of Potassio-tartrate of Antimony.*

OINTMENT (Tobacco). Syn. *Unguentum Tabaci*,—Lat. *Prep.* 1. (Chippendale.) *Extract of tobacco*, 1 dr.; *lard*, 1 oz. As a friction in neuralgia.

2. (Ph. U. S.) *Fresh tobacco leaves*, 1 oz.; *lard*, 12 oz.; as ointment of hemlock. As an anodyne application in irritable ulcers, ringworm, prurigo, and some other skin diseases.

OINTMENT (Tripharmic). Syn. *Ointment of Three Things; Unguentum Tripharmacum*,—Ph. L. 1746. *Prep.* From *lead plaster*, 4 oz.; *olive oil*, 2 fl. oz.; *distilled vinegar*, 1 fl. oz.; melt together, and stir until they combine, and a proper consistence is obtained. Cooling and desiccative; formerly greatly esteemed as a dressing.

OINTMENT (Trooper's). See *Mercurial Ointment.*

OINTMENT (Turpentine). Syn. *Unguentum Terebinthinæ*,—Lat. *Prep.* 1. (Guy's Hosp.) *Camphor*, 1 dr.; *oil of turpentine*, 1 to 2 fl. dr.; dissolve, and add of *resin cerate*, 1 oz. As a stimulant and anodyne friction in nephritic and rheumatic pains, engorgements, &c.

2. (Ph. Austr.) *Turpentine*, 2 ℔; *simple ointment*, 1 ℔; mix by a gentle heat. As a stimulant dressing.

OINTMENT (Tutty). Syn. *Unguentum Zinci Oxydi impuri*,—Ph. E. 1807. *Ung. Tutiæ*,—Ph. D. 1826 & Ph. L. 1788. *Prep.* From *prepared tutty*, 1 part; *simple ointment*, 5 parts; mix by trituration. Formerly in great repute in ophthalmic practice, more particularly in inflammation, &c., of the eyelids. See *Ointment of Oxide of Zinc.*

OINTMENT (Veratrine). Syn. *Pommade de Veratrine; Unguentum Veratriæ*,—Lat. *Prep.* 1. (Magendie.) *Veratrine*, 4 gr.; *lard*, 1 oz.; mixed by *careful* trituration.

2. (Pereira.) *Veratrine*, 30 gr.; *lard*, 1 oz.

3. (Turnbull.) *Veratrine*, 10 to 20 gr.; *olive oil*, 1 dr.; triturate, and add of *spermaceti ointment*, 1 oz.

Uses, &c. As a friction in neuralgia, neuralgic rheumatism, gout, dropsy, &c. A piece, about the size of a hazel nut, is to be rubbed for 10 or 15 minutes over the seat of pain, twice a day. It must not be applied where the skin is unsound, nor to a large surface at a time; and the greatest caution must be used, on account of the extremely poisonous character of veratrine.

OINTMENT (Verdigris). Syn. *Ointment of Subacetate of Copper; Unguentum Æruginis*,—Ph. E. *Ung. Cupri Subacetatis*,—Ph. D. *Prep.* 1. (Ph. E.) *Resinous ointment*, 15 oz.; melt by a gentle heat, sprinkle into it of *verdigris* (in very fine powder), 1 oz., and stir the mixture briskly until it concretes.

2. (Ph. D.) *Prepared subacetate of copper*, ½ *dr.*; *ointment of white wax*, 7½ *dr.*; mix by trituration.

3. (Ph. D. 1826.) *Verdigris*, ½ oz.; *olive oil*, 1 oz.; triturate them together, and add them to *resin ointment*, 1 ℔ (melted), and stir until the mixture is nearly cold.

Uses, &c. Detergent and escharotic; as an occasional dressing to foul and flabby ulcers, to keep down fungous flesh, and, diluted with oil or lard, in scrofulous ulceration and inflammation of the eyelids.

OINTMENT (Vinegar). Syn. *Acetic Ointment; Unguentum Aceti, Ung. Acidi Acetici*,—Lat. *Prep.* 1. (Dr. Cheston.) *Olive oil*, 1 ℔; *white wax*, 4 oz.; melt them together by a gentle heat, add of *strong vinegar*, 2 fl. oz., and stir until the mixture concretes. As a cooling astringent dressing, and as an application in chronic ophthalmia.

2. (W. Cooley.) *Acetate of morphia*, 6 gr.; *acetic acid* (Ph. L.) and *water*, of each, 1½ fl. dr.; dissolve, add the solution to *simple ointment* (melted), 1½ oz., and stir the mixture briskly until nearly cold. In chronic ophthalmia, painful inflamed piles, &c.; also to remove freckles, and to allay itching and irritation in several skin diseases.

OINTMENT (White). Both *spermaceti ointment* and *ointment of carbonate of lead* were formerly so called, but the name is now obsolete. The *camphorated white ointment* of the Ph. L. 1746 (*Ung. album camphoratum*) was spermaceti ointment to which a little camphor had been added.

OINTMENT (White Hellebore). See *Hellebore Ointment.*

OINTMENT (White Precipitate). See *Ointment of Ammonio-chloride of Mercury.*

OINTMENT (White Wax). See *Simple Ointment.*

OINTMENT (Wolfsbane). See *Ointment of Aconite.*

OINTMENT (for Worms). Syn. *Unguentum Anthelminticum, Ung. Vermifu-*

gum,—Lat. *Prep.* 1. (Boerhaave.) *Aloes* and *ox-gall*, of each, 1 part; *marshmallow ointment*, 8 parts.

2. (Fr. Hosp.) *Aloes* and *oil of tansy*, of each, 1 part; *dried ox-gall*, 2 parts; (both in fine powder;) *lard*, 8 parts.

3. (Ph. Bat.) *Aloes*, 1 dr.; *dried ox-gall* and *petroleum*, of each, 1½ dr.; *lard*, 1½ oz.

4. (Soubeiran.) *Powdered aloes*, 2 dr.; *lard*, 1 oz.

Uses, &c. The above are purgative and vermifuge, applied as frictions to the abdomen. They are chiefly employed for children and delicate females. See *Colocynth Ointment.*

OINTMENT (Yellow Wax). Syn. *Unguentum Ceræ Flavæ*,—Lat. *Prep.* (Ph. D. 1826.) *Bees' wax*, 1 ℔; *lard*, 4 ℔; melt them together. A mild emollient dressing. Some parties regard it as more "healing" than the "ointment of white wax."

OINTMENT (Zinc). See *Ointment of Oxide of Zinc.*

OINTMENT (Zinc,—Compound). Syn. *Unguentum Zinci Compositum*, — Lat. *Prep.* 1. (Hufeland.) *Oxide of zinc* and *lycopodium*, of each, 1 dr.; *simple ointment*, 1 oz. In excoriations and simple ulcerations, especially those of the eyelids, nipples, &c.

2. (Thomson.) *Oxide of zinc*, ½ dr.; *powdered opium*, 5 gr.; *lard*, 1 oz. As the last, when there is much pain.

OINTMENTS (Flower of). Syn. *Flos Unguentorum*,—Lat. *Prep.* From *resin*, *thus*, *wax*, and *suet*, of each, ½ ℔; *olibanum* and *Venice turpentine*, of each, 2½ oz.; *myrrh*, 1 oz.; *wine*, ½ pint; boil them together, and lastly, add of *camphor*, 2 dr. Suppurative; warming.

OLANINE. See *Animal Oil* (p. 839).

OLEFIANT GAS. Syn. *Carburetted Hydrogen; Bicarburetted do., Percarburetted do., Hydroguret of Carbon, Ethylene; Heavy Inflammable Air*,—Obs. var. A substance discovered by some associated Dutch chemists, in 1796, and composed of carbon and hydrogen in equivalent proportions.

Prep. 1. A *mixture* of *alcohol* (rectified spirit), 1 part, and *oil of vitriol*, 6 parts, is heated in a retort until it blackens and sulphurous acid begins to be evolved; the product is then passed first through a wash-bottle containing a solution of *caustic potassa* or *milk of lime*, and next through a bottle containing *concentrated sulphuric acid;* the last being furnished with a tube dipping into the water of the pneumatic trough.

2. The *vapour* of *boiling alcohol* is passed into a *mixture* of *oil of vitriol* diluted with rather less than one half its weight of *water*, and so heated as to be in a state of tranquil ebullition (320° to 330° Fahr.); the gaseous product is chiefly olefiant gas, and the vapour of water, from which it may be separated as above. No sulphurous acid is formed, nor does the acid blacken as in the last process.

Prop., &c. Colourless; neutral; nearly odourless; nearly insoluble in water; alcohol, ether, and the volatile and fixed oils absorb a portion of it; burns with a brilliant white flame; at a full red heat it suffers decomposition, with deposit of carbon and liberation of light carburetted hydrogen gas; mixed with twice its volume of chlorine and inflamed, hydrochloric acid is formed, and the carbon of the gas is precipitated in the form of dense black soot; if the mixture (best in equal volumes), instead of being kindled, be left standing over water, it soon condenses into a heavy oily liquid (*chloride of hydrocarbon, Dutch liquid*). It is the presence of olefiant gas in *coal gas* that principally gives to the latter its illuminative properties. Sp. gr. 0·981; 100 cubic inches weigh 30·57 gr.

OLEFIANT GAS (Bromide of). From *bromine* and *olefiant gas*, as *Dutch liquid.* A colourless liquid with an ethereal odour, boiling at 265°, and solidifying at 0° Fahr. Sp. gr. 2·16.

OLEFIANT GAS (Chloride of). Syn. *Dutch Liquid; Chloride of Ethylene.* This substance, referred to above, may be easily prepared in any quantity by the following process:—*Chlorine* and *olefiant gas* (the latter a little in excess) are conveyed by separate tubes (passing through the same cork) into a glass globe, having a narrow funnel-shaped neck at its lower part, dipping into a small bottle destined to receive the product of their mutual reaction; the newly formed liquid trickles down the sides of the globe into the receiver, and when a sufficient quantity is collected, it is purified by agitating it first with water, and then with sulphuric acid, and lastly, submitting it to distillation.

Prop., &c. Colourless; sweet-tasted; agreeably fragrant, the odour approaching that of oil of caraway; slightly soluble in water; freely so in alcohol and ether; it sinks in water; boils at 180° Fahr.; burns with a smoky greenish flame; is unaffected by oil of vitriol; but decomposed by solution of caustic potassa. It combines with chlorine, forming new compounds. See *Chlorides of Carbon.*

OLEFIANT GAS (Iodide of). From

iodine and *olefiant gas*, as the last. Colourless, crystalline, highly volatile with a penetrating odour; it melts at 174° Fahr.

OLEIC ACID. Syn. *Elaic Acid.* One of the oily acids discovered by Chevreul, and produced by saponifying oils, and then separating the base from the resulting soap by means of a dilute acid. It now forms an important secondary product in the manufacture of stearic acid. Perfectly pure oleic acid may be obtained as follows:—

1. By saponifying *oleine*, as just noticed.

2. Pure *almond* or *olive oil soap* is decomposed by a *dilute acid*, and the resulting *oily acid* is digested in a water bath with half its weight of *litharge* (in very fine powder) for some hours, constantly stirring; the mixture is then agitated with twice its volume of *ether* in a close vessel, and in 24 hours the clear *ethereal solution* is decanted, and decomposed with *dilute hydrochloric acid;* the *oleic acid* separates, and the ether mixed with it is expelled by evaporation. To render it colourless, the acid is again saponified with *caustic soda*, and the soap thus obtained is repeatedly dissolved in a *solution of soda*, and as often separated by adding *common salt;* this soap is, lastly, decomposed by *dilute hydrochloric acid* as before.

Prop., &c. A colourless oily acid, insoluble in water, soluble in alcohol, ether, and oil; with the bases it forms salts called *oleates.* The *crude oleic acid* of commerce is noticed at page 851.

OLEINE. Syn. *Elaine; Huile Absolue.* The liquid portion of the fixed oils and fats. By saponification it yields oleic acid.

Prep. 1. *Olive oil* or *almond oil* is digested for 24 hours with a quantity of *caustic soda lye*, only sufficient to saponify one-half of the oil, and the undecomposed oily portion (*oleine*) is then separated from the alkaline solution and newly formed stearine soap.

2. The *saponified mixture of oil and alkali* (see No. 1) is digested with *proof spirit* until all the soap is dissolved out, and the *oleine* separates and floats on the surface; the latter, after repose, is decanted.

3. *Almond* or *olive oil* is agitated in a stout bottle with 7 or 8 times its weight of *strong alcohol* (sp. gr. 0·798) at nearly the boiling point, until the whole is dissolved; the solution is next allowed to cool, after which the clear upper stratum is decanted from the stearine which has been deposited, and after filtration, the spirit is removed by distillation at a gentle heat; by exposure at a very low temperature it deposits any remaining stearine, and then becomes pure.

Prop., &c. The product of the last two formulæ have only a very slight yellow colour, but may be rendered quite limpid and colourless by digestion for 24 hours with a little pure freshly burnt animal charcoal, and subsequent filtration. In this state it is perfectly neutral to test paper, does not in the slightest degree affect metallic bodies immersed in it, and does not thicken by exposure to the greatest cold. *Oleine* is *used* by watchmakers for their fine work. Some years ago the product of the last formula was sold, by a certain metropolitan house, as "*watchmaker's oil,*" at 1*s.* 6*d.* a drachm. *Commercial oleine* is generally lard oil. The refined oleic acid of the stearine works also commonly passes under the name. *Oleine* burns well in lamps; but *oleic acid* does not do so unless when well refined and when the wick-tube is so formed as to remain cool. Messrs. Humfreys & Wilson have patented an excellent arrangement for this purpose. See *Lard Oil* and *Oleic Acid.*

OLEOMETER. Syn. *Elaïometer, Elæometer, Oil-balance.* A delicate areometer or hydrometer, so weighted and graduated as to adapt itself to the densities of the leading fixed oils. As the differences of the specific gravities of these substances are inconsiderable, to render it more susceptible, the bulb of the instrument is proportionately large, and the tube or stem very narrow. The scale of the elaïometer in general use (M. Gobby's) is divided into 50 degrees, and it floats at 0 or zero in *pure poppy oil*, at 38 or 38½ in *pure almond oil*, and at 50 in *pure olive oil.* The standard temperature of the instruments made in this country are now 60°; those made on the Continent, 54·5° Fahr. The oil must therefore be brought to this normal temperature before testing it, by plunging the glass cylinder containing it into either hot or cold water, as the case may be; or a correction of the observed density must be made. The last is done by *deducting* 2 from the indication of the instrument for *each degree* of the thermometer *above* the normal temperature of the instrument, and adding 2 for every degree below it. Thus; suppose the temperature of the oil at the time of the experiment is 60° Fahr., and the elaïometer indicates 61°; then—

60·0°	*Actual temperature.*
54·5	*Normal temperature.*
5·5	Difference.

Indication of the elaïometer .	61·0
The difference 5·5 × 2 = . .	11·0
Real density	50·0

Suppose the temperature observed at the time of the experiment is 52°, and the elaïometer indicates 45°; then—

54·5	*Normal temperature.*
52·0	*Actual temperature.*
2·5	Difference.

Indication of the elaïometer .	45·0
The difference 2·5 × 2 = . .	5·0
Real density	50·0

The oil is, therefore, presumed to be pure. See *Hydrometer*, *Oils* (Fixed), and *Specific Gravity*.

OLEON. A peculiar liquid obtained by the distillation of *oleic acid* and *lime*.

OLEO-PHOSPHORIC ACID. An acid compound found by Fremy in the brain and nervous matter.

OLEO-RESINS. The natural compounds of *resin* and *essential oil* forming the vegetable balsams and turpentines.

OLEO-RICINIC ACID. See *Ricinoleic Acid*.

OLEOSACCHARUM. Syn. *Elæosaccharum*. Sugar aromatized or medicated by being rubbed up with an essential oil. The *oleosacchara* of *aniseed*, *caraway*, *cinnamon*, *peppermint*, *pennyroyal*, and the other like *essential oils*, are made by rubbing 15 to 20 drops of the *respective oils* with *white sugar*, 1 oz.—The Ph. Græca, 1837, prescribes 1 part of *oil* to 20 parts of *sugar*.—The Ph. Austr. 1836 and Ph. Bor. order the same proportions, or 3 drops of *oil* to the dr., and 24 drops to the oz. of *powdered sugar*. When intended for making *extemporaneous distilled waters*, 1 dr. of *magnesia* is a common addition. The *oleosacchara* of *citrons*, *lemons*, *oranges*, *&c.*, are made from the peels, as follows:—After cleaning off any specks in the outer rind of the fruit, rub a large piece of *loaf sugar* on it until the yellow rind is completely removed. Those parts of the sugar which are impregnated with the essence are, from time to time, to be cut away with a knife, and put into an earthen pot. The whole being thus taken off, the sugared essence (*oleasaccharum*) is to be closely pressed down in the pot, tied over with bladder, and preserved in a cool place for use.

OLIBANUM. Syn. *Indian Olibanum*; *Frankincense*. A gum resin obtained from either *juniperus lycia* or *Boswellia serrata*. It is stimulant, astringent, and diaphoretic. It is burnt as *incense* in the temples of India, and in Roman Catholic churches. *African frankincense* is produced by *Boswellia floribunda*. (Royle.) This substance must not be confounded with the resin noticed at *page* 489.

OLIVE. Syn. *Olea*, *Oliva*,—Lat. The *olea Europæa* (Linn.), a native of the South of Europe. The *unripe fruit* is preserved in brine (*Spanish olives*, *French olives*); the *ripe fruit* furnishes olive oil; the *bark* is bitter, astringent, and febrifuge, and has been used as a substitute for cinchona bark; it yields a gum-like substance which was formerly reputed vulnerary, and contains *olivile*. The olive tree has in all ages been held in peculiar estimation, as the bounteous gift of heaven to man. Some authors have styled it "a mine on earth." It is remarkable for yielding a fixed oil from the pericarp, instead of from the seed. See *Med. Circ.*, i, 350.

OLIVILE. The name given by Pelletier to the substance obtained by evaporating an *alcoholic solution* of the *gum of the olive tree*. It is a white, brilliant, starch-like powder, soluble in hot water and in alcohol.

OLIVINE. Syn. *Olivina*, *Olivinum*. A white, crystalline substance, obtained by Landerer from the leaves of the olive tree.

Prep. The *recent leaves* (bruised) are digested in *water* acidulated with *hydrochloric acid*, the infusion is concentrated by a gentle heat, and precipitated by *ammonia*; the precipitate is washed with a little *cold water*, redissolved in *dilute acid*, and decoloured by *animal charcoal*; the filtered solution is, lastly, reprecipitated with *ammonia*, as before.

Prop., *&c.* White; crystalline; bitter; soluble in dilute acids, and in alcohol. It is feebly basic.

OLLIVIER'S BISCUITS. See *Patent Medicines*.

OMELET. Syn. *Omelette*,—Fr. A variety of pancake or fritter made of eggs, and other ingredients. *Omelets* may contain *bacon*, *ham*, *herbs*, *fish*, *shell-fish*, *cold meat*, *cold game*, *fruit*, or anything else at hand at the pleasure of the cook. "*Spirit omelets*" are made by pouring a little *brandy*, *rum*, or *whisky* over them on serving them up, and setting it on fire for a *moment* just before placing the dish on the table. "Where is the man or woman cook but says they know how to make an omelette, and that to perfection? But this is rarely the case. It is related of Sarah, the Duchess of Marlborough, that no one could cook a '*fraise*,'

as it was then called, for the great duke but herself. The great point is, if in an iron pan, it should be very clean and free from damp, which sometimes comes out of the iron when placed on the fire. The best plan is to put it on the fire, with a little fat, and let it get quite hot, or until the fat burns; remove it, and wipe it clean with a dry cloth, and then you will be able to make the omelette to perfection." (Soyer.)

The following formula for a *plain omelet* is by the above august authority:—Break *four eggs* into a basin, add ½ *tea-spoonful* of *salt*, and ¼ *do.* of *pepper*, and beat them up well with a fork; put into the frying-pan 1½ *oz.* of *butter*, *lard*, or *oil*, place it on the fire, and when *hot*, pour in the *eggs*, and keep on mixing them quickly with a spoon until they are delicately set; then let them slip to the edge of the pan, laying hold by the handle, and raising it slantways, which will give an elongated form to the omelette; turn in the edges, let it rest a moment, to set, turn it over on to a dish, and serve." "It ought to be of a rich-yellow colour, done to a nicety, and as light and delicate as possible." "2 *table-spoonfuls* of *milk* and 1 *oz.* of the *crum of bread* cut into thin slices, may be added."

Mixed and *fancy omelettes* are made by simply dropping the ingredients, cut into dice or fragments, into the above. *Anchovy*, *oyster*, and *shrimp omelettes* are generally prepared by placing a few spoonfuls of the respective sauces in the centre of each, when nearly dressed.

ONGUENT (de la mère). A stimulant and digestive ointment very popular in French pharmacy.

Prep. (P. Cod.) *Black pitch*, 1 part; *butter*, *lard*, *litharge*, *suet*, and *yellow wax*, 4 parts; *olive oil*, 8 parts.

OMYCHILE. A brown, resinous substance, obtained by Scharling from *inspissated urine*.

ONION. Syn. *Cepa*,—Lat. The *bulb* of *allium cepa* (Linn.) The onion is diuretic, expectorant, rubefacient, and stimulant. The *juice*, made into a syrup with sugar (*syrupus cepæ*), has been given in chronic catarrh, diarrhœa, croup, dropsy, and calculus. Roasted and split open, onions have been applied as poultices to suppurating tumours; and applied to the pubes to relieve suppression of urine in children. According to Dr. Cullen, "onions are acrid and stimulating, and possess little nutrient power. In *bilious constitutions* they generally produce flatulence, thirst, headache, and febrile symptoms; but where the *temperament* is *phlegmatic*, they are of infinite service, by stimulating the system, and promoting the excretions, particularly expectoration and urine." They also possess antiscorbutic and soporific properties.

ONONINE. A sweet crystallizable substance contained in the *root* of *ononis spinosa* or *rest-harrow*.

ONYX. A sub-species of quartz often wrought into small ornamental articles. Among jewellers, any stone exhibiting layers of two or more colours, strongly contrasted, is called an *onyx*. A regularly and richly banded agate of this class is much prized for cameos. See *Gems*.

OPAL. See *Gems* and *Pastes*.

OPHTHALMIA. Syn. *Ophthalmitis*. Inflammation of the eye. In ordinary cases this disease is confined to the external membrane of the globe of the eye, or to the eyelids; but it occasionally attacks the sclerotica, cornea, choroid coat, and retina.

The *common causes* of ordinary or *conjunctival ophthalmia*, are the sudden exposure of the organ to a cold easterly wind, to dust, gritty particles, or to any external irritation or injury.

The *symptoms* are, in part, those common to local inflammation. The eye or eyelids become more or less bloodshot, swollen, and tender, and a sensation resembling that induced by the presence of particles of sand or some gritty substance, accompanied by much heat and a pricking pain, is almost constantly experienced. The secretion becomes yellowish and glutinous, and during the night frequently glues, as it were, the lids together. Sometimes only one eye is attacked, but after 2 or 3 days the disease extends to the other.

The *treatment* of *mild cases* of conjunctival ophthalmia is extremely simple. In general it may be relieved by fomentations of warm water, or decoction of poppy-heads, and the use of aperient medicines; to which leeches and cupping may often be added with advantage. In *severer cases*, general depletion and blisters to the nape of the neck must be had recourse to. When the *inflammation has subsided*, mild astringent and cooling eye-waters and ointments will be found useful; but all applications of this kind should be used with caution. The *purulent ophthalmia* of new-born infants, and that which often follows the smallpox, measles, and fevers, generally yields to the use of mild astringent eye-waters and ointments, and to the application, at bedtime, of a drop of *wine of opium* diluted with 5 or 6 drops of water. A *very weak* solution of *sulphate of zinc*, or the *ointment of nitric oxide of mercury*,

will be found a good application in the latter cases. In every variety the eye should be kept clean by careful ablution with warm milk-and-water. A solution of *chloride of barium* (3 to 5 gr. to distilled water 1 fl. oz.) is an excellent application in chronic ophthalmia arising from scrofula or syphilis.

When the disease is symptomatic of other affections, as gout, rheumatism, hysteria, &c., the treatment should have reference to the primary disease. Intense pain (*ophthalmodynia*), having this origin, is sometimes felt in the eye when there is no inflammation.

Occasionally ophthalmia assumes a malignant form, producing the most intense suffering, ending in destruction of the eyeball, and total blindness. In this state, it is highly contagious. Of this description was the disease which fell with such severity on the French and English armies in their expeditions to Egypt.

OPIAMMON. A nearly white insoluble powder formed by evaporating the *ammonia salt of opianic acid* to dryness. The stronger acids reconvert it into opianic acid and ammonia.

OPIANE. Narcotine.

OPIANIC ACID. A crystalline substance, resulting from the oxidation of narcotine, discovered by Wöhler and Liebig.

Prep. Narcotine is dissolved in *dilute sulphuric acid*, in considerable excess; *binoxide of manganese*, in very fine powder, is next added, also in excess, and the mixture is boiled until carbonic acid ceases to be evolved; the liquid is then filtered, and on cooling forms a crystalline mass of *opianic acid;* this is drained on a filter, pressed, washed with *cold water*, and frequently recrystallized from a saturated solution in *boiling water.*

Prop., &c. Colourless, prismatic, reticulated crystals; very sparingly soluble in cold water; freely soluble in hot water, and in alcohol; soluble in alkaline lyes, but insoluble in them after fusion, unless when concentrated. It forms crystallizable salts called *opianates*, including an ether (*opianic ether*).

OPIANINE. A substance of little importance occasionally found in opium.

OPIATES. Syn. *Opiata*,—Lat. Preparations containing opium. The word is often applied in a general sense to anodynes and soporifics. In French pharmacy the name is commonly used synonymously with confections.

Anti-dysenteric Opiate,—Quarin. *Purified opium*, 4 gr.; *ipecacuanha*, ½ dr.; *tormentilla*, 1 dr.; *syrup of whortleberries* and *conserve of red roses*, of each, 6 dr. *Dose.* A tea-spoonful every hour.

Anti-hysterical Opiate, — Trousseau & Reveil. *Powdered indigo*, 1 oz.; *white honey*, 3 oz. *Dose.* 1 table-spoonful daily, gradually increased until the whole is taken in a day. In hysteria, epilepsy, and nervous affections of an epileptic character.

Anti-tubercular Opiate; Lepecq de la Cloture. From *spermaceti, crab's eyes*, and *sulphur*, of each, 2 dr.; *conserve of roses*, 4 dr.; *pepper mushroom*, 3 dr.; *honey*, q. s. to make an electuary. In pulmonary consumption. *Dose.* 1 to 2 tea-spoonfuls, 3 or 4 times a day.

Balsamic Opiate,—Trousseau & Reveil. *Oleo-resin* (balsam) *of copaiba*, 1 oz.; *cubebs* (in powder), 3 oz.; *potassio-tartrate of iron*, 2½ dr.; *syrup of quince*, q. s. In gleet. *Dose.* 3 boluses the size of a nut, thrice daily.

Charcoal Opiate,—Ratier. *Willow charcoal* (recent), 1 oz.; *prepared chalk*, 1 dr.; *powdered white sugar*, 2 oz.; *rose water*, q. s. to form an electuary. In diarrhœa and incipient cholera, in dysentery with fetid stools, and in gastralgia, flatulence, &c. By substituting calcined magnesia for chalk it becomes an excellent remedy for habitual constipation.

Cubeb Opiate, — Deyeaux. *Powdered cubebs*, 4 dr.; *powdered camphor*, 1 dr.; mix, and divide it into 18 powders. *Dose.* One, 3 or 4 times daily, in gleet, painful and scalding micturition, &c.

OPIATE (en Poudre). *Prep.* From *Bath brick*, 8 *oz.; china ware*, 4 *oz.; red coral*, 1 *oz.; cinnamon* and *cloves*, of each, 1 dr.; reduced to very fine powder, and passed through gauze or muslin. *Used* as a dentifrice; rapidly whitens the teeth, but should not be employed too freely.

OPIUM. Syn. *Opium*,—Ph. L. E. & D. "Turkey opium (*opium Turcicum*);" "the juice emitted from the incised unripe fruit (*capsules*) of *papaver somniferum*, Linn.," or *white poppy*, "indurated by exposure to the air."

Var.—1. *Egyptian;* in roundish flattened lumps; inferior to Turkey opium. — 2. *English;* often equal to the best Smyrna.—3. *French;* resembles the last.—4. *German;* similar to English opium. — 5. *Indian;* —*a.* Benares opium, in large balls; — *b.* Malwa opium, in roundish flattened cakes, of 9 or 10 *oz.* in weight each;—*c.* Patna opium, in balls or square cakes. Inferior to Turkey opium.—6. *Levant;* same as Smyrna opium.—7. *Persian;* in rolls or sticks, 6 × ½ inch; inferior; resembles hepatic aloes in appearance.—8. *Smyrna;* in irre-

gular, rounded, flattened pieces, varying in weight from 2 or 3 *lb.* to only as many *oz.* It forms the best variety of Turkey opium, and is particularly rich in morphia. It is the only one adapted for the manufacture of the *salts of morphia*, as it contains on the average from 7 to 9% of that alkaloid, and usually yields about 12 to 12·5% of *hydrochlorate of morphia*, which is more than can be obtained from any other variety of opium.—9. *Turkey;* of which two varieties are known in commerce; viz., Constantinople opium, and Levant or Smyrna opium. The *first* is generally in small flattened, roundish cakes, 2 to 2½ inches in diameter, and covered with poppy leaves. It is more mucilaginous and less esteemed than Smyrna opium, from which it may be distinguished by this last being always covered with the reddish capsules of a species of rumex.

Pur. The opium of commerce is not unfrequently adulterated with *extract of poppies*, *extract of lettuce*, *lactucarium*, *mucilage of gum tragacanth*, *dried leaves*, *starch*, *water*, *clay*, *sand*, *gravel*, and other substances, in order to increase its weight. This fraud is readily detected by inspection, by chemical analysis, and the microscope; and indirectly, with the greatest certainty, by a simple assay of the sample for its morphia ("*morphiometry*"). This may be effected by one or other of the following methods:—

1. (Couerbe.) *Opium*, 4 parts; and *quicklime*, 1 part, made into a milk with *water*, q. s.; are boiled together, and the solution filtered whilst hot; *dilute hydrochloric acid* is then added, to saturation, and the *morphia* precipitated by the addition of *liquor of ammonia*, any excess of the latter being expelled by heat; the precipitate is then collected, dried, and weighed. If 100 gr. have been operated on, the given weight will represent the per centage richness of the sample in morphia (nearly).

2. (M. Guilliermond.) 100 gr. of *opium* are triturated for some time in a mortar along with 4 times its weight of *rectified spirit*, and the tincture strained through linen, with expression, into a wide-mouthed bottle; the marc is triturated a second time with about 3 times its weight of alcohol, and the tincture strained into the bottle as before; to the *mixed tinctures* is added 1 fl. dr. of *liquor of ammonia*, and the whole is agitated for a short time. In about 12 hours the *morphia* spontaneously separates, accompanied with some *narcotine* and *meconate of ammonia;* the morphia covering the interior of the vessel with large, coloured, and gritty crystals, feeling like sand, and the narcotine crystallizing in very light, small, white, and pearly needles. These crystals are washed with *water*, either through a paper filter or linen, to free them from the *meconate of ammonia* which they contain; after which the *narcotine* is separated from the morphia by decantation in water, which removes the narcotine, which is the lighter of the two. According to M. Mialhe, however, the morphia is more effectually removed by washing the crystals with 1 to 1½ fl. dr. of *ether*, by triturating the two together; when the morphia is left in an insoluble state, and may then be dried and weighed.

3. (Ph. E.) Macerate 100 gr. of *opium* for 24 hours in 2 fl. oz. of *water*, filter, and strongly squeeze the residue; then precipitate the infusion with *carbonate of soda*, ½ oz., dissolved in *cold water*, 2 fl. oz.; gently heat the precipitate until it shrinks and fuses, then cool and weigh it. It should weigh at least 10 gr.; and when powdered, be entirely soluble in a *solution of oxalic acid.*

Tests. These depend chiefly on the chemical and physical characters of morphia and meconic acid, the tests for which have been already noticed. In operating upon the *contents of the stomach*, or upon *solid organs*, in cases of suspected poisoning, the best method of proceeding is that already described under "*Alkaloid.*" — *Another method* is to boil the substances in *water slightly acidulated with acetic acid*, next to evaporate the solution to the consistence of a thick syrup, and then to treat it *twice* with *boiling rectified spirit;* the tincture thus obtained is to be filtered when cold, and again evaporated to the consistence of syrup; it is now redissolved in *distilled water*, the filtrate treated with solution of *diacetate of lead*, and the precipitate of *meconate of lead*, separated by filtration, and carefully preserved. A current of *sulphuretted hydrogen* is then passed through the solution, to precipitate excess of lead, and after again filtering it, the liquid is evaporated, at *first*, in a water bath, and afterwards, under the receiver of an air-pump. The shapeless mass of crystals thus obtained, present all the characters of morphia, if the substance examined contained opium. In the mean time the *precipitate* of *meconate of lead* is to be boiled with *water acidulated with sulphuric acid*, and the insoluble sulphate of lead separated by filtration; the filtered liquid, by evaporation, furnishes meconic acid, either under the form of crystals or an amorphous powder, the solution of which precipitates the *sesquisalts of iron* of a deep blood-red.

The following are additional tests to those already noticed :—

1. From the peculiar odour of opium, often perceptible when the drug has been taken only in very small quantities.

2. A solution containing crude opium is turned of a deep-red colour, or if coloured, it is turned of a reddish-brown, and is darkened, by tincture of sesquichloride of iron.

3. (M. Hare.) A portion of the *suspected liquid* is poured into a beakerglass, and a few drops of *solution of acetate of lead* are added to it; the whole is stirred frequently for 10 or 12 hours, and then allowed to settle, after which the supernatant liquid is decanted; 20 or 30 drops each of *dilute sulphuric acid* and *solution of sesquisulphate of iron*, are next poured on the precipitate (*meconate of lead*), when a deep and beautiful red colour will be developed, if the original liquid contained opium. This test is said to be so delicate as to detect "10 drops (? *laudanum*) in half a gallon of water."

4. (Dr. Rieget.) The *suspected substance* is mixed with some *potassa*, and is then agitated with *ether;* a strip of *white unsized paper* is next several times moistened with the solution, and when dry it is remoistened with *hydrochloric acid*, and exposed to the *steam of hot water*. The paper assumes a red colour, more or less deep, if opium is present.

Uses, &c. Opium is one of the most valuable substances employed in medicine. In small doses it acts as a powerful and diffusible stimulant; in somewhat larger ones it is narcotic; and in excessive doses, it proves an active narcotic poison. It is also anodyne, antispasmodic, diaphoretic, soporific, and sedative, its peculiar action being greatly modified by the dose and the condition of the patient. Its action as a stimulant is followed by sedative effects, which are, in general, much more marked than could be expected from the degree of previous excitement it induces. It is employed to fulfil a variety of indications,—to procure sleep, to lull pain, allay irritation, check morbid discharges, alleviate cough and spasm, &c., &c. It also, when judiciously administered, renders the body less susceptible of external impressions, as those of cold, contagion, &c.; but it is injurious when the pulse is high, the heat of the body above the natural standard, and the skin dry, or when there is a disposition to local inflammation or congestion. When applied externally, in the form of frictions, liniments, ointments, &c., it is absorbed, and produces similar effects to those produced by swallowing it, but in this way it requires to be used in larger quantities. *Dose.* As a stimulant, ¼ gr., every 2 or 3 hours; as an anodyne and antispasmodic, ½ to 1 gr.; as a soporific, ½ to 2 gr.; in violent spasms, neuralgia, acute rheumatism, &c., 2 to 4 gr., increased in delirium tremens, hydrophobia, mania, tetanus, &c., to several times that quantity, according to circumstances.

The *use* of *opium* as a *stimulant* and *intoxicant* is common among the nations of the East. The Turks chew it, and the Chinese smoke a watery extract of it, under the name of *Chundoo*. Of late years "*opium-eating*" and "*laudanum-taking*" have, unfortunately, been greatly on the increase in this country, and the employment of this drug as a soporific for infants and young children, has become so general amongst the poor and dissipated, as to call for the interference of the legislature. The *first effect* of *opium*, as a stimulant, is to excite the mental powers and to elevate those faculties proper to man; but its *habitual use* impairs the digestive organs, induces constipation, and gradually lessens the energy of both the mind and body. In excessive quantities it destroys the memory, induces fatuity, and a state of wretchedness and misery, which after a few years is cut short by a premature death. In this respect the effects of the excessive use of opium closely resemble those of fermented liquors. According to the testimony of Christison and Johnson, the one neither injures the health nor shortens life more than the other. Nor does the practice of *smoking opium* affect the health of the inhabitant of China, more than the practice of *smoking tobacco* does that of the phlegmatic Englishman. Mr. Smith states that "the health of the opulent Chinese, many of whom, within my own observation, have attained the age of 60, 70, or more, and are well known as habitual opium-smokers for more than 30 years, is little affected by it. The practice is most destructive to those who live in poverty, and who carry it to excess." (*China*, 1838.)

Pois. — *Symptoms.* Headache; drowsiness; stupor; frightful reveries; vertigo; contracted pupil (generally); scanty urine; pruritus or dry itching of the skin, often accompanied by a papular eruption; thirst; dryness of mouth and throat; weak and low pulse; vomiting; respiration, generally, natural. Sometimes the drowsiness or sleep is calm and peaceful. The *lesions* are trifling.—*Ant., &c.* Vomiting must be induced as soon as possible, by means of a strong emetic, and tickling the fauces. If this does not succeed the stomach-pump

should be applied. The emetic may consist of ½ dr. of *sulphate of zinc* dissolved in ½ pint of *warm water*, of which one third should be taken at once, and the remainder at the rate of a wine-glassful, every 5 or 10 minutes, until vomiting commences. When there is much drowsiness or stupor, 1 or 2 fl. dr. of *tincture of capsicum* will be found a useful addition; or one of the formulæ for *emetic draughts* given at *page* 337 (especially No. 7) may be taken instead. *Infusion of galls, cinchona,* or *oak-bark,* should be freely administered before the emetic, and water soured with *vinegar* and *lemon juice, after* the stomach has been well-cleared out. To rouse the system, *spirit-and-water,* or *strong coffee,* may be given. To keep the sufferer awake rough friction should be applied to the skin, an upright posture preserved, and walking exercise enforced, if necessary. When this is ineffectual, cold water may be dashed over the chest, head, and spine, or mild shocks of electricity may be had recourse to. To allow the sufferer to sleep is to abandon him to destruction. Bleeding may be subsequently necessary in plethoric habits, or in threatened congestion. The costiveness that accompanies convalescence may be best met by aromatic aperients; and the general tone of the habit restored by stimulating tonics and the shower bath. The *smallest fatal dose* of *opium* in the case of an *adult,* within our recollection, was 4½ gr. Children are much more susceptible of the action of opium than of other medicines; and hence, the dose of it for them must be diminished considerably below that indicated by the common method of calculation depending on the age. See *Doses, &c.*

Concluding Remarks. Opium is a very complicated substance, and contains a number of alkaloids and other proximate vegetable principles, besides a certain portion of saline matter. The substances already detected in it, are *caoutchouc, codeia, fatty matter, lignine, meconic acid, meconine, morphia, narceine, narcotine, odorous matter, opianine, papaverine, porphyroxine, pseudomorphine, resin, saline matter, sulphuric acid, thebaine* or *paramorphine,* &c. It is doubtful, however, whether some of these substances are not generated from other principles existing in opium, during the processes adopted to obtain them. By contact with oxidizing agents, *narcotine* yields *cotarnine, hemipinic acid, opiammon, opianic acid,* &c., which are noticed in their alphabetical places.

According to Mulder, 100 parts of ordinary Smyrna opium contain :—

Morphia . . .	10·842
Codeia . . .	·678
Narcotine . . .	6·808
Narceine . . .	6·662
Meconine . . .	·804
Meconic acid . .	5·154
Resin . . .	3·582
Gummy matter . .	26·242
Mucus . . .	19·086
Fatty matter . .	2·166
Caoutchouc . .	6·012
Water . . .	9·846
Matter undetermined and loss . . .	2·118
	100·

The sp. gr. of *Smyrna opium* is 1·336.

OPIUM (Accarie's Purified). *Infusion of opium,* digested with *powdered charcoal* for some days, then clarified with *white of egg,* and evaporated to an extract.

OPIUM (Baumé's Purified). Similar to *Homberg's opium.*

OPIUM (Cornette's Purified). Similar to the aqueous extract, Ph. L.

OPIUM (Cumin). From *hypecoum procumbens* (Linn.) or *horned wild cumin.* Narcotic.

OPIUM (Glasier's Prepared). *Infusion of opium* made with *may-dew,* filtered and evaporated.

OPIUM (Glauber's Prepared). *Opium,* 4 oz.; *spirit of salt,* 1½ oz.; (diluted with) *water,* 3 oz.; *cream of tartar,* 1 oz.; mix, and digest in *rectified spirit,* 1 quart; lastly, filter, and evaporate the tincture.

OPIUM (Homberg's Purified). *Opium* exhausted by repeated coction in 10 or 12 times its weight of *water,* and the mixed liquors evaporated to one third, and kept boiling for 2 or 3 days, adding *water* from time to time, then straining and evaporating to a pilular consistence.

OPIUM (Josse's Purified). Resembles *extract of opium,* Ph. L.

OPIUM (Launcelotte's Prepared). *Opium,* 1 ℔; *quince juice,* 1 gall.; *pure potassa,* 1 oz.; *sugar,* 4 oz.; ferment for some time, evaporate to a syrup, digest in *rectified spirit,* filter, and evaporate the tincture.

OPIUM (Lettuce). Lactucarium.

OPIUM (Neumann's). *Infusion of opium,* strained, mixed with a little *sugar,* and fermented for some months in a warm place; and, lastly, strained and evaporated to an extract, or preserved in the liquid form.

OPIUM (Powell's Purified). *Opium,* exhausted by coction with *water,* the residuum treated with *spirit of wine,* and the

mixed *tincture* and *decoction* evaporated to an extract.

OPIUM (Purified). Syn. *Opium Purificatum*,—Lat. The purified opium of old pharmacy is now represented by the aqueous extract of the pharmacopœias. Formerly, *picked opium* beaten to a pilular consistence, with the addition of a little *water* or *proof spirit*, was called "*soft purified opium*" (*opium purificatum molle*); and *picked opium* dried in a water-bath until brittle enough for powdering, was called "*hard purified opium*" (*o. p. durum*).

OPIUM (Quercetan's). *Vinegar of opium* evaporated to an extract.

OPIUM (Strained). Syn. *Extractum Thebaicum, Opium Colatum, Opium Purificatum, Laudanum Opiatum*,—Obs. Lat. *Opium* dissolved or softened in an equal weight of *water*, pressed through canvass, and evaporated to the consistence of an extract. It is now superseded by the aqueous extract.

OPIUM (Torrefied). Syn. *Roasted Opium; Opium Torrefactum*,—Lat. *Opium*, dried, cut into thin slices, and roasted on an iron plate, at a low heat, as long as it emits vapours, care being taken not to burn it.

Obs. Most of the above preparations are now obsolete in this country. Those that are made with *cold water*, or by fermentation, are considered milder than crude opium, and, in this respect, to closely resemble "*black drop*."

OPODELDOC. See *Soap Liniment*.

OPODELDOC (Steer's). This differs from common opodeldoc chiefly in containing more soap.

Prep. 1. *White Castile soap* (cut very small), 2 *lb.*; *camphor*, 5 *oz.*; *oil of rosemary*, 1 *oz.*: *oil of origanum*, 2 *oz.*; *rectified spirit*, 1 gall.; mix, and digest in a *strong bottle* (closely corked), by the heat of a water-bath, until solution is complete; when the liquid has considerably cooled, add of *liquor of ammonia*, 11 *oz.*; and immediately put it into wide-mouthed bottles (Steer's), cork them close, and tie them over with bladder. Very fine, solid and transparent when cold.

2. *Soap*, 4 *oz.*; *camphor*, 1 *oz.*; *oils of rosemary* and *origanum*, of each, 1 *dr.*; *rectified spirit*, 1 pint; *liquor of ammonia*, 1½ *fl. oz.*; mix.

3. (Phil. Col. of Pharm.) *White soap*, 20 oz.; *camphor*, 8 oz.; *rectified spirit*, 6½ pints; dissolve, suffer the impurities to subside, add of *liquor of ammonia*, 4 fl. oz.; *oils of rosemary* and *horsemint* (monarda), of each, 1 fl. oz.; and pour it into phials, as before.

ORANGE. Syn. *Aurantium*,—Lat. The common *China* or *sweet orange* is the fruit of *citrus aurantium* (Risso). The *Seville* or *bitter orange* is produced by *citrus vulgaris* or *bigaradia* (Risso).

Oranges are probably about the most wholesome and useful of all the subacid fruits. Their *juice* differs from that of lemons chiefly in containing less citric acid and more sugar. In their general properties the two are nearly similar.

Factitious Orange-juice is made by dissolving *citric acid*, 1 *oz.*, and *carbonate of potassa*, 1 dr., in *water*, 1 quart, and digesting the solution on the *peel of half an orange*, until sufficiently flavoured; *Narbonne honey* or *white sugar* is then added to impart the necessary sweetness. Instead of orange peel, 5 or 6 drops of *oil* of *orange peel*, with ½ fl. oz. of *tincture of orange peel*, may be used.

Orange peel (*cortex aurantii*) is an agreeable stomachic, bitter tonic, especially useful as an adjunct to more active medicines. That ordered to be used in medicine is the exterior (yellow) "rind" of the "*citrus bigaradia*" or bitter orange, "dried in the months of February, March, or April." (Ph. L.) See *Candies, Infusions, Issue Peas, Oils* (Volatile), *&c.*

ORANGEADE. Syn. *Orange Sherbet*. From *oranges*, or *orange flavour*, in the same way as *lemonade* from lemons, &c.

ORANGE CHROME. *Prep.* 1. From a *solution* of *chromate of potash* and *diacetate of lead*, as chrome yellow.

2. From *chrome yellow* or *chromate of lead*, by acting on it with a *weak alkaline lye* until sufficiently darkened. *Used* as a pigment.

ORANGE DYES. These are produced from mixtures of red and yellow dyes in various proportions; or by passing the cloth, previously dyed yellow, through a weak red bath. A very good *fugitive orange* may be given with *annotta*, by passing the goods through a solution made with equal parts of *annotta* and *pearlash*; or still better, through a bath made of 1 part of *annotta*, dissolved in a *lye* of 1 part each of *lime* and *pearlash*, and 2 parts of *soda*. The shade may be REDDENED by passing the dyed goods through water acidulated with *vinegar*, *lemon-juice*, or *citric acid*; or through a *solution of alum*. The goods are sometimes passed through a weak *alum mordant* before immersion in the dye-bath. See *Annotta, Dyeing, &c.*

ORANGE RED. Syn. *Sandix*. From *white lead*, by calcination, in a nearly similar manner to that by which red lead is

prepared from the protoxide. Brighter than red lead; *used* wholly as a pigment.

ORANGERY. The gallery, building, or enclosure in a garden, in which orange trees are preserved or cultivated, to shield them from the effects of the external winter, or to assist their growth by artificial heat.

ORCHARD. See *Cider*.

ORCEINE. Syn. *Lichen Lake, Orceic Acid.* A brownish-red powder, obtained by dissolving *orcine* in *liquor of ammonia*, exposing the solution to the air, and then precipitating with *dilute acetic acid*. It is nearly insoluble in water, but dissolves freely in solutions of ammonia and the fixed alkalies, with the production of a rich purple or violet colour. It probably constitutes the leading tinctorial ingredient in archil, cudbear, and litmus. (See *below*.)

ORCHIL. See *Archil*.

ORCINE. The colouring principle of *lichen dealbatus*, and of other tinctorial lichens, and the general product of the decomposition of the acids obtained from them under the influence of heat or the alkaline earths.

Prep. 1. The *powdered lichen* is treated with *boiling alcohol*, the tincture filtered whilst hot, and again after it has become cold; the alcohol is then removed by distillation, and the remainder evaporated to the consistence of a syrup; this is redissolved in *water*, and the solution is again filtered and evaporated to a syrup; it is then set aside some days, in a *cool place*, and the crystals of *orcine* which form are collected, and dried by pressure in bibulous paper. Impure.

2. *Lecanoric* or *orsellinic acid* (impure will do) is boiled in *baryta water*, and the excess of baryta is precipitated by *carbonic acid;* the filtered liquid is then evaporated to a small bulk, and set aside to crystallize, as before.

Prop., &c. Large, square, prismatic crystals; slightly yellowish; intensely sweet; very soluble in both water and alcohol; melt to a syrupy liquid, and then distil unchanged. Alkalies decompose it; when exposed to the air it gradually reddens. (See *above*.)

ORELLINE. The colouring matter of annotta. (See *p.* 68.)

ORES. The mineral bodies from which metals are obtained. The processes adopted for this purpose constitute *operative metallurgy;* those by which their value is determined, *mineral assaying*. The last only will be noticed here.

Assay. Three general methods are adopted for this purpose:—

1. (*Mechanical.*) This consists in *pulverizing* the *ore* by any convenient method, and expertly *washing* a *given weight* of it (say 1000 gr.) in a wooden bowl or capsule with *water*, so as to remove the *earthy gangues* from the denser and valuable metallic matter in such a way that none of the latter may be lost. This is the common plan adopted with *auriferous sands*, the *ores of tin* after they have passed the stamping mill, *galena*, *gray antimony*, *&c.*, and may either be employed as an independent process, or merely as preparatory to more exact investigations. When *galena* is thus tested, the product is a nearly pure sulphuret of lead, of which every grain is equivalent to 0·8666 of METALLIC LEAD, the rest being SULPHUR. The results with *gray antimony ore* are still more direct, since the product is only melted into pigs before being sent to market. In this state it contains 73% (nearly) of METALLIC ANTIMONY.

2. (*Humid.*) Assays in the humid way are true chemical analyses, and are described under the head "*Estim.*" attached to most of the more important minerals noticed in this work. This plan offers greater facilities and gives more accurate results than either of the other methods.

3. (*Dry.*) Of the methods of *assay* in the "*dry way*," the following are the most accurate, generally useful, and easily applied:—

a. (Dr. Abiche.) The *mineral* is reduced to powder, and mixed with 5 or 6 times its weight of *carbonate of baryta*, also in powder; this mixture is fused at a white heat in a platinum crucible, and the resulting slag, after being powdered, is exhausted with *hydrochloric acid*. This process answers well with both stony and metallic minerals, the most refractory of which give way under this treatment.

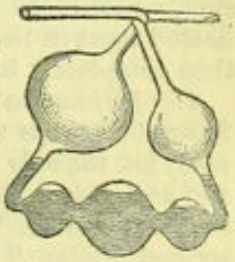
b. (Liebig.) Into a crucible containing *commercial cyanide of potassium*, a *weighed quantity* of the *ore*, in the state of fine powder, is sprinkled, when the *metallic oxides* and *sulphurets* which it contains are almost immediately reduced to the metallic state, and may be separated from the scoria by edulcoration with water. With the *oxides* and *sulphurets of antimony* and *tin*, this reduction occurs at a dull red heat; with the compounds of *copper* it occurs with the disengagement of light and heat; but an *ore of iron* requires to be mixed with a little *carbonate of potassa* or of *soda* before throwing it into the fused cyanide, and to be then submitted to a full-red heat for a short time, before it is reduced to the regu-

line state. In this case, any *manganese* present in the ore of iron is left under the form of protoxide. A mixture of about equal parts of *dry carbonate of soda* and *cyanide of potassium* answers better for the crucible than the cyanide alone. See *Alloys, Metallurgy, Testing, &c.*

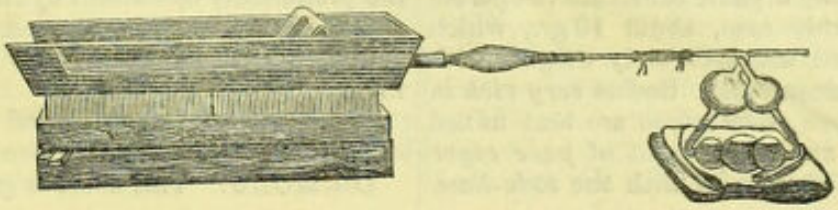
ORGANIC BASES. See *Alkaloid.*

ORGANIC BASES (Artificial). These are numerous, and when of practical interest are noticed under their respective names. See *Amylamine, Aniline, Ethylamine, Methylamine, &c.*

ORGANIC SUBSTANCES. We have reserved a notice of the methods of *estimating* the quantity of *carbon, hydrogen, oxygen,* and *nitrogen,* in organic compounds until now, in order to present them to the reader in a more useful and connected form. The operation essentially consists, in respect of the first three, in causing the complete combustion of a known quantity of the substance under examination, in such a manner, that the *carbonic acid* and *water* thus produced, shall be collected and their quantity determined. From these the proportions of their elements are easily calculated. The *estimation* of the *quantity* of *nitrogen,* (as is also the case with *chlorine,* phosphorus, sulphur, &c.,) requires a separate operation. The two great classes of organic bodies (*azotized* and *non-azotized*) are readily *distinguished* from *each other* by heating a small portion with some solid *hydrate of potassa,* in a test tube. If nitrogen is present, it is converted into ammonia, which may be recognized by its characteristic odour, and its alkaline reaction.



1. *Estimation* of the *carbon, hydrogen,* and *oxygen.*—*a.* The method of Prof. Liebig, now almost exclusively adopted for this purpose, is as follows:—The *substance under examination,* reduced to powder, is rendered as *dry* as possible either by the heat of a *water bath,* or by exposure over *concentrated sulphuric acid, in vacuo;* 5 or 6 gr. of it are then weighed in a narrow open test tube, 2 or 3 inches long, and to ensure accuracy, this tube and any little adhering matter is again weighed after its contents have been removed—the *difference* between the *two weights* being regarded as the *true quantity* of the substance employed in the experiment. A "*combustion tube*" of hard white Bohemian glass (0·4 to 0·5 inch *diam.;* 14 to 18 inches *long*) is next taken, and about 2-3ds filled with *protoxide of copper,* prepared by the ignition of the nitrate, and which has been just reheated to expel hygrometric moisture. Nearly the whole of this oxide, whilst still warm, is then gradually poured from the tube and triturated with the *organic sample* in a *dry* and *warm mortar,* after which it is transferred to the combustion tube, and the mortar being rinsed out with a little *fresh protoxide,* which is added to the rest, the tube is, lastly, nearly filled with some *warm protoxide* fresh from the crucible. The contents of the tube are next arranged in a proper position by a few *gentle* blows, so as to leave a small passage for the evolved gases from the one end of the tube to the other. (See *Engr.*)



The "*combustion tube*" with its "charge" is next placed in a *furnace* or *chauffer* of thin sheet iron, similar to that figured at *page* 549. Its *open end* is then connected with *another tube* filled with *fragments* of *fused chloride of calcium,* and carefully weighed.

This tube is, in its turn connected with a small glass *bulb apparatus,* containing *solution* of *pure potassa* of the sp. gr. 1·27, also carefully weighed. The junction with the *first* is made by means of a perforated cork; that with the *second,* by means of a small tube of Indian rubber tied with silk, the whole being being made *quite air-tight.* The apparatus is then tested by sucking a few bubbles through the liquid with the *dry* lips, when if the level of the solution of potassa in the two legs continues *unequal* for some minutes, the joints are regarded as perfect. The whole arrangement being complete (See *engr.*), *burning charcoal* is now

placed in the furnace, around the *front* part of the combustion tube, and when this has become red-hot, the screen is slowly moved back, and more burning charcoal is added, until the furthest extremity of the tube has been exposed to its action. The *firing* is so regulated that the gas enters the potassa apparatus in bubbles easily counted, without any violence or inconvenience; and it is kept up as long as gas is extricated. As soon as the operation is complete, and the *slightest* retrograde action is observed, the charcoal is removed from the combustion tube, and the extreme point of this last is broken off. A *little air* is then sucked through the apparatus in order to seize on any remaining carbonic acid gas and moisture. The *potash apparatus* and the *chloride of calcium tube*, are, lastly, detached, and again *accurately weighed*. The *increase* in the *weight* of the *first* gives the *weight* of the CARBONIC ACID formed during the combustion; that of the *second*, the *weight* of the WATER.

		Gr.		Gr.	
1 gr. of *Carbonic acid*	=	0·27273	of *Carbon*	+ 0·72727	of *Oxygen*.
1 „ *Water*	=	0·11112	„ *Hydrogen*	+ 0·88888	„
2 . . less . . .		0·38385	. . equal to	1·61615	„

The numbers equivalent to any given number of grains, found as above, are converted into the proportions *per cent.* by simply *dividing* them by the weight of the organic substance which has been employed in the experiment, and moving the decimal point of the result two figures to the right.

b. In applying the preceding method to *volatile liquids* it is necessary to enclose them in a *small bulb* with a narrow neck, instead of mixing them directly with the protoxide of copper. The bulb with its contents is introduced into the combustion tube, and after some 6 or 8 inches of the protoxide is heated to redness, a hot coal is applied near where the bulb is situated, so that the liquid which it contains may be slowly volatilized and passed through the heated mass in the state of vapour, and be thus completely burned.

2. *Estimation* of the *Nitrogen.* — *a.* Several methods are employed for this purpose, but the only one of general application, and adapted to the non-scientific operator, is that of MM. Varrentrap and Will, described under "*Guano*" (*p.* 548-9). To ensure correct results the *caustic soda* must be pure, and the *lime* of good quality and well-burnt. The last, having been properly slaked with a *little water* holding the former in solution, the mixture is thoroughly dried in an iron vessel, and then heated to full redness in an earthen crucible. The ignited mass is rubbed to powder in a warm dry mortar, and either used at once, or carefully preserved from the air. The best quantity of the organic substance to operate on, is, in this case, about 10 gr., which must be dried, and accurately weighed with the usual precautions. Bodies *very rich* in either *nitrogen* or *hydrogen* are best mixed with about an equal weight of *pure sugar* before triturating them with the *soda-lime*. MM. Varrentrap and Will weigh the nitrogen under the form of *ammonio-chloride of platinum*, dried at 212° Fahr. This salt contains 6·272% of NITROGEN.

b. M. Péligot has modified the preceding plan by conducting the gaseous matter extricated during the operation into a three-bulb tube charged with a standard *solution of sulphuric acid*. This he subsequently pours into a beaker glass, and after *tinging* it with a *single* drop of *tincture of litmus*, he tests it with either a standard *aqueous solution of soda*, or one of *lime in sweetened water*, after the common method of *alkalimetry*. The *difference* between the *saturating power* of the *acid* in its *normal* condition, and after its *exposure in the condenser*, indicates the amount of ammonia formed. (See *p.* 548.) Each grain of *ammonia* contains 0·82353 gr. of NITROGEN.

Concluding Remarks. The successful application of the above processes requires considerable care and some aptitude in manipulating, as well as the employment of a very delicate balance for determining the weights. A greater error in the weighings than the $\frac{1}{250}$ gr. cannot be tolerated when exact results are desired. The method of MM. Varrentrap and Will for the determination of nitrogen answers admirably for all organic compounds containing it, except those in which it exists under the form of hyponitrous, nitrous, and nitric acids; for which, however, it is not required. When extreme accuracy is aimed at, the atmospheric air in the apparatus, and that absorbed during the preliminary operations by the substances employed, must be expelled before the application of heat to the combustion tube.

ORGEAT. See *Syrups* and *Pastes*.

ORIENTAL RUSMA. See *Hair Dyes*.

OR-MOLU. This name is given to gold-

coloured brass or bronze, so finished off as to have the appearance of gold, or of being gilt; but it is often applied in a more general sense. The French more particularly excel in working in or-molu, and the products of this branch of their industry hold an important position in the art manufactures of France.

To give *or-molu* its richest appearance "it is not unfrequently *brightened* up after '*dipping*' (that is cleaning in acid) by means of a *scratch-brush* (a brush made of very fine brass-wire,) the action of which helps to produce a very brilliant gold-like surface. It is protected from tarnish by the application of lacquer." (*Dict. Arts, Man. and Mines.*)

ORMSKIRK MEDICINE. So named after the residence of its inventor, Mr. Hill, of Ormskirk. It is said to have consisted of the ingredients named below, but nothing certain is known on the subject, as the inventor died without revealing his secret:—*Chalk*, ½ oz.; *Armenian bole*, 3 dr.; *elecampane root*, 1 dr.; *alum*, 10 gr.; *oil of aniseed*, 5 or 6 drops; all in fine powder. For a *dose*, to be taken for 6 successive mornings, in a glass of weak *milk-and-water*.

ORPIMENT. Native yellow sulphuret of arsenic. The finest samples used by artists (*golden orpiment*) come from Persia. See *Tersulphuret of Arsenic.*

ORRIS. Syn. *Orris Root*, *Florentine do.*; *Radix Iridis*,—Lat. The *dried rhizoma* of *iris Florentina* (Linn.) Sialogogue, irritant, subacrid, and errhine. Chiefly employed to impart a violet odour to oils, tooth powder, snuffs, spirits, &c.; and when cut into *peas*, to keep open issues.

ORSEDEW. Dutch leaf-gold.

ORSELLIC ACID. Two compounds pass under this name,—*Alphaorsellic acid* (see *p.* 50), and *betaorsellic acid*. They closely resemble each other, and are obtained in a similar manner; the *first* from the South American variety of *roccella tinctoria*; the *last* from that grown at the Cape.

ORSELLINIC ACID. Syn. *Lecanoric Acid*, *Lecanorine*. A compound formed along with *picro-erythrine*, by boiling *erythric acid* for some time with *water*. It is also formed by boiling *alphaorsellic acid* with *water*. In both cases, if the ebullition is too long continued, the new acid is wholly or in part converted into *orcine*.

Prop., *&c.* Crystallizable; bitter-tasted; soluble in water; its aqueous solution by exposure to the air assumes a beautiful purple colour.

ORTHOPÆDIA. See *Surgery* (Popular and Orthopædic).

OSMAMIC ACID. See *Osmic Acid.*

OSMAZOME. The substance on which the peculiar odour and flavour of boiled meat and broth was formerly supposed to depend.

Prep. From *lean meat*, minced, and digested in *cold water*, with occasional pressure; the filtered infusion is gently evaporated nearly to dryness, and then treated with *alcohol*; the alcoholic tincture is, lastly, evaporated. The *product* has a brownish-yellow colour, is soluble in water, and its aqueous solution is precipitated by infusion of galls and the mineral astringent salts.

OSMIC ACID. Syn. *Peroxide of Osmium.* This is obtained from *osmium*, in small fragments, heated in a current of *pure oxygen*. It condenses in the cooler portion of the tube, under the form of colourless, transparent crystals.

Prop., *&c.* Odour and vapour offensive and highly acrid; slightly soluble in water; melts at 165°, and boils below 212° Fahr.; nearly all the metals precipitate it from its solutions, as metallic osmium; its salts are called *osmates*; ammonia converts it into *osmamic* or *osman-osmic acid*.

OSMIOUS ACID. Syn. *Teroxide of Osmium.* Formed by adding *alcohol* to a *solution of osmate of potassa*, when a rose-coloured precipitate of *osmite of potassa* subsides. The acid has never been isolated.

OSMIUM. A rare metal found associated with the ores of platinum by M. Tennant, in 1803.

Prep. See *Iridium.*

Prop., *&c.* Bluish white; somewhat brittle; easily powdered; neither fusible nor volatile; heated to full redness in the air it inflames, with the production of *osmic acid*, which volatilizes; its powder, when digested in nitric acid, is slowly oxidized; fused with nitre, *osmate of potassa* is obtained. Sp. gr. (greatest), 10.

Osmium forms 5 *compounds* with oxygen. —*Protoxide of osmium*, a dark-green powder which falls, along with a little alkali, when *liquor of potassa* is added to a solution of the double protochloride of osmium and potassium.—*Sesquioxide of osmium*, a black powder formed by the deoxidation of osmate of ammonia by heating its solution along with potassa. It always contains ammonia and fulminates when heated. Both the above are feebly soluble in acids.—*Binoxide of osmium*, a black, insoluble powder, obtained by heating a mixture of carbonate of soda and the double bichloride of osmium

and potassium.—*Teroxide of osmium*, see *Osmious acid.*—*Peroxide of osmium*, see *Osmic acid.*

The *principal compounds* of *osmium* with *chlorine* are—*Protochloride of osmium*, a dark green, imperfectly crystalline substance, formed by gently heating osmium in chlorine gas. It is soluble; but a large quantity of water decomposes it.—*Sesquichloride of osmium*, formed when the sesquioxide is dissolved in hypochloride acid. It has not been obtained in the solid state.—*Bichloride of osmium* (*bichloride of osmium and potassium*), red octahedral crystals, obtained by strongly heating a mixture of chloride of potassium, sesquichloride of osmium, and metallic osmium, in chlorine gas.

Osmium combines with *phosphorus* and *sulphur*, forming *phosphurets* and *sulphurets*, but these compounds possess little interest.

OSTEOCOLLA. A rough sort of glue or gelatine obtained from bones by digestion in *dilute hydrochloric acid*, to remove their earthy matter, and afterwards acting on the residuum with *water* at a high temperature, until it is wholly dissolved.

OSTEODENTINE. The substance found in the central portion of the *tooth* of the *cachalot* and of some other cetaceans. It partakes of the properties of both bone and dentine.

OTALGIA. See *Ear-ache.*

OTTO OF ROSES. See *Oils* (Volatile).

OURARI. See *Woorari.*

OVALBUMEN. White of egg; to distinguish it from *seralbumen*, or the albumen of the serum of the blood.

OVENS. A very ingenious and useful improvement in the apparatus for baking has been recently made by Mr. Sclater, of Carlisle. It consists in causing the articles to be baked, to *traverse* a *heated earthenware tube.* This tube forms the oven. It is of considerable length, and the biscuits or other articles are slowly traversed through it, from end to end, at such a rate as will allow of the baking being completed during the passage. The *biscuits* are carried on trays, set on travelling chains; or the trays are made into an endless web or chain. The oven is thus entirely self-acting, and the articles demand no attention whatever from the attendants, whilst the system combines superior economy with the best results. A *pyrometer*, or heat indicator, is attached externally, so that the attendant can regulate the heat with great facility. The object of these improvements is to *reduce* the *cost of baking*, and to *improve* the *appearance* of the baked articles. The apparatus is applicable as well to the baking of articles of *clay* or *earthenware*, as to *bread* or *biscuits.*

Of the ovens now in common use by the bakers, that known as the "*Hot-water Oven*" is undoubtedly the best; not merely in reference to economy, but also with reference to its superior cleanliness, and the ease with which the articles operated on may be turned out of that delicate yellowish-brown tint for which the bread of the Viennese and Parisian bakers is so celebrated. See *Baking*, *Bread*, *Roasting*, *&c.*

OX. The *bos taurus* (Linn.), one of the ruminantia. In its more limited sense the word is restricted to the emasculated animal. The *flesh*, *milk*, *skin*, *horns*, *bones*, and *blood* of this animal are all serviceable to man. *Goldbeater's skin* is prepared from the peritoneal membrane of its cæcum. Its blood, fat, horns, and excrement were among the simples of the Ph. L. 1618. See *Beef*, *Milk*, *&c.*

OXALAMIDE. See *Oxamide.*

OXALATE. Syn. *Oxalas*, — Lat. A salt of oxalic acid. The *soluble oxalates* are easily formed by directly neutralizing a solution of *oxalic acid* with the *hydrate*, *carbonate*, or *oxide* of the base; and the *insoluble oxalates*, by double decomposition. See *Oxalic Acid* and the *respective bases.*

OXALHYDRIC ACID. See *Saccharic Acid.*

OXALIC ACID. Syn. *Acidum Oxalicum*, — Lat. *Saccharine Acid*, *Acid of Sugar*, — Obs. This substance was discovered by Bergman, in 1776. It occurs both in the mineral and organic kingdoms, and is produced artificially by the action of nitric acid on sugar, starch, woody fibre, &c. It abounds in wood-sorrel, in which it exists in combination with a little potassa. With the exception of gum and sugar of milk, all starchy and saccharine substances yield oxalic acid when treated with nitric acid at a somewhat elevated temperature.

Prep. 1. *Nitric acid* (sp. gr. 1·42), 5 parts, diluted with *water*, 10 parts, is poured on *sugar*, or, preferably, *potato starch*, 1 part, and the mixture is digested at a gentle heat, as long as gaseous products are evolved; the liquid is then concentrated by evaporation until it deposits crystals on cooling; the crystals, after being drained and freed from superfluous moisture, are redissolved in the smallest possible quantity of *boiling water*, and the solution is set aside to crystallize. The *residuary mother-water*, which consists principally of malic acid (?) with some oxalic and nitric acid, is

treated with a little fresh *nitric acid* (say 1½ part) at a gentle heat, after which it is evaporated, as before, for a second crop of crystals. This process is repeated until the solution is exhausted. The brownish-coloured crystals thus obtained, are allowed to effloresce by exposure to *dry air*, and are then redissolved and recrystallized. By repeating this treatment they yield pure colourless *oxalic acid* at the third crystallization. The above method has received the sanction of Liebig, and is probably the best that can be devised.

2. (Schlesinger.) *Sugar* (dried at 257° Fahr.), 4 parts, and *nitric acid* (sp. gr. 1·38), 33 parts, are digested together, as before, and as soon as the evolution of gas ceases, the liquid is boiled down to *one sixth* of its original volume, and set aside to crystallize. The whole process may be completed in about 2 hours, and in 1 vessel, and yields of beautifully crystallized oxalic acid, at the first crystallization, a quantity equal to 56 to 60% of the weight of the sugar employed.

3. (Ure.) *Nitric acid* (sp. gr. 1·4), 4 parts, and *sugar*, 1 part, are digested together by the heat of a water bath, and as soon as gas ceases to be extricated, the vessel is removed from the heat, and set aside to cool and crystallize. "The use of a little *sulphuric acid* along with the nitric acid contributes to increase the product."

4. (From *Formic acid*,—Jullion.) The *formic acid* is first exactly neutralized with *liquor of potassa* (or of *soda*), after which a second quantity of *liquor of potassa*, equal to *one half* of that already used, is added; the liquid is then evaporated to dryness, and the solid residuum of the evaporation is heated to 560° Fahr.; the calcined matter (*oxalate of potassa* or *soda*) is next treated with *sulphuret of barium*, *hydrate of baryta*, or any *soluble salt* of *baryta*, so as to convert it into *oxalate of baryta*, which falls as a precipitate; from the last salt pure oxalic acid is obtained by the action of *dilute sulphuric acid* in equivalent proportions. (Vide *Specification*.)

5. (From *Potato* or *dextrine sugar*,—Nyren.) From the washed *pulp of potatoes*, boiled for some hours with *water*, q. s., in a *leaden vessel* with about 2% of *oil of vitriol*, until the fecula of the pulp is converted into saccharine matter, shown by the liquid being no longer turned blue by iodine: the whole is then filtered through horse-hair bags or strainers, and the filtrate is evaporated until its density is such that a gallon of it weighs 14 to 14½ *lb.*; in this state it is converted into *oxalic acid*, by treatment with *nitric acid* in the way already described. A similar process has been patented by Messrs. Davy, Macmurdo, and Co.

6. (From *Uric acid*,—Dr. Wilton Turner.) *Uric acid* (from guano) is placed in an open cylindrical iron vessel capable of holding fully three times the quantity, and heated by steam; strong but clear *lime water* is then poured in, and as soon as it boils briskly, *peroxide of lead* is added in successive portions as long as it is whitened by the boiling liquid; the supernatant liquor is next drawn off from the white heavy sediment (*oxalate of lead*), which, after being washed with *water*, is decomposed by boiling it in a mixture of *hydrochloric acid* and *water*, equal parts; the resulting liquid contains the *oxalic acid*, which is obtained by evaporation; the sediment is *chloride of lead*. The liquor decanted from the oxalate of lead contains *allantoine*. By boiling it with *caustic alkali*, this substance is converted into *oxalic acid*, which remains in the liquor, and into ammonia, which escapes during the ebullition. 10 parts of peroxide of lead are required for the conversion of 7 parts of uric acid. An equivalent of *binoxide of manganese* may be substituted for the oxide of lead. *Patent*.

Prop., &c. Colourless, transparent, prismatic crystals, possessing a powerfully sour taste and acid reaction; these effloresce in warm dry air, with loss of 28% (2 eq.) of water, and then form a white powder, which may be sublimed, in part, without decomposition; the crystals are soluble in 8 parts of water (9 parts, "and form a solution of sp. gr. 1·045,"—Ure) at 60° Fahr., in their own weight or less of boiling water, and in about 4 parts of alcohol; with the acids it forms salts called *oxalates*.

Tests.—1. Solution of chloride of barium occasions a white precipitate in neutral solutions of oxalic acid (oxalates), which is soluble in both nitric and hydrochloric acid.—2. Solution of nitrate of silver, under like circumstances, gives a white precipitate which is soluble in nitric acid, and in ammonia, and which, when heated to redness, yields pure silver.—3. Lime water and solutions of all the soluble salts of lime produce white precipitates, even in highly dilute solutions of oxalic acid or of the oxalates, which is freely soluble in both nitric and hydrochloric acid, but is nearly insoluble in either acetic or oxalic acid, and is converted into carbonate of lime upon ignition.—4. Oxalic acid (or an oxalate) when heated, in the dry state, with oil of vitriol in excess, is converted into carbonic acid and carbonic oxide, which escape, and

when kindled, burn with a faint blue flame, whilst the residual sulphuric acid continues colourless, if the substance operated on is free from organic matter. Of the above tests, solution of sulphate of lime (vide No. 3) is the most delicate and characteristic.—5. It is *distinguished* from *Epsom salt* by its acid reaction, its solubility in rectified spirit, its complete dissipation by heat, and by emitting a slight crackling noise during its solution in water. See *Magnesia* (Sulphate).

Uses, &c. Oxalic acid is chiefly used in the arts of calico printing and bleaching; to remove ink-spots and iron-moulds from linen, and to clean boot-tops. It is extremely *poisonous*. The *treatment* in cases of its having been swallowed, is to promote *vomiting*, and to administer *chalk*, *whiting*, or *magnesia*, mixed up with water, in considerable quantities. The use of the alkalies or their carbonates must be avoided, as the compounds which these form with oxalic acid are nearly as poisonous as the acid itself. The remaining treatment is noticed under *Acids*. In poisoning by oxalic acid, the nervous system is almost always affected, and the patients experience numbness, formication of the extremities, and sometimes convulsions, so that the symptoms somewhat approach those produced by strychnine, from which it is distinguished by its corrosive action on the tissues, and its effect upon the heart and circulatory system.

Concluding Remarks. The manufacture of oxalic acid is an important one. On the *large scale*, the first part of the process is either conducted in salt-glazed stoneware pipkins of the capacity of 3 to 5 quarts each, (which are about two thirds filled and set in a water bath), or in wooden troughs lined with lead, and heated by means of a coil of steam pipe. On the *small scale*, a glass retort or capsule is commonly employed. The most appropriate temperature appears to be about 125° Fahr., and the best evidence of the satisfactory progress of the decomposition, is the free but not violent evolution of gas, without the appearance of dense red fumes, or, at all events, any marked quantity of them. When these are disengaged with violence and rapidity, a greater quantity of the newly formed acid suffers decomposition, and flies off in a gaseous form. The sp. gr. of the nitric acid commonly used on the large scale, ranges from 1·22 to 1·27, equivalent quantities being taken. The evaporation is preferably conducted by the heat of steam. The evolved nitrous vapours (*nitric oxide*) are usually allowed to escape, but this loss may be in part avoided by conveying them into a chamber filled with *cold damp air*, and containing a *little water*, when they will absorb oxygen, and be recondensed into fuming nitric acid. Various modifications of this plan have been patented. That of Messrs. McDougall and Rawson, which is one of the simplest and best, consists in passing the mixed nitrous fumes, through a series of vessels containing water, and connected together by tubes, so that the fumes which collect at the top of one vessel are conveyed to nearly the bottom of the next one, and then bubbling up through the water, mix with the air, a supply of which is provided for the purpose. The nitrous fumes are thus brought alternately into contact with air and water, and by the time they reach the last vessel, are re-converted into nitric acid. *Another plan* is to pass the mixed nitrous vapours through a vessel stuffed with some porous substance, as pumice-stone or pounded glass, conjointly with a supply of steam from a boiler, and a supply of oxygen by a blowing machine.

The *products* obtained by skilful manipulation are—from *good dry sugar*, 128%; from *good treacle*, 107%.—"*One cwt.* of *good treacle* will yield about 116 *lb.* of marketable oxalic acid, and the *same weight* of *good brown sugar* may be calculated to produce about 140 *lb.* of acid." "As a general rule, 5 *cwt.* of *saltpetre*, or an equivalent of nitrate of soda, with 2½ *cwt.* of *sulphuric acid*, will generate sufficient nitric acid to decompose 1 *cwt.* of *good sugar*, and yield, as above, 140 *lb.* of fair marketable *oxalic acid*, free from superfluous moisture." (Ure.) On the *small scale*, 5 parts of *sugar* yield nearly 6 parts of *crystallized acid*.

Chemically pure oxalic acid is best prepared by precipitating a *solution* of *binoxalate of potassa* with a *solution* of *acetate of lead*, washing the precipitate with water, decomposing it, whilst still moist, with *dilute sulphuric acid* or *sulphuretted hydrogen*, and gently evaporating the *filtrate* so that crystals may form as it cools.

OXALME. The old name of a mixture of *salt* and *vinegar*, formerly employed in medicine.

OXALOVINIC ACID. *Prep.* An *alcoholic solution of caustic potassa* is added to a solution of *oxalic ether* in *anhydrous alcohol* in quantity sufficient to neutralize *one half* only of the oxalic acid present; the crystalline scales (*oxalovinate of potassa*) which precipitate, are dissolved in *very dilute alcohol*, and decomposed by *hydro-*

fluosilicic acid. It is a sour liquid, possessing little stability.

OXALURIC ACID. A new acid discovered by Wöhler and Liebig. It is obtained by heating a *solution of parabanic acid* with *ammonia*, decomposing a hot saturated solution of the resulting *oxalurate of ammonia* with *dilute sulphuric acid*, and rapidly cooling the liquid, when *oxaluric acid* falls as a white crystalline powder. It possesses an acid taste and reaction, and forms salts (*oxalurates*) with the *bases;* its solution is resolved by ebullition into free oxalic acid and oxalate of urea.

OXALYLE. The hypothetical radical of oxalic acid.

OXAMETHANE. Syn. *Etheroxamide, Oxalate of Ether and Oxamide.* A colourless crystalline substance, prepared by dissolving *oxalic ether* in *alcohol*, and gradually adding *alcohol saturated with dry ammoniacal gas*, until a white powder begins to fall, when after some hours the solution is filtered, evaporated, and crystallized. Soluble in water, fusible, and volatile.

OXAMETHYLANE. Syn. *Oxamate of Methyle.* A white, solid substance formed when *oxalate of oxide of methyle* (methylo-oxalic ether) is treated with *dry ammoniacal gas.* It may be obtained in pearly cubic crystals from its alcoholic solution.

OXAMIC ACID. A substance obtained, along with other products, when *binoxalate of ammonia* is heated by means of an oil bath to about 450° Fahr. It forms salts (*oxamates*) with the bases; those with lime and baryta are soluble; when heated in contact with alkalies and oil of vitriol it suffers decomposition.

OXAMIDE. Syn. *Oxalamide.* A snow-white, tasteless, crystalline powder, obtained during the destructive distillation of *oxalate of ammonia.* It is insoluble in either water or alcohol, and is chiefly interesting as forming the type of a large class of bodies of a precisely similar constitution, containing the elements of an ammoniacal salt, less those of water.

OXANILIDE and *Oxanilic Acid.* Names occasionally applied to the neutral and acid oxalates of ammonia.

OX-GALL. Syn. *Ox-bile; Fel Bovinum, F. Bovis, F. Tauri,*—Lat. Crude ox-gall is noticed at *page* 502. *Refined ox-gall* (fel bovinum purification) is prepared as under:—

1. *Fresh ox-gall* is allowed to repose for 12 or 15 hours, after which the clear portion is decanted, and evaporated to the consistence of a thick syrup by the heat of a water bath; it is then spread *thinly* on a dish, and exposed in a warm situation near the fire, or to a current of dry air, until nearly dry; it is, lastly, put into wide-mouthed bottles or pots, and carefully tied over with bladder. In this state it will keep for years in a cool situation. *For use*, a little is dissolved in water.

2. *Fresh gall*, 1 pint; boil, skim, add *powdered alum*, 1 *oz.;* boil again, until the alum is dissolved, and when sufficiently cool, pour it into a bottle, and loosely cork it down. In a similar manner boil and skim *another pint* of *gall*, add to it 1 *oz.* of *common salt*, and again boil, cool, and bottle it, as above. In *three months* decant the *clear* from both bottles, and mix them in equal quantities; the clear portion must then be separated from the coagulum by subsidence or filtration.

Uses, &c. Both the above are employed by artists to fix chalk and pencil drawings before tinting them, and to remove the greasiness from ivory, tracing paper, &c. The *first* is also used in medicine.

OXIDATION. Syn. *Oxydation.* The combination of bodies with oxygen forming oxides; the operation or process adopted to induce or facilitate such conversion. See the *respective oxides, Oxygenation, &c.*

OXIDE. Syn. *Oxyde; Oxydum,*—Lat. A compound formed by the direct union of oxygen with another body, and which does not exhibit acid qualities. The leading characteristic of the oxides (*oxyda*) is their basic property, or power of forming salts with the acids. Some, however, are almost neutral, and exhibit little disposition to enter into such combinations. *Potassa, soda, lime, litharge*, and *rust of iron*, which are respectively direct compounds of the metals *potassium, sodium, calcium, lead*, and *iron* with *oxygen*, may be taken as examples of the BASIC OXIDES; and *black oxide of manganese*, as an example of the NEUTRAL or *indifferent ones.* Formerly, the term *oxide* was for the most part restricted to the compounds of oxygen with the metals; but at the present time it is extended to other bodies possessing a similar constitution and behaviour. Thus, we have *oxide of ethyle* (ether), *oxide of amyle* (amyl-ether), &c. In a *general sense*, or for theoretical purposes, all direct compounds of oxygen are occasionally termed oxides. Thus, *benzoic acid* is said to be an oxide of benzoyle, and *hypochloric acid* a peroxide of chlorine.

The *nomenclature* of the *oxides* resembles that adapted for other compound bodies.

The terms *oxide* or *protoxide*, *sesquioxide*, *binoxide*, *teroxide*, &c., denote that the *oxygen* is in the ratio to the metal of 1 to 1, —1½ to 1 or 3 to 2,—2 to 1,—3 to 1, &c. The Greek numerals *dis*, *tris*, *tetrahis*, &c., are prefixed in a similar way, to denote oxides formed of 1 equivalent of *oxygen* with 2, 3, or more equivalents of metal. *More complex ratios* are denoted by a fraction, the numerator of which represents the eq. of oxygen, and the denominator the eq. of metal. The terminations *-ous* and *-ic* are occasionally employed in a similar manner to that noticed under "*acids*," the former being applied to the lower, and the latter to the higher state of oxidizement; as *cuprous oxide*, *cupric do.*, *ferrous oxide*, *ferric do.*, applied to the respective oxides of copper and iron. Oxides containing less than 1 eq. of *oxygen* to 1 eq. of *metal* are commonly called *suboxides*. See *Nomenclature*, *&c.*

OXIODIC ACID. See *Iodic Acid.*

OXIODINE. See *Iodic Acid.*

OXYCHLORIDE. Syn. *Oxichloride; Oxychloridum*,—Lat. A term often loosely applied to compounds of an oxide and chloride, whether in definite or variable proportions. They are also frequently called *subchlorides* or *submuriates*. See *Oxychlorides of Antimony*, *Lead*, *&c.*

OXYCRATE. Syn. *Oxycratum*,—Lat. The old name of a mixture of *vinegar* and *water*, dulcified with *honey*.

OXYCROCEUM. See *Plasters.*

OXYFLUORIDES. Double compounds of fluorides and oxides. They possess no practical importance.

OXYGEN. Syn. *Oxygen Gas; Oxygenium*,—Lat. *Dephlogisticated Air*, *Empyreal do.*, *Vital do.*,—Obs. var. An important elementary body discovered by Scheele and Priestley, in 1774. It is remarkable, that although this substance forms a large proportion of our atmosphere, and confers upon it the power of supporting respiration and combustion, and also constitutes the principal portion of the water of our rivers and seas, and enters largely into the composition of the majority of the various mineral bodies that form the bulk of our globe, its existence should have remained unsuspected, or at least undetermined, until a recent date. Even now, our utmost skill fails to obtain it in an absolutely isolated form distinctly perceptible to the human senses. Nature never presents it solitary; and even in combination, whether gaseous, liquid, or solid, we know it only by its effects. The *oxygen gas* of the chemist is merely a compound of this archæal element with light, caloric, and electricity.

Prep. 1. From *red oxide* of *mercury*, heated over a spirit lamp or a few pieces of ignited charcoal. The operation is usually performed in a small green-glass retort, or in a short tube of hard Bohemian glass, closed with a perforated cork furnished with a piece of bent glass tube of small bore, to convey the liberated gas to the vessel arranged to receive it. Pure. 1 *oz.* yields about 100 cubic inches.

2. From *chlorate of potassa*, as the last. Pure. 100 gr. yield nearly 100 cubic inches (Brand; 115, — Ure). This is the plan adopted in the P. Cod. The decomposition occurs with both the above substances at a heat below that of redness.

3. From a *mixture* of *chlorate of potassa* (in coarse powder), 3 parts; powdered *binoxide of manganese*, 1 part; both by volume. Pure. 100 gr. of the mixture yield about 110 cubic inches of oxygen. This method, which has received the approval of Faraday, is exceedingly convenient. The gas is evolved with a rapidity which is entirely at the command of the operator, by simply increasing or lessening the heat. The residuum in the retort may be kept for another operation, if not exhausted; or it may be at once washed out with a little warm water, and the manganese, which is uninjured by the process, reserved for future use. *Red lead*, *black oxide of copper*, and several other substances, answer *nearly* as well as binoxide of manganese.

4. From a *mixture* of *bichromate of potassa*, 3 parts; *oil of vitriol*, 4 parts; gently heated as before. Yields pure oxygen very freely, and with a rapidity entirely at the will of the operator. (Balmain.)

5. From *binoxide of manganese* and *oil of vitriol*, equal parts; as the last. 44 gr. of pure binoxide of manganese yield 8 gr., or 24 cubic inches of oxygen; 1 oz. yields 88 gr., or 256 cubic inches. (Liebig.)

6. (On the *large scale.*)—*a.* From *nitre* exposed to a dull-red heat in an iron retort or gun-barrel. 1 *lb.* yields about 1200 cubic inches of gas, slightly contaminated with nitrogen. (Ure.)

b. From *binoxide of manganese*, as the last. 1 oz. of the *pure binoxide* yields 44 gr., or 128 cubic inches of oxygen (Liebig); 1 *lb.* of good *commercial do.*, yields from 1500 to 1600 cubic inches, or from 5 to 6 gall.

c. M. Boussingault has lately reinvestigated a process, long known although not usefully applied, by which *pure oxygen gas* may be obtained from the *atmosphere* at a

trifling cost, so as to enable it to be collected in unlimited quantities and preserved in gasometers, like coal-gas, for application in the arts, manufactures, and sanitation. This process depends upon a peculiar property possessed by the *earth baryta*, of absorbing atmospheric oxygen at one temperature and evolving it at another; or rather, the ready conversion of *hydrate of baryta* into *peroxide of barium* by a current of *atmospheric air* at a dull-red heat, and the decomposition of this peroxide, by *steam*, at a lower temperature, even at 212° Fahr., with reproduction of *hydrate of baryta*, the process being in reality a continuous one. The *baryta* is mixed with a portion of *hydrate of lime* or of *magnesia*, to prevent its fusion. The mixture is placed in an appropriate *earthen tube* heated to dull redness, and is oxidized by passing a *current* of *dry atmospheric air* over it. As soon as the oxidation is *complete*, the tube is connected with the gas-holder, and a *jet of steam* allowed to act upon it: this *reconverts* the *peroxide of barium* into *hydrate of baryta*, the excess of oxygen being given off and collected in the gas-holder. The baryta is then *again* oxidized by a fresh current of air, and deoxidized by steam, and the whole process is repeated as frequently as required. *One ton* of *baryta*, thus treated, is capable of yielding 2500 cubic feet of *pure oxygen* every 24 hours; and this, as it does not waste or lose its properties, at the mere cost of the fuel and labour required in the process. It is not improbable that this product might be easily *doubled*.

d. From *perferrate of potassa*, prepared on the large scale. When exposed to moisture or thrown into water, *pure oxygen* is evolved. This method has been successfully adopted to maintain the air of diving-bells, and of other confined spaces in a state fit for respiration. It was tried in a small apartment in which were three patients in the collapse stage of cholera; two of whom rapidly recovered, and the symptoms in the third case were ameliorated for a time, although the patient died a few hours afterwards of the disease.

Prop. Oxygen gas is colourless, tasteless, odourless, and incombustible; the sp. gr. is 1·057 (Dumas; 1·1026,—Berzelius & Dulong; 1·111,—Thomson); 100 cubic inches at 60° Fahr., and 30 inches of the barometer, weigh 34·29 gr. (Dumas; 34·109 gr.,—Berz.; 34·6 gr.,—Brande; 33·85 gr.,—Ure). Its density to that of atmospheric air is therefore as about 11 to 10. It is a powerful supporter of combustion, and its presence is essential to the existence of both animal and vegetable life. It forms $21\frac{9}{0}$ ($20{\cdot}81\frac{9}{0}$) by *volume*, and $23\frac{9}{0}$ by weight, of the atmosphere. (M. Dumas.) Water dissolves about $5\frac{9}{0}$ by volume of oxygen, and by pressure a much larger quantity, forming *oxygenated water* (aqua oxygenii).

Tests. 1. It is distinguished from other gases by yielding nothing but pure water when mixed with twice its volume of hydrogen and exploded, or when a jet of hydrogen is burnt in it.—2. A recently extinguished taper, with the wick still red-hot, instantly inflames when plunged into this gas.—3. A small spiral piece of iron wire ignited at the point, and suddenly plunged into a jar of oxygen, burns with great brilliancy and rapidity. Charcoal does the same.

Estim. The estimation of the quantity of oxygen in an *organic compound* is described at *p.* 915-6. For determining the quantity present in atmospheric air, and other like gaseous mixtures, Dobereiner has proposed the use of pyrogallic acid. The *air under examination* (freed from moisture) is measured into an accurately graduated tube over mercury, capable of holding about 30 cubic centimetres, and which it should $\frac{2}{3}$ds fill. A *solution* formed of 1 part of dry *hydrate of potassa* and 2 parts of *water*, and in volume about $\frac{1}{3}$th that of the air, is next introduced by means of a pipette with a curved point, and is gently agitated therewith in the gas for a short time; the decrease of volume gives the proportion of CARBONIC ACID present. A solution of *pyrogallic acid* (1 gramme, in 5 or 6 centimétres of water), equal in volume to *one-half* that of the solution of potassa already used, is then introduced by means of another pipette, and the mixed liquids are cautiously shaken together over the inner surface of the tube. When absorption ceases (which it does in a few minutes) the quantity of residual air (NITROGEN) is read off from the graduations; the *difference* in volume before and after the introduction of the pyrogallic acid, indicates the proportion of OXYGEN. This is a mere modification of Prof. Liebig's method. 1 gramme of *pyrogallic acid* in combination with *hydrate of potassa*, is capable of absorbing about 189 cubic centimétres of oxygen. (Dobereiner.) *Other methods* employed for the analysis of air, depending on the *increase* or *loss of weight* when the air is passed over finely divided copper heated to redness, the *loss of volume* when the air is exploded in a eudiometer with half its bulk of hydrogen, or when a stick of phosphorus is left in it for some hours, are well known, and de-

scribed at length in every elementary work on chemical analysis. The *last method*, although less accurate than the others, has the advantage of extreme simplicity.

Uses. Hitherto the trouble and expense of preparing oxygen has precluded its direct use on the large scale. It has been employed to increase the illuminative and heating power of lamps, and to render vitiated air respirable, &c.; and when largely diluted with atmospheric air, or condensed in water, as a remedial agent in asphyxia arising from the inhalation of carbonic acid and carbonic oxide.

Concluding Remarks. Oxygen gas may be collected in the usual way, either over water, mercury, or in bags; or, on the *large scale*, in gasometers. The *purity* of the products of the several processes given above, depends on the substances from which the gas is obtained being themselves pure. For nice experiments, the first portion of gas should be allowed to escape, or be received apart, as with this, as with the other gases, it is contaminated with the atmospheric air of the apparatus. The *gas* procured from *manganese* or *nitre* may be purified by passing it through milk of lime, or a solution of caustic potassa; it will still, however, retain some traces of nitrogen. See *Organic Substances*, *Ozone*, *&c.*

OXYGENATION. Syn. *Oxygenizement.* The act or process of combining with oxygen. It is of more general application than the word *oxydation*, which is frequently confounded with it; but which is only correctly applied when an *oxide* is formed.

OXYGENIZED LARD. Syn. *Oxygenated Axunge; Axungia Oxygenata*,—Ph. Bat., 1805. *Prep.* From *prepared lard*, 16 parts, melted over a slow fire, and then mixed with *nitric acid*, 1 part; the combination being promoted by constant stirring with a glass rod, until it *ceases* to affect *litmus paper*. It should be extremely white, and should be kept in the dark. See *Ointment of Nitric Acid.*

OXYIODES. The iodates were so called by Sir H. Davy.

OXYIODINE. See *Oxiodine.*

OXYMEL. Syn. *Oxymel*,—Lat. An acidulous syrup made of honey and vinegar. There are now only two oxymels in the Ph. L. The ingredients in an oxymel should be of such a character, and in such proportions, as to produce a mixture of the proper consistence without evaporation.

OXYMEL (Colchicum). Syn. *Oxymel Colchici Cormi; Oxymel Colchici*,—Ph. D. 1826. *Prep.* (Ph. D. 1826.) *Fresh corms* (roots) *of meadow saffron*, 1 oz.; *distilled vinegar*, 1 pint (wine measure); macerate for 2 days, press out the liquor, filter, add of *clarified honey*, 2 lb; and boil down the mixture to the consistence of a syrup, frequently stirring. *Dose.* 1 to 3 dr., twice or thrice a day; in gout, rheumatism, dropsy, &c.

OXYMEL (Garlic). Syn. *Oxymel Alii*,—Lat. *Prep.* (Ph. L. 1746.) *Sliced garlic*, 1½ oz.; *caraway seed* and *sweet fennel seed*, of each, 2 dr.; *boiling vinegar*, 8 fl. oz.; infuse, strain, and add of *clarified honey*, 10 oz. In hooping-cough, chronic diarrhœa, rheumatism, &c.

OXYMEL (Pectoral). Syn. *Oxymel Pectorale, O. Inulæ Compositum*,—Lat. *Prep.* (Ph. Br.) *elecampane*, 1 oz.; *orris root*, ½ oz.; *water*, 1½ pint; boil to ½ pint, strain, add of *honey*, 16 oz.; *ammoniacum*, 1 oz.; (dissolved in) *vinegar*, 8 fl. oz.; lastly, boil to an oxymel. *Dose.* 1 spoonful, occasionally; in coughs, humid asthma, &c.

OXYMEL (Simple). Syn. *Vinegar Syrup, Acetated Honey; Oxymel*,—Ph. L. & D. *Oxymel Simplex*,—Ph. L. 1824. *Mel Acetatum*,—Ph. L. 1788. *Prep.* 1. (Ph. L.) *Acetic acid* (sp. gr. 1·048), 7 fl. oz.; *distilled water*, 8 fl. oz.; mix, and add them to *honey*, 5 lb, previously made hot. This contains only one-half the acid ordered in the Ph. L. 1836.

2. (Ph. D.) *Clarified honey*, 1 *lb.*; *acetic acid* (sp. gr. 1·044), 3 *oz.*; as before. Stronger than the last.

3. (Ph. L. 1836.) *Honey*, 10 lb; *acetic acid* (1·048), 1½ pint; as before. This contains too much vinegar. (See No. 1.)

4. (*Wholesale.*) From *honey* (thick and good), 12 *lb.*; melt it by a gentle heat, add of *distilled vinegar* (of fully 5°), 2 quarts, and strain the mixture through flannel. No evaporation is required.

Uses, &c. Demulcent and refrigerant. *Dose.* 1 to 4 fl. dr., either gradually sucked from the spoon, or diffused through some simple liquid. Dissolved in water it forms a useful and pleasant cooling drink or gargle in fevers, sore-throats, hoarseness, &c.; but in some individuals it occasions griping. It is commonly used as an adjunct, in mixtures &c.

OXYMEL (Squills). Syn. *Honey of Squills; Mel Scillæ; Oxymel Scillæ*,—Ph. L., & Ph. D. 1826. *O. Scilliticum*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Vinegar of squills*, 2½ pints; gently evaporate it to 12 fl. oz., and add of *honey* (previously made hot), 5 lb.

2. (Ph. L. 1836.) *Strained honey*, 3 lb; *vinegar of squills*, 1½ pint; boil to a proper

consistence. The formula of the Ph. D. 1826 was similar.

Uses, &c. Expectorant, and in large doses, nauseant. *Dose.* ½ to 2 fl. dr.; in chronic coughs, hoarseness, humoral asthma, &c.

OXYMEL (Verdigris). See *Liniments.*

OXYMURIATE. See *below.*

OXYMURIATIC ACID. The old name of chlorine, given to it owing to a mistake as to its constitution. Some of the hypochlorites and chlorides were, in like manner, called "*oxymuriates.*" The "*hyperoxymuriates*" are the chlorates of modern chemistry.

OXYPRUSSIC ACID. The old name of the gaseous chloride or protochloride of cyanogen.

OXYRRHODINE. Syn. *Oxyrrhodinon.* An old compound formed of 1 part of *vinegar of roses*, and 2 parts of *oil of roses.*

OXYSACCHARUM. A syrup acidulated with vinegar. See *Syrups.*

OXYSAL (diaphoreticum Angeli Salæ). The liquid formed by allowing *acetate of potassa* to deliquesce in a moist atmosphere; so called after the celebrated alchemist Angelo Sala.

OXYSULPHURET. Syn. *Oxysulphuretum*,—Lat. A name given to certain compounds under the supposition of their being direct combinations of sulphur with an oxide. In general, they are mere mixtures of the sulphuret and oxide or hydrate of the base, in indefinite and accidental proportions. See *Oxysulphuret of Antimony, &c.*

OYSTER. Syn. *Ostrea*,—Lat. This well-known shell-fish is the *ostrea edulis* (Linn.), the most valuable and important of the numerous species of *ostracean acephala* (Cuvier).

Oysters are nutritious, and easy of digestion, when fresh, but are apt to prove laxative to those unaccustomed to their use. They are in season in each month of the year, the name of which contains the letter R. The *best* British oysters are found at Purfleet; the *worst* near Liverpool. Colchester, and other places in *Essex*, are the great nurseries or feeding grounds for supplying the metropolis, and, indeed, the whole of England with the most esteemed variety (*natives*) of this shell-fish. The *shells* (*testæ preparatæ, t. ostreariæ*) were formerly used in medicine as an absorbent. See *Shell-fish, Sauces, &c.*

OZENA. Syn. *Ozæna.* A malignant ulcer in the nose, attended with a copious discharge of fœtid purulent matter, and, not unfrequently, with caries and exfoliation of the bones. It often has a scrofulous or syphilitic origin, and then requires corresponding treatment. Its character, in all cases, is such as to require prompt and skilful medical treatment.

OZONE. A peculiar substance found in the atmosphere, and probably always existing in it in elevated and healthy situations. Originally, it was supposed to be a new elementary principle analogous to chlorine, but is now shown to be oxygen in a second or allotropic state (*ozonized*), in which it exhibits increased activity and new properties. This probably arises from an altered electrical condition.

Ozone was discovered by Schönbein, and it has since been elaborately studied by Baumert, Becquerel, Berzelius, De la Rive, Erdmann, Frémy, Marchand, Marignac, Rhumkorff, Schönbein, and others; but more particularly by its discoverer.

The *ozonization* of *oxygen* may be effected—

1. (*Chemically.*)—*a.* From *phosphorus* about half-covered with *water*, and immersed in *oxygen*, under only ¼ or ⅕th the usual pressure of the atmosphere, or under the ordinary pressure (preferably the former) at 75° to 97° Fahr. The gas is soon found in a highly *ozonized* condition.

b. By passing *perfectly dry oxygen* over *dry phosphorus* contained in a tube. The effect is rapid, but the operation soon ceases. (Marchand.)

c. A stick of *phosphorus*, about 2 inches in length, and about one half covered with *water*, is placed in a flask, of the capacity of 130 litres, filled with atmospheric air; the mouth is then loosely closed with a cork or stopper, and the whole allowed to repose at 61° to 70° Fahr. Phosphorous vapours are soon developed, and ozonization commences. After some hours the air of the flask manifests the peculiar odour and effects of ozone in a powerful degree.

2. (*Electrically.*)—*a.* By passing a succession of *electrical discharges* through *pure* and *perfectly dry oxygen*, contained in a stoppered bottle or tube (1 by several inches long) furnished with two platinum points passing through, and fused into opposite parts, so that they are 4 or 5‴ apart; the one being connected with a powerful electrical machine, and the other with the earth. The ozonization proceeds rapidly up to a certain point, but then retrogrades, so that the whole of the gas can never be ozonized. Atmospheric air is also ozonized when treated in a similar manner.

b. A series of *electrical sparks* are passed along the surface of a sealed glass tube

containing *pure dry oxygen*. The gas is ozonized by induction. The same occurs with atmospheric air. In the grand laboratory of nature air is thus ozonized by a flash of lightning at the distance of several hundred yards.

3. (*Voltaically.*)—*a*. By passing a powerful *galvanic current* through a mixture of 1 part of *pure sulphuric acid*, and 12 parts of *water* (both absolutely free from organic substances), at as low a temperature as possible. The gas evolved at the + electrode is powerfully ozonized.

b. As the last, but employing a *mixed solution* of *chromic* and *sulphuric acid*. The evolved gas is now so highly ozonized that even vulcanized Indian-rubber tubes are perforated by it in a few minutes. (Baumert.)

Prop., &c. Ozone or ozonized oxygen has never been isolated, and is only recognized by its extraordinary effects. Its odour resembles that often perceived after a flash of lightning, and in the neighbourhood of an electrical machine in a state of extreme activity. According to Dr. Baumert, however, *pure ozone* is odourless until it comes into contact with moisture or water. It exerts the most powerful bleaching and oxidizing action on the substances it comes into contact with. It peroxidizes many of the metals at ordinary temperatures, decolorizes indigo, converts phosphorus into phosphoric acid, separates iodine from iodide of potassium, transforms most of the protosalts into persalts, the yellow into the red prussiate of potash, sulphuret of lead into sulphate, &c. It instantly destroys the organic combinations forming the matter of contagion, &c., and is probably the agent employed by nature for this purpose, since no ozone can be found in the atmosphere of infected districts. Our own belief is that the action of chlorine, both as a bleacher and disinfectant, depends on its power of inducing this allotropic condition of oxygen by contact with organic compounds.

OZONIZED ETHER. M. Schönbein has found that *ether*, and the *oils* of *lemons* and *turpentine* act like phosphorus on oxygen, but less rapidly. On introducing a small amount of *pure ether* into a flask filled with *oxygen gas*, or *atmospheric air*, and shaking them from time to time, the *ether*, after the lapse of four months, was found to have acquired new properties. Although it did not change the colour of litmus, it exhibited most of the other properties of ozonized air. (*Journ. de Chim. Méd.*)

OZONOMETER. This name has been given to paper prepared with a *mixed solution* of *starch* and *iodide of potassium*. It is white, but is turned *blue* by ozonized air, when exposed to it in a slightly moistened state. This test is sufficiently delicate to detect the presence of ozone in atmospheric air.

PACKFONG. Syn. *Pakfong; Chinese White Copper*. An alloy formed by fusing together, in a covered crucible, *arsenic*, 2 parts, and *copper clippings*, 4½ to 5 parts, arranged in alternate layers, and covered with a capping of *common salt*. The product contains about 10% of arsenic.

Prop., &c. White, slightly ductile, and permanent at ordinary temperatures; at a temperature below that of redness it suffers decomposition, with the extrication of fumes of arsenious acid. Formerly much *used* for the scales of thermometers and other instruments, dial plates, candlesticks, &c. It is now almost superseded by the alloy of nickel and copper called *German silver*, to which the name is also applied by some recent writers.

PACKING. As there is considerable art in packing brittle hollow-ware, as *glass*, *china*, *&c.*, in such a way that it will stand exposure to the jolting, blows, and agitation of land carriage, it is better, when it is of much value, or in quantity, to employ a person qualified for the job. A man, accustomed to packing such articles, may be readily procured at any glass-works, or china warehouse, for a trifling consideration. When this cannot be done, it must be recollected that the great secret of safe packing consists in the articles being carefully preserved from undue pressure or contact with each other, yet so firmly arranged, and so surrounded with some material, as *hay*, *straw*, *sawdust*, *&c.*, that they cannot be shaken into such a condition by the ordinary contingencies of transport. Loose packing must always be avoided.

PACKWAX. The ligamental matter of the neck of ruminants. It differs from common ligament in being insoluble in boiling water.

PADDING. Amongst *calico printers* this term is applied to the operation of impregnating the pores of their cloth with a mordant. It is now almost exclusively performed by means of a simple piece of machinery (*padding machine*), which essentially consists of—a *large reel* around which the unprepared cloth is wound,—a *guide-roller* over which it passes to smooth and

adjust it before entering the liquor,—a *copper cylinder* (dip-roller) nearly at the bottom of the *mordant trough* under which it is carried from the guide-roller,—a half-round polished *stretcher-bar*, to give it equal tension—a pair of *padded cylinders*, to remove superfluous moisture, and lastly, —a *reel* to receive the mordanted (*padded*) cloth. The *degree of tension* is regulated by a weight suspended on a lever, and motion is given to the whole by an endless band from the driving shaft. This machine is also applicable to many of the operations of *dyeing*, *bleaching*, and *starching* textile fabrics.

PAINTER'S CREAM. *Prep.* Take of *pale nut oil*, 6 *oz.*; *mastic*, 1 *oz.*; dissolve, add of *sugar of lead*, ¼ *oz.*, previously ground in the least possible quantity of *oil*; then further add of *water*, q .s. gradually, until it acquires the consistence of cream, working it well all the time. *Used* by painters to cover their work when they are obliged to leave it for some time. It may be washed off with a sponge and water.

PAINTING. The art or employment of laying on colour. In the *fine arts*, the production of a picture or a resemblance in colours on a flat surface. The artistical and mechanical consideration of this subject does not come within the province of our little volume; but a notice of the leading materials employed by both artists and house painters is given under the respective names. See *Crayons*, *Oils*, *Pigments*, *&c.*

PAINTING (Elydoric). A method of painting invented by M. Vincent, of Montpelier, having for its object to combine the fresh appearance and finish of water colours, with the mellowness of oil painting. The liquid employed as a vehicle for the pigments is an *emulsion* formed of *oil* and *water* by the intervention of a certain portion of *gum* or *mucilage*.

PAINTING (Enamel). In this variety of painting *vitrifiable colours* are laid on thin plates of metal, and fused into it. The *outline* is first burnt in, after which the parts are filled up gradually, with repeated fusions at an enameller's lamp to the most minute finishing touches. "The enamel painter has to work, not with actual colours, but with mixtures which he only knows from experience will produce certain colours after the operation of the fire." (Aikin.)

PAINTING (Encaustic). This method is very ancient, but is now seldom practised. According to Pliny, the colours were made up into *crayons* with *wax*, and the subject being traced on the ground with a metal point, they were melted on the picture as they were used. A coating of *melted wax* was then evenly spread over all, and when it had become quite cold, was finally polished.

The art of encaustic painting, after lying dormant for about 15 centuries, was revived by Count Caylus, in 1753. In its new form, the wood or canvass to be painted on is first well-rubbed over with *wax*, and then held before the fire, so that the wax may penetrate and fill up all the interstices, and form a perfectly even surface. The *coloured pigments* are next mixed with the *powder* noticed below, which is then rubbed smooth with some thick *gum water*, and applied with brushes in the same manner as ordinary water colours. When the painting is finished, and *quite dry*, it is brushed over with *pure white wax* in a melted state, the surface being equalized by the skilful application of heat; it is, lastly, polished off, as before.

The *powder*.—To *white wax*, melted in an earthen pipkin, add in small portions at a time, an equal weight of *powdered mastic*, stirring continuously until the whole is incorporated; then pour it into *cold water*, and afterwards reduce it to powder in a wedgwood-ware mortar. A small quantity only of this powder is used with *light colours*; but more is required with the darker ones, until, on approaching black, the two may be mixed in almost equal proportions.

PAINTING (Fresco). This method of painting was known to the ancient Egyptians, and was commonly practised by the Greeks and Romans. It is confined to the decoration of the walls of buildings, and is executed by incorporating the *colours* with the *still moist plaster*. The pigments employed are entirely mineral or vitreous. As it is extremely difficult to alter the work after the colours are once absorbed, or after the ground has hardened, the whole must be carefully designed before commencing the picture, and no more commenced at once than can be executed during the day.

Of all the varieties of painting, fresco is "undoubtedly the most virile, most sure, most resolute, and most durable," (Vasari,) and the one most adapted for the purposes of historical painting in its grandest and most exalted forms. In comparison with it, it has been said that even oil painting is "employment fit only for women and children." (Michael Angelo.)

PAINTING (Glass). See *Stained Glass*.

PAINTING (Oil). This well-known and much practised method of painting, takes

its name from the vehicle employed for the colours. The last may be any of those of a permanent character, and whose natural tint is not altered by admixture with oil. Linseed, nut, and poppy oil, are those which are principally employed. The first requires the addition of "driers," and hence is generally used under the form of "boiled oil." Spirit (*oil*) of turpentine is commonly used to thin down the prepared colours, and the finished picture is frequently covered with a coat of varnish.

PAINTING (Porcelain). See *Porcelain, Stained Glass, &c.*

PAINTING (Velvet). Any of the ordinary *non-corrosive pigments* or *liquid colours*, thickened with a little *gum*, may be employed in this art; preference being, however, given to those that possess the greatest brilliancy, and which dry without spreading. See *Pigments, Stains, &c.*

PAINTINGS. Many valuable paintings suffer premature decay from the attacks of a microscopic insect, a species of acarus or mite. This is especially the case with "*Christ's Passion*," by Northcote, in the Hanover chapel, Regent-street,—the "*Raising of Lazarus*," in the National Gallery, and several pictures in the Louvre, and other national treasuries of art. The *best method* of *preventing* this variety of decay, is to add a little *creasote* (dissolved in brandy or vinegar), or a few grains each of *bichloride of mercury* and *sal ammoniac* (dissolved in a little water) to the *paste* and *glue* used to "line" the picture, as well as to add a few drops of *pure creasote* or of an *alcoholic* or *ethereal solution of bichloride of mercury* to the varnish, when any is to be applied. If the destruction alluded to has already commenced, the painting should be at once carefully cleaned and "re-lined," observing to employ one or other of the remedies just mentioned.

The most *appropriate* and *only safe situation* in which to keep paintings, is where there is a *pure*, and *moderately dry atmosphere*. Impure air abounds in carbonic acid and sulphuretted hydrogen. It is the presence of the last in the air that *blackens* the "*lights*," and causes most of the *middle tints* and *shades* to fade; and it is exposure to damp that produces *mouldiness* and *decay of the canvass*. For this reason valuable paintings should *not be kept in churches*, nor *suspended against heavy walls of masonry*, especially in badly-ventilated buildings. *Excess of light*, particularly the direct rays of the sun, also acts injuriously on paintings, since it bleaches some colours and darkens others.

The *blackened lights* of *old pictures* may be *instantly restored* to their *original hue* by touching them with *deutoxide of hydrogen*, diluted with 6 or 8 times its weight of *pure water*. The part must be afterwards washed with a clean *sponge and water*. We have produced the most astonishing results in this way, but have recently discovered a cheaper and more convenient method of effecting the same object.

PAINTS. In *trade* this term is commonly applied to pigments ground with oil to a thick paste, ready to be "thinned down" with oil or turpentine to a consistence adapted for application with a brush.

Paints are *prepared* on the *small scale* by grinding the *dry pigments* with the *oil* by means of a *stone-and-muller*; on the *large scale* they are ground in a *colour mill*. There are several pigments, as *king's yellow, Scheele's green, verdigris, white lead, &c.*, which from their *poisonous* character cannot be safely ground by hand, except in very small quantities at a time, and then only by the exercise of extreme caution.

In *mixing* or *thinning down paints* for use, it may be useful to mention that—for "*out-door work*" *boiled oil* is principally or wholly employed, unless it be for the decorative parts of houses, when a portion of turpentine and pale linseed oil is often added.—For "*in-door work*," *linseed oil, turpentine*, and a little *driers*, are generally used in the same way. The smaller the proportion of oil employed for the purpose, the less will be the gloss, and the greater the ultimate hardness of the coating. For "*flatted white*," &c., the colour being ground in oil, requires scarcely any further addition of that article, as the object is to have it "dead" or dull. The best "*driers*" are, ground litharge, and ground sugar of lead; the first for *dark* and *middle tints*, and the last for *light ones*.

To *preserve mixed paints* in pots from "*skinning over*" or *drying up*, they should be kept constantly covered with *water*; or, what is better, with a *thin film* of *linseed oil*.

Brushes, when out of use, may be *preserved* in a similar manner to mixed paints. When *dirty*, or required for a paint of another colour, they may be *cleaned* with a little oil of turpentine, which may be either preserved for the same purpose another time, or may be allowed to deposit its colour, and then used to thin down paints as usual. In no case, however, should it be thrown back into the cistern or can with the pure "turps."

PAINTS (Fish Oil). *Prep.—a.* (The

Oil.) Dissolve *white vitriol* and *litharge*, of each, 14 *lb.*, in *vinegar*, 32 *gall.*; add of *whale*, *seal*, or *cod oil*, 1 ton, boil the mixture to dryness, and continue the heat for an hour or two afterwards, with constant agitation the whole time; the next day decant the clear portion, add of *boiled linseed oil*, 12 gall.; *oil of turpentine*, 3 gall.; and mix them well together; in a week decant the clear portion for use.

The *sediment* left after both the decantations, is to be well agitated with about half its volume of *lime water*. It is then used for some inferior paints, under the name of "*prepared residue oil.*"

b. (The *Paints.*)—1. (*Pale green.*) Take of *lime water*, 6 galls.; *whiting* and *road dust*, of each, 1 cwt.; *blue black*, 30 *lb.*; *yellow ochre*, 28 *lb.*; *wet blue* (previously ground in *prepared residue oil*), 20 *lb.*; grind them well together. For *use*, thin with equal parts of *prepared residue oil* and *linseed oil.*

2. (*Bright green.*) Take of *yellow ochre* and *wet blue*, of each, 1 cwt.; *road dust*, 1½ cwt.; *blue black*, 10 *lb.*; *lime water*, 6 gall.; *prepared fish oil*, 4 gall.; *prepared residue* and *linseed oils*, of each, 7½ gall.

3. (*Lead colour.*) From *whiting*, 1 cwt.; *blue black*, 7 *lb.*; *white lead* (ground in oil), 28 *lb.*; *road dust*, 56 *lb.*; *lime water*, 5 gall.; *prepared residue oil*, 2½ gall.

4. (*Reddish brown.*) From *lime water*, 8 gall.; *Spanish brown*, 1 cwt.; *road dust*, 2 cwt.; *prepared fish*, *prepared residue*, and *linseed oils*, of each, 4 gall.

5. (*Yellow.*) Substitute *yellow ochre* for *Spanish brown* in the last receipt.

6. (*Black.*) Substitute *lamp black* or *blue black* for *Spanish brown* in No. 4.

7. (*Stone colour.*) From *lime water*, 4 gall.; *whiting*, 1 cwt.; *white lead* (ground in oil), 28 *lb.*; *road dust*, 56 *lb.*; *prepared fish*, *linseed*, and *prepared residue oil*, of each, 3 gall.

8. (*Chocolate colour.*) No. 4 and No. 6 mixed together so as to form a chocolate colour.

Obs. At the time when the price of linseed oil was a serious objection to its use in coarse paints, various plans were devised to produce a substitute for it. The preceding was one of them, and was, we believe, made the subject of a patent now long expired. The diminished price of linseed oil of late years has materially lessened, if not wholly divested the subject of present interest.

All the above paints require the addition of some "*driers.*" They are well fitted by their cheapness, hardness, and durability, for common out-door work.

PAINTS (Flexible). *Prep.* Take of good *yellow soap* (cut into slices), 2½ *lb.*; *boiling water*, 1½ gall.; dissolve, and grind the solution whilst hot with good *oil paint*, 1¼ cwt. *Used* to paint canvass.

PAINTS (Vitrifiable). See *Enamels*, *Glazes*, *Stained Glass*, *&c.*

PALAMOUD. *Prep.* 1. From *rice flour* and *British arrow-root*, of each, 1 *lb.*; *roasted chocolate-nuts* (ground), ¼ *lb.*; *red beet* (sliced, dried by a gentle heat, and powdered), 1 oz.; mix them well together, and pass the powder through a sieve.

2. *Sago flour*, 2 *lb.*; *soluble cocoa powder*, 6 *oz.*; *red beet* (dried and powdered), 1 *oz.*

PALLADIUM. A rare metal discovered by Dr. Wollaston in the ore of platinum, in 1803.

Prep. 1. A *solution of the ore of platinum in aqua regia*, from which most of the metal has been precipitated by *sal ammoniac*, is neutralized by *carbonate of soda*, and then treated with a *solution of bicyanide of mercury*; the white insoluble precipitate (*cyanide of palladium*) is next washed, dried, and heated to redness; the residuum of the ignition (*spongy palladium*) is then submitted to a gradually increased pressure, and welding at a white heat, so as to form a button, in a similar manner to that adopted with platinum. *Prod.* Columbian ore of platinum, 1%; Uralian do., 0·25 to 0·75%.

2. The *native alloy of gold and palladium* (from the Brazils) is submitted to the operations of *quartation* and *parting* (see *p.* 98), the *nitric acid* employed being of the density of 1·3; the *silver* is next precipitated from the solution by means of a *solution of common salt* or *dilute hydrochloric acid*, and the decanted supernatant liquid, after evaporation to one half, is neutralized with *ammonia*, and concentrated so that crystals may form; these (*ammonio-chloride of palladium*) are cautiously washed in a little *very cold water*, dried, mixed with *borax*, and exposed in a crucible to the strongest heat of a powerful blast furnace, when a solid button of pure palladium is formed.

Prop., *&c.* Palladium closely resembles platinum in appearance, fusibility, malleability, and ductility; but it is less dense, and has a rather more silvery colour than that metal; it is freely soluble in aqua regia, and is slowly attacked by nitric acid, but the other acids exert little or no action on it; heated to redness in the air a very superficial blue or purple film of oxide forms on the surface, which is again reduced

at a white heat. It melts at 156° Wedgewood. Sp. gr. 11·3 to 12·1 (11·8,—Wollaston; 12·14,—Vauquelin.) It readily unites with copper, silver, and some other metals, by fusion.

Tests. 1. The neutral solutions of palladium are precipitated in the metallic state by *sulphate of iron*, dark brown by *sulphuretted hydrogen*, olive by *ferrocyanide of potassium*, and yellowish white by *cyanide of mercury*.—2. A drop of *tincture of iodine* placed on the surface of metallic palladium and then evaporated by the heat of a spirit lamp, leaves a black spot. By the last two tests palladium is readily distinguished from platinum.

Uses. It has been employed to form the scales of mathematical and astronomical instruments. Its alloy with silver is a very valuable white metal.

PALLADIUM (Chlorides of). Of these there are two:—

1. (*Chloride* or *Protochloride.*) From a *solution of the metal* in *aqua regia*, evaporated to dryness.

Prop., &c. A dark-brown, semi-crystalline mass, soluble in water; at a temperature above 212° it loses its combined water, and becomes black; with the chlorides of potassium and ammonium it forms double salts (*ammonio-chloride of palladium*, *potassio-chloride of do.*), which have a brownish-yellow colour, and are more soluble than the corresponding salts of platinum.

2. (*Bichloride* or *Perchloride.*) By digesting the *protochloride* in *aqua regia.*

Prop., &c. It cannot be obtained in a separate form, as it suffers decomposition during the evaporation; the solution has an intense brown colour; by adding an equivalent proportion of chloride of potassium or sal ammoniac, a red crystalline precipitate (*potassio-bichloride* or *ammonio-bichloride of palladium*) is formed, which is very sparingly soluble in water.

PALLADIUM (Oxides of). Two oxides of palladium are noticed by chemical writers:—

1. (*Oxide* or *Protoxide.*) This is precipitated as a brown *hydrate* by adding an *alkaline carbonate*, in excess, to a *solution of any of the salts of palladium.* This precipitate, when heated to redness, is converted into the *anhydrous black protoxide.* It forms salts with the acids.

2. (*Binoxide* or *Peroxide.*) Obtained by treating solid *bichloride of palladium and potassium* with a *solution of potassa*, in excess, and heating the mixture to 212°

Prop., &c. Yellowish-brown, before being heated; black afterwards. It usually retains a little alkali and water in combination. Both the above oxides form red or reddish-yellow salts with the acids.

PALLADIUM (Sulphuret of). *Sulphide of Palladium.* This is prepared by either fusing together 4 parts of *sulphur* with 13 parts of *palladium*; or by passing a stream of *sulphuretted hydrogen* through a *solution of the protochloride.*

PALMIC ACID. *Prep.* Decompose a *solution* of *soap prepared from palmine and potassa*, by adding to it a *solution* of *tartaric acid*, dissolve the *fatty acid* that separates in *cold alcohol*, and evaporate the filtered solution at a gentle heat.

Prop., &c. Crystallizable; soluble in alcohol, and in ether; melts at 122° Fahr. It may also be procured from the solid mass obtained by passing *sulphurous acid* through *castor oil.*

PALMINE. A new fatty substance obtained by treating *castor oil* with *nitrous acid.* It melts at 143° Fahr., and when saponified yields *palmic acid* and *oxide of glyceryle.*

PALMITIC ACID. *Prepared* from *palm oil* in a similar way to that by which palmic acid is obtained from palmine. It is purified by pressure between the folds of porous paper, washing with *hot alcohol*, and crystallization from *hot ether.* It forms pearly scales, and melts at 140° Fahr., like margaric acid, which it closely resembles.

PALMITINE. The *stearine* or *solid portion* of *palm oil*, purified by crystallization from hot ether. White; soluble in ether and slightly so in hot alcohol; melts at 118° Fahr.; by saponification, it is converted into *palmitic acid.* (See *above.*)

PALM OIL. The melting point of this oil is 80° to 87½° Fahr., and not 117½°, as misprinted at *p.* 854. The statement made by several writers that *lard*, coloured with *annotta*, and scented with *orris root*, is often sold for palm oil, is absurd. As remarked by Dr. Normandy, "it is hardly possible that such a fraud can be practised, seeing that hog's lard is double the price of genuine palm oil." See *Palm Tallow.*

PALPITATION. Syn. *Palpus, Palpitatio Cordis*,—Lat. A violent and irregular beating or action of the heart, either temporary or occasional. When it does not arise from sudden or violent agitation or distress of mind, it may be regarded as a symptom of a disturbance of the nervous functions by disease; in which case attention should be directed to the removal of the primary affection.

PALSY. See *Paralysis.*

PANACEA. A term formerly applied

to those remedies which were supposed to be capable of curing all diseases. Unfortunately for mankind the supposition is opposed to experience. The name is still applied to some quack medicines. Among the preparations to which this name was applied were—*Panacea Anglica*, magnesia; *p. antimonii* (see *p.* 76); *p. dulcis Holsatiæ*, sulphate of potassa; *p. duplicata*, do.; *p. Glauberi*, do.; *p. Holsatica*, do.; *p. lapsorum*, arnica montana; *p. mercurialis*, calomel which has been sublimed 9 times; *p. solutiva*, magnesia; *p. vegetabilis*, saffron.

PANADA. See *Bread Jelly.*

PANARY FERMENTATION. The vinous fermentation as developed in the dough of bread.

PANCAKES. These are essentially fried batter, variously enriched and flavoured, according to the taste of the cook. When they contain *fruit*, *fish*, *meat*, or *poultry*, or are highly seasoned or ornamented, they are commonly called *fritters.*

Prep. (M. Soyer.) Break 2 to 4 *eggs* into a basin, add 4 small table-spoonfuls of *flour*, 2 tea-spoonfuls of *sugar*, and a little *salt*; beat the whole well together, adding, by degrees, ½ pint of *milk*, or a little more or less, depending on the size of the eggs and the quality of the flour, so as to form a rather thick batter; next add a little *ginger*, *cinnamon*, or any other flavour at will; lastly, put them into the pan, and when set, and one side *brownish*, lay hold of the frying-pan at the extremity of the handle, give it a sudden but slight jerk upwards, and the cake will turn over on the other side; when this is brown, dish up with *sifted sugar*, and serve with *lemon*. See *Fritters.*

PANIFICATION. The changes which occur in flour-dough under the influence of the fermentative process and heat, by which it is converted into bread. (See *p.* 159, &c.)

PAPAVERINE. Syn. *Papaverina.* An alkaloid recently discovered by Merck in opium. It crystallizes in needles; is insoluble in water; is slightly soluble in cold alcohol, and in ether; and forms crystallizable salts with the acids which possess little solubility. The *hydrochlorate*, one of the most characteristic of these compounds, crystallizes in beautiful colourless prisms, which possess a high refractive power, and are only very slightly soluble in dilute hydrochloric acid.

PAPER. Syn. *Charta*, *Papyrus*,—Lat. *Papier*,—Fr. The limits of this work preclude the introduction of a description of the manufacture of this well-known and most useful article, which is now almost exclusively made by machinery of an elaborate and most ingenious description. We must, therefore, content ourselves with a short notice of a few of the preparations of the manufactured article. (See *below.*)

Good white paper should be perfectly devoid of odour, and when burnt it should leave a mere nominal amount of ash; digested in hot water, the liquid should be neutral to test paper, and not affected by sulphuretted hydrogen or the alkaline sulphurets, or by tincture of iodine. *Coloured papers* should not contain any deleterious matter.

PAPER (Blistering). See *Vesicants.*

PAPER (Calotype). See *Sun Painting.*

PAPER (Cloth.) This is prepared by covering gauze, calico, canvass, &c., with a surface of *paper pulp* in a Foudrinier machine, and then finishing the compound sheet in a nearly similar manner to that adopted for ordinary paper.

PAPER (Coloured). For those which are merely coloured on *one* side, the *pigments*, ground up with *gum-water* or *size*, or the *stains* thickened with a little of the same, are applied with a brush; after which the sheets are suspended on a line to dry.

For *paper coloured throughout its substance*, the *tinctorial matter* is usually mixed with the *pulp* in the process of manufacture; or the manufactured paper is dipped into a bath of the colouring substance, and then hung up to dry. See *Maps*, *&c.*

PAPER (Copying). *Prep.* Make a stiff ointment with *butter* or *lard* and *black lead* or *lamp-black*, and smear it thinly and evenly over soft writing paper, by means of a piece of flannel; the next day wipe off the superfluous portion with a piece of soft rag.

Use, *&c.* Placed on white paper and written on with a style or solid pen, a copy of the writing is left on the former. By repeating the arrangement, 2, 3, or more copies of a letter may be obtained at once. This paper, set up in a case, forms the ordinary "*Manifold writer*" of the stationers. The *copying* or *transfer paper* used for obtaining fac-similes of letters written with "copying ink," is merely a superior quality of *bank-post paper.*

PAPER (Glass). *Prep.* From *powdered glass*, as emery paper. *Used* to polish wood, &c. (See *p.* 366.)

PAPER (Gout). Syn. *Papier Fayard*; *Charta Anti-arthritica*,—Lat. *Prep.* 1. *Euphorbium*, 1 part; *cantharides*, 2 parts; (both in powder;) *rectified spirit*, 8 parts;

ether, 3 parts; digest in a stoppered bottle, with frequent agitation, for a week; to the strained tincture add of *Venice turpentine*, 1 part; lastly, dip *thin white paper* into it, and dry the sheets in the air.

2. (Mohr.) *Euphorbium*, 1 dr.; *cantharides*, 4 dr.; *rectified spirit* (strongest), 5 oz.; make a tincture, to which add of *Venice turpentine*, 1½ oz., previously liquefied with *resin*, 2 oz.; and spread the mixture, whilst warm, very thinly on paper. *Used* as a counter-irritant in gout, rheumatism, &c.

PAPER (Hydrographic). An absurd name given to paper which may be written on with water, or with some colourless liquid having the appearance of that fluid.

Prep. 1. A mixture of *nut-galls*, 4 parts, and *calcined sulphate of iron*, 1 part (both perfectly dry and reduced to very fine powder), is rubbed over the surface of the paper, and is then forced into its pores by powerful pressure, after which the loose portion is brushed off. Writes *black* with a pen dipped in water.

2. From *sesquisulphate of iron* and *ferrocyanide of potassium*, as the last. Writes *blue*.

3. As the last, but using *sulphate of copper* instead of sulphate of iron. Writes *reddish-brown*.

4. The *paper* is wetted with a *colourless solution* of *ferrocyanide of potassium*, and after being dried is written on with a *colourless solution* of *sesquisulphate of iron*. Writes *blue*.

Obs. The above applications, we need scarcely say, are more amusing than useful. Though long known, we believe that they first acquired a trading importance in the hands of a gentleman of Stamford Street, well known for his skill in both science and business. See *Sympathetic Inks*.

PAPER (Incombustible.) See *Incombustible Cloth*.

PAPER (Iridescent). *Prep.* (Mr. Beasley.) *Sal ammoniac* and *sulphate of indigo*, of each, 1 part; *sulphate of iron*, 5 parts; *nut-galls*, 8 parts; *gum arabic*, ⅛ part; boil them in water, and expose the paper washed with the liquid to (the fumes of) *ammonia*.

PAPER (Issue). Syn. *Charta ad Fonticulos*,—Lat. *Prep.* (Soubeiran.) *Elemi*, *spermaceti*, and *Venice turpentine*, of each, 1 part; *white wax*, 2 parts; melt them together by a gentle heat, and spread the mixture on paper. *Used* to keep issues open.

PAPER (Lithographic). *Prep.* 1. *Starch*, 6 *oz.*; *gum arabic*, 2 *oz.*; *alum*, 1 *oz.*; make a strong solution of each separately, in *hot water*, mix, strain through gauze, and apply it whilst still warm to one side of leaves of paper, with a clean painting-brush or sponge; a second and a third coat must be given as the preceding one becomes dry; the paper must be, lastly, pressed, to make it smooth.

2. Give the paper 3 coats of *thin size*, 1 coat of *good white starch*, and 1 coat of a *solution of gamboge in water*; the whole to be applied cold, with a sponge, and each coat to be allowed to dry before the other is applied. The solutions should be freshly made.

Use, &c. Lithographic paper is written on with lithographic ink. The writing is transferred by simply moistening the back of the paper, placing it evenly on the stone, and then applying pressure. A reversed copy is obtained, which, when printed from, yields corrected copies, resembling the original writing or drawing. In this way the necessity of executing the writing or drawing in a reversed direction is obviated. See *Lithography*, *Inks*, *&c.*

PAPER (Oiled). *Prep.* Brush *sheets of paper* over with "*boiled oil*," and suspend them on a line till dry. Waterproof. Extensively employed as a cheap substitute for bladder and gut skin, to tie over pots and jars, and to wrap up paste blacking, ground white lead, &c.

PAPER (Razor). Smooth *unsized paper*, one of the surfaces of which, whilst in a slightly damp state, has been rubbed over with a *mixture* of *calcined sesquioxide of iron* and *emery*, both in *impalpable* powder. It is cut up into pieces (about 5 × 3 inches) and sold in packets. *Used* to wipe the razor on, which thus does not require stropping.

PAPER (Razor-strop). From *emery* and *quartz* (both in impalpable powder), and *paper pulp* (estimated in the dry state), equal parts, made into sheets of the thickness of drawing paper, by the ordinary process. For *use*, a piece is pasted on the strop and moistened with a little oil.

PAPER (Resin), Syn. *Poor-man's Plaster*; *Charta Resinosa*,—Lat. *Prep.* 1. *Bees' wax*, 1 *oz.*; *tar* and *resin*, of each, 3 *oz.*; melted together and spread on paper.

2. (Ph. Bor.) *Paper*, thinly spread over with *black pitch*. Calefacient, stimulant, and counter-irritant; in rheumatism, chest affections, &c.

PAPER (Rheumatism). See *Gout* and *Resin Papers*.

PAPER (Safety). Syn. *Papier de Sureté*, —Fr. *White paper pulp* mixed with an equal quantity of *pulp tinged with any*

stain easily affected by chlorine, acids, alkalies, &c., and made into sheets as usual.

PAPER (Test). Syn. *Charta Exploratoria*,—Lat. Under this head may be conveniently included all the varieties of prepared paper employed in testing. For this purpose, *sheets* of *unsized paper* or of *good ordinary writing paper* (preferably the first), are uniformly wetted with a *solution of the salt*, or with a *cold infusion* or *decoction of the tinctorial substance* in *distilled water*, and are then hung up to dry in a current of pure air; they are, lastly, cut into pieces of a convenient size, and preserved in closed bottles or jars. For *use*, a small strip of the *prepared paper* is either dipped into or moistened with the *liquid under examination*, or it is moistened with *distilled water*, and then exposed to the *fumes*. A single drop, or even less, of any liquid may be thus tested.

The following are the principal test papers and their applications:—

Brazil-wood Paper. From the *decoction.* Alkalies turn it purple or violet; strong acids, red.

Buckthorn Paper. From the *juice of the berries.* Reddened by acids.

Cherry-juice Paper. As the last.

Dahlia Paper, Georgina do. From an *infusion* of the *petals* of the *violet dahlia* (georgina purpurea). Alkalies turn it green; acids, red; strong caustic alkalies turn it yellow. Very delicate.

Elderberry Paper. From the *juice of the berries.* As the last.

Indigo Paper. From a *solution of indigo.* Decoloured by chlorine.

Iodide of Potassium Paper.—a. From the *solution* in *distilled water.* Turned blue by an acidulated solution of starch.

b. From a *mixture* of *a solution of iodide af potassium* and *starch paste.* Turned blue by chlorine, ozone, and the mineral acids, and by air containing them.

Lead Paper. From a *solution* of either *acetate* or *diacetate of lead.* Sulphuretted hydrogen and hydrosulphuret of ammonia turn it black.

Litmus Paper. In general, this is prepared from *infusion of litmus*, without any precaution, but the following plan may be adopted when a superior test paper is desired:—

a. (Blue.) Triturate *commercial litmus*, 1 *oz.*, in a wedgewood-ware mortar with *boiling water*, 3 or 4 fl. oz.; put the mixture into a flask, and add more *boiling water* until the liquid measures fully ½ pint; agitate the mixture frequently until it is cold, then filter it, and divide the filtrate into two equal portions; stir one of these with a glass rod previously dipped into *very dilute sulphuric acid*, and repeat the operation until the litmus infusion begins to look *very slightly* red, then add the other half of the filtrate, and the two being mixed together, dip strips of *unsized paper* into the liquid, in the usual manner, and dry them. Acids turn it red; alkalies, green. The neutral salts of most of the heavy metallic oxides also redden this, as well as the other blue test papers that are affected by acids.

b. (Red.) The treatment of the *whole quantity of the infusion* (see *above*) with the *rod dipped in dilute sulphuric acid*, is repeated until the fluid begins to look distinctly red, when the paper is dipped into it, as before. The alkalies and alkaline earths, and their sulphurets, restore its blue colour; the alkaline carbonates and the soluble borates also possess the same property. Very sensitive. An *extemporaneous red litmus paper* may be prepared by holding a strip of the *blue variety* over a pot or jar into which 2 or 3 drops of hydrochloric acid have been thrown.

Mallow Paper. From an *infusion* of the *purple flowers* of the *common mallow.*

Manganese Paper. From a *solution of sulphate of manganese.* Ozonized air blackens it.

Rhubarb Paper. From a *strong infusion* of the *powdered root.* Alkalies turn it brown; but boracic acid and its salts do not affect it. Very sensitive.

Rose Paper. From the *petals of the red rose*, as the last. Alkalies turn it bright green. Mr. A. S. Taylor recommends the infusion to be *very slightly* acidulated with an acid, before dipping the paper into it. More sensitive than turmeric paper.

Starch Paper. From a *cold decoction of starch.* Free iodine turns it blue.

Sulphate of Iron Paper. From a solution of the *protosulphate.* As a test for hydrocyanic acid and the soluble cyanides.

Turmeric Paper. From *decoction of turmeric* (2 *oz.* to the pint). It is turned brown by alkalies, and by boracic acid and the soluble borates. It is not quite so susceptible as some other tests, but the change of colour is very marked and characteristic.

PAPER (Tracing). *Prep.* 1. Open a quire of *smooth unsized white paper*, and place it flat upon a table, then apply, with a clean "*sash tool*," to the upper surface of the first sheet, a coat of *varnish* made of equal parts of *Canada balsam* and *oil of turpentine*, and hang the prepared sheet

across a line to dry; repeat the operation on fresh sheets until the proper quantity is finished. If not sufficiently transparent, a second coat of varnish may be applied as soon as the first has become quite dry.

2. Rub the paper with a *mixture* of equal parts of *nut oil* and *oil of turpentine*, and dry it immediately by rubbing it with *wheaten flour;* then hang it on a line for 24 hours to dry.

Obs. Both the above are used to copy drawings, writing, &c. If washed over with ox-gall and dried, they may be written on with ink or water colours. The *first* is the whitest and clearest, but the *second* is the toughest and most flexible. The *paper* prepared from the *refuse of the flax-mills*, and of which bank-notes are made, is also called "*tracing paper*," and sometimes "*vegetable paper*." This requires no preparation; but though very flexible it has little strength.

PAPER (Varnished). Before proceeding to varnish *paper*, *card-work*, *pasteboard*, &c., it is necessary of give it 2 or 3 coats of "size," to prevent the absorption of the varnish, and any injury to the colour or design. The "*size*" may be made by dissolving a little *isinglass* in *boiling water*, or by boiling some clean *parchment cuttings* until they form a clear solution. This, after being strained through a piece of *clean muslin*, or, for very nice purposes, clarified with a little *white of egg*, is applied by means of a small clean brush, called by painters a sash tool. A light, delicate touch must be adopted, especially for the first coat, lest the ink or colours be started, or smothered. When the prepared surface is perfectly dry, it may be varnished in the usual manner. See *Maps*, *Varnishes*, &c.

PAPER (Wafer). See *Wafers*.

PAPER (Waxed). *Prep.* Place *cartridge paper*, or strong *writing paper*, on a hot iron plate, and rub it well with a lump of *bees' wax*. *Used* to form extemporaneous steam or gas pipes, to cover the joints of vessels, and to tie over pots, &c.

PAPER HANGINGS. The ornamental paper used to cover the walls of rooms, &c. Under the *old system*, the paper, after being *sized* and *prepared with a ground colour*, had the pattern produced on it by the common process of *stencilling*, a separate plate being employed for each colour that formed the pattern. To this succeeded the use of *wooden blocks*, the surface of which bearing the design in relief, and being covered with *colour*, was applied by simple hand-pressure on the paper, in a precisely similar manner to that adopted in the block-printing of calicoes. The cylinder calico-printing machine has now been successfully applied to the manufacture of paper hangings.

The *colours* employed for *paper hangings* are—

Blacks. Frankfort, ivory, and blue black.

Blues. Prussian blue, verditter, and factitious ultramarine.

Browns. Umber (raw and burnt), and mixtures.

Grays. Prussian blue and blue black, with Spanish white.

Greens. Brunswick green, Scheele's do., and green verditter; also mixtures of blues and yellows.

Reds. Decoctions of Brazil wood (chiefly), brightened with alum or solution of tin; the red ochres; and, sometimes, red lake.

Violets. Decoction of logwood and alum; also blues tempered with bright red.

Yellows. Chrome yellow, decoction of French berries or of weld, terra di sienna, and the ochres.

Whites. White lead, sulphate of baryta, plaster of Paris, and whiting, and mixtures of them.

The *vehicle* employed to give *adhesiveness* and *body to the colours*, is a solution of gelatine or glue, sufficiently strong to gelatinize on cooling.

The *satiny lustre* observable in some paper hangings is produced by dusting finely powdered *French chalk* over the surface, and rubbing it strongly with a brush or burnisher. The ground for this purpose is prepared with plaster of Paris.

Flock and *velvet papers* are produced by covering the surface of the pattern with a mordant formed with *boiled oil thickened with white lead* or *ochre*, and then sprinkling powdered *woollen flocks* on it. These are previously dyed, and ground to the required fineness in a mill. See *Walls*, &c.

PAPIER-MACHE. Pulped paper moulded into forms. It possesses great strength and lightness. It may be rendered partially *waterproof* by the addition of *sulphate of iron*, *quicklime*, and *glue* or *white of egg*, to the pulp; and incombustible, by the addition of *borax* and *phosphate of soda*. The *papier-maché tea-trays*, *waiters*, *snuff-boxes*, &c., are prepared by pasting or glueing *sheets of paper together*, and then submitting them to powerful pressure, by which the composition acquires the hardness of board when dry. Such articles are afterwards *japanned*, and are then perfectly waterproof.

The *refuse of the cotton* and *flax mills*, and numerous other substances of a like

character, are now worked up as papier-maché, and the manufactured articles formed of them are indistinguishable from those prepared directly from paper.

PAPYRINE. An absurd name given to *white unsized paper* which has been immersed for about half a minute in *concentrated sulphuric acid*, and afterwards washed in water *slightly alkalized* with *ammonia*, by which it assumes a toughness and appearance somewhat like parchment. It is simply a modified form of vegetable fibre, between that of lignine and dextrine.

PARABANIC ACID. A new acid, obtained by Wöhler and Liebig by treating *uric acid* or *alloxan*, 1 part, with *strong nitric acid*, 8 parts, at a gentle heat, and when the reaction has nearly ceased, evaporating the liquid to the consistence of a syrup; the crystals which form in the liquid after standing for some time, are purified by re-solution and crystallization.

Prop., &c. Beautiful, colourless, transparent prisms, freely soluble in water, with an acid taste and reaction. Its salts (*parabanates*) give a white precipitate with nitrate of silver.

PARACHUTE. In *aerostation*, an instrument or apparatus having for its object to retard the descent of heavy bodies through the air. The only *form* of parachute which has been hitherto adopted with success, is that of the common umbrella when extended. The *materials* of which the apparatus is made, are *canvass* and *cord*, both light but strong, and carefully put together. The *car* to contain the adventurer resembles that of the balloon, only smaller.

It is *estimated* that a circular *parachute* to descend, in safety, with an adult, weighing, with the apparatus, 225 *lb.*, must have a diameter of at *least* 30 feet. Its *terminal velocity* would then be at the rate of 12 to 13 feet per second, or about 6½ miles per hour; and the shock experienced on contact with the earth would be equal to that which the aeronaut would receive if he dropped freely from a height about 2½ feet.

Several descents from balloons after they have acquired a great elevation, have been effected without accident by means of parachutes; and there is no more risk in the undertaking, *per se*, than there is in ordinary ballooning. Unfortunately, however, any want of integrity in the machine, or any accident which may happen to it after its detachment from the balloon, is irreparable and fatal. See Hutton's *Math. Tracts*, iii, 316.

PARACYANOGEN. The *brown solid matter* left in the retort when *cyanide of mercury* is decomposed by heat. It is insoluble in either water or alcohol, and is dissipated, with decomposition, at a very high temperature. Cyanogen and paracyanogen are isomeric compounds. (Johnston.)

PARAFFINE. Syn. *Tar-oil Stearine.* This remarkable hydrocarbon is one of the several substances discovered by Reichenbach in wood tar.

Prep. Distil *beech tar* to dryness, rectify the oily portion of the product which is heavier than water, until a thick matter begins to rise, then change the receiver, and moderately urge the heat as long as anything passes over; next digest the product (*pyrélaine* and *paraffine*) in the second receiver, in an equal measure of alcohol of 0·833, gradually add 6 or 7 parts more of alcohol, and expose the whole to a low temperature; crystals of paraffine will gradually fall down, which, after being washed in *cold alcohol*, must be dissolved in *boiling alcohol*, when crystals of *pure paraffine* will be deposited as the solution cools.

Prop., &c. White; odourless; tasteless; sp. gr. 0·87; melts at 110° to 112° Fahr., and boils at a somewhat higher temperature; it dissolves in boiling alcohol and in oils, and burns entirely away with a clear white flame without smoke. In its more obvious properties it closely resembles stearic acid, from which, however, it differs in its total indifference to chemical agents. Even the more powerful acids, the caustic alkalies, and chlorine, fail to exert the smallest action on it, nor does it form a single definite combination with any other body.

Obs. Since the preceding was written several attempts have been made to obtain paraffine, with other products, on the commercial scale, from Irish peat. The efforts for this purpose have turned out unsatisfactory, owing, according to Mr. Lewis Thompson, to too much heat having been employed, by which the paraffine, instead of being carried over into the receiver, is destroyed, and passes away as incondensable gas or useless matter. To obtain the greatest possible product in paraffine from Irish peat, the process must be conducted at a dull-red heat only, and in such a manner, that the volatile and gaseous matter given off from the contents of one retort, may be conducted over those of another simultaneously undergoing the same process of distillation, "by which the nascent

paraffine and pyroligneous spirit will be rapidly swept out, and carried away from the injurious effects of the heat into the condenser." The product hitherto obtained by the *peat-companies* of Ireland, has been only at the rate of 3 *lb.* of *paraffine*, and ½ gall. of *pyroligneous spirit*, with several gall. of a highly fœtid and useless *oil*, from each ton of peat; whereas, by proper management, the quantity of paraffine should be from 9 to 12 *lb.*, or more. *All* the *products* obtainable from peat, may, however, be procured in much greater quantity, and at a less cost from the imperfectly formed *coal* of Bovey Hayfield, near Exeter, where the additional advantage of a ready market and the facilities of transport exist, to render any commercial speculation in connexion with the subject successful. A few years since we invited the attention of capitalists to this matter, but unfortunately, owing to the sudden commercial depression consequent upon the "railway panic," the enterprise was suspended, and finally abandoned.

PARAGUAY ROUX. Syn. *Compound Tincture of Para Cress.* A tincture *prepared* from the *root* of *pellitory of Spain* and the *leaves* and *flowers* of *Italian elecampane* (inula bifrons,—Linn.), of each, 1¼ *oz.*; *flowers of Para cress* (spilanthes oleracea, —Jacq.), 5 *oz.*; *rectified spirit*, ½ pint; macerated for 14 days, pressed, and filtered. Exceedingly stimulant; in toothache, &c.

PARAKAKODYLIC OXIDE. An oily liquid obtained by the action of air, very slowly admitted, on *alkarsine.*

PARALYSIS. Syn. *Palsy.* A loss or considerable diminution of power of voluntary motion, or functional action of any part of the body. In its most usual form one side only of the body is affected. "It not uncommonly seizes the lower extremities, or all parts below the pelvis; sometimes the arms only; and occasionally a part, as one side of the face, one eyelid, the tongue, or the muscles of deglutition." In these cases, the speech frequently becomes indistinct and incoherent, and the memory and judgment impaired, whilst the distorted features assume a more or less revolting aspect.

The *causes* of *paralysis* are various. It may be occasioned by anything that prevents the free flow of the nervous power from the brain into the organs of motion, as pressure on particular parts of the brain, the spinal marrow, or the nerves; by poisons, the long-continued use of sedatives, local injuries, the sudden suppression of profuse and habitual evacuations, and by whatever tends to greatly relax or enervate the system. It may also be a consequence of an attack of apoplexy, or it may be symptomatic of other diseases, as scrofula, syphilis, and worms. When it is of a distinctly local character, it may arise from excessive use or undue employment of the part or organ. That of old age is, probably, a mere consequence of the failing nervous energy of the system being unequally distributed.

"*Palsy*" usually *comes on* with a sudden and immediate loss of the motion and sensibility of the parts; but, in a few instances, it is preceded by a numbness, coldness, and paleness; and, sometimes, by slight convulsive twitches. If the disease affects the extremities, and has been of long duration, it not only produces a loss of motion and sensibility, but likewise a considerable flaccidity and wasting away of the muscles of the parts affected."

When *palsy attacks* any *vital part*, such as the brain, heart, or lungs, it soon terminates in death.

The *treatment* of *paralysis* depends upon a careful consideration of its cause. The first object should be, as far as possible, to remove any compressing force, and to gradually arouse the torpid portion of the nervous system. In general, more or less depletion will be found beneficial, together with rather active purgation, and nervous stimulants, as *ammonia*, *musk*, &c. *Blisters* to the head and neck are also appropriate. With the debilitated and aged, venesection must be avoided. Stimulant and rubefacient frictions and liniments, the vapour bath, and other like remedies, also frequently prove useful. In local attacks of the disease, as the loss of use of one of the hands, arms, legs, &c., no agent has proved so generally successful as voltaic electricity. For this purpose the current should be in *one direction* only, and continued uninterruptedly for some time daily. When the direction of the current is *alternate*, with slight shocks, as in the common coil machine, this agent is of doubtful utility, except for occasional use. In all cases, *medical aid* should be sought as early as possible. See *Strychnia* and *Nux Vomica.*

PARAMIDE. A white, amorphous, insoluble substance, formed along with *eu-chronic acid*, during the distillation of *mellitate of ammonia.* When boiled in water it is converted into *bimellitate of ammonia.*

PARAMORPHINE. See *Thebaine.*

PARAMYLENE. A substance formed along with amylene during its preparation

by the common process. It boils at 320° Fahr.; whereas amylene boils at about 103°.

PARANAPHTHALINE. Syn. *Anthracine.* A substance found in the naphthaline of coal tar. The two are separated by digestion in *alcohol*, which dissolves the *naphthaline* and leaves the *paranaphthaline* in an insoluble form; it is then purified by redigestion in hot alcohol, and final sublimation.

Prop., &c. White; crystalline; inflammable; soluble in ether and oil of turpentine; melts at 356° and boils at 570° Fahr. Naphthaline and paranaphthaline are isomeric compounds.

PARANTHINE. The mineral *scapolite.*

PARAPECTINE. See *Pectine.*

PARAPHOSPHORIC ACID. See *Phosphoric Acid.*

PARASITES. The parasitical animals that infest the human body are referred to under the heads *Acarus* and *Pediculi.*

PARATARTARIC ACID. See *Racemic Acid.*

PARCHMENT. See *Vellum.*

PAREGORIC. See *Compound Tincture of Camphor.*

PAREGORIC (Scotch). See *Ammoniated Tincture of Opium.*

PAREIRA BRAVA. See *Velvet Leaf.*

PARELLIC ACID. A compound obtained along with *orsellic acid* by boiling the lichen *lecanora parella* with *baryta*, by a process nearly similar to that adopted for erythric acid.

PARFUM (des Rois). See *Spirits* (Perfumed).

PARFUM (pour les autres poudres). *Prep.* Take of *poudre d'ambrette*, 12 *lb.*; *civette*, 1½ *oz.*; *musk*, 1 *dr.*; reduce the last two to powder by grinding them with some dry *lump sugar*, then mix the whole together, and pass it through a sieve. *Used* to perfume hair powder, sachets, &c.

PARILLIC ACID. See *Sarsaparilla.*

PARILLINE. See *Sarsaparilla.*

PARING AND BURNING. The operation of paring off the surface of worn-out grass land, or lands covered with coarse herbage, and burning it for the sake of the ashes, and for the destruction of weeds, seeds, insects, &c. "Agriculturalists differ as to the value of this mode of treating land; the greater number preferring a naked fallow even for one or two years, alleging that more injury is done by the vegetable matter lost in burning, than benefit obtained by the ashes produced." (Loudon.) It is, however, evidently the most rapid mode of bringing land abounding in coarse herbage into a state of good culture.

PARR. A name applied to the salmon until near the end of its second year, when it loses its dark lateral bars by the superaddition of a silvery pigment. It was formerly regarded as a distinct species (*salmo salmulus*).

PARROT COAL. Syn. *Cannel Coal, Kennel do.; Ampelitis, Terra A., Pharmacitis.* Formerly used as a vermifuge.

PARSLEY. Syn. *Petroselinum,*—Lat. This is the *apium petroselinum* (Linn.) The *root* is diuretic; the *fruit* (seed), carminative; the *leaves*, are a pleasant stimulating salad and condiment, and are much used to flavour broth and soup. "The fruit is a deadly poison to parrots." (Lind. *ex* Burnett.)

PARSNEP. The *pastinaca sativa* (Linn.) *Roots* (parsneps) are esculent, but are watery, and apt to offend the stomach; *juice*, made into sugar and wine; the last, when well prepared, closely resembles malmsey.

PARTING. See *Assaying.*

PASTE. Syn. *Pâte; Pasta,*—Lat. This word is very loosely applied to substances and preparations differing so widely from each other, that it would be scarcely possible to class them together. We shall, therefore, refer the reader to the individual articles. The pastes (*pâtes*) of French pharmacy are compound medicines of the consistence of hard dough, and which do not stick to the fingers. They are formed of *sugar* and *gum*, dissolved in *water* or in some medicated liquid. They are evaporated, so as to unite these principles by degrees, and give them the pliancy and the firmness of paste. They are *employed* internally in doses more or less variable, in a similar manner to lozenges. "Pâtes, properly so called, are divided into *transparent*, or such as are made without agitation, like jujubes of brown liquorice; and *opaque*, or such as are made with agitation, like the pâtes of marsh-mallow, lichen, &c." (Trousseau & Reveil.)

PASTE (Almond). Syn. *Pâte Royale; Pasta Amygdalina, P. Amygdalarum, P. Regia,*—Lat. *Prep.* 1. (*Moist.*)—*a.* Take of *blanched Valentia almonds*, 4 *oz.*; reduce them to a very smooth paste by patient pounding in a clean mortar, adding, towards the last, a little *rose water*, with some *eau de Cologne*, or 3 or 4 drops of *otto of roses* or *neroli*, or an equivalent quantity of any other perfume, according to the fancy of the artiste.

b. From *bitter* and *sweet almonds* (blanched), equal parts; *rose water*, q. s. It requires no other perfume.

c. To either of the preceding add of *spermaceti*, ½ *oz.* The *white of an egg*, or ¼ *oz.* of *white soap* is added by some makers. With about ½ dr. of *powdered camphor* to each *oz.* of the above, it forms the "*camphorated almond paste*" of the shops.

d. Take *fine Narbonne honey* and *white bitter paste* (see *below*), of each, 1 *lb.*; beat them to a smooth paste, then add, in alternate portions, of *oil of almonds*, 2 *lb.*; *yelks* of 5 *eggs*; and reduce the whole to a perfectly homogeneous pasty mass. Much esteemed. It is commonly sold under the name of "*honey paste*," "*pâte royale*," &c. In a similar manner are made *nosegay*, *orange*, *rose*, *vanilla*, and other like pastes having almonds for a basis, by merely adding the respective perfumes.

2. (*Pulverulent.*)—*a.* (*Gray.*) Prepared from the *cake of bitter almonds* from which the oil has been thoroughly expressed, by drying, grinding, and sifting it.

b. (*Bitter White.*) As the last, but the *almonds* are *blanched* before being pressed.

c. (*Sweet White.*) As the last, but using *sweet almonds.*

Obs. All the above are *used* as *cosmetics*, to soften and whiten the skin, prevent chaps, abrasions, chilblains, &c. The *honey paste*, and the *sweet* and *bitter white pastes*, are those most esteemed.

PASTE (Almond). *Prep.* 1. Take of *Valentia almonds*, ¾ *lb.*; *bitter do.*, ¼ *lb.*; blanch them, and reduce them to a very smooth paste by pounding, then put them into a clean copper pan along with *white sugar* and good *gum arabic*, of each, 1 *lb.*; (the last previously dissolved in about a pint of water;) apply a gentle heat, and stir until the whole is mixed and has acquired a proper consistence, then pour it out on a smooth oiled marble slab, and when cold cut it into squares.

2. As the last, but when the mixture has acquired the consistence of thick honey, setting it aside to cool; when nearly cold the *whites of* 6 *eggs* are to be added, and heat being again *gradually* applied, the whole is to be stirred until it acquires the proper consistence, as before.

3. *Blanched sweet almonds* and *white sugar*, of each, 1 *lb.*; *blanched bitter almonds* and *powdered gum*, of each, 3 *oz.*; beat them, in the cold, to a perfectly smooth paste, with *orange-flower water*, or *rose water*, q. s., so that it may be sufficiently stiff not to stick to the fingers, and then cut the mass into squares, as before. The above are eaten as *confections.*

PASTE (Anchovy). *Prep.* Remove the larger bones from the *fish*, and then pound them to a *smooth* paste in a marble mortar, adding a little *bay-salt* and *cayenne pepper*, at will; next rub the pulp through a fine hair sieve, and about 3-4ths fill the pots with it; lastly, cover the surface of each to the depth of about ⅛ inch with *good butter* in a melted state. It should be kept in a cool situation. Other *fish pastes*, as those of *bloaters*, *lobsters*, *shrimps*, *caviare*, &c., are made in a similar manner.

PASTE (Arsenical). See *Caustics*, *Patent Medicines*, and *Powders.*

PASTE (Baudry's). See *Pectoral Paste.*

PASTE (Bird). See *German Paste* (*p.*513).

PASTE (Black Currant). As *black currant lozenges*, but simply cutting the mass into dice or square.

PASTE (Chinese). *Prep.* From *bullock's blood*, 10 *lb.*, reduced to dryness by a gentle heat, then powdered, and mixed with *quicklime*, also in fine powder, 1 *lb.* It is *used* as a cement, made into a paste with water, and at once applied.

PASTE (Chloride of Zinc). See *Caustics.*

PASTE (Curry). See *Powders.*

PASTE (Dates). Syn. *Pâtes de Dattes*; *Pasta Dactyliferæ*, *P. Dactylorum*,—Lat. From *dates* (stoned), as jujube paste. Pectoral, and slightly astringent. "Pâte de gomme Senegal" is usually sold for it.

PASTE (De Handel's). *Prep.* From *opium*, ½ dr.; *camphor*, 1 dr.; (both in powder;) *extracts of belladonna* and *henbane*, of each, 1 dr.; *oil of cajeput* and *tincture of cantharides*, of each, 10 or 12 drops; *distilled water of opium* (or of *lettuce*), q. s. In toothache.

PASTE (Depilatory). Syn. *Pasta Epilatoria*,—Lat. Several preparations of this character are noticed at *pages* 324-5. A mixture of *slaked lime*, 2 parts, and *water*, 3 parts, saturated with *sulphuretted hydrogen*, is said to be so powerful, that "a layer a line in thickness denudes the scalp in three minutes." (Mr. Beasley.)

PASTE (Figs). Syn. *Pasta Caricarum*, *P. Ficaria*,—Lat. *Prep.* 1. From *figs*, as jujube paste.

2. (Soubeiran.) *Pulp of figs*, 1 part; press it through a sieve, mix it with *powdered sugar*, 4 parts, concentrate by a gentle heat (if necessary), roll the mass out, and cut it into squares or lozenges.

PASTE (Flour). Syn. *Colle de Pâte.* From *wheaten flour.* Paper-hangers, shoemakers, &c., usually add to the flour ⅛ to ¼th of its weight of *finely powdered rosin.* It is then sometimes called "*hard paste.*" The addition of a few drops of *creasote* or *oil of cloves*, or a little *powdered camphor*, *colocynth*, or *corrosive sublimate* (especially

the first two and the last), will prevent insects from attacking it, and preserve it in covered vessels for years. Should it get too hard it may be softened with water. See *Cements*.

PASTE (Fruit). *Prep.* 1. To *each pint* of the *strained juice* add of *gum arabic*, 1 *oz.*, gently evaporate to the consistence of a *syrup*, and add an equal weight of *bruised white sugar*; as soon as the whole is united, pour it out on an *oiled slab*, and when cold enough cut it into pieces.

2. *Citric acid*, ¾ *oz.*; *gum arabic*, 6 *oz.*; *white sugar*, ¾ *lb.*; *water*, q. s.; dissolve, and flavour with any of the *fruit essences*. It may be coloured with any of the stains used for confectionery or liqueurs.

3. See *Fruit Lozenges* (*page* 727).

PASTE (Furniture). See *Polishes*.

PASTE (Glove). See *Ganteine*.

PASTE (Gum Arabic). Syn. *Pâte de Gomme*, *P. de G. Arabique*; *Pasta Gummi*, *P. Gummosa*,—Lat. *Prep.* 1. As *pâte de guimauve*, omitting the mallow roots.

2. *Gum arabic* (picked), 1 *lb.*; *water*, 1 pint; dissolve, add of *white sugar*, 1 *lb.*; evaporate by a gentle heat to a very thick syrup, then add the *whites* of 3 *eggs*, previously beaten up with *orange-flower water*, 1 fl. oz., and strained through muslin, and continue the heat, with constant stirring, until of a proper consistence on being cooled. The last two are commonly sold for pâte de guimauve.

3. (*Transparent.*) From *gum arabic* (picked), 1 *lb.*; *cold water*, 1 pint; *white sugar*, 1¼ *lb.*; proceed as the last, adding *orange-flower water*, 1 fl. oz., towards the end. Often sold under the name of "*white jujubes*."

PASTE (Gum Senegal). Syn. *Pâte de Gomme Senegal*. As *jujube paste* without the fruit.

PASTE (Honey). See *Almond Paste*.

PASTE (Jujube). Syn. *Jujubes*, *Jujube Lozenges*; *Pasta Jujubæ*,—Lat. *Pâte de Jujubes*,—Fr. *Prep.* (P. Cod.) *Jujubes* (the fruit), 1 ℔; *water*, 4 ℔; boil ½ hour, strain with expression, settle, decant the clear portion, and clarify it with *white of egg*; add a strained solution of *gum arabic*, 6 ℔, in *water*, 8 ℔, and to the mixture add of *white sugar*, 5 ℔; gently evaporate, at first constantly stirring, and afterwards, without stirring, to the consistence of a soft extract, then add of *orange-flower water*, 6 fl. oz., and place the pan in a vessel of boiling water. In 12 hours carefully remove the scum, pour the matter into slightly oiled tin moulds, and finish the evaporation (hardening) in a stove heated to 104° Fahr. It is commonly coloured with *beet root*, *cochineal*, or *saffron*. Expectorant; in coughs, &c. "Pâte de gomme" is usually sold for it.

PASTE (Lichen). Syn. *Pasta Lichenis*,—Lat. *Pâte de Lichen*,—Fr. *Prep.* (P. Cod.) *Iceland moss*, 1 ℔; *water*, q. s.; heat them to nearly the boiling point, strain with pressure, reject the liquor, and boil the moss in *fresh water*, q. s., for 1 hour; strain, press, add of *gum arabic*, 5 ℔; *white sugar*, 4 ℔; and evaporate to a proper consistence, as above. Pectoral. With the addition of ½ gr. of *extract of opium*, to each oz., it forms the *opiated lichen paste*. (P. Cod.)

PASTE (Liquorice). Syn. *Liquorice Jujubes*; *Pasta Glycyrrhizæ*,—Lat. *Pâte de Réglisse*, *P. de R. noire*,—Fr. *Prep.* 1. (P. Cod.) *Refined juice* and *white sugar*, of each, 1 ℔; *gum arabic*, 2 ℔; *water*, 3 quarts; dissolve, strain, evaporate considerably, add of finely powdered *orris root*, ½ oz., *oil of aniseed* or *essence of cedrat*, a few drops, and pour the paste upon an oiled slab, or into moulds, as before.

2. (*Brown*; *Pasta G. Fusca*; *Pâte de R. brune.*) *Refined juice*, 4 *oz.*; *white sugar*, 2 *lb.*; *gum arabic*, 3 *lb.*; *water*, 4 pints; proceed as last.

3. (*Opiated*; *Pâte de R. Opiacée*,—P. Cod.) To the last add of *extract of opium*, 15 gr.

4. (*White*; *Pâte de Réglisse blanche.*) As No. 2, substituting the *powder* of the *decorticated root* for the extract. All the above are pectoral; the second is also slightly anodyne. They are useful in tickling coughs, hoarseness, &c.

PASTE (Marshmallow). Syn. *Pasta Althææ*,—Lat. *Pâte de Guimauve*,—Fr. *Prep.* (P. Cod. 1816.) *Decorticated marshmallow root* (French), 4 oz.; *water*, ½ gall.; macerate for 12 hours, strain, add *white sugar* and *gum arabic*, of each, 2½ ℔; dissolve, strain, evaporate without boiling to the thickness of honey, constantly stirring, and add, gradually, the *whites of* 12 *eggs*, well beaten with *orange-flower water*, 4 fl. oz., and strained; continue the evaporation and constant stirring until the mass is so firm as not to adhere to the fingers, then proceed as before.

Obs. It should be very white, light, and spongy. In the P. Codex of 1839 the marshmallow root is omitted, and the name is changed to that of "*pâte de gomme*," a compound long sold for it in the shops. Both are agreeable pectorals.

PASTE (Odontalgic). Syn. *Pasta Odontalgica*, — Lat. *Prep.* 1. *Pellitory* (in powder), 1 dr.; *hydrochlorate of morphia*,

3 gr.; triturate, add of *honey*, 2 dr.; and *oil of cloves*, 6 drops.

2. *Powdered mastic*, *pellitory*, and *white sugar*, of each, 1 dr.; *chloroform*, q. s. to form a paste. It must be kept in a stoppered bottle. See *Toothache* (and *below*).

PASTE (Orange). *Prep.* From *orange flowers*, 2 *lb.*; *bitter* and *sweet almonds*, of each, blanched, 2½ *lb.*; beaten to a perfectly smooth paste. An agreeable cosmetic. See *Almond Paste.*

PASTE (Orgeat). *Prep.* From *blanched Jordan almonds*, 1 *lb.*; *blanched bitter do.* and *white sugar* or *honey*, of each, ¼ *lb.*; beaten to a paste with *orange-flower water*, q. s. (or *neroli*, a few drops), and put into pots. As a cosmetic or to make *orgeat milk.* For use, rub 1 *oz.* with ½ pint of *water*, and strain through muslin.

PASTE (Pectoral). Syn. *Pasta Pectoralis*,— Lat. *Prep.* 1. (*Pâte pectorale de Baudry.*) Take of *gum arabic* and *white sugar*, of each, 7 lb; *water*, q. s.; dissolve, add of *extract of liquorice*, 3 oz.; evaporate, add of *extract of lettuce*, 2 dr.; *balsam of tolu*, 1¼ oz.; *orange-flower water*, 4½ fl. oz.; *whites of* 4 *eggs*; *oil of citrons*, 5 or 6 drops.

2. (*Regnault's*; *Pâte pectorale balsamique de Regnault.*) From the *flowers* of *coltsfoot*, *cudweed*, *mallow*, and *red poppy*, of each, 1 oz.; *water*, 1 quart; boil, strain, add of *gum arabic*, 30 oz.; *white sugar*, 20 oz.; dissolve, concentrate, add of *tincture of tolu*, 3 fl. dr., and pour the mixture on an oiled slab.

3. (*Anisated Coltsfoot Paste*; *Pâte de Tussilage à l'Anis.*) From *strong decoction of coltsfoot flowers*, 1 quart; *Spanish juice*, ½ *lb.*; dissolve, strain, evaporate as before, and towards the end add of *oil of aniseed*, 1 dr. All the above are useful in hoarseness, coughs, &c.

PASTE (Phosphor). See *Rats.*

PASTE (Polishing). *Prep.* 1. (For *Copper* and *Brass.*) See *Brass* (*p.* 158).

2. (For *Iron* and *Steel.*) From *emery* (in fine powder) and *lard*, equal parts.

3. (For *Pewter.*) From *powdered Bath brick*, 2 parts; *soft soap*, 1 part; *water*, q. s. to make a paste. *Used* with a little water, and afterwards well rinsed off.

4. (For *Furniture.*) See *Polishes.*

PASTE (Razor). *Prep.* 1. From *jeweller's rouge*, *plumbago*, and *suet*, equal parts, melted together and stirred until cold.

2. From *prepared putty powder* (levigated oxide of tin), 3 parts; *lard*, 2 parts; *crocus martis*, 1 part; triturated together.

3. *Prepared putty powder*, 1 *oz.*; *powdered oxalic acid*, ¼ *oz.*; *powdered gum*, 20 gr.; make a stiff paste with *water*, q. s., and evenly and thinly spread it over the strop, the other side of which should be covered with any of the common greasy mixtures. With very little friction this paste gives a fine edge to the razor, and its action is still further increased by *slightly* moistening it, or even breathing on it. *Immediately* after its use, the razor should receive a few turns on the other side of the strop.

4. *Diamond dust*, *jeweller's rouge*, and *plumbago*, of each, 1 part; *suet*, 2 parts. Powdered quartz is generally substituted for diamond dust, but is much less effective.

5. (*Mechi's.*) *Emery* (reduced to an impalpable powder), 4 parts; *deer suet*, 1 part; well mixed together.

6. (*Pradier's.*) From *powdered Turkey stone*, 4 *oz.*; *jeweller's rouge* and *prepared putty powder*, of each, 1 *oz.*; *hard suet*, 2 *oz.*

Obs. The above (generally made up into square cakes) are rubbed over the razor strop, and the surface being smoothed off with the flat part of a knife or a phial bottle, the strop is set aside for a few hours to harden before being used.

PASTE (Regnault's). See *Pectoral Paste.*

PASTE (Rubefacient). Syn. *Pasta Rubefaciens*,—Lat. *Prep.* (Clarus.) From *acetate of lead*, 1 oz.; *bisulphate of potassa*, 3 oz.; *water*, q. s. It acts powerfully and quickly on the skin.

PASTE (Rust's). *Prep.* From *powdered opium* and *extract of henbane*, of each, 10 gr.; *powdered pellitory* and *extract of belladonna*, of each, 20 gr.; *oil of cloves*, 10 drops. In toothache.

PASTE (Shaving). *Prep.* 1. *Naples soap* (genuine), 4 *oz.*; *powdered Castile soap*, 2 *oz.*; *honey*, 1 *oz.*; *essence of ambergris*, and *oils of cassia* and *nutmegs*, of each, 5 or 6 drops.

2. *White wax*, *spermaceti*, and *almond oil*, of each, ¼ *oz.*; melt, and whilst warm, beat in 2 squares of *Windsor soap* previously reduced to a paste with a little *rose water.*

3. *White soft soap*, 4 *oz.*; *spermaceti* and *salad oil*, of each, ½ *oz.*; melt them together, and stir until nearly cold. It may be scented at will. When properly prepared these pastes produce a good lather with either hot or cold water, which does not dry on the face. The proper method of using them is to smear a minute quantity over the beard, and then to apply the

wetted shaving brush, and not to pour water on them as is the common practice.

PASTE (Swediaur's). See *Chilblains.*

PASTE (Tooth). Syn. *Pasta Dentifricia, Electuarium Dentifricium,*—Lat. Various preparations are known under this name. They consist, for the most part, of the ordinary substances used as dentifrices, reduced to the state of a very fine powder, and mixed with sufficient *honey, sugar,* or *capillaire,* to give them the required consistence. *Honey of roses* is often used for this purpose, with some agreeable perfume at will. A little *eau de Cologne* or *rectified spirit* is a useful addition. The following are a few examples :—

1. (*Carbon Paste; Opiat Carbonique.*) The *chippings of Turkey stone, cylinder charcoal,* and *prepared chalk,* of each, 2 *oz.; cochineal* and *cloves,* of each, 1 *dr.; honey,* 5 *oz.; eau de Cologne,* q. s. It should not be put into the pots until the next day, and should be afterwards well preserved from the air. Much prized by smokers, and by parties troubled with a fœtid breath from rotten teeth.

2. (*Coral Paste; Opiat Dentifrice rouge.*) From *prepared coral,* 8 *oz.; cuttle-fish bone,* 4 *oz.; mastic,* 2 *oz.; cochineal,* ½ *oz.; honey,* ¾ *lb.*; *essence of ambergris,* 1 fl. dr.; *oil of cloves,* ½ fl. dr., dissolved in *rectified spirit,* 1 fl. oz. As the last. Cleans the teeth rapidly.

3. (Dyon's *Charcoal Paste.*) From *chlorate of potassa,* 1 dr.; *mint water,* 1 fl. oz.; triturate until dissolved, then add of *powdered charcoal,* 2 oz.; *honey,* 1 oz.

4. (*Magic Paste.*) From *white marble dust,* 4 *oz.; pumice stone* (in impalpable powder), 3 *oz.; rose pink,* 1 *oz.; honey,* ½ *lb.; otto of roses,* 15 drops. Rapidly whitens the teeth, but it should not be used too freely, nor too frequently.

5. (P. Cod.) *Prepared coral,* 4 oz.; *bitartrate of potassa,* 2 oz.; *cuttle-fish bone* and *cochineal,* of each, 1 oz.; *alum,* ½ dr.; *Narbonne honey,* 10 oz.; with *essential oil,* q. s. to aromatize the mixture.

6. (Pelletier's *Odontine.*) This is stated to be a *mixture* of *pulverized sepia-bone, butter of cacao,* and *honey,* with *essential oil.*

7. (*Rose Paste.*) Coral paste scented with roses, or the following :—*Cuttle-fish bone,* 1 *oz.; prepared chalk,* 2 *oz.; cochineal,* ½ *dr.; honey of roses,* 3 *oz.; otto of roses,* 6 drops.

8. (*Soluble Paste, Saline Dentifrice.*) From *bitartrate of potassa* or *sulphate of potassa* (in fine powder), 3 *oz.; honey of roses,* 2 *oz.*

9. (*Spanish Dentifrice, Castilian Tooth Cream.*) From *Castile soap* (in fine powder) and *cuttle-fish bone,* of each, 2 *oz.; honey of roses,* 5 *oz.* An excellent preparation. It is superior to all the other pastes for removing tartar and animalculæ from the teeth.

10. (*Vanilla Paste.*) From *red cinchona bark,* 2 *dr.; vanilla,* 1 *dr.; cloves,* ½ *dr.;* (the last two reduced to powder by trituration with) *white sugar,* 1 *oz.; cuttle-fish bone* and *marble dust,* of each, ½ *oz.; syrup of saffron,* q. s.

11. (*Violet Paste.*)—*a.* From *prepared chalk* and *cuttle-fish bone,* of each, 3 *oz.; powdered white sugar,* 2 *oz.; orris root,* 1 *oz.; smalts,* ¼ *oz.; syrup of violets,* q. s. to mix.

12. (Winckler's *Roseate Dentifrice.*) From *cuttle-fish bone,* 1 part; *conserve of roses* (Ph. L.), 3 parts; with *otto of roses,* 2 drops to the *oz.*

13. *Chalk,* 8 *oz.; myrrh* and *rhatany root,* of each, 2 *oz.; orris root,* 1 *oz.; honey of roses,* q. s. to mix. In foul and spongy gums.

PASTE (Toothache). See *Odontalgic Paste.*

PASTE (Tormentil). Syn. *Pasta Tormentillæ,*—Lat. *Prep.* (M. Morin.) *Powdered tormentil root* (tormentilla erecta,—*Linn.*) made into a paste with *white of egg.* In whitloe; applied on linen. Mixed with an equal weight of *simple syrup* it has also been recommended in dysentery and diarrhœa.

PASTE (Vienna). See *Potassa with Lime.*

PASTE (Vohler's). *Prep.* From *dragon's blood,* 1 dr.; *powdered opium,* 2 dr.; *powdered gums* of *mastic* and *sandarich,* of each, 4 dr.; *oil of rosemary,* 20 drops; *tincture of opium,* q. s. to form a paste. In toothache.

PASTE (Ward's). See *Confection of Pepper.*

PASTES. Syn. *Artificial Gems, Factitious do.; Pierres Précieuses Artificielles,*—Fr. Vitreous compounds made in imitation of the gems and precious stones. The substances which enter into their composition, and the principles on which their successful production depends, have been already briefly noticed. The present article will therefore be confined to giving the reader a few original formulæ, together with several others carefully selected from the most reliable English and Continental authorities. Like enamels, the artificial gems have for their basis a very fusible, highly transparent and brilliant, dense

glass, which is known under the name of *frit, paste, strass, flux, fondant,* or *Mayence base,* and which in its state of greatest excellence constitutes the *artificial diamond.* For convenience this will be noticed here under its last synonyme. (See *below.*)

Amethyst. 1. *Paste* or *strass,* 500 gr.; *oxide of manganese,* 3 gr.; *oxide of cobalt,* 2 gr.

2. (M. Douault-Wiéland.) *Strass,* 4608 gr.; *oxide of manganese,* 36 gr.; *oxide of cobalt,* 24 gr.; *purple of cassius,* 1 gr.

3. (M. Lançon.) *Strass,* 9216 gr.; *oxide of manganese,* 15 to 24 gr.; *oxide of cobalt,* 1 gr.

Aqua Marina. From *strass,* 4800 gr.; *glass of antimony,* 30 gr.; *oxide of cobalt,* 1½ gr. See *Beryl,* of which this is merely a variety.

Aventurine. 1. From *strass,* 500 gr.; *scales of iron,* 100 gr.; *protoxide of copper,* 50 gr.; fuse until the protoxide of copper is reduced to the reguline form, then allow the mass to cool very slowly, so that the minute crystals of metal may be equally diffused through it. Has a rich golden iridescence.

2. As the last, but substituting *oxide of chromium* for the protoxide of copper. Appears brown, filled with countless gold spangles; or, when mixed with more paste, of a greenish gray, filled with green spangles.

Beryl. (M. Douault-Wiéland.) *Strass,* 3456 gr.; *glass of antimony,* 24 gr.; *oxide of cobalt,* 1½ gr. See *Aqua Marina.*

Carbuncle. See *Garnet.*

Chrysolite. From *strass,* 7000 gr.; pure *calcined sesquioxide of iron* (crocus martis), 65 gr.

Cornelian. 1. (*Red.*) From *strass,* 7000 gr.; *glass of antimony,* 3500 gr.; *calcined peroxide of iron,* 875 gr.; *binoxide of manganese,* 75 gr.

2. (*White.*) From *strass,* 7200 gr.; *calcined bones,* 250 gr.; *washed yellow ochre,* 65 gr.

Diamond. 1. From *rock crystal* (purest), 1600 gr.; *borax,* 560 gr.; *carbonate of lead* (pure), 3200 gr.; *oxide of manganese,* ½ to 1 gr.; powder each separately, mix them together, fuse the mixture in a clean crucible, pour the melted mass into water, separate any reduced lead, and again powder and remelt the mass.

2. *Pure silica,* 150 gr.; *pure litharge,* 250 gr.; *borax* and *nitre,* of each, 50 gr.; *arsenious acid,* 21 gr.

3. (M. Douault-Wiéland.)—*a.* From *rock crystal,* 4056 gr.; *minium,* 6300 gr.; *potash,* 2154 gr.; *borax,* 276 gr.; *arsenic,* 12 gr.

b. From *rock crystal,* 3600 gr.; *ceruse of Clichy* (pure carbonate of lead), 8508 gr.; *potash,* 1260 gr.; *borax,* 360 gr.

4. (M. Fontanier.) *Pure silica,* 8 oz.; *salt of tartar,* 24 oz.; mix, bake, cool, treat the fused mixture with *dilute nitric acid* until effervescence ceases, and afterwards with *water* as long as the "washings" affect litmus paper; next dry the powder, add to it of *pure carbonate of lead,* 12 oz., and to every 12 oz. of the mixture add of *borax,* 1 oz.; triturate in a porcelain mortar, melt in a clean crucible, and pour the fused mass into *cold water;* dry, powder, and repeat the process a *second* and a *third* time in a clean crucible, observing to separate any revived lead. To the *third frit* add of *nitre,* 5 dr.; and again melt. The product is perfectly limpid and extremely brilliant.

5. (M. Lançon.) *Litharge,* 100 gr.; *pure silica,* 75 gr.; *white tartar* or *potash,* 10 gr.

6. (Loysel.) *Pure silica,* 100 parts; *red oxide of lead* (minium), 150 parts; *calcined potash,* 30 to 35 parts; *calcined borax,* 10 parts; *arsenious acid,* 1 part. This produces a paste which has great brilliancy and refractive and dispersive powers, and also a similar specific gravity to the oriental diamond. It fuses at a moderate heat, and acquires the greatest brilliancy when remelted, and kept for 2 or 3 days in a fused state, in order to expel the superabundant alkali, and perfect the refining. (Polytech. Journ.) The products of the above formula are not only employed to imitate the diamond, but they also form the basis of the other factitious gems.

7. (*Parisian Diamonds.*) These beautiful imitations of the "priceless gem," which have lately attracted so much attention, are made by a chemist in Paris, and are only fused *oxide of tin.* It is to be regretted that the brilliancy which has rendered this imitation so famous, cannot be depended upon, as, after exposure for some time, they become as dull as common glass. (Mining Journal.)

8. (*Yellow Diamond.*) *Strass,* 500 gr.; *glass of antimony,* 10 gr.

Eagle Marine. From *strass,* 3840 gr.; *copper stain,* 72 gr.; *pure zaffre,* 1 gr.

Emerald. 1. From *strass,* 7000 gr.; *carbonate of copper,* 65 gr.; *glass of antimony,* 7 gr.

2. *Paste,* 960 gr.; *glass of antimony,* 42 gr.; *oxide of cobalt,* 3¼ gr.

3. (M. Douault-Wiéland.) *Paste,* 4608 gr.; *green oxide of copper,* 42 gr.; *oxide of chrome,* 2 gr.

4. (M. Lançon.) *Paste,* 9612 gr.; *acetate of copper,* 72 gr.; *peroxide of iron,* 1½ gr.

Garnet, Oriental do., Syrian do., Ancient Carbuncle.—1. *Paste* or *strass*, 1200 gr.; *glass of antimony*, 580 gr.; *purple of cassius* and *binoxide of manganese*, of each, 3 gr.

2. (M. Douault-Wiéland.) *Paste*, 512 gr.; *glass of antimony*, 256 gr.; *purple of cassius* and *oxide of manganese*, of each, 2 gr.

3. (*Vinegar Garnet.*) From *paste*, 7000 gr.; *glass of antimony*, 3460 gr.; *calcined peroxide of iron*, 56 gr.

Lapis Lazuli. From *paste*, 7000 gr.; *calcined horn* or *bones*, 570 gr.; *oxides of cobalt* and *manganese*, of each, 24 gr. The *golden veins* are produced by painting them on the pieces with a mixture of *gold powder*, *borax*, and *gum water*, and then gently heating them until the borax fluxes.

Opal. 1. From *strass*, 960 gr.; *calcined bones*, 48 gr.

2. (Fontanier.) *Paste*, 1 oz.; *horn silver*, 10 gr.; *calcined magnetic ore*, 2 gr.; *absorbent earth* (calcined bones), 26 gr.

Ruby. 1. *Paste*, 45 parts; *binoxide of manganese*, 1 part.

2. *Paste*, 1 *lb.*; *purple of cassius*, 3 dr.

3. (M. Douault-Wiéland.)—*a.* From *paste*, 2880 parts; *oxide of manganese*, 72 parts.

b. Topaz-paste that has turned out opaque, 1 part; *strass*, 8 parts; fuse them together for 30 hours, cool, and again fuse it in small pieces before the blowpipe. Very fine.

4. (M. Fontanier.) *Strass*, 16 oz.; *precipitate of cassius, peroxide of iron, golden sulphuret of antimony*, and *manganese calcined with nitre*, of each, 168 gr.; *rock crystal*, 2 oz., or more.

5. *Paste* and *glass of antimony*, of each, 8 oz.; *rock crystal*, 1 oz.; *purple of cassius*, 1½ dr. Turns on the orange.

Sapphire. 1. From *strass*, 3600 gr.; *oxide of cobalt*, 50 gr.; *oxide of manganese*, 11 gr.

2. (M. Douault-Wiéland.) *Paste*, 4608 gr.; *oxide of cobalt*, 68 gr.; fuse in a luted Hessian crucible for 30 hours.

3. (M. Fontanier.) *Paste*, 8 oz.; *oxide of cobalt*, 49 gr.

Topaz. 1. From *strass*, 1050 gr.; *glass of antimony*, 44 gr.; *purple of cassius*, 1 gr.

2. (M. Douault-Wiéland.) *Paste*, 3456 gr.; *calcined peroxide of iron*, 36 gr.

Turquoise. From *blue paste*, 20 to 24 parts; *calcined bones*, 1 part.

Concluding Remarks. It is absolutely necessary for the successful application of the preceding formulæ, that the substances employed should be perfectly free from impurities, more particularly those of a mineral kind. The litharge, oxide of lead, and carbonate of lead, above all things, must be entirely free from oxide of tin, as the smallest particle of that substance may impart a "milkiness" to the paste. All the ingredients must be separately reduced to powder, and, after being mixed, sifted through lawn. The fusion must be carefully conducted and continuous, and the melted mass should be allowed to cool *very* slowly, after having been left in the fire for 24 to 30 hours, at the least. Hessian crucibles are preferred for this purpose, and the heat of an ordinary pottery or porcelain kiln is sufficient in most cases; but a small wind-furnace, devoted exclusively to the purpose, is, in general, more convenient. It is found that the more tranquil, continuous, and uniform the fusion, the denser and clearer is the paste, and the greater its refractive power and beauty.

All the coloured vitreous compounds noticed at *pp.* 369-371, may be worked up as ornamental stones, in the same way as those just referred to.

It may be further observed that the beauty of *pastes* or *factitious gems*, and especially the brilliancy of *mock diamonds*, is greatly dependent upon the *cutting*, *setting up*, and the skilful arrangement of the *foil* or *tinsel* behind them. See *Enamels*, *Foils*, *Gems*, *Glass*, *&c.*

The *following method* of obtaining *artificial rubies* and *emeralds*, first pointed out by Boettger, is exceedingly simple and inexpensive, and deserves the serious attention of those interested in this ingenious art:—*Recently precipitated* and *well washed hydrate of alumina* is moistened with a few drops of *neutral chromate of potassa*, and kneaded so that the mass assumes a tinge scarcely perceptible; it is then rolled out into small sticks, about the thickness of a finger, and slowly dried, taking the precaution to fill the fissures (if any) that form during desiccation with fresh *hydrate of alumina*. When perfectly dry, and after having been submitted to a gentle heat, one end of these sticks is brought into the termination of the flame of an *oxyhydrogen blowpipe*, until a portion of the mass is fused into a small globule. After the lapse of a few minutes, several minute balls form, having a diameter of some millimetres, and of such intense hardness, that quartz, glass, topaz, and granite, may be easily and perceptibly scratched with them. These, when cut and polished, appear, however, slightly opaque. By employing *nitrate of nickel* in lieu of chromate of potassa, green-coloured globules, closely resembling the *emerald*, are obtained.

By the substitution of oxide of chromium for chromate of potassa, we have procured

factitious gems of considerable hardness and beauty, though slightly opaque in some portion of the mass. The addition of a very little silica prevents, in a great measure, this tendency to opacity.

PASTELS. Coloured crayons. (See *p.* 295.)

PASTIL. Syn. *Pastille; Pastillus, Pastillum*,—Lat. A lozenge or confection. The pastilles (*pastilli*) of French pharmacy, are merely "*confectionery drops*" aromatized or medicated. The name is also given to mixtures of odorous substances made up into small cones and burnt as incense. (See *below*.)

PASTILS (Explosive). Fumigating pastilles, containing a little gunpowder. *Used* to produce diversion, but they often prove far from harmless.

PASTILS (Fumigating). Syn. *Aromatic Pastilles, Incense do.; Clous Fumans; Pastille Fumantes, P. Odorati*, — Lat. *Prep.* 1. *Benzoin*, 4 *oz.*; *cascarilla*, ½ *oz.*; *nitre* and *gum arabic*, of each, 3 *dr.*; *myrrh*, 1 *dr.*; *oils of nutmeg* and *cloves*, of each, 25 drops; *charcoal*, 7 *oz.*; all in fine powder; beat them to a smooth ductile mass with *cold water*, q. s.; form it into small cones with a tripod base, and dry them in the air.

2. (Henry and Guibourt.) Powdered *gum benzoin*, 16 parts; *balsam of tolu* and *powdered sandal wood*, of each, 4 parts; a *light charcoal* (Linden), 48 parts; *powdered tragacanth* and *true labdanum*, of each, 1 part; *powdered nitre* and *gum arabic*, of each, 2 parts; *cinnamon water*, 12 parts; as above.

3. (P. Cod.) *Benzoin*, 2 oz.; *balsam of tolu* and *yellow sandal wood*, of each, 4 dr.; *nitre*, 2 dr.; *labdanum*, 1 dr.; *charcoal*, 6 oz.; mix with a *solution* of *gum tragacanth*, and divide the mass into pastilles, as before.

4. (*Pastilles à la fleur d'orange.*) For *powdered roses* in the next formula substitute *pure orange powder*, and for the essence of roses use *pure neroli*.

5. (*Pastilles à la rose.*) *Gum benzoin, olibanum* (in tears), and *styrax* (in tears), of each, 12 *oz.*; *nitre*, 9 *oz.*; *charcoal*, 4 *lb.*; *powder of pale roses*, 1 *lb.*; *essence of roses*, 1 *oz.*; mix with 2 *oz.* of *gum tragacanth*, dissolved in *rose water*, 1 quart.

6. (*Pastilles à la Vanille.*) *Gum benzoin, styrax*, and *olibanum* (as last), of each, 12 *oz.*; *nitre*, 10 *oz.*; *cloves*, 8 *oz.*; *powdered vanilla*, 1 *lb.*; *charcoal*, 4½ *lb.*; *oil of cloves*, ½ *oz.*; *essence of vanilla*, 7 or 8 fl. oz.; as before.

Obs. The products of the above formulæ are all of excellent quality. They may be varied to please the fancy of the artiste, by the addition or substitution of other perfumes or aromatics. Cheaper pastilles may be made by simply increasing the quantity of the *charcoal* and *saltpetre*. The whole of the ingredients should be reduced to fine powder before mixing them. The use of *musk* and *civet*, so often ordered in pastilles, should be avoided, as they yield a disagreeable odour when burned. The addition of a little *camphor* renders them more suitable for a sick chamber. The simplest and most convenient way of forming the mass into cones, is by pressing it into a mould of lead or porcelain.

Pastilles are burned either to diffuse a pleasant odour, or to cover a disagreeable one. For this purpose they are kindled at the apex, and set on an inverted saucer or a penny-piece to burn. Persons who use them frequently employ a small china or porcelain toy (*pastille house*) sold for the purpose.

PASTILS (Mouth). Syn. *Breath Pills, Cachou Lozenges; Cachou Aromatisé, C. Aromatique, C. de Bologna, Grains de Cachou; Pastilli Cosmetici*,—Lat. *Prep.* 1. *Soft extract of liquorice*, 3 *oz.*; *gum catechu* and *white sugar*, of each, 1 *oz.*; *gum tragacanth* (powdered), ½ *oz.*; *oil of cloves*, 1 *dr.*; *oil of cassia*, ½ *dr.*; *essence of ambergris* and *oil of nutmeg*, of each, 12 drops; make a firm mass with *rose* or *orange-flower water*, q. s., and divide it into one-grain pills; when these are dry, cover them with gold or silver leaf.

2. *Solazzi juice* (dried by a gentle heat and powdered), 4 *oz.*; *lump sugar*, 3 *oz.*; *powdered catechu*, 2 *oz.*; *powdered tragacanth*, 1 *oz.*; *oil of cloves*, 2 fl. dr.; *oil of cassia*, 1 fl. dr.; *white of egg* or *rose water*, q. s. to form a pill-mass; as before.

3. *Powdered catechu*, 1 *oz.*; *Solazzi juice*, 4 *oz.*; *lump sugar*, 12 *oz.*; *oils of cloves, cassia*, and *peppermint*, of each, 1 fl. dr.; *mucilage of tragacanth*, q. s. to mix; as before.

4. *Extract of liquorice* (soft), 2 *oz.*; *white sugar*, 3 *oz.*; *powdered tragacanth* and *cascarilla* (or *orris root*), of each, ½ *oz.*; *oil of cloves*, ½ fl. dr.; *oil of cassia*, 12 drops; *water*, q. s.; as before.

5. (M. Chevallier.) *Powdered coffee, chocolate*, and *sugar*, of each, 1½ *oz.*; *powdered vanilla* and *freshly burnt charcoal*, of each, 1 *oz.*; *mucilage of tragacanth*, q. s.

6. *Chloride of lime* (dry and good), 1 dr.; *white sugar*, 3 *oz.*; *powdered tragacanth*, 1 *oz.*; *oil of cloves*, 30 drops; *rose water*, q. s. To disinfect the breath.

Obs. Almost every maker employs his

own forms for these articles. The objects to be aimed at, are the possession of a rather powerful and persistent odour, and a toughness to prevent their too rapid solution in the mouth. The original Italian formula included *liquorice, mastic, cascarilla, charcoal, orris root, oil of peppermint*, and the *tinctures of ambergris* and *musk*, but is now seldom employed in this country. The flavour of peppermint does not, indeed, appear to be approved of by English smokers. Sometimes, instead of being made perfectly spherical, they are flattened a little.

Cachou à l'ambre gris, Cachou à la Canelle, Cachou à la fleurs d'Orange, Cachou Musqué, Cachou à la Rose, Cachou à la Vanille, Cachou à la Violette, &c., are merely flavoured and scented respectively with the essences or oils of ambergris, cinnamon, neroli, musk, rose, vanilla, violets, &c. See *Breath, Cachou Aromatisé, Lozenges, Pills, &c.*

PASTRY. Articles of food made of "paste" or dough, or of which "paste" forms a principle and characteristic ingredient. The word is popularly restricted to those which contain *puff-paste*, or such as form the staple productions of the modern pastrycook; but it is, in reality, of much more general signification.

Several varieties of *paste* are prepared for different purposes, of which the following are the principal:—

Puff Paste. The production of a first-class puff paste is commonly regarded as a matter of considerable difficulty, but by the exercise of the proper precautions, it is, on the contrary, an extremely simple affair. This paste, before being placed in the oven, consists of alternate laminæ of butter or fat, and ordinary flour dough, the latter being, of course, the thicker of the two. During the process of baking, the elastic vapour disengaged, being in part restrained from flying off by the buttered surfaces of the dough, diffuses itself between these laminæ, and causes the mass to swell up, and to form an assemblage of thin membranes or flakes, each of which is more or less separated from the other. Individually these flakes resemble those of an ordinary rich unleavened dough when baked; but, collectively, they form a very light crust, possessing an extremely inviting appearance, and an agreeable flavour.

The *precautions* above referred to are—the use of *perfectly dry flour*, and its conversion into dough with a "light hand," avoiding unnecessarily working it,—the use of *butter free from water* or *buttermilk*, and which has been reduced to *precisely the same degree of plasticity* as the *dough* between which it is to be rolled,—conducting the operation in a *cool apartment*, and after the second or third folding of the dough *exposing* it to a *rather low temperature* before proceeding further with the process; and lastly,—*baking the paste* in a *moderately smart* but not too hot an oven. The following are examples:—

1. (*Rich.*) Take of *flour*, 1 *lb.*; *butter*, ¼ *lb.*; *cold spring-water*, q. s.; make a moderately soft flexible dough, then roll in (as described above) of *dry fresh butter*, ½ *lb.*

2. (*Ordinary.*) Take of *flour*, 1 *lb.*; *cold water*, q. s.; make a dough, and roll in, as before, of *butter*, 6 *oz.*

3. (Rundell.) Take ¼ peck of *flour*, rub into it 1 *lb.* of *butter*, and make a *light paste* with *cold water*, just stiff enough to work well; next lay it out about as thick as a crown-piece; put a layer of *butter* all over it, sprinkle on a little flour, double it up, and roll it out again; by repeating this with fresh *layers of butter* three or four times, or oftener, a very light paste will be formed. Bake it in a moderately quick oven.

4. (Soyer.) Put 1 *lb.* of *flour* upon your pastry slab, make a hole in the centre, into which put a tea-spoonful of *salt*, mix it with *cold water* into a *softish flexible paste* with the right hand, dry it off a little with *flour* until you have well cleared the paste from the slab, but *do not work it more than you can possibly help;* let it remain for 2 or 3 *minutes upon the slab*, then take 1 *lb.* of *fresh butter*, from which you have squeezed all the buttermilk in a cloth, and brought to the *same consistency as the paste*, upon which place it; press it out flat with the hand, then fold over the edges of the paste so as to hide the butter, and reduce it with the rolling-pin to the thickness of about ½ an inch, when it will be about two feet in length; fold over one third, over which again pass the rolling-pin; then fold over the other third, thus forming a square; place it with the ends top and bottom before you, shaking a little flour both under and over, and repeat the rolls and turns twice again as before; flour a *baking-sheet*, upon which lay it, on ice, if handy, or otherwise, in some cool place, for about half an hour; then roll it twice more, turning it as before, and again place it upon *ice* or in the *cold* for ¼ of an hour; next give it *two* more rolls, *making seven in all*, and it is ready for use. "You must continually add *enough flour* while rolling to prevent your paste *sticking to the slab.*"

Half-puff Paste. As the preceding, using only *one half* the *quantity of butter*, and giving the paste only 3 or 4 folds.

Short Paste, Short Crust.—1. *Flour* (dry and warm), 1 *lb.; sugar*, 3 *oz.; butter*, ¼ *lb.; 2 eggs; water*, ½ pint; make a light dough. If one half of "*Jones's patent flour*" be used, no eggs will be required.

2. (Soyer.) Put on the "*paste slab*" or "*pie board*" 1 *lb.* of *flour*, 2 *oz.* of *pounded sugar*, 6 *oz.* of *butter*, 1 *egg*, ½ tea-spoonful of *salt*, and ½ pint of *water;* mix the sugar and butter well together, add them with the water by *degrees* to the flour, and form a paste, but firmer than puff paste.

Pie Paste. That commonly used is "*short paste*," varied at will; but at good tables the *upper crust* of the pie is generally made of "*puff paste*," and the *remainder* of "*short paste.*"

Pudding Paste. This for *baked puddings* may resemble the last. For *boiled puddings* (or indeed for any) the paste may be either ordinary "*short paste*," or one made with 2 to 6 *oz.* of *butter* or *lard*, or 3 to 8 *oz.* of *chopped beef suet*, to each *lb.* of *flour*, with or without an *egg*, and a *little sugar*, according to the means of the parties. The *first* is most appropriate for those containing *fresh fruit*, and that with suet for *meat puddings*, and those containing *dried fruit*, as grocer's currants, plums, &c. *Milk* or *milk-and-water* is often used instead of simple water to make the dough. *Ginger, spices, savory herbs, &c.*, are common additions to the crusts of puddings. Where economy is an object, and especially among the lower classes, *kitchen fat* is frequently substituted for suet, and *lard* for butter. When "*Jones's patent flour*" is employed, an excellent *plain pudding paste* may be made by simply mixing it up with *very cold water*, and immediately putting it into the water, which should be boiling, and kept in that state until the pudding is dressed.

PATENT MEDICINES. Syn. *Medicamenta Arcana*,—Lat. The majority of the preparations noticed under this head are the *nostrums* popularly termed "*Quack Medicines*," and which are sold with a *Government stamp* (!!) attached to them. A few other *secret* or *proprietary remedies* are also, for convenience, included in the list. An alphabetical arrangement based on the names of the reputed inventors or proprietors of the articles has been adopted, as being the one best suited for easy reference. The composition of a number of them is given from careful personal inspection and analysis, and that of the remainder on the authority of Gray, Griffith, Paris, Redwood, the Philadelphia College of Pharmacy, and other respectable writers.

(Those desirous of receiving further information on the *composition* of the *leading advertised nostrums* of the present day, and the doings of their vendors and proprietors, are referred to the "*Anatomy of Quackery*," or to the "*Medical Circular*," vols. ii, iii, iv, and v, in which most of the papers forming it appeared. A variety of articles not included in the following list are noticed along with other preparations of the class to which they belong, or under the names of their proprietors. See *Balms, Cerates, Drops, Pills, &c.*)

Albinolo's Ointment. See *Holloway's Ointment.*

Ali Ahmed's Treasures of the Desert. There are three preparations included under this name:—

a. (*Antiseptic Malagma.*) From *lead plaster*, 3 parts; *gum thus* and *salad oil*, of each, 2 parts; *bees' wax*, 1 part; melted together by a gentle heat, and spread upon calico.

b. (*Pectoral Antiphthisis* or *Cough Pills.*) From *myrrh*, 3½ *lb.; squills* and *ipecacuanha*, of each, 1 *lb.;* (all in powder;) *white soft soap*, 10 *oz.; oil of aniseed*, 1¼ *oz.; treacle*, q. s. to form a pill mass.

c. (*Sphairopeptic* or *Antibilious Pills.*) From *aloes*, 28 *lb.; colocynth pulp*, 12 *lb.; rhubarb*, 7 *lb.; myrrh* and *scammony*, of each, 3½ *lb.; ipecacuanha*, 3 *lb.; cardamom seeds*, 2 *lb.;* (all in powder;) *soft soap*, 9 *lb.; oil of juniper*, 7 fl. oz.; *treacle*, q. s. This, as well as the last, is divided into 3½-gr. pills, which are then covered with tin foil or silver leaf. An excellent aperient pill no doubt, and one likely to prove useful in all those cases in which the administration of a mild diaphoretic and stomachic purge is indicated. Unlike many of the advertised nostrums of the day there is nothing in their composition that can, by any possibility, prove injurious; but *beyond* this they are destitute of virtue.

For a *history* of the incubation and advent of "Ali Ahmed's Treasures of the Desert" (one of the most warily conceived and energetically carried-out quackeries of modern times), vide *Anat. of Quackery*, or *Med. Cir.*, ii, 328, 347-8, 386, &c.

Anglo-Yankee Sarsaparilla. See *Sarsaparilla.*

Anodyne Drops. See *p.* 340.

Antidynous Lotion. See *p.* 698.

Aperient Biscuits. See *Cakes* (Medicated.)

Baby Poisons. For an exposition of the effects of a number of nostrums vended for

the especial service of unnatural mothers and drunken nurses, we must refer the reader to *Med. Cir.*, ii, 266, 286, &c.

Balm of Rackasiri. See *p.* 110.

Baume de Vie. See *Balsam of Life.*

Betton's British Oil. From *oil of turpentine*, 1 pint; *Barbados tar*, ½ *lb.*; *oil of rosemary*, 1 fl. oz.

Blake's Green-mountain Ointment. We are told that the active ingredient in this compound is *arnica montana*, with a basis of *soap cerate.* It is very useful as an external application in several affections, and testimonials as to its efficacy have been given by Mr. A. B. Harrison, and other surgeons who have tried it. The chief objection to its use, is that it is a secret preparation.

Blake's Toothache Essence. From *alum*, in fine powder, 1 dr.; *sweet spirit of nitre*, 5 dr.

Boerhaave's Odontalgic. From *opium*, ½ dr.; *oil of cloves*, 2 dr.; *powdered camphor*, 5 dr.; *rectified spirit*, 1½ fl. oz.

Bouchardat's Tasteless Aperient. From *phosphate of soda*, ¾ *oz.*, placed in a soda-water bottle, which is then filled up with *carbonated water*, at the bottling machine. For a *dose.*

Brande's Tooth Tincture. From *pellitory of Spain* (bruised), 1 oz.; *camphor*, ¾ oz.; *opium*, ¼ oz.; *oil of cloves*, 1 dr.; digested for 10 days in *rectified spirit*, ½ pint.

Brodum's Nervous Cordial. See *p.* 291.

Cachou Aromatisé. See *Pastils.*

Chamomile Drops. See *Essence of Chamomile.*

Clarke's Conglutinum. See *p.* 282.

Cochrane's Cough Remedy. Acidulated syrup of poppies.

Corn Nostrums. See *p.* 293.

Cottereau's Odontalgic Essence. A nearly saturated *ethereal solution of camphor*, mixed with about $\frac{1}{12}$th of its volume of strong *liquor of ammonia.*

Coupelle's Crinoline or *Crinutriar.* Ordinary fatty matter agreeably scented.

Curtis's Anti-venereal Lotion. A mixture of Beaufoy's *solution of chloride of lime*, 2 fl. oz., with *cold soft water*, 8 fl. oz. For *use* 1 to 2 table-spoonfuls are put into a wine-glassful of water.

Dalby's Carminative. 1. (Dr. Paris.) *Carbonate of magnesia*, 40 gr.; *tincture of castor* and *compound tincture of cardamoms*, of each, 30 drops; *tincture of assafœtida* and *spirit of pennyroyal*, of each, 15 drops; *laudanum*, 5 drops; *oil of aniseed*, 3 drops; *oil of nutmeg*, 2 drops; *oil of peppermint*, 1 drop; *peppermint water*, 2 fl. oz. *Dose.* ½ to 1 tea-spoonful. The bottle should be well shaken before pouring it out.

2. (Wholesale.) *Carbonate of magnesia*, 1 *oz.*; *tincture of castor*, 5 fl. dr.; *tincture of assafœtida*, 3 fl. dr.; *oils of aniseed* and *pennyroyal*, of each, ½ fl. dr.; *oil of nutmeg*, 15 drops; *syrup of poppies*, 7 *oz.*; *rectified spirit*, 3½ fl. oz.; *peppermint water*, ½ pint; as before.

Davidson's Cancer Remedy. A mixture of *arsenious acid* and *hemlock*, both in powder. (Dr. Paris.)

Davis's (Dr.) *Calorific.* The "*liquid*" is *commercial acetic acid* (sp. gr. 1·048), diluted with about an equal volume of *water*, and coloured with *burnt sugar* or *spirit colouring.* The "*shield*" consists of a piece of *red flannel* backed with *oil skin* to prevent evaporation. A few drops of the *calorific* are sprinkled on the flannel, which is then bound over the affected part. The heat of the body gradually volatilizes the acetic acid, and the escape of the vapour being prevented by the oil skin, a strongly counter-irritant action is set up.

De Jongh's "Light-brown Cod-liver Oil." See *p.* 847 to 850.

Derbyshire's Embrocation. From *opium* and *mottled soap*, of each, 2 oz.; *extract of henbane*, 2 dr.; and *mace*, ½ dr.; boiled for 30 minutes in *water*, 3 pints; to the cold liquor, *rectified spirit*, 1 quart, and *liquor of ammonia*, 1 fl. oz., are added, and, after repose, the clear portion is decanted. As a preventive of sea-sickness.

Deshler's Cerate. Yellow basilicon.

Duncan's Gout Remedy. See *Gout.*

Dutch Ague Remedy. A mixture formed of *Peruvian bark* and *cream of tartar*, of each, 1 oz.; *cloves*, ½ dr.; reduced to fine powder. *Dose.* 1½ dr. every 3 hours. (Dr. Paris.)

Eau de Magnanimité. An *aromatized tincture of ants.*

Electuaire Arabique. See *Traitment Arabique.*

Gants Cosmetiques. See *Gloves.*

Gingerbread (Purgative). Each cake weighs about ¼ *oz.*, and contains 5 to 6 gr. of *powdered jalap.* The *dose* is 2 to 4.

Godfrey's Cordial. 1. (Original formula.) *Opium* (sliced), ¼ oz.; *sassafras chips*, 1 oz.; *English brandy*, 1 quart; macerate for 4 or 5 days, then add of *water*, 1 quart; *treacle*, 3½ ℔; and simmer the whole gently for a few minutes; the next day decant the clear portion.

2. (Dr. Paris.) *Aniseed*, *caraways*, and *corianders*, of each, bruised, 1 oz.; *sassafras chips*, 9 oz.; *water*, 6 pints; simmer gently until reduced to 4 pints, then add of *treacle*, 6 ℔; and when nearly cold, further add of *tincture of opium*, 3 fl. oz.

3. (Phil. Col. of Phar.) *Carbonate of*

potassa, 2½ oz.; *water*, 26 pints (old wine measure); dissolve, add of *sugar-house molasses* (treacle), 16 pints (o. w. m.); simmer the mixture, remove the scum, and when it has considerably cooled, add of *tincture of opium*, 24 fl. oz.; *oil of sassafras*, ½ fl. oz.; (dissolved in) *rectified spirit*, 1 quart (o. w. m.) It contains about 16 drops of laudanum (= 1⅛ gr. of *opium*) in each fl. oz.

The following forms are also current in the wholesale trade:—

4. From *molasses*, 16 *lb.*; *distilled water*, 2¾ gall.; *oil of sassafras*, 1 fl. oz.; (dissolved in) *rectified spirit*, ½ gall.; *bruised ginger*, ¾ *oz.*; *cloves*, ½ *oz.*; *laudanum*, 8 fl. oz.; macerate for 14 days, and strain through flannel.

5. *Sassafras chips*, 1 *lb.*; *ginger* (bruised), 4 *oz.*; *water*, 3 gall.; simmer until reduced to 2 gall., then add of *treacle*, 16 *lb.*; *rectified spirit*, 7 pints; *laudanum*, 1 pint.

6. *Opium*, ½ *oz.*; *treacle*, 7 *lb.*; *boiling water*, 1 gall.; dissolve, and add of *rectified spirit*, 1 quart; *oil of sassafras*, ½ dr.; *cloves* and *mustard seed*, of each, ¼ *oz.*; *coriander* and *caraway seeds*, of each, 1 dr.; digest for a week.

7. *Caraways*, *corianders*, and *aniseed*, of each, 1 *lb.*; *water*, 6 gall.; distil 5 gall., and add of *treacle*, 28 *lb.*; *laudanum*, 1 quart; and *oil of sassafras*, 1 fl. oz., previously dissolved in *rectified spirit*, 1 gall.

Obs. This preparation is anodyne and narcotic, and, amongst the lower classes, is commonly given to children troubled with wind or colic. Its frequent and excessive use has sent many infants prematurely to the grave. Gray says, "*It is chiefly used to prevent the crying of children in pain or starving.*" The dose is ½ tea-spoonful and upwards, according to the age and susceptibility of the child.

Golden Spirit of Scurvy Grass. From a *mixture* of the *juice of scurvy grass* (cochlearia officinalis,—*Linn.*) and *proof spirit*, equal parts; coloured with *gamboge*.

Grains (various). See *Pilules Angeliques*, *Dinner Pills*, *&c.*

Graves' Gout Preventive. A tincture prepared by steeping, for a week, *dried orange peel* and *hiera picra*, of each, 1 *oz.*, and *rhubarb*, ½ *oz.*, in *brandy*, 1 pint.

Grinrod's (Dr.) *Remedy for Spasms.* From *acetate of morphia*, 1 gr.; *spirit of sal volatile* and *sulphuric ether*, of each, 1 fl. oz.; *camphor julep*, 4 fl. oz.; for a mixture. It should be kept closely corked, in a cool place, and should be well shaken before use. *Dose.* A tea-spoonful in a glassful of cold water or wine, as required. It is a really valuable preparation.

Hawkin's Essence for the Headache. See *p.* 389.

Herrendschwand's Specific. A mixture of *gamboge*, 10 gr., with *carbonate of potassa*, 20 gr. (Dr. Paris.)

Holloway's Ointment. The original formula of *Albinolo's ointment*, of which this pretends to be a re-production, contains the "graisses de serpent et de vipère," curiosities only to be obtained "à la manufacture de Felix Albinolo, R.D.B." (?) or "à Paris, chez M. C. C——, Pharmacien, Rue——." The principal ingredients, however, in both *Albinolo's* and *Holloway's ointment* of the present day,—if, indeed, it were ever otherwise, are butter, wax, and resin. The formula adopted by those who prepare an imitation ointment on the large scale, and which closely resembles, if it be not actually identical with that employed by Mr. Holloway, is as follows:—*Fresh butter*, (free from water), ¾ *lb.*; *bees' wax* (good), 4 *oz.*; *yellow resin*, 3 *oz.*; melt them together, add of *vinegar of cantharides*, 1 fl. oz., and simmer the whole, with constant agitation, for 10 or 12 minutes, or until the moisture is *nearly* evaporated; then add of *Canada balsam*, 1 *oz.*; *expressed oil of mace*, ½ *dr.*; *balsam of Peru* or *liquid styrax*, 10 or 12 drops; again stir well, allow the mixture to settle, and when it is about half cold (not before) pour it into the pots, previously *slightly* warmed, and allow it to cool very slowly. The label will do the rest. No two samples of Holloway's ointment are precisely of the same colour or consistence.

Holloway's Pills. From *aloes*, 4 parts; *jalap*, *ginger*, and *myrrh*, of each, 2 parts; made into a mass with *mucilage*, and divided into 2-grain pills, of which about 4 dozen are put into each 1s. 1½d. box. (For a full exposition of the Hollowayan quackery and nostrums, see "*Anat. of Quackery*," or "*Med. Circ.*," ii, 45, 67, 86.)

Jackson's Bathing Spirit. A species of soap liniment, made of *soft soap*, 1 lb; *camphor*, 6 oz.; *oils of rosemary* and *thyme*, of each, ¾ fl. oz.; *rectified spirit*, 1 gall.

Kaye's Infant's Preservative. A preparation partaking of the joint properties of Atkinson's nostrum and Godfrey's cordial, but more powerful than either, as indicated by the doses in which it is directed to be given during early infancy; viz., "*two, three*, or more drops." (*Med. Circ.*, ii, 248.)

Keating's Cough Lozenges. These are said to be composed of—*Lactucarium*, 2 dr.; *ipecacuanha*, 1 dr.; *squills*, ¾ dr.; *extract*

of liquorice, 2 oz.; *sugar*, 6 oz.; made into a mass with *mucilage of tragacanth*, and divided into 20-gr. lozenges. (*Anat. of Quackery.*)

King's Sarsaparilla Pills. From the *compound extract.* "Instead of two pills being equivalent to ½ fl. oz. of the *concentrated decoction* or *essence of sarsaparilla*, as asserted, it takes about 32 of them to represent the given quantity, and about 4 of them to be equal in strength to the *common* decoction of the pharmacopœia." "Instead of one 2*s.* 9*d.* box of these pills being equal to a pint of the costly concentrated fluid preparation, it would take nearly 1½ *lb.* of them for that purpose." (*Med. Circ.*, ii, 493.)

Kitchener's Peristaltic Persuaders. See *Pills.*

Lambert's Asthmatic Balsam. The active ingredients in this compound are said to be *squills* and *aqueous extract of opium.*

Lemazurier's Odontalgic Essence. From *acetate of morphia*, 1 gr.; dissolved in *cherry-laurel water*, 1 oz. For *use*, a teaspoonful is added to ½ a wine-glassful of warm water, and the mouth well rinsed out with the mixture.

Leroy's Purgative.—a. (No. 1.) *Vegetable turbith*, 6 dr.; *scammony*, 1½ oz.; *jalap*, 6 oz.; *brandy*, 10 pints; digest for 24 hours, and add a syrup made of *senna*, 6 oz.; *water*, 1¼ pint; *sugar*, 32 oz.

b. (No. 2.) As the last, only 1-3rd stronger.

c. (No. 3.) Twice as strong as No. 1.

Lewis's Electuarium. A liquid nostrum, said to be alterative and to contain a small quantity of both antimony and mercury.

Lewis's Balsamic Ointment. This preparation, which is declared by its proprietor to be "utterly unsurpassable," for the most part resembles Holloway's ointment. (*Med. Circ.*, ii, 493.)

Lewis's Silver Cream. This nostrum is said to depend for its efficacy on *white precipitate* and a *salt of lead.*

Locock's Pulmonic Lozenges. See *Wafers.*

Mahomed's Paste. See *Electuaries.*

Mardant's Norton's Drops. A mixture of the *tinctures of gentian* and *ginger*, holding in solution a little *bichloride of mercury*, and coloured with *cochineal.*

Marriott's Dry Vomit. A mixture of equal parts of *tartar emetic* and *sulphate of copper.*

Marsden's Drops. A coloured solution of *corrosive sublimate.* (Dr. Paris.)

Matthieu's Vermifuge.—a. (To destroy the worm.) *Tin filings*, 1 oz.; *male-fern root*, 6 dr.; *worm seed*, 4 dr.; *resinous extract of jalap* and *sulphate of potassa*, of each, 1 dr.; *honey*, q. s. to form an electuary. *Dose.* A tea-spoonful repeated every third or fourth hour, for 2 or 3 days, when the following is to be substituted, and continued until the bowels are well acted on.

b. (To expel the worms.) *Jalap* and *sulphate of potassa*, of each, 40 gr.; *scammony*, 20 gr.; *gamboge*, 10 gr.; *honey*, q. s.; as before.

McKinsey's (Baron) *Golden Cerate.* This appears to resemble *Poor man's friend.*

McKinsey's (Baron) *Katapotia.* This notorious nostrum is compounded of *aloes*, 5 *oz.; soap*, 1½ *oz.;* (both in powder;) beaten up with *syrup of saffron* and a little *essential oil*, and divided into pills varying in weight from 2 to 2½ gr. each. (*Med. Circ.*, iv, 86.)

McKinsey's Medicinal Powder, Rev. T. Smith's do. From *dried lavender flowers* and *rosemary tops*, of each, 2½ *oz.; asarabacca*, 1 *oz.;* reduced to powder, and further disguised with a *little perfume.* A very small quantity of *subsulphate of mercury* is also most probably added. Two or three pinches of this powder taken 3 or 4 times a day, as snuff, is said by the proprietor to be sufficient to cure almost every known disease. "This is the '*great remedy*' on which Baron McKinsey offers to stake his claim for immortality!" (See *p.* 95; also *Anat. of Quackery*, or *Med. Circ.*, ii, 32, 86.)

Moat's Sarsaparilla. Resembles the ordinary decoction of the shops. See *Pills.*

Montein's Barèges Balls. Nearly similar to No. 2, p. 106.

Morison's Aperient Powder. A mixture of *cream of tartar* and *lump sugar*, in nearly equal proportions, with sufficient *powdered cassia* to give it an aromatic flavour. See *Pills.*

Morrison's Adhesive Paste. See *Plasters.*

Norton's Drops. Similar to *Green's* or *Marsden's drops.*

Ollivier's Biscuits. Take of the *white of* 2 *eggs; water*, ¾ pint; beat them together, strain the mixture, and add to it a *solution* of *bichloride of mercury*, 76 gr.; collect the precipitate, wash, dry, powder, and carefully weigh it; next add it to such a quantity of *flour*, &c., that each 2-dr. biscuit may contain exactly ¼ gr.

Papier Fayard. See *Gout Paper* (*p.* 931).

Pâte Arsenicale. A powder composed of *arsenious acid*, 8 gr.; *dragon's blood*, 22 gr.; *cinnabar*, 70 gr. It is to be made into a paste with the saliva at the time of applying it. A favorite remedy in cancer on the Continent. (Dr. Paris.)

Perry's Balm of Syriacum. See *page* 108, and *Med. Circ.*, iii, 144, 283.

Perry's Preventive Lotion. This is said to be a *solution* of *sal alembroth*, 2 dr., in *water*, 1 pint. For *use*, it is diluted with 4 or 5 times its bulk of water. (*Med. Circ.*, iii, 284.)

Pierre Divine. See *p.* 675.

Pieste's Toothache Essence. From *liquor of ammonia*, 2 parts; *laudanum*, 1 part. It is applied on lint.

Pilules Angeliques, Grains de Santé. Take of *aloes* and *juice of roses*, of each, 4 oz.; *juices of borage* and *chicory*, of each, 2 oz.; beat them together, and when they are reduced to the consistence of a soft pill-mass, add of *powdered rhubarb*, 2 dr.; *powdered agaric*, 1 dr.; and divide the mixture into 1½-gr. pills. A good purgative. *Dose.* 4 to 12.

Poor-man's Friend (French). See *Brown Ointment.*

Poor-man's Friend (Dr. Roberts'.) This consists chiefly of *ointment of nitric-oxide of mercury.*

Portland's (Duke of) *Gout Powder.* A mixture of the *roots* of *birthwort* and *gentian*, and the *tops* of *germander*, *ground-pine*, and *lesser centaury*, in equal proportions.

Pringle's Remedy for Typhus. (Dr. Paris.) *Pale cinchona* (bruised), ½ oz.; *water*, 12 fl. oz.; boil them together for 10 minutes, adding, towards the end, *Virginian snake-root* (bruised), 2 dr.; macerate for an hour in a covered vessel, and to the strained liquid add of *dilute sulphuric acid*, 2 fl. dr., and when the mixture is cold, further add of *spirit of cinnamon*, 1 fl. oz. The *dose* is 2 table-spoonfuls every six hours.

Reynold's Gout Specific. Wine of colchicum disguised by some unimportant additions.

Righini's Odontalgic Drops. A *solution* of *creasote* in an equal weight of the strongest *rectified spirit*, coloured with *cochineal*, and disguised by the addition of a few drops of *oil of peppermint.*

Ruspini's Styptic. A strong *solution* of *gallic acid* in *spirit of roses.* Dr. A. T. Thomson says that it also contains sulphate of zinc.

Rust's Toothache Paste. See *p.* 940.

Scott's Drops, Tincture of Soot. From *wood soot*, 2 *oz.*; *assafœtida*, 1 *oz.*; *brandy* or *proof spirit*, 1 pint. *Dose.* 1 to 2 table-spoonfuls; in hysteria, &c.

Smith's Powder (Rev. T.). See *McKinsey's Powder.*

Solomon's Anti-impetigines. A solution of *bichloride of mercury* disguised by the addition of a little flavouring and tinctorial matter. (*Med. Circ.*, ii, 69-70.)

Standert's Red Mixture. Take of *carbonate of magnesia*, 1 oz.; *powdered Turkey rhubarb*, ½ oz.; *tincture of rhubarb*, 3 fl. oz.; *tincture of opium*, 2 fl. dr.; *oils of aniseed* and *peppermint*, of each, ½ dr.; (dissolved in) *gin* or *proof spirit*, 5 fl. oz.; agitate the whole together, then further add of *soft water*, 1¼ pint. In colic and diarrhœa. *Dose.* A wine-glassful. The spirit is frequently omitted, but then the mixture soon spoils.

Standert's Stomachic Candy. Take of *lump sugar*, 1 lb; *water*, 3 fl. oz.; dissolve by heat, add *cardamom seeds*, *ginger*, and *rhubarb*, of each, 1 oz.; and when the mixture is complete pour it out on an oiled slab or into moulds.

Storey's Worm Cakes. Take of *calomel* and *cinnabar*, of each, 24 gr.; *powdered jalap*, 72 gr.; *ginger*, 1 dr.; *white sugar*, 1¼ oz.; *syrup*, q. s.; mix, and divide into a dozen cakes. Resemble Ching's lozenges in their action.

Struve's Lotion. See *p.* 720.

Succession Powder. A mixture of *powdered quartz* and *diamond dust*; chiefly the first. *Used* as an escharotic.

Tasteless Ague Drop. See *Ague.*

Tasteless Worm Medicine. See *Lozenges.*

Turlington's Balsam. See *Balsam of Life.*

Valangin's Solution of Solvent Mineral. From *arsenious acid*, ½ dr.; dissolved in *hydrochloric acid*, 1½ dr.; and the solution diluted with *distilled water*, 1½ pint. In ague, &c. It has rather less than half the strength of the *solution of arsenite of potassa*, Ph. L.

Vance's Cream. See *Chilblains.*

Wahler's Ointment. See *Chilblains.*

Ward's Purging Powder. A mixture of *jalap* and *cream of tartar*, equal parts, coloured with a little *red bole. Dose.* A tea-spoonful, or more, in broth or beer, twice or thrice daily; in dropsy.

Webster's Diet Drink. A *sweetened decoction* of *betony*, *dulcamara*, *guaiacum wood*, *liquorice root*, *sarsaparilla*, *sassafras*, *thyme*, and *turmeric.*

Wilson's Gout Tincture. This is said to be *wine of colchicum.*

Wright's Pearl Ointment. Take of *white precipitate*, 8 *oz.*; *Goulard's extract*, 1 pint; rub them to a cream, and add the mixture to *white wax*, 7 *lb.*, and *olive oil*, 16 *lb.*, previously melted together by a gentle heat; lastly, stir the whole until it is nearly cold. (Pharm. Journ.)

Young's Aperient Drink. From *carbonate*

of soda, 2½ dr.; *bitartrate of potassa*, 3 dr.; (both in crystals;) throw them into a soda-water bottle containing *cold water*, 8 fl. oz., and immediately cork it down securely, and keep it inverted, in a cool place, until required for use.

Zanetti's Bohemian Restorative Tincture. From crushed *raisins*, ¾ *lb.*; *hay saffron*, 2 *oz.*; *aqueous extract of opium*, 3 dr.; *powdered cochineal*, 2 dr.; *capillaire* and *orange-flower water*, of each, ½ pint; *proof spirit*, 3 pints; digested together for a week, and then strained, with expression.

PAULLINIA. See *Guarana.*

PAYNIZING. The name given to Mr. Payne's process for *preserving* and *mineralizing wood.* The pores of the wood are first *exhausted of air* by the action of a powerful air-pump; a *solution* of *sulphuret of calcium* or of *sulphuret of barium* is next forced into them under a pressure of 100 to 150 *lb.* to the square inch; subsequently, a *solution* of *sulphate of iron* is applied in the same manner. In this way sulphate of baryta (*heavy spar*) or sulphate of lime (*gypsum*) is formed in the pores of the wood, which is thus rendered harder, more durable, and nearly fire-proof.

PEACH. Syn. *Persicum*,—Lat. The *fruit* of *persica vulgaris* (amygdalus persica, —*Linn.*) Two varieties are known in our gardens,—*clingstone peach* and *freestone peach*, terms which explain themselves. The *fruit* is wholesome; but the *flowers* and *kernels* contain prussic acid, and are poisonous.

PEACHWOOD. The produce of a species of *cæsalpinia*, now extensively used in calico-printing.

PEAR. Syn. *Pyrus*,—Lat. The fruit of *pyrus communis* (Linn.), one of the rosaceæ. Its general qualities resemble those of the apple.

PEAR FLAVOUR. See *Essences.*

PEARL. Syn. *Margarita*, *Margaritum*, *Perla*, *Unio*,—Lat. The most beautiful and costly pearls are obtained exclusively from the *pearl oyster* (*meleagrina margaritifera*) of the Indian Seas. The principal fisheries are on the coast of Ceylon, and at Olmutz, in the Persian Gulf. An *inferior description* of *pearl* is procured from a fresh-water shell-fish (*unio margaritifera*) in the neighbourhood of Omagh, county of Tyrone. A similar quality is also procured from the river Ythan, Aberdeenshire. It is probable that pearls from this source, collected by the ancient Britons, may have given rise to the statement by Tacitus, in his Life of Agricola, of pearls "not very orient, but pale and wan," being among the indigenous products of Great Britain.

Pearls are *composed* of *membrane* and *carbonate of lime;* or, in other words, of substances similar to *bladder* and *chalk*, in alternate layers. When steeped in *dilute hydrochloric acid*, or even in *vinegar*, the carbonate of lime is dissolved with effervescence, and the films of membrane remain, for a time, unacted on.

The *cause* of the *production* of *pearls* is highly curious and interesting. When any foreign body gains a permanent lodgment within the shells of any of the mollusca which are lined with pearly matter, or nacre, the pearly secretion of the animal, instead of being spread in layers on the inside of its habitation, is accumulated around the offending particles in concentric films of extreme tenuity, and more or less spherical, forming a *pearl.*

Pearls were *formerly used* in medicine as absorbents or antacids; and among the ancients they were occasionally taken, dissolved in wine or vinegar, both as a remedy and for the purpose of displaying the careless opulence and luxury of their possessors. A perfect pearl, large, truly spherical, highly iridescent, and reflecting and decomposing the rays of light with vivacity, claims to rank with the most costly of the gems, and in some parts of the East, is, with justice, more highly prized than even the diamond. In Europe, however, the present estimation of their value is somewhat different. "A handsome necklace of Ceylon pearls, smaller than a large pea, cost from £170 to £300; but one of pearls about the size of peppercorns may be had for £15. The pearls in the *former* sell at a guinea each, and those in the latter at about 1*s.* 6*d.*" (Mr. Milburn.) *Seed pearls* are of little value however beautiful.

PEARL (Artificial). These are hollow spheres or beads of glass, perforated with two holes at opposite sides to permit of their being strung into necklaces. A small portion of *essence d'orient* (see *p.* 388) is introduced into each, by suction, and is then spread over the inner surface of the glass. When this has become dry and hard, the globe is filled up with *white wax*, *spermaceti*, or *gum arabic.* The glass of which the beads are formed is *slightly* bluish and opalescent, and very thin. The latest improvement consists in removing the glassy appearance of the surface of the prepared bead by exposure to the *fumes of hydrofluoric acid*, highly diluted.

PEARL (Mother of). Syn. *Nacre; Nacre de Perle; Unionum Conchæ.* This is the internal or nacreous layer of those shells which produce the pearls for orna-

menting the person; hence the term "mother" of pearl is by no means inappropriate. It is also derived from several other species, known in trade as *ear-shells, green snail-shells, Bombay-shells, &c.*

The brilliant hues of mother of pearl do not depend so much upon the nature of the substance as on its structure. Its surface is covered by minute corrugations or furrows, which give a chromatic appearance to the reflected light. Sir David Brewster was the first to show that this substance is capable of imparting its iridescent appearance to fusible metal or fine black wax.

Mother of pearl is *cut* and *wrought* with nearly similar tools to those used for ivory, but its treatment, owing to its more fragile nature and delicate structure, requires considerably greater care. It is polished with colcothar or putty powder.

The *numerous applications* of *mother of pearl*, for buttons, knife handles, boxes, inlaying work, &c., are well known.

PEARLASH. This is prepared by calcining the *crude potashes* on a reverberatory hearth, dissolving the calcined mass in *water*, and, after repose, decanting the clear solution, and evaporating it to dryness in flat iron pans, the product being constantly stirred towards the end to reduce it to a semi-granular state. Although purer, its richness in *absolute alkali* is less than that of the potashes from which it is prepared, being only from 47 to 51%. This exists almost entirely under the form of carbonate. The commercial value of this substance is determined by the ordinary processes of *Alkalimetry*. (See *p.* 39–44.)

PEARL BARLEY. See *Barley*.

PEARLS (Rose). Syn. *Rose Beads*. The *petals* of *red roses* beaten in an iron mortar for some hours, until they form a smooth, black paste, then rolled into beads and dried. Hard; very fragrant; take a fine polish.

PEARL WHITE. This is *subchloride of bismuth;* but the name is now commonly applied to *trisnitrate of bismuth*, which is sold for it.

PEAS. Syn. *Garden Peas, Motor do.; Pisa*,—Lat. The *seed* of *pisum sativum* (Linn.) In the fresh state (*green peas*) they are saccharine and nutritive, and with the *pods* which contain them are highly serviceable in scurvy. The last have been used for making beer. The *dried seeds* are still more nutritious, but are heavy and flatulent unless well cooked. For *kitchen use*, "*split peas*" should be chosen, and after having washed them in a little *clean soft water*, and allowed them to drain, they should be left to soak in *cold soft water*, for at *least* 12 hours before applying heat to them, and should then be dressed in the *same* water in which they have been soaked, and be only *gently simmered* until they are reduced to a pulp. Additions of meat, vegetables, &c., should not be made until they have nearly arrived at this condition. "*Whole peas*" require soaking for at least 18 or 20 hours.

A *substitute* for *green peas* in *winter* may be obtained by placing the dried seed on a flat dish, sprinkling them with *water*, and keeping them in a warm situation. In a few days germination commences, and after it has proceeded sufficiently far, the whole is dressed in the usual manner. An *easier* and *simpler plan* is to preserve the *green peas*, when they are in season, by the common method adopted for gooseberries and other like fruit.

PEAS (Issue). Syn. *Pisa pro Fonticulis*,—Lat. *Orange berries*, or the *small unripe fruit* of the *orange tree*, dried, and smoothed in a lathe. See *Issue*.

PEAT. For some remarks in connexion with this subject, see *Paraffine;* also an excellent paper on the "Irish Amelioration Society," by Mr. Jasper W. Rogers in "*The Chemist*" (new series), i, 120–3.

PEBBLE. The trade name for the transparent colourless variety of *rock crystal* or *quartz* used for the lenses of spectacles, instead of glass, over which, from its extreme hardness, it has the advantage of being little apt to be scratched.

PECTIC ACID. The name given by Braconnot to an acid which is found very generally diffused throughout the vegetable kingdom, and analogous to jelly.

Prep. From *carrot roots*, from which the juice has been pressed out, by boiling them with $\frac{1}{25}$th part of their weight of *carbonate of potassa*, and about 6 times their weight of *water*, until the liquid becomes gelatinous when neutralized with an *acid*. A *pectate of potassa* is formed, from which the acid may be obtained by neutralizing the alkali with a stronger acid, or by carefully adding a *solution of chloride of calcium* as long as a gelatinous precipitate (*pectate of lime*) falls, and after washing this with *water*, decomposing it with *dilute hydrochloric acid*.

Prop., &c. A colourless jelly, having an acid reaction; scarcely soluble in cold water, more so in hot water; and precipitated by acids, alkalies, alcohol, salts, and even sugar. Its compounds with the bases are called *pectates*. (See *below*.)

PECTINE. Syn. *Vegetable jelly.* Obtained by adding *alcohol* to the *juice of ripe currants* or *other fruit*, until a gelatinous precipitate forms, which must be drained, washed with a little *weak alcohol*, and dried.

Prop., &c. In the moist state it forms a neutral, tasteless, soluble, transparent jelly; when dried, a translucent mass, closely resembling isinglass; boiled with water, or with dilute acids, it is converted into *parapectine* and *metapectine;* in the presence of alkalies, these, as well as pectine, are changed into *pectic acid*, and, by continuing the ebullition for some time longer, into *metapectic acid*, which is not gelatinous. See *Pectic Acid.*

PECTORALS. Under this head are popularly included all the various remedies employed in breath or chest diseases.

PEDICULI. Three species of these parasites infest the human body:—*Pediculus humanus capitis*, or *head louse*, which lives and breeds in the hair of the scalp, and does not voluntarily extend its ravages beyond it;—*p. h. corporis*, or *body louse*, which resides on the trunk of the body and the garments, and is characterised by being white and nearly immaculate; and—*p. pubis*, or *crab louse*, (so named from the cheliform structure of its legs,) found chiefly on the pubes, but if not checked, gradually extending itself to the armpits, eyebrows, and other parts covered with hair. This is the most malignant species of the three, and frequently burrows so deeply in the skin as to be with difficulty dislodged.

The *presence of pediculi* is, in general, an indication of dirty habits, or of contact with the dirty and lazy. Persons who perform the duties of the toilet with ordinary care, and who change their linen sufficiently often, are utter strangers to the visitations of these insects. The use of the *hair-brush*, *strong scents*, *oil*, *soap-and-water*, and the like, are incompatible with their existence. For the *destruction* of the *p. pubis*, a solution of from 15 to 20 gr. each, of *bichloride of mercury* and *sal ammoniac*, in a pint of *distilled* or *pure soft water*, is most cleanly and effective. Weak *tobacco water*, *decoction of stavesacre seeds* or of *white hellebore*, and the *ointments* of *mercury*, *sulphur*, and *white precipitate*, are also frequently employed for the same purpose. See *Acarus*, *Vermin*, *&c.*

PEDILUVIUM. See *Baths.*

PELARGONIC ACID. A compound obtained from *pelargonium roseum.* It has precisely the same composition as *hydrated œnanthic acid*, and the two are probably identical.

PELLETIER'S ODONTINE. See *Tooth Pastes.*

PELLICLE. See *Crystallization.*

PELLITORY. Syn. *Pellitory of Spain; Pyrethrum*,—Ph. L. & E. "The root" of "*anacyclus pyrethrum*" (De Cand.); *anthemis pyrethrum* (Linn.) It is a powerful topical excitant. It is chiefly employed as a masticory in headache, toothache, palsy of the tongue, and facial neuralgia and rheumatism; and made into a *tincture* with *rectified spirit*, it is a common remedy among dentists for the toothache. Internally, it has been given as a gastric stimulant, and in intermittents, &c. ½ to 1 dr. may be chewed at a time.

PELOPIUM. A new metal discovered by H. Rose, along with *niobium*, in the *tantalite* of Bodenmais, in Bavaria. See *Tantalum.*

PELOSINE. A dark-coloured, bitter extractive matter found in the *root* of *cissampelos pareira*, or *velvet leaf.*

PELTRY. The name applied to fur skins in the state in which they are received from the hunters. To *prepare* them as *furs*, the inside of them is generally first "*tawed*" by the application of a *solution of alum.* They are next well dusted over and rubbed with *hot plaster of Paris* or *whiting*, and are, lastly, thoroughly dried and brushed clean. When it is desired to *change* or *modify their colour*, the grease being removed by lime water or a weak soda lye, they are stretched out on a table or board, and the ordinary *liquid mordants* and *dyes* are applied to them hot, by means of a painter's brush.

The *furs* of the *rabbit* and *hare* are rendered fit for the purposes of the *felt* and *hat manufacturers* by a process called by the French "*sécretage.*" This consists in thoroughly moistening the hair with a *solution* of *quicksilver*, 1 part, in *aquafortis*, 16 parts, diluted with half to an equal bulk of *water.* This is applied with a brush, and the moistened skins being laid together, face to face, are dried as rapidly as possible in a stove room. See *Furs.*

PEMPHIGUS. Syn. *Febris Bullosa, Pompholyx.* An eruption consisting of vesicles of various sizes, from a pea to a walnut, or even larger, filled with a pellucid or slightly coloured fluid, and attended by more or less fever. There are several popular synonymes of this affection. The French call it the "*bubble fever*," and the Germans, "*water-bladders.*" "The bubbles raised under a common blister are a

local pemphigus, only differing from the disease in question in being produced by a known and local cause. The bubbles, in this disease, are raised upon a base of inflamed skin scarcely larger than the bladder which they support;" and they occur either singly or in patches. "They rise up very rapidly, frequently in the course of a few hours, and break in two or three days, when they are followed by an excoriated surface, which becomes covered by a thin crust, and speedily heals."

The *varieties* of *pemphigus* are *acute* and *chronic*, "the former being active and brief in its course, and accompanied by a smart attack of feverishness; the latter slow, without fever, but with more intrinsic constitutional disturbance." It is said to be infectious, and has occasionally spread as an epidemic.

The *treatment* of this *disease* has been already generally referred to under "*Vesicular Eruptions.*" The best application to the eruption after the vesicles break is, perhaps, *powdered starch* or *arrow-root*, employed as a dusting powder. The fever, when severe, is usually of a typhoid character, and may be met by *port wine*, *bark*, and the *mineral acids*. In *slight cases* a few doses of some saline aperient are generally sufficient.

PENCILS. This name is applied to the small brushes made of *camel's hair* used by artists, as well as to the plumbago crayons familiarly known as *black-lead pencils*. The last are prepared by one or other of the following methods:—

1. The *blocks of plumbago* are exposed to a bright-red heat in a closely covered crucible, and are afterwards sawn into minute sticks, and mounted in cases of *cedar* or *satin wood*.

2. The *plumbago*, in powder, is calcined as before, and then mixed with an equal, or any other desired proportion of *pure washed clay*, also in powder, after which the mixture is reduced to a plastic state with *water*, and pressed into groves cut on the face of a smooth board, or into well-greased wooden moulds, in which state it is left to dry. When dry the pieces are tempered to any degree of hardness by exposing them, surrounded by *sand*, or *powdered charcoal*, in a closely covered crucible, to various degrees of heat. The crucible is not opened until the whole has become cold, when the prepared "slips" are removed and mounted as before. This method was invented by M. Conté, in 1795.

3. The *dough* or *paste*, prepared as last, is reduced to the required form by forcing it through a *perforated plate* (in a similar manner to that adopted for coloured crayons), or into *minute metallic cylinders*, from which it may be readily shaken after it has become partially dry.

Obs. The leads for some varieties of drawing pencils are immersed for a minute in very hot *melted wax* or *suet* before mounting them. To the composition for others a little *lamp black* is added to increase and vary the degree of blackness. The pencils for *asses' skin books* and *prepared paper* are tipped with "*fusible metal.*" (See *p.* 501.) Numerous inprovements in pencil cases and pencil mounts have been patented of late years by Stevens and others.

PENNYROYAL. Syn. *Pulegium*,—Ph. L. & E. *Mentha P.*,—Ph. D., & Ph. L. 1836. "The recent and dried flowering herb" of "*mentha pulegium*, Linn." (Ph. L.) *Pennyroyal tea* is a popular emmenagogue, expectorant, and diaphoretic, and is in common use in asthma, bronchitis, hooping-cough, hysteria, suppressions, &c. *Water*, *essence*, *oil*, and *spirit of pennyroyal*, are officinal. They are now chiefly used as mere adjuncts or vehicles.

PENS. The manufacture of *steel pens* is purely mechanical, and only conducted on the large scale. Those made of "*quills*" are noticed under that head.

PEPPER (Black). Syn. *Pepper; Piperis Nigri Baccæ; Piper Nigrum*,—Ph. L. E. & D. "The immature fruit" (berry) of "*piper nigrum*," Linn., or the *black pepper vine*. (Ph. L.)

Pur. The *ground black pepper* of the shops is *universally* adulterated. In fact, the public taste and judgment are so vitiated, that the *pure* spice is unsaleable. A most respectable London firm on commencing business supplied their customers with *unadulterated* ground pepper, but in 3 cases out of every 4, it was returned on their hands and objected to, on account of its dark colour and rich pungency, which had induced the belief that it was sophisticated. The "house" alluded to was therefore *compelled* by their customers to supply them with an *inferior*, but *milder* and *paler* article. The substances employed to lower black pepper are known in the trade as—"P. D.," "H. P. D.," and "W. P. D.," — abbreviations of *pepper dust*, *hot do.*, *white do.* The *first* is composed of the *faded leaves of autumn*, dried, and powdered; the *second*, the *ground husks* (hulls) *of black mustard* obtained from the mustard mills; and the *third* is *common rice*, finely powdered. Equal parts of *black pepper-corns*, *H. P. D.*,

and *W. P. D.*, form the *very best* ground pepper sold. The *ordinary pepper* of the shops does not contain more than $\frac{1}{8}$th to $\frac{1}{6}$th of *genuine pepper*, or 2 to 2½ *oz.* in the *lb.* Very recently, *ground oil-cake* or *linseed meal* has been chiefly employed as the adulterant, instead of the old "P. D."

A *factitious pepper-corn*, formed of various pungent and acrid substances, amongst which are capsicums and mustard hulls, made up with *linseed* and *rice meal*, with sufficient *genuine pepper* to disguise them, is now extensively prepared for the grocers and oilmen. The resemblance, to the common observer, is complete. The manufacturers, in order to render the deception more difficult of detection, introduce into the interior of each of the false grains, as a kernel, a mustard seed which has become swollen by immersion in water, so that on breaking the artificial grain, the mustard, which has become loose by drying, falls out, and leaves a little hollow, which closely simulates that found in the centre of genuine peppercorns.

Another fraud is the admixture of *exhausted berries* (those which have been used to flavour sauces, pickles, &c.) with those kept for sale.

Assay 1. (The *Microscope*.) The appearance of a sample of the suspected article under the microscope should be compared with that of a known genuine one.

2. Pure pepper, reduced to coarse powder, loses 30% of its weight by digestion in ether; and the ethereal tincture by spontaneous evaporation on the surface of water, deposits an intensely hot, biting, yellowish oleo-resin, which smells strongly of pepper, together with some nearly insipid extractive matter.

3. It should not contain less than $\frac{1}{65}$th, or about 1½ % of piperine. See *Piperine*.

4. *Factitious pepper-corns* on being immersed in hot water, swell, become soft, fall to pieces, and are partly dissolved; *genuine ones* swell a little, but remain solid, spherical, and exhibit no very marked alteration.

5. The berries should be hard, and little wrinkled, or shrivelled, and should not easily break when pressed between the fingers.

Uses, &c. Black pepper is a powerful stimulant, carminative, and rubefacient. Its use, in moderation, as a condiment, is peculiarly serviceable to persons who are of a cold habit, or who suffer from a weak digestion; but in inflammatory habits, and in affections of the mucous membranes, it is generally highly injurious. As a *medicine* it is often serviceable in nausea, vomiting, chronic diarrhœa, and agues. In North America, a common remedy for the last is ½ *oz.* of *ground pepper* stirred up with a glassful of warm beer; or a like quantity made into a *tincture* by steeping it in 5 or 6 times its weight of *gin*, *rum*, or *whisky*, for a few days.

Prepared black pepper is made by steeping the berries for 3 days in 3 times their weight of vinegar, and then drying and grinding them. It is milder than common pepper. See *Confections*, *Piperine*, *&c.*

PEPPER (Cayenne). Syn. *Bird Pepper*, *Chilli do.*, *Guinea do.*, *Indian do.*, *Red do.*; *Piper Capsici*, *P. Cayenne*,—Lat. This is prepared from *tschillies* or the pods of *capsicum frutescens* (Linn.), or from *capsicum baccatum* (Willd.) or *bird pepper*, but generally from the first on account of its greater pungency and acrimony; and, occasionally, from *capsicum annuum* (Linn.) or medicinal capsicum.

Prep. 1. From the *dried pods* (powdered), 1 *lb.*; and *wheaten bread* or *captain's biscuits* (heated until they are perfectly dry and brittle, and begin to acquire a yellow colour throughout, and then powdered), 7 *lb.*; mixed and ground together. *Colouring matter* and *common salt* are frequently added, but are unnecessary.

2. As the last, but making the mixture into a dough with *water*, then forming it into small cakes, drying these as rapidly as possible at a gentle heat, and then grinding them.

3. (Loudon.) The *ripe pods*, dried in the sun, are stratified with *wheaten flour* in a dish or tray, and exposed in a stove-room or a half-cold oven until they are quite dry; they are then removed from the flour, and ground to fine powder; to every *oz.* of *this powder*, 1 *lb.* (say 15 *oz.*) of *wheaten flour* (including that already used) are added, and the mixture is made into a dough with a little *tepid water*, and a tea-spoonful of *yeast*; after fermentation is well set up, the dough is cut into small pieces, and baked in a slow oven until it is perfectly hard and brittle; it is then beaten or ground to powder, and forms "*cayenne pepper*."

Pur. The *cayenne pepper of the shops* is commonly a spurious article made by grinding a mixture of any of the reddish woods or sawdust, with enough red pods or tschillies to render the mixture sufficiently acrid and pungent. Common salt, colcothar, red bole, brick dust, vermilion, and even red lead, are also common additions. The presence of these substances may be detected as follows:—

1. Water digested on cayenne pepper

containing *common salt* gives a white curdy precipitate with *nitrate of silver*, soluble in ammonia, and darkened by exposure to the light. Every grain of this, after being washed, dried, and gently fused, is equivalent to $\frac{5}{12}$ gr. of common salt (nearly).

2. Acetic acid or dilute nitric acid digested on a sample containing *red lead*, gives a black precipitate with sulphuretted hydrogen, and a heavy white one (*sulphate of lead*) with dilute sulphuric acid. Each grain of that with the last, after being washed, dried, and ignited, represents $\frac{1}{2}$ gr. of red lead (nearly).

3. If the acetic or nitric solution (*see* No. 2) is blackened by tincture of galls, or turned blue by a solution of prussiate of potash, the pepper contains *colcothar* or *sesquioxide of iron*.

4. If a tea-spoonful of the suspected sample be agitated in a wine-glassful of water, and after repose for a few seconds, the water be poured off, the reddish sediment (if any) is probably either *red lead* or *vermilion*. The *first* of these may be removed by digesting the sediment in dilute nitric acid, and the new solution may be tested as before. The undissolved portion, if it is volatilized by a strong heat, is vermilion.

5. *Pure cayenne pepper*, when burnt, leaves a scarcely perceptible quantity of white ash; a red-coloured ash indicates the presence of *red ochre*, *brick dust*, *Armenian bole*, or other *earthy colouring matter*. If *red lead* is present, it will be left behind under the form of a dark-coloured powder, or a small metallic globule.

Uses, &c. The capsicums resemble the other peppers, except in their greater energy, and their pungency being unmodified by the presence of essential oil. As a condiment, under the form of cayenne pepper, and in all diseases in which the employment of a powerful stimulant or rubefacient is indicated, their uses are well known. In *medicine*, the *fruit* of *capsicum annuum* (Linn., Ph. E. & D.; *C. fastigiatum*, Blume, —Ph. L.) or *annual capsicum* is ordered (*Capsicum*,—Ph. L. E. & D.) The London College directs the fruit to be that of "Guinea," "less than one inch long, oblong, cylindrical, and straight." See *Essence of Cayenne*.

Prepared cayenne pepper is the *residuum* of cayenne vinegar, essence, or tincture, dried and ground.

PEPPER (Cayenne, — Soluble). Syn. *Crystallized Soluble Cayenne*. *Prep.* 1. *Capsicum pods* (recent, ground in a pepper mill), 1 *lb.*; *rectified spirit*, 2½ pints; proceed by percolation so as to obtain 2½ pints; from this distil *one half* of the spirit by the heat of a water bath; to the residuum add of *fine dry salt*, 5 *lb.*; mix them well together, and dry the mixture at a very gentle heat, frequently stirring; lastly, rub it through a sieve, and put it into warm dry bottles. It is usually coloured with a little *vermilion* or *rouge* (sesquioxide of iron), but it possesses an agreeable colour without it.

2. *Essence of cayenne* (No. 1, *p.* 387), 6 pints; distil off 3 pints, add to the residual liquor, of *dry salt*, 12 *lb.*; mix well, dry by a gentle heat, and otherwise proceed as before.

3. *Capsicums* (ground), 3 *lb.*; *red sanders* or *Brazil wood* (sliced or rasped), 10 *oz.*; *rectified spirit*, 1 gall.; macerate for 14 days, then express the tincture, filter, distil off one half, add of *dry salt*, 15 *lb.*; and proceed as before.

4. As the first formula, with the addition of a *strong decoction of saffron*, q. s. It gives a beautiful colour to soups, &c.

Obs. The above formulæ are those actually employed by the houses most celebrated for their "soluble cayenne." The products are of the very finest quality, and are perfectly wholesome. We speak from an extensive experience in the manufacture. The spirit distilled from the essence forms a most suitable menstruum for making fresh essence or tincture of cayenne.

PEPPER (Cubeb). Syn. *Cabob Pepper*, *Tailed do.* See *Cubebs*.

PEPPER (Jamaica). See *Pimento*.

PEPPER (Kitchen). See *Mixed Spice*.

PEPPER (Long). Syn. *Piperis Longi Fructus*; *Piper Longum*,—Ph. L. & E. "The immature fruit" (dried female spikes) of "*piper longum*, Linn." (Ph. L.) or *long-pepper vine*. The spikes are about 1½ inch in length, with an indented surface, and are of a dark-gray colour. In its general properties it resembles black pepper, but it is less aromatic, though equally pungent. *Elephant pepper* is merely a larger variety of this species. (Gray.) The *root* and *stems*, sliced and dried, form the "*pippula moola*" of the East Indies. (Roxburgh.)

PEPPER (Red). See *Cayenne Pepper*.

PEPPER (White). Syn. *Piper Album*, —Lat. This is made by either soaking ordinary *black pepper* in a *solution of common salt*, until the outside skins are soft, and then rubbing them off in the hands, or by merely rubbing off the skins of the *overripe* berries that fall from the vines. An *inferior quality* is made by bleaching black pepper with chlorine.

Obs. The use of *white* pepper instead of

black is one of those contemptible specimens of squeamishness by which the palate and stomach is continually injured to please the eye. Pure *white* pepper has only about 1-4th of the strength of pure *black* pepper, whilst it is nearly destitute of the fine aroma of the latter. It also contains a *mere trace* of piperine, one of the most valuable constituents of black pepper. Luca says it *does not* contain *any piperine*.

PEPPER PODS. Capsicum. See *Cayenne Pepper*.

PEPPERMINT. Syn. *Mentha Piperita*, —Ph. L. E. & D. "The recent and dried flowering herb" of "*mentha piperita*" (Ph. L.) or *garden* peppermint. The flavour and odour of this herb are well known. It is the most pleasant and powerful of all the mints. *Peppermint water* and the *essential oil* have long been employed in nausea, griping, flatulent colic, hysteria, diarrhœa, &c.; but in regular practice chiefly to cover the taste of nauseous medicines, or as an adjunct or vehicle for more active remedies. See *Essential Oils*, *Waters*, *&c.*

PEPSINE. A peculiar principle found in the gastric juice, and which, in conjunction with hydrochloric acid, also present in the stomach, confers upon it the power of digesting certain portions of the food.

Prep. (M. Vogel.) Digest the *glandular skin of a hog's stomach*, cut into pieces, in cold water for 24 hours, then strain off the liquid portion, and repeat the maceration with *fresh water*; mix the liquors, and add to them *dilute solution of acetate of lead*; diffuse the precipitate through *water*, decompose it by a stream of *sulphuretted hydrogen*, again filter, gently evaporate the filtrate to a syrupy consistence, and add to it an excess of *absolute alcohol*; collect the bulky precipitate that gradually forms, and carefully dry it by exposure to dry air.

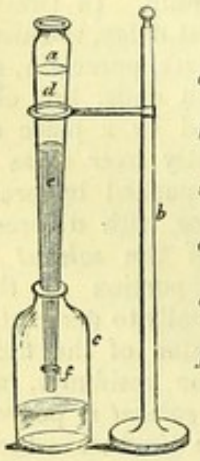
Prop., &c. An amorphous mass. By the heat of a salt-water bath it forms a white powder, but in this state it is found to have lost some of its power of assisting digestion. A *very small* quantity of hydrochloric acid added to its weak aqueous solution, renders it capable of artificial digestion. Liebig denies the existence of pepsin as a distinct principle, in opposition to the opinions of Wasman and some others.

PERCHLORATE. Syn. *Perchloras*,—Lat. A salt of perchloric acid.

The *perchlorates* are distinguished from the *chlorates* by their greater stability, and by not turning yellow when treated with hydrochloric acid. Like the chlorates, they give off oxygen when heated to redness. They may be *prepared* by directly neutralizing a solution of the acid with a *solution of the base*. See *Perchlorate of Potassa* (and *below*).

PERCHLORIC ACID. Syn. *Oxychloric Acid*; *Acidum Perchloricum*, *A. Oxychloricum*,—Lat. A compound of chlorine containing more oxygen than chloric acid, discovered by Count Stadion.

Prep. To *perchlorate of potassa*, contained in a retort, is added about ½ its weight of *strong sulphuric acid*, previously diluted with an equal weight of *water*; heat is then applied, and as it rises to 284° Fahr., vapours of *perchloric acid* pass over and condense in the receiver.

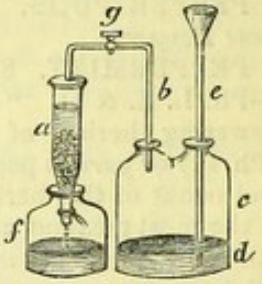


Prop., &c. A colourless liquid, of the sp. gr. 1·65, which fumes slightly in the air, is very greedy of moisture, and distils unchanged at about 392° Fahr. It is a more stable compound than chloric acid, and does not inflame organic substances. By distillation from concentrated sulphuric acid Serullas obtained it in a solid form. In this state it hisses when thrown into water, like red-hot iron.

PERCOLATION. Syn. *Method of Displacement*. A method of extracting the soluble portion of any substance in a divided state, by causing the menstruum to filter or strain through it. The "sparging" of the Scotch brewers is an example of the application of this principle on the large scale. In *pharmacy*, the "method of displacement" is frequently adopted for the preparation of tinctures, infusions, &c., and is, in some respects, superior to digestion or maceration. "The *solid materials*, usually in coarse, or moderately fine powder, are moistened with a sufficiency of the *solvent* to form a thick pulp. In twelve hours, or frequently without delay, the mass is put into a cylinder of glass, porcelain, or tinned iron, open at both ends, but obstructed at the lower end by a piece of calico or linen, tied tightly over it as a filter; and the pulp being packed by pressure, ranging as to degree with different articles, the *remainder* of the *solvent* is poured into the upper portion of the cylinder, and allowed gradually to percolate. In order to obtain the portion of the fluid which is absorbed by the residuum, an *additional quantity* of the *solvent* is poured into the cylinder, until the tincture which has passed through, equals in amount the spirit originally prescribed. The spirit employed for this purpose is then recovered, for the most part, by pouring over the residuum as much *water* as there is spirit retained in it, which may be easily known

by an obvious calculation in each case. The method of percolation is now preferred by all who have made sufficient trial of it to apply it correctly." (Ph. E.)

The first portion of liquid obtained by the "method of displacement," is always in a state of high concentration. In general, it is a simple solution of the soluble ingredients of the crude drug in the fluid employed. But sometimes the solvent, if compound, is resolved into its component parts, and the fluid which passes through at any given time, is only *one* of these, holding the soluble parts of the drug in solution. Thus, if diluted alcohol be poured over powder of myrrh, in the cylinder of the percolator, the fluid which first drops into the receiver is a solution of an oily consistence chiefly composed of *resin* and *volatile oil* dissolved in *alcohol*. In like manner, when the powder of gall-nuts is treated in the same way by *hydrated sulphuric ether*, two layers of fluid are obtained, one of which is a highly concentrated solution of tannin in the water of the ether, and the other a weak solution of the same principle in pure ether. In all cases, therefore, in which it is not otherwise directed, it is absolutely necessary to agitate the several portions of the liquid obtained by percolation together, in order to ensure a product of uniform strength or activity.



Several forms of displacement apparatus are employed by different operators. A simple and useful one is that figured in the margin. It has also the advantage of being inexpensive, and may be made by any worker in tin plate.

a. Percolator.
b. Stand.
c. Receiver.
d. Menstruum.
e. Substance operated on.
f. Calico strainer.

In operating on some substances it is found advantageous to hasten the process by pressure. This may be effected by any of the methods adopted for that purpose, and already described under "*filtration*." (See *p*. 462.) An *ingenious little apparatus* which is well adapted for *retail use*, or small quantities, is shown in the Engr. By pouring *mercury* or *water* through (*e*), into the bottle (*c*), the air in the latter suffers compression, and acts in a corresponding manner on the percolating liquor in (*a*). The whole of the joints must be made air-tight.

a. Percolator.
b. Tube connecting it with—
c. A double-necked bottle containing—
d. Mercury.
e. Feeding tube.
f. Receiver.
g. Stop-cock to regulate or arrest the pressure of air on the contents of the cylinder (*a*).

The "*method of displacement*," although apparently simple, requires for its successful application no inconsiderable amount of experience and skill in manipulation. The *principal points* to be *attended to* are the—*reduction of the substance to the proper state of comminution* (neither too coarse nor too fine),—the *due regulation of the period of the maceration* according to the hardness, density, and texture of the substance; and, more important still,—the *proper packing of the ingredients in the cylinder*. On the correct performance of the last, the success of the process mainly depends. *Some substances* require *considerable pressure* to be used, whilst others, when even *lightly packed*, scarcely permit the fluid to pass through them. When the *material* is too *loosely packed*, the menstruum passes through quickly, but without exerting its proper solvent action; when *too great pressure* is employed, percolation either progresses very slowly, or not at all. On the whole, the firmness of the packing should be inversely as the solvent and softening power of the menstruum upon the solids exposed to its action; but to this rule there are many exceptions, and each substance may be said to require special treatment. An *excellent plan*, applicable to all substances, and especially to those of a *glutinous* or *mucilaginous nature*, is to mix the *powder* with an *equal bulk* of *well-washed siliceous sand* before rubbing it up with the menstruum. In reference to the *coarseness* of the *powder*, it must be observed that substances which readily become soft and pappy when wetted by the menstruum, should not be used so fine as those that are more woody and fibrous, and not of a glutinous or resinous nature.

