1877.

PREFACE.

This work is not a literal translation of any particular treatise, but a compilation from standard Sanskrit medical works, arranged somewhat upon the plan of Waring's Manual of Therapeutics, and intended to give a concise exposition of the Materia Medica of the Hindus. Dr. Wise, in his Commentary on the Hindu system of Medicine, has given a pretty full and accurate account of the Anatomy, Surgery and Pathology of the Hindus. With regard to his work I may here repeat what I have stated in the preface to my translation of the Nidána, "That the natives of India cannot be too grateful to him for the trouble he has taken in bringing to light the contents of their ancient medical works, and establishing their right position in the history of Medicine." The scope and plan of his book did not, however, admit of his treating of Sanskrit Materia Medica in the manner of modern works on the subject. I have, therefore, undertaken to publish this work under the impression that it will prove an acceptable contribution to the history of drugs, and will form a basis for further researches on indigenous medicines.

In the first part of the work I have given an account of the mineral medicines used by the Hindus, the mode in which they are prepared for use, their chemical composition, and the principal combinations in which they are employed in different diseases. With regard to the Vegetable Materia Medica, I have endeavoured to give the correct scientific names of the plants described, by procuring the drugs through practising kavirajas or native physicians, and having them identified in the Royal Botanic Gardens.

In describing the general properties of individual articles I have not followed the Sanskrit texts literally. Sanskrit writers, under this head, after recounting their sensible properties, enter into minute details regarding their cooling or

heating effects on the system, and their special influence on the humours which are supposed to support the machinery of life, namely, air, bile, phlegm and blood. These details are not so much the result of observation and experience as the outcome of an erroneous system of pathology and therapeutics. I have, therefore, selected for notice such portions of the texts as relate to the practical use of the drugs and their tangible effects on the system. This latitude in departing from the texts, has enabled me to bring together in one place, useful hints regarding the uses of particular drugs from different Sanskrit treatises on therapeuties. I have occasionally added remarks on their history and economic uses where I thought I had new or additional information to afford on the subject. These remarks are for the most part based on personal knowledge.

In describing the preparation and uses of medicines employed in different diseases I have confined myself strictly to the texts of the authors whom I have quoted, and have given the original Sanskrit verses in foot-notes. I have not incorporated with them the results of modern researches on indigenous drugs, or my personal experience of their use. These I have reserved for a future essay. My object here has been to show the extent of knowledge attained by Hindu physicians by their own practice and observation.

In the selection of the prescriptions for illustrating the uses of medicines in individual diseases I have, as a rule, given preference to such recipes as are commonly used by native physicians. Where there are several well-known medicines of similar composition and use, I have described in detail only one, and given under it the names of the others with a brief allusion to their composition. My main object in including the names of the principal or generally known preparations of the Hindu Materia Medica in the text and index, is to enable the practitioner of European Medicine to get an idea of their nature and composition when he comes to hear of their having been used by patients who had been under native treatment before coming under his care, as is very often the case. The list is by no means

an exhaustive one, nevertheless I have, at the risk of being tedious, endeavoured to include under some head or other most of the combinations which were pointed out to me by experienced native physicians, as generally used in practice.

In detailing the uses of particular combinations of medicines, Sanskrit writers are, sometimes, in the habit of indulging in exaggerated statements. Thus for example a medicine, which is really used in a special disease, say jaundice, is described in the chapter devoted to the treatment of this disease, but a host of other diseases may also be recited as cured by it. Native physicians who regard these writings as sacred, explain these irrelevant statements by saying that they are secondary uses. I have, for the most part, omitted them in my translations of the texts, hence their English renderings will sometimes appear deficient or incomplete.

The names of the works given below the Sanskrit texts merely shew that those texts are to be found in them, and not that they were originally composed by the authors or compilers of those books. The combinations or formulæ generally used, are to be found in most compilations, and it is not always practicable to trace them to their original sources. In quoting these authorities I have, as a natural consequence of the principle upon which the prescriptions were selected, had to give preference to works that are used as text books by native physicians.

The number of Sanskrit medical works, and especially of small compilations on the treatment of diseases, is too numerous and indefinite to admit of detailed enumeration here. The enquirer after them is sure to find, in different parts of the country or seats of learning, many little manuals, essays and digests of which he did not hear before. It would seem that in the absence of printing, teachers of medicine used to prepare small compilations containing such prescriptions as they were in the habit of using, for the guidance of their pupils, who copied them for personal use. These manuals are often dubbed with fancy names, and have more or less circulation according to their merit or the extent of influence of their authors. There are

however a few works which owing to their comprehensive character, ancient date, or real merit, are well known throughout India. I will here notice them briefly.

The two works called Charaka Sanhitá and Susruta A'yurveda are the oldest and most celebrated treatises on Hindu medicine now extant. An older work called A'yurveda is mentioned in both these works as having formed a part of the Atharva Veda. It is said to have been originally composed by Brahmá, the creator, and to have consisted of a thousand chapters and a hundred-thousand slokas. Afterwards, in consideration of the short lives and small intellects of human beings, it was abridged into eight chapters as follows:—

- 1. Salya or surgical treatment.
- 2. Sálakya or diseases of the head, eyes, ears and face.
- 3. Káyachikitsá or treatment of general diseases.
- 4. Bhutavidyá or diseases caused by evil spirits.
- 5. Kaumára-bhritya or the treatment of infants and of the puerperal state.
 - 6. Agada or antidotes to poisons.
- 7. Rasáyana or medicines which promote health and longevity.
 - 8. Vájikaruna, or aphrodisiaes.

The A'yurveda with a hundred thousand slokas is probably a myth, but the abridged A'yurveda with its eight divisions seem to have had a real existence, although it is not available in the present day. It probably became obsolete after the works of Charaka and Susruta were composed.

Charaka is generally believed to be older than Susruta and consequently to be the oldest work on Sanskrit Medicine now extant. In the introduction to this work it is said that A'treya, a learned devotee, taught the holy A'yurveda to six pupils; namely, Agnivesa, Bhela, Játukarna, Parásara, Hárita and Kharapáni. Agnivesa first wrote a treatise on medicine, and afterwards Bhela and others followed, each producing a separate work and thereby acquiring great renown. The work of Agnivesa was regarded as the best. It was edited or corrected by Charaka in whose name it is now current. At the end of each book

of this work it is said, that this tantra or scientific treatise was composed by Agnivesa and corrected by Charaka. - A later writer Vágbhatta in his introduction to his Ashtánga-hridayasanhitá says, that that work had been compiled from the treatises of Agnivesa, Hárita, Bhela, Sásvata, Susruta, Kavala, and others. From this it would seem that the six disciples of A'treya, mentioned in Charaka, were not mythical beings, but authors of books, for two of them, namely, Agnivesa and Bhela are mentioned by Vágbhatta. It would appear also that at the time Vágbhatta lived, Agnivesa's work was not called by the name of Charaka, and Susruta had also been written. Hence it follows that Charaka's edition of Agnivesa, that is the work now called Charaka, was probably edited after Susruta had been written. A'treya is said to have lectured somewhere near the Himalaya, and his name occurs very frequently in the Vedas. father Atri was a renowned sage, and the author of a law treatise which is current in his name. There is no clue to the nativity of Charaka, but Dridhabala, who added some chapters to his work, calls himself a native of Panchanada or the Panjab.* Susruta, on the other hand, is said to have been written in Benares. From the facts detailed above it is clear that the work called Charaka was composed at a very early age. I will not attempt to hit at the century before Christ in which it was probably written as it is a question which can be best discussed by professed antiquarians. I may notice, however, that the book is composed in an antiquated style and appears to have been written before the spread of the Puranic form of Hinduism, as the names of modern gods and goddesses do not occur in it, and the author does not, at the commencement of the work, offer his salutations to any mythological deity, as is usual with later writers. Beef was not then, apparently, a forbidden food, for Charaka speaks of it as an article of diet that should not be taken daily.†

^{*} व्यवर्षार्थं दृढवलो जातः पञ्चनदे पुरे। कत्वा वड्डश्यस्तन्त्रस्यो विशेषाञ्च मलोच्चयम्। सप्तद्शौषघाध्यायैः विद्विकल्पैरपूरयत्।

यवकां स्व न भीनयेत्। स्व स्व स्व स्थान भावाभितीयाध्यायः।

The work next in point of age, namely, Susruta, is more systematic in its arrangement, contains better details of anatomy and pathology, and shews on the whole a more advanced state of knowledge, both of general principles and of details of treatment.

The origin of the Susruta A'yurveda is thus described in the introduction to that work. Dhanvantari, the surgeon of heaven, descended upon earth in the person of Diva dása, king of Benares, for the purpose of teaching surgery along with the other branches of medical knowledge by which the gods preserve themselves from decline, disease and death. Susruta and other pupils besought him for instruction in surgical knowledge. Dhanvantari asked them what they wished to learn. The pupils replied "you will be pleased to make surgical knowledge the basis of your instruction, and to address your lectures to Susruta, who will take notes." Dhanvantari replied, "be it so. For surgery is the first and most important part of the A'yurveda, inasmuch as the healing of wounds was the first necessity for the medical art among the gods on account of their battles with the demons. Besides surgical treatment effects rapid cures, has recourse to instruments, mechanical appliances, caustics and the actual cautery and is intimately connected with the other branches of medical science." Accordingly we find that Susruta devotes the greater portion of his work to such subjects as anatomy, surgical instruments and operations, inflammation and surgical diseases, care of the king and his troops in the battle-field, obstetrical operations, poisons, etc.

The general diseases such as fever, diarrhæa, chest diseases, etc., are treated of in the last book called "Uttara-tantra," but there are reasons for believing, that this portion did not originally form a part of the work, but was subsequently added by some writer with the object of giving completeness to it. This is evident from several reasons. The very name Uttara "supplemental" is enough to suggest the idea of its being an after thought, if not a subsequent work. Had it been an integral part of the original treatise, it would have been included in the original scheme. But at the end of the first chapter of the first book an analysis of the contents of the entire work is given

wherein it is said that this work consists of five parts containing 120 chapters in all.* This is followed by a line to the effect that in the Uttara-tantra the remainder of the subject will be described. This last line, however, is evidently an interpolation, for if the original writer of the work had divided his book into six parts, he would not have said that it consisted of five parts. Besides the Uttara-tantra has a separate introduction in which the writer says it is compiled from the works of learned sages on the six divisions of Káyachikitsá or the treatment of general diseases, and from the work of Videhidhipa on Sálakya Sástra or diseases of the head, eyes, ears and nose.

If therefore we leave out of consideration the Uttara-tantra of Susruta, the work resolves itself mainly into a treatise on the principles of medicine as bearing on surgical diseases. It would thus appear that from a very early age, Hindu medical practitioners were divided into two classes, namely, Salya chikitsaka or surgeons and Káyachikitsaka or physicians. The surgeons were also called Dhanvantaryia sampradáya after Dhanvantari the reputed teacher of Susruta, or from Dhanvantari the mythological surgeon of the gods. This division existed before the work of Charaka was compiled, for as pointed out by Kavirája Brajendra-kumar Sen Gupta, Charaka, like our modern physicians, refers his readers to surgeons when surgical aid is necessary, as for example in the passage quoted below. † We may conclude, therefore, that Charaka is the oldest treatise on Medicine and Susruta the oldest treatise on Surgery now extant.

These two works, namely, Charaka and Susruta mark the highest phase of development of the Hindu system of Medicine

^{*} वीजं विकित्सितस्य तत्समामेन प्रकीिर्त्ततं । मिवंश मध्याय शतमस्य व्याख्या भविष्यति । तज्ञ मिवंशमध्याय शतंपञ्चस्य स्थानेषु । तत्र मूत्रस्थान निदान शारीर चिकित्सित कल्पेष्यधे यशात् मंविभज्योत्तरे तन्त्रे शेषानधीन् व्याख्यास्थामः । सुत्रुतः प्रथमाध्यायः ।

in ancient times. Their comprehensive character and superior merit probably led, in course of time, to the extinction of the manuscripts of authors who had preceded them. Succeeding writers and practitioners came to regard these works as of divine origin and beyond the criticism of man. Accordingly they dared not add to or amend what these ancient sages had recorded regarding the general principles of medicine and special pathology, but confined their labours to making better arranged and more compendious compilations for the use of students, and to explaining or dilating upon the texts of Charaka and Susruta, while in the matter of surgical practice, there has been a gradual decline in knowledge and experience till at the present day an educated surgeon of the Dhanvantariya sampradáya is a phenomenon unknown in Hindustan.

The next compilation on Hindu Medicine is said to be the Ashtánga-hridaya-sanhitá by Sinha Gupta Sena Vágbhatta. This work is a mere compilation from Charaka and Susruta methodically arranged. It contains little or nothing that is original or that is not to be found in the works from which it was compiled. This circumstance, together with the fact of Vágbhatta being always mentioned by later writers as an old authority, seems to show that his work was compiled not long after those of Charaka and Susruta. Like these two writers he does not mention the use of mercury in the treatment of diseases.

Next in point of age, are the two works called respectively the Nidána by Mádhava Kara and Chakradatta-sangraha by Chakrapáni Datta. The first is a concise treatise on the causes, symptoms and prognosis of diseases, compiled from various authors, and has been used from a long time as the text-book on pathology by students of Hindu Medicine throughout India. Professor Wilson is of opinion that "the Arabians of the eighth century cultivated the Hindu works on Medicine before those of the Greeks; and that the Charaka, the Susruta, and the treatise called Nidána were translated and studied by the Arabians in the days of Harun and Mansur (A. D. 773), either from the originals, or more probably from translations made at a still earlier period into the language of Persia."

The creatise called Chakradatta-sangraha, describes in detail the treatment of diseases arranged in the order in which they are described in the Nidána of Mádhava Kara, and to which it is a companion volume. Its author deals chiefly with vegetable drugs. He gives a few prescriptions containing mercury, in which this metal is mixed with sulphur and vegetable substances, but the preparations of mercury produced by sublimation and chemical combination with salts, etc., were unknown to him. It would appear, therefore, that mercury was just coming into use in his time. He does not mention opium, so that his work, and consequently the Nidàna, must have been composed before the introduction of this drug into India by the Mussulmans.

The last great work on Hindu Medicine is that called the Bhávaprakása, compiled by Bháva Misra. It is a comprehensive treatise, compiled from the works of preceding authors, with much additional information on the properties of drugs, accounts of new drugs, and of some new diseases, as for example the syphilis introduced into India by the Portugeese and described in this work under the name of Phiringi-roga. By the time this work was composed, opium had been largely employed in practice, the use of mercury had extended to almost all diseases, various preparations of gold, silver, tin, copper, orpiment, arsenic, etc., had come into fashion, superseding to a considerable extent the vegetable drugs of the older writers; in short Hindu pathology and therapeutics had reached their acme. Dr. Wise says that the Bhávaprakása was composed about three hundred years ago. It cannot, at any rate, be a much older work. China root, called Chob-chini in the vernacular, is described in it. According to Fluckiger and Hanbury the use of this drug as a remedy for syphilis was made known to the Portugueese at Goa by Chinese traders, about (A. D. 1535). Hence the Bhávaprakása must have been compiled after this period.

Besides the systematic treatises on the description and treatment of diseases above noticed, there are several works in Sanskrit devoted especially to the description of the synonyms and properties of individual medicines and articles of diet. The oldest treatise on this subject is the one called Rájanirghantu. It is generally

ascribed to Dhanvantari, but Pundit Madhusudan Gupta estimated the age of this work at 600 years. As both mercury and opium are mentioned in this treatise, it cannot be older. Some later compilations on this subject are in general use at the present day. In the North-West Provinces, the Nirghantu, compiled by Madanapála, is generally perused by students. In Bengal, a very superficial compilation, under the name of Rájavallabha, is in currency. In Orissa, a superior work, called Satkantha-ratnábharana, is used.

The progress of chemistry or rather of the art of calcining, subliming and of otherwise preparing mineral substances for medical use, was comparitively slow in the early ages. Susruta used the natural salts, such as chloride of sodium, impure carbonates of potash and soda, borax, etc.; he employed iron in anæmia, and briefly referred to the supposed properties of silver, copper, tin, lead and the precious stones, but he gave no detailed instructions regarding their calcination, preparation or administration in special diseases. Chakradatta gives some processes for reducing to powder iron, copper and tale, and a few prescriptions containing these remedies. The oldest work containing a detailed account of the calcination or preparation of the different metals (such as gold, silver, iron, mercury, copper, tin and lead), for internal use, with formulæ for their administration, is I believe a concise treatise on medicinal preparations by Sárangadhara. Opium and pellitory root are mentioned in this work, hence it must have been compiled during the Mussulman period. Since then a host of works on metallic preparations and combinations have been prepared both in Bengal and the North-West Provinces, and mineral medicines have been largely adopted in the treatment of diseases. The more important parts of the information contained in these works are embodied in the Phávaprakása and the two works on inorganic medicines generally used in Bengal, namely, Rasendra-chintámani and Rasendra-sárasangraha. As observed on page 54, most of the mineral medicinal preparations of the Hindus consist of their few metallic remedies combined or mixed together in an endless variety of forms. Nevertheless we cannot help admiring the ingenuity and boldness of the Hindu physicians, when we find that they were freely and properly using such powerful drugs as

arsenic, mercury, iron, etc., while the Mussulman Hakims around them, with imperial patronage and the boasted learning of the west, recording such remarks regarding them as the following :-

"Soomboolkhar, 'the white oxide of arsenic.' There are six kinds of this, one named Sunkia, the third Godanta, the fourth Darma, the fifth Huldea. The Yunani physicians do not allow this to form a part of their prescriptions, as they believe it destroys the vital principle. The physicians of India, on the contrary, find these . drugs more effectual in many disorders, than others of less power, such as the calx of metals. For this reason too I am in the habit of seldom giving these remedies internally, but I usually confine my use of them to external application and as aphrodisiacs which I prescribe to a few friends, who may have derived no benefit from Yunani prescriptions. It is better however to use as few of them as possible." 1

"Para, 'Mercury.' It is very generally used throughout India in many ways, both in its native and prepared state, but in the latter we ought to be very cautious, for it is seldom sufficiently killed or removed from its native state, in which it is a dangerous drug." 2

"Loha, 'iron.' It is commonly used by physicians in India, but my advice is to have as little to do with it as possible."3

At the end of the present work is appended a glossary of Indian plants described by Sanskrit writers. In the body of the work I have selected for notice only such drugs and plants as have some definite use in a particular disease, or class of diseases. Numerous other plants used in medicine incidentally, or for economic purposes, are mentioned by Sanskrit writers, but these are not of sufficient importance in a medicinal point of view to deserve detailed notice in a work of this sort. I had prepared an alphabetical list of these plants with their vernacular and scientific names for my personal use. Dr. King kindly undertook to revise this glossary for me, and, at his suggestion, it is printed as an appendix to this work.

Taleef Shareef, translated by George Playfair, page 99.
 Idem, page 26.
 Idem, page 146.

The Bengali equivalents of the Sanskrit terms in the glossary have been taken mainly from Sir Rájá Rádhákánta Deva's Encyclopædia of Sanskrit learning entitled the Sabdakalpadruma. The Hindi names have been obtained from the vernaculars given in the Bhávaprakása; the Amrita-ságar, a Hindi translation of a treatise on Sanskrit medicine; and the Kesava-binoda-bhásá Nirghantu, a Hindi treatise on therapeutics translated from the Sanskrit by Pandit Kesava-prasáda Dvivedi of the Agra College.

The scientific equivalents of these Sanskrit and vernacular terms have been gleaned chiefly from Roxburgh's Flora Indica, Jameson's Report on the Botanical garden of the North-West Provinces for 1855, O'Shaughnessy's Bengal Dispensatory, Powell's Report on Panjab Products, etc. The translations of these writers have been verified, whenever it was practicable to do so, by identifying the plants in the Royal Botanic Gardens. The rest have been given chiefly on the authority of Roxburgh after carefully comparing his descriptions with the characters assigned to them by Sanskrit writers. Some plants, the identification of which was doubtful, have been omitted from the list. The scientific names of many of these plants have been ascertained for the first time, by Dr. King, after examination of specimens procured by me. Dr. King has also furnished the recent botanical names of numerous plants the old names for which have now become obsolete. With regard to the spelling of the Sanskrit and vernacular terms, I should mention that professor H. H. Wilson's system of transliteration, or as it is now sometimes called the Hunterian System, has been adopted, so far as is necessary to arrive at the correct pronunciation of the words, but the minute distinctions between the two varieties of the dental and palatal S, the four varieties of N, and the long and short sounds of some of the vowels, which are not always practically observed in pronouncing them, have not been insisted upon in correcting the proof-sheets. The vernacular terms have been for the most part, spelt as they are written in standard Bengali and Hindi dictionaries. The spoken language varies so much in different parts of the country and among different classes of people, that it would be hopeless to attempt any thing like a complete

vocabulary of names as pronounced by the people of the different provinces of which Hindi and Bengali are the vernaculars.

One great peculiarity of the Sanskrit language consists in its having numerous synonyms for material objects, and medicines form no exception to this rule. Almost all well-known plants have several synonyms, and some have as many as twenty to forty names; gulancha has thirty-nine, chebulic myrobalan thirty, the lotus thirty-eight, with half as many for its varieties, and so on. Native physicians learn these synonyms by rote, just as they do their grammars and dictionaries. Sanskrit medical works, like most other works in the language, are composed in rhyme, and any one of the numerous synonyms of a drug may be used to designate it in prescriptions containing the article according to the fancy of the writer and the necessities of metrical composition. Many names again are common to numerous articles, and it is often impossible without the help of annotations to make out which drug is meant by a particular term. In the absence of any scientific description of plants, however, these synonyms sometimes serve to describe their prominent characters, and thus prove an aid to their identification. In the glossary appended to this work, I have not attempted to give a complete list of all these synonyms. As a general rule I have given only the principal or current name of each plant. Some plants have however more than one well-known and currently-used names. In such instances I have given those names in the first column only, with a reference to the synonyms under which their vernacular and Sanskrit equivalents have been given.

I avail myself of this opportunity, publicly to tender my cordial thanks to those gentlemen who have assisted me in carrying this work through the press. To Dr. George King, Superintendent of the Royal Botanic Gardens, I feel myself particularly beholden. He has helped me most materially in a variety of ways, and has thereby enabled me to avoid many errors and mistakes. On many occasions he has spent hours in identifying various drugs for me; and he has revised nearly all the last proofs, before the sheets were printed. The recent names of plants in the glossary are entirely due to his pen, and they entailed on him considerable and tedious labour. Without these names I should

have been obliged to content myself with the old names, gleaned from the works of Roxburgh and others, which are now only tolerated as synonyms, and which would have seriously impaired the usefulness of the glossary as a work of reference. I am indebted to him, likewise, for his permission to allow Babu Prasanna Kumar Sen, overseer of the Royal Botanic Gardens, to assist me in my enquiries, and this has enabled me to solve many a doubtful point in the translation of the scientific names of plants into the vernacular. During the absence of Dr. King from the Gardens, Mr. S. Kurz cordially helped me whenever I had occasion to seek his aid in identifying native medicines.

Dr. Norman Chevers kindly corrected for me some of the forms, and put me in the proper way of doing this work. Rai Kánái Lál Dey Bahadur has, at considerable sacrifice of his valuable time, analyzed the mineral substances and preparations, the chemical composition of which has been described in the first part of this work. Most of these preparations have now for the first time been analyzed by him. To Dr. Rájendralála Mitra, I am indebted for valuable advice regarding the plan of getting up this work, and for explanations of some obscure questions regarding the history of Indian medical works.

To Kaviráj Binod Lál Sen, my grateful acknowledgments are due for the very liberal manner in which he has furnished me with lists of medicines generally used in practice, supplied me with specimens of native medicines, and practically shewn and explained to me the processes by which metallic medicines are prepared in the dispensary under his charge. His cordial assistance has enabled me to bring out this work with greater confidence than if I had had to depend upon my knowledge of Sanskrit books alone.

Kaviráj Brajendra Kumár Sen Gupta, son of the late learned Hárádhan Sen Gupta, the leading native physician of his time in Calcutta, and latterly physician to his Highness the Maharaja of Kashmere, has interpreted for me the meanings of many obscure passages in Sanskrit, furnished me with specimens of drugs from his dispensary, supplied me with a list of the preparations ordinarily used by him in practice, and cordially rendered me such other assistance as I had occasion to seek from him.

THE

MATERIA MEDICA

OF THE HINDUS.

INTRODUCTION.

MATERIAL OBJECTS AND CLASSIFICATION OF MEDICINES.

CHARAKA divides material objects into three classes, namely, mineral, animal and vegetable. Minerals consist of gold, silver and other metals; diamond, emerald and other gems; realgar, orpiment and other ores; and the various sorts of earths. Vegetables are divided into four classes, namely, Vanaspati, Vriksha, Virudh and Oshadhi. Those plants which produce fruits, without first showing their flowers, are called Vanaspati. Plants which produce fruits from flowers, which are known by their flowers and fruits, and which wave small branches from their trunks, are called Vriksha. Plants which during their growth are supported by other plants, are called Virudh, Pratánavatya or Valli. those grasses, etc., which die after maturing their fruits, are called Oshadhi. Animals are divided into four classes, namely, Jaráyuja or mammalia, Andaja or oviparous, Svedaja or those produced from animal excretions, as parasites, etc., and Udbhijja or those produced under ground or from vegetable matter, as for example Indragopa, a sort of red insect.

All parts of vegetables may be used in medicine, namely, Root, as of Chitraka (Plumbago Zeylanica).

Underground stem, as of Surana (Amorphophallus campanulatus).

Leaves, as of Vásaka (Justicia Adhatoda).

Fruits, as the three Myrobalans.

Flowers, as of Dhátaki (Woodfordia floribunda).

Extract, as Catechu, Opium, etc.

Bark, as of Kurchi (Holarrhena antidysenterica).

Wood, as of Dárvi (Berberis Asiatica or aristata).

Gum, as Myrrh, Assafœtida, etc.

Sometimes the entire plant is used as Kanţakári (Solanum Xantho-carpum).

The skin, hair, wool, nails, horns, hoofs, milk, bile, honey, fat, marrow, blood, flesh, urine, fæces, semen, bones and ne rves of animals are all used in medicine.

Susruta divides remedial agents into two classes, namely, Párthiva or material and Kálakrita or effected by time, such as wind, sun-shine, shade, moon-light, darkness, heat, cold, rain, day and night, changes of the moon, months and se asons of the year, etc. These are all said to affect the humours of the body, and, through them, the diseases caused by their derangement. The influence of these agents, if properly regulated or availed of, sometimes cures diseases, without the aid of material remedies.

Sanskrit writers do not agree in the mode in which they classify medicines when describing their properties. Charaka divides medicines into fifty classes, according to their supposed action on the different organs of the system, or on particular symptoms of disease. These classes are as follows:—

- 1. जीवनीय Jivaniya-Medicines which prolong life.
- 2. टंड्पोय Vrinhaniya—Medicines which promote nutrition and increase corpulency.
- 3. चेखनीय Lekhaniya—Medicines which thin the tissues, or reduce corpulency.
- 4. भेदनीय Bhedaniya-Promote excretions.
- 5. सन्दानीय Sandháníya—Promote the union of fractured or divided parts. [power.
- 6. दीपनीय Dipaniya-Increase the appetite and digestive
- 7. Act Balya-Increase strength. Tonics.
- 8. वर्ष्ट्र Varnya—Improve the complexion.
- 9. Aus Kanthya-Improve the voice, or cure hoarseness.
- 10. ছব Hridya-Promote cheerfulness or relish.
- 11. व्याप्त Triptighna—Remove a supposed phlegm which causes a sense of satiety.
- 12. अभीष Arsoghna—Cure piles.
- 13. ज्ञा Kushthayhna—Cure skin diseases.
- 14. कार्ड ध Kandughna—Cure pruritus.

- 15. व्यामिष् Krimighna—Cure worms.
- 16. faua Vishaghna Act as antidotes to poisons.
- 17. स्तन्यजनन Stanyajanana—Promote secretion of milk.
- 18. सन्यशोधन Stanyasodhana—Improve the quality of milk.
- 19. गुक्रजनन Sukrajanana—Increase the secretion of semen.
- 20. शुक्रयोधन Sukrasodhana—Purify the semen.
- 21. स्त्रहोपयोग Snehopayoga—Emollients.
- 22. संदोपयोग Svedopayoga—Diaphoretics.
- 23. वमनोपयोग Vamanopayoga-Emetics.
- 24. विरेचनोपयोग Virechanopayoga—Purgatives. [enemas.
- 25. द्यास्वापनोपयोग A'sthápanopayoga-Medicines for use in
- 26. व्यत्वासनोपयोग Anuvásanopayoga—Medicines for oily enemas. [from the nose.
- 27. त्रिरोविरेचनोपयोग Sirovirechanopayoga-Promote discharge
- 28. इहि नियइण Chhardinigrahana—Relieve vomiting.
- 29. त्रणानियहण Trishnánigrahana—Relieve thirst.
- 30. डिकानियइण Hikkánigrahana-Relieve hiccup.
- 31. प्रोषसंप्रहणीय Purishasangrahaniya—Render the fæces consistent.
- 32. प्रोविवरजनीय Purishavirajaniya-Alter the colour of the
- 33. मत्रसंप्रच्योय Mutrasangrahani'ya—Reduce secretion of urine.
- 34. मूत्रविरजनीय Mutravirajaniya—Alter colour of urine.
- 35. मूलविरेचनीय Mutravirechaniya-Increase secretion of
- 36. कागहर Kásahara—Cure cough.

- [urine.
- 37. স্থাৰ্ছ Svásahara—Cure difficult breathing or asthma.
- 38. भोषहर Sothahara—Cure anasarca or swellings.
- 39. ज्वरहर Jvarahara—Febrifuges.
- 40. अमहर Sramahara—Remove fatigue. [body.
- 41. दाइप्रमन Dáhaprasamana-Relieve' burning or heat of
- 42. भोतप्रयमन Sitaprasamana—Relieve sense of coldness.
- 43. जद्देष्रमन U'darddhaprasamana—Cure urticaria. [limbs.
- 44. अङ्गमह प्रयमन Angamarddaprasamana—Relieve pain in the
- 45. श्रुखप्रयमन Sulaprasamana—Cure pain in the bowels.
- 46. योणितस्थापन Sonitasthápana Styptics.
- 47. वेदनास्थापन Vedanásthápana-Anodynes.
- 48. संज्ञास्यापन Sanjnásthápana—Restore consciousness.

- 49. प्रजास्थापन Prajásthápana—Cure sterility.
- 50. वयःस्थापन Vayahsthápana—Prevent the effects of age.

Susruta divides medicines into thirty seven classes, named after the first article of each class. The medicines included in each class have certain common properties, such as acidity, sweetness, astringency, etc., are often used in combination, and can be substistuted for one another. This has the advantage of bringing analogous substances under one head, but numerous medicines come to be written under two or more heads. The Nighantu and some other works on the properties of medicines adopt the following classification in describing them :- 1. Strongly scented substances. 2. Moderately scented substances. 3. Weak scented substances. 4. Extracts. 5. Precious stones. 6. Metals. 7. Sweet plants. 8. Acid plants. 9. Potherbs. 10. Bitter herbs. 11. Flower plants. 12. Fruitbearing creepers. 13. Root-stocks. 14. Large trees. 15. Middle sized trees. 16. Small trees or shrubs. 17. Creepers. 18. Corn and Pulses. 19. Cooked food. 20. Different sorts of water. 21. Fluids as milk, honey, etc. 22. Necessaries of life, such as baths, dress, ornaments, etc. 23. The influence of the elements and imponderables, etc.

THE PROPERTIES OF MATERIAL OBJECTS AND THE ACTION OF MEDICINES ON THE HUMAN SYSTEM.

Material objects, according to Sanskrit writers, have six sorts of tastes, twenty sorts of qualities, and two sorts of forces in them. The six tastes are sweet, acid, salt, bitter, acrid and astringent. The twenty qualities of objects are as follows:—Heavy, light, soft, dull, oily, consistent, watery, hot, fixed, sharp, tremulous, delicate, demulcent, smooth, harsh, transparent, hard, pungent, coarse and cold. The two forces are heating and cooling. All substances are supposed, after digestion, to assume one or other of three sorts of properties: thus sweets and salts are supposed to be turned after digestion into sweets; acids, into acids; and bitters, acrids and astringents, into acrids. Besides the above properties, each medicine has a special action of its own. It is that quality which shews itself superior to the usual properties of taste, force, and result of assimilation; as for example, Danti (Baliospermum Montanum), which though similar in properties to Chitraka (Plumbago

Zeylanica), yet, unlike the latter, acts as a purgative. This result is owing to its special action, the nature or ultimate cause of which is beyond the comprehension of the Gods themselves.

The various actions of medicines on the human system are described in considerable detail. All diseases being supposed to be caused by derangement of the humours, namely, wind, bile, phlegm, blood, etc., all medicines are likewise supposed to have some influence upon one or other of these humours. Susruta divides medicines into two classes, with reference to their action on the humours, namely, Sansamana and Sansodhana. Sansamana are medicines which rectify the deranged state of the humours and calm their excited action, without promoting the excretions. Sansodhana are medicines which remove collections of bad humours and discharge them by the excretions. The first is subdivided into three orders, namely, medicines influencing wind, bile and phlegm, respectively. The second includes emetics, purgatives, errhines and other depuratories. Sárangadhara and other writers describe the actions of medicines in further detail and mention the following classes :-

दोषन Dipana are medicines which promote appetite, but do not aid in digesting undigested food.

पाचन Páchana are medicines which assist in digesting undigested food, but do not increase the appetite. Some medicines have both these properties, that is, they are appetizers as well as digestives.

चनुडोमन Anulomana are medicines which digest the humours and set them free, that is, promote excretions and favour their discharge.

heads, namely, স্বাৰ Sransana, মাহৰ Bhedana, and বৈদ্ধ Rechaka. Those medicines which hurry the chyle or materials for digestion, without allowing them to be properly digested, are called Sransana, as for example the pulp of Cassia fistula. Those medicines which set free scybala and other contents of the intestines, and discharge them from the bowels, without producing watery stools, are called Bhedana, as for example Katuki (Pricorrhiza Kurroa). Those medicines which cause the discharge of the digested or undigested contents of the

intestines in a liquid form, are called Rechaka, as for example, Trivrit (Ipomæa Turpethum). These last again are subdivided into three orders, namely, mridu or mild, madhyama or intermediate, and krura or drastic.

वसन Vamana or emetics are medicines which cause emesis of bile, mucus and other contents of the stomach.

ब्रेट्न Chhedana are medicines which remove by force as it were and discharge from the body adherent phlegm or other humours. Emetics, expectorants, errhines, caustics, etc. would probably come under this head. Black pepper and alkaline ashes are given as examples of this class of medicines.

वेखन Lekhana or attenuants remove bad humours and altered constituents of the body by thinning them gradually and thus clearing the system of them. Warm water, honey, barley, etc. are examples of this class.

Medicines which promote the secretion of perspiration, urine, and milk are called, respectively, चंदन Svedana, मृत्रज Mutrala and सान्यजनन Stanyajanana.

মন্দি Pramáthi are medicines which facilitate the exit of collected secretions from their tubes or receptacles, as for example Vacha (Acorus Calamus).

पाइ Gráhi or inspissants are medicines which from their stomachic, digestive and heating qualities, dry the fluids of the body.

their drying, astringent and cooling qualities, and from their easy digestibility, increase the air and retain the secretions, as for example Indrayava (seeds of Holarrhena antidysenterica).

विषयि Abhishyandi are substances which from their emollient qualities or heaviness, retain the secretions and cause heaviness and fulness of the body, as for example, Dadhi or curdled milk.

रसायन Rasáyana or alternative tonics are medicines which prevent or remove the effects of age, increase the vigour of healthy persons and cure the ailments of the sick.

ৰন্ধ Balya or tonics are medicines which increase strength.
ত হ'ল Vrinhana are medicines which promote nutrition and increase the bulk of the body.

वाजीकरण Váji'karana or aphrodisiaes are medicines which increase the sexual powers.

विष Visha or poisons are said to be endowed with the following qualities, namely, व्यवस्था Vyaváyv, that is affecting the entire system, as for example, opium and hemp. चून्स Sukshma that is, penetrating into the minutest pores of the body विकासि Vikási, that is drying the humours, depressing the system and causing relaxation of the joints, as for example betel-nuts. चान्ते य A'gneya, that is, heating or stimulant. मदावह Madávaha, that is, depriving men of their senses and enveloping their minds in darkness as spirituous liquors. Taken in large doses, poisons destroy life, but, judiciously used, they act as curatives and restore health, even in dangerous diseases.

Nine active or virulent poisons are mentioned by most writers, namely vatsanábha, háridra, saktu, pradipana, sauráshtrika sringi, kálakuta, haláhala, and brahmaputra. These cannot all be identified at present. Most of them are apparently varieties of aconite, (see page 97). The following seven drugs are described, as minor poisons, viz., opium, gunjá (seeds of Abrus precatorius), datura, roots of Nerium odorum (karavirá), and Gloriosa superba lánguli) and the milky juices of Calotropis gigantea (arka) and Euphorbia neriifolia (snuhi). The mineral poisons mentioned in Susruta are phenásma bhasma or white arsenic, and haritála or orpiment. Of animal poisons, the poison of the serpent is the only one used in medicine.

WEIGHTS AND MEASURES.

The scales of weights and measures used in ancient days differed in different parts of the country. Separate scales are described by modern compilers, under the names of Mágadhi, Kálinga, Cháraka, Sausruta, etc. The number of gunjás making a tolá varies in these scales from forty to ninety-six. The scale of weights and measures in ordinary use in Bengal, at the present day, has the gunjá (seed of Abrus precatorius) for its lowest weight. The gunjá, however, is divided into fractional parts by other seeds, thus eighteen mustard seeds, four grains of paddy, three grains of

barley and two, grains of wheat are respectively said to be equal to one gunjá प्रज्ञा. This scale is as follows:—

- 6 Gunjás make one áná.
- 12 Gunjás make one máshá माघा.
 - 8 Máshás or 16 ánás make one tolá तो जक.
 - 8 Tolás make one pala पंज.
- 8 Palas or 64 tolás make one seer भराव.
- 2 Seers make one prastha प्रस्त.
- 8 Seers make one ádhaka আর্ক.
- 32 Seers make one drona द्रोच.
- 100 Palas or 12½ seers make one Tulá ৱৰা.

In the scale above described ninety-six gunjás make one tola. It would seem, however, that in ancient days Susruta's scale of forty gunjás to a tolá was in general use, for the doses of powders, confections, decoctions, etc. given in the older works, are considered monstrous for the present age, and much smaller doses are given in practice. Orthodox physicians explain the large doses by saying that they were intended for a superior race of men of ancient days. The subject is involved in much obscurity and this is scarcely the place to discuss it thoroughly. In giving the doses of medicines described in this work, I will state the quantities now prescribed by native physicians in current weights, hence they will differ from the Sanskrit texts from which the prescriptions will be translated.

There is a peculiarity in fluid measures which must also be noticed in order to prevent misapprehension of the Sanskrit texts. When a fluid article is ordered in measures of a prastha or two seers and upwards, twice the quantity mentioned should be taken. Thus if in a preparation it is stated, take of solid paste of certain substances one seer, oil two seers, and water eight seers, the quantities actually taken are solid paste one seer, oil four seers and water sixteen seers. In measures below two seers or in those indicated by pala such as eighty palas, sixty palas etc, the quantities are not doubled.

The doses of medicines are not fixed. They are regulated by the age, strength, and digestive power of the patient, the nature of the illness, the state of the viscera and humours, and lastly by the properties of individual drugs. Supposing the full dose of a medicine for adults to be two tolás, the doses for children of different ages would be as follows:—
For infants a month old, one gunjá, and an additional gunjá for each additional month. For children a year old, the dose would be one máshá or twelve gunjás, and an additional máshá for every year, till the full dose of sixteen máshás or two tolás is reached at the sixteenth year. From sixteen to seventy the full dose should be used, after which it should be again gradually reduced. When infants are unable to take decoctions and other bulky medicines, their nurses are made to take them. Sometimes small quantities of medicines are applied to the nipples, and the infants made to suck them.

Medicines may be administered during four periods of the day, namely, sunrise, mid-day, evening and night. Sometimes they are administered frequently. Morning is regarded as the best time for administering such medicines as purgatives, emetics, decoctions and pills which are generally given once daily. When no specific direction is given regarding the time of administration, morning must be taken for granted. Very often one sort of medicine is given in the morning and another in the afternoon. Some medicines for dyspepsia are given before, along with, and after meals.

FORMS OF MEDICINES.

stances in a mortar with a pestle and passing the powder through cloth.

खर Svarasa or expressed juice is prepared by pounding fresh vegetables in a mortar, expressing the juice and straining it through cloth.

we we with a muller, and then making a thin paste, with the addition of water when necessary.

boiling one part of vegetable substances with sixteen parts of water, till the latter is reduced to one-fourth. The medicines should first be pounded small, then boiled over a slow fire, and the

decoction strained through cloth. When decoctions are prepared with dry substances, eight parts of water are recommended to be used. Decoctions are administered with the addition of salt, honey, sugar, treacle, alkalies, clarified butter, oil, or some medicinal powders.

powdered herbs in eight parts of hot water, for twelve hours during the night. They are administered in the same way as decoctions.

भीतकवाय Sítakasháya or cold infusion is prepared by steeping one part of a drug in six of water for the night, and straining the fluid in the morning.

पानीय Páni'ya is a weak form of decoction prepared by boiling one part of medicinal substances in thirty-two of water till the latter is reduced to one-half. This preparation is usually taken ad libitum for appearing thirst or some such object.

मस्या Pramathyá is a sort of decoction in which the medicines are first reduced to a pulp and then boiled in eight parts of water till the latter is reduced to one-fourth. It is administered with the addition of honey.

मन्य Mantha is an emulsion of medicines in fine powder with four parts of cold water.

चीरपास Kshi'rapáka or decoction in milk. The proportions in this preparation, are one part of medicine, eight of milk and thirty-two of water. The materials are boiled together, till the water is evaporated and the milk alone remains; the decoction is then strained.

rice, wheat, barley, etc., and boiled with water into a gruel which is taken as aliment. The proportion of water in this preparation is six to one of solid materials. This preparation is called Kalka-sádhya-yavágu or gruel made with medicinal paste, in contradistinction to another form called Kvátha-sádhya-yavágu or gruel made with a decoction of medicines, for which last see Oryza sativa.

being strained, are again boiled down to the consistence of a thick extract. This extract, when properly made, does not readily dissolve in water, can be drawn out into wires, and will receive

impressions of coins on its surface. Extracts are administered with the addition of sugar, decoctions, or powders.

विका Vatiká and मुद्दिका Gudiká or pills and boluses. These are usually prepared by reducing a decoction of vegetable substances to a thick consistence and then adding some powders for making a pill-mass. Sometimes pill-masses are made of powdered medicines with the addition of treacle or honey.

भोदन Modaka are boluses prepared by adding powders to cold syrup and stirring them together till uniformly mixed. No boiling is required in this preparation.

adding to syrup medicines in fine powder and stirring them over the fire till intimately mixed and reduced to proper consistence. Honey is often subsequently added to confections. Syrup may be made with sugar and water or milk or the strained decoction of some medicinal substance. Confections should be of the same consistence as extracts above described.

and especially mineral substances, are often soaked in various fluids, such as expressed juice of herbs, decoctions, etc., and then dried. For this process the quantity of fluid added to the powder should be sufficient to cover it. The mixture is then allowed to dry in the sun. A single operation of this sort is completed in twenty-four hours, but the process is generally repeated from three to seven times, and often with a variety of fluids, so that the resulting mass combines in it the active principles of various drugs.

are reduced to a paste which is wrapped up in jamvu or vaṭapaṭra (leaves of Eugenia Jambolona and Ficus Bengalensis), firmly tied with fibres of some sort, covered with a layer of clay from half to one inch in thickness and roasted in cowdung fire. When the layer of clay assumes a brick-red colour on the surface, the roasting is known to be completed. The ball should now be withdrawn from the fire and broken, and the juice of the roasted drug expressed and administered, with the addition of honey or such other adjuncts as may be directed. Sometimes the roasted drug itself is given in the form of a powder or pill.

सन्दानवर्ग Sandhánavarga or products of acetous fermentation. काञ्चिक Kánjika. This is a sour liquid produced from the acetous fermentation of powdered paddy. Two seers of powdered áus dhán (paddy grown in rainy season), are steeped in eight seers of water and laid aside in an earthen pot for fifteen days and upwards, when the mixture undergoes acetous fermentation. The resulting fluid is called Kánjika or Dhányámla, that is, the acid produced from paddý. Kánjika is a clear transparent fluid with an acid taste and vinous smell. It is cooling, refrigerent, and useful as a drink in fever, burning of the body, etc. It is sometimes applied externally upon the principle of wet-sheet packing, cloth steeped in the fluid being wrapped round the body for relief of high fever and heat of body. It is also used as a vehicle for other medicines and for preparing decoctions, oils, etc. Other grains besides paddy are sometimes used for acetous fermentation. If mustard or the seeds of Raphanus sativus (mulaka) are added to paddy, the resulting fluid is called Sintáki. If the husked grains of barley are boiled and steeped in water, the resulting acid liquor is called Sauvira. When the husks of fried máshakaláya (pulse of Phaseolus Roxburghii) and barley are boiled together for acetous fermentation, the acid is called Tushámvu. A'rnála is a sour gruel made from fermentation of boiled rice. A mixture called Sukta or Chukra is thus prepared :- Take of treacle one part, honey two parts, kánjika made as above described, four parts, whey eight parts, mix together in a clean earthen pot, and bury the pot in a heap of paddy for three days. The properties of these preparations are similar, they being regarded as cooling, refrigerent, diuretic, and useful in nervous diseases, rheumatism, dyspepsia, indigestion, urinary diseases, intoxication from spirituous drinks, etc. What is ordinarily spoken of as conjee water in English, is a decoction of rice and not the kánjika of Sanskrit Materia Medica.

हाउन Drávaka or distilled mineral acids. Several formulæ are given in different works for the preparation of mineral acids. Anumber of mineral substances or salts are heated in a retort and the distilled fluid collected in a glass receiver. The test of acids is said to be their property of dissolving a cowrie or shell

thrown into them. The following are two examples of the compositions used for preparing mineral acids.

borax, sulphide of antimony, impure carbonates of potash and soda called yavakshára and svarjikákshára, and rock salt, each eight tolás, nitre six tolás, orpiment four tolás; powder, mix and rub them together repeatedly with lemon juice and dry. Introduce the mixture into the receptacle of a distilling apparatus, and distill over the fire. The dose of the acid thus distilled is two drops. It should be taken with six grains of long pepper. One week's use of this medicine is said to cure spleen disease, dyspepsia, etc.

বিশ্ব Sankhadrávaka. For this preparation take of sulphate of iron thirty-two tolás, alum and rock salt sixteen tolás each, nitre one hundred and twenty-eight tolás, powder, mix and distill the mixture from a glass retort. The dose of this acid is said to be twelve minims. The tongue should be anointed with clarified butter before using this medicine. It should not also touch the teeth.

आस्वादिष्ट Asava and arishta or medicated spirituous liquors. These are prepared from honey and treacle, with the addition of various medicinal substances. They are all steeped in water and aid aside in earthen jars for vinous fermentation. The proportion of the different ingredients, as a general rule, is as follows :-Water thirty-two seers, treacle twelve seers and a half, honey six seers and a quarter, medicinal substances one seer and a quarter, in powder or decoction. When raw vegetables are used for fermentation, the resulting fluid is called A'sava. When the decoction of drugs only is added, the fermented liquor is called Arishta. These preparations combine the properties of spirituous drinks and those of the drugs used in preparing them. They are heating, stimulant, easily digested and stomachic. The preparation called Drákshárishta is made with honey, sugar and decoction of raisins, with the addition of a few aromatics, (see Vitis vinifera). Its action must be analogous to that of wines. It is used as a stimulant in exhausting diseases.

ष्टत तैलयोदिष: Medicated oils and Ghritas. These are decoctions of vegetable drugs in oil or ghrita (clarified butter) and form a prominent feature of native practice. They are prepared in

great varieties and are extensively used in almost all sorts of diseases. The ghritas are chiefly used internally, and the oils are rubbed on the body. They are prepared by boiling vegetable drugs in ghrita or oil, with the addition of water or other fluids such as kánjika, milk or a decoction of drugs, etc. As a general rule, the proportion of the different ingredients used is as follows:—Medicinal substances, in form of paste, one part, ghrita or oil four parts, water or other menstruum sixteen parts. When the fluids used are thick, such as decoctions or the expressed juice of vegetables, the proportion of solid paste is reduced from one-fourth to one-sixth and one-eighth respectively of the oil or ghrita. Sometimes no solid paste is used at all.

If more than one variety of fluid is ordered, then up to four sorts the usual proportion of four of fluid to one of ghrita or oil is observed, and these are boiled separately with each fluid; but, when the number of fluids exceeds four, each of the fluids ordered is taken in quantity equal to the oil or ghrita, and the whole boiled together.

चतपाक Ghritapáka or preparation of medicated ghrita. The ghrita or clarified butter is first of all heated on a fire so as to deprive it of any water that may be mixed with it. A little turmeric juice is then added to purify it, as it is said, but the object, I suppose, must be to colour it. Ghrita thus purified is placed on a fire in an earthen, copper, or iron pan and melted with a gentle heat. Then the medicinal paste and fluids to be used are added, and the whole boiled together till the watery parts are all evaporated and the ghrita is free from froth. It is then strained through cloth and preserved for use. Ghrita thus prepared should be imbued with the colour, taste and odour of the medicines with which it has been boiled. It is recommended that the preparation of ghrita by boiling be not completed in one day, and that the medicines be allowed to remain in contact with the butter for some time, so that their active principles may be thoroughly extracted. The boiling process is carried on to three degrees, called, respectively, mridu, madhyama and khara páka. In the first, the boiled paste is somewhat soft; in the second, it is dry and just soft enough to be made into pills with the fingers. In the third form, it is turned hard and dry. The intermediate form is preferred for internal administration and injection into the rectum, while the over-boiled form is used for external application. The under-boiled form is said to be suitable for use as snuff.

तैचपाक Tailapáka or medicated oils. In preparing these, sesamum oil should be used unless otherwise specified. Sesamum oil. before being boiled with medicinal substances, is coloured and purified as follows :- First of all it is heated to deprive it of any water that may be mixed with it; then the following substances are steeped in it for twenty-four hours, viz., madder one sixteenth part in weight of the oil, turmeric, wood of Symplocos racemosa (lodhra), tubers of Cyperus rotundus (mustaka), a bark called naliká, the three myrobalans, root of Pavonia odoráta (bálá) and the tender shoots of Pandanus odoratissimus (ketaki), each one sixty-fourth part in weight of the oil. These ingredients in fine powder should be soaked in the oil, with the addition of an equal quantity of water for a day. The mixture should then be boiled till the water is evaporated, and finally strained. To the oil thus prepared, medicinal substances, in the form of paste, decoction, etc., are added in the same proportions as for the preparation of ghritapáka. They are then boiled together till the watery parts are all evaporated. When cool, the oil is strained through cloth so as to separate the solid particles. Some medicinal oils, and especially those used in the treatment of nervous diseases, rheumatism, etc., are subjected to a third process of boiling with various aromatic and fragrant substances. This is called the Gandha páka or boiling for rendering the oil fragrant. The following substances, or as many of them as are available, are used for scenting medicated oils, namely, cardamoms, cinnamon, cloves, fenugreek seeds, saffron, leaves of Cinnamomum Tamala, white sandal wood, aloes wood, jatámansi root, Curcuma Zedoaria (sati), Cyperus rotundus (mustaka), kakkola (an aromatic seed,) resin of Pinus longifolius (gandhavirajá), storax, long pepper root, root of Andropogon muricatus (usira), nakhi (Unguis odoratus),* pouch of civet cat (khattási), camphor,

^{*} This nakhi according to Rumphius who describes ten kinds of the odoriferous onyx which serve as the basis of the principal perfumes in the Indian Islands, (Herb. Amb. ii. c. 17) is the operculum or lid of the shells of Purpura and Murex, This being flat and something like a nail explains the origin of its name,—Royle's Antiquity of Hindu Medicine, page 144.

musk, Permelia perlata (saileya,) root of Aplotaxis auriculata (kushta), seeds of Abelmoschus moschatus (latákasturi), etc.

For four seers of oil, one tola of each of the above ingredients should be taken, with the exception of camphor which should be four tolas. These ingredients, with the exceptions noticed below, are reduced to a paste with water and added to the oil, which is then boiled with an equal quantity of water till the latter is evaporated, and lastly strained. Camphor, musk, storax and the substance called nakhi should be added after the process of boiling is finished, and the oil strained. Oils for rheumatism and nervous diseases, are sometimes rendered fragrant by the addition of camphor alone.

Castor oil and mustard oil are sometimes used in the preparation of medicated oils. The proportions of oil, medicinal substances and fluids are the same as with sesamum oil, but the preliminary preparation of these oils is different. Mustard oil is purified by being boiled with the following ingredients, namely, emblic myrobalan, turmeric, tubers of Cyperus rotundus (mustaka), rootbark of Egle Marmelos (vilva), pomegranate bark, flowers of Mesua ferrea (nágakesara), Nigella seeds, root of Pavonia odorata (bálá), the bark called naliká, and belleric myrobalan, two tolás each, and madder sixteen tolás, for four seers of oil. These should be boiled together with sixteen seers of water, till the latter is all evaporated, and the oil should then be strained. It is now fit for being boiled with medicinal substances, the process for which is the same as for sesamum oil above described.

For purifying castor oil, the following ingredients are used, namely, madder, tubers of Cyperus rotundus (mustaka), coriander, the three myrobalans, leaves of Sesbania aculeata (vaijayanti), Pavonia odorata (hrivera), wild dates, tender red buds of Ficus Bengalensis (vaṭasunga), turmeric, wood of Berberis Asiatica (dáruharidrá), the bark called naliká, ginger and the shoots of Pandanus odoratissimus (ketaki), each half a tolá for four seers of oil. Castor oil should be boiled with equal parts of whey and kánjika (fermented paddy water) along with the above ingredients.*

^{*} The processes above described, for the preliminary purification of oils before being boiled with medicinal substances are not adopted by the physicians of upper India. They are not mentioned by the ancient writers and are the inventions of recent Bengali authors.

ON THE DIFFERENT MODES IN WHICH MEDICINES ARE APPLIED.

Besides being taken internally, medicines are applied in various other ways, such as by injections into the rectum, urethra and female organs; application to the nose; to the mouth; to the eyes; to the skin in the shape of plasters, ointments, oils and umigations, and to the lungs by inhalation.

The bag was recommended to be made of the bladder of some mimal, such as bull, goat, etc. It was filled with the fluid to be njected and tied to one end of a tube, about eight inches long and with a tapering rounded extremity for introduction into the rectum. Injections into the urethra and vagina were thrown in by similar contrivances, the tubes being adapted in length and thickness to the passages for which they were intended.

कार में Phalavarti or suppositories were recommended to be made of the size of the patient's thumb. They were smeared with clarified butter and introduced into the rectum. The following is an example of a suppository. Take of assafætida and rock-salt equal parts and make a suppository with honey, for use in tympanitis.

Nasya or the application of medicated substances to the nose, forms a prominent feature of native therapeutics. Two primary classes of medicines for this organ are recognized, namely Sirovirechana or medicines causing a flow of secretion from the nose and thus relieving cerebral congestion, and Vrinhana or medicated oils applied to the nose with the object of cooling the head and relieving affections of the neck and chest. For clearing the head and promoting discharge from the nose, the expressed uice of pungent drugs is poured into the nose, drop by drop, or powders are blown into the nostrils by means of a tube. The former process is called Avapida and the latter, Pradhamana. For cooling the head and relieving affections of the upper part of the body, various medicated oils are used. In one form of snuff called Pratimarsha, two or three drops of medicated oil are

directed to be snuffed up the nostril till they reach the throat, when they should be expectorated and not swallowed. In another form of application called *Marsha* about a drachm of oil is recommended to be gradually poured into each nostril from a spoon or shell.

करण Kavala. Liquids used as gargles are so called. Sometimes a mixture of liquid and solid substances or solid balls of medicine are taken into the mouth and retained in it till they bring on a discharge from the nose and eyes. This mode of application is called गाउम Gandusha. When powders or thick solutions are applied to the teeth and gums with the finger, the process of medicament is called मित्रगरम Pratisárana.

fuciled Sirovasti, etc. or applications to the head. Oils or other fluids are applied to the head in four different ways. The first form called Sirovasti, consists in tying a piece of leather four and a half inches in breadth all round the head, luting its lower margin to the skin by a paste of the pulse called máshakaláya and then filling the cavity thus formed on the top of the head with lukewarm oil. The oil is directed to be retained till relief of pain, or till there is discharge from the eyes and nose. It should then be removed and the head washed with warm water. This sort of medication is said to be useful in severe headache and shaking of the head. In the second form, oil or other fluid is poured in a stream on the head. This is called Parisheka. In the third form, called Pichu, cotton soaked in oil is applied to the scalp; and in the fourth, called Avyanga, the oil is simply rubbed on the head.

Applications of liquids and medicated oils to the ears are used in diseases of the head as well as of the ears. The external meatus is filled with the fluid which is allowed to remain in it from one to twenty minutes and is then withdrawn.

names according to the nature of the substances used and the manner in which they are applied. Pouring of drops into the eyes is called A'schotana. A poultice enclosed within a piece of cloth and applied over the lids is called Pinda. A paste applied to the lids is called Vidálaka. Medicines applied to the margin of the lids or to the conjunctiva with the finger or a metallic probe are called Anjana. These last may be in the shape of powder or liquid or they

may be made into sticks or pills which are rubbed with water before use. The probe for applying medicines to the margin of the lids should be six inches long with a rounded bulbous end. It may be made of gold, silver, copper, iron or stone. For habitual use of collyria a lead probe is preferred. When medicines are applied not only to the lids but also to the conjunctiva up to the margin of the cornea, the finger is recommended to be used, as it is soft and safe.

Applications to the skin. These consist of ghritas, oils, plasters poultices, baths and hot applications for inducing perspiration. Medicated ghritas and oils have been already described. They are for the most part rubbed all over the body, except those intended for local ailments. Plasters called udu Pralepa are applied moist and cold. Ut Pradeha or poultices are applied moist and hot. They are also thicker than plasters.

स्वेदन Svedana or application of heat to the skin for inducing perspiration is carried out in four different ways, namely :--

- 1. तापसंद Tápasveda or the application of dry heat by means of heated plates, bricks, sand, cloth or the palm of the hand only. These are recommended to be heated by catechu-wood fire.
- 2. Exist Ushmasveda or the application of hot steam. This is effected in various ways. The part to be heated is covered with wet cloth. Bricks, stones or iron plates are made red hot and sprinkled over with kánjika or some decoction, and are then applied to the part to be heated; or an earthen pot with a small opening in the side is filled with hot water or decoction of some drugs, a tube is adjusted to the hole in the pot and the steam is applied to the covered body through it. A third method consists in heating the ground by burning catechu-wood over it, and after removing the fire, sprinkling some decoction over the spot and making a bed of castor oil leaves on it. The patient is to lie on this bed and cover himself with a blanket. Or the ground may be covered with a thick layer of boiled pulse such as máshakaláya and a bed made over it for the patient.
- 3. उपगाइस्वेट Upanáhasveda. This means the application of heat by hot medicinal substances in the form of decoctions, pastes, or plasters, or of fomentation by cloth wrung out of hot fluids;

or heat may be applied by enclosing hot medicinal substances or pastes within a cloth bag and applying the latter to the skin.

4. इवस्ट Dravasveda. This means the hot hip-bath and hot bath with warm water or decoctions. Milk, broth, oil, kánjika etc. may also be used for baths. The patient should sit in a tub with the fluid up to his navel, and which should also be poured over his body from above the shoulders, so as to bathe him thoroughly. The tub should be made of wood, silver, copper or iron, of square form and twenty-six fingers in measurement in all directions, that is in height, length and breadth. After the application of heat, the patient should take a hot bath, eat light food and keep himself covered in bed. If too much heat has been applied, and the patient suffers from pain in the joints, thirst, langour or giddiness, then he should be treated by cooling applications. The region of the heart, scrotum and eyes should be heated with great care and to a mild degree only.

ध्यपान Dhumapána or inhalations. Tapers or pastilles made of medicinal substances are set fire to, and their fumes inhaled through a tube by the mouth or nose. Pastilles for inhalation are thus prepared: a reed, half a cubit in length, is smeared or laid over with a paste of the drugs to be used, to two-thirds of its extent and is dried in the shade. When dry, the reed is withdrawn from the paste, leaving it in the form of a hollow tube. This is smeared with clarified butter and lighted. The lighted extremity is introduced into one end of the inhaling tube and the fumes drawn in by the other end through the mouth or nose, as the case may be, and emitted again through the mouth. In affections of the throat and chest, inhalation through the mouth is recommended, while in diseases of the head, eyes or nose, the fumes are drawn in through the nose. The tube for inhalation may be metallic or made of wood or ivory. Its length varies from two cubits to half a cubit, and its calibre should be sufficient to allow a large pea to pass through. The shorter tubes are used in administering expectorant and emetic fumes. Inhalations are useful in cough, asthma, catarrh, pain in the neck or head, etc. They may be used for soothing the air passages, for promoting discharge from them, for the relief of cough, or for inducing vomiting. Another form of inhalation, called Samana,

is recommended to be used daily after washing the face, bathing, breakfast, etc. The pastille for this was made of cardamoms and other aromatic substances. This sort of smoking is not seen in the present day. Probably it was in vogue before the introduction of tobacco and has been displaced by the latter.

skin diseases. The pastilles for these are made as for inhalation. They are lighted and placed inside two earthen pots, placed face to face. A hole is made in the upper pot and a tube adjusted to it. The free or open end of the tube is now directed to the affected part and the fumes allowed to spread over it. Incenses and tapers composed of various medicinal substances are also burnt in rooms occupied by the sick, for removing unpleasant smells and supposed evil spirits.

बारकमा Kshárakarma or caustic applications. The ancient physicians of India, like their modern representatives, preferred opening abscesses by caustics, to incising them with the lancet. Hence caustics were described as superior to the lancet, inasmuch as, in addition to opening abcesses, they purified them by removing the derangement of the humours. The ashes of the following plants were used for the preparation of caustics, namely:—

पाटना Páṭalá.—Stereospermum suaveolens.

कुटन Kuṭaja. - Holarrhena antidysenterica.

पनाच Palása.—Butea frondosa.

अञ्चलक Asvakarna. - Shorea robusta.

पारिभद्र Páribhadra.—Erythrina Indica.

विभितक Vibhitaka, - Terminalia Bellerica.

त्रारम्बध A'ragvadha.—Cassia fistula.

नोध Lodhra.—Symplocos racemosa.

अर्क Arka. — Calotropis gigantea.

च्चित्र Snuhi.—Euphorbia neriifolia.

अपामार्ग Apámárga.—Achyranthes aspera.

करञ्ज Karanja.—Pongamia glabra.

वासक Vásaka.—Justícia Adhatoda.

कदिन Kadali.—Musa sapientum.

चित्रक Chitraka. - Plumbago Zeylanica.

पुनिक Putika.—Cæsalpinia Bonducella.

हेबदार Devadáru.—Cedrus Deodara. चास्कोता A'sphotá.—Vallaris dichotoma. करबोर Karavira.—Nerium odorum. सप्तर्पा Saptaparni.—Alstonia scholaris. गम्मारि Gambhári.—Gmelina arborea. गम्मारि Gunjá.—Abrus precatorius. कोबातको Koshátaki.—Luffa pentandra.

The roots, stems and leaves of these plants or of such of them as are available, are cut into pieces and burnt in a pit. The ashes are then collected and boiled in six times their weight of water till the solution becomes transparent, red, pungent and soapy to the feel. It should then be strained and again put on fire and the following substances added, namely, ashes of Euphorbia neriifolia (snuhi), and the burnt powders of bivalve and conch shells. The mixture should be constantly stirred and boiled till it is of a thick consistence. The proportion of shell-lime added varies from one fourth to one-eighth or one-sixteenth part of the solution. Caustics of three strengths are thus obtained. Sometimes orpiment and realgar are added to increase their strength.

The part where the caustic is to be applied, should first be cleaned and rubbed. The caustic should then be applied with a probe. It should be allowed to remain in contact with the skin for such time as is occupied in uttering a hundred words and then removed. The skin becomes black from the application, when it is dressed with a paste of acids, clarified butter and honey. For hastening the removal of the slough, a paste or poultice composed of sesamum seeds, liquorice root, lemon juice and kánjika should be applied. Caustics are applied to external piles, sinuses, fistulæ in ano, abscesses, warts, tumours, leprous patches, etc.

MATERIA MEDICA OF THE HINDUS. PART I.

INORGANIC MATERIA MEDICA.

GENERAL REMARKS ON MINERAL MEDICINES.

Mineral or inorganic medicines are generally described under five heads, namely, Rasa or mercury which forms a class by itself; Uparasa or metallicores and earths, Dhátu or metals, Lavana or salts, and Ratna or precious stones. The metals used in Sanskrit medicine are mercury, gold, silver, copper, tin, zinc, lead, iron, bell-metal, and brass. The Uparasas used are sulphur, tale or mica, two sorts of iron pyrites called Svarnamákshika and Táramákshika, load-stone, orpiment, realgar, sulphate of copper, sulphate of iron, cinnabar, minium or red lead, sulphuret of lead, calamine (kharpara), Silájatu (a bituminous substance containing iron), alum, borax, chalk, calcined cowries and conch shells, Gairika a sort of red mountain earth or ochre, Kankushta a sort of mountain earth, Sauráshtri a fragrant earth from Surat, sand, clay, etc.

The precious stones described are, 1 Hiraka, diamond; 2 Gárutmat, emerald; 3 Pushparága, topaz; 4 Mánikya, ruby; Indranila, sapphire; 6 Gomeda, a yellow gem of the colour of fat; 7 Vaidurya, a gem of a dark blue colour, the lapis lazuli; 8 Mauktika, pearls; 9 Vidruma, corals. Collectively they are called Navaratna or the nine gems. Rájavarta, an inferior kind of diamond from Virat, and Vaikránta, another inferior kind of diamond, are sometimes used instead of diamond.

Salts.—Of these the following are noticed by most writers, viz., Saindhava, rock salt; Sámbara, Sambar lake salt; Sauvarchala, sonchal salt; Bit, black salt; Sámudra, sun-dried sea salt, commonly known as Karkach; Audbhida, a saline efflorescence on reh lands; Pánsuja or salt obtained from saline earth; Yavakshára, impure carbonate of potash; Sarjikákshára, impure carbonate

of soda; Sarvakshára, mixed ashes of several plants; Narasára chloride of ammonium; Soraka, nitrate of potash, and Tankana, borax. The term Ushara is applied to saline earth.

Metals and metallic compounds are subjected to a so-called process of purification in order to get rid of their impurities or deleterious qualities. If used in an unpurified state, they are supposed to induce certain diseases or morbid symptoms. The metals, for the most part, are purified by repeatedly heating their plates and plunging them in the following fluids, namely, oil, whey, sour conjee, cow's urine and the decoction of a pulse called kulattha (Dolichos uniflorus). Another method of purification consists in soaking the plates of heated metals in the juice of the plantain-tree.

Metals and metallic compounds are reduced to powder by various processes. The operation is called márana, which literally means killing or destruction of metallic character but practically a reduction to powder, either in the metallic state, or after conversion into an oxide or a sulphide. Various processes for the calcination of different metals are described in Sanskrit works on the subject. I will not burden these pages with a detailed account of these but shall only describe modes of preparation followed at the present day.

Although the Hindus had made some successful efforts in preparing a certain number of chemical compounds such as perchloride of mercury, sulphides of copper and silver, oxide of tin, some acids, alkalies, etc., yet their chemical operations were of a very rude and primitive character. The apparatus employed by them consisted of crucibles of different sorts, glass bottles and earthen pots arranged for sublimation of volatile compounds, retorts for distillation, sand and vapour baths, etc. The furnace for heating metals is usually a pit in the ground called Tayz Gajaputa. It is made one and a quarter cubits in depth, length and breadth. This is filled with dried balls of cowdung. The metals or metallic compounds to be roasted are enclosed in a covered crucible and placed in the centre of the pit within the balls of cowdung, which are then set fire to and allowed to burn till consumed to ashes.

स्थायन्त. Musháyantra or crucibles, are recommended to be made of husks of rice two parts, earth from ant-hills, iron rust, chalk and human hair cut into small bits, one part each. These are rubbed

together into a paste with goat-milk, and made into crucibles which are dried in the sun. Practically, however, goldsmith's crucibles or common earthen cups are used. The compounds to be roasted are placed in one crucible, this is covered with a second, and the two are luted together with clay.

नासुकायन्त्र. The sand-bath called Váluká yantra is made by filling an earthen pot with sand and heating it over the fire. Metalic preparations sublimed within glass bottles are heated in sand-baths.

होचायन्त. When medicines, tied in a piece of cloth or other material, are suspended and boiled in a pot of water, the apparatus is called *Dolá yantra*. The steam-bath called *Svedana yantra* is got up by covering the mouth of a pot of boiling water with a piece of cloth, placing the medicines to be heated by steam on this cloth, and then covering them with another pot.

For the sublimation of metals and metalic preparations, two sorts of apparatus are used. The first, called अर्ड्ड पातन्यन्य Urddha-pátana yantra, consists of two earthen pots placed one above the other with their rims luted together with clay. The lower pot containing the medicine is put on fire while the upper one is kept cool with wet rags. The sublimate is deposited in the interior of the upper pot. Sometimes the lower pot is covered with a concave dish and water poured into its hollow to keep it cool and changed as often as it gets hot. The second plan consists in placing the medicines to be sublimed in the bottom of a glass bottle which has been strengthened with layers of clay and cloth wrapped round it, and then exposing it to heat in a sand-bath. The sublimate is deposited in the neck of the bottle, whence it is extracted by breaking the latter.

तिर्श्वेत्रपातनयन्त्र Tiryak pátana yantra. This apparatus means the adjustment of retorts and receivers for sublimation and distillation. At the present day glass retorts of European manufacture are used. Country-made glass retorts are also available.

SULPHUR.

Sans. मञ्जूक Gandhaka.

Four varieties of sulphur are mentioned by Sanskrit writers, namely, red, yellow, white and black. Of these the red and black are not now available. The yellow variety or vitreous sulphur is called ámlá-sár, because its semi-transparent crystals resemble the translucent ripe fruits of the ámalaki (Phyllanthus emblica). It is preferred for internal use in combination with mercury. The white variety or ordinary roll sulphur is inferior to the yellow, and used for external application in skin diseases.

Sulphur is purified by being washed in milk. It is first dissolved in an iron ladle smeared with butter and then gradually poured into a basin of milk. When cool and solidified it is fit for use. Dose twelve to twenty-four grains with milk or other vehicle.

Sulphur is described as of bitter, astringent taste, with a peculiar strong smell. It increases bile, acts as a laxative and alterative, and is useful in skin diseases, rheumatism, consumption, enlarged spleen etc. In combination with mercury it is used in almost all diseases. The circumstance of its readily combining with and fixing metalic mercury, has led to its extensive use in combination with that metal.

In skin diseases sulphur is used both internally and externally. Internally it is given with milk or in the shape of a sulphurated butter, prepared from milk boiled with the addition of sulphur. The butter thus obtained is called *Gandha taila*, and is taken internally, and applied externally, in skin diseases. Sulphur and yavakshára (an impure carbonate of potash), mixed with mustard oil, is applied in pityriasis psoriasis etc. Sulphur enters into the composition of a large number of applications for skin diseases, the following is an example.

^{1.} गत्यतै बम्। त्याव त्तमाने पयि दता गत्यक जंरजः। तज्जात दि अर्थे सिर्मे त्यतै वं बद् नि हि। गत्यतै वं गबत्क छं हिन वेपा च भचा यात्।। सन्देह-भञ्जनी।

^{2.} गन्धपाषाणचूर्णेन यवचारेण पेषितम्। शिश्वानाशं जजत्याशः कटुतैख-युतेन वा ॥ चक्रः।

A'dityapáka taila. Take of sesamum oil four seers, madder, the three myrobalans, lac, turmeric, orpiment, realgar and sulphur equal parts, in all one seer. Mix and expose to the sun. This oil is useful in eczema, scabies etc.

In rheumatism it is used in combination with bdellium, as in the following, called Sinhanáda guggulu.² Take of sulphur eight tolás, bdellium eight tolás, decoction of the three myrobalans seventy-two tolás, castor oil thirty-two tolás, mix and boil together in an iron vessel till reduced to the consistence of a confection. Dose about one drachm twice daily. It is useful in chronic rheumatism, lameness, cough, asthma, and skin diseases.

MERCURY.

Sans. पारद Párada. रम Rasa.

Mercury, though not mentioned by Charaka* and Susruta, has in later days come to be regarded as the most important medicine in the Hindu Pharmacopæia. Párada literally means that which protects, and mercury is so called because it protects mankind

^{1.} चादित्यपाकं तैलम्। मञ्जिष्ठा तिष्णला लाचा निशा शिलालगन्धकैः। चृथितै स्तैलमादित्यपाकं पामाहरं परम्॥ चकः।

^{*} There is a passage in Charaka in the chapter on Kushtha or skin diseases which some physicians construe into a recommendation for the use of mercury. It is this स्व व्याधिवनायन सद्भात तुष्टी रसञ्चित्रहोतस. It may be translated as follows. Reduced mercury which cures all diseases should be taken by those affected withskin diseases. The term rasa, however, signifies mercury as well as many other things, such as myrrh, sulphur, gold etc., and since Charaka does not mention párada, the principal name for mercury, it is doubtful if he really meant mercury by the term rasa. Supposing, however, he did mean mercury, its use was at all events, in his time, confined to skin diseases only.

from all sorts of diseases. It is said that the physician who does not know how to use this merciful gift of God is an object of ridicule in society.

Good mercury is said to be bright like the mid-day sun externally, and of a bluish tinge internally. Mercury of a yellowishwhite, purple, or variegated colour should not be used in medicine. Mercury, as met with in commerce, contains several sorts of impurities, such as tin, lead, dirt, stone, etc. If administered in an impure state it is said to bring on a number of diseases; hence it is purified before use. Various processes for purifying mercury are described in books. At the present day the following is generally adopted by Kavirájas. Mercury is first rubbed with brick-dust and garlic, then tied in four folds of cloth and boiled in water over a gentle fire for three-hours in an apparatus called Dolá yantra. When cool, it is washed in cold water and dried in the sun. Some practitioners use betle-leaves instead of garlic for rubbing the mercury with. Mercury obtained by sublimation of cinnabar is considered pure and preferred for internal use.1 Cinnabar is first rubbed with lemon juice for three hours, and then sublimed in the apparatus called Urddhapátana yantra. The mercury is deposited within the upper pot of the apparatus, in form of a blackish powder. This is scraped, rubbed with lemonjuice and boiled in water, when it is fit for use. A peculiar form of mercury called Shadguna bali járita rasa2 is thus prepared. A little sulphur is placed in an earthen pot, and over it some mercury. The pot is heated in a sand-bath, and, as the sulphur begins to melt, cautiously and gradually more of it is added to or placed over the mercury, altogether to the extent of six times the weight of the

^{1.} हिंकु नो त्यर सः। जन्नीर निख्नीरेख महित' हिंकु लंदिनम्। जह पातन-यन्त्रेष यात्रः स्था दिस्रो लोरसः। कञ्च कौनांगवङ्गादी निर्धिको रसकस्त्रीन।। रसेन्द्र भारस्य हः।

रमेन्द्रसारसंग्रहः।

mercury. When the whole is melted like oil the pot should be quickly removed from the fire, and cooled till the mass is consolidated. It should then be broken, and the mercury extracted from within the mass. Mercury thus obtained is said to be superior to all other forms, but it is not much used at present.

The purified metal obtained by the processes above mentioned is employed for the preparation of mercurial compounds. Four preparations of mercury are described in books, namely, black, white, yellow, and red, called respectively, krishna, sveta, pita and rakta bhasmas.

- Krishna bhasma. The black preparation is the black sulphide of mercury, made by rubbing together and dissolving over the fire three parts of mercury with one of sulphur.
- 2. Rasakarpura. The white preparation is the Rasakarpura or perchloride of mercury. Several processes are given for preparing it; one is as follows.² Take of mercury and chalk equal parts, and rub them together till the globules disappear. Rub this mixture of chalk and mercury with pánsu (salt obtained from saline earth) and the juice of Euphorbia nereifolia (snuhi) repeatedly. Enclose in a covered crucible and heat it within a pot full of rock salt. The perchloride of mercury will be deposited in the shape of a pure white powder under the lid of the crucible. The Bhávaprakása gives the following process for its preparation.³ Take of purified

mercury, gairika (red-ochre), brick dust, chalk, alum, rock salt, earth from ant-hill, kshári lavana (impure sulphate of soda) and bhándaranjaka, or red earth used in colouring pots, in equal parts, rub together and strain through cloth. Place the mixture in an earthen pot, cover it with another pot, face to face, and lute the two together with layers of clay and cloth. The pots so luted are then placed on fire, and heated for four days, after which they are opened, and the white camphor-like deposit in the upper pot is collected for use.

- 3. Pita bhasma. The yellow preparation called Pita bhasma¹ is directed to be prepared as follows. Take of mercury and sulphur equal parts, rub them together for seven days with the juice of bhumyámalaki (Phyllanthus neruri) and hastisundi (Heliotropium Indicum). Place the mixture in a covered crucible, and heat it in a sand-bath for twelve hours. The result will be a yellow compound.
- 4. Rakta bhasma. The red preparation called Rakta bhasma or Rasa sindura² is prepared in a variety of ways. The following is one of them. Take of mercury and sulphur equal parts, rub together with the juice of the red buds of Ficus Bengalensis (vata) for three days successively, introduce the mixture within a bottle and heat it in a sand-bath for twelve hours. A red deposit will adhere below

स्वस्वकृष्टितस्ट्दा सुद्रयेदनयोर्ग् खभ्। संशोध्य सुद्रयेद्वयो भूयः संशोध्य सुद्रयेत्। सस्यक् विशोध्य सुद्रां तां स्थालीं चुल्यां विधारोत्। स्थान निरन्तरं दद्यात् याव-द्विन सत्यस्यम्। अङ्गारोपरितद्यन्त्रं रचोद्यत्नाद हर्निश्यम्। शनकृष्टाटयेद् यन्त्र सूर्ज्वस्थालीगतं रसम् कर्पूरवत् सुविमलं ग्टङ्गीयाद् गुणवत्तरम्॥ सावप्रकाशः। 1 पीतसस्य। रसगन्त्रौ सभौ कत्वा हस्तिशुग्छीद्रवैदृंदम्। भूधात्तिकरसैः पिष्टा पर्यन्तं दिनसप्तकम्। विष्ट्रध्य वालकायन्त्रो मूषायां सन्तिवेश्य तत्। दिनमेकं ददेदग्निं सन्दं सन्दं निशाविध। एवं निष्पाद्यते पीतः शीतः सूतस्तु ग्टङ्यते॥ रसेन्द्र सारसंग्रहः।

the neck of the bottle. It is taken out in the shape of dark red shining scales.

The four preparations of mercury above mentioned, though described in most works on metalic medicines, are not, practically used in the treatment of disease under these names. In the present day the yellow preparation is not in use. The white form called Rasakarpura is now prepared, not according to the processes described in Sanskrit works, but by subliming the black sulphide of mercury with common or rock salt. In this form it is largely manufactured and sold in all the bazars. The red preparation is better known as Rasa sindura; and the black one as Rasa parpati. In fact, practically, prepared mercury means the red preparation or Rasa sindura and this is the form in which it is largely used. Besides this, the black and red sulphides of mercury are also used internally. The black sulphide is prepared by rubbing together equal parts of sulphur and mercury till the globules disappear. It is called Kajjali. The red sulphide or cinnabar is called hingula. These four preparations, namely, cinnabar, the black sulphide called Kajjali, the red preparation called Rasasindura, and the Rasakarpura of the bazar, are the four principal forms in which mercury is used in Hindu medicine; that is, they constitute the basis of all the formulæ containing mercury.

Mercury is said to be imbued with the six tastes, and capable of removing derangements of all the humours. It is the first of alterative tonics. Combined with other appropriate medicines it cures all diseases, acts as a powerful tonic and improves the vision and complexion.

In fevers of all descriptions, mercury is extensively used in combination with aconite, croton seed, datura, and other medicines. The following are a few illustrations.

Hingulesvara. Take of cinnabar, aconite, and long pepper, equal parts, rub together in a mortar and make into pills about

¹ कञ्चिता। गुडं स्ततं तथा गन्धं खन्ने ताविह्न मह्येत्। स्ततं न दृश्यते यावत् किन्तु कञ्च बद्भवेत्॥ एषा कञ्चितिका ख्याता दृं हणी वीर्यवर्डिनी। नाना सु-पानयोगेन सर्व्व व्याधिविनाशिनी॥ रसेन्द्रसारसं यहः।

four grains each. They are given, beaten up with a little honey, in ordinary remittent fever.1

Taruna jvarári.² Take of mercury, sulphur, aconite and croton seeds, equal parts, rub together with the juice of Aloe Indica and make into four grain pills. These pills act on the bowels and relieve fever. They are administered with sugar and water.

In diarrhœa and dysentery, mercury is used in a great variety of forms. The following are a few examples.

Vajrakapáta rasa.³ Take of mercury, sulphur, opium, mocharasa, (gum of Bombax Malabaricum), the three myrobalans, ginger, black pepper, and long pepper, in equal parts, powder and mix. Soak the powder in the juice of the leaves of Cannabis sativa (Vijayá) and Verbesina calendulacea (bhringarája) seven times and make into six grain pills. This medicine is administered with honey in obstinate chronic diarrhœa. Dose grains four to twentyfour.

Rasa parpati.⁴ This is prepared by melting together a mixture of equal parts of sulphur and mercury in an iron ladle, smeared with ghee (clarified butter). The melted fluid is poured on a piece of plantain leaf, placed on a ball of cowdung. It is then pressed

¹ हिङ्गुलेश्वरः। तुल्यांगं मह्येत् खन्नो पिप्पलीहिङ्गुलं विषम्। हिगुञ्जं मधुना देयं वातञ्चरविमुक्तये॥ सैषज्यरत्नावली।

by another ball of cowdung, enclosed in plantain leaf. When cool, the black sulphide of mercury is obtained in the shape of round disks. It is much used alone, or with the addition of other medicines, in chronic diarrhea. Other varieties of Parpati or mercurial preparations in shape of disks are prepared with the addition of iron, gold, copper etc, and used in this complaint, as for example, Svarna parpati, Panchámrita parpati etc. The preparation of the former will be described under the head gold. The latter is thus prepared.

Panchámrita parpati.¹ Take of sulphur eight tolás, mercury four tolás, prepared iron two tolás, prepared tale one tolá, prepared copper half a tolá. Rub together in an iron mortar, melt in an iron ladle and prepare disks like those of Rasa parpati, above described. Dose four grains with honey and ghee, to be gradually increased to sixteen or eighteen grains. Parpatis of different sorts when given in cases of diarrhæa with anasarca are conjoined with a milk diet, water and salt being prohibited.

Mahágandha rasa.² Take of mercury and sulphur each two tolás, and make a Parpati as before described. Take of nutmegs, mace, cloves, and nim leaves, each two tolás, powder them well, mix together, and inclose the mixture within bi-valve shells. Cover the shells with a layer of clay and roast in fire. When cool, extract

the medicine from the shells. It is administered in doses of about four grains in the acute diarrhœa of children.

Pándusudana rasa.¹ In jaundice, mercury is used along with other alteratives and purgatives, as in the following, called Pándusudana rasa. Take of mercury, sulphur, prepared copper, croton seeds and bdellium, equal parts, rub them together with ghee and make into two-grain pills. They are given with the juice of nim bark and honey in jaundice. Acids and cold water for drinking should be avoided.

In affections of the lungs mercury is used in a variety of combinations. The following are a few illustrations.

Rasendra gudiká.² Take of purified mercury two tolás. Add to it one tolá of the juice of jayanti leaves (Sesbania Ægyptica) and of fresh ginger, rub together till the mixture thickens, then soak it in the juice of Jussiwa repens (kanchata) and Solanum Indicum (vrihati) respectively for twenty-four hours. Take of purified sulphur eight tolás and soak in the juice of Verbesina calendulacea (bhringarája). When dry, mix the sulphur with the mercury, and rub together with sixteen tolás of goat-milk till the mass is fit for being made into pills. Dose about four grains, to be taken with goat-milk and juice of ginger. This pill is useful in bronchitis and cough generally.

Rájamrigánka rasa.³ Take of Rasa sindura three parts, prepared gold and copper one part each, realgar, orpiment and sulphur

¹ पाराड् मूदनरमः। रसंगन्धं स्ततं तास्तं जयपालञ्च गुग्गुलुम्। समां श-माञ्चसंयुक्तां गुड़िकां कारयेद्भिषक्।। एकैकां खादयेद्भित्यं पाराड् शोयोप-शान्तये। शीततञ्च जलं चास्तं वर्ज्ययेत् पाराड् स्तदने॥ रसेन्द्रसार संपन्तः।

² रमेन्द्रगुडिका। कर्षं गुद्धरमेन्द्रस्य स्वरमेन जयाईयोः। गिलायां खल्व-येत्तावद्यावत् पिग्छं घनं ततः॥ जलकर्णा काकमाची रमाभ्यां भावयेत् पुनः। सौगन्धिकपणं स्टङ्गस्वरमेन विभायितम्॥ चूर्णितं रमसंयुक्तमजाचीरपलद्वये। खिल्लातं घनपिग्छन्तु गुड़ीं स्विद्धक्तलायवत्॥ कत्वादौ गिवमभ्यच्या दिजातीन् परितोष्य च। जीर्णाचोभचयेदेकां चीरमांसरमाशनः॥ सर्व्यक्तपं चयं काशं रक्तपित्तमरोचकम्। खिप वैद्यश्वतं स्थक्तमस्वपित्तं नियच्छति॥ चकः।

couries, close their openings with borax reduced to a paste with goat-milk, roast the shells in closed crucibles and take out the medicine when cold. Dose about four grains, with two grains of long and two of black pepper, honey and clarified butter. It is said to be useful in phthisis, and chronic bronchitis with fever.

In diseases of the nervous system, several combinations of mercury with gold, iron, talc, etc. are used, such as, the *Chaturmukha* rasa, *Chintámani chaturmukha*, *Yogendra rasa* etc. They are all similar in composition, with but slight variation in the proportions of the active ingredients and their adjuncts.

Chintámani chaturmukha¹ is thus prepared. Take of the red preparation of mercury called Rasa sindura two tolás, prepared talc two tolás, prepared iron one tolá, prepared gold half a tolá, rub them together with the juice of Aloe Indica and make into two-grain pills. This medicine is said to be useful in nervous diseases, insanity, cephalalgia, deafness, noise in the ears, paralysis of the tongue, diseases of the female and urinary organs, phthisis, fever etc. It improves nutrition, increases the appetite and strength, and brightens the complexion.

As an alterative tonic the red preparation of mercury, or Rasasindura already described, is much used in a variety of diseases.

भाग के शिकागन्धकता ककम् ।। प्रतिभागद्वयं शुद्ध मेकी कत्य विमर्द्यत्। वराटीं प्रयेत्तेन खजचीरेण टङ्गणम् ॥ पिद्या तेन सखं रुद्धा स्द्र्झा गुडे तत् निधापयेत्। शुद्धं गजपुटे पाच्यं चूर्णयेत् स्वाङ्गणीतकम् ॥ रसी राजस्माङ्कीऽयं चतुर्श्व द्यापद्यः। दणप्रप्रकिकं चौदैर्भरिवैकोन विश्वतिस्।। सप्तते द्विपयेद् वैदेप्रा वातस्त्रे भाभवे चये॥ भेषजप्रतावकी।

Two other forms of this medicine in common use are called Shadguna balijárita rasa sindura and Svarna sindura respectively.

Shadguna balijárita rasa sindura is thus prepared. Take of mercury and sulphur equal parts, and prepare Rasa sindura as already described by sublimation in a glass bottle. On the second day, mix this Rasa sindura with an equal quantity of sulphur and again sublime the compound. Repeat the process in this way, six times. This preparation is considered superior to the ordinary Rasa sindura.

Svarna sindura¹ is thus prepared. Take of fine leaf gold one tolá, purified mercury eight tolás, mix together by rubbing in a mortar, add twelve tolás of sulphur and again rub together, till the mass is of a dark colour. Sublime in a glass bottle on the sand-bath. The three forms of Rasa sindura above mentioned are said to cure all sorts of diseases, but are particularly used in chronic fever, catarrh and cough of children, mental and bodily debility, anæmia etc.

Mercury is used in syphilis both externally and internally. Syphilis and its treatment by mercury are described only in recent compilations, such as the Bhavaprakása. The following are a few illustrations of its use in this disease.

Saptasáli vati.² Take of mercury and catechu each half a tolá, pellitory root one tolá, honey one and a half tolá. Rub together till the globules of mercury disappear, and divide into seven pills or boluses. One pill is administered every morning with

^{1.} खर्ण सिन्दूरः । सूच्यापत्नं सुवर्णस्य सुशुद्धं को समितम् । शुद्धस्तपने केन सेखये द्यत्नतो भिषक् ॥ सार्द्धं पनं गन्यकञ्च कत्वा कळालिकां ततः। निवेश्य काचकूष्याञ्च हहायां परिवेष्ट्यते ॥ तां कर्पटै स्ट्टिंदा चैव खटिकाभिः समन्ततः । सम्यक्निक्ध्य यत्नेन संपूज्येषां सहोमया ॥ वानुकायन्त्रमध्य तां सिच्चक्ध्य समा- हितः । पचेद्वाद्ययामांस्तु निः सम्याते सुनिर्क्जने ॥ एकाकी पाकविद्देद्यः खाङ्ग्यीतं रसुद्वरेत् । खर्ण सिन्दूर्यमञ्चेतत् सर्व्वरोगनिस् दनम् ॥ संचित्रसारः।

water in primary syphilis. Acids and salt should not be taken after the use of this medicine.

Rasa karpural or corrosive sublimate as sold in the bazars is recommended to be given in a single dose of eight grains. The medicine is enclosed in a ball of wheat-flour and covered with powdered cloves. It is swallowed with water so as not to touch the teeth. Salts and acids are forbidden to be taken after the use of this medicine. As the Rasa karpura of the bazars is not a pure perchloride of mercury, but is a mixture of calomel and corrosive sublimate in indefinite proportions, the patient sometimes escapes after this dose. When, however, it contains more of corrosive sublimate than of calomel, intense salivation, gastritis and even death may result. When such doses of poisonous remedies are recommended in standard works it is no wonder that we should occasionally come across cases of dreadful salivation, induced by native treatment. The circumstance of wheat-flour being used as a covering to the poison may act as an antidote to some extent. In secondary syphilis Rasa karpura is given in small doses in combination with cloves, saffron, sandal wood, and musk.

For external application, about a drachm of mercury is recommended to be rubbed between the palms with the juice of the leaves of Sida cordifolia (bátyálaka) till the globules of mercury are no longer visible. The palms are then to be warmed over the fire till perspiration breaks out from them.²

^{1.} रसकपूरिपायनेविधिः। फिरङ्ग संज्ञकं रोगं रसः कपूर संज्ञकः। अवश्यं नाययेदेतदुचुः पूर्वचिकित्सकाः॥ जिख्यते रसकपूरिपायनेविधिक्त्रमः। अनेन विधिना खादेन्युखे योथं न विन्द्रति॥ गोधूसचूर्षं सद्गीय विदध्यात् सृच्या-कूपिकास्। तन्त्रध्ये निच्चिपेत्सूतं चत्रग्रञ्जसितं भिषक्।। ततस्तु गुटिकां जुर्था-द्राया न दृश्यते विद्यः। सृच्या चूर्षे जवङ्गस्य तां वटीमवधूजयेत्।। दन्तस्यभी यथा न स्थात् तथा तामकासा गिलेत्। ताम्बूलं भच्यते, पञ्चाच्याकाक्त जवणान् त्यजेत्। त्या तथा तामकासा विशेषात् स्त्रीनिषेवनम्।। भावप्रकाशः।

For fumigation in primary syphilis, about half a drachm of the black sulphide, mixed with one fourth part of wheat-flour, is employed daily for seven days in succession. In secondary syphilitic eruptions the following composition is used for fumigation. Take of cinnabar one tolá, realgar half a tolá, powder and mix. About fifteen grains of this is used at a time. Powders for fumigation are heated over a fire of jujube tree wood, and the vapour is applied to the skin under cover in a closed room.

Mercury enters into the composition of several applications for skin diseases, as in the following. Take of cinnabar, sulphur, red oxide of lead, rock salt, seeds of Cassia tora (chakramarda), baberung, Cleome felina (svarnakshiri), and the root of Aplotaxis auriculata (kushta) in equal parts. Powder them, and reduce to a thin paste with the juice of datura, nim or betle leaves. This application is said to cure ringworm, eczema, prurigo, psoriasis etc.²

For lice in the hair, mercury rubbed with datura or betle leaf is recommended to be applied to the scalp.³

ARSENIC.

Three compounds of arsenic are used in Hindu medicine, namely, arsenious anhydride or white arsenic, red sulphide of arsenic or realgar, and the yellow sulphide or orpiment. Of these three, orpiment and realgar have been used in medicine from a very remote period, and are indigenous to India. Native white arsenic is not met with in India. It is brought from Burmah, China and

the Persian gulf. It is not mentioned in the more ancient Sanskrit works, neither in the list of metallic ores, where or piment, realgar etc. are described, nor in any prescription for the treatment of diseases. In compilations of a later date, however, such as the Bhávaprakása, and the Tantras, it is recommended as a powerful medicine for fever, and is now much used as such.

In these later works white arsenic is called by several names, such as usfau Sankha visha, usaut Sámbala kshára, usautu Phenásma bhasma, and दार्च Dárumuch. None of these terms, however, is to be found in standard lexicons, such as Wilson's Sanskrit-English Dictionary, or Sir Rájá Rádhákanta Deva's Sabdakalpadruma. Phenásma bhasma is mentioned by Susruta in his chapter on poisons, where he says, it and haritála (orpiment) are the two mineral poisons,* but it is very doubtful if Susruta meant any native white arsenic by it. The derivation of the term implies that it was obtained by roasting some sort of stone or ore. White arsenic was obtained artificially in ancient days by roasting orpiment (see orpiment), and probably this preparation was called Phenásma bhasma. At a later period imported white arsenic had been used in medicine under the designations of sambalakshára, dárumuch, and sankha visha.

WHITE ARSENIC.

Sans. सञ्ज्ञिष Sankha visha. दारसुच Dárumuch. साम्बन्जार Sámbala kshára.

White Arsenic is sold in the bazars under the names of Sunka bish, Suffed sambul and Darumuch. It is purified by being soaked in lemon juice or the juice of the plantain tree. It is chiefly used in fever, for which it is now preferred to the other compounds of arsenic, and is employed alone as also in a great variety of combinations. The following are a few illustrations.

Jvara brahmástra. Take of white arsenic two tolás, soak it in cow's urine for three days, and afterwards in the juice of

^{*} फेनाइसभसाइरितालञ्च हेथात विषे | Susruta. kalpasthana. chapter II.

¹ ज्वरब्रह्मास्तः। विपनीञ्च समागस्य ग्रुभवर्षं सुशोधनम्। त्रानीय सन्वतः

Celsia Coromandeliana (kokasima), for one day, and then wash in cold water. Take a small quantity, the weight of a mustard, (about one-ninth of a grain), and administer within a lump of sugar in intermittent fever before the paroxysm comes on. Thus taken for three days, it cures recent and chronic fevers, ague and remittent fever. It is called Jvara brahmástra or the weapon which infalliably destroys fever.

Dárubrahma rasa.¹ Take of white arsenic, cinnabar, datura seeds and long pepper, equal parts, and make into four-grain pills with lemon juice. They are given with the juice of tulsi (leaves of Ocimum sanctum) in remittent fever with shivering, incoherent speech or wandering, profuse perspiration or much heat of body, difficult breathing, etc. The dose of arsenic in this medicine is very large and may induce unpleasant symptoms.

Chandesvara rasa.² Take of mercury, sulphur, aconite, prepared copper and white arsenic, equal parts, rub together with the juice of fresh ginger for six hours, then soak in ginger-juice and dry, successively for seven days. Afterwards soak in the juice of Vitex nigundo (nirgundi) for seven days, make into pills about a grain each, and administer with the juice of fresh ginger. Along with this medicine, inunction with oil, cold bathing and nourishing animal food should be used.

ORPIMENT.

Sans. इतिताल, Haritála.

ORPIMENT occurs in two forms, namely, in smooth shining gold-coloured scales called Vansapatri haritála, and in yellow opaque masses called Pinda haritála. Vansapatri haritála is preferred for internal use as an alterative and febrifuge. Pinda haritála is chiefly used as a colouring ingredient in paints, and for sizing country paper. Most of the older Sanskrit MSS. are written on paper prepared with haritála, to preserve them from the ravages of insects, and this it does most effectually.*

मह्येद् याममात्रकम् ॥ रसे नापि च तेनास्य भावयेत् सप्तवारकम् । निर्मू ग्रुडीस्वर-से नापि भावयेत् सप्तधा पुनः ॥ गुञ्जार्डमाना वटिका ग्रुडार्ट्र करसे नवै । मुखादेव ज्वरं इत्ति तैलाभ्यक्षः समाचरेत् ॥ स्वर्धोतलजले स्नानं तैल मत्स्यादि भोजनम् । चग्रुध्वरो रसो नाम सर्व्धरोगकुलानकत् ।। संचिप्तसारः॥

* Babu Rájendralála Mitra gives the following interesting account of arsenicised paper in his report on Sanskrit manuscripts, published in the Proceedings of the Asiatic Society, for March 1875.

"The manuscripts examined have mostly been written on country paper sized with yellow arsenic and an emulsion of tamarind seeds, and then polished by rubing with a conch-shell. A few are on white Kásmiri paper, and some on Palm-leaf. White arsenic is rarely used for the size, but I have seen a few codices sized with it, the mucilage employed in such cases being acacia gum. The surface of ordinary country paper being rough, a thick coating of size is necessary for easy writing; and the tamarind-seed emulsion affords this admirably. The paper used for ordinary writing is sized with rice gruel; but such paper attracts damp and vermin of all kinds, and that great pest of literature, "the silver-fish" thrives luxuriantly on it. The object of the arsenic is to keep off this insect, and it serves the purpose most effectually. No insect or worm of any kind will attack arsenicised paper, and so far the MSS. are perfectly secure against its ravages. The superior appearance and cheapness of European paper has of late induced many persons to use it instead of the country arsenicised paper in writing puthis; but this is a great mistake, as the latter is not near so durable as the former, and is liable to be rapidly destroyed by insects. I cannot better illustrate this than by referring to some of the MSS. in the Library of the Asiatic Society. There are among them several volumes written on foolscap paper, which dates from 1820 to 1830, and they already look decayed, mouldering, and touched in several places by silver-fish. Others on John-letter paper which is thicker, larger and stouter, are already so far injured that the ink has quite faded, and become in many places illegible, whereas the MSS. which were originally copied on arsenicated paper for the College of Fort William in the first decade of this century, are now quite as fresh as they were when first written, I

Haritála is purified for internal use by being successively boiled in kánjika, the juice of the fruit of Benincasa cerifera (kushmánda), sesamum oil, and a decoction of the three myrobalans, for three hours in each fluid. Some physicians, probably to save time, mix all these fluids together, and boil the orpiment in the mixture for three hours only. The dose of orpiment thus purified is from two to four grains.

Several methods of roasting orpiment are described. The Bhávaprakása recommends that orpiment should be powdered and made into a ball with the juice of Boerhaavia diffusa (punarnavá) and placed in the centre of a pot full of the ashes of that plant. The pot should be now covered with a dish, luted with clay, and heated over a fire for twenty hours. When cool the ball of roasted orpiment is taken out from the pot and reduced to powder. Another process is as follows. Take of purified orpiment and yavakshára, equal parts, rub them together with the juice of Vitex Negundo (nirgundi), and roast the mixture in a closed crucible. The resulting compound from both these processes is described as a white camphor-like substance.

A specimen of roasted orpiment supplied to me by an upcountry physician was analized and found to contain but a small
proportion of white arsenic. Bengali physicians do not prepare
this drug from a superstitious notion that the man who roasts
orpiment dies very soon. They purchase it from Fakirs or religious
mendicants. It is said that some specimens of roasted orpiment
are highly poisonous, and contain a large proportion of white
arsenic. The quality of the drug would no doubt vary according
to the method in which it is prepared.

Orpiment is said to cure fevers and skin diseases, to increase strength and beauty, and to prolong life. In fever it is used in combination with mercury, aconite, etc. The following is an illustration.

have seen many MSS. in private collections which are much older, and still quite as fresh. This fact would suggest the propriety of Government records in Mofussil Courts being written on arsenicised paper instead of the ordinary English foolscap, which is so rapidly destroyed both by the climate and also by white-ants. To guard against mistake I should add here that the ordinary yellow paper sold in the bazars is dyed with turmeric, and not at all proof against the attack of insects."

Vetála rasa. Take of purified mercury, sulphur, orpiment, aconite, and black pepper, equal parts. First rub the mercury and sulphur together, then add the other ingredients in fine powder, and make into two-grain pills. They are given with the juice of fresh ginger in remittent fever with affection of the brain.

Vidyádhara rasa.² Take of mercury, sulphur, prepared copper, iron pyrites, realgar and orpiment equal parts, rub them together and soak the mixture in a decoction of long pepper and in the milky juice of Euphorbia nereifolia (vajri). Make into pills about six grains each. These pills are given with honey in enlarged spleen and other enlargements of the abdominal viscera.

Tálakesari rasa.3—Orpiment forms the active ingredient of several pills for skin diseases, of which this is an example. Take of orpiment, realgar, iron pyrites (svarnamákshika), mercury, borax, and rock salt, one part each, sulphur and burnt conch-shell two parts each, rub them together for a day with lemon juice, then add to the mass one-thirtieth part of its weight of aconite, and mix. Dose, five to ten grains with butter. After it, powdered seeds of Vernonia anthelmintica (vákuchi), two drachms should be taken with honey and ghee. This medicine is useful in all sorts of chronic skin diseases. The above formula is taken from the Bhávaprakása. Sárangadhara gives a similar prescription under the name of Mahátálesvara.

^{1.} वेतालरमः । रसंगन्धं विषं तालं मरिचञ्च ममांशिकम् । शिलायां मह्-येत्तावत् यावत् कञ्जलसिमम् ॥ गुञ्जामात्रं प्रयोक्तव्यं हरेद्दादशमं ज्ञकम् । साध्यासाध्यं निह्नत्याशु सिद्धपातं सुदारुणम् ।। म्ह्वानेषु लिप्तदेहेषु मोह्यस्तेषु देहिष् । दात्तमर्हति वेतालं यमदूतनिवारणम् ॥ सैष्वत्रारतावली ।

Orpiment forms an ingredient of several external applications for skin diseases. Thus, take of orpiment, wood of Berberis lycium (dáruharidrá), seeds of Raphanus sativus (mulaka), wood of Pinus Deodara and betle leaves, each two tolás, burnt conch-shell half a tolá, beat them together with water into a thin paste. This paste is an useful application in psoriasis.¹

The use of orpiment as a depilatory was known to the ancient Hindus. It enters into the composition of numerous formulæ for the removal of hair. The following are examples.² Take of conchshell-lime, soaked in the juice of plantain tree, and of orpiment, equal parts, make them into a paste with the aid of water, and apply it to the part from which the hair is to be removed. Or take of conch-shell-lime two parts, orpiment one part, realgar half a part, sarjikákshára (impure carbonate of soda) one part, rub together with water, and apply.

REALGAR.

Sans. मन: शिला, Manahsila.

Realgar is purified by being rubbed with the juice of lemons, or of ginger. It is used internally in fever, skin diseases, cough, asthma, etc, and externally in skin diseases. In fever, it is generally used in combination with mercury, or piment etc. The following is an illustration.

Chandesvara rasa.3 Take of realgar, mercury, sulphur, and aco-

- 1. दावीं म्लक्षेत्रीज्ञानि तालकं सुरदारु च। ताम्बूलपतं सर्व्वाणि कार्षि-कािष प्रथक् प्रथक्॥ मङ्खाचूणं भानमातं सर्व्यान्येकत चूर्णगेत्। लेपोयं वारिणा पिष्ठः सिञ्जानां नाभनः परः॥ साङ्गेधरः।
- 2. शङ्खचूर्णस्य भागौ हो इतितालञ्च भागैकम्। मनःशिलाचार्द्वभागा सिर्जिका चैक भागिका॥ लेपोऽयं वारिषिष्टस्तु केशासुत्पाद्य दीयते। अनया लेपयुक्तप्राच सप्तवेलं प्रयुक्तया। निर्मृत्वकेशस्थानं स्थात् चपणस्य िरो यथा॥ शाङ्केषरः।
- 3 चराडे खर रणः। समां गं यो जयेत् खन्ने रसंगत्यं शिवां विषम्। निर्मू रखी सरसै भाव्यं तिवारं चाद्रक द्वैः। गुञ्जैकं भच्चयेत् प्रतिः ज्वरं इन्ति सहोद्भतम्॥ रसेन्द्रसारसंयहः।

nite, equal parts, soak in the juice of Vitex Negundo (nirgundi), and of fresh ginger, three times respectively, and make into two-grain pills. This medicine is useful in remittent fever.

Svása kuthára rasa. Take of realgar, mercury, sulphur, aconite, borax, each one part, black pepper seven parts, ginger, and long pepper, three parts each, rub them together with water, and make into four-grain pills. They are said to be useful in asthma with cough, and in remittent fever with cerebral complications. In coma from remittent fever, these pills are powdered and used as snuff for rousing the patient. They are also used in this manner in cephalalgia, hemicrania, ozæna, etc.

Realgar enters into the composition of numerous applications for skin diseases. Realgar mixed with the ashes of Achyranthes aspera (apámárga) is applied to patches of leucoderma or white lepra. In leprous ulcers a liniment composed of realgar, orpiment, black pepper, sesamum oil and the juice of Calotropis gigantea is used.²

Chandraprabhá varti.³ Realgar enters into the composition of several applications for the eye: the following is an example. Take of realgar, galena, conch-shell lime, seeds of Moringa pterygosperma (sveta maricha), long pepper, liquorice and the kernel of belleric myrobalan, equal parts, rub them together with goat's milk, dry the mixture and make into small pastils or pencils. These are rubbed with a little honey and applied to the eyes as a collyrium in affections of the internal tunics, tumors or other growths, night-blindness etc.

¹ श्वामकुठाररमः। स्त्रतं गन्धं विषञ्जैव टङ्गनञ्च मनःशिका। एतानि टङ्कमात्रानि मरिचं तञ्चतुर्यथम्।। तिकटु तिग्रणञ्जैव खङ्की पिद्वा विचूर्णयेत्। रसः श्वामकुठारोऽयं श्वासमर्थञ्चरापद्यः॥ रक्षेन्द्रशारसंपद्यः।

³ चन्द्रप्रभावितः। अञ्चनं खेतमरिचं पिप्पती मधुयष्टिका। विभीतकस्य मध्यन्तु गञ्चनाभि भनः शिला॥ एतानि समभागानि अजाचीरेणपेषयेत्। च्छायाशुःकां क्षतां वित्तं नेत्रेषुच प्रयोजयेत्॥ अर्ब्बुदं पटलं काचं तिसिरं रक्तराजिकाम्। अधिमां सं सल्ज्ञेव यसरात्रौ न पश्चिति॥ वित्तं सन्द्रप्रभा नाम जातान्ध्रप्रमिष गोधयेत्॥ चक्तः॥

An oil for application to fistulous sores is prepared as follows. Take of sulphur, realgar and turmeric, eight tolas each, mustard-oil one seer, juice of datura leaves one seer, water four seers; boil together in the usual way.¹

IRON.

Sans. जौह, Lauha.

Three varieties of iron are used in Hindu Medicine, namely, Kánta lauha or cast-iron, Mandura or iron rust, and Lauhasára or salts of iron produced by iron being kept in contact with vegetable acids. The form of cast iron used in the manufacture of pans for boiling milk is considered superior to all others for medicinal use. The small particles of iron which are scattered around when hot iron is beaten on the anvil, are called mandura. They are allowed to remain in contact with the earth till they become very rusty and brittle, when they are considered fit for use. The properties of mandura are said to be analogous to those of cast iron. Lauhasára or the granules produced on iron plates, smeared with vegetable acids, are also used in medicine. This variety of iron is said to be especially useful in diarrhæa, chronic bowel-complaints, dyspepsia and nervous diseases.

Cast iron is purified by beating it into thin plates, heating the plates in fire and sprinkling them with cow's urine, sour conjee, oil, and a decoction of the pulse of Dolichos uniflorus (kulattha), seven times in succession. The plates are reduced to powder by pounding them in an iron mortar, rubbing them with cow's urine, and roasting the powder in a covered crucible repeatedly till it is reduced to a fine impalpable powder, that will float on water and will not irritate the eyes when applied to them. It is usual to rub the iron with cow's urine and roast it about a hundred times in succession. In some cases it is recommended that iron should be thus roasted repeatedly for a thousand times. Mandura is purified and prepared for uselike cast iron. Prepared iron is a fine impalpable

¹ चूर्यान गन्धकियाना रजनीभवेन सुद्धां शकोन कटुतै खपलाष्टकं छ । धत्तूर पत्रसत् ल्यास्टं विपक्तं नाडीं जयेत् चिरभवामिप कर्याजाताम्॥ भावप्रकाशः।

powder of a reddish grey or brick-dust colour. On chemical analysis it is found to be a mixture of the proto and peroxide of iron. Dose grains six to twelve.

Iron, it is said, increases strength, vigour and longevity, cures all sorts of diseases and is the best of tonics. When gold and silver are not available, iron is substituted for them. It is used in painful dyspepsia, chronic fever, phthisis, anasarca, piles, enlarged spleen and liver, anæmia, jaundice, obesity, urinary diseases, diseases, of the nervous system, skin diseases etc. When iron is administered, the following articles of diet should be avoided, namely, kushmanda (fruit of Benincasa cerifera), sesamum oil, kulattha (pulse of Dolichos uniflorus), mustard, wines and acids.

In chronic fever with anæmia, debility, emaciation, enlarged spleen or other complications, several preparations of iron are used, such as the *Vrihat sarvajvara hara lauha*, *Chandanádya lauha*, etc.