The "method of displacement" has the advantage of expedition, economy, and yielding products possessing considerable uniformity of strength; but the difficulties attending its application by the inexperienced are serious obstacles to its general adoption in the laboratory. It answers admirably for the preparation of all *tinctures* that are not of a *resinous nature*, and for most *infusions* of woody and fibrous substances; as, roots, woods, barks, leaves, seeds, insects, &c., and particularly when cold or tepid water is taken as the solvent. It is also especially adapted for the preparation of *concentrated infusions* and *essences*, as they may thus be obtained of any required strength without loss, or requiring concentration by heat, which is so destructive to their virtues.

"When (ordinary) *tinctures* are made in *large quantities*, displacement is never likely to supersede maceration, on account of any practical advantages it may possess. If the prescribed directions be duly attended to, the process of *maceration* is unexceptionable. The process is more simple than the other; the mode of operating is more uniform, it is, in fact, always the same; it requires less of skill and dexterity in conducting it; it requires less constant attention during its progress, which, in operating on large quantities, is a consideration; and, finally, the apparatus required is less complicated. When, however, only *small quantities* of *tincture* are made at a time, and kept in stock, the adoption of the process of displacement will often be fouud convenient and advantageous. It offers the means of making a tincture in two or three hours, which, by the other process, would require as many weeks." (Mohr and Redwood.)

Another useful *application* of the *method* of *displacement* is to the manufacture of *extracts* on the *large scale*. Here it is superior to any other plan. By an extremely simple and inexpensive apparatus which we have recently designed for the purpose, and which will shortly be made the subject of a patent, not merely a first-class product is ensured, but a saving of fully 60 per cent. in fuel and labour is at the same time effected. See *Extracts*, *Brewing*, *Tinctures*, *&c.*

PERCUSSION CAPS. The explosive compound employed to prime these articles consists of *fulminating mercury* with a little *gunpowder*, or a mixture of sulphur and chlorate of potassa, ground to a smooth paste with a little *water*. When this composition has become quite dry and hard, a drop of *varnish* is applied over it, by which it is secured in its place and protected from change.

The *explosive power* of a *good percussion cap* is *not affected* by immersion in cold water, even during several days; nor by exposure to a moist atmosphere for any length of time.

According to Dr. Ure, "8½ parts of gunpowder exploded by a percussion cap, have an equal force to 10 parts exploded by a flint lock."

PERFECT LOVE. See *Liqueurs*.

PERFUME. A substance that emits or casts off volatile particles which, when diffused through the atmosphere, agreeably affect the organs of smelling. The term is also applied to the volatile effluvia so perceived. The most fertile source of perfumes is the vegetable kingdom. Its flowers, seeds, woods, and barks, furnish a rich variety, from which the most fastidious connoisseur may select his favorite bouquet. A few perfumes, as *musk*, *ambergris*, and *civet*, are derived from the animal kingdom; but none of these evolve an aroma comparable in freshness to that of the rose, or in delicacy to that of the orange-blossom, or even the unpretending jasmine. The inorganic world yields not a single perfume, properly so called; nor has the science of chemistry yet been able to produce a single odoriferous compound from matter absolutely inorganic. There is a wonderful consistency in the works of nature; and not the least pleasing and remarkable example of this is exhibited in all those substances essential to the existence and well-being of man—his food, clothing, luxuries, and corporeal enjoyments, being furnished either directly, or indirectly, by the vegetable kingdom, and exclusively by the organic world.

PERFUMERY. Perfumes in general; also the art of preparing them. In its *commercial application* this word embraces not merely perfumes, but also cosmetics, and other articles of a closely allied character employed at the toilet, the manufacture and sale of which constitute the trade of the modern perfumer. It was our intention to have presented the reader with a compendious notice of this interesting subject in all its various relations to beauty, civilization, personal comfort, and hygiene, condensed from our book and lectures on personal beauty and the toilet, but, at the instance of our publisher, who points to the growing bulk of our volume, we are driven to defer its introduction to some other opportunity. *Formulæ* for the pre-

paration of all the *more valuable perfumes*, as well as of others met with in trade, both *simple* and *compound*, will be found under the heads *Cosmetiques*, *Depilatories*, *Essences*, *Hair Dyes*, *Oils*, *Pastes*, *Pastils*, *Pommades*, *Spirits*, *Waters*, *&c.*, *&c.*, to which, for the present, we must refer the reader.

PERFUMES (Acetic). See *Vinegars.*

PERFUMES (Ammoniated). These may be *prepared* by simply adding a sufficient quantity of *liquor of ammonia* to the liquid perfumes. *When* the *articles* are to be *distilled*, a cheaper plan is to add about 5 *dr.* of *sal ammoniac*, and 8 *dr.* of *carbonate of potassa* to each pint of the article just before distillation. *Ammoniated Cologne water* is now a fashionable substitute for spirit of sal volatile.

PERILYMPH. The fluid in which the membranous labyrinth of the ear is suspended.

PERIODIC ACID. A compound of analogous constitution to perchloric acid, discovered by Ammermüller and Magnus.

Prep. Pure *caustic soda* is added to a *solution of iodate of soda*, and the mixture is saturated with *gaseous chlorine;* the pulverulent white salt which falls either at once, or after concentration, is dissolved in *dilute nitric acid*, and the solution precipitated with *nitrate of silver;* the filtrate, on evaporation, yields yellow crystals (*periodate of silver*), from which the acid is obtained by the action of *water*, which resolves the salt into free *periodic acid*, which remains in solution, and into *basic periodate of silver*, which is insoluble. The solution yields crystals by cautious evaporation.

Prop., *&c.* Permanent in the air; a strong heat resolves it into iodine and oxygen; it forms numerous compounds (*periodates*) with the bases.

PERISTALTIC PERSUADERS. See *Kitchener's Pills.*

PERLATE ACID. The name given by Bergmann to *superphosphate of soda.*

PERMANENT WHITE. *Sulphate of baryta;* so called on account of its not being affected by sulphuretted hydrogen, like white lead. *Carbonate of baryta* is also frequently sold under the name. They are both natural productions, but the finest variety is prepared by precipitating a *solution of chloride of barium* by a *solution* of either *sulphate* or *carbonate of soda.* The white precipitate is then collected, washed, and dried. See *Baryta* and *White Pigments.*

PERMANGANIC ACID, or *Hypermanganic Acid.* See *Manganesic Acid.*

PERNAMBUCO WOOD. The product of *cæsalpinia echinata.* It constitutes the paler variety of Brazil wood used by the dyers.

PEROXIDE. See *Nomenclature.*

PERRY. Syn. *Pyraceum*,—Lat. A fermented liquor prepared from pears in the same way as cider is from apples. The red rough-tasted sorts are principally used for this purpose. The *best perry* contains about 9% of absolute alcohol; *ordinary perry*, from 5 to 7%.

Perry is a very pleasant-tasted and wholesome liquor. When bottled "*champagne fashion*" we have seen it frequently passed off for champagne, without the fraud being suspected.

PERSIAN BERRIES. See *French Berries.*

PERSPIRATION. The liquid or vapour secreted by the ramifications of the cuticular arteries over the surface of the body. The perspiratory apparatus consists of a gland deeply seated in the corium, communicating by means of tubules (*pores*) with the surface of the scarf-skin. On the palm of the hand the orifices of these pores are faintly perceptible to the naked eye, and distinctly so with a lens of small magnifying power. An old author remarks, that, "If one will, with an indifferent glass, survey the palm of his hand, very well washed, he may perceive innumerable little ridges of equal bigness and distance, and everywhere running parallel one with the other. Upon these ridges stand the pores all in even rows, and of that magnitude as to be visible to a very good eye without a glass; but, being viewed with one, each pore looks like a little fountain, and the sweat may be seen to stand therein as clear as rock-water, and as often as it is wiped off to spring up within them again." (Grew.) The entire length of these perspiratory tubes in the skin of a man of ordinary height and bulk is estimated at 1,750,000 inches, or nearly 28 miles.

According to Lavoisier and Seguin the greatest amount of perspiration exceeds 6 ℔ in the 24 hours, and the smallest, 2 ℔. It is at its maximum immediately after taking food, and decreases during digestion. Anselmino found the perspiration to consist of *water* holding in solution about 1% of solid animal and saline matter, besides carbonic acid gas and nitrogen.

The *uses* of the *perspiratory functions* appear to be to preserve the suppleness and sensibility of the skin, to maintain the temperature of the body at a uniform standard, and to remove from the system a number of compounds noxious to animal life. The

perspiration "is a fluid whose *regularity* and *continuance of exhalation* are not merely *conducive*, but ABSOLUTELY NECESSARY TO HEALTH; without such regularity, the animal temperature would run riot, and substances of an injurious quality would be allowed to permeate the finest and most delicate of the tissues of the body." (Eras. Wilson.) "From the constriction or constipation of the cutaneous pores by the ambient air, especially when the body, beforehand put into a heat, is suddenly exposed thereunto, the serous particles, which used to fly off continually in vapour, being now pent in, excite an intense and feverish effervescence; till finding some other passage, either by the kidneys or by the glandules of the nose and windpipe, they are discharged by way of a *catarrh*; or missing this separation, still keep up the ebullition, very often to the hazard of life, by *suffocating the vital flame*. And *this* is the *natural consequence* of *obstructed insensible perspiration*, which, in the vulgar phrase, is the same with what they mean by *catching cold*, and of which, give me leave to remark, that as *fevers* make two-thirds of diseases infesting mankind, according to the computation of the judicious Sydenham, so *two-thirds of fevers* very probably may *take their rise* from *perspiration hindered*." (Daniel Turner.) Suppressed perspiration is also one of the commonest causes of *diarrhœa*.

PERUVIAN BALSAM. Syn. *Balsam of Peru; Balsamum Peruvianum*,—Ph. L. & E. "The balsam flowing from the incised trunk of uncertain species of *myrospermi* (myroxyli)." Ph. L. It was formerly assigned to the *myroxylon Peruiferum* (Linn.) It is a chocolate-coloured or reddish-brown liquid, of the consistence of treacle, and possessing a bitterish, somewhat pungent taste, and an agreeable aromatic odour. It is reputed stimulant, tonic, and expectorant, and has long been a popular remedy in chronic asthma, catarrh, and other pulmonary affections, debility, &c. It is now, however, principally used as an ingredient in pommades, hair-oils, lip-salves, and other cosmetics, and in compound perfumery.

Pur., Tests, &c.—1. The sp. gr. should not be less than 1·15; nor higher than 1·16.—2. Ether dissolves it readily and completely.—3. Alcohol, in quantity, also dissolves it completely. — 4. It should undergo no diminution in volume when agitated with water.—5. 1000 parts should be exactly saturated by 15 gr. of pure crystallized carbonate of soda.—6. Sulphuric acid converts it into artificial tannin or charcoal.—7. Treated with nitric acid some hydrocyanic acid is formed, benzoic acid sublimes, and the residual matter is artificial tannin.—8. The alkalies and their carbonates form with it a thickish semi-crystalline mass, which, on being treated with sulphuric acid, deposits a peculiar resinous matter, with crystals of benzoic and cinnamic acid. Balsam of Peru, like most other costly articles, is very commonly met with adulterated. The following formulæ for the purpose are extant in the trade:—

PERUVIAN BALSAM (Factitious). *Prep.* From *gum benzoin* (in coarse powder), 3 *lb.*; dissolved in the least possible quantity of *rectified spirit*, and then mixed with *balsam of tolu*, 1 *lb.*; and *liquid styrax*, 2 *oz.*; adding of *rectified spirit*, q. s.

PERUVIAN BALSAM (Reduced).—1. *Balsam of Peru*, 3 *lb.*; *balsam of tolu*, 2 *lb.*; *rectified spirit*, q. s. to reduce it to a proper consistence.

2. *Balsam of Peru*, 3 *lb.*; *gum benzoin* (dissolved in the least quantity of spirit possible), 1 *lb.*; as before.

PERUVIAN BARK. See *Cinchona*.

PERUVINE. A light, colourless, oily liquid, produced along with cinnamate of potash by boiling *cinnameine* with *alkalies*; or better, by distilling *cinnameine* with *hydrate of potassa*. It also occurs under a crystalline form, when it is called *styrone*.

PESSARY. Syn. *Pessus, Pessarium*,—Lat. An instrument made of caoutchouc, gutta percha, box-wood, or ivory, inserted into the vagina to support the mouth and neck of the uterus. They are variously formed, to meet the prejudices of the party or the necessities of the case. The *cup*, *conical*, *globe*, and *ring pessaries* (pessi) are those best known. The improved form of this instrument, known as '*Coxeter's patent*,' manufactured by the Gutta Percha Company, is, however, the only one adapted to permanent use.

Medicated Pessaries are prepared by adding the *active ingredients* to a *hard cerate*, and pressing the mixture into the desired form. *Astringents* (various), *belladonna*, *acetate of lead*, *iodine*, *mercury*, *opium*, *&c.*, have been thus applied by Dr. Simpson, and others.

PESTILENCE. See *Plague*.

PESTILENTIAL DISEASES. All those diseases which are epidemic and malignant, and assume the character of a plague.

In another portion of this volume we expressed a hope that under this head we should be enabled to give the reader the results of important investigations then in progress touching the treatment of *malignant* or *pestilential cholera*. Time has not, how-

ever, fulfilled our expectations, and, to repeat a painful truth recently enunciated by one of the medical journals,—"Our knowledge of the treatment of cholera at the present time (1854) is scarcely greater than it was during its first visitation in 1832." The principle on which we have acted throughout this work, has been to avoid, as much as possible, any expression of opinion of our own on medical affairs; our desire being merely to give such an outline of the prevailing treatment of the more constantly occurring diseases as might prove useful to parties either remote from, or unable to obtain, professional assistance. We shall, therefore, now content ourselves with reproducing, from the '*Medical Circular*,' a condensed outline of the recent report of the "*Treatment Committee*" of the *Medical Council* appointed by the *President of the General Board of Health* to inquire into the results of the different methods of treatment adopted in epidemic cholera, during its recent visit to this kingdom. The reporters were — Dr. Alderson, Dr. Babington, Dr. Paris, Dr. Tweedie, and Mr. Ward.

"The *number* of *cholera cases* from which the *deductions* have been drawn was 2749. These cases were arranged for examination in three classes,—those which were *attended* in *hospitals;* those *attended* in *metropolitan districts*, not in hospitals; and those which *occurred* in the *provinces*. There is a remarkable agreement as to results in these classes of cases; and the usefulness of the inquiry derives from this circumstance an important confirmation."

"The plans of treatment adopted were arranged for convenience under four heads:—1. The *alterative*.—2. The *astringent*.—3. The *stimulant*.—4. The *eliminant*. We now give the results, in the words of the committee:—

"'The evidence of these tables *condemns* the *eliminated treatment* altogether as a principle of practice.

"'It testifies *against* the *stimulant principle*, excepting as a resource in extreme cases.

"'It displays a *decided advantage* in the *alterative principle*, especially as carried out by *calomel* and *opium;* and it shows a *still superior advantage* in the *astringent principle*, as applied through the means of chalk and opium—the *general per centage of deaths* following each plan of treatment being—

	Per cent.
Of Eliminants	71·7
Stimulants	54·
Alteratives, calomel and opium	36·2
Astringents, chalk and opium	20·3

"'In order to judge correctly of the value of this evidence, it is necessary to examine, as far as may be possible, the degree of severity of the cases brought beneath this test. The only means at our command (on the present occasion at least) to make this examination, is, to consider the relative proportion which the cases of *collapse* bear to the number of deaths of their own classes respectively. Examining, therefore, the collapse cases with the number of deaths, we find that *calomel* and *opium* stands highest in the scale of success, and the *order of preference* appears as follows:—

	Per cent.
Calomel and opium	59·2
Calomel (*larger doses*)	60·9
Salines	62·9
Chalk and opium	63·2
Calomel (*small doses*)	73·9
Castor oil	77·6
Sulphuric acid	78·9

"'According to this result, the superior success of calomel and opium in severer cases appears as a distinct fact, elicited by the present inquiry. It is accompanied by other facts, viz., the relative advantages of those other modes of treatment which follow in their order of success. This order marks the use of *calomel* in small doses, of *castor oil*, and of *sulphuric acid*, as actually to be deprecated in severe cases. *Chalk and opium*, as shown above, stands at the head of the list in the general per centages, both in hospitals and in private practice; but in the comparison of the *collapse cases* with the number of deaths, the *average declines to the 4th rank*.'

"Other important tables are given of the results of the treatment of the premonitory diarrhœa, with a view to show which method of treatment was best in preventing the diarrhœa from running into cholera. On this point the authors say:—

"'Thus the order of per centage of failure to stay the disease in its earlier stages, or that of premonitory diarrhœa, is as follows:—

	Per cent.	Or, *including the Deaths from Diarrhœa as Failures, per cent.*
Salines	13·6	... —
Chalk mixture	8·9	... 12·6
Calomel, with opium	6·9	... 7·1
Opium	—	... 2·6
Calomel	2·4	... —
Chalk, with opium, calomel, and astringents	1·5	... 1·7
Sulphuric acid, with opium and calomel	1·3	... 1·5
Sulphuric acid, with opium	—	... 0·3
Chalk, with opium, ammonia, and catechu	0·2	... —
Taking sulphuric acid with and without opium, and with calomel as an adjunctive remedy	1·33	... 1·54
Taking chalk with, and without opium, together with aromatic confection and ammonia, with catechu, kino, logwood, and calomel as an adjunctive remedy	1·31	... 1·55

Showing a decided preference to the astringent plan of treatment in the early stages of the disease, or in the premonitory diarrhœa.'

"The astringent method of treatment is again shown to have been the best; salines having been the least successful, and the ordinary chalk mixture second to it in inefficiency. The value of the sulphuric acid method in diarrhœa appears to be confirmed

by these tables, although it *failed* in cases of collapse. There are many other interesting points in this Report, to which we shall advert at greater length on a future occasion." ('*Med. Circ.*,' April 11, 1855.)

Before closing this article we must express our regret that the committee in their first report on the *Castor-oil treatment*, which they thought proper to publish in the 'Times' and other newspapers, should have suppressed (substituted dashes for) the names of the parties who were reported to have tried it, as well as of the institutions in which the experiments were made, in all cases in which it was unsuccessful; whilst the name of the eminent and benevolent surgeon who advocated it, and of others on the same side of the question, were so freely "bandied" before the public. This omission, which was undoubtedly accidental or unintentional, is the more to be regretted, since it has led some persons hastily to infer the existence of a prejudice in the minds of the committee incompatible with the absolute impartiality of their subsequent investigations; whereas the committee appear to have bestowed considerable labour and pains in analysing the complex evidence they had to deal with, and have doubtless arranged their figures with rigorous accuracy, and made their deductions with the utmost fairness.

PETININE. Syn. *Butylamine* (?). A basic substance analogous to biethylamine, found by Dr. Anderson in Dippel's animal oil. It boils at 175° Fahr.

PETONG. Same as *packfong*.

PETROLENE. The pure liquid portion of *mineral tar*. It has a pale-yellow colour, a penetrating odour, and a high boiling point; is lighter than water, and is isomeric with the oils of turpentine and lemons. In its general properties it resembles rectified mineral naphtha.

PETROLEUM. Syn. *Rock Oil, Liquid Bitumen, Oil of Petre; Oleum Petræ, Bitumen Liquidum*,—Lat. Under this name are commonly included all those native hydrocarbons which are darker, and more unctious and consistent than naphtha, but less so than common tar or true bitumen. These substances vary in their boiling points, from about 180° to 600° Fahr. One of them (*Barbadoes tar*) is officinal in the Ph. L. 1851.

PETROLINE. A substance, analogous to paraffine, obtained by distillation from the *petroleum* of Rangoon.

PE-TUNT-SE. See *Porcelain*.

PEUCEDANINE. A white crystallizable substance discovered by Schlatter in the root of *peucedanum officinale* (Linn.) or *hog's fennel*. It is obtained by the action of *alcohol* in the usual manner.

PEUCILE. A peculiar liquid obtained by the action of *quicklime* upon the *hydrochlorate of oil of turpentine*, of which oil it appears to be an isomeric modification. (Brande.)

PEWTER. This is an alloy of tin and lead, or of tin with antimony and copper. The first only is properly called *pewter*. Three varieties are known in trade:—

Prep. 1. (*Plate Pewter.*) From *tin*, 89%; *antimony*, 7%; *bisbuth* and *copper*, of each, 2%; fused together. *Used* to make plates, tea-pots, &c. Takes a fine polish.

2. (*Trifle Pewter.*) From *tin*, 79%; *antimony*, 15%; *lead*, 6%; as the last. *Used* for minor articles, syringes, toys, &c.

3. (*Ley Pewter.*) From *tin*, 80%; *lead*, 20%. *Used* for measures, inkstands, &c.

Obs. According to the report of the French commission, pewter containing more than 18 parts of *lead* to 82 parts of *tin*, is unsafe for measures for wine and similar liquors, and indeed for any other utensils exposed to contact with our food or beverages. The legal sp. gr. of pewter in France is 7·764; if it be greater, it contains an excess of lead, and is liable to prove poisonous. The proportions of these metals may be approximately determined from the sp. gr.; but correctly, only by an assay for the purpose. See *Brass, German Silver, Lead*, and *Tin*.

PHARMACEUTICAL. The pronunciation of this word has been a *quæstio vexata* for many years with those to whom it more particularly applies. Parties who had never troubled themselves with Greek before, suddenly became eloquent on its direct derivation from φαρμακευτικος or φαρμακον, and in defiance of its immediate etymology and the rules of analogy, discarded one of its letters, and converted its soft sibilant into the guttural *kappa* (κ) or the Hebrew *koph* (ק). For months the subject was even made a matter of controversy in one of our periodicals, but was left unsettled by the parties most concerned; as the belligerents were too impetuous to be influenced by the opinions of our leading philologists, and appeared determined to wage war on independent principles. We well recollect that on our induction (now many years since) to a celebrated metropolitan laboratory, we committed the heinous offence of calling certain publications "*pharmaçeutical*" (seu). Need we say, that our temerity cost us dear. Such, however, is the truth. For some time we

lost "caste" amongst those around us, and whispered doubts often reached our ears, as to the possibility of one so ignorant (?) being an efficient laboratorian. Happily, ignorant as we doubtless were, we had John Walker, Noah Webster, Worcester, Smart, Ogilvie, Jameson, and others, on our side, with only the obsolete authority of Perry, and that of the fantastic Knowles, against us. Years have rolled away since the period alluded to, but the "pharmaceutical chemists" of Great Britain, appear to be still uncertain as to the pronunciation of the very appropriate adjective by which they are distinguished. In the recent trial, the *Queen* v. *The Pharm. Society*, Lord Chief-Justice Campbell, a man alike distinguished for his learning and research, expressed, in very forcible language, his opinion in favour of the soft sound of the *c;* and since that date, both in the Court of Queen's Bench and the Court of Exchequer, the word has been pronounced pharmaçeutical (seu). We therefore trust the question is now finally settled, and that the eccentric enemies of poor letter *c*, will abandon their "*coo-ing*" for ever.

PHENYLAMINE. Aniline; on account of its relation to the phenyl-series.

PHENAMYLOL. An unimportant phenyl-compound.

PHENE. Benzole.

PHENECINE. See *Indigo Purple.*

PHENETOLE. A compound of the phenyl-series, possessing no practical interest.

PHENOLE. See *Carbolic Acid.*

PHENYLE. The hypothetical compound radical of the *phenyl-series.* Carbonic acid is said to be its *hydrated oxide.* The following are some of the phenyl compounds:—

Alcohol of Phenyle. This is aniline.

Benzoate of Phenyle. A substance analogous to benzoate of ethyle, obtained along with hydrochloric acid, by treating *hydrated oxide of phenyle* with *chloride of benzoyle.* It is white, fusible, and crystallizable; when heated with ammonia it yields phenyl-alcohol (*aniline*).

Chloride of Phenyle. A heavy oily liquid obtained by the action of *pentachloride of phosphorus* upon *hydrated oxide of phenyle.*

Cyanide of Phenyle. Benzonitrile.

Hydrated Oxide of Phenyle. Carbolic acid.

PHENYLE BASES. Of these the more important are *aniline*, and its derivatives, *chloraniline, cyaniline, melaniline, nitraniline, &c.*

PHILANTROPE MUOPHOBON. See *Rats.*

PHILLYRINE. Syn. *Phillyrina.* An alkaloid obtained from the *leaves* and *young twigs* of *phillyrea latifolia*, a species of privet, by a process similar to that adopted for the cinchona alkaloids. The sulphate (*phillyrinæ sulphas*) has been strongly recommended by M. Jachelli, and others, as a febrifuge in the place of disulphate of quinine; but recent trials of it have not induced a favorable impression as to its value.

PHILONIUM. The ancient name of an aromatic opiate, reputed to possess many virtues, invented by Philo. A collyrium containing numerous ingredients, was also so called. (See *below.*)

PHILONIUM. (London.) Syn. *Philonium Londinense, Ph. Romanum,*—Lat. *Prep.* (Ph. L. 1746.) *Caraway seeds, ginger,* and *white pepper,* of each, in powder, 2 oz.; *strained opium* (dissolved in wine), 6 dr.; *diacodion* (syrup of poppies), boiled to the consistence of honey, 3 times the weight of all the other ingredients; make an electuary. For the modern representative of this once celebrated compound see *Confection of Opium.*

PHILOSOPHER'S STONE. Syn. *Lapis Philosophorum,*—Lat. A wonderful substance, the discovery of which formed the day dreams of the alchemists. It was supposed to be capable of converting all the baser metals into gold, and of curing all diseases. Some of the alchemists appear to have laboured under the delusion that they had actually discovered it. The last of these enthusiasts was the talented and unfortunate Dr. Price of Guildford, who fell a victim to the jealousy and persecution of a society and notabilities, who would have better acquitted themselves in some nobler game. Modern discoveries tend to deprecate the opprobrium that has been so lavishly heaped upon the alchemists. The recently expressed opinions of Faraday and Dumas, two of the most illustrious chemical philosophers of the present day, must forcibly impress on the mind the conviction of not merely the *possibility*, but the *high probability* that some important discoveries on the constitution of the metals will ere long be made.

PHILOSOPHIC CANDLE. An inflamed jet of hydrogen gas.

PHILOSOPHIC WOOL. Flowers of zinc.

PHILTRE. Syn. *Philtrum,*—Lat. A charm or potion to excite love. The ancients had great faith in such remedies.

Nothing certain is now known respecting their composition; but there is sufficient evidence that recourse was frequently had to them by the ancients, and that "their operation was so violent that many persons lost their lives and their reason by their means." The Thessalian philtres were those most celebrated. (Juv., vi, 610, &c.) At the present day the administration of preparations of the kind is interdicted by law.

PHLORETINE. A crystallizable, sweet substance formed along with grape sugar, when *phloridzine* is acted on by *dilute acids.*

PHLORIDZINE. Syn. *Phlorizine; Phloridzinum,*—Lat. *Prep.* 1. By acting on the *fresh root-bark* of the *apple, pear,* or *plum tree,* with *boiling rectified spirit;* the spirit is distilled off, and the *phloridzine* crystallizes out of the residual liquor as it cools.

2. From the *aqueous decoction,* decolored by a little *fresh oxide of lead* (the excess of lead being removed by the cautious addition of a few drops of dilute sulphuric acid); the crystals that form as the solution cools are purified by recrystallization from *rectified spirit.*

Prop., &c. Fine, colourless, silky needles, freely soluble in rectified spirit and in hot water, but requiring 1000 parts of cold water for its solution; its taste is bitter and astringent. By the joint action of ammonia and oxygen it is converted into a gum-like substance, which has been named *phloridzéine.* When its solution is boiled with a little dilute sulphuric acid or hydrochloric acid, it is changed into *grape sugar* and *phloretine.*

Phloridzine is said to be a *more powerful febrifuge* than even quinine. (M. Lebandy.) Others compare it to salicine. *Dose.* 3 to 15 gr.

PHOCENIC ACID. Syn. *Delphinic Acid.* An oily acid, prepared from the *oil* of the *porpoise, seal,* and *whale,* in the same way as the volatile acids from butter. It is volatile and odoriferous, and dissolves in 18 parts of water. Its salts are called *phocenates.* Recent researches go to show that it is merely valerianic acid.

PHOCENINE. The name given by Chevreuil to a peculiar fatty matter which is mixed with oleine in the *oil of the porpoise.* By saponification it is converted into *phocenic acid,* and other products.

PHŒNICINE. See *Indigo Purple.*

PHORONE. A peculiar volatile oil obtained by the distillation of *camphorate of lime.* It is odorous and freely soluble in rectified spirit; anhydrous phosphoric robs it of a portion of its combined water, and converts it into *cumol.*

PHOSGENE GAS. See *Chloro-carbonic Acid.*

PHOSPHATE. Syn. *Phosphas,*—Lat. A salt of phosphoric acid. See *Phosphoric Acid* and the *respective bases.*

PHOSPHATIC ACID. Syn. *Acidum Phosphaticum,*—Lat. A name given by M. Dulong to the oil-like acid liquor resulting from the slow oxidation of phosphorus when exposed to the air. According to Sir H. Davy, it is a mere mixture of phosphoric and phosphorus acid. Largely diluted with water it acts as a powerful aphrodisiac on some of the lower animals.

PHOSPHIDES. See *Phosphurets.*

PHOSPHITE. Syn. *Phosphas,*—Lat. See *Phosphorous Acid.*

PHOSPHO-ETHYLIC ACID. See *Phosphovinic Acid.*

PHOSPHO-MESITYLIC ACID. *Glacial phosphoric acid* dissolved in *acetone.* It forms soluble salts (*phospho-mesitylates*).

PHOSPHORIC ACID. Syn. *Tribasic Phosphoric Acid; Acidum Phosphoricum,* —Lat. This compound abounds in each of the three kingdoms of nature. In combination with lime it forms the earthy portion of the bones of animals.

Prep. 1. (*Anhydrous.*) By the vivid combustion of *phosphorus* in a stream of *dry atmospheric air,* or under a bell-jar, copiously supplied with *dry air.* The product is *pure anhydrous phosphoric acid* under the form of snow-like flakes. It must be immediately collected and put into a warm, dry, well-stoppered bottle. In this state (*anhydrous pyrophosphoric acid*) it exhibits an intense attraction for water, and when thrown into it combines with it with explosive violence; exposed to the air for only a few seconds, it deliquesces to a syrupy-looking liquid; when dissolved in water and heated, or kept for some days, a solution of pure *hydrated tribasic phosphoric acid* alone remains. Once combined with water it cannot be again reduced to the anhydrous state.

2. (*Hydrated.*)—*a.* Ordinary *nitric acid* is heated in a tubulated retort connected with a receiver, and *small fragments* of *phosphorus* are dropped into it, singly and at intervals; as soon as the oxygenation of the phosphorus is complete, the heat is increased, the undecomposed acid distilled off, and the residuum evaporated to the consistence of a syrup. In this state it forms the *phosphoric acid* of the shops. By transferring it to a platinum crucible,

and gradually raising the heat to redness, pure *hydrated metaphosphoric acid*, or *glacial phosphoric acid*, is obtained. By solution in water and ebullition for a few minutes, it is reconverted into *common* or *tribasic phosphoric acid*. The product, in both cases, must be carefully preserved from the air. See *Dilute Phosphoric Acid*, Ph. L.

b. Bones (calcined to whiteness and powdered), 3 parts, are digested for several days in *oil of vitriol*, 2 parts, previously diluted with *water*, 6 parts, the mixture being frequently stirred during the time; a large quantity of *water* is next added, the whole thrown in a strainer, and the residual matter washed with some *hot water;* the mixed liquids are then precipitated with a *solution of carbonate of ammonia*, in slight excess, and the filtrate evaporated as before. Heat facilitates the process.

c. (Ure.) From *ground bone-ash*, and a solution of *oxalic acid* in *water*, digested together. The solution merely requires to be evaporated.

d. From *bone-ash*, 5 parts; *oil of vitriol*, 3 parts; *water*, 30 parts; mix, boil for 1 hour, filter, evaporate to the consistence of honey, and pour it out on an oiled slab; when cold break it into pieces, and put it at once into a bottle. The product is merely an *acid phosphate of lime*, although recognised as medicinal phosphoric acid in Russia and some parts of Germany.

Prop. Solid hydrated or glacial phosphoric acid contains 89% of real acid and 11% of water. It is a highly deliquescent, glassy-looking substance, very soluble in water, yielding a solution exhibiting powerful acid properties. Its concentrated solution differs from it chiefly in being in the liquid form. Its dilute solution is not poisonous, nor does it precipitate albumen. See *Tribasic Phosphoric Acid* (below.)

Tests.—1. Chloride of barium produces in aqueous solutions of the neutral and basic phosphates a white precipitate which is insoluble in either hydrochloric or nitric acid, and with difficulty soluble in a solution of sal ammoniac.—2. Solution of sulphate of lime produces in neutral and alkaline solutions of the phosphates a white precipitate, freely soluble in acids, even the acetic.—3. Sulphate of magnesia produces in solutions of the phosphates to which some sal ammoniac and free ammonia or its carbonate has been added a white, crystalline, and quickly subsiding precipitate of the basic phosphate of ammonia and magnesia, which is insoluble in a solution of either ammonia or sal ammoniac, but readily soluble in acids, even the acetic.—4. Acetate and nitrate of lead in neutral and alkaline solutions produce a white precipitate, which is nearly insoluble in acetic acid, but freely soluble in nitric acid.—5. Nitrate of silver, in the same cases, gives a light yellow precipitate. If the fluid in which the precipitate is suspended contained a *basic* phosphate, it does not affect test paper; if it contained a *neutral* phosphate, the reaction will be acid. If the phosphate examined has been heated to redness before solution, it then gives a white precipitate with nitrate of silver.—6. Hydrochloric acid is added to the solution to acid reaction, and afterwards 1 or 2 drops of a concentrated solution of sesquichloride of iron; a solution of acetate of potassa is next added in excess, when a flocculent, gelatinous, white precipitate (*sesquiphosphate of iron*) will be formed if phosphoric acid was present in any form or combination in the original liquor. This test is highly characteristic, and of general applicability.—7. *Phosphoric acid* is *distinguished* from *arsenious acid* by not being affected by sulphuretted hydrogen.—*Obs.* The *insoluble phosphates* must be first treated with diluted hydrochloric or sulphuric acid, and the resulting solution filtered and neutralized with an alkali before applying the reagents. When the substance under examination consists of a *very small quantity* of *phosphoric acid* in combination or admixture with a *large quantity* of *sesquioxide of iron*, it should be fused with some carbonate of soda, the residuum of the ignition exhausted with water, and the tests applied to the filtered solution. Arsenious acid, if present, should be removed by sulphuretted hydrogen before applying the tests. When the *acid exists* in *combination with alumina*, the solution in hydrochloric acid is neutralized with carbonate of soda; carbonate of baryta is next added in excess, followed by the addition of caustic potassa, also in excess, after which the whole is boiled. An insoluble phosphate of baryta is formed, which may be decomposed by sulphuric acid, as before.

Estim. Pure solutions of phosphoric acid may be tested by the common methods of *Acidimetry*. When in a state of combination it may be separated and weighed in either of the forms noticed under *Guano*. (See *p.* 549, 550.)

Uses, &c. Phosphoric acid is extensively employed by the bleacher, dyer, calico-printer, and enameller. Unlike sulphuric acid and the other strong acids, it does not

coagulate albumen, nor injure vegetable fibre, and is not decomposed by contact with organic matter. In combination with alumina and a little boracic acid, it is said to be capable of producing a glaze for earthenware of extreme beauty and durability, and perfectly innocuous. It is also *used* in *medicine*. (See *below*.)

PHOSPHORIC ACID (Dilute). Syn. *Medicinal Phosphoric Acid; Acidum Phosphoricum Dilutum*,—Ph. L. *Prep.* (Ph. L.) A mixture of *nitric acid*, 4 fl. oz., and *distilled water*, 8 fl. oz., is poured on *phosphorus* (placed in a retort), 6 dr., and the heat of a sand-bath being applied, 6 fl. oz., are allowed to pass over into the receiver; this liquid is returned into the retort, and a second like quantity allowed to distil, which is rejected; the liquid remaining in the retort is next evaporated in a platinum capsule until reduced to 2 oz., and, when it has cooled, as much *distilled water* is added to it as will make the whole accurately measure a pint.

Pur., &c. It is "free from colour and odour. Neither chloride of barium nor nitrate of silver disturbs its solution. It does not in any way affect strips of copper or silver, nor is it coloured by sulphuretted hydrogen either before or after contact with these metals. 1 fl. oz. of this acid is saturated by 132 gr. of crystallized carbonate of soda, and no precipitate is formed. Sp. gr. 1·064." (Ph. L.) By heat it yields pure glacial phosphoric acid. It contains about 8·7% of dry phosphoric acid; or nearly 10% of glacial acid.

Uses, &c. As a remedy in nervous disorders, phosphatic urinary deposits, diabetes, morbid ossifications, caries, rickets, &c. *Dose.* 10 to 30 drops, in water or any bland fluid; also made into *lemonade*, to allay thirst, as the other mineral acids; and into a *liniment*, as a friction to osseous tumours.

PHOSPHORIC ACID (Bibasic). Syn. *Pyrophosphoric Acid.* This compound is best obtained by strongly heating *common* or *tribasic phosphate of soda.* The water of crystallization only is at first expelled, and the salt becomes anhydrous; but as the temperature reaches that of redness, the basic water of the acid is also driven off. By solution of the *altered salt* in *water* crystals of *bibasic phosphate of soda* may be obtained. A solution of this last compound, treated with *acetate of lead*, and the resulting precipitate (*bibasic phosphate of lead*) suspended in *cold water*, and decomposed by *sulphuretted hydrogen*, yields a solution of pure *hydrated bibasic phosphoric acid.* Heat resolves it into a solution of the ordinary or tribasic acid. Bibasic phosphoric acid precipitates the salts of silver of a white colour. The salts of this acid are called *pyrophosphates* or *bibasic phosphates.*

PHOSPHORIC ACID (Monobasic). Syn. *Metaphosphoric Acid, Paraphosphoric do.* When *tribasic phosphoric acid* is added to a *strong solution* of *tribasic phosphate of soda*, and the mixture, after concentration, is exposed to a low temperature, prismatic crystals are deposited. These, after being strongly heated to expel their basic water, are pure *monobasic phosphate of soda.* From the solution of this salt in *cold water*, a solution of pure *hydrated monobasic phosphoric acid* may be obtained, as above, by means of *acetate of lead* and *sulphuretted hydrogen.* This acid precipitates the salts of silver white, and is distinguished from the other modifications of phosphoric acid by the property which its solution possesses of coagulating albumen. Heat rapidly converts its solution into that of the tribasic acid, but when this solution is evaporated to dryness and heated to redness, the acid is reconverted into the monobasic state. The salts of this acid are termed *paraphosphates, metaphosphates*, or *monobasic phosphates.* See *Phosphoric Acid.*

PHOSPHORIC ACID (Tribasic). This is the common form of phosphoric acid, and the only one which enters into the composition of the salts used in medicine or the industrial arts, or which occurs in nature. When *phosphoric acid* is spoken of, it is this compound which is alluded to.

Prep. This has been already noticed. (See *p.* 965.) *Another method*, very convenient on the *small scale*, is as follows:—*Commercial phosphate of soda* is dissolved in *water*, and the solution precipitated with another of *acetate of lead;* an abundant white precipitate (*phosphate of lead*) falls; this is collected on a filter, well washed, and whilst still moist, is suspended in *distilled water*, and *sulphuretted hydrogen gas* passed into it, in excess; a black insoluble precipitate forms, while pure *tribasic phosphoric acid* remains in solution, and is easily deprived of the residual sulphuretted hydrogen by a gentle heat. By concentration in vacuo over sulphuric acid it may be obtained in thin crystalline plates.

Prop., &c. The solution of this acid may be boiled without change, but when concentrated and heated alone to about 400° Fahr., it is converted into a mixture of

hydrated bibasic and monobasic phosphoric acid. At a red heat it is wholly converted into monohydrated (glacial or monobasic) phosphoric acid, which at a still higher temperature sublimes. Its salts are the *tribasic* or *common phosphates*. The preparation of the principal ones is noticed under the names of the respective bases. The *soluble phosphates* for which directions are not given may be obtained by the direct solution of the base or its hydrate in a solution of the acid; the *insoluble ones*, from solutions of a salt of the base and of phosphate of soda, by double decomposition. See *Phosphoric Acid*.

PHOSPHOROUS ACID. Syn. *Acidum Phosphorosum*,—Lat. This substance is slowly formed on the surface of phosphorus when exposed to the air at a temperature below 60° Fahr.

Prep. 1. (*Anhydrous.*) By burning *phosphorus* under a bell-glass, with a *very limited* supply of air. White; pulverulent.

2. (*Hydrated.*) Pure *phosphorus* is volatilized through a layer of *powdered bichloride of mercury*, contained in a glass tube; *terchloride of phosphorus* comes over, which on being mixed with *water*, is resolved into hydrochloric acid and phosphorus acid; by evaporating the mixed liquid to the consistence of a syrup, the first is expelled, and the residuum forms a crystalline mass of *hydrated phosphorous acid* on cooling.

Prop., &c. It is a powerful deoxydizing agent. Heated in a closed vessel, it is resolved into hydrated phosphoric acid, and pure phosphuretted hydrogen gas. With the bases it forms salts called *phosphites*, which possess little practical importance.

PHOSPHORUS. Syn. *Phosphorus*,—Ph. L. A remarkable elementary substance, discovered by Brandt, a chemist of Hamburgh, in 1669.

Prep. This is now only conducted on the large scale:—*Bone-ash* (in powder), 12 parts, and *water*, 24 parts, are stirred together in a large tub until the mixture is reduced to a perfectly smooth "pap;" *oil of vitriol*, 8 parts, is then added in a slender stream, active stirring being employed during the whole time, and afterwards until the combination appears complete; the next day the mass is thinned with *cold water*, and, if convenient, heated in a leaden pan or boiler until it has entirely lost its granular character; it is now transferred to one or a series of tall casks (according to the extent of the batch) and further diluted with a *large quantity of water;* after repose, the clear liquid is decanted, the sediment washed with *water*, and the "*washings*" and "*decanted liquor*" evaporated in a leaden or copper boiler until the white calcareous deposit (*gypsum*) becomes considerable; the whole is then allowed to cool, the clear portion decanted, and the sediment thoroughly drained on a filter; the liquid thus obtained is evaporated in an iron pot to the consistence of a thick syrup (say 4 parts), when *dry charcoal* (in powder), 1 part, is added, and the desiccation continued until the bottom of the pot becomes nearly red hot, after which, it is covered over and allowed to cool; the dry mixture, when cold, is put into one or more *earthen retorts* well covered with "*luting*" and properly dried, and heat is applied (sideways rather than at the bottom) by means of a good air-furnace; after a short time the beak of the retort is connected with a copper tube, the other end of which is made to dip about one-fourth of an inch beneath the surface of some lukewarm water placed in a trough, or wide-mouthed bottle.

The *distilled product* is *purified* by squeezing it through *chamois leather* under warm water, and is then *moulded for sale* by melting it *under water* heated to about 145° Fahr., and sucking it up to any desired height in slightly tapering, but perfectly straight glass tubes, previously warmed and wetted. The bottom of the tube being now closed with the finger, it is withdrawn, and transferred to a pan of cold water to congeal the phosphorus, which will then commonly fall out, or may be easily expelled by pressure with a piece of wire.

Prop., &c. Phosphorus is a pale yellow, semitransparent, and highly combustible solid; soft and flexible at common temperatures; it becomes waxy at about 75° Fahr.; melts at 108° (in close vessels at 95°,—Ure); begins to evaporate at 217½°; sublimes rapidly at 480° to 500°, and boils at 554° Fahr.; it takes fire at 165°, and at a lower temperature when slightly oxidized. Exposed to the air below 60° its surface is slowly converted into phosphorous acid. It is apparently insoluble in water, but it conveys its peculiar flavour and odour to that fluid when agitated with it; it is slightly soluble in ether, naphtha, and the fixed and volatile oils, and more freely so in bisulphuret of carbon. Its slow oxidation is entirely prevented by the presence of a small quantity of olefiant gas, or the vapour of ether, or of the essential oils; and what is singular, it suffers no change when immersed in *pure* oxygen below 60° Fahr., but oxidation is immediately set up if the oxygen be rarified, or diluted with any other gas; and unites with oxygen forming *acids*, and

with the metals forming *phosphurets*. It is soluble in ether, naphtha, and the oils.

Pur. "Almost colourless; resembles wax; transparent; shines in the dark. It ought to be kept in water, and shut out from access of light." (Ph. L.) A small fragment heated at one end of a long closed tube should be volatilized, without residue, from the end to which the fire is applied. 32 gr. (dried by blotting paper) burned rapidly with free admission of air, in a tube or under a bell-glass, should yield fully 70 gr. of a snow-like substance, which is wholly soluble in water to a clear, colourless solution; this solution is not affected by sulphuretted hydrogen, and after agitation for some time with 100 gr. of dry precipitated carbonate of lime, the clear portion is volatile without the least residue.

Uses. The principal consumption of phosphorus is in the manufacture of Congreve matches. When swallowed it acts as a *powerful corrosive poison;* but small doses of its ethereal and oily solutions are occasionally administered in cases of chronic debility, extreme prostration of the nervous powers, impotency, &c. Its action is that of a powerful diffusible stimulant and diuretic; it is also aphrodisiac. Its use requires great caution, and the effects must be narrowly watched. The *treatment* of *poisoning* by *phosphorus* consists of the administration of a powerful emetic, and the copious use of mucilaginous drinks.

Concluding Remarks. From the great inflammability of phosphorus it can only be safely preserved under water. In *commerce*, it is always packed in tin cylinders filled with water, and soldered up air-tight. The leading points to be observed to ensure success in this manufacture are chiefly connected with the firing. "The heat of the furnace should be most slowly raised at first, but afterwards equably maintained in a state of bright ignition. After 3 or 4 hours of steady firing, carbonic acid and sulphurous acid gases are evolved in considerable abundance, provided the materials had not been well dried in the iron pot; then sulphuretted hydrogen makes its appearance, and next phosphuretted hydrogen, which last should continue during the whole of the distillation." "The firing should be regulated by the escape of this remarkable gas, which ought to be at the rate of about *two* bubbles per second. If the discharge comes to be intercepted, it is to be ascribed either to the temperature being too low, or to the retort getting cracked; and if upon raising the heat sufficiently no bubbles appear, it is a proof that the apparatus has become defective, and that it is needless to continue the operation. We may infer that the process approaches its conclusion by the increasing slowness with which the gas is disengaged under a powerful heat; and when it ceases to come over, we may cease firing, taking care to prevent reflux of water into the retort," (and consequent explosion) "from condensation of its gaseous contents, by admitting air into it through a recurved glass tube, or through the tube of the copper adopter." "The usual period of the operation upon the *great scale*, is from 24 to 30 hours." (Ure.)

PHOSPHORUS (Bromides of). When *bromine* and *phosphorus* are *cautiously* brought into contact in a vessel filled with dry *carbonic acid gas*, they unite with the evolution of light and heat, forming a crystalline yellow compound (*perbromide of phosphorus*) which sublimes and attaches itself to the upper part of the flask, and a liquid substance (*protobromide of phosphorus*) which remains at the bottom. Neither of them are used in medicine.

PHOSPHORUS (Chlorides of). Two of these are known:

Prep. 1. (*Terchloride; Chloride, Protochloride, Sesquichloride.*) By gently heating *phosphorus*, in excess, in *dry chlorine gas;* or by passing the *vapour of phosphorus* through a stratum of *powdered bichloride of mercury* strongly heated in a glass tube. It is limpid, colourless, highly fœtid, fumes in the air, and is slowly resolved by water into *phosphorous acid* and *hydrochloric acid.* Sp. gr. 1·45.

2. (*Pentachloride; Perchloride.*) By the spontaneous combustion of *phosphorus* in an excess of *dry chlorine;* or by passing a stream of *dry chlorine* into the *liquid terchloride.* By the first method it is obtained as a white crystalline sublimate; by the second, as a solid crystalline mass. It is volatile; water resolves it in *phosphoric acid* and *hydrochloric acid.*

PHOSPHORUS (Iodides of). *Prep.* 1. (*Protiodide.*) From *phosphorus*, 1 part; *iodine*, 7 parts; mixed together in a closed vessel, placed in a freezing mixture. Orange coloured; melts at 212°; volatile; decomposed by water.

2. (*Teriodide; Sesquiodide.*) From *phosphorus*, 1 part; *iodine*, 12 parts; as the last. A dark gray semi-crystalline mass, liquid at 84° Fahr.

3. (*Pentiodide; Periodide.*) From *phosphorus*, 1 part; *iodine*, 20 parts; as the last. A black mass, fusible at about 115° Fahr. All the above yield *hydriodic acid*

and *phosphorous* or *phosphoric acid*, by contact with water.

PHOSPHORUS (Oxide of). Syn. *Suboxide of Phosphorus.* A reddish-brown powder, formed when a *stream of oxygen* is forced upon *phosphorus* melted beneath the surface of hot water. By heat it is resolved into phosphorous and phosphoric acid. (For the other compounds of phosphorus and oxygen, see *Hypophosphorous*, *Phosphorous*, and *Phosphoric Acids.*)

PHOSPHORUS (Amorphous). Syn. *Red Phosphorus; Phosphorus Fuscus, P. Ruber.* This is phosphorus in that peculiar condition to which Berzelius has applied the term allotropic. The honour of its discovery is due to Dr. Schrötter of Vienna.

Prep. The ordinary *phosphorus of commerce*, rendered as dry as possible, is placed in a shallow vessel of thick, hard, and well-annealed Bohemian glass, fitted with a safety tube just dipping beneath the surface of a little *hot water* contained in an adjacent vessel; heat is then applied by means of a metallic bath (a mixture of lead and tin), the temperature of which is gradually raised until it ranges between 480 and 490° Fahr., and bubbles of gas escape from the end of the safety tube and catch fire as they come in contact with the air; this temperature is maintained until the amorphous condition is produced, the length of the exposure being regulated by a miniature operation with tubes conducted in the same bath; as soon as this point is reached, the apparatus is allowed to cool, and the amorphous phosphorus, which still contains some unconverted phosphorus, detached from the glass; it is then reduced to powder by careful trituration *under water*, drained on a calico filter, and, whilst *still moist*, spread thinly on shallow trays of iron or lead; in this state it is exposed, with frequent stirring, to heat in a chloride of calcium bath, at *first gentle*, and then gradually increased to its highest limit, and the heat continued until no more luminous vapour escapes; the residuum on the trays is then cooled, washed with *water* until this last ceases to affect test-paper, and is, lastly, drained and dried. To render it absolutely free from unaltered phosphorus, it may be washed with *bisulphuret of carbon.*

On the *small scale*, common phosphorus may be converted into *amorphous phosphorus* by simply exposing it for 50 or 60 hours to a temperature of about 480° Fahr., in closed glass tubes, or in any suitable vessel surrounded with an atmosphere which is unable to act chemically on it.

By keeping *common phosphorus* fused at a high temperature, under the above conditions, for fully 8 days, compact masses of amorphous phosphorus may be obtained.

Prop., &c. A reddish-brown, infusible, inodorous, solid substance, which is reconverted into ordinary phosphorus by simply exposing it to a heat a little above 500° Fahr. It is unaltered by atmospheric air; is insoluble in bisulphuret of carbon, alcohol, ether, or naphtha; is non-luminous in the dark below about 390° Fahr.; and does not take fire at a lower temperature than that necessary for its reconversion into the common or crystalline form. The sp. gr. ranges between 2·089 to 2·107, according to the method of preparing it. Its properties render it an admirable substitute for the common phosphorus in the composition for tipping matches, both as regards security from spontaneous ignition and the health of the manufacturers; but the anticipations that it would be thus applied, owing to its high price, have not been realized.

PHOSPHORUS (Baldwin's). Recently fused *nitrate of lime.* For this purpose it must be broken into fragments whilst still warm, and at once placed in dry and well-stopped phials. After exposure for some time to the direct rays of the sun, it emits sufficient light in the dark to render visible the figures on the dial-plate of a watch.

PHOSPHORUS (Bolognian). Syn. *Kercher's Phosphorus, Bolognian Stone.* This substance was accidentally discovered by a shoemaker of Bologna, and excited much interest about the middle of the 17th century. The following is said to have been the formula employed by the Logani family, who were particularly successful in its preparation, and acquired wealth by its sale to the curious throughout Europe:

Prep. Reduce recently calcined *native sulphate of baryta* to powder, make it into a paste with *mucilage of gum tragacanth*, and roll the mass into pieces about ¼ inch thick, and 1 to 2 inches long; dry these slowly by a moderate heat, and then expose them to ignition in a wind furnace, by placing them loosely among the charcoal; lastly, allow them to cool slowly, and at once place the pieces in well-stopped phials. Like the preceding substance, it phosphoresces in the dark after exposure to the sun's rays.

PHOSPHORUS (Canton's). *Prep.* From *calcined oyster shells*, 3 parts; *flowers of sulphur*, 1 part; placed in alternate layers in a covered crucible, and exposed to a strong heat for about an hour. It is preserved and used like the above.

PHOSPHORUS (Homberg's). Recently ignited *chloride of calcium*.

PHOSPHORUS (Kercher's). See *Bolognian Phosphorus*.

PHOSPHORUS BASES. Under this head chemists include various substances, analogous to organic bases, but containing phosphorus instead of nitrogen. Those yet examined are phosphuretted methyl-bodies, partly liquid and partly solid, obtained by passing a *current* of *chloride of methyle* over a layer of *phosphuret of calcium* heated to about 356° Fahr. From the mixed product, three distinct substances have been eliminated by M. Paul Thénard, two of which are powerfully basic.

PHOSPHORUS BOTTLES. *Prep.* 1. *Phosphorus*, 12 gr.; *olive oil*, ½ *oz.*; mix in an *oz.* phial, and place the latter, loosely corked, in a basin of *hot water*; as soon as the phosphorus is melted, remove the phial, cork it securely, and agitate it until nearly cold. On being uncorked, it emits sufficient light in the dark to see the time by a watch, and will retain this property for some years if not too frequently employed. These are frequently called "*luminous phials*."

2. (*Briquets Phosphoriques.*)—*a.* From *phosphorus*, 3 parts; *white wax*, 1 part; cautiously melted together by the heat of *hot water*; as the mixture begins to cool, the bottles are turned round so that it may adhere to the sides.

b. (Bendix.) *Cork* (rasped small, and dry), and *yellow wax*, of each, 1 part; *phosphorus*, 4 parts; *petroleum*, 8 parts; mixed, by fusion, as the last.

Used as "*instantaneous-light bottles*." A sulphur match rubbed against the composition immediately inflames on exposure to the air. They should be only unstoppered at the instant of introducing the match, and should be handled with caution.

PHOSPHORUS MATCHES. See *Matches* (and *above*).

PHOSPHORUS PASTE. Syn. *Anti-arsenical Rat-Poison, Phosphor Paste. Prep.* 1. *Phosphorus*, 1 *oz.*; *warm water*, 1 pint; place them in a bottle, cork it, and agitate them well together, until the phosphorus is reduced to a minute state of division, adding towards the end, *moist sugar*, ½ *lb.*; next add of *lard* (melted by a gentle heat), 1 *lb.*, and repeat the agitation until the whole is nearly cold; when *cold*, form it into a stiff dough with *oatmeal* or *barley meal*, and make this into small balls or cakes; lastly, dry these in the air, without artificial heat.

2. (M. Simon.) *Phosphorus*, 8 parts; *water* (lukewarm), 180 parts; mix in a mortar, and add of *rye meal*, 180 parts; when cold, further add of *butter* or *lard*, 180 parts; *sugar*, 125 parts; and mix the whole thoroughly together. This is the formula authorised by an ordonnance of the Prussian Government, dated April 27th, 1843.

Obs. Rats, mice, &c., eat the above composition with avidity, after which they soon die. It is said that the best method of using it, is to place small pieces of it in and about the holes, with some water in a shallow vessel for them to drink. It has the advantage of retaining its efficacy for many years, and is less dangerous to human beings than compositions containing arsenic, whilst it is even more effective for the purpose for which it is employed. Some persons recommend the addition of a little *oil of rhodium* or *oil of aniseed*. See *Rats*, *&c.*

PHOSPHOVINIC ACID. Syn. *Phosphethylic Acid*. A bibasic acid containing the elements of ether.

Prep. A mixture of *strong alcohol* and *syrupy phosphoric acid*, equal parts, are exposed to a temperature of 180° Fahr.; after 24 hours, the whole is diluted with *water*, and neutralized with *carbonate of baryta*; the filtered liquid, by evaporation at a gentle heat, yields crystals of *phosphovinate of baryta*, under the form of brilliant hexagonal plates; these are redissolved in *cold water*, the solution is precipitated with *dilute sulphuric acid* (carefully avoiding excess), and the filtered liquid evaporated *in vacuo* to the consistence of a syrup.

Prop., &c. Colourless; intensely sour; soluble in water, alcohol, and ether; easily decomposed by heat. Its salts are the *phosphovinates*; those of the *alkalies*, *magnesia*, and *strontia*, are freely soluble in water; those of *lime*, *silver*, and *lead*, only slightly so. According to Vögeli, a second acid is formed along with the phosphovinic by the action of syrupy phosphoric acid on alcohol, to which he has given the name of *phosphobiethylic acid*.

PHOSPHURET. Syn. *Phosphide; Phosphuretum, Phosphidum*,—Lat. A compound of phosphorus with a base. See the respective *Metals*, *&c.*

PHOTOGENIC DRAWING. See *Sun Painting*.

PHOTOGRAPHY. See *Sun Painting*.

PHOTOMETRY. The art of determining the relative intensities of different lights. Various methods have been adopted, at different times, for this purpose, among which, however, a few only are sufficiently simple for general application. The principle adopted by Bouguer and Lambert depends

on the fact, that though the eye cannot judge correctly of the proportional force of different lights, it can, generally, distinguish with great precision when two similar surfaces or objects presented together are equally illuminated; or when the shadows of an opaque object produced by different lights are equally dark. Now, as light travels in straight lines, and is equally diffused, it is evident that its intensity will progressively lessen as the distance of its source increases. This diminution is found to be in the *duplicate ratio of the distance.* To apply this principle to *candles, lamps, gas-lights, &c.*, we have only to arrange two of them so that the *light* or *shadow* resulting from both shall be of *equal intensity*, after which we must carefully measure the distance of each of them from the surface on which the light or shadow falls. The squares of these distances give their relative intensity. In general some known light, as that from a *wax candle* (4 to the *lb.*), is taken as the standard of comparison.

Dr. Ritchie's "*Photometer*" consists of a *rectangular box*, about 2 inches square, open at both ends, and blackened inside to absorb extraneous light. In this, inclined at angles of 45° to its axis, are placed two precisely similar *rectangular plates* of *plain silvered glass*, and fastened so as to meet at the top, in the middle of a narrow slit about an inch long, and the eighth of an inch broad, and which is covered with a strip of *tissue* or *oiled paper.* In employing this instrument, the "lights must be placed at such a distance from each other, and from the instrument between them, that the light from each shall fall on the reflector next it, and be reflected to the corresponding portion of the oiled paper. The photometer is then to be moved nearer to the one or the other, until the two portions of the oiled paper corresponding to the two mirrors are equally illuminated, of which the eye can judge with considerable accuracy."

In Prof. Wheatstone's "*photometer*" the relative intensity of the two lights is determined by the relative brightness of the opposite sides of a *revolving silvered ball* illuminated by them.

In the *method of photometry* usually, but erroneously, ascribed to Count Rumford, the shadows of an opaque object formed by different lights, and allowed to fall on a *white wall* or *paper screen*, are contrasted. A wire about $\frac{3}{16}$ths of an inch thick, and about a foot in length, with the one end bent so as to form a handle, is commonly used to form the shadows. The method of proceeding is similar to that first above noticed.

It is generally supposed that the *equality* of *two shadows* can be appreciated with greater certainty than that of *two lights.*

PHRENITIS. Syn. *Phrensy; Encephalitis,*—Lat. Inflammation of the brain or its membranes. It is a highly dangerous and often fatal disease, requiring prompt and skilful medical treatment. In the *acute forms*, liberal venesection in the arm, or cupping, or leeches, an active and irritating purgative, (as a full dose of *calomel* and *jalap*,) followed by saline purgatives, and the *cold water douche*, or *ice* to the head (previously shaved), forms the common treatment. In the *subacute* and *chronic forms* active depletion is unnecessary, and often proves injurious.

PHTHALIC ACID. A new bibasic acid, obtained by boiling *tetrachloride of naphthaline* with *nitric acid*, or by acting on *alizarine* with *nitric acid.* It crystallizes in yellow plates, is only slightly soluble in water, but is freely soluble in alcohol and ether. Fuming nitric acid converts it into *nitro-phthalic acid.* Some *phthalates* have also been formed.

PHTHIRIASIS. Syn. *Morbus Pediculosus.* A disease in which lice breed on the body, puncture the skin, and produce small but irritating ulcers. It is symptomatic of a bad state of body, or of other diseases, to which the attention should be directed. The best *local treatment* is warm sea bathing, and the free use of clean linen.

PHTHISIC. A popular name for difficulty of breathing, from its supposed resemblance to phthisis. See *Bronchitis* (and *below*).

PHTHISIS. Syn. *Consumption, Pulmonary do., Tubercular do.* A diseased condition of the lungs, *distinguished* by progressive emaciation, debility, cough, difficulty of breathing, hectic fever, and purulent, and usually copious expectoration. As the disease advances, the expectorated matter is frequently streaked with blood; there is pain in the side (especially after coughing or a full inspiration), inability to lie with equal comfort on both sides, frequent flushings and chilliness, and a red sediment in the urine. The tongue is seldom much altered; the bowels, at first irregular, become at length habitually relaxed; profuse perspirations, attended by extreme debility and rapid emaciation, follow; the legs swell; the eyes brighten; and the patient sinks, generally retaining his senses in full vigour, and even his hope of recovery, and his spirits, to the last.

The *causes* which predispose to pulmonary consumption are numerous and varied.

Among these, hereditary disposition and scrofulous habit are the principal in the most alarming form of the disease, or that which arises from tubercles of the lungs. Particular formation of body, as narrow chest, or spinal or pectoral distortion, in which the functional action of the lungs is interfered with; unhealthy occupations; confined or unwholesome air; excessive indulgence of the passions; intemperance, or unnatural abstemiousness; exhausting habits and diseases; sudden or lengthened exposure to extreme cold, damp, &c.; insufficient clothing; checked perspiration; and, more particularly, neglected catarrh, bronchitis, asthma, and similar affections.

The *treatment* of this disease is necessarily not of a very decided character; much more depending on proper attention to diet and regimen, clothing, exercise, ventilation, and uniformity of temperature, than on medicine. In the early stages, the *tendency to inflammatory action* may be cautiously combated by cupping or blisters, and the use of mild saline aperients, as citrate of potassa, bitartrate of potassa, or even sulphate of magnesia in appropriate doses; and the *irritation* and *coughing* may be allayed by small doses of the salts of morphia, tincture or extract of henbane, and expectorants, with any of the ordinary demulcents. The *night-sweats* are often alleviated by the administration of draughts containing dilute sulphuric acid; and the *exhausting diarrhœa*, by the common cretaceous mixture, to which a little tincture of catechu may be added, with small doses of rhubarb and bicarbonate of potassa at intervals. Change of air is commonly recommended, but is seldom attended with advantage when the residence of the patient is already in a healthy locality.

Numerous *pretended specifics* in *phthisis* have at different times been brought before the public, but all of them, after a short course of puffing, have sunk into oblivion. The inhalation of air mixed with the vapour of *chlorine*, *iodine*, *medicated ether*, or *tar water*; the internal administration of *digitalis*, *wood naphtha*, and numerous other compounds, have each had enthusiastic advocates, but their once much vaunted effects appear to have been entirely imaginary. Unfortunately, no substance or treatment has yet been discovered capable of curing, or even of permanently arresting the progress of this disease in its more malignant forms. Evidence, both medical and non-medical, recently collected, certainly goes to show that substances of a bland oleaginous character, or which are rich in *carbon* or in *hydrocarbons*, exert, under favorable circumstances, an ameliorating, if not a curative action in phthisis. The value of *pale cod-liver oil*, when freely taken by consumptive patients, is indisputable; and the beneficial effects of that containing quinine (*oleum jecoris aselli cum quinâ*) is often still more perceptible. An equally curious fact is, that persons who have the skin constantly in contact with *oil* seldom suffer from pulmonary affections; and it is said that a case of fatal phthisis is very rare among them. This has suggested the use of *oil baths*, and frequent *frictions with oil*. The latter have been lately tried with very marked advantage, and deserve the serious consideration of the practitioner. Again, we have seen several consumptive patients who have wonderfully improved from constant exposure to the *fumes* of *coal-tar naphtha;* and of these, three or four, whose cases were reported hopeless, appear to have absolutely and completely recovered. The fumes of this naphtha have a very irritating effect on the eyes, but a precisely opposite effect on diseased lungs. The *modus operandi* of this remedy we do not pretend to explain. We merely record results, which an almost unlimited field of observation amongst workers in gutta percha and Indian rubber, who constantly use coal-tar naphtha, has enabled us to collect. Another singular fact is, that working in *gutta percha*, when naphtha is not used, tends greatly to increase the appetite and to promote digestion. In a recent number of 'L'Union Médicale' we are told that "Avicenna recommended *sugar* as the best palliative of consumption. At the present time *sugar-candy* and *honey* are popular remedies against catarrhs and chest-affections. Doubtless they moisten the throat, and facilitate expectoration; but, besides this, there has lately sprung up a regular plan of treating phthisis with sugar. A celebrated American physician sends his patients to pass several hours daily in sugar works. It appears that the fumes emanating from the sugar exert a beneficial influence on the lungs." It may here be observed that sugar, like mineral naphtha and oil, is a substance rich in carbon. *Gum*, an article closely approaching sugar in constitution, is one of the very best demulcents in all breath affections.

PHTHORE. Fluorine.

PHYLLIREINE. A bitter principle extracted from the *phyllirea latifolia*. It is crystallizable.

PHYSIC BALLS. See *Veterinary Medicines*.

PICA. See *Depraved Appetite*.

PICAMAR. Syn. *Picamare*. One of

the six peculiar principles discovered by Reichenbach in beech-tar, of which it constitutes about 1-6th. It is a viscid, colourless, oily liquid, only feebly odorous, but intensely bitter; insoluble in water; freely soluble in alcohol, ether, and oils; boiling point 520° Fahr.; Sp. gr. 1·095. It is characterised by forming crystalline compounds with the alkalies and ammonia, which are decomposed by water, but dissolve, without change, in alcohol. See *Kreasote.*

PICCALILLI. See *Pickles.*

PICKLE. The liquor in which substances used as food are preserved. That for *flesh* is commonly brine,—that for *vegetables*, vinegar; both of which are commonly flavoured with spices, &c.

Prep. 1. (For *meat.*)—*a.* From *bay salt*, 3 *lb.*; *saltpetre*, 2½ *oz.*; *moist sugar*, 1 *lb.*; *allspice* and *black pepper*, of each (bruised), 1 *oz.*; *water*, 9 pints; simmer them together in a clean covered iron or enamelled vessel for 7 or 8 minutes; when the whole has cooled, remove the skum, and pour it over the articles to be preserved. *Used* for hams, tongues, beef, &c., to which it imparts a fine red colour, and a superior flavour.

b. From *bay salt* and *common salt*, of each, 2 *lb.*; *moist sugar*, 1 *lb.*; *saltpetre*, ½ *lb.*; *allspice* (bruised), ½ *oz.*; *water*, 1 gall.; as before. *Used* chiefly for pork and hams. Common salt may be substituted for bay salt, but it is less powerfully antiseptic, and the flavour is less grateful.

2. (For *vegetables.*)—*a.* Strong *distilled vinegar*, to each quart of which, 1½ *oz.* of *good salt* has been added.

b. Good *distilled vinegar*, 4 pints; *common salt*, 2½ *oz.*; *black pepper*, ½ *oz.*; *unbleached Jamaica ginger*, 2½ *oz.*; (the last two bruised, but not dusty;) *mace* (shredded), ¼ *oz.*; simmer in an *enamelled iron* or *stoneware* vessel, as above, and strain through flannel. Sometimes a little *capsicum* is added. *Used* either hot or cold, according to the vegetable it is intended to preserve.

PICKLE (Lemon). See *Sauces.*

PICKLES. These well-known substances are easily *prepared* of the finest quality. The *vegetables* and *fruit*, selected of the proper quality and at the proper season, after being well cleansed with *cold spring-water*, are steeped for some time in *strong brine;* they are then drained and dried, and transferred to bottles or jars; the spice (if any) is then added, the bottles filled up with *strong pickling vinegar*, and *at once* securely corked down and tied over with bladder. As soon as the bottles are cold, the corks are dipped into *melted wax*, the more surely to preserve them air-tight. Good *wood* or *distilled vinegar* is commonly used for this purpose; but the best *malt* or *white wine* vinegar of the strength known as No. 22 or 24, is exclusively employed for the finer pickles which are not spiced. In those for early use the steep may be made in hot or boiling brine, by which the product will be ready for the table in a much shorter period; but with substances of a succulent and flabby nature, as cabbage, cauliflower, some fruit, &c., or in which crispness is esteemed a mark of excellence, this is inadmissible. For such articles a cold steep in strong *alum water* is preferable to one in brine. The vinegar should also be added *cold;* or, at furthest, should be only slightly warmed. As a *general rule*, the *softer* and *more delicate articles* do not require so long *soaking in brine* as the harder and coarser kinds; and they may be often advantageously pickled by simply pouring very *strong pickling vinegar* over them, *without applying heat.* It must also be observed that *beetroot*, and other like substances which are sliced, as well as certain delicate fruits, must not be steeped at all. The *spice* is commonly added *whole* to the bottles; but a more *economical plan* is to steep it (bruised) for some time, or to simmer it in the vinegar before using the latter, as in the forms given above.

The *spices* and *flavoring ingredients* employed for pickles are—*allspice*, *black* and *white pepper*, *capsicums* or *red pods*, *cloves*, *garlic*, *ginger*, *horse-radish*, *lemon-peel*, *mace*, *mustard*, *shallots*, and *turmeric.* These are chosen with reference to the particular variety of the pickle, or the taste of the consumer.

In the preparation of pickles it is highly necessary to avoid the use of metallic vessels; as both vinegar and brine rapidly corrode *brass*, *copper*, *lead*, &c., and thus become poisonous. These liquids may be best heated or boiled in a *stoneware* jar by the heat of a water-bath, or a stove. *Common glazed earthenware* should be avoided either for making or keeping the pickles in, as the glazing usually contains lead. *Pickles* should also *be kept from the air* as much as possible, and should only be touched with *wooden* or *bone spoons.* They are also better preserved in *small jars*, or *bottles*, than in *large ones*, as the more frequent opening of the latter, exposes them too much. *Copper* or *verdigris* is frequently added to pickles to impart a green colour; or

the vinegar is boiled in a copper vessel until sufficiently "*greened*," before pouring it on the vegetables. This *poisonous* addition may be readily detected by any of the tests mentioned at p. 287. If a green colour be desired, it may be imparted to the vinegar, and ultimately to the pickles, by steeping *vine leaves*, or the *leaves* of *parsley* or *spinach* in it. The evidence of Dr. Hassall (the *Lancet Commissioner*), and of Mr. Blackwell (*of the eminent firm of Cross and Blackwell*) goes to prove that the *pickles of the shops* are nearly always artificially coloured, and are thus rendered highly unwholesome, if not *actively* poisonous. A teaspoonful of *olive oil* may be advantageously added to each bottle, to keep the pickles white, and to promote their preservation.

The *following list* includes the *leading pickles* of the shops, and some others:—

Barberries. From the *ripe fruit*, without heat.

Beans. From the *young green pods* of the *scarlet bean*, and the *French* or *kidney bean*, with heat.

Beetroot. From the *sliced root*, without steeping in brine, and with *cold spiced vinegar*. When wanted for immediate use, the vinegar may be used boiling hot.

Brocoli. As *Cauliflowers.*

Cabbage. This, either *red* or *white*, is cut into thin slices, and steeped in *strong brine*, or sprinkled with *common salt*, and allowed to lie for 1 or 2 days; after which it is drained for 10 or 12 hours in a warm room, and then put into jars or bottles, with or without a little *mace* and *white peppercorns*, and at once covered with *cold strong white vinegar.—Another plan* is to steep the *sliced cabbage* in *alum water* for 10 or 12 hours, and after draining and drying it, to pour the *vinegar* over it as before. The product of the last formula eats very fresh and crisp, but takes longer to mature than that of the other. Some persons add a little *salt* with the vinegar; and others mix slices of *red beet* with the cabbage.

Capsicums. As *Gherkins.*

Cauliflowers. As *Cabbage* (nearly). *Or* they may be steeped in *hot brine* for 1 to 2 hours, before pouring the *vinegar* over them.

Cherries. From the *scarcely ripe fruit*, bottled, and covered with *strong* and *colourless pickling vinegar.*

Codlins. As *Beans.*

Cucumbers. See *Gherkins.*

Elderflowers. From the *clusters*, just before they open, as *red cabbage.* A beautiful pickle.

English Bamboo. From the *young shoots* of *elder*, denuded of the outer skin, pickled in *brine* for 12 or 14 hours; then bottled with a little *white pepper*, *ginger*, *mace*, and *allspice*, and pickled with *boiling vinegar.* Excellent with boiled mutton.

Eschalots. With *boiling spiced vinegar*, or *spices* added to each bottle.

French Beans. See *above.*

Garlic. As *Eschalots.*

Gherkins. From *small cucumbers* (not too young), steeped for a week in very *strong brine;* this last is then poured off, heated to the boiling point, and again poured on the *fruit;* the next day the *gherkins* are drained on a sieve, wiped dry, put into bottles or jars with some *spice* (ginger, pepper, or cayenne), and at once covered with *strong pickling vinegar*, boiling hot. Several other pickles may be prepared in the same way.

Gooseberries. From the *green fruit*, as either *cabbage* or *cauliflowers.*

Indian Mango. From *green peaches.* (See *below.*)

Indian Pickle, Piccalili. This is a mixed pickle which is characterised by being highly flavoured with curry-powder or turmeric, mustard, and garlic. The following form is commonly used:—Take 1 *hard white cabbage* (sliced); 2 *cauliflowers* (pulled to pieces); some *French beans;* 1 stick of *horseradish* (sliced); about 2 dozen *small white onions;* and 1 dozen *gherkins;* cover them with boiling brine; the next day drain the whole on a sieve, put it into a jar, and add of *curry-powder* or *turmeric*, 2 *oz.; garlic*, *ginger*, and *mustard seed*, of each, 1 *oz.; capsicums*, ½ *oz.;* fill up the vessel with *hot pickling vinegar*, bung it up close, and let it stand for a month, with occasional agitation. See *Mixed Pickles* (below).

Lemons. From the *fruit*, slit half way down into quarters, and cored, put into a dish, and sprinkled with a *little salt;* in about a week, the *whole* is placed in jars or bottles with a little *turmeric* and *capsicums*, and covered with *hot vinegar.*

Limes. As the last.

Mangoes. As *Lemons*, adding *mustard seed*, and a *little garlic*, with *spices*, at will. *English mangoes* are made from cucumbers or small melons, split and deprived of their seeds.

Melons. As *Lemons* (nearly).

Mixed Pickles. From *white cabbage*, *cauliflowers*, *French beans*, *cucumbers*, *onions*, or *any other* like vegetable, at will, *except* red cabbage or walnuts, treated as gherkins; with *raw ginger*, *capsicum*,

mustard seed, and *long pepper*, for spice, added to each bottle. A little coarsely bruised *turmeric* improves both the colour and flavour.

Mushrooms. From the *small button mushrooms*, cleansed with *cold spring water*, and gently wiped dry with a towel, then placed in bottles, with a blade or two of *mace*, and covered with the strongest *white pickling vinegar*, boiling hot.

Myrobalans. The *yellow myrobalan* preserved in *strong brine*. Gently aperient.

Nasturtiums. From the *unripe* or *scarcely ripe fruit*, simply covered with *cold strong vinegar; or*, as *cabbage* or *gherkins*.

Onions. From the *small button* or *filbert onion*, deprived of the outer coloured skin, and either at once put into bottles and covered with *strong white pickling vinegar*, or previously steeped for a day or two in *strong brine* or *alum water*. When required for early use, the vinegar should be poured on boiling hot.

Peaches. From the *scarcely-ripe fruit*, as *Gherkins*.

Peas. As *Beans* or *Cauliflowers*.

Piccalili. See *Indian Pickle*.

Radish Pods. As *Beans* or *Gherkins*.

Samphire. From the *perennial samphire* (erythmum maritimum, — *Linn.*), covered with *strong vinegar*, to each pint of which ¾ *oz.* of *salt* has been added, and poured on boiling hot. Said to excite the appetite.

Tomatoes. From the *common tomato* or *love apple*, as *Gherkins*.

Walnuts. From the *young fruit* of *juglans regia* (Linn.), or common walnut.—*a.* Steep them in *strong brine* for a week, then bottle them, add *spice*, and pour on the *vinegar* boiling hot.—*b.* On each pint of the *nuts*, spread on a dish, sprinkle 1 *oz.* of *common salt;* expose them to the sun or a full light for 10 or 12 days, frequently basting them with their own liquor; lastly, bottle them, and pour on the *vinegar* boiling hot.—*c.* (Dr. Kitchener.) Gently simmer the *fruit* in *brine*, then expose it on a cloth for a day or two, or until it turns black; next put it into bottles or jars, pour *hot spiced vinegar* over it, and cork down immediately. In this way the pickle becomes sufficiently mature for the table in *half the time* required for that prepared by the common method. Dr. Kitchener also recommends this parboiling process for several other pickles. *Some persons* pierce the *fruit* with an awl or stocking-needle, in several places, in order to induce early maturation. The *spices* usually employed are mustard-seed, allspice, and ginger, with a little mace and garlic.

PICOLINE. An oily substance, discovered by Dr. Anderson, associated with aniline, chinoleine, and some other volatile bases, in certain varieties of coal tar. It is *separated* from these substances by careful distillation, being the most volatile. It is colourless, limpid, strongly odorous, acrid, and bitter tasted; miscible with water in all proportions, insoluble in alkaline and saline solutions, remarkably alkaline and basic, and forms well-defined and crystallizable salts with the acids; liquid at 0°, and boils at 272° Fahr. Sp. gr. 0·955. Unlike aniline, it does not become brown by age, or by slight exposure to the air.

PICRAMYLE. A name given to a hydrocarbon radical of which the essential oil of almonds is stated to be the *binoxide*.

PICRIC ACID. Syn. *Carbazotic Acid, Nitrophenisic do., Nitropicric do.; Acidum Carbazoticum, &c.*,—Lat. A peculiar compound formed by the action of strong nitric acid on indigo, aloes, silk, wool, and several other substances.

Prep. Add, cautiously and gradually, 1 part of *powdered indigo* to 10 or 12 parts of *hot nitric acid*, of the sp. gr. 1·43; when the reaction has moderated and the scum has fallen, add an *additional* quantity of *nitric acid*, and boil the whole until red fumes are no longer evolved; redissolve the crystals of *impure picric acid* deposited in *boiling distilled water*, and remove any oily matter found floating on the surface of the solution by means of bibulous paper; a second time redissolve in *boiling water* the crystals which form as the liquid cools, saturate the new solution with *carbonate of potassa*, and set it aside to crystallize; the crystals of *picrate of potassa* thus obtained must be purified by several re-solutions and re-crystallizations, and next decomposed by *nitric acid;* the crystals deposited as the liquid cools yield pure *picric acid* by again dissolving them in *boiling water*, and re-crystallization.

Prop., &c. Brilliant yellow scales, scarcely soluble in cold water, but very soluble in boiling water, and in alcohol and ether; fusible; volatile; taste, insupportably bitter, and very permanent. It forms salts with the bases (*picrates, carbazotates*), mostly possessing a yellow colour, and exploding when heated. The *picrate* or *carbazotate of lead* has been proposed as a fulminating powder for percussion caps. The carbazotate of potassa has been given with advantage in intermittent fevers. A *solution of picric acid* in alcohol is an excellent test for potassa, if there be not too much water present, as it throws down a yellow crystalline precipitate with that alkali, but forms a very

soluble salt with soda. Most of the *picrates* may be *made* by the direct solution of the *carbonate, hydrate*, or *oxide of the base*, in a *solution of the acid* in hot water. The *carbazotate of silver* forms beautiful starry groups of acicular crystals, having the colour and lustre of gold.

The *principal uses* of crude picric acid are in dyeing and the adulteration of beer. It is, however, highly poisonous. According to Prof. Rapp, it acts deleteriously both when swallowed and applied to the unsound skin. Five grains seriously affected a large dog, and killed it within 24 hours. It induces vomiting, feebleness, and general loss of nervous tone. The tissues of animals poisoned by it (even the white of the eye) were tinged of a yellow colour. See *Porter, &c.*

PICRO-ERYTHRINE. A crystallizable, bitter principle, formed, along with orsellinic acid, when *erythric acid* is boiled for some time with *water*.

PICROGLYCION. An extractive matter obtained from the stalks of the *solanum dulcamara* (Linn.) or *woody nightshade*. It possesses a mixed sweet and bitter taste; hence the name.

PICROLICHENINE. A crystallizable, bitter substance, found by Alms in the *lichen variolaria amara*. It is *extracted* by *alcohol*, and *purified* by washing it with a *weak solution of carbonate of potassa*. It is said to be a powerful febrifuge.

PICROMEL. The name given by Thénard to a dark-coloured substance, formerly supposed to be the bitter principle of bile. It may be *obtained* from *fresh bile*, by adding to it *sulphuric acid* diluted with 5 parts of *water*, applying a *gentle heat*, and, after repose, decanting the clear portion, edulcorating the sediment (*resin of bile*) with *water*, digesting with *carbonate of baryta*, and evaporating.

PICROTOXINE. Syn. *Picrotoxia, Picrotoxina, Picrotoxic Acid, Picrotoxium*. A poisonous principle discovered by Boullay in *menispermum cocculus* or *cocculus Indicus*.

Prep. 1. Precipitate a *decoction* of *cocculus Indicus* with a *solution of acetate of lead*, gently evaporate to dryness, redissolve the residuum in *alcohol* of 0·817, and crystallize by evaporation; repeat the solution and crystallization a second and a third time. Any adhering colour may be removed by agitating it with a very little *water;* or by *animal charcoal*, in the usual manner.

2. (Kane.) *Alcoholic extract of cocculus Indicus* is exhausted with the smallest possible quantity of *water*, and the mixed liquors filtered; to the filtrate *hydrochloric acid* is added, and the whole set aside to crystallize. The *product* may be purified as before.

Prop., &c. It forms small, colourless, stellated needles; soluble in alcohol, ether, and acetic acid, and feebly so in water; boiling water dissolves it freely; taste of solutions, inexpressibly bitter; reaction, neutral. It does not combine with acids, as formerly asserted, but it forms feeble combinations with some of the bases. It is a powerful intoxicant and narcotico-acrid poison. It acts powerfully on the spinal cord, and nervous system generally, occasioning an increase of the animal temperature, and peculiar movements, similar to those described by Flourens as resulting from sections of the cerebellum. It is frequently present in malt liquors, owing to their common adulteration with cocculus Indicus. (See *p.*268.)

PIERRE DIVINE. Syn. *Cuprum Aluminatum*. See *Lapis Divinus*.

PIES. Alexis Soyer declares that everybody eats pies "in England," and that in these countries they "may, in fact, be considered as one of our best companions *du voyage* through life;" and therefore "it is needful that we should learn not merely how to make them, but to make them *well!* If all the spoilt pies made in London on a single Sunday were exhibited in a row beside a line of railway, it would take above an hour by special train to pass in review these culinary victims." The following is condensed from the instructions of this notable:—

To *make a pie to perfection*,—when your paste (*half-puff* or *short*) is carefully made, and your dish or form properly full, throw a *little flour* on your *paste-board*, take about a ¼ *lb.* of your *paste*, which roll with your hand, until (say) an inch in circumference; then moisten the rim of your pie-dish, and fix the paste equally on it with your thumb. When you have rolled *your paste* for the covering, or upper crust, of an equal thickness throughout, and in proportion to the contents of your pie (½ inch is about the average), fold the cover in two, lay it over one half of your pie, and turn the other half over the remaining part; next press it slightly with your thumb round the rim, cut neatly the rim of the paste, form rather a thick edge, and mark this with a knife about every quarter of an inch apart; observing to hold your knife in a slanting direction, which gives it a neat appearance; lastly, make two small holes on the top, and egg-over the whole with a paste-brush; or else use a little *milk* or *water*. Any small portion of paste remaining may be shaped

to fanciful designs, and placed as ornaments on the top.

"For meat pies, observe, that if your paste is either too thick or too thin, the covering too narrow or too short, and requires pulling one way or the other, to make it fit, your pie is sure to be imperfect, the covering no longer protecting the contents. It is the same with fruit; and if the paste happens to be rather rich, it pulls the rim of the pie to the dish, soddens the paste, makes it heavy, and, therefore, indigestible as well as unpalatable."

Meat pies require the addition of either cayenne, or black pepper, or allspice; and *fruit pies*, of enough *sugar* to sweeten, with *mace*, *ginger*, *cloves*, or *lemon peel*, according to taste, and the substance operated on. See *Pastry*, *Tarts*, *&c.*

PIG. The pig or hog (*sus scrofa*,—Linn.), one of the *common pachydermata*, is now domesticated in all the temperate climates of the world. Its *flesh* constitutes *pork*, *bacon*, *ham*, *&c.*; its *fat* (lard) is officinal in the pharmacopœias. The *skin*, *bristles*, and even the *blood* and *intestines* of this animal, are either eaten as food, or turned to some useful purpose in the arts. See *Pork*, *Leather*, *&c.*

PIGMENTS. These are noticed under the *respective colours*.

PIKE. The *esox lucius* (Linn.), of the order of soft-finned abdominal fishes (*malacopterygii abdominales*). It is remarkable for its voracity, but is highly esteemed by epicures. Various parts of it were formerly used in medicine. The *fat* (*oleum lucii piscis*) was one of the simples of the Ph. L. of 1618, and was esteemed as a friction in catarrhs. It is even now used in some parts of Europe to disperse opacities of the cornea.

PILCHARD. The *clupea pilchardus*, a fish belonging to the same genus, and closely resembling the common herring, than which, however, it is smaller, but thicker and rounder, and more oily. It abounds on the coasts of Devon and Cornwall, where it is not only consumed as food, but pressed for its oil.

PILES. Syn. *Hæmorrhoides*,—Lat. A painful disease occasioned by the morbid dilatations of the veins at the lower part of the rectum, and surrounding the anus.

Piles are principally *occasioned* by costiveness and cold; and, occasionally, by the use of acrid food. They have been distinguished into—*blind piles*, or a varicose state of the veins without bleeding,—*mucous piles*, when the tumours are excoriated, and mucus or pus is discharged,—*bleeding piles*, when accompanied with loss of blood, and—*excrescential piles*, when there are loose fleshy excrescences about the verge of the anus and within the rectum.

The *treatment of piles* consists in the administration of *mild aperients*, as castor oil, or an electuary of sulphur and cream of tartar. When there is *much inflammation* or *bleeding*, cold and astringent lotions, as those of sulphate of zinc or alum, should be applied; and when the *pain is considerable*, fomentations of decoction of poppy heads may be used with advantage. To *arrest the bleeding*, ice is also frequently applied, but continued pressure is more certain. *When* the *tumours are large* and *flaccid*, the compound ointment of galls is an excellent application; and if there is a *tendency to inflammation*, a little liquor of diacetate of lead may be added. In *confirmed piles*, the internal use of copaiba, or still better, of the confection of black pepper, should be persevered in for some time, together with local applications. In *severe cases* the protruded tumours are removed by surgeons, by the knife or ligature. See *Ointments*, *Electuaries*, *&c.* (and *below*.)

PILL COCHIA. See *Compound Colocynth Pills*.

PILL RUFI. See *Pills of Aloes with Myrrh*.

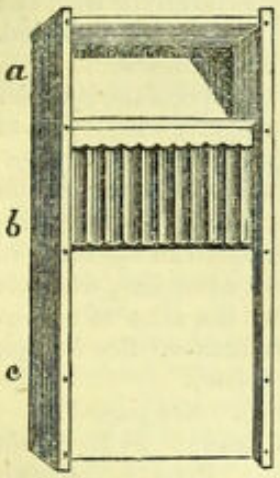
PILLS. Syn. *Pilulæ*,—Lat. *Pilules*, *Saccharolés Solides*,—Fr. Pills are little balls, of a semi-solid consistence, composed of various medicinal substances, and intended to be taken whole. The facility with which they are made and administered, their comparatively little taste, their power of preserving their properties for a considerable length of time, and, lastly, their portability and inexpensiveness, have long rendered them the most frequently employed and the most popular form of medicine.

The *rapid* and *skilful preparation* of *pills* from all the numerous substances of which they are composed, is justly considered to demand the highest qualifications in the practical dispenser. The *medicinals* employed must be made into a consistent and moderately firm mass, sufficiently plastic to be rolled or moulded into any shape, without adhering to the fingers, knife, or slab, and yet sufficiently solid to retain the globular form when divided into pills. A few substances, as certain extracts, &c., are already in this condition; but the others require the use of an excipient to give them the requisite bulk or consistence. As a *general rule*, all the constituents of a pill which can be pulverized, should be reduced to fine

powder, before mixing them with the soft ingredients which enter into its composition; and these last, or the excipient, should next be gradually added, and the mixture triturated and beaten until the whole forms a perfectly homogeneous mass. It is then ready to be divided into pills. This is effected by rolling it on a slab, with a pill or bolus knife, into small pipes or cylinders, then dividing these into pieces of the requisite weight; and, lastly, rolling them between the thumb and finger to give them a globular form. A little *powdered liquorice-root* or *starch* is commonly employed to prevent the pills adhering to the fingers, or to each other, after they are made. *Magnesia*, so frequently used for this purpose, is unsuited for pills containing metallic salts or the alkaloids, or other remedies which are exhibited in very small doses.

Instead of forming the mass into pills by hand, in the manner just referred to, a convenient and simple instrument, called a "*pill machine*," is now generally used by the

Fig. 1.



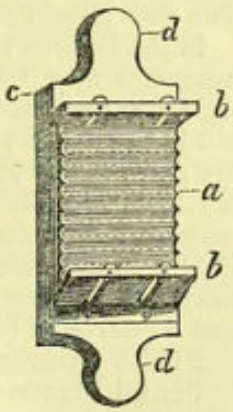


Fig. 2.

druggists for the purpose. This consists of two pieces. The *first* (see *fig.* 1) is divided into three compartments;—*c* is a vacant space to receive the divided mass, which is to be rolled into pills;—*b* is a grooved brass plate, which assists in dividing the mass into pills; and—*a* is a box for containing the powder for covering the pills, and to receive them as they are formed. The *second* (see *fig.* 2) consists of a brass plate (*a*), grooved to match the plate *b* in *fig.* 1, and bounded at both ends by moveable projecting plates (*b b*), containing each two wheels under the ledge of the plate (*b*); and a wooden back (*c*), with two handles, (*d d*), to which this plate is affixed. In *using* this machine, the pill-mass is rolled into a cylindrical form on the front part of it, by means of *fig.* 2 inverted; the small roll is then laid on the cutting part of the instrument (1, *b*), and divided by passing *fig.* 2. over it, the little wheels enabling the latter to run easily on the brass plate which forms the margin of the bed of the machine. The pills, thus formed, are then drawn forward on to the smooth bed on which the mass was first rolled, and receive a finishing turn or two with the smooth side of the "cutter," by which they are rendered more nearly spherical. They are, lastly, thrown over into 1, *c*, ready to be transferred to the pill-box.

The *nature* of the *excipient* should be suited to that of the active ingredients in pills, as well as in all other forms of medicine. *Soft extracts*, and other substances of a like character, may be rendered more consistent by the addition of any simple powder, as that of liquorice or sugar. *Vegetable powders* are generally beaten up with syrup or treacle, and *heavy powders* with conserve of roses, or extract of liquorice. Castile soap (made of olive oil and soda) and medicinal soft-soap (made of olive oil and potash) are commonly employed for *fatty* and *resinous matters*, as well as for many others which are not decomposed by alkalies. When the chief ingredient of the mass is *resin*, rectified spirit is frequently used to soften it, either with or without the addition of soap to increase its solubility in the stomach. For many substances no excipient is required. Thus, most of the *gum-resins* and *stiff extracts* may be at once made into pills, or, at all events, after being slightly softened by heat. *Mucilage*, formerly so much used in the preparation of pills, is now only employed for those which are to be taken within a day or two after being made; as pills containing it become so hard and insoluble when kept for some time, as to resist the action of the stomach, and frequently to pass through the bowels without even losing their form.

It may be further remarked, that no *deliquescent salt* should enter into the composition of pills not intended for immediate use; and that when *efflorescent salts* are so employed, they should be first freed from their water of crystallization.

When the *mixed ingredients* are made into a mass (*pill-mass*) which it is not intended at once to divide into pills, it should be *preserved* in a piece of bladder or gut-skin placed in a covered stoneware or earthenware pot. In this state it may be occasionally moistened with a little weak spirit to prevent its getting hard.

The *weight* (size) of *pills* varies from ½ gr.

to 6 gr. If heavier than this, they are called *boluses*. Formerly, as a general rule, they were made of 5 gr. each; but pills of this weight are, in general, so large, that some persons find a difficulty in swallowing them. Another disadvantage of large pills is the trouble of nicely apportioning the dose,—*one* pill being, perhaps, too small a quantity, and *two* pills the reverse. Hence, 2 to 3-gr. pills are now the favorite size with both pill-takers and dispensers, notwithstanding that 5-gr. pills are still ordered in one of the British pharmacopœias.

Pills are occasionally *coated* with gold, silver, and other substances to render them more agreeable to the eye, or to prevent the taste of nauseous ingredients affecting the palate during deglutition. They are *gilded* and *silvered* by placing them, in the moist state, on a leaf or two of the metal in a small gallipot, and covering them in a similar manner with another leaf of metal; over the mouth of the gallipot is laid a piece of smooth writing paper, and on this the palm of the hand; a sudden and rapid circular motion is then given to the whole. If the pills are not sufficiently moist or sticky, they should be rendered so, by rolling them between the fingers *very slightly* moistened with mucilage, before proceeding to silver them. *Another method*, is to shake them in a similar manner with a little gold or silver dust.

When *pills* are to be covered with *gelatine*, each pill being stuck on the point of a very thin wire four or five inches in length, is dipped into a *solution of gelatine*, so as to coat it completely, and the wire is then inserted into a pin-cushion, or a vessel containing fine sand, and left until the gelatine is firm, which occurs in about a quarter of an hour; the pins may then be easily removed by simply warming them, by placing the centre of each for a second or two in the flame of a spirit lamp or candle. "*Sugar coated pills*" are prepared in nearly the same way, but substituting hot and highly concentrated syrup, to which a little gelatine has been added, for a simple solution of gelatine.

M. Durden covers pills with *collodion*. We have frequently used the *traumaticine* of the Gutta Percha Company for this purpose, for which a solution of gutta percha in either chloroform or bisulphuret of carbon may be substituted. The ready solubility in the stomach of pills thus covered has, with justice, been questioned. Gelatine, or still better, gelatine mixed with a little sugar, is unexceptionable in this respect; whilst it undoubtedly excludes the taste of nauseous medicines more effectually than any other substance.

As *pill-masses* are liable to *get hard* and *brittle by keeping*, an excellent plan is to keep the dry ingredients powdered and mixed together in well-corked bottles or jars, when a portion may at any time be beaten up with syrup, conserve, soap, &c., according to the formula, and as wanted for use. The mixed ingredients in this state are technically known as "*species*" or "*powder for*" the respective pills.

"It is generally said, that pills should be taken on an empty stomach, and at a considerable distance from a meal; but for ourselves, we think that it is nearly always better to take them during a meal; first, because the stomach does not then find itself immediately under the influence of substances, which, if not always dangerous, seldom fail to act more or less disagreeably; secondly, because its absorbent action is more certain; and, lastly, because they are then taken more easily." (Trousseau & Reveil.) The meal here referred to should be a light one, from which acidulous and other substances likely to interfere with the action of the remedy should be excluded. The dose should also be increased.

In the London pharmacopœia the singular number is now very properly employed to express the names of the officinal pill-masses; but in the other pharmacopœias the names are given in the plural form. As the latter is almost universally adopted in speaking of magistral formulæ and nostrums, we have used it in *all* cases for the sake of uniformity, and for ease of reference. See *Boluses* and *Prescribing* (and *below*).

PILLS (Abernethy's). See *page* 1.

PILLS (Acetate of Lead). Syn. *Pilulæ Plumbi Acetatis*,—Lat. *Prep.* 1. *Acetate of lead*, 20 gr.; *powdered camphor*, 15 gr.; *conserve of roses*, q. s.; mix, and divide into 12 pills.

2. (Radius.) *Acetate of lead* and *powdered mallow* or *liquorice root*, of each, ½ dr.; *simple syrup*, q. s.; divide into 18 pills. *Dose.* 1 to 5 daily, washed down with water soured with vinegar; as a powerful astringent in hæmorrhages, diarrhœa, the night-sweats in phthisis, &c. See *Opiated Lead Pills.*

PILLS (Acetate of Mercury). Syn. *Pilulæ Hydrargyri Acetatis*,—Lat. *Prep.* 1. *Acetate of mercury*, 18 gr.; *sugar of milk* (or *manna*), 1 dr.; *mucilage*, q. s.; divide into 24 pills. *Dose.* As an *alterative*, 1 daily; as a *sialogogue*, 1 every 4 or 5 hours, or oftener; in syphilis, &c. See *Keyser's Pills.*

2. (*Opiated*,—Carmichael.) *Acetate of mercury, camphor*, and *opium*, of each, 30 gr.; *syrup of poppies* to mix. For 30 pills. Less apt to affect the stomach and bowels than the last.

PILLS (Acetate of Morphia). Syn. *Pilulæ Morphiæ Acetatis*,—Lat. *Prep.* 1. *Acetate of morphia*, 2 gr.; *sugar of milk*, 15 gr.; *conserve of roses*, 20 gr.; for 12 pills. Anodyne, sedative, and soporific. *Dose.* One, as required.

2. (Dr. A. T. Thomson.) *Acetate of morphia*, 1 gr.; *powdered foxglove*, 6 gr.; *powdered camphor*, 10 gr.; *powdered gum arabic*, 8 gr.; *syrup of tolu*, q. s.; to be divided into 6 pills. Sedative and antispasmodic. *Dose.* One, every 3 or 4 hours; in phthisis, palpitations, spasms, &c. The *hydrochlorate of morphia* may be used instead of the acetate, with advantage.

PILLS (Aconite). Syn. *Pilulæ Aconiti, P. Extracti A.*,—Lat. *Prep.* (Dr. Turnbull.) *Alcoholic extract of aconite*, 1 gr.; *liquorice powder*, 12 gr.; *simple syrup*, q. s.; mix, and divide the mass into 6 pills. *Dose.* One pill, every 3 or 4 hours; as a powerful anodyne and sedative in excessive action of the heart, acute rheumatism, gout, neuralgia, &c. The utmost care should be taken both in their preparation and administration.

PILLS (Alibert's). See *Aperient Pills.*

PILLS (Aloes). Syn. *Pilulæ Aloeticæ; Pilulæ Aloes*,—Ph. E. *Prep.* 1. (Ph. E.) *Socotrine aloes* (in powder) and *Castile soap*, equal parts; *conserve of red-roses*, q. s. to form a pill-mass.

2. (Ph. U. S.) *Powdered aloes* and *Castile soap*, equal parts, beat into a mass, and divided into 4-gr. pills.

Obs. "This pill may be also correctly made with the finer qualities of East Indian aloes, as the (true) Socotrine variety is very scarce; and many, not without reason, prefer (pure) Barbadoes aloes." (Ph. E.) The *dose*, as a *laxative*, is 5 to 10 gr.; as a *purgative*, 12 to 20 gr., or more. See *Aloes Pills with Soap.*

PILLS (Aloes,—Compound). Syn. *Pilulæ Aloeticæ Compositæ; Pilula Aloës Composita*,—Ph. L. *Pilulæ A. Compositæ*,—Ph. D. *P. ex Aloë*,—Ph. L. 1788. *Prep.* 1. (Ph. L.) *Socotrine aloes* (in powder), 1 oz.; *extract of gentian*, ½ oz.; *oil of caraway*, 40 drops; *treacle*, q. s.; the whole to be beaten together until they form a mass proper for making pills.

2. (Ph. D.) *Hepatic aloes* (in powder), 2 *oz.*; *extract of gentian* and *treacle*, of each, 1 *oz.*; *oil of caraway*, 1 fl. dr.; as the last.

Obs. The above is a very valuable purgative in habitual costiveness and indigestion, in all cases in which the use of aloes is not contra-indicated. The *dose* is from 5 to 15 gr., or more.

PILLS (Aloes,—Diluted). Syn. *Pilulæ Aloës Dilutæ*,—Lat. *Prep.* (Dr. Marshall Hall.) *Barbadoes aloes, Castile soap, extract of liquorice*, and *treacle*, equal parts; *water*, q. s.; dissolve, with heat, strain, and evaporate to the consistence of a pill-mass. Resembles the *pilula aloës cum sapone*, Ph. L.

PILLS (Aloes and Assafœtida). Syn. *Pilulæ Aloës et Assafœtida*,—Ph. E. *Prep.* (Ph. E.) *Aloes* (Socotrine or East Indian, powdered), *assafœtida*, and *Castile soap*, equal parts; beat them with *conserve of red-roses* to a proper pill-mass. *Dose.* 5 to 10 gr., once or twice daily, as a stomachic tonic and laxative, in dyspepsia, flatulence, &c.; and 12 to 20 gr., as a purgative in similar cases. It is extremely useful in costiveness, with flatulency, occurring in hysterical and hypochondriacal subjects.

PILLS (Aloes and Ginger). Syn. *Pilulæ Aloës et Zingiberis*,—Lat. *Prep.* (Ph. D. 1826.) *Aloes*, 1 oz.; *Castile soap*, ½ oz.; *ginger*, 1 dr.; *oil of peppermint*, ½ dr.; beaten to a mass. A useful laxative in cold habits. *Dose.* As the last.

PILLS (Aloes and Ipecacuanha). Syn. *Dr. Baillie's Dinner Pills; Pilulæ Aloës et Ipecacuanhæ*,—Lat. *Prep.* (Dr. Baillie.) *Powdered aloes*, 30 gr.; *powdered ginger* (finest), 45 gr.; *ipecacuanha*, 12 gr.; *syrup of orange peel*, q. s. to mix. For 24 pills. *Dose.* One, about an hour before dinner.

PILLS (Aloes and Iron). Syn. *Pilulæ Aloës et Ferri*,—Ph. E. *Prep.* (Ph. E.) *Sulphate of iron*, 3 parts; *Barbadoes aloes*, 2 parts; *aromatic powder*, 6 parts; *conserve of red roses*, 8 parts; powder the aloes and sulphate of iron separately, beat the whole to a mass, and divide this into 5-gr. pills. An excellent medicine in chlorosis, hysteria, and atonic amenorrhœa. *Dose.* 1 to 3 pills daily.

PILLS (Aloes and Mastic). See *Dinner Pills.*

PILLS (Aloes and Mercury). Syn. *Pilulæ Aloës cum Hydrargyro*,—Lat. See *Abernethy's Pills* (*p.* 1).

PILLS (Aloes and Myrrh). Syn. *Pilula Aloës cum Myrrhâ*,—Ph. L. & D. *Pilulæ Rufi*, or *Communes*,—Ph. L. 1720. *Pil. Aloës et Myrrhæ*,—Ph. E. *Rufus's Pills, Common do*,—Obs. *Prep.* 1. (Ph. L.) *Socotrine* or *hepatic aloes* (in powder), ½ oz.; *saffron, myrrh* (powdered), and *soft soap*

(Ph. L.), of each, 2 dr.; *treacle*, q. s. to form a pill-mass.

2. (Ph. D.) *Hepatic aloes*, 2 *oz.*; *myrrh*, 1 *oz.*; *dried saffron*, ½ *oz.*; all in powder; *treacle*, 2½ *oz.*

3. (Ph. E.) *Aloes* (Socotrine or East Indian), 4 parts; *myrrh*, 2 parts; *saffron*, 1 part; beat them to a pill-mass with *conserve of red-roses*, q. s.

4. (Ph. L. 1836, and Ph. D. 1826.) *Aloes* (in powder), 2 oz.; *saffron* and *powdered myrrh*, of each, 1 oz.; *syrup*, q. s. to form a pill-mass.

Obs. This compound is a most excellent stomachic purgative and emmenagogue, when there are no febrile symptoms present. It is said to have been employed ever since the time of Rhazes, and is still in extensive use. *Dose.* 10 to 20 gr.

PILLS (Aloes and Rhubarb). Syn. *Pilulæ Aloës et Rhei, P. A. cum Rheo,*—Lat. *Prep.* Powdered *Socotrine* or *hepatic aloes*, powdered *rhubarb*, and *soft soap* (Ph. L.), of each, ½ dr.; *oil of chamomile*, 10 drops; for 30 pills. *Dose.* 1 to 5, either as a stomach tonic or laxative; especially in dyspepsia with loss of appetite.

PILLS (Aloes and Rose-juice). Syn. *Pilulæ Aloës Rosatæ,*—Lat. *Pilules Angeliques, Grains de Santé,*—Fr. *Prep.* Take *aloes* and *rose-juice*, of each, 4 oz.; *juices of borage* and *chicory*, of each, 2 oz.; dissolve with heat, evaporate to an extract, add of *rhubarb*, 2 dr.; *agaric*, 1 dr.; and divide the mass into 1½-gr. pills. *Dose.* 4 to 12, as a purge.

PILLS (Aloes with Soap). Syn. *Pilula Aloës cum Sapone,*—Ph. L. *Prep.* (Ph. L.) Powdered *extract of Barbadoes aloes*, *soft soap*, and *extract of liquorice*, equal parts; *treacle*, q. s. to form a pill-mass. *Dose.* 10 to 20 gr.; in the usual cases in which aloes is administered. It is more readily soluble in the juices of the primæ viæ, and is milder than most of the aloetic pills without soap. See *Pills* (Aloes,—Diluted).

PILLS (Alterative). Syn. *Pilulæ Alterantes,*—Lat. See *Calomel, Mercurial,* and *Plummer's Pills, &c.*

PILLS (Alum). Syn. *Pilulæ Aluminis, P. A. Compositæ,*—Lat. *Prep.* 1. (Augustin.) *Alum*, 20 gr.; *benzoic acid*, 6 gr.; *powdered gum* and *white sugar*, of each, 10 gr.; *water*, q. s. to form a mass. For 36 pills. In phthisis, and atonic mucous discharges. The whole to be taken in the course of 2 or 3 days.

2. (Capuron.) *Catechu*, 1 dr.; *alum*, ½ dr.; *opium*, 10 gr.; *syrup of red-roses*, q. s.; divide into 5-gr. pills. *Dose.* 1 to 3; in chronic diarrhœa and leucorrhœa.

3. (Radius.) *Alum* and *catechu*, equal parts; *extract of gentian*, q. s. to mix; divide into 2 or 3-gr. pills. *Dose.* 2 to 4 every four hours; in passive hemorrhages, mucous discharges, and chronic diarrhœa.

PILLS (Ammoniacum). Syn. *Pilulæ Ammoniaci,*—Lat. *Prep.* 1. *Gum ammoniacum*, 1 dr.; *powdered sugar*, ½ dr.; *conserve of hips*, q. s. In old coughs and hysterical affections.

2. (*Compound.*)—*a.* (Ainslie.) *Ammoniacum*, 1 dr.; *mercurial pill*, 15 gr.; *powdered squills*, 6 or 8 gr.; *simple syrup*, q. s. For 16 pills. In asthmatic coughs with deranged action of the liver. *Dose.* One, 2 or 3 times a day.

b. (W. Cooley.) *Ammoniacum* and *sagapenum*, of each, 1 dr.; *dried sulphate of iron*, ½ dr.; *conserve of hips*, q. s. In obstructed menstruation, and in the chronic diarrhœa of hysterical subjects.

PILLS (Ammoniated Copper). Syn. *Pilulæ Cupri Ammoniati,*—Ph. E. *P. C. Ammoniureti,*—Ph. E. 1839. *Prep.* (Ph. E.) *Ammoniated copper* (in fine powder), 1 part; *bread-crumb*, 6 parts; *solution of carbonate of ammonia*, q. s. to make a mass, which is to be divided so that each pill may contain ½ gr. of ammoniated copper. In epilepsy, and in some other spasmodic diseases. *Dose.* 1 pill, night and morning, gradually increased to 5 or 6.

PILLS (Ammoniated Iron). Syn. *Pilulæ Ferri Ammoniati, P. F. Ammonio-chloridi,*—Lat. *Prep.* 1. (Dr. Copland.) *Ammoniated iron*, 1 dr.; *aloes* and *extract of gentian*, of each, ½ dr.; for 30 pills. In scrofula, chlorosis, amenorrhœa, &c.

2. (Radius.) *Ammoniated iron* and *galbanum*, of each, 1 dr.; *assafœtida*, 2 dr.; *castor*, 20 gr.; *tincture of valerian*, q. s. For 3-gr. pills. *Dose.* 2 pills, night and morning; in atonic nervous disorders, epilepsy, &c.

PILLS (Ammonio-citrate of Iron). Syn. *Pilulæ Ferri Ammonio-citratis,* — Lat. *Prep.* (Beral.) *Ammonio-citrate of iron*, 1 dr.; *white sugar*, 3 dr.; *mucilage*, q. s. to mix. For 3-gr. pills. *Dose.* 1 to 3 or more; as a mild chalybeate tonic.

PILLS (Analeptic). See *James's Pills, &c.*

PILLS (Anderson's Scot's). Various formulæ for these pills are extant, the products of which differ widely from the genuine article. Dr. Paris, some years since, declared that they consisted of *Barbadoes aloes*, *jalap*, and *oil of aniseed.* A careful examination of the proprietary article, with other facts that have come to our knowledge, leads us to believe that the

first of the following formulæ is the one now employed in the preparation of the "*Grana Angelica*," or "*Anderson's True Scot's Pills*," of the present day.

Prep. 1. (Anat. of Quackery.) From *Barbadoes aloes*, 7 *lb.*; *jalap* (in fine powder), 2¼ *lb.*; *treacle*, ½ *lb.*; *soap*, 6 *oz.*; melted together by the heat of a water-bath, and when partly cold, aromatized by stirring in of *oil of aniseed*, 1 *oz.* The mass is divided into about 3½-gr. pills, of which 26 or 27 are placed in each 1*s.* 1½*d.* box. A mild and useful aperient. *Dose.* 5 to 15 gr., or more.

2. (Original Formula.) *Socotrine aloes*, 1 oz.; *best myrrh*, ¼ oz.; *saffron*, 1 dr.; separately pounded very fine; mix them in an earthen pipkin, with a spoonful each of *water* and *sweet oil*, by the heat of a slow fire, and form the mass into "common sized pills." For a copy of the original document in the "Chapel of the Rolls," see *Med. Circ.*, vol. ii, p. 248.

3. (P. Cod.) *Aloes* and *gamboge*, of each, 6 dr.; *oil of aniseed*, 1 dr.; *syrup*, q. s.; mix, and divide into 4-gr. pills. Much more powerful than the preceding, and closely resembling Morison's No. 2 pills.

4. (Phil. Coll. of Pharm.) *Barbadoes aloes* (in powder), 3 ℔; *Castile soap*, ½ ℔; *colocynth* and *gamboge* (both in fine powder), 2 oz.; *oil of aniseed*, 1 oz.; beat to a mass with *water*, q. s., and divide it into 3-gr. pills. Less active than the last; but more so than the "*True Scot's Pills.*"

PILLS (Anodyne). Syn. *Pilulæ Anodynæ*,—Lat. *Prep.* 1. (Hosp. F.) *Opium* (in powder), 6 gr.; *camphor*, 15 gr.; *conserve of roses*, q. s.; divide into 12 pills. *Dose.* 1 to 3, as required.

2. (A. T. Thomson.) *Calomel*, *potassio-tartrate of antimony*, and *opium*, equal parts; *syrup of saffron*, q. s.; divide into 3½-gr. pills. In acute rheumatism and neuralgia. *Dose.* 1 pill, at bedtime.

PILLS (Antibilious). All the ordinary *aperient* and *stomachic pills* may be classed under this head. See the *names* of their proprietors or reputed inventors, or those of their leading ingredients.

PILLS (Antichlorotic). Syn. *Pilulæ Antichloroticæ*,—Lat. *Prep.* 1. (Radius.) *Aloes* and *carbonate of iron*, of each ½ dr.; *gum ammoniacum*, 1 dr.; *extract of taraxacum*, q. s. For 3-gr. pills. *Dose.* 2 to 6, night and morning; in chlorosis, amenorrhœa, &c.

2. (Trousseau & Reveil.) *Porphyrized iron filings*, 1 dr.; *extract of wormwood*, q. s. For 36 pills. *Dose.* 3 or 4; as the last.

PILLS (Antimonial,—Compound). Syn. *Pilulæ Antimonialis Compositæ*, *P. Antimonii Co.*,—Lat. *Prep.* 1. *Antimonial powder*, ½ dr.; *calomel*, *camphor*, and *powdered opium*, of each, 6 gr.; *conserve of roses*, q. s.; divide into 4-gr. pills. *Dose.* Two, at night; in acute rheumatism, neuralgia, chronic coughs, &c.

2. (St. B. Hosp.) *Tartar emetic*, 1 gr.; *guaiacum* and *pill of aloes and myrrh*, of each, ½ dr.; *treacle*, to mix. For 16 pills. As the last.

PILLS (Antispasmodic). Syn. *Pilulæ Antispasmodicæ*,—Lat. *Prep.* (Dr. A. T. Thomson.) *Opium*, 1 gr.; *Russian castor*, 13 gr.; *powdered digitalis*, 2 gr.; *syrup*, to mix; divide into 4 pills. *Dose.* 1 or 2, two or three times a day; in spasmodic asthma, difficulty of breathing, &c. Several other formulæ for *antispasmodic pills* will be found both above and below.

2. (Trousseau & Reveil.) *Musk*, 15 gr.; *extract of valerian*, ½ dr.; *liquorice powder*, q. s. For 20 pills. *Dose.* 1 every two hours until there is a marked improvement in the symptoms; in pneumonia, accompanied by delirium, especially in drunkards; in spasms of the uterus, and in various other spasmodic affections.

PILLS (Aperient). Syn. *Pilulæ Aperientes*,—Lat. *Prep.* 1. *Hepatic aloes*, 2 dr.; *rhubarb* and *Castile soap*, of each, 1 dr.; *scammony*, ½ dr.; (all in powder;) *essential oil* (at will), 10 or 12 drops; beaten to a smooth mass, and divided into pills.

2. *Compound extract of colocynth* (Ph. L. 1836), 1½ dr.; *extract of gentian*, ½ dr.; *powdered ipecacuanha*, 20 gr.; *oil of cloves*, *caraway*, or *cassia*, a few drops. In dyspepsia, loss of appetite, &c.

3. (Abernethy's.) See *page* 1.

4. (Alibert's.) From *calomel*, *resin of jalap*, and *Castile soap*, of each, 1 dr.; *oil of orange-peel* or *citron*, 6 or 8 drops. For 60 pills. As an occasional mild purgative, especially in bilious habits and worms.

5. (Sir B. Brodie.) *Compound extract of colocynth* and *mercurial pill*, of each, ½ dr.; *scammony* and *Castile soap*, of each, 15 gr.; *oil of caraway*, 6 or 7 drops. For 24 pills. As the last.

6. (W. Cooley.) *Aloes*, 1½ dr.; *jalap* and *Castile soap*, of each, 1 dr.; *rhubarb* and *cardamoms*, of each, ½ dr.; (all in powder;) *oil of juniper*, 12 drops. For 3-gr. pills. A useful mild aperient, for either frequent or occasional use.

7. (Dr. Copland.) *Compound extract of colocynth* (Ph. L. 1836), 40 gr.; *extract*

of henbane, 30 gr.; *Castile soap*, 12 gr.; *ipecacuanha*, 6 or 7 gr. For two dozen pills. *Dose.* 2, on retiring to rest. As an aperient in nervous affections and irritable habits.

8. (Harvey.) *Mercurial pill* and *powdered aloes*, of each, ½ dr.; *ginger*, 20 gr. For 24 pills. In constipation attended with a deficiency of bile.

9. (Dr. Neligan.) *Compound colocynth pill* and *soap of jalap*, equal parts; either with or without a few drops of some *aromatic essential oil*. For 4 or 5-gr. pills. As an aperient for general use.

10. (Sir C. Scudamore.) *Compound extract of colocynth*, 40 gr.; *extract of rhubarb*, ½ dr.; *scammony* and *soap*, of each, 12 gr.; *oil of caraway*, 5 or 6 drops. For 20 or 24 pills.

11. (*Stahl's Pills; Pilulæ Aperientes Stahlii*,—Ph. Hannov.) *Powdered aloes*, 1 oz.; *compound extract of colocynth*, ½ oz.; *iron filings*, 2 dr.; *mucilage*, q. s. In amenorrhœa, low habits, and worms.

12. (Vance.) *Compound extract of colocynth*, 80 gr.; *extract of rhubarb*, 12 gr.; *Castile soap*, 6 or 8 gr.; *oil of cinnamon*, 4 or 5 drops.

Obs. The products of the above formulæ may be divided into pills of any size deemed most agreeable to the patient, and they may be aromatized by the addition of any essential oil at will. The *dose* varies, according to circumstances, from 5 to 10 or 12 gr., or more. Those containing aloes or mercurials are best taken at bedtime. For *other formulæ*, see the various officinal and other pills containing *aloes*, *colocynth*, *gamboge*, *rhubarb*, *scammony*, &c.

PILLS (Arabian). See *Cholera Pills*.

PILLS (Aromatic). Syn. *Pilulæ Aromaticæ*,—Lat. *Prep.* (Ph. L. 1746.) *Compound powder of aloes*, 3 oz.; *balsam of Peru*, ½ oz.; *syrup of orange-peel*, q. s. Aperient, sudorific, and nervine. *Dose.* 10 to 20 gr.

PILLS (Arseniate of Iron). Syn. *Pilulæ Ferri Arseniatis*,—Lat. *Prep.* (Biett.) *Arseniate of iron*, 3 gr.; *extract of hops*, 2 dr.; *powdered mallow-root*, ½ dr.; *syrup*, q. s. For 48 pills. *Dose.* 1 to 2, daily; in cancerous, scrofulous, and herpetic affections.

PILLS (Arseniate of Soda). Syn. *Pilulæ Sodæ Arseniatis*,—Lat. *Prep.* (Erasmus Wilson.) *Arseniate of soda*, 2 gr.; *distilled water*, the smallest possible quantity to dissolve it; *powdered gum guaiacum*, ½ dr.; *oxysulphuret of antimony*, 20 gr.; *mucilage*, q. s. For 24 pills. *Dose.* 1 pill, as the last; in herpes, &c.

PILLS (Arsenical). Syn. *Asiatic Pills*, *Carnatic do.*, *East Indian do.*, *Tanjore do.*; *Pilulæ Arsenici*, *P. Arsenicalis*, *P. Asiaticæ*, *P. Acidi Arseniosi*,—Lat. *Prep.* (P. Cod.) *Arsenious acid*, 1 gr.; *black pepper* (in fine powder), 12 gr.; rub them together for some (considerable) time in an iron mortar, then add of *powdered gum*, 2 gr.; *water*, q. s. to make a mass; which is to be accurately divided into 12 pills. Each pill contains $\frac{1}{12}$ gr. of white arsenic.

Obs. This compound is commonly employed in the East Indies in syphilis, elephantiasis, intermittents, the bites of venomous snakes, &c.; and as a preventive to hydrophobia. The common practice in England is to employ 16 gr. of *pepper* to 1 gr. of *arsenious acid*, and to divide the mass into 16 instead of 12 pills. The *dose* is one or two pills daily, taken *after* a meal. The use of all compounds containing *arsenic* demands great caution.

PILLS (Arsenical, — Opiated). Syn. *Pilulæ Arsenici cum Opio*,—Lat. *Prep.* (A. T. Thomson.) *Arsenious acid*, 2 gr.; *powdered opium*, 8 gr.; *Castile soap*, 20 gr.; *simple syrup*, q. s. For 24 pills. *Dose.* As the last; in intermittents, herpes, lepra, psoriasis, periodical headaches, neuralgia, &c.

PILLS (Asiatic). See *Arsenical Pills*.

PILLS (Assafœtida). Syn. *Pilulæ Assafœtidæ*,—Ph. E. & U. S. *P. A. Compositæ*,—Ph. E. 1839. *Prep.* 1. (Ph. E.) *Assafœtida*, *galbanum*, and *myrrh*, of each, 3 parts; *conserve of red roses*, 4 parts, or q. s.; mix, and beat them to a proper pill-mass.

2. (Ph. U. S.) *Assafœtida*, 1½ oz.; *Castile soap*, ½ oz.; *water*, q. s.; divide into 240 pills.

Obs. The above (particularly the last) are stimulant and antispasmodic. *Dose.* 5 to 10 gr., twice or thrice daily; in hysterical affections, &c.

PILLS (Assafœtida,—Compound). Syn. *Pilulæ Assafœtidæ Compositæ*,—Ph. D. *Prep.* 1. (Ph. D.) *Assafœtida*, 2 oz.; *galbanum*, *myrrh*, and *treacle*, of each, 1 oz.; mix in a capsule, by the heat of steam or a water bath, and stir until it becomes a uniform mass. *Dose*, &c. As the last.

2. (Ph. E. 1817.) *Assafœtida*, *galbanum*, and *myrrh*, of each, 8 parts; *rectified oil of amber*, 1 part; *simple syrup*, q. s. As the last.

3. (Hosp. F.) *Assafœtida*, 1 dr.; *soft soap* (Ph. L.), 20 gr.; *ipecacuanha* and *squills*, of each (in powder), 12 gr.; *syrup*, q. s. *Dose.* 5 to 10 gr.; in chronic asthmas, coughs, &c.

PILLS (Assafœtida with Iron). Syn. *Pilulæ Assafœtidæ cum Ferro*,—Lat. *Prep.* (W. Cooley.) *Assafœtida*, 1 dr.; *extract of chamomile*. ½ dr.; mix with a slight heat, add of *dried protosulphate of iron*, 15 gr.; *oil of cajeput*, 10 drops; and divide into 36 pills. In hypochondriasis, hysteria, amenorrhœa, chlorosis, &c., after an aperient.

PILLS (Asthma). Syn. *Pilulæ Antasthmaticæ*,—Lat. *Prep.* 1. (*Expectorant.*) From *compound squill-pill*, 20 gr.; *calomel*, 5 gr.; *powdered opium*, 3 gr.; made into 6 pills. *Dose.* 1 or 2 at bedtime. Expectorant, and sometimes laxative.

2. (*Tonic.*) From *compound iron pill*, 2 dr.; *extract of gentian*, 1 dr.; mix, and divide into 60 pills. *Dose.* 2, night and morning, with an occasional dose of laxative medicine.

PILLS (Astringent). Syn. *Pilulæ Astringentes*,—Lat. See *Pills of Acetate of Lead, Alum, Gallic Acid, Nitrate of Silver, Tannin, Sulphate of Iron, &c.*

PILLS (Bacher's Tonic). Syn. *Pilulæ Tonicæ Bacheri*,—Lat. *Prep.* 1. (Dr. Paris.) *Extract of black hellebore* and *powdered myrrh*, of each, 1 oz.; *powdered blessed thistle*, 3 dr.; mix, and divide into 1-gr. pills. *Dose.* 2 to 6, three times a day.

2. (P. Cod.) *Alkaline extract of hellebore* and *extract of myrrh*, of each, 2 dr.; *powdered blessed thistle*, 1 dr. For 4-gr. pills. *Dose.* 1 or 2, as the last. An alterative tonic, hydragogue, and emmenagogue; in debility, dropsy, amenorrhœa, &c. A favorite remedy in some parts of Europe.

PILLS (Dr. Baillie's). *Prep.* (Anat. of Quackery.) *Aqueous extract of aloes* and *compound extract of colocynth*, of each, 3 dr.; *Castile soap*, 1 dr.; *oil of cloves*, 15 drops. For 4-gr. pills. A good occasional aperient. *Dose.* 1 to 3, at bedtime, or early in the morning. See *Dinner Pills.*

PILLS (Barbarossa's). These are supposed to have been the first mercurial preparation employed in medicine. They consisted of *quicksilver, rhubarb, musk*, and *amber.*

PILLS (Rev. D. Barclay's). *Prep.* (Anat. of Quackery.) *Resinous extract of jalap*, 1 dr.; *almond* or *Castile soap*, 1½ dr.; *extract of colocynth*, 2 dr. (or *powdered colocynth*, 3 dr.); *gum guaiacum*, 3 dr.; *potassio-tartrate of antimony*, 10 gr.; *oil of juniper*, 8 or 10 drops; *oils of caraway* and *rosemary*, of each, 4 drops; make a mass with *syrup of buckthorn* (the smallest possible quantity), and divide into 4-gr. pills. A diaphoretic aperient. *Dose.* 1 to 3, at bedtime.

PILLS (Dr. Baron's). *Prep.* From *compound rhubarb pill*, 30 gr.; *compound extract of colocynth*, 20 gr.; *powdered ipecacuanha*, 6 gr. For 3-gr. pills. An excellent stomachic aperient. *Dose.* 1 to 3 pills, at bedtime; in dyspepsia, loss of appetite, &c.

PILLS (Barthez's). *Prep.* From *myrrh*, 1 dr.; *aloes*, ½ dr.; *musk*, 15 gr.; *camphor*, 12 gr.; *balsam of Peru*, q. s. to form a mass. For 3½-gr. pills. *Dose.* 2, thrice daily; in hysteria, amenorrhœa, chlorosis, &c.

PILLS (Bath Digestive). *Prep.* (Anat. of Quackery.) *Rhubarb*, 2 oz.; *ipecacuanha* and *Castile soap*, of each, ½ oz.; *capsicum, ginger*, and *gamboge*, of each, ¼ oz.; (all in powder;) *syrup of buckthorn*, q. s. For 4-gr. pills. *Dose.* 1, as a dinner pill; 2 or 3, as an aperient.

PILLS (Bebeerine). Syn. *Pilulæ Bebeerinæ*,—Lat. *Prep.* From *sulphate of bebeerine*, ½ dr.; *aromatic confection*, q. s.; *oil of cajeput*, 5 or 6 drops. For 18 pills. *Dose.* 1 to 3, every four hours; as an antiperiodic, instead of bark or quinine.

PILLS (Bechic). *Pilulæ Bechicæ*,—Lat. *Prep.* (Trousseau & Reveil.) *Extract of digitalis*, 15 gr.; *white oxide of antimony*, 30 gr.; *extract of liquorice*, 40 gr.; mix carefully, and divide into 40 pills. Expectorant and sedative. *Dose.* 2 to 12, or more; in cases of irritating coughs, catarrh of the pulmonary capillaries or bronchia, &c. See *Cough Pills.*

PILLS (Beddoe's). *Prep.* From *dried* (effloresced) *carbonate of soda*, 1 dr.; *soap*, 1½ dr.; *oil of juniper*, 12 drops; *syrup of ginger*, q. s.; divide into 30 pills. In gravel, stone, &c. *Dose.* 2 to 5.

PILLS (Belladonna,—Compound). Syn. *Pilulæ Belladonnæ Compositæ*,—Lat. *Prep.* 1. (Ainslie.) *Extract of belladonna, mercurial pill*, and *powdered ipecacuanha*, equal parts. For 3-gr. pills. *Dose.* 1, night and morning; in cancerous and glandular affections.

2. (Debreyne.) *Camphor* and *assafœtida*, of each, 1 dr.; *extract of belladonna*, 20 gr.; *extract of opium*, 5 gr.; *syrup*, q. s. For 48 pills. *Dose.* 1 pill, gradually increased to 6, daily. In hysteria, amenorrhœa, &c.

PILLS (Belloste's). See *Mercurial Pills*,

PILLS (Bennet). See *Fuller's Pills.*

PILLS (Bichloride of Mercury). Syn. *Hoffmann's Pills; Pilulæ Hydrargyri Bichloridi, P. Majores Hoffmanni*,—Lat. *Prep.* 1. *Bichloride of mercury*, 3 gr.; *white sugar*, ½ dr.; triturate together in a glass mortar for some time, then add of *powdered gum arabic*, 20 gr.; and beat the

whole to a mass with *dilute hydrochloric acid*, q. s. For 36 pills, each containing $\frac{1}{12}$ gr. of corrosive sublimate.

2. (Brera.) *Bichloride of mercury*, 3 gr.; *rectified spirit*, the smallest possible quantity to dissolve it; *bread-crumb*, q. s. to form a mass. For 24 pills, each containing $\frac{1}{8}$ gr. of the bichloride.

3. (Dr. Paris.) *Corrosive sublimate* and *sal ammoniac*, of each, 5 gr.; *water*, $\frac{1}{2}$ fl. dr.; triturate together until solution is complete, then add of *honey*, $\frac{1}{2}$ dr.; *liquorice powder*, 1 dr. (*or*, q. s.); and divide into 40 pills. Each pill contains $\frac{1}{8}$ gr. of the bichloride.

4. (Ph. Hannov.) *Corrosive sublimate*, 15 gr.; *distilled water*, $\frac{1}{2}$ fl. dr.; *crumb of bread*, q. s. to form a mass. For 120 pills, each containing $\frac{1}{8}$ gr.

Obs. The above formulæ are among those most usually employed. Other authorities order pills containing $\frac{1}{16}$th of a gr. Dzondi orders $\frac{1}{20}$ gr., and Hüfeland only $\frac{1}{30}$ gr. in each pill. The *commencing dose* should not exceed 1 pill containing the $\frac{1}{12}$th of a grain, twice or thrice a day. It may afterwards be safely kept at $\frac{1}{8}$th of a grain. They are chiefly employed in syphilis, but are also occasionally exhibited with great advantage in glandular indurations and enlargements, and in cancer; due caution being observed.

PILLS (Bichloride of Platinum). Syn. *Pilulæ Platini Bichloridi*,—Lat. *Prep.* (Dr. Hoefer.) *Bichloride of platinum*, 7½ gr.; *extract of guaiacum*, 1 dr.; *liquorice powder*, q. s. For 24 pills. *Dose.* 1 pill, twice or thrice daily; as an alterative in syphilis, &c.

PILLS (Bicker's). *Prep.* From *rust* (carbonate) *of iron*, 2 dr.; *aloes*, *myrrh*, and *sulphur*, of each, 1 dr.; *ox-gall*, q. s. to mix. For 4-gr. pills. *Dose.* 1 to 6, morning and evening; in debility, chlorosis, &c.

PILLS (Bittersweet). Syn. *Pilulæ Dulcamaræ*,—Lat. *Prep.* (Radius.) *Extract of bittersweet* (dulcamara), 1 dr.; *crude antimony* and *bittersweet* (in powder), of each, ½ dr. For 3-gr. pills. *Dose.* 6 to 12, twice or thrice a day; in obstinate skin diseases.

PILLS (Blaud's). Syn. *Pilulæ Antichloroticæ*,— Lat. *Prep.* (Trousseau & Reveil.) *Sulphate of protoxide of iron*, 2 parts; reduce it to powder, and dry it in a stove at 104° Fahr.; add this to *dry carbonate of potassa*, 2 parts; *honey*, 1 part; and form the mass into 50 pills. Tonic and emmenagogue. *Dose.* 1 to 10, daily; in debility, chlorosis, &c.

PILLS (Blue). See *Mercurial Pills.*

PILLS (Bontius's). Syn. *Pilules de Bontius; Pilulæ Hydrogogæ, P. H. Bontii*,—Lat. *Prep.* (P. Cod.) *Socotrine aloes*, *gamboge*, and *gum ammoniacum*, of each, 1 dr.; *white-wine vinegar*, 6 dr.; dissolve by heat, at twice, press out the liquor, evaporate to a pilular consistence, and divide into 4-gr. pills. *Dose.* 1 to 3; as a strong cathartic, in dropsy.

PILLS (Brigg's Gout and Rheumatic). This nostrum is prepared by a grocer of Lincoln, and closely resembles in appearance, odour, and properties the *Plummer's pill* of the pharmacopœia; the two are probably identical. (Anat. of Quackery.)

PILLS (Bromide of Iron). Syn. *Pilulæ Ferri Bromidi*,—Lat. *Prep.* (Magendie.) *Bromide of iron* and *powdered gum arabic*, of each, 12 gr.; *conserve of roses*, 20 gr.; mix, and divide into 20 pills. They should be kept in a dry corked phial. Tonic and alterative. *Dose.* 1 to 2, night and morning; in debility, especially that of scrofulous habits, in chlorosis, &c.

PILLS (Brucine). Syn. *Pilulæ Bruciæ*,—Lat. *Prep.* (Magendie.) *Brucia* or *brucine*, 12 gr.; *confection of roses*, ½ dr.; carefully mixed and divided into 24 pills, which are recommended to be silvered. The quantity of the confection may be advantageously doubled. *Dose.* 1 pill, night and morning; in the same affections as those for which strychnine is administered. The acetate, hydrochlorate, or sulphate of brucia may be substituted for the alkaloid in the above formula, in a slightly larger quantity.

PILLS (Calomel). Syn. *Pilulæ Calomelanos, P. e Calomelane, P. Hydrargyri Chloridi; P. H. C. Mitis*,— Ph. U. S. *Prep.* 1. *Calomel*, 4 dr.; *powdered gum arabic*, 1 dr; *simple syrup*, q. s.; mix, and divide into 240 pills. Each pill contains 1 gr. of calomel. A convenient form of exhibiting this drug when uncombined with other remedies. *Dose.* 1 to 5 pills, according to the indication.

2. (U. C. Hosp.) *Calomel*, 2 dr.; *rhubarb*, 1½ dr.; *confection of senna*, q. s. For 4 dozen pills. An excellent alterative aperient, especially in hepatic affections.

PILLS (Calomel,— Compound). Syn. *Pilulæ Calomelanos Compositæ*,—Ph. E. & D. *Prep.* 1. (Ph. E.) *Calomel* and *golden sulphuret of antimony*, of each, 1 part; *guaiacum* (in powder) and *treacle*, of each, 2 parts; beat the whole to a pill-mass, and divide it into 6-gr. pills.

2. (Ph. D.) *Calomel* and *precipitated sulphuret of antimony*, of each, 1 *dr.*; triturate them together, then add of *guaiacum resin* (in powder), 2 *dr.*; *castor oil*, 1 *fl. dr.*; and beat the whole to a uniform

mass. For the London formula, dose, &c., see *Compound Pills of Chloride of Mercury.*

PILLS (Calomel and Opium). Syn. *Pilulæ Hydrargyri Chloridi cum Opio; P. Calomelanos et Opii,*—Ph. E. *Prep.* (Ph. E.) *Calomel,* 3 parts; *opium,* 1 part; *conserve of red-roses,* q. s.; divide the mass so that each pill may contain 2 gr. of calomel. *Dose.* 1 or 2 pills, in rheumatism, facial neuralgia, and various inflammatory affections. They offer a convenient form for gradually introducing mercury into the system, and, if continued, induce salivation.

PILLS (Camphor). Syn. *Pilulæ Camphoræ, P. Camphoratæ,* — Lat. *Prep. Camphor* and *sugar,* of each (in powder), 2 parts; *conserve of hips,* 1 part. For 3-gr. pills. Anaphrodisiac, sedative, diaphoretic, and nervine. *Dose.* 1 to 5, twice or thrice a day.

PILLS (Camphor,— Compound). Syn. *Pilulæ Camphoræ Compositæ, P. Camphoratæ C.,*— Lat. *Prep.* 1. (Dupuytren.) *Camphor,* 24 gr.; *pure musk,* 8 gr.; *opium,* 2 gr.; *syrup,* q. s.; divide into 12 pills. *Dose.* 1 to 4, three or four times daily; in putrescent sores, hospital gangrene, &c.

2. (Fr. Hosp.) *Gum ammoniacum,* 40 gr.; *camphor,* 30 gr.; *musk,* 10 gr.; *opium,* 5 gr.; *tincture of valerian,* q. s.; divide into 4-gr. pills. *Dose.* 2 to 6 pills daily; in nervous and hysterical affections, &c.

3. (Ricord.) *Camphor* and *lactucarium* (or *extract of lettuce*), equal parts; divide into 4-gr. pills. *Dose.* 3 to 6 daily; as an anaphrodisiac.

4. (U. C. Hosp.) *Camphor,* 20 gr.; *assafœtida,* 1 dr.; *extract of valerian,* 2 dr. For 30 pills. As No. 2.

PILLS (Cantharides). Syn. *Pilulæ Cantharidis, P. C. Compositæ,*—Lat. *Prep.* 1. *Cantharides* (in very fine powder), 8 gr.; *extract of gentian,* ½ dr.; *liquorice powder,* 10 gr. For 12 pills. *Dose.* 1 to 4 daily; as a diuretic, emmenagogue, &c.

2. (Ellis.) *Cantharides* (in very fine powder), 18 gr.; *opium* and *camphor,* 36 gr.; mix, and divide into 36 pills. *Dose.* 1 pill, at bedtime; as an aphrodisiac, in parties labouring under general debility. They should be used with extreme caution, and but seldom.

PILLS (Caoutchouc). Syn. *Pilulæ Gummi Elastici,* — Lat. *Prep.* (M. Bouis.) *Indian rubber,* cut into small squares or spheres, then moistened with *syrup of tolu,* and lastly, shaken in a box with a mixture of *powdered gum* and *sugar.* In phthisis. *Dose.* 1 pill, three or four times a day. They pass through the primæ viæ unaltered, and may therefore fairly be presumed to be inert. Probably these pills, like '*gutta percha pills*' and homœopathic globules, act through the imagination.

PILLS (Capsicum). Syn. *Cayenne Pepper Pills: Pilulæ Capsici,*—Lat. *Prep.* 1. (Guy's Hosp.) *Capsicum,* 1 part; *rhubarb,* 2 parts; (both in powder;) *treacle,* q. s.; mix, and divide into 3½-gr. pills. *Dose.* 1 to 3, an hour before dinner; to create an appetite and promote digestion.

2. (Radius.) *Powdered capsicum,* 20 gr.; *extract of gentian,* 1 dr.; *powdered gentian,* q. s. to form a mass. For 60 pills. *Dose.* 2 to 4 pills, thrice daily; in chronic dyspepsia, especially in the loss of tone of the stomach arising from intemperance.

PILLS (Carbonate of Iron). Syn. *Vallet's Pills; Pilulæ Ferri Carbonatis,* — Ph. E. *Prep.* (Ph. E.) *Saccharine carbonate of iron,* 4 parts; *conserve of red-roses,* 1 part; mix, and divide the mass into 5-gr. pills. *Dose.* 1 to 3, or more; as a mild chalybeate and antichlorotic. For another formula, see *Dr. Blaud's Pills* (above).

PILLS (Catarrh). Syn. *Pilulæ Anticatarrhales,*—Lat. *Prep.* 1. (Trousseau & Reveil.) *Turpentine,* 4 dr.; *ammoniacum,* 1 dr.; *balsam of tolu,* ½ dr.; *aqueous extract of opium,* 6 gr.; *liquorice powder,* q. s.; mix, and divide into 80 pills. *Dose.* 5 or 6 daily; in chronic catarrh of the bronchi and bladder.

2. (Trousseau & Reveil.) *Alcoholic extract of aconite,* 30 gr.; *sulphuret of calcium,* 15 gr.; *powdered sugar,* q. s. For 24 pills. *Dose.* 1 pill, three or four times daily; in chronic pulmonary catarrh.

PILLS (Cathartic). Syn. *Pilulæ Catharticæ,*—Lat. *Prep.* 1. (Dr. Collier.) *Calomel,* 10 gr.; *powdered jalap* and *prepared chalk,* of each, ½ dr.; *oil of caraway,* 10 drops; *syrup of buckthorn,* to mix; divide into 5-gr. pills. *Dose.* 1 to 4.

2. (Dr. A. T. Thomson.) *Scammony,* 4 gr.; *extract of taraxacum,* 16 gr.; divide into 6 pills. *Dose.* 3 pills, twice daily; in hypochondriasis, and chronic inflammation of the liver.

3. (A. T. Thomson.) *Calomel,* 15 gr.; *powdered jalap,* 45 gr.; *mucilage,* q. s. to mix. For 18 pills. *Dose.* 1 to 3, at night, to empty the bowels, in bilious affections. Other formulæ for cathartic pills will be found both above and below.

PILLS (Cathartic,—Compound). Syn. *Pilulæ Catharticæ Compositæ,*—Lat. *Prep.* (Ph. U. S.) *Compound extract of colocynth,* 4 dr.; *powdered extract of jalap* and *calomel,* of each, 3 dr.; *powdered gamboge,* 40 gr.; *water,* q. s.; mix, and divide into 180 pills. An excellent purgative, espe-

cially in bilious affections, dyspepsia, &c. *Dose.* 1 to 3 pills.

PILLS (Chamberlain's Restorative). A nostrum composed of *cinnabar* and *milk of sulphur*, equal parts; beaten up with *conserve of hips*.

PILLS (Chamomile). Syn. *Pilulæ Anthemidis, P. Florum Chamæmeli,* — Lat. *Prep. Extract of gentian*, 1 dr.; *powdered aloes*, ½ dr.; *powdered rhubarb*, 20 gr.; *oil of chamomile*, 10 drops. A tonic and stomachic aperient. *Dose.* 5 to 15 gr. This forms the "*chamomile pills*" of the shops. They should be kept in a corked phial.

PILLS (Chamomile,—Compound). Syn. *Pilulæ Anthemidis Compositæ,*—Lat. *Prep.* 1. (Ainslie.) *Extract of chamomile*, 1 dr.; *assafœtida*, ½ dr.; *powdered rhubarb*, 20 gr.; divided into 30, or better, 36 pills. *Dose.* 1, as a dinner pill; or 2 to 3, twice a day in flatulent dyspepsia.

2. (Mr. Beasley.) *Aqueous extract of aloes*, 12 gr.; *extract of chamomile*, 36 gr.; *oil of chamomile*, 3 drops. For 12 pills. *Dose.* 2 at night, or twice a day; in dyspepsia, loss of appetite, &c. See *Norton's Pills.*

PILLS (Chapman's). *Prep. Mastic*, 12 gr.; *aloes*, 16 gr.; *rhubarb*, 24 gr. For 12 pills. An excellent stomachic aperient. *Dose.* 2 to 4.

PILLS (Chirayta). Syn. *Dr. Reece's Pills; Pilulæ Chiraytæ,* — Lat. *Prep.* From *chirayta*, 2 dr.; *dried carbonate of soda*, 20 gr.; *powdered ginger* (best), 15 gr.; divided into 36 pills. *Dose.* 2, twice a day. In acidity, flatulence, and dyspepsia, especially when complicated with gout or debility.

PILLS (Chloride of Barium). Syn. *Pilulæ Barii Chloridi,*— Lat. *Prep.* 1. (Pierquin.) *Chloride of barium*, 1 dr.; *resin of guaiacum*, 4 dr.; *conserve of fumitory*, q. s.; divided into 188 pills. *Dose.* 1 pill, morning and evening, afterwards increased to 2; in tape-worm, and in the rheumatism of scrofulous subjects.

2. (Walsh.) *Chloride of barium*, 15 gr.; *powdered marsh-mallow* or *liquorice root*, and *mucilage of tragacanth*, of each, q. s. to make 200 pills. *Dose.* 3, gradually increased to 10 or 12 daily; in cancer, scrofula, goiture, syphilis, &c.

PILLS (Chloride of Calcium). Syn. *Pilulæ Calcii Chloridi,*— Lat. *Prep.* 1. As the last.

2. (Gräfe.) *Chloride of calcium*, 1 dr.; *extract of opium*, 10 gr.; *mucilage*, q. s. For 54 pills. *Dose.* 1, every two or three hours, gradually increased until 10, or even 12 are taken every hour; in gonorrhœa, more especially when occurring in scrofulous subjects.

PILLS (Chloride of Gold). Syn. *Pilulæ Auri Chloridi,*—Lat. *Prep.* From *terchloride of gold*, 3 gr.; *powdered liquorice*, 1 dr.; *syrup*, q. s. For 48 pills. *Dose.* 1 pill, twice or thrice daily. (See *p.* 537.)

PILLS (Chloride of Gold and Sodium). Syn. *Pilulæ Auri et Sodii Chloridi, P. A. Sodio-chloridi,*—Lat. *Prep.* (Magendie.) *Soda-chloride* (soda-muriate) *of gold*, 1 gr.; *extract of mezereon*, 2 dr.; divide into 60 pills. (See *page* 537.)

PILLS (Chloride of Lime). Syn. *Pilulæ Calcis Hypochloritis, &c.,*—Lat. *Prep.* 1. *Chloride of lime*, 12 gr.; *starch-powder*, 24 gr.; *conserve of hips*, q.s.; divide into 36 pills.

2. (Dr. Copland.) *Chloride of lime*, 15 gr.; *compound powder of tragacanth*, 90 gr.; *syrup*, q. s. For 24 pills. *Dose.* 1 to 3, twice or thrice, daily; in various putrid affections, fevers, &c.

PILLS (Chloride of Mercury). See *Calomel Pills.*

PILLS (Chloride of Mercury,—Compound). Syn. *Plummer's Pills, Red do.; Pilulæ Plummeri; Pil. Hydrargyri Chloridi Composita,*—Ph. L. *Pil. H. Submuriatis Co.,* —Ph. L. 1824, and Ph. E. 1839. *Pil. H. Submuriatis,*—Ph. L. 1809. *Pil. Calomelanos Co.,*—Ph. E. & D. *Prep.* (Ph. L.) *Chloride of mercury* (calomel), and *oxysulphuret of antimony*, of each, 2 dr.; rub them together, add of *guaiacum* (in powder) and *treacle*, of each, 4 dr.; and form the whole into a pill-mass. An excellent alterative pill; very useful in lepra, in secondary syphilis affecting the skin, and in various other chronic cutaneous diseases; also in dyspepsia and liver complaints. *Dose.* 3 to 10 gr., night and morning. For the formulæ of the Ph. E. & D. see *Compound Calomel Pills.*

PILLS (Cholera). Syn. *Pilulæ Anticholericæ,*—Lat. *Prep.* 1. *Powdered camphor*, 15 gr.; *powdered capsicum* (pure), ½ dr.; *bicarbonate of soda*, 1 dr.; *conserve of roses*, q. s. For 36 pills. *Dose.* 2 to 4, every 15 minutes, washed down with a wineglassful of cold water containing half a teaspoonful of *ether;* repeated every 15 or 20 minutes, until reaction ensues. They should be freshly made.

2. (*Arabian Anticholera Pills.*) From *assafœtida, asclepias gigantea*, and *opium*, equal parts; divided into 4½-gr. pills. *Dose.* 1 pill, every 30 or 40 minutes, followed by a spoonful of strong brandy-and-water, until the symptoms abate. For other formulæ see *page* 251.

PILLS (Citrate of Iron and Quinine). Syn. *Pilulæ Ferri Citratis cum Quinâ*,—Lat. *Prep.* From *citrate of iron and quinine*, 1 dr.; *powdered citric acid*, 20 gr.; *conserve of hips*, q. s. For 36 pills. An excellent tonic in debility, chlorosis, &c. *Dose.* 1 to 3, twice or thrice daily.

PILLS (Dr. Clark's). See *Dinner Pills.*

PILLS (Coindet's). See *Pills of Protiodide of Mercury.*

PILLS (Colchicum). See *Gout Pills.*

PILLS (Colocynth). Syn. *Pilulæ è duobus; P. ex Colocynthide Simpliciores*,—Ph. L. 1746. *Prep.* (Ph. L. 1746.) *Colocynth* and *scammony*, of each, 2 oz.; *oil of cloves*, 2 dr.; *syrup of buckthorn*, q. s. An active hydragogue cathartic. *Dose.* 3 to 12 gr.

PILLS (Colocynth,—Compound). Syn. *Pill of Cochia; Pilulæ Cocciæ, P. Cochiæ; Pil. Colocynthidis Compositæ*,—Ph. L. & D. *Pil. Colocynthidis*,—Ph. E. *P. ex Colocynthide cum Aloë*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Extract of colocynth* (simple), 1 dr.; *powdered extract of aloes*, 6 dr.; *powdered scammony*, 2 dr.; *powdered cardamoms*, ½ dr.; *soft soap* (Ph. L.), 1½ dr.; mix, and beat them altogether, so that a mass may be formed. This is intended as a substitute for the *compound extract of colocynth* of the Ph. L. 1836.

2. (Ph. E.) *Socotrine* or *East Indian aloes* and *scammony*, of each, 8 parts; *sulphate of potassa*, 1 part; beat them together, add of *colocynth*, in fine powder, 4 parts; next add of *oil of cloves*, 1 part; and with the aid of a little *rectified spirit*, beat the whole to a mass, and divide this into 5-gr. pills.

3. (Ph. D.) *Colocynth pulp, scammony*, and *Castile soap*, of each (in powder), 1 *oz.; hepatic aloes*, 2 *oz.; treacle*, 10 dr.; *oil of cloves*, 1 fl. dr.; mix, and beat them into a mass of uniform consistence.

4. (Ph. L. 1746.) *Socotrine aloes* and *scammony*, of each, 2 oz.; *pulp of colocynth*, 1 oz.; *oil of cloves*, 2 dr.; *syrup of buckthorn*, q. s. to form a pill-mass. This is the original formulæ published by Galen for "*pilulæ cochiæ minores*," and under various slight modifications, it has continued in use ever since.

5. *Aloes*, 1½ *lb.; colocynth*, ¾ *lb.; jalap*, 6 *oz.;* (all in powder;) *oil of cloves*, 1½ *oz.; syrup* or *treacle*, q. s. to mix. *Prod.* About 4¾ *lb.* This forms the common "*pil cochiæ*" of the druggists. A few, more conscientious than the rest, add to the above, *scammony*, 6 *oz.* It is greatly inferior to the Ph. pill.

Obs. Compound colocynth pill is a cheap and excellent cathartic, more powerful than the other officinal aloetic pills, and well adapted to cases of habitual costiveness. It has long been extensively used by the poorer classes, and in domestic medicine generally. *Dose.* 5 to 15 gr.

PILLS (Colocynth and Henbane). Syn. *Pilulæ Colocynthidis et Hyoscyami*,—Ph. E. *Prep.* (Ph. E.) *Colocynth pill-mass*, 2 parts; *extract of henbane*, 1 part; beat them up with a few drops of *rectified spirit* (if necessary), and divide into 5-gr. pills. *Dose.* 1 to 3 pills; as an anodyne purgative, in irritable bowels.

PILLS (Copaiba). Syn. *Pilulæ Copaibæ*,—Lat. *Prep.* (Ph. U. S.) Pure *balsam of copaiba*, 2 oz.; recently prepared *calcined magnesia*, 1 dr.; mix thoroughly, then set the mixture aside until it acquires a pilular consistence, and, lastly, divide it into 200 pills.

Obs. Unless the magnesia has been very recently calcined, the copaiba hardens very slowly, or not at all. It is said that "lime produces the effect more completely and uniformly than magnesia," and that "specimens of copaiba which are old and contain the most resin," harden quickest. (Redwood.) For present use, the quantity of magnesia may be at least doubled. Dr. Pereira orders *copaiba*, 1 oz.; *magnesia*, 5 or 6 dr. *Dose.* 10 to 30 gr., frequently; in diseases of the mucous membranes of the urinary organs. Cubebs are often added.

PILLS (Dr. Copland's). See *Aperient* and *Pectoral Pills.*

PILLS (Corrosive Sublimate). See *Pills of Bichloride of Mercury.*

PILLS (Cough). See *Pectoral Pills, Expectorant do., &c.*

PILLS (Creasote). Syn. *Pilulæ Creasoti*,—Lat. *Prep.* 1. (Pitschaft.) *Creasote*, 6 gr.; *powdered henbane*, 24 gr.; *conserve of hips*, q. s. For 24 pills. *Dose.* 1, three times daily; in sea-sickness, the vomiting during pregnancy, &c.

2. (Rieche.) *Creasote*, 1 dr.; *extract of liquorice* and *gum galbanum*, of each, ½ dr.; *powdered mallow-root*, 2 dr.; to be divided into 2-gr. pills. *Dose.* 3 to 6, four times a day; in acute rheumatism, bronchitis, neuralgia, phthisis, &c.

PILLS (Crespigny's). See *Dinner Pills.*

PILLS (Croton Oil). Syn. *Pilulæ Crotonis, P. Tiglii*,—Lat. *Prep.* 1. *Croton oil*, 3 drops; *oil of cloves*, 4 drops; *bread-crumb*, q. s. For 3 pills, one of which is a dose.

2. (Dr. Copland.) *Croton oil*, 6 drops; *pill of aloes and myrrh*, 1½ dr.; *soap*, 20 gr.;

liquorice powder, q. s. For 30 pills. *Dose.* 2 to 4.

3. (Dr. Reece.) *Croton oil*, 6 drops; *Castile soap*, ½ dr.; *oil of caraway*, 8 drops; *liquorice powder*, q. s. For 12 pills. *Dose.* 1 to 3. In dropsy, visceral obstructions, &c. See *Croton Oil.*

4. (*With mercury*,—Dr. Neligan.) *Croton oil soap*, 3 gr.; *extract of henbane* and *mercurial pill*, of each, 24 gr.; *oil of pimento*, 12 drops; divide into 12 pills. *Dose.* 2 at bedtime. (See *above.*)

PILLS (Cyanide of Mercury). Syn. *Pilulæ Hydrargyri Cyanidi, P. H. Cyanureti*,—Lat. *Prep.* (Guibourt.) *Cyanuret of mercury*, 6 gr.; *opium*, 12 gr.; *bread-crumb*, 60 gr.; *honey* or *syrup*, q. s. For 96 pills. *Dose.* 1, night and morning; in syphilis, chronic inflammation of the viscera, &c.

PILLS (Cyanide of Potassium). Syn. *Pilulæ Potassii Cyanidi*,—Lat. *Prep.* (Golding Bird.) *Cyanide of potassium*, 2 gr.; *arrow root*, 20 gr.; *simple syrup*, q. s. For 18 pills. *Dose.* 1, twice or thrice a day; as a sedative, in hysteria, gastrodynia, extreme nervous excitability, &c. See *Draughts* and *Mixtures.*

PILLS (Dandelion). See *Pills of Taraxacum.*

PILLS (De Haen's). *Prep.* (St. Marie.) *Gum ammoniacum* and *pill aloes with myrrh*, of each, 1 dr.; *extract of hemlock* and *Castile soap*, of each, 1½ dr. For 3-gr. pills. *Dose.* 3 to 6 daily; in painful or obstructed menstruation, chlorosis, &c.

PILLS (Delphine). Syn. *Pilulæ Delphiniæ*, — Lat. *Prep.* (Dr. Turnbull.) *Delphine*, 1 gr.; *extracts of henbane* and *liquorice*, of each, 12 gr. For 12 pills. *Dose.* 1 to 3, twice a day; in dropsy, gout, rheumatism, &c., instead of veratria.

PILLS (Diaphoretic). Syn. *Pilulæ Diaphoreticæ*,—Lat. *Prep.* 1. *Antimonial powder*, ½ dr.; *opium*, 10 gr.; *calomel*, 5 gr.; *confection of opium*, q. s. to mix; divide into 10 pills. *Dose.* 1, at bedtime; in coughs and bronchial irritability, after an aperient.

2. *Guaiacum*, 10 gr.; *emetic tartar* and *opium*, of each, 1 gr.; *simple syrup*, q. s. to mix; divide into 3 pills. *Dose.* 1 or 2, in acute rheumatism, &c.

3. *Camphor* and *antimonial powder*, of each, ½ dr.; *opium*, 10 gr.; *aromatic confection*, q. s. to mix. For 12 pills. In fevers; and in some spasmodic diseases. *Dose.* 1 pill.

4. *Powdered guaiacum*, 10 gr.; *compound powder of ipecacuanha*, 5 gr.; *confection of roses*, q. s. to mix; for a dose. As a diaphoretic in inflammatory affections, and rheumatism.

PILLS (Diarrhœa). Syn. *Pilulæ Antidiarrhœales*,—Lat. *Prep.* (Trousseau & Reveil.) *Soft extract of opium*, 1½ gr.; *calomel* and *powdered ipecacuanha*, of each, 3 gr.; *conserve of hips*, q. s.; divide into 10 pills. *Dose.* 1, two or three times daily; in chronic and choleraic diarrhœa.

PILLS (Digestive). Under this head are generally classed all the stomachic and milder aperient pills. See *Bath Pills, Dinner Pills, &c.*

PILLS (Digitaline). Syn. *Pilulæ Digitalinæ*,—Lat. *Prep.* 1. *Digitaline*, 1 gr.; *powdered sugar*, ½ dr.; *thick mucilage*, q. s. For 24 pills. *Dose.* 1 to 4 daily, watching the effects; as a sedative to reduce the force of the circulation, in phthisis, enlargement of the heart, &c. See *Granules*, and *Foxglove Pills.*

PILLS (Dinner). Syn. *Grains de Santé; Pilulæ Dictæ Ante-cibum*,—Lat. *Prep.* 1. *Aloes*, 1 dr.; *rhubarb* and *extract of gentian*, of each, ½ dr.; *ipecacuanha* and *capsicum*, of each, 12 gr.; *syrup of ginger*, q. s. to mix. For 3½-gr. pills.

2. (Dr. Baillie's.) See *page* 981.

3. (*Bath Dinner Pills.*) See *page* 985.

4. (*Pills of Aloes and Mastic; Lady Crespigny's Pills, Lady Hesketh's do., Lady Webster's do., Digestive do., Stomach do.; Grains de Vie, Grains de Mesue; Pilulæ Aloës et Mastiches, P. A. cum Mastiche, P. Stomachicæ Mesues.*) From *aloes* (powdered), 6 dr.; *powdered mastic* and *petals of red-roses*, of each, 2 dr.; *syrup of wormwood*, q. s. to form a pill-mass. For 3-gr. pills. In small doses, they excite the appetite; in larger ones, they produce a bulky and copious evacuation. This is the formula of the *old Paris Codex.* Rhubarb is now frequently substituted for the rose petals. (*Med. Circ.*, ii, 208.)

5. (*Sir C. Bell's.*) From *sulphate of quinine*, 4 gr.; *mastic*, 6 gr.; *rhubarb*, 50 gr.; *syrup of orange peel*, q. s. to mix. For 12, or preferably 18 pills.

6. (*Sir Chas. Clarke's.*) From *extract of chamomile*, ½ dr.; *myrrh* and *rhubarb* (in powder), of each, 20 gr.; *powdered Socotrine aloes*, 10 gr.; *oil of chamomile*, 8 drops; *mucilage*, q. s. to form 20 pills. "These pills, which were originally prescribed by Sir Chas. Clarke, are much used in London." (Redwood.)

7. (*Frank's.*) From *aloes* and *jalap*, of each, 4 parts; *rhubarb*, 1 part; *syrup of wormwood*, q. s. For 3-gr. pills.

8. (P. Cod.) *Aloes*, 6 dr.; *extract of*

cinchona bark, 3 dr.; *cinnamon*, 1 dr.; *syrup of wormwood*, q. s.

The *dose* of the above is 3 to 5 gr., about an hour before dinner, to *promote the appetite;* or, as a *purgative*, 10 to 15 gr.

PILLS (Diuretic). Syn. *Pilulæ Diureticæ*,—Lat. *Prep.* 1. From *powdered foxglove*, 12 gr.; *calomel, powdered squills*, and *opium*, of each, 4 gr.; *conserve of hips*, q. s. For 12 pills.

2. (Dr. A. T. Thomson.) *Mercurial pill*, 1 dr.; *powdered squills*, 20 gr.; *confection of roses*, q. s.; divided into 20 pills. The *dose* of either of the above is 1 pill, twice or thrice daily; in dropsy, &c.

PILLS (Dixon's). According to Dr. Paris, these pills consist of *aloes, scammony, rhubarb*, and a little *tartar emetic*, beaten up with *syrup*. "The following formula produces a pill precisely similar to this nostrum:—Take of *compound extract of colocynth* (Ph. L. 1836), 4 dr.; *powdered rhubarb*, 2 dr.; *potassio-tartrate of antimony*, 8 gr.; *syrup of buckthorn*, q. s.; mix, and divide into 120 pills. Aperient and diaphoretic. *Dose.* 2 or 3, at bedtime." (*Anat. of Quackery.*) Although a nostrum, it is a really excellent medicine, adapted for numerous cases.

PILLS (Duchesne's). *Prep.* From *aloes* and *gum ammoniacum*, of each, 30 gr.; *mastic* and *myrrh*, 10 gr.; *carbonate of potassa* and *saffron*, of each, 3 gr.; *syrup*, q. s. In the dyspepsia of hysterical patients, in engorgements of the abdominal viscera following intermittent fevers, &c.

PILLS (Dysentery). Syn. *Pilulæ Dysentericæ*,—Lat. *Prep.* Pure *alumina* and *tannic acid*, of each, 20 gr.; *antimonial powder*, 15 gr.; *castor oil*, ½ dr. *Dose.* 5 to 10 gr., frequently.

PILLS (Elaterium). Syn. *Pilulæ Elaterii*,—Lat. *Prep.* (Radius.) *Elaterium*, 6 gr.; *extract of gentian* and *Castile soap*, of each, 9 gr.; mix, and divide into 12 pills. *Dose.* 1 to 4; in obstinate constipation, and as a purge in dropsy, &c.

PILLS (Emetic). Syn. *Pilulæ Emeticæ, P. Cupri Sulphatis Compositæ*,—Lat. *Prep.* (Swediaur.) *Sulphate of copper* and *ipecacuanha*, equal parts; *syrup* or *conserve of roses*, q. s. For 5-gr. pills. *Dose.* 1 pill, repeated every 15 minutes, until vomiting comes on. See *Emetics.*

PILLS (Epilepsy). Syn. *Pilulæ Antepilepticæ, P. ad Epilepsiam*,—Lat. *Prep.* 1. (Griffith.) *Powdered indigo*, 75 gr.; *assafœtida*, 15 gr.; *Russian castor*, 7 gr.; mix, and divide the mass into 20 pills. *Dose.* 1, every hour.

2. (Récamier.) *Oxide of zinc*, 9 gr.; *camphor* and *extract of belladonna*, of each, 6 gr. For 12 pills. *Dose.* 1 to 3, every 3 or 4 hours.

PILLS (Ergot of Rye). Syn. *Pilulæ Ergotæ, P. Secalis Cornuti*,—Lat. *Prep.* 1. (Dewees.) *Powdered ergot*, ½ dr.; *extract of gentian*, 1 dr.; divide into 15 pills. In obstructed and painful menstruation, hæmorrhages, &c. *Dose.* 1 pill, thrice daily.

2. (Lallemande.) *Aloes, ergot*, and *rue*, of each, 8 gr.; for 12 pills. As the last.

PILLS (Ergotine). Syn. *Pilulæ Ergotinæ*,—Lat. *Prep.* (Bonjean.) *Ergotine* (Bonjean's), 24 gr.; *liquorice powder*, 40 gr.; *syrup*, q. s. For 24 pills. *Dose.* 3 to 6, daily; as an internal hæmostatic, &c.

PILLS (Everlasting). Syn. *Perpetual Pills; Pilulæ Æternæ, P. Perpetuæ*,—Lat. Small spheres of *metallic antimony*. They possess the property of purging as often as swallowed, but have now long fallen into disuse.

PILLS (Expectorant). Syn. *Pilulæ Expectorantes*,—Lat. *Prep.* 1. *Myrrh*, 1½ dr.; *powdered squills*, ½ dr.; *extract of henbane*, 2 dr.; *syrup*, q. s.; divide into 30 pills. *Dose.* 2, night and morning.

2. (A. T. Thomson.) *Powdered squills* and *extract of hemlock*, of each, ½ dr.; *ammoniacum*, 1½ dr.; divide into 30 pills. *Dose.* 2, twice or thrice a day. In chronic coughs, asthma, &c., after an aperient. See *Pectoral Pills, &c.*

PILLS (Family Antibilious). Syn. *Aloe Pills; Aloës Rosata, Pilulæ Aloës Rosatæ*,—Lat. *Prep. Socotrine* or *hepatic aloes*, 4 *oz.; juice of roses*, 1 pint; dissolve by heat, strain through a piece of coarse flannel, evaporate to a proper consistence, and form it into pills. Purgative, in *doses* of 5 to 15 gr.

PILLS (Fever). Syn. *Pilulæ Febrifugæ*,—Lat. Of these, the principal are those containing *antimonials, bark, quinine*, and *salicine* (which see).

PILLS (Fordyce's). An active purgative, closely resembling in composition the *compound gamboge pill* of the Ph. L.

PILLS (Dr. Fothergill's). *Prep.* (Anat. of Quackery.) *Aloes*, 4 dr.; *extract of colocynth* and *scammony*, of each, 1 dr.; *diaphoretic antimony*, 30 gr.; *syrup*, q. s. For 3½-gr. pills. A diaphoretic aperient. *Dose.* 1 to 4 pills, at bedtime.

PILLS (Foxglove and Henbane). Syn. *Pilulæ Digitalis et Hyoscyami*,—Lat. *Prep.* (Dr. A. T. Thomson.) *Powdered foxglove*, 4 gr.; *powdered camphor*, 12 gr.; *extract of henbane*, 18 gr. For 6 pills. *Dose.* 1 or 2, at bedtime; as a sedative in maniacal and spasmodic affections, &c.

PILLS (Foxglove and Squills). Syn. *Pilulæ Digitalis et Scillæ*,—Ph. E. *Prep.* (Ph. E.) *Powdered foxglove* and *squills*, of each, 1 part; *aromatic electuary* (Ph. E.), 2 parts; *conserve of red-roses*, q. s.; divide into 4-gr. pills. A valuable diuretic in dropsies. *Dose.* 1 to 2 pills.

PILLS (Frank's). See *Dinner Pills.*

PILLS (Frankfort). These are the *pilules angeliques* noticed at page 950, formed into 2-gr. pills, and silvered.

PILLS (Fuligokali). Syn. *Pilulæ Fuligokali*,—Lat. *Prep.* (Deschamps.) *Fuligokali*, 5 dr.; *starch*, 2½ dr.; *powdered tragacanth*, 10 gr.; *syrup*, q. s. For 100 pills, which must be covered with 2 or 3 coats of *gum*, and preserved from the air. The pills of sulphuretted fuligokal (*pilulæ fuligokali sulphurati*) are prepared in a similar manner.

PILLS (Fuller's). Syn. *Bennet Pills; Pilulæ Benedictæ. Prep.* (Anat. of Quackery.) *Aloes* and *sulphate of iron*, of each, ½ dr.; *myrrh* and *senna*, of each, 20 gr.; *assafœtida* and *galbanum*, of each, 10 gr.; *mace* and *saffron*, of each, 6 gr.; *syrup*, q. s.; mix, and divide into 4-gr. pills. Antispasmodic, emmenagogue, and tonic, and slightly aperient. *Dose.* 1 to 4, according to the object in view.

PILLS (Gairthorn's Mild Provisional). *Prep.* (Anat. of Quackery.) *Compound gamboge pill*, 60 gr.; *aqueous extract of aloes*, 40 gr.; *sulphate of potassa* and *extract of senna*, 30 gr.; *compound scammony powder*, 15 gr.; *balsam of Peru*, 6 or 8 gr.; *emetic tartar*, 3 gr.; mix, and divide into 36 pills. Purgative. *Dose.* 1, 2, or more, when required.

PILLS (Galbanum,—Compound). Syn. *Pilula Galbani Composita*,—Ph. L. *P. è Gummi*,—Ph. L. 1788. *P. Gummosæ*,—Ph. L. 1746. *Pilulæ G. Compositæ*,—Ph. D. 1826. *P. Myrrhæ C.*,—Ph. D. 1807. *Prep.* 1. (Ph. L.) *Myrrh* and *prepared sagapenum*, of each, 3 dr.; *prepared galbanum* and *soft soap*, of each, 2 dr.; *prepared assafœtida*, 1 dr.; *treacle*, q. s. to form a pill-mass.

2. (Ph. L. 1836.) As the last, *omitting* the *soap*.

3. (Ph. D. 1826.) As the Ph. L., except that *treacle* is substituted for syrup.

Obs. These pills are stimulant, expectorant, antispasmodic, and emmenagogue. *Dose.* 10 to 20 gr.; in hysteria, chronic coughs, chlorosis, amenorrhœa, &c.

PILLS (Galbanum with Iron). Syn. *Pylulæ Galbani cum Ferro*,—Lat. *Prep.* (Guy's Hosp.) *Compound galbanum pill*, 2 parts; *precipitated sesquioxide of iron*, 1 part; *water*, q. s. to form a mass. For 4½-gr. pills. An excellent tonic emmenagogue. *Dose.* 10 to 20 gr.; in chlorosis, amenorrhœa, &c., when chalybeates are not contra-indicated.

PILLS (Gamboge,—Compound). Syn. *Gamboge Pills, Fordyce's do.; Pilula Cambogiæ Composita*,—Ph. L., and Ph. D. 1826. *P. Cambogiæ*,—Ph. E. *Prep.* 1. (Ph. L.) *Powdered Socotrine* or *hepatic aloes*, 3 dr.; *powdered gamboge*, 2 dr.; *powdered ginger*, 1 dr.; *soft soap* (Ph. L.), 4 dr.; mix, and beat them to a pill-mass. The formulæ of the Ph. L. 1836 and Ph. D. 1826 are precisely similar.

2. (Ph. E.) *Gamboge, East Indian* or *Barbadoes aloes*, and *aromatic powder*, of each (in powder), 1 part; *Castile soap*, 2 parts; *syrup*, q. s.

Obs. Both the above are active cathartics. *Dose.* 5 to 15 gr., at bedtime; in obstinate constipation, &c.

PILLS (Gentian,—Compound). Syn. *Pilulæ Gentianæ Compositæ*,—Lat. *Prep.* (W. Cooley.) *Extract of gentian*, 1 dr.; *powdered rhubarb* and *cardamoms*, of each, ½ dr.; *ipecacuanha*, 12 gr. For 3-gr. pills. Stomachic. *Dose.* 2 or 3, twice or thrice daily, to improve the appetite and digestion.

PILLS (Gout). Syn. *Pilulæ Antarthriticæ*,—Lat. *Prep.* 1. (Bouchardat.) *Extract of colchicum* and *compound extract of colocynth*, of each, 1 dr.; *aqueous extract of opium*, 3 gr.; mix, and divide into 3-gr. pills. *Dose.* 1 or 2, according to their purgative action, as required.

2. (*Sir H. Halford's.*) From *acetic extract of colchicum*, ½ dr.; *Dover's powder* and *compound extract of colocynth*, of each, 18 gr. For 12 pills. *Dose.* 1 pill.

3. (*Lartigue's.*) From *compound extract of colocynth*, 20 gr.; *alcoholic extract of colchicum seeds* and *alcoholic extract of digitalis*, of each, 1 gr. For 2-gr. pills. *Dose, &c.* As the last.

4. (St. George's Hosp.) *Acetic extract of colchicum*, 12 gr.; *Dover's powder*, 30 gr. For 12 pills. *Dose.* 2 pills.

5. (*Sir C. Scudamore's.*) From *acetic extract of colchici*, 1 dr.; *powdered marshmallow root*, q. s. to form a mass. For 40 pills. *Dose.* 1 to 3, or more, with caution, as required.

6. (Trousseau & Reveil.) *Powdered colchicum seeds*, ½ dr.; *powdered digitalis* and *sulphate of quinine*, of each, 15 gr.; *calomel* and *extract of colocynth*, of each, 8 gr.; *syrup*, q. s. For 20 pills. *Dose.* 1 to 4, during the day, at the commencement of an attack of gout. Other formulæ for *gout pills* will be found under the respective names.

PILLS (Dr. Griffitt's). *Powdered rhu-*

barb, 1½ dr.; *sulphate of iron*, ½ dr.; *Castile soap*, 40 gr.; *water*, q. s. to form a mass. For 48 pills. An excellent remedy in costiveness with loss of tone of the bowels. *Dose.* 2 to 4, at bedtime.

PILLS (Guaiacum,—Compound). Syn. *Pilulæ Guaiaci Compositæ*,—Lat. *Prep.* 1. *Powdered resin of guaiacum*, 1 dr.; *oxysulphuret of antimony*, 40 gr.; *oil of cajeput*, 12 drops; *extract of gentian*, q. s. to form a mass. For 4-gr. pills. *Dose.* 3 to 6, thrice daily; in gout, rheumatism, secondary syphilis, various obstinate cutaneous affections, &c.

2. (St. B. Hosp.) *Guaiacum*, 30 gr.; *ipecacuanha* and *opium*, of each, 3 gr.; *syrup*, q. s. For 12 pills. *Dose.* 1 to 3. As the last.

PILLS (Halford's). See *Gout Pills.*

PILLS (Dr. Hamilton's). The same as the *colocynth and henbane pill* of the Ph. E. The *compound pills of gamboge*, now vended under the title of "*Morison's No.* 2 *Pills*," were long known in Scotland as Dr. Hamilton's Pills.

PILLS (Headache). Syn. *Cephalic Pills; Pilulæ Cephalicæ, P. Anticephalalgicæ*,—Lat. *Prep.* 1. *Caffeine*, 15 gr.; *aloes*, 20 gr.; *conserve of hips*, q. s. For 12 pills. *Dose.* 1, occasionally; when only one side of the head is affected.

2. (Broussais.) *Extract of opium*, 6 gr.; *extracts of belladonna* and *henbane*, of each, 15 gr.; *extract of lettuce*, 30 gr.; *butter of cacao*, 4 dr. For 120 pills. *Dose.* 1, twice or thrice daily; in headache, accompanying spasmodic affections, &c.

3. (Dr. Wilson Philip.) *Powdered nutmeg* and *rhubarb*, of each, 30 gr.; *extract of chamomile*, 20 gr.; *oil of peppermint*, 10 or 12 drops. For 30 pills. *Dose.* 1 to 3, thrice daily; in nervous headaches.

PILLS (Helvetius's). Syn. *Pilulæ Aluminis Helvetii*,—Lat. *Prep. Alum*, 2 dr.; *dragon's blood*, 1 dr.; *honey of roses*, to mix. For 48 pills. Astringent.

PILLS (Hemlock,—Compound). Syn. *Pilula Conii Composita*, — Ph. L. *Prep.* (Ph. L.) *Extract of hemlock*, 5 dr.; *powdered ipecacuanha*, 1 dr.; *treacle*, q. s. Antispasmodic, expectorant, and narcotic. *Dose.* 4 to 8 gr., twice or thrice daily; in hooping-cough, bronchitis, incipient phthisis, &c.

PILLS (Henbane,—Compound). Syn. *Pilules de Meglin; Pilulæ Hyoscyami et Zinci*,—Lat. *Prep.* (P. Cod.) *Extracts of henbane* and *valerian*, and *oxide of zinc*, equal parts. For 3-gr. pills. *Dose.* 1 to 10; as an anodyne or sedative in neuralgia, nervous attacks, &c.

PILLS (Lady Hesketh's). See *Dinner Pills.*

PILLS (Hoffmann's). See *Pills of Bichloride of Mercury.*

PILLS (Holloway's). See *Patent Medicines.*

PILLS (Hooper's Female). *Prep.* 1. (Gray.) *Sulphate of iron* and *water*, of each, 8 *oz.*; dissolve, add *Barbadoes aloes*, 2½ *lb.*; *white canella*, 6 *oz.*; *myrrh*, 2 *oz.*; *opopanax*, ½ *oz.*

2. (Phil. Coll. of Pharm.) *Barbadoes aloes*, 8 oz.; *dried sulphate of iron*, 2¼ oz.; *myrrh, extract of black hellebore*, and *Castile soap*, of each, 2 oz.; *canella* and *ginger*, of each, 1 oz.; *water*, q. s.; divide the mass into 2½ or 3-gr. pills, and put 40 into each box. Cathartic and emmenagogue. *Dose.* 2, or more. "If we omit the soap, lessen the quantity of extract of hellebore, and increase that of the aloes, we think the form will be nearer that of the original." (*Anat. of Quackery.*)

PILLS (Humphrey's). See *Pectoral Pills.*

PILLS (Hunter's). See *Renal Pills.*

PILLS (Hydragogue). See *Bontius' Pills, &c.*

PILLS (Hydrophobia). Syn. *Pilulæ ad Rabiem*,—Lat. *Prep.* (Werlhoff.) *Cantharides* (in very fine powder), 2 gr.; *belladonna* and *calomel*, of each, 4 gr.; *camphor*, 8 gr.; *mucilage*, q. s. For 12 pills. *Dose.* 2 to 3, twice daily.

PILLS (Indian Hemp). Syn. *Pilulæ Cannabis Indicæ*,—Lat. *Prep.* From *alcoholic extract of Indian hemp*, ½ dr.; *sugar of milk*, 1 dr.; *mucilage*, q. s. For 48 pills. An excellent pill for soothing pain and quieting the system, acting without causing headache or constipation of the bowels. *Dose.* 1 pill, increased to 2 or more, as necessary. (See *pages* 434, &c.)

PILLS (Indigo). See *Pills for Epilepsy.*

PILLS (Iodide of Arsenic). Syn. *Pilulæ Arsenici Iodidi*, — Lat. *Prep.* 1. (Dr. Neligan.) *Iodide of arsenic*, 2 gr.; *manna*, 40 gr.; *mucilage*, q. s.; mix, and divide into 20 pills.

2. (Gardiner.) *Iodide of arsenic*, 1 gr.; *extract of hemlock*, 20 gr. For 12 pills. *Dose.* 1 pill, twice or thrice daily; in lepra, psoriasis, and some other scaly skin-diseases.

PILLS (Iodide of Iron). Syn. *Pilulæ Ferri Iodidi*,—Lat. *Prep.* 1. *Unoxidized iron filings* (recently levigated), 20 gr.; *iodine*, 40 gr.; *distilled water*, ½ dr.; mix in a *cold* wedgewood-ware mortar, and triturate them together until the red colour of the mixture has entirely disappeared; then add of *powdered gum*, 20 gr.; *powdered sugar*, 1 dr.; *liquorice powder*, q. s. to form a mass; and divide it into 48 pills. Each pill contains 1 gr. of dry iodide of iron. *Dose.* 1 to 6 pills, twice or thrice a day.

2. (Ph. U. S.) *Protosulphate of iron*, 60 gr.; *iodide of potassium*, 80 gr.; (both in fine powder;) mix, add of *powdered tragacanth*, 10 gr.; *powdered sugar*, 30 gr.; and form the whole into a mass with *syrup*, q. s. For 40 pills. Each pill contains nearly 2 gr. of the dry iodide, or about 2½ gr. of the common hydrated iodide of the shops. *Dose.* 1 to 3, as the last.

Obs. The above pills are reputed alterative, tonic, and emmenagogue, and are found peculiarly useful in indurations, scrofula, chlorosis, leucorrhœa, &c., when the administration of chalybeates is not contra-indicated.

PILLS (Iodide of Lead). Syn. *Pilulæ Plumbi Iodidi*,—Lat. *Prep.* From *iodide of lead*, 15 gr.; *powdered sugar*, 1½ dr.; *mucilage*, q. s. For 60 pills. *Dose.* 1 pill, gradually increased to 3, or more, twice a day; in scrofula, schirrus, &c. (See *p.* 681.)

PILLS (Iodide of Mercury). Syn. *Pilulæ Hydrargyri Iodidi*, — Ph. L. 1836. *Prep.* 1. (Ph. L. 1836.) *Iodide* or *protiodide of mercury* and *powdered ginger*, of each, 1 dr.; *conserve of hips*, 3 dr. *Dose.* 2 to 5 gr., twice or thrice daily; as an alterative in scrofula and scrofulous syphilis, &c.

2. (*Coindet's Pills.*) From *protiodide of mercury*, 1 gr.; *extract of liquorice*, 20 gr.; mix, and divide into 8 pills. *Dose.* 2 to 4, as the last. *Pills of biniodide* or *deutoiodide of mercury* are made in the same way, but owing to its greater activity only *one fourth* of the above quantity of iodide must enter into their composition. (See *p.* 775.)

PILLS (Iodide of Potassium). Syn. *Pilulæ Potassii Iodidi, P. Potassæ Hydriodatis*,—Lat. *Prep.* 1. *Iodide of potassium* and *powdered starch*, of each, ½ dr.; *conserve of hips*, q. s. For 36 pills. *Dose.* 1 to 6, thrice daily; in glandular indurations and enlargements, goiture, scrofula, &c.

2. (Voght.) *Iodide of potassium*, 15 gr.; *burnt sponge* and *extract of dulcamara*, of each, 5 dr.; *water*, q. s. For 180 pills. *Dose.* 4 to 6, twice a day; as the last.

PILLS (Iodine). Syn. *Pilulæ Iodinii*, —Lat. *Prep.* (Radius.) *Iodine*, 6 gr.; *extract of gentian*, 1 dr.; *powdered gum*, q. s. For 24 pills. *Dose.* 1 to 3; in scrofula, &c.; also in mercurial and scorbutic salivation.

PILLS (Iodoform). Syn. *Pilulæ Iodoformi*,—Lat. *Prep.* (Bouchardat.) *Iodoform*, ½ dr.; *extract of wormwood* (or *gentian*), 1 dr.; mix, and divide into 36 pills. *Dose.* 1, twice or thrice daily; in scrofula, &c.

PILLS (Ipecacuanha, — Compound). Syn. *Pills of Ipecacuanha with Squills, P. of I. and Opium; Pilula Ipecacuanhæ cum Scillâ*,—Ph. L. *P. I. Compositæ*,—Ph. L. 1836. *P. Ipecacuanhæ et Opii*,—Ph. E. *Prep.* 1. (Ph. L.) *Compound powder of ipecacuanha* (Dover's powder), 3 dr.; *powdered ammoniacum* and *squills* (freshly powdered), of each, 1 dr.; *treacle*, q. s. to form a pill-mass. Anodyne, sudorific, and expectorant. *Dose.* 5 to 10 gr.; in chronic coughs and asthma, &c.

2. (Ph. E.) *Dover's powder*, 3 parts; *conserve of red-roses*, 1 part; mix, and divide into 4-gr. pills. Resembles *Dover's powder* in its effects. It is hence regarded by many as a useless preparation.

PILLS (Iron,—Compound). Syn. *Pilula Ferri Composita*, — Ph. L. *P. F. cum Myrrhâ*,—Ph. L. 1836. *Prep.* (Ph. L.) *Myrrh* (in powder), 2 dr.; *carbonate of soda*, 1 dr.; rub them together in a warm mortar, then add of *sulphate of iron*, 1 dr., and again triturate; lastly, add of *treacle*, 1 dr., and beat all together, to form a pill-mass. An excellent mild chalybeate tonic and emmenagogue, similar in its properties to "Griffith's mixture." *Dose.* 5 to 15 gr., two or three times a day.

PILLS (Italian Black). Syn. *Pilulæ Italicæ Nigræ, P. Aloeticæ Ferratæ*,—Lat. *Prep.* (Ph. Bor.) *Powdered aloes* and *dried sulphate of iron*, equal parts; beaten up with *rectified spirit*, q. s., and divided into 2 or 2½-gr. pills. See *Pills of Aloes and Iron.*

PILLS (Jalap). Syn. *Pilulæ Jalapæ*,—Lat. *Prep.* 1. (Ph. E. 1783.) *Extract of jalap*, 2 dr.; *aromatic powder*, 1 dr.; *syrup*, q. s.

2. (Ph. Bor.) *Soap of jalap*, 3 parts; *powdered jalap*, 1 part; beat them to a pill-mass. *Dose.* (Of either) 10 to 15 gr.

PILLS (James's Analeptic). *Prep.* 1. *Antimonial powder, guaiacum*, and *pill of aloes with myrrh*, equal parts; *syrup*, q. s.

2. (Anat. of Quackery.) *Antimonial powder* (James's), *pill aloes with myrrh*, and *compound aloes powder*, of each, 2 parts; *powdered ammoniacum*, 1 part; beaten up with *tincture of castor*, q. s., and divided into 3½-gr. pills. A diaphoretic purge. *Dose.* 2 to 4 pills.

PILLS (Dr. J. Johnson's). *Prep.* From *compound extract of colocynth*, 2 dr.; *calomel*, ½ dr.; *potassio-tartrate of antimony*, 2 gr.; *oil of cassia*, 12 drops. For 4 dozen pills. An excellent alterative and diaphoretic aperient. *Dose.* 1 to 3 pills.

PILLS (Kaye's). See *Worsdell's Pills.*

PILLS (Keyser's). *Prep.* (Guibourt.) *Red oxide of mercury*, 1½ oz.; *distilled vinegar* (dilute acetic acid), 1 pint; dis-

solve, add to the resulting solution, *manna*, 2 ℔, and triturate for a long time before the fire, until a proper consistence is attained; lastly, divide the mass into pills of 1½ gr. each.

Obs. Keyser's pills were once celebrated throughout Europe as a remedy possessing extraordinary virtue, and so highly were they prized, that the method of preparing them was purchased by the French Government for the benefit of the nation. Richard, who first published a full account of them, concludes by observing, that he considers this compound to be, without exception, the most effectual remedy for syphilis hitherto discovered. In this country, however, it has long sunk into comparative disuse with the faculty; probably from *pills* of *acetate of protoxide of mercury* being erroneously employed under the name, whereas, according to Robiquet, *acetate of peroxide of mercury* forms the basis of the original preparation. The *dose* is 1 to 2, night and morning, as an alterative; and 2 to 6, twice a day, as a sialogogue.

PILLS (King's). See *Patent Medicines* (*p.* 949).

PILLS (Kitchener's). Syn. *Dr. Kitchener's Peristaltic Persuaders; Pilulæ Rhæi et Carui*,—Lat. *Prep.* From *powdered Turkey rhubarb*, 2 dr.; *simple syrup*, 1 dr.; *oil of caraway*, 10 or 12 drops. For 40 pills. An admirable stomachic, dinner, or laxative pill, according to the quantity taken. *Dose.* 2 to 6. "From 2 to 4 will generally produce one additional motion within twelve hours. The best time to take them is early in the morning."

PILLS (Klein's). *Prep.* From *ammoniacum* and *extract of centaury*, of each, ½ dr.; *Castile soap*, 1 dr.; *oil of amber*, 3 drops. For 2-gr. pills. Stomachic, emmenagogue, and pectoral. *Dose.* 2 to 6 pills.

PILLS (Lactate of Iron). Syn. *Pilulæ Ferri Lactatis*,—Lat. *Prep.* (Cap.) *Lactate of protoxide of iron* and *powdered marsh-mallow root*, equal parts; *clarified honey*, q. s. For 3-gr. pills. One of the most valuable of the chalybeates. *Dose.* 1 to 2, three or four times a day.

PILLS (Lactucarium). Syn. *Pilulæ Lactucarii*,—Lat. *Prep.* 1. (Brera.) *Lactucarium*, 18 gr.; *conserve of elder-berries* and *extract of liquorice*, of each, q. s. For 12 pills. *Dose.* 1 to 2 pills, every three or four hours; in dry asthma, obstinate coughs without expectoration, &c.

2. (Dr. Duncan.) *Lactucarium*, 12 gr.; *liquorice powder*, 20 gr.; *simple syrup*, q. s. For 12 pills. *Dose.* 1 to 2 pills, every hour, as an anodyne, or to induce sleep.

PILLS (Lartigue's). See *Gout Pills.*

PILLS (Lead). See *Acetate of Lead* and *Opiated Lead Pills.*

PILLS (Lee's Antibilious). *Prep.* (Amer. Journ. of Pharm.) *Aloes*, 12 oz.; *scammony*, 6 oz.; *calomel*, 5 oz.; *gamboge*, 4 oz.; *jalap*, 3 oz.; *Castile soap* and *syrup of buckthorn*, of each, 1 oz.; *mucilage*, 7 oz.; beat them together, and divide the mass into 5-gr. pills. A powerful cathartic, and, from containing mercury, not adapted for frequent use. See *Wyndham's Pills.*

PILLS (Lewis's Alterative and Liver). These "for the most part resemble *Scott's Bilious and Liver Pills.* They are, however, of a more drastic and powerful character, and frequently operate with considerable violence." (*Med. Circ.*, ii, 493.)

PILLS (Lockstadt's). *Prep.* (Phœbus.) *Disulphate of quinine*, 3 gr.; *aromatic powder*, 10 gr.; *essential oil of almonds*, 1 drop; *extract of gentian*, q. s. For 10 pills. *Dose.* 1 to 2, thrice daily, as a stomachic tonic; or the whole at once, before an expected attack of an ague or intermittent.

PILLS (Lockyer's). *Prep.* From *panacea of antimony*, 6 gr.; *powdered white sugar*, 4 dr.; *mucilage*, q. s. For 48 pills. Cathartic and emetic. *Dose.* 1 to 4 pills.

PILLS (Dr. Lynn's). *Prep.* From *pill of aloes with myrrh* and *compound extract of colocynth*, of each, 1 dr.; *calomel*, ½ dr. For 4 dozen pills. Aperient and antibilious. *Dose.* 1 to 3; in costiveness, biliousness, &c.

PILLS (Manganese). These are chiefly prepared from the recently precipitated carbonate (*Pilulæ manganesii carbonatis*), the iodide (*P. m. iodidi*), the chloride (*P. m. chloridi*), the phosphate (*P. m. phosphatis*), the sulphate (*P. m. sulphatis*), and the double sulphate of manganese and iron (*P. m. et ferri sulphatis*). The best excipients are *conserve of roses* or *of hips*, and *liquorice powder.* See *Manganese* and its *Salts.*

PILLS (Martial). Syn. *Pills of Iron and Wormwood; Pilulæ Ferri cum Absinthio, P. Martiales*,—Lat. *Prep.* (Sydenham.) *Levigated iron filings*, 1 dr.; *extract of wormwood*, q. s. Tonic and hæmatinic. *Dose.* 5 to 10 gr., twice a day.

PILLS (Matthew's). Syn. *Pilulæ Matthæi, P. Pacificæ*,—Lat. *Prep.* 1. (Dr. Paris.) *Black hellebore, Castile soap, liquorice, opium, saffron*, and *turmeric*, equal parts; made into pills with *oil of turpentine.*

2. (Ph. E. 1744.) *Opium* and *saffron*, of each, 1 dr.; *castor*, 2 dr.; *soap of turpentine*, 3 dr.; *balsam of copaiba* (or oil of

turpentine), q. s. to form a mass. Alterative and anodyne. *Dose.* 3 to 10 gr.

PILLS (Baron McKinsey's). See *McKinsey's Katapotia* (*p.* 949).

PILLS (Meglin's). Syn. *Pilules de Meglin; Pilulæ Hyoscyami et Zinci Oxydi, P. Antineuralgicæ,*—Lat. See *Compound Henbane Pills.*

PILLS (Mercurial). Syn. *Blue Pill; Pilules Mercurielles,*—Fr. *Pilulæ Hydrargyri,*—Ph. L. *Pilulæ H.,*—Ph. E. & D., & Ph. L. 1836. *P. ex Hydrargyro,*—Ph. L. 1788. *P. Mercuriales,*—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Mercury*, 4 dr.; *confection of roses*, 6 dr.; rub them together until globules can no longer be seen; then add of *liquorice powder*, 2 dr., and beat the whole together, so that a proper mass may be formed.

2. (Ph. E.) As the last; afterwards dividing the mass into 5-gr. pills.

3. (Ph. D.) As the Ph. L. formula, but taking four times the quantity of the respective ingredients.

Obs. The remarks under "*mercurial ointment*" (*p.* 496), for the most part, also apply here. This pill, when properly prepared, presents no globules of mercury when moderately rubbed on a piece of white paper, and immediately communicates a white stain to a piece of bright gold or copper. It possesses considerable density, and has a dark blue or slate colour. It *contains* 1-3rd of its weight of mercury, which may be ascertained from its sp. gr.; or, more exactly, by an assay for the metal. It is the mildest and the most extensively used of all the mercurial preparations. *Dose.* As an *alterative*, 1 to 3 gr.; as a *purgative*, 10 to 15 gr.; and, as a *sialogogue*, 5 or 6 gr., or more, twice or thrice daily. To prevent it affecting the bowels, it is commonly combined with either rhubarb or opium. A blue pill taken over-night, and a black draught in the morning, is a popular remedy in bilious complaints. See *Abernethy Medicines.*

4. (Collier.) *Mercury*, 2 dr.; *sesquioxide of iron*, 1 dr.; *confection of red-roses*, 3 dr.; triturated, as before, until the globules disappear. An excellent extemporaneous substitute for the common mercurial pill. The addition of only a few gr. of the sesquioxide of iron to 1 *oz.* of conserve, renders the latter capable of rapidly killing a large quantity of quicksilver.

5. (Tyson.) *Blue oxide of mercury* (prepared by decomposing calomel with liquor of potassa to which a little liquor of ammonia has been added), 2 dr.; *confection of roses*, 6 dr.; *powdered chamomiles*, 1 dr.; mix. As a substitute for the College pill. (*Pharm. Journ.*)

6. (Pharm. Journ.) *Stearine*, 1 dr.; rub it in a warm mortar till it assumes the consistence of thick cream, then add of *mercury*, 4 dr.; and again triturate until the globules disappear; next further add of *confection of roses* and *wheaten flour*, of each, 3 dr.; *powdered gum*, 1 dr.; and form the whole into a pill-mass. As a substitute for the College pill.

7. (*Pilulæ Hydrargyrosæ,*—P. Cod.) *Mercury* and *honey*, of each, 6 dr.; triturate till the globules are extinguished, then add of *aloes*, 6 dr.; *rhubarb*, 3 dr.; *scammony*, 2 dr.; *black pepper*, 1 dr.; and make a pill-mass as before. Contains 1-4th part of quicksilver. Alterative and aperient. *Dose.* 5 to 10 gr. *Belloste's, Barbarossa's, Sèdillot's*, and *Morelot's pills*, and the *Pilulæ Hydrargyri Caxantes,*—Ph. E. 1744, and the *Pil. Mercuriales,*—Ph. L. 1746, are nearly similar compounds. See *Calomel Pills, &c.*

PILLS (Mercurial,—Arabic). Syn. *Pilulæ Mercuriales Arabicæ,*—Lat. *Prep.* Take of *quicksilver* and *corrosive sublimate*, of each, ½ dr., triturate them patiently together until the globules disappear, then add of *agaric, pellitory*, and *senna*, of each, 1 dr.; *honey*, q. s. to make a pill-mass. For 3½-gr. pills. *Dose.* 2 a day. Employed in the "*traitement arabique*" for the cure of obstinate cutaneous diseases (which see).

PILLS (Mitchell's). *Prep. Aloes*, ½ dr.; *rhubarb*, 1 dr.; *calomel*, 6 gr.; *emetic tartar*, 2 gr. For 36 pills. An alterative aperient. *Dose.* 2 to 4 pills.

PILLS (Moat's). Similar to Morison's Pills. (*Med. Circ.*, ii, 492.)

PILLS (Morison's). *Prep.—a.* (*No.* 1 *Pills.*) From *aloes* and *cream of tartar*, equal parts, made into a mass with either *syrup* or *mucilage.* A mild aperient.

b. (*No.* 2 *Pills.*) From *colocynth*, 1 part; *gamboge*, 2 parts; *aloes*, 3 parts; and *cream of tartar*, 4 parts; made into a mass with *syrup*, as the last. An active purgative, often acting with great violence. Both No. 1 and No. 2 are divided into 3-gr. pills, of which 4 dozen are put into each thirteen penny-halfpenny box. The proper *dose* of either is 1 to 3 or 4 pills; but they are often given by the Morison's in *doses* of 12, 20, 30, or even more daily. For the history of these pills and their proprietors, see *Anat. of Quackery*, or *Med. Circ.*, ii, 9-27.

PILLS (Morphia). Syn. *Pilulæ Morphiæ,*—Lat. *Prep.* (Magendie.) *Morphia*, 1 gr.: *conserve of roses* (stiff), q. s. For 6

(or better 8) pills. *Dose.* 1 pill; as an anodyne or soporific. (See *p.* 983.)

PILLS (Moseley's). *Prep.* Finest *Turkey rhubarb*, 60 gr.; *Jamaica ginger*, 30 gr.; *sugar*, 20 gr.; (all in powder;) *tincture of rhubarb*, q. s. to form a mass. For 4-gr. pills. A mild and excellent medicine, closely resembling *Kitchener's peristaltic persuaders.* (See *p.* 995.)

PILLS (Musk). Syn. *Pilulæ Moschi*,—Lat. *Prep.* (Dupuytren.) *Opium*, 2 gr.; *musk* (genuine), 8 gr.; *camphor* (in powder), 24 gr.; *syrup*, q. s. For 8 pills. Antispasmodic and stimulant. *Dose.* 1 to 3, thrice daily, in low nervous affections; or the whole during the day in hospital gangrene, &c.

PILLS (Myrrh). See *Pills of Aloes and Myrrh.*

PILLS (Napier's Neurotonic). Of these, like Morison's pills, there are No. 1, and No. 2. The *first* is a simple stomachic aperient; the *other*, a stimulant tonic. They both owe their sale and reputed virtues to extensive advertising. (Anat. of Quackery.)

PILLS (Napoleon's). See *Pectoral Pills.*

PILLS (Neuralgia). Syn. *Pilulæ Antineuralgicæ*,—Lat. *Prep.* 1. (Marchal De Calvi). *Aqueous extract of opium*, 4 gr.; *disulphate of quinine*, 16 gr.; *powdered cinnamon*, *powdered orange-leaves*, and *extract of valerian*, of each, 20 gr.; *syrup of belladonna*, q. s. For 3 dozen pills. *Dose.* 1, hourly.

2. (Trousseau & Reveil.) *Extracts of opium* and *stramonium*, of each, 8 gr.; *oxide of zinc*, 2 dr.; *syrup*, q. s. For 40 pills. *Dose.* 1, every two or three hours, gradually increased in frequency until there is some considerable disorder of vision, &c. Both of the above should be used with care. See *Meglin's Pills*, &c.

PILLS (Nitrate of Bismuth.) Syn. *Pilulæ Bismuthi Trisnitratis*,—Lat. *Prep.* From *trisnitrate of bismuth* and *powdered rhubarb*, equal parts; *syrup of orange-peel*, q. s. to form a mass. For 3-gr. pills. *Dose.* 1 to 2, every two hours; as a tonic, stomachic, and antispasmodic, in dyspepsia, debility, spasms, &c.

PILLS (Nitrate of Silver). Syn. *Pilulæ Argenti Nitratis*,—Lat. *Prep.* 1. (St. B. Hosp.) *Nitrate of silver* (crystallized), 12 gr.; *liquorice powder*, 24 gr.; *treacle*, q. s. For 12 pills. *Dose.* 1 pill, twice or thrice a day; in chronic epilepsy, and some other spasmodic disorders.

2. (Dr. A. T. Thomson.) *Nitrate of silver*, 6 gr.; *crumb of bread*, q. s. (say ½ dr.); mix, and divide into 12 pills. *Dose.* 1 every six hours.

Obs. To prevent the blue or slate-coloured tinge of the skin, so often produced by the continued use of the salts of silver, 8 drops of *diluted nitric acid* in 1 fl. oz. of *water*, should be taken after each pill.

PILLS (Norton's Chamomile). *Prep.* From *aqueous extract of aloes*, 1 dr.; *extract of gentian*, 3 dr.; mix, and drive off the excess of moisture by the heat of a water bath; then add of *essential oil of chamomile*, 20 drops; and divide the mass into 60 pills. To preserve their aromatic properties they should be kept in a dry glass bottle or a well-covered earthenware pot. *Dose.* 1, as a dinner pill; or 2, night and morning, as a stomachic tonic. (Anat. of Quackery.)

PILLS (Nux Vomica). Syn. *Pilulæ Nucis Vomicæ*,—Lat. *Prep.* 1. *Nux vomica* and *aloes* (both in powder), equal parts; *syrup*, q. s. For 3-gr. pills. *Dose.* 1 to 3, twice or thrice daily, carefully watching the effects; in nervous derangement, general debility, impotence, paralysis, &c.

2. *Alcoholic extract of nux vomica*, 1 part; *powdered sugar*, 2 parts; beaten up with *rectified spirit*, q. s. For 2½-gr. pills. *Dose* 1 to 2; as the last.

3. (Mondière.) *Alcoholic extract*, 6 gr.; *levigated black oxide of iron*, 1 dr.; *syrup*, q. s. In atonic incontinence of urine, amenorrhœa, &c.

PILLS (Odontalgic). Syn. *Pilulæ Odontalgicæ*, — Lat. *Prep.* (Ph. Bor.) *Powdered opium* and *extracts of belladonna* and *henbane*, of each, 10 gr.; *oil of cloves*, 20 drops; *powdered pellitory of Spain*, ½ dr.; beat them to a mass, and divide it into 1-gr. pills; keep these in a corked phial.

PILLS (Opiated Lead). Syn. *Pilulæ Plumbi Opiatæ*,—Ph. E. *Prep.* (Ph. E.) *Acetate of lead*, 6 parts; *opium*, 1 part; *conserve of red-roses*, about 1 part; beat them to a proper mass, and divide this into 4-gr. pills. "This pill may also be made with *twice* the quantity of opium." In hemorrhages, obstinate diarrhœa, dysentery, spitting of blood, and other cases demanding the use of a powerful astringent. It has also been highly extolled in cholera. *Dose.* 1 to 3 pills, twice or thrice daily, washed down with water soured with pure vinegar.

PILLS (Opium). Syn. *Anodyne Pills*, *Night do.*, *Thebaic do.*; *Pilulæ Opii*,—Ph. U. S. *P. O.* or *Thebaicæ*,—Ph. E. *Prep.* 1. (Ph. E.) *Opium* and *conserve of red roses*, of each, 1 part; *sulphate of potash*, 3 parts; rub them together to a proper mass, and

divide into 5-gr. pills. *Dose.* 1 to 2 pills, as an anodyne or soporific. Each pill contains 1 gr. of opium, or double the quantity in the same pill of the previous edition of the Ph. E.

2. (Ph. U. S.) *Powdered opium*, 1 dr.; *Castile soap*, 12 gr.; *water*, q. s. For 60 pills. As the last.

PILLS (Ox-Gall). Syn. *Bile Pills; Pilulæ Fellis Bovini, P. Bilis*,—Lat. *Prep.* 1. From *inspissated ox-gall* formed into pills by the addition of any *simple powder;* or the *harder extract* beaten up with a little *proof spirit.* Powdered rhubarb is frequently used for the purpose. For 3-gr. pills. *Dose.* 1 to 6; in constipation, flatulence, &c., arising from a deficiency of bile.

2. (Compound.) From *inspissated ox-gall*, 1 dr.; *powdered rhubarb*, ½ dr.; *powdered ipecacuanha* and *capsicum*, of each, 15 gr.; *oil of caraway*, 12 drops. For 48 pills. *Dose.* 1 to 4; in loss of appetite and dyspepsia, with torpor of the bowels, &c. See *Constipation, Gall*, &c.

PILLS (Oxide of Gold). Syn. *Pilulæ Auri Oxydi*,—Lat. *Prep.* (Magendie.) *Teroxide of gold*, 5 gr.; *extract of mezereon*, 2 dr.; mix, and divide into 60 pills. Each pill contains $\frac{1}{12}$ gr. of teroxide. *Dose.* 1 to 3; in scrofula, syphilis, malignant fevers, &c.

PILLS (Oxide of Mercury). Syn. *Pilulæ Hydrargyri Protoxydi*,—Lat. See *Mercurial Pills.*

PILLS (Oxide of Silver). Syn. *Pilulæ Argenti Oxydi*,—Lat. *Prep.* From *oxide of silver*, 6 gr.; *powdered rhubarb* and *extract of gentian*, of each, 12 gr. For 1 dozen pills. *Dose.* 1 pill, twice or thrice daily; in gastralgia, hæmorrhages, nervous affections, &c. Milder than the *pills of nitrate of silver.*

PILLS (Oxide of Zinc). Syn. *Pilulæ Zinci Oxydi*,—Lat. *Prep.* From *oxide of zinc, powdered cascarilla*, and *conserve of hips*, equal parts. For 3½-gr. pills. Tonic and antispasmodic. *Dose.* 1 to 3, thrice daily; in dyspepsia, gastric or spasmodic coughs, epilepsy, chorea, &c.

PILLS (Parr's Life). *Prep.* (Anat. of Quackery.) *Aloes, 7 lb.; rhubarb* and *jalap*, of each, 5 *lb.;* (all in powder;) *extract of gentian*, 3½ *lb.; soft soap*, ½ *lb.; liquorice powder, treacle*, and *moist sugar*, of each, 4½ *lb.; oil of cloves*, 10 *oz.; oil of caraway*, 3½ *oz.;* mix, and beat the whole to a proper mass with *syrup bottoms*, q. s., and divide it into 3½-gr. pills. "There are about 4 dozen in each 1*s.* 1½*d.* box, weighing (dry) barely 3 gr. each." A good stomachic and aperient pill, but possessing none of the extraordinary virtues ascribed to it by its proprietors. (Med. Circ., ii, 146, 167, &c.)

PILLS (Paullinia). Syn. *Guarana Pills; Pilulæ Guaranæ, P. Paullinæ*,—Lat. *Prep.* 1. *Paullinia* mixed up with *syrup of orange peel*, and the mass divided into 2½-gr. pills. *Dose.* 2 to 8.

2. (Dr. Gavrelle.) *Extract of guarana*, 1 dr.; *liquorice powder*, q. s. For 40 pills. *Dose.* 3 to 6, daily.

Obs. These pills are highly esteemed on the Continent as a tonic and astringent, in diseases of the bowels and bladder, in chlorosis, debility, &c.

PILLS (Pectoral). Syn. *Breath Pills; Pilulæ Pectorales*,—Lat. *Prep.* 1. *Compound squill pill*, 1 dr.; *gum benzoin*, ½ dr.; *powdered ipecacuanha* and *extract of henbane*, of each, 15 gr.; *syrup*, q. s. For 3-gr. pills. *Dose.* 2 to 4, three or four times a day; in asthmas, chronic bronchial affections, coughs, &c.

2. (Dr. Copland.) *Camphor* (in powder), 10 gr.; *ipecacuanha*, 15 gr.; *extract of hemlock*, 1 dr. *Dose.* 3 to 6 gr.; in irritating and spasmodic coughs, &c.

3. (Haggart.) *Powdered ipecacuanha* and *squills*, of each, ½ dr.; *acetate of morphia*, 6 gr.; *Castile soap*, 3 dr.; mix, and divide into 72 pills. A most excellent medicine, at once soothing and expectorant. *Dose.* 1 to 2, thrice a day, or oftener.

4. (*Humphries' Cough Pills.*) From *powdered ipecacuanha*, 15 gr.; *compound squill-pill*, 1 dr.; *compound extract of colocynth*, ½ dr. For 3½-gr. pills. *Dose.* 2 pills, night and morning.

5. (Dr. Latham.) *Compound powder of ipecacuanha*, 1 dr.; *fresh squill* and *gum ammoniacum*, of each, 20 gr.; *calomel*, 4 gr. For 20 pills. A most valuable pectoral and expectorant. *Dose.* 1 pill, thrice daily; in bronchitis, coughs, &c., after the more active inflammatory symptoms have subsided.

6. (*Napoleon's.*) From *ipecacuanha*, 30 gr.; *squills* and *ammoniacum*, of each, 40 gr.; (all in powder;) *mucilage*, q. s. to mix. For 24 pills. It is said that this was a favorite remedy with the late Emperor of France for difficulty of breathing, bronchitis, and various affections of the organs of respiration. *Dose.* 2 pills, night and morning.

7. (Dr. Paris.) *Powdered squills*, ½ dr.; *powdered myrrh*, 1½ dr.; *extract of henbane*, 40 gr.; *water* (or *simple syrup*), q. s. to mix. For 4-gr. pills. *Dose.* 2 pills, night and morning. As No. 2.

8. (Ph. L. 1746). *Gum ammoniacum*, 4 dr.; *gum benzoin*, 3 dr.; *gum myrrh*, 2 dr.; *saffron*, 1 dr.; *anisated balsam of*

sulphur, ½ dr.; *syrup of tolu*, q. s. to mix. *Dose.* 5 to 15 gr.

9. (Richter.) *Assafœtida* and *valerian*, of each, ½ dr.; *castor*, 15 gr.; *powdered squills* and *sesquicarbonate of ammonia*, of each, 8 gr.; *extract of aconite* (alcoholic), 3 gr. For 4-gr. pills. *Dose.* 1 to 3 pills, night and morning; in spasmodic affections of the respiratory organs.

PILLS (Perpetual). See *Everlasting Pills.*

PILLS (Peter's). *Prep.* (Anat. of Quackery.) *Aloes*, 3 dr.; *gamboge*, *jalap*, and *scammony*, of each, 2 dr.; (all in powder;) *calomel*, 1 dr.; beaten up with *rectified spirit*, q. s. A powerful cathartic. *Dose.* 1 to 3 pills.

PILLS (Piperine). Syn. *Pilulæ Piperinæ*, —Lat. *Prep.* From *piperine*, ½ dr.; *extract of cinchona*, q. s. For 30 pills. *Dose.* 1 pill, every two hours, during the intermission of an ague; also as an aphrodisiac, and a remedy in piles.

PILLS (Pitch). Syn. *Pilulæ Picis Nigræ*,—Lat. *Prep.* From *black pitch* and *powdered black pepper*, equal parts; beaten together in a warm mortar, and divided into 4-gr. pills. *Dose.* 2 pills, night and morning; in piles, &c.

PILLS (Pitschaft's Eccoprotic). *Prep.* From *strained aloes* and *disulphate of quinine*, equal parts; made into 2-gr. pills. A tonic and stomachic aperient. *Dose.* 2 to 4, at bedtime; in torpor of the large intestines, the dyspepsia of the debilitated, &c.

PILLS (Plummer's). See *Compound Pills of Chloride of Mercury.*

PILLS (Purgative). Syn. *Pilulæ Purgantes*,—Lat. *Prep.* 1. (Dr. Robinson.) *Aqueous extract of aloes*, 1 dr.; *powdered scammony*, ½ dr.; *balsam of Peru*, 10 or 12 gr.; *oil of caraway*, 9 or 10 drops; mix, and divide into 30 pills. A warm, stimulating aperient, highly recommended to excite the peristaltic action of the bowels of the aged, sedentary, and debilitated. *Dose.* 1 to 4 pills, as required.

2. (Trousseau & Reveil.) *Resin of jalap*, 1 dr.; *scammony*, ½ dr.; *extract of colocynth*, 6 gr.; *excipient*, as required. For 20 (or better, 24) pills. *Dose.* 1, "every two hours, in the morning, fasting, until they operate." For other formulæ see *Aperient* and *Cathartic Pills*, and *Pills of Aloes, Jalap, Colocynth, &c.*

PILLS (Quinine). See *page* 1003.

PILLS (Reece's). See *Chirayta Pills.*

PILLS (Renal). Syn. *Pilulæ Renales*, —Lat. *Prep.* 1. *Squills*, *myrrh*, and *digitalis*, of each (in powder), 10 gr.; *extract of rhubarb* and *mercurial pill*, of each, 15 gr.; *powdered nitre*, 20 gr.; *oil of juniper*, 10 or 12 drops. For 24 pills. Alterative, diuretic, and tonic. *Dose.* 3 to 6, thrice a day. Hunter's "*Renal purifying pills*" are similar, but omiting the mercurial pill. *De Roos'* "*Renal pills*" contain a preparation of copaiba.

PILLS (Rheumatism). Syn. *Pilulæ Anti-rheumaticæ*, — Lat. *Prep.* 1. *Gum guaiacum*, 1 dr.; *nitrate of potassa*, 1½ dr., (both in powder;) *soft soap* (Ph. L.), ½ dr.; *oil of cajeput*, 16 drops. For 4 dozen pills. *Dose.* 2 to 6, night and morning; in chronic rheumatism, and rheumatic gout. Their action is accelerated by the copious use of lemon juice during the day.

2. (Mr. Beasley.) *Extract of artichoke*, ½ dr.; *powdered sarsaparilla*, 20 gr.; *oil of sassafras*, 1 drop. For 12 pills. *Dose.* 1 pill, thrice daily.

PILLS (Rhubarb). Syn. *Pilulæ Rhei*,— Ph. E. *Prep.* 1. (Ph. E.) *Powdered rhubarb*, 9 parts; *acetate of potassa*, 1 part; *conserve of red-roses*, 5 parts; mix, and divide into 5-gr. pills. A stomachic and gentle aperient, particularly useful in atonic dyspepsia. *Dose.* 2 to 4 pills.

2. (Ph. U. S.) *Powdered rhubarb*, 6 dr.; *Castile soap*, 2 dr.; beaten up with *water*, q. s., and divided into 120 pills. As the last.

PILLS (Rhubarb,—Compound). Syn. *Aromatic Pills, Balsamic Laxative do., Edinburgh do., Stomachic do.; Pilula Rhei Composita*,—Ph. L. *Pilulæ R. Compositæ*, —Ph. E. & D. *P. Stomachicæ*,—Ph. E. 1744. *P. Aromaticæ, &c. Prep.* 1. (Ph. L.) *Powdered rhubarb*, 4 dr.; *powdered Socotrine aloes*, 3 dr.; *powdered myrrh*, 2 dr.; *soft soap* (Ph. L.), ½ dr.; *oil of caraway*, 15 drops; *treacle*, q. s. to form a mass.

2. (Ph. L. 1836.) *Powdered rhubarb* 1 oz.; *aloes*, 6 dr.; *myrrh*, 4 dr.; *Castile soap*, 1 dr.; *oil of caraway*, ½ fl. dr.; *syrup*, q. s.

3. (Ph. E.) *Powdered rhubarb*, 12 parts; *aloes*, 9 parts; *myrrh* and *Castile soap*, of each, 6 parts; *conserve of red-roses*, 5 parts; *oil of peppermint*, 1 part; mix, and divide into 5-gr. pills. The oil of peppermint may be omitted, when so preferred.

4. (Ph. D.) *Rhubarb*, 1½ *oz.*; *hepatic aloes*, 9 *dr.*; *myrrh* and *Castile soap*, of each, in fine powder, 6 *dr.*; *oil of peppermint*, 1 *fl. dr.*; *treacle*, 2 *oz.*; mix, and beat the whole to a uniform mass.

5. (Ph. U. S., & Ph. E. 1817.) *Rhubarb*, 8 dr.; *aloes*, 6 dr.; *myrrh*, 4 dr.; *oil of peppermint*, ½ fl. dr.; *syrup of orange peel*, q. s.; mix, and divide into 240 pills.

Obs. The above are tonic, stomachic, and gently laxative; extremely useful for obviating costiveness, and giving tone to the stomach and bowels. *Dose.* 6 or 8 to 20 gr. The London pill is not only the most agreeable, but it keeps the best.

PILLS (Rhubarb and Caraway). See *Kitchener's Pills.*

PILLS (Rhubarb and Chamomile). Syn. *Speediman's Pills; Pilulæ Rhei et Anthemidis,*—Lat. *Prep.* From *aloes, myrrh, rhubarb* (each in powder), and *extract of chamomile,* of each, 1 dr.; *essential oil of chamomile,* 10 or 12 drops. For 4-gr. pills. An excellent tonic and stomachic aperient, particularly useful in the dyspepsia and loss of appetite of hard drinkers. *Dose.* 1 to 3 pills, either before dinner, or at bed-time.

PILLS (Rhubarb and Copaiba). Syn. *Pilulæ Rhei et Copaibæ, P. R. Balsamicæ,* —Lat. *Prep.* (Swediaur.) *Powdered rhubarb* and *gum,* equal parts; *balsam of copaiba,* q. s.

PILLS (Rhubarb and Ginger). Syn. *Stomach Pills; Pilulæ Rhei et Zingiberis,* —Lat. *Prep.* From *powdered rhubarb,* 1 dr.; *powdered ginger,* ½ dr.; *Castile soap,* 20 gr.; *tincture* or *essence of ginger,* q. s. to form a mass. For 30 pills. *Dose.* 1 to 6.

PILLS (Rhubarb and Ipecacuanha). Syn. *Pilulæ Rhei et Ipecacuanhæ,*—Lat. *Prep.* From *rhubarb,* ½ dr.; *ipecacuanha,* 15 gr.; *opium,* 5 gr.; (each in powder;) *oil of cinnamon,* 6 drops; *syrup,* q. s. For 18 pills. *Dose.* In loss of appetite and spasmodic dyspepsia, 1 to 3 pills, twice a day; in dysentery, diarrhœa, &c., to relieve tormina and tenesmus, 1, every two hours.

PILLS (Rhubarb and Iron). Syn. *Pilulæ Rhei et Ferri,*—Ph. E. *Prep.* (Ph. E.) *Dried sulphate of iron,* 4 parts; *extract of rhubarb,* 10 parts; *conserve of red-roses,* 5 parts; beat them to a proper mass, and divide this into 5-gr. pills. *Dose.* 2 to 4 pills; in the atonic dyspepsia of debilitated subjects; in chlorosis, &c.

PILLS (Rhubarb and Ox-gall). Syn. *Pilulæ Rhei et Fellis Bovini,*—Lat. *Prep.* From *powdered rhubarb, gum ammoniacum,* and *inspissated ox-gall,* equal parts; beaten up with a little *tincture of ginger* or *proof spirit,* and the mass divided into 2½-gr. pills. In dyspepsia and constipation dependent on a torpid action of the liver. *Dose.* 2 to 6 pills.

PILLS (Rhubarb and Soda). Syn. *Pilulæ Rhei et Sodæ, P. R. Comp. cum Sodâ,*—Lat. *Prep.* (Guy's Hosp.) *Dried carbonate of soda, powdered rhubarb,* and *extract of gentian,* equal parts. For 4½-gr. pills. *Dose.* 2 to 4 pills; in acidity, heart-burn, diarrhœa, loss of appetite, &c.

PILLS (Richter's). See *Pectoral Pills.*

PILLS (Dr. Robinson's). See *Purgative Pills.*

PILLS (Roper's Bath). See *Roper's Bath Plasters.*

PILLS (Rudius's). Syn. *Rudius's Extract; Pilulæ Rudii, Extractum Rudii,*—Lat. *Prep.* 1. *Colocynth pulp,* 6 dr.; *agaric, black hellebore,* and *turpethum root,* of each, 4 dr.; *cinnamon, mace,* and *cloves,* of each, 40 gr.; *rectified spirit,* ½ pint; digest for 4 days, express the tincture, and evaporate it to a proper consistence for making pills. Formerly esteemed one of the most safe and certain cathartics, in troublesome constipation. *Dose.* 5 to 20 gr.

2. (Ph. E. 1783.) *Black hellebore* and *colocynth,* of each, 2 oz.; *water,* 4 pints (o. w. m.); boil to a quart, strain, evaporate to the consistence of honey, and add of *aloes,* 2 oz.; *scammony* (powdered), 1 oz.; next remove the vessel from the fire, and further add of *sulphate of potassa,* 2 dr.; *oil of cloves,* 1 dr.; and form the whole into a pill-mass. Resembles the last (nearly).

PILLS (Rufus'). See *Pills of Aloes with Myrrh.*

PILLS (Saffron). Syn. *Pilulæ Croci,*—Lat. *Prep.* From *hay saffron,* 1 dr.; *myrrh,* ½ dr.; *oil of cajeput,* 6 drops; *syrup of saffron,* q. s. For 36 pills. *Dose.* 1 to 3 or 4, occasionally; as a stimulant in low spirits, hypochondriasis, &c.

2. (Phœbus.) *Saffron, myrrh,* and *sulphur,* equal parts; *inspissated bile,* q. s. For 2-gr. pills. *Dose.* 2 to 12 daily; as an emmenagogue.

PILLS (Sagapenum,—Compound). Syn. *Pilulæ Sagapeni Compositæ. Prep.* (Ph. L. 1836.) *Sagapenum,* 1 oz.; *aloes,* ½ dr.; *syrup of ginger,* q. s. *Dose.* 5 to 20 gr.; as a stimulant antispasmodic laxative, in dyspepsia with flatulence, flatulent colic, &c.

PILLS (Salicine). Syn. *Pilulæ Salicinæ,* —Lat. *Prep.* From *salicine,* ½ dr.; *powdered rhubarb,* 20 gr.; *extract of gentian,* q. s. to mix. For 4-gr. pills. *Dose.* 2 to 4, every three hours, during the apyrexia of intermittents.

PILLS (Scammony,—Compound). Syn. *Pilulæ Scammonii Compositæ,*—Lat. *Prep.* (St. B. Hosp.) *Scammony,* 24 gr.; *ginger,* 20 gr.; *aloes* and *gamboge,* of each, 12 gr.; *treacle,* q. s.; mix, and divide into 12 pills. A powerful cathartic and vermifuge. *Dose.* 1 to 3 pills.

PILLS (Scot's). *Prep.* From *aloes,* 9 *lb.; jalap,* 3 *lb.; gamboge* and *ginger,* of each,

½ *lb.*; beaten up with *treacle* q. s. See *Anderson's Scot's Pills.*

PILLS (Dr. Scott's Bilious and Liver). *Prep.* (Anat. of Quackery.) *Compound extract of colocynth* (Ph. L. 1836), 8 oz.; *powdered rhubarb*, 4 oz.; *powdered myrrh*, 2 oz.; *soft soap*, ½ oz.; *oil of caraway*, 2½ dr.; strong *syrup of saffron*, q. s. to form a pill-mass. "There are twenty-five 3½-gr. pills in each 1*s.* 1½*d.* box." "It has been stated that these pills contain a minute portion of antimony."

PILLS (Sedative). Syn. *Pilulæ Sedativæ*,—Lat. *Prep.* 1. *Hydrochlorate of morphia*, 6 gr.; *powdered sumbul*, 20 gr.; *alcoholic extract of Indian hemp*, ½ dr. For 2-gr. pills. *Dose.* 1 to 3, twice or thrice daily; in excessive nervous irritability, painful menstruation, &c.

2. (U. C. Hosp.) *Camphor*, 1 dr.; reduce it to powder by means of *rectified spirit*, 3 or 4 drops; add of *extract of henbane*, 20 gr., and divide the mass into 20 pills. To allay pain and excitement, &c. *Dose.* 1 to 2 pills.

3. To either of the above, add of *powdered rhubarb* and *extract of gentian*, of each, 20 gr.; and divide the mass into 4-gr. pills. *Dose.* 1 to 4 pills; when, besides the other symptoms, the stomach and bowels are disordered.

PILLS (Sèdillot's Febrifuge). *Prep.* From *powdered opium*, 3 gr.; *disulphate of quinine*, 12 gr.; *confection of opium*, 10 gr., or q. s. For 12 pills. *Dose.* 1 to 2, every second hour, during the intermission of an ague.

PILLS (Senna). Syn. *Pilulæ Sennæ, P. S. Compositæ*,—Lat. *Prep.* 1. *Powdered senna*, 1 dr.; *extract of rhubarb*, ½ dr.; *powdered capsicum*, 4 gr.; *oil of juniper*, 6 or 8 drops. For 3-gr. pills. An aperient well suited for females. *Dose.* 5 to 8 pills.

2. (Hufeland.) *Powdered senna*, 1 dr.; *extract of dandelion*, q. s. to mix. For 30 pills. As the last.

PILLS (Smith's). *Prep.* From *powdered aloes*, 4 dr.; *jalap*, 2 dr.; *ginger* and *soft soap*, of each, 1 dr.; *oil of juniper*, ½ dr.; *emetic tartar*, 6 gr. For 120 pills. Laxative and diuretic. *Dose.* 1 to 4, at bedtime, or early in the morning.

PILLS (Dr. Hugh Smith's). See *Stomach Pills.*

PILLS (Soap). Syn. *Pilulæ Saponis, P. cum Sapone*,—Lat. *Prep.* (P. Cod.) *White Castile soap*, 32 parts; *powdered marsh-mallow root*, 4 parts; *powdered nitrate of potassa*, 1 part; beat them to a mass, and divide this into 4-gr. pills. In habitual costiveness, calculary affections, &c. *Dose.* 1 to 6 pills, twice orthrice a day.

PILLS (Soap,—Compound). Syn. *Pills of Soap and Opium, Laudanum Pills; Pilula Saponis Composita*,—Ph. L. *Pilulæ Saponis cum Opio*,—Ph. L. 1824. *P. Opii*,—Ph. L. 1788 edit. alt. *P. ex Opio*,—Ph. L. 1788 edit. prim. *P. Saponaceæ*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Opium* and *liquorice*, of each (in powder), 2 dr.; *soft soap* (Ph. L.), 6 dr.; beat them to a uniform mass.

2. (Ph. D., & Ph. U. S.) *Opium* (in fine powder), ½ *oz.*; *Castile soap*, 2 *oz.*; *distilled water*, ½ fl. dr., or q. s.; reduce the soap to powder, mix it with the other ingredients, and beat the whole together, as before.

Obs. The above pills contain 1-5th part of their weight in dry opium. The *dose* is 3 to 10 gr., in the usual cases in which the administration of opium is indicated. Mr. Skey, the eminent surgeon of St. Bartholomew's Hospital, has recently shown the great value of this pill in promoting the healing of obstinate ulcers, more especially those of the legs. (See *p.* 911.)

PILLS (Soda). Syn. *Pilulæ Sodæ Carbonatis; P. S. Subcarbonatis*,—Ph. E. 1817. *Prep.* (Ph. E. 1817.) *Exsiccated subcarbonate of soda*, 4 parts; *Castile soap*, 3 parts; *syrup*, q. s. to form a mass. Antacid, and slightly laxative. *Dose.* 10 to 20 gr. This pill was a great favorite of the once celebrated Dr. Beddoes.

PILLS (Speediman's). *Prep.* (Anat. of Quackery.) *Aloes*, 3 dr.; *rhubarb*, *myrrh*, (all in powder,) and *extract of chamomile*, of each, 1 dr.; *oil of chamomile*, 20 drops. For 4-gr. pills. An excellent aperient, tonic, and stomachic. *Dose.* 2 to 4 pills, as a purgative; 1, as a stomachic or dinner pill. (See *p.* 990.)

PILLS (Splenetic). Syn. *Pilulæ Antisplenetiæ*,—Lat. *Prep.* (Saunders.) *Strained aloes* and *gum ammoniacum*, of each, 3 dr.; *myrrh* and *bryony*, of each, ½ dr. For 4-gr. pills. *Dose.* 3 to 5. "Extolled in amenorrhœa and hypochondriasis." (Dr. R. E. Griffith.)

PILLS (Squill,—Compound). Syn. *Cough Pills, Pills of Squills and Ginger; Pilula Scillæ Compositæ*,—Ph. L. *Pilulæ Scillæ Compositæ*,—Ph. D. *P. Scillæ*,—Ph. E. *P. Scilliticæ*,—Ph. E. 1817. *P. è Scilla*,—Ph. L. 1788. *P. S. cum Zingibere*,—Ph. D. 1807. *Prep.* 1. (Ph. L.) *Freshly powdered squills*, 1 dr.; *powdered ginger* and *powdered ammoniacum*, of each, 2 dr.; mix, add of *soft soap* (Ph. L.), 3 dr.; *treacle*, 1 dr.; and beat the whole together, so that a mass may be formed.

2. (Ph. E.) *Squills*, 5 parts; *ammoniacum*, *ginger*, (all in fine powder,) and *Spanish*

soap, of each, 4 parts; *conserve of red-roses*, 2 parts; mix, as before, and divide the mass into 5-gr. pills.

3. (Ph. D.) *Squills* (in fine powder), 2½ *dr.*; *ammoniacum*, *ginger*, and *Castile soap*, of each (in fine powder), 2 *dr.*; *treacle*, ½ *oz.*

Obs. Compound squill pill is a most useful expectorant, in chronic coughs, asthmas, bronchial affections, difficulty of breathing, &c.; and, combined with *calomel* and *foxglove*, and, occasionally, with *croton oil*, as a diuretic, &c., in dropsies. Unfortunately, however, it soon spoils; and, therefore, to be effective as a remedy, it must be recently prepared. As an expectorant, it should not be administered until the inflammatory symptoms have been subdued by purgatives or bleeding. A little *powdered opium*, or *extract of henbane*, is occasionally *added*, to allay irritation. *Dose.* 5 to 20 gr., twice or thrice a day, accompanied by an occasional aperient.

PILLS (Stahl's). See *Aperient Pills.*

PILLS (Starkey's). *Prep.* (Original Formula.) *Extract of opium*, 4 oz.; *mineral bezoar* and *nutmeg*, of each, 2 oz.; *saffron* and *Virginian snake-root*, of each, 1 oz.; *Starkey's soap*, ½ lb; *oil of sassafras*, ½ oz.; *tincture of antimony* (Old Ph.), 2 fl. oz. Anodyne, diaphoretic, &c. *Dose.* 3 to 10 gr. The formula already given under *Matthew's Pills* is erroneously assigned to this pill by some writers.

PILLS (Mrs. Stephen's). This once celebrated remedy for stone, was prepared from the *calcined shells of eggs* and *snails*, made into 3-gr. pills with *soft soap*. Its active ingredients were, consequently, lime and potash.

PILLS (Stimulant). Syn. *Pilulæ Stimulantes*,—Lat. *Prep.* 1. *Capsicum*, ½ dr.; *nitrate of silver*, 2 gr.; *conserve of hips*, q. s. For 12 pills. *Dose.* 2 to 4, washed down with a spoonful of warm spirit-and-water, and repeated hourly, until reaction ensues; in cholera, &c.

2. (A. T. Thomson.) *Strychnia*, 1 gr.; *acetic acid*, 1 drop; *crumb of bread*, 20 gr.; mix *very carefully*, and divide the mass into 10 pills. *Dose.* 1, every six hours; in paralysis arising from lead.

PILLS (Stoerck's). Syn. *Pilulæ Conii*, *P. Cicutæ*,—Lat. *Prep.* From *extract of hemlock*, 1 dr.; *powdered hemlock*, q. s. to make a mass. For 2-gr. pills. *Dose.* 1 to 4, twice a day; in various glandular and visceral enlargements, pulmonary affections, cancer, scrofula, neuralgia, &c.

PILLS (Stomach). Syn. *Pilulæ Stomachicæ*,—Lat. *Prep.* 1. *Ipecacuanha*, 10 gr.; *sumbul* and *extract of rhubarb*, of each, 30 gr.; *powdered quassia*, 20 gr.; *oil of sassafras*, 6 drops; beaten up with *essence of ginger* (strongest), q. s. For 3-gr. pills. *Dose.* 1 to 3, thrice daily; in loss of appetite, flatulence, dyspepsia, &c.

2. (*Dr. Hugh Smith's.*) From *aloes*, *rhubarb*, *ginger*, (all powdered,) and *sagapenum*, of each, 1 dr.; *oils of peppermint* and *cloves*, of each, 10 drops; *balsam of Peru*, q. s. to mix. For 5-gr. pills. *Dose.* 2 or 3, nightly; or 1 to 2, before dinner. For other formulæ, see *Dinner Pills*, *Aperient do.*, *Compound Rhubarb do.*, *Aloes and Mastic do.*, &c., &c.

PILLS (Storax,—Compound). Syn. *Storax Pills; Pilula Styracis Composita*,—Ph. L. *Pilulæ Styracis*,—Ph. E., & Ph. D. 1826. *Prep.* 1. (Ph. L.) *Prepared storax*, 6 dr.; *saffron* and *powdered opium*, of each, 2 dr.; beat them together to a uniform mass. Contains 1-5th of its weight of opium.

2. (Ph. E.) *Opium* and *saffron*, of each, 1 part; *extract of styrax*, 2 parts; beat them to a uniform mass, and divide this into 4-gr. pills. Contains 1-4th part of opium.

Obs. The storax is here chiefly employed to disguise the odour and taste of the opium. The name of the preparation has been chosen so that the word "*opium*" may not appear in the prescription; a point highly necessary with certain patients. *Dose.* 3 to 10 gr.; as compound soap pill, and as an anodyne and expectorant in chronic coughs, &c.

PILLS (Stramonium). Syn. *Pilulæ Stramonii*,—Lat. *Prep.* 1. *Stramonium seeds* (in powder), 12 gr. (or *leaves*, 25 gr.); *powdered camphor* and *extract of seneka root*, of each, 1 dr.; *powdered savine*, 1½ dr.; *oil of cajeput*, 15 drops. For 2½-gr. pills. *Dose.* 2 to 4, thrice daily; in rheumatism, &c.

2. (Sir H. Halford.) *Extract of stramonium* and *liquorice powder*, of each, 1 dr.; *powdered Castile soap*, 2 dr.; *mucilage*, q. s. to mix. For 60 pills. *Dose.* 1, night and morning; in asthmas, &c.

PILLS (Strychnine). Syn. *Pilulæ Strychniæ*,—Lat. *Prep.* (Magendie.) *Strychnine*, 2 gr.; *conserve of hips*, 36 gr.; (*liquorice powder*, q. s.;) mix *very carefully*, divide the mass into 24 pills, and silver them. *Dose.* 1 pill, night and morning; in amaurosis, impotence, paralysis, &c.

PILLS (Sulphate of Iron). Syn. *Pilulæ Ferri Sulphatis*,—Ph. E. *P. F. S. Compositæ*,—Ph. E. 1817. *Prep.* 1. (Ph. E.) *Dried sulphate of iron* and *conserve of red-roses*, of each, 2 parts; *extract of dandelion*, 5 parts. For 5-gr. pills. A useful

chalybeate tonic. *Dose.* 1 to 2, twice or thrice daily; in dyspepsia, chlorosis, amenorrhœa, &c.

2. (Ph. E. 1817.) *Sulphate of iron* (dried), 1 oz.; *extract of chamomile*, 1½ oz.; *oil of peppermint*, 1 dr.; *syrup*, q. s. As the last.

3. (Ph. U. S.) As No. 1, but substituting *extract of gentian* for extract of dandelion. For *other formulæ* see *Hooper's Pills*, &c.

PILLS (Sulphate of Quinine). Syn. *Pilulæ Quiniæ Sulphatis, P. Q. Disulphatis,*—Lat. *Prep.* 1. *Disulphate of quinine*, 20 gr.; *extract of gentian*, 40 gr. For 20 pills.

2. (Ph. U. S.) *Disulphate of quinine*, 2 dr.; *powdered gum*, ½ dr.; *strained honey*, q. s. For 120 pills. Each pill contains 1 gr. of the sulphate or disulphate of quinine. *Dose.* 1 or 2, twice a day, as a tonic and stomachic; 6 to 12, every two or three hours, during the remissions of agues.

Obs. Various additions are often made to the above formulæ, according to the indications, by which numerous other useful pills are produced. Thus, *potassio-tartrate of antimony* is frequently added in obstinate intermittents; *iodide of potassium*, in scrofulous affections; *foxglove*, in the hectic fever of phthisis; *bitter tonics* and *aromatics*, in dyspepsia, flatulence, &c.; *carbonate of soda* or *magnesia*, in acidity and heartburn; *calomel, mercurial pill*, in bilious affections; *rhubarb* and *aloes*, in bowelly affections; *sulphate of iron* and *other chalybeates*, in debility, amenorrhœa, and chlorosis; *calomel*, as an alterative; &c., &c.

PILLS (Sulphate of Zinc). Syn. *Pilulæ Zinci Sulphatis, P. Z. S. Compositæ,*—Lat. *Prep.* 1. *Sulphate of zinc*, 12 gr.; *extract of gentian*, ½ dr.; *liquorice powder*, q. s. For 20 pills. In dyspepsia, epilepsy, and various convulsive diseases.

2. (Dr. Paris.) *Sulphate of zinc*, 10 gr.; *powdered myrrh*, 1½ dr.; *conserve of roses*, q. s. For 30 pills. *Dose.* 1 to 2, twice or thrice daily; in hooping-cough, &c.

PILLS (Syphilis). Syn. *Pilulæ Antisyphiliticæ,*—Lat. See the various pills of *mercury, gold*, &c. The *pills of bichloride of mercury* commonly pass under this name.

PILLS (Tangore). See *Arsenical Pills.*

PILLS (Tannic Acid). Syn. *Pilulæ Tannini, P. Acidi Tannici,*—Lat. *Prep.* From *tannic acid* or *tannin* and *powdered sugar*, of each, ½ dr.; *conserve of roses*, q. s. For 24 pills. *Dose.* 1 or 2 pills, thrice daily, in diarrhœa; or 2, every three hours, in internal hæmorrhages, spitting of blood, &c.

PILLS (Tar). Syn. *Pilulæ Picis Liquidæ,*—Lat. *Prep.* From *tar*, 1 dr.; *powdered gentian*, ½ dr., or q. s. For 24 pills. Stimulant, diuretic, and sudorific. *Dose.* 1 to 4, thrice a day; in dropsies, worms, ichthyosis, and several other skin diseases, &c.

PILLS (Taraxacum). Syn. *Pilulæ Taraxaci,*—Lat. *Prep.* 1. *Extract of dandelion*, 1 dr.; *powdered rhubarb*, q. s.; divide into 3½-gr. pills In dyspepsia, &c., complicated with congestion of the liver.

2. (St. Marie.) *Extract of dandelion* and *Castile soap*, equal parts; *liquid acetate of potassa*, q. s. to mix. For 4-gr. pills. As a diuretic in dropsy.

3. *Extract of dandelion*, 1 dr.; *mercurial pill*, 20 gr.; *powdered digitalis*, 15 gr.; *liquorice powder*, q. s. For 24 pills. *Dose.* 1, afterwards increased to 2 or 3; in dropsy connected with liver disease.

PILLS (Thomson's Stomach and Liver). *Prep.* From *extract of dandelion*, 1 dr.; *scammony and rhubarb*, of each, 15 gr. For 24 pills. *Dose.* 2 pills, night and morning; in hysteria, hypochondriasis, and chronic inflammation of the liver or kidneys.

PILLS (Tonic). Syn. *Pilulæ Tonicæ,*—Lat. *Prep.* 1. *Sulphate of iron, ginger*, and *myrrh*, (all in powder,) equal parts; *conserve of roses*, q. s.; mix, and divide into 4-gr. pills. *Dose.* 1, twice a day; in debility, chlorosis, &c.

2. *Powdered myrrh* and *sulphate of iron*, of each, 1 dr.; *disulphate of quinine*, ½ dr.; *powdered capsicum*, 15 gr.; *conserve of roses*, q. s. to mix. For 60 pills. *Dose.* 1 or 2, twice or thrice a day; in debility, dyspepsia, ague, &c.

3. (Dr. Collier.) *Tartrate of iron* and *extract of gentian*, of each, 1 dr.; *oil of cinnamon*, 2 drops. For 30 pills. *Dose.* 3 to 6, three or four times a day. A good stomachic tonic.

4. (Dr. Collier.) *Oxide of zinc*, ½ dr. (or *sulphate of zinc*, 20 gr.); *myrrh*, 2 dr.; *camphor*, 20 gr.; *confection of hips*, to mix. For 40 pills. *Dose.* 1 or 2 pills, three times a day; in epilepsy, chorea, and other nervous disorders, debility, &c.

5. (Dr. A. T. Thomson.) *Rhubarb* and *ginger*, of each, ½ dr.; *extract of chamomile*, 1 dr.; divide into 30 pills. *Dose.* 2 or 3, twice a day; in dyspepsia and chlorosis.

6. (Dr. A. T. Thomson.) *Sesquioxide of iron* and *extract of hemlock*, of each, 1 dr.; mix, and divide into 20 pills. *Dose.* 1 or 2, twice a day; in fluor albus, scrofula, &c. Several other formulæ for tonic pills will be

found under the names of the leading ingredients, &c. (See *above.*)

PILLS (Valerian, — Compound). Syn. *Pilulæ Valerianæ Compositæ*,—Lat. *Prep.* (Dupuytren.) *Powdered valerian*, ½ dr.; *castor* and *white oxide of zinc*, of each, 20 gr.; *syrup*, q. s. to mix. For 18 pills. *Dose.* 2 or 3, thrice daily; in hysteria, hypochondriasis, chlorosis, hemicrania, &c.

PILLS (Valerianate of Zinc). Syn. *Pilulæ Valerianas*,—Lat. *Prep.* From *valerianate of zinc* and *powdered gum*, of each, 15 gr.; *conserve of hips*, q. s. to form a mass. For 18 pills. *Dose.* 1 pill, twice daily; in nervous headache, neuralgia, hysteria, &c.

PILLS (Vallet's). See *page* 987.

PILLS (Vance's). See *Aperient Pills.*

PILLS (Veratrine). Syn. *Pilulæ Veratriæ*,—Lat. *Prep.* 1. (Magendie.) *Veratriæ*, ½ gr.; *powdered gum arabic* and *syrup of gum*, of each, q. s. to form 6 pills. (See *below.*)

2. (Turnbull.) *Veratria*, 1 gr.; *extract of henbane* and *liquorice powder*, of each, 12 gr.; mix, and divide into 12 pills. *Dose.* 1 pill, every 3 hours; in dropsy, epilepsy, hysteria, paralysis, nervous palpitations, &c. This should be prepared and used with great caution.

PILLS (Ward's Red). Syn. *Ward's Antimonial Pills. Prep.* From *glass of antimony* (finely levigated), 4 oz.; *dragon's blood*, 1 oz.; *mountain wine*, q. s. to form a mass. For 1½-gr. pills. Emetic. "They are recommended in obstinate rheumatic affections, in foulness of the stomach and bowels, &c. Their action is often of a very unpleasant character." (*Anat. of Quackery.*)

PILLS (Lady Webster's). See *Dinner Pills.*

PILLS (Whitehead's Essence of Mustard). *Balsam of tolu*, with *resin.* (Dr. Paris.)

PILLS (Whytt's). *Prep.* (Radius.) *Aloes*, *chloride of iron*, and *extract of horehound*, of each, ½ dr.; *assafœtida*, 1½ dr. For 2-gr. pills. *Dose.* 2 to 5, thrice daily; in leucorrhœa, chlorosis, hysteria, &c., with constipation.

PILLS (Worm). Syn. *Pilulæ Anthelminticæ, P. Vermifugæ*,—Lat. *Prep.* 1. *Calomel*, 1 oz.; *sugar*, 1½ oz.; *mucilage*, q. s.; mix, and divide into 240 pills. *Dose.* 1 to 2, over-night, followed by a strong dose of castor oil early the next morning.

2. *Gamboge*, 6 gr.; *calomel*, 5 gr.; *mucilage*, q. s.; divide into 3 pills. For a morning's dose, fasting.

3. *Extract of wormwood*, *calomel*, and *powdered scammony*, equal parts. For 4-gr. pills. *Dose.* 2 to 4, as the last. For ascarides, and other small worms.

4. (Bresmer.) *Powdered aloes* and *tansy seed*, of each, ½ dr.; *oil of rue*, 9 or 10 drops. For 12 pills. *Dose.* 3 to 6, in the morning, fasting, and repeated in two or three hours.

5. (Phœbus.) *Iron filings*, ½ dr.; *assafœtida*, 1½ dr.; *essential oil of tansy*, 10 or 12 drops; *extract of wormwood*, q. s.; mix, and divide into 80 pills. *Dose.* 6 pills, thrice daily.

6. (Peschier.) *Ethereal extract of male-fern*, 30 drops; *extract of dandelion*, 1 dr.; *powdered rhizomes of male-fern*, q. s. to mix. For 30 pills. In tape-worm. *Dose.* 6 to 15, at bedtime; the dose being repeated in the morning, and then followed in an hour by a strong dose of castor oil.

PILLS (Worsdell's, — Kaye's). *Prep.* (Anat. of Quackery.) *Powdered aloes*, *gamboge*, and *ginger*, equal parts; together with a very small quantity of *diaphoretic antimony*, beaten into a mass with either *syrup* or *treacle*, and divided into 2½-gr. pills. "There are about 4½ dozen pills in each 1*s.* 1½*d.* box." "The *dose*, as given in the directions, is from 2 to 8 pills (or even 10 to 12) daily." They frequently operate with great violence.

PILLS (Wyndham's, — Lee's). *Prep.* (Anat. of Quackery.) *Aloes* and *gamboge*, of each (in powder), 3 oz.; *Castile soap* and *extract of cow-parsnip*, of each, 1 oz.; *nitre*, ½ oz. For 5-gr. pills. A powerful drastic cathartic. *Dose.* 1 to 3 pills.

PILLS (Zinc). See *Pills of Oxide, Sulphate*, and *Valerianate of Zinc, &c.*

PIMARIC ACID. First obtained by Laurent from the turpentine of *pinus maritima* (Bordeaux turpentine), by the action of *hot alcohol.* By dry distillation, in vacuo, it yields *pyropimaric acid;* and by a like distillation, under ordinary pressure, an oily fluid called *pimarone.* By the action of nitric acid it yields *azomaric acid.*

PIMELIC ACID. One of the products of the action of *nitric acid* on *fatty bodies.*

PIMENTIC ACID. The heavier and least volatile portion of *oil of pimento.*

PIMENTO. Syn. *Allspice, Clove Pepper, Jamaica do., Pimenta Berries; Pimenta*,—Ph. L. E. & D. *Piper Caryophyllatum, P. Jamaicense, P. Odoratum, Pimentæ Baccæ*,—Lat. var. "The immature fruit" of "*Eugenia pimenta* (myrtus pimenta, *Linn.*),"— Ph. L. It possesses a mixed odour of cinnamon, cloves, and nutmegs, which, with its other properties, it for the most part yields to alcohol, ether,

and water. It is stimulant and tonic, and is much esteemed as an adjuvant in medicines prescribed in dyspepsia, flatulence, gout, hysteria, &c.; and also to cover the taste of disagreeable medicines. *Dose.* 5 to 30 gr., bruised or in powder. See *Essences*, *Oils* (Volatile), *Spirits*, and *Waters*.

PIMPLES. See *Eruptions* (Papular).

PINCHBECK. A gold-like alloy of copper and zinc. See *Brass* and *Mosaic Gold*.

PINE APPLE. Syn. *Ananas*. The fruit of *bromelia ananas*. It is astringent, esculent, and possesses a rich flavour and odour. In Europe it is chiefly used as a delicacy for the table; but in tropical climates it is said to be valuable in renal diseases. See *Essences*, &c.

PINEY TALLOW. From the *fruit* of *valeria indica*, a tree common in Malabar, by boiling it with water. It is intermediate between fat and wax, makes good soap, and excellent candles. It melts at 98° Fahr. Sp. gr. 0·9250 to 0·9265.

PINIC ACID. The portion of *common resin* or *colophony* which is soluble in *cold alcohol* of sp. gr. 0·833.

PINK. A well-known shade of light-red. The name is also applied to several pigments, consisting of *whiting* stained with *liquid dyes*. See *Rose Pink*, *Yellow Pigments*, &c.

PINK DYE. *Prep.* From *washed safflowers*, 2 *oz.*; *salt of tartar*, ½ *oz.*; *cold water*, 1 quart; digest for 3 hours, express the liquor, and strain it. *Used* as a cosmetic, and to dye silk stockings, &c., of a rose-colour. The colour is brought out by afterwards applying to, or passing the articles through, *water* soured with *lemon juice*. See *Pink Saucers*.

PIPERINE. Syn. *Piperina*, *Piperinum*, —Lat. (P. Cod.) *Alcoholic extract of black pepper* is treated with a weak *solution of caustic potassa* (1 to 100), and the residuum, after being washed with *cold water* is dissolved in *alcohol*; the solution is next agitated with a little *animal charcoal*, and the filtrate is allowed to evaporate spontaneously; the product may be purified by re-solution in alcohol, and re-crystallization.

Prop., &c. Colourless, or only slightly yellow; tasteless; inodorous; fusible; and crystallizable; insoluble in water; freely soluble in strong spirit, and in the acids; very feebly basic; (a few definite compounds have, however, been obtained with difficulty;) reddened by oil of vitriol. It has been much employed in Italy and on the Continent as a febrifuge. *Dose.* 2 to 10 gr., frequently repeated, during the apyrexia of intermittents.

Obs. An assay for its piperine is the only certain method of testing the quality of either *black* or *white pepper*. For this purpose a *weighed quantity* of the *sample* is reduced to powder, and is exhausted with *alcohol* of the sp. gr. 0·833; the mixed tinctures are then evaporated to an extract, which is treated as above. (See *p.* 954.)

PIPES. (In Confectionery.) These are formed from any of the common *lozenge-masses*, by rolling them into cylinders of about the thickness of a goose quill. They are frequently medicated.

PISASPHALTUM. Mineral pitch.

PISTACHIA NUTS. Syn. *Pistachio Nuts*; *Nuces Pistachiæ*,—Lat. The *kernels* of the fruit of *pistachia vera* (Linn.); a species of turpentine tree, common to some parts of Europe and the East. They closely resemble almonds, but are sweeter, and form a green emulsion with water. *Used* in confectionery and perfumery, and also as a dessert fruit.

PITCH. Syn. *Black Pitch*, *Boiled do.*, *Stone do.*, *Wood do.*; *Pix*,—Ph. L. *Pix Nigra*,—Ph. L. 1836. *Pix Arida*,—Ph. L. 1788. *P. Atra*, *P. Navalis*, *P. Sicca*,—Obs. var. "A dry bitumen prepared from liquid pitch." (Ph. L.) The residuum from boiling tar in an open iron pot, or in a still, until the volatile and liquid portion is driven off. The volatile products principally consist of *crude pyroligneous acid* and *oil of tar*. Pitch is chiefly employed in ship-building. As a *medicine*, it is stimulant and tonic, and has been used internally in some skin diseases, and in piles. An *ointment* made of it is also extensively used in cutaneous affections of the scalp. *Dose.* 10 gr. to ½ dr.

PITCH (Burgundy). Syn. *White Pitch*; *Burgundy Pine Resin*; *Pix Burgundica*,—Ph. L. E. & D. *Pix Abietina*,—Ph. L. 1836. *Pix Arida*,—Ph. L. 1809. *P. Alba*, *P. Humida*,—Obs. var. "Impure resin prepared from the turpentine of *abies excelsa*" or Norway spruce fir. (Ph. L.) "A concrete resinous exudation, probably, in a great measure, from *abies excelsa*." (Ph. E.) It is chiefly used in plasters.

Obs. The importation of this substance has for some years past been gradually lessening in amount, in consequence of the substitution for it of a factitious pitch, made by melting *common resin* with *linseed oil*, and colouring the mass with *annotta* or *palm oil*. The physiological action of the two articles is, however, considerably different, since Burgundy pitch acts upon the skin as

a powerful local irritant, exciting a slight degree of inflammation, and not unfrequently producing a pimply eruption, and an exudation of purulent matter. It is celebrated for its effects when employed as a plaster in all cases where warmth, support, and long adhesion to the skin are desirable; and in the latter quality no substance equals it. The factitious Burgundy pitch has similar properties, but in an *immensely* less degree.

Prepared Burgundy Pitch ("Pix Burgundica Præparata,"—*Ph. L.*) is ordered to be obtained in the same way as that adopted for *strained ammoniacum*. (See *p.* 174.) This plan is, however, seldom, if ever, adopted in trade.

PITCH (Burgundy,—Factitious). Syn. *Pix Burgundica Factitia*,—Lat. *Prep.* By melting good *yellow resin*, 1 cwt., with *linseed oil*, 1 gall., and *palm oil* (bright), q. s., to colour. The mixture is allowed to cool considerably, and is then pulled with the hands in the same way as lead plaster is treated; after which it is placed in "*bladders*" or "*stands*" for sale.

Obs. The product of the above formula is the *Burgundy pitch* of the shops. The "pulling" or "working" destroys the translucency of the resin, and imparts to it the peculiar semi-opacity of foreign Burgundy pitch. Cold water is commonly employed to cool it down. *Annotta* is often substituted for palm oil as a colouring substance. The addition of some of the "droppings" or "bottoms" of *Canada balsam*, *Chio turpentine*, *oil of juniper*, *&c.*, renders this article nearly equal to foreign pitch; but in commerce this is never attempted, the aim being only the production of a *lively colour* with *moderate toughness*. A common melting-pan and fire (if clean and carefully managed) will succeed sufficiently; but, both for safety and convenience, steam is preferable, and, on the *large scale*, almost indispensable. A good workman can pull and put into stands or casks about 5 cwt. daily; or from 1½ cwt. to 3 cwt. in bladders, the latter quantity depending on the size of the bladders. (See *above*.)

PITCH (Canada). Similar to Burgundy pitch; but from the *pinus Canadensis*, or *hemlock spruce fir*. It is also called *hemlock gum* and *hemlock pitch*.

PITCH (Jews'). See *Asphaltum*.

PITCH (Mineral). Indurated mineral bitumen. See *Asphaltum*, *Bitumen*, *&c.*

PITCOAL. This article has been truly described as the most valuable of all those mineral substances from which Great Britain derives its prosperity, and the one which may be regarded as the main support of the whole system of British production. "It fuses the metals, it produces the steam which sets our machinery in motion, and, in short, it may be said to render all the resources of this country available for use."

The two *principal varieties* of coal are "*hard coal*" or "*anthracite*," and "*soft*" or "*bituminous coal*." The first has been already noticed. (See *p.* 69.) The second is the well-known fuel of our domestic fires. The finer *qualities* of this variety are furnished by the coal fields of Northumberland, Durham, and Yorkshire; but, more especially, by the first of these. This coal is rich in bitumen, kindles easily, softens, swells, and cakes together as it becomes heated, and throws out streams of gas which burst into jets of vivid flames. It furnishes light, porous, deep-coloured cinders, and very little ash.

The *quality of coal* may be ascertained by either directly testing its heating power, or by chemical analysis. In the investigations undertaken at the Museum of Economic Geology, under the directions of Sir H. De la Beche, and which furnished the materials for the celebrated "*Admiralty reports*," three different methods were adopted for this purpose. These consisted in—the *determination* of the *quantity of water* which a *given weight of the coal* was capable of *converting into steam*, — the *quantity of litharge* which it was capable of *reducing* to the *metallic state*, and, lastly,—its *ultimate analysis* by *peroxide of copper*. (See *p.* 915.) "The evaporative (heating) value of a bituminous coal," says the report just referred to, "is expressed by the *evaporative value of its coke*, the heat of combustion of its volatile products proving, in practice, little more than that necessary to volatilize them." "It is easy from analysis to determine whether the duty performed by the coal is to be attributed to its fixed ingredients or coke, by estimating the work which the latter is capable of performing. This may be done by *subtracting the ashes in the coal* from its *amount of coke*, and *estimating the remainder* as *carbon*; this carbon, *multiplied* by its *heating power*, 13268, and *divided* by 965·7, or the latent heat of steam, *indicates* the *number of pounds of water* which the coke by itself would evaporate, without the aid of the volatile combustible ingredients of the coal." The results thus obtained, "placed in juxtaposition with the *actual work* done by the coal, show, on the whole, that the work capable of being performed by the coke

alone, is actually greater than that obtained by experiments with the original coal." This statement is, however, questioned by Dr. Ure, who asserts, that "so far from finding that the 'evaporative value of a coal is expressed by the evaporative value of its coke,'" his own experiments "clearly prove that the evaporative power of a bituminous coal is an immense deal *greater* than its coke; indeed, almost double; and that the volatile ingredients of coal evolve in burning relatively a much greater proportion of heat than the fixed constituents. This is precisely what might have been expected from the well-known calorific power of hydrogen, which is three times greater than that of carbon." On this it must be remarked, that the words of the report had especial reference to the principal Welsh coals, commonly known as "*steam coal;*" whilst Dr. Ure's assertion was probably based on experiments performed with some other varieties of bituminous coal. The Admiralty report is undoubtedly very near the truth with reference to furnaces that do not burn their own smoke.

It is found that "a relative *excess of carbon* constitutes a coal best adapted for *furnaces* of various kinds; while a relative *excess of hydrogen* forms the best coal for *common grates* and *gas-works*."

The *quantity* of *sulphur* in *coal* is another matter of importance that may be determined by chemical analysis. (See *Sulphur*.) The presence of more than 1% of sulphur renders coal unfit for the economical production of good light-gas, and more than 2% of sulphur renders it objectionable for use as domestic fuel. In like manner, coal containing *mineral ingredients* in excess, are to be avoided, not merely on account of the quantity of ashes left by them, but for their tendency to vitrify upon the bars of the furnace, and to produce what is technically called "clinkers." The presence of much *silica* or *alumina*, and more particularly of any of the *salts of lime* in "steam coal," is, on this account, highly objectionable.

The following particulars are given as examples:—

Blackley Hurst Coal of Lancashire, an excellent coal for the production of gas and for domestic use;—*Gaseous products* (combustible gases) from a luted crucible, 41·5%; *coke*, 58·5%; *sulphur*, 1%; *ashes*, 1·2 to 2%. Sp. gr. 1·26. (Dict. Arts, Manuf., and Mines, ii, 426.)

Llangennech Coal, an excellent, powerful, and well-known "steam coal," yielding a very intense heat, with little smoke;—*Combustible gases*, 17%; *coke*, 83%; *sulphur*, ½%; *ashes*, 3 to 3·5%. Sp. gr. 1·337. (Dict. A. M. & M., ii, 427.)

(For some further information connected with this subject, see *Anthracite, Chimneys, Coke, Ebullition, Evaporation, Fuel, Furnace, Gas, Heat, Organic Substances, Smoke, Steam, Stoking, Sulphur, &c.*)

PITTACAL. A peculiar substance, obtained by Reichenbach from a certain portion of the *oil of tar*, by the action of *baryta*. In appearance, it closely resembles indigo, and might easily be mistaken for it, were it not that on the slightest friction it assumes a resplendent metallic lustre. It is insoluble in water, although very diffusible in it; insoluble in alkaline lyes; soluble in sulphuric acid to a green solution, turning on the crimson; and in hydrochloric acid and acetic acid, forming a reddish blue solution. It gives a *fast blue dye* to cotton cloth previously mordanted with *solution of tin* or *alum*.

PITYRIASIS. See *Tetters*.

PLAGUE. Syn. *Pestis*,—Lat. "A typhus fever, eminently contagious, and attended by excessive debility; at an uncertain period of the disease carbuncles or buboes ensue." (Cullen.) The *premonitory symptoms* are those common to fevers; followed by nausea, the vomiting of dark bilious matter, violent headache, delirium, and the other symptoms just referred to. The medical art has hitherto been unable to arrest or control the progress of this disease. It is said that when it is unattended by buboes its runs its course more rapidly, and is more generally fatal, than when early accompanied by such inflammations. "When they proceed kindly to suppuration, they always prove critical, and ensure the patient's recovery." See *Fevers, Pestilential Diseases, &c.*

PLAICE. The *pleuronectes platessa*, a well-known flat fish, common to both the English and Dutch coasts. Its flesh is good, and easy of digestion, but more watery than that of the flounder.

PLASMA. Syn. *Liquor Sanguinis*,—Lat. The fluid of the blood in which the red globules are suspended. It consists of serum holding some fibrine in solution.

PLASTER. See *Mortar*.

PLASTER. Syn. *Emplastrum*,—Lat. Plasters (*emplastra*) are external applications that possess sufficient consistence not to adhere to the fingers when cold, but which become soft and adhesive at the temperature of the human body.

Plasters are chiefly *composed* of *unctuous substances* united to *metallic oxides*, or to

powders, *wax*, or *resin*. They are usually formed, whilst warm, into ½-*lb*. rolls, about 8 or 9 inches long, and wrapped in paper. When required for *use*, a little is melted off the roll by means of a heated iron spatula, and spread upon leather, linen, or silk. The *less adhesive plasters*, when spread, are usually surrounded with a margin of resin plaster, to cause them to adhere.

In the *preparation* of *plasters*, the heat of a water-bath, or of steam, should *alone* be employed. On the *large scale*, well-cleaned and polished copper, or tinned copper pans, surrounded with iron jackets, supplied with high-pressure steam, are used for this purpose. The *resins* and *gum resins* that enter into their composition, are previously purified by straining. After the ingredients are mixed, and the mass has acquired sufficient consistence by cooling, portions of it are taken in the hands anointed with a little olive oil, and well pulled or worked until it becomes solid enough to admit of being formed into rolls. To promote the cooling of the plaster it is usual to plunge it into cold water, and to expose it to the action of the fluid by working it about under the surface, after which it is well pulled in the hands to remove the superfluous water; but this process must not on any account be practised on *compound plasters*, containing *odorous substances*, or substances *soluble in water*. These should be suffered to cool on an oiled marble slab, until sufficiently "stiff" to be formed into rolls. Many plasters, as those of *lead* and *resin*, derive much of their whiteness and beauty from the treatment just referred to. *White plasters* are not, however, always the best; but they are those which are most admired, and the most sought after in trade.

Plasters are *preserved* by enveloping the rolls with paper, to exclude the air as much as possible, and by keeping them in a cool situation. A few, as those of *belladonna* and *ammoniacum with mercury*, are commonly placed in pots. When kept for any length of time, they are all more or less apt to become hard and brittle, and to lose their colour. When this is the case, they should be re-melted by a gentle heat, and sufficient oil added to the mass to restore it to a proper consistence.

The operation of *spreading plasters* for use, requires skill and experience on the part of the operator. Various textures are employed for the purpose, of which *linen* or *cotton cloth*, or *leather*, are those most generally employed. *Silk* and *satin* are used for "*court plaster*." The *shape* and *size* must be regulated by the part to which they are to be applied.

On the *large scale*, plasters are spread by means of a "spreading machine."

Compound plasters are now much less frequently employed in medicine than formerly. Those principally in use are such as afford protection to sores and abraded surfaces, and give support to the parts. A few, however, which contain acrid, stimulating, and narcotic substances, and operate as rubefacients, blisters, or anodynes, are still retained in the pharmacopœias.

PLASTER (Aconite). Syn. *Emplastrum Aconiti*,—Lat. *Prep.* (Curtis.) Gently evaporate *tincture of aconite* to the consistence of a soft extract, then spread a very small portion over the surface of a common adhesive plaster, on either calico or leather. Mr. Curtis, of Camden Town, has strongly recommended this plaster in neuralgia. A little of the alcoholic extract may be employed instead of that obtained fresh from the tincture.

PLASTER (Adherent). See *Compound Soap Plaster*.

PLASTER (Adhesive). See *Resin Plaster*, *Court do.*, *&c.*

PLASTER (Ali Ahmed's). See *Patent Medicines* (*p.* 946).

PLASTER (Ammoniacal). Syn. *Dr. Kirkland's Volatile Plaster*; *Emplastrum Ammoniæ*, *E. A. Hydrochloratis*, — Lat. *Prep.* Take of *lead plaster*, 1 oz.; *white soap* (shaved fine), ½ oz.; melt them together, and when nearly cold, add of *sal ammoniac* (in fine powder), 1 dr. Stimulant and rubefacient. Dr. Paris, who highly recommends it in pulmonary affections, employs double the above proportion of sal ammoniac. Its efficacy depends on the gradual extrication of free ammonia by the decomposition of the hydrochlorate, on which account it is proper to renew the application of it every 24 hours.

PLASTER (Ammoniacum). Syn. *Emplastrum Ammoniaci*,—Ph. L. E. & D. *Prep.* 1. (Ph. L. & E.) *Ammoniacum* (strained), 5 oz.; *dilute acetic acid* (distilled vinegar), 8 fl. oz. (9 fl. oz.,—Ph. E.); dissolve, and, frequently stirring, evaporate by a gentle heat, to a proper consistence.

2. (Ph. D.) *Gum ammoniacum* (in coarse powder), 4 *oz.*; *proof spirit*, 4 *fl. oz.*; dissolve by the aid of a gentle heat, and evaporate, as before.

Obs. This plaster is adhesive, stimulant, and resolvent, and is employed in scrofulous and indolent tumours, white swellings, &c. In the Ph. D. 1826, *vinegar of squills* was ordered instead of distilled vinegar.

PLASTER (Ammoniacum with Hemlock). Syn. *Emplastrum Ammoniaci cum Cicutâ*,—Lat. *Prep.* (Ph. E. 1744.) *Gum ammoniacum*, 8 oz.; *vinegar of squills*, q. s. to dissolve; *hemlock juice*, 4 oz.; gently evaporate, as before. In cancerous and other painful tumours. A better plan is to add 1 dr. of *extract of hemlock* to 1¼ oz. of *strained ammoniacum* (previously reduced to a proper consistence with a little *distilled vinegar*), melted by a very gentle heat.

PLASTER (Ammoniacum with Mercury). Syn. *Emplastrum Ammoniaci cum Hydrargyro*,—Ph. L. E. & D. *Prep.* 1. (Ph. L. & E.) *Olive oil*, 1 dr.; heat it in a mortar, add of *sulphur*, 8 gr.; triturate, further add of *mercury*, 3 oz.; again triturate, and when the globules are extinguished, add it to *ammoniacum* (strained), 1 lb, previously melted by a gentle heat, and mix them well together.

2. (Ph. D.) From *ammoniacum plaster*, 4 *oz.*; *mercurial plaster*, 8 *oz.*; melted together by a gentle heat, and then stirred constantly until nearly cold.

3. (*Wholesale.*) Take of *mercury*, 38 *oz.*; *prepared sevum*, 5 *oz.*; triturate, as last, and add the mixture to *strained ammoniacum*, 10 *lb.*, previously sufficiently softened by a gentle heat. Possesses a fine blue colour, and is quickly made.

Obs. This plaster cannot be rolled till considerably cooled; and, neither this nor the simple plaster, must be put into water. It is powerfully discutient, and is applied to indurated glands, indolent tumours, &c.

PLASTER (Anodyne). See *Opium Plaster*, *Belladonna do.*, *&c.*

PLASTER (Antimonial). Syn. *Emplastrum Antimoniale*, *E. Antimonii Potassio-tartratis*,—Lat. *Prep.* (U. C. Hosp.) By sprinkling *tartar emetic*, in very fine powder, on the surface of a *spread Burgundy pitch* (or common adhesive) *plaster*. It has been successfully applied to the nape of the neck, in the scarlatina of children; also to the chest, in phthisis; and, with the addition of a little *opium*, in rheumatic affections of the joints.

PLASTER (Aromatic). Syn. *Stomach Plaster*; *Emplastrum Aromaticum*,—Lat. *Prep.* (Ph. D. 1826.) *Strained frankincense* (thus), 3 oz.; *bees' wax*, ½ oz.; melt them together, and when the mass has considerably cooled, add of *powdered cinnamon*, 6 dr.; *oils of allspice* and *lemons*, of each, 2 dr. Stimulant; applied over the stomach in dyspepsia, spasms, nausea, flatulence, &c. *Camphor*, 1 dr., is commonly added.

PLASTER (Assafœtida). Syn. *Antihysteric Plaster*, *Antispasmodic do.*; *Emplastrum Assafœtidæ*,—Ph. E. *E. Antihystericum*, *&c.* *Prep.* (Ph. E.) From *lead plaster* and *strained assafœtida*, of each, 2 oz.; *strained galbanum* and *bees'-wax*, of each, 1 oz.; melted together. Antispasmodic; applied to the stomach or abdomen in spasms, hysteria, &c.; and to the chest in hooping-cough.

PLASTER (Baynton's Adhesive). *Prep.* From *yellow resin*, 1 *oz.*; *lead plaster*, 1 *lb.*; melted together. Recommended for bad legs, and other like sores.

PLASTER (Belladonna). Syn. *Emplastrum Belladonnæ*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Soap plaster*, 3 oz.; melt it by the heat of a water-bath, add of *extract of belladonna* (deadly nightshade), 3 oz.; and keep constantly stirring the mixture until it acquires a proper consistence.

2. (Ph. E.) *Resin plaster*, 3 oz.; *extract of belladonna*, 1½ oz.; as the last.

3. (Ph. D.) *Resin plaster*, 2 *oz.*; *extract of belladonna*, 1 *oz.*

Uses, *&c.* As a powerful anodyne and antispasmodic; in neuralgia and rheumatic pains, and as an application to painful tumours. The plaster of the shops is usually deficient in extract. The following formula is in common use in the wholesale trade:—*Lead plaster* and *resin plaster*, of each, 2½ *lb.*; *extract of belladonna*, 1¾ *lb.* This plaster must not be "pulled" in water.

PLASTER (M. Berg's Antirheumatic). Syn. *Gout Paper*; *Emplastum Antirheumaticum*, *Charta Antirheumatica*,— Lat. *Prep.* By digesting *euphorbium*, 2 parts; and *cantharides*, 1 part; (both in powder;) in *rectified spirit*, 10 parts, for eight days; adding to the strained liquid, *black resin* and *Venetian turpentine*, of each, 4 parts; assisting the mixture by a gentle heat. Two or three coats of the product are successively spread over the surface of thin paper. *Used* in gout and rheumatism. (*Anat. of Quackery.*)

PLASTER (Black Diachylon). See *Court Plaster.*

PLASTER (Black Pitch). Syn. *Emplastrum Picis Nigræ*,— Lat. *Prep.* (Ph. Wirtem.) *Black pitch*, *black resin*, and *bees' wax*, of each, 8 parts; *suet*, 1 part; melted together. Rubefacient and stimulant.

PLASTER (Blistering). See *Cantharides Plaster.*

PLASTER (Bree's Antiasthmatic). *Prep.* From *lead plaster*, 1 oz.; *olive oil*, 1 dr.; melted together, and, when somewhat cooled, mixed with *powdered camphor*,

2 dr.; *powdered opium*, 1 dr.; and at once spread on leather.

PLASTER (Brown). Syn. *Brown Cerate; Emplastrum Fuscum, Ceratum F.; Onguent de la Mère.* This is noticed at *page* 908. The *butter*, *lard*, *oil*, *suet*, and *wax*, should be first melted together, and the heat gradually increased until they begin to smoke; the *litharge* is then to be sifted in, and the stirring and heat continued until the mixture assumes a brown colour; the *pitch* is next added, and the whole stirred for some time longer.

PLASTER (Brown Diachylon). See *Galbanum Plaster.*

PLASTER (Burgundy Pitch). Syn. *Cephalic Plaster, Breath do.; Emplastrum Picis,*—Ph. L. & E. *E. P. Compositum,*—Ph. L. 1824. *E. P. Burgundicæ,*—Ph. L. 1788. *E. Cephalicum,*—Ph, L. 1745. *Prep.* 1. (Ph. L.) *Prepared* (strained) *Burgundy pitch*, 2 ℔; *prepared frankincense* (thus), 1 ℔; *yellow resin* and *bees' wax*, of each, 4 oz.; melt them together, then add, *olive oil* and *water*, of each, 2 fl. oz.; *expressed oil of nutmeg* (mace), 1 oz.; and, constantly stirring, evaporate to a proper consistence.

2. (Ph. E.) *Burgundy pitch*, 1 ℔; *resin* and *bees' wax*, of each, 2 oz.; *olive oil* and *water*, of each, 1 fl. oz.; *oil of mace*, ½ oz.; as the last.

Uses, &c. Burgundy-pitch plaster is stimulant, rubefacient, and counter-irritant. It is a common application to the chest in pulmonary affections, to the joints in rheumatism, and to the loins in lumbago. Spread on leather, it forms a good *warm plaster* to wear on the chest during the winter. "When it produces a serous exudation, it should be frequently renewed."

The *Burgundy-pitch plaster* of *the shops* is commonly made as follows:—*Factitious Burgundy pitch* (bright coloured), 42 *lb.; palm oil* (bright), ¾ *lb.; bees' wax* (bright), 5 *lb.;* melt, and when nearly cold, add of *oil of mace*, 6 *oz.; oil of nutmeg*, 1 *oz.*

PLASTER (Calefacient). Syn. *Warm Plaster; Emplastrum Calefaciens,*—Ph. D. *Prep.* (Ph. D.) *Plaster of cantharides*, ½ *lb.* (1 part); *Burgundy pitch*, 5½ *lb.* (11 parts); melt them together by a gentle heat, and stir the mixture as it cools until it stiffens. Stimulant, rubefacient, and counter-irritant; in a variety of affections. In some persons, when long applied, it blisters or produces a running sore.

PLASTER (Cancer). Syn. *Emplastrum Anticancrosum,*—Lat. *Prep.* 1. *Wax plaster*, 1 oz.; *extract of hemlock*, 1 dr.; *levigated arsenious acid*, ½ dr.

2. (Richter.) *Extract of hemlock*, 1 oz.; *extract of henbane*, ½ oz.; *powdered belladonna*, 1 dr.; *acetate of ammonia*, q. s. to form a plaster. Both the above must be used with great caution. See *Cancer, &c.*

PLASTER (Cantharides). Syn. *Blistering Plaster, Vesicant do.; Plaster of Spanish Flies; Emplastrum Cantharidis,*—Ph. L. E. & D. *E. C. Vesicatoriæ,*—Ph. E. 1817. *E. Lyttæ,*—Ph. L. 1809. *E. Vesicatorium, E. Meloës Vesicatoriæ,*—Obs. var. *Prep.* 1. (Ph. L.) *Yellow wax* and *suet*, of each, 7½ oz.; *lard*, 6 oz.; *resin*, 3 oz.; melt them together, remove the vessel from the fire, and a little before they concrete, sprinkle in of *cantharides* (in very fine powder), 1 ℔; and mix.

2. (Ph. E.) *Cantharides, bees' wax, resin*, and *suet*, equal parts; as the last.

3. (Ph. D.) *Spanish flies*, 6 *oz.; prepared lard, resin*, and *yellow wax*, of each, 4 *oz.;* proceed as before, and "stir the mixture constantly until the plaster is cool."

4. (*Wholesale.*) From *bees' wax* and *good lard*, of each, 4 *lb.; flies* and *yellow resin*, of each, 6 *lb.; suet*, 10 *lb.* A commonly used formula, the product of which is, however, greatly inferior to that of the Pharmacopœia.

Obs. All the above are used to raise blisters. The plaster is spread on *white leather* with a cold knife, and is surrounded with a margin of *resin plaster* to make it adhere. A piece of *thin muslin* or *tissue paper* is usually placed between the plaster and the skin to prevent *absorption.* A little *powdered camphor* is sometimes sprinkled on the surface of the spread plaster, to prevent strangury. A better mode of obviating the action on the urinary organs is by the copious use of diluents. This plaster should be rolled in *starch powder*, and not with oil.

PLASTER (Cantharides,— Compound). Syn. *Emplastrum Cantharidis Compositum,*—Lat. *Prep.* (Ph. E.) *Venice turpentine*, 4½ oz.; *cantharides* and *Burgundy pitch*, of each, 3 oz.; *bees' wax*, 1 oz.; *verdigris* (in fine powder), ½ oz.; *powdered mustard* and *black pepper*, of each, 2 dr.; mix at a heat under 212° Fahr. Stronger than the last, and quicker in its action; but it causes more pain, and is much more apt to occasion troublesome ulcerations. *Used* in gout, spasms of the stomach, &c.

PLASTER (Capuchin). See *Euphorbium Plaster.*

PLASTER (Carbonate of Lead). Syn. *Emplastrum Plumbi Carbonatis, E. Cerussæ,*—Lat. *Prep.* (P. Cod.) *Carbonate of lead*, 1 *lb.; olive oil* and *water*, of each,

2 *lb.*; boil them together until they combine and form a plaster; lastly, remelt this with *white wax*, 3½ *oz.* Its properties resemble those of ordinary lead plaster. An excellent emollient and defensive plaster. See *Mahy's Plaster.*

PLASTER (Cephalic). Syn. *Ladanum Plaster: Emplastrum Cephalicum, E. Ladani,*—Ph. L. 1788. *Prep.* (Ph. L. 1788.) *Ladanum*, 3 oz.; *frankincense* (thus), 1 oz.; melt, and add to the mixture when nearly cold, *powdered cinnamon* and *expressed oil of mace*, of each, ½ oz.; *oil of mint*, 1 dr. Applied to the forehead or temples, in headache; to the stomach, in colds, &c. See *Burgundy Pitch Plaster, &c.*

PLASTER (Cheselden's Sticking). Syn. *Emplastrum Plumbi cum Pice,* — Lat. *Prep.* From *lead plaster*, 2 lb; *Burgundy pitch* (genuine), 1 oz.; melted together.

PLASTER (Corn). Syn. *Emplastrum ad Clavos,*—Lat. *Prep.* 1. *Resin plaster*, 5 parts; melt, stir in of *sal ammoniac* (in fine powder), 1 part; and at once spread it on linen or soft leather.

2. (*Kennedy's.*) From *bees' wax*, 1 *lb.*; *Venice turpentine*, 5 *oz.*; *verdigris* (in fine powder), 1½ *oz.*; mixed by a gentle heat, and spread on cloth. It is cut into pieces, and polished, and of these 1 dozen are put into each box.

3. (Le Foret.) *Galbanum plaster*, 2 oz.; melt by a very gentle heat, add *sal ammoniac* and *saffron*, of each, ½ oz.; *powdered camphor*, 2 oz.; and when nearly cold, stir in of *liquor of ammonia*, 2 oz. Applied, spread on leather, to the corn only, as it will blister the thinner skin surrounding its base.

4. (Ph. Sax.) *Galbanum plaster*, 1 oz.; *pitch*, ½ oz.; *lead plaster*, 2 dr.; melt them together, and add *verdigris* and *sal ammoniac* (in fine powder), of each, 1 dr. For other formulæ see *Verdigris Plaster* and *Corns.*

PLASTER (Court). Syn. *Sticking Plaster, Isinglass do.; Emplastrum Ichthyocollæ, E. Adhesivum Anglicum,* — Lat. *Prep.* 1. *Isinglass*, 1 part; *water*, 10 parts; dissolve, strain the solution, and gradually add to it of *tincture of benzoin*, 2 parts; apply this mixture, gently warmed, by means of a camel-hair brush, to the surface of silk or sarcenet, stretched on a frame, and allow each coating to dry before applying the next one, the application being repeated as often as necessary; lastly, give the *prepared* surface a coating of *tincture of benzoin* or *tincture of balsam of Peru.* Some parties apply this to the *unprepared* side of the plaster, and others add to the tincture a few drops of *essence of ambergris* or *essence of musk.*

2. (*Deschamps'.*) A piece of *fine muslin, linen*, or *silk*, is fastened to a flat board, and a thin coating of smooth, strained *flour paste* is given to it; over this, when dry, two coats of colourless gelatine, made into *size* with *water*, q.s., are applied warm. Said to be superior to the ordinary court plaster.

3. (*Liston's.*) Soak *isinglass*, 1 *oz.*, in *water*, 2½ fl. oz., until it becomes swollen and quite soft, then add of *proof spirit*, 3½ fl. oz., and expose the mixture to the heat of hot water, frequently stirring, until the union is complete; lastly, apply four coats of the solution to the surface of *oiled silk* nailed to a board, by means of a soft brush.

4. (Dr. Paris.) *Black silk* or *sarcenet* is strained and brushed over 10 or 12 times with the following composition:—*Gum benzoin*, ½ oz.; *rectified spirit*, 6 oz.; dissolve. In a separate vessel dissolve of *isinglass*, 1 oz., in as little water as possible; strain each solution, mix them, decant the clear portion, and apply it *warm.* When the last coating is *quite dry*, a finishing coat is given with a solution of *Chio turpentine*, 4 oz., in *tincture of benzoin*, 6 oz.

Obs. The common "*Court plaster*" of the shops, is generally prepared without using spirit, and with merely sufficient tincture of benzoin, or other aromatic, to give it an agreeable odour. Formerly, *black silk* or *sarcenet* was exclusively employed as the basis of the plaster, but at the present time *checkered silk* is also in much favour. "*Flesh-coloured Court plaster*" is likewise fashionable. "*Transparent Court plaster*" is prepared on *oiled silk.* "*Waterproof Court plaster*" is simply the common plaster which has received a thin coating of *pale drying oil* on its exposed surface. The *finest Court plaster* of the West-end houses, is now prepared on *gold-beaters' skin* (or the prepared membrane of the cæcum of the ox), one side of which is coated with the *isinglass solution*, as above, and the other with *pale drying oil* or a *solution* of either *gutta percha* or *caoutchouc* in *chloroform*, or in *bisulphuret of carbon.*

PLASTER (Croton Oil). Syn. *Emplastrum Crotonis, E. Olei Tiglii,*—Lat. *Prep.* (Bouchardat.) To *lead plaster*, 4 parts, melted by a very gentle heat, add of *croton oil*, 1 part. A powerful counter-irritant; it also generally acts powerfully on the bowels.

PLASTER (Cumin). Syn. *Emplastrum Cumini,*—Ph. L. *E. Cymini, E. è Cymino,*—Obs. var. *Prep.* 1. (Ph. L.) *Burgundy pitch*, 3 lb; *bees' wax*, 3 oz.; melt, add of *cumin*

seed, *caraways*, and *bay-berries*, of each (in powder), 3 oz.; next add of *olive oil* and *water*, of each, 1½ fl. oz., and evaporate to a proper consistence.

2. (*Wholesale.*) From *yellow resin*, 7 *lb.*; *bees' wax* and *linseed oil*, of each, ½ *lb.*; *powdered cumin* and *caraway seeds*, of each, 7 *oz.*; mix.

Obs. This is a mere revival of the formula of the Ph. L. 1724. In that of the Ph. L. 1788 no water was ordered, and the powders simply stirred into the melted mass shortly before it cools; the common practice in all laboratories.

Cumin plaster is carminative, stimulant, and discutient. It is applied over the regions of the stomach and bowels in colic, dyspepsia, and flatulence, and is also applied to indolent tumours. It has long been a favorite remedy with the lower classes.

PLASTER (Delacroix's Agglutinative). Syn. *Emplâtre d'André de la Croix*,—Fr. *Emplastrum Glutinans Santi Andreæ à Cruce*, *E. Picis cum Elemi*,— Lat. *Prep.* (P. Cod.) From *Burgundy pitch*, 25 parts; *gum elemi*, 6 parts; *Venice turpentine* and *oil of bays*, of each, 3 parts; melted together, and strained.

PLASTER (Diachylon). See *Lead Plaster*.

PLASTER (Diapalma). See *Palm Plaster*.

PLASTER (Elemi). Syn. *Emplastrum Elemi*,— Lat. *Prep.* From *wax plaster*, 3 parts; *gum elemi*, 1 part; melted together by a gentle heat. Stimulant and discutient. *Used* for issues, &c.

PLASTER (Euphorbium) Syn. *Emplastrum Euphorbii*,—Lat. *Prep.* 1. (Guy's Hosp.) *Burgundy pitch plaster*, 8 oz.; melt, and add of *euphorbium* (in powder), 1 dr.

2. (*Capuchin Plaster*,—Ph. Wirt.) *Burgundy pitch* and *bees' wax*, of each, 3 oz.; *Venice turpentine*, 1 oz.; melt them together, add *gum ammoniacum*, *olibanum*, *mastic*, and *lapis calaminaris*, of each, 1 oz.; *euphorbium*, *pyrethrum*, and *common salt*, of each (in powder), 2 oz.; and stir until the mass concretes. Both of the above are stimulant, rubefacient and counter-irritant.

PLASTER (Fayard's). See *Papier Fayard* (*p.* 931.)

PLASTER (Flower of Ointments). Syn. *Emplastrum Flos Unguentorum Dictum*,— Ph. L. 1720. *Prep.* From *frankincense* (thus), *yellow resin*, *suet*, and *bees' wax*, of each, 1 lb; *olibanum*, ½ lb; *Venice turpentine*, 5 oz.; *gum myrrh*, 2 oz.; *white wine*, 16 fl. oz.; boil to a plaster, adding before the mass cools, of *camphor*, ½ oz. Calefacient and stimulant.

PLASTER (Frankincense). Syn. *Strengthening Plaster*; *Emplastrum Thuris*, *E. Roborans*,—Lat. *Prep.* (Ph. L. 1788.) To *lead plaster*, 2 lb, melted by a gentle heat, add of *frankincense* (thus), ½ lb; *dragon's blood* (in powder), 3 oz.; and stir well. In muscular relaxations, weak joints, &c. Mr. Redwood says that a "better-looking plaster is produced by melting the *frankincense* and *dragon's blood* together, and straining them through a cloth, then mixing these with the lead plaster previously melted." See *Oxide of Iron Plaster*.

PLASTER (Galbanum). Syn. *Compound Galbanum Plaster*; *Yellow Diachylon*, *Gum Plaster*, *Diachylon with the Gums*; *Emplastrum Galbani*,—Ph. L., & Ph. D. 1826. *E. G. Compositum*,—Ph. L. 1824. *E. Gummosum*,—Ph. E. *Prep.* 1. (Ph. L.) Take of *strained galbanum*, 8 oz.; *common turpentine*, 1 oz.; melt them together, then add of *prepared frankincense* (thus), 3 oz.; and next, of *lead plaster*, 3 lb, previously melted over a slow fire.

2. (Ph. E.) *Gum ammoniacum* and *galbanum*, of each, ½ oz.; melt them together, strain, and add of *litharge plaster*, 4 oz.; *bees' wax*, ½ oz.; (both previously melted;) and mix the whole thoroughly.

3. (*Wholesale.*) From *lead plaster*, 42 *lb.*; *yellow resin*, 12 *lb.*; *strained galbanum*, 3 *lb.*; *strained assafœtida*, 1 *oz.*

Obs. Galbanum plaster is stimulant and resolvent, and is much used in indolent, scrofulous, and other tumours, painful gouty and rheumatic joints, in rickets, &c.

PLASTER (Gaulthier's). *Prep.* (Guibourt.) *Palm plaster*, 12 parts; *olive oil* and *white wax*, of each, 1 part; melt, and add of *Venice turpentine*, 2 parts. More adhesive than the simple "palm plaster."

PLASTER (Ginger). Syn. *Emplastrum Zingiberis*,—Lat. See *Ginger*.

PLASTER (Gout). Syn. *Emplastrum Antarthriticum*, — Lat. See *Galbanum Plaster*, *Pitch do.*, *Gout Paper*, *&c.*

PLASTER (Gum). See *Galbanum Plaster*.

PLASTER (Hemlock). Syn. *Emplastrum Conii*, *E. Cicutæ*,—Lat. *Prep.* 1. *Wax*, 1 part; *Burgundy pitch*, 9 parts; melt them together, and add of *extract of hemlock*, 3 parts.

2. (Ph. Bat.) *Lead plaster* and *bees' wax*, of each, 1 lb; *olive oil*, 6 fl. oz.; melt, and add of *powdered hemlock* (recent), 1 lb.

Obs. Hemlock plaster is occasionally used as an application to painful and malignant ulcers and tumours, painful joints, &c. A spread plaster of it, with 6 or 8 gr. of *tartar emetic* (in very fine powder)

sprinkled over its surface, has been highly extolled as a counter-irritant in hooping-cough, phthisis, &c.

PLASTER (Henbane). Syn. *Emplastrum Hyoscyami*,—Lat. *Prep.* As the last, but using *henbane* instead of hemlock. As an anodyne, in various external affections.

PLASTER (Iodide of Potassium). Syn. *Emplastrum Potassæ Hydriodatis; E. Potassii Iodidi*,—Ph. L. *Prep.* (Ph. L.) *Iodide of potassium*, 1 oz.; *olive oil*, 2 fl. dr.; triturate them together, then add of *strained frankincense* (thus), 6 oz.; *wax*, 6 dr.; and stir constantly until the mass cools. "This plaster is to be spread on linen, rather than on leather." *Used* as a discutient or resolvent; more particularly as an application to scrofulous tumours and indurations.

PLASTER (Iodine). Syn. *Emplastrum Iodinii*,—Lat. *Prep.* Triturate *iodine*, 1 dr., in a warm mortar, with *olive oil*, 1 oz.; then add of *bees' wax*, 1 oz.; *yellow resin*, ½ oz.; previously melted together, and stir the whole until it concretes. It should be, preferably, spread at once on leather, and applied shortly after being prepared. *Used* as the last.

PLASTER (Iodine,—Compound). Syn. *Emplastrum Iodinii Compositum*,— Lat. *Prep.* 1. *Iodine*, 1 dr.; *iodide of potassium*, 2 dr.; rub them to a fine powder, add this to *lead plaster*, 2 oz.; *Burgundy pitch*, 1 oz.; previously melted together, and just about to concrete. More active than either of the preceding.

2. (*Emp. Iod. cum Belladonnâ.*) To *belladonna plaster*, 2 oz., melted by a very gentle heat, add *iodine* and *iodide of potassium* (in fine powder), of each, 1 dr., and stir the mixture until nearly cold. Powerfully resolvent and anodyne. *Used* in the same cases as the preceding, when there is much pain.

PLASTER (Iron). See *p.* 1015.

PLASTER (Isinglass). See *Court Plaster.*

PLASTER (Issue). Syn. *Emplastrum ad Fonticulos, Sparadrapum pro Fonticulis*,—Lat. *Prep.* 1. From *bees' wax*, ½ *lb.; Burgundy pitch* and *Chio turpentine*, of each, 4 oz.; *vermilion* and *orris powder*, of each, 1 oz.; *musk*, 4 gr.; melted together, and spread upon linen. This is afterwards polished with a smooth piece of glass moistened with water, and cut into pieces.

2. (Ph. Austr.) *Yellow wax*, 6 oz.; *mutton suet*, 2 oz.; *lard*, 1½ oz.; melt, add of *turpentine*, 1½ oz., and afterwards, of *red lead*, 4 oz.; dip pieces of *linen* into the melted mixture, pass these between rollers, and when cold, polish them, as before, and cut them into squares. The Issue plaster (*Issue paper; Charta ad fonticulos*) of the Ph. Suecica is a nearly similar compound, with the addition of about 1-48th part of *verdigris*, in very fine powder, and being spread upon paper.

PLASTER (Kennedy's). See *Corn Plasters.*

PLASTER (Kirkland's). See *Ammoniacal Plaster.*

PLASTER (Ladanum). See *Cephalic Plaster.*

PLASTER (Lead). Syn. *Litharge Plaster, Common do.; Diachylon, Simple Diachylon, White do.; Emplastrum Plumbi*,—Ph. L. *E. Lythargyri*,—Ph. E. & D., and Ph. L. 1788. *E. Commune*,—Ph. L. 1745. *Diachylon Simplex*, Ph. L. 1720. *Emp. Diapalma*,—Ph. E. 1744. *Prep.* 1. (Ph. L.) *Oxide of lead* (litharge), in very fine powder, 6 ℔; *olive oil*, 1 gall.; *water*, 1 quart; boil them over a slow fire, constantly stirring, to the consistence of a plaster, adding a little *boiling water*, if nearly the whole of that used in the beginning should be consumed before the end of the process.

2. (Ph. E.) *Litharge*, 5 oz.; *olive oil*, 12 fl. oz.; *water*, 8 fl. oz.; as the last.

3. (Ph. D.) *Litharge*, 5 *lb.; olive oil*, 1 gall.; *water*, 1 quart.

4. (Otto Kohnke.) For each ℔ of *litharge* employed, add ¼ pint of *colourless vinegar* (each *fl. oz.* of which is capable of saturating ½ dr. of carbonate of potassa); add the *oil*, boil until all moisture is evaporated, and until only a few striæ of litharge rise to the surface, then remove the vessel from the heat, add gradually ⅓ to ½ as much *vinegar* as before, and boil the mixture to a proper consistence.

5. (*Wholesale.*) From *Genoa oil*, 7 gall. (or 65 *lb.*); *litharge* (perfectly free from copper), 28 *lb.; water*, 2½ gall.; boil to a plaster, as before.

Obs. The London College orders too little oil. The second, fourth, and fifth formulæ produce beautiful plasters, that keep well; those of the others, although very white, get hard and brittle much more rapidly. The *proper proportion* of *oil* is fully 2⅓ times the weight of the litharge,—2½ times appears the best quantity; and without this is used, the plaster speedily gets hard and non-adhesive. The process consists in putting the *water* and the *litharge* into a perfectly clean and well-polished tinned-copper or copper pan, mixing them well together with a spatula, adding the oil, and boiling, with *constant stirring*, until the plaster is sufficiently

hard, when *thoroughly* cold. This process usually occupies from 4 to 5 hours, but by adopting the fourth formula, an excellent plaster may be made in from 20 to 30 minutes. This plaster is generally cooled by immersion in *cold water;* and to render it *very white*, a quality highly prized in the trade, it is usual to submit it to laborious "pulling," in the manner already noticed.

Use. As a simple defensive plaster or strapping; but principally as a basis for other plasters.

PLASTER (Liston's). See *Court Plaster.*

PLASTER (Mahy's). Syn. *Emplastrum Plumbi Carbonatis, E. P. C. Compositum,* —Lat. *Prep.* (Ph. U. S.) *Carbonate of lead* (pure white lead), 1 lb; *olive oil*, 32 fl. oz.; *water*, q. s.; boil them together, constantly stirring until perfectly incorporated, then add of *yellow wax*, 4 oz.; *lead plaster*, 1½ lb; and when these are melted, and the mass somewhat cooled, stir in of *powdered orris root*, 9 oz. A favorite application in the United States of America to inflamed and excoriated surfaces, bed-sores, burns, &c.

PLASTER (Melilot). Syn. *Emplastrum Meliloti, E. è Meliloto,*—Lat. *Prep.* 1. (Ph. E. 1744.) *Fresh melilot*, chopped small, 6 lb; *suet*, 3 lb; boil until crisp, strain with pressure, and add of *yellow resin*, 8 lb; *bees' wax*, 4 lb; and boil to a plaster. Stimulant. *Used* to dress blisters, &c. The greater portion of this plaster in the shops is made without the herb, and is coloured with verdigris. (See the *next formula.*)

2. (*Wholesale.*) Take of *yellow resin*, 18 *lb.; green ointment*, 4½ *lb.; yellow wax*, 3 *lb.; finely-powdered verdigris*, q. s. to give a deep-green colour.

PLASTER (Mercurial). Syn. *Emplastrum Mercuriale; E. Hydrargyri,*—Ph. L. E. & D. *Prep.* 1. (Ph. L.) Add, gradually, of *sulphur*, 8 gr., to heated *olive oil*, 1 fl. dr., and stir the mixture constantly with a spatula until they unite; next add of *mercury*, 3 oz., and triturate until globules are no longer visible; lastly, gradually add of *lead plaster* (melted over a slow fire), 1 lb; and mix them all well together. (About 1 fl. dr. of *balsam of sulphur* may be substituted for the oil and sulphur ordered above.)

2. (Ph. E.) *Resin*, 1 oz.; *olive oil*, 9 fl. dr.; mix by heat, cool, add of *mercury*, 3 oz., and triturate until its globules disappear; then add of *litharge plaster*, 6 oz. (previously liquefied), and mix the whole thoroughly.

3. (Ph. D.) *Oil of turpentine*, 1 *fl. oz.; resin*, 2 *oz.;* dissolve, with the aid of heat; add of *mercury*, 6 *oz.;* triturate until the globules disappear, and the mixture assumes a dark-gray colour, then add of *litharge plaster* (previously melted), 12 *oz.*, and stir the whole until it stiffens on cooling.

4. (*Wholesale.*) Take of *mercury*, 7 *lb.; prepared sevum*, ½ *lb.;* triturate until the globules disappear, and add the mixture to *lead plaster* (melted by a gentle heat), 36 *lb.*; stir them well together, and until they concrete. Very fine bluish-slate or lead colour.

Obs. Mercurial plaster is *used* as a discutient in glandular enlargements, and other swellings; and is also applied over the hepatic regions in liver complaints.

PLASTER (Mercurial, — with Belladonna). Syn. *Emplastrum Hydrargyri cum Belladonnâ,*—Lat. *Prep.* From *mercurial plaster*, 6 dr.; *extract of belladonna*, 2 dr.; *olive oil*, 1 dr.; mixed by a gentle heat. One of our most useful anodyne and discutient applications, in painful schirrous, scrofulous, and syphilitic tumours. The Medico-Chirurgical Pharm. orders ½ fl. dr. of *hydrocyanic acid* to be added to every 2 oz. of the above.

PLASTER (Minium). Syn. *Emplastrum Minii, E. è Minio, E. Plumbi Oxydi Rubri,*— Lat. *Prep.* (Ph. L. 1746.) *Olive oil*, 4 lb; *minium* (red lead), in fine powder, 2½ lb; *water*, q. s.; procced as for lead plaster (which it closely resembles).

Obs. To ensure a good colour and the quality of keeping well, the quantity of oil should be increased about 1-3rd. When discoloured by heat it forms the "Brown Minium Plaster" (*Emp. è minio fuscum*) of old pharmacy. Lead plaster, either alone or with the addition of a little red lead, is usually sold for it.

PLASTER (Minium,—Compound). Syn. *Nuremberg Plaster; Emplâtre de Nuremberg; Emplastrum Minii Compositum,*— Lat. *Prep.* (Soubeiran.) *Red lead*, 12 parts; *olive oil*, 8 parts; grind them together on a porphyry slab, and add the mixture to *lead plaster*, 50 parts; *bees' wax*, 24 parts; melted together; lastly, when nearly cold, stir in of *camphor*, 1 part.

PLASTER (Morrison's Adhesive). Syn. *Morrison's Adhesive Paste.* From *wheaten flour*, 2 *oz.; mild ale*, ½ pint; stir them together, and heat the mixture to the boiling point; when cold, add of *powdered resin*, 3 *oz.;* and, constantly stirring, again heat them to boiling. *Used* as a depilatory in ring-worm, &c.

PLASTER (Mucilages). Syn. *Diachylon*

Compositum, Emplastrum è Mucilaginibus, —Lat. *Prep.* (Ph. L. 1746.) *Bees' wax*, 20 oz.; *oil of mucilages*, 4 oz.; melt, and add them to *strained ammoniacum*, 3 oz.; *common turpentine*, 1 oz.; previously melted together. Stimulant and emollient.

PLASTER (Mustard). Syn. *Emplastrum Sinapis*,—Lat. This is always an extemporaneous preparation. *Flour of mustard* is made into a stiff paste with *lukewarm water*, or with *vinegar*, and is then spread on a piece of *calico* or *linen* (folded two or three times); over the surface of the mustard is placed a piece of *gauze* or *thin muslin*, and the plaster is then applied to the part of the body it is intended to medicate. Its action is that of a powerful rubefacient and counter-irritant; but its application should not be continued long, unless in extreme cases. Its effects are often apparently wonderful. We have seen very severe cases of facial neuralgia, sore-throat, painful joints, rheumatic pains, &c., relieved in a few minutes by means of a *mustard plaster* or *poultice*.

PLASTER (Nuremberg). See *Compound Minium Plaster*.

PLASTER (Opium). Syn. *Emplastrum Anodynum; E. Opii*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Lead plaster*, 8 oz.; melt, and add of *frankincense* (thus), 2 oz.; next, add of *extract of opium*, 1 oz.; previously dissolved in *boiling water*, 1 fl. oz.; and, constantly stirring, evaporate the mixture over a slow fire to a proper consistence. This plaster is much stronger than that of the Ph. L. 1836, and of the other British Colleges.

2. (Ph. L. 1836.) *Lead plaster*, 1 ℔; melt, add of powdered *thus*, 3 oz.; mix, and further add of *powdered opium*, ½ oz.; *water*, 8 fl. oz.; and boil to a proper consistence.

3. (Ph. E.) *Litharge plaster*, 12 oz.; *Burgundy pitch*, 3 oz.; liquefy by heat, then add, by degrees, of *powdered opium*, ½ oz.; and mix them thoroughly. This and the preceding contains only 1-3rd part of the opium ordered in the present Ph. L. & D.

4. (Ph. D.) *Resin plaster*, 9 *oz.*; *opium*, in fine powder, 1 *oz.*; as the last.

Obs. The above plaster is reputed anodyne, and useful in various local pains; but its virtues in this way have been greatly exaggerated. The formulæ of the new Pharm. have not yet come into general use in the wholesale laboratory; that of the Ph. L. 1836, from being less costly, being still employed. The following is commonly used: —*Lead plaster*, 14 *lb.*; *yellow resin*, 2 *lb.*; *powdered opium*, ½ *lb.*

PLASTER (Oxide of Iron). Syn. *Iron Plaster, Frankincense do.; Strengthening do.; Emplastrum Roborans; Emp. Ferri*, —Ph. L. E. & D. *Emp. Thuris*,—Ph. D. 1826. *E. Ferri Oxydi Rubri*,—Ph. E. 1817. *Prep.* 1. (Ph. L.) *Lead plaster*, 8 oz.; *frankincense* (thus), 2 oz.; melt them together over a slow fire, sprinkle into the mixture, *sesquioxide of iron*, 1 oz.; and mix the whole well together.

2. (Ph. E.) *Litharge plaster*, 3 oz.; *yellow resin*, 6 dr.; *bees' wax*, 3 dr.; melt them together, then add of *red oxide of iron*, 1 oz.; previously triturated with *olive oil*, 3½ fl. dr.

3. (Ph. D.) *Litharge plaster*, 8 *oz.*; *Burgundy pitch*, 2 *oz.*; *peroxide of iron*, in fine powder, 1 *oz.*; as No. 1.

4. (*Wholesale.*) From *lead plaster* (quite dry), 84 *lb.*; *powdered yellow resin*, 14 *lb.*; *crocus martis* (lively coloured), 14 *lb.*; *olive oil*, 3 pints; as No. 2.

Obs. Iron plaster is reputed strengthening and stimulant. It is employed as a *mechanical* support in muscular relaxation, weakness of the joints, &c., especially by public dancers. Its tonic action is probably wholly imaginary. No. 4 is the "*emplastrum roborans*" of the shops, at the present time.

PLASTER (Oxycroceum). Syn. *Emplastrum Oxycroceum*,—Lat. *Prep.* 1. (Ph. E. 1744.) *Bees' wax*, 1 ℔; *black pitch* and *strained galbanum*, of each, ½ ℔; melt, and add of *Venice turpentine*, *powdered myrrh*, and *olibanum*, of each, 3 oz.; *powdered saffron*, 2 oz.

2. (*Wholesale.*) From *black pitch*, 9 *lb.*; *black resin*, 11 *lb.*; *bees' wax* and *lard*, of each, 2½ *lb.*; melted together. Warm; discutient. Still popular with the lower orders. The saffron of the original formula never finds its way into the *oxycroceum plaster* of the druggists.

PLASTER (Palm). Syn. *Diapalme, Emplâtre Diapalme*,—Fr. *Emplastrum Diapalmum*,—Lat. *Prep.* (P. Cod.) *Lead plaster*, 32 parts; *yellow wax*, 2 parts; melt them together, add of *sulphate of zinc*, 1 part, dissolve in a *little water*, and continue the heat, with constant agitation until all the water is evaporated.

Obs. This plaster originally contained palm oil, and this ingredient is still ordered in the formulæ of Plenck and Reuss. Soubeiran directs *white wax* to be employed.

PLASTER (Paracelsus'). Syn. *Emplastrum Paracelsi, E. Stypticum*,—Lat. *Prep.* From *lead plaster*, 28 *lb.*; *galbanum plaster*, 2 *lb.*; *powdered white canella* and *gum thus*, of each, 1½ *lb.*; melted together. The original formula, as well as that of the Ph. L.

1721, were similar, although much more complicated.

PLASTER (Pitch). Syn. *Poor-man's Plaster, Gout do., Anti-rheumatic do.; Emplastrum Pauperis, E. Antirheumaticum, E. Antarthriticum, E. Picis Commune*,—Lat. This has been already noticed under the head of *Resin Paper*. It is also, but less frequently, spread on cloth and leather. (See *p.* 932.)

PLASTER (Prestat's Adhesive). *Prep.* From *lead plaster*, 2½ *lb.*; *yellow resin*, 5 *oz.*; *Venice turpentine*, 4 *oz.*; *gum ammoniacum*, and *mastic*, of each, 1¼ *oz.*; made into a plaster, and spread on linen or calico.

PLASTER (Red Lead). See *page* 1014.

PLASTER (Resin). Syn. *Adhesive Plaster, Resinous do.; Emplastrum Adhesivum; Emp. Resinæ*,—Ph. L. & D. *E. Resinosum*,—Ph. E. *E. Lythargyri cum Resinâ*,—Ph. D. 1826. *Prep.* 1. (Ph. L.) To *lead plaster*, 3 ℔; melted by a gentle heat, add of *resin*, ½ ℔, also liquefied by heat, and mix. The formula of the Ph. U. S. is similar.

2. (Ph. E.) *Litharge plaster*, 5 oz.; *resin*, 1 oz.; mix with a moderate heat.

3. (Ph. D.) To *litharge plaster*, 2 *lb.*, melted by a gentle heat, add of *powdered resin*, 4 *oz.*; *Castile soap*, in powder, 2 *oz.*; and mix them intimately.

4. (*Wholesale.*) Pale *lead plaster* (from a previous batch, and quite dry), 72 *lb.*; *olive oil* (Genoa), 3 *lb.*; melt them together in a bright and perfectly clean copper pan, and sift in of *pale yellow resin* (in powder), 12 *lb.*; stirring all the while. The mixture is to be cooled, and "pulled" or "worked," after the manner of lead plaster.

Obs. Resin plaster, spread upon calico, forms the well-known "*Strapping*" or "*Adhesive plaster*," so extensively used to protect raw surfaces, support parts, and for dressing ulcers, retaining the lips of recent cuts and wounds in contact, &c. It is gently stimulant, and is thought to assist the healing process. It is also employed as a basis for other plasters. The "*Hospital plaster*," of certain houses, is of this kind. See *Compound Soap Plaster*.

PLASTER (Resolvent). Syn. *Emplastrum Resolvens, E. ex Mixtis Quatuor*,—Lat. var. *Prep.* (P. Cod.) *Galbanum, hemlock, mercurial*, and *soap plasters*, equal parts, melted together.

PLASTER (Roper's Royal Bath). *Prep.* (Anat. of Quackery.) *Strained black pitch*, 16 *oz.*; *Burgundy pitch*, 10 *oz.*; *tar* and *bees' wax*, of each, 1 *oz.*; melt, and when considerably cooled, add of *expressed oil of mace*, 2 *dr.*; *croton oil*, 1 dr.; and spread the mixture upon heart-shaped pieces of white sheep-skin, without remelting it. Stimulant and counter-irritant; recommended by its proprietor as a cure for *all* human ailments. It generally acts upon the bowels. The "*Bath-plaster Pills*," also prepared by Mr. Roper, resemble several others already noticed. (See *Med. Circ.*, iii, 419.)

PLASTER (Scott's). *Prep.* From *lead plaster*, 14 oz.; *olive oil* and *white resin*, of each, 1 oz.; melted together, and spread on calico.

PLASTER (Sharp's Black). *Prep.* From *olive oil*, 5 parts; *carbonate of lead*, 4 parts; *bees' wax*, 1 part; boiled to a plaster.

PLASTER (Simple). See *Wax Plaster*.

PLASTER (Soap). Syn. *Emplastrum è Sapone; E. Saponis*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) To *lead plaster*, 3 ℔, melted by a slow heat, add of *Castile soap*, sliced, ½ ℔; *resin*, 1 oz.; both (also) liquefied by heat, and constantly stirring, evaporate to a proper consistence.

2. (Ph. E.) To *litharge plaster*, 4 oz.; *gum plaster*, 2 oz.; melted together, add of *Castile soap*, in shavings, 1 oz.; and boil a little.

3. (Ph. D.) To *litharge plaster*, 2½ *lb.*, melted over a gentle fire, add of *Castile soap*, in powder, 4 *oz.*; and heat them together (constantly stirring), until they combine.

Obs. Care must be taken to evaporate all the moisture from the above compounds, as, if any is left in the plaster, it turns out crumbly, and does not keep well. Much heat discolours it. (See *below*.)

Soap plaster is emollient and resolvent, and is used in abrasions and excoriations, and as a dressing to soft corns, lymphatic tumours, &c.

PLASTER (Soap,—Compound). Syn. *Emplastrum Saponis Compositum*, or *E. Adhærens*,—Ph. D. 1826. *Prep.* (Ph. D. 1826.) *Resin plaster*, 3 oz.; *soap plaster*, 2 oz.; melted together.

Obs. Less emollient, but more stimulant than the simple plaster. The *Emplastrum è Minio cum Sapone*, Ph. E. 1744, was made by melting 1 part of *soap* with 5 parts of *minium plaster*. Neither of the above must be put into water. See *Resin Plaster*, Ph. D.

PLASTER (Soap-Cerate). Syn. *Emplastrum Cerati Saponis*,—Lat. *Prep.* From *soap cerate*, heated by means of a water bath until all the moisture is evaporated. Sometimes 2 or 3 dr. each of *powdered mastic* and *gum ammoniacum* are added for each pound of *cerate*. The product is generally spread whilst still warm. Said to be suppurative, resolvent, cooling, and desiccative. See *Soap Cerate*.

PLASTER (St. Andrew's). *Prep.* From

yellow resin, 8 oz.; *gum elemi*, 2 oz.; *Bordeaux turpentine* and *oil of the bay-laurel*, of each, 1 oz.; melted together by a gentle heat. A stimulant, resolvent, and adhesive plaster, once supposed to possess extraordinary virtues.

PLASTER (Sticking). See *Court Plaster*, *Resin Plaster*, *&c.*

PLASTER (Stomach). See *Aromatic Plaster*, *&c.*

PLASTER (Strengthening). See *Plasters of Frankincense* and *Oxide of Iron.*

PLASTER (Styptic). See *Oxide of Iron Plaster*, *Paracelsus' do.*, *&c.*

PLASTER (Sulphate of Quinine). Syn. *Emplastrum Quiniæ*, *E. Q. Disulphatis*,—Lat. *Prep.* 1. *Disulphate of quinine*, 1 dr.; *resin plaster*, 1 oz. Applied to the abdomen in intermittents.

2. *Disulphate of quinine*, 1 dr.; *mercurial plaster*, 2 oz. In affections of the liver or spleen, following intermittents, applied over the regions of those viscera.

3. *Resin plaster*, 9 dr.; *disulphate of quinine*, 1 dr.; *camphor* and *oil of cajeput*, of each, ½ dr. Applied over the epigastrium as a prophylactic of cholera.

PLASTER (Thus). See *Frankincense Plaster.*

PLASTER (Verdigris). Syn. *Emplastrum Æruginis*, *E. Cupri Subacetatis*,—Lat. *Prep.* (P. Cod.) *Bees' wax*, 4 parts; *Burgundy pitch*, 2 parts; melt, add of *Venice turpentine* and *prepared verdigris* (in powder), of each, 1 part; and stir until the mass is nearly cold. For other formulæ see *Corn Plasters*, *&c.*

PLASTER (Vermifuge). Syn. *Emplastrum Vermifugum*, *E. Anthelminticum*,—Lat. *Prep.* From *powdered aloes*, 1 dr.; *oil of chamomile*, 10 drops; *croton oil*, 2 drops; *oil of turpentine*, q. s.

PLASTER (Vigo's). Syn. *Emplastrum Vigonis*,—Lat. *Prep.* (P. Cod.) *Lead plaster*, 40 oz.; *mercury*, 12 oz.; *liquid styrax*, 6 oz.; *bees' wax*, *turpentine*, and *resin*, of each, 2 oz.; *ammoniacum*, *bdellium*, *myrrh*, and *olibanum*, of each, 5 dr.; *saffron*, 3 dr.; *oil of lavender*, 2 dr.; made into a plaster *s. a.*

PLASTER (Warm). See *Calefacient Plaster*, *Burgundy Pitch do.*, *&c.*

PLASTER (Wax). Syn. *Simple Plaster*; *Emplastrum Attrahens*; *E. Simplex*,—Ph. E. *E. Ceræ*,—Ph. L. 1836. *Prep.* 1. (Ph. E.) *Bees' wax*, 3 oz.; *suet* and *yellow resin*, of each, 2 oz.; melt them together, and stir the mixture briskly until it concretes by cooling.

2. (Ph. L. 1836.) *Yellow wax* and *suet*, of each, 3 ℔; *yellow resin*, 1 ℔; as the last. Intended to be employed as a simple dressing, especially to blistered surfaces. It is now seldom used.

PLASTER (White Diachylon). See *Lead Plaster.*

PLASTER (Yellow Diachylon). See *Galbanum Plaster.*

PLASTER (Zinco-lead). Syn. *Emplastrum Zinco-plumbicum*, *E. Diapompholygos*,—Lat. var. *Prep.* (Ph. Suec.) *Bees' wax*, 1 ℔; *olive oil* and *graphite* (black lead), of each, 6 oz.; *carbonate of lead*, 4 oz.; *oxide of zinc* (impure), 3 oz.; *olibanum*, 1½ oz.; boil to a plaster. Astringent and desiccant. Other forms substitute an equal weight of *litharge* for the graphite.

PLASTER OF PARIS. See *Alabaster* and *Gypsum.*

PLATE. The name commonly given to gold and silver wrought into instruments or utensils for domestic use.

The *cleaning* of *plate* is an important operation in a large establishment, as its durability, and much of its beauty, depend on this being properly done. The common practice of using *mercurial plate-powder* is destructive to both of these, as mercury not only rapidly erodes the surface of silver, but renders it softer, and, in extreme cases, even brittle. The only *powder* that may be *safely used* for *silver* is *prepared chalk*, of the best quality; or, better still, *calcined hartshorn*, finely pulverized. For *gold*, the form of red oxide of iron known as *jeweller's rouge*, is the most useful and appropriate. *Chamois leather*, a *plate-brush*, or *very soft woollen rags* should alone be used to apply them; and their application should be gentle and long continued, rather than the reverse. *Dirty plate*, after being cleaned with *boiling water*, may be restored by boiling it in *water*, each quart of which contains a few grains of *carbonate of soda*, and about an ounce of *prepared chalk*, *calcined hartshorn*, or *cuttle-fish bone*, in very fine powder. The ebullition sets up a gentle friction, which effects its purpose admirably. The boiled plate, after being dried, is best "finished off" with a piece of *soft* leather or woollen cloth which has been dipped into the cold mixture of chalk and water, and then dried. The same method answers admirably with *German silver*, *brass*, *pewter*, and all the softer metals. See *Plate Powder*, *&c.*

PLATINA. See *Platinum.*

PLATING. The art of covering copper and other metals with either silver or gold.

Plating is performed in various ways. Sometimes the silver is fluxed on to the surface of the copper by means of a solu-

tion of borax, and subsequent exposure in the "plating furnace," and the compound ingot is then rolled to the requisite thinness between cylinders of polished steel. The common thickness of the silver plate before rolling, is equal to about the 1-40th of that of the compound ingot. Sometimes the nobler metal is precipitated from its solutions upon the copper by the action of chemical affinity, or by the agency of electro-chemical decomposition.

The metal employed for plating is a mixture of copper and brass, annealed or hardened, as the case may require. See *Gilding*, *Platinizing*, *Silvering*, *&c.*

PLATINIZING. *Metals* may be *coated* with *platinum* by nearly similar processes to those already referred to under *Plating*. In the "*moist way*," vessels of *brass*, *copper*, and *silver*, are conveniently platinized in the following manner:—Solid *chloride of platinum*, 1 part, is dissolved in *water*, 100 parts, and to this solution is added of *common salt*, 8 parts; or still better, 1 part of *platino-chloride of ammonium*, and 8 parts of *hydrochlorate of ammonia*, are placed in a suitable porcelain vessel, with about 40 parts of *water*, and the whole is heated to ebullition; the vessels or utensils, previously made perfectly bright, are then immersed in the boiling liquid. In a few *seconds* they generally acquire a brilliant and firmly adhering layer of platinum.

Silver plates for *galvanic batteries* are commonly platinized by immersing them for a few seconds in a mixture of *saturated solution* of *bichloride of platinum*, 1 part; *dilute sulphuric acid*, 3 parts; *water*, 4 to 6 parts. *Platinum battery-plates* are covered with a pulverulent deposit of platinum by means of the electrotype.

Platinized asbestos is *prepared* by dipping *asbestos* into a *solution* of *bichloride of platinum*, or of one of the double chlorides of that metal, and then gradually heating it to redness. It is *used* as a substitute for spongy platinum. See *Voltaic Platinizing*.

PLATINO-CHLORIDES. See *below*.

PLATINUM. Syn. *Platina*, *White Gold*; *Platinum*,—Lat. A heavy, grayish-white metal, chiefly imported from South America, but also found in the Ural Mountains of Russia, in Ceylon, and in a few other places. It occurs in nature under the form of grains and small rolled masses, associated with palladium, rhodium, iridium, and iron. It has only been known in Europe since 1748.

Prep. The native alloy of this metal (*crude platinum*) is acted upon, as far as possible, by *nitro-hydrochloric acid*, containing an *excess* of *hydrochloric acid*, and slightly diluted with *water*, in order to dissolve as small a quantity of iridium as possible; to the deep yellowish-red and highly acid solution thus produced *sal ammoniac* is added, by which nearly the whole of the *platinum* is thrown down in the state of *ammonio-chloride*. This substance, after being washed with a little *cold water*, is dried and heated to redness; the product is *spongy metallic platinum*. This is made into a thin uniform paste with water, introduced into a slightly conical mould of brass, and subjected to a graduated pressure, by which the water is squeezed out, and the mass rendered at length sufficiently solid to bear handling. It is next dried, very carefully heated to whiteness, and hammered, or subjected to powerful pressure by suitable means, whilst in the heated state. It will now bear forging into a bar, and may afterwards be rolled into plates, or drawn into wire, at pleasure.

Prop., &c. Platinum is the heaviest substance known; its sp. gr. being fully 21·00, which may be raised by forging to about 21·5. It is whiter than iron, harder than silver, infusible in the strongest heat of our furnaces, and melts only before the oxy-hydrogen blowpipe. It is unaffected by air, water, and all the pure acids, and even its polish is uninjured by the strongest heat of a smith's forge; chlorine and aqua regia, however, dissolve it, though with much more difficulty than gold; it is also superficially oxidized by fused hydrate of potassa. *Spongy platinum*, *powdered platinum*, and even perfectly clean *platinum foil*, possess the remarkable property of causing the union of oxygen and hydrogen gases, with more or less elevation of temperature. (See *Lamps.*) *Platinum* is precipitated from its solutions by de-oxidizing substances under the form of a black powder, which has the power of absorbing oxygen, and again imparting it to combustible substances, and thus causing their oxidation. In this way alcohol and pyroxilic spirit may be converted into the acetic and formic acids, &c. See *Acetic Acid*.

Tests. 1. Sulphuretted hydrogen throws down from neutral and acid solutions of the per-salts of platinum, a blackish-brown precipitate, which is only formed after a time in the cold, but immediately, on heating the liquid.—2. Hydrosulphuret of ammonia also gives a blackish-brown precipitate, which completely redissolves in a large excess of the precipitant, provided the latter contains

an excess of sulphur.—3. Sal ammoniac and chloride of potassium give yellow crystalline precipitates, insoluble in acids, but soluble in excess of the precipitant, upon the application of heat, and decomposable by heat, with production of spongy platinum.—4. Ammonia and potassa also give similar precipitates in solutions previously acidulated with hydrochloric acid.

Estim. This may be effected by throwing down the metal under the form of *ammonio-chloride* or *potassio-chloride*, which, after being washed on a filter with a little weak spirit to which a little of the precipitant has been added, and afterwards with the spirit alone, may be carefully dried at 212° Fahr., and weighed. Or, the precipitate may be ignited in a platinum crucible, and weighed under the form of spongy platinum. The ignited mass from the potassio-chloride should be well edulcorated with water, and ignited a second time, before weighing it. 193·25 gr. of the *ammonio-chloride*, and 244·25 gr. of the *potassio-chloride* are equivalent to 98·75 gr. of METALLIC PLATINUM. See *Assaying*.

Uses. Platinum is valuable for the formation of crucibles, capsules, and other utensils or instruments intended to be exposed to a strong heat, or to the action of acids. Bichloride and sodio-chloride of platinum are much used in chemical analysis. Both of these are also used in medicine with the same intentions, and in the same doses, as the corresponding salts of gold. These compounds are *poisonous*. The *antidotes* and *treatment* are similar to those described under *Gold*. (See *p.* 536.)

PLATINUM (Ammonio-chloride of). Syn. *Platino-bichloride of Ammonium; Platini Ammonio-chloridum*,—Lat. *Prep.* A *solution* of *sal ammoniac* is added to a *strong solution* of *bichloride of platinum*, avoiding excess, and the precipitate is collected on a filter, washed with a little *weak alcohol*, and dried at a heat not exceeding 180° Fahr.

Prop., &c. Minute, transparent, yellow, octahedral crystals; very feebly soluble in water, less so in dilute alcohol, and insoluble in acids; heat converts it into spongy platinum.

PLATINUM (Chlorides of). Of these two are known:—

1. *Protochloride of Platinum.* Formed by exposing for some time the dried and powdered *bichloride* to a temperature of 400° to 450° Fahr. A greenish-gray powder, insoluble in water, but soluble in hydrochloric acid.

2. *Bichloride of Platinum, Perchloride of do.; Platini Bichloridum*,— Ph. L. Formed by dissolving *platinum* in *nitro-hydrochloric acid*, and evaporating the solution to dryness at a gentle heat. Reddish-brown, deliquescent, and very soluble in both water and alcohol, yielding orange-coloured solutions. *Used* as a test in chemical analysis, and as an alterative in secondary syphilis, &c. *Dose.* $\frac{1}{16}$ to $\frac{1}{4}$ gr., dissolved in distilled water, or made into a pill with syrup and liquorice powder. Some parties prescribe much larger doses; but unsafely. Hoefer recommends an *ointment* made with it as an application to indolent ulcers. In doses of 5 gr. and upwards it acts as a violent caustic poison. This last salt is the "*chloride of platinum*" of the shops, and the one used in the arts and medicine. It forms one of the *tests* included in the "*Appendix*" to the Ph. L.

PLATINUM (Iodides of). Of these there are two:—

1. *Protiodide of Platinum.* Formed by digesting the *protochloride* in a *solution of iodide of potassium*. Black.

2. *Biniodide of Platinum, Periodide of do.* Formed by the action of *iodide of potassium* on a *weak solution* of the *bichloride*. Black. (Lassaigne.)

PLATINUM (Oxides of). Three of these compounds are noticed by chemists:—

1. *Oxide of Platinum, Protoxide of do.* Obtained by digesting *protochloride of platinum* in a *solution of pure potassa*. It is soluble in excess of alkali, and freely so in the acids, forming brown solutions of the *protosalts of platinum*. These are distinguished from solutions of the salts of the binoxide by not being precipitated by sal ammoniac. *Oxalate of the protoxide of platinum*, in fine copper-coloured needles, may be obtained by heating the *binoxide* in a *solution of oxalic acid*.

2. *Binoxide of platinum, Deutoxide of do., Peroxide of do.; Platinic Acid; Platini Binoxydum*,—Lat. Formed by exactly decomposing the *sulphate of the binoxide* with *nitrate of baryta*, and adding *pure soda* to the filtered solution, so as to precipitate only half the oxide. (Berzelius.) Or, by boiling *bichloride of platinum* with *caustic soda*, in considerable excess, and then adding *acetic acid*.

Prop., &c. In the hydrated form it is a bulky brownish powder; this, when gently heated, becomes black and anhydrous. It forms salts with the acids, and combines with some of the bases, like an acid. These compounds have a red or yellow colour. It

is remarkable for its tendency to form double salts with the salts of the alkalies and earths.

3. *Sesquioxide of Platinum.* Formed by heating *fulminating platinum* in *nitrous acid.* (E. Davy.) All the oxides of platinum are reduced to the metallic state on ignition.

PLATINUM (Potassio-bichloride of). Syn. *Platino-bichloride of Potassium.* A bright yellow, crystalline precipitate, formed whenever *solutions* of the *chlorides of platinum* and of *potassium* are mixed; or a *salt of potassa*, acidulated with a little *hydrochloric acid*, is added to *bichloride of platinum.* In appearance, solubility, &c., it closely resembles ammonio-bichloride of platinum.

PLATINUM (Sodio-bichloride of). Syn. *Chloride of Platinum and Sodium, Platino-bichloride of Sodium; Platini et Sodii Chloridum, Platini Sodio-chloridum, &c.*,—Lat. *Prep.* (Redwood.) *Bichloride of platinum*, 17 parts; *chloride of sodium*, 6 parts; dissolve the two salts separately in *water*, q. s., mix the solutions, and evaporate, that crystals may form. *Dose.* $\frac{1}{12}$ to $\frac{1}{2}$ gr.; in the same cases, as the bichloride. (See *above.*)

The *platino-protochlorides of ammonium, sodium*, and *potassium*, are obtained from the proto-compounds in a similar manner to that adopted for the respective double bichlorides.

PLATINUM (Sulphate of). Syn. *Platini Sulphas*,—Lat. *Prepared* by acting on *bisulphuret of platinum* with strong *nitric acid.*

PLATINUM (Sulphurets of). The *protosulphuret* is prepared by heating the *yellow ammoniacal chloride* with $\frac{1}{3}$ its weight of *sulphur* in a retort;—the *bisulphuret*, by dropping a solution of the *bichloride* into a *solution of sulphuret of potassium.* Neither of them possess any practical importance.

PLATINUM-BASES. This name has been applied to a number of extraordinary compounds derived from the *protochloride of platinum*, or from the *green salt of Magnus*, noticed at page 544. As they have not, however, received any practical application, their consideration belongs to pure chemistry.

PLATINUM-BLACK. Syn. *Oxyphorus; Platina-mohr.* This is platinum in a finely divided state.

Prep. 1. A *solution* of *bichloride of platinum*, to which an excess of *carbonate of soda* and a quantity of *sugar* have been added, is boiled until the precipitate which forms after a little time becomes perfectly black, and the supernatant liquid colourless; the black powder is then collected on a filter, washed, and dried by gentle heat.

2. (M. Boetger.) *Ammonio-chloride* or *potassio-chloride of platinum*, reduced to very fine powder, is moistened with *strong sulphuric acid*, and a *small piece* of *zinc* is thrust into the mixture; after the whole is reduced to a black powder, it is washed, first with *hydrochloric acid*, and then with *pure water*, and is, lastly, dried.

3. (Descotils.) *Platinum ore*, or *crude platinum*, is melted with twice its weight of *zinc*, and after powdering the resulting alloy, it is digested, first in *dilute sulphuric acid*, and next in *dilute nitric acid*, to remove the zinc, the action of the menstruum being assisted by heat; it is then digested in a *weak solution of potassa*, and lastly in *pure water*, after which it is carefully dried.

Prop., &c. Platinum-black possesses the property of condensing gases, more especially oxygen, into its pores, and afterwards giving it out to various oxidizable substances. When placed in contact with a *solution of formic acid*, it converts it, with copious effervescence, into *carbonic acid; alcohol*, dropped upon it, becomes changed by oxidation into *acetic acid*, the rise of temperature being often sufficient to cause inflammation; exposed to a red-heat, it shrinks in volume, assumes the appearance of common spongy platinum, and, for the most part, loses these peculiarities. That prepared with zinc explodes, when heated, like gunpowder. "When platina-mohr, prepared by means of zinc, is moistened with alcohol, it becomes incandescent, and emits *osmic acid;* but if it be mixed with alcohol into a paste, and spread upon a watch-glass, nothing but *acetic acid* will be disengaged; affording an elegant means of diffusing the odour of vinegar in an apartment." (Berzelius.) See *Acetic Acid.*

PLATINUM (Spongy). *Prep.* 1. By heating *ammonio-chloride of platinum* to redness.

2. *Crude bichloride of platinum* and *hydrochlorate of ammonia* are separately dissolved in *proof spirit*, and the one solution added to the other as long as a precipitate forms; this is collected, and, whilst still moist, formed into little balls or pieces, which are then dried, and gradually heated to redness.

Prop., &c. These have been noticed above. (See p. 1018.) Small balls of spongy platinum are used for the "hydrogen instantaneous-light lamp;" but they are apt to absorb moisture from the atmosphere, and then lose their power of in-

flaming hydrogen, until they are re-dried and heated.

PLETHORA. A redundancy of blood in the system. "Plethora may arise from a highly entonic state of the arterial system, and a thick crasis of the blood, with a large quantity of colouring matter; and it is then called *sanguine plethora;* or it may arise from a lax and weak state of the arterial system, with a redundancy of serum in the blood; in which case it is called *serous plethora* or *atonic plethora.*" The *treatment* should be directed to the removal of the primary affection on which it depends. When it results from excessive or improper feeding, a due attention to the diet, exercise, &c., will generally effect a cure.

PLEURISY. Syn. *Pleuritis.* Inflammation of the pleura or membrane which lines the cavity of the chest and covers the surface of the lungs.

The *common causes* are exposure to cold, sudden changes of temperature, or a damp or impure atmosphere, and also all those circumstances which usually give rise to other inflammatory affections.

Amongst the most marked of the *early symptoms of pleurisy*, are fever, cough, pain in the side, and a peculiar hard and strong pulse, followed by painful and difficult respiration, and other alarming symptoms, rapidly increasing in their severity and dangerous character.

The *treatment* of the *acute forms* of *pleurisy* must be prompt and decided. Bleeding freely, blisters, diaphoretics, and active purgatives, must be at once had recourse to; and in the *after treatment*, great care must be taken against "an insidious and local form of the disease, which often extends to the lungs." *Chronic pleurisy* is an affection which is little under the control of medicine.

Pleurisy chiefly attacks persons of a vigorous constitution and plethoric habit; but it also extends its ravages, though less frequently, to others. See *Phthisis* and *Pneumonia.*

PLICA. Syn. *Plaited Hair; Plica Polonica.* A disease of the hairs in which they are distended with a reddish-coloured fluid, and the scalp is so exquisitely sensitive that much pain is occasioned by the trifling movement which accompanies the cutting of the hair. During the disease, a quantity of fluid exudes from the hair tubes, and agglutinates into a repulsive mass of inextricable tangles. It is confined to Poland, Lithuania, and Tartary.

PLICIDENTINE. A peculiar modification of *dentine* found in the basal part of the teeth of the wolf-fish, and of a few other animals.

PLUGGING. The introduction of a mass of lint, sponge, or other suitable material, into a wound or cavity, with the intention of arresting hæmorrhage. It is now seldom adopted, except in cases of bleeding from the nose, and that only after more approved methods have failed.

PLUM. A name applied to several varieties of the *prunus domestica* (Linn.) or *wild plum.* Among the cultivated varieties, the *damson*, *green gage*, *French plum*, *magnum bonum* or *Mogul do.*, *mirabelle do.*, *Orleans do.*, and *prune*, are those best known. *Grocer's plums* are raisins or dried grapes.

PLUMBAGINE. Syn. *Plumbagina,*— Lat. A crystallizable principle found by M. Dulong in the roots of *plumbago Europæa* (Linn.), or *tooth-wort.*

Prep. The *etherial tincture* of the *root-bark of tooth-wort* is mixed with six times its weight of *water*, and the ether removed by distillation; the residual liquor is boiled a few minutes, filtered whilst hot, concentrated by evaporation, and then set aside to crystallize. It may be purified by re-crystallization in hot alcohol.

Prop., &c. It is acrid and irritant; in small doses, emetic; in larger ones, poisonous. It is soluble in alcohol and ether; and, less freely, in water.

PLUMBAGO. Syn. *Black Lead, Graphite; Percarburet of Iron?* The finest *plumbago* or *black lead* comes from Borrowdale, in Cumberland, and is used for making pencils for artists. The *coarser sorts* are employed to impart a metallic lustre to other bodies, and mixed with grease to diminish friction. Plumbago is also used to cover the face of articles on which it is desired to deposit a coating of copper by the electrotype. It has been used, with apparent advantage, in herpes, and in several chronic skin diseases, in the form of an ointment, made with four times its weight of lard; and, *internally*, made into pills.

The sp. gr. of plumbago varies from 2·075 to 2·45. The iron found in it is believed to be merely an accidental contamination, and not to be chemically combined with the carbon in it.

Pur., &c. The *black lead* of *commerce* is almost always *adulterated.* Crude sulphuret of antimony, micaceous iron ore, Eastern glimmer, and an inferior variety of lamp-black, are the substances mostly employed for this purpose. The *packet black-lead*, especially that sold under the name of "*Servant's Friend,*" generally contains

from 50% to 70% of such admixture. A pure sample of plumbago digested in hydrochloric acid, and then washed, dried, and exposed to a cherry-red heat in a platinum crucible, with constant stirring, as long as it loses weight, suffers a loss equal to from 8% to 9%, and never more than 12% of its weight.

PLUMBIC ACID. Peroxide of lead; on account of its combining with some of the bases to form compounds which have been called *plumbates*.

PLUMBUM CORNEUM. See *Chloride of Lead*.

PLUMOSE ALUM. The old name of the silky amianthine crystals of the *double sulphate of alumina and iron* occasionally found on alum slate. *Asbestos* has also been so called.

PLUNKET'S CANCER REMEDY. See *Plunket's Caustic*.

PNEUMONIA. Syn. *Pneumony, Peripneumony; Pneumonitis, Peripneumonia.* Inflammation of the lungs.

Causes. Undue exposure of the body to cold, wet, &c.; suppressed perspiration; inordinate exertion of the lungs, in singing, speaking, or playing on wind instruments, &c.; and other circumstances inducing a determination of blood to the lungs, or an unnatural action of them. Hence the robust and plethoric are the most subject to attacks of pneumonia.

Symp. Feverishness; difficulty of breathing; pain in the side or chest; cough; a strong, hard, and quick pulse, afterwards becoming weak, soft, and irregular. As the inflammation increases, there is delirium, and threatened suffocation; the vessels of the neck become turgid and swollen, the colour of the face changes to a purple, an effusion of blood takes place into the cellular substance of the lungs, its functional action becomes impeded, and the patient rapidly sinks, and dies. At other times it proves fatal by inducing suppuration and gangrene. Abundant expectoration, perspiration, or diarrhœa, are held to be favorable symptoms.

Treat. This is similar to that noticed under *pleurisy;* to which mercurials, and small doses of morphia, opium, or henbane, may be added, to quiet the cough, and procure sleep. In the severer forms of this disease, prompt and skilful medical assistance is the only means of affording the patient a chance of recovery.

POACHING. Amongst cooks, a peculiar method of cooking small articles by a slight boiling or stewing process.

Poached Eggs are prepared by breaking them into a small saucepan or stewpan containing about ½ a pint of *boiling water*, to which a tea-spoonful of *common salt*, and, occasionally, a *little vinegar* is added, and gently simmering them for 3 to 4 minutes, or until sufficiently firm to bear removal with a spoon or "slice." *Another method* is to employ *melted butter*, instead of water, and to dress them either with, or without stirring.

Poached eggs are commonly served on *toast*, or with *fried ham* or *bacon*, with *spice* or *vegetable seasoning*, at will. They form an excellent breakfast, or "make-shift dinner."

PODOPHYLLINE. Obtained from the *root* of the *podophyllum peltatum* (Linn.) or *may apple*, a substance officinal in the Ph. U. S.

Prep. The *alcoholic extract of may apple* is digested in *cold ether*, to remove fatty matter, and is then dissolved in *rectified spirit;* the solution is decoloured with a little *animal charcoal*, and filtered; it is, lastly, allowed to evaporate spontaneously.

Prop., &c. An amorphous, grayish-white mass, soluble in alcohol, and slightly soluble in water. It is a safe and certain cathartic, superior in activity to resin of jalap. *Dose*, ½ to 3 gr.

POISON. Syn. *Toxicum, Venenum,*—Lat. Any substance which, when swallowed, or applied in any particular way to the living body, disturbs, suspends, or destroys one or more of the vital functions. In sufficient quantity, or in small doses long continued, the common result of the administration of deleterious substances is either impaired vitality or death.

Poisons are classified by Orfila under four heads:—

1. *Irritant poisons*, or such as inflame or corrode the parts with which they come in contact. Their chief effects are upon the alimentary canal, with, sometimes, ulceration of the tongue, fauces, and œsophagus. Nausea, vomiting, stomachic and intestinal pains, extreme anxiety and anguish, quick and feeble pulse, cold and clammy skin, and mucous, bilious, or bloody diarrhœa, are among the common leading symptoms. Arsenic, blue vitriol, verdigris, strong acids and alkalies, drastic purgatives, and numerous other substances, belong to this class.

2. *Narcotic* or *Stupefying poisons*, or such as paralyse the functions of the nervous system, and produce headache, vertigo, confused vision, delirium, stupor, convulsions, coma, &c. It includes morphia, opium, henbane, oil of bitter almonds, prussic acid, &c.

3. *Narcotico-acrid poisons*, which produce at the same time narcotism, and irritation

of the parts which they touch. Alcohol, belladonna, coal gas, choke damp, cocculus Indicus, colchicum, foxglove, hemlock, poisonous fungi, strychnine, tobacco, veratria, &c., are of this kind.

4. *Septic* or *Putrefiant poisons*, including all those which alter, liquefy, or cause the putrescence of the fluids of the body; as sulphuretted hydrogen, the gas from sewers and cess-pools, putrefying organic matter, miasmata, &c.

The *treatment* of *cases of poisoning*, varies with the substance occasioning it; and, with the proper *antidotes*, will be found noticed under the names of the various substances that exert a deleterious action on the animal body. It may here, however, be useful to remark, that in almost all cases of poisoning, copious vomiting should be excited *as soon as possible* by the administration of a *powerful emetic* (see *p.* 366); its action being promoted by copious draughts of *luke-warm water*, tickling the throat with the finger, &c. Should this fail, but not otherwise, the stomach-pump should be had recourse to. The vomiting should be kept up and the stomach well washed out with *bland albuminous* or *mucilaginous liquids*, such as milk-and-water, barley water, sweetened water, flour-and-water, or any similar matters as circumstances may afford. After the vomiting a brisk aperient draught, or clyster, may be administered, and nervous irritability or exhaustion allayed by means of ether, opium, wine, or warm spirit-and-water, as the case may require. Even in a *suspected case* of *poisoning*, when proper medical advice is not at hand, an emetic should be immediately taken or administered. Vomiting may be, in general, produced very promptly by merely swallowing a *cupful* of *warm water* mixed with a tea-spoonful of *flour of mustard*. If no dry mustard is at hand, a portion of the contents of a *mustard-pot*, put into the water will answer nearly as well. As mustard may thus prove of so much use, it should never be wanting in any house; but even should there be no mustard at hand, *warm water* by itself, freely taken, forms a tolerably efficacious emetic. (See the Editor's "*Epit. of Toxicology*" for further information connected with *poisons* and *poisoning*.)

POLARIZATION (of Light). A change produced upon light by the action of certain media and surfaces, by which it ceases to present the ordinary phenomena of reflection and transmission. Instruments or apparatus employed to effect this change are called "*polariscopes*." Although the polarization of light is frequently employed as a means of chemical investigation, and is of the utmost interest to the philosophical inquirer, its consideration is not of a character to come within the province of this work.

POLISHES. Various substances, differing widely from each other, are popularly known under this name. See *Powders*, *Varnishes*, *&c.* (and *below*).

French Polish. See *p.* 490.

French Polish Reviver.—1. *Linseed oil*, ½ pint; *pale lac varnish* and *wood napththa*, of each, ¼ pint; well shaken together, and again every time before use.

2. *Methylated rectified spirit*, 3 pints; *linseed oil* and *French polish*, of each, 1 *pint*; as the last.

3. *Linseed oil* (pale), 1 quart; strong *distilled vinegar*, ½ pint; *spirit of turpentine*, ¼ pint; *muriatic acid*, 1 *oz.*

Furniture Cream.—1. *Pearlash*, 2 *oz.*; *soft soap*, 4 oz.; *bees' wax*, 1 *lb.*; *water*, 1 gall.; boil until the whole is united and forms a creamy liquid, when cold.

2. *Bees' wax*, ½ *lb.*; good *yellow soap*, ¼ *lb.*; *water*, 5 pints; boil to a proper consistence with constant agitation, then add of *boiled oil* and *spirit of turpentine*, of each, ½ pint. For *use*, the above are diluted with water, spread upon the surface with a painter's brush, and then polished off with a hard brush, cloth, or leather.

3. *Boiled oil* (pale), ½ pint; *bees' wax*, 1½ *oz.*; mixed by heat. Applied by a "rubber," and at once polished off.

Furniture Oil. See *page* 858.

Furniture Paste.—1. *Oil of turpentine*, 1 pint; *alkanet root*, ¼ *oz.*; digest until sufficiently coloured, then add of *bees' wax* (scraped small), 4 *oz.*; put the vessel into hot water, and stir until the mixture is complete, then put it into pots. If wanted *pale*, the alkanet root should be omitted.

2. (*White.*) *White wax*, 1 *lb.*; *liquor of potassa*, ½ gallon; boil to a proper consistence.

Harness Polish. See *p.* 140.

Leather Polish. See *Blacking.*

POLLARD. See *Flour.*

POLLEN. The farina which adheres to the anthers of flowers.

POLLENINE. A peculiar substance extracted by Prof. John from the *pollen* of *tulips*. It is insoluble in most menstrua, and extremely combustible, burning as a flash of white flame. It is said to be used in the Continental theatres to imitate lightning.

POLYCHREST. Syn. *Polychrestus*,—Lat. A term formerly applied to several medicines on account of the numerous virtues they were supposed to possess. *Sal poly-*

crestus is the old name for sulphate of potassa.

POLYCHROITE. The colouring matter of *saffron*, so named from the variety of colours which it exhibits with different reagents. Its alcoholic and aqueous solutions are of a golden yellow; nitric acid turns it *green;* sulphuric acid, first *blue*, and then *lilac*.

POLYCHROME. A peculiar substance obtained from the bark of the *horse chesnut*, and from *quassia wood*, by precipitating the *infusion* with *acetate of lead*, decomposing the precipitate by *sulphuretted hydrogen*, and filtering and evaporating the liquid to a syrup; crystals of *polychrome* form after some time. It is purified by repeated solutions in a mixture of *alcohol and ether*.

Prop., &c. It is chiefly remarkable for its solution appearing colourless by transmitted light, but blue by reflected light; and exhibiting a beautiful play of colours, visible when dissolved in even 1,500,000 parts of water.

POLYCHROMIC ACID. Syn. *Polychromate, Polychromatic Acid, Factitious Aloes-bitter*. A peculiar substance obtained by acting on aloes with nitric acid.

Prep. Take of *powdered aloes*, 1 part; *nitric acid* (sp. gr. 1·25), 8 parts; mix, and when the action is over, evaporate to a syrup, and add *cold water* to throw down the *polychromic acid;* purify it by washing it with water until the liquid passes off of a blue colour.

Prop., &c. A yellowish-brown powder, forming a purple solution; it explodes when heated. When used as a dye-stuff it yields a variety of colours. It is a mixture of *aloetic* and *aloeresinic acids*. (Schunck.) It closely resembles, if it be not identical with *chrysammic acid*.

POLYGALIC ACID. See *Senegine*.

POLYGALINE. See *Senegine*.

POMACE or *Pommage*. See *Cider* (*p.* 257).

POMAMBRA. Syn. *Pomum Ambra*. A ball composed of *musk, ambergris, civet, aromatics, &c.*, formerly used by embalmers to fill the vacant orbits of the eyes.

POMATUM. Syn. *Pomade; Pommade*, —Fr. This term was originally applied to a fragrant ointment prepared with *lard* and *apples;* but is now wholly restricted, in this country, to solid greasy substances used in dressing the hair. The *pomatums* of French pharmacy (*Pommades, Graisses médicamenteuses*, — P. Cod; *Liparolés*,— Guibourt; *Liparolés* and *Liparoïdés*,— Béral; *Stearolés*,—Chéreau) are soft ointments, having a basis of lard or fat, without resinous matter. See *Ointments* and *Pommades*.

POMEGRANATE. The *punica granatum* (Linn.), a small tree indigenous in Persia and the East. Fruit (*pomegranate; granata, mala punica*) is cooling and astringent; fruit-rind (*pomegranate peel; malacorium, cortex granati; Granatum*, —Ph. L.), and root-bark (*Granati radix*, —Ph. L. E. & D.) are powerfully astringent, detersive, and anthelmintic; the last more particularly so. The double flowers of the wild tree (*balaustines; balaustiæ*), as well as those of the cultivated one (*cytini*) are tonic and astingent. *Dose.* 15 to 20 gr., of the root-bark, repeated every 30 or 40 minutes, until four doses have been taken, followed by castor oil; in tape-worm. As an astringent, all the parts described are commonly given under the form of decoction.

POMMADE D'ALYON. See *p.* 898.

POMMADES. The *pomatums* of Continental perfumers.

In the *preparation* of *pommades*, one of the *first objects* of *consideration* is to obtain their fatty basis in as fresh and pure a state as possible. *Lard, beef* and *mutton suet, beef marrow, veal fat*, and *bear's fat*, are the substances commonly employed for this purpose, either singly, or in mixtures of two, or more of them. The *fat* carefully selected from a *young* and *healthy animal*, after being separated from extraneous skin and fibre, is pounded in a *marble mortar*, in the cold, until all the membranes are completely torn asunder. It is next placed in a *covered porcelain* or *polished metal pan*, and submitted to the heat of a water-bath, which is continued until its fatty portion has liquefied, and the albuminous and aqueous matter, and other foreign substances, have completely separated, and subsided. The *liquid fat* is then *carefully skimmed*, and at once passed through a clean *flannel filter*. In this state it may be *aromatized* or *perfumed* at will; after which, when it is intended that the *pommade* should be *opaque* and *white*, it is assiduously stirred or beaten with a *glass* or *wooden knife*, or *spatula*, until it concretes; but when it is desired that it should appear *transparent* or *crystalline*, it is allowed to cool very slowly, and without being disturbed. To prevent the *accession* of *rancidity*, a little *benzoic acid, gum benzoin*, or *nitric ether*, may be added to the fat, whilst in the liquid state, as noticed under *Fats* and *Ointments*. Sometimes a small portion of *white wax* or *bees' wax* (according to the

intended colour of the product) is melted with the fat, to increase its *solidity*. Some parties employ a few grains of *powdered citric acid* per *ounce*, in a like manner, with the intention of increasing the *whiteness* of the compound; but the practice is not to be commended, as pommades so prepared prove injurious to the hair.

The *French perfumers*, who are celebrated for the variety and excellence of their pommades, divide them into *four classes*:—

1. *Pommades by Infusion.* These are made by gently melting in a *clean pan*, over a water-bath, 2 parts of *hog's lard*, and 1 part of *beef suet*, (both of the finest quality, and carefully "rendered,") and adding thereto, 1 part of the given *flowers*, previously carefully picked and separated from foreign matter; or, if the odorous substance is a *solid*, then coarsely bruised, but not reduced to fine powder. The mixture is next digested at a very gentle heat for from 12 to 24 hours, with occasional stirring; the vessel being kept covered as much as possible during the whole time. The next day the mixture is re-heated, and again well stirred for a short time, after which it is poured into *canvass bags*, and these being securely tied, are submitted to powerful pressure, gradually increased, in a screw or barrel press. This operation is repeated with the *same fat* and *fresh flowers*, several times, until the pommade is sufficiently perfumed. A good *pommade* requires *thrice* to *six times* its *weight* in *flowers* to be thus consumed; or of the *aromatic barks* and *seeds* a corresponding proportion. The *pommades of Cassia, orange flowers*, and several others kept by the French perfumers, are prepared in this manner.

2. *Pommades by Contact.* These are made by spreading, with a pallette knife, *simple pommade* (made with lard and suet as above,) on *panes of glass* or *pewter plates*, to the thickness of a finger, and sticking the surface all over with the *sweet-scented flowers*. These last are renewed daily for one, two, or three months, or until the pommade has become sufficiently perfumed. On the *large scale*, the panes are placed in small shallow frames made of four pieces of wood nicely fitted together, and are then closely piled one upon another. On the *small scale*, pewter plates are generally used, and they are inverted one over the other. In some of the perfumeries of France, many thousands of frames are employed at once. *The Pommades of Jasmin, Jonquil, Orange-flowers, Narcissus, Tuberose, Violet*, and of some other *delicate flowers*, are prepared in this manner.

3. *Pommades by Addition.* These are prepared by simply adding the *fragrant essences* or *essential oils*, in the required quantity, to the *simple pommade* of lard and suet (see *above*) to produce the proper odour. In this way the *Pommades* of *Bergamotte, Cédrat, Cinnamon, Lemons, Lemon thyme, Lavender, Limettes, Marjoram, Portugal, Roses, Rosemary, Thyme, Verbena*, and above 40 others kept by the Parisian perfumers, are made.

4. *Mixed Pommades.* Of these a great variety exists, prepared by the addition of judicious combinations of the *more esteemed perfumes* to *simple pommade*; or, by the admixture of the different *perfumed pommades*, whilst in the semi-liquid state.

The *coloured pommades* derive their respective tints from *tinctorial matter* added to the melted fat before perfuming it. *Green* is given by *gum guaiacum* (in powder), or by the *green leaves* or *tops* of *spinach, parsley, lavender*, or *walnut*;—*Red*, by *alkanet root* and *carmine*;—*Yellow* and *orange*, by *annatto* or *palm oil*.—*White pommades* are made with *mutton suet*, instead of beef suet. The *brown* and *black* hard pomatums, vended under the name of "*cosmetiques*," are noticed at *page* 293.

A few *compound pommades* are used as skin cosmetics.

Pommade or *Pomatum, Plain do., Simple do.*—1. From *lard*, 2 *lb.*; *beef suet*, 1 *lb.*; carefully rendered, as above. The ordinary consistence for temperate climates.

2. *Lard* and *suet*, equal parts. For warm climates. Both may be *scented* at will.

Pommade (Scented).—1. *Plain pomatum*, 1 *lb.*; melt it by the least possible degree of heat, add of *essence of lemon* or *essence of bergamot*, 3 dr., and stir the mixture until it concretes. This forms the ordinary "*pomatum*" of the shops.

2. *Plain pomatum*, 1½ *lb.*; *essence of bergamot*, 1½ dr.; *essence of lemon*, 1 dr.; *oils of rosemary* and *cassia*, of each, ½ dr.; *oil of cloves*, 20 drops. More fragrant than the last.

Castor Oil Pommade.—1. From *castor oil*, 1 *lb.*; *white wax*, 4 *oz.*; melt them together, then add, when nearly cold, of *essence of bergamot*, 3 dr.; *oil of lavender* (English), ½ dr.; *essence of ambergris*, 10 drops. Supposed to render the hair glossy.

2 (*Crystallized.*) From *castor oil*,

1 *lb.*; *spermaceti*, 3 *oz.*; melt them together, by a gentle heat, add of *essence of bergamot*, 3 dr.; *oils of verbena, lavender*, and *rosemary*, of each, ½ dr.; pour it into wide-mouthed glass bottles, and allow it to cool very slowly, and undisturbed.

Cazenave's Pommade. From *prepared beef-marrow*, 4 *oz.*; *tincture of cantharides* (P. Cod.), 3 to 4 dr.; *powdered cinnamon*, ½ *oz.*; melt them together, stir until the spirit has, for the most part, evaporated, then decant the clear portion, and again stir it until it concretes. Recommended as a remedy for *baldness* and *weak hair*. It is to be used night and morning; the head being washed with *soap-and-water*, and afterwards with *salt-and-water*, before applying it. Dr. Cattell scents it with the *oils of origanum* and *bergamot*, instead of cinnamon.

Pommade Collante.—1. *Oil of almonds*, 3 *oz.*; *white wax*, ¾ *oz.*; melt them together, and add of *tincture of mastic* (strong), 1 *oz.*; *essence of bergamot*, ½ dr. *Used* to stiffen the hair, and to keep it in form.

2. *Burgundy pitch* (true), 3 *oz.*; *white wax*, 2 *oz.*; *lard*, 1 *oz.*; melt, and when considerably cooled, stir in of *tincture of benzoin*, 1 *oz.*; *essence of bergamot*, ½ dr. *Used* to fasten false curls.

Cowslip Pommade or *Pomatum.* From *plain pommade*, 2 *lb.*; *essence of bergamot*, 3 dr.; *essence of lemon* and *essence of orange peel*, of each, 1 dr.; *huile au jasmin* and *essence de petit grain*, of each, ½ dr.; *essence of ambergris*, 6 drops.

Crystallized Pommade. From *olive oil* and *spermaceti*, as *crystallized castor oil pommade*, with *scent* at will.

Pommade de Beauté. From *oil of almonds*, 2 *oz.*; *spermaceti*, 2 dr.; *white wax*, 1½ dr.; *glycerine*, 1 dr.; *balsam of Peru*, ½ dr.; mixed by a gentle heat. *Used* as a skin cosmetic, as well as for the hair.

Pommade de Casse. From *plain pommade*, 1 *lb.*; *palm oil*, ½ *oz.*; melt, pour off the clear, and add *oil of cassia* and *huile au jasmin*, of each, 1 dr.; *neroli*, 20 drops; *oil of verbena* or *lemon grass*, 15 drops; *otto of roses*, 5 drops; and stir until nearly cold. Very fragrant.

Pommade d'Hèbe. To *white wax*, 1 *oz.*, melted by a gentle heat, add of the *juice of lily bulbs* and *Narbonne honey*, each, 2 *oz.*; *rose water*, 2 dr.; *otto of roses*, 2 drops. Applied night and morning to remove wrinkles.

Pommade de Ninon de l'Enclos. Take of *oil of almonds*, 4 *oz.*; *prepared lard*, 3 *oz.*; *juice of houseleek*, 3 *fl. oz.* *Used* chiefly as a skin cosmetic. Said to be very softening and refreshing.

Pommade Divine.—1. *Washed* and *purified beef marrow*, 2 *lb.*; *liquid styrax*, *cypress wood*, and *powdered orris root*, of each, 2 *oz.*; *powdered cinnamon*, 1 *oz.*; *cloves* and *nutmegs*, of each (bruised), ½ *oz.*; digest the whole together by the heat of a water bath for six hours, and then strain through flannel.

2. *Plain pommade*, 2 *lb.*; *essence of lemon* and *bergamot*, of each, 2 dr.; *oils of lavender* and *origanum*, of each, 1 dr.; *oils of verbena, cassia, cloves*, and *neroli*, of each, 12 drops; *huile au jasmin*, 3 dr.; *essence of violets*, ½ *oz.*

Dupuytren's Pommade.—1. Take of *prepared beef marrow*, 12 *oz.*; melt, add of *baume nerval* (see *p.* 897), 4 *oz.*; *Peruvian balsam* and *oil of almonds*, of each, 3 *oz.*; and, lastly, of *alcoholic extract of cantharides*, 36 gr.; (dissolve in) *rectified spirit*, 3 fl. dr. This is the *original formula* for this celebrated pommade. The following modifications of it are now commonly employed:

2. (M. Cap.) *Beef marrow*, 2 *oz.*; *alcoholic extract of cantharides*, 8 gr.; *rose oil*, 1 dr.; *essence of lemons*, 30 drops.

3. (M. Guibourt.) *Beef marrow* and *baume nerval*, of each, 1 *oz.*; *rose oil*, 1 dr.; *alcoholic* (or *acetic*) *extract of cantharides*, 6 gr.; (dissolved in) *rectified spirit*, q. s. These compounds are *used* to promote the growth of the hair and to prevent baldness, for which purpose they are usually coloured and scented, according to the taste of the manufacturer. To be useful, they should be well rubbed on the scalp, at least once daily, for several weeks, and the head should be occasionally washed with soap-and-water.

East India Pomatum or *Pommade.* Take of *suet*, 3 *lb.*; *lard*, 2 *lb.*; *bees' wax* (bright), ½ *lb.*; *palm oil*, 2 *oz.*; *powdered gum benzoin*, 3 *oz.*; *musk*, (previously triturated with a little lump sugar), 20 gr.; digest the whole together in a covered vessel, by the heat of a water bath for 2 hours, then decant the clear portion, and add of *essence of lemon*, ½ *oz.*; *oil of lavender*, ¼ *oz.*; *oils of cloves, cassia*, and *verbena*, of each, ½ dr. A favorite pommade in the East Indies.

Pommade en Crème. See *Cold Cream.*

Hard Pomatum, Roll do.—1. Take of *beef suet*, 2 *lb.*; *yellow wax*, ¼ *lb.*; *spermaceti*, 1 *oz.*; *powdered benzoin*, ¼ *oz.*; melt them together, then add of *oil of lavender*, 2 dr.; *essence of ambergris*, ½ dr. Before it concretes pour it into moulds of *paper* or *tin foil.*

2. *Mutton suet* and *lard*, of each, 1 *lb.*;

white wax, 6 *oz.*; melt, and add of *essence of lemon*, 2 dr.; *oil of cassia*, ½ dr. Other perfumes may be employed at will.

Hard pomatums are used to gloss and set the hair. They act both as *pommade* and *fixateur*. See *Cosmetiques*.

Macassar Pommade. From *castor oil*, 5 *oz.*; *white wax*, 1 *oz.*; *alkanet root*, ½ dr.; heat them together until sufficiently coloured, then strain, and add *oil of origanum* and *oil of rosemary*, of each, 1 dr.; *oil of nutmeg*, ½ dr.; *otto of roses*, 10 drops. Said to be equal in efficacy to *Macassar oil*.

Marechal Pommade. Plain pommade scented by digesting it with *poudre marechale*.

Marrow Pommade, Marrow Pomatum. From *prepared beef marrow*, ½ *lb.*; *beef suet*, ¼ *lb.*; *palm oil*, ¼ *oz.*; melted together and scented at will.

Millefleur Pommade. From *plain pommade* scented with a mixture of *essence of lemon* and *essence of ambergris*, each, 4 parts; *oil of lavender*, 2 parts; *oil of cloves* and *essence de petit grain*, of each, 1 part; or with other like perfumes so proportioned to each other that no one shall predominate. Much esteemed.

Roll Pomatum. See *Hard Pomatum*.

Roman Pommade. See *below*.

Rose Pommade, Rose Pomatum. This is *plain pommade* or *hard lard*, which has been well beaten with *eau de rose*, or, better still, scented with *otto of roses*. It is sometimes tinged with *alkanet root*.

Soft Pomatum. Plain pomatum scented at will.

Soubeiran's Pommade. From *beef marrow*, 1½ *oz.*; *oil of almonds*, ½ *oz.*; *disulphate of quinine*, 1 dr. Recommended for strengthening and restoring the hair.

Vanilla Pomatum, Pommade à la Vanille, Pommade Romain. From *plain pommade* and *pommade à la rose*, of each, 12 *lb.*; *powdered vanilla*, 1 *lb.*; heat them together in a water bath, stir constantly for 1 hour, let it settle for another hour, decant the clear, and add *oil à la rose*, 2½ *lb.*; *bergamot*, 4 *oz.*

POMPHOLIX. See *Oxide of Zinc*.

POMPHOLYX. See *Pemphigus*.

POPPY. Syn. *White Poppy; Papaver Somniferum*,—Linn. The *capsules* or *fruit* ("mature,"—Ph. L.; "not quite ripe,"—Ph. E.) form the *poppies* or *poppy heads* of the shops (*papaveris capsulæ; papaver*,—Ph. L. E. and D.) They are anodyne and narcotic, similar to opium, but in only a very slight degree. The seeds (*maw seed*), which are sweet, oleaginous, and nutritious, are used as a substitute for almonds in confectionery and mixtures, and are pressed for their oil. See *Extracts*, *Opium*, and *Syrups*.

POPPY (Red). Syn. *Corn Poppy, Corn Rose; Papaver Rhœas*,—Linn. The fresh petals or flowers (*rhœados petala; rhœas*,—Ph. L. E. & D.) are reputed pectoral, but are chiefly employed on account of their rich colour. See *Syrups*.

POPULINE. Syn. *Populinum*,—Lat. A peculiar neutral, crystallizable substance, formerly supposed to be an alkaloid, found, associated with salicine, in the *root-bark* of the *populus tremula* (Linn.) or *aspen*.

Prep. Concentrate the *decoction* by a gentle heat, and set it aside in a cool situation to crystallize; dissolve the crystals which are deposited in *rectified spirit*, decolour them by digestion with *animal charcoal*, filter, and again crystallize. To render them still purer, they may be redissolved and crystallized a second, and a third time, if necessary.

Prop., &c. It resembles salicine in appearance and solubility, but, unlike that substance, has a penetrating sweet taste. Dilute acids convert it into benzoic acid, grape sugar, and *saliretine*; and with a mixture of sulphuric acid and bichromate of potassa it yields a large quantity of *hydruret of salicyle*. It appears to be tonic, stomachic, and febrifuge.

PORCELAIN. See *Pottery*.

PORK. The value of pork as an article of diet is well known. That from the young and properly fed animal is savoury, easy of digestion, and, when only occasionally employed, highly wholesome; but it is apt to disagree with some stomachs, and should, in such cases, be avoided. To render it proper for food, it should be *thoroughly*, but not over-cooked. When *salted* it is less digestible. "The frequent use of pork is said to favour obesity, and to occasion disorders of the skin, especially in the sedentary."

"The *quality* of *pork* entirely depends on the feeding. A friend of mine made various experiments, and more particularly on the same litter of pigs, and the various sizes and different flavour of the meat was extraordinary. There is one thing very certain, that whatever a pig is fed upon, it will be much better in size and quality if kept thoroughly clean, and supplied with a proper quantity of wholesome food." (A. Soyer.)

PORPHYRIZED and *Porphorization*. Words coined by recent pharmaceutical writers, and possessing similar meanings to *levigated* and *levigation*. (See *p*. 689.)

PORPHYROXINE. A neutral crystal-

lizable substance discovered by Merck in opium. It is soluble in both alcohol and ether, insoluble in water, and is characterized by assuming a purplish red colour when heated in dilute hydrochloric acid.

PORRIGO. See *Ring-worm*.

PORTER. This well-known beverage, now the common drink of the inhabitants of London, by whom it is generally termed "beer," originated with a brewer named Harwood, in 1722. Previously to this date "*ale*," "*beer*" and "*twopenny*," constituted the stock in trade of the London publican, and were drunk, either singly, or together under the names of "*half-and-half*" or "*three threads*," for which the vendor was compelled to have recourse to two or three different casks, as the case might demand. The inconvenience and trouble thus incurred led Mr. Harwood to endeavour to produce a beer which should possess the flavour of the mixed liquors. In this he succeeded so well that his new beverage rapidly superseded the mixtures then in use, and obtained a general preference among the lower classes of the people. At first this liquor was called "entire" or "entire butt," on account of it being drawn from *one* cask only, but it afterwards acquired, at first in derision, the now familiar name of "*porter*," in consequence of its general consumption among porters and labourers. The word "*entire*" is still however, frequently met with on the sign-boards of taverns about the metropolis.

The *characteristics* of *pure* and *wholesome porter* are its transparency, lively dark brown colour, and its peculiar bitter and slightly burnt taste. Originally, these qualities were derived from the "high-dried malt" with which alone it was brewed. It is now generally, if not entirely, made from "*pale*" or "*amber malt*" mixed with a sufficient quantity of "*patent*" or "*roasted malt*" to impart the necessary flavour and colour. *Malt-wort* evaporated to an extract, and then partially torrefied in *an iron pan*, and, less frequently, *burnt sugar* or *caramel*, are also used for the same purpose. Formerly, this liquor was "vatted" and "stored" for some time before being sent out to the retailer, but the change in the taste of the public during the last quarter of a century in favour of mild or new porter, has rendered this unnecessary. The best "*draught porter*," at the time of its consumption, is now only a few weeks old. In this state only would it be tolerated by the modern beer-drinker. The old and acid beverage that was formerly sold under the name of porter would be rejected at the present day, as "hard" and unpleasant, even by the most thirsty votaries of malt liquor.

The *beer* or *porter* of the *metropolitan brewers* is essentially a *weak mild ale*, coloured and flavoured with *roasted malt* or *malt extract*. Its *richness* in *sugar* and *alcohol*, on which its stimulating and nutritive properties depend, is, hence, *less* than that of an *uncoloured* mild ale brewed from a like original quantity of malt. For pale malt is assumed to yield 80 to 84 *lb.* of saccharine per quarter; whereas the torrefied malt employed by the porter-brewers, only yields 18 to 24 *lb.* per quarter, and much of even this small quantity is altered in its properties, and is incapable of undergoing the vinous fermentation. In the manufacture of porter there is a waste of malt which does not occur in brewing ale; and the consumer must, therefore, either pay a higher price for it or be content with a weaker liquor.

The *hygienic properties* of *porter*, for the most part, resemble those of other malt liquors. Some members of the faculty conceive that it is better suited to persons with delicate stomachs and weak digestion than either ale or beer. That there may be some reason for this preference, in such cases, we are not prepared to deny, but undoubtedly, when the intention is to stimulate and nourish the system, *ale* is *preferable*. Certain it is, however, that the dark colour and strong taste of porter render its adulteration easier than that of ale, whilst such adulteration is more difficult of detection than in the paler varieties of malt liquors. "For *medical purposes*, 'bottled porter' (*cerevisia lagenaria*), is usually preferred to 'draught porter.' It is useful as a restorative in the latter stages of fever, and to support the powers of the system after surgical operations, severe accidents, &c." (Pereira, ii, 982.) When "out of condition" or adulterated, porter, more than perhaps any other malt liquor, is totally unfit for use as a beverage, even for the healthy; and when taken by the invalid, the consequences must necessarily be serious. Dr. Ure says that *pure porter*, "when drank in moderation, is a far wholesomer beverage for the people than the thin acidulous wines of France and Germany."

The *manufacture of porter* has been described in our article on "*brewing*," and is also referred to above. It presents no difficulty or peculiarity, beyond the choice of the proper materials. A mixture of "*brown*" and "*black malt*" is thought to yield a finer flavour and colour to the pale malt that gives the body to the liquor, than

when "black" or "patent malt" is employed alone. The proportion of the former to the latter commonly varies from 1-6th to 1-4th. When "black malt" alone is used, the proportion varies from the 1-10th to 1-15th. 1 *lb.* of "*patent malt*" mashed with about 79 *lb.* of *pale malt*, is said to be capable of imparting to the liquor the flavour and colour of porter. The following formulæ were formerly commonly employed in London :—

1. (*Draught Porter.*) From *pale malt*, 3½ qrs.; *amber malt*, 3 qrs.; *brown malt*, 1½ qrs.; mash at twice with 28 and 24 barrels of water, boil with *brown Kent hops*, 56 *lb.*; and set with *yeast*, 40 *lb.* *Prod.* 28 barrels, or 3½ times the malt, besides 20 brls. of table-beer from a third mashing.

2. (*Bottling Porter; Brown Stout.*) From *pale malt*, 2 qrs.; *amber* and *brown malt*, of each, 1½ qrs.; mash at 3 times with 12, 7, and 6 brls. of water, boil with hops, 50 *lb.*; and set with *yeast*, 26 lb. *Prod.* 17 brls. or 1½ times the malt.

The *purity* and *quality* of *porter*, as well as of other malt liquors, may be inferred in the manner noticed under "*Beer*" (see *p.* 122); but can only be positively determined by a chemical examination. For this purpose several distinct operations are required :—

1. *Richness in Alcohol.* This may be correctly found by the *method* of M. Gay-Lussac; or, from the *boiling point*. (See *Alcoholometry* and *Ebullioscope.*) The method *with fused carbonate of potassa* (see No. 6. *p.* 36) will also give results sufficiently near to the truth for ordinary purposes, when strong or old beer is operated on, The quantity of the liquor tested should be 3600 water-grains measure; and it should be well agitated, with free exposure to the air, after weighing it, but before testing it for its alcohol. The WEIGHT OF ALCOHOL found, multiplied by 1·8587 gives its equivalent in *sugar*. This may be converted into *brewer's pounds* or *density per barrel*, as below.

2. *Richness in Saccharine* or *Extractive matter.* A *like quantity* of the *liquor* under examination, after being boiled for some time to dissipate its alcohol, or the *liquor from which the alcohol has been distilled* (see No. 1), is made up with *distilled water*, so as to be again exactly equal to 3600 water-grains measure. The sp. gr. of the resulting liquid is then taken, and this is reduced to BREWER'S POUNDS per barrel, by multiplying its excess of density above that of water (*or* 1000) by 360, and pointing off the three right-hand figures as decimals.

3. *Acetic Acid* or *Vinegar.* This is determined by any of the common methods of *Acidimetry.* (See *pp.* 17—20.) *Each grain* of ANHYDROUS ACETIC ACID, so found, represents 1·6765 gr. of *sugar.*

4. *Gravity of Original Wort.* This is obtained by the addition of the respective quantities of *saccharine matter* found in Nos. 1, 2, and 3 (*above*). These results are always slightly under the true original density of the wort, as cane sugar appears to have been taken by the Excise as the basis of their calculations. More correctly, 12% of *proof spirit* is equivalent to 19 *lb.* of SACCHARINE per *barrel.* 10½ *lb.* of *saccharine* are equiv. to 1 gall. of *proof spirit.*

5. *Detection of Narcotics.* This may be effected either by the *method* described under *Alkaloids* (*Tests, &c.* p. 45), or by one or other of the following processes :—

a. ½ gall. of the *beer under examination* is evaporated to dryness in a water bath; the *resulting extract* is boiled for 30 or 40 minutes in a covered vessel with 10 or 12 *fl. oz.* of *alcohol*, or strong *rectified spirit*, the mixture being occasionally stirred with a glass rod, to promote the action of the menstruum; the *alcoholic solution* is next filtered, treated with a sufficient quantity of *solution of diacetate of lead* to precipitate colouring matter, and again filtered; the filtrate is treated with a few drops of *dilute sulphuric acid*, again filtered, and then evaporated to dryness; it may then be tested with any of the usual reagents, either in the solid state, or after being dissolved in *distilled water.* Or, the *extract*, obtained as above, may be boiled as directed with *rectified spirit*, the solution filtered, the spirit distilled off, and a small quantity of pure *liquor of potassa* added to the aqueous residue, which is then to be shaken up with about 1 *fl. oz.* of *ether;* lastly, the *ethereal solution*, which separates and floats on the surface, is decanted, evaporated, and the residuum tested, as before. This answers well for the detection of STRYCHNINE or NUX VOMICA.

b. From 2 to 3 *oz.* of *purified animal charcoal* are diffused through ½ gall. of the *beer*, and is digested in it, with frequent agitation, for from 8 to12 hours; the liquor is next filtered, and the *charcoal* collected on the filter, is boiled with about ½ pint of *rectified spirit;* the resulting *alcoholic solution* is then further treated as above, and tested.

6. *Picric Acid.* This substance, now so commonly employed to impart *bitterness* to London porter, in lieu of hops, may be detected as follows :—

a. A portion of the liquor agitated with

a little *solution of diacetate of lead* LOSES its bitter flavour if it depends on *hops*, but RETAINS it, if it depends on *picric acid*.

b. Pure beer is *decoloured* and *deodorized* by *animal charcoal;* but beer containing *picric acid*, when thus treated, *retains both*. In this way the 1-12,000 to the 1-18,000th part of PICRIC ACID may be detected. (*Journ. de Chemie Méd.*)

c. The *complexion* of heavy drinkers of beer containing *picric acid* generally acquires more or less of a bilious yellow colour; and the white of the eye gradually loses its original purity, assuming a peculiar abnormal appearance, not very marked, but which may be readily recognised by any person who has observed the peculiar physiological action of *picric acid* on animals.

7. *Alkaline or Earthy matter.—a*. A weighed quantity of *pure beer* evaporated to dryness, and then incinerated, does not furnish more than from ·20% to ·35% of ASH, the quantity varying within these limits with the strength of the liquor, and the character of the water used in brewing it.

b. A solution of this *ash*, made by coction with *distilled water*, should be only rendered slightly turbid by *solutions* of *acetate of lead*, *bichloride of platinum*, *nitrate of baryta*, *nitrate of silver*, *oxalate of ammonia*, and *sulphuretted hydrogen*.

c. If the beer contained *common salt* the above solution will give a cloudy white precipitate, with a *solution of nitrate of silver*. Each grain of this precipitate is equivalent to ½ gr. of COMMON SALT (nearly).

d. If *green copperas* or *sulphate of iron* is present, *ferridcyanide of potassium* gives a blue precipitate, and *ferrocyanide of potassium* a bluish-white one, turning dark blue in the air; *solution of chloride of barium* gives a white precipitate, *each grain* of which, after being washed, dried, and ignited, represents 1·188 gr. of CRYSTALLIZED PROTOSULPHATE OF IRON.

e. The *ash*, digested in *water slightly acidulated with nitric acid*, and then boiled, yields a solution, which, when cold, gives a black precipitate with *sulphuretted hydrogen*, and a white one with *dilute sulphuric acid* when LEAD is present. (See *p*. 157.)

Concluding Remarks. The adulteration of malt liquor, and especially of porter, has become so general, that the sale of *pure beer* by the publican is the *exception*, and *not* the *rule*. This we have amply verified by an extensive investigation of the subject, undertaken for the proprietors of one of the *medical journals*, in 1852. We collected and carefully examined altogether upwards of 70 samples of "*draught*" and "*bottled porter*," and "*draught* and *bottled stout*," not *one third* of which did we find to be the *produce of malt and hops* alone. Most of them were shamefully adulterated, and several of them contained substances of a highly deleterious character. Not more than 6% of them were, indeed, absolutely pure, and at the same time in fine drinking condition. Since the above date this evil has increased, rather than lessened, and the venalities of the publicans seriously interfere with the hygienic condition of the people. The public of this great metropolis are the principal sufferers from this practice; but, though they have been often warned, and are hence cognisant of its existence, they are utterly indifferent on the subject. They appear to prefer the stupor and narcotism produced by *cocculus Indicus*, *nux vomica*, *extract of poppies*, *opium*, and *tobacco*, with all their *frightful consequences*, to the genial stimulus and wholesome tonic action of pure malt liquor, when consumed in moderation. The drunken porter-drinker undoubtedly enjoys the delirium produced by these substances, and even prizes the shattered condition of the nervous system, the parched mouth, the "swimming head," and the "shaking hand" experienced on rising in the morning, on account of their reminding him of his over-night's "tipple." This is a state of things on which the medical practitioner and the observant philanthropist have long exerted themselves in vain. With the view of obviating this evil, some of these gentlemen, a few years since, called in the joint-stock system of trading, and obtained an *Act of Parliament* establishing a company upon entirely new principles, having for its especial object the production of *malt liquors*, not merely *absolutely pure*, but also at *reduced prices*. It was shown that the manufacture of the various beverages from malt and hops, known to be so largely remunerative, was much less satisfactory on the *small scale* than on a *large one*, but might be carried out with facility and success by a number of small capitalists united. The managers more particularly addressed themselves to the trading and working classes, and divided their capital of £200,000 in such a manner as to place a full participation in its advantages within their reach. The shares were fixed at £5 each, payable in calls of 10*s*. each; and these at once enabled the shareholders to reap the advantages of being both buyers and sellers, and of being their own brewers. A person is also admitted as a *subscriber* by a single

payment of £1, by which he is entitled to a *reduction in price*, and avoiding all further liability. The shareholders and subscribers are privileged to *inspect the premises*, the *operations* carried on, and the *materials used*. The company have hitherto paid a dividend of 5 per cent. to the shareholders; and the workmen regularly employed are allowed to participate in the surplus profits, in proportion to the wages earned. A larger capital would, however, enable the company to realize much larger profits, while, at the same time, it would place it in a position more extensively to diffuse the benefits derived from the manufacture of *good* and *cheap beer*, an article so essential to the health and enjoyment of the working man. The existing shareholders therefore wisely press upon *all*, but the working class more particularly, the importance of giving their support to the company.

We have carefully examined and analysed the *ales* and *beers* produced by the "*Metropolitan and Provincial Joint-stock Brewery Company*" above referred to, and can, therefore, positively affirm them to be *absolutely pure*, and to contain nothing but what is derived from *malt*, *hops*, and *water*, and which *alone* should be present in good malt liquor. In further evidence of our confidence in the integrity and wholesome character of these liquors, we may add, that, for some time, they are the only kind we have employed in our household, although, did we follow convenience instead of purity, we should not do so, as our *interest*, apart from *health*, lies *elsewhere*. The *company's premises*, where operations are now being carried on, are at Brentford, Middlesex, and Hemel Hempstead, Herts. The *Chief Office* is at No. 8, Moorgate Street; and their *Town Stores* (conducted by Mr. Wm. Stevens) at No. 13, Upper Wellington Street, Strand.

(For further information connected with this subject, see the '*Med. Circ.*,' i, 257-260, 296-300; '*Lancet*,' 1852, i, 473-479; and the articles *Alcoholmetry*, *Beer*, *Brewing*, *Distillation*, *Ebullioscope*, *Malt Liquors*, *Wines*, &c., in this work.)

PORT-FIRE. A paper tube, from 9 to 12 inches in length, filled with a slow burning composition of *meal-powder*, *nitre*, and *sulphur*, rammed moderately hard, by a similar process to that adopted for small rockets. It is *used* in lieu of a touch-match, to fire guns, mortars, pyrotechnical devices, &c.

PORTLAND CEMENT. A *species* of *mortar* formed by calcining a *mixture* of *limestone* and *argillaceous earth*, and grinding the calcined mass to powder, in which state it must be preserved from the air. It is characterised by absorbing a large quantity of water, and then rapidly becoming solid, and, after a time, acquiring considerable hardness. See *Mortars* and *Cements*.

POSCA. The old Latin name of *vinegar-and-water*, to which *eggs* were sometimes added.

POSOLOGY. See *Doses*.

POSSET. Syn. *Possetum*,—Lat. *Milk* curdled with *wine* or any other *slightly acidulous liquor*. It is usually sweetened with either *sugar* or *treacle*, and is taken hot.

Prep. From *new milk*, ½ pint; *sherry* or *marsala*, 1 wine-glassful; *treacle*, 1 or 2 table-spoonfuls, or q. s.; heat them together in a clean saucepan until the milk coagulates. This is called "*Treacle Posset*," or "*Molasses Posset*," and taken on retiring to rest, is highly esteemed in some parts of the country as a domestic remedy for colds. *Lemon juice*, *strong old-ale*, or even *vinegar*, is occasionally substituted for wine, and *powdered ginger* or *nutmeg* added at will.

POST. See *Poppy Wine*.

POTASH. The "*potash*," or "*potashes*," of commerce, is an impure *carbonate of potassa*, so named after the pots or vessels in which it was first made. The "*potash*," or "*potassa*," of the chemist, is the *hydrate of potassa*, or *hydrated oxide of potassium*, a peculiar metal, which is more particularly referred to below. The word *potash* is now generally employed in connexion with the crude or commercial compounds of the alkali; and *potassa*, in connexion with those which are chemically or commercially pure, or which are prepared on the small scale for the purposes of medicine, analysis, &c. See *Carbonate of Potassa*, *&c.*

POTASSA. Syn. *Potash* (pure); *Oxide of Potassium*, *Protoxide of do.*; *Vegetable Alkali*; *Potasse*,—Fr. *Kali*,—Germ. *Potassa*,—Lat. This occurs in two forms:—

1. (*Anhydrous.*) Obtained by the combustion of *potassium* in hot dry air. A volatile, fusible, white substance, intensely corrosive, and passing into *hydrate of potassa*, with the evolution of much heat, when moistened with water.

2. (*Hydrated.*) See *Hydrate of Potassa*.

Tests, *&c.* Potassa and its salts are—*colourless*, when not associated with a coloured metallic oxide or acid;—*non-volatile* by the strongest heat of a spirit lamp;—*soluble in water*, and, generally, freely so;—they impart a *purple* or *violet* colour to the *outer flame* of the blowpipe, when,

supported on a platinum wire, they are heated in the apex of the *inner flame*.—A like colour is also imparted to the *flame of alcohol*, when that substance is ignited with a salt of potassa, previously heated with a very small quantity of water. The *presence* of SODA obscures the last two reactions completely.—*Pure potassa*, as well as its *hydrate* and *carbonate*, deliquesce in the air, forming oily liquids which do not solidify by the absorption of carbonic acid.

Solutions of potassa and its *salts* are thus distinguished:—1. They are unaffected by sulphuretted hydrogen, the hydrosulphurets, ferrocyanides, and carbonates.—2. A solution of tartaric acid, added, in excess, to moderately strong neutral, or alkaline solutions of potassa or its salts, gives a quickly subsiding, gritty or crystalline, white precipitate of bitartrate of potassa, which is redissolved on heating the liquid, and again separates as it cools; and is also soluble in aqueous solutions containing free alkali, or free mineral acids.—3. Bichloride of platinum produces, in neutral and acid solutions, a yellow, crystalline precipitate of potassio-chloride of platinum. Alkaline solutions require to be first slightly acidulated with hydrochloric acid. The separation of the precipitate here, as well as in No. 2, is promoted by violent agitation and friction against the sides of the vessel, and the delicacy of both is increased by the addition of some alcohol.—4. Carbazotic acid gives a yellow crystalline precipitate, which is only sparingly soluble in water.—5. Hydrofluosilicic acid gives a white precipitate, which is only slightly soluble.—6. Perchloric acid also gives a like white precipitate.

Estim. See *Alkalimetry*.

Concluding Remarks. The compounds of potassa are a highly valuable and important class of bodies, and are applied to an almost infinite variety of uses in the arts and manufactures, and in medicine. It is the most powerful antiscorbutic known. According to Dr. Garrod, the peculiar efficacy of fresh vegetables and fruit in scurvy depends on the potash which they contain. *Potatoes*, *wheat-meal*, and *lemon juice* are rich in *this substance*. *Fine wheaten flour* and *rice* contain little of it; the last, even too little to support life. Under the form of carbonate, citrate, malate, oxalate, tartrate, or some similar combination, potassa is universally diffused throughout the vegetable world, and from this kingdom of nature man obtains, by means at once simple and inexpensive, an unfailing and plentiful supply of this substance. Potassa is also found in the mineral kingdom, which indeed is the only original storehouse of it; but its direct elimination from this source has not, hitherto, been successfully carried out on the commercial scale.

Most of the *salts of potassa* may be *prepared* by directly saturating or neutralizing a *solution of the acid* with a *solution* of the *carbonate* or *hydrate of potassa;* and, in some instances, advantageously, by *double decomposition*. The filtered solution will generally yield crystals, either by simple evaporation, or by allowing the boiling concentrated solution to cool very slowly. See *Crystallization* (and *below*).

POTASSA (Acetate of). Syn. *Potassæ Acetas*,—Ph. L. E. & D. *Kali Acetas*,—Ph. D. 1807. *Kali Acetatum*,—Ph. D. 1788. *Sal Diureticus*,—Ph. L. 1745. *Diuretic Salt*, *Foliated Tartar*, *Regenerated do.*, *Foliated Salt of Tartar*, *Essential Salt of Wine*, *Digestive Salt of Silvius*, *Arcanum Tartari*, *Terra Foliata Tartari*, *&c.*,—Obs. var. *Prep.* 1. (Ph. L.) *Acetic acid*, 26 fl. oz.; *distilled water*, 12 fl. oz.; mix, and add, gradually, of *carbonate of potassa*, 1 lb, or q. s. to saturate the acid; next, filter the solution, and evaporate it by the heat of a sand-bath, gradually applied, until the salt is dried.

2. (Ph. E.) *Pyroligneous acid*, 1½ pint; *carbonate of potassa* (dry), 7 oz., or q. s.; mix as before, then evaporate the neutral solution over a vapour-bath, until it is sufficiently concentrated to form a (dry) concrete mass on cooling; lastly, allow the whole to cool slowly, so as to crystallize in a solid cake, which must be broken up, and immediately put into well-closed bottles.

3. (Ph. D.) Pure *carbonate of potassa*, 1 *lb.;* commercial *acetic acid* (sp. gr. 1·044), 1 quart; mix as before, and boil for "a couple of minutes;" next add, if necessary, a few drops more of acetic acid, "so that the solution may have a *slightly* acid reaction, and, having evaporated the liquid to dryness, melt the residuum, by the cautious application of heat, in a clean pot of cast iron; the liquefied salt is now to be removed from the fire, and when, upon cooling, it has solidified, it should be quickly broken into fragments of a suitable size, and enclosed in a bottle furnished with an air-tight stopper."

Prop., &c. Acetate of potassa, prepared as above, occurs in shining white masses, having a foliated, soft texture, a slight, but peculiar odour, and a warm sharp taste; it deliquesces in the air; dissolves in rather less than its own weight of water, and in about twice its weight of alcohol; and by

exposure to a red heat is converted into pure carbonate of potassa. In trade it is preserved in well-corked and sealed bottles.

Pur. "It is (entirely) soluble in water, and in rectified spirit. These solutions neither affect litmus nor turmeric, nor are they disturbed by either chloride of barium or nitrate of silver; but if from a stronger solution anything is thrown down by nitrate of silver, the same is again dissolved on the addition of water or dilute nitric acid. Sulphuric acid being added, fumes of acetic acid are evolved. 100 gr. of this salt digested in sulphuric acid, the solution evaporated, and the residuum dried at a high temperature, furnish 88·8 gr. of sulphate of potassa." (Ph. L.)

Uses, &c. Acetate of potassa has been found useful in dropsies, febrile affections, jaundice, scurvy, calculus, and several chronic skin diseases. During its exhibition the urine becomes at first neutral, and then alkaline, owing to the salt being converted into carbonate of potassa in the system. *Dose.* As a diaphoretic and antiscorbutic, 15 to 20 gr.; as a diuretic, 20 to 60 gr.; as an aperient, 2 to 3 dr.; in each case dissolved in some bland liquid, or in the infusion of some mild vegetable bitter.

POTASSA (Antimoniate of). See *Diaphoretic Antimony.*

POTASSA (Arseniate of). Syn. *Neutral Arseniate of Potash; Potassæ Arsenias,*—Lat. From solutions of *arsenic acid* and *potassa*, in equivalent proportions; or by saturating the *excess* of acid in the *binarseniate* with *potassa*. Uncrystallizable. (See *below.*)

POTASSA (Binarseniate). Syn. *Superarseniate of Potash; Arsenicated Kali, Macqueer's Neutral Arsenical Salt; Potassæ Binarsenias; Kali Arsenias,*—Ph. D. 1806. *Prep.* Take of *arsenious acid* (white arsenic) and *nitrate of potassa*, of each, in powder, 1 part; heat the mixture to dull redness in a glass flask, until it fuses, and red vapours cease to be evolved; dissolve the residuum, when cold, in *boiling distilled water*, 50 parts; concentrate the solution by evaporation, and set it aside to crystallize.

Prop., &c. This salt forms large crystals, which are permanent in dry air, soluble in about 4½ parts of water, and insoluble in alcohol. It is reputed tonic, alterative, and antiperiodic. *Dose.* $\frac{1}{16}$ to $\frac{1}{8}$ gr., dissolved in sweetened water. It is also used to form a resist-paste in calico-printing, and in the manufacture of cobalt blue.

Obs. Binarseniate of potassa is now made on a very extensive scale in Saxony. It forms the *arseniate of potash* of commerce, and the *potassæ arsenias* employed in medicine. The *arseniates of lime* and *magnesia* are prepared in a similar manner.

POTASSA (Arsenite of). Syn. *Potassæ Arsenitis,*—Lat. This is formed by boiling *hydrated potassa*, or its *carbonate*, with *arsenious acid*, in atomic proportions. It is a very soluble and scarcely crystallizable compound. It forms the basis of *Dr. Fowler's Solution*, and the *Liquor Arsenicalis* of the Pharmacopœias.

POTASSA (Benzoate of). Syn. *Potassæ Benzoas,*—Lat. Very soluble, and somewhat difficult to crystallize. See *Benzoates.*

POTASSA (Borate of). Syn. *Boraxated Kali; Potassæ Boras,*—Lat. *Prep.* From *dry carbonate of potassa* and *dry boracic acid*, equal parts, reduced to powder, and heated to redness in a covered crucible; the sublimed mass, when cold, being dissolved in boiling water, and the filtered solution concentrated by evaporation, and then set aside to crystallize; or at once completely evaporated to dryness. *Dose.* 1 to 6 gr.; in calculi, &c.

POTASSA (Boro-tartrate of). Syn. *Soluble Cream of Tartar; Crème de Tartre Soluble,*—Fr. *Potassæ Boro-tartras, Cremor Tartari Solubilis,*—Lat. *Prep.* (P. Cod.) *Crystallized boracic acid*, 1 part; *bitartrate of potassa*, 4 parts; *water*, 24 parts; dissolve by the aid of heat, in a silver basin, and, constantly stirring, evaporate the resulting solution, either to dryness, and then powder it, or merely to a syrupy consistence, when it may be spread upon plates, and dried in scales, by the heat of a stove. It must afterwards be preserved from the air.

Prop., &c. A white, deliquescent powder, freely soluble in water. It has been *used* as a solvent for lithic calculi, and in gout, &c. *Dose.* 15 to 30 gr. In doses of 2 to 4 dr. it is laxative, and is very popular as such on the Continent. For another formula for *soluble tartar*, see *Boro-tartrate of Potassa and Soda.*

POTASSA (Carbonate of). Syn. *Potassæ Carbonas,*—Ph. L. E. & D. *Potassæ Subcarbonas,*—Ph. L. 1824, Ph. E. 1839, and Ph. D. 1807. *Kali Præparatum,*—Ph. L. 1788. *Sal Absinthii, Sal Tartari,*—Ph. L. 1746. *Subcarbonate of Potash, Salt of Tartar, Salt of Wormwood, Prepared Kali, Fixed Nitre, Mild Vegetable Alkali, &c.,*—Obs. var. Impure or crude carbonate of potassa is chiefly imported from America and Russia, and is obtained by

lixiviating *wood ashes*, and evaporating the solution to dryness. The mass is then transferred into iron pots, and is kept in a state of fusion for several hours, until it becomes quiescent, when the heat is withdrawn, and the whole is left to cool. It is next broken up and packed in air-tight barrels, and in this state constitutes the "*potashes*" or "*potash*" of commerce. *Another method* is to transfer the black salts, or product of the first evaporation, from the kettles to a large oven or furnace, so constructed that the flame is made to play over the alkaline mass, which is kept constantly stirred by means of an iron rod. The ignition is continued until the impurities are burned out, and the mass changes from a blackish tint to a dirty or bluish white. The whole is next allowed to cool, and is then broken into fragments, and packed in casks as before. It now constitutes "*pearlash*." (*Lixivus Cinis*,—Ph. D.) When either *potash* or *pearlash* is dissolved in *cold distilled water*, the solution depurated, filtered, and crystallized, or simply evaporated to dryness, it forms "*refined ashes*," or carbonate of potash sufficiently pure for most pharmaceutical and technical purposes. The *granulated carbonate of potash*, *salt of tartar*, or *prepared kali*, of the shops, is simply *refined ashes* which, during the evaporation, and more especially towards the conclusion of the desiccation, has been assiduously stirred, so that it may form small white granulations, instead of adhering together to form an amorphous solid mass. In this state it constitutes the ordinary *carbonate of potassa* of the Pharmacopœias.

Prep. 1. (*Potassæ Carbonas è Lixive Cinere*,—Ph. D.) *Pearlash*, 10 *lb.*; *distilled water* (cold), 1 gall.; macerate for a week, occasionally stirring the mixture, filter the (depurated) solution through calico, and having evaporated it nearly to dryness (in an iron vessel), reduce the heat, and stir constantly with an iron rod, until granular crystals are obtained, which are to be immediately enclosed in well-stopped bottles (or otherwise excluded from the air). The formula of the Ph. L. 1836, was similar, except in directing simple solution, instead of "digestion for a week." The corresponding preparation of the Ph. L. & E. is included in the Materia Medica.

2. (M. Meyer.) *Raw potash*, 10 parts, is dissolved in *cold water*, 6 parts, and the solution is allowed to remain for 24 hours in a *cool place*; it is then filtered, and somewhat concentrated by evaporation, crystallization being prevented by continually stirring the mass until the whole is nearly cold; it is next decanted into a strainer, and the mother-liquor (containing chloride of potassium and silicate of potassa) allowed to drip off; the residuum is evaporated to dryness at a gentle heat, and redissolved in an equal quantity of *cold distilled water*; the new solution, after filtration, is again evaporated to dryness. The *product* is *quite free* from sulphate of potassa, and is nearly free from both chloride of potassium and silicates.

3. *Pure Carbonate of Potassa*; *Potassæ Carbonas Purum*,—Ph. E. & D., and Ph. L. 1836.—*a.* (Ph. L. 1836.) From *bicarbonate of potassa*, in crystals, heated to redness in a crucible.

b. (Ph. E.) As the last. Or, more cheaply, by dissolving *bitartrate of potassa* in thirty parts of *boiling water*, separating and washing the crystals which form on cooling, heating them in a loosely-covered crucible to redness so long as fumes are discharged, breaking down the mass, and roasting it in an oven for two hours with occasional stirring; lixiviating the product with (cold) *distilled water*, filtering the solution thus obtained, evaporating it to dryness, granulating the salt towards the close by brisk agitation, and, lastly, heating the granular salt, thus obtained, nearly to redness. The *potassæ carbonas è tartari crystallis*, Ph. D. 1826, and the *potassæ subcarbonas purissimus*, Ph. E. 1817, were prepared in a nearly similar manner, the evaporation being ordered in a "vessel of silver."

c. (Ph. D.) *White bitartrate of potassa*, 2 *lb.*, is exposed to a red heat in an iron crucible, as before; the powdered calcined mass is boiled for 20 minutes in *water*, 1 quart, the solution filtered, and the filter washed with *water*, 1 pint, to which *sesquicarbonate of ammonia*, ½ *oz.*, has been added; the mixed and filtered liquors are evaporated to dryness, and a low red heat having been applied, the residuum is rapidly reduced to powder in a warm mortar, and at once enclosed in (dry and) well-stopped bottles.

d. From *nitre*, 4 parts; *charcoal*, 1 part (both in powder); the mixture being deflagrated by throwing it, in small portions at a time, into a red-hot crucible, which is then kept at a *bright red-heat* for a few minutes; the calcined mass is, lastly, dissolved in *water*, and the solution filtered and evaporated, as before. The *purity* of the *product* corresponds to that of the nitre employed in the process.

Prop. These are well known. It exhibits most of the properties of hydrate of potassa, but in a vastly less degree. It is very deliquescent, effervesces with acids, exhibits a

marked alkaline reaction with test paper, is insoluble in alcohol, but dissolves in less than its own weight of water; its affinity for the last being so great, that it takes it from alcoholic mixtures. (See *below.*)

Pur., &c. Carbonate of potassa frequently contains an undue quantity of water, as well as silicic acid, sulphates, and chlorides. The *first* may be detected by the loss of weight the salt suffers when heated; the *second*, by adding to it hydrochloric acid in excess, evaporating to dryness, and igniting the residuum, by which this contamination is rendered insoluble; the *third* and *fourth* may be detected by adding nitric acid in excess, and testing the liquid with nitrate of silver and chloride of barium. If the former produces a white precipitate, a *muriate* or *chloride* is present; and if the *latter* does the same, the contamination is a *sulphate*. Carbonate of potassa "deliquesces in the air, and is almost entirely dissolved by water; in an open vessel it spontaneously liquefies (forming the *oil of tartar; oleum tartari, o. t. deliquium* of the old chemists). It changes the colour of turmeric brown. Supersaturated with nitric acid, neither carbonate of soda nor chloride of barium throws down anything, and nitrate of silver very little. 100 gr. lose 16 gr. of water by a strong red heat; and the same weight loses 26·3 gr. of carbonic acid when placed in contact with dilute sulphuric acid." (Ph. L.) "*Pure carbonate of potassa* does not lose weight at a low red heat; and a solution supersaturated with pure nitric acid is precipitated either faintly or not at all by a solution of nitrate of baryta or of nitrate of silver. 100 gr. of the commercial salt does *not* lose *more* than 20 gr. on exposure to a red heat." (Ph. E.)

Estim. (See *Alkalimetry.*)

Ant. In excessive doses, carbonate of potassa acts as a corrosive poison. The *antidotes* are water soured with lemon juice or vinegar, or with citric or tartaric acid; followed by demulcents. See *Poisons, &c.*

Uses, &c. It possesses powerful alkaline and antiscorbutic properties, and is hence commonly exhibited as an antacid and alterative, in doses of 5 to 20 gr., in a similar manner to the bicarbonate. The *carbonate of commerce* is largely employed in the arts, in soap-making, dyeing, the manufacture of glass, &c.

Concluding Remarks. The high price of pearlash and potash has led, of late years, to the preparation of a carbonate of potash from the bisulphate or sulphate, by heating it in a reverberatory furnace with charcoal. A sulphuret is formed, which, by continuing the roasting, is converted into carbonate of potash, which is then purified by solution, defecation, and evaporation. (See *Carbonate of Soda.*) The "*Potasse d'Amérique,*" and "*Petit potasse bleu*" of our lively Continental neighbours, is said to be formed of *caustic soda* melted with *salt* and *lime*, and tinged with *oxide of copper.* This is sold to the Parisian laundresses for American potash, as they object to using soda. The potash of the shops in England is often mixed with a similar compound. The "*cendres gravelées*" of Burgundy, are incinerated *wine-lees.* The latter are peculiarly rich in potassa, and commonly yield about 16% of it.

POTASSA (Bicarbonate of). Syn. *Potassæ Bicarbonas,*—Ph. L. E. & D. *Potassæ Carbonas,*—Ph. L., 1824, and Ph. E., 1839. *Neutral Carbonate of Potash, Aerated Kali, A. Vegetable Alkali, Kali Aeratum, &c.*—Obs. This useful salt was first produced by Cartheuser, in 1752. The method which he adopted for this purpose is frequently employed, even at the present day.

Prep. 1. (Ph. L., 1836.) *Carbonate of potassa*, 6 lb; *distilled water*, 1 gall.; dissolve, and pass *carbonic acid gas* (from chalk and oil of vitriol diluted with water) through the solution to saturation; apply a *gentle* heat, so that whatever crystals have been formed may be dissolved; and set aside the solution, that crystals may again form; lastly, the liquid being poured off, dry them. In the present Ph. L. bicarbonate of potassa is placed in the Materia Medica.

2. (Ph. D.) *Carbonic acid*, obtained by the action of dilute *hydrochloric acid* on *chalk* (the latter contained in a perforated bottle immersed in a vessel containing the acid), is passed, by means of glass tubes connected by vulcanized Indian rubber, to the bottom of a bottle containing a solution of carbonate of potassa, 1 part, in water, 2½ parts; as soon as the air is expelled from the apparatus, the corks through which the tubes pass are rendered air-tight, and the process left to itself for a week; the crystals, thus obtained, are then shaken with twice their bulk of *cold water*, drained, and dried on bibulous paper, by simple exposure to the air. From the *mother-liquor*, filtered, and concentrated to one-half, at a heat not exceeding 110° Fahr., more crystals may be obtained. "The tube immersed in the solution of carbonate of potassa will have to be occasionally cleared of the crystals with which it is liable to become choked, else the process will be suspended."

3. (*Apothecaries' Hall*, London.) *Carbonate of potassa*, 100 *lb.; distilled water*, 17 gall.; dissolve, and saturate the solution

with *carbonic acid gas*, as in No. 1, when 35 to 40 *lb.* of *crystals* of *bicarbonate of potassa* may be obtained; next dissolve, of *carbonate of potassa*, 50 *lb.*, in the *mother-liquor*, and add enough *water* to make the whole a second time equal to 17 gall.; the remaining part of the operation is then to be performed as before. This plan may be repeated *again* and *again*, for some time, provided the carbonate used is sufficiently pure.

4. (Ph. E.; *Cartheuser's Process.*) Take of *carbonate of potassa*, 6 oz.; *carbonate* (sesquicarbonate) *of ammonia*, 3½ oz.; triturate them together, and when reduced to a very fine powder, and perfectly mixed, make them into a stiff paste with a very little *water;* dry this, very carefully, at a heat not *higher* than 140° Fahr., until a fine powder, *perfectly devoid of ammoniacal odour*, be obtained, occasionally triturating the mass towards the end of the process.

5. (MM. Henry and Guibourt.) To *carbonate of potassa*, 5 parts; dissolved in *water*, 10 parts; contained in a porcelain capsule set in a salt-water bath, add gradually of *sesquicarbonate of ammonia*, 3 parts; slightly agitate the liquor until ammoniacal fumes are perceived, then filter over a heated vessel, and set it aside to crystallize. The proportions recommended by Geiger are, of *carbonate of potassa*, 2 parts; *sesquicarbonate of ammonia*, 3 parts. The ammonia process (Nos. 4 or 5) answer well on the *small scale*. On the *large scale* the fumes of ammonia may be recondensed or collected, and again usefully employed.

6. (M. Behrens.) *Acetic acid* is gradually and cautiously added to a *strong solution* of *carbonate of potassa*, in the cold, as long as a precipitate forms; *bicarbonate of potassa* is precipitated, and is drained on a filter, strongly pressed in linen, washed with *ice-cold water*, and dried. The decanted liquor is a solution of pure *acetate of potassa*, and yields that salt on evaporation. An excellent process on the *small scale*.

7. (*Commercial.*) From *carbonate of potassa*, in powder, made into a paste with *water*, and exposed for some time on shallow trays, in a chamber filled with an atmosphere of *carbonic acid gas*, generated by the combustion of either coke or charcoal, and purified by being forced through a cistern of cold water; the resulting salt is next dissolved in the least possible quantity of water at the temperature of 120° Fahr., and the solution filtered and crystallized.

Prop. It is soluble in 4 times its weight of water at 60° Fahr.; is fixed in the air, but loses carbonic acid below the temperature of boiling water, and is wholly decomposed into a carbonate at a red heat. It possesses the general alkaline properties of carbonate of potassa, but in an inferior degree, having only a slightly alkaline taste, and, when absolutely pure, not affecting the colour of turmeric.

Pur. In a solution of pure bicarbonate of potassa a solution of corrosive sublimate merely causes an opalescence, or very slight white precipitate; if it contains carbonate of potassa a brick-coloured precipitate is thrown down. "Crystals." "From 100 gr. of this salt, 30·7 gr. of water and carbonic acid are expelled at a red heat." (Ph. L.) In other respects it may be tested like the carbonate (which see).

Uses, &c. Bicarbonate of potassa is the most agreeable of all the salts of potassa, and is much used as an antacid or absorbent, and for making effervescing saline draughts. It has also been successfully employed in rheumatism, scurvy, gout, dyspepsia, and various other diseases in which the use of potash is indicated. The *dose* is from 10 gr. to ½ dr.

20 gr. *bicarbonate of potassa*, in crystals,

are equivalent to

14 gr. of *crystallized citric acid;*
15 gr. „ *tartaric acid;* and
½ *oz.* of *lemon juice.*

POTASSA (Chlorate of). Syn. *Potassæ Chloras*,—Ph. L. & D. *Oxymuriate of Potash*, *Hyperoxymuriate of do.*, *Potassæ Oxymurias*, *Kali Fulmineum*,—Obs. var. *Prep.* 1. *Chlorine gas* is conducted by a wide tube into a *moderately strong* and *warm solution* of *caustic potassa* or *carbonate of potassa*, until the absorption of the gas ceases, and the alkali is completely neutralized; the liquid is then kept at the boiling temperature for a few minutes, after which it is gently evaporated (if necessary) until a pellicle forms on the surface, and is next set aside, so as to cool very slowly; the crystals, thus obtained, are drained and carefully washed on a filter, with *ice-cold water*, and are purified by re-solution, and re-crystallization. The *product* is pure *chlorate of potassa*. The *mother-liquor*, which contains much *chloride of potassium* mixed with some *chlorate*, is either evaporated for more crystals (which are, however, less pure than the first crop), or is preserved for a future operation.

Obs. The *product* of the above process is small, varying from 10 to 45% of the weight of the potash consumed in it, according to the skill with which it is conducted; this

apparent loss of potash arises from a large portion of it being converted into *muriate of potassa* or *chloride of potassium*, a salt of comparatively little value. The following processes have been devised principally with the view of preventing this waste, or of employing a cheaper salt of potassa than the carbonate:—

2. (M. Gay-Lussac.) A *solution of chloride of lime* is precipitated with a *solution of carbonate of potassa*, and the liquid, after filtration, saturated with *chlorine gas*; it is then evaporated and crystallized as before. Dr. Ure has suggested the substitution of *sulphate of potash*, for the carbonate, by which the process would be rendered very inexpensive.

3. (Prof. Graham.) *Carbonate of potassa*, 1 equiv. (= 69 parts of the *dry*, or 82 parts of the *granulated* carbonate); *hydrate of lime*, 1 equiv. (= 37 parts of dry fresh slaked lime); both in powder; are mixed together, and exposed to the action of *chlorine gas*, to saturation; (the *gas* is absorbed with great rapidity, the temperature rises above 212° Fahr., and water is freely evolved;) the heat, with free exposure, is then maintained at 212° for a few minutes (to remove some trace of hypochlorite), the residuum, consisting of chlorate of potassa, and chloride of potassium, is treated with hot water, and the *chlorate of potassa* crystallized out of the resulting solution, as before. This process, which is an excellent one (the loss of potash being for the most part avoided), has been modified and improved by various authorities, as will be seen below.

4. (Prof. Juche.) *Dry* and *fresh hydrate of lime* and *carbonate of potassa*, of each, 1 part; are mixed with *water*, 8 parts; and *chlorine* passed through the mixture, to saturation; the *chlorate* is then obtained from the filtered liquid, as before.

5. (Prof. Liebig.) *Chloride of lime* is kept heated with a *little water*, until it ceases to effect vegetable colours; it is then dissolved in *hot water*, and to the solution, concentrated (if necessary) by evaporation, a *strong solution* of *chloride of potassium* is added, and the liquid filtered; crystals of *chlorate of potassa* are deposited as the solution cools. Chloride of lime utterly worthless for other purposes may be used in this process. "12 *oz.*, containing fully 65% of insoluble matter, yielded 1 *oz.* of the chlorate." (See No. 8.)

6. (M. Romer.) *Carbonate of potassa* is placed on shelves or trays in an air-tight chamber, which is then filled with an atmosphere of *chlorine gas* (generated in the usual manner), the supply being maintained for 15 or 18 consecutive hours; after which the apparatus is opened, and the *newly-formed chlorate* freed from chloride or muriate by solution and crystallization.

7. (M. Vée.) A *solution* of *chloride of lime* (18 to 20° Baumé) is heated in a *leaden* or *cast-iron vessel*, and sufficient *chloride of potassium* added to raise the density of the liquid 3 or 4 hydrometer degrees; the solution is then quickly, but carefully, concentrated until the gravity rises to 30° or 31° Baumé, when it is set aside to crystallize. A good and economical process.

8. (Dr. Wagenmann.) *Chloride af potassium*, 1 equiv. (= 76 parts), and *fresh hydrate of lime*, 6 equiv. (= 222 parts), are reduced to a thin paste with *water*, q. s., and a stream of *chlorine gas* passed through the mixture, to saturation; *chloride of calcium* and *chlorate of potash* are formed; the last is then removed by solution in *boiling water*, and is crystallized, as before. — *Obs.* This process has received the approval and recommendation of Liebig. It has long been practised in Germany, and was originally introduced to this country by Dr. Wagenmann. (Vide Buchner's *Repert.*) The *product* is very large, and of excellent quality.

9. As the last, but substituting 1 equiv. or 56 parts of *hydrate of potassa*, for the chloride, and heating the mixture to 125° Fahr. before exposing it to the *stream of chlorine*, which should be rapid, and plentiful. The *product*, under skilful management, varies from 210 to 225% of the weight of pure potassa operated on.

Prop. White, inodorous, four and six-sided pearly scales, soluble in about 20 parts of cold, and 2½ parts of boiling water; in taste it resembles nitre, but is somewhat more austere; at about 450° Fahr. it undergoes the igneous fusion, and on increasing the heat *almost* to redness, effervescence ensues, and fully 39% of *pure oxygen gas* is given off, whilst the salt becomes changed into chloride of potassium. When mixed with inflammable substances, and triturated, heated, or subjected to a smart blow or strong pressure, or moistened with a strong acid, it explodes with terrific violence. (See *below.*)

Pur., Tests, &c. The usual impurity of this salt is chloride of potassium, arising from careless or imperfect manipulation. When this is present, a solution of nitrate of silver, gives a curdy white precipitate soluble in liquor of ammonia; whereas a

solution of the pure chlorate remains clear. (See *Potassa* and *Chlorate.*)

Uses. Chlorate of potassa is principally used in the manufacture of fireworks, oxygen gas, lucifer matches, &c. It was formerly used to fill percussion caps, but was abandoned for fulminating mercury, on account of its disposition to rust the nipples of the guns. As a *medicine* it is stimulant and diuretic. It has been given in dropsy, syphilis, scurvy, cholera, typhus, and other depressing affections. It gives a fine arterial colour to the blood. (Stevens.) *Dose.* 5 to 15 grs., in solution, twice or thrice daily.

Concluding Remarks. Formerly chlorate of potassa was a salt which was made only on the small scale, and chiefly used in experimental chemistry; now it is in considerable demand, and forms an important article of chemical manufacture. The latter has hence, of late years, received considerable attention and improvement in the leading laboratories of Europe. In many chemical books a variety of experiments illustrative of the extraordinary powers of this substance are given, as objects of amusement, for the juvenile reader; but we implore such parties not to meddle with such dangerous matters, without necessity or duty urges them to do so. We have been witnesses of the awful consequences of such folly and temerity. Even the wary and experienced are not unfrequently sufferers from the dangerous nature of this, and like explosive compounds. The late talented Mr. Hennel, of Apothecaries' Hall, was literally *blown into fragments* whilst preparing fulminate of mercury for the East India Company; and, more recently, Mr. Callow, of the firm of Melville and Callow, lost the fingers of his right hand, from an unforeseen explosion of some of his own celebrated '*blasting powder*,' whilst he was explaining its properties to a visitor. Numerous other similar accidents might be referred to. Chlorate of potassa should not, therefore, be kept in admixture with any inflammable substance, more especially with sulphur, phosphorus, or the sulphurets; as these compounds are exploded by the most trivial causes, and, not unfrequently, explode spontaneously.

POTASSA (Chromate of). Syn. *Neutral Chromate of Potash, Yellow do., Salt of Chrome; Potassæ Chromas, P. C. Flava,* —Lat. This salt is only prepared on the large scale. Its source is *chrome ore*, a natural octahedral chromate of iron, found in various parts of Europe and America. For *medicinal purposes* the commercial chromate is purified by solution in hot water, filtration, and re-crystallization.

Prep. 1. The *ore*, previously assayed to determine its richness, and freed as much as possible from its gangue, is ground to powder in a mill, and mixed with a quantity of *coarsely powdered nitre* rather less than that of the oxide of chromium which it contains; this mixture is exposed, for several hours, to a powerful heat on the hearth of a *reverberatory furnace*, during which time it is frequently stirred up with iron rods; the calcined mass is next raked out, and lixiviated with *hot water*, and the resulting yellow-coloured solution evaporated briskly over a *naked fire*, or by the heat of *high pressure steam; chromate of potash* falls under the form of a *granular yellow salt*, which is removed from time to time with a ladle, and thrown into a wooden vessel, furnished with a bottom full of holes (*draining box*), where it is left to drain and dry. In this state it forms the *chromate of potash* of *commerce.* By a second solution, and re-crystallization, it may be obtained in large and regular crystals. The next process has for its object the employment of a cheaper salt of potassa than the nitrate.

2. (Swindell & Co.) A mixture of *pulverized chrome ore* and *chloride of potassium* is exposed to a full red heat, on the hearth of a reverberatory furnace, with occasional stirring for some time, when *steam* at a *very elevated temperature* is made to act on it, until the conversion is complete, known by assaying a portion of the mass; the *chromate of potassa* is then dissolved out of the residuum, as before. *Common salt* or *hydrate of lime* may be substituted for chloride of potassium, when the *chromates of soda* or *lime* are respectively produced. *Patent* dated Nov., 1850.

3. (Chas. Watt, jun.) By the calcination, in the usual manner, of a *mixture* of *chrome ore, sulphate of potassa,* and *freshly slaked lime*, until a portion of the mass, digested in an excess of *dilute nitric acid*, yields a solution which only gives a "slight milkiness," and not a plentiful heavy white precipitate, on the addition of *solution of chloride of barium;* the calcined mass is then treated as before. A cheap, simple, and excellent process.

Prop. Yellow; tastes cool, bitter, and disagreeable; soluble in 2 parts of water at 60° Fahr.; the crystals are efflorescent.

Pur. The salt of commerce is frequently contaminated with large quantities of sulphate or muriate of potash, or both of them. To detect these, M. Zuber adds *tartaric*

acid, dissolved in 50 parts of *water*, to a like solution of the sample. As soon as the decomposition is complete, and the colour verges towards the green, the supernatant liquor should afford no precipitate with solutions of the *nitrates of silver* and *baryta;* whence the *absence* of *muriates* (chlorides) and *sulphates* may be respectively inferred. The proportions are, 8 parts of *tartaric acid* to 1 part of the *chromate*. If saltpetre is the adulterating ingredient, the sample deflagrates when thrown upon burning coals.

Assay. 1. A solution of 50 gr. of the salt is treated with a *solution* of *nitrate of baryta*, the precipitate, digested in *nitric acid*, and the insoluble portion (*sulphate of baryta*) washed, dried, and weighed. 117 gr. of this substance are equivalent to 88 gr. of SULPHATE OF POTASH.

2. The *nitric solution*, with the *washings* (see *above*), is treated with a *solution* of *nitrate of the silver*, and the precipitate of *chloride of silver* carefully collected, washed, dried, ignited, and weighed. 144 gr. of *chloride of silver* represent 76 gr. of CHLORIDE OF POTASSIUM or MURIATE OF POTASH.

3. The *nitric solution* with the washings (see *above*), after having any remaining baryta thrown down by adding *dilute sulphuric acid*, in slight excess, is treated with *liquor of ammonia*, and the resulting precipitate of *oxide of chromium*, collected on a filter, washed, dried, carefully ignited in a silver, platinum, or porcelain crucible, and weighed. 40 gr. of *this oxide* represent 100 gr. of pure CHROMATE OF POTASSA. Any deficiency consists of impurities or adulterants.

Uses. Chromate of potash is used in dyeing, bleaching, the manufacture of chromic acid, bichromate of potash, &c. It is the common source of nearly all the other compounds of chromium. It is reputed *alterative* in doses of $\frac{1}{12}$ to $\frac{1}{2}$ gr.; and is *emetic* in *doses* of 1 to 4 gr. A solution in 8 parts of water is occasionally used to destroy fungus; one in 30 to 40 parts of water is also used as an antiseptic and desiccant.

Concluding Remarks. The first process is undoubtedly the best, when expense is not an object. To reduce this, a mixture of *potash* or *pearlash* with about $\frac{1}{2}$ of its weight of *nitre*, or 1-5th part of its weight of *peroxide of manganese*, may be substituted, without much inconvenience. The *assay* of the *chrome ore*, alluded to above, may be made by reducing 100 gr. of it to powder, mixing it with twice its weight of *powdered nitre*, and a little *hydrate of lime*, and subjecting the mixture to a strong red heat for 3 or 4 hours; the calcined mass may then be exhausted with *boiling water*, and the resulting solution, after precipitation with *dilute sulphuric acid*, in slight excess, and filtration, may be treated with *rectified spirit*, when its *oxide of chromium* may be thrown down by the addition of *liquor of ammonia*. (See *above*.) In the *conversion* of *chrome ore* into *chromate of potash*, care should, in all cases, be taken, that the proportion of nitre or alkali should be *slightly less*, than what is absolutely required to saturate the ore, as the production of a neutral salt is thereby ensured; for should not the whole of the chromate of iron be decomposed by the first calcination, it may easily be roasted a second time with fresh alkali, should the remaining quantity be thought worth the trouble. The *nature* of the *furnace* to be employed in the conversion, is not of any great importance, so long as carbonaceous matters from the fire are entirely excluded, and the required temperature is attainable.

POTASSA (Bichromate of). Syn. *Red Chromate of Potash; Potassæ Bichromas*, —Lat. *Prep.* To a *concentrated solution* of *yellow chromate of potash*, *sulphuric acid*, or better, *acetic acid*, is added in quantity equal to one-half that required for the entire decomposition of the salt; the liquid is then concentrated by evaporation, and slowly cooled, so that crystals may form.

Prop., &c. It forms very beautiful, square tables, or flat four-sided prismatic crystals; permanent in the air; soluble in 10 parts of water at 60°, and in less than 3 parts, at 212° Fahr.; it has a metallic, bitter taste, and is *poisonous*. It is chiefly used in dyeing and bleaching, and as a source of chromic acid. The *tests*, *&c.*, are the same as for the yellow chromate.

POTASSA (Citrate of). Syn. *Potassæ Citras*,—Ph. U. S. From a *solution of citric acid* neutralized with *carbonate of potassa*, evaporated, and granulated, or crystallized; very deliquescent. Or, *extemporaneously*, in the form of solution, by adding *carbonate* or *bicarbonate of potassa* to *lemon juice*, as in the common effervescing draught. The preparation sold under the names of "*Citrate of potash*," "*Lemon and Kali*," "*Acidulated Kali*," "*Lemoniated Kali*," &c., in the shops is a spurious compound made as follows:—

1. *Sesquicarbonate of soda* and *tartaric acid*, of each, 5 *oz.; lump sugar*, 1 *lb.;* all in the state of fine powder, and separately dried by a very gentle heat, after which they are mixed together, flavoured with

essence of lemon, 1 dr., rubbed through a gauze sieve in a warm dry situation, put into bottles, and corked down immediately.

2. Finely-powdered white sugar, 16 *lb.*; *tartaric acid*, 4¼ *lb.*; *sesquicarbonate of soda*, 4 *lb.*; *essence of lemon*, 1 *oz.*; as the last. Keeps well. A dessert-spoonful of either thrown into a glassful of water makes a pleasant effervescing draught.

POTASSA (Cyanate of). Syn. *Potassæ Cyanas*,—Lat. *Prep.* 1. By roasting, at a red heat, dry *ferrocyanide of potassium* in fine powder, upon an iron plate, constantly stirring it until it becomes fused into one mass, which must be reduced to fine powder, and digested in *boiling alcohol*, from which crystals of the cyanate will be deposited as the solution cools.

2. (Liebig.) A *mixture* of *ferrocyanide of potassium*, with half its weight of *peroxide of manganese*, may also be used to produce this salt, as the last; the compound should be kindled by a red hot body, and allowed to smoulder away, after which it may be treated with alcohol as before.

Obs. This salt is poisonous. The *cyanates* of *silver*, *lead*, and many other metals, may be made by adding a solution of *cyanate of potassa* to another of a *neutral salt of the base*.

POTASSA (Ferro-prussiate of). See *Ferrocyanide of Potassium*.

POTASSA (Hydrate of). Syn. *Pure Potassa, Caustic do., Hydrated Oxide of Potassium; Potassa*,—Ph. E. *P. Caustica*,—Ph. D. *P. Hydras*,—Ph. L. *P. Fusa*,—Ph. L. 1824. *Kali Purum*,—Ph. L. 1788. *K. Causticum*,—Ph. D. 1807. *Kali Hydras, Cauterium Potentiale, Lapis Alkalinus, L. Causticus, L. Infernalis, L. Septicus*,—Obs. var. *Prep.* 1. (Ph. L.) *Liquor of potassa*, 1 gall.; evaporate the water in a *clean iron vessel* over the fire until the ebullition being finished, the residuum of *hydrate of potassa* liquefies; pour this into proper moulds.

2. (Ph. E. & D.) As the last, but pouring the *fused hydrate* upon a bright and clean iron plate (*silver* or *iron dish*,—Ph. D.); "as soon as it solidifies break it quickly (into fragments), and put it into stoppered glass (*green-glass*,—Ph. D.) bottles."

3. (*Pure.*) The *hydrate*, obtained as above, is dissolved in *alcohol* or *rectified spirit*, and after repose for a few days in a closely-stopped green-glass or silver vessel, the solution is decanted, and cautiously evaporated in a deep silver basin, out of contact with the air.

Prop., &c. When perfectly pure, it is white, solid, very soluble in water, and in alcohol; very deliquescent; intensely acrid and corrosive; and exhibiting the usual signs of alkalinity in the highest degree. That of the shops has usually a grayish or bluish colour. "Boiling water commonly leaves oxide of iron undissolved, which should not exceed 1·25%." (Ph. E.) "It should be totally soluble in rectified spirit." (Ph. L.) Its dilute solution should be scarcely affected by the nitrates of baryta and silver. It is chiefly used as a caustic, and in chemistry. See *Solution* or *Liquor of Potassa*.

POTASSA (Hydriodate of). See *Iodide of Potassium*.

POTASSA (Hydrobromate of). See *Bromide of Potassium*.

POTASSA (Hydrocyanate of). See *Cyanide of Potassium*.

POTASSA (Hypochlorite of). See *Solutions*.

POTASSA (Iodate of). Syn. *Potassæ Iodas*,—Lat. *Prep.* 1. Neutralize a *hot solution* of *potassa* with *iodine*, evaporate to dryness by a gentle heat, powder the residuum, and digest it in *alcohol*, to remove iodide of potassium; dissolve the insoluble portion in *hot water*, and crystallize.

Obs. Iodate of potassa is resolved at a red heat into oxygen gas and iodide of potassium. It has been recommended in bronchocele. *Dose.* 1 to 5 gr. *Biniodate* and *teriodate of potassa* have also been formed, but possess little interest.

POTASSA (Muriate of). See *Chloride of Potassium*.

POTASSA (Nitrate of). Syn. *Nitre, Saltpetre; Potassæ Nitras*,—Ph. L. E. & D. *Nitrum, Sal Nitri, Sal Petræ, Kali Nitratum*,—Obs. var. This salt is spontaneously generated in the soil, owing to the action of the atmosphere, and crystallizes upon its surface, in various parts of the world, especially in the East Indies. It is also found in the horse-radish, nettle, sunflower, and several other plants. On the Continent it has long been produced artificially, by exposing a *mixture* of *calcareous soil* and *animal matter* to the atmosphere, when *nitrate of lime* is slowly formed, and is extracted by lixiviation. The liquid is then decomposed by the addition of *wood ashes*, or *carbonate of potash*, by which carbonate of lime is precipitated, and *nitrate of potash* remains in solution. The places where these operations are performed are called "*nitriaries*," or "*nitrières artificielles*." The British market is wholly supplied from India. The salt of the first crystallization, by either process, is called *crude nitre* or *rough saltpetre*. This is *purified* by solution in *boiling water*, skim-

ming, and after a short time allowed for defecation, straining (while still hot,) into *wooden* crystallizing vessels. The crystals thus obtained are called "*single refined nitre*;" and when the process is repeated, "*double refined nitre.*"

For *medicinal use*, nitre is purified as follows:—

1. (*Potassæ Nitras Purum*,—Ph. D.) *Commercial nitre*, 4 *lb.*: *boiling distilled water*, 1 quart; dissolve, withdraw the heat, and stir the solution constantly as it cools; the minute crystals, thus obtained, are to be drained, and washed in a glass or earthenware percolator, with *cold distilled water*, until that which trickles through ceases to give a precipitate with a solution of nitrate of silver; the contents of the percolator are then to be withdrawn, and dried in an oven.

2. (*P. N. Depuratum*,—Ph. Hann. N. 1831.) Dissolve *commercial nitre* in twice its weight of *water*, add a *solution of carbonate of potassa* as long as a precipitate forms, filter the liquid, evaporate, and crystallize. The *potassæ nitras purificata* of the old pharmacopœias was prepared in a similar manner, but without the addition of the carbonate.

Prop. White, pellucid, six-sided prisms; permanent in the air; soluble in 7 parts of water at 60°, and in 1 part at 212° Fahr.; insoluble in alcohol; its taste is cool, saline, and slightly bitter and pungent; at about 560° it fuses to an oily-looking mass, which concretes, on cooling, forming "*sal prunella*;" at a red heat it gives out oxygen, and afterwards, nitrous fumes; sp. gr. 1·925 to 1·975.

Pur. Commercial nitre generally contains *chlorides*, *sulphates*, or *calcareous salts*. The *first* may be detected by its solution giving a cloudy white precipitate with nitrate of silver,—the *second*, by chloride of calcium or barium giving a white precipitate,—and the *third*, by oxalate of ammonia, which also gives a white precipitate. "Crystals." "From 100 gr., digested in sulphuric acid, are prepared 86 gr. of sulphate of potassa, dried at a red heat." (Ph. L.)

Assay. Of the numerous methods prescribed for this purpose, few are sufficiently simple for mere practical men. The proportion of *chlorides*, *sulphates*, and *calcareous salts*, may be determined, as above; and the general richness of the sample by the method of M. Gay-Lussac, modified as follows:—100 gr. of the *sample* (fairly chosen) are triturated with 50 gr. of *lamp black*, and 400 gr. of *common salt*, and the mixture placed in an *iron ladle*, and ignited or fused therein, due care being taken to prevent loss; the residuum is exhausted with *hot water*, and the solution thus obtained tested by the usual methods of *alkalimetry* for carbonate of potash. The quantity of *carbonate of potassa* found, multiplied by 2·125 or $2\frac{1}{8}$, gives the per centage richness of the sample in NITRATE OF POTASSA.

Uses, &c. Nitre is chiefly employed in the manufacture of gunpowder, fireworks, and nitric acid. It is also used in medicine as a sedative, refrigerant, and diaphoretic, and as a cooling diuretic. It has been recommended in active hæmorrhages (especially spitting of blood), in various febrile affections, in scurvy, and in herpetic eruptions; and it has been highly extolled, by Dr. Basham, as a remedy in acute rheumatism. *Dose.* 5 to 15 grs. every 2 hours. A small piece, dissolved slowly in the mouth, frequently stops a sore throat at the commencement. In *large doses*, it is *poisonous*. The best *treatment* is a powerful emetic, followed by opiates. See *Sal Prunella.*

POTASSA (Nitrite of). Syn. *Hyponitrite of Potassa; Potassæ Nitris*,—Lat. *Prep.* 1. By heating *nitre* to redness, dissolving the fused mass in a *little water*, and adding twice the volume of the solution in *alcohol*; after a few hours the upper stratum of liquid is decanted, and the lower one, separated from the crystals, evaporated to dryness.

2. (Corenwinder.) *Nitric acid*, 10 parts, are poured on *starch*, 1 part, and the *evolved gas* passed through a *solution of caustic potassa* of the sp. gr. 1·380, to saturation; the liquid is then either neutralized with a little *liquor of potassa* (if necessary), and kept in the liquid form, or at once evaporated. *Used* as a test for iodine. See *Hyponitrous Acid.*

POTASSA (Oxalates of). *Prep.* 1. (*Oxalate of Potassa, Neutral do.; Potassæ Oxalas*,—Lat.) Neutralize a *solution of oxalic acid*, or the *acid oxalates of commerce*, with *carbonate of potassa*, evaporate, and crystallize. Transparent rhombic prisms, soluble in 3 parts of water.

2. (*Binoxalate of Potassa, Superoxalate of do., Salt of Sorrel, Essential Salt of Lemons; Potassæ Binoxalas, Sal Acetosellæ, Sal Limonis*,—Lat.) By saturating a *solution of oxalic acid*, 1 part, with *carbonate of potash*, adding to the mixture a *similar solution of* 1 part of *oxalic acid* unneutralized, and evaporating for crystals. It may also be obtained from the *expressed juice* of *wood* or *sheep's sorrel*, by clarifying it with *eggs* or *milk*, and evaporating, &c., as before. Colourless rhombic crystals, soluble in 40

parts of cold, and 6 parts of boiling water, yielding a very sour solution.

3. (*Quadroxalate of Potassa; Potassæ Quadroxalas*,—Lat.) Prepared by *neutralizing* 1 part of *oxalic acid* with *carbonate of potassa*, adding to the solution 3 parts more of *oxalic acid*, evaporating, and crystallizing. Or, by dissolving the *binoxalate* in *dilute hydrochloric acid*, and evaporating, &c., as before. Resembles the last; but is less soluble, and more intensely sour, and forms modified octahedral crystals. This salt, like the binoxalate, is occasionally sold under the names of *Sal Acetosellæ*, *Salt of Sorrel*, and *Essential Salt of Lemons*. Both are used to remove ink and iron stains from linen, to bleach the straw used for making bonnets, and, occasionally, in medicine, as a refrigerant.

Obs. When *pure*, each of the above salts, when strongly heated, emits white acid fumes, without being charred, and yields nothing but carbonate of potassa, under the form of a grayish-white mass. If it contains cream of tartar, it is rapidly charred, and emits the peculiar odour of burning bread. All the oxalates of potash are *poisonous*. See *Oxalic Acid*.

POTASSA (Perchlorate of). Syn. *Potassæ Perchloras*,—Lat. Prepared by adding well-dried and finely-powdered *chlorate of potassa*, in small portions at a time, to an equal weight of *concentrated sulphuric acid*, gently warmed in an open vessel; the bisulphate of potassa formed is washed off with a *little cold water*, and the residuum (*perchlorate of potassa*) dissolved in boiling water, and crystallized. See *Perchlorate*, and *Perchloric Acid*.

POTASSA (Prussiate of). See *Ferridcyanide* and *Ferrocyanide of Potassium*.

POTASSA (Silicate of). Syn. *Potassæ Silicas*,—Lat. See *Soluble Glass* (p. 529).

POTASSA (Stannate of). See *Stannates*, and *Tin Mordants*.

POTASSA (Sulphate of). Syn. *Potassæ Sulphas*,—Ph. L. E. & D. *Kali Vitrolatum*,—Ph. L. 1788. *Nitrum V.*,—Ph. L. 1746. *Tartarum V.*,—Ph. L. 1721. *Polychrest Salt*, *Sal Polychrest*, *S. Polychrestus*, *S. de Duobus*, *Nitrum Fixum*, *Arcanum Duplicatum*, *Specificum Purgans Paracelsi*,—Obs. var. This salt is now placed in the Materia Medica of the Ph. L. That of *commerce* is a secondary product of several chemical and manufacturing processes. Thus, the *residuum* of the distillation of *nitric acid from nitre* is dissolved in water, the solution neutralized with *carbonate of potash* (with *quick-lime*,—Ph. D.; with *marble*,—Ph. E.), and, after defecation, evaporated until a pellicle forms; it is then strained, or decanted, and set aside to crystallize. Or, the *residuum* is simply ignited, to expel excess of acid, and then dissolved, and crystallized, as before.

Prop., &c. Anhydrous, heavy, quartz-like crystals; permanent in the air; soluble in 12 parts of water at 60°, and in 5 parts at 212° Fahr.; insoluble in alcohol; extremely nauseous, and bitter-tasted. "It crepitates on the application of heat; fuses at a red heat, but loses nothing in weight. 100 gr., dissolved in distilled water, on the addition of chloride of barium and hydrochloric acid, furnish 132 gr. of sulphate of baryta, dried at a red heat." (Ph. L.)

Uses, &c. It is cathartic, and is reputed deobstruent. *Dose.* 10 gr. to 1 dr.; in jaundice, dyspepsia, and (in proportionate doses) in the visceral obstructions of children. It is usually given in powder, combined with rhubarb or jalap, and some aromatic.

POTASSA (Sulphate of,—with Sulphur). Syn. *Potassæ Sulphas cum Sulphure*,—Ph. E. *Glaser's Polychrest Salt*, *Sal Polychrestum Glaseri*,—Obs. *Prep.* (Ph. E.) *Nitrate of potassa* and *sulphur*, equal parts; mix them thoroughly, and throw the mixture, in small successive portions, into a red-hot crucible; when the deflagration is over, and the salt has cooled, reduce it to powder, and preserve it from the air.

Obs. This is the original *sal polychrest* of the older chemists, afterwards supplanted by the common sulphate. Glaser orders the deflagrated mass to be kept in a state of fusion for some time, then to be cooled, dissolved in water, and the filtered solution evaporated for crystals. It appears to be a mixture of sulphate, bisulphate, and sulphite of potassa. The *uses* and doses are similar to those of sulphate of potash.

POTASSA (Bisulphate of). Syn. *Supersulphate of Potash: Potassæ Bisulphas*,—Ph. E. & D., and Ph. L. 1836. *P. Supersulphas*,—Ph. L. 1824. *Acid Vitriolated Tartar*, *Sal Enixum*, *S. Polychrestus Acidulatum*, *S. Auri Philosophicum*,—Obs. var. *Prep.* 1. *Sulphate of potassa* and *oil of vitriol*, equal parts; *hot water*, q. s. (not more) to dissolve; *anhydrous bisulphate of potassa* crystallizes out, in long delicate needles, as the solution cools. If these are left for several days in the mother-liquor they are redissolved, and crystals of the ordinary *hydrated bisulphate* are deposited.

2. (Ph. L. 1836.) *Salt left in distilling nitric acid* (sal enixum), 2 ℔; *boiling water*, 3 quarts; dissolve, add of *sulphuric acid*, 1 ℔; concentrate by evaporation, and set the liquid aside, so that crystals may form.

3. (Ph. D.) *Sulphate of potash* (in powder), 3 *oz.*; *sulphuric acid*, 1 fl. oz.; mix them in a *porcelain capsule*, and expose it to a heat capable of liquefying its contents, until acid vapours cease to be evolved; powder the residuum, and preserve it in a well-stopped bottle.

4. (Ph. D. 1826.) *Sulphuric acid*, 1 part; *water*, 6 parts; mix, and saturate with *carbonate of potash*, q. s.; then add 1 part more of *sulphuric acid*, and proceed as before.

Prop., &c. Sour and slightly bitter-tasted rhombic prisms; soluble in about 2 parts of cold, and 1 part of boiling water, the solution exhibiting a strongly acid reaction. It is much employed, in lieu of tartaric acid, for the production of carbonic acid, in "*gazogenes*," &c.; also to adulterate cream of tartar and tartaric acid. According to Dr. Paris, it forms "a grateful adjunct to rhubarb." *Dose.* 12 gr. to 1½ dr., in solution, combined with rhubarb or bitters, as the neutral sulphate. A *sesquisulphate* of *potassa*, in asbestos-like crystals, noticed by Mr. Phillips, was probably anhydrous sulphate. (See above.)

POTASSA (Sulphuret of). See *Sulphuret of Potassium.*

POTASSA (Tartrate of). Syn. *Neutral Tartar, Soluble do.; Potassæ Tartras*,—Ph. L. E. & D. *Kali Tartarizatum*,—Ph. L. 1787. *Tartarum Solubile, Tartarus Tartarizatus, Sal Vegetabile*,—Obs. var. *Prep.* (Ph. D.) *Carbonate of potash*, 8 *oz.*; *distilled water*, 2 quarts; dissolve, and to the solution, whilst boiling hot, gradually add of *bitartrate of potassa*, in fine powder, 1 *lb.*, or q. s., so that the liquid, after ebullition for a couple of minutes, ceases to change the colour of either *blue* or *reddened litmus paper*; next filter the liquid through calico, evaporate it until a pellicle forms on the surface, and set it aside to crystallize; after 12 hours, collect the crystals, dry them on bibulous paper, and preserve them from the air. The formula of the Ph. L. 1836, is nearly similar.

Prop., &c. The crystals of this salt, which are obtained with difficulty, are right rhombic prisms, and are deliquescent. The *salt* of *commerce* is usually in the form of a white, granular powder, which is obtained by simply evaporating the solution to dryness, with constant stirring. In this state it requires about 4 parts of cold water for its solution. Acids convert it into the bitartrate. As a *medicine*, it acts as a gentle diuretic and aperient; and is valued for correcting the griping properties of senna and resinous purgatives. It is also antiscorbutic. The "solution changes the colour neither of litmus nor turmeric. The addition of almost any acid throws down crystals of bitartrate of potassa, which generally adhere to the vessel. The precipitate occasioned by either chloride of barium or acetate of lead is dissolved by dilute nitric acid." (Ph. L.) "44 gr. are not entirely precipitated by 55 gr. of nitrate of lead." (Ph. E.) *Dose.* ½ dr. to ¾ *oz.*, in powder, or dissolved in water.

POTASSA (Bitartrate of). Syn. *Supertartrate of Potash, Acidulous Tartrate of do., Cream of Tartar; Cremor Tartari; Potassæ Bitartras*,—Ph. L. E. & D *Potassæ Supertartras*,—Ph. E. 1817. *Tartari Crystalli*,—Ph. D. 1826. This well-known salt is deposited during the fermentation of grape juice, as a crust on the sides of the casks or vats. In its unprepared or crude state, it is called *white*, or *red tartar* or *argol*, according to the wine from which it has been obtained. It is *purified* by boiling it in *water*, crystallization, re-solution in *water*, and treatment with *freshly burnt charcoal* and *aluminous clay* to remove the colour; the clear liquid is then decanted, whilst still *hot*, and allowed to cool slowly; the resulting crystals form the *cream of tartar* of commerce.

Prop., &c. Small, translucent, gritty, prismatic crystals, irregularly grouped together; permanent in the air; requiring fully 100 parts of cold water, and about 15 parts of boiling water for their perfect solution; the solution has a harsh, sour taste, and, like that of the tartrate, suffers spontaneous decomposition by keeping. Its "solution reddens litmus. At a red heat, it is converted into carbonate of potash." (Ph. L.) "Entirely soluble in 40 parts of boiling water; 40 gr., in solution, are neutralized by 30 gr. of crystallized carbonate of soda." (Ph. E.) *Dose.* As an aperient, 1 to 3 dr.; as a diuretic, ½ dr. to 1 dr.; as an antiscorbutic, 10 to 20 gr., frequently. It is much used to make a pleasant cooling drink (*Imperial*), and in tooth-powders.

POTASSA (Zincate of). Syn. *Bi-zincate of Potassa; Potassæ Zincas, P. Bi-zincas*,—Lat. *Prep.* (Fremy.) By adding *rectified spirit* to a *strong saturated solution* of *oxide of zinc in liquor of potassa*; the resulting crystals are carefully washed, and dried. Its precise composition is not known.

POTASSA (Caustic), *Potassa fusa, Potassa pura*, &c. See *Hydrate of Potassa.*

POTASSA AND ALUMINA (Sulphate of). See *Alum.*

POTASSA AND AMMONIA (Tartrate of). See *Soluble Tartar* (Ammoniacal).

POTASSA AND IRON (Sulphate of). See *Iron Alum.*

POTASSA AND SODA (Tartrate of). See *Potassio-tartrate of Soda.*

POTASSA AND UREA (Ferrocyanate of). Syn. *Potassii et Ureæ Ferrocyanidum*, —Lat. A compound of about 3 parts of *ferrocyanide of potassium* and 1 part of *urea*, dissolved, and evaporated or crystallized together. Recommended by M. Baup in intermittents. *Dose.* 5 to 15 gr., twice or thrice daily.

POTASSA WITH LIME. Syn. *Vienna Paste, Common Caustic; Stronger do. do., Pasta Viennensis; Potassa cum Calce*,—Ph. L. & E. *Potassa Caustica cum Calce*, —Ph. D. *Kali Causticum cum Calce*,—Ph. D. 1807. *Calx cum Kali Puro*,—Ph. L. 1788. *Causticum commune fortius*,—Ph. L. 1746. *Prep.* 1. (Ph. L. & D.) *Hydrate of potassa* and *quicklime*, of each, 1 oz.; rub them together (in a warm mortar,—Ph. D.), and keep the powder from the air in a well-stopped bottle.

2. (Ph. E.) *Liquor potassa* is evaporated to 1-3rd its volume in a clean iron vessel, then mixed with sufficient *fresh-slaked lime* to give it the consistence of a firm paste, and at once put into well-stopped bottles.

Use, &c. As a caustic; but it is less manageable than either nitrate of silver or fused hydrate of potassa. For another formula see *Filho's Caustic* (p. 212).

POTASSIO-TARTRATES. See the names of *respective bases.*

POTASSIUM. The metallic base of potash. It was discovered, in 1807, by Sir H. Davy, who obtained it by acting on moistened hydrate of potassa, under a film of naphtha, with the negative wire of a very powerful galvanic battery. It has since been procured by easier methods, of which the following, invented by Brunner, is the best.

Prep. An intimate mixture of *carbonate of potassa* and *charcoal* is prepared by calcining, in a covered iron pot, the crude tartar of commerce; when cold, it is rubbed to powder, mixed with 1-10th part of *charcoal* in small lumps, and quickly transferred into a *retort of stout hammered iron;* the latter may be one of the iron bottles in which quicksilver is imported, a short and somewhat wide *iron tube* having been fitted to the aperture; the retort, thus charged, is placed upon its side, in a *furnace* so constructed that the flame of a very strong fire, preferably fed with dry wood, may wrap round it, and maintain every part of it at a very high and uniform degree of heat. A *copper receiver*, divided in the centre by a diaphragm, is next connected to the iron pipe, and kept cool by the application of ice, whilst the receiver itself is partly filled with *mineral naphtha*, to preserve the newly formed potassium as it distils over. The arrangement of the apparatus being completed, the fire is gradually raised until the requisite temperature, which is that of full whiteness, is reached, when decomposition of the alkali by the charcoal commences, carbonic oxide gas is abundantly disengaged, and potassium distils over, and falls in large drops into the liquid. To render the product *absolutely pure*, it is redistilled in an *iron* or *green glass retort*, into which *some naphtha* has been put, that its vapour may expel the air, and prevent the oxidation of the metal. The pieces of charcoal are introduced for the purpose of absorbing the melted carbonate of potassa, and preventing its separation from the finely divided carbonaceous matter. *Iron filings* are frequently employed with a like intention. *Prod.* $3\frac{0}{0}$ to $4\frac{0}{0}$ of the weight of tartar acted on; 1 *lb.* yielded 280 gr.

Prop., &c. Pure potassium is a brilliant white metal, with a high lustre; at the common temperature of the air it is soft, and may be easily cut with a knife, but at 32° Fahr. it is brittle and crystalline; it melts completely at 136° Fahr., and in close vessels distils unaltered at a low red heat. Sp. gr. 0·865. Its most remarkable property is its affinity for oxygen gas, which is so great that it takes it from most other substances containing it. Exposed to the air, its surface is instantly tarnished, and quickly becomes covered with a crust of caustic potassa. It inflames spontaneously when thrown on water, and burns with a beautiful purple or purple-red flame, yielding a pure alkaline solution. It can only be preserved in naphtha, or some other fluid hydrocarbon. With oxygen it forms two oxides, one of which is *potassa* or *protoxide of potassium*, and the other (*peroxide of potassium, teroxide of do.*,) an orange-coloured substance, formed by burning the metal in dry air or oxygen gas, or by passing oxygen over pure potassa heated to redness.

POTASSIUM (Bromide of). Syn. *Hydrobromate of Potash; Potassæ Hydrobromas; Potassii Bromidum*,—Ph. L. 1836. This compound is prepared by precisely similar processes to those adopted for *Iodide of potassium.* The proportions ordered in the Ph. L. 1836 were,—*Bromine*, 2 oz.; *iron filings*, 1 oz.; *distilled water*, 1½ pint; the solution being afterwards decomposed with *carbonate of potassa*, 17 dr.; dissolved in *distilled water*, ½ pint.

Prop., &c. In appearance and general characters it is indistinguishable from iodide of potassium; and it is employed in similar

cases, and given in similar doses, to that substance.

POTASSIUM (Chloride of). Syn. *Potassii Chloridum*,—Lat. *Hydrochlorate of Potash, Muriate of do., Salt of Sylvius, Potassæ Hydrochloras, P. Murias, Sal Digestivus, S. Febrifugus Sylvii*,—Obs. var. The chloride of potassium of *commerce*, is generally a secondary product of the manufacture of *chlorate of potassa*, and other substances. The *mother-liquor* of the former is evaporated to dryness, and heated to dull redness; the calcined mass is then dissolved in water, the solution purified by defecation, and evaporated for crystals. On the *small scale*, it is sometimes prepared by neutralizing *dilute hydrochloric acid* with *carbonate of potash*, and evaporating, &c., as before.

Prop., &c. It closely resembles culinary salt in appearance; is anhydrous; dissolves in about 4 parts of cold, and 2 of boiling water; has a slightly bitter, saline taste; fuses at a red heat; and is volatilized at a very high temperature. As a *medicine* it is diuretic and aperient. It was formerly in high repute as a resolvent and antiscorbutic, and, particularly, as a remedy for intermittents. It is now seldom used. *Dose.* 10 gr. to ½ dr., or more.

POTASSIUM (Cyanide of). Syn. *Cyanuret of Potassium, Hydrocyanate of Potash; Potassii Cyanidum, P. Cyanuretum*,—Lat. Two varieties of this article are known in commerce,—the one, *pure* and *costly*, used for medicinal purposes;—the other, *impure*, but sufficiently cheap to be employed in the arts.

Prep. 1. *Medicinal Cyanide of Potassium.*—*a.* A solution of *pure hydrate of potassa*, 2 parts, in *highly rectified spirit*, 7 parts, is placed in a receiver furnished with a safety tube, and surrounded with *bruised ice;* the beak of a tubulated retort containing *ferrocyanide of potassium*, in powder, 4 parts, is then adapted to it in such a manner that any gas or vapour evolved in the retort must traverse the solution in the receiver; the arrangement being complete, *oil of vitriol*, 3 parts, diluted with an *equal weight* of *water*, and allowed to cool, is cautiously poured into the retort, and the distillation conducted *very slowly*, a *very gentle heat* only being applied, as circumstances may direct; as soon as the force of ebullition in the retort has subsided, the distillation is complete, and the connexion between the retort and receiver is broken; the *contents of the receiver*, now transformed into a mixture of a crystalline precipitate of *cyanide of potassium*, and an alcoholic solution of undecomposed potassa, is carefully thrown on a filter, and the precipitate, after the mother-liquor has drained off, very cautiously washed with *ice-cold* and *highly rectified spirit*, and then drained, pressed, and dried on the same filter. The *product* is *chemically pure*, and equal to fully 10% of the ferrocyanide employed. This is a modification of what is commonly known as "*Wigger's process.*"

b. Expose *well-dried* and *powdered ferrocyanide of potassium* to a moderate red-heat, in a close vessel; when cold, powder the fused mass, place it in a funnel, moisten it with a *little alcohol*, and wash it with *cold water;* evaporate the solution thus formed to dryness, expose it to a dull red heat in a porcelain dish, cool, powder, and digest it in *boiling rectified spirit;* as the spirit cools, *crystals* of *cyanide of potassium, nearly pure*, will be deposited. The alcohol employed in both this, and the preceding process, may be recovered by distillation from calcined sulphate of iron.

c. (Ph. U. S. 1840.) Heat *ferrocyanide of potassium*, 8 oz., until it becomes nearly white, and is deprived of its water of crystallization; put this into an earthen retort, with the beak loosely stopped, and expose it to a red heat for about two hours, or until gas ceases to be evolved, then withdraw it from the fire, close the orifice, and let it remain until cold; next break the retort, remove the contents, reduce them to a coarse powder, introduce them into a bottle of the capacity of 12 fl. oz., and add of *distilled water*, 6 fl. oz.; agitate occasionally for half an hour, throw it on a filter, evaporate the filtered solution rapidly to dryness, and keep in a closely stopped bottle. A cheap process, but the product is inferior to the last.

2. *Crude* or *Commercial Cyanide; Fused do.* (Liebig.) *Commercial ferrocyanide of potassium*, 8 parts, rendered *anhydrous* by gently heating it on an iron plate, is intimately mixed with *dry carbonate of potassa*, 3 parts; this mixture is thrown into a red-hot earthen crucible, and kept in a state of fusion, with occasional stirring, until gas ceases to be evolved, and the fluid portion of the mass becomes colourless; the crucible is then left at rest for a few minutes to allow its contents to settle, after which, the clear portion is poured from the heavy black sediment at the bottom, upon a clean marble slab, and the mass, whilst yet warm, broken up, and placed in well-closed bottles. —*Obs.* A cheap and excellent process. The *product* is said to contain about 1-8th part of *cyanate of potassa*, and though not sufficiently pure for employment in *medicine* as

cyanide of potassium, is admirably adapted for the various technical applications of this substance, as in *electro-plating*, *electro-gilding*, &c. It may also be advantageously substituted for the *ferrocyanide* in the preparation of hydrocyanic acid by the distillation of that substance along with dilute sulphuric acid.

Prop., *&c.* When pure, this salt is colourless and odourless; it forms cubic or octahedral crystals, which are anhydrous; it is freely soluble in water, and in boiling alcohol, but most of it separates from the latter as the solution cools; it is fusible; and undergoes no change, even at a full red heat, in close vessels; it exhibits an alkaline reaction; when exposed to the atmosphere, it absorbs moisture, and acquires the smell of hydrocyanic acid. If it effervesces with acids, it contains carbonate of potassa, and if it be yellow, it contains iron. It is employed in chemical analyses, and for the preparation of hydrocyanic acid; cyanide of soda may be made in the same way. The *dose* is $\frac{1}{12}$ to $\frac{1}{4}$ gr., in solution; in the usual cases in which the administration of hydrocyanic acid is indicated.

POTASSIUM (Ferridcyanide of). Syn. *Ferricyanide of Potassium*, *Ferric-cyanide of do.*, *Ferridcyanate of Potassa*, *Hydro-ferridcyanate of do.*, *Sesqui-ferrocyanate of do.*, *Red Prussiate of Potash; Potassii Ferridcyanidum*, *Potassæ Ferricyanas*, *P. Prussias Rubrum*,—Lat. This important and beautiful salt was discovered by L. Gmelin. At first it was merely regarded as a chemical curiosity, but it is now extensively employed in dyeing, calico-printing, assaying, &c.

Prep. 1. *Chlorine gas*, prepared in the ordinary manner, is slowly passed into a *cold solution* of *ferrocyanide of potassium*, 1 part; in *water*, 16 parts; with constant agitation, until the liquid appears of a deep reddish-green colour, or of a fine red-colour by transmitted light, and ceases to give a blue precipitate, or even a blue tinge to a solution of a *sesqui-salt* of iron, an excess of chlorine being carefully avoided; the liquor is next evaporated by the heat of steam or boiling water, until a pellicle forms upon the surface, when it is filtered, and set aside to cool; the crystals are afterwards purified by re-solution, and re-crystallization.—*Another method* is simply to evaporate the original solution to dryness, by a steam-heat, with agitation, then to redissolve the residuum in the least possible quantity of *boiling water*, and after defecation, or filtration, to allow the new solution to cool very slowly that crystals may form.

2. (*Extemporaneous.*) Add *nitric acid*, very gradually, to a *cold solution* of *ferrocyanide of potassium*, with constant agitation, until a drop of the mixture ceases to impart a blue colour to a solution of a *sesqui-salt* of iron, carefully avoiding excess of acid. It may be at once used in solution, or evaporated, &c., as before.

Prop., *&c.*, Magnificent regular prismatic, or sometimes, tabular crystals, of a rich ruby-red tint; permanent in the air; combustible; decomposed by a high temperature; soluble in 4 parts of cold water; insoluble in alcohol. Its most remarkable property is its not affecting solutions of the *sesqui-salts* or *per-salts* of iron, by which it becomes a valuable test for the *proto-salts* of that metal. It is further distinguished by precipitating solutions of—*Bismuth* (pale), *cadmium*, *peroxide of mercury*, and *zinc* (deep), of a yellow colour;—*Mercury*, *cobalt* (dark), *copper*, *molybdenum*, *silver*, and *uranium*, reddish brown;—*Peroxide of copper*, greenish yellow;—*Protoxide of iron*, blue;—*Manganese*, brown;—*Nickel*, yellowish-brown or olive green;—and *Protoxide of tin*, white; hence its use in chemical analysis.

POTASSIUM (Ferrocyanide of). Syn. *Ferrocyanuret of Potassium*, *Ferro-potassio-cyanide*, *Prussiate of Potash*, *Yellow do.*, *Ferro-prussiate of Potash*, *Ferro-cyanate of Potassa*, *Ferruretted Hydrocyanate of do.; Potassii Ferrocyanidum*,—Ph. L. E. & D. *Phlogisticated Alkali*, *Prussian do.*,—Obs. This valuable salt, the well-known "prussiate of potash" of commerce, was discovered by the illustrious Scheele, about the middle of the 18th century. It is now only manufactured on the large scale.

Prep. 1. Good *potash* or *pearlash*, 2 parts, and *dried blood*, *horns*, *hoofs*, *woollen rags*, or other *refuse animal matter*, 5 or 6 parts, are reduced to coarse powder, and mixed with some coarse *iron-borings;* the mixture is then injected into egg-shaped *cast-iron pots* in a state of moderate ignition; the mass is frequently stirred with an *iron spatula* so as to prevent it running together, and the calcination is continued until fœtid vapours cease to be evolved, and flame is no longer seen on stirring the mixture, care being taken to exclude the air from the vessels as much as possible; during the latter part of the process the pots are kept constantly covered, and the ignited mass stirred less frequently the hot pasty mass is then removed with an *iron ladle*, and excluded from the air until cold; it is next exhausted by edulcoration with *boiling water*, and the resulting solution, after defecation, or fil-

tration, is concentrated by evaporation, so that crystals may form as the liquid cools; these are redissolved in hot water, and the solution allowed to cool *very slowly*, when large and beautiful yellow crystals of *ferrocyanide of potassium* are deposited.—*Product.* 1 ton of *dried blood* or *woollen refuse*, with 3 cwt. of *pearlash*, yields from 2 to 2½ cwt. of *commercial ferrocyanide*. The mother-liquor contains sulphate of potash.

2. (Lewis Thompson.) *Potash* or *pearlash*, and *coke*, *cinders*, or *coal*, of each 10 parts; *iron turnings*, 5 parts; all in coarse powder; expose the mixture for ½ an hour to a full red heat in an open crucible, stirring occasionally until small jets of purple flame are no longer seen; then allow the whole to cool, dissolve out the soluble matter, and proceed as above. The *product* is about 15% of the weight of pure alkali employed. The *Society of Arts* presented their *Gold Medal* to Mr. Thompson for this discovery.

3. (*Pure.*) Fuse effloresced *commercial prussiate of potash* in a glass vessel, dissolve the fused mass in *water*, neutralize any excess of alkali with *acetic acid*, and precipitate the salt with *strong alcohol;* wash the precipitate with a little *weak alcohol*, redissolve it in water, and crystallize.

Prop. It forms large and very beautiful yellow crystals, which are permanent in the air, and very tough and difficult to powder; it is soluble in 4 parts of cold, and 2 parts of boiling water; has a mild saline taste; at a gentle heat loses water; at a higher temperature, in closed vessels, it is, for the most part, converted into cyanide of potassium, and when exposed to the air, into cyanate of potassa. It precipitates solutions of *Antimony*, *Bismuth*, *Protoxide of mercury*, and *Zinc*, of a white colour; —*Cadmium*, pale yellowish white;—*Protoxide of cerium*, white, soluble in acids;—*Protoxide of copper*, white, changing to red colour;—*Protoxide of iron*, white, rapidly turning blue;—*Lead*, white, with a pale yellowish cast;—*Protoxide of manganese*, white, rapidly passing into a peach or blood-red colour;—*Peroxide of mercury*, white, turning blue;—*Oxide of nickel*, white, turning green;—*Silver*, white, turning brown or blackish brown in the light; —*Protoxide of tin*, white (gelatinous);—*Cobalt*, green, turning reddish gray;—*Peroxide of copper*, brown-red;—*Peroxide* or *sesqui-oxide of iron*, dark blue;—*Deutoxide* or *sesqui-oxide of manganese*, greenish gray; —*Molybdenum*, dark brown;—*Protoxide of palladium*, green (gelatinous);—*Tantalum*, burnt yellow colour;—*Peroxide of tin*, yellow (gelatinous);—*Uranium*, reddish brown; and—*Zinc*, white.

Pur. It is "totally dissolved by water; loses 12·6% of its weight by a gentle heat; scarcely, if at all, alters the colour of turmeric; is precipitated deep blue by the sesquisalts of iron, and white by zinc; its ashes dissolved by hydrochloric acid are again thrown down by ammonia; it yields 18·7% of sesquioxide of iron. (Ph. L.)

Uses, &c. Ferrocyanide of potassium is chiefly used in dyeing and calico-printing, in the manufacture of Prussian blue, in electro-plating, and in chemistry, as a test, and a source of hydrocyanic acid. As a *medicine* it is said to be sedative and astringent, and in large doses purgative, but appears to possess little action. *Dose.* 10 gr. to ½ dr., dissolved in water; in hooping-cough, chronic bronchitis, night-sweats, leucorrhœa, &c. D'Arcet swallowed a solution containing ½ *oz.* of this salt without experiencing any injurious effects.

Concluding Remarks. According to Hofflmayr, the addition of 1 to 3% of nitre is useful to promote the fusion of the mixture, and a very strong heat, duly regulated, is favorable to the process. The animal matter may, in many cases, be advantageously carbonized before mixing it with the alkali. Of 100 parts of animal matters, the best proportions of *good potash* are said to be—for *dried blood*, 28 to 30%; *horns* or *hoofs*, 33 to 35%; *waste leather*, 45 to 48%; with 2 to 4% of *smith's scales* or *iron filings* to each. "*Woollen rags* or *clippings* give a larger product than any other substance within the range of our experience." (Ure.) The "*greaves*" obtained from the tallow-chandlers are employed as an economical substitute for horns and blood by one of the largest Scotch manufacturers.

POTASSIUM (Hydrargyro-iodideof). See *Iodide of Mercury and Potassimu* (p. 781).

POTASSIUM (Hydrargyro-iodo-cyanide of). See *Iodocyanide of Mercury and Potassium* (p. 781).

POTASSIUM (Iodide of). Syn. *Hydriodate of Potash; Potassii Iodidum*,—Ph. L. E & D. *Potassæ Hydriodas*,—Ph. D. 1826. *Ioduret of Potassium*, *Potassii Ioduretum*, *Potassium I.*, *Kalium Iodatum*, —Obs. *or* unus. *Prep.* There are several methods of preparing this important medicinal compound, of which the following are the most valuable: —

1. (Ph. L. 1836.) Take of *iron filings*, 2 oz.; *distilled water*, 2 quarts; *iodine*, 6 oz.; mix them, and heat the solution until it turns green, then add of *carbonate of potassa*, 4 oz.; dissolved in *water*, 1 quart; filter,

wash the residuum on the filter with *water*, evaporate the filtered mixed liquors, and crystallize. *Product.* 1 oz. of *iodine* yields 1 oz. 45 gr. of *iodide*. This compound is placed in the Materia Medica of the *present* Ph. L. The formula of the new Ph. D. resembles the above.

2. (Ph. E.) As the last, nearly; but the solution is ordered to be "concentrated at a temperature, short of ebullition, until a dry salt be obtained, which is to be purified by dissolving it in less than its own weight of *boiling distilled water*, or, still better, boiling it in twice its weight of *rectified spirit*, filtering the solution, and setting it aside to crystallize."

3. (Ph. D. 1826.) By saturating, with *carbonate of potassa*, an *aqueous solution of hydriodic acid* formed by transmitting chlorine through water in which iodine is suspended. *Prod.* 1 oz. of *iodine* yields fully 1 oz. 1½ dr. of *iodide*.

4. (Duflos.) *Iodine* and *pure granulated zinc*, of each, 4 oz.; *water*, 8 oz.; after the action has ceased, neutralize the liquid with a *solution of pure carbonate of potassa*, in very slight excess, filter, neutralize, if necessary, with a *little hydriodic acid*, treat the liquid with *sulphuretted hydrogen*, for the sake of security, filter, evaporate, and crystallize. *Prod.* 1 oz. of *iodine* yields 1 oz. 2 dr.

5. (Gregory.) Add *iodine* to a *hot solution of pure potassa* until the alkali is perfectly neutralized, carefully avoiding excess, evaporate the liquid to dryness, and expose the dry mass to a gentle red heat in a *platinum* or *iron crucible;* afterwards, dissolve out the salt, gently evaporate, and crystallize. An excellent process, yielding a large product, but, if the ignition be not carefully managed, it is apt to contain a little undecomposed iodate. To obviate this Mr. Scanlan proposes the addition of a little *powdered charcoal* to the mass before ignition, a plan adopted in the Ph. U. S.

6. (Rev. J. B. Reade.) To a *solution of iodide of iron*, prepared by the ordinary process (*see* No. 1, above), *iodine*, in quantity equal to one half that already in it, is added; when the solution is complete, *ferrocyanide of potassium*, nearly equal to the *whole weight* of the iodine, and under the form of a semi-saturated solution, is further added, and the whole stirred together; *soluble prussian blue*, of very fine quality, and highly valuable in the arts, is precipitated, whilst *neutral iodide of potassium*, with a little iodide of iron, remain dissolved in the liquid; this last is then evaporated to dryness, and carefully ignited; the fused mass is dissolved in *water*, and the solution filtered, evaporated, and crystallized. The *product* is very large, perfectly neutral, and chemically pure. *Patented.*

7. (Turner.) To a *hot solution of caustic potassa* (sp. gr. 1·19), add as much *iodine* as it will dissolve, and pass *sulphuretted hydrogen* through the liquid until it becomes colourless; next apply a gentle heat to expel excess of acid, filter the liquid, exactly neutralize it with *potassa*, evaporate, and crystallize. *Prod.* 1 oz. of *iodine* yields 1 oz. 1¼ dr.

Prop. It crystallizes in cubes, which in the *pure salt* are extremely white, though frequently opaque; these are anhydrous; fuse when heated, without decomposition; dissolve in less than an equal weight of water, at 60° Fahr., and very freely in alcohol; and do not deliquesce in moderately dry air, unless they contain undecomposed potassa. Its solution dissolves iodine freely, and also, less readily, several of the insoluble metallic iodides and oxides.

Pur. It is *entirely* soluble in both water and alcohol. Its aqueous solution alters the colour of turmeric either not at all, or but *very slightly;* nor does it affect litmus paper, or effervesce with acids. "Nitric acid and starch being added together, it becomes blue. It is not coloured by the addition of tartaric acid with starch. No precipitate occurs on adding either a solution of lime or of chloride of barium. 100 gr., dissolved in water, by the addition of nitrate of silver, yield a precipitate of 141 gr. of iodide of silver." (Ph. L.) "Its solution is not affected, or only rendered hazy by solution of nitrate of baryta. A solution of 5 gr. in 1 fl. oz. of *distilled water*, precipitated by an excess of solution of nitrate of silver, and then agitated in a bottle with a little water of ammonia, yields quickly, by subsidence, a clear supernatant liquor, which is not altered by an excess of nitric acid, or is merely rendered hazy." (Ph. E.) The pure salt does not lose by weight when heated.

Assay. The *iodide* of *commerce* frequently contains fully one half its weight of either *chloride of potassium* or *carbonate of potash*, or both of them, with variable quantities of *iodate of potassa*, a much less valuable salt. The presence of these substances are readily detected by the above tests. As the first of these is only very slightly soluble in *cold alcohol* and the others insoluble in that liquid, a ready method of determining the richness of a sample in pure iodide, sufficiently accurate for ordinary purposes, is as follows:—Reduce 50 gr. of the *sample* to fine powder, introduce this into a test tube

with 6 fl. dr. of *alcohol*, agitate the mixture violently for *one* minute, and throw the whole on a weighed filter set in a *covered* funnel, observing to wash what remains on the filter with *another* fl. dr. of *alcohol*. The *filtrate*, evaporated to dryness, gives the quantity of PURE IODIDE, and the *filter*, dried by the heat of boiling water, that of the IMPURITIES present in the sample examined, provided it contained no *caustic potassa*. The QUANTITY OF ALKALI, whether *caustic* or *carbonated*, may be found by the common method of "*Alkalimetry*."

Uses, &c. Chiefly in medicine and pharmacy. *Dose.* 1 to 10 gr., twice or thrice daily, made into pills, or better, in solution, either alone, or combined with iodine; in bronchocele, scrofula, chronic rheumatism, dropsy, syphilis, glandular indurations, and various other glandular diseases. Also *externally*, made into a *lotion* or *ointment*.

Concluding Remarks. According to theory, 4 oz. of *iodine* should yield 5 oz. 1 dr. 55 gr. of *pure iodide of potassium*; but such a product is never obtained in practice, as will be seen by reference to the above formulæ, which are those most generally approved of for the preparation of a pure salt. The *old method* of acting on iodine with *potassa*, or *carbonate of potash water*, yields a very impure product.

A not uncommon practice in the wholesale drug trade, is to send *iodine* to the manufacturing chemist, and to receive in return an *equal weight* of *iodide of potassium*; and, in most cases, a fee is paid for the conversion. The above data will, however, show how far such a practice is politic on the part of the holders of iodine.

POTASSIUM (Biniodide of). Syn. *Potassii Biniodidum*,—Lat. A name absurdly given to *ioduretted iodide of potassium*.

Prep. 1. *Iodide of potassium*, 3 parts; *iodine*, in powder, 1 part; *water*, at 180° Fahr., 3 parts; triturate them together, pour the mixture into a flask, and keep it for some days in ice. Brown crystals.

2. (Giordano.) *Iodide* (dry), 20 parts; *iodine*, 6 parts; triturate them together until they form a homogeneous mass, then place it at once in stoppered phials. *Used* to make *ioduretted draughts, lotions, &c.* See *Iodine* (and *above*).

POTASSIUM (Iodo-hydrargyrate of). See *page* 781.

POTASSIUM (Oxides of). See *Potassa* and *Potassium*.

POTASSIUM (Phosphuret of). Syn. *Potassii Phosphuretum*,—Lat. A compound formed by gently heating *phosphorus* with *sulphur* in a close vessel.

POTASSIUM (Salicylide of). Syn. *Hydrosalicylate of Potassa*. Formed by mixing *salicylous acid* (artificial oil of meadow-sweet) with a *solution of caustic potassa*; it separates, on agitation, as a yellow crystalline mass, which, after pressure in bibulous paper, is recrystallized from *alcohol*. Golden-yellow crystals, soluble in both water and alcohol; damp air gradually converts them into *acetate of potassa* and *melanic acid*.

POTASSIUM (Sulphocyanide of). Syn. *Sulpho-cyanuret of Potassium; Potassii Sulphocyanidum, P. Sulpho-cyanuretum*,—Lat. *Prep.* 1. *Ferrocyanide of potassium* (anhydrous, or dried by a gentle heat), 46 parts; *sulphur*, 32 parts; *pure carbonate of potassa*, 17 parts; reduce them to powder, and very gradually heat the mixture to *low* redness in a covered iron crucible which it will less than one-half fill; remove the *half-refrigerated* and still soft mass, crush it, exhaust it with *water*, and evaporate the aqueous solution to dryness; powder the residuum, and exhaust it with *hot alcohol* or *rectified spirit*; the alcoholic solution will yield beautiful white crystals as it cools, and the residual or mother-liquor, may be evaporated for the remainder of the salt.

2. *Cyanide of potassium*, 3 parts; *sulphur*, 1 part; *water*, 6 parts; digest them together for some time, add 3 parts more of *water*, filter, evaporate, and crystallize.

Prop., &c. Long, slender, colourless prisms or plates, which are anhydrous, bitter-tasted, deliquescent, fusible, very soluble in both water and alcohol, and non-poisonous. It is chiefly used as a test for sesquioxide of iron, for which purpose it is preferable to all other substances.

POTASSIUM (Sulphuret of). Syn. *Sulphide of Potassium, Liver of Sulphur, Sulphuret of Potash; Potassii Sulphuretum*,—Ph. L. E. & U. S. *Hepar Sulphuris*,—Ph. D., & Ph. L. 1721. *Potassæ Sulphuretum*,—Ph. L. 1824 & Ph. D. 1826. *Kali Sulphuratum*,—Ph. L. 1788. *Prep.* 1. (Ph. E.) *Sulphur*, 1 oz.; *carbonate of potash*, 4 oz.; mix, heat them in a covered crucible till they form a uniform fused mass; when cold, break it into fragments, and preserve it in well-closed vessels. The formulæ of the Ph. L. 1836 & Ph. U. S., are similar.

2. (Ph. D.) *Sublimed sulphur*, 4 *oz.*; *carbonate of potash* (from pearlash, first dried, and then reduced to powder), 7 *oz.*; mix in a warm mortar, heat them in a Hessian crusible, as before, pour the fused mass into an iron cup, over which immediately invert a second vessel, to exclude the air, and when

cold, break the mass into fragments, and preserve it in a green-glass stoppered bottle.

Prop.,&c. A hard, brittle, liver or greenish brown coloured solid; inodorous whilst dry; soluble in water, forming a highly fœtid solution; and, in acids, evolving strong fumes of sulphuretted hydrogen; reaction, alkaline; exposed to the air it is gradually converted into sulphate of potassa. As a *medicine*, it is reputed diaphoretic, expectorant, and stimulant. *Dose.* 2 to 6 gr., in solution, or made into pills with soap; in gout, rheumatism, liver affections, and various chronic skin diseases. *Externally*, made into a lotion and ointment. It is highly acrid and corrosive, and in large doses *poisonous*.

Obs. The above is the only sulphuret of potassium used in medicine, and is of doubtful constitution. Chemists describe six distinct compounds of potassium with sulphur. The *monosulphuret* or *protosulphuret* is formed by either reducing sulphate of potassa, at a full red heat, by means of hydrogen or charcoal; or by taking a strong solution of hydrate of potassa, saturating *one half* of it with sulphuretted hydrogen, then adding the remaining half, and evaporating and fusing the mixture. It forms a soluble, crystalline, cinnabar-red mass, which acts as a strong sulphur-base. The *higher sulphurets* may be formed by fusing the protosulphuret with the additional equivalents of sulphur, as required. The preparation of the Pharmacopœia is a mixture of these sulphurets with hyposulphite and sulphate of potassa, in variable proportions. From these compounds a solution of the *pentasulphuret of potassium* may be obtained by digestion in alcohol; and one of the *tersulphuret*, in like manner, from a fused mixture of carbonate of potassa with half its weight of sulphur.

POTATO. This well-known and valuable article of food is the *root* or *tuber* of the *solanum tuberosum* or *esculentum*, a plant which was introduced to this country, by either Sir Francis Drake or Sir Walter Raleigh, towards the latter part of the 16th century. It is now extensively cultivated in all the temperate climates of the world. It yields a vast quantity of food on a small space of ground, but only about 1-7th part of the weight of the tuber is nutritious, and this is chiefly farinaceous. Its farina or starch, is, however, accompanied by no inconsiderable portion of saline matter, more especially of potassa, which renders it highly antiscorbutic, and a powerful corrective of the grossness of animal food. When forming part of a mixed diet, perhaps, no substance is more wholesome than the potato; and certainly, no other esculent hitherto discovered appears equally adapted for universal use.

In the *choice* of *potatoes* "observe, as a general rule, that the *smaller the eye*, the *better the potato;* as when they are too full in the eye they are either of an inferior quality, or are running to seed. To *ascertain if they are sound*, nip a piece from the thickest end with your finger nail; if *good*, the inside will be of a white, yellow, or reddish hue, according to the sort and quality; if, on the contrary, they are spotted, they are bad, or getting so." (Soyer.)

No certain rules can be laid down for "*dressing*" potatoes. "If *boiled*, it may be that they require to be put into boiling water, or, may be, into cold, and either boiled quickly, or slowly; but this you must find out. Choose them all about the same size, with a smooth skin, and when they are boiled and begin to crack, throw off the water immediately, as it only damages the root. When dressed, let them stand near the fire, with a cloth over them, and serve them in the skins. Salt may be put into the water at the beginning. A *watery potato* will require quick boiling, and, sometimes, to be put into boiling water. If *very watery*, and they will not boil mealy, put them into the pot in their skins, fill up the pot with water, and add a piece of quicklime the size of a nut; they will then turn out mealy." (Soyer.)

To *retain* the *highest amount* of *nourishment* in *potatoes* they should be "dressed" with their skins on them. The bruised or damaged parts, worm-holes, &c., being removed with a knife, the dirt should be carefully cleaned out of the "eyes," and from the rough parts of the skins, by means of a brush and water, after which they should be well rinsed in clean water, and drained in a colander. If they are at all dry, or shrivelled, they may be advantageously left to soak for 3 or 4 hours in clean cold water before cooking them. Potatoes "dressed" in the skins have been found to be nearly twice as rich in potassa-salts as those which have been first peeled. The skins are easily removed before sending them to table.

New potatoes should have their *loose outer skin* rubbed off with a cloth or stiff brush before being dressed or cooked.

Mashed potatoes are prepared by crushing, with the back of a spoon, or with a rolling-pin, the hot "dressed" tubers placed in a bowl or dish, or on a pie-board. A little milk, butter, and salt, may be added to

them at will; and they may be either at once "served up," or pressed into "forms," and first "browned off" in the oven. Potatoes, if not soft and mealy, and well masticated, frequently escape the solvent action of the stomach, and pass off undigested, often to the serious derangement of the health. By mashing them, this inconvenience is removed. The delicate, the dyspeptic, and the aged, shonld take them in no other form. See *Distillation*, *Salep*, *Starch*, *Sugar*, *&c.*

Potatoes may be *preserved*, so as to stand the longest voyages unchanged, by thoroughly desiccating them in an oven, or by steam heat. For this purpose, the roots, either raw or three-parts dressed, are generally first cut into dice of about ¾ inch square, to facilitate the operation. Under a patent granted to Mr. Downes Edwards, Aug., 1840, the boiled potatoes are mashed and granulated, by forcing them through a perforated plate, before drying them. The granulated product, beaten up with a little hot milk or hot water, forms an excellent *extemporaneous dish* of *mashed potatoes*.

POTATO DISEASE. Various schemes have been promulgated, from time to time, having for their object the prevention of this calamity, from which we select the following, as having proved the most successful in practice:—

1. This consists simply in *drying* the *seed potatoes completely*, before planting them. This plan originated in Russia, and has been very extensively adopted in Germany.

2. (Dr. Klotsch.) The potato is cultivated for the tubers, and not for the fruit, hence the mode of cultivation should be regulated accordingly. The chief points for effecting this object consist—1, in increasing the functional powers of the tubers; and—2, in restricting the metamorphosis of the leaves. We effect both these points in the following manner:—During the 5th, 6th, and 7th, week after the tubers have been planted, or in the 4th or 5th week after the planting of rooted shoots, or at any time when the young plants have reached a height of six or nine inches above the ground, the tops of the branches are lopped or clipped by means of the thumb and first finger to the extent of half an inch. This operation is repeated the 10th or 12th week after planting. The effect of this treatment in the development and strength of the tubers is stated to be remarkable.

3. The potatoes are steeped in *weak milk of lime* for some hours, and afterwards, in *water soured with sulphuric acid*, they are then drained, dried, and stored, in the usual manner. Chevalier Bunsen found that potatoes so treated soon after being dug up, retained their good qualities unimpaired; whilst the remainder of the same crop, not so treated, was in a few weeks rendered valueless by the disease.

4. The "changes in question can only be brought about by introducing a complete alteration in the mode of cultivation:—1, in thoroughly drying the seed potatoes;—2, in steeping them for a short time in a *dilute solution* of *sulphate of copper* (blue vitriol or blue stone), of about the same strength as that used for 'pickling' wheat;—3, in planting them in poor, well drained land;—4, and lastly, in substituting for the farm-yard manure, &c., now employed, some *inorganic* compost." (Thornton J. Herapath.)

POTESTATES SUCCINI. See *page* 342.

POTIONS. See *Draughts*, and *Ptisans*.

POT METAL. An alloy of *copper* and *lead*. (Brande.) The vulgar name for the metal of which iron pots are made. (Wilcox.)

POT POURRI. A mixture of odorous flowers, roots, gums, &c., varied according to the taste of the operator, either mixed together *dry*, or in the *fresh state* preserved with salt. "The usual way of making it is to collect *roses*, *lavender*, and other *sweet-scented flowers*, as they blow; to put them into a large jar mixed (stratified) with *salt*, until a sufficient quantity has been collected; then to add to these such other *odorous substances* as may be required to form an agreeable perfume." Among the substances thus added are—*ambergris*, *benzoin*, *calamus root*, *cascarilla*, *cassia*, *cassia buds*, *cinnamon*, *civet*, *cloves*, *musk*, *musk seed*, *orange berries* and *flowers*, *orris root*, *pimento*, *storax*, *vanilla*, *yellow sandal wood*, *&c.*

"Instead of the fresh flowers, *dried roses* are sometimes used, and with the addition of some *essential oils*, these answer quite as well." (Redwood.)

POTTED MEATS. See *Putrefaction* (and below).

POTTERY. The mechanical operations connected with the manufacture of pottery (*ceramic art*) do not come within the province of this work. The materials employed, in this country, to produce the best kind of earthenware (*Staffordshire ware*) are the fine white clays of Devonshire and Cornwall, and *powdered chert* or *flint*. This is brought to a perfectly homogeneous plastic mass with *water*, and in this state is fashioned upon the *potter's wheel* and *lathe*, or by moulding, into all the various objects of utility and ornament which are made in this material. After the newly formed vessels and other articles have been dried by exposure in heated rooms, they are en-

closed in clay-cases (*seggars*) and exposed to heat in a kiln, by which they arrive at a state (*biscuit*) which renders them fit for *glazing;* the patterns (if any) and, afterwards, appropriate vitreous materials having been applied to their surfaces, they are again placed in the *seggars*, and are again exposed in a kiln to a heat sufficiently high to fuse the newly applied compound, by which they acquire a uniform enameled surface, and become fit for the market. *Porcelain*, or *China*, as it is commonly called, is manufactured in a nearly similar manner, but the materials are selected, and the various processes conducted with corresponding skill and care.

The *ornamental patterns* are produced upon both *Staffordshire ware* and *porcelain* by a number of ingenious processes, among which *printing*, *painting*, and *moulding*, are the principal. The *colours* employed are those which have been already referred to under "*Enamels.*"

The *metallic lustres* now so common on *stoneware*, &c., are given as follows:—

1. *Gold Lustre.* Dissolve of *grain-gold*, 1 dr.; in *aqua regia*, ¾ oz.; to the solution add of *metallic tin*, 6 gr.; and when this is dissolved pour it very gradually, with constant stirring, into a mixture of *balsam of sulphur*, ½ dr.; *oil of turpentine*, 20 gr.; when the mass begins to stiffen, ½ dr. more of *oil of turpentine* must be added, and well mixed in. *More gold* deepens and brightens the lustre; *more tin* turns it on the violet or purple.

2. *Iron Lustre.* From a *mixture* of *muriate of iron* and *spirit of tar.*

3. *Platinum Lustre.* To a *solution of platina in aqua regia* (bichloride of platinum) is added, drop by drop, a *mixture* of *spirit of tar* and *balsam of sulphur* in equal proportions, until by a trial the composition is found to give the required result. This gives the appearance of polished steel.

4. *Silver Lustre.* The *ammonio-chloride of platinum* is reduced to an impalpable powder, ground up to the requisite consistence with a little *spirit of tar*, and at once applied with a brush.

The above *lustres* are applied, over an *easily fusible glaze*, to the outer surfaces only of the vessels, after which adhesion is produced by exposing the pieces to a slight degree of heat in the *muffle.* To give them their full beauty, they must be rubbed with *cotton*, *wool*, or *chamois leather*, after the firing. See *Alumina*, *Enamels*, *Gilding*, *Glazes*, *Kaolin*, *&c.*

POTTING. A term commonly applied to the operation or practice of preserving animal substances in a state fit for immediate use, in small pots or jars. The method of proceeding is, first, to mince the *substance* (previously well dressed, and carefully deprived of bones, sinews, skin, &c.), and next, to pound it in a clean polished marble or iron mortar, along with a little *butter*, and some *cayenne pepper*, or other suitable *spice* or *sauce*, until it forms a perfectly smooth paste; this is pressed into the pots, so as to about 2-3rds fill them, and *clarified melted butter* is then poured in to the depth of about 1-8th of an inch; the pots are, lastly, closely covered over, and kept in a cool situation. In this state, their contents may be preserved for a year, or longer. *Potted Beef*, *Ham*, *Veal*, *Poultry*, *Game*, *Anchovies*, *Bloaters*, *Salmon*, *&c.*, are commonly sold in the shops. They are all intended for *relishes*, and are eaten spread upon bread, in the same manner as butter.

POUDRE CLARIFICANTE. Powdered albumen. (See *p.* 31.)

POUDRE KOUSIQUE. A French nostrum, consisting of *nitre* and *sulphur*, of each, 50 parts; *charcoal* and *antimony*, of each, 1 part. It is divided into ½-dr. doses, of which three are put into each packet. It is given to dogs in a ball of butter, to prevent the disorders to which they are liable.

POUDRE METALLIQUE. See *Tooth Cements.*

POUDRE SUBTILE. See *Depilatories.*

POUDRES COSMETIQUES, *P. odorantes*, &c. See *Powders.*

POUDRETTE. Dried *night-soil.* The manure sold under this name is a compound of *night-soil* with *clay*, *charcoal*, or *gypsum*, made into balls or cakes. Its extensive use in Belgium, France, the United States of America, and, more particularly, in China, where it was first employed, has shown it to be the most fertilizing, and generally applicable, of all the numerous substances used as manures. Unfortunately, the prejudices of Englishmen lead them to poison the air of their cities and towns, and the water of their rivers, with a substance which, if rightly applied, would crown their fields with golden harvests, and drive pauperism from the land.

POULTICE. Syn. *Cataplasm; Cataplasma*,—Lat. An external application, generally extemporaneous, used to promote suppuration, allay pain and inflammation, resolve tumours, &c.

Poultices (*cataplasmata*) are generally prepared with substances capable of absorbing much water, and assuming a pulpy consistence, so as to admit of their appli-

cation to any surface, however irregular. Their curative action principally depends upon the liquids with which they are moistened, and the heat retained by the mass. With this object they should never be heavy, or very bulky, and should be frequently repeated, and lightly, but securely bandaged on, to prevent displacement.

The addition of a little *lard*, *olive oil*, or still better, *glycerine*, to a poultice, tends greatly to promote its emollient action, and to retard its hardening.

As the continued medication of the part with warmth and moisture, or with substances applied in the moist way, is the principal object to be attained in the application of poultices, a fold or two of *lint* or *soft linen* dipped in *hot water*, either simple or medicated, and covered with a piece of thin *sheet gutta-percha*, or *Indian-rubber cloth*, to prevent evaporation, may be often conveniently applied in their stead. A very elegant and useful substitute of this kind is the *spongio-piline*, of Mr. Margwick. Its cleanliness, lightness, and ease of application, must ultimately lead to its general adoption by the medical profession.

The following formulæ embrace all the *cataplasmata* of the pharmacopœias :—

POULTICE (Alum). Syn. *Cataplasma Aluminis*,—Ph. D. 1826. *Coagulum Aluminis*,—Ph. L. 1788. *Prep.* (Ph. D. 1826.) *Alum* (in powder), 1 dr.; *whites of* 2 *eggs;* shake them together until they form a coagulum. Applied, between the folds of fine linen, to chilblains, sore nipples, inflamed eyes, &c.

POULTICE (Bread). Syn. *Cataplasma Panis*,—Lat. *Prep.* From *crum of bread* soaked in *hot water*, slightly pressed, and then beaten up with a little *lard*, *butter*, or *oil*. Emollient. See *Linseed-meal Poultice*.

POULTICE (Carrot). Syn. *Cataplasma Dauci*,—Ph. D. 1826. *Prep.* 1. From the common esculent *carrot* scraped fine, so as to form a pulp.

2. (Ph. D. 1826.) From the *cultivated carrot* boiled with a *little water*, until it becomes soft enough to form a poultice. Anodyne and antiseptic. *Used* in foul and painful ulcers, burns, contusions, &c. That from the first formula is the more stimulant.

POULTICE (Charcoal). Syn. *Cataplasma Carbonis*,—Ph. L. *C. C. Ligni*,—Ph. D. 1826. *Prep.* (Ph. L.) Soak *bread*, 2 oz., in *boiling water*, ½ pint; to this, add, by degrees, of *linseed meal*, 10 dr.; and, afterwards, of *powdered* (recently burnt) *charcoal*, 2 dr.; lastly, sprinkle on the surface of the poultice, *powdered charcoal*, 1 dr. As an application to fœtid and gangrenous sores; frequently renewed.

POULTICE (Chloride of Soda). Syn. *Cataplasma Sodæ Chlorinatæ*,—Ph. L. *Prep.* (Ph. L.) *Boiling water*, 6 fl. oz.; *linseed meal*, 4½ oz.; mix gradually, then add of *solution of chlorinated soda*, 2 fl. oz. Applied to foul ulcers, gangrenous parts, &c.

POULTICE (Hemlock). Syn. *Cataplasma Conii*,—Ph. L. *Prep.* (Ph. L.) *Boiling water*, ½ pint; *linseed meal*, 4½ oz., or q. s.; make a poultice, and on this spread of *extract of hemlock* (Ph. L.), 1 oz., first softened with a *little hot water*. Anodyne. In irritable and painful cancerous, scrofulous, and syphilitic sores, tumours, &c.

POULTICE (Linseed-meal). Syn. *Cataplasma Lini*,—Ph. L. *Prep.* (Ph. L.) To *boiling water*, ½ pint, add, gradually, constantly stirring, of *linseed meal*, 4½ oz., or q. s. Emollient. *Used* to promote the suppuration or "ripening" of tumours. A little *oil* or *lard* should be added, and some smeared over the surface as well, to prevent its getting hard. For small "gatherings," as of the fingers, a little *chewed bread* and *butter* is an efficient and convenient substitute.—*Obs.* Linseed meal prepared from the cake from which the oil has been expressed, is less adapted for poultices than that prepared from the unpressed, whole seed. The latter is ordered in the Ph. L.

POULTICE (Mustard). Syn. *Cataplasma Sinapis*,—Ph. L., and Ph. D. 1826. *Prep.* 1. (Ph. L.) *Linseed meal* and *powdered mustard*, of each, 2½ oz., or q. s.; *boiling water*, ½ pint; mix as before.

2. (Ph. L. 1836.) As the last, but substituting *boiling vinegar* for *water*. *Used* as a powerful counter-irritant, stimulant, and rubefacient; in low fevers, apoplexy, coma, &c., where there is a determination of blood to the head; in deep-seated inflammatory pains; neuralgic pains, &c. It should not be left on long enough to raise a blister. See *Plasters*.

POULTICE (Poppy). Syn. *Cataplasma Papaveris*,—Lat. *Prep.* (P. Cod. 1839.) A strong *decoction of poppies* thickened with *crum of bread*. Anodyne.

POULTICE (Potato). Syn. *Cataplasma Solani Tuberosi*,—Lat. *Prep.* From the *raw potato*, scraped or grated fine. A popular application to fresh bruises, extravasations, burns, scalds, &c.

POULTICE (Pradier's). Syn. *Pradier's Cataplasm; Cataplasme de Pradier*,—Fr. *Prep.* Take of *balm of Mecca*, 6 dr.; *rectified spirit*, 16 oz.; dissolve; next, separately, take *red cinchona bark*, *sarsaparilla*, and *sage*, of each, 1 oz.; *saffron*, ½ oz.; *rectified*

spirit, 32 oz.; digest for 48 hours, and filter; mix the two liquors, and add to them twice their weight of *lime water*. In gout; 2 fl. oz. are sprinkled on the surface of a *hot linseed-meal poultice* sufficiently large to surround the affected part. It is said that the Emperor Napoleon gave £2500 for this receipt.

POULTICE (Simple). Syn. *Cataplasma Simplex*,—Ph. D. 1826. *Prep.* (Ph. D. 1826.) *Powder for a cataplasm* and *boiling water*, of each, q. s. to form a poultice, the surface of which is to be smeared over with *olive oil*. Emollient. *Bread poultice* and *linseed-meal poultice* are now generally called by this name.

POULTICE (Soap). Syn. *Cataplasma Saponis*,—Lat. *Prep.* From *white soap* (scraped or sliced), 1 *oz.*; *boiling water*, ¼ pint; dissolve, and add *crumb of bread*, q. s. As an application to scalds and burns.

POULTICE (Vinegar). Syn. *Cataplasma Aceti*,—Lat. *Prep.* From *crum of bread* soaked in *vinegar*. Applied cold in bruises, extravasations, &c., especially black eyes. *Verjuice* is often employed in the same way.

POULTICE (Yeast). Syn. *Cataplasma Fermenti*,—Ph. L. *C. F. Cerevisiæ*,—Ph. D. 1826. *Prep.* (Ph. L.) *Beer yeast* and *water* at 100° Fahr., of each, 5 fl. oz.; mix, stir in *flour*, 1 lb; and place it near the fire until it rises. In gangrenous or foul ulcers; to correct the fœtor of the discharge, and to hasten the sloughing.

POULTRY. Domestic birds, which are propagated and fed for the table, and for their eggs, feathers, &c.

The poultry of this country are the common *domestic fowl*, the *turkey*, the *duck*, and the *goose*; to which some writers add the *guinea fowl*, and the *peacock*. Of these, the first (*phasianus gallus*,—Linn.) is the most generally useful. Though a native of India, it accompanies man through almost every gradation of civilization and climate, and flourishes almost everywhere, when properly secured from the inclemency of the weather, and allowed an ample supply of fresh air, with proper food. For the production of abundance of eggs, it must, however, be well fed, and warmly lodged. The *hen-roosts* and *poultry-house* should be well protected from the weather, and their temperature should be duly maintained by proximity to the stables, cow-houses, or dwelling-house, and, in cold weather, by the employment, when necessary, of artificial heat. The *food* should also contain an ample supply of nitrogenous matter, for without this how can it be expected that hens can produce abundance of eggs, which are peculiarly rich in nitrogen. The "*greaves*" of the tallow-chandlers, and such-like substances, are hence excellent additions to the ordinary food of poultry. But it is not sufficient merely to supply poultry with abundance of food and warmth; it is equally necessary that they should have ample space for exercise and recreation. This space "should always contain living plants of various kinds, and some gravelly or sandy soil; because worms, snails, as well as, occasionally, grass and herbage, form a part of the food of poultry; and sand or gravel is swallowed by them for the purpose of promoting digestion. Hence, no healthy poultry can ever be reared in towns, however much the natural food may be imitated by the supply of animal matters, herbage, and sand." (Loudon.)

Choice. The "*age* is known by the spur, and the *quality* by the skin. There is, perhaps, no poultry in the world that comes up to the well-fed Dorking capon. The new breed of *Cochin China fowls* (of which the best for eating is the grey kind), if fed and treated in the same way as the Dorking capon, might produce a larger fowl, but it is questionable if so tender." (Soyer.) White-legged fowls are generally preferred, but there are black ones equally as good; and many judges say that the yellow-legged ones are better than either. See *Eggs*, *Food*, *Fattening*, *Boiling*, *Roasting*, &c.

POUNCE. *Powdered gum sandarac* generally passes under this name. It is used to prepare *parchment* for writing on, and to prevent *ink* from spreading upon *paper* after erasures. *Powdered cuttle-fish bone* is occasionally employed in the same way. Both are applied to the surface by means of a cylindral roll of *list*, called a "*rubber*." *Packers* rub the surface of porous and greasy wood, as the heads of boxes, cases, casks, &c., with *whiting*, or *powdered rosin*, to make them bear the ink. The *coloured powders* used by *pattern drawers*, for sprinkling over pricked papers, are also called pounce. For *liquid pounce*, see *Marking Ink*.

POWDER. Syn. *Pulvis*,—Lat. Powders are divided by pharmaceutical writers into two classes—*simple* and *compound*. The first are prepared by simple pulverization; the second, by the admixture of two or more simple powders. For *use*, the appropriate *doses* are separately weighed, and placed in separate papers. They are usually *exhibited* in a little honey, sugar, or milk, either taken from a spoon, or made into an electuary or bolus, and swallowed in the semi-solid form. Metallic and other

heavy powders are best taken in the latter state. *Very active substances* should be, in all cases, mixed with some inert powder, as that of starch, gum, liquorice, or marshmallow, at the time of "dispensing" them.

"This form of preparing medicines is the simplest, and perhaps the least objectionable; but it is not applicable to all the articles of the Materia Medica. Those remedies which are very unpleasant to the taste; those which deliquesce rapidly when exposed to the air, or are very volatile; and those which require to be given in very large doses, or which are not diffused readily in water, cannot, with propriety, be administered in the form of powder. Some substances cannot be reduced to powder unless they be very much dried; and the heat necessary for that purpose alters their properties." Nor can we "be surprised that a great alteration should be effected in a short time by the action of the air on so great an extension of surface as takes place in the operation usually adopted for reducing drugs to a fine powder." (A. T. Thomson.)

In this country, *compound powders* appear to be a favorite form of medicine in the diseases of infancy and childhood.

"It is necessary that whatever we order to be reduced to powder should be *rubbed through a fine sieve*, so that the impurities and coarser parts may be separated; and it is needful that most powders should be recently prepared, and not too long kept." (Ph. L.)

As nearly all powders suffer by exposure to the air and light, they should be preserved in closely corked opaque or green-glass bottles, or in tin canisters from which the external air is carefully excluded. See *Pulverization, &c.*

The following formulæ include all the powders (*pulveres*) of the British Pharmacopœias, with some others of interest or utility:—

POWDER (Algaroth's). See *Oxychloride of Antimony.*

POWDER (Almond,—Cosmetic). This is noticed under "*almond paste.*" It is *used* for cleaning and softening the skin, and may be scented at will. (See *p.* 938.)

POWDER (Aloes,—Compound.) Syn. *Pulvis Aloës Compositus,*—Ph. L. *P. Aloës cum Guaiaco,*—Ph. L. 1788 & Ph. D. 1807. *P. Aloëticus cum Guaiaco,*—Ph. L. 1787. *P. de Diambræ,*—Ph. L. 1720. *Prep.* (Ph. L.) *Socotrine* or *hepatic aloes* (in powder), 1½ oz.; *guaiacum* (in powder), 1 oz.; *compound cinnamon powder*, ½ oz.; rub them together. A warm, sudorific purgative. *Dose.* 10 to 20 gr.

POWDER (Aloes with Canella). Syn. *Pulvis Aloës cum Canellâ,*—Ph. D. 1826 & Ph. L. 1746. *Aloetic Powder, Holy Bitter, Hiera Picra,*—Obs. var. *Prep.* From *powdered socotrine* or *hepatic aloes*, 4 parts; *powdered white canella*, 1 part. *Uses* and *dose*, as the last.

Obs. Once a highly popular remedy. It was originally made into an electuary with honey, and in this form was frequently called *Hiera Logadii.* It is still a favorite in domestic medicine and veterinary practice. The principal objection to both this and the preceding preparation, is the nauseous flavour of the aloes, which is ill concealed by the aromatics. The "*hiera picra*" for farriers is usually made with the cheapest Cape aloes.

POWDER (Alum,—Compound). Syn. *Styptic Powder; Pulvis Stypticus; P. Aluminis Compositus,*—Ph. E. *Prep.* (Ph. E.) *Alum*, 4 oz.; *kino*, 1 oz.; mix them, and reduce them to fine powder. Astringent and styptic. *Dose.* 5 to 15 gr.; in diarrhœa, profuse menstruation, &c. *Externally*, in hæmorrhages, &c.

POWDER (Anchovy). Syn. *Pulvis Clupeæ Encrasicoli,*—Lat. *Prep.* Pound *anchovies* to a paste, then rub them through a sieve, and add enough *flour* to make a dough, which must be rolled out into thin slices and dried by a gentle heat in a stove; it is, lastly, powdered and bottled. Colouring is frequently added. Chiefly *used* to make sauces. British anchovies are frequently substituted for the genuine fish.

POWDER (Antimonial). Syn. *Fever Powder, Lisle's do.; James's do.* (?); *Pulvis Jacobi* (?); *Pulvis Antimonialis,*—Ph. E. & D. *Pulvis Antimonii Compositus,*—Ph. L. *Oxydum Antimonii cum Phosphate Calcis,*—Ph. E. 1817. *Prep.* 1. (Ph. L.) A mixture of *tersulphuret of antimony*, 1 lb., and *hartshorn shavings*, 2 lb., is reduced to powder, thrown into a crucible heated to whiteness, and stirred constantly until vapour no longer rises; the calcined mixture is then rubbed to powder, again put into the crucible, and the heat gradually increased to whiteness, and maintained so for 2 hours; the residuum is, lastly, reduced to a very fine powder.

2. (Ph. E.) From *sulphuret of antimony* and *hartshorn shavings*, equal weights; as the last.

3. (Ph. D.) *Tartarized antimony*, 4 *oz.*, is dissolved in *water*, ½ gall.; and added to a *solution of phosphate of soda*, 4 *oz.*, in *water*, 1 quart; a *solution of chloride of*

calcium, 2 *oz.*, in *water*, 1 quart, and to which *solution of ammonia* (Ph. D.), 4 fl. oz. has been added, is next poured in, and the whole boiled for 20 minutes; the precipitate is then collected on a *calico filter*, and washed with *hot distilled water*, until the liquid which passes ceases to give a precipitate with a *weak solution of nitrate of silver*; it is, lastly, dried by a *steam* or *water heat*, and reduced to a fine powder.

Uses, &c. Febrifuge and diaphoretic. Intended as a substitute for the proprietary and more expensive James's powder. *Dose.* 3 to 10 or 12 gr., or more, repeated every fourth or fifth hour until diaphoresis is set up; in fevers, rheumatic affections, chronic skin diseases, &c. It is a very uncertain and variable compound, unless it has been carefully prepared. Dr. Elliotson exhibited it in doses of upwards of 100 gr., without producing any sensible effect. A *spurious article*, made by triturating 1 *oz.* of *tartar emetic* with 18 or 19 *oz.* of *burnt hartshorn*, is frequently sold for it in the shops. It appears to differ from the true *James's powder* in containing *antimonious acid*, instead of *teroxide of antimony*. See *Antimonious Acid* and *James's Powder*.

POWDER (Antimony,—Compound). See *Antimonial Powder*.

POWDER (Aromatic). See *Compound Cinnamon Powder*.

POWDER (Arsenical). See *Escharotic Powder*.

POWDER (Asarabacca, — Compound). See *Cephalic Snuff*.

POWDER (Astringent). Syn. *Pulvis Astringens, P. Stypticus*,—Lat. *Prep.* From *Aleppo galls* and *burnt alum*, in fine powder, equal parts. *Used* in piles, soft polypi of the nose, chilblains, &c.

POWDER (Baking). *Prep.* 1. *Tartaric acid*, ½ *lb.*; *bicarbonate of soda* and *potato farina* or *British arrow-root*, of each, ¾ *lb.*; (each in powder;) separately dry them *perfectly* by a very gentle heat, then mix them in a dry room, pass the mixture through a sieve, and at once put it into packets, observing to press it hard, and to cover it with tinfoil or close-made paper, to preserve it as much as possible from the air lastly, and moisture.

2. (*Delforte's.*) *Powdered tartaric acid*, ¼ *lb.*; *powdered alum*, ½ *lb.*; *bicarbonate of soda*, ¾ *lb.*; *farina*, 1 *lb.*; dry separately, as before, mix, and further add of *sesquicarbonate of ammonia* (in powder), 3 *oz.*; lastly, closely pack it in tinfoil.

3. (*Green's.*) *Tartaric acid*, 35 *lb.*; *sesquicarbonate of soda*, 56 *lb.*; *potato flour* 1 cwt.; mix as before.

Uses, &c. Baking powder is chiefly employed as a substitute for yeast. 1 or 2 tea-spoonfuls are mixed with the dry flour and other ingredients, which are then made into a dough, as *quickly as possible*, with *cold water*, and *at once* baked or boiled, as the case may be. By the addition of about ½ dr. of *turmeric powder* to each *pound of the mixture* it is converted into *egg powder*. When intended to be kept for any length of time it should be preserved in bottles or tins, so as to prevent the absorption of moisture. We have discovered *traces* of *arsenic* in some of the baking powders of the shops, which we refer to common washerwoman's soda being used in their composition, instead of the pure carbonate or sesquicarbonate.

POWDER (Basilic). Syn. *Royal Powder, Cornachini's do.; Pulvis Basilicus, P. Cornachini*,—Lat. *Prep.* From *scammony, calomel, cream of tartar*, and *diaphoretic antimony*, equal parts. This is the formula generally adopted for this compound, which has now long been omitted from the British Pharmacopœias. It is still a favorite with many practitioners, as an alterative purgative, and vermifuge for children. *Dose.* For a child, 2 to 8 gr.; for an adult, 5 to 20 gr. *Compound powder of scammony* is now generally sold for it.

POWDER (Bezoardic). See *Gascoigne's Powder*.

POWDER (Blaine's Distemper). The basis of this preparation is the *aurum musivum*, or *bisulphuret of tin*. (Dr. Paris.)

POWDER (Blancmange). *Prep.* From *sago-meal*, 1 *lb.*; *essence of lemon*, 15 drops; *mace*, 12 gr.; mix.

POWDER (Bleaching). Chloride or hypochlorite of lime. (See p. 693.)

POWDER BLUE. See *Smalts*.

POWDER (Bole, — Compound). See *Compound Chalk Powder*.

POWDER (Bronze). See *Bisulphuret of Tin, Bronzing, &c.*

POWDER (Burnt Hartshorn). Syn. *Pulvis Cornu Cervini Usti*,—Ph. D. 1826. *Prep.* From pieces of *hartshorn* calcined to whiteness, and powdered. It consists principally of phosphate of lime. *Dose.* 10 to 30 gr.; in rickets, &c.

POWDER (Burnt Hartshorn, — with Opium). Syn. *Pulvis Opiatus; Pulvis Cornu Usti cum Opio*,—Ph. L. 1824. *Prep.* From *powdered calcined hartshorn*, 1 oz.; *powdered opium* and *cochineal*, of each, 1 dr. *Dose.* 5 to 20 gr.

POWDER (Capuchin). *Prep.* From *powdered cevadilla, parsley seed, stavesacre*, and

tobacco, equal parts. *Used* to destroy pediculi.

POWDER (Castillon's). *Prep.* From *sago-meal*, *salep*, and *gum tragacanth*, of each, 3 dr.; *prepared oyster shells*, 1 dr.; *cochineal*, q. s. to colour. Absorbent. *Dose.* ½ to 1 dr., boiled in milk; in diarrhœa, &c.

POWDER (Catechu,—Compound). Syn. *Pulvis Catechu Compositus*,—Ph. D. *Prep.* (Ph. D.) Take *catechu* and *kino*, of each, 2 *oz.*; *cinnamon* and *nutmeg*, of each, ½ *oz.*; reduce each to a fine powder, mix, and keep the prepared powder in a well-stopped bottle. Aromatic and astringent. *Dose.* ½ dr. to 2 dr.; in various affections.

POWDER (Chalk,—Compound). Syn. *Pulvis Creta Compositus*,—Ph. L. E. & D. *P. Carbonatis Calcis Comp.*,—Ph. E. 1841. *P. è Bolo Compositus*, *P. è B. sine Opio*, *Species è Scordio sine Opio*,—Obs. var. *Prep.* 1. (Ph. L.) *Prepared chalk*, ½ lb; *cinnamon*, 4 oz.; *tormentil* and *gum acacia*, of each, 3 oz.; *long pepper*, ½ oz.; rub them, separately, to a very fine powder, and mix them.

2. (Ph. E.) *Prepared chalk*, 4 oz.; *cinnamon*, in fine powder, 1½ dr.; *nutmeg*, in fine powder, 1 dr.

3. (Ph. D.) *Prepared chalk*, 5 *oz.*; *cinnamon*, 2½ *oz.*; *gum*, 2 *oz.*; *nutmeg*, ½ *oz.*

Uses, *&c.* Aromatic, astringent, and antacid. *Dose.* 10 to 30 gr.; in acidity, flatulence, heartburn, diarrhœa, &c. The following form is used by many wholesale houses:—*prepared chalk*, 4 *lb.*; *powdered cassia*, 2 *lb.*; *powdered calamus aromaticus*, ¾ *lb.*; *powdered gum*, 1½ *lb.*; *long pepper*, ¼ *lb.*

POWDER (Compound Chalk,—with Opium). Syn. *Opiated Chalk Powder*; *Pulvis Cretæ Compositus cum Opio*,—Ph. L. *Pulvis Cretæ Opiatus*,—Ph. E. & D. *P. Opiatus*,—Ph. E. 1839, and Ph. L. 1787. *P. è Bolo Comp. cum Opio*, *Species è Scordio cum Opio*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Compound chalk powder*, 6½ oz.; *powdered opium*, 80 gr.

2. (Ph. E.) *Compound chalk powder*, 6 oz.; *powdered opium*, 80 gr.

3. (Ph. D.) *Compound chalk powder*, 4 *oz.* 7 *dr.*; *opium*, in fine powder, 1 dr.

4. (*Wholesale.*) *Compound chalk powder*, 21 *oz.*; *powdered opium*, ½ *oz.* Anodyne, antacid, and carminative. *Dose.* 10 to 30 gr.; in the same cases as the preceding, than which it is more active. It has long been a favorite remedy in all cases of simple, and even choleraic diarrhœa.

POWDER (Chalk Mixture). Syn. *Pulvis pro Mistura Cretæ*,—Lat. *Prep.* (Mr. Beasley.) *Powdered gum acacia*, 5 oz.; *prepared chalk*, 4 oz.; *white sugar*, 3 oz.; *oil of cinnamon*, 1½ fl. dr.; mix. 40 gr. of this powder triturated with 1 fl. oz. of *water*, forms the *mistura cretæ* of the Pharmacopœia.

POWDER (Cholera,—Saline). Syn. *Pulvis Salinus Anticholericus*,—Lat. *Prep.* 1. (Dr. O'Shaughnessey.) *Carbonate of soda*, 5 gr.; *chloride of sodium*, *phosphate of soda*, and *sulphate of soda*, of each, 10 gr. For a *dose*.

2. (Dr. Stevens.) See *p.* 251.

POWDER (Cinnamon,—Compound). Syn. *Aromatic Powder*; *Pulvis Cinnamomi Compositus*,—Ph. L. *Pulvis Aromaticus*,—Ph. E. & Ph. L. 1788. *Species Aromaticæ*,—Ph. L. 1746. *S. Diambræ sine Odoratis*,—Ph. L. 1721. *Prep.* (Ph. L.) *Cinnamon*, 2 oz.; *cardamoms*, 1½ oz.; *ginger*, 1 oz.; *long pepper*, ½ oz.; rub them together so that a fine powder may be made.

2. (Ph. E.) *Cinnamon*, *cardamom seeds*, and *ginger*, equal parts; to be kept in a well-closed glass vessel.

3. (Ph. D.) *Cinnamon* and *ginger*, of each, 2 *oz.*; *cardamon seeds* (husked), and *nutmegs*, of each, 1 *oz.* Aromatic and carminative. *Dose.* 10 to 30 gr. In the powder of the shops *cassia* is very frequently substituted for *cinnamon*.

POWDER (Clarifying). Powdered albumen. (See *p.* 31.)

POWDER (Cockle). From the well-known shell-fish *cardium edule* (Linn.), as "*oyster powder*."

POWDER (Colbatche's Specific). *Prep.* From *solution of sesquichloride of iron*, and *acetate of lead*, of each, 4 oz.; mix, evaporate to dryness, powder the residuum, and preserve it from the air. Astringent and hæmostatic. *Dose.* 3 to 8 gr.

POWDER (Colocynth). Syn. *Pulvis Colocynthidis*,—Lat. That of the shops is generally prepared from the whole of the peeled fruit, with the seeds, instead of merely from the pulp; by which its activity is greatly lessened. A *factitious article* is also met with in trade, made by grinding *bryony root* with about twice its weight of *colocynth seeds*, and a very small quantity of *gamboge*.

POWDER, (Contrayerva,—Compound). Syn. *Pulvis Contrayervæ Compositus*,—Lat. *Prep.* (Ph. L. 1824.) *Powdered contrayerva root*, 5 oz.; *prepared oyster-shells*, 1½ lb.; mix. A tonic absorbent or antacid. *Dose.* 10 gr. to ½ dr., as required.

POWDER (Corn). See *Corn Solvents* (p. 293), and *Wart Powder* (below).

POWDER (Cosmetic). See *Almond*

Powder, Hair do.; Scented Powders, Pastes, &c.

POWDER (Cosmetic). Syn. *Pulvis Cosmeticus*,—Lat. *Prep.* (Ph. Hann. 1831.) *Blanched sweet almonds* and *beans*, of each, 18 oz.; *orris root*, 8 oz.; *white Spanish soap*, 6 oz.; *spermaceti*, 1½ oz.; *dried carbonate of soda*, 1 oz.; *oils of lavender, bergamot*, and *lemon*, of each, 6 dr.; mix, and beat them to a powder. See *Hand Powder.*

POWDER (Crystal). From *quartz*, like "Powdered Glass." *Used* to make fine glass; also as a dryer for paints; and, under the name of "*Diamond Dust*," for razor strops.

POWDER (Curry). Syn. *Indian Curry Powder.* The samples of this compound prepared by different houses vary so greatly from each other in the proportions of the ingredients, that it is difficult to regard any one as a standard. The following are therefore merely given as examples:—

Prep. 1. *Corianders*, 1 *lb.; turmeric*, ¾ *lb.; black pepper*, ½ *lb.; scorched mustard*, ¼ *lb.; ginger*, 2 *oz.*; *cumin seed*, 1 *oz.; capsicums*, ¾ *oz.; mace*, ¼ *oz.*; (all in powder;) mix well.

2. *Coriander seeds* and *black pepper*, of each, 8 *lb.; turmeric* and *cumin seeds*, of each, 4 *lb.; allspice*, ¾ *lb.*; *mace*, 1 *oz.*; (all in powder); mix. This receipt is employed by an eminent wholesale house that does very largely in currie powder. *Used* as a condiment and flavouring ingredient. The addition of a *few heads* of *garlic* gives it an increased zest for Indian veterans.

POWDER (Custard). *Prep.* From *sago meal*, 2 *lb.; powdered turmeric*, ½ *oz.; bitter-almond powder, cassia*, and *mace*, of each, ½ dr.

POWDER (Cyprus). From *lichen rangiferinus* (Linn.) or *rein-deer moss.* It has a very agreeable smell, and being extremely retentive of odours, is much used as a basis for *scent-powders, sachets, &c.* The lichen *evernia prunastri* or *ragged hoary evernia*, also possesses nearly similar properties, and is often substituted for it. See *Scented Powders.*

POWDER (Depilatory). See *page* 325.

POWDER (Diapente). See *page* 326.

POWDER (Disinfecting). Syn. *Pulvis Disinfectans*,—Lat. *Prep.* (Keist.) *Bisulphate of potassa*, 41 parts; *sugar of lead*, 7 parts; *binoxide of manganese*, 3 parts; reduce them separately to a fine powder, and when wanted for *use*, mix a proper quantity in any suitable vessel. For other formulæ, see *Disinfecting Compounds.* The name is commonly applied to *Chloride of lime.*

POWDER (Dover's). Syn. *Pulvis Doveri*,—Lat. *Prep.* (Original Formula.) *Nitre* and *sulphate of potash*, of each, 4 oz.; melt them together in a red-hot crucible, reduce the cold fused matter to powder, and add *powdered ipecacuanha, liquorice*, and *opium*, of each, 1 oz. This is the formula adopted in the Paris Codex. *Compound Ipecacuanha Powder* is now sold under this name. (See *below.*)

POWDER (Egg). See *Baking Powder.*

POWDER (Emmenagogue). Syn. *Pulvis Emmenagogus, P. Hæmatinus, P. contra Amenorrhœam*,—Lat. *Prep.* 1. *Saccharine carbonate of iron*, 3 parts; *powdered myrrh, ginger*, and *nutmeg*, of each, 1 part; divide into ½ dr. papers. One for a *dose*, twice or thrice daily.

2. (Augustin.) *Myrrh*, 12 gr.; *saffron*, 3 gr; *oil of cloves*, 1 drop. For a *dose*, as the last.

3. (Klein.) *Calomel*, 4 gr.; *extract of yew*, 10 gr.; *powdered savine*, 1 dr.; *Quevenne's iron*, ½ dr.; *loaf sugar*, 2 dr. For 6 powders; as before.

POWDER (Epilepsy). Syn. *Pulvis Antepilepticus, P. ad Epilepsiam*,—Lat. *Prep.* 1. (Ph. E. 1744.) *White dittany, peony, misletoe of the oak*, and *valerian*, equal parts. *Dose.* 12 to 60 gr.

2. (*Poudre de Guttète.*) From *misletoe, peony root* and *seeds, prepared coral, elk's hoof, orache seeds*, and *white dittany*, of each, 2 parts; reduced to powder. *Dose.* 2 to 6 gr., in the convulsions of infants; ½ to 1 dr., in epilepsy.

3. (*Poudre de Ragola.*) From *misletoe, valerian, orange leaves*, and *sugar*, of each, 4 dr.; *magnesia*, 1 dr.; *oxide of zinc*, ½ dr.; *oil of cajeput*, 40 drops. *Dose.* 15 to 20 gr., thrice daily.

4. (*Sommer's Specific.*) From *wall-crop* and *lump sugar*, of each, 1 dr.; divide into 8 powders. *Dose.* One, twice a day until all are taken.

POWDER (Escharotic,—Arsenical). Syn. *Pulvis Escharoticus Arsenicalis*,—Lat. *Poudre du Frères Cosme*,—Fr. *Prep.* 1. (*Original formula.*) From *white arsenic*, 12 gr.; *burnt hartshorn*, ½ dr.; *cinnabar*, 1 dr.

2. (P. Cod.) *Red sulphuret of mercury* and *powdered dragon's blood*, of each, 2 parts; *levigated arsenious acid*, 1 part; carefully mixed together. See *Arsenical Caustic.*

POWDER OF ETHIOPIA (Guy's). A mixture of *tin filings* with about 1-3rd their weight of *æthiop's mineral*, triturated together. Vermifuge.

POWDER (Extract of Colocynth,—Com-

pound). Syn. *Pulvis Extracti Colocynthidis Compositi*,—Lat. *Prep.* From *compound extract of colocynth* (Ph. L. 1836), dried by a gentle heat, and powdered.

Obs. This, like many other articles employed by lazy dispensers, does not represent the preparation for which it is used as a substitute; whilst, from its peculiar character, it is very open to sophistication, a practice, we regret to say, very general with certain druggists. Indeed some of these parties make this article by simply throwing the *ingredients of the extract* into a pan along with a *little water*, and when they have become soft, stirring them together with a spatula, after which they are desiccated, and powdered. This is then labelled by certain houses "*Pulv. Ext. Coloc. Co. P. L.*" and sold to their unfortunate customers as such, although, no such an extract has been in the Ph. L. since that of 1836.

POWDER (Faynard's). The *charcoal* of *beechwood*, finely powdered. (Paris.) *Used* in piles, and as a styptic.

POWDER (Fever). See *Antimonial Powder.*

POWDER (Filtering). See *p.* 455.

POWDER (Flint.) Syn. *Silex Contritus*, —Ph. L. *Prep.* As powdered glass. (See *p.* 529.) It is ordered in the Ph. L. to be employed, instead of magnesia, for the purpose of mechanically dividing the *essential oils* used in the preparation of *distilled waters.* It is also used as an escharotic.

POWDER (Fly). *Prep.* From *white arsenic*, 5 *oz.*; *white sugar*, 6 *lb.*; *rose pink*, 2 *oz.*; mix, and put 6 dr. in each paper. *Used* to kill flies. It is *poisonous*, and should be employed with great caution, particularly where there are children.

POWDER (Fulminating). See *page* 497.

POWDER (Fumigating). Syn. *Pulvis Fumalis*,—Lat. *Prep.* (Ph. Russ.) *Amber*, *mastic*, and *olibanum*, of each, 3 parts; *storax*, 2 parts; *benzoin* and *labdanum*, of each, 1 part; reduce them to coarse powder, and mix them well. See *Fumigations.*

POWDER (Galls, — Compound). Syn. *Pulvis Gallæ Compositus*,—Lat. See *Astringent Powder.*

POWDER (Gascoigne's). Syn. *Pulvis Gascoigni*,—Lat. *Prep.* From *powdered crabs' claws*, 1 *lb.*; *oriental bezoar*, 1 *oz.* When made into balls it forms *Gascoigne's balls.* This powder was once held in great repute as an absorbent, &c. It is, however, no better than the less costly *prepared chalk* of modern pharmacy.

POWDER (Goelis's Antihectic). *Prep.* From *burnt hartshorn*, *powdered nutmeg*, *black pepper*, and *roasted laurel berries*, of each, 1 part; *liquorice powder*, 3 parts. *Dose.* ½ to 1 dr.; in the hectic fever of scrofulous subjects.

POWDER (Goulard). Effloresced sugar of lead. *Poisonous.*

POWDER (Gray). Mercurial powder.

POWDER (Gregory's). See *Compound Rhubarb Powder.*

POWDER (Guy's). See *page* 1058.

POWDER (Hæmostatic). Syn. *Pulvis Hæmostaticus*,—Lat. *Prep.* 1. (Guibourt.) *Charcoal* and *gum arabic*, of each, in powder, 1 part; *powdered resin*, 4 parts.

2. (Mialhe.) From *powdered alum*, *gum tragacanth*, and *tannin*, equal parts. *Used* to check local bleeding.

POWDER (Hair). Syn. *Pulvis pro Crine*,—Lat. *Starch* reduced to a very fine powder, and then *scented* according to the fancy of the artist; it is, lastly, passed through a gauze sieve. In its simple form, without any addition, it constitutes "*plain hair powder.*" In other cases it is distinguished by the name of the substance added to perfume it. Thus, we have "*Rose hair powder*," "*Violet do.*," &c. Potato farina, well triturated, is now commonly used for hair powder. Amongst the lower classes, the contents of the "flour dredger" of the kitchen, are frequently misappropriated to this purpose. See *Scented Powders* (below).

POWDER (Hand). *Prep.* From *almond powder*, 1 *lb.*; *powdered cuttle-fish bone* and *white soap*, of each, 4 *oz.*; *orris powder*, 1 *oz.*; mix. *Used* to clean the hands, and to render them soft and white. See *Cosmetic Powder.*

POWDER (Helvetius's). Syn. *Pulvis Helvetii*,—Lat. A mixture of *powdered alum* and *dragon's blood.* (Dr. Paris.)

POWDER (Herrenschwand's Specific). See *p.* 948.

POWDER (Hiera Picra). See *page* 1055.

POWDER (Hufeland's). Syn. *Hufeland's Quinquina Factice; Pulvis Cinchonæ Factitius*, *P. Salicis Compositus*,—Lat. *Prep.* From *bennet* (the herb), *calamus aromaticus*, *chestnut bark*, *gentian root*, and *willow bark*, equal parts; reduced to powder.

POWDER (Hunter's). See *Wart Powder.*

POWDER (Hunt's Breakfast). See *page* 273.

POWDER (Hydrophobia). Syn. *Pulvis Antilyssus*,—Lat. *Prep.* 1. (Dr. Asmus.) *Prepared crab's eyes* and *gentian*, of each, 1 *oz.*; *Armenian bole*, ½ *oz.*; *powdered myrrh*, ¼ *oz.*; mix, rub them to a very fine powder. *Dose.* As much as will stand on a sixpenny-piece, every morning fasting, for several days.

2. (Heine.) *Yellow broom*, in fine powder, 2 oz.; *black pepper*, 1 oz.; mix, add of *levigated arsenious acid*, 6 gr.; mix *very carefully*, and put ½ dr. into each paper. *Dose.* 1 paper, twice a day, after a meal.

3. (Dr. Meade.) *Ash-coloured ground liverwort* (peltidea canina *or* lichen caninus), ½ oz.; *black pepper*, ¼ oz.; (both in powder;) mix, and divide it between 4 papers. *Dose.* 1 paper, every morning for four successive days.

4. (*Ormskirk Medicine.*) See *page* 916.

5. (*Pulvis Antilyssus*,—Ph. L. 1746.) As the last.

6. (*Tonquin Powder*,—Sir G. Cobb's.) From *pure musk*, 16 gr.; *red cinnabar*, 48 gr.; well triturated together. To be taken for a dose, in a gill of arrrack, on three alternate days, and repeated in the same manner on the next three changes of the moon.