Vrihat sarvajvara hara lauha. Take of purified mercury and sulphur, prepared copper, iron pyrites, talc, gold and orpiment,

^{1.} वृह्नत्मव्यञ्चरहर खीहम्। पारदं गन्यकं गुद्धं ताव्यं माजिकसभ्यकम्। हिरएयं हरितालञ्च कर्षमेकं प्रथक् प्रथक् ॥ स्टतकान्तं पलंदेयं सर्व्यमेकी कर्तं शुभम्। बच्चमानौषधभाव्यं प्रत्येकं दिनसप्तकम्॥ कारवेल्ल रहेनापि दशसूल रसेन च। पर्पटस्वकषायेन काथेन त्रैफलेनच॥ गुड्चाः खरसेनापि नागवक्की रसेन च। काकमाचीरसेनैव निर्णु रख्याः खरसेनच। पुनर्नवार्द्र काम्मोभिर्भावनां परिकल्पत्र च ॥ रिक्तिकादिक्रमे चौव वटिकां कारयेद्भिषक् । पिष्पली गुड्संयुक्ता वटिका वीर्यवर्द्धिनी ॥ ज्वरम्प्टविधं इन्ति चिरका वससुद्भवस् । विविधं वारिटोषोत्यं नानादोषोद्धवन्तया॥ सततादि ज्वरं इन्तिसाध्यासाध्यमयापि वा। चयोद्भवञ्च धातुस्यं कामगोकभवं तथा॥ भूतावेश ज्वरं हन्ति ऋच-दोषभवन्तथा। अभिघात ज्वरञ्जैव अभिचार ससुद्भवम्॥ अभिन्यासं महाबोरं विषमञ्ज तिदोषजम् । शीतपूर्वे दाच्यूर्वे विषमं शीतलं ज्वरम्॥ प्रखेपकज्वरं घोरं अर्द्धनारी खरंतथा। सी इञ्चरं तथाका गंचा तर्धक विपर्ययम्॥ पार्ष्ड रोगान गणान सर्वान अग्निमान्दंत्र महागदम्। एतान् सर्वान् निहन्याशु पचार्द्धनात्मसं गयः ॥ पाल्यचं । तक्रमहितं भोजयेद्विजसं युतम्। ककारपूर्व्वकं सर्व्यं वर्ज्यनीयं विशेषतः ॥ भैयनं वर्ज्ययेत्तावत् यावन्न वलवान् भवेत्। सर्व्य ज्वर भैषज्रारतावनी। इरं खेष्ठ मनुपानं प्रकल्पयेत्॥

each two tolás, prepared iron eight tolás, mix them together, and soak the mixture for seven days, in each of the following fluids, viz, fresh juice of the leaves of Momordica Charantia (káravella), decoction of dasamula or ten roots (see Hedysarum Gangeticum), decoction of parpata (Hedyotis biflora), and of the three myrobalans, fresh juice of guruchi, (Tinospora cordifolia), of betel leaves, of kákamáchi (Solanum nigrum), of nirgundi, (Vitex Negundo), of punarnavá (Boerhaavia diffusa) and of ginger. Divide the mass into two-grain pills, and administer with long pepper and treacle. The dose of the medicine may be gradually increased. It is used in all sorts of intermittent fevers, in emaciation, wasting, hectic fever, enlarged spleen, anæmia, loss of appetite etc. A light diet consisting of fine rice and poultry meat should be adopted during the use of this medicine, and all undigestible food should be avoided.

Chandanádya lauha.¹ Take of red sandal wood, Pavonia odorata (bálá), Cissampelas hernandifolia (páthá), Andropogon muricatus (usir), long pepper, chebulic myrobalan, emblic myrobalan, ginger, Nymphæa cyanea (nilotpala), Chavica officinarum (chai), Plumbago Zeylanica, (chitraka), and baberung seeds, each one part, prepared iron twelve parts, rub them all together. Dose about ten grains to be taken with the fresh juice of Tinosphora cordifolia (guruchi) and Hedyotis biflora (parpati). This medicine is said to cure all sorts of chronic intermittent fever and fever with enlarged spleen.

Vishamajvarántaka lauha.² This is another compound metallic preparation containing iron and much used in chronic fever. To

^{1.} चन्द्नाद्य कौ इम्। रक्त चन्द्रन हो वेर पाठो शीरकणाशिवा। नागरी तृप क धाली शिल्लिमदेन समन्वतः। कौ इं नि इन्ति विविधान् समलान् विषमञ्चरान्।। रसेन्द्र सारसंग्रहः।

IRON, 49

prepare it, take of mercury obtained by sublimation of cinnabar, and sulphur, each one tolá. Rub them together and melt over the fire in an iron ladle as in the preparation called Rasaparpati, described under mercury. Then take of prepared gold, one quarter of a tolá, prepared iron, copper, and talc, two tolás each, prepared tin, red ochre, and corals, half a tolá each, roasted pearls, conchshell and bi-valve shell, each a quarter of a tola. Beat all these ingredients together into a mass with the aid of water. Inclose the mass within bi-valve shells, cover the shells with a layer of clay and roast them lightly in cow-dung fire. This medicine is given in doses of four grains with the addition of long pepper, rock salt and assafætida, each four grains, and a little honey. It is taken once daily in the morning and is said to be useful in chronic fever, spleen and liver diseases etc.

Several preparations of iron are used in piles, such as the Mána suranádya lauha, Arsàri lauha, Agnimukha lauha etc. The first mentioned compound is prepared as follows.

Mána suranádya lauha.1 Take of the root-stocks of Colocasia Indica (mána) and Amorphophallus campanulatus (surana), of the roots of Ipomæa Turpethum (trivrit) and Baliospermum montanum (danti), marking nuts, the three myrobalans, black pepper, long pepper, ginger, seeds of Embelia Ribes (baberung), root of Plumbago Zeylanica (chitraka) and the tubers of Cyperus rotundus (mustaka), equal parts, prepared iron in quantity equal to all the above ingredients. Powder and mix. Dose about a scruple. This medicine is said to be useful in piles with constipation.

Lauhásava.2 Take of powdered iron, of the three myrobalans,

^{1.} मानन्त्रणाद्यजौ इम् । माणन्त्रणभञ्चातिवहह्नी समन्तिम् । तिकतय-समायुक्तमयोदुर्नामनाधनम् ॥ भैवज्यरत्वावजी

^{2.} चौहासवम्। चौह वूर्णे तिकरुकं तिफलाञ्च यमानिकाम्। विड्कं चित्रकं सक्तं चतः प्रविमतं प्रथम। चूर्णीकत्य ततः चौदं चतः ष्रिप चं चिपेत्। दद्यात् गुड़तवां तत्र जन्दोणद्यं तथा। घतभाग्छे विनिच्चिय निद्ध्या-न्यासमात्रकम्। चौहासविमदं मर्त्यः पिवेद्दिक्तकरं परम्। पाग्छु ख्वयथुगुन्यानि जठराग्यर्थसां रूजम्। जुड़िश्लीहामयं कग्डु कास श्वासं भगन्द्रम्। खरोचकञ्च यह्नभी हृद्दोगञ्च विनाध्येत्॥ श्राह्मभरः।

ginger, long pepper and black pepper, ajwain, baberung seeds, plumbago root, and tubers of Cyperus rotundus (mustaka), each thirty-two tolas, honey eight seers, treacle twelve and a half seers, water one hundred and twenty-eight seers. Powder the solid ingredients and steep them in the honey and water in an earthen jar smeared with ghee, for a month, or till complete fermentation takes place. This iron-wine is said to be tonic and stomachic, and useful in anæmia, spleen, anasarca, ascites, enlargements of the abdominal viscera, piles etc.

A'malakádya lauha.¹ Iron enters into the composition of several medicines for hæmorrhagic diseases, such as the Khandakádya lauha, Sudhánidhi rasa, A'malakádya lauha etc. We will here transcribe the mode of preparing the last which is the simplest and shortest. Take of emblic myrobalan and long pepper, each one part, sugar two parts, prepared iron four parts, powder and mix them together. Dose six to twelve grains in hæmoptysis, hæmaturia etc., with suitable adjuncts.

Guda mandura.² A preparation nearly similar to the above and called Guda mandura is used in dyspepsia. It is composed of old treacle, emblic and chebulic myrobalans one part each, and iron rust three parts. These are rubbed together with honey and ghee, and made into boluses about a drachm each. One of these is taken in divided doses before, along with, and after meals, in dyspepsia with pain after digestion.

Vidyádharábhra.³ Take of baberung seeds, tubers of Cyperus rotundus (mustaka), the three myrobalans, gulancha, root of

Baliospermum montanum (danti), of Ipomæa Turpethum (trivrit), of Plumbago Zeylanica (chitraka), ginger, long pepper and black pepper, each two tolás, prepared iron thirty-two tolás, old iron rust thirty-two tolás, prepared talc eight tolás, purified mercury one tolá and a half, sulphur two tolás. Rub together the sulphur and mercury, then mix them with the other ingredients, add sufficient ghee and honey, and rub them together for twelve hours. Preserve the confection in an earthen pot smeared with ghee. Dose from ten to thirty grains with milk or cold water. This medicine is used in chronic dyspepsia, especially in that form of the disease in which the pain comes on after digestion is completed, and in chronic fever, diarrhæa, phithisis etc.

Naváyasa lauha.1 In anæmia iron is much used in a variety of forms. The following compound powder called Naváyasa lauha is a popular and well known medicine. To prepare it take of ginger, long pepper, black pepper, the three myrobalans, baberung seeds, tubers of Cyperus rotundus (mustaka) and plumbago root, each one part, prepared iron nine parts, powder the ingredients and mix. Dose four grains, gradually increased to eighteen grains, to be taken with honey and ghee. This medicine is used in anæmia, jaundice, piles, heart disease etc. It is given on the first day in four-grain dose. Every second day the dose is increased

यदायमनानि शिराटिकायाः। कणाभ्य न प्रश्च पर्वा विशु द्विस् न्द्रिकस्य स्व स्व मितीव मृतात्। पारोनकर्षं स्वरमेन खन्ने शिवातने मन्युमनीदनस्य। विशोय पसादितगुद्धगन्धपाषाणा न पर्वे पिन क्यितेन। युक्तप्रा ततः पूर्वे र- जां कि दन्त्वा मिर्पर्भ प्रांपरिम ह्रिय यतात्। निधापयेत् स्विग्धविगु द्व भाग्छे ततः प्रयोज्यास्य रमोत्तमस्य। प्राङ्माषकोद्दावय वात्रयो वा गवां पयो वा शिविरं जन्नं वा। विवदयं योगवरः प्रभूतकानप्रन ष्टान न दीपनेषु। योगेषु हन्यात् परिनामस्यनं स्त्रवं योगवरः प्रभूतकानप्रन ष्टान न दीपनेषु। योगेषु हन्यात् परिनामस्यनं स्त्रवं त्रयाद्व इत्व त्याद्व इत्व त्याद्व हन्त्व त्याद्व हित्रवित्तक्षण्यः। न मन्ति ते यानि निहन्ति रोगान् योगोत्तमः मध्यगुप्तिस्त्व । न मन्ति ते यानि निहन्ति रोगान् योगोत्तमः मध्यगुप्तिस्त्व । न मन्ति ते यानि निहन्ति रोगान् योगोत्तमः मध्यगुप्तिस्त्व । न मन्ति ते यानि निहन्ति रोगान् योगोत्तमः मध्यगुप्तिस्त्व ।

by two grains till the maximum quantity is reached. The above preparation with the addition of one part of the watery extract of gulancha is called Guduchyádi lauha, and is given in burning of hands and feet and in diseases supposed to be caused by deranged air.

Mahásvásári lauha and Pippuládi lauha² are the two forms in which iron is used in asthma. They are similar in composition. The former is thus prepared. Take of prepared iron four tolás, prepared talc one tolá, honey and sugar four tolás each, the three myrobalans, liquorice root, raisins, long pepper, kernel of jujube fruits, bamboo-manna, tálisapatri (leaves of Pinus Webbiana), baberung seeds, cardamoms, root of Aplotaxis auriculata (kushtha), and flowers of Mesua ferrea (nágakesara), each one tolá, powder and rub them together in an iron mortar. Dose about one scruple, to be taken with honey two or three times a day.

In enlarged spleen Rohitaka lanha is the favourite form in which iron is used. It will be described under Rohitaka (Amoora Rohitaka). In enlarged liver the following called Yakridari lanha³ is used. Take of prepared iron, tale and copper, each four tolás, root of Citrus Bergamia (limpáka) eight tolás, burnt deer-skin eight tolás,

^{1.} गुड्रच्यादिखौ हम्। गुड्रचीसारसंयुक्तं तिकत्यमयो रजः। वातरक्तं विह्नत्यागु सम्बनातहरं परम्॥ रसेन्द्रसारसंग्रहः।

rub them together with water and prepare a pill-mass. Dose grains nine to eighteen in enlarged liver, spleen, jaundice etc.

In anasarca, iron is given in combination with carbonate of potash, as in the following called *Tryushanádi lauha*. Take of yavakshára (impure carbonate of potash), ginger, long pepper and black pepper, one part each, iron four parts. Make into six-grain pills with water.

In erysipelas, carbuncles and boils the following called Kálágnirudra rasa² is recommended. Take of mercury, sulphur, prepared tale, iron, iron rust, and iron pyrites, each one part, rub them together with water, and roast the mixture within a covered crucible; when cool add to it one-tenth part of its weight of aconite, mix intimately, and divide the mass into twenty-two grain pills.

In urinary diseases the following, called Meha mudgara rasa,3 is used. Take of rusot, black salt, wood of Berberis Asiatica (dáruharidrá), root of Ægle Marmelos (bilva), Tribulus terrestris (gokshura), pomegranate seeds, chiretta, long pepper-root, long pepper, black pepper, ginger, the three myrobalans and root of Ipomæa Turpethum (trivrit), each one tolá, prepared iron fifteen tolás, bdellium eight tolás, mix them together and beat into a uniform mass with ghee. Dose twenty-two grains with water or goat's milk. This medicine is said to be useful in gonorrhæa, strangury, chronic fever, anæmia, jaundice etc.

रसेन्द्रशारसंयहः।

Vrihat Somanátha rasa. 1 Take of mercury obtained by subliming cinnabar and purified with the juice of Erythrina Indica (páribhadra), and of sulphur, rubbed with the juice of Salvinia cucullata (Leandá) each one part, prepared iron four parts, prepared talc, tin, silver, kharpara or calamine, iron pyrites, and gold, each half a part. Rub them together with, and soak in the juice of Aloe Indica (ghritakumári) and Hydrocotyle Asiatica (mandukaparni) and divide into four-grain pills. They are administered with honey in diabetes and other urinary diseases, female complaints etc. A preparation similar to the above in composition, and called Somesvara rasa is given in leucorrhea and other female complaints. Besides the preparations mentioned above numerous other combinations of mercury, iron and talc with the addition of gold, silver, copper etc, in varying proportions and combinations, are described under different names. In fact the three first mentioned drugs constitute the basis of the great majority of the pills used by Kavirájas.

Iron forms an ingredient of hair dyes. The following is an illustration. Take of powdered iron two tolás, mangoe stones five tolás, chebulic and emblic myrobalans two tolás each, belleric myrobalan one tolá, rub them together with water in an iron vessel and steep for one night. This paste is applied to grey hairs for turning them into black.²

SULPHATE OF IRON.

Sans. कामीम Kásisa.

NATIVE sulphate of iron is indigenous to India, and has been used in medicine from a very ancient age. Two sorts of sulphate of iron are mentioned, namely, Dhátukásis or green variety and Phushpa kásis or yellowish variety. The latter is evidently sulphate of iron, covered with the basic sulphate of the sesquioxide from absorption of oxygen. It would seem that the ancient Hindus did not know sulphate of iron, as an iron compound. It is neither described as a tonic nor used in combination with iron like iron pyrites and iron rust. It is seldom used internally. I have met with only one prescription by Chakradatta, who recommends a linctus composed of sulphate of iron and pulp of wood apple, in hiccup.1

Externally, it is used in skin diseases along with other medicines. Thus take of sulphate of iron, gall-stone of cows (gorochaná). rusot and orpiment, equal parts and beat into to a paste with kánjika. It is useful in intertrigo, pruritis etc.²

Kásisádyataila.³ Take of sesamum oil four seers, water sixteen seers, sulphate of iron, wood of Withania somnifera (asvagandhá), bark of Symplocos racemosa (lodhra), root of Pothos officinalis (gajapippali) each sixteen tolás. Beat the solid ingredients into a paste and boil it with the oil and water in the usual way. This oil is recommended to be applied to the genitals and the breasts with the view of strengthening these parts.

IRON PYRITES.

Sans. खर्णमाचित्र Svarnamákshika, तारमाचित्र Táramákshika.

IRON pyrites is met with in many parts of India, and has been used in medicine from a very remote period. It occurs in two forms, namely, in dark yellow nodules with a golden lustre, and in silvery radiated crystals. The former is called Svarnamákshika and the latter Táramákshika. The ancients supposed that they contained gold and silver respectively, in combination with other ingredients, and possessed in part the properties of those precious metals.* Chemically iron pyrites consists of bisulphide of iron. It is purified by being boiled in lemon juice with one-third of its weight of rocksalt in an iron vessel, till the pot turns red hot. It is reduced to powder by being rubbed with oil or goat's urine and then roasted in a closed crucible. Iron pyrites thus prepared has a sweetish bitter taste. It is considered as tonic, alterative and useful in anæmia, urinary diseases, ascites, anasarca, prurigo, eye diseases etc. As an alterative tonic it is generally used in combination with other medicines of its class, such as iron, tale, mercury etc. following is an example. Take of prepared iron, sesamum seeds, long pepper, black pepper and ginger, each one part, iron pyrites five parts. Beat into a mass with honey. Dose about half a drachm in advanced anæmia.1

In diseases of the pregnant state the following called *Garbha-vinoda rasa*² is much used, as an alterative tonic. Take of iron pyrites and cinnabar, each four tolás, ginger, long pepper and black pepper, each three tolás, cloves and mace, each six tolás, beat them

GOLD. 57

together with water and divide into pills about four grains each. One pill to be taken twice daily.

GOLD.

Sans. सुवर्ष, Suvarna.

GOLD enters into the composition of a large number of medicines for various diseases. Pure leaf-gold is used. It should be free from admixture of copper and silver, of a red colour when exposed to heat, and of saffron colour when rubbed on touchstone. It is purified by heating its leaves and cooling them alternately with kánjika, oil, cow's urine, butter-milk and a decoction of horsegram. Gold is reduced to powder by being rubbed with mercury and exposed to heat in a covered crucible with the addition of sulphur. Two parts of mercury and one of leaf-gold are rubbed together into a mass with lemon juice and placed in a crucible with three parts of sulphur. The crucible is then covered and exposed to heat. This process of mixing the gold with mercury and exposing to heat is repeated fourteen times, when the gold completely loses its metallic character. In books it is stated that the gold should be rubbed with mercury only the first time, and that in roasting it afterwards sulphur alone should be placed in the crucible with the gold, but Kavirája Binod Lál Sen tells me that he reduces gold to powder by mixing it with mercury every time it is roasted, and that he repeats the process till the gold is reduced to a dark brown impalpable powder. This powder of gold appears to undergo little change from its metallic state, for on being rubbed on an agate mortar it produces a brilliant yellow stain like that of massive gold, when it is rubbed on touchstone for ascertaining its purity.

Gold thus prepared for medicinal use is considered a valuable tonic and alterative. It is said to increase strength and beauty, to improve the intellect and memory, to clear the voice and to increase the sexual powers. It is used in fever, consumption, insanity, diseases of the nervous system and urinary organs, impotence, etc. Dose, one to two grains.

Jayamangala rasa. Take of mercury obtained by sublimation, of cinnabar, sulphur, borax, prepared copper, tin and iron pyrites, rock-salt, and black pepper, prepared iron and silver, each one part, prepared gold two parts, powder them well, mix and soak the mixture three times respectively in the juice of datura leaves, and leaves of Nyctanthes Arbor-tristis (sepháliká), in the decoction of the ten roots, called dasamula, and of chiretta. Divide the mass into four-grain pills. They are taken with cumin-seed powder and honey. This medicine is used in old chronic fevers of all sorts and is said to be a powerful tonic and alterative, that may be administered with suitable adjuncts in many diseases.

Mrigánka rasa.² Take of mercury one part, prepared gold one part, sulphur and pearls each two parts, borax one-fourth part, rub them together and beat into a ball with kánjika. This is dried, enclosed in an earthen crucible and exposed to heat within a pot of rock-salt in the manner of a hot sand-bath for twelve hours. When cool the ball is taken out from the crucible and reduced to powder. It is administered in doses of one to four grains with about a scruple of black pepper in phthisis. Two other preparations used in this disease, and called Pottali hemagarbha rasa, and Ratnagarbha pottali rasa, respectively, are similar in composition to the Mrigánka rasa. They contain mercury, sulphur, gold, pearls, borax etc, in varying proportions.

1 जयमङ्ग जरसः। हिङ्ग जसमारं स्ततं गन्धकं टङ्ग खंतया। ताम्नं वङ्गं माणि-कञ्च सैन्ध्यं मिर्चं तथा। सञ्चं समं समाहृत्य दिगुणं खणेमस्कर्मः। तद्दें कान्त जौ हञ्च रूथमसापि तत्सममः। एतत्सव्यं विन्यर्थाय भावयेत् कनकद्रवैः। भोफा जिद्व जैद्यापि दशमू जरसेन च। किरातितक्तकायैः विवारं भावयेत् सुधीः। भावयित्वा ततः कार्यागुञ्ज दयमिता वटीं। अनुपानं प्रयोक्तयं जीरक-मधुसंयुतम्। जी याज्वरं महावीरं चिरकाल ससुद्वामः। ज्वरमष्टविधं हन्ति साध्यासाध्यमयापिवा। प्रयक्त दोषां स्विविधान् समस्तान् विषमज्वरान्।

2 स्टगाङ्करतः । स्टाद्रसेन समं हे भं मौक्तिकं दिग्रणं भवेत् । गन्यकस्तु सम-स्तेन रसपादस्तु टङ्गणः ॥ सर्वं तहो खकं काला काञ्चिकेन विघोधयेत् । भाग्छे खवणपूर्णे च पवेद्यामचतुष्टयम् ॥ स्टगाङ्क सङ्गको न्तेयं रोगराज निकन्तनः ॥ रसेन्द्रसारसंग्रहः । Svarna parpati. Take of mercury eight tolas, gold one tola, rub them together, then add sulphur eight tolas and mix. Melt the mixture over the fire in an iron ladle smeared with ghee, and press the melted fluid between cow-dung balls enclosed in plantain-leaves in the manner described under Rasa parpati, so as to make thin round disks of it. This medicine is used like Rasa parpati in chronic diarrhæa, and anasarca. Milk diet is enjoined, and water and salt are prohibited. Dose grains two, gradually increased to grains ten in the course of twenty-one days, to be again gradually reduced to the original dose of two grains in another three weeks. Another preparation of the sort called Vijayaparpati contains diamond, pearls, silver, copper, and tale, in addition to gold, sulphur and mercury. It is used in the same cases as the Svarnaparpati above Jescribed.

Gold is much used as an alterative tonic. Prepared gold in doses of two grains daily with the addition of honey, ghee and emblic myrobalan, or root of Acorus Calamus (vacha) is recommend ded to be taken for a lengthened period.² It is also given to infants under an impression that it will impart strength and beauty to their frames. The following composition is recommended for them. Take of powdered gold, root of Acorus Calamus (vacha) and Aplotaxis auriculata (kushtha), chebulic myrobalans, and leaves of Herpestes Monniera (brimhi) equal parts, powder and mix. Dose two grains with honey and ghee. It is recommended to be given to feeble infants a few days after birth.

The principal alterative tonic of the Hindu Materia Medica is the preparation popularly called *Makaradhvaja*. To prepare it, take

1 खर्णपर्पटी। रशेत्तमं पर्जं शुद्धं हेमतोस्त्रमं युत्रम्। शिस्तायां मह्येत् तावत् यावदेकत्वमागतम्॥ गत्वकत्य पर्जञ्जेकमयः पात्रे ततो हृ । मह्येहह-पाणिश्वां यावत् कळानतां त्रजोत्॥ ततः परं विधानन्नः पर्पटीं कारयेत्-सुधीः। रिक्तिकादिक्रमेशैव योजयेदनुपानतः। यहणीं विविधां हन्ति हत्या सर्व्य ज्वरापहा॥

2 मध्वाम नक्त्र पञ्च स्वर्णञ्च ति तत्त्रयम्। प्राध्यारिष्ठ ग्रही तोऽपि सञ्चते प्राणमं ग्रयात्। वचाष्टतं सुवर्णञ्च मधुना सह सं निहेत्। सम्बत्धरं प्रयुञ्जानः सन्दे हभञ्चनी।

of leaf-gold one tolá, mercury eight tolás, beat into a mass, then add sulphur sixteen tolás, and rub together till the mass becomes black. Rub this mass repeatedly with the juice of the red cotton flower and of Aloe Indica, and dry. Now take a bottle with a flat bottom, wrap it with layers of cloth and clay to strengthen it, and dry. Place the mixture of gold, mercury and sulphur at the bottom of the bottle, insert it in a sand-bath up to its neck and cover the mouth lightly with a piece of chalk. Apply heat gently at first. When the process of sublimation commences the heat should be increased, and the chalk-stopper removed. The sulphur now burns with its characteristic blue flame at the mouth of the bottle and a red sublimate collects below its neck. The narrow neck of the bottle is apt to be closed with sulphureous deposits and when there is this tendency, it should be cleared with an iron rod. The sublimation is over in the course of about nine hours. When done the bottle is broken, and the sublimate extracted from its neck in the shape of shining dark red scales. In this process the sulphur and mercury are sublimed in the form of red sulphide, and the gold remains at the bottom of the bottle. The latter may be used again in the preparation of Makaradhvaja or converted into powdered gold. Makaradhvaja is administered in doses of one grain daily with honey or other suitable adjuncts in nervous debility, weakness of brain from excessive mental labour, habitual costiveness, general debility, female complaints after delivery, spermatorrhoea etc.

Chandrodaya makaradhvaja. 1 When Makaradhvaja is adminis-

SILVER. 61

tered as an aphrodisiac, it is usual to mix it with some stimulant drugs, the resulting preparation being called Chandrodaya makaradhvaja. Thus take of Makaradhvaja, one part, camphor, nutmegs, black pepper, and cloves, each four parts musk one-sixteenth part, mix together and make into pills about ten grains each. These pills are enclosed or wrapped in betle leaves and chewed. Along with this medicine a generous diet consisting of meat, ghee, milk, pulses, etc, should be taken. It is used in nervous debility, impotence, premature old age etc.* A preparation similar in appearance to Makaradhvaja and called Ashtavaktra rasa, is sublimed from a mixture of mercury, sulphur, gold, silver, lead, copper, zinc and tin in equal parts. It is used as a nervine tonic in general debility.

SILVER.

Sans. रूप, Rupya. तार, Tára.

Pure silver, according to Sanskrit writers, should be soft, white, brilliant and ductile. It should not be discoloured by fire. Impure silver, that is, silver mixed with other metals, is discoloured by fire, of a reddish or yellowish colour, and not ductile. Silver is purified in the same way as gold. It is converted into a black oxide by thin silver leaves being mixed with twice their weight of cinnabar, and heated in the subliming apparatus, called *Urddhapátana yantra*. This process is repeated fourteen times. The resulting compound is a fine greyish black powder with minute shining white particles intermixed with it. On chemical analysis it is found to consist of the black oxide of silver. The properties of silver thus prepared are said to be allied to those of gold but somewhat inferior. It is generally used in combination with other metals, such as gold, iron,

^{*} Makaradhvaja is regarded as a preparation of gold, which is supposed to be the active principle of the medicine. The gold used in its preparation however remains below, and the mercury and sulphur only are sublimed in the form of red sulphide. as in the preparation of mercury called Rasasindura. Properly speaking, therefore, it is but a preparation of mercury, although the gold may possibly exercise some catalytic influence during the process of sublimation. some physicians use the preparation called Sadgunabalijarita rasasindura (see page 36) under the name of Makaradhvaja.

etc. Dose, grains one to two. The following is an example of a complex prescription containing silver.

Vrihat váta gajánkusa.¹ Take of mercury, prepared tale; iron, gold, copper and silver, orpiment, sulphur, ginger, coriander, root of Sida cordifolia (balá), bark of Myrica sapida (katphala), Rhus succedanea (sringi), aconite, long pepper, black pepper, and borax, each one part, chebulic myrobalans, two parts, powder, mix and rub with the juice of Sphæranthus mollis (mundi) and Vitex Negundo (nirgundi) for one day. Divide the mass into four grainpills. They are said to be useful in various nervous diseases. Silver enters into the composition of several other remedies in common use, such as the Yogarája (see silájatu), Jayamangala rasa (see gold) etc.

COPPER.

Sans. ताच, Támra. Vern. Támá.

Thin plates of copper such as can be pierced by thorns are used in medicine. They are purified by being boiled in cow's urine for three hours. Copper is reduced to powder by smearing its thin leaves with a paste of sulphur and lemon juice, beating them into a mass, and exposing to heat in a covered crucible within a sand-bath for twelve hours. The powder thus produced is rubbed with kánjika and made into a ball, which is introduced into a tuber of Amorphophallus campanulatus (ola), as in a crucible and roasted. This last process is said to render the copper innocuous and prevent it from causing purging and vomiting when taken internally.

Copper thus prepared is a dark coloured powder, somewhat gritty to the feel. On chemical analysis it is found to consist of sulphide

COPPER. 63

of copper. It is described as an alterative, emetic and purgative, and is used in poisoning, dyspepsia, fever, enlarged liver and spleen, anæmia, skin diseases, diarrhæa etc. Dose, as an alterative, grains two to four. In poisoning prepared copper is given in doses of about twenty-four grains with sugar or honey to cause vomiting.

Copper enters into the composition of several medicines for ague, remittent fever, enlarged spleen etc. The following are a few illustrations.

Sitabhanji rasa.² Take of orpiment, mercury, sulphur and realgar, two, one, half and quarter parts, respectively, rub them together into a thin paste with the juice of Momordica Charantia (káravella). Apply this paste on copper plates equal in weight to the other ingredients, enclose the plates in a covered crucible, and roast in a sand-bath over a strong fire for twelve hours. When cool extract the copper plates from the crucible and powder them. Dose, four grains with four black peppers enclosed in a betel leaf. This packet should be chewed. It is given in intermittent fever with shivering fits, followed by burning and heat of skin. A preparation very similar to the above in composition is called Pliha panchánana rasa, and used in enlarged spleen.

Svachchhanda bhairava rasa.³ Take of prepared copper and aconite equal parts, rub together with the juice of datura leaves and make into one-grain pills. They are given with ginger juice, sugar and rock salt in fevers complicated with cerebral symptoms.

¹ चौद्र नीइं तासर जोवसनं गरदोष सुत्। चकः।

Mahámritunjaya lauha.1 Take of mercury, sulphur, talc, orpiment and realgar, each one part, iron two parts, copper four parts, yavakshára and sarjikákshára (impure carbonates of potash and soda), borax, black salt, burnt couries, and conch-shells, plumbago-root, assafætida, root of Picrorrhiza Kurroa (katuki), Amoora rohitaka (rohitaka,) and Ipomæa Turpethum (trivrit); tamarind pulp, colocynth root, root bark of Anogeissus latifolius (dhava), root of Alangium decapetalum (ankota), Achyranthes aspera (apámárga), ashes of the spikes of the palm-tree, turmeric and wood of Berberis Asiatica (dáruharidrá), croton seeds, sulphate of copper, rusot and Oxalis corniculata (amlaloniká), all in equal parts, with the exception of rohitaka bark, which should be two parts. Powder the ingredients, mix, soak the mixture in the fresh juice of ginger and gulancha and add to it thirty-two tolás of honey. Make into six grain pills with honey. One pill is given every morning in enlarged liver, spleen disease, ascites etc.

In enlargements of the abdominal viscera, designated by the term gulma, copper is used in a variety of forms. Thus, prepared copper in doses of two grains rubbed with ginger juice and enclosed in betel leaf may be given, or the following composition may be used.²

1 महास्टत्युञ्जयलौहम् । ग्रुडम् तं समं गन्धं जारिताम्बं समं तथा।

2 को वर्ज जारित ताम इट्ड्र वेरर में सह। दातव्य पर्ण खर्छ न सर्वेगुक्य निवारणम्॥ रसेन्द्रसारसं यहः। Gulma kálánana rasa.¹ Take of mercury, sulphur, copper, orpiment, borax, and yavakshára (impure carbonate of potash), each two tolás, tubers of Cyperus rotundus (mustaka), black pepper, ginger, long pepper, fruit of Pothos officinalis (gajapippuli), chebulic myrobalans, Acorus Calamus (vacha) and Aplotaxis auriculata (kushtha), each one tolá. Powder them all, mix and soak the mixture in the juice of Hedyotis biflora (parparti), Heliophytum Indicum (hastisundi), Achyranthes aspera (apámarga) and Trichosanthes dioica (patala) respectively and dry. This medicine is given in the form of a powder in doses of eight grains with the decoction of chebulic myrobalans.

Several preparations of copper are recommended for use in asthma and heart disease, as for example, Suryávarta rasa, Hridayár nava rasa etc.

Suryávarta rasa.² This preparation of copper is recommended for use in asthma by Sárangadhara and other writers of note. It is thus prepared. One part of mercury and one of sulphur are rubbed together with the juice of Aloe Indica for six hours. Two parts of copper leaves are pasted with the above mixture, and roasted within a closed crucible in a sand-bath for twelve hours. When cool the copper leaves are taken out from the crucible and powdered. Dose four grains with the addition of honey and the juice of Adhatoda Vasica (vásaka).

Hridayárnava rasa. Take of purified mercury and salphur, each one part, prepared copper two parts, rub them together for twelve hours with the decoction of the three myrobalans, and with the fresh juice of Solanum nigrum (kákamáchi). Make into pills about four grains each. These pills are administered with a decoction of the fruits of Solanum nigrum and the three myrobalans, prepared with two tolás, in all of the drugs and thirty-two tolás of water, which is boiled down to one-eighth, or four tolás. They are said to be useful in heart disease.

Támresvara.² Take of prepared copper, mercury, borax, and iron, sulphur, and long pepper, equal parts, soak in the decoction of the leaves, bark, fruit, root, and flowers of Azadirachta Indica (nimba), of the pulp of Cassia fistula and of the three myrobalans. Dose four grains, in skin diseases of various sorts. During the administration of this medicine a cooling regimen should be observed-

SULPHATE OF COPPER.

Sans. तस, Tuttha. Vern. Tutia.

SULPHATE of copper was known in India from a very remote period. It is prepared by roasting copper pyrites, dissolving the roasted mass in water and evaporating the solution to obtain crystals of the sulphate. It was known as a salt of

It is then soaked for three days in whey, and dried. Sulphate of copper thus prepared is said not to produce vomiting when taken internally. Dose, one to two grains.

Sulphate of copper dissolved in hot water is administered in insensibility from poisoning to excite vomiting. It enters into the composition of some medicines for remittent fever, such as the Jvar-ánkusa mentioned in Bhávaprákása, but arsenic is the active ingredient in these preparations. In quartan fever the following, called Cháturthakàri, is recommended by many writers. Take of orpiment, realgar, sulphate of copper, burnt conch-shell and sulphur, equal parts, rub them together with the juice of Aloe Indica and roast in a covered crucible. When cool extract the powder and make into four-grain pills with the juice of Aloe Indica. They are administered with powdered black pepper and ghee. Butter-milk should be taken before these pills which relieve the fever by inducing vomiting.

Grahanikapáta rasa.² Sulphate of copper is used in chronic bowel complaints along with other medicines, as for example in the following called Grahanikapáta rasa. Take of sulphate of

^{*}त्रत्यं वित्यक्तञ्चापि धिखियोवं मयुरकम्। त्रत्यनाच्चोप धात हि किञ्चि-चा भेषा तङ्गवेत्॥ किञ्चनाच्च गुणनकाहच्चमाण गुणञ्च तत्। भावप्रकाशः।

भैषज्यतन्तः ।

² यहणीकपाटः। तुस्यं तानं रसं कान्तं माचिकं टक्ष्यं तथा। सपादिनिक्के प्रस्थेकं पञ्चनिक्कावराटिका। दिनिष्कं गन्धकं सर्व्वं पिद्वा जम्बीर और्द्रेयैः। सर्बु-

copper, orpiment, mercury, iron, iron pyrites and borax, each five máshás. Prepared couries two and a half tolás and sulphur one tolá. Rub them all together with lemon juice and roast the mass lightly. This medicine is given in chronic bowel complaints, consumption etc.

Garbhavilása rasa.¹ Sulphate of copper enters into the composition of some medicines for diseases of the pregnant and puerperal state, such as, the Sutikàvinoda or Garbhavilása rasa. To prepare it take of mercury, sulphur and sulphate of copper, each one part, rub them together with lemon juice for three days. Then take of cumin seeds, kálájirá, long pepper, black pepper and ginger each one part, mix and make into eight-grain pills. They are used in bowel complaints and indigestion during the puerperal and pregnant state.

Sulphate of copper is applied to sinuses and fistula-in-ano with the object of stimulating and healing them. It is added to ointments for foul ulcers.² A solution of sulphate of copper is poured into the eyes in opacity of the cornea.³ The following compound powder is applied to chances. Take of mercury, sulphur, sulphate of copper, cinnabar, and sulphate of iron, equal parts, powder and mix. This composition may be used in the form of powder or paste.

TIN.

Sans. 45, Vanga. Vern. Ráng.

TIN, though not indigenous to India, has been known from a very ancient period and is mentioned by Susruta. Dr. Royle

भाग करीषेचा प्रटितं भक्ताशीभनम् । योजितं यहणीगुल्याच्यक्षप्रमेहजित्।

1 गर्भविवासरसः। रस गन्धकतृत्यञ्च त्यः जन्बीरमिहितम्। हिजीरकं तिक-दुना देयं गुञ्जाचतुष्यम्। गर्भिण्याः सूनविष्टमा ज्वराजीर्णेषु केवलम्॥ रसेन्द्रसारसंग्रहः

2 व्रण्विशोधने । कुष्ठ तिश्रत्ति बादन्तीमागध्यः मैन्धवं मधु । रजनी तिकाला तुर्खं च्रितं व्रण्विशोधनम् ॥ चक्रः

3 चचुःरोगे । तस्यकं त्रारिणायुक्तं गुक्तं इन्यचिपूरणात्॥ चकः।

TIN. 69

observed "But the Hindoos like the Egyptians have employed tin for various purposes from very ancient times. And though there is no proof of its being found in the present day in the peninsula of India yet it is abundant on the opposite coast of the Bay of Bengal, as in Burma, Tenasserim, Junkseylon and Malacca. There must in very ancient times have been a trade between India and these places."

Tin is purified by melting it over the fire and pouring the melted fluid into the milky juice of Calotropis gigantea (arka). It is prepared for medicinal use by melting it in an iron cup, adding to it one-fourth part of its weight of yavakshára (impure carbonate of potash) and powdered tamarind shells, and agitating with an iron rod till the mass is reduced to a fine powder. It is then washed in cold water and dried over a gentle fire. The resulting product is a greyish white powder consisting chemically of oxide of tin with some impurities. It is chiefly used in urinary disorders in a variety of forms. Thus the simple powder may be given in four-grain dose every morning with honey, or one of the following preparations may be used.

Trinetra rasa. Take of prepared tin, mercury and sulphur equal parts, rub them together in an iron mortar and soak seven times respectively in the juice of Cynodon dactylon (durvá) and the decoctions of liquorice root, gum of Bombax Malabaricum (Mocharasa), and Tribulus terrestris (gokshura). Then roast in a covered crucible, again soak in the above mentioned fluid medicines and make into four-grain pills. This medicine is given with a decoction in milk of the above named vegetable drugs, in painful micturition.

Vangesvara rasa.2 Take of the preparation of mercury called

¹ तिनेतरसः। वङ्गं मृतं गन्धकं भावियता लौ हपात्रे मह्येदे अवसम्। दूर्वायष्टी प्रात्मलीगोत्तुरेस्तु सवामध्ये भूधरे पाचियता। तत्तह्रवैभावियता- स्वत्नं दद्याच्हीतं पायमं वच्चमाणम्। दूर्वायष्टी प्राव्मलीवल्कतुल्वेद्वं ग्धैः कुर्यात् पायमं तह्दीत। प्रातःकालेगीत पानीयपानात् मृत्रेजातेस्वात् सुस्वी- चंक्रमेण॥

रसेन्द्रसारसंग्रहः।

² बङ्गो खरः । रसभस्त्रसमायुक्तं बङ्गभस्त प्रकल्पनेत् । अख्यमाषद्यं इन्ति प्रमेहान चौद्रसंयुतम् । रसेन्द्रसारसंयहः।

Rasasindura, and of prepared tin, equal parts and mix. Dose about four grains with honey in urinary diseases and diabetes.

Vrihat Vangesvara rasa. Take of prepared tin, mercury, silver and talc, sulphur and camphor each two tolas, prepared gold and pearls, each half a tola, mix them together, soak the mixture in the juice of Eclipta prostrata (kesarájá), and make into four-grainpills. This medicine is said to cure all sorts of urinary diseases, and to act as an alterative tonic. It is given in diabetes with the juice of the ripe fruit of Ficus glomerata (udumbara).

Svarnavanga.² Take of mercury, sulphur and tin, equal parts, andrub them together, then take sal-ammoniac in quantity equal to all the above ingredients and rub together in a mortar. Introduce the mixture in a glass bottle and expose to heat in a sand-bath. The resulting powder called Svarna Vanga or golden preparation of tin has a beautiful golden lustre and flaky texture. It is given in urinary complaints in doses of five to ten grains with honey and the juice of emblic myrobalans. This preparation is the bisulphuret of tin or mosaic gold "used in the arts as a bronze powder especially for the manufacture of paper hangings." It is noticed by Pereira. The Sanscrit text for its preparation quoted below, is taken from a manuscript compilation in the possession of Kavi-

¹ हह्वझु श्वरः। वक्तभस्तरमं गन्धं रोष्यं कर्प् रमभ्जकम्। कर्षं कर्षं मानमेषां मृताङ्कि हेनमौतिकम्। केगराजरमे भीव्यं दिगुञ्जाफलमानतः। वह्नदक्तं - श्वरोनाम सोमरोगं निह्न्यनम्। बद्धमृतं बद्धविधं मृतमेहं व्यपोष्ट्रति। मृत्रातीसारकच्छञ्च चौषानां पृष्टिग्र्डनम्। खोजखेजस्करं स्त्रीषु सम्यक्षचापि वृद्यायते। बस्तव करं रूच्यं गुक्रसञ्जनकं परम्। क्षागं वा यदि वा गव्यं प्रयो वा दिधिनिस्मितं व्यनुपानं प्रयोक्तव्यं वृध्वा दोषगितं भिषक्। दद्यात् वालेच प्रौढेच सेवयेच्च रसायनम्॥ सेवच्य रत्नावली।

71

raja Benod Lal Sen. It is evidently a recent innovation if not an imitation of the European preparation.

ZINC.

ZINC.

Sans. 212, Yasada. Vern. Dastá.

Zinc is not mentioned by the older writers, such as Susruta, nor does it enter into the composition of many prescriptions. The Bhávaprakása mentions it in the chapter on metallic preparations, and directs it to be purified and reduced to powder in the same way as tin. It is said to be useful in eye diseases, urinary disorders, anæmia and asthma.

Kharpara. This mineral is mentioned in most works. enters into the composition of a number of prescriptions both for internal and external use. The article used under this name by the physicians of Upper India is a sort of calamine or zinc ore. Most of the physicians in Bengal are not acquainted with this ore, and substitute zinc for kharpara, that is, they consider kharpara as a mere synonym of zinc or yasada. They accordingly direct that kharpara should be reduced to powder by being melted over a fire and rubbed with rock salt. Zinc thus prepared is a fine yellowish grey powder consisting of carbonate of zinc mixed with chloride of sodium. In the works of the physicians of Upper India, this preparation is not described. There they use the zinc ore, which does not dissolve on the application of heat. It is simply purified by being boiled in cow's urine or soaked in lemon juice and then powdered. The Bengali physicians who substitute zinc for kharpara are evidently wrong, for the description of some of the preparations of this drug, as for example of the collyrium mentioned below, can not apply to metallic zinc.

Kharpara, as sold by Hindustani medicine vendors, occurs in greyish or greyish black porous earthy masses composed of agglutinated granules. On chemical analysis it was found to consist of carbonate and silicate of zinc with traces of other metals as iron, baryta, etc. Kharpara is described as tonic and alterative and useful

in skin diseases, fevers etc. It is also much used as a collyrium in eye diseases. Dose, grains six to twelve.

Vasanta málati rasa. Take of leaf gold one part, pearls two parts, cinnabar three parts, black pepper four parts, purified kharpara eight parts, and rub them together. Then add some butter and lemon juice and rub together till intimately mixed and no separate particles are visible. Dose two to four grains with honey and long pepper. This medicine is much used by Up-country physicians in chronic fever, secondary syphilis, chronic gonorrhœa, leucorrhœa etc.¹

A collyrium is prepared as follows. Rub some *kharpara* in a stone mortar with water, take the dissolved watery portion, rejecting any solid particles that may have subsided to the bottom. Evaporate this solution, powder the residue and soak it three times in a decoction of the three myrobalans. When dry add one tenth part of powdered camphor and mix intimately. This collyrium is said to be useful in various sorts of eye diseases.²

LEAD.

Sans. HHA, Sisaka. Vern. Sisá.

Lead is produced abundantly in India in the shape of the sulphide called galena. Galena is sold in the bazars under the name of surma, and is much used by the natives as a collyrium.

¹ सुवर्ण सुक्ता दरद मरिचं भागदृद्ध्या प्रदिष्टं खर्पराष्टी प्रथम मखिलं मह्येत् स्टच्यं न । यावत् स्त्रोहो ज्ञजित विखयं निम्बनीरेण तावत् सुझादृन्दं सध् चपलया मालतीप्राग् वयन्ता ॥ सेवितेयं हरेत्यूणं जीर्णञ्च विषमञ्चरम् । व्याधीनन्यां च कासादोत् प्रदीप्तं कुरूते उनलम् । वैद्यविनोदः ।

² खर्परवर्त्तः। शिवायां रक्तं पिष्टा सम्यगाञ्चात्य वारिणा। ग्टक्नोयात् तळावं सर्वे त्यां स्थान् मधोगतम्। शुष्कञ्च तळावं सर्वे पर्पटी सिन्नभं भवेत्। विचू ग्र्यं भावयेत् सम्यक् त्रिवेवं त्रिप्पचार्यः। कपूरस्यरज्ञस्तत्र दशमां भेन निच्चियेत्। खञ्चयेत् नयनेतेन सर्व्वदोषद्वरं हितत्। सर्व्वरोगहरं चूर्णम् चचुषः सुखकारि च॥

सार्क्षरः।

The red oxide of lead, or minium, was manufactured by the ancient Hindoos. It is known by the name of sindura, and is used by all married Hindu women as a paint for the forehead. Litharge or massicot, called murdasang in Hindustani, has no proper Sanskrit name and was unknown to the ancients. In some recent compilations it is occasionally introduced as a component of some compound preparations. Carbonate of lead, called saffedá, now common in the bazars and extensively used as a paint, is not mentioned by the ancient writers. The name saffedá is of Persian origin, and the article itself is an imported one.

Lead is purified and reduced to powder in the same way as tin. Lead thus prepared is a gritty powder of a greyish red colour. Chemically it is an impure carbonate of lead. Its properties are said to be similar to those of tin. It is seldom used internally except as a component of compound medicines containing a number of other metals. A probe made of lead is preferred for applying collyria to the eyelids.

The red oxide of lead, called sindura, is used externally in eruptive skin diseases in the form of ointment or liniment. Thus sindura and powdered black pepper mixed with butter is recommended to be applied in chronic eczema. An oil called Sindurádya taila¹ is thus prepared. Take of mustard oil one seer, water four seers, minium four tolás and cumin seeds eight tolás. Boil together in the usual way. This oil is used in eczema and other eruptive skin diseases.

GALENA.

Sans. अञ्चन, Anjana. सौविराञ्चन, Sauviránjana.

Galena or sulphide of lead is called anjana or sauviránjana in Sanskrit, and krishna surmá in Vernacular. It is called anjana, which literally means collyrium or medicine for the eyes, from the

¹ सिन्दुराद्यं तै बम् । सिन्दुराई पर्वं पिष्टा जीरकस्य फवं तथा। कटुतै बात् पचेन्यानी सद्यः पामा हरं परम्।। चक्रः॥

circumstance of its being considered the best application or cosmetic for them. The other varieties of anjana mentioned are srotonjana, pushpánjana and rasánjana.

चौदाञ्चन Sauviránjana is said to be obtained from the mountains of Sauvira, a country along the Indus, whence it derives its name. The article supplied under its vernacular name surma is the sulphide of lead ore. Surmá is usually translated as sulphide of antimony, but I have not been able to obtain a single specimen of the antimonial ore from the shops of Calcutta and of some other towns. The sulphide of antimony occurs in fine streaky, fibrous, crystalline masses of a radiated texture. The lead ore on the contrary, occurs in cubic masses destitute of rays and is tabular in its crystalline arrangement.

स्रोतोञ्चन Srotonjana is described as of white colour, and is said to be produced in the bed of the Jamuná and other rivers. It is called saffed surmá in the vernacular, and the article supplied under this name by Hindustani medicine vendors is calcareous or Iceland spar. It is used as a collyrium for the eyes, but is considered inferior to the black surmá or galena.

I have not met with any vernacular translation of this word, nor with any person who could identify or supply the drug. Wilson, in his Sanskrit-English Dictionary, translates the term as calx of brass, but I know not on what authority.

হয়ের Rasánjana is the extract of the wood of Berberis Asiatica called rasot in the vernacular. It will be noticed in its place in the Vegetable Materia Medica.

Sauviránjana or galena is chiefly used as a cosmetic for the eyes, and is supposed to strengthen these organs, improve their appearance and preserve them from disease. It enters into the composition

¹ सौवीराञ्चन' कष्णं कालनीलं सुवीरजम्। स्रोतोञ्चनं तु स्रोतोजं नदीजं यासन' वरम्। सौवीरं पाहि मधुरं च चुष्यं कफ शतजित्॥ सिध्माच्ययस्तु-च्हीतं स्रोतोञ्चन मपीट यस्॥ पुष्पाञ्चनं पुष्पकेतु रीतिजं कृ सुमाञ्चनम्। पुष्पा-ञ्चनं चारस्रष्णं का वार्म पटलाप इम्॥ सदनपातः।

of some collyria for eye diseases. Galena, heated over a fire and cooled in a decoction of the three myrobalans for seven times in succession, is rubbed with human milk and used in various eye diseases. Another collyrium prepared with lead is as follows. To one part of purified and melted lead, add an equal portion of mercury and two parts of galena, rub them all together and reduce to powder. Now add camphor, equal in weight to one-tenth part of the mass and mix intimately. This preparation is said to be useful in eye diseases. From the composition and uses of lead and galena above described it would seem that by the term surmá the Hindus meant sulphide of lead, and not sulphide of antimony as is generally supposed.

BELL METAL AND BRASS.

Bell metal, (कांस, Kánsa), as used in medicine, is an alloy of copper and tin. Brass, (विचल, Pittala) is an alloy of copper and zinc. They are sometimes used in combination with other metals, and are regarded as tonic and alterative. They are purified and reduced to powder in the same way as copper. The following is an example of a preparation containing bell metal.

Nityánanda rasa.3 Take of mercury, prepared copper, iron, bellmetal and tin, purified orpiment, sulphate of copper and calcined

¹ अग्नितप्रञ्च सौदोरं निषिञ्चेत् तिफवारसैः। सप्तदेवन्तयास्तन्यैः स्तीणां सिक्तं विचूर्णितम्। अञ्जयेद्रयनेतेन प्रत्यहञ्चचुषोहितम्। सर्वानचिविकारां स्तु इन्यादेतद्रसंभयः।। शार्ङ्घरः।

conch-shell and couries, sulphur, ginger, long pepper and black pepper, the three myrobalans, baberung seeds, the five salts, namely, rock, sun-dried sea, black, sonchál and Sambar Lake salts, Chavica officinarum(chavika), long pepper root, havusa (an aromatic substance), Acorus Calamus (vacha), Curcuma zedoaria (sati), Stephania hernandifolia (páthá), Pinus deodara, cardamoms, seeds of Argyreia speciosa (vridhya dàraka) each two tolás, rub together with the juice or decoction of chebulic myrobalans and make into ten-grain pills. They are given in hydrocele and elephantiasis of the scrotum. The remark that, when a disease has a long list of drugs for curing it, one may take it for an incurable one, is well exemplified in this medicine for elephantiasis of the scrotum.

MICA OR TALC.

Sans. 34 Abhra.

Four varieties of tale are described by Sanskrit writers, namely, white, red, yellow and black. Of these the white variety is used as a substitute for glass in making lanterns etc, and the black variety called vajrábhra is used in medicine. It is of a black colour, hard and heavy, and generally known by the name of krishnábhra or sheábhra.

Tale is purified in the following manner. It is first heated and washed in milk. The plates are then separated and soaked in the juice of Amaranthus polygamus (tandulia) and kánjika for eight days. Tale thus purified is reduced to powder by being

द्वारक्षम्। एतानि समभागानि संच्या विद्यां कुर्। इरीतकीरनं द्वा पञ्चगुञ्जामितां ग्रुभाम्। एकेकां खादयेन्ति योतकञ्च जलं पिवेत्। श्वीपदं कफवातीत्यं रक्षमां सितञ्च यत्। सदीगतं धात्यतं इन्यवस्यं न संग्रयः। अर्ज्यदं गण्डमानाञ्च स्वन्त्रद्विं चिरन्तनीम्। वातद्विं पित्तद्विं स्वेशव्विं निहन्ति च। अग्निद्विं करोत्येषवनवर्णकरः परः। सीमक्ष्णनायेन निर्मातीविश्वसम्पदे। नित्यानन्द रक्षो नाम यथोकाः स्वीपदे गदे । रसेन्द्रसारसं पष्टः।

rubbed with paddy within a thick piece of cloth, when the powdered tale passes through the pores of the cloth in fine particles and is collected for use. Tale, thus reduced to powder, is called dhányábhraka. It is prepared for medicinal use by being mixed with cow's urine and exposed to a high degree of heat within a closed crucible, repeatedly for a hundred times. Sometimes the process is said to be repeated a thousand times. When this is the case, the preparation is called sahasra putita abhra and sold at high price (eight rupees per tolá). It is considered to be of superior efficacy. Prepared tale is a powder of brick-dust colour and a saline, earthy taste. Chemically it consists of silicate of magnesia with iron in excess. It is considered tonic and aphrodisiac and is used in combination with iron in anæmia, jaundice, chronic diarrhoea and dysentery, chronic fever, enlarged spleen, urinary diseases, impotence etc. Its efficacy is said to be increased by combination with iron. Dose, grains six to twelve.

Jvaràsani rasa. Take of mercury, sulphur, rock salt, aconite and copper, one part each, prepared iron and tale, five parts each, rub together with the juice of Vitex Negundo leaves, then add one part of black pepper and make into two-grain pills. They are administered with the juice of bette leaves in chronic fever and enlarged spleen.

Agnikumára rasa.2 Take of mercury, sulphur, borax, iron,

¹ ज्वराधित रसः। रसं गत्थं सैन्ध्रत्रञ्च विषं तामृं समं समस्। सर्व वृष् सनं लौहं तत्समं गुद्धमभ्वतमः। लौहे च लौह दर्ग्डेन निर्ध्र ग्रहीस्वरसेन च। सर्द् बेद् यद्भातः पञ्चात् मरिचं सुनतु त्यक्षम्। नागवद्ध्यादलेनैव दातत्यं रिक्ता सम्भातमः। सर्व ज्वरहरः श्रोष्ठः ज्वरान् हन्ति सुदाक्षान्। कासं खासं महाधोरं विष- माख्यं ज्वरं विमन्। धातुस्यं प्रवनं दाहं ज्वर दोवं चिरोद्भवमः। यक्षद्गुल्- मोदरं स्नीह श्रवयुञ्च विनाध्येत्॥ भेषज्यरत्नावली।

aconite, ginger, long pepper, black pepper, ajowan and opium each one part, prepared tale ten parts, rub together for three hours with the decoction of *Plumbago rosea* (rakta chitraka) and make into pills of the size of black peppers. This preparation is used in chronic diarrhoea and indigestion.

Sulachanàmritábhra.¹ Take of prepared tale eight tolás, rub it with eight tolás each of the fresh juice or decoction of the following drugs, namely, pulp of Ziziphus Jujuba (kola), Chavica officinarum (chaviká), root of Andropogon muricatus (usira), pomegranate fruit, lemon juice, emblic myrobalan and Oxlais corniculata (amlalonikà), and make into pills about six grains each. This medicine is used in loss of appetite, disinclination for food, dyspepsia, vomiting, urinary diseases, anasarca and debility. It is tonic, alterative and aphrodisiac. The preparation called Kandarpa kumárábhra is very similar to the above in composition. In disorders of the urine the following called Harisankara rasa² in used. Soak some prepared tale in the juice of emblic myrobalans seven times in the course of a week and make into two-grain pills.

Arjunábhra.³ In heart disease talc is used with the juice of the arjuna bark which last is considered a specific for this complaint. Arjunbhra is prepared by soaking some prepared tale in the juice of the bark of Terminalia Arjuna, seven times, and dividing

¹ स्वीवनास्ताभ्यम् । पवं स्वजीयं गगयन्तु वव्यकं तेजीवतो को स्व स्वीरदाष्ट्रिमम् । धाल्ण्यस्वकोनीक् चकं प्रथक्रसेः पकोन्तिनै महिंतमे व से वितम्। अरोचकं वातकप्रात्रदेशजं पित्तोद्भवं गन्धसस्द्भवं नृयाम् । कासं स्वराधात स्रोधः क्वं प्रवासं ववासं यक्षत्भगन्द्रम् । स्रोह्णानमान्दं प्रयथुं समीरणं सेहं स्थां कुष्ठमस्थ्रदरक्षमीन्। स्त्वास्वप्तं चयरोग-सद्धतं स रक्षपत्तं विसदाहमस्सरीम्। निहन्तिचाधांसि स्वोचनास्तां ववप्रदे स्थासदं रसायनम् । रसेन्द्रसारसंग्रहः।

the mass into two-grain pills. In phthisis and chronic bronchitis the following called Sringárábhra¹ is used. Take of prepared talc sixteen tolás, camphor, cardamoms, nutmegs, mace, cloves, root of Pavonia odorata (bàlá), Pothos officinalis (gajapippuli), leaves called tejpatra, jatamansi root, leaves of Pinus Webbiana (tálisapatra), cinnamon, flowers of Mesua ferrea (nágakesara), root of Aplotaxis auriculata (kushtha), flowers of Woodfordia Flori bunda (dhátaki) and purified sulphur, each one tolá, mercury half a tolá. Powder the ingredients, mix and make into four-grain pills with water. One pill at a time is to be chewed with betle leaves and ginger, and a little water is to be taken afterwards. The pills may be taken three or four times daily. The diet should consist of ghee, milk and broth.

Mohàlakshmi bilásarasa.² This preparation is used as an alterative tonic and aphrodisiac in general debility, impotence etc. To prepare it, take of talc eight tolás, mercury four tolás, sulphur four tolás, tin two tolás, silver one tolá, orpiment one tolá, copper half a tolá, gold half a tola, camphor, nutmegs and mace, each four tolás, seeds of Argyreia speciosa (bridhadáraka) and of datura, two tolás each. Mix together, rub with the juice of betle leaves and

Another preparation of composition similar to the above is called *Manmathábhra rasa*. It is, as its name implies, intended for the votaries of Cupid.

Galitakushthári rasa.¹ Take of mercury, sulphur, prepared copper and iron, bdellium, plumbago root, silájatu, nux vomica, and the three myrobalans, each one part, prepared talc and the seeds of Pongamia glabra (karanja), four parts each, rub together with honey and ghee, and preserve in an earthen pot smeared with ghee. Dose about a drachm. It is given in leprosy with ulceration of the toes and fingers. The diet should consist of fine rice, milk, sugar and honey. The patient must live apart from his wife.

ALUM.

Sans. स्फिटिका र Sphatikári.

Alum is prepared from alum shale in the Punjab and Behar It is not mentioned by Susruta, in his list of metallics, but later writers give its synonyms and uses. It is described as an astringent, and as useful in leucorrhœa, strangury, vomiting, ulcers, white leprosy, eye diseases etc. It enters into the composition of several applications to the eye in combination with rusot, opium etc, for which see Berberis Asiatica. It is seldom used internally.

BORAX

Sans. 250, Tankana. Vern. Sohágá.

Borax was known to the ancient Hindus from a very remote period, and is mentioned by Susruta. It is brought from Thibet across the Himalaya, and from Nepal, and is used in medicine as well as in the arts. It is purified for medicinal use by being steeped for a night in kánjika, and dried in the sun. Borax is said to be useful in loss of appetite, painful dyspepsia, cough, asthma, skin diseases and diarrhæa. It is also used for procuring abortion and promoting uterine contractions. Borax enters into the composition of numerous formulæ for dyspepsia, such as the Amritakalpa rasa, Tankanádi vati etc.

Amirtakalpa rasa. Take of mercury, sulphur and aconite, one part each, borax three parts, soak them for three days in the juice of Wedelia calendulacea (bhringarája) and make into two-grain pills. This medicine is said to be useful in loss of appetite, indigestion and dyspepsia. Tankanádi vati contains the above ingredients with the addition of ginger and black pepper, all in equal parts.

Chandrámrita rasa.² Take of the three myrobalans, ginger, long pepper and black pepper, Chavica officinarum (chaviká), coriander, cumin seeds and rock salt, each one tolá, and rub them together with goat's milk. Then add mercury, sulphur and iron, each two tolás, borax eight tolás and black pepper four tolás, all in fine powder, mix and make into pills or boluses about eighteen grains each. They are administered with goat's milk in chronic bronchitis and various sorts of cough with copious expectoration. Along with

these pills a decoction made of gulancha, Adhatoda vasica (vásaka), Clerodendron Siphonanthus (brahmayashti), Cyperus rotundus (mustaka), and Solanum Jacquinii (kantakári) should be administered.

Borax enters into the composition of several prescriptions for diarrhœa, along with opium, such as the *Grahanikapáta rasa* and *Nripavallava rasa*, for which see Opium.

A mixture of equal parts of borax, long pepper and baberung seeds is given for five days, at the menstrual periods for the purpose of preventing conception. It is also used for procuring abortion and inducing labour pains. Borax rubbed into a paste with the root of Vallaris dichotoma (bhadravalli) is applied to diseased nails.

LIME.

Sans. शङ्कभसा, Sankha bhasma. चूर्च, Churna.

Several sorts of lime are used in Hindu medicine. Thus we have lime from limestone called churna. Then we have lime from calcined cowries, conch-shells, bivalve-shells and snail-shells, called respectively, Kapardaka bhasma, Sankha bhasma, Sukti bhasma, and Sambuka bhasma. These shells are purified by being soaked in lemon juice, and are prepared for use by being calcined within covered crucibles. Lime is used internally in dyspepsia, enlarged spleen and other enlargements in the abdomen, and externally as a caustic. Lime enters into the composition of a great many prescriptions for different sorts of dyspepsia. The following are a few examples.

पर्णदिला मिरचस पर्णाईकं। नवगुञ्जा प्रमाणेन वित्वां कारयेद् भिषक्। एकैकां वित्वां खादेत् रक्तोत्पन जनश्रुताम्। नीनोत्पन रसैर्वापि क्रनत्यस रसेनवा। क्लागीचीरेण मग्डेन केशराजरसेन वा। निइन्ति विविधं कासं यच्याण- भिपदारुणम्। वासा गुडू चिका भागीं सस्तकं कर्णकारिका। समभागं क्रतंकाषं प्रस्ट भचयेदन्त ॥

रसेन्द्रसारसंप्रहः।

¹ पिष्पत्ती विङ्क्ष रक्ष्य सम्बूर्ण या पिनेत् पयसा। ऋत समये निह तस्या गर्भः सञ्चायते कापि॥ मानः प्रकाशः।

Amrita vati. 1 Take of calcined cowries five parts, aconite two parts, black pepper nine parts, and make into two-grain pills. They are used in loss of appetite and indigestion.

Agnikumára rasa.² Take of borax, mercury and sulphur, each one tolá, aconite, calcined cowries and conch-shells, each three tolás, black pepper eight tolás, rub them together for twelve hours with lime juice and make into twelve-grain pills. This medicine is said to increase the appetite and cure indigestion. Calcined conch-shell in half a drachm doses is recommended to be taken with lime juice in enlarged spleen.³

Lime is used in various combinations as a caustic for different diseases. Thus a mixture of conch-shell lime, impure carbonate of soda (sarjiká) and the ashes of Raphanus sativus (mulaka), is applied to tumours and enlarged glands.⁴ A mixture of lime, carbonate of soda, sulphate of copper and borax is applied as a caustic to tumours and warts. Lime enters into the composition of depilatories. Thus take of conch-shell lime three tolás, orpiment and the ashes of Butea frondosa (palása), one tolá each, and rub them together with the juice of plantain stalks or of Calotropis gigantea (arka). This paste is applied seven times to the part from which the hair is to be removed.⁵

CHLORIDE OF SODIUM.

Sans. सवस, Lavana.

Susruta describes the following varieties of salts, viz., 1 Sáindhava, 2 Sámudra, 3 Vit or Vid, 4 Sauvarchala, 5 Romaka, 6 Audbhida, 7 Gutiká, 8 Pánsuja, also called Ushasuta. The first five in the above list generally pass by the name of pancha lavana or the five salts, and are often used in combination. The other varieties are rarely used in medicine.

country along the Indus. The term is applied to rock salt which is regarded as the best of salts. Three varieties of rock salt are recognized, VIZ., white, red and crystalline. The pure white crystalline salt is preferred for medicinal use. For alimentary purposes also, rock salt is considered superior to the other varieties. It is regarded as digestive, appetizing, sweet and agreeable, and is much used in dyspepsia and other abdominal diseases.

term is applied to sun-dried sea-salt, manufactured in the Madras Presidency. It is called karkach in the vernacular. Orthodox natives, who consider common salt as impure from the circumstance of its having undergone the process of boiling, and who take only rock salt, substitute karkach for rock salt, if the latter is not available. Sun-dried sea-salt is described as somewhat bitter and laxative. In other respects its properties are said to resemble those of rock salt.

what resembling coarsely powdered lac in appearance. It has a mild, saline and somewhat nauseous taste. Dr. Fleming says "that the following process for making this salt was communicated by a native druggist to Mr. Turnbull at Mirzapore and was actually performed in his presence. Fifty six pounds of sambar salt are mixed with twenty ounces of dried aonlás (emblic myrobatans.) One fourth of these materials is put into a round earthen pot with a narrow mouth, which is put in a fire-place made of clay. The fire-place has a hole at the bottom for introducing the firewood. After the fire has been lighted about an hour, and the materials, in the

pot, appear to be heated, the rest of the materials is added by degrees. The whole is then exposed to a strong red heat for about six hours. The fire is then allowed to die away, and the pot to cool; which upon being broken is found to contain about forty-eight pounds of calanemuc or bitlaban."

Vit lavana, besides possessing the properties of salts in general, is said to be carminative and stomachic, and to be useful in enlarged spleen, dyspepsia, indigestion, bowel complaints, etc.

stani is said to be aromatic, agreeable and digestive, and useful in the same sort of cases as vitlavana. It is described in the Report on Punjab Products as "a dark colored salt said to be made by dissolving common salt in a solution of "sajimáti" (crude soda) and evaporating it; this salt contains chloride of sodium, sulphate of soda, caustic soda and a little sulphate of sodium, but no carbonate of soda." Sonchal salt is not available in the drug shops of Calcutta. Some Bengali physicians give this name to a crystalline form of rock salt, but up-country physicians always translate sauvarchala as sonchal or kálánimak. The latter interpretation appears also to obtain in the Punjab where a specimen of sonchal salt from Ram Sing, a noted druggist, is said in the Report on Punjab Products, "to be a salt of the same kind as kálánimak."

বাদৰ Romaka, also called মাৰ্কাৰী Sákambari, is the salt produced from the Sambar Lake near Ajmere. The name romaka is said to be derived from a river called Rumá. It is obtained by the evaporation of salt water in the shape of clear rhomboidal crystals. It has a pungent taste, and is considered laxative and diuretic, in addition to possessing the other properties of salts. It is said to be the best and purest of evaporated salts.

the name applied to a salt produced as an efflorescence on reh lands. The salt is called reha or kalar in the vernacular. It consists principally of sulphate of soda with a little chloride of sodium, and is described as alkaline, bitter, pungent and nauseating. It is said to be so abundant in some parts of the Punjab as to render

Asiatic Researches Vol. XI. Page 192.

the soil quite barren. Some physicians or rather writers substitute this article for sambar salt in the composition of pancha lavana or the five salts.

gran Gutiká. This salt, mentioned by Susruta and some later writers, cannot be identified at present. In the treatise called Dravyaguna by Chakra Datta, his commentator Siva Dass says that the name gutiká is derived from the circumstance of the salt assuming a hard, granular or nodular shape from boiling. So that it is a sort of boiled salt. Susruta describes it as stomachic digestive and laxative.

पांग्रज Pánsuja or Ushasuta literally means, salt manufactured from saline earth. Pángá or common salt, manufactured from earth impregnated with salt water, would come under this head.

Rock salt with warm water is used as an emetic. The different varieties of salt enter into the composition of a great many medicines for dyspepsia, indigestion, enlarged spleen and other tumours in the abdomen. The following are a few illustrations.

Nárikelakshára. ² Take a cocoa-nut fruit full of water, make a hole in it and fill the cocoa-nut with rock salt, that is, dissolve the salt in its water. Then close the opening, cover the nut with a ayer of clay and roast it in a pit of fire. The salt thus roasted is esteemed as a valuable medicine in the form of dyspepsia which is attended with pain, two or three hours after meals. It is given with the addition of long pepper. Dose about a quarter tolá.

Bháskara lavana. 3 Take of karkach salt sixteen tolás, sonchal salt ten tolás, black salt, rock salt, coriander, long pepper, long

³ भास्तरत्वयाच्यां। मासुद्रत्वयां कार्यमष्टकर्मनतं वृषेः। पञ्चमौवर्चतं पाद्यं विड्सैन्वयधान्यकम्। पिष्पतीपिष्पत्तीम् कृष्णजीरकपत्रकम्। नागकेशरं तालीयमस्त्रवेतसकं तथा। दिक्षमं मात्राख्येतानि प्रत्येकं कार्यद् वृधः। मरिचं जीरकं विद्यमेकैकं कर्षमात्रकम्। दाङ्गं स्याञ्चत्रक्षषं त्वगेलेचाईकार्षिके।

pepper root, leaves called tejpatra, seeds of Nigella sativa (krishnajiraka), leaves of Pinus Webbiana (talisa patra), flowers of Mesua ferrea (nágakesara), fruits of Calamus fasciculatus (amlave_asa), four tolás each, black pepper, cumin seeds and ginger, two tolás each, pomegranate seeds eight tolás, cinnamon and cardamoms one tolá each, powder, mix and soak seven times in lemon juice. Dose about a drachm with whey or wine, in enlarged spleen and other tumours in the abdomen, dyspepsia, loss of appetite, constipation etc. Rock salt is applied to opacities on the cornea, either singly or in combination with other drugs, as in the following. Take of the seeds of Acacia Lebbek (sirisa), long pepper, black pepper and rock salt in equal parts, rub them together with water, and make into pellets or pencils. These are rubbed on opacities of the cornea.

CARBONATE OF POTASH.

Sans. यवचार, Yavakshára.

This article, as well as the next one called sarjikákshára, is mentioned by Susruta, and has been used in medicine from a very remote period. Yavakshára is prepared by reducing to ashes the green spikes of the barley (Hordeum hexastichum), dissolving the ashes in water, straining the solution through thick cloth, and evaporating it over the fire. The resulting salt is a clear amorphous powder with a saline and partly acid taste. Chemically it is carbonate of potash with some impurities. Yavakshára is described as stomachic, laxative and diuretic. It is used in urinary diseases, dyspepsia, enlarged spleen and other enlargements of the abdominal viscera. A decoction of chebulic myrobalan and rohitaka bark is given with the addition of carbonate of potash and long pepper in enlarged spleen and liver, and in tumours in the abdomen called

वी अपूररसेने व भावित सप्तवारकम्। एतच्च पाँकतं सर्व लवणं भास्तराभिधम्। पाणप्रमाणं देयन्तु मस्तुतक्रसुरासकैः। वातस्त्रेष्ट्रभवं गुल्मं भ्लीकृ । सन्दानि नाधवेदेतद्दीपनं पाचनं परम्। सर्व लोकि क्लियां य भास्त्ररेणोदितं प्राम्। सर्व लोकि क्लियां य भास्त्ररेणोदितं प्राम्।

gulma. In strangury or painful micturition, carbonate of potash with sugar is considered a very efficacious remedy. It enters into the composition of numerous saline medicines.

CARBONATE OF SODA.

Sans. सर्जिकाचार Sarjikákshára. Vern. Sájji.

Sájji or barilla is produced from several species of salt-worts growing in brackish soil in the Punjab and North-West Provinces. The process of manufacturing sájji is described in full detail in the "Report on Punjab Products". The plants are cut down during the cold months, dried and burnt in a pit of a hemispherical shape, about six feet in circumference and three feet deep. At the bottom of this pit, one or more inverted gharás or earthen vessels having small holes pierced in their upper portion are buried. The holes are kept closed at the commencement of the operations. Into the pit is thrown a small quantity of the plants and burnt, fresh plants being gradually added to keep up a constant fire, and this is continued till the pit fills up. During this process a liquid matter exudes from the plants. As soon as this is observed the orifices in the gharás are opened and the liquid runs down into them below the fire. After all the liquid has run down, the ashes are stirred up with a stick and covered over with earth. The alkali found in the earthen vessels is sájji of the first quality, called sájji lotá because it is found in the lotá or pot. The residuary mass in the pit is crude dirty potash.

Sarjikákshára or sájji, as used in medicine, occurs in porous granular masses of a greyish white colour, and with a strong alkaline taste of soda. Chemically, it consists of carbonate of soda with certain impurities, such as organic matter, sulphate of soda,

¹ पथ्यारोहितकं कायं यवचारकणायुतस् । पिवेत् प्रातर्थकत् भी हरा च्या कि रातर्थक त् भी हरा च्या कि प्रात्येक त् भी हरा चरा । प्राक्षियः ।

² यवचारस्य चूर्णेन्त संयोज्य सितया सङ् । भच्चयेन्नियतं तस्य प्रभा सेन्यूत्रनियहः। भावप्रकाशः।

potash etc. The properties of sarjiká are said to be like but somewhat inferior to those of yavakáshara. It is chiefly used in combination with other medicines of its class in the treatment of acidity, dyspepsia, and enlargements of the abdominal viscera. Externally it is used as a caustic.

Sáiji, or barilla, should not be confounded with sájimati or fuller's earth. The latter is earth impregnated with soda and not a barilla. Sájimáti occurs in great abundance on the surface of the soil in many parts of India, and is chiefly used in washing cloth. The following is an example of a saline medicine containing sarjiká.

Sarjikádya churna. ¹ Take of sarjikákshára and yavakshára, rock, sonchal, vit, sámbar and karkach salts in equal parts, powder, soak in lemon juice or the juice of pomegranate fruits and dry in the sun. Dose about twenty grains. This medicine is said to promote the appetite, to remove local swellings or tumours in the abdomen and to cure dyspepsia with severe pain after meals.

A paste made of equal parts of yavakshára and sarjikákshára with water is applied to abscesses, for the purpose of opening them.

NITRATE OF POTASH.

NITRE was unknown to the ancient Hindus. There is no recognized name for it in Sanskrit. The Bhávaprakása mentions Suvarchiká as a variety of sarjiká or barilla, and gives sorá as its vernacular equivalent. But suvarchiká, according to standard lexicons, is a synonym of sarjiká and not a separate article. Some recent Sanskrit formulæ for the preparation of mineral acids containg nitre, mention this salt under the name of Soraka. This word

¹ स्वितिकादाचूर्णम् । स्वितिका च यवचारः सिन्धुकीरई लं विङ्म् । सामुद्रिकं रोमकञ्च कोलमाताणि कारयेत् । एकीकत्याखिलं चूर्णं भावयेन्यात- खुङ्जैः । रमैर्वा दाङ्मैर्वाप योषयेदातपेन वा । तञ्चूणं नाथयेदुगुल्मं पहणीमामजां रजम् । अग्निञ्च कुरुते दीप्तं रचिक्षत् कफनाथनम् ।

however is not met with in any Sanskrit dictionary and is evidently Sanskritized from the vernacular sorá, a term of foreign origin. The manufacture of nitre was therefore most probably introduced into India after the adoption of gunpowder as an implement of warfare. It is necessary to observe here that many writers have erroneously translated nitre into the Sanskrit term yavakshára. This last however is not a nitrate but an impure carbonate of potash obtained by reducing to ashes the spikes of the barley.

Chloride of ammonium is not mentioned by Susruta and the older writers. In recent Sanskrit works it is called narasára, a term apparently derived from the vernacular nausadar of Persian oirgin. Another salt mentioned in recent Sanskrit compilations is the impure sulphate of soda called Khárinoon in the vernacular. It is called Kshári lavana in Sanskrit, and is used in combination with other saline medicines.

ALKALINE ASHES.

Sans, चार, Kshára.

The ashes of a number of plants containing more or less potash are employed both externally and internally. A list of these plants used in the preparation of caustic pastes, has been already given in the Introduction (see page 21). It remains now to notice the preparations of alkaline ashes for internal use. A solution of the ashes of these plants or of such of them as are available, is prepared by mixing them with six parts of water and straining the fluid through cloth for twenty-one times, that is, the strained fluid is poured over the ashes twenty-one times in succession, and made to percolate through them. Lastly the fluid is allowed to stand and the clear solution drained off. This alkaline solution is given in doses of one to three drachms in dyspepsia, ascites, enlargements of the abdominal viscera, calculous affections, etc. It is regarded as laxative, diuretic and antacid.

Váisvánarakshára. 1 Take of the mixed ashes of Euphorbia

¹ वैश्वानरचारः । सुद्धकंचित्रकेरण्ड्यर्णं स पुनर्नवम् । तिखापामार्ग-

neriifolia (snuhi), Calotropis gigantea (arka), Plumbago Zeylanica (chitraka), Ricinus communis (eranda), Cratæva Roxburghii (varuna), Boerhaavia diffusa (punarnavá), Sesamum Indicum (tila), Achyranthes aspera (apámárga), Musa sapientum (kádali), Butea frondosa (palása), and of the shells of tamarinds, two seers in all, boil in sixteen seers of water till reduced to one-fourth. Allow the solution to stand, and drain the clear liquid. To the clear solution add two seers of rock salt, boil again till the fluid is evaporated, dry and powder. To this powder add the following carminatives, namely, ajowan, cumin seeds, kálájirá, ginger, long pepper, black pepper and assafætida, each four tolas, and mix. This combination is given in doses of one to two scruples, with cold water in dyspepsia, anasarca etc.

Abhayá-lavana.¹ This is a preparation similar to Vaisránara-kshára above described. It is much used in enlarged spleen of long standing, and often with success. To prepare this two seers of mixed alkaline ashes are boiled in sixty-four seers of water till it is reduced to one-fourth. One seer of chebulic myrobalans, two seers of rock salt, and sixteen seers of cow's urine are then added, and the mixture boiled till it is reduced to a thick syrupy consistence. Lastly are added cumin seeds, ginger, black pepper, long pepper,

1 अभया बन्यम्। पारिमद्रप बाधार्मस्त्र ह्या पामार्ग चिल्लकम्। कणा ग्निमन्य न सुर्के प्रवरंद्र वहती द्वयम । पृतिका स्कोत कट ज को पातकाः प्रनिवा। समू बपल या खा ख चोद्यित्वा उद्देख है। तिलना लेन दीप्ता ग्निस्त सुरम्भं भसा गीत बन्। चारं प्रस्थं

assafætida, ajowan, root of Aplotaxis auriculata, (kushtha), and Curcuma Zedoaria (sati), each four tolás, and the whole intimately mixed. This medicine is given in doses of half to one tolá once daily in enlarged spleen, liver disease, ascites etc. If the bowels are not sufficiently moved it is given in larger doses.

DIAMOND.

Sans. First, Hiraka.

Or the precious stones enumerated in page 14, diamond, pearls and coral only are much used in medicine. The rest are rarely used or not used at all. Diamond is purified by being enclosed within a lemon and boiled in the juice of the leaves of Agati grandiflora (vaka). It is reduced to powder in the following manner. A piece of the root of a cotton plant is beaten to a paste with the juice of some betle leaves. Both these vegetables should not be less than three years old. The diamond is enclosed within this paste and roasted in a pit of fire. The process is repeated seven times, when the stone is easily reduced to a fine powder. Another process consists in roasting the diamond enclosed in a paste made of hornshavings, for three times in succession. Diamond thus prepared is said to be a powerful alterative tonic that improves nutrition, increases the strength and firmness of the body and removes all sorts of diseases. Dose about one grain.

Diamond enters into the composition of several alterative and tonic medicines, such as the *Trailakya chintámani rasa*, *Ratnagiri-rasa*, *Sarvánga sundara rasa*, etc. These medicines are similar in

भैषज्ञ रह्यावनी । composition. They all contain diamond, pearls, gold, iron, talc, mercury, etc, in varying proportions and are used in similar cases.

Trailakya chintámani rasa¹ is thus prepared. Take of diamond, gold and pearls, each one part, iron, tale and Rasa sindura or red preparation of mercury, four parts each, rub together with the juice of Aloe Indica and make into two-grain pills. This medicine is used as an alterative tonic with suitable adjuncts in various diseases.

PEARLS AND CORAL.

Sans. स्क्रा Muktá, Pearls. प्रवान Pravàla, Coral.

These gems have been used in medicine from a very ancient period and are mentioned by Susruta. Pearls are purified by being boiled in the juice of the leaves of Sesbania aculeata (jayanti), or of the flowers of Agati grandiflora (vaka). Coral is purified by being boiled in a decoction of the three myrobalans. Both are prepared for medicinal use by being calcined in covered crucibles and then reduced to powder. The properties of both these articles are said to be alike and they are generally used in combination. They are said to be useful in urinary diseases, consumption etc, and to increase the strength, nutrition, and energy of weak persons. The following are examples of prescriptions containing pearls and coral.

Pittántaka rasa.2 Take of nutmegs, mace, jatámánsi root, root

of Aplotaxis auriculata (kushtha), leaves of Pinus Webbiana (tálisa patra, aconite, iron pyrites, iron, talc and realgar, one part each, prepared pearls equal in quantity to all the above ingredients. Beat them together into a paste with the aid of water and make into four-grain pills. This medicine is said to be useful in diseases supposed to be caused by deranged bile, such as dyspepsia, jaundice, biliousness, vomiting of bile, etc.

Vasanta Kusumákara rasa.1 Take of prepared gold and camphor, each two parts, of prepared tin, lead and iron, three parts each, prepared tale, pearls and coral, four parts each. Rub these ingredients together in a mortar and soak the powder seven times successively in each of the following fluids, namely milk, sugar-cane juice, juice of Adhatoda Vasica (vàsaka), decoction of lac and of Pavonia odorata (bálá), juice of the flowers and rootstock of the plantain tree, of the root-stock of Nelumbium speciosum (padma) and of the flowers of Aganosma caryophyllata (málatipuspa). Lastly soak in an infusion of musk prepared by macerating one part of musk in eight parts of warm water for twelve hours. Divide this mass into four-grain pills. They are given with sugar, honey and ghee in urinary diseases, impotence, gleet, diabetes, consumption and general debility. This medicine is regarded as a valuable alterative tonic in chronic gonorrhea and spermatorrhea and is much prescribed in these complaints in combination with an extract called Kusávalehá (see Sugar cane).

SILAJATU.

Silájatu literally means stone and lac. The term is applied to certain bituminous substances said to exude from rocks during the hot weather. It is said to be produced in the Vindhya and other mountains where iron abounds. It is a dark sticky unctuous substance resembling bdellium in appearance. It has a bitter taste and a strong smell resembling stale cow's urine. Over platinum foil it burns with a little inflammable smoke and leaves a large quantity of ashes consisting chiefly of lime, magnesia, silica, and iron in a mixed state of proto and peroxide.*

Silájatu is prepared for medicinal use by being washed with cold water and then rubbed into an emulsion with its bulk of hot water or milk in an iron pot. This emulsion is exposed to the sun, when a black cream-like substance collects on its surface and; this is removed. The process is continued as long as any cream rises. If the mixture becomes too thick, hot water is added from time to time as required, but too much water should not be added at once, for then the cream will not rise to the surface. The silájatu thus collected is dried in the sun and preserved for use. The dregs at the bottom are thrown away. The extract of silájatu thus obtained is purified by being soaked in a decoction of the following plants, namely. Shorea robusta, (sála), Buchanania latifolia (piála), Terminalia tomentosa (asana) and Acacia catechu (khadira). Silájatu is regarded as a powerful alterative tonic and is considered specially useful in urinary diseases, diabetes, gravel, anæmia, consumption, cough, and skin diseases. The extract of silájatu is given in doses of six to twelve grains. In strangury or painful micturition it is given with honey or with the decoction of Tribulus terrestris (gokshura). In urinary complaints it is given in combination with preparations of lead or tin. As an alterative tonic, it is used in combination with iron, as in the following called Yogarája.

^{*} The silajit or alum earth of Nepal is a different article from the silajatu of the Sanskrit Materia Medica. The former is an article of Yunani not Hindu Medicine.

¹ खेद्यां शुक्रविवन्धोत्ये गिलाजत समाचितम् । चक्रदत्तः ।

Yogarája. ¹ Take of silájatu, prepared iron, iron pyrites and silver, each five parts, of the three myrobalans, ginger, black pepper and long pepper, plumbago root and báberung seeds, each one part, sugar eight parts. Powder, mix and make into a confection with honey. Dose about half a tolá. This medicine is considered a valuable alterative tonic, and is used in anæmia, jaundice, consumption, chronic fever, skin diseases, urinary diseases, piles, etc.

RED OCHRE.

Sans. 1 Ta Gairika. Vern. Gerumáti.

Two sorts of gairiká or ochre are mentioned by Sanskrit writers, namely, red and yellow. The red variety, called also Raktapáshána is used in medicine. It is a silicate of alumina coloured with oxide of iron It is purified by being soaked in milk seven times, and is described as sweetish, astringent, cooling, and useful in ulcers, burns, boils etc. It is rarely used internally except as an ingredient of some of the complex prescriptions containing a large number of mineral drugs, such as the preparation called Jvarakunjara párindra rasa, which contains nearly all the mineral substances.

Besides gairika several other varieties of earth are described and occassionally used in medicine. A sweet scented earth brought from Surat and called Saurástra mrittiká is regarded as astringent and useful in hemorrhages. It enters into the composition of several medicines for relieving bleeding from internal organs.

SANSKRIT MATERIA MEDICA. PART II.

WEGETABLE MATERIA MEDICA

NAT. ORDER. RANUNCULACEÆ.

ACONITUM FEROX.

Sans. विष, Visha. वत्सनाभ, Vatsanábha.

Vern. Mithábish, Sringibish, Dagrá.

The poisonous root called bish or sringibish is derived chiefly from Aconitum ferox and Aconitum Napellus, which are indigenous to the temperate and sub-alpine Himalaya. Other equally poisonous species of aconite are met with in these regions, and their roots collected for use. In the Introduction (page 7) it has been stated that of the nine virulent poisons mentioned by Sanskrit writers, the majority probably consist of species of aconite. The characters of these poisons are described in the Bhabaprakasa, as follows.

Vatsanábha. This root resembles in appearance the navel of children, hence it is called Vatsanábha. Its leaves are like those of Vitex Negundo. It is said that no plant can grow near it.

Háridra. This root resembles turmeric in appearance, hence it is so called.

Saktu. This poisonous tuber, when broken, is found to contain a white starch-like substance.

Pradipana. This variety is said to be red and shining in appearance, and to cause a severe burning sensation when taken internally.

Sauráshtrika is the variety of poisonous root produced in the country called Surat.

Sringi is a variety of aconite which if tied to the horn of a cow, is said to tinge her milk red.

Kálakuta. This poison is said to be the gum of a plant resembling the Ficus religiosa in appearance. It is a native of Malwa and the Concans.

Haláhala. The bunches of fruits of this plant resemble those of grapes. Its leaves are like those of the palm tree. It is found in the Himalaya, in the sea coast to the south, the Concan and in the mountain called Kishkindhya to the north of Mysore.

Brahmaputra. This poison is of a tawny colour and causes purging. It grows on the Malayachala, that is, the Western Ghats on the Malabar Coast.

From the above description it would seem that of these nine poisons, the first six are probably species of aconite. Of these the variety called *Vatsanábha* has been used in medicine from a very remote period.

Aconite is purified by being cut in small slices and steeped in cow's urine for three days, before being used. It is regarded as heating and stimulant, and useful in diseases supposed to be caused by deranged phlegm and air. It is used in a great variety of affections, but is specially recommended in fever, cephalalgia, affections of the throat, dyspepsia and rheumatism. In recent or acute fevers the following is a favourite medicine.

Mrityunjaya rasa. Take of purified aconite, sulphur, black pepper, long pepper and borax, each one part, cinnabar two parts; powder and beat them into a mass with water and make into two-grain pills. These pills are given with suitable adjuncts in fever supposed to be caused by deranged air, as also in those caused by the derangement of all the humours, that is, in ordinary remittent fever and in that of typhoid type. A composition very similar to the above is recommended by Sarangadhara under the name

¹ ऋ खुझयरसः । विषय्वैकं तथा भागं मिरचं पिप्पजीकणा । गन्धटङ्गः तथा भागं दिभागं हिङ्गुलं भवेत् । जलेन विष्कां कार्या गुझामाता प्रमा-णतः । मधुना लेइनं कार्यं सर्व्य ज्वरनिवस्तये । रसरस्राकरः ।

of A'nanda bhairava rasa. If there is much constipation along with the fever, croton seeds are added to the above ingredients, as in the preparation called Jvara murári rasa.

In fever complicated with cerebral symptoms aconite is used in combination with mercury and datura, as in the following called Panchavaktra rasa.² Take of purified mercury, sulphur, aconite, black pepper and borax, rub them together with the juice of datura leaves for twelve hours, and make into four-grain pills. Along with these pills a decoction of the root of Calotropis gigantea (arka) with the addition of long pepper, black pepper and ginger is recommended to be taken.

In chronic fever with strong shivering fits, copious perspiration, or much heat of body, aconite is used in combination with salts and aromatics, as in the following called Saubhágya vatiká. Take of aconite, borax, cumin seeds, the five salts, viz. rock, sea, sonchal, vit and sambar salts, the three myrobalans, ginger, long pepper and black pepper, prepared tale, mercury and sulphur, in equal parts. First rub the mercury and sulphur together, then mix them with the other ingredients, soak the mixture seven times successively in the juice of the following leaves, namely, of Vitex

Negundo (nirgundi) Nyctanthes Arbor-tristis (sepháliká), Eclipta prostrata (kesarája), Adhatoda Vasica (vásaka) and Achyranthes aspera (apámárga), and make into four-grain pills.

Aconite is much used in dyspepsia with loss of appetite, in a variety of combinations. The following called Rámavána rasa 1 is an illustration. Take of mercury, aconite, cloves, and sulphur, each one part, black pepper, two parts, nutmeg, half a part, rub them together with tamarind juice and make into two-grain pills. These pills are given with the addition of powdered black pepper. Another preparation called Hutásana rasa is similar in composition to the above, and is recommended by several writers.

In diseases supposed to be caused by deranged phlegm, such as catarrh, sore throat, cough, asthma, discharges from the ears and nose etc, aconite is used in combination with other heating medicines. The following called Kapha ketu rasa² is a well known medicine for these diseases. Take of aconite, borax, long pepper, and conch-shell lime, equal parts; powder, mix and soak the mixture three times successively in fresh ginger juice. Dose, two grains, to be given with ginger juice. A preparation similar to the above and called Bhairava rasa, is used in hoarseness and loss of voice.

In cephalalgia and hemicrania it is recommended to be given in the following form. Take of aconite one part, liquorice root and the pulse of *Phaseolus Roxburghii* (másha), each two parts; powder and make into one-grain pills.

In boils and other skin diseases aconite is used in the form of liniment and ointment. The following is an illustration.

¹ रामवाणरसः। पारदास्तत अवङ्गान्धकं भागयुग्म मरिचेन मिश्चितम्। तत्रजातिफलभद्धभागिकं तिन्तिङ्गोफलरसेनमिह्तम्। विक्रमान्धदशवत्राना-श्रानो रामवाण इतिविश्वतोरसः। रसेन्द्रचिन्तामनी।

Visha taila. Take of sesamum oil four seers, aconite root eight tolas, seeds of Pongamia glabra (karanja), turmeric, wood of Berberis Asiatica (dáruharidrá), root of Calotropis gigantea (arka), of Nerium odorum (karavira), flowers of Tabernaemontana coronaria (tagara), Acorus calamus (vacha), Aplotaxis auriculata (kushtha) Vallaris dichotoma (ásphotá), red sandal wood, flowers of Aganosma caryophyllata (málati), bark of Alstonia Scholaris, (saptaparna), madder and leaves of Vitex Negundo (nirgundi), each four tolás, cow's urine sixteen seers. The solid ingredients should be beaten into a paste with water, and then boiled with the oil and cow's urine till the watery portion is evaporated. This oil is said to be useful in boils, prurigo, psoriasis, leucoderma and other skin diseases.

ACONITUM HETEROPHYLLUM

Sans. आतेच, A'taicha, अतिविष, A'tivisha. Vern. A'tis.

THE tuberous roots of this plant are considered tonic, astringent and stomachic, and are used in fever, diarrhœa, irritability of stomach and cough. Atis is also regarded as an antidote to poisons.

In fever with diarrhoea the following compound decoction² is much used in practice. Take of átis, ginger, kurchi bark, tubers of Cyperus rotundus (mustaka), and root of Tinospora cordifolia (gulancha), equal parts, in all two tolás, water thirty-two tolás. Boil till the water is reduced to one-fourth or eight tolás. This

quantity is given in two or three divided doses during the course of the day. Chakradatta recommends the following called *Hrive-rádi*¹ in similar cases. Take of átis, dried bela, root of Pavonia odorata (bálá) and Cyperus rotundus (mustaka), ginger and coriander, equal parts, in all two tolás and prepare a decoction in the usual way.

In the fever, diarrhoea, cough, and irritability of stomach of infants, átis is used alone or in the following combination. Take of átis, tubers of Cyperus rotundus (mustaka) and the horny excrescence of Rhus succedanea (karkatasringi), equal parts, powder and mix. This compound powder is given in suitable doses with the addition of honey. Sometimes long pepper is added to the above ingredients, when the powder is called Bála-cháturbhadra-ka,2 from its being composed of four ingredients.

NIGELLA SATIVA.

Sans. क्या जीरक, Krishnajiraka. Vern. Kálájirá, Beng. Mugrela, Hind.

The seeds of Nigella sativa are regarded as aromatic, carminative stomachic and digestive, and are used in indigestion, loss of appetite, fever, diarrhoea puerperal diseases etc. They are also said to increase the secretion of milk, and are therefore given to recently delivered females in combination with a few other medicines. Nigella seeds are scattered between layers of woolen clothes, shawls etc., to preserve them from insects. This use of the seeds appears to be common all over India.

In intermittent fever nigella seeds slightly roasted are recommended to be given in two drachm doses with the addition of an equal quantity of treacle.³

मिन्नेरादिः । च्वीनेरातिविषामुक्त विलुधान्यक्रनागरैः । पिनेत्पच्छा-वित्रस्थन्नं स्त्रुलदेषामपाचनस् । सरक्षं इन्त्यतीसारं सञ्चरं वाष्टविच्चरस् । चक्रदत्तः ।

³ कालाजाजी तु सगुड़ा विषम ज्वर नाशिनी। भावप्रकाश: ।

In loss of appetite and distaste for food a confection made of Nigella seeds, cumin seeds, black pepper, raisins, tamarind pulp, pomegranate juice and sonchal salt, with treacle and honey is said to be very useful.¹

Chakradatta recommends the administration of nigella seeds with the addition of long pepper, sonchal salt and wine in the after pains of puerperal women.² In puerperal diseases, such as fever, loss of appetite and disordered secretions, after delivery, the following called Pancha jiraka páka³ is used. Take of nigella seeds, cumin seeds, aniseeds, ajowan, seeds of Carum sativum (ajamodá) Anethum Sowa (sulpha) and Trigonella Fænum-græcum (methi), coriander, ginger, long pepper, long pepper root, plumbago root, habushá (an aromatic substance) dried pulp of the fruit Ziziphus Jujuba (vadari phala), root of Aplotaxis auriculata (kushtha) and kamala powder, each one tolá, treacle one hundred tolás, milk one seer, clarified butter four tolas. Boil them together and prepare a confection. Dose about a drachm every morning.

NAT. ORDER. MENISPERMACEÆ. STEPHANIA HERNANDIFOLIA.

Syn. Cissampelos hexandra. Rox.

Sans. खबडा, Ambashthá. पाउा, Páthá. Vern. A'kanádi, Nemuka.

In the Pharmacopæia of India it is stated that the Cissampelos hernandifolia, Wall. is identical with Pareira Brava, and is

¹ कारव्यजाजीमरिचं द्राचा हचा स्त्रदा डिमस्। भौवर्च तं गुडं चौद्रं सर्वाः रोचकना थनस्। चक्रदत्तः।

common throughout India. Other authorities say, that the true Pareira Brava is derived from Chondodendron tomentosum. The plant used by Kavirajas in Bengal under the name of páthá is identical with that figured by Roxburgh as Cissampelos hcxandra. The root of this plant is regarded as light, bitter, astringent and useful in fever, diarrhœa, urinary diseases, dyspepsia etc.

In fever with diarrhea, the following compound decoction is recommended by Chakradatta. Take of páthá root, indrajava seeds, chiretta, tubers of Cyperus rotundus (mustaka), Hedyotis biflora (parpati), gulancha, and ginger, equal parts, in all two tolas, water thirty-two tolas; and boil till reduced to one-fourth. In diarrhea caused by indigestion and attended with pain and slimy or bilious stools, the following decoction is used. Take of páthá root, indrajava seeds, chebulic myrobalan and ginger, each half a tola, water thirty-two tolas. Boil down to one-fourth.

In internal or deep seated inflammation, Chakradatta recommends the root of this plant to be taken with honey and water in which rice has been macerated.²

In urine depositing salts or a white flocculent substance, a decoction of páthá and aloes-wood is used.3

In painful micturition the following decoction⁴ is considered useful. Take of páthá root, Hedysarum lagopodioides (prisniparni),

TINOSPORA CORDIFOLIA.

Sans. गुड़् ची, Guduchi. अस्ता, Amritá. Vern. Gulancha, Beng. Gurach, Hind.

The stem, leaves, roots and watery extract of this plant are all used in Hindu Medicine. The entire plant is regarded as a valuable alterative and tonic. It is used in general debility, fever, jaundice, skin diseases, rheumatism, urinary diseases, irritability of stomach, etc.

The fresh juice of the plant is taken with milk as a general tonic. In fevers it is used in a great variety of forms. Thus a cold infusion of gulancha is given with honey in bilious fever. A decoction of gulancha or its fresh juice is given with the addition of long pepper and honey in chronic fever with cough. A compound decoction is thus prepared. Take of gulancha, Hedyotis biflora (parparta), Cyperus rotundus (mustaka), chiretta and ginger, each one drachm, water, half a seer. Boil down to one-fourth. It is said to be useful in fevers caused by deranged air and bile. Practically it is found very useful in chronic fevers, which have resisted other antiperiodics, and which are apt to recur after apparent recovery. In chronic fever with loss of appetite, the following confection is recommended by many writers.

Dhátrimodaka.² Take of chebulic and emblic myrobalans, ginger and long pepper, one part each, watery extract of gulancha, four parts, water sixteen parts. Boil till reduced to one-fourth, and prepare a confection with eight parts of sugar. When of proper

consistence divide the mass into boluses of about a drachm each. One of these is taken every morning, in chronic fever with enlarged spleen, cough, loss of appetite, etc.

Gulancha enters into the composition of a large number of prescriptions for chronic skin diseases. The juice of the plant or its decoction is given alone, or with the addition of guggulu or bdellium. Numerous compound decoctions with the addition of various other drugs such as nim, turmeric, catechu, etc. are used in these diseases, as well as in gout and rheumatism. Several oils, for external application are prepared with gulancha and are much used in skin diseases, rheumatic affections and nervous complaints.

Guduchyádi taila.³ Take of fresh gulancha, eight seers, water, sixty-four seers, boil till reduced to one-fourth and strain. To the strained decoction, add prepared sesamum oil, four seers, and gulancha beaten to a paste with water, one seer, boil together till the water is evaporated. This oil is a favourite application in eruptive skin diseases from impure blood. The Vrihat guduchy-ádi taila is prepared by the addition of a number of other medicines in the form of paste, to the decoction of gulancha and the oil. Another compound oil called Váta guduchyádi taila is thus prepared. Take of gulancha, twelve seers, and a half water sixty-four seers. Boil till reduced to one fourth. Take of the fresh juice of Adhatoda Vasica (vásaka) and of datura leaves, each four seers, prepared mustard oil, four seers, aromatics in the form of paste one seer. Boil together the decoction of gulancha with the vegetable juices, oil and paste, in the usual

manner. This oil is recommended by Charaka in eruptive skin diseases with troublesome itching, as also in diseases of nervous origin.

NAT. ORDER. BERBERIDEÆ. BERBERIS ASIATICA AND OTHER SPECIES.

Sans. दारहरिद्रा, Dáruharidrá. दावी, Dárvi.

Vern. Dáruhaldi. Hind.

The wood, root-bark and extract of Indian Barberry have been used in Hindu Medicine from a very remote period. Its properties are said to be analogous to those of turmeric. The extract, called Rasánjana* in Sanskrit and Rasot in the vernacular, is directed to be prepared by boiling together equal parts of a decoction of Indian barberry and milk, till reduced to the consistence of an extract.† The extract thus prepared, is said to be particularly useful in affections of the eyes. Indian barberry and its extract rasot are regarded as alterative and deobstruent, and are used in skin diseases, menorrhagia, diarrhæa, jaundice and above all, in affections of the eyes.

Rasánjanádi churna, 1 or compound powder of rasot. Take of rasot, átis, the bark and seeds of Holarrhena antidysenterica, flowers of Woodfordia floribunda (dhátaki) and ginger, in equal parts. Powder and mix. Dose, about a drachm, with rice water

^{*} Galena or the sulphide of lead ore is sometimes called rasánjana in Sans-krit, and some physicians in Bengal use the lead ore for rasánjana, whenever this term occurs in a prescription. In the Upper Provinces however, rasánjana is invariably translated rasot in the vernacular. This, no doubt, is the correct practice. The mistake on the part of the Bengali physicians, probably occurred from their not being acquainted with rasot, which is the produce of plants indigenous to the Himalayan range.

(tandulámbu) and honey. This powder is said to be useful in bilious diarrhœa.

Dárvyádi kvátha,¹ or compound decoction of Indian barberry. Take of the root bark of Indian barberry, rasot, chiretta, Adhatoda Vasica (vásaka), Cyperus rotundus (mustaka), bela fruit and marking nuts, equal parts, and prepare a decoction in the usual way. This is administered with honey in menorrhagia and copious discharges from the womb. Another combination said to be very useful in menorrhagia is as follows. Take of rasot and the root of Amaranthus spinosus (tanduliya) equal parts, beat into a paste with water, and administer with honey and water in which rice has been steeped.

Sárangadhara recommends a simple decoction of Indian barberry to be given with the addition of honey in jaundice. In painful micturition from bilious or acrid urine, a decoction of Indian barberry² and emblic myrobalan is given with honey. A decoction³ of the root bark is used as a wash for unhealthy ulcers, and is said to improve their appearance and promote cicatrization. In the intertrigo of infants, rasot is recommended to be applied externally and administered internally.⁴ Rasot mixed with honey, is said to be an useful application to aphthous sores.

The principal use of rasot however is in eye-diseases, in which it is employed in a great variety of forms. The following are a few illustrations. Take of rasot, chebulic myrobalan, rock salt and red ochre, equal parts, rub them together into a paste with water,

and apply round the orbit in inflammatory affections of the eyes. ¹
Rasot mixed with honey may also be used in the same way. An emulsion of rasot made with milk is recommended to be poured into the eyes, or used as a collyrium for relieving pain, burning and lachrymation.²

NAT. ORDER. NYMPHÆACEÆ. NELUMBIUM SPECIOSUM. NYMPHÆA LOTUS ETC.

These beautiful aquatic plants had attracted the attention of the ancient Hindus from a very remote period, and obtained a place in their religious ceremonies and mythological fables; hence they are described in great detail by Sanskrit writers. The flowers of Nelumbium speciosum, called Padma or Kamala, are sacred to Lakshmi, the goddess of wealth and prosperity. The white variety of this plant is called Pundarîka, the red, Kokanada and the blue, Indivara. The entire plant including root, stem and flower is called Padmini. The torus or receptacle for the seed is, called Karnikára, and the honey formed in the flowers, Makaranda. The filaments round the base of the receptacle, pass by the name of Kinjalka and the leaf-stalk by that of Mrinála. The species of Nymphæa described, are as follows:—

Nymphæa Lotus. Kumuda, Sans. Sáluka. Beng. Koi. Hind. Nymphæa stellata. Nilotpala, Sans. Nilsaphalá, Beng. Nymphæa rubra. Raktotpala, Sans. Raktakambal, Beng.

The root-stocks of these water plants contain a sort of starch, and are eaten by the poorer classes. During the famine of 1866 in Orissa, they were much sought after by the starving people.

¹ इरोतकी मैन्यवञ्च मेरिकञ्च रसाञ्चनम् । विडालको जलेपिष्ठः सर्वनेत्वाम-यापदः ॥ शार्द्धधरः ।

² दार्व्योरसाञ्चनं वापि स्तन्ययुक्तं प्रपूरणम् ॥ निहित्तिशीघृ दाहात्र्यवेदनाः स्वन्दसम्भवाः । चक्रदत्तः ।

The seeds of Nelumbium speciosum are eaten raw. The small seeds of Nymphaa Lotus, called bheta, are fried in heated sand and used as a light easily digestible food. The seeds of Euryale ferox called makhánna is Sanskrit, are also used in the same manner, and are regarded as light, invigorating food suited for sick people.

The filaments of these plants are used medicinally. They are considered astringent and cooling, and useful in burning of the body, bleeding piles and menorrhagia. In bleeding piles the filaments of the lotus are given with honey and fresh butter or with sugar. In menorrhagia the filaments of Nymphæa stellata are given with the addition of sonchal salt, nigella seeds, liquorice powder, curdled milk and honey. A compound decoction is thus prepared.

Utpaládi sritam.³ Take of the filaments of Nymphæa Lotus, N. stellata and N. rubra, of the white váriety of Nelumbium speciosum and liquorice root, equal parts, in all, two tolás, and prepare a decoction in the usual way. This decoction is said to be useful in thirst, burning of the body, fainting, vomiting, hemorrhage from the internal organs, and bleeding from the womb during gestation.

A cooling application⁴ for external use is prepared as follows. Take of the filaments and leaf-stalks of *Nelumbium speciosum*, *Nym-phæa stellata*, and *Nymphæa Lotus* and of red sandal wood, equal parts, and rub them together into a thin paste with cold water. This is applied to the forehead in cephalalgia. A paste made of emblic

myrobalans and the filaments of the lotus is also used for the same purpose. Similar compositions are recommended for external inflammations, erysipelas etc.

The large leaves of Nelumbium speciosum are used as cool bedsheets, in high fever with much heat and burning of the skin.¹

NAT. ORDER. PAPAVERACE Æ.

PAPAVER SOMNIFERUM.

Sans. व्यक्तिन, Ahiphena. Vern. A'phim.

OPIUM appears to have been brought into India by the Mussulmans, as its Sanskrit name is evidently derived from the Arabic Afyun, and as it is not mentioned by the older Sanskrit writers.

The capsules of the poppy are called Khákhas, and the seeds, Khasatila, in Sanskrit. The seeds yield a bland oil, which is used for culinary purposes and in lamps. The seeds themselves are innocuous and used as food. They are boiled, mixed with a little oil and salt, and taken as a curry with rice, or they are made into balls and formed with tamarind, into an acid curry. Poppy seeds are sprinkled over some sorts of native sweetmeats.

Sanskrit writers describe poppy seeds as demulcent and nutritive, and useful in cough and asthma. The capsules of the poppy are regarded as light, astringent, and narcotic. They promote talkativeness and destroy or diminish the sexual power. The properties of opium are said to be analogous to those of the capsules. Opium is used as an astringent and narcotic in bowel complaints, cough, external inflammations, urinary diseases, fractures, skin diseases etc.

In diarrhæa and cholera the following, called A'marákshasi,2 is used. Take of opium, nutmeg, cloves, cinnabar and camphor,

¹ चन्दनाम्बुकणास्यन्दितालहन्तोपनीजितः। स्याद्दाहार्दितोऽम्भोजकद-लीदलसभावे। चक्रदत्तः।

equal parts. Beat them into a mass with water, and make into four-grain pills.

In chronic diarrhea and dysentery, the following called Grahani kapáta rasa, is recommended. Take of nutmeg, borax, prepared tale and datura seeds, each one part, opium two parts, and make into two-grain pills with the juice of Paderia fatida (prasárani). In diarrhea with anasarca the following, called Dugdhavati, is much used by the Kavirajas.

Dugdhavati.² Take of opium and aconite, twenty-four grains each, prepared iron ten grains, prepared tale twelve grains. Beat them into a mass with milk and make into four-grain pills. One pill is to be given every morning with milk. The diet is restricted to milk alone, water and salt being prohibited. In fever with diarrhea, opium is used in combination with arsenic, as for example in the following preparation.

Sambhunátha rasa.3 Take of orpiment, realgar, cinnabar, white arsenic, borax, aconite and alum each, one part, mercury,

Soak them for seven days in each of the following fluids, namely, juice of the leaves of Cannabis sativa, Vitex Negundo, datura and nim. Make into two-grain pills. These are given with ginger juice in diarrhœa with high fever.

Akarádi churna.¹ Take of pellitory root, ginger, seeds called (kakkola), saffron, long pepper, nutmeg, cloves and red sandal wood, each two tolás, opium eight tolás. Rub them together and pass the powder through a cloth. Then add sugar, equal in quantity to all the above ingredients. Dose grains six to twelve, with honey. This medicine is used as an aphrodisiac.

Opium enters into the composition of some external applications in the form of paste, along with other medicines. A poultice made of poppy seeds with milk is prescribed by Sárangadhara in porrigo of the scalp.²

The Amritaságar recommends the following preparation of opium in diabetes. Take of camphor and musk, each one part, opium and mace, each four parts. Make into two-grain pills. They are administered with the juice of betel leaves.

NAT. ORDER. CRUCIFERÆ.

SINAPIS.

Sans. विद्वार्थ, Siddhartha. राजिका, Rajika. Vern. Sarisha, Rai Sarisha, Beng.

Two varieties of mustard are mentioned by Sanskrit writers, namely, siddhártha or white mustard, (Sinapis glauca of Roxburgh, Brassica campestris, L.) and rájiká or dark brown variety, (Sinapis ramosa of Roxburgh, Brassica juncea, Hooker, fil, et Thomson). The latter is more pungent and preferred for external application as a rubefacient. Mustard oil is largely used by the natives for culinary purposes as well as for anointing the body before bathing. Mustard oil anointment is said to keep the body cool, and the skin soft, to promote the growth of hair and to remove prurigo, lice and scurf. The leaves of the mustard plant are used as a pot-herb, and considered pungent and stomachic.