Obs. All the above have been celebrated as *preventives of hydrophobia;* the *first*, *third*, and *sixth* are, indeed, stated by their respective advocates to be "*infallible.*" Their action may, probably, be through the imagination; but we beg the reader to take them at the same value as other reputed specifics and nostrums. See *Hydrophobia.*

POWDER (Ipecacuanha,—Compound). Syn. *Dover's Powder*, *Compound Powder of Ipecacuanha with Opium; Pulvis Doveri; Pulvis Ipecacuanhæ Compositus*,—Ph. L. E. & D. *Poudre d'Ipecacuanha et d'Opium*,—Fr. *Prep.* 1. (Ph. L.) *Ipecacuanha* and *opium*, of each, in fine powder, 1 dr.; *sulphate of potassa*, in fine powder, 1 oz.; mix them (thoroughly). The Edin. & Dublin formulæ are similar.

2. (P. Cod.) *Nitre* and *sulphate of potassa*, of each, 4 oz.; *ipecacuanha*, *liquorice root*, and *hard extract of opium*, of each, 1 oz. This closely resembles the original formula.

3. (*Wholesale.*) From *powdered ipecacuanha* and *opium*, of each, 1 *lb.; powdered sulphate of potash*, 8 *lb. Uses*, &c. Dover's powder is a powerful and valuable sudorific. *Dose.* 5 to 15 or 20 gr., followed by warm diluents; in inflammatory affections, rheumatisms, colds, &c.

POWDER (Itch). Syn. *Pulvis Antipsoricus*,—Lat. *Prep.* 1. *Sulphur* and *potato farina*, of each, ½ *lb.; essence of bergamot*, ¼ *oz.;* mix.

2. (*Poudre de Pihorel.*) A mixture of finely pulverized *sulphuret of calcium* and *farina*, in nearly equal quantities. *Used* either as a dusting powder, or mixed with a little oil or fat, and rubbed into the affected part.

POWDER (Jalap,—Compound). Syn. *Pulvis Jalapæ Compositus*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Jalap*, 3 oz.; *bitartrate of potassa*, 6 oz.; *ginger*, 2 dr.; rub them separately into fine powder, then mix them.

2. (Ph. E.) As the last, *omitting* the *ginger.*

3. (Ph. D.) *Jalap*, 2 *oz.; bitartrate of potassa*, 3½ *oz.; ginger*, ½ *oz.;* (all in fine powder;) mix by careful trituration. *Dose.* 20 to 60 gr.; as a purgative in habitual costiveness, dropsies, &c.; also in worms, the tumid bellies of children, &c.

4. (*Pulvis Lenitivus; Sucre Orangé Purgatif.*) From *refined sugar*, ¾ *lb.; jalap* and *cream of tartar*, of each, 2 *oz.; oil of orange-peel*, ¼ *oz.* A popular purgative on the Continent. *Dose.* 1 to 3 dr.

POWDER (James's). Syn. *Pulvis Jacobi*, *P. Febrifugus Jacobi*,—Lat. The *antimonial powder*, or *compound powder of antimony*, of the Pharmacopœias, is the preparation which usually passes under this name; but the *true James's powder* is a nostrum, the pretended secret of the preparation of which is claimed to be possessed by only two parties in the kingdom. The *patent specification* of the once celebrated Dr. James runs as follows:—

"Take of *antimony*, calcine it with a continued protracted heat, in a flat, unglazed earthen vessel, adding to it, from time to time, a sufficient quantity of any *animal oil* and *salt*, well dephlegmated; then boil it in *melted nitre* for a considerable time, and separate the *powder* from the nitre by dissolving it in water." On this, it has been remarked, that it yields a product totally different from that which Dr. James and his successors have sold under the name, and he has hence been charged with concealing the real formula for his powder, and publishing a false one in its stead.

According to Dr. Robinson, the original formula for this nostrum, and that still adopted by the vendors of the proprietary article at the present day, is—*Tartarized antimony*, 1 part; *prepared burnt hartshorn* and *calx of antimony*, of each, 5 parts; carefully mixed together, and divided into 21-gr. powders. ('Phil. Journ. Pharm.,' vi, 282.) If this formula be the true one, as asserted, we suspect heat must be employed in the process.

Perhaps no nostrum ever received such extensive patronage from the faculty as James's powder. Dr. James was himself remarkably successful in its use, but whether his success depended upon his powder, or the mercurials and bark which he commonly employed at the same time, is still undetermined. The death of an eminent per-

sonage, as was asserted, from a dose of this nostrum, at one time injured its sale, but the unfortunate circumstance was soon forgotten, and the happy proprietors continued as prosperous as ever.

POWDER (Kino, — Compound). Syn. *Pulvis Kino Compositus*,—Ph. L. and Ph. D. 1826. *Prep.* (Ph. L.) *Kino*, 15 dr.; *cinnamon*, 4 dr.; *dried opium*, 1 dr.; reduce them separately to fine powder, and then mix them. Astringent. *Dose.* 5 to 20 gr.; in diarrhœa, pyrosis, &c.

POWDER (Lausanne). *Prep.* From *nitre*, 1½ dr.; *carbonate of magnesia*, *bitartrate of potassa*, *precipitated sulphur*, and *oleosaccharum of peppermint*, of each, 4 dr.; *sugar of milk*, 1 oz. Lenitive and antidysenteric.

POWDER (Laxative, — St. Germain). See *Species*.

POWDER (Liquorice,—Compound). Syn. *Pulvis Glycyrrhizæ Compositus*, *P. Pectoralis Kurellæ*,—Lat. *Prep.* (Ph. Bor.) *Liquorice root* and *senna leaves*, of each, 6 oz.; *fennel seed* and *milk of sulphur* (pure), of each, 3 oz.; *white sugar*, 18 oz. (all in fine powder); mix. Pectoral and laxative.

POWDER (Magnesia and Rhubarb). See *Compound Rhubarb Powder*.

POWDER (Martin's Cancer). An American nostrum, composed of the *powdered stems* of the *orobanche Virginiana* (Linn.) combined with a *very small quantity* of *arsenious acid*. It is *used* as a sprinkle for open cancers, and cancerous sores.

POWDER (M'Kinsey's). See *Patent Medicines*.

POWDER (Mercurial). Syn. *Mercury with Chalk*. In addition to the authorised formulæ given at *p.* 781-2, the following may be found useful:—Take of *mercury*, 3 oz.; *powdered resin*, ¾ oz.; *prepared chalk*, 5 oz.; *rectified spirit*, q. s.; make a paste with the *resin*, and a small quantity of the *spirit*; add the *mercury*, which may be extinguished in a short time; then the *chalk* and *alcohol*, gradually, so as to keep up the pasty consistence; lastly, add *sufficient spirit* to dissolve out the *resin*, wash the powder on a filter, and dry it. *Rectified oil of turpentine* may be substituted for the spirit.

POWDER (Milk). See *page* 789.

POWDER (Morison's Aperient). See *Patent Medicines*.

POWDER (Mushroom). Syn. *Pulvis Agarici*, *P. A. Esculenti*,—Lat. From *edible mushrooms* dried by a gentle heat, and then powdered along with a little *white pepper*, *cloves*, and *mace*. Some *cayenne* is frequently added.

POWDER (Mussel). From the *mytilus edulis* (Linn.), or *common mussel*, in the same way as *Oyster powder*.

POWDER (Myrrh,—Compound). Syn. *Pulvis è Myrrhâ Compositus*,—Lat. *Prep.* (Ph. L. 1788.) *Myrrh*, *dried savine*, *dried rue*, and *Russian castor*, equal parts, rubbed to powder, and then well mixed. Emmenagogue and antispasmodic. *Dose.* 12 to 30 gr.

POWDER (Nursery). See *Violet Powder*.

POWDER (Opiated). See *p.* 1057.

POWDER (Oyster). Syn. *Pulvis Ostreæ*,—Lat. *Prep.* From the *common oyster* (ostrea edulis,—Linn.), pulped through a sieve, made into a paste with *wheaten flour*, and a *little salt*, and then rolled out into thin pieces and dried; these are reduced to powder, sifted, and packed in well-corked bottles. *Used* to make sauce; about 1 *oz.*, to *water* 1 pint. Other shell-fish are treated in the same way.

POWDER (Pea). Syn. *Farina Pisorum*,—Lat. *Prep.* From *peas*, in the usual manner. *Used* to make *extemporaneous pea-soup*.

POWDER (Pearl). *Prep.* From pure *pearl white* and *French chalk* (scraped fine by Dutch rushes), equal parts; triturated together. Some makers add more French chalk. *Used* as a skin cosmetic. This mixture is preferable to *pearl white* alone, from being more adhesive. See *Subchloride* and *Trisnitrate of Bismuth*.

POWDER (Pease). *Prep.* From *dried mint* and *sage*, of each, 4 *oz.*; *celery seed* and *white pepper*, of each, ½ *oz.*; *turmeric powder*, ¼ *oz.*; reduced to fine powder. *Used* as a condiment and kitchen spice.

POWDER (Pectoral). See *above*.

POWDER (Piles). Syn. *Pulvis Antihæmorrhoidalis*, *P. Hæmorrhoidalis*,—Lat. *Prep.* 1. (Fr. Hosp.) *Precipitated sulphur*, 3 oz.; *cream of tartar*, and *black pepper*, of each, 1 oz.; *oil of cubebs*, ½ dr. *Dose.* A teaspoonful, in milk or honey, thrice a day.

2. (*External.*)—*a.* From *Aleppo galls*, in very fine powder, 2 oz.; *opium*, in fine powder, 1 dr. A pinch to be applied occasionally.

b. From *sesquioxide of iron*, 1 oz.; *powdered acetate of lead*, ½ dr. As the last.

POWDER (Plate). Syn. *Pulvis pro Argento*,—Lat. *Prep.* 1. *Jeweller's rouge*, ¼ *lb.*; *prepared chalk* or *levigated burnt hartshorn*, ¾ *lb.*; mix.

2. *Levigated putty powder*, ¼ *lb.*; *burnt hartshorn*, ½ *lb.*; *prepared chalk*, 1 *lb.*; *rose pink*, 1 *oz.*

3. (*Mercurial.*) From *quicksilver with chalk*, 1 *oz.*; *prepared chalk*, 11 *oz.*; mix. *Used* to clean and polish plate. See *Plate.*

POWDER (Plate Boiling). *Prep.* From *cream of tartar*, *common salt*, and *alum*, *equal parts.* A *little* of this powder, added to the water in which plate is boiled, gives to it a silvery whiteness.

POWDER (Plummer's Alterative). See *page* 410.

POWDER (Portland). Syn. *Pulvis Antarthriticus*, *Pulvis Ducis Portlandiæ*,—Lat. *Prep.* (Dr. Paris.) *Roots* of *gentian*, and *round birthwort* (aristolochia rotunda), and the *tops* and *leaves* of *germander* (chamædrys), *ground pine* (chamæpitys), and *lesser centaury* (chirouca centaurium), of each, in powder, equal parts. A once celebrated gout remedy, ascribed to the Duke of Portland. *Dose.* 1 dr., twice or thrice a day, when required.

POWDER (Poterius's Antihectic). Syn. *Antheticum Poterii*, *Diaphoreticum Joviale*, —Lat. *Prep.* Melt together equal parts of *tin* and *metallic antimony*, powder, mix it with 6 parts of *powdered nitre*, and deflagrate it in a red-hot crucible; lastly, powder, and wash the residuum well with water. Astringent and tonic; formerly held in great esteem in hectic and consumption. *Dose.* 10 to 30 gr.

POWDER (Poultice). Syn. *Pulvis pro Cataplasmate*,—Ph. D. 1826. *Prep.* From *linseed meal*, 1 part; *oatmeal*, 2 parts; mixed together.

POWDER (Quevenne's Ferruginous). See *Quevenne's Iron* (p. 650).

POWDER (Rat). See *Rat Poisons.*

POWDER (Rhubarb,—Compound). Syn. *Gregory's Mixture*, *Gregory's Powder*; *Pulvis Rhei Compositus*,—Ph. E. & D. *Prep.* 1. (Ph. E.) *Calcined magnesia*, 1 ℔; *rhubarb*, 4 oz.; *ginger*, 2 oz; all in fine powder; mix, and preserve it from the air.

2. (Ph. D.) *Calcined magnesia*, 6 *oz.*; *rhubarb*, 2 *oz.*; *ginger*, 1 *oz.*

3. *Calcined magnesia* 8 *oz.*; *rhubarb*, 3 *oz.*; *chamomile*, 2 *oz.*; *ginger*, 1 *oz.*

Obs. An excellent stomachic, antacid, and laxative. *Dose.* 20 gr. to ½ dr. Some druggists substitute the *heavy carbonate* for the calcined magnesia ordered above, but this alters the nature of the preparation, and requires the dose to be increased. *Heavy calcined magnesia* may, however, be employed with advantage.

POWDER (Sachet). See *Scented Powders.*

POWDER (Saline,—Compound). Syn. *Pulvis Salinus Compositus*,—Ph. E. & Ph. D. 1826. *Prep.* (Ph. E.) *Pure muriate of soda* and *sulphate of magnesia*, of each, 4 oz.; *sulphate of potash*, 3 oz.; each separately dried by a gentle heat, and pulverized, then triturated together, and preserved in well-closed vessels. An excellent saline purgative. *Dose.* 2 to 6 dr., in ½ pint of water or table-beer, in the morning fasting.

POWDER (Scammony,—Compound). Syn. *Basilic Powder?* *Pulvis Basilicus?* *Pulvis Scammonii Compositus*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Scammony* and *hard extract of jalap*, of each, 2 oz.; *ginger*, ½ oz.; rub them separately to a very fine powder, and then mix them. *Dose.* 5 to 15 gr.

2. (Ph. E.) *Scammony* and *bitartrate of potassa*, of each, in very fine powder, equal parts. *Dose.* 7 to 20 gr.

3. (Ph. D.) *Scammony*, in fine powder, 1 *oz.*; *compound powder of jalap*, 3 *oz.*; mix. *Dose.* 10 to 30 gr.

Obs. The above are favorite cathartics in worms, especially for children. They are commonly sold for *Basilic Powder.* (See *p.* 1056.)

POWDER (Scammony,—with Calomel). Syn. *Pulvis Scammonii cum Calomelane*,—Ph. L. 1788. *Prep.* From *scammony*, ½ oz.; *calomel* and *white sugar*, of each, 2 dr. An excellent vermifuge for children. *Dose.* For an adult, 5 to 20 gr.; for a child, 2 to 8 gr. Sold for *Basilic powder*, to which it approaches nearer in composition than the preceding.

POWDER (Scammony,—with Wood-soot). Syn. *Poudre d'Ailhaut*; *Pulvis Scammonii cum Fuligine*,—Lat. *Prep.* *Scammony*, 2 parts; *wood-soot*, 3 parts; *resin*, 4 parts. Purgative and vermifuge. A once fashionable medicine. *Dose.* 20 to 40 gr.

POWDER (Schmidt's Parturifacient). Syn. *Schmidt's Poudre Ocytique*,—Fr. *Prep.* From *powdered ergot of rye*, *borax*, and *oleo-saccharum* of *chamomile*, of each, 8 gr.; *powdered sugar*, q. s. For a *dose*; to be repeated every quarter of an hour, until some effect is produced.

POWDER (Senna,—Compound). Syn. *Pulvis Sennæ Compositus*,—Ph. L. 1824. *Pulvis è Sennâ Compositus*,—Ph. L. 1788. *Prep.* (Ph. L. 1824.) *Senna and bitartrate of potassa*, of each, 2 oz.; *scammony*, ½ oz.; *ginger*, 2 dr.; all in fine powder; mix. *Dose.* 20 to 30 gr., or more; as a purgative or anthelmintic.

POWDER (Senna,—Battley's Green). Syn. *Pulvis Sennæ Viridis*,—Lat. *Prep.* From *senna leaves* dried and heated until they turn yellow, then powdered along

with a little (blue) *charcoal*, to give a green colour.

POWDER (Silvering). *Prep.* 1. *Silver dust* (fine), 20 gr.; *alum*, 30 gr.; *common salt*, 1 dr.; *cream of tartar*, 3 dr.; rub them together to a fine powder.

2. As the last, but substituting 35 gr. of *nitrate of silver* for the silver dust.

3. *Chloride of silver* is dissolved in a *solution of hyposulphite of soda*, and the solution made into a paste with *levigated burnt hartshorn* or *bone dust*; this is next dried, and powdered.

4. *Silver dust*, 1 *oz.*; *common salt* and *sal ammoniac*, of each, 4 *oz.*; *corrosive sublimate*, ¼ *oz.*

Obs. The above powders, made into a paste with a little water, are *used* to silver dial-plates, statuettes, and other articles in copper, previously *well cleaned*, by friction. The best silver powder for the purpose, is that precipitated from its nitric solution by means of a copper plate. When the product of the last formula is used, the articles should be afterwards made red-hot, and polished.

POWDER (Soap). Syn. *Sapo Contritus*, *Pulvis Saponis*,—Lat. *Castile soap*, sliced or cut small, dried by exposure to a warm atmosphere, or by a very gentle heat, and then powdered. *Used* in dispensing; also as a *hand*, *shaving*, and *tooth powder*. As a cosmetic it may be scented at will.

POWDER (Sponge). Syn. *Pulvis Spongiæ*, *P. Spongiæ Ustæ*,—Ph. D. 1826. *Prep.* Let *sponge*, cut into small pieces, be beaten so as to free it from sand or stones; then burn it in a covered iron vessel, until it becomes black and friable; finally, reduce it to powder. Deobstruent. *Dose.* ½ to 3 dr.; in glandular indurations and enlargements, &c. It should be of a brownish black colour; if over burnt its efficacy is destroyed.

POWDER (Squills). Syn. *Pulvis Scillæ*,—Ph. D. 1826. *Prep.* Remove the membranous integuments from the *bulb* of the *squill*, cut it into thin slices, and dry it at a heat between 90 and 100° Fahr.; next reduce it to powder, and keep it in well-stopped bottles.

POWDER (Sternutatory). See *Snuffs* (Medicated).

POWDER (Styptic). See *p.* 1056-9, &c.

POWDER (Succession). See *page* 950.

POWDER (Tragacanth,—Compound). Syn. *Pulvis Tragacanthæ Compositus*,——Ph. L. and E. *Prep.* (Ph. L.) *Gum tragacanth*, *gum acacia*, and *starch*, of each, in fine powder, 1½ oz.; *powdered white sugar*, 3 oz. The Edinburgh formula is similar. Demulcent. *Dose.* ½ dr. to 2 dr., in water or any simple liquid; in hoarseness and catarrhs, combined with squills and henbane, to allay irritation; in dysentery, combined with ipecacuanha; and in gonorrhœa, strangury, &c., combined with acetate of potassa or nitre.

POWDER (Vienna). Potash with lime. (See *p.* 1044.) The once celebrated refrigerant powder, *pulvis Viennensis albus virgineus*, has now been long obsolete.

POWDER (Violet). Syn. *Nursery Powder*, *Skin do.* This is simply *starch* reduced to a very fine powder, and scented with *orris powder* or *essence of violets*. The *best kinds* are also perfumed with a little *musk* or *ambergris*, and are now generally made with *potato farina*. The *commoner sort* is only scented with a little *essence of bergamot* or *essence of lemon*. "*Plain violet powder*" is, of course, unscented.

Prep. 1. *Powdered starch*, 28 *lb.*; *powdered orris root*, 1 *lb.*; *essence of ambergris* and *essence of bergamot*, of each, ½ *oz.*; *oil of rhodium*, ½ dr.; mix, and pass the powder through a sieve.

2. *Powdered starch*, 14 *lb.*; *essence of bergamot*, ½ *oz.*; *oil of cloves*, ¼ *oz.*; as last. *Used* as a dusting powder in excoriations, &c. See *Cosmetic Powders* (below).

POWDER (Voght's Stomachic). *Prep.* From *powdered nux vomica*, 18 gr.; *powdered ipecacuanha*, 24 gr.; *powdered rhubarb*, *prepared oyster shells*, and *mint oleosaccharum*, of each, 1 dr.; mix, and divide it into 12 powders. One for a *dose*; twice daily.

POWDER (Ward's Sweating). Resembles *Dover's powder*.

POWDER (Wart). Syn. *Corn Powder*, *Cosmetic Caustic*, &c. *Prep.* 1. *Ivy leaves* ground to powder. A pinch is applied with a rag, the part being first moistened with strong vinegar. Useful for soft corns and warts.

2. (*Hunter's.*) From *savine* and *verdigris*, equal parts. See *Corn Solvents*.

POWDER (Warwick's,—Earl of). Syn. *Pulvis Comitis Warwicensis*,—Ph. L. 1721. *Prep.* From *scammony*, prepared with the fumes of sulphur, 2 oz.; *diaphoretic antimony*, 1 oz.; *cream of tartar*, ½ oz. *Dose.* 15 to 30 gr.

Obs. This is a modification of *Cornachini's powder*. It is represented in the present pharmacopœias by *compound scammony powder*. "Cornachini wrote a whole book about his powder, the proportions of the ingredients of which he varied

according to circumstances." (*Med. Lex.*)

POWDER (Washing). The numerous compounds vended under this name have for their basis the *soda-ash* of commerce, blended with common *Scotch soda* in variable proportions. The *best of them* consist either wholly, or chiefly, of the first of these substances. The *alkaline matter* is reduced to coarse powder, and stirred up with *liquid size*, or with a *decoction of linseed*, *Irish moss*, or *British gum*, and is then dried, and again crushed, or powdered, and at once put into the packages, in which it is rammed tight, and covered up immediately. The object aimed at by the manufacturer is to keep his commodity from the air as much as possible; because exposure renders it less caustic, and consequently, less detergent. We have samples of *Green's*, *Ward's*, and several other *Washing powders* now before us; and from personal examination, and the tests which they have been put to in our household, we are absolutely lost to conceive how persons can be so foolish as to purchase such articles at the rate of 8*d*., 10*d*., 1*s*., or even more per *lb*., when they can buy *really good soda* at ¾*d*. This last, rendered partly caustic by a little quicklime, is better than any of them; and 1 *pennyworth of lime*, judiciously used, would, for this purpose, last an ordinary household a *twelvemonth*. From this category, we must, however, exclude the "*Washing Crystal*" of Mr. Manby, of Temple Bar, which candour compels us to admit is a most excellent article of its kind, and, more than all, is "put up" in a very neat and convenient form, especially for toilet use. We always keep a packet of Mr. Manby's article on our dressing table, by which the hard water with which we are supplied is instantly rendered soft and agreeable.

POWDERS (Effervescing). Syn. *Pulveres Effervescentes*,—Ph. E. *Prep.* Take of *tartaric acid*, 1 oz.; *bicarbonate of soda*, 1 oz. 54 gr. (534 gr.), or *bicarbonate of potassa*, 1 oz. 2 dr. 40 gr. (640 gr.); reduce the acid, and either bicarbonate separately to fine powder, divide each of these into 16 powders, and preserve the acid and alkaline powders in separate papers of different colours.

POWDERS (Effervescing Citric). Syn. *Pulveres Effervescentes Citrati*,—Ph. D. *Prep.* Take of *citric acid* (crystallized), 9 *dr.*; *bicarbonate of soda*, 11 *dr.*, or *bicarbonate of potassa*, 13 *dr.*; proceed as last, dividing each into 18 parts.

POWDERS (Effervescing Tartaric). Syn. *Pulveres Effervescentes Tartarizati*,—Ph. D. *Prep.* Take of *tartaric acid* (in crystals), 10 dr.; *bicarbonate of soda*, 11 dr., or *bicarbonate of potassa*, 13 dr.; reduce them to powder, and divide them into 18 parts, as before.

POWDERS (Ginger Beer). Syn. *Pulveres Effervescentes cum Zingibere*,—Lat. *Prep.* 1. *Powdered white sugar*, 1 to 2 dr.; *bicarbonate of soda*, 26 gr.; *finest powdered Jamaica ginger*, 6 gr.; *essence of lemon*, 1 drop; mix, and wrap it in BLUE PAPER. In the WHITE PAPER put of *powdered tartaric acid*, 35 gr., or of *powdered citric acid*, 30 gr.

2. *Finest Jamaica ginger*, 1 dr.; *bicarbonate of soda*, 5 dr.; *white sugar*, 16 dr.; *essence of lemon*, 6 or 8 drops; mix, and divide it between 12 papers (*blue*). For the *white papers*, divide *tartaric acid*, 6 dr., in the same way. By taking the *drachms* as *ounces* the quantity will be sufficient for 8 dozen. For *use*, dissolve one of each colour separately in somewhat less than half a glass of water, mix the two, and drink the mixture whilst effervescing.

3. (*In one bottle.*)—*a.* The *sugar* and the *saline ingredients* are separately dried by a very gentle heat, then mixed in a dry room with the *ginger* and *essence of lemon*, and *at once* put into bottles.

b. By adding to the *lemoniated kali*, noticed at *page* 1039, about 1-16 of its weight of the *finest powdered Jamaica ginger*, (i. e., ½ *dr.* to each *oz.*; 1 *oz.* to each *lb.*,) at the time of mixing the ingredients together. A dessert-spoonful, thrown into a tumbler two thirds filled with *cold water*, produces an excellent glass of ginger beer.

POWDERS (Ink). The article usually sold under this name is noticed at *p.* 628. *Another formula*, which we have adopted with considerable success, is as follows:—*Good black ink*, 3 pints; *lump sugar*, 1½ *oz.*; and *gum arabic*, ½ *oz.*; are put into a clean iron pan, and evaporated by the heat of boiling water, with occasional stirring, to dryness; the dried mass is reduced to powder, and divided into 12 parts, which are enveloped in either *tin-foil* or *glazed paper*, and kept dry. One of these papers dissolved in ¼ pint of *hot water* forms that quantity of an *excellent black ink*, without sediment, and which answers well with the copying press.

POWDERS (Lemonade). Syn. *Lemon Sherbet*; *Limonadum Siccum*, *Pulvis pro Limonado*,—Lat. *Prep.* 1. *Powdered citric* or *tartaric acid*, 12 gr.; *powdered white sugar*, ½ *oz.*; *essence of lemon*, 1 drop, (or a little of the *yellow peel of a lemon* rubbed off on a piece of sugar); mix. For one glass.

2. *White sugar*, 4 *lb.*; *citric* or *tartaric acid*, 1½ *oz.*; *essence of lemon*, ¼ *oz.*; mix well, and preserve it in a bottle, for use. 1 to 2 dessert-spoonfuls make a glass of lemonade. It is also put up in papers, containing about 2½ dr. each.

3. (*Effervescing.*)—*a.* For the *blue papers*, take of *powdered white sugar*, 1 *lb.*; *bicarbonate of soda*, ¼ *lb.*; *essence of lemon*, 1½ dr.; mix, and divide it between 6 dozen papers. Next divide *tartaric* or *citric acid*, 5 *oz.*, between 6 dozen *white papers*. Or the two may be kept in bulk, in separate bottles.

b. (*In one bottle.*) As *acidulated kali* (p. 1039). Some makers slightly increase the quantities of *acid* and *essence of lemon*, there ordered.

POWDERS (Polishing). *Prep.* 1. (For *Brass* and *Copper.*)—*a.* From *rotten stone*, 3 *oz.*; *powdered soap*, 1 *oz.*

b. From *rotten stone*, 7 *oz.*; *powdered oxalic acid*, 1 *oz.* Both are used with a little water. See *Brass Paste*.

2. (For *Gold.*) See *Jeweller's Rouge*.

3. (For *Ivory.*) Pumice stone and putty powder.

4. (For *Plate.*) See *Plate* and *Plate Powder*.

5. (For *Silver.*) As the last.

6. (For *Specula.*) Putty powder and jeweller's rouge. See *Glass* and *Specula*.

POWDERS (Scented). *Prep.* 1. *Cosmetic Powders.*—*a.* (*Poudre de Chipre.*) Macerate *oak-moss* in *running water* for 2 or 3 days, then dry, and powder it. *Used* as a basis for other powders, on account of its being highly retentive of odours. *Reindeer moss* and *ragged hoary evernia*, are also used for the same purpose. See *Cyprus Powder* (above).

b. (*Poudre de Chipre de Montpelier.*) From *poudre de chipre*, 2 *lb.*; *musk*, 30 gr.; *civet*, 20 gr.; (the last two powdered by means of a little sugar;) *cloves*, ¼ *oz.*

c. (*Poudre de Fleurs d'Oranges.*) From *starch* or *cyprus powder*, 25 *lb.*; *orange flowers*, 1 *lb.*; mixed in a covered chest, and stirred twice or thrice daily; the process being repeated, with *fresh* flowers, a second, and a third time. Or, the *plain powder* is scented by the addition of a little *neroli* or *essence of petit grain*.

d. (*Poudre de Frangipane.*) From *poudre de fleurs d'oranges* and *poudre de chipre*, of each, 6 *lb.*; *essence of ambergris*, 1 *oz.*; *civet* (powdered with sugar), ½ dr. Ash-gray colour.

e. (*Poudre de Jasmine.*) As *poudre de Fleurs d'oranges*, but using *jasmin flowers*.

f. (*Poudre à la Maréchale.*) From *poudre de chipre*, 2 *lb.*; *starch powder*, 1 *lb.*; *calamus aromaticus*, *cloves*, and *cyperus perennis* or *rotundus*, of each, 2 *oz.* Or, *starch powder*, 28 *lb.*; *powdered cloves*, ¾ *lb.*; *powdered orris root*, ½ *lb.*; *essence of ambergris*, 2 dr.

g. (*Poudre à la Mousseline.*) From *orris root*, 1 *lb.*; *coriander seed*, 6 *oz.*; *mace*, and *violet ebony*, of each, 2 *oz.*; *musk-seed*, *cassia*, *cloves*, and *sandal wood*, of each, 1 *oz.*

h. (*Poudre de Jonquille.*) From *jonquilles*, as *poudre de jasmine*.

i. (*Poudre à l'Œillet.*) From *plain powder*, 2 *lb.*; *orris root* and *dried red rose* leaves, of each, 1 *lb.*; *cloves* and *musk-seed*, of each, 4 *oz.*; *essence of bergamot* and *essence de petit grain*, of each, ½ dr.

k. (*Poudre de Roses communes.*) From *pale roses*, as *poudre de fleurs d'oranges*.

l. (*Poudre de Roses musquées.*) From *musk roses*, as the last.

m. (*Poudre à la Vanille.*) From *poudre de chipre* or *cyprus*, 3 *lb.*; *vanilla*, powdered by means of sugar, 2 dr.; *oil of cloves*, and *essence of ambergris*, of each, 20 drops.

n. (*Poudre à la Violette.*) See *page* 1063.

The above are used as *cosmetic powders* for the skin and hair; also, but less frequently, for *sachets*, *drawers*, &c.

2. *Sachet Powder.*—*a.* From *orris root*, 2 *oz.*; *cassia*, 1½ *oz.*; *cloves*, 1 *oz.*; *yellow sandal wood*, ¼ *oz.*; *oils of lavender* and *bergamot*, of each, 1 dr.; *otto of roses*, 20 drops; *musk* and *ambergris*, of each, rubbed with a little sugar, 6 gr.; reduce the dry ingredients to coarse powder, mix them, and add the oils.

b. From *corianders*, *orris root*, *rose leaves*, and *calamus aromaticus*, of each, 4 *oz.*; *lavender flowers*, 8 *oz.*; *rhodium wood*, 1 *dr.*; *musk*, 20 gr.

c. From *corianders*, *orris*, *calamus aromaticus*, and *red roses* (dried), of each, 1 *oz.*; *lavender flowers*, 2 *oz.*; *mace* and *cloves*, of each, 1 dr.; *essential oil of almonds*, 10 drops.

d. As last, but substituting *musk*, 5 gr., for the oil of almonds.

e. From *patchouli*, 8 *oz.*; *lavender flowers* (lightly dried), 3 *oz.*; *orris root*, 2 *oz.*; *cloves*, 1 *oz.*; *essence of bergamot*, 1 dr.; *essences of ambergris* and *musk*, of each, ½ dr.

These are *used*, along with cotton wool, to fill *scent bags*, *cassolettes*, &c.; and as *scent powders* for boxes, drawers, and the like. The scent is added to the dry ingredients, separately reduced to powder, and the whole is then passed through a fine sieve, to ensure perfect admixture.

POWDERS (Seidlitz). Syn. *Pulveres Effervescentes Aperientes*,—Lat. *Prep.* 1.

Potassio-tartrate of soda (Rochelle salt), 2 dr.; *bicarbonate of soda*, 40 gr.; *mix*, and put it in a *blue* paper; *tartaric acid*, 35 gr., to be put in a *white* paper. For about ½ pint of water. Laxative.

2. (*In one bottle.*) From *potassio-tartrate of soda*, 12 *oz.*; *bicarbonate of do.*, 4 *oz.*; *tartaric acid*, 3½ *oz.*; *white sugar*, 1 *lb.*; all in fine powder; dry each separately by a gentle heat, add of *essence of lemon*, ½ dr., mix well, pass the mixture through a sieve, and put it *at once* into clean dry bottles. *Dose.* A dessert-spoonful, or more, to a tumbler full of water.

Obs. The above mixtures, though now universally sold as *Seidlitz powder*, do not, when dissolved, exactly resemble the natural water, which contains carbonates, sulphates, and muriates of lime and magnesia. However, the factitious article is equally effective, and much more agreeable. See *Mineral Waters.*

POWDERS (Sherbet). These are made of the same materials as *lemonade powders*, the flavouring ingredient being varied to suit the particular case. See *Sherbets* (and *above*).

POWDERS (Soda-water). Syn. *Effervescing Powders, E. Saline, do., Sodaic do., Aerated Soda do.; Pulveres Effervescentes*, —Lat. *Prep.* 1. From *bicarbonate of soda*, 30 gr., in each BLUE PAPER; *tartaric acid*, 25 gr. (or *citric acid*, 24 gr.), in each WHITE PAPER. One of each is dissolved separately in about ½ a glassful of water, and the two solutions mixed, and drank immediately. A cooling, wholesome summer beverage, but it should not be indulged in to excess.

2. (*Chalybeated.*) By adding 1 gr. of dried *protosulphate of iron* to each paper of acid. Tonic.

3. (*Midgeley's.*) Made by adding ⅛ gr. of *tartarized antimony* to *each paper* of *acid.* Refrigerant and diaphoretic. For the Ph. formulæ see *p.* 1064.

POWDERS (Soup). See *Currie Powder, Pease do., Spices, Zests, &c.*

POWDERS (Spruce Beer). Syn. *Pulveres Effervescentes cum Abiete*,—Lat. *Prep.* As *ginger-beer powders*, but substituting *essence of spruce*, 3 to 6 drops, for the powdered ginger.

POWDERS (Steedman's Soothing). These are said to consist chiefly of *nitre*, together with a very small portion of a *salt of morphia.*

POWDERS (Tooth). Syn. *Pulvis Dentifricii*,—Lat. The general principles which should be kept in view in the selection of the materials, and in the preparation of *dentifrices*, have been already fully noticed (see *p.* 323-4), and need not, therefore, be repeated here. Care must be taken that all the dry ingredients be *finely pulverized*, and that the harder and gritty ones, be reduced to the state of an impalpable powder, either by levigation or elutriation. The *mixture* of the *ingredients* must also be complete. This is the most readily effected by stirring them well together until they form an apparently homogeneous powder, and then passing this powder through a very fine sieve. Those which contain *volatile substances* should be preserved in closely-corked wide-mouth bottles; and those which contain *acidulous* or *gritty matter* should not be frequently employed. The *selection* of the *tooth brush* likewise deserves attention. It should be sufficiently stiff to effect its purpose completely; but, at the same time, it should be so formed as not to cause irritation or injury to the gums during its use.

Prep. 1. *Cuttle-fish bone* and *prepared chalk*, of each, 2 *oz.*; *oil of cloves*, 20 drops. This may be perfumed at will, and medicated by any of the substances referred to under *Dentifrices.*

2. To the last add of *powdered Castile soap*, 2 *oz.*

3. *Prepared chalk*, 12 *oz.*; *cuttle-fish bone*, 8 *oz.*; *orris root*, 4 *oz.*; *dragon's blood*, 1½ *oz.*; *oils of cloves* and *cassia*, of each, ½ dr.

4. *Prepared chalk*, 1 *lb.*; *pumice stone*, in impalpable powder, ¼ *lb.*; *orris root*, 2 *oz.*; *pure rouge*, ¼ *oz.*; *neroli*, ½ dr.

5. *Yellow cinchona bark* and *myrrh*, of each, ½ *oz.*; *recently burnt charcoal*, 3 *oz.*; *cloves*, 1 dr.

6. *Pumice stone, red coral*, and *powdered rhatany root*, of each, 2 *oz.*; *orris root*, ½ *oz.*; *essence of vanilla*, ½ dr.

7. (*Aromatic Tooth Powder.*) From *cuttle-fish bone*, 4 *oz.*; *calamus aromaticus*, 2 *oz.*; *powdered Castile soap*, 1 *oz.*; *oil of cloves*, ½ dr.

8. (*Asiatic Dentifrice.*) From *prepared red coral*, 8¼ *lb.*; *Venetian red*, ¾ *lb.*; *prepared chalk* and *pumice-stone*, of each, 1¼ *lb.*; *China musk*, 30 gr.

9. (*Cadet's.*) From *lump sugar* and *charcoal*, of each, 1 *oz.*; *Peruvian bark*, ½ *oz.*; *cream of tartar*, ¼ *oz.*; *cinnamon*, ½ dr.

10. (*Camphorated.*) See *Camphorated Chalk.*

11. (*Charcoal Dentifrice.*) From *charcoal*, preferably that from the willow, or the areka nut, either alone, or combined with twice its weight of *prepared chalk.* Scent or medicinals injure it.

12. (*Coral Dentifrice.*) See *below.*

13. (*Deschamp's Alkaline Dentifrice.*)

From *powdered talc*, 4 *oz.*; *bicarbonate of soda*, 1 *oz.*; *carmine*, 6 gr.; *oil of mint*, 12 or 15 drops.

14. (*Florentine Dentifrice.*) From *prepared shells*, 4 *oz.*; *orris root*, 1½ *oz.*; *bitartrate of potassa*, ¾ *oz.*; *Florentine lake*, q. s. to colour.

15. (*Galvanic Dentifrice.*) From *gold*, 3 leaves; *silver*, 4 leaves; triturate them with *alum* and *sulphate of potash*, of each, 1½ dr.; then add of *dry common salt*, *pellitory of Spain*, and *Peruvian bark*, of each, 1 dr.; *prepared hartshorn*, 1 *oz.*; mix, and either colour it *blue* with smalts, or *red* with lake. A useless compound.

16. (*Grosvenor's.*) From *red coral*, 3*lb.*; *prepared oyster-shells*, 2½ *lb.*; *orris powder*, ½ *lb.*; *oil of rhodium*, 25 drops. *Rose-pink* is now commonly substituted for the coral.

17. (*Hemet's Dentifrice.*) From *cuttle-fish bone*, 6 *oz.*; *cream of tartar*, 1 *oz.*; *orris root*, ½ *oz.*

18. (Lancet.) *Red bark* and *Armenian bole*, of each, 1 *oz.*; *powdered cinnamon* and *bicarbonate of soda*, of each, ½ *oz.*; *oil of cinnamon*, 2 or 3 drops.

19. (*Lardner's.*) See *page* 231.

20. (*Miahle's Rational Dentifrice.*) From *sugar of milk*, 3 *oz.*; *pure tannin*, 3 dr.; *red lake*, 1 dr.; *oils of mint* and *aniseed*, of each, 7 or 8 drops; *neroli*, 4 or 5 drops.

21. (*Myrrh Dentifrice.*) From *cuttle-fish bone*, 6 *oz.*; *myrrh* and *orris root*, of each, 2 *oz.*

22. (*Pearl Dentifrice.*) From *heavy carbonate of magnesia* or *precipitated chalk*, 1 *lb.*: *finest smalts*, 3 dr.; *essence de petit grain*, ½ dr.

23. (*Pelletier's Quinine Dentifrice.*) From *prepared red coral*, 3 oz.; *myrrh*, 1 dr.; *disulphate of quinine*, 12 to 15 gr.

24. (Ph. Russ.) *Cinchona bark*, 4 oz.; *orris root*, 2 oz.; *catechu* and *myrrh*, of each, 1½ oz.; *sal ammoniac*, 1 oz.; *oil of cloves*, 20 drops.

25. (*Poudre Dentifrice*,—P. Cod.) *Red coral*, *red bole*, and *cuttle-fish bone*, of each, 3 oz.; *dragon's blood*, 1½ oz.; *cinnamon*, ¾ oz.; *cochineal*, 3 dr.; *cloves*, 1 dr.; *bitartrate of potassa*, 4½ oz.; reduce them separately to very fine powder before mixing them. This is the "*Coral Dentifrice*" of the French.

26. (*Righini's.*) From *charcoal*, 1 *oz.*; *yellow bark*, ¼ *oz.*

27. (*Rose Dentifrice.*) From *precipitated chalk*, 6 *oz.*; *cuttle-fish bone*, 3 *oz.*; *bicarbonate of soda*, 2 *oz.*; *red lake*, ¼ *oz.*; *otto of roses*, 20 drops.

28. (*Ruspini's Dentifrice.*) From *cuttle-fish bone*, 8 *oz.*; *roach alum* and *orris root*, of each, 1 *oz.*; *cream of tartar*, 2 *oz.*; *oil of rhodium*, 6 or 8 drops.

29. (*Violet Tooth Powder.*) From *orris root*, 3 *oz.*; *cuttle-fish bone* and *rose pink*, of each, 5 *oz.*; *precipitated chalk*, 12 *oz.*; *pure indigo*, q. s. to give it a pale violet tinge.

30. (*Zieter's.*) From *finely powdered calcined hartshorn* and *cuttle-fish bone*, of each, 6 *oz.*; *calamus aromaticus*, *cassia*, and *pellitory of Spain*, of each, 1 *oz.*; *essence of vanilla*, ½ dr.; *essence of ambergris*, 10 or 12 drops.

POWDERS (Worm). Syn. *Pulveres Anthelmintici*, *P. Vermifugi*,—Lat. *Prep.* 1. (Bouchardat.) *Powdered Corsican moss* and *worm-seed*, of each, 5 dr.; *calomel*, 40 gr.; rub them together.

2. (Collier.) From *powdered jalap* and *scammony*, of each, 1 dr.; *cream of tartar*, 2 dr.; *Ethiop's mineral*, 3 dr.

3. (Guibourt.) *Sulphate of iron*, 1 dr.; *tansy*, 2 dr.; *worm-seed*, 3 dr.

4. (P. Cod.) *Corsican moss* and *worm-seed*, of each, 2 oz.; *rhubarb*, 1 oz.; rubbed to a fine powder, and carefully mixed.

POWERS OF AMBER. See *page* 342.

POX. A corruption of a Saxon word, originally applied to pustules or eruptions of any kind, but now restricted to *varicella*, *variola*, *vaccinia*, and, in its unqualified form, to *syphilis*. (See *below.*)

POX (Chicken). Syn. *Water Pox*; *Varicella*,—Lat. An eruptive disease, consisting of smooth, semi-transparent vesicles of various sizes, which afterwards become white and straw-coloured, and about the fourth day break and scale off, without leaving any permanent mark behind them. In hot weather the discharge sometimes becomes purulent, and at others the eruption is attended with considerable fever. Sometimes the vesicles assume a pointed form, and the fluid remains clear throughout the disease; it is then frequently called the "*swine-pox.*" When the vesicles are large and globular, and their contents, at first whey-coloured, afterwards turn yellow, it is popularly known as "*hives.*"

The *treatment* of chicken-pox consists in the adoption of a light, vegetable diet, and in the administration of mild saline aperients, and cooling drinks.

The chicken-pox, except in children of a very bad habit of body, is an extremely mild disease. Like the small-pox, it only attacks the same person once during life.

POX (Cow). Syn. *Vaccinia*, *Variola Vaccina*,—Lat. This disease was proposed as a substitute, and a preventive of small-pox, by Dr. Jenner, in 1798. The success

which has followed its artificial production has nearly led to the extinction of small-pox in England. There appears no reason to doubt that *the pretensions* of the *advocates of vaccination* have been *fully justified* by the *experience of more than half a century;* or, that *this disease*, when actively developed, evinced by the completeness and maturation of the pustules, *acts as a certain prophylactic of small-pox.*

The *process* of *vaccination* is similar to that of *inoculation* for the small-pox. The *point of a lancet* is wetted with the matter taken from one of the *pustules*, and is then gently inserted under the cuticle, and the scratch afterwards rubbed over with the same. Hæmorrhage should be avoided, as the blood is apt to wash away the virus, or to form a cake which shields the living organism from its action.

The *leading symptoms* of cow-pox are as follows:—About the *third day* the puncture usually becomes red and elevated, and continues to enlarge and become vesicular, until at about the *eighth* or *ninth day*, it is at its height, and the vesicle is surrounded with a florid areola. About the *eleventh* or *twelfth day* the symptoms decline; the centre of the pustule becomes brown, and a dark scale gradually forms and separates, leaving the arm as heretofore.

This disease seldom requires *medical treatment;* but should febrile symptoms come on, a mild aperient may be given. In all cases great care should be taken to avoid the rupture of the pustule before its maturity, or until between the *seventh* and *ninth* day.

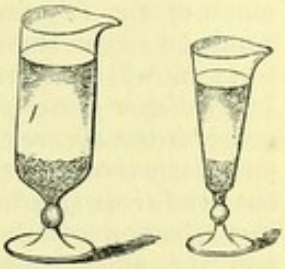
In some cases, owing to peculiar conditions of the system, vaccination fails to produce the effect intended. When this happens, the child should be re-vaccinated after the lapse of a few weeks; or earlier, if altered circumstances appear to justify it. When the patient has taken the disease, but the pustules have not been fully and satisfactorily developed in the usual manner, it is also wise to repeat the vaccination in a twelvemonth.

"If, when the vaccine virus has been inserted, and a *genuine vesicle* has risen, the virus be again inserted on the fourth, fifth, or sixth day, the vesicle arising from this second insertion will be hurried in its progress, so that, on the *ninth day*, it will be *surrounded by an areola*, and *appear as mature* as the first. This affords conclusive evidence of the constitution being fully under the influence of the disease." This is known as "*Bryce's Test*," from having been proposed by Mr. Bryce, of Edinburgh, in 1802. Prudence suggests vaccination in early infancy. See *Small-pox* and *Vaccine Matter.*

POX (Small). Syn. *Variola*, — Lat. This disease comes on with the usual *symptoms* of inflammatory fever. About the *third day*, red spots, resembing flea-bites, make their appearance on the face and head, and gradually extend over the whole body. About the *fifth day* small circular vesicles, depressed in the centre, surrounded by an areola, and containing a colourless fluid, begin to form, when the feverish symptoms abate; about the *sixth day* the throat becomes sore; about the *eighth day* the face is swollen, and about the *eleventh day* the pustules acquire the size of a pea, and cease to enlarge, the matter which they contain becomes opaque and yellow, a dark central spot forms on each, the swelling of the face subsides, and secondary symptoms of fever come on; the pustules become rough, break and scab over, and a dark spot remains for some days, often followed by permanent indentations, popularly known as "*pock-marks.*" At the end of the *sixteenth* or *eighteenth* day, the symptoms usually disappear. In the *confluent small-pox*, a severer form of the disease, the pustules coalesce, the eruption is irregular in its progress, and the inflammatory symptoms are more severe.

The *treatment* of *ordinary cases* of *small-pox* resembles, for the most part, that mentioned above for *chicken-pox.* As soon as the febrile symptoms become marked, the patient should not be suffered to lie in a hot bed, but on a mattrass, in a cool and well-ventilated apartment, and antiseptic cooling drinks should be freely administered. When convulsions occur, or *great irritability exists*, small doses of morphia, opium, or camphor, may be administered, and *obstinate vomiting* arrested by effervescing saline draughts. When the skin is pale and cold, the pulse weak, and the eruption languidly developed, the warm or tepid bath is often serviceable. The application on the third day of a *mask* formed of *thick muslin* covered with *mercurial ointment*, and having holes cut in it for the nostrils, eyes, and mouth, will effectually prevent "*pitting.*" (Dr. Stewardson.) *Gold leaf* is also applied for the same purpose, the object being to exclude the light and air. With the same intention some persons recommend the puncture of the pustules as soon as they are mature. To *remove* the *pock-marks*, whether recent or old, nothing appears to be better than *warm*

sea-bathing, or the use of *tepid ioduretted lotions*.



The *small-pox* is *eminently contagious*, but only attacks the same person once during life. Formerly, a milder form of the disease was propagated by *inoculation;* a practice introduced into England from Turkey, by Lady Mary Wortley Montague, about the year 1721. At the present day, in England, inoculation, as well as the exposure of a patient labouring under small-pox, is penal, the punishment being either by fine or imprisonment.

"The proportion of deaths from small-pox in *London* is three times, and in *Glasgow*, six times what it is in *Brussels*, *Berlin*, or *Copenhagen*. Of each thousand persons who die in England and Wales, twenty-two die of small-pox. Of each thousand persons who die in *Ireland*, forty-nine die of small-pox; while of each thousand persons who die in *Lombardy*, two only die of small-pox. The *proportionate mortality*, then, *from small-pox*, in *England and Wales*, is eleven times, and in *Ireland*, twenty-four times greater than it is in *Lombardy*. Whence comes this difference? In England those who please take their children to be vaccinated; in Lombardy vaccination is compulsory. The proportionate mortality from small-pox in England and Wales is three times greater than what it is in any country in which the inhabitants are compelled, by law, to have their children vaccinated. In our *metropolis* alone, *one thousand persons die annually of small-pox*. If vaccination were compulsory, it is indisputable that the number of deaths from this disease, in London, would be reduced to two or three hundred per annum. From six to eight hundred persons thus die yearly in this metropolis alone, whose lives might be saved by an Act of the Legislature." (*Med. Times.*) See *Cow-pox*.

PRECIPITATE. Any substance which has separated from its solution in a solid, and usually, a pulverulent or flocculent form. The substance by which such a change is produced is called the "*precipitant;*" and the act or operation by which it is effected is called "*precipitation.*" The old chemists gave this name to several compounds. *Red precipitate*, or *precipitate per se*, is the nitric oxide of mercury prepared by heat. *White precipitate* is ammonio-chloride of mercury.

PRECIPITATION. The formation or subsidence of a precipitate. (See *above.*) When the precipitate is the chief object of the process, it is necessary to wash it, after it is separated by filtration. This operation requires little attention when the substance thrown down is insoluble in water; but when it is in some degree *soluble* in that liquid, great attention is required to prevent the loss which might result from the use of too much water. Precipitates soluble in water, but insoluble in alcohol, are frequently, on the small scale, washed with spirit more or less concentrated.

The *best precipitating vessel* is a very tall glass jar, furnished with a lip and spout, and narrower at the bottom than at the mouth, so that the precipitate may readily collect by subsidence, and the supernatant liquor be decanted off with more ease.

PREGNANCY. For the preservation of the health, and the prevention of the numerous discomforts and dangers which so frequently attend this condition, nothing is so effective as *exercise*. It is this that is so favorable to the humble peasant; and it is its absence that inflicts such calamities on the wealthier classes. *Exercise*, moderate and unfatiguing, when assisted by regular habits, and a diet nutritious, but not too liberal, is indeed, capable of not only affording pleasure and increasing the comforts of existence, but is also generally sufficient to greatly lessen the severity of the sufferings, and to ward off the not unfrequently fatal results which terminate this interesting condition. The daughter of nature yields her bosom's treasure to the world with little more than a passing pang and tear; whilst the poor sempstress and the high born lady, debased by sedentary or luxurious habits, perform the same duty only at the cost of frightful sufferings; and, in many cases, find it an ordeal that leads them prematurely to the tomb.

The *sickness of pregnancy* may be greatly ameliorated, if not removed, by the occasional use of a *saline aperient*, and by *effervescing draughts* formed with the *bicarbonate of potassa* and *citric acid*.

The *physical signs* of *pregnancy* do not come within the province of this work. MM. Nauche and Eguiser have given the name of "*Kisteine*" to a peculiar substance which forms upon the surface of the urine of pregnant females after the first month, when that fluid is allowed to stand exposed to the air from 2 to 6 days. It is distinguished during its formation, by the appearance and gradual agglomeration of

minute opaque bodies, which ultimately form a whitish, opalescent, and slightly granular layer, so consistent, that it may be almost lifted off by one of its edges. It bears no inconsiderable resemblance to the fatty pellicle that generally swims on the surface of soup. It disappears as the urine becomes turbid. These properties are said to be well marked, and characteristic.

PRESCRIBING (Art of). Besides a knowledge of diseases and their treatment, much of the success of the physician depends on circumstances connected with the form in which the remedies are exhibited. In *writing a prescription*, it is necessary to consider the *age*, *sex*, *temperament*, *habits*, and *idiosyncrasy* of the patient, as well as the *conditions of climate* and *season*, before the selection of the leading medicament, and the apportioning of the dose. The most convenient form of exhibiting it, whether it should be given alone or in some simple form, or combined with other ingredients, the compatibility of the latter, and how far these are likely to assist, impede, or modify, its operation, must also receive the consideration of the practitioner. Without a careful attention to all these circumstances the most valuable remedies may be rendered worthless, and the highest medical skill, and the best intentions frustrated.

A *prescription* generally *contains* several *medicinal substances*, which are distinguished by medical writers by names indicative of the office which each of them performs. These are—1. The *basis*, which is the principle or most active ingredient ;—2. The *adjuvans*, or that which is intended to promote the action of the base ;—3. The *corrigens* or *corrective*, intended to correct, modify, or control its action, or to cover its odour or taste, as when we add carminatives or diaphoretics to cathartics, or aromatics or liquorice to nauseous substances ;—4. The *constituens*, *excipiens*, or *vehiculum*, or that which gives the whole a commodious or agreeable form, and which, consequently, gives the prescription its peculiar character, as that of draught, mixture, pills, &c. To these, certain Continental writers add a 5th,—The *intermedium*, which is the substance employed to unite remedies which are not, by themselves, miscible with each other, or with the excipient. Of this character are the *yelk of egg*, and *mucilage*, employed in the preparation of emulsions.

The medicinal substances, with the quantities to be taken, generally arranged as above, are said to form the "*inscription*,"—the directions as to their combination or dispensing, which usually come next, the "*subscription*," and—the orders for the exhibition of the compound medicine, which follow these, the "*instructions*." These distinctions are, however, in many cases more technical than usefnl.

In *choosing* the *form of a prescription*, it should be recollected that solutions and emulsions generally act with more certainty and rapidity than powders diffused through water ; and these, again, than the semi-solid and solid forms of medicine represented by electuaries, boluses, and pills. On these matters, however, the taste and wishes of the patient should not be disregarded. For this purpose, the *taste* of *nauseous medicines* should be disguised, as much as possible, by the judicious selection of an appropriate *corrective* or *excipient*. Thus, the disagreeable flavour of *Epsom salt* may be in a great measure covered by dissolving it in peppermint water; that of *aloes*, by liquorice; that of *castor oil* and *copaiba*, by orange peel ; and that of *powdered bark*, by mixing it with milk immediately before taking it ; whilst the *bitterness* of all *bitter substances* is concealed by strong coffee.

In order that a prescription may be well made, it is not necessary to unite *all* the elements above referred to. The *basis* and the *excipient* are the only two which are absolutely necessary, since there are many medicines which have no need of an adjuvant. The agreeable flavour and odour of some, and the mild and harmless nature of others, often render the intervention of a corrigent unnecessary when they are employed. A single substance may also "be capable of answering two or more purposes. Thus, the adjuvant may also act as a corrigent, as when the addition of soap to aloes, or to extract of jalap, lessens their griping properties, and at the same time promotes their action. In the same way neutral salts correct the colic which follows the use of resinous purgatives, and accelerate their action." According to Gaubius, the number of ingredients in a prescription should scarcely ever exceed three or four. See *Dose*, *Medicines*, *Incompatibles*, *Pills*, *&c.*

PRESCRIPTION. A recipe or formula for the preparation and exhibition of medicines intended, generally, for immediate use. See *Prescribing* (above), and *Appendix*, II.

PRESERVES. A general term under which are included the various *fruits* and *vegetables* which are seasoned and kept in *sugar* or *syrup ;* more especially those which are so preserved whole, or in slices. See *Candies*, *Jams*, *Marmalades*, *&c.*

PRESS (Correcting). See *Proofs*.

PREVENTIVE (Royal). Syn. *White Wash, Lotio Alba.* A quack lotion, formed of *solution of diacetate of lead* and *proof spirit*, each, 1 *oz.; water*, 1 pint. *Used* to prevent infection. See *Disinfectants* and *Patent Medicines.*

PRICKLY HEAT. See *Eruptions.*

PRIMING (Chlorate). *Prep.* Pulverize the *best gunpowder*, and make it into a paste with *water;* then add half its weight of *chlorate of potassa*, and, whilst semi-fluid, drop the composition into the empty *copper caps;* place them aside in a warm situation to dry. *Used* for guns and matches. A little sulphur is sometimes added. For the first of these it is now superseded by fulminating mercury. See *Percussion Caps.*

PRINCE'S METAL. See *Mosaic Gold.*

PRINCIPLE. Syn. *Principium*,—Lat. A term rather loosely applied by chemical writers to the component parts of bodies, to the distinct compounds or elements of which they are composed, and to any substance presumed to be capable of bestowing certain qualities which are common to a number of bodies. Thus, we read of *constituent, proximate, ultimate, acidifying*, and *alkalizing principles, &c.*, which sufficiently explain themselves.

PRINTING (Anastatic). A method of zincography, patented in 1845, having for its object the reproduction of drawings, engravings, and letter-press, from copies however old. To describe briefly the *preparation* of a *plate* or *cylinder*, let us suppose a newspaper about to be reprinted by this means. The *sheet* is first moistened with *dilute acid* and placed between sheets of *blotting-paper*, in order that the superfluous moisture may be absorbed. The ink neutralizes the acid, which is pressed out from the blank spaces only, and etches them away. In all cases where the letter-press is of recent date, or not perhaps older than half a year, a few minutes suffice for this purpose. The *paper* is then carefully placed upon the *plate* with which the letter-press to be transferred is in immediate contact, and the whole passed under a press, on removal from which, and on carefully disengaging the paper, the letters are found in reverse on the plate. The latter is then rubbed with a *preparation of gum*, after which the letters receive an addition of *ink*, which is immediately incorporated with that by which they are already formed. These operations are effected in a few minutes. The surface of the plate round the letters is next bitten in a very slight degree by the *acid*, and on the fresh application of the *ink* it is rejected by the zinc, and received only by the letters, which are charged with the ink by the *common roller* used in hand-printing. Each letter comes from the press as clear as if it had been imprinted by type metal; and the copies are fac-similes, which cannot be distinguished from the original sheet.

When *pen-and-ink drawings* are to be reproduced, they are made on any *paper free from hairs* or *filaments*, and *well sized.* The *ink* used is a preparation made for the purpose, closely resembling lithographic ink, and may be mixed to any degree of thickness in *pure distilled water.* It should be used fresh and slightly warm when a fine effect is to be given. In *making* or *copying a design* a *pencil* may be used; but the marks must be left on the paper, and by no means rubbed with india-rubber or bread. It is necessary to add, that the paper should be kept quite clean and free from friction, and should not be touched by the fingers; inasmuch as it will retain marks of very slight touches.

Before closing this notice of *anastatic printing* it may be proper to remark, that the great pretensions originally set up by the patentees, have not been fulfilled by its extensive, if not general, adoption in trade. Whether this arises from the power of invested or rival interests, or on account of any practical difficulties attending the application of the new process on the large scale, we are unable to state. We have certainly seen reproductions by this method, which to the inexperienced observer, appeared only very slightly inferior in beauty to the original copy.

PRINTING (Galvanic). See *Voltaic Engraving.*

PRINTING INK. *Prep.—a.* The VARNISH. *Linseed* or *nut oil*, 10 or 12 gall., is set over the fire in an *iron pot* capable of containing *fully* as much more; when it boils it is kept stirred with an *iron ladle*, and if it does not take fire of itself soon after the smoke begins to rise, it is kindled by means of a piece of burning paper, stuck in the cleft end of a long stick; the pot is shortly afterwards removed from the fire, and the oil is suffered to burn for about half an hour, or until a sample of the varnish cooled upon a pallet knife, may be drawn into strings of about ½ inch long, between the fingers; the flame is now extinguished by the application of a *closely fitting tin cover*, and as soon as the froth of the ebullition has subsided, *black resin* is added, in the proportion of ¾ *lb.*, to 1 *lb.*, for *every quart of oil* thus treated; the mixture is next stirred until the resin is dissolved,

when *dry brown soap*, cut into slices, 1¾ *lb.*, is further added (cautiously), and the ingredients are again stirred with the spatula until the whole is united, the pot being once more placed over the fire to promote the combination; when this is effected, the varnish is removed from the heat, and after a good stirring, is covered over and set aside.

b. The INK. *Indigo* and *Prussian blue*, of each, in fine powder, 2½ *oz.*; *mineral lampblack* (finest), 4 *lb.*; *vegetable lampblack*, 3½ *lb.*; stir them gradually into the warm varnish, and submit the mixture to careful grinding, either in a mill, or by means of a slab and muller. On the *large scale* steam power is now generally employed for this purpose.

An *extemporaneous superfine black ink* may be made by the following formula:—Take of *balsam of copaiba*, (pure), 9 *oz.*; *lampblack*, 3 *oz.*; *indigo* and *Prussian blue*, of each, ½ *oz.*; *Indian red*, ¾ *oz.*; *yellow soap* (dry), 3 *oz.*; grind the mixture to an impalpable smoothness by means of a stone and muller. *Canada balsam* may be substituted for balsam of copaiba where the smell of the latter is objectionable, but the ink then dries very quickly.

Coloured Printing Inks are made in a *similar* way from the following pigments:—*Carmine, lakes, vermilion, chrome red, red lead, orange red, Indian red, Venetian red*, for RED; *orange chrome, chrome yellow, burnt terra di sienna, gall stone, Roman ochre, yellow do.*, for ORANGE and YELLOW; *verdigris, Scheele's green, Schweinfurth's do., blues and yellows mixed*, for GREENS; *indigo, Prussian blue, Antwerp do., cobalt do., charcoal do*, for BLUE; *lustre, bronze powders, &c.*, for METALLIC COLOURS; and *umber, sepia, &c.*, for BROWN.

Obs. It is necessary to prepare two kinds of varnish, varying in consistence, from more or less boiling, to be occasionally mixed together as circumstances may require; that which answers well in hot weather being too thick in cold, and vice versâ. Large characters also require a thinner ink than small ones. *Old* linseed oil is preferable to new. *Yellow-resin soap* is preferred for black and dark coloured inks, and *white curd soap* for light ones.

A *good varnish* may be drawn into threads like glue, and is very thick and tenacious. The *oil loses* from 10% to 14% by the boiling. Mr. Savage obtained the large medal of the Society of Arts for his black ink made as above. It is said to be unrivalled.

PRINTS (Ackerman's Liquor for). *Prep.* Take of the finest *pale glue* and *white curd soap*, of each, 4 *oz.*; *boiling water*, 3 pints; dissolve, then add of *powdered alum*, 2 *oz.* *Used* to size prints and pictures before colouring them.

PROLAPSUS. See *Surgery* (Popular) and *Truss.*

PROMETHEANS. See *Matches.*

PROOF. See *Acetimetry, Alcoholmetry, &c.*

PROOFS (Correcting). The specimen on the opposite page, with the notes, will, if carefully perused, put the reader into possession of all the secrets of this most useful art.

PROPIONE. See *Metacetone.*

PROPIONIC ACID. See *Metacetonic Acid.*

PROPYLENE. A gaseous substance which is formed, along with other gases, when the *vapour of fusel-oil* is passed through a *glass* or *porcelain tube* heated to redness. In this form it cannot be isolated; but by bringing the gaseous mixture in contact with *gaseous chlorine*, a *chloride of propylene* subsides as a heavy liquid, analogous to *Dutch liquid* noticed at *p.* 905. This chloride boils at 218° Fahr.

PROTEINE. An important compound of carbon, hydrogen, nitrogen, and oxygen, discovered by Mülder, and so named because it forms the original matter from which albumen, caseine, and fibrine are derived.

Prep. (Liebig.) *Albumen, caseine*, or *fibrine* is dissolved in moderately strong *liquor of potassa*, the solution heated for some time to 120° Fahr., and *acetic acid* added; a gelatinous precipitate subsides, which, after being washed and dried, is *proteine.*

Prop., &c. Proteine is insoluble in water and alcohol. With sulphuric acid it forms *sulphoproteic acid*, and with chlorine, *chloroproteic acid.* When digested in nitric acid *xanthoproteic acid* is formed along with ammonia and oxalic acid. The names *binoxide* and *teroxide of proteine* have been given by Mülder to products of the long-continued action of boiling water upon fibrin in contact with the air.

Obs. Proteine is produced by vegetables alone, and cannot be formed by animals, although the animal organism possesses the power of converting one modification of proteine into another, fibrine into albumen, or vice versâ, or both into caseine. Vegetable albumen, caseine, and fibrine are therefore the only sources of proteine for animal life, and consequently of nutrition, strictly so called, or the growth in mass of the body. (Liebig.)

[*Proof.*]

1 *Ital.* As the vine, which has long
2 twined its graceful foliage
3 about the oak, and been
lifted by it into sunshine, will,
4 when the hardy plant is rift
5 ed by the thunder bolt,
6 cling round it with its
7 *caressing* tendrils, and bind
8 its shattered boughs up,
9 so is it ordered beautifully
10 *caps* by Providence, that woman,
12 who is the mere dependant
13 and ornament of man in the
14 happier hours, should his
15 *run on* stay and solace
When smitten by
16 sudden calamity, winding
17 herself into the rugged
18 recesses of his nature, ten-
derly supporting the droop-
19 ing ~~head~~, and binding up

27 cles; Nature seems, &c.
28 IRVING.
29 *every disadvantage*

[*The same corrected.*]

As the *vine*, which has long twined its graceful foliage about the oak, and been lifted by it into sunshine, will, when the hardy plant is rifted by the thunderbolt, cling round it with its caressing tendrils, and bind up its shattered boughs, so is it beautifully ordered by Providence, that WOMAN, who is the mere dependant and ornament of man in his happier hours, should be his stay and solace when smitten by sudden calamity; winding herself into the rugged recesses of his nature, tenderly supporting the drooping head, and binding up the broken heart.

It also is interesting to notice how *some* minds seem almost to create THEMSELVES, springing up under every disadvantage, and working their "solitary, but irresistible way," through a thousand obstacles. Nature seems, &c.

IRVING.

Explanation of the marks:

1. When a letter or word is to be in *italics*.
2. When a letter is turned upside down.
3. The substitution of a comma for another point or letter.
4. The insertion of a hyphen; also marked (-)
5. When letters should be close together.
6. When a letter or word is to be omitted.
7. When a word is to be changed to roman.
8, 9. Two methods of marking a transposition: when there are *several* words to be transposed, and they are much intermixed, it is a common plan to number them, and to put the usual mark in the margin.
10. Substitution of a capital for a small letter.
11. When a word is to be changed from small letters to capitals.
12. The transposition of letters in a word.
13. The substitution of one word for another.
14. When a word or letter is to be inserted.
15. When a paragraph occurs improperly.
16. The insertion of a semicolon.
17. When a space or quadrat stands up, and is seen along with the type.
18. When letters of a wrong fount are used.
19. When words crossed off are to remain.
20. The mark for a paragraph, when its commencement has been neglected. Sometimes the sign [, or ¶, or the word "*break*" is used instead of the syllables "*New Par.*"
21. For the insertion of a space when omitted or insufficient.
22. To change capitals to small letters.
23. To change small letters to small capitals.
24. When lines or words are not straight.
25, 26. The insertion of inverted commas. The apostrophe is similarly marked.
27. The insertion of a period when omitted, or in place of another point or letter.
28. Substitution of one letter for another.
29. The method of marking an omission or insertion when too long for the side margin.

PROTIDE. A soluble, straw-yellow substance, formed, along with other products, by the action of *liquor of potassa* on *albumen*, *fibrine*, or *caseine*. See *Erythroprotide*.

PROTO-. See *Nomenclature*.

PROVISIONS (Preservation of). See *Putrefaction*.

PRUNES. The *fruit* of cultivated varieties of *prunus domestica* (Linn.) The dried fruit (*French prunes* or *plums*; *prunum*,—Ph. L.; *pruna*,—Ph. E. & D.) is cooling and gently laxative, and as such is useful in habitual costiveness and fevers.

PRUNES (Pulp of). Syn. *Prepared Prunes*; *Pulpa Prunorum*; *Prunum Præparatum*,—Ph. L. *Prep.* The imported dried fruit is boiled gently for four hours with *water*, q. s. to cover them, and then pressed, first through a fine *cane-sieve*, and afterwards, through a fine *hair-sieve*; the pulp is, lastly, evaporated by the heat of a water bath to the consistence of a confection. A *better plan* is to use as *little water as possible*, by which the necessity of subsequent evaporation is avoided. *Used* in the preparation of confection of senna.

PRUNING varies according to the kind of plant or tree operated on, and the particular object in view, and its skilful performance must, therefore, greatly depend on the experience and knowledge of the gardener. "In the *operation* of *pruning*, the shoots are cut off close to the buds, or at a distance not greater than the diameter of the branch to be cut off; because without the near proximity of a bud, the wounds will not heal over. In *shoots* which *produce their buds* alternately, the cut is made at the back of the bud, sloping from it, so that it may be readily covered by the bark in the same, or in the following year; but in the case of *branches* where the *buds are produced opposite each other*, either one bud must be sacrificed or the branch must be cut off at right angles to its line of direction, which is most conveniently done with the *pruning shears*." (Loudon.) In many cases pruning may be superseded by *rubbing off*, or *pinching out* the *leaf-buds*.

PRURIGO. Syn. *Pruritus*. A papular eruption, remarkable for the incessant itching and irritation by which it is accompanied. In its milder form (*prurigo mitis*) the cuticle is covered with soft and smooth elevations, somewhat larger than those in lichen, and differing from them by generally retaining the natural colour of the skin, and in the absence of a tingling sensation. It chiefly attacks young persons. The *prurigo senilis*, as its name implies, chiefly attacks the aged. It is of a more aggravated and permanent description than the preceding, and as the disease progresses, the skin usually becomes covered with pediculi, which defy every effort made for their extermination, and keep the patient in a constant state of the most frightful irritation. In *prurigo formicans*, or *ant-bite prurigo*, a still severer variety of this distressing malady, the sensations experienced have been compared to that of having the flesh devoured by myriads of ants, or the skin pierced with an equal number of red-hot needles. This often occurs without any obvious reason in elderly persons, rendering their existence one of perpetual torture. Plato, Charles V, and Charles IX of France, are reputed to have thus suffered.

"*Prurigo*, even in its mildest form, is a cruel and relentless disorder; all rest and repose are out of the question, and sleep impossible, until exhaustion conquers suffering." (Eras. Wilson.)

The *treatment* mainly *consists* in the removal of visceral obstructions by alteratives and mild saline aperients. The *tone of the system* may be afterwards raised by a nourishing diet and the use of tonic medicine, and the *irritation* may be often *alleviated* by the *internal use* of dilute sulphuric acid or lemon juice, and the *external employment* of lotions of lemon juice or glycerine, to which a very little morphia or chloroform may be often advantageously added. Warm sea-bathing is frequently had recourse to with advantage.

The terms *prurigo* and *pruritus* are also medically applied to itching and like irritation of various parts of the body from other causes than the above disease; as worms, vermin, &c. See *Eruptions* (Papular).

PRUSSIAN ALKALI. See *Ferrocyanide of Potassium*.

PRUSSIAN BLUE. Syn. *Berlin Blue*, *Paris do.*; *Ferrocyanide of Iron*; *Sesquiferrocyanide of do.*; *Cyanure Ferroso-ferrique*,—Berzelius. *Ferri Percyanidum*,—Ph. L. 1836. *Ferri Cyanuretum*,—Ph. D. 1826. *Prussiate of Iron*, *Ferro-prussiate of do.*, *Cyanuret of do.*,—Obs. var. This is the well-known blue pigment of the shops.

Prep. 1. The *crude* but *clear solution of prussiate of potash* (blood lye) is precipitated by a mixed solution of *alum*, 2 parts, and *green sulphate of iron*, 1 part; the dingy greenish precipitate that falls gradually becomes blue by absorption of atmospheric oxygen, which is promoted by

exposure and agitation of the liquor; as soon as it has acquired its full colour, the sediment is repeatedly washed with *water*, and is then drained, and dried, at first in a stove, but afterwards on chalk stones. *Product* large, but inferior in quality.

2. Repeatedly digest and wash the precipitate obtained by the above process, in very *dilute hydrochloric acid*, and then in *pure water;* drain and dry it, as before. *Superior.*

3. (*Paris Blue.*)—*a.* Neutralize the solution of *prussiate of potash* (blood lye) with *dilute sulphuric acid*, precipitate the liquid with a solution of any *persalt* or *sesquisalt of iron* (as the persulphate, nitrate, sesquichloride, or peracetate); well wash the precipitate with *water*, and dry it, as before. A very rich and intense colour.

b. (Hochstätter.) *Crystallized ferrocyanide of potassium* and *green sulphate of iron*, of each, 6 parts, are each separately dissolved in *water*, 15 parts; after the admixture of the solutions, and frequent agitation, *oil of vitriol*, 1 part, and *fuming hydrochloric acid*, 24 parts, are stirred in; after some hours have elapsed, a *strained solution* of *chloride of lime*, 1 part, dissolved in *water*, 80 parts, is *gradually* added, the addition being stopped as soon as an effervescence from the escape of chlorine is perceived; the whole is now left for 5 or 6 hours, when the precipitate is thoroughly washed in *pure soft water*, drained, and dried. Or, *instead* of the above, the precipitate is at once washed in *dilute nitric acid*, until its colour ceases to be improved by the process. The *product* is of the *finest quality.*

Prop. Insoluble in water, and in dilute acids, except the oxalic, in solutions of which it dissolves freely, when pure; oil of vitriol dissolves it to a white pasty mass, which is again precipitated of the usual blue colour by water; alkalies instantly decompose it, and so do red oxide of mercury, and some other oxides when boiled with it; it burns in the air like tinder, leaving an ash of oxide of iron. It is not poisonous.

Pur., &c. The quality of Prussian blue may be estimated by the richness of its colour, and by the quantity of potash or soda required to destroy this. If it effervesces with acids, it contains *chalk;* and if it forms a paste with boiling water, it is adulterated with *starch.* It is *pure*, if, "after being boiled with dilute hydrochloric acid, ammonia throws down nothing from the filtered liquid." (Ph. L. 1836.) It is distinguished from indigo by exhibiting a coppery tint when broken, but which is removed by rubbing with the nail.

Concluding Remarks. The object in employing *alum* is to prevent or lessen the precipitation of oxide of iron by the free alkali in the blood lye, but a portion of alumina is in consequence thrown down with the blue, and tends to render it paler, and increase the product. The same purpose is effected by neutralizing the alkali with *dilute sulphuric acid*, and omitting the alum from the precipitating solution; but in this case, if green copperas is employed, it is necessary to treat the precipitate with *dilute hydrochloric acid*, to remove the excess of peroxide of iron, before the precipitate can acquire its full richness of colour. The quantity of alum employed may be varied according to the shades of the intended blue. Samples containing this contamination must not be employed medicinally. (See *page* 641.)

PRUSSIAN BLUE (Soluble). *Prep.* 1. *Basic Prussian Blue; Basic Ferrocyanide* or *Sesqui-ferrocyanide of Iron; Ferri Sesqui-ferrocyanidum cum Ferri Oxydo,*—Lat. Obtained by adding a *solution of proto-sulphate of iron* to a *solution of ferrocyanide of potassium;* a *bluish-white* precipitate, turning *dark blue* by free exposure, is formed, which, after it has acquired this colour, is washed until it begins to dissolve in the water, and colour it blue; it is then either collected and dried, or is at once dissolved in *pure* water. This variety is *not* precipitated from its solution by alcohol.

2. *Ferrocyanide of Potassium and Iron, Soluble do.; Ferri Ferro-cyanidum cum Potassii Ferrocyanido, F. Sesqui-ferrocyanidum c. P. F.,*—Lat. This is made by precipitating a solution of a *sesquisalt* or *persalt of iron* (as the persulphate, pernitrate, peracetate, or sesquichloride) with a *stronger solution of ferrocyanide of potassium*, so that the latter may be in considerable excess. A blue precipitate is formed, which is treated as before. This variety is precipitated by alcohol. Both are freely soluble in *pure water*, but not in water which has the *slightest* saline contamination. Hence it is that lengthened exposure to the atmosphere, and the use of the common steel pen, causes the gradual precipitation of this substance from its solution when used as ink. See *Writing Fluids.*

PRUSSIATE. Syn. *Prussias,*—Lat. See *Cyanide* and *Hydrocyanic Acid.*

PRUSSIC ACID. See *Hydrocyanic Acid.*

PRUSSINE. See *Cyanogen.*

PSEUDO-ERYTHRINE. Syn. *Orsellinic Ether, Orsellinate of Ethyle.* See *Erythrine.*

PSEUDO-MORPHIA. Syn. *Pseudo-Morphine.* A substance of little importance, occasionally found in opium. It differs from morphia chiefly in not decomposing iodic acid. It is said to contain nitrogen.

PSORIASIS. Syn. *Irregular Dry Tetter.* A rough, scaly eruption, sometimes continuous, and sometimes in patches of various sizes, but of an irregular figure, and, for the most part, accompanied by fissures of the skin. It is distinguished from lepra, "not only by the distribution of the patches, but also by its cessation and recurrence at different periods of the year."

There are several *varieties* of this *disease*, as—*psoriasis guttata, p. diffusa, p. gyrata, p. inveterata, p. palmaria, p. labialis, p. scrotalis, p. infantilis, &c.* In the more aggravated form (*inveterata*) the skin becomes red, deeply furrowed or wrinkled, and so stiff and rigid, that the motion of the muscles and the joints is seriously impeded. The production and separation of the scales is also so remarkably rapid, that a large quantity of them is found on the bed, and confined within the linen of the patient.

The "*baker's itch*" is psoriasis diffusa of the back of the hand, and certain portions of the fingers. *Washerwomen* are often troubled with a like affection. The "*grocer's itch*" differs from the preceding in being pustular at its commencement, or of a mingled character.

The *general treatment* of *this disease* has been noticed under "*Scaly eruptions,*" and, for the most part, may resemble that for *leprosy*, and for the other *dry tetters.* A light and nutritious diet, with good ripe fruits, exercise in the open air, warm sea-bathing, and the *internal use* of the *bicarbonate* or *citrate of potassa* combined with *sulphur*, or with *cinchona*, generally prove useful. *Decoction of bran, butter-milk*, or *lotions containing glycerine*, may be employed to allay itching and irritation. When the disease is local (as *baker's itch*, &c.), the application of the *ointment of nitrate of mercury*, diluted with 10 or 12 times its weight of lard, has been highly recommended. Among internal remedies Donovan's solution (*liq. hydriod. arsen. et hydrarg.*) is, probably, the most active and certain.

PSOROPHTHALMIA. Syn. *Ophthalmitis Tarsalis.* An inflammation and ulceration of the eyelids, attended by considerable itching and irritation, and by a copious discharge of viscid and acrimonious matter. The *ointment of nitrate of mercury* or of the *nitric oxide of mercury*, largely diluted with *fresh lard*, is a very excellent application. A single drop of *wine of opium*, or the *fumes of oil of turpentine*, may also be applied nightly. See *Ophthalmia.*

PTISAN. Syn. *Ptisana*,—Lat. A decoction made of *pearl barley, liquorice, raisins*, and other like vegetable matters, either alone, or so slightly medicated as to be taken as a common drink in fevers, catarrhs, &c. Those retained in English pharmacy have been already noticed. The French physicians often employ this form of medicine. The "*tisanes*" of the P. Cod. are numerous. See *Decoctions, Infusions, Juleps, Tisanes, &c.*

PTYALINE. A peculiar animal matter, analogous to diastase, obtained from the saliva. It is soluble in water, but insoluble in alcohol.

PUCHA PAT. Syn. *Patchouli, Patchoulie.* Puchá pât is the dried foliaceous tops of an Indian species of *labiatæ.* It is much *used* in perfumery, particularly for making *sachets;* but its odour, although very durable, is not so agreeable as that of many other substances, unless it is combined with lavender, bergamot, ambergris, musk, or some other like perfume.

PUDDINGS. Every English female can make a pudding; and every Englishman seems to have an intuitive talent in the same direction, as evinced by the excellent compounds of this kind which he produces when "pinched for a meal" by either sea or land,—on the steppes of Asia, the deserts of Africa, the prairies of North America, on the mountain sides of either the Old or New world, or in the camp or trench, anywhere. Pudding is, in truth, a national dish in England, and its varieties are legion, extending over an almost infinitude of classes, orders, genera, and species, which it would occupy a whole life to digest and classify. Every county, every district, in this country, has its particular kind of pudding; and even the genius of our friend Alexis feels a proud self-complacency as he regards his numerous progeny of this description.

The *instructions* given under *Cakes, Pies, &c.*, will be found, with some slight modifications, also to apply to puddings, and, therefore, need not be repeated here. Soyer tells us that every sort of pudding, if sweet or savoury, is preferably dressed in a *basin*,

instead of in a *cloth*. If boiled in a basin, the paste receives all the nutriment of the materials, which, if boiled in a cloth, are dissolved out by the water, when by neglect it *ceases boiling*. To cause them to turn well out, the inside of the basin should be thoroughly "larded" or rubbed with butter.

In the *preparation* of *meat-puddings* the "first and most important point is *never to use any meat* that is *tainted;* for in pudding, above all other dishes, it is least possible to disguise it by the confined process which the ingredients undergo. The gradual heating of the meat, which alone would accelerate decomposition, will cause the smallest piece of tainted meat to contaminate all the rest. Be particular, also, that the *suet* and *fat* are *not rancid*, ever remembering the grand principle, that everything which gratifies the palate nourishes."

"A *pudding-cloth*, however coarse, ought *never* to be *washed with soap;* it should be simply dried as quickly as possible, and kept dry and free from dust, and in a drawer or cupboard free from smell." (A Soyer.)

PUDDLING. See *Iron*.

PUERPERAL FEVER. Syn. *Febris Puerperalis*,—Lat. This is a term which is differently applied by pathologists. That here referred to is a febrile affection of lying-in women, and may be regarded as a malignant form of milk fever, complicated with peritonitis, or inflammation of the peritoneum. It usually attacks the patient about the third day after delivery, and is marked by great tenseness and tenderness of the abdomen, suppression of the milk and lochia, a quick, small, and sharp pulse, hot skin, frequent vomiting, difficult respiration, inclination to belch, aphthous fauces, &c. In fatal cases death usually occurs in from 5 to 8 days.

The *treatment*, to be serviceable, must be prompt and skilful. In *full habits*, bleeding, mercurial purgatives, and saline sudorifics, with occasional doses of henbane, opium, or morphia, to induce sleep, are most relied on. When there is incessant vomiting or purging, and the fever assumes a typhoid character, the system must be supported with cordials and mild stimulants.

"If the pulse continue above a hundred in the minute for 24 hours after delivery, there is reason to apprehend that serious mischief is about to happen; and, therefore, unless the frequency depend, *decidedly*, on debility, produced by great hæmorrhage, &c., we ought to open the bowels, and give a diaphoretic." "If the belly be full or painful on pressure, or if the patient be inclined to vomit, we ought instantly to open a vein, and give a purgative. *One* copious bleeding on the very invasion of the disease, is more useful than *ten* afterwards; and the delay of two hours may be the loss of the patient, whose danger, even under the most active practice, is extreme." (*Lex. Med.*)

PUGGING. The stuff made of plaster, put between floors to deaden the sound.

PULMONITIS. Inflammation of the lungs. See *Pneumonia*.

PULP. Syn. *Pulpa*,—Lat. The softer parts of plants, more particularly, of fruits, separated from the fibrous and harder portions.

"*Pulpy fruits*, if they be *unripe*, or *ripe and dried*, are to be placed in a damp situation, until they become soft: then the pulp is to be pressed out through a hair sieve; afterwards, it is to be boiled with a gentle heat, frequently stirring; and, finally, the (excess of) water is to be evaporated in a water bath, until the pulp acquire a proper consistence."

"Press the *pulpy fruits* which are *ripe* and *fresh* through a *hair sieve*, without boiling them." (Ph. L. 1836.)

PULVERIZATION. The reduction of any substance to dust or powder.

On the *small scale*, pulverization is usually performed by means of a pestle and mortar; on the *large scale*, by stamping, grinding, or cutting the substance in a mill. A few *soft substances*, as carbonate of magnesia, carbonate of lead, &c., may be pulverized by simply rubbing them through a fine sieve, placed over a sheet of paper; whilst many *hard*, *gritty substances* can only be reduced to fine powder by porphyrization or levigation. *Elutriation*, or "*washing* over," is adopted for several substances, as chalk, antimony, &c., which are required to be reduced to fine powder on the large scale. For some articles which are very tough, fibrous, or resisting, a rasp or file is employed. Whichever of these methods is adopted, the *body to be powdered* must be *very dry*, and where spontaneous drying is insufficient, *artificial desiccation* in a stove or oven, gently heated, is employed. To facilitate this, the substance should be first cut into pieces or crushed small. On the other hand, a few substances, as *rice*, *sago*, *nux vomica*, and *St. Ignatius's bean*, are often soaked in water, or steamed, before being further operated on. Whenever a *substance cannot be dried completely*, without an *alteration of its properties*, an *intermedium* is had recourse to, by which the moisture may be absorbed, or its state of aggregation modified. Thus, sugar is employed in pulverizing *civet*, *musk*, *nutmeg*,

and *vanilla*. When *camphor* is to be pulverized, the addition of a very small quantity of alcohol renders the operation easy. In other cases, the *intermedium* is of so hard a nature as to assist in breaking-down the substance to be powdered; thus, *gold-leaf* is reduced to powder by rubbing it with sulphate of potassa, and afterwards removing this last by means of water. *Fusible metals*, as *zinc* and *tin*, are powdered by pouring them into a mortar, and stirring them rapidly whilst cooling; or, by briskly agitating them, in the melted state, in a wooden box covered with chalk or whiting. *Phosphorus* is powdered by melting it in urine or lime-water, and then shaking the bottle until its contents have become quite cold. *Glass*, *quartz*, and *silicated stones*, require to be heated red hot, and in this state to be thrown into cold water, by which they become sufficiently friable to admit of pulverization. Many *salts* which are reduced to fine powder with very great difficulty, and do not dissolve in spirit of wine, are easily obtained in a pulverulent form, by agitating their concentrated aqueous solution with a considerable quantity of rectified spirit; the disengaged fine crystallized powder may then be dried, and further divided by trituration. *Potassio-tartrate of antimony* may be advantageously thus treated. A *large number* of *salts*, including *nitre*, *sal ammoniac*, and *carbonate of potash*, may also be reduced to powder by keeping their solutions in a state of constant and violent agitation during their rapid evaporation.

The following rules should be observed in the preparation of powders:—

1. If possible, *perfectly dry articles* should alone be operated on, and only in *dry weather*.

2. The *nature of the mortar*, and the *mode of operating*, should be adapted to the nature of the substance. Thus *woods* and *barks* should be pulverized in an iron mortar; *sugar*, *alum*, and *nitre*, in one of marble or wedgewood-ware; and *corrosive sublimate*, only in one of glass.

3. The mortar should be provided with a cover to prevent *loss* and *annoyance* to the operator. If *much powder escapes*, or if it is *dangerous* or *disagreeable when breathed*, or if the *substance* is *rare or costly*, the mortar should be covered with a *skin of leather*, to which the pestle is attached, so that the latter may be freely moved without causing the slightest opening for the escape of the dust occasioned by the process. When *aloes* or *gamboge* is powdered, a few drops of olive oil are commonly added, with the same intention.

4. The pulverized portions should be separated from time to time, by aid of a sieve, the coarser particles being returned to the mortar to be again beaten and triturated; and this *alternate pulverization* and *sifting* is to be repeated until the process is complete.

PUMICE STONE. Syn. *Pumex*, *Lapis Pumiceus*, *L. Pumicis*,—Lat. Found in the neighbourhood of volcanoes. *Used*, in the solid form, to polish wood, paint, &c.; also, when pulverized, as a polishing powder for glass, bone, ivory, marble, metals, &c.

PUNCH. An acidulous, intoxicating beverage, composed of water sweetened with sugar, with a mixture of lemon juice and spirit, to which some aromatic, as nutmeg, mace, or cinnamon, is occasionally added. Wine is sometimes substituted for spirit. It is much less drank than formerly. *Rum punch* is the most popular amongst sailors, who are now the principle consumers of this beverage.

Prep. 1. *Juice of* 3 or 4 *lemons; yellow peel of* 1 *lemon; lump sugar*, ¾ *lb.; boiling water*, 3½ pints; infuse ½ an hour, strain, and add of *bitter ale*, ½ pint; *rum* and *brandy*, of each, ¾ to 1 pint (or *rum* alone, 1½ to 2 pints). More *hot water* and *sugar* may be added if the punch is desired either *weaker* or *sweeter*.

2. (*Cold Punch.*) From *arrack*, *port wine*, and *water*, of each, 1 pint; *juice of* 4 *lemons*; *white sugar*, 1 *lb.*

3. (*Gin Punch.*) From the *yellow peel* of ½ a *lemon; juice of* 1 *lemon; strongest gin*, ¾ pint; *water*, 1¾ pint; *sherry*, 1 glassful.

4. (*Iced Punch.*) From *champagne* or *Rhenish wine*, 1 quart; *arrack*, 1 pint; *juice of* 6 *lemons; yellow peel* of 3 *lemons; white sugar*, 1 *lb.; soda water*, 1 or 2 bottles; to be iced as cream.

5. (*Milk Punch; Verder.*) Steep the *yellow rinds* of 18 *lemons* and 6 *oranges*, for 2 days in *rum* or *brandy*, 2 quarts; then add 3 quarts more of either *spirit; hot water*, 3 quarts; *lemon juice*, 1 quart; *loaf sugar*, 4 *lb.*; 2 *nutmegs*, grated; and *boiling milk*, 2 quarts; mix well, and in 2 hours strain the liquor through a jelly-bag.

6. (*Norfolk Punch.*) Take of *French brandy*, 20 quarts; *yellow peels* of 18 *oranges* and 30 *lemons;* infuse for 12 hours; add of *cold water*, 30 quarts; *lump sugar*, 20 *lb.;* and the *juice* of the *oranges* and *lemons;* mix well, strain through a hair sieve, add of *new milk*, 2 quarts, and in 6 weeks bottle it. Keeps well.

7. (*Orange Punch.*) As No. 1, using *oranges*, and adding some *orange wine*, if at

hand. A little *Curaçoa, Noyau,* or *Maraschino* improves it.

8. (*Raspberry Punch.*) As the last, but using *raspberry juice* or *raspberry vinegar,* for the oranges or lemons.

9. (*Regent's Punch.*) From *strong hot green tea, lemon juice,* and *capillaire,* of each, 1½ pint; *rum, brandy, arrack,* and *Curaçoa,* of each, 1 pint; *Champagne,* 1 bottle; mix, and slice a *pineapple* into it.

10. (*Tea Punch.*) From *strong hot tea,* 1 quart; *arrack,* ½ bottle; *white sugar,* 6 *oz.: juice of* 8 *lemons;* and the *yellow rinds* of 4 *lemons;* mixed together.

11. (*Wine Punch.*) From *white sugar,* 1 *lb.; yellow peel* of 3 *lemons; juice* of 9 *lemons; arrack,* 1 pint; *port* or *sherry* (hot), 1 gall.; *cinnamon,* ¼ *oz.; nutmeg,* 1 *dr.;* mix.

12. (*Yankee Punch.*) Macerate *sliced pineapple,* 3 *oz.; vanilla,* 6 gr.; and *ambergris* (rubbed with a little sugar), 1 gr., in the strongest *pale brandy,* 1 pint, for a few hours, with frequent agitation; then strain with expression, add of *lemon juice,* 1 pint; *lemon syrup,* and either *claret* or *port wine,* of each, 1 bottle; with *sugar,* ½ *lb.,* dissolved in *boiling water,* 1½ pint. See *Shrub.*

PURGATIVES. Syn. *Dejectoria, Purgantia, Purgativa,*—Lat. These have been divided into *five orders* or *classes,* according to their particular actions. The following are the principal of each class:—

1. (*Laxatives, lenitives,* or *mild cathartics.*) Manna, cassia pulp, tamarinds, prunes, honey, phosphate of soda; castor, almond and olive oils; ripe fruit.

2. (*Saline* or *cooling laxatives.*) Epsom salt, Glauber's salt, phosphate of soda (tasteless salt), seidlitz powders, &c.

3. (*Active cathartics,* occasionally *acrid,* frequently *tonic* and *stomachic.*) Rhubarb, senna, aloes, &c.

4. (*Drastic* or *violent cathartics.*) Jalap, scammony, gamboge, croton oil, colocynth, elaterium, &c.

5. (*Mercurial purgatives.*) Calomel, blue-pill, quicksilver with chalk, &c.

In *prescribing purgatives,* regard should be had to the particular portion of the alimentary canal on which we desire more immediately to act, as well as to the manner in which the medicine effects its purpose. Thus, Epsom salt, sulphate of potassa, and rhubarb, act chiefly on the *duodenum;* aloes, on the *rectum;* blue-pill, calomel, and jalap, on the *larger intestines* generally; and tartrate and bitartrate of potassa, and sulphur, on the *whole length* of the intestinal canal. Again, others are *stimulant,* as aloes, croton oil, jalap, scammony, &c.; others are *refrigerant,* as most of the saline aperients; magnesia and its carbonate is both *aperient* and *antacid;* whilst another class, including rhubarb, damask roses, &c., are *astringent.* Further, some produce only *serous* or *watery dejections,* without greatly increasing the peristaltic action of the bowels; whilst a few occasion a copious discharge of the fæces in an apparently natural form. See *Draughts, Mixtures, Pills, Prescribing,* &c.

PURL. *Prep.* To *ale* or *beer,* ½ pint, gently warmed, add of *bitters,* 1 wine-glassful, or q. s. Some add a little *spirit.* A favorite beverage with hard drinkers early in the morning.

PURPLE. A rich compound colour, produced by the admixture of *pure blue* and *pure red.* This colour has always been the distinguishing badge of royalty and distinction. The celebrated *Tyrian dye* was produced by a shell-fish called *murex* or *conchyllium,* a species of *gasteropoda.*

PURPLE OF CASSIUS. Syn. *Purple Precipitate of Cassius, Gold Purple, Gold prepared with Tin; Aurum Stanno paratum, Purpura Mineralis Cassii,*—Lat. *Prep.* 1. *Crystallized protochloride of tin,* 1 part; *crystallized perchloride of tin,* 2 parts; dissolve each separately, mix the solutions, and add of *crystallized terchloride of gold* (in solution), 1 part; carefully wash, and dry the precipitate. Very fine.

2. (Frick.) Dissolve *pure grain-tin* in *cold dilute aqua regia,* until the fluid becomes faintly opalescent, then take the metal out and weigh it; next, dilute the solution largely with *water,* and add, simultaneously, a *dilute solution of gold,* and *dilute sulphuric acid,* in such proportion, that the *tin in the one* shall be to the *gold in the other,* in the ratio of 10 to 36.

3. (P. Cod.) *Terchloride of gold,* 1 part, is dissolved in *distilled water,* 200 parts; *another solution* is made by dissolving, in the cold, *pure tin,* 1 part, in a *mixture* of *nitric acid,* 1 part, and *hydrochloric acid,* 2 parts; this last solution is diluted with *distilled water,* 100 parts, and is then added to the *solution* of *terchloride of gold* until precipitation ceases to take place; the powder is, lastly, washed by decantation, and dried by a very gentle heat.

4. *Silver,* 150 parts; *gold,* 20 parts; *pure grain-tin,* 35 parts; fuse them together under charcoal and borax, cool, laminate, and dissolve out the silver with *nitric acid.*

Obs. Purple of Cassius is *used* as a purple in porcelain painting, and to communicate a ruby red colour to glass, when melted in *open* vessels.

PURPURA. An eruption, or efflorescense, consisting of small specks and patches,

caused by extravasation of blood under the cuticle, and so named from its colour. *Saline aperients*, and *mild tonics*, appear to be the *best remedies*. Although it is not a severe affection, it is often very little influenced by medicine.

PURPURATE OF AMMONIA. See *Murexide*.

PURPURIC ACID. See *Murexan*.

PURPURINE. Syn. *Madder Purple*. The name given by Robiquet and Colin to pure madder-red.

Prep. Coarsely powdered *madder* is allowed to ferment with *water*, after which it is boiled in a *strong solution of alum*; the *decoction* is next mixed with *sulphuric acid*, and the resulting red precipitate is purified by one or more crystallizations from *alcohol*.

Prop., &c. Crystalline red needles, insoluble in cold water, but soluble in hot water, and in alcohol, ether, and solutions of alum and the alkalies. It differs from alizarine or garancine prepared by the direct action of oil of vitriol on madder, in containing 2 equiv. less of carbon. (See *p.* 734.)

PURREE. Syn. *Indian Yellow*. A yellow substance, of doubtful origin, imported from China and India, and now extensively used in both oil and water-colour painting. According to the researches of Stenhouse and Erdmann, it consists of *purreic acid*, a strongly tinctorial vegetable substance, united to *magnesia*.

PURREIC ACID. Syn. *Euxanthic Acid*. This substance is obtained from *purree*. It crystallizes in nearly colourless needles, which are only sparingly soluble in cold water, and forms rich yellow-coloured compounds with the alkalies and earths. Heat converts it into a neutral, crystallizable substance, called *purrenone*.

PURRENONE. Syn. *Euxanthone*, *Pyropurreic Acid*. See *Purree*, and *Purreic Acid*.

PUS. The cream-like, white or yellowish liquid secreted by wounded surfaces, abscesses, sores, &c.

PUTREFACTION. Syn. *Putrefactio*,—Lat. *Putrefactive Fermentation*, *Putrid do.*,—*Obs.* The spontaneous decomposition of animal and nitrogenized vegetable substances, under the joint influence of warmth, air, and moisture. The solid and fluid matters are resolved into gaseous compounds and vapours, which escape, and into earthy matters, which remain. The most striking characteristic of this species of decomposition, is, the ammoniacal or fœtid exhalations that constantly accompany it.

The *nature* of *putrefaction*, and the *conditions essential* to *its occurrence*, have been briefly alluded to at *pages* 451-3, to which we must refer the reader. It may here, however, be useful to reiterate that *this change* can only be *prevented* by the abstraction or exclusion of the conditions essential to its occurrence. This may be effected by—*reduction of temperature*,—*exclusion of atmospheric air*, or—*the abstraction of moisture*. The antiseptic processes in common use, are effective in precisely the same degree as these preventive means are carried out. *Frozen meat* may be preserved for an unlimited period, while the same substance will scarcely keep for more than a few days at the ordinary heat of summer. *Animal substances* will also remain uninjured for a long period if kept in vessels from which the *air* is *entirely excluded*, as in the process now so extensively adopted for the preservation of fresh meat for the use of our army and marine. The *third condition* is fulfilled when nitrogenized matter is preserved in *alcohol*, *brine*, or any similar fluid, and when it is *dried*. In either case water is abstracted from the surface, which then loses its propensity to putrefy, and forms an impervious layer, which excludes atmospheric oxygen from the interior and softer portion of the substance. *Creasote*, and most of the *antiseptic salts*, also act in this way.

Among special antiseptic processes are the following:—

Application of Cold. The accession of putrefaction is prevented, and its progress arrested, by a temperature below that at which water freezes. In the colder climates of the world, *butcher's meat*, *poultry*, and even *vegetables*, are preserved from one season to the other in the frozen state. In North America millions are thus supplied with animal food, which, we can state, from personal experience, is often superior in flavour, tenderness, and apparent freshness, to that from the recently killed animal. In temperate climates, and in cold ones during their short summer, *ice-houses* and *ice-safes* afford a temperature sufficiently low for keeping meat fresh and sweet for an indefinite period. Substances preserved in this manner should be allowed to gradually assume their natural condition before cooking them; and on no account should they be plunged into hot water, or put before the fire, whilst in the frozen state. (See *p.* 591.)

Bucaning. A rude kind of drying and smoking meat, cut into thin slices, practised by hunters in the prairies and forests.

Desiccation or *Drying.* In this way every article of food, both animal and vegetable,

may be preserved, without the application of salt or other foreign matter. The proper method is to expose the substances, cut into slices or small fragments, in the sun, or in a current of warm dry air, the temperature of which should be under 140° Fahr. Articles so treated, when immersed for a short time in cold water, to allow the albumen and organic fibres to swell, and then boiled in the *same* water, are fully as nutritious as fresh meat cooked in the same manner. If a higher degree of heat than 140° be employed for animal substances, they become hard, and insipid. Owing to the practical difficulties in the way of applying the above process to fresh meats, it is usually employed in conjunction with either salting or smoking, and, frequently, with both of them.

Exclusion of Atmospheric Oxygen. This is effected by the method of "preserving in sugar," "potting in oil," and, more particularly, by the method known as "M. Appert's process," as improved by Messrs. Donkin & Gamble. (See *below.*)

Fresh meat may be preserved for some months in that state, by keeping it in water *perfectly* deprived of air. In practice, some iron filings and sulphur may be placed at the bottom of the vessel, over which must be set the meat; over the whole is gently poured recently boiled water, and the vessel is at once closed, so as to exclude the external air.

Immersion in Antiseptic Liquids. One of the commonest and most effective liquids employed for this purpose is *alcohol* of 60 to 70%, to which a little camphor, ammonia, sal ammoniac, or common salt is occasionally added. A *cheaper* and *equally efficient* plan is to employ a weak spirit holding a little creasote in solution. A weak solution of *sulphurous acid* may be substituted for alcohol. Weak solutions of *alum*, with or without the addition of a few grains of corrosive sublimate, or of arsenious acid, are also highly antiseptic. These are chiefly employed for *anatomical specimens*, &c. A *solution* containing only $\frac{1}{850}$th part of *nitrate of silver* is likewise very effective; but, from this salt being *poisonous*, it cannot be employed for preserving articles of food. *Butcher's meat* is occasionally pickled in vinegar. By immersing it for 1 hour in water holding $\frac{1}{100}$th part of *creasote* in solution, it may be preserved unchanged for some time, even during summer.

Injection of Antiseptic Liquids into the veins or arteries of the recently killed animal. It is found that the sooner this is done after the slaughter of the animal the more effective it becomes, as the absorbent power of the vessels rapidly decrease by age. See *M. Gannal's Process* (below).

Jerking, is a method of preserving flesh sometimes adopted in hot climates. It consists in cutting the lean parts of the meat into thin slices, and exposing these to the sunshine until quite dry and brittle, when they are bruised in a mortar, and pressed into pots.

Pickling in Vinegar. In this method the substances, rendered as dry as possible by exposure to the air, are placed in glass or stoneware jars (not salt-glazed), or wooden vessels, when *strong vinegar*, either cold or boiling hot, is poured over them, and the vessel at once closely corked, or otherwise covered up, and preserved in a cool situation. *Meat* is occasionally thus treated; *vegetables* frequently so. (See *p.* 974.)

Potting in Oil. In this case *salad* or *olive oil* is substituted for vinegar, (see above,) and is always used cold.

Salting acts chiefly by abstracting water from the albuminous portions of the meat, by which its disposition to change is lessened.

Smoking. This process, which, as well as the last, is referred to further on, acts both by the abstraction of moisture, and the antiseptic properties of certain substances (*creasote*, &c.) contained in wood smoke. *Fresh meat* and *fish* are occasionally smoked; but, in general, substances intended to be thus treated, are first salted.

In *Messrs. Donkin & Gamble's patent process*, the substances, previously parboiled, are placed in small tin cylinders, which are then filled up with rich soup; the lids are next soldered on quite air-tight, and a small hole is afterwards made in the centre; the cylinders are then placed in a bath of strong brine, or a strong solution of chloride of calcium, which is at once heated to the boiling point, to nearly complete the cooking process; after which the small hole in the lid is hermetically sealed, by covering it with solder while the vessel still remains boiling hot; the tins are, lastly, again submitted to heat in the heated bath, the duration of which is proportioned to the quantity and character of their contents, the "dressing" of which is to be perfected by this operation. The ends of the tins on cooling assume a concave form, from the pressure of the atmosphere, without which they cannot be air-tight, and the process has been unsuccessful. To determine this, the patentees expose the canisters, prepared as above, for at least a month, in an apartment heated to about 100° Fahr.; when, if the process has failed, putrefaction commences, and the

ends of the cases, instead of remaining concave, *bulge*, or become *convex*. This is called the "*test*." By this process, which was invented by M. Appert in France, about the year 1808, *fish*, *flesh*, *poultry*, and *vegetables*, may be preserved for years, or even centuries, in any climate.

The *process of Mr. Goldner* differs somewhat from the preceding, in the employment of a higher degree of heat, more hastily applied, and not prolonged or repeated after the tins are soldered up. The results, whether from careless manipulation, or otherwise, have not been so satisfactory as those of the preceding method under the personal direction of Mr. Gamble.

The *process of M. Gannal*, having for its object the preservation of *butcher's meat* in the *fresh state*, depends on the peculiar absorbent property of the flesh of recently killed animals, above referred to. This process consists in injecting a *solution* of *sulphate of alumina*, or, better, of *chloride of aluminium*, of the sp. gr. 1·070 to 1·085 (10° to 12° Baumé), into the carotid artery, by means of a syphon, as soon as the blood ceases to flow from the slaughtered animal; both extremities of the jugular vein being previously tied. 9 to 12 quarts of the solution are sufficient for an ox, and a proportionate quantity for smaller animals. A less quantity is also required in winter than summer. When the animal has been well bled, and the injection skilfully performed, it is scarcely perceptible that the animal has undergone any preparation. The *injected animal* is cut up in the usual way; and when intended to be eaten within 2 or 3 weeks merely requires to be hung up in a dry, airy situation, free from flies; but if it is to be kept for a longer period, it is directed to be washed with a mixed *solution* of *common salt* and *chloride of aluminium* at 10° Baumé, and then simply dried and packed in clean *air-tight* barrels, and kept in a cool, dry place. If the air cannot be *perfectly excluded*, it should be packed in dry salt, not for the purpose of preserving it, but to prevent the vegetation of bissus; as without this precaution, the meat becomes musty, from exposure, and the action of moisture. Meat preserved by this process may be kept for several years, and merely requires soaking for 24 hours in water, for the purpose of swelling its pores, to give it the appearance and taste of fresh meat, fit for either roasting or boiling. For hot climates a somewhat stronger solution, or a larger quantity of the usual one, may be injected. The use of the strong solutions ordered in some recent works, however, deprives the flesh of a portion of its apparent freshness, and makes it more nearly approach in flavour to that which has been slightly salted in the ordinary manner.

In addition to the above it may be added, that both *flesh* and *fish* may be preserved by dipping them into, or brushing them over with *pyroligneous acid*, and then drying them. This gives them a smoky flavour, but if *pure acetic acid* (Ph. L.) be used, no taste will be imparted. These fluids may be applied by means of a clean painter's brush, or even a stiff feather. A table-spoonful is sufficient to brush over a large surface. Fish and flesh so prepared will bear a voyage to the East Indies, and back, uninjured.

Fish may also be preserved in a dry state, and perfectly fresh, by means of *sugar* alone. Fresh fish may be thus kept for some days, so as to be as good when boiled as if just caught. If dried and kept free from mouldiness there seems no limit to their preservation; and they are much more nutritious in this way than when salted. This process is particularly valuable in making what is called "*kippered salmon;*" and the fish preserved in this manner are far superior in quality and flavour to those which are salted or smoked. A few table-spoonfuls of *brown sugar* are sufficient for a salmon of five or six pounds weight; and if *salt* be desired, a tea-spoonful or two may be added. *Saltpetre* may be used, instead of salt, if it be wished to make the *kipper* hard.

According to Prechtl, *fish* may be preserved in a *living state* for 14 days, or longer, *without water*, by stopping their mouths with crumb of bread steeped in brandy, pouring a little brandy into them, and then placing them in straw in a moderately cool situation.

The well-known property possessed by *ether*, *alcohol*, *pyroxilic spirit*, *chloroform*, and certain other *hydrocarbons*, of averting putrefaction, has been thus applied by M. Robin:—He encloses the meat or other substances to be preserved in a glass case, along with a sponge or a capsule, containing the preservative liquid, which latter is continually evolved in a vaporous condition, and exercises the preservative agency. In this way the vapours of hydrocyanic acid are found to be very efficacious. *Camphor* is thus employed in the *mummy cases* in the British Museum.

It has been recently asserted by Mr. George Hamilton, that in an atmosphere of *binoxide of nitrogen*, in the dark, flesh pre-

serves its natural colour and freshness for about 5 months; and eats well, provided it be boiled in open vessels, to expel nitrous fumes. See *Animal Substances*, *Candies*, *Eggs*, *Fish*, *Fruit*, *Meat*, *Milk*, *Pickles*, *Potting*, *Preserves*, *Salting*, *Skins*, *Smoking*, *Stuffing*, *Tanning*, *Tawing*, *Vegetables*, &c., &c.

PUTRID FEVER. See *Typhus*.

PUTTY (Glazier's). From *whiting*, made into a stiff paste with *drying oil*. It is used to fix panes of glass in sashes, to fill holes and cracks in wood before painting it, &c.

PUTTY (Plasterer's). A fine cement used by plasterers, made of *lime* only. It differs from "*fine stuff*" in the absence of hair.

PUTTY (Polisher's). Syn. *Putty Powder*, *Calcine; Cineres Stanni*, *Stanni Oxydum Crudum*,—Lat. A crude peroxide of tin, obtained by exposing *metallic tin* in a reverberatory furnace, and raking off the dross, as it forms; this is afterwards calcined until it becomes whitish, and is then reduced to powder. *Another method* is to melt *tin* with rather more than an equal weight of *lead*, and then to rapidly raise the heat so as to render the *mixed metal* red hot, when the tin will be immediately flung out in the state of *putty* or *peroxide*. The *products* of both these processes are very hard, and are *used* for polishing glass and japan work, and to colour opaque white enamel.

PUZZOLANA, *Puozzolana*, or more correctly, *Puzzuolana*, is a volcanic ash, found at Puzzuoli, near Naples. When mixed with *lime* it forms an excellent hydraulic cement. A good factitious *puzzolene* may be made by heating a mixture of 3 bushels of *clay* and 1 bushel of *fresh-slaked lime*, for some hours, to redness. (M. Bruyere.) See *Cements and Mortars*.

PYRETHRINE. An acrid, resinous principle, extracted by *alcohol* and *ether* from the *bark* and *root* of pellitory of Spain, (*anthemis pyrethrum*,—Linn.) It is also soluble in acetic acid.

PYRITES. A term applied to several native metallic sulphurets. *Iron pyrites*, the best known of these, is a *bisulphuret* of that metal.

PYRO-. This term is applied to several acids that are obtained by the action of heat on other substances; as, *pyrogallic acid*, *pyroligneous do.*, &c.

PYROACETIC ETHER. See *Acetone*.

PYROACETIC SPIRIT. See *Acetone*.

PYROBENZOLINE. See *Benzoline*.

PYROCITRIC ACID. Syn. *Citricic Acid*. Obtained by the action of heat on *citric acid*. It appears to be identical with the *aconitic* or *itaconic acid*.

PYROCONIA. Obtained by the action of heat on *hemlock*. (See *p.* 839.)

PYRODIGITALINE. A semi-solid, poisonous, empyreumatic oil, obtained by Dr. Morries, by the destructive distillation of the *dried leaves of foxglove*.

PYROGALLIC ACID. Syn. *Acidum Pyrogallicum*,—Lat. *Prep.* 1. From either *gallic* or *tannic acid* heated in a retort, by means of an oil bath, and steadily maintained at a temperature of about 420° Fahr. as long as crystals are formed in the neck of the retort, or in the receiver, both of which should be kept well cooled. If a much higher heat is employed the product consists chiefly of *metagallic acid*. Pure.

2. From *Aleppo galls*, in very coarse powder, heated in a dish covered with thin filtering paper pasted to its edge, and connected with a well-cooled receiver. Dr. Ure says, that the so-called *Chinese galls*, furnish, by dry distillation, a "very concentrated solution of pyrogallic acid, which, evaporated on the water bath, yields of brown crystalline pyrogallic acid nearly 15% of the weight of the galls."

3. (Dr. Stenhouse.) By sublimation from the *dry aqueous extract of nut-galls*, in a Mohr's apparatus, in the same way that benzoic acid is obtained from benzoin resin, (see *p.* 126,) observing the precautions referred to in No. 1, (above.) Nearly pure. The *product* is fully 10% of the weight of extract operated on.

Prop. Light crystals, which when perfectly pure are quite white; freely soluble in water, but the solution cannot be evaporated without turning black, and suffering decomposition; it strikes a rich blackish blue colour with the proto-salts of iron, and reduces those of the sesquioxide to the state of protoxide; when heated to from 460° to 480° Fahr. it is converted into *metagallic acid* and water. The nature of its compounds with the bases have not been determined.

Uses, &c. Pure pyrogallic acid is now very extensively employed in photography. A solution of the *crude acid* mixed with a little spirit is used to dye the hair, to which it imparts a fine brown colour, but has the disadvantage of also staining the skin when applied to it.

PYROGEN ACIDS. Those generated by heat.

PYROKINIC ACID. From *kinic acid* by heat.

PYROLA. See *Winter Green*.

PYROLIGNEOUS ACID. Syn. *Vinegar of Wood, Spirit of do., Smoking Liquor, Essence of Smoke; Acidum Pyrolignosum* —Lat. Impure acetic acid obtained by the destructive distillation of *wood* in close vessels. It comes over along with *tar, creasote*, and other liquid and gaseous matters. In this state it contains much empyreumatic matter in solution; but by separation from the tar, saturation with *slaked lime* or *chalk*, defecation, and evaporation, an *impure acetate* or *pyrolignate of lime* is obtained, which, after being gently heated, to destroy part of its empyreumatic matter, without injuring its acetic acid, is again dissolved and defecated, and then precipitated by a *solution of sulphate of soda*, when a solution of acetate of soda and a precipitate of sulphate of lime are formed by double decomposition. The solution is next evaporated to dryness, the dry mass (*pyrolignite of soda*) dissolved in *water*, and the new solution filtered, and recrystallized. The *crystals of acetate of soda*, obtained by the last process, yield nearly PURE ACETIC ACID by distillation along with *sulphuric acid*. See *Acetic Acid* and *Vinegar*.

PYROLIGNEOUS SPIRIT. See *Spirit* (Pyroxilic).

PYROLITHIC ACID. Syn. *Pyro-uric Acid*. From *uric acid concretions*, by heat; the silvery white crystalline plates (*pyrolithate of ammonia*) which sublime, are decomposed, in solution, by *solution of diacetate of lead;* the precipitate (*pyrolithate of lead*) is next washed, and decomposed with *sulphuretted hydrogen;* the supernatant liquor, on evaporation, yields *pyrolithic acid*, in acicular crystals.

PYROMALIC ACID. Syn. *Pyrosorbic Acid*. Obtained from *malic acid*, by heat.

PYROMECONIC ACID. From either *meconic acid* or *comenic acid*, by exposing it to a heat about that of 450° Fahr., when the new acid sublimes, and afterwards condenses in brilliant, colourless plates.

PYROMETER. An instrument to measure high degrees of heat. *Wedgewood's pyrometer*, the one best known, depends on the property which clay possesses of contracting when strongly heated. *Prof. Daniell's pyrometer* consists, essentially, of a small rod or bar of platinum, which acts in a precisely opposite manner to the preceding; viz., by its expansion.

PYROMUCIC ACID. Syn. *Pyromucous Acid*. A substance, resembling benzoic acid in appearance, obtained from *mucic acid*. It is soluble in water. See *Mucic Acid*.

PYROPHORUS. Syn. *Luft-Zunder*,— Germ. Any substance that inflames spontaneously when exposed to the air.

Prep. 1. *Neutral chromate of lead*, 6 parts; *sulphur*, 1 part; triturate them with *water* q. s. to form a paste, and make this into pellets; dry these perfectly by a gentle heat, then heat them in a closed tube until the *sulphur* is all driven off; lastly, transfer them to a stoppered phial.

2. (*Homberg's.*) From *alum* and *brown sugar*, equal parts; stir the mixture in an iron ladle over the fire until dry, then put it into an earthen or coated glass phial, and keep it at a red heat so long as flame is emitted; it must then be carefully stopped up and cooled.

3. (Dr. Hare.) *Lamp-black*, 3 parts; *burnt alum*, 4 parts; *carbonate of potash*, 8 parts; as the last.

4. (Gay Lussac.) From *sulphate of potassa*, 9 parts; *calcined lamp-black*, 5 parts; as No. 2.

5. (Göbel.) Heat *tartrate of lead* red-hot in a glass tube, and then hermetically seal it.

6. *Alum*, 3 parts; *wheat flour*, 1 part; as No. 2.

Obs. When the above are properly prepared, a little of the powder rapidly becomes very hot, and inflames on exposure to the air. The accession of the combustion is promoted by moisture, as a damp atmosphere or the breath. With the exception of the first and fifth "they owe their combustibility to the presence of sulphuret of potassium." (Gay Lussac.)

PYROPHOSPHORIC ACID. See *Bibasic Phosphoric Acid* (p. 967).

PYROSIS. Syn. *Black Water, Water Brash, Water-qualm*. An affection of the stomach, attended by a sensation of heat, and the eructation of a thin, sour liquid, often in considerable quantity, especially in the morning. It is a variety of *Heartburn* (which see).

PYROSORBIC ACID. See *Pyromalic Acid*.

PYROTARTARIC ACID. Obtained, along with *pyruvic acid*, by the destructive distillation of tartaric acid. See *Tartaric Acid* (and *below*).

PYROTECHNY. The art of making fire-works. The three principal materials employed in this art are, *charcoal, nitre*, and *sulphur*, along with *filings of iron, steel, copper*, or *zinc*, or with *resin, camphor, lycopodium*, or other substances, to impart colour, or to modify the effect, or the duration of the combustion. GUNPOWDER is used "either in *grain, half-crushed*, or

finely ground, for different purposes. The longer the *iron filings* are, the brighter red and white spots they give; those being preferred which are made with a coarse file, and quite free from rust. *Steel filings* and *cast-iron borings* contain carbon, and afford a more brilliant fire, with wavy radiations. *Copper filings* give a *greenish* tint to flame; those of *zinc*, a fine *blue colour*; the *sulphuret of antimony* gives a less greenish blue than zinc, but with much smoke; *amber* affords a *yellow fire*, as well as *colophony* (resin), and *common salt*; but the last must be very dry. *Lamp-black* produces a very *red colour* with gunpowder, and a *pink one* with nitre in excess; it serves for making golden showers." When this substance is lightly mixed with gunpowder and put into cases, it throws out small stars resembling the rowel of a spur; this composition has hence been called SPUR FIRE. "The *yellow sand*, or *glistening mica*, communicates to fire-works *golden radiations*. *Verdigris* imparts a *pale green*; *sulphate of copper* and *sal ammoniac* give a *palm-tree green*. *Camphor* yields a very *white flame* and aromatic fumes, which masks the bad smell of other substances. *Benzoin* and *storax* are also used on account of their agreeable odour. *Lycopodium* burns with a *rose colour* and a magnificent flame; but it is principally employed in theatres to represent lightning, or to charge the torch of a fury." (Ure.) See *Fires* (Coloured), *Gunpowder*, *Rockets*, *Stars*, &c.

PYROTHONIDE. See *Paper Oil* (p. 839).

PYRO-URIC ACID. See *Pyrolithic Acid*.

PYROXANTHINE. Syn. *Eblanine*,—Scanlan; *Pyroxiline*,—Ure. An orange-red, crystalline substance, obtained by Scanlan from *raw pyroxilic spirit*, by adding *liquor of potassa*, pressing the precipitate, washing it with *cold alcohol* of the sp. gr. 0·840 and crystallizing from *boiling alcohol*. With oil of vitriol it gives a rich crimson, and with hydrochloric acid a deep purple colour. "Its alcoholic or turpentine solution imparts a permanent yellow dye to vegetable and animal matter."

PYROXYLIC SPIRIT. See *Spirit* (Pyroxylic).

PYROXYLINE. Syn. *Fulminating Cotton*, *Gun do.*, *Pyroxyle*, *Pyroxylon*, *Nitrate of Lignine*; *Hyponitrite of Lignea*,—Porret. A highly inflammable and explosive compound, discovered by Schönbein. It is obtained by the action of nitric acid on cotton, in the presence of sulphuric acid.

Prep. 1. *Concentrated nitric acid* (sp. gr. 1·500), and *concentrated sulphuric acid* (sp. gr. 1·845), are mixed together in about equal measures; when the mixture has become cold, it is poured into a *glass* or *wedgwood-ware mortar* or *basin*, and *clean*, *dry carded cotton*, in as loose a state as practicable, is immersed in it for 4 or 5 minutes, the action of the liquid being promoted by incessant stirring with a glass rod; the acid is next poured off, and the cotton, after being squeezed as dry as possible, by means of the *glass stirrer*, or between two plates of glass, is thrown into a large quantity of *clean soft water*, and again squeezed to free it from superfluous moisture; it is then washed in a *stream* of *pure water* until it becomes *perfectly free from acid*, and is, lastly, carefully dried by the heat of hot water or steam, at a temperature not higher than about 180° Fahr. The *product* is *pure pyroxyline*.

2. (Schönbein.) *Nitric acid* (1·45 to 1·50), 1 part; *sulphuric acid* (1·85), 3 parts; (both by volume;) proceed as above, but, after the cotton has been squeezed from the acid, allow it to remain in a covered vessel for an hour *before* washing it; and *after* washing it, dip it into a *solution* of *carbonate of potassa*, 1 *oz.*, in *pure water*, 1 gall., then squeeze, and partially dry it; next dip it into a *weak solution of nitre*, and dry it in a room heated by hot air or steam to about 150° Fahr. (See *Patent Specif.*)

3. (Bulletin de St. Pétersbourg.)—*a.* Take of *powdered nitre*, 20 parts; *sulphuric acid* (1·830 to 1·835), 31 parts; dissolve in a glass vessel, and whilst the solution is still warm (122° Fahr.), add of *dry carded cotton*, 1 part, and employ agitation until this last is well saturated; then cover over the vessel with a *plate of glass*, and let it stand, for 24 hours, at a temperature of about 86° Fahr.; next well wash the cotton, as above, first with *cold*, and afterwards with *boiling water*, and dry it carefully at a very low temperature.

b. From *sulphuric acid* (containing 3 equiv. of water), 13 parts; *nitric acid* (monohydrated), 12 parts; *carded cotton*, 1 part; the immersion being limited to one hour at a temperature of from 104° to 122° Fahr. (See *Pharm. Journ.*, vol. xiii, No. 2.)

Prop., *&c.* Pyroxyline explodes, with a very sudden flash, and the development of very little heat, without either smoke or residue, at a temperature of about 300° Fahr. Its power is fully four times that of the best gunpowder. It is soluble in ether, forming a glutinous solution which is used

in surgery under the name of *collodion*, and is also extensively used in photography. It is *distinguished from xyloidine*, with which it was formerly confounded, by the mode of its combustion, and being insoluble, when quite pure, in ether containing a little alcohol. That prepared by the formula 3, *a*, (above,) is, however, soluble in a mixture of 7 parts of ether and 1 part of alcohol; whilst the product of 3, *b*, if prepared by 2 hours' digestion, instead of 1, is said to be even soluble in absolute alcohol. As usually prepared it becomes damp by exposure to the atmosphere.

Obs. The *gun cotton* of *commerce*, prepared with oil of vitriol and nitre, or with any but the most concentrated acids, is not *pure pyroxyline*, but a mixture of that substance with another compound to which the name of *cotton xyloidine* has been given by Dr. Gladstone. The former is insoluble in ether; the latter, freely soluble in that menstruum. This accounts for the different degrees of solubility possessed by pyroxyline, as prepared by different processes and makers. For the manufacture of collodion it is best used in the recently prepared, and scarcely dry state, as it is then much more soluble than when perfectly dry; a condition, however, which can be afterwards reproduced by dipping it into distilled water, and submitting it to strong pressure, to remove superfluous moisture.

When first gun cotton became known, it was thought likely that it would soon supersede the use of common gunpowder; but from the extreme suddenness of its explosion it is apt to burst the gun, or to only partly explode, a considerable portion of the charge being blown out of the piece in an unaltered state. The last inconvenience we have found to be nearly always the case with small-arms when hastily loaded with gun cotton in the common state; and, hence, after experiments, extending over some months, at the time of the first introduction of this substance to this country, we became convinced, and publicly stated our opinion, that it would never supersede gunpowder for general purposes. As yet, this assertion has not been disproved. The product of Schönbein's formula is rather less objectionable on this point than that prepared in any other manner.

The proportions of the two acids (see *above*) ordered by different authorities, vary so greatly, that extreme nicety in that respect would not appear to be essential to success. A mixture of 2 parts of *nitric acid* with 1 part of *sulphuric acid*, has been highly recommended by some; whilst the proportions ordered in the specification of Schönbein give a vast preponderance to the sulphuric acid. Immersion of the *cotton* in highly *concentrated nitric acid* (sp. gr. 1·50 to 1·52) also produces a highly explosive pyroxyline, but is more expensive, and less convenient in practice than the other formulæ. On the *large scale*, the principal object is to reduce the quantity of nitric acid as low as possible to produce the necessary results.

Gun cotton may be dried at 212° Fahr., with care, without suffering decomposition; but at a few degrees above this temperature it becomes brown and disintegrated, and is then explosive at a much lower temperature than previously, and is subject to spontaneous decomposition, if not spontaneous explosion. See *Collodion* and *Xyloidine*.

PYRUVIC ACID. A compound, resembling acetic acid, discovered by Berzelius among the products of the destructive distillation of *racemic acid* and *tartaric acid*.

QUACK MEDICINES. See *Patent Medicines, Ointments, Pills. &c.*

QUADRI-. See *Nomenclature.*

QUAIL. The *tetrao coturnix* (Linn.), a gallinaceous bird, allied to the partridge, but of smaller size. Its flesh is highly esteemed by epicures. It is imported from Turkey, preserved in oil; and from Italy, potted with clarified butter.

QUARTAN. See *Ague.*

QUARTATION. The practice, among assayers, of alloying 1 part of *gold* with 3 parts of *silver*, before submitting it to the operation of "*parting;*" in order that its particles may be too far separated to protect the copper, lead, palladium, silver, or other metals with which it is contaminated, from the solvent action of the *nitric* or *sulphuric acid*, as the case may be. See *Assaying.*

QUARTZ. Pure native silica. It is an essential constituent of granite and many other rocks. Its crystalline, transparent varieties are known as *Rock crystal.* See *Glass, Powders, &c.*

QUASS. Syn. *Posca Venalis*, — Lat. *Prep.* Mix *rye-flour* and *warm water* together, and keep the mixture by the fireside until it has turned sour. *Used* as vinegar in Russia.

QUASSIA. Syn. *Quassia*,—Ph. L. E. & D. The "*wood* of *picræna* (quassia) *excelsa*, Lindl." (Ph. L.), or *Jamaica quassia;* and

also of the "*quassia amara*, Linn." (Ph. E.) It is characterised by its intense bitterness. It is reputed tonic and stomachic, assisting digestion, and giving tone and vigour to the system. Its name was given to it by Linnæus, in honour of a negro slave who had long employed it as a remedy for the malignant endemic fevers of Surinam. When sliced, it forms the "*quassia chips*" of the shops. It is generally taken in the form of *infusion*. This last, sweetened with sugar, forms a safe and effective poison for flies. *Dose*. (In powder) 10 to 20 gr. See *Infusions*.

Roasted Quassia, reduced to powder, is largely employed, instead of hops, to embitter porter; and the unroasted powder is used for the same purpose in the manufacture of the bitter varieties of ale.

QUASSINE. Syn. *Quassite*, *Quassina*. A peculiar bitter principle, obtained by evaporating *tincture of quassia*. In this state it is a brownish-yellow, semi-transparent, amorphous mass; but by purification it assumes the form of small, opaque, white, prismatic crystals, which are freely soluble in alcohol, less so in ether, and in not less than 200 parts of cold water.

QUEEN'S BLUE. See *p.* 146.

QUEEN'S METAL. A species of pewter used for *teapots*, *&c.*, made by fusing under charcoal a *mixture* of *tin*, 9 parts; and *antimony*, *bismuth*, and *lead*, of each, 1 part; or, *tin*, 100 parts; *antimony*, 8 parts; *copper*, 4 parts; *bismuth*, 1 part. See *Britannia Metal* and *Pewter*.

QUEEN'S YELLOW. Yellow subsulphate of mercury.

QUERCITANNIC ACID. See *Tannic Acid*.

QUERCITRINE. The yellow colouring principle of *quercitron bark*. It is soluble in alcohol, but only sparingly so in ether and water. It is crystallizable, forming pale yellow, micaceous scales.

QUERCITRON. The *bark* of *quercus nigra* or *tinctoria*, a species of oak indigenous in North America. With alum mordants it yields a very permanent yellow dye.

QUICKSILVER. See *Mercury*.

QUILLS. *Prep.* 1. The *quills* or *wing-feathers* of the goose are separately plunged, for a few seconds, into *hot ashes*, *cinders*, or *sand*, of a temperature about equal to that of boiling water, after which they are scraped with a blunt knife, strongly rubbed with a piece of *flannel* or *woollen cloth*, and gently "stoved;" they are, lastly, tied up in bundles by women or children. A *yellow tinge* is often given to them by dipping them for a short time into *dilute hydrochloric* or *nitric acid*, or into an *infusion of turmeric*.

2. Suspend the *quills* in a copper over *water* sufficiently high to nearly touch the nibs; then close it steam tight, and apply three or four hours' hard boiling; next, withdraw the *quills*, and dry them, and in 24 hours cut the nibs and draw out the pith; lastly, rub them with a piece of cloth, and expose them to a moderate heat in an oven or stove. Quills prepared in this way are as hard as bone, without being brittle, and nearly as transparent as glass. *Crow quills* and *swan quills* may be cured in the same manner.

QUINA. See *Quinine*.

QUINATES. See *Kinic Acid*.

QUINCE. Syn. *Cydonia*,—Lat. The *fruit* of *cydonia vulgaris* (pyrus cydonia, —*Linn.*), or common *quince tree*. Its flavour in the raw state is austere, but it forms an excellent marmalade (*quince marmalade*, *quiddany*; *cydonium*, *mira cydonarium*), and its juice yields an agreeable and wholesome wine. The *seed* or *pips* (*cydoniæ semina*; *cydonium*, — Ph. L.) abound in a species of gummy matter (*cydonine*), which forms a mucilage with water, and possesses the advantage of not being affected by the salts of iron or alcohol. See *Decoctions* and *Jellies*.

QUINIDINE. Syn. *Quinidia*, *Quinidina*, *Quinidinum*. An alkaloid discovered by MM. Henry & Delondre in quinoidine, or amorphous quinine, of which it constitutes from 50 to 60%. It is the *β quina* of M. J. Van Heijningen.

Prep. Saturate *purified quonoidine* with *dilute sulphuric acid*, then add *caustic potassa* or *ammonia*, in slight excess, and afterwards agitate the mixture with *ether* or *benzole*; as soon as the ethereal solution separates, decant it, and distil off the ether; lastly, further purify the residuum by any of the common methods adopted for quinine.

Prop., *&c.* These, together with the means of *distinguishing* it *from quinine*, are fully noticed below. Another marked dissimilarity, is its not striking a green colour when treated with chlorine followed by ammonia, as that alkaloid does. Its *medicinal properties* are said to resemble those of quinine, in character, but not in degree; its powers being comparatively feeble. It is contained in nearly all the ordinary disulphate of quinine of the shops. This contamination generally arises from that article being carelessly made; but, occasionally, it occurs as a wilful adultera-

tion. *Sulphate of quinidine* is now often employed as a substitute, and is even sold for disulphate of quinine, the inducement being its apparent cheapness.

According to M. Roder, *quinidine* may be reduced to the state of ordinary *crystallizable quinine*, by means of protochloride of tin. If true, this would realise the conjectures of Liebig on the nature of this substance, now long since expressed.

QUININE. Syn. *Quina, Quinia, Quinina; Chinine, Quinium, Quininum, &c.*,—Obs. *or* Err. A valuable medicinal alkaloid, discovered by MM. Pelletier & Caventou, in cinchona bark. It is found in the greatest quantity in *yellow* or *Calisaya bark* (cinchona cordifolia *or* flava); just as *cinchonine* forms the principal alkaloid in *pale bark* (cinchona condaminea, lancifolia, *or* pallida). *Red bark* (cinchona oblongifolia *or* rubra) contains both alkaloids.

Prep. 1. By precipitating a *solution of sulphate*, or *disulphate of quinia* with *liquor of ammonia* or of *potassa*, carefully avoiding excess, and washing and drying the precipitate. By solution in alcohol, sp. gr. 0·815, and spontaneous evaporation, it may be procured in crystals. Crystals may also be obtained from "its solution in hot water with a little ammonia." (Liebig.)

2. (*Direct.*) By adding *hydrate of lime*, in slight excess, to a *strong decoction of the ground bark* made with *water* acidulated with *sulphuric acid*, washing the precipitate which ensues, and boiling it in *alcohol;* the solution, filtered while hot, deposits the *alkaloid* on cooling.

Prop., &c. Quinia, when prepared by precipitation, is an amorphous, white powder, but when this precipitate is left in the liquor, it assumes, after some time, the appearance of aggregated crystalline needles; when slowly crystallized from its solution these needles are remarkably fine, and of a pearly or silky lustre. It is freely soluble in rectified spirit, and in ether and liquor of ammonia, but is only sparingly soluble in water, even when boiling; both the fixed and volatile oils dissolve it with the aid of heat, more especially when it has been rendered anhydrous, or is presented to them under the form of an ethereal solution. It fuses by a gentle heat, without decomposition; forms crystallizable salts, which are only slightly soluble in water, unless it be acidulated, and, like the pure alkaloid, are extremely bitter, and possess much of the characteristic flavour of cinchona bark. It is precipitated by the alkalies and their carbonates, by tannic acid, and by most astringent substances.

Pur. See *Disulphate of Quinine* and *Quinometry.*

Tests. Quinia is recognised by—1. Its appearance under the microscope.—2. Its solubility in ether, and in pure ammonia water.—3. Its solubility in concentrated nitric acid, forming a colourless liquid which does not become yellowish until it is heated.—4. The solubility of itself and salts, when pure, in concentrated sulphuric acid forming colourless fluids "which do not acquire any coloration upon being heated to the point of incipient evaporation of the sulphuric acid, but which afterwards become yellow, and finally brown." (Fresenius.)—5. Its solubility in concentrated sulphuric acid to which some nitric acid has been added, forming a colourless, or, at the most, only a faintly yellowish liquid.—6. It is *wholly* destroyed by heat.

A *solution of quinia* in *acidulated water*, and *solutions of its salts*, exhibit the following reactions:—1. Ammonia, potassa, and the alkaline carbonates, give white, pulverulent precipitates, becoming crystalline after some time (see *above*), and which are soluble in ammonia in excess, and which when ether is added after the ammonia, and the whole is agitated, redissolve in the ether, whilst the clear liquid, on repose, presents two distinct layers.—2. Bicarbonate of soda (avoiding excess) gives a similar precipitate, both in acid and neutral solutions of quina, either at once, or after a short time. This precipitate is soluble in excess of the precipitant, and is again precipitated from the new solution upon protracted ebullition. "Vigorous stirring of the liquid promotes the separation of this precipitate." (Fresenius.)—3. If recently prepared chlorine be added to it, and then ammonia, a (beautiful emerald) green colour is developed. (Ph. L.)—4. A concentrated solution of ferrocyanide of potassium being added, in excess, after the chlorine, instead of the ammonia, a dark-red colour is instantly produced, which, after some time, passes into green, especially when freely exposed to the light. "This reaction is characteristic of quinine." (Ure.)—5. If caustic potassa be used instead of ammonia (see *above*), the solution acquires a sulphur-yellow colour. "These reactions are restricted to this alkaloid." (Dr. Garrod.)

Quinia is *distinguished* from both *cinchonia* and *quinidia*, by its comparatively free solubility in ether; the last of these being very sparingly soluble, and the other wholly insoluble in that menstruum. The *presence of cinchonia* may also be positively determined by reference to the behaviour of

that alkaloid, noticed at *page* 261. *Quinidine* is also distinguished from quinine by the different crystallization, greater specific gravity, and freer solubility of its salts in *cold* water. (An extremely elegant and highly sensitive method of testing for quinine and quinidine, by means of the microscope, &c., is described at considerable length, by Dr. Herapath, in the *Pharm. Journ.* for Nov., 1853.)

Estim. See *Quinometry.*

Uses, &c. Pure quinine or quinia is not used in medicine, but several of its salts are employed as remedies, on account of their great stimulant, tonic, and febrifuge powers. As a tonic in dyspeptic affections and for restoring strength and vigour to morbidly weakened habits, and as an anti-periodic or agent to counteract febrile action, it appears to be superior to all other remedies, provided no abnormal irritability of the mucous membranes, or of the circulatory organs, exists. It has been recently combined with *cod-liver oil* (see *p.* 1092), by which a compound medicine of the most valuable kind, possessing both alterative and tonic powers, has been produced. The *dose* of the *salts of quinine*, as a *tonic*, is ½ to 1 gr., twice or thrice daily; as an *anti-periodic*, 2 to 5 gr., or even more, every second or third hour, during the intervals of the paroxysms of ague, and of other intermittent or periodic affections; also in acute rheumatism. The *disulphate* is the salt generally used; they are all most effective when taken in solution.

The *salts of quinine* may be made by simply saturating the *dilute acids* with the *base*, and gently evaporating the solutions for crystals, or to dryness. Prince Lucien Bonaparte recommends *all these salts* to be prepared by the addition of a *strong alcoholic solution of quinia* to a *cold solution of the acid.* We have tried this method with success.

It has been recently asserted by Dr. Bell, of the Royal Infirmary, Manchester, that "*carbo-azotic acid* is a valuable and efficient substitute for quinine in intermittents." *This acid* may be "easily prepared from *carbolic acid* in any quantity" (Prof. Crace Calvert), and "from the *grass-tree* or *black-bay gum* of Australia, at 1*s.* per *lb.*, by treating it with *nitric acid.* (R. Warrington.)

QUININE (Acetate of). Syn. *Quinæ Acetas*,—Lat. *Prep.* (P. Cod.) Mix *quinia*, 2 parts, with *water*, 3 parts; heat the mixture, and add of *acetic acid*, q. s. to dissolve the alkaloid, and to render the solution slightly acid; lastly, decant or filter the solution whilst boiling hot, and set it aside to crystallize. The mother-water, on evaporation, will yield a second crop of the acetate.

Prop., &c. Satiny, acicular crystals, which are rather more soluble in water than those of the disulphate. *Dose.* ½ to 5 gr.

QUININE (Arseniate). Syn. *Quinæ Arsenias*,—Lat. *Prep.* (Bourières.) *Arsenic acid*, 1½ dr.; *quinia*, 5 dr.; *distilled water*, 6 fl. oz.; boil them together in a covered glass vessel until the alkaloid is dissolved, then set the solution aside to crystallize.

Uses, &c. Recommended by Dr. Neligan, and others, as being more powerfully anti-periodic than the other preparations of quinine. *Dose.* $\frac{1}{12}$ to ¼ gr., made into pills; in agues, neuralgia, &c.; also in cancer.

QUININE (Arsenite of). Syn. *Quinæ Arsenis*,—Lat. *Prep.* By adding an *alcoholic solution of quinia* to a *concentrated solution of arsenious acid*, avoiding excess; on heating the solution the precipitate is redissolved, and again deposited in the crystalline form as the liquid cools.

Uses, &c. As the last. A *diarsenite of quinine* (*quiniæ diarsenis*) is also formed, by dissolving in a hot solution of the arsenite, as much quinine as that already in it.

QUININE (Chloride of). See *p.* 1090.

QUININE (Citrate of). Syn. *Quinæ Citras*,—Lat. *Prep.* 1. By mixing a *hot solution of sulphate of quinine* with a like *solution of citrate of soda.*

2. From *quinia* and *citric acid*, as the acetate. Needle-shaped prisms. *Dose, &c.* As the sulphate or disulphate.

QUININE (Disulphate). See *Quinine* (Sulphates).

QUININE (Ferrocitrate of). Syn. *Quinæ Ferro-citras*,—Lat. See *Quinio-citrate of Iron.*

QUININE (Ferrocyanide of). Syn. *Cyanide of Iron and Quinine; Quinæ Ferro-prussias, Quinæ Ferrocyanidum, Ferri Cyanidum cum Quinâ, Hydrocyano-ferras Quinicus*,—Lat. var. *Prep.* (P. Cod.) *Disulphate of quinine*, 100 parts; *ferrocyanide of potassium*, 31 parts; *distilled water*, 2500 parts; boil for a few minutes, and when cold separate the impure salt which floats as an oily mass on the surface, wash it with a little *cold water*, and dissolve it in *boiling alcohol;* the solution will deposit crystals as it cools.

Obs. This compound is said by some parties to be the most efficacious of all the salts of quinia. M. Pelouze asserts that it is a mere combination of the common sul-

phate with percyanide of iron. *Dose.* 1 to 6 gr.

QUININE (Ferrosulphate of). See *Quinine and Iron* (Sulphate of).

QUININE (Hydriodate of). Syn. *Quinæ Hydriodas, Q. Iodidum,*—Lat. *Prep.* 1. By adding, drop by drop, a concentrated *solution of iodide of potassium* to a *like solution of neutral sulphate of quinine,* and drying the precipitate in the shade; or, heat the liquid nearly to the boiling point, and allow it to crystallize.

2. (*Ioduretted,*—Bouchardat.) From an *acid solution of quinia* and a *solution of iodide of iron* containing a *slight excess of iodine,* as the last.

Obs. By solution in hot alcohol both the above may be obtained in crystalline scales. They are reputed alterative, tonic, and antiperiodic. *Dose.* 1 to 4 gr.; in obstinate intermittents, and in the scrofulous affections of debilitated subjects.

QUININE (Hydrochlorate of). Syn. *Chloride of Quinia, Muriate of Quinine; Quinæ Hydrochloras, Quiniæ Murias, Q. Iodidum, Chinium Hydrochloratum,*—Lat. *Prep.* 1. By neutralizing *dilute hydrochloric acid* with the *base,* as above.

2. (Ph. Bor.) *Chloride of barium,* 5 dr.; *boiling water,* 1 ℔; dissolve, add, gradually, of *sulphate of quinine,* 2 oz.; boil gently for a few minutes, filter the solution whilst hot, and set it aside that crystals may form.

3. (*Quinæ Murias,*—Ph. D.) Dissolve *chloride of barium,* 123 gr., in *distilled water,* 2 fl. oz.; add of *sulphate* (disulphate) *of quinine,* 1 *oz.,* dissolved in *boiling water,* 1½ pint; mix, evaporate the solution to one half, filter, and again evaporate until spiculæ begin to appear; next allow the liquid to cool, collect the crystals, and dry them on bibulous paper. The mother-liquor, by further concentration and cooling, will yield an additional product.

Obs. Hydrochlorate of quinine occurs in snow-white groups of feathery crystals, of a mother-of-pearl lustre, which are more freely soluble than those of the disulphate.

QUININE (Kinate of). Syn. *Quinæ Kinas,*—Lat. *Prep.* As the other salts of quinine; also, by double decomposition, from the *residuary kinate of lime* of the manufacturers of sulphate of quinine.

QUININE (Lactate of). Syn. *Quinæ Lactas,*—Lat. *Prep.* As the *acetate* or *citrate.* By spontaneous evaporation fine crystals may be obtained. Said to agree better with dyspeptic patients than the other salts of quinine.

QUININE (Muriate of). See *above.*

QUININE (Nitrate of). Syn. *Quinæ Nitras,*—Lat. *Prep.* As the *hydrochlorate,* substituting *dilute nitric acid,* or *nitrate of baryta* (P. Cod.), for hydrochloric acid or chloride of barium.

QUININE (Phosphate of). Syn. *Quinæ Phosphas,*—Lat. As the *acetate.* Silky, needle-shaped crystals, with a pearly lustre. It has been highly recommended in intermittents, &c., associated with rickets, and stomach affections.

QUININE (Sulphate of). Syn. *Neutral Sulphate of Quinine, Soluble do.; Quinæ Sulphas, Q. S. Neutralis, Q. S. Solubilis,*—Lat. *Prep.* From *disulphate of quinine,* 1 oz.; dissolved, by the aid of heat, in *water,* ½ pint, previously acidulated with *dilute sulphuric acid,* 5 fl. dr.; the solution affords crystals on cooling, and more on evaporation.

Obs. This salt possesses the advantage of being soluble in about 10 parts of water at 60° Fahr.; but it is seldom used. It is the *bisulphate, supersulphate,* or *acid sulphate of quina* of Soubeiran, and other Continental chemists.

QUININE (Disulphate of). Syn. *Basic Sulphate of Quinine, Subsulphate of do.; Quinæ Disulphas,*—Ph. L. *Sulphate of Quinine, Quinæ Sulphas,*—Ph. E., D., & U. S.; & P. Cod. *Quininæ Sulphas,*—Ph. D. 1826. *Sulphate de Quinine,*—Fr. *Prep.* 1. (Ph. L. 1836.) Take of *yellow cinchona bark* (cinchona cordifolia), bruised, 7 ℔; *sulphuric acid,* 4¼ oz.; (diluted with) *water,* 6 gall.; boil them for 1 hour, and strain; repeat this a second time for 1 hour, with a *like quantity* of *acid* and *water,* and again strain; next boil the *bark* for 3 hours, in *water,* 8 gall., and strain; wash the residue with fresh quantities of *boiling distilled water;* to the *mixed decoctions* and *washings,* add *moist hydrated oxide of lead* to saturation, decant the supernatant fluid, and wash the sediment with *distilled water;* boil down the liquor for 15 minutes, and strain, then *precipitate* the *quina* with *liquor of ammonia,* and wash the precipitate (with *very cold water*) until nothing alkaline is perceptible; saturate what remains with *sulphuric acid,* ½ oz., diluted with *water,* q. s., digest with *animal charcoal,* 2 oz., and strain; lastly, the charcoal being well washed, evaporate the mixed liquors that crystals may form.

2. (Ph. E.) This process varies from the last one, in the *bark* (1 ℔) being first boiled in *water* (4 pints) along with *carbonate of soda* (4 oz.); the residuum being pressed, is moistened with *water,* and again pressed, and this operation is repeated a second and a third time; the object being to remove,

as much as possible, the acids, colouring matter, gum, and extractive, before proceeding to extract the alkaloid. *Carbonate of soda* is also used as the precipitant, instead of ammonia, and the *precipitate* is formed into a *sulphate* (disulphate) by being stirred with *boiling water*, 1 pint, to which *sulphuric acid*, 1 fl. scruple, or q. s., is subsequently added. The crystals, after digestion with *prepared animal charcoal*, 2 dr., are ordered to be dried at a heat not higher than 140° Fahr.—*Obs.* This is an excellent process. *Lime* (Stolze) and *caustic potassa* (Badollier & Scharlau) have been successfully employed for the same purpose as the carbonate of soda is used for by the Edinburgh College. The *methods* recently *patented* by Mr. Edward Herring, and by Dr. W. B. Herapath, are simply modifications of the above.

3. (Ph. D.) *Yellow bark*, 1 *lb.*, is macerated for 24 hours in *water*, 2 quarts, acidulated with *oil of vitriol*, 2 fl. dr.; and then boiled for half an hour, after which the fluid is decanted; this is repeated a second and a third time with *water*, 2 quarts, and *oil of vitriol*, 1 fl. dr.; the decanted (or strained) liquors are evaporated to a quart, and filtered, and *slacked lime*, 1 *oz.*, or q. s., added to the solution until it exhibits a decidedly alkaline reaction; the *precipitate* is next collected on a calico filter, and after having been washed with *cold water*, partially dried on porous bricks, and subjected to powerful pressure enveloped in blotting paper, is boiled for 20 minutes in *rectified spirit*, 1 pint, and the liquid, after subsidence, decanted; this is repeated a *second* and a *third* time with a fresh pint of *spirit*, and the residuum being well pressed, the mixed liquors are filtered, and the spirit removed by distillation; the brown viscid residuum is dissolved in *boiling water*, 16 fl. oz., boiled, and *dilute sulphuric acid*, ½ fl. oz., or q. s., added to render the solution neutral or only slightly acid; *animal charcoal*, ½ *oz.*, is next stirred in, the mixture boiled for about 5 minutes, filtered, and set aside to crystallize; the crystals are dried on blotting paper, by mere exposure to a dry atmosphere.—*Obs.* This process is a modification of that of M. Henry. When adopted on the *large scale*, either freshly slaked lime, or milk of lime is used, the resulting precipitate, after being drained on a filter, is submitted to powerful hydraulic pressure, and the tinctures formed by exhausting the dry cake, merely reduced by distillation to a syrupy consistence. The addition of the acid is also sometimes made to the *tincture*, and, at other times, to the *hot aqueous solution*, as above. The use of spirit of wine does not increase the expense above ¾*d.* to 1*d.* per oz., which is more than counterbalanced by the saving of time and the superiority of the product.

4. (*Hospital Sulphate*,—Mr. E. Herring.) The *crushed bark* is boiled in a *solution of caustic soda* or *potassa*, to extract colouring matter and gum; it is then pressed, washed with *cold water*, a second time boiled with a *solution of caustic alkali*, and again pressed, washed, and pressed; the *decoloured* and *purified bark* is next exhausted by coction with *acidulated water*, in the usual way, and the filtered mixed decoctions are precipitated with *carbonate of soda;* the *precipitated quinia* is then dissolved in *hot dilute sulphuric acid*, to saturation, when the "*hospital sulphate*" crystallizes out, as the solution cools; this is, lastly, washed with a little *cold water*, drained, and dried. —The advantage of this process is the non-use of animal charcoal as a bleacher, and the consequent less cost of the product. In the preparation of his *white sulphate* Mr. Herring uses *benzole* as a solvent, instead of alcohol. *Patent* dated July 28th, 1853.

Prop. When pure it forms very light, delicate, flexible, white needles, which are efflorescent, inodorous, and intensely bitter; it is soluble in 740 parts of water at 60°, and in 30 parts at 212° Fahr.; it takes about 80 parts of cold rectified spirit for its solution, but is freely soluble in boiling alcohol, and in acidulated water; it melts at 240° Fahr., and is charred and destroyed at a heat below that of redness. The crystals contain 76·1% of quinia, 8·7% of sulphuric acid, and 15·2% of water; of the last, they lose about 3-4ths by exposure to dry air, and nearly the whole when kept in a state of fusion for some time.

Pur. This may be inferred from the form of its crystallization. "It is entirely soluble in water (hot), and more readily so when an acid is present. Precipitated by ammonia, the residuary liquid, after evaporation, should not taste of sugar. By a gentle heat it loses 8 or 10% of water. It is wholly consumed by heat. If chlorine be first added, and then ammonia, it becomes green." (Ph. L. 1836.) "On adding chloride of barium to 100 gr. of this salt dissolved in water mixed with hydrochloric acid, 26·6 gr. of sulphate of baryta, dried at a red heat, are prepared." (Ph. L. 1851.) "A solution of 10 gr. in 1 fl. oz. of distilled water, and 2 or 3 drops of sulphuric acid, if decomposed by a solution of ½ oz. of carbonate of soda, in two waters, and heated until the precipitate shrinks and fuses,

yields on cooling a solid mass, which, when dry, weighs 7·4 gr., and when reduced to powder, dissolves entirely in a solution of oxalic acid." (Ph. E.)

Adult. Disulphate of quinine is often adulterated with *starch*, *magnesia*, *gum*, *sugar*, *cinchonine*, *quinidine*, &c. The *first three* remain undissolved when the salt is digested in spirit; the *fourth* is dissolved out by cold water; the *fifth* may be detected by its total insolubility in ether; or, by precipitating the quinine by liquor of potassa, and dissolving the precipitate in boiling alcohol; cinchona crystallizes out as the solution cools, but the quinine remains in the mother-liquor; and the *last*, by the greater solubility and sp. gr. of the salt, &c., as noticed at *page* 1089. If the sample disengages ammoniacal fumes when treated with liquor of potassa, it contains *sal ammoniac*. The *presence of most foreign organic substances* is also shown by the sample being turned brown, and being soon charred when treated with a drop of concentrated sulphuric acid. If it turn red it contains *salicine*, a substance which is now frequently used to adulterate disulphate of quinine. The pure disulphate is not discoloured by this reagent.

Uses, &c. The disulphate is more extensively employed than any of the other salts of quinine, and, indeed, to almost the exclusion of them. It is the article intended to be used whenever *sulphate of quinine*, or even *quinine*, is ordered for medicinal purposes, unless the name is qualified by some other term. It is a most valuable *stomachic*, in doses of ¼ to 1 gr.; as a *tonic*, 1 to 3 gr.; and as a *febrifuge*, 2 to 20 gr.

QUININE (Sulpho-tartrate of). Syn. *Quinæ Sulpho-tartras*,—Lat. *Prep.* From *disulphate of quinine*, 4 parts; *tartaric acid*, 5 parts; *distilled water*, 20 parts; mix, gently evaporate to dryness, and powder the residuum.

QUININE (Tannate of). Syn. *Quinæ Tannas*,—Lat. *Prep.* Dissolve *disulphate of quinine* in *slightly acidulated water*, and add a *solution of tannic acid* as long as a precipitate forms; wash this with a little *cold water*, and dry it. The Ph. Græca orders infusion of galls to be used as the precipitant. In intermittent neuralgia.

QUININE (Tartrate of). Syn. *Quinæ Tartras*,—Lat. *Prep.* (P. Cod.) From *tartaric acid* and *quinia*, as the *acetate*.

QUININE (Valerianate of). Syn. *Quinæ Valerianas*,—Ph. D. *Prep.* 1. As the *acetate* or *citrate*.

2. (Ph. D.) *Valerianate of soda*, 124 gr.; *distilled water*, 2 fl. oz.; dissolve; also dissolve *muriate of quina*, 7 *dr.*, in *distilled water*, 14 fl. oz.; next heat each solution to 120° (*not higher*), mix them, and set the vessel aside for 24 hours; lastly, press the mass of crystals thus obtained, and dry them, without the application of artificial heat.

Prop., &c. Silky needles and prisms; its solution suffers decomposition when heated much above 120° Fahr. It is powerfully antispasmodic, antiperiodic, and nervine. *Dose.* ½ gr., every two hours, or 1 to 3 gr., twice or thrice daily; in epilepsy, hemicrania, hysteria, neuralgia, and other nervous affections.

QUININE (Amorphous). See *Quinoidine*.

QUININE AND COD-LIVER OIL. Syn. *Cod-liver Oil with Quinine*, *Quiniaretted Cod-liver Oil*; *Oleum Morrhuæ cum Quinâ*, *Oleum Jecoris Aselli cum Quinâ*,—Lat. This valuable medicine is a solution of pure anhydrous quinia in pure cod-liver oil.

Prep. 1. *Pure quinia* (preferably recently precipitated) is fused in a *glass* or *porcelain capsule* by this heat of an oil or sand bath, carefully applied, by which it assumes a brown colour, and the appearance of a resin; it is then allowed to cool out of contact with the air, after which it is reduced to powder in a dry mortar, and added to pure *pale Newfoundland cod-liver oil*, *gently* heated in a closed glass vessel over a water bath; the solution of the alkaloid is promoted by constant agitation, and, when complete, the vessel, still corked, is set aside in a dark situation to cool; when the *quiniaretted oil* is quite cold, it is put into bottles, in the usual manner, and preserved, as much as possible, from the light and air.

2. The *anhydrous quinia* is dissolved in a little *anhydrous ether* before adding it to the *oil*, which in this case need not be heated, as the union is effected by simple agitation; should this not take place, it may be gently warmed for a few minutes.

3. The *anhydrous quinia* is dissolved in *anhydrous alcohol*, and after being added to the *oil*, the whole is gently heated, in an open vessel, by the heat of a water bath, until the *alcohol* is expelled; agitation, &c., being had recourse to, as in No. 1.

Prop., &c. The above preparation resembles ordinary cod-liver oil, except in having a pale yellowish colour, and a slightly bitter taste, similar to that of cinchona bark. It possesses all the properties of cod-liver oil combined with those peculiar to quinine, by which the tonic, stomachic, and antiperiodic qualities of the latter are associated, in one remedy, with the genial, supporting, and alterative action of the other. It is

now extensively used both in private practice and in the hospitals, with almost general success, in all those cases in which cod-liver oil is commonly administered; more especially when these are associated with extreme debility, loss of appetite, or dyspeptic affections. It is found that the stomach will bear this preparation when the simple cod-liver oil is rejected by it. It has also the advantage of being effective in smaller doses. The *common strength* of this remedy is 2 gr. of *quina* per *oz.* That prepared by Messrs. Drew & Co., the well-known wholesale druggists, of 91, Blackman Street, Borough, and which is the one now principally used in the hospitals, is much stronger than this; and we may also add, from personal inspection, that it is compounded of the choicest importations of pure Newfoundland cod-liver and pure quinine, without the addition of any foreign ingredient.

QUININE AND IRON (Citrate of). See *Quinio-citrate of Iron.*

QUININE AND IRON (Iodide of). Syn. *Quinæ et Ferri Iodidum*,—Lat. *Prep.* From *protiodide of iron*, 2 parts; *hydriodate of quinia*, 1 part; *rectified spirit*, 12 parts; heat them together, and either evaporate to dryness, or crystallize by refrigeration. A powder, or crystalline scales.

QUININE AND IRON (Sulphate of). Syn. *Ferro-sulphate of Quinine; Quinæ Ferro-sulphas, Quinæ et Ferri Sulphas*,—Lat. *Prep.* From *solutions* of the *sulphates of iron* and *quinine*, in atomic proportions, mixed whilst hot, and the crystals which form as the liquid cools, carefully dried, and preserved from the air.

QUININE AND MERCURY (Chloride of). See *page* 781.

QUINOIDINE. Syn. *Amorphous Quinine, Chinoidine; Quina Amorpha, Quina Informis, Quinoidia, Quinoidina, Quinoidinum, Chinoideum*,—Lat. This is obtained from the refuse or mother-liquors of the quinine-manufacturers, and appears to consist chiefly of quinidine associated with some cinchonine, a little crystallizable quinine, and vegetable extractive matter altered by heat.

Prep. 1. The dark-coloured *mother-liquor* remaining from the crystallization of *disulphate of quinine* is precipitated with a *carbonate of soda;* the precipitate is purified by dissolving it in *dilute sulphuric acid*, passing *sulphuretted hydrogen* through the solution, and after a short ebullition, and filtration, re-precipitating it with *carbonate of soda;* the last precipitate is then washed, dried, and reduced to powder.

2. (Liebig.) *Crude quinoidine*, precipitated from the mother-liquor by a *caustic alkali*, is exhausted with *ether*, which after defecation is distilled off, leaving the *purified quinoidine* behind. This process has been patented in England by Mr. Bullock.

Prop., &c. In its crude form quinoidine somewhat resembles aloes; in its purest state it is a yellowish-brown resin-like mass, freely soluble in alcohol and ether, but nearly insoluble in water; with the acids it forms dark-coloured, uncrystallizable salts. It is powerfully febrifuge, but less so than either quinidine or quinine, although it is identical in chemical composition with both of them. "It evidently bears to quinine the same relation that uncrystallizable syrup does to ordinary sugar, being produced from quinine by the heat employed in the preparation." The *amorphous quina* prepared by Liebig's or Bullock's process consists chiefly of *quinidine.*

QUINOLEINE. See *Chinoleine.*

QUINOMETRY. The art of estimating the quantity of quinine in cinchona bark, and in the commercial salts of this alkaloid.

Proc. 1. *For Bark.—a.* (Ph. E.) A filtered decoction of 100 gr. of *bark*, in *distilled water*, 2 fl. oz., is precipitated with 1 fl. dr., or q. s. of a *concentrated solution of carbonate of soda;* the precipitate, after being heated in the fluid so as to become a fused mass, and having again become cold, is dried, and weighed. "It should be 2 gr., or more, and entirely dissolve in a solution of oxalic acid." To render the result strictly accurate, the *product* should be exhausted with ether, and the mixed solutions evaporated.

b. (M. Rebourdain.) 100 gr. of the *bark* (coarsely powdered) are exhausted with *acidulated water*, and the *filtered solution* rendered alkaline with *liquor of potassa;* it is next shaken with about 1-3rd of its volume of *chloroform*, and then allowed to repose for a short time; the chloroform holding the alkaloid in solution sinks to the bottom of the vessel in a distinct stratum, from which the supernatant liquid is separated by decantation; the chloroformic solution, either at once, or after being washed with a *little cold water*, is allowed to evaporate; the residuum, when weighed, gives the *per centage* richness of the sample.—*Obs.* A like result may be obtained with *ether*, instead of chloroform; in which case the solution of quinine will form the *upper* stratum.

2. *For the Salts.* The above methods, as well as several others which have been devised for the purpose, may also be applied to the *salts of quinine;* but, unfortunately,

they are inapplicable when great accuracy is required, owing to the non-recognition of the presence of *quinidine*, as such, and which consequently goes to swell the apparent richness of the sample in quinine. The following ingenious method, invented by Dr. Ure, not merely enables us to detect the presence of *cinchonine* and *quinidine* in commercial samples of the *salts of quinine*, but, with some trifling modifications, it also enables us to determine the quantity of each of these alkaloids present in any sample :— "10 gr. of the *salt* to be examined" (the disulphate is here more especially referred to) "is put into a *strong test-tube*, furnished with a tight-fitting cork; to this are to be added 10 drops of *dilute sulphuric acid* (1 acid and 5 water), with 15 drops of *water*, and a gentle heat applied to accelerate solution. This having been effected, and the solution *entirely cooled*, 60 drops of *officinal sulphuric ether* with 20 drops of *spirits of ammonia* (? liquor of ammonia) must be added, and the whole well shaken while the top is closed by the thumb. The tube is then to be closely stopped, and shaken *gently* from time to time, so that the bubbles of air may readily enter the layer of ether. If the salt be *free* from CINCHONINE and QUINIDINE, or contain the *latter* in no *greater proportion* than 10%, it will be *completely dissolved;* while on the surface, where contact of the two layers of clear fluid takes place, the MECHANICAL IMPURITIES only will be separated. After some time the layer of ether becomes hard and gelatinous, and no further observation is possible."

"From the above statement respecting the solubility of quinidine in ether, it appears that the 10 gr. of the salt examined may contain 1 gr. of *quinidine*, and still a complete solution with ether and ammonia may follow; but in this case the QUINIDINE will shortly begin to crystallize in a layer of ether. The *least trace of quinidine* may be yet more definitively detected by employing, instead of the ordinary ether, some *ether previously saturated with quinidine*, by which means all of the QUINIDINE contained in the quinine examined, must remain undissolved. It is particularly requisite, in performing this last experiment, to observe, (*immediately*) after the shaking, whether *all* has dissolved; for owing to the great tendency of quinidine to crystallization, it may become again separated in a crystalline form, and be a source of error."

"If more than 1-10th of *quinidine* or (any) *cinchonine* be present, there will be found an insoluble precipitate at the limits of the two layers of fluids. If this be QUINIDINE, it will be *dissolved* on the addition of proportionately more ether, while CINCHONINE will remain unaffected."

QUINOVINE. Syn. *Cinchovine*, *Quinovia*. An alkaloid obtained from the *bark* of *quina ovata*, by a like process to that by which quinine is obtained from yellow bark.

QUINQUINA. See *Cinchona*.

QUINSEY. See *Throat Affections*.

QUINTESSENCE. Syn. *Quinta Essentia*, —Lat. A term invented by the alchemists to represent a concentrated alcoholic solution of the active principles of organic bodies. It is still occasionally employed in perfumery and the culinary art. See *Essences*, *Tinctures*, &c.

QUOTIDIAN. See *Ague*.

RABBIT. The *lepus cuniculus* (Linn.) of the Cuvian Order *rodentia*. The *domestic* rabbit, when young, is a light and wholesome article of food, approaching in delicacy to the common barn-door fowl; but has less flavour than the wild animal. The *fat* is among the "*Simples*" of the Ph. L. 1618. Its *hair* and *skin* are made into *cheap furs*, *gloves*, *hats*, &c.

RACAHOUT. Syn. *Racahout des Arabes*. This is said to be farina prepared from the acorns of *quercus ballota* or *Barbary oak*, disguised with a little flavouring. The following is recommended as an imitation :— *Roasted cacao* or *chocolate nuts*, 4 *oz.*; *tapioca* and *potato farina*, of each, 6 *oz.*; *white sugar*, slightly flavoured with vanilla, ½ *lb*. Very nutritious. *Used* as arrow-root.

RACEMIC ACID. Syn. *Paratartaric Acid*, *Thannic do.*, *Uvic do.*, *Vinic do.* This compound was discovered by Kestner, in 1820, replacing tartaric acid in the grape-juice of the Department of the Vosges. For upwards of 30 years it was regarded as a peculiar product of the grapes of that district and of the Upper Rhine; but it has since been found in the mother-liquors of the manufacturers of tartaric acid residing in other localities. The subject, at different times, has occupied the attention of the leading chemists of Europe. In 1850, the Society of Pharmacy of Paris offered a reward for its investigation; and during the year of the Great Exhibition (1851) it was brought into the market, for the first time, by Mr. Simpson, the well-known manufacturing chemist, of Kennington.

Racemic acid may be distinguished from *tartaric acid* as follows :—

TARTARIC ACID *dissolves* in less than its

own weight of cold water;—a *ray* of *polarized light* in passing through its solution turns to the *right*;—its solution added to *lime water*, or to a *dilute solution of chloride of calcium*, causes *no* immediate precipitate;—it *furnishes* ample *indications of electricity* when one of its crystals, held by a pair of platinum tongs, and gently heated in the flame of a spirit lamp, is brought into contact with the plate of an electroscope.

RACEMIC ACID takes *fully* 5 parts of *cold water* for solution;—*polarized light* is *not* altered by it;—with *lime water*, &c., it *gives* an *immediate* precipitate;—it is *not* pyro-electric.

In 1849, Pasteur discovered that racemic acid is a compound of two other acids, in equal proportions, one polarizing the rays of light to the *right*, and hence named "*dextro-racemic acid*;" the other exhibiting *left-handed* polarization, and called "*levo-racemic acid.*" By adding a *neutral solution of racemate of soda* to a like *solution of racemate of ammonia*, and allowing the solution to crystallize *very slowly*, two varieties of polyhedrous crystals are obtained, and may be distinguished by their form; namely, as the image and the reflection of the image, or as *right-handed* and *left-handed*, like an ordinary daguerreotype and its subject. These crystals are separated by careful inspection, and on being separately converted into *lead* or *barytic salts*, and decomposition by sulphuric acid, yield crystalline acids which are identical in every respect except their deportment with polarized light, their degree of solubility in cold water, and the peculiarity of their crystals, just referred to as occurring in their salts. The crystals of both are strongly pyro-electric.

Racemic acid and *tartaric acid*, as well as their salts (*racemates* and *tartrates*), have precisely the same chemical composition, and yield, when heated, precisely the same products; viz., *paratartralic*, *paratartrelic*, and *anhydrous racemic* or *tartaric acids*.

"It is very probable, not to say certain, that *dextroracemic acid* is nothing but *common tartaric acid.*" (Fownes.) See *Tartaric Acid*.

RACKING. See *Cider* and *Wines*.

RADICAL. The *base* or distinguishing part of a compound. It may be either *simple* or *compound*. Thus, *sulphur* and *phosphorus* (elementary substances) are the radicals of the acids which bear their names; and *acetyle* and *ethyle* (carbo-hydrogens), of the acetyl- and ethyl-compounds or series.

RADICAL VINEGAR. See *Acetic Acid*.

RADISH. The common garden radish (*raphanus*,—Lat.) is the *root* of *raphanus sativus* (Linn.), one of the *cruciferæ*. There are several varieties. They are all slightly diuretic and laxative, and possess considerable power in exciting the appetite. The *seed* is pressed for its oil. The *horse-radish* belongs to a distinct genus. (See *p.* 568).

RAIN-GUAGE. Syn. *Ombrometer*, *Pluviameter*, *Udometer*. An instrument for determining the quantity of water, which falls as rain, at any given place. A simple and convenient rain-guage for agricultural purposes, is formed of a wide-mouthed funnel, or open receiver, connected with a glass tube furnished with a stop-cock. The diameter of the tube may be exactly 1-100th that of the receiver, and if the tube be graduated into *inches* and *tenths*, the quantity of rain that falls may be easily read off to the 1-1000th of an inch. The instrument should be set in some perfectly open situation; and for agricultural purposes, with its edge as nearly level with the ground as possible. "The quantity of water should be duly measured, and registered at 9 a.m., daily." (*Instr. of the Royal Soc.*, 1840.)

RAISINS. Syn. *Dried Grapes; Uvæ Siccatæ; Uva*,—Ph. L. *Uvæ Passæ*, Ph. E. & D. "The prepared fruit of *vitis vinifera*" (Linn.),—Ph. L. The grapes are allowed to ripen and dry on the vine. After being plucked and cleaned, they are dipped, for a few seconds, into a *boiling lye of wood-ashes* and *quicklime* at 12° or 15° Baumé, to every 4 gall. of which a handful of *culinary salt* and a pint of *salad oil* has been added; they are then exposed for 12 or 14 days in the sun to dry; they are, lastly, carefully garbled, and packed for exportation. The sweet, fleshy kinds of grapes are those selected for the above treatment; and, in general, their stalks are cut about one half through, or a ring of bark is removed, to hasten their maturation.

Raisins are nutritious, cooling, antiseptic, and, in general, laxative; the latter to a greater extent than the fresh fruit. There are *many varieties* found in *commerce*. Their *uses* as a dessert and culinary fruit, and in the manufacture of wine, &c., are well known, and are referred to elsewhere. See *Grapes*, *Wines*, &c.

RANCIDITY. The strong, sour flavour and odour which oleaginous bodies acquire by age and exposure to the air. For its *prevention* see *Fats*, *Oils* (Fixed), &c.

RAPE. Syn. *Vinacea*,—Lat. The cake left from pressing grapes. By fermentation with *water*, and *distillation*, it yields an inferior variety of *brandy*.

RAPE OIL. See *Oils* (Fixed).

RASH. A term "properly limited to that state of inflammation of the skin in which the inflammatory action does not proceed beyond its more simple and primary signs, namely, redness, heat, swelling, and pain." (Eras. Wilson.)

The above authority notices *four* different affections, as included under this head:—

1. *St. Anthony's Fire*, or *Erysipelas*, the severest of them all, already referred to. (See *p.* 381.)

2. *Nettle-rash*, or *Urticaria*, characterised by its tingling and pricking pain, and its little white elevations on a reddish ground, like the wheals caused by the sting of a nettle. This efflorescence seldom stays many hours, and, sometimes, not even many minutes in the same place, and is multiplied or reproduced whenever any part of the skin is scratched or even touched. No part of the body is exempt from it, and when many of them occur together, and continue for an hour or two, the parts are often considerably swelled, and the features temporarily disfigured. In many cases these eruptions continue to infest the skin, sometimes in one place, and sometimes in another, for one or two hours together, two or three times a day, or, perhaps, for the greatest part of the twenty-four hours. In some constitutions this lasts only a few days; in others several months.

There are *several varieties* of *nettle-rash* or *urticaria* noticed by medical writers, among which *urticaria febrilis*, *persistans*, and *evanida*, are the principal.

The *common cause* of *nettle-rash* is some derangement of the digestive functions, arising either from the use of improper food, or a disordered state of the nervous or other systems of the body. Lobsters, crabs, mussels, shrimps, dried fish, pork, cucumbers, mushrooms, and adulterated beer or porter, bear the character of frequently causing this affection. In childhood, it commonly arises from teething. Occasionally, in persons of peculiar idiosyncrasy, the most simple articles of food, as almonds, nuts, and even milk, rice, and eggs, will produce this affection.

The *treatment* may consist of the administration of *gentle saline aperients*, and in severer cases, a gentle emetic, followed by the copious use of *acidulated diluent drinks*, as weak lemon-juice-and-water, effervescing potash-draughts, &c., and, when required, diaphoretics. The clothing should be light but warm, and the itching, when severe, may be allayed by the application of a *lotion* of water to which a little vinegar, or camphorated spirit has been added; the latter must, however, be employed with caution. A hot knee-bath is useful in drawing the affection from the face and upper part of the body. A "compress" wrung out of cold water until it ceases to drip, and kept in contact with the stomach by means of a dry bandage, has been recommended to relieve excessive irritation of the stomach and bowels. It has been stated, that *decoction of Virginian snake-root* is particularly useful in relieving *chronic urticaria*.

3. *Red-rash*, *Red-blotch*, or *Fiery spot*, is commonly the consequence of disordered general health, of dyspepsia, and particularly, in females, of tight lacing. Sometimes it is slight and evanescent; at others, it approaches in severity to the milder forms of erysipelas, there being much swelling and inflammation. Chaps, galls, excoriations, and chilblains, are varieties of this disease produced by cold, excessive moisture, or friction. The *treatment* is similar to that of nettle-rash.

4. *Rose-rash*, *False measles*, or *Roseola*, is an efflorescence, or rather a discoloration of a rose-red tint, in small irregular patches, without wheals or papulæ, which spread over the surface of the body, and are ushered in by slight febrile symptoms. There are several varieties. The *causes* are the same as those which produce the preceding affections, and the *treatment* may be similar. In all of them strict attention to the diet, and a careful avoidance of cold applications, or exposure to cold, so as to cause a retrocession, are matters of the first moment.

RASPBERRY. Syn. *Hindberry*. The *fruit* of *rubus idæus* (Linn.), a small shrub of the natural order *rosaceæ*. It is cooling, antiscorbutic, and mildly aperitive. It is frequently used to communicate a fine flavour to liqueurs, confectionery, wine, &c. See *Fruits* and *Vegetables*.

RAS-SA-MA-LA. See *Storax*.

RATAFIA. Originally, a liquor drank at the ratification of an agreement or treaty. It is now the common generic name in France of liqueurs compounded of spirit, sugar, and the odoriferous and flavouring principles of vegetables; more particularly of those containing the juices of recent fruits, or the kernels of apricots, cherries, or peaches. In its unqualified sense this

name is commonly understood as referring to cherry-brandy or peach-brandy.

Ratafias are *prepared* by distillation, maceration, or extemporaneous admixture, in the manner explained under the head "*Liqueurs.*"

Ratafia d'Angelique. From *angelica seeds*, 1 dr.; *angelica stalks*, 4 *oz.*; *blanched bitter almonds*, bruised, 1 *oz.*; *proof spirit* or *brandy*, 6 quarts; digest for 10 days, filter, add of *water*, 1 quart; *white sugar*, 3½ *lb.*; mix well, and in a fortnight decant the clear portion through a piece of clean flannel.

Ratafia d'Anis. See *Aniseed Cordial.*

Ratafia de Baume de Tolu. From *balsam of Tolu*, 1 *oz.*; *rectified spirit*, 1 quart; dissolve, add water, 3 pints; filter, and further add of *white sugar*, 1½ *lb.* Pectoral and traumatic.

Ratafia de Brou de noix. From *young walnuts* with soft shells (pricked or pierced), 60 in no.; *brandy*, 2 quarts; *mace*, *cinnamon*, and *cloves*, of each, 15 gr.; digest for 8 weeks; press, filter, add of *white sugar*, 1 *lb.*; and keep it for some months before decanting it for use. Stomachic.

Ratafia de Cacao, R. de Chocolat. From *Caracca cacao-nuts*, 1 *lb.*; *West Indian do.*, ½ *lb.*; both roasted and bruised; *proof spirit*, 1 gall.; digest for 14 days, filter, and add of *white sugar* 2½ *lb.*; *tincture of vanilla*, ½ dr.; (or, a *shred of vanilla* may be infused with the nuts in the spirit instead;) lastly, decant in a month, and bottle it.

Ratafia de Café. From *coffee*, ground and roasted, 1 *lb.*; *brandy* or *proof spirit*, 1 gall.; *sugar*, 2 *lb.*; (dissolved in) *water*, 1 quart; as last.

Ratafia de Cassis. From *black-currant juice*, 1 quart; *cinnamon*, 1 dr.; *cloves* and *peach-kernels*, of each, ½ dr.; *brandy*, 1 gall.; *while sugar*, 3 *lb.*; digest for a fortnight, and strain through flannel.

Ratafia de Cerises. From *Morello cherries*, with their kernels bruised, 8 *lb.*; *brandy* or *proof spirit*, 1 gall.; *white sugar*, 2 *lb.*; as last.

Ratafia de Chocolat. See above.

Ratafia de Coings. From *quince juice*, 3 quarts; *bitter almonds*, 3 *dr.*; *cinnamon* and *coriander seeds*, of each, 2 *dr.*; *mace*, ½ *dr.*; *cloves*, 15 gr. (all bruised); *rectified spirit* (quite flavorless), ½ gall.; digest for a week, filter, and add of *white sugar*, 3½ *lb.*

Ratafia de Crème. From *crème de noyau*, and *sherry*, of each, ¼ pint; *capillaire*, ½ pint; *fresh cream*, 1 pint; beaten together.

Ratafia de Curaçoa. See *p.* 707.

Ratafia de Framboises. See *Raspberry Cordial* (p. 709).

Ratafia de Genièvre. From *juniper berries* (each pricked with a fork), ¼ *lb.*; *caraway* and *coriander seed*, of each, 20 gr.; *finest malt-spirit* (22 u. p.), 1 gall.; *white sugar*, 2 *lb.*; digest a week, and strain with expression.

Ratafia de Grenoble. From the small *wild black cherry* (with the kernels bruised), 2 *lb.*; *proof spirit*, 1 gall.; *white sugar*, 3 *lb.*; *citron peel*, a few grains; as before.

Ratafia de Grenoble, de Teyssère. From *cherries* (bruised with the stones), 1 quart; *rectified spirit*, 2 quarts; mix, digest for 48 hours, then express the liquor, and heat it to boiling in a *close* vessel; when cold add of *sugar* or *capillaire*, q. s.; together with some *noyau*, to flavour, and a little *syrup of the bay laurel*, and of *galangal*; in 3 months decant, and bottle it.

Ratafia de Noyau. From *peach* or *apricot kernels* (bruised), 120 in no.; *proof spirit* or *brandy*, 2 quarts; *white sugar*, 1 *lb.*; digest for a week, press, and filter. (See *p.* 829.)

Ratafia de Œillets. From *clove-pinks* (without the white buds), 4 *lb.*; *cinnamon* and *cloves*, of each, 15 gr.; *proof spirit*, 1 gall.; macerate for 10 days, express the tincture, filter, and add of *white sugar*, 2½ *lb.*

Ratafia d'Ecorçes d'Oranges. See *Crème d'Orange* (p. 767).

Ratafia de Fleurs d'Oranges. From fresh *orange petals*, 2 *lb.*; *proof spirit*, 1 gall.; *white sugar*, 2½ *lb.*; as last. Instead of orange flowers, *neroli*, 1 dr., may be used.

Ratafia à la Provençale. From *striped pinks*, 1 *lb.*; *brandy* or *proof spirit*, 1 quart; *white sugar*, ¾ *lb.*; *juice of strawberries*, ¾ pint; *saffron*, 20 gr.; as before.

Ratafia des Quatre fruits. From *cherries*, 30 *lb.*; *gooseberries*, 15 *lb.*; *raspberries*, 8 *lb.*; *black currants*, 7 *lb.*; express the juice, and to each pint add of *white sugar*, 6 *oz.*; *cinnamon*, 6 gr.; *cloves* and *mace*, of each, 3 gr.

Ratafia Rouge. From the *juice* of *black cherries*, 3 quarts; *juices of strawberries* and *raspberries*, of each 1 quart; *cinnamon*, 1 dr.; *mace* and *cloves*, of each, 15 gr.; *proof spirit* or *brandy*, 2 gall.; *white sugar*, 7 *lb.*; macerate, &c., as before.

Ratafia Sec. Take of the *juice of gooseberries*, 5 pints; *juices of cherries, strawberries*, and *raspberries*, of each, 1 pint; *proof spirit*, 6 quarts; *sugar*, 7 *lb.*; as before.

Ratafia à la Violette. From *orris powder*, 3 *oz.*; *litmus*, 4 *oz.*; *rectified spirit*,

2 gall.; digest for 10 days, strain, and add of *white sugar*, 12 *lb.*; dissolved in *soft water*, 1 gall.

The addition of a *few drops* of *essence of ambergris*, or of a grain of *ambergris*, rubbed up with sugar and infused in the spirit, imparts a delightful flavour and bouquet, which is much admired. For *other formulæ* and *directions*, see "*Liqueurs.*"

RATS. The common rat is the *mus decumanus* (Linn.), one of the most prolific, and destructive species of the *rodentia*. It was introduced to these islands from Asia; and has since spread over the whole country, and multiplied at the expense of the black rat (*mus rattus*,—Linn.), which is the old British species of this animal, until its inroads on our granaries, our stores, and dwelling-houses, have increased to such an extent, that its extirpation has become a matter of serious, if not of national importance.

For the *destruction* of these noxious animals two methods are adopted—

1. *Trapping.* To render the *bait* more attractive, it is commonly sprinkled with a little of one of the *rat-scents* noticed below. The trap is also occasionally so treated.

2. *Poisoning.* The following are reputed the most effective mixtures for this purpose:—

Arsenical Paste. From *oatmeal* or *wheaten flour*, 3 *lb.*; *powdered indigo*, ½ *oz.*; *finely powdered white arsenic*, ¼ *lb.*; *oil of aniseed*, ½ dr.; mix, add of *melted suet*, 2½ *lb.*; and beat the whole into a paste. A similar compound has the sanction of the French government.

Arsenical Powder. From *oatmeal*, 1 *lb.*; *moist sugar*, ¼ *lb.*; *white arsenic* and *rotten cheese*, of each, 1 *oz.*; *rat-scent*, a few drops.

Millers' Rat Powder. From *fresh oatmeal*, 1 *lb.*; *nux vomica* (in very fine powder), 1 *oz.*; *rat-scent*, 5 or 6 drops. This is highly spoken of by those who have used it.

Mineral Rat-poison. From *carbonate of baryta*, ¼ *lb.*; *sugar* and *oatmeal*, of each, 6 *oz.*; *oils* of *aniseed* and *caraway*, of each, a few drops.

Philantrope Muophobon. A French preparation which, according to Mr. Beasley, consists of *tartar emetic*, 1 part; with *farinaceous matter*, 4 parts; and some other (unimportant) ingredients.

Phosphor Paste. See *page* 971.

Among "*Rat-scents*" the following are said to be the most attractive:—

a. Powdered *cantharides* steeped in *French brandy*. For traps. It is said that rats are so fond of this, that if a little be rubbed about the hands they may be handled with impunity.

b. From *powdered assafœtida*, 8 gr.; *oil of rhodium*, 2 dr.; *oil of aniseed*, 1 dr.; *oil of lavender*, ½ dr.; mix by agitation.

c. From *oil of aniseed*, ½ *oz.*; *tincture of assafœtida*, ¼ *oz.*

d. From *oil of aniseed*, ¼ *oz.*; *nitrous acid*, 2 to 3 drops; *musk* (triturated with a little powdered sugar), 1 gr.

RAZORS. See *Papers*, *Pastes*, and *Shaving*.

REAGENTS. See *Tests*.

REALGAR. See *Bisulphuret of Arsenic* and *Red Pigments*.

RECTIFICATION. A second distillation of a fluid, for the purpose of rendering it purer.

RED BOTTLE. Syn. *Taylor's Red Bottle*, *Whitworth Doctor's do.* From *British brandy*, 1 quart; *cochineal* (bruised), ¼ *oz.*; *oil of origanum*, 10 or 12 drops; digested together for 24 hours, and then filtered.

REDDLE. See *Red Pigments*.

RED DYES. The substances principally employed for this purpose are *cochineal*, *lac-dye*, and *madder*, which, under proper treatment, yield permanent colours of considerable brilliancy, the first and third, more particularly so. Extremely beautiful, but fugitive colours, are also obtained from *Brazil wood*, *safflower*, *archil*, and some other substances. SILK is usually dyed of a permanent red or scarlet with cochineal, safflower, or lac-dye; WOOL, with cochineal and, still more frequently, with madder; and COTTON, with madder (chiefly), Brazil wood, &c. The leading properties of these substances are given under their respective names, and the methods of employing them are generally referred to in the articles "*Dyeing*," "*Mordants*," &c., and, therefore, need not be repeated here. The following may, however, be useful to the reader:—

1. First give the "*goods*" a *mordant* of *alum*, or of *alum-and-tartar*, rinse, dry, and boil them in a bath of madder. If *acetate of iron* be used instead of alum, the colour will be PURPLE, and by combining the two, as mordants, any intermediate shade may be produced.

2. The *yarn* or *cloth* is put into a *very weak alkaline bath* at the boiling temperature, then washed, dried, and "*galled*;" (or, when the calico is to be printed, for this bath may be substituted one of cow-dung, subsequent exposure to the air for a day or two, and immersion in very dilute sulphuric acid. In this way the stuff gets opened, and takes and retains the colour better). After

the "galling," the *goods* are dried, and *alumed* twice; then dried, rinsed, and passed through a *madder bath*, composed of ¾ *lb.* of good madder for every *lb.* weight of the goods; this bath is slowly raised to the boiling point in the course of 50 or 60 minutes, more or less, according to the shade of colour required; after a few minutes, the stuff is taken out, and slightly washed; the operation is then repeated, in the same manner, with fresh madder; it is, lastly, washed and dried, or passed through a *hot soap bath*, which carries off the fawn-coloured particles.

3. *Adrianople red, Turkey do.* This commences with cleansing or scouring the goods by *alkaline baths*, after which they are steeped in *oily liquors* brought to a creamy state by a little *carbonate of soda;* a bath of *sheep's dung* is next often used as an intermediate or secondary steep; the oleaginous bath, and the operation of removing the superfluous or loosely adhering oil with an *alkaline bath*, is repeated two or three times, due care being taken to dry the goods thoroughly after each distinct process; then follow the distinct operations of *galling*, *aluming*, *maddering*, and *brightening*, the last for removing the dun-coloured principle, by boiling at an elevated temperature with *alkaline liquids* and *soap;* the whole is generally concluded with a "*rosing*" by *spirit of tin.* In this way are given the most brilliant reds on cotton.

Obs. Wool takes from half its weight of madder to an equal weight to dye it red; cotton and linen take rather less. On account of the comparative insolubility of the colouring matter of madder, this dye-stuff must be boiled along with the goods to be dyed, and not removed from the decoction, as is the practice in using many other articles. Other dyes-stuffs are frequently added to the *madder bath*, to vary the shades of colour. *Decoction of fustic, weld, logwood, quercitron, knoppern, &c.*, are often thus employed, the mordants being modified accordingly. By adding *bran* to the *madder bath*, the colour is said to be rendered much lighter, and of a more agreeable tint.

RED GUM. A slight eruptive disease of infancy, occasioned by teething, and, less frequently, by irritation from rough flannel worn next the skin. See *Strophulus.*

RED LAVENDER. See *Compound Tincture of Lavender.*

RED LIQUOR. The crude solution of acetate or sulpho-acetate of alumina employed in calico-printing. It is generally *prepared* by mixing *crude sulphate of alumina* with about an equal weight of *crude pyrolignite of lime*, both being in the state of solution.

RED PIGMENTS. Of these the following are the principal:—

Armenian Bole; Bolus Armeniæ. Formerly imported from Armenia, Portugal, Tuscany, &c.; now generally made by grinding together a mixture of *whiting*, *red oxide of iron*, and *red ochre*, in nearly equal proportions.

Brown Red. A factitious mixture of *red oxide of iron* and *red ochre*, in variable proportions.

Carmine. See *page* 205.

Carminated Lake. See *page* 671.

Chrome Red. Syn. *Dichromate of Lead, Subchromate of do., Red Chromate of do.; Plumbi Dichromas, P. Chromas Rubrum,*— Lat. *Prep.* 1. Boil pure *carbonate of lead* with *chromate of potash*, in excess, until it assumes a proper colour; then wash it well with *pure water*, and dry it in the shade.

2. Boil *neutral chromate of lead* with a little *water of ammonia* or *lime water.*

3. (Liebig & Wöhler.) Fuse *saltpetre* at a low red heat in a *Hessian crucible*, and throw in *chromate of lead* (pure chrome yellow), by small portions at a time, as long as a strong ebullition follows upon each addition of the pigment, observing to stir the mixture frequently with a glass rod; after repose for a minute or two, pour off the fluid part, and, as soon as the solid residuum is cold, wash it with *water*, and dry it by a gentle heat.

Obs. Great care must be taken in conducting the last process, not to employ too much heat, nor to allow the saline matter to stand long over the newly formed chrome-red, as the colour is thus apt to change to a brown or orange. When well managed, the product has a crystalline texture, and so beautiful a red colour, that it vies with native cinnabar. The liquid poured from the crucible is reserved for manufacturing chrome yellow.

Indian Red, Purple Ochre; Ochra Purpurea Persica, Terra Persica. This is a native production, brought from Ormus. A *factitious article* is prepared by calcining a *mixture* of *colcothar* and *red ochre.*

Lakes (Various). See *p.* 671-2.

Light Red. From *yellow ochre*, by careful calcination. It works well with both oil and water, and produces an admirable flesh-colour by admixture with pure white. All the ochres, both red and yellow, are darkened by heat.

Orange Red, Sandix. Obtained from *white lead*, by calcination. Very bright.

Realgar. See *p.* 86.

Red Bole. See *Armenian* and *Venetian Bole.*

Red Chalk. A clay iron-ore, much used for pencils and crayons, and, when ground, also for paints.

Red Lead, Minium. The finest *red lead* is *prepared* by exposing *ground* and *elutriated massacot*, or *dross of lead*, in shallow iron trays, (about 12 inches square, and about 4 or 5 inches deep,) piled up on the hearth of a reverberatory furnace, to a heat of about 600 to 650° Fahr., with occasional stirring until it acquires the proper colour. The furnace employed for the preparation of massicot during the day, usually possesses sufficient residuary heat during the night for this process, by which fuel is saved. Lead for the above purpose should be quite free from copper and iron.

Red Ochre. A natural production abounding on the Mendip hills.

Red Orpiment, Red Arsenic. See *page* 86.

Rose Pink. This is *whiting* coloured with a *decoction of Brazil wood* to which a little *pearlash* has been added. A very pretty colour, but it does not stand. It is always kept in a damp state. The *colour* may be *varied* by substituting *alum* for pearlash, or by the addition of a little *spirits of tin.*

Venetian Red; Bolus Veneta. A species of *ochre*, brought from Italy.

Vermilion. (See that word.)

REDUCTION. Syn. *Revivification.* A term, in its fullest sense, applied to any operation by which a substance is restored to its natural state; but, now generally restricted, in chemistry, to the abstraction of oxygen, and hence, frequently termed *deoxydation* or *deoxydizement.* This change is operated by either heating the substance in contact with carbon or hydrogen, or in exposing it to the action of some other body having a powerful affinity for oxygen. See *Potassium, &c.*

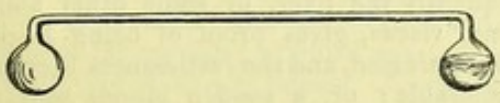
REECE'S MIXTURE. *Prep.* From *infusion of chirayta*, 8 fl. oz.; *carbonate of soda*, 1 dr.; mix. *Dose.* 1 or 2 dessert-spoonfuls, twice daily. See *Pills, &c.*

REFINING. A term employed in commercial chemistry and metallurgy synonymously with purification. The separation of the precious metals from those of less value, as in the operation of parting, constitutes the business of the "*refiner.*" See *Gold, Silver, &c.*

REFRACTION (of Light). The deviation of a ray of light from its original path on entering a medium of a different density or power. For the practical application of this property see *Gem* and *Goniometry.*

REFRIGERANTS. Medicines or agents which tend to lessen the animal temperature without causing any marked diminution of sensibility or nervous energy. Among *internal* refrigerants *cold water, weak acidulous drinks*, and *saline aperients*, are those which are, probably, the best known, and the most useful. Among *external* refrigerants are *cold, cold water, evaporating lotions, weak solutions of diacetate of lead, &c.*

REFRIGERATION. The abatement of heat; the act or operation of cooling.



Among the purposes to which *refrigeratory processes* are applied in the *arts*, the principal are—the *condensation of vapours*, —the *cooling of liquids*,—the *congelation of water*, and—the *production* of *extreme degrees of cold* in chemical operations. The *first* of these is referred to under the heads *Distillation, Steam, Still, &c.*; and the *second*, under *Worts.* It is, therefore, only necessary to notice here the *third* and *fourth* applications of cold, artificially produced, above referred to.

The *refrigeratory processes* at present employed depend upon the *greater capacity for heat* which the *same body possesses* as its *density lessens*, or its *attenuation increases*; as exhibited in the *sudden liquefaction of solids*, the *rapid evaporation of liquids*, and the almost *instantaneous return of atmospheric air*, or other *gaseous body*, from a *highly condensed state* to its *normal condition.* The loss of sensible heat in the *first* example, is the basis of the various processes of producing cold by what are commonly called "*freezing*" or "*frigorific mixtures*," all of which act upon the principle of liquefying solid substances without supplying heat. The caloric of liquidity being in these cases derived from that previously existing in the solid itself in a sensible state, the temperature must necessarily fall. The *degree of cold* produced, depends upon the quantity of heat which is thus diffused through a larger mass, or which, as it were, disappears; and this is dependent on the quantity of solid matter liquefied, and the rapidity of the liquefaction. *Saline compounds* are the substances most frequently employed for this purpose, and those which have the greatest affinity for water, and thus liquefy the most rapidly, produce the greatest degree of cold. Similar changes occur during the *evaporation* of *liquids.* When heat passes from the sensible to the insensible state, as in the formation of vapour, cold is gene-

rated. This may be shown by pouring a few drops of ether or rectified spirit on the palm of the hand, when a strong sensation of cold is experienced. A still more familiar illustration of this fact is exhibited in the rapidity with which the animal body loses heat when enveloped in damp or wet clothing. The *evaporation of water*, produces a degree of cold, which is greater than that of other liquids, in exact proportion as the *insensible* or *latent heat* of its *vapour* exceeds theirs. In the *attenuation* or *rarefaction of gases* similar phenomena occur.

It has been found that evaporation proceeds much more rapidly from the surface of fluids in a vacuum than in the atmosphere. Water may be easily frozen by introducing a surface of *sulphuric acid* under the receiver of an air-pump, over which is placed a *capsule* filled with *water*, so that the vapour arising from the latter may be immediately absorbed by the former. After a few strokes of the piston the water is converted into a solid cake of ice. The acid operates by absorbing the aqueous vapours as soon as generated, and thus maintaining the integrity of the vacuum. Professor Leslie found that when air is thus rarified 250 times, the surface of evaporation was cooled down 120° in winter; and when only 50 times, a depression of 80° or even 100° took place. "Sulphuric acid is capable of congealing more than 20 times its weight of water before it has imbibed nearly its own bulk of that liquid, or has lost about $\frac{1}{8}$th of its refrigerating power." (Ure.) Sulphuric acid, which has become diluted in this way, may be reconcentrated by heat.

A pleasing philosophical toy, illustrative of the evaporative power of a vacuum, is the *Cryophorus*, or *frost-bearer*, of Dr. Wollaston. This instrument consists of two small glass globes united by a tube, one of which is partly filled with water. The whole apparatus is perfectly free from air, and is, consequently, filled with attenuated aqueous vapours. No sooner is the pres-

sure removed, as by plunging the empty ball into a freezing mixture (which condenses the vapour), than rapid evaporation commences, and the water in the other ball is frozen in two or three minutes.

It has been discovered that *oatmeal*, dried nearly to brownness before a common fire, and cooled in close vessels, may be substituted for sulphuric acid. With a quantity of this substance, one foot in diameter, and 1 inch deep, Professor Leslie froze 1 imperial pint of water, contained in a hemispherical porous cup. Ignited chloride of calcium, in porous pieces, has also been successfully used for the same purpose. Dr. Ure has found that a requisite vacuum for this purpose may be produced by the agency of steam, afterwards condensed by the affusion of cold water.

Even in hot climates ice may be produced under favorable circumstances by evaporation. On the open plains, near Calcutta, this is effected by exposing a thin stratum of water to the atmosphere, during the fine clear nights of December, January, and February. The pans are made of porous earthenware, and water is poured in to the depth of about $1\frac{1}{2}$ inch. A large number of these vessels are arranged in an excavation in the ground, 30 or 40 feet square and 2 feet deep, the bottom of which is covered, to the depth of 10 or 12 inches, with sugar canes or the stalks of Indian corn. At sunrise the pans are visited, the ice separated from the water, and packed as tight as possible in a deep cavity or pit, well screened from the heat.

Dr. Gorrie, a physician of New Orleans, has recently invented a machine, by which water is frozen in large quantities, by exposure to condensed air in the act of its subsequent expansion. It is worked by either hand or steam power. (*Mech. Mag.*, 1851.)

In the production of ice, or an extreme degree of cold, by saline mixtures, the salts should be in the crystallized state, and as rich as possible in water, but without being in the least damp. They should also be coarsely pulverized at the time of using them, and should not be mixed until immediately before throwing them into the liquid ingredients. The mixture should be made in a thick vessel, well clothed, to prevent the accession of external heat; and the substance to be acted on should be contained in a very thin vessel, so as to expose it more fully to the action of the mixture. On the *large scale*, a vessel called a "*freezing pot*" or "*sabolière*" is commonly employed. See *Ices* (and the *following Table*).

TABLE *exhibiting a few of the most useful* FRIGORIFIC MIXTURES *contained in* MR. WALKER'S *Publication, of* 1808, *drawn up from actual experiments.*

Ingredients.		Thermometer sinks.	Deg. of cold produced.
Snow *or* pounded ice	2 parts	From any temperature. to — 5°	—
Chloride of sodium	1 „		
Snow *or* pounded ice	5 „	From any temperature. to — 12°	—
Chloride of sodium	2 „		
Sal ammoniac	1 „		
Snow *or* pounded ice	12 „	From any temperature. to — 25°	—
Chloride of sodium	5 „		
Nitrate of ammonia	5 „		
Snow	8 „	From + 32° to — 27°	59°
Hydrochloric acid (*concentrated*)	5 „		
Snow	2 „	From + 32° to — 50°	82°
Crystallized chloride of calcium	3 „		
Sal ammoniac	5 „	From + 50° to + 10°	40°
Nitrate of potassa	5 „		
Water	16 „		
Nitrate of ammonia	1 „	From + 50° to + 4°	46°
Water	1 „		
Nitrate of ammonia	1 „	From + 50° to — 7°	57°
Carbonate of soda	1 „		
Water	1 „		
Phosphate of soda	9 „	From + 50° to — 21°	71°
Nitrate of ammonia	6 „		
Diluted nitrous acid*	4 „		
Sulphate of soda	8 „	From + 50° to 0°	50°
Hydrochloric acid	5 „		
Snow	3 „	From 0° to — 46°	46°
Diluted nitrous acid*	2 „		
Snow	2 „	From — 20° to — 60°	40°
Sulphuric acid	1 „		
Water	1 „		
Snow	1 „	From 0° to — 66°	66°
Crystallized chloride of calcium	2 „		
Snow	1 „	From — 40° to — 73°	33°
Crystallized chloride of calcium	3 „		
Snow	8 „	From — 68° to — 91°	23°
Sulphuric acid	5 „		
Water	5 „		

* *Fuming nitrous acid,* 2 part; *water,* 1 part; by weight.

Obs. The materials in the first column are to be cooled, previously to mixing, to the temperature required in the second, by the use of other mixtures.

REGULUS. A term applied by the alchemists to various metallic matters obtained by fusion; as *Regulus of antimony, arsenic,* &c. It is now obsolete.

RELISH (Kitchener's). See *Sauces.*

REMITTENT. A term applied to fevers, and other diseases, which exhibit a decided remission in violence during the twenty-four hours, but without entirely leaving the patient, in which they differ from intermittents or agues.

REMITTENT FEVER. Syn. *Febris Remittens,*—Lat. The diseases which come under this name vary in degree from extreme mildness to alarming violence, and are regarded as both inflammatory and malignant. The *milder form* of *remittent fever* commences with drowsiness, languor, chilliness, and other febrile symptoms; the skin is hot and dry, the thirst considerable, and there is, generally, nausea, and total loss of appetite. In the course of the day, usually towards evening, the pulse quickens, the heat and constitutional disturbance increase, and, at length, terminate in a sweat, which after a time goes off, leaving the skin hot and dry, and the pulse still quicker than before. These symptoms, if not arrested, are repeated with increased severity daily, until "the head, but more frequently the liver, or some other abdominal viscus, gives proof of being loaded and oppressed, and the restlessness becomes intolerable; or, a sudden bilious purging or vomiting supervenes, and carries off the complaint by a salutary crisis." In the *severer forms* of *remittent fever* the febrile symptoms are much exaggerated, there is a putrid tendency in the fluids, the sweat becomes fœtid, the breath offensive, the

tongue fœtid, livid, or greenish-black, and the dejections blackish, highly offensive, and parted with insensibly; the mind also wanders, and there are spasmodic twitchings and petechial spots.

The remittent fever of infancy (*infantile fever*), perhaps, the mildest form of this disease, is *occasioned* by worms or a disordered state of the bowels; but remittent fevers in general are referred to the action of marsh miasmata, and unwholesome air. The *remittents of autumn*, in this country, often assume a character of extreme severity. The malignant fevers of hot climates, of this kind, are commonly known as *bilious remittent fever*, from the great disorder of the hepatic system. Among these, the *African*, *West Indian*, and *yellow fever*, are the most fatal.

The *treatment* of the *milder forms* of *remittent fever* consists in the administration of *mercurial* and *saline purgatives*, assisted by saline diaphoretics, and a spoon-farinaceous diet. As the pulse becomes less frequent, and diaphoresis is established, *mild tonics*, such as bark and the vegetable bitters, in combination with the dilute mineral acids, should be had recourse to. This treatment, with good air, and careful ventilation, generally effects a cure in 10 days or a fortnight. In the *bilious remittents*, last above alluded to, "particular symptoms frequently present themselves which require particular modes of treatment; and this must also be modified according to the inflammatory, malignant, nervous, or intermittent form which they may assume or pass into." In these cases skilful medical assistance in the early stages is absolutely necessary for the safety of the patient. See *Fever*, *&c.*

RENNET. Syn. *Runnet*, *Prepared Calf's Maw*, *Coaguline*. The *stomach of the calf*, freed from the outer skin, fat, and useless membrane, washed, treated with either *brine* or *dry salt* for a few hours, and then hung up to dry. When well prepared the dried "*vells*" somewhat resemble parchment in appearance.

Uses, *&c.* Rennet is employed to curdle milk. A piece of the requisite size is cut off, and soaked for some hours in *whey* or *water*, after which the whole is added to the *milk* for curdling, slightly warmed, and the mixture is slowly heated, if necessary, to about 122° Fahr. In a short time after this temperature has been attained, the milk separates into a solid, white coagulum (*curd*), and into a yellowish, translucent liquid (*whey*). Two square inches from the bottom of a good "vell" are sufficient for a cheese of 60 *lb.* It is the gastric juice of the stomach that operates these changes. The stomachs of all sucking quadrupeds possess the same properties. See *Cheese.*

RENNET (Liquid). Syn. *Essence of Rennet*, *Liquid Coaguline*, *&c.* *Prep.* From *fresh rennet* (cut small), 12 *oz.*; *common salt*, 3 *oz.*; knead them together, and leave the mixture at rest, in a cool place, for 5 or 6 weeks, then add of *water*, 18 *oz.*; *good rum* or *proof spirit*, 2 *oz.*; lastly, digest for 24 hours, filter, and colour the liquid with a little *burnt sugar.*

Obs. 2 or 3 teaspoonfuls will curdle a quart of milk. Some persons use white wine instead of water, with simple digestion for a day or two.

RENOVATION (of Clothing). See *Scouring.*

RESINEONE. An oily liquid obtained, along with "*resinone*," when *resin* and *lime* are distilled together. (Fremy.)

RESINS. Syn. *Resinæ*,—Lat. Proximate vegetable principles, the ultimate composition of which is carbon, hydrogen, and oxygen. They are distinguished by their solubility in alcohol, insolubility in water, inflammability, fusing by a moderate heat, and not being volatilized at a higher temperature without decomposition. Their sp. gr. varies from 0·9 to 1·2. According to Liebig, they are oxidized essential oils. *Common rosin* or *colophony*, and the *shell lac* of which sealing-wax is made, are familiar examples of these substances. Gutta-percha and caoutchouc may also be regarded as belonging to this class of bodies, although distinguished by their total insolubility in alcohol.

Some valuable contributions have recently been made to the chemistry of the resins and allied substances. The *hancornia speciosa*, one of the *sapotaceæ*, which grows on the high plateaux of Brazil, bears a fruit (*mangrava*), in shape resembling a bergamot pear, the milky juice of which is liquid Indian-rubber. After this fruit has been gathered and kept about three weeks, the Indian-rubber disappears, or is converted into sugar, and it is then found to be superior to all the other fruits of the country. Profiting from this wonderful fact, Chevalier de Claussen was led to suppose that both *caoutchouc* and *gutta-percha* contained starch, and was hence induced to endeavour to form these substances from mixtures of *starch* or *flour* with *resinous* or *oily substances* in combination with *tannin.* In this he was so successful, that he produced new compounds which will mix with Indian-rubber and gutta-percha in all proportions

without altering their properties; and some of these combinations are as hard as horn. (*Trans. Brit. Ass.*, 1855.)

RESIN (Black). Syn. *Rosin, Black do.; Colophony; Resina Nigra, Colophonia,*—Lat. What remains of *turpentine* after the oil has been distilled. When this substance, whilst still fluid, is agitated with about 1-8th part of *water*, it forms the *yellow resin* of pharmacy. *Used* for violin bows, dark-coloured ointments, varnishes, &c.

RESIN (Yellow). Syn. *Yellow Rosin, White do.; Resina Flava; Resina,*—Ph. L. Detergent. *Used* in ointments, plasters, &c. (See *above.*)

RESOLVENTS. Syn. *Discutients; Resolventia.* Substances or agents which discuss or resolve inflammatory and other tumours. See *Digestives.*

RESPIRATION. The peculiar function by which the nutrient circulating fluid of organized beings is submitted to the action of the air, for the purpose of removing carbonic acid, and restoring its vitality by the absorption of atmospheric oxygen.

The *primary object* of the *respiratory process* is the production of animal heat. The air expired from the lungs is found to have undergone a most remarkable change. It is now loaded with aqueous vapour, whilst a considerable portion of its oxygen has disappeared, and its place is supplied by about a like volume of carbonic acid. It is no longer capable of supporting animal life, and even a lighted taper plunged into it is immediately extinguished. In the meantime, the *venous blood* which entered the lungs from the right chambers of the heart has lost its dingy hue, and has acquired the rich florid colour which is characteristic of *arterial blood.* In this state it is returned to the left chambers of the heart, and is propelled by that organ to every part of the body, from which it passes by the capillaries to the veins, and by these again to the heart and lungs, to undergo the same changes and circulation as before. The *carbon* and *hydrogen* of the blood, ultimately derived from the food, are, in this course, gradually converted into carbonic acid and water, by a species of *slow combustion;* but how these changes are effected is not definitely ascertained, although it appears pretty certain that they occur in the capillaries of the whole body, and not in the lungs, the temperature of which does not exceed that of the other parts. Much of the oxygen is, no doubt, simply dissolved in the *serum* of the blood. According to Prof. Liebig, the *corpuscles* act as carriers of another portion, in virtue of the iron which they contain, that metal being alternately in the state of sesquioxide and of carbonate of the protoxide, — of sesquioxide in the arteries, and of carbonate of protoxide in the veins, by loss of oxygen, and acquisition of carbonic acid. M. Mulder considers the *fibrine* of the blood to act in the same manner; being *true fibrine* in the veins, and, in part at least, an *oxide of proteine* in the arteries.

The lungs, as is well known, receive the atmospheric air through the *trachea* or *windpipe.* At the root of the neck this divides into two branches called bronchi, and each bronchus upon entering its respective lung divides into an infinity of small tubes. The latter terminate in small pouches, called the *air-cells,* and a number of these little air-cells communicate together at the extremity of each small tube. The number of air-cells in the two lungs has been estimated at 1,744,000,000, and the extent of the skin which lines the cells and tubes together at 1500 square feet. (Dr. Addison.) Under ordinary circumstances, about 15 cubic inches only of air are thrown out at each expiration; but, by a forced effort, as much as 50 or even 60 inches may be expelled. The number of respirations per minute, in health, when the individual is tranquil and undisturbed, is about 18. Exercise increases this number. See *Food, Nutrition, &c.*

RESPIRATION (Artificial). Various means have been adopted for this purpose, among which blowing air into the lungs is, perhaps, that generally adopted. A better, and, in general, a much more efficient method, is as follows:—Powerful but not violent *pressure* is made upon the *sides of the chest* and upon the *abdomen* at the *same time,* by which the cavity of the thorax is diminished, and the air contained in the lungs is expelled; the compression is then suddenly withdrawn, when the elasticity of the ribs causes them to resume their old expanded positions; the chest is again enlarged, a partial vacuum is formed, and air rushes into the lungs, to be again expelled by pressure upon the ribs and abdomen as before. By this means artificial respiration may be kept up for a great length of time, without the use of bellows, or any other apparatus. See *Animation* (Suspended).

RESUSCITATION. See *Animation* (Suspended).

RETINIC ACID. The name given by Prof. Johnston to that part of *retinite* or *retinasphalt* which is soluble in alcohol.

REVALENTA ARABICA. A mixture of the *red Arabian* or *Egyptian lentil* with

barley flour, and a little *sugar* or *salt*. ('Lancet.') See *Lentils* and *Ervalenta*.

REVERBERATORY FURNACE. A furnace so formed, with a roof or dome, that the flame and hot air from the fuel is thrown down upon a "hearth," or space beyond it. For an example, see *Carbonate of Soda*.

REVIVER (Black). Syn. *Paris's Anticardium*. *Prep.* 1. *Blue galls* (bruised), 4 *oz.*; *logwood* and *sumach*, of each, 1 *oz.*; *vinegar*, 1 quart; macerate in a closed vessel, at a gentle heat, for 24 hours, then strain off the clear, add *iron filings* and *green copperas*, of each, 1 *oz.*, shake it occasionally for a week, and preserve it in a corked bottle.

2. *Galls*, 1 *lb.*; *logwood*, 2 *lb.*; boil for 2 hours in *water*, 5 quarts, until reduced to a gallon, then strain, and add of *green copperas*, ½ *lb*. *Used* to restore the colour of faded black cloth.

REVIVER (Blue). *Prep.* From *soluble Prussian blue*, 1 *oz.*; dissolved in *distilled water*, 1 quart. *Used* for either black or blue cloth.

REVIVER (French-polish). See *p.* 1023.

RHABARBERIC ACID. See *Rheumic Acid*.

RHABARBERINE. Syn. *Rheine*, *Rheumine*. The yellow colouring principle of rhubarb. It is obtained by digesting *powdered rhubarb* in *ether*, distilling off greater part of the ether, and submitting the remainder to spontaneous evaporation. The crystals thus obtained are purified by repeated solutions and crystallizations in alcohol. Orange yellow. Gripes, but does not purge. (Brandes.) See *Rheine*.

RHAMNINE. Syn. *Rhamnina* (?). *Prep.* Express the juice from *buckthorn berries* scarcely ripe, which is to be rejected; boil the *cake* or *residue* with *water*, strain with pressure, and filter the liquid whilst hot; *crude rhamnine* will be deposited as the liquid cools, which, by solution in *boiling alcohol*, and *filtration*, may be procured in crystals.

Obs. Buckthorn juice (*succus rhamni*), "the juice of the fruit of *rhamnus catharticus* (Linn.)," is officinal in the Ph. L.

RHAPONTICINE. A peculiar, yellow, odourless, tasteless, and crystallizable substance, obtained from the root of *English rhubarb*. It is extracted by boiling *absolute alcohol*.

RHATANY. Syn. *Rhatany Root*; *Krameria*,—Ph. L. E. & D. *Rhataniæ Radix*,—Ph. D. 1826. "The *root* of *krameria triandria*." (Ph. L.) It is stomachic, and powerfully astringent and styptic. *Dose*. 10 gr. to ½ dr., either in substance or made into a decoction or infusion. It is much employed in tooth-powders, to fix the teeth when they become loosened by the recession of the gums, and also for improving the natural red colour of the lips and gums. A *saturated tincture* or *fluid extract*, made with brandy, forms the "*wine-colouring*" used by the Portuguese to give roughness, colour, and tone to their Port wine. *Hard extract of rhatany* is also much employed for the same purpose.

RHEINE (?). An inodorous, bitterish substance, of a yellow colour, obtained by gently heating *powdered rhubarb* with 8 parts of *nitric acid* of the sp. gr. 1·37, evaporating to the consistence of syrup, and diluting with *water*. (Brande.) See *Rhabarberine*.

RHEUMATISM. Syn. *Rheumatismus*,—Lat. An affection of the joints, and of the external muscular, tendinous, and fibrous textures of the body, attended with swelling, stiffness, and great pain. *Acute rheumatism*, or *rheumatic fever*,—*arthritis*, inflammation of the synovial membrane, or *rheumatic gout*,—*sciatica*, or rheumatism of the cellular envelope of the great sciatic nerve, affecting the hip,—and *lumbago*, or rheumatism of the loins, are varieties of this disease.

The *treatment* of *rheumatism* consists in the administration of *purgatives* and *diaphoretics* or *sudorifics*, accompanied by *tonics*, as bark, quinine, &c. *Calomel* with *opium*, and *iodide of potassium*, have also been frequently and successfully employed in this complaint. Of late years the administration of the *bicarbonate*, *citrate*, or *nitrate of potassa* in rather large doses has been strongly recommended, and in numerous cases adopted with success. *Lemon juice*, liberally taken, has also proved useful in suddenly cutting short severe attacks of certain forms of rheumatism. When the inflammatory symptoms are severe, occasional *venesection* may be had recourse to. The *compound powder of ipecacuanha*, taken at night, will generally promote the ease and sleep of the patient, and, by its sudorific action, tend considerably to hasten a cure. Where possible, a dry atmosphere and a regular temperature should be sought, since a damp atmosphere, and, indeed, exposure to damp under any form, are the *principal causes of rheumatism*. *Stimulating embrocations*, *blisters*, *frictions*, and above all, the *hot* or *vapour bath*, are also frequently serviceable in rheumatism, especially in *lumbago*, and casual attacks arising from cold. The *daily use of oranges*, or of *lemon juice* diluted with water, has

been found, in the majority of cases, to lessen the susceptibility of those who employ them to attacks of rheumatism and rheumatic gout, arising from a damp situation, or exposure to the weather. See *Lemon Juice.*

RHEUMIC ACID. Syn. *Rhabarberic Acid.* A name erroneously given by Mr. Henderson to the oxalic acid found in *rhubarb.*

RHODANIC ACID. Sulphocyanic Acid.

RHODIUM. A whitish metal discovered by Wollaston, in 1803, associated with palladium in the ore of platinum.

Prep. The *solution of platinum ore in aqua regia*, after being saturated with *soda*, is precipitated with *bicyanide of mercury*, to throw down the "*palladium*," and after filtration, is mixed with *hydrochloric acid*, and the whole evaporated to dryness; the residuum is next powdered and digested in *alcohol* of the sp. gr. 0·837; the undissolved portion (*double chloride of rhodium and sodium*) is then washed with *alcohol*, and either exposed to a *very strong heat*, or *gently heated* in a *stream of hydrogen gas*; it is, lastly, boiled in *water*, and dried. The *product* is a white, coherent, spongy mass.

Another method is to dissolve in *water* the *portion left after the action of the alcohol*, and to precipitate it by a *plate of zinc.* In either case, the solution from which the platinum and palladium have been separated in the ordinary method of preparing those metals, may be employed, by which the process will be shortened. In this state it is a black powder.

Prop., &c. Pure rhodium is brittle, and resembles platinum in appearance; it is the hardest, most difficultly fusible, and least soluble of all the metals; it is insoluble in acids, even when heated, but dissolves in aqua regia when it is alloyed with other metals. Obtained as above it is only blackened by heat; but with borax it acquires a white metallic lustre, though it remains infusible. Sulphur or arsenic, however, renders it fusible, and may afterwards be expelled by continuing the heat; but the button thus obtained is not malleable. It unites with oxygen and chlorine, and forms alloys with nearly all the metals. The solutions of its salts are characterised by their rosy colour. Sp. gr., about 11.

Uses, &c. It is chiefly employed for the points of "*rhodium*" or "*everlasting pens.*" A very small quantity added to steel is said to improve its closeness, hardness, and toughness, and to render it less easily corrodible by damp.

RHODIUM (Chloride of). Syn. *Sesquichloride of Rhodium, Perchloride of do.* Obtained by adding to a *solution of the double chloride of rhodium and potassium, silico-hydrofluoric acid*, as long as the *double fluoride of potassium and silicium* is generated, then filtering, evaporating to dryness, and redissolving the residuum in water. (Berzelius.)

Prop., &c. A brownish red, deliquescent mass, forming a rich red solution. Several double chlorides may be formed. *Chloride of rhodium and potassium* is prepared by heating in a stream of chlorine a mixture of equal parts of finely powdered rhodium and chloride of potassium. This salt has a fine red colour, is soluble in water, and crystallizes in 4-sided prisms. *Chloride of rhodium and sodium* is also a very beautiful red salt, obtained by a similar process.

RHODIUM (Oxide of). Syn. *Sesquioxide of Rhodium, Peroxide of do.* Obtained by heating *pulverulent rhodium*, mixed with *hydrate of potassa* and *a little nitre*, in a silver crucible, and well washing the resulting powder, first with *water*, then with *hydrochloric acid*, and again with *water.* A greenish gray powder. In this state it is insoluble in acids. An *impure soluble oxide* is precipitated when carbonate of potash or soda is added in excess to the double chloride of rhodium and potassium. A *protoxide* may be also formed, but is little known.

RHODIZONIC ACID. *Prep.* When *dry carbonic oxide* is passed over *fused potassium*, a black porous mass is obtained, and this substance, exposed to moist air, deliquesces into a solution of *rhodizonate of potassa* of a scarlet colour, from which the excess of alkali may be taken by alcohol; by treatment with a *mixture* of *sulphuric acid* and *alcohol*, the *rhodizonic acid* may be obtained in a separate form.

Prop. This acid is yellow, soluble in both water and alcohol, and easily crystallizable. When its solution is heated, it is converted into "*croconic acid.*" This last acid is obtained by adding *fluosilicic acid* to a *solution of croconate of potassa*, evaporating to dryness, and dissolving out the *croconic acid* with *water.* Croconic acid, as well as its salts, are yellow; hence its name.

RHUBARB. Syn. *Rheum*,—Ph. E. & D. *Rheum* (Sinense),—Ph. L. *Rhabarbarum, Rhœum*,—Obs. "The *root* of uncertain species of rheum." (Ph. L.) According to Dr. F. Farre, the term *sinense* (Chinese), employed by the London College, "was placed after rheum, to *include* the so-called Russian and East Indian rhubarbs, which are considered to be the produce of China

and Chinese Tartary, and to *exclude* European, Himalayan, &c." The Dutch trimmed or Batavian rhubarb is regarded in the light of East Indian by the College.

Three *principal varieties* of *rhubarb* are known in this country:—

Russian or *Turkey rhubarb* is the produce of six-years old plants of the mountain declivities of Chinese Tartary; and its principal excellence depends on its more careful preparation, and subsequent garbling, both before its selection for the Russian market, and after its arrival at Kiachta, and again at St. Petersburgh. At Kiachta all pieces of a porous, gray, or pale colour, are rejected, the whole being pared and perforated, the better to determine the quality of the interior portion. At St. Petersburgh the pieces are again carefully examined and garbled, and are, finally, packed in close cases or chests, which are rendered air-tight by the application of pitch on the outside.

East Indian or *Chinese rhubarb* is the produce of the locality just referred to, as well as of other parts of China. It is obtained from younger plants, and its preparation and subsequent selection or garbling is conducted with less care.

English rhubarb is principally produced at Banbury, Oxfordshire, from the rheum palmatum and rhaponticum. It is cut and dressed up after the manner of Turkey rhubarb, for which it is sold by itinerant vendors, habited as Turks.

Qual. Russian or *Turkey rhubarb* occurs in irregular plano-convex or roundish lumps, perforated with a circular hole; it possesses a yellow colour outside; when recently broken the inside presents a rich mottled appearance, and evolves a peculiar, and somewhat aromatic odour. It is firm, compact, heavy, perfectly free from moisture, and easily grated. Its taste is bitter, slightly astringent, and sub-acid; and when chewed it feels gritty, and tinges the saliva of a beautiful yellow colour. It breaks with a rough, hackly fracture, is easily pulverized, and its powder is of a bright, buff-yellow colour.

East Indian, Canton, or *Chinese rhubarb* is in flat pieces, seldom perforated, and its taste and odour are stronger than the other. It is also heavier, tinges the saliva of an orange-red hue, and when pulverized the powder is redder than that of Russian rhubarb.

English rhubarb possesses all the preceding qualities in a greatly less degree. It is light and spongy, does not feel gritty between the teeth, its taste is mucilaginous, and its powder has a peculiar pinkish hue not present in either of the other varieties of rhubarb. As a medicine it possesses little value, and is chiefly employed to adulterate East Indian and Turkey rhubarb.

Prop., &c. Rhubarb is an astringent, stomachic, and purgative. In small doses its operation is principally or wholly confined to the digestive organs; in larger ones, it first acts as a mild aperient, and, afterwards, as an astringent; hence its value in diarrhœa. It has also been used externally, to promote the healing of indolent sores. *Dose.* As a stomachic, 5 to 8 gr.; as a purgative, 15 to 30 gr. It is most effective when chewed, or in the form of powder produced by *grating* it.

RHUBARB (Roasted). Syn. *Burnt Rhubarb; Rheum Ustum.*—Lat. *Prep.* 1. *Rhubarb*, in coarse powder, is carefully and regularly heated in a smooth shallow iron-dish, with constant stirring, until its colour has changed to a *moderately dark brown*, when it is allowed to cool out of contact with the air; when cold it is reduced to powder, and at once put into a well-closed bottle.

2. (Mr. Hoblyn.) Roast *powdered rhubarb* in an *iron vessel*, constantly stirring, until it becomes almost black, then smother it in a covered jar. *Dose.* 5 to 10 gr.; as an astringent in diarrhœa, and a tonic in dyspepsia, &c. Mr. W. Procter, the well-known American pharmaceutist, recommends the rhubarb to be only roasted to a "*light brown.*"

RICE. Syn. *Oryza,*—Lat. The *seed* of *oryza sativa*, a plant of the natural order *gramineæ*. Several varieties are known in commerce, distinguished by the name of the country or district which produces them. The finest is that imported from Carolina.

As an *article* of *diet* rice is highly nutritious and wholesome when combined with fresh animal or other nitrogenized food; but, owing to the very small quantity of 'flesh-formers' which it contains, and its comparative destitution in saline matter, it is totally unfit to form the principal portion of the diet of the working classes, or the poorly fed, at least in this climate. "It does not appear so well calculated for European constitutions as the potato; for we find the poor constantly reject it, when potatoes can be had." This preference evidently depends on something more than mere whim or taste; for a few years since, when rice was substituted for potatoes in some of our Union Workhouses, the most serious consequences followed. In one of these, nine or ten deaths from scurvy and allied diseases occurred in a single fortnight.

RICINOLEIC ACID. Syn. *Elaiodic Acid, Oleoricinic Acid.* A variety of oleic acid discovered by MM. Bussy & Lecanu in *saponified castor oil.*

RICINOSTEARIC ACID. A solid fatty acid resulting from the *saponification* of *castor oil.* Neither this nor the preceding compound possesses any practical interest.

RICKETS. Syn. *Rachitis,*—Lat. A disease, generally confined to childhood, *characterised* by a large head, prominent forehead, protruded breast bone, flattened ribs, tumid belly, emaciated limbs, and great general debility. The bones, more particularly those of the spine and legs, become distorted, and exhibit a deficiency of earthy matter; the stools are frequent and loose, a slow fever succeeds, with cough, painful and difficult respiration, and unless the child rallies, atrophy is confirmed, and death ensues. When recovery takes place there is always more or less deformity left. Children of a scrofulous diathesis are the most liable to this affection.

The *common causes* of *rickets* are bad nursing, exposure to damp and cold, and insufficient nutrition arising from the use of white bread containing alum, or any of the pernicious compounds vended under the names of "*Farinaceous food,*" "*Infants' do.,*" "*Patent do.,*" *&c.* Rickets, like caries of the bones, is a disease which is scarcely known amongst infants whose pap is made of coarse meal bread, and whose mothers or nurses consume the same themselves.

The *treatment* of *rickets* depends more on proper domestic management, than on direct medication. Careful nursing, warm dry clothing, thorough ventilation, moderate exercise, and, above all, a light nutritious mixed diet abounding in nitrogenous matter and the phosphates, will do much to effect a cure. To these may be added, the administration of the milder chalybeate tonics, bark, or quinine, with occasional doses of some mild aperient, as phosphate of soda, or, when there is diarrhœa, of rhubarb or some other tonic purge. The administration of *small* doses of phosphate of lime or of dilute phosphoric acid, frequently repeated, or, still better, the daily use of jelly made of pure ivory or bone shavings, will often effect wonders in those cases in which the bones are implicated from an apparent deficiency of earthy matter. See *Bread, Farinaceous Food, Nursing, &c.*

RINGWORM. Syn. *Scald-head; Porrigo,*—Lat. The common ringworm, the *porrigo scutulata* of medical writers, is a disease that appears in circular patches of little pustules which afterwards form scabs, leaving a red pimply surface, and destroying the bulbs of the hair in its progress. It spreads rapidly, and is *very infectious,* often running through a whole school. It chiefly affects the neck, forehead, and scalp of weakly children, and frequently arises without any apparent cause, but, in general, may be traced to uncleanliness, or contact with parties suffering from the disease.

The *treatment* of *ringworm* consists in shaving the part, and keeping it clean with soap and water, at the same time that an occasional mild saline aperient is administered, and a light, nutritious diet, of which the *red meat* and *ripe fruits* should form a portion, be rigorously adhered to. When the *scabbing* commences, dressings of *tar ointment,* or of the *ointment of nitrate* or *nitric-oxide of mercury* of the London Ph., or a *mixture* of equal parts of the *first,* and either the *second* or *third,* should be applied, in each case diluting the mixture with sufficient *lard* to adapt it to the state of irritability of the part. During this treatment the head should be covered with an ordinary nightcap, or some simple bandage, and not enveloped in a bladder or oil-skin case, as is commonly the practice; since the complete exclusion of atmospheric air tends to aggravate the disease.

Obs. There are *several varieties* of *ringworm* or *porrigo* besides that noticed above, but being of less frequent occurrence, they are, consequently, less important. Of these are the *porrigo larvalis, crusta lactea,* or *milky crust* of infancy; the *porrigo furfurans,* or *scaly* or *branny scald-head,* occasionally occurring in adults, and more particularly in females;—the *porrigo favosa,* or *honey-comb ringworm,* of childhood, consisting of an eruption of large, soft, straw-coloured pustules, the appearance of which have given this name to the disease; and the *porrigo decalvans,* characterised by simple bald circular patches, without any other affection of the scalp. The last, although not a severe, is often a very obstinate disease, and can only be cured by the long-continued application to the part of some stimulant pommade, liniment, or wash, with the frequent use of the razor and warm soap-and-water.

RIPENING. See *Wines, Brewing,* and *Malt-liquors.*

ROACH. The *cyprinus rutilis* (Linn.), a fish of the carp family of soft-finned abdominal fishes (*malacopterigii abdominales*). It is found in most of the rivers and streams of England, and its flesh is regarded as "particularly light, sound, and wholesome."

ROASTING. Alexis Soyer recommends

"as an invariable rule," that "all *dark meats*, such as *beef* and *mutton*, should be put down to a *sharp fire*, for at least fifteen minutes, until the outside has acquired a coating of *osmazome* or *condensed gravy*, and then removed back, and allowed to cook *gently*. *Lamb*, *veal*, and *pork*, if young and tender, should be done at a moderate fire. *Veal* should even be covered with paper."

"Very *rich meat*, if covered with paper, does not require basting. *Fowls*, *&c.*, should be placed close to the fire, to set the skin, and in about ten minutes rubbed over with a small piece of *butter*, pressed in a spoon. *Meats* whilst *roasting* should be dredged with *flour*, just at the time when the gravy begins to appear; the flour absorbs it, and forms a coating which prevents any more coming out. *Hares* and *small game* should be treated in the same manner."

Under ordinary circumstances as to the fire, and the distance between it and the joint, *beef*, *mutton*, and *veal*, take about ¼ *hour* per *lb.* in roasting. *Lamb*, *poultry*, and *small game*, require only 12 to 14 minutes per *lb.*; whilst *veal* takes fully 15 minutes, and *pork* takes from ¼ hour to 20 minutes, as they must always be well done. The *flesh* of *old animals* requires more cooking than the flesh of *young ones*; and *inferior*, *tough*, and *bony parts*, than the prime joints and pieces.

Roasting is not an *economical method* of cooking pieces of meat abounding in bone or tendinous matter; since the nutritious portion of these is either destroyed, or rendered insoluble by the heat employed. Thus, the *raw bones* from a joint are capable of affording a rich and excellent basin of soup, highly nutritious; whilst the bones from a corresponding joint which has been roasted are nearly worthless when so treated. The same applies with even greater force to the gristly and tendinous portions. A dry heat either destroys them or converts them into a horny substance unfit for food; whilst by boiling they are transformed into a highly succulent, and nutritious article of food, besides affording excellent soup or jelly. Hence the policy of "*boning*" meat before roasting or baking it; or, at all events, of removing the bony portion which would be most exposed to the action of the fire. See *Bones* and *Jellies*.

ROB. Syn. *Roob*. A term, derived from the Arabic, formerly applied to the *inspissated juices of ripe fruit*, mixed with *honey* or *sugar* to the consistence of a conserve or thin extract. Rob of elder-berries (*elder rob; roob sambuci*), juniper berries (*juniper rob; roob juniperi*), mulberries (*mulberry rob; roob diamorum*), and walnuts (*walnut rob; roob dyacaryon*), with a few others, are still found in some of the foreign pharmacopœias.

ROCCELLIC ACID. Syn. *Roccelline*. A fatty crystallizable substance obtained from *roccella tinctoria* or *herb-archil*.

ROCCELLININE. A substance obtained, along with *orsellinic acid*, when *betaorsellic acid* is boiled with *water*. It forms hair-like crystals of a silvery lustre.

ROCK. The popular name of a sweetmeat formed of *sugar boiled to a candy*, and then poured upon an *oiled slab*, and allowed to cool in the lump. It is variously flavoured.

ROCK CRYSTAL. Native crystallized silica. See *Quartz*.

ROCK LEATHER, *Rock Wood*. See *Asbestos*.

ROCK OIL. See *Petroleum*.

ROCK SOAP. A native subsilicate of alumina; *used* for crayons, and for washing cloth.

ROCKETS (In Pyrotechny). *Prep.* 1. The Cases. These are made of *stout cartridge paper*, rolled on a mould and pasted, and then throttled a little below the mouth, like the neck of a phial. The *diameter* should be exactly equal to that of a leaden ball of the same weight, and the length should be equal to 3½ times the internal diameter. They are filled with the following mixtures, tightly driven in; and when intended for flight (*sky rockets*), they are "*garnished*," and affixed to willow rods to direct their course.

2. The Composition—*a*. (Marsh.)—*aa*. For 2-*oz. rockets*. From *nitre*, 54½ parts; *sulphur*, 18 do.; *charcoal*, 27¼ do.; all in fine powder, and passed through lawn.

ab. For 4-*oz. do*. From *nitre*, 64 parts; *sulphur*, 16 do.; *charcoal*, 20 do.; as the last.

ac. For ½-*lb*. to 1-*lb. do*. From *nitre*, 62¾ parts; *sulphur*, 15¾ do.; *charcoal*, 21½ do.

b. (Ruggieri.) — *ba*. For *rockets* of ¾-*inch diameter*. From *nitre*, 16 parts; *charcoal*, 7 do.; *sulphur*, 4 do.

bb. For ¾ to 1½-*inch rockets*, use 1 part more of *nitre*.

bc. For 1¾-*inch rockets*, use 2 parts more of *nitre*.

bd. By using 1 *part less* of *charcoal* and *adding* respectively 3, 4, and 5 parts of *fine steel filings*, the above are converted into "*Brilliant fires*."

be. By the substitution of *coarse cast-*

iron borings for filings, and a *further omission* of 2 *parts* of *charcoal* from each, the latter are converted into "*Chinese fire.*"

Hand rockets and *ground rockets* are usually loaded with nothing but very fine *meal gunpowder* and *iron* or *zinc filings* or *borings.*

After *sky-rockets* and *water-rockets* are charged a *piece of clay* is driven in, through which a hole is pierced, and the "*head*" or "*garniture*" filled with *stars*, and a little cornpowder is then applied. See *Coloured Fires* and *Stars.*

ROLLS. A variety of fancy bread, generally in the form of small semi-cylindrical cakes, prepared by the bakers, and intended to be eaten hot for breakfast. They differ from *ordinary fine*, or *French bread*, as it is called, chiefly in containing more water. Some are wetted up with *milk-and-water*, and are hence called "*milk rolls.*"

ROLL (Wine). *Prep.* Soak a *French roll* or *sponge-biscuit* in *raisin*, *marsala*, or *sherry wine*, surround it by a *custard* or *cream thickened with eggs*, and add some *spice* and *ornaments.*

ROOT. Syn. *Radix*,—Lat. That part of a plant which imbibes its nourishment (from the soil or medium in which it grows), producing the herbaceous portion and the fructification, and which consists of the *caudex* or body, and *radicles.* (Linnæus.) In popular language, *bulbs*, *corms*, *tubers*, *&c.*, are included under this term.

Although the *roots* of *plants* are hidden by the soil from the gaze of man, and, when gathered, prove less showy and odorous than the members of the floral world, they are infinitely more useful and important than they are. With the single exception of the seeds or fruits, among which is bread corn, the roots of vegetables furnish a more ample and varied supply of matter fit for food, than any other part of their structure. Nor are their good offices confined to supplying man with food, for they also furnish him with many of his most valuable medicines, as well as numerous products of the utmost value in the arts, manufactures, and domestic economy. See *Vegetable Substances.*

ROOTS (Aperient). See *Species.*

ROPINESS. See *Malt Liquors* and *Wines.*

ROPOPHAGON. *Prep.* From *yellow soap*, sliced, 1 *oz.*; *soft soap* (finest), 3 *oz.*; melt them by the heat of *hot water*, then allow them to cool a little, and stir in of *oil of cloves*, ½ dr.; *essence of ambergris*, 10 drops. It is kept a month before sale. *Used* for shaving.

ROSACIC ACID. The name given by M. Proust to the rose-coloured sedimentary matter found in the urine of persons laboring under gout and inflammatory fevers. It is obtained by acting on the sediment with alcohol.

ROSE (Dog). See *Hips.*

ROSE (Damask). Syn. *Cabbage Rose*, *Hundred-leaved do.*; *Rosa Centifolia*,—Linn., Ph. L. & E. *Rosa Damascena*, *Flores Rosæ Albæ*, *Rosæ Centifoliæ Petala*,—Lat. var. "The *fresh petals*," (Ph. L.) Odorous, and slightly astringent and laxative. See *Distilled Waters* and *Syrups.*

ROSE (French). Syn. *Provins Rose*, *Red do.*; *Rosa Gallica*,—Linn., Ph. L. E. & D.; *Flores Rosæ Rubræ*, *F. Rosarum Rubrarum*, *Rosæ Gallicæ Petala*,—Lat. var. "The *fresh* and *dried unexpanded petals*," (Ph. L.) The white claws or peels of the petals are removed before drying them.

Uses, &c. The red rose is an elegant astringent and tonic, and as such is used as the basis of several pharmaceutical preparations. See *Confections*, *Honeys*, *Infusions*, and *Syrups.*

ROSEMARY. Syn. *Rosmarinus*,—Ph. L. E. & D. The *flowering tops* of *rosmarinus officinalis* (Linn.), or the common rosemary of our gardens, are officinal in the Ph. E. & D.; as is also the oil (*oleum rosmarini*) in the Ph. L. The odour of both is refreshing, and they are reputed carminative, emmenagogue and neurotic. The *dried leaves* are occasionally used by the hysterical and hypochondriacal as a substitute for China tea. The *oil* is an ingredient in Hungary water, and is much used in various cosmetic compounds under the presumption of its encouraging the growth of hair and improving its quality.

ROSEOLA. See *Rashes.*

ROSE PINK. See *Red Pigments.*

ROSIN. See *Resins.*

ROSY-DROP. See *Acne.*

ROT. Syn. *Great Rot*, *Hydrophic do.*, *Sheep do.*, *Wet do.* A disease peculiar to sheep, produced by a humid atmosphere, wet pasturage, and exposure to the weather. The *leading symptoms* are loss of flesh and vivacity; the lips and tongue look livid, and the eyes sad and glassy; the pelt comes off on the slightest pull; the breath is fœtid, and the urine high-coloured and scanty; and there is either black purging or obstinate costiveness. The *treatment* consists in a change to a dry warm situation, and a dry diet, consisting of oats, barley meal, tail-wheat, &c., to which some turnips, carrots, or mangel wurzel may be added, with a liberal supply of common salt, and a

few grains of sulphur, daily. These last two substances form the active ingredients in Flesh's "*Patent restorative.*"

ROT (In Timber). See *Dry Rot.*

ROTATION (of Crops). The *rotation* or *succession of crops* is absolutely necessary for the successful and economical cultivation of the soil. *Crops* have been divided by agriculturists into *exhausting crops*, *restoring crops*, and *cleaning crops*. The most EXHAUSTING CROPS are usually considered to be those of corn, but all those that are allowed to ripen their seed, and which are carried off the ground, are also exhausting, but in different degrees. Even *clover*, *tares*, and *grass* cut green, are considered as exhausting, but in a less degree than those that are allowed to ripen. RESTORING CROPS are such as are allowed to decay upon the ground, or are consumed upon it by domestic animals. CLEANING CROPS are such as are grown in drills, and undergo the usual operations of *weeding*, *hoeing*, &c.; the majority of these may also be regarded as exhausting crops. An *exhausting* crop should always be followed by a *restoring* or *a cleaning* crop; or where possible by *both combined*. Crops should also succeed each other in such a way that the soil may not be exhausted of any one particular kind of nutriment. This is best effected by so rotating the crops that plants which are nearly allied should not succeed each other on the same soil, or at all events not more than once. See *Agriculture*, *Soils*, *&c.*

ROTTEN STONE. See *Tripoli.*

ROUGE. Syn. *Toilet Rouge; Rouge Végétal, Rouge d'Espagne,* — Fr. *Prep.* Wash *safflower* (any quantity) until the water comes off colourless; dry and pulverize it, and digest the powder in a *weak solution* of *crystallized carbonate of soda;* then place some *fine cotton-wool* at the bottom of a porcelain or glass vessel, pour the filtered *tinctorial solution* on this, and throw down the colouring matter, by gradually adding *lemon juice* or *white-wine vinegar*, until it ceases to produce a precipitate; next wash the *prepared cotton* in *pure cold water*, and dissolve out the colour with a fresh *solution of soda;* to the *new solution* add a quantity of *finely-powdered talc* or *French chalk*, proportionate to the intended quality of the rouge; mix well, and precipitate with *lemon juice*, as before; lastly, collect the powder, dry it with great care, with as little heat as possible, and triturate it with a *very small quantity* of *oil of olives*, to render it smooth and adhesive.

Obs. According to the best authorities, this is the only article which will brighten a lady's complexion, without injuring the skin. The relative fineness and proportion of talc employed determines the quality of the rouge. It is applied by means of a camel's hair pencil, a small "powder puff," or a hare's foot. It is also employed under the form of *pommade* and *crepons.* The last of these consist of pieces of white *woollen-crape*, upon which the colouring matter of the carthamus has been precipitated, instead of upon the talc, noticed above.

The following articles also pass under the name of *rouge*, and are used for the purposes named after each:—

Brown-red Rouge. Jeweller's rouge.

Chinese Card Rouge. This is a *carthamate of soda*, colourless when applied, but being decomposed by the acid secretions of the skin, acquires a most beautiful rose-like tint. (O'Shaughnessy.)

Jeweller's Rouge. See *page* 644. *Used* to polish gold, &c.

Liquid Rouge. The *red liquid* left from the preparation of carmine; or, a *solution of carmine* in *weak carbonate of potash water;* or of *pure rouge* in *alcohol acidulated with acetic acid.*

Rouge Indienne. The *terra persica*, or *Indian red*, imported from Ormuz.

Rouge de Prusse. Light red, or burnt *yellow ochre.* See *Red Pigments.*

Spanish Lady's Rouge. This is *cotton wool* which has been repeatedly wetted with an *ammoniacal solution of carmine*, and dried. It is applied like *rouge crepons.*

Vert Rouge d'Athènes, or "*pure rouge.*" See *Carthamine.*

ROUGHENING. See *Wines.*

RUBEFACIENTS. Substances or agents which when applied for a certain time to the skin occasion a redness and increase of heat, without blistering. They act as counter-irritants. *Mustard*, *powdered ginger* (both made into a paste with water), *hartshorn* and *oil*, and *ether* and *spirit of wine* (when their evaporation is prevented), are familiar examples of this class of remedies.

RUBEOLA. See *Measles.*

RUBIACINE. An orange-coloured substance, obtained from *madder.* By the action of oxidizing agents it is converted into *rubiacic acid*, *rubian* (a bitter principle), and some other substances.

RUBIC ACID. Syn. *Rubinic Acid.* See *Japonic Acid.*

RUBY. See *Gems* and *Pastes.*

RUDDLE. See *Red Pigments.*

RUE. Syn. *Rutæ Folia; Ruta,* — Ph. L. & E. "The *leaf* of *ruta graveolens*"

THE YORKSHIRE COLLEGE

(Linn.) Ph. L. A powerful antispasmodic, diuretic, and stimulant. It is also reputed nervine and emmenagogue. The *fresh leaves* are powerfully acrid, and even vesicant; but they become milder in drying. *Dose.* Of the powder, 15 to 30 gr., twice or thrice daily; in hysteria, flatulent colic, &c. See *Infusions* and *Oils* (Volatile).

RUFINE. A red substance, possessing little practical interest, formed by the action of *sulphuric acid* on *salicine*.

RUM. Syn. *Spiritus Jamaicensis, Spiritus Sacchari,*—Lat. An ardent spirit obtained by distillation from the fermented skimmings of the sugar-boilers (*syrup scum*), the drainings of the sugar-pots and hogsheads (*molasses*), the washings of the boilers and other vessels, together with sufficient *recent cane juice* or *wort* prepared by mashing the *crushed cane*, to impart the necessary flavour. The *sweet liquor*, before fermentation, commonly contains from 12 to 16% of saccharine.

Obs. Rum is imported from the West Indies. The best comes from Jamaica, and is hence distinguished by that name. *Leeward Island Rum* is less esteemed. The *duty* on *West India rum* is 9*s.* per proof gallon; that on *East India rum*, 15*s.*; the latter, hence, amounts to a prohibition. The consumption of rum has long been declining in England; its place being supplied by *gin* or *British brandy*. Rum owes its flavour to a volatile oil and butyric acid; a fact which the wary chemist has availed himself of in the manufacture of a butyric compound (*essence of rum*) for the especial purpose of enabling the spirit-dealer to manufacture a *factitious rum* from malt or molasses spirit. In Jamaica it is usual to put *sliced pine apples* into the puncheons containing the finer qualities of rum, which is then termed *pine-apple rum*. See *Alcohol, Spirit*, &c.

RUPERT'S DROPS. These are made by letting *drops of melted glass* fall into *cold water*. By this means they assume an oval form, with a tail or neck resembling a retort. They possess this singular property, that if a small portion of the tail is broken off, the whole bursts into powder with an explosion, and a considerable shock is communicated to the hand.

RUPIA. A skin disease, which commences with an eruption of flattish vesicles, which are slightly inflamed at their base. These are slowly succeeded by an ill-conditioned discharge, which concretes into thin scabs, which are easily rubbed off, and are rapidly regenerated, a circumstance which more particularly distinguishes this affection from ecthyma. In *rupia simplex* the crust or scab "is comparable in appearance, and apparent construction, and sometimes, also, in size, to an oyster-shell." In another variety, *rupia prominens*, the crust is "conical in shape, and resembles a limpet-shell." In *rupia escharotica*, which is confined to infants and young children, there are ill-looking sores which, from their peculiar corroded appearance, and the absence, or the thin and imperfectly formed condition of the crusts, have been termed "burnt holes."

Rupia is a *common consequence* of dirt and semi-starvation; and, from thus occurring in highly debilitated constitutions, and cachectic habits, is very difficult to cure, and frequently fatal. The *treatment* consists in the judicious use of a light restorative diet, with tonics and alteratives, assisted by warm bathing, and free exercise in the open air.

RUPTURE. See *Surgery* (Popular).

RUSKS. *Prep.* From 4 *eggs; new milk* and *warm water*, of each, ½ pint; *melted butter* and *sugar*, of each, ¼ *lb.; yeast*, 3 table-spoonfuls; beat well together with as much *flour*, added gradually, as will make a very light paste; let it rise before the fire for half an hour, then add a *little more flour*, form it into small loaves or cakes 5 or 6 inches wide, and flatten them; bake these moderately, and when cold, cut them into slices the size of rusks, and put them into the oven to brown a little. A nice *tea-cake* when hot, or with caraways to eat cold. *Plain rusks* are made by simply cutting loaves of bread into slices, and baking them in a slow oven to the proper colour.

RUSMA. An *arsenical iron pyrites*, found in Galatia, which when reduced to powder, and mixed with half its weight of *quick-lime*, is used by the Turkish ladies to make their "*psilothrons*," or compounds to remove superfluous hair. See *Depilatories*.

RUST. Syn. *Rubigo,*—Lat. The coating or film of oxide or carbonate which forms on the surface of several of the metals when exposed to a moist atmosphere; more particularly, that which forms on iron or steel (*hydrated sesquioxide of iron; Ferrugo, Ferri rubigo*).

To *prevent iron* or *steel goods rusting*, it is merely necessary to preserve them from damp or moisture. In the shops, *small articles* in *steel* are, commonly, either *varnished* or enclosed in *quicklime* finely pulverized; *large articles* are generally protected with a *coating* of *plumbago*, or of *boiled oil*, or some cheap *varnish*, applied to them previously gently heated. *Surgical*

instruments are frequently slightly smeared with a little *strong mercurial ointment*, with the same intention.

Spots of *rust* may be removed from the surface of *polished iron* or *steel* by rubbing them with a little *tripoli* or *very fine emery* made into a paste with *sweet oil;* or, chemically, by a mixture of *polisher's putty-powder* with a little *oxalic acid*, applied with *water*. When the *last* is employed, the articles should be afterwards well *rinsed* in *pure water*, then wiped dry, and finished off with a warm and dry rubber, in order to remove every trace of acid.

RUST'S ASTRINGENT. *Prep.* From *Armenian bole*, *carbonate of magnesia*, and *white sugar*, of each, 2 dr.; *rhubarb*, 1 dr.; (all in powder;) *oil of mace*, 2 or 3 drops; mix, and triturate well. *Dose.* 1 teaspoonful, thrice daily; in chronic gonorrhœa, gleet, excessive menstruation, &c.

RUTHENIUM. A new metal, discovered by M. Claus, associated with iridium, in the *residue* from *crude platinum* which is insoluble in aqua regia. It forms small angular masses, with a metallic lustre; is very brittle and infusible; resists the action of acids, but readily oxidizes when heated in the air. Sp. gr. 8·6.

Chloride or *sesquichloride of ruthenium* is orange-yellow, astringent, and soluble. Its solution, when heated, turns first green and then blue, with decomposition, and the formation of the *protochloride*. It forms *double salts* with the chlorides of ammonium and potassium.

Protoxide of ruthenium is a greyish-black, bronze-like powder, obtained by heating bichloride of ruthenium with carbonate of soda in excess, in a stream of carbonic acid gas, and then washing away the soluble saline matter. Thus prepared, it is insoluble or only feebly soluble in acids.

Sesquioxide of ruthenium, in the anhydrous state, is a bluish-black powder, formed by heating the metal in the air. It is also precipitated by alkalies from the sesquichloride as a blackish-brown hydrate, soluble in acids forming orange-yellow salts.

Binoxide of ruthenium is a deep-blue powder, procured by roasting the bisulphuret.

Other compounds of ruthenium, besides those named above, have heen formed, but possess no practical importance, including an acid (*ruthenic acid*). A paper on the subject will be found in the *Annalen der Chemie und Pharm.*, lix, 234.

RUTILINE. A name given by Braconnot to the product of the decomposition of *salicine* by *sulphuric acid*. A brownish-red solid, coloured blood-red by acids, and violet by alkalies.

RUTINIC ACID. An acid compound said to exist in the *leaves* of *ruta graveolens* or *garden rue*.

RYE. Syn. *Secale*,—Lat. The *seed* of *secale cereale* (Linn.), a gramineous plant, the native country of which is undetermined. It is a more certain crop, and requires less culture and manure than wheat, and is, hence, largely cultivated in Germany, Russia, and the northern parts of Europe.

It has been stated that *rye* comes nearer to wheat than any other grain; but this is evidently an error, since it is less nourishing than wheat, and is more strongly disposed to acescency than any other grain. In those unaccustomed to its use, it generally, at first, occasions acidity, heartburn, and diarrhœa. It, however, furnishes an excellent *malt* for the distillation of spirit.

According to Einhof, *rye* consists of—*husk*, 24·2%; *flour*, 65·6%; *water*, 10·2%. The FLOUR gave of—*gluten*, 9·5%; *vegetable albumen*, 3·2%; *starch*, 61·1%; *uncrystallizable sugar*, 3·3%; *gum*, 11·0%; *vegetable fibre*, 6·3%; *loss*, including a *vegetable acid*, 5·6%. The ASH contained the *phosphates of lime* and *magnesia*.

RYE (Spurred). See *Ergot*.

SABADILLA. *Cebadilla*, *Cevadilla*; *Sabadilla*,—Ph. E. The *fruit* or *seeds* of *asagræa officinalis* (Lindley), *helonias officinalis* (Don.), *veratrum sabadilla* (Retz.), and, probably, of other species of *melanthaceæ* (*colchicaceæ*,—Lindl.) A drastic and dangerous cathartic, formerly used in tape-worm; and, *externally*, to destroy pediculi, but, even, for this purpose, when the scalp has been denuded or ulcerated, it has sometimes caused death. It is now used chiefly as a source of *veratria*.

SABADILLIC ACID. Syn. *Cevadic Acid*. A crystallizable, fusible, volatile, fatty acid, obtained from the oil extracted by ether from the *seeds* of *veratrum sabadilla*. The *sabadillate of baryta* is prepared in the same way as the butyrate of baryta is from butter. When this salt is heated with concentrated phosphoric acid, the sabadillic acid sublimes in white needles. It has an odour resembling butyric acid.

SABADILLINE. Syn. *Sabadillina*. An alkaloid obtained by Couerbe from *cebadilla seeds*. According to Simon, it is merely a compound of the resinates of soda and veratria. It is very poisonous.

THE YORKSHIRE COLLEGE

SABLE. The *mustella zibellina* (Linn,) a small quadruped of the martin-cat family, found in Northern Asia. Its *fur* is remarkable for its fine quality and rich colour, and for the hairs turning with equal ease in every direction. A single skin of the darker colour, taken from the animal between November and February, though only 4 inches square, fetches about £15. The skins of the rabbit, cat, &c., dressed, painted, and lustred, are sold under the name of *common* or *mock sable*.

SABOTIERE. An apparatus of peculiar construction, employed by the French confectioners for making *ices*. It consists of a *pail* to contain a freezing mixture, and an *inner vessel* for the creams to be iced. It may be used with a mixture of *pounded ice* and *salt* (see *p.* 591), but is intended for one of *powdered sulphate of soda* and *hydrochloric acid*. The pail and cream vessel being loaded, and closely covered, an alternate rotatory motion is given to the apparatus by means of the handle, for 10 or 15 minutes, care being taken to occasionally scrape down the frozen portion of the cream from the sides, by means of a wooden spoon. See *Refrigeration*.

SACCHARIC ACID. Syn. *Oxalhydric Acid*. A compound, formerly supposed to be identical with malic acid, resulting from the action of dilute nitric acid on sugar. It is frequently found in the mother-liquor of oxalic acid.

Prep. Take of *sugar* or *gum*, 1 part; *nitric acid*, 2 parts; (diluted with) *water*, 10 parts; dissolve by the aid of heat, and continue the heat as long as reaction takes place; then neutralize the liquid with *carbonate of lime*, precipitate by *acetate of lead*, and decompose the precipitate, suspended in water, by *sulphuretted hydrogen;* neutralize the *filtered liquid* with *potash*, concentrate and crystallize; redissolve the resulting *saccharate of potassa*, decolour it with a little *animal charcoal*, reprecipitate by *acetate of lead*, and decompose the precipated *saccharate of lead* by *sulphuretted hydrogen*, as before.

Prop., &c. Long colourless needles; mixed with nitrate of silver, ammonia being subsequently added, a white precipitate falls, which is reduced, on gently warming the whole, to *pure metallic silver*, the vessel being coated with a smooth and brilliant layer of that metal. It forms salts with the bases called *Saccharates;* of which those of the alkalies, lime, and baryta, are soluble. Nitric acid converts it into oxalic acid.

SACCHARINE. The technical name of the uncrystallizable sugar found in malt-wort.

SACCHARINE FERMENTATION. This occurs during the germination and kiln drying of grain in the operations of malting, and in the mashing of malt in brewing. The sweetening of bread during its exposure to heat in the oven, is also included under this head by many writers.

The *substance* which most *powerfully excites* the *sugar fermentation* was first shown by Payen and Persoz to be a peculiar principle to which they have given the name of "*diastase*." This is always present in good malt, and possesses the singular property of converting *starch* successively into *gum* (dextrine) and *sugar*, at a temperature ranging between 149° and 168° Fahr. During the action of this substance on starch, it is itself decomposed, and when the sugar fermentation ceases, it is found to have entirely disappeared. It is the presence of diastase in malt, which *alone* converts the starch of the grain into sugar during the operation of *mashing* with hot water; and hence the absolute necessity of employing water at the proper temperature, as on this depends the *strength* and *sweetness* of the wort, and consequently its fitness for undergoing the vinous fermentation, and for making beer. *Vegetable albumen* and *gluten* also possess the property of exciting the saccharine fermentation, but in a considerably inferior degree to diastase.

The sugar formed during the germination of seeds containing starch results from the action of diastase, and disappears as soon as the woody fibre (*lignine*), which has a similar constitution, is developed, forming the skeleton of the young plant. (Liebig.) See *Brewing*, *Diastase*, *Dextrine*, *&c.*

SACCHAROMETER. An instrument, similar in principle to the common spirit hydrometer, but so weighted and graduated, as to adapt it for the indication of the richness of malt-worts in sugar, or saccharine, expressed in *pounds* per *barrel*, or the *excess of gravity*, over that of *water*, the last being taken at 1000. See *Brewing*, *Syrups*, *Worts*, *&c.*

SACCHOLACTIC ACID. Syn. *Saclactic Acid*. See *Mucic Acid*.

SACCHULMIC ACID. A light brown powder, obtained by Boullay and Malaguti, by boiling *sugar* along with *dilute sulphuric acid*. It is soluble in ammonia and the fixed alkalies, forming salts (*sacchulmates*). It is the *ulmic acid* of Boullay & Malaguti.

SACCHULMINE. An insoluble substance, obtained, like the last, by boiling 10 parts of *sugar*, 30 of *water*, and 1 of

sulphuric acid, for a very long time. It is deposited in brilliant, brown scales, along with some *sacchulmic acid*. The latter is removed by the action of ammonia water.

Prop., &c. Sacchulmine is insoluble in ammonia and the alkalies. It is the *ulmin* of Boullay & Malaguti.

SACHET. Syn. *Sacculus*,—Lat. Sachets (*sacculi*) are little bags, containing dry substances, used for the external medication of parts, or for communicating agreeable perfumes to wearing apparel, drawers, furniture, &c. Those belonging to *perfumery* are commonly filled with mixtures of *fragrant vegetable substances* reduced to coarse powder, and differ from those employed for *pot pourri* chiefly in being used in the dry state. Sacculi are now seldom employed in this country in legitimate medicine. See *Powders* (Scented), *&c.*

SACHET (Anti-phthisic). Syn. *Sacculus Anti-phthisicus*,—Lat. *Prep.* Dissolve of *aloes*, 1 *oz.*, in *strong decoction of fresh rue*, ½ pint; next fold a piece of *soft muslin* in 8 folds, large enough to cover the chest and part of the stomach; steep this in the decoction and dry it in the shade; lastly, place in a small bag, one side of which is formed of scarlet silk or wool, and the other, intended to be worn next the skin, of the finest net or gauze. A celebrated domestic remedy for consumption and asthma. It is intended to be constantly worn on the chest.

SACHET (Resolvent). Syn. *Melting Bag; Sacculus Resolvens*,—Lat. *Prep.* 1. (Dr. Breslau.) *Iodide of Potassium*, 1 part; *sal ammoniac*, 8 parts; dry and reduce each separately to fine powder; mix them, and enclose ½ *oz.* to 1 *oz.* of the mixed powder in a *small bag* of linen or silk. *Used* as a resolvent to indolent tumours, especially goitures and scrofulous indurations. It should be worn on the part night and day for some time. The part next the skin should be well-pricked with a needle, and the powder shaken up and readjusted every 2 or 3 days; and it should be renewed about once a fortnight.

2. (Trousseau & Reveil.) *Iodide of potassium*, 1 part; *burnt sponge*, 4 parts; *fine saw-dust*, 5 parts; as before.

SACK. (From *sec*, Fr., *dry*.) A wine used by our ancestors, supposed by some to have been Rhenish or Canary; but, with more probability, by others, to have been *dry mountain* or "*vin d'Espagne; vin sec;*" (Howell, Fr. and Eng. Dict., 1650.) Falstaff calls it "*sherris sack*," (sherry sack,) from *Xeres*, a sea town of Corduba, where that kind of sack (wine), is made. (Blount.) At a later period, the term came to be used as a general name for all sweet wines.

SAFFLOWER. Syn. *Bastard Saffron, Dyer's do.; Carthamus.* The *flowers* of *carthamus tinctorius* (Linn.), a plant cultivated in Spain, Egypt, and the Levant. It contains two colouring principles; the one *yellow*, and the other *red*. The first is removed by water, and is rejected. The *second* is easily dissolved out by *weak solutions* of the *carbonated alkalies*, and is again precipitated on the addition of an acid. This property is taken advantage of in the manufacture of *rouge*, and in *dyeing silk* and *cotton*.