Mustard enters into the composition of emetic mixtures, of which the following is an example. Take of mustard seeds, Acorus Calamus root (vacha), bark of Symplocos racemosa (lodhra), and rock salt, equal parts. Powder and mix.1

Mustard forms an ingredient of several prescriptions for loss of appetite, indigestion, etc. Thus take of mustard seeds, cumin seeds, fried assafætida, ginger and rock salt, equal parts. Powder and mix. Dose, grains twenty-two with butter-milk.

Mustard is used externally, alone, or in combination with other medicines in a great variety of diseases, and notably in parotitis, sciatica, paraplegia, gout, inflammatory swellings, urticaria etc. Sárangadhara recommends the following application² in urticaria. Take of mustard seed, turmeric, pátchuk root, sesamum and the seeds of Cassia Tora (chakramardaka), equal

parts, and rub them together into a paste with mustard oil. In gout, sciatica, etc, simple mustard plasters are used. In inflammatory affections, the following poultice is prescribed by Sárangadhara. Take of the root of Boerhaavia diffusa (punarnavá), wood of Berberis Asiatica (dáruharidrá), root of Moringa pterygosperma (sobhánjana), ginger and mustard seeds, equal parts, and rub them into a paste with fermented rice water.²

LEPIDIUM SATIVUM. The seeds of Lepidium Sativum, called Chandra sura in Sanskrit, and Hálim in Hindi, are described as tonic and alterative, and useful in hiccup, diarrhœa, and skin diseases from disordered blood. It is said to be a very efficaceous remedy in hiccup, for which the Bhávaprakása gives the following formula. Hálim seeds are macerated in eight times their weight of water; when the seeds are softened they are rubbed in the water, and the emulsion strained through cloth. This emulsion is recommended to be given frequently in doses of about an ounce for the relief of obstinate hiccup.³

NAT. ORDER. CAPPARIDACEÆ. CRATÆVA RELIGIOSA.

Syn. Capparis trifoliata. Rox.

Sans. वर्ष, Varuna. चप्रारिञ्च, Asmarighna. Vern. Barun, Beng. Hind.

THE bark of the stem and root of this plant constitutes the principal medicine of the Hindu Pharmacopæia, for calculous affections. It is said to promote the appetite, increase the secretion of the bile, act as a laxative and remove disorders of the urinary organs.

¹ गौरसर्पेयकस्केन प्रदेशीया केजापहः। भावप्रकाशः।

² पुनर्नवांदारुश्युश्हों सिद्धार्थं शियुमेवन। पिक्षाचैवारनालेन प्रलेप: सर्खे-गोयहा। गाईधर:।

In calculous affections it is used in a great variety of forms. Thus a simple decoction of the bark may be given with the addition of treacle. A compound decoction is prepared along with equal parts of Tribulus terrestris (gokshura) and ginger, and is administered with the addition of yavakshára and honey. A compound powder called Varunádya churna is prepared as follows. A solution of the ashes of varuna is made as directed under the head of alkaline water (Kshárodaka). This solution is boiled with the addition of varuna bark in powder and yavakshára (impure carbonate of potash), till the water is entirely evaporated. The resulting powder is given in ascites, calculus, enlargements of the abdominal viscera, and affections of the bladder and uterus. A confection called Varunádya guda is prepared by adding to the fluid extract of the bark, treacle and a number of diuretic and aromatic substances.

Varunádya ghrita.⁴ Take of coarsely powdered varuna bark twelve seers and a half, water sixty-four seers, boil together till reduced to one-fourth and strain. To the strained decoction, add four seers of clarified butter, and two tolás each of the following substances in the form of a paste, namely, varuna bark, unripe

plantains, bela fruit, the five roots called trinaja pancha mulaka (see Sugar cane), gulancha, leaves of Coleus aromaticus (asmabheda), cucumber seeds, Acorus Calamus root, bamboo-manna, the ashes of Sesamum Indicum (tila), and of Butea frondosa (palása) and the root of Jasminum auriculatum (juthiká). Boil them together and prepare a ghrita in the usual way. It may be given in doses of one to two tolás, according to the constitution of the patient. After this medicine is digested, butter-milk and treacle should be taken.

Varunádya taila. This is an oil prepared with varuna bark, for injection into the bladder. Take of varuna bark and of the entire plant of Tribulus terrestris (gokshura), two seers each, water sixty-four seers, boil together till reduced to one-fourth and strain. Boil this strained decoction with four seers of prepared sesamum oil and half a seer each, of the above mentioned drugs in the form of paste. This oil is recommended to be injected into the bladder, for the relief of painful micturition, calculus and gravel.

In scrofulous enlargement of the glands under the lower jaw, a decoction² of varuna bark is prescribed by several writers. It is said to cure even old standing cases. In internal or deep seated suppurative inflammation, a decoction of varuna and Boerhaavia diffusa (punarnavá) is given internally.³

NAT. ORDER. MORINGACEÆ. MORINGA PTERYGOSPERMA.

Sans. शोभाञ्चन, Sobhánjana. शिद्य, Sigru.

This plant is cultivated all over the country for the sake of it's leaves, flowers, and seed vessels which are used by the natives

in their curries. The root is described as acrid, pungent, stimulant and diuretic. Applied externally it acts as a rubefacient. The seeds are described as acrid and pungent and are used externally as a stimulant. They are called Sveta maricha that is white pepper. The Bhávaprakása describes two varieties of sobhánjana, namely, white and red. The root of the white variety is said to be a stronger rubefacient, while that of the red, is preferred for internal use, for promoting the appetite and acting on the excretions.

In ascites and enlarged spleen, a decoction of the root-bark of Moringa pterygosperma and the leaves of Rumex vesicarius (amlaloniká) is given with the addition of long pepper, black pepper and rock salt in powder. In enlarged spleen and liver, a decoction of the root-bark is recommended to be given with the addition of plumbago root, rock salt and long pepper, or of the ashes of Butea frondosa (palása), or of yavakshára (impure carbonate of potash).2

In internal and deep seated inflammation and abscess (vidradh) a decoction of the root-bark is recommended to be given with the addition of assafætida and rock salt.³ The expressed juice of the root-bark is also given in these cases, with the addition of honey or rock salt.⁴ The root-bark is used externally in the shape of plaster, and the inflamed part is fomented with its decoction.⁵

⁵ स्वेदोपना हाः कर्त्तव्या शियुमूल समन्तिताः । चक्रदत्तः ।

In calculous affections the decoction of the root-bark is given internally.1

The seeds of Moringa pterygosperma enter into the composition of some stimulant applications. The following is an illustration. Take of the seeds of Moringa pterygosperma, rock salt, mustard seeds and putchuk root, equal parts, and reduce them to a paste with goat's urine. When dried this is used as a snuff for rousing comatose or drowsy persons.² The fresh juice of the root bark is recommended to be poured into the ears, for the relief of otalgia. The gum of the tree mixed with sesamum oil, is also used for the same purpose.³

NAT. ORDER. GUTTIFERÆ. MESUA FERREA.

Sans. नामकेशर, Nágakesara. Vern. Nágkesar. Beng. Hind.

The dried flowers of Mesua ferrea are much used as a fragrant adjunct to decoctions and oils. They are regarded as astringent and stomachic and useful in thirst, irritability of the stomach, excessive perspiration etc. A paste of the flowers with the addition of butter and sugar is recommended by most of the later writers, to be taken in bleeding piles.⁴ The powdered flowers mixed with old clarified butter, that has been washed a hundred times in water, are said to be an effectual application in burning of the feet.⁵

NAT. ORDER. DIPTEROCARPEÆ, SHOREA ROBUSTA.

Sans. शान, Sála, अञ्चलकर्ष, Asvakarna.

The resin of Shorea robusta, called Rála in Sanskrit and Dhuná or rál, in the vernacular, is regarded as astringent and detergent and is used in dysentery, and for fumigations, plasters, etc. The resin thrown over the fire, gives out thick volumes of fragrant smoke, and is much used for fumigating rooms occupied by the sick. It is also a common practice with natives to burn some rál in their rooms every evening, about the time that chirags or lamps are lighted, as also during the worship of idols.

In the dysentery of children rál is recommended to be given in doses of about twenty grains, with an equal quantity of sugar or treacle.¹

Rál enters into the composition of some plasters and ointments. The following is an illustration. Take of rál, rock salt, treacle, wax, honey, bdellium, red ochre and clarified butter, in equal parts, boil them together and prepare an ointment.²

NAT. ORDER. MALVACEAE. SIDA CORDIFOLIA.

Sans. बना, Balá. बाट्यानक, Bátyálaka. Vern. Berela, Beng. Khareti, Hind.

Four varietes of balá are mentioned by Sanskrit writers, namely, Bátyálaka, (Sida cordifolia). Mahábalá, (Sida rhomboidea.)*
Atibalá, (Sida rhombifolia). Nágabalá, (Sida alba). The roots of all these species, are regarded as cooling, astringent, tonic and useful

^{*} This is only a variety of Sida rhombifolia, L.

¹ श्वेतीया यदि वा रक्तः श्रुपको यहणीगदः गुड़े नाधिकसर्जेन भित्ततेनाशु-नश्चित । भावप्रकाशः ।

in nervous diseases, urinary diseases and disorders of the blood and bile. In intermittent fever, a decoction of the root of Sida cordifolia and ginger is given. It is said to be useful in fevers with cold shivering fits, followed by strong heat of body. The powder of the root-bark is given with milk aud sugar, for the relief of frequent micturition and leucorrhea.

In diseases of the nervous system, such as insanity, paralysis, facial palsy, etc. the root of Sida cordifolia is used alone or in combination with other medicines, as in the following, called Másha baládi kvátha. Take of the pulse of Phaseolus Roxburghii (másha), root-bark of Sida cordifolia (balá), root of castor oil plant and of Mucuna pruriens (átmaguptá), Hygrophila polysperma (katrina), Vanda Roxburghii (rásná), and Withania somnifera (asvagandhá), equal parts, in all two tolas, and prepare a decoction in the usual way. It is administered with the addition of assafætida and rock salt, in hemiplegia, stiff neck, facial paralysis, and noise in the ears with headache. An oil for external application in these diseases, called Balátaila4 is thus prepared. Take of the root of Sida cordifolia, four seers, water, thirtytwo seers and boil down to eight seers. To this decoction, add eight seers of milk, four seers of prepared sesamum oil, and one seer of the root of Sida cordifolia in the form of paste, and prepare an oil in the usual way.

BOMBAX MALABARICUM.

Sans. शानुमनी, Salmali, भोचा, Mochá.

Vern. Simul, Rakta Simul. Beng.

"THIS is one of the largest of our Indian trees, often about one hundred feet high and the trunk thick and ramous in proportion. Flowering time the end of winter, when the tree is totally destitute of leaves. The great numbers of very large bright red flowers with which it is then covered make it remarkably conspicuous at a very great distance." The thick stems are used for making large boats called kondas, from their being made by hollowing out the trunks. Some of these boats are large enough to carry a freight of a thousand maunds. The smaller floats are in very common use in Eastern Bengal, for crossing over rice fields during the rainy season. In fact during the rains these little floats, constitute the only mode of conveyance from village to village in low alluvial tracts. The thick beds and pillows of the natives are stuffed with the Cotton attached to the interior of the seed vessels of this plant, while the thin quilts and stuffed clothing for winter, are made with kárpása (cotton of Gossypium herbaceum).

The gum of this tree, called mocharasa is used in medicine.* It is considered astringent, tonic and alterative, and is used in diarrhœa, dysentery and menorrhagia. Mocharasa with sugar in equal parts, is given in doses of twenty to forty grains, in the diarrhœa of children. In the dysentery of children, the following is used. Take of mocharasa, flowers of Woodfordia floribunda (dhátaki),

^{*} In the Pharmacopæia of India it is stated. "To this tree (Bombox Malabaricum), which is common in some parts of India, two drugs which hold a prominent place in the Native Materia Medica, have been usually but erroneously referred. 1. An astringent gummy exudation, Mucherus (Hind). Its botanical source is unknown. 2, Dried roots well known as Safed Musli (Hind)." The Sanskrit term Mocharasa of which the Hindi Mucherus is a corruption, means the juice or exudation of the Mocha tree, and Mocha is one of the sanskrit names of Bombax Malabaricum. Hence there can be no error in attributing the origin of Mucherus to Bombax Malabaricum. Safed Musli is the Tàlamuli of Sanskrit Materia Medica, the Hypoxis orchioides of Botanists.

root of Mimosa pudica (lajjálu), and the filaments of the lotus, equal parts, in all one tolá, powdered rice one tolá, water eleven tolás, and boil together to the consistence of a gruel (yavágu). In the dysentery of adults a decoction of bela fruit in goat's milk, is given with the addition of powdered mocharasa and indrajava seeds.²

HIBISCUS MOSCHATUS. Sans. जनामस्तिः Latá-kasturiká, Vern. Latàkasturi Beng. The scented seeds of this plant are much used in perfuming medicinal oils. They also enter into the composition of some compound prescriptions, being regarded as cooling, tonic and carminative.

PAVONIA ODORATA. Sans. बाजा Bálá, होबर Hrivera. Vern. Sugandha bálá, Hind. The fragrant roots of this plant are considered aromatic, cooling and stomachic and are much used in combination with other medicines of the sort in fever, inflamwation, hemorrhage from internal organs etc. Bálá enters into the composition of a well-known fever drink called shaḍanga pániya, (see Andropogon muricatum).

NAT. ORDER STERCULIACEÆ.

Pterospermum suberifolium. Sans. सन्द, Muchukunda. The flower of this tree, rubbed into a paste with kánjika is an ancient and well known application for hemicrania. It is mentioned by many writers and is used even at the present day, as a domestic remedy.3

NAT. ORDER GERANIACEÆ. OXALIS CORNICULATA.

Sans. अञ्चलोणिका, Amlaloniká. चार्झरी, Chángerí.

Vern. A'mrulsák, Beng.

The leaves of Oxalis corniculata are used as a pot-herb. They are considered cooling, refrigerant, appetizing and stomachic. The fresh juice of the leaves is given to relieve intoxication from datura, and is said to be useful in dysentery and prolapsus of the rectum, for which it is recommended by most writers. Chakradatta gives the following formula for preparing a ghrita with this medicine.

Chángeri ghrita. Take of clarified butter, four seers, the fresh juice of Oxalis corniculata, four seers, curdled milk called dadhi, sixteen seers and the leaves of Oxalis corniculata reduced to a paste, one seer. Boil them together in the usual way and prepare a ghrita. This preparation is said to be useful in diarrhæa, dysentery, prolapsus of the rectum, tympanites, piles and difficult micturition. The Bhávaprakása gives the following process for preparing a compound ghrita. Take of the fresh juice of Oxalis corniculata, decoction of jujube fruits and ginger, alkaline water (see Alkalies), and curdled milk, each four seers, clarified butter four seers, and prepare a ghrita in the usual way. It is recommended for use in prolapse of the rectum.

AVERRHOA CARAMBOLA. Sans. कर्फर्ड, Karmaranga. Vern. Kámrángá, Beng. and Hind. The five-angled fruits of this plant contain an acid watery pulp, and are eaten raw as well as in curries. They enter into the composition of some cooling medicines for fever and other diseases.

NAT. ORDER ZYGOPHYLLACEÆ.

TRIBULUS TERRESTRIS.

Sans. गोचरी, Gokshuri. इच् गन्धा, Ikshugandhá.

Vern. Gokhuru, Beng. Hind.

This plant is also called Sthala sringátaka and Trikantaka, from the resemblance of its fruits to those of Trapa bispinosa and from their being armed with three spines. The entire plant but more particularly the fruits are used in medicine. They are regarded as cooling, diuretic, tonic and aphrodisiac and are used in painful micturition, calculous affections, urinary disorders and impotence. The fruits constitute an ingredient of Dasamula (see Desmodium gangeticum).

A decoction of the fruits is given with the addition of yava-kshára (impure carbonate of potash), in painful micturition. A decoction of the entire plant is given with silájatu (a bituminous substance) and honey, in the same affection. Equal parts of gokhuru and sesamum seeds, taken with goat's milk and honey, is said to cure impotence arising from bad practices.

Gokshurádya valeha³ or electuary of gokshuri is prepared as follows. Take of the entire plant of Tribulus terrestris, twelve

seers and a half, water, sixty-four seers and boil till reduced to one-fourth. To the strained decoction, add six seers and a quarter of sugar and again boil till reduced to the proper consistence for an electuary; then add the following substances in fine powder, namely, ginger, long pepper, black pepper, cinnamon, cardamoms, flowers of Mesua ferrea (nágakesara), leaves called tejapatra, nutmeg, bark of Terminalia Arjuna, and cucumber seeds, each sixteen tolás, bamboo-manna half a seer, and prepare an electuary. It is given in doses of two tolás, in painful micturition, suppression of urine, bloody urine, calculous affections etc.

NAT. ORDER RUTACEÆ. CITRUS.

The different species of Citrus described by Sanskrit writers are as follows.

जन्दीर, Jambira. Vern. Goránebu, Beng. Citrus acida. Roxb. Var. 3 विस्मान, Limpáka. Vern. Pátinebu, Beng. do. do. 1 विस्मान, Nimbuka. Vern. Kágujinebu, Beng. do. do. 2 वीजपूर, Vijapura. Vern. Tabánebu, Beng. do. do. 7 सधननेदिना, Madhukarkaṭiká, Vern. Miṭhánebu, Beng. do. do. 9 साहबङ्ग, Matulunga. Vern. Chholonga nebu, Beng. Citrus medica. करणा, Karuná, Sans. and Beng. Citrus medica, variety of. नागरङ्ग, Nágaranga. Vern. Kamlánebu, Beng. C. Aurantium.

The variety of Citrus acida,* called Jambira, yields the lemon juice used in medicine. Limpáka or páti nebu is much used as a sauce by the natives. The fruits are cut vertically into two pieces, and the fresh juice, squeezed out with the fingers, is sprinkled on soup, dál, curry etc. to which it imparts a pleasant acid taste and agreeable flavour. A pickle of páti nebu, in its own juice, and salt is a popular and effectual medicine for indiges-

^{*} Citrus acida is itself a variety of the Citrus medica of Linnæus to which species C. Limonum, C. Limetta and C. Lumia are also reduced.

CITRUS. 127

tion brought on by excess in eating, or by undigestible articles of diet. The fruits are first rubbed over a stone, or their rind scraped a little so as to thin it. They are then steeped in juice obtained from other fruits of the sort, and exposed to the sun for a few days with the addition of common salt. When crisp and of a brown colour, they are preserved in porcelain vessels or glass jars. This preparation is called Járak nebu (that is digestive lemon) in the vernacular.

The variety of Citrus acida called káguji nebu has larger fruits than that of páti nebu, and is also used as sauce like the latter, but its flavour and the fragrance of the essential oil in its rind is not so delicious.

Citrus Aurantium, or the sweet orange, comes from the valleys of the Khasia Hills and of the eastern Himalaya. It is called kamlá nebu in Bengali. The variety grown in the plains has an acid taste and is called nárengá in the vernacular.

The Sanskrit term karuná nimbu is variously translated by different authorities. Wilson in his Sanskrit dictionary calls it Citrus decumana. In the Hortus Bengalensis it is translated into Citrus medica, while Drury and other Madras authorities make the variety Citrus Limonum. The Sabdakalpadruma does not give any synonym or vernacular term for it, so that it is difficult to say, what form it really meant. In the vernacular the term karuná is applied to a variety of Citrus medica.

Citrus decumana has I believe no Sanskrit name. In the vernacular it is called Bátávi nebu, from its having been originally brought from Batavia. It is now much cultivated in gardens and is one of the common edible fruits of the country. Some varieties of the fruit have a pleasant taste and aroma, with little or no acidity.

Madhukarkatiká. This variety of Citrus medica is probably the one described by Roxburgh as Mithá nebu, that is sweet lemon. The variety of Citrus which has very large oblong fruits, almost equal in size to the shaddock, and the thick spongy rind of which constitutes the largest portion of the fruit, was shewn to me by a

gardener in Malda, under the name of madhukarkati. The pulp of this variety is very limited in quantity, of a bland sweetish taste and without any aroma or acidity.

Lemon juice is considered cooling, refrigerant stomachic and useful in indigestion, dyspepsia, vomiting of meals, thirst, burning of the body, intoxication from spiritious drinks or narcotics, etc. Fresh lemon juice is recommended to be taken in the evening, for the relief of dyspepsia with vomiting of meals. It enters into the composition of several carminative medicines for dyspepsia, such as the *Hingváshṭaka* (see Assafætida), *Kravyádi churna* etc.

In rheumatic affections such as pleurodynia, sciatica, lumbago, pain in the hip joints etc., Sárangadhara recommends the administration of lemon juice with the addition of yavakshára (impure carbonate of potash) and honey.²

Rasáyanámrita lauha.³ Take of long pepper, black pepper, ginger, the three myrobalans, báberung seeds, cumin and nigella seeds, ajowan and the seeds of Cnidium diffusum (vanajamáni), chiretta, trivrit, root of Baliospermum montanum (danti), nim bark, and rock salt, each two tolás, prepared iron sixteen tolás, sugar two seers, decoction of the three myrobalans four seers, and lemon juice two seers. Boil all these ingredients together till the watery portion is evaporated, lastly add clarified butter, half a seer and

prepare a confection. Dose one to two tolás, in enlargements of the abdominal viscera, anæmia, jaundice, anasarca and chronic fever.

In fever complicated with pain in the head, throat and chest, the following mixture is directed to be used as a snuff for promoting discharge of phlegm. Take of lemon juice, ginger juice, rock salt, black salt, and sonchal salt, equal parts, and mix. The mixture should be warmed a little before use.

The root of the variety of Citrus acida, called limpáka constitutes one of the principal ingredients in the composition of a medicine called Yakridari lauha, described under Iron.

ÆGLE MARMELOS.

Sans. face, vilva. Vern. Bela, Beng. Hind.

The Ægle Marmelos is held in great veneration by the Hindus. It is sacred to Siva whose worship cannot be accomplished without its leaves. Hence this tree is always met with near temples dedicated to Siva. It is incumbent on all Hindus to cultivate and cherish this tree, and it is sacrilegious to up-root or cut it down. The Hindu who expires under a bela tree, expects to obtain immediate salvation, notwithstanding that he may have committed innumerable sins.

The Ægle Marmelos is used in medicine in a variety of ways. The unripe or half ripe fruit is regarded as astringent, digestive and stomachic and as useful in restraining discharges from the alimentary canal. The ripe fruit is described as sweet, aromatic, cooling and laxative. It is not easily digested and has a tendency to cause flatulence. The dried pulp of the fruit, called Vilva peshiká in Sanskrit, is regarded as astringent and a specific for dysentery. The root-bark is considered useful in diseases supposed to be caused by deranged air. It constitutes an ingredient of dasamul or the ten roots, (see Desmodium gangeticum.) The fresh juice of the leaves is given with honey as a domestic laxative and febrifuge.

The dried pulp of the fruit is given with treacle, in recent dysentery with griping, pain in the loins and costiveness. A compound powder is prepared with equal parts of dried bela, tubers of Cyperus rotundus (mustaka), flowers of Woodfordia floribunda (dhátaki), root of Stephania hernandifolia (páthá) ginger and mocharasa. It is given in doses of twenty-two to forty-four grains with buttermilk and treacle. In the dysentery of children, a decoction and an electuary of the following drugs is used, namely dried bela, fruits of Pothos officinalis (gajapippuli), root of Pavonia odorata (bálá), flowers of Woodfordia floribunda (dhátaki), and bark of Symplocos racemosa (lodhra), in equal parts.

A decoction of the root of Ægle Marmelos,⁴ is given with sugar and fried rice, for checking diarrhœa and gastric irritability in infants.

The fresh juice of the leaves is given, with the addition of black pepper, in anasarca with costiveness and jaundice.⁵ In external inflammations, the juice of the leaves is given internally, to remove the supposed derangement of the humours.

Vilva taila is thus prepared.6 Take of dried bela fruits, twelve , seers and a half and boil in sixty-four seers of water, till reduced

to one-fourth. To the strained decoction, add four seers of prepared sesamum oil and six tolás each of the following substances, in the form of paste, namely, Vanda Roxburghii (rásná). Boerhaavia diffusa (punarnavá), Aplotaxis auriculata (kushṭa), ginger, dried bela, flowers of Woodfordia floribunda (dhátaki), wood of Pinus deodara (devadáru), bark of Symplocos racemosa (lodhra), tubers of Cyperus rotundus (mustaka), Acorus Calamus (vachá), and gum of Bombax Malabaricum (sálmaliveshṭa), and prepare an oil in the usual way. This oil is used externally in chronic bowel complaints.

FERONIA ELEPHANTUM.

Sans. कपिस Kapittha. Vern. Kathbel, Beng. Kaith, Hind.

THE wood apple tree is met with throughout India and is cultivated for the sake of the fruits, the pulp of which is edible. A chátni, made of the ripe pulp with the addition of oil, salt, tamarind and spices, is esteemed by many. The unripe fruit is described as astringent and is used in combination with bela and other medicines in diarrhœa and dysentery. The ripe fruit is said to be useful in hiccup and affections of the throat. The leaves are aromatic and carminative.

Kapittháshṭaka churna.¹ Take of the pulp of unripe wood apples eight parts, sugar six parts, pomegranate juice, tamarind

Dose, about one drachm. This preparation is used in chronic diarrhæa and dysentery with loss of appetite and in affections of the throat.

XANTHOXYLUM HOSTILE. Sans. 37. Tumburu. Vern. Nepáli dhaniá, Tumri, Hind. The aromatic and pungent fruits of this plant, resemble coriander in appearance and are used as aromatic adjuncts, in compound prescriptions and in perfuming medicinal oils.

NAT. ORDER BURSERACEÆ. BALSAMODENDRON MUKUL.

Syn. Balsamodendron Agallocha.

Sans. गुम्माल, Guggulu. Vern. Guggul. Beng. Hind.

Guggulu or Indian bdellium is obtained by making incisions in the tree, through which the gum resin exudes. According to Sanskrit writers, new or recently exuded guggulu is moist, viscid, fragrant and of a golden colour. It burns in the fire, melts in the sun and forms a milky emulsion with hot water. Old guggulu is dry and without flavour or colour; it should not be used in medicine.

Guggulu is said to be demulcent, aperient, alterative and a purifier of the blood. It is used in rheumatism, nervous diseases, scrofulous affections, urinary disorders, and skin diseases. In rheumatism it is used in a great variety of forms. The following called Yogarája guggulu is a favourite preparation.

यमानीञ्च चात्रज्ञीतं सचित्रकम्। नागरञ्जैकभागाः खुः प्रत्येकं स्त्रच्याचूर्निताः। कपित्याष्टक संज्ञं खात् चूर्णमेतद्गलामयान्। अतीसारं चयञ्जैन पहणीञ्च व्यपो-इति। शाङ्गिरः।

Yogarája guggulu. 1 Take of plumbago root, long pepper root ájowan, seeds of Nigella sativa (kálájirá), báberang seeds, seeds of Carum Roxburghianum (ajamodá), cumin seeds, Pinus Deodara (devadáru), Chavica officinarum (chavya), cardamoms, rock salt, root of Aplotaxis auriculata (kushtha), root of Vanda Roxburghii (rásná), fruits of Tribulus terrestris (gokshura), coriander, the three myrobalans, tubers of Cyperus rotundus (mustaka), long pepper, black pepper, ginger, cinnamon, root of Andropogon muricatus (usira), yavakshára (impure carbonate of potash), leaves of Pinus Webbiana (tálisapatra) and the leaves called tejapatra, one part each, in fine powder, bdellium in quantity, equal to all the above ingredients. Rub them together with clarified butter and preserve the preparation in an earthen pot smeared with clarified butter. Dose from a half to one tolá. It is given in rheumatic affections and other diseases supposed to be caused by deranged air in unhealthy ulcerations, affections of the joints etc. Another preparation called Trayodasánga guggulu is similar in composition to the above. It is made with thirteen aromatic adjuncts, hence its name, and is recommended for use in rheumatism affecting the loins and the sacrum. In rheumatism affecting the joints and bones the following preparation called A'dityapáka guggulu2 is used. Take

of the three myrobalans and long pepper each eight tolás, cinnamon and cardamoms four tolás each; powder the ingredients finely and soak for seven days in a decoction of the ten drugs, called dasamula (see Desmodium gangeticum). Then add forty tolás of guggulu and beat together into a uniform mass. Dose, half to one tolá.

Vatári rasa ¹ This preparation is used in paralysis and nervous diseases. To prepare, it take of mercury one part, sulphur two parts, the three myrobalans, three parts in all, plumbago root four parts and pure guggulu five parts. Rub them together with castor oil for twelve hours, then add to the mass the compound powder, called Hingvastaka (see Assafætida), in weight equal to all the above ingredients, and again rub together for twelve hours. Dose, about half a drachm.

Kaisara guggulu.² Take of pure bdellium, gulancha and the three myrobalans, each two seers, water ninety-six seers. First boil the gulancha and the myrobalans in the water till the latter is reduced to one-half, and strain the decoction; to the strained fluid add the bdellium and boil in an iron vessel till the whole is reduced to the consistence of treacle. Now add to it the following

गुग्गु वोवटकी कतः। एष मां पर सां पर

thurifera), is called Kunduru in Sanskrit. It is used as an incense and as a local application to buboes.1

MYRRH is called *Vola* in Sanskrit and is described as an article to be had in the *beniah's* shop, thereby implying it to be an imported drug. It is said to be useful in fever, epilepsy and uterine affections, but is not much used in practice.

NAT. ORDER MELIACEÆ. AZADIRACHTA INDICA.

Sans. faca, Nimba. Vern. Nim, Beng. Hind.

This useful tree is indigenous to India and is cultivated all over the country for the sake of its bark, leaves and fruits. These have been used in Hindu medicine from a very remote period. The bark is regarded as bitter, tonic, astringent and useful in fever, thirst, nausea, vomiting and skin diseases. The bitter leaves are used as a pot-herb being made into soup or curry with other vegetables. The slightly aromatic and bitter taste which they impart to the curries thus prepared, is much relished by some. The leaves are moreover an old and popular remedy for skin diseases. The fruits are described as purgative and emollient and useful in intestinal worms, urinary diseases, piles etc. The oil obtained from the seeds is used in skin diseases, and ulcers.

The bark is used in fever in combination with other medicines for this disease as for example, in the following compound decoction called Amritáshṭaka.² Take of nim bark, gulancha, root of Picrorrhiza Kurroa (katuki), tubers of Cyperus rotundus (mustaka), seeds of Holarrhena antidysenterica (indrayava), leaves of

Momordica dioica (patala), ginger and red sandal wood, each quarter of a tolá, water half a seer, boil till reduced to one-fourth. This decoction is given with the addition of honey and long pepper in fever supposed to be caused by deranged phlegm and bile and attended with vomiting, nausea, thirst and lassitude.

The fresh juice of the leaves is given with salt in intestinal worms, and with honey in jaundice and skin diseases. The juice of nim leaves and of emblic myrobalans, quarter of a tolá each, are recommended to be given with the addition of clarified butter in prurigo, boils and urticaria. Nim enters into the composition of several compound preparations used in skin diseases, such as the Pancha tikta ghrita, Pancha nimba guḍiká, Pancha kasháya, etc.

Pancha tikta ghrita.² Take of nim bark, leaves of Momordica dioica (patala), Solanum Jacquinii (kantakári), gulancha, and bark of Adhatoda vasica (vásaka), each eighty tolás, and boil them in sixty-four seers of water till it is reduced to one-fourth. To the strained decoction, add four seers of clarified butter and a seer of the three myrobalans in the form of a paste, and prepare a ghrita in the usual way. This preparation is given in doses of three to six drachms in chronic skin diseases.

As an external application to ulcers and skin diseases, nim leaves are used in a variety of forms such as poultice, wash, ointment and liniment.³ A poultice made of equal parts of nim leaves

NAT. ORDER ANACARDIACEÆ. RHUS SUCCEDANEA, Linn.

Sans. वर्त्र द्राष्ट्री, Karkatasringi. Vern. Kákrásringi, Beng. Kakarsing, Hind.

THE horn-like excrescences caused by insects on the branches of Rhus Succedanea are called karkatasringi. They "are large, hollow, thin-walled, generally cylindrical, tapering to either extremity." They are considered tonic, expectorant and useful in cough, phthisis, asthma, fever, want of appetite and irritability of stomach. Dose, about twenty grains. This medicine is much used in cough, in combination with other drugs for the disease. The following is an example. Take of karkatasringi, root of Clerodendron Siphonanthus (brahmayashti), raisins, ginger, long pepper and Curcuma Zedoaria (sati), equal parts, powder and mix. Dose, about thirty grains with treacle or honey, in dry cough. In catarrhal fever with difficult breathing a powder composed of equal parts of karkatasringi, bark of Myrica sapida (katphala), and long pepper is recommended to be given in doses of about a drachm, with honey.2 The following called Sringyádi churna is much esteemed as a cough linetus for children. Take of karkatasringi; átis, and long pepper, equal parts; powder and make into a linctus with honey.3

MANGIFERA INDICA, Linn.

Sans. 到時, A'mra. Vern. A'm. Beng. Hind.

THE Mango is well known as the most delicious of Indian fruits. The ripe fruit is somewhat laxative and useful to persons

of constipated habits. The bark and kernel are regarded as astringent and useful in hæmorrhages, diarrhæa and other discharges.

In diarrhea, a decoction of the kernel is given alone or in combination with bela and ginger. In bleeding from the nose the juice of the kernel is recommended to be snuffed. In bleeding from internal organs, a cold infusion of the barks of Mangifera Indica, Eugenia Jambolana, and Terminalia Arjuna is prescribed. This infusion is also used in diarrhea. The Bhávaprakása recommends a confection made of the juice of the ripe mango sugar and aromatics, for use as a restorative tonic.

SEMECARPUS ANACARDIUM, Linn.

Sans. अज्ञातक, Bhallátaka. अरुकार, Arushkara.

Vern. Bhelá. Beng. Hind.

THE acrid juice of marking nuts is a powerful vesicant and is often employed by the natives for producing fictitious marks of bruises. These can be distinguished from actual bruises caused by blows with a stick or other weapon, by their deep bluish-black colour and from their presenting small vesicles or minute blisters on their surface.

The practice of causing blisters by the application of the juice of marking nuts among the Hindus appears to have been at one time very common, for in our ancient medical works a section or paragraph is generally devoted to the treatment of ulcerations thus produced.

The ripe fruits are regarded as acrid, heating, stimulant, digestive, nervine and escharotic, and are used in dyspepsia, piles

skin diseases, nervous debility, etc. They are prepared for internal use by being boiled with cow-dung and afterwards washed with cold water. Equal parts of marking nuts, chebulic myrobalans and sesamum seeds, are made into a confection with treacle and administered in doses of forty to sixty grains.¹

Amrita Bhallátaki.² Take of ripe marking nuts divided into halves, eight seers, boil them in thirty-two seers of water till the latter is reduced to one-fourth and strain. Again boil the nuts in sixteen seers of milk with the addition of four seers of clarified butter, till reduced to a thick consistence. Then add sugar two seers and set aside for seven days, when the prepartion will be ready for use. It is described as a powerful restorative tonic, which increases the appetite, promotes nutrition and strength, prolongs life and so forth. It is used in hæmorrhoids and other diseases of the rectum. Dose, about one to two scruples. Another confection of marking nuts, made with the addition of a number of aromatic substances, is recommended for use in skin diseases and leprosy.

Marking nuts enter into the composition of some caustic applications for warts and piles. They form an ingredient of a liniment for rheumatic affections called Saindhavádyataila, for which see Ginger.

NAT. ORDER LEGUMINOSÆ. SARACA INDICA, Linn.

Syn. Jonesia Asoca, Roxb.

Sans. अयोक, Asoka. Vern. Asok, Hind. Beng.

Dr. Roxburgh says, "when this tree is in full blossom I do not think, the whole vegetable kingdom affords a more beautiful object." It is famed in Hinda mythology from the circumstance of Sita the wife of Rámchandra, having been confined by Rávana in a grove of asoka trees. The bark is much used by native physicians in uterine affections and especially in menorrhagia. A decoction of the bark in milk, is prepared by boiling eight tolás of the bark in eight tolás of milk and thirty-two tolás of water till the latter is evaporated. This quantity is given in two or three divided doses during the course of the day, in menorrhagia. A ghrita called Asoka ghrita is prepared with a decoction of the bark and clarified butter with the addition of a number of aromatic substances in the form of a paste.

GLYCYRRHIZA GLABRA, Linn.

Sans. यष्टिमधु, Yashti madhu, मधुक, Madhuka. Vern. Jashti madhu, Beng. Mulhatti. Hind.

LIQUORICE root, though not indigenous to India, has been used in Hindu Medicine from a very remote period, and is mentioned by Susruta. It is described as sweet, demulcent, cooling and useful in inflammatory affections, cough, hoarseness, thirst etc. It is much used for flavouring medicinal decoctions, oils and ghritas. It enters into the composition of numerous external cooling applications along with red sandal wood, madder, Andropogon muricatus

etc. I have not met with any notice in Sanskrit works, of the watery extract of liquorice, sold in the bazars in the shape of black pencils, and called *Rubas sus* in Hindustani.

TRIGONELLA FŒNUM-GRÆCUM, Linn.

Sans. मेचि, Methi. Vern. Methi, Hind. Beng.

The Trigonella Fanum-gracum is extensively cultivated in many parts of India. Its seeds are used as a condiment and its aromatic leaves, as a pot-herb. Fenugreek seeds are considered carminative, tonic and aphrodisiac. Several confections made with this article are described under the names of Methi modaka, Svalpa methi modaka etc., and are recommended for use in dyspepsia with loss of appetite, in the diarrhæa of puerperal women and in rheumatism. All these preparations consist of a number of aromatic substances, one part each, and fenugreek seed equal in quantity to all the other ingredients. The following is an illustration.

Methi modaka.¹ Take of the three myrobalans, ginger, long pepper and black pepper, tubers of Cyperus rotundus (mustaka), nigella and cumin seeds, coriander, bark of Myrica sapida (katphala), pátchak root, Rhus succedanea (karkatasringi), ajowan, rock salt, black salt, leaves of Pinus Webbiana (tálisa), flowers of Mesua ferrea (nágakesara), tejpatra, cinnamon, cardamom, nutmegs, mace, cloves, sandal wood and camphor one part each; fenugreek seed, in quantity equal to all the above ingredients; powder them all and prepare a confection with old treacle. Dose, one to two drachms to be taken in the morning with clarified butter and honey.

ALHAGI MAURORUM, Tournef.

Sans. द्वरसम, Duralabhá, यवास, Yavása. Vern. Yavása Hind.

This plant is described as laxative, diuretic and expectorant. The thorny flower-stalks or branches are supplied by druggists as the parts used in medicine. An extract obtained by evaporating a decoction of the plant is called yásasarkará or the sugar obtained from yavása. It has a sweetish bitter taste, and is used as a demulcent in the cough of children. There is no mention in Sanskrit of any saccharine exudation or manna obtained from this plant.

The fresh juice of the plant is used as a diuretic in suppression of urine. The following compound decoction is recommended by Sárangadhara in constipation with suppression of urine. Take of Alhagi Maurorum, chebulic myrobalans, pulp of Cassia Fistula (áragbadha), fruits of Tribulus terrestris (gokshura), and root of Coleus aromaticus (páshanbhid), prepare a deoction in the usual way, and administer it with honey. The following electuary is recommended by several writers for the cough of children. Take of the extract of yavása, raisins, chebulic myrobalans and long pepper in equal parts, powder and mix with honey and clarified butter.²

DESMODIUM GANGETICUM, DC.

Syn. Hedysarum Gangeticum. (Roxb.)

Sans. VIETUT, Sálaparni. Vern. Sálpáni, Beng. Sarivan, Hind.

This little shrub is regarded as febrifuge and anti-catarrhal. It forms an ingredient of the compound decoction called dasamula kvatha a combination, much used in a great variety of diseases. Dasamula is made up of Desmodium Gangeticum (sálaparni), Uraria lagopodioides (prisniparni), Solanum Jacquinii (kantakári), Solanum Indicum (vrihati), Tribulus terrestris (gokshura), Ægle Marmelos (vilva), Calosanthes Indica (syonáka), Gmelina arborea (gambhári), Stereospermum suaveolens (pátalá) and Premna spinosa (ganikáriká).

¹ हरोतकी दुरासभा सतमासक गोस्त्रः। पाषाणभेदसहितः काष्यामास्तिक संयुतः। विवस्त्र नृत्र सक्षेत्र सदाहेस र जेहितः पार्क् धरः।

र द्राचा यासाभया क्रणा चूर्णं सर्वोद्र सर्विषा। स्रीढं सासं निह्नस्याशु कासञ्चतमकं तथा। चक्कदत्तः।

The first five in the above list, are collectively called hrasvapancha mula or the five minor plants, and the last five are called vrihat pancha mula or the five major plants. A decoction of the hrasva pancha mula is used in catarrhal fever, cough and other diseases supposed to be caused by deranged phlegm. The vrihat panchamula is used in fever and other diseases supposed to be caused by deranged air. The ten drugs together are used in remittent fever, puerperal fever, inflammatory affections within the chest, affections of the brain and many other diseases supposed to be caused by derangement of all the humours.1 Another combination called Ashtádasánga páchana consists of the ten drugs above mentioned, with the addition of the eight following, namely, chiretá, devadáru, ginger, tubers of Cyperus rotundus (mustaka), root of Picrorrhiza Kurroa (katuki), indrajava seeds, coriander, and fruits of Pothos officinalis. A decoction of these eighteen drugs is used in fevers of a severe type with drowsiness, delirium, picking of bed clothes, insensibility, and difficult breathing. A preparation of aconite and arsenic is generally given along with it.2

Dasamula taila. This is an oil prepared with a decoction of the ten drugs above mentioned, and is much used as a cooling application in headache and other diseases. To prepare it take of the ten drugs, in all twelve seers and a half, water sixty four seers. Boil down to sixteen seers and strain. To the strained decoction add four seers of lemon juice, four seers of prepared sesamum oil and a seer of the usual aromatics and colouring agents in the form of a paste and boil them together.

URARIA LAGOPODIOIDES, Dc. Edgew. Syn. Doodia lagopodioides Roxb. Sans. ध्रांत्रपणी, Prisniparni. Vern. Chákuliá, Beng. Pitvan, Hind. This plant is an ingredient of the dasamula above described, and is thus much used in native medicine. It is considered alterative, tonic and anti-catarrhal, but is seldom used alone.

CLITOREA TERNATEA, Linn.

Sans. श्रापराजिता, Aparájitá, विष्णुकाना, Vishnukrántá. Vern. Aparájitá, Beng. Aprájit, Hind.

The root of Clitorea ternatea is regarded as laxative and diuretic, and is generally used in combination with other medicines of the sort in ascites, fever, etc. The following is an example of a prescription containing aparájitá root. Take of the roots of aparájitá, Pladera decussata (sankhini), Baliospermum montanum (danti) and Indigofera tinctoria (nilini), in equal parts, rub them together into an emulsion with water and administer with cow's urine. This preparation is given in ascites and enlargements of the abdominal viscera.¹

MUCUNA PRURIENS, DC.

Sans चात्रगुप्ता, A'tmaguptá. कपिकच्छ, Kapikachchhu. वानरी, Vánari. Vern. A'lkusi, Beng. Kiwach, Hind.

The English names Cowage or Cowitch are derived from the Hindi Kiwach. The plant is indigenous to India and has been used in Hindu medicine from a very ancient period. Susruta describes the seeds as a powerful aphrodisiac, and gives the following formula for their use. Take of the seeds of Mucuna pruriens and the fruits Tribulus terrestris (gokshura) equal parts and administer in doses of about a drachm with sugar and tepid milk.² The Bháva-

¹ गवाची पश्चिनो दनो नी जिनोक्त संयुतम्। सर्वोदरिवनाथाय गोमूत्रं पातुमाचरेत्।। चनः।

² स्वयं ग्रेते जुरकयो की ज चूर्ण सगर्करम्। धारो च्यो न नरः पीत्वा पयसा न चयं व्रजेत्। स्थान

Take of the seeds of Mucuna pruriens thirty two tolás, boil them in four seers of cow's milk till the latter becomes thick. The seeds should now be decorticated and pounded, then fried in clarified butter and made into a confection with double their weight of sugar. The mass should then be divided into balls which should be steeped in honey. Dose, about a tolá. This preparation is said to be the best of aphrodisiacs.¹

The root of Mucuna pruriens is considered tonic and useful in diseases of the nervous system, such as facial paralysis, hemiplegia etc. It is generally used in combination with other medicines of its class, as for example in the compound decoction called Máshbaládi, for which see Assafætida.

BUTEA FRONDOSA, Roxb.

Sans. पचा भ, Palása. किंगुक, Kinsuka. Vern. Dhák. Hind.

DR. Hooker states "that when in full flower the Dhák tree is a gorgeous sight; the masses of flowers resembling sheets of flame, their bright orange red petals contrasting brilliantly against the jet black velvety calyx." These beautiful flowers were used as ear-ornaments by the ancient Hindu women and much admired by the poets. The seeds of Butea frondosa are said to be laxative and anthelmintic and are used, both alone and in combination with other medicines, for expelling intestinal worms. Thus the fresh juice of the seeds, or the seeds beaten to a paste are given with honey.² Sárangadhara gives the following recipe for worms.

¹ वानरीविटका । वीज्ञानि किपकच्याङ्ग व मितानि खेदयेच्छनकेः ।

प्रस्थे गोभवदुग्धे तावत् बाबद्भवेत् गाड्म् । त्यपहितानिचक्रत्या स्रच्यां पर्से

² प्रजायवीजस्वर सं पिवेदा चौद्र संयुतस् । पिवेसदीजकं वा तक्रेण क्रिसिना-यमस् । भावप्रकाशः ।

Take of the seeds of Butea frondosa, root of Ipomæa Turpethum (trivrit), seeds of Hyoscyamus niger (párasika yamáni), kamalá powder, báberang seeds and treacle, equal parts, beat them together into a paste with water and administer with butter-milk.1

The gum of Butea frondosa, now used as a substitute for kino, was employed by the ancient Hindus, externally only, as for example in the following. Take of red sandal wood one part, rock salt two parts, chebulic myrobalans three parts, and the gum of Butea frondosa four parts, powder and mix. This powder is recommended to be applied to pterygium and opacities on the cornea.²

The alkaline ashes of this plant are used in the preparation of caustic pastes, and diuretic medicines, along with others of their class.

PHASEOLUS ROXBURGHII, W. & A. ETC.

The following varieties of leguminous pulses are mentioned by Sanskrit writers.

सह, Mudga. Phaseolus Mungo, Linn. Vern. Mug, B.

माष, Másha. Phaseolus Roxburghii, W. & A. Vern. Urid, Hसहपणि, Mudgaparni. P. trilobus, Ait. Vern. Mugáni, B.

पन्न, Makushtha. P. aconitifolius, Jacq. Vern. Mot, H.
इन्स, Kulattha. Dolichos uniflorus, Lamark. Vern. Kulthi, H.B.
राजमाष, Rájamásha. Vigna Sinensis, Linn. Vern. Barbati, B.
विक्रि, Simbi. A common name for several species of Dolichos.
चणक, Chanaka. Cicer arietinum, Linn. Vern. But, Beng. Chená, H.
महर, Masura. Vicia Lens, Benth. Vern. Masur, H.B.

गिर्म, Satilá. Pisum sativum, Linn. Vern. Matar. H.B.

¹ तिहत्पनायवीजानि पारसीकयमानिका। कम्पिञ्चकं विङ्क्षञ्च गुडस् समभागिकः। तक्रीण कन् एतेषां पीतः क्रिंमगणापहः। य क्षिपः। 2 चन्दनं सैन्ववं पथ्या पनायतस्योणितम्। क्रमष्टद्विमदं चूणं गुकामीदिः विनेखनम्। चक्रदक्षः।

चार्सी, A'dhaki. Cojanus Indicus, Sprengel. Arar, B. Tor, H. रिअपटी, Triputi. Lathyrus sativus, Linn. Khesári, H. B. माषपार, Máshaparni. Glycine labialis, Linn. Vern. Másháni, H.B.

Some of these pulses have several varieties. For example seven sorts of mudga are mentioned, namely, krishna or black, mahá or large, gaura or pale red, harita or green, pita or yellow, sveta or white and rakta or red.

Mudga, ordinarily known as moong ká dál, and especially its green variety, is considered most wholesome and suited to sick persons. A soup made of this pulse is often the first article of diet prescribed after recovery from acute illness. The following varieties are also considered wholesome and suited for use by convalescent persons, namely, masura, chanaka, kulattha and makushtha. Vicia Lens or lentils, which take rank first among the pulses as containing the largest proportion of flesh-forming matter, are regarded by the Hindus as highly nutritive, and useful in bowel complaints. A poultice made of this pulse is an effectual domestic medicine for checking secretion of milk and reducing distension of the mammary glands. Cicer arietinum is perhaps the most favourite pulse with the natives, and is used as an article of diet in a great variety of ways. It is taken raw, or cooked in its green as well as ripe state. Gram is made into dál, is roasted and ground into meal and is prepared in many other ways.

The acid liquid exuded from the hairs of the stem and leaves of Cicer arietinum is called chanakámla in Sanskrit. It is collected by spreading a cloth over the plants during the night and rinsing the fluid absorbed by it. Chanakámla is described as acid, refrigerent, saltish, and useful in dyspepsia, indigestion and costiveness. It enters into the composition of some medicines for dyspepsia along with other vegetable acids.

Dolichos uniflorus is used medicinally chiefly as an external application in the shape of poultices and pastes. Its soup is said to be useful in gravel and urinary disorders.

The Phaseolus Roxburghii or másha is much used in medicine both internally and externally in paralysis, rheumatism and affections of the nervous system. It enters into the composition of several decoctions used in these diseases. The following is an illustration. Take of the pulse of Phaseolus Roxburghii. root of castor oil plant, of Mucuna pruriens (átmaguptá) and Sida cordifolia (balá), half a tolá each, and prepare a decoction in the usual way. This decoction is given with the addition of rock salt and assafætida. Several oils for external application in the above mentioned diseases have the pulse of Phaseolus Roxburghii for their basis or principal ingredient, as for example the following.

Svalpa másha taila.² Take of the pulse of Phaseolus Roxburghii eight seers, water sixty-four seers, boil down to sixteen seers, and strain. Boil the strained decoction with four seers of sesamum oil, and one of rock salt till the water is evaporated. This oil is said to be useful in rheumatism, contracted knee joint, stiff shoulder joint, etc.

ABRUS PRECATORIUS, Linn.

Sans. 13 gr, Gunjá.

Vern. Kuch, Beng. Chirmiti, Hind.

"This plant is remarkable for its small egg-shaped seeds, which are of a brilliant scarlet colour with a black scar indicating the place where they were attached to the pods." Sanskrit writers mention two varieties, namely, white and red seeded. The properties of both are said to be identical. The seeds are described as poisonous, and are used internally in affections of the nervous system and externally in skin diseases, ulcers, affections of the hair, etc. The root of the plant is described as emetic and useful in poisoning. The seeds constitute the ratti weight used by Hindu jewellers and druggists. Ninety-six rattis make one tolá or rupee.

¹ साषात्मगुप्तकरण्ड वाद्यालक म्हतं पिवेत्। हिङ्गुर्वेन्ववसंयुक्तं पचाणात निवारणम्। चक्रदत्तः।

Gunjá bhadra rasa.¹ Take of the seeds of Abrus precatorius six parts, mercury three parts, sulphur twelve parts, nim seeds, Cannabis sativa leaves and croton seeds, each one part. Rub them together and soak for one day in each of the following fluids, namely, lemon juice, juice of the leaves of Cannabis sativa, of datura leaves and of the leaves of Solanum nigrum (kákamáchi). This medicine is given in doses of about eight grains, with rock salt and assafætida, in paraplegia. The seeds of Abrus precatorius reduced to a paste are recommended to be applied locally in sciatica, stiffness of the shoulder joint, paralysis and other nervous diseases.²

In white leprosy, a paste composed of gunjá seed and plumbago root is applied as a stimulant dressing. In alopecia a paste of gunjá seed is recommended to be rubbed on the bare scalp.3

Gunjádya tailam.⁴ Take of prepared sesamum oil four seers, juice of the leaves of Wedelia calendulacea (bhringarája) sixteen seers, seeds of Abrus precatorius reduced to a paste, one seer, and boil them together in the usual way. This oil is used as a local application in scurf of the scalp, prurigo and other skin diseases.

PONGAMIA GLABRA, Vent.

Sans. करञ्च, Karanja. नक्तमाच, Nactamála. Vern. Darkaranja, Beng. Kiramál, Hind.

This tree appears to be common in, and well known all over India. The seeds are much used as an external application in skin diseases. The expressed oil of the seeds is used in these diseases as well as in rheumatism. A poultice of the leaves is applied to ulcers infested with worms. The seeds of *Pongamia glabra*, Cassia Tora (chakramarda), and the root of Aplotaxis auriculata (kushtha), are rubbed into a paste with cow's urine, and applied to eruptive skin diseases.

Prithisára taila.² Take of the expressed oil of the seeds of Ponyamia glabra one seer, kánjika eight tolás, roots of Plumbago Zeylanica (chitraka), Nerium odorum (karavira), Vitex Negundo (nirgundi), aconite, and the seeds of Corchorus olitorius (nádika), eight tolás each, in the form of a paste made wlth kánjika. Mix them together and warm in the sun. This oil is said to be useful in various sorts of skin diseases, ulcers etc.

Tiktádya ghrita.³ Take of the leaves and fruits of Pongamia glabra, root of Picrorrhiza Kurroa, (katuki), wax, turmeric, liquorice root, leaves of Trichosanthes dioica (patala), Aganosma caryophyllata (málati) and Azadirachta Indica (nim), equal parts, in all one seer. Beat them into a paste and boil with four seers of clarified butter and sixteen seers of water in the usual manner. This preparation is used as an ointment in unhealthy ulcerations and wounds.

GUILANDINA BONDUCELLA, Linn. The properties of Bonduc nuts called पूतीकरञ्ज, Putikaranja in Sanskrit, and Nátáka-

ranja in Bengali, are said to resemble those of the seeds of Pongamia glabra. Their antiperiodic virtues were not known to Sanskrit writers.

PTEROCARPUS SANTALINUS. Linn.

Sans. रतःचन्दन, Raktachandana.

Vern. Raktachandan, Beng. Lálchandan, Hind.

The Pterocarpus Santalinus is indigenous to the Indian Peninsula and is chiefly of importance from its yielding the red dye-wood known as red saunders, large quantities of which are annually exported from India. Sanskrit writers describe several varieties of sandal or chandana. Of these srikhanda or white, pitachandana or yellow, and raktachandana or red, sandal wood are best known. The first two varieties are founded on the difference in the shades of the colour of the wood of Santalum album. It has been a question however how the wood of Pterocarpus santalinus, which is nearly inodorous, came to be called by the name of raktachandana in Sanskrit and the vernaculars of India. I am inclined to think that the name is owing to the similarity in the uses to which the Hindus put both these articles. Both sandal wood and red sandal wood are rubbed on a piece of stone with water, and the emulsions are used for painting the body after bathing and in religious services.

Red sandal wood is described as an astringent tonic. It enters into the composition of numerous prescriptions of an astringent character and of cooling external applications for inflammation, headache, etc., but is seldom used alone. It is also much used as a coloring agent in the preparation of medicated oils.

The Pterocarpus marsupium or Indian kino tree is translated into "peet sál," Beng. by Roxburgh. The Sanskrit term Pitasála is however a synonym of Asana (Terminalia tomentosa). I have not found any notice of the Indian kino tree in Sanskrit works. It was probably unknown to the ancients.

¹ तिला; पयः शिता चौद्रं तैलं मधुक चन्दनम् । लेपेन शोधरुग् दाइ रक्तं निर्द्धापयेद्व, पान् । चक्रदत्तः ।

CASSIA FISTULA, Linn.

Sans. खारम्बध, A'ragbadha. सुनणक, Suvarnaka.

Vern. A'multás, Hind. Sondháli, Beng.

Cassia fistula is indigenous to India and is an old medicine of the Hindu Materia Medica. "The tree is uncommonly beautiful when in flower, few surpassing it in the elegance of its numerous long pendulous racemes of large bright yellow flowers, intermixed with the young lively green foliage." Hence I believe its Sanskrit name of Rájataru or the king of trees. The pulp of the fruit is used as a mild cathartic. The root is also described as laxative, and useful in fever, heart diseases, retained excretions, biliousness, etc.

Aragbadhádi.¹ The compound decoction which passes by this name is a very commonly used purgative in native practice. To prepare it, take of the pulp of Cassia fistula, Picrorrhiza Kurroa (katuki), chebulic myrobalans, long pepper root and the tubers of Cyperus rotundus (mustaka), about sixty-four grains each, water thirty-two tolás, and boil down to eight tolás. Half of this quantity, or in strong constitutions the whole of it, is given for a dose. The root of Cassia fistula enters into the composition of numerous compound prescriptions.

CASSIA SOPHORA, Linn. Sans. कासमई, Kásamarda. Vern. Kálkásundá, Beng. Kásundá, Hind.

CASSIA TORA, Linn. Sans. चक्रमह, Chakramarda. Vern. Chákundia, Beng. Chakaund, Hind.

CASSIA ALATA, Linn. Sans. दर्घ, Dadrughna. Vern. Dád-mardan. Beng. and Hind.

THE leaves and seeds of these three plants are used in skin diseases, and enter into the composition of numerous prescriptions for them. Kásamarda signifies destroyer of cough. It is described as expectorant and useful in cough and hoarseness, but it does not appear to be much used in these diseases.

[े] च्यारग्वधादि। च्यारग्वध कथामूल सत्त तिकाभयाकतः। काषः यस्यति चिपं च्चरं वातकफोत्तरम्। याक्रधरः।

The seeds of Cassia Sophora, Raphanus sativus (mulaka) and sulphur, in equal parts, are rubbed into a paste with water and applied to patches of pityriasis and psoriasis. The seeds of Cassia Tora are steeped in the milky juice of Euphorbia neriifolia, and afterwards rubbed into a paste with cow's urine for application to keloid tumours. Equal parts of the seeds of Cassia Tora and Pongamia glabra (karanja) with a fourth part of the root of Tinospora cordifolia (gulancha) are rubbed together into a paste and applied in ringworm. Dadrughna or Dádamardana signifies curer of ringworm. Its leaves are used in this disease.

BAUHINIA VARIEGATA, Linn.

Sans. काञ्चनार, Kánchanára. कोविदार, Kovidára.

Vern. Kachnár, Hind. Rakta Kánchan, Beng.

Two species of Bauhinia, namely purple and white flowered (Bauhinia variegata and acuminata), are noticed in the Bhávaprakása under the names of Kovidára and Kánchanára and the properties of both are said to be identical. The bark of Bauhinia variegata is described as alterative, tonic, astringent and useful in scrofula, skin diseases and ulcers.

Chakradatta recommends the bark of the red variety to be rubbed into an emulsion with rice water and administered, with the addition of ginger, in scrofulous enlargement of the glands of the neck.⁴ Sárangadhara gives the following preparation for the same affection.

¹ कासभद्दे कशीजानि मृतकानां तथैशच। गन्धपाषाणि मित्राणि सिध्मानां परमौषधस्। चक्रदत्तः।

⁴ पिणा ज्येशम्बुनापेयाः काञ्चनाखत्वचः शुभाः। विश्वभेषजसंयुक्ता गर्ड-साचापहाः पराः । चक्रदत्तः ।

Kánchanára guggulu.¹ Take of the bark of Bauhinia variegata, eighty tolás, the three myrobalans sixty tolás, ginger, black pepper, long pepper and the bark of Cratæva religiosa (varuna), eight tolás each, cardamoms, cinnamon, and tejpatra leaves, each two tolás, powder them all and rub together with guggulu, equal in weight to all the other ingredients. Dose, half a tolá to be taken every morning with a decoction of Sphæranthus mollis (mundi) or of catechu. This medicine is said to be useful in scrofulous enlargement of glands, tumours, ulcers, skin diseases, etc.

TAMARINDUS INDICA, Linn.

Sans. तिनिड़ी, Tintidi. अम्बिका, Amliká.

Vern. Tentul, Beng. Imli, Hind.

The tamarind tree is met with throughout India, and has been known from a very remote period. "From the Hindus it would seem that the fruit became known to the Arabians who called it Tamare-hindi:" from which last the word tamarind is derived. Tamarinds form an important ingredient in native cookery. The unripe fruit is very acid and possesses a peculiar aroma for which it is much relished when cooked with curry. The ripe fruit is regarded as refrigerant, digestive, carminative and laxative, and useful in diseases supposed to be caused by deranged bile, such as burning of the body, costiveness, intoxication from spirituous liquors or datura, etc. The shells of the ripe fruit are burnt, and their ashes used in medicine as an alkaline substance, along with other medicines of the sort, as for example in the preparation called Abhayá-lavana, (see Alkaline ashes). The pulp of the ripe fruit, as well as

¹ काञ्चनारग्रग्रु । काञ्चनारत्वचोयाद्यं प्रवानां द्यकं वृधेः। तिप्रवा षट्पवायाद्या तिकटुखात्पवत्यम्। प्रवेकोवर्णः कार्य्य एवात्वक्पतकत्त्रमा। एकैकोवर्णः कार्य्य एवात्वक्पतकत्त्रमा। एकैकोवर्णः कार्य्य एवात्वक्पतकत्त्रमा। एकैकोवर्णः वर्षे प्रवास्त्र विकालित्य । यावञ्च प्रितः पर्वे तावन्यात्रस्तु गुग्गु । सङ्गु अवविभेकत्र पिण्डं कत्वाच धारयेत्। गुटिकाः धाणिकाः कत्वा प्रात्याद्याययोचितम्। गण्डमावां जयस्य प्रामपचीमवृदानिच। यात्र्य व्याक्षाययोचितम्। प्रदेयश्वानुपानाधं काष्यो स्विष्डितिकाभवः। काषः खदिरसारस्य पय्याकायो यचोष्णकम्। प्राकृधरः।

a poultice of the leaves, is recommended to be applied to inflammatory swellings.

Amliká pána. Macerate some tamarind pulp in water; strain, and add black pepper, sugar, cloves, camphor and cardamoms to taste. This preparation is prescribed as an agreeeable cooling draught in loss of appetite and disinclination for food. In intoxication from spirituous liquors the following mixture is recommended by Chakradatta. Take of dates, raisins, tamarind pulp, pomegranate seeds, fruits of Grewia Asiatica (parushaka) and ripe emblic myrobalans, each one tolá, pound them together, and make an emulsion with thirty-two tolás of water. Dose, about two ounces.

ACACIA CATECHU, Linn.

Sans. खदिर, Khadira. Vern. Kat, Hind. Khaer, Beng.

Khadira or catechu is obtained by boiling the wood of Acacia catechu in water and inspissating the decoction. The Bhávaprakása mentions two varieties of catechu, namely, khadira or the ordinary dark brown catechu, and kadara or pale catechu. This last is known as pápri khaer, or catechu having a laminated structure. Fluckiger and Hanbury thus describe the preparation of pale catechu in Northern India. "Instead of evaporating the decoction to the condition of an extract, the inspissation is stopped at a certain point and the liquor allowed to cool, "coagulate," and crystallize over twigs and leaves thrown into the pots for the purpose." Pale catechu is a porous, opaque, earthy looking substance with a laminated texture, light and easily broken.

The chief use of catechu in India, is as an ingredient of the packet of betle leaf chewed by the natives. For this purpose it is sometimes aromatized in various ways. The packets of betle

2 मन्धः खर्जूर स्ट्वीका एचाम्बास्तीकदार्डि मैं: । पर्विकः सामन कैर्युक्ती सद्यविकारणुत्। चक्रदत्तः।

³ Pharmacographia, page 250.

leaf sold in all the Indian bazars under the name of golábi khili, are prepared with catechu dissolved in rose water. Again, catechu is softened with the addition of water, and mixed with powdered spices, such as cardamoms, nutmeg, cloves, etc., the mixture is enclosed within the fragrant floral leaves of Pandanus odoratissimus (ketaki), and dried. The leaves adhere to the catechu, which is cut into small pieces suitable for use with the betle leaf.

Catechu is described as astringent, cooling, digestive, and useful in hoarseness, diseases of the mouth and gums, cough and skin diseases. In diarrhœa it is sometimes used in combination with other medicines of its class, as for example in a prescription in the Bhaisajya Ratnávali, called *Grahani kapáta rasa*, which contains catechu along with a large number of other drugs, but it is not regarded as an important medicine for this disease.

In hoarseness, catechu rubbed with oil, is recommended to be kept in the mouth. In diseases of the mouth and gums the following called Svalpakhadira vatiká is a favourite medicine. To prepare it, take of catechu twelve seers and a half, water sixty-four seers, boil down to eight seers, then add nutmeg, camphor, betle-nuts and kakkola, each half a seer in fine powder, and prepare a mass fit for being made into balls or boluses. They are directed to be kept in the mouth, in affections of the teeth, gums, palate and tongue.

In skin diseases, catechu is much used in a variety of forms both externally and internally. A decoction of catechu is used as a wash for inflamed parts and ulcers.³ Water in which catechu is dissolved is recommended to be used as a drink, wash and bath. The following decoction called *khadiráshṭaka* is prescribed by several writers for internal use in boils, prurigo, measles and other

skin diseases. Take of catechu, the three myrobalans, nim bark, leaves of Trichosanthes dioica (patala), gulancha and Justicia Adhatoda (vásaka), equal parts, and prepare a decoction in the usual way Sárangadhara describes a fermented liquor called khadirárishta for use in skin diseases. It is prepared with catechu and the wood of Pinus Deodara, and some other ingredients in smaller proportions.

ACACIA ARABICA, Willd. Sans. बब्ब, Vabbula. Vern. Bábul, Beng. Hind. The tender leaves beaten into a pulp, are given in diarrhœa as an astringent. A decoction of the bark is used as an astringent gargle and wash. I have not met with any notice of gum acacia in Sanskrit works.

NAT. ORDER COMBRETACEÆ.

TERMINALIA CHEBULA, Retz.

Sans. इरीतकी, Haritaki. अभया, Abhayá. पथा, Pathyá. Vern. Har. Hind. Haritaki, Beng.

The chebulic myrobalan was highly extolled by the ancient Hindus as a powerful alterative and tonic. It has received the names of $Pr\'{a}nad\'{a}$, or life-giver, $Sudh\'{a}$ or nectar, Bhishakpriya or physician's favourite and so forth. So highly esteemed was this plant by the ancient Hindus, that a mythological origin has been attributed to it. It is said that when Indra was drinking nectar in heaven, a drop of the fluid fell on the earth and produced the haritaki plant. Seven varieties of haritaki are described by Sanskrit writers, the distinctions being founded upon the shape, colour and marks on the outer covering of the fruits. At the present day, however, two varieties only are recognised, namely, the large ripe fruit called haritaki, and the unripe dried fruit called jangi

प्रेचेपोद्दर्भन स्तान पान भोजनकर्माण । शीलितं खादिरं वारि सर्व्य-त्वगदोषनाशनम् । चक्रदत्तः ।

² खदिराष्ट्रकः। खदिर तिमाखारिष्ट पटो जास्त्रत वासकैः। काष्टोऽष्टकाङ्गो जयित रोमान्तिकमस्त्ररिकाः । जुडविसर्प स्कोट कगङ्कादीनिप पानतः । चक्रदत्तः ।

haritaki in the vernacular. A good haritaki fit for medicinal use should be fresh, smooth, dense, heavy and rounded in shape. Thrown into water it should sink in it. Haritaki fruits weighing four tolás and upwards, are also considered fit for use, although they may not possess some of the above-mentioned properties. The seeds are rejected and their coats only are used in medicine. Those fruits which have small seeds and abundant cortex are preferred.

Chebulic myrobalans are described as laxative, stomachic, tonic and alterative. They are used in fevers, cough, asthma, urinary diseases, piles, intestinal worms, chronic diarrhœa, costiveness, flatulence, vomiting, hiccup, heart diseases, enlarged spleen and liver, ascites, skin diseases, etc. In combination with emblic and belleric myrobalans, and under the name of triphalá or the three myrobalans, they are extensively used as adjuncts to other medicines in almost all diseases.

Two or three chebulic myrobalans, rubbed into a paste and taken with a little rock salt, act as a mild laxative. The following compound decoction called Pathyádi kvátha is also much used as a purgative. Take of chebulic myrobalans, pulp of Cassia fistula (áragbadha), root of Picrorrhiza Kurroa (katuki), root of Ipomæa Turpethum (trivrit) and emblic myrobalans, equal parts, in all two tolás, and prepare a decoction in the usual way. Dose, two to four ounces. Bengali practitioners now a days often add senna and rhubarb to the above preparation, but these last were not known to the ancient writers, and are not mentioned in their works.

As an alterative tonic for promoting strength, preventing the effects of age and prolonging life, chebulic myrobalan is used in a peculiar way. One fruit is taken every morning with salt in the rainy season, with sugar in autumn, with ginger in the first half of the cold season, with long pepper in the second half, with honey in spring, and with treacle in the two hot months. These adjuncts are supposed to agree best with the humours that are liable to be

¹ पर्यादिकायः । पर्यारम्ब धितक्का तिष्टदामलकैः म्हतपेयं । पाचनसारक युक्तं नवजीर्यञ्चरे सामे ।

deranged in the different seasons. This old device for prolonging life is still believed in, and acted upon, by some superstitious elderly native gentlemen.¹

Numerous preparations of haritaki for special diseases are described in books, such as the Amrita haritaki for dyspepsia, Danti haritaki for enlargements in the abdomen called gulma, Bhrigu haritaki in cough, Agasti haritaki in consumption, Dasa muli haritaki in anasarca, etc.

Amrita haritaki² is thus prepared. One hundred large sized chebulic myrobalans are boiled in butter-milk, and their seeds are taken out. Four tolás each of long pepper, black pepper, ginger, cinnamon, plumbago root, root of Piper Chaba (chaviká), the five salts, ájowan, and the seeds of Seseli Indicum, (vanayamáni), yavakshára, sarjikákshára, borax, assafætida and cloves, are reduced to powder, and soaked for three days respectively in a decoction of tamarind and in lemon juice. This mixture is introduced within the seedless myrobalans, which are then exposed to the sun and dried. One of these prepared myrobalans is directed to be taken every morning for the relief of various sorts of dyspepsia and indigestion. Danti haritaki will be described under Baliospermum montanum. The other preparations of chebulic myrobalan are not much in vogue at present.

TERMINALIA BELLERICA, Roxb.

Sans. fafunai, Vibhitaki. Vern. Baherá, Hind. Beng.

Belleric myrobalans are described as astringent and laxative and useful in cough, hoarseness, eye diseases, etc. As a constituent

of triphalá or the three myrobalans, they are used in almost al diseases. The kernel of the fruits is said to be narcotic and astringent, and is used as an external application to inflamed parts.

In hoarseness, belleric myrobalans, rock salt and long pepper, rubbed into a paste with butter-milk, are recommended to be used as a linctus.² Another prescription for sore throat and hoarseness is as follows. Belleric myrobalans are fried in clarified butter; they are then covered with a paste of wheat-flour and slightly roasted on a fire. The cortical portion of the fruits thus prepared, is recommended to be kept in the mouth for the relief of sore throat, cough and catarrh.³

TERMINALIA ARJUNA, Bedd.

Sans. अर्ज, न, Arjuna. क्रक्रभ, Kukubha. Vern. Arjuna, Beng. Kahu, Hind.

The bark of this timber tree is considered tonic, astringent and cooling, and is used in heart diseases, contusions, fractures, ulcers, etc. In diseases of the heart it is used in a variety of ways. Thus a decoction of the bark with milk is given as a nourishment. The powdered bark is given with milk, treacle or water. A ghrita is prepared with the decoction and paste of the bark for internal use. 5

In fractures and contusions with extensive ecchymosis, powdered arjuna bark is recommended to be taken internally with milk. A decoction of the bark is used as a wash in ulcers and chances.

NAT. ORDER MYRTACEÆ. EUGENIA JAMBOLANA, Lam.

Syn. Syzygium Jambolanum, W. & A.

Sans. जन्ब, Jambu. Vern. Kálajám, Beng. Jámun, Hind.

This tree, which yields an abundant crop of sub-acid edible fruits during the months of July and August, is common all over the country. In some places the fruits attain the size of a pigeon's egg and are of superior quality. A vinegar prepared from the juice of the ripe fruit, is an agreable stomachic and carminative. It is also used as a diuretic in scanty or suppressed urine. A sort of spirituous liquor called Jámbava is described in recent Sanskrit works as prepared by distillation from the juice of the ripe fruits. The bark is astringent, and is used, alone or in combination with other medicines of its class, in the preparation of astringent decoctions, gargles and washes. The fresh juice of the bark is given with goat's milk in the diarrhea of children.2 The expressed juice of the leaves is used alone or in combination with other astringents in dysentery with bloody discharge, as for example in the following prescription. Take of the fresh juice of the leaves of jambu, mango and emblic myrobalan about a drachm each, and administer with goat's milk and honey.3

CARYOPHYLLUS AROMATICUS, Linn. Sans. বৰত্ন, Lavanga. Cloves, as might be expected, are much used in Hindu

Medicine, as an aromatic adjunct. They are regarded as light, cooling, stomachic, digestive and useful in thirst, vomiting, flatulence, colic, etc. An infusion of cloves is given to appease thirst. The following pill, called *Chatuḥsama vati*, is commonly used in indigestion. Take of cloves, ginger, *ájowan* and rock salt, equal parts, and make into eight-grain pills.

NAT. ORDER LYTHRACEÆ. WOODFORDIA FLORIBUNDA, Salisb.

Syn. Grislea tomentosa, Roxb.

Sans. धातकी, Dhátaki. अग्निजान, Agnijvála. Vern. Dháiphul, Beng. Dhái, Hind.

The Sanskrit synonyms of this beautiful flowering shrub well describe some of its prominent characters. It is called Támra-pushpi or red flowered, on account of its bright red permanent calyx, and Guchchhapushpi or having clusters of blossoms, on account of its numerous small flowers, which give it a gaudy appearance. From the circumstance of its being common in mountainous tracts, it has got the name of Párvati or hill-born.

The dried flowers of Woodfordia floribunda are regarded as stimulant and astringent and are much used, in combination with other astringent medicines, in bowel complaints and hæmorrhages. Two drachms of the dried flowers are given with curdled milk in dysentery, and with honey in menorrhagia.² In the dysentery of children, the following combination is recommended to be given in the form of powder or decoction with the addition of honey. Take of the flowers of Woodfordia floribunda, bel fruits, bark of Symplocos racemosa (lodhra), root of Pavonia odorata (bálá), and the fruits of Pothos officinalis (gajapipul), in equal parts, two tolás in all, and prepare a decoction in the usual way.³

The powdered flower is sprinkled over ulcers for diminishing their discharge and promoting granulation.¹

NAT. ORDER HAMAMELIDEÆ.

LIQUIDAMBAR ORIENTALE, Miller. Sans. चिक्रक, Silhaka. Vern. Siláras, Hind. Liquid storax is described in Sanskrit works as a product of Turkey. It is considered useful in affections of the throat, copious perspiration and skin diseases, but is chiefly used in perfuming medicinal oils.

NAT. ORDER, GRANATEÆ. PUNICA GRANATUM, Linn.

Sans. दाज्म, Dádima. Vern. A'nár, Hind.

The pomegranate is indigenous to North Western India. The best fruits, having sweet juice and very small seeds come from Cabul. The fresh juice of the fruits is much used as an ingredient of cooling and refrigerent mixtures and of some medicines for dyspepsia. The rind of the fruit is used as an astringent in diarrhæa. In the Pharmacographia it is stated that the use of the root-bark as an anthelmintic by the Hindus attracted the notice of Buchanan at Calcutta about the year 1805. This physician pointed out the efficacy of the root-bark which was further shown by Fleming and others. I have not been able to find any notice of pomegranate root-bark in Sanskrit works.

Dádimáshtaka.² Take of pomegranate rind one seer, bamboo-manna two tolás, cardamom, cinnamon, tejapátra, and flowers of Mesua ferrea (nágakesara), each four tolás, ájowan, coriander, cumin seeds, long pepper root, long pepper, black pepper and ginger, each eight tolás, sugar one seer. Powder the ingredients and mix. Dose, about one drachm in chronic bowel complaints.

NAT. ORDER CUCURBITACEA. BENINCASA CERIFERA, Savi.

Syn. Cucurbita Pepo, Roxb.

Sans. जमार, Kushmánda. Vern. Kumrá, Beng. Pethá, Hind.

The large fruit or gourd of Benincasa cerifera is eaten by the natives in their curries, and is extensively cultivated all over India. It is considered tonic, nutritive and diuretic, and a specific for hæmoptysis and other hæmorrhages from internal organs. It would appear that the older Sanskrit writers were not acquainted with its peculiar action on the circulatory system by which it rapidly puts a check to hæmorrhage from the lungs. The Rája Nirghantu, the oldest work on therapeutics, gives a long account of its virtues, but does not allude to its use in phthisis or hæmoptysis. Neither does Susruta mention it in his chapters on the treatment of hæmorrhage and phthisis, though the plant is alluded to by him elsewhere. The more recent compilations, such as Chakradatta Sangraha, Sárangadhara etc. give numerous preparations of the article and detail its uses.

Khanda kushmándaka, or confection of squash. In preparing this medicine, old ripe gourds are selected. Those not at least a year old, are not approved. They are longitudinally divided into two halves and the pulp scraped out in thin flakes by an iron comb or scratcher. The watery juice that oozes out abundantly during

this process is preserved, the seeds being rejected. The pulp is boiled in the above mentioned juice, till softened. It is then tied up tightly in a cloth, and the fluid portion allowed to strain through it. The softened and drained pulp is dried in the sun and the watery portion preserved for future use. Fifty tolás of the prepared pulp are fried in sixteen tolás of clarified butter, and again boiled in the juice of the fruit, till reduced to the consistence of honey. To this are added fifty tolás of refined sugar, and the whole is heated over a gentle fire, till the mass assumes such a consistence as to adhere to the ladle. The pot is now removed from the fire, and the following substances, namely, long pepper and ginger, each two tolás, cumin seeds, cardamoms, cinnamon, leaves called tejapatra, black pepper and coriander, each half a tolá in fine powder, are aded to the syrup and stirred briskly with a ladle, till the mass is cool. Eight tolás of honey are now added to the confection which is preserved in a new earthen pot. The dose of this medicine is from one to two tolás, according to the age and strength of the patient. It is useful in hæmoptysis, phthisis, marasmus, cough, asthma, ulceration of the lungs, hoarseness, etc.

Vásá kushmánda khanda. Take of the root of Justicia Adhatoda (vásaka), one seer, water eight seers; boil together till reduced to one-fourth and strain. Then take of the pulp of Benincasa cerifera, prepared as above described, fifty tolás; fry it in thirty-two tolás of clarified butter, and boil in the decoction of vásaka till the whole is reduced to the consistence of honey. Add to it sugar, one hundred tolás, and apply heat till the mass thickens to the proper consistence. Remove from the fire, add the following substances in fine powder, namely, tubers of Cyperus rotundus, (mustaka), dried emblic myrobalan, bamboo manna, root of Clerodendron Siphonanthus (brahmayasti), a fragrant substance called

elabáluka, cinnamon, cardamom, tejapatra, each quarter of a tolá, ginger, coriander, and black pepper each one tolá, long pepper, four tolás, stir well till the confection cools, and lastly add eight tolás of honey. This preparation is used in cough, asthma, phthisis, hæmoptysis, heart disease, and catarrh.

In insanity, epilepsy and other nervous diseases, the fresh juice of the squash is given either with sugar or as an adjunct to other medicines for these diseases. A ghrita for use in these diseases is also prepared as follows.

Kushmándaka ghrita. Take of the juice of Benincasa cerifera eighteen seers, clarified butter, one seer, liquorice root beaten into a paste with water, quarter of a seer. Boil them together and prepare a ghrita in the usual way. Dose, one to two tolás.

TRICHOSANTHES DIOICA, Roxb. Sans. पटोन, Patola. Vern. Palwal, Hind.

THE Trichosanthes dioica is extensively cultivated as an article of food in Bengal. The unripe fruits are much used by the natives as a culinary vegetable and are considered very wholesome and especially suited for the convalescent. In fact they constitute one of the most palatable vegetables grown in this country. The tender tops are also used as a pot-herb and are regarded as tonic and vermifuge.

The leaves, fresh juice of the fruits and the root are all used medicinally. The leaves are described as a good, light and agreeable bitter tenic. The fresh juice of the unripe fruit is often used as a cooling and laxative adjunct to some alterative medicines such as the preparation called Rasa sindura, etc. The bulbous root is called Ramyaka in Sanskrit and is classified amongst purgatives by Susruta.

In bilious fever, a decoction of patola leaves and coriander, in equal parts, is given as a febrifuge and laxative.² The leaves

¹ जुद्याग्डकष्टतम् । जुद्याग्डकर्षे चर्षिरप्टाद्यगुणे पर्वत् । वष्ट्राह्य-कर्कं तत्पानमपद्यारिवनायनम् । चक्रदत्तः ।

enter into the composition of several compound decoctions for fever. The following called Paţoládi kvátha is an illustration. Take of paţola leaves, red sandal wood, root of Sanseviera Zeylanica (murvá), Picrorrhiza Kurroa (katuki), Stephania hernandifolia (páṭhá) and gulancha, each one drachm, water half a seer, boil together till reduced to one-fourth.

Patola enters into the composition of several compound decoctions for boils and other skin diseases for which it is considered a very efficacious remedy. The following is an illustration. Take of patola leaves, gulancha, mustaka, chiretá, nim bark, catechu, root-bark of Justicia Adhatoda (vásaka), and Oldenlandia herbacea (parpaṭa), equal parts, in all two tolás, and prepare a decoction in the usual way. This decoction is regarded as a valuable alterative, tonic and febrifuge.²

The root is used in combination with Ipomæa Turpethum and other adjuncts as a drastic purgative in jaundice, anasarca and ascites. The following called Patoládya churna is an illustration. Take of the root of Trichosanthes dioica (patola), turmeric, báberang seeds, kamalá powder, and the three myrobalans, two tolás each, cinnamon, and the root of the indigo plant, three tolás each, Ipomæa Turpethum (trivrit) four tolás; powder the ingredients finely and mix. Dose, about one drachm with cow's urine. After the use of this medicine, light food only (such as gruel) should be taken.³

The fresh juice of the leaves of Trichosanthes dioica is recommended by several writers, to be applied to the bald patches of alopecia.1

CUCUMIS MELO, Linn.

Syn. Cucumis utilissimus, Roxb.

Sans. 4421, Karkați. Vern. Kánkur, Beng. Kákri, Hind.

THE seeds of this useful species of Cucumis are described as cooling, edible, nutritive and diuretic, and are used in painful micturition and suppression of urine. Two drachms of the seeds rubbed into a pulp with water, are given alone or in combination with salt and kánjika.²

The seeds of Cucumis sativa, (Sans. AN, Trapusha. Vern. Khirá, Hind.) and of Benincasa cerifera (Sans. Kushmánda.) are also used as diuretics like those of Cucumis utilissimus.³

COCCINIA INDICA, W. & A. Syn. Momerdica monodelpha, Roxb. Sans. [444], Vimba, Vern. Telákuchá, Beng. The expressed juice of the thick tap-root of this plant is used by the leading native Kavirájas of Calcutta, as an adjunct to the metallic preparations prescribed by them in diabetes. I have not found this use of the plant noticed in any written work, but I know several patients who have taken the juice of the root along with Vangesvara or Somanátha rasa and who were benefitted by the use of these remedies. I am inclined to think that the juice of the root of this plant probably acts beneficially in some way. It is very desirable that its therapeutic action should be tested. The expressed juice is directed to be taken in doses of one tola along with a pill, every morning.

CITRULLUS COLOCYNTHIS, Schrad.

Syn. Cucumis Colocynthis, Linn.

Sans. इन्द्रवादकी, Indraváruni. Vern. Indráyan. Hind.

Indian colocynth is common on the lower slopes of the Western Himalaya and also on the plains of the drier parts of India. It is procurable in the bazars of the North-West Provinces under the name of indráyan. The pulp of the fruit is described as bitter, acrid, cathartic, and useful in biliousness, constipation, fever and worms. The root of the plant is considered cathartic and useful in jaundice, ascites, enlargements of the abdominal viscera, urinary diseases, rheumatism, etc.

Jvaraghni guṭiká. Take of mercury one part; sulphur, colocynth pulp, cardamoms, long pepper, chebulic myrobalan, and pellitory root, each four parts. Rub these ingredients with the juice of indraváruni root and make into pills weighing about twenty grains each. These pills are administered with the fresh juice of gulancha in recent fever. They move the bowels and reduce the fever.

An oil prepared from the seeds of Indian colocynth, is used for blackening grey hairs. A poultice of the root is said to be useful in inflammation of the breasts.²

NAT. ORDER UMBELLIFERÆ.

The following aromatic fruits belonging to this natural order, are noticed by Sanskrit writers and are used in medicine or as condiments by the natives.

यमानि, Yamáni. Ptychotis A'jowan,* DC. Vern. A'jowan Hind. वनयनानि, Vanayamáni. Seseli Indicum, W. & A. Vern. Banjoán, B.

मिन्ने या, Misreyá. Anethum Sowa, * Roxb. Vern. Sulphá, B. Sowá, H.

PTYCHOTIS AJOWAN. The seeds of Ptychotis Ajowan have an aromatic smell and warm pungent taste. They are used for culinary purposes, as spices along with betel nuts and pan leaves, and as a carminative medicine. A tea spoonful of ájowan with a little rock salt, is a common domestic remedy for indigestion from irregular diet. The following compound powder is used in cases of colic or pain in the bowels. Take of ájowan, rock salt, sonchal salt, yavakshára, assafætida, and chebulic myrobalan, equal parts; powder the ingredients and mix. Dose, grains ten to twenty, to be taken with wine. A jowan, taken daily with treacle, is said to cure urticaria within a week. A jowan, as well as the seeds of Seseli Indicum (vanajamáni), are much used as aromatic adjuncts in compound prescriptions.

CARUM ROXBURGHIANUM. The seeds of Carum Roxburghianum (ajamodá) are an essential ingredient of native cookery, They are said to be useful in hiccup, vomiting and pain in the region of the bladder. They enter into the composition of several carminative and stimulant preparations, such as the Ajamodádi churna (see Argyreia speciosa), etc.

CUMINUM CYMINUM. Cumin seeds form an ingredient of some curry powders and pickles used by the natives. They are regarded as stomachic, carminative, astringent and useful

in dyspepsia, diarrhœa, etc. A confection of cumin seeds is prepared as follows:

Jirakádi modaka. Take of the three myrobalans, tubers of Cyperus rotundus (mustaka), watery extract of gulancha, prepared talc, flowers of Mesua ferrea (nágakesara), leaves called tejapatra, cinnamon, cardamoms, cloves, coriander, ginger, long pepper, Oldenlandia herbacea (parpați), root of Andropogon muricatum (usira), Pavonia odorata (bálá), and Plumbago Zeylanica (chitraka), each one part, cumin seed, nineteen parts or equal in weight to all the other ingredients; powder them all and mix. Add two parts of sugar to one of the powder and make into a confection with honey and clarified butter. Dose, one drachm. This medicine is prescribed in chronic diarrhœa and dyspepsia with loss of appetite.

Jirakádya taila. Take of powdered cumin seeds, eight tolás, minium or red lead, four tolás, prepared mustard oil three seers, water twelve seers, boil them together in the usual way for the preparation of medicinal oils. This oil is used in eczema.

A poultice made of cumin seeds, with the addition of honey, salt and clarified butter, is recommended to be applied to scorpion bites.²

FŒNICULUM VULGARE. Fennel seeds are largely used as a condiment. In medicine they are chiefly used as an aromatic adjunct to other articles. Distilled fennel water is prepared and sold in India, under the name of A'rak bádian, and is used as a domestic carminative.

CARUM CARUI. The fruits called shiá jirá in the vernacular, do not appear to differ from European caraway. The plant grows wild largely in the "high alpine region of Lahul in the Western Himalaya," but is rare in the plains. The fruits contain a volatile oil and are used as a carminative like cumin seeds.

¹ जीरकाद्य तैनम् । जीरकस्य पनं पिष्टं सिन्दुराह्मपनं तथा । कट्रतैनं पचेदाभ्यां सर्वेपामाइरं परम् । भावप्रकाश: ।

² जीरकस्य कतः कज्को घतमैन्धन संयुतः। सुखोन्णो सधुनालेपो प्रश्चिकस्य विषं इरेत्। भावप्रकाणः।

CORIANDRUM SATIVUM. Coriander is largely used by the natives as a condiment and along with betel nuts and pán leaves. It is described as carminative, refrigerent, diuretic, tonic and aphrodisiac. A cold infusion of coriander is given with sugar for the relief of internal heat and thirst. A decoction of coriander and ginger is given in dyspepsia and indigestion. Coriander enters into the composition of numerous cooling and carminative medicines. The fresh leaves of the plant are pungent and aromatic. They are used for preparing a sauce or chátni, in the same way as the leaves of spearmint (pudiná).

FERULA ASSAFŒTIDA, Linn.

Sans. for, Hingu. Vern. Hing, Beng. Hind.

SANSKRIT writers describe assafætida as an exudation from the root of the assafætida plant which is indigenous to Persia, Khorasan and Multan.* Assafætida is regarded as a stimulant and carminative and is much used in dyspepsia, flatulence, colic, and diseases of the nervous system. It is fried before being used internally. Raw or unfried assafætida is said to cause vomiting.

Hingvashṭaka churna.³ Take of fried assafœtida, ginger, long pepper, black pepper, ájowan, cumin seeds, nigella seeds and rock salt, equal parts; reduce them to powder and mix. Dose, ten to twenty grains, to be taken with the first morsel of rice and clarified butter taken at breakfast. Thus administered, it is said to increase the appetite and digestive powers and to cure flatulence. Some writers recommend the above powder to be made into pills with lemon juice.

प्रातः समर्करः पेयोहिमोधन्याकसम्भवः। खन्तद्देशं तथात्वणां जयेच्छ्रोतोविभोधनः। भावप्रकाभः।

^{*} Not now found at Multan, G. K.

In the flatulence of infants a powder composed of assafætida, rock salt, cardamoms, ginger, and the root of Clerodendron Siphonanthus (bhárgi), in equal parts, is prescribed by several writers. In flatulent colic with costiveness, a suppository made of assafætida, rock salt and honey, and smeared over with clarified butter, is introduced into the rectum.

In hemiplegia, stiff-neck, facial palsy, sciatica and other diseases of the nervous system, fried assafætida is given along with a compound decoction called *Máshabaládi*, (see *Phaseolus Roxburghii*). A bit of warm assafætida, placed in the cavity of a carious tooth, is said to relieve pain.³

HYDROCOTYLE ASIATICA, Linn. Sans. 405446, Mandukaparni. Vern. Thalkuri, Beng. Bráhmamanduki, Hind. The properties of this plant are said to resemble those of Bráhmi (Herpestes Monniera), both being regarded as alterative, tonic, and useful in diseases of the skin, nervous system and blood. The fresh juice of the leaves is given with milk and liquorice powder, as an alterative tonic.4

NAT. ORDER RUBIACEÆ. OLDENLANDIA HERBACEA, DC.

Syn. Oldenlandia biflora, Roxb.
Sans. vyz, Parpata. Vern. Khetpáprá. Beng.

THE Oldenlandia herbacea is a "small, weak, straggling delicate plant, appearing in the rainy season" in fields and low ground

on the banks of water courses. The entire plant is used in medicine, and is regarded as a valuable bitter tonic and febrifuge. It enters into the composition of numerous prescriptions for fever, diarrhæa, skin diseases, etc. A simple decoction of the plant is used in bilious fever, with irritability of the stomach or delirium. Parpata enters into the composition of numerous febrifuge and tonic decoctions. The following is an example.

Panchabhadra.² Take of parpata, tubers of Cyperus rotundus (mustaka), gulancha, chireta and ginger, equal parts, in all two tolás, and prepare a decoction in the usual way. This preparation is much used in fever supposed to be caused by deranged air and bile, that is, remittent fever with gastric irritability, nervousness, etc.

RANDIA DUMETORUM, Linn.

Sans. मदन, Madana. Vern. Mayin, Hind.

THE Randia dumetorum is a small thorny tree common in waste places. The fruit when ripe, looks like a small apple, and has a peculiar sweetish, sickly smell. It is described by Sanskrit writers, as the best or safest of emetics. In fact the ancient Hindus depended chiefly upon this drug for causing emesis. One ripe fruit is generally administered for this purpose. It is also used in combination with other medicines, as for example in the following prescription.

Pancha kasháya.³ Take of Justicia Adhatoda (vásaka), Acorus Calamus (vachá), nim bark, leaves of Trichosanthes dioica (paṭola), and bark of Aglaia Roxburghiana (priyangu), equal parts, half

a seer in all, water eight seers; boil them together till reduced to one-fourth. This decoction is given with the addition of the pulp of Randia dumetorum for causing emesis.

RUBIA CORDIFOLIA, Linn.

Syn. Rubia Manjista, Roxb.

Sans. मंजिल, Manjishthá, Vern. Manjit, Beng. Hind.

Indian madder, well known as a red dye, is used in medicine chiefly as a colouring agent. All medicated oils are first prepared for use by being boiled with madder. It is regarded as astringent and useful in external inflammations, ulcers and skin diseases. Madder and liquorice root, rubbed into a paste with kánjika, is applied over fractures, to reduce inflammation and swelling. Madder rubbed with honey, is recommended by several writers to be applied to brown spots on the face (pityriasis versicolor).1

Manjishthádya ghrita,² is prepared with clarified butter and a paste composed of equal parts of madder, red sandal wood, and the root of Sanseviera Zeylanica (murvá), and applied to ulcers from burns.

PÆDERIA FŒTIDA, Linn.

Sans. प्रचारची, Prasarani.

Vern. Gandhabháduli, Beng. Gandháli, Hind.

THE Pæderia fætida is a long climbing plant, twining up and over trees. All parts of the plant give off a most offensive odour when bruised. The leaves, boiled and made into soup, are considered wholesome and suitable for the sick and convalescent. The entire plant including stem, leaves and root, is much used both internally and externally in rheumatic affections for which it is regarded as a specific.

Prasárani leha, or electuary of Pæderia fætida. Take of the leaves, root and stem of Pæderia fætida, two seers, water, thirty-

¹ आनेपनार्थं मञ्जिष्ठा मध्कं चान्त्रपेषितम्। चक्रदत्तः।

wo seers, boil till reduced to one-fourth. To the strained decoction add, two seers of treacle, and again boil till reduced to the consistence of a thick syrup. Lastly add powdered ginger, long pepper, black pepper, plumbago root and the root of *Piper Chaba* (chaviká), equal parts, in all half a seer. Dose, about one tolá in acute rheumatism.¹

Several oils or liniments for external application are prepared with this plant. The following, called Kubja prasárani taila,2 is argely used by native physicians. Take of the entire plant of Pæderia fætida eight hundred tolás, boil in sixty-four seers of water till reduced to sixteen seers, and strain. To the strained decoction, add sesamum oil, sixteen seers, milk, thirty-two seers, whey and fermented paddy water (kánjika), each sixteen seers, and the following substances, namely, root of Pæderia fætida, plumbago root, long pepper root, liquorice, rock salt, Acorus Calamus root, dill seeds, bark of Cedrus Deodara, root of Vanda Roxburghii (rásná), Scindapsus officinalis (gajapippali), jatámánsi root and marking nuts, each two tolás in the form of a paste. First boil the oil with the decoction of Paderia fatida till the water is nearly evaporated, then boil the oil successively with the addition of milk, whey and kánjika, adding the aromatic paste during the last process of boiling. This oil is used externally in rheumatism with contraction and stiffness of the joints. After the application of the oil, the affected parts should be fomented with dry heat.

NAT. ORDER VALERIANACEÆ. NARDOSTACHYS JATAMANSI, DC.

Syn. Valeriana Jatamansi, Jones.

Sans. जटामर्रीम, Jatámánsi. Vern. Jatámánsi, Beng. Báluchar, Hind.

THE Nardostachys Jatamansi is a native of the mountains of Northern India and has been used in Hindu medicine from a very ancient period. The fragrant root is considered a nervine tonic, and is much used as an aromatic adjunct in the preparation of medicinal oils and ghritas. It does not appear however to have been used internally except as an ingredient of complex prescriptions. In the Pharmacopæia of India it is stated that jatámánsi enters into the composition of a nostrum highly recommended in the treatment of epilepsy by Susruta. I do not find in Susruta's work any prescription for epilepsy, containing jatámánsi, except the following, in which however it can hardly be said to be an active ingredient. Take of the pulse of Phaseolus Roxburghii (kulattha), barley, jujube fruit, seeds of Crotolaria juncea (sana), bdellium, jatámánsi root, the ten drugs collectively called dasamula (see Desmodium gangeticum), and chebulic myrobalan, equal parts; and prepare a decoction in the usual way. This decoction is recommended to be administered with the addition of clarified butter and goat's urine.1

NAT. ORDER COMPOSITÆ. SAUSSUREA AURICULATA, Bth. et Hf.

Syn. Aplotaxis auriculata, DC.

Sans. 38, Kushtha. Vern. Kur, Páchak. Hind. Beng.

THE Aplotaxis auriculata is a native of the mountains around Cashmere, and has been used in Hindu medicine from an early age. Its root is described as aromatic, stimulant and useful in cough, asthma, fever, dyspepsia and skin diseases. It enters also into the composition of some pastiles for fumigation.

¹ कुलत्य यवको सानि शखनी जंपलङ्कषाम् । जटिकां पञ्चमूल्यौ हे पथ्या ञ्चोत्काथ्ययत्वतः । वस्तमूलयुतं सपिः पिवेसहातिके हितस् । सुन्नुतः ।

Agnimukha churna. Take of assafætida, one part, Acorus Calamus (vachá) two parts, long pepper, three parts, ginger, four parts, ajowan five parts, chebulic myrobalan, six parts, plumbago root, seven parts, and the root of Aplotaxis auriculata, eight parts. Powder the ingredients, mix and pass the powder through a cloth. Dose, twenty to forty grains with whey or wine in dyspepsia with loss of appetite.

A liniment composed of the root of Aplotaxis auriculata, kánjika and castor oil is recommended by several writers to be applied to the o rehead in cephalalgia.² The fried root, mixed with mustard oil, is applied to the scalp in porrigo. Equal parts of the powdered root and of rock salt, mixed with mustard oil and fermented paddy water (kánjika), are rubbed on joints affected with chronic disease.³

WEDELIA CALENDULACEA, Less.

Syn. Verbesina calendulacea, Roxb.

Sans. सङ्गराज, Bhringarája. नेशराज, Kesarája. Vern. Kesarája, Beng. Bhánrá, Hind.

There is some confusion between the Sanskrit and vernacular names of Wedelia calendulacea, and Eclipta prostrata. Both these plants are called kesaráj or kesuriá in Bengali, and the two Sanskrit names of bhringarája and kesarája are used as synonyms. The Hindustani term bhángrá, derived from the Sanskrit bhringarája is however generally applied to Wedelia calendulacea, and this is the plant used in medicine at present. The leaves, which have a slight camphoraceous taste, are considered tonic, alterative,

and useful in cough, cephalalgia, skin diseases and alopecia. The juice of the leaves is much used as a snuff in cephalalgia, and in soaking various sorts of powders for the preparation of pills. "In tattooing the natives after puncturing the skin, rub the juicy green leaves of *Eclipta prostrata* over the part; which gives the desired indelible colour, namely a deep bluish black." The leaves of both these plants are used in various ways for the purpose of dyeing grey hair and for promoting the growth of hair.

Játiphaládya churna.² Take of nutmeg, baberang seeds, plumbago root, flowers of Tabernæmontana coronaria (tagara), sesamum seeds, leaves of Pinus Webbiana (tálisa), red sandal wood, ginger, cloves, cumin seeds, camphor, chebulic and emblic myrobalans, black pepper, long pepper, bamboo-manna, cinnamon, cardamom, tejapatra, and the flowers of Mesua ferrea (nágakesara), each two tolás, powdered leaves of Wedelia calendulacea, fifty six tolás, sugar, in quantity equal to all the above ingredients. Powder and mix. Dose, about a drachm. This preparation is said to be useful in phthisis, cough and catarrh.

Shadbindu taila.³ Take of sesamum oil, four seers, goat's, milk four seers, juice of bhringarája leaves, sixteen seers and prepare an oil with a paste composed of the following substances, namely, root of castor oil plant, and of Tabernæmontana coronaria (tagara), dill seeds, Cælogyne ovalis (jivanti), Vanda Roxburghii (rásná), rock salt, Wedelia calendulacea (bhringarája), baberang seeds

liquorice root, and ginger, in all one seer. Six drops of this oil, drawn in through the nostrils, are said to relieve headache and other affections of the head.

Bhringarája taila. Take of sesamum oil four seers, juice of bhringarája leaves, sixteen seers, iron rust, the three myrobalans and the root of Ichnocarpus frutescens (syámalatá), reduced to a paste, in all one seer, and prepare an oil in the usual way. This oil is said to remove scurf from the head, turn grey hairs black, and cure alopecia.

The fresh juice of the leaves of Eclipta prostrata, is rubbed on the shaven scalp for the purpose of promoting the growth of hair.

VERNONIA ANTHELMINTICA, Willd.

Syn. Serratula anthelmintica, Roxb.

Sans. सोमराजी, Somaráji. अवलगुज, Avalguja. वाक्रची, Vákuchi. Vern. Hákuch, Somráj, Beng. Bákchi, Hind.

The seeds of Vernonia anthelmintica are of great repute in Sanskrit Materia Medica as a medicine for white leprosy (leucoderma), and other skin diseases. It is mentioned also as an anthelmintic, but is not much used as such, except in combination with a number of other medicines.

In chronic skin diseases the seeds are taken alone or in combination with other medicines. In the severer forms of skin diseases, such as psoriasis and lepra, the medicine is recommended to be continued daily for one year, when a complete cure is said to be effected. The following combination is used in these cases. Take of vákuchi seeds, and black sesamum, equal parts; powder and mix. Dose, about a drachm to be taken in the morning, with

The medicine should be taken after perspiration has been induced by exercise or exposure to the sun. The diet should consist of milk and rice. In leucoderma a decoction of emblic myrobalan and catechu is given with the addition of powdered vákuchi seeds.¹

Externally it is used in skin diseases in a variety of forms such as paste, oil, etc. The following combination is said to be very useful in eruptions attended with itching. Take of vákuchi seeds, seeds of Cassia Sophora (kásamarda) and Cassia Tora (chakramarda), turmeric and common sea salt, equal parts; rub them together into a paste with whey and fermented paddy water (kánjika), and apply over the eruptions.² Vákuchi seeds four parts, and orpiment one part are rubbed into an emulsion with cow's urine, and applied to the patches of white leprosy or leucoderma.³

Somaráji taila. Take of vákuchi seeds, twelve seers and a half, water sixty four seers, and boil down to sixteen seers. Take of the seeds of Cassia Tora (chakramarda) twelve seers and a half, water sixty four seers and boil down to sixteen seers. Boil these two decoctions with sixteen seers of cow's urine, sixteen seers of mustard oil and the following substances in the form of a paste, namely root of Plumbago rosea (raktachitráka), of Gloriosa superba (lánguli), ginger, turmeric, pátchak root, seeds of Pongamia glabra (karanja), root Clitoria ternatea (aparájitá), of Nerium odorum (karavira) and of Calotropis gigantea (arka), bark of Alstonia scholaris (saptaparni), wood of Acacia catechu (khadira), of symplocos

Racemasa (ladhra), black pepper, nim leaves, leaves of Cassia Sophora (kásamarda), juice of cow-dung, orpiment and realgar, each eight tolás. This oil is said to cure all sorts of skin disease³ from vitiated blood, ringworm, prurigo, etc.¹

ANACYCLUS PYRETHRUM, DC. Pellitory root was unknown to the ancient Hindus. In later compilations as Sárangadhara and the Bhávaprakása it is occasionally mentioned under the name of Akarákarava, and is used as an ingredient of compound prescriptions, as for example in the Akarádi churna described under opium.

ENHYDRA HELONCHA, DC. Syn. Hingtsha repens, Roxb. Sans. इन्डमोचोका, Hilamochiká. Vern. Hingchá, Beng. Harhuch, Hind. The leaves of this water plant are eaten by the natives as a vegetable. Being somewhat bitter they are regarded as wholesome and invigorating. Medicinally they are described as laxative and useful in diseases of the skin and nervous system. The fresh juice of the leaves, in doses of about a tolá is, prescribed by some Kavirajas in Calcutta, as an adjunct to tonic metallic medicines given in neuralgia and other nervous diseases.

NAT. ORDER PLUMBAGINACEÆ. PLUMBAGO ZEYLANICA, Linn.

Sans. चिल्रक, Chitraka. Vern. Chitá, Beng. Hind.

The root of *Plumbago Zeylanica* is said to increase the digestive power, to promote the appetite and to be useful in dyspepsia, piles, anasarca, diarrhœa, skin diseases, etc. It is much used as a stimulant adjunct to other preparations, in the form of a com-

bination called trimada consisting of plumbago root, báberang seeds and the tubers of Cyperus rotundus (mustaka).

It enters into the composition of numerous medicines for dyspepsia. The following is an illustration. Take of plumbago root, rock salt, chebulic myrobalan, and long pepper, equal parts; powder and mix. Dose, about forty grains. A favourite medicine for flatulence is an old prescription of Susruta called Shaddharana yoga. It is a powder composed of equal parts of the following substances, namely, plumbago root, indrayava seeds, root of Stephania hernandifolia (páthá), of Picrorrhiza Kurroa (katuki), átis, and chebulic myrobalan. Dose, about a drachm.

The root of *Plumbago Zeylanica* is said to exercise a beneficial effect on piles, in which disease it is given in various combinations. One mode of administering it, is as follows. An earthen jar or pot is lined in its interior with a paste of the root, and curdled milk (dadhi) or kánjika is prepared in this pot, and taken by persons affected with hæmorrhoids, and prurigo.

Plumbago root reduced to a paste is applied to abscesses with the object of opening them. It enters also into the composition of several preparations used as caustics. The following is an illustration. Take of plumbago root, root of Baliospermum montanum (danti), the milky juice of Euphorbia neriifolia (snuhi), and of Calotropis procera or Hamiltonii (arka), marking nut, sulphate of iron, treacle and rock salt, equal parts; mix them together and make into a paste.³

PLUMBAGO ROSEA, Linn. Sans. বন্ধবিদ্ধান, Raktachitraka. Vern. Lálchitá, Beng. The properties of the root of Plumbago rosea are said to be like those of P. Zeylanica. It has besides a specific

action on the uterus.* The root of *Plumbago rosea* taken internally will expel the fœtus from the womb, whether dead or alive.¹ This root is a more powerful vesicant than that of *P. Zelanica*, and enters into the composition of caustic pastes, and stimulant and rubefacient applications.

NAT. ORDER MYRSINACEÆ. EMBELIA RIBES, Burm.

Sans. विङ्क, Vidanga. Vern. Báberang, Hind.

Susrum describes the seeds of *Embelia Ribes* as anthelmintic, alterative and tonic and recommends their use along with liquorice root for the purpose of strengthening the body and preventing the effects of age. Later writers regard *báberang* as carminative stomachic, anthelmintic and useful in intestinal worms, dyspepsia, and skin diseases.

For expelling intestinal worms, the powder of the seeds is given in drachm doses with honey, or with an infusion of the seeds. A compound powder and a *ghrita* are also prepared by the addition of various other drugs.²

^{*} It is generally known that the scraped root of Plumbago rosea is introduced into the mouth of the womb, for the purpose of procuring abortion. The root is sometimes put to another use, a knowledge of which is likely to be of importance in a medico-legal point of view. Many years ago I had under my treatment a married female, who had accidental abortion and copious hæmorrhage after it. On the third day after the accident, she was brought to hospital, suffering from severe pain in the pelvic region, purulent discharge and high fever. On examination I found a piece of the lálchitrá root, with a little rag wrapped round it, projecting into the vagina from the cervix uteri. I was told that a midwife had introduced it into the womb with the object of checking hæmorrhage after the abortion. If this woman had been a widow and had died from the effects of the abortion, and if on examination of the dead body, the root of the lálchitrá had been found in the position mentioned above, the inevitable conclusion would have been, that it was introduced for the purpose of procuring abortion.

Báberang enters into the composition of several applications for ringworm and other skin diseases. The following is an example. Take of báberang, rock salt, chebulic myrobalan, bakuchi, mustard, turmeric and the seeds of Pongamia glabra (karanja), equal parts and make them into a thin paste with cow's urine.1

NAT. ORDER SAPOTACEÆ.

BASSIA LATIFOLIA, Roxb.

Sans. 444 Madhuka. Vern. Mauá, Beng. Hind.

The flowers of Bassia latifolia yield a distilled spirit which is described by Susruta as heating, astringent, tonic and appetizing. The flowers are regarded as cooling, tonic and nutritive. They enter into the composion of several mixtures of a cooling and demulcent character. The following is an example. Take of the flowers of Bassia latifolia, bark of Gmelina arborea (gambhári), red sandal wood, root of Andropogon muricatum (ushira), coriander and raisins, equal parts, and prepare an infusion in the usual way. This infusion is given with the addition of sugar for the relief of thirst, burning of the body and giddiness.²

The seeds of Bassia latifolia yield by expression a thick concrete oil which is used in lamps, and by the poorer classes, for culinary purposes. This oil called madhuka sára in Sanskrit, is recommended to be applied to the head in cephalalgia.³

MIMUSOPS ELENGI, Linn.

Sans. वज्ञ , Vakula. Vern. Maulsarau, Hind.

This ornamental tree is generally reared in gardens for the sake of its fragrant flowers from which a distilled water is prepared. The ripe fruits are sweetish and edible. The unripe

ly with their fallen corollas. Native women and children collect them and, separating the orange coloured tubes from the white petals, dry them in the sun and preserve them for dyeing their clothes a beautiful buff or orange colour.

The leaves are used in medicine. They are regarded as useful in fever and rheumatism. The fresh juice of the leaves is given with honey in chronic fever. Some preparation of iron is also generally given along with it. A decoction of the leaves prepared over a gentle fire is recommended by several writers as a specific for obstinate sciatica.

JASMINUM GRANDIFLORUM, Linn.

Sans. Sint, Játi. Vern. Chámeli, Hind.

The fragrant flowers of Jasminum grandiflorum are used for preparing a scented oil, which is considered cooling, and is much used by the richer natives for anointing their bodies before bathing. The leaves of this plant are used medicinally in skin diseases, ulcers in the mouth, otorrhea, etc. and enter into the composition of numerous prescriptions for these diseases.

The fresh juice of the leaves is applied to soft corns between the toes.³ In ulcerations or eruptions in the mucous membrane of the mouth, the leaves are recommended to be chewed.⁴ An oil prepared with the juice of the leaves is poured into the ear in otorrhœa.⁵

JASMINUM SAMBAC, Willd. Sans. वार्षिकी, Várshiki. Vern. Bel, Beng. Hind. The properties of this plant are said to resemble those of Jasminum grandiflorum.