The most lively tints of *cherry*, *flame*, *flesh*, *orange red*, *poppy*, and *rose colour* are imparted to silk by the following process, modified to suit the particular shade required:—The *safflower* (previously deprived of its yellow colouring matter by water) is exhausted with *water* containing either *carbonate of soda* or of *potassa*, in the proportion of about 5% of the weight of the prepared dye-stuff acted on; the resulting liquid is next treated with *pure lemon-juice* until it acquires a distinct and rich red-colour; the silk is then introduced and turned about as long as it is perceived to take up colour, a little *more lemon-juice* being added as may appear necessary; for deep shades this is repeated with one or more *fresh baths*, the silk being dried and rinsed between each immersion; it is, lastly, brightened by turning it for a few minutes through a bath of *warm water* to which a little *lemon juice* has been previously added. For *flame colour*, the silk should receive a slight shade with annatto *before* putting it into the safflower-bath. For the *deeper shades*, when expense is an object, a little *archil* is commonly added to the first and second bath.

SAFFRON. The prepared *stigmata* or stigmas of *croci sativus* or *saffron crocus*. There are two principal varieties known in commerce:—

1. *Saffron, Hay do.; Crocus in Fœno. C. Hispaniolus, Croci Stigmata; Crocus*,—Ph. L. E. & D. This consists of the stigmas, with part of the styles, carefully picked from the other parts of the flowers, and then dried on paper, by a very gentle heat, generally, in a portable oven constructed for the purpose.

2. *Cake saffron; Crocus in Placentâ.* This, professedly, merely varies from the last, in being compressed into a cake, after it has become softened by the fire, and being then

THE YORKSHIRE COLLEGE

dried in that condition. The *cake saffron* of *commerce* is now, however, mostly, if not entirely, composed of *safflower* made into a paste with some *sugar* and *gum-water*, rolled out on paper into oval cakes 10 to 12 inches long, 9 or 10 broad, and about $\frac{1}{8}$th of an inch thick, and then dried. "I can detect neither saffron nor marigold in them." (Dr. Pereira.)

Pur. Saffron, of all the articles of commerce, except French brandy, is, perhaps, the one most largely and constantly adulterated. Abroad it is frequently mixed with safflower, and in England with "*prepared marigolds*," or *French* (mock) *saffron*. These frauds may be detected by the inferiority of the colour, and by soaking the leaves in water, when the stigmas of the *crocus sativus* may be readily distinguished from the *florets* of *safflower* and the *petals* of *marigolds*. Winckler and Grüner propose to detect these substances by means of a solution of *nitrate of silver* or of *sesquichloride of iron*. The infusion of *true saffron* is not altered by these reagents, but that of either of the above-mentioned adulterants is rendered opaque, and is at length precipitated. "It consists of tripartite filaments of an orange-red colour, with the small filaments towards the apex dilated." (Ph. L.) In the *wholesale drug-trade*, *prepared marigolds* are not only employed to mix with genuine saffron, but are extensively sold to the country dealers for that purpose. *Old* and *dry saffron* is "*freshened up*" by rubbing it between the hand, slightly oiled, and then re-picking it.

Prop., &c. Saffron is anodyne, cordial, emmenagogue, and exhilarant; but is now seldom employed, except as an adjuvant, in medicine. Amongst cooks, confectioners, and liquoristes, it is largely used on account of its fine colour. Its colouring principle is named *polychroite*.

SAFFRON (Meadow). See *Colchicum*.

SAGAPENUM. This substance is described in the London Pharmacopœia as a gum resin, the production of an uncertain species of ferula. The mass of the sagapenum sold to the retail trader is, however, a factitious article, formed by softening a mixture of *assafœtida*, 3 parts, and *galbanum*, 15 parts; over a water or steam bath, and then stirring in about $\frac{1}{17}$th of their weight of *oil of turpentine*, with a little *oil of juniper*. This mixture is labelled "*Gum. Sagapeni Opt*," an inferior sort being made by adding sundry portions of *yellow resin* and *paste of gum tragacanth* to the above. (Cooley, *Chem.* v, 369.)

Prepared Sagapenum (*Sagapenum præparatum*,—Ph. L.) is ordered to be prepared in the same manner as "prepared ammoniacum."

Obs. Sagapenum is the feeblest of all the fœtid gum-resins. *Dose.* 5 to 15 gr., made into pills; as an antispasmodic and emmenagogue.

SAGO. Syn. *Sago*,—Ph. L. E. & D. "The *fœcula* (starch) from the stem of *sagus lævis*, *s. Rumphii*, and, perhaps, of other species of palms." (Ph. L.) It forms the principle portion of the pith of the sago palm, and other allied trees. Its *properties* and *uses*, for the most part, resemble those of arrow-root. It is *used* for making puddings, jellies, &c. (See *p.* 656.)

SAL ABSINTHII. Carbonate of Potash.

SAL ACETOSELLÆ. See *page* 1041.

SAL ALEMBROTH. See *pages* 570 and 781.

SAL AMMONIAC. See *page* 59.

SAL DE DUOBUS. Sulphate of potash.

SAL DIURETICUS. Acetate of potash.

SAL ENIXUM. Crude bisulphate of potash.

SAL GEMMÆ. Rock or fossil salt.

SAL MARTIS. Sulphate of Iron.

SAL MIRABILE. Sulphate of Soda.

SAL PERLATUM. Phosphate of soda.

SAL POLYCRESTUS. See *page* 1042.

SAL PRUNELLA. Syn. *Sore-throat Salt*, *Crystal Mineral; Potassæ Nitras Fusa*, *P. N. Fusum*, *Nitrum Tabulatum*, *Sal Prunellæ*, *Lapis*, *do.*,—Lat. From *nitre*, fused in a Hessian crucible, and poured out on a smooth surface, or into moulds, to cool. Its usual form and size is that of an ordinary musket bullet, with the tail, in which state it is known in the drug trade as "*sal prunellæ globosum*." When in cakes it is often called "*sal p. in placentis*," or "*s. p. tabulatum*." A small portion allowed to dissolve slowly in the mouth, the saliva being slowly swallowed, often removes incipient inflammatory sore throat. *Product* 50%.

SAL SATURNI. Sugar of lead.

SAL SEIGNETTE. Rochelle salt.

SAL VOLATILE. Sesquicarbonate of ammonia.

SALADS are generally made of *esculent vegetables*, either singly or mixed, chosen according to taste or time of year, and seasoned with *oil*, *mustard*, and other *condiments*. Sliced *boiled egg* is a common addition. *Cold meat*, *poultry*, and *game*, sliced small, with some *cucumber*, or *celery*, and a little *onion* or *chopped parsley*, or instead of them, some *pickles*, make a very relishing salad. *Fish* are also employed in the same manner.

Lettuce Salad. Take two *large lettuces*, remove the faded leaves and the coarser green ones; next cut the green tops off, pull each leaf off separately, rinse it in *cold water*, cut it *lengthways*, and then into *four* or *six pieces:* put these into a bowl, and sprinkle over them, with your fingers, 1 small tea-spoonful of *salt*, ½ do. of *pepper*, 3 do. of *salad oil*, and 2 do. of *English* or 1 of *French vinegar;* then with the spoon and fork turn the salad *lightly* in the bowl until thoroughly mixed; the less it is handled the better. A tea-spoonful each of *chopped chervil* and *tarragon* is an immense improvement.

Obs. The above seasoning is said to be enough for ¼ *lb.* of lettuce. According to the celebrated M. Soyer, it is "such as the Italian Count used to make some years since, by which he made a fortune in dressing salads for the tables of the aristocracy." The above may be varied by the addition of 2 *eggs*, boiled hard, and sliced, a little *eschalot*, or a few *chives* or young *onions*. Several other salad herbs, especially *endive*, *water cresses*, and *mustard-and-cress*, may be "dressed" in the same manner; always remembering that the excellence of a salad depends chiefly on the vegetables which compose them being *recently gathered*, and *carefully cleansed*.

To improve the appearance of the above, and other salads, when on the table or sideboard, before being used, the gay flower of the nasturtium or marygold, with a little sliced *beet-root* or *radish*, and *sliced cucumber*, may be tastefully intermixed with them; by which they are rendered not only more refreshing to the sight, but also, through the mind, more grateful to the palate.

Lobster Salad. (Soyer.) "Have the bowl half filled with any kind of *salad herb* you like, as *endive*, *lettuce*, *&c.;* then break a *lobster* in two, open the tail, extract the *meat* in *one piece*, break the *claws*, cut the meat of both in small slices, about a quarter of an inch thick, and arrange these tastefully on the salad; next take out all the *soft part* from the belly, mix it in a basin with 1 tea-spoonful of *salt*, ½ do. of *pepper*, 4 do. of *vinegar*, and 4 do. of *oil;* stir these well together, and pour the mixture on the *salad;* lastly, cover it with 2 *hard eggs*, cut into slices, and a few slices of *cucumber*." "To vary this, a few *capers* and some *fillets* of *anchovy* may be added, stirred lightly, and then served, either with, or without some *salad sauce*. If for a dinner, *ornament* it with some *flowers* of the *nasturtium* and *marigold*."

Concluding Remarks. Salads being eaten raw, are mostly of difficult digestion, especially those of the more cooling kind, containing cucumbers, hard egg, &c. They are, however, *highly antiseptic*, and tend to correct "the grossness" of animal food, and the bad effects of a salt-meat diet. They are very useful in scurvy, and excellent to excite the appetite when languid or temporarily lost. "What is more refreshing than salads when your appetite seems to have deserted you, or even after a capacious dinner—the nice, fresh, green, and crisp salad, full of life and health, which seems to invigorate the palate and dispose the masticating powers to a much longer duration." (Soyer.) See *Sauces*, and the respective *salad vegetables*.

SALEP. Syn. *Salop*, *Saloup?* The tuberous roots of *orchis mascula*, and other allied species, washed, dried, and afterwards reduced to coarse powder. That imported from Persia and Asia Minor, occurs in small oval grains, of a whitish-yellow colour, often semi-translucent, with a faint, peculiar smell, and a taste somewhat resembling gum tragacanth. It consists, chiefly, of *bassorine* and *starch*, is very nutritious, and is reputed aphrodisiac. It is employed in the same way as sago. A decoction of about 1 *oz.* of this substance in a pint of *water*, is sold at street-stalls, in various parts of this country, under the name of "*saloup*." A tea made of *sassafras chips*, flavoured with *milk* and *coarse brown sugar* or *treacle*, is also sold in the same way, and under the same name.

French salep is prepared from the *potato*. Dr. Ure says that the *orchis mascula* of our own country, properly treated, would afford an article of salep, equal to the Turkey, and at a vastly lower price.

SALICINE. Syn. *Salicina?* A white, crystalline substance, discovered by Le Roux and Buchner, in the *bark* and *leaves* of several species of *salix* and *populus*. It occurs most abundantly in the white willow (*salix alba*), and the aspen (*salix helix*), but is also found in all the bitter poplars and willows. From willow bark which is fresh, and rich in salicine, it may be obtained by the cautious evaporation of the cold aqueous infusion.

Prep. 1. (Merck.) Exhaust *willow bark* by repeated coction with *water*, concentrate the *mixed liquors*, and while boiling, add *litharge* until the liquid is nearly decoloured; filter, remove the dissolved oxide of lead, first by *sulphuric acid*, and afterwards by *sulphuret of barium;* filter, and evaporate, that crystals may form; the crystals must

be purified by re-solution and re-crystallization.

2. (P. Cod.) To a *strong filtered decoction* of *willow bark* add *milk of lime* to throw down the colour; filter, evaporate the liquor to a syrupy consistence, add *alcohol* (sp. gr. 0·847), to separate the gummy matter, filter, distil off the spirit, evaporate the residuum, and set it aside in a cool place to crystallize; the crystals are purified by solution in *boiling water*, agitation with a little *animal charcoal*, and re-crystallization.

Prop., &c. Salicine forms white, silky needles and plates; it is intensely bitter; inodorous; neutral; non-basic; fuses at 230° Fahr. with decomposition; is soluble in 5½ parts of water at 60°, and in much less at 212°; dissolves readily in alcohol; but is insoluble in ether. Hydrochloric acid, and dilute sulphuric acid convert it into a tasteless powder called *Saliretine*, which is insoluble in water, but dissolves in alkalies and alcohol. With chlorine it forms *Chlorosalicine*. It is tonic and febrifuge, and has been given in dyspepsia, intermittents, and other diseases in which quinine is commonly administered; but it has not fulfilled the early expectations respecting it. *Dose.* 3 to 30 gr.

Pur., & Tests.—1. It is entirely soluble in water and rectified spirit.—2. When strongly heated it is *wholly* dissipated, and if kindled, burns with a bright flame, leaving a bulky charcoal.—3. Its solution is absolutely neutral to test paper.—4. Concentrated sulphuric acid causes it to agglutinate into resin-like lumps, with the accession of an intense blood-red colour.—5. When its aqueous solution is mixed with some hydrochloric acid, or dilute sulphuric acid, and the mixture is boiled for a short time, the liquid suddenly becomes turbid, and deposits *saliretine*, under the form of a granular crystalline precipitate. This is characteristic.—6. No reagent precipitates salicine without decomposition. See *Salicylic* and *Salicylous Acid.*

SALICYDES. Syn. *Hydrosalicylates, Salicylites?* Compounds of salicyle with the metals, &c. See *Salicylous Acid.*

SALICYLE. Syn. *Salicule.* A compound salt-radical, forming the basis of the so-called *salicyl-compounds*, or *salicyl-series.* It is known only in combination. The volatile oil of meadow-sweet is a natural *hydride* or *hydruret of salicyle*, a substance which, when artificially prepared, is better known under the name of *hydrosalicylic* or *salicylous acid.* (See *p.* 875, 1027, and *below.*)

SALICYLIC ACID. Syn. *Saliculic Acid.* A peculiar volatile, crystallizable acid, discovered by Piria. It is *obtained* by fusing *salicylous acid* with *solid hydrate of potassa* in slight excess, until the mixture turns white and gas is disengaged, and treating a solution of the residuum with *hydrochloric acid*, in slight excess, to separate the potash; the *salicylic acid* separates in crystals, which are purified by solution in hot water. It may *also* be *obtained* from the *oil of partridge-berry* (gaultheria procumbens), by acting on it with a *strong* and *hot solution of potassa*, and afterwards separating the acid as before. This oil is true *salicylic ether* or *salicylate of oxide of ethyle.* (See *p.* 876.) In its general properties *salicylic acid* closely resembles benzoic acid.

SALICYLOUS ACID. Syn. *Hydrosalicylic Acid, Hydride of Salicyle, Hydruret of do., Saliculous Acid, Hydruret of Spiroyle.* A nearly colourless, oily, inflammable liquid, discovered by Pagenstecher in the volatile oil of spiræa ulmaria (*meadow-sweet*), which, when pure, entirely consists of it; and by Piria, as a product of the decomposition of salicine.

Prep. 1. The *oil of meadow-sweet* is mixed with *a strong solution of caustic potassa*, and the yellow crystalline mass which separates on agitation is purified by pressure between folds of *bibulous paper*, and re-crystallization from alcohol; the resulting crystals (*salicylide of potassium*) are then decomposed by the addition of *dilute sulphuric acid*, the *floating oil* separated from the water, and freed from moisture by careful distillation from *chloride of calcium.*

2. (From *Salicine,*) See *p.* 875. The *product* is 25%. (Ettling.)

Prop., &c. Salicylous acid, or, more correctly, *hydrosalicylic acid*, is soluble in ether and alcohol, and slightly so in water, to which it imparts its peculiar fragrance, and the characteristic property of striking a deep violet colour with the sesquisalts of iron. It is distinguished from salicylic acid, which also exhibits this reaction, by its liquid form, and odour.

Hydrosalicylic acid combines with the bases to form *hydrosalicylates*, which are true *salicylides* (salicylites,) of which the following are the principal:—*Salicylide of ammonium;* unstable yellow needles:—*Salicylide of barium;* yellow acicular crystals slightly soluble in cold water:—*Salicylide of copper;* a green insoluble powder, yielding some curious products by destructive distillation:—*Salicylide of potassium;* large, square, golden-yellow tables, permanent in the air when dry, and soluble in both

water and alcohol with an alkaline reaction. It also forms several highly interesting compounds with *iodine*, *bromine*, *chlorine*, *&c.* (See *above.*)

SALIFIABLE BASES. Substances which by combination with the acids, &c., form salts.

SALIGENINE. A substance formed, along with grape sugar, by the action of the *emulsion* or *synaptase of sweet almonds*, or of *dilute acids*, on *salicine*. It forms colourless, pearly scales, which are freely soluble in water, alcohol, and ether; it melts at 180° Fahr., and is decomposed at a higher temperature. When boiled in dilute acids it is converted into a resinous looking substance, called *saliretine*. Its aqueous solution strikes a deep blue with the sesquisalts of iron. *Chlorosaligenine*, *bichlorosaligenine*, and other interesting compounds have been formed.

SALIRETINE. See *Salicine* (and *above.*)

SALIVA. See *Mastication.*

SALMON. Syn. *Salmo*,—Lat. The *salmo salar* (Linn.), a well-known, soft-finned abdominal fish. Its normal locality is at the mouth or estuary of the larger rivers of the northern seas, which, during the breeding season, it ascends, sooner or later, in the summer months, against all obstacles, for the purpose of depositing its spawn.

The *salmon* is an excellent and highly esteemed fish; but it is rich, oily, and difficult of digestion, and, therefore, ill adapted to the delicate or dyspeptic. When *pickled*, *salted*, or *smoked*, it is only fitted for persons of very strong stomachs, although in this state it is regarded as a great delicacy by epicures.

Salmon is preferably *cooked* by boiling. One weighing 10 *lb.* will require to be *gently simmered* for about an hour, reckoning from the time the water commences boiling. For fish of other weights from 6 to 7 minutes per *lb.* may be allowed. See *Fish*, *&c.*

SALOOP. *Sassafras* (chips) *tea*, flavoured with *milk* and *sugar*. A wholesome and useful drink in cutaneous and rheumatic affections. See *Salep.*

SALT. Syn. *Sal*,—Lat. *Sel*,—Fr. A compound of an acid with an alkali or a salifiable base, or of bromine, chlorine, fluorine, or iodine, with a metal. The names of the salts are derived from the acids which they contain, followed by that of the base; as *sulphate of soda*, a compound of sulphuric acid and soda; *sulphite of lime*, a compound of sulphurous acid and lime. *Neutral salts* are such as contain 1 eq. each of acid and base; *basic*, or *sub-salts*, such as contain 2 or more atoms of base to one of acid; *acid*, or *supersalts*, such as contain more than 1 eq. of acid.

Double salts are combinations of two salts of the same acid, but of different bases, which crystallize together. *Hydrous* or *hydrated salts*, are such as contain water of crystallization, or combined water; *anhydrous salts*, those that are destitute of water. *Deliquescent salts* are those that attract moisture from the atmosphere; *efflorescent salts*, such as part with their combined water, and become opaque and pulverulent, under like circumstances. The salts formed by the direct union of the *archæal elements*, bromine, chlorine, iodine, &c., of which culinary salt and iodide of potassium are well-known examples, are termed *haloid salts*. The *salts* of the *hydracids* belong to this class. *Oxy-salts*, are those, which like nitrate of potassa (nitre) and sulphate of magnesia (Epsom salt), are supposed to be simple combinations of an acid with an oxide or base. *Sulphur-salts* are such as contain sulphur in the place of oxygen; and which are usually formed by the union of a protosulphuret of an alkaline metal (*sulphur base*) with a higher sulphuret of a non-metallic substance or of a metal whose protoxide is a feeble base (*sulphur-acid*). The name *ternary salt* has been applied to those which consist of two single members of one class, and one member of another; such as the boro-fluorides, hydrargyro-chlorides, sodio-chloride of gold, &c.

The *salts* are a most important class of bodies, and their applications and uses in the arts of life and civilization are almost infinite. See *Nomenclature*, *Pulverization*, *&c.*

SALT (Bitter Purging). See *page* 738.

SALT (Cathartic). Of *Glauber*, sulphate of soda; *English* or *bitter do.*, sulphate of magnesia.

SALT (Common), *Culinary do.* Chloride of sodium.

SALT (Diuretic). Acetate of potash.

SALT (Epsom). See *page* 738.

SALT (Febrifuge). Chloride of potassium.

SALT (Fusible). Phosphate of ammonia.

SALT (Glauber's). Sulphate of soda.

SALT (Macqueer's). See *page* 1033.

SALT (Microcosmic). See *page* 786.

SALT (RED). *Common salt* wetted with an *infusion of beet-root* or *cochineal*, or *tincture of red sanders wood*, then dried, and rubbed through a sieve. *Used* to impart a colour to gravies, &c. *Infusion of saffron* also gives a beautiful colour for this purpose. It has been proposed to colour

Epsom salt in this way to distinguish it from oxalic acid.

SALT (Rochelle). Potassio-tartrate of soda.

SALT (Sea). Chloride of sodium.

SALT (Sedative). See *page* 150.

SALT (Sore-throat.) See *page* 1116.

SALT (Tasteless). Phosphate of soda.

SALT (Vegetable). Tartrate of potash.

SALT (Volatile). See *page* 58.

SALT OF AMBER. Succinic acid.

SALT OF BENZOIN. Benzoic acid.

SALT OF HARTSHORN. Carbonate of ammonia.

SALT OF LEMONS. Syn. *Sal Limonum*, —Lat. Citric acid. That sold in the shops for the *removal* of *ink-spots from linen*, is *binoxalate of potash*, either alone, or mixed with one half of its weight of *cream of tartar*. (See *p.* 1042.)

SALT OF SORREL. See *pages* 1041-2.

SALT OF STEEL. Sulphate of iron.

SALT OF TARTAR. See *page* 1033.

SALT OF VITRIOL. Sulphate of zinc.

SALT OF WORMWOOD. See *page* 1033.

SALTPETRE. Nitrate of potassa.

SALTS (Cheltenham). See *Mineral Waters.*

SALTS (Harrowgate). See *Mineral Waters.*

SALTS (Smelling). Syn. *Sal Volatilis Oleosus*,—Lat. Sesquicarbonate of ammonia commonly passes under the name of *smelling salts*, and, with the addition of a few drops of essential oil, is frequently employed to fill "*smelling bottles*;" but when a strong and durable pungency is desired, the *carbonate* should alone be used, as in one or other of the following formulæ:—

1. *Carbonate* (not sesquicarbonate) *of ammonia*, 1 *lb.*; *oil of lavender* (Mitcham), 2 *oz.*; *essence of bergamot*, 1 *oz.*; *oil of cloves*, ¼ *oz.*; rub them together, and sublime; keep the product in well-stopped bottles.

2. *Carbonate of ammonia*, 1 *lb.*; *oil of lavender*, 2 *oz.*; *oils of bergamot* and *lemon*, of each, 1 *oz.*; as the last.

3. *Carbonate of ammonia*, ½ *lb.*; *essence of bergamot*, 1 *oz.*; *oil of verbena*, ¼ *oz.*; *otto of roses*, 1 dr.; as before.

4. *Carbonate of ammonia*, ¾ *lb.*; *essences of bergamot* and *lemon*, of each, ½ *oz.*; *essence de petit grain*, ¼ *oz.*: *oil of cloves*, 1 dr.; as before.

5. *Carbonate of potash* and *sal ammoniac*, of each, 8 *oz.*; powder, add of *leaves of Syrian herb mastich* (*marum Syriacum*), ½ *oz.*; *rectified spirit*, ½ pint; (holding in solution) *oil of cinnamon*, 20 gr.; *oils of cloves* and *nutmeg*, of each, ½ dr.; *oils of sweet marjoram, lemon*, and *orange*, of each, 1 dr.; triturate together, then distil by a very gentle heat, and stop the process as soon as the liquid that rises begins to dissolve the salt.

6. (*Extemporaneous.*)—*a.* From *sal ammoniac*, 1 dr.; *pure potassa*, 3 dr.; grind them together, and add of *essence of lemons*, 15 drops; *oil of cloves*, 3 or 4 drops.—*b.* From *carbonate* or *sesquicarbonate of ammonia* (bruised), q. s.; *volatile ammoniacal essence*, a few drops. (See *p.* 395.)

According to Dr. Paris, *Godfrey's Smelling Salts* are made by re-subliming *volatile salt* with *subcarbonate of potash*, and a little *spirits of wine* (and *essential oil*).

SALTING, or *pickling*, is an easy method of *preserving butcher's meat, fish*, and, indeed, *most animal substances*. It is performed in two ways:—

1. *Dry salting*. This, as practised in Hampshire, Yorkshire, and in various *large establishments* elsewhere, consists in merely well rubbing ordinary *culinary salt*, mixed with a little *saltpetre*, into the meat, until every crevice is thoroughly penetrated, and, afterwards, sprinkling some over it, and placing it on a board or in a trough, in such a manner that the brine may drain off. On the *small scale*, in private families, a mixture of *salt*, 2 *lb.*, with *saltpetre*, 1½ or 2 *oz.*; either with or without about an *oz.* of *good moist sugar*, is commonly used for the purpose, and imparts a fine flavour to the meat. In both cases the pieces are turned every day, or every other day, until sufficiently cured, a little *fresh salt* being added as required. *Sometimes* the *fresh meat* is packed *at once* in casks, with the best *coarse-grained* or *bay-salt*. This method is that commonly adopted for sea stores.

2. *Wet salting* or *pickling in brine*. When the meat is allowed to lie in the liquor that runs from it (see *above*), or is at once plunged into strong *brine*, it is said to be *pickled* or *wet salted*. On the *small scale*, this is most conveniently performed by rubbing the *fresh meat* with *salt*, *&c.*, as above, and after it has lain a few hours, putting it into a pickle formed by dissolving about 4 *lb.* of *good salt* and 2 *oz.* of *saltpetre* in 1 gall. of *water*, either with or without the addition of ½ to 1 *lb.* of *moist sugar*. This pickling liquor gets weaker by use, and should, therefore, be occasionally boiled down a little, and skimmed, at the same time adding some more of the dry ingredients. Three to ten days, depending on the size, is sufficiently long to keep the meat in the brine. When it is taken out it

should be hung up to dry, after which it may be packed in barrels with *coarse-grained salt*, or *smoked*, whichever may be desired. Saltpetre added to brine gives the meat a red colour, and brown sugar improves the flavour.

The sooner animal substances, more especially flesh, are salted after being killed, the better, as they then possess considerable absorbent power, which they gradually lose by age. See *Putrefaction*, *Scurvy*, *Smoking*, *&c.*

SALVE. A name indiscriminately applied by the vulgar to any consistent, greasy preparation used in medicine.

SALVE (Lip). Syn. *Ceratum Labiale*, —Lat. *Prep.* 1. (*Red* or *Peruvian.*) From *spermaceti ointment*, ½ *lb.*; *alkanet root*, ½ *oz.*; melt them together until sufficiently coloured, strain, and when the strained fat has cooled a little, add of *balsam of Peru*, 3 *dr.*; stir well, and in a few minutes pour off the clear portion from the dregs; lastly, stir in of *oil of cloves*, 20 or 30 drops. This never gets rancid.

2. (*Rose.*) See *Cerates.*

3. (*White.*) From the finest *spermaceti ointment* or *cerate*, 3 *oz.*; *finely powdered white sugar*, 1 *oz.*; *neroli* or *essence de petit grain*, 10 or 12 drops, or q. s.

Obs. Numerous formulæ are extant for lip-salves, as for other like articles, but the preceding are those generally employed in trade. The perfumes may be varied at will, and the salve named after them. A very small quantity of *finely powdered borax* is occasionally added. *French lip-salve* is said to contain alum, in fine powder; and *German lip-salve* is said to be made of cocoa-nut butter, scented with essence of Portugal. See *Cerates*, *Pommades*, and *Ointments.*

SAND. Syn. *Arena*,—Lat. River and sea sand consist chiefly of finely divided siliceous matter, mixed, occasionally, with carbonate of lime. That of Lynn and Alum Bay is nearly pure silex, and is, therefore, selected for the manufacture of glass. Sand is used by *moulders* in metal, and as *manure* for heavy land. It is a large and necessary portion of every fertile soil.

SANDAL WOOD. Syn. *Red Sanders Wood*, *Red Saunders do.*; *Lignum Santali Rubri*; *Lignum Santalinum Rubrum*; *Pterocarpus*,—Ph. L. & E. The *wood* of *pterocarpus santalinus.* It is used in medicine as a colouring matter. It is also employed in *dyeing*, and to stain *varnishes.* Wool may be dyed a *carmine red* by dipping it alternately into an *infusion of this wood*, and an *acidulous bath.* (Trommsdorff.) Prepared with a *mordant of alum and tartar*, and then dyed in a *bath of sandal wood and sumach*, it takes a *reddish yellow.* (Bancroft.)

Obs. The colouring principle of red sanders wood is called "*santaline*," and may be obtained as a reddish resinous mass by evaporating its alcoholic infusion, or by digesting the rasped wood in ammonia water, and then precipitating it with an acid. Its spirituous solution gives a rich purple precipitate with *protochloride of tin*, and a violet one with *acetate of lead.*

White sandal wood (white sanders; santalum album) is the young timber, or according to others, the outside wood of *santalum album* (Linn.) *Yellow sandal wood* (santalum citrinum, s. flavum) is the old timber, or, according to others, the heart of the same tree. Both are much esteemed on account of their fragrance, and yield a valuable essential oil.

SANDARACH. Syn. *Sandrac*, *Gum do.* Obtained from the *thuja articulata*, a coniferous tree growing in Africa. It is slightly fragrant, is freely soluble in rectified spirit, and has a sp. gr. of 1·05 to 1·09. It is used as incense, pounce, in varnishes, &c.

SANDERS WOOD. See *Sandal Wood.*

SANDIVER. Syn. *Glass Gall*; *Fel Vitri*, *Sal Vitri*,—Lat. The saline scum that swims on glass when first made. It is occasionally used in tooth-powders.

SANDYX. See *Red Pigments.*

SANGUINARINE. Obtained from the *root* of *sanguinaria Canadensis* (Linn.) or *blood-root*, by digesting it in *anhydrous alcohol*, precipitating by *liquor of ammonia*, washing the red precipitate in *water*, boiling it with *water* and *animal charcoal*, filtering, and digesting the *solid portion* in *alcohol*; the resulting tincture, by distillation, yields a pearl-gray or yellowish substance which is *sanguinarine.* It excites sneezing, and is turned red by acids.

SANTALINE. See *Sandal Wood.*

SANTONINE. Syn. *Santonic Acid*; *Santoninum*,—Lat. The crystalline and characteristic principle of the seed of several varieties of artemisia.

Prep. 1. (M. Galloud.) Boil *worm-seed* (semen cynæ, semen contra) in *water* with *milk of lime*; strain, press, boil the *marc* with more *water*, and again press; mix the decoctions, and when clear, concentrate the liquor by evaporation; strain, further evaporate, pour it into an earthen vessel, and add *hydrochloric acid*, in slight excess; after 24 hours, collect the precipitate, wash it with a little very weak *spirit*, press, and dry it.

2. (Ph. Baden. 1841.) Take of *worm-seed*, 4 parts; *hydrate of lime*, 1½ part; mix, and exhaust them with *alcohol* of 90%; distil off 3-4ths of the spirit, and evaporate the remainder to one half, which at the boiling temperature is to be mixed with *acetic acid* in excess, and *afterwards* with *water;* on repose *impure santonine* subsides; wash this with a little *weak spirit*, then dissolve it in *rectified spirit*, 10 parts, decolour by ebullition for a few minutes with *animal charcoal*, and filter; the *filtrate* deposits colourless crystals of *santonine* as it cools; these are to be dried, and kept in opaque bottles.

Prop., &c. Prismatic or tabular crystals; inodorous; tasteless, or only slightly bitter; fusible; volatilizable; soluble in 4500 parts of cold, and about 200 parts of boiling water; soluble in cold alcohol and ether; freely soluble in hot alcohol. It is much esteemed as "*a tasteless worm medicine*," and is especially adapted to remove *lumbricales* (large round worms). *Dose.* 6 to 18 or 20 gr., repeated night and morning, followed by a brisk purge.

SAPAN WOOD. See *page* 159.

SAP GREEN. See *Green Pigments.*

SAPONIFICATION. See *Soap.*

SAPONINE. Syn. *Saponinum*,—Lat. A white, non-crystallizable substance, obtained by the action of *hot alcohol* on the *root* of *saponaria officinalis* (Linn.) or *soap wort*. It separates as the solution cools, and may be purified, by re-solution, and digestion with a little *animal charcoal.*

Prop., &c. Saponine is soluble in water, and the solution froths strongly on agitation. The smallest quantity of the powder causes violent sneezing. By the action of acids and alkalies it is converted into a white powder termed "*saponic acid*," which is soluble in alcohol. Another substance absurdly called saponine is noticed at *page* 505.

SAPPHIRE. See *Gems* and *Pastes.*

SARCOCOLLA. The *inspissated juice* of *penæa mucronata* or *p. sarcocolla*, a tree growing in Arabia and Persia. It somewhat resembles gum arabic, except in being soluble in both water and alcohol; and in having a bitter-sweet taste. It was formerly used in surgery.

SARCOCOLLINE. The peculiar principle of sarcocolla, obtained by evaporating either its clear *aqueous* or *alcoholic solution.*

SARCOSINE. Syn. *Sarcomide.* A basic substance, obtained by boiling *kreatine* for some time with a *solution of pure baryta.* It forms colourless, transparent plates, freely soluble in water, sparingly so in alcohol, and insoluble in ether; it may be fused, and volatilized. With sulphuric acid it unites to form a crystallizable salt (*sulphate of sarcosine*).

SARDONYX. See *Gems.*

SARSAPARILLA. Syn. *Radix Sarzæ, Radix Sarsaparillæ; Sarza*,—Ph. L. & E. *Sarsaparilla*,—Ph. D. & U. S., & Ph. E. 1817. "Jamaica sarza. The *root* of *smilax officinalis*, Kunth" (Ph. L.); "and probably of other species." (Ph. E.)

The *sarsaparillas* of *commerce* are divided by Dr. Pereira into two classes:—"*Mealy sarsaparillas*" and "*Non-mealy sarsaparillas.*" In the *first* are placed *Brazilian* or *Lisbon*, *Caraccas* or *gouty Vera Cruz*, and *Honduras;* the *second* includes *Jamaica*, *Lima*, and *true Vera Cruz.*

The *mealy sarsaparillas* are distinguished by "the mealy character of the inner cortical layers, which are white or pale-coloured. The meal or starch is sometimes so abundant, that a shower of it, in the form of white dust, falls when we fracture the roots." The medulla or pith is also frequently very amylaceous.

The *non-mealy sarsaparillas* "are characterised by a deeply coloured (red *or* brown), usually non-mealy cortex. The cortex is red, and much thinner than in the mealy sorts." "If a drop of *oil of vitriol* be applied to a transverse section of the root of the non-mealy sarsaparillas, *both cortex* and *wood* acquire a *dark-red* or *purplish tint;*" whilst in the *preceding varieties*, the mealy coat, and, sometimes, the pith, is but little altered in colour. "The *decoction* of *non-mealy* sarsaparilla, when cold, is somewhat darkened, but does *not yield* a *blue* colour when a solution of iodine is added to it." The *aqueous extract*, when rubbed down with a little cold distilled water in a mortar, *does not* yield a *turbid* liquid, *nor* become *blue* on the addition of iodine. The *reverse* is the case with the decoction and extract of the mealy varieties.

The *Jamaica*, *red Jamaica*, or *red-bearded sarsaparilla* (Sarza Jamaicensis,—Ph. L.) is the variety which should *alone* be used in medicine. This kind yields from 33 to 40% of its weight of extract, (Battley, Hennell, Pope), and contains less starchy matter than the other varieties. It is distinguished, by exhibiting the above peculiarities in a marked degree, by the dirty reddish colour of its bark, which "is not mealy," and by being "beset very plentifully with rootlets" (fibres),—Ph. L. Its powder has also a pale reddish brown colour. The other varieties of sarsaparilla, viz.—the *Lisbon*, *Lima*, *Vera Cruz*, and *Honduras*, are frequently substituted for

the *Jamaica* by the druggists in the preparation of the decoctions and extracts of this drug; but the products are vastly inferior in *quantity*, *colour*, *taste*, and *medicinal virtue*, to those prepared from the officinal sarsaparilla. Decoction of sarsaparilla when made with the Honduras root, is very liable to ferment, even by a few hours' exposure, in hot weather. We have seen hogsheads of the strong decoction, after exposure for a single night, in as active a state of fermentation as a *gyle of beer*, with a *frothy head*, and evolving a most disagreeable odour, that was not wholly removed by several hours' boiling. When this occurs the decoction suffers in density, and the *product* in *extract* is, consequently, *considerably lessened*. Yet this is frequently allowed to occur in the wholesale laboratory, where the *rule* should be—*always begin a "batch of sarza"* (as it is called,) and, indeed, of other perishable articles, *early in the morning, and finish it*, COMPLETELY *and* ENTIRELY, *the* SAME DAY.

Sarsaparilla has been recommended as a mild but efficacious alterative diaphoretic, and tonic. It has long been a popular remedy in chronic rheumatism, rheumatic and gouty pains, scurvy, scrofula, syphilis, secondary syphilis, lepra, psoriasis, and several other skin diseases; and, especially, in cachexia, or a general bad-habit of body, and to remove the symptoms arising from the injudicious use of mercurials, often falsely called "secondary syphilis." During its *use* the skin should be kept warm, and *diluents* should be freely taken. Its efficacy has been greatly exaggerated. It is, however, much more effective in warm, than in Northern climates. *Dose.* In substance, ½ to 1 dr., three or four times daily; but, preferably, made into a decoction or infusion.

The articles recently so much puffed under the names of *American* or *United States sarsaparilla* and *extract of sarsaparilla* are "nothing more than the decoction of a common herb, a sort of 'aralia,' inhabiting the swamps and marshes of the United States. When cut up it has the appearance of *chaff*, but not the slightest resemblance in character, colour, or taste, to even the most inferior species of smilax (or sarza). The decoction, or I may say, cabbage water, according to the taste of it in the first stage, is sweetened with a little sugar, flavoured with benzoin (and sassafras), and finally, preserved from decomposition, by means of the bichloride of mercury." "I have heard of several cases of deadly sickness, and other dangerous symptoms following its use." "We do not believe that a particle of real sarsaparilla ever entered into the composition of either of the articles referred to." (Med. Circ., ii, 227.) See *Decoctions* and *Extracts.*

SARSAPARILLINE. Syn. *Parigline; Parilline,* — Pallotta. *Parillinic Acid,* — Bakta. *Salseparine; Smilacine,* — Folchi. A white, crystallizable, odourless, and nearly tasteless substance, discovered by Pallotta and Folchi, in *sarsaparilla.*

Prep. The *bark* of *Jamaica sarsaparilla* is treated with *hot rectified spirit*, and the resulting tincture reduced to about one third by distilling off the spirit; the residual liquid is then filtered, whilst boiling, slightly concentrated by evaporation, and set aside to crystallize; the crystalline deposit is redissolved in either *hot rectified spirit* or *boiling water*, and decoloured by agitation with a little *animal charcoal;* the *filtrate* deposits crystals of nearly pure *smilacine* as it cools. It may also be extracted by boiling water.

Prop., &c. By some, this substance has been regarded as a weak acid; by others, as an alkaloid or base, which its general characters would indicate to be correct. Water holding a very small quantity of it in solution, froths considerably on agitation. This is especially the case with infusion of Jamaica sarsaparilla, and this property has consequently been proposed as a test of the quality of sarsaparilla root. Its medicinal properties are similar to those of sarsaparilla. According to Pallotta, it is a powerful sedative, and diminishes the vital energies in proportion to the quantity taken. *Dose.* 2 to 10 gr.; in the usual cases in which the root is given.

SASSAFRAS. Syn. *Sassafras Radix; Sassafras,*—Ph. L. E. & D. "The *root* of *sassafras officinale*, Nees. (*Laurus sassafras*, Linn.)"—Ph. L. It has a fragrant odour, and a sweetish aromatic taste. It has long been reputed a stimulating alterative, diaphoretic, diuretic, and tonic; and an *infusion* of the chips (*sassafras chips*), under the name of *sassafras tea*, has been a popular "diet drink" in various cutaneous affections, gout, chronic rheumatism, &c.

SASSOLINE. Native boracic acid.

SATIN. See *Silk.*

SATURATION. The state in which a body has taken its full dose, or chemical proportion, of any other substance with which it can combine, or which it can dissolve; as *water* with sugar or a salt, or an *alkali* with an acid, when the properties of both are neutralized.

SAUCERS (Blue). *Prep.* From *blue carmine*, made into a paste with *gum water*, which is then spread over the inside of the saucers, and dried.

SAUCERS (Pink). *Prep.* 1. From *pure rouge* mixed with a little *carbonate of soda*, then made into a paste with *thin gum water*, and applied as the last.

2. *Well-washed safflower*, 8 *oz.*; *carbonate of soda*, 2 *oz.*; *water*, 2 gallons; infuse, strain, add of *French chalk* (scraped fine with Dutch rushes), 2 *lb.*; mix well, and precipitate the colour by adding a *solution of tartaric acid*; collect the red powder, drain it, add a very small quantity of *gum*, and apply the paste to the saucers. Inferior. Both the above are used to tinge silk stockings, gloves, &c.

SAUCES. Liquid or semi-liquid condiments or seasoning for food. The following may be useful to the reader:—

Anchovy Sauce.—1. (Extemporaneous.) From 3 or 4 *anchovies*, chopped small; *butter*, 3 *oz.*; *water*, a wine-glassful; *vinegar*, 2 table-spoonfuls; *flour*, 1 do.; stir them over the fire till it thickens, then rub it through a coarse hair-sieve.

2. (Wholesale.) As *essence of anchovies* (p. 385). Other *fish sauces* may be made in the same manner.

Apple Sauce. From *sharp apples*, cored, sliced, stewed with a spoonful or two of *water*, and then beaten to a perfectly smooth pulp with a little good *moist sugar*. Tomato, and many other like sauces, may be made in the same manner.

Sauce Aristocratique. From *green-walnut juice* and *anchovies*, equal parts; *cloves*, *mace*, and *pimento*, of each, bruised, 1 dr. to every *lb.* of juice; boil and strain, then add to *every pint*, 1 pint of *vinegar*; ½ pint of *port wine*; ¼ pint of *soy*; and a few *shallots*; let the whole stand for a few days, and decant the clear liquor.

Bechamel. A species of fine *white broth* or *consommée*, thickened with *cream*, and used as "white sauce."

Caper Sauce. Put twelve table-spoonfuls of *melted butter* into a stewpan, place it on the fire, and when on the point of boiling, add one *oz.* of *fresh butter* and one table-spoonful of *capers*; shake the stewpan round over the fire until the butter is melted, add a little *pepper* and *salt*, and serve where directed. Also as *Mint Sauce.*

Chetney Sauce, Quihi do. From *sour apples* (pared and cored), *tomatoes*, *brown sugar*, and *sultana raisins*, of each, 8 *oz.*; *common salt*, 4 *oz.*; *red chillies* and *powdered ginger*, of each, 2 *oz.*; *garlic* and *shallots*, of each, 1 *oz.*; pound the whole well, add of *strong vinegar*, 3 quarts; *lemon juice*, 1 do.; and digest, with frequent agitation, for a month; then pour off nearly all the liquor, and bottle it. *Used* for fish or meat, either hot or cold, or to flavour stews, &c. The residue is the "*Chetney*" or "*Chitni*," which must be ground to a smooth paste with a stone and muller, and then put into pots or jars. It is used like mustard.

Bengal Chitni. As the last, but using *tamarinds* instead of apples, and only sufficient *vinegar* and *lemon juice* to form a paste.

Coratch. From good *mushroom ketchup*, ½ gall.; *walnut ketchup*, ¾ pint; *India soy* and *chillie vinegar*, of each, ½ pint; *essence of anchovies*, 5 or 6 *oz.*; macerate for a fortnight.

Sauce Epicurienne. To the last add of *walnut ketchup* and *port wine*, of each, 1 quart; *garlic* and *white pepper*, of each (bruised), 4 *oz.*; *chillies* (bruised), 1 *oz.*; *mace* and *cloves*, of each, ½ *oz.*

Fish Sauce. From *port wine*, 1 gall.; *mountain do.*, 1 quart; *walnut ketchup*, 2 quarts; *anchovies* (with the liquor), 2 *lb.*; 8 *lemons*; 48 *shallots*; *scraped horseradish*, 1½ *lb.*; *flour of mustard*, 8 *oz.*; *mace*, 1 oz.; *cayenne*, q. s.; boil the whole up gently, strain, and bottle.

Ketchup. See *page* 661-2.

Kitchener's Sauce, Kitchener's Relish. From *salt*, 3 *oz.*; *black pepper*, 2 *oz.*; *allspice*, *horseradish*, and *shallots*, of each, 1 *oz.*; *burnt-sugar colouring*, a wine-glassful; *mushroom ketchup*, 1 quart; (all bruised or scraped;) macerate for 3 weeks, strain, and bottle.

Lemon Pickle. From *lemon juice* and *vinegar*, of each, 3 gall.; *bruised ginger*, 1 *lb.*; *allspice*, *pepper*, and *grated lemon peel*, of each, 8 *oz.*; *salt*, 3½ *lb.*; *cayenne*, 2 *oz.*; *mace* and *nutmegs*, of each, 1 oz.; digest for 14 days.

Lobster Sauce. From *lobsters*, as anchovy sauce.

Mint Sauce. From *garden mint*, chopped small, and then beaten up with *vinegar*, some *moist sugar*, and a little *salt* and *pepper.*

Onion Sauce. From *onions* boiled to a pulp, and then beaten up with *melted butter*, and a little *warm milk.*

Oyster Sauce. From about 12 *oysters*, and 6 or 7 *oz.* of *melted butter*, with a little *cayenne pepper*, and 2 or 3 spoonfuls of *cream*, stirred together over a slow fire, then brought to a boil, and served.

Sauce Piquante. From *soy* and *cayenne pepper*, of each, 4 *oz.*; *port wine*, ½ pint; *brown pickling vinegar*, 1½ pint; mix,

and let them stand for 7 or 8 days before bottling.

Quin's Sauce. From *walnut pickle*, and *port wine*, of each, 1 pint; *mushroom ketchup*, 1 quart; *anchovies* and *shallots* (chopped fine), of each, 2 dozen; *soy*, ½ pint; *cayenne*, ¼ *oz.*; simmer gently for 10 minutes, and in a fortnight, strain, and bottle.

Sauce au Roi. From *brown vinegar* (good), 3 quarts; *soy* and *walnut ketchup*, of each, ½ pint; *cloves* and *shallots*, of each, 1 doz.; *cayenne pepper*, 1½ *oz.*; mix, and digest for 14 days.

Shrimp Sauce. From *shrimps* or *prawns*, as anchovy sauce.

Soy. See that article.

Sauce Superlative. From *port wine* and *mushroom ketchup*, of each, 1 quart; *walnut pickle*, 1 pint; *soy*, ½ pint; *pounded anchovies*, ½ *lb.*; *fresh lemon peel*, *minced shallots*, and *scraped horseradish*, of each, 2 *oz.*; *allspice* and *black pepper* (bruised), of each, 1 *oz.*; *cayenne pepper* and *bruised celery seed*, of each, ¼ *oz.*; (or *currie powder*, ¾ *oz.*); digest for 14 days, strain, and bottle. Very relishing.

Tomato Sauce. From *bruised tomatoes*, 1 gall.; *good salt*, ½ *lb.*; mix, in 3 days press out the juice, to each quart of which add of *shallots*, 2 *oz.*; *black pepper*, 1 dr.; simmer very gently for 20 to 30 minutes, strain, and add to the *strained liquor*, *mace*, *allspice*, *ginger*, *nutmegs*, and *cochineal*, of each, ¼ *oz.*; *coriander seed*, 1 dr.; simmer gently for 10 minutes, strain, cool, and in a week put it into bottles.

Waterloo Sauce. From *strong vinegar* (nearly boiling), 1 quart; *port wine*, ¾ pint; *mushroom ketchup*, ½ pint; *walnut do.*, ¼ pint; *essence of anchovies*, 4 *oz.*; 8 *cloves of garlic*; *cochineal* (powdered), ½ *oz.*, (or *red beet*, sliced, 3 *oz.*); let them stand together a fortnight or longer, occasionally shaking the bottle.

White Sauce, Butter do., Melted Butter. From *good butter*, 4 *oz.*; *cream*, 2½ *oz.*; *salt* (in very fine powder), ½ tea-spoonful; put them into a pot or basin, set this in *hot water*, and beat the whole with a bone, wooden, or silver spoon, until it forms a perfectly smooth cream-like mixture, avoiding too much heat, which would make it run "oily." A table-spoonful of *sherry*, *marsala*, *lemon-juice*, or *vinegar*, is sometimes added; but the selection must depend on the dishes the sauce is intended for. *Used* either by itself, or as a basis for other sauces. Beaten up with any of the "bottled sauces," an excellent compound sauce of the added ingredient is immediately obtained.

Obs. The cautions given under pickles (*p.* 974) also apply here. A variety of other sauces may be made by the judicious use of the ingredients employed in those noticed above, and by the addition of any other flavouring substances, according to the palate of the manufacturer. The *peculiar flavour* of some of the most popular sauces of the shops is imparted to them by means of scorched saw-dust; and an *empyreumatic* or *smoky flavour* to others, by the addition of a little crude pyroligneous acid, or a drop or two of creasote, or by allowing a little of the vinegar to stand over some Barbadoes tar for a day or two. The reader will distinguish between those sauces which are merely intended for present use, and those which are intended for bottling. The more noted *advertised sauces* present a great sameness of flavour, and would be generally considered very inferior if the bottles containing them were divested of their showy labels.

SAUR KRAUT. *Prep.* Clean *white cabbages*, cut them into small pieces, and stratify them in a cask along with *culinary salt*, and a few *juniper berries* and *caraway seeds*, observing to pack them down as hard as possible, without crushing them, and to cover them with a lid pressed down with a heavy weight. The cask should be placed in a cold situation as soon as a sour smell is perceived. Used by the Germans and other northern nations of Europe, like our "*pickled cabbage*," but more extensively.

SAUSAGES. From the *fat* and *lean of pork* (pork sausages), or of *beef* (beef sausages), chopped small, flavoured with *spice*, and put into *gut skins*, or pressed into *pots* or *balls* (sausage meat). *Crumb of bread* is also frequently added. Their quality is proportionate to that of the ingredients, and to the care and cleanliness employed in preparing them.

SAVELOYS. *Prep.* (Mrs. Rundell.) "Take of *young pork*, free from bone and skin, 3 *lb.*; *salt* it with 1 *oz.* of *saltpetre*, and ½ *lb.* of *common salt* for 2 days; then chop it fine, add 3 tea-spoonfuls of *pepper*; 1 doz. *sage leaves*, chopped fine; and 1 *lb.* of *grated bread*; mix well, fill the *skins*, and steam them or bake them half an hour in a slack oven. They are said to be good either hot or cold.

SAVINE. Syn. *Folia Sabinæ*; *Sabina*, —Ph. L. E. & D. "The *recent* and *dried tops* of *juniperus sabina*, Linn.," or common savine. (Ph. L.) It is a powerful stimulant, diaphoretic, emmenagogue, and anthelmintic; and, externally, rubefacient, escha-

rotic, and vesicant. In large doses it is apt to occasion abortion and acts as a poison. *Savine powder* mixed with verdigris is often applied to corns and warts. It is now chiefly used in the form of ointment. *Dose.* 5 to 15 gr., twice or thrice daily, (with care,) in amenorrhœa and worms. (See *p.* 224.)

SAVONETTES. Syn. *Wash Balls.* These are made of any of the mild, toilet soaps, scented at will, generally with the addition of some powdered starch or farina, and sometimes sand. The spherical or spheroidal form is given to them by pressure in moulds, or by first roughly forming them with the hands, and when quite hard, turning them in a lathe. According to Mr. Beasley, "they are formed into spherical balls by taking a mass of the prepared soap in the left hand, and a conical drinking glass with rather thin edges in the right. By turning the glass and ball of soap in every direction the rounded form is soon given; when dry the surface is scraped to render it more smooth and even."

Prep. 1. Take of *curd soap*, 3 *lb.*; *finest yellow soap*, 2 *lb.*; (both in shavings;) *soft water*, ¾ pint; melt by a gentle heat, stir in of *powdered starch* (farina), 1½ *lb.*; when the mass has considerably cooled, further add of *essence of lemon* or *bergamot*, 1 *oz.*; and make it into balls.

2. (*Camphor.*) Melt *spermaceti*, 2 *oz.*; add *camphor* (cut small), 1 *oz.*; dissolve, and add the liquid mass to *white curd-soap*, 1½ *lb.*, previously melted by the aid of a *little water* and a gentle heat, and allowed to cool considerably, as above. These should be covered with *tin-foil.*

3. (*Communes.*) From *soap* (in shavings), 5 *lb.*; *starch*, 2 *lb.*; *essence of orange* or of *citron*, 1 *oz.*; *eau pour la barbe*, ½ gall.; beaten together in the cold.

4. (*Honey.*) From the *finest bright-coloured yellow soap*, 7 *lb.*; *palm oil*, ¼ *lb.*; melt, and add of *oil of verbena*, *rose-geranium*, or *ginger-grass*, 1 *oz.*; as No. 1, Sometimes ½ *oz.* of *oil of rosemary* is also added.

5. (*Mottled.*)—*a.* Red, Cut *white curd* or *Windsor soap* (not too dry), into small square pieces, and roll these in a mixture of *powdered bole* or *rouge*, either with or without the addition of some *starch*; then squeeze them strongly into balls, observing to mix the colour as little as possible.—*b.* Blue. Roll the pieces in *powder-blue*, and proceed as before.—*c.* Green. Roll the pieces in a mixture of *powder blue* and *bright yellow ochre.* By varying the colour of the powder, *mottled savonettes* of any colour may be produced.

6. (*Sand.*) From *soap* (at will), 2 *lb.*; *fine siliceous sand*, 1 *lb.*; *scent*, q. s.; as No. 1. For the finer qualities finely powdered *pumice stone* is substituted for sand.

7. (*Violet.*) From *palm-oil soap*, 4 *lb.*; *farina*, 2 *lb.*; *finely powdered orris root*, 1 *lb.* Sometimes a little *smalts*, or *indigo*, is added.

SCABIES. See *Itch.*

SCAGLIOLA. A species of plaster or stucco, made of *pure gypsum*, with variegated colours, in imitation of marble. In general, the liquid employed is a weak *solution of Flanders glue*; and the *colours*, any which are not decomposed or destroyed by admixture with sulphate of lime, and exposure to the light. The *composition* or *compositions* is often applied upon hollow columns formed of wood, or even of laths nailed together, and the surface, when hard, is turned smooth in a lathe, and polished.

SCALD-HEAD. See *Ringworm.*

SCALDS. See *Burns and Scalds.*

SCALL or *Scald.* The popular name of several skin diseases distinguished by scabs or scurfiness, whether dry or humid. See *Eruptions*, *Ringworm*, &c.

SCAMMONY. Syn. *Scammonium*,—Ph. L. E. & D. The "gum resin emitted from the *cut root*" of "*convolvulus scammonia*," Linn. (Ph. L.) or *Aleppo scammony-plant.*

There are three *principal varieties* or *qualities* of *scammony* known in the market; viz.,—*virgin* (sp. gr. 1·21), *seconds*, (sp. gr. 1·460 to 1·463), and *thirds* (sp. gr. 1·465 to 1·500). The best, and that only intended to be used in medicine, is imported from Aleppo.

Pur. Scammony is not only largely adulterated in the country of its production, but again after its arrival in England. *Smyrna scammony*, a very inferior variety, is also commonly dressed up, and sold as Aleppo scammony. In many cases, substances are sold at the "public sales" in London, and elsewhere, as scammony, which contain only a mere trace of that article. This is all ground up to form the *scammony-powder* of the shops. (Vide *Evid.*, *Com. Ho. Com.*, 1855.) *Pure scammony* has a peculiar cheesy smell, and a greenish gray colour. It is "porous and brittle, and the freshly broken surface shines; hydrochloric acid being dropped on it, it emits no bubbles; nor does the powder digested in water, at a heat of 170° Fahr., become blue by the simultaneous addition of iodide of

potassium and dilute nitric acid. Out of 100 gr., 78 (80,—Ph. E.) should be soluble in ether." (Ph. L.) The tincture of pure scammony is not turned *green* by nitric acid. If the powder effervesce with dilute acids it contains chalk.

Uses, &c. Pure scammony is a powerful drastic purgative and anthelmintic, inadmissible in inflammatory conditions of the alimentary canal, but well adapted for torpid and inactive conditions of the abdominal organs. Associated with calomel, rhubarb, or sulphate of potassa, it is useful in all cases in which an active cathartic or vermifuge may be required, especially for children. *Dose.* (For an adult) 5 to 15 gr., in powder, or made into a bolus, or emulsion.

SCARLATINA. See *Scarlet Fever.*

SCARLET DYE. *Proc.* (Poërner,)—*a.* The *Bouillon.* Take of *cream of tartar*, 1¾ *oz.; water*, q. s.; boil in a block-tin vessel, and when dissolved, add of *solution of tin* (made by dissolving 2 *oz.* of grain tin in a mixture of 1 *lb.* each of nitric acid and water, and 1½ *oz.* of sal ammoniac), 1¾ *oz.;* boil for 3 minutes, then introduce the cloth, boil it for 2 hours, drain it, and let it cool.—*b.* The *Rougie.* Next, take of *cream of tartar*, ¼ *oz.; water*, q. s.; boil, and add *powdered cochineal*, 1 *oz.;* again boil for 5 minutes, then gradually add of *solution of tin*, 1 *oz.*, stirring well all the time; lastly, put in the goods and dye as quickly as possible. The quantities given are those for 1 to 1¼ *lb.* of woollen cloth. The result is a *full scarlet.* To make the colour turn on the *ponceau* or *poppy*, a little turmeric is added to the bath.

SCARLET FEVER. Syn. *Scarlatina,*—*Febris Scarlatina,*—Lat. A highly contagious disease, so named after the peculiar eruption or efflorescence of the skin which accompanies it. The *milder form* of this disease (*scarlatina simplex* or *mitis*) comes on with languor, chilliness alternated by fits of heat, nausea, vomiting (frequently), and other common symptoms of fever; followed, on the third or fourth day, by a scarlet efflorescence upon the skin, which after three or four days ends in the cuticle or scarf-skin peeling off in branny scales. Dropsical swelling of the whole body sometimes follows the disappearance of the eruption; but this, with the febrile symptoms, and the soreness of the throat (if any), then give way, and the patient gradually regains his former health and strength. In the *malignant form* of scarlet fever (*scarlatina cynanchica, anginosa*, or *maligna*) the febrile symptoms, from the first, are more alarming; there is bilious vomiting, great soreness and ulceration of the throat, the pulse is small and quick, and the breathing laborious. These symptoms rapidly increase on the appearance of the eruption; the body then becomes swollen, the nose and eyes inflamed, the breath fœtid, the throat suppurates, putrid symptoms ensue, and the patient is either suddenly cut off, or recovers very slowly.

The *early symptoms* of *scarlet fever* are *distinguished* from those of the *measles* and *small-pox* by the greater extent and want of elevation of the eruption, and by its not congregating into patches. Nor is there the cough and running from the eyes and nose, which ushers in the measles.

The *treatment* of the *milder form* of *scarlet fever*, especially that of childhood, may consist of the administration of an *emetic*, followed by a *saline aperient*, to clear the bowels; the latter being repeated as occasion may require. The patient should be kept in a cool and well-ventilated room, the diet shonld be light and farinaceous, and the use of diluent drinks copiously indulged in. If the febrile symptoms are severe, or the throat much affected, small doses of some *mild mercurial*, as calomel, mercurial pill, or quicksilver with chalk, may be administered, either separately or combined with *antimonial diaphoretics*, or Dover's powder. In *malignant scarlet fever* a smart emetic should be given early, and mercurials and diaphoretics at once freely exhibited. *Acidulated gargles* may be used for the throat, and when the heat of the body is much above the natural standard, sponging the whole body with cold water, or with vinegar-and-water, may be had recourse to. If the malignant symptoms run high, and assume a typhoid or putrid character, the system must be supported with *stimulant tonics*, as, wine, bark, capsicum, &c.

According to Hahnemann and Prof. Koreff, belladonna is a *prophylactic* against *scarlet fever;* a statement confirmed by Dr. Randhahn, by experiment on 160 children, fully exposed to the disease. The homœopathists also hold it to be almost a specific in scarlatina.

Scarlet fever is common to all ages of life, but children and young persons are the most subject to it. Unlike the *small-pox*, it occasionally attacks the same person more than once. It is most common in dirty, close, damp situations.

SCENE PAINTING. A variety of *distemper painting* employed in theatres, &c., governed by perspective, and having for its

object the production of striking effects when viewed at a distance. *Water*, *size*, and the *ordinary pigments*, are the only materials used for the purpose.

SCENT BAGS. See *Sachets*.

SCENT BALLS. Syn. *Pastilles de Toilette Odorantes*. These are prepared from any of the materials noticed under *pot pourri*, *scented powders*, and *sachets*, made into a paste with *mucilage of gum tragacanth*, and moulded into any desired form, as that of *balls*, *beads*, *medallions*, &c. The larger ones are frequently polished.

SCENTED CASSOLETTES. See *Pot Pourri* (and *above*).

SCENTS (Pommade). *Prep.* 1. (*Cowslip.*) From *essence of bergamot*, 8 *oz.*; *essence of lemon*, 4 *oz.*; *oil of cloves*, 2 *oz.*; *essence de petit grain*, 1 *oz.*

2. (*Jonquille.*) From *essences of bergamot* and *lemon*, of each, 8 *oz.*; *oils of orange-peel* and *cloves*, of each, 2 *oz.*; *oil of sassafras*, 1 *oz.*; *liquid storax*, ½ *oz.*; digest, with warmth and agitation, for a few hours, and decant the clear portion in a week.

3. (*Millefleur.*) From *essence of ambergris* (finest), 4 *oz.*; *essence of lemon*, 3 *oz*; *oil of cloves* and *English oil of lavender*, of each, 2 *oz.*; *essence de petit grain*, *essence of bergamot*, *and balsam of Peru* (genuine), of each, 1 *oz.*; as the last.

Obs. The above are employed to scent pomatums, hair oils, &c. 1 *oz.* of any one of them, dissolved in 1 pint of the *strongest rectified spirit*, produces a *delicious perfume* for the *handkerchief*. (See *p.* 875.)

SCENTS (Snuff). *Prep.* 1. *Essence of bergamot*, 2 *oz.*; *otto of roses* and *neroli*, of each, 1 dr.

2. *Oil of lavender*, 1 *oz.*; *essence of lemon*, 2 *oz.*; *essence of bergamot*, 4 *oz.*

3. To the last, add of *oil of cloves*, 2 *oz.*

4. *Essences of musk* and *ambergris*, of each, 1 *oz.*; *liquor of ammonia*, ½ dr. See *Snuffs*, &c.

SCHEELE'S GREEN. See *Green Pigments*.

SCHEELIUM. See *Tungsten*.

SCHLEROGEN. The ligneous matter deposited in the cells of plants. (Brande.)

SCHLIPPE'S SALT. See *page* 78.

SCHWART'S DROPS. See *Worm Drops*.

SCIATICA. See *Rheumatism*.

SCILLITINE. Syn. *Scillitina*, *Scillitite*. A whitish, resinous, translucent, bitter, deliquescent substance, obtained by Vögel from squills. It is soluble in water, alcohol, and acetic acid, and is purgative, acrid, and poisonous.

SCORBUTUS. See *Scurvy*.

SCORIA. Dross the refuse or useless part of any substance, more especially that left from bodies which have been subjected to the action of fire. It is frequently used in the plural (*scoriæ*).

SCOTT'S DROPS. See *Patent Medicines*.

SCOURING. The common method of cleaning cloth is by beating and brushing it, unless it be very dirty, when it undergoes the operation of *scouring*. This is best done on the *small scale*, as with *articles of wearing apparel*, as follows:—A little *curd soap* is dissolved in *water*, and, after mixing it with a little *clarified ox-gall*, is applied to all the *spots of grease*, *dirt*, &c., and well rubbed into them with a *stiff brush* until they appear to be removed; after which the article is well cleaned all over with a brush or sponge dipped into some *warm water*, to which the previous mixture and a little more *ox-gall* has been added. The cloth is next thoroughly rinsed in *clean water*, and hung up to dry. For dark-coloured cloths, some *fuller's earth* is often added to the mixture of soap and gall. When the article is *nearly* dry, the nap is laid smooth, and it is carefully pressed (if with a hot iron, on the wrong side), after which a *soft brush*, *moistened with a drop or two of olive oil*, is frequently passed over it, to give it a finish and gloss.

Cloth is also cleaned in the *dry way*;—The spots being removed, as above, and the wetted parts having become dry, *clean damp sand* is strewed over it, and beaten into it with a brush, after which the article is well gone over with a *hard brush*, when the sand comes out, and brings the dirt with it.

Buff and *drab cloth* is generally cleaned by covering it with a paste made with *pipe-clay* and *water*, either with or without a little *umber* to temper the colour, which, when dry is rubbed and brushed off.

When the article requires *renovation* as well as scouring, it is placed, whilst *still damp*, on a board, and the threadbare parts are rubbed with a *half-worn hatter's card filled with flocks*, or with a *teasel*, or a *prickly thistle*, until a nap is raised; it is next hung up to dry, after which it is "finished off" as before. When the cloth is much faded, it is usual to give it a "dip," as it is called, or to pass it through a dye-bath to freshen up the colour. *Black* and *dark blue cloth*, if rusty or faded, is commonly treated to a coat of "*reviver*," instead of being "re-dipped," and is then hung up until the next day, before being

pressed and finished off. See *Spots and Stains*.

SCOURING DROPS. See *page* 343.

SCROFULA. A non-contageous disease, consisting in "hard indolent tumours of the conglobate glands in various parts of the body, but particularly in the neck, behind the ears, and under the chin, which after a time suppurate, and degenerate into ulcers, from which, instead of pus, a white curdled matter, somewhat resembling the coagulum of milk, is discharged." In *mild cases*, the glands, after suppuration, slowly heal; in *others*, the eyes become inflamed, and the joints affected; whilst in *severe cases*, the disease gradually extends to the ligaments and bones, producing a debilitated and hectic condition, under which the patient sinks; or, it induces phthisis, and the patient dies of that disease.

The *first appearance* of *scrofula* is usually between the *third* and *seventh* year; but it not unfrequently occurs between this age and that of puberty; after which it seldom makes a *first* attack. Delicate children with fair complexions, and those disposed to rickets, are the most liable to scrofula. In its milder forms, when not affecting any deep-seated or important parts, it is not, in itself, a dangerous disease; although by rendering the patient more liable to certain other diseases, and by aggravating their severity, it indirectly becomes so, and thus often tends greatly to shorten life.

The *exciting causes* of *scrofula*, when it is not hereditary, are a moist atmosphere, a low damp situation, and insufficient or improper diet, as well as everything that tends to debilitate the system. It is rare in either hot or very cold climates, where the air is generally dry.

The *treatment of scrofula* at different periods, and by different parties, has included at least a tithe of the materia medica; but the articles that appear to be most beneficial, are comparatively few. *Iodine*, or better, *iodide of potassium*, *cod-liver oil*, *lemon-juice*, and the *bicarbonate of potassa*, are among this number. *Mild chalybeate tonics* are also useful. The *diet* of the patient should be nourishing and liberal, and contain a moderate share of the red meats and cruciferous vegetables. The *clothing* should be warm, and amply sufficient; and, when convenient, an *elevated* or *dry situation* should be chosen for a residence. *Sea air* and *sea-bathing* often prove most beneficial when all other remedies have failed.

SCUDAMORE'S LOTION. See *page* 720.

SCURF. Syn. *Furfura*. Scurf "is a natural and healthy formation, and though it may be kept from accumulating, it cannot be prevented. It is produced on every part of the body where hair is found, although, from the more active growth of hair on the scalp, the facilities for collecting, and the contrast of colour, it strikes the eye most disagreeably in that situation. This will show how futile any attempt must be, which shall have for its object to prevent the formation of the scurf. It *may be removed*, and *should be removed*, every day, with the hair-brush; but prevention is impossible, inasmuch as it is opposed to a law of nature. *Occasionally*, as a *morbid action*, an *unusual quantity of scurf is produced*, in which case medical means may be adopted to bring the scalp into a more healthful state." (Eras. Wilson.) In such cases the daily use of some mild stimulating or detergent wash, with due attention to the stomach and bowels, will generally abate this annoyance.

SCURVY. Syn. *Scorbutus*.—Lat. This disease commences with indolence, sallow looks, debility, and loss of spirits; the gums become sore and spongy, the teeth loose, and the breath fœtid; the legs swell, eruptions appear on different parts of the body, and, at length, the patient sinks under general emaciation, diarrhœa, and hæmorrhages.

The *treatment* of *ordinary cases* of this disease mainly consists in employing a *diet* of *fresh animal* and *green vegetable food*, with *mild ale*, *beer*, or *lemonade*, as beverages; scrupulously avoiding salted and dried meat. The *fresh-squeezed juice of lemons*, is, perhaps, of all other substances, the most powerful remedy in this disease in its early stages, and is useful in all of them. *Effervescing draughts* formed with the *bicarbonate of potassa* (not soda) are also excellent. See *Potassa* (*p.* 1032).

SEALING WAX. See *Wax*.

SEA SICKNESS. The most *effectual preventive* of *sea sickness* appears to be the *horizontal position*. When there is *much pain*, after the stomach has been well cleared, a few drops of *laudanum* may be taken, or an *opium plaster* may be applied over the region of the stomach. *Persons about to proceed to sea* should put their stomach and bowels in proper order by the use of mild aperients, and even an emetic, if required; when it will generally be found, that a glass of warm and weak *brandy-and-water* to which 15 or 20 drops of *laudanum*, or, still better, 1 or 2 drops of *creasote* have been added, will effectually prevent any disposi-

tion to sea sickness, *provided* the bowels be attended to, and excess in eating and drinking be at the same time avoided. A spoonful of *crushed ice*, in a wine-glassful of *cold water*, or *weak-brandy-and-water*, will often afford relief when all other means fail. *Smoking at sea* is very apt to induce sickness. M. F. Curie, in the Comptes Rendus, asserts that *drawing in* the breath as the vessel *descends*, and *exhaling* it as it *ascends* on the billows, by preventing the movements of the diaphragm acting abnormally on the phrenetic nerves, *prevent sea sickness*. On this Mr. Atkinson, at a recent meeting of the *British Association*, observed that—if a person, seated on board ship, holding a tumbler filled with water in his hand, makes an effort to prevent the water running over, at the same time allowing not merely his arm, but also his whole body to participate in the movements, he will find that this has the effect of preventing the giddiness and nausea that the rolling and tossing of the vessel have a tendency to produce in inexperienced voyagers. If the *person* is *suffering from sickness* at the commencement of his experiment, as soon as he grasps the glass of liquid in his hand, and suffers his arm to take its course and go through the movements alluded to, he feels as if he were performing them of his own free will, and the nausea abates immediately, and very soon ceases entirely, and does not return so long as he suffers his arm and body to assume the postures into which they *seem* to be drawn. Should he, however, resist the free course of his hand, he instantly feels a thrill of pain, of a peculiarly stunning kind, shoot through his head, and experiences a sense of dizziness and returning nausea.

SEBACIC ACID. *Prep.* Distil *fat*, *oil*, or *oleine*, in an earthen retort, and treat the product with *boiling water* as long as that liquid deposits anything on cooling; wash the crystals in *cold water*, and re-crystallize from *boiling water*, as before, repeating the process until the crystals become colourless.

Prop., &c. Light, pearly scales, resembling those of benzoic acid; it is very soluble in hot water, ether, and alcohol; it fuses when melted, and sublimes unchanged. Its salts are called *sebates*. Sebacid acid has been recently formed by the action of potassa on castor oil.

SEDATIVES. Syn. *Sedativa*, — Lat. Medicines and agents which diminish the force of the circulation or the animal energy, and allay pain. *Foxglove*, *henbane*, *tobacco*, *potassio-tartrate of antimony*, and several of the *neutral salts* and *acids*, act as sedatives. *Cold* is, perhaps, the most powerful agent of this class.

SEDIMENT. See *Precipitate*.

SEED. Syn. *Semen*,—Lat. The seeds of plants are conspicuous for their vast number and variety, and their extreme usefulness to man. The seeds of certain of the *gramineæ* furnish him with his daily bread, some of those of the *leguminosæ*, in either the immature or ripe state, supply his table with wholesome esculents, or provide a nourishing diet for his domestic animals; whilst those of numerous other plants, dispersed through every class, order, and family, yield their treasures of oil, medicinals, or perfumes, for his use. The value and importance of the seeds of plants is clearly shown by the care which nature has bestowed on their production and preservation. Every other part of the vegetable fabric is made, in some manner or other, subservient to the formation, perfecting, or dispersing of these. These objects appear to be the sole "end and aim" of all the organs of fructification, and, indeed, of the whole existence of plants; since after they are performed the individual either remains dormant for a season, when it becomes re-invigorated for the same special purpose, or, it at once dwindles and dies. The last is the case with the majority of plants. By delaying or arresting the development or maturation of their seeds, *annuals* may be converted into biennials, and the existence of *biennials* extended to the third, or even to the fourth year. See *Species*, *Vegetables*, *Worm Seed*, *&c.*

SELENIC ACID. Syn. *Acidum Selenicum*,—Lat. *Prep.* By fusing *selenium* or *seleniuret of lead* along with *nitrate of potassa* or *of soda*, acting on the *fused mass* with *water*, precipitating the resulting solution of *seleniate of soda* with *acetate* or *nitrate of lead*, and decomposing the precipitate (*seleniate of lead*), diffused in *water*, with *sulphuretted hydrogen*. The *selenic acid*, thus obtained, may be cautiously concentrated in a glass vessel, if necessary; but if this be pushed too far, it is resolved into *selenious acid* and oxygen.

Prop., &c. Selenic acid is a colourless liquid, closely resembling sulphuric acid; its salts (*seleniates*) bear the closest analogy to the sulphates.

SELENIOUS ACID. *Prep.* By digesting *selenium* in *aqua regia* or *nitric acid*, and evaporating the solution to dryness. It may be sublimed unchanged, is soluble in water and alcohol, and forms salts with the bases, termed *selenites*.

SELENIUM. A chemical element, discovered by Berzelius, in 1818.

Prep. (Magnus.) A mixture of *native sulphuret of selenium*, 1 part, and *binoxide of manganese*, 8 parts; is exposed to a low red-heat in a glass retort, the beak of which dips into water; the product, after being washed in *water*, may be purified by resublimation.

Prop., &c. A brittle, opaque, dark reddish-brown substance, having somewhat the appearance of lead, when in mass; but, with only a semi-metallic lustre, and forming a deep red powder; sp. gr. 4·30 to 4·32; it softens at 212°; fuses at 220°; and boils at 650° Fahr.; when heated in the air, it exhales a peculiar odour, which has been compared to that from rotten horse-radish. With the metals it forms compounds called *seleniurets*, or *selenides*, which closely resemble the corresponding sulphurets.—*Oxide of selenium* is a neutral, gaseous substance, obtained by heating selenium in a vessel of air, and washing the product with water.—*Sulphuret and phosphuret of selenium* are made by simply fusing their elements together. See *Hydrogen* (Seleniuretted.)

SELENOCYANOGEN and *Selenocyanides.* Substances analogous in their composition and properties to *sulphocyanogen* and the *sulphocyanides.*

SEMOLA (Bullock's). *Wheaten flour*, to which some of the *gluten* of the starch-works has been added, artificially granulated.

SEMOLINA. Syn. *Sémoule, Semoulina.* The large hard grains of *wheat flour* retained in the bolting machine, after the fine flour has passed through its meshes. "The best sémoule is obtained from the wheat of the southern parts of Europe. With the sémoule, the fine white Parisian bread called '*gruau*' is baked." (Ure.)

SENEGA. Syn. *Seneka, Snake Root, Rattlesnake do.; Senega,*—Ph. L. E. & D. *Radix Senegæ,*—Ph. L. 1824. "The *root*" of "*polygala senega*, Linn." (Ph. L.) A stimulating diaphoretic, and expectorant; in large doses, diuretic, cathartic, and emetic. In America it is used as an antidote to the bite of the rattlesnake. Drs. Chapman and Hartshorne extol it as an emmenagogue. Dr. Pereira says that it is an exceedingly valuable remedy in the latter stages of bronchial or pulmonary inflammation, when this disease occurs in aged, debilitated, or torpid constitutions. *Dose.* 10 to 30 gr., in powder or decoction, (combined with aromatics, opium, or camphor,) thrice daily.

SENEGINE. Syn. *Seneginum; Polygaline, Polygalic Acid.* A white odourless powder discovered by Gehlin in the bark of seneka root (*polygala senega*). It is *obtained* by exhausting the *bruised root-bark* with *rectified spirit*, evaporating the resulting *tincture* to a syrupy consistence, and then strongly agitating it with *ether;* after repose for some time crystals are deposited, which may be purified in the usual manner.

Obs. Senegine is a powerful errhine and acrid poison. It is volatile, and soluble in both water and alcohol. According to Gehlin, it possesses acid properties. The *polygaline*, of Peschier, is an alkaloid, and exists in the root united to an acid, which he calls the *polygalinic.* Is not this *polygalinate of polygaline* the *senegine* of M. Gehlin?

SENNA. Syn. *Senna, Sennæ Folia,*—Lat. There are three principal varieties:—

1. Alexandrian senna (*senna Alexandrina,*—Ph. L. E. & D.), referred in the Ph. L. to "*cassia officinalis?* (senna officinalis, Roxb.) and *cassia obovata;*" in the Ph. D., to *cassia acutifolia* (Delile); and in the Ph. E., to various species of cassia. The *leaves* are "unequal at the base, ovate acute, or obovate mucronate." (Ph. L.) It is generally mixed with the leaves of *cynanchum argel*, the presence of which is often the occasion of much griping. The *leaf* of *argel* is fully an inch long, warty, regular in its formation, and the lateral nerves are imperfectly seen on the under side; whilst that of the true *Alexandrian senna* never exceeds ¾ inch in length, is oblique, and the nerves on the under side are very conspicuous.

2. Indian senna (*senna Indica,*—Ph. L. & E.) is referred to "*cassia officinalis* (senna officinalis, Roxb.)" in the Ph. L.; and in the Ph. E. & D. to *cassia elongata* (Lemaire, Lisancourt). The leaf is "unequal at the base," and "lanceolate." (Ph. L.)

3. *Tinnevelly senna*, forming the *finest Indian*, now introduced into the Ph. D., is therein described as composed of the leaflets of *cassia oblongata.* These are pale green, thin, flexible, and from 1 to 2 inches long, and nearly ½ inch broad. This variety is equal in medicinal virtue to the best Alexandrian, and is to be preferred, on account of its being imported perfectly free from adulteration.

Senna is *purgative* in *doses* of 20 gr. to 1 dr., either in powder, or made into an infusion or tea with water, combined with *ginger, caraways*, or some other aromatic, to prevent griping. It acts chiefly on the small intestines, and generally effects its purpose within 4 hours after being taken.

SEPIA. A pigment prepared from the "*ink*" or *black fluid* secreted by *sepia*

officinalis (Linn.), and several other varieties of *cuttle-fish*. The contents of the "ink bags" are inspissated as soon as possible after collection, and then form the *crude sepia* of commerce. This is *prepared* for *artists* by boiling it for a short time in a *weak lye of caustic alkali*, precipitating the solution with an *acid*, and well washing and carefully drying the precipitate by a gentle heat. It possesses a fine brown colour, and is used like Indian ink.

SERPENTARY. Syn. *Virginian Snake-root; Serpentariæ Radix; Serpentaria*,—Ph. L. & E. *Aristolochia Serpentaria*,—Ph. D. An excellent, stimulating diaphoretic and tonic; in typhoid and putrid fevers, dyspepsia, &c. It is admirably suited to check vomiting and to tranquillise the stomach, particularly in bilious cases. (Dr. Chapman.) *Dose*. 10 to 20 gr., every third or fourth hour, its use being preceded by an aperient.

SERUM. Syn. *Seralbumen*. The clear pale fluid in which the blood-globules float, and which separates from blood during its coagulation. It is, essentially, a feebly alkaline solution of albumen. See *Albumen* and *Ovalbumen*.

SESQUI-. See *Nomenclature*.

SETON. Syn. *Setaceum*. An artificial ulcer, made by passing a portion of *silk* or *thread* under the skin by means of a *seton needle*, a part of which is drawn through daily, and thus keeps up a constant irritation. Occasionally, the thread is anointed with some irritating substance, for the purpose of increasing the discharge.

SEVUM (Prepared). Syn. *Sevum Præparatum, Sevum Magneticum*,—Lat. *Prep.* 1. (Pharm. Journ.) *Mould candles*, at *least* 2 years old, melted by a very gentle heat, and strained from the wicks.

2. As *magnetic adeps*. (See *p.* 741.) *Used* to make *mercurial ointment*. Triturated with 8, 12, or 16 times its weight of quicksilver, the globules are completely extinguished in from 10 to 15 minutes.

SHAD. The *siluris glanis* (Linn.), a soft-finned abdominal fish, found chiefly in the rivers of northern Europe. It is the largest European fresh-water fish. It yields *Samovey isinglass*, and its flesh is esteemed as food. The fish called *shad* or *twaite shad* (alosa finta), and *allice* or *allice shad* (alosa communis), are species belonging to a sub-genus of the *clupeidæ* (alosa). The *first* is a small fish only 12 or 14 inches long; the *second* is considerably larger, being often 2 to 3 feet in length.

SHADDOCK. A large species of orange, the fruit of *citrus decumana*, (Linn.)

SHAGREEN. This is prepared from the skins of the horse, wild ass, and camel, as follows:—The *skin*, freed from epidermis and hair by soaking in *water*, and, after dressing with the currier's fleshing-knife, is sprinkled over, whilst still wet and stretched, with the *seeds of a species of chenopodium*, which are imbedded in it by strong pressure, and in this state it is dried; the seeds are then shaken off, and the surface rubbed or shaved down, nearly to the bottom of the seed-pits or indentations; it is next soaked in *water*, by which the skin swells, and the recently depressed surface rises into a number of minute prominences; it is, lastly, dyed and smoothed off. *Black* is given to it with galls and copperas; *blue*, with a solution of indigo; *green*, with copper filings and sal ammoniac; and *red*, with cochineal and alum. *Shagreen* was formerly very extensively used for covering the cases of watches, spectacles, surgical instruments, &c.

SHALLOT. Syn. *Eschalot*. The *allium ascalonicum* (Linn.), a plant allied to the onion, the bulb of which is much used as a sauce or pot-herb.

SHAMPOOING. A practice, common in the East, having for its object the increase or restoration of the tone and vigour of the body, or the mitigation of pain. It is applied either in the bath or immediately after quitting it, generally, the latter, and consists in pressing and kneading the flesh, stretching and relaxing the joints, and laboriously brushing and scrubbing the skin, and rubbing down the rough and hard parts with pumice-stone. It is "most singular. You are laid out at full length, rubbed with a hair-brush, scrubbed, buffeted, and kicked; but it is all very refreshing." (Sir A. Burnes.) An experienced shampooer causes almost every joint of the body to crack. See *Bathing*.

SHAMPOO LIQUID. See *Spirits*.

SHARPS. See *Flour*.

SHAVING. The following are Mr. Mechi's instructions for this, to many persons, troublesome operation:—*Never fail to well wash your beard with soap and cold water*, and to rub it dry, immediately before you apply the lather, of which the *more you use* the easier you will shave. *Never use warm water*, which makes a tender face. Place the razor (closed of course) in your pocket, or under your arm, to *warm it*. The moment you leave your bed is the *best time to shave*. Always put your *shaving brush* away with the *lather on it*.

The razor (being only a very fine saw) should be moved in a *sloping* or *sawing direction*, holding it *nearly flat* to your face,

care being taken to *draw the skin as tight as possible* with the left hand, so as to present an even surface and throw out the beard. The practice of pressing on the edge of a razor in stropping generally rounds it; the pressure should be directed to the back, which must never be raised from the strop. If you shave from *heel to point* of the razor, strop it from *point to heel;* but if you *begin with the point*, then strop from *heel to point.* If you *only once* put away your razor *without* stropping or otherwise cleaning the edge, you must no longer expect to shave well, the soap and damp so soon rust the fine teeth or edge. A piece of plate leather should always be kept with the razors.

SHAVING FLUID. See *page* 394.

SHEEP. Syn. *Ovis*—Lat. The *ovis aries*, an animal domesticated almost everywhere. Its *flesh* supplies us with food; its *skin*, with leather; its *fleece*, with wool; and its *intestines*, with catgut. Its *fat* (sevum) is officinal. See *Suet*, *Mutton*, *&c.*

SHELL-FISH. Few articles of food are so liable to disturb the functions of the stomach and bowels as shell-fish. The *oyster* (ostrea edulis, *Linn.*), and the *cockle* (cardium edule, *Linn.*), are, perhaps, the least objectionable. The *crab* (cancer pagurus, *Linn.*), the *crayfish* (cancer astacus, *Linn.*), the *lobster* (cancer gammerus, *Linn.*), the *mussel* (mytilus edulis, *Linn.*), the *prawn* (cancer squilla, *Linn.*), the *periwinkle* (turbo littoreus, *Linn.*), and the *shrimp* (cancer crangon, *Linn.*), with the exception of the *claws* of the *first three*, are always suspicious, particularly in hot weather, and often absolutely *poisonous.* We have seen the most alarming, nay fatal symptoms, follow the use of *mussels*, even amongst those habitually accustomed to take them; whilst it is a well-known fact, that the luscious body of the crab and lobster have too often formed the last supper of the epicure. See *Oysters*, *&c.*

SHELLS (Prepared). Syn. *Testæ Præparatæ*,—Ph. L. 1836. *T. Ostreorum P.*, —Ph. L. 1788. *Prep.* (Ph. L. 1836.) Wash *oyster shells* (ostræ,—Ph. L.) with *boiling water*, having previously freed them from extraneous matters; then prepare them in the manner directed for chalk. The product is similar in constitution and properties to *prepared chalk.*

SHERBET. (*Pers.*) A cooling drink, used in the East, prepared with the *juices of fruit*, and *water*, variously *sweetened* and *flavoured.* The word has been, of late years, commonly employed in these countries in a similar manner. See *Lemonade*, *Orangeade*, and *Powders.*

SHERRY. Syn. *Sherry Wine; Sherris; Vinum Xericum*,—Ph. L. *Vinum Album*,—Ph. E. *Vinum Album Hispanicum*,—Ph. D. This is the only wine ordered in the British Pharmacopœias. See *Wines.*

SHERRY-COBBLER. *Prep.* (Redwood.) Half fill a tumbler with *clean pounded ice;* add a table-spoonful of *powdered white sugar*, a few *thin slices of lemon* with the *peel* (or some *strawberries* or other similar fruit, bruised), and a wine-glassful or more of *sherry-wine;* mix them together (lightly), and as the ice melts, suck the liquor through a straw (or a small tube of silver or glass).

Obs. A favorite beverage in the United States of America, and, as prepared there, most excellent in its way. It has been recently introduced to England.

SHINGLES. Syn. *Zoster*, *Herpes Zoster*, *Herpes Zona*,—Lat. A local variety of herpes or tetter, remarkable for forming a kind of belt round or partly round some part of the trunk of the body, chiefly the waist or abdomen. See *Tetters.*

SHOT METAL. *Prep.* From *lead*, 1000 parts, *arsenic*, 3 parts. When the lead is coarse, 6 to 8 parts of metallic arsenic are required to fit it for this purpose.

SHOW COLOURS (Druggist's). The following formulæ are perhaps the best of this class:—

Amber. From *dragon's blood* (in coarse powder), 1 part; *oil of vitriol*, 4 parts; digest, and when solution is complete, dilute the mixture with *distilled* or *soft water*, q. s.

Blue.—a. From *blue vitriol*, 2 *oz.; oil of vitriol*, ½ *oz.; water*, 1 pint.—*b.* A solution of *indigo* in *sulphuric acid*, diluted with *water*, q. s.—*c.* A solution of *soluble prussian blue* in *distilled water.—d.* A solution of pure ordinary *prussian blue* in either *oxalic* or *hydrochloric acid*, slightly diluted, and afterwards further diluted with *water* to the proper shade of colour.

Crimson.—a. From *alkanet root*, 1 *oz.; oil of turpentine*, 1 pint. *Used* chiefly for lamps.—*b.* As *pink* (*b*), below.

Green.—a. From *sulphate of copper*, 2 *oz.; bichromate of potash*, 1 dr., or q. s.; *water*, 1 pint.—*b.* A solution of *sulphate of copper*, 2 *oz.; chloride of sodium*, 4 *oz.; water*, 1 pint, or q. s.—*c.* A solution of *distilled verdigris* in *acetic acid*, diluted with *water*, q. s.—*d.* Dissolve *blue vitriol* in *water*, and add *nitric acid* until it turns green.

Lilac.—a. Dissolve *crude oxide of cobalt* (zaffre) in *nitric or hydrochloric acid*, add *sesquicarbonate of ammonia*, in excess, and afterwards, sufficient *ammonio-sulphate of copper* to strike the colour.—*b.* As the *purple*, but more diluted.

Olive. Dissolve *sulphate of iron* and *oil of vitriol*, equal weights, in *water*, and add of *nitrate of copper*, q. s. to strike the colour.

Orange.—a. A solution of *bichromate of potash* in *water*, either with or without the addition of some *hydrochloric* or *sulphuric acid.—b.* Dissolve *gamboge* or *annotta* in *liquor of potassa;* dilute with *water*, and add a *little spirit.*

Pink.—a. To a solution of *chloride* or *nitrate of cobalt*, in *water*, add *sesquicarbonate of ammonia*, q. s. to dissolve the precipitate at first formed.—*b.* From *madder* (washed with cold water), 1 *oz.; sesquicarbonate of ammonia*, 4 *oz.; water*, 3 pints; digest, with agitation, for 24 hours, then dilute with more *water*, and filter.

Purple.—a. A solution of *sulphate of copper*, 1 *oz.*, in *water*, 1 quart, or q. s.; with the addition of *sesquicarbonate of ammonia*, 1½ *oz.—b.* To the last, add a sufficient quantity of the *first pink* (above), to turn the colour.—*c.* To an *infusion of logwood*, add *carbonate of ammonia* or *of potassa*, q. s.—*d. Sugar of lead*, 3 *oz.; powdered cochineal*, 1 *dr.; water*, q. s.—*e.* Add *sulphate of indigo*, nearly neutralized with chalk, to an *infusion of cochineal*, till it turns purple.

Red.—a. Dissolve *carmine* in *liquor of ammonia*, and dilute with *water.—b.* Digest *powdered cochineal* in a *weak solution of ammonia* or *of sal ammoniac*, and afterwards dilute with *water.—c.* Add *oil of vitriol*, 4 *oz.*, to *water*, 1 gall., and digest *dried red-rose leaves*, 8 *oz.*, in the mixture for 24 hours.—*d.* Dissolve *madder lake* in a *solution of sesquicarbonate of ammonia*, and dilute the solution with *water.*

Violet. To a solution of *nitrate of cobalt* in a *solution of sesquicarbonate of ammonia*, add *solution of ammonia-sulphate of copper*, q. s. to strike the colour.

Yellow.—a. A solution of *sesquioxide* or *rust of iron*, ½ *lb.*, in *hydrochloric acid*, 1 quart, diluted with *water.—b.* To a strong decoction of *French berries* add a little *alum.—c.* A simple solution of *chromate* or *bichromate of potash* in *distilled water.—d.* A solution of equal parts of *nitre* and either *chromate* or *bichromate of potash*, in *water.*

Obs. Most of the above require filtering, which should be done through *powdered glass*, placed in a *glass funnel*, and *never* through paper. They usually need a second filtration, after being exposed to the light for some weeks; hence it is convenient always to make a little more of them than is required to fill the bottle, as several of them when diluted after filtration become again turbid.

SHRIMP. See *Shell-fish.*

SHRUB. A species of concentrated cold punch, prepared with lemon juice, spirit, sugar, and water. When the word is used in its unqualified form, *rum shrub* is alluded to.

Brandy Shrub.—a. Take of *brandy*, 1 gall.; *orange* and *lemon juice*, of each, 1 pint; *peels of* 2 *oranges; do. of* 1 *lemon;* digest for 24 hours, strain, and add of *white sugar*, 4 *lb.*, dissolved in *water*, 5 pints; in a fortnight decant the clear liquid for use.

b. As *rum shrub* (below), but using brandy.

Lemon Shrub, Lemonade do. Concentrated lemonade, either with or without the addition of a *little spirit. Used* to make lemonade or lemon sherbet.

Punch Shrub. Concentrated punch, made with equal parts of *spirit* and *water. Used* to make punch.

Rum Shrub.—a. As *brandy shrub*, but substituting *rum* for brandy.

b. Take of *rum*, at proof, 34 gall. (or if of any other strength an equivalent quantity); *essential oils of orange* and *lemon*, of each, 2 *oz.*, dissolved in *rectified spirit*, 1 quart; *good lump sugar*, 300 *lb.;* dissolved in *water*, 20 gall.; mix well by "rummaging," and gradually and cautiously add of *Seville orange juice*, or of a *solution of tartaric acid in water*, q. s., to produce a *pleasant*, but *scarcely perceptible acidity*; next "rummage" well for 15 minutes, then add sufficient *water* to make the whole measure *exactly* 100 *gall.*, and again "rummage" well for at least half an hour; lastly, bung the cask down loosely, and allow it to repose for some days. In a fortnight, or less, it will usually be sufficiently "brilliant" to be *racked.* The *product* is 100 gall., at 66 u. p.

Obs. Rum shrub is the kind in the greatest demand, and that having a slight preponderance of the orange flavour is the most esteemed. If wholly flavoured with lemon it is apt to acquire a kind of "dead" or "musty" flavour by long keeping. The substitution of a *few gallons of brandy* for a *portion* of the *rum*, or the addition, after racking, of about 1 *oz.* each of *bruised bitter almonds, cloves*, and *cassia*, the *peels of about* 2 *dozen oranges*, and a "*thread*"

of the *essences of ambergris* and *vanilla*, render it delicious.

SIALOGOGUES. Medicines which increase the flow of saliva. *Mercurials* and *pellitory of Spain* belong to this class.

SICKNESS. Nausea and vomiting frequently arise from the use of improper food, and other articles which offend the stomach; at other times, it is symptomatic of some disease, as colic, cholera, dyspepsia, head affections, incipient fever, &c.; in which case the primary affection should be attended to. "*Nausea* lowers the pulse, contracts the small vessels, occasions cold perspiration, severe rigors, and trembling; and diminishes, as long as it lasts, the actions, and even the general powers of life. The act of *retching*, and *vomiting* more especially, on the contrary, rouses rather than depresses, puts to flight all the preceding symptoms, and often restores the system to itself."

The best *remedies* or *palliatives* in these affections are effervescing saline draughts, either with or without the addition of a few drops of *tincture of henbane* or *tincture of opium*. A glass of *genuine lemonade*, *iced*, or a spoonful of *crushed ice* in a wine-glassful of *mint water*, is also very serviceable. See *Draughts*, *Pregnancy*, *Sea-sickness*, &c.

SIFTING is to pulverulent substances what filtration is to liquids; but in this case the *medium* through which the substance passes is, usually, of a simpler and coarser description. *Sieves* are commonly employed for the purpose, which are fitted with *silk* or *brass-wire gauze* for fine purposes, and *horse-hair cloth*, or *wire netting*, for coarser ones. *Drum sieves* are such as are furnished with covers and an enclosed space to receive the fine powder that passes through, by which dust and loss are prevented.

SIGHT. See *Vision*.

SIGNATURES (Fac-similes of). These may be readily obtained as follows:—

1. Let the *name* be written on a piece of *paper*, and while the ink is still wet sprinkle over it some *finely-powdered gum arabic*, then make a rim round it and pour on it some fusible alloy in a liquid state. Impressions may be taken from the plates formed in this way, by means of printing ink and the copperplate press.

2. By the use of *transfer ink* and *lithography*.

SILICA. Syn. *Silex*, *Silicic Acid*, *Oxide of Silicium*; *Siliceous Earth*, *Earth of Flints*, —Obs. This exists in quartz and rock crystal in a nearly pure state. The sands of rivers and the sea shore, flint, and almost all the scintillating stones, chiefly consist of it. It may be *obtained* in a *state of absolute purity* by passing *gaseous fluoride of silicium* into *water*, collecting the resulting gelatinous precipitate on a calico filter, washing it with *distilled water*, drying it, and heating it to redness. *Another method* is to precipitate a *solution of silicate of soda* or *potassa* (soluble glass) with *dilute hydrochloric acid*, and to treat the precipitate as before.

Prop., &c. A fine, white, tasteless, infusible powder, insoluble in all acids, after being heated, except the hydrofluoric; soluble in strong alkaline solutions; its salts are called *silicates*. Sp. gr. 2·66. *Flint glass* is a silicate of lead; *plate glass*, a silicate of potassa. See *Glass*, *Soluble do.*, *Powdered do.*, *Flint Powder*, &c.

SILICIUM. Syn. *Silicon*. An elementary substance forming the combustible base of silica. It was first procured by Berzelius in 1824, by the action of *potassium* on *hydrofluosilicic acid*; but it is more *conveniently obtained* from the *double fluoride of silicium and potassium*, previously dried at nearly a red heat. This substance is gently heated with nearly an equal weight of *potassium*, in a glass tube, and the resulting compound washed with *cold water*; the insoluble residuum is *silicium* under the form of a dark brown powder.

Prop., &c. Silicium dissolves in a mixture of nitric and fluoric acids, and burns or explodes when heated with the hydrates and carbonates of the alkalies. It is permanent in the air, unless when heated. After being heated to redness in a covered crucible, it becomes darker, denser, and quite incombustible. *Bromide* and *chloride of silicium* have been formed by exposing it in a spongy or pulverulent state to the action of chlorine. They are colourless, fœtid, volatile fluids, with low boiling points (the first, 122° Fahr.) With fluorine it forms *hydrofluosilicic acid*.

SILICO-FLUORIDES. Double fluorides formed by precipitating or saturating *silico-hydrofluoric acid* with the *bases*.

SILK. As an *article of clothing*, as far as "roundness of fibre, softness of texture, absence of attraction for moisture, and power of communicating warmth, are concerned, *silk* is greatly superior to both linen and cotton; moreover it gives the sensation of freshness to the touch which is so agreeable in linen. But, with all these advantages, silk (when worn next the body) has its defects: on the slightest friction, it disturbs the electricity of the skin, and thus becomes

a source of irritation. Sometimes, it is true, this irritation is advantageous, as causing a determination of blood to the surface; but when this action is not required, it is disagreeable, and quite equal, in a sensitive constitution, to producing an eruption on the skin. I have seen eruptions occasioned in this manner, and when they have not occurred, so much itching and irritation as to call for the abandonment of the garment." (Eras. Wilson.)

Silk is *characterised* by its fibres appearing perfectly smooth and cylindrical, without depressions, even under a magnifying power of 160. Its *fibres* (even when dyed) acquire a permanent straw-yellow colour when steeped in *nitric acid* of the sp. gr. 1·20 to 1·30. The fibres of white or light coloured silk are similarly stained by a *solution of picric acid.* A thread of silk when inflamed, shrivels and burns with difficulty, evolves a peculiar odour, and leaves a bulky charcoal. By these properties SILK is *distinguished* from *cotton* and *linen.*

The *cleaning* and *renovation* of articles of wearing apparel made of silk, are matters requiring some care. No silk goods look well after being washed, however carefully it may be done; and this method should therefore never be resorted to, but from absolute necessity. It is recommended to sponge *faded silks* with *warm water* and *curd soap*, then to rub them with a dry cloth on a flat board, and afterwards to iron them on the wrongside with an ordinary smoothing iron. *Sponging* with *spirit*, *camphine*, or *pure oil of turpentine*, also greatly improves *old silk*, and is often preferable to any other method. The odour of the camphine and turpentine passes off by exposure for a few days. When the *ironing* is done on the right side, *thin paper* should be spread over the surface, to prevent "glazing." See *Dyeing*, *Gilding*, *&c.*

SILKWORM GUT. See *page* 553.

SILLABUB. *Prep.* Grate off the *yellow peel of a lemon* with *lump-sugar*, and dissolve the *sugar* in ¾ pint of *wine;* add the *juice of ½ a lemon*, and a ¼ pint of *cream;* beat the whole together until of a proper thickness, and then put it into glasses. —*Obs.* ¾ to 1 pint of *new milk* is often substituted for the cream, and *strong cider* or *perry* for the wine. *Grated nutmeg* is often added. When "whipt" to a froth it is called "*whipt sillabub.*" See *Whipt Cream.*

SILVER. Syn. *Argentum*,—Lat. This metal, like gold, appears to have been as much valued in the remotest ages of antiquity of which we have any record, as at the present time. It is found in nature both in the metallic state and mineralized, in the state of alloy, and combined with sulphur, chlorine, and other metallic sulphurets. In Great Britain it is found in combination chiefly with lead. It is extracted from its ores principally by the process of *amalgamation*, founded on its easy solubility in mercury, and by subsequent cupellation. It is only prepared on the large scale.

Chemically pure silver may be obtained by any of the methods noticed at page 1138.

Refined Silver, *Virgin do.*; *Argentum*, —Ph. L.; *A. Purificatum.*—Ph. D.; *A. Cupellatum;* is silver that has passed the cupel.

Prop. Pure Silver has a very white colour, a high degree of lustre, is exceedingly malleable and ductile, and is the best conductor of heat and electricity known. Its hardness is between that of copper and gold; its sp. gr. is 10·475 to 10·500; it melts at about 1873° Fahr., or bright redness (Daniell); is freely soluble in nitric acid, and dissolves in sulphuric acid by the aid of heat; it refuses to oxidize alone at any temperature, but, when strongly heated in open vessels, it absorbs many times its bulk of oxygen, which is again disengaged at the moment of solidification; its surface is rapidly tarnished by sulphuretted hydrogen and by the fumes of sulphur.

Pur. "Entirely soluble in diluted nitric acid. This solution, treated with an excess of muriate of soda, gives a white precipitate *entirely* soluble in ammonia water, and a fluid which is not affected by sulphuretted hydrogen." (Ph. E).

Tests. 1. The *compounds of silver*, mixed with carbonate of soda, and exposed on a charcoal support to the *inner flame* of the blowpipe, afford white, brilliant, and ductile metallic globules, without any incrustation of the charcoal.—2. The *salts of silver* are non-volatile and colourless, but most of them acquire more or less of a black tint by exposure to full daylight.

The *soluble salts of silver* give—1, A *white curdy* precipitate (*chloride of silver*) with hydrochloric acid and the soluble metallic chlorides, which is soluble in ammonia and insoluble in nitric acid, and blackened by exposure to light;—2, *White* precipitates with solutions of the alkaline carbonates, oxalates, and ferrocyanides;—3, *Yellow* precipitates with the alkaline arsenites and phosphates;—4, With the arseniates, *red* precipitates;—5, With the fixed alkalies, *brown* precipitates;—6, With

sulphuretted hydrogen and hydrosulphuret of ammonia, a black powder, which is insoluble in dilute acids, alkalies, alkaline sulphurets, and cyanide of potassium, but readily soluble, with separation of sulphur, in boiling nitric acid; and—7, With phosphorus, and with metallic copper or zinc, *pure silver*.

Assay. 1. The method of *assaying silver* by *cupellation* has been explained at *page* 99; and that method is alone applicable when the alloy contains a very small quantity of silver, as a few ounces only per ton. When the reverse is the case, as with the silver of commerce, the following is a much more accurate method:—

2. *Humid assay of silver.—a*. Dissolve 10 gr. of the *silver for assay* in 100 gr. of *nitric acid*, sp. gr. 1·28, by the aid of heat, the solution being made in a tall stoppered glass tube, furnished with a foot; then place it in a very delicate balance, bring it into an exact state of equilibrium, and add the *test solution* (see below), *gradually* and *cautiously*, until the whole of the silver be thrown down; the *number of grains* now required to restore the equilibrium of the balance or scales gives the exact quantity of *pure silver* in 1000 parts of the sample.—*Obs*. To ensure accuracy, after each addition the stopper should be placed in the tube, and the latter violently agitated for a short time, when the liquor will rapidly clear and enable us to see when the operation is concluded. We must then, as a check, add a small quantity of a solution of nitrate of silver to the liquor in the tube, after having first carefully taken the weight. If too much of the test liquor has been added, this will produce a fresh precipitate, and the assay cannot then be depended on.—*Instead* of *weighing* the *quantity* of *test liquor* used, a *tube graduated into* 100 *parts*, and holding 1000 gr., may be employed, every division of which required to throw down the silver, will represent the $\frac{1}{10}$th of a grain. See *Alkalimetry* and *Acidimetry*.

b. The precipitate of *chloride of silver* may be collected in a *paper filter*, and be dried, washed, fused, and weighed. The *previous weight* of the paper, deducted from the *gross weight of the filter and its contents*, gives the quantity of *chloride of silver* present, which multiplied by 0·75278, gives the weight of the PURE SILVER in the sample.

Test liquor. Dissolve 54·27 (54¼) gr. of pure sea salt in 9945·73 gr. (or 22 *oz*. and 320¾ gr. avoirdupois) of distilled water; filter, and keep the liquor in a stoppered bottle for use. *Pure sea salt* is obtained by boiling together, for a few minutes, in a glass vessel, a *solution of common salt* with a little pure *bicarbonate of soda*; then adding to the filtered liquor sufficient *hydrochloric acid* to render it *neutral* to litmus and turmeric paper, and, lastly, evaporating and crystallizing.

Obs. The presence of mercury, lead, or sulphuret of silver, interferes with the accuracy of the above assay. When MERCURY is present, the precipitate blackens less readily by exposure to light; and when it contains $\frac{4}{1000}$ or $\frac{5}{1000}$ of chloride of mercury, it remains of a dead white; with $\frac{3}{1000}$ it is not sensibly discoloured by the diffused light of a room, with $\frac{2}{1000}$ only slightly darkened, with $\frac{1}{1000}$ more so, but with pure chloride of silver, the effect is very rapid and intense. When this metal is present, which is, however, seldom the case, the assay sample must be placed in a small crucible, and exposed to a full red heat, before solution in the acid. *Another method*, proposed by M. Levol, and modified by M. Gay-Lussac, is to add to the *nitric solution of the silver* sufficient *acetate of ammonia* or *crystallized acetate of soda* to saturate *all* the *nitric acid* existing in the liquor, either in the free state or combined with the silver. When the alloy contains LEAD, shown by the precipitated chloride being partly soluble in water, it may either be *laminated* and subjected to the action of *acetic acid* before solution in the nitric acid; or, the *test solution of chloride of soda* should be replaced by one of *chloride of lead*; (139·355 gr. of the latter are *equiv. to* 58·732 gr. of the former). The presence of SULPHURET OF SILVER is detected whilst dissolving the sample in nitric acid, by the *black flakes* which may be observed floating about in the liquor in an insoluble state. These flakes may be dissolved by *fuming nitric acid*, or by adding pure *concentrated sulphuric acid* to the solution, which should be then heated for about a ¼ hour in a steam-bath. When thus treated, the precipitate produced by the *test-liquor* represents the *whole of the silver* contained in the alloy.

Uses, &c. Metallic silver, unless in a state of very minute division, has no action on the human body. A plate of silver is ordered, in the Ph. L., as a test of the presence of nitric acid in the acetic and phosphoric acids; and metallic silver (preferably granulated) is employed by the other colleges in the preparation of the nitrate. Its numerous applications in the arts are well known. The *standard silver* of England

contains 111 parts of *silver*, and 9 parts of *copper*.

Concluding Remarks. The researches of Tillet, D'Arcet, and Gay-Lussac, have clearly shown that the per centage of silver in an alloy, as indicated by cupellation, is always below its real richness in that metal, owing to loss in the process; and, that the *cupelled button* always retains a trace of lead and copper, the precise quantity of which is variable. The *following Table* exhibits the additions to be made on this score, when the quantity assayed (*assay pound*) is 20 gr. :—

Weight after cupellation.	Actual richness in *pure Silver.*	Per centage richness in *pure Silver.*
19·979	20	100
18·95	19	95
17·92	18	90
16·917	17	85
15·914	16	80
14·91	15	75
13·905	14	70
12·905	13	65
11·906	12	60
10·906	11	55
9·906	10	50
7·921	8	40
5·948	6	30
3·949	4	20
1·982	2	10

In *assaying lead ores very poor in silver*, the best quantity to be taken for cupellation is 500 gr.; and from that quantity 0·0148 of silver, including compensation for loss, represents one ounce of silver to the ton. "A cupel may absorb its own weight of lead. If the quantity of lead to be absorbed is more considerable, another cupel may be turned topsy-turvy, and the cupel in which the assay is to be made may be placed upon it." See *pages* 96–9, and M. Gay-Lussac's elaborate memoir on the "*Humid Assay of Silver.*"

For the *recovery* or *reduction* of silver from the chloride and its other compounds, several methods are employed :—

a. The *washed chloride* is placed in a *zinc* or *iron cup*, along with a *little water* strongly acidulated with sulphuric acid; or in a *glass* or *porcelain cup* along with a *zinc plate;* the whole may then be left to itself for some hours; or, to hasten the reduction, gently heated, or even boiled; the precipitated silver is washed with *pure water*, and dried.

b. (Hornung.) Digest the *chloride* with some *liquor of ammonia* and *pure copper filings*, for 24 hours, then wash and dry the powder.

c. (M. Levol.) The *washed chloride* is mixed with an equal weight of *sugar*, and the mixture is digested in an excess of a moderately strong *solution of caustic potassa*, with occasional agitation for 24 hours; or the whole is boiled for some time; the reduced silver is washed with distilled water.

d. (Mohr.) The *dry chloride* is mixed with 1-3rd of its weight of *powdered black rosin*, and moderately heated in a crucible until the flame ceases to have a greenish-blue colour; the heat is then suddenly increased so as to melt the metal into a *button* or *ingot*.

e. (M. Gay-Lussac.) If the "*chloride*," dry it, and throw it, in successive portions, into twice its weight of *carbonate of potassa* fused in a red-hot Hessian crucible; effervescence ensues, and the pure silver subsides to the bottom.—If a "*soluble salt*," as the nitrate, acidulate the solution, and precipitate it by means of a *polished plate of copper;* the silver is then obtained in the form of *powder*. The *products* of the above processes, when the latter are carefully conducted, are chemically pure silver.

SILVER (Acetate of). Syn. *Argenti Acetas*,—Lat. *Prep.* By adding a *solution of acetate of potassa* to a like *solution of nitrate of silver*, washing the precipitate with *cold water*, redissolving it in a little *hot water*, and setting the solution aside to crystallize. Small colourless needles.

SILVER (Ammoniaret of). See *Fulminating Silver* (Berthollet's, Nos. 1 and 2, *page* 497).

SILVER (Ammonio-chloride of). Syn. *Argento-chloride of Ammonia; Argenti Ammonio-chloridum*, — Lat. *Prep.* Add, gradually, *chloride of silver* (recently precipitated and well-washed) to *concentrated liquor of ammonia*, as long as it is dissolved on agitation, applying a gentle heat towards the end; then heat the solution to the boiling point, concentrate a *little*, and allow it to cool very slowly; collect the crystals which form, dry them by pressure (*with care*) between folds of *bibulous paper*, and at once preserve them from the light and air. *Dose.* $\frac{1}{16}$ to $\frac{1}{8}$ gr.

SILVER (Benzoate of). Thin transparent plates, which are blackened by exposure to the light. See *Benzoates*.

SILVER (Bromide of). Resembles the chloride (which see).

SILVER (Carbonate of). Syn. *Argenti*

Carbonas,—Lat. A white insoluble powder, obtained by precipitating a *cold solution of nitrate of silver* with another of *carbonate of soda*. It is decomposed by heat.

SILVER (Chloride of). Syn. *Muriate of Silver; Argenti Chloridum, A. Murias*,—Lat. *Calx Lunæ*,—Bate. *Prep.* Precipitate a *solution of nitrate of silver* by *dilute hydrochloric acid* or a *solution of common salt;* wash the precipitate, and dry it in the shade. *Dose.* ¼ to 3 gr., thrice daily; in epilepsy, chronic dysentery, cholera, diarrhœa, &c. Dr. Perry regards it as preferable to the nitrate. When *fused*, chloride of silver forms *horn silver*, or "*luna cornea*" of the older writers.

SILVER (Cyanide of). Syn. *Hydrocyanate of Silver, Cyanodide of do., Cyanuret of do.; Argenti Cyanidum*,—Ph. L. 1836. *A. Hydrocyanas, Argentum Zootinicum*,—Lat. var. *Prep.* Add *dilute hydrocyanic acid* to a *solution of nitrate of silver*, as long as a precipitate falls; wash this with *distilled water*, and dry it.

Prop., &c. Cyanide of silver is a white powder, soluble in ammonia, and decomposed by contact with vegetable substances; light turns it violet-coloured. *Dose.* 1/16 to ⅛ gr.; in syphilis, &c. It has been proposed as a source of hydrocyanic acid. (Everitt.)

SILVER (Fulminate of). See *pages* 497-8.

SILVER (Hyposulphate of). A soluble, crystallizable salt, permanent in the air. See *Hyposulphuric Acid.*

SILVER (Hyposulphite of). Syn. *Argenti Hyposulphis*,—Lat. A white substance, insoluble in water, and very prone to decomposition. It is very soluble in the alkaline hyposulphites forming compounds possessing an intensely sweet taste. See *Hyposulphurous Acid.*

SILVER (Iodate of). Syn. *Argenti Iodas*,—Lat. See *Iodate* and *Iodic Acid.*

SILVER (Iodide of). Syn. *Argenti Iodidum, A. Ioduretum*,—Lat. *Prep.* Precipitate a *solution of nitrate of silver* with another of *iodide of potassium;* wash the precipitate with *distilled water*, and dry it in the shade. Pale greenish-yellow; insoluble in water and in liquor of ammonia; soluble in a solution of hyposulphite of soda. *Used* in some of the French hospitals in the stomach affections of scrofulous subjects; also in epilepsy. *Dose.* 1/12 to 1 gr.

SILVER (Nitrate of). Syn. *Argenti Nitras*,—Lat. This article is *prepared* under two forms:—

1. Crystallized, (*Argenti nitratis crystalli*,—Ph. D. 1826. *Crystalli Lunares*,—Obs. *Prep.* By dissolving *grain silver* in *nitric acid* diluted with about twice its weight of *water*, evaporating the solution until it is strong enough to crystallize on cooling, and then allowing it to cool very slowly. Colourless, transparent, anhydrous rhombic prisms or tables; soluble in an equal weight of cold, and in half their weight of boiling water; soluble in alcohol; fuse when heated, and at a higher temperature suffer decomposition; blackened by light, and by contact with organic substances. Its solution in distilled water is not sensibly darkened by light, in the absence of organic matter. *Used* for solutions, and in photography.

2. Fused, (*Lunar caustic; Argenti nitras*,—Ph. L. & E. *A. N. Fusum*,—Ph. D. *Argentum Nitratum*,—Ph. L. 1787. *Causticum Lunares, Lapis Infernalis*,—Obs.) *Prep.* (Ph. D.) *Refined silver*, 3 *oz.; pure nitric acid*, 2 fl. oz.; *distilled water*, 5 fl. oz.; mix in a glass flask, and apply a gentle heat until the metal is dissolved; transfer the solution to a porcelain capsule (or a large porcelain crucible), decanting it off a heavy black powder which appears at the bottom of the flask, and, having evaporated it to dryness, raise the heat (in a dark room) until the mass liquefies; then pour it into a brass mould (*iron moulds*,—Ph. E. & Ph. L. 1836), furnished with cylindrical cavities of the size of a goose-quill, and which then admits of being opened by a hinge; preserve the concreted salt in well-stopped bottles impervious to the light. The formulæ of the Ph. E. & Ph. L. 1836, are similar.

Pur., &c. Pure nitrate of silver, whether crystallized or fused, is entirely soluble in water, yielding a colourless solution, from which metallic silver is precipitated by a piece of bright copper; both are originally white, but are darkened by exposure to light and contact with organic matter. "If, after 17 gr. of nitrate of silver have been added to 6 gr. of the chloride of sodium dissolved in water, more of the nitrate be poured into the filtered liquor, nothing more is thrown down." (Ph. L.) —"29 gr. dissolved in 1 fl. oz. of water acidulated with nitric acid, precipitated by a solution of 9 gr. of muriate of ammonia, briskly agitated for a few seconds, and then allowed to rest a little, yields a clear supernatant liquor, which is still precipitable by more of the test." (Ph. E.) Nitre is the most common adulterant of nitrate of silver.

Uses, &c. Nitrate of silver is a powerful tonic, antispasmodic, astringent, and escharotic. *Dose.* ⅛ to 1 gr., gradually increased,

twice or thrice a day, made into a pill with crum of bread; in chorea, epilepsy, &c., preceded by purgatives. It has recently been highly extolled, by Mr. Ross, as a remedy in cholera. Its continued use permanently colours the skin. It is also extensively employed *externally* as a caustic. It is *powerfully poisonous*. A solution of common salt, emetics, and demulcents, constitute the treatment in such cases. Nitrate of silver is much employed in the manufacture of "*indelible ink*" for linen, and hair dyes.

Obs. In preparing this salt, care should be had that the silver is free from copper. *Pure nitrate of silver* may, however, be prepared from silver containing copper, by evaporating the nitric solution to dryness, and cautiously heating the mixed nitrates to fusion. A small portion of the melted mass is examined from time to time, until a little dissolved in water, and treated with ammonia in excess, ceases to strike a blue colour. When this point is arrived at, the fused nitrate is allowed to cool, when it is re-dissolved in water, filtered or decanted from the insoluble black oxide of copper, and evaporated in the usual way.

The heat employed in preparing the *fused nitrate* should not exceed 420° Fahr.; and the fusion should be effected completely, but with moderate expedition, to prevent loss of nitric acid. Formerly, a mass of well-tempered white clay, perforated by means of a well-greased goose-quill, was used instead of metal moulds. In the Ph. E. & Ph. L. 1836, the moulds are ordered to be "*greased;*" when this is done, the sticks of caustic should be wiped clean before rolling them in paper. The moulds should be gently heated before pouring the fused nitrate into them.

SILVER (Oxides of). Two of these are known:—

1. *Suboxide of Silver; Suroxide of do.*,—Berzelius. *Prep.* From dry *citrate of silver* heated to 212° Fahr., in a *stream* of *hydrogen gas*, until it turns dark brown, when it is dissolved in water; the solution (*acid citrate of suboxide of silver*) is next treated with potassa, and the precipitate is carefully washed and dried. A black powder, easily decomposed, and soluble in liquor of ammonia.

2. *Oxide of Silver, Protoxide of do., Argentic Oxide*,—Berzelius; *Argenti Oxydum*,—Ph. D. *Prep.*—*a.* (Mr. Lane.) *Nitrate of silver*, 2 parts; *hydrate of potassa*, 1 part; dissolve each separately in *distilled water*, mix the solutions, and after frequent agitation during an hour, collect and wash the precipitate, and dry it by a gentle heat in the shade. A pale-brown powder.

b. (Gregory.) Recently precipitated *chloride of silver* is boiled in a *solution of caustic potassa* of the sp. gr. 1·25, with frequent stirring and *trituration*, until on testing a little of it, it is found to be *entirely* soluble in dilute nitric acid, when it is washed, and dried, as before. A black and very dense powder; chemically pure.

c. (Ph. D.) *Nitrate of silver*, ½ *oz.*; *water*, 4 fl. oz.; dissolve, and pour the solution into a bottle containing *lime water*, 2 quarts, or q. s.; agitate the mixture well, collect and wash the sediment, and dry it at a heat not exceeding 212° Fahr. A dark olive-brown powder. Pure.

Prop, &c. Very soluble in solutions of ammonia and of the alkaline hyposulphites; slightly soluble in water; reaction, alkaline; decomposed by light. *Dose.* ½ to 2 gr.; in epilepsy, gastralgic irritations, &c. It is much used in France, and has been highly extolled in menorrhagia. By some, however, it is not considered superior to the nitrate.

SILVER (Sulphate of). Syn. *Argenti Sulphas*,—Lat. *Prep.* By dissolving *silver* in *sulphuric acid* containing $\frac{1}{10}$th part of *nitric acid;* or, by precipitating a *solution of the nitrate* by another of *sulphate of soda.* It dissolves in 80 parts of hot water, and falls in small colourless needles as the solution cools.

SILVER (Sulphuret of). Syn. *Sulphide of Silver; Argenti Sulphuretum*,—Lat. Prepared by passing *sulphuretted hydrogen* through a *solution* of *nitrate of silver;* or, by melting its constituents together. It possesses a grayish black colour, and is a strong *sulphur-base.*

SILVER (Amalgamated). See p. 515.

SILVER (Leaf). Syn. *Argentum Foliatum, A. in libellis*,—Lat. As leaf-gold; but it cannot be reduced to an equally attenuated state as that metal, being fully $\frac{1}{100000}$th of an inch in thickness. *Used* by dentists and for silvering.

SILVER (Nickel). See *German Silver.*

SILVER (Oxidized). The high appreciation in which *ornamental articles* in *oxidized silver* are now held, renders a notice of the process followed interesting. There are two distinct shades in use, one produced by *chlorine*, which has a BROWNISH TINT, and the other by *sulphur*, which has a BLUEISH-BLACK TINT. To produce the *former*, it is only necessary to wash the article with a *solution of sal ammoniac.* A much more beautiful tint may, however, be

obtained by employing a *solution* composed of equal parts of *sulphate of copper* and *sal ammoniac* dissolved in *vinegar*. A FINE BLACK TINT may be produced by a *slightly warm solution* of *sulphuret of potassium* or of *sodium*. (*Chem. Techn.*)

SILVER (Recovery of). See *page* 1138.

SILVER (Substitutes for). Of these the principal are *German silver*, *Britannia metal*, and *packfong*. The newly discovered metal *aluminium*, possesses nearly all the properties of silver, with many valuable ones peculiarly its own. (See *pp.* 53, 266, *&c.*) Recently, M. Plée, has made the following announcement in the '*Siècle*:'—"The *pavé* contains *metal*, as beet-roots contain alcohol and sugar; nothing can be more true." "Take a thick lump of *freestone* or quartzeous silex, reduce it to powder, and mix it, when pulverized, with a sufficient quantity of *alkali*; fuse it, and you will obtain a *soluble glass* that you can dissolve so as to precipitate the silicia it contains in the shape of a jelly; then take this last product and redissolve it a second time in a *cyanureted lixivium*, so as to produce a compound cyanuret; this operation will give you a fluid, whence it then only remains to extract the metal called *silicium*; into this liquid plunge your utensils, whether of copper, iron, zinc, tin, or lead; bring the electric process to bear upon them properly, and they will instantly be covered with an adherent plating of *silicium*, which is white as silver, and attains to the highest degree of lustre under the polisher's hand." M. Charles Junot is the name of the man who has discovered this new metal.

SILVER DUST. Syn. *Silver Powder*; *Argenti Crocus*, *A. Pulvis*,—Lat. *Prep.* 1. Pure *pulverulent silver* obtained by any of the methods explained at *page* 1138. *Used* to coat pills, by japanners, &c.

2. Heat *oxide of silver* to dull redness in a *porcelain crucible*, cool, triturate the powder in an *agate mortar* and pass it through a fine sieve. Used at the hospital of Montpellier.

SILVER SHELLS. These are *prepared* and *used* like *gold shells*.

SILVERING. The art of covering the surfaces of bodies with a thin coating of silver. *Leather*, *paper*, *wood*, *&c.*, are silvered by covering them with *silver leaf*, by a similar process to that employed for gilding them. (See *p.* 516, *&c.*)

SILVERING (of Glass). Two distinct methods are adopted for this purpose,—one of which consists of a layer of tin-foil and mercury, or some similar alloy, *falsely* called silvering; the other consisting of a coating of *real silver* precipitated from a solution of that metal.

1. *Plane surfaces*, as those of *mirrors*, *&c.*, are commonly silvered as follows:—A *sheet of tin foil* corresponding to the size of the *plate of glass* is evenly spread on a *perfectly smooth* and *solid marble table*, and every wrinkle on its surface is *carefully* rubbed down with a *brush*; a portion of *mercury* is then poured on, and rubbed over the foil with a clean piece of very soft *woollen stuff*, or a *hare's foot*, after which two rules are applied to the edges, and mercury poured on to the depth of a crown piece, when any oxide on the surface is carefully removed, and the *sheet of glass* made *perfectly clean and dry*, is slid along over the surface of the liquid metal, so that no air, dirt, or oxide, can possibly either remain or get between them. When the glass has arrived at its proper position, gentle pressure is applied, and the table sloped a little to carry off the waste mercury, after which it is covered with flannel and loaded with heavy weights; in 24 hours it is removed to a *wooden table* and further slanted, and this position is progressively increased during a month, until it becomes perpendicular.

For *silvering convex* or *concave surfaces* a mould of *plaster of Paris* is employed, so that the amalgamated foil may be accurately fitted to the surface.

Globes and other *hollow vessels* are commonly silvered by the application of one of the *silvering amalgams* noticed at *pages* 54-5.

2. In the *Humid way*.—*a*. (Mr. Drayton.) A *mixture* is first made of *nitrate of silver* (in coarse powder), 1 *oz.*; *liquor of ammonia*, ½ *oz.*; and *water*, 2 *oz.*; which, after standing for 24 hours, is filtered (the deposit upon the filter, which is silver, being preserved), and an addition is made thereto of *spirit* (by preference, *rectified spirit* at 60°_{0} *o.p.*), or *naphtha*, 3 *oz.*; from 20 to 30 drops of *oil of cassia* are then added; and, after remaining for about 6 hours longer, the solution is ready for use. The glass to be silvered (first well cleaned and polished) is placed in a horizontal position, and a wall of putty, or other suitable material, formed around it; the *above solution* is then poured over it to the depth of from ⅛ to ¼ inch; from 6 to 12 drops of a *mixture of oil of cloves* and *spirit of wine* (in the proportion of 1 part, by measure, of oil of cloves, to 3 of spirit of wine) are next dropped into it, at different places; or the diluted oil of cloves may be mixed with the solution before it is poured upon the glass, a larger quantity, in both cases, increasing the rate of the deposit. When the glass is *suffi-*

ciently silvered, the solution is poured off; and as soon as the silver on the glass is perfectly dry, it is *varnished* with a *composition* formed by melting together equal quantities of *bees' wax* and *tallow*. The *solution*, after being poured off, is allowed to stand for 3 or 4 days, in a close vessel; as it still contains silver, and may be again employed after *filtration*, and the *addition* of a sufficient quantity of *fresh ingredients* to supply the place of those which have been used. 18 gr. of *nitrate of silver* are sufficient for one square foot of glass. *Hollow vessels* may be silvered by pouring the solution into them. By the addition of a small quantity of *oil of caraway*, *oil of cloves*, or *oil of thyme*, the *colour of the silver* may be varied. (*Patent Journ.*)

b. (Thomson & Mellish.) *Nitrate of silver*, 2 *oz.*; *water* and *rectified spirit*, of each, 3 fl. oz.; dissolve, add of *spirit of hartshorn* or *liquor of ammonia*, 1 fl. oz., mix, and after a short time filter the solution; to *each ounce* of this add of *grape sugar*, ¼ *oz.*, previously dissolved in a mixture of *rectified spirit* and *water*, of each, ½ pint; after 3 or 4 hours' repose it is *fit for use*. This solution is applied to the glass, heated to about 160° Fahr., in a similar manner to the last. *Patented.*

c. (M. Vohl.) *A solution of gun cotton in caustic potassa* is added to a *solution of nitrate of silver*, followed by sufficient *strong liquor of ammonia* to redissolve the precipitate; the resulting *argentiferous liquid* is applied to the glass, which is then slowly heated over a *water bath* until effervescence ensues, and the deposit of silver is complete.

Obs. Various other reducing substances besides those above named, as aldehyde, and several of the acids, cause the deposition of silver in a reguline form from its solutions. Our own plan, which, as practised by us, appears superior to all those patented, is essentially as follows:—A certain proportion of *saccharic acid* is added to a *solution of nitrate of silver*, and when the mixture is complete, and after repose for a short time, the liquid is decanted, and applied to the glass; a *solution of ammonia* is at the same time added, to throw down the metal, followed by the application of a gentle heat, to impart brilliancy to the deposit.

SILVERING (of Metals). 1. *Leaf Silvering*. This is performed with *leaf silver* in the way described at *p.* 517, for the *Gilding of Polished Metals*.

2. (*Cold Silvering.*) Mix *chloride of silver*, 1 part; with *pearlash*, 3 parts; *common salt*, 1½ part; and *whiting*, 1 part; and well rub the mixture on the surface of the *brass* or *copper* (previously well cleaned), by means of a piece of soft leather, or a cork moistened with *water* and dipped into the powder. When properly silvered the metal should be well washed in *hot water slightly alkalized*, and then wiped dry. See *Powder* (Silvering), *Voltaic Silvering*, *&c.*

SILVIC ACID. See *Sylvic Acid.*

SIMAROUBA. Syn. *Simaruba*,—Ph. E. & D. The *root-bark* of *simaruba amara* (*s. officinalis*), or *mountain damson*. Tonic, bitter, and astringent. *Dose.* 20 to 30 gr.; in intermittents, obstinate diarrhœa, dysentery, and dyspepsia. Its bitter principle has been called *quassina*.

SIMILOR. See *Dutch Gold.*

SINAPISINE. A white, crystallizable, inodorous, bitter-tasted substance extracted from the *seed* of *sinapis alba* or *white mustard*.

SINAPISM. Syn. *Sinapismus*,—Lat. A mustard poultice.

SINAPOLINE. A basic substance formed, along with carbonic acid, when the *volatile oil of mustard* is treated with *protoxide of lead*. It is soluble in water and alcohol, has an alkaline reaction, and crystallizes in colourless plates.

SINNAMINE. A basic substance formed, along with sulphuret of lead, when *thiosinnamine* is treated with *protoxide of lead*. It is very bitter-tasted, has a powerful alkaline reaction, and, when slowly obtained from its concentrated aqueous solution, forms brilliant colourless crystals.

SIZE. Obtained like glue from the skins of animals, but is evaporated less, and kept in the soft state. See *Glue* and *Gold Size*.

SKATE. The *raia batis* (Linn.). Other varieties of *raia* also pass under the name. It is a coarse fish, and is principally salted and dried for exportation.

SKIN (The). Syn. *Cutis*, *Dermis*, *Pellis*, —Lat. Every person knows what this is, and its external appearance, and general properties; but, there are many of our readers who may not be aware of its peculiar construction, and its compound character. The skin then, although apparently a single membrane, is composed of three distinct layers or membranes, each of which performs its special duties:—1. The *exterior* of these is called the *cuticle*, *epidermis*, or *scarf-skin*. It is an albuminous tissue, possessing no sensibility, and is found thickest on those parts of the body most exposed to friction or injury.—2. The *mucous net* or *rete mucosum*, which is a

thin layer of soft pulpy matter, which lies immediately under the cuticle, and is supposed to be the seat of the colour of the skin.—3. The *derma*, *cutis vera*, or *true skin*, is a highly sensitive, vascular, gelatinous texture, the third, and last in succession from the surface of the body. It is this which, when the scarf-skin and hair have been removed, is converted by the process of *tanning* or *tawing* into leather. See "*Eruptions, &c.*," (and *below.*)

SKIN COSMETICS. The simplest, cheapest, and most generally employed *cutaneous cosmetics* are *soap* and *water*, which at once cleanse and soften the skin. *Soap* containing a *full proportion of alkali*, exercises a solvent power upon the cuticle, a minute portion of which it dissolves; but when it contains a *small preponderance of oily matter*, as the principal part of the milder toilet soaps now do, it mechanically softens the skin and promotes its smoothness. *Almond*, *Naples*, and *Castile soaps* are esteemed for these properties, and *milk of roses*, *cold cream*, and *almond powder* (paste), are also used for a similar purpose. To produce an opposite effect, and to *harden* the cuticle, *spirits*, *astringents*, *acids*, and *astringent salts* are commonly employed. The frequent use of *hard water* has a similar effect. The application of these articles is generally for the purpose of strengthening or preserving some particular part against the action of cold, moisture, &c.; as the *lips*, or *mammæ*, from *chapping*, or the *hands* from contracting *chilblains;* but in this respect, *oils*, *pommades*, and other *oleaginous bodies*, are generally regarded as preferable.

Another class of *cutaneous cosmetics* are employed to remove *freckles* and *eruptions*. Among the most innocent and valuable of these, is *Gowland's lotion*, which has long been a popular article, and deservedly so, for it not only tends to impart a delightful softness to the skin, but is a most valuable remedy for many obstinate *eruptive diseases* which frequently resist the usual methods of treatment. *Bitter almonds* have been recommended to remove *freckles* (Celsus), but moistening them with a *lotion* made by mixing 1 fl. oz. of *rectified spirit* and a tea-spoonful of *hydrochloric acid*, with 7 or 8 fl. oz. of *water*, is said to do this more effectually. A safe and excellent cosmetic is, an *infusion of horseradish* in *cold milk*. (Withering.)

Skin paints and *skin stains* are employed to give an artificial bloom, or delicacy to the skin. *Rouge* and *carmine* are the articles most generally used to communicate a *red colour*. The *first* is the only cosmetic that can be employed, without injury, to brighten a lady's complexion. The *other*, though possessing unrivalled beauty, is apt to impart a *sallowness* to the skin by frequent use. *Starch powder* is employed to impart a *white tint*, and generally proves perfectly harmless. The *American ladies*, who are very fond of painting their necks white, use *finely powdered magnesia*, another very innocent substance. Several *metallic compounds*, as the *trisnitrate*, *subchloride*, and *oxide of bismuth* (pearl white, Fard's white, &c.), *carbonate of lead* (flake white), *white precipitate*, *&c.*, are frequently used to revive faded complexions; but they are not only injurious to the skin, but act as *poisons* if taken up by the absorbents. *Trisnitrate of bismuth* (pearl white), probably the least injurious of these articles, has been known to cause spasmodic tremblings of the muscles of the face, ending in paralysis. (Vogt. Pharm.) The employment of *liquid preparations* containing *sugar of lead*, which are commonly sold under the name of *milk of roses*, *cream of roses*, *&c.*, is equally injurious. *Another disadvantage* of these metallic preparations, is that they *readily turn black* when exposed to the action of sulphuretted hydrogen gas, or the vapours of sulphur, such as frequently escape into the apartment from coal fires. There are many instances recorded of a whole company being suddenly alarmed, by the pearly complexion of one of its belles being thus transformed into a sickly gray or black colour.

In conclusion, it may be remarked, that the best PURIFIERS *of the skin* are *soap* and *water*, followed by the use of a *coarse*, but *not* a *stiff cloth*, in opposition to the *costly* and *smooth diapers* that are commonly employed; and the best BEAUTIFIERS, are *health*, *exercise*, and *good temper*.

SKIN (Goldbeater's). See *page* 539.

SKINS (of Animals). The *preparation* and *preservation* of *fur skins* are noticed under "*Peltry*," the *preparation* and *uses* of the *skins of the larger animals* under "*Leather*," "*Tanning*," "*Tawing*," *&c.*

SKY-LARK. See *page* 676.

SLACK. Small coal, such as is used for kilns.

SLAG. The semi-vitrified compounds produced, on the large scale, during the reduction of metallic ores by fluxes. Those from iron and copper works are often used for building materials, mending roads, &c.

SLATE. The excellence of this material

for *water-cisterns*, deserves a passing notice here. *Irish slate* (lapis Hibernicus) is an argillaceous mineral, said to contain iron and sulphur, found in different parts of Ireland. It is a common remedy, among the vulgar, for internal bruises, taken in a glass of gin.

SLEEP. Syn. *Somnus*,—Lat. After being awake for 16 to 18 hours, a general feeling of weakness and fatigue comes over us; "our motions become more difficult, our senses lose their activity, the mind becomes confused, receives sensations indistinctly, and governs muscular contraction with difficulty. We recognise by these signs the necessity of sleep; we choose such a position as can be preserved with little effort; we seek obscurity and silence, and sink into the arms of oblivion."

The slumberer loses in succession the use of his senses. The *sight* first ceases to act by the closing of the eyelids; the organs of *taste* next become dormant, followed by the sense of *smell;* after these the sense of *hearing* loses its activity, or ceases to act altogether; the susceptibility of *touch* is lost; the complete relaxation of the muscles follow,—at first those of the limbs, then those of the neck, and, *lastly*, those of the spine give way; the respiration becomes slower and deeper, and sleep is sound and complete. In some cases, the *sense of hearing* is the last to fall asleep, and when the other senses have become completely dormant, revels in increased activity. This is the case with the writer of this article, who is conscious of the slightest noise, and hears and understands a conversation passing in his presence nearly as well whilst asleep as when awake. During indisposition his sense of hearing has become so exalted, that even a whisper in a distant apartment has been distinctly audible to him. See *Watchfulness, &c.*

SMALL-POX. See *page* 1068.

SMALT. Syn. *Azure, Powder Blue, Siliceous do., Smalts; Azurum, Smalta.* This consists, essentially, of glass coloured by fusing it with protoxide of cobalt.

Prep. 1. *Cobalt ore* is roasted, to drive off the arsenic, then made into a *paste* with *oil of vitriol*, and heated to redness *for an hour;* the *residuum* is powdered, dissolved in water, and the oxide of iron precipitated with *carbonate of potash*, gradually added, until a rose coloured powder begins to fall; the clear portion is then decanted and precipitated with a *solution of silicate of potash* (prepared by fusing together, for 5 hours, a mixture of 10 parts of potash, 15 parts of finely ground flints, and 1 part of charcoal); the precipitate after being dried, is fused, and reduced to a very fine powder. A very rich colour.

2. *Roasted cobalt ore* and *carbonate of potash*, of each, 1 part; *siliceous sand*, 3 parts; fuse them together, and cool and powder the residuum. *Used* as a blue pigment, also to colour glass, and to get up linen. See *Blue Pigments.*

SMELLING SALTS. See *pages* 58 and 1120.

SMELLOME'S EYE SALVE. See *page* 890.

SMELT. The *salmo eperlanus*, a beautiful little abdominal fish abounding in the Thames, and a few other rivers, between the months of November and February. It is esteemed a great delicacy by epicures, but sometimes proves offensive to the delicate and dyspeptic.

SMILACINE. See *Sarsaparilline.*

SMILASPERIC ACID. See *p.* 562.

SMOKE PREVENTION. Although the full consideration of this subject belongs to public hygiène and civil engineering, its immediate application and advantages are interesting and important to everybody. Few persons are aware, that much the larger proportion of the heat generated by the combustion of fuel in common grates, as well as in ordinarily constructed furnaces, passes up the chimney, and is not only absolutely lost, as far as its original application is concerned, but also tends to darken and poison the atmosphere. This is what occurs every day with the millions of fires which are constantly burning in this country. Yet this loss of fuel, this partial privation of solar light, and this deterioration of the atmosphere, may be easily and economically ameliorated, nay, entirely prevented, by means and appliances which are, or ought to be, within the reach of every manufacturer and householder in the kingdom. The *smoke-bill* of Lord Palmerston, although not sufficiently comprehensive, nor so rigorously enforced as it should be, is nevertheless a real boon to the inhabitants of this great metropolis.

The *history* of "*smoke burning*" scarcely commences before the year 1840, at which date Mr. Chas. Wye Williams obtained a patent for this purpose. Since that time a "thousand-and-one" schemes, either patented or non-patented, professedly for the same object, have been brought before the public. Most of these have been supported by the most reckless statements regarding their value, made by interested parties; and the most serious inconvenience and losses have often followed their adoption. In

this dilemma many worthy and well-meaning individuals have become so discouraged, as to eschew all inventions of the kind referred to, and have been led to regard the prevention of smoke as a thing impossible. *Smoke prevention* is now, however, "un fait accompli;" and we should not be performing our duty to our readers, did we not point out to them the methods which they may adopt, with confidence and economy, to realise this desideratum in their workshops and factories, as well as in their household fires. The one most eminently successful and economical is based on the admission of *heated air*, under due regulation, both through the door, and at the bridge or back of the furnace, by which means combustion is rendered absolutely complete, and smoke impossible. This is the principle of "*Lark's Patent Smoke Burner*," approved by the Government Inspectors, and almost invariably mentioned by them, when parties summoned to the Police Courts state their inability to apply a remedy. This invention is now in successful operation upon numerous *steam furnaces* with boilers variously constructed. It has also been extensively tested for the *furnaces* of *coke ovens*, *baker's ovens*, *potteries*, and *chemical works*, and appears equally adapted to them all; whilst from the extreme liberality of the proprietors of the patent ("*The Smoke-burner Company*," Nine Elms), as to charge for license, and the small cost of its application, it is placed within the reach of every manufacturer and tradesman. The *Bakers*, especially, a class of men who have been recently bewailing the extreme difficulty and hardship of their case, have here a cheap and easy remedy. *Ten furnaces* to which this invention has been *successfully applied*, may be seen in daily operation at the Cement Works of Messrs. Francis Brothers, Nine Elms.

For *household fires* the smokeless grate, invented by Dr. Arnott, will be found entirely successful, and most economical. Its general introduction would be a great advance in both domestic and public hygiène; and, being hence of national importance, should be enforced by law.

SMOKING. This is done, on the *large scale*, by hanging up the articles (previously more or less salted) in *smoking rooms*, into which smoke is very slowly admitted from smoothered *dry wood fires*, kindled in the cellar, for the purpose of allowing it to cool and deposit its cruder part, before it arrives at the meat. This process requires from six days to as many weeks to perform it properly, and is best done in winter. In *farm-houses*, where dry wood is burnt, *hams*, *&c.*, are often smoked by hanging them up in some *cool part* of the kitchen chimney. When the meat is cut into slices, or scored deeply with a knife to allow the smoke to penetrate it, it is called "*bucaning*."

"The *quality of the wood* has an influence upon the smell and taste of the smoke-dried meat; smoke from *beech wood* and *oak* being preferable to that from *fir* and *larch*. Smoke from the *twigs* and *berries of juniper*, from *rosemary*, *peppermint*, *&c.*, impart somewhat of the aromatic flavour of these plants." (Ure.) The occasional addition of a few *cloves* or *allspice* to the fuel, gives a very agreeable flavour to the meat.

Hung beef, a highly esteemed variety of smoked beef, is prepared from any part, free from bone and fat, by well salting and pressing it, and then drying and smoking it in the usual manner. It is best eaten shredded. See *Putrefaction*, *Salting*, *&c.*

SNAKE-ROOT. See *Senega*. For Virginian snake-root see "*Serpentary*." Snake-weed (*bistortæ radix*) is the *root* of *polygonum bistorta* (Linn.)

SNIPE. The *scolopax gallinago*, a well-known bird of the Linnean order *grallæ* (waders). It is fine flavoured, but rather indigestible.

SNUFF. Syn. *Pulvis Tabaci; Tabac en poudre*,—Fr. A powder, prepared from tobacco, for the purpose of being snifted up the nose as a stimulant or intoxicant.

The *finer kinds of snuff* are made from the *soft portions* of the best description of *manufactured leaf-tobacco*, separated from the damaged portion; but the *ordinary snuffs of the shops* are mostly prepared from the *coarser* and *damaged portions*, the *mid-ribs*, *stems*, or *stalky parts* that remain from the manufacture of shag tobacco, the *dust* or *powder* sifted from the bales, and the *fragments* that are unfit for other purposes.

Prep. The *proper materials* being chosen, and if not in a sufficiently mature state rendered so by further fermentation, they are sufficiently dried by a gentle heat or exposure to the air, to admit of being pulverized. This is performed, on the *large scale*, in a mill, and, on the *small scale*, with a kind of pestle and mortar. During the operation the *tobacco* is frequently sifted, that it may not be reduced to too fine a powder, and is several times slightly moistened with *rose* or *orange-flower water*, or *eau d'ange*, which are the only ones fit

for the superior kinds of snuff. In preparing the *dry snuffs* no moisture is used. The *scent* or other like matters are next added, and, after thorough admixture, the snuff is packed in jars or canisters.

Pur. During the grinding of tobacco it is frequently mixed with *dark-coloured rotten wood*, various *English leaves*, *colouring*, and other matter. *Ammonia*, *hellebore*, *euphorbium*, and *powdered glass*, are common additions to snuffs to *increase their pungency*. We have seen powdered *sal ammoniac* sent by the hundred-weight at one time to a certain celebrated London tobacconist. The *moist kinds of snuff* are generally drugged with *pearlash*, for the triple purpose of keeping them damp and increasing their pungency and colour. The *dry snuffs*, especially *Scotch* and *Welsh*, are commonly adulterated with *quicklime*, the particles of which may be occasionally distinguished even by the naked eye. This addition causes their biting and desiccating effect on the pituitary membrane. We were once severely injured by taking snuff which, after our suspicions were awakened, we found to contain a mixture of *red lead* and *umber*.

Var. Snuffs are divided into two kinds—Dry Snuffs; as *Scotch*, *Irish*, *Welsh*, and *Spanish snuff*, *Lundyfoot*, *&c.*; and—Moist Snuffs, or rappees, including *black* and *brown rappee*, *carotte*, *Cuba*, *Hardham's mixture*, No. 37, *prince's mixture*, *princeza*, *queen's snuff*, *&c.* The last three also come under the denomination of scented snuffs.

The *immense variety of snuffs* kept in the *shops*, independently of the above-named conditions, depend for their distinguishing characteristics on the length of the fermentation, the fineness of the powder, the height to which they are dried, and the addition of odorous substances. *Tonquin beans*, *essence of do.*, *ambergris*, *musk*, *civet*, *leaves of orchis fusca*, *root* and *oil of calamus aromaticus*, *powder* and *essence of orris root*, and the *essences* or *oils of bergamot*, *cedra*, *cloves*, *lavender*, *petit grain*, *neroli*, and *roses* (otto), as well as several others, either alone or compounded, are thus employed. *Tabac parfumée aux Fleurs* is perfumed by putting *orange flowers*, *jasmins*, *tuberoses*, *musk roses*, or *common roses*, to the snuff in a close chest or jar, sifting them out after 24 hours, and repeating the infusion with fresh flowers, as necessary. *Another way* is to lay paper, pricked all over with a large pin, between the *flowers* and the *snuff*.

Macouba snuff is imitated by moistening the *tobacco* with a mixture of *treacle* and *water*, and allowing it to ferment well.

Spanish snuff is made from unsifted *Havannah snuff*, reduced by adding *ground Spanish nutshells*, sprinkling the mixture with *treacle water*, and allowing it to sweat for some days before packing.

Yellow snuff is prepared from *ordinary pale snuff* moistened with a mixture of *yellow ochre* diffused in *water*, to which a few spoonfuls of *thin mucilage* has been added; when dry, the colour that does not adhere to the snuff is separated with a fine sieve.

Red Snuff. As last, but using *red ochre*.

SNUFF (Asarabacca). Syn. *Cephalic Snuff*, *Compound Powder of Asarabacca*; *Pulvis Asari Compositus*,—Lat. *Prep.* 1. (Ph. D. 1826.) *Asarabacca leaves*, 1 oz.; *lavender flowers*, 1 dr.; (both dried;) mix and powder them.

2. (Ph. E. 1817.) *Asarabacca leaves*, 3 dr.; *leaves of marjoram* and *flowers of lavender*, of each, 1 dr.; as before. See *Cephalic Snuff*, *Asarabacca*, *&c.* Both are used as errhines in headaches and ophthalmia.

SNUFF (Cephalic). *Prep.* 1. From *asarabacca leaves* and *Lundyfoot snuff*, of each, 2 *oz.*; *lavender flowers*, ¼ *oz.*; *essence of bergamotte* and *oil of cloves*, of each, 2 or 3 drops; mixed and ground to a powder, the perfume being added last.

2. (*Boeli's.*) From *tobacco* or *pure snuff* and *valerian root*, of each, ½ *oz.*; reduced to powder, and scented with the *oils of lavender* and *marjoram*, of each, 5 or 6 drops.

Obs. The first formula is an excellent one; and the product is very useful in nervous headaches, dimness of sight, &c. See *Asarabacca Snuff*.

SNUFF (Eye). *Prep.* From *subsulphate of mercury* (finely levigated), ½ dr.; *pure dry Scotch* or *Lundyfoot snuff*, 1 *oz.*; triturate them well together. A pinch of this, occasionally, has been recommended in inflammation of the eyes, dimness of sight, headache, polypus, &c.; but it should be used with caution, and not too often.

SOAP. Syn. *Sapo*,—Lat. *Savon*,—Fr. Spanish or Castile soap, made with olive oil and soda, (*sapo*, *sapo ex olivæ oleo et sodâ confectus*, —Ph. L.; *Sapo durus*,—Ph. E. & D.,) and soft soap, made with olive oil and potash, (*sapo mollis*, —Ph. L. & E.; *Sapo ex olivæ oleo et potassa confectus*,—Ph. L.,) are the *only kinds* directed to be *employed in medicine*. The *former* is intended whenever *soap* is ordered, and is the one which is principally employed internally, the *latter* is used in

ointments, &c., and in some of the officinal pills.

Prep. The *fatty* or *oleaginous matter* is boiled with a *weak alkaline lye* (soap-lye) rendered *caustic* by quick-lime, and portions of *stronger lye* are added from time to time, the ebullition being still continued, until these substances, reacting on each other, combine to form a tenacious compound, which begins to separate from the water; to promote this separation and the granulation of the newly formed soap, some *common salt* is generally added, and the fire being withdrawn, the contents of the boiler are allowed to repose for some hours, in order that the soap may collect into one stratum, and solidify; when this happens it is put into *wooden frames* or *moulds*, and when it has become stiff enough to be handled, it is cut into bars or pieces, and exposed to the air, in a warm situation, to further harden and to dry.

Var. The principal of these are:—

Almond Soap (*sapo amygdalinus*), made from *almond oil* and *caustic soda*, and chiefly used for the toilet.

Castile Soap, *Spanish do.*, *Marseilles do.*; *Sapo Castiliensis*, *Sapo Hispanicus*. An *olive-oil soda soap*, kept both in the *white* and *marbled* state. The former is said to be the *purest*; the latter, the *strongest*.

Curd Soap, made with *tallow* (chiefly) and *soda*.

Mottled Soap, made with *refuse kitchen-stuff*, *&c.*

Soft Soap (of commerce), made with *whale*, *seal*, or *cod oil*, *tallow*, and *caustic potash*.

Toilet Soaps, prepared from any of the preceding varieties, and variously coloured and scented.

Yellow Soap, *Rosin Soap*, made with *tallow*, *rosin*, and *caustic soda*.

Soaps are also divided into *soft* or *potash soaps*, and *hard* or *soda soaps*.

Pur. See *below*.

Assay. 1. For the *Water*. A piece, *fairly taken* from the sample, and weighing 100 gr., is reduced to thin shavings, which are dried by the heat of boiling water until they cease to lose weight. The *loss* indicates the proportion of FREE WATER. This should not exceed 35% for ordinary *curd* and *mottled soap*; 45% for *yellow soap*; and about 15 to 16% for *Castile soap*.

2. For the *Alkali*. 100 gr. of the *soap* are dissolved in 4 or 5 fl. oz. of *boiling water*, and the solution tested by the common method of alkalimetry. *Curd* and *yellow soap* usually contain from 6 to 7%; *mottled soap*, from 7 to 8%; and *Castile soap*, 8 to 9% of *soda*.

3. For the *Oil* or *Fat*. The *solution* tested for alkali (see No. 2) is heated, and then allowed to cool slowly; when cold, the floating fatty matter is removed, freed from water, and weighed. When the fat or oil has little consistence, 100 gr. of pure white wax is added to the soap solution, before heating it. The *weight obtained*, in grains in the one case, and the excess above 100 gr. in the other, give the proportion of OIL or FAT present. This, in ordinary *mottled soap*, should be about 68%; in *yellow soap*, 65%; in *curd soap*, 60%; and in *Castile soap*, 75%.

4. *Unsaponified fatty matter.*—*a.* Pure soap is *entirely* soluble in distilled *water* and insoluble in saline solutions; if a film of fatty matter forms on its solution in the former, after repose, *that portion* has NOT BEEN SAPONIFIED.

b. The fat separated from soap (See No. 2) when it has been *perfectly saponified* is *entirely* soluble in alcohol.

5. *Other Impurities.* Pure soap is soluble in *rectified spirit*, forming a colourless, or nearly colourless solution. The *undissolved portion*, if exceeding 1%, is adulteration.

Uses, *&c.* The common uses of soap need not be enumerated. As a *medicine*, it acts as a mild purgative and lithontriptic, and it has been thought by some to be useful in certain affections of the stomach arising from deficiency of bile. *Externally*, it is stimulant and detergent. *Dose.* 3 to 20 or 30 gr., made into pills, and usually combined with aloes or rhubarb.

Concluding Remarks. Prior to the researches of M. Chevreul, no correct ideas were entertained as to the constitution of soap. It was long known that the fixed *oils* and *fats*, in contact with *caustic alkaline solutions* at a high temperature, undergo the remarkable change which is called *saponification*; but here the knowledge of the matter stopped. Chevreul discovered that if the soap, so produced, be afterwards decomposed by the addition of an acid, the fat which separates is found to be completely changed in character; to have acquired a strong acid reaction when applied in a melted state to test-paper, and to have become soluble with the greatest facility in warm alcohol; in other words,—that a new substance, capable of forming salts, and exhibiting all the characteristic properties of an *acid*, has been generated out of the elements of the neutral fat under the influence of the base. Stearine, when

thus treated, yields *stearic acid*, margarin gives *margaric acid*, oleine gives *oleic acid*, and common animal fat, which is a mixture of the three neutral bodies, affords by saponification by an alkali and subsequent decomposition of the soap, a mixture of the three fatty acids in question. These bodies are not, however, the only products of saponification; the change is always accompanied by the formation of a very peculiar sweet substance, called *glycerine*, which remains in the mother-liquor from which the acidified fat has been separated. The process of saponification itself proceeds with perfect facility even in a closed vessel; no gas is disengaged; the neutral fat, of whatsoever kind, is simply resolved into an *alkaline salt of the fatty acid*, which is *soap*, and into *glycerine*, a neutral body resembling syrup, and like that liquid, miscible with water in every proportion.

"When yellow soap is made with the cheaper kinds of fat, it will hardly acquire a sufficient degree of firmness or hardness to satisfy the thrifty washerwoman. It melts away too rapidly in hot water; a defect which may be well remedied by the introduction into the soap of a little (1-20th) *fused sulphate of soda;* and this salt concreting gives the soap a desirable hardness, whilst it improves its colour, and renders it a more desirable article for the washing tub." (Ure.) This process was patented by Dr. Normandy, but soon proved a source of annoyance and molestation to him on the part of the Board of Excise, it being an enormous crime in law to attempt to improve and cheapen soap.

"Soda which contains sulphurets is preferred for making mottled or marbled soap, whereas the desulphuretted soda makes the best white curd soap." "The Barillas always contain a small proportion of potash to which their peculiar value, in making a *less brittle* or *more plastic* hard soap than the factitious sodas, may, with great probability, be ascribed." (Ure.)

The *mottled appearance* is usually given, in the London Soap-works, by watering the nearly finished soap with a strong lye of *crude soda*, by means of a watering can furnished with a rose spout. For *Castile soap*, a solution of sulphate of iron is so employed.

SOAP (Arsenical—Bécœurs). Syn. *Sapo Arsenicalis*,—Lat. *Prep.* From *carbonate of potash*, 12 *oz.; white arsenic, white soap*, and *air-slaked lime*, of each, 4 *oz.; powdered camphor*, ¾ *oz.;* made into a paste with *water*, q. s. *Used* to preserve the skins of birds, and other small animals.

SOAP (Black). Syn. *Sapo Niger, S. Mollis Communis*,—Lat. A crude soft soap made of *fish-oil*, and *potash;* but the following mixture is usually sold for it: —*soft soap*, 7 *lb.; train oil*, 1 *lb.; water*, 1 *gall.;* boil to a proper consistence, adding *ivory black* or *powdered charcoal*, q. s. to colour. *Used* by Farriers.

SOAPS (Medicated). A few only of these deserve notice here:—

Antimonial soap; Sapo Antimonialis, Sapo Stibiatus,—Lat. *Prep.* (Hamb. Cod. 1845.) *Golden sulphuret of antimony*, 2 dr; *solution* of *caustic potassa*, 6 dr. (or q. s.); dissolve and triturate the solution with *medicated* (Castile) *soap* (in powder), 1½ oz.; until the mass assumes a pilular consistence. It should be of a greyish-white colour.

Chlorinated Soap; Sapo Calcis Chlorinatæ,—Lat. *Savon Antisyphilitique*,—Fr. *Prep.* From *Castile soap* (in powder), 11 *oz.; chloride of lime* (dry and good), 1 *oz.;* mix, beat them to a mass with *rectified spirit*, q. s.; (holding in solution) *oil of verbena* or *of ginger grass*, ¼ *oz.;* lastly, form the mass into flat tablets, and wrap these in thin sheet gutta percha. A most excellent detergent and stimulant soap in various affections, admirably adapted for hospital use, and for removing stains from the skin and rendering it white. It is the most powerfully known agent against infection from *all* contagious diseases communicable by contact.

Croton Soap; Sapo Crotonis,—Lat. *Prep.* From *croton oil* and *liquor of potassa*, equal parts; triturated together in a warm mortar until they combine. Cathartic. *Dose.* 1 to 3 gr.

Soap of Guaiacum; Sapo Guaiaci, Sapo Guaiacinus,—Lat. *Prep.* (Ph. Bor.) *Liquor of potassa*, 1 oz.; *water*, 2 oz.; mix in a porcelain capsule, apply heat, and gradually add of *resin of guaiacum* (in powder), 6 dr., or as much as it will dissolve; next decant or filter, and evaporate to a pilular consistence. *Dose.* 10 to 30 gr.; in chronic rheumatism, various skin diseases, &c.

Iodine Soap; Sapo Ioduratus,—Lat. *Prep.* From *Castile soap* (sliced), 1 *lb.; iodide of potassium*, 1 *oz.;* (dissolved in) *water*, 3 *fl. oz.;* melt them together in a glass or porcelain vessel, over a water bath. Excellent in varions skin diseases; also as a common soap for scrofulous subjects.

Soap of Jalap. See *page* 654.

Macquer's Acid Soap; Sapo Vitriolicus, —Lat. *Prep.* From *Castile soap*, 4 *oz.;* softened by heat and a *little water;* and then continually triturated in a mortar with

oil of vitriol (added drop by drop). Detergent. *Used* where alkalies would be prejudicial.

Mercurial Soap; Sapo Mercurialis,—Lat. *Prep.* 1. (*Sapo Hydrargyri Bichloridi.*) From *Castile soap* (in powder), 4 *oz.*; *corrosive sublimate*, 1 dr.; (dissolved in) *rectified spirit*, 1 fl. oz.; beaten to a uniform mass in a porcelain or wedgewood-ware mortar.

2. (*Sapo Hydrargyri Precipitati Rubri*,—Sir H. Marsh.) From *white Windsor-soap*, 2 oz.; *nitric oxide of mercury* (levigated), 1 dr.; *otto of roses*, 6 or 8 drops; (dissolved in) *rectified spirit*, 1 to 2 fl. dr.; as the last. Both the above are employed as stimulant detergents and repellants, in various skin diseases; also as *savon antisyphilitique*.

Sulphuretted Soap; Sapo Sulphuris, Sapo Sulphuratus—Lat. *Prep.* (Sir H. Marsh.) From *white soap*, 2 *oz.*; *sublimed sulphur*, ¼ *oz.*; beaten to a smooth paste in a marble mortar with 1 or 2 fl. dr. of *rectified spirit* strongly coloured with *alkanet root*, and holding in solution *otto of roses*, 10 or 12 drops. In itch, and various other cutaneous diseases.

Tar Soap; Sapo Picis Liquidæ, Sapo Piceus,—Lat. *Prep.* From *tar*, 1 part; *liquor of potassa* and *soap* (in shavings), of each, 2 parts; beat them together until they unite. Stimulant. *Used* in psoriasis, lepra, &c.

Turpentine Soap; Starkey's Soap; Sapo Terebinthinæ, S. Terebinthinatus,—Lat. *Savon Térébinthine*,—Fr. *Prep.* (P. Cod.) *Subcarbonate of potash, oil of turpentine*, and *Venice turpentine*, equal parts; triturate them together, in a warm mortar, with a *little water* until they combine; put the product into *paper moulds*, and in a few days slice it, and preserve it in a well-stopped bottle.

SOAPS (Toilet). Of *Toilet-soaps* there are two principal varieties:—

1. (*Hard.*) The basis of these is, generally, a *mixture* of *suet*, 9 parts, and *olive oil*, 1 part, saponified by *caustic soda*; the *product* is variously scented and coloured. They are also made of *white tallow, olive, almond*, and *palm oil soaps*, either alone or combined in various proportions, and scented.—2. (*Soft.*) The basis of these is a *soap made of hog's lard* and *potash*, variously scented and coloured.

On the *small scale*, the *perfume* is generally added to the *soap* melted in a bright copper pan by the heat of a water bath; on the *large scale*, it is mixed with the *liquid soap*, at the soap-maker's, before the latter is poured into the frames.

The following are examples of a few of the leading toilet soaps:—

Savon à la Rose. From a mixture of *olive oil soap*, 36 *lb.*; *best tallow soap*, 24 *lb.*; (both new and in shavings;) *water*, 1 quart; melted in a covered *bright copper pan*, by the heat of a *water bath*, then coloured with *vermilion* (finely levigated), 2½ *oz.*; and, after the mixture has cooled a little, scented with *otto of roses*, 3 *oz.*; *essence of bergamot*, 2½ *oz.*; *oils of cloves* and *cinnamon*, of each, 1 *oz.*

Bitter-almond Soap; Savon d'Amande. From *white tallow soap*, 56 *lb.*; *essential oil of almonds*, ¾ *lb.*; as before.

Savon au Bouquet. From *tallow soap*, 30 *lb.*; *olive-oil soap*, 10 *lb.*; *essence of bergamot*, 4 *oz.*; *oils of cloves, sassafras*, and *thyme*, of each, 1 *oz.*; *pure neroli*, ½ *oz.*; *brown ochre* (finely powdered), ½ *lb.*; mixed as the last.

Cinnamon Soap. From *tallow soap*, 14 *lb.*; *palm-oil soap*, 7 *lb.*; *oil of cinnamon* (cassia), 3 *oz.*; *oil of sassafras* and *essence of bergamot*, of each, ½ *oz.*; *levigated yellow ochre*, ½ *lb.*

Floating Soap. From good *oil-soap*, 14 *lb.*; *water*, 3 pints; melted together by the heat of a *steam* or *water bath*, and assiduously beaten until the mixture has at *least* doubled its volume, when it must be put into the frames, cooled, and cut into pieces. Any *scent* may be added.

Honey Soap. 1. From *palm-oil soap* and *olive-oil soap*, of each, 1 part; *curd soap*, 3 parts; melted together and scented with the *oil of verbena, rose-geranium*, or *ginger-grass*.

2. From the *finest bright-coloured yellow soap*, scented with the *oils of ginger-grass* and *bergamot*.

Musk Soap. As *cinnamon soap*, but with *essence of musk*, supported with a little *essence of bergamot* and *oil of cloves*, as perfume, and *burnt sugar*, to colour.

Naples Soap. From *olive oil* and *potash*.

Orange-flower Soap. As *soap à la rose*, with *oil of neroli* or *essence de petit grain*, supported with a little of the *essences of ambergris* and *Portugal*, for perfume.

Palm-oil Soap, Violet do. Made of *palm oil* and *caustic soda lye*. It has a pleasant odour of violets and a lively colour.

Pearl Soap, Almond Cream; Créme d'Amandes. From a *soap* made of *lard* and *caustic potash lye*; when *quite cold*, it is beaten in small portions at a time in a marble mortar, until it unites to form a homogeneous mass, or "*pearls*" as it is called; *essence of bitter almonds*, q. s., to perfume, being added during the pounding.

Shaving Soap. See *page* 940.

Transparent Soap. From perfectly dry *almond*, *tallow*, or *soft soap*, reduced to shavings, and dissolved, in a closed vessel or still, in an equal weight of *rectified spirit*, the clear portion, after a few hours' repose being poured into moulds or frames; after a few weeks' exposure to a dry atmosphere, the pieces are "trimmed up" and stamped, as desired. It may be scented and coloured, at will, by adding the ingredients to it while in the soft state. A ROSE COLOUR is given by *tincture of archil;* and YELLOW, by *tincture of turmeric* or *annotta.* It does not lather well.

Windsor Soap; Sapo Vindesoræ S. Vindesoriensis.—1. (*White; S. V. Albus.*) The best *English* is made of a *mixture* of *olive oil*, 1 part, and *ox tallow* or *suet*, 9 parts, saponified by *caustic soda. French Windsor-soap* is made of *hog's lard*, with the addition of a little *palm oil.* That of the *shops* is merely ordinary *curd soap*, scented with *oil of caraway*, supported with a little *oil of bergamot*, *lavender*, or *origanum.* To the finer qualities a *little* of the *essences of musk* and *ambergris* is *occasionally* added. 1½ *lb.* of the *mixed scents* is the common proportion per *cwt.*

2. (*Brown; S. V. Fuscus.*) This merely differs from the last in being coloured with *burnt sugar*, or (less frequently) with *umber.* Originally, it was the white variety that had become mellow and brown with age.

SODA. Syn. *Oxide of Sodium*, *Protoxide of do.; Soda*,—Lat. *Natron*,—Germ. *Mineral Alkali*,—Obs. This substance bears the same relation to its metallic base *sodium*, as potassa does to potassium. The hydrate of soda (*sodæ hydras*), as well as its solution (*liquor sodæ*), are prepared from *carbonate of soda* in precisely the same way as the corresponding preparations of potassa. The majority of the *salts of soda* may also be obtained in a similar manner to those of potassa.

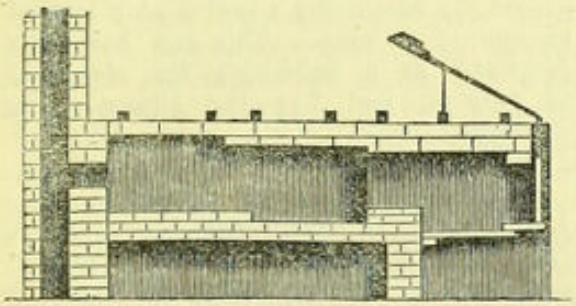
Tests, &c. Pure soda, its hydrate, and salts, in their *general* deportment and properties, resemble potassa and its corresponding compounds; but its basic and alkaline action are rather less powerful than those of potassa.

Soda and *its salts* are *recognised*—1, by their solubility in water, and not being precipitated by any reagent except the antimoniate of potassa; which gives, in alkaline and neutral solutions, a white crystalline precipitate, the formation of which is greatly promoted by friction with a glass rod against the sides of the vessel; (if carbonate of potassa is present, it should be neutralized with acetic acid before applying this test;)—2, by yielding a salt with sulphuric acid, which by its taste (*intensely bitter*) and form (six-sided prisms, transparent, and extremely efflorescent) is readily recognised as sulphate of soda;—3, by its salts, when exposed by means of platinum wire to the *inner* flame of the blowpipe, imparting a *rich yellow* colour to the *outer* flame;—4, by its muriate or chloride, and other salts, imparting a yellow tinge to the flame of alcohol. Like the other alkalies, it is distinguished in the caustic and carbonated states—5, by turning turmeric *brown*, and vegetable blues *green.* (See p. 1151.)

Soda is *distinguished* from potassa—1, by its hydrate, after it has deliquesced in the air, speedily resolidifying by the absorption of carbonic acid, forming carbonate of soda, a salt marked by being *easily* crystallizable, and rapidly effloresing when exposed to dry air;—2, by not being precipitated by bichloride of platinum, nor by picric, nor tartaric acid;—3, by all the reactions the preceding paragraph, except the last one.

SODA (Acetate of). Syn. *Sodæ Acetas*,—Ph. D. & Ph. L. 1836. *Terra Foliata Mineralis*,—Obs. Prepared from *carbonate of soda* as the corresponding potassa salt; but the resulting solution is evaporated to a pellicle, and set aside to crystallize. Its crystals are striated oblique rhombic prisms; it effloresces slightly in the air, and is soluble in 4 parts of water at 60° Fahr. Diuretic. *Dose.* 20 to 40 gr.

SODA (Arseniate of). This salt (*soda arsenias*), as well as the *superarseniate* or *biarseniate of soda*, are made like, and resemble in their *properties* and *doses*, the corresponding potash-salts.



SODA (Biborate of). See *Borax.*

SODA (Bicarbonate of). See *below.*

SODA (Carbonate of). Syn. *Sodæ Carbonas*,—Ph. L. E. & D. *Sodæ Subcarbonas*,—Ph. L. 1824, & Ph. E. 1839. *Natron Præparatum*,—Ph. L. 1788. *Subcarbonate of Soda*, *Mild Fossil* or *Mineral Alkali*, *Aerated Mineral do.*, *Salt of Barilla*, *Salt of Soda*, *Natron Carbonicum*,—Obs. var. The carbonate of soda of commerce is either prepared from the *ashes of sea weed* and other marine vegetables, in a somewhat similar manner to that by which carbonate of potash is obtained from the ashes of inland vegetables, or it is prepared from *common salt* or *sulphate of soda* by the action of sulphuric acid, carbonaceous matter, and heat. The *ashes of marine plants* have been long an article of commerce, under the names of *barilla*, *barilla ashes*, *kelp*, *blanquette*, *&c.*, but the carbonate

made from them is of a very impure description. That from the sulphate, when the process has been well-conducted, is much purer. The quantity of carbonate of soda in the ashes of marine plants varies from 3 to 40%.

Prep. 1. From *Sea-salt* or *Sulphate of Soda*. The *latter* is generally obtained by decomposing the *former* with *sulphuric acid;* the evolved gas being passed into *water*, or through flues filled with coak, over which a very small stream of cold water constantly flows, by which it is condensed, and forms "*liquid hydrochloric acid*," a substance afterwards consumed, in large quantities, in the manufacture of chloride of lime, and for other purposes. The *sulphate of soda*, obtained from this or any other source, is well mixed with an equal weight of *chalk*, and about half its weight of *coal*, each being previously ground to powder, and the mixture is exposed to a strong heat in a reverberatory furnace (see *Engr.*) until the decomposition of the sulphate is complete; the mass during the calcination being frequently stirred about

Scotch Soda-furnace.

with a long iron rod; the semi-liquid mass is now raked into an iron trough, where it is allowed to cool, whilst the furnace is *recharged* with fresh materials. The crude dark-gray product, thus obtained, is known as "*ball alkali*" or "*British barilla*," and usually contains about 22 or 23% of *pure soda*. This is now *lixiviated* with *tepid water*, and the solution, after defecation, evaporated to dryness; the residuum is mixed with about half its bulk of *coal-dust*, or an equal bulk of *sawdust* or *charcoal*, and roasted in a reverberatory furnace, at a heat not exceeding 700° Fahr., until *all the sulphur* is expelled. The *product* is the "*soda-ash*," "*soda salt*," or "*British alkali*," of commerce, and contains about 50% of pure soda. When this is *purified* by solution in water, defecation, evaporation, and crystallization, it furnishes *commercial crystallized carbonate of soda*. When this last is redissolved, and the filtered solution is carefully crystallized, it constitutes the ordinary *carbonate of soda* used in *pharmacy* and *medicine*.

Sulphate of Soda, treated as above, yields about 168% of *crude soda* at 33 per cent.; or 130% of the *crystallized carbonate*. (Ure.)

2. From the *Ashes of Marine plants*. See *above*.

3. (*Chemically pure.*) From *pure bicarbonate* or *acetate of soda* heated to redness in a platinum crucible. (See *p.* 1034.)

Prop., &c. This salt forms large, transparent, oblique rhombic prisms, which, as ordinarily met with, contain 10 equivalents of water, but by particular management may be had with fifteen, nine, seven, or sometimes with only one, (Fownes); it is soluble in twice its weight of water at 60°, and less than an equal weight at 212° Fahr. As a *medicine* it is deobstruent and antacid, and is given in *doses* of 10 to 30 gr. It is also, occasionally, used to make effervescing draughts. When taken in an over dose it is poisonous. The *antidotes* are the same as for carbonate of potassa. The *crude* carbonate is largely employed in the manufacture of soap, glass, &c.

Pur. The ordinary carbonate of soda generally contains either sulphates or chlorides, and frequently both. These impurities may be detected in the manner noticed under *Carbonate of Potassa*. "After saturation with hydrochloric acid, chloride of barium throws down nothing from its solution. 100 gr. at a high temperature lose 62·5 gr. of water. A like quantity added to dilute sulphuric acid evolves 15·28 of carbonic acid." (Ph. L.) It should be "totally soluble in water, but not at all in alcohol." (Ph. L. 1836.) "A solution of 21 gr. in 1 fl. oz. of water, precipitated by 19 gr. of nitrate of baryta, remains precipitable by more of the test; and the precipitate is *entirely* soluble in nitric acid." (Ph. E.) Its solution is not disturbed by the addition of a solution of picric acid in alcohol, by which it is *distinguished* from the *carbonate of potassa*.

Assay. See *Alkalimetry* (and *above*.)

SODA (Carbonate of,—Dried). Syn. *Sodæ Carbonas Exsiccata*,—Ph. L. *Sodæ Carbonas Siccatum*,—Ph. E. & D. *Sodæ Subcarbonas Exsiccata*,—Ph. L. 1824. *Prep.* 1. (Ph. L.) Take of *carbonate of soda*, 1 lb; expose it to heat until the crystals fall to powder, next heat it to redness, and when cold, rub it to powder.

2. Expose the salt, reduced to coarse powder, to the air in a dry and warm situation, when it will rapidly effloresce

and fall into a pulverulent state, not liable to further change.

Obs. 53 gr. of the *dried carbonate of soda* are equal to 143 of the *crystallized salt.* The medicinal properties of both are similar. It has, however, the disadvantage of being difficultly soluble in water. "It is (*entirely*) soluble in water; 100 gr. treated with dilute sulphuric acid, lose 40·7 gr. of carbonic acid." (Ph. L.) *Dose.* 5 to 20 gr. in pills or powder; in calculus, &c.

SODA (Bicarbonate of). Syn. *Sesquicarbonate of Soda; Sodæ Bicarbonas,*—Ph. L. E. & D. *Sodæ Sesquicarbonas,*—Ph. L. 1836. *Sodæ Carbonas,*—Ph. L. 1824 and Ph. E. 1839. *Aerated Soda,*—Obs. This is the soda analogue of the potassa salt noticed at *pages* 1035-6, and is prepared in a precisely similar manner. *Another method* is as follows:—Take of *crystallized carbonate of soda,* 1 part; *dried carbonate of soda,* 2 parts; (both in powder;) triturate them well together, and surround them with an atmosphere of *carbonic acid gas,* under pressure; let the action go on until no more gas is absorbed, (which will generally occupy 10 to 14 hours, according to the pressure employed,) then remove the salt and dry it at a heat not above 120° Fahr.—*Obs.* This process is essentially that of the Ph. E. In that of Mr. Smith, described in the *Phil. Pharm. Journ.,* and now adopted in the Ph. U. S., the salt employed is in crystals. In Scotland the method just described has been adopted with perfect success, and we can, from our own experience, bear testimony to its efficiency. Both the *carbonate* and *bicarbonate of soda* are now placed in the Materia Medica of the Ph. L.

Prop., &c. A crystalline white powder; it is soluble in 10 parts of water at 60° Fahr., but it cannot be dissolved in even warm water without partial decomposition; it is more pleasant tasted and more feebly alkaline than the carbonate of the same base. When absolutely pure it does not darken turmeric paper, or only *very* slightly. The *dose* is from 10 to 40 grains, as an antacid and absorbent. It is much employed in the preparation of *effervescing powders* and *draughts;* for which purpose

20 gr. of *commercial bicarbonate of soda*

are taken with

18 gr. of *crystallized tartaric acid;*
17 gr. of *crystallized citric acid;* or
½ fl. oz. of *lemon juice.*

Pur. It is entirely "soluble in water; from this solution neither bichloride of platinum, nor sulphate of magnesia, throws down anything, unless heat be applied; what is thrown down by chloride of barium is dissolved by hydrochloric acid. 100 gr. added to dilute sulphuric acid evolve 51·7 gr. of carbonic acid." (Ph. L.) "Dissolved in 40 parts of water it does not give a reddish precipitate with a solution of corrosive sublimate." (Ph. E.)

Assay. The *quantity of bicarbonate* any given sample contains may be approximatively determined by well washing 100 gr. of the *salt* with an equal weight of *water,* and filtering the solution. The residuum left upon the filter, dried at a heat of 120° Fahr., and weighed, gives the per centage of *pure bicarbonate of soda* present (very nearly). The solution of this in water will give only a very trifling *white* precipitate with corrosive sublimate; whilst the filtered portion, which was used to wash the salt, will give a *red* one, if it contains the simple carbonate of soda.

SODA (Chloride of). See *Hypochlorite of Soda.*

SODA (Chromate of). As *chromate of potash,* by employing a *salt of soda* instead of one of potassa. This salt has been proposed as a substitute for chromate of potassa, and has the advantage in cheapness.

SODA (Hydrate of). See *page* 1150.

SODA (Hydrosulphate of). Syn. *Sodæ Hydrosulphas Crystallizatum,*—Lat. *Prep.* (P. Cod.) Saturate a *solution of caustic soda* (sp. gr. 1·200) with *sulphuretted hydrogen,* closely cover up the vessel, and set it aside that crystals may form; drain, press them in bibulous paper, and at once preserve them in a well-closed bottle. *Used* to make mineral waters, and in certain skin diseases.

SODA (Hypochlorite of). Syn. *Chloride of Soda; Oxymuriate of do.; Chloruret of Oxide of Sodium; Soda Chlorinata,*—Lat. *Prep.* (Dr. Christison.) *Dried carbonate of soda,* 19 parts; are triturated with *water,* 1 part; and the mixture placed in a proper vessel, and exposed to the prolonged action of *chlorine gas,* generated from a mixture of *chloride of sodium,* 10 parts; *binoxide of manganese,* 8 parts; *sulphuric acid,* 14 parts; (diluted with) *water,* 10 parts. See *Solutions.*

SODA (Hyposulphite of). Syn. *Sodæ Hyposulphis,*—Lat. *Prep.* 1. *Dried carbonate of soda,* 1 *lb.; flowers of sulphur,* 10 *oz.;* mix, and slowly heat the powder in a porcelain dish until the sulphur melts; stir the fused mass freely to expose it to

the atmosphere, until the incandescence flags, then dissolve the mass in *water*, and immediately boil the filtered liquid with some *flowers of sulphur;* lastly, carefully concentrate the solution for crystals.

2. A *stream of well washed sulphurous acid gas* is passed into a *strong solution of carbonate of soda*, which is then digested with *sulphur* at a gentle heat during several days; by evaporating the solution at a *moderate temperature* the salt is obtained in large and regular crystals.

3. (*Capaun's process.*) Boil a *dilute solution of caustic soda* with *sulphur* to saturation, then pass *sulphurous acid gas* into the solution until a small portion, when filtered, is found to have a very pale yellow colour; when this is the case, it must be filtered and evaporated, as before.

4. (P. Cod.) Dissolve *carbonate of soda*, 8 parts, in *water*, 16 parts; add of *sublimed sulphur*, 1 part, and pass *sulphurous acid gas*, in excess, into the solution; next boil the liquid in a glass matrass for a few minutes, filter, gently evaporate the filtrate to 1-3d its volume, and set it aside in a cool place to crystallize.

Prop., &c. Hyposulphite of soda crystallizes in four-sided prisms, which, in the dry state, are unalterable in the air; it is freely soluble in water. It may be perfectly freed from sulphuret of sodium by agitating it with about half its weight of alcohol; the alcohol dissolves out the sulphuret, which may then be easily separated. This salt is now very extensively used in the practice of Daguerreotype and photography.

SODA (Muriate of). See *Chloride of Sodium.*

SODA (Nitrate of). Syn. *Cubic Nitre; Sodæ Nitras*,—Lat. This salt is obtained in a similar way to ordinary nitre, and is chiefly imported into England from South America. It is largely employed as a manure, in the preparation of nitric acid, and, recently, in the manufacture of fireworks, on account of the comparative slowness with which it burns. It is deliquescent and very soluble in water.

SODA (Oxymuriate of). See *page* 1152.

SODA (Phosphate of). Syn. *Sodæ Phosphas*,—Ph. L. E. & D. *Tasteless Purging Salt, Tribasic Phosphate of Soda, Rhombic do., Neutral do.; Soda Phosphoratum, Sal Mirabile Perlatum*,—Obs. var. *Prep.* 1. (Ph. E.) Take of *powdered bone ashes*, 10 *lb.; sulphuric acid*, 44 fl. oz.; mix, add gradually of *water* 6 pints, and digest for 3 days, replacing the water which evaporates; then add 6 pints of *boiling water*, strain through linen, and wash the residue on the filter with *boiling water*; mix the liquors, and after defecation, decant and evaporate to 6 pints; let the impurities again settle, and neutralize the clear fluid, heated to boiling, with a *solution of carbonate of soda* in slight excess; crystals will be deposited as the solution cools, and by successively evaporating, adding a little more *soda* to the mother-liquor till it is *feebly* alkaline, and cooling, more crystals may be obtained; these must be kept in closed vessels. The formula of the Ph. D. is nearly similar. It is placed in the materia medica of the Ph. L.

2. (M. Funcke.) To *ground calcined bones*, diffused through water, add a *little dilute sulphuric acid* to saturate any carbonate of lime present; when effervescence ceases, dissolve the whole in *nitric acid*, q. s.; to this solution add as much *sulphate of soda* as the bone-ash used, and distil the whole to *recover* the nitric acid; the residuum is treated with *water*, and the resulting solution filtered, evaporated, and crystallized.

Prop., &c. It forms very beautiful oblique rhombic prisms, which effloresce in the air, dissolve in about 4 parts of cold water, and in 2 parts at 212° Fahr., and fuse when heated. As a *medicine* it is mildly aperient in *doses* of ½ to 1 *oz.*, or even more; and antacid in doses of 20 or 30 gr., frequently repeated. It has a purely saline taste, resembling that of culinary salt, and is commonly taken in broth or soup.

Pur. Its solution "turns turmeric slightly brown. What is thrown down by chloride of barium is white, and dissolves without effervescence in nitric acid. The precipitate thrown down by nitrate of silver is yellow, and is dissolved by the same acid. At a red heat 100 gr. give off 62·3 gr. of water. What is thrown down by nitrate of silver from the remaining salt dissolved in water, is white." (Ph. L.) "45 gr. dissolved in 2 fl. oz. of boiling water, and precipitated by a solution of 50 gr. of carbonate of lead in 1 fl. oz. of pyroligneous acid, still remain precipitable by a solution of acetate of lead." (Ph. E.)

SODA (Potassio-tartrate of). Syn. *Tartrate of Potash and Soda, Rochelle Salt, Seignette's do., Tartarized Soda; Sel de Seignette; Sal Rupellensis, Sal Polychrestum Seignetti; Sodæ Potassio-tartras*,—Ph. L. *Sodæ et Potassæ Tartras*,—Ph. E. & D. *Soda Tartarizata*,—Ph. L. 1824. *Natron Tartarizatum*,—Ph. L. 1788. *Prep.* (Ph. L. 1836.) Take of *carbonate of soda*, 12 oz.; *boiling water*, 2 quarts; dissolve, and add,

gradually, of *powdered bitartrate of potash*, 16 oz. (or q. s.); strain, evaporate to a pellicle, and set it aside to crystallize; dry the resulting crystals, and evaporate the mother-liquor that it may yield more of them. The formulæ of the other Colleges are nearly similar.

Prop., &c. Large, transparent, hard, right rhombic prisms, often occurring in halves; slightly efflorescent; soluble in 5 parts of water at 60° Fahr. Its "solution neither changes the colour of litmus nor of turmeric. On the addition of sulphuric acid, bitartrate of potash is thrown down; on adding either nitrate of silver or chloride of barium nothing is thrown down, or only what is re-dissolved by the addition of water." (Ph. L.) By heat it yields a mixture of the pure carbonates of potash and soda.

Potassio-tartrate of soda is a mild and cooling laxative. *Dose.* ½ to 1 *oz.*, largely diluted with water. It forms the basis of the popular aperient called *Seidlitz Powders.*

SODA (Sesquicarbonate of). See *p.* 1152.

SODA (Stannate of). *Prep.* (Greenwood & Co.) *Caustic soda*, 22 *lb.*, is heated to low redness in an iron crucible, when *nitrate of soda*, 8 *lb.*, and *common salt*, 4 *lb.*, are added; when the mixture is at a "fluxing heat," 10 *lb.* of *feathered block tin* is stirred in with an *iron rod*, both the stirring and heat being continued until the mass becomes red-hot and "pasty," and ammoniacal fumes are given off. The *product* may be purified by solution and crystallization. Patented.

SODA (Stannite of). *Prep.* (Greenwood & Co.) From *caustic soda*, 13½ *lb.*; *feathered block tin* and *common salt*, of each, 4 *lb.*; as the last. *Patented.* Both the above are *used* to prepare *tin* mordants (about 12 *oz.* to *water* 1 gall.). The *stannate* and *stannite of potash* are prepared in a similar manner.

SODA (Sulphate of). Syn. *Glauber's Salt; Sal Glauberi; Sodæ Sulphas*,—Ph. L.E.&D. *Natron Vitriolatum*,—Ph.L.1788. *Sal Catharticus Glauberi*,—Ph.L.1746. *Sal Mirabile Glauberi, &c.* This is obtained as a secondary product in various chemical processes; but it may be easily formed directly from its constituents.

Prep. (Ph. L. 1836.) Dissolve 2 ℔ of the *salt left in distilling muriatic acid* in 1 quart of *boiling water*, neutralize the solution with *carbonate of lime*, evaporate, and crystallize.

Prop., &c. It forms transparent six-sided, irregular channelled prisms with dihedral summits, which effloresce in the air, and fall to an opaque white powder; soluble in about 3 parts of water at 60°, and in considerably less at 100° Fahr., but at a higher temperature its solubility rapidly lessens; insoluble in alcohol; fuses when heated. It is seldom wilfully adulterated. When *pure*, the solution is neutral to test paper; nitrate of silver throws down scarcely anything from a dilute solution; nitrate of baryta more, which is not dissolved by nitric acid. It loses 55·5% of its weight by a strong heat. (Ph. L.)

Uses. It is purgative, but being extremely bitter-tasted, is now less frequently used than formerly. Its nauseous flavour is said to be covered by lemon juice. *Dose.* ½ to 1 *oz.* The dried salt (*sodæ sulphas exsiccata*) is twice as strong. *Lymington Glauber's Salt* is a mixture of the sulphates of soda and potassa obtained from the mother-liquor of sea salt. A *bisulphate of soda* is also prepared.

SODA (Tartrate of). Syn. *Sodæ Tartras*,—Lat. See *Effervescing Powders* (*page* 1064).

SODA (Valerianate of). Syn. *Sodæ Valerianas*,—Ph. D. *Prep.* (Ph. D.) Dilute *oil of vitriol*, 6½ fl. oz. with *water*, ½ pint; then dissolve of *powdered bichromate of potash*, 9 *oz.*, with the aid of heat in *water*, 3½ pints; when both solutions have cooled, put them into a matrass, and having added of *fusel oil* (alcohol amylicum, Ph. D.), 4 fl.oz., shake them together repeatedly until the temperature, which first rises to 150°, has fallen to 80° or 90° Fahr.; a condenser being connected, next apply heat so as to distil over about 4 pints of liquid; saturate this exactly with a pint, or q. s. of *solution of caustic soda*, separate the liquid from the oil which floats upon the surface, and evaporate it until the residual salt is partially liquefied; the heat being now withdrawn, and the salt concreted, this last, whilst still warm, is to be divided into fragments, and preserved in well-stopped bottles.

Obs. This salt is intended to be used in the preparation of the *valerianates of iron, quinia*, and *zinc.*

SODA AND AMMONIA (Phosphate of). See *Microcosmic Salt.*

SODIUM. Syn. *Natrium.* The metallic base of soda. It was first obtained by Sir H. Davy, in 1807, by means of a powerful galvanic battery; but it may be more conveniently and cheaply procured, in quantity, by the method described under *potassium.* The process, when well conducted, is, however, much easier and more certain than that for the last-named metal.

Prep. The *anhydrous carbonate of soda* (or its equiv.), 6 parts; is dissolved in a

little water, and the solution mixed with *charcoal*, in fine powder, 2 parts; and *charcoal*, in small lumps, 1 part; the whole is then evaporated to dryness, transferred to an iron retort, and treated in the manner described at *page* 1044.

Prop., &c. Sodium is a soft silver-white metal, scarcely solid at common temperatures, fuses at 194° Fahr., and volatilizes at a red heat; it oxidizes very rapidly in the air; when placed on the surface of cold water it decomposes that liquid with great violence, but generally without flame, in which it differs from potassium; on hot water it burns with a bright yellow flame,—in both cases a solution of pure soda being formed. Sp. gr. 0·972 (0·970,—Ure); it is more malleable than any other metal, and may be easily reduced into very thin leaves (Ure); its other properties resemble those of potassium, but are of a feebler character. With oxygen it forms a *protoxide* (anhydrous soda), and a *binoxide*, *teroxide*, or *peroxide*,—with chlorine, a *chloride* (common salt), and—with bromine, iodine, fluorine, sulphur, &c., *bromide*, *iodide*, *fluoride*, *sulphuret*, *&c.*, *of sodium*, all of which may be obtained by similar processes to the respective compounds of potassium, which, for the most part, they resemble.

Uses. Until recently sodium has been regarded as a mere chemical or philosophical curiosity; it has now, however, become of great practical importance from being employed in the manufacture of the new metal aluminium. *Sulphuret* or *sulphide of sodium* is supposed to be a principal element in the beautiful blue pigment ultramarine.

SODIUM (Chloride of). Syn. *Muriate of Soda*, *Common Salt*, *Culinary do.*, *Sea do.*; *Sodii Chloridum*, — Ph. L. & D. *Sodæ Murias*, — Ph. E. & Ph. L. 1824. This important and wholesome compound appears to have been known in the earliest ages of which we have any record. It is mentioned by Moses (Gen. xix, 26), and by Homer in the Iliad (lib. ix, 214). In ancient Rome it was subjected to a duty (*vectigal salinarium*); and, even at the present day, a similar tax furnishes no inconsiderable portion of the revenue of certain nations. Common salt forms no small portion of the mineral wealth of England, and has become an important article of commerce in every part of the known world. The principal portion of the salt consumed in this country is procured by the evaporation of the water of brine springs. It is also prepared by the evaporation of sea water (hence the term *sea salt*), but this process has been almost abandoned in England, being more suited to hot dry climates, or to very cold ones.

Var.—*Bay Salt*, *Sal marinus*, *Sal niger*; imported from France, Portugal, and Spain, and *obtained* from sea water evaporated in shallow ponds by the sun; large-grained and dark-coloured. — *British Bay Salt*, *Cheshire large-grained Salt*; by evaporating native brine at a heat of 130° to 140° Fahr.; hard cubical crystals. Both of the above are used to salt provisions for hot climates, as they dissolve very slowly in the brine as it grows weaker.—*Cheshire Stoved Salt*, *Lump Salt*, *Basket do.*; obtained by evaporating the brine of salt springs; small flaky crystals. — *London's Patent Solid Salt*; Cheshire rock salt melted and ladled into moulds. — *Rock Salt*, *Fossil Salt*; *Sal Gemmæ*, *Sal Fossilis*; found in mineral beds in Cheshire; has commonly a reddish colour; chiefly exported for purification.

Prop. Pure chloride of sodium is fixed in the air; crystallizes in anhydrous cubes, which are often grouped into pyramids or steps; dissolves in about 2½ parts of water at 60° Fahr.; its solubility is not increased by heat; it is slightly soluble in proof spirit; insoluble in alcohol; decrepitates when heated; fuses at a red heat, and volatilizes at a much higher temperature.

Pur., &c. The common salt of commerce contains small portions of *chloride of magnesium*, *chloride of calcium*, and *sulphate of lime*; and hence, has commonly a slightly bitter taste, and *deliquesces* in the air. To *separate these*, dissolve the salt in 4 times its weight of *pure water*, and drop into the filtered solution, first, *chloride of barium*, and then *carbonate of soda*, as long as any precipitate falls; filter, and evaporate the clear fluid very slowly, until the salt crystallizes, which is pure chloride of sodium. (Thomson's Chem, ii, 377,) For *medical purposes*, the Ph. E. orders the salt to be dissolved in *boiling water* and the solution to be filtered and evaporated over the fire, skimming off the crystals as they form; which must then be quickly washed in *cold water*, and dried. "A solution of *pure salt* is not precipitated by a solution of carbonate of ammonia, followed by a solution of phosphate of soda: a solution of 9 gr. in distilled water, is not entirely precipitated by a solution of 26 gr. of nitrate of silver." (Ph. E.)

Uses. Common salt is stimulant, antiseptic, and vermifuge, and is hence employed as a *condiment*, and for *preserving* animal and vegetable substances. It is also occasionally used in medicine, in clysters and lotions.

SODIUM (Iodide of). Syn. *Sodii Iodidum, Sodæ Hydriodas*,—Lat. As iodide of potassium. This, as well as *bromide of sodium*, crystallizes in cubes, is very deliquescent, and very soluble in water.

SODIUM (Platino-chloride of). See *page* 1019.

SODIUM (Sulpho-antimoniuret of). Syn. *Sulphuret of Antimony and Sodium; Sodii Sulpho-antimoniatum, Sodii et Antimonii Sulphuretum*,—Lat. See *Schlippe's Salt* (p. 78).

SOIL. The earth in which vegetables grow, and from which their roots absorb nourishment.

Soils are *classified* by agriculturists according to their chief ingredients; as *loamy*, *clayey*, *sandy*, *chalky*, and *peaty* soils. Of these the *first* is the best, but the others may be improved by the addition of the mineral constituents of which they are deficient. *Sand* and *lime* or *chalk* are the proper additions to CLAYEY SOILS, and *clay*, *gypsum*, or *loam* to SANDY and GRAVELLY ones. *Clayey soils* are expensive to bring into a fertile state, but when this is once effected, and they are well manured, they yield immense crops of wheat, oats, beans, clover, and most fruits and flowers of the rosaceous kinds.

The *fertilization* of *soils* is suggested partly by chemical analysis, practical experience, and geological observations. In cases where a barren soil is examined with a view to its *improvement*, it is, when possible, compared with an extremely fertile soil in the same neighbourhood, and in a similar situation; the difference given by their analyses indicates the nature of the manure required, and the most judicious methods of cultivation; and thus, a plan of improvement is suggested founded upon scientific principles. See *Agriculture*, *Manures*, *&c.*

The *analysis* of *soils* may be briefly and generally described as follows:—

1. The general character of the soil, as *loamy*, *sandy*, *stoney*, *rather stoney*, *&c.*, being noted, 3 or 4 *lb.* of it, fairly selected as an average specimen, may be taken during a period of ordinary dry weather. From this, after crushing or bruising the lumps with a piece of wood, all STONES of a larger size than that of a filbert may be picked out, and *their proportion* to the *whole quantity* duly registered.

2. 1000 gr. of the *remainder*, may be next dried by the heat of boiling water, until the mass ceases to lose weight; and, afterwards, exposed to a moist atmosphere for some time. The *loss* of weight in the *first* case, and the *increase* of weight, in the *second*, indicate the ABSORBENT POWERS of the soil.

3. The *matter from No.* 2, freed from siliceous stones by garbling, may be *gradually* heated to *dull* redness in a shallow open vessel, avoiding waste from decrepitation, &c. The *loss of weight* divided by 10, gives the per centage quantity of VEGETABLE OR ORGANIC MATTER present (nearly).

4. *Another* 1000 gr. (see No. 1,) may be next washed with successive portions of cold water as long as anything is removed. The *residuum*, after being dried, indicates the proportion of SAND and GRAVEL (nearly).

5. *Another portion* of the *soil* (100, 200 or more *gr.*, according to its character), is tested in the manner described under *Carbonates* and *Alkalimetry* (p. 42). The *loss of weight* in *carbonic acid* indicates the quantity of CARBONATE OF LIME present in the sample examined; 22 gr. of the former being equal to 50 gr. of the latter.

6. *Another like portion* of the *soil* may be gently boiled for 4 or 5 hours, along with dilute hydrochloric acid, in a flask furnished with a long glass tube passing through the cork, to prevent loss (See *Ether*); after that time the whole must be thrown upon a filter, and, what refuses to pass through (SILICA), washed with distilled water, dried, ignited and weighed.

7. The *filtrate* and *washings* from No. 6 are next successively treated for ALUMINA (*pure clay*), LIME, PHOSPHATE OF LIME, PHOSPHORIC ACID, OXIDE OF IRON, ALKALIES (*potassa* or *soda*), AMMONIA (both *ready formed* and *latent*), &c., &c.. in the manner noticed under "*Glass*," "*Guano*," and the names of the *respective substances* referred to.

SOLANINE. Syn. *Solania*, *Solanina*, —Lat. A peculiar basic substance, obtained from various species of the solanaceæ.

Prep. Filter the *juice of ripe nightshade berries* (solanum nigrum, — Linn.), add *ammonia*, filter, wash the sediment, boil it in *alcohol*, filter, and distil off the spirit; the solanine is left as a white powder.

Prop., &c. Insoluble in water; freely soluble in alcohol; bitter; emetic; narcotic, and poisonous. By careful crystallization in alcohol it forms pearly, needle-like crystals, somewhat resembling those of disulphate of quinine. With the acids it forms salts, many of which are crystallizable. It may also be obtained from the leaves and stem of *solanum dulcamara* or *bitter-sweet*.

SOLDERING. The union of metallic surfaces by means of a more fusible metal fluxed between them. The method of *autogenous soldering*, invented by M. De Richmont, is an exception to this definition. (See *p.* 102.) In all cases the surfaces must be perfectly clean, and in absolute contact, and the air must be excluded, to prevent oxidation. For this last purpose the *brazier* and *silversmith* uses powdered borax made into a paste with water; the *coppersmith*, powdered sal ammoniac; and the tinman, powdered rosin. Tin-foil applied between the joints of *fine brass-work*, first wetted with a strong solution of sal ammoniac, makes an excellent juncture, care being taken to avoid too much heat.

SOLDERS. *Prep.* 1. (For *Copper*, *Iron*, and *Dark Brass.*) From *copper*, and *zinc*, equal parts; melted together. For *pale brass* more zinc must be used.

2. (*Fine Solder.*) From *tin*, 2 parts; *lead*, 1 part. Melts at 350° Fahr. *Used* to tin and solder copper, tin plates, &c.

3. (For *German Silver.*) From *German silver*, 5 parts; *zinc*, 4 parts; melted together, run into thin flakes, and then powdered. *Also* as No 7.

4. (*Glazier's.*) From *lead*, 3 parts; *tin*, 1 part. Melts at 500° Fahr.

5. (For *Gold.*) *Gold*, 12 pennyweights; *copper*, 4 do.; *silver*, 2 do.

6. (For *Lead and Zinc.*) From *lead*, 2 parts; *tin*, 1 part.

7. (For *Pewter*, *Britannia metal*, *&c.*) From *tin*, 10 parts; *lead*, 5 parts; *bismuth*, 1 to 3 parts.

8. (For *Silver.*) From *fine-brass*, 6 parts; *silver*, 5 parts; *zinc*, 2 parts.

9. (For *Tin plate.*) From *tin*, 2 parts; *lead*, 1 part. The addition of *bismuth*, 1 part, renders it fit for pewter.

SOLE. The *pleuronectes solea*, a well-known mucilaginous thoracic fish. It is perhaps more frequently eaten than any other flat fish, and when skilfully cooked, exceeds them all in delicacy, nutritiousness, and flavour.

SOLUTION. Syn. *Solutio*,—Lat. Under the head of solutions (*solutiones*), in pharmacy, are properly included only those liquids which consist of water, or an aqueous menstruum, in which has been dissolved an appropriate quantity of any soluble substance to impart to the liquor its peculiar properties. When *spirit* is the menstruum the liquid receives the name of *alcoholic solution*, *spirit*, or *tincture*. In the Ph. L. & D., *aqueous solutions* are named *liquors* (liquores); whilst in the Ph. E., and in the old pharmacopœias generally, they are termed *waters* (*aquæ*).

The following list embraces all the solutions of the British Pharmacopœias, with a few others likely to be useful to the reader. Some other preparations to which the name has been given will be found under *Liquors*, *Tinctures*, *&c.*

SOLUTION (Acetate of Ammonia). Syn. *Liquor of Acetate of Ammonia*, *Water of do.*, *Mindererus' Spirit*; *Liquor Ammoniæ Acetatis*,—Ph. L. & D. *Ammoniæ Acetatis Aqua*,—Ph. E., Ph. D. 1826, & Ph. L. 1788. *Prep.* 1. (Ph. L.) From *dilute acetic acid*, 1 pint; exactly neutralized by *sesquicarbonate of ammonia* (in coarse powder), 9 dr., or q. s. Sp. gr. 1·022.

2. (Ph. E.) *Distilled vinegar* (preferably from French vinegar), sp. gr. 1·005, 24 fl. oz.; *carbonate* (sesquicarbonate) *of ammonia*, 1 oz., or q. s. Sp. gr. 1·011.

3. (Ph. D.) *Sesquicarbonate of ammonia*, 2½ *oz.*; *dilute acetic acid*, 3 pints. Sp. gr. 1·012.

Prop., *&c.* "Free from colour and odour. It changes the colour neither of litmus nor turmeric. Sulphuretted hydrogen being dropped in, it is not discoloured, neither is anything thrown down on the addition of chloride of barium. What is precipitated by nitrate of silver is soluble in water, but especially so in nitric acid. Potassa being added, it emits ammonia; and sulphuric acid being added, it gives off acetic vapours. The fluid being evaporated, what remains is completely destroyed by heat." (Ph. L.)

Uses, *&c.* Solution of acetate of ammonia is a very common and excellent febrifuge and diaphoretic, and, in large doses, aperient saline liquor. Taken warm, in bed, it generally proves a powerful sudorific; and as it operates without heat, it is much used in febrile and inflammatory disorders. Its action may likewise be determined to the kidneys, by walking about in the cold air. *Dose.* ½ to ¾ fl. oz., twice or thrice daily, either by itself or along with other medicines. *Externally*, as a discutient and refrigerant lotion; and diluted (1 *oz.* to 9 *oz.* of water), as a collyrium in chronic ophthalmia. For this last purpose it must be free from excess of ammonia.

4. (*Concentrated.*) Saturate *acetic acid*, sp. gr. 1·038, ½ gall., with *sesquicarbonate of ammonia* (in powder), 2½ *lb.*, or q. s.; carefully avoiding excess.—*Obs.* This article is in great demand in the wholesale drug trade, under the name of concentrated liquor of acetate of ammonia (*liq. ammon. acet. conc.*) It is very convenient for dispensing. 1 fl. dr. added to 7 fl. dr. of

water, forms the *liquor ammoniæ acetatis* of the Ph. L.

SOLUTION (Acetate of Lead). See *Solution of Diacetate of Lead.*

SOLUTION (Acetate of Morphia). Syn. *Liquor Morphiæ Acetatis*,—Ph. L. & D. *Prep.* 1. (Ph. L.) *Acetate of morphia*, 4 dr.; *acetic acid*, 15 drops; *distilled water*, 1 pint; *proof spirit*, ½ pint; mix, and dissolve. 60 drops (minims) contain 1 gr. of acetate of morphia. *Dose.* 5 to 15 or 20 drops.

2. (Ph. D.) *Acetate of morphia*, 82 gr.; *rectified spirit*, 5 fl. oz.; *distilled water*, 15 fl. oz. 120 drops (minims) contain 1 gr. of the acetate. *Dose.* 10 to 45 or 50 drops, or similar to that of tincture of opium.

3. (Magendie.) *Each* fl. dr. contains 1½ gr. of *acetate* (nearly). *Dose.* 5 to 15 drops. Anodyne, hypnotic, and narcotic; in those cases in which opium is inadmissible. See *Morphia.*

SOLUTION (Alum,—Compound). Syn. *Bate's Alum Water; Liquor Aluminis Compositus*, — Ph. L. *Aqua Aluminosa Composita*,—Ph. L. 1788. *A. A. Bateana*, &c. *Prep.* (Ph. L.) *Alum* and *sulphate of zinc*, of each, 1 oz.; *boiling water*, 3 pints; dissolve, and filter (if necessary). Detergent and astringent. *Used* as a lotion for old ulcer, chilblains, excoriation, &c.; and, largely diluted with water, as an eye-wash and injection.

SOLUTION (Ammonia). Syn. *Liquor of Ammonia, Water of do.; Liquor Ammoniæ*,—Ph. L. & D. *Aqua Ammoniæ*,——Ph. E. *A. A. Causticæ*,—Ph. D. 1826. See *page* 59.

SOLUTION (Ammonia,—Anisated). See *Spirits.*

SOLUTION (Ammonio-nitrate of Silver). Syn. *Hume's Test; Solutio Argenti Ammoniati*,—Ph. E. *Prep.* (Ph. E.) *Nitrate of silver* (pure crystallized), 44 gr.; *distilled water*, 1 fl. oz.; dissolve, and add *ammonia water*, gradually, until the precipitate, at first thrown down, is *very nearly*, but not *entirely*, redissolved. *Used* as a test for arsenious acid.

SOLUTION (Ammonio-sulphate of Copper). Syn. *Liquor Cupri Ammonio-sulphatis*,—Ph. L. *Cupri Ammoniati Solutio*,—Ph. E. *C. A. Aqua*,—Ph. D. 1826. *Solution of Ammoniated Copper; Blue Eye-water, Aqua Sapphirina, &c.*,—Obs. *Prep.* (Ph. L.) *Ammonio-sulphate of copper*, 1 dr.; *water*, 1 pint; dissolve, and filter. Stimulant and detergent. Applied to indolent ulcers, and when largely diluted, to remove specks on the cornea; also used as a test.

SOLUTION (for Anatomical Preparations, &c.) Syn. *Antiseptic Solution. Prep.* 1. Nearly saturate *water* with *sulphurous acid*, and add a little *creosote.*

2. Dissolve *chloride of tin*, 4 parts, in *water*, 100 parts, to which 3% of *hydrochloric acid* has been added.

3. Dissolve *corrosive sublimate*, 1 part; and *chloride of sodium*, 3 parts; in *water*, 100 parts, to which 2% of *hydrochloric acid* has been added.

4. Mix *liquor of ammonia* (strong) with 3 times its weight (each) of *water* and *rectified spirit.*

5. *Sal ammoniac*, 1 part; *water*, 10 or 11 parts. For the muscular parts of animals.

6. *Sulphate of zinc*, 1 part; *water*, 15 to 25 parts. For muscles, integuments, and cerebral masses.

7. (Dr. Babington.) *Wood naphtha*, 1 part; *water*, 7 parts; or *wood naphtha* undiluted, as an *injection.*

8. (Sir W. Burnett.) *Concentrated solution of chloride of zinc*, 1 *lb.*; *water*, 1 gall. The substances are immersed in the solution for 2 to 4 days, and then dried in the air.

9. (Gannal.) *Alum* and *culinary salt*, of each, ½ *lb.*; *nitre*, ¼ *lb.*; *water*, 1 gall.

10. (Goadsby.) *a.* From *bay salt*, 2 *oz.*; *alum*, 1 *oz.*; *bichloride of mercury*, 1 gr.; *water*, 1 pint. For ordinary purposes.

b. To the last add of *bichloride of mercury*, 1 gr.; *water*, 1 pint. For very tender tissues, and where there is a tendency to mouldiness.

c. From *bay salt*, ¼ *lb.*; *bichloride of mercury*, 1 gr.; *water*, 1 pint. For subjects containing carbonate of lime.

d. From *bay salt*, ¼ *lb.*; *arsenious acid*, 10 gr.; *water*, 1 pint; dissolve by heat. For old preparations.

e. To the last add of *bichloride of mercury*, 1 gr. As the last; when there is a tendency to the softening of parts; and, diluted, for *mollusca.* These solutions are approved of by Prof. Owen.

11. (M. Rèboulet.) *Nitre*, 1 part; *alum*, 2 parts; *chloride of lime*, 4 parts; *water*, 16 or 20 parts; to be afterwards diluted according to circumstances. For pathological specimens.

12. (Dr. Stapleton.) *Alum*, 2¼ *oz.*; *nitre*, 1 dr.; *water*, 1 quart. For pathological specimens.

13. (For *Feathers*,—Mr. Beasley.) *Strychnine*, 16 gr.; *rectified spirit*, 1 pint.

Obs. These fluids are used for preserving *anatomical preparations, objects of natural history, &c.*, by immersing them therein, in

close vessels; or, for *temporary purposes*, applying them by means of a brush or pieces of rag. The presence of corrosive sublimate is apt to render animal substances very hard. See *Putrefaction*.

SOLUTION (Antiseptic). See *above*.

SOLUTION (Arsenical). Syn. *Mineral Solution; Solutio Arsenicalis, Solutio Mineralis*,—Lat. *Prep.* 1. (*De Valingin's.*) See *page* 950.

2. (Devergie.) As *solution of arsenite of potassa*, Ph. L., but of only 1-50th the strength, and *flavoured* with *compound spirit of balm*, and *coloured* to a deep rose with *cochineal*.

3. (Pearson.) *Arseniate of soda*, 4 gr.; *water*, 4 fl. oz.; dissolve. *Dose.* 10 to 30 drops during the day. (See *below*.)

SOLUTION (Arsenious Acid). See *Tasteless Ague Drop* (p. 340).

SOLUTION (Arsenite of Potassa). Syn. *Fowler's Mineral Solution; Liquor Potassæ Arsenitis*,—Ph. L. *Liquor Arsenicalis*,—Ph. E. D. & U. S. *Prep.* 1. (Ph. L. & E.) *Arsenious acid*, coarsely powdered, and *carbonate of potassa*, of each, 80 gr.; *distilled water*, 1 pint; boil until dissolved, and add, to the cold solution, *compound tincture of lavender*, 5 fl. dr.; *water*, q. s. to make the whole *exactly* measure a pint. Tonic, antiperiodic, and alterative. *Dose.* 4 or 5 drops, gradually and cautiously increased; in agues and various scaly skin diseases. It is preferably taken soon after a meal. See *Arsenious Acid, &c.*

SOLUTION (Bichloride of Mercury). Syn. *Solution of Corrosive Sublimate; Liquor Hydrargyri Bichloridi*, — Ph. L. *Prep.* 1. (Ph. L.) *Bichloride of mercury* and *sal ammoniac*, of each, 10 gr.; *water*, 1 pint; dissolve. *Dose.* As an *alterative*, 10 to 30 drops; as an *antisyphilitic*, ½ to 2 fl. dr., in simple or sweetened water. It must not be allowed to touch anything metallic. It also forms a most useful lotion in various skin diseases.

2. See *Lotions*.

SOLUTION (Bimeconate of Morphia). Syn. *Solutio Opii Bimeconas; Liquor Morphiæ Bimeconas*,—Lat. *Prep.* From *liquor opii sedativus*, agitated with a little *animal charcoal*, and filtered. It is a little stronger than the tincture of opium.

SOLUTION (Bleaching). See *page* 1160.

SOLUTION (Brandish's). See *page* 1164.

SOLUTION (Burnett's). See *pages* 330 and 1158.

SOLUTION (Carbonate of Ammonia). See *page* 1165.

SOLUTION (Carbonate of Potassa). Syn. *Oil of Tartar, Water of Subcarbonate of Potash; Liquor Potassæ Carbonatis*,—Ph. L. & D. *L. P. Subcarbonatis*,—Ph. L. 1824. *Potassæ Carbonatis Aqua*,—Ph. D. 1826. *Aqua Kali Præparati*,—Ph. L. 1788. *Aqua Kali*,—Ph. L. 1787. *Lixivium Tartari*,—Ph. L. 1746. *Liquamen Tartari* or *Oleum Tartari per deliquium*,—Ph. L. 1721. *Prep.* 1. (Ph. L.) *Carbonate of potassa*, 20 oz. (10 *oz.*,—Ph. D.); *water*, 1 pint; dissolve and filter (or decant). Sp. gr.—Ph. L., 1·473,—Ph. D., 1·310. *Dose.* 10 drops to 1 dr., as an antacid, &c.

2. (*Henry's.*) Sp. gr. 1·248; equivalent in *saturating power* to an equal measure of *sulphuric acid*, sp. gr. 1·135, or of *nitric acid*, sp. gr. 1·143, or of *hydrochloric acid*, sp. gr. 1·074. *Used* in assaying mineral waters, &c.

SOLUTION (Carbonate of Soda). Syn. *Subcarbonate of Soda Water; Sodæ Carbonatis Liquor*,—Ph. D. *Aqua Sodæ Carbonatis*,—Ph. D. 1826. *Prep.* 1. (Ph. D.) *Carbonate of soda* (in crystals), 1½ *oz.; distilled water*, 1 pint. Sp. gr. 1·026. *Dose.* ¼ to 1½ fl. oz., as an antacid; in heartburn, dyspepsia, &c.

2. (*Henry's.*) Sp. gr. 1·11; 2 measures are equal in saturating power to one of his *carbonate of potash water*.

SOLUTION (Chloride of Arsenic). Syn. *Liquor Arsenici Chloridi*,—Ph. L. *Prep.* (Ph. L.) *Arsenious acid* (in coarse powder), ½ dr.; *hydrochloric acid*, 1½ fl. dr.; *distilled water*, 1 fl. oz.; boil until the solution of the arsenious acid is complete, and, when cold, add enough *distilled water* to make the whole *exactly* measure a pint.

Obs. This is a mere solution of arsenious acid in dilute hydrochloric acid, no chloride being formed, and would, therefore, be more appropriately named "hydrochloric solution of arsenious acid" (*liquor acidi arseniosi hydrochloricus*). *Dose* and *uses*; same as those of *solution of arsenite of potassa*. (See *above*.)

SOLUTION (Chloride of Barium). Syn. *Solution of Muriate of Baryta, Liquor of do.; Liquor Barii Chloridi*,—Ph. L. & D. *Solutio Barytæ Muriatis*,—Ph. E. *Aqua B. M.*,—Ph. D. 1826. *Prep.* (Ph. L. & E.) Dissolve *chloride of barium*, 1 dr. (1 *oz.*,—Ph. D.), in *water*, 1 fl. oz. (8 *oz.*,—Ph. D.); and filter the solution. Sp. gr. (Ph. D.) 1·088. *Dose.* 5 drops, gradually increased to 10 or 12, twice or thrice daily; in scrofula, scirrhous affections, and worms; *externally*, largely diluted, as a lotion in scrofulous ophthalmia; also used as a *test* for sulphuric acid and the soluble sulphates.

Its *susceptibility* of the first is said to be fully 0·00009.

SOLUTION (Chloride of Calcium). Syn. *Solution of Muriate of Lime, Liquor do., Water of do.; Calcii Chloridi Liquor*,—Ph. D. & Ph. L. 1836. *Calcis Muriatis Solutio*,—Ph. E. *C. M. Aqua*,—Ph. D. 1826. *Prep.* 1. (Ph. L. 1836.) *Fused chloride of calcium*, 4 oz.; (*crystals*, 8 oz.,—Ph. E.); *water*, 12 fl. oz.; dissolve, and filter.

2. (Ph. D.) *Fused chloride of calcium*, 3 *oz.; water*, 12 *oz.* Sp. gr. 1·225. *Dose.* 10 drops to 1 dr., or more; in scrofulous and glandular diseases, &c.; also used as a test for sulphuric acid.

SOLUTION (Chloride of Lime). Syn. *Bleaching Liquid, Solution of Chlorinated Lime, Sol. of Hypochlorite of Lime; Solutio Calcis Hypochloris, Sol. Calcis Chloridi; Calcis Chlorinatæ Liquor*,—Ph. D. *Prep.* 1. (Ph. D.) *Chlorinated lime* (chloride of lime), ½ *lb.; water*, ½ gall.; triturate them together, then transfer the mixture to a stoppered bottle, and shake it repeatedly for the space of 3 hours; lastly, filter through calico, and preserve it in a well-stopped bottle.

2. *Chloride of lime* (dry and good, and rubbed to fine powder), 9 *lb.; tepid water*, 6 gall.; mix in a stoneware bottle capable of holding 8 gall., agitate frequently for a day or two, and after 2 or 3 days' repose, decant the clear portion, and keep it in well-corked bottles in a cool situation. If filtered it should be done as rapidly as possible, and only through *coarsely powdered glass* in a covered vessel.

Obs. The last is the usual strength sold in trade, under various attractive names, to give it importance. It is *used* as a disinfectant, bleacher, and fumigation; and, diluted with water, as a lotion, injection, or collyrium, in several diseases. See *Hypochlorite of Lime.*

SOLUTION (Chloride of Potash). Syn. *Javelle's Bleaching Liquid; Eau de Javelle; Liquor Potassæ Chloridi, Liquor Potassæ Chlorinatæ*,—Lat. *Prep.* 1. Dissolve *carbonate of potash*, 1 part; in *water*, 10 parts; and pass *chlorine gas* through the solution to saturation.

2. *Chloride of lime* (dry and good), 1 part; *water*, 15 parts; agitate them together for an hour; next dissolve of *carbonate of potash*, 2 *oz.*, in *water*, ¼ pint; mix the two solutions, and after a time either decant or filter. *Uses, &c.* As the last.

SOLUTION (Chloride of Soda). Syn. *Solution of Hypochlorite of Soda, Sol. of Oxymuriate of do., Sol. of Chloruret of Oxide of Sodium, Labarraque's Disinfecting Liquid; Solutio Sodæ Hypochloris; Hypochloris Sodicus Aqua Solutus*,—P. Cod. *Liquor Sodæ Chlorinatæ*,—Ph. L. & D. *Prep.* 1. (Ph. L.) *Carbonate of soda* (in crystals), 1 lb; *water*, 1 quart; dissolve, and pass through the solution the chlorine evolved from a mixture of *common salt*, 4 oz.; *binoxide of manganese*, 3 oz.; *sulphuric acid*, 2½ fl. oz. (4 oz.,—Ph. L. 1836); diluted with *water*, 3 fl. oz.; placed in a retort; heat being applied to promote the action, and the gas being purified by passing through 5 fl. oz. of *water* before it enters the alkaline solution.

2. (Ph. D.) *Chlorinated lime*, ½ *lb.;* and *water*, 3 pints; are triturated together in a marble mortar, after which the mixture is transferred to a stoppered bottle, agitated frequently during three hours, and then filtered through calico; in the mean time *carbonate of soda* (cryst.), 7 *oz.;* is dissolved in *water*, 1 pint; the two solutions are next mixed, and, after agitation for about 10 minutes, the whole is filtered as before; the filtrate is to be preserved in a well-stopped bottle.

Obs. This solution is *used* as an antiseptic, disinfectant, and bleaching liquid. *Dose.* 20 to 30 drops, in any bland fluid, in scarlet fever, sore-throat, &c.; it is also made into a lotion, gargle, injection, and eye-water. Meat in a nearly putrid state, unfit for food, is immediately restored by washing or immersion in this liquid.

SOLUTION (Chlorine.) Syn. *Chlorine Water; Solutio Chlorinii; Liquor Chlorinii*,—Ph. L. & D. *Chlorinei Aqua*,—Ph. E. *Aqua Chlorinii*,—Ph. D. 1826. *Prep.* 1. (Ph. L.) On *binoxide of manganese* (in powder), 2 dr., placed in a retort, pour *hydrochloric acid*, 1 fl. oz., and pass the *chlorine* into *distilled water*, ½ pint, until it ceases to be evolved.

2. (Ph. E.) *Muriate of soda*, 60 gr.; *red oxide of lead*, 350 gr.; triturate them together, and put them into 8 fl. oz. of *distilled water*, contained in a stoppered bottle; then add of *sulphuric acid*, 2 fl. dr.; and having replaced the stopper, agitate the whole, occasionally, until the oxide of lead turns *white;* lastly, after subsidence, pour off the clear liquid into another stoppered bottle.

3. (Ph. D.) Introduce into a gas bottle *peroxide of manganese* (in fine powder), ½ *oz.;* add of *hydrochloric acid*, 3 fl. oz.; (diluted with) *water*, 2 fl. oz.; apply a gentle heat, and cause the evolved gas to pass through *water*, 2 fl. oz., and then into a 3-pint bottle containing *distilled water*, 20 fl. oz.; and whose mouth is loosely plugged with tow; when the air has been

entirely displaced by the chlorine, cork the bottle loosely, and shake it until the chlorine is absorbed; it should now be transferred to a pint stoppered bottle, and preserved in a dark and cool place.

Prop., &c. Irritant and acrid, but, when largely diluted, stimulant and antiseptic. *Dose.* ½ to 2 fl. dr., in ½ pint of water, sweetened with a little sugar, in divided doses, during the day; in scarlatina, malignant sore-throat, &c. On the *large scale*, liquid chlorine may be procured by passing the gas obtained by any of the methods named under "*Chlorine*," into *water*, until it will absorb no more.

SOLUTION (Citrate of Ammonia). Syn. *Liquor Ammoniæ Citratis*,—Ph. L. *Prep.* (Ph. L.) Dissolve *citric acid*, 3 oz.; in *distilled water*, 1 pint; and to the solution add of *sesquicarbonate of ammonia* (in powder), 2½ oz., or. q. s. to exactly neutralize the liquor. *Qual., uses, & doses*, similar to those of the acetate. (See *p.* 1157.)

SOLUTION (Citrate of Magnesia). Syn. *Solutio Magnesiæ Citratis*, — Lat. See *page* 737.

SOLUTION (Citrate of Morphiæ). Syn. *Liquor Morphiæ Citratis, Solutio M. C.*,— Lat. *Prep.* (Magendie.) *Pure morphia*, 13 gr.; *citric acid*, 8 or 10 gr.; *water*, 1 fl. oz.; *tincture of cochineal*, 2 fl. dr. *Dose.* 3 to 12 drops.

SOLUTION (Citrate of Potassa). See *Citrate of Potassa & Powders.*

SOLUTION (Copaiba). See *page* 1165.

SOLUTION (Corrosive Sublimate). See *page* 1159.

SOLUTION (Cosmetic). See *Lotions & Washes.*

SOLUTION (Diacetate of Lead). Syn. *Liquor of Diacetate of Lead, Goulard's Extract; Liquor Plumbi; Liquor Plumbi Diacetatis*,— Ph. L. *Plumbi Diacetatis Solutio*,—Ph. E. *Plumbi Subacetatis Liquor*, —Ph. D. & Ph. L. 1824. *Liq. P. Acetatis*, —Ph. L. 1809. *Aqua Lythargyri Acetatis*, —Ph. L. 1788. *Extract of Lead, Extractum Saturni*,—Obs. *Prep.* 1. (Ph. L.) *Acetate of lead*, 27 oz.; *litharge*, in fine powder, 16 oz.; *water*, 3 quarts; boil for ½ an hour, constantly stirring, and then add enough *distilled water* to make the whole measure 3 quarts; lastly, filter, if required, and keep it in a closed vessel. The proportions ordered in the Ph. E. are similar. Sp. gr. 1·260.

2. (Ph. D.) *Acetate of lead*, 6 *oz.; litharge*, 4 *oz.; distilled water*, 1 quart; boil, &c., as before; to produce 1 quart. Sp. gr. 1·066.

3. (*Wholesale.*) From *finely powdered litharge*, 32 *lb.; distilled vinegar*, 32 gall.; boil in a perfectly bright copper pan for 2 hours, cool, add water to make up 32 gall., again simmer for 1 minute, cover up the vessel, and in an hour decant the clear portion. Common *trade strength.* (See *below.*)

SOLUTION (Diacetate of Lead,—Dilute). Syn. *Goulard, Goulard's Lotion* or *Water, Goulard's Vegeto-mineral do.; Liquor Plumbi Diacetatis Dilutus*,—Ph. L. *Plumbi Subacetatis Liquor Compositus*,—Ph. D. *Water of Saturn, Aqua Goulardii, A. Saturni, A Vegeto-mineralis Goulardii*,—Obs. var. *Prep.* 1. (Ph. L.) *Liquor of diacetate of lead*, 1½ fl. dr.; *proof spirit*, 2 fl. dr.; *distilled water*, 1 pint; mix.

2. (Ph. D.) *Solution of subacetate of lead* and *proof spirit*, of each, 2 fl. oz.; *distilled water*, ½ gall.; mix, filter, and preserve it in a well-stopped bottle.

Obs. Both the above preparations were formerly made with common vinegar, and hence were coloured, but those of the Pharm. are white. If wanted coloured, a little spirit colouring may be added. The formula No. 3 will take a quart. The *stronger liquor* is only used diluted; and the *dilute solution* is now seldom prepared by the wholesale druggist. The last (*diluted solution*) is employed as a sedative, refrigerant, and astringent wash, in various affections. Both are *poisonous.* For the *antidotes*, see *Lead.*

SOLUTION (Donovan's). See *page* 1161.

SOLUTION (Ergot, — Essential). See *Essences.*

SOLUTION (Escharotic — Freyburg's). Syn. *Solutio Escharotica*, — Lat. *Prep.* From *camphor*, 30 gr.; *corrosive sublimate*, 60 to 100 gr.; *rectified spirit*, 1 fl. oz.; dissolve. In syphilitic vegetations, and, especially, condylomes. It is spread over the diseased surface, either at once, or after the application of a ligature.

SOLUTION (Evaporating). See *Lotions.*

SOLUTION (Flints). Syn. *Liquor of Flints, Oil of do.; Liquamen Silicum, Liquor Potassæ Silicatis*,—Lat. *Prep.* 1. *Soluble glass* dissolved in *water.*

2. (Bate.) *Powdered quartz*, 1 part; *dry carbonate of potash*, 2 parts (3 parts;—Turner); triturate them together, fuse the mixture in a Hessian crucible, and allow the resulting glass to deliquesce by exposure in a damp situation. *Dose.* 5 or 6 to 30 drops; in gouty concretions, stone, &c. "It resolves the stone, and opens obstructions." (See *p.* 529.)

SOLUTION (Gannal's). See *page* 1158.

SOLUTION (Goadsby's). See *page* 1158.

SOLUTION (Goulard's). See *above.*

SOLUTION (Hahnemann's Prophylactic.)

Syn. *Liquor Belladonnæ, Solutio Prophylactica,*—Lat. *Prep.* From *extract of belladonna* (alcoholic), 3 gr.; *distilled water*, 6 fl. dr.; *rectified spirit*, 2 fl. dr.; dissolve. *Used* against scarlet fever. *Dose.* 2 or 3 drops for a child under 12 months; and an additional drop for every year above that age to maturity.

SOLUTION (Hydriodate of Arsenic and Mercury). Syn. *Donovan's Solution; Solutio Arsenici et Hydrargyri Iodidi; Arsenici et Hydrargyri Hydriodatis Liquor,*—Ph. D. *Prep.* 1. (Mr. Donovan.) Triturate *metallic arsenic*, 6·08 gr.; *mercury*, 15·38 gr.; and *iodine*, 50 gr.; with *alcohol*, 1 fl. dr., until dry; to this add, gradually, of *distilled water*, 8 fl. oz., and again well triturate; next put the whole into a flask, add of *hydriodic acid*, ½ fl. dr.; and boil for a few moments; lastly, when cold, add *distilled water*, q. s. to make the whole measure exactly 8 fl. oz.

2. (Ph. D.) *Pure arsenic*, (in fine powder), 6 gr.; *pure mercury*, 16 gr.; *pure iodine*, 50½ gr.; *alcohol*, ½ fl. dr.; triturate, as before, add, gradually, of *water*, 8 fl. oz.; heat the mixture until it begins to boil, and, afterwards, make up the cold and filtered solution to exactly 8 fl. oz. 6 fl. dr.

3. (*Wholesale.*) From *metallic arsenic*, 61 gr.; *iodine*, 500 gr.; *mercury*, 154 gr.; *rectified spirit*, 1½ fl. oz.; *distilled water*, 2 quarts; *hydriodic acid*, 5 fl. dr.; as No. 1; the *product* being made up with *distilled water* so as to measure *exactly* 4 pints, or 80 fl. oz.; or to weigh 5 *lb.* 1¼ *oz.* (av.), when cold.

Obs. Great care must be taken that the whole of the arsenic be dissolved, which can only be effected by the most careful trituration. Soubeiran recommends the employment of 1 part, each, of the *respective iodides*, with 98 parts of *water*, as furnishing a simpler and equally effective product; proportions which are *almost* exactly those employed by Mr. Donovan. *Dose.* 10 to 30 drops, twice or thrice a day, preferably soon after a meal; in lepra, psoriasis, lupus, and several other scaly skin diseases. It is a most valuable medicine in these affections.

SOLUTION (Hydriodate of Potassa). See *Solution of Iodide of Potassium.*

SOLUTION (Hydrochlorate of Morphia.) Syn. *Solution of Muriate of Morphiæ; Liquor Morphiæ Hydrochloratis,*—Ph. L. *Solutio Morphiæ Muriatis,*—Ph. E. *Morphiæ Muriatis Liquor,*—Ph. D. *Prep.* 1. (Ph. L.) *Hydrochlorate of morphia*, 4 dr.; *proof spirit*, ½ pint; *distilled water*, 1 pint; dissolve by the aid of a *gentle* heat. 60 drops (minims) of this solution contain 1 gr. of hydrochlorate of morphia. *Dose.* 5 to 15 or 20 drops.

2. (Ph. E. & D.) *Muriate of morphia*, 90 gr.; *rectified spirit*, 5 fl. oz.; *distilled water*, 15 fl. oz. 107 drops (minims) contain 1 gr. of the hydrochlorate. *Dose.* 10 to 30 or 40 drops, or nearly as laudanum.

3. (Apothecaries' Hall.) *Muriate of morphia*, 16 gr.; *rectified spirit*, 1 fl. dr.; *water*, 1 fl. oz.; 30 drops (minims) contain 1 gr. *Dose.* 3 to 10 drops. See *Solution of Acetate of Morphia, &c.*

SOLUTION (Hydrosulphuret of Ammonia.) Syn. *Ammoniæ Hydrosulphuretum,*—Ph. D. *Ammoniæ Hydrosulphas,*—Ph. U. S. See *page* 60.

SOLUTION (Hypochlorite of Lime). See *page* 1160.

SOLUTION (Iodide of Arsenic). Syn. *Liquor Arsenici Periodidi,*—Lat. *Prep.* (Wackenroder.) Each *drachm* contains $\frac{1}{8}$ gr. of *teriodide of arsenic*; equivalent to $\frac{1}{48}$ gr. of *metallic arsenic*, and $\frac{1}{10}$ gr. (nearly) of *iodine.* (See *p.* 86.)

SOLUTION (Iodide of Potassium,—Compound). Syn. *Ioduretted Water, Compound Solution of Iodine; Liquor Potassii Iodidi Compositus,*—Ph. L. & D. *Liquor Iodinei Compositus,*—Ph. E. *Prep.* 1. (Ph. L. & D.) *Iodide of potassium*, 10 gr.; *iodine*, 5 gr.; *water*, 1 pint; dissolve. *Dose.* 1 to 6 dr.; in the usual cases where iodine is employed.

2. (Ph. E.) *Iodide of potassium*, 1 oz.; *iodine*, 2 dr.; *water*, 16 fl. oz. This is 30 times as strong as the preceding. *Dose.* 5 to 20 drops.

3. (*Lugol's.*) See *Lotions*, and *Baths* (Ioduretted).

SOLUTION (Iodine). See *above.*

SOLUTION (Iodohydrargyrate of Iodide of Potassium). Syn. *Liquor Iodohydrargyratis Potassii Iodidi,*—Lat. *Prep.* 1. (Dr. Channing.) *Iodide of potassium*, 3½ gr.; *biniodide of mercury*, 4½ gr.; *distilled water*, 1 fl. oz.; dissolve. *Dose.* 2 to 5 or 6 drops, three times a day, much diluted; in dyspepsia, indurations, enlargement of the spleen, dropsy, &c. (See *p.* 781.)

SOLUTION (Iron,—Alkaline). Syn. *Liquor Ferri Alkalini,*—Ph. L. 1824. *Prep.* (Ph. L. 1824.) *Iron filings*, 2½ dr.; *nitric acid*, 2 fl. oz.; *water*, 6 fl. oz.; dissolve, decant, gradually add of *solution of carbonate of potash*, 6 fl. oz.; and in 6 hours decant the clear portion. This was intended as an imitation of Stahl's *tinctura martis alkalina.* It is tonic, emmenagogue, &c. *Dose.* 20 to 60 drops.

SOLUTION (Javelle's). See *page* 1160.

SOLUTION (Labarraque's). See *page* 1160.

SOLUTION (Lime). Syn. *Lime Water; Solutio Calcis Hydratis; Liquor Calcis,*—Ph. L. & D. *Aqua Calcis,*—Ph. E. *Prep.* (Ph. L.) Upon the *lime, ½ lb.;* first slaked (by sprinkling it) with a *little* of the water, pour the remainder of *water*, 12 pints; and shake them well together (for 5 minutes, —Ph. D.); immediately cover the vessel, and set it aside for three hours; then keep the solution *with the remaining lime* (equally divided) in stoppered glass vessels, and when it is to be used, decant the required portion from the clear solution, (replacing it with *more water*, and agitating briskly, as before;—Ph. E.)

Obs. Cold water dissolves more lime than hot water. 1 pint of water at 32° Fahr. dissolves 13¼ gr., at 60° it dissolves 11½ gr., but at 212°, only 6½ gr. (Phillips.)

Uses, &c. Lime water is antacid, astringent, antilithic, tonic, and vermifuge. *Dose.* A wine-glassful, or more, 2 or 3 times a day, in milk or broth; in dyspepsia, diarrhœa, calculous affections, &c.; and *externally*, as a detersive and discutient lotion.

SOLUTION (Mackenzie's). *Prep.* From *nitrate of silver*, 20 gr.; dissolved in *distilled water*, 1 fl. oz. *Used* to wash the throat and fauces, and to sponge the trachea, in affections of those parts.

SOLUTION (Magnesia). Syn. *Aerated Magnesia Water, Carbonated do., Fluid Magnesia, Condensed Solution of do., Concentrated do. do.; Liquor Magnesiæ Bicarbonatis, Aqua M. Carbonatis,*—Lat. *Eau Magnesienne,*—Fr. *Prep.* (Dinneford's.) *Water* and *Howard's heavy carbonate of magnesia*, in the proportion of 17½ gr. of the *latter* to every *fl. oz.* of the *former*, are introduced into a cylindrical tinned copper vessel, and *carbonic acid*, generated by the action of *sulphuric acid* on *whiting*, is forced into it by steam power, for 5½ hours, during the whole of which time the cylinder is kept in motion. Sir J. Murray's is similar. The Paris Codex orders *recently precipitated carbonate of magnesia* to be used while still moist. Antacid and laxative. See *Fluid Magnesia.*

SOLUTION (Mineral). See *page* 1159.

SOLUTION (Morphia). See *pages* 1158, 1162, and 1166.

SOLUTION (Muriate of Baryta). See *page* 1159.

SOLUTION (Muriate of Lime). See *page* 1160.

SOLUTION (Muriate of Morphia). See *page* 1162.

SOLUTION (Nitrate of Baryta.) Syn. *Solutio Barytæ Nitratis,*—Ph. E. *Prep.* (Ph. E.) *Nitrate of baryta*, 40 gr.; *water*, 800 gr.; dissolve. *Used* as a test for sulphuric acid and the soluble sulphates.

SOLUTION (Nitrate of Silver). Syn. *Liquor Argenti Nitratis,*—Ph. L. *Solutio A. N.,*—Ph. E. *Prep.* (Ph. L.) *Nitrate of silver* (cryst), 1 dr. (40 gr.,—Ph. E.); *distilled water*, 1 fl. oz. (1600 gr.,—Ph. E.); dissolve. *Used* as a test for chlorine, hydrochloric acid, and the soluble chlorides; also used as an escharotic, &c. It should be kept from the light. See *Lotions,* (and *p.* 1139.)

SOLUTION (Opium,—Sedative. See *Liquors.*

SOLUTION (Oxalate of Ammonia). Syn. *Liquor Ammoniæ Oxalatis,*—Lat. *Prep.* Dissolve *oxalate of ammonia* in 10 or 12 times its weight of *pure water. Used* as a test for lime.

SOLUTION (Oxysulphate of Iron). Syn. *Liquor Ferri Oxysulphatis,*—Lat. *Prep.* From *sulphate of iron* (in powder), and *nitric acid*, of each, 3 dr.; triturated together for 15 minutes, and then dissolved in *distilled water*, 1½ fl. oz. *Dose.* 5 or 6 to 12 drops.

SOLUTION (Pernitrate of Iron). Syn. *Solution of Persesquinitrate of Iron; Ferri Pernitras Liquor,*—Ph. D. *Solutio Persesquinitratis Ferri,*—Kerr. *Prep.* (Ph. D.) Take of *pure nitric acid*, 3 fl. oz.; *water*, 16 fl. oz.; mix, add *fine iron-wire*, 1 *oz.;* dissolve, and to the clear solution add as much *water* as will make the whole measure 1½ pint. Sp. gr. 1·107. *Dose.* 5 or 6 to 30 drops, or more; in passive hæmorrhages, mucous discharges, chronic diarrhœa with prostration, &c.

SOLUTION (Phosphate of Soda). Syn. *Solutio Sodæ Phosphatis,*—Lat. *Prep.* (Ph. E.) *Crystallized phosphate of soda*, 175 gr.; *water*, 8 fl. oz.; dissolve and keep it in a corked bottle. *Used* as a test for the salts of lead and magnesia.

SOLUTION (for Plate). Syn. *Plate Liquor; Solutio pro Argento,*—Lat. *Prep.* From *alum, cream of tartar*, and *common salt*, of each, 1 *oz.; water*, ½ gall.; dissolve. *Used* to increase the lustre and whiteness of silver plate, the articles being boiled in it.

SOLUTION (Potassa). Syn. *Liquor of Potassa, Potash Water, Caustic do. do.; Liquor Potassæ,*—Ph. L. *Aqua Potassæ,* —Ph. E. *Potassæ Causticæ Liquor,*—Ph. D. *Aq. Potassæ Causticæ,*—Ph. D. 1826. *Aqua Kali Puri,*—Ph. L. 1788. *Lixivium Saponarium,*—Ph. L. 1746. *Aqua Kali*

Causticum, Lixivium Causticum, Potassæ Pura Liquida,—Obs. var. *Prep.* 1. (Ph. L.) *Lime* (recently burnt), ¸8 oz.; *boiling distilled water*, 1 gall.; sprinkle a little of the water on the lime in an earthen vessel, and when it is slaked and fallen to powder, add of *carbonate of potash*, 15 oz., dissolved in the remainder of the water; bung down, and shake frequently, until the mixture is cold, then allow the whole to settle, and decant the clear supernatant portion into perfectly clean and well-stoppered green-glass bottles. Sp. gr. 1·063. It contains 6·7% of pure potassa.

2. (Ph. E.) *Carbonate of potash* (dry), 4 oz.; *quicklime*, 2 oz.; *water*, 45 fl. oz.; boiling briskly for a few minutes after each addition of the milk of lime; to yield at least 35 fl. oz., by decantation, after 24 hours' repose in a deep narrow glass vessel. Sp. gr. 1·072.

3. (Ph. D.) *Pure carbonate of potassa*, 1 *lb.*; *distilled water*, 1 gall.; dissolve, heat the solution to the boiling point in a clean iron vessel, gradually add to it of *fresh quicklime*, 10 *oz.*; previously slaked with *water*, 7 fl. oz.; and continue the ebullition for 10 minutes, with constant stirring; next allow it to cool out of contact with the air, and when perfectly clear decant it by means of a syphon, and bottle it as before. Sp. gr. 1·068.

4. (Wöhler.) *Nitrate of potassa*, 1 part; is mixed, in alternate layers, with *clippings of sheet copper*, 2 or 3 parts; and then heated to moderate redness for about ½ an hour in a *copper* or *iron crucible*; when cold, the *potassa* is washed out with *distilled water*, and the solution, after repose in a closed vessel, decanted as before. Not a trace of copper can be detected in the liquid. The *clippings* may be again used if mixed with a little fresh metallic copper. (*Annalen der Chemie und Pharm.*)

5. (*Wholesale.*) From *carbonate of potash* (kali), 1 *lb.*, and *quicklime*, ½ *lb.*, to each gall. of *water*.

6. (*Brandish's Alkaline Solution; Liquor Potassæ Brandishii.*) From *American pearl-ashes*, 6 lb; *quicklime* and *woodashes* (from the ash), of each, 2 lb; *boiling water*, 6 gall. (*old meas.*); to each gall. of the clear product is added 12 or 15 drops of *oil of juniper*. This "solution" is much asked for in trade. Ordinary liquor of potassa is generally sold for it.

7. (*Henry's Pure Potash Water.*) Sp. gr. 1·100. *Two* measures possess the same saturating powers as *one* of his carbonate of potash water. *Used* in testing.

Pur. "Nothing, or scarcely anything, is thrown down from this solution on the addition of lime-water; and when it has been first saturated by nitric acid, no precipitate falls on the addition of carbonate of soda, chloride of barium, or nitrate of silver. What is thrown down by bichloride of platinum is yellowish." (Ph. L.)

Assay. 1. See *Alkalimetry*.

2. From the specific gravity, as follows:—

TABLE *of the Densities and Value in Real Alkali of different Solutions of Hydrate of Potassa.* By Dr. DALTON.

Density.	Per centage of real alkali.	Density.	Per centage of real alkali.
1·68	51·2	1·33	26·3
1·60	46·7	1·28	23·4
1·52	42·9	1·23	19·5
1·47	39·6	1·19	16·2
1·44	36·8	1·15	13·0
1·42	34·4	1·11	9·5
1·39	32·4	1·06	4·7
1·36	29·4		

Uses, &c. Liquor of potassa is antacid, diuretic, resolvent, and lithontriptic. *Dose.* 10 to 30 or 40 drops, in any bland diluent (not acidulous); in heartburn, gout, calculi, indurations, scrofula, lepra, psoriasis, &c.

Obs. Quick-lime fails to abstract the carbonic acid from the alkaline carbonates in solutions much stronger than those above referred to. Weaker solutions may, however, be easily concentrated by evaporation in iron vessels. See *Hydrate of Potassa*.

SOLUTION (Potassa, — Effervescing). Syn. *Potash Water* (Effervescing), *Supercarbonate of Potash do.*; *Aqua Potassæ Effervescens*, — Ph. E. *A. P. Supercarbonatis*, — Ph. E. 1839. *Liquor P. Eff.*,— Ph. L. 1836. *Prep.* (Ph. L. & E.) *Bicarbonate of potash*, 1 dr.; *distilled water*, 1 pint; dissolve, force in *carbonic acid gas*, in excess, and keep it in a well-stoppered bottle. Resembles soda water, but sits better on the stomach. It is almost specific in the early stages of scurvy. An excellent *substitute* for *this preparation* is to pour a *bottle of soda water* into a tumbler containing 20 gr. of *powdered bicarbonate of potash*, and to drink it immediately.

SOLUTION (Potassio-tartrate of Antimony). Syn. *Solutio Antimonii Potassio-tartratis*; *Antimonii Tartarizati Liquor*,— Ph. D. *Prep.* (Ph. D.) *Tartarized antimony*, 1 *dr.*; *rectified spirit*, 7 fl. oz.; *dis-*

tilled water, 1 pint; dissolve. *Strength, doses*, and *uses*, similar to those of *antimonial wine* (which see); than which it keeps better.

SOLUTION (Prophylactic). See *page* 1161.

SOLUTION (Sesquicarbonate of Ammonia). Syn. *Solution of Carbonate of Ammonia; Carbonate of Ammonia Water; Liquor Ammoniæ Sesquicarbonatis*, —Ph. L. *Aqua Ammoniæ Carbonatis*, —Ph. E. *Liq. Ammoniæ Subcarbonatis*,—Ph. L.1824. *L. A. Carbonatis*,—Ph. L. 1809. *Aqua Ammoniæ*,—Ph. L. 1788. *Spiritus Salis Ammoniaci*, — Ph. L. 1746. *Prep.* 1. (Ph. L. & E.) *Sesquicarbonate of ammonia*, 4 oz.; *distilled water*, 1 pint; dissolve. Stimulant and antacid. *Dose.* ½ to 1 fl. dr., in water.

2. (*Henry's.*) Sp. gr.1·046. *Two* measures are equal in saturating power to *one* of his carbonate of potash water. *Used* in analysis.

SOLUTION (Silicate of Potassa). See *Solution of Flints.*

SOLUTION (Soda). Syn. *Liquor of Soda, Caustic Soda Water; Liquor Sodæ*,—Ph. L. *Sodæ Causticæ Liquor*,—Ph. D. *Prep.* 1. (Ph. L.) *Carbonate of soda* (cryst.), 32 oz.; *lime*, 9 oz.; *boiling distilled water*, 1 gall.; proceed as for *solution of potassa.* "In 100 gr. are contained 1 gr. of (*pure*) soda." (Ph. L.) Sp. gr. 1·061.

2. (Ph. D.) *Carbonate of soda* (cryst.), 2 *lb.*; *fresh-burned lime*, 10 *oz.*; *water*, 1 gall. 7 fl. oz.; as *liquor of potassa.* Sp. gr. 1·056.

3. (*Henry's.*) Sp. gr. 1·07. It has the same saturating power as his carbonate of soda water. *Used* in testing.

Obs. The strength of a *solution of caustic soda* may be determined from its *density*, and, more correctly, by its *saturating power*. See *Alkalimetry*, and the following Table by Dr. Dalton.

TABLE *of the Density of Solutions of Caustic Soda.*

Density.	Per centage of real soda.	Density.	Per centage of real soda.
2·00	77·8	1·40	29·0
1·85	63·6	1·36	26·0
1·72	53·8	1·32	23·0
1·63	46·6	1·29	19·0
1·55	41·2	1·23	16·0
1·50	36·8	1·18	13·0
1·47	34·0	1·12	9·0
1·44	31·0	1·06	4·7

SOLUTION (Soda,—Effervescing). Syn. *Soda Water; Liquor Sodæ Effervescens*,—Ph. L. 1836. *Aqua S. E.*,—Ph. E. *A. S. Supercarbonatis*,—Ph. E. 1839. *Sodæ Carbonatis Aqua Acidula*, — Ph. D. 1826. *Prep.* (Ph. E.) *Bicarbonate of soda*, 1 dr.; *distilled water*, 1 pint; dissolve, and force *carbonic acid gas* into the solution, under pressure. *Used* as an antacid and grateful stimulant, often proving gently laxative. The *soda water* of *the shops* cannot be substituted for this preparation, as, in opposition to its name, it is usually made *without* soda.

SOLUTION (Soldering). *Prep.* Dissolve *zinc* in *hydrochloric acid* nearly to saturation, add 1-5th part of *powdered sal ammoniac*, and simmer for 5 minutes. *Used* to make solder flow easily and take well; applied with a feather.

SOLUTION (Specific,—Frank's). Syn. *Specific Solution of Copaiba; Liquor Copaibæ Alkalina*, — Lat. *Prep.* Take of *balsam of copaiba*, 2 parts; *liquor of potassa* (Ph. L.), 3 parts; *water*, 7 parts; boil the mixture for 2 or 3 minutes, put it into a *separator*, and allow it to stand for 5 or 6 days; then draw it off from the bottom, avoiding the upper stratum of oil, and to the *clear liquid* add of *sweet spirit of nitre* (perfectly free from acid), 1 part; should it turn foul or milky, a *very little* liquor of potassa will usually brighten it; if not, place it in a *clean separator*, and let it stand, closely covered, for a few days, and then draw it off from the bottom as before, when it will be *perfectly transparent*, without filtering. *Some persons* add the *sweet spirit of nitre* whilst the solution is still warm, mix it in as rapidly as possible, and immediately cork or fasten up the vessel. This is a good way when the article is wanted in a hurry, but is objectionable from the loss of spirit thereby occasioned, and the danger, without care, of bursting the separator.

Obs. A receipt for this article, upon the authority of Battley, has been going the round of the pharmaceutical works for many years. It is as follows:—"Take 12 oz. of *balsam of copaiba*, and 6 oz. of *calcined magnesia*; rub together, add a pint of *proof spirit*, filter, and then add ½ oz. of *sweet spirits of nitre.*" (*Gray's Supplement.*) The product of this formula, utterly unlike "*Frank's Specific Solution*," is a colourless tincture, scarcely flavoured with copaiba, and holding very little of the active matter of the balsam in solution, owing to the compound formed with the magnesia being *insoluble* in spirit. Such is

the affinity of this earth for copaiba (*copaibic acid*), that it will even take it from caustic potassa. See *Copaiba* and its *preparations*.

SOLUTION (Subacetate of Lead). See *page* 1161.

SOLUTION (Sulphate of Morphia). Syn. *Liquor Morphiæ Sulphatis*,—Lat. *Prep.* From *sulphate of morphia*, as the *solution* of the *acetate* or *hydrochlorate*. The *uses, doses, &c.*, are the same.

SOLUTION (Sulphate of Zinc,—Compound). See *Compound Solution of Alum*.

SOLUTION (Sulphuret of Potassium). Syn. *Solution of Hydrosulphate of Potash; Solutio Potassii Sulphureti, Liquor Potassæ Hydrosulphatis; Aqua Potassæ Sulphureti.* (P. D.) *Prep.* Take of *washed sublimed sulphur*, 1 part; *water of caustic potassa*, 11 parts; mix, boil for 10 minutes, filter, and keep the solution in well-closed bottles. Sp. gr. 1·117. The *product* is a mixed solution of hydrosulphate and hyposulphite of potassa. *Dose.* 10 to 60 drops, diluted in water; and, *externally*, made into a lotion; in itch, and several other eruptive diseases.

SOLVENT. Syn. *Menstruum*,—Lat. The liquid in which any substance is dissolved. The substance dissolved is, occasionally, called the *solvend*. (Kirwan.)

SOLVENT (Glazier's). Syn. *Glazier's Pickle*. From *soft soap* dissolved in thrice its weight of strong *soaper's lye*; or, from *freshly slaked lime* made into a thin paste or cream with twice its weight of *pearlash* dissolved in a little *water*. Very caustic. *Used* to soften old putty, and to remove old paint.

SOLVENT MINERAL (Valangin's). See *page* 950.

SOOT. Syn. *Fuligo*,—Lat. *Wood soot* was formerly officinal, and reputed vermifuge and antiseptic. The *soot* from *pitcoal* contains, besides empyreumatic matter, sulphate of ammonia; hence, it is valuable as a manure, when not too freely applied. It is also employed by gardeners to kill insects.

SOPORIFICS. Hypnotics (which see).

SORBIC ACID. Malic acid obtained from the *berries* of the *sorbus aucuparia* (Linn.) or *mountain ash*.

SOUJEE. Syn. *Soojee*. A species of semolina. *Semoletta* (*semola rarita*) is a still smaller variety of *pearled wheat*, separated from the others by means of a sieve. Baster's *soojee* is said to be a mixture of ordinary *wheat-flour* and *sugar*.

SOUR-KROUT. This is either eaten as a pickle, or stewed in its *own juice* with *bacon, pork*, or other *fat meat*. It is laxative and antiscorbutic. The value of *sauer-kraut* in scurvy was noticed by Capt. Cook. (See *p.* 1125.)

SOUP. A strong decoction of *flesh*, properly *seasoned* with *salts, spices, &c.*, for the table. The different tastes of people require more or less of the *flavour of spices, salt, garlic, butter, &c.*, which can, therefore, never be ordered by general rules. If the cook has not a good taste, and attention to that of his or her employers, not all the ingredients which nature and art can furnish will give an exquisite flavour to the dishes. The *proper articles* should be always at hand, and must be proportioned until the true zest be obtained. A variety of flavours may be given to different dishes served at the same time, or even to the same soup, by varying the *condiments* and *spices*. At a Parisian restaurant *one cauldron* is made to produce almost every imaginable variety of soup.

SOUP (Portable). Syn. *Glaze*. From *shin of beef*, or other like part; the soup being gently simmered until reduced to the consistence of a thin syrup, and then poured into small upright jelly-pots, with covers, or, upon flat dishes, to lie about ¼ inch deep. The latter, when set, is divided into pieces, which are dried. *Used* to make *extemporaneous soup* and *glazes*. A similar article, prepared on the *large scale*, now generally forms part of every ship's stores.

SOURING. See *Malt-liquors* and *Wines*.

SOY. Genuine soy is a species of thick black sauce, imported from China. *Prep.* Take of the *seeds of dolichos soja* (white haricots or kidney beans may be used for them), 1 gall.; boil them in *water*, q. s., until soft, add of *bruised wheat*, 1 gall., and keep the mixture in a warm place for 24 hours; then add of *common salt*, 1 gall.; *water*, 2 gall.; put the whole into a stone jar, and bung it up loosely for two or three months, shaking it very frequently during the whole time; lastly, press out the liquor and bottle it; the residuum may be treated afresh with *water* and *salt*, for soy of an inferior quality.

Obs. The soy of the shops, is, in nine cases out of ten, a spurious article made in this country, by simply saturating *molasses* or *treacle* with *common salt*. A better, and a really wholesome imitation is made as follows:—*Malt syrup*, 1 gall. (or, 13½ *lb.*); *treacle*, 5 *lb.*; *salt*, 4¼ *lb.*; *mushroom juice*, 1 quart; mix, with a gentle heat, and stir until the union is complete; in a fortnight decant the clear portion.

SPANIOLITMINE. See *page* 381.

SPANISH FLIES. See *Cantharides*.

SPARADRAP. Syn. *Sparadrapum*,—

Lat. Originally, a cerecloth; now, applied to spread plasters; as, *sparadrapum commune*, common strapping or adhesive plaster; *s. vesicatorium*, blistering plaster or tissue, &c.

SPARROW. The *fringilla domestica*, a well-known bird of the order *passeres* (passerinæ). It was formerly used in medicine—the *dung*, against toothache; the *fat*, to resolve hard tumours; and the *flesh*, against epilepsy.

SPARTEINE. A volatile oily liquid, possessing basic properties, obtained from *spartium scoparium* or *broom*. It is highly poisonous, and resembles conia and nicotine in its general properties.

SPASMS. Syn. *Cramp: Spasmus*,—Lat. An involuntary contraction of the muscles, generally of the extremities, accompanied with pain, more or less severe. Spasms are distinguished into *clonic spasms* or convulsions, in which the contractions and relaxations are alternate, as in epilepsy; and into *tonic spasms*, in which there is continued rigidity, as in locked-jaw. That form which commonly attacks muscles of the legs and feet, especially after great exertion or exposure to cold, is commonly called *cramp*. The best *treatment* for this is immediately to stand upright, and to well rub the part with the hand. The application of *strong stimulants*, as spirits of ammonia, or of *anodynes*, as opiate liniments, has been recommended. When *spasm* or *cramp* occurs in the *stomach*, a tea-spoonful of *sal volatile* in water, or a table-spoonful of *good brandy* may be swallowed immediately. When *cramp* comes on during *cold bathing*, the limb should be thrown out as suddenly and violently as possible, which will generally remove it, care being also taken not to become flurried or frightened; as presence of mind is very essential to personal safety on such an occasion. A *common cause* of *spasm* is indigestion, and the use of acescent liquors; these should, therefore, be avoided, and bitters and absorbents had recourse to. See *Antispasmodics*, and the *names* of the principal spasmodic diseases.

SPEARMINT. See *page* 791.

SPECIES. Mixtures of dried plants, or parts of plants, in a divided state, which, for convenience, are kept mixed for use. The dry ingredients of pills, conserves, electuaries, mixtures, &c., that do not keep well when made up, or which are in little demand, may he economically and conveniently preserved in this state. The word, thus applied, is obsolete out of the pharmaceutical laboratory.

SPECIES (Anthelmintic). Syn. *Species Anthelminticæ*,—Lat. The *dried flowering tops* of *tansy* and *wormwood*, and the *flowers of chamomile*, equal parts; mix, and keep them in a close vessel. (P. Cod.)

SPECIES (Aperitive). See *below*.

SPECIES (Aromatic). Syn. *Aromatic Powder; Species Aromaticæ*,—Lat. *Prep.* (Ph. Bor.) *Leaves* of *balm* and *curled-leaf mint* (mentha crispa), of each, 4 oz.; *lavender flowers*, 2 oz.; *cloves*, 1 oz.; dry them by a gentle heat, and then powder them. See *Species* (Vulnerary).

SPECIES (Astringent). Syn. *Species Astringentes*,—Lat. The *roots* of *bistort* and *tormentil*, and *bark* of *pomegranate*, equal parts. (P. Cod.)

SPECIES (Bitter). Syn. *Three Bitter Herbs; Species Amaræ, Herbæ Amaræ*,—Lat. The *leaves* of *germander*, and *dried tops of lesser centaury* and *wormwood*, equal parts. (P. Cod.)

SPECIES (Capillary). Syn. *Five Capillary Herbs; Herbæ Quinque Capillares*,——Lat. *Hart's tongue, black maiden-hair, white do., golden do.*, and *spleenwort*, equal parts. (Ph. L. 1720.)

SPECIES (Cordial). Syn. *Four Cordial Flowers; Species Cordiales*,—Lat. The *flowers* of *borage, bugloss, roses*, and *violets*, equal parts. (Ph. L. 1720.)

SPECIES (Diuretic). Syn. *Aperient Roots, Aperitive Species; Species Diureticæ*,—Lat. 1. (*Five greater Aperitive roots*,—P. Cod., & Ph. E. 1744.) The *dried roots* of *asparagus, butcher's broom, parsley, smallage*, and *sweet fennel*, equal parts.

2. (*Five lesser Aperitive roots.*) Those of *caper, dog-grass, eryngo, madder*, and *rest-harrow*.

SPECIES (Emollient). Syn. *Species Emollientes*,—Lat. 1. (*Three Emollient Meals; Farinæ Emollientes.*) The *meal* of *barley, linseed*, and *rye*, equal parts. (P. Cod.)

2. (*Five Emollient Herbs; Herbæ Quinque Emollientes.*)—*a.* The *dried leaves* of *groundsel, common mallow, marsh-mallow, great mullein*, and *wall pellitory*, equal parts. (P. Cod.)

b. The *leaves of mallow, marsh-mallow, French mercury, pellitory of the wall*, and *violet*. (Ph. E. 1744.)

SPECIES (for Enemas). Syn. *Herbs for Clysters; Herbæ pro Enemate*,—Lat. *Mallow leaves*, 2 parts; *chamomile flowers*, 1 part.

SPECIES (for Fomentations). Syn. *Species pro Fotu, Herbæ pro Fotu*,—Lat. *Leaves of southernwood, tops of sea-worm-*

wood, and *flowers of chamomile*, of each, 2 parts; *bay leaves*, 1 part.

SPECIES (Hot).—1. (*Four greater Hot seeds.*) The *seeds of anise, caraway, cumin,* and *fennel.*

2. (*Four lesser Hot seeds.*) The *seeds of bishop's weed, smallage, stone parsley,* and *wild carrot.*

SPECIES (Laxative). Syn. *St. Germain Laxative Powder; Species Laxantes St. Germain,*—Lat. *Prep.* (Ph. Bor.) *Senna leaves* (exhausted with spirit), 4 oz.; *elder flowers*, 2½ oz.; *aniseed* and *fennel seed*, of each, 1¼ oz.; reduce them to coarse powder, and, when dispensing, add of *powdered cream of tartar*, 1 dr., to each 1½ oz. of the mixture.

SPECIES (Narcotic). Syn. *Four Narcotic Herbs; Species Narcoticæ,*—Lat. *Dried leaves* of *belladonna, black nightshade, henbane,* and *thorn-apple*, equal parts.