NAT. ORDER APOCYNEÆ. NERIUM ODORUM, Solander.

Sans. करवीर, Karavira. अश्वमारक, Asvamáraka. Vern. Karabi, Beng. Kaner, Hind.

Two varieties of Karavira are described in the Bhávaprakása, namely, white and red flowered. The properties of both are identical, their roots being regarded as poisonous when taken internally and useful in skin diseases and inflammatory affections. The Nerium odorum has several synonyms in Sanskrit signifying horse-killer. It would seem from this, that the poisonous roots were used for destroying horses.

Karavirádya taila.¹ Take of sesamum oil four seers, decoction of the root of Nerium odorum, eight seers, cow's urine, eight seers, Plumbago rosea root and báberang seeds, each half a seer, in the form of a paste; boil them together and prepare an oil in the usual way. This oil is used in eczema, impetigo and other skin diseases.

The root of *Nerium odorum* beaten into a paste with water is recommended to be applied to chancres and ulcers on the penis.² The fresh juice of the young leaves is poured into the eyes in ophthalmia with copious lachrymation.³

ALSTONIA SCHOLARIS, R.Br.

Sans. सप्तपर्ण, Saptaparna. विशासन्त, Visálatvak. Vern. Chhátin, Beng. Chhátián, Hind.

The bark of Alstonia scholaris is very thick and spongy, hence the tree has recieved the names of Visálatvak, Vrihattvak,

etc. It is described as tonic, alterative and useful in fever and skin diseases. Susruta gives the following formula for use in catarrhal fever. Take of the bark of Alstonia scholaris, gulancha, nim bark and the bark of Betula Bhojpattra, equal parts, in all two tolás and prepare a decoction in the usual way. It enters into the composition of several formulæ for skin diseases. The following is an illustration.

Amritáshṭaka páchana. Take of the bark of Alstonia scholaris, gulancha, leaves of Justicia Adhatoda (vásaka) and Trichosanthes dioica (paṭola), tubers of Cyperus rotundus (mustaka), Calamus Rotang (vetra), catechu and nim leaves, and prepare a decoction in the usual way.

HOLARRHENA ANTIDYSENTERICA, R. Br.

Sans. कुटन, Kuṭaja, का चिङ्ग, Kálinga. Vern. Kurchi, Beng. Kureyá, Kaureyá, Hınd.

The bark of Holarrhena antidysenterica constitutes the principal medicine for dysentery in the Hindu Pharmacopæia. Before the discovery of the efficacy of ipecacuana in this disease, many chronic cases which did not get well under European medical treatment, used to be cured by the Kavirajes, by their preparations of this bark. The seeds called Indrayava in Sanskrit and Indrajav in the vernacular, are also used in medicine, they being regarded as astringent, febrifuge and useful in fever, dysentery, diarrhæa, and intestinal worms.

The bark of Holarrhena antidysenterica is administered in a variety of ways. The expressed juice of the bark is given with honey.² A fluid extract of the bark is given with the addition of ginger and átis.³ A compound decoction called Kuṭajáshṭaka is

मिप्त च्छदं गुड़्रुचीञ्च निम्ह्स्सूर्यकमेव च। काथिया पिवेत्काथं सचौद्रं कफ जे ज्वरे।

Dose, about a drachm. This preparation is given in menorrhagia and other discharges from the uterus.

The seeds of Holarrhena antidysenterica enter into the composition of a good many prescriptions for fever, bowel complaints, piles, intestinal worms, etc. The following are a few illustrations Take of indrayava seeds and the tubers of Cyperus rotundus (mustaka), each four tolas, rub them into a paste with water and boil in one seer of water, till the latter is reduced to one-fourth. This boiled emulsion is given in doses of about a half to one ounce with honey.

Laghu gangádhara churna.² Take of indrayava seeds, tubers_of Cyperus rotundus, (mustaka), bela fruit, bark of Symplocos racemosa (lodhra), gum of Bombax Malabaricum (mocharasa), and flowers of Woodfordia floribunda (dhátaki) equal parts; powder and mix. Dose, about a drachm with butter-milk and treacle, in various sorts of bowel complaints.

ICHNOCARPUS FRUTESCENS. Sans. After, Sárivá. Vern. Shyámalatá. The properties of the roots of this plant are said to be identical with those of Hemidesmus Indicus. These two drugs are often used in combination under the designation of Sárivádvaya, (see next article).

NAT. ORDER ASCLEPIADEÆ. HEMIDESMUS INDICUS, R. Br.

Sans. व्यननमूल, Anantamula, धारिवा, Sárivá. Vern. Anantamul, Beng. Hind.

In Sanskrit Medicine, Hemidesmus Indicus and Ichnocarpus frutescens are both called sárivá and are described under the name

1 सस्त केन्द्र यमै : सिद्धा प्रमध्या दिप लो नियता। सुगीता मधु संयुक्ता रक्ताती सार-नाशिनी। शाक्ष धरः।

खबुगङ्गाधरचूर्णम् । सस्तिमन्द्रयः विल्वं लोधं मोचरमन्त्रया । धातकीं चूर्णयेत्तक गुडाभ्यां पाययेत् सुधीः । सर्वातीसारश्यमनं निरुणि द्विपवाहिकाम् । खधुगङ्गाघरं नामचूर्णं संपाहकं परम् । शाङ्गिधरः ।

of sárivádvaya or the two sárivás. They are often used together. When however sárivá is used in the singular number it is the usual practice to interpret it as syámalatá (Ichnocarpus frutescens). The roots of these plants are said to be sweet, demulcent, alterative and useful in loss of appetite, disinclination for food, fever, skin diseases, syphilis and leucorrhæa. They are generally used in combination with a number of other medicines. The following are a few illustrations. Take of anantamula, root of Pavonia odorata (bálá), tubers of Cyperus rotundus (mustaka), ginger, and the root of Picrorrhiza kurroa (kaṭuki), equal parts, in all two tolás, and reduce them to a paste with water. This dose administered with warm water in the morning, is said to clear the bowels and relieve fever.

A decoction of the roots of colocynth, anantamula, sárivá and Hedyotis biflora (parparta), prepared in the usual way, is administered with the addition of powdered long pepper and bdellium in chronic skin diseases, syphilis, elephantiasis, loss of sensation and hemiplegia.²

CALOTROPIS GIGANTEA AND PROCERA, R. Br.

Syn. Asclepias gigantea, Roxb.

Sans. अर्क, Arka, अनुके Alarka.

Vern. A'kanda, Beng. Mádár, Hind.

Calotropis procera and C. gigantea, both pass by the native native name of mádár. "C. procera the smaller of the two, prefers the drier climate of the Deccan, the Upper Provinces of Bengal, the Punjab and Scinde; C. gigantea, lower Bengal, the

² इत्द्रवाक् णिकानना प्रारिवा पर्पटैः समैः । एभिः कतं पिवेत् कायं क्यागुग्जू संयुतम् । च्यष्टाद्ये सुक्षके षु वातरक्तादिते तथा । खपदं ये स्तीपदेच प्रसुप्ते पच्चवातके । प्राक्षियः ।

Madras and Malayan Peninsulas, and Ceylon." Sanskrit writers mention two varieties founded upon the colour of the flowers, namely, white, called alarka, and red, called arka. The milky juice, flowers, root-bark and leaves are all used in medicine. The root-bark is said to promote the secretions and to be useful in skin diseases, enlargements of the abdominal viscera, intestinal worms, cough, ascites, anasarca, etc. The milky juice is regarded as a drastic purgative and caustic and is generally used as such in combination with the milky juice of Euphorbia neriifolia. The flowers are considered digestive, stomachic, tonic and useful in cough, asthma, catarrh and loss of appetite.

The leaves mixed with rock salt are roasted within closed vessels, so that the fumes may not escape. The ashes thus produced are given with whey in ascites and enlargements of the abdominal viscera.¹

The following inhalation is prescribed for cough. Soak the powdered root-bark of árka in its own milky juice and dry. Bougies are prepared with this powder and their fumes inhaled.² The root-bark, reduced to a paste with sour congee, is applied to elephantiasis of the legs and scrotum.³ The milky juices of Calotropis gigantea and Euphorbia neriifolia are made into tents with the powdered wood of Berberis Asiatica, for introduction into sinuses and fistula in ano.⁴ The milky juice is applied to carious teeth for relief of pain.⁵

Arka taila. Take of prepared sesamum oil, four seers, juice of arka leaves, sixteen seers, and turmeric reduced to a paste, one seer; boil them together in the usual way. This oil is said to be useful in eczema, and other eruptive skin diseases. Sometimes orpiment is substituted for turmeric is this preparation.

NAT. ORDER LOGANIACEÆ. STRYCHNOS NUX VOMICA, Linn.

Sans. क्रपीन, Kupilu, क्रनक, Kulaka, विषम्री, Vishamushti. Vern. Kuchilá, Beng. Hind.

Nux vomica has been introduced into Hindu Medicine at a recent period. There is no generally recognized Sanskrit name for it. In some recent Sanskrit compilations it is mentioned under its vernacular name kuchilá, a term which is not to be found in standard Sanskrit dictionaries. Sárangadhara and other writers give some prescriptions containg a drug named vishamushti, which is generally interpretted to mean in these places, nux vomica seeds; but vishamushti according to the Bhávaprakása has an edible fruit and is called Kareruá in Hindi. In this work the Sanskrit term kupilu with its synonyms, kulaka, vishatinduka, markaţatinduka, etc., is said to be the Sanskrit synonyms for kuchiláand this translation is followed in some Hindi medical books, as for example in the treatise on the properties of drugs, compiled by Pundit Keshava Prasáda Dvivedi of the Agra College. This interpretation however is not accepted in Bengal, for neither Wilson nor Sir Rájá Rádhákunta Deva has given kuchilá as the Vernacular for kupilu, nor does this term or any of its synonyms above mentioned, occur in any Sanskrit medical prescription. our account of this drug we will according to the practice of ous kavirájas in Bengal interpret vishamushti as kuchilá.

The Strychnos nux vomica is indigenous to most parts of India. I found it to be common in the jungles about Manbhom. The

¹ च्यक्ततेलम् । च्यकेपत्ररसेपकं कटुतैलं नियायुतम्। मनःशिलायुतं वापि पामाकच्छादिनायनम्। चक्रदत्तः।

ripe fruits of the size of apples, have a beautiful orange colour and contain a bitter gelatinous pulp, within which the flat and curiously umbilicated seeds are found imbedded.

Nux vomica seeds produce a sort of intoxication, for which they are habitually taken by some natives as an aphrodisiac. Those who do so gradually become so far accustomed to this poison that they often come to take one seed daily, which is cut into small pieces and chewed with a packet of betel leaf. Medicinally the seeds are used in dyspepsia and diseases of the nervous system.

Samiragaja kesari. Take of nux vomica, opium and black pepper equal parts, and make into two-grain pills. These are given with the juice of betel leaves in diseases of the nervous system.

Sulharanayoga. Take of chebulic myrobalan, long pepper, black pepper, ginger, nux vomica, assafætida, sulphur and rock salt, equal parts and make into four-grain pills. These are given with warm water in dyspepsia with pain after meals, and in diarrhæa. Sárangadhara gives the following prescription in which the term vishamushti is usually understood to mean nux vomica. Take of mercury, sulphur, aconite, ajowan, the three myrobalans, sarjiká (impure carbonate of soda), yavakshára (impure carbonate of potash), rock salt, plumbago root, cumin seeds, sonchal salt, seasalt, báberang, black pepper, long pepper and ginger, equal parts, vishamushti (nux vomica seeds) equal in weight to all the above ingredients and make into pills of the size of black pepper corns with lemon juice. These pills are given to promote the appetite and increase the digestive power.²

STRYCHNOS POTATORUM, Linn. fil.

Sans. कतक, Kataka, अन्त प्रसाद, Ambuprasáda. Vern. Nirmali, B.

The use of these seeds for the purpose of clearing muddy water is as old as Susruta, who mentions it in his chapter on water. Medicinally it is chiefly used as a local application in eye-diseases. The seeds are rubbed with honey and a little camphor, and the mixture applied to the eyes in lachrymation or copious watery discharge from them. Rubbed with water and rock salt they are applied to chemosis in the conjunctiva. They enter also into the composition of several complex preparations for ulcer of the cornea, etc.¹

NAT. ORDER GENTIANACEÆ.

OPHELIA CHIRATA, Grisebach.

Syn. Gentiana Chirayita, Roxb.

Sans. विदातितज्ञ, Kirátatikta, भू विष्य, Bhunimba. Vern. Chiretá, Beng. Hind.

The Ophelia Chirata is indigenous to the "mountainous regions of Northern India from Simla through Kumaon to the Morung district in South-Eastern Nepal." Its Sanskrit name kirátatikta, means "the bitter plant of the Kirátas, an outcast race of mountaineers in the north of India." It is also called Anáryatikta or the bitter plant of the Non-Aryans. The Bhavaprakása mentions a variety of chiretá, under the name of Naipála, that is, produced in Nepál, and describes it as a febrifuge.

Chiretá is regarded as tonic, febrifuge and laxative, and is used in fever, burning of the body, intestinal worms, skin diseases, etc. It is much used in fevers of all sorts in a variety of forms and in combination with other medicines of its class. The following are a few illustrations. Take of chiretá, gulancha, raisins, emblic myrobalan and zedoary root, equal parts and prepare a decoction

¹ यञ्चः चौद्रेष संयुक्तः कतकः सैन्ववेनवा । सितयार्थवफेनो वा प्रथमञ्जन मर्जुने । चक्रदत्तः ।

in the usual way. A compound powder called Sudarsana churna, is prepared by taking equal parts of fifty-four different substances and of chireta, equal to one-half the weight of all the other ingredients, and mixing them together. It is largely prescribed by native physicians in chronic febrile diseases.

Kirátádi taila, or oil of chiretá.2 Take of chiretá one seer, water sixteen seers, boil together till reduced to four seers and strain. Boil this decoction of chiretá, with four seers each of prepared mustard oil, kánjika and whey, and two tolás each of the following substances in the form of a paste, namely, root of Sanseviera Zeylanica (murvá), lac, turmeric, wood of Berberis Asiatica (dáruharidrá), madder, root of Citrullus Colocynthis (indraváruni), páchak root, root of Pavonia odorata (bálá), of Vanda Roxburghii (rásná), Scindapsus officinalis (gajapippali), long pepper, black pepper, ginger, root of Stephania hernandifolia, (páthá), indrajava seeds, sonchal, vit, and rock salts, root of Justica Adhátoda (vásaka), Calotropis gigantea (arka), Ichnocarpus frutescens (shyámalatá), Cedrus Deodara (devadáru) and the fruit of Trichosanthes palmata (mahákála). The oil thus prepared is rubbed on the body in chronic fever with emaciation and anæmia.

CANSCORA DECUSSATA, R. et Sch.

Syn. Pladera decussata, Roxb. Sans. महाप्रजी, Sankhapushpi.

Vern. Dánkuni, Beng. Sankháhuli, Hind.

This little plant is regarded as laxative, alterative and tonic and is much praised as a nervine. It is used in insanity, epilepsy

¹ किरात तिक्तमस्तां द्राचा खामलकी घठो। निष्पीड्य सततंकाचं वातिपत्तच्चरे पिनेत्। भैषच्यरत्नावली।

² किरातादि तैलम्। मूर्व्यालाचा इरिहे हे मिल्लिश सेन्द्रवास्णी। प्रम्करं ही वेरं रास्ता किपवसी कटुलयं। पाठा चेन्द्र यवश्चैव खवणलय संयुतं। वासकार्क स्थामादास महाकाल फलं तथा। दिध मन्यारनालेन कैरातेनच संपचेत्। प्रस्थं प्रस्थं समादाय तैल प्रस्थे विपाचयेत्। लिप्त मूक्त ज्वरश्चैव

and nervous debility. The fresh juice of the plant, in doses of about an ounce, is given, with the addition of honey and páchak root, in all sorts of insanity. A paste made of the entire plant, including roots and flowers, is recommended to be taken with milk as a nervine and alterative tonic. The following compound powder is used in similar cases. Take of gulancha, Achyranthes aspera (apámárga), báberang, páchak root, root of Asparagus racemosus (satamuli), Acorus Calamus (vachá), chebulic myrobalan, and Canscora decussata, in equal parts; powder and mix. It is said that the use of this powder for three days will enable a student to learn by rote a thousand couplets of poetry.

NAT. ORDER BIGNONIACEÆ. CALOSANTHES INDICA, Bl.

Syn. Bignonia Indica, Linn. Sans. स्थोनाक, Syonáka. चरनु, Aralu. Vern. Násoná, Beng. Arlu, Hind.

This is a small tree, growing over a large part of India. The root-bark is used in medicine. It is considered astringent, tonic, and useful in diarrhea and dysentery. It is also an ingredient of dasamula (see Desmodium gangeticum), and is thus largely used in a great variety of diseases. The tender fruits are described as grateful, carminative and stomachic.

सन्तं सततं तथा। धातस्यं अस्यमञ्जस्यं सर्वे ज्वरं व्यापोहित। कामनां यहणी च्वेव च्यतिसारं हनी मकं। भ्रीहा पार्ड् अथयुच्च नामयेत् नात्रसंभयः। नास्ति तैन वरच्वेव ज्वरदर्पे कुनान्तकं। भेषज्यरत्ववनी।

3 गुडच्यपामार्ग विडङ्ग यिङ्गनी बचाभया कुष्ठयतावरीसमा। घतेन खीढा-प्रकरोति मानवं विभिद्दिनै: स्रोकसङ्ख्यारियम्। चक्रदत्तः। The root-bark is enclosed within some leaves and a layer of clay and roasted. The juice expressed from this roasted bark is given in diarrhea and dysentery with the addition of mocharasa (gum of Bombax Malabarium).1

In otorrhea, Sárangadhara recommends the use of an oil prepared by boiling, over a gentle fire, sesamum oil with a paste made of the root-bark of *Calosanthes Indica*.²

STEREOSPERMUM SUAVEOLENS, DC.

Syn. Bignonia suaveolens, Roxb.

Sans. पाटना, Páțalá. Vern. Párul, Beng. Pád, Hind.

This is a middle sized flowering tree, a native of Bengal. The flowers are large, of a dark crimson colour and exquisitely fragrant. Steeped in water they impart their fragrance to it. Rubbed up with honey they are given to check hiccup. The rootbark is an ingredient of dasamula (see Desmodium gangeticum), and is thus largely used in native medicine. It is regarded as cooling, diuretic and tonic, and is generally used in combination with other medicines. The ashes of this plant are used in the preparation of alkaline water and caustic pastes.

NAT. ORDER. CONVOLVULACEÆ.

IPOMŒA TURPETHUM, R. Br.

Syn. Convolvulus Turpethum, Roxb.

Sans. faet, Trivrit. fayer, Tripuțá.

Vern. Teori, Beng. Nisoth, Tarbud, Hind.

Two varieties of trivrit are described by most writers, namely, sveta or white and krishna or black. The white variety is pre-

¹ अरनुत्वस्कृतस्व पुरपाको न्निरीपनः। मधुमोचरशास्याञ्च युक्तः सर्वा-तिसारजित्। गार्ङ्गधरः।

² तैनं स्थोनाकमूनेन मन्दाग्नौपरिपाचितम् । इरेदाशु तिदोषोत्यं कर्ण मूनं प्रप्रणम् । मार्क्षभरः ।

ferred for medicinal use as a moderate or mild cathartic. The black variety is said to be a powerful drastic and to cause vomiting, faintness and giddiness. Trivrit has been used as a purgative from time immemorial and is still used as such by native practitioners, alone, as well as in various combinations. In fact this medicine is the ordinary cathartic in use amongst natives, just as jalap is among Europeans. The usual mode of administering it is as follows. About two scruples of the root are rubbed into a pulp with water and taken with the addition of rock salt and ginger or sugar and black pepper.

A compound powder called Nárácha churna, is thus prepared Take of trivrit root two tolás, long pepper two tolás, sugar eight tolás; powder and mix. About a scruple of the powder is recommended to be taken before meals in constipation with hard fæces.

Tumburádya churna.² Take of the fruits of Xanthoxylum hostile (tumburu), rock, vit and sonchal salts, ajowan, páchak root, yavakshára, chebulic myrobalan, assafætida and baberang seeds, one part each, trivrit three parts; powder the ingredients and mix. Dose, about a drachm with warm water, in painful dyspepsia with costiveness and flatulence.

In anasarca supposed to be caused by deranged bile, a decoction of trivrit, gulancha, and the three myrobalans is recommended to be taken. Milk diet should be prescribed along with this medicine.³

BATATAS PANICULATUS, Choisy.

Syn. Convolvulus paniculatus, Roxb.

Sans. विदारी, Vidári, भूमिनुषागड, Bhumikushmánda.

Vern. Bhui kumrá, Beng, Bilai kand, Hind.

The large tuberous root of this handsome climber is considered tonic, alterative, aphrodisiac, demulcent and lactagogue. The powdered root-stock is given with wine, for the purpose of increasing the secretion of milk. In the emaciation of children with debility and want of digestive power, the following diet is recommended. Take of vidári, wheat-flour and barley equal parts, and make into a confection with milk, clarified butter, sugar and honey. Susruta gives several prescriptions for its use as an aphrodisiac. The simplest is as follows. Macerate the powder of the root in its own juice and administer with honey and clarified butter. Vidári enters into the composition of several diuretic and demulcent mixtures. The following is an illustration.

Mutrakrichchhántaka rasa.⁴ Take of vidári, fruits of Tribulus terrestris, (gokshura), liquorice root, and flowers of Mesua ferrea (nágakesara), equal parts and prepare a decoction with water. This decoction is given with the preparation of mercury called rasasindura, in scanty or acrid urine, to promote this secretion.

PHARBITIS NIL, Choisy. The seeds of this plant, called káládáná in the vernacular and now commonly used as a purgative

all over India, were unknown to the ancient Hindus. There is no name for them in Sanskrit.

ARGYREIA SPECIOSA, Sweet.

Syn. Lettsomia nervosa, Roxb.

Sans. Eszita, Vriddhadáraka. Vern. Bijtarká, Beng.

The root of this plant is regarded as alterative, tonic and useful in rheumatic affections, and diseases of the nervous system. As an alterative and nervine tonic it is prescribed in the following manner. The powdered root is soaked, seven times during seven days, in the juice of the tubers of Asparagus racemosus (satamuli) and dried. The resulting powder is given in doses of a quarter to half a tolá, with clarified butter, for about a month. It is said to improve the intellect, strengthen the body and prevent the effects of age. In synovitis the powdered root is given with milk.

Ajamodádi churna.³ Take of ajowán, báberang, rock salt, plumbago root, Cedrus deodara, long pepper root, long pepper, black pepper and dill seeds each two tolsá, chebulic myrobalan ten tolás, root of Argyreia speciosa twenty tolás, ginger twenty tolás; powder and mix. Dose, about two drachms with treacle. This preparation is said to be useful in rheumatic affections and hemiplegia.

NAT. ORDER SOLANACEÆ.

DATURA ALBA, Rumph. and FASTUOSA, Linn.

Sans. धूस्तूर, Dhustura, डन्मत्त, Unmatta.

Vern. Dhuturá, Hind. and Beng.

Sanskrit writers do not make any distinction in the properties of the two varieties of Datura, and in practice both are indiscriminately used. Sometimes the white flowered variety is specified, as for example in a prescription for insanity, quoted below. Dhaturá leaves are used in smoking by debauched devotees and others accustomed to the use of gánja. The seeds are added to the preparations of bháng (leaves of Cannabis sativa) used by natives, for increasing their intoxicating powers. The use of the powdered seeds in sweet-meats, curry powder, etc., for the purpose of stupifying travellers and then robbing them, is well known.

The seeds, leaves and roots are all used in medicine. They are considered useful in insanity, fever with catarrhal and cerebral complications, diarrhœa, skin diseases, lice, etc.

Svalpajvaránkusa.¹ Take of mercury, sulphur, aconite, ginger, long pepper and black pepper, each one part, dhaturá seeds two parts; rub them together with lemon juice and make into fourgrain pills. These pills are used in fever attended with catarrh or cough. Several other preparations of composition similar to the above, are in use under the names of Nava jvaránkusa, Kálári, Jvaránkusa, etc.

The root of Datura alba (svetonmatta) is boiled in milk and this milk is administered with the addition of clarified butter and treacle in insanity.² A metallic preparation called Unmádankura rasa and composed of the sulphides of mercury and copper together with a number of other substances and dhaturá seeds, is also used

¹ रसं गन्धं विषञ्जीव प्रत्ये सं समभागिकम् । दिभागं धुस्तुवी जञ्च तिकटु तद्धं भागिकम् । जम्बीराणां रवैमेह्यवटी गुञ्जादयमाता । कणाचूणं पिवेत् चाशुर्वात स्त्री भाज्यरं जयेत् । रसेन्द्र सार्या प्रतः ।

² श्रोतोत्मत्तोत्तरदिङ्मू बिखस्तु पायसः। गुडाच्य गृंयतो इन्ति सर्वोत्मा-दांस्तु दोषजान् । चक्रदत्तः ।

in this disease. The fresh juice of the leaves alone, or mixed with opium, is a common domestic application to inflamed parts.

In inflammation of the breasts, a paste composed of turmeric and dhatura fruits is recommended to be applied. An oil prepared in the usual manner with the paste and juice of dhatura leaves, is applied to the head for destroying lice. An oil prepared by boiling dhatura seeds, and sesamum oil, with an alkaline water made from the ashes of Colocasia Indica (mánaka), is used in psoriasis.

In the Bengal Dispensatory (page 469) it is stated that "we are indebted to the native practitioners of India for a method of using stramonium in spasmodic asthma, which is certainly found of great benefit in numerous cases. We allude to the practice of smoking the leaves or dried stems." The smoking of dhatura leaves is prescribed at present both by English and native practitioners in spasmodic asthma, but I have not met with any written prescription for it in Sanskrit or vernacular medical works, nor does the Taleef Shereef allude to the practice as known to the Mussulman hakims. It would seem therefore that this use of the drug is of recent origin.

SOLANUM XANTHOCARPUM, VAR. JACQUINIS, Schrad.
Syn. Solanum Jacquinii, Linn.

Sans. करडकारी, Kanṭakári, निद्धिका, Nidigdhiká. Vern. Kanṭakári, Beng. Kaṭeli, Kaṭai, Hind.

The root of Solanum Jacquinii is much esteemed as an expectorant and is used in cough, asthma, catarrhal fever and pain in the chest. It is an ingredient of dasamula (see Desmodium gangeticum), and is thus largely used in a great variety of diseases. The fruits are said to possess properties similar to those of the roots and are eaten as a vegetable.

³ जनासकसा बीजेन माणकत्तारवारिया। कटुतैनं विपक्तव्यं शीघं इत्यादिपादिकाम्। चक्रदत्तः।

Kantakári is used in medicine in various forms, such as decoction, electuary, ghrita, etc. A decoction of the root is given with the addition of long pepper and honey, in cough and catarrh, and with rock salt and assafætida in spasmodic cough. Several compound decoctions made along with other expectorant and demulcent drugs are in use. The following is an example. Take of kantakári, root of Justicia Adhatoda (vásaka), pulse of Dolichos uniflorus (kulattha) and ginger, equal parts, in all two tolas; prepare a decoction in the usual way and administer, with the addition of páchak root, in cough with difficult breathing.

Kantakáryavaleha³ or electuary of Solanum Jacquinii. Take of kantakári root twelve seers and a half, water sixty-four seers, boil till reduced to one fourth and strain. Boil the strained decoction till reduced to the consistence of a fluid extract, and add to it the following substances in fine powder, namely, gulancha, Piper Chaba (chavya), plumbago root, tubers of Cyperus rotundus (mustaka), Rhus succedanea, (karkaṭa sringi), long pepper, black pepper, ginger, Alhagi Maurorum (yása), Clerodendron Siphonanthus (várgi), Vanda Roxburghii, (rásná) and zedoary root, each eight tolas, sugar two seers and a half, sesamum oil and clarified butter each one seer, and boil together till reduced to the proper consistence. Lastly add honey one seer, bamboo-manna and long pepper in fine powder, each half a seer. This electuary is given in various sorts of cough.

2 वलादिष्टहतीवासाद्राचाभिः काथितं जलम्। पित्तकासापहं पेयं धर्करा सध्योजितम्। चक्रदत्तः। root smells like a horse whence the Sanskrit name asvangandhá. The specimen in my possession however has scarcely any odour or taste. It is regarded as tonic, alterative and aphrodisiac and is used in consumption, emaciation of children, debility from old age, rheumatism, etc.

In consumption a decoction of asvagandhá root and long pepper is given with the addition of clarified butter and honey. For improving the nutrition of weakly children, the root reduced to a paste, is recommended to be taken with milk and clarified butter for a fortnight.²

Asvagandhá ghrita.³ Take of the decoction of asvagandhá root one part, milk ten parts, clarified butter one part; boil them together and prepare a ghrita. It is said to promote the nutrition and strength of children.

In rheumatism, a ghrita prepared with a decoction and paste of the root, is used internally and an oil prepared with a decoction of the root and a number of aromatic substances in the form of a paste, is used externally.

About half a drachm of asvagandhá root, taken with milk or clarified butter is said to act as an aphrodisiac and restorative to old men. Asvagandhá enters into the composition of several medicines intended for use as aphrodisiacs.4

HYOSCYAMUS NIGER, Linn. The seeds of Hyoscyamus niger are used in Hindu medicine under the name of khorásáni yamáni. They are considered stimulant or heating, narcotic,

astringent and digestive, and are used in combination with other medicines of their class.

NICOTIANA TABACUM, Linn. According to Royle, the tobacco plant was introduced into India (A.D. 1605) towards the end of the reign of Jelaludeen Akbar. It is not described even in the latest Sanskrit medical works such as the Bhávaprakása or Rája Vallava. The Sabdakalpadruma mentions it under the name of Timaz Támrakuṭa, and quotes as authority for the use of the word, a passage from the Kulárnáva Tantra where it is stated to be one of eight intoxicating agents.

CAPSICUM FRUTESCENS, Linn. and MINIMUM, Roxb. have no Sanskrit name. Although they are now cultivated all over India and form an essential ingredient of all curry powders, they are not mentioned in any Sanskrit medical work and are evidently of recent introduction into this country.

NAT. ORDER SCROPHULARIACEÆ. PICRORRHIZA KURROA, Royle.

Sans. कटका, Katuká, कट्रोहिची, Katurohini. Vern. Katki, H. B.

The root of Pierorrhiza Kurroa is described as bitter, acrid and stomachic and in larger doses a moderate cathartic. It is used in fever and dyspepsia and as an ingredient of various purgative medicines. About two drachms of the powdered root given with sugar and warm water, is said to act as a mild purgative. In bilious fever the following decoction is highly recommended. Take of kaṭuki root, liquorice, raisins, and nim bark, half a tolá each, water thirty-two tolás; boil till reduced to one-fourth. The following is an example of a powder containing kaṭuki root, used in dyspepsia. Take of kaṭuki, Acorus Calamus (vachá), chebulic myrobalans and plumbago root, equal parts; powder and mix.

HERPESTIS MONNIERA, H. B. K.

Syn. Gratiola Monniera, Roxb.

Sans. ब्रह्मी, Brahmi, मण्डू की, Manduki, Vern. Brahmi, Beng. Hind.

The herb used by the native physicians of Calcutta under the name of brahmi is the Herpestis Monniera. Roxburgh however gives brahmi and one of its synonyms somalatá as the Sanskrit for Ruta graveolens. This descrepancy induced me to get specimens of the plant from different parties, but every where I got the Herpestis Monniera under the name of brahmi. This plant is considered a nervine tonic, useful in insanity, epilepsy and hoarseness. Half a tolá of the fresh juice of the leaves, with two scruples of páchak root and honey, is recommended to be given in insanity. The leaves fried in clarified butter are taken to relieve hoarseness.

A powder composed of equal parts of brahmi, Acorus Calamus (vachá), chebulic myrobalan, root of Justicia Adhatoda (vásaka) and long pepper, is given with honey in the hoarseness of phthisis.² Several ghritas are prepared with the juice of brahmi leaves and various other substances in the form of paste. They are used in insanity, epilepsy and hoarseness. The following is an example.

Brahmi ghrita.³ Take of old clarified butter four seers, fresh juice of brahmi four seers, Acorus Calamus (vachá), páchak root, and the root of Canscora decussata (sankhapushpi), equal parts, in all thirty-two tolás, in the form of a paste and boil them together till the watery portion is evaporated.

¹ See note 1 page 202.

NAT. ORDER ACANTHACEÆ. JUSTICIA ADHATODA, Roxb.

Syn. Adhatoda Vasica, Nees.

Sans. वासक, Vásaka, चटरप, Atarusha. Vern. Bákas, B. Arushá, H.

This is a bushy shrub common in most parts of India and used in making fences. The leaves and roots of this plant are considered expectorant and antispasmodic and are much used in a variety of forms in cough, consumption, catarrhal fever and asthma. This medicine was considered so serviceable in phthisis that it was said no man suffering from this disease need despair as long as the vásaka plant exists.

The fresh juice or decoction of the leaves in doses of one tolá, is given with the addition of honey and long pepper in cough. A decoction of vásaka root, chebulic myrobalan and raisins is used in the same cases. Another compound decoction much used in fever with cough, is as follows. Take of vásaka root, gulancha, and the root of Solanum Jacquinii (kanṭakári) in equal parts, two tolás in all and prepare a decoction in the usual way. This is given with the addition of honey. A ghrita is prepared with clarified butter, a decoction of the plant and a paste of the root taken in the usual proportions and is used in phthisis.

Vásávaleha² or electuary of vásaka. Take of the juice of vásaka leaves four seers, white sugar one seer, long pepper sixteen tolás, clarified butter sixteen tolás, boil them together till reduced to the consistence of an extract. When cool add honey

one seer, and stir with a ladle till intimately mixed. Dose, one to two tolás in phthisis, cough with pain in the sides, hæmoptysis and asthma.

Vásáchandanádi taila. Take of vásaka plant, twelve seers and a half, water sixty-four seers; boil till reduced to one-fourth. Take of lac eight seers, water sixty-four seers; boil down to sixteen seers. Take of red sandal wood, gulancha, root of Clerodendron Siphonanthus (brahmayashti), the ten drugs called dasamula and Solanum Jacquinii (nidigdhiká), each two seers and a half, water sixty-four seers; boil down to sixteen seers. To these decoctions, add of whey and prepared sesamum oil sixteen seers each and the following substances in the form of a paste, namely, red sandal wood, liquorice, wood of Berberis Asiatica, long pepper, black pepper, ginger, turmeric, páchak root, emblic myrobalans, tejapatra leaves, wood of Cedrus Deodara, cinnamon, and cardamom, seeds called renuka, pouch of civet cat, root of Withania somnifera (asvagandhá), Pæderia fætida (prasárani), Vanda Roxburghii (rásná), saileya (a sort of lichen), zedoary root, and the fruit of Aglaia Roxburghiana (priangu), each eight tolás; and boil them together in the usual way. This oil is rubbed on the body in affections of the chest and especially in phthisis.

HYGROPHILA SPINOSA, T. Anders. Syn. Asteracantha longifolia, Nees. Ruellia longifolia, Roxb. Sans. को किंचाच, Kokiláksha, इन्गन्दा, Ikshugandhá. Vern. Kuliákhará, Beng. Tálmakhána, Hind.

This little annual is met with in low places all over the country. The leaves are described as cooling and useful in jaundice and anasarca. They are used as a pot herb. The root is considered cooling, bitter, tonic and diuretic, and is used in rheumatism, urinary affections, and anasarca. The ashes of the plant are also used as a diuretic in dropsy.1

ANDROGRAPHIS PANICULATA, Nees. This bitter shrub is well-known in Bengal under the name of kálmeg and is the principal ingredient of a domestic medicine for infants called A'lui. There is some doubt regarding its Sanskrit name. A plant called yavatiktá with synonyms of mohátiktá, sankhini, etc., is said by some to mean this shrub but the term mohátiktá when occuring in Sanskrit prescriptions is usually interpreted as Melia sempervirens, Sw. and yavatikta has not been noted by me as having occurred in any prescription, so that I am inclined to think Andrographis paniculata was not used in Sanskrit medicine. The álui above referred to is made of the expressed juice of the leaves with the addition of powdered cardamoms, cloves, cinnamon etc., and is given to infants for the relief of griping, irregular stools and loss of appetite.

NAT. ORDER. SESAMEÆ. SESAMUM INDICUM, Linn.

Sans. तिल, Tila, इ इफल, Snehaphala. Vern. Til, Beng. and Hind.

This plant is extensively cultivated in India for the sake of the seeds and their expressed oil, both of which articles are in great demand for various economic, religious and medicinal purposes. The word taila, the sanskrit for oil, is derived from tila; it would therefore seem, that sesamum oil, was one of the first, if not the first oil manufactured from oil-seeds by the ancient Hindus. The Bhávaprakása describes three varieties of til seeds, namely, black, white and red. Of these the black is regarded as the best, suited for medicinal use. It yields also

¹ शोधनुत्को किलाचस भसा मूलेण वास्त्रसा।

the largest quantity of oil. White til is of intermediate quality. Til of red or other colours is said to be inferior and unfit for medicinal use.

Sesamum seeds are used as an article of diet, being made into confectionary with sugar, or ground into meal. They form an essential article of certain religious ceremonies of the Hindus, and have therefore received the names of homadhánya or the sacrificial grain, pitritarpana or the grain that is offered as an oblation to deceased ancestors, etc. Sesamum oil forms the basis of most of the fragrant or scented oils used by the natives for inunction before bathing and of medicated oils prepared with various vegetable drugs. It is preferred for these purposes from the circumstance of its being little liable to turn rancid or thick, and from its possessing no strong taste or odour of its own.

Sesamum seeds are considered emollient, nourishing, tonic, diuretic, and lactagogue. They are said to be especially serviceable in piles, by regulating the bowels and removing constipation. Sesamum seeds ground to a paste with water are given with butter in bleeding piles. Sweetmeats made of the seeds are also beneficial in this disease. A poultice made of the seeds is applied to ulcers. Both the seeds and the oil are used as demulcents in dysentery and urinary diseases in combination with other medicines of their class.

NAT. ORDER. VERBENACEÆ.

VITEX NEGUNDO, Linn.

Sans. निर्प रही, Nirgundi, विस्ववार, Sindhuvára.

Vern. Nisinda, Beng. Nisindá, Sámbhalu, Hind.

SANSKRIT writers mention two varieties of nirgundi. That with pale blue flowers is called sindhuvára (Vitex trifolia) and that with blue flowers is called nirgundi. The properties of both are said to be identical, but the latter is generally used in

¹ नवनीतित्वैः करको जेता रक्तार्थसां स्मृतः। शार्क्कघरः। 2 करकः संरोपणः कार्य्यस्तिन्तानां सधुकान्वितः। चक्रदत्तः।

medicine. The root of *Vitex Negundo* is considered tonic, febrifuge and expectorant. The leaves are aromatic and regarded as tonic and vermifuge. Their juice is much used for soaking various metallic powders, before making the latter into pills.

A decoction of nirgundi leaves is given with the addition of long pepper in catarrhal fever with heaviness of head and dullness of hearing. A pillow stuffed with the leaves of nirgundi is placed under the head for relief of headache. The juice of the leaves is said to remove fætid discharges and worms from ulcers. An oil prepared with the juice of the leaves is applied to sinuses and scrofulous sores.

GMELINA ARBOREA, Linn.

Sans. गमारी, Ghambhári, श्रीपणी, Sriparni, काम्सरी, Kásmari. Vern. Gámári, Beng. Gámbhár, Hind.

The root of this plant is described as bitter, tonic, stomachic, laxative, and useful in fever, indigestion, anasarca etc. It is an ingredient of dasamula (see Desmodiun gangeticum), and is thus much used in a variety of diseases. Bangasena says that gambhári root taken with liquorice, honey and sugar increases the secretion of milk. The fruits of Gmelina arborea are sweetish bitter and cooling; they enter into the composition of several cooling or refrigerent decoctions for fever and burning of the body. The following is an example. Take of the fruits of Gmelina arborea, Grewia Asiatica (parushaka), liquorice root, red sandal wood, and the root of Andropogon muricatum (ushira), equal parts, in all two tolás, water thirty-two tolás, and boil till reduced to one half. This decoction is used as a drink in bilious fever.³

CLERODENDRON SIPHONANTHUS, R. Br. Syn. Siphonanthus Indica, Lam. Sans. A parter, Brahmayashtika and, Bhárgi. Vern. Bámanháti, Beng. Bhárangi, Hind. The root of Clerodendron Siphonanthus is considered useful in asthma, cough and scrofulous affections. The root beaten to a pulp is given with ginger and warm water in asthma. It enters into the composition of several compound decoctions for diseases of the lungs. A confection called Bhárgiguda, is prepared with a decoction of this root and the ten drugs called dasamula, chebulic myrobalan, treacle and the usual aromatic substances. It is used in asthma. An oil, prepared with a decoction and paste of the root of Clerodendron Siphonanthus in the usual proportions, is recommended for external application in the marasmus of children.

PREMNA SERRATIFOLIA, Linn. Syn. Premna spinosa, Roxb. Sans. Afaita, Ganikáriká, Agnimantha. Vern. Ganiári, Beng. Arni, Hind. The root of Premna spinosa is described as bitter, stomachic and useful in fever, anasarca, urticaria, etc. The leaves are bitter and carminative. A soup made of the leaves is occasionally used as a stomachic and carminative. The root forms an ingredient of dasamula (see Desmodium gangeticum), and is thus largely used in a variety of affections.

The root rubbed into a paste with water is recommended to be taken with clarified butter in urticaria and roseola, for a week.²

NAT. ORDER LABIATÆ. OCIMUM SANCTUM, Linn.

Sans. त्वरी, Tulasi, पर्णास, Parnása. Vern. Tulsi, Beng. Hind.

SANSKRIT writers make two varieties of this plant (founded upon some difference in the colour of their leaves) namely, white and black. The Ocimum sanctum is held sacred to Vishnu of the

[े] चिकाश्वासी पिवेद्वार्गी सिवश्वास्यावारिया। नागरं वासिता भागीं सीवर्ज्ञ समन्वतस्।। चक्रदत्तः।

² व्यक्तिमञ्चानवं मूलं पिष्टं पीतञ्च सर्पिषा। गीतिपत्तोदर्शकोठान् सप्ता-चादेवनाग्रयेत्॥ चक्रदत्तः।

Hindu trinity, and is reared in every hindu house where it is daily watered and worshipped by all the members of the family. The beads or rosaries used by orthodox natives for counting the number of recitations of their deity's name, are made of the stems of this plant.

The leaves are regarded as anti-catarrhal or expectorant and are used in catarrh, cough and pain in the sides. The juice of the leaves is given with the addition of black pepper in catarrhal fever. It is often used as an adjunct to metallic preparations, which are rubbed with it into a thin paste and then licked up. The leaves enter into the composition of some compound decoctions for cough and affections of the chest. The following is an example. Take of the leaves of Ocimum sanctum, gulancha, ginger, root of Clerodendron Siphonanthus, (bhárgi) and Solanum Jacquinii (kanţakári), equal parts and prepare a decoction in the usual way.2 The dried leaves are used as snuff in ozena. They also enter into the composition of some compound medicines used in this disease, as for example of an oil which is prepared with a paste of the leaves of Ocimum sanctum, roots of Solanum Jacquinii (kanţakári), Baliospermum montanum (danti), Acorus Calamus (vachá), Moringa pterygosperma (sigru), long pepper, black pepper, and ginger.3

OCIMUM BASILICUM, Linn. Syn. Ocimum pilosum, Willd. Sans. वर्बर, Varvara. Vern. Bábui tulsi. Beng. The seeds of this plant, called rehán in the vernacular, are demulcent and nourishing. Steeped in water they swell into a mucilaginous jelly which is taken with the addition of sugar in dysentery, gonorrhæa and cough.

NAT. ORDER AMARANTACEÆ.

AMARANTHUS SPINOSUS. Linn. Sans. नाड़, जो ब, Tanduliya. Vern. Kantánatiá, Beng. Cholái, Hind. This thorny weed is considered light, cooling and a promoter of the alvine and urinary discharges. Its root is said to be an efficaceous medicine for menorrhagia, in which disease it is given with rasot and honey. It enters also into the composition of other medicines for this disease, as for example in the preparation called Asoka ghrita.

ACHYRANTHES ASPERA, Linn.*

Sans. खपामार्ग, Apámárga. खरमञ्जरी, Kharamanjari.

Vern. A'páng, Beng. Latjirá, chirchirá, Hind.

This troublesome weed is chiefly valued on account of its ashes which contain a large quantity of potash. These are used in the preparation of alkaline medicines and caustic pastes, (see Alkaline ashes). The ashes mixed with orpiment are applied as a caustic to warts on the penis and other parts of the body.

Apámárga taila.² Take of sesamum oil four seers, the alkaline water prepared from the ashes of Achyranthes aspera sixteen seers, the ashes of the plant one seer, and boil them together in the usual way. This oil is poured into the meatus in cases of noise in the ears and deafness.

The weed itself is described as heating like fire, laxative and a promoter of secretions; it is used in combination with other medicines of its class in ascites and anasarca, (see Cedrus Deodara).

NAT. ORDER NYCTAGINACEÆ.

BOERHAAVIA DIFFUSA, Linn.

Sans. प्रनवा, Punarnavá, भोषञ्जी, Sothaghni.

Vern. Svetapunarnabá, Beng. Sánt, Hind.

BOTH the red and white varieties of this plant are noticed by Sanskrit writers but the white is preferred for use. Its root is

¹ रगञ्जनं तण्ड् लकस्य मूलं जौद्रान्तितं तण्ड् लतोयपीतम्। अस्ग्र्रं गर्वभवं निर्हान्त श्वामञ्च भागी गर्हनागरेण। भागप्रकाशः। * The closely allied species A. bidentata, Bl. is probably used as frequently as this. G. K.

थ अपासार्गचारतैन्य। अपासार्गचार जने तत्कतकत्के न साधितं तिन्ज-जस्। अपहरतिकर्णनादं वाधिर्यञ्चापिपूरणतः।। चक्रद्तः

regarded as laxative, diuretic and stomachic; it is used in jaundice, ascites, anasarca, scanty urine and internal inflammations. One of its Sanskrit synonyms, namely, sothagni means cure for dropsy. A decoction of punarnavá root is recommended to be given with the addition of powdered chiretá and ginger in anasarca. A compound decoction much used in this disease is prepared as follows.

Punarnaváshtaka.² Take of Punarnavá root, nim bark, leaves of Trichosanthes dioica (patola), ginger, Picrorrhiza Kurroa (katuki), chebulic myrobalan, gulancha, and the wood of Berberis Asiatica (dáruharidrá), quarter of a tola each, water thirty-two tolas; boil together till reduced to one-fourth. This decoction is given in general anasarca with ascites, cough, jaundice, difficult breathing, etc. An oil, prepared with a decoction of the root and a number of the usual aromatics in the form of a paste, is rubbed on the body in general ansarca complicated with jaundice. It is called Punarnavá taila.³

The Bhávaprakása gives an electuary under the name of Punarnavávaleha. It is prepared with a decoction of the root of Boerhaavia diffusa and a number of other ingredients, and is used in strangury or scanty urine.

NAT. ORDER LAURACEÆ.

CINNAMOMUM CAMPHORA, Nees et Ebermaier.

Sans. कर्र, Karpura, चन्द्राह्न, Chandráhba.

Vern. Kápur, Hind. Karpur. Beng.

Two varieties of camphor are mentioned by Sanskrit writers, namely, pakva and apakva, that is prepared with the aid of heat

1 भूनिस्व विश्वत्रत्वं जग्ध्वापेयः प्रननेवाकायः। अपहर्रात नियतमाशुशोधं सर्वाङ्गजं न्हणाम् ।।

² पुनर्नवाष्ट्रकः । पुनर्नवाणिन्वपटोलशुग्छीतिक्तान्छतादाब्ब्याभयाकषायः। सर्व्याङ्गशोथोदर कासन्यल्यासान्तितं पाग्डगदं निर्हान्ति ॥ चक्रदत्तः ।

े पुनर्नशतैनस्। पुनर्नवापन्यतं जन्दोणे विपाचयेत्। तेन पादावयेषेन तैनप्रस्थं विपाचयेत्। तिकटु तिष्कना प्रदक्षी धन्याकं कट्षानं तथा। यठी दारुप्रयङ्गुच देवदारु हरेणुभिः। कुष्ठं पुनर्नवाघनं यमानी कारवी तथा। एना त्वचं पदाकञ्च पत्नं नागरके प्रस्म। एषाञ्च कार्षिकैः कल्कैः पेष्रित्वा and without it. The latter is considered superior to the former. It would seem from the above description that by the term apakva karpura, was probably meant the camphor obtained in Borneo from the trunk of Dryobalanops aromatica, (Shorea Camphorifera, Roxb). and by the term pakva karpura, the China camphor obtained by sublimation from the wood of Cinnamomum Camphora.

The Rájanirghantu describes an oil of camphor under the name of karpura taila. It is said to be useful in rheumatism and in giving firmness to loose teeth. This oil is not recognized or used by the native practitioners of the present day, but it most probably meant the camphor oil or liquid camphor obtained by making incisions on the Borneo camphor tree.

Camphor is regarded as carminative, stimulant and aphrodisiac; it is used in fever, diarrhea, impotence, cough, eyediseases, etc. It is also much used in the preparation of medicinal oils for imparting fragrance to them, singly as well as in combinanation with other aromatic substances. Camphor enters into the composition of numerous medicines for the diseases mentioned above. The following is an illustration.

Karpura rasa. Take of cinnabar, opium, camphor, tubers of Cyperus rotundus (mustaka), indrajava seeds and nutmegs, equal parts; powder the ingredients, and make into four-grain pills with water. These pills are used in diarrhœa.

Camphor, rubbed with the milky juice of Ficus Bengalensis, is recommended to be applied to opacities on the cornea. It enters also into composition of several collyria.² A small tent made with

² वटचीरेणसंयुक्तं स्वच्णं कर्णूरजंरजः । चिषमञ्जनतो हन्ति शुक्रञ्चापि घनोद्रतम् ।। चक्रदत्तः ।

camphor is introduced into the urethra for the relief of irritability of the bladder and frequent micturition.1

CINNAMOMUM ZEYLANICUM, Breyn. Sans. युद्धार Gudatvak. Cinnamon is largely used as an aromatic adjunct in compound prescriptions. A combination of cinnamon, cardamoms and tejapatra leaves, passes by the name of trijátaka, these three aromatics being often used together.

CINNAMOMUM TAMALA, Nees. and other species, furnish the leaves called tejapatra in Sanskrit, and tejpát in the vernacular. They are an essential ingredient of Indian cookery. For remarks on their uses in medicine see Cinnamomum Zeylanicum.

NAT. ORDER MYRISTICEÆ.

MYRISTICA OFFICINALIS, Linn. Both nutmegs and mace enter into the composition of numerous medicines as aromatic adjuncts, but there is no peculiarity in their use that need special consideration here. An infusion of nutmegs is recommended by several writers as a serviceable drink in the thirst of cholera patients.²

NAT. ORDER SANTALEÆ. SANTALUM ALBUM, Linn.

Sans. चन्द्रन, Chandana, श्रीखण्ड, Srikhanda. Vern. Chandan, Beng. Saphed chandan, Hind.

Sanskrit writers describe several varieties of chandana and some include the woods of Pterocarpus Santalinus (raktachandana) and Casalpinia Sappan (pattanga) under this common denomination. Excluding these last, two varieties of sandal wood are generally recognised, namely, srikhanda or white sandal wood

¹ मेहनखाययोनेवां सुख्यास्यन्तरे श्नैः। घनसारयुतां वित्त स्वारयेना त्न-नियहे। भावप्रकाशः।

² विपासायासनुत्केशे नवद्गस्यास्तु गस्ते । जातीफनस्य वाशीतं स्तं भद्रधनस्य वा । चक्रदत्तः ।

and pitachandana or the yellow variety. These varieties are founded on the difference in the depth of colour in the heart-wood and not on any specific difference in the plants. The use of sandal wood in carving, and the elegant and fragrant articles made from it, are too well known to need description here. The Hindus use an emulsion of the wood in the worship of their idols and for painting or anointing their bodies after bathing. Rich natives sometimes use sandal wood for burning their dead relatives. Rich or poor, all add at least one piece of the wood to the funeral pile.

The essential oil of chandan (chua chandana) obtained by distillation from the heart-wood and roots, is of a pale yellow colour and has a peculiar fragrant smell best appreciated by rubbing a few drops of it on the hand. It is much used as a perfume by the Hindus both for themselves and for their idols. In Orissa it is a practice with the better classes to rub a little sandal oil in the spices which they take with their betle-leaf.

Sandal wood is described as bitter, cooling, astringent, and useful in biliousness, vomiting, fever, thirst and heat of body. An emulsion of the wood is used as a cooling application to the skin in erysipelas, prurigo and sudamina. Two tolás of the watery emulsion of sandal wood, with the addition of sugar, honey and rice-water, is given to check gastric irritability and dysentery, and to relieve thirst and heat of body.

NAT. ORDER EUPHORBIACEÆ. PHYLLANTHUS EMBLICA, Linn.

Syn. Emblica officinalis, Gaertn.

Sans. चामलको, A'malaki, घानि, Dhátri. Vern A'mlaki, Beng. A'onlá, Hind.

LIKE chebulic myrobalan, emblic myrobalan is also extensively used in Hindu medicine, both alone and in combination

¹ पित्तकते विवर्षे लेपाविधेया: सहताः सुमीताः । प्रदेश: परिषेकाच बन्दनैर्वा प्रमस्ते । प्रत्येकाच

² पीतं मध्सितायुतं चन्दनं तराङ्जाम्बुना । रक्तातीसारजिहक्तिपित्तत्व द्-दाइमेइत् ।। भावमकायः।

with the two other myrobalans. The fresh fruits are glolular, six-striated, with a fleshy, acidulous pulp. A preserve of the ripe fruits made with sugar, is considered a wholesome article of diet and a preservative of health. The dried fruits are wrinkled, of a blackish grey colour, and have an acidulous, astringent taste.

The properties of emblic myrobalan are said to resemble those of the chebulic. The fresh juice is cooling, refrigerant, diuretic and laxative. The dried fruits are astringent and useful in hæmorrhages. It is said that the exudation from incisions made on the fruits while on the tree, is a very useful external application in recent inflammation of the eye. It is also used as a collyrium.

The following preparation is used as a cooling and stomachic drink in irritability of the stomach. Take of emblic myrobalan, raisins, sugar and honey, eight tolas each, water half a seer; rub them together, strain through cloth and administer the strained fluid in suitable doses.²

About two drachms of emblic myrobalan is recommended to be given in the form of a paste, with the addition of honey for checking menorrhagia and discharge of blood from the uterus. The fresh juice of the ripe fruits is given with honey as a diuretic.³ A paste of the fruits is applied over the pubic region in irritability of the bladder.⁴

Khandámalaki,⁵ or confection of emblic myrobalan. Take of the pulp of an old gourd of Benincasa cerifera, (kushmánda) four

hundred tolás, clarified butter two seers, sugar four hundred tolás, fresh emblic myrobalans four seers, juice of the gourd of Benincasa cerifera, four seers; first dry the pulp of the gourd and fry it in the clarified butter. Express the juice of the emblic myrobalans and boil the fried pulp in the mixed juices of the emblic myrobalan and the pumpkin, with the addition of the sugar. When the syrup is thick enough, add the following aromatic substances, namely, long pepper, nigella seeds and ginger, each sixteen tolas, black pepper eight tolás, coriander, cinnamon, leaves called tejapatra, cardamoms, flowers of Mesua ferrea (nágakesara), tubers of Cyperus rotundus (mustaka), and the leaves of Pinus Webbiana (tálisa), each two tolás, (all in fine powder) and stir with a ladle till intimately mixed. Then add honey one seer and stir well till reduced to the consistence of a confection. This preparation is said to be useful in dyspepsia with pain and vomiting after meals, disinclination for food, pain in the precordial region, etc. It promotes the appetite and acts as a tonic.