SPECIES (Pectoral). Syn. *Species Bechicæ, Species ad Infusum Pectorales,*—Lat. 1. *Mallow root*, 4 oz.; *coltsfoot leaves*, 2 oz.; *liquorice root*, 1½ oz.; *aniseed, great-mullein flowers,* and *red-poppy flowers*, of each, 1 oz.; *orris root*, ½ oz. (Ph. Bor.)

SPECIES (Refrigerant).—1. (*Four Cold seeds.*) The *seeds of cucumber, gourd, melon,* and *water-melon.*

2. (*Four lesser Cold seeds.*) The *seeds* of *endive, lettuce, purslane,* and *succory.*

SPECIES (Resolvent). Syn. *Farinæ Resolventes,*—Lat. The *meal* of the *seeds* of *barley, bean, tare,* and *white lupin.*

SPECIFIC GRAVITY is the density of the matter of which any body is composed, compared to the density of another body, assumed as the standard, or 1·000. This standard is pure distilled water for liquids and solids, and atmospheric air for gaseous bodies and vapours. In England the sp. gr., unless when otherwise expressed, is always taken at 60° Fahr.; but in France it is taken at 32°, or the temperature of melting ice. In the *London Pharmacopœia* "whenever specific gravity is mentioned, the substance spoken of is supposed to be of the temperature of 62° Fahr." In most cases, however, it is sufficient merely to note the temperature, and to apply a correction, depending on the known density of water, or air, at the different degrees of the thermometric scale.

To *determine* the *specific gravity* of a *solid*, we weigh it, first in the air, and then in water. In the latter case it loses, of its weight, a quantity precisely equal to the weight of its own bulk of water; and hence, by comparing this weight with its total weight, we find its specific gravity. The rule is—*Divide* the *total weight* by the *loss of weight in water;* the *quotient* is the *specific gravity.*

The *specific gravity* of a substance which is *lighter* than *water*, may be determined by attaching it to some substance, as a piece of lead, the sp. gr., &c., of which are known. In this way, by *deducting* the *loss in weight of the two substances* when weighed in water, from the *loss sustained by the lead alone*, when so weighed, we obtain a difference (*a*) which, added to the weight of the substance taken in air (*b*), gives the respective densities. From these the sp. gr. is found by the rule of three:—

$$(a + b) : 1 :: b : sp.\ gr.$$

The *specific gravity* of *substances* which are *soluble in water* are taken in pure *oil of turpentine, rectified spirit, olive oil,* or some other liquid, the density of which is exactly known. Sometimes, for rough purposes, the article is covered with a coating of mastic varnish. This last method answers for mercurial pill.

The *specific gravity* of a *liquid* or a *gas*, is found by weighing it in a *sp. gr. bottle, glass flask*, or other vessel of known capacity, and dividing that weight by the weight of the same bulk of water; the *quotient* is, as before, the specific gravity. A *bottle* of the capacity of 1000 water-grains (*specific gravity bottle*) gives the density of a liquid at once, by simply filling it to the given mark, and then accurately weighing it.

The *specific gravity* of a substance in *fragments*, or in *powder*, may be found by putting a portion (say 100 gr.) into a sp. gr. bottle, filling the latter with distilled water, and then weighing it. The *weight of water* which it is found to contain deducted from 1000 (the weight of the bottle when filled with distilled water), gives a *difference* (*a*) which bears the same relation to the *sp. gr. of water* (1·000), as the *weight of the powder* (*b*) put into the bottle, does to the *required sp. gr.* Or—

$$a : 1{\cdot}000 :: b : sp.\ gr.$$

The *sp. gr.* of *alloys* and *mixtures*, when no condensation has occurred, is equal to the *sum of the weights* divided by the *sum of the volumes*, compared to *water* reckoned as unity; and is not merely the arithmetical mean between the two numbers denoting the two sp. gr., as is frequently taught. See *Alligation, Beads* (Lovi's), *Hydrometer, Mixtures* (Arithmetic of), and the *Appendix.*

SPECULUM, METAL. *Prep.* 1. Take of *copper*, 64 parts; *pure tin*, 29 parts;

melt them separately under a little *black flux;* next incorporate them thoroughly by stirring with a wooden spatula, and run the metal into the moulds, so that the face of the intended mirror may be downwards; lastly, allow the whole to cool very slowly.

2. *Pure copper*, 2 parts; *pure tin*, 1 part. *Used* to make the mirrors of reflecting telescopes. The addition of a little metallic arsenic renders it whiter.

SPELTER. See *Zinc.*

SPERMACETI. Syn. *Cetaceum*,—Ph. L. E. & D. "A concretion prepared from the *oily matter* of the *head* of the *physeter macrocephalus*, or *spermaceti whale.*" (Ph. L.) It is demulcent and emollient; chiefly *used* in ointments and cerates.

SPHERICAL HEAT. It is found that water, and other volatile liquids, thrown on a metallic plate heated to dull redness, are not resolved into vapour, but assuming a somewhat globular form, remains intact, until the temperature becomes sufficiently lowered to allow of contact between the liquid and the heated surface. It is then immediately volatilized. M. Boutigny, who fully investigated this subject, has also shown, that the same thing happens when a solid body containing water, is substituted for the liquid in the above and similar experiments. Thus, the *finger* or *hand*, under certain restrictions, *may be thrust*, with perfect impunity, *into a stream of molten metal*, and *ice* may be produced by *throwing water* into a *red-hot crucible.* This last experiment, as performed by MM. Boutigny and Prevostaye, is essentially as follows:—A thick platinum crucible, of the capacity of 1 fl. oz., is heated to redness over a *powerful spirit lamp*, and some *liquid anhydrous sulphurous acid* (a very volatile substance) poured into it by means of a *pipette;* the acid assumes the spherical form, and not a drop evaporates; a few drops of *water* are now introduced into the *sulphurous acid* in the same way; the diluted and slightly cooled acid instantly flashes off in vapour, and robbing the water of its caloric, leaves the latter in a *frozen state;* and, if the operator seizes the right moment, a *solid lump of ice* may be thrown out of the red-hot crucible before his astonished audience, as has been repeatedly done at the Polytechnic Institution.

SPICE (Horse). Syn. *Cow Spice; Species Equinus*,—Lat. *Prep.* 1. *Aniseed, allspice, cumin seed, ginger, liquorice*, and *turmeric*, equal parts.

2. *Turmeric*, and *cumin seed*, of each, 5 *lb.; ginger*, 2½ *lb. Used* by farriers.

SPICE (Kitchen). Syn. *Mixed Spice, Kitchen Pepper*, &c. *Prep.* From *black pepper*, 2 *lb.; ginger*, 1 *lb.; cinnamon, allspice*, and *nutmegs*, of each, 8 *oz.; cloves*, 1 *oz.; dry salt*, 6 *lb.;* well ground together. *Useful* to flavour gravies, soups, &c.

SPICE (Mixed). As the last, omitting half the salt.

SPICE (Pease). See *Powders.*

SPICE (Ragout). *Prep.* From *dry salt*, 1 *lb.; flour of mustard, black pepper*, and *grated lemon peel*, of each, ½ *lb.; cayenne pepper*, 2 *oz.; allspice* and *ginger*, of each, 1 *oz.; nutmeg*, ½ *oz.;* all separately powdered.

SPICE (Sausage,—French). Syn. *Epice Fines. Prep.* From *black pepper*, 5 *lb.; ginger*, 2½ *lb.; cloves* and *nutmegs*, of each, 1 *lb.; aniseed* and *coriander seeds*, of each, ½ *lb.;* powder and mix them.

SPICE (Savoury). *Prep.* 1. (*Kidder's.*) From *cloves, mace, nutmegs, pepper*, and *salt*, equal parts. *Used* by cooks.

2. (*Dr. Kitchener's.*) See *Ragout Spice* (above).

SPICE (Soup). Syn. *Kitchener's Soup-herb Powder, Kitchener's Vegetable Relish, &c. Prep.* From *parsley, lemon thyme, sweet marjoram*, and *winter savoury*, of each, dried, 2 *oz.; sweet basil* and *yellow peel of lemon*, of each, dried, 1 *oz.;* mix, and powder.

SPICE (Sweet—Kidder's). *Prep.* From *cinnamon, cloves, mace, nutmegs*, and *sugar*, equal parts. *Used* in pastry.

SPIGELIA. Syn. *Carolina Pink-root; Spigelia*,—Ph. E. The *root* of *spigelia Marilandica* or *worm grass.* It is purgative, narcotic, and vermifuge. *Dose* 10 to 40 gr., in powder or infusion, night and morning, until the worms are expelled. Rhubarb or calomel is commonly added to it.

SPINAL AFFECTIONS. See *Surgery* (Popular).

SPIRIT. Syn. *Spiritus*,—Lat. Under this term are included all the inflammable and intoxicating liquors obtained by distillation, and used as beverages; as *brandy, gin, rum, &c.*, each of which is noticed in its alphabetical order. Spirit may also be obtained by fermentation and distillation from all vegetable juices or solutions that contain sugar.

The *spirit* used in *pharmacy* and *chemistry* is distinguished by names which have reference to its richness in alcohol. (See *below.*)

* Frequently retailed at 25 to 35 u. p.

† Though "permitted" at 22 or 24, are generally from 25 to 35 u. p., or even weaker.

‡ These though "permitted" at 60 or 64 u. p. are generally 75 or 80 u. p.

§ Generally retailed as low as the Excise Laws allow; viz., 17 u. p.

‖ Usual strength 54 o. p.

¶ The specific gravity is no guide when sugar is present, as in compounds.

Spirituous liquors, like all other fluids at common temperatures, expand when they are heated, and diminish in volume when they are cooled. It is found that 1000 gall. of proof spirit measured at the temperatnre of 50° Fahr., will, if re-measured at 59°, be found to have increased in bulk to fully 1004¼ gall.; whilst 1000 gall. of the same spirit measured at 77° Fahr., will be only equal to 991½ gall. at 59°. These changes are still more marked at higher strengths, and at extreme temperatures, and from not being recognisable by the hydrometer, often lead to serious losses in trade, and to serious fluctuations in "stock," which, to those unaware of the action of temperature, are perfectly unaccountable. A *gallon* of *proof spirit* only weighs 9½ *lb.* at 60° Fahr. At a higher temperature it will weigh *less*, —at a lower one, *more;* but as this weight constitutes the standard gallon at the temperature the proof is calculated for, it is manifest that any variations from it must result in loss either to the buyer or seller. Hence the equity of buying and selling liquors by *weight*, instead of by *measure*. The stock-keeper in every wholesale house, as well as every Excise officer, should be aware of this fact, and on "taking stock" should as regularly enter the *temperature* of his cellars in his stock book, as he does the "dip" or "wet inches." See *Alcohol*, *Alcoholmetry*, *Ebullioscope*, *Porter*, *Specific Gravity*, *&c.*

SPIRIT (Acetic). See *Acetone.*

SPIRIT (Amylic). See *page* 872.

SPIRIT (Dyer's). See *Tin Mordants.*

SPIRIT (Proof). See *above.*

SPIRIT (Pyroacetic). See *Acetone.*

SPIRIT (Pyrolyxic). Syn. *Pyroligneous Spirit*, *Wood do.*, *Medicinal Naphtha*, *Wood do.*, *Hydrated Oxide of Methyle*, *Bihydrate of Methylene; Spiritus Pyroxylicus*,— Ph. D. A light volatile liquid, discovered by Mr. P. Taylor, in 1812, among the liquid products of the distillation of dry wood. It has been shown by MM. Dumas and Peligot to be "really a second alcohol, forming an ether, and a series of compounds (*methyl-series*) exactly corresponding with those of vinous spirit, and, in some points, even more complete than the latter."

Prep. 1. (*Commercial.*) By saturating *crude pyroligneous acid*, after it has been separated from the tar, with *quick-lime*, and then distilling it. About 1% of spirit is obtained, which is purified by 2 or 3 rectifications. In this state it contains acetone and other inflammable fluids, from which it may be separated by distilling it with an excess of *chloride of calcium*, in a water bath, as long as any volatile matter passes over, which is the impurities. A quantity of water equal to the spirit employed is then added, and the distillation continued. The *product* is now nearly pure *pyroxylic spirit* combined with a little water, from which it may be freed by distillation along with *quick-lime.*

2. (*Medicinal.*) The *pyroxylic spirit* of *commerce* is agitated along with about 5 times its volume of *water*, and, after repose, any oily matter which separates and floats on it, is carefully removed; the spirit is then separated by careful distillation, and the product is freed from water as before. Berzelius recommends the *crude spirit* to be agitated with a *fatty oil*, to remove empyreumatic matter, and then to rectify it, first, from *recently burnt charcoal*, and next with *chloride of calcium.*

Prop., &c. Pure pyroxylic spirit is a transparent colourless liquid, having a penetrating ethereal smell, and a hot disagreeable taste; it is very inflammable, burning with a pale blue flame, by which it may be readily distinguished from pyroacetic spirit. It is neutral to test paper, mixes with water, alcohol, and ether in all proportions; and boils at 150° Fahr., sp. gr. 0·798 at 68° Fahr. (Regnault and Liebig.) Dr. Ure states the sp. gr. to be 0·824 at 60°; the Dublin College makes it 0·846. That of the latter must therefore have contained a little water. It does not dissolve Indian rubber and gutta percha, like mineral or true naphtha.

Pyroxylic spirit is *distinguished* from *acetone* or *pyroacetic spirit*, by the character or its flame, and by *freely* dissolving chloride of calcium, which is quite insoluble in the latter. In a mixture of these two liquids, two distinct strata are formed when this substance, either in powder or concentrated solution is added.

Pyroxylic spirit is *distinguished* from *vinous spirit* by the action of potassa (see *p.* 33), and by its lower boiling point. The *presence of alcohol* in a *mixture* of the two is readily detected by the violent effervescence which follows the addition of a little concentrated nitric acid (sp. gr. 1·45). The *proportion* of *alcohol* may be determined by treating the mixture with a recent solution of mercury in nitric acid (1 mercury to 5 or 6 of acid), aiding the action, if required, by a gentle heat. The effervescence which ensues, and the formation of a detonating precipitate (*fulminating mercury*), are not only characteristic of the presence of alcohol, but the weight of the fulminate thus formed, is nearly equal to

that of the alcohol contained in the wood spirit. (Ure.)

Uses, &c. Chiefly to dissolve resins and volatile oils, especially shell lac. As a *medicine*, it is anodyne and sedative; and has been beneficially employed by Drs. Christison, Hastings, and Neligan, to allay the harassing cough, troublesome vomiting, and excessive expectoration in phthisis, and some other affections. *Dose.* 5 to 30 drops, thrice a day, in water.

SPIRIT (Raisin). *Prep.* From *raisins* fermented along with *water*, and the wash distilled by a quick fire. *Used* to give a brandy flavour to malt spirit. 1 gall. added to 150 gall. of *plain spirit*, along with some *colouring*, and a little *catechu*, either with, or without, a little *acetic ether*, makes a very decent "*British Brandy.*"

SPIRIT (Rectified). See *page* 1170.

SPIRIT OF SALT. See *page* 571.

SPIRIT OF SOUP-HERBS. As *essence of soup-herbs*, but substituting 1 quart of *brandy* or *proof spirit* for the rectified spirit.

SPIRIT OF WINE. See *pages* 1170.

SPIRITS (Culinary). These are prepared in the same way as the "*Tinctures for Kitchen use*" noticed at *page* 396.

SPIRITS (Medicinal). Syn. *Spiritus Medicinales*,—Lat. The spirits of *pharmacy* are either *prepared* by macerating the *bruised seeds, flowers, herbs &c.*, in the *spirit* for 2 or 3 days before distillation, and then drawing it off by a gentle heat; or *extemporaneously*, by adding a proper proportion of *essential oil* to *pure spirit* of the prescribed strength. This plan is very generally adopted in the new Ph. D. In the *first method*, when a naked fire is employed, a *little water* is put into the still along with the spirit, to prevent empyreuma. These spirits are principally employed as aromatics and stimulants, in *doses* of ¼ *oz.* to ½ *oz.*, or as adjuvants in draughts and mixtures.

The following are the *principal medicinal spirits:*—

Spirit of Ammonia; Spiritus Ammoniæ,—Ph. E., Ph. L. 1836, & Ph. D. 1826. *Alcohol Ammoniatum*,—Ph. E. 1839. *Sp. Salis Ammoniaci Dulcis*,—Ph. L. 1746. *Prep.* 1. (Ph. E.) Take of *quick-lime*, 12 oz.; slake it with *water*, 6½ fl. oz.; add of *finely powdered hydrochlorate of ammonia*, 8 oz.; and distil in a glass retort furnished with a tube reaching nearly to the bottom of a bottle containing *rectified spirit*, 2 pints; and kept well cooled. A sand heat is to be employed, and the distillation continued as long as anything passes over. The product has a sp. gr. about 0·845, and should not effervesce with acids. The alkali is here in the caustic state, and in this respect it resembles the *spirit of ammonia*, Ph. U. S. and Dzond's *caustic spirit of ammonia*, Ph. Bor.

2. (Ph. L. 1836.) *Hydrochlorate of ammonia*, 10 oz.; *carbonate of potassa*, 16 oz; *rectified spirit* and *water*, of each, 3 pints; mix, and let 3 pints distil.

3. (Ph. D. 1826.) Dissolve 3½ oz. of *carbonate of ammonia*, in *rectified spirit*, 3 wine pints.

Obs. The ammonia in the last two preparations exists in the carbonated state. They are chiefly employed to make other preparations.

Anisated Spirit of Ammonia; Liquor Ammoniæ Anisatus, Spiritus Ammoniæ Anisatus,—Lat. *Prep.* (Ph. Bor.) *Rectified spirit*, 12 oz.; *oil of aniseed*, 3 dr.; dissolve, and add of *caustic solution of ammonia* (0·960), 3 oz.

Aromatic Spirit of Ammonia, Spirit of Sal Volatile; Spiritus Ammoniæ Aromaticus,—Ph. L. E. & D. *Alcohol Ammoniatum Aromaticum*,—Ph. E. 1839. *Sp. A. Compositus*,—Ph. L. 1788. *Sp. Volatilis Aromaticus*,—Ph. L. 1746. *Sp. Salis Volatilis Oleosus*,—Ph. L. 1721. *Prep.* 1. (Ph. L.) Take of *hydrochlorate of ammonia*, 6 oz.; *carbonate of potassa*, 10 oz.; *cinnamon* and *cloves*, of each, bruised, 2½ dr.; *fresh lemon peel*, 5 oz.; *rectified spirit* and *water*, of each, 2 quarts; mix, and distil 3 quarts. Sp. gr. 0·918.

2. (Ph. E.) *Spirit of ammonia*, 8 fl. oz.; *oil of rosemary*, 1½ fl. dr.; *oil of lemon peel*, 1 fl. dr.; mix.

3. (Ph. D.) *Rectified spirit*, 3 pints; *oil of lemon*, ½ fl. oz.; *oil of nutmeg*, 2 fl. dr.; *oil of cinnamon*, ½ fl. dr.; dissolve, and add of *stronger solution of ammonia*, 6 fl. oz. Sp. gr. 0·852.

Obs. The ammonia exists in the state of neutral carbonate in the product of the *first* formula; but in the caustic state in those of the others. *Dose.* ½ to 1 fl. dr., in water, or any bland liquid; as a diffusible stimulant and antacid, in debility, low spirits, dyspepsia, heartburn, flatulent colic, hysteria, &c. The *spirit of sal volatile* of the *shops* is generally a spurious compound of little more than ½ the above strength.

Fœtid Spirit of Ammonia; Spiritus Ammoniæ Fœtidus,—Ph. L. E. & D. *Alcohol Ammoniatum Fœtidum*,—Ph. E. 1817. *Tinctura Assafœtidæ Ammoniata*,—Ph. E. 1839. *Sp. Volatilis Fœtidus*,—Ph. L. 1746. *Prep.* 1. (Ph. E.) *Hydrochlorate of ammonia*, 10 oz.; *carbonate of potassa*, 16 oz.; *assafœtida*, 5 oz.; *rectified spirit* and *water*, of

each, 3 pints; mix well, then slowly distil 3 pints. Sp. gr. 0·861.

2. (Ph. E.) *Spirit of ammonia*, 10½ fl. oz.; *assafœtida* (broken small), ½ oz.; digest for 12 hours, then distil 10½ fl. oz., by the heat of a vapour (water) bath.

3. (Ph. D.) *Assafœtida*, 1½ *oz.; rectified spirit*, 1½ pint; digest for 24 hours, then distil off the whole of the spirit, and mix the product with *stronger solution of ammonia*, 3 fl. oz. Sp. gr. 0·849.

Obs. The *dose, &c.*, are the same as those of the last, but it is preferred for hysterical and spasmodic affections.

Amylic Spirit,—Ph. D. See *page* 872.

Spirit of Aniseed; Spiritus Anisi,—Ph. L. *Prep.* 1. (Ph. L.) *Oil of aniseed*, 3 fl. dr.; *proof spirit*, 1 gall.; dissolve. Carminative. *Dose.* ½ fl. dr. to 4 fl. dr.

2. (*Essentia Anisi*,—Ph. D.) *Oil of aniseed*, 1 fl. oz.; *rectified spirit*, 9 fl. oz.; mix with agitation. Chiefly used to make *aniseed water*.

Compound Spirit of Aniseed; Spiritus Anisi Compositus,—Ph. D. 1826. *Prep.* (Ph. D. 1826.) *Aniseed* and *angelica seed*, of each, ½ lb; *proof spirit*, 1 gall.; *water*, q. s.; distil 1 gallon. When coloured with saffron, or sap green, it closely resembles the Irish *Usquebaugh*. (Montgomery.) *Dose.* 1 to 4 fl. dr.

Arquebusade Spirit. See *Vulnerary Spirit* (below).

Compound Spirit of Balm, Balm Water, Carmelite do.; Eau des Carmes, Eau de Melisse des Carmes; Aqua Melissæ Composita, Spiritus M. Compositus,—Lat. *Prep.* 1. (P. Cod.) *Fresh flowering tops of balm*, 24 oz.; *fresh lemon-peel*, 4 oz.; *cinnamon, cloves*, and *nutmegs*, of each, 2 oz.; *coriander seed* and *dried angelica root*, of each, 1 oz.; *rectified spirit*, 8 lb; macerate for 8 days, and distil in a water bath to dryness. This spirit is much esteemed in France as a stomachic, a cosmetic, and a stimulant.

Bathing Spirit. Soap liniment.

Spirit of Camphor, Camphorated Spirit; Spiritus Camphoræ,—Ph. L. *Tinctura Camphoræ*,—Ph. L. 1836. *Spiritus Camphoratus*,—Ph. D. 1826. *Prep.* (Ph. L.) *Camphor*, 5 oz.; *rectified spirit*, 1 quart; dissolve. *Used* as an application to chilblains, and in chronic rheumatism, cholera, &c. See *Drops, Essences*, and *Tinctures*.

Spirit of Caraway; Spiritus Carui,—Ph. L. & E., & Ph. D. 1826. *Prep.* 1. (Ph. L.) *Oil of caraway*, 2 fl. dr.; *proof spirit*, 1 gall.; dissolve.

2. (Ph. E.) *Caraway seeds* (bruised), ½ lb.; *proof spirit*, 7 pints; macerate for 2 days in a covered vessel, then add of *water*, 1½ pint; and distil 7 pints. Aromatic and carminative. *Dose.* 1 to 4 fl. dr. A similar spirit, "sweetened with sugar, is drunk in Germany as a dram, (*Kümelliqueur; Kümelbrandtwein.*" (Pereira.)

3. (*Essentia Carui*,—Ph. D.) *Oil of caraway*, 1 fl. oz.; *rectified spirit*, 9 fl. oz. *Used* to make caraway water.

Spirit of Cassia; Spiritus Cassiæ,—Ph. E. *Prep.* From *coarsely powdered cassia*, 1 lb.; *proof spirit*, 7 pints; *water*, 1½ pint, or q. s.; draw off 7 pints. *Dose, &c.* As the last. It is almost universally substituted for *spirit of cinnamon*.

Spirit of Cinnamon; Spiritus Cinnamomi,—Ph. L. & E., & Ph. D. 1826. *Prep.* 1. (Ph. L.) *Oil of cinnamon*, 2 fl. dr.; *proof spirit*, 1 gall.; dissolve.

2. (Ph. E.) From *cinnamon*, as *spirit of cassia*. *Dose.* 1 to 4 fl. dr.

3. (*Essentia Cinnamomi*,—Ph. D.) *Oil of cinnamon*, 1 fl. oz.; *rectified spirit*, 9 fl. oz. *Used* to make cinnamon water, &c.

Spirit of Ether, Spirit of Sulphuric do.; Spiritus Ætheris Sulphurici,—Ph. E., & Ph. L. 1824. *Æther Sulphuricus cum Alcohole*,—Ph. E. 1839. *Sweet Spirit of Vitriol, Sp. Ætheris Vitriolici, Sp. Vitrioli Dulcis*,—Obs. var. *Prep.* (Ph. E. & Ph. L. 1824.) *Sulphuric ether*, 1 part; *rectified spirit*, 2 parts. Sp. gr. 0·809. *Obs.* This preparation should be neutral to test paper, mix (clear) with water, and when shaken with twice its volume of concentrated solution of chloride of calcium, $28\frac{9}{10}$ of ether should separate. *Dose.* ½ to 2 or 3 fl. dr.; as a stimulant and anodyne.

Compound Spirit of Ether, Hoffman's Anodyne Liquor; Spiritus Ætheris Compositus,—Ph. L. 1851 & 1809. *Sp. Ætheris Sulphurici Compositus*,—Ph. L. 1836. *Sp. Ætheris Oleosus*,—Ph. D. *Sp. Æth. Vitriolici Co.*,—Ph. L. 1788. *Prep.* 1. (Ph. L.) *Ether*, 8 fl. oz.; *rectified spirit*, 16 fl. oz.; *ethereal oil*, 3 fl. dr.; mix.

2. (Ph. D.) Mix in a glass matrass, *oil of vitriol*, 1½ pint; with *rectified spirit*, 1 pint; connect this with a Liebig's condenser, apply heat, and distil until a black froth begins to rise; then separate the upper stratum of the *distilled liquid*, and having exposed it to the air for 24 hours, let the oil be transferred to a moist paper filter, and washed with a little cold water; lastly, dissolve it in a mixture of *rectified spirit*, ½ pint; *sulphuric ether*, 5 fl. oz.

Obs. This compound is anodyne, and antispasmodic, and was once held in very great repute. *Dose.* ½ to 2 fl. dr.

Aromatic Spirit of Ether, A. Sp. of Sulphuric do., Sweet Elixir of Vitriol; Elixir Vitrioli Dulce; Spiritus Ætheris Aromaticus,—Ph. L. 1824. *Prep.* (Ph. L. 1824.) *Bruised cinnamon*, 3 dr.; *cardamoms*, 1½ dr.; *long pepper* and *ginger*, of each, 1 dr.; *rectified spirit*, 10 fl. oz.; *sulphuric ether*, 5 fl. oz.; mix, and digest 14 days. The last two preparations are also frequently called "*Sweet Elixir of Vitriol.*"

Freeman's Bathing Spirits. See *page* 489.

Spirit of Hartshorn; Liquor or *Spiritus Volatilis Cornu Cervi*,—Lat. Originally distilled from hartshorn. Dilute liquor of ammonia is now generally sold for spirit of hartshorn.

Compound Spirit of Horse-radish; Spiritus Armoraciæ Compositus,—Ph. L. & Ph. D. 1826. *Prep.* (Ph. L.) *Sliced horse-radish* and *dried orange peel*, of each, 20 oz.; *bruised nutmegs*, 5 dr.; *proof spirit*, 1 gall.; *water*, 1 quart, or q. s.; distil 1 gallon. Stimulant and diuretic. *Dose.* 1 to 4 fl. dr.; in dropsies, when there is much debility. It is usually combined with infusion of juniper berries or foxglove.

Spirit of Hydrochloric Ether, Spirit of Muriatic do., Clutton's Febrifuge Spirit; Æther Hydrochloricus Alcoholicus, Spiritus Ætheris Muriatici,—Lat. *Prep.* 1. From *hydrochloric ether* and *rectified spirit*, equal parts; mixed together.

2. (Ph. E. 1744.) *Hydrochloric acid*, 1 part; *rectified spirit*, 3 parts; digest some days, and distil in a sand bath. *Dose.* ½ to 3 fl. dr.; in dyspepsia, liver complaints, hectic fever, &c.

Compound Spirit of Juniper; Spiritus Juniperi Compositus,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Oil of juniper*, 1½ fl. dr.; *oils of caraway* and *fennel*, of each, 12 drops; *proof spirit*, 1 gall.; dissolve.

2. (Ph. L. 1836.) *Juniper berries*, bruised, 15 oz.; *caraway* and *fennel seed*, of each, bruised, 2 oz.; *proof spirit*, 1 gall.; *water*, 1 quart, or q. s.; distil 1 gallon.

Obs. This spirit is stimulant and diuretic. *Dose.* 2 to 4 fl. dr. Mixed with twice or thrice its weight of proof spirit and sweetened with a little sugar, it makes no bad substitute for Hollands gin.

Spirit of Lavender; Spiritus Lavandulæ,—Ph. E., & Ph. L. 1836. *Prep.* From *fresh lavender*, 2½ lb.; *rectified spirit*, 1 gall.; *water*, 1 quart, or q. s.; distil 1 gallon, (7 pints,—Ph. E.)

2. (*Wholesale.*) From *Mitcham oil of lavender*, 3 *oz.*; *rectified spirit*, 1 gall.; dissolve. Cordial and fragrant. See *page* 1177.

Compound Spirit of Lavender. See *Tinctures.*

Spirit of Nitric Ether, Spirit of Nitrous Ether, Sweet Spirit of Nitre, Nitrous Ethereal Spirit, Nitre Drops; Spiritus Ætheris Nitrici,—Ph. L. & E. *Spiritus Æthereus Nitrosus*,—Ph. D. *Sp. Æ. Nitrosi*,—Ph. L. 1788. *Sp. Nitri Dulcis*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) Take of *rectified spirit*, 1 quart; *nitric acid*, 3½ fl. oz.; add the acid, by degrees, to the spirit; then mix them, and let 28 fl. oz. distil over. An earthenware still and condensing worm should be employed. Sp. gr. 0·834.

2. (Ph. E.) *Pure hyponitrous ether* (Ph. E.), 1 part; *rectified spirit*, 4 parts; (both by volume;) mix. Sp. gr. 0·847.

3. (Ph. D.) *Nitrous* or *hyponitrous ether* (which has been washed with half of its volume of liquor of ammonia), 4 fl. oz.; *rectified spirit*, 42 fl. oz.; mix, and preserve the compound "in small, strong, and accurately stopped bottles."

4. (Dr. Geisler.) *Alcohol* of 0·840, 24 oz.; are mixed with *sulphuric acid*, 4 oz.; and the compound is left to stand for 8 days, when it is poured into a retort containing of *dried nitre*, 4½ oz.; 20 oz. of the liquid are next distilled over at a gentle heat, and the product is then rectified over magnesia. Copper retorts and a tinned cooling apparatus may be employed in this process without any disadvantage. The preparation is also pretty constant in its amount of ether.

Pur., &c. Pure spirit of nitric ether boils at about 160° Fahr., scarcely reddens litmus paper, and "gives off no bubbles of carbonic acid gas, on the addition of carbonate of soda." (Ph. L.) "When agitated with twice its volume of concentrated solution of chloride of calcium, 12/0 of ether slowly separates." (Ph. E.) *Dose.* ½ to 3 fl. dr., as a febrifuge, a diaphoretic, diuretic, antispasmodic, &c.; in various affections.

Obs. The mass of the sweet spirits of nitre of the shops is of very inferior quality, and is scarcely, if ever, made directly from spirit that has paid the duty. One, and a very large portion, is obtained from Scotland; another, from the manufacturers of fulminating mercury; and, a third, and in fact the principal part, from certain persons in the neighbourhood of the metropolis who employ contraband spirit for its preparation, as this article is not under the excise. Very recently *methylated spirit* has been employed for the purpose.

Sweet spirits of nitre, sp. gr. ·850, is now commonly and publicly sold, in quantity, at a price which is only about 2-3rds that of

the spirit in it, if the latter had paid duty. The spirit obtained from the manufacturers of fulminating mercury frequently contains no inconsiderable quantity of prussic acid.

The mere admixture of nitric or hyponitrous ether with alcohol does not afford an officinal *Spir. æther. nitr.*, as this always contains *aldehyde*, which, according to Prof. Liebig, is an essential constituent of the officinal compound.

Spirit of Nutmeg; Spiritus Myristicæ,—Ph. L. & E. *Sp. Nucis Moschatæ*,—Ph. D. 1826, & Ph. L. 1788. *Aqua N. M.*,—Ph. L. 1746. *Prep.* 1. (Ph. L. & E.) *Bruised nutmegs*, 2½ oz.; *proof spirit*, 1 gall.; *water*, 1 pint, or q. s.; distil a gallon. Cordial and carminative. *Dose.* 1 to 4 fl. dr.; chiefly used to flavour mixtures and draughts.

2. (*Essentia Myristicæ Moschatæ*,—Ph. D.) *Oil of nutmegs*, 1 fl. oz.; *rectified spirit*, 9 fl. oz. *Used* in dispensing.

Oily Ethereal Spirit. See *page* 1173.

Spirit of Pennyroyal: Spiritus Pulegii,—Ph. L. *Sp. Menthæ Pulegii*,—Ph. L. 1836. *Prep*, 1. (Ph. L.) *Oil of pennyroyal*, 3 fl. dr.; *proof spirit*, 1 gall.; dissolve. Stimulant, antispasmodic, and carminative. *Dose.* ½ to 2 fl. dr.

2. (*Essentia Menthæ Pulegii*,—Ph. D.) *Oil of pennyroyal*, 1 fl. oz.; *rectified spirit*, 9 fl. oz. *Used* chiefly in dispensing.

Spirit of Peppermint; Spiritus Menthæ Piperitæ,—Ph. L., & Ph. D. 1826. *Sp. Menthæ*,—Ph. E. *Aqua Menthæ Piperitidis Spirituosa*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Oil of peppermint*, 3 fl. dr.; *proof spirit*, 1 gall.; dissolve.

2. (Ph. E.) *Green peppermint*, 1½ lb.; *proof spirit*, 7 pints; macerate 2 days; add of *water*, q. s., and distil 7 pints. *Dose.* ½ to 2 dr.

3. (*Essentia Menthæ Piperitæ*,—Ph. D.) *Oil of peppermint*, 1 fl. oz.; *rectified spirit*, 9 fl. oz. See *Essence of Peppermint.*

Spirit of Pimento, Spirit of Allspice; Spiritus pimentæ,—Ph. L. & E., & Ph. D. 1826. *Prep.* 1. (Ph. L.) *Oil of pimento*, 2 fl. dr.; *proof spirit*, 1 gall.; dissolve.

2. (Ph. E.) From *pimento*, bruised, ½ lb; and *proof spirit*, 7 pints; as *spirit of caraway.* Carminative and stomachic. *Dose.* 1 to 4 fl. dr.; in flatulent colic, dyspepsia, &c.

3. (*Essentia Pimentæ*,—Ph. D.) *Oil of pimento*, 1 fl. oz.; *rectified spirit*, 9 fl. oz. *Used* to make *pimento water* and in dispensing.

Spirit of Pine-tops; Spiritus Turionum Pini,—Lat. See *Riga Balsam.*

Spirit of Rosemary; Spiritus Rorismarini; Sp. Rosmarini,—Ph. L. & E., & Ph. D. 1826. *Prep.* 1. (Ph. L.) As *spirit of pimento.*

2. (Ph. E.) *Rosemary tops*, 2½ lb; *rectified spirit*, 1 gall.; as *spirit of lavender.* Fragrant and stimulant.

3. (*Essentia Rosmarini*,—Ph. D.) As *essence of pimento.*

Spirit of Scurvy Grass. See *page* 948.

Spirit of Spearmint; Spiritus Menthæ Viridis,—Ph. L., & Ph. D. 1826. *Sp. Menthæ Sativæ*,—Ph. L. 1788. *Aqua M. Vulgaris Spirituosa*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) As *spirit of peppermint*, Ph. L.

2. (*Essentia Menthæ Viridis*,—Ph. D.) As *essence of peppermint*, Ph. D. The *uses* and *doses* are also the same.

Spirit of Sulphuric Ether. See *page* 1173.

Compound Spirit of Sulphuric Ether. See *page* 1173.

Sweet Spirit of Vitriol. See *Aromatic Spirit of Ether.*

Vulnerary Spirit, Vulnerary Water, Arquebusade; Spiritus Vulnerarius, Eau D'Arquebusade; Aqua Vulneraria, Aq. Vul. Spirituosa, Aq. Sclopetaria,—Lat. var. *Prep.* 1. *Dried tops* of *sage, wormwood, fennel, hyssop, marjoram, savory, thyme, rosemary, calamint, balm, peppermint*, and *scordium, fresh leaves of angelica* and *basil*, and *lavender flowers*, of each, 4 oz.; *proof spirit*, 2 gall.; digest for 14 days, and distil over 1½ gall.

2. *Rosemary leaves*, 1½ lb; *leaves of thyme* and *summits of millefoil*, of each ½ lb; *juniper berries*, 3 oz.; *proof spirit*, 2 gall.; distil over 5 quarts.

Obs. This preparation is stimulant and vulnerary, and is in great repute on the Continent as a cosmetic and cordial.

SPIRITS (Perfumed). Syn. *Spiritus Odoriferi, Odores Spirituosi*,—Lat. The odoriferous spirits of the perfumer are, for the most part, prepared from various aromatic and odorous substances, by a similar process to that described under *Essences* and *Spirits* (Medicinal); but in this case a *perfectly pure, flavourless*, and *scentless* spirit must be employed. The *distillation* should also be preferably conducted by steam, or the heat of a water bath, and the distilled spirit should be kept for some time in a cellar, or other cold situation, previously to being used. When *simple solution* of an *essential oil* in the *spirit* is adopted, care should be taken that the oil is pale and new; or, at least, has not been much exposed to the air; as in that case it would contain resin, which would make the perfumed spirit, or essence, liable to stain delicate articles of clothing to which it may

be applied. Most of the *eaux* and *esprits* of the perfumers, are prepared by one or other of the above methods. It is found, however, that the *perfumed spirits* of some of the more *delicate flowers* cannot be well obtained by either *infusion* or *distillation*, or by the *simple solution* of their *essential oils* in spirit; or, at least, they are not usually so prepared by the foreign perfumers. The *spirits* of *orange flowers*, *jasmin*, *tuberose*, *jonquille*, *roses*, and of some *other flowers*, and of *cassia*, *vanilla*, &c., are commonly prepared by digesting *pure rectified spirit* for 3 or 4 days on half its weight of the respective *pommades* or *oils*, obtained by infusion or contact. The operation is performed in a *closed vessel* placed in a *water bath*, and frequent agitation is employed for 3 or 4 days, when the perfumed spirit is decanted into a second digester, containing a like quantity of oil to the first. The whole process is repeated a *second*, and a *third* time, after which the spirit is allowed to settle and is then decanted. It now forms the most fragrant and perfect odoriferous spirit (*extrait*) of the Continental perfumer. The *product* is called "*esprit*" or "*extrait of the first infusion.*" The three portions of oil are then treated again with *fresh spirit* in the same manner, and thus spirits or essences of inferior quality are obtained, which are distinguished by the perfumers as No. 2, 3, 4, &c.; or *esprits* or *extraits* of the *first*, *second*, *third*, &c., operation or infusion. In some, though only a very few cases, the spirits are afterwards distilled.

The *strength* of the *spirit* for the concentrated essences should not be less than 56 o. p. (sp. gr. 0·8376); that for *eaux*, *esprits*, and *extraits*, not less than 35 o. p. (sp. gr. 0·8723). The strength of the *second quality* of the last three must be fully *proof* (sp. gr. 0·920). See *Alcohol*, *Distillation*, *Essences*, *Oils*, *Pommades*, &c. (and *below*).

Eau d'Ambre Royale. From *essences of ambergris* and *musk*, of each, 1 fl. oz.; *spirit of ambrette* and *orange-flower water*, of each, 1 pint; *rectified spirit*, 1 quart; mix.

Eau d'Ange. From *flowering tops of myrtle* (bruised), 1½ *lb.*; *rectified spirit*, 7 pints; *water*, 3 pints; digest a week, add of *common salt*, 2 *lb.*; and distil 1 gall.

Eau d'Arquebusade. See *page* 1175.

Eau de Bouquet. From *spirits of rosemary* and *essence of violets*, of each, 1 fl. oz.; *essences of bergamot* and *jasmine*, of each, 1 fl. dr.; *oils of verbena* and *lavender*, of each, ½ fl. dr.; *orange-flower water*, 1 fl. oz.; *eau de rose*, ½ pint; *rectified spirit*, 1 quart; mix.

Eau de Bouquet de Flore. From *spirits of rosemary* and *roses*, and *essence of violets*, of each, ½ fl. oz.; *oil of cedra* and *essence of ambergris*, of each, 1 fl. dr.; *orange-flower water*, 5 fl. oz.; *rectified spirit*, 1 pint.

Eau des Carmes. See *page* 1173.

Eau de Cologne, Cologne Water; Aqua Coloniensis, Aq. C. Spirituosa, Spiritus Coloniensis. For the production of good eau de Cologne it is absolutely essential that the spirit be of the purest description, both *tasteless* and *scentless*, and that the oils be not only *genuine*, but *recently distilled*; as old oils are less odorous and contain a considerable quantity of resin and camphor, which prove injurious. When flowers and the flowering tops of plants are ordered, it is also necessary that they be either fresh gathered, or well preserved, without drying them. To produce an article of the *finest quality*, distillation should be had recourse to. A very excellent eau de Cologne may, however, be produced by simple solution of the *oils* or *essences* in the spirit, provided they be *new*, *pale-coloured*, and *pure*. The mass of the eau de Cologne prepared in England, some of which possesses the most delicate fragrance, and is nearly equal to the best imported, is made *without* distillation. In the shops two kinds of this article are generally kept, — *French* and *German*. That prepared by Farina of Cologne is esteemed the best, and is preferred in the fashionable world.

Prep. 1. From *essences* of *bergamot* and *lemon*, of each, 1 fl. dr.; *oil of orange*, ½ dr.; *oil of neroli*, 20 drops; *oil of rosemary*, 10 drops; *essences* of *ambergris* and *musk*, of each, 1 drop; *rectified spirit*, ½ pint; mix.

2. *Essence of bergamot*, 3 fl. oz.; *essence of lemon*, 3 fl. dr.; *essence of cedrat*, 2 fl. dr.; *oils of neroli* and *rosemary*, of each, 1½ fl. dr.; *oil of balm*, ½ fl. dr.; *rectified spirit*, 1½ gall.; mix.

3. (Cadet Gassincourt.) Take of *pure neroli*, *essences* (oils) *of cedrat*, *orange*, *lemon*, *bergamot*, and *rosemary*, of each, 24 drops; *lesser cardamom seeds*, ¼ *oz.*; *spirit* at 32° Baumé (sp. gr. 0·869), 1 quart; digest a few days, and then distil 1½ pint.

4. (Farina.) Take of *rectified spirit*, 5 gall.; *calamus aromaticus*, *sage*, and *thyme*, of each, ½ dr.; *balm-mint* and *spear-mint*, of each, 1 oz.; *angelica root*, 10 gr.; *camphor*, 15 gr.; *petals of roses* and *violets*, of each, 3 dr.; *lavender flowers*, 1½ dr.; *orange flowers*, 1 dr.; *wormwood*, *nutmeg*, *cloves*, *cassia lignea*, and *mace*, of each, 20 gr.; *oranges* and *lemons*, sliced, of each, 2 in no.;

bruise or slice the solids, macerate, with agitation, for 48 hours, then distil off 2-3rds, and add to the product—*essences* of *lemon*, *cedrat*, *balm-mint*, and *lavender*, of each, 1 fl. dr.; *pure neroli* and *essence of the seeds of anthos*, of each, 20 drops; *essences of jasmine* and *bergamot*, of each, 1 fl. oz.; mix well, and filter, if necessary.

5. (P. Cod.) *Oils of bergamot*, *lemon*, and *cedrat*, of each, 3 oz.; *oils of rosemary*, *lavender*, and *neroli*, of each, 1½ oz.; *oil of cinnamon*, ¾ oz.; *spirit of rosemary*, 1 quart; *compound spirit of balm* (eau de melisse des carmes), 3 pints; *rectified spirit*, 3 gall.; digest for 8 days, then distil 3 gall.

6. (Dr. A. T. Thomson.) *Oils of bergamot*, *orange*, and *rosemary*, of each, 1 fl. dr.; *cardamom seeds*, 1 dr.; *rectified spirit* and *orange-flower water*, of each, 1 pint; mix, digest for a day, and then distil a pint.

7. (Trommsdorff.) *Oils of neroli*, *citron*, *bergamot*, *orange*, and *rosemary*, of each, 12 drops; *Malabar cardamoms*, bruised, 1 dr.; *rectified spirit of wine*, 1 quart; mix, and after standing 2 or 3 days, distil a quart.

Obs. Eau de Cologne is principally used as a perfume, but a very large quantity is consumed by fashionable ladies, as a cordial and stimulant, to drive away the vapours. For this purpose it is dulcified with sugar. A piece of linen dipped in Cologne water, and laid across the forehead, is a fashionable remedy for headache.

Eau d'Elegance. From *spirit of jessamine*, 1 pint; *rectified spirit*, and *spirits of hyacinth* and *storax*, of each, ½ pint; *tinctures of star-anise* and *tolu*, of each, 2 fl. oz.; *tincture of vanilla*, 1 fl. oz.; *essence of ambergris*, ½ dr.; mix, and in a week decant the clear portion.

Eau de Framboises. From *strawberries*, bruised, 16 *lb.*; *rectified spirit*, 1 gall.; digest, and distil to dryness in a salt-water or steam bath.

Eau d'Heliotrope. From *essence of ambergris*, ½ fl. dr.; *vanilla*, ½ oz.; *orange-flower water*, ½ pint; *rectified spirit*, 1 quart; digest a week, and filter.

Eau d'Hongrie, *Eau de la Reine d'Hongrie*; *Aqua Hungarica*, *Spiritus Rosmarini Compositus*; *Hungary Water.* A fragrant stimulant and cosmetic. Sweetened with sugar it is also used as a liqueur.

Prep. 1. *Rosemary tops*, in blossom, 4 *lb.*; *fresh sage*, ½ *lb.*; *bruised ginger*, 2 *oz.*; *rectified spirit*, 1½ gall.; *water*, ½ gall.; macerate for 10 days, add of *common salt*, 3 *lb.*; and then distil 11 pints.

2. From *oil of rosemary* (genuine), 1½ fl. dr.; *oil of lavender*, ½ dr.; *orange-flower water*, ½ pint; *rectified spirit*, 1½ pint; mix. *Spirit of rosemary* (see *p.* 1175) is now commonly sold for it.

Eau d'Ispahan. From *oil of the bitter orange*, 2 fl. oz.; *oil of rosemary*, 2 dr.; *oils of cloves* and *neroli*, of each, 1 fl. dr.; *oil of spearmint*, ½ fl. dr.; *eau de rose*, 1 pint; *rectified spirit*, 7 pints; mix. It is better for distillation. *Used* as eau de Cologne.

Eau de Jasmin. See *Esprit de Jasmin* (below).

Eau de Lavande; Lavender Water; Double distilled do.; Aqua Lavandulæ, Aq. L. Odorifera, Spiritus L.,—Lat. var. *Prep.* 1. From the *flowering tops of lavender* (freshly and carefully picked), 7 ℔; *rectified spirit*, 2 gall.; macerate for a week, add of *water*, ½ gall.; (holding in solution) *common salt*, 3 *lb.*; and distil 2 gallons.

2. From *Mitcham oil of lavender*, 8 *oz.*; *essence of musk*, 4 *oz.*; *essence of ambergris* and *oil of bergamot*, of each, 1½ *oz.*; *rectified spirit*, 2 gallons; mix well. Very fine.

3. (Brande.) *Oil of lavender*, 20 *oz.*; *oil of bergamot*, 5 *oz.*; *essence of ambergris* (finest), ½ *oz.*; *rectified spirit*, 5 gall.; mix.

Obs. The products of the last two formula are better for distillation; but in that case the essences of ambergris and musk should be added to the distilled spirit. The oils should be of the best quality, and newly distilled, and the spirit should be perfectly scentless.

It may be useful to observe here, that the common *lavender water*, *double distilled do.*, or *spirit of lavender* of the *shops*, is made with spirit at proof, or even weaker; hence its inferior quality to that of the more celebrated perfumers. 1 *oz.* of *true English oil of lavender* is all that will properly combine with 1 gall. of *proof spirit*, without rendering it muddy or cloudy.

Eau de Lavande is a most agreeable and fashionable perfume. The article produced by the *second* formula, under our inspection, has received the commendation of her Majesty and many of the nobility.

Eau de Lavande Ammoniacal. 1. To *lavender water*, 1 pint; add of *liquor of ammonia*, ½ fl. oz.

2. (P. Cod.) *English oil of lavender*, 1 oz.; *spirit of ammonia*, 2 ℔; dissolve. *Used* as a stimulating scent in fainting. See *Perfumes* (Ammoniated).

Eau de Lavande de Millefleurs. To *each* quart of the *last* (Nos. 2 or 3), add of *oil of cloves*, 1½ fl. dr.; *essence of ambergris*, ½ fl. dr.

Eau de Luce. See *Compound Tincture of Ammonia.*

Eau de Maréchale, Extrait de Maréchale. 1. From *ambergris* and *grain musk*, of each, 20 gr.; *oils of bergamot, lavender*, and *cloves*, of each, 1 *oz.*; *oils of sassafras* and *origanum*, of each, ½ fl. dr.; *rectified spirit*, 2 quarts; macerate with agitation for a week.

2. *Rectified spirit*, 1 pint; *essence of violets*, 1 *oz.*; *essences of bergamot* and *œillets*, of each ¼ *oz.*; *orange-flower water*, ½ pint; mix.

Eau de Melisse. See *page* 1173.

Eau de Miel; Honey Water, Sweet scented do.; Aqua Mellis, Aq. M. Odorifera,—Lat. *Prep.* 1. Take of *spirit of roses* (No. 3), 2 quarts; *spirit of jasmin* and *rectified spirit*, of each, 1 quart; *essence of Portugal*, 1 fl. oz.; *essences of vanilla* and *musk*, of each (No. 3), 4 fl. oz.; *flowers of benzoin*, 1½ dr.; mix, agitate, and add of *eau de fleurs d'oranges*, 1 quart. Delightfully fragrant.

2. *Honey* (finest), ¼ *lb.*; *essence of bergamot*, ½ *oz.*; *essence of lemon*, ¼ *oz.*; *oil of cloves*, 12 drops; *musk*, 12 gr.; *ambergris*, 6 gr.; *orange-flower* and *rose water*, of each, 1 quart; *rectified spirit*, 1 gall.; macerate for 14 days, with frequent agitation, and filter.

Obs. The last is often coloured with 20 or 30 gr. of saffron, and made into a *ratifia* with sugar. *Honey water for the hair* is a different article to the above. It is obtained by the *dry distillation* of *honey*, mixed with an equal weight of *clean sand*, a gentle heat only being employed. The product is yellowish, and acidulous, from the presence of acetic acid. This last is used to promote the growth of the hair.

Eau de Millefleurs, Extrait de Millefleurs. 1. From *grain musk*, 12 gr.; *ambergris*, 20 gr.; *essence of lemon*, 1½ *oz.*; *oils of cloves* and *lavender* (English), of each, 1 *oz.*; *neroli* and *oil of verbena*, of each, ½ dr.; *rectified spirit*, 2 quarts; macerate in a closed vessel, and a warm situation, for a fortnight.

2. *Balsam of Peru* (genuine), and *essence of cloves*, of each, 1 *oz.*; *essences of bergamot* and *musk*, of each, 2 *oz.*; *essences of neroli* and *thyme*, of each, ¼ *oz.*; *eau de fleurs d'oranges*, 1 quart; *rectified spirit*, 9 pints; mix well. Very fine.

3. *Essence of bergamot*, ¼ *oz.*; *eau de lavande* and *essence of jasmin*, of each, 1 *oz.*; *orange-flower water*, 8 fl. oz.; *rectified spirit*, 1 pint; mix.

Eau de Mousseline. From *eau de fleurs d'oranges* and *spirit of clove-gilly flower*, of each, 1 quart; *spirit of roses* (No. 3), *spirit of jasmin* (No. 4), and *spirit of orange flowers* (No 4), of each, 2 quarts; *essences of vanilla and musk*, of each (No. 3), 2 fl. oz.; *sanders wood*, ½ *oz.* Very fine.

Eau de Naphe. See *Waters.*

Eau Romain. From *essence of ambergris*, 1 fl. oz.; *tincture of benzoin*, 4 fl. oz.; *spirit of tuberose*, ½ pint; *spirit of acacia flowers* and *tincture of vanilla*, of each, 1 pint; *spirit of jessamine*, 3 pints; mix.

Eau de Rosieres. From *spirit of roses*, 1 pint; *spirits of cucumber, angelica root*, and *celery seeds*, of each, ½ pint; *spirits of jasmine* and *orange flowers*, of each, ¼ pint; *tincture of benzoin*, 2 fl. oz.; mix.

Eau sans Pareille. 1. From *essence of bergamot*, 5 dr.; *essence of lemon*, 8 dr.; *essence of citron*, 4 dr.; *Hungary water*, 1 pint; *rectified spirit*, 6 quarts; mix, and distil.

2. *Grain musk*, 20 gr.; *ambergris*, 25 gr.; *oils of lavender* and *cloves*, of each, 1 *oz.*; *essence of bergamot*, ½ *oz.*; *oils of sassafras* and *origanum*, of each, 20 drops; *rectified spirit*, 1 gall.; macerate for 14 days.

Eau de Violette. See *Esprit de Violette* (below).

Esprit d'Ambrette. See *Essences.*

Esprit de Bergamotte. From *essence* (oil) *of bergamot* (best), 5 *oz.*; *essence of ambergris* (pale), 2 fl. oz.; *essence of musk*, ½ fl. oz.; *oil of verbena*, 2 fl. dr.; *rectified spirit*, 1 gall.; mix.

Esprit de Bouquet. From *Mitcham oil of lavender*, 1 *oz.*; *oils of cloves* and *bergamot*, of each, 3 fl. dr.; *essence of musk*, 1 fl. dr.; *otto of roses*, 10 drops; *rectified spirit*, 1 quart.

Esprit de Fleurs. See *page* 1179.

Esprit de Jasmin, Eau de Jasmin. See *page* 1176.

Esprit de Jasmin Odorante. From *spirit of jasmin*, and *rectified spirit*, of each, 1 pint; *essence of ambergris*, 1 fl. dr.

Esprit de Jonquille. See *page* 1176.

Esprit de la Reine. From *oil of bergamot*, 1 fl. oz.; *essence of ambergris*, 2 fl. dr.; *otto of roses*, 1 fl. dr.; *rectified spirit*, 1 quart.

Esprit de Rondeletia, Extrait de Rondeletia. From *Mitcham oil of lavender*, 3 oz.; *oil of cloves*, 1¼ oz.; *oil of bergamot*, 1 oz.; *essences of musk* and *ambergris*, of each, 2 fl. dr.; *rectified spirit*, 3 pints.

Esprit de Rose. 1. From *spirit of roses*, 1 pint; *essence of ambergris* and *oil of rose-geranium*, of each, ½ fl. dr.

2. From *otto of roses*, 2 dr.; *neroli*, ½ dr.; *rectified spirit*, 1 gall.; dissolve, add of *chloride of calcium* (well dried and in powder), 1½ *lb.*; agitate well, and distil 7 pints. Very fine.

Esprit de Suave. From the *essences of cloves* and *bergamot*, of each, 1½ fl. dr.; *neroli*, ½ fl. dr.; *essence of musk*, 1 fl. oz.; *spirit of tuberose* and *rectified spirit*, of each, 1 pint; *spirits of jasmin* and *cassia*,

of each, 1 quart; dissolve, then add of *eau de rose*, 1 pint; and mix well.

Esprit de Tain; Spirit of Lemon Thyme; Spiritus Thymi. From *tops of lemon thyme*, 2 *lb.*; *proof spirit*, 1 gall.; distil 7 pints.

Esprit de Violettes; Spirit of Violets, Essence of do.; Essence of Orris. From *Florentine orris root*, reduced to coarse powder, ¼ *lb.*; *rectified spirit*, 1 pint; by simple maceration for a fortnight. A stronger and finer article (*essence of violets*) is prepared from *orris root*, 5 *lb.*, to *rectified spirit*, 1 gall.; by percolation. See *Essences.*

Essences (Various). See *pages* 382 to 396.

Curious Essence. From *otto of roses*, 1 dr.; *essence of musk*, 3 fl. dr.; *rectified spirit*, 1 pint.

Extract of Nosegay. See *page* 437.

Extract of Peach-blossoms. See *page* 439.

Extrait de Bouquet. See *page* 437.

Extrait de Maréchale. See *page* 1178.

Extrait de Millefleurs. See *page* 1178.

Extrait de Rondeletia. See *Essences*, and *above.*

Odeur Délectable. From *oils of lavender, bergamot, rose-geranium*, and *cloves*, of each, 1 fl. dr.; *eaux de rose* and *fleurs d'orange*, of each, ¼ pint; *rectified spirit*, 1½ pint.

Odeur Suave. See *Esprits* (above).

Spirits. All the *simple perfumed spirits* or *esprits* may be prepared in one or other of the manners noticed at *pages* 1175-6. They are principally used for making the *compound eaux* and *esprits.* The same may be said of the *odoriferous tinctures* employed by perfumers. The common strength of those prepared with the oils is about ½ fl. dr. of *otto*, 1 fl. dr. of *neroli*, ½ fl. oz. of the ordinary *essential oils*, or, 2 fl. oz. of the *concentrated essences* to each pint of *spirit* at about 30 o.p. (0·880), or never weaker than proof (0·920).

Spirit of Cytherea. From the *spirits of violets, tuberose, clove-gilly-flower, jasmine* (No. 2), *roses* (No. 2), and *Portugal*, of each, 1 pint; *orange-flower water*, 1 quart; mix.

Spirit of the Flowers of Italy; Esprit de Fleurs. From the *spirits of roses* (No. 1), *jasmine* (No. 2), *oranges* (No. 3), and *cassia* (No. 2), of each, 4 pints; *orange-flower water*, 3 pints; mix.

Victoria Perfume. See *Esprit de la Reine.*

SPIROYLOUS ACID. Salicylous acid.

SPITTING OF BLOOD. See *Hæmoptysis.*

SPLINTS. See *Surgery* (Popular).

SPONGE. Syn. *Spongia*,—Lat. *Spongia Officinalis*,—Linn. Sponge is a cellular fibrous tissue produced by very small marine animals, which are called *polypi* by naturalists. The *finest quality* is imported from Smyrna, and is known as *Turkey sponge;* another called *West Indian* or *Bahama sponge* is much less esteemed, being coarse, dark coloured, and very rotten.

Sponge, as collected, and also as generally imported, contains many impurities, more especially sand, most of which may be removed by beating it, and by washing it in water. Amusing disputes often arise between the smaller importers and the wholesale purchasers, on this subject,—the privilege of beating it before weighing it, the number of minutes so employed, and even the size of the stick, being often made important matters in the "haggling."

Bleached Sponge (*White Sponge; Spongia Dealbata*) is prepared by soaking *ordinary sponge* in *very dilute hydrochloric acid*, to remove calcareous matter, then in *cold water*, changing it frequently, and squeezing the sponge out each time, and next, in *water holding a little sulphuric* or *sulphurous acid*, or still better a *very little chlorine in solution;* the sponge is, lastly, repeatedly washed and soaked in clean water, scented with *rose* or *orange-flower water*, and dried.

Burnt Sponge (*spongia usta*,—Ph. D.) is prepared by heating the *cuttings* and *unsaleable pieces* in a closed iron crucible until they become black and friable, avoiding too much heat, and allowing the whole to cool before exposing it to the air. It was formerly in great repute in bronchocele and scrofulous complaints.—*Dose.* 1 to 3 dr. in water, or made into an electuary or lozenges. —*When good*, burnt sponge evolves violet fumes of iodine on being heated in a flask along with sulphuric acid.

Compressed or Waxed Sponge (*spongia cerata, s. compressa*) is sponge which has been dipped into *melted wax*, and then compressed between two iron plates until cold. When cut into pieces it forms "*sponge tents*," which are used by surgeons to dilate wounds.

SPOTS and STAINS.—1. *Oil and grease spots* on *boards, marble, &c.*, when recent, may be removed by covering them with a *paste* made of *fuller's earth* and *hot water*, and the next day, when the mixture has become perfectly dry, scouring it off with *hot soap-and-water.* For *old spots*, a *mixture* of *fuller's earth* and *soft soap*, or a *paste* made of *fresh slaked lime* and *pearlash* will be better; observing not to touch the last with the fingers.

2. *Recent spots* of *oil, grease*, or *wax*, on *woollen cloth* or *silk*, may be removed with a little *clean oil of turpentine* or *naphtha;* or with a little *fuller's earth* or scraped *French chalk* made into a paste with *water*, and allowed

to dry on them. They may also be generally removed by means of a *rather hot flat-iron* and *blotting paper* or *spongy brown-paper*, more especially if the cloth, or one of the pieces of paper, be first slighty damped. *Old oil* and *grease spots* require to be treated with *ox-gall* or *yelk of egg* made into a paste with *fuller's earth* or *soap*. *Paint spots*, when recent, generally yield to the last treatment. *Old ones*, however, are more obstinate, and require some *fuller's earth* and *soft soap* made into a *paste* with either *ox-gall* or *spirit of turpentine*.

Fruit and *wine stains*, on *linen*, commonly yield easily to *hot soap and water*. If not, they must be treated as those noticed below.

Ink spots and *recent iron moulds* on *washable fabrics*, may be removed by dropping on the part a little *melted tallow* from a common candle, before washing the articles; or, by the application of a little *lemon juice*, or of a little *powdered cream of tartar* made into a paste with hot water. *Old ink spots* and *iron moulds* will be found to yield almost immediately to a very little *powdered oxalic acid*, which must be well rubbed upon the spot previously moistened with *boiling water*, and kept hot over a basin filled with the same.

Stains arising from *alkalies* and *alkaline liquors*, when the colours are not destroyed, give way before the application of a little *lemon juice;* whilst those arising from the *weaker acids* and *acidulous liquids* yield to the *fumes of ammonia*, or the application of a little *spirit of hartshorn* or *sal volatile*.

Stains of marking ink may be removed by soaking the part in a *solution of chloride of lime*, and afterwards rinsing it in a little *solution of ammonia* or of *hyposulphate of soda;* or they may be rubbed with *tincture of iodine*, and then rinsed as before. See *Balls*, *Clothes*, *Hands*, *Scouring*, &c.

SPRAIN. Syn. *Subluxatio*,—Lat. An injury of a joint, in which it has been strained or twisted in an unnatural manner, without actual dislocation Pain, swelling, and inflammation, are the common consequences, which must be combated by purgatives, repose, and a low diet, with refrigerant lotions, or warm fomentations according to circumstances. In extreme cases, blood should be taken. Where there is simple stiffness and weakness, exercise is often serviceable.

SPRAT. The *clupea sprattus* (Linn.), a small fish of the herring family, abounding on our coasts. Gutted, coloured, and pickled, it is sold for *anchovies*, or as *British anchovies*, and much used to make the sauce of that name.

SPRUCE. See *Beer*, *Essences*, and *Powders*.

SPUNK. See *Amadou*.

SQUILL. Syn. *Scilla*,—Ph. L. E. & D. "The *recent bulb*" of "*urginea scilla*, *Steinheil* (*scilla maritima*, Linn.)" "Dry this as ordered for colchicum." (Ph. L.) In *small doses* squill acts as a stimulating expectorant and diuretic; in *larger ones*, as an emetic and purgative. With the first intention it is generally given in substance (powder), in *doses* of 1 to 3 or 4 gr.; with the latter, either made into vinegar or oxymel (which see). It is an excellent remedy in coughs, &c., after the inflammatory symptoms have subsided.

STAINED GLASS. The art of *painting* or *staining glass* resembles enamel painting, in the effect being produced by fluxing certain metallic substances, as oxides or chlorides, on its surface, by means of heat applied in a suitable furnace. The operations it embraces are difficult, and require great promptitude and experience to prove successful. The *colours* or *compounds* employed are, for the most part, similar to those noticed under *Enamels* and *Pastes*.

STAINS (Blood). *Spots of dried blood* on *wood*, *linen*, &c., however old, are easily recognised by the microscope; but simple stains or marks of blood of a slight character, especially those occurring on *iron* or *steel*, are recognised with greater difficulty. To obviate this, H. Zollikofer adopts the following plan:—The *spot* is removed by scraping, from the *surface of the metal*, and the resulting *powder* is digested in *tepid water*, when a liquid is obtained which exhibits the following reactions:—

1. The *liquid* is neutralized with *acetic acid*, and heated to ebullition, when opalization or a dirty-red coagulum forms.

2. The *coagulum* is dissolved in *hot liquor of potassa;* the solution, if blood (*hæmatine*) be present, is diachromatic, or appears *green* by transmitted light, and *red* by reflected light.

3. By the addition of *concentrated chlorine water*, in excess, to either solution, white flocks of *albumen* and *chlorhæmatine* separate, which are free from iron, as tested by sulphocyanide of potassium.

Obs. The last two reactions are said to be characteristic. Very old spots must be boiled in water containing a little liquor of potassa.

STAINS (Bookbinder's). See *Leather*, *Marbling*, &c.

STAINS (Confectioner's). These are

similar to those noticed under *Liqueurs* (p. 705-6). *Mineral colours*, especially mineral blues, greens, and yellows, must on no account be used, as they are nearly all *dangerous poisons;* nor is there any inducement to use them, since the vegetable substances referred to afford, by proper management, every shade that can be possibly required. These *stains* are also used for *cakes* and *pastry*.

STAINS (Liqueur). See *Liqueurs*.

STAINS (Map). See *Maps*, *Velvet Painting*, and *Water Colours*.

STALL-FEEDING. See *Fattening*.

STAMMERING. Syn. *Blæsitas*,—Lat. Occasionally, this depends on some organic affection, or slight malformation of the parts of the mouth or throat immediately connected with the utterance of vocal sounds; but, much more frequently, it is an habit resulting from carelessness, or acquired from example or imitation. When the latter is the case, it may be generally removed by *perseveringly* adopting the plan of never speaking without having the chest moderately filled with air, and then only slowly and deliberately. Hasty and rapid speaking must not be attempted until the habit of stammering is completely subdued. Nervous excitement and confusion must be avoided as much as possible, and the general health attended to, as circumstances may direct. This variety of stammering is commonly distinguished by the party being able to *sing* without hesitation. *Stammering depending* on *elongation* of the *uvula*, and other like causes, may be generally removed by a very simple, safe, and almost painless operation, which in the hands of Mr. Yearsley, the eminent Surgeon-aurist, of Savile Row, does not occupy more than a few seconds.

STANNIC ACID. Peroxide of tin.

STARCH. Syn. *Amylum*,—Lat. Starch, or *pure fecula*, is one of the most important and widely diffused of the proximate principles of vegetables, being found, in greater or less quantity, in every plant. The mealy and farinaceous seeds, fruits, roots, and the stem-pith of certain trees, consist chiefly of it, in a nearly pure state. *Wheat* contains about 75%, and *potatoes* about 15% of this substance. From these sources the fecula is obtained by rasping or grinding to pulp the vegetable structure, and washing the mass upon a sieve, by which the torn cellular tissue is retained, whilst the starch passes through with the liquid, and eventually settles down from the latter as a soft, white, insoluble powder, which after being thoroughly washed with *cold water*, is dried in the air, or with a very gentle heat.

Wheat starch (*amylum*,—Ph. L. E. & D.) is commonly prepared by steeping the *flour* in *water* for a week, or a fortnight, during which time the saccharine portion ferments, and the starch granules become freed, for the most part, from the glutinous matter which envelopes them, by the disintegrating and solvent action of the lactic acid generated by the fermentation. The sour liquor is then drawn off, and the feculous residue washed on a sieve; what passes through is allowed to settle, when the liquid is again drawn off, and the starch thoroughly washed from the slimy matter; it is then drained in perforated boxes, cut up into square lumps, placed on porous bricks to absorb the moisture, and, lastly, air or stove-dried.

In the *preparation* of *starch* from *potatoes*, and other like vegetable substances, the *roots* or *tubers*, after being washed and peeled, either by hand-labour or by machinery, are rasped by a revolving grater, and the pulp washed on hair sieves until freed from feculous matter. Successive portions of the pulp are thus treated until the vessel over which the sieves are placed, or into which the washings run, is sufficiently full. The starch held in suspension in the water having subsided to the bottom, the water is drawn off, and the starch stirred up with fresh water, and again allowed to subside. This operation is repeated several times, with fresh water, until the starch is rendered sufficiently pure for commercial purposes, when it is washed and dried as before. The *waste fibres* and the *washing waters* are used as *manure*. See *Arrow-root*.

In the *manufacture* of *starch* from *rice* and *Indian corn*, a very dilute solution of *caustic soda*, containing about 200 gr. of alkali to each gallon of liquid, is employed to facilitate the disintegration and separation of the gluten and other nitrogenized matters. A weak solution of *ammonia*, or *sesquicarbonate of ammonia*, is also similarly employed with advantage. The gluten may be recovered by saturating the alkali with dilute sulphuric acid. Such starch does not require boiling, and is less apt than wheat starch to attract moisture from the atmosphere.

To *whiten* the *starches* from *damaged roots* and *grains*, and the *coarser portions* of those from sound ones, a little *solution of chloride of lime* is occasionally added to the water, followed by another water containing a *very little dilute sulphuric acid;* every trace of the last being afterwards removed by the copious use of pure soft or spring water.

The *ordinary bluish-white starch* used

by laundresses is *coloured* with a mixture of *smalts* and *alum* in *water*, and is regarded as unfit for medicinal purposes.

Prop., &c. Starch is insoluble in cold water, and in alcohol and most other liquids, but it readily dissolves in, or at least forms a gelatinous compound with water at 175° Fahr.; alcohol and most of the astringent salts precipitate it from its solutions; infusion of galls throws down a copious yellowish precipitate, containing tannic acid, which is redissolved by heating the liquid; heat and dilute acids convert it into dextrine and grape sugar; strong alkaline lyes dissolve it, and ultimately decompose it. Sp. gr. 1·53.

To the naked eye it presents the appearance of a soft, white, and often glistening powder; under the microscope it is seen to be altogether destitute of crystalline structure, but to possess, on the contrary, a kind of organization, being made up of multitudes of little rounded transparent bodies, upon each of which a series of depressed parallel rings surrounding a central spot or *hilum*, may be traced. The *starch-granules* from different plants vary both in magnitude and form. Those of *potato-starch* and *tous les mois* are the largest, and those of the *millet* the smallest, the dimensions ranging from the $\frac{1}{200}$ to the $\frac{1}{3000}$ of an inch. The *granules* of *arrow-root* and *tous les mois*, are ovoids, those of *potato starch* truncated ovoids, those of *tapioca* mullar-shaded, and those of *wheat starch* insulated globules.

Identif. One of the commonest frauds practised upon the profession and the public is the admixture of the cheaper kinds of starch, chiefly potato farina, with *arrow-root*, and vending *manufactured* for *genuine tapioca*, *sago*, and other articles of diet, used for invalids and children. These sophistications are most easily detected with a good microscope. M. Gobley has proposed a method for this purpose which is very simple, consisting in merely placing the various kinds of starch, in a moist state, in watch-glasses, and covering them over with a bell-glass under which there is also placed a capsule containing a little *iodine*, and leaving them in this state for 24 hours. The vapour of the iodine acts upon, and colours, all kinds of starch, but the colour it imparts varies with the different kinds. Thus the vapour of iodine colours—

Wheat-starch, violet;
Potato-starch, dove gray;
Arrow-root, bright chocolate colour;
Tapioca (unbroken), uniformly yellowish;
Tapioca (powdered), chamois colour;
White sago (entire), some granules violet gray, others yellowish;
Do. (powdered), chamois colour; and
Dextrine, unaltered.

This method, at all events, renders the detection of *potato-starch* very easy, and also whether common or potato-starch is substituted for tapioca powder; and, probably, some modification of it will render it still further applicable. See *Arrow-root, &c.*

The *measurements* and *microscopical appearances* of all the commercial starches will be found accurately described and figured in Pereira's *Elem. of Therap.* and *Mat. Med.*, vol. ii and iii.; and their *manufacture*, in Ure's *Dict. Arts. Manuf. and Mines.*

STARCH (Iodide of). Syn. *Amyli Iodidum, Amyli Iodatum*,—Lat. *Prep.* (Ph. Castr. Ruthena.) *Iodine*, 24 gr.; *rectified spirit*, a few drops; rub them to a powder; then add of *starch*, 1 oz., and again triturate, until the mass assumes a uniform colour. Recommended by Dr. A. Buchanan, of Glasgow, as producing the alterative effects of iodine, without the usual irritant action of that medicine. *Dose.* A tea-spoonful, or more, in water-gruel, or any *bland* liquid, twice or thrice a day.

STARCHING (Clear). *Muslins, &c.*, are "*clear-starched*" or "*got-up*" by laundresses in the following manner:—Rinse the *articles* in *three waters*, dry them, and dip them into thick *made-starch* which has been previously strained through a piece of muslin; squeeze them, shake them gently, and again hang them up to dry; when they are dry, dip them twice or thrice into *clear water*, squeeze them, spread them on a *linen cloth*, roll them up in it, and let them lie an honr before ironing them. Some persons put a morsel of *sugar* into the *starch* to prevent it sticking whilst ironing; and others, stir the starch with a candle to effect the same end; both these practices are as injurious as unnecessary. The best plan to *prevent sticking* is simply to use the *best starch*, and to *make it well*, and to have the *irons quite clean* and *highly polished.*

STAVESACRE. Syn. *Stavesacre Seeds; Staphisagriæ Semina; Staphisagria*,—Ph. L. & D. "The *seed* of *delphinium staphisagria*, Linn." (Ph. L.) This article is powerfully emetic and cathartic, but is now scarcely ever used internally. Mixed with hair-powder, it is used to kill lice. An infusion, or ointment, made with it is said to be infallible in itch, but its use requires some caution.

STARS. *Prep.* 1. (*Brilliant*,—Marsh.) *Nitre*, 52½ parts; *sulphur* and *black antimony*, of each, 13 parts; reduce them to powder, make this into a stiff paste with *isinglass*, 1½ part, dissolved in a mixture of *vinegar*, 6½ parts, and *spirits of wine*, 13 parts; lastly, form this into small pieces, and, whilst moist, roll them in *meal gunpowder*.

2. (*White*,—Ruggieri.) *Nitre*, 16 parts; *sulphur*, 7 do.; *gunpowder*, 4 do.; as the last.

3. (*Golden Rain.*)—*a.* (Ruggieri.) *Nitre* and *gunpowder*, of each, 16 parts; *sulphur*, 10 do.; *charcoal*, 4 do.; *lamp-black*, 2 do.; mix, and pack it into small paper tubes.

b. (Ruggieri.) *Nitre*, 16 parts; *sulphur* and *gunpowder*, of each, 8 do.; *charcoal* and *lamp-black*, of each, 2 do.; as the last.

c. (Marsh.) *Mealed gunpowder*, 66¾ parts; *sulphur*, 11 do.; *charcoal*, 22¼ do.; as before. *Used* for the "garniture" of rockets, &c.

STAYS or *corsets*, "before womanhood, are *instruments* of *barbarity and torture*, and then they are needed *only* to give beauty to the chest. It is the duty of every mother, and every guardian of children, to inquire the purpose for which stays were introduced into female attire. Was it for *warmth?* If so, they certainly fulfil the intention very badly, and are much inferior to an elastic woollen habit, or one of silk quilted with wool. Was it to *force the ribs*, while yet soft and pliable, *into the place of the liver and stomach*, and the *two latter* into *the space allotted for other parts*, to *engender disease* and *deformity to the sufferer and her children for generations?* Truly, if this were the object, the device is most successful, and the intention most ingeniously fulfilled." (Eras. Wilson.)

"Only observe," exclaimed Dr. John Hunter, "only observe, if the statue of the Medicean Venus were to be dressed in stays, and her beautiful feet compressed into a pair of execrably tight shoes, it would extort a smile from an Heraclitus, and a horse-laugh from a Cynic."

The *Italian ladies*, the most beautiful perhaps in the world, are innocent of the use of corsets. "The *Turkish ladies* express *horror* at seeing Englishwomen so tightly laced." (Lady M. W. Montague.)

STEAM. The application of steam in the laboratory, as a source of heat, is commonly effected by means of *double pans*, to the space between which steam, at a moderate pressure, is introduced; the arrangement being such as to permit of the condensed steam, or distilled water, being removed, by means of a cock, nearly as soon as formed, or as may be desirable. *Another plan* is to place *coils of metal pipe* along the bottom of *cisterns*, *vats*, *&c.*, formed either of *wood* or *metal*, and to keep them supplied with high-pressure steam.

"It is quite susceptible of positive proof, that by no arrangement yet discovered, can more than two thirds of the heat generated by a given quantity of coal, during combustion, be fairly absorbed and utilized in any of our manufactories; and, moreover, there are undeniable facts, which demonstrate that seldom, in the burning of coal, are more than three fourths of the total heat, which might be eliminated, actually obtained; thus justifying the supposition, that one half of all the coal now consumed" (even under the best circumstances) "is virtually wasted, and lost to society." To lessen, as much as possible, this loss, various improvements have been made, which, "for the most part, have consisted in lengthening the flues, and exposing a larger surface of the boiler to the action of the heated air passing from the furnace to the chimney." "Remembering that air is an extremely bad conductor of heat, and that water about to be converted into steam is also a bad conductor, it is evident that *time* must form an important element in the perfect transmission of heat from one of these to the other; and hence, with a great velocity of current existing in the flues, very little heat would pass from air, however high its temperature, to water contained in a boiler, and so circumstanced in respect to its all but gaseous condition." The results of the experiments on fuel made at the Museum of Practical Geology by Sir H. De la Beche and Dr. Lyon Playfair, go clearly to show, that "to open the damper of a steam-boiler furnace is pretty generally to diminish the effective power of the fuel." "Great waste of coal now arises from this simple circumstance; and much of the heat of the fire, which ought to go to the boiler, is lost by its (too) hasty transmission up the chimney. If, however, there be thus far room for improvement in the direction just indicated, still wider is the vacant space, caused by imperfect combustion, or, in technical phrase, 'bad stoking,'" "merely because the stoker, to economize his labour, and to avoid trouble, throws on to the bars of his furnace a thick layer of fuel, by which loss is caused in two or three directions." These are, principally, imper-

fect combustion, and the volatilization of the fuel, as smoke, &c., from an insufficient supply of air, and from a mass of mere red-hot coke or cinder two or three inches thick, lying between the boiler and the hottest part of the furnace; which last, according to Dr. Kennedy, is about one inch above the fire-bars. Besides which, "in passing over this red-hot coke, the carbonic acid would be converted into carbonic oxide, and thus not only remove a quantity of carbon equal to its own, without yielding any additional heat, but actually with the production of cold, or in other words, the absorption of heat." (*Dict. Arts, M. & M.*) This points to the evident policy of using a smoke-consuming furnace, as noticed elsewhere.

Another matter worthy of remark, is the *constant waste* of *heat*, and consequently of *fuel*, in laboratories and manufactories in which steam is employed, owing to the exposed condition of the *pipes*, *boilers*, and *pans*. All of these should be well "clothed" or covered by some non-conducting medium, to prevent loss of heat by radiation, and by contact with the atmosphere. Not only does economy dictate such a course, but the health and comfort of the work-people demand that the atmosphere in which they labour should be as little heated and poisoned as possible.

TABLE *of corresponding Pressures and Temperatures of Steam.* By MM. ARAGO and DULONG.

Pressure in Atmospheres.*	Temperature, Fahr.	Pressure in Atmospheres.*	Temperature, Fahr.

* Estimating 14·6 *lb.* = 1 atmosphere.

A cubic inch of water during its *conversion into steam*, under the ordinary pressure of the atmosphere, *expands* into 1696 cubic inches, or nearly a cubic foot.

One part, by weight, of *steam*, at 212° Fahr., when *condensed* into cold water, is found to be *capable of raising* 5·6 parts of the latter from the *freezing* to the *boiling point*. See *Fuel*, *Pit Coal*, *Smoke*, *&c.*

STEARINE. The solid portion of fats which is insoluble in cold alcohol.

Prep. Pure strained *mutton suet*, is melted in a glass flask along with 7 or 8 times its weight of *ether*, and the solution allowed to cool; the soft pasty semi-crystalline mass is then transferred to a cloth, and is strongly pressed as rapidly as possible, in order to avoid unnecessary evaporation; the solid portion is then redissolved in ether and the solution allowed to crystallize, as before. The *product* is nearly *pure*.

Prop., &c. White; semi-crystalline; insoluble in water and cold alcohol; soluble in 225 parts of cold ether, and freely so in boiling ether. It melts at 130° Fahr. The *stearine* of *commerce* is stearic acid.

STEARIC ACID. Syn. *Stearine* (Commercial), *Hypomargarulic Acid*. This is the previous substance after saponification.

Prep. 1. Repeatedly dissolve and crystallize *commercial stearic acid* in *hot alcohol*, until its melting point becomes constant at not less than 158° Fahr. Pure.

2. (Chevreul.) Saponify *mutton suet* with *caustic potassa*, and dissolve the *newly formed soap* in 6 times its weight of *hot water*; to the solution add 40 or 50 parts of *cold water*, and set the mixture aside in a temperature of about 52° Fahr.; after a time separate the pearly matter (*bistearate* and *bimargarate of potassa*) which falls, drain and wash it on a filter, and dissolve it in 24 parts of *hot alcohol* of sp. gr. 0·820; collect the *bistearate of potassa* which falls as the liquid cools, recrystallize it in *alcohol*, and decompose it, in *boiling water*, with *hydrochloric acid*; lastly, wash the disengaged *stearic acid* in *hot water*, and dry it.

3. (*Commercial.*) Ordinary *tallow* is boiled in large wooden vessels, by means of high-pressure steam, with about 16% of *hydrate of lime* (equiv. to 11% of pure lime) for 3 or 4 hours, or until the combination is complete, and an earthy soap is formed, when the whole is allowed to cool; the product (*stearate of lime*) is then transferred to another wooden vessel, and decomposed, by adding to it 4 parts of *oil of vitriol* (diluted with water) for every 3 parts of *slaked lime* previously employed, the action being promoted by steam heat, and brisk agitation; after repose the liberated fat is decanted from the sediment (*sulphate of lime*) and

water, and is then well washed with *water*, and by blowing steam into it; it is next allowed to cool, when it is reduced to shavings by means of a number of knives worked by machinery, and in this divided state is placed in canvass bags and submitted to the action of a *powerful hydraulic press*, by which a large portion of the oleine which it contains is expelled; the *pressed cakes* are then a second time exposed to the action of *steam* and *water*, again cooled, and coarsely powdered, and again submitted to the joint action of *steam* and *pressure*; they are lastly melted and cast into blocks for sale.

Prop., &c. Pure stearic acid forms brilliant pearly scales, which are soluble in ether, and in cold alcohol, and form salts with the bases called *stearates*. The commercial acid is made into candles. See *Fat*, *Fixed Oils*, and *Tallow*.

STEAROPTENE. The name given by Herberger to the concrete portion or camphor of volatile oils. Bizio calls it *stereusin*. Stearopténe corresponds to the margarine of the fixed oils.

STEEL. According to M. Bréant, the steel of which the celebrated Damascus blades are made, differs from European cast steel, in being more highly charged with carbon, and in being slowly cooled in such a manner that a crystallization takes place of two distinct combinations of carbon and iron. The orbicular veins or knots found on the Oriental scimitars are the result of the peculiar method of forging them, as well as the method of twisting the bars.

Under Mr. Heath's patent, dated 1839, ½ to 1% of *carburet of manganese* is introduced into the crucible with the broken bars of *blistered steel* ordinarily used. The cast steel thus obtained is of very superior quality, and possesses the peculiar and valuable property of being weldable to itself, and to wrought iron.

There is no test of the value of steel beyond its elasticity and temper, and the fineness, equality, and smoothness of its grain.

STEREOTYPE METAL. See *Type Metal*.

STERLING. The truth of the old proverb, that "all is not gold which glitters," is often painfully experienced by the purchaser of modern jewelry. The following table in connexion with the remarks at pages 538, and 559, will, therefore, prove highly useful to the reader in *determining* the *value* of *articles* in *gold*, provided he ascertain the "fineness" of the metal either by *examination* or *written warranty*:—

Sterling value of Gold of different degrees of "Fineness."

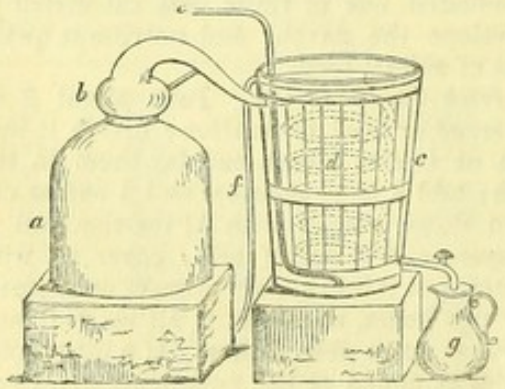
STEWING is a method of cooking food, intermediate to frying and boiling, performed by simmering it in a saucepan or stewpan, with merely sufficient water to prevent burning, and to effect the object in view; the whole being served up to form the "dish." It is undoubtedly the most simple and economical, and, when skilfully conducted, one of those best calculated to develope the flavour and nutritious qualities of animal food.

Irish Stew,—Soyer. Take about 2 *lb.* of *scrag* or *neck of mutton*; divide it into ten or twelve pieces, and lay them in the pan; add 8 *large potatoes* and 4 *onions* cut into slices, season with 1½ tea-spoonful of *pepper*, and 3 do. of *salt*; cover all with water, put it into a slow oven, or on a stove, for two hours, then stir it all up well, and serve it up in deep dishes. If a little more water is added at the commencement, you can take out, when half done, a *nice cup of broth*.



STIBETHYLE. A peculiar ethereal liquid obtained by MM. Löwig & Schweizer, by distilling *iodide of ethyle* along with an *alloy of antimony and potassium*. It is transparent, very mobile, very inflammable, smells strongly of onions, and boils at 317° Fahr.; exposed to the air it emits dense white fumes, and often inflames. *Bichloride*,

biniodide, *binoxide*, *bisulphuret*, and some other *compounds of stybethyle*, have been formed.

STIBIC ACID. See *Antimonic Acid.*

STILBENE. A peculiar hydrocarbon, which crystallizes in scales of a pearly lustre. (Brande.)

STILL. A vessel or apparatus employed for the distillation of liquids on the large scale. The forms of stills, and the materials of which they are made, vary according to the purposes for which they are intended, some being exceedingly simple, whilst others are equally elaborate and complicated. The *Engraving* represents the most common and useful apparatus of this kind, and the one almost exclusively employed in the laboratory. It is *used* as follows :—After the *fluid* and *other matters* (if any) are put into the *still*, the *head* is placed on and connected with the *worm tub* or *refrigerator*, and the joints are all *securely luted*. For *ordinary liquids*, a *stiff paste* made with *linseed meal* and *water*, to which a little *chalk* may be added, answers well for this purpose. For *corrosive liquids* nothing is better than *elastic bands* or *rings* interposed between the joints, which are then "brought home," as it is called, with *screws* or *clamps*. Heat is next applied, and the *worm tub* is supplied with *cold water* in sufficient quantity to preserve its contents at a proper temperature; the application of the heat being so regulated that the liquid may drop from the end of the refrigerator *quite cold* and *unaccompanied with vapour*. For *highly volatile liquids* a closed receiver should be provided.

a. Body of still, which may be either placed in a steam jacket, or in a brick furnace.
b. Still head or capital.
c. Worm tub.
d. Pewter worm, or refrigerator.
e. Cold water pipe.
f. Waste pipe.
g. Receiver.

STIMMI. (Obs.) Antimony.

STIMULANTS. Syn. *Stimulantia*. Medicines or agents which possess the power of exciting vital action. They are divided into *general stimulants*, or those which affect the whole system, as mercury or bark; and *local* or *topical stimulants*, or those which affect a particular organ or part only, as mustard applied as a poultice. *Diffusible stimulants* are general stimulants, the effects of which are rapid but fugacious, as ether or alcohol. "Much discrimination and caution are required in the administration of articles of this class, because, if given when inflammation is present, they are liable to create more mischief than benefit; but they are called for when, on the decline of that condition of an organ or organs, a state of relaxation or torpidity exists. In this state of things, a gentle stimulation materially assists the functions, and is productive of much benefit."

STINGS. See *Bites and Stings.*

STIR-ABOUT. *Thick gruel* formed of *oatmeal* and *water* boiled together. When eaten with cold milk it forms the *porridge* of the Scotch; and when mixed with the liquor in which meat or vegetables have been boiled, it is called *beef brose*, *kale brose*, *&c.* See *Oats* and *Oatmeal.*

STOCK. Among *cooks*, is *condensed soup* or *jelly*, used to make *extemporaneous soup*, *broth*, *&c.*

STOKING. See *Steam.*

STOMACH AFFECTIONS. Those of a character to admit of being usefully noticed in a popular work, will be found so referred to under the heads, *Appetite*, *Dyspepsia*, *Sickness*, *&c.*

Dr. Budd, in a recent lecture, recommends *small doses* of *ipecacuanha* as a remedy for those cases of indigestion in which digestion is slow, and the food lies heavily on the stomach, and there is an inability for mental or bodily exertion for some time after meals. He says it should be given in the morning fasting, and in quantity barely sufficient to occasion a slight feeling of vermiculating motion in the stomach, but without causing any sensation of pain or nausea. The *dose* to produce this effect varies from ¼ to 2 gr. He thinks there is no other medicine which appears so effectual in removing the affections in question. *Small doses* of *rhubarb*, *ginger*, and *cayenne pepper*, have a similar kind of action, and may be given singly or together for the same purpose. "I generally prescribe from ½ to 1 gr. of *ipecacuanha* in a pill with 3 or 4 gr. of *rhubarb*. With many, a favorite remedy for the discomfort resulting from slow digestion, is a grain of *cayenne pepper*, with 3 or 4 gr. of *rhubarb*. The best time for

giving these medicines is shortly" (say ½ an hour) "before any meal after which a sense of oppression is usually felt."

STONES (Precious). See *Gems* and *Pastes*.

STONE-WARE. See *Pottery*.

STOPPERS, when obstinately immovable in bottles, are the most safely treated by patiently hitting them upwards alternately on opposite sides with a piece of wood. When this fails the part may be dipped into hot water.

STORAX. See *Styrax*.

STORM GLASS. A philosophical toy, consisting of a thin glass tube about 12 inches *long*, and ¾ inch in *diameter*, about three fourths filled with the following liquid, and covered with a brass cap having an almost capillary hole through it, or else tied over with bladder.

The Solution. Take of *camphor*, 2 dr.; *nitre*, 1½ dr.; *sal ammoniac*, 1 dr.; *proof spirit*, 2¼ fl. oz.; dissolve, and place it in the tube above referred to. *Used* to foretell changes of the weather.

STRABISMUS. Syn. *Squinting*. This need not be described. When *one eye* only *is affected*, an excellent plan is to blindfold the sound eye during several hours each day, until the affection be removed. When *both eyes are affected*, a projecting piece of pasteboard, in the line of the nose, may be worn as much as possible with the same object. In *bad cases* of *squinting inwards*, as it is called, the division of the internal rectus muscle of the eyeball, by a skilful surgeon, is said to often relieve the deformity.

STRAMONIUM. See *Thorn Apple*.

STRANGURY. See *Urine*.

STRAPPING. Spread adhesive-plaster. *Used* to dress wounds, &c.

STRASS. See *Enamels*.

STRAWBERRY. Syn. *Fragaria*. The *fruit* of *fragaria vesca* (Linn.), or *strawberry plant*. Strawberries are, perhaps, the mildest of all the cultivated fruits; they are cooling, and slightly laxative and diuretic; rubbed on the teeth they dissolve the tartar, and whiten them. They were formerly in repute in gout, stone, and consumption. The *root* of the plant is aperient.

STRAW PLAIT, and articles made of it, are *bleached* by exposing them to the *fumes* of *burning sulphur* in a close chest or box; or, by *immersing* them in a *weak solution of chloride of lime*, and afterwards well washing them in water. *Water acidulated with oil of vitriol* or *oxalic acid*, is also used for the same purpose. *Straw-plait* may be *dyed* with any of the simple liquid dyes.

STRINGS (Musical). See *Catgut*.

STRIPPING LIQUOR. A mixture of *nitre*, 1 part; with *sulphuric acid*, 8 parts. *Used* to recover the silver on old plated-goods.

STRONTIA. *Strontian, Protoxide of Strontium, Oxide of do.* The protoxide of the metal strontium.

Prep. Pure strontia is best obtained by igniting *nitrate of strontia*.

Prop., &c. Pure caustic strontia is a grayish-white powder, possessing an extremely pungent acrid taste; with water it forms a white hydrate (*hydrate of strontia*), which is soluble in about 50 parts of water at 60° Fahr., and in 3 or 4 parts of boiling water; the hot saturated solution deposits crystals as it cools. Hydrate of strontia closely resembles hydrate of baryta in its general appearance and properties. It readily unites with the acids forming salts; all of which may be most cheaply prepared by dissolving the native *carbonate of strontia* in the respective *acids*. The *nitrate* is the only one met with in commerce, and is employed to give a *red colour* to *fireworks*. This salt is soluble in proof spirit, and in 5 parts of cold, and less than an equal weight of boiling water.

Tests. The *solution* of *strontia* and its *hydrate* exhibit an alkaline reaction, and, like baryta, is precipitated white by sulphuric acid, and the alkaline sulphates and carbonates. It is *distinguished* from BARYTA, —1, by its inferior solubility;—2, by not being precipitated by hydrofluosilicic acid. It is *distinguished* from LIME,—1, by sulphuric acid and the soluble sulphates producing a precipitate in its solutions, either at once, or after a time, which is more soluble in water than that from lime, but quite insoluble in acids and alkalies;—2, by its strong solutions being precipitated yellow by neutral chromate of potassa. It is *distinguished* from MAGNESIA, besides other reactions, by the comparative insolubility of its sulphate. It is also *distinguished* from *each* of the *preceding earths* by its soluble salts giving a *deep carmine-red tinge* to flame; while the salts of BARYTA impart a yellow tinge, and those of LIME a yellowish-red one.

STRONTIUM. The metallic base of the earth *strontia*. It was discovered by Sir H. Davy, in 1808. It closely resembles barium, but is less lustrous. With *chlorine* it combines to form *chloride of strontium*, a somewhat deliquescent salt, soluble in 2 parts of cold, and in less of boiling water; and freely soluble in alcohol. With *oxygen* it forms a *protoxide* (strontia); and a

binoxide or *peroxide*, which is prepared in the same manner as binoxide of barium.

STROPHULUS. A papular eruption peculiar to infants. There are several varieties:—In *strophulus intertinctus*, *red gum*, or *red gown*, the pimples rise sensibly above the level of the cuticle, possess a vivid red colour, and are usually distinct from each other; they commonly attack the cheeks, forearm, and back of the hand, and, occasionally, other parts of the body.—In *strophulus albidus* or *white gum* there are a number of minute whitish specks, which are, sometimes, surrounded by a slight redness. The two preceding varieties commonly occur during the first two or three months of lactation.—In *strophulus confertus*, *rank red gum*, or *tooth rash*, which usually appears about the fourth or fifth month, the pimples usually occur on the cheeks and sides of the nose, sometimes on the forehead and arms, and still less frequently, on the loins. They are smaller, set closer together, and less vivid, but more permanent than in the common red gum.—In *strophulus volaticus*, small circular patches or clusters of pimples, each containing from 6 to 12, appear successively on different parts of the body, accompanied with redness; and as one patch declines another springs up near it, by which the efflorescence often spreads gradually over the whole face and body.—In *strophulus candidus*, the pimples are larger than in the preceding, and are pale, smooth, and shining; it principally attacks the upper parts of the arms, the shoulders, and the loins. The last two varieties commonly appear between the third and ninth month.

The *treatment* of the *above affections* consists chiefly in removing *acidity* and *indigestion*, and duly regulating the bowels by an occasional dose of *magnesia* or *rhubarb*, or both combined. *Diarrhœa* may be met by the warm bath and the daily use of arrow-root (*genuine*), to which a teaspoonful or two of pure port wine has been added; and *itching* and *irritation* may be alleviated by the use of a lotion consisting of water, to which a little milk, lemon-juice, borax, or glycerine, has been added.

STRUTHEINE. An acrid bitter principle obtained from the *roots* of *gypsophila Struthium* (Linn.), a species of soap-wort. It appears to be identical with saponine.

STRYCHNINE. Syn. *Strychnina*, *Tetanine*, *Vanquelina*; *Strychnia*,—Ph. L. E. & D. *Prep.* 1. Dissolve *hydrochlorate* or *sulphate of strychnia* in *distilled water*, and throw down the alkaloid with *ammonia*, carefully avoiding excess; redissolve the precipitate in hot *rectified spirit*, and collect the crystals which form as the liquid cools.

2. (Ph. D.) *Nux vomica* (in powder), 1 *lb.*, is digested for 24 hours in ½ gall. of *water acidulated with* 2 fl. dr. *of sulphuric acid*, after which it is boiled for half an hour, and the decoction decanted; the residuum is boiled a *second*, and a *third* time with a fresh ½ gall. of *water acidulated with* 1 fl. dr. *of the acid*, and the undissolved matter is finally submitted to strong expression; the *decoctions* are next filtered and concentrated to the consistence of a syrup, which is boiled with *rectified spirit*, 3 pints, for about 20 minutes, *hydrate of lime*, 1 *oz.* or q. s., being added in successive portions during the ebullition, until the solution becomes distinctly alkaline; the liquid is then filtered, the spirit distilled off, and the residuum dissolved in *diluted sulphuric acid*, q. s.; *ammonia*, in *slight* excess, is added to the filtered solution, and the precipitate which falls is collected upon a paper filter, and dried; it is next re-dissolved in a minimum of *boiling rectified spirit*, and digested with ½ *oz.* of *animal charcoal* for 20 minutes; the filtered liquid, as it cools, deposits *strychnia*, in crystals.

Prop. A white, inodorous, infusible powder; or small, but exceedingly brilliant, transparent, colourless, octahedral crystals; soluble in about 7000 parts of water at 60°, and in 2500 parts at 212° Fahr.; freely soluble in hot rectified spirit; insoluble in absolute alcohol, ether, and solutions of the caustic alkalies; imparts a distinctly bitter taste to 600,000 times its weight of water, (1 part in 1,000,000 parts of water is still perceptible,—Fownes); exhibits an alkaline reaction; and forms salts with the acids, which are easily prepared, are crystallizable, and well defined.

Pur. "Crystals." "On the application of heat it liquefies (?), and if the heat be increased it is destroyed." (Ph. L.) "Nitric acid strongly reddens it" (*commercial*, not the pure); "a solution of 10 gr. in 4 fl. oz. of water and 1 fl. dr. of pyroligneous acid, when decomposed by 1 fl. oz. of concentrated solution of carbonate of soda, yields on brisk agitation a coherent mass, weighing, when dry, 10 gr., and entirely soluble in solution of oxalic acid." (Ph. E.)

Tests.—1. Potassa and its carbonate produce, in solutions of the salts of strychnia, white precipitates, which are insoluble in excess of the precipitant, and which, when viewed through a lens magnifying 100 times, appear as aggregates of small crystalline needles. In weak solutions the precipitate

only separates after some time, in the form of crystalline needles, which are, however, in this case, perfectly visible to the naked eye.—2. Ammonia gives a similar precipitate, which is soluble in excess of the precipitant. —3. Bicarbonate of soda produces, in neutral solutions, a like white precipitate, which is insoluble in excess, but which re-dissolves on the addition of a *single* drop of acid; in acid solutions no precipitate occurs for some time, in the cold, but immediately on boiling the liquid.—4. Nitric acid dissolves pure strychnia and its salts to colourless fluids, which become yellow when heated. Commercial strychnia, from containing a little brucia, is reddened by this test.—5. A minute quantity of strychnia being mixed with a small drop of concentrated sulphuric acid, placed on a white capsule or slip of glass, forms a colourless solution, but yields, on the addition of a very small crystal of bichromate of potash, or a very minute portion of chromic acid, a rich violet colour, which gradually changes to red and yellow, and disappears after some time. The $\frac{1}{1000}$th of a grain yields very distinct indications. —6. Puce oxide or peroxide of lead produces a similar reaction to the last, provided the sulphuric acid contain about $1\frac{0}{0}$ of nitric acid.

Pois. The *characteristic symptom* is the special influence exerted upon the nervous system, which is manifested by a general contraction of all the muscles of the body, with rigidity of the spinal column. A profound calm soon succeeds, which is followed by a new tetanic seizure longer than the first, during which the respiration is suspended. These symptoms then cease, the breathing becomes easy, and there is stupor followed by another general contraction. In fatal cases, these attacks are renewed, at intervals, with increasing violence, until death ensues. One phenomenon which is only found in poisonings by substances containing strychnia, is, that touching any part of the body, or even threatening to do so, instantly produces the tetanic spasm.—*Treat.* The stomach should be immediately cleared by means of an *emetic*, tickling the fauces, &c. To *counteract* the *asphyxia* from tetanus, &c., *artificial respiration* should be practised with diligence and care. "If the *poison* has been *applied externally*, we ought immediately to *cauterize* the part, and apply a *ligature* tightly above the wound. If the *poison* has been *swallowed for some time*, we should give a *purgative clyster*, and administer *draughts* containing *sulphuric ether* or *oil of turpentine*, which in most cases produce a salutary effect. Lastly, *injections of chlorine* and *decoction of tannin* are of value."

According to M. Ch. Gunther, the greatest reliance may be placed on full doses of *opium*, assisted by venesection, in cases of poisoning by strychnia or nux vomica. His plan is to administer this drug in the form of solution or mixture, in combination with a saline aperient.

Uses, &c. It is a most *frightful poison*, producing tetanus and death in very small doses. Even $\frac{1}{24}$ gr. will *sometimes occasion* tetanic twitchings in persons of delicate temperament. $\frac{1}{4}$ gr. blown into the throat of a small dog produced death in 6 minutes. In very *minute doses* it acts as a useful tonic in various nervous diseases, chronic diarrhœa, leucorrhœa, &c.; in slightly larger ones, it has been advantageously employed in certain forms of paralysis, in tic douloureux, impotence, &c. *Dose.* $\frac{1}{24}$ to $\frac{1}{16}$ gr. (dissolved in water by means of a drop of acetic or hydrochloric acid), gradually and cautiously increased until it slightly affects the muscular system. *Externally*, $\frac{1}{8}$ to $\frac{1}{4}$ gr. at a time.

Concluding Remarks. The Edinburgh College orders the nux vomica to be exposed for two hours to steam, to soften it, then to chop or slice it, next to dry it by the heat of a vapour bath or hot air, and, lastly, to grind it in a coffee-mill. In the process of the Ph. L. 1836, *magnesia* is employed to effect the precipitation. In the present Ph. L., strychnia appears in the Materia Medica. Most of that of commerce is now obtained from *St. Ignatius' bean*, which, according to Geiseler, yields $1\frac{1}{4}\frac{0}{0}$ of it; whereas 3 *lb.* of nux vomica produce little more than 1 dr. Commercial strychnia may be freed from brucia by digesting the powder in dilute alcohol.

The *salts* of *strychnia* which are occasionally asked for in trade, are the *acetate* (strychniæ acetas), *hydrochlorate* or *muriate* (s. murias,—Ph. D.), *hydriodate* (s. hydriodas), *iodate* (s. iodas), *nitrate* (s. nitras), *phosphate* (s. phosphas), and *sulphate* (s. sulphas). All of these may be easily formed by simply neutralizing the *acid* previously diluted with 2 or 3 parts of *water*, with the *alkaloid*, assisting the solution with heat; crystals are deposited as the liquid cools, and more may be obtained by evaporating the mother-liquor.

(The concluding sentence of 5, *a*, page 1029, is, unfortunately, misplaced. It should be at the end of 5, *b*.)

STUCCO. The name of several calcareous cements or mortars. *Fine stucco* is the third or last coat of three-coat plas-

ter, and consists of a mixture of *fine lime* and *quartzose sand*, which in application is "twice hand-floated and well trowelled."

STUFFING. Seasoning placed in meat poultry, game, &c., before dressing them, in order to give them an increased relish. The same materials, formed into balls, are added to soups, gravies, &c., under the name of *forcemeat*.

Prep. 1. (For *Fowls*, *&c.*) Shred a little *ham* or *gammon*, some cold *veal* or *fowl*, some *beef suet*, a small quantity of *onion*, some *parsley*, a very little *lemon peel*, *salt*, *nutmeg*, or *pounded mace*, and either *white pepper* or *cayenne*, and *bread crumbs;* pound them in a mortar, and bind it with 1 or 2 *eggs*.

2. (For *Hare*, or *anything in imitation of it*,—Mrs. Rundell.) The *scalded liver*, an *anchovy*, some *fat bacon*, a little *suet*, some *parsley*, *thyme*, *knotted marjoram*, a little *shalot*, and either *onion* or *chives*, all chopped fine; with some *crumbs of bread*, *pepper*, and *nutmeg*, beaten in a mortar with an *egg*.

3. (For *Goose*.) From *sage*, *onion*, *suet*, and *crumb of bread*. Geese are now, however, more commonly stuffed with *veal stuffing*.

4. (For *Veal*,—Soyer.) Chop ½ *lb.* of *suet*, put it into a basin with ¾ *lb.* of *bread crumbs*, a teaspoonful of *salt*, a ¼ do. of *pepper*, a little *thyme* or *lemon peel* chopped, and 3 *whole eggs;* mix well.—*Obs.* 1 *lb.* of *bread crumbs* and *one more egg* may be used; they will make it cut firmer. This, as well as No. 1, is now commonly employed for poultry and meat. Ude, a great authority in these matters, observes that "it would not be amiss to add a *piece of butter*, and to pound the whole in a mortar." "*Grated ham* or *tongue* may be added to this stuffing." (Rundell.) This is also used for *Turkeys*, and for "*forcemeat patties*."

STUFFING (Birds, &c.) The skins are commonly *dusted* over with a mixture of *camphor*, *alum*, and *sulphur*, in about equal quantities; or, they are smeared with *Bécœur's arsenical soap* noticed at *page* 1148. According to Prof. Crace Calvert, *carbolic acid*, which is worth only about 2*s.* per gall., is superior to all other substances for preserving the skins of birds and animals, as well as *corpses*.

STURGEON. Several species of *acipenser* pass under this name. The *common sturgeon* is the *acipenser sturio* (Linn.) The *roe* is made into "*caviare;*" the *swimming-bladder* into "*isinglass*."

STY. Syn. *Stye*, *Stian;* *Hordeolum*,—Lat. A small inflamed tumour, or boil, at the edge of the eyelid, somewhat resembling a barleycorn. It is usually recommended to promote its maturation by warm applications; since "the stye, like other furunculous inflammations, forms an exception to the general rule, that the best mode in which inflammatory swellings can end is resolution."

STYPHNIC ACID. Syn. *Nitrostyphnic Acid*. A compound obtained by the action of *nitric acid* (sp. gr. 1·2) upon *assafœtida*, *purree*, and several other *gum resins*, *extracts*, *&c.* It forms slender, yellowish-white prisms, which are sparingly soluble in water, but freely soluble in alcohol and ether. Its salts crystallize in orange-yellow needles, and detonate when heated.

STYPTICS. Syn. *Styptica*. Substances which arrest local bleeding. *Creasote*, *tannic acid*, *alcohol*, *alum*, and most of the *astringent salts* belong to this class.

Brocchieri's Styptic. A nostrum consisting of the *water distilled from pine tops*.

Eaton's Styptic. A *solution of sulphate* disguised by the addition of some unimportant substances. "Helvetius's styptic was for a long time employed under this title." (Paris.)

Helvetius's Styptic (stypticum Helvetii). *Iron filings* (fine) and *cream of tartar*, mixed to a proper consistence with *French brandy*. See *Helvetius's Styptic Powder* (p. 1059).

STYRACINE. A name given by Simon to a crystallizable substance extracted from storax by means of *alcohol*. It also exists under the liquid or oily form, when it is called *cinnaméine*. (See *p.* 262.)

STYRAX. Syn. *Storax*, *Storax Balsam;* *Styrax*,—Ph. L. & E. "The *liquid balsam* of an *uncertain plant*." (Ph. L.) The "*balsamic exudation* of *styrax officinale*, Linn." (Ph. E.), or *cane storax tree*. Two or three varieties are known in commerce:—*Liquid storax* (styrax liquida), *lump* or *red storax* (s. in massis), which is generally very impure; *storax in tears* (s. in lachrymis), and *storax in reeds* (s. calamita). The last are now seldom met with in trade. A fine variety of *liquid storax* (rasamala) is obtained from *liquidambar altingia* and *l. orientale*.

Prepared storax (*styrax colata;* *s. præparata*,—Ph. L.) is obtained by dissolving *storax*, 1 lb, in *rectified spirit*, 4 pints, by a gentle heat, straining the solution through linen, distilling off greater part of the spirit, and evaporating what is left to a proper consistence by the heat of a water bath. It is less fragrant than the raw drug.

Storax is stimulant, expectorant, and nervine. It was formerly much used in menstrual obstructions, phthisis, coughs,

asthmas, and other breath diseases. It is now chiefly used as a perfume. *Dose.* 6 to 20 or 30 gr.

A *factitious strained storax* is made as follows:—1. *Balsam of Peru*, 1 *lb.*; *balsam of tolu*, 4 *lb.*; mix.

2. *Gum benzoin*, 8 *lb.*; *liquid storax*, 6 *lb.*; *balsam of tolu*, and *socotrine aloes*, of each, 3 *lb.*; *balsam of Peru*, 2 *lb.*; *N.S.W. yellow gum*, 7 *lb.*; *rectified spirit*, 7 gall.; digest with frequent agitation for a fortnight, strain and distil off the spirit (about 5½ gall.) until the residuum has a proper consistence. *Prod.* 28 *lb.*

3. *Liquid storax*, 1 *oz.*; *socotrine aloes*, ¼ *lb.*; *balsam of tolu*, 2 *lb.*; *rectified spirit*, q. s.

STYROLE. An ethereal liquid, obtained by cautious distillation, from the *volatile oil of liquid storax*. It is thin; colourless; powerfully aromatic and fragrant; scarcely soluble in water; dissolves freely in alcohol and ether; boils at 293° and remains liquid at 0° Fahr. Sp. gr. 0·924. It may be also obtained from cinnamic acid. *Crude styrole* may be obtained by distilling a mixture of 3 parts of *storax*, 1 of *carbonate of soda*, and 5 of *water*. (See *pp.* 262, 785.)

STYRONE. A neutral, crystalline substance, obtained, along with *cinnamic acid*, when *styracine* is distilled with *hydrate of potassa*. It is the styrax analogue of *peruvine*.

SUB-. See *Nomenclature* and *Salts*.

SUBERIC ACID. Obtained by boiling *rasped cork* for some time in *nitric acid*, and then evaporating the liquid to one-half; the resulting crystalline powder may be purified by redissolving it in boiling water, and allowing it to neutralize. Margaric acid treated in the same way also yields *suberic acid*.

Prop., &c. It closely resembles mucic acid; it is colourless; sparingly soluble in cold water; fusible and volatilizable by heat; and forms salts called *suberates*, many of which are soluble and crystallizable.

SUBERINE. *Cork* deprived of all its soluble matter by the successive action of *water* and *alcohol*.

SUBLIMATE (Corrosive). See *page* 772.

SUBLIMATION. The process by which volatile substances are reduced to the state of vapour by heat, and again condensed in the solid form. It differs from ordinary distillation in being confined to dry solid substances, and in the heat employed being, in general, much greater. *Calomel*, *corrosive sublimate*, and *sal ammoniac*, are thus prepared.

SUBSTANTIVE COLOURS. In the *art of dyeing*, are such as impart their tints to cloth and yarns without the intervention of a mordant; in contradistinction to ADJECTIVE COLOURS, "which require to be fixed by certain *intermedes*, or substances which have a joint affinity for the colouring matter and the material to be dyed." (Brande.)

SUCCEDANEUM. See *Tooth-cements*, *&c.*

SUCCIN, *Succinum*. Amber.

SUCCINIC ACID. Syn. *Acid of Amber*, *Volatile Salt of do.*; *Sal Succini*; *Acidum Succinicum*,—Ph. D. 1826. *Prep.* From *amber*, in coarse powder, mixed with an equal weight of *sand*, and distilled by a gradually increased heat; or from the *impure acid* obtained during the distillation of oil of amber; the product in both cases being purified by wrapping it in bibulous paper and submitting it to strong pressure, to remove the oil, and then resubliming it. *It may also* be *prepared* from the *mother-liquor* of *suberic acid*, by evaporation and digesting the resulting crystals in *ether*, to remove suberic acid.

Prop., &c. Colourless, inodorous (when pure), crystalline scales or prisms; soluble in 5 parts of cold, and in 2½ parts of boiling water; fusible and volatile without decomposition. Its *salts* are called "*succinates*," most of which are soluble.—*Succinate of ammonia* is used as a test for iron.—*Succinamide* is a compound formed by the action of ammonia water on succinic ether;—*bisuccinamide*, by heating anhydrous succinic acid in dry gaseous ammonia.—*Succinone* is an oily liquid obtained by distilling succinic acid with lime.—*Succinic acid* has been recently formed by a process of fermentation from *malic acid*. It is *distinguished* from *benzoic acid* by its greater solubility, and by giving a brownish or pale red bulky precipitate with sesquichloride of iron in neutral solutions; whereas that with benzoic acid is paler and yellower.

Uses, &c. Succinic acid is antispasmodic, stimulant, and diuretic, but is now seldom used. *Dose.* 5 to 15 gr.

SUCCORY. Chicory or wild endive. (See *p.* 236.)

SUDORIFICS. See *Diaphoretics*.

SUET. Syn. *Sevum*, *Sebum*,—Lat. This is prepared from the *fat* of the loins of the *sheep* (or *bullock*), by melting it by a gentle heat, and straining the liquid fat. In this state it forms the *adeps ovillus* (Ph. D.), *sevum* (Ph. L. & E.), *sevum ovillum*, or *sevum præparatum*, employed in *medicine* and *perfumery*, as the basis of *ointments*, *cerates*, *plasters*, *pommades*, *&c.*

SUET (Melilot). Syn. *Sevum Meliloti*,

—Lat. *Prep.* From *suet*, 8 *lb.*; *melilot leaves*, 2 *lb.*; boil until the leaves are crisp, strain, and allow it to cool very slowly, so that it may "grain well." *Used* by farriers, and to make melilot plaster.

SUFFOCATION. The *treatment* varies with the cause. See *Animation* (Suspended), *Charcoal*, *Drowning*, *Hanging*, *Sulphuretted Hydrogen*, *&c.* Suffocation from *coal gas* may be treated like that from charcoal; and that resulting from the inhalation of the *gas* from *cess-pools*, *grave-yards*, *sewers*, *&c.*, in the manner noticed under *sulphuretted hydrogen*.

SUGAR. Syn. *Cane Sugar*; *Sucre*,—Fr. *Saccharum*,—Lat. This well-known and most useful substance is found in the juice of many of the canes or grasses, in the sap of several forest trees, and in the roots of various plants. In *tropical climates* it is extracted from the sugar-cane (*arundo saccharifera*; *saccharum officinarum*,—Linn.); in *North America* from the sugar maple (*acer saccharinum*,—Linn.); and in *France* from white beet-root (*beta vulgaris alba*,—Linn.). The ordinary sugar used in England is extracted from the sugar-cane which is raised so abundantly in our numerous colonies.

The *manufacture of sugar* is exclusively conducted on the *large scale*. The *recent canes* are crushed between rollers, and the *expressed juice* is suffered to flow into a suitable vessel, where it is slowly heated to nearly the boiling-point, to coagulate albuminous matter. A *small quantity* of *milk of lime* is then added, to remove mechanical impurities, and the *skimmed* and *clarified juice*, after being sufficiently concentrated by rapid evaporation in open pans, is transferred to *coolers*, and thence into upright casks perforated at the bottom, and so placed that the *syrup*, or uncrystallizable portion, may drain off into a tank or cistern from the *newly formed sugar*. During the period of crystallization it is frequently agitated in order to hasten the change, and to prevent the formation of large crystals. The *solid portion* of the product forms *moist*, *raw*, or *muscovado sugar*; the uncrystallizable syrup, *molasses* or *treacle*.

Raw sugar is *refined* by re-dissolving it in *water*, adding to the solution a *little albumen*, under the form of *serum of blood* or *white of egg*, and, sometimes, a little *lime-water*, and heating the whole to the boiling-point; the *impurities* are then removed by careful *skimming*, and the syrup is *decolored* by *filtration* through recently burnt *animal charcoal*; the clear decolorized syrup is next evaporated to the crystallizing-point *in vacuo*, and at once transferred into *conical earthen-moulds*, where it solidifies, after some time, to a confusedly-crystallized mass; this, when *drained*, *washed* with a *little clean syrup*, and *dried in a stove*, constitutes ordinary *loaf*, *lump*, or *refined sugar*. When the crystallization is allowed to take place quietly and slowly, the product is *sugar-candy*. The *production of molasses* in the rude colonial manufacture is chiefly the result of the high and long-continued heat applied to the cane-juice, an error avoided in the "sugar-refining."

Prop. Sugar requires for its solution only 1-3rd of its weight of cold, and still less of boiling water; it is slowly dissolved by cold rectified spirit; it dissolves in 4 parts of boiling rectified spirit, and in 80 parts of boiling absolute alcohol; it melts by heat and cools to a glassy amorphous mass (*barley sugar*); at about 400° Fahr. it suffers rapid decomposition, and fuses to a brown, uncrystallizable mass (*caramel*); long boiling with water increases its colour, and lessens its tendency to crystallize; its aqueous solution dissolve alkalies, earths, and many metallic oxides with facility; weak syrups take up about half as much *hydrate of lime* as they contain sugar; when slowly crystallized it assumes the form of oblique 4-sided prisms, terminated by 2-sided summits. Sp. gr. 1·60, (1·577, —Ure.)

Pur. Moist or muscovado sugar, and crushed lump sugar are *occasionally* adulterated with *chalk*, *plaster*, *sand*, *potato flour*, and other *fecula*; but *frequently*, and in certain neighbourhoods, CONSTANTLY, with *starch-sugar* or *potato-sugar*. These frauds may be detected as follows:—

Tests.—1. *Pure cane sugar* dissolves freely and entirely in both water and proof spirit forming transparent colourless solutions, which are unaffected by either sulphuretted hydrogen or dilute sulphuric acid.—2. Its solution bends the luminous rays in circumpolarization to the *right*, whereas grape and fecula sugars bend it to the *left*.—3. (Chevallier.) Boiled for a short time in water containing 2 or 3% of caustic potassa the liquid remains colourless; but it turns brown, which is more or less intense, according to the quantity, if starch sugar is present. Even 2 or 3% of starch sugar may be thus detected.—4. (E. Krantz.) A filtered solution of 33 gr. of cane or beet sugar in 1 fl. oz. of water, mixed with 3 gr. of pure caustic potassa, and then agitated with

1½ gr. of sulphate of copper in an air tight bottle, remains clear, even after the lapse of several days; but if starch sugar be present, a red precipitate is formed after some time; and if it is present in considerable quantity, the copper will be wholly converted into oxide within 24 hours, the solution turning first blue or green, and then entirely losing its colour.—5. (*Trommer's Test.*) A solution of cane sugar is mixed with a solution of sulphate of copper, and caustic potassa added in excess; a blue liquid is obtained, which, on being heated, is at first but little altered; a small quantity of red powder falls after a time, but the liquid long retains its blue tint. When *grape-sugar*, or *fecula sugar*, is thus treated, the first application of heat throws down a copious greenish precipitate, which rapidly changes to scarlet, and eventually to dark red, leaving a nearly colourless solution. This is an excellent test for distinguishing the two varieties of sugar, or discovering an admixture of grape-sugar with cane-sugar. The $\frac{1}{1000}$th part of *grape-sugar* may be thus detected. The *proportion of oxide of copper* produced, affords a good criterion, not only of the *purity of the sugar*, but also, of the *extent* of the adulteration.—6. (Ure.) Dissolve a little sulphate of copper (say 20 gr.) in a measured quantity of water, and add to it, in the cold, a solution of caustic potassa, until, by testing with turmeric paper, the liquid appears faintly alkaline, shown by the paper becoming *slightly* brown. If a small quantity of this test-liquor (previously well-shaken) be added to an aqueous solution of the sugar, and the whole boiled, the solution becomes at first green, and then olive-green, if *dextrine* is present; but if it contain *grape-sugar*, the salt of copper is immediately reduced into the state of orange and oxide; whilst a solution of *pure cane-sugar* undergoes *no change*, or is scarcely altered.—7. The presence of the inspissated sweet waste liquor (*crude glycerine*) of the stearine manufactories, now a common adulterant, may be detected by the inferior sweetness, and by the moist and "sickly" appearance of the sugar.—8. The specific gravities and crystalline forms offer other means of distinguishing the varieties of sugar.

Concluding Remarks.— Refined sugar (*saccharum*,—Ph. L.; *s. purum*,—Ph. E.; *s. purificatum*,—Ph. D.), raw sugar (*s. commune*,— Ph. E.), and molasses or treacle (*sacchari fæx*,—Ph. L. & E.) are officinal.

The *relative sweetening power* of *cane sugar* is estimated at 100; that of *pure grape sugar*, at 60; that of *fecula* or *starch sugar*, at 30 to 40.

According to Messrs. Oxland's method (patented 1849) of *defecating* and *bleaching* the juice of beet-root, cane, &c., *acetate of* alumina, formed by dissolving 4 *lb.* of that earth in acetic acid, is boiled with each ton of sugar, and as soon as the acetic acid is nearly all driven off, a solution of tannin, formed from 1 *lb.* of bruised valonia and 2 gall. of hot water, is added to the boiling syrup; the excess of alumina is afterwards separated by lime, and the usual method of further procedure adopted. By their *second patent* (1851), *superphosphate of alumina* or *of lime* is substituted for acetate of alumina, in the proportion of about 6 *lb.* of alumina, dissolved in phosphoric acid, for each ton of sugar.

Sugar may be *obtained* from nearly all *sweet vegetable substances*, by a process essentially similar to that described above.

SUGAR (Acid of). See *page* 918.

SUGAR (Alum). Syn. *Saccharum Aluminatum*, *Alumen Saccharinum*,—Lat. From *alum* and *white sugar*, in fine powder, equal parts, formed into minute sugar-loaf shaped lumps with *mucilage of gum arabic* made with rose water. *Used* to make astringent lotions and eye-waters.

SUGAR (Barley). Syn. *Saccharum Hordeatum*, *Penidium*, *Saccharum Penidium*,—Lat. *Prep.* Take of *saffron*, 12 gr.; *hot water*, q. s.; infuse for 20 minutes, strain, and add of *white sugar*, 1 *lb.*; boil to a full *candy height*, or that state called "*crack*," or "*crackled sugar*," when 2 or 3 drops of clear *lemon juice* or *white vinegar* must be added, and the pan removed from the fire and set for a single minute in *cold water* to prevent its burning; the sugar must be then at once poured out on an *oiled marble slab*, and either cut into pieces, or rolled into cylinders, and twisted in the usual manner. 1 drop of *oil of citron*, *orange*, or *lemon*, will flavour a considerable quantity. *White barley-sugar* is made with a *strained decoction of barley* instead of water, or starch is added to whiten it.

SUGAR (Beet-root). Syn. *Saccharum Betæ*,—Lat. See *page* 1192.

SUGAR-BOILING. The art or business of the confectioner or sugar-baker; the candying of sugar. The stages are as follow:—*Well clarified* and *perfectly transparent syrup*, is boiled until a "skimmer" dipped into it, and a portion "touched" between the forefinger and thumb, on opening them, is drawn into a small thread, which crystallizes and breaks. This is called a "*weak candy height*." If *boiled*

again, it will draw into a larger string, and if bladders may be blown through the "drippings" from the ladle, with the mouth, it has acquired the second degree, and is now called "*bloom sugar*." After *still further boiling* it arrives at the state called "*feathered sugar*." To determine this, re-dip the skimmer, and shake it over the pan, then give it a sudden flirt behind, and the sugar will fly off like feathers. The *next degree* is that of "*crackled sugar*;" in which state the sugar that hangs to a stick dipped into it, and put directly into a pan of *cold water*, is not dissolved off but turns hard and snaps. The *last stage* of refining this article reduces it to what is called "*carmel sugar*;" proved by dipping a stick first into the sugar, and then into cold water, when, on the moment it touches the latter, it will, if matured, snap like glass. It has now arrived at a "*full candy height*." Care must be taken throughout that the fire is not too fierce, as by flaming up against the sides of the pan, it will burn and discolour the sugar; hence, the boiling is best conducted by steam heat.

Any *flavour* or *colour* may be given to the candy by adding the colouring matter to the syrup before boiling it, or the flavouring essences when the process is nearly complete. See *Stains*, *&c.*

SUGAR CANDY. Syn. *Saccharum Candidum*, *S. Crystallinum*, *S. Crystallizatum*, —Lat. *Sugar* crystallized by leaving the *saturated syrup* in a warm place (90 to 100° Fahr.), the shooting being promoted by placing *sticks*, or *threads*, at small distances from each other in the liquor; it is also deposited from *compound syrups*, and does not seem to retain much of the foreign substances with which they are loaded. *Brown sugar-candy* is prepared in this way from raw sugar; *white do.*, from refined sugar; and *red do.*, from a syrup of refined sugar which has been coloured red by means of *cochineal*.

Sugar candy is chiefly *used* as a sweetmeat; and, being longer in dissolving than sugar, in coughs, to keep the throat moist; reduced to powder, it is also blown into the eyes, as a mild escharotic in films or dimness of that organ.

SUGAR (Diabetic). Grape sugar found in the urine of persons labouring under *diabetes*.

SUGAR (Gelatine). See *Glycocine*.

SUGAR (Grape). Syn. *Glucose*, *Fruit Sugar*; *Saccharum Uvæ*, *S. Fructûs*,—Lat. This substance is found in the juice of grapes and other fruit, in the urine of diabetic patients, and in the liquid formed by acting on starch and woody fibre with dilute sulphuric acid.

Prep. From the *juice of ripe grapes* or an *infusion* of the *ripe fruit* (raisins), by saturating the acid with *chalk*, decanting the clear liquid, evaporating to a syrup, clarifying with *white of egg*, or *bullock's blood*, and then carefully evaporating to dryness; it may be purified for chemical purposes by solution and crystallization in either *water* or *boiling alcohol*. Like other sugar, it may be decoloured by animal charcoal.

In the ordinary process of refining, crude grape sugar yields 75% of a *white granular sugar*, and 24% of *treacle*.

Prop. It is less sweet and less soluble than cane sugar, requiring 1½ parts of cold water for its solution; instead of bold crystals it forms granular warty masses, without distinct crystalline faces; it does not easily combine with either lime, or oxide of lead; with heat, caustic alkaline solutions turn it brown or black, but it dissolves in oil of vitriol without blackening, the reverse being the case with cane sugar; with chloride of sodium it forms a soluble salt which yields large, regular, and beautiful crystals. Sp. gr. 1·400.

Obs. Cane sugar is converted into grape sugar during the process of fermentation, and by the action of acids. See *Sugar* (*p.* 1192.) and *Starch Sugar* (below).

SUGAR (Lemon). Syn. *Saccharum Limoniatum*,—Lat. See *Lemonade Powders*.

SUGAR (Maple). Syn. *Saccharum Acerinum*,—Lat. From the *juice* of the *sugar maple*. The *average product* from each tree is about 6 *lb.* per season. (See *p.* 1192.

SUGAR OF LEAD. See *page* 679.

SUGAR OF MILK. Syn. *Lactine*; *Saccharum Lactis*,—Ph. D. *Prep.* Gently evaporate *clarified whey* until it crystallizes on cooling, and purify the crystals by digestion with *animal charcoal*, and repeated crystallizations.

Prop., *&c.* White, translucent, very hard, cylindrical masses or four-sided prisms; soluble in about 6 parts of cold, and in 2 parts of boiling water; it is unsusceptible of the vinous fermentation, except under the action of dilute acids, which convert it into grape sugar; in solution, it is converted into lactic or butyric acid by the action of caseine and albuminous matter. Milk contains about 5% of it. (Boussingault.)

Obs. Sugar of milk is chiefly imported from Switzerland. In this country it is chiefly used as a vehicle for more active

medicines; especially among the homœopathists.

SUGAR (Starch). Syn. *Potato Sugar, Fæcula do.* This is grape sugar obtained by the action of diastase on starch in the manner noticed under *Dextrine* and *British gum;* or by the action of dilute sulphuric acid on starch, or of the strong acid on lignine, or on substances containing it.

Prep. 1. *Potato fecula,* 100 parts; *water,* 400 parts; *sulphuric acid,* 6 parts; mix, boil for 35 or 40 hours, adding *water,* to make up for evaporation; then saturate the acid with lime or chalk, decant or filter, and evaporate the clear liquor. Under pressure, the conversion is more rapid. *Prod.* 105%.

2. *Shreds of linen* or *paper,* 12 parts; *strong sulphuric acid,* 17 parts, (Braconnot; —5 of acid, and 1 of water,—Vogel;) mix in the cold; in 24 hours dilute with *water,* and boil it for 10 hours; then neutralize with chalk, filter, evaporate to a syrup, and set the vessel aside to crystallize. *Prod.* 114%. Sawdust, glue, &c., also yield grape sugar by like treatment. See *p.* 691.

SUGARS (Medicated). Syn. *Saccharides; Sacchara Medicata; Saccharolés, Saccharures.* Some of these are prepared by moistening *white sugar* with the *medicinal substance,* then gently drying it, and rubbing it to powder; in other cases they are obtained in the manner noticed under *Pulverulent Extracts* (*p.* 446), or *Oleosaccharum.* The most valuable preparation of this class in British pharmacy is the *saccharated carbonate of iron,* (ferri carbonas cum saccharo,—Ph. L.)

SUGAR PLUMS. Syn. *Bon-bons, Dragées.* These are made by various methods, among which are those noticed under *Confectionery Drops, Lozenges,* and *Pastils,* to which may be added the following: —Take a quantity of *sugar-syrup* in the proportion to their size, in that state called a "blow," (which may be known by dipping the skimmer into the sugar, shaking it, and blowing through the holes, when parts of light may be seen;) and add a drop or two of any esteemed *flavouring essence.* If the *bon-bons* are preferred white, when the sugar has cooled a little, stir it round the pan till it grains, and shines on the surface. When all is ready pour it through a funnel into little *clean, bright, leaden moulds,* which must be of *various shapes,* and be previously slightly moistened with *oil of sweet almonds;* it will then take a proper form and harden. As soon as the plums are cold take them from the moulds; dry them for two or three days in the air, and put them upon paper. If the *bon-bons* are required to be *coloured,* add the *colour* just as the sugar is ready to be taken off the fire.

Crystallized bon-bons are *prepared* by dusting them with powdered *double-refined lump sugar* before drying them.

Liqueur bon-bons, now so beautifully "got up" by the Parisian confectioners, are obtained by pressing pieces of *polished bone* or *metal* into *finely powdered sugar,* filling the hollow spaces so formed with *saturated solutions of sugar* in the respective *liqueurs,* and then spreading over the whole an ample layer of *powdered sugar.* In the course of three or four days the bon-bons may be removed, and *tinted* by the artist at will. Instead of white powdered sugar ordered above, *coloured sugar* may be used. These bon-bons are found to be hollow spheres, containing a small quantity of the spirit or liqueur employed; and will bear keeping for many months. See *Sweetmeats, &c.*

SUGAR RESIN. See *Sugar Xyloidine.*

SULFAMIDE. A remarkable crystallized compound formed by the action of *anhydrous sulphuric acid* on *anhydrous ammonia.*

SULFIMIDE. From *anhydrous sulphurous acid* and *ammonia,* as the last.

SULPHAMYLIC ACID. A new acid formed by the action of equal parts of *potato-oil* and *oil of vitriol* on each other. After the mixture has become blackened, it is diluted with *water,* saturated with *carbonate of baryta,* filtered and crystallized by gentle evaporation; the crystals (*sulphamylate of baryta*) are purified by re-solution and re-crystallization, and are ultimately decomposed by *dilute sulphuric acid;* from the resulting clear liquid *sulphamylic acid* may be obtained in a crystalline form by cautious evaporation. The *sulphamylates of baryta, lead, lime,* and *potassa,* are soluble and crystallizable.

SULPHARSENIOUS ACID. See *page* 86.

SULPHATED BONES. See *Coprolite, Superphosphate of Lime,* and *Manures.*

SULPHATE. Syn. *Sulphas,*—Lat. A salt of sulphuric acid.

The *soluble sulphates* may be *recognised* by—1. Yielding a heavy, white, pulverulent precipitate with chloride of barium or nitrate of baryta, which is insoluble in either hydrochloric or nitric acid.—2. Acetate or nitrate of lead gives a heavy white precipitate, which is only sparingly soluble in dilute nitric acid, but completely soluble in hot strong hydrochloric acid.

An *insoluble sulphate* may be tested by mixing it with 3 times its weight of carbonate of potash or soda (both in fine powder), exposing the mixture in a platinum crucible to a red heat for ½ an hour, dissolving the mass in water, filtering, neutralizing the free alkali with acetic or hydrochloric acid, and then applying the reagents as before.

The *sulphates* of *baryta*, *tin*, *antimony*, *bismuth*, *lead*, and *mercury* are INSOLUBLE; those of *strontia*, *lime*, *zirconia*, *yttria*, and *silver*, very SPARINGLY SOLUBLE; the *other sulphates* are, for the most part, FREELY SOLUBLE in water.

The *sulphates* of the *alkalies*, *earths*, and *common metals*, when mixed with charcoal and heated to redness, suffer decomposition, a *sulphuret* of the base being formed.

SULPHIDES. See *Sulphuret*.

SULPHINDYLIC ACID. Syn. *Sulphindigotic Acid*. An intensely blue pasty mass, formed by dissolving 1 part of *indigo* in about 15 parts of *concentrated sulphuric acid*.

Prop. &c. It forms blue *salts* with the bases which are freely soluble in *pure* water, but quite insoluble in saline solutions. The purple powder left undissolved on diluting the acid product, when the acid used has been too small in quantity, or the digestion too brief, is soluble in a large quantity of pure water. (See *p.* 597.)

SULPHISATHYDE, *bisulphisathyde*, *sulfasathyde*, *sulfesathyde*, &c. See *Isathyde*.

SULPHITE. See *Sulphurous Acid*.

SULPHOBENZIDE. A crystalline substance which separates when a mixture of *benzole* and *anhydrous sulphuric acid* is largely diluted with *water*. It is purified by washing it with water, dissolving it in ether, and crystallizing by spontaneous evaporation. It fuses at 212° Fahr., and is volatile.

SULPHOBENZOIC ACID. A bibasic, crystallizable acid, formed by the direct union of *benzoic acid* and *anhydrous sulphuric acid*; the viscid mass is dissolved in water, the solution saturated with *carbonate of baryta*, and *hydrochloric acid* added to the filtered liquid; *sulphobenzoate of baryta* crystallizes out, from which the *sulphobenzoic acid* may be obtained by decomposing it with *dilute sulphuric acid*.

SULPHOCYANIC ACID. See *page* 587.

SULPHOCYANIDES. See *below*.

SULPHOCYANOGEN. Syn. *Bisulphuret of Cyanogen*. A light, insoluble, deep yellow powder, discovered by Liebig, and obtained by saturating a *concentrated solution of a metallic sulphocyanide* with *chlorine*; or by heating it with *nitric acid*. Its compounds are the *sulphocyanides* or *hydrosulphocyanates*. Most of these may be formed by directly saturating *hydrosulphocyanic acid* with the *oxide*, or *hydrate of the base*; or, from the *sulphocyanide of potassium*, and a soluble salt of the base, by double decomposition. (See *page* 587.)

SULPHOFORM. Syn. *Sulphoformum*, —Lat. An oily liquid obtained by distilling a *mixture* of *iodoform*, 1 part; with *sulphuret of mercury*, 3 parts. Its properties are undetermined.

SULPHOGLYCERIC ACID. See *below*.

SULPHOHYDRIC ACID. See *p.* 583.

SULPHOLEIC ACID. When *olive oil* is slowly and cautiously mixed with half its volume of *concentrated sulphuric acid*, all rise of temperature being avoided, a homogeneous liquid is obtained, which, when mixed with a little water, separates into two layers, the undermost consisting of *sulphoglyceric acid* and free sulphuric acid, and the upper and syrupy portion, of two compound acids, the *sulphomargaric* and *sulpholeic*. These latter dissolve in a large quantity of water, but after some time undergo decomposition into sulphuric acid and several new fatty acids, to which the names *metamargaric*, *hydromargaric*, *hydromargaritic*, *metoleic*, and *hydroleic* are given. (See *p.* 585.)

SULPHOMARGARIC ACID. See *Sulpholeic Acid*.

SULPHOMETHYLIC ACID. A peculiar acid substance formed from *sulphate of methyle* by the action of *water*. The action is slow in the cold, but more rapid with heat, and is accompanied with violence at the boiling temperature. Its salts are called *sulphomethylates*.

SULPHONAPHTHALIC ACID. A crystallizable acid compound, formed along with another acid, by dissolving naphthaline in *warm oil of vitriol*, diluting the solution with *water*, and saturating it with *carbonate of baryta*; the resulting baryta salt (the most soluble of the two) crystallizes from a hot solution, and *sulphonaphthalic acid* is afterwards obtained from it by the addition of *dilute sulphuric acid*.

SULPHOPHENIC ACID. A syrupy liquid, formed by the union of *sulphuric acid* with *hydrated oxide of phenyle*.

SULPHOSACCHARIC ACID. *Prep.* Melted *grape-sugar* is cautiously mixed with *concentrated sulphuric acid*; the *product* is dissolved in *water*, and neutralized with carbonate of baryta; sulphate of baryta is formed together with a soluble sulphosaccharate of that earth, from which the acid itself may be afterwards eliminated. It

is a sweetish liquid, forming a variety of soluble salts (*sulpho-saccharates*), and is very prone to decompose into sugar and sulphuric acid.

SULPHOSELS or *sulphosalts*. See *Salt* (p. 1119).

SULPHOSINAPISINE. A crystallizable compound obtained from *mustard seed*.

SULPHOTULUOLIC ACID. A fluid acid compound resulting from the combination of *tuluole* with *fuming sulphuric acid*.

SULPHOVINIC ACID. Syn. *Œnothionic Acid, Ethereo-Sulphuric do., Bisulphate of Oxide of Ethyle; Acidum Sulphovinicum*,—Lat. *Prep.* 1. Mix equal weights of *sulphuric acid* and *alcohol*, and, in half an hour, add as much *carbonate of lead* as acid employed, or q. s. to remove all the free sulphuric acid present; filter, when a *solution* of *sulphovinic acid* will be obtained.

2. Strong *rectified spirit* is mixed with twice its weight of *concentrated sulphuric acid*; the mixture is heated to its boiling point, and then left to cool; when cold, it is diluted with a large quantity of *water*, and neutralized with *carbonate of baryta*; (much sulphate of baryta is produced;) the mass is placed upon a cloth filter, drained, and pressed; the *clear solution* is evaporated to a small bulk by the heat of a *water bath*, filtered from a little sulphate, and left to crystallize; the product is *sulphovinate of baryta*, in very beautiful colourless, transparent crystals. These crystals dissolve in about an equal weight of cold water, and the *hydrated acid* may be procured by exactly precipitating the base by *dilute sulphuric acid*, and evaporating the filtered solution, *in vacuo*, at the temperature of the air.

Prop., &c. A sour syrupy liquid, very easily decomposed by heat, and even by long exposure in the vacuum of the air-pump. Combined with the bases, it forms salts called *sulphovinates*, which may be purified by re-solution and re-crystallization. *All* the *sulphovinates* are soluble; the solutions are decomposed by ebullition; and most of them crystallize well. Heated with hydrate of lime or baryta, the *sulphovinates* yield a *sulphate of the base* and *alcohol*.

SULPHUR. Syn. *Brimstone; Soufre*, —Fr. *Sulphur*,—Lat. An undecompounded substance, or chemical element, the general properties of which are well known. That of commerce is chiefly imported from Sicily and Italy, and is a volcanic production.

Var. The principal of these are—

Amorphous Sulphur, Brown do.; Sulphur amorphum, S. fuscum, S. informe, S. rubrum, —Lat. Prepared from *sublimed sulphur*, by melting it, increasing the heat to from 320° to 350° Fahr., and continuing it at that temperature for about half an hour, or until it becomes brown and viscid, and then pouring it into water. In this state it is ductile like wax, may be easily moulded in any form, is much heavier than usual, and when it has cooled does not again become fluid until heated to above 600° Fahr. The same effect is produced more rapidly by at once raising the temperature of the melted mass to from 430° to 480° Fahr.

Precipitated Sulphur, Hydrate of sulphur, Milk of do.; Sulphuris hydras, Lac sulphuris; Sulphur precipitatum, — Ph. L. *Prep.* From *sublimed sulphur*, 1 part; *dry* and recently *slaked lime*, 2 parts; *water*, 25 parts, or q. s.; boil for 2 or 3 hours, dilute with 25 parts more of *water*, filter, and precipitate with *dilute hydrochloric acid*; drain, and well wash the precipitate, and dry it by a gentle heat. Resembles sublimed sulphur in its general properties, but is much paler, and in a finer state of division. "Pale yellow" (not white),—Ph. L.

Roll Sulphur, Cane do., Stick do.; Sulphur in bacculis, S. in rotulis, S. rotundum, —Lat. This is *crude sulphur*, purified by melting and skimming it, and then pouring it into moulds. That obtained during the roasting of copper pyrites, and which forms the common roll sulphur of England, frequently contains from 3 to 7% of yellow arsenic.

Sublimed Sulphur, Flowers of sulphur; Flores sulphuris; Sulphur,—Ph. L. *Sulphur sublimatum*,—Ph. E. & D., & Ph. L. 1836. Prepared by subliming sulphur in iron vessels. For *medical purposes* it is ordered to be well washed with water, and dried by a gentle heat. In this state it forms the *washed sulphur* (*sulphur lotum*,—Ph. L. 1824) of old pharmacy. In this state it is "of a lemon colour; is sublimed at the heat of 600° Fahr., and is entirely soluble in oil of turpentine aided by heat." (Ph. L.) "When washed with water, it (the liquid) does not alter the colour of litmus." (Ph. L. 1836.)

Sulphur Vivum, Black sulphur, Crude do., Horse brimstone; Sulphur nigrum, S. caballinum, S. griseum,—Lat. This is crude native sulphur. It is a gray or mouse-coloured powder. The residuum in the subliming pots from the preparation of *flowers of sulphur* is now commonly substituted for it. It generally contains much arsenic, and is consequently *very poisonous*.

Pur. The *sublimed sulphur* of the shops is now, in general, of respectable quality, but the *precipitated sulphur* frequently contains about $\frac{2}{3}$rds of its weight of sulphate of lime (*plaster of Paris*), owing to the substitution of *sulphuric acid* for hydrochloric acid in its manufacture. *This fraud* is readily *detected* by strongly heating a little of the suspected sample in an iron spoon or shovel, when the sulphur is burnt or volatilized, and leaves behind the sulphate of lime as a white ash; this, when mixed with water, and gently dried, gives the amount of the adulteration. *A still simpler plan* is to dissolve out the sulphur in the sample with a little hot oil of turpentine or liquor of potassa; the undissolved portion is foreign matter.

Prop. Sulphur melts to a clear thin fluid, and volatilizes at about 232° Fahr., and in open vessels rapidly takes fire, burning with a bluish flame. It is insoluble in both water and alcohol; it is soluble in oil of turpentine and the fatty oils, and freely so in bisulphuret of carbon and hot liquor of potassa. With oxygen it unites to form *oil of vitriol* and *sulphurous acid*, and with the metals to form *sulphurets*. Sp. gr. 1·982 to 2·045.

Estim. The determination of the quantity of *sulphur*, *phosphorus*, and *chlorine*, in a state of combination, especially in organic mixtures, is often rather troublesome. The proportion of SULPHUR is best determined by oxidizing a *known weight of the substance* by *strong nitric acid*, or by *fusing* it in a silver vessel with 10 or 12 times its weight of *pure hydrate of potassa* and about half as much *nitre*. The sulphur is thus converted into sulphuric acid, the quantity of which can be determined by *dissolving the fused mass in water*, acidulating the solution with *nitric acid*, adding a salt of *baryta*, and weighing the resulting *sulphate*. PHOSPHORUS is, in like manner, oxidized to *phosphoric acid*, the quantity of which is determined by precipitation in combination with *sesquioxide of iron*, or otherwise. The CHLORINE is correctly determined by placing a small weighed portion in a *combustion-tube*, which is afterwards filled with fragments of *pure quicklime*. The lime is then brought to a red-heat, and the vapour of the liquid driven over it, when *chloride of calcium* is formed. The *contents of the tube*, when cold, are dissolved in *dilute nitric acid*, filtered, the chlorine precipitated by *nitrate of silver*, and the chlorine weighed under the form of *chloride of silver*. See *Organic Bodies*.

Uses, &c. Sulphur is extensively used in the manufacture of gunpowder, in bleaching, &c., &c. When swallowed it acts as a mild laxative and stimulating diaphoretic; and has hence been long taken in various chronic skin diseases, in pulmonary, rheumatic, and gouty affections, and as a mild purgative in piles, prolapsus ani, &c. *Externally*, it is extensively used in skin diseases, especially the itch, for which it appears a specific. *Dose.* 12 or 15 gr. to 2 dr., in sugar, honey, treacle, or milk.

Obs. According to Dr. J. Hannon, amorphous sulphur possesses properties of a very energetic kind, and approaches in activity to the alkaline sulphurets, without possessing any of their inconveniences. "Yellow sulphur very rarely succeeds against gout and rheumatism; but brown (amorphous) sulphur succeeds invariably; and in much smaller doses." He says it is obtained in the most active state by decomposing sulphuret of copper by aqua regiæ; observing to add the latter, until all the newly-formed sulphate has been dissolved, and changed into chloride of copper. The viscous sulphur floats on the surface of the fluid in the form of globules of different sizes, which are to be collected and washed. *Another plan* is to mix 2 parts of *nitrate of potassa* with 2 parts of *chloride of sodium*, and to add to the mixture 1 part of *sulphuret of copper*, obtained either directly or by precipitation; from this mixture there will result a viscous sulphur by adding *dilute sulphuric acid*, until no further effervescence takes place. The *dose* is 5 to 15 or 20 gr., made into pills with *balsam of tolu*.

SULPHUR (Bromide of). A reddish, oily-looking liquid, prepared by dissolving *sulphur* in *bromine*. It is easily decomposed, particularly by water.

SULPHUR (Chlorides of). 1. *Dichloride* or *Subchloride*. Prepared by passing *dry chlorine gas* over the surface of *sulphur* melted in a bulbed-tube or small retort connected with a well-cooled receiver. The *product* is a deep orange-yellow and very mobile liquid, which possesses a disagreeable odour, and boils at 280° Fahr.

2. *Chloride* or *Protochloride*. A red liquid, formed by exposing the *dichloride* for some time to the action of *chlorine*, and then distilling it in a stream of that gas. It sinks in water, and boils at 147° Fahr. (See *below*.)

3. *Chloride*, *Hypochloride*, or *Hypochlorite* of the shops; *Sulphuris Chloridum*, *S. Hypochloridum*, *S. Hypochloritis*,—Lat. This is prepared by spreading *washed sulphur* thinly on the bottom of a wooden box, or other chamber, and passing *chlorine gas*

slowly over it until it ceases to be absorbed.

Obs. This compound is of variable and undetermined constitution. It has been recommended for *internal use*, by Derksengi, in old gouty affections combined with pains in the stomach, and in severe nervous fever. *Dose.* ½ to 2 gr., dissolved in ether, and taken with old Hungary wine. It is also used *externally* in *psoriasis inveterata*, and other skin diseases.

SULPHUR (Hypochlorite of). See *above*.

SULPHUR (Iodide of). Syn. *Biniodide of Sulphur; Sulphuris Iodidum*,—Ph. L. *Sulphur Iodatum*,—Ph. D. *Prep.* Into a glass flask put 1 part of *sublimed sulphur*, and over it place 4 parts of *iodine;* insert the cork loosely, and place the flask in a *water bath;* as soon as its contents melt, stir them with a glass rod, replace the cork, remove the bath from the fire, and let the whole cool together. When cold, break the iodide into pieces, and place it in a wide-mouthed stoppered bottle. In this way a beautiful semi-crystalline, dark grey mass, resembling antimony, is obtained. The formulæ of the Ph. L. E. & D., Ph. U. S. & P. Cod., are essentially similar. The Ph. D. orders the two substances to be powdered and mixed before heating them.

Uses, &c. It is stimulant and alterative. An ointment made of it has been recommended by Biett and others in tuberculous affections of the skin, in lepra, psoriasis, lupus, porrigo, &c.

Iodide of sulphur stains the skin like iodine, and is readily decomposed by contact with organic substances. "From 100 gr. diligently boiled in water, a residue of about 20 gr. of sulphur is obtained." (Ph. L.)

SULPHURATION. The process by which silk, cotton, and woollen goods, straw plait, &c., are subjected to the fumes of burning sulphur, or sulphurous acid, for the purpose of bleaching or decolouring them. On the *large scale*, this is effected in closed apartments, called "*sulphuring rooms*," to which sufficient air only is admitted to keep up the slow combustion of the sulphur. On the *small scale*, as for straw hats, bonnets, &c., a large wooden chest is frequently employed in the same way.

SULPHURET. Syn. *Sulphide; Sulphuretum, Sulphidum*,—Lat. Sulphurets are compounds of sulphur with the electro-positive or inflammable bodies.

The *sulphurets* are *prepared* by—heating a *mixture* of the *metal* and *sulphur*, in equivalent proportions, in a covered crucible, —by igniting a mixture of the *metallic oxide* and *sulphur*,—by depriving a *sulphate of the base* of its oxygen, by igniting it in contact with *charcoal*,—or by precipitating a *salt of the base* by *sulphuretted hydrogen* or a *soluble metallic sulphuret*.

The *sulphurets* are mostly opaque, brittle fusible, semi-metallic bodies; those of *mercury* and *arsenic* are volatile, and those of the *alkalies* and the *earths* soluble in water.

The *sulphurets* often unite among themselves, forming crystallizable compounds analogous to salts, and, hence, termed *sulphosalts* by chemical writers.

The insoluble *sulphurets* may be either tested directly, by treating them with dilute sulphuric acid when they evolve sulphuretted hydrogen, or by converting their sulphur into sulphuric acid, in the manner noticed under *Sulphur*.

Nitroprusside of sodium has recently been proposed by Dr. Playfair as a most delicate test for the *alkaline sulphurets*, with which it strikes a most beautiful violet colour. This salt is prepared by treating 2 parts of *powdered ferrocyanide of potassium* with 5 parts of *common nitric acid*, previously diluted with its own volume of *water;* the solution, after effervesence has ceased, is digested by a gentle heat, until salts of protoxide of iron no longer yield with it a blue, but a slate-coloured precipitate; it is now allowed to cool, after which it is filtered, neutralized with *carbonate of soda*, and again filtered; the *filtrate*, on evaporation, gives a crystallization of nitrate of potassa and soda, together with the *new salt;* the *crystals of the latter* are then selected and purified by crystallization. They are rhombic, and of a splendid ruby colour. (The other *nitroprussides* are formed in a similar manner.)

SULPHURETTED HYDROGEN. See *page* 583.

SULPHURIC ACID. Syn. *Oil of Vitriol, Vitriolic Acid, Monohydrated Sulphuric Acid; Acidum Sulphuricum*,—Ph. L. & E. *Acidum Sulphuricum Venale*,——Ph. D. *Acidum Vitriolicum*,—Ph. L. 1788. This acid, in a concentrated form, was discovered by Basil Valentine towards the end of the 15th century. At first it was obtained by the distillation of green vitriol; but is now made by bringing the *fumes* arising from the slow combustion of *sulphur* into contact with those evolved from a *mixture* of *nitre* and *oil of vitriol*, so that the former becomes oxidized at the expense of the latter. The process is con-

ducted in a series of leaden chambers, having a *little water* on the floor, to absorb the acid, and so arranged as to prevent the loss of gas. As soon as the water, or rather liquid acid, has acquired the sp. gr. of 1·350 to 1·450, it is drawn off, and concentrated in *leaden boilers* to the density of 1·659 to 1·700; after which it is further concentrated in *green-glass* or *platinum retorts*, until the sp. gr. reaches 1·842 to 1·844. When cold, the clear acid is put into large globular bottles of green glass (*carboys*), surrounded with straw and basket work, and is sent into the market under the name of *oil of vitriol*.

Purif. Commercial sulphuric acid frequently contains *nitrous acid*, *arsenic*, and *saline matter*. The *first* of these may be removed by adding about 1½ gr. of *sugar* to each fluid ounce of the *acid*, heated to nearly its boiling point, and continuing the heat until the dark colour at first produced shall have disappeared, when it should be distilled; or ⅛ to ½ of 1% of *sulphate of ammonia* may be substituted for the sugar, and the acid heated to ebullition for a few minutes, by which the most impure acid may be rendered absolutely free from nitric acid and nitrous oxide. The ARSENIC may be got rid of by adding a little *sulphuret of barium*, or *copper-foil* to the acid, agitating the mixture well, and after repose decanting, and distilling it. SALINE MATTER may be removed by simple rectification. "The *distillation* is most conveniently conducted, on the *small scale*, in a *glass retort*, containing a few *platinum chips*, and heated by a *sand bath* or *gas flame*, rejecting the first ½ fl. oz. that comes over." (Ph. E.) In the new Ph. D., the *first tenth* of the *distillate* is ordered to be rejected, and the process to be stopped when no more than about 1 fl. oz. is left in the retort. According to Dr. Ure, the capacity of the retort should be from 4 to 8 times as great as the volume of the acid, and connected with a large tubular receiver, by a loosely fitting glass tube, 4 feet long and 1 to 2 inches in diameter. "The receiver should not be surrounded with cold water." We find that *fragments of glass*, or of *rock crystal*, may be advantageously substituted for platinum foil to lessen the explosive violence of the ebullition. Sulphuric acid, which has become *brown* by exposure, may be decolorized by heating it gently, the carbon of the organic substances being thus converted into carbonic acid.

Prop. Commercial sulphuric acid (*oil of vitriol*) is a colourless, odourless, acrid, and highly corrosive liquid, the general properties of which are well known. Its sp. gr. at 60° should never be *greater* than 1·8450, or *less* than 1·840. 1 fl. oz. *weighs* 14 dr. It is immediately coloured by contact with organic matter. It attracts water so rapidly from the atmosphere when freely exposed to it, as to absorb 1-3rd of its weight in 24 hours, and 6 times its weight in a few months. When 4 parts are suddenly mixed with 1 part of water, the temperature of the mixture rises to about 300° Fahr.; whilst 4 parts of pounded ice mixed with 1 part of acid sinks the thermometer to some degrees below zero. It freezes at about — 20°, and boils and distils over at 620° Fahr. It exhibits all the properties of the acids in an exalted degree. Its salts are called *sulphates*.

Pur. "Free from colour and odour. Sp. gr. 1·843. 100 gr. are saturated by 285 gr. of crystallized carbonate of soda." (Ph. L.) "What remains after the acid is distilled to dryness, does not exceed $\frac{1}{400}$th part of its weight. Diluted sulphuric acid is not discoloured by sulphuretted hydrogen." (Ph. L. 1836.) "Diluted with its own volume of water, only a scanty muddiness arises, and no orange fumes escape. Sp. gr. 1·840." (Ph. E.) The RECTIFIED ACID (*acidum sulphuricum purum*,—Ph. E. & D.) is "colourless; dilution causes no muddiness; solution of sulphate of iron shows no reddening at the line of contact when poured over it. Sp. gr. 1·845." (Ph. E.) Sp. gr. 1·846,—Ph. D.; 1·842,—Ure.

Tests.—See *Sulphate*.

Uses.—Sulphuric acid is much employed in the arts, and, from its superior affinity, to disengage most of the other acids from their saline combinations, in chemical processes. In the diluted state it is used in medicine. When swallowed, it acts as a violent corrosive poison. The antidotes are *chalk*, *whiting*, *magnesia*, *carbonate of soda*, or *carbonate of potash*, mixed with water, or any bland diluent, and taken freely, an emetic being also administered.

Estim. The *strength* of *sulphuric acid* is most correctly ascertained by its power of saturating bases. In *commerce* it is usually determined from its sp. gr. The *quantity* of *sulphuric acid present in a compound* may be determined by weighing it under the form of sulphate, as explained in a former part of this volume. See *Acidimetry* (and *below*).

TABLE *of the quantity of Oil of Vitriol and Dry Sulphuric Acid in* 100 *parts of the Dilute Acid at different Densities.* By Dr. URE.

SULPHURIC ACID (Alcoholized). Syn. *Eau de Rabel*,—Fr. *Acidum Sulphuricum Alcoholisatum*,—Lat. *Prep.* (P. Cod.) To *rectified spirit*, 3 parts; add, very gradually, *sulphuric acid*, 1 part. It is generally coloured by letting it stand over a little *cochineal*. Refrigerant, and, externally, escharotic. *Dose.* ½ fl. dr. to water, 1 pint; as a cooling drink in fevers, &c.

SULPHURIC ACID (Anhydrous). Syn. *Dry Sulphuric Acid; Acidum Sulphuricum sine Aquâ*,—Lat. *Prep.* 1. By heating *Nordhausen acid* in a glass retort connected with a well-cooled receiver.

2. (Barreswill.) 2 parts of the *strongest oil of vitriol* are *gradually* added to 3 parts of *anhydrous phosphoric acid*, contained in a retort surrounded by a *freezing mixture*; when the compound has assumed a brown colour, the retort is removed from the bath, and connected with a receiver which is set there in its place; a gentle heat is now applied to it, when white vapours pass over into the receiver and condense there under the form of beautiful silky crystals. The *product* equals in weight that of the phosphorus originally employed. "If a few drops of water be added, a *dangerous explosion* ensues."

Prop. White, silky, asbestos-like crystals; deliquesces rapidly and fumes in the air; put into water it hisses like a red-hot iron; it melts at 66°, and boils at about 105° Fahr.; it does not redden dry litmus paper; sp. gr. 1·97 at 78° Fahr.

SULPHURIC ACID (Aromatic). Syn. *Elixir of Vitriol, Acid do. do.; Acidum sulphuricum aromaticum*,—Ph. E. & D. *Prep.* 1. (Ph. E. & D.) *Oil of vitriol*, 3½ fl. oz.; *rectified spirit*, 1½ pint; mix, add of *powdered cinnamon*, 1½ oz.; *powdered ginger*, 1 oz.; digest for 6 days (7 days,—Ph. D.), and filter. Sp. gr. 0·974,—Ph. D.

2. (*Wholesale.*) From *compound tincture of cinnamon*, 1 gall.; *oil of vitriol*, 1 *lb.*; mix, and in a week filter. *Dose.* 10 to 30 drops, in the same cases as the dilute acid.

SULPHURIC ACID (Dilute). Syn. *Spirit of Vitriol; Acidum Sulphuricum Dilutum*,—Ph. L. E. & D. *A. Vitriolicum D.*,—Ph. L. 1788. *Spiritus Vitrioli Tenuis*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) Take of *sulphuric acid*, 15 fl. dr.; and dilute it gradually with *distilled water*, q. s. to make the whole exactly measure a pint. Sp. gr. 1·103. "1 fl. oz. of this acid is exactly saturated by 216 gr. of crystallized carbonate of soda."

2. (Ph. E.) *Sulphuric acid*, 1 fl. oz.; *water*, 13 fl. oz. Sp. gr. 1·090.

3. (Ph. D.) *Pure sulphuric acid*, 1 fl. oz.; *distilled water*, 13 *oz.* Sp. gr. 1·084.

4. (*Henry's.*) Sp. gr. 1·135. Has the same saturating power as his hydrochloric, and nitric acid. *Used* for assays.

Prop., &c. Antiseptic, tonic, and refrigerant. *Dose.* 10 to 30 drops, largely diluted with water, several times daily; in low typhoid fevers, passive hæmorrhages, profuse perspiration, in various skin diseases to relieve the itching, in dyspepsia, &c. It is also used *externally.*

SULPHURIC ACID (Nordhausen). Syn. *Fuming Sulphuric Acid; Acidum Sulphuricum Fumans,*—Lat. *Prep.* By distilling *calcined sulphate of iron* in an earthen retort. The *product* is a brown, oily liquid, which fumes in the air, is intensely corrosive, and has a sp. gr. about 1·900. It is chiefly *used* for dissolving indigo.

SULPHURIC ACID (Oxygenized). Formed by adding *sulphate of silver* to the *oxygenized hydrochloric acid* of Thénard, and afterwards precipitating a part of the sulphuric acid with *solution of baryta.* (See *p.* 17.)

SULPHURIC ETHER. See *page* 398.

SULPHUROUS ACID. Syn. *Acidum Sulphurosum,*—Lat. This acid is freely evolved in the gaseous form when *sulphur* is burnt in *air* or *dry oxygen;* and when the *metals* are digested in *hot sulphuric acid;* and, mixed with carbonic acid, when *charcoal, chips of wood, cork,* and *sawdust,* are treated in the same way.

Prep. 1. By the action of *sulphuric acid* on *clippings of copper* or *mercury* at a gentle heat. Pure.

2. (Berthier.) By heating, in a glass retort, a *mixture* of *black oxide of manganese,* 100 parts; and *sulphur,* 12 or 14 parts. Pure. The gas evolved should be collected over mercury, or received into water, when it forms *liquid sulphurous acid.*

3. (Redwood.) *Pounded charcoal,* ½ *oz.; oil of vitriol,* 4 fl. oz.; mix in a retort, apply the heat of a spirit lamp, and conduct the evolved gases by means of a bent tube into a bottle containing *water.* The *sulphurous acid* is absorbed, whilst the *carbonic acid gas* passes off.

Prop., &c. Water absorbs 30 times its volume of this gas. *Pure liquid sulphurous acid* can only be obtained by passing the *pure dry gas* through a glass tube surrounded by a powerful freezing mixture. Its sp. gr. is 1·45; boiling point 14° Fahr.; it causes intense cold by its evaporation. *Sulphurous acid* forms salts called *sulphites.*

Uses. To bleach silks, woollens, straw, &c., and to remove vegetable stains and iron-moulds from linen. For these purposes it is prepared from saw-dust or any other refuse carbonaceous matter.

SUMACH. This dye stuff is chiefly used as a substitute for galls. With a *mordant* of *acetate of iron,* it gives GRAY or BLACK; with *tin* or *acetate of alumina,* YELLOW; and with *sulphate of zinc,* a YELLOWISH BROWN; alone it gives a GREENISH FAWN-COLOUR.

SUMBUL. Syn. *Musk Root; Jatamansi.* A substance introduced to British medicine by Dr. A. B. Granville, in 1850. It occurs in circular pieces, varying from 1 to 3 or 4 inches in diameter; has a musk-like-odour, and a sweet balsamic taste. It acts as a powerful stimulant, especially of the nervous system. In India and Persia it has long been used as a medicine, a perfume, and as incense. *Dose.* 15 gr. to 1 dr., either masticated, or made into an infusion, electuary, or tincture; in cholera, hysteria, neuralgia, epilepsy, low fevers, and various other spasmodic and nervous disorders.

SUMMER DRINKS. See *Lemonade, Sherbet, &c.*

SUN PAINTING. Syn. *Heliography, Heliotype, Photography, Phototype, &c.* Names which apply to the production of pictures upon any medium by means of light; but principally to those on paper. Those on metal are distinguished by the name of their inventor, Daguerre. The methods of obtaining pictures in this way essentially consist in coating or saturating any surface with a material the chemical constitution of which is easily affected by the rays of light, exposing it in this state in the camera obscura; then "fixing" or developing the picture so formed by appropriate reagents; and, lastly, when necessary, removing or dissolving off the undecomposed sensitive medium from the surface of the paper or plate. The minutiæ of the different processes vary much from each other, but in all, considerable experience and tact in manipulating is essential to *great* success in their application. No real difficulty, however, exists in any of them.

The limits of this work will not permit us to describe the *processes* of the *Daguerreotype* and the numerous *methods* of *photography* now practised, as we first intended. Mere names and quantities, without very full and explicit directions, would prove useless to the reader. We must, therefore, refer him to the various little treatises published on the subject by Messrs. Knight & Son, and others, in which the details are minutely explained. The same remarks apply to the *solutions* and *other preparations*

used in *photography*, the strength of which are regulated by the *particular process* which they are intended for, and the immediate effect to be produced.

SUPER-. See *Nomenclature.*

SUPPER. The evening meal; the last meal of the day. *Supper* is generally an unnecessary meal, and when either heavy, or taken at a period not long before that of retiring to rest, proves nearly always injurious, preventing sound and refreshing sleep, and occasioning unpleasant dreams, night-mare, biliousness, and all the worst symptoms of imperfect digestion. Cases of sudden death during sleep, arising from the stomach being overloaded with undigested food, are far from rare. The *last meal* of the day should be taken at least *three hours* before bedtime. Even when it consists of some "trifle," as a sandwich or biscuit, an interval of at least *an hour* should elapse before retiring to rest. In this way restlessness and unpleasant dreams will become rare. See *Meals, Watchfulness, &c.*

SUPPOSITORY. Syn. *Suppositorium*, —Lat. A medicine placed in the rectum for the purpose of remaining there, and dissolving gradually. The mode of proportioning the doses has been noticed in the article *Enema.*

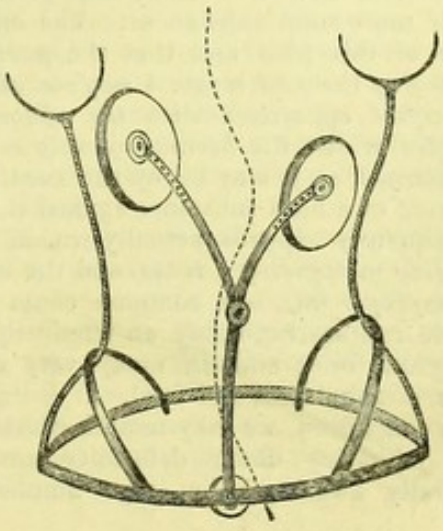
SUPPOSITORY (for Piles). Syn. *Suppositorium Hæmorrhoidale, S. Sedativum*, —Lat. *Prep.* 1. *Powdered opium*, 2 gr.; *finely-powdered galls*, 10 gr.; *spermaceti cerate*, 1 dr.

2. (Ellis.) *Powdered opium*, 2 gr.; *soap*, 10 gr; mix.

3. (Richard.) *Extracts of opium* and *stramonium*, of each, 1 gr.; *cocoa nut butter*, 2 dr. *Used* when the piles are very painful.

SUPPOSITORY (Purgative). Syn. *Suppositorium Catharticum*,—Lat. *Prep.* 1. *Soap*, 1 dr.; *elaterium*, 1 to 2 gr.; mix. As a strong purge.

2. (Niemann.) *Soap*, 2 dr.; *common salt*, 1 dr.; *honey*, q. s.; mix. As a mild cathartic.



SUPPOSITORY (Resolvent). Syn. *Suppositorium Resolvens*,—Lat. *Prep.* (Stafford.) *Iodide of potassium*, 3 to 4 gr.; *extracts of henbane* and *hemlock*, of each, 6 gr. In enlargement or induration of the prostate gland.

SUPPOSITORY (Sedative). See *above.*

SUPPOSITORY (Vermifuge). Syn. *Suppositorium Anthelminticum, S. Vermifugum*, —Lat. *Prep.* (Swediaur.) *Aloes*, 4 dr.; *common salt*, 3 dr.; *flour*, 2 dr.; *honey*, q. s., to make a stiff mass; divide into proper-shaped pieces weighing about 15 gr. each. One to be used after each motion.

SURGERY (Popular). Under this head we proposed, in a collective form, briefly to refer to certain matters which commonly fall under the care of mothers, nurses, &c.; or, which it may be useful to emigrants, and to persons residing in "out of the way" localities to be able to attend to. Much that we had prepared on this subject (as in the case of *sun painting*, and various other heads), we are compelled to omit, in order to bring our book within the limits which our publisher, no doubt judiciously, deems desirable for the work. We must, therefore, content ourselves with referring the reader to the various useful remarks connected with the subject which lie scattered through this volume, as well as to those below.

Deformities arise from various causes. Sometimes the parties are born with them; at other times they arise from violence; but, more frequently, perhaps, from debility or disease, either natural, or the result of mismanagement in infancy and childhood. Of these, deformities of the spine are usually the most difficult of cure, and the most distressing in their consequences. The only useful mode of *treatment*, in these cases, appears to consist in the *judicious application* of *mechanical means*, assisted by the usual *medical efforts* to restore or improve the general health. Among "*spinal appliances*" no apparatus is better calculated to effect the object in view, than that which has for its action the *gradual* reduction of the several prominences (*arcs of curve*), and the consequent rectification of the vertebral column. The mechanical principle known as the "rack and pinion" appears more particularly adapted to this purpose, by admitting of a *gradual* increase of the rectifying power, entirely at the will of the medical attendant and the patient. A greatly improved apparatus of this discription is shown in the *Engraving.*

It *consists* of *two metal uprights* upon which the arms rest: a *band* that passes around the pelvis, and is secured to the hips by semicircular pieces of light metal: from the back of this band is affixed a *steel stem* with a *pad* at the upper end, and having its point of motion at the pelvic band, but, unlike the ordinary apparatus, it is in *one piece*, and *curved rather sharply* in its centre, from which another point of motion is established by means of a *second stem* and *plate* resting against the opposite side. The *conjoined motion* of the two resembles the *closing of a pair of scissors*, and acting in opposite directions, *gradually*, but *surely*, depresses the arc of each curve, as required, and produces a straightened or normal condition of the spine.

Rupture or *hernia*, as commonly met with, is the protrusion of some of the viscera of the abdomen out of that cavity into a kind of sac, composed of the portion of the peritonæum which is pushed before them. When the protrusion may be returned by pressure into the abdomen, it is called a *reducible hernia*; and when the contrary is the case, *irreducible hernia*. Where the protrusion is not only irreducible, but the contents of the sac suffer constriction, so that their passage towards the anus is arrested, a train of the most alarming and often fatal symptoms ensue, and the affection is called *strangulated hernia*. For the *relief* of *ordinary cases* of *rupture* the patient has recourse to a *truss*, which is an apparatus which, perhaps, more than any other, it is highly important to have so constructed as not only to avoid unnecessary pressure upon the abdominal surface, but likewise to guard against the dilation of the hernial aperture in the attempt to apply a remedy. This *desideratum* is remarkably well secured by a *truss* which we have recently examined, wherein a *layer of sand* acts as a support, in lieu of that usually given by much more solid substances. The *advantages* of this plan are, that the *particles composing the pad* create a *surface always in perfect apposition with the abdominal parietes*, whilst the *hernial opening cannot be enlarged*, as it may be by the continued pressure of a hard substance against it, and, as frequently happens, actually within it.

Delay in *applying a truss*, and the *use* of an *improper one*, is a common cause of a simple rupture becoming an irreducible or dangerous one; and, in many, very many cases, strangulated, and fatal.

In conclusion, we may remark, that persons labouring under deformity are not generally aware of the large number of ingenious contrivances of a mechanical character which have been produced of late years for removing or alleviating their misfortunes. The profession, and their patients who are thus afflicted, would do well to inspect for themselves the various manufactures of Mr. Heather Bigg, of 29, Leicester Square, the inventor of the *spinal appliance* and *truss* above refered to, who has recently visited the orthopædic establishments of Germany and France, for the express purpose of rendering himself acquainted with the most recent inventions employed in *mechanical surgery*.

SURINAMINE. A crystallizable substance obtained from the *bark* of *Geoffroya Surinamensis*, or *Surinam bark*.

SWALLOW. Three or four species of *hirundo* (Linn.) pass under this name. It was once held in great repute in medicine. Even the *excrement* was included among the simples of the Ph. L. 1618. The swallow is an insectivorous bird, but, like the sparrow and rook, is much persecuted for its good services. It has been calculated, that directly and indirectly, a single swallow is the humble means of lessening the race of one kind of insect alone to the extent of 560,970,489,000,000,000 of its race in one year.

SWEET BALLS. *Prep.* Take of *Florentine orris root*, 3 *oz.*; *cassia*, 1 *oz.*; *cloves*, *rhodium-wood*, and *lavender flowers*, of each, ½ *oz.*; *ambergris* and *musk*, of each, 6 gr.; *oil of verbena*, 10 or 12 drops; beat them to a paste, form this into balls with *mucilage of gum tragacanth* made with *rose-water*, pierce them whilst soft with a needle, and when they are quite dry and hard, polish them. *Worn in the pocket* as a *perfume*. Some persons varnish them, but that keeps in the smell. See *Scent Balls*, *Scented Cassolettes*, &c.

SWEET BAY. Syn. *Laurel; Laurus Nobilis*,—Linn. The *fruit* (*lauri baccæ; laurus*,—Ph. L.) as well as the *leaves* (*lauri folia*) are reputed aromatic, stimulant, and narcotic. They were formerly very popular in coughs, colic, hysteria, suppressions, &c.; and, *externally*, in sprains, bruises, &c.

SWEETS. Home-made wines; British wines.

SWEETBREAD. The thymus gland of the calf. When boiled it is light and digestible; but when highly dressed and seasoned, it is improper both for dyspeptics and invalids. (Pereira.)

SWEETMEATS. Under this head are properly included confections, candies, and preserves, in sugar; but, as generally em-

ployed, the word embraces all the sweet compounds of the confectioner.

Sweetmeats, as well as *cakes*, *blancmange*, and *jellies*, are not unfrequently coloured with deleterious substances, the consequences of which are always pernicious, and, in many instances, have proved fatal. *Gamboge*, a drastic cathartic; *chrome yellow*, *red lead*, *orpiment*, *emerald green*, and various other pigments containing lead, arsenic, copper, or other poisons, have been thus employed. The whole of these may be readily detected by the *tests* and *characteristics* appended to their respective names. The *colours* and *stains* which may be safely employed to increase the beauty of these articles, are noticed under *Stains* and *Liqueurs*.

SWINE POX. See *page* 1067.

SYCOSIS. An obstinate tubercular eruption, which chiefly attacks the scalp and part of the face covered by the beard, more especially the chin. The *treatment* is the same as for *acne*, of which it is a variety.

SYDENHAM'S LENITIVE. *Prep.* Take of *rhubarb* (recently grated or powdered), 3 dr.; *tamarinds*, 2 oz.; *senna*, ½ oz.; *coriander seeds* (bruised), 2 dr.; *boiling water*, 1 pint; macerate for 3 hours in a covered vessel, and strain. An excellent stomachic and laxative. *Dose.* ½ to 1 wine-glassful.

SYLVIC ACID. Syn. *Silvic Acid*. The portion of *common resin* or *colophony* which is the most readily soluble in cold alcohol. It is extracted by *weak alcohol*, and purified by solution in *strong* alcohol. It crystallizes in small, colourless, rhombic prisms; is freely soluble in hot strong alcohol, volatile oils, and ether; and is *distinguished* from *pinic acid* by its insolubility in cold alcohol of the sp. gr. 0·883. With alkalies it forms salts called *sylvates*, which are soluble in both alcohol and ether.

SYMBOLS. In *chemistry*, are representations of one atom or equivalent of each of the elementary, or pseudo-elementary bodies, by the capital initial letter or letters of their Latin names. As C, for *carbon*; Fe. (ferrum), *iron*; O, *oxygen*, &c. *Chemical formulæ* are combinations and arrangements of these symbols, to show the composition of bodies, and the changes which they undergo in their various combinations and decompositions. The *symbols* and *formulæ* of *bodies*, both simple and compound, are inserted in all complete "*tables of equivalents*."

SYMPATHETIC INK. See *page* 627.

SYNAPTASE. Syn. *Emulsine*. The name given by Robiquet to the *emulsine*, or *vegetable caseine*, which forms a large proportion of the white pulp of both the bitter and sweet *almond*. It possesses the remarkable property of converting *amygdaline*, in the presence of water, into *hydrocyanic acid* and the *essential oil of bitter almonds*. 100 gr. of *amygdaline* yield, under the influence of *synaptase* and *water*, 47 gr. of *raw oil*, and 5·9 gr. of *anhydrous hydrocyanic acid*. (Liebig.)

SYNCOPE. See *Fainting*.

SYNOCHA. See *Fever*.

SYRINGINE. See *Lilacine*.

SYPHILIS. A well-known contagious disease, characterised by symptoms too numerous and delicate to be usefully described here. In all cases in this, as well as in other kindred affections, the assistance of a skillful surgeon should be promptly sought.

SYRUP. Syn. *Sirup*, *Sirop*; *Syrupus*, —Lat. A saturated, or nearly saturated solution of sugar in water, either simple, flavoured, or medicated.

In the *preparation* of *syrups* care should be taken to employ the *best refined sugar*, and either *distilled water* or *filtered rain water*; by which they will be rendered much less liable to spontaneous decomposition, and will be perfectly transparent, without the trouble of clarification. When *inferior sugar* is employed, *clarification* is always necessary. This is best done by dissolving the sugar in the water, or other aqueous menstruum, *in the cold*, and then beating up a *little* of the *cold syrup* with some *white* of *egg*, and an ounce or two of *cold water*, until the mixture *froths well*; this must be added to the *syrup in the boiler*, and the whole "whisked up" to a good froth; heat should now be applied, and the *scum* which forms, removed from time to time with a clean "skimmer." As soon as the syrup begins to slightly simmer it must be removed from the fire, and allowed to stand until it has cooled a little, when it should be again skimmed, if necessary, and then passed through *clean flannel*. When *vegetable infusions* or *solutions* enter into the *composition* of *syrups*, they should be rendered perfectly transparent by filtration or clarification, before being added to the sugar.

The *proper quantity* of *sugar* for *syrups* will, in general, be found to be 2 *lb.* (avoir.) to every imperial pint of *water* or *thin aqueous fluid*. These proportions, allowing for the water that is lost by evaporation during the process, are those best calculated to produce a syrup of the proper consistence, and possessing good "keeping

qualities." They closely correspond to those recommended by Guibourt for the production of a *perfect syrup*, which, he says, consists of 30 parts of *sugar* to 16 parts of *water*.

In the *preparation* of *syrups* it is of great importance to employ as little heat as possible, as a solution of sugar, even when kept at the temperature of boiling water, undergoes slow decomposition. The *plan* which we adopt, is to pour the *water* (cold) over the *sugar*, and to allow the two to lie together for a few hours, in a covered vessel, occasionally stirring, and then to apply a *gentle heat* (preferably that of steam or a water-bath) to finish the solution. Some persons (falsely) deem a syrup ill prepared unless it has been allowed to boil well; but if this method be adopted, the ebullition should be only of the gentlest kind (*simmering*), and should be checked after the lapse of 1 or 2 minutes.

When it is necessary to *thicken* a *syrup* by *boiling*, a few *fragments of glass* should be introduced, in order to lower the boiling point.

To make *highly transparent syrups*, the *sugar* should be in a single lump, and by preference taken from the *bottom* or *broad end* of the loaf; as, when taken from the smaller end, or if it be powdered or bruised, the syrup will be more or less cloudy.

Syrups are *judged*, by the laboratory man, to be *sufficiently boiled*, when some taken up in a spoon pours out like oil; or, a drop cooled on the thumb-nail gives a proper "*thread*" when touched. When a thin skim appears on blowing upon the syrup, it is judged, by the same party, to be completely saturated. These rude tests often lead to errors, which might be easily prevented by employing the proper proportions, or determining the sp. gr.

A *fluid ounce* of *saturated syrup* weighs 577½ gr.; a *gallon* weighs 13⅛ *lb.* (avoir.); its sp. gr. is 1·319 to 1·321, or 35° of Baumé's aerometer; its *boiling point* is 221° Fahr., and its density at the temperature of 212° is 1·260 to 1·261, or 30° Baumé. The *syrups* prepared with the *juices of fruits*, or which contain much *extractive matter*, as those of sarsaparilla, poppies, &c., mark about 2° or 3° more on Baumé's scale than the other syrups.

In most pharmaceutical works directions are given to *completely* saturate the water with sugar. Our own experience, which is extensive, leads us to disapprove of such a practice, since we find, that, under all ordinary circumstances, a syrup with a *very slight excess* of water keeps better than one fully saturated. In the latter case, a portion of sugar generally crystallizes out on standing, and thus, by abstracting sugar from the remainder of the syrup, so weakens it, that it *rapidly ferments* and *spoils*. This change proceeds at a rapidity proportionate to the temperature. *Saturated syrup* kept in a vessel that is frequently *uncorked* or exposed to the air soon loses sufficient water, by evaporation from its surface, to cause the formation of minute crystals of sugar, which falling to the bottom of the vessel, continue to increase in size at the expense of the sugar in the solution. We have seen a single 6-gallon stone bottle, in which syrup has been kept for some time, the inside of which, when broken, has been found to be entirely cased with sugar-candy, amounting in weight to 16 or 18 *lb.* *On the other hand*, *syrups* containing *too much water* also rapidly ferment, and become acescent; but of the two, this is the less evil, and may be more easily prevented. The proportions of sugar and water given above will form an excellent syrup, provided care be taken that an undue quantity be not *lost by evaporation*.

The *decimal part* of the *number denoting the sp. gr. of a syrup*, multiplied by 26, gives the *number of pounds of sugar* it contains per gallon, very nearly. (Ure.)

In *boiling syrups*, if they appear likely to *boil over*, a little *oil*, or rubbing the edges of the pan with *soap*, will prevent it.

Syrups may be *decoloured* by *agitation* with, or *filtration* through, *recently burnt animal charcoal*. (See *p.* 321.) *Medicated syrups*, should not, however, be treated in this way.

The *preservation* of *syrups*, as well as of all other saccharine solutions, is best promoted by keeping them in a *moderately cool*, but *not* a *very cold* place. "Let syrups be kept in vessels well closed, and in a situation where the temperature never rises above 55° Fahr." (Ph. L.) They are better kept in *small*, rather than in *large* bottles, as the longer a bottle lasts, the more frequently it will be opened, and, consequently, the more it will be exposed to the air. By *bottling syrups* whilst *boiling hot*, and immediately corking down and tying the bottles over with bladder perfectly air-tight, they may be preserved, even at a summer heat, for years without fermenting, or losing their transparency.

The "*candying*," or *crystallization* of *syrup*, unless it be oversaturated with sugar, may be prevented by the addition of a little *acetic* or *citric acid* (2 or 3 dr. per gall.)

The *fermentation* of *syrups* may be effec-

tually *prevented* by the addition of a little *sulphite of potassa* or of *lime*. *Chlorate of potassa* has been proposed for this purpose by Dr. Macculloch, on theoretical grounds. M. Chereau recommends the addition of some (about 3 to 4%) *sugar of milk*, with the same intention. Mr. Durand asserts that by adding about 1 fl. dr. of *Hoffmann's anodyne* to each pint of *syrup*, the accession of fermentation may not only be prevented, but arrested when it occurs. *Fermenting syrups* may be immediately restored by exposing the vessel containing them to the temperature of *boiling water*. The addition of a little *spirit* is ordered in the new London Pharmacopœia.

In making the above additions to syrup, care must be had not to mix incompatible substances. Thus, in general, the two methods referred to, cannot be practised together.

Syrup is, perhaps, the worst possible form of medicine, owing to the difficulty of accurately saturating it with active medicinals, and its liability to change. Few persons think that "sweetness renders a nauseous drug more palatable."

The *following formulæ* embrace all the *syrups* (syrupi) which are *officinal* in these countries. Those not included in the list may be easily made by adding to *simple syrup* a *concentrated infusion* or *solution of the particular substance*, or of its *extract* dissolved in, or rubbed down with a little *water* or *spirit*, in such proportion that the dose of the compound may range from 1 to 3 fl. dr.

SYRUP (Acetate of Morphia). Syn. *Syrupus Morphiæ Acetatis*, — Lat. *Prep.* (Ph. D.) *Solution of acetate of morphia*, 1 fl. oz.; *simple syrup*, 15 fl. oz.; mix. Each fl. oz. contains ¼ gr. of acetate. *Dose.* ½ to 2 teaspoonfuls.

SYRUP (Almond). Syn. *Barley Syrup, Orgeat; Sirop d'Orgeat; Syrupus Amygdalæ*, —Lat. *Prep.* 1. *Sweet almonds*, 1 *lb.*; *bitter almonds*, 1 *oz.*; blanch, beat them to a smooth paste, and make an emulsion with *barley water*, 1 quart; strain, to each pint add of *sugar*, 2 *lb.*, and a table-spoonful or two of *orange-flower water*; put the mixture into small bottles, and preserve it in a cool place. Some persons add a little brandy.

2. (Ph. Bor.) *Sweet almonds*, 8 oz.; *bitter almonds*, 2 oz.; blanch them, after cold maceration, then beat them in a marble mortar, with a wooden pestle to a paste, adding, gradually, of *water*, 16 fl. oz.; *orange-flower water*, 3 fl. oz.; after straining through flannel, dissolve 3lb of *sugar* in each pint of the emulsion. An agreeable pectoral and demulcent.

SYRUP (Buckthorn). Syn. *Syrupus Rhamni*,— Ph. L. & E., & Ph. D. 1826. *Syr. Rhamni Cathartici*, — Ph. E. 1817. *Syr. Spinæ Cervinæ*,—Ph. L. 1788. *Syr. de Spinâ Cervinâ*,—Ph. L. 1720. *Prep.* 1. (Ph. L.) *Juice of buckthorn*, defecated by 3 days' repose, 2 quarts; *ginger* and *allspice* of each (bruised), 6 dr.; macerate the spice in 1 pint of the juice at a gentle heat for 4 hours, and filter; boil the remainder of the juice to 1½ pint, mix the liquors, dissolve therein of *white sugar*, 6lb; and add to (the nearly cold) syrup 6 fl. oz. of *rectified spirit*. In the Ph. E. the spirit is omitted.

2. (*Wholesale.*) *a.* Take of *buckthorn juice*, 3 gall.; *bruised pimento* and *ginger* (sifted from the dust), of each, ½ *lb.*; simmer for 15 minutes, strain, and add of *sugar*, 44 *lb.*

b. Take of *buckthorn juice*, 3 gall.; boil to 2 gall., add of *bruised pimento* and *ginger gruffs* (free from dust), of each, ¾ *lb.*; boil to 1 gall., strain, add *molasses*, 72 *lb.*; and finish the boiling.

Obs. Syrup of buckthorn is a brisk but unpleasant cathartic. It is now chiefly used in veterinary practice. *Dose.* ½ fl. oz. to 1 fl. oz. Should the *colour* be *dull*, the addition of a few gr. of *citric* or *tartaric acid* will brighten it.

SYRUP (Capillaire) Syn. *Syrup of Maiden-hair; Syrupus Adianthi, Syrupus Capillorum Veneris*,—Lat. *Capillaire, Sirop de Capillaire*,—Fr. *Prep.* (P. Cod.) *Canadian maiden-hair* (adiantum pedatum,—*Linn.*), 4 oz.; *boiling water*, 2½ pints; infuse, strain, add of *white sugar*, 5 lb; and pour the boiling clarified syrup over 2 oz. more of maiden-hair; re-infuse for 2 hours, and again strain. (See *Capillaire.*)

Obs. Demulcent. Clarified syrup flavoured with *orange-flower water* or *curaçoa* is now commonly sold for *capillaire*. It is usually "put up" in small bottles of a peculiar shape, known in the trade as "*Capillaires.*" It is now chiefly used to sweeten and flavour grog. (See *p.* 199.)

SYRUP (Citric Acid). Syn. *Syrupus Acidi Citrici*, — Ph. D. *Prep.* (Ph. D.) Take of *citric acid* (in powder), and *distilled water*, of each, 2½ *oz.*; dissolve, add the solution together with *tincture of lemon-peel*, 5 fl. dr., to *simple syrup*, 3 pints; and mix with agitation. An agreeable refrigerant. *Used* for sweetening barley-water, &c., and for flavouring water to be used as a beverage in fevers and other inflammatory diseases.

SYRUP (Cochineal). Syn. *Syrupus Coc-*

cinellæ; Syrupus Cocci, — Ph. L. *Prep.* (Ph. L.) Take of *cochineal* (bruised), 80 gr.; *boiling distilled water*, 1 pint; boil for 15 minutes in a closed vessel, strain, and add of *sugar*, 3 lb, or twice that of the strained liquor; lastly, when the syrup has cooled, add of *rectified spirit*, 2½ fl. oz, or ½ *fl. dr.* to *each fl. oz.* of *syrup*. *Used* as a colouring syrup, and often sold for syrup of clove-pinks.

SYRUP (Coltsfoot). Syn. *Syrupus Tussilaginis,* — Lat. *Prep.* (P. Cod.) *Flowers of coltsfoot*, 1 lb; (or *dried flowers*, 2 oz.;) *boiling water*, 2 lb; macerate for 12 hours; strain, press, filter, and add of *white sugar*, 4 lb. A popular remedy in coughs, cold, &c. *Dose.* 1 to 2 table-spoonfuls, ad libitum.

SYRUP (Cream). *Finely powdered lump sugar* mixed with an equal weight of *fresh cream.* It will keep for a long time if put into bottles, and closely corked and sealed over. It is commonly placed in 2 *oz.* wide-mouthed phials, and taken on long voyages, a fresh phial being opened at every meal.

SYRUP (Empyreumatic). Treacle.

SYRUP (Ether). Syn. *Sirop d'Æther,* — Fr. *Syrupus Ætheris, Syr. Æth. Sulphurici,*—Lat. *Prep.* (P. Cod.) *Sulphuric ether*, 1 part; *white* (simple) *syrup*, 16 parts; place them in a glass vessel having a tap at the bottom, shake them frequently for 5 or 6 days, and then draw off the clear syrup into small bottles. *Dose.* ½ to 3 fl. dr.

SYRUP (Ginger). Syn. *Syrupus Zingiberis,*—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Bruised ginger*, 2½ oz.; *boiling water*, 1 pint; macerate for 4 hours, strain, and add of *white sugar*, 2½ lb, or q. s.; and *rectified spirit*, as directed for *syrup of cochineal.* The Ph. E. omits the spirit.

2. (Ph. D.) *Tincture of ginger*, 1 fl. oz.; *simple syrup*, 7 fl. oz.; mix. Stimulant and carminative. Chiefly used as an adjuvant, in mixtures.

SYRUP (Gum). Syn. *Syrupus Acaciæ,* —Lat. *Sirop de Gomme,* — Fr. *Prep.* (P. Cod.) Dissolve *pale* and *picked gum arabic* in an equal weight of *water*, by a gentle heat, add the *solution* to *four times* its weight of *simple syrup*, simmer for 2 or 3 minutes, remove the scum, and cool. A pleasant demulcent. The addition of 1 or 2 fl. oz. of *orange-flower water* to each pint, greatly improves it.

SYRUP (Hive). See *page* 1211.

SYRUP (Horehound). Syn. *Sirop de Prassio; Syrupus Marubii,*— Lat. *Prep.* 1. (P. Cod.) *Dried horehound*, 1 oz.; *horehound water*, 2 lb; digest in a water bath for 2 hours, strain, and add of *white sugar*, 4 lb.

2. *White horehound* (fresh), 1 *lb.; boiling water*, 1 gall.; infuse for 2 hours, press out the liquor, filter, and add of *sugar*, q. s.

Obs. A popular remedy in coughs and diseases of the lungs. *Dose.* A table-spoonful, ad libitum. "It is sold for any syrup of herbs that is demanded, and which is not in the shop." (Gray.)

SYRUP (Hydrochlorate of Morphia). See *page* 1209.

SYRUP (Indian Sarsaparilla). Syn. *Syrupus Hemidesmi,*—Ph. D. *Prep.* (Ph. D.) *Indian sarsaparilla* (hemidesmus Indicus,—Brown), bruised, 4 *oz.; boiling water*, 1 pint; infuse for 4 hours, and to the strained and defecated infusion, add twice its weight of *sugar.* Tonic, diuretic, &c. *Dose.* 2 to 4 fl. dr.; in nephritic complaints, and in some others, instead of sarsaparilla.

SYRUP (Iodide of Iron). Syn. *Syrupus Ferri Iodidi,* — Ph. L. E. & D. *Prep.* (Ph. L.) Mix *iodine*, 1 oz.; and *iron wine*, 3 dr.; with *distilled water*, 8 fl. oz.; and heat the solution until it assumes a greenish colour, then strain it, evaporate it to about 4 fl. oz.; and add to it of *white sugar*, 10 oz.; lastly, when the syrup has cooled, add as much *water* as may be necessary, that it may measure exactly 15 fl. oz., and keep it in a well-stoppered black glass bottle. The formulæ of the Ph. E. & D. are nearly similar, a fl. dr. of each containing about 5 gr. of the pure dry iodide.

Obs. This syrup is tonic and resolvent, and hæmatinic. *Dose.* 15 or 20 drops to 1 fl. dr.; in anæmia, debility, scrofula, &c. It should be perfectly transparent and colourless, or at most only of a very pale green tint, and should be without sediment even when exposed to the air. (Ph. E.) Before the publication of the new Ph. L. a syrup containing only 3 gr. of *dry iodide* per fl. dr. was usually employed in this country, and is still sent out by many houses.

SYRUP (Ipecacuanha). Syn. *Syrupus Ipecacuanhæ,*—Lat. *Prep.* (Ph. E.) *Ipecacuanha* (in coarse powder), 4 oz.; *rectified spirit*, 15 fl. oz.; digest for 24 hours at a gentle heat, and strain; add of *proof spirit*, 14 fl. oz., and again digest and strain; and *repeat* the *process* with *water*, 14 fl. oz.; distil off the spirit from the mixed liquors, evaporate to 12 fl. oz., and filter; next add to the residuum, *rectified spirit*, 5 fl. oz., and *simple syrup*, 7 pints; and mix well. *Dose.* As an emetic for *infants*, ½ tea-spoonful; for *adults*, 1 to 1½ fl. oz.; as an *expectorant*, 1 to 3 tea-spoonfuls.

SYRUP (Lemon). Syn. *Syrupus Li-*

monum,—Ph. L. & E. *Syrupus Citri Medicæ*, —Ph. E. 1839. *Syrupus Limonis*,—Ph. D. 1826. *Prep.* (Ph. L.) *Lemon juice* (strained or defecated), 1 pint; *white sugar*, 2½ lb; dissolve by a gentle heat, and set it aside; in 24 hours remove the scum, decant the clear portion, and add of *rectified spirit*, 2½ fl. oz. The Edinburgh College omits the spirit.

Obs. A pleasant refrigerant syrup in fevers, &c. *Dose.* 1 to 4 fl. dr. in any diluent. With water it forms an excellent extemporaneous lemonade.

SYRUP (Marshmallow). Syn. *Syrupus Althææ*,— Ph. L. & E., & Ph. D. 1826. *Prep.* 1. (Ph. L.) *Marshmallow root*, fresh and sliced, 1½ oz.; *distilled water* (cold), 1 pint; macerate for 12 hours, press out the liquor, strain it through linen, and add to the strained liquor twice its weight of *white sugar* (about 3 lb); dissolve by a gentle heat, and when cold add of *rectified spirit*, 2½ fl. oz., or q. s. (See *Syrup of Cochineal.*)

2. (Ph. L. 1836.) Take of *fresh marshmallow root*, bruised, 8 oz.; *water*, 4 pints; boil down to one half, and express the liquor when it is cold; set it aside for 24 hours, that the fæces may subside, then decant off the clear liquid, and, having added to it of *sugar*, 2½ lb, boil the whole to a proper consistence. The formulæ of the Ph. E. is similar.

Obs. This is a popular demulcent and pectoral. *Dose.* 1 to 4 fl. dr.; in coughs, &c., either alone or added to mixtures.

SYRUP (Mulberries). Syn. *Syrupus Mori*, — Ph. L. *Prep.* (Ph. L.) *Juice of mulberries*, strained, 1 pint; *sugar*, 2½ lb; dissolve by a gentle heat, and set the solution by for 24 hours; then remove the scum, decant the clear liquid, and add of *rectified spirit*, 2½ fl. oz. *Used* as a colouring and flavouring, when alkalies and earths are not present. Syrup of red poppies (*rhœados*) slightly acidulated with *tartaric* or *dilute sulphuric acid*, is very generally sold for it.

SYRUP (Muriate of Morphia). Syn. *Syrup of Hydrochlorate of Morphia; Syrupus Morphiæ Muriatis*,—Ph. D. *Prep.* (Ph. D.) *Solution of muriate of morphia*, 1 fl. oz.; *simple syrup*, 17 fl. oz.; mix. Each fl. oz. contains ¼ gr. of the muriate. *Dose.* ½ to 2 tea-spoonfuls.

SYRUP (Orange-peel). Syn. *Syrupus Aurantii*,—Ph. L. E. & D. *Syr. Citri Aurantii*, — Ph. E. 1817. *Syr. è Corticibus Aurantiorum*, — Ph. L. 1746. *Prep.* 1. (Ph. L.) *Dried orange-peel*, 2½ oz.; *boiling distilled water*, 1 pint; macerate for 12 hours in a covered vessel, press out the liquor, simmer it for 10 minutes, and then complete the process as directed for *syrup of cochineal.* In the Ph. E. & D., & Ph. L. 1836, no spirit is ordered.

2. (*Wholesale.*)—*a.* From *fresh orange-peel*, 18 *oz.* (or dried, ¾ *lb.*); *sugar*, 18 *lb.*; *water*, q. s.

b. From *tincture of orange-peel*, 1 fl. oz.; *simple syrup*, 19 fl. oz.; mix. An agreeable flavouring and stomachic. *Dose.* 1 to 4 fl. dr.

SYRUP (Poppies). Syn. *Syrup of White Poppies; Syrupus Papaveris*,—Ph. L. & E., & Ph. D. 1826. *Syr. P. Albi*,—Ph. D. 1807, & Ph. L. 1788. *Syr. P. Somniferi*,—Ph. E. 1817. *Syr. de Meconio*, or *Diacodium*,— Ph. L. 1721. *Prep.* 1. (Ph. L.) *Poppy-heads*, dried, bruised, and without the seeds, 3 lb; *boiling water*, 5 gall.; boil down to 2 gall., press out the liquor, evaporate the expressed liquid to 2 quarts, strain it whilst hot, and set it aside for 12 hours; next decant the clear portion from the fæces, boil this down to 1 quart, and dissolve in it, *sugar*, 5 lb; lastly, when cold, add of *rectified spirit*, 5 fl. oz. "Each *fl. oz.* is equivalent to 1 gr. of dry extract." In the Ph. E. & Ph. D. 1826, no spirit is ordered.

2. (*Wholesale.*) *Extract of poppies*, 1½ *lb.*; *boiling water*, 2½ gall.; dissolve, clarify or filter, so that it may be *perfectly transparent when cold*, then add of *white sugar*, 44 *lb.*, and dissolve.

Obs. Syrup of poppies is anodyne and soporific. *Dose.* For an *infant*, ¼ to ½ tea-spoonful; for an adult, 2 to 4 fl. dr. According to M. Chereau its *tendency* to *fermentation* is *prevented* by the addition of 32 parts of *sugar of milk* to every 1000 parts of the syrup.

SYRUP (Red Poppies). Syn. *Syrupus Rhœados*,—Ph. L. & E. *Syr. Papaveris Rhœados*,—Ph. D. 1826. *Syr. P. Erratici*, —Ph. L. 1788, & Ph. D. 1807. *Prep.* 1. (Ph. L.) *Petals of the red poppy*, 1 lb; *boiling water*, 1 pint; mix in a water bath, remove the vessel, macerate for 12 hours, press out the liquor, and after defecation or filtering, complete the process as directed for *syrup of cochineal.*

2. (*Wholesale.*) From *dried red-poppy petals*, 3 *lb.*; *boiling water*, q. s.; *white sugar*, 44 *lb.*; as the last.

Obs. Syrup of red poppies is chiefly employed for its fine red colour. A *little* acid brightens it. The *colour* is *injured* by contact with iron, copper, and all the common metals.

SYRUP (Rhubarb). Syn. *Syrupus Rhei*, —Lat. *Prep.* 1. (P. Cod.) *Bruised rhubarb*, 3 oz.; *cold water*, 16 fl. oz.; macerate for 12 hours, filter, and add of *white sugar*, 32 oz.

2. (Ph. U. S.) Take of *rectified spirit*,

8 fl. oz.; *water*, 24 fl. oz.; *rhubarb* (coarsely powdered), 2 oz.; (mixed with) *sand*, an equal bulk, or q. s.; make a tincture by percolation, evaporate this, over a water-bath, to 13 fl. oz., and dissolve in it 2 *lb.* of *white sugar*. An excellent formula.

3. (*Wholesale.*) *Rhubarb* (bruised), 1¾ *lb.*; *cold water*, q. s.; *sugar*, 20 *lb.*; as No. 1. Stomachic and purgative. *Dose.* For an infant, ½ to 1 teaspoonful; for an *adult*, ½ to ¾ fl. oz., or more.

SYRUP (Rhubarb,—Spiced). Syn. *Syrups Rhei Aromaticus*,—Lat. *Prep.* (Ph. U. S.) *Rhubarb*, 2½ oz.; *cloves* and *cinnamon*, of each, ½ oz.; *nutmeg*, ¼ oz.; (all bruised;) *proof spirit*, 32 fl. oz.; macerate for 14 days (or percolate), strain, gently evaporate to 16 fl. oz., filter whilst hot, and mix the liquid with *simple syrup* (gently warmed), 4¾ pints. A cordial laxative. *Dose.* ½ to 1 tea-spoonful; in infantile constipation, diarrhœa, &c.

SYRUP (Roses). Syn. *Syrupus Rosæ*,—Ph. L., & Ph. D. 1826. *Syrupus Rosæ Centifoliæ*,—Ph. E. *Syr. Rosarum Solutivus*,—Ph. L. 1746. *Syr. è Rosis Siccis*,—Ph. L. 1721. *Prep.* 1. (Ph. L.) *Dried petals of damask roses* (rosa centifolia), 7 oz.; *boiling water*, 3 pints; macerate for 12 hours, filter, evaporate in a water bath to 1 quart, and add of *white sugar*, 6 ℔; and when cold, *rectified spirit*, 5½ fl. oz.

2. (*Wholesale.*) From *rose leaves*, 1 *lb.*; *sugar*, 19 *lb.*; *water*, q. s.; as the last. Gently laxative. *Dose.* ¼ to 1 fl. oz. It is usual to add a few drops of dilute sulphuric acid to brighten the colour. Alkalies turn it green.

SYRUP (Red Roses). Syn. *Syrupus Rosæ Gallicæ*,—Ph. E. & D. *Prep.* 1. (Ph. E.) *Dried petals of the red rose*, 2 oz.; *boiling water*, 1 pint; *pure sugar*, 20 oz.; as the last.

2. (Ph. D.) *Dried petals of the gallic rose*, 2 oz.; *boiling water*, 1 pint; boil in a glass or porcelain vessel until the colour is extracted, strain with expression, and, after defecation, add to the clear decanted liquor twice its weight of *white sugar*. Astringent and stomachic; chiefly used as an adjunct in mixtures, &c.

SYRUP (Rue). Syn. *Syrupus Rutæ*,—Lat. *Prep.* Take of *oil of rue*, 12 to 15 drops; *rectified spirit*, ½ fl. oz.; dissolve, and add it to *simple syrup*, 1 pint. *Dose.* ½ to 1 tea-spoonful; in the flatulent colic of children. An *infusion* of ½ oz. of the *herb* is sometimes substituted for the solution of the essential oil.

SYRUP (Saffron). Syn. *Syrupus Croci*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Hay saffron*, 5 dr. (10 dr.,—Ph. E; ½ *oz.*,—Ph. D.); *boiling water*, 1 pint; macerate in a covered vessel for 12 hours, then strain the liquor, and add of *white sugar*, 3 ℔, or q. s.; and *rectified spirit*, 2½ fl. oz., or q. s.; in the manner directed under *syrup of cochineal*. The Ph. E. & D. omit the spirit.

2. (*Wholesale.*) *Hay saffron*, 6 *oz.*; *boiling water*, 6 quarts; *white sugar*, 24 *lb.*; as the last. *Used* for its colour and flavour; the first is very beautiful.

SYRUP (Sarsaparilla). Syn. *Syrupus Sarzæ*,—Ph. L. & E. *Syrupus Sarsaparillæ*,—Ph. D. 1826. *Prep.* 1. (Ph. L.) Take of *sarsaparilla* (sliced), 3½ ℔; boil it in *water*, 2 gall., down to one half; pour off the liquor and strain it whilst hot; again boil the *sarsaparilla* in another gall. of *water* down to one half, and strain; evaporate the *mixed liquors* to 1 quart, and in these dissolve of *white sugar*, 8 oz.; lastly, when the syrup has cooled, add to it of *rectified spirit*, 2 fl. oz.

2. (Ph. E., & Ph. L. 1836.) *Sarsaparilla*, sliced, 15 oz.; *boiling water*, 1 gall.; macerate for 24 hours, boil to 2 quarts, strain, add of *sugar*, 15 oz.; and boil to a syrup.

3. (*Wholesale.*) Take of *extract of sarsaparilla*, 3 *lb.*; *boiling water*, 3 quarts; dissolve, strain, and add of *white sugar*, 12 *lb.* Alterative and tonic. *Dose.* 2 to 4 dr. See *Sarsaparilla*.

SYRUP (Sarsaparilla,—Compound). Syn. *Syrupus Sarzæ Compositus*; *Syrop de Cusinier*,—Fr. *Prep.* (Ph. U. S.) *Sarsaparilla*, bruised, 2 ℔; *guaiacum wood*, rasped, 3 oz.; *damask roses*, *senna*, and *liquorice-root*, bruised, of each, 2 oz.; *diluted alcohol* (proof spirit), 10 wine pints (1 gall. imperial); macerate for 14 days, express, filter through paper, and evaporate in a water bath to 4 wine pints (3¼ pints, imperial); then add of *white sugar*, 8 ℔, and, when cold, further add of *oils of sassafras* and *aniseed*, of each, 5 drops; and *oil of partridge berry* (gualtheria procumbens), 3 drops; previously triturated with a little of the syrup.

Obs. This is an excellent preparation; but the rose leaves might be well omitted. *Dose.* ½ fl. oz., 3 or 4 times a day, as an alterative, tonic, and restorative. The syrup of the P. Cod. is made with water instead of spirit, and is inferior as a remedy to the preceding.

SYRUP (Senna). Syn. *Syrupus Sennæ*,—Ph. L. & E. *Prep.* 1. (Ph. L.) Take of *senna*, 3½ oz.; *fennel seed* (bruised), 10 dr.; *boiling water*, 1 pint; macerate for 6 hours, with a gentle heat; then strongly press out the liquid through linen, and dissolve in it

of *manna*, 3 oz.; next add this solution to *treacle*, 3 lb, previously evaporated over a water bath until a little of it on being cooled almost concretes, and stir them well together.

2. (Ph. E.) *Senna*, 4 oz.; *boiling water*, 24 fl. oz.; infuse, strain, add of *treacle*, 48 oz.; and evaporate to a proper consistence. Aperient. *Dose.* 1 to 4 dr.

SYRUP (Simple). Syn. *Syrupus*,—Ph. L. *Syrupus Simplex.*—Ph. E. & D. *Prep.* 1. (Ph. L.) *White sugar*, 3 lb; *distilled water*, 1 pint; dissolve by a gentle heat.

2. (Ph. E., & Ph. L. 1836.) *Pure sugar*, 10 lb; *boiling water*, 3 pints.

3. (Ph. D.) *Refined sugar* (in power,—? crushed), 5 *lb.*; *distilled water*, 1 quart.

4. (*Wholesale.*) Finest *double refined sugar*, 44 *lb.*; *distilled water*, 2¾ gall.; make a syrup.

Obs. This preparation should be as white and transparent as water. *Used* as *capillaire*, &c., and to give cohesiveness and consistence to pulverulent substances in the preparation of electuaries, pills, &c.

SYRUP (Squills). Syn. *Syrupus Scillæ*,—Ph. E. & D. *Prep.* 1. (Ph. E.) *Vinegar of squills*, 3 pints; *white sugar* (in powder), 7 lb; dissolve by a gentle heat.

2. (Ph. D.) *Vinegar of squills*, 8 fl. oz.; *refined sugar* (in powder), 1 *lb.*; dissolve.

3. (*Wholesale*) Take of *vinegar of squills* (*perfectly transparent*), 14 *lb.*; *double refined sugar*, 28 *lb.*; dissolve in a *stoneware vessel*, in the *cold*, or at most by a very gentle heat.

Obs. This syrup, like the last, should be as clear as water, and nearly colourless. *Dose.* 1 to 2 fl. dr., as an expectorant; in chronic coughs and asthma. In large doses it proves emetic.

SYRUP (Squills, — Compound.) Syn. *Hive Syrup; Syrupus Scillæ Compositus*,—Lat. *Prep.* (Ph. U. S.) *Squills* and *senega*, of each, bruised, 5 oz.; *water*, ½ gall.; boil to a quart, add of *sugar*, 4½ lb; evaporate to 3 pints, or a proper consistence, and dissolve in it, whilst hot, of *potassio-tartrate of antimony* (in powder), 1 dr.

Obs. This syrup is a popular expectorant in the U. S., where it is known as *hive syrup*. *Dose.* As an expectorant, 20 to 30 drops, for *adults*; for *children*, 5 to 10 drops; in *croup*, 10 drops to ½ fl. dr., repeated until it vomits.

SYRUP (Tolu). Syn. *Balsamic Syrup; Syrupus Tolutanus*,—Ph. L. E. & D. *Syr. Toluiferi Balsami*,—Ph. E. 1839. *Syr. Balsami Tolutani*,—Ph. D. 1826. *Syr. Balsamicus*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Balsam of Tolu*, 10 dr. (1 *oz.*,—Ph. D.); *boiling distilled water*, 1 pint; boil in a covered vessel for ½ an hour, frequently stirring, then cool, strain, and dissolve in the liquor, *sugar*, 2½ lb.

2. (Ph. E.) *Simple syrup* (warm), 2 lb; *tincture of Tolu*, 1 oz.; mix by degrees, and agitate them briskly together in a closed vessel.

3. (*Wholesale.*) To *warm water*, 23 *lb.*; add *tincture of Tolu*, gradually, until it will bear no more without becoming opaque; then cork down the bottle, and occasionally agitate until cold; when quite cold filter it through paper, and add of the *finest double-refined sugar*, 44 *lb.*; lastly, promote the solution, in a closed vessel, by a gentle heat in a water bath.

Obs. This syrup should be clear and colourless as water; but as met with in the shops it is usually milky. It is strange that the London College should have omitted from their formula the usual addition of *rectified spirit*, although this syrup, perhaps more than any other, would be benefited by it.

Syrup of Tolu is pectoral and balsamic.

SYRUP (Velno's Vegetable). According to Dr. Paris and Sir B. Brodie, this celebrated nostrum is prepared as follows:—*Young* and *fresh burdock root*, sliced, 2 oz.; *dandelion root*, 1 oz.; *fresh spearmint*, *senna*, *coriander seed*, and *bruised liquorice root*, of each, 1½ dr.; *water*, 1½ pint; boil down gently to a pint, strain, add of *lump sugar*, 1 *lb.*, boil to a syrup, and, lastly, add a *small* quantity of *corrosive sublimate*, previously dissolved in a little spirit. *Used* as an alterative and purifier of the blood.

SYRUP (Vinegar). Syn. *Syrupus Aceti*,—Lat. *Prep.* (Ph. E.) Take of *vinegar* (French in preference), 11 fl. oz.; *white sugar*, 14 oz.; and make a syrup. *Dose.* 1 dr. to 1 fl. oz.; as an expectorant in coughs and colds, or diffused through any mild diluent, as a drink in fevers. A more agreeable preparation is that of the P. Cod., made by dissolving 30 parts of *sugar* in 16 parts of *raspberry vinegar*.

SYRUP (Violets). Syn. *Syrupus Violarum; Syrupus Violæ*,—Ph. L. & E., & Ph. D. 1826. *Syr. Violæ Odoratæ*,—Ph. E. 1817. *Prep.* 1. (Ph. L.) Macerate *violet flowers*, 9 oz.; in *boiling water*, 1 pint; for twelve hours, then press, strain, and set aside the liquid that the fæces may subside; afterwards complete the process with *sugar*, 3 lb, and *rectified spirit*, 2½ fl. oz., (or as much of *each* as may be necessary,) in the way which has been ordered concerning *syrup of cochineal.*

2. (Ph. E.) *Fresh violets*, 1 *lb.*; *boiling water*, 2½ pints; infuse for 24 hours in a covered vessel of glass or earthenware, strain

off the liquor (with gentle pressure), filter, and dissolve in the liquid, *white sugar*, 7½ lb.

3. (*Wholesale.*) From *double-refined white sugar*, 66 *lb.*; *anthokyan*,* 11 *lb.*; *water*, 22 *lb.*, or q. s.; dissolve in earthenware.

Uses. Syrup of violets is gently laxative. *Dose.* For an *infant*, a teaspoonful.

Obs. Genuine syrup of violets has a lively violet-blue colour, is *reddened* by acids, turned *green* by alkalies, and both smells and tastes of the flowers. It is frequently used as a *test*. A *spurious sort* is met with in the shops, which is coloured with litmus, and slightly scented with orris root. The *purest sugar*, perfectly free from either acid or alkaline contamination, should alone be used in the manufacture of this syrup. The Ph. E. orders the infusion to be strained *without pressure*; and the P. Cod., and some other Ph., direct the flowers to be first washed in cold water.

SYRUP (Wormwood). Syn. *Syrupus Absinthii*, — Lat. *Sirop d'Absinthe*,—Fr. *Prep.* (P. Cod.) *Tops of wormwood* (dried), 1 part; *boiling water*, 8 parts; infuse for 12 hours, strain, with expression, and dissolve in the liquor twice its weight of *sugar*. Bitter, tonic, and stomachic. *Dose.* 1 to 3 fl. dr.

TABES. The medical name for a wasting of the body, *characterised* by emaciation, and weakness, without coughing or pulmonary expectoration. It is *distinguished* from *atrophy* in being accompanied by symptoms of fever, more or less extreme; which are absent in that disease. The *common causes* are said to be acrimony in the blood, owing to the absorption of pus from an abscess (*tabes purulenta*); or the presence of some poisonous substance, as arsenic or mercury (*tabes venenata*); or a scrofulous taint (*tabes scrofulosa*, *t. mesenterica*); or an excesive indulgence of the veneral appetite (*tabes dorsalis*). To the second variety may be assigned the case of Mrs. Wooler, which has acquired so much notoriety by a recent trial. The *treatment* consists mainly in the avoidance of exciting causes or practices, change of residence to a more salubrious atmosphere (where necessary), and the adoption of the usual tonic treatment recommended under *atrophy*.

* The *expressed juice of violets*, defecated, gently heated in earthenware to 192° Fahr., then skimmed, cooled, and filtered; a *little spirit* is next added, and the next day the compound is again filtered.

TABLETTES. See *Lozenges* and *Savonettes*.

TÆNIA. See *Worms*.

TAFFETAS. Plasters on silk are occasionally so called. For *taffetas Anglicum*, see *Court plaster*; for *taffetas vesicans*, see *Vesicants*.

TALC. Syn. *Foliated Talc*; *Ubruc*. A transparent, foliated, silicious magnesian mineral, flexible but not elastic, found in Scotland, the Tyrol, and elsewhere. It is used as a cosmetic to impart a silky whiteness to the skin; also in the composition of *rouge végétal*, and to give a flesh-like polish to alabaster figures. A *second* and harder species of this mineral (*French chalk*, *soapstone*, *steatite*; *creta Gallica*) is employed as a *crayon* by carpenters, glaziers, and tailors, and forms the *boot-powder* of the boot-makers. *Writing* executed with it on *glass*, even after being apparently removed by friction, becomes again visible when breathed upon.

TALLOW and *other fats* are commonly *purified* by melting them along with water, passing the *mixed fluids* through a sieve, and letting the whole cool slowly, when a cake of cleansed fat is obtained.—*Another plan* is to keep the tallow melted for some time, along with about 2% of *oil of vitriol* largely diluted with water, employing constant agitation, and allowing the whole to cool slowly; then to *re-melt* the cake with a large quantity of *hot water*, and to wash it well.—*Another method* is to blow *steam* for some time through the melted fat. By either this or the preceding process a *white hard tallow* may be obtained.—*Some persons* add a *little nitre* to the melted fat, and afterwards, a *little dilute nitric* or *sulphuric acid*, or a *solution of bisulphate of potash*. *Others* boil the fat along with *water* and a *little dilute nitric* or *chromic acid*, or a *mixture of bichromate of potash* and *sulphuric acid*; and afterwards wash it thoroughly with *water*. These methods answer well for the tallow or mixed fats of which ordinary candles are made.

Tallow converted into *stearic acid* by *saponification* (see *p.* 1184-5) is readily *hardened* and *bleached*, if moderately pure. A *mixture* composed of 1 part of *oxalic acid* and 2000 parts of *water* is sufficient to bleach 1000 parts of *stearic acid*. The mode of operating is as follows:—Throw the *stearic acid*, cut into small pieces, into a vessel of *cold water*, and turn on steam; as soon as it has melted and assumed a turbid appearance, add the *solution of oxalic acid*, and boil the mixture. After boiling for ¾ hour, long threads ap-

pear in the liquid; the liquid itself, which previously was of a greyish colour, becomes black, and the threads unite together. The boiling must now be discontinued, and the contents of the vessel having been allowed to settle for three or four hours, must be drawn off into the coolers.

As *commercial stearic acid* frequently contains undecomposed tallow, as well as albuminous matter, this process is occasionally unsuccessful. To obviate these inconveniences, the candle may be run at two operations, as follows:—The *stearic acid*, treated as above, is exposed for a month to the sun, by which means the foreign matters are oxidized, and the *bleached stearic acid* acquires a dirty yellow colour; the *oxidized blocks* are then melted in *water* containing a little *sulphuric acid*, at about 150° Fahr.; an addition of about 10 per cent. of good *white wax* (or *spermaceti*) is next made, and the whole boiled for half an hour; the white of an egg, previously beaten up in a quart of *water*, is then added to each 1 cwt. of *stearic acid*, the temperature of the mass having been reduced to 100° or at most 120° Fahr., after which the mixture is again well stirred and boiled, when the *liquid soon becomes clear*, which is seen by the dark colour it assumes.

This mixture of stearic acid and wax or spermaceti is very suitable for forming the *exterior coating* of the candle; it is transparent and of perfect whiteness, and, as it is devoid of oxalic acid, it does not injure the moulds; whilst at the same time, as it is less fusible than pure stearic acid, candles made with it do not run. This first coating may be run hot without crystallizing; the interior of the candle, being protected from without against too sudden a cooling, may also be run somewhat hot; by this means the candle acquires a whiteness and a transparency which cannot be realized by other processes. (*Le Moniteur Industriel.*)

The *sulphuric saponification* of *inferior tallow* and other *solid* or *semi-solid fatty bodies* is now carried out on a very large scale for producing the *cheaper varieties* of "*stearine candles.*" For this purpose, the *tallow* or *fat* is mixed with 5 or 6% of *concentrated sulphuric acid*, and exposed to a steam-heat of 350° to 360° Fahr. After cooling, the black mass thus obtained crystallizes to a tolerably solid fat, which is well washed once or twice with *water*, or *high pressure steam*, and is then submitted to distillation by the aid of steam, heated to about 560° Fahr. The *product* of the *distillation*, is beautifully white, and may be at once used for making candles. It is better, however, to first submit it to the processes of *cold* and *hot pressing*, whereby a much more solid fat is obtained.

According to M. Pohl, *palm oil* or *palm tallow* is most easily purified by simple exposure to a high temperature, provided it has been first well defecated. When *quickly* heated to about 465° Fahr., and kept at that temperature for from 5 to 15 minutes, it is completely decoloured. The *product* has a slight empyreumatic odour, but this disappears by age, exposure, or saponification, and the natural violet odour of the oil returns. Cast-iron pans should be employed in this process, and should be only 2-3rds filled, and well-covered during the operation.

By the *distillation* of *sulphurated palm-oil* in *closed vessels*, at a heat ranging from 570° to 600° Fahr., from 68% to 75% of a *mixture* of *palmitic* and *palm-oleic acid* passes over; of which 25% to 30% is colourless, hard, and crystalline; and the rest darker and softer. (Pohl.) The *residuum* in the still is a *fine hard pitch.*

Most of the methods of *bleaching* and *refining* the *fatty oils* noticed at *pages* 841-3, also apply to the *crude tallows* and *fats* of *commerce.*

TAMARA. A mixed spice used in Italian cookery, consisting of *cinnamon*, *cloves*, and *corianders*, of each, 2 parts; *aniseed* and *fennel seed*, of each 1 part.

TAMARIND. Syn. *Tamarindus*,—Ph. L. E. & D. The *pulp* or *preserved fruit* or *pod* of the *tamarindus Indica* (Linn.), or *tamarind tree.* In the Ph. L., *tamarind pulp* (tamarindus præparatus) is ordered to be obtained by macerating *tamarinds*, 1 lb., with *water*, q. s. to cover them, by a gentle heat, for 4 hours, and completing the process as directed for *prepared prunes.*

Tamarind pulp is refrigerant and gently laxative. Mixed with water, it forms a grateful acidulous drink in fevers, &c.

TAN BALLS. Syn. *Tanner's Turf.* The muddy sediment of *tan-pits*, and the *exhausted bark*, pressed into balls or cakes. *Used* for summer fuel; but chiefly to "recover fires when nearly out," or "to keep them in" for a long time.

TANGHICINE. A crystallizable substance extracted by *ether* from the *seeds* of *tanghinia venenifera* or *Madagascariensis*, after the fixed oil has been removed by pressure. It is soluble in water, alcohol, and ether; and is bitter, acrid, and very poisonous.

TANGHININE. The ethereal extract of the seeds last referred to.

TANNATE. Syn. *Tannas*,—Lat. See *below*.

TANNER'S BARK. The best of this is *oak bark;* but the *bark* of the *chestnut*, *willow*, *larch*, and other trees which abound in tannin, are also used for preparing leather.

TANNIC ACID. Syn. *Tan*, *Tannin; Gallo-tannic Acid*, *Quercitannic do.; Scytodephic do.; Tanninum; Acidum Tannicum*, —Ph. L. D. & U. S. A peculiar vegetable principle, remarkable for its astringency, and its power of converting the skins of animals into leather.

Prep. 1. Precipitate an *infusion of galls* with a *concentrated solution of carbonate of potash*, avoiding excess; wash the precipitate with ice-cold *water*, dissolve it in *dilute acetic acid*, filter the solution, precipitate it with *acetate of lead*, wash the precipitate with *water*, suspend it in *water*, and decompose it by means of a *stream* of *sulphuretted hydrogen*; lastly, evaporate the *filtered liquid* in vacuo, or over sulphuric acid.

2. (Berzelius.) To a *hot infusion of galls* add a few drops of *sulphuric acid;* agitate, filter, and add, gradually, to the filtered liquor *sulphuric acid* diluted with its own weight of *water*, until the precipitate, after standing for an hour, is found to form a semi-fluid glutinous mass; then decant the liquid, and mix it carefully with *concentrated sulphuric acid* as long as a precipitate forms; wash this precipitate with *water* strongly *acidulated with sulphuric acid*, press it between the folds of bibulous paper, and dissolve it in *pure water;* to this solution gradually add *carbonate of lead* in very fine powder, and after agitation, and maceration for some time, until the sulpho-tannate is all decomposed, filter, and gently evaporate; lastly, powder the dry residuum, digest it in *ether*, allow the ether to evaporate spontaneously, and preserve the dry powder from the air.

3. (M. Pelouze.) From *galls*, in moderately fine powder, by percolation, in a closed vessel, with *sulphuric ether* that has been previously agitated with *water*. After some time the percolated liquid will be found divided into two distinct portions; the *lower* and *heavier* one being a watery solution of *tannic acid*, and the *upper* one, an *ethereal solution* of gallic acid and colouring matter. Fresh ether must be passed through the powder as long as the lower stratum of liquid continues to augment. The two fluids are now carefully separated, and after the heavier one has been well washed with ether, it is gently evaporated to dryness; preferably under the receiver of an air-pump, or over sulphuric acid. The *ether* may be recovered unaltered from the ethereal solution, by cautious distillation in a retort connected with a Liebig's condenser supplied with ice-cold water. *Prod.* About 40%.

4. (Ph. D.) From *galls*, in tolerably fine powder, 8 *oz.;* and a mixture of *sulphuric ether*, 3 pints; with *water*, 5 fl. oz.; by percolation, in successive portions, like the last; the aqueous solution of tannic acid being evaporated, and finally dried at a heat not exceeding 212° Fahr.

Prop., &c. Pure tannic acid is perfectly white, but as ordinarily met with it has a slight yellowish colour, owing to the action of the air; it is uncrystallizable; possesses a powerful and purely astringent taste, without bitterness; is freely soluble in water, less so in alcohol, and only very slightly soluble in ether; it reddens vegetable blues; in solution, it is gradually converted by the action of heat into *ellagic*, *gallic*, and *carbonic acids;* when heated in the dry state it suffers decomposition, *metagallic* and *pyrogallic acids* being formed; it unites with the bases forming salts called *tannates*, which are characterised by striking a deep black with the persalts of iron (*ink*); with gelatine it unites to form *leather*.

Pur. "Almost colourless. Dissolved in water, it is powerfully astringent. From a solution of isinglass it throws down a certain white precipitate. In other respects its properties correspond with those of gallic acid, before named." (Ph. L.)

Uses, &c. The value of substances containing tannin in the preparation of leather is well known. In its *pure form* it is used as an astringent in medicine; *internally*, in diarrhœa, hæmorrhages, as a tonic in dyspepsia, &c.; *externally*, made into a gargle, injection, or ointment. *Dose.* 1 to 10 gr., under the form of pills or solution.

Tannic acid and gelatine are mutually used as tests for each other; a thick flocculent precipitate is formed whenever these substances meet in solution. When a solution of tannin is dropped into another of gelatine, thick flocks are precipitated, which re-dissolve when heated with the supernatant fluid. The following is a useful and simple form for preparing this test: —Infuse *pounded galls*, 1 *oz.*, in *hot water*, ¼ pint, for several hours; strain with pressure, add to the turbid fluid, *common salt*, 2 *oz.;* and the next day filter it. The *filtrate* will retain its transparency and

power of precipitating gelatine for years. (*Chem. Gaz.*)

By digesting *powdered charcoal* in *nitric acid*, and carefully evaporating the solution so obtained, Mr. Hatchett succeeded in procuring an astringent subject, possessing many of the properties of tannic acid, and which has been called *artificial tannin* and *tannin resin*.

It is said that *tannin* may be *decolorized* by sulphuret of mercury.

TANNIN. See *Tannic Acid*.

TANNING. When the skin of an animal, carefully deprived of hair, fat, and other impurities, is immersed in a dilute solution of tannic acid, the animal matter gradually combines with that substance as it penetrates inwards, forming a perfectly insoluble compound, which resists putrefaction completely; this is *tanned leather*. In practice, *lime water* is used for *cleansing* and *preparing* the skin, *water acidulated with oil of vitriol* for "raising" or opening the pores, and an *infusion of oak-bark*, or, sometimes, of *catechu*, or other *astringent matter*, for the source of tannic acid. The process itself is necessarily a slow one, as dilute solutions only can be safely used. *Skins* intended for the curriers, to be dressed for "*uppers*," commonly require about 3 weeks; and *thick hides*, from 12 to 18 months.

Of late years various ingenious contrivances have been adopted, with more or less success, to hasten the process of tanning skins and hides. Among these may be mentioned, the employment of *stronger tan-solutions*, the application of a *gentle heat*, *puncturing the skins* to afford more ready access for the liquid to their interior parts, and *maceration* in the tan-liquor *under pressure*, either at once, or after the vessel containing them has been exhausted of air by means of an air-pump. On the merit of these several methods it has been remarked, "that the *saturated* infusions of astringent barks contain much less extractive matter, in proportion to their tannin, than the *weak* infusions; and when the skins are *quickly* tanned in the former, common experience shows that it produces leather which is less durable than leather *slowly* formed." (Sir H. Davy.) "100 *lb.* of skin, *quickly* tanned in a strong infusion of bark, produce 137 *lb.* of leather; while 100 *lb.* *slowly* tanned in a weak infusion, produce only 117½ *lb.*" "Leather thus highly (and hastily) charged with tannin is, moreover, so spongy as to allow moisture to pass readily through its pores, to the great discomfort and danger of persons wearing shoes made of it." (Ure.)

According to Mr. G. Lee, much of the original gelatine of the skins is wasted in the preliminary processes to which they are subjected, more especially, the "*liming*" and "*bating*." He says, that 100 *lb.* of perfectly dry hide, cleaned from extraneous matter, should, on chemical principles, afford at least 180 *lb.* of leather.

Morocco leather is prepared from *goat* or *sheep skins*, which after the action of *lime water* and a *dung bath*, are slightly tanned in a *bath of sumach*. They are subsequently grained, polished, &c.

Russia leather is generally tanned with a *decoction of willow bark*, after which it is dyed, and curried with the *empyreumatic oil of the birch tree*. It is the last substance which imparts to this leather its peculiar odour and power of resisting mould and damp. See *Leather*, *Tannic Acid*, *Tawing*, *&c.*

TANTALIC ACID. Syn. *Columbic Acid*. This compound exists in the ores of columbium in combination with iron, manganese, or yttria.

Prep. The *ore* is fused along with 3 or 4 times its weight of *carbonate of potassa*; the resulting *columbate* or *tantalate of potassa* is dissolved out of the *fused mass* with *water*, and the *solution* thus obtained is precipitated with a *mineral acid*; the white powder which falls is *hydrated columbic* or *tantalic acid*.

Prop., &c. It is insoluble in water, but readily unites with the alkalies forming salts termed *columbates* or *tantalates*, which are crystallizable. It is soluble in hydrofluoric acid, and the solution, by evaporation at 76° Fahr., deposits crystals of *terfluoride of columbium*. The *double fluoride of columbium* and *potassium* may also be readily formed. Sp. gr. 7·25 to 8·25.

TANTALUM. Syn. *Columbium*. A rare metal discovered by Mr. Hatchett, in 1801, in a mineral from Massachusets; and by M. Ekeberg, in 1803, in tantalite. It exists in most of its ores in combination with oxygen.

Prep. From the *double fluoride of potassium and columbium*, by heating it with *potassium*, in the way described under *Silicium*.

Prop., &c. A grey metal, little acted on by acids, burning to tantalic acid when heated in the air, or when fused with potassa. With oxygen it forms two compounds—an *oxide* or *protoxide*, which is insoluble, obtained by exposing columbic or tantalic acid, for 4 or 5 hours, to an intense heat, in a crucible lined with charcoal, and luted; and a *binoxide* or *peroxide*, which is tantalic acid. (See

above.) It also forms corresponding compounds with chlorine.

Obs. It has been lately discovered, by H. Rose, that the supposed *tantalic acid* obtained from the *tantalite* of Bavaria and of America, is in reality a compound of *tantalum*, and two new metals (*niobium* and *pelopium*), with *oxygen*. When this supposed *tantalic acid* is mixed with *powdered charcoal*, and heated to redness in a *stream* of *chlorine gas*, a mixed sublimate is obtained, consisting of a yellow, readily fusible, and very volatile substance, which is *chloride of pelopium;* and a white, infusible, less volatile body, which is *chloride of niobium*. When these substances are separated and thrown into water, they suffer immediate decomposition, a solution of hydrochloric acid, and an insoluble precipitate of *niobic acid* or *pelopic acid* being formed. The properties of these bodies closely resemble each other. From their respective chlorides metallic *niobium*, *pelopium*, and *tantalum* may be obtained, by the action of *ammonia*, at a high temperature. So prepared, they are black, pulverulent, unaffected by water, and burn, when heated in the air, with the production of the respective acids.

TAPE-WORM. See *Worms.*

TAPIOCA. Syn. *Tapioca*,—Ph. E. & D. The *fecula* of the *root* of *janipha manihot* (jatropha manihot,—*Linn.*), which has been well washed in *water*, and dried on *hot plates*, by which it assumes the appearance of warty-looking granules.

Pure tapioca is insipid, inodorous, only slightly soluble in cold water, but *entirely* soluble in boiling water, forming a translucent, and highly nutritious jelly. Its granules are muller-shaped, about $\frac{1}{2000}$th of an inch in diameter, and display very marked hilums. It is *used* in a similar manner to sago and arrowroot. See *Cassava.*

TAR. Syn. *Pix Liquida*,—Ph. L. E. & D. "A liquid bitumen prepared from (the) wood" of "*pinus sylvestris*, and other species, by heat." (Ph. L.) The chemical constitution of tar is very complicated. Its *uses* in the arts are well known. As a *medicine*, it is stimulant, diuretic, sudorific, and vermifuge. *Dose.* 5 to 20 gr., made into pills; in ichthyosis, &c. *Externally*, in lepra, psoriasis, foul ulcers, &c. See *Ointments* and *Infusions.*

TAR (Barbadoes). Syn. *Pix Liquida Barbadensis, Petroleum Barbadense; Petroleum*,—Ph. L. & E. "Black liquid bitumen exuding spontaneously from the earth." (Ph. L.) Its properties for the most part resemble those of the last. *Dose.* 10 to 30 drops; in asthma, chronic coughs, tapeworm, &c. *Externally*, in chilblains, chronic and rheumatic pains, &c.

TAR (Coal). Produced during the distillation of *bituminous coal* for gas.

TAR (Oil of). See *page* 839.

TARAXACUM (Ph. L. E. & D.). See *page* 307.

TARES. See *Vetch.*

TARPAULIN. Syn. *Tarpawling. Canvas* covered with *tar* or any composition to render it waterproof.

TARRAS. Syn. *Terras.* A volcanic product resembling *puzzolene*, that imparts to mortar the property of hardening under water. Several other *argillo-ferruginous minerals* possess the same power, and are *used* under this term.

TARTAR. Syn. *Argal, Argol; Tartarum, Tartarus*,—Lat. *Crude tartar* is the concrete deposit formed upon the sides of the casks and vats during the fermentation of grape juice. That obtained from white wine is *white argol;* that from red wine, *red argol.* After purification it forms *cream of tartar.*

TARTAR (Ammoniated). Syn. *Ammoniotartrate of Potassa, Soluble Tartar* (Ammoniated); *Tartarus Ammoniatus, Tartarum Solubile Ammoniatum*,—Lat. *Prep.* Neutralize a *solution of cream of tartar* with *ammonia* in slight excess, then evaporate, and crystallize. Very soluble in water. A favorite laxative on the Continent.

TARTAR (Boraxated). Syn. *Soluble Cream of Tartar, Boro-tartrate of Potassa and Soda; Tartarum Boraxatum, Cremor Tartari Solubilis, Potassæ et Sodæ Tartras Boraxata*,—Lat. *Prep.* From *borax*, 2 *lb.; cream of tartar*, 5 *lb.;* both in powder; dissolved in water, evaporated, and crystallized. See *Borotartrate of Potassa.*

TARTAR (Chalybeated). See *page* 646.

TARTAR (Cream of). See *page* 1043.

TARTAR (Emetic). See *page* 76.

TARTAR (Oil of). See *page* 1035.

TARTAR (Reduced). Syn. *Cremor Tartari Reductus*,—Lat. An article is sold under the name of *British cream of tartar*, which contains $\frac{1}{4}$th its weight or more of *bisulphate of potash.*

TARTAR (Salt of). See *page* 1033.

TARTAR (Soluble). See *page* 1043.

TARTAR (Spirit of). Pyrotartaric acid.

TARTAR (Tartarized). Tartrate of potassa.

TARTAR (Vitriolated). Sulphate of potash.

TARTARIC ACID. Syn. *Acidum Tartaricum*,—Ph. L. E. & D. *Acid of Tartar, Essential Salt of do., Tartareous Acid, Sal Essentiale Tartari, Acidum Tartari Essentiale*,—Obs. var. *Prep.* 1. (Ph. L. 1836.)

Take of *cream of tartar*, 4 lb; *boiling water*, 2 gall.; dissolve by boiling, add, gradually, of *prepared chalk*, 12 oz. 7 dr. (made into a milk with water), and when the effervescence ceases, add another like portion of *prepared chalk*, dissolved in *hydrochloric acid*, 26½ fl. oz., or q. s., diluted with *water*, 4 pints; collect the precipitated *tartrate of lime*, and after well washing it with *water*, boil it for 15 minutes in *dilute sulphuric acid*, 7 pints and 17 fl. oz.; next filter, evaporate the filtrate (to the density of 1·38), and set it aside to crystallize; re-dissolve the crystals in *water*, concentrate the solution by evaporation, and re-crystallize a *second*, and a *third* time. The Edinburgh formula is nearly similar. In the present Ph. L. & D. tartaric acid is placed in the Materia Medica.

2. (Mr. Gatty.) The solution of *argol* or *tartar* is first neutralized with *carbonate of potash*, and to every 300 gall. of the *clear liquid*, at the density of 5° Twaddell, 34 gall. of *milk of lime* (1 *lb.* of *lime* per gall.) are added; *carbonic acid gas* is then forced in, with agitation; decomposition ensues, with the formation of *bicarbonate of potassa* and *tartrate of lime*; the *last* is converted into *tartaric acid* in the usual manner, and the *former* is evaporated in iron pans, and roasted in a reverberatory furnace for its *potash*.

3. (Dr. Price.) This is a mere modification of his process for obtaining *citric acid*, described at *page* 263.

Prop. Tartaric acid forms inodorous, scarcely transparent, oblique rhombic prisms, more or less modified, which are permanent in the air; it possesses a purely sour taste, dissolves in about 2 parts of water at 60° Fahr., and in about its own weight of boiling water; it is slightly soluble in alcohol; the aqueous solution exhibits right-handed polarization, and suffers gradual decomposition by age; it contains 9% of water; fuses at 220°, boils at 260°, and when heated to about 400° Fahr., after losing 1-4th of its water, is converted into *tartralic acid*; by continuing the heat until another 1-4th of its water is driven off, it is converted into *tartrelic acid*; at a still higher degree of heat it loses all its water, and assumes the form of an insoluble white powder, which is *anhydrous tartaric acid*. By distillation it yields *pyrotartaric* and *pyruvic acids*, with other products; when strongly heated, it is wholly dissipated. With the bases it forms salts called *tartrates*.

Pur. It is "free from colour; is entirely, or almost entirely dissipated by fire; and is entirely soluble in water. This solution throws down bitartrate of potash from any neutral salt of potassa. Nothing is precipitated from the same solution by chloride of barium, and what is thrown down by acetate of lead is dissolved by nitric acid. 100 gr. of this acid, dissolved in water, are saturated by 192 gr. of crystallized carbonate of soda." (Ph. L.) If it contain *tartrate of lime*, or *cream of tartar*, it is not wholly soluble in alcohol, nor wholly destroyed by fire. If it contain *sulphuric acid*, or a *sulphate*, chloride of barium gives a white precipitate.

Tests. 1. Tartaric acid is known to be such by its solution giving white precipitates with solutions of caustic lime, baryta, and strontia, which dissolves in excess of the acid.—2. A solution of potassa causes a white granular precipitate of cream of tartar, soluble by agitation in excess of the precipitant.—3. Nitrate of silver and acetate of lead give white precipitates, which, when heated, fume, and yield the pure metal.—4. If to a solution of tartaric acid, or a tartrate, solution of sesquioxide of iron, or of alumina, be added, and subsequently ammonia or potassa, no precipitate is formed.—5. At about 570° Fahr., all the tartrates are blackened, and yield a peculiar and characteristic odour.

Uses, &c. Tartaric acid is chiefly employed in *calico printing*, and in *medicine*, as a substitute for citric acid and lemon juice in the preparation of cooling drinks and saline draughts. For the latter purpose, bicarbonate of soda is the alkaline salt commonly employed.

20 gr. of *crystallized tartaric acid*

are saturated by

27 gr. of *crystallized bicarbonate of potassa*;
22 gr. of *commercial carbonate of do.*;
22 gr. of *crystallized bicarbonate of soda*;
38 gr. *of crystallized carbonate of soda*; and
15½ gr. of *sesquicarbonate of ammonia*.

Concluding Remarks. On the *large scale*, the decomposition of the tartar is usually effected in a copper boiler, and that of the tartrate of lime in a leaden cistern. This part of the process is often performed by mere digestion for a few days, without the application of heat. Leaden or stoneware vessels are used as crystallizers. *Good cream of tartar* requires 26% of *chalk*, and 28·5% of *dry chloride of calcium* for its perfect decomposition. *Dry tartrate of lime* requires 75% of *oil of vitriol* to liberate the whole of its tartaric acid. A *very slight excess* of sulphuric acid may be safely, nay, advan-

tageously employed. Some manufacturers *bleach* the *coloured solution* of the first crystals, by treating it with *animal charcoal;* but for this purpose the latter substance should be first purified by digesting it in hydrochloric acid, and afterwards by edulcorating it with water, and exposing it to a *dull* red heat in a covered vessel. The general management of this manufacture resembles that of *citric acid.* To obtain a *large product*, care must be taken that the *whole* of the tartrate of lime be thoroughly decomposed, a matter not always effected by clumsy manipulators, who do not adapt their quantities or practice to the circumstances before them.

TARTARINE. The name given by Kirwin to potash.

TARTRALIC ACID. This acid is *distinguished* from *tartaric acid* by saturating 1-4th less base, and by forming soluble salts with lime and baryta. By heat it is converted into *tartrelic* acid. This *new acid* possesses only *half* the neutralizing power of tartaric acid. In contact with water the tartralic and tartrelic acids, and their salts, are slowly reconverted into tartaric acid and tartrates. *Dry tartralic*, *tartrelic*, and *tartaric acids* are isomeric compounds. *Tartaric acid* is *bibasic.*

TARTRATE. Syn. *Tartras*,—Lat. The *tartrates* are noticed under the names of the *respective bases* and *tartaric acid.* The *tartrates* of *baryta*, *lime*, *magnesia*, *strontia*, and most of the *ordinary metals* are INSOLUBLE; the *others*, are SOLUBLE.

TARTRELIC ACID. See *Tartaric* and *Tartralic Acids.*

TARTROVINIC ACID. A compound, formed of *tartaric acid* in combination with the *elements of ether*, analogous to *oxalvinic acid.*

TARTS. These may be regarded as miniature pies, consisting of *fruit*, either *fresh* or *preserved*, baked or spread on *puff-paste.*

TAURINE. Obtained, along with *choloidic acid* and *ammonia*, when *purified bile* is boiled for some hours with an excess of *hydrochloric acid.* By filtration, evaporation, and dissolving the dry residuum in about 6 parts of *boiling alcohol*, nearly *pure taurine* crystallizes out as the solution cools. It forms white crystalline needles, which are soluble in water, and sparingly soluble in alcohol. It is remarkable for containing fully 25% of sulphur.

TAUROCHOLALIC ACID. See *Choleic Acid.*

TAURO-HYOCHOLALIC ACID. A peculiar sulphuretted acid, found by Strecker, in *pig's bile*, corresponding to the *taurocholalic acid* of ox-bile.

TAWING. In the *preparation* of the *tawed leather* used for *gloves*, *housings*, *&c.*, the *skins* are first *soaked*, *scraped*, and *hung* in a *warm room* until they begin to exhale an ammoniacal odour, and the wool readily comes off; they are then *de-haired*, and soaked in *water* with some *quick-lime* for several weeks, the water being changed two or three times during that period; they are then again *beamed*, *smoothed*, and *trimmed*, after which they are *rinsed*, and *re-soaked* in a *vat* of *bran-and-water*, where they are kept in a state of gentle fermentation for some weeks; (in this state they are called "*pelts;*") the *skins* are next well worked about in a *warm solution of alum* and *salt*, again *fermented* in *bran-and-water* for a short time, and are then stretched on hooks, and dried in a stove-room; they are lastly, again *soaked* in *water*, and *trodden* or *worked* in a pail or tub containing some *yelks* of *eggs* beaten to a froth with *water*, after which they are *stretched* and *dried* in a loft, and are smoothed with a warm *smoothing-iron.* Sometimes the process is shortened by soaking the skins in the following mixture after the first steep with bran:—*Common salt*, 3½ *lb.; alum*, 8 *lb.; boiling water*, q. s.; dissolve, add of *wheaten flour*, 21 *lb.; yelks* of 9 dozen *eggs;* make a paste. For *use*, a portion is to be *largely diluted* with *water.*

Chamois or *shammy leather* is generally *prepared* from either *sheep* or *doe-skins*, which, after *dressing*, *liming*, *&c.*, are *well oiled* on the grain side, then rolled into balls, and thrown into the trough of the *fulling mill*, where they are beaten for 2, 3, or 4 hours. They are next *aired*, and again *oiled* and *fulled*, and this is repeated a *third* time, or oftener, as circumstances may direct. The *oiled skins* are then exposed to a *fermenting process*, or *heating* in a close chamber, and are afterwards freed from redundant oil by being scoured in a *weak alkaline lye.* They are, lastly, rinsed in clean water, wrung at the peg, dried, and "finished" at the *stretcher-iron.*

Tawed leather differs from *tanned leather* in yielding *size* or *glue* under the influence of heat and moisture, in nearly the same way as the raw skins.

TEA. Syn. *Thea*,—Lat. The *dried leaves* of *thea bohea* (Linn.), and *thea viridis* (Linn.) The first yields *black tea;* the second, *green tea.*

Pur. The only *adulteration* of *tea* which is extensively practised at the present day, is mixing it with a certain portion of *exhausted tea-leaves* which have been re-

dried and curled. The *collection* and *preparation* of these occupy several hundred persons, chiefly women and children, in and about London. The *leaves* which have been found in the possession of the manufacturers of *imitation tea* are those of the *sloe tree, ash tree, elder bush*, and *white thorn*. According to Mr. Warrington, a most extensive system of adulterating tea is practised in China. Many samples directly imported from that country, examined by him, *did not* contain a *single grain of tea*, being made up entirely of other leaves. The *ordinary green teas* he found, for the most part, spurious, being manufactured out of the cheaper black teas. These are "*faced up*" or "*painted*" with various *colouring substances, powdered porcelain clay, &c.*, which are readily perceived under the microscope, and even admit of being separated, and chemically examined.

It is a *general practice* among the grocers in this country to impart what they call a "*bloom*" to their GREEN TEAS by "*rouncing*" them up with a little *calcined magnesia*, or *finely powdered talc* or *French chalk*. The quantity that adheres to the tea is very trifling, but it greatly improves its appearance. BLACK TEAS are "*faced*," in a similar manner, with *finely powdered plumbago* or *black lead*.

Pure China tea is not *turned black* by being put into water impregnated with sulphuretted hydrogen gas, nor does it tinge spirit of hartshorn *blue*. The *infusion* is *amber-coloured*, and is *not reddened* by the addition of an acid. The *ashes* left from the combustion of genuine tea are white, and do not exceed 5 to 5½ %. If they exceed this they may be chemically examined with the usual tests for *alumina, chromate of lead, copper, cyanide of potassium, gypsum, lime, magnesia, &c.* Many of these substances may be detected by simply agitating the tea with a little *cold water*, when they will be detached from its surface, and render the water turbid, or, by their gravity, sink to the bottom.

Among *domestic substitutes* for tea are—the *leaves* of *speedwell, wild germander, black currant, syringa* or *mock orange, purple-spiked willow herb, gaultheria procumbens* or *winter green, sweetbriar, cherry tree, sloe, &c.*, all of which are used for tea, either singly or mixed. The addition of a *single bud* of the *black currant* to the infusion of *ordinary black tea* imparts to it a flavour closely resembling that of *green tea*.

The brownish-coloured powder vended under the name of "*la veno beno*," is a mixture of 2 parts of *tea-dust* with 5 parts of *powdered catechu* or *terra japonica*. A few grains of this substance thrown into the tea-pot, are described in the advertisements as being capable of more than doubling the strength of the beverage.

The once notorious "*paraguay plant*," sold in packets, was simply *new meadow-hay* that had been wetted with a *strong infusion of catechu*, then dried, chopped small, and strongly compressed. See *Theine* and *Caffeine*.

TEA. "The tea is not a meal; when it is properly used, it should not be a meal; but it has a special purpose to fulfil which I will now explain. Tea, and under the generic term tea I include coffee—tea is usually taken three hours after dinner. This is the moment which corresponds with the completion of digestion, when the food having been conveyed away from the stomach, nothing remains behind but the excess of the acid juices employed in digestion; these acid juices create an uneasy sensation at the stomach, and a call is made for something to relieve the uneasiness; tea fulfils that object." "On the same principle, after the business of the dining-room, the antacid and refreshing beverage, either in the shape of tea or coffee, is prepared in the drawing-room. In taking either, the nearer they approach to the simple infusion the better, little milk or cream, and less sugar, should be the principle. But seeing the purpose of tea; how unreasonable to make it the excuse for a meal, to conjoin with it, toast, muffins, bread and butter, and *id genus omne*." "Three meals a day may be taken as the standard of habit and custom; tea and coffee having a specific place and purpose as a beverage, but none as a meal." (Eras. Wilson.) See *Meals, &c.*

TEA (Beef.) Syn. *Infusum Carnis Bubulæ, Jusculum cum Carne Bovis*,—Lat. This is merely a very concentrated soup formed of lean beef. According to the common plan, *lean beef*, 1 *lb.* is gently simmered in *water*, 1 quart, for about ½ an hour, when *spice, salt, &c.*, is added, and in a few minutes the whole is strained for use. The following are other formulæ:—

1. (Dr. A. T. Thomson.) Take of good *rump steak*, ½ *lb.*; cut it into *thin slices*, spread these over a hollow dish, sprinkle a *little salt* on them, add a pint of *boiling water*, and place the dish (covered) near the fire for half an hour; then remove the whole to a saucepan, and boil it gently for 15 minutes; lastly, strain through a hair sieve.

2. (Prof. Liebig.) *Beef*, free from fat, 1 *lb.*, is to be minced very small, mixed with an equal weight of *cold water*, and, after

digestion and agitation in the cold for about ½ an hour, heated slowly to boiling; when it has boiled for a minute or two, strain it through a cloth. It may be coloured with *roasted onion* or *burnt sugar*, and *spiced* and *salted* to taste.

Obs. Similar preparations are ordered in some foreign pharmacopœias from *calves' lights, crayfish, frogs, mutton, pullets, snails, tortoise, veal, &c.* In the Ph. L. 1746, a form was given for *viper broth* (jusculum viperinum).

TEA (Bran). See *page* 152.

TEETH (The). Syn. *Dentes*,—Lat. An object very subservient to health, and which merits due attention, is the *preservation of the teeth;* the care of which, considering their importance in preparing the food for digestion, is, in general, far from being sufficiently appreciated. Comparatively very few persons *wash their mouths* and *clean their teeth* even once a day; a feat which ought always to be practised at the conclusion of a meal, when either animal food or vegetables are eaten; for the first is apt to leave behind it a rancid acrimony, and the other, an acidity, both of them hurtful to the teeth. Those who abhor a fœtid breath, rotten teeth, and the toothache, would do well to invariably clean their teeth before retiring to rest. With *smokers* this practice is almost obligatory. *Washing* the *mouth* frequently with *cold water* is not only serviceable in keeping the teeth clean, but in *strengthening* the *gums*, the firm adhesion of which to the teeth, is of the greatest importance in preserving them sound and secure. Some parties think it serviceable to add a few drops of *spirit* or *essence of camphor* to the *water* thus employed, a plan we certainly approve of. See *Breath, Dentifrices, Pastes, Powders, Tooth Cements, Washes, &c.*

TEETHING. Syn. *Dentition.* Children are sometimes born with one or more teeth; but in general, the teeth, at birth, consist of mere pulpy rudiments buried in the gum. Their *development* is gradual. About the *third* or *fourth month* they begin to assume shape and hardness. At this period children become fretful, the saliva flows copiously, the gums grow turgid, and there is a fondness of biting hard cold objects. In nearly all cases there is more or less fever, frequently a cough or diarrhœa, and a rash commonly appears, which is called by nurses the "*red gum.*" These symptoms generally abate after a fortnight or three weeks, and the child remains undisturbed until the *seventh* or *eighth month.* About this period the gums again become red, tender, and swollen, and often extremely sensitive and painful. The upper part of the gum gradually becomes attenuated and pale, and, just before the tooth appears, even covered with a blister. These changes are usually attended by an increased flow of saliva, or "drivelling," and a lax state of the bowels; both of which are regarded as favorable symptoms. Sometimes, however, the *diarrhœa* is excessive, when it may be cautiously restrained by a dose or two of *rhubarb-and-magnesia*, with a little *dill* or *peppermint water;* or better, by the daily use of a little *arrow-root*, to which a few drops of *pure port wine* may be added. Sometimes the *local irritation* is considerable, or there are *spasms* or *convulsions*, in which case the practice is to *lance* the gums. When there is *drowsiness, stupor*, or *oppressed respiration*, one or two *leeches* may be applied to the temples, and a *small blister* to the back of the neck, or behind the ear. *Sluggishness of the bowels* may be removed by a little *castor oil;* or, when there is actual *constipation*, by a little *calomel* or *mercurial powder* and *rhubarb. Excessive irritability*, without other marked symptoms, is best combated by a drop or two of *tincture of hops* in sweetened water. *Throughout* the *whole period* of *dentition*, the *use* of *warm dry clothing*, freedom from *tight bandages*, with *thorough ventilation*, good *nursing exercise, fresh air* without undue exposure, abundance of "*crawling on the carpet*," and frequent *warm baths*, will be found most advantageous. Indeed the *last*, without other treatment, is often sufficient to subdue the most distressing convulsions, and the most obstinate diarrhœa; and in no case can they do harm. See *Nursing, Strophulus, &c.*

TEKORETINE. A crystalline resinous principle obtained from *turf.*

TELA VESICATORIA. See *Vesicants.*

TELESCOPE. See *Glass, Speculum Metal, &c.* The *metal* used for the *specula* of Lord Ross's great 53-feet reflecting telescope is an alloy of *copper* and *tin* in atomic proportions. One of these specula weighs 3½ tons; the other, 4 tons; they are each of them 6 feet in diameter.

TELLURETTED HYDROGEN. See *page* 584.

TELLURIC ACID. Syn. *Teroxide of Tellurium. Prep.* Equal parts of *tellurous acid* and *carbonate of soda* are fused together, the product dissolved in *water*, a little *hydrate of soda* added, and a *stream of chlorine* passed through the solution; the liquid is next saturated with *ammonia*, and mixed with *solution of chloride of*

barium, by which a white insoluble precipitate of *tellurate of baryta* is thrown down; this is washed and digested with 1-4th of its weight of *sulphuric acid* diluted with *water;* the filtered solution gives, on evaporation in the air, large crystals of *telluric acid.*

Prop., &c. Soluble in water; a strong heat renders it anhydrous, and insoluble, even in boiling liquor of potassa; a red heat converts it into *tellurous acid;* its salts (*tellurates*) are uncrystallizable; those of the earths, insoluble.

TELLURIUM. A rare grayish white metal, found only in small quantities, in the metallic state, in the gold mines of Transylvania.

Prep. The native *sulpho-telluret of bismuth*, of Chemnitz, in Hungary, reduced to fine powder, is mixed with an equal weight of *dry carbonate of soda*, the mixture made into a *paste* with *oil*, and heated to whiteness in a closely covered crucible; *telluret* and *sulphuret of sodium* are produced, and *metallic bismuth* set free; the fused mass is dissolved in water and the solution freely exposed to the air, when the sodium and sulphur oxidize to *caustic soda* and *hyposulphite of soda*, whilst the *tellurium* separates in the metallic state.

Prop., &c. It possesses a colour and lustre closely approaching those of silver; is brittle; fuses below redness; burns in the air when heated; and is volatilized at a red heat; sp. gr. 6·2578. With *oxygen* it forms two compounds, both of which exhibit acid properties. It also forms two compounds with *chlorine.*

TELLUROUS ACID. *Prep.* By burning *tellurium* in the air; or, by heating it, in fine powder, with *nitric acid* of the sp. gr. 1·25; the solution, thus obtained, deposits white anhydrous octahedral crystals of *tellurous acid* on standing. *Hydrated tellurous acid* is also thrown down when *tellurite of potassa* is mixed with *nitric acid* in slight excess. In this state it is a white powder, soluble to a certain extent in water, and reddens litmus. Under both forms it is easily soluble in alkaline solutions. Its salts are called *tellurites.*

TEMPERANCE. See *Abstinence, Intemperance, Summer Beverages, &c.*

TEMPERATURE. "We measure the degree of heat by Fahrenheit's thermometer. When we direct a *boiling heat*, we mean that of 212°. We call a *gentle heat* that which is denoted by any degree between 90° and 100° Fahr."

"Whenever specific gravity is mentioned, we suppose the substance spoken of to be of the temperature of 62° Fahr." (Ph. L.)

In the Ph. E. & D., and in chemical works in this country generally, the specific gravities of bodies are taken at, or referred to the temperature of 60° Fahr.

TENCH. The *cyprinus tinca* (Linn.), a soft-finned abdominal fish (*malacopterigii abdominales*), formerly employed in medicine, but now only known as an easily digestible, and nice-flavoured fresh-water fish.

TENT. A piece of *lint*, or *compressed sponge*, used to dilate openings, wounds, &c.

TER-, See *Nomenclature.*

TERBIUM. A new metal found by Prof. Mosander, associated with *erbium* and *yttrium* in ordinary *yttria.* See *Erbium* and *Yttria.*

TEREBENE. A hypothetical principle supposed to exist in the *liquid hydrochlorate of oil of turpentine.*

TEREBYLENE. A volatile, oily liquid, obtained by distilling the *liquid hydrochlorate of oil of turpentine* with *quicklime.*

TERRA, (Lat.) Earth. *Terra Japonica*, catechu; *terra ponderosa*, sulphate of baryta; &c.

TERRA COTTA. Literally, *baked clay;* a term applied to statues, architectural ornaments, &c., made of pure white clay fine sand, and powdered potsherds, slowly dried, and baked to a strong hardness.

TERTIAN. See *Ague.*

TESTS or *reagents* are substances employed to determine the name or character of any other substance, or to detect its presence in compounds. They are used in both the solid and fluid state; generaliy the latter, when they are known as *liquid tests.* Their *application* as *reagents* is called "*testing.*" For this purpose they are commonly added, drop by drop, to the *liquid to be tested* contained in a *test-tube* or *test-glass.* A *simple way* of employing them, is to place a few drops of the *liquid* or *substance* for examination on a *slip* of *common white glass*, and to add to them a drop of the *test-liquid.* By placing the glass over a sheet of white paper, the effect will be rendered more perceptible. See *Test Papers, &c.*

TESTING. Assay by cupellation.

TETANINE. See *Strychnine.*

TETANUS. Spasm with rigidity. When it affects the under jaw, it is called *trismus* or *locked-jaw;* when the body is drawn backward by the contraction of the muscles, it is called *opisthotonos;* when the body is bent forward, *emprosthotonos;* and when

the body is drawn to one side, *pleurosthotonos*.

The *cause* of *tetanus*, in *temperate climates*, is generally irritation of the nerves, arising from local injuries, especially punctured or lacerated wounds. Of these the most trivial are occasionally sufficient to produce *locked-jaw*. Thus, a lady known to the writer lost her life in this way from simply cutting one of her corns carelessly; and a young man of our acquaintance, in the full vigour of life and health, died after a few days' illness, from his foot having been slightly punctured by an old nail on which he accidentally trod. In *hot climates* the disease is occasionally produced by exposure to cold, or by suddenly suppressed perspiration. The last variety is curable; the former one, scarcely ever so. The proper *treatment* is a matter still undetermined. *Sedatives*, *antispasmodics*, and *powerful stimulants*, have each had their advocates. Large doses of wine and spirits, in conjunction with opium, have occasionally been administered with success. *Electricity* and the *vapour bath* have also proved useful. In all cases the bowels should be moved by *active aperients*, either by the mouth or per anum.

TETRATHIONIC ACID. See *Trithionic Acid*.

TETTERS. The popular name of several cutaneous diseases.

Branny tetter, or *pityriasis*, is an eruption in which there is a dry and reddened state of the skin, occurring in patches of every variety of size, and marked by the copious production of minute bran-like scales. It is always accompanied by itching more or less severe, and sometimes unendurable. The face, scalp, breast, hands, and feet, are the parts usually attacked. The *treatment* is similar to that of the other scaly eruptions.

Crusted Tetter, or *ecthyma*. See *page* 380.

Dry Tetter. See *Psoriasis*.

Humid Tetter. Several vesicular eruptions which are accompanied by a watery discharge, and the formation of a thick crust are known by this name; but chiefly the variety called by surgeons, *eczema*. This affection is frequently observed in irritable habits, and is occasionally mistaken for the itch. It consists of small vesicles, often forming patches or blotches, and produces, as these die off, a desquamation of the cuticle. The discharge, left to itself, dries up by evaporation, and forms a crust which gets progressively thicker. Around the lips and on the face of children this crust not unfrequently forms, as it were, a mask; and on the scalp it mats the hair together, and is peculiarly unpleasant. Eczema exhibits several degrees of severity. When it attacks the scalp it is often called the *humid scall*, and constitutes one of the most common varieties of "*scald head*." A milder form of this disease which attacks the face of infants, during lactation, is often called the *milk-scall*. The *treatment* of this and allied affections is noticed at *page* 380.

Yellow Crusted Tetter, or *impetigo*, is a pustular eruption, that has been generally referred to at *page* 380. "*Impetigo*, in one respect, resembles the humid tetter, namely, in the oozing of fluid from the excoriated skin. It is this fluid, or humour, which causes the great thickness of the crusts, and their reproduction when once removed. A resemblance may be traced, also, in the manner of evolution of the eruption, for sometimes the mattery pimples break out in clusters of regular form and various size upon a single part of the body, and at other times they are scattered irregularly over the entire surface of the skin; the former is termed *figured* (*impetigo figurata*), the latter *scattered* (*impetigo sparsa*); the former presents occasionally another peculiarity, namely, growth by the circumference and evanescence in the centre, forming a *crusted ringworm*." (Eras. Wilson.)

THEBAINE. Syn. *Thebaia*, *Paramorphia*. A crystaline substance obtained by Thibourméry from an *infusion of opium* that has had its morphia extracted by acting on it by an excess of *lime*. The residuum dissolved in *dilute acid*, precipitated by *ammonia*, and the precipitate dissolved in *alcohol* or *ether*, yields *pure thebaine* on evaporation.

Prop., &c. It forms, when pure, colourless needles, like those of narcotine; it has a sharp metallic taste; is fusible; strongly alkaline, soluble in ether; freely soluble in alcohol; and scarcely soluble in water; with the weak acids it forms salts which do not readily crystallize. It is *distinguished* from *morphia* by its insolubility in potassa; by not becoming *blue* on the addition of sesquichloride of iron, and by not being *reddened* by nitric acid. It is *distinguished* from *codeia* by both itself and salts being difficultly crystallizable. (Kane.) 1 gr. injected into the jugular vein of a dog, acts like strychnia, and causes tetanus and death in a few minutes. (Magendie.)

THEINE. Syn. *Theina*. A peculiar crystallizable azotized substance extracted

from tea. It is identical with *caffeine*, and may be obtained from *tea* in the same manner as that substance is from coffee. The best *gunpowder* tea contains fully 6% of *theine*, about one half of which is lost in the present careless mode of making *infusion of tea* for the table.

According to Prof. Liebig, the daily use of tea and coffee is capable of effecting important services in the animal economy. "We may consider these vegetable compounds (*théine* and *caffeine*), so remarkable for their action on the brain, and the substance of the organs of motion, as elements of food for organs as yet unknown, which are destined to convert the blood into nervous substance, and thus recruit the energies of the moving and thinking faculties." M. Peligot, at a recent meeting of the French Academy of Sciences, expressed his belief that "tea contains essential principles of nutrition, far exceeding in importance its stimulating properties; and is, in every respect, one of the most desirable articles of general use." "The nutritious qualities of tea and coffee, as compared with those of soup, are vastly in favour of the former."

THENARD'S BLUE. See *Blue Pigments* and *Ultramarine.*

THEOBROMINE. A peculiar principle, closely resembling caffeine or theine, found by Woskresensky in the *seed* of the *theobroma cacao*, or the nuts from which chocolate is prepared. Its form is that of a light, white, crystalline powder, which is rather less soluble than caffeine. It is obtained like caffeine.

THERIACA. A name given in ancient pharmacy to various compound medicines, chiefly electuaries or confections, employed as antidotes to poisons or infection. The *theriaca Andromachi*, Ph. L. 1746, contained above 60 ingredients. *Mithridate* and *Venice treacle* are examples of this class.

THERMOMETERS. *Fahrenheit's thermometer* is the one universally employed in England, while *Celsius'*, or the *centigrade scale*, is principally used on the continent. *Reaumur's* is another scale occasionally employed. De Lisle's thermometer was formerly used in Russia, and some other parts of the North of Europe. As references to these scales are frequently met with in books, it is useful to know their relative value, and the method of reducing the one to the other. The BOILING POINT *of water* is indicated by 212° on *Fahrenheit's scale*, 100° on the *centrigrade scale*, 80° on that of *Reaumur*, and 0° on that of *De Lisle;* the FREEZING-POINT *of water* marks 32° *Fahrenheit*, and 0° or zero, on the *centigrade* and *Reaumur*, and 150° on the scale of De Lisle. The 0° or zero of Fahrenheit is 32° below the freezing point of water.

1. To reduce *Centigrade* degrees to those of FAHRENHEIT, *multiply* them by 9, *divide* the *product* by 5, and to the *quotient* add 32; that is—

$$\frac{\text{Cent.}^\circ \times 9}{5} + 32 = \text{Fahr.}^\circ$$

2. To reduce FAHRENHEIT'S degrees to *Centigrade*:—

$$\frac{\text{Fahr.}^\circ - 32 \times 5}{9} = \text{Cent.}^\circ$$

3. To reduce *Reaumur's* to FAHRENHEIT'S:—

$$\frac{\text{Reau.}^\circ \times 9}{4} + 32 = \text{Fahr.}^\circ$$

4. To convert FAHRENHEIT'S to *Reaumur's*:—

$$\frac{\text{Fahr.}^\circ - 32 \times 4}{9} = \text{Reaumur.}^\circ$$

Thermometers intended to register extreme degrees of heat are called *Pyrometers* (which see).

THIALDINE. *Prep.* Crystallized *aldehyd-ammonia*, 1 part; is dissolved in *water*, 14 parts; and the solution, after being *very slightly* alkalized with *caustic ammonia*, is subjected to a feeble stream of *sulphuretted hydrogen;* the white crystalline deposit formed after some time, is washed with a little *cold water*, dissolved in *ether*, the solution mixed with a *little alcohol*, and then abandoned to spontaneous evaporation. It forms large, regular, transparent, colourless, rhombic prisms; it melts at 110° Fahr.; is aromatic; neutral; freely soluble in alcohol and ether; scarcely soluble in waters; and forms crystallizable salts with the acids. Heat decomposes it.

THIONURIC ACID. A white crystalline acid, obtained by the action of a *saturated solution of sulphurous acid* in *water*, in slight excess, on a *cold solution of alloxan.* Its saturated solution, heated to the boiling-point, congeals into a semi-fluid, crystalline mass of *uramile.*

THIOSINNAMINE. A peculiar substance formed when the *volatile oil of black mustard seed* is placed in contact with a solution of *pure ammonia.* Colourless prismatic crystals, which are basic, bitter-tasted, and soluble in water.

THORINA. Syn. *Thoria, Oxide of Thorium.* A primitive earth discovered by Berzelius, in 1828, in a rare mineral called *thorite.*

Prep. The mineral is reduced to powder, digested in *hydrochloric acid*, and the resulting solution evaporated to dryness; the residuum is redissolved in *dilute acid*, the solution, after filtration, treated with *sulphuretted hydrogen*, and then precipitated with *pure ammonia;* the precipitate after being washed with *water*, is exposed to a red heat.

Prop., &c. A very heavy white powder; insoluble in all acids except the sulphuric; it is precipitated as a hydrate by caustic alkalies, and is then easily soluble in the acids and alkaline carbonates. It is *distinguished* from all the other earths by its great density, its sp. gr. being 9·402.

THORIUM. The metallic base of thorina. It is obtained by the action of *potassium* on the *chloride of thorium*, and washing the resulting mass in water.

THORN-APPLE. The *datura stramonium* (Linn.) The *leaves* (*stramonii folium*, —Ph. L.) and the *seeds* (*stramonii semen*, —Ph. L.; *Stramonium*,—Ph. E. & D.) are officinal. Both are anodyne, narcotic, and sedative; but not hypnotic. The whole plant is intensely *poisonous.* No antidote is known. The *leaves* are occasionally *smoked* to relieve the paroxysms of spasmodic asthma; but should be used with caution. General Gent, who introduced the practice into England from Ceylon, fell a victim to it. *Dose.* 1 to 4 or 5 gr.; in asthma, gout, headache, severe chronic pains, &c. It is said to be almost specific in many of the last.

THRIDACE. See *Lactucarium.*

THROAT AFFECTIONS. We intend here only to allude to those arising from exposure or cold. The list is therefore a short one. *Croup*, one of the most important, has been already briefly noticed.

Quinsy or *inflammatory sore-throat*, the *tonsillitis phlegmonoides* of medical writers, commonly commences with stiffness and pain on one side of the throat, and swelling of the tonsils, attended by febrile symptoms which increase as tumefaction advances, and sometimes become extreme. There is great restlessness and anxiety, considerable difficulty in swallowing even liquids, the respiration is painful and laborious, and the speech obstructed. When the inflammation is not resolved, these symptoms rapidly increase in severity, the patient suffers the greatest misery, the tumour suppurates rapidly, the abscess bursts, and with the rupture comes almost immediate relief. It occasionally happens that the other side of the throat then becomes affected, and goes through the same stages; but in general this is not the case, and the patient rapidly recovers, a few detergent gargles, and a light nutritious diet being all that is required. Sometimes, at the very commencement of the attack, the inflammation may be resolved by the patient sucking a lozenge or powder, every hour or two, containing ¼ or ½ gr. of *tartarized antimony* carefully triturated with about 20 gr. of *lump sugar;* so as to keep up a constant state of nausea or vomiting for hours.

Malignant sore throat (*angina, cynanche*, or *tonsillitis maligna*) is marked by the inflammation of the tonsils being more superficial; but no sooner does it occur than it passes into small ulcers of varied colours and appearance, extending to the pharynx, and spreading over the whole fauces, into the nostrils, and even around the glottis, and down the œsophagus. These ulcers rapidly slough, and the febrile symptoms of a typhoid character which are present throughout, become more or less severe. In this way the disease often hastens to a fatal termination, and, being highly contagious, often extends itself to all, or nearly all the members of a family. The *treatment* must be similar to that adopted for typhus fever. *Stimulating gargles* containing *capsicum*, the *mineral acids*, or *port wine*, are useful local remedies.

THRUSH. Syn. *Aphtha*,—Lat. A disease of infancy, which in its common form, is marked by small white ulcers upon the tongue, palate, and gums. In some cases it extends through the whole course of the alimentary canal, and, assuming a malignant form, proves fatal. The *treatment* consists of a gentle emetic of ipecacuanha wine, followed by an occasional dose of *rhubarb-and-magnesia*, to keep the bowels clear, and to arrest diarrhœa. The ulcerations may be touched with a little *honey of borax;* and if they assume a dark colour, or there be much debility, astringents and tonics should be had recourse to. In all cases the diet should be light, but supporting; as imperfect nutrition is a common cause of the disease.

TIC DOULOUREUX. According to a writer in one of the medical periodicals, a *solution* of *atropia*, 2 gr., in *water*, 1 fl. dr., to which *nitric acid*, 1 drop (minim), has been previously added, applied as a paint, by means of a camel's hair pencil to the part of the face over the spot affected, im-

mediately and completely subdues the pain, or at all events within 3 to 5 minutes, in all accidental cases, and affords considerable relief in others. The application is to be continued until some relief is experienced. The solution, being very *poisonous*, must not be taken internally, nor applied to the skin when broken. See *Atropia* and *Neuralgia*.

TIGLINE. The acrid principle of *croton oil*.

TIN. Syn. *Stannum*.—Ph. E. & D. This metal has been known from the most remote antiquity, being mentioned in the books of Moses (*Numb.* xxxi, 22), and by Homer (*Iliad*, x, 25), and other early writers. The ancients obtained it principally, if not solely from Cornwall. The Phœnicians traded with England for this metal, at least 1000 years before the birth of Christ.

Tin occurs in nature in the state of oxide, and, more rarely as sulphuret (*tin pyrites*). In Cornwall it is found under the form of *tin-stone* (peroxide), associated with copper ore, in the slate and granite rocks, and as an alluvial deposit (*stream tin*) in the beds of rivers.

Prep. The *ore* is first reduced to powder in *stamping mills*, *washed* to remove earthy matter, and then roasted to expel arsenic and sulphur; it is next *deoxidized* or *reduced* by smelting it with about 1-6th of its weight of *powdered culm*, and a little *slaked lime*; it is, lastly, *refined* by *liquation*, followed by a second smelting of the *purer portion*, which, after being treated, in a state of fusion, for some time with *billets of green wood*, or "*tossed*," as the workmen call it, is allowed to settle, and is then cast into moulds, forming *refined* or *block tin*. Sometimes the *blocks* are afterwards heated until they become brittle, when they are allowed to fall from a considerable height, by which they are broken into small fragments which form *grain tin* or *tin in tears*.

Prop. Tin approaches silver in whiteness and lustre; in hardness it is intermediate between gold and lead; it is very malleable when pure, but the presence of a very small quantity of any other metal, particularly lead, deprives it of this property; when rubbed it evolves a peculiar odour, and when bent backwards and forwards it emits a peculiar crackling noise; it melts at 442° Fahr.; volatilizes at a white heat; and when heated to redness with free access of air, is speedily converted into the pulverulent *gray protoxide*, and by longer ignition, into a yellowish-white powder, which is the *peroxide*, or the *putty powder* of polishers. Sp. gr. 7·29 to 7·31.

Pur. "It is almost entirely dissolved by hydrochloric acid, yielding a colourless solution; the precipitate thrown down by potash is white, and soluble in excess of the precipitant." (Ph. L. 1836.) If it contain ARSENIC brownish black flocks will be separated during the solution, and arseniuretted hydrogen evolved, which may be inflamed and tested in the usual manner. (See *p.* 89-91.) The presence of other metals in tin may be detected by treating the *hydrochloric solution* with *nitric acid*, sp. gr. 1·16, first in the cold, and afterwards with heat, until all the tin is thrown down in the state of *insoluble peroxide*. The decanted *acid solution* from PURE TIN leaves *no residuum* on evaporation. If, after all the acid has been dissipated by heat, dilution with *water* occasion a heavy white precipitate, the tin contained BISMUTH; if, after dilution, a *solution of sulphate of ammonia* or *of soda* produce a similar white precipitate (*sulphate of lead*), it contained LEAD; if liquor of ammonia, added in excess, occasion reddish-brown flocks, or if *red prussiate of potash* give a blue precipitate, it contained IRON; and, if the *clear supernatant liquid* leave a residuum on evaporation, it is COPPER. If the first solution be made in a large quantity of *dilute hydrochloric acid* to which a few drops of *dilute nitric acid* be from time to time added, the whole of the ARSENIC will be left in an insoluble metallic state.

Tests. The salts of *protoxide of tin* are characterised as follow:—1. Caustic potassa gives a bulky white precipitate, readily soluble in excess of the precipitant; on concentrating the solution the precipitate is changed from hydrated protoxide to peroxide, which remains in solution, and metallic tin, which separates in brown flakes.—2. Ammonia, and the carbonates of potassa, soda, and ammonia, give white precipitates insoluble in excess.—3. Sulphuretted hydrogen gives, in neutral and acid solutions, a dark brown precipitate, which is soluble in liquor of potassa, in the alkaline sulphurets (especially when they contain an excess of sulphur), and in strong hot hydrochloric acid; and insoluble in nitric acid, even when boiling.—4. Hydrosulphuret of ammonia produces a like brown precipitate, soluble in excess of the precipitant, provided the latter contains an excess of sulphur.—5. Terchloride of gold gives, in the cold, on the addition of a little nitric acid, a precipitate of the purple of Cassius.—6. Bichloride of mercury gives a black precipitate, but, in excess, it produces a white one.—7. Bichloride of platinum gives an orange-coloured precipitate.

The *salts* of *peroxide of tin* behave with reagents as follows:—1. Potassa, ammonia, and their carbonates give a white precipitate which is freely soluble in an excess of potassa and in acids, sparingly soluble in excess of ammonia, only very slightly soluble in excess of carbonate of potassa, and insoluble in excess of carbonate of ammonia. —2. Sulphuretted hydrogen gives, in acid and neutral solutions, a golden-yellow precipitate, either at once, or on heating the liquid, which is readily soluble in pure potassa, the alkaline sulphurets, and boiling hydrochloric acid; less soluble in liquor of ammonia, and insoluble in nitric acid.—3. Hydrosulphuret of ammonia gives a similar precipitate, freely soluble in excess of the precipitant, and again precipitated unaltered by acids.—4. A plate of metallic zinc throws down metallic tin, under the form of gray scales or a spongy mass, from solutions free from nitric acid; and from those containing free nitric acid, white hydrated peroxide of tin, or a mixture of the oxide and metal.—5. Bichloride of mercury gives a white precipitate.—6. Ferrocyanide of potassium gives no precipitate at first, but after a time the whole forms a thick jelly.

Assay. Each grain of peroxide of tin (see above), after being washed and gently ignited, is equivalent to 0·78365 gr. of PURE TIN. The *loss of weight* represents the impurities. Each gr. of *sulphate of lead*, so treated, is equiv. to 0·683 gr. of METALLIC LEAD (nearly).

Uses. The uses of tin in the *arts* are well known. In *medicine* 1 to 3 dr. of the *filings* or *powder*, made into an electuary with *treacle*, are sometimes given in tapeworm, for 2 or 3 successive mornings, followed by an aperient.

TIN (Chlorides of) Of these two are known:—

TIN (Protochloride of). Syn. *Chloride of Tin, Muriate of do.; Stanni Chloridum, Stanni Murias,*—Lat. *Prep.* 1. (*Anhydrous.*) By transmitting *hydrochloric acid gas* over *grain-tin* heated in a glass tube; or, better, by distilling a mixture of *chloride* of *mercury* and *tin* in fine powder. Gray; solid; resin-like; fusible; and volatile.

2. (*Liquid* or *hydrated.*) By digesting *granulated tin* in hot *hydrochloric acid* as long as any hydrogen gas is evolved, observing to keep an excess of tin always present. *Used* as a powerful deoxidizing agent. It may be obtained in needle-like crystals by cautious evaporation.

TIN (Perchloride of). Syn. *Bichloride of Tin, Permuriate of do.; Stanni Bichloridum, Stanni Permurias,*—Lat. *Prep.* 1. (Liebig.) By dissolving *grain-tin* in a mixture of *hydrochloric acid*, 2 parts; *nitric acid* and *water*, of each, 1 part; (all by volume;) observing to add the tin by degrees, and to allow one portion to dissolve before adding another; as without this precaution the action is apt to become violent, and peroxide of tin to be deposited. (See *below.*)

2. (*Anhydrous; Libavius's Fuming Liquor.*) By heating *protochloride of tin* in *chlorine gas;* or, by distilling a mixture of *powdered tin*, 1 part; with *corrosive sublimate*, 3 parts (5 parts,—Fownes). A very volatile, colourless, mobile liquid, which fumes in the air, and boils at 248° Fahr.; when mixed with 1-3rd of its weight of water, it solidifies to a crystalline mass.

Obs. Liquid bichloride of tin is much used by dyers, under the name of *Spirits of Tin, Dyer's Spirits, Tin Mordant, &c.*, the proportions of the ingredients and the state of dilution being various according to circumstances, or the caprice of the manufacturer. A process which has been highly recommended, and which seems preferable to all others, is to prepare a simple solution of the *proto-chloride*, and to convert it into a solution of the *bichloride*, either by the addition of *nitric acid* and a gentle heat, or by passing *chlorine* through it. See *Tin Mordants.*

TIN (Subchloride of). Syn. *Oxychloride of Tin, Submuriate of do.* A white powder, obtained by pouring a large quantity of *water* on *crystallized protochloride of tin.* Insoluble.

TIN (Iodides of). *Prep.* 1. (*Iodide of Tin, Protiodide of do.; Stanni Iodidum,*—Lat. *Granulated tin*, 2 parts; *iodine*, 5 parts; heat them together. A fusible, brownish-red, translucent substance, soluble in water.

2. (*Periodide.*) By dissolving *hydrated peroxide of tin* in *hydriodic acid.* Yellow, silky crystals.

TIN (Oxides of). *Prep.* 1. (*Oxide* or *Protoxide; Stanni Oxydum,*—Lat.) Precipitate a *solution* of *protochloride of tin* with *carbonate of potassa;* well wash and dry the powder at a heat under 196° Fahr., with as little exposure to the air as possible. A white, or grayish-white powder, soluble in acids and in the pure fixed alkalies. When heated in an atmosphere of carbonic acid it loses its water, and changes to a dense, black powder, which is the *anhydrous protoxide.* In this state it is nearly insoluble in acids; kindled in the air, it burns like tinder, producing the binoxide.

2. (*Sesquioxide.*) Obtained by mixing *fresh, moist hydrated peroxide of iron* with a solution of the *neutral protochloride of tin.* It falls as a gray, slimy precipitate, which is soluble in hydrochloric acid and ammonia. (Fuchs.)

3. (*Binoxide, Peroxide; Stannic Acid.*)—*a.* By adding *potassa* or an *alkaline carbonate* to a solution of *perchloride of tin.* Soluble in acids and pure alkalies. Its compounds with the latter are sometimes called *stannates.* (See *p.* 1154.)

b. By the action of *nitric acid* on *metallic tin;* the resulting white powder being well washed with water; or by heating *metallic tin* above its melting point, in the air. Yellow; anhydrous; insoluble.

Obs. Frémy has given the name of *metastannic acid* to the oxide prepared by the action of nitric acid on metallic tin; the other (3, *a*,) he calls *stannic acid.* (See *p.* 1083.)

TIN (Sulphurets of). There are three sulphurets of tin corresponding to the oxides just referred to:—

TIN (Protosulphuret of). Syn. *Sulphuret of Tin, Sulphide of do. Prep.* A brittle bluish-gray compound, obtained by agitating *melted tin* with its own weight of *sulphur,* in a close vessel, and, afterwards, strongly heating the product.

TIN (Sesquisulphuret of). A yellowish-gray compound, formed by heating the *protosulphuret,* mixed with 1-3rd of its weight of *sulphur,* to low redness.

TIN (Bisulphuret of). Syn. *Bisulphide of Tin, Bronze Powder, Mosaic Gold; Aurum Musivum, Aurum Mosaicum, Stanni Bisulphuretum,*—Lat. *Prep.* 1. To *pure tin,* 12 *oz.,* melted by a gentle heat, add of *mercury,* 6 *oz.;* to the powdered mass, when cold, add of *sal ammoniac,* 6 *oz.; flowers of sulphur,* 7 *oz.;* and, after thorough admixture, place the compound in a glass flask or matrass, and gradually heat it, imbedded in sand, to low redness, and continue the heat for several hours, or until white fumes cease to be disengaged; cinnabar, protochloride of tin, and sal ammoniac sublime, whilst the *aurum musivum* remains at the bottom of the vessel under the form of soft, and very brilliant, gold-coloured flakes.

2. (Berzelius.) *Peroxide of tin* and *sulphur,* of each, 2 parts; *sal ammoniac,* 1 part; mix, and expose it to a low red heat in a glass or earthenware retort, until sulphurous fumes cease to be evolved.

3. (Marquis de Bullion.) *Tin* and *mercury,* of each, 8 *oz.;* mix, add to the amalgam, *sulphur,* 6 *oz.; sal ammoniac,* 4 *oz.;* mix well, and expose the compound for 3 hours on a sand heat, so as to render the bottom of the matrass *obscurely* red.

4. (Chaptal.) As the last, but expose the matrass to a naked fire, and apply a violent heat, when the mixture will take fire, and a sublimate will form in the neck of the matrass, consisting of very beautiful *aurum musivum,* in hexagonal plates.

Obs. In the firing or sublimation, if too great a heat be employed, only a gray sulphuret of tin is obtained. *Used* as a metallic gold colour, or substitute for powdered gold, in bronzes, varnish work, sealing-wax, &c.

TIN (Crystallized). See *page* 799.

TIN FILINGS. See *below.*

TIN GLASS. See *Bismuth.*

TIN MORDANTS. Syn. *Dyer's Spirit, Solution of Tin, Spirit of do., Nitromuriate of Tin.* These, as noticed above, vary greatly in their composition and character.

Prep. 1. Take of *aquafortis,* 8 parts; *sal ammoniac* or *common salt,* 1 part; dissolve, and add, very gradually, of *grain-tin,* 1 part; and, when dissolved, preserve it in stoppered bottles from the air. This is the common "*spirit of tin*" of the dyers.

2. (Berthollet.) *Nitric acid,* at 30° Baumé, 8 parts; *sal ammoniac,* 1 part; dissolve, then add by degrees, of *tin,* 1 part; and when dissolved, dilute the solution with 1-4th of its weight of water.

3. (Dambourney.) *Hydrochloric acid,* at 17° Baumé, 4 parts; *nitric acid,* at 30° Baumé, 1 part; mix, and add by degrees, of *Molucca tin,* 1 part.

4. (Hellot.) *Nitric acid* and *water,* of each, 1 *lb.; sal ammoniac,* 1 *oz.; nitre,* ½ *oz.;* dissolve, then add, by degrees, of *granulated tin,* 2 *oz.*

5. Poerner.) *Nitric acid* and *water,* of each, 1 *lb; sal ammonia,* 1½ *oz.;* dissolve, then add, by very slow degrees, of *pure tin beaten into ribands,* 2 *oz.*

6. (Schoeffer.) *Nitric acid* and *water,* of each, 2 *lb.; sal ammoniac,* 2 *oz.; pure tin,* 4½ *oz.;* as last. All the above are used chiefly for dyeing scarlet, more particularly with cochineal.

7. (*Lac Spirit.*) From *grain-tin,* 1 *lb.;* slowly dissolved in *hydrochloric acid* (sp. gr. 1·19), 20 *lb.* Recommended as a *solvent* for *lac dye.* For use, ¾ to 1 *lb.* of the liquid is digested on each *lb.* of the dye for 5 or 6 hours, before adding it to the dye-bath. See *Mordants, Stannate of Soda, &c.*

8. *Hydrochloric acid,* 6¾ *lb.; aquafortis,* ½ *lb.; grain-tin,* gradually added, 1 *lb.* Recommended for *lac dye.*

TIN-PLATE. Iron-plate covered with a *coating of tin*, by dipping it into a bath of that metal.

TIN POWDER. Syn. *Tin Filings, Tin Dust; Stanni Pulvis*,—Ph. E. & D. *Prep.* 1. (Ph. E.) Melt *grain-tin* in an *iron vessel*, pour it into an earthenware mortar heated a little above its melting point, and triturate briskly as the metal cools; lastly, sift the product, and repeat the process with what remains in the sieve.

2. (Ph. D.) Melt *grain-tin* in a *black-lead crucible*, and, whilst it is cooling, stir it with a *rod of iron* until it is reduced to powder; let the finer particles be separated by means of a sieve, and when, after having been several times in succession shaken with distilled water, the decanted liquor appears quite clear, let the product be dried for use.

Obs. Powdered tin is also prepared by filing and rasping. *Dose.* 2 to 4 dr., as a vermifuge. *Polisher's putty*, coloured with ivory black, is frequently substituted for this powder, and hence arises the *ill effects* that sometimes follow its use.

TINNING. *Proc.* 1. *Plates* or *vessels of brass* or *copper*, boiled with a *solution of stannate of potassa*, mixed with *turnings of tin*, become, in the course of a few minutes, covered with a *firmly attached layer* of *pure tin*.

2. A similar effect is produced by boiling the articles with *tin filings* and *caustic alkali* or *cream of tartar*.

Obs. By either of the above methods *chemical vessels* made of *copper* or *brass* may be easily and perfectly tinned.

TINCAL. See *Borax*.

TINCTURE. Syn. *Tinctura*, — Lat. *Teinture*, — Fr. Tinctures (*tincturæ; alcoolés, alcoolatures;*) are solutions of the active principles of bodies, obtained by digesting them in alcohol more or less dilute. *Ethereal tinctures* (*tincturæ æthereæ; ethérolés, ethérolatures;*) are similar solutions prepared with ether. The merit of having *invented* tinctures is usually assigned to Arnoldus de Villa Nova, who was Professor of Medicine, at Montpellier, about the end of the 13th century. He was certainly the first person who systematically employed alcohol for the purpose of extracting the active principles of vegetable matter.

Prep. "Tinctures are usually prepared by reducing the solid ingredients to small fragments, coarse powder, or fine powder, macerating them for 7 days, or longer, in *proof spirit* or *rectified spirit*, straining the solution through *linen* or *calico* (or paper), and finally expressing the residuum strongly, to obtain what fluid is still retained in the mass. They are also advantageously prepared by the *method of displacement* or *percolation*." (Ph. E.) "All tinctures should be prepared in closed *glass* (or stoneware) *vessels*, and be shaken frequently during the process of maceration." (Ph. L.) *Cooper's patent jars* are very convenient for the preparation of tinctures, as they are made with wide mouths, large enough to admit the hand, and yet may be closed in an instant, with as much ease and certainty as an ordinary stoppered bottle.

Tinctures are better clarified by *repose* than by *filtration*, as in the latter case a considerable portion is retained by the filtering medium, and lost by evaporation. The *waste* in this way is never less than 10% of spirit. In all *ordinary cases*, it is sufficient to allow the tincture to settle for a few days, and then to pour off the clear supernatant portion through a *funnel* loosely choked with a piece of *sponge* or *tow;* after which the remaining foul portion of the liquid may be filtered through *bibulous paper* in a *covered* funnel. The filtration should be conducted as rapidly as possible, for the double purpose of lessening the amount lost by evaporation, and the action of the air on the fluid. Tinctures which have been long exposed to the air, frequently lose their transparency within a few days after being filtered, owing to the oxidizement and precipitation of some portion of the matter previously held in solution; a change which occurs even in stoppered bottles. *Resinous* and *oily tinctures*, as those of *myrrh*, *tolu*, and *lavender* (comp.), may be generally restored to their former brightness by the addition of a quantity of *rectified spirit*, equal to that which they have lost by evaporation; but many tinctures resist this mode of treatment, and require refiltering.

Ethereal tinctures are best prepared by *percolation*, and should be both *made* and *kept* in stoppered bottles.

Qual. The *tinctures* of the *shops* are usually very uncertain and inferior preparations, owing to their manufacture being carelessly conducted, and *refuse drugs* and an *insufficient quantity of spirit* being employed in their production. It is a general practice among the druggists to substitute a *mixture* of equal parts of *rectified spirit* and *water*, or a spirit of about 26 u. p., for PROOF SPIRIT; and a mixture of 2 gall. of *water* with 5 gall. of *rectified spirit*, for RECTIFIED SPIRIT. In some *wholesale drug-houses*, *all* the *simple tinctures* (except those that are of a very active or valuable kind, as laudanum, for instance) are made

with 1 *lb.* of the *dry ingredient* to the gall. of *spirit*, irrespective of the instructions in the pharmacopœia. Appearance is the object which is alone aimed at, without reference to quality. If the tincture be perfectly transparent, and has a good colour, the conscience of the seller and the stomach of the consumer are alike satisfied.

Assay. 1. The RICHNESS in ALCOHOL may be readily determined by the *method of alcoholmetry*, No. 6; but more accurately, by the *method* of M. Gay-Lussac (No. 7). That of tinctures containing simple extractive, saccharine, or like organic matter in solution, may be approximately found from the *boiling point*, or from the *temperature of the vapour* of the boiling liquid. (See *p.* 35-6.)

2. The QUANTITY of SOLID MATTER *per cent.* may be ascertained by evaporating to dryness 100 grains-measure, in a weighed capsule, by the heat of boiling water.

3. The QUANTITY of the INGREDIENTS used in the preparation of tinctures may be inferred from the *weight* last found, reference being had to the known per centage of extract, which the substances employed yield to spirit of the strength under examination. When the ingredients contain alkaloids, or consist of saline or mineral matter, an assay may be made for them.

Uses, &c. Tinctures, from the quantity of alcohol which they contain, are necessarily administered in small doses, unless in cases where stimulants are indicated. The most important and useful of them are those that contain very active ingredients, such as the *tincture of opium, foxglove, hemlock, henbane, &c.* In many instances the *solvent*, even in doses of a few fluid drachms, acts more powerfully on the living system than the principles it holds in solution; and when continued for some time, produces the same deleterious effects as the habitual use of ardent spirits. When the action of a substance is the reverse of stimulant, it cannot with propriety be exhibited in this form, unless the dose be so small that the operation of the spirit cannot be taken into account; as with the *narcotic tinctures.* Hence, this class of remedies are in less frequent use than formerly.

The following list embraces all the *formulæ* of the *tincturæ* of the British Pharmacopœias, with a few others likely to be useful to the reader. These will furnish *examples* for the preparation of others in less general use; care being had to proportion the ingredients with due reference to the proper or usual dose of tinctures of that class.

TINCTURE (Acetate of Iron). Syn. *Tinctura Ferri Acetatis*,—Ph. D. *Prep.* (Ph. D.) To *water*, 9 fl. oz.; add of *pure sulphuric acid*, 6 fl. dr.; and in the mixture, with the aid of a gentle heat, dissolve *sulphate of iron*, 8 *oz.*; next add of *pure nitric acid*, ½ fl. oz.; previously diluted with *water*, 1 fl. oz.; and evaporate the resulting solution to the consistence of a thick syrup; dissolve this in *rectified spirit*, 1 quart; also dissolve of *acetate of potassa*, 8 *oz.*, in another quart of *rectified spirit*; and having thoroughly mixed the solutions, by frequent agitation in a large bottle, filter the whole, with expression, first through *calico*, and then through *paper.* Sp. gr. 0·891. *Dose.* 15 to 60 drops, in water; in the same cases as the other chalybeates.

TINCTURE (Acetate of Zinc). Syn. *Tinctura Zinci Acetatis*, — Lat. *Prep.* (Ph. D. 1826.) *Acetate of potassa* and *sulphate of zinc*, of each, 1 oz.; rub them together, then add of *rectified spirit*, 16 fl. oz.; macerate for a week, and filter. Astringent. Diluted with water, it is used as a collyrium and injection.

TINCTURE (Aconite). Syn. *Tinctura Aconiti*—Ph. L. *Tinct. Aconiti Radicis*,—Ph. D. *Prep.* (Ph. L.) Take of *aconite root*, coarsely powdered, 15 oz. (20 *oz.*,—Ph. D.); *rectified spirit*, 1 quart; macerate for 7 days, press, and filter.

Obs. These tinctures differ materially in strength. *Dose.* Of the Ph. L., 5 to 10 drops; of the Ph. D., 3 to 6 drops, two or three times daily (carefully watching its effects); in rheumatism, gout, syphilis, &c., where a narcotic sedative is indicated. Diluted with water, it forms an excellent embrocation in rheumatism, neuralgia, &c. It should be applied by means of a small sponge, tied to the end of a stick or glass rod. The Ph. D. formula is nearly the same as that for Dr. Turnbull's *concentrated tincture of aconite root*, and that given by Dr. Pereira. The *tinctura aconiti foliorum*, of the Ph. U. S., is made with 1 oz. of the *dried* leaves, to 8 fl. oz. of *rectified spirit.*

TINCTURE (Aloes). Syn. *Tinctura Aloës*, — Ph. L. & E., & Ph. D. 1826. *Prep.* (Ph. L.) *Socotrine* or *hepatic aloes*, coarsely powdered, 1 oz.; *extract of liquorice*, 3 oz.; *water*, 1½ pint; *rectified spirit*, ½ pint; macerate for 7 days, and filter. The formula of the Ph. E. is nearly similar. Purgative and stomachic. *Dose.* ¼ to 1 fl. oz.

TINCTURE (Aloes,—Compound). Syn. *Tincture of Aloes and Myrrh; Tinctura Aloës Composita*,—Ph. L., & Ph. D. 1826.

Tinctura Aloës et Myrrhæ,—Ph. E. *Elixir Aloës*,—Ph. L. 1746. *Elixir Proprietatis*,—Ph. L. 1721. *Prep.* 1. (Ph. L. & E.) *Socotrine* or *hepatic aloes*, coarsely powdered, 4 oz.; *hay saffron*, 2 oz.; *tincture of myrrh*, 1 quart; macerate for 7 days, with occasional agitation, and strain. The Dublin College (1826) omits the saffron.

2. (*Wholesale.*) From *aloes*, 1 *lb.*; *myrrh*, ¾ *lb.*; *hay saffron*, 2 *oz.*; *rectified spirit*, 5 pints; *water*, 3 pints; as the last. Purgative, stomachic, and emmenagogue. *Dose.* ½ to 2 fl. dr.

TINCTURE (Ammonia, — Compound). Syn. *Tinctura Ammoniæ Composita*,—Ph. L. *Prep.* 1. (Ph. L.) *Mastic*, 2 dr.; *rectified spirit*, 9 fl. dr.; digest until dissolved, decant, add of *oil of lavender*, 14 drops; *stronger solution of ammonia*, 1 pint; and mix well.

2. (Ph. L. 1836; *Eau de Luce; Aqua Luciæ; Spiritus Ammoniæ Succinatus*,—Ph. L. 1788.) As the last, but adding 4 drops of *oil of amber* along with the oil of lavender.

Obs. This preparation is reputed antacid, antispasmodic, and stimulant. *Dose.* 10 to 20 drops, in water; in hysteria, low spirits, &c. In the East Indies, *eau de luce* is regarded almost as a specific for the bite of the *cobra di capello* and other venomous reptiles.

TINCTURE (Ammonio-chloride of Iron). Syn. *Ammoniated Tincture of Iron, Mynsicht's do. do.; Tinctura Ferri Ammoniochloridi*,—Ph. L. *Tinctura Ferri Ammoniati*,—Ph. L. 1824. *T. Martis Mynsichti*,—Ph. L. 1721. *Prep.* (Ph. L.) *Ammonio-chloride of iron*, 4 oz.; *proof spirit* and *distilled water*, of each, 1 pint; dissolve. *Dose.* 20 to 60 drops, or more; as a stimulant, chalybeate tonic. "A fl. oz. of this, on potassa being added, yields 5·8 gr. of sesquioxide of iron." (Ph. L.)

TINCTURE (Angustura). See *p.* 1233.

TINCTURE (Arnica). Syn. *Tinctura Arnicæ, Tinctura Arnicæ Florum*, — Lat. *Prep.* (Ph. Bor. and Hamb. Cod.) *Flowers of arnica montana*, 1½ oz.; *spirit*, sp. gr. 0·900 (15½ o. p.), 1 lb; digest for 8 days, and strain with expression. *Dose.* 10 to 30 drops; in diarrhœa, dysentery, gout, rheumatism, paralysis, &c.

TINCTURE (Arnica-root). Syn. *Tinctura Arnicæ Radicis*,—Lat. *Prep.* From *arnica root*, 2 *oz.*; *proof spirit*, 1 pint; as the last.

TINCTURE (Aromatic). See *page* 1233.

TINCTURE (Assafœtida). Syn. *Tinctura Assafœtidæ*,—Ph. L. E. & D. *Tinctura Fœtidæ*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Assafœtida* (small), 5 oz.; *rectified spirit*, 1 quart; macerate for 7 days (14 days,—Ph. D.), and filter. "It cannot be made by percolation without delay." (Ph. E.)

2. (*Wholesale.*) *Assafœtida*, 2½ *lb.*; *boiling water*, 2 quarts; dissolve, add of *rectified spirit*, 1½ gall.; agitate well for 3 or 4 days, then let it settle, and decant the clear portion. *Dose.* ½ to 2 fl. dr.; in hysteria, flatulent colic, &c.

TINCTURE (Assafœtida,—Ammoniated). See *Fœtid Spirit of Ammonia* (*page* 1172).

TINCTURE (Asthmatic). See *page* 1231.

TINCTURE (Balsam of Peru). Syn. *Tinctura Balsami Peruviani*,—Lat. *Prep.* (Ph. L. 1788.) *Balsam of Peru*, 4 oz.; *rectified spirit*, 16 fl. oz.; dissolve. Pectoral, stimulant, and fragrant. *Dose.* 10 to 30 drops.

TINCTURE (Balsam of Tolu). See *Tincture of Tolu.*

TINCTURE (Bark). See *Tincture of Cinchona.*

TINCTURE (Belladonna). Syn. *Tinctura Belladonnæ*,—Ph. L. & D. *Prep.* 1. (Ph L.) *Dried leaves of belladonna*, 4 oz. (5 *oz.*, in coarse powder,—Ph. D.); *proof spirit*, 1 quart; macerate for 7 days (14,—Ph. D.), press, and filter.

2. (*Wholesale.*) From the *dried leaves*, 1 *lb.*; *proof spirit*, 1 gall.; macerate 14 days. *Dose.* 5 to 10 drops, gradually increased; also, *externally*, diluted with water.

TINCTURE (Benzoin, — Compound). Syn. *Friar's Balsam, Traumatic do.; Tinctura Benzoini Composita*,—Ph. L. & E. *Tinct. Benzoës Comp.*,—Ph. D. 1826, & Ph. L. 1788. *Balsamum Traumaticum*,—Ph. L. 1746. *Balsam for Cuts, Commander's Balsam, Vervain's do., Wound do., Jesuits' Drops, Wade's do.*, — Obs. var. *Prep.* 1. (Ph. L.) *Gum benzoin*, coarsely powdered, 3½ oz.; *prepared storax*, 2½ oz.; *balsam of tolu*, 10 dr.; *socotrine* or *hepatic aloes*, in coarse powder, 5 dr.; *rectified spirit*, 1 quart; macerate, with frequent agitation, for 7 days, and strain.

2. (Ph. E.) *Benzoin*, 4 oz.; *balsam of Peru*, 2½ oz.; *East Indian* (hepatic) *aloes*, ½ oz.; *rectified spirit*, 1 quart.

Obs. Either of the above formulæ produces a most beautiful tincture, truly balsamic. The following is, however, very generally employed by the wholesale druggists, and the product, though possessing a very rich colour, is thin and watery.

3. (*Wholesale.*) From *gum benzoin*, 4 *lb.*; *aloes* (lively coloured), 1¼ *lb.*; *liquid storax*, 1 *lb.*; *balsam of tolu*, ¼ *lb.*; *powdered*

turmeric (best), 6 *oz.*; *rectified spirit*, 5½ gall.; digest with frequent agitation for 10 days, then add of *hot water*, 1½ gall.; again digest for 4 days, and, after 24 hours' repose, decant the clear portion.

Dose. 10 drops to 2 fl.dr.; as a stimulating expectorant, in chronic coughs, and various breath affections. It is also employed to stop the bleeding from cuts, &c., and promote their healing.

TINCTURE (Bitter Stomachic). See *page* 1234.

TINCTURE (Brandish's). See *p.* 1238.

TINCTURE (Buchu). Syn. *Tinctura Diosmæ; Tinctura Bucku*,—Ph. E. *Tinct. Buchu*,—Ph. D. *Prep.* (Ph. E.) *Buchu leaves*, 5 oz.; *proof spirit*, 1 quart; macerate 7 days (14 days,—Ph. D.); or proceed by the method of percolation. *Dose.* 1 to 4 fl. dr.; as a tonic, sudorific, and diuretic. It is inferior to the fresh infusion.

TINCTURE (Calumba). Syn. *Tinctura Calumbæ*,—Ph. L. & E. *Tinct. Colombæ*,—Ph. D. *Prep.* (Ph. L.) *Calumba root*, finely sliced, 3 oz.; *proof spirit*, 1 quart; macerate a week, (14 days,—Ph. D.), press, and filter. "Or, more conveniently by percolation, allowing the calumba, in moderately fine powder, to first soak in a little of the spirit for 6 hours." (Ph. E.)

Obs. This tincture is commonly made with 1 *lb.* of *calumba root* to the gallon of a mixture of equal parts of *rectified spirit* and *water*. *Dose.* 1 to 2 fl. dr.; as a stomachic bitter and tonic, usually joined with soda or chalybeates.

TINCTURE (Camphor). Syn. *Spirit of Wine and Camphor; Camphorated Spirit; Tinctura Camphoræ*,—Ph. E. & D., & Ph. L. 1836. *Spiritus Camphoræ*,—Ph. L. *Spiritus Camphoratus*,—Ph. D. 1826, & Ph. L. 1788. *Prep.* 1. (Ph. E.) *Camphor*, 2½ oz.; *rectified spirit*, 1 quart; dissolve. This is only one half as strong as the Ph. L. preparation.

2. (Ph. D.) *Camphor*, 1 *oz.*; *rectified spirit*, 8 fl. oz. Stimulant and anodyne. *Dose.* 10 to 60 drops. Also as a liniment for sprains, bruises, chronic rheumatism, &c. For the Ph. L. formula see *Spirits* (p. 1173).

TINCTURE (Camphor,—Compound). Syn. *Camphorated Tincture of Opium, Asthmatic Elixir, Paregoric Elixir, Asthmatic Tincture; Tinctura Camphoræ Composita*,—Ph. L. *Tinctura Opii Camphorata*,—Ph. E. & D., & Ph. L. 1788. *Elixir Paregoricum*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Camphor*, 50 gr.; *powdered opium* and *benzoic acid*, of each, 72 gr.; *oil of aniseed*, 1 fl. dr.; *proof spirit*, 1 quart; macerate for 7 days, and filter. The formulæ of the Ph. E. & D. are nearly similar. The *oil of aniseed*, probably one of the most useful and characteristic of the ingredients, was omitted in the Ph. L. 1824, but was restored in that of 1836.

2. (*Wholesale.*) From *powdered opium*, 3 *oz.*; *benzoic acid*, *camphor*, and *oil of aniseed*, of each, 2 *oz.*; *rectified spirit* and *water*, of each, 3 gall.; as before.

Obs. This tincture is a popular and excellent pectoral and anodyne, where there are no inflammatory symptoms. *Dose.* ½ to 2 fl. dr.; in troublesome coughs, &c. ½ fl. oz. contains about 1 gr. of opium.

TINCTURE (Cantharides). Syn. *Tinctura Cantharidis*,—Ph. L. E. & D. *Tinctura Lyttæ*,—Ph. L. 1809. *Prep.* 1. (Ph. L.) *Powdered cantharides*, 4 dr., (½ *oz.*,—Ph. D.); *proof spirit*, 1 quart; macerate for 7 days (14 days,—Ph. D.), and strain, with expression.

2. (*Wholesale.*) From *powdered cantharides*, 2¼ *oz.*; *rectified spirit* and *water*, of each, ½ gall.; as the last. *Dose.* 10 drops, gradually raised to 1 fl. dr., in any bland liquid; in fluor albus, gleets, incontinence of urine, lepra, &c. It should be used with caution. The Ed. College recommends it to be prepared by displacement.

TINCTURE (Capsicum). Syn. *Tincture of Cayenne Pepper; Tinctura Capsici*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Capsicum*, bruised, 10 dr.; *proof spirit*, 1 quart; digest 14 days, (or percolate,—Ph. E.) *Dose.* 10 to 60 drops; in atonic dyspepsia, scarlet fever, ulcerated sore throat, &c. It is also made into a gargle.

2. (Ph. D.) *Cayenne pods*, bruised, 1½ *oz.*; *proof spirit*, 1 pint; macerate for 14 days. This is of fully twice the strength of the preceding.

TINCTURE (Capsicum,—Concentrated.) See *Essences*.

TINCTURE (Cardamoms). Syn. *Tinctura Cardamomi*,—Ph. E., & Ph. L. 1836. *Tinct. Amomi Repentis*,—Ph. E. 1817. *Prep.* (Ph. L. 1836.) *Cardamom seeds*, 3½ oz., (4½ oz.,—Ph. E.); *proof spirit*, 1 quart; digest for 14 days, (or percolate, —Ph. E.)

Obs. The shells should be sifted from the *seeds* before maceration, and they are preferably ground in a pepper-mill instead of being bruised in a mortar. Aromatic and carminative. *Dose.* 1 to 2 fl. dr., as an adjunct to purgative mixtures.

TINCTURE (Cardamoms,—Compound). Syn. *Stomachic Tincture; Tinctura Cardamomi Composita*,—Ph. L. E. & D. *Tinctura Stomachica*,—Ph. L. 1746. *Prep.* 1.

(Ph. L.) *Cardamoms* (without the shells), *caraways*, and *cochineal*, of each, bruised, 2½ dr.; *cinnamon*, bruised, 5 dr.; *raisins*, stoned, 5 oz.; *proof spirit*, 1 quart; macerate 7 days, then strain, with expression.

2. (Ph. E., & Ph. L. 1836.) As the last, but using only 1 dr. of *cochineal*, and macerating 14 days; or, "it may be prepared by the method of displacement,"—Ph. E.

3. (*Wholesale.*) From *cardamoms* and *caraway seeds*, of each, 4 *oz.*; *cochineal* (s. g.), 6 *oz.*; *cassia*, 8 *oz.*; *sultana raisins*, 5 *lb.*; *proof spirit*, 4 gall., (or *rectified spirit* and *water*, of each, 2 gall.); macerate, &c., as before.

Obs. The Dublin College omitted the cochineal and raisins in their Ph. of 1826; but have restored them in their new one. The order of the London College to stone the raisins, is seldom adopted in practice; by which the tincture is rendered unfit to be employed in dispensing prescriptions containing quinine, or other alkaloids. When parties are too lazy or conceited to follow the instructions in their pharmacopœia, they had better use sultana raisins, which have no stones. *Dose.* 1 to 4 fl. dr.; as a cordial and stomachic, but chiefly as an adjunct, for its colour and flavour.

TINCTURE (Cascarilla). Syn. *Tinctura Cascarillæ*,—Ph. L. E. & D. *Tinct. Crotonis Eleutheriæ*,—Ph. E. 1839. *Prep.* (Ph. L.) *Cascarilla*, bruised, 5 oz.; *proof spirit*, 1 quart; macerate for 7 days, (14 days,—Ph. D.; or *percolate*,—Ph. E.) An excellent tonic and stomachic; chiefly employed as an adjunct to mixtures, &c. *Dose.* 1 to 2 fl. dr.

TINCTURE (Cassia). Syn. *Tinctura Cassiæ*,—Lat. *Prep.* (Ph. E.) *Cassia*, 3½ oz.; *proof spirit*, 1 quart; macerate for 7 days, or percolate. Stomachic and carminative. *Dose.* 1 to 2 fl. dr.

TINCTURE (Castor). Syn. *Tinctura Castorei*,—Ph. L. & E. *Tinct. Castorei Rossici*,—Ph. D. 1826. *Prep.* (Ph. L.) *Castor*, bruised, 2½ oz.; *rectified spirit*, 1 quart; macerate for 7 days, (or *percolate*,—Ph. E.)

Obs. The Dublin College ordered *Russian castor* in their Ph. of 1826; but the scarcity and high price of that variety, we fear, too often precludes its use. The *tincture of the shops* is usually made with only 8 *oz.* of *castor* to the gall. of *proof spirit*. Nervine and antispasmodic. *Dose.* 20 drops to 2 fl. dr.; in hysteria, epilepsy, &c.

TINCTURE (Castor, — Ammoniated). Syn. *Elixir Fœtidum*; *Tinctura Castorei Composita*; *Tinctura Castorei Ammoniata*,—Ph. E. *Prep.* (Ph. E.) *Castor*, bruised, 2½ oz.; *assafœtida*, in small fragments, 10 dr.; *spirit of ammonia*, 1 quart; digest 7 days in a well-closed vessel. Stimulant and antispasmodic. *Dose* and *uses* as the last. With the addition of ½ oz. of *opium*, it forms the *Elixir Uterinum*, or *Elixir Castorei Thebaicum* of foreign Pharmacopœias.

TINCTURE (Catechu). Syn. *Compound Tincture of Catechu*; *Tinctura Catechu Composita*,—Ph. L. *Tinctura Catechu*,—Ph. E. & D., & Ph. L. 1836. *Tinct. Japonica*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Catechu*, in powder, 3½ oz., (4 *oz.*,—Ph. D.); *cinnamon*, bruised, 2½ oz., (2 *oz.*,—Ph. D.); *proof spirit*, 1 quart; macerate for 7 days, (or percolate,—Ph. E.)

2. (*Wholesale.*) From *catechu*, 2 *lb.*; *oil of cassia*, 3 fl. dr.; *rectified spirit* and *water*, of each 1 gall.; macerate for 10 days. *Dose.* 1 to 2 fl. dr., as a warm astringent; in diarrhœa, &c., either alone, or combined with chalk.

TINCTURE (Chirayta). Syn. *Tinctura Chirayta*; *Tinctura Chirettæ*,—Ph. D. *Prep.* (Ph. D.) *Chiretta* or *chirayta* (bruised), 5 *oz.*; *proof spirit*, 1 quart; macerate for 14 days. Tonic and stomachic. *Dose.* ½ to 2 fl. dr.

TINCTURE (Cinchona). Syn. *Tincture of Bark*; *Tinctura Cinchonæ*,—Ph. L. E. & D. *Tinctura Corticis Peruviani*; *Tinct. C. P. Simplex*,—Ph. L. 1746. *Prep.* (Ph. L.) *Yellow cinchona bark* (bruised), 8 oz.; *proof spirit*, 1 quart; macerate for 14 days, (or *percolate*,—P. E.)

Obs. The Dublin College orders *pale bark*, and the Edinburgh, either species according to prescription. *Dose.* 1 to 3 fl. dr.; as a tonic, stomachic, and febrifuge.

TINCTURE (Pale Cinchona). Syn. *Tincture of Pale Bark*; *Tinctura Cinchonæ Pallidæ*,—Ph. L. *Prep.* From *pale bark*, as the last.

TINCTURE (Cinchona, — Compound). Syn. *Compound Tincture of Bark*, *Huxham's Tincture of do.*, *Fever Tincture*; *Tinctura Cinchonæ Compositæ*,—Ph. L. E. & D. *Tinct. Corticis Peruviani Composita*,—Ph. L. 1788. *Prep.* 1. (Ph. L.) *Pale bark*, bruised, 4 oz.; *dried bitter-orange peel*, 3 oz., (2 *oz.*,—Ph. D.); *serpentary root*, bruised, 6 dr.; *hay saffron*, 2 dr.; *cochineal*, in powder, 1 dr.; macerate for 7 days, (14 days,—Ph. D.; or, *percolate*, —Ph. E.); press, and filter.

2. (*Wholesale.*) From *pale bark*, 3½ *lb.*; *dried orange peel*, 2 *lb.*; *serpentary root*, 4 *oz.*; *hay saffron*, 1 *oz.*; *cochineal*, ½ *oz.*; *proof spirit*, 4 gall., (or *rectified spirit* and

water, of each, 2 gall.); macerate for 14 days.

Obs. In the Ph. E. yellow bark is ordered. *Dose* and *use*, as the last.

TINCTURE (Cinnamon). Syn. *Tinctura Cinnamomi*, Ph. L. & E., & Ph. D. 1826. *Aqua Cinnamomi Fortis*,—Ph. L. 1721. *Prep.* (Ph. L.) *Cinnamon*, bruised, 3½ oz.; *proof spirit*, 1 quart; macerate for 7 days, (or *percolate*,—Ph. E.) In the shops *cassia* is usually substituted for cinnamon, and *spirit* 26 *u. p.* for proof spirit. *Dose.* 1 to 4 fl. dr.; as a cordial, aromatic, and stomachic.

TINCTURE (Cinnamon, — Compound). Syn. *Aromatic Tincture; Tinctura Cinnamomi Composita*,—Ph. L. E. & D. *Tinctura Aromatica*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Cinnamon*, bruised, 1 oz.; *cardamoms*, (bruised, without the shells), ½ oz.; *long pepper* and *ginger*, of each, 2½ dr.; *proof spirit*, 1 quart; digest for 7 days, (or *percolate*,—Ph. E.) The Ph. E. *omits* the ginger, and uses ½ oz. more *cardamoms*.

2. (Ph. D.) *Cinnamon*, 2 *oz.; cardamoms*, 1 *oz.; ginger*, ½ *oz.: proof spirit*, 1 quart; macerate for 14 days. The following form is current in the wholesale houses.

3. *Cassia*, 1 *lb.; cardamoms*, 6 *oz.; long pepper* and *ginger*, of each, ¼ *lb.; oil of cassia*, 1½ fl. dr.; *proof spirit*, 4 gall., (or *rectified spirit* and *water*, of each, 2 gall.) Cordial, aromatic, stomachic. *Dose.* 1 to 2 fl. dr.; in atonic gout, debility, flatulence, &c.

TINCTURE (Clutton's). See *page* 1234.

TINCTURE (Cochineal). Syn. *Tinctura Cocci Cacti*,—Ph. D. *Prep.* (Ph. D.) *Cochineal*, in fine powder, 2 *oz.; proof spirit*, 1 pint. Antispasmodic and sedative; but chiefly employed for its colour. *Dose.* ½ to 2 fl. dr.

TINCTURE (Colchicum). Syn. *Gout Tincture*, *Tincture of Meadow Saffron; Tinctura Colchici*,—Ph. L. & E. *Tinctura Seminum Colchici*,—Ph. D. *Prep.* (Ph. L.) *Seeds of meadow saffron* (colchicum autumnale), bruised (finely ground in a coffee mill,—Ph. E.), 5 oz.; *proof spirit*, 1 quart; macerate for 7 days (14 days,—Ph. D.) or, *percolate*,—Ph. E.); then press, and filter. *Dose.* 15 or 20 drops to 1 fl. dr.; in gout, &c.

TINCTURE (Colchicum — Compound). Syn. *Tinctura Colchici Composita*,—Ph. L. *Spiritus Colchici Ammoniatus*, — Ph. L. 1824. *Prep.* (Ph. L.) *Colchicum seeds*, bruised, 5 oz.; *aromatic spirit of ammonia*, 1 quart; digest for 7 days, then press, and filter. *Dose.* 20 drops to 1 fl. dr.; in gout, &c.

TINCTURE (Colchicum Flowers). Syn. *Tinctura Florum Colchici; Eau Medicinale d'Husson*,—Dr. Wilson. *Prep.* Take of the *fresh juice of colchicum flowers*, 2 parts; *French brandy* (or *proof spirit*), 1 part; mix, and in a few days decant, or filter, and preserve it in small bottles in a cool place.

TINCTURE (Copaiba,—Alkaline). Syn. *Tinctura Copaibæ Alkalina*,—Lat. *Prep.* (Lewis Thompson.) Dissolve *carbonate of potassa*, 2 oz.; in *water*, 1 pint; and add to this, *balsam of copaiba*, in a thin stream, constantly stirring, until the mixture, at first white and milky, becomes clear like jelly or amber, which will generally take place when about a pint of balsam has been added; set the mixture aside for two or three hours, then pour in of *rectified spirit*, 1 quart, and mix the whole together. *Sweet spirit of nitre* may be substituted for spirit of wine, provided it does not contain free acid. *Dose.* 1 to 2 tea-spoonfuls.

TINCTURE (Cubebs). Syn. *Essence of Cubebs; Tinctura Cubebæ*,—Ph. L. & D. *Tinctura Piperis Cubebæ*,—Ph. D. 1826. *Prep.* 1. (Ph. L.) *Cubebs* (bruised or ground in a pepper-mill), 1 lb; *proof spirit*, 1 quart; macerate for 7 days, press out the liquor, and filter. *Dose.* ½ to 1 fl. dr., three or four times a day; in gonorrhœa, &c.

2. (Ph. D., & Ph. L. 1836.) *Cubebs*, 5 *oz.; rectified spirit*, 1 quart (*proof spirit*,—Ph. D. 1826); macerate for 14 days. *Dose.* 1 to 2 fl. dr.

TINCTURE (Cusparia). Syn. *Tinctura Cuspariæ*,—Ph. E. *Tinct. Angosturæ*,—Ph. D. 1826. *Tinct. Bonplandiæ Trifoliatæ*,—Ph. E. 1817. *Prep.* (Ph. E.) *Angostura bark* or *cusparia*, 4½ oz.; *proof spirit*, 1 quart; digest or percolate. Tonic, stimulant, and stomachic. *Dose.* 1 to 2 fl. dr.

TINCTURE (Deadly-nightshade). See *Tincture of Belladonna*.

TINCTURE (De Coetlogon's). See *p.* 1235.

TINCTURE (Digitalis). See *below*.

TINCTURE (Elecampane). Syn. *Tinctura Inulæ*, *Tinct. Helenii*,—Lat. *Prep.* (P. Cod.) *Powdered elecampane*, 4 oz.; *proof spirit*, 1 pint; macerate for 15 days. Tonic, deobstruent, and expectorant. *Dose.* ½ to 2 fl. dr.; in dyspepsia, palsy, dropsies, uterine obstructions, &c.

TINCTURE (Ergot). Syn. *Tinctura Secalis Cornuti; Tinctura Ergotæ*,—Ph. D. *Prep.* 1. (Apothecaries' Hall.) *Ergot* (ground in a coffee-mill), 2½ oz.; *proof spirit*, 1 pint; digest for 7 days. *Dose.* A tea-spoonful to excite the action of the uterus in labour.

2. (Ph. D.) *Ergot*, 8 *oz.; proof spirit*,

1 quart; macerate for 14 days, and strain with expression. *Dose.* 20 drops to 1 fl. dr.; as the last.

TINCTURE (Ergot, — Ethereal). Syn. *Tinctura Ergotæ Ætherea*,—Ph. L. *Prep.* (Ph. L.) *Ergot*, bruised, 15 oz.; *ether*, 1 quart; macerate for 7 days, press, and filter. *Dose.* 10 drops to 1 fl. dr.

TINCTURE (Febrifuge,—Clutton's). Syn. *Tinctura Febrifuga Cluttoni*,—Lat. *Prep.* Take of *febrifuge spirit*, 8 fl. oz.; *angelica root*, *serpentary*, and *cardamom seed*, of each, 1½ dr.; digest a week, and filter.

Obs. The original formula for *Dr. Clutton's Febrifuge Spirit*, is as follows:—*Oil of sulphur by the bell*, *oil of vitriol*, and *sea salt*, of each, 1 oz.; *rectified spirit*, 3 oz.; mix, digest for a month, and distil to dryness. "Water acidulated with these and sweetened to the taste, forms a cooling diuretic and diaphoretic julep. Though never admitted into the pharmacopœias, these preparations are favorites with a few practitioners."

TINCTURE (Foxglove). Syn. *Tinctura Digitalis*,—Ph. L. E. & D. *Prep.* (Ph. L.) *Dried foxglove leaves*, 4 oz. (5 *oz.*,—Ph. D.); *proof spirit*, 1 quart; macerate for 7 days (14 days,—Ph. D.; or, *percolate*,—Ph. E.), then press, and strain.

Obs. This tincture is a powerful sedative, diuretic, and narcotic. The commencing *dose* should be 10 drops, gradually and cautiously increased to 30, or even 40; in asthmas, dropsies, fevers, phthisis, &c. "If 40 fl. oz. of spirit be allowed to pass (percolate) through, the sp. gr. will be 0·944; and the solid contents of 1 fl. oz. will amount to 24 gr." (Ph. E.)

TINCTURE (Galbanum). Syn. *Tinctura Galbani*,—Lat. *Prep.* (Ph. D. 1826.) *Galbanum*, 2 oz.; *proof spirit*, 32 fl. oz.; digest 7 days. Stimulant and antispasmodic. *Dose.* 1 to 3 fl. dr. "If less nauseous than tincture of assafœtida, it is also less powerful." (Dr. A. T. Thomson.)

TINCTURE (Galls). Syn. *Tinctura Gallæ*,—Ph. L. & D. *Tinctura Gallarum*,—Ph. E. *Prep.* (Ph. L.) *Galls*, in powder, 5 oz.; *proof spirit*, 1 quart; macerate for 7 days (14 days,—Ph. D.; or, *percolate*,—Ph. E.), then express the liquid, and filter it. Astringent and styptic. *Dose.* ½ to 2 fl. dr. It is chiefly used as a test for iron.

TINCTURE (Gentian,—Compound). Syn. *Bitter Stomachic Tincture*; *Tinctura Gentianæ Composita*,—Ph. L. E. & D. *Tinctura Amara*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) *Gentian root*, sliced and bruised, 2½ oz.; *dried orange peel*, 10 dr.; *cardamoms*, bruised, 5 dr.; *proof spirit*, 1 quart; macerate for 7 days (or *percolate*,—Ph. E.) The Edinburgh college substitutes *canella* for cardamoms, and adds of *cochineal*, ½ dr.

2. (Ph. D.) *Gentian root*, 3 *oz.*; *dried bitter-orange peel*, 1½ *oz.*; *cardamoms*, ½ *oz.*; *proof spirit*, 1 quart; macerate for 14 days.

3. (*Wholesale.*) *Gentian*, 2½ *lb.*; *dried orange peel*, 1¼ *lb.*; *bruised cardamoms*, ½ *lb.*; *proof spirit*, 4 gall. (or *rectified spirit* and *water*, of each, 2 gall.); digest as last.

Obs. This is an elegant and popular stomachic bitter and tonic. *Dose.* 1 to 2 fl. dr.; in dyspepsia, loss of appetite, &c.

TINCTURE (Gentian, — Ammoniated). Syn. *Tinctura Gentianæ Ammoniata*,—Lat. *Elixir Antiscrofuleux*,—Fr. *Prep.* (P. Cod.) *Gentian*, 1 oz.; *sesquicarbonate of ammonia*, ¼ oz.; *proof spirit*, 32 fl. oz. As the last; but preferred in acidity and low spirits.

TINCTURE (Ginger). Syn. *Tinctura Zingiberis*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Ginger*, bruised, 2½ oz.; *rectified spirit*, 1 quart; macerate for 7 days, (or *percolate*, —Ph. E.)

2. (*Wholesale.*) *Coarsely powdered unbleached Jamaica ginger*, 1¼ *lb.*; *rectified spirit* (or, *spirit distilled from the essence*), 1½ gall.; *water*, ½ gall.; digest as above. Stimulant and carminative. *Dose.* 1 to 2 fl. dr.

Obs. The formula of the Ph. D. 1826, resembles the above; that of the new Ph. D. orders 8 *oz.* of *ginger* to 1 quart of *rectified spirit*. The product is, consequently, of fully 3 times the strength of that of the others; and is similar to the common *essence of ginger* of the shops.

TINCTURE (Gout). Syn. *Tinctura Antarthritica*, — Lat. *Prep.* 1. (*Dr. Graves's.*) Take of *dried orange peel* and *powder of aloes and canella*, of each, 2 oz.; *rhubarb*, 1 oz.; *French brandy* (or *proof spirit*), 1 quart; digest a week, and strain with expression. *Dose.* 1 to 2 tea-spoonfuls, night and morning.

2. (*Dr. Wilson's.*) See *page* 1233.

3. See *Tincture of Colchicum*.

TINCTURE (Guaiacum). Syn. *Tinctura Guaiaci*,—Ph. E. & D., & Ph. L. 1836. *Prep.* (Ph. E., & Ph. L. 1836.) *Guaiacum resin* (powdered), 7 oz. (8 *oz.*,—Ph. D.); *rectified spirit*, 1 quart; digest for 14 days, and filter. An excellent sudorific, in chronic gout and rheumatism. *Dose.* 1 to 3 fl. dr., taken in milk.

TINCTURE (Guaiacum, — Compound). Syn. *Ammoniated Tincture of Guaiacum*, *Volatile do.*; *Rheumatic Drops*; *Tinctura Guaiaci Composita*, — Ph. L. *Tinctura*

Guaiaci Ammoniata,—Ph. E., Ph. L. 1824, & Ph. D. 1826. *Tinct. Guaiaci*,—Ph. L. 1788. *Tinct. Guaiacina Volatilis*,—Ph. L. 1746. *Prep.* (Ph. L.) *Guaiacum*, in coarse powder, 7 oz.; *aromatic spirit of ammonia* (*spirit of ammonia*,—Ph. E.), 1 quart; digest for 7 days, and decant or filter. A powerful, stimulating sudorific and emmenagogue, in chronic rheumatism, gout, amenorrhœa, &c. *Dose.* 1 to 2 fl. dr., in milk, or some viscid liquid.

TINCTURE (Haffenden's Balsamic). Syn. *De Coetlogon's Balsamic Tincture.* This is a nostrum, of many virtues, prepared from *tincture of serpentary* (of double strength), 1½ fl. oz.; *compound tincture of benzoin*, 1 fl. oz.; *tinctures of tolu* and *opium*, of each, ½ fl. oz.; with *rectified spirit*, q. s. to render the mixture "bright," should it turn milky. (*Anat. of Quackery.*)

TINCTURE (Hatfield's). *Prep.* From *gum guaiacum* and *soap*, of each, 2 dr.; *rectified spirit*, 1 pint; digest for a week. *Used* as tinct. of guaiacum; also *externally.*

TINCTURE (Hellebore). Syn. *Tincture of Black Hellebore; Tinctura Hellebori*,—Ph. L., & Ph. D. 1826. *Tinctura Hellebori Nigri*,—Ph. L. 1824. *Tinct. Melampodii*,—Ph. L. 1746. *Prep.* (Ph. L.) *Black-hellebore root*, bruised, 5 oz.; *proof spirit*, 1 quart; macerate 7 days, then strain with expression.

Obs. This tincture is a powerful emmenagogue, and was a favorite remedy with Dr. Mead, in uterine obstructions and certain cutaneous affections. *Dose.* 20 drops to 1 fl. dr.

TINCTURE (White Hellebore). See *Tincture of Veratrum.*

TINCTURE (Hemlock). Syn. *Tinctura Cicutæ; Tinctura Conii*,—Ph. L. & E. *Tinct. Conii Maculati*,—Ph. D. 1826. *Prep.* 1. (Ph. L.) *Dried hemlock leaves*, 5 oz.; *proof spirit*, 1 quart; digest a week, press and filter. In the Ph. L. 1836, *cardamom seeds*, 1 oz., was added.

2. (Ph. E.) *Fresh hemlock leaves*, 12 oz.; express the *juice*, bruise the residuum, and treat it, by *percolation*, first with *tincture of cardamoms*, 10 fl. oz.; and next with *rectified spirit*, 1½ pint; mix the liquids, and filter. Deobstruent and narcotic. *Dose* of the Ph. L., 20 to 60 drops; that of the Ph. E. tincture, is less, it being a much stronger and certain preparation. See *Hemlock.*

TINCTURE (Hemp). See *below.*

TINCTURE (Henbane). Syn. *Tinctura Hyoscyami*,—Ph. L. E. & D. *Prep.* (Ph. L.) *Dried leaves of henbane*, 5 oz.; *proof spirit*, 1 quart; macerate for 7 days (14 days,—Ph. D.; or, *percolate*, Ph. E,), then press, and filter. Anodyne, sedative, soporific, and narcotic. *Dose.* 20 drops to 2 fl. dr.

Obs. This, as well as the *tinctures* of *foxglove, hemlock, hops, jalap, lobelia inflata, rhatany, savine, squills, senna, valerian, wormwood, &c.*, is usually prepared by the druggists with 1 *lb.* of the *dried leaves* (or dried drug), to each gall. of a *mixture* of equal parts of *rectified spirit* and *water.*

TINCTURE (Hops). Syn. *Tinctura Lupuli*, — Ph. L. & E. *Tinctura Humuli*, — Ph. D. 1826, & Ph. E. 1817. *Prep.* (Ph. L.) *Hops*, 6 oz.; *proof spirit*, 1 quart; digest 7 days, then press, and filter. Anodyne, sedative, and soporific. *Dose.* ½ to 2 fl. dr. For the formulæ of the Ph. E. & D., see *Tincture of Lupuline.*

TINCTURE (Hudson's). See *page* 1240.

TINCTURE (Huxham's). See *page* 1232.

TINCTURE (Indian Hemp). Syn. *Tinctura Cannabis; Tinctura Cannabis Indicæ*, —Ph. D. *Prep.* (Ph. D.) *Purified extract of Indian hemp*, ½ *oz.; rectified spirit*, ½ pint; dissolve. 21 drops (minims) contain 1 gr. of the extract.

Obs. The formulæ of O'Shaughnessy and the Bengal Ph. are similar. *Dose.* 10 drops, every ½ hour, in cholera; 1 fl. dr., every ½ hour, in tetanus, till the paroxysms cease, or catalepsy is induced. (See *p.* 562.)

TINCTURE (Indian Tobacco). See *Tincture of Lobelia.*

TINCTURE (Iodine). Syn. *Tinctura Iodinei*,—Ph. E. *Tinctura Iodinii*,—Ph. D. 1826. *Prep.* (Ph. E.) *Iodine*, 2½ oz.; *rectified spirit*, 1 quart; dissolve, and preserve it in well-closed bottles. *Dose.* 5 to 30 drops, twice or thrice daily, where the use of iodine is indicated. *Externally*, as a paint, &c.

Obs. The formulæ of Magendie, the Ph. U. S., and the Paris Codex, are similar.

TINCTURE (Iodine,—Compound). Syn. *Antiscrofulous Drops; Tinctura Iodinii Composita*,—Ph. L. & D. *Prep.* (Ph. L. & D.) *Iodine*, 1 oz.; *iodide of potassium*, 2 oz.; *rectified spirit*, 1 quart; dissolve. *Dose, &c.* As the last.

TINCTURE (Ipecacuanha). Syn. *Tinctura Ipecacuanhæ*,—Lat. *Prep.* (Ph. Bor.) *Ipecacuanha* (coarsely powdered), 1 oz.; *spirit*, sp. gr. 0·897 to 0·900 (16 to 17 o. p.), 8 oz.; macerate for 8 days. The tincture of the P. Cod. has twice this strength. *Dose.* 10 or 12 drops to 2 fl. dr., according to the intention.

TINCTURE (Jalap). Syn. *Tinctura Jalapæ*,—Ph. L. E. & D. *Tinctura Jalapii*, —Ph. L. 1788. *Prep.* (Ph. L.) *Jalap*, coarsely powdered, 5 oz. (10 oz.,—Ph. L.

1836; 7 oz.,—Ph. E.); *proof spirit*, 1 quart (1½ pint,—Ph. D.); macerate for 7 days (or, *percolate*,—Ph. E.), then press, and filter. Cathartic. *Dose.* 1 to 4 fl. dr.

TINCTURE (Kino). Syn. *Tinctura Kino*, —Ph. L.& E., & Ph. D.1826. *Prep.* (Ph. L.) *Powdered kino*, 3½ oz.; *rectified spirit*, 1 quart; macerate for 7 days (or, *percolate*,—Ph. E.), and filter. Astringent. *Dose.* 1 to 2 fl. dr., combined with chalk mixture, in diarrhœa, &c.

TINCTURE (Lactucarium). Syn. *Tinctura Lactucarii*, — Lat. *Prep.* (Ph. E.) *Powdered lactucarium*, 4 oz.; *proof spirit*, 1 quart; digest or percolate. Anodyne, soporific, antispasmodic, and sedative. *Dose.* 20 to 60 drops; in cases for which opium is unsuited. 10 drops (minims) contain 1 gr. of lactucarium.

TINCTURE (Lavender, — Compound). Syn. *Red Lavender*, *Red Lavender Drops*, *Red Hartshorn*; *Tinctura Lavendulæ Composita*,—Ph. L. & D. *Spiritus Lavandulæ Compositus*,—Ph. E., Ph. D. 1826, & Ph. L. 1824. *Sp. Lavendulæ Co. Matthiæ*,—Ph. L. 1721. *Prep.* 1. (Ph. L.) *Cinnamon* and *nutmegs*, of each, bruised, 2½ dr.; *red sanders wood*, sliced, 5 dr.; *rectified spirit*, 1 quart; macerate for 7 days, then strain with expression, and dissolve in the strained liquid, *oil of lavender*, 1½ fl. dr., *oil of rosemary*, 10 drops.

2. (Ph. L. 1836.) *Spirit of lavender*, 1½ pint; *spirit of rosemary*, ½ pint; *red sanders wood* (rasped), 5 dr.; *cinnamon* and *nutmegs* (bruised), of each, 2½ dr.; macerate for 14 days.

3. (Ph. E.) *Spirit of lavender*, 1 quart; *spirit of rosemary*, 12 fl. oz.; *cinnamon*, 1 oz.; *nutmegs*, ½ oz.; *red sanders*, 3 dr.; *cloves*, 2 dr.; as No. 1.

4. (Ph. D.) *Oil of lavender*, 3 fl. dr.; *oil of rosemary*, 1 fl. dr.; *cinnamon*, 1 *oz.*; *nutmegs*, ½ *oz.*; *cloves* and *cochineal*, of each, ¼ *oz.*; *rectified spirit*, 1 quart; macerate for 14 days.

5. (*Wholesale.*) From *oil of cassia*, ¾ fl. oz.; *oil of nutmeg*, 1 fl. oz.; *oils of lavender* and *rosemary*, of each, 4½ fl. oz.; *red sanders* (rasped), 3 *lb.*; *proof spirit*, 6 gall. (or, *rectified spirit* and *water*, of each, 3 gall.); digest 14 days. Should it be cloudy, add a little more proof spirit.

Obs. Compound tincture of lavender is a popular stimulant, cordial, and stomachic. *Dose.* 1 to 3 tea-spoonfuls (½ to 2 fl. dr.); in lowness of spirits, faintness, flatulence, hysteria, &c.

TINCTURE (Lemons). Syn. *Tinctura Limonum*, — Ph. L. *Tinctura Limonis*, — Ph. D. *Prep.* (Ph. L.) *Fresh lemon peel*, 3½ oz. (cut thin, 5 *oz.*,—Ph. D.); *proof spirit*, 1 quart; macerate for 7 days (14 days,—Ph. D.), then express the liquid, and filter it. An aromatic bitter and stomachic. *Dose.* ½ to 2 fl. dr.

TINCTURE (Lobelia). Syn. *Tincture of Indian Tobacco*; *Tinctura Lobeliæ Inflatæ*; *Tinctura Lobeliæ*,—Ph. L. E. & D. *Prep.* (Ph. L.) *Dried* and *powdered lobelia inflata*, 5 oz.; *proof spirit*, 1 quart; macerate for 7 days (14 days,—Ph. D.; or, *percolate*, — Ph. E.), press, and filter. *Dose.* As an *expectorant*, 10 to 60 drops; as an *emetic* and *antispasmodic*, 1 to 2 fl. dr., repeated every third hour until it causes vomiting. It is principally employed in spasmodic asthma, and some other pulmonary affections.

TINCTURE (Lobelia,—Ethereal). Syn. *Tinctura Lobeliæ Ætherea*, — Ph. L. & E. *Prep.* 1. (Ph. L.) *Indian tobacco*, powdered, 5 oz.; *ether*, 14 fl. oz.; *rectified spirit*, 26 fl. oz.; macerate 7 days, press, and filter.

2. (Ph. E.) *Dry lobelia*, 5 oz.; *spirit of sulphuric ether*, 1 quart; by digestion for 7 days, or by percolation. *Dose.* 6 or 8 drops to 1 fl. dr.

3. (*Whitlaw's.*) From *lobelia*, 1 *lb.*; *rectified spirit* and *spirit of nitrous ether*, of each, 4 pints; *sulphuric ether*, 4 *oz.* *Dose*, *&c.* As the last.

TINCTURE (Lupuline). Syn. *Tincture of Hops*; *Tinctura Lupuli*,—Ph. E. *Tinctura Lupulinæ*, — Ph. D. *Prep.* (Ph, D.) *Lupuline* (the yellowish-brown powder attached to the scales of hops, separated by friction and sifting), 5 *oz.*; *rectified spirit*, 1 quart; macerate for 14 days (or, proceed by *displacement*,—Ph. E.), press, and filter. *Dose.* ½ to 2 fl. dr. See *Tincture of Hops.*

TINCTURE (Matico). Syn. *Tinctura Matico*, — Ph. D. *Prep.* (Ph. D.) *Matico leaves*, in coarse powder, 8 *oz.*; *proof spirit*, 1 quart; macerate for 14 days, and strain with expression. *Dose.* 1 to 2 fl. dr., as an internal astringent or hæmostatic. It is a very feeble remedy, as matico leaves are destitute of either tannin or gallic acid, and derive their power of stopping local bleeding from the peculiar mechanical construction of their surface.

TINCTURE (Meadow Saffron). See *Tincture of Colchicum.*

TINCTURE (Monesia). Syn. *Tinctura Monesiæ*,—Lat. *Prep.* From *monesia*, 2½ oz.; *proof spirit*, 1 pint; macerate a week. Astringent. *Dose.* ½ to 2 fl. dr.

TINCTURE (Musk). Syn. *Tinctura Moschi*,—Lat. *Prep.* (Ph. D. 1826.) *Musk*, 2 dr.; *rectified spirit*, 16 fl. oz.; digest 7 days. Antispasmodic; but principally used

as a perfume, being too weak for medical use.

TINCTURE (Myrrh). Syn. *Golden Tooth-drops; Tinctura Myrrhæ*, — Ph. L. E. & D.) *Prep.* 1. (Ph. L.) *Myrrh*, in powder, 3 oz. (3½ oz.,—Ph. E.; 4 *oz.*,—Ph. D.); *rectified spirit*, 1 quart; macerate for 7 days (14 days,—Ph. D.; or, by *displacement*,—Ph. E.), and filter.

2. (*Wholesale.*) *Myrrh* (in coarse powder), 2¼ *lb.*; *rectified spirit*, 2 gall.; *water*, 1 gall.; as the last.

Obs. Tincture of myrrh is tonic and stimulant. *Dose.* ½ to 1 fl. dr., as an adjuvans in mixtures, gargles, &c. Chiefly used, diluted with water, as a dentifrice or wash for ulcerated and spongy gums.

TINCTURE (Myrrh,—Compound). Syn. *Tinctura Myrrhæ Composita*,—Lat. *Prep.* From *myrrh* and *socotrine aloes*, of each, 2 *lb.*; *rectified spirit*, 3 gall.; *water*, 2 gall.; digest for 14 days. This is frequently substituted for "*compound tincture of aloes*" in the wholesale trade.

TINCTURE (Nux Vomica). Syn. *Tinctura Nucis Vomicæ*,—Lat. *Prep.* (Ph. D. 1826.) *Nux vomica* (ground in a coffee-mill), 2 oz.; *rectified spirit*, 8 fl. oz.; macerate 7 (14) days. *Dose.* 5 to 20 drops; in paralysis, &c. It is *poisonous*.

TINCTURE (Odontalgic). Syn. *Tooth-ache Tincture; Tinctura Odontalgica*,—Lat. *Prep.* 1. *Tincture of opium*, 1 fl. dr.; *ether*, 2 fl. dr.; *oil of cloves*, 15 drops.

2. *Rectified spirit*, 3 fl. dr.; *chloroform*, 2 dr.; *creasote*, 1 dr.; mix.

3. (Collier.) *Pellitory of Spain*, 4 dr.; *camphor*, 3 dr.; *opium*, 1 dr.; *oil of cloves*, 2 fl. dr.; *rectified spirit*, 16 fl. oz.; digest for a week.

4. (Niemann.) Digest 60 or 80 *common lady-birds* (coccinella septempunctata,—Linn.) in *rectified spirit*, 1 fl. oz.; for 8 days, and strain.

Obs. The above are commonly applied, on a small piece of lint, in toothache. For other formulæ see *Drops*, *Tinctures of Myrrh* and *Pellitory*, &c.

TINCTURE (Opium). Syn. *Laudanum*, *Liquid do.*, *Anodyne Tincture*, *Thebaic do.*; *Tinctura Opii*,—Ph. L. E. & D. *Tinct. Opii*, *Tinct. Thebaica*, or *Laudanum Liquidum*,—Ph. E. 1817. *Tinct. Opii Simplex*, *Tinct. Meconii*,—Ph. Bor., &c. *Prep.* 1. (Ph. L.) *Powdered opium*, 3 oz. (3 *oz.*,—Ph. D.); *proof spirit*, 1 quart; macerate for 7 days (14 days,—Ph. D.), and strain, with expression.

2. (Ph. E.) *Opium*, sliced, 3 oz.; *boiling water*, 13½ fl. oz.; digest, with heat, for 2 hours, break down the opium with the hand, strain, and express the infusion; then macerate the residuum, for about 20 hours in *rectified spirit*, 1 pint 7 fl. oz.; next strain, press, mix the watery and spirituous infusions, and filter.

Obs. This preparation has a deep brownish red colour, and the characteristic odour and taste of opium. 14 *minims* or *measured drops* of the *London*, and about 15 minims of the *Edinburgh* and *Dublin tinctures*, are equivalent to 1 gr. of *dry opium*, or 1·12 gr. of *ordinary opium*. 14 *minims* of this tincture are equal to about 25 *drops* of it poured from a bottle. Its sp. gr. is 0·952. (Phillips.) *Dose.* 10 to 60 drops; as an anodyne, sedative, or hypnotic. The following form is substituted for that of the Pharmacopœia by many of the wholesale drug houses:—Take of *Turkey opium*, 2½ *lb.*; *boiling water*, 9 quarts; digest till dissolved or disintegrated, cool, add of *rectified spirit*, 2 gall.; and, after repose for 24 hours, decant the clear portion. *Prod.* 4 gall.

TINCTURE (Opium, — Ammoniated). Syn. *Ammoniated Tincture of Opium*, *Scotch Paregoric; Tinctura Opii Ammoniata*,—Ph. E. *Tinct. O. A.*, or *Elixir Paregoricum*,—Ph. E. 1817. *Prep.* (Ph. E.) *Benzoic acid* and *hay saffron*, of each, 6 dr.; *opium*, sliced, 4 dr.; *oil of aniseed*, 1 dr.; *spirit of ammonia* (Ph. E.), 1 quart; digest for a week, and filter. Stimulant, antispasmodic, and anodyne. *Dose.* 20 to 80 drops; in *hysteria*, *hooping-cough*, &c.

Obs. This preparation is called *paregoric*, or *paregoric elixir*, in Scotland, but should be carefully distinguished from the compound tincture of camphor, which passes under the same names in England; as the former contains about 4 times as much opium as the latter. 80 minims or 145 poured drops contain about 1 gr. of opium.

TINCTURE (Opium, — Camphorated). See *Compound Tincture of Camphor*.

TINCTURE (Orange-peel). Syn. *Tinctura Aurantii*,—Ph. L. E. & D. *Tinct. Corticis Aurantii*,—Ph. L. 1788. *Prep.* (Ph. L.) *Dried orange peel*, 3½ oz. (4 *oz.*—Ph. D.); *proof spirit*, 1 quart; digest for 7 days (14 days,—Ph. D.; or, by *percolation*,—Ph. E.), press, and filter. A grateful bitter stomachic. *Dose.* 1 to 3 fl. dr.; chiefly as an adjuvant in mixtures, &c.

TINCTURE (Pellitory). Syn. *Tooth-ache Tincture; Tinctura Pyrethri*,—Lat. *Prep.* 1. *Pellitory of Spain* (bruised), 1 *oz.*; *rectified spirit*, ¼ pint; digest a week. In the P. Cod. a tincture is ordered prepared with spirit about 41 o. p.; and another prepared with *spirit of sulphuric ether*.

2. (*Compound*,—Brande.) *Pellitory root*,

4 dr.; *camphor*, 3 dr.; *oil of cloves*, 2 dr.; *opium*, 1 dr.; *rectified spirit*, 6 fl. oz.; digest for eight days. Both the above are *used* for the toothache. See *Paraguay Roux* and *Tincture* (Odontalgic).

TINCTURE (Phosphorus, — Ethereal). Syn. *Æther Phosphoratus*, *Tinctura Phosphori Ætherea*,—Lat. *Prep.* 1. (Ph. Hann. 1831.) *Phosphorus* (powdered by agitation with rectified spirit), 16 gr.; *ether*, 2 oz.; macerate, with agitation, for 4 days, then decant the clear portion, and preserve it in a stoppered bottle, in a cool dark situation.

2. (P. Cod.) *Phosphorus*, cut small, 1 part; *ether*, 50 parts; digest with occasional agitation for 1 month, and decant the clear. *Dose.* 5 to 15 drops, in any bland vehicle, thrice daily; in impotency, low sinking conditions of the system, &c.

TINCTURE (Quassia). Syn. *Tinctura Quassiæ*,—Ph. E., & Ph. D. 1826. *Prep.* (Ph. E.) *Quassia*, in chips, 10 dr.; *proof spirit*, 1 quart; digest 7 days. Bitter, tonic. *Dose.* ½ to 2 fl. dr.; in dyspepsia, &c.

TINCTURE (Quassia,—Compound). Syn. *Tinctura Quassiæ Composita*,—Ph. E. *Prep.* (Ph. E.) *Cardamoms* and *cochineal*, of each, bruised, ½ oz.; *powdered cinnamon* and *quassia chips*, of each, 6 dr.; *raisins*, 7 oz.; *proof spirit*, 1 quart; digest for 7 days (or, by *percolation*), then press, and filter. Aromatic and tonic. *Dose* and *use*, as the last.

TINCTURE (Quinine,—Compound). Syn. *Fever Drops*; *Tinctura Quinæ Composita*, —Ph. L. *Prep.* (Ph. L.) *Disulphate of quinine*, 5 dr. 1 scrup. (or, 320 gr.); *tincture of orange peel*, 1 quart; digest, with agitation, for 7 days, or until solution is complete.

Obs. Unless the tincture employed as the solvent be of the full strength, some of the disulphate remains undissolved. It is an excellent medicine when faithfully prepared. *Dose.* ½ to 2 fl. dr.; in debility, dyspepsia, &c.

TINCTURE (Red Lavender). See *p.* 1236.

TINCTURE (Rhatany). Syn. *Tinctura Krameriæ*,—Ph. D. *Prep.* (Ph. D.) *Rhatany root*, in coarse powder, 8 *oz.*; *proof spirit*, 1 quart; macerate for 14 days, then press, and filter. Astringent. *Dose.* 1 to 2 fl. dr. The formula of the Ph. U. S. is similar.

TINCTURE (Rhubarb). Syn. *Tinctura Rhei*,—Ph. E., Ph. L. 1824, & Ph. D. 1826. *Tinct. Rhabarbari*,—Ph. L. 1788. *Prep.* 1. (Ph. E.) *Powdered rhubarb*, 3½ oz.; *cardamom seeds*, bruised, ½ oz.; *proof spirit*, 1 quart; digest or proceed by the method of displacement.

2. (Ph. L. 1824.) *Rhubarb*, 2 oz.; *cardamoms*, 4 dr.; *saffron*, 2 dr.; *proof spirit*, 32 fl. oz. Both the above are cordial, stomachic, and laxative. *Dose.* 1 fl. dr. to 1 fl. oz.

TINCTURE (Rhubarb, — Compound). Syn. *Tinctura Rhei Composita*,—Ph. L. & D. *Tinct. Rhabarbari Comp.*,—Ph. L. 1788. *Prep.* 1. (Ph. L.) *Rhubarb*, sliced, 2½ oz.; *liquorice root*, bruised, 6 dr.; *ginger* (bruised), and *hay saffron*, of each, 3 dr.; *proof spirit*, 1 quart; macerate for 7 days, then press, and filter.

2. (Ph. D.) *Rhubarb*, 3 *oz.*; *cardamoms*, 1 *oz*; *liquorice root*, ½ *oz.*; *saffron*, ¼ *oz.*; *proof spirit*, 1 quart; macerate for 14 days.

3. (Ph. L. 1824.) *Rhubarb*, 2 oz.; *liquorice root*, 4 dr.; *ginger* and *saffron*, of each, 2 dr.; *proof spirit*, 16 fl. oz.; *water*, 12 fl. oz.

Obs. This tincture is a popular remedy in diarrhœa and colic, and is an especial favorite with drunkards. *Dose*, as a *stomachic*, 1 to 3 fl. dr.; as a *purgative*, ½ to 1½ fl. oz. The tincture of rhubarb of the shops is mostly inferior, being generally deficient both in rhubarb and spirit. The following forms we have seen extensively employed in the wholesale trade:—*East Indian rhubarb*, 20 *lb.*; *boiling water*, q. s. to cover it; infuse for 24 hours, then slice the rhubarb, and put it into a cask with *moist sugar*, 14 *lb.*; *ginger*, bruised, 3½ *lb.*; *hay saffron*, 1 *lb.*; *carbonate of potash*, ½ *lb.*; *bruised nutmegs*, ¼ *lb.*; *rectified spirit*, 19 gall.; *water*, 21 gall.; macerate with frequent agitation for 14 days, decant the clear portion, and press and filter the bottoms. Those houses that adhere to the Ph. L. for 1824, substitute *cardamom seeds*, 5 *lb.* for the ginger. For the corresponding Ph. E. formula see the last article.

TINCTURE (Rhubarb,—Brandish's Alkaline). Syn. *Tinctura Rhei Alkalina Brandishii*,—Lat. *Prep.* From *rhubarb*, in coarse powder, 1½ *oz.*; *Brandish's alkaline solution*, 1 quart; macerate for a week. In the original formula, only ½ *oz.* of rhubarb is ordered. *Dose.* 20 drops to 2 fl. dr., in any bland liquid, not acidulous; in acidities, dyspepsia, &c.

TINCTURE (Rhubarb and Aloes). Syn. *Tinctura Rhei et Aloës*,—Ph. E. *Sacred Elixir*, *Elixir Sacrum*,—Ph. L. 1721. *Prep.* (Ph. E.) *Rhubarb*, in powder, 1½ oz.; *Socotrine* or *East Indian aloes*, 6 dr.; *cardamom seeds*, bruised, 5 dr.; *proof spirit*, 1 quart; macerate 7 days, or percolate. A warm stomachic purgative. *Dose.* ½ fl. oz. to 1 fl. oz.

TINCTURE (Rhubarb and Gentian). *Tinctura Rhei Amara; Tinctura Rhei et Gentianæ*,—Ph. E. *Prep.* (Ph. E.) *Rhubarb*, 2 oz.; *gentian*, ½ oz.; *proof spirit*, 1 quart; proceed as for the last. Stomachic, tonic, and purgative. *Dose.* 1 fl. dr. to 1 fl. oz.

TINCTURE (Rhubarb and Senna). Syn. *Warner's Gout Cordial; Tinctura Rhei et Sennæ*,—Ph. U. S. *Prep.* (Ph. U. S.) *Rhubarb*, 1 oz.; *senna* and *red sanders wood*, of each, 2 dr.; *coriander* and *fennel seed*, of each, 1 dr.; *saffron* and *extract of liquorice*, of each, ½ dr.; *stoned raisins*, 6 oz.; *proof spirit*, 2½ pints; macerate for 14 days. A popular stomachic and laxative. *Dose.* ½ to 1½ fl. oz. For another formula see *page* 541.

TINCTURE (Riemer's Nervous). *Prep.* From *oil of juniper*, 1 part; *volatile liquor of hartshorn*, 4 parts; *rectified spirit*, 16 parts. *Dose.* 1 tea-spoonful, in water.

TINCTURE (Ruspini's). See *page* 1240.

TINCTURE (Saffron). Syn. *Tinctura Croci*,—Ph. E. & D. *Tinct. Croci Sativæ*, Ph. E. 1817. *Prep.* (Ph. E.) *Hay saffron*, 2 oz. (2 *oz.*,—Ph. D.); *proof spirit*, 1 quart (1 pint,—Ph. D.); proceed either by maceration (for 14 days,—Ph. D.) or by displacement. Stimulant, and emmenagogue. *Dose.* 1 to 2 fl. dr. Chiefly used for its colour and flavour.

TINCTURE (Senna,—Compound). Syn. *Tincture of Senna, Elixir of Health; Tinctura Sennæ Compositæ*,—Ph. L. E. & D. *Tinct. Sennæ*,—Ph. L. 1824. *Elixir Salutis*,—Ph. L. 1721. *Prep.* 1. (Ph. L.) *Senna*, 3½ oz.; *caraway seeds*, bruised, 3½ dr.; *cardamom seeds*, bruised, 1 dr.; *stoned raisins*, 5 oz.; *proof spirit*, 1 quart; macerate for 7 days, press, and filter.

2. (Ph. E.) *Senna* and *stoned raisins*, of each, 4 oz.; *sugar*, 2½ oz.; *corianders*, 1 oz.; *jalap*, 6 dr.; *caraways* and *cardamoms*, of each, 5 dr.; *proof spirit*, 1 quart; digest, or proceed by percolation.

3. (Ph. D.) *Senna*, 4 *oz.*; *caraway* and *cardamom seeds*, of each, bruised, ½ *oz.*; *proof spirit*, 1 quart; macerate for 14 days.

4. (*Wholesale.*) From *senna*, 6 *lb.*: *treacle*, 2 *lb.*; *caraways*, ¾ *lb.*; *cardamoms*, ¼ *lb.*; *rectified spirit* and *water*, of each, 4 gall.; as before. Carminative, stomachic, and purgative. *Dose.* ¼ to 1 fl. oz.

Obs. "If Alexandrian senna be used for this preparation, it must be freed from *cynanchum* (argel) leaves, by picking." (Ph. E.)

TINCTURE (Serpentary). Syn. *Tincture of Virginian Snake-root; Tinctura Serpentariæ*,—Ph. L. & E., & Ph. D. 1826. *Tinct. Serpentariæ Virginianæ*,—Ph. L. 1721. *Prep.* (Ph. L.) *Serpentary*, bruised, 3½ oz. (*cochineal*, 1 dr.,—Ph. E.); *proof spirit*, 1 quart; macerate for 7 days (or, by *percolation*,—Ph. E.), strain, and filter. Stimulant, tonic, and diaphoretic. *Dose.* 1 to 3 fl. dr.

TINCTURE (Sesquichloride of Iron). Syn. *Tincture of Muriate of Iron, Tincture of Steel, Steel Drops; Tinctura Ferri Sesquichloridi*,—Ph. L. & D. *Tinct. Ferri Muriatis*,—Ph. E. *Ferri Muriatis Liquor*,—Ph. D. 1826. *Tinct. Martis cum Spiritû Salis*,—Ph. L. 1721. *Prep.* 1. (Ph. L.) *Sesquioxide of iron*, 6 oz.; *hydrochloric acid*, 1 pint; mix, and digest in a sand bath, frequently shaking, (with a gentle heat for a day,—Ph. E.,) until solution is complete, then add, when cold, of *rectified spirit*, 3 pints, and (in a short time) filter. —Sp. gr. 0·992. "1 fl. oz., potash being added, deposits nearly 30 gr. of sesquioxide of iron." (Ph. L.)

2. (Ph. D.) *Iron wire*, 8 *oz.*; *pure hydrochloric acid*, 1 quart; *distilled water*, 1 pint; mix, and dissolve by a gentle heat; next add, in successive portions, of *pure nitric acid*, 18 fl. dr.; evaporate by a gentle heat to a pint, and, when cold, mix this in a bottle with *rectified spirit*, 1½ pint; lastly, after 12 hours, filter. Sp. gr. 1·237.

Obs. This tincture is an active ferruginous tonic. *Dose.* 10 to 30 drops, gradually increased, taken in water, ale, or wine. In the old *Tinctura Martis*, Ph. L., iron filings, and in the *T. Ferri muriatis*, Ph. E. 1817, black oxide of iron, were used instead of the sesquioxide or carbonate. "*Bestuchef's Nervine Tincture*" of the P. Cod. is prepared by dissolving 1 dr. of dry sesquichloride of iron, in 7 dr. of spirit of sulphuric ether. See *De la Motte's Drops* (p. 342).

TINCTURE (Sesquinitrate of Iron). Syn. *Tinctura Ferri Sesquinitratis, Tinct. Ferri Persesquinitratis*, — Lat. *Prep.* (Onion.) *Iron filings*, ½ oz.; *nitric acid* (1·5), 2¼ oz.; dissolve, add of *hydrochloric acid* (1·16), 6 dr., simmer for 2 or 3 minutes, cool, add of *rectified spirit*, 8 oz.; and filter. Proposed as a substitute for the last preparation; but the name misrepresents its chemical constitution.

TINCTURE (Squills). Syn. *Tinctura Bechica; Tinctura Scillæ*,—Ph. L. E. & D. *Prep.* (Ph. L.) *Squills*, recently dried, and sliced (or in coarse powder), 5 oz.; *proof spirit*, 1 quart; macerate for 7 days (14 days,—Ph. D.; or, by *percolation*,—Ph. E.), press, and filter. A stimulating expectorant and diuretic. *Dose.* 10 to 30 drops; in chronic coughs, and other bronchial affections.

TINCTURE (Stomachic). Compound tincture of cardamoms. Compound tincture of gentian is also, occasionally, so called.

TINCTURE (Stramonium). Syn. *Tincture of Thorn-apple; Tinctura Stramonii,* —Ph. D. & U. S. *Prep.* (Ph. D.) *Stramonium* or *thorn-apple seeds* (bruised), 5 *oz.; proof spirit,* 1 quart; macerate for 14 days (or, *by displacement,*—Ph. U. S.), then press, and filter. Anodyne. *Dose.* 10 to 20 drops; in neuralgia, rheumatism, &c. Said to be superior to laudanum.

TINCTURE (Sumbul). Syn. *Tinctura Sumbuli,* — Lat. From *sumbul,* bruised, 5 oz.; *proof spirit,* 1 quart; macerate for a week, and strain with expression. Stimulant and tonic. *Dose.* 10 to 30 or 40 drops.

TINCTURE (Thorn-apple). See *Tincture of Stramonium.*

TINCTURE (Tobacco). Syn. *Tinctura Nicotianæ, Tinctura Tabaci,*—Lat. *Prep.* From *pure manufactured tobacco,* 1¼ oz.; *proof spirit,* 1 pint; macerate for 7 days. *Compound spirit of juniper* is often used instead of proof spirit. Sedative and narcotic. *Dose.* 10 to 30 drops. A tincture is also made from the fresh leaves. See *Vegetable Juices* (and *below*).

TINCTURE (Tolu). Syn. *Tinctura Tolutana,*—Ph. L. E. & D. *Tinctura Balsami Tolutani,*—Ph. L. 1836, & Ph. D. 1826. *Tinct. Toluiferæ Balsami,*—Ph. E. 1839. *Prep.* (Ph. L.) *Balsam of Tolu,* 2 oz. (3½ oz.,—Ph. E.); *rectified spirit,* 1 quart (1 pint,—Ph. D.); dissolve (by the aid of a gentle heat,—Ph. E. & D.), and filter.

Obs. This tincture is reputed pectoral and expectorant; but it is chiefly used as an adjuvant in mixtures, on account of its flavour. *Dose.* 10 to 60 drops.

TINCTURE (Tooth). *Prep.* 1. (Greenhough's.) From *bitter almonds,* 2 *oz.; Brazil wood, cinnamon,* and *orris root,* of each, ½ *oz.; alum, cochineal,* and *salt of sorrel,* of each, 1 dr.; *spirit of scurvy grass,* 2 fl. oz.; *proof spirit,* 1½ pint; macerate a week.

2. (*Hudson's.*) From the *tinctures of myrrh* and *cinchona,* and *cinnamon water,* equal parts, with a little *arquebusade* and *gum arabic.*

3. (*Ruspini's.*) From *orris root,* 8 oz.; *cloves,* 1 oz.; *ambergris,* 20 gr.; *rectified spirit,* 1 quart; digested for 14 days. The above are used as cosmetics for the teeth and gums. The last has long been a popular dentifrice.

TINCTURE (Toothache). See *Odontalgic Drops, Essences, Tinctures, &c.*

TINCTURE (Valerian). Syn. *Tinctura Valerianæ,*— Ph. L. E. & D. *Prep.* (Ph. L.) *Valerian root,* bruised, 5 oz.; *proof spirit,* 1 quart; macerate 7 days (14 days, —Ph. D.; or, by *percolation,*—Ph. E.), press, and filter. Tonic and antispasmodic. *Dose.* 1 to 3 fl. dr.; in hysteria, epilepsy, &c.

TINCTURE (Valerian, — Compound). Syn. *Ammoniated Tincture of Valerian, Volatile do.; Tinctura Valerianæ Composita,*—Ph. L. *Tinct. Valerianæ Ammoniata,*—Ph. E., Ph. D. 1826, & Ph. L. 1788. *Tinct. V. Volatilis,*—Ph. L. 1746. *Prep.* (Ph. L.) *Valerian root,* bruised, 5 oz.; *aromatic spirit of ammonia* (simple, — Ph. E.), 1 quart; macerate for 7 days (or, by *percolation,*—Ph. E.), then press, and filter. Stimulant, tonic, and antispasmodic. *Dose* and *use,* same as those of the simple tincture, than which it is thought to be more powerful. The *tincture of the shops* is generally made with only 1 *lb.* of the *root* to the gallon.

TINCTURE (Veratrum). Syn. *Tincture of White Hellebore; Tinctura Hellebori Albi; Tinct. Veratri,*—Ph. E. *Tinct. V. Albi,*—Ph. E. 1817. *Prep.* (Ph. E.) *White hellebore,* 4 oz.; *proof spirit,* 1 pint; digest or percolate. *Dose.* 10 drops, 2 or 3 times a day, gradually increased; in gout, rheumatism, &c., as a substitute for *colchicum;* also, *externally.*

TINCTURE (Virginian Snake-root). See *Tincture of Serpentary.*

TINCTURE (Vittie-vayr). Syn. *Tinctura Vetiveriæ,*—Lat. *Prep.* From *vittie-vayr* (roots of *andropogon muricatum*), 2½ oz.; *proof spirit,* 1 pint; macerate a week. Stimulant, tonic, and sudorific. *Dose.* 15 to 30 drops.

TINCTURE (Warburg's Fever). Syn. *Tinctura Febrifuga Warburgii.* According to M. Fuchs, this tincture may be exactly imitated as follows:—Take of *hepatic aloes* and *zedoary root,* of each, 1 dr.; *saffron,* 3 gr.; *angelica root* and *camphor,* of each, 2 gr.; *spirit* (0·897, or about 18 o. p.), 3 oz.; make a tincture (which should be 25 dr.), and dissolve in it (by the aid of a gentle heat), 30 gr. of *disulphate of quinine.* It is put up in 5-dr. bottles, each of which contains a dose, and is sold at about 5*s.* English. If the spirit be weaker than 18 or 20 o. p., some of the *disulphate* remains undissolved.

TINCTURES (Concentrated). Syn. *Tincturæ Concentratæ Haenli,*—Lat. *Prep.* (Ph. Baden.) Digest 8 parts of the *vegetable powder* in 16 of *spirit* of the sp. gr. 0·857 (45 o. p.) for 4 days at 72° Fahr., with occasional agitation, then press and filter; to the *marc* or *residuum* add as much *spirit* as it has absorbed, and again press, and filter;

the *weight* of the *mixed liquors* should be 16 parts. In this way are prepared *concentrated tinctures* of *aconite leaves; arnica* and *chamomile flowers; belladonna, digitalis, hemlock, henbane, peppermint,* and *savine leaves; ipecacuanha* and *valerian roots, &c.*

TINCTURES (Culinary). See *Essences, Spirits, &c.*

TINCTURES (Ethereal). Syn. *Tincturæ Æthereæ,* — Lat. *Prep.* (P. Cod.) From the *vegetable substance,* 1 oz.; *sulphuric ether,* 4 oz. (or 6 fl. oz.); by maceration, for 4 days, in a well-closed vessel; or, *preferably,* by *percolation* in a cylindrical glass vessel furnished with a stopper, and terminating at the lower end in a funnel, obstructed with a little cotton. The *powder* being introduced over the *cotton,* pour on it enough *ether* to moisten it, put in the stopper, fix the tube into the neck of a bottle, and leave it for 48 hours; then add, gradually, the remaining portion of the *ether,* and lastly, *enough water* to displace the *ether* absorbed. In this manner are prepared the *ethereal tinctures* of *aconite leaves, arnica flowers, belladonna, hemlock, foxglove, tobacco, pellitory, solanum, valerian, stramonium, &c.,* of the Paris Codex.

The *ethereal tinctures* of *amber, ambergris, assafœtida, cantharides* (acetic ether), *castor, musk, tolu, &c.,* are prepared by maceration only.

TINCTURES (Odoriferous). These are prepared from *odoriferous substances* by the usual processes of digestion or percolation. See *Spirits* (*p.* 1179).

TINCTURES (from Recent Vegetables). See *Vegetable Juices.*

TINDER (German). See *Amadou.*

TISANES. Syn. *Ptisans; Ptisanæ,*— Lat. This form of medicine is much used in France. They may be readily prepared by slightly medicating *barley, rice,* or *tamarind water, lemonade, &c.* See *Juleps, Decoctions, Infusions, Ptisans, &c.* (and *below*).

Tisane Antiscorbutique. An infusion of *buckbean* and the fresh *roots* of *horseradish.*

Tisane Antivenerienne, Tisane de Feltz. See *page* 319.

Tisane Commune. A *decoction* of *pearl-barley* and *couch-grass,* flavoured with *liquorice root.*

Tisane Pectorale. An *infusion* of the *roots* of *liquorice* and *marsh-mallow, Canadian maiden-hair,* and the *flowers* of the *red-poppy* and *coltsfoot,* in a *decoction* of rice.

Tisane Royale. From *senna, fresh chervil,* and *sulphate of soda,* of each, 4 dr.; *aniseed* and *cinnamon,* of each, 1 dr.; 1 *lemon,* sliced; *cold water,* 1¾ pint; macerate for 24 hours, stirring occasionally, then press and filter. Aperient. *Dose.* A wine-glassful, or more, repeated every half-hour, until it operates.

Tisane de Vinache, also called *T. Royale.* See *page* 319.

TISSUE (Blistering). See *Vesicants.*

TITANIC ACID. Syn. *Peroxide of Titanium.* This acid is found nearly pure in the minerals *rutile* and *anastase.* It may be obtained from *rutile* by fusing it, in powder, along with 3 times its weight of *carbonate of potash,* powdering and washing the resulting compound, dissolving it in strong *hydrochloric acid,* diluting the solution with *water,* and boiling it; when most of the *titanic acid* falls down, and after being collected on a filter, and well-washed, first with *dilute hydrochloric acid,* and then with *water,* is nearly pure. It *may also* be *prepared* by calcining *titanium* or *titanite* along with *nitre,* and decomposing the resulting *titanate of potassa,* as above.

Prop., &c. The precipitated acid is white, and soluble in acids; heat decomposes the solutions; ignition converts it into *metatitanic acid.*

TITANIUM. A rare metal, discovered by Klaproth, in mechanite, in 1794, and first minutely examined by Wollaston, in 1822. It is occasionally found at the bottom of the smelting furnaces of iron works, under the form of minute crystals, having a coppery lustre.

Prep. Pure *titanium* in a finely divided state may be obtained by heating the *double fluoride of titanium and potassium* with *potassium.*

Prop., &c. Extremely hard; brittle; more infusible than even platinum; insoluble in all acids, except the nitrohydrochloric, and then only when reduced to very fine powder; sp. gr. 5·3. With oxygen it forms an *oxide* or *protoxide,* which is a deep purple powder, obtained by placing a piece of metallic zinc or iron in the hydrochloric solution of titanic acid; and, a *peroxide* or *binoxide,* which is *titanic acid.* With *chlorine* it forms at least two compounds. *Bichloride of titanium,* obtained by passing chlorine over a mixture of titanic acid and charcoal strongly heated, is a colourless, volatile liquid, closely resembling bichloride of tin.

TOAST (Essence of). This is *liquid burnt sugar* or *spirit colouring. Used* to make *extemporaneous toast-and-water* (3 or 4 drops to the glass), and to flavour soups, gravies, &c.

TOBACCO. Syn. *Tabac*,—Fr. *Tabacum*, Ph. L. E. & D. The *prepared leaf* of *nicotiana tabacum* (Linn.) The name was given to this herb by the Spaniards, because it was first seen by them at *Tabasco* or *Tabaco*, a province of Yucatan, in Mexico.

The *tobacco* of *commerce* is chiefly obtained from Virginia, and other parts of the United States, but the finest varieties are imported from Havannah and from the East. The plants are gathered when mature, during hot dry weather, and are hung up in pairs, in sheds, to dry. When sufficiently dry, the leaves are separated from the stems, bound up in bundles, and these are formed into bales, or packed in hogsheads, for exportation.

Prep. To impart to the *dried leaves* the characteristic odour and flavour of tobacco, and to render them agreeable to "smokers" and "snuffers," it is necessary that they should undergo a certain preparation, or kind of fermentation. If a *fresh green leaf* of tobacco be crushed between the fingers, it emits merely the herbaceous smell common to most plants; but if it be triturated in a mortar along with a very small quantity of *quicklime* or *caustic alkali*, it will immediately exhale the peculiar odour of *manufactured tobacco.* This arises from the active and volatile ingredients being liberated from their previous combination, by the ammonia developed by fermentation, or the action of a stronger base. Tobacco contains a considerable quantity of *hydrochlorate of ammonia*, and this substance, as is well known, when placed in contact with *lime* or *potassa*, immediately evolves *free ammonia.* If we reverse the case, and saturate the excess of alkali in prepared tobacco by the addition of any mild acid, its characteristic odour entirely disappears. In the *preparation* of *tobacco* previously to its manufacture for *sale*, these changes are effected by a species of fermentation. The *tobacco*, either *unprepared* or cut into *pieces*, is placed in layers or heaps, and sprinkled with a weak solution of *common salt* and *water* (about the sp. gr. 1·107), or "*sauce*," as it is called; the salt being added to prevent the tobacco becoming mouldy, and to keep it moist, as well as to moderate the fermentation. *Molasses* is also frequently added to the sauce when a *violet* or *dark coloured product* is desired; and some persons, with a like intention, add a *decoction* or *solution of extract of liquorice.* *Pure water*, without any addition, is, however, quite sufficient to promote and maintain the perfect fermentation of tobacco, and, of late years, the larger and more respectable houses assert that they have employed *nothing* else. The *leaves* soon become *hot* and evolve ammonia; during this time the *heaps* require to be occasionally opened up and turned over, lest they become too hot, take fire, or run into the putrefactive fermentation. The extent to which the process is allowed to proceed, varies for different kinds of snuff or tobacco from *one* to *three* months.

Pur. The cheap tobacco vended in the shops is largely adulterated. Tobacco is now offered for sale at 3*d.* per ounce, *i. e*, 4*s.* per pound, while the duty alone amounts to about 3*s.* 3*d.*, thus leaving only 9*d.* to be divided among the grower, the importer, the manufacturer, and the retailer; besides which there is a loss by weighing it out in small quantities, and by evaporation. Is it possible for this tobacco to be genuine? It cannot be. It is a well-known fact that this tobacco is largely adulterated with foreign matter. It is a general practice to moisten it with *treacle water*, in which a little *saltpetre* has been dissolved, for the purpose of making it sufficiently adhesive to retain the *fine sand* which is afterwards added, and to make it burn well. All this is done to increase the weight. When *foreign vegetable matter* is mixed with tobacco, *Bengal safflower* (at the price of 28*s.* per cwt.) is preferred. It is infused in a very weak *solution* of *potassa* or *ammonia;* the former giving a dark brown colour resembling "*Shag*," and the latter a light brown, approaching in appearance to "*Returns.*" Considerable loss, however, having occurred from some of the vegetable matter being dissolved out, an *improvement* has been *lately* introduced; the *safflower*, having been moistened, is placed in trays in an empty *sugar hogshead* or other suitable cask, into which the *ammoniacal gas* is allowed to pass. By this process the weight is *increased;* whereas, by the earlier methods of preparing it, a *loss* of *one half* was sustained. (Chem., iii, 304.) *Another means* of *profit* is the use of extremely heavy paper (rich in plaster) for wrappers. In a recent trial, a London tobacconist admitted clearing £2 per week, by thus selling paper at 4*s.* per *lb.* that cost him only 3½*d.*

Qual., &c. Tobacco is a powerful narcotic, sedative, and emetic; and is also cathartic and diuretic; but the last in a weaker degree than either squills or foxglove. Its action is violently depressing and relaxing, producing fainting, and even death, in comparatively small quantities. Toxicologists rank it among the more active narcotico-

acrid poisons; and physicians, when they wish to produce sudden physical prostration, in accidents or spasmodic diseases, order an enema of the infusion or smoke of tobacco. (See *p.* 375.) Its deleterious properties depend on the presence of *nicotine*, one of the most frightful vegetable poisons known (see *p.* 819), of which ordinary tobacco contains from 6 to 11%. Yet of such a vegetable substance, so rich in such a deadly poison, nearly 40,000,000*lb.* are annually consumed in these countries. And "with what results?" probably inquires the reader. We dread to tell. Let those interested,—let the multitudes of smokers suffering from countless nervous ailments, irremediable dyspepsia, imperfect vision, and mental confusion or derangement imperceptibly leading to insanity,—let the debased sot who intoxicates himself with tobacco because he is too poor, too mean, or too despicable to do so on wine, or beer, or spirit,—let the myriads it has led to drunkenness, answer the question. An eminent physician tells us, that many cases of insanity may be fairly ascribed to the excessive use of tobacco. In the American statistical tables of lunacy this fact has been long acknowledged. Indeed, it would be monstrous to suppose that so powerful an agent as tobacco could be daily "*smoked*," or "*snuffed*," or "*chewed*," without being productive of the most serious consequences. *Opium eating* is incompatible with the enjoyment of health,—the excessive use of *alcoholic liquors* is still more so, besides being more morally degrading; but the *constant use of tobacco* is more pernicious than both of them, besides which, it is the common incentive to habitual drunkenness, and thus indirectly fills our workhouses and gaols. The *temperance* and *teetotal advocates* have begun at the wrong end of their mission. They should have made their first onslaught on the use of tobacco. Unfortunately, the tight-laced gentleman whose feelings of propriety would be outraged by swallowing a glass of wine before dinner, if at all, considers it a harmless proceeding to throw himself into a state of pleasing narcotism — nay, to speak truthfully—of moody intoxication or quiet drunkenness, by inhaling the fumes of his favorite "weed," even before breakfast. But what avails the words of truth and philanthropy, the teachings of science, or the records of dear-bought experience, against the self-indulgence and the prevailing habits of a people; more especially when that habit or, rather say, *vice*, is upheld by law, is a rich source of revenue to a government, and is practised, and even defended, by the dignitaries of our holy religion. "Truth," says Milton, "comes into the world like a bastard, to the injury or ruin of its parent;" and we think we may add, that in no earthly mission is the apostle of truth so much neglected and contemned, as when his efforts are directed against the luxuries and degrading habits of his race. Were the use of tobacco as infrequent, as it is now general, it would be held in abhorrence, and its devotees placed beyond the pale of sanity and civilisation. The regal author of a "*Counterblast to Tobacco*" was a true philanthropist and philosopher in his way.

"He who devoteth himself to the weed begetteth sickly offspring, who are frequently short-lived, and are weaker minded than those of other men." Youth should, especially, eschew the use of tobacco, as their physical growth is commonly, nay nearly always, arrested on their initiation therein. *Smoking* is, however, undoubtedly the least pernicious method of employing tobacco, although it is, perhaps, the most filthy, and the most annoying to those who do not use it.

The injurious effects of *smoking* have been greatly increased, of late years, by the substitution of ridiculously short pipes for the long ones previously in use.

(For the effects of tobacco on both mind and body, *see* an excellent little pamphlet by Mr. Lizars, which will prove invaluable to those who choose to attend to its monitions.)

TOBACCO (British). Syn. *Herb Tobacco; Tabacum Anglicum, Species Sternutoriæ,*—Lat. *Prep.* Take of *thyme*, *marjoram*, and *hyssop*, of each, 2 *oz.*; *betony* and *eyebright*, of each, 3 *oz.*; *rosemary* and *lavender*, of each, 4 *oz.*; *coltsfoot*, 1 *lb.*; mix, press them together, and cut the mass in imitation of manufactured foreign tobacco. Some asthmatic subjects add 5 or 6 *oz.* of *stramonium* or *thorn-apple leaves*; others add ½ *lb.* of *genuine tobacco.*

TOBACCO (Indian). See *Lobelia.*

TODDY. Obtained from various species of *palms*, by cutting off the end of the flowering bud, and collecting the sap. *Used*, fresh, as a cooling beverage; and, after fermentation, as an intoxicating one. *Sweetened grog* is so called in Cornwall, and in some other parts of England.

TOFFY. Syn. *Everton Toffy.* A sweetmeat *prepared* by heating *brown sugar*, in a saucepan or skillet, with about one half its weight of *fresh butter*, for 15 to 20 minutes, or until a "little of it dropped into *cold water* forms a lump that breaks crisply;" it is then poured into a *buttered tin mould.*

TOILET REQUISITES. See *Essences, Oils, Pommades, Perfumes, Soaps, &c.*

TOKAY. A luscious, yet agreeable wine, made at Tokay, in Hungary. It is preferred in the *turbid* state, and, hence, it is agitated before pouring it into the glass.

TOLENE. A volatile, colourless liquid, obtained, along with *benzoic acid* and *cinnameine*, when *balsam of tolu* is distilled along with *water*. It boils at 338° Fahr.

TOLU (Balsam of). Syn. *Balsamum Tolutanum*,—Ph. L. E. & D. "Balsam flowing from the incised trunk" of "*myrospermum toluiferum*, hardened." (Ph. L.) It is a stimulating expectorant, and has long been a popular pectoral. *Dose.* 5 to 20 gr., dissolved in spirit, or made into an emulsion. See *Tinctures.*

Pure balsam of tolu is *perfectly* soluble in alcohol, forming a *transparent* solution. It is frequently adulterated, in which case it has a *weaker smell*, is *less soluble in alcohol*, and the *tincture formed with that fluid is opaque.*

A *factitious balsam of tolu* is occasionally met with in trade, formed of equal parts of *orange lac* reduced to a proper consistence with *rectified spirit*, and "brought up" with a few drops of the *oils of cassia* and *nutmeg*, dissolved in a little *essence of vanilla.*

TOLUIDINE. An organic base obtained by the action of *sulphuret of ammonium* on *nitro-toluide*, in the manner adopted for *aniline.* It forms colourless crystals, sparingly soluble in water, freely soluble in alcohol and ether, is basic, and possesses an aromatic odour and flavour.

TOLUOLE. Syn. *Benzoene.* A peculiar liquid hydrocarbon, found among the products of the destructive distillation of *balsam of tolu* which has been previously freed from essential oil by distillation along with *water.* From these it is obtained pure by a second distillation. It may *also* be *prepared* by distilling *toluylic acid* with *lime* or *baryta.* It is an ethereal liquid, which is sparingly soluble in alcohol, freely so in ether, and boils at 226° Fahr. Sp. gr. 0·870.

TOLUYLIC ACID. A new organic acid, obtained by Mr. Noad, by the action of *dilute nitric acid* on *cymol.* It closely resembles benzoic acid.

TOMBAC. A species of brass with excess of zinc. *Red tombac* is red brass or Dutch gold; *white tombac*, an alloy of copper with arsenic.

TONICS. Medicines that increase the tone of the muscular fibre, and impart vigour to the system. The principal *mineral tonics* are,—*iron, zinc, copper, silver, arsenic, bismuth, mercury*, and the *mineral acids.* The principal *vegetable tonics* are—*cinchona, cinchonine, quinine*, the *vegetable bitters*, and some of the *aromatics.* Of the above, *iron, bark*, and its preparations, and the *aromatic bitters*, are those generally employed, and which prove most genial to the constitution. Many tonics, as *cinchona*, and *quinine*, are remarkable for curing diseases of a periodic character. *Iron* appears to act by altering or improving the condition of the blood; whilst the *vegetable bitters* probably act indirectly by giving tone to the stomach.

TONQUIN REMEDY. Syn. *Pulvis Trunchinensis, P. Alexipharmicus Sinensis*,—Lat. *Prep.* From *valerian*, 20 gr.; *musk*, 16 gr.; *camphor*, 6 gr.; mix. Antispasmodic and alexiterial, in doses of 6 to 12 gr., in hooping-cough, &c.; 1 dr., in hydrophobia, exanthemata, and mania. (See *page* 1060.)

TOOTHACHE. Syn. *Odontalgia*,—Lat. This annoying affection frequently arises from sympathy with a *disordered stomach.* In such cases a *saline purgative* should be administered, and an *emetic*, if required, When *cold* is the cause, an excellent remedy is a hot *embrocation of poppy-heads*, followed by the *use of flannel* and *diaphoretics.* When it arises from a *hollow* or *decayed tooth*, the best application is a *piece of lint* moistened with *creasote* or a *strong spirituous solution of creasote*, and closely rammed into the cavity of the tooth. *Laudanum*, the *essential oils* of *cloves, caraway*, and *cajeput*, and *essence* or *tincture of pellitory of Spain*, are also used in the same way. To *prevent* the *recurrence* of the latter kind of toothache, the cavity should be filled with an *amalgam of gold*, or with *mineral marmoratum* or some other good cement. In many cases, *chewing* a piece of *good ginger*, or, still better, a small piece of *pellitory*, will afford relief in a few minutes. The celebrated John Wesley recommended a "few whiffs" at a pipe containing a little *caraway seed* mixed with the *tobacco.* A "touch" of one of Pulvermacher's or Meinig's *electric chain-batteries*, will often instantly remove the toothache after all other means have failed. See *Drops, Essences, Tinctures, &c.*

TOOTH CEMENTS. *Prep.* 1. *Amalgam of gold*, applied warm. *Silver*, and, even *tin*, are also used in the same way.

2. A piece of *native uncoloured gutta percha*, softened in *hot water*, and applied at once. Efficient and durable.

3. *Zinc filings*, 1 part; *quicksilver*, 2

parts; mixed and applied at once. Not very durable.

4. (*Bernotte's.*) From *powdered mastic* mixed with about half its weight of *ether*, and, afterwards, with enough *finely powdered burnt alum* to form a stiff paste. *Taveare's Cement* is similar.

5. (Mr. Evans.) *Pure tin*, 2 parts; *cadmium* and *bees' wax*, of each, 1 part; melt them together, cast the compound metal into a small ingot, and reduce it to filings. For *use*, form these into a *liquid amalgam* with *quicksilver*, q. s.; squeeze out the *excess of quicksilver* through a piece of *chamois leather*, and at once apply it to the tooth. (See No. 9.) Recommended as very durable and unobjectionable.

6. (*Marmoratum.*) From *anhydrous phosphoric acid*, 12 gr.; *pure caustic lime*, 13 gr.; both finely pulverized, mixed rapidly in a mortar, and applied, in the *dry state*, as rapidly as possible, as it soon becomes moist; the mixed powder, after being well-pressed in, is smoothed off with the finger moistened with a *drop* of *water*. This is white and durable, and soon acquires great hardness. In its composition it resembles the natural earthy matter of the teeth.

7. (*Mineral Marmoratum.*) The same as *mineral succedaneum*, with the addition of a little *powdered glass* or *quartz*. A common sort is made of *levigated glass* mixed with *amalgam of tin*.

8. (*Mineral Metallic Cement.*) Add finely levigated *steel filings* to some *mineral succedaneum*. Dark coloured; inferior to *mineral marmoratum*.

9. (*Mineral Succedaneum.*) This is merely amalgam of gold first above noticed. The common method of proceeding is to heat *pure gold* in a *bright iron ladle*, and to add enough *pure mercury* to render it of a doughy consistence at the heat of hot water; when cold, the excess of mercury, if any, must be removed by pressure in a piece of *chamois leather*. For *use*, a little must be kneaded, as hot as possible, in the hand, and at once wedged into the cavity of the tooth.

10. (*Ostermaier's.*) Same as No. 6.

11. (*Poudre Metallique.*) The article sold in Paris under this name, is said to be a triple *amalgam* of *mercury*, *silver*, and *ammonium*, with the latter in excess; part of the ammonium escapes as ammoniacal gas, whilst the remainder of the ammonium, silver, and mercury, remains as a firm alloy in the cavity of the tooth. (Redwood.)

12. (*Silica.*) From *levigated porcelain*, *plaster of Paris*, and *iron filings*, equal parts; made into a paste with the thickest *quick-drying copal varnish*.

13. (*Vienna Cement,*) From *powdered asbestos* made into a paste with *mastic varnish*.

14. (*Wirth's.*) From *levigated quartz*, made into a paste with very thick *mastic varnish*.

Obs. It is absolutely necessary for success that the teeth be well cleaned out, and wiped dry, before applying any of the above *stoppings* or *cements*.

TOOTH COSMETICS. See *Dentifrices, Pastes, Powders, Tinctures, &c.*

TOOTH-RASH. See *Strophulus.*

TOPAZ. See *Gems.*

TORMENTIL. Syn. *Tormentillæ Radix; Tormentilla*,—Ph. L. & E. The *root* or *rhizome* of *potentilla tormentilla* (tormentilla erecta,—Linn.) It is astringent and febrifuge, without being stimulant. *Dose.* 20 to 60 gr.; in agues, diarrhœa, &c.; also, formerly, in syphilis.

TOUCH-NEEDLES. See *Assaying.*

TOUCH-WOOD. See *Amadou.*

TOUS-LES-MOIS. The *fecula* of the *roots* of *canna edulis.* (Ph. D.); intended as a substitute for arrow-root. To the naked eye, it closely resembles the finest quality of potato starch; but under the microscope, its granules are found to be oblong, oval, with a concentric structure, and larger than those of the potato tuber.

TOXICOLOGY. See *Poison.*

TRACING PAPER. It has been recently stated that a very excellent *tracing paper*, that will bear writing on with chalk, pencils, or even steel pens, may be *prepared* from *Damara resin*, formed into a varnish, and applied as described at *page* 933. An *extemporaneous tracing paper* may be made by moistening the *paper* with *spirit of wine* or with *rectified oil of turpentine.*

TRAGACANTH. Syn. *Gum Dragon, Gum Tragacanth; Tragacantha*,—Ph. L. E. & D. "The *juice* exuded from the *bark* of *astragalus verus* hardened by the air." (Ph. L.) It differs from gum arabic in being only semi-transparent, and in swelling up, forming a kind of jelly, but not dissolving in cold water; with which, however, when pure, it forms as thick a mucilage as 24 parts of gum arabic. It is *entirely* soluble in boiling water.

TRAGACANTHINE. Syn. *Adragantine.* The portion of *gum tragacanth* which is insoluble in cold water.

TRANSPARENCIES. Water-colour pictures on paper, linen, or calico, if executed in non-opaque or glazing colours,

may be converted into transparencies by simply brushing over their backs with *Canada balsam* thinned down, when necessary, with a little *oil of turpentine*. For coarse work, *boiled oil* may be employed.

TRAUMATIC BALSAM. See *p* 1230.

TRAUMATICINE. This article, as manufactured by the Gutta Percha Company, is simply a *solution* of *white* and *dry unmanufactured gutta percha* in *bisulphuret of carbon*. A small portion dropped on a wound, or raw surface, almost instantly forms a pliable, waterproof, and airtight defensive covering to the part. The only objection to the preparation is the fœtid odour of the menstruum, which, however, is lost in a few seconds; or may be obviated by employing *chloroform* as the solvent.

TREACLE. Syn. *Molasses; Theriaca; Sacchari Fæx*,—Ph. L. & E. The viscid, brown, uncrystallizable syrup which drains from moist sugar during its formation (*common treacle* or *molasses*), and from the sugar-refining moulds (*treacle, sugar-house molasses*). The last, according to Dr. Ure, has generally the sp. gr. 1·4, and contains about 75% of solid matter.

Treacle is more laxative than sugar, and always contains more or less free acid. It is used as the *vehiculum* in some of the pill-masses of the Ph. L. See *Sugar &c.*

TREACLE (German). Syn. *Theriaca Germaniæ*. An evaporated *infusion* or *decoction* of *juniper berries*. It is sweet-tasted, aromatic, and diuretic.

TREACLE (Venice). Syn. *London Treacle; Theriaca; Theriaca Andromachi*. The *theriaca* of the Ph. L. 1746 consists of 61 ingredients, and contains 1 gr. of *opium* in 75 gr.; that of the *Paris Codex* consists of 72 ingredients, and contains 1 gr. of *opium* in 72 gr.; that of the Ph. E. 1744, consists of 10 ingredients, and contains 1 gr. of *opium* in every 100 gr. It is *prepared* as follows:—Take of *serpentary root*, 6 oz.; *valerian* and *contrayerva roots*, of each, 4 oz.; *aromatic powder*, 3 oz.; *guaiacum resin*, *castor*, and *nutmeg*, of each, 2 oz.; *saffron* and *opium* (dissolved in a little wine), of each, 1 oz.; *clarified honey*, 75 oz.; reduce all the dry ingredients to fine powder, then mix them. The *confection* or *electuaries* of *catechu* and *opium* are the representatives of the above polypharmic compounds in the modern British pharmacopœias. The same efficacy was ascribed to the "*theriaca*" as to the *mithridate* noticed at *page* 791.

TRI-, *tris-*. See *Nomenclature*.

TRIP. See *Sesquioxide of Iron*.

TRIPOLI. Syn. *Rotten Stone; Alana; Terra Cariosa*. A mineral employed as a *polishing powder*, originally imported from *Tripoli*, in Barbary. It consists almost entirely of silica, and is composed of the skeletons of minute infusoria, the precise character of which is readily distinguishable under the microscope.

TRISMUS. See *Tetanus*.

TRITHIONIC ACID. Syn. *Sulphuretted Hyposulphuric Acid*. A compound discovered by M. Langlois, and obtained by gently heating *sulphur* in a *solution of carbonate of potassa* previously saturated with *sulphurous acid;* the resulting *trithionate of potassa* is next decomposed by *hydrofluosilicic acid*, and the liquid acid concentrated in vacuo. *Tetrathionic acid* has been formed by MM. Fordos and Gélis; and *pentathionic acid*, by M. Wackenroder.

TRITOXIDE. See *Nomenclature*.

TRITURATION. Syn. *Tritura, Trituratio*,—Lat. The act of rubbing a solid body to powder. See *Pulverization*.

TROCHES. See *Lozenges*.

TRONA. A native true *sesquicarbonate of soda*, found on the banks of the soda-lakes of Sokena, in Africa.

TROPHAZOME. A concentrated *infusion of minced lean meat* mixed with the fluid obtained from the *residuum* after being heated for 20 minutes in a water bath, and flavoured with *salt* and *spices*, the whole being, lastly, simmered for a few minutes. Excellent for convalescents.

TROUT. The *salmo fario* of Linnæus, a highly esteemed fish, found in most of the rivers and lakes of this country. Other members of the genus *salmo* are also so called; as, *salmo eriox*, the bull or grey trout; *salmo ferox*, the great grey or lake trout; *salmo trutta*, the salmon trout, &c. All of these varieties are in the finest condition from the end of May to late in September.

TRUSS. See *Surgery* (Popular).

TSCHILLIES. See *Pepper* (Cayenne).

TUMOUR. A permanent swelling, enlargement, or induration, possessing a distinct locality and more or less restricted in extent. There are two principal classes, —*sarcomatous tumours*, or those which are firm and of a fleshy consistence; and *encysted tumours*, or those consisting of a sac containing matter more or less pulpy or fluid. Of each of these classes there are numerous varieties. The *treatment of ordinary tumours* is either by resolution or dispersion, by the application of repellants or resolvents, or even pressure, supported by a low diet; or, their suppuration or

ripening, is promoted by warmth, stimulating applications, and a liberal diet. The former, applies to both varieties; the latter chiefly to those that suppurate readily and afterwards heal kindly. The choice must, however, depend almost entirely on the precise character of the tumour, and existing circumstances, as the locality, habit of body, &c. See *Abscess*, *Boils*, *&c.*

TUNGSTEN. Syn. *Tungstenum*, *Wolframium*; *Scheelium* (?). A heavy, gray, brittle metal, discovered by Messrs. Delhuyart. It occurs in *wolfram*, a mineral tolerably abundant in Cornwall, united with oxygen (*tungstic acid*), manganese, and iron, from which it may be obtained by the action of *charcoal*, at a high temperature. It is, however, more conveniently obtained by strongly heating *tungstic acid* in a stream of *hydrogen gas*.

Prop., *&c.* Sp. gr. 17·35; heated in the air it takes fire, producing tungstic acid. *Sesquioxide* or *blue oxide of tungsten* is prepared by heating tungstate of ammonia; and the (*binoxide*, *peroxide*, *brown oxide*, *tungstous acid*), by exposing tungstic acid to a stream of hydrogen at the temperature of *dull* redness. Two *chlorides* and two *sulphurets* have also been formed.

TUNGSTIC ACID. A yellow powder, obtained by digesting native *tungstate of lime*, finely powdered, in *nitric acid*. It is insoluble in water, but dissolves freely in a concentrated solution of pure potassa, forming *tungstate of potassa*.

TURBOT. The *rhombus maximus* (Cuvier), said to be the best, and, excepting the halibut, the largest of our flat fishes. Dutch turbots are the most esteemed.

TURKEY. See *Poultry*.

TURMERIC. Syn. *Curcuma*,—Ph. L. & D. The *rhizome* of *curcuma longa* (Linn.) The best is imported from Ceylon. It is stimulant and carminative, but is chiefly used in dyeing yellow, and as an ingredient in *curry-powder*; also as a test for alkalies. It gives a fugitive *golden yellow* with weld, and an *orange tinge* to scarlet. It dyes *wool* and *silk*, mordanted with common salt, or sal ammoniac, a *fugitive yellow*. *Dose.* 10 to 30 gr. See *Curcumine*.

TURNBULL'S BLUE. Syn. *Ferricyanide of Iron*, *Hydroferridcyanate of do.*; *Ferri Ferridcyanidum*,—Lat. *Prep.* Precipitate a solution of *protosulphate of iron* with another of *red prussiate of potash* (ferridcyanide of potassium).

Obs. This is a variety of Prussian blue, remarkable for its beautiful colour, and may be distinguished from the ordinary Prussian blue of commerce by its action on the yellow prussiate of potash. When boiled in a solution of the latter it is decomposed, a portion is dissolved, and a gray residue remains. Liebig, however, says that it has the same constitution as ordinary Prussian blue.

TURNER'S YELLOW. See *Yellow Pigments*.

TURNSOLE. See *Litmus*.

TURPENTINE. Syn. *Terebinthina* (Americana), — Ph. L. *Terebinthina Vulgaris*,—Ph. L. 1836. "An oleo-resin flowing from the trunk, the bark being removed, of *pinus palustris* (pitch *or* swamp pine) and *pinus tæda* (loblolly *or* old field pine)." —Ph. L. It is viscid, of the consistence of honey, and transparent; by distillation it is resolved into *oil of turpentine*, which passes over into the receiver; and into *rosin*, which remains in the still.

TURPENTINE (Bordeaux). Syn. *French Turpentine*. From the *pinus maritima* or *cluster pine*. Solidifies with magnesia. (Lindley.) *Briançon turpentine*, a nearly similar variety, is from the *pinus cembra* (Linn.) or *Siberian stone pine*.

TURPENTINE (Chian). Syn. *Chio Turpentine*, *Cyprus do.*, *Scio do.*; *Terebinthina Chia*,—Ph. L. & E. "An oleo-resin flowing from the *incised trunk* of *pistachia terebinthus*" (Linn.)—Ph.L. It is pale, aromatic, fragrant, and has a warm taste devoid of acrimony or bitterness. It is much adulterated. A factitious article (*terebinthina Chia factitia*), made as follows, is also very generally sold for it:—*Black rosin*, 7 *lb.*; melt, remove the heat, and stir in of *balsam of Canada*, 7 *lb.*; *oils of fennel* and *juniper*, of each, 1 fl. dr.

TURPENTINE (Venice). Syn. *Terebinthina Veneta*,— Ph. E. Liquid resinous exudation from the *abies larix* (pinus larix,—Linn.) or *larch tree*. It is sweeter and less resinous-tasted than common turpentine, but is now scarcely ever met with in trade. *That* of *the shops* is wholly a *factitious article*, made as follows:—*Black rosin*, 48 *lb.*; melt, remove the heat, and add of *oil of turpentine*, 2 gall.

TURPETH MINERAL. Subsulphate of mercury.

TURQUOISE (Factitious). See *Pastes*.

TURTLE. Syn. *Green Turtle*. The *testuda mydas* (Linn.), a *chelonian reptile*, highly esteemed for its *flesh*, *eggs*, and *fat*.

TUSSILAGO. See *Coltsfoot*.

TUTENAG. A name sometimes applied to *German silver*; at others, to *pale brass* and *bell metal*. "In India *zinc* sometimes goes under this name." (Brande.)

TUTTY. Syn. *Tutia, Tuthia, Impure Oxide of Zinc.* The *sublimate* that collects in the chimneys of the furnaces in which the *ores of zinc* are smelted. Drying; astringent. *Used* in eye-waters and ointments.

TYPE METAL. An alloy formed of *antimony*, 1 part; *lead*, 3 parts; melted together. *Small types* are usually made of a harder composition than large ones. A good *stereotype metal* is said to be made of *lead*, 9 parts; *antimony*, 2 parts; *bismuth*, 1 part. This alloy expands as it cools, and consequently brings out a fine impression.

TYPHUS. Syn. *Typhus Fever.* A form of continued fever, marked by extreme debility and depression of the nervous powers, an imperfect reaction of the vascular system, and a tendency to putrefaction. It is generally regarded as contagious or infectious, and is often epidemic. The debilitated and uncleanly are those *most liable* to its *attacks;* and crowded, damp, ill-ventilated, and badly drained buildings and localities, more especially those in which the effluvia from decaying animal or vegetable matter abound, are those in which it is *most prevalent* and *fatal.*

Typhus fever has been divided into two great varieties,—MILD TYPHUS (*nervous fever, slow fever; typhus mitior*), and MALIGNANT TYPHUS (*putrid fever, pestilential do., petechial do.; typhus gravior, typhus malignus*). The last has also received various names, derived from the places where it most prevails; as, *camp fever, hospital do., gaol do.*, and, in cases in which there is much bilious vomiting, *bilious fever.*

The *general symptoms* of *typhus* are "inordinate muscular, nervous, and mental depression; weariness; flying pains; a frequent, small, and fluttering pulse; a foul and brown tongue; impaired taste; and, frequently, nausea and bilious vomiting. As the disease advances the debility increases; the mouth becomes foul, and the breath fœtid; the urine deposits a brown sediment, and, together with the motions, is fœtid, and rapidly putrefies; all these symptoms increase in intensity; the speech becomes inarticulate, muttering, and delirious; there is a tendency to bleeding from the nose, mouth, and bowels; petechiæ, or livid spots, appear upon the surface; the pulse sinks and intermits; the mind wanders; hiccup comes on; the hands and feet become cold; and, under these horrible symptoms, the patient dies. Such is an outline of the ordinary progress of a typhus fever to a fatal termination. In this climate it may endure for three weeks or a month; but in hot countries the symptoms follow each other more rapidly and violently, and it is then not of more than eight or ten days' duration. When it does not terminate fatally, the symptoms begin to assume a more favorable aspect about the twelfth or fourteenth day; the pulse improves, the patient gets some tranquil sleep, perhaps perspires; the urine deposits a red sediment; bilious stools are passed; he becomes more tranquil in mind and body, and his symptoms gradually disappear until health is restored; but it is a disease, the event of which must be anticipated with the utmost caution, for attacks apparently mild sometimes terminate fatally, whilst, in other cases, the constitution has rallied under the most alarming and malignant features."

The *milder form of typhus* generally *commences* with slight shiverings; heavy or vertiginous headache; the tongue exhibits little change; the pulse is only slightly, but somewhat smaller than usual; and the other early symptoms are less marked and severe than in the malignant variety, and are often, otherwise considerably modified. When the patient is of a sound constitution, and not debilitated by age, or bad habits, it is seldom fatal; otherwise it is frequently so. Scarlet fever and other varieties, often assume a typhoid character.

The *treatment* of *typhus* must be greatly regulated by the peculiarities of the case. In the *very commencement* an *antimonial emetic* and a *mild aperient* are proper, followed by aromatic opiates, with camphor and ether. "It is possible that some particular symptom, indicative of local congestion, may call for *bleeding* or *blistering:* the former, except in some very rare cases, should be *local only*, and *very limited* as to quantity." *Serpentaria, Peruvian bark, cascarilla*, and *calumba*, more particularly the first two, are the *tonics* most relied on; and with these should be combined *camphor, aromatic confection, confection of opium*, and *ether;* or, if agreeable to the stomach and bowels, *water* slightly acidulated with the *mineral acids*, or *lemon juice*, on account of their tonic and antiseptic action. As *stimulants*, to keep up the general powers of the system, *wine*, and *brandy*, or even good *ale* or *porter*, may often be *cautiously* had recourse to with advantage. A *supporting spoon diet*, with extreme attention to cleanliness and ventilation, will complete the treatment. A *cold shower-bath* twice or thrice daily on the first attack, and afterwards, sponging with *cold* or *tepid water*, or with *vinegar-and-water*, have also been highly recommended.

The *principal objects* to be kept in view during the above treatment are—"to *assist arterial action*, when deficient;—to *subdue local inflammation*, or at least, to keep it below the point of disorganization; and—to *sustain* the *vital powers* by a proper regulation of the diet, and the judicious use of *stimulants*, when required." (*Med. Lex.*)

TYROSINE. A peculiar crystallizable substance, obtained by Mr. Warren de la Rue, from the *mother-liquor* of *carminic acid*.

ULCER. Syn. *Ulcus*,—Lat. A sore arising from a solution of continuity in any of the soft parts of the body, either open to the surface or to some natural cavity, and attended by a secretion of matter or pus, or by some other kind of discharge.

"*Ulcers* may *arise* from a *variety* of *causes*, as all those which produce inflammation, from wounds, specific irritations of the absorbents, from scurvy, cancer, the venereal or scrofulous virus, &c. The *proximate* or *immediate cause* is, however, an increased action of the absorbents, and a specific action of the arteries, by which a fluid is separated from the blood upon the ulcerated surface." *Cancerous*, *fistulous*, *fungous*, *gangrenous*, *inveterate*, *scorbutic*, *scrofulous*, *sinuous*, *syphilitic*, *&c.*, are terms which will explain themselves. Those resulting from accidental injuries are termed *local* or *simple ulcers;* and those from specific poisons or particular habits of body, *constitutional* or *specific sores* or *ulcers*.

The *treatment* of *ulcers* varies with their character. *Simple* or *local ones*, unless the habit of body be bad, generally give way before extreme cleanliness, and some simple dressing, as noticed under abscess and boils. *Constitutional* or *specific ones* usually require the use of some particular dressing, which varies with the exciting cause. Thus, *ointments containing mercury* are generally regarded as appropriate to those of a SYPHILITIC character; and *ointments* containing *iodine* or the *iodides*, to those of a SCROFULOUS character. INDOLENT ULCERS are commonly dressed with *digestive* or *stimulating ointments*, as those of *resin* and *elemi;* and FOUL ULCERS, with *astringent* or *detergent ointments*. PAINFUL and IRRITABLE SORES are often treated with the *ointment of hemlock* or *henbane*, or some other *anodyne;* whilst to those with a PUTRID TENDENCY, *antiseptic ointments* and *charcoal poultices* are applied. OPEN CANCERS are often dressed with *unguents* containing *arsenic* or *arsenious acid*, due caution being observed. FUNGOUS GROWTHS are suppressed by *escharotics*. In *all cases*, a rigid attention to the general health must be enforced, the *diet* must be carefully regulated, and *fresh air* at home, and *gentle out-door exercise* secured as much as possible. In cases of a CONSTITUTIONAL or SPECIFIC CHARACTER, the *primary disease* must also receive the usual treatment.

According to Mr. Skey, the eminent surgeon of St. Bartholomew's hospital, the administration of a *pill of soap and opium* (pilula saponis cum opio,—*Ph. L.*) exerts a very marked action in promoting the healing of OBSTINATE SORES, more especially those of the legs. See *Cerates*, *Lotions*, *Ointments*, *Poultices*, *&c.*

ULMINE. Syn. *Ulmic Acid*. A peculiar substance which exudes from the bark of the elm (*ulmus nigra*) and some other trees, and first examined by Klaproth, in 1802. When dry, it is hard, blackish, resinous, readily soluble in the mouth, but insoluble in alcohol and ether. It may always be obtained from *elm-bark*, previously exhausted with *hot alcohol*, and afterward with *cold water*, by digesting it in a *solution of carbonate of potash*, and precipitating the resulting liquid with *dilute hydrochloric acid*. A closely allied substance may be formed artificially by heating *caustic potassa* with *sawdust*, by the action of *sulphuric acid* on *vegetable matter*, and by combining *gallic acid* with *ammonia* and exposing the compound to *oxygen*. (See *page* 1114.)

ULTRAMARINE. Syn. *Lapis-lazuli Blue*, *Ultramarine do.;* *Cæruleum Ultramontanum*,—Lat. This beautiful pigment is obtained from the blue mineral *azure stone*, *lazulite* or *lapis lazuli;* the finest specimens of which are brought from China, Persia, and Great Bucharia.

Prep. Pure *lapis lazuli* (reduced to fragments about the size of a pea, and the colourless pieces rejected), 1 *lb.*, is heated to redness, quenched in *water*, and ground to an impalpable powder; to this is added, of *yellow rosin*, 6 *oz.;* *turpentine*, *bees' wax*, and *linseed oil*, of each, 2 *oz.;* previously melted together; the whole is next made into a mass, which is kneaded in successive portions of *warm water*, as long as it colours it blue; from these it is deposited on repose, and is then collected, well washed with clean water, dried, and sorted according to its qualities. The *first water*, which is usually dirty, is thrown away; the *second* gives a blue of the first quality; and the

third, and following ones, yield samples of less value. The process is founded on the property which the colouring matter of azure-stone has of adhering less firmly to the resinous cement than the foreign matter with which it is associated. When azure-stone has its colour altered by a moderate heat, it is reckoned bad or factitious.

Obs. Ultramarine is the most costly, but at the same time the most splendid and permanent of our blue pigments, and works well in oil.

ULTRAMARINE (Artificial). Syn. *Azure Blue, Meissner Ultramarine, Paris do., Vienna do.; Cæruleum Ultramontanum Factitium*,—Lat. From the researches of MM. Clement & Desormes, & M. Robiquet, it has been inferred that the colour of ultramarine depends on the presence of sulphuret of sodium in a peculiar state of combination with the silicates of soda and alumina; but, according to Elsner & Tirnmon, a minute quantity of sulphuret of iron is also an essential ingredient. It is by heating mixtures of this kind, that the *artificial ultramarine* of commerce is prepared. The finer specimens, thus obtained, are quite equal in durability and beauty of colour to those prepared from lazulite, while they are very much less expensive.

Prep. 1. (Gmelin.) *Sulphur*, 2 parts; *dry carbonate of soda*, 1 part; mix well, gradually heat them in a covered crucible to redness, or till the mixture fuses, then sprinkle in, by degrees, *another mixture* of *silicate of soda* and *aluminate of soda* (containing 72 parts of *silica*, and 70 parts of *alumina*), and continue the heat for an hour. The product contains a little free sulphur, which may be separated by water.

2. (M. Robiquet.) By exposing to a low red heat, in a covered crucible, as long as fumes are given off, a *mixture* of *pure kaolin*, 2 parts; *anhydrous carbonate of soda* and *sulphur*, of each, 3 parts. Some manufacturers who adopt this process use 1-3rd less carbonate of soda.

3. (Tirnmon.) Take of *crystallized carbonate of soda*, 1075 gr.; apply a gentle heat, and when fused in its water of crystallization, shake in of *finely pulverized orpiment*, 5 gr., and when partly decomposed, add as much *gelatinous hydrate of alumina* as contains 7 gr. of anhydrous alumina; *finely sifted clay*, 100 gr., and *flowers of sulphur*, 221 gr., are next to be added, and the whole placed in a *covered crucible*, and at first *gently* heated to drive off the water; but as soon as this is effected, raised to redness, the heat being so regulated that the ingredients only "sinter" together without actually fusing; the mass is then to be cooled, finely pulverized, suspended in *river water*, and brought upon a filter; the product has now a very beautiful delicate green or bluish colour, but on being heated in a covered dish, and stirred about from time to time, until the temperature reaches that of *dull redness*, at which it must be kept for 1 or 2 hours, it changes to a *rich blue*. If the heat of the first calcination has been properly regulated, the whole of the mass taken from the crucible will have a uniform colour; but if *too little heat* has been used, and the ingredients have not been properly mixed, there will be colourless parts, which should be rejected; if *too much heat* has been used, or the mass allowed to *fuse*, brown parts will appear, especially if the crucible is of a bad kind, or easily destroyed; these must also be rejected. (*Compt. Rend.*, 1842.)

ULTRAMARINE (Cobaltic). Syn. *Chinese Blue, Cobalt do., Louisa do., Höpfner's do., Thénard's do., &c.* A very rich blue pigment, with many synonymes, prepared by slowly drying and heating to dull redness a *mixture* of *freshly precipitated alumina* (freed from water as much as possible), 8 to 10 parts; *arseniate* or *phosphate of cobalt*, 1 part. By daylight it is of a pure blue, but by artificial light the colour turns on the violet. For other formulæ see *Blue Pigments*.

ULTRAMARINE ASHES. Syn. *Saunder's Blue.* Obtained from the *resinous mass* left from making *ultramarine*, by melting it with *fresh oil*, and kneading it in water containing a little potash or soda; or, by *burning away* the *wax* and *oil of the mass* and well grinding and washing the residue with *water*. Very permanent but much less brilliant than ultramarine.

UMBER. See *Brown Pigments*.

UNGUENTS. See *Ointments*.

UPAS. The Javan name of several deadly poisons. "*Bohun upas*" is a gum-resin obtained from the *bark* of the *antiaris* or *ipo toxicaria*. (See *Antiarine*.) The "*upas tieuté*" is obtained from the *strychnos tieuté*, and owes its fatal power to strychnia. They are both used to poison arrows and other offensive weapons.

URAMILE. A product of the decomposition of thionuric acid, discovered by Wöhler and Liebig. It is *obtained* by treating a *hot saturated solution of thionurate of ammonia*, with *hydrochloric acid* in excess, and boiling the mixture until a slight turbidity is observed, when the whole is converted into a semifluid mass; this is washed

with a little *cold water*, and dried by a gentle heat. Minute acicular crystals, often slightly pinkish; soluble in boiling water and alkaline solutions.

URAMILIC ACID. A product of the decomposition of uramile, discovered by Wöhler and Liebig. A *saturated solution of thionurate of ammonia* in *cold water*, is mixed with a small quantity of *sulphuric acid*, and the *mixture* evaporated over a water bath, when crystals of *uramilic acid* are slowly deposited. Soluble in water; with the alkalies it forms crystallizable salts, called *uramilates*, most of which are soluble.

URANIC ACID. See *Uranium*.

URANIUM. A rare metal, discovered by Klaproth, in 1789. It occurs in the *pechblende* of Saxony, and the *uranite* or *uran mica* of Cornwall.

Prep. Uranium may be extracted from *pechblende* by heating it to redness, cooling, powdering, digesting the powder in *nitric acid diluted with* 3 *or* 4 *parts of water*, in quantity insufficient to dissolve the whole, passing *sulphuretted hydrogen* through the solution, boiling to expel free sulphurous gas, concentrating by evaporation, and setting the remaining fluid aside to crystallize; beautiful lemon-coloured crystals of *pernitrate of uranium* are slowly deposited; these, by exposure to a strong heat, yield *proto-sesquioxide of uranium* (formerly called *protoxide*), which, when heated in *hydrogen gas*, is reduced to a crystalline brown powder, which is the *protoxide* (formerly mistaken for the *metal*); from this last, *metallic uranium* can only be obtained in the manner described under *magnesium*.

Prop., &c. A white malleable metal, unaffected by air or water, but very combustible when heated; in a divided state it appears as a heavy black powder. Sp. gr. 11·5. The *protoxide* is a *brown* crystalline powder, which is pyrophoric, and forms green salts with the acids. The *protosesquioxide* is *black* and not basic. The *sesquioxide* (*peroxide of uranium, uranic acid*) is precipitated as a *yellow* hydrate, when a pure alkali is added to a solution of the *sesquinitrate*; and as a *carbonate*, when alkaline carbonates are used. It is best obtained by heating the salt to about 480° Fahr., in an oil bath, as long as any nitrous fumes are disengaged. It is soluble in alkalies in excess, acting the part of a feeble acid.

Tests. The *salts* of *protoxide of uranium* are *characterised* by their green colour; those of the *sesquioxide* or *peroxide* are very beautiful and of a yellow colour. With caustic alkalies they yield a *yellow* precipitate; with ferrocyanide of potassium a *reddish brown* precipitate, resembling ferrocyanide of copper; with hydrosulphuret of ammonia and with infusion of galls, a *brown* one. Sulphuretted hydrogen turns the solutions of the persalts *green*.

Uses. Its ores and oxides are occasionally used to colour glass and enamels.

URATES. See *Uric Acid*.

UREA. Syn. *Cyanate of Ammonia* (Anomalous.) A crystalline, colourless, transparent substance, discovered by Fourcroy and Vauquelin in urine, and by Wöhler as the first organic compound artificially produced.

Prep. 1. (Thénard.) *Fresh urine*, gently evaporated to the consistence of a syrup, is treated with its own volume of *nitric acid* of sp. gr. 1·19; the mixture is shaken and immersed in an ice bath to solidify the crystals of *nitrate* or *supernitrate of urea*; these are washed with *ice-cold water*, drained, and pressed between sheets of blotting paper; they are next dissolved in *water*, and the *solution* is decomposed and precipitated with *carbonate of potassa* (or *carbonate of baryta*); the whole is then gently evaporated nearly to dryness; and the residuum is exhausted with *pure alcohol*, which dissolves the *urea*, which crystallizes out as the solution cools.

2. (Liebig.) See *below*.

Prop., &c. Urea forms four-sided prisms, which are soluble in an equal weight of cold water, and are also freely soluble in alcohol; the solution is neutral to test paper; it is permanent in dry air; has a cooling saline taste; fuses at 250° Fahr.; and is decomposed at higher temperatures. It is said to be diuretic, and has been given in *doses* of 10 to 30 gr., or more, dissolved in sugared water.

UREA (Factitious). Syn. *Cyanate of Ammonia; Ammoniæ Cyanas, Urea Factitia*,—Lat. *Prep.* (Liebig.) *Cyanate of potassa* (prepared by Liebig's process) is dissolved in a small quantity of *water*, and a quantity of *dry neutral sulphate of ammonia*, equal in weight to the cyanate, added; the whole is evaporated to dryness in a water bath, and the *dry residuum* boiled with *alcohol* of 80%; the filtered solution, concentrated by distilling off a portion of the spirit, deposits, as it cools, the *urea* in crystals of considerable magnitude and beauty, and which are *absolutely identical* with the urea obtained from urine. *Prod.* 25% of the weight of the ferrocyanide of potassium used in the preparation of the cyanate employed.

UREA (Nitrate of). Syn. *Ureæ Nitras*,

—Lat. *Prep.* See *Urea;* or it may be prepared by saturating *artificial urea* with *nitric acid.* Diuretic. *Dose.* 2 to 5 gr., twice or thrice daily, in dropsy.

URETHANE. A white, solid, crystallizable substance, formed by the action of either *gaseous* or *liquid ammonia* on *chlorocarbonic acid.* It is very soluble in water, fuses at about 212°, and, when dry, volatilizes unchanged at about 350° Fahr.

URETHYLANE. A solid, crystallizable substance, formed by acting on *chlorocarbonic methyl-ether* with dry *gaseous ammonia.*

URIC ACID. Syn. *Lithic Acid; Acidum Lithicum; A. Uricum,*—Lat. A substance discovered by Scheele, and peculiar to the urine of certain animals, and the excrement of serpents and several birds. The fæces of the boa constrictor consist of little else than *urate of ammonia.* Uric acid is a product of the animal organism, and has never been formed artificially. It constitutes one of the commonest varieties of *urinary calculi,* and of the *red gravel* or *sand,* which is voided in certain morbid states of the urine. *Guano* derives its principal value as a *manure* from the presence of *urate of ammonia.* The gouty concretions of the joints, popularly known as *chalk-stones,* consist chiefly of *urate of soda.*

Prep. Dissolve *urinary lithic calculi,* or the *chalk-like excrement of serpents,* reduced to fine powder, in a solution of *caustic potassa,* by boiling, then add *hydrochloric acid* in excess, again boil for 15 minutes, and well wash the precipitate with *water.*

Prop., &c. Brilliant, very minute, white and silky scales, which are tasteless, inodorous, slightly soluble in boiling water, and dissolve in strong sulphuric acid, but are again precipitated by water. It forms salts with the bases called *urates,* all of which are very sparingly soluble. The *characteristic reaction* of *uric acid* is, that, when moistened with nitric acid and heated, it dissolves, and by evaporation yields a red compound, which, upon the addition of a drop or two of solution of caustic ammonia, assumes a magnificent crimson colour, being converted into *murexide* or *purpurate of ammonia.*

URIC OXIDE. Syn. *Xanthic Oxide.* A rare constituent of urinary calculi, discovered by Marcet.

URINARY AFFECTIONS. Of these deserving a popular notice are—

Diabetes or an *immoderate flow of urine.* Of this disease there are two varieties:—*Diabetes insipidus,* which consists of a superabundant discharge of ordinary urine; and —*diabetes mellitus,* in which the urine has a sweet taste, contains grape sugar, and is capable of affording alcohol by fermentation. The *first variety,* when the patient is not very debilitated or aged, admits of cure by the use of tonics, stimulants, and the mineral acids, supported by a nutritious diet, and regular habits of life. When symptomatic of nervous disease or hysteria, the primary affection must be first combated. The *second variety* is incurable. All that can be done is to avoid exciting causes, to abstain from vegetable food, to support the system by a general tonic treatment, and to allay irritation and as much as possible diminish secretion by the free use of opium.

Difficult micturition or dysuria. The causes are numerous; among them the most frequent are gravel, stone, inflammation of the urinary organs, spasm, stricture, schirrus of the prostate gland, and the absorption of the acrid matter of cantharides. When the urgings to empty the bladder are frequent, and the urine passes off only in drops, or in very small quantities, it is called *strangury.* When a sense of heat and pain attend the discharge, it is styled *ardor urinæ* or *heat of urine.* The nature of the *treatment* depends upon the exciting cause.

Incontinence of urine or *enuresis* commonly arises from want of tone, relaxation, or paralysis of the sphincter of the bladder. Excessive drinking or indulgence of the passions, compression, or the presence of some irritating substance in the cavity, are the more usual causes. In ordinary cases, it may be relieved by the judicious administration of *cubebs, tincture of cantharides,* or *aloetics,* supported by a *tonic course. Blisters to the perinæum* are also serviceable. When occurring in young persons, especially females, during sleep, without any marked cause, the careful application of a little *nitrate of silver,* once or oftener to the orifice of the urethra, will generally remove the habit.

Retention of urine (*retentio urinæ, ischuria*). This, like the preceding, may arise from various causes. The *treatment,* when the case is urgent, is drawing off the urine by means of a *catheter,* carefully introduced through the urethra. When it depends on want of tone in the bladder, tonics, as *chalybeates* and *bark,* are employed. When it depends on spasmodic stricture, fomentations, the warm or hot bath, or opium, often prove successful. In the last, the *tincture of sesquichloride of iron,* in doses of 5 to 10 drops, every 10 or 15

minutes, until nausea comes on, has been highly spoken of. This affection requires prompt treatment, especially when it happens during pregnancy, as when early attacked it is seldom attended with danger; but by a few hours' neglect, it may terminate fatally. Surgical aid should, therefore, be sought as soon as possible.

Boys from the age of about 6 or 7 to 10 or 11 years, are occasionally subject to peculiar attacks after having retired to rest for an hour or two. The patient starts up in bed, moans, struggles, is delirious, talks incoherently, and exhibits a total unconsciousness of all that is passing around him. This condition is purely nervous or spasmodic, and disappears as soon as the bladder is relieved by micturition; an event which should be promoted by placing the patient in the natural position for that purpose, and employing continued coaxing until it occurs. Should this fail, the *warm bath* will generally afford almost immediate relief. We have noticed this affection, because these attacks have been, to our personal knowledge, referred to calculus, and on more than one occasion, an operation was suggested.

URINE. The *density* of the *urine* varies from 1·005 to 1·030; the average, in health being 1·020; when it contains about 380 gr. of solid matter in the pint. According to Berzelius, the proportion is about $6\frac{3}{4}\frac{0}{0}$, the rest being pure water. It *exhibits* a decidedly *acid reaction*, and is never alkaline, except during disease, or the use of large quantities of alkaline salts of the vegetable acids. The *average quantity* secreted during 24 hours, may be taken at $1\frac{1}{2}$ to $1\frac{3}{4}$ pint.

The *presence* of BILE in *urine*, or other like fluids, may be detected as follows:— Put a *small quantity* of the *suspected liquid* into a test-tube, and add to it, drop by drop, *strong sulphuric acid* until it becomes warm, taking care not to raise the temperature above 122° Fahr.; then add from 2 to 5 drops of *syrup*, (made with 5 parts of *sugar* to 4 of *water*), and shake the mixture. *If the liquid* contain *bile*, a *violet coloration* is observed. *Acetic acid* may be substituted for sugar.

The *presence* of SUGAR, and the quantity present may be determined in the manner described at *p.* 1192-3. *White merino* that has been wet with a solution of *bichloride of tin*, is also said to form a ready test for sugar in urine. A *portion* wetted with the *suspected urine*, and exposed to a heat of about 285° Fahr., becomes *blackened* if *sugar be present.*

The *quantity* of UREA present in *urine* is best determined by treating that liquid with a *solution of pernitrate of mercury* of known strength, alternately with a *solution of baryta*, as long as a white precipitate falls. As soon as the whole of the urea is thrown down, the precipitate assumes a yellow colour.

URINOMETER. An hydrometer adapted to determining the density of urine. That of Dr. Prout is the simplest and best.

URN POWDER. Crocus martis or jeweller's rouge.

URTICARIA. See *Rash.*

USNIC ACID. A substance extracted by *alcohol* from the *usnea barbata* and several other *lichens*. It forms pale yellow needles, possessing a metallic lustre.

USQUEBAUGH. Syn. *Escubac.* Literally, *mad water*, the Irish name of which whiskey is a corruption. At the present time it is applied to a strong cordial spirit, much drunk in Ireland, and made in the greatest perfection at Drogheda.

Prep. 1. *Brandy* or *proof spirit*, 3 gall.; *dates* (without their kernels), and *raisins*, of each, bruised, $\frac{1}{4}$ *lb.*; *juniper-berries*, bruised, 1 *oz.*; *mace* and *cloves*, of each, $\frac{3}{4}$ *oz.*; *coriander* and *aniseed*, of each, $\frac{1}{2}$ *oz.*; *cinnamon*, $\frac{1}{4}$ *oz.*; macerate, with frequent agitation for 14 days, then filter, and add of *capillaire* or *simple syrup*, 1 gall.

2. *Pimento* and *caraways*, of each, 3 *oz.*; *mace*, *cloves*, and *nutmegs*, of each, 2 *oz.*; *aniseed*, *corianders*, and *angelica root*, of each, 8 *oz.*; *raisins*, stoned and bruised, 14 *lb.*; *proof spirit*, 9 gall.; digest as before, then press, filter, or clarify, and add of *simple syrup*, q. s. Should it turn *milky* add a little *strong spirit*, or *clarify it with alum*, or *filter through magnesia.*

Obs. Usquebaugh is either coloured *yellow* with *saffron* (about $\frac{1}{4}$ *oz.* per gall.), or *green* with *sap-green* (about $\frac{1}{2}$ oz. per gall.); either being added to the other ingredients, before maceration in the spirit. The Ph. L. 1677 contained a form for this liquor, which has since been superseded by that for *compound tincture of cardamoms.*

VACCINATION. See *Cow-pox.*

VACCINE MATTER. Syn. *Lympha Vacciniæ.* This is collected either upon the *points* of *lancet-like* pieces of *ivory*, or by opening the *pustule*, and applying a *small glass ball and tube* (like those called by the boys in London candle-pops, or fire-pops) to the orifice, expelling part of the air in the ball by bringing a lighted taper

near it, then withdrawing the taper the matter is sucked into the ball, in which it may be sealed up hermetically or cemented, and thus kept for a length of time. It is, however, now generally preserved between two small *pieces of glass*. It is said that *cotton thread* is a convenient and efficient vehicle. *Used* lately as an absolute *preventive* of the *small-pox*; but now, with a view of diminishing the susceptibility of acquiring that disease, and to render it milder if acquired, a circumstance extremely rare indeed. The *matter* may be liquefied with a little *clean water* before application. A degree of heat scarcely higher than that of the blood lessens its efficacy. SMALL-POX MATTER is collected in the same way. (See *page* 1068.)

VACUUM. Empty space; a portion of space void of matter. The possibility of the existence of an absolute vacuum has been a matter of dispute with the metaphysicians and schoolmen ever since the time of Pythagoras, and appears as far from being settled as ever. The *nearest approach* to a perfect vacuum is that of the Torricellian barometer. For *experimental* and *manufacturing purposes*, a sufficient vacuum is produced either by means of the *air-pump*, or filling an inclosed space with *steam*, which is then condensed by the application of cold. Evaporation proceeds much more rapidly, and liquids boil at much lower temperatures in an exhausted receiver, than when exposed to the air. Thus, under ordinary circumstances, *in the air*, ether boils at 96°, alcohol at 177°, and water at 212° Fahr.; but *in vacuo* water boils at about 88°, alcohol at 56°, and ether at — 20° Fahr. In the best vacuum obtainable by a powerful air-pump, *water* placed over oil of vitriol, to absorb the aqueous vapour as it forms, will often enter into *violent ebullition* whilst *ice* is in the *act of formation* on *its surface*. The reduction of the boiling point with reduced pressure is practically taken advantage of by the *pharmaceutist* in the preparation of *extracts*, by the *sugar refiner* in the evaporation of his *syrups*, by the distiller in the production of certain *liqueurs*, and by the *chemist* in a variety of processes of interest or utility. See *Extracts*, *Evaporation*, *&c.*

VALERACETONITRILE and *Valeronitrile*. Two remarkable, light, ethereal liquids, obtained, along with other products, when a *dilute solution of gelatine* is distilled with a *mixture* of *bichromate of potassa* and *sulphuric acid*. The first boils at 158°, and the other at 257° Fahr.

VALERAMIDE. A fusible crystalline substance, formed by treating *valerianic ether* with *ammonia*.

VALERIAN. Syn. *Valerianæ Radix*; *Valeriana*,—Ph. L. E. & D. "The *root* of the wild plant *valeriana officinalis* (Linn.), or *wild valerian*." (Ph. L.) An excitant, antispasmodic, tonic, and emmenagogue, not only acting on the secretions, but exercising a specific influence over the cerebro-spinal system, and in large quantities producing agitation, mental exaltation, and even intoxication. *Dose*. 10 to 30 or 40 gr., thrice daily; in hysteria, epilepsy, headache (affecting only one side), morbid nervous sensibility, &c. Even the odour of it exerts a species of fascination over cats.

VALERIANIC ACID. Syn. *Angelicic Acid*, *Valeric Acid*; *Acidum Valerianicum*, —Lat. *Prep*. 1. By distilling *valerian root* along with about 8 times its weight of *water*, and acting on the *product* with *caustic potassa*, when *valerianate of potassa* is formed, and a volatile oil is separated; by evaporating to dryness, the latter is dissipated, and the dry mixture, treated with *dilute sulphuric acid* and *distilled*, yields an *aqueous solution* of *valerianic acid*; by careful re-distillation this may be deprived of water.

2. (*Artificially*.) A mixture of *potato oil* or *corn-spirit oil* (hydrated oxide of amyle), with about 10 times its weight of *quick-lime* and *hydrate of potassa* in equal proportions, placed in a glass flask, is kept heated to about 400° Fahr., for 10 or 12 hours, by means of a bath of oil or fusible metal; the nearly white solid residuum is mixed with *water*, an excess of *sulphuric acid* added to the mixture, and the whole subjected to distillation; the distillate is supersaturated with *potassa*, evaporated nearly to dryness, to dissipate any undecomposed potato-oil, and then mixed with *weak sulphuric acid* in excess; a light oily liquid (*terhydrated valerianic acid*) separates, which by cautious rectification, yields at *first* water containing a little acid, and afterwards, *pure* (monohydrated) *valerianic acid*, which is perfectly identical with that prepared from valerian root.

3. See *Valerianate of Soda*, Ph. D. This is the most economical process.

Prop., *&c.* A limpid oily liquid, smelling strongly of valerian root; it has an acid taste and reaction, and leaves a sensation of sweetness and a white spot on the tongue; is inflammable; boils at 370°; is freely soluble in alcohol and ether; dissolves in 30 parts of water; and forms salts called *valerianates*, most of which have a sweetish taste, are soluble, and uncrystallizable; sp.

gr. 0·937; placed in contact with water, it absorbs a portion of it, and is converted into the *terhydrated acid*, with increase of sp. gr., and reduction of the boiling point.

VALERIANIC ACID (Anhydrous). Less odorous than the preceding; boils at 419° Fahr.; contact with water converts it into the ordinary liquid acid. See *Organic Acids*.

VALERIC ACID. See *above*.

VALEROLE. A neutral oily body, found, along with *valerianic acid*, *borneene*, &c., in *oil of valerian*. Oxidizing agents convert it into *valerianic acid*.

VALERONITRILE. See *Valeracetonitrile*.

VALONIA. The cup of a large species of acorn, imported from the Levant. *Used* in tanning leather.

VALYLE. Syn. *Butyle*. A colourless ethereal fluid, forming the chief bulk of the oily liquid, which, along with *butylene*, results from the *electrolysis* of *valerianic acid*. It boils at about 225° Fahr. According to Kolbe, it is the radical of the valerianic compounds.

VANADIC ACID. Syn. *Peroxide of Vanadium*, *Teroxide of do.*; *Acidum Vanadicum*,—Lat. *Prep.* (Johnston.) From the *native vanadate of lead*, by dissolving it in *nitric acid*, passing *sulphuretted hydrogen* through the solution, to throw down lead and arsenic, and evaporating the resulting *blue liquid* to dryness; the *residuum* is then dissolved in a *solution of ammonia*, and a piece of *sal ammoniac*, considerably larger than can be dissolved, introduced; as the latter dissolves, a pulverulent precipitate of *vanadate of ammonia* is formed, which must be washed, first in a *solution of sal ammoniac*, and then in *alcohol* of 0·860; by exposing *this salt*, in an open platinum crucible, to a heat a little below redness, and keeping it constantly stirred, until it acquires a dark-red colour, *pure vanadic acid* is obtained.

Prop., &c. Vanadic acid is orange-coloured, scarcely soluble in water, and forms, with the alkaline bases, soluble salts called *vanadates*; and with the other bases sparingly soluble salts. All of these have an orange or yellow colour. "*Vanadate of ammonia* mixed with *solution of galls* forms a black fluid, which is the best *writing ink* hitherto known. The quantity of the salt required for this purpose is very small; the writing is perfectly black, and not obliterated by alkalies, acids, chlorine, or other reagents, that at the same time will not destroy the paper." (Ure.)

VANADIUM. A rare metal discovered by Sefström, in 1830, in some Swedish iron extracted from an iron mine near Jönköping. It has since been found in a lead ore from Scotland.

Prep. 1. The *liquid chloride of vanadium* is introduced into a bulb blown in a glass tube, and *dry ammoniacal gas* passed over it; the latter is absorbed, and a *white saline mass* produced; this is heated by the *flame* of a *spirit-lamp*, when *chloride of ammonium* is volatilized, and *pure metallic vanadium* left behind.

2. (Berzelius.) By placing *fragments* of *fused vanadic acid* and of *potassium*, of equal size, in alternate layers, in a *porcelain crucible*, the potassium being in rather the largest proportion, and after well luting on the cover, heating it *carefully* over a *spirit-lamp*; the cooled mass is then to be washed with *water*.

Prop., &c. It is a white brittle substance, of perfect metallic lustre, and a very high degree of infusibility; it is very difficult of reduction; is neither oxidized by air or water, nor attacked by sulphuric, hydrochloric, or even hydrofluoric acid; nitric acid dissolves it slowly, and aqua regia more freely, yielding deep blue solutions. It forms 3 compounds with oxygen:—*Protoxide of vanadium* is obtained by acting on vanadic acid by heat and charcoal or hydrogen gas. Black; non-basic.—*Binoxide of vanadium* (*vanadous acid*), formed by heating to dull redness a mixture of 10 parts of the protoxide, and 12 parts of vanadic acid, in an atmosphere of carbonic acid gas, or out of contact with air and combustible matter. It is also formed by heating vanadate of ammonia in close vessels. A black powder; it forms a series of blue salts, which have a tendency to decomposition, becoming first green and then red. It also unites, as a feeble acid, to alkalies. It is *precipitated*, as a grayish-white hydrate from its solutions, by carbonate of soda in slight excess.—*Bichloride of vanadium* is formed by dissolving the metal in hydrochloric acid, passing a stream of sulphuretted hydrogen through the solution, and evaporating the whole to dryness. Water resolves it into a *blue solution* and an insoluble *oxychloride*.—*Terchloride of vanadium* is a yellow liquid obtained by passing chlorine over a mixture of protoxide of vanadium and charcoal. It is converted by water into hydrochloric and vanadic acids.

Tests. Vanadium is *distinguished* from *chromium*, for which it may be mistaken, by deoxidizing substances giving a *blue* colour to its solutions, but a *green* one to solutions of the latter.

VANILLA. The *dried pods* of *epidendron vanilla* (Linn.) It is chiefly *used* in the

manufacture of chocolate and perfumery. As a *medicine* it is much employed on the Continent as an aromatic stimulant and neurotic. *Dose.* 6 to 12 gr.; in asthenic fevers, hysteria, hypochondriasis, impotency, &c.

Vanilla is reduced to powder (*pulvis vanillæ; poudre de vanille*) by slicing it, and triturating the fragments with twice or thrice their weight of *well-dried lump sugar*. For *sucre de vanille*, 11 parts of *sugar* are employed. The very high price of vanilla, of late, has almost precluded its use for common purposes.

VANQUELINA. See *page* 1188.

VAN SWIETEN'S SOLUTION. Contains $\frac{1}{1000}$th part of its weight of *bichloride of mercury;* or ½ gr. per fl. oz. (See *pages* 343 and 1159.)

VAPOUR. See *Evaporation*, *Steam*, *&c.*

VAREC, or *blanquette.* The kelp of Brittany.

VARICELLA. See *Chicken-pox.*

VARIOLA. See *Small-pox.*

VARIOLARIA. A peculiar substance found in the *variolaria faginea* (lichen fagineus,—*Linn.*), or *bright-zoned variolaria.*

VARIX. The permanent unequal dilation of a vein, or veins, which are then said to be *varicose.* It is known by the presence of a soft tumour, which does not pulsate, and often assumes a serpentine figure. Those of the groin and scrotum generally form a collection of knots. The *treatment* consists of cold applications, and pressure from bandages. Some cases are relieved by ligature. When occurring in the legs, much standing or walking should be avoided, and the use of the elastic stockings made for the purpose, will be proper.

VARNISH. Syn. *Vernis*,—Fr. Any liquid matter, which when applied to the surface of a solid body, becomes dry, and forms a hard glossy coating, impervious to air and moisture.

Varnishes are commonly divided into two classes—*fat* or *oil varnishes* and *spirit varnishes.* The *fixed* or *volatile oils*, or *mixtures* of them, are used as *vehicles* or *solvents* in the former, and *concentrated alcohol* in the latter. The sp. gr. of *alcohol* for the purpose of making varnishes should not be more than 0·8156 (= 67 o. p.), and it should be preferably chosen of even greater strength. A little *camphor* is often dissolved in it, to increase its solvent power. The *oil of turpentine*, which is the essential oil chiefly employed for varnishes, should be pure and colourless. *Pale drying linseed oil* is the fixed oil generally used; but *poppy oil* and *nut oil* are also occasionally employed. Among the substances which are dissolved in the above menstrua are—*amber*, *anime*, *copal*, *elemi*, *lac*, *mastic*, *sandarach*, and *turpentine*, to impart BODY and LUSTRE; *benzoin*, on account of its agreeable ODOUR; *annotto*, *gamboge*, *saffron*, *socotrine aloes*, and *turmeric*, to give a YELLOW COLOUR; *dragon's blood* and *red sandal wood*, to give a RED TINGE; *asphaltum* to give a BLACK COLOUR and BODY; and *caoutchouc* to impart body, toughness, and ELASTICITY.

In the *preparation* of *spirit varnishes*, care should be taken to *prevent* the *evaporation* of the *alcohol* as much as possible, and also to *preserve* the portion that evaporates. On the *large scale*, a *common still* may be advantageously employed; the head being furnished with a stuffing-box, to permit of the passage of a vertical rod, connected with a stirrer at one end and a working handle at the other. The *gum* and *spirit* being introduced, the head of the still closely fitted on and luted, and the connection made with a proper refrigerator, heat (preferably that of *steam* or a *water bath*), should be applied, and the *spirit* brought to a gentle boil, after which it should be *partially* withdrawn, and *agitation* continued until the *gum* is dissolved. The *spirit which has distilled over* should be then added to the *varnish*, and, after thorough admixture, the whole should be run off, as rapidly as possible, through a *silk-gauze sieve*, into *stone jars*, which should be immediately corked down, and set aside to clarify. On the *small scale*, spirit varnishes are best made by maceration in closed bottles or tin cans, either in the cold, or by the heat of a water bath. In order to *prevent* the *agglutination of the resin*, it is often advantageously mixed with *clean siliceous sand* or *pounded glass*, by which the surface is much increased, and the solvent power of the menstruum greatly promoted.

To ensure the *excellence* of *oil varnishes*, one of the most important points is the use of good drying oil. *Linseed oil* for this purpose should be very pale, perfectly limpid or transparent, scarcely odorous, and mellow and sweet to the taste.—100 gall. of such *an oil* is put into an *iron* or *copper boiler*, capable of holding fully 150 gall., gradually heated to a gentle simmer, and kept near that point for about 2 hours, to expel moisture; the *scum* is then carefully removed, and 14 *lb.* of finely pulverized *scale litharge*, 12 *lb.* of *red lead*, and 8 *lb.*

of *powdered umber* (all carefully dried and free from moisture), are gradually sprinkled in; the whole is then kept well stirred, to prevent the driers sinking to the bottom, and the boiling is continued at a gentle heat for about 3 hours longer; the fire is next withdrawn, and, after 30 to 40 hours' repose the *scum* is carefully removed, and the *clear supernatant oil* decanted from the "bottoms."—The *product* forms the best "*boiled*" or "*drying-oil*" of the varnish-maker.—*Another method* is to heat a *hogshead* of the *oil* gradually for 2 hours, then to gently simmer it for about 3 hours longer, and after removing the scum, to add, *gradually*, 1 *lb.* of the *best calcined magnesia*, observing to mix it up well with the oil, and, afterwards, to continue the boiling pretty briskly for at least an hour, with *constant* agitation. The fire is then allowed to die away, and, after 24 hours, the oil is decanted as before. The product is called "*clarified oil*," and requires to be used with *driers*. It should be allowed to lay in the cistern for 2 or 3 months to clarify. (See *p.* 837-8.)

In the *preparation* of *oil varnishes*, the "*gum*" is melted as rapidly as possible, without discolouring or burning it; and when *completely fused*, the *oil*, also heated to *nearly* the boiling-point, is poured in, after which the mixture is boiled until it appears perfectly homogeneous and clear like oil, when the heat is raised, the driers (if any are to be used) gradually and cautiously sprinkled in, and the boiling continued, with constant stirring, for 3 or 4 hours, or until a little when cooled on a palette knife, feels strong and stringy between the fingers. The mixture is next allowed to cool considerably, but while still *quite fluid*, the *turpentine*, previously made *moderately* hot, is *cautiously* added, and the whole thoroughly incorporated. The *varnish* is then run through a *filter* or *sieve* into *stone jars*, *cans*, or other *vessels*, and set aside to clarify itself by subsidence. *When no driers* are *used*, the *mixture* of *oil* and *gum* is boiled until it runs perfectly clear, when it is removed from the fire, and, after it has cooled a little, the turpentine is added as before.

It is generally conceived that the *more perfectly* the "*gum*" is fused, or "*run*," as it is called, the larger and stronger will be the product; and the *longer the boiling* of the "*gum*" and *oil* is continued, within moderation, the freer the resulting varnish will work and cover. An *excess of heat* renders the varnish "*stringy*," and injures its flowing qualities. For *pale varnishes* as little heat as possible should be employed throughout the whole process. Good *body varnishes* should contain 1½ *lb.*; *carriage*, *wainscot*, and *mahogany varnish*, fully 1 *lb.*; and *gold size*, and *black japan*, fully ½ *lb.* of "*gum*" per gall., besides the *asphaltum* in the latter. *Spirit varnishes* should contain about 2½ *lb.* of "*gum*" per gall. The *use* of *too much driers* is found to injure the brilliancy and transparency of the varnish. *Copperas* does not combine with varnish, but only hardens it; *sugar of lead*, however, *dissolves* in it to a greater or less extent. *Boiling oil of turpentine* combines very readily with *melted copal*, and it is an improvement on the common process to use it, either *before*, or in *conjunction* with the *oil*, in the preparation of copal varnish, that it is desired should be very white. "*Gums*" of *difficult solubility* are rendered more soluble by being exposed, in the state of powder, for some time to the air.

Varnishes, like wine, improve by age; and should always be kept as long as possible before use.

From the *inflammable nature* of the *materials* of which *varnishes* are composed, their manufacture should be only carried on in some detached building of little value, and built of uninflammable materials. When a *pot of varnish*, *gum*, or *turpentine*, catches fire, it is most readily extinguished by *closely covering it* with a *piece of stout woollen carpeting*, which should be always kept at hand, ready for the purpose.

An *excellent paper*, by Mr. J. W. Niel, on the *manufacture of varnishes*, will be found in the *Trans. of the Soc. of Arts*, vol. 49. See also the articles *Alcohol*, *Amber*, *Copal*, *Oils*, *&c.*, in this work.

VARNISH (Amber). *Prep.* 1. Take of *amber* (clear and pale), 6 *lb.*; fuse it, add of *hot clarified linseed-oil*, 2 gall.; boil until it "strings well," then let it cool a little, and add of *oil of turpentine*, 4 gall., or q. s. Nearly as pale as copal varnish; it soon becomes very hard, and is the most durable of the oil varnishes; but it requires some time before it is fit for polishing, unless the articles are "*stoved*." When required to dry and harden quicker, "*drying oil*" may be substituted for the linseed oil; or "*driers*" may be added during the boiling.

2. *Amber*, 4 *oz.*; *pale boiled-oil*, 1 quart; proceed as last. Very hard.

3. *Pale transparent amber*, 5 *oz.*; *clarified linseed-oil* or *pale boiled-oil*, and *oil of turpentine*, of each, 1 pint; as before.

Obs. Amber varnish is suited for all purposes, where a very hard and durable oil

varnish is required. The paler kind is superior to copal varnish, and is often mixed with the latter to increase its hardness and durability. The only objection to it is, the difficulty of preparing it of a very pale colour. It may, however, be easily *bleached* with some *fresh-slaked lime.*

VARNISH (Balloon). See *page* 1259.

VARNISH (Bessemer's). This consists of a pale *oil copal varnish*, diluted with about 6 times its volume of *oil of turpentine*, the mixture being subsequently agitated with about 1-30th part of *dry slaked lime*, and decanted after a few days' repose. 5 parts of the *product* mixed with 4 parts of *bronze powder* forms "*Bessemer's Gold paint.*"

VARNISH (Black). *Prep.* 1. (*Black Amber-varnish.*) From *amber*, 1 *lb.*; fuse, add of *hot drying-oil*, ½ pint; *powdered black rosin*, 3 *oz.*; *asphaltum* (Naples), 4 *oz.*; when properly incorporated and considerably cooled, add of *oil of turpentine*, 1 pint. This is the beautiful black varnish of the coachmakers.

2. (*Ironwork black.*) From *asphaltum*, 48 *lb.*; fuse, add of *boiled oil*, 10 gall.; *red lead* and *litharge*, of each, 7 *lb.*; *dried* and *powdered white copperas*, 3 *lb.*; boil for 2 hours, then add of *dark gum amber* (fused), 8 *lb.*; *hot linseed oil*, 2 gall.; boil for 2 hours longer, or until a little of the mass, when cooled, may be rolled into pills, then withdraw the heat, and afterwards thin it down with *oil of turpentine*, 30 gall. *Used* for the ironwork of carriages, and other nice purposes.

3. (*Black japan; Bituminous varnish.*)—*a.* From *naples asphaltum*, 50 *lb.*; *dark gum animé*, 8 *lb.*; fuse, add of *linseed oil*, 12 gall.; boil as before, then add of *dark gum amber*, 10 *lb.*; previously fused and boiled with *linseed oil*, 2 gall.; next add of *driers*, q. s., and further proceed as ordered in No. 2. Excellent for either wood or metals.

b. From *burnt umber*, 8 *oz.*; *true asphaltum*, 4 *oz.*; *boiled linseed oil*, 1 gall.; grind the umber with a *little of the oil*; add it to the *asphaltum*, previously dissolved in a small quantity of the *oil* by heat; mix, add the *remainder of the oil*, boil, cool, and thin with a sufficient quantity of *oil of turpentine.* Flexible.

4. (*Brunswick Black.*)—*a.* To *asphaltum*, 2 *lb.*, fused in an iron pot, add of *hot boiled-oil*, 1 pint; mix well, remove the pot from the fire, and, when cooled a little, add of *oil of turpentine*, 2 quarts. *Used* to blacken and polish grates and ironwork. Some parties add *driers.*

b. From *black pitch* and *gas-tar asphaltum*, of each, 25 *lb.*; boil gently for 5 hours, then add of *linseed oil*, 8 gall.; *litharge* and *red lead*, of each, 10 *lb.*; boil as before, and thin with *oil of turpentine*, 20 gall. Inferior to the last, but cheaper.

VARNISH (Body). *Prep.* 1. From the *finest African copal*, 8 *lb.*; *drying oil*, 2 gall.; *oil of turpentine*, 3½ gall.; proceed as for *amber varnish.* Very hard and durable.

2. *Pale gum copal*, 8 *lb.*; *clarified oil*, 2 gall.; *dried sugar of lead*, ½ *lb.*; *oil of turpentine*, 3½ gall.; proceed as before, and mix the product, whilst still hot, with the following varnish:—*pale gum animé*, 8 *lb.*; *linseed oil*, 2 gall.; *dried white copperas*, ¼ *lb.*; *oil of turpentine*, 3½ gall.; the mixed varnishes are to be immediately strained into the cans or cistern. *Dries* in about 6 hours in winter, and in about 4 hours in summer. *Used* for the bodies of coaches and other vehicles.

VARNISH (Bookbinder's). *Prep.* Take of *pale gum sandarach*, 3 *oz.*; *rectified spirit*, 1 pint; dissolve by cold digestion, and frequent agitation. *Used* by binders, to varnish Morocco leather book covers. A similar varnish is also prepared from *very pale shell-lac* and *wood naphtha.*

VARNISH (Cabinet-maker's). French polish is occasionally so called.

VARNISH (Carriage). *Prep.* 1. (*Spirit.*) Take of *gum sandarach*, 1¼ *lb.*; *very pale shell-lac*, ¾ *lb.*; *very pale transparent rosin*, ½ *lb.*; *rectified spirit* of 0·8221 (64 *o. p.*), 3 quarts; dissolve, and add of *pure Canadian balsam*, 1½ *lb.* *Used* for the internal parts of carriages, &c. *Dries* in 10 minutes or less.

2. (*Oil.*)—*a.* (*Best Pale.*) Take of *pale African copal*, 8 *lb.*; fuse, add of *clarified linseed oil*, 2½ gall.; boil until very stringy, then add of *dried copperas* and *litharge*, of each, ¼ *lb.*; again boil, thin with *oil of turpentine*, 5½ gall., mix, whilst both are hot, with the following varnish, and immediately strain the mixture into a covered vessel:—*Gum animé*, 8 *lb.*; *clarified linseed oil*, 2½ gall.; *dried sugar of lead* and *litharge*, of each, ¼ *lb.*; boil as before, thin with *oil of turpentine*, 5½ gall. *Dries* in 4 hours in summer, and 6 in winter. *Used* for the wheels, springs, and carriage parts of coaches, and other vehicles, and by house painters, decorators, &c., who want a *strong, quick-drying*, and *durable varnish.*

b. (*Second Quality.*) From *gum animé*, ("sorts"), 8 *lb.*; *clarified oil*, 3 gall.; *litharge*, 5 *oz.*; *dried* and *powdered sugar of lead* and *white copperas*, of each, 4 *oz.*; boil as

last, and thin with *oil of turpentine*, 5½ gall. *Used* as the last.

VARNISH (Chinese). *Prep.* From *mastic* and *sandarach*, of each, 2 *oz.*; *rectified spirit* (64 o. p.), 1 pint; dissolve. *Dries* in 6 minutes. Very tough and brilliant.

VARNISH (Copal). *Prep.* 1. (*Oil.*)—*a.* From *pale hard copal*, 2 *lb.*; fuse, add of *hot drying-oil*, 1 pint; boil as before directed, and thin with *oil of turpentine*, 3 pints, or q. s. *Dries* hard in 12 to 24 hours.

b. From *clear* and *pale African copal*, 8 *lb.*; *pale drying oil*, 2 gall.; *rectified oil of turpentine*, 3 gall.; proceed as before, and immediately strain it into the store can or cistern. Very fine, hard, and durable.

2. (*Spirit.*)—*a.* From *coarsely-powdered copal* and *glass*, of each, 4 *oz.*; *alcohol of* 90% (64 o. p.), 1 pint; *camphor*, ½ *oz.*; heat the mixture, with frequent stirring, in a water bath, so that the bubbles may be counted as they rise, until solution is complete, and when cold, decant the clear portion.

b. From *copal* (which has been melted, dropped into water, and then dried and powdered), 4 *oz.*; *gum sandarach*, 6 *oz.*; *mastic*, 2 *oz.*; *pure Chio turpentine*, 3 *oz.*; *powdered glass*, 5 *oz.*; *spirit of* 90%, 1 quart; dissolve by a gentle heat. *Dries* rapidly.

3. (*Turpentine.*) To *oil of turpentine*, 1 pint; heated in a water bath, add, in small portions at a time, of *powdered copal* (prepared as above), 3 to 4 *oz.*; dissolve, &c., as before. *Dries* slowly, but is very pale and durable.

4. (*Japanner's copal varnish.*) From *pale African copal*, 7 *lb.*; *pale drying-oil*, ½ gall.; *oil of turpentine*, 3 gall.; proceed as in No. 1. *Dries* in 20 to 60 minutes, and may be polished as soon as hard, particularly if stoved. See *Japanning*.

Obs. All copal varnishes, when properly made, are very hard and durable, though less so than those of amber; but they have the advantage over the latter of being paler. They are applied on *coaches*, *pictures*, *polished metal*, *wood*, and *other objects* requiring a good durable varnish. *Animé* is frequently substituted for copal in the *copal varnishes* of the shops. See *Body* and *Carriage Varnishes*, *Copal*, &c.

VARNISH (Crystal). *Prep.* 1. From *genuine pale Canada-balsam* and *rectified oil of turpentine*, equal parts. *Used* for maps, prints, drawings, and other articles of paper, and also to prepare tracing paper, and to transfer engravings.

2. *Mastic*, 3 *oz.*; *rectified spirit*, 1 pint; dissolve. *Used* to fix pencil drawings.

VARNISH (Drying). Spirit copal varnish.

VARNISH (Dutch). See *Lac* and *Toy Varnish*.

VARNISH (Etching). See *page* 398.

VARNISH (Fat). See *Oil Varnish* (and *page* 1256.)

VARNISH (Flexible). Syn. *Balloon Varnish*, *Caoutchouc do.*, &c. *Prep.* 1. From *Indian rubber* (cut small), 1½ oz.; *chloroform*, *ether* (washed), or *bisulphuret of carbon*, 1 pint; digest in the cold until solution is complete. *Dries* as soon as it is laid on. *Pure gutta percha* may be substituted for Indian rubber.

2. *Indian rubber*, in shavings, 1 *oz.*; *rectified mineral naphtha*, or *benzole*, 1 pint; digest at a gentle heat, in a closed vessel, and strain. *Dries* very badly; and never gets perfectly hard.

3. *Indian rubber*, 1 *oz.*; *drying oil*, 1 quart; dissolve by heat. Very tough; *dries* in about 48 hours.

4. *Linseed oil*, 1 gall.; *dried white copperas* and *sugar of lead*, of each, 3 *oz.*; *litharge*, 8 *oz.*; boil, with constant agitation, until it strings well, then cool slowly, and decant the clear portion. If too thick, thin it down with *quick-drying linseed oil*. The above are used for balloons, gas bags, &c. See *Balloons*, *Caoutchouc*, &c.

VARNISH (Furniture). A solution of *pure white wax*, 1 part; in *rectified oil of turpentine*, 4 parts; frequently passes under this name. See *Body*, *Carriage*, and *Copal Varnishes*, &c.

VARNISH (Gilder's). *Prep.* (Watin.) *Pale gum-lac in grains*, *gamboge*, *dragon's blood*, and *annotta*, of each, 12½ *oz.*; *saffron*, 3¼ *oz.*; dissolve each resin separately in 5 pints of *alcohol of* 90%; and make two separate tinctures of the *dragon's blood* and *annotta*, with a like quantity of spirit; then mix the solutions in the proper proportions to produce the required shade. *Used* for gilded articles, &c.

VARNISH (Glass). A solution of soluble glass. *Used* to render wood, &c., fireproof.

VARNISH (Gun-barrel). *Prep.* From *shell-lac*, 1½ *oz.*; *dragon's blood*, 3 dr.; *rectified spirit*, 1 quart. Applied after the barrels are "browned."

VARNISH (Hair). *Prep.* From *hog's bristles* (chopped small), 1 part; *drying oil*, 10 parts; dissolve by heat. *Said* to be *used* to give cotton or linen cloth the appearance of horsehair.

VARNISH (Indian-rubber). See *above*.

VARNISH (Italian). *Prep.* Boil *Scio turpentine* until brittle, powder it, and dis-

solve this in *oil of turpentine*. *Used* for prints, &c.

VARNISH (Japan). Pale amber or copal varnish. *Used* for japanning tin, papier maché, &c.

VARNISH (Lac). *Prep.* 1. *Pale seed-lac* (or *shell-lac*), 8 *oz.*; *rectified spirit*, 1 quart; dissolve.

2. Substitute *lac bleached* with *chlorine* for seed lac. Both are very tough, hard, and durable, but quite inflexible. *Wood naphtha* may be substituted for spirit. *Used* for pictures, metal, wood, or leather, and particularly for toys.

VARNISH (Lac, — Aqueous). *Prep.* From *pale shell-lac*, 5 *oz.*; *borax*, 1 *oz.*; *water*, 1 pint; digest at nearly the boiling point until dissolved; then strain. Equal to the more costly spirit varnish for many purposes; it is an excellent vehicle for water colours, inks, &c.; when dry it is waterproof.

VARNISH (Lac,—Coloured). Syn. *Lacquer*, *Brasswork Varnish*, *&c.* *Prep.* 1. Take of *turmeric* (ground), 1 *lb.*; *rectified spirit*, 2 gall.; macerate for a week, strain with expression, and add to the tincture, *gamboge*, 1½ *oz.*; *pale shell-lac*, ¾ *lb.*; *gum sandarach*, 3½ *lb.*; when dissolved, strain, and further add of *good turpentine varnish*, 1 quart. Gold coloured.

2. *Seed lac*, 3 *oz.*; *turmeric*, 1 *oz.*; *dragon's blood*, ¼ *oz.*; *rectified spirit*, 1 pint; digest for a week, frequently shaking, then decant the clear portion. Deep gold coloured.

3. *Spanish annotta*, 3 *lb.*; *dragon's blood*, 1 *lb.*; *gum sandarach*, 3¼ *lb.*; *rectified spirit*, 2 gall.; *turpentine varnish*, 1 quart; as before. Red coloured.

4. *Gamboge*, 1 *oz.*; *Cape aloes*, 3 *oz.*; *pale shell-lac*, 1 *lb.*; *rectified spirit*, 2 gall.; as before. Pale brass coloured.

5. *Seed lac*, *dragon's blood*, *annotta*, and *gamboge*, of each, ¼ *lb.*; *gum sandarach*, 2 *oz.*; *saffron*, 1 *oz.*; *rectified spirit*, 1 gall. Resembles the last.

Obs. Lacquers are used upon polished metals and wood to impart to them the appearance of gold. Articles in brass, tin-plate, and pewter, or which are covered with tinfoil, are more especially so treated. As *lacquers* are required of different depths and shades of colour, it is best to keep a concentrated solution of each of the colouring ingredients ready, so that it may be added, at any time, to produce any desired tint.

VARNISH (Mahogany). *Prep.* From *gum animé* ("sorts"), 8 *lb.*; *clarified oil*, 3 gall.; *litharge* and *powdered dried sugar of lead*, of each, ¼ *lb.*; proceed as for *body varnish*, and thin with *oil of turpentine*, 5 gall., or q. s.

VARNISH (Mastic). Syn. *Picture Varnish*, *Turpentine do.*, *Tingry's Essence do.* *Prep.* 1. Take of *pale* and *picked gum mastic*, 5 *lb.*; *glass* (pounded as small as barley, and well washed and dried), 3 *lb.*; finest *newly rectified oil of turpentine* (lukewarm), 2 gall.; put them into a clean 4 gall. *tin bottle* or *can*, bung down securely, and keep rolling it backwards and forwards pretty smartly on a counter, or any other solid place, for at least 4 hours; when, if the gum is all dissolved, the varnish may be decanted, strained through muslin into another bottle, and allowed to settle; if the solution is still incomplete, the agitation must be continued for some time longer, or a *gentle* warmth applied as well. Very fine.

2. (*Second Quality.*) From *mastic*, 4 *lb.*; *oil of turpentine*, 2 gall.; dissolve with heat.

Obs. Mastic varnish is much used for pictures, &c.; when good, it is tough, hard, brilliant, and colourless. It greatly improves by age, and, when possible, should never be used before it has been made at least a twelvemonth. Should it get "*chilled*," 1 *lb.* of *well-washed siliceous sand* should be made moderately hot, and added to each gallon, which must then be well agitated for 5 minutes, and afterwards allowed to settle.

The present high price of the best mastic (15*s.* to 16*s.* per *lb.*) almost precludes its use for varnishes.

VARNISH (Oak). Syn. *Wainscot Varnish*, *Common Turpentine do.*, *&c.* *Prep.* 1. Clear *pale rosin*, 3½ *lb.*; *oil of turpentine*, 1 gall.; dissolve.

2. To the last add of *Canada balsam*, 1 pint. Both are cheap and excellent common varnishes for wood or metal.

VARNISH (Oil). The finer qualities are noticed under *Amber*, *Body*, *Carriage*, and *Copal Varnish*; the following produces the ordinary *oil varnish* of the *shops*:—Take of *good clear rosin*, 3 *lb.*; *drying oil*, ½ gall.; melt, and thin with *oil of turpentine*, 2 quarts. A good and durable varnish for common work.

VARNISH (Painter's). See *Carriage*, *Copal*, *Mahogany*, *Oak*, *Oil*, and other varnishes. The selection depending greatly on the colour and quality of the work.

VARNISH (Patent Leather). This is carefully prepared *drying oil*. The *skins* being stretched on a board, and every trace of grease being removed from them by means of a *mixture* of *fuller's earth* and *water*, they are ready to receive the *varnish*,

which is then spread upon them, *very thinly*, by means of a species of scraper. The *first-coat varnish* consists of *pale Prussian blue* (that containing some alumina), 5 *oz.*; *drying oil*, 1 gall.; boiled to the consistence of single size, and when cold, ground with a little *vegetable black*; it is stoved, and afterwards polished with *fine-grained pumice*;—the *second coating* resembles the first, excepting in having a little *pure Prussian blue* mixed with it;—the *third-coat varnish* consists of a similar mixture, but the *oil* is boiled until it strings well, and a *little* more *pure Prussian blue* and *vegetable black*, are added;—the *last-coat varnish*, or *finish*, is the same as the third, but must contain ½ *lb.* of *pure dark-coloured Prussian blue* and ¼ *lb.* of *pure vegetable black* per gall.; to which a little *oil copal* or *amber varnish* is often added; each coat being duly stoved and pumiced before the next is applied. The *heat* of the *stove* or *oven* is commonly 120° Fahr. for "*enamelled skins*," as those of the calf and seal, intended for "*uppers*;" and 175° to 180° for stout "*japan leather*;" the *exposure* in the stove is commonly for 6 to 10 hours. The skins are next *oiled* and *grained*. The "*graining*" of the "*enamelled skins*" is done by holding the skin in one hand, and with a curved board lined with cork (*graining stick*), lightly pressed upon the fleshy side, working it up and down until the proper effect is produced.

VARNISH (Picture). Several varnishes, especially *mastic varnish*, are called by this name. *Pale copal* or *mastic varnish* is generally used for oil paintings, and *crystal*, *white hard spirit*, or *mastic varnish*, for water colour drawings on paper.

VARNISH (Printer's). See *page* 1071. Diluted with twice its volume of *oil of turpentine* it forms a good common varnish.

VARNISH (Spirit). *Prep.* 1. (*Brown Hard.*)—*a.* From *gum sandarach*, 3 *lb.*; *pale seed-lac* or *shell-lac*, 2 *lb.*; *rectified spirit* (65 o. p.), 2 gall.; dissolve, and add of *turpentine varnish*, 1 quart; agitate well, strain (quickly) through gauze, and in a month decant the clear portion from the sediment. Very fine.

b. From *seed-lac* and *yellow resin*, of each, 1½ *lb.*; *rectified spirit*, 5 quarts; *oil of turpentine*, 1¼ pint; dissolve. Inferior to the last.

2. (*White Hard.*)—*a.* From *gum sandarach* (picked), 5 *lb.*; *camphor*, 2 *oz.*; *washed* and *dried coarsely pounded glass*, 3 *lb.*; *rectified spirit* (65 o. p.), 7 quarts; proceed as in making mastic varnish; when strained add of *pure Canada balsam*, 1 quart. Very pale, durable and brilliant.

b. From *gum sandarach* and *gum mastic*, of each, picked, 4 *oz.*; *coarsely powdered glass*, 8 *oz.*; *rectified spirit*, 1 quart; dissolve, and add of *pure Strasburgh turpentine*, 3 *oz.* Very fine.

3. (*Soft Brilliant.*) From *sandarach*, 6 *oz.*; *elemi* (genuine), 4 *oz.*; *animé*, 1 *oz.*; *camphor*, ½ *oz.*; *rectified spirit*, 1 quart; as before.

4. (*Scented.*) To the preceding add some *gum benzoin*, *balsam of Peru*, *balsam of tolu*, *oil of lavender*, or the *essence of musk* or *ambergris*. The first two can only be employed for dark varnishes.

Obs. The above varnishes are chiefly applied to articles of the toilette, as work-boxes, card-cases, &c.; but are also suitable to other articles, whether of paper, wood, linen, or metal, that require a brilliant and quick drying varnish. They dry almost as soon as applied, and are usually hard enough to polish in 24 hours. They are, however, much less durable, and more liable to crack, than oil varnishes. See *p.* 1256.

VARNISH (Stopping-out). Syn. *Petit Vernis*. From *lampblack* made into a paste with *turpentine*. *Used* by engravers. See *Etching*.

VARNISH (Tingry's). See *page* 1260.

VARNISH (Toy). Similar to *common spirit varnish*, but using *carefully rectified wood-naphtha* as the solvent. See *Lac Varnish* (and *above*).

VARNISH (Transfer). Syn. *Mordant Varnish*, *&c.* *Prep.* From *mastic* (in tears) and *sandarach*, of each, 4 *oz*; *rectified spirit*, 1½ pint; dissolve, and add of *pure Canada balsam*, ½ pint. *Used* for transferring and fixing engravings or lithographs on wood, and for gilding, silvering, &c. See *Crystal Varnish*.

VARNISH (Turpentine). See *Mastic* and *Oak Varnish*.

VARNISH (Wainscot). See *Oak Varnish*.

VARNISH (Wax). Syn. *Milk of Wax*; *Emulsio Ceræ Spirituosa*,—Lat. *Prep.* Take of *white wax* (pure), 1 *lb.*; melt it with as gentle a heat as possible, add of *warm rectified spirit*, sp. gr. 0·830 (60 o. p.), 1 pint; mix *perfectly*, and pour the liquid out upon a *cold* porphyry slab; next grind it with a *muller* to a perfectly smooth paste, adding *more spirit*, as required; put the *paste* into a marble mortar, make an emulsion with *water*, 3½ pints, gradually added, and strain it through muslin. *Used* as a varnish for paintings; when dry, a hot iron is passed over it, or heat is otherwise evenly applied, so as to fuse it, and render it transparent, after which, when *quite cold*, it is

polished with a clean linen cloth. The most protective of all varnishes.

2. *Wax* (pure), 5 *oz.; oil of turpentine*, 1 quart; dissolve. *Used* for furniture.

VARNISH (White). See *Spirit Varnish*, 2, *a* and *b*.

VARNISHING. To give the *highest degree* of *lustre* to *varnish* after it is laid on, as well as to remove the *marks of the brush*, it undergoes the operation of *polishing*. This is performed by *first* rubbing it with *very finely powdered pumice stone* and *water;* and, afterwards, with an *oiled rag* and *tripoli*, until the required polish is produced. The surface is last of all cleaned with *soft linen cloths*, cleared of all greasiness with *powdered starch*, and then rubbed bright with the palm of the hand.

In *varnishing*, great care must be taken that the surface is *free* from *grease*, or *smoke;* as unless this be the case, the best oil or turpentine varnish in the world will not dry and harden. *Old articles* are usually washed with soap and water, by the painters, before being varnished, to prevent any misadventure of the kind alluded to.

VAUXHALL NECTAR. See *page* 84.

VEAL. "The grain should be close, firm, and white, the fat of a pinkish white, not a dead white, and the kidneys well covered with thick white fat." (Soyer.)

Veal, like pork, requires to be well dressed, to develope its nutritive qualities. It should also be eaten fresh, as a peculiar principle is generated in it when improperly kept, which acts as a malignant poison. See *Roasting*, *&c.*

VEGETABLE ALKALI. Potassa.

VEGETABLE JUICES. See *below.*

VEGETABLES. *Vegetables* are organic beings, which are distinguished from animals by a number of characteristics, but, like them, are composed of certain proximate principles, or compounds, which possess a high degree of scientific interest, and, in many cases, are invaluable to man. Among the more important of these are—*albumen*, *fibrin*, *gluten*, *gum*, *lignine*, *starch*, *sugar*, *tannin*, *wax*, the *fixed* and *volatile oils*, the *resins* and *gum-resins*, the *alkaloids*, and innumerable forms of *extractive matter*. Several of these substances are noticed under their respective names.

The *method* of *propagating plants* from their *seeds*, depending on their simple exposure, at the proper season, to warmth and moisture, under the protection of the soil, is well known; that by "*layers*," has been briefly referred to at *page* 676; and some points connected with their propagation from "*slips*" and "*cuttings*," which will doubtless prove interesting to the amateur gardener, are noticed below.

The *choice of* "*slips*" and "*cuttings*" should be made from the side shoots of trees and plants, and, when possible, from such as recline towards the ground, observing, when they are removed by the knife, to leave a little wood of a former year or season's growth attached to them, as such are found to take root more readily than when they are wholly composed of new wood. The *time* to take *slips* or *cuttings* is as soon as the sap gets into full motion. *Before setting them* the latter should be cut across, just below an eye or joint, with as smooth a section as possible, observing not to injure the bud. The superfluous leaves may be removed, but a sufficient number should be left on for the purposes of vegetation. The *common practice* of removing *all* or *nearly all* the *leaves* of cuttings is injudicious. In some cases *leaves alone* will strike root. *When cuttings* are *set in pots* they should be so placed as to reach to the bottom and touch the sides throughout their whole length, when they will seldom fail to become rooted plants. In the case of *tubular-stalked plants*, it is said to be advantageous to insert both ends into the soil, each of which will take root, and may then be divided, when two plants will be produced instead of one. An *equable temperature*, a *moist atmosphere*, a *shady situation*, and a *moderate supply of water*, are the principal *requisites* to induce speedy rooting. Excess of any of these is prejudicial. When the size of the cuttings admit, it is better to place them under a hand or bell-glass, which will preserve a constant degree of heat, and prevent evaporation from the surface of the leaves, which is the most common cause of their dying, especially in hot, dry weather.

Qual. The vegetable kingdom furnishes by far the larger portion of the food of man, and indirectly perhaps the whole of it. The great value of *culinary vegetables* and *fruit* in a mixed diet need not be insisted on, since it is a fact which is almost universally known and appreciated. Indeed, there appears great plausibility in the assertion of a certain modern author, that "the fruits and farinacea are the *proper* food of man," as without doubt they were the original.

In the *choice* of *culinary* vegetables observe, that if they are stiff and break freely and crisply, they are *fresh*, and fit for food; if, on the contrary, they have a

flabby appearance, or are soft or discoloured, they are *stale*, and should be rejected.

The *doses* of the generality of vegetable substances that exercise no very marked action on the human frame, is about ½ to 1 dr. of the *powder*, night and morning; or 1 *oz.*, or q. s. to impart a moderately strong taste or colour may be infused, or boiled in 1 pint of *water*, and a wine-glassful or thereabouts, taken 2 or 3 times a day.

VEGETABLE SUBSTANCES. Syn. *Vegetabilia*,— Ph. L. The following *general directions* are given in the London Pharmacopœia for the *collection* and *preservation* of vegetable substances:—

"*Vegetables* are to be *collected* in dry weather, and when neither wet with rain nor dew; they are to be collected annually, and are not to be kept beyond a year.

"*Barks* are to be *collected* at that season in which they can be most easily separated from the wood." Spring is the season here alluded to; as at this time, after the sap begins to ascend, the bark is, in general, very easily separated.

"*Flowers* are to be collected recently blown." The red-rose, however, must be gathered before the buds are expanded.

"*Fruits* and *seeds* are to be collected when ripe.

"*Herbs* and *leaves* are to be gathered *after* the flowers have expanded, and *before* the seeds are mature.

"*Roots* and *rhizomes* (underground stems), for the most part, are to be dug up after the old leaves and stalks have fallen, and before the new ones appear." ("*Roots*, which are required to be preserved fresh, should be buried in dry sand."—Ph. L. 1836.)

"*Seeds* are to be collected when they are ripe, and before they drop from the plant." ("They ought to be preserved in their seed-vessels,"—Ph. L. 1836.)

"The *different parts* of *vegetables* are to be kept *dried* for use, except where we shall otherwise direct. *Expose those* you wish to *dry*, within a short time after they have been gathered, in shallow wicker baskets, to a gentle heat in a dark place, and where there is a current of air. Then, the moisture being driven off, gradually increase the heat to 150° Fahr., in order that they may be dried. Finally, *preserve* the *more delicate parts*, viz., *flowers* and *leaves*, in black glass vessels, well closed; and keep the rest in proper vessels, preventing the access of light and moisture."

Fruits, *culinary vegetables*, and *vegetable juices*, of every class, may be *preserved* for *any length of time* by the system of M. Appert, as practised by Messrs. Donkin and Gamble; as well as by several other methods described under "*Putrefaction*." On the *small scale* the following method is often adopted:—The *substances to be preserved* are put into *strong glass* or *stone-ware bottles*, with necks of a proper size, which are then *corked* with the greatest care, *tied* or *wired*, and *luted* with a mixture of lime and soft cheese, or with a paste formed of linseed meal and water, spread on rags; or, *tin cases* are employed, and are soldered up instead of being corked. The bottles are then placed in an *oven*, the temperature of which is cautiously raised to fully 212° Fahr.; or, they are inclosed, separately, in *canvass bags*, and put into a *copper of water* to which *some salt* has been added, which is then gradually heated until it boils, and thus kept for 15 or 20 minutes: the whole is next left to cool, when the bottles are taken out and carefully examined before being laid by, lest they should have cracked, or the lute have given way.

Herbs and *flowers* are now generally *preserved* for *distillation* by means of *common salt*. The objection which is raised against the use of fresh aromatic plants is thus obviated, whilst the *odours* of the *distilled products* are rendered *superior* to those obtained from either the *recent* or *dried plant*, *fruit*, or *flower*, without the great loss, inconvenience, or trouble, attending the common methods. Besides, *many aromatic* and *odorous substances almost entirely lose* their properties by drying; whilst *most of them* yield *more oil*, and that of a finer quality in the *fresh*, than in the *dried* state. The *odours of roses*, *elder flowers*, and a *variety of others*, are vastly improved by this treatment, and these flowers may thus be preserved with ease and safety from season to season, or even longer, if required. The *process* simply *consists* in intimately mixing the *flowers*, or *other vegetables*, soon after being gathered, with about ¼th *their weight*, or less, of *good dry salt*, and ramming down the mixture as tightly as possible in strong casks. The casks are then placed in a *cold cellar*, and covered with boards, on which heavy weights are put, to keep the mass tight and close. See *Fruits*, *Putrefaction*, *&c.*

VEGETABLES (Juices of). Syn. *Expressed Vegetable Juices*, *Simple do.*; *Succi Expressi*,—Lat. These are obtained by bruising the *fresh leaves*, or other *vegetable matter*, in a *marble mortar*, or in a *mill*, and expressing the liquid portion by means of a *powerful screw press*. After defe-

cation for 12 or 14 hours in a cold situation, the *juice* is either decanted or filtered from the feculous sediment, and is next heated for some minutes to about 185° Fahr., to coagulate albuminous matter. The clear portion is subsequently separated as before, and the product preserved for use in well-closed and well-filled bottles, in a cool situation. Some plants, as *borage*, *cabbage*, &c., require the addition of $\frac{1}{8}$th of water before being pressed. The *expression* of the *juice of lemons*, *oranges*, *quinces*, &c., is facilitated by previously mixing the *pulp* with clean chopped straw. *Buckthorn berries*, *mulberries*, &c., after being crushed between the hands, are commonly left for 3 or 4 days to undergo a slight fermentation, before pressing them.

The *expression* of the *juices* of the *narcotic plants*, and of some *other vegetables*, has lately assumed considerable interest, from these juices being now extensively used in *pharmacy* for the preparation of *extracts* and the *preserved juices* noticed below. It appears that the *juice* of *young plants just coming into flower* yields only $\frac{2}{3}$rds the amount of extract, which may be obtained from the same quantity of *juice* expressed from the *matured plant*, or when the flowers are fully blown, and the strength of the product is also inferior, the case appears to be best met by selecting the plants when more than half the flowers are fully blown. The *leaves* alone should be preferably employed, and should be exclusively of the second year's growth, when the plants are biennials. (Squire.) The *homœopathists* commonly employ the whole flowering herb.

The *inspissated vegetable juices* (*succis spissatis*) are now included among the extracts.

The principal *simple vegetable juices* of *commerce* are—

Buckthorn Juice (*succus rhamni*,—Ph. L.), from the fruit of rhamnus catharticus or buckthorn berries.

Citron Juice (*succus citri*, *acetositas citras*), chiefly imported from Italy in large casks.

Lemon Juice (*succus limonum*,—Ph. L.), from lemons that spoil before they can be sold; also imported.

Mulberry Juice (*succus mori*,—Ph. L.), from the fruit of morus nigra or mulberry.

Orange Juice (*succus aurantii*), obtained from the same sources as that of lemons.

Concentrated Orange Juice (*succus spissatus aurantii* vel *aurantiorum*) and *Concentrated Lemon Juice* (*succus spissatus limonum*), are prepared by evaporating the fresh juices of oranges and lemons, either alone or mixed with sugar, and are employed as substitutes for the fruit, where the latter cannot be obtained.

VEGETABLES (Juices of,—Medicinal). These are principally prepared from the narcotic plants, and are generally preserved with spirit; or, less frequently, with ether.

Alcoholized Vegetable Juices, *Preserved do. do.*; *Tinctures of Recent Plants*; *Succi Alcoholati*,—Lat. *Alcoolatures*,—Fr. *Prep.* 1. The *juice*, obtained by powerful pressure, in the manner noticed above, is allowed to remain for 24 hours in a *cold place*, when the clear portion is decanted from the feculous matter which has subsided, and is then agitated with *one half* its *volume* of *rectified spirit* (56 o. p.); after another 24 hours the *clear portion* is again decanted, and, if necessary, filtered through *bibulous paper* or *linen*. In this way are now generally prepared the *preserved juices of aconite*, *belladonna*, *colchicum* (corms), *hemlock*, *henbane*, *foxglove*, *elaterium*, *lactuca virosa*, *taraxacum*, &c., sold in this country.

2. (P. Cod.) To the *fresh leaves*, bruised in a *marble mortar*, is added an equal weight of *rectified spirit*, and after maceration for 15 days, the whole is pressed, and the resulting tincture filtered. In this manner are prepared the *tinctures* of the *fresh leaves* of *aconite* (tinctura aconiti cum foliis recentibus), *belladonna*, *foxglove*, *hemlock*, *henbane*, *strong-scented lettuce* (lactuca virosa), *stramonium*, *trailing poison oak* (rhus toxicodendron), *mugwort* (artemisia vulgaris), *colchicum corms*, *squirting cucumber* (momordica elaterium), *jacobea*, *white poppy*, *taraxacum*, &c. &c., of the Paris Codex.

Obs. These tinctures are much more powerful, and more certain in their operation, than those prepared from the dried plants. The *commencing dose* is from 2 to 5 drops, the effects of which should be carefully watched. The *products* of the *first* of the above formulæ keep as well as the ordinary tinctures, and there is less waste of spirit than with the *second*. That of the P. Cod. is, however, preferred by M. Soubeiran, as affording more uniform products; an opinion which is questionable. Béral orders *equal weights* of *juice* and *spirit*; Mr. Squire recommends $\frac{1}{2}$ part; Messrs. Bentley & Davenport $\frac{1}{4}$ part (both by volume); and M. Gieseke only $\frac{1}{5}$ part (by weight) of *spirit*, to 1 part of the *expressed juice*. The homœopathists generally go with M. Béral. Our own experience, which has been very considerable, and extends over upwards of 16 years, leads us to prefer

the proportions given in formula 1, which are similar to those of Mr. Squire. If *less* spirit be employed the product is apt to suffer rapid deterioration when kept in a warm shop or surgery.

Etherized Vegetable Juices; Succi Æthe-rizati,—Lat. *Ethérolatures, Sucs Ethérés*, —Fr. For these we are indebted to M. Bouchardat. They are prepared as follows: —*Ether* is gradually added to the *depurated freshly expressed juice*, until, after active agitation, a *thin layer* of it rises to the surface on the mixture being allowed to repose for a minute or two; the whole is then set aside for 24 hours, when the supernatant ether is expertly removed by means of a pipette or syringe, and the juice is filtered; lastly, the decanted ether is returned to the filtrate, and the etherized juice is at once put into well-stopped bottles. For *use*, one of the bottles is reversed, and the *dose* taken from the lower part, so that the ether remains behind. We find, in practice, that decantation, carefully conducted, may be substituted for filtration; thus not only rendering the process less costly, but ensuring a more uniform product.

The etherized juices are said to retain their active properties for an indefinite period. The method has been successfully applied to the juices of *aconite*, *anemone*, *black hellebore*, and *hemlock*, and is probably applicable to many others; but, we think, not to the *juices* of *all* the narcotic plants, as has been asserted.

VEGETATION (Metallic). This name has been fancifully applied to the following—

Lead Tree; Arbor Saturni. Take of *sugar of lead*, 1 *oz.*; *distilled water*, 1½ pint; *acetic acid*, a few drops; dissolve, place the liquid in a clear white glass bottle, and suspend a *piece of zinc* in it, by means of a *fine thread.*

Silver Tree; Arbor Dianæ. From *nitrate of silver*, 20 gr.; *water*, 1 fl. oz.; dissolve in a phial, and add about ½ dr. of *pure mercury.*

Tin Tree; Arbor Jovis. From *chloride* or *muriate of tin*, 3 dr.; *nitric acid*, 10 to 15 drops; *distilled* or *rain water*, 1 pint; dissolve in a white glass bottle, and hang in it by a thread, a *small rod of zinc.*

Obs. In the above experiments, the metals are precipitated in a very beautiful arborescent form. It is curious to observe the laminæ shoot out as it were from nothing, assuming forms resembling real vegetation. This phenomenon results from galvanic action being set up between the liquid and the metals.

VEGETO-ALKALIES. See *Alkaloids.*

VELLUM is a fine kind of parchment prepared from the *skins* of *calves*, *kids*, and *lambs.* The skins are *limed*, *shaved*, *washed*, and *stretched* in hoops or other frames, where they are *scraped* and *trimmed* with the *currier's fleshing-knife*, and next carefully *rubbed down* with pumice stone; they are, lastly, *polished* with *finely powdered chalk* or *fresh-slaked lime*, and then dried. A GREEN COLOUR is given with a *solution* of *crystallized verdigris* to which a little *cream of tartar* and *nitric acid* has been added; and a BLUE COLOUR, with *solution of indigo.* The surface is often finished off with *white of egg*, and subsequent friction.

The *skins* of *sheep* are commonly used for *parchment*; those of *he-goats* and *wolves*, for *drum-heads*; and those of the *ass*, for *battledores.* The species of vellum used for *church services* by binders is said to be prepared from *pig-skins.* See *Pounce.*

VELVET COLOURS. Syn. *Map Stains, Paper do.; Lacca Fluida*,—Lat. *Prep.* 1. (*Blue.*)—*a.* Dissolve *litmus* in *water*, and add ⅓rd of *spirit of wine.*—*b.* Dilute *Saxon blue* or *sulphate of indigo* with *water.* If required for *delicate work*, neutralize the acid with chalk.—*c.* To an *aqueous infusion of litmus* add a few drops of *vinegar*, until it turns of a *full blue.*

2. (*Green.*)—*a.* Dissolve *crystallized verdigris* in *water.*—*b.* Dissolve *sap green* in *water*, and add a *little alum.*—*c.* Add a *little salt of tartar* to a *blue* or *purple solution of litmus*, until it turns green.—*d.* Dissolve equal parts of *crystallized verdigris* and *cream of tartar* in *water.*

3. (*Purple.*)—*a.* Steep *litmus* in water, and strain the solution.—*b.* Add a *little alum* to a stained *decoction of logwood.*—*c.* Add a *solution of carmine* (red) to a little *blue solution of litmus* or *Saxon blue.*

4. (*Red.*)—*a.* Macerate *ground Brazil-wood* in *vinegar*, boil a few minutes, strain, and add a little *alum* and *gum.*—*b.* Add *vinegar* to an *infusion of litmus* until it turns red.—*c.* Boil or infuse *powdered cochineal* in *water* containing a little *ammonia* or *sal-volatile.*—*d.* Dissolve *carmine* in *liquor of ammonia*, or in *weak carbonate of potash water*; the former is superb.

5. (*Yellow.*)—*a.* Dissolve *gamboge* in *water*, and add a little *alum.*—*b.* Dissolve *gamboge* in equal parts of *proof spirit* and *water.* Golden coloured.—*c.* Steep *French berries* in *boiling water*, strain, and add a little *alum.*—*d.* Steep *turmeric*, *round zedoary*, *gamboge*, or *annotta*, in spirits of wine.—*e.* Dissolve *annotta* in a *weak ley of sub-carbonate of soda* or *potash.*

Obs. The preceding, thickened with a *little gum*, are used as *inks* for writing, as

colours to *tint maps, foils, paper, artificial flowers, &c.*, and to *paint on velvet*. Some of them are very beautiful. Those containing litmus, are, however, fugitive. It must be observed, that those made with *strong spirit* do not mix well with gum water, unless somewhat diluted with water. Any other transparent colours or stains may be employed for *painting on velvet*, as well as the above.

VELVET LEAF. Syn. *Pareira Brava, White do.; Pareira*,—Ph. L. E. & D. "The *root*" of "*cissampelos pareira*" (Ph. L.), *white pareira* or *velvet-leaf*. It is tonic, aperient, and diuretic. *Dose*. 20 to 60 gr.; in chronic and purulent inflammation and extreme irritability of the bladder; in leucorrhœa, dropsy, ulceration of the kidneys, &c.

VENESECTION. Syn. *Phlebotomy*. The abstraction of blood by opening a vein. The operation is now confined to the veins at the bend of the arms, and to the external jugular; but was formerly practised on various others. The method of proceeding is as follows:—"A *band* or *ligature* is to be applied around the *arm* above the point at which the vein is to be opened, so as to obstruct the passage of the blood to the heart; this causes an enlargement and turgidity of the vessel below the ligature. This bandage should never be applied so tightly as to prevent the passage of blood in the arteries of the part. The vein is to be opened by means of a *common* or *thumb-lancet*, or a *spring lancet*. In using the *first*, the *vein* is to be kept from rolling by means of the thumb of the left hand placed a small distance below where the puncture is to be made; but care should be taken not to alter the relative position of the skin and vein, because in resuming their position after the lancet is inserted, the aperture through the skin will no longer correspond with that in the vein, in consequence of which a *thrombus* or *ecchymosis* will form —a very common accident in venesection. The lancet is to be pushed into the vein, and when its point is within the cavity of the vessel, it is to be carried forward a little, so as to enlarge sufficiently the opening. The arm is to be kept extended after the operation until the necessary quantity of blood is taken. If the *blood* should *not flow as freely as is desired*, the patient should exert the muscles of the arm by grasping a stick, or moving the fingers.

"*After* a *sufficient quantity of blood* has been *drawn*, the flow is to be stopped by removing the ligature and placing a finger on the orifice, when any blood that has soiled the arm is to be wiped off, and the edges of the orifice carefully brought together, that they may unite by the first intention. To accomplish this, let the bleeder, with the thumb of that hand which holds the arm, push the skin towards the orifice, while he draws it on the other side to the same point with the compress; thus the skin will be thrown into folds at the wound, over which he is immediately to apply the compress, which should be broad to keep the skin better together, and thick to make the compression more certain.

"The *ligature* for *tying the arm*, so as to obstruct the flow of blood in the veins below it, should be a *soft old ribbon;* and the same may be employed for securing the *pledget over the orifice*, when the flow of the blood is to be stopped. The *pledget*, or *compress*, should be a piece of *linen folded into a square form*, about an inch in diameter, and comprehending three or four thicknesses of the material. It is always proper to use a *graduated basin* for *receiving the blood*, that the exact quantity drawn may be ascertained. If the *invalid* be *bled in bed*, he should *sit erect;* if he be up, he should be placed erect in a chair." (Dr. R. E. Griffith.)

The *common lancet* is usually employed in this country, but the *spring-lancet* is in almost general favour in the United States, and, according to Dr. Physick, of Philadelphia, has the advantages of durability, economy, and safety, greatly on its side. "There is no country in which venesection is more frequently performed than in the United States, and, *perhaps, none where fewer accidents from the operation* have occurred; of these few, I beg leave to state that *all the aneurisms* produced by bleeding, which I have seen, have been in cases where the *common lancet* was used." (*Elem. of Surgery.*)

VENISON. The flesh of several species of deer. That from good land, killed at the proper season, and eaten in a moderately fresh state, is most easily digestible, and, perhaps, the most wholesome of all the *red meats;* but when it is "*high*" or in a state of *incipient putrefaction*, it is far from wholesome, and often poisonous.

VENO BENO (La). See *Tea*.

VENTILATION. The proper ventilation of our habitations, as well as of other buildings in which we pass any considerable portion of our time, is quite as necessary to health as food and clothing. Lavoiser, writing in the middle of the last century, remarks,—"It is certain that mankind degenerate when employed in sedentary manu-

factures, or living in crowded houses, or in the narrow lanes of large cities; whereas they improve in their nature and constitution in most of the country labours which are carried on in the open air." Yet many persons, by the care which they take to shut out fresh air, and to prevent the escape of that which their own bodies, by pulmonary and surfacial respiration, have contaminated, would seem to hug to themselves the discomfort of breathing over and over again an impure and unrefreshing atmosphere, and to be anxious to finish their career by lingering suicide. The almost universal indifference to the subject, considering its importance, is unaccountable.

The first step towards effecting and maintaining a liberal supply of fresh air, is either by means of ventilators, or by regularly opening the windows for stated periods daily. During the colder portion of the year, when fires are kept burning, and there is an up-current in the chimney, nothing is so simple and effective as the well-known *chimney-valve* of Dr. Arnott; and, indeed, without this, open fires are powerful instruments of ventilation. In cold weather, where expense is not an object, the apartments may be supplied with air that has been previously warmed by passing through a heated chamber, on the principle recommended by Dr. Reid; but care must be taken, that in warming the air, we do not over-heat it, nor contaminate it.

A *sufficient supply of light*, another powerful sanitary agent, is now regarded as nearly as essential as thorough ventilation, and the two are commonly treated of together. According to Palladio, the *openings of windows* should not *exceed* a *fourth*, nor be *less than* a *fifth* of the length of a side of a room, and should be in *height* two and one sixth times the width. Mr. Gwilt, another high authority on this subject, has given as a definite rule, that we should allow 1 *square foot of glass* to every 100 *cubic feet of space* in any apartment or inclosure. A great deal must, however, depend on the shape of the apartment; but, in all cases, care should be taken that the windows are placed at the longest side of the room, and not at the narrowest, or the end of it. A *southern aspect* affords the most light and heat; a *northern one*, the most diffused and least variable light, and, is hence, usually chosen by artists for their studios.

VERATRIA. Syn. *Veratrine*, *Veratrina*, *Sabadilline*; *Veratria*, — Ph. L. & E. A vegetable alkali discovered by Pelletier and Caventou, in the seeds of veratrum sabadilla (*asagræa officinalis*), and in white hellebore.

Prep. 1. (Ph. E.) Digest *sabadilla seeds* (cevadilla) in *boiling water* for 24 hours, then squeeze them, dry them thoroughly by a gentle heat, beat them in a mortar, and separate the seeds from the capsules by agitation in a deep and narrow vessel; next grind the *seeds* in a coffee mill, and exhaust them by percolation with *rectified spirit*; concentrate the *resulting tincture* by distillation so long as no deposit forms, and pour the residuum, whilst still hot, into 12 times its volume of *cold water*; then filter through *calico*, and wash the residuum on the filter as long as the *washings* yield a precipitate with ammonia; unite the *filtered liquid* with the *washings*, add *ammonia* in excess, collect the precipitate on a filter, wash it *slightly* with *cold water*, and dry it first by imbibition with *filtering paper*, and then in the *vapour bath*. "The *product* is not pure, but sufficiently so for medical use. From this *coloured substance* it may be obtained *white*, but at considerable loss, by solution in *very weak hydrochloric acid*, decolorization with *animal charcoal*, and re-precipitation with ammonia."

2. (Ph. L. 1836.) This is the same in principle as the last; a tincture is formed by boiling the *seeds* in *rectified spirit*, which is then evaporated to a *syrup*, dissolved in *very dilute sulphuric acid*, the *veratria* precipitated with *magnesia*, re-dissolved in *very dilute acid*, treated with *animal charcoal*, the filtrate again evaporated to a syrup, and precipitated with *ammonia*; it is, lastly, washed, and dried.

3. By means of *ether*, as noticed under *Alkaloid* and *Aconitine*. This is by far the best method.

Prop. Pure veratria is perfectly white; but as usually met with, it is a yellowish or greenish-white powder; it is highly acrid; uncrystallizable; scarcely soluble in water; soluble in ether; and freely soluble in hot alcohol; heated to about 125° Fahr., it fuses like wax, and solidifies, upon cooling, to a transparent yellow mass. With the dilute acids it forms *salts*, which are either amorphous or difficultly crystallizable. The smallest possible portion of its powder causes violent sneezing.

Tests. 1. Potassa, ammonia, and their carbonates, give flocculent white precipitates, which at first are not crystalline under the microscope, but which, after some minutes, assume the appearance of small scattered clusters of short prismatic crystals; they are insoluble in excess of potassa and

its carbonate, and only very slightly so in excess of ammonia.—2. With sulphuric acid it strikes an intense red colour, changing afterwards to crimson, and finally to violet.—3. A dilute acetic solution of veratria is turned to a *superb red* by strong sulphuric acid.

Veratria is *distinguished* from *brucia* and the other alkaloids by its easy fusibility, —by the crystalline form of its precipitate with potassa, and—by its reaction with oil of vitriol.

Uses, &c. "As an external application it has been efficaciously employed by Magendie in France, and by Dr. Turnbull in this country; but the extravagant eulogies of the latter have not tended to confirm the reputation of the remedy." (Dr. A. T. Thomson.) From 6 to 12 gr. dissolved in 1 fl. oz. of *rectified spirit*, as a liniment; or 30 gr. mixed with 1 dr. of *olive oil*, and 1 oz. of *lard*, as an ointment, have been occasionally found very serviceable in neuralgia, and other like painful affections, and in gouty and rheumatic paralysis. As an internal remedy it possesses no advantage, as it merely acts as a violent and depressing cathartic. *Dose.* $\frac{1}{24}$ to $\frac{1}{16}$ gr. In larger doses, it acts as a *powerful irritant poison*. For *antidotes, &c.*, see *Alkaloid*. The *product* varies from 0·1 to 0·2%.

VERATRIC ACID. Syn. *Sabadillic Acid*. A crystallizable, fusible, volatile acid, soluble in alcohol, slightly so in water, and insoluble in ether, found by Merck, in the seeds of sabadilla. It is *obtained* by exhausting the *bruised seed* with a mixture of *alcohol* and *sulphuric acid*, and precipitating the *filtered solution*, with *milk of lime*; *veratrate of lime* remains in solution, and on this salt being decomposed with *hydrochloric acid*, the *veratric acid* crystallizes out.

VERATRUM. See *White Hellebore*.

VERDIGRIS. Syn. *Ærugo*,—Lat. *Vert-de-gris*,—Fr. This is a mixture of binacetate and basic acetate of copper, in variable proportions, obtained in the wine districts of the South of Europe, by the action of *refuse grapes*, from which the juice has been expressed, on thin sheets of copper. When *pure*, it should dissolve, almost entirely, and without effervesence, in dilute sulphuric acid. (See *p.* 289.) It is very *poisonous*; for antidotes, see *Copper*.

An *inferior quality* of *verdigris* is now prepared from *pommage*, or *apple marc*, in the cyder districts of England.

VERDIGRIS. (Distilled). Syn. *Crystallized Verdigris*. This is prepared in the wine districts by dissolving of *ordinary verdigris*, 1 part; in good *distilled vinegar*, 2 parts; the operation being performed in a copper vessel, by the aid of a gentle heat, and agitation; the *solution* is afterwards slowly evaporated until a pellicle begins to form on the surface, when it is transferred into glazed earthen pans (*oulas*), in each of which is placed 2 or 3 cleft sticks, and it is then left in a warm apartment for 14 or 15 days, to crystallize.

A *spurious article* is often *prepared* by adding a *solution* of *sulphate of copper*, 12½ *lb.*; to a *solution* of *sugar of lead*, 19 *lb.*, or q. s.; and filtering, evaporating, and crystallizing the mixture.

"There is a *triple acetate of copper and lime*, which *resembles distilled verdigris* in colour. It was manufactured pretty extensively in Scotland some years ago, and fetched a high price, till I published an analysis of it in the *Edin. Phil. Trans.* It is much inferior, for all uses in the arts, to the proper binacetate." (Ure.)

Pure distilled verdigris is *entirely soluble* in water and is not precipitated on the addition of sulphuric acid, or of ammonia in excess. (See *p.* 289.)

VERDIGRIS (English). *Prep. Blue vitriol*, 24 *lb.*; *white vitriol*, 16 *lb.*; *sugar of lead*, 12 *lb.*; *alum*, 2 *lb.*; all coarsely powdered; mix, and heat them in a pot over the fire until they unite into a mass. Sold by fraudulent dealers for foreign verdigris.

VERDITER. Syn. *Blue Verditer*, *Refiners' Verditer*; *Cendres Bleues*. A blue pigment obtained by adding *chalk*, *whiting*, or *milk of lime* to a *solution of copper in aquafortis*; or, by triturating *recently precipitated* and still moist *carbonate* or *oxide of copper* with *hydrate of lime*.

Prep. A quantity of *whiting* or *milk of lime* is put into a tub, and upon this the *solution of copper* is poured; the *mixture* is stirred every day for some hours together, until the liquor loses its colour; it is then poured off, and *more solution of copper* added; this is repeated until the *whiting* or *lime* has acquired the proper colour; the whole is then washed with *water*, drained, spread on *chalk stones*, and dried in the sun.

Obs. The cupreous solution employed in the above process, is made by neutralizing the *nitric solution* obtained from the refiners of gold and silver, by heating it along with *metallic copper*. For the *finer qualities* of *verditer* the *lime* should be of the purest kind; and the cupreous precipitate should be carefully triturated with it, after it is nearly dry, by which a fine velvety

appearance is produced. The *cendres bleues en pâtes* of the French differs from the above mainly in a solution of *chloride of copper* being employed, and in the resulting *green precipitate* being turned *blue* by the action of *carbonate of potash*. Verditer is made into crayons whilst moist, or dried into a powder, or it is used as a water colour in the moist state.

VERDITER (Green). Syn. *Bremen Green*. The process for *refiners' verditer* frequently miscarries, and a *green colour* is produced, instead of a *blue one*. It may also be obtained directly by omitting the "*blueing up*" with *potash*, mentioned above.

VERJUICE. Syn. *Agresta*, *Omphacium*,—Lat. The *expressed juice* of *unripe grapes*. The term is also often extended to the *expressed juice* of the *wild* or *crab apple*. It was formerly used as an astringent and refrigerant in medicine; but is now principally employed as an ingredient in sauces, ragouts, &c.

VERMICELLI. This, like *macaroni*, is prepared from a stiff paste made of a peculiar fine kind of *granular wheat flour*, called *semoule*, which is mixed up with *hot water*, and after being well kneaded, is formed into small ribands, cylinders, or tubes, by being placed in a vertical cylinder press, the bottom of which is filled with proper shaped holes, through which it is driven by an *iron plate* or "*follower*" being forced down by means of a powerful screw. The pieces that protrude are broken off, twisted into any desired shape upon paper, and dried. Those in the form of *fillets* or *ribands* are called "*lazagnes*." See *Macaroni*.

VERMIFUGES. Syn. *Anthelmintica*, *Helminthagoga*, *Vermifuga*,—Lat. See *Anthelmintics* and *Worms*.

VERMILION. Syn. *Factitious Cinnabar*, *Red Sulphuret of Mercury*. This article may be prepared both in the *moist* and *dry way*; that of *commerce* is almost entirely obtained by the latter.

Prep. 1. By *Sublimation*. Take of *pure mercury*, 202 parts; *pure sulphur*, 33 parts; fuse them together by a gentle heat, observing not to allow the mass to take fire; when fused cover over the vessel, and when the whole has become cold, powder the mass, and sublime it in a closed vessel, so placed in a furnace that the flame may freely circulate and play upon it to about half its height; the heat being at first gradually applied, and afterwards augmented until the lower part of the subliming vessel becomes red hot; the *cold sublimate* is broken into pieces, ground along with water to a fine powder, elutriated, passed through a sieve, and dried. *Prod.* Fully 112⅝ of the *weight* of the *mercury* employed.

2. In the *Humid way*. (Brunner.) Take of *pure quicksilver*, 300 parts; *pure sublimed sulphur*, 114 parts; triturate them together for several hours until a *perfect ethiops* is formed, add gradually of *caustic potassa*, 75 parts; (dissolved in) *water*, 450 parts; continue the trituration for some time longer, then gently heat the mixture in an *iron vessel*, at first, constantly stirring, but *afterwards*, only from time to time, observing to keep the heat at about 113°, or, at all events, under 122° Fahr., and to add *fresh water*, to compensate for the portion evaporated. When the colour begins to redden, great caution is requisite to preserve the mixture at the lower temperature, and to keep the sulphuret of mercury perfectly pulverulent; as soon as the colour becomes nearly "*fine*," the process must be conducted with increased caution, and at a lower heat for some hours, or until a rich colour is produced, when the *newly formed vermilion* must be *elutriated with water*, to separate any particles of metallic mercury, and carefully dried. *Prod.* 332 parts of *vermilion* equal in brilliancy to the finest Chinese.

Obs. It has been said that the rich tone of Chinese vermilion may be imitated by adding to the materials 1⅛ of *sulphuret of antimony*, and by digesting the ground sublimate, first in a solution of sulphuret of potassium, and next in diluted hydrochloric acid, after which it must be well edulcorated with water, and dried. Our own belief is, that the finer qualities of vermilion owe their superiority of shade more to the *care* bestowed on their *sublimation*, and the extent to which their *division* is carried, than to anything else.

Vermilion is a beautiful and permanent red pigment, and works and covers well both in oil and water.

VERTIGO. Dizziness and swimming of the head. In its more serious forms there is more or less mental confusion, the objects around the patient appear in motion, the ears are oppressed with strange sounds, and visual illusions are experienced, whether the eyes be closed or open, and in darkness as well as in the light. The *causes*, are fulness of the vessels of the head, nervous derangement, general debility, hæmorrhage, the use of narcotics, an overloaded stomach, and, in some cases, an empty one. It is also frequently symptomatic of fevers and in-

flammations, and of a condition threatening apoplexy. The *treatment* must be varied according to the cause, and the peculiar habit or condition of the patient.

VESICANTS. Syn. *Epispastics; Epispastica, Vesicantia.* Substances which vesicate or raise blisters. Among these are the *cantharis* or *blistering fly, mezereon, croton oil, boiling water, &c.;* the first only of which is now in common use in England.

"It is a principle sufficiently established with regard to the living system, that where a morbid action exists, it may often be removed by inducing an action of a different kind, in the same or a neighbouring part. On this principle is explained the utility of blisters in local inflammation and spasmodic action, and it regulates their application in pneumonia, gastritis, hepatitis, phrenitis, angina, rheumatism, colic, and spasmodic affections of the stomach; diseases in which they are employed with the most marked advantage. A similar principle exists with respect to pain; exciting one pain often relieves another. Hence blisters often give relief in toothache, and some other painful affections. Lastly, blisters, by their operation, communicate a stimulus to the whole system, and raise the vigour of the circulation. Hence, in part, their utility in fevers of the typhoid kind, though in such cases they are used with still more advantage to obviate or remove local inflammation." (*Med. Lex.*)

Blisters are *commonly prepared* with *cantharides plaster*, or with some other *preparation of cantharides;* and, in the former case, are usually lightly covered with the *powdered fly.* In order to *prevent* the *action* of the *cantharides* upon the mucous membrane of the *bladder*, blistering plasters are often sprinkled with a little *powdered camphor*, or better still, are moistened with camphorated ether, which leaves a thin layer of camphor. In all these cases the layer should not be too thick, for in that case the plaster would not take effect.

When it is not wished to maintain a discharge from the blistered part, it is sufficient to make a puncture in the vesicle, to let out the fluid; but when the case requires the *blister* to be "*kept open*," as it is called, the whole of the detached cuticle is carefully removed with a pair of scissors, and the part is dressed with either the *ointment of cantharides* or of *savine*, at first, more or less diluted with *lard* or *simple ointment*, with an occasional dressing of resin cerate. According to Mr. Crowther, the blistered surface is best kept clean, by daily fomentation with warm water.

Of late years, to obviate the unpleasant effects occasionally arising from the common blister, various compounds having cantharides for their base have been brought before the public. Among these the following may be noticed:—

1. Take of *cantharides*, in fine powder, 2 parts; *spermaceti*, 2 parts; *olive oil*, 4 parts; *white wax*, 8 parts; *water*, 10 parts; simmer, with constant agitation for 2 hours, strain through flannel, separate the plaster from the water, gently remelt it with *common turpentine*, 1 part, and spread the mass whilst still fluid. This nearly resembles the form recommended by MM. Henry and Guibourt.

2. (P. Cod.) Distil off the *ether* from a *concentrated ethereal tincture of cantharides*, melt the *oily residue* with twice its weight of *white wax*, and spread the mixture on *thin oiled silk*, or on *cloth* prepared with *wax plaster.*

3. (Oettinger.) *Cantharidal ether* (prepared from cantharides, 1 part; ether, 2 parts), and *sulphuric ether*, of each, 10 dr.; *turpentine* and *black resin*, of each, 2½ dr.; mix, dissolve, and apply it to the surface of *stretched silk* or *taffeta* which has been previously prepared with *two coatings of a solution of isinglass.*

Obs. The above compounds are spread on *leather, linen, paper, silk, oiled silk, taffeta, &c.*, and then form the numerous compounds vended under the names of—*Blistering tissue, Charta* (paper) *epispastica, Pannus* (cloth) *vesicatorius, Papier epispastique, Sparadrapum vesicatorium, Taffetas vesicans, Tela* (tissue) *vesicatoria, &c.*

Acetic extract of cantharides, croton oil, or *extract of mezereon*, is sometimes substituted for the ethereal extract ordered in the above formulæ.

The *Papier epispastique*, de Vée, is prepared of three strengths, which are respectively distinguished by the colours, *white, green*, and *red.* The *composition* is made by boiling *powdered cantharides*, for an hour with *water, lard*, and *green ointment*, or with *lard coloured with alkanet root*, adding *white wax* to the *strained fats*, and spreading the mixture whilst fluid;—No. 1, is made with 10 oz. of *cantharides*, to 4 lb of *lard;*—No. 2, of 1 lb of *cantharides*, to 8 lb of *green ointment;* and—No. 3, of 1½ lb of *flies*, to 8 lb of *reddened lard.* To each are added 2 lb of *white wax.*—(Dorvault.)

The *Magistral blister*, of M. Valleix, is a revival of the *vesicating epithem* noticed at *page* 377.

VESICATION. The *formation* of a *blis-*

ter is a vital process, and its success may be taken as a proof of the presence of life. Hence, a French physician, Dr. Mandl, has suggested such a stimulation of the skin as would ordinarily cause a blister as a test of life, in those cases of *long-continued trance* which we occasionally hear of, where all the functions of life seem to be extinct. Dr. Mandl's plan is to apply a *stick of lunar caustic*. The application of a little strong vinegar of cantharides or other *cantharidal blister* of the size of a sixpenny piece, or of two or three spoonfuls of *boiling water* by means of a bent tube of like diameter, is, however, more certain and satisfactory.

VESICATORINE. Syn. *Cantharidine*, *Cantharidina*, *Cantharides-camphor*. The blistering principle of Spanish flies, discovered by M. Robiquet.

Prep. 1. (P. Cod.) Exhaust *powdered cantharides* with *concentrated alcohol*, by percolation; distil off the *spirit* from the *filtered tincture*, and leave the residuum to deposit crystals; these may be purified by dissolving them in *boiling alcohol*, digestion with *animal charcoal*, filtration whilst hot, and crystallizing by refrigeration.

2. (Thierry.) Macerate *cantharides* (in coarse powder) for several days in *ether*, in a closed displacement apparatus; then, after the whole of the soluble matter has been extracted by the addition of fresh portions of ether, pour on sufficient *water* to displace the retained ether; next distil off the ether, dissolve the remaining extract in *boiling alcohol*, filter while hot, and abandon the filtrate to spontaneous evaporation. *Prod.* 0·5%.

3. Digest the *aqueous extract of cantharides* in *hot alcohol*, filter, evaporate to dryness, digest the *residuum* in *sulphuric ether*, evaporate, and slightly wash the resulting crystals with cold alcohol.

Prop., &c. Micaceous plates resembling spermaceti; fusible; vaporizable; insoluble in water; soluble in ether, oils, acetic acid, and hot alcohol; powerfully *vesicant* and *poisonous*. Its vapour, even at ordinary temperatures, frequently produces temporary blindness. The 1-100th part of a grain, placed on a piece of paper, and applied to the edge of the lower lip, caused small blisters in 15 minutes, which, when rubbed with a little simple cerate, extended over a large surface, and covered both lips with blisters. (Robiquet.)

VETCH. The common generic name of various leguminous plants with herbaceous stems, and (generally) twining tendrils. The *common vetch* (*vetches*, *tares*) is the *vicia sativa* (Linn.), now much cultivated as green fodder for milch cows and working stock. The *seeds* (tares) were formerly reputed detersive and astringent. Those of "the Canadian variety make good bread." (Lindley.)

VETERINARY MEDICINES. The common form of medicine for HORSES, is that popularly known as *horse balls*. They are usually *prepared* by mixing the *dry ingredients*, in the state of powder, with a sufficient quantity of *treacle*, or *syrup bottoms*, to give the mass a proper consistence for rolling into balls; adding, when necessary, *linseed meal*, or any other simple powder, to increase the bulk. The usual practice among the *farrier's druggists* is to keep a compound known in the trade as "*ball-mass*," or "*common mass*," ready prepared to give form and bulk to more active ingredients. This is usually made of about equal parts of *linseed meal* and *treacle*, together with a little *palm oil* or *lard*, thoroughly incorporated by kneading with the hands; and, it is kept in a cool situation, tied over to prevent it drying and hardening. For *use*, the ball-masses are either rolled or moulded into small cylinders of about 1½ to 1¾ *oz.* in *weight*; and in *size*, from 2 to 2¾ inches long, and from about ½ to ⅞th of an inch in diameter; and they are *wrapped* in soft paper which is administered with them. Those for DOGS are commonly formed into large boluses or nut-like pieces. The common practice, in some houses, of adding a little *salt of tartar* or *acetate of potash* to ball-masses kept in stock, for the purpose of preserving them in a soft state, is not to be commended; since these articles decompose many of the saline aud mineral compounds which are subsequently added to them.

Medicines for NEAT CATTLE are *always* administered in a liquid form, popularly called *drenches*, which are noticed at *page* 339. A similar plan is adopted with *small cattle*, as SHEEP and GOATS. For these, however, the quantity should seldom exceed ¼ pint. In all cases, *drenches* should be *very slowly* administered.

The *following* are a few *useful horse-balls:*—

Alterative Balls.—1. *Levigated sulphuret of antimony*, *sulphur*, and *linseed meal*, of each, 3 *oz.*; *nitre*, 4 *oz.*; *palm oil*, q. s. to form a mass; for 12 balls. One to be taken every day, or every other day.

2. (J. Bell & Co.) *Sulphuret of antimony*, *nitre*, *sulphur*, and *ethiop's mineral*, of each, 3 oz.; *soft soap*, 10 oz.; *oil of juniper*, ½ oz.; for 12 balls. As the last.

3. (White.) *Sulphuret of antimony*, *ca-*

raways, and *treacle*, of each, ½ oz.; for one ball. As the last.

Cordial Balls.—1. (Blaine.) *Coriander seed*, *caraway*, and *gentian*, of each, 8 oz.; *ginger*, 4 oz.; *oil of aniseed*, ½ oz.; *honey* or *palm oil*, q. s. to form a mass. Cordial, warming, and stomachic. *Dose.* 1½ oz.

2. (Hill.) *Anise*, *caraway*, and *cumin seed*, of each, 4 ℔; *ginger*, 2 ℔; *treacle*, q. s.; divide into 1¾ oz. balls. *Prod.* 21 ℔.

Cough Balls.—1. (Blaine.) *Ipecacuanha*, 1 dr.; *camphor*, 2 dr.; *honey*, q. s. to form a ball. One night and morning.

2. (B. Clarke.) *Emetic tartar* and *benzoin*, of each, 2 dr.; *squills*, 4 dr.; *spermaceti* and *balsam* of *copaiba*, of each, 1 oz.; *elecampane* and *sulphur*, of each, 2 oz.; *syrup of poppies*, q. s. to mix; for 8 balls. As the last.

Diuretic Balls.—1. (Bracy Clark.) *Nitre* and *common turpentine*, of each, 1 ℔; *Castile soap*, ½ ℔; *barley meal*, 2½ ℔, or q. s. For common-sized balls.

2. (Morton.) *Digitalis*, 1 oz.; *aloes*, 2 oz.; *liquorice*, 13 oz.; *honey* or *Barbadoes tar*, q. s. to mix; for 1 oz. balls. One, twice a day, with care.

Physic Balls, *Purging do.*, *Cathartic do.*—1. *Aloes* and *hard soap*, of each, 5 *oz.*; *salt of tartar*, and *cayenne pepper*, of each, 1 *oz.*; melt together. For 8 balls.

2. (Vet. Coll.)—*a.* (Common Physic ball.) *Aloes*, 8 oz.; *treacle*, 3 oz.; *olive oil*, 1 oz.; melted together. *Dose.* 1 to 1½ oz.

b. (Stronger ball.) To each dose of the last, add of *croton oil*, 4 to 8 drops.

Obs. The *dose* of the above, is 1 ball, fasting in the morning, preceded by a *bran mash*, on one or two successive nights, and followed by *gentle* exercise until the ball begins to operate.

Worm Balls.—1. *Barbadoes aloes*, 5 dr.; *calomel* and *ginger*, of each, 2 dr.; *oil of cloves*, 12 drops; *treacle*, q. s. for a ball.

2. (J. Bell & Co.) *Barbadoes aloes*, 5 to 8 dr.; *powdered tin*, *ethiop's mineral*, and *ginger*, of each, 2 dr.; *oils of aniseed* and *savine*, of each, 20 drops; *treacle*, q. s. for a ball.

3. (Clater.) *Sulphur* and *emetic tartar*, of each, 1 dr.; *linseed meal*, 4 dr.; *palm oil*, q. s. to form a ball. One every morning, having prepared the animal with a *physic ball* containing 1 dr. of *calomel*.

VINE. See *Grapes* and *Vinous Fermentation*.

VINEGAR. Syn. *Acetum*,—Lat. *Vinaigre*,—Fr. Dilute acetic acid, more or less contaminated with gum, sugar, and vegetable matter.

1. *Vinegar*, *Malt do.*, *British do.*; *Acetum* (Britannicum),—Ph. L. & E. This is the ordinary coloured vinegar consumed in this country, and is correctly described in the Ph. L. as "impure (dilute) acetic acid, prepared by fermentation from an infusion of malt (malt-wort)."

In the *manufacture* of *malt vinegar* a *mixture* of *malt* and *barley*, is mashed with *hot water*, and the resulting *wort* is fermented, as in the common process of brewing. The *liquor* is then run into barrels, placed endways, tied over with coarse canvass, and arranged side by side in darkened chambers, moderately heated by a stove, and freely supplied with air. Here it remains till the acetous fermentation is nearly complete, which usually occupies several weeks, or even months. The *newly formed vinegar* is next run off into two large tuns, furnished with false bottoms, on which some "*rape*" (the pressed cake from making domestic wines, or the green twigs or cuttings of vines,) is placed. One of these vessels is wholly, and the other only about 3-4ths filled. The fermentation recommences and the *acetification* proceeds more rapidly in the latter than in the former tun, and the liquor it contains consequently matures the sooner. When fit for sale, a portion of the vinegar is withdrawn from the smaller quantity, and its place supplied with a like quantity from the full tun, and this in its turn is refilled from the barrels before noticed. This process is carried on with a number of tuns at once, which are all worked in pairs.

Formerly, *malt vinegar* was wholly made by placing the wort in casks, loosely covering the bung-holes with tiles, and exposing them to the joint action of sun and air for several months, or until the acetification was complete.

Prop., &c. The general *properties* of *malt vinegar* are well known. Its pleasant and refreshing odour is chiefly derived from acetic acid and acetic ether. Its strength is distinguished by the makers as Nos. 18, 20, 22, and 24; the last of which, also called "*proof vinegar*," is the strongest, and usually contains about 4·6% of *real*, or about 5% of *glacial acetic acid*. Its density varies according to the quantity of foreign matter which it contains. Sp. gr. 1·006 to 1·019,—Ph. E.; 1·019,—Ph. L.; 1·0135 to 1·0251,—Thomson. This vinegar usually contains a small quantity of sulphuric acid. The presence of 1-1000th part of this acid is allowed by law.

Pur. "Brownish; of a peculiar odour. Its sp. gr. is 1·019. 1 fl. oz. of the acid is

saturated by 1 dr. of the crystals of carbonate of soda. If, after 10 minims of solution of chloride of barium have been added to the same quantity, more of the chloride be poured into the filtered acid, nothing further is thrown down. The colour is not changed by the addition of hydrosulphuric acid." (Ph. L.) "Solution of chloride of barium being added to 1 fl. oz. of this vinegar, the precipitated sulphate of baryta does not exceed in weight 1·14 gr." (Ph. L. 1836.)

2. *Wine Vinegar, French do.; Vinaigre d'Orleans; Acetum Gallicum,*—Ph. E. & D. *Acetum Vini,*—Ph. D. 1826. This is prepared, in wine countries, from *grape-juice* and *inferior new wines*, worked up with wine-lees, by a nearly similar process to that adopted for malt vinegar. That prepared from white wine (*white wine vinegar*) is the most esteemed. It is purer and pleasanter than malt vinegar. Sp. gr. 1·014 to 1·022, —Ph. E.; 1·016,—Phillips. It usually contains from 5 to 6% of acetic acid. "100 parts of *good Orleans vinegar* should require 10 parts of *dry carbonate of potassa* for saturation." (Soubeiran.)

3. *German*, or *Quick-method of making Vinegar; Process of Ham.* This method is based upon the fact, that acetification is the mere oxidation of alcohol in contact with organic matter. Hence, by employing dilute alcohol, or liquors containing it, and by vastly enlarging the surface of the liquid exposed to the air, at a proper temperature, we may reduce the period occupied in acetification from weeks to as many hours. In *practice* this is *effected* by causing the *dilute spirit* previously mixed with 1-1000th part of *sugar* or *malt extract*, or the *fermented* and *clarified malt-wort*, to *slowly trickle* down through a *mass* of *beech shavings* steeped in *vinegar*, and contained in a vessel called a *vinegar generator* (essigbilder), or *graduation vessel.* This is an *oaken tub*, narrower at the bottom than at the top, furnished with a *loose lid* or *cover*, below which is a *perforated shelf* (colander or false bottom), having a number of small holes, which are loosely filled with *packthread* about 6 inches long, and prevented from falling through by a knot at the upper end. The *shelf* is also perforated with four *open glass tubes*, as air vents, each having its ends projecting above and below the shelf. This arrangement is repeated a *second*, and a *third* time, or even oftener, according to the size of the vessel. The *tub* or *graduator* at its lower part is pierced with a horizontal row of eight equidistant round holes, to admit atmospheric air. One inch above the bottom is a *syphon-formed discharge pipe*, whose upper curvature stands one inch below the level of the air-holes in the side of the tub. The *floors* or *partitions* of the *tub* or *generator* being covered with *birch twigs* or *beech chips* to the depth of a few inches, the *alcoholic liquor* (first heated to between 75° and 83° Fahr.) is introduced at the upper part of the apparatus. This immediately commences trickling slowly down through the holes by means of the packthreads, diffuses itself over the chips or twigs forming the respective strata, slowly collects at the bottom of the tub, and then runs off by the syphon pipe. The air enters by the circumferential holes, circulates freely through the tub, and escapes by the glass tubes. As the acetification proceeds, the temperature of the liquid rises to 100° or 105° Fahr., and remains stationary at that point while the action goes on favorably. The *alcoholic solution* or *wort* requires to be passed three or four times through the cask before acetification is complete, which is, in general, effected in from 24 to 36 hours.

Obs. For the *production* of a *superior vinegar* by this process, it is necessary that the *spirit* employed be sufficiently pure not to contaminate the product with its flavour or odour; and that the *malt-wort* should be fermented and treated with all the care usually employed in the production of beer. Messrs. Evans, Hill, & Co., who now produce the purest, finest flavoured, and best-keeping vinegars of any English manufacturers, are in the habit of *filtering* or *clarifying* their *fermented wash*, and also of *storing* it away for several months ere they subject it to *acetification* in the *graduator.* The most *favorable temperature* for the process is about 90° Fahr., and this should be preserved, as much as possible, by artificial means. *Prod.* A *malt-wort* of the sp. gr. 1·072, or "in technical language, weighing about 26 *lb.* per barrel, afforded a *vinegar* containing 5·4% of *pure acetic acid*, and a *residuary extract* of 10 *lb.* from 36 gall. The *former* of these would indicate 35 *lb.* of *sugar*, or 13·7 *lb.* per barrel of gravity; whilst the *latter* shows 3·8 *lb.* per barrel; the two united being only 17·5 *lb.*, instead of 26, the original weight. The loss, therefore, has been 8·5 *lb.*, or from a sp. gr. of 1·072 to less than 1·050." (Ure.) Thus, about one-third of all the extractive matter of the malt is lost or dissipated during the processes of fermentation and acetification. According to Knopp, a mixture of about 80 gall. of *water*, 9 gall. of *spirit* of from 44 to 45% Tralles (18 or 20 u. p.), and 3 gall. of *vinegar* containing 3·5% of real acid, forming together 92 gall., yield, on an

average, an almost equal quantity of vinegar, or about from 90 to 91 gall. of the above-stated strength.

4. *Wood Vinegar.* See *Pyroligneous Acid.*

5. *Other Varieties of Vinegar*, of minor importance; chiefly domestic, and commonly "worked" as malt vinegar.—*Ale Vinegar, alegar; acetum cerevisiæ.* From strong pale ale, which has soured.—*Argol Vinegar; acetum ex tartaro.* From white argol or cream of tartar, 1 *lb.*; dissolved in boiling water, 2 gall.; with the addition, when cold, of proof spirit or whiskey, 3 pints.—*Crystal Vinegar.* Pickling vinegar decoloured with fresh burnt animal charcoal.—*Cyder Vinegar.* From cyder, worked as malt vinegar.—*German household Vinegar.* From soft water, 7½ gall.; honey or brown sugar, 2 *lb.*; cream of tartar, 2 *oz.*; *corn spirit* or whiskey, 1 gall.—*Gooseberry Vinegar.* From bruised gooseberries and brown sugar, of each, 1¼ *lb.*; water, 1 gall. *Other fruits* may be substituted for gooseberries.—*Pickling Vinegar.* The strongest pale malt-vinegar.—*Raisin Vinegar.* From the marc left from making raisin wine, 1 cwt. to every 12 or 15 gall. of water, along with a little yeast.—*Sugar Vinegar.* From brown sugar, 4 *lb.* to each gallon of water.—*Whiskey Vinegar.* From whiskey, 1 pint; *sugar*, 2 *oz.*; yeast, a dessert-spoonful.

Pur., Tests, & Assay. These are, for the most part, rather fully noticed under *Acetic acid, Acetimetry, Pyroligneous acid*, and *above.* The following additional *tests, &c.*, may, however, be useful:—1. Paper written on, or smeared with *pure vinegar*, is *not charred* when strongly warmed before the fire; if it is, the sample examined contains fully 2% of OIL OF VITRIOL.—2. A small porcelain capsule, or china cup, dipped into a solution of sugar in 30 times its weight of water, and then heated to a temperature equal to that of boiling water, is *not* materially *discoloured* when a drop of pure vinegar is poured on it; but a spot of an *intensely brown* or *black colour* is formed if the sample contain only 1-300th part of SULPHURIC ACID; if it contains only 1-1000th part, the spot is *olive green*; and if a less quantity, then only of a *pale green colour.*—3. The heavy white precipitate given with chloride of barium (see *above*) shows the presence of *oil of vitriol*; each grain after being dried, and gently ignited, represents 0·344 gr. of DRY SULPHURIC ACID. If the precipitate from 1000 gr. of the vinegar exceeds 2½ gr., it contains an illegal quantity of this acid.—4. If a solution of nitrate of silver gives a *cloudy white precipitate*, HYDROCHLORIC ACID (*spirit of salt*) is present.—5. If, after the addition of 2 or 3 gr. of carbonate of potash, and evaporation of the sample to dryness, the residuum *deflagrates* when ignited, the sample under examination contains NITRIC ACID (*aquafortis*).—6. If the vinegar be *blackened* by sulphuretted hydrogen or hydrosulphuret of ammonia, it contains either *lead* or *copper.* If it gives a *yellow precipitate* with iodide of potassium or chromate of potash, the metal is LEAD. If ferrocyanide of potassium gives a *bronze-brown* coloured precipitate, or a little olive oil when agitated with some of the vinegar be turned *green*, the metal is COPPER.—7. If a small sample gently evaporated to dryness leaves more than 1% of residuum, and this has a sweet taste, it is UNDECOMPOSED SUGAR.—8. The presence of ACRID SUBSTANCES, as *capsicum, chillies, grains of paradise, mustard-seed, pellitory of Spain, pepper, &c.*, may be detected by neutralizing the acidity of the vinegar with carbonate of soda, when the acrid taste of the adulterant will be readily perceived.

VINEGAR (Aromatic). Syn. *Acetum Aromaticum*,—Lat. *Prep.* 1. *Glacial acetic acid*, 1 *lb.*; *oil of cloves*, 1½ dr.; *oil of rosemary*, 1 dr.; *oils of bergamot, cinnamon, pimento*, and *lavender*, of each, ½ dr.; *neroli*, 20 drops; *camphor*, 2½ *oz.*; *rectified spirit*, 2 fl. oz.; mix. Very fine.

2. (P. Cod.) *Camphor*, 2 oz.; *oil of lavender*, 10 gr.; *oil of cinnamon*, 20 gr.; *oil of cloves*, 30 gr.; *concentrated acetic acid*, 1 pint.

3. (*Henry's.*) From *glacial acetic acid* strongly scented with the *oils of cloves, lavender, rosemary*, and *calamus aromaticus*, to which the usual quantity of *camphor* is added. This is the formula adopted at *Apothecaries' Hall.*

4. (*Extemporaneous.*) From *acetate of potash* (dry), 1 dr.; *oil of vitriol*, 20 drops; *oils of lemon* and *cloves*, of each, 3 drops.

Obs. Aromatic vinegar is used as a pungent and refreshing perfume, in faintness, &c. For this purpose it is generally dropped on a small piece of sponge placed in a stoppered bottle or a vinaigrette. It is highly corrosive, and should therefore be kept from contact with the skin and clothes. (See *p.* 11-12.)

VINEGAR (Camp.) *Prep.* Take of *sliced garlic*, 8 *oz.*; *Cayenne pepper, soy*, and *walnut ketchup*, of each, 4 *oz.*; 36 *chopped anchovies*; *vinegar*, 1 gall.; *powdered cochineal*, ½ *oz.*; macerate for a month, strain, and bottle.

VINEGAR (Camphorated). See *page* 12.

VINEGAR (Cantharides). Syn. *Blister-*

ing Vinegar; Acetum Cantharidis,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Cantharides*, in powder, 2 oz.; *acetic acid*, 1 pint; macerate, with agitation, for 8 days, then press, and strain.

2. (Ph. E.) *Cantharides*, 3 oz.; *euphorbium*, ½ oz.; *acetic acid*, 5 fl. oz.; *pyroligneous acid*, 15 fl. oz.; macerate a week.

3. (Ph. D.) *Spanish flies*, 4 *oz.; strong acetic acid*, 4 fl. oz.; *commercial acetic acid* (sp. gr. 1·044), 16 fl. oz.; macerate, as before, for 14 days.

Uses, &c. As a counter-irritant, and to raise blisters. For the last purpose, it is applied on a piece of lint, evaporation being prevented with a piece of oiled silk or thin sheet gutta percha. The last is the best, and, indeed, the only effective form; the others being too weak. "If the acetic acid be strong, a blister will be as rapidly raised *without* the cantharides as with them." (Dr. A. T. Thomson.)

VINEGAR (Currie). *Prep.* From *currie powder*, ½ *lb.; vinegar*, 1 gall.; infuse for a week. *Used* as a flavouring. Other *like vinegar* may be made in the same way.

VINEGAR (Colchicum). Syn. *Acetum Colchici*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Dried corms of colchicum* or *meadow saffron*, 3½ dr.; *dilute acetic acid*, 1 pint; macerate for 3 days, then press out the liquor, and after defecation, add to the strained liquid, *proof spirit*, 1½ fl. oz.

2. (Ph. E.) *Fresh colchicum bulbs* (dried), 1 oz.; *distilled vinegar*, 16 fl. oz.; *proof spirit*, 1 fl. oz.

3. (Ph. D.) *Dried colchicum bulbs*, 1 *oz.; acetic acid* (1·044), 4 fl. oz.; *distilled water*, 12 fl. oz.; as before, but prolonging the maceration for 7 days.

Obs. Vinegar of colchicum is chiefly used in gout. *Dose.* 20 drops to 1 fl. dr. The Dublin preparation is about *three times as strong* as the others, and the dose must therefore be proportionately less.

VINEGAR (Distilled). Syn. *Acetum Destillatum*,—Ph. L. & E., & Ph. D. 1826. *Prep.* 1. (Ph. L.) *Vinegar*, 1 gall.; distil in a sand bath, 7 pints. Sp. gr. 1·0065.

2. (Ph. E.) *Vinegar* (preferably French), 8 parts; distil over with a gentle heat, 7 parts; and dilute the product, if necessary, with *distilled water*, until the sp. gr. is 1·005.

Pur., &c. "1 fl. oz. is saturated by 57 gr. of crystallized carbonate of soda." (Ph. L.) 100 gr. are saturated by 13 gr. of crystallized carbonate of soda. It contains about 4·6% of real acetic acid. If a pewter worm is used, a portion of lead is dissolved, and the product becomes cloudy and poisonous. *Distilled vinegar* is more agreeable than pure dilute acetic acid of the same strength.

VINEGAR (Marseilles). Syn. *Vinegar of the Four Thieves, Prophylactic Vinegar; Acetum Prophylacticum, A. Antisepticum, A. Theriacale, A. Quatuor Furum*,—Lat. *Vinaigre des Quatre Voleurs*,—Fr. *Prep.* Take of the *summits of rosemary* and *flowers of sage* (dried), of each, 4 oz.; *dried lavender flowers*, 2 oz.; *cloves*, 1 dr.; *distilled vinegar*, 1 gall.; digest for 7 days, press, and filter. *Used* as a corrector of bad smells, and formerly as a prophylactic against the plague, and other contagious diseases. It is said to have been a favorite preventive with Cardinal Wolsey, who always carried some with him. The *original formula* also contained of *garlic*, ¼ oz.; *fresh rue*, 1½ oz.; and *camphor* dissolved in spirit, 1 oz.

VINEGAR (Opium). Syn. *Acetum Opii*,—Ph. E. & D. *Prep.* 1. (Ph. E.) *Opium*, sliced, 4 oz.; *distilled vinegar*, 16 fl. oz.; macerate for 7 days, press, and filter. *Dose.* 5 to 20 drops.

2. (Ph. D.) *Opium*, in coarse powder, 1½ *oz.; dilute acetic acid*, 1 pint; macerate for 7 days. *Dose.* 10 or 12 to 60 drops.

Obs. These were intended to supersede the old "*black drop*," which they closely resemble in their action.

VINEGAR (Raspberry). Syn. *Acetum Rubi Idæi*,—Lat. *Vinaigre Framboise*,—Fr. *Prep.* 1. *Bruised ripe raspberries* and *white wine vinegar*, of each, 3 pints; macerate for 3 days, press, strain, and to each pint add of *white sugar*, 1 *lb.;* boil, skim, cool, and at once bottle. Some persons add 2 fl. oz. of *brandy* to each pint.

2. (P. Cod.) *Fresh raspberries*, picked from their calices, 3 ℔ (1 ℔,—Ph. Bor.); *good vinegar*, 2 ℔; macerate, in glass, for a fortnight, then strain without pressure.

Obs. In a similar manner may be made *cherry vinegar, strawberry do.*, and the *vinegars* of *all other like fruits.*

VINEGAR (Squill). Syn. *Acetum Scillæ*,—Ph. L. E. & D. *Acetum Scilliticum*,—Ph. L. 1746. *Prep.* 1. (Ph. L.) Take of *squills*, recently dried and bruised, 2½ oz.; *dilute acetic acid*, 1 pint; macerate with a gentle heat, in a covered vessel, for 3 days, then press out the liquor, and, after defecation, add to the strained liquid, *proof spirit*, 1½ fl. oz. The Edinburgh & Dublin Colleges direct cold maceration for 7 days in a glass vessel; and the Dublin *omits* the spirit.

2. (*Wholesale.*) From *squills*, 7 *lb.; distilled vinegar*, 6 gall.; macerate in the cold for 10 days, press, and filter. Expectorant and diuretic. *Dose.* ½ to 1½ fl. dr.; in chronic pulmonary affections, dropsies, &c.

VINEGARS (Culinary). *Prep.* 1.—*Black Pepper Vinegar,—Caper do.,—Capsicum do.,—Celery-seed do.,—Chillie do.,—Cress-seed do.,—Garlic do.,—Ginger do.,—Horse-radish do.,—Onion do.,—Red rose do.,—Seville-orange Peel do.,—Shallot do.,—Truffle do.,—White Pepper do.,*—with several others of a like kind, are made by steeping about an *oz.* of the *respective articles* in a *pint* of *good vinegar* for 14 days, and straining.

2. *Basil Vinegar,—Burnet do.,—Celery do.,— Cherville do.,— Elder-flower do.,— Green-mint do.,— Tarragon do.,* — with several others from like substances, are prepared from 2 to 3 *oz.* of the *leaves* to each pint of *vinegar;* the whole being frequently shaken for 14 days, then strained and bottled. They are used in cookery. The *culinary vinegars* may also be prepared in the same manner as the "*culinary spirits*" and "*tinctures,*" by simply substituting strong *pickling vinegar* for the spirit.

VINEGARS (Perfumed). Syn. *Aceta Odorifera,*—Lat. *Prep.* From the *dried flowers,* 1 to 2 *oz.;* or, the *fresh flowers,* 2 to 4 *oz.; strongest distilled vinegar,* 1 pint; digest for a week, strain with pressure, and repeat the process with *fresh flowers,* if necessary. They may also be made by adding 15 to 20 drops, or q. s. of the respective *essential oils* to the *vinegar.* In a similar way are *prepared* the *vinegars* of—*Clove-gilly flowers, elder-flowers, lavender do.* (vinaigre distillé de lavande), *musk roses, orange-flowers* (fresh), *Provins roses, red-roses* (vinaigre de rose; acetum rosatum), *rosemary flowers* (vinaigre de rosmarin; acetum anthosatum), *tarragon flowers, &c., &c. Another excellent plan is to add* 1 fl. oz. of *glacial acetic acid* to each pint of the *respective perfumed spirits.* This answers admirably for *acetic eau de Cologne* and like perfumes.

VINOUS FERMENTATION. Syn. *Alcoholic Fermentation.* The peculiar change by which *sugar,* in solution, is converted into *carbonic acid,* which is eliminated, and into *alcohol,* which remains in solution in the fermented liquor.

The *presence* of a *ferment* is essential to excite the vinous fermentation; as a solution of absolutely pure sugar remains unaltered, even though exposed to the conditions most favorable to its accession. In the *juices* of the *sweet fruits,* and in those *vegetable solutions* that *spontaneously* run into a state of fermentation, the *ferment* is supplied by nature, and is intimately associated with the saccharine matter. In the juice of those grapes which produce the more perfect wines, the relative proportions of the exciters of fermentation and the sugar, are so accurately apportioned, that the whole of the *former* are decomposed, and nearly the whole of the *latter* is converted into *alcohol;* so that the liquid (*wine*) is left in a state but little liable to future change. An *infusion of malt,* however, in which the nitrogenized matters (*gluten, gliadine, vegetable albumen, &c.*) are absent, or at least present in too small quantities to vigorously excite the vinous fermentation, undergoes a mixed species of decomposition with the production of products widely different from those that result from the *true* vinous fermentation; or, in other words, the liquid becomes *spoiled.* But if a *ferment* (yeast) be added to this infusion of malt under the above circumstances, and in the proper proportion to the sugar present, the true vinous fermentation speedily commences, and the liquid becomes converted into *beer.* This is what actually takes place in the process of brewing, and the scientific brewer endeavours to employ a proper quantity of ferment to decompose the whole of the saccharine matter of his wort; but, at the same time, as equally endeavours to avoid the use ofan *excess.*

The *chief product* of the *vinous fermentation* is *alcohol,* but there are other substances simultaneously produced, and which remain associated with the fermented liquor. Among the principal of these are *œnanthic acid, œnanthic ether, fusel oil,* (oil of potato spirit, oil of grain,) *&c.;* none of which exist previously to fermentation, and are generally supposed to result from the action of the nitrogenized matters of the solution on the sugar. Under certain circumstances these extraneous products are formed in much larger quantities than under others, and as these substances injure the value of the alcohol with which they are associated, a knowledge of the peculiar circumstances favorable and unfavorable to their production, is a desideratum to the brewer and distiller.

According to MM. Colin and Thénard, Frémy, Rousseau, and others, the essential condition of a *ferment,* to be able to excite the pure vinous fermentation, is to be *sufficiently acidulous* to act on coloured test paper; and this acidity should arise from the presence of certain vegetable acids and salts, capable of conversion into carbonic acid and carbonates by their spontaneous decomposition. Those acids and salts which are found to pre-exist in fermentable fruits and liquors, as the tartaric, citric, malic, and lactic acids, and their salts,

should be chosen for this purpose; preference being given to the *bitartrate of potassa*, on account of its presence in the grape. The addition of any of these substances to a saccharine solution renders its fermentation both more active and complete. The favorable influence of cream of tartar on fermentation was first pointed out by Thénard and Colin, and the addition of a little of this article has been adopted in practice, with manifest advantage, by the manufacturers of British wine. When the acidity caused by these acids, or their acidulous salts, in a ferment, is considerable, the animal and mineral poisons, the essential oils, and various other substances, cease to modify the fermentation; while, at the same time, the resulting alcohol is obtained in a purer state, as the extraneous products which we have just mentioned, are either not formed at all, or only in small and unimportant quantities. The contrary takes place when the ferment is rendered neutral by washing it with water, or, when, owing to partial spontaneous decomposition, it exercises an *alkaline reaction* on test paper. It then *ceases* to *excite* the *alcoholic fermentation* in solutions of cane-sugar, and instead thereof, induces the development of *lactine* (sugar of milk), *lactic acid*, *&c.*: in this respect exercising a similar action on solutions of sugar to that of caseine, diastase, and animal membrane.

There is good reason for supposing that *each variety of sugar* which is susceptible of the alcoholic fermentation, is first converted into *grape* sugar, by contact with the ferment, and that this variety of sugar, is alone capable of yielding carbonic acid and alcohol. (Liebig.) During this conversion of *grape sugar*, it is presumed that one of its atoms, (represented, in the crystallized state, by C_{12} H_{14} O_{14}), *loses* two atoms of water, and yields (according to theory) 44·84% of *carbonic acid*, 47·12% (49·38, Thénard,) of *alcohol*, and 9·04% of *water*, which nearly agrees with the experiments of Guerin-Varry. According to Gay-Lussac, 45 *lb.* of *sugar* are converted into 23 *lb.* of *alcohol*, and 22 *lb.* of *carbonic acid*. This explanation will be simplified by reference to the following diagram:—

4 atoms of *carbonic acid*	=	C_4	.	O_8
2 „ *alcohol*	=	C_8	H_{12}	O_4
1 „ *grape sugar*, dried at 212°	=	C_{12}	H_{12}	O_{12}

From the above it will be readily seen, that by a new grouping of the elements of grape-sugar, alcohol and carbonic acid are produced, without the elements of the body which excites the fermentation taking any part in the conversion.

The circumstances most favorable to this fermentation, are—*a certain degree of warmth—a sufficient quantity of active ferment*, and its *due distribution through the liquor*. The temperature of from 68° to 77° Fahr. is usually regarded as the most propitious for the commencement and progress of fermentation; but it has been ably shown by Liebig, that, at this temperature, the newly formed alcohol slowly undergoes the acetous fermentation, forming *vinegar*, by which the vinous character of the liquor is lessened. This conversion of alcohol into vinegar proceeds most rapidly at a temperature of 95° Fahr., and gradually becomes more languid, until, at about 46° to 50° Fahr. (8 to 10 Cent.), it ceases altogether, while the tendency of the nitrogenous substances to absorb oxygen at this low temperature is scarcely diminished in a perceptible degree. "It is therefore evident, that if wort (or any other saccharine solution), is fermented in wide, open, shallow vessels, as is done in Bavaria, which afford free and unlimited access to the atmospheric oxygen, and this in a situation where the temperature does not exceed 46° to 50° Fahr., a separation of the nitrogenous constituents, *i. e.*, the *exciters of acidification*, takes place simultaneously on the surface, and within the whole body of the liquid." (Liebig.) By this method wine or beer is obtained, which is invariably far superior in quality to that fermented in the usual manner.

The *symptoms* of a *perfect fermentation* of *malt wort*, according to the usual English system with top yeast (*oberhefe*), have been thus described by a well-known practical writer on brewing.—1. A *cream-like substance* forms round the edges of the *gyle tun*, which gradually extends itself, and ultimately covers the whole surface of the liquor.—2. A fine *curly*, or *cauliflower-head*, in a similar way extends itself over the surface, and indicates to the experienced brewer the probable quality of the fermentation.—3. The "*stomach*," or *vinous odour*, is next evolved, and continues to increase with the attenuation of the wort. The peculiar nature of this odour is also an indication of the state of the fermentation.—4. The *cauliflower-head* changes, or rises to a fine "*rocky*" or "*yeasty*" *head*, and ultimately falls down.—5. In this stage the head assumes a peculiar *yeasty appearance*, called by brewers "*close-yeasty*," and the gas is evolved in sufficient quantity to blow up little "*bells*" or "*bladders*," which imme-

diately burst, and are followed by others, at intervals depending on the activity and forwardness of the fermentation. These *bells* should be bright and clear; as, if they appear opaque or dirty, there is something the matter with the wort. (Black.)

It is *often* of the *utmost importance* to *brewers, wine-merchants, sugar-refiners, druggists, &c.*, to be able to *lessen* the *activity* of the *vinous fermentation*, or to *stop it altogether*, or to *prevent its accession* to *syrups* and other *saccharine* and *vegetable solutions*. Whatever will still the motion of the molecules of the nitrogenous matter forming the ferment will render them inoperative as exciters of fermentation. Among the simplest means of effecting this object, and such as admit of easy practical application, may be mentioned *exposure* to either *cold* or *heat*. At a temperature below about 50° Fahr., the *acetous fermentation* is suspended, and the *alcoholic fermentation* proceeds with diminished activity as the temperature falls, until at about 38° Fahr. it ceases altogether. In like manner, the *rapid increase of the temperature* of a *fermenting liquid* arrests its fermentation, and is preferable to the action of cold, as it is of easier application, and perfectly precipitates the ferment in an inert state. For this purpose, a heat of about 180° Fahr. is sufficient; but even that of *boiling water* may be employed with advantage. In *practice*, fluids are commonly raised to their boiling point for this purpose, or they are submitted to the heat of a water bath (207½° Fahr.) In this way the fermentation of *syrups* and *vegetable solutions* and *juices* is commonly arrested in the pharmaceutical laboratory.

Among *substances* that may be added to *liquids* to *arrest fermentation*, the most active are—the *volatile oil of mustard*, *coarsely powdered mustard seed* or *pure flour of mustard*, *sulphurous acid* or the *fumes of burning sulphur*, *sulphuric acid*, *sulphite of lime*, *tincture of catechu*, *strong spirit*, *strong acetic acid*, *chlorate of potassa*, *sugar of milk*, *bruised horseradish*, *garlic*, and *cloves*, and their *essential oils*, and all the *other volatile oils* that contain *sulphur*, and *most of the salts* that *readily part with their oxygen*. These substances arrest fermentation by rendering the *yeast inoperative;* and they possess this power nearly in the order in which they stand above. In practice, *mustard*, the *fumes of burning sulphur*, *sulphite of lime*, and *chlorate of potassa*, are those most adapted for *beer*, *cider*, *wines*, *syrups*, *&c.;* but some of the others are occasionally used, though less active. For arresting or preventing the fermentation of the vegetable juices and solutions, and the *medicated syrups* employed in pharmacy, *mustard seed*, either alone, or combined with a *little bruised cloves*, may be safely used, as the addition of acids or salts would lead to the decomposition of their active principles. For this reason such liquids should be kept in a sufficiently low temperature to prevent fermentation, and should they pass into that state, it should be preferably arrested by the application of heat or cold, as above explained. *Sugar of milk* is also very effective for certain syrups, if not all of them.

To *prevent*, or rather to *lessen* the *production* of *fusel oil*, it has been proposed to add a certain quantity of *tartaric acid* or *bitartrate of potassa* to the *wort;* or, to *arrest* the *fermentative process* somewhat before the liquid has reached its *utmost degree of attenuation*. The best means of *depriving* the *spirit* of this and other substances of a similar nature, is to largely dilute it with water, and to redistil it at a gentle heat. *Agitation* with *olive oil*, *decantation*, *dilution* with a large quantity of *water*, and *redistillation*, have also been recommended. An *excellent method* is *filtration* through *newly burnt* and *coarsely powdered charcoal*. This plan succeeds perfectly with moderately diluted spirit. On the Continent, the addition of about 1% of *common vinegar*, and a *very little sulphuric acid*, followed by agitation, repose for a few days, and redistillation, is a favorite method. A *solution of chloride of lime* is also employed for the same purpose, and in the same way. In both these cases a species of ether is formed, which possesses a very agreeable odour. In the *first*, acetate of oxide of amyle (*essence of Jargonelle*) is produced; and in the other, *chloride of amyle*, which also possesses a pleasant ethereal smell and taste. The affinity of the hydrated oxide of amyle (*fuselöl*) for acetic acid is so great, that they readily unite without the intervention of a mineral acid. (Doebereiner.) Thus, the oil of vitriol mentioned above, though always used in practice, might be omitted without any disadvantage.

According to Messrs. Bowerbank, the distillers, quoted by Dr. Pereira, 500 gall. of *corn-spirit* yield about one gall. of *corn-spirit oil*. See *Acetification*, *Alcohol*, *Brewing*, *Distillation*, *Fermentation*, *Fusel Oil*, *Spirit*, *Vinegar*, *Viscous Fermentation*, *Yeast*, *&c.*

VIOLET. Syn. *Purple Violet*, *Sweet do.;* *Viola*,—Ph. L. & E. "The *recent petals* of *viola odorata*, Linn," (Ph. L.) It is

chiefly used on account of its colour. See *Syrups*.

VIOLET DYE. Violet, like purple, is produced by a mixture of *red* and *blue* colouring matter, applied either together, or in succession. A *good violet* may be given to SILK or WOOL by passing it first through a *solution of verdigris*, then through a *decoction of logwood*, and, lastly, through *alum water*. A *fast violet* may be given by first dying the goods a *crimson* with *cochineal*, without alum or tartar, and, after rinsing, passing them through the *indigo vat*.—LINENS and COTTONS are first *galled* with about 18% of *gall-nuts*, next passed through a *mixed mordant* of *alum*, *iron liquor*, and *sulphate of copper*, working them well, then through a *madder bath* made with an equal weight of root, and, lastly, *brightened* with soap or soda. *Another good method* is to pass cloth, previously dyed *Turkey red*, through the *blue vat*. WOOL, SILK, COTTON, or LINEN *mordanted* with *alum* and *dyed* in a *logwood bath*, or a *mixed bath* of *archil* and *Brazil*, takes a pretty, but false violet.

VIOLINE. Syn. *Violina; Emetique Indigène*. A white, pulverulent, bitter, acrid substance extracted from the *roots*, *leaves*, *flowers*, and *seeds*, of the *viola odorata*. It is soluble in alcohol, sparingly soluble in water, and insoluble in ether. Its operation resembles that of emetine, for which it was at first mistaken.

VIRGINEIC ACID. The name applied by Quevenne to one of the acid principles contained in the *root* of *polygala senega* (Linn.), or *rattle-snake root*.

VISCOUS FERMENTATION. Syn. *Mucilaginous Fermentation*, *Mucous do*. The peculiar change by which sugar, in solution, is converted into gummy matters, and other products, instead of into alcohol.

When the *expressed juice of the beet* is exposed to a temperature of 90° to 100° Fahr., for a considerable time, the sugar it contains suffers this peculiar kind of fermentation. Gases are evolved which are rich in hydrogen, instead of being exclusively carbonic acid, and when the sugar has, for the most part, disappeared, mere traces of alcohol are found in the liquid, but, in place of that substance, a quantity of lactic acid, mannite, and a *mucilaginous substance* resembling gum-Arabic, and said to be identical with gum in composition. By boiling *yeast* or the *gluten of wheat* in *water*, dissolving sugar in the filtered solution, and exposing it to a tolerably high temperature, the viscous fermentation is set up, and a large quantity of the gummy principle generated, along with a *ferment* of a globular texture, like that of yeast, but which is capable of producing *only* the viscous fermentation in saccharine solutions.

The peculiar cloudy, stringy, oily appearance of wine and beer, called by the French "*graisse*," and the English "*ropiness*," depends on the accession of the viscous fermentation. The mineral acids and astringent substances, especially the *sulphuric* and *sulphurous acids*, and *tannin*, precipitate the viscous ferment, and are, hence, the best cures for this malady of fermented liquors. It is the large amount of tannic acid in the red wines and well-hopped beer, which is the cause of their never being attacked with "*graisse*" or "*ropiness*." See *Wines* (and *above*).

VISION. The following means of *preserving* and *restoring* the sight, which has been going the round of the periodical press, being really based upon scientific principles, may be appropriately inserted here:—

For *Near-sightedness*.—Close the eyes and press the fingers *very gently*, from the nose *outward*, across the eyes. This flattens the pupil, and thus lengthens or extends the angle of vision. This should be done several times a day, or at least always after washing the face, until short-sightedness is overcome.

For *Loss of Sight* by *Age*, such as require magnifying glasses, pass the fingers or towel from the *outer corner* of the eyes *inwardly*, above and below the eye-balls, pressing *very gently* against them. This rounds them up, and preserves or restores the sight.

It is *said* that many persons, by this last means, have preserved their sight so as to read fine print at 80 years of age; others, whose sight had been impaired by age, by carefully manipulating the eyes with their fingers, from their external angles inwardly, have restored their sight, and been able to dispense with glasses, and have since preserved it by a continuance of the practice. To be successful, or safe, these practices must be applied with great gentleness and caution. Many persons seriously damage their eyes by forcibly rubbing them when drowsy, especially on awaking in the morning.

The *Lancet* remarks, that "there is good reason to believe that *chicory* (the *coffee* of the Londoners), from its narcotic character, exerts an injurious effect on the nervous system. So convinced of this is Professor Beer, of Vienna, a most celebrated German oculist, that he has enumerated *chicoried-coffee* among the causes of *amaurotic blindness*."

To *strengthen* the *eyes*, to relieve them

when *swollen* or *congested*, and to remove *chronic ophthalmia, purulent discharges, &c.*, nothing is equal to frequently *bathing* them with *water*, at *first tepid*, but afterwards lowered in temperature to absolute *coldness*. The *Eye-douche* of Mr. Heather Bigg, of Leicester Square, is an admirable invention for this purpose.

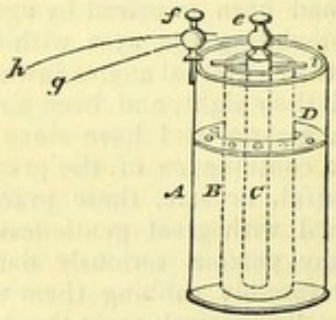
VITAROBORANT (Palmer's). Resembles *ervalenta*.

VITRIFIABLE PIGMENTS. See *Enamels*.

VITRIFICATION. See *Glass*.

VITRIOL or *Green vitriol*. Commercial sulphate of iron.

VITRIOL (Blue). Commercial sulphate of copper.



VITRIOL (Roman). As the last.

VITRIOL (White). Commercial sulphate of zinc.

VITTIE VAYR. Syn. *Vetiver*. The Tamool name of the odorous and fibrous *roots* of the *andropogon muricatum* (anthoxanthum muricatus,—Linn.), recently sold by the perfumers.

VOLTAIC BATTERY. Syn. *Galvanic Battery*. An instrument or apparatus for the production of an electrical current by chemical decomposition.

One of the most useful forms of the galvanic battery is that proposed by Professor Daniell, and commonly known by his name. Its peculiar advantages arise from its action continuing without interruption, for a long time, hence the name of "*constant battery*" that has been applied to it. The following figure will explain its construction and application:—

A. A *copper cylinder* filled with a *saturated solution of sulphate of copper*.
B. A smaller *porous cylinder* or *membrane*, containing a mixture of 1 part of *oil of vitriol*, and about 7 of *water*.
C. A *rod of zinc* supported in the smaller cylinder by the cross piece (*i*).
D. A *shelf* full of small holes, for supporting *crystals of sulphate of copper*, to keep up the strength of the solution.
e and *f*. *Screws* and *caps* to connect the wires *g* and *h* with the battery.
g. The *positive wire*.
h. The *negative wire*.

One of these batteries is sufficient for electrotyping; *six* of them form a circle of considerable power, and about 20, produce one sufficiently strong for most experiments of demonstration and research.

In arranging these, as well as other batteries, when *intensity*, or *travelling power*, is desired, the metallic communication is made between the *opposite* metals; but when simple *quantity* without intensity is required, the zinc of one battery is united with the zinc of the other, and the copper of the one with the copper of the other, an effect which is equally attainable with a single battery of enlarged dimensions.

VOLTAIC BRASSING. An actual deposit of copper and zinc in the state of alloy forming brass, may be obtained by employing the following solution for the decomposition cell: — *Sesquicarbonate of ammonia* and *cyanide of potassium*, of each, 1 *lb.*; *cyanide of copper*, 2 *oz.*; *cyanide of zinc*, 1 *oz.*; *water*, 1 gall.; dissolve. If the deposit be *too red*, add some more ammonia; if *too pale*, add more cyanide of potassium. See *Volatype*.

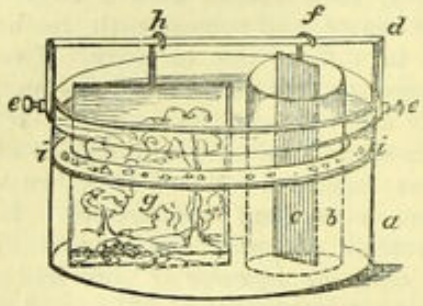
VOLTAIC COPPERING. A *solution of the sulphate of copper* for the decomposition cell; or, for *fine work*, a liquid formed by dissolving *black oxide of copper* or *ferrocyanide of copper* in a *solution of cyanide of potassium*, the solution being neutralized, from time to time, with a little *caustic potassa*. See *Voltatype*.

VOLTAIC GILDING. Various solutions have been recommended by different authorities for the decomposition cell. M. De la Rive employs a *solution of neutral terchloride of gold*; M. Dumas, a solution formed of 31 grammes and 25 centigrammes of *gold converted into oxide*; 5 hectogrammes of *cyanuret of potassium*; and *water*, 4 litres; boiled for half an hour in glass or porcelain; used with a constant battery (gilds very quickly, especially when boiling); M. Louyet, a *strong solution of bisulphuret of gold* in *cyanide of potassium*, with a powerful electric current; M. Ruolz, a *solution* of *cyanide*, *chloride*, or *potassio-chloride of gold*, in *cyanide of potassium* or *red* or *yellow prussiate of potash*, a *solution of sodio-chloride of gold* in *carbonate of soda*, or of *sulphuret of gold* in *neutral cyanide* or *sulphuret of potassium*; Messrs. Elkington (under patent dated March, 1840), employ a *solution of cyanide of gold* in *cyanide of potassium*, formed by either directly dissolving the former in the latter, or by subjecting the *metallic gold* to the joint action of a *solution of cyanide of potassium* and *electricity*. In 1841, Mr.

C. V. Walker called the attention of the *Electrical Society* to the fact, that hitherto *voltaic gilding* and *silvering* had been accomplished by the use of a *single cell*, and, therefore, at the expense of a salt of gold or silver. These salts, as he correctly stated, are troublesome to prepare, and are expensive; and, therefore, if the *anions* would combine with *gold* and *silver anodes*, the *operations of plating* and *gilding* might be rendered more simple, more sure, and more economical. This, he showed, might be effected by dissolving the *neutral oxides of silver* and *of gold*, or the *chloride of gold*, each in a *solution of cyanide of potassium*, and *electrolizing* the *solutions* respectively with a *silver* and a *gold anode*. In this case, the cyanogen, released at the anode, combines with it, whether it be silver or gold, and destroys a portion, equivalent to that deposited at the cathode; and thus the *strength* of the *solution* is maintained, and the expense of the operation is reduced to a minimum. The deposition is most conveniently effected in *glass cells*, so that the eye can detect the regularity of the process. The *anodes* are *gold* and *silver wire*, or *plate*, which are suspended in the *decomposition cell*, and connected with the positive element of the battery, like the pieces of copper (*d*, *d*) in the *engr.* at *page* 1282. The *solutions of gold* recommended by other authorities, may also be employed with gold anodes, and will thus be rendered more constant and convenient. In the above way *copper*, *brass*, *bronze*, *silver*, *iron*, *lead*, *tin*, *steel*, and *platinum*, may be perfectly gilded.

Obs. It is absolutely necessary that the metallic surfaces be entirely free from dirt, grease, or oxide. For this purpose they should be boiled in a caustic lye, then carefully scoured with sand-and-water, next dipped into acidulated water, and, lastly, rinsed in pure water. After immersion for a minute or two, the article to be gilt is withdrawn, wiped dry with a fine linen cloth, rubbed a little, and again immersed. This should be repeated a second and a third time. To *render* the *gilding perfect*, the *power of the battery* should be proportioned to the *extent of surface to be gilded*, and the *intensity of the current* to the *density* of the gilding solution. The power of the electric current may be moderated at will, by immersing more or less of the zinc plate, so that no hydrogen may be disengaged, and in this case the gold solution is alone decomposed. Messrs. Elkington employ their *gilding* solution at about 135° Fahr.; and state, that the more *intense* the electric current, the denser and harder the deposit. M. Becquerel amalgamates the pieces, by which the best effects of gilding, with respect to durability and solidity, are produced. The articles are simply immersed in a *weak solution of protonitrate of mercury*, then washed with a large quantity of water, and rubbed with leather, in order to diffuse the mercury. The immersions are repeated until the metal is equally diffused over the surface. If it be slightly spread without rubbing, the surface remains tarnished; but if it be brushed it assumes a brilliant appearance. If the pieces thus prepared be steeped in the usual *bath of cyanide of gold and potassium*, at a temperature of 77° to 86° Fahr., and connected with a constant battery in operation, in less than a quarter of an hour they will be *gilded*, either dead (*matt*) or shining, but of a *matt* equal to that of clocks, a quality difficult to obtain by the ordinary process. After the pieces are gilded they are "*put in colour*," by which their lustre and beauty are brought out. See *Voltatype*.

VOLTAIC PLATINIZING. By proceeding in a similar way to the last, but substituting *platinum* or *its compounds* for gold. A solution of *potassio-chloride of potassium* in *caustic potassa* has also been highly recommended. Manufacturing and operative chemists will find, in this process, a means of procuring large capsules of platinized brass, which combine cheapness with the necessary resistance to saline or acid solutions. 1 milligramme of *platinum* is capable of perfectly covering 50 square millimètres, which corresponds to a thickness of 1-100,000th of a millimètre. Platinum, thus applied, may be obtained from the crude solution of platinum ore, as the metals which accompany it do not injure the effect. (Dumas.)

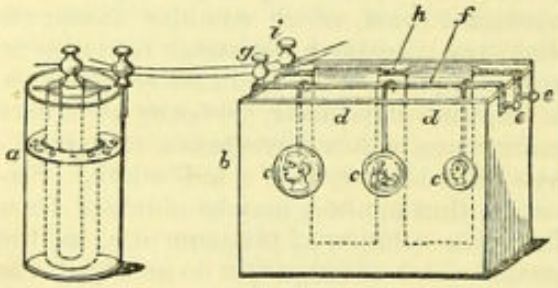


VOLTAIC SILVERING. From *silver* and *its compounds* as noticed under *Voltaic Gilding*.

VOLTAIC ZINCING. From like solutions to those employed for *voltaic coppering*. See *Voltatype* and *Zincing*.

VOLTATYPE. Syn. *Electrotype*, *Electro-metallurgy*. The art of working in metals by means of voltaic electricity.

The *most simple* and *easily managed electrotype apparatus*, is formed in a similar manner to the common constant battery, but instead of employing a plate of copper for the negative element, a *mould of the object to be copied*, the face of which has been covered with *plumbago*, is substituted. An *electrograph* of this kind may be made of any well glazed earthen jar or vessel,



and the following arrangement will be found convenient for most of the purposes to which this art is applied by the amateur; viz., *copying medals*, *multiplying plates*, &c.

a. An *oval vessel* of salt glazed earthenware or wood, nearly filled with a *concentrated solution of sulphate of copper*.
b. A *porous diaphragm*, containing the *cylinder* or *plate of zinc* (*c*), and filled with *dilute sulphuric acid*.
d. A *small bar of brass* or *copper*, fastened to the vessel by the *binding screws* (*e*, *e*), and supporting the cylinder of zinc (*c*), by the *hook of copper wire* (*f*), and the *mould* (*g*), by the *hook* (*h*).
i. A *small shelf* or *partition* to support *crystals of sulphate of copper*, to keep up the strength of the solution.

Another method is to employ a separate *trough* or *decomposition cell* connected with a *constant battery*, by which means several moulds may be coated at once.

This arrangement will be understood by reference to the annexed engr.:—

a. A *constant battery*. (See *above*.)
b. *Decomposition cell*; a cubical vessel made of wood, or earthenware, and filled with a *mixture* of 1 part of *dilute sulphuric acid*, and 2 parts of *concentrated solution of sulphate of copper*.
c, *c*, *c*. *Moulds* suspended to the *brass rod* (*f*), and connected with the *copper* or *negative element* of the battery (*a*), by means of the *screw* (*g*).
d, *d*. *Pieces of sheet copper* suspended on the *brass rod* (*h*), and connected with the *zinc end* of the battery, by means of the *screw* (*i*), employed to keep up the strength of the cupreous solution in the decomposition cell.

When it is desired to *copy* any *object* by either of these apparatuses, an *exact mould* of it must be first obtained. Supposing the article to be a *medal*, for instance, a *hoop of paper* is commonly placed round it, and *white wax*, or any similar substance, poured on it in a melted state, and then allowed to cool; when cold it is removed, a small piece of *copper wire* to suspend it by is attached, and its face brushed over with *finely powdered plumbago*, by means of a camel-hair pencil; the excess and loose portion being carefully removed. The *mould so prepared* is next suspended in the apparatus, to receive a deposit of metal on its surface.

After the *mould* has *received a sufficiently thick metallic deposit*, the latter is separated, washed in a little *clean water*, and *bronzed* by any of the methods mentioned under "*Bronzing*."

Concluding remarks. Some persons experience considerable difficulty in procuring moulds *free* from *air bubbles*; but this inconvenience is readily avoided, by removing with a camel-hair pencil any that may be observed on the surface of the medal, after the melted wax is poured on, and while it remains liquid and transparent. The *tyro* in *electrotype manipulation* also frequently experiences much annoyance, from the metal being deposited on the surface of the mould under the form of a powder, or in a very friable or brittle state. This generally arises from the battery being in too active a condition, or not proportioned to the strength of the metallic solution. It is found that the slower the deposit is formed, the tougher and more solid it generally is; but there are numerous exceptions which may be learned by practice. *Air-bubbles* may be avoided by brushing them off the face of the mould, after immersion in the decomposition cell, and by properly regulating the action of the battery. The *dilute sulphuric acid* employed to excite the zinc end of the battery, should never be stronger than 1 part of *concentrated acid* to 7 or 8 parts of water. *Iron* may be substituted for zinc, and is more economical. *Stearine*, *hard tallow*, *gutta percha*, *shell-lac*, *rosin* softened with a *little* oil, *plaster of Paris*, *sealing wax*, *fusible metal*, and numerous other substances, besides wax, are employed as materials for moulds. When *plaster of Paris* is used, it is necessary to embue its surface with melted wax, to enable it to retain the plumbago. *Fusible metal* requires no preparation. Messrs. Elkington make their moulds with *wax* combined with a *little phosphorus*, which reduces upon their surface a *thin film* of *gold* or *silver* from solutions of these metals, which acts better than a face of plumbago for receiving the electro-deposit.

In *gilding*, *silvering*, or *platinizing* the common metals by electricity, *solutions of*

gold, *silver*, or *platinum*, are placed in the decomposition cell, and plates of *these metals*, instead of copper, suspended in the solution; care being taken so to shape the cell that the *greatest possible extent of surface* shall be obtained with the *least possible quantity* of *solution*. (See *above*.)

WAFER PAPER. See *below*.

WAFERS. Thin adhesive discs used for securing letters or sticking papers together.

Prep. 1. *Wafers, Flour do.* The finest *wheaten flour* is mixed with *water*, either *pure* or *coloured*, to a smooth pap or batter, which, after being passed through a *sieve*, to remove clots or lumps, is poured into the "*wafer-irons*" (previously warmed and greased with butter or olive oil), and in this state exposed to the heat of a clear charcoal fire; the whole is then allowed to cool, when the irons are opened, and the *thin cake*, which has become hard and brittle, is cut into *wafers* by means of sharp annular steel punches, made exclusively for the purpose.

2. *Gelatine Wafers, Transparent do.* Good *gelatine* or *glue* is dissolved, by the heat of a *water bath*, in just sufficient *water* to form a consistent mass on cooling; it is then poured, whilst hot, upon the surface of a *warm plate* of *mirror glass*, slightly oiled, and surrounded with a border of *card paper* (laid flat); a *similar plate*, also warmed and oiled, is next laid upon the gelatine, and the two plates pressed into as close contact as is permitted by the card paper; when quite cold, the *thin sheet of gelatine* is removed, and cut into wafers with punches, as before. 1 to 2 *oz.* of *sugar* is commonly added to each *lb.* of *gelatine*.

3. *Medallion Wafers.* A *sheet* of *metal* or *glass* having designs sunk in it corresponding to the raised part of seals, being provided, the hollows are filled up with a mixture formed of any appropriate *coloured powder*, made into a paste with *gum-water* or *size*, leaving the flat part clear; melted coloured glue is then poured on the plate, and the process is otherwise conducted as before. For *use*, the *paper* is wetted where the wafer is to be applied.

Obs. Care must be taken that no poisonous colours be employed. For gelatine wafers transparent colours only can be used. Those noticed under *Liqueurs* and *Stains* (Confectioner's) are appropriate. To these may be added *plumbago*, *sesquioxide of iron* (crocus martis), *smalts*, *levigated vegetable charcoal*, and *vermilion*.

WAFERS. (In Cookery.) *Prep.* Make *fine flour*, dried and sifted, into a smooth thin batter with good *milk*, or a little *cream-and-water*; add about as much *white wine* as will make it thick enough for pancakes, sweeten it with a little *loaf-sugar*, and flavour it with *powdered cinnamon*. When thus prepared, have the *wafer-irons* made ready by being heated over a charcoal fire; rub them with a piece of linen cloth dipped in *butter*; then pour a spoonful of the batter upon them, and close them almost immediately; turn them upon the fire, and pare the edges with a knife, if any of the batter oozes out. A short time will bake them, when the irons are properly heated. The wafers must be curled round whilst warm when they are for ornaments. "*Wafer Paper*" is prepared in a similar way to the above; but when intended to be kept for some time, the milk must be omitted. *Used* by cooks, &c.; and, recently, as an envelope for nauseous medicines.

WAFERS (Da Silva's). Of these well-bepuffed nostrums, to which their proprietors have impudently affixed the name of Dr. Locock, there are three varieties, which are said to be prepared as follows:—

1. *Aperient* or *Antibilious Wafers.* From *sugar* and *extract of liquorice* (Spanish juice), equal parts; *senna* and *jalap*, of each, in fine powder, about ½ dr. to every *oz.* of sugar employed; made into a mass with a *concentrated infusion of senna*, and divided into 12-gr. lozenges or squares with the corners rounded off.

2. *Female Wafers.* From *sugar*, *horehound candy* (or *honey*), and *aperient wafer mass*, equal parts; beaten to a proper consistence with *weak gum-water*, to which a little *orange-flower water* has been added, and divided into 8-gr. tabellæ, as before.

3. *Pulmonic Wafers.* From *lump sugar* and *starch*, of each, in powder, 2 parts; *powdered gum*, 1 part; made into a lozenge-mass with *vinegar of squills*, *oxymel of squills*, and *ipecacuanha wine*, equal parts, gently evaporated to 1-6th their weight, with the addition of *lactucarium* in the proportion of 25 to 30 gr. to every *oz.* of the dry powders; the mass being divided into half-inch squares, weighing about 7½ gr. each (when dry), as before.

Obs. For an exposition of the Da Silva quackery, with Dr. Locock's letter on the subject, see the *Anat. of Quackery*, or the *Med. Circ.*, ii, 106-126.

WALNUT. The *juglans regia* (Linn.), a tree of the natural order *juglandeæ* (De Cand.) The *sap* yields sugar; the *fruit* is walnuts; the *kernels* of the latter are eaten and pressed for their oil; the *peel* or *husks* are used for "rooting" or dyeing brown; the *unripe fruit* is pickled, and its *juice* is used as a hair dye; the *leaves* are reputed diaphoretic and antisyphilitic; and the *wood* is esteemed for cabinet work.

WARBURG'S FEVER DROPS. See *Tinctures.*

WARD'S RED DROP. A strong solution of *emetic tartar* in *wine.*

WARTS. Syn. *Verrucæ*,—Lat. These chiefly attack the hands, and may be removed by the daily use of a little *nitrate of silver*, *nitric acid*, or *aromatic vinegar*, as directed under *Corns.* The *first* of the above applications produces a black stain, and the *second* a yellow one; both of which, however, wear off after the lapse of some days. *Acetic acid* scarcely discolours the skin. Erasmus Wilson, the eminent surgeon and talented author of several works on the skin, mentions the case of a gentleman who removed an entire crop of warts from his knuckles and fingers by subjecting them to a succession of sparks from one of the poles of an electrical machine. "He was in the habit, as is usual, of trying the amount of electric fluid collected in his machine by placing his knuckle near the brass knob, and receiving a spark. Observing that an odd sensation was produced whenever the spark struck a wart, he was tempted for amusement to give them a round of discharges. When his attention was next directed to his hands, he found to his surprise and satisfaction that all the warts had disappeared." Dr. Peez, of Wiesbaden, "confirms the statement made by several German practitioners, of the rapid curative agency which attends the internal use of carbonate of magnesia in cases of warts." (*Brit. & For. Med. & Chir. Review.*)

The *papular eruption* which covers the hands of some persons, and which is occasionally called "*soft warts*," is best removed by the daily use of *Gowland's lotion.*

WASH. The fermented wort of the distiller.

WASH-BALLS. See *Savonettes.*

WASHERWOMAN'S SCALL. See *p.* 1076.

WASHES. The familiar name of lotions, more especially of those employed as cosmetics.

WASHES (Cosmetic). See *Freckles*, *Kalydor*, *Lotions*, *Milk of Roses*, *Skin Cosmetics*, *&c.* (and *below*).

WASHES (Hair). *Prep.* 1. From *rosemary tops*, 2 *oz.*; *boiling water*, 1 pint; infused together in a tea-pot or jug, either with or without the addition of *rectified spirit*, 1 fl. oz. (or *rum*, 2 fl. oz.), to the cold strained liquor.

2. *Box leaves*, a small handful; *boiling water*, 1 pint; digest for an hour, simmer 10 minutes, and strain. Both are used to improve the growth and to strengthen the hair.

3. To clean the "partings,"—remove scurf, &c.—*a.* (*Antipityrienne.*) From *sesquicarbonate of ammonia*, 1 *oz.*; *spirit of rosemary*, ½ pint; *rose*, or *elder-flower water*, 1½ pint.

b. (*Detergent Essence.*) From *honey*, 2 *oz.*; *borax*, 1 *oz.*; *cochineal* (bruised), ¼ *oz.*; *camphor*, 1 dr.; (dissolved in) *rectified spirit*, 2 fl. oz.; *soft water*, ¾ pint; *oil of rosemary*, 20 drops.

c. (*Vegetable Extract.*) Take of *salt of tartar*, 1 *oz.*; *rosemary water*, 1 pint; *burnt sugar*, q. s. to tinge it brown; dissolve, filter, and add of *essence of musk*, 10 drops.

4. To darken the hair.—*a.* From *pyrogallic acid*, ¼ *oz.*; *distilled water*, *orange-flower water*, and *rectified spirit*, of each, 1¼ fl. oz.

b. (*La Forest's Cosmetic Lotion* or *Liquid Hair Dye.*) Boil, for a few minutes, *chloride of sodium*, 1 dr.; and *sulphate of iron*, 2 dr.; in *red wine*, 1 lb; then add of *verdigris*, 1 dr.; in 2 or 3 minutes remove it from the fire, and further add of *powdered galls*, 2 dr.; the next day filter. For *use*, moisten the hair with the liquid; in a few minutes dry it with a cloth, and afterwards wash the skin with water.

5. To prevent the hair falling off.—*a.* (*American Shampoo Liquid.*) Take of *carbonate of ammonia*, ½ *oz.*; *carbonate of potash*, 1 *oz.*; *water*, 1 pint; dissolve, and add the solution to a mixture of *tincture of cantharides*, 5 fl. oz.; *rectified spirit*, 1 pint; *good rum*, 3 quarts. *Used* to strengthen the hair and to remove *dandruff*, by moistening it with the mixture, rubbing, so as to form a lather, and then washing with cold water.

b. (*Balm of Colombia.*) As the last, *omitting* the potash, *quadrupling* the *carbonate of ammonia*, and *adding* some *perfume.*

c. (Eras. Wilson.) *Eau de Cologne* (strongest), 8 fl. oz.; *tincture of cantharides*, 1 fl. oz.; *oils of rosemary* and *lavender*, of each, ½ fl. dr.

d. (*Dr. Locock's Lotion.*) From *expressed oil of mace* (nutmeg), 1 *oz.*; *liquefied*, at a gentle heat, with *olive oil*, ½ *oz.*; and when cold, formed into an emulsion by agitation with *rose water*, ¼ pint; *spirit of rosemary*,

2½ fl. oz.; *stronger liquor of ammonia*, 1½ fl. dr. For other formulæ, see *Baldness, Hair Dyes, Lotions, &c.*

WASHES (Medicinal). See *Lotions, &c.*

WASHES (Mouth). Syn. *Collutoria*,—Lat. *Prep.* 1. Take of *camphor* (cut small), *¼ oz.; rectified spirit*, 2 fl. oz.; dissolve. A few drops to be added to a wine-glassful of water, to sweeten the breath and preserve the teeth.

2. *Chloride of lime*, *½ oz.; water*, 2 fl. oz.; agitate well together in a phial for ½ an hour, filter, and add of *rectified spirit*, 2 fl. oz.; *rose* or *orange-flower water*, 1 fl. oz. *Used*, highly diluted with water, as the last, by smokers and persons having a foul breath.

3. *Mastic* (in powder), 2 dr.; *balsam of Peru*, ½ dr.; *gum*, 2 dr.; or q. s.; *orange-flower water*, 6 fl. oz.; *tincture of myrrh*, 2 fl. dr.; for an emulsion. In loose teeth, &c.

4. *Tannin*, ½ dr.; *tincture of tolu*, 2 fl. dr.; *tincture of myrrh*, 6 fl. dr.; *spirit of horse-radish*, 2 fl. oz.; mix. In spongy gums, scurvy, &c.; diluted with tepid water.

5. (Swediaur.) *Borax*, ¼ oz.; *water* and *tincture of myrrh*, of each, 1 fl. oz.; *honey of roses*, 2 oz. In tender or ulcerated gums.

6. *Balsam of Peru*, 2 dr.; *camphor*, ½ dr.; *essence of musk* and *liquor of ammonia*, of each, ½ fl. dr.; *tincture of myrrh*, 3 fl. dr.; *spirit of horse-radish*, 1½ fl. oz. To sweeten and perfume the breath; a tea-spoonful in ½ wine-glassful of tepid water to rinse the mouth with.

WASHES (Tooth). See *above.*

WASHING FLUIDS. *Solutions of soda* rendered caustic with quick-lime.

WASHING POWDERS. (See *p.* 1064.)

WATCHFULNESS. Syn. *Sleeplessness; Agrypnia.* The *common causes* of *watchfulness* are thoughtfulness or grief, disordered stomach or bowels, heavy and late suppers, and a deficiency of out-door exercise. The *best treatment*, in ordinary cases, simply consists in an attention to these points. The *method* of *producing sleep* recommended by a late *celebrated Hypnotist*, consists in merely adopting an easy recumbent position, inclining the head towards the chest, shutting the eyes, and taking several deep inspirations with the mouth closed. *Another method*, recommended by an eminent surgeon, and which appears infallible if *persevered in with proper confidence*, and which is suitable either to the sitting or recumbent posture, consists in tying a decanter cork with a bright metallic top, a pencil-case, or any other *bright object*, on the forehead, in such a position that the eyes must be distorted or strained to be capable of seeing it. By resolutely gazing in this way for a short time, *without winking*, with the mind fully absorbed in the effort, the muscles of the eyes gradually relax, and the experimenter falls asleep. Gazing in a similar manner on an *imaginary* bright spot in the dark, as at night, exerts a like effect. A tumblerful of *cold spring water*, either with or without a few grains of *bicarbonate of potash* in it, taken just before lying down, will frequently succeed with the *dyspeptic* and *nervous*, when all other means fail. See *Supper, &c.*

WATER. Syn. *Oxide of Hydrogen, Protoxide of do.; Aqua*,—Lat. *Eau*,—Fr. *Wasser*,—Germ. The ancients regarded water as a simple substance, and as convertible into various mineral and organic products. Earth, air, fire, and water, were at one time conceived to be the elementary principles or essences of matter, from which all form and substance derived their existence. The true constitution of water was not discovered until about the year 1781, when Mr. Cavendish and Mr. James Watt, independently and nearly simultaneously, showed it to be a compound of hydrogen and oxygen. Five years, however, before this time (1776), the celebrated Macquer, assisted by Sigaud de la Fond, obtained pure water by the combustion of hydrogen in the air. It has since been satisfactorily demonstrated that hydrogen and oxygen exist in water in the proportion of 1 to 8 by *weight*, or 2 to 1 by *volume*; the sp. gr. of hydrogen being to that of oxygen as 1 to 16. By the union of these gases, there is a condensation of nearly 2000 volumes into 1, thus showing the wonderful effects of chemical combination. One *cubic inch* of *perfectly pure water* at 62° Fahr., and 30 inches of the barometer, weighs 252·458 gr.; by which it will be seen that it is 815 times heavier than atmospheric air. Its sp. gr. is 1·0, it being made the standard by which the densities of all solid and liquid bodies are estimated. The sp. gr. of *frozen water* (ice) is 0·95; that of *aqueous vapour* 0·6252, air being 1·0. Water changes its volume with the temperature; its greatest density is at about 39½° Fahr., and its sp. gr. decreases from that point, either way. By the enormous pressure of 30,000 *lb.* on the square inch, 14 volumes of water are *condensed* into 13 volumes. Water *evaporates* at all temperatures, but at 212° this takes place so rapidly, that it boils, and is converted into vapour (*steam*), whose bulk is nearly 1700 times greater than that of water. The general properties and uses of water are too well known to require notice.

Var. Of these the following are the principal:—

Distilled Water; Aqua Destillata,—Ph. L. E. & D. Obtained by the distillation of common water, observing to reject the first and last portions that come over. The still employed for this operation should be used for no other purpose; and when great nicety is required, the distillation should be performed in glass or earthenware. "It remains limpid on the addition of lime-water, chloride of barium, nitrate of silver, oxalate of ammonia, or hydrosulphuric acid." (Ph. L.) It is the *only kind of water* that should be employed in chemical and pharmaceutical operations. When distilled water is not at hand, *clean filtered* or *clarified rain water* is the only kind that can be successfully substituted.

Rain Water; Aqua Pluvia, A. Pluvialis, A. Imbrium,—Lat. A nearly pure kind of natural water; but it contains minute quantities of air, carbonic and nitric acid, carbonate of ammonia, &c.

Snow Water; Aqua Nivalis, A. ex Nive, —Lat. The purest of all natural waters.

Spring Water; Aqua,—Ph. E. *Aqua Fontana*,—Ph. D. Rain water which has percolated through the earth almost always contains mineral impurities. "For pharmaceutical use, spring water must be so far free of saline matter, as not to possess the quality of hardness, or contain above 1-6000th part of solid matter." (Ph. E.)

River Water; Aqua Fluvialis, A. ex Flumine,—Lat. Less pure than good spring water. Thames water contains about 1-3500th part of fixed impurities, chiefly carbonate of lime; or from 16 to 24 gr. of solid matter per gallon, independently of gaseous matter and mechanical impurities. The average of six analyses gave us 21·5 gr. per gall. (*Med. Circ.*, i. 260.)

Well Water, Pump Water; Aqua Puteana, A. ex Puteo,—Lat. Less pure than either of the preceding. Usually contains a large quantity of carbonate and sulphate of lime. Hence its "*hardness*" and property of curdling soap. When this arises from the first-named substance it is called "*temporary hardness*," since it is, for the most part, removed by boiling and exposure; but when it arises from sulphate of lime it is called "*permanent hardness*," since it cannot be so easily remedied.

Marsh Water (*Aqua ex Palude*) and *Lake Water* (*Aqua ex Lacu*) resemble river water, but contain more organic matter in a state of decomposition, and are hence deemed unwholesome.

Sea Water; Aqua Maxina, A. Maris, —Lat. The characteristic of this variety is its saltness. Its density is about 1·0274, and the average quantity of saline matter which it contains is about 3½ per cent., of which about $\frac{27}{35}$ths are *chloride of sodium*, and the remainder chiefly *chloride of magnesium* and *sulphate of magnesia*.

Analysis of Sea Water (British Channel), by Dr. Schweitzer, of Brighton.

1000 *grains contained*	*grains.*
Water	964·745
Chloride of sodium	27·059
„ of potassium	0·766
„ of magnesium	3·666
Bromide of magnesium	0·029
Sulphate of magnesia	2·296
„ of lime	1·406
Carbonate of lime	0·033
Traces of iodine and ammoniacal salt	
	1000·

Pur. Pure water is perfectly transparent, odourless, and colourless, and evaporates without residue, or even leaving a stain behind. The purest natural water is that obtained by melting snow or frozen rain, that has fallen at some distance from any town. Absolutely pure water can only be obtained by the union of its gaseous constituents; but very pure water, sufficiently so for all chemical and philosophical purposes, may be procured by the careful distillation of common water.

Tests. 1. If a precipitate is formed, or a fur or crust deposited on the vessel during *ebullition*, it indicates the presence of CARBONATE OF LIME.—2. The reiduum, if any, of *evaporation*, is *impurity*; if it be ORGANIC MATTER, smoke and a peculiar odour will be evolved, as the residue becomes dry and charred.—3. If a *solution of protosulphate of iron* when added to the water contained in a stoppered phial, occasions a reddish brown precipitate after a few days, the presence of OXYGEN is indicated.—4. Neither *litmus*, *syrup of violets*, nor *turmeric*, are discoloured or affected when moistened with pure water; if the *first two* are *reddened*, it indicates an ACID; if the *last* is turned *brown*, an ALKALI.—5. If a milkiness follows the addition of *lime water before* and *not after* the water has been boiled, it contains CARBONIC ACID.—6. *Chloride of barium* occasions a white precipitate, insoluble in nitric acid, in water containing SULPHURIC ACID (usually in the state of sulphate of lime).—7. *Oxalate of ammonia* produces a white precipitate in water, containing CARBONATE or SULPHATE OF LIME.—8. *Nitrate of silver* occasions a cloudy white precipitate, inso-

luble in nitric acid, but soluble in ammonia, in water containing CHLORINE or CHLORIDES.—9. *Phosphate of soda and ammonia* (microcosmic salt) added to water that has been boiled, and precipitated by oxalic acid (if required) produces, in a few hours, a white precipitate, if the water contains MAGNESIA.—10. *Tincture* or *infusion of galls* turns water containing IRON *black;* when this takes place, both *before* and *after* the water has been boiled, the metal is present under the form of SULPHATE OF IRON; but if it only occurs *before* boiling, then CARBONATE OF IRON may be suspected, and will be precipitated as a reddish powder by exposure and heat.—11. *Ferrocyanide of potassium* gives a *blue* precipitate in water containing a SESQUISALT OF IRON, and a *white* one, *turning blue* by exposure to the air, in water containing a PROTOSALT OF IRON.—12. *Sulphuretted hydrogen* and the *hydrosulphurets* give a *brown* or *black* precipitate in water containing COPPER, IRON, or LEAD; and a *yellow* precipitate in water containing ARSENIC, or its compounds.—13. *Soap*, or a *solution of soap* in *proof spirit*, mixes easily and perfectly with pure water, but is curdled and precipitated in water containing CARBONATES, CHLORIDES, or SULPHATES. —14. (*Prof. Clark's Soap Test.*) Take of the *finest white soap*, 1 dr.; *proof spirit*, 1 pint; dissolve, and so adjust the strength (if not already so) that exactly 32 measures are required to be added to 100 *measures* of the *standard solution of chloride of calcium* (see below), before a lather can be produced. *Every measure* of this *test solution* required to produce this effect on 100 *measures* of any *sample of water* under examination, represents ½ gr. of CARBONATE OF LIME, or ½° of "*hardness*"; 2 measures equal 1° of "*hardness*," or 1 gr. of carbonate per gall.—The "*standard solution of chloride of calcium*" is formed by carefully dissolving 2 gr. of *pure carbonate of lime* in a little *pure hydrochloric acid*, evaporating the solution to dryness, and dissolving the *residuum* in 1 pint of *pure water*. This forms the standard solution of 16 degrees of hardness. 1 measure of this solution, mixed with 15 measures of distilled water, constitutes a solution of 1° of hardness; and so on up to 16°. See *Alkalimetry*.

Purif. Pure water is incapable of putrefaction, but ordinary water contains a small quantity of organic matter in solution, which speedily undergoes decomposition, even in closed vessels. This is especially the case with water kept in wooden casks, or in open cisterns into which leaves and insects are driven by the wind. Putrescent water is highly unwholesome as a beverage; and it is a fact, clearly demonstrated by the returns of the Registrar-General, that the recent visitations of cholera corresponded in severity to the impurity of the water supplied to the respective districts.

Among the methods adopted for purifying foul water are the following:—1. *Filtration* through, or *agitation* with coarsely powdered *freshly burnt charcoal*, either animal or vegetable; but preferably the former. This removes both mechanically suspended matter, and the calcareous and gaseous impurities held in solution.—2. *Free exposure* to the *action of the air*, by which the organic matters become oxidized and insoluble, and speedily subside. This may be easily effected by agitating the water in contact with fresh air, or by forcing air through it by means of bellows. —3. The addition of a little *sulphuric acid* has a like effect; 15 or 20 drops are usually sufficient for a gallon. This addition may be advantageously made to water intended for filtration through charcoal, by which plan at least ⅔ of the latter may be saved. (Lowitz.) — 4. An ounce of *powdered alum* (dissolved) well agitated with a hogshead or more of foul water, will purify it in the course of a few hours, when the clear portion may be decanted. When the water is very putrid, about ½ *dr.* (or even 1 *dr.* per gall.) may be employed; any alum that may be left in solution may be precipitated by the cautious addition of an equiv. proportion of carbonate of soda. —5. A solution of *red sulphate* or *sesquisulphate of iron* acts in the same way as alum: a few drops are sufficient for a gallon.—6. Agitation with about the ½ to 1% of finely powdered black oxide of manganese, has a similar effect to the last.—7. The addition of a *little aqueous chlorine*, or *chlorine gas*, to foul water, cleanses it immediately. This method has the advantage of the water being perfectly freed from any excess of the precipitant by heat.—8. *Sea water* may be rendered fit for washing by the addition of a *solution of carbonate of soda* or *salt of tartar*, as long as it turns milky. After repose, the clear portion must be decanted.—9. *Sea water* may be rendered fit for use as a beverage by distillation. The waste heat of the cook's galley is amply sufficient for this purpose. (There are several patent contrivances for the distillation of water on shipboard.)—10. *Hard water* may be softened in the same way as sea water.—11.

Hard water may be both aerated and softened by the addition of a few grains of bicarbonate of potash per gallon, followed by half as much *lemon juice* or *tartaric acid* as is sufficient to saturate the alkali in the carbonate thus added.—12. The *hardness* of *water* depending on the presence of carbonate of lime ("*temporary hardness*"), including that of most rivers and many springs, may be nearly removed by ebullition; or, as recommended by Prof. Clark, by mixing the *hard water* with *lime water* in the proper proportions, when both the dissolved carbonate and the dissolved lime, which thus becomes carbonated, are precipitated. This method has been successfully adopted by several of the great water-companies.—13. *Another method* is to precipitate the lime by the addition of *oxalate of ammonia* in atomic proportion, carefully avoiding excess, and then to agitate the water with a little *binoxide of manganese*, in fine powder.—14. "*Permanently hard*" water may be softened by substituting *hydrate of baryta*, or *baryta water*, for the lime in No. 12.

Pres. Water is usually preserved on shipboard in *iron tanks*, or in *casks* well *charred* on the inside. It cannot be safely kept in copper or leaden vessels, and receives a calcareous impregnation by contact with lime, mortar, stucco, or stone containing lime. The *addition* to water of about $\frac{1}{2}$ to $1\frac{0}{0}$ of *finely powdered black oxide of manganese*, materially promotes its preservation, especially at sea, where the motion of the vessel, and the consequent agitation of the water, increases the points of contact. *Water never putrefies* in *iron vessels*, or when some *fragments* of *metallic iron* are immersed in it. *Distilled water* should be preserved in stoppered glass-bottles or carboys.

WATER (Barèges). *Prep.* Take of *alum*, *carbonate of lime*, and *hard Spanish soap*, of each, 2 gr.; *common salt*, 4 gr.; *dried carbonate of soda*, 20 gr.; *sulphuret of potassium*, 16 gr.; *water*, 1 quart; boil them together until the fumes of sulphuretted hydrogen begin to be evolved, then add enough water to make up 1 gallon. *Used* as a medicated lotion or bath in cutaneous diseases, from the slightest eruption to the most obstinate cases of leprosy. 60 times the above quantity formed the medicated warm bath employed by the Emperor Napoleon.

WATER (Carrara). Syn. *Carbonated Lime-water; Aqua Calcis Supercarbonatis*, —Lat. *Prep.* From *lime-water* (professedly prepared from lime made by calcining Carrara marble) supersaturated, by strong pressure, with *carbonic acid*; so that the carbonate of lime at first thrown down is redissolved. Each $\frac{1}{2}$ pint bottle contains 8 to 10 gr. of *carbonate of lime*.

WATER (Chalybeated). Syn. *Aqua Chalybeata*,—Lat. *Prep.* (Ure.) *Protosulphate of iron*, 3 gr.; *bicarbonate of potassa*, 61 gr.; *cold rain* or *distilled water*, 1 quart; mix and agitate in a corked bottle. Possesses equal tonic powers to that of the springs; but it may be rendered pleasanter by forcing in a little carbonic acid gas.

WATER (Fly). *Prep.* From *white arsenic*, 1 dr.; *boiling water*, 1 pint; dissolve, and sweeten the mixture with treacle. *Used* to kill flies. A *dangerous method*, and one that should never be adopted where there are children.

WATER (Lime). See *Solutions*.

WATER (Lithia). From the *freshly precipitated carbonate*, as *solution of magnesia*. Antacid and antilithic.

WATER (Oxygenated). See *page* 582.

WATER (Potash). See *Solutions*.

WATER (Rose). See *Distilled Waters*.

WATER (Seidlitz). See *Powders* and *Mineral Waters*.

WATER (Soda). Each bottle of this liquid should contain at least 15 gr. of *carbonate of soda*, but that of the shops is now nothing else but *distilled water* highly charged with *carbonic acid gas*. Not a particle of soda ever enters into its composition, on which account it cannot be substituted for the preparation of the pharmacopœias.

To *produce* a *superior article* of *soda water* the possession of a powerful *aerating* and *bottling machine* is absolutely necessary. The *water* employed must also be of the *purest quality*, the *carbonic acid* well washed with water, and the *corks* so prepared that they will not impart their peculiar flavour to the beverage. See *Powders*, *Solutions*, and *Wines*.

WATER (Tar). See *Infusions*.

WATERS (Distilled). Syn. *Aromatic Waters*, *Odoriferous do.*, *Perfumed do.*; *Aquæ*,—Ph. L. *Aquæ Destillatæ*,—Ph. E. & D., & Ph. L. 1836. Pure water charged, by distillation, with the volatile, odorous, and aromatic principles of plants.

Prep. 1. (Ph. L.) *a.* 2 gall. of *water* are put into the still along with the *vegetable matter* (bruised, if necessary), but only 1 gall. is drawn over. In the Ph. L. 1836, 7 fl. oz. of *proof spirit* were added before distillation.

b. Take of the *essential oil of the plant*, 2 fl. dr.; *powdered silex*, 2 dr.; triturate them diligently together, and then with *dis-*

tilled water, 1 gall., gradually added; lastly, (after briskly agitating the whole for some time) strain the solution.

2. (Ph. E.) As 1, *a*, but adding of *rectified spirit*, 3 fl. oz., before distillation.

3. (Ph. D.) From the *respective essences* (Ph. D.), 1 fl. oz.; *distilled water*, 2 quarts; agitated well together, and then filtered through paper.

The following are the *aquæ destillatæ* of the British Colleges, with some others, the quantities referring to a product of 1 gall., to be prepared as above when not otherwise directed:—

Angelica Water; Aqua Angelicæ,—P. Cod. *Bruised seed*, 3 lb.

Aniseed Water; Aqua Anisi,—Ph. D.

Balm Water; Aqua Melissæ,—P. Cod. *Fresh tops*, 12 lb.

Bitter Almond Water; Aqua Amygdalæ Amaræ; Aqua Amygdalarum Amararum,—P. Cod. *Bitter-almond cake* (from which the oil has been expressed), 5 lb; macerate for 24 hours, and filter the distilled product through *paper previously wetted* with pure distilled water. Poisonous. *Dose*. 10 to 60 drops, as a substitute for hydrocyanic acid.

Borage Water; Aqua Boraginis,—P. Cod. *Fresh leaves*, 12 lb.

Caraway Water; Aqua Carui,—Ph. L. & D.

Cascarilla Water; Aqua Corticis Cascarillæ,—P. Cod. *Cascarilla*, bruised, 3 lb.

Cassia Water; Aqua Cassiæ,—Ph. E. *Cassia*, bruised, 1½ lb.

Castor Water; Aqua Castorei,—Ph. L. 1746. *Castor*, 6 oz.

Cherry-laurel Water; Aqua Lauro-cerasi,—Ph. E. & D. 1. (Ph. E.) *Fresh leaves*, chopped, 10 lb (10 *lb.*,—Ph. D.) To the product add of *compound spirit of lavender*, 8 fl. oz.; agitate well, and if milky, filter it (through *wet paper*,—Ph. D. & P. Cod.) *Dose*. 10 to 60 drops, as a substitute for hydrocyanic acid. It is commonly imitated in trade, by dissolving 75 drops (minims) of the *oil of bitter almonds* in 2½ fl. oz. of *rectified spirit*, agitating the mixture with *warm distilled water*, 1 gall., and filtering.

Cinnamon Water; Aqua Cinnamomi,—Ph. L. E. & D. *Cinnamon*, bruised, 18 oz.; or *oil*, 2 fl. dr.

Clove Water; Aqua Caryophilli,—P. Cod. *Cloves*, bruised, 3 lb.

Dill Water; Aqua Anethi,—Ph. L. & E. *Bruised seed*, 1½ lb; or, *essential oil*, 2 fl. dr.

Elder-flower Water; Aqua Sambuci,—Ph. L. & E. *Fresh elder-flowers*, 10 lb.

Fennel Water; Aqua Fœniculi,—Ph. E. & D., and Ph. L. 1836. As *dill water*.

Hyssop Water; Aqua Hyssopi,—P. Cod. *Fresh tops*, 12 lb.

Juniper Water; Aqua Baccæ Juniperi,—P. Cod. *Berries*, bruised, 3 lb.

Lavender Water; Aqua Lavendulæ,—P. Cod. *Flowering tops*, 3 lb.

Lettuce Water; Aqua Lactucæ,—P. Cod. *Fresh lettuces*, bruised, 12 lb.

Melilot Water; Aqua Meliloti,—P. Cod. *Dried flowers*, 3 lb.

Mint Water, Spearmint do.; Aqua Menthæ Viridis,—Ph. L. E. & D. *Dried herb*, 2 lb; or *fresh herb*, 4 lb; or *essential oil*, 2 fl. dr.

Orange-flower Water; Aqua Aurantii Floris,—Ph. L. *Aq. Florum Aurantii*,—Ph. L. 1836. "Water distilled from the flowers of *citrus bigaradia*, Risso, and *citrus aurantium*, D. C." (Ph. L.) *Orange flowers*, 10 lb; *proof spirit*, 7 fl. oz. (Ph. L. 1836.)

Orange-peel Water; Aqua Corticis Aurantii,—Ph. L. 1746. *Yellow rind*, 5 oz.

Origanum Water; Aqua Origani,—P. Cod. *Dried flowers*. 3 lb.

Peach Water; Aqua Persicæ,—P. Cod. *Fresh leaves*, chopped small, 12 lb; as *cherry-laurel water*.

Pennyroyal Water; Aqua Pulegii,—Ph. L. & E. *Aqua Menthæ Pulegii*,—Ph. D., & Ph. L. 1836. As *mint water* (above).

Peppermint Water; Aqua Menthæ Piperitæ,—Ph. L. E. & D. As *mint water* (above).

Pimento Water; Aqua Pimentæ,—Ph. L. E. & D. *Pimento*, bruised, 1 lb; or *oil*, 2 fl. dr.

Rose Water; Aqua Rosæ,—Ph. L. E. & D. *Damask* or *hundred-leaved rose*, 10 lb. (Ph. L. & E.) *Otto*, 40 drops. (Ph. D.)

Sage Water; Aqua Salviæ,—P. Cod. As *lavender water* (above).

Sassafras Water; Aqua Ligni Sassafras,—P. Cod. *Sassafras chips*, 3 lb.

Spearmint Water. See *Mint Water*.

Tansy Water; Aqua Tanaceti,—P. Cod. *Flowering tops*, 6 lb.

Thyme Water; Aqua Thymi,—P. Cod. As the last.

Valerian Water; Aqua Valerianæ, Aq. Radicis V.,—P. Cod. *Root*, bruised, 3 lb.

Vanilla Water; Aqua Vanillæ,—Lat. *Vanilla*, coarsely powdered, 1 *lb.*; *salt*, 5 *lb.*; *water*, 2½ gall.; macerate for 24 hours in a covered vessel, then distil 1 gall.

Uses, &c. Distilled waters are mostly employed as vehicles or perfumes. A few, as *bitter almond, cherry laurel*, and *peach water*, are poisonous in doses larger than a few drops. The *dose* of the aromatic or carminative waters, as those of dill, caraway,

peppermint, pennyroyal, &c., is a wine-glassful, ad libitum.

Concluding Remarks. In the *preparation* of *distilled waters* for *medicinal purposes*, the utmost care should be taken to prevent contamination from contact with either copper, lead, or zinc, since these metals are gradually oxidized and dissolved by them. In *preparing* them from the *essential oils*, silica, in impalpable powder, is the best substance that can be employed to promote the division and diffusion of the oil, as directed in the Ph. L. *Magnesia* and *sugar*, formerly used for the purpose, are objectionable; as the *first* not only decomposes a portion of the oil, but the water is apt to dissolve a little of it, and is hence rendered unfit to be used as a solvent for metallic salts, more especially for bichloride of mercury and nitrate of silver; whilst the *other*, causes the water to ferment and acetify.

In the *distillation of waters* intended for *perfumery*, the utmost care is requisite to produce a highly fragrant article. The still should be furnished with a high and narrow neck, and the heat of steam, or a salt-water bath, should alone be employed. The first 2 or 3 fl. oz. of the runnings should be rejected, except when spirit is used, and the remainder collected until the proper quantity be obtained, when the whole product should be mixed together; as distilled waters progressively decrease in strength the longer the process is continued. When a very superior article is desired, the waters may be redistilled by a gentle heat, the first two thirds only being preserved. The *herbaceous odour* of *recently distilled waters* is removed by keeping them for some months, loosely covered, in a cold cellar.

When *distilled waters* have been *carefully prepared*, so that none of the liquor in the still has "spirted" over into the condensing worm, they keep well, and are not liable to change; but when the reverse is the case, they frequently become ropy and viscid. The *best remedy* for this is to *re-distil* them. *Waters* which have acquired a *burnt smell* in the "stilling," loose it by freezing. *Distilled waters* may be *prevented* from *turning sour* by adding a little calcined magnesia to them; and *those* which *have begun* to *spoil*, may be recovered by adding 1 gr. each of *borax* and *alum* to the pint. This doctoring is not, however, to be recommended, and should never be adopted for those used in medicine. A drop of *solution of terchloride of gold* added to these waters shows whether they contain any *uncombined essential oil*, by forming, in that case, a fine metallic film on the surface. After distilled waters have acquired their full odour, they should be carefully preserved in well-stopped bottles. Some houses keep a separate still for each of the more delicate perfumed waters, as it is extremely difficult to remove any odour that adheres to the body of the still and worm. The addition of the small quantity of spirit ordered in the Ph. E., & Ph. L. 1836, in the preparation of their waters, in no way tends to promote their preservation.

In general, the *druggists* draw off 2 gall., or more, of *water* from the quantities of the *herbs*, *barks*, *seeds*, or *flowers* ordered in the Pharmacopœias; hence the inferior quality of the *waters of the shops*. They do, however, very well for vehicles. The *perfumers*, on the contrary, use an excess of flowers, or at least reserve only the first and stronger portion of the water that distils over, the remainder being collected and used for a second distillation of fresh flowers.

The most beautiful distilled waters are those prepared in the South of France, and which are imported into England under the French names. Thus *eau de rose*, *eau de fleurs d'oranges*, *&c.*, are immensely superior to the *best* English rose or orange-flower water, &c. The water that distils over in the preparation of the essential oils is usually of the strongest and finest class. See *Essences*, *Oils* (Volatile), *Vegetables* (for distillation), *&c.*

WATERS (Eye). Syn. *Collyria*,—Lat. *Prep.* 1. From *distilled vinegar*, 1 fl. oz.; *distilled water*, ½ pint. ½ fl. oz. of *rectified spirit*, or 1 fl. oz. of *brandy* is often added. In simple chronic ophthalmia, blear eyes, &c.; also to remove particles of lime from the eyes.

2. *Sugar of lead*, 10 gr.; *pure vinegar*, ½ tea-spoonful; *distilled water*, ½ pint. In ophthalmia, as soon as active inflammation ceases; also as the last.

3. *Wine of opium*, 2 fl. dr.; *sulphate of zinc*, 20 gr.; *distilled water*, ½ pint. Astringent and anodyne; in painful ophthalmia, and extreme irritability.

4. *Opium*, 15 gr.; *boiling water*, 8 fl. oz.; when cold, add of *solution of acetate of ammonia*, 2½ fl. oz.; and filter. As the last.

5. *Sulphate of zinc*, 20 gr.; *distilled water*, ½ pint; dissolve. An excellent astringent water in chronic ophthalmia, weak and irritable eyes, &c.

6. *Sulphate of copper*, 10 gr.; *camphor mixture* (julep), ½ pint; dissolve. In the purulent ophthalmia of infants.

7. *Camphor julep*, 5 fl. oz.; *solution of acetate of ammonia* and *rose water*, of each,

2½ fl. oz.; mix. For weak or swollen eyes, particularly after ophthalmia.

8. *Chloride of barium*, 30 gr.; *distilled water*, ½ pint. In the ophthalmia of scrofulous and syphilitic habits.

9. (*Bate's.*) From *blue vitriol*, 15 gr.; *camphor*, 4 gr.; *hot water*, ¼ pint; agitate in a corked bottle, and when cold make it up to 4 pints, and filter. In purulent ophthalmia, and blear eyes.

10. (*Goulard's.*) From *solution of diacetate of lead*, 16 drops; *distilled water*, ½ pint; mix. As No. 2.

11. (Krimer.) *Hydrochloric acid*, 20 drops; *mucilage*, 1 dr.; *water*, 2 fl. oz. To remove particles of iron or lime from the eye.

12. (P. Cod.) *Extract of opium*, 4 gr.; *rose water*, 4 fl. oz.; dissolve. In painful ophthalmia.

WATERS (Medicated). See *Lotions, Solutions, Distilled Waters, Eye do., &c.*

WATERS (Mineral). Syn. *Saline Waters; Aquæ Minerales*,—Lat. Our space will not permit a description of these individually. The *tables* given below, exhibiting their composition, will however enable the reader, with a little attention, to produce *artificial waters* more closely resembling the natural ones, than can be done by adopting any of the numerous formulæ published for the purpose. The "*aerated waters*" are charged with 5 or 6 times their volume of *carbonic acid gas* by means of the apparatus employed by the soda-water manufacturers. On the *small scale*, the gas is often produced by the reaction of the ingredients on each other, in which case, on the introduction of the latter, the bottle must be instantly closed, and inverted. *Distilled water*, or *filtered rain water*, should alone be employed in their composition; and for the *chalybeated* and *sulphuretted waters*, it should be first boiled, and allowed to cool out of contact with the air.

In addition to the tables, it may be remarked that traces of IODINE have been found in the water of *Cheltenham* (old well), traces of BROMINE in the water of *Epsom*, and traces of both BROMINE and IODINE in that of *Leamington* (royal pump). MANGANESE has been found in the waters of *Tunbridge, Carlsbad, Spa, Pyrmont, Marienbad, Saidschütz, &c.* Traces of PHOSPHORIC and FLUORIC ACID have also been found in some mineral waters. It is the opinion of many high authorities that the medicinal virtues of these waters, depend more on the minute quantities of the above substances, and the high state of dilution in which they are held, than on their more abundant saline ingredients.

WATERS (Perfumed). Syn. *Aquæ Odoriferæ*,—Lat. The *simple distilled waters* of the perfumer have been already noticed. (See *p.* 1288-90.) They may be prepared from any substance which imparts its fragrance to water by distillation. The *compound waters* (eaux) employed as perfumes consist of very pure rectified spirit, holding in solution essential oils, or other odorous matter, and resemble the *esprits, essences, and spirits*, before noticed. They differ from *extraits* in being mostly colourless, or nearly so, and in being generally prepared by distillation, or by the addition of the pure essential oils or essences to carefully rectified and perfectly scentless spirit; whereas the *extraits* are mostly and preferably prepared by macerating the flowers, &c. in the spirit, or by digesting the spirit with the oils, in the manner noticed at *pages* 1175-6. *Extraits* are preferred to *eaux* and *esprits* as the basis of good perfumery, where the colour is not objectionable.

The following are a few additional formulæ and remarks:—

Angel Water, Portugal do. From *orange-flower* and *rose water*, of each, 1 pint; *myrtle water*, ½ pint; *essence of ambergris*, ½ fl. oz.; *essence of musk*, ¼ fl. oz.; shake them well together for some hours, then filter the mixture through paper.

Eau d'Ange; Aqua Myrti. From *myrtle flowers*, 3½ *lb.; water*, 2 gall.; distil a gallon. A pleasant perfume.

Eau d'Ange bouillée. From *rose water* and *orange-flower water*, of each, 3 pints; *benzoin*, ½ *lb.; storax*, ¼ *lb.; cinnamon*, 1 *oz.; cloves*, ½ *oz.*; 3 *fresh-emptied musk-bags;* digest in a securely covered vessel at nearly the boiling heat for 2 hours, then allow it to cool; strain off the clear, press the remainder, and filter for use. Very fragrant.

Eau d'Ange distillée. From *benzoin*, 4 *oz.; storax*, 2 *oz.; cloves*, ½ *oz.; calamus* and *cinnamon*, of each, ¼ *oz.; coriander seeds*, 1 dr.; all bruised; *water*, 3 quarts; distil 2 quarts. *Eau d'Ange distillée et musquée*, is made by adding a little *essence of musk* to the distilled product. Both are highly fragrant.

Eau de Naphre, Eau de Naphe; Aqua Naphæ; Double distilled Orange-flower Water. This article is distilled in Languedoc from the leaves of the *bigarade* or *bitter orange tree*, but the preparation sold in England under this name is often prepared as follows:—*Orange flowers*, 7 *lb.; fresh yellow peel of the bigarade* or *Seville orange*, ½ *lb.; water*, 2 gall.; macerate 24 hours, and distil 1 gall. In many cases,

ordinary orange-flower water is sold for *eau de naphe.*

Rose Water. From *otto of roses*, 3 dr.; *rectified spirit* (warm), 1 pint; dissolve, add of *hot water*, 10 gall.; mix in a 12-gallon carboy, cork, and well agitate the whole until quite cold. This makes the ordinary rose water of the shops, and is really excellent; but it is better for distillation. See *Distilled Waters.*

Unparalleled Water; Eau Incomparable. From *oil of lemon*, 4 dr.; *oil of bergamot*, 2½ dr.; *oil of cedrat*, 2 dr.; *rectified spirit*, 3½ pints; *Hungary water*, ½ pint; mix, and distil all but 9 oz. (Guibourt.)

WATERS (Perfumed, — Ammoniated). See *p.* 960.

WATERS (Saline). See *page* 1291.

WATER BRASH. See *Pyrosis.*

WATER-COLOUR CAKES. These are *prepared* from any of the *ordinary pigments* that work well in water, made into a *stiff* and *perfectly smooth paste* with *gum water*, or *isinglass size*, or a *mixture* of the two, and then compressed in polished steel moulds, and dried. See *Destemper*, and the *respective pigments.*

WATER CRESS. The *nasturtium officinale* (sisymbrium nasturtium,—Linn.), a well-known plant of the natural order *cruciferæ.* It is alterative and antiscorbutic, and was formerly used in medicine, but now chiefly as a salad, or a refreshing relish at breakfast.

WATER-POX. See *Chicken-pox.*

WATERPROOFING. Cloth is "waterproofed" as follows:—

1. Moisten the *cloth*, on the *wrong side*, first with a *weak solution of isinglass*, and, when dry, with an *infusion of nut-galls.*

2. As the last, but substitute a *solution of soap* for isinglass, and another of *alum* for galls.

3. (*Hancock's Patent.*) By spreading the *liquid juice* of the *caoutchouc tree* upon the *inner surface* of the goods, and allowing them to dry in the air. Absolutely chimerical.

4. (*Potter's Patent.*) The *cloth* is first embued on the *wrong side* with a *solution of isinglass*, *alum*, and *soap*, by means of a brush; when dry, it is brushed on the same side against the grain, and then gone over with a brush dipped in *water.* Impervious to water, but not to air.

5. (*Sievier's Patent.*) By applying first a solution of *Indian rubber in oil of turpentine*, and afterwards *another Indian rubber varnish*, rendered very drying by the use of driers. On this, wool or other material of which the fabric is made, cut into proper lengths, is spread, and the whole passed through a press, whereby the surface acquires a nap or pile.

6. A simple method of rendering cloth waterproof *without* being *airproof*, is to spread it on any smooth surface, and to rub the *wrong side* with a *lump* of *bees' wax* (perfectly pure and free from grease), until it presents a slight, but even white or grayish appearance; a *hot iron* is then to be passed over it, and the cloth being brushed whilst warm, the process is complete. When the operation has been skilfully peformed, a candle may be blown out through the cloth, if coarse, and yet a piece of the same, placed across an inverted hat, may have several glassfuls of water poured into the hollow formed by it, without any of the liquid passing through. Pressure or friction will alone make it do so. During the last 20 years we have shown this to numerous cloth-manufacturers, waterproofers, tailors, and others, several of whom have adopted the method very extensively, and with perfect success.

WATERPROOF LIQUID. *Prep.* 1. *Indian rubber*, in fragments, 1 *oz.; boiled oil*, 1 pint; dissolve by heat, carefully applied, then stir in of *hot boiled oil*, 1 pint; and remove the vessel from the fire.

2. *Boiled oil*, 1 pint; *bees' wax* and *yellow rosin*, of each, 2 *oz.*; melt them together.

3. *Salad oil*, 1 pint; *mutton suet*, ¼ *lb.*; *white wax* and *spermaceti*, of each, 1 *oz.*; as the last. For "ladies' work."

Obs. The above are used for boots, shoes, harness, leather straps, leather trunks, &c., applied warm before the fire.

WAX. Syn. *Bees' Wax, Yellow do.; Cera*,—Ph. L. *Cera Flava*,—Ph. E. & D. The substance which forms the cells of bees; obtained by melting the comb in water, after the honey has been removed, straining the liquid mass, remelting the defecated portion, and casting it into cakes.

Pure bees' wax has a pleasant ceraceous odour, a pale yellowish brown colour, and the sp. gr. 0·960 to 0·965. It is brittle at 32°, softens and becomes plastic at 88 or 90°, and melts at 154 to 155° Fahr. It is *very frequently adulterated* with *farina*, *rosin*, and *mutton suet* or *stearine.* Dr. Normandy met with a sample containing 28% of effloresced *sulphate of soda.* The *first* may be detected by oil of turpentine, which dissolves only the wax,—the *second*, by its solubility in cold alcohol, and by its terebinthinate taste,—the *third* and *fourth*, even when forming less than 2% of the wax, may be detected by it affording sebacic acid on distillation. When greasy matter is

present in any considerable quantity, it *may* also be detected by the suspected sample having an *unctuous* feel, and a disagreeable taste. *Saline matter* may be detected by the loss of weight, when a weighed quantity of the wax is boiled in water. *Heavy substances*, as *chalk*, *plaster of Paris*, *white lead*, *oxide of zinc*, &c., may also be thus separated, since they subside, owing to their superior gravity, to the bottom of the vessel. The fracture of wax containing *rosin*, or any *fatty matter*, is smooth instead of granular; and, when the first of these is present, it burns with a smoky, instead of a clear white flame.

Factitious Wax; Cera Flava Factitia,—Lat. A spurious compound sold by the farrier's druggists for veterinary purposes. —1. From *yellow rosin*, 16 *lb.*; *hard mutton suet* or *stearine*, 8 *lb.*; *palm oil*, 2½ *lb.*; melted together.

2. As last, but substituting *turmeric*, 1 *lb.*, for the palm oil.

3. *Best annotta*, 6 *oz.* or q. s.; *water*, 1 gall.; boil, add of *hard mutton suet* or *stearine*, 35 *lb.*; *yellow rosin*, 70 *lb.*; again boil with constant agitation until perfectly mixed and of a proper colour, and as soon as it begins to thicken, pour it out into basins to cool. When cold rub each cake over with a little *potato starch*.

WAX (Bleached). See *White Wax*.

WAX (Etching). See *Etching* and *Varnishes*.

WAX (Gilder's). See *page* 519.

WAX (Grave). See *Adipocere*.

WAX (Modeling). *Prep.* Take of *bees' wax*, *lead plaster*, *olive oil*, and *yellow rosin*, equal parts; *whiting*, q. s. to form a paste; mix well, and roll it into sticks. Colours may be added at will.

WAX (Refined). *Crude wax*, especially that imported, is generally loaded with dirt, bees, and other foreign matter. To free it from these substances, it undergoes the operation of "*refining*." This is done by melting *the wax* along with about 4 or 5% of *water* in a *bright copper* or *stone-ware boiler*, preferably heated by steam, and after the whole is perfectly liquid, and has boiled for some minutes, withdrawing the heat, and sprinkling over its surface a little *oil of vitriol*, in the proportion of about 5 or 6 fl. oz. to every *cwt.* of *wax*. This operation should be conducted with great care and circumspection; as, when done carelessly, the melted wax froths up, and boils over the sides of the pan. The acid should also be *well scattered* over the *whole surface*. The melted wax is next covered over, and left for some hours to settle, or until it becomes sufficiently cool to be drawn off for "*moulding*." It is then *very gently* skimmed with a *hot ladle*, baled or decanted into *hot tin* "*jacks*," and by means of these poured into basins, where it is left to cool. Great care must be taken not to disturb the sediment. When no more clear wax can be drawn off, the remainder in the melting pan is allowed to cool, and the cake, or "*foot*" as it is called, is taken out, and the impurities (mostly bees) scraped from its under surface. The scraped cake is usually reserved for a second operation; but if required, it may be at once remelted, and strained through canvass into a mould.

Much of the *foreign wax* has a *pale dirty colour*, which renders it, no matter however pure, objectionable to the retail purchaser. Such wax undergoes the operation of "*colouring*" as well as "*refining*." A small quantity of the *best roll annotta*, cut into slices, (¼ lb more or less, to wax 1 cwt., depending on the paleness of the latter,) is put into a clean boiler with about a gallon of *water*, and boiled for some time, or until it is perfectly dissolved, when a few ladlefuls of the *melted wax* are added, and the boiling continued until the wax has taken up all the colour, or until the water is mostly evaporated. The *portion of wax* thus treated has now a deep orange colour, and is added, in quantity as required, to the *remainder* of the *melted wax* in the larger boiler until the proper shade of colour is produced when cold; the whole being well mixed, and a sample of it cooled now and then, to ascertain when enough has been added. The copper is next brought to a boil, and treated with *oil of vitriol*, &c., as before. Some persons add *palm oil* (bright) to the *wax* until it gets sufficient colour; but this plan is objectionable from the quantity required for the purpose being often so large as to injure the quality of the product; besides which the colour produced is inferior, and less transparent and permanent than that given by annotta.

Another method of *refining crude wax*, and which produces a *very bright* article, is to melt it in a large *earthen* or *stoneware vessel*, heated by steam or a salt-water bath, then to cautiously add to it about 1% of *concentrated nitric acid*, and to continue the boiling until *nitrous fumes* cease to be evolved, after which the whole is allowed to settle, and is treated as before.

Obs. The great art in the above process is to produce a wax which shall at once be "*bright*," or semi-translucent in thin pieces, and *good coloured*. The former is best ensured by allowing the melted mass to

settle well, and by carefully skimming and decanting the clear portion without disturbing the sediment. It should also not be poured into the moulds too warm, as, in that case, it is apt to "*separate*," and the resulting cakes to be "*streaky*," or of different shades of colour. It should also be allowed to cool *very slowly*. When cooled *rapidly*, especially if a current of air fall upon its surface, it is apt to crack, and to form cakes full of fissures. *Some persons* who are very nice about their wax, have the cakes polished with a stiff brush when quite cold and hard. It is absolutely necessary that the "*jacks*" or *cans*, *ladles*, and *skimmers* used in the above process, be kept *pretty hot*, as without this precaution the wax cools, and accumulates upon them in such quantity as to render them inconvenient, and *often* quite useless, without being constantly scraped out.

WAX (Sealing). *Prep.* 1. (*Red.*)—*a.* Take of *shell-lac* (very pale), 4 *oz.*; cautiously melt it in a bright copper pan over a clear charcoal fire, and when fused add of *Venice turpentine*, 1¼ *oz.*; mix, and further add of *vermilion*, 3 *oz.*; remove the pan from the fire, cool a little, weigh it into pieces, and roll them into circular sticks on a *warm marble slab* by means of a *polished wooden block*; or it may be poured into moulds whilst in a state of fusion. Some persons polish the sticks with a rag until quite cold.

b. From *shell-lac*, 3 *lb.*; *Venice turpentine*, 1¼ *lb.*; *finest cinnabar*, 2 *lb.*; mix as before. Both the above are "*fine*."

c. As the last, but using ½ *less* of *vermilion*. Inferior.

d. Rosin, 4 *lb.*; *shell-lac*, 2 *lb.*; *Venice turpentine* and *red lead*, of each, 1½ *lb.*; as before. Common.

2. (*Black.*)—*a.* From *shell-lac*, 60 parts; *finest ivory-black*, reduced to an impalpable powder, 30 parts; *Venice turpentine*, 20 parts. Fine.

b. Rosin, 6 *lb.*; *shell-lac* and *Venice turpentine*, of each, 2 *lb.*; *lampblack*, q. s. Inferior.

3. (*Gold-coloured.*) By stirring *gold-coloured mica spangles* or *talc*, or *aurum musivum*, into the melted resins just before they begin to cool. Fine.

4. (*Marbled.*) By mixing 2 or 3 different coloured kinds just as they begin to grow solid.

5. (*Soft.*)—*a.* (*Red.*) Take of *bees' wax*, 8 parts; *olive oil*, 5 parts; melt, and add of *Venice turpentine*, 15 parts; *red lead*, to colour.—*b.* (*Green.*) As the last, but substituting *powdered verdigris* for red lead. Both are used for sealing official documents kept in tin boxes; also as a cement.

6. (*Bottle Wax.*)—*a.* (*Black.*) From *black rosin*, 6½ *lb.*; *bees' wax*, ½ *lb.*; *finely powdered ivory-black*, 1½ *lb.*; melted together.—*b.* (*Red.*) As the last, but substitute *Venetian red* or *red lead* for ivory-black.

Obs. All the above forms for "*fine*" wax produce "*superfine*," by employing the best qualities of the ingredients; and "*extra-superfine*" or "*scented*," by adding 1% of *balsam of Peru* or *liquid storax* to the ingredients when considerably cooled. The "*variegated*" and "*fancy-coloured kinds*" are commonly *scented* with a little *essence of musk* or *ambergris*, or any of the more fragrant essential oils. The addition of a *little camphor*, or *spirit of wine*, makes sealing-wax burn easier. Sealing-wax containing rosin, or too much turpentine, runs into thin drops at the flame of a candle.

WAX (White). Syn. *Bleached Wax*; *Cera Alba*,—Ph. L. E. & D. *Prep.* From *pure bees' wax*, by exposing it in thin flakes to the action of the sun, wind, and rain, frequently changing the surface thus exposed, by remelting it, and reducing it again to thin flakes. *Used* in making candles, and in white ointments, pommades, &c., for the sake of its colour. *Block White-wax* (*cera alba in massis*) is the above when cast into blocks; the best foreign is always in this form. *Virgin Wax* (*Cake white wax*; *cera alba in offis*) should be the last made into round flat cakes; but this is seldom the case, the mixture sold under the name generally containing from 1-3rd to 1-2nd its weight of spermaceti. The white wax (?) supplied by certain wholesale druggists to their customers, is often totally unfit for the purposes to which it is applied. The presence of spermaceti in wax is shown by its reduced melting point, by its bending before it breaks, and by its flavour when chewed. The *pela*, or natural white wax of the Chinese, is an animal wax, produced by the *cicada limbata*, a species of *coccus*, to protect its larva.

WEIGHT. The quantity of a body determined by means of a balance, and expressed in terms having reference to some known standard; the measure of the force of gravity, from which the relative quantity of a body is inferred. The *relation* between the *weight* and *volume* of a body, compared to a given standard taken as unity, constitutes its *specific gravity*.

For the *purpose* of *weighing*, a *balance* or *lever* is required, which, when accurately

suspended in a state of equilibrium, will be affected, in precisely an equal manner, by like weights applied to its extremities. Hence, the construction of such an instrument is not more difficult than its application is important in chemical and philosophical research. A balance, made by Ramsden, turning on points instead of edges, was sensibly affected by the 1-1600th of a gr. when loaded with 5 oz. This is 1-1,384,000th part of the weight; so that by means of this beam the weight of any substance might be determined to 5 places of decimals, besides a sixth figure, which might be estimated. (*Phil. Trans.*, vol. 75.) A balance in possession of the Royal Society, made by the same artist, is capable of weighing 10 *lb.*, and is said to turn with the 1-100th of a gr., which is only the 1-7,000,000th part of the load. A *balance* with *arms of unequal length* or *weight*, will weigh as accurately as another of the same workmanship with *equal arms*, provided the substance weighed be removed, and standard weights placed in the same scale until the equilibrium be again restored, when the weights so employed being exactly in the same condition as the substance previously occupying the scale, will, of course, indicate its proper weight. A knowledge of this fact is useful, as it enables any one to *weigh correctly* with *unequal scales*, or with *any suspended lever*.

Small weights may be made of thin leaf brass. *Jewellers' foil* is a good material for weights below 1-10th of a grain as low as to the 1-100th of a grain; but *aluminium*, from its small sp. gr., is better for this purpose than any other metal. Quantities below the 100th of a gr. may be either estimated by the position of the index, or shown by actually counting rings of wire, the value of which has been previously determined. The *readiest* way to *subdivide small weights*, consists in weighing a certain quantity of *very fine wire*, and afterwards cutting it into such parts, by measure, as are desired; or the wire may be wrapped close round two pins, and then cut asunder with a knife. By this means it will be divided into a great number of equal lengths, or small rings.

The following Tables represent the values and relative proportions of the principal weights employed in Commerce and the Arts.

I. English Weights.

1. *Imperial Avoirdupois Weight.*

Old Drachms	New Drachm of the Ph. D. *dr.*	Ounces. *oz.*	Pounds. *lb.*	Quarters *qr.*	Hundred weight. *cwt.*	Ton.	Equiv. in Grains. (*Troy*).	Equiv. in French grammes	Equiv. in Minims or measured drops.
1·	·5	·0625	·0039	.	.	.	27·34375	1·7714	·

28672·	14336·	1792·	112·	4·	1·	·0	784,000·		
573440·	286720·	35840·	2240·	80·	20·	1·	15,680,000·		

*** The *standard* in *avoirdupois weight* is the same as in troy weight. The *old avoirdupois drachm* is now never used except in weighing silk; whenever a drachm is mentioned in commerce, the 1-8th of the *avoird. oz.* is intended, which, together with other divisions, is now adopted in the Ph. D. The *stone* of *butcher's meat* is 8 *lb.*, and of other commodities 14 *lb.*, in London.

Avoird.

1 *lb.* = 1·21577 ℔, or 1 ℔ 2 oz. 4 dr. 40 gr. Troy.
1 *oz.* = ·9114583 oz., or 7 dr. 17·5 gr. ,,

1 *lb. distilled water* (therm. 62°, barom. 30 in.) = 27·72740 cubic inches.
1 *oz.* ,, ,, = 1·73296 ,,
1 *dr.* ,, ,, = ·21662 ,,

†‡† Avoirdupois weight is *distinguished* in this *work* by the *abbreviations* referring to it being printed in italics.

2. *Imperial Troy Weight.*

Grains. gr.	Pennyweights. dwt.	Ounces. oz.	Pound. lb. or ℔.
24	1		
480	20	1	
5760	240	12	1

*** The *standard* of the *above measure* is 1 cubic inch of *distilled water*, which at 62° Fahr., and 30 inches of the barometer, weighs 252·458 troy grains

The *carat* used in weighing diamonds is $3\frac{1}{6}$ grains (nearly). Troy weight is employed in weighing *gold*, *silver*, *jewellery*, &c., and, under a somewhat modified form, in medicine and philosophical experiments. (See *below*.)

3. *Apothecaries' Weight.*

(Modified Troy Weight.)

Grains (*Troy*). gr.	Scruples. ℈	Drachms ʒ	Ounces. ℥	Pounds. ℔	Equiv. in French grammes.	Equiv. in Minims or measured drops.	Equiv. in cubic inches.	Equiv. in Avoirdupois weight.
1·	·05	·01666	·002083	·0001736	·06475	1·09	·003961055	1· gr.
20·	1·	·3333	·0416	·003472	1·295	21·94	·07922109	20· „
60·	3·	1·	·1250	·0104166	3·885	65·82	·23766329	60· „
480·	24·	8·	1·	·0833333	31·08	526·62	1·90130635	1 *oz.* 42·5 „
5760·	288·	96·	12·	1·	372·96	6319·54	22·81567609	13 „ 72·5 „

*** Apothecaries' weight is employed in prescriptions and dispensing, and is the one recognised in the British pharmacopœias, with the exception of the new Ph. D., in which avoirdupois weight, as modified above, is ordered.

†‡† The same *abbreviations* being commonly used to represent both the *avoirdupois* and the *troy* or *apothecaries'* pound, it is necessary to observe, that the *former* is indicated when this sign is *preceded* by *Arabic figures;* and the *latter*, when it is *followed* by *Roman numerals.* It was also formerly used along with Roman numerals, to represent the wine-pint. In *this work* the *abbreviations* representing Troy Weight are *printed* in Roman characters.

Troy.		*Avoirdupois.*
1 ℔ is	equivalent to	0·822857 *lb.*
1 oz.	„	1·097143 *oz.*

II. French Weights.

1. *Metrical or Decimal Weights.*

Names.	Equiv. in Grammes.	Equiv. in Troy grains.	Equiv. in Avoirdupois weight.			Equiv. in Apothecaries' weight.			
			lb.	*oz.*	*gr.*	℔	oz.	dr.	gr.

18432·	768·	256·	32·	2·	1·	1000·	1000·	2 3¼ 13·

*** The old French grain is equal to 0·820 of an imperial troy grain; hence 1 troy grain is equal to 1·21 old French grains. The gros, once, and other multiples of the grain are of course proportionate. The new French grain (of 1812) is equal to 0·0542 gramme, or 0·8365228 gr. troy. It is said, in some works, to be equal to 0·878 gr. troy; or in round numbers, 0·9, but this is much too high.

III. Continental Medicinal Weights, *in Troy Grains.*

(From Dr. Christison's Dispensatory.)

Venetian . .	4661·4	388·45	48·55	—	16·18	0·809

WELCH RAREBIT. *Prep.* Cut slices of *bread*, toast and butter them; then cover them with *slices* of *rich cheese*, spread a little *mustard* over the cheese, put the bread in a cheese-toaster before the fire, and in a short time serve it up very hot.

WELD. Syn. *Woald.* The *reseda luteola* (Linn.), an herbaceous annual employed by the dyers. A *decoction* of the *stems* and *leaves* gives a rich YELLOW to goods mordanted with *alum*, *tartar*, or *muriate of tin.* See *Luteoline* and *Yellow Pigments.*

WEN. The popular name of pulpy encysted and fleshy tumours of the face and neck.

WHEAT. Syn. *Triticum*,—Lat. The *ripe seed* or *fruit* of several varieties of *triticum vulgare* (Linn.), of which the principal are *triticum æstivum* or spring wheat, *triticum hybernum* or winter wheat, and *triticum turgidum* or turgid wheat, the last two of which include several red and white sub-varieties. Of all the cereal grains *wheat* appears to be that best adapted for bread corn, not merely on account of its highly nutritious character, but also on account of the power it possesses, from its richness in gluten, of forming a light and agreeable loaf by the process of fermentation.

According to Sir H. Davy, good English wheat contains of *gluten*, 19%; *starch*, 77%; *insoluble matter*, 4 to 5%.

The *average weight* of *good wheat* per *bushel* is from 58 to 60 *lb.*; and its *average yield* of *flour* is fully 12½ *lb.* for every 14 *lb.* The *weight* of the *straw* is said to be about double that of the grain. The *produce* per *acre* varies from 12 to 60, or even 64 bushels an acre. See *Flour*, *Starch*, &c.

WHEAT (Buckwheat). Syn. *Fagopyrum.* The *seed* of *polygonum fagopyrum* (Linn.), a plant of the natural order *polygoneæ* (De Cand.) It makes excellent cakes, crumpets, and gruel. In North America, *buckwheat cakes*, or rather *fritters*, are in general use at breakfast, eaten with molasses.

WHEAT (Indian). See *Maize.*

WHEAT (Steeps for). *Quicklime*, *sulphate of zinc* or white vitriol, *sulphate of copper* or blue vitriol, and *arsenious acid* or white arsenic, are the substances chiefly employed for this purpose. About 5 *lb.* of the *first* (slaked and made into a milk with water), 1¼ *lb.* of the *second*, 1 *lb.* of the *third*, and 3 or 4 *oz.* of the last, are regarded as sufficient for each sack of seed. The *method of applying them* is either to dissolve or mix them with just sufficient *water* to cover the *seed*, which is then to be soaked in the mixture for a few hours, or a less quantity of water is employed, and the more concentrated solution is, at intervals, well sprinkled, by means of a "watering pot," over the *seed wheat* spread upon the barn floor, the action being promoted by occasional stirring.

Obs. The first two substances above named have been separately proved to be amply sufficient to destroy the "*smut*" in seed wheat, and are perfectly harmless in their effects, which renders them greatly preferable to arsenic, or even to sulphate of copper. Nearly all the numerous advertised "*Anti-smuts*" or nostrums to prevent the smut in wheat, contain one or other of the last three of the above substances. "*Down's Farmer's Friend*" is an old and well-tried compound, and deserves the extensive and high patronage which it has received.

WHEY. Syn. *Petit-lait*,—Fr. *Serum Lactis*,—Lat. The liquid portion of milk after the curd has been separated. It consists chiefly of *water*, holding in solution 3 or 4% of *sugar of milk*. A pound of milk, mixed with a table-spoonful of proof spirit, allowed to become sour, and the whey filtered from the sediment, yields, in the course of a few weeks, a good vinegar (*whey vinegar*) free from lactic acid. (Scheele.) Skimmed milk may be used.

WHEY (Alum). Syn. *Serum Lactis Aluminatum*,—Lat. *Prep.* Take of *powdered alum* 1 dr.; *hot milk*, 1 pint; simmer a few seconds, let it repose for a short time, and strain the whey from the coagulum. *Used* in diarrhœa, &c.; a wine-glassful after every motion. *Acid whey* (*serum lactis acidum*) may be prepared in a similar manner, by substituting ½ dr. of tartaric or citric acid for the alum. *Orange whey* and *lemon whey* are prepared from the juice of the respective fruits, with a little of the yellow peel to impart flavour.

WHEY POWDER. *Prep.* 1. From *whey* gently evaporated to dryness, and powdered along with about 1-3rd of its weight of *lump sugar.*

2. *Sugar*, 7 *oz.*; *sugar of milk*, 2 *oz.*; *gum arabic*, 1 *oz.* (all in fine powder); mix well. 1 *oz.* dissolved in 1¼ pint of water forms *extemporaneous whey.*

WHISKEY. Dilute alcohol obtained from the fermented wort of malt or grain. That from the *former* is the most esteemed. The *inferior qualities* of this spirit are prepared from *barley*, *oats*, or *rye*, a small portion only of which is malted, or from *potatoes* mashed with a portion of barley malt, the resulting wash being carelessly fermented and distilled, and purposely suffered to burn, to impart the peculiar empyreumatic or smoky flavour so much relished by the lower orders of whiskey-drinkers. The malt whiskey (sold as such) of the principal Scotch and Irish distillers, is fully equal in quality to London gin, from which it merely differs in flavour. The peculiar flavour of *whiskey* may be nicely imitated by adding a *few drops* each of *pure creasote* and *purified fusel oil* to 2 or 3 gallons of *good London gin*; and the imitation will be still more perfect if the liquor be kept for some months before drinking it. See *Gin*, *Spirits*, and *Usquebaugh.*

WHITE ARSENIC. See *page* 87.

WHITE BAIT. The *clupea iatulus* (clupea alba,—Yarrell), a very small and delicate fish, common in the brackish waters of the Thames from April to September. When fried in oil it is esteemed a great luxury by epicures.

WHITE COPPER. See *German Silver* and *Packfong.*

WHITE HELLEBORE. Syn. *Veratrum*,—Ph. L. & E. *Veratri Albi Radix*,—Ph. D. 1826, & Ph. E. 1817. "The *rhizome* of *veratrum album*, Linn., or white hellebore." (Ph. L.) A powerful acrid cathartic, emetic, and sternutatory. It is now seldom exhibited internally, and its external use over a large or ulcerated surface is not unaccompanied with danger. *Dose.* ½ to 2 gr. of the powder, made into a pill; in gout, mania, &c.; or 1 to 3 gr., carefully triturated with 12 or 15 gr. of liquorice powder, as an errhine, in amaurosis, &c.

WHITE LEAD. See *below.*

WHITE PIGMENTS. Among these are—

Alum White, Baumé's do. Take of *powdered Roman alum*, 2 *lb.*; *honey*, 1 *lb.*; mix,

dry, powder, calcine in a shallow dish to whiteness, cool, wash, and dry. A beautiful and permanent white both in oil and water.

Derbyshire White. From *cawk* or *heavy spar*, by grinding and elutriation.

Flake White. The finer kinds of white lead are so called.

Mineral White. Precipitated carbonate of lead.

Newcastle White. White lead made with molasses vinegar.

Nottingham White. White lead made with alegar. Permanent white is now commonly sold for it.

Pearl White, Fard's Spanish White. Trisnitrate of bismuth.

Permanent White. Artificial sulphate of baryta, *prepared* by precipitating *chloride of barium* with *dilute sulphuric acid*, or a *solution of glauber salts*. A good fast white, unchanged by sulphurous fumes. *Used* to mark jars and bottles for containing acids or alkalies, as it is affected by very few substances; also to adulterate white lead.

Spanish White; Blanc d'Espagne, Blanc de Troyes. The softest and purest white chalk, elutriated, made into balls, and well dried. *Used* as a cheap white paint.

White Lead, Fine White, Flake do., Carbonate of Lead, Subcarbonate of Lead, Basic Carbonate of do., White Oxide of do., Ceruse, Magistery of Lead; Cerussa, Plumbi Subcarbonas; Plumbi Carbonas,—Ph. E. & D., & Ph. L. 1836. Made by suspending *rolls* of *thin sheet-lead* over *malt vinegar*, or *pyroligneous acid*, in close vessels, the evaporation from the acid being kept up by the vessels being placed in a heap of dung, or a steam bath.—*Obs.* Commercial carbonate of lead is never quite pure, and is generally *largely adulterated* with native sulphate of baryta (*heavy spar*), and sometimes with *chalk*. The *former* may be detected by its insolubility in dilute nitric acid, and the *latter* by the nitric solution yielding a white precipitate with dilute sulphuric acid, or a solution of oxalic acid or oxalate of ammonia, after having been treated with sulphuretted hydrogen, or a hydrosulphuret, to throw down the lead. "*Pure carbonate of lead* does not lose weight at a temperature of 212° Fahr.; 68 gr. are entirely dissolved in 150 minims of acetic acid diluted with 1 fl. oz. of distilled water; and the solution is *not entirely* precipitated by a solution of 60 gr. of phosphate of soda." (Ph. E.) The solution in nitric acid should not yield a precipitate when treated with a solution of sulphate of soda.—*Used* as a superior white paint, and in *medicine*, as an external astringent, refrigerant, and desiccant.—The numerous synonoymes acquired by this substance have arisen from the indeterminate ideas which have prevailed as to its composition. It is now ascertained that the *best white lead*, prepared by the slow process referred to above, is a mixture of 2 atoms of *carbonate of lead* and 1 atom of *oxide of lead* hydrated with 1 atom or about $2\frac{1}{2}$ % of *water*, the compound being in a pulverulent and absolutely amorphous condition. The particles of white lead prepared by precipitation (see *p.* 680), or by any of the quick processes, are in a somewhat crystalline and semitranslucent condition, and hence, do not cover so well as that just noticed.

Dutch White Lead.—a. (Finest). From *flake white*, 1 cwt.; *cawk*, 3 cwt.—*b.* (Ordinary.) *Flake white*, 1 cwt.; *cawk*, 7 cwt. These form the best white lead of the shops.

English White Lead. Flake white *lowered* with *chalk*. Covers badly, and the colour is inferior to the preceding.

French White Lead; Blanc de Plomb. From *litharge* dissolved in *vinegar*, and the lead thrown down by a current of *carbonic acid gas* from coke. Does not cover so well as flake white.

Grace's White Lead. Made from *sheet lead*, with the *refuse water* of the *starch-makers*, *soured brewer's grains*, &c.

Hamburg White, Hamburg White Lead. From *flake white*, 1 cwt.; *cawk*, 2 cwt. Also sold for *best Dutch white lead.*

Venetian White, Venetian White lead; Cerussa Veneta. From *flake white*, or *pure white lead* and *cawk*, equal parts.

White Precipitate of Lead, Miniature Painter's White, Sulphate of Lead. From an *acetic* or *nitric solution of litharge*, precipitated by adding *dilute sulphuric acid*, and the white powder washed and dried. The clear liquid decanted from the precipitate is poured on fresh litharge, when a second solution takes place; and this may be repeated for any number of times. *Used* in miniature painting, being a beautiful and durable white.

Whiting. The same as prepared chalk, but prepared more carelessly, in horse-mills.

Wilkinson's White. From *litharge* ground with *sea water* until it ceases to whiten, and then washed and dried.

Zinc White (Hubbock's). A hydrated oxide of zinc. It possesses the advantage of being innocuous in use, and not being blackened by sulphuretted hydrogen like white lead.

WHITE SWELLING. Syn. *Hydarthrus*,—Lat. A variety of indolent, malignant, scrofulous tumour attacking the knee,

ankle, wrist, and elbow, especially the first.

WHITES. See *Leucorrhœa.*

WHITES (Sharp). *Prep.* 1. From *wheaten flour* and *powdered alum*, equal parts, ground together.

2. (*Stuff; Baker's Stuff.*) From *alum*, ground to the coarseness of common salt, 1 *lb.*; *common salt*, 3 *lb.*; mixed together. Both the above are used by bakers for the purpose of clandestinely introducing alum into their bread.

WHITEWASH. *Whiting* made into a milk with *water*, holding in solution a little *fresh size.* When employed as a *disinfectant*, *milk of lime*, made from *freshly slaked lime* and *water*, should alone be used.

WHITING. See *White Pigments.*

WHITING. The *gadus merlangus* (Linn.), a member of the cod family of fishes (*gadidæ*). It is a very light and nutritious fish, and well adapted to dyspeptics and invalids; but it has too little flavour to be a favorite with gourmands.

WHITLOW. Syn. *Whitloe; Paronychia.* A painful inflammation, tending to suppuration and abscess, at the ends of the fingers, and mostly under or about the nails. Emollient poultices are useful in this affection; extreme tension and pain may be relieved by an incision so as to allow the exit of the pus or matter from under the nail. The *treatment* must also be directed to establish the general health, as without this, local remedies often fail.

WHOOPING-COUGH. Syn. *Chin-cough, Kin-cough; Pertussis,*—Lat. A convulsive strangling cough, characterised by peculiar sonorous or whooping inspirations, from which its popular name is taken. It comes on in fits, which are usually terminated by vomiting. It is infectious, chiefly attacks children, and, like the small-pox, only occurs once during life.

The *treatment* of *whooping-cough* consists, chiefly, in obviating irritation, and in exciting nausea, and occasional vomiting. For the first, *aperients* and *sedatives* (hemlock or henbane) in *small doses* may be given; for the *second* intention, an *extremely weak* sweetened solution of *tartarized antimony*, or a *mixture* containing *squills* or *ipecacuanha* may be administered in small doses every hour or two, according to the effect produced. In full habits *blisters* and *leeches* may be resorted to; and in all cases *opiate* and *stimulating embrocations* may be applied to the chest and spine with advantage. Whenever the head is affected the use of narcotics is contra-indicated. The *hot bath* is often serviceable. A mixture of cochineal and carbonate of potassa is by some regarded as almost a *specific* for this disease; but our own observations lead us to look with more favour on antimonial nauseants and emetics. See *Antimonials, Draughts, Mixtures, Oxymels, Syrups, Wines, &c.*

WHORTLEBERRY (Bear's). Syn. *Uva Ursi,* — Ph. L. E. & D. The *leaf* of *arctostaphylos uva ursi*, *trailing arbutus*, or *bear-berry.* Astringent. *Dose.* 10 to 30 gr. of the powder, thrice daily. See *Decoctions* and *Extracts.*

WIKANA. Syn. *Wacaka des Indes,*— Fr. *Prep.* (Guibourt.) *Roasted chocolate nuts* (ground), 2 oz.; *powdered cinnamon*, 2 dr.; *powdered vanilla*, ½ dr.; *ambergris*, 3 gr.; *musk*, 1½ gr.; *sugar*, 6 oz.; well mixed together. A tea-spoonful is boiled with ½ pint of milk, or arrow-root, as a stimulating diet for convalescents.

WILDFIRE RASH. Strophulus volaticus.

WILLOW. Syn. *Salix,*—Lat. The *barks* of *salix alba* (Linn.) or white willow, *salix fragilis* (Linn.) or crack willow, and *salix caprea* (Linn.) or great round-leaved willow (*willow bark; salicis corticis,*—Ph. E.), were officinal in the Ph. D. 1826; and with that of *salix Russelliana*, and other species, are rich in salicine, and hence possess considerable febrifuge power. *Dose.* ½ to 1 dr., either in powder, or made into a decoction; as a substitute for Peruvian bark, in agues, hectics, debility, dyspepsia, &c.

WINDOWS. A *prismatic* or *crystalline appearance*, may be imparted to windows by several expedients.—

1. Mix a *hot solution of sulphate of magnesia* (Epsom salt) with a *clear solution of gum arabic*, and lay it on hot. For a *margin*, or for *figures*, wipe off the part you wish to remain clear with a wet towel as soon as the surface has become cold and hard. The effect is very pretty, and may be varied by substituting *oxalic acid*, *red* or *yellow prussiate of potash*, or any other salt (not efflorescent), for the sulphate of magnesia. *Sulphate of copper* gives a very beautiful crystallization of a *blue colour.*

2. Evenly cover the *surface of the glass* with a layer of *thin gum water*, and sprinkle any of the saline crystals before noticed over it whilst wet. The *gum water* may be tinged of any colour to vary the effect.

A *blinded appearance* more or less resembling ground glass may be given as follows:—

1. By evenly dabbing the surface with a *piece* of *soft glazier's putty.*

2. A *coating* of *stained rice jelly*, laid on with a painter's brush (*sash tool*), and after-

wards dabbed with a duster brush, applied endways.

3. *Tissue paper*, either white or coloured, applied by means of clear *gum water* or some *pale varnish*. The pattern may be lined with a pencil, and when the whole is somewhat dry, but not hard, the lines may be cut through, and the pattern stripped off with the flat point of a knife.

4. The *surface of the glass* being coated with *mucilage*, or any *pale varnish*, as before, coarsely powdered *glass* or *quartz* reduced to a uniform state of grain by a sieve, may be sprinkled over it; when dry, the loose portion should be removed with a soft brush.

WINE. Syn. *Vin*,—Fr. *Vinum*,—Lat. The fermented juice of the grape. The general characters and quality of wine are principally influenced by climate, soil, and aspect, the nature and maturity of the grape, and the method of conducting the fermentation. The sp. gr. of the *must* varies from 1·063 to 1·285, from which the proportion of *saccharine matter* and the ultimate alcoholic richness of the wine resulting from its fermentation, may be inferred. That of Rhenish grapes seldom exceeds 1·095 to 1·100. Want of space compels us to confine our remarks chiefly to the *properties*, *uses*, and *management* of grape juice after it has passed through the stage of fermentation, or, in reality, become *wine*.

Officinal Wine. The only wine ordered by the British Colleges is sherry (*white wine; vinum Xericum*,—Ph. L.; *vinum album*,—Ph. E.; *vinum Hispanicum*,—Ph. D.); but several other wines are employed in medicine, as tonics, stimulants, antispasmodics, and restoratives, according to the circumstances of the case, or the taste of the patient. In *pharmacy*, the less expensive *Cape* or *marsala*, or even *raisin wine*, is usually substituted for sherry in the preparation of the *medicated wines* of the pharmacopœias.

Varieties, characteristics, &c. The following Tables will convey much useful information on this subject in a condensed form :—

I. Table *of the Quantity of Alcohol in Wine.* By Dr. Christison.

Names, &c.		Alcohol of 0·7939 per cent., by weight.	Proof Spirit per cent., by volume.
Port	Weakest	14·97	31·31
	Mean of 7 samples	16·20	34·91
	Strongest	17·10	37·27
	White	14·97	31·31
Sherry	Weakest	13·98	30·84
	Mean of 13 wines, excluding those very long kept in cask	15·37	33·59
	Strongest	16·17	35·12
	Mean of 9 wines long kept in cask in the East Indies	14·72	31·30
	Madre da Xeres	16·90	37·06
Madeira	Long kept in cask in the East Indies — Strongest	16·90	37·06
	Long kept in cask in the East Indies — Weakest	14·09	30·86
Teneriffe long in cask at Calcutta		13·84	30·21
Cercial		15·45	33·65
Lisbon (dry)		16·14	34·71
Shiraz		12·95	28·30
Amontillado		12·63	27·60
Claret. A first growth of 1811		7·72	16·95
Chateau-Latour. Do. 1825		7·78	17·06
Rosan. Second growth 1825		7·61	16·74
Ordinary Claret. (Vin Ordinaire.)		8·99	18·96
Rivesaltes		9·31	22·35
Malmsey		12·86	28·17
Rüdesheimer. 1st quality		8·40	18·44
,, Inferior		6·90	15·19
Hambacher. Superior quality		7·35	16·15

II. *Quantity of Alcohol* (sp. gr. 0·825* at 60° Fahr.) *in* 100 *parts of Wine by volume.*

Names of Wine.	Alcoholic Content.	Authority.
Alba Flora	17·26	Brande.
Barsac	13·86	do.
Bucellas	18·49	do.
Burgundy (average)	14·57	do.
Ditto	12·16	Prout.
Calcavella (average)	18·65	Brande.
Cape Madeira (do.)	20·51	do.
Cape Muschat	18·25	do.
Champagne (average)	12·61	do.
Ditto	12·20	Fontenelle.
Claret (average)	15·10	Brande.
Colares	19·75	do.
Constantia (White)	19·75	do.
Ditto (Red)	18·92	do.
Ditto (average)	14·50	Prout.
Côte Rôtie	12·32	Brande.
Currant	20·55	do.
Elder	8·79	do.
Frontignac (Rivesalte)	12·79	do.
Gooseberry	11·84	do.
Grape (English)	18·11	do.
Hermitage (Red)	12·32	do.
Ditto (White)	17·43	do.
Hock (average)	12·08	do.
Lachryma Christi	19·70	do.
Lisbon	18·94	do.
Lissa (average)	25·41	do.
Ditto (do.)	15·90	Prout.
Lunel	15·52	Brande.
Madeira (average)	22·27	do.
Ditto (do.)	21·20	Prout.
Malaga	17·26	Brande.
Ditto	18·94	do.
Malmsey Madeira	16·40	do.
Marsala (average)	25·09	do.
Ditto (do.)	18·40	Prout.
Nice	14·63	Brande.
Orange (average)	11·26	do.
Port (do.)	20·64	Prout.
Ditto (do.)	22·96	Brande.
Raisin (do.)	25·41	do.
Ditto (do.)	15·90	Prout.
Red Madeira (do.)	20·35	Brande.
Roussillon (do.)	18·13	do.
Sauterne	14·22	do.
Shiraz	15·52	do.
Sherry (average)	19·17	do.
Ditto (do.)	23·80	Prout.
Syracuse	20·00	do.
Ditto	15·28	Brande.
Teneriffe	19·79	do.
Tent	13·30	do.
Tokay	9·88	do.
Vidonia	19·25	do.
Vin de Grave	13·94	do.
Zante	17·05	do.

* Alcohol of 0·825 contains 92·6% of *real* or *anhydrous alcohol*; or, in the *language of the Excise*, is about 62½% o. p., and in round numbers may be said to be of about *twice* the *strength* of *brandy* or *rum*, as usually sold.

Composition. The constituents of wine are—*Alcohol*, which is one of its principal ingredients, and on which its power of producing intoxication chiefly depends;—*Sugar* which has escaped the process of fermentation, and which is most abundant in the sweet wines, as tokay, tent, frontignac, &c.;—*Extractive*, derived chiefly from the husk of the grape;—*Colouring matter*, also derived from the husk of the grape, and is extracted from it by the newly formed alcohol;—*Tartar*, or *bitartrate of potassa*, which constitutes the most important portion of the saline matter of wine;—*Odoriferous matter*, imparting the characteristic *vinous odour*, depending chiefly upon the presence of œnanthic acid and ether;—*Bouquet*, arising from essential oil, or amyl-compounds, probably existing under the form of ethers. Besides these, small quantities of *tannin*, *gum*, *acetic* and *malic acid*, *acetic ether*, *lime*, *&c.*, are found in wine. The *specific gravity* of *wine* depends on the richness and ripeness of the grapes used in its manufacture, the nature of the fermentation, and its age. It varies from about 0·970 to 1·041. That of *port* averages about 0·975; of *sherry*, 0·978; of *claret*, 0·972; of *Madeira*, 0·976. That of *Rhenish wine* ranges from 0·9925 to 0·9985, and is sometimes as high as 1·0022 to 1·0027. The sp. gr. of some rich samples of *mountain*, *malaga*, *tent*, and *lachryma Christi*, is occasionally so high as 1·039 or 1·040.

Purity. The most frequent species of *fraud in the wine trade* is the *mixing of wines of inferior quality* with those of a *superior grade.* In many cases the inferior kinds of foreign wine are flavoured and substituted for the more expensive ones. This is commonly practised with *Cape wine*, which, after having a slight "*nuttiness*" communicated to it by bitter almonds or peach kernels, a *lusciousness* or *fulness*, by honey, and *additional strength* by a little plain spirit or pale brandy, is made to undergo the operation of "*fretting in*," and is then sold for *sherry*. Formerly, it was a common practice of ignorant wine-dealers to add a little *litharge* or *acetate of lead* to their inferior wines to correct their acidity, but it is believed that this *highly poisonous substance* is now never employed in this country, *salt of tartar* being made to perform the same duty. The lead which is frequently detected in bottled wine, and which often causes serious indisposition, may be generally traced to shot being carelessly left in the bottles, and not to wilful fraud. *Sherry* is commonly *coloured*, in Spain, by the addition of *must* boiled down to ⅓ of its original volume; and in England, by *burnt brown sugar*, or spirit colouring. *Amontillado* (a very nutty wine) is frequently added to *sherries* deficient in flavour. Various other ingredients, as the essential *oil of almonds*, *bitter almonds* in substance, *cherry-laurel leaves*, *cherry-laurel water*, *&c.*, are also employed for a like purpose. In Portugal the *juice of elderberries* is very commonly added to *Port wine* to increase its *colour*, and *extract of rhatany* for the double purpose of *improving its colour* and imparting an *astringent taste.* In England, *beet-root*, *Brazil wood*, the *juices of elderberries* and *bilberries*, the *pressed cake of elder wine*, *extract of logwood*, *&c.*, are frequently added to port to deepen its colour; and *oak sawdust*, *kino*, *alum*, and *extract of rhatany* to increase its astringency. But the most *common adulterant of Port wine*, both in Portugal and this country, is "*jerupiga*" or "*geropiga*," a componnd of elder juice, brown sugar, grape juice, and crude Portuguese brandy. That imported here contains about 45% of proof spirit, and is allowed by the Customs-house authorities to be mixed with Port wine in bond. A *factitious bouquet* is also commonly given to wine by the addition of *sweetbriar*, *orris root*, *clary*, *orange flowers*, *elder-flowers*, *esprit de petit grain*, *&c.*

Tests. These, for the most part, are applicable to all fermented liquors:—

1. *Richness in Alcohol.* This may be found by any of the methods noticed under *alcoholmetry*, *porter*, and *tinctures*. The *carbonate of potash test* (p. 36, No. 6) is easily applied, and gives good approximate results. The *boiling point*, or the *ebullioscope*, will give the same still more correctly. When greater accuracy is required, the method of M. Gay-Lussac (No. 7) may be adopted with complete success.

2. *Saccharine* and *Extractive matter.* The *sp. gr.* corresponding to the alcoholic strength, last found, is deducted from the *real sp. gr.* of the sample, the difference divided by ·0025, or multiplied by 400, gives the weight of SOLID MATTER (chiefly sugar) in *oz.* per gallon (nearly).

3. *Narcotics.* These may be detected in the manner noticed at *page* 1029.

4. *Lead.* The *presence* of *lead* or *litharge* in wine may be readily detected by *sulphuretted hydrogen*, or a *solution* of any *hydrosulphuret*, which will, in that case, produce a black precipitate. (See *p.* 1316.)

5. *Potash* or *Soda* improperly present.

A *portion of the wine* is evaporated nearly to dryness, and then agitated with *rectified spirit;* the *filtered tincture*, holding in solution acetate of potassa, is then divided into two portions, one of which is tested for ACETIC ACID, and the other for the ALKALI.

6. *Alum.* A portion of the wine is evaporated to dryness, and ignited; the residuum is then treated with a small quantity of *hydrochloric acid*, the mixture evaporated to dryness, again treated with *dilute hydrochloric acid*, and tested with *liquor of potassa.* If a white bulky precipitate forms, which is soluble in an excess of caustic potassa, and which is re-precipitated by a *solution of sal ammoniac*, the sample examined contained ALUM.

7. *Oil of Vitriol.—a.* A drop or two of the *suspected wine* may be poured upon a piece of paper, which must then be dried before the fire. *Pure wine* at most only *stains* the paper, but one containing SULPHURIC ACID causes it to become *charred* and *rotten.* The effect is more marked on paper which has been previously smeared with starch-paste.

b. According to M. Lassaigne, *pure red wine* leaves, by *spontaneous evaporation*, a *violet* or *purple stain* on paper; whilst that to which SULPHURIC ACID has been added, even in quantity only equal to $\frac{1}{2000}$ to $\frac{1}{3000}$th part, leaves a *pink stain* in drying.

8. *Spurious Colouring-matter.—a.* Genuine red wines yield GREENISH GRAY precipitates with *sugar of lead*, and GREENISH ones with *potassa;* but those coloured with *elderberries*, *bilberries*, *litmus*, *logwood*, and *mulberries*, give DEEP BLUE or VIOLET precipitates, and those coloured with *Brazil wood*, *red sanders wood*, or *red beet*, give RED ones.

b. Pure red wine is *perfectly decoloured* by agitation with *recent hydrate of lime.*

9. *Artificial Flavouring.* This can only be detected by a discriminating and sensitive palate.

10. *Artificial Bouquet.* The substances added for this purpose may often be readily detected by a comparison of the sample with another of known purity.

Uses. The *uses* of *wine* as a *beverage* are too well known to require description. As a *medicine*, PORT WINE is most esteemed as an *astringent* and *tonic;* and SHERRY and MADEIRA as *stimulants* and *restoratives*, in diseases where the acidity of the former would be objectionable; CHAMPAGNE is reputed diuretic and excitant, but its effects are not of long duration; and the RHENISH WINES are regarded as refrigerant, diuretic, and slightly aperient. *Claret*, *Rhenish*, and *Moselle wines* are said to be the most wholesome. In *pharmacy*, wine is used as a menstruum.

MANAGEMENT OF WINE. *Age.* The sparkling wines are in their prime in from 18 to 30 months after the vintage, depending on the cellaring and climate. Weak wines, of inferior growths, should be drunk within 12 or 15 months, and be preserved in a very cool cellar. Sound, well-fermented, full-bodied still wines are improved by age, within reasonable limits, provided they be well preserved from the air, and stored in a cool place, having a pretty uniform temperature. See *Maturation* (below).

Bottling. The secret of bottling wine with success consists in the simple exercise of care and cleanliness. The BOTTLES should be all *sound*, *clean*, and *dry*, and perfectly free from the least *mustiness* or other odour. The CORKS should be of the best quality, and immediately before being placed in the bottles should be compressed by means of a "cork-squeezer." For superior or very delicate wines, the corks are usually prepared by placing them in a copper or tub, covering them with weights to keep them down, and then pouring over them boiling water, holding a little pearlash in solution. In this state they are allowed to remain for 24 hours, when they are well stirred about in the liquor, drained, and re-immersed for a second 24 hours in hot water, after which they are well washed and soaked in several successive portions of clean and warm rain water, drained, dried out of contact with dust, put into paper bags, and hung up in a dry place for use. The WINE should be *clear* and *brilliant*, and if it be not so, it must undergo the process of "fining" before being bottled. In fact, it is a common practice with some persons to perform this operation whether the wine require it or not; as, if it has been mixed and doctored, it "amalgamates and ameliorates the various flavours." The *bottles*, *corks*, and *wine* being ready, a fine clear day should be preferably chosen for the bottling, and the utmost cleanliness and care should be exercised during the process. Great caution should also be observed to avoid shaking the cask so as to disturb the bottoms. The remaining portion that cannot be drawn off clear should be passed through the "wine-bag," and when bottled, should be set apart as inferior to the rest. The coopers, to prevent breakage and loss, place each bottle, before corking it, in a small bucket having a bottom made of soft cork, and which is strapped on the knee of the bottler. They thus seldom break a

bottle, though they "flog" in the corks very hard. When the process is complete, the *bottles of wine* are stored in a cool cellar, and on *no account upright*, or in *damp straw*, but *on their sides*, in *sweet, dry sawdust* or *sand*.

Bouquet. See *Flavouring* and *Perfuming*.

Brandying. Brandy is frequently added to *weak* or *vapid wines*, to *increase* their *strength*, or to *promote* their *preservation*. In Portugal, *one third* of brandy is commonly added to *port* before shipping it for England, as without this addition it generally passes into the acetous fermentation during the voyage. A little good brandy is also usually added to *sherry* before it leaves Spain. By recent *regulations* of the *Customs of England*, 10% of brandy may be added to wines in bond, and the increased quantity is only charged the usual duty on wine. The addition of brandy to wine injures its proper flavour, and hence it is chiefly made to *port*, *sherry*, and *other wines*, whose flavour is so strong as not to be easily injured. Even when brandy is added to wines of the latter description they require to be kept for some time to recover their natural flavour. To promote this object, the *wine-doctors* employ the process called "*fretting in*," by which they effect the same change in 3 or 4 weeks, as would otherwise require some months, at the very least.

Cellaring. A wine-cellar should be dry at bottom, and either covered with good hard gravel, or be paved with flags. Its gratings or windows should open toward the north, and it should be sunk sufficiently below the surface to ensure an equable temperature. It should also be sufficiently removed from any public thoroughfare, so as not to suffer vibration from the passing of carriages. Should it not be in a position to maintain a regular temperature, arrangements should be made to apply artificial heat in winter, and proper ventilation in summer. In a celebrated wine-establishment known to the writer, where the cellars are above ground, a number of thermometers are suspended on the walls, and whenever the mercury sinks below 48° Fahr., several Arnot's stoves, arranged for that purpose, are immediately lighted, and their action properly watched and regulated.

Colouring. Wines are as commonly doctored in their colour as their flavour. A FAWN YELLOW and GOLDEN-SHERRY YELLOW are given by means of *tincture* or *infusion of saffron*, *turmeric*, or *safflower*, followed by a little spirit colouring, to prevent the colour being too lively. All shades of AMBER and FAWN to DEEP BROWN and BRANDY colour, are given by *burnt sugar*. *Cochineal* (either alone or with a little alum) gives a PINK colour;—*beet root* and *red sanders* give a RED colour;—the *extracts of rhatany* and *logwood*, and the *juice of elderberries*, *bilberries*, &c., give a PORT-WINE colour. A *hogshead of inferior pale sherry* or *white cape* is commonly converted into a *full-flavoured brown sherry* by the "honest" wine-dealer, by the addition of ¼ pint of *spirit colouring*, a gallon of *brandy*, and a few drops of the *essential oil of almonds* dissolved in a little *rectified spirit;* the whole being well mixed, and in a few days fined down.

Crusting. To make *port wine* form a *crust* on the *inside of the bottles*, a spoonful of *powdered catechu* or ½ a spoonful of *finely powdered cream of tartar* is added to each bottle before corking it, after which the whole is well agitated. It is also a common practice to put the *crust* on the bottle *before putting the wine into it*, by employing a *hot saturated solution of red tartar*, thickened with *gum* and some *powdered tartar*.

Deacetification. This is effected by the cautious addition of either *salt of tartar* or *carbonate of soda*. Wine so treated soon gets insipid by exposure and age; and, without care, the colour of red wines is thus frequently spoiled.

Deacidification. See *Detartarization* (below).

Decanting. This only refers to small quantities of wine, ready for consumption. In decanting wine, care must be taken not to shake or disturb the crust when moving it about or drawing the cork, particularly of port wine. Never decant wine without a wine-strainer, with some clean fine cambric in it, to prevent the crust and bits of cork going into the decanter. In decanting *port wine* do not drain it too close; as there are generally two thirds of a wine-glassful of thick dregs in each bottle, which ought to be rejected. In *white wine* there is not much settling; but it should nevertheless be poured off very slowly, the bottle being raised gradually.

Decolouring. The *colour of wine* is precipitated by *age* and by *exposure* to the *light*. It is also *artificially removed* by the action of *skimmed milk*, *lime-water*, *milk of lime*, and *fresh-burnt charcoal*. Wine-merchants avail themselves of this property for the purpose of whitening wines that have acquired a brown colour from the cask, or which are esteemed pale; and also for turning "pricked" red or dark-coloured wines into white wines, in which a small

degree of acidity is not so much perceived. In this way *brown sherry* is commonly converted into *pale* or *gold-coloured sherry*. For the latter purpose, 2 to 3 pints of *skimmed milk* are usually sufficient; but to *decolour red wine* 2 to 3 quarts or more will be required, according to the nature and intensity of the colour, or the shade of paleness desired. *Charcoal* is seldom used, as it removes the flavour as well as colour, but a little *milk of lime* may sometimes be advantageously substituted for milk, when the wine has much acidity, more particularly for *red wines*, which may even be rendered quite colourless by it.

Detartarization. Rhenish wines, even of the most propitious growths, and in the best condition, besides their tartar, contain a certain quantity of *free tartaric acid*, on the presence of which many of their leading properties depend. The excess of tartar is gradually deposited during the first years of the vatting, the sides of the vessels becoming more and more encrusted with it; but owing to the continual addition of new wine, and other causes, the liquid often gains such an excess of free tartaric acid, as to acquire the faculty of redissolving the deposited tartar, which thus again disappears after a certain period. The *taste* and *flavour* of the wine are thus exalted, but the excess of acid makes the wine less agreeable in use, and probably less wholesome. Amateurs and manufacturers should therefore welcome a means of taking away the free tartaric acid, without altering, in any respect, the quality of the wine. This is pure *neutral tartrate of potash*. When this salt, in *concentrated* solution, is added to such a fluid as the above, the *free acid* combines with the neutral salt, and *separates* from the *liquid* under the form of the sparingly soluble bitartrate of potash. "If to 100 parts of a *wine* which contains one part of free tartaric acid, we add 1½ part of *neutral tartrate of potash*, there will separate on repose at 70 to 75° Fahr., 2 parts of *crystallized tartar;* and the *wine will then contain only* ½ part of *tartar dissolved*, in which there are only 0·2 part of the original free acid; 0·8 part of the original free acid having been withdrawn from the wine." (*Liebig's Annalen.*) This method is particularly applicable to recent *must* and to wines which do not contain much free acetic acid; but when this last is the case, so much acetate of potash is formed, as occasionally to vitiate the taste of the liquor.

Fining. Wine is clarified in a similar manner to beer. WHITE WINES are usually fined by *isinglass*, in the proportion of about 1½ *oz.* (dissolved in 1½ pint of water, and thinned with some of the wine) to the hogshead. RED WINES are generally fined with the *whites of eggs*, in the proportion of 15 to 20 to the pipe. Sometimes *hartshorn shavings*, or *pale sweet glue* is substituted for isinglass; and for *port* and other *strong red wines* abounding in tannin, a little sheep's or bullock's blood is very commonly employed. The use of blood is not, however, to be recommended, as it communicates a very trifling, but still an unpleasant flavour and odour, which is easily recognised by the palate of a professed "wine-taster;" besides which, the practice is dirty and disgusting. *Gypsum* and *milk of lime* are frequently used to clear muddy *white wines*. See *Finings*.

Flatness. This is removed by the addition of a little *new brisk wine* of the same kind; or by rousing in 2 or 3 *lb.* of *honey;* or by adding 5 or 6 *lb.* of *bruised sultana raisins*, and 3 or 4 quarts of good brandy per hogshead. By this treatment the wine will usually be recovered in about a fortnight, except in very cold weather. Should it be wanted sooner, a table-spoonful or two of *yeast* may be added, and the cask removed to a warmer situation.

Flavouring. Various ingredients are added to inferior wines to give them the *flavour* of others *more expensive*, and to British wines to make them resemble those *imported*. Substances are also added in a similar manner to communicate the *aroma* of the *high-flavoured grape wines*. Among the *first* are *bitter almonds, almond cake*, or the *essential oil of almonds*, or preferably, its *alcoholic solution*, which are used to impart a SHERRY or NUTTY taste to weak-flavoured wines, as *poor sherry, white cape*, and *malt, raisin, parsnip*, and other similar British wines;—*rhatany, kino, oak sawdust* and *bark, alum*, &c., to convey ASTRINGENCY, and—*tincture of the seeds of raisins* to impart a PORT WINE flavour. Among the substances employed to communicate the BOUQUET of the *finer wines*, may be mentioned — *orris root, eau de fleurs d'oranges, neroli, essence de petit grain, ambergris, vanilla, violet petals, essence of cedrat, sweet briar, clary*, and *elder flowers, quinces, cherry-laurel water*, &c. By the skilful, though fraudulent use of the above flavouring substances and perfumes, the experienced wine-brewer manages to produce, in the dark cellars of London, from white cape, currant, gooseberry, raisin, rhubarb, parsnip, and malt wine, very excellent imitations of foreign wine, and which

pass current among the majority of English wine-drinkers as the choicest productions of the grape, "*genuine as imported.*"—A grain or two of *ambergris*, well rubbed down with sugar, and added to a hogshead of claret, gives it a flavour and bouquet much esteemed by some connoisseurs.

Improving. This is the cant term of the wine trade, under which all the adulteration and "doctoring" of wine is carried on. A *poor sherry* is *improved* by the addition of a little *almond flavour*, *honey*, and *spirit*;—a *port deficient in body* and *astringency*, by the addition of some *red tartar* (dissolved in boiling water), some *rhatany*, *kino*, or *catechu*, and a little *honey* or *foots*, and brandy. See *Mixing* (below).

Insensible Fermentation. See *Maturation.*

Insipidity. See *Flatness.*

Maturation. The natural *maturation* or *ripening* of *wine* and *beer* by age, depends upon the *slow conversion* of the *sugar* which *escaped decomposition* in the *gyle tun*, or *fermenting vessel*, into alcohol. This conversion proceeds most perfectly in vessels which *entirely* exclude the air, as in the case of wine in bottles; as when air is present, and the temperature sufficiently high, it is accompanied by slow acetification. This is the case of wine in casks; the porosity of the wood allowing the very gradual permeation of the air. Hence the superiority of *bottled* wine over *draught* wine, or that which has matured in wood. Good wine, or well-fermented beer, is vastly improved by age, when properly preserved; but *inferior* liquor, or even superior liquor, when preserved in improper vessels or situations, becomes acidulous, from the conversion of its alcohol into vinegar. *Tartness* or *acidity* is consequently very generally, though *wrongly* regarded by the ignorant, as a sign of *age* in liquor. The peculiar change by which fermented liquors become mature or ripe by age, is termed the "*insensible fermentation.*" It is the alcoholic fermentation impeded by the presence of the already-formed spirit in the liquor, and by the lowness of the temperature. See *Ripening* (below).

Mixing. Few wines are sold without admixture. It is found that the *intoxicating properties* of *wine* are *increased* by *mixing them* with other wines of a different age and growth. In many cases the flavour is at the same time improved. Thus, a *thin port* is improved by the addition of a similar wine having a full body, or by a little Malaga, Teneriffe, or rich sherry; and an *inferior old sherry* may be improved by admixture with a little full-bodied wine of the last vintage. In this consists the great art of "*cellar management*," and to such an extent is this carried, both abroad and in England, that it may be confidently asserted that no wine ever reaches the consumer in an *unmixed* or *natural* state.

Mustiness. This may generally be removed by violently agitating the wine for some time with a little of the sweetest olive or almond oil. The cause of the bad taste is the presence of an essential oil, which the fixed oil seizes on, and rises with to the surface, when it may be skimmed off; or the liquor under it may be drawn off. A little *coarsely powdered fresh-burnt charcoal*, or even some *slices of bread toasted black*, will frequently have a like effect. A little *bruised mustard seed*, is also occasionally used for the same purpose.

Perfuming. This is chiefly performed on *British wines* for family use. For its application to foreign wines, see *Flavouring. Wines* may be *perfumed* by the simple addition of any *odorous substances* previously well mixed with a *little of the wine*, or dissolved in a few fl. oz. of *rectified spirit.*

Racking. This should be performed in cool weather, and preferably early in the spring. A *clean syphon*, well managed, answers better for this purpose than a cock or faucet. The bottoms, or foul portion, may be strained through a wine-bag, and added to some other inferior wine.

Ripening. To *promote* the *maturation* or *ripening* of wine, various plans are adopted by the growers and dealers. One of the *safest ways* of *hastening* this, especially for *strong wines*, is not to rack them until they have stood 15 or 18 months upon the lees; or whether "*crude*" or "*racked*," keeping them at a temperature ranging between 50 and 60° Fahr., in a cellar free from draughts and not too dry. *Another method*, is to *remove* the *corks* or *bungs*, and to substitute *bladder* tied or fastened air-tight over the openings. *Bottled wine*, treated in this way, ripens very quickly in a temperate situation. *Some dealers* add a little *dilute sulphuric acid* to the *coarser wines* for the same purpose; but a small quantity of *concentrated acetic acid* or *tartaric acid*, would be preferable, since these acids are found in all wines. 4 or 5 drops of the former, added to a bottle of some kinds of new wine, immediately give it the appearance of being 2 or 3 years old.

Ropiness, viscidity; Graisse. This arises from the *wine containing* too little tannin or astringent matter to precipitate the glu-

ten, albumen, or other azotized substance, occasioning the malady. Such wine cannot be clarified in the ordinary way, because it is incapable of causing the coagulation or precipitation of the finings. The remedy is to supply the principle in which it is deficient. M. François, of Nantes, prescribes the *bruised berries of the mountain ash* (1 *lb.* to the barrel) for this purpose. A little *catechu*, *kino*, or better still, *rhatany*, or the *bruised footstalks* of the grape, may also be conveniently and advantageously used in the same way. For *pale white wines*, which are the ones chiefly attacked by the malady, nothing equals a little *pure tannin* or *tannic acid* dissolved in *proof spirit*. See *Viscous Fermentation*, *Malt Liquors*, *&c.*

Roughening. See *Flavouring.*

Second Fermentation; La-pousse. Inordinate fermentation, either primary or secondary, in *wine* or any other *fermented liquor*, may be readily checked by *sulphuration*, or by the addition of *mustard seed* or *sulphite of lime*. 1 *oz.* of *brimstone*, ¾ to 1 *lb.* of *bruised mustard seed*, and about 4 to 8 *oz.* of *sulphite of lime*, are fully sufficient for a hogshead. This substance seldom fails of arresting the fermentation. —In addition to the above remedies, a little sulphuric acid is sometimes employed, and the use of black oxide of manganese, or chlorate of potash, has been proposed on theoretical grounds.

Souring. This is either *occasioned* by the *wine* having been *imperfectly fermented*, or from its having been kept in too warm a cellar where it has been exposed to draughts of air, or to continual vibrations, occasioned by the passage of loaded vehicles through the adjoining thoroughfare. The remedy commonly recommended in books for this purpose, is to saturate the acid with chalk, milk of lime, or calcined oyster shells; but such additions, made in sufficient quantity to effect this object, destroy the character of the wine, and render it sickly and vapid. The *best* and only *safe remedy* is a little *neutral tartrate of potash*, cautiously added; or it may be mixed with a considerable portion of *full-bodied new wine* of its class, adding at the same time a *little brandy*, and in 2 or 3 weeks *fining* it down, when it should be either *at once* put into bottles, or consumed as soon as possible.

Sparkling, creaming, and briskness. These properties are conveyed to wine by *racking* it into closed vessels *before* the *fermentation is complete*, and while there still remains a considerable portion of undecomposed sugar. Wine of this description which has lost its briskness, may be restored by adding to each bottle a few grains of *white lump-sugar* or *sugar-candy*. This is the way in which champagne is treated in France. The bottles are afterwards inverted, by which means any sediment that forms falls into the necks, when the corks are *partially* withdrawn, and the sediment is immediately expelled by the elastic force of the compressed carbonic acid. If the wine remains muddy, a little solution of sugar and finings are added, and the bottles are again placed in a vertical position, and, after two or three months, the sediment is discharged, as before.

Sweating in. The technical terms "*sweating in*" and "*fretting in*," are applied to the partial production of a second fermentation, for the purpose of mellowing down the flavour of foreign ingredients (chiefly brandy) added to wine. For this purpose 4 or 5 *lb.* of *sugar* or *honey*, with a *little crude tartar* (dissolved), are commonly added per hogshead; and when the wine is *wanted* in *haste*, a spoonful or two of *yeast*, or a few *bruised vine leaves*, are also mixed in, the cask being placed in a moderately warm situation until the new fermentation is established, when it is removed to the wine-cellar, and, after a few days, *fined down*.

Taste of Cask. The remedies for this malady are the same as those for *mustiness*. In the case of a large and valuable vat of *old Christmas beer* thus affected, on which we were consulted, we recommended agitation with three 4-*lb. loaves of bread*, cut into *thin slices*, highly toasted (scorched), and then crumbled in the hands. The effect was most satisfactory, and almost immediate; the beer was sold within a fortnight, and highly approved of.

*** For *further information* connected with the *nature* and *management* of *wines*, and other *fermented liquors*, see *Brewing*, *Fermentation*, *Malt Liquors*, *Porter*, *Sugar*, *Syrups*, *Vinous Fermentation*, *Viscous do.*, *Worts*, *Yeast*, *&c.* (and *below.*)

WINE (British). The various *processes* in *British wine-making* depend upon the same principles, and resemble those employed for foreign wine.

The FRUIT should be preferably gathered in fine weather, and not until *mature*, as evinced by its flavour; for if it be employed whilst *unripe*, the resulting wine will be harsh, disagreeable, and unwholesome, and a larger quantity of sugar and spirit will be required to render it palatable. The common practice of employing *unripe gooseberries* for the manufacture of British cham-

pagne, arises from a total ignorance of the scientific principles of wine-making. On the other hand, if ordinary British fruit be employed in *too ripe* a state, the wine is apt to be inferior, and deficient in the flavour of the fruit.

The *fruit* being *gathered*, at once undergoes the operation of PICKING or GARBLING, for the purpose of removing the stalks and unripe or damaged portions. It is *next* placed in a tub, and is *well bruised*, to facilitate the solvent action of the water. *Raisins* are commonly permitted to soak about 24 hours previously to bruising them, but they may be advantageously bruised or minced in the dry state. The *bruised fruit* is then put into a *vat* or *vessel* with a guard placed over the tap-hole, to keep back the husks and seeds of the fruit when the *must*, *juice*, or *extract* is drawn off. The WATER is now added, and the whole is allowed to macerate for 30 or 40 hours, more or less, during which time the magma is frequently roused up with a suitable wooden stirrer. The *liquid portion* is next drawn off, and the *residuary pulp* is placed in hair bags, and undergoes the operation of PRESSING, to expel the fluid which it contains. The *sugar*, *tartar* (in *very fine powder*, or in *solution*), *&c.*, are now added to the mixed liquors, and the whole is well stirred or "rummaged" up for some time. The *temperature being suitable*, the VINOUS FERMENTATION soon commences, when the liquor is frequently skimmed (if necessary), and well "roused" up, and, after 3 or 4 days of this treatment, it is run into CASKS, which should be quite filled, and left purging at the bung-hole. In about a week the FLAVOURING INGREDIENTS, in the *state of coarse powder*, are commonly added, and well stirred in; and in about another week, depending upon the state of the fermentation, and the attenuation of the must, the BRANDY or *spirit* is added, and the cask is filled up, and bunged down close. In four or five weeks more, the cask is again filled up, and, after some weeks (the longer the better), it is "pegged" or "spiled," to ascertain if it be fine or transparent; if so, it undergoes the operation of RACKING; but if, on the contrary, it still continues muddy, it must be either again bunged up, and allowed to repose for a few weeks longer, or it must pass through the process of FINING. Its future treatment is similar to that already noticed under Foreign Wine.

The *must* of many of the *strong-flavoured fruits*, as black currants, mulberries, &c., is improved by being *boiled* before being made into wine. The flavour and bouquet of the *more delicate fruits* are either greatly diminished or utterly dissipated by boiling.

General Formulæ for the *Preparation of British Wines.*

1. From *ripe saccharine fruits.* Take of the *ripe fruit*, 4 to 6 *lb.*; *clear soft water*, 1 gall.; *sugar*, 3 to 5 *lb.*; *cream of tartar* (dissolved in boiling water), $1\frac{1}{4}$ *oz.*; *brandy*, 2 to $3\frac{0}{0}$; *flavouring*, as required. If the full proportions of fruit and sugar are used the product will be good *without* the brandy, but better with it. $1\frac{1}{2}$ *lb.* of *raisins* may be substituted for each pound of sugar.

In the above way are made the following wines—GOOSEBERRY WINE (British *Champagne*);—CURRANT WINE (*red*, *white*, or *black*);—MIXED FRUIT WINE (*currants* and *gooseberries*, or *black*, *red*, and *white currants*, ripe *black-heart cherries*, and *raspberries*, equal parts;) a good family wine;—CHERRY WINE;—COLEPRESS'S WINE (from *apples* and *mulberries*, equal parts);—ELDER WINE;—STRAWBERRY WINE;—RASPBERRY WINE;—MULBERRY WINE (when flavoured makes *British port*);—WHORTLEBERRY WINE (*bilberry wine*), makes a good *factitious port*;—BLACKBERRY WINE;—DAMSON WINE (makes good *factitious port*);—MORELLA WINE;—APRICOT WINE;—APPLE WINE;—GRAPE WINE; &c.

2. From *dry saccharine fruit* (as raisins). Take of the *dried fruit*, $4\frac{1}{2}$ to $7\frac{1}{2}$ *lb.*; *clear soft water*, 1 gall.; *cream of tartar* (dissolved), 1 *oz.*; *brandy*, $1\frac{1}{2}$ to $4\frac{0}{0}$. Should the *dried fruit* employed be at all deficient in saccharine matter, 2 to 3 *lb.* of it may be omitted, and *half* that quantity of *sugar*, or *two thirds* of *raisins* added. In the above way are made—DATE WINE,—FIG WINE,—RAISIN WINE, &c.

3. From *acidulous*, *astringent*, or *scarcely ripe fruits*, or those which are *deficient in saccharine matter.* Take of the *picked fruit*, $2\frac{1}{2}$ to $3\frac{1}{2}$ *lb.*; *sugar*, $3\frac{1}{2}$ to $5\frac{1}{2}$ *lb.*; *cream of tartar* (dissolved), $\frac{1}{2}$ *oz.*; *water*, 1 gall.; *brandy*, 2 to $6\frac{0}{0}$.

In the above way are made—GOOSEBERRY WINE (*English champagne*);—BULLACE WINE (makes an excellent *factitious port*);—DAMSON WINE; &c.

4. From *footstalks*, *leaves*, *cuttings*, *&c.* By infusing them in *water*, in the proportion of 3 to 6 *lb.* to the gall., or q. s. to give a proper flavour, or to form a good saccharine liquor; and adding $2\frac{1}{2}$ to 4 *lb.* of *sugar* to each gall. of the *strained liquor.* $1\frac{1}{2}$ *lb.* of *raisins* may be substituted for each *lb.* of sugar.

In the above way are made—RAPE WINE

(from the *pressed cake of grapes*);—ENGLISH GRAPE WINE;—RHUBARB WINE (*Bath champagne, patent do.*), from garden rhubarb;—CELERY WINE;—PARSNIP WINE; &c.

5. From *saccharine roots* and *stems of plants*. Take of the *bruised, rasped,* or *sliced vegetable,* 4 to 6 *lb.; boiling water,* 1 gall.; infuse until cold, press out the liquor, and to each gall. add of *sugar,* 3 to 4 *lb.; cream of tartar,* 1 *oz.; brandy,* 2 to 5%. For some roots and stems the water must not be very hot, as they are thus rendered troublesome to press.

In the above way are made—BEET-ROOT WINE (*British Roussillon*);—PARSNIP WINE (*British Malmsey*);—TURNIP DO.; &c.

6. From *flowers, spices, aromatics, &c.* These are prepared by simply infusing a sufficient quantity of the bruised ingredients for a few days in any simple wine (as that from sugar, honey, raisins, &c.) after the active fermentation is complete, or at all events, a few weeks before racking them.

In the above way are made—CLARY WINE (*muscadel*), from *flowers,* 1 quart to the gall.; COWSLIP WINE (*flowers,* 2 quarts to the gall.);—ELDER-FLOWER WINE (*Frontignac*), flowers of *white-berried elder,* ¾ pint, and *lemon juice,* 3 fl. *oz.,* to the gall.;—GINGER WINE (1¼ *oz.* of *ginger* to the gall.);—ORANGE WINE (1 dozen *sliced oranges* per gall.);—LEMON WINE (juice of 12 and rinds of 6 *lemons* to the gall.);—SPRUCE WINE (¼ *oz.* of *essence of spruce* per gall.);—JUNIPER WINE (*berries,* ¾ pint per gall.);—PEACH WINE (4 or 5 sliced, and the *stones broken,* to the gall.);—APRICOT WINE (as peach wine, or with more fruit);—QUINCE WINE (12 to the gall.);—ROSE, CLOVE-GILLYFLOWER, CARNATION, LAVENDER, VIOLET, PRIMROSE, and OTHER FLOWER WINES (*distilled water,* 1½ pint, or *flowers,* 1 pint, to the gall.);—BALM WINE (*balm tops,* 4 *oz.* per gall.); &c.

7. From *saccharine juices,* or *infusions,* or from *fermented liquors.* Take of the *juice* or *liquor,* 1 gall.; *honey* or *sugar,* 2 to 3 *lb.* (or *raisins,* 3 to 5 *lb.*); *cream of tartar,* 1¼ *oz.; brandy,* 2 to 4%.

In this way are made—ENGLISH GRAPE WINE;—MIXED FRUIT WINE;—PINE APPLE WINE;—CIDER WINE;—ELDER WINE;—BIRCH WINE (from the sap at the end of February or beginning of March);—SYCAMORE WINE (from the sap);—MALT WINE (*English Madeira*), from strong wort;—and the wines of any of the saccharine juices of ripe fruit.

8. From *simple saccharine matter.* Take of *sugar,* 3 to 4 *lb.; cream of tartar,* ½ *oz.; water,* 1 gall.; *honey,* 1 *lb.; brandy,* 2 to 4%. A handful of *grape leaves* or *cuttings, bruised,* or a pint of *good malt wort,* or *mild ale,* may be substituted for the honey. Chiefly used as the basis for other wines, as it has little flavour of its own; but makes a good *British champagne.*

Obs. In all the preceding formulæ *lump sugar* is intended when the wines are required very pale, and good *Muscovado sugar* when this is not the case. Some of the *preceding wines* are vastly improved by substituting good *cider, perry,* or *pale ale* or *malt wort,* for the whole or a portion of the water. Good *porter* may also be advantageously used in this way for some of the *deep-coloured red wines.* When expense is no object, and very strong wines are wanted, the *expressed juices* of the *ripe fruits,* with the addition of 3 or 4 *lb.* of *sugar* per gall., may be substituted for the fruit in substance, and the water.

EXAMPLES of *British imitations* of FOREIGN WINES:—

American Honey Wine. From *good honey,* 21 *lb.; cider,* 12 gall.; ferment, then add of *rum,* 5 pints; *brandy,* 2 quarts; *red* or *white tartar* (dissolved), 6 *oz.; bitter almonds* and *cloves,* of each, bruised, ¼ *oz.; powdered capsicum,* 3 dr. This is also called "*Mead wine.*" With the addition of 3 *oz.* of *unbleached Jamaica ginger* (finely grated), it forms the best *American ginger wine.*

British Burgundy. By adding a little *lemon juice,* and a "*streak*" of *orris* or *orange-flower water* to *British port,* the ingenious wine-brewer converts it into "*British Burgundy.*" It is also made by mixing together equal parts of *British port* and *claret.*

British Cape. 1. (White.) *Raisin wine,* well attenuated by fermentation, either alone, or worked up with a little *cider* and *pale malt-wort.*

2. (Red.) *British white-cape,* sound *rough cider,* and *mulberry wine,* equal parts; well mixed, and *fined down.*

British Champagne. 1. From *stoned raisins,* 7 *lb.; loaf sugar,* 21 *lb.; water,* 9 gall.; *crystallized tartaric acid,* 1 *oz.; cream of tartar,* ½ *oz.; Narbonne honey,* 1 *lb.; sweet yeast,* ¼ pint; ferment, skimming frequently, and when the fermentation is nearly over, add of *coarsely powdered orris root,* 1 dr.; *eau de fleurs d'oranges,* ¼ pint; and *lemon juice,* 1 pint; in 3 months fine it down with *isinglass,* ¼ *oz.;* in 1 month more, if not sparkling, again fine it down, and in another fortnight bottle it, observing to put a piece of *double-refined white sugar,* the size of a pea, into each bottle; lastly, wire down the

corks, and cover them with *tin-foil*, after the manner of champagne.

2. As the preceding, but substituting 32 *lb.* of *double-refined sugar* for the sugar and raisins therein ordered, with the addition of 3 gall. of *rich pale-coloured perry*.

3. From *amber hairy champagne gooseberries*, *English grape juice*, or the *stalks* of *garden rhubarb*, and *lump sugar*; with a little *sweetbriar*, *orris*, or *orange-flower water*, to impart a slight bouquet. The *last* forms the *patent* or *Bath champagne*, of the Champagne Wine Company.

4. (*Pink.*) To either of the preceding add *red currant juice*, q. s. to colour; or 1 *oz.* of *coarsely-powdered cochineal* to each 10 or 12 gall. at the time of racking.

Obs. It is notorious that *two* bottles of wine out of every *three* sold for *genuine champagne* in England, is of British manufacture. We have ourselves seen sparkling gooseberry, rhubarb, and white sugar wines, sold for imported champagne, at 7*s.* 6*d.* per bottle, and the fraud has passed undetected, even by habitual wine drinkers.

British Claret. 1. *Rich old cider* or *perry* and *port wine*, equal parts.

2. To each gall. of the last add of *cream of tartar* (genuine), 3 *dr.*; with the *juice* of 1 *lemon*. Sometimes ¼ pint of *French brandy* is also added.

Obs. If these mixtures are well fined-down, and not bottled for at least a month or 5 weeks, they closely resemble good "*Bordeaux.*" A mixture of 4 parts of *raisin wine*, with 1 part each of *raspberry* and *barberry* or *damson wine*, also forms, when so treated, an excellent *factitious claret*.

British Cyprus. From the *juice of white elderberries*, 1 quart; and *Lisbon sugar*, 4 *lb.*; to *water*, 1 gall.; together with ½ *dr.* each of *bruised ginger* and *cloves*. When racked add *minced raisins* and *brandy*, of each, 2 *oz.*

British Hock, *British Red Hock.* From *cream of tartar*, 1¼ *oz.*; *tartaric acid*, ½ *oz.* (both in extremely fine powder); *juices* of the *purple plum*, *ripe apples*, and *red-beet*, of each (warmed), 5 pints; *lemon-juice*, 1 pint; with *white sugar*, 2½ *lb.* per gall.

British Madeira. From very strong *pale-malt wort*, 36 gall.; *sugar-candy*, 28 *lb.*; and *cream of tartar*, 3 *oz.*; fermented with *yeast*, 2 *lb.*; adding, when the fermentation is nearly finished, *raisin wine*, 2½ gall.; *brandy* and *sherry wine*, of each, 2 gall.; *rum* and *brandy*, of each, 3 pints; after 6 or 9 months, fine it down, and in another month, bottle it. See *British Sherry*.

British Malmsey. From *sliced* or *grated parsneps*, 4 *lb.*; *boiling water*, 1 gall.; when cold press out the liquor, and to each gallon add of *cream of tartar*, ½ *oz.*, and *good Muscovado sugar*, 3 *lb.*; ferment, rack, and add of *brandy*, 3 to 5%. Good *Malaga raisins* may be substituted for the sugar.

British Sparkling Moselle. From *rich cider apples* (carefully peeled and garbled), pressed with 1-4th of their weight of *white magnum-bonum plums* (previously stoned), and the juice fermented with 2½ *lb.* of *double-refined sugar* per gall., as champagne.

British Red Moselle. The last, coloured with *clarified elderberry juice*.

British Muscadel. As *sparkling Moselle*, with some *infusion of clary*, or of the *musk plant*, to flavour it.

British Port, *London do.*, *Southampton do.* 1. From *red cape*, 2 gall.; *damson* or *elder wine*, 1 gall.; *brandy*, ½ pint; *powdered kino*, ½ *oz.*

2. *Strong old cider*, 6 gall.; *elderberry juice*, 4 gall.; *sloe juice*, 3 gall.; *sugar*, 28 *lb.*; *powdered extract of rhatany*, 1 *lb.*; at the time of racking, add *brandy*, ½ gall.; *good port wine*, 2 gall.

3. *Good port*, 12 gall.; *rectified spirit*, 6 gall.; *French brandy*, 3 gall.; *strong rough cider*, 42 gall.; mix in a well-sulphured cask. (*Publican's Guide.*)

4. *Port wine*, 8 gall.; *brandy*, 6 gall.; *sloe juice*, 4 gall.; *strong rough cider*, 45 gall.; as the last. (*Licensed Victualler's Companion.*)

5. *Cider*, 24 gall.; *juice of elderberries*, 6 gall.; *sloe juice*, 4 gall.; *rectified spirit*, 3 gall.; *brandy*, 1½ gall.; *powdered rhatany*, 7 *lb.*; *isinglass*, 4 *oz.*, dissolved in a gall. of the cider; bung it down; in 3 months it will be fit to bottle, but should not be drank until the next year; if a rougher flavour is required, the quantity of *rhatany* may be increased, or *alum*, 5 or 6 *oz.* (dissolved), may be added.

British Sherry.—1. From *Cape* or *raisin wine*, slightly flavoured with a *very little bitter-almond cake*, or, what is more convenient, a little of the essential oil dissolved in alcohol (*essence of bitter almonds*). A mere "streak" or "thread" of *sweet-briar*, *eau de fleurs d'oranges*, or *orris*, is occasionally added by way of *bouquet*; but care must be taken not to *overdo* it.

2. To each gallon of strong *raisin must*, add, when racking, 1 *Seville orange*, and 3 or 4 *bitter almonds*, both sliced. By omitting the almonds, and adding 1 *green citron* to each 2 or 3 gallons, this forms *British Madeira*.

3. Very strong *pale-malt wort*, 36 gall.; *finest muscovado sugar*, 1 cwt.; *yeast*, 1 pint; ferment; on the third day add of *raisins*, stoned, 14 *lb.*; and in another week, add of

rectified spirit, 1 gall.; *rum*, ½ gall.; and *bitter almonds*, grated, 1¼ oz.; bung down for 4 months, then draw it off into another cask, add of *brandy*, 1 gall., and in 3 months bottle it.

4. *Teneriffe*, slightly flavoured with *cherry-laurel* or *bitter almonds*, forms an excellent *British sherry*, either alone or diluted with an equal quantity of *Cape* or *raisin* wine, or good *perry*.

British Tokay. To *good cider*, 18 gall.; add of *elderberry juice*, ½ gall.; *honey*, 28 *lb.*; *sugar*, 14 *lb.*; *red argol* (powdered), ¾ *lb.*; *crystallized tartaric acid*, 3 *oz.*; mix, boil, ferment, and when the active fermentation is complete, add of *brandy*, 1 gall.; and suspend in the liquor from the bunghole, a mixture of *cassia* and *ginger*, of each, ½ *oz.*; *cloves* and *capsicum*, of each, ¼ oz.; the whole bruised, and loosely inclosed in a coarse muslin bag. It will be ripe in 12 months.

Obs. Some of the preceding formulæ, by skilful management, produce very good imitations of some of the imported wines; but (prejudice aside) many of the British fruit wines possess an equally agreeable flavour, and are frequently more wholesome. All British wines require to be kept at least a year to "*mellow*." Much of the superiority of foreign wine arises from its *age*.

WINE (Culinary). Syn. *Wines for Kitchen use*. These are *prepared* in a similar manner to the *medicated wines* noticed below:—

Basil Wine. From *green basil leaves*, 4 or 5 *oz.*; *sherry*, *Cape*, or *raisin wine*, 1 pint; digest for 10 days, press, and strain. *Used* to give a turtle flavour to soups and gravies. In a similar way may be made the *wines* of *celery leaves*, *celery seed*, *sage*, *shallots*, and the various *green* and *dried herbs* used in cookery.

Cayenne Wine. From *capsicum* or *cayenne*, 1 *oz.*; *Cape*, 1 pint; steep for a fortnight, and strain. In a similar way may be made *Currie* (powder), *ragout* (spice), and several other similar wines used in the kitchen.

WINE (Impregnated). See *Culinary Wines*, *Medicated do.*, &c.

WINE (Medicated). Syn. *Impregnated Wine*; *Vinum Medicatum*,—Lat. The medicated wines (*vina medicata*) are prepared by cold maceration, in well-closed vessels, in precisely the same way as *tinctures*. In the Ph. L. of 1824 a *diluted spirit* was substituted for wine, without altering the name of the preparation; but the use of wine (*sherry*) was restored in that of 1836. The druggists commonly use *Cape* or *raisin wine* as a menstruum, from it being cheaper than sherry, and, perhaps, scarcely less powerful as a solvent. The "*vinum*" of the Ph. U. S. was formerly *Teneriffe*.

"*Medicated wines* should be kept in stoppered glass vessels, and be *frequently shaken* during maceration." (Ph. L.)

The following are the principal medicated wines at present in use:—

WINE (Aloes). Syn. *Tinctura Sacra*,—Ph. L. 1746. *Tinct. Hieræ Picræ*,—Ph. L. 1721. *Vinum Aloës*,—Ph. L. & E., & Ph. D. 1826. *Prep.* (Ph. L.) *Powdered Socotrine* or *hepatic aloes*, 2 oz.; *powdered canella*, ½ oz.; *sherry*, 1 quart; macerate for 14 days, and filter. In the Ph. E. *cardamoms* and *ginger*, of each, 1½ dr., are substituted for *canella*. *Dose*. As a purgative, ½ to 2 fl. oz.; as a stomachic, 1 to 2 fl. dr.

WINE (Aloes,—Alkaline). Syn. *Vinum Aloës Alkalinum*; *Vin. Aloeticum Alkalinum*,—Ph. L. 1746. *Prep.* (Dr A. T. Thomson.) *Carbonate of soda*, 3 oz.; *myrrh* and *extract of aloes*, of each, 6 dr.; *sesquicarbonate of ammonia*, 4½ dr.; *sherry*, 24 fl. oz. (say, 1½ pint); macerate, as before. In dyspepsia, chlorosis, &c. *Dose*. As the last.

WINE (Antimonial). Syn. *Tartar Emetic Wine*, *Wine of Potassio-tartrate of Antimony*; *Vinum Antimonii Potassio-tartratis*,—Ph. L. *Vinum Antimoniale*,—Ph. E. *Vinum Antimonii Tartarizati*,—Ph. L. 1788. *Prep.* (Ph. L. & E.) *Potassio-tartrate of antimony*, 40 gr.; *sherry*, 1 pint; dissolve. Each *fluid oz.* contains 2 gr. of emetic tartar. *Dose*. As a *diaphoretic* and *expectorant*, 10 to 30 drops, frequently; as a *nauseant*, 1 to 2 fl. dr.; as an *emetic*, 2 to 4 fl. dr. The corresponding compound of the Ph. D. is *antimonii tartarizati liquor*. (See *p.* 1164.)

WINE (Chalybeate). See *Wine of Iron*.

WINE (Colchicum). Syn. *Wine of Colchicum Root*; *Vinum Radicis Colchici*; *Vinum Colchici*,—Ph. L. & E. *Prep.* (Ph. L.) *Dried corms* of *meadow saffron* (sliced), 8 oz.; *sherry wine*, 1 quart; macerate 7 days, and strain; (press strongly the residuum, and filter the mixed liquors,—Ph. E.) A powerful sedative and purgative. *Dose*. ½ to 1 fl. dr.; in gout, acute rheumatism, and other painful inflammatory and nervous affections.

Obs. The celebrated *eau médicinale* of M. Husson (*aqua medicinalis Hussonii*) resembles, in composition and action, the above *preparation* in every point except its strength, which, we believe, is much above that of the wine of the British Colleges.

WINE (Colchicum Seed). Syn. *Vinum Seminis Colchici*, *Vin. Seminum C.*,—Lat. *Prep.* (Ph. U. S. & Dr. Williams.) *Seeds of*

meadow saffron (preferably ground in a coffee-mill), 2 oz.; *sherry*, 16 fl. oz.; macerate for 14 days. *Dose.* 1 to 1½ fl. dr.; in gout, &c.

WINE (Emetic). · See *Antimonial Wine, Ipecacuanha do., &c.*

WINE (Gentian). Syn. *Bitter Wine, Tonic do.; Vinum Amara; Vinum Gentianæ,* —Ph. E. *Prep.* (Ph. E.) *Gentian*, in coarse powder, ½ oz.; *yellow bark* (do.), 1 oz.; *dried orange-peel*, 2 dr.; *canella*, in coarse powder, 1 dr.; *proof spirit*, 4½ fl. oz.; digest for 24 hours, then add of *sherry*, 1 pint and 16 fl. oz.; and further digest for 7 days. Tonic and stomachic. *Dose.* ½ to ¾ fl. oz.

WINE (Hellebore,—White). See *Wine of White Hellebore.*

WINE (Ipecacuanha). Syn. *Emetic Wine; Vinum Ipecacuanhæ,*—Ph. L. E. & D. *Ipecacuanha root*, bruised, 2½ oz.; *sherry*, 1 quart; macerate for 7 days, (14 days, and strain with expression,—Ph. D.) This is a mild and excellent preparation. *Dose.* As a *diaphoretic* and *expectorant*, 10 to 40 drops, in coughs, diarrhœa, dysentery, dyspepsia, &c.; as an *emetic*, 2 fl. dr. to 1 fl. oz., in divided doses; as an emetic for infants and young children, ½ tea-spoonful every 10 or 15 minutes until it operates.

WINE (Iron). Syn. *Chalybeate Wine, Steel do.; Vinum Ferri,*—Ph. L. *Prep.* 1. (Ph. L.) *Iron wire*, 1 oz.; *sherry*, 1 quart; digest with frequent agitation for 30 days, and strain. Each fl. oz. contains less than 1½ gr. of metallic iron.

2. *Ammonio-tartrate of iron* (Aikin's), 1½ dr.; *sherry*, 1 pint; dissolve. Frequently substituted for the last, especially when the preparation is required in a hurry. *Dose.* 1 to 5 fl. dr.; as a mild chalybeate.

Obs. The formula for *wine* of *iron* was modified in the Ph. L. 1824, omitted in that of 1836, and restored, in its original character, in that of 1851.

WINE (Meadow Saffron). See *p.* 1314.

WINE (Opium). Syn. *Vinum Opii,*—Ph. L. E. & D. *Tinctura Thebaica,*—Ph. L. 1746. *Laudanum Liquidum Sydenhami,*—Ph. L. 1721. *Sydenham's Liquid Laudanum, &c.,*—Obs. *Prep.* 1. (Ph. L.) *Extract of opium* (Ph. L.), 2½ oz.; *cinnamon* and *cloves*, of each bruised, 2½ dr.; *sherry*, 1 quart; macerate for 7 days (14 days,—Ph. D.) and filter. In the Ph. E. *opium*, 3 oz.; and in the Ph. D., *opium* in coarse powder, 3 *oz.;* are ordered instead of extract of opium. The Dublin College also omits the aromatics.

2. (*Wholesale.*) From *extract of opium*, 11 *oz.; oil of cassia*, 25 drops; *oil of cloves*, 20 drops; *wine*, 1 gall.; (or *rectified spirit*, 1½ pint; *water*, 6½ pints; *colouring*, q. s.;) digest with agitation until dissolved. Milder than the tincture. *Dose.* 10 to 40 drops; as an anodyne and hypnotic.

WINE (Opium,— Fermented). Syn. *Rousseau's Laudanum, Black-drop; Vinum Opii Fermentatione Paratum, Gutta Nigra,* —Lat. *Prep.* (P. Cod.) *Opium*, 4 oz.; *boiling water*, 5 ℔; dissolve, add of *honey*, 1 ℔; *yeast*, 2 dr.; keep it at 86° Fahr. for a month, or until the fermentation is complete; then press, filter, distil off 16 oz., and evaporate the residuum to 10 oz.; distil the 16 oz. of spirit obtained above, until 12 oz. have passed over; and from this, by a third distillation, obtain 4½ oz.; which add to the *evaporated solution* (10 oz.), and filter. About *four times* as strong as *tincture of opium.* See *Black Drop.*

WINE (Potassio-tartrate of Antimony). See *Antimonial Wine.*

WINE (Quinine). Syn. *Vinum Quinæ*, Lat. *Prep.* (Magendie.) *Disulphate of quinine*, 14 gr.; *sherry*, 1 quart; agitate frequently for some time. *Dose.* 1 wine-glassful, as a tonic and stomachic.

WINE (Rhubarb). Syn. *Vinum Rhabarbari, Tinctura Rhæi Vinosa; Vinum Rhei,*—Ph. E. & D. *Prep.* 1. (Ph. E.) *Rhubarb*, in coarse powder, 5 oz.; *canella*, in coarse powder, 2 dr.; *proof spirit*, 5 fl. oz.; *sherry*, 1¾ pint; macerate for 7 days, press, and filter.

2. (Ph. D.) *Rhubarb*, 3 *oz.; canella*, 2 dr.; *sherry*, 1 quart; macerate 14 days. Weaker than the last. *Dose.* As a *stomachic*, 1 to 3 fl. dr.; as a *purgative*, ½ to 1 fl. oz., or more. It does not keep well.

WINE (Tobacco). Syn. *Vinum Tabaci,* —Ph. E. *Prep.* (Ph. E.) *Tobacco*, 3½ oz.; *sherry*, 1 quart; digest 7 days, strain with strong pressure, and filter. A powerful sedative and diuretic. *Dose.* 10 to 30 drops; in dropsy, lead colic, ileus, &c.

WINE (White Hellebore.) Syn. *Vinum Veratri,*—Ph. L. *Tinctura Veratri Albi,*—Obs. *Prep.* (Ph. L.) *White hellebore*, sliced, 8 oz.; *sherry wine*, 1 quart; digest for 7 days, press and filter. *Dose.* 10 drops, gradually increased to 25 or 30; as a substitute for colchicum, in gout and rheumatism, &c. It is less manageable than wine of colchicum, and is now seldom employed.

WINE (White Hellebore,— Opiated). Syn. *Mr. Moore's Eau Médicinale; Vinum Veratri Opiatum,*—Lat. *Prep.* From *wine of white hellebore*, 3 fl. dr.; *tincture of opium*, 1 fl. dr. *Dose.* As the last.

WINES (Medicated,—Dr. B. Lane's). Syn.

Vinous Essences; Essentiæ Vinosæ, Liquores Vinosi,—Lat. *Prep.* From an *infusion* or *solution of the drug*, of about 3 or 4 times the usual strength, fermented with a little *yeast*, and about 3 or 4 *lb.* of *sugar* per gallon; the fermented liquor being afterwards set in a cool cellar until fit for bottling. Compounds of *calumba*, *cascarilla*, *gentian*, *opium*, *rhubarb*, *senna*, and *valerian*, have been thus prepared. That of opium is made of *only twice* the strength of the common tincture.

WINE-STONE. Crude tartar, or argol.

WINE TESTS. *Prep.* 1. (*Hahnemann's.*) From *quicklime*, 1 oz.; *flowers of sulphur*, 1½ oz.; mix and heat them in a covered crucible for 5 or 6 minutes; put 2 dr. of the *product* and an equal weight of *tartaric acid* (separately powdered), into a stoppered bottle, with a pint of *water*, and shake them well; let the liquid settle, pour off the clear portion, and add of *tartaric acid*, 1½ dr.

2. (*Dr. Paris's.*) From *sulphuret* of *calcium* and *cream of tartar*, of each (in powder), ½ oz.; *hot water*, 1 pint; agitate, &c., as before; decant the *cold clear liquid* into 1-*oz. phials*, and add 20 drops of *hydrochloric acid* to each of them.

Obs. The above tests will throw down the least quantity of lead from wines, as a very sensible black precipitate. As iron might be accidentally contained in the wine, the hydrochloric acid is added to the last test, to prevent the precipitation of that metal.

WINTER-GREEN (American). Syn. *Pipsissewa; Chimaphila*,—Ph. L. & E. *Pyrola*,—Ph. D. The *herb* of *chimaphila umbellata* (pyrola umbellata,—Linn.) It is astringent, diuretic, tonic, and stomachic; and has been successfully administered in loss of appetite, dyspepsia, dropsy, chronic affections of the urinary organs, scrofula, &c. It must not be confounded with ordinary *winter-green* (box-berry, chequer do., partridge do., mountain tea), which is the *gaultheria procumbens* (Linn.), a plant belonging to the *ericaceæ* (De Cand.); whilst the former plant belongs to a genus of the *pyrolaceæ* (De Cand.) See *Decoctions*, *Extracts*, and *Oils* (Essential).

WITCH MEAL. Syn. *Vegetable Sulphur*, *Lycopodium*. The *pollen* of *lycopodium clavatum* or *club moss*. (See *p.* 372.)

WOAD. Syn. *Dyer's Woad; Pastel*,—Fr. The *isatis tinctoria* (Linn.) To prepare them for the dyer, the *leaves* are partially dried, and ground to a paste which is made into balls; these are placed in heaps, and occasionally sprinkled with *water*, to promote the fermentation; when this is finished, the woad is allowed to fall down into lumps, which are afterwards reground and made into cakes for sale. On mixing the prepared woad with *boiling water*, and, after standing for some hours in a close vessel, adding about 1-20th its weight of *newly slaked lime*, digesting in a gentle warmth, and stirring the whole together every 3 or 4 hours, a new fermentation begins; a blue froth rises to the surface, and the liquor, though it appears itself of a reddish colour, dyes *woollens* of a *green*; which, like the green from indigo, changes in the air to a BLUE. This is said to be one of the nicest processes in the art of dyeing, and does not well succeed on the small scale. Woad is now mostly used in combination with indigo. 50 *lb.* of *woad* are reckoned equal to 1 *lb.* of *indigo*.

WOLFRAMIUM. See *Tungsten*.

WOLFSBANE. See *Aconite*.

WOOD is *polished* by carefully rubbing down the grain with fine *glass paper*, or *pumice-stone*, and then rubbing it, *first* with *finely powdered pumice-stone* and *water*, and *afterwards* with *tripoli* and *linseed oil*, until a proper surface is obtained. For common purposes, *glass paper*, followed by a *metal burnisher*, is employed.

WOOD is *stained* by the application of any of the ordinary *liquid dyes* employed for wool or cotton. They sink deeper into the wood when they are applied hot. When the surface is properly stained and dried, it is commonly cleaned with a *rag* dipped in *oil of turpentine* or *boiled oil*, after which it is either *varnished* or *polished* with bees' wax. *Musical instruments*, *articles of the toilette*, &c., are usually treated in this way.

Wood is *preserved* by any agents which destroy the tendency to putrefaction of the matter within its pores, or which enables it to resist the attack of insects, or renders it unsuited to the growth of minute fungi. Under Mr. Bethell's patent, *coal tar* or *crude pyrolignite of iron*, and other *bituminous matters* containing *creasote* are forced into it, under powerful pressure. See *Kyanizing*, *Paynizing*, *&c.*

WOODY FIBRE. See *Lignine*.

WOOD ETHER. See *page* 406.

WOODY NIGHTSHADE. See *page* 820.

WOOL. Syn. *Lana*,—Lat. Wool is a fine, soft, elastic variety of hair, is cellulated in its structure, and each of its little cells is the separate casket of a collection of air. Its filaments are cylindrical, like those of silk; but the surface is covered with thin scales or epidermic cells. In the finer quali-

ties, these filaments vary in thickness from $\frac{1}{1100}$ to $\frac{1}{1500}$ of an inch; and under a good microscope, distinctly exhibit, at intervals of about $\frac{1}{300}$ of an inch, a series of serrated rings, imbricated towards each other, "like the joints of equisetum, or rather, like the scaly zones of a serpent's skin." These appearances render it almost impossible to mistake *wool* for *silk*, *linen*, or *cotton*. From experiments made by different competent authorities, it is found, that wool is one of the *worst* conductors, and one of the *best* radiators of heat known. These properties render textile fabrics composed of it particularly adapted for clothing in cold, damp, and changeable climates; since, from its peculiar structure and other conditions, it not merely gently excites the arterial circulation of the skin, but prevents the loss of heat by radiation, and thus materially assists in maintaining the surface of the body at a proper and equable temperature. It sometimes, however, proves too irritative for highly sensitive skins, and, moreover, disturbs the electricity of the cutaneous surface, on friction, more than even silk. On these accounts there are persons who find it unpleasant to wear woollen garments, of any description, next the skin; in which cases, all the advantages that such parties can derive from their use, may be obtained by wearing them outside one of linen or cotton. According to Erasmus Wilson, this method "is preferable in warm weather, since the *linen* absorbs the perspiration, while the *woollen* garment preserves the warmth of the body, and prevents the inconvenience resulting from its evaporation." See *Flannel*.

Identif. 1. By the microscope. (See *above*.)

2. Its fibres, when inflamed, shrivel up, and burn with difficulty, and evolve the peculiar and characteristic odour of hair when similarly treated, leaving a bulky charcoal; whereas cotton and linen burn rapidly, leave no charcoal, and evolve little or no odour. *Silk* acts in nearly the same manner as wool.

3. Nitric acid, picric acid, and gaseous chlorine stain the fibres of wool and silk yellow. Dr. J. J. Pohl recommends an aqueous or alcoholic solution of picric acid as well adapted for a test.—After immersion of a small portion of the fabric or yarn for from 5 to 10 minutes in the solution, it is to be taken out, and washed in warm water. The *linen* and *cotton* in it will then appear *white*, but the *wool*, *silk*, or other animal fibre, will retain its yellow colour. In stuffs, cloths, flannels, &c., the mixed threads may be readily observed by means of a pocket lens, and their relative numbers may be ascertained by means of a "thread counter." This test acts best with white, but is also applicable to many other colours. For *dark colours* nitric acid is preferable.

4. A square inch of the fabric, or a small portion of the yarn, is boiled for a short time in a solution of caustic soda or potassa, and then withdrawn and washed. If it be of *pure wool*, it will be dissolved, and wholly disappear; if any threads or fibres are left undissolved, they consist of either *cotton* or *linen*; of these, such as have acquired a dark yellow tinge, are LINEN, whilst those which have retained their whiteness, or which are only slightly discoloured, are COTTON. The relative proportion of the adulteration may be ascertained as before. See *Cotton*, *Linen*, and *Silk*.

Wool and *woollen goods* exhibit a greater affinity for colouring matter, than either cotton or linen, and in many cases, this exceeds even that of silk. The most difficult dye to impart to wool is a rich, deep, and permanent black. See *Dyeing*, *Mordants*, *&c.*

Woollen goods are cleaned and scoured in the manner noticed under *Bleaching*, *Fulling*, and *Scouring*.

WOOL (Spanish). See *Rouge crepons* (*p.* 1111).

WOORARA. Syn. *Ourari*, *Wourali*. A deadly poison employed in Guiana, obtained from a species of *strychnos*. See *Upas*.

WOOTZ. The Indian name of steel; applied in this country to the steel imported from Bengal.

WORMS (Intestinal). Syn. *Vermes; Intestinalia*, — Cuvier; *Entozoa*, — Rudolphi. The parasites which are generated and nourished in the human intestinal canal, are the—*Ascaris lumbricoides* (Gmelin; *ascaris*, —Rudolphi), or *long round-worm*, found in the small intestines, and which is generally of the thickness of a goose-quill, and varies in length from 10 to 15 inches;—*ascaris vermicularis* (Gmelin; *oxyurus*, — Rud.), *maw*, or *thread-worm*, the ascaris (*ascarides*) of medical writers, which is thread-like in appearance, varies from 1½ to 5 lines in length, and confines itself chiefly to the rectum; — *trichocephalus hominis* (Gmelin; *t. dispar*,—Rud.), or *long thread-worm*, varying from 1¼ to 2 inches in length, and found chiefly in the cœcum;—*tænia solium* (Gmelin), or common *tape-worm*, having a flattened riband-like appearance, varying in length from 3 or 4, to 15 or 20 feet, and occupying the small intestines, especially of females and the debilitated;—*tænia vul-*

garis (Gmelin), or *broad tape-worm*, a variety seldom found in this country, but common in Switzerland and the north of Europe.

Causes. A debilitated state of the digestive organs; improper food; sedentary habits; impure air; bad water; and, apparently, an occasional hereditary tendency to worms.

Symp. Griping pains, especially about the navel; acid eructations; slimy stools; occasional nausea and vomiting, without any manifest cause; heat and itching about the anus; tenesmus; emaciation; disturbed dreams; grinding of the teeth during sleep; pallor of countenance; discoloration round the eyes; feverishness; headache; vertigo; &c. In many cases these symptoms are often highly aggravated, and mistaken for primary diseases. The only absolutely positive evidence of the existence of worms is, however, their being seen in the fæces.

Treat. In common cases, an occasional moderately strong dose of *calomel* overnight, followed by a smart purgative the next morning, is an excellent remedy, where the use of mercurials is not contra-indicated. *Cowhage*, made into an electuary with honey or treacle, is also an excellent vermifuge. *Oil of turpentine* is useful against nearly every variety of worms, and when taken in sufficient doses to reach the rectum, is almost specific in *ascarides*. When this is inconvenient, an occasional *enema of oil of turpentine* is even more effective. *Enemas of aloes* are also very useful in such cases. *Scammony*, under the form of *Basilic powder*, has long been employed to expel worms in children. *Aloes*, *castor oil*, *worm-seed*, *tin filings*, and *sulphur*, are likewise popular remedies. *Cabbage-tree bark* is a powerful anthelmintic; but its use requires caution. Most of the *quack vermifuges* contain either *aloes* and *gamboge*, or *calomel* and *jalap*. The substances which have been most highly extolled for the destruction or expulsion of *tape-worm* (tænia) are *koussa*, *oil of turpentine*, *male-fern*, *pomegranate*, and *tin-filings*. The first two are those on which the most dependence may be placed. *Madame Nouffer's* celebrated "*Swiss remedy*" for *tape-worm*, for which Louis XVI gave 18,000 francs, consisted of 2 or 3 dr. of *powdered male-fern*, taken in ¼ pint of *water* in the morning, *fasting*, followed in 2 hours by a bolus made of *calomel* and *scammony*, of each, 10 gr.; *gamboge*, 6 or 7 gr. "*Swain's Vermifuge*" is prepared from *worm-seed*, 2 oz.; *valerian*, *rhubarb*, *pink root*, and *white agaric*, of each, 1½ oz.; boiled in *water*, q. s. to yield 3 quarts of *decoction*, to which 30 drops of *oil of tansy*, and 45 drops of *oil of cloves*, dissolved in a quart of *rectified spirit*, are added. *All purgatives* may be regarded as *vermifuges*. Besides our efforts to destroy and expel the worms, the tone of the primæ viæ should be raised by the use of stomachics and tonics, by which the tendency to their equivocal generation will be either removed or lessened. See *Anthelmintics*, *Decoctions*, *Enemas*, *Pills*, *Patent Medicines*, &c.; and also the several vermifuges under their *respective names*.

WORM BARK. Syn. *Cabbage-tree Bark; Geoffræa Inermis*,—Ph. D. 1826. *Geoffræya Inermis*,—Ph. E. 1817. A powerful astringent, purgative, anthelmintic, and narcotic. *Dose.* 10 to 30 gr. In larger doses, or if cold water be drunk during its action, it is apt to occasion sickness, vomiting, and delirium. The remedy for this is copious draughts of warm water.

WORM SEED. Syn. *Semen Contra*, *Semen Cinæ*,—Lat. The broken peduncles, mixed with the calyces and flower buds of *artemisia santonica*, and some other species of artemisia, imported from the Levant. *Dose.* 10 to 30 gr., in powder; as a vermifuge. See *Santonine*.

WORM TEA. A preparation sold in the shops of the United States, and much used, consisting, according to Brande, of *spigelia* or *pink-root*, *savine*, *senna*, and *manna*.

WORMWOOD. Syn. *Absinthium*,—Ph. L. & E. The *flowering herb* of *artemisia absinthium* (Linn.), a well known plant indigenous to this country, and largely cultivated for medicinal purposes. It is a bitter tonic and stomachic, and also anthelmintic. *Dose.* 20 to 40 gr., of the dried herb, either in powder, or made into a tea or infusion; in dyspepsia, dropsy, scurvy, sympathetic epilepsy, &c. See *Absinthine* and *Absinthic Acid*.

WORT. The technical name for the fermentable infusion of malted grain.

The *strength* of *worts* is ascertained by means of an instrument commonly termed a saccharometer. (See *p.* 1114.) "Brewers, distillers, and the Excise, *sometimes* denote by the term '*gravity*' the *excess* of weight of 1000 parts of a liquid by volume above the weight of a like volume of distilled water, so that if the specific gravity be 1045, 1070, 1090, &c., the gravity is said to be 45, 70, or 90; at *others*, they thereby denote the *weight* of *saccharine matter* in a barrel (36 gall.) of wort; and *again*, they denote, the *excess* in weight of a barrel of wort over a barrel of water, equal to 36 gallons, or 360 *lb.* This and the first

statement are identical, only 1000 is the standard in the *first* case, and 360 in the *second.*" (Ure.) The last is that commonly adopted by the brewers.

According to Dr. Ure, the *solid dry extract of malt*, or *saccharine*, has the *specific gravity* 1·264; and the *specific volume* 0·7911; "that is, 10 *lb.* of it will occupy the volume of 7·911 *lb.* of water. The mean sp. gr.. by *computation* of a solution of that extract in its own weight of water, is 1·116; but by *experiment*, the sp. gr. of that solution is 1·216 (?—1·231), showing considerable condensation of volume in the act of combination with water." The *quantity* of *solid saccharine* or *sugar* in a *wort* may be determined in the manner mentioned under *Syrup.*

According to the compilers of the tables accompanying Field's Alcoholmeter, 1·8 *lb.* of *saccharine* is decomposed for the production of 1 of *proof spirit;* but according to our experiments, the proportion of saccharine named is rather below the true equivalent.

The rapid *cooling* of *worts* is an important object with the brewer and distiller. On the *large scale*, the old system, in which shallow coolers are employed, with all its numerous inconveniences and accidents, is now for the most part abandoned, being supplanted by the method introduced by Mr. Yandall about 30 years ago. This consists in the use of a "refrigerator," which is an apparatus so constructed that any hot liquid may be cooled by about its own volume of cold water, in a very short space of time. The principle is that of passing the two fluids through very shallow and very long passages, in opposite directions, being essentially that of a *Liebig's refrigerator* on a gigantic scale. The apparatus may consist of zigzag passages, flattened tubes or convoluted curves, of any convenient shape, so that they possess little capacity in one direction, but great breadth and length. A refrigerator having the passages for the fluids ⅛ of an inch thick, is said to require a run of about 80 feet. The success of this method is such as to leave nothing more to desire. See *Brewing, Fermentation, Malt, &c.*

WOUND. Syn. *Vulnus*,—Lat. A solution of continuity in any of the soft parts of the body, arising from external violence.

Wounds are *distinguished* by surgeons into *contused wounds, incised do., lacerated do., poisoned do., punctured do., &c.;* terms which explain themselves. *Sword-cuts* are incised wounds; *gun-shot wounds*, lacerated and contused ones. *Slight wounds*, and indeed all those not demanding material surgical assistance, after dirt and foreign substances have been removed, may be treated in the manner noticed under *cuts* and *abrasions.*

WOUND BALSAM. See *page* 1230.

WRITING executed in the ordinary tanno-gallic ink, and which has been rendered illegible by age, may be restored by carefully moistening it, by means of a feather, with an *infusion of galls*, or a *solution of prussiate of potash* slightly acidulated with *hydrochloric acid*, observing so to apply the liquid as to prevent the ink spreading.

WRITING FLUIDS. A term commonly applied, of late years, to easy-flowing inks adapted for metallic pens; in contradistinction to the old tanno-gallic compounds at one time exclusively employed for writing.

Prep. 1. Dissolve *pure basic* or *soluble Prussian blue* in *pure distilled water*, and dilute the resulting solution with *pure water* until the desired shade of colour is obtained. Very permanent and beautiful. It is not affected by the addition of alcohol, but is immediately precipitated by saline matter. The precipitate, however, still possesses the property of dissolving in *pure* water.

2. From the *soluble ferrocyanide of potassium and iron*, dissolved in *pure water.* Resembles the last, but it is precipitated from its solution by alcohol.

3. *Powdered Prussian blue*, 1 *oz.; concentrated hydrochloric acid*, 1½ fl. oz.; mix in a matrass or glass bottle, and after 24 or 30 hours, dilute the mass with a sufficient quantity of water.

4. Dissolve *ceruleo-sulphate of potassa* or *ammonia* (or blue carmine or soluble indigo) in *hot water*, and when cold decant the clear portion. It is an intense blue, and dries nearly black; is perfectly incorrosive, and very permanent and easy flowing.

5. (Horning.) *Perchloride of iron*, 4 parts, *water*, 750 parts; dissolve, add of *cyanide of potassium*, 4 parts, dissolved in a little *water*; collect the precipitate, wash it with several effusions of *pure water*, allow it to drain until it weighs about 200 parts, then add of *oxalic acid*, 1 part; and promote solution by agitating the bottle or vessel containing it.

6. (Mohr.) *Pure Prussian blue*, 6 parts; *oxalic acid*, 1 part; triturate with a little water to *a perfectly smooth* paste, then dilute the mass with a proper quantity of soft water. The *product* resembles Stephen's "*patent-blue ink.*"

7. (Rev. J. B. Reade.)—*a.* A *solution* of his *soluble Prussian blue* in *distilled water.* Blue.

b. Prepared by adding to good *gall ink* a strong *solution* of his *soluble Prussian blue.* This addition "makes the ink, which was previously proof against *alkalies*, equally proof against *acids*, and forms a writing fluid, which cannot be erased from paper by any common method of fraudulent obliteration, without the destruction of the paper." This ink writes greenish blue, but afterwards turns intensely black. Stephen's "*patent ink*," which does the same, is a similar compound.

8. (Prof. Runge.) *Logwood*, in fine chips, ¼ *lb.*; *boiling water*, 3 pints; digest for 12 hours, then simmer the liquid down gently to 1 quart, carefully observing to avoid dust, grease, and smoke; when cold decant the decoction, and add to it of *yellow chromate of potash*, 20 gr.; dissolve by agitation, after which it will be fit for use. Cheap and good. It resists the action of all ordinary destructive agents better than the tanno-gallic inks; it may be washed after use with a wet sponge, or steeped for twenty-four hours in water, or even tested with dilute acids, and yet preserve its original blackness. It is perfectly liquid, it scarcely thickens by age, and neither deposits a sediment, nor corrodes steel pens.

9. (Ure.) From *vanadate of ammonia* decomposed with *infusion of galls.* It is of a perfectly black hue, flows freely from the pen, is rendered blue by acids, is unaffected by dilute alkaline solutions, and resists the action of chlorine.

Obs. The preceding formulæ, under proper management, produce excellent products, all of which are extremely noble, and most of them of a more or less beautiful colour. The *blue* ones, when concentrated, dry of a blue black, whilst two or three of the others, though at first pale, rapidly pass into a deep black, when exposed to the air. Care must be taken in all cases that the ingredients be pure. The Prussian blue, except when directly prepared for the purpose, should be washed in dilute hydrochloric acid before attempting its solution by means of oxalic acid. Unless these precautions are attended to, success is unlikely. A little gum may be added, if required, to prevent the fluid spreading on the paper; but in most cases the addition is no improvement. Most of the *blue fluids* may be used as *indelible ink* to mark linen, and will be found very permanent, provided the part be first moistened with *alum water*, and dried.

XANTHATES. See *below.*

XANTHIC ACID. Syn. *Hydroxanthic Acid, Bisulphocarbonate of Oxide of Ethyle.* A peculiar acid, composed of sulphur, carbon, hydrogen, and oxygen, discovered by Zeise.

Prep. Dry *xanthate of potassa* is mixed with *dilute sulphuric* or *hydrochloric acid;* after a time a milky liquid is formed, from which, by the addition of more *water*, a heavy oily substance is deposited, which is quickly washed with *water*, and dried by standing over *chloride of calcium;* this is *hydrated xanthic acid.*

Prop., &c. A nearly colourless, inflammable, oily liquid, having a bitter taste, and a peculiar, penetrating, disagreeable odour. It is decomposed into alcohol and bisulphuret of carbon at a temperature above 75° Fahr. The *compounds* of *xanthic acid* are mostly of a yellow colour; hence its name.—*Xanthate of Potassa* (*Bisulphocarbonate of oxide of ethyle and potassa*,—Liebig) is obtained by adding *bisulphuret of carbon* to a solution of *fused caustic potassa*, 1 part; in *alcohol*, sp. gr. 0·800, 12 parts; as long as it is dissolved; by cooling the solution to 32°, or better, to 0° Fahr., the salt separates as a semi-solid mass of brilliant, slender, colourless, prismatic crystals, which, after being washed with ether, and pressed between bibulous paper, must be dried out of contact with the air. Soluble in water and alcohol; insoluble in ether; decomposed by exposure to the air. The *xanthates* of *soda*, *potassa*, and *baryta*, are soluble and crystallizable; those of *lead*, *mercury*, and *zinc*, white and nearly insoluble; that of *lime* is uncrystallizable; that of *copper* is a flocculent, insoluble substance, of a rich yellow colour.

XANTHIC ACID. A peculiar substance, found by Dr. Marcet in a *urinary calculus*, and so named from its *solution* in *nitric acid* furnishing a bright lemon-coloured residuum on evaporation.

XANTHINE. The name given by Kuhlmann to the yellow tinctorial principle of madder. (See *p.* 733.)

XANTHOGEN. The hypothetical radical of *xanthic acid.*

XANTHOPHYLLINE. The yellow colouring matter of autumn leaves.

XANTHOPICRITE. A crystallizable bitter principle obtained from the *bark* of *xanthoxylum Caribæum*, which, according to Brande, is used in the *Antilles* as a febrifuge. This name has been erroneously spelled *xanthopichroite* and *xanthopicrine.*

XANTHOPROTEINE. A yellow organic acid, formed by the action of nitric

acid on fibrine, and some other proteine compounds.

XANTHORHAMNINE. The pure yellow colouring principle of the fruit of *rhamnus tinctoria*, or French berries.

XYLIDINE. A peculiar unexamined compound of *carbon*, *hydrogen*, and *oxygen*.

XYLOIDINE. When *starch* is immersed in *concentrated nitric acid* (sp. gr. 1·45 to 1·50), it is converted, without disengagement of gas, into a colourless, tremulous jelly, which when treated with an excess of *water*, yields a white curdy insoluble substance, which, after being edulcorated with *pure water*, until every trace of acid is removed, is *xyloidine* or *starch-xyloidine*. Cotton, when so treated, yields a precisely similar compound, in a pulverulent form, termed, by way of distinction, *cotton xyloidine*. Paper, sugar, gum, *mannite*, and several other substances, yield xyloidine compounds of greater or less purity.

Prop., *&c.* Pure xyloidine *differs* from *pyroxyline*, or *pure gun-cotton*, in the mode of its combustion, in leaving a residuum on explosion, and in being freely soluble in ether, and in ether containing a little alcohol. In other points these substances bear a considerable resemblance, and either pure or mixed, are continually confounded with each other.

Obs. A mixed xyloidine compound, recently employed under the name of *sugar-resin*, to render gunpowder, percussion caps, and the tips of lucifer matches waterproof, is prepared as follows: — *Oil of vitriol*, 2 parts; is mixed with *nitric acid* (1·50), 1 part; and when the mixture has cooled to the temperature of the atmosphere, *powdered sugar*, 1 part, is stirred in; after a few seconds, or as soon as it becomes pasty, it is removed, thrown into cold water, and well washed; the mixed acids being, in the mean time, treated with *more sugar*, as before; the product (sugar-resin) *carefully* dried at about 180° Fahr., is formed into a varnish by solution in a mixture of alcohol and ether.

Another substance belonging to the above class of bodies is *Nitro-glycerine*, or *Glonoïne*, which was discovered by M. Sobrèro, soon after the discovery of gun-cotton. According to M. J. E. Vrij, the best formulæ for its preparation is that given below:—*Glycerine* (sp. gr. 1·262), 1543 gr.; is added *cautiously*, and in small portions at a time, to *monohydrated nitric acid*, 18 oz.; previously immersed in a powerful freezing mixture, observing to allow the mixture to cool to about 15° Fahr. between each addition, as if it rises to 32° Fahr., a fearful explosion occurs; when a homogeneous fluid is formed, promoted by frequent stirring with a glass rod, *concentrated sulphuric acid*, 18 oz.; is cautiously and slowly added, with agitation, as before; the *glonoïne* separates after a time, and floats on the surface as an oily liquid, which is decanted; (more may be obtained by the addition of *water* to the residual acid liquor;) it is next purified by solution in *ether*, agitating the ethereal solution with water to remove acid; and, lastly, expelling the ether by the heat of a water-bath. *Prod.* 2840 gr.—*Prop.* A transparent, oily liquid; sp. gr. 1·595 to 1·600; heated to about 245° Fahr., it is decomposed into red vapours; at higher temperatures it explodes violently, or it suddenly inflames without detonation. It also explodes by percussion. (*Journ. de Pharm.*)

XYLOLE. A hydrocarbon, homologous to benzole, found in *wood-tar* and *coal-gas naphtha*.

XYLORETINE. Syn. *Turf Resin*. A crystallizable resin-like substance, found in certain varieties of natural turf.

YAWS. Syn. *Frambœsia*. A peculiar disease of the skin common in the Antilles and some parts of Africa. It is characterised by mulberry-like excrescences, which discharge a watery humour. The *treatment* chiefly consists in alleviating urgent symptoms (if any), and the adoption of a temperate diet and regimen, until the eruptions, having run their course, begin to dry, when *tonics* and *alteratives*, as cinchona bark, quinine, and sarsaparilla, with occasional small doses of mercurials, generally prove advantageous. The *master* (or principal) *yaw*, which frequently remains troublesome after the others have disappeared, may be dressed with the *ointment of nitric-oxide of mercury*, or of *nitrate of mercury*, diluted with an equal weight of lard.

The *yaws* is not a dangerous, although a very disgusting disease. It is contagious by contact, and, like the small-pox, only occurs once during life.

YEAST. Syn. *Barm*, *Ferment*, *Zumine*; *Fermentum*, — Lat. Yeast is either the froth or the deposit of fermenting worts, according to the character of the fermentation. Liebig regards yeast as a substance in a state of putrefaction or fermentation, the atoms of which are in continual motion,

a condition which it communicates by contact, to fermentable substances. According to Dr. Lüdersdorff, yeast is an organic body, and acts by means of its organs on the sugar contained in the saccharine solution, and not by mere contact and communication of its own condition. This view receives considerable support from the construction of its particles, as shown by the microscope, as well as from the fact that its power of causing fermentation is destroyed by trituration and by strong pressure. Our own investigations induce us to believe, that both these views are, to a certain extent, correct, and that the "atoms in a state of contiuual motion or change," referred to by Liebig, are elaborated by the organs of *vital yeast*, when in contact with sugar under circumstances favorable to fermentation.

The *oberhefe*, *top yeast*, or *superficial ferment* which covers the *surface* of fermenting worts, is oxidized gluten in a state of *putrefaction;* and the *unterhefe*, *bottom yeast*, or the *ferment of deposit*, is oxidized gluten in a state of *eremacausis*. (Liebig.) The first is the common yeast of the English brewer; the other, that used in Bavaria for the fermentation of worts from below (*untergährung*). Both varieties yield their own kind under proper conditions. Wort fermented with *top yeast* at from 46 to 50° Fahr., yields both varieties, and each of these furnishes its own kind, nearly pure, by a second fermentation. See *Brewing*, *Fermentation*, *&c.*

Pres. 1. Ordinary beer yeast may be kept fresh and fit for use for several months, by placing it in a close canvass bag, and gently and gradually squeezing out the moisture in a screw press, until the remaining matter acquires the consistence of clay or soft cheese, in which state it must be preserved in close vessels, or wrapped in *waxed* cloth. This is the method generally adopted for the best *Flanders* and *German yeast*.

2. Whisk the *yeast* until it forms a uniform liquid mass, and then lay it with a clean and soft painter's brush evenly and thinly on *flat dishes*, or any convenient surface, on which it can be exposed to the sun or air; this operation must be repeated as soon as the first coat is sufficiently solid, and so on, until the layers acquire a proper thickness, when it must be detached and preserved as before. If rendered quite dry, its power of exciting fermentation will be destroyed.

3. By employing strips of *clean new flannel* (well-washed), as above; and when sufficiently dry, rolling these up, and covering them with *waxed cloth* or *paper*, or placing them in tin canisters or boxes. For *use*, a few inches of one of the strips is cut off, and soaked in *luke-warm water*, when the *barm* leaves the flannel, and mixes with the water, which may then be stirred up with the flour.

YEAST (Artificial). "Although the conversion of a small into a larger quantity of yeast is a very easy thing, yet to produce that substance from the beginning is very difficult." (Berzelius.) Both cases are met in the formulæ below.

Prep. 1. *Without a Ferment.—a.* (Fownes.) *Wheat-flour* is to be mixed with *water* into a thick paste, which is to be slightly covered, in a moderately warm place; about the third day, it begins to emit a little gas, and to exhale a disagreeable, sour odour; about the sixth or seventh day, the smell changes, much gas is evolved, accompanied by a distinct and agreeable vinous odour, and it is then in a state to excite either the vinous or panary fermentation, and may be either at once employed for that purpose, or formed into small and very thin cakes, dried in the air, and preserved for future use. Wort fermented with it in the ordinary way, yields a large quantity of yeast, of excellent quality, which is found at the bottom of the vessel. "This is a revival of a method which, although he (Mr. Fownes) seems to regard it as new, is to be found in the *Chemistry* of Boerhaave." (Lancet.) It is, indeed, a mere modification of the mode of preparing *leaven*, as practised from the most remote ages of antiquity; but is not the less valuable on that account.

2. (*With a Ferment.*)—*a.* Take of *bean-flour*, ¼ *lb.;* *water*, 6 quarts; boil for ½ an hour, pour the *decoction* into any suitable vessel, add of *wheat-flour*, 3½ *lb.;* stir the whole well together, and when the temperature reaches 55° Fahr., add of *beer yeast*, 2 quarts; mix well, and in 24 hours after the commencement of the fermentation, add of *barley* or *bean-flour*, 7 *lb.;* make a uniform dough by thorough kneading, form it into small cakes, as above, and then preserve these in a dry situation. For *use*, one of these discs is to be broken into pieces, laid in tepid water, and set in a warm place during 12 hours, when the soft mass will serve the purpose of beer yeast.

b. (*Patent Yeast.*) Take of *hops*, 6 *oz.;* *water*, 3 gall.; simmer for 3 hours, strain, and in 10 minutes, stir in of *ground malt*, ½ peck; next reboil the *hops* in *water*, as before, and let the strained liquor run into the first mash, which must then be well-

stirred up, covered over, and left for 4 hours; after that time drain off the wort, and when the temperature has fallen to 90° Fahr., set it to work with *yeast* (preferably patent), 1 pint; after standing for 20 to 24 hours in a warm place, take off the *scum*, strain it through a coarse hair sieve, and it will be fit for use. 1 pint is said to be enough for 1 bushel of bread.

Obs. The preparation of artificial yeast and substitutes for yeast, has long engaged the attention of both the scientific chemist and the practical tradesman. The subject is, undoubtedly, of great importance to emigrants and voyagers; though less so than formerly, owing to the introduction of *Jones's Patent Flour*. At one time the periodicals absolutely teemed with receipts for "substitutes for yeast;" and even at the present day, some of the minor publications amuse their readers in the same way. The above processes, by good managemont, yield products which are all that can be desired.

YELLOW DYES. The following substances impart a YELLOW to goods, either at once, or after they have been mordanted with alumina or tin:—*annotta*, *barberry root*, *dyer's broom*, *French berries*, *fustic*, *fustet*, *quercitron bark*, and *turmeric*. Goods *mordanted* with *acetate of lead*, and afterwards passed through a *bath* of *chromate of potash*, acquire a brilliant CHROME YELLOW colour;—*solution of sulphate* or *acetate of iron*, followed by immersion in *potash* or *lime-water*, gives a BUFF or ORANGE;—*orpiment*, dissolved in *ammonia water*, imparts a GOLDEN YELLOW. (See the above-named substances in their alphabetical places.)

YELLOW FEVER. The bilious remittent fever of hot climates. It is very common in the West Indies and the Southern states of America. New Orleans has been several times nearly depopulated by it. Various pretended specifics for this disease have from time to time been brought before the public. We are told in the *Journ. do Commerico*, that "Senhora Orfila has discovered an infallible remedy for the cure of yellow fever and black vomit." This is the *expressed juice* of the *verbena*, which is "to be given to the patient, in small doses, two or three times a day, accompanied by injections of the same juice every two hours, until the bowels are cleansed." "There are two species of verbena, male and female; the latter is the sort to be used for this purpose." (See *p.* 1102.)

YELLOW PIGMENTS. Of these the principal are—

Brown Pink. Take of *French berries* and *pearlash*, of each, 1 *lb.*; *fustic chips*, ½ *lb.*; *water*, 2 gallons; boil in a *tin* or *pewter vessel*, and strain the decoction through flannel, whilst hot; then dissolve of *alum*, 1½ *lb.*, in *hot water*, 2½ gall.; add the *solution* to the *strained decoction* as long as a precipitate falls, which must afterwards be washed, drained, and dried. Some manufacturers omit the fustic. A good glazing colour when ground in linseed, and used with drying oil.

Chrome Yellow, *Chromate of Lead*, *Yellow do.*; *Plumbi Chromas*, *Plumbi Chromas Flavum*,—Lat. The preparation of the pure salt is noticed at *pages* 680-1; that of the *commercial pigment* is as follows:—

1. Add a *filtered solution* of *nitrate* or *acetate of lead*, to a like *solution of neutral chromate of potash*, as long as a precipitate falls; then collect this, wash it well with clean *soft water*, and dry it out of the reach of sulphuretted vapours.

2. To the *lye of chromate of potash*, prepared by roasting the chrome ore with nitre, and lixiviation with water, add a *solution of acetate of lead*, and otherwise proceed as before.

3. Dissolve *acetate of lead* in *warm water*, and add of *sulphuric acid*, q. s., to convert it into sulphate of lead; decant the clear liquid (*vinegar*), wash the residuum with *soft water*, and digest it, with agitation, in a *hot solution of neutral* (yellow) *chromate of potash*, containing 1 part of that salt to every three parts of sulphate of lead operated on; afterwards decant the liquid, which is a solution of sulphate of potash, and carefully drain, wash, and dry the newly formed pigment. The *product* contains much sulphate of lead, but covers as well, and has as good a colour as pure chromate of lead, whilst it is much cheaper. The shade may be varied by increasing or lessening the quantity of the chromate. (Armengaud's *Génie Industriel*, April, 1853.)

Obs. Four shades of this beautiful pigment are met with in the shops; viz., *Pale yellow* or straw colour, *yellow*, *deep yellow*, and *orange*. The *former* are made by adding a little alum or sulphuric acid to the solution of the chromate before mixing it with the solution of lead; the last, by the addition of a little subacetate of lead, or by washing the precipitate with a weak alkaline lye. The darker colour appears to arise from a little dichromate being thrown down intimately mixed with the neutral chromate, and the paler shades from a *slight* excess of acid, or from the presence of water, sulphate of lead, and, occasionally, alumina. The colour is also influenced by the temperature

of the solutions at the time of admixture. Anthon has found, that when *hot* solutions of equal equivalents of *acetate of lead* (190 parts) and *chromate of potash* (100 parts, both neutral and in crystals) are mixed, the *yellow precipitate*, when dried, is *anhydrous;* but when the mixture is made at ordinary temperatures, the precipitate has a *paler* yellow, and when dried contains 1 eq., or nearly 5¼% of water. (Buch. *Rept.*) It thus appears that the shades of colour of chrome yellow may be varied without any foreign addition. In practice, the *third* formula will be found very satisfactory. See *Orange Chrome* and *Chrome Red.*

Dutch Pink. Take of *French berries* 1 *lb* ; *turmeric*, ½ *lb.; alum*, ½ *lb.; water*, 1½ *gall.;* boil ½ an hour, strain, evaporate to 2 quarts, add of *whiting*, 3 *lb.*, and dry by a gentle heat. *Starch* or *white lead* is sometimes employed, instead of whiting, to give it a body. Golden yellow. Used as a pigment; but will not glaze like brown pink.

English Pink, Light Pink. As the last, but using 5 *lb.* of *whiting.*

Indian Yellow. See *Purree.*

King's Yellow. Factitious tersulphuret of arsenic. (See *p.* 86 and 917.)

Naples Yellow, Mineral do.. Take of *metallic antimony*, in powder, 3 *lb.; red lead*, 2 *lb.; oxide of zinc*, 1 *lb.;* mix, calcine, well triturate the calx, and fuse it in a covered crucible; the fused mass must be reduced to an impalpable powder by grinding and elutriation.

2. *Flake white*, 1½ *lb.; diaphoretic antimony*, ¼ *lb.; calcined alum*, 1 *oz.; sal ammoniac*, 2 *oz.;* calcine in a covered crucible with a moderate heat for 3 hours, so that at the end, it may be barely red hot. More antimony and sal ammoniac turn it on the gold colour.

3. (*M. Guimel.*) *Washed diaphoretic antimony*, 1 part; *pure red lead*, 2 parts; grind them to a paste with *water*, and expose this mixture to a moderate red heat for 4 or 5 hours, as before. *Used* in oil, porcelain, and enamel painting. Chrome has now nearly superseded it for ordinary purposes.

Patent Yellow, Cassel do., Montpellier do., Turner's do. Take of dry *chloride of lead*, 28 parts; *pure carbonate of lead*, 27 parts; grind them together, fuse and powder.

2. *Common salt*, 1 part; and *litharge*, 4 parts; are ground together with *water*, and digested at a gentle heat for some time, *water* being added to supply the loss by evaporation; the carbonate of soda formed is then washed out with more water, and the white residuum heated until it acquires a fine yellow colour. Works well in oil. Chiefly used in coach-painting.

Weld Yellow. Prepared from a *decoction of weld* brightened with a little *alum*, in the same manner as Dutch pink. *Used* chiefly for paper hangings.

YTTRIA. Syn. *Oxide of Yttrium, Protoxide of do.* A rare, white earth, discovered by Gadolin, in 1794, in a mineral from Ytterby in Sweden, since called Gadolinite. Its sp. gr. is 4·842; its salts have in general a sweetish taste, and the sulphate and several others an amethystine colour. Its solutions are precipitated by pure alkalies, but alkaline carbonates, especially carbonate of ammonia, dissolve it in the cold. It is *distinguished* from *glucina* by the colour of its sulphate, by being insoluble in pure alkalies, and by yielding a white precipitate with ferrocyanide of potassium. *Yttria* may be obtained from *Gadolinite* by a similar process to that by which *glucina* is extracted from the *beryl.*

According to Prof. Mosander, *ordinary yttria* is a mixture of the oxides of not less than three metals—*yttrium*, *erbium*, and *terbium.* These differ from each other in many important particulars. The first is a powerful base, and the others are said to be weak ones. They are separated with extreme difficulty, and are only interesting in a scientific point of view.

YTTRIUM. The metalic base of Yttria, discovered by Wöhler, in 1828. It may be obtained in a similar way to that described under glucinium. It is brittle, and has a dark gray colour.

ZAFFRE. Syn. *Saffra, Safflor.* Crude *oxide of cobalt*, obtained by roasting *cobalt ore*, reduced to an impalpable powder, and then ground with 2 or 3 parts of very pure *quartzose* or *siliceous sand. Used* as a blue colour by enamellers and painters on porcelain and glass. Chiefly imported from Saxony. See *Smalts.*

Zanthopicrine. See *Xanthopicrite.*

ZEINE. A name given by Gorham to a yellow waxy substance, obtained by treating the portion of *maize* or *Indian corn*, which is insoluble in water, with *alcohol*, and evaporating the solution.

ZEISE'S PLATINUM SALTS. Syn. *Combustible Platinum-salts*, of Zeise. *Prep.* (Fownes.) A *solution of bichloride of platinum* in *alcohol* is mixed with a little *chloride of potassium* dissolved in *hydrochloric acid*, and the whole digested some

hours at a high temperature; the alcohol is distilled off, the *acid residue* neutralized by *carbonate of potassa*, and left to crystallize. Yellow, transparent, prismatic crystals, which become opaque on heating from loss of water; introduced into the flame of a spirit-lamp, it burns vividly, leaving metallic platinum; it is soluble in 5 parts of warm water.

ZERO. See *Thermometer.*

ZESTS. See *Powders, Sauces, Spices, &c.*

ZIEGA. Syn. *Serai.* The *curd* which separates from *milk* on the addition of *acetic acid*, after rennet ceases to produce a coagulum.

ZIMOME. The name given by Taddei to the portion of *wheat gluten*, which is insoluble in alcohol. See *Gluten.*

ZINC. Syn. *Zink, Spelter, Indian Tin, Golden Marcasite; Zincum,*—Ph. L. E. & D. This metal was first noticed by Paracelsus, in the 16th century, who called it *zinetum;* but its ores must have been known at a much earlier period, as the ancients were acquainted with the manufacture of brass. *Prep.* The *zinc* of *commerce* is obtained from the native sulphuret (*zinc blende*), or carbonate (*calamine*), by roasting those ores, and distilling the calx with carbonaceous matter in a covered earthen crucible, having its bottom connected with an iron tube which terminates over a vessel of water situated beneath the furnace. The first portion that passes over, contains cadmium and arsenic, and is indicated by what is technically called the "*brown blaze;*" but when the metallic vapour begins to burn with a bluish white flame, or the "*blue blaze*" commences, the volatilized metal is collected.

The following method by which several pounds of chemically pure zinc may be obtained in about ¼ of an hour, will be found very useful:—Melt the *zinc of commerce* in a common crucible, and granulate it by throwing it into a tolerably deep vessel of water, taking care that the metal be very hot at the time; dry the *metallic grains*, and dispose them by layers in a *Hessian crucible* with ¼th of their weight of *nitrate of potash*, using the precaution to place a slight excess at the top and at the bottom; cover the crucible, and secure the lid, then apply heat; after the vivid deflagration, which occurs is over, remove the crucible from the fire, separate the dross with a tube, and lastly, run the zinc into an ingot mould. This zinc tested in Marsh's apparatus during entire days has never given any stain, and in solution the most sensitive reagents, such as *hydro-sulphocyanic acid*, have never indicated the least atom of iron. (*Journ. de Pharm.*)

Prop. Zinc is a bluish white metal, having the sp. gr. 6·8 to 7·2; tough when cold, ductile and malleable at from 250° to 300° Fahr.; brittle and easily pulverized at 400°; fuses at 773° (Daniell); at a white heat it boils, and sublimes unchanged in close vessels; heated to whiteness (941° Daniell) in contact with the air, it burns with a brilliant green light, and is converted into oxide (*flowers of zinc*). It is very soluble in dilute sulphuric and hydrochloric acid, with the evolution of hydrogen gas. It is little acted on by the air, even when moist. The *salts* of *zinc* are colourless.

Pur. Commercial zinc is never pure. "Its specific gravity is 6·86. It is soluble in nitric acid. What is thrown down by ammonia is again dissolved when the same is added in excess." (Ph. L.) "It is almost entirely soluble in dilute sulphuric acid, forming a colourless solution." (Ph. L. 1836.) When tested in a Marsh's apparatus it should yield no trace of arsenic.

Tests. 1. The solutions of zinc give a gelatinous white precipitate with the pure alkalies, ammonia, and carbonate of ammonia, which is completely redissolved by an excess of the precipitant.—2. The carbonates of potassa and soda give a permanent *white* precipitate of carbonate of zinc. All the above precipitates acquire a lemon-yellow colour when dried and heated, but again become white on cooling.—3. Hydrosulphuret of ammonia gives, in neutral solutions, a *white* precipitate, insoluble in excess of the precipitant, or in solutions of potassa or ammonia; but freely soluble in the dilute mineral acids.—4. Sulphuretted hydrogen, in neutral and alkaline solutions, also gives a like white precipitate.—5. Ferrocyanide of potassium gives a gelatinous white, or bluish white precipitate.

Estim., &c.—a. 100 gr. are digested in dilute hydrochloric acid in excess, and the insoluble portion, which is chiefly CARBON, dried, and weighed.

b. The *acidulous solution* (see *a.*) is next treated with a current of sulphuretted hydrogen until it smells very strongly of that gas; the whole is then left for some time in a warm situation. The precipitate which subsides consists of the SULPHURETS of *arsenic, cadmium, copper, lead, &c.*, if any of these metals were present in the sample.

c. The *filtrate* from *b.*, after being boiled, is treated with a little nitric acid, after which it is again boiled, and when cold, is precipitated with carbonate of baryta added in excess; the precipitate (*sesquioxide of*

iron) is then collected, dried, ignited, and weighed. The weight, in grains, multiplied by 0·7, gives the per centage of IRON in the sample examined.

d. The *filtrate* from *c*, is next precipitated with dilute sulphuric acid, and solution of carbonate of soda is added in excess to the filtered liquid; the whole is then boiled, after which the new precipitate is washed, dried, gently ignited for some time, and then cooled, and weighed. The weight, in grains, multiplied by 0·80247, gives the per centage of pure ZINC in the sample.

Uses, &c. Zinc is used to form galvanic plates; in fireworks, and in medicine. Of late years it has also been extensively used in the manufacture of vessels of capacity, tubing, &c., that require lightness and durability.

Obs. A new alloy of zinc has been recently patented by Mr. Anger, of Stamford Street. —"I melt in a crucible," says the inventor, "100 parts of *good copper*, and while in a perfect state of fusion, I add 17 parts of *zinc*, 6 parts of *magnesite*, or any substance of a like nature, though, perhaps, differing in name, 3·6 parts of *ammonia* or *salts of ammonia*, 1·8 parts of *quick-lime* or *other calx*, and 9 parts of *crude tartar*. I then cover up the crucible, and allow the whole to come to a complete state of fusion." The metal resulting from the above combination is said to resemble gold in several of its properties.

The "*amalgamated zinc*," as it is called, which is employed for voltaic batteries, is prepared as follows:—The *plates* having been scoured with *emery*, are immersed for a few seconds in *dilute sulphuric acid*, then rinsed in *clean soft water*, and after the loose water has drained from their surface, dipped into a *strong solution* of either *nitrate* or *bichloride of mercury;* or into equal parts of a mixture of *saturated solutions of bichloride of mercury* and *acetate of lead;* the plates are, lastly, dipped into water, and then rubbed with a soft cloth.

Platinized zinc plates are prepared in a similar manner to platinized silver plates. (See *p.* 1018.)

ZINC (Acetate of). Syn. *Zinci Acetas*, —Lat. *Prep.* 1. (Ph. D.) *Acetate of lead*, 1 *lb.;* is dissolved in *distilled water*, 2½ pints; and the *solution* being placed in a cylindrical jar, *sheet zinc*, 4 *oz.*, rolled into a coil, is immersed therein; after 24 hours, the liquid is decanted, evaporated to 15 *oz.*, and solution of *chlorinated lime*, added drop by drop, until a reddish precipitate ceases to form; the liquid is then filtered, acidulated by the addition of a few drops of acetic acid, reduced by evaporation to 10 fl. oz., and set aside to crystallize; the crystals are dried on *bibulous paper* set on a porous brick, and then preserved in a well-stopped bottle. More crystals may be obtained from the mother-liquor.

2. *Crystallized sulphate of zinc*, 143 parts; *crystallized acetate of lead*, 190 parts; dissolve each separately in *water*, mix the solutions, filter, evaporate, and crystallize.

Prop., &c. Efflorescent, white, hexagonal plates, having a powerful styptic taste; very soluble in water; less soluble in alcohol; decomposed by heat. It is tonic, antispasmodic, and emetic. *Dose.* 1 to 2 gr.; as an *emetic*, 10 to 20 gr.; externally, 2 or 3 gr. to *water* 1 fl. oz., as an astriugent lotion or injection.

ZINC (Ammonio-chloride of). Syn. *Zinci et Ammoniæ Chloridum*, *Zinci Ammonio-chloridum*,—Lat. *Prep. Chloride of zinc*, 68 parts; *sal ammoniac*, 54 parts; *water*, q. s.; dissolve, and crystallize. Its solution possesses the property of dissolving the oxides of copper and iron. A crude liquid of this class is used in zincing, tinning, and soldering these metals.

ZINC (Bromide of). Syn. *Zinci Bromidum*,—Lat. Prepared like the corresponding salt of iron.

ZINC (Butter of). See *page* 241.

ZINC (Carbonate of). Syn. *Zinci Carbonas Purum; Zinci Carbonas*,—Ph. D. *Prep.* 1. (Ph. D.) *Solution of chloride of zinc* (Ph. D.), 1 pint; is added, in successive portions, to a *solution* of *crystallized carbonate of soda* of commerce, 2 *lb.;* dissolved in *boiling distilled water*, 6 pints; and the whole is boiled until gas ceases to be evolved; the precipitate is then washed, and dried, at first on blotting paper, and finally, by a steam or water heat.

2. Add a solution of *carbonate of soda* to another of *pure sulphate of zinc*; and wash, and dry the precipitate, as before. *Dose.* 2 to 10 gr. For the impure or native carbonate of zinc, see *Calamine.*

ZINC (Chloride of). See *p.* 241.

ZINC (Cyanide of). Syn. *Cyanuret of Zinc*, *Hydro-cyanate of do.; Zinci Cyanidum*, *Zinci Cyanuretum*,—Lat. *Prep.* (P. Cod.) Add a *solution of cyanide of potassium* to another of *pure sulphate of zinc;* wash, and dry the precipitate. *Dose.* ⅛ to 1 gr., twice a day; in epilepsy, hysteria, and other nervous affections, heartburn, worms, &c.; and as a *substitute* for *hydrocyanic* acid.

ZINC (Ferrocyanide). Syn. *Zinci Ferrocyanidum*,—Lat. *Prep.* By adding a hot

solution of ferrocyanide of potassium to a hot and strong *solution of pure sulphate of zinc*, and washing, and drying the precipitate. White. *Dose.* 1 to 4 gr.; in the same cases as the last.

ZINC (Flowers of). Syn. *Zinci Flores, Zinci Calcinatum*,—Ph. L. 1788. *Zinci Oxydum*,—Ph. D. 1826, & Ph. L. before 1824. *Calx of Zinc, Philosopher's Wool, Arcanum Ludemanni, Luna Frixata, Lana Philosophica, L. Philosophorum, Nil, Nihil, Nihil Album, Pompholyx, &c.*,—Obs. var. Oxide of zinc obtained by the rapid combustion of metallic zinc in a deep crucible, placed sideways in a furnace, so that the flowers may be collected as they form. Antispasmodic. *Dose.* 2 to 8 gr.; in epilepsy, &c. Also used as a white pigment, but it dries badly.

ZINC (Fluoride of). A white compound, scarcely soluble in water, obtained by acting on oxide of zinc with liquid hydrofluoric acid.

ZINC (Fulminate of). See *page* 498.

ZINC (Iodide of). Syn. *Hydriodate of Zinc, Ioduret of do.; Zinci Iodidum, Zinci Hydriodas*,—Lat. *Prep.* 1. (Duflos.) *Iodine*, 2 parts; *granulated zinc*, 1 part; *water*, 4 parts; proceed as for iodide of iron, only employing a glass or porcelain vessel.

2. (Magendie.) *Iodine*, 17 parts; *zinc* (in powder), 20 parts; mix, and sublime in a matrass.

Prop., &c. Deliquescent. Chiefly used externally; 15 gr. to *water*, 6 fl. oz., as a collyrium in scrofulous inflammation of the eye, (Poulet); 1 dr., to *lard*, 1 oz., as a powerful resolvent in scrofulous and other granular swellings, rubbed on the part twice a day. (Ure.)

ZINC (Lactate of). Syn. *Zinci Lactas*,—Lat. Prepared from *zinc* in the same way as *lactate* of iron is from that metal.

ZINC (Oxide of). Syn. *Protoxide of Zinc; Zinci Oxydum*,—Ph. L. E. & D. *Prep.* 1. (Ph. L.) *Sulphate of zinc* (pure), 1 lb; *sesquicarbonate of ammonia*, 6½ oz.; dissolve each separately in 6 quarts of *water*, filter, mix the solutions, well wash the precipitate with *water*, and calcine it for 2 hours in a strong fire. The Ph. E. is nearly similar.

2. (Ph. D.) Place *carbonate of zinc* in a covered clay crucible, and expose it to a very low red heat, until a portion taken from the centre of the mass ceases to effervesce on being dropped into dilute sulphuric acid.

Prop., &c. A white, tasteless powder; insoluble in water; freely soluble in acids, the solution yielding colourless, and easily crystallizable salts; strongly basic. "Pulverulent, yellowish-white; it is (entirely) soluble in ammonia, potash, and hydrochloric acid." (Ph. L.) "Entirely soluble in dilute nitric acid, without effervescence; and this solution is not affected by nitrate of baryta, but yields a white precipitate with ammonia, entirely soluble in excess of the precipitant." (Ph. L. 1836.)

Uses, &c. It is tonic and antispasmodic, and has been advantageously used in chorea, epilepsy, and other nervous and spasmodic affections. *Dose.* 1 to 6 gr., twice a day. It is also used as a *dusting powder*, and to make an ointment. It has been proposed as a substitute for white lead in painting, than which it covers better, but dries slower; and hence, requires the addition of dried white vitriol. This oxide is the only compound which zinc forms with oxygen. See *Flowers of Zinc.*

ZINC (Sulphate of). Syn. *White Copperas, White Vitriol, Salt of Vitriol; Zinci Sulphas*,—Ph. L. E. & D. *Zincum Vitriolatum*,—Ph. L. 1788. *Sal Vitrioli*,—Ph. L. 1746. *Vitriolum Album Depuratum.* Ph. L. 1721. *Prep.* 1. (Ph. L.) *Granulated zinc*, 5 oz.; *diluted sulphuric acid*, 1 quart; dissolve, filter, evaporate to a pellicle, and set it aside to crystallize.

2. (Ph. D.) *Zinc* (laminated or granulated), 4 *oz.; oil of vitriol*, 3 fl. oz.; *water*, 1 pint; mix in a porcelain capsule, and when gas ceases to be evolved, boil for 10 minutes, filter through calico, and evaporate the filtrate to dryness; dissolve the *dry salt* in *water*, 1 pint; frequently agitate the solution, when cold, during 6 hours, with *prepared chalk*, ¼ *oz.*; next filter, acidulate the filtrate with *nitric acid of commerce* and *dilute sulphuric acid*, of each, 1 fl. dr.; evaporate until a pellicle forms on the surface, and set it aside to crystallize; dry the crystals on bibulous paper, without heat, and preserve them in a bottle. More crystals may be obtained from the mother-liquor.

3. The *common sulphate of zinc* of *commerce* frequently contains copper, cadmium, lead, iron, and manganese, and nearly always, one or more of them. By digesting its *concentrated solution* for some time with *metallic zinc*, it may be *freed* from COPPER, LEAD, and CADMIUM, for these metals are all reduced and precipitated in a metallic state; or, the acidulated *solution* may be treated with *sulphuretted hydrogen* as long as any precipitate forms. In order to *separate* the IRON, chlorine gas may be passed into the solution, by which the iron is converted into the protochloride; if this solu-

tion be exposed to the air for a length of time, it absorbs oxygen, and oxide of iron (basic salt?) is deposited as a yellow powder, from which the solution must be filtered. When the *sulphate* contains MANGANESE, which is not very often the case, the solution must be boiled up a few times with purified charcoal, filtered and evaporated. (*Jour. für prakt. Chem.*) The *product* of each of the above formulæ is nearly chemically pure.

4. The *crude* sulphate of zinc (*white copperas* or *white vitriol*, of the shops,) is *prepared* by roasting *native sulphuret of zinc* (zinc blende) in a reverberatory furnace, exposing the calcined mass to the *air* and humidity for some time, then lixiviating it, and evaporating the resulting solution until it forms a white semicrystalline mass on cooling.

Prop. Pure sulphate of zinc forms inodorous, colourless, transparent, quadrangular prisms, closely resembling in appearance those of Epsom salt, which effloresce slightly in the air, and contain 7 equiv. of water; it has a slightly acidulous, and very styptic metallic taste; the crystals dissolve in 2½ parts of cold, and in less than their own weight of boiling water; they are insoluble in alcohol. The *crude sulphate of zinc* of commerce (*white vitriol*) occurs in irregular granular masses, which somewhat resemble loaf sugar.

Pur. "Crystals." "It is soluble in water. The precipitate with ammonia is white, and is re-dissolved if the test be added in excess. What is thrown down by either chloride of barium or acetate of lead is not dissolved by dilute nitric acid. What is precipitated by sesquicarbonate of ammonia from 100 gr. of this salt dissolved in water, is reduced, at a high temperature, to 27·9 gr. of oxide of zinc." (Ph. L.) "When a solution of this salt, in 6 waters, is boiled with a little nitric acid, and a solution of ammonia is then added until the oxide of zinc at first precipitated is all redissolved, no yellow precipitate remains, or a trace only, and the solution is colourless." (Ph. E.)

Uses. In *medicine*, as a *tonic*, *antispasmodic*, *&c.*; in *doses* of 1 to 2 gr. twice daily; as an *emetic*, 10 to 30 gr. In large doses it is *poisonous*. It has been employed with benefit in dyspepsia, fluor albus, chorea, epilepsy, hooping-cough, and other convulsive and nervous affections, generally combined with bitters, foxglove, hemlock, henbane, or opium. As an emetic it acts almost immediately, and is therefore well suited to empty the stomach at the commencement of a fit of ague, and in cases of poisoning, &c. It is also extensively used *externally*, to form astringent and repellent collyria, injections and lotions.

ZINC (Valerianate of). Syn. *Zinci Valerianas*,—Lat. *Prep.* (Ph. D.) *Valerianate of soda*, 2½ *oz.*; and *sulphate of zinc*, 2 *oz.* 7 *dr.*; are each separately dissolved in *distilled water*, 1 pint; the solutions are then heated to 200° Fahr., mixed, and the resulting crystals skimmed off; the liquid is next evaporated at a temperature not higher than 200°, until it measures 4 fl. oz, the crystals, as they form, being removed from the surface; the salt thus obtained is steeped, for an hour, in *distilled water*, just sufficient to cover it, after which the whole is transferred to a paper filter, on which it is at first drained, and then dried at a heat not exceeding 100°.

Prop., &c. Brilliant white, pearly scales; very light; astringent; smells strongly of valerianic acid; only slightly soluble in cold water, more so in hot water, and freely soluble in alcohol and ether; exposure to heat rapidly decomposes; exposure to the air also decomposes it, but more slowly. It is regarded as powerfully antispasmodic and tonic. *Dose.* 1 to 3 gr., thrice daily, made into pills; in neuralgia, tic douloureux, nervous headaches (more particularly hemicrania), hysteria, palpitation of the heart, vertigo, chorea, epilepsy, &c.

Obs. Butyrate of zinc scented with valerianic acid, which is often sold for the above compound, may be detected by distilling it with sulphuric acid; the *distillate*, tested with a strong solution of acetate of copper, gives a bluish-white precipitate, if it contains butyric acid. The *valerianate* is distinguished from the other salts of zinc by its extreme lightness.

ZINC-AMYLE. See *page* 54.

ZINC-ETHYLE. A curious liquid hydrocarbon, discovered by Dr. Frankland, and formed, along with iodide of zinc, when *iodide of ethyle* is heated with *pure zinc* in a sealed glass tube. The mixed white product, by distillation in a current of *hydrogen*, yields pure *zinc-ethyle*. It is a highly volatile liquid, having a rather disagreeable odour, and is rapidly decomposed by contact with the air. Water resolves it into *hydruret of ethyle*, and other products.

ZINC-METHYLE. See *page* 786.

ZINCING. Syn. *Zinking*. Vessels of *copper* and *brass* may be covered with a firmly adherent layer of *pure zinc*, by boiling them in a *solution of chloride of zinc*, pure *zinc turnings* being at the same time present in considerable excess. The *same object* may be effected by means of *zinc*,

and a *solution of sal ammoniac*, or *caustic potassa*.

Iron may be *coated* with *zinc* by means of the *electrotype*. The variety of *zinked iron* commonly known by the name of "*galvanized iron*" is prepared by immersing the *sheets of metal*, previously scoured and cleaned with *dilute hydrochloric acid*, in a *bath* of *melted zinc* covered with *powdered sal ammoniac*, and moving them about until they are sufficiently coated.

ZINCOGRAPHY. An art closely resembling lithography, in which *plates of zinc* are substituted for slabs of stone.

ZIRCON. See *Gems*.

ZIRCONIA. Syn. *Oxide of Zirconium*. A white pulverulent earth discovered in the *jargon* or *zircon*, of Ceylon, by Klaproth, in 1789. It has since been found in the *hyacinth*.

Prep. The *stone* is calcined and thrown into cold water, and then powdered in an *agate mortar*; the *powder* is mixed with 9 parts of *pure potassa*, and the *mixture* projected, by spoonfuls, into a red-hot crucible, care being taken that each portion is fused before another is added; after fusion, with an increased heat, for an hour and a half, the whole is allowed to cool; the calcined mass is next powdered, and boiled in water; the *insoluble portion* is then dissolved in *hydrochloric acid*, and the solution heated, that the silex may fall down; after which the *zirconia* is precipitated with *caustic alkali*; or, the *zirconia* may be precipitated with *carbonate of soda*, and the carbonic acid expelled by heat.

Prop., &c. Zirconia has neither taste nor odour, is insoluble in water, and forms salts with the acids. It is *distinguished* from all the *other earths*, except thorina, by being precipitated when any of its neutral salts are boiled with a saturated solution of sulphate of potassa. It is *distinguished* from *alumina* and *glucina* by its salts being precipitated by all the pure alkalies, and by being insoluble when they are added in excess. The precipitated hydrate and carbonate are readily soluble in acids.

ZIRCONIUM. The metallic base of zirconia. It was discovered by Berzelius, in 1824.

Prep. By heating in a glass tube, with a spirit lamp, a *mixture* of *potassium*, and the *double fluoride of zirconium and potassium*, carefully dried; the product is washed with *water*, and digested for some time in dilute *hydrochloric acid*.

Prop., &c. A black powder; it acquires a feeble metallic lustre under the burnisher; and takes fire when heated in the air. It has been but imperfectly examined.

ZOMIDINE. The aqueous extract of flesh.

ZOONIC ACID. A name given by Berthollet to the *acid liquid* procured by distillation from *animal substances*. It has been showed by Thénard to be merely *acetic acid* combined with *animal matter*.

ZOOTIC ACID. Hydrocyanic acid.

ZUMIC ACID. Syn. *Nanceic Acid*. The name given by Braconnot to the *acid* formed in *bread*, and in some other *vegetable substances*, which have undergone the acetous fermentation. It appears to be a mixture of acetic acid and lactic acid.

TABLE *of* CHEMICAL *and* PHARMACEUTICAL EQUIVALENTS,
including recent revisions.

Names of Elements and Compounds.	Symbols or Formulæ.	Hydrogen = 1.	Oxygen = 100.
Acetic Acid (*anhydrous*) .	$C_4O_3H_3$; or $\overline{A}$.	51·	637·5
,, (*glacial*) . .	$\overline{A}$, Aq.	60·	750·
Acetone	C_3H_3O.	29·	—
Acetyle	C_4H_3; or Ac.	27·	—
Aconitina	$C_{60}H_{27}O_{14}N$.	513·	—
Alcohol	$C_4H_6O_2$.	46·	—
Aldehyde	C_4H_3O, HO; or Ac O, Aq.	35·	—
ALUMINIUM . . .	Al.	13·7	171·25
Alumina	$Al\,O_{1\frac{1}{2}}$.	25·7	321·25
Alum (*anhydrous*) . .	$Al_2O_3, 3SO_3 + KO, SO_3$.	258·55	—
,, (*crystallized*) . .	Alum + 24Aq.	474·55	—
,, ,, ½ . .	—	237·27	—
Amidogen	NH_2.	16·	—
Ammonium	NH_4.	18·	—
Chloride . . .	NH_4Cl.	53·5	—
Ammonia	NH_3.	17·	212·5
Acetate (*dry*) . .	$NH_3, \overline{A}$.	68·	—
Carbonate (*dry*) . .	NH_3, CO_2.	39·	—
Sesquicarb. (*ord.* or *hydrated*) . . .	$NH_3, 1\frac{1}{2}CO_2, +$ Aq.	59·	—
Bicarb. (*hydrated*) .	$NH_3, 2CO, 2Aq$.	79·	—
Hydrochlorate (see *Chloride of Ammonium*) .	NH_3, HCl; or NH_4, Cl.	53·5	—
Sulphate . . .	NH_3, SO_3, HO.	66·	—
,, (*crystallized*) .	$NH_3, SO_3, 2Aq$.	75·	—
Amyle	$C_{10}H_{11}$; or Ayl.	71·	—
Amylene	$C_{10}H_{10}$.	70·	—
Amylic Alcohol . . .	Ayl O, HO.	88·	—
ANTIMONY (*Stibium*) . .	Sb.	129·	1612·5*
Terchloride . . .	$Sb\,Cl_3$.	235·5	—
Teroxide . . .	$Sb\,O_3$.	153·	—
Potassio-tartrate (*effloresced*) .	$Sb\,O_3, KO, \overline{2T}, + 2Aq$.	350·15	—
,, ,, (*cryst.*)	$Sb\,O_3, KO, 2\overline{T}, + 3Aq$.	359·15	—
Tersulphuret . .	$Sb\,S_3$.	177·	—

* 64·5,—Gerhardt & Laurent.

Names of Elements and Compounds.	Symbols or Formulæ.	Hydrogen = 1.	Oxygen = 100.
Antimonious Acid	SbO_4.	161·	—
Antimonic Acid	SbO_5.	169·	—
Aridium (?)	—	—	—
Arsenic	As.	75·	937·5*
Arsenious Acid	AsO_2.	99·	1232·5
Arsenic Acid	AsO_5.	115·	—
Atropia (*cryst.*)	$C_{34}H_{23}O_6N$, HO.	298·	—
Sulphate	$C_{34}H_{23}O_6N$, HO, SO_3.	338·	—
Auric Acid (see *Gold*)	—	—	—
Barium	Ba.	68·5	856·25†