Dhátri lauha. Take of powdered emblic myrobalan, sixtyfour tolás, prepared iron thirty-two tolás, liquorice powder sixteen
tolás, mix them together and soak in the juice of gulancha for
seven times successively. This preparation is given in doses of
twenty to forty grains in anæmia, jaundice and dyspepsia.

Dhátri arishṭa¹ or fermented liquor of emblic myrobalan. Take the fresh juice of two thousand emblic myrobalans, honey in quantity equal to one-eighth of the juice, powdered long pepper sixteen tolás, sugar six seers and a quarter; mix them together, boil for a while and leave the mixture to ferment in an earthen jar. This liquor is used in jaundice, dyspepsia, indigestion, cough, etc.

CROTON TIGLIUM, Linn.

Sans. जयपास, Jayapála. कनकफल, Kanakaphala Vern. Jaypál, Beng. Jamálgotá, Hind.

The seeds of Croton Tiglium are considered heating, drastic, and useful in fever, constipation, intestinal worms, enlargements of the abdominal viscera, ascites, anasarca, etc. They are boiled in milk and their outer skin and embryo are removed before being used internally. Croton oil is not mentioned by any Sanskrit writer and was unknown to the ancient Hindus. Croton seeds enter into the composition of a great many medicines for the diseases mentioned above. The following are a few illustrations.

Ichchhávedivaţiká.² Take of mercury, sulphur, borax and black pepper, one part each, ginger three parts, croton seeds nine parts; rub them together with water and make into two-grain pills. These are given in fever with constipation as also in ascites and anasarca.

Rukkesa rasa.3 Take of chebulic myrobalan five parts, croton

seeds one part, soak them in the milky juice of Euphorbia neriifolia (snuhi), and make into four-grain pills. These are given with a decoction of the root of Ipomæa Turpethum (trivrit), or Baliospermum montanum (danti), as a drastic purgative in obstinate constipation.

Mahánárácha rasa. Take chebulic myrobalan, pulp of Cassia Fistula, emblic myrobalan, root of Baliospermum montanum (danti), Picrorrhiza Kurroa (tiktá), milky juice of Euphorbia neriifolia (snuhi), root of Ipomæa Turpethum (trivrit) and the tubers of Cyperus rotundus (mustaka), each one tolá; pound them to a coarse powder and boil in four seers of water till the latter is reduced to one-eighth. Then take a tola of husked croton seeds, tie them in a piece of thin cloth and boil them in the above mentioned decoction till the latter is reduced to the consistence of a fluid extract. To this extract add a powder composed of eight parts of purified croton seeds, three parts of ginger and two of black pepper, mercury and sulphur, in quantity sufficient to make a pill-mass; rub them together for twelve hours, and make into two-grain pills. These are given with cold water in tympanitis, colic, ascites, etc., as a drastic purgative. After the operation of this medicine, rice should be given with curdled milk and sugar.

BALIOSPERMUM MONTANUM, Mull.

Sans. दन्ती, Danti. Vern. Danti, Hind. Beng.

THE seeds of Baliospermum montanum are described as drastic. Like croton seeds they are boiled in milk before use. The root of the plant is considered cathartic. Both are much used in diseases where purgatives are indicated. The following are a few examples of prescriptions containing these medicines.

1 महानाराच रसः। छभयारग्वधो धाली दन्ती तिल्ला सुहीलिष्ठत्। छसाप्रत्येकसेतानि पाद्यानि पचमालया। तानि सङ्घ सर्व्याणि जचादकयुगे पचेत्।

काचो घनो भवेत्। ततः खल्ले चिपेद्वागानहौ जैपाचवीजतः। भागान् लीन्
नागरात् हौ च मरिचाद्दौ च पारदात्। गन्धकाद्दौ च तानी इ यावद्यामं

Nárácha rasa. Take of mercury, borax and black pepper, one part each, sulphur, ginger and long pepper two parts each, seeds of Baliospermum montanum nine parts; powder the ingredients and make into two-grain pills with water. These are given in constipation and tympanites.

Danti haritaki.² Take twenty-five large chebulic myrobalans and enclose them in a piece of cloth; then take of the roots of Baliospermum montanum and Ipomæa Turpethum (trivrit), each two hundred tolás, water sixty-four seers, boil them together till the water is reduced to eight seers. Strain the decoction, take out the chebulic myrobalans and fry them in thirty-two tolas of sesamum oil. To the strained decoction add two hundred tolás of old treacle; then boil till reduced to the proper consistence for a confection. Now add to the mass the following substances, namely powdered root of Ipomæa Turpethum (trivrit) thirty-two tolás, long pepper and ginger, each eight tolás, and stir them well; when cool add thirty-two tolás of honey, cinnamon, cardamom, leaves called tejapatra, and the flowers of Mesua ferrea (nágakesara) each

eight tolás, and prepare a confection. The chebulic myrobalans should be kept imbedded in the medicine. Two tolás of the confection and one of the chebulic myrobalans are to be taken every morning.

Gudáshtaka. Take of danti, trivrit and plumbago roots, black pepper, long pepper, ginger and long pepper root, equal parts in fine powder; treacle, equal in weight to all the other ingredients and mix. Dose, about a tola every morning in flatulence and retained secretions, anasarca, jaundice, etc.

RICINIS COMMUNIS, Linn.

Sans. पराड, Eranda. र्वन, Ruvuka. Vern. Bherendá, Beng. Erend. Hind.

The root of Ricinis Communis and the oil obtained from the seeds have been used in medicine by the Hindus from a very remote period. They are mentioned by Susruta. Two varieties of the plant are described, namely red and white. Their properties are said to be identical. Castor oil is regarded as purgative and useful in costiveness, tympanitis, fever, inflammation, etc. It is much praised for its efficacy in chronic rheumatic affections in which it is used in various combinations. One of its synonyms is vátári or anti-rheumatic. The root of the plant is also said to be particularly useful in the local varieties of rheumatism such as lumbago, pleurodynia, and sciatica.

As a purgative, castor oil is recommended to be taken with cow's urine, or an infusion of ginger or a decoction of the combination called dasamula (see Desmodium gangeticum).²

¹ गुड़ाएकम्। व्याषं दन्ती त्निष्टिञ्चत्नं कृष्णामूनं विचूर्णितम्। तञ्जूणं गुड़मिम्मं भच्चयेत् प्रातकित्यतः। एतद्गुड़ाएकं नाम बनवर्णिग्नवर्द्धनम्। भोयोदावर्त्तं स्तुनम्ं भ्रीह्माण्ड्यामयापहम्। सर्व्य चूर्णसमोगुड़ो देयः।

² दममू जी कथायेष पिवेदा नागराम्थना । किटम्ब नेषु सर्वेषु तैन मेर ग्रङ् सम्भवम् । चक्र दत्तः ।

The seeds, freed from impurities and rubbed into a paste, are boiled in milk and water, and the decoction is given in lumbago and sciatica. In pleurodynia, or pain in the sides, a decoction of the root is given with the addition of yavakshára, (impure carbonate of potash). The root of Ricinis communis enters into the composition of various compound prescriptions for rheumatic affections and diseases of the nervous system.

In affections of the eyes, castor oil leaves and root are used in a variety of forms and several prescriptions containing them are given by most writers. A decoction of the bark, leaves and root of the plant, in goat's milk and water is recommended for use as a wash in recent ophthalmia.³

MALLOTUS PHILIPPENSIS, Mull.

Syn. Rottlera tinctoria, Roxb.

Sans. कस्पन्न, Kampilla, रेचनक, Rechanaka. Vern. Kamilá, Beng. Kambilá, Kamalá, Hind.

Roxburgh and Brandis give Punnága as the Sanskrit for this plant. As far as my information goes, Punnága is the Sanskrit for Calophyllum inophyllum, a large tree of the Coromandel Coast with beautiful white fragrant flowers and numerous stamens arranged in rows. Kampilla is the red mealy powder covering the capsules of Mallotus Philippensis. It is described as cathartic and anthelmintic and is chiefly used to expel intestinal worms. Kampilla powder given in doses of one tolá with treacle, is said to kill and expel all intestinal worms.⁴ It enters into the composition of

numerous compound prescriptions for worms. The following is an illustration. Take of kampilla, báberang seeds, chebulic myrobalan yavakshára (impure carbonate of potash), and rock salt, equal parts; powder and mix. Dose, about a drachm, with butter-milk.¹

EUPHORBIA NERIIFOLIA, Linn.

Syn. Euphorbia ligularia, Roxb.

Sans. द्वांड, Snuhi, वज्जो, Vajri, येड्डवड, Sehunda. Vern. Mansásij, Beng. Sehund, Thohar, Hind.

This prickly shrub is sacred to Mansá the goddess of serpents. On the fifth day after full moon of the month of Sravana (July, August) it is planted in the court-yard of Hindu houses and worshipped as the representative of Mansá the goddess of serpents. Euphorbia antiquorum, called tekátá sij in Bengali on account of its triangular stem, is probably alluded to by some Sanskrit writers under the name of vajri, which is explained as a variety of snuhi. This plant is supposed to ward off lightening strokes and is generally kept in tubs or pots on the roofs or other exposed parts of native houses. Its popular medicinal uses are like those of Euphorbia neriifolia.

The milky juice of Euphorbia neriifolia is considered purgative and rubefacient. As a purgative it is generally used in combination with other medicines which are steeped in it. Chebulic myrobalan, long pepper, trivrit root, etc., are thus treated and administered as drastic purgatives, in ascites, anasarca and tympanitis.² It enters into the composition of several compound prescriptions of a drastic character as for example, the Mahánárácha rasa described under Croton Tiglium, and Vindu ghrita a preparation with clarified butter, of similar composition.

Turmeric powder mixed with the milky juice of Euphorbia

neriifolia is recommended to be applied to piles. Thread steeped in the above mentioned mixture is used in ligaturing external hæmorrhoids. The powdered wood of Berberis Asiatica (dáruhari-drá) is steeped in the milky juice of snuhi and of Calotropis gigantea (arka), and made into tents for introduction into the tracks of fistula in ano and other sinuses.

NAT. ORDER MYRICEÆ. MYRICA SAPIDA, Wall.

Sans. नर्फल, Katphala. Vern. Káephal, Hind.

THE bark of Myrica sapida (a Himalayan tree), is its most valuable product, and is largely exported to the plans. It is dark or browish grey, with deep vertical wrinkles, and is considered heating, stimulant and useful in diseases supposed to be caused by deranged phlegm, such as catarrhal fever, cough, and affections of the throat. It enters into the composition of numerous formulæ for these diseases. The following is an example.

Katphaládi Churna.⁴ Take of the bark of Myrica sapida, tubers of Cyperus rotundus (mustaka), root of Picrorrhiza Kurroa (katuki), Curcuma Zedoaria (sati), Rhus succedanea (karkarta sringi), and the root of Aplotaxis auriculata (kushta), equal parts; powder and mix. This powder is given in doses of about a drachm with the addition of ginger-juice and honey in affections of the throat, cough and asthma.

In catarrh with headache the powdered bark is occasionally used as a snuff.

NAT. ORDER URTICEÆ.

FICUS RELIGIOSA, Linn. Sans. अवस, Asvattha. Vern. Pipal, Hind.

FICUS BENGALENSIS, Linn. Sans. 42, Vata. Vern. Bar. Hind.

FICUS GLOMERATA, Willd. Sans. उड़ानर, Udumbara. Vern. Jagnodumar, Beng. Gular, Hind.

FICUS INFECTORIA, Roxb. Sans. पर्काट, Parkaţi. Vern. Pákur, Beng. Pákri, Hind.

The root-barks of these four species of Ficus together with that of Azadarachta Indica pass by the name of panchavalkala or the five barks, and are used in combination. A decoction of these barks, called pancha valkala kasháya is much used as a gargle in salivation, as a wash for ulcers, and as an injection in leucorrhea. The powdered root-bark of Ficus religiosa rubbed with honey is applied to aphthous sores of children. It is also sprinkled over unhealthy ulcers to improve their condition and promote granulation.

The figs of Ficus glomerata are considered astringent, stomachic and carminative and are given in menorrhagia and hæmoptysis in doses of one tolá of the dried fruits with sugar and honey.4 The fresh juice of the ripe fruit is given as an adjunct to a metallic medicine for diabetes and other urinary complaints, called Vrihat vangesvara rasa, (see Tin).

CANNABIS SATIVA, Linn. VAR. INDICA.

Sans. विजया, Vijayá, भङ्गा, Bhangá, गञ्जा, Ganjá, इन्ट्रामन, Indrásana. Vern. Siddhi, Bháng, Beng. Bháng. Hind.

THE Cannabis sativa has been used from a very remote period both in medicine and as an intoxicating agent. A mythological

origin has been invented for it. It is said to have been produced in the shape of nectar while the gods were churning the ocean with the mountain called Mandára. It is the favourite drink of Indra the king of gods, and is called vijayá, because it gives success to its votaries. The gods through compassion on the human race sent it to this earth so that mankind by using it habitually may attain delight, loose all fear, and have their sexual desires excited. On the last day of the Durga pooja, after the idols are thrown into water, it is customary for the Hindus to see their friends and relatives and embrace them. After this ceremony is over it is incumbent on the owner of the house to offer to his visitors a cup of bháng and sweet-meats for tiffin.

An intoxicating agent with such recommendations cannot but be popular and so we find it in general use amongst all classes especially in the North-West provinces and Behar. In Bengal it has latterly become the fashion to substitute brandy, but I well remember having seen in the days of my boyhood the free use of bháng among the better classes of people who would have shunned as a pariah any one of their society addicted to the use of the forbidden spirituous liquor. At the doors of many rich baboos, Hindustani durwans could be seen rubbing the bháng in a stone mortar with a long wooden pestle, and the paste so prepared was not solely intended for the use of the servants. I do not mean to say that all classes of Hindoos without exception are or were addicted to the use of bháng. Some castes among the up-country men and some classes of people amongst Bengalis are as a rule very temperate in their habits and do not use any narcotic at all; but the ordinary run of orthodox Hindus, accustomed to have their little excitements, use

1 जाता मन्दरमन्यनाळालिमधी पीयूषक्षा सरा लेलोक्यविजयपदेति विजया श्रीदेवराजप्रिया। खोकानां हितकास्यया चितितले पाप्ता नरैः कामदा सर्व्यातकृतिनायकृषेजननीयैः सेविता सर्वदा। राजवस्तमः।

फलर मं को गोलु न्वर मं पिवेत्। श्रास्टर विना याय स्था र पयो सभक्। स्वतः ।

bháng for the purpose without incurring any opprobium such as would result from the use of spirituous liquors.

The three principal forms in which Indian hemp is met with in India are,—1, Gánjá, the dried flowering tops of the female plant, from which the resin has not been removed. 2, Charas, the resinous exudation from the leaves, stems and flowers. 3, Bháng, the larger leaves and seed vessels without the stalks.

Sir William O'Shaughnessy has so well described the preparations of Indian hemp in use amongst the natives, and his name is so intimately associated with the history of this drug, that I cannot do better than quote his account of them.

"Sidhee, Subjee and Bháng (synonymous) are used with water as a drink which is thus prepared:—About three tolás' weight (540 troy grains) are well washed with cold water, then rubbed to powder, mixed with black pepper, cucumber and melon seeds, sugar, half a pint of milk and an equal quantity of water. This is considered sufficient to intoxicate an habituated person. Half the quantity is enough for a novice. This composition is chiefly used by the Mahomedans of the better classes.

"Another recipe is as follows:-

The same quantity of Siddhi is washed and ground, mixed with black pepper, and a quart of cold water added. This is drank at one sitting. This is the favourite beverage of the Hindus who practice this vice, especially the Birjobassies and many of the Rajpootana soldiery.

"From either of these beverages intoxication will ensue in half an hour. Almost invariably the inebriation is of the most cheerful kind, causing the person to sing and dance, to eat food with great relish, and to seek aphrodisiac enjoyments. In persons of a quarrelsome disposition it occasions, as might be expected, an exasperation of their natural tendency. The intoxication lasts about three hours, when sleep supervenes. No nausea or sickness of stomach succeeds, nor are the bowels at all affected; next day there is slight giddiness and vascularity of the eyes, but no other symptom worth recording.

"Gánja is used for smoking alone: one rupee weight, (180 grains) and a little dried tobacco are rubbed together in the palm

of the hand, with a few drops of water. This suffices for three persons. A little tobacco is placed in the pipe first, then a layer of the prepared gánga, then more tobacco and the fire above all. Four or five persons usually join in this debauch. The hookáh is passed round, and each person takes a single draught. Intoxication ensues almost instantly and from one draught to the unaccustomed; within half an hour, and after four or five inspirations to those more practised in the vice. The effects differ from those occasioned by the siddhi. Heaviness, laziness, and agreeable reveries ensue, but the person can be readily roused and is able to discharge routine occupations, such as pulling the pánkah, waiting at table, etc.

"The Májoon or hemp confection, is a compound of sugar, butter, flour, milk, and siddhi or bháng. The process has been repeatedly performed before us by Ameer, the proprietor of a celebrated place of resort for hemp devotees in Calcutta and who is considered the best artist in his profession. Four ounces of siddhi and an equal quantity of ghee are placed in an earthen or well-tinned vessel, a pint of water added, and the whole warmed over a charcoal fire. The mixture is constantly stirred until the water all boils away, which is known by the crackling noise of the melted butter on the sides of the vessel; The mixture is then removed from the fire, squeezed through cloth while hot, by which an oleaginous solution of the active principles and colouring matter of the hemp is obtained; and the leaves, fibres, etc., remaining on the cloth are thrown away. The green oily solution soon concretes into a buttery mass and is then well washed by the hand with soft water, so long as the water becomes coloured. The colouring matter and an extractive substance are thus removed and a very pale green mass, of the consistence of simple ointment, remains. The 'washings are thrown away; Ameer says that these are intoxicating, and produce constriction of the throat, great pain and very disagreeable and dangerous symptoms.

"The operator then takes two pounds of sugar, and adding a little water, places it in a pipkin over the fire. When the sugar dissolves and froths, two ounces of milk are added; a thick seum rises and is removed; more milk and a little water are added

from time to time, and the boiling continued about an hour, the solution being carefully stirred until it becomes an adhesive clear syrup, ready to solidify on a cold surface; four ounces of tyre (new milk dried before the sun) in fine powder are now stirred in, and lastly the prepared butter of hemp is introduced, brisk stirring being continued for a few minutes. A few drops of áttar of roses are then quickly sprinkled in, and the mixture poured from the pipkin on a flat cold dish or slab. The mass concretes immediately into a thick cake, which is divided into small lozengeshaped pieces. A seer thus prepared sells for four rupees. One drachm by weight will intoxicate a beginner; three drachms, one experienced in its use. The taste is sweet and the odour very agreeable. Ameer states that sometimes by special order of customers he introduces stramonium seeds, but never nux vomica; that all classes of persons including the lower Portugese or Kala Feringhees and especially their females, consume the drug; that it is most fascinating in its effects, producing extatic happiness, a persuasion of high rank, a sensation of flying, voracious appetite and intense aphrodisiac desire."*

The leaves of Cannabis sativa are purified by being boiled in milk before use. They are regarded as heating, digestive, astringent, and narcotic. The intoxication produced by bháng is said to be of a pleasant description and to promote talkativeness.

In sleeplessness, the powder of the fried leaves is given in suitable doses for inducing sleep and removing pain.1

Játiphaládya churna.2 Take of nutmeg, cloves, cinnamon,

^{*} Bengal Dispensatory, p. 582.

cardamon, tejapatra leaves, flowers of Mesua ferrea (nágakesara), camphor, sandal wood, sesamum seeds, bamboo manna, flowers of Tabernæmontana coronaria (tagara), chebulic and emblic myrobalans, long pepper, black pepper, ginger, leaves of Pinus Webbiana (tálisa), plumbago root, cumin seeds and the seeds of Embelia Ribes (viranga), equal parts, purified bháng equal in weight to all the above ingredients, and sugar twice as much as the bháng. Powder and mix. Dose, about twenty to forty grains. This preparation is given in diarrhæa, indigestion and loss of appetite.

Jválánala rasa.¹ Take of yavakshára, and sarjikákshára, (impure carbonates of potash and soda) borax, mercury, sulphur, long pepper, black pepper, Piper Chaba (chavya) and ginger, equal parts, fried leaves of Cannabis sativa equal to all the above ingredients, root of Moringa pterygosperma half the weight of bháng; powder the ingredients, mix and soak the mixed powder for three days in each of the following fluids, namely a decoction or fresh juice of the leaves of Cannabis Indica, the roots of Moringa pterygosperma, and Plumbago rosea, and dry in the sun. Then roast the mass lightly and make into a pill mass with the juice of the leaves of Wedelia calendulacea (bhringarája). Dose, about half a drachm with honey. This medicine is given in indigestion and loss of appetite with nausea and vomiting.

Numerous confections of bháng, such as Kámesvara modaka, Madana modaka, Bályasakrásana modaka, etc., are described in books. These, as their names imply, are considered aphrodisiac and are used in chronic bowel complaints and nervous debility. Most of them are prepared with equal parts of a number of supposed tonic and aphrodisiac substances in small quantities and bháng equal in weight to all the other ingredients, together with

sugar, honey and the usual aromatics. Májoon, the preparation of which has been already described, would I believe be a neater substitute for these complicated preparations. The following is an illustration.

Madana modaka.¹ Take of the three myrobalans, ginger, long pepper, black pepper, Rhus succedanca (sringi), páchak root, coriander, rock salt, zedoary root, leaves of Pinus Webbiana (tálisa), bark of Myrica sapida (katphala) flowers of Mesua ferrea (nágakesara), ajowan, seeds of Seseli Indicum (vanayamáni), liquorice root, seeds of Trigonella fænum-græcum (methi), cumin and nigella seeds equal parts; hemp leaves with flowers and seeds fried in clarified butter, equal in weight to all the other ingredients; sugar equal in weight to the hemp. Prepare a syrup with the sugar, then add the other substances in fine powder and make into a confection. Lastly add clarified butter, honey, powdered sesamum seeds, cardamoms, cinnamon, tejapatra leaves and camphor, each two tolás, and make into boluses of about eighty grains each. This confection is used in cough, chronic bowel complaints and impotence.

NAT. ORDER PIPERACEÆ.

PIPER NIGRUM, Linn.

Sans. मरिच, Maricha, उपण, Ushana.

Vern. Golmarich, Beng. Kálimarich, Hind.

THE use of black pepper as a condiment is too well known to require any notice here. Medicinally it is much used in combina-

tion with long pepper and ginger, under the name of trikatu or the three acrids. In fact, as any reader who has gone through these pages must have noticed, very few compound prescriptions are free from the three myrobalans, and the three acrids, which seem to be added often without reason, and sometimes for the sake of rhyme. Black pepper is described as acrid, pungent, hot, dry, carminative and useful in intermittent fever, hæmorrhoids and dyspepsia. Externally it is used as a rubefacient in alopecia and skin diseases.

In intermittent fever, black pepper in doses of about a drachm, is recommended to be given with the juice of the leaves of Ocimum sanctum (tulasi), or Leucas linifolia (dronapushpi). It enters into the composition of numerous prescriptions for dyspepsia, piles and indigestion. The following is an example.

Pránadá gudiká.² Take of black pepper thirty-two tolás, ginger twenty-four tolás, long pepper sixteen tolás, Piper Chaba (chavya) eight tolás, leaves of Pinus Webbiana (tálisa) eight tolás, flowers of Mesua ferrea, (nágakesara) four tolás, long pepper root sixteen tolás, leaves called tejapatra and cinnamon one tolá each, cardamoms and the root of Andropogon muricatus, (usira) two tolás each, old treacle two hundred and forty tolás; rub them together. Dose, about two drachms. This confection is given in hæmorrhoids. When there is costiveness and a sense of heat, chebulic myrobalan is substituted for the ginger in the above prescription.

The bald patches of alopecia are recommended to be rubbed

with some rough leaves as of Streblus asper (sákhota) and then sprinkled over with powdered black pepper.1

PIPER LONGUM, Linn.

Syn. Chavica Roxburghii, Miq.

Sans. पिपपनी, Pippali. कचा, Kaná, कचा, Krishná. Vern. Pipul, Beng. Pipal, Hind.

The dried catkins and the root of Piper longum are used in medicine. They are considered heating, stimulant, carminative, alterative, laxative and useful in cough, hoarseness, asthma, dyspepsia, paralysis, etc. Old long pepper is said to be more efficacious than the fresh article. In the form of trikatu or the three acrids (see Piper nigrum), it is much used as an aromatic adjunct in compound prescriptions. Powdered long pepper, administered with honey, is said to relieve cough, asthma, hoarseness, hiccup and sleeplessness.² A mixture of long pepper, long pepper root, black pepper and ginger in equal parts, is prescribed by several writers as a useful combination for catarrh and hoarseness.³

As an alterative tonic, long pepper is recommended for use in a peculiar manner. An infusion of three long peppers is to be taken with honey on the first day, then for ten successive days the dose is to be increased by three peppers every day, so that on the tenth day the patient will take thirty at one dose. Then the dose is to be gradually reduced by three daily and finally the medicine is to be omitted. Thus administered it is said to act as a valuable alterative tonic in paraplegia, chronic cough, enlargements of the spleen and other abdominal viscera, etc.4

Long pepper and black pepper enter into the composition of several irritating snuffs. The following is an example. Take of black pepper, long pepper, seeds of Moringa pterygosperma (sveta maricha) and ginger equal parts; powder the ingredients and rub them together with the juice of the root of Agati grandiflora (vaka). This preparation is used as a snuff in coma and drowsiness.

Ashtakatvara taila. Take of ginger and long pepper each sixteen tolas, mustard oil four seers, butter-milk thirty-two seers, curdled milk four seers and boil them together in the usual way. This oil is rubbed externally in sciatica and paraplegia.

PIPER CHABA, Hunter. Sans. afam, Chaviká. Vern. Chai, Beng. Cháb, Hind. The fruits of this species of Piper are considered stimulant, anti-catarrhal and carminative and are much used as adjuncts to medicines for cough, cold and hoarseness.

PIPER BETLE, Linn.

Sans. तास्त्र ज, Támbula. Vern. Pán, Beng. Hind.

The leaves of this creeper are, as is well known, masticated by the natives of India. The poorer classes make their packet of betle with the addition of lime, catechu and betle-nuts. The rich add cardamoms, nutmegs, cloves, camphor and other aromatics. Betle-leaf thus chewed acts as a gentle stimulant and exhilarant. Those accustomed to its use feel a sense of langour when deprived of it. The ancient Hindu writers recommend that betle-leaf should be taken early in the morning, after meals and at bedtime.

मादिक्षा स्थ्यू रुप हाप हः । अष्टकटुरते छेऽल्लते सं स्थिपित्यते । चलदत्तः

According to Susruta, it is aromatic, carminative stimulant, and astringent. It sweetens the breath, improves the voice and removes all foulness from the mouth. According to other writers it acts as an aphrodisiac.

Medicinally it is said to be useful in diseases supposed to be caused by deranged phlegm and its juice is much used as an adjunct to pills administered in these diseases; that is, the pills are rubbed into an emulsion with the juice of the betle-leaf and licked up. Being always at hand, $p\acute{a}n$ leaves are used as a domestic remedy in various ways. The stalk of the leaf smeared with oil is introduced into the rectum in the constipation and tympanitis of children, with the object of inducing the bowels to act. The leaves are applied to the temples in headache for relieving pain, to painful and swollen glands for promoting absorption, and to the mammary glands with the object of checking the secretion of milk. $P\acute{a}n$ leaves are used as a ready dressing for foul ulcers which seem to improve under them.

NAT. ORDER CONIFERÆ. PINUS WEBBIANA, Wall.

Syn. Abies Webbiana, Lindl.

Sans. ताजी शपल, Tálisapatra, Vern. Tálispatra Beng. Hind.

The dried leaves used by Kavirajas under the name of tálisapatra, were identified at the herbarium of the Royal Botanic
Garden to be the leaves of Pinus Webbiana. They are single,
spirally arranged all round the branchlets, flat, narrow, linear,
one to three inches long, one line broad, narrowed into a short
terete petiole, under side with two longitudinal furrows on either
side of the raised midrib, upper side shining. The Sanskrit term
tálisapatra has been hitherto translated by most writers on Botany
and Materia Medica, as Flacourtia cataphracta. The error originated probably in Wilson's Sanskrit-English dictionary and has
since been repeated by subsequent writers. This medicine is regarded as carminative, expectorant and useful in phthisis, cough
and asthma.

The powdered leaves are given with the juice of Justicia

Adhatoda (vásaka) and honey in cough, asthma and hæmoptysis. A confection called Tálisádya churna is prepared with tálisapatra, black pepper, long pepper, ginger, bamboo-manna, cardamoms, cinnamon, and sugar, and is used in the above mentioned diseases. These leaves enter into the composition of numerous complex prescriptions.

PINUS LONGIFOLIA, Roxb.

Sans. Uto, Sarala, Vern. Chir, Saral, Hind.

The aromatic wood of Pinus longifolia is used in Hindu medicine. The tree yields an oleo-resin called sarala drava, srivása and kshira in Sanskrit. In the vernacular it is called gandhabirozá. Dr. Royle remarked, "The chir exudes or yields to incisions a very fine turpentine. This is chiefly valued by the natives for its resin, and as the latter is only obtained by exposing the turpentine to heat, the oil, the more valuable product is dissipated to procure the resin; but by adopting a very simple still, the resin was obtained as good as ever for the purposes of the natives, while the oil of turpentine which distilled over was pronounced on being sent to the General Hospital of Calcutta, to be of very superior quality." Turpentine is now distilled by the natives in the Panjab but the distilled oil is not mentioned by Sanskrit writers.

The wood of *Pinus longifolia* is considered stimulant, diaphoretic and useful in burning of the body, cough, fainting, and ulcerations; it is generally used in combination with other medicines.

¹ ताली यचूर्ण संयुक्तः पेयः चौद्रेण यासकस्तरसः। कफिपत्ततमकश्वासस्वर-भेदरक्तिपत्तहरः। चक्रदत्तः।

² तालीयाद्धं चूर्णम् । तालीयं मरिचं शुग्ठीपिप्पलीवं यलोचना । एक दितिचतः पञ्चकप्रभागान् प्रकल्पयेत् । एलात्वचोस्तु कर्षाद्धं प्रत्येकं भागमा-वच्चेत् । दाति शत्कप्रतिलिताप्रदेयायर्करा वृधेः । तालीयाद्यमिदं चूर्णं पाचनं रोचनं स्ट्रतम् । कामश्वामञ्चरहरं क्रद्यितीसारनायनम् । योषाभ्यानहरं श्रीह यहणीपास्तुरोगजित् । पक्षां वा युक्तरां चूर्णं चिपेत् स्वाद्युटिका ततः ।

The oleo-resin or crude turpentine is used in the preparation of plasters, ointments, and pastiles for fumigation. It is applied to buboes and abscesses for promoting absorption. The following is an example of a pastile containing crude turpentine. Take of crude turpentine, bdellium, wood of Aquilaria Agallocha (aguru), and resin of Shorea robusta, and make into pastiles. These are used for fumigating unhealthy and painful ulcers.¹

CEDRUS DEODARA, Loud.

Pinus Deodara, Roxb.

Sans. देवदाक, Devadáru. Vern. Deodár Hind.

The aromatic wood of this elegant pine is considered carminative, diaphoretic, diuretic and useful in fever, flatulence, inflammation, dropsy, urinary diseases, etc. It is chiefly used in combination with other medicines. The following is an example of a diuretic mixture containing this drug. Take of devadáru wood, root of Moringa pterygosperma (sigru), and Achyranthes aspera (apámárga), one drachm each and reduce to a paste with cow's urine. This composition is given in ascites.²

NAT. ORDER PALMACEÆ. COCUS NUCIFERA, Linn.

Sans. नारिकेच, Nárikela, Vern. Nárial, Hind. Nárikel, Beng.

The numerous economical uses of this valuable tree are fully detailed in standard works. I will refer only to such of them as are mentioned in Sanskrit medical works. The water of the unripe fruit is described as a fine-flavoured, cooling, refrigerent drink useful in thirst, fever and urinary disorders. The tender pulp of the fruit is said to be nourishing, cooling and diuretic. The pulp of the ripe fruit is hard and indigestible but is used medicinally. The terminal bud of the tree is esteemed as a nourish-

² देवद्रुमं शियुभयूरकञ्च गोमूलिपिषामध्याऽश्वगन्धाम्। पीत्वाशुष्टन्यादु-दरं प्रद्यतं किमीन् सभोधानुदरञ्च दुष्यम्। अकदत्तः।

ing, strengthening and agreeable vegetable. The same remark applies to the tops of the tál palm and date trees. The root of the cocoa-nut is used as a diurctic as also in uterine diseases. Cocoanut oil is said to promote the growth of hair. It is much used as a hair-oil by the lower classes of native women. For this purpose it is scented by steeping in it a number of fragrant vegetable substances sold in packets under the Bengali name of Máthághasá. The ashes of the leaves are used in medicine. They contain a great deal of potash. The fresh juice of the tree is considered refrigerent and diurctic. The fermented juice constitutes one of the spirituous liquors described by the ancient writers. The cleared shell of the nut or portions of it are burnt in a fire and while red hot, covered by a stone cup. The fluid deposited in the interior of the cup is rubefacient and is an effectual domestic remedy for ringworm.

Narikelakhanda. Take of the pounded pulp of cocoa-nut, half a seer, fry it in eight tolas of clarified butter, and afterwards boil in four seers of cocoa-nut water till reduced to a syrupy consistence. Now add coriander, long pepper, bamboo manna, cumin seeds, nigella seeds, cardamoms, cinnamon, tejapatra, the tubers of Cyperus rotundus (mustaka), and the flowers of Mesua ferrea (nágakesara) one tolá each in fine powder and prepare a confection. Dose, two to four tolas, in dyspepsia and consumption.

BORASSUS FLABELLIFORMIS, Linn.

Sans. ताल, Tála, त्रवराज, Trinarája. Vern. Tál, Beng. Hind.

THE properties of the various parts of this noble palm are described in detail in Sanskrit works. The root is cooling and restorative. "The saccharine juice obtained by the excision of the spadix or young flowering branch," is when freshly drawn, cooling,

¹ नारिकेलखण्डः। इडामित मिह्याचारिकेलं सुपिष्टं पलपरिमितसिं पाचितं खण्डतल्यम् । निजपयसितदेतत्प्रस्थमाने विपक्तं गुडवद्यस्योते याणाभागान् चिपेच । धन्याकपिप्पलिपयोदत्गाहिजीरान् याणं निजातिन-भ केथरविष्ट्रम् एर्थ । इन्यम्लपित्तमस्तिं च्यमस्पित्तं स्त्रलं विभं सकलपौर्ष कारिहारि । चन्नदत्तः ।

sweet and useful in inflammatory affections and dropsy. The fermented juice called tári or toddy is intoxicating. The yellow pulp surrounding the seeds of the ripe fruit is sweet, heavy and indigestible. It is extracted by rubbing the seeds over a wooden scratcher, and with the addition of a little lime, it settles into a firm jelly which is a ready mode of taking the pulp. It is also made into cakes with flour and other ingredients. The young seeds contain a clear watery fluid which is very refreshing and cooling. They form one of the edible fruits of the country and are sold in the markets in large quantities when in season. The natives after extracting the pulp from the fibres surrounding the ripe seeds, preserve them for some months. When the embryo begins to germinate and enlarge, the seeds are cut open and the expanded embryo is extracted and eaten. It is cooling, sweet and palatable. The terminal bud or top of the tál tree is regarded as nutritive, diuretic and tonic. The leaves of this palm tree were used for writing on by the ancient Hindus. The letters were engraved upon the leaves by a pointed iron instrument. This system of writing is still followed to a considerable extent in Orissa where boys in the indigenous patsálás write with iron pens on palm leaves. In Bengal the leaves are written upon with pen and ink as on paper. The ashes of the flowering stalk are said to be useful in enlarged spleen.1

ARECA CATECHU, Linn.

Sans. गुवाक, Guváka, पूग, Puga, कान्न, Kramuka.

Vern. Guá, Supári, Beng. Supári, Hind.

The chief consumption of betel-nuts is as a masticatory, alone or in conjunction with betle leaf. The unripe nuts are said to be laxative and carminative. The fresh nuts when not yet dry in their interior, have intoxicating properties and produce giddiness. The dried nuts are masticated. They are said to sweeten the breath, strengthen the gums, remove bad tastes from the mouth, and produce a stimulant or exhilarant effect on the system. The burnt nuts are used as a tooth powder.

¹ तालपुष्पभवः चारः सगुडः श्लीकृनायनः। चक्रदसः।

Medicinally betel-nuts are used in urinary disorders and as an aphrodisiac. The Bhávaprakasa gives a preparation called Rativallava pugapáka. It is a confection made of betel-nuts boiled in milk, with the addition of a number of aromatic and stimulant substances supposed to have aphrodisiac properties. Sometimes datura seeds and the leaves of Cannabis sativa are added to this confection when it is called Kámesvara modaka.

PHŒNIX SYLVESTRIS, Roxb. Sans. उत्तर, Kharjura. Vern Kejur, Beng. Hind. The Phænix sylvestris is indigenous to India and is cultivated for the sake of its sweet sap which is manufactured into gur or jagari. The imported fruits of Phænix dactylifera are used medicinally as demulcents and expectorants.

NAT. ORDER HYPOXIDEÆ. HYPOXIS ORCHIOIDES.

Syn. Curculigo orchioides, Gaërtn.

Sans. मुचली, Mushali, तालभूली, Tálamuli. Vern. Mushali, Hind.

The tuberous roots of this plant are considered alterative, tonic, restorative and useful in piles, debility and impotence. They enter into the composition of several medicines intended to act as aphrodisiacs and restoratives. The following in an example. Take of the root of Asparagus racemosus (satávari), Sphæranthus mollis (munditiká), gulancha, seeds of Butea frondosa (hastikarna), and the tuberous roots of mushali, equal parts; powder and mix. Dose, about a drachm with honey or clarified butter, in the debility of old age. The Rája nirghantu mentions two varieties of mushali, namely, white and black. The properties of the white variety are said to be inferior to those of the black which is preferred for use as an alterative tonic. The roots of Bombax Malabaricum and Asparagus racemosus are sometimes sold by the native druggists

¹ यतावरी स्विष्डितिका गुडुवी सहस्तिकणी सह तालमू ली। एतानि कात्वा समभागयुक्तान्याच्येन किंवा सभुनाविल्ह्यात्। जराक्जास्ट व्यक्त देहो भवेद्यरो वीर्थ्यवलादियुक्तः। विभाति देवप्रतिमः सनित्यं प्रभामयो भूरि-विष्टिश्विब्दिः। भावप्रकायः।

of Calcutta under the name of suffed musli. These articles have however separate names and are not designated by the name of suffed musli in any native medical work. On the contrary a white variety of tálamuli or musali is, as already noticed, mentioned in the Rája nirghantu. The tubers of Curculigo orchioides become when dry, trans lucent like ambar. The dried roots were probably considered a separate variety, namely, the white by the ancients.

NAT. ORDER AROIDEÆ. ACORUS CALAMUS, Linn.

Sans. वचा, Vachá, षड पन्या, Shadgranthá. Vern. Bach, B. H.

THE aromatic rhizome or root-stock of Acorus Calamus is considered emetic in large doses, and stomachic, carminative and nervine in smaller doses.

As an emetic it is administered in doses of about eighty grains with half a seer of tepid salt-water.² The following is an example of a prescription for dyspepsia containing this drug. Take of Acorus Calamus root, assafætida, átis, long pepper, black pepper, ginger, chebulic myrobalan and sonchal salt equal parts; powder and mix. Dose, about half a drachm.³ As a stimulant or nervine it is used in combination with other medicines in low fevers, epilepsy and insanity.

AMORPHOPHALLUS CAMPANULATUS, Blume.

Syn. Arum campanulatum, Roxb.

Sans. यूरण, Surana, योज्ञ, Olla. Vern. ol, Beng. Hind.

THE Amorphophallus campanulatus is cultivated for the sake of its tubers, which are cooked and eaten by the natives like yams or potatoes. The tubers contain an acrid juice which should be got rid off by thorough boiling and washing, otherwise the vege-

¹ मृष्ठी च दिधा प्रोक्ता श्वेता चापरा गंत्रका। श्वेता खल्पगुणोपेता खपराच रसायनी। राजनिष्णुटः।

² वचा जवणतीयेन वान्तिरामे प्रशस्ति। चक्रदत्तः।

³ न्य्रजीविवस्थकोषोऽद्भिरुणाभिसुर्णिताः पिवेत्। हिन्द्रप्रतिविषाव्योषवचा सौबर्च जाभयाः। धक्रदशः।

table is apt to cause troublesome irritation in the mouth and fauces. Medicinally, surana is considered serviceable in hæmorrhoids; in fact one of its Sanskrit synonyms is arsoghna or the curer of piles. It is administered in this disease in a variety of forms. The tuber is covered with a layer of earth and roasted in a fire; the roasted vegetable is given with the addition of oil and salt. Several confections are described such as the Laghusurana modaka, Vrihat surana modaka, Surana pindi, Kánkáyana modaka etc. These are all confections made of the tubers of Amorphophallus campanulatus with the addition of treacle and various aromatics and acrids.

Svalpa or Laghu surana modaka² is thus prepared. Take of black pepper one part, ginger two parts, plumbago root four parts, tuber of surana eight parts, treacle sixteen parts, mix together and prepare a confection. Dose, about a tolá every morning, in piles and dyspepsia.

SCINDAPSUS OFFICINALIS, Schott. Syn. Pothos officinalis, Roxb. Sans. गर्जापचले, Gajapippali. Vern. Gajapipul, Bengelind. The sliced fruits of this plant pass by the name of gajapipul. They are considered aromatic, carminative, stimulant and useful in diarrhæa, asthma and other affections supposed to be caused by deranged phlegm. They are chiefly used as an aromatic adjunct to other medicines.

ALOCASIA INDICA, Schott.

Syn. Arum Indicum, Roxb.

Sans. माणक, Mánaka, Vern. Mánkachu, Beng. Mánkanda, Hind.

The underground stems of Alocasia Indica constitute a valuable and important vegetable of native dietary. The stems

¹ सीरणं कन्द्मादायप्रयाकेन पाचयेत्। सतैललवणसास्य रसयागीविकार सत्। याङ्गधरः।

² खल्पन्यरणभोदनः । मरिचमहौषधचित्रकस्य न्यरणभागाययोत्तरं दि-गुणाः । सर्व्यसमोगुड्भागः सेव्योऽयं मोदनः प्रसिद्धप्ततः । जःतनं जःस-यितजाटरश्चन्य नयितन्यलगुक्मगदान् । निःभेषयित स्वीपदमभासिनाभयत्याशु ।

sometimes grow to an immense size, from six to eight feet in length and can be preserved for a considerable time. Hence they are of great importance in jail dietary when fresh vegetables become scarce in the bazar or jail garden. They thrive best in shade under the eaves of huts or buildings and beside fences.

Medicinally mánaka is said to be useful in anasarca, in which disease it is used in the following manner. Take of the powdered meal of Alocasia Indica eight tolás, powdered rice sixteen tolás, water and milk, forty-eight tolás each, boil them together till the water is evaporated. This preparation called Mánamanda, is given as diet. No other article is allowed in addition to it except milk. A ghrita is also ordered to be made with a decoction and paste of mánaka but it is not in vogue.

NAT. ORDER SCITAMINEÆ.

ZINGIBER OFFICINALE, Roscoe.

Sans. चार् क, A'rdraka, म्ह्नेंबर, Sringavera.

Vern. A'dá, Beng. A'drak, Hind.

GINGER is described as acrid, heating, carminative and useful in dyspepsia, affections of the throat, head and chest, piles, rheumatism, urticaria, dropsy, etc. It is much used as a carminative adjunct along with black pepper and long pepper under the name of trikatu or the three acrids. The dried root is called Nágara, Sunti and Mahaushadha in Sanskrit. In addition to possessing the properties of ginger it is said to be laxative.

Ginger with salt taken before meals, is highly praised as a carminative. It is said to purify the tongue and throat, increase the appetite and produce an agreeable sensation. Ginger forms the active ingredient of several medicines for dyspepsia and hæmorrhoids.

Samasarkara churna.2 Take of cardamoms one part, cinna-

mixed with milk is used as a snuff.1 The fresh juice of ginger taken with honey relieves catarrh, cough and loss of appetite.2

Saindhavádya taila. Take of dry ginger forty tolás, rock-salt, long pepper root and plumbago root, sixteen tolás each, marking nuts twenty in number, fermented rice water sixteen seers, sesamum oil four seers, boil them together and prepare an oil in the usual way. This oil is rubbed externally in sciatica and other forms of rheumatism.

ZINGIBER ZERUMBET, Roxb. Sans. स्थान पंच, Sthula-granthi, Vern. Mahá bari bach, Hind. Beng.

ZINGIBER CASSUMUNAR, Roxb. Sans. वनाई क, Vanár-draka, Vern. Banáda, Beng.

ALPINIA GALANGA, Linn. Sans. কুৰিস্থাৰ, Kulinjána. Vern. Kulinján, Beng. Hind.

THE aromatic tubers of these three species are occasionally used as carminative or fragrant adjuncts in complex prescriptions, but they have nothing peculiar in their properties or action.

CURCUMA LONGA, Roxb.

Sans. इरिट्रा, Haridrá, निमा, Nisá. Vern. Halud, B. Haldi, H.

THE turmeric plant is extensively cultivated for the sake of its tubers which are an essential ingredient of native curry powders. Turmeric pounded into a paste and mixed with oil, is rubbed on the skin to improve its appearance and prevent skin diseases. The rubbing of turmeric and oil is an essential part of the Hindu marriage festival as well as of some religious ceremonies. Medici-

nally turmeric is used chiefly in skin diseases both externally and internally. Turmeric paste with the addition of a little lime is a popular application to sprains and bruises. A decoction of turmeric is used as a cooling wash in ophthalmia; cloth steeped in it is employed as an eye-shade. A paste of turmeric and the leaves of Justicia Adhatoda (vásaka), with cow's urine is rubbed on the skin in prurigo. Several other combinations of the sort are in vogue, such as turmeric and nim leaves, turmeric and the ashes of the plantain tree, etc. Turmeric is also given internally with cow's urine in prurigo and eczema.

Haridrákhanda.³ Take of turmeric sixty-four tolás, clarified butter forty-eight tolás, milk sixteen seers, sugar twelve tolás, and boil them together over a gentle fire in an earthern pot. Then add black pepper, long pepper, ginger, cinnamon, cardamom, tejapatra, báberang seeds, root of Ipomæa Turpethum (trivrit), the three myrobalans, flowers of Mesua ferrea (nágakesara), tubers of Cyperus rotundus (mustaka) and prepared iron, each eight tolás in fine powder, and prepare a confection. Dose, one tolá every morning in prurigo, boils, urticaria, etc. A cure is said to be effected in seven days.

The term haridrádve, or the two turmerics, signifles turmeric and the wood of Berberis Asiatica. They are often used together in compound prescriptions both for external and internal use and their properties are said to be analogous.

CURCUMA ZEDOARIA, Roscoe.

Syn. C. Zerumbet, Roxb.

Sans. Wat, Sati, Vern. Sati, Beng. Kachur, Hind.

The rhizomes of this plant possess an agreeable camphoraceous smell and warm, bitterish, spicy taste. They are considered carminative and useful in fever and skin diseases arising from impure or deranged blood. They are generally used in combination with other medicines as also in the preparation of medicated oils. "The dry root powdered and mixed with the powdered wood of the Caesalpinia Sappan makes the red powder called ábir by the Hindustanis, and phág by the Bengalis. It is copiously thrown about by the natives during the Huli or Hindu holidays in the month of March."

CURCUMA AROMATICA, Salisb. Syn. C. Zedoaria, Roxb. Sans. वन्हरिहा, Vanaharidrá. Vern. Banhalud, Beng. Jedwar, Hind. The rhizomes of this plant are of a pale yellow colour and have an agreeable fragrant smell. The Bhávaprakása describes them as useful in skin diseases and disorders of the blood. They are sometimes used in combination with other medicines in these diseases.

CURCUMA A'MA'DA', Roxb. Sans. AU TEFET, Karpura-haridrá. Vern. A'mádá, Beng. The Bhávaprakása mentions this plant under the name of karpuraharidrá, but the term is not to be found in standard lexicons. The fresh root possesses the smell of green mango and is used as a condiment and vegetable. Medicinally it is described as cooling and useful in prurigo.

ELETTARIA CARDAMOMUM, White et Maton. Also Amomum subulatum, Roxb. Sans. Telá. Vern. Eláchi, Hind. Gujráti elách, Beng. Cardamoms are largely used as aromatic adjuncts but have no peculiarity deserving of special notice.

NAT. ORDER MUSACEÆ. MUSA PARADISIACA, Linn.

Variety of Musa Sapientum Linn.

Sans. कदली, Kadalí, रमा, Rambhá. Vern. Kalá, Beng. Kelá, Hind.

THE economical uses of this most valuable plant are too well-known to need any notice here. I will refer only to one of them.

The leaves and leaf-stalks when burnt yield alkaline ashes which can be used instead of country soap or fuller's earth, in washing clothes. In the Noakhally jail, the old leaves are collected, dried and burnt to ashes. The ashes being placed on a piece of cloth supported on four posts, water is made to percolate through them into an earthen vessel. The alkaline water thus obtained is used for steeping clothes intended to be washed. As the stems of the plantain are cut down soon after the fruit is gathered, there is always a large quantity of leaves and stalks available in all gardens where it is cultivated. They can be readily economised in the simple method above described, if not manufactured into cloth or paper.

The unripe fruit, called *mochaka* in Sanskrit, is considered cooling and astringent; it is much used in diabetes in the form of a *ghrita* prepared as follows:—

Kadalyádi ghrita.¹ Take of plantain flowers twelve seers and a half, watery juice of the root-stock of the plantain tree sixty-four seers; boil them together till reduced to one-fourth and strain. To the strained decoction add four seers of prepared clarified butter and the following substances in the form of a paste, namely, unripe plantains, cloves, cardamoms, red sandal wood, wood of Pinus longifolia, (sarala), jatámánsi root, the three myrobalans, Raphanus sativus (mulaka), and the fruit of Feronia elephantum (kapittha) in equal parts, one seer in all, and prepare a ghrita in the usual way. This medicine is generally given along with some preparation of tin or other metallic medicine in diabetes. Dose, about two tolás.

NAT. ORDER ORCHIDACEÆ. VANDA ROXBURGHII, R. Br.

Syn. Cymbidium tessaloides, Roxb.

Sans. राम्ना, Rásná, गन्वनाजुनी, Gandhanákuli. Vern. Rásná, B. H.

UNDER the name of rásná, the roots of Vanda Roxburghii and Acampe papillosa, are both indiscriminately used by

¹ कदल्यादि घतम् । कदलीकन्द्निर्यासे तत्पस्तनत्वांपचेत्। चतुर्भागा-वधेषेऽस्मिन् घत प्रस्थं विपाचयेत्। चन्दनं सरलं सांसी कदलोमूलकन्तथा।

native physicians. They are very similar in the appearance of their roots and leaves, though they differ much in their flowers and fruits. One native physician whom I consulted, pronounced both these plants to be $r\acute{a}sn\acute{a}$; when however I showed him the different flowers and fruits of the two species, he was puzzled. He had never looked to the flowers before, but only knew the roots and leaves. These epiphytes are very common on mango trees.

Rásná root is said to be fragrant, bitter and useful in rheumatism and allied disorders, in which it is prescribed in a variety of forms.

Rásnápanchaka. Take of rásná, gulancha, devadáru, ginger, and the root of the castor oil plant in equal parts, and prepare a decoction in the usual way. This is apparently a popular prescription for rheumatism, being mentioned by most writers.

Rásná guggulu.² Eight parts of rásná and ten of bdellium are beaten into a uniform mass with clarified butter. Dose, about a drachm, in sciatica.

Rásná enters into the composition of several medicated oils for external application in rheumatism and diseases of the nervous system, such as the Mahámásha taila, Madhyama Naráyana taila, etc.

NAT. ORDER LILIACEÆ.

ALOE INDICA, Royle.

Sans. धतकुमारी, Ghritakumári, कन्या Kanyá. Vern. Ghritakumári, Beng. Ghikumári, Hind.

ALOES (called mushabbar in the vernacular), though now used in native medicine, was unknown to the Sanskrit writers. They

रैनानक् तिमना किपत्यमन मेवन । कन्केनानेन संसिद्धं सोमरोगंनिवारणम् । मूत्ररोगानगेषां स्र प्रस्तान् शुक्रिपिच्छिनान् । प्रमेहान् विंगितिचैव मूत्राघातां स्त्रयोदणान् । बद्धमूत्रं विभेषेण मूत्रकच्छ्रं तथाश्वरीम् । कदन्यादि घतं नाम विष्णुना परिकोत्तितम् । राहीयसारसंयहः ।

mention only the fresh juice of the leaves which is regarded as cathartic, cooling, tonic and useful in fevers, enlarged lymphatic glands, spleen and liver, eye diseases, etc. The fresh juice is much used in making up various sorts of pill-masses and more particularly those of a purgative character, as for example the preparation called Taruna jvarári rasa, described under Mercury (see page 32). In glandular enlargements and spleen disease, the juice of the leaves is given with the addition of powdered turmeric.¹

ASPARAGUS RACEMOSUS, Willd.

Sans. यतावरी, Satávari, यतम् ली, Satamuli. Vern. Satamuli, Beng. Satávari, Hind.

The Sanskrit name satamuli (that is possessing a hundred roots), is in allusion to the numerous fusiform tubers of this plant. These are regarded as cooling, demulcent, diuretic, tonic and aphrodisiac, and are used both internally and in the preparation of several medicated oils. The tubers are candied and taken as a sweet-meat. This preparation however has scarcely any other taste or flavour besides that of the sugar. The fresh juice of the root is given with honey as a demulcent in bilious dyspepsia or diarrhea. As an aphrodisiac tonic, it is used in a variety of forms. A ghrita is prepared as follows.—

Satávari ghrita.³ Take of clarified butter four seers, juice of Asparagus racemosus four seers, milk forty seers, boil them together and prepare a ghrita. This is given with the addition of sugar, honey, and long pepper.

Phalaghrita. This is prepared with four seers of clarified butter, and sixteen seers each of the juice of Asparagus racemosus and cow's milk, with the addition of a number of other medicines in small quantities, in the form of a paste. Its use is said to increase the secretion of semen, to cure barrenness in women and to remove disorders of the female genitals.

¹ निमान् र्णयतः कन्यारसः भी हाऽपची हरः।

² शताबर्याय मधुनापित्तम्यूलक्षरोरमः। शाक्षिरः।

[े] यतावरीष्टतम्। ष्टतं यतावरीगभं चीरे द्यगुणे पचेत्। यर्करापिप्प-चीचौद्रयुक्तं तदृष्यस्यते। चक्रदत्तः।

As a diuretic, it is prescribed in combination with other medicines of its class. The following is an illustration. Take of the roots of Asparagus racemosus, Saccharum spontaneum (kása), Poa cynosuroides (kusa), Oryza sativa (variety called sálidhánya) and Saccharum officinarum (ikshu), Batatus paniculatus (vidári), Scirpus Kysoor (kaseruka), and Tribulus terrestris (gokshura) equal parts, and prepare a decoction in the usual way. This decoction is administered, with the addition of sugar and honey, in scanty urine with heat and ardor urinæ. The chief use of the drug however consists in the preparation of several popular cooling and emollient medicated oils for external application in disorders of the nervous system, rheumatic affections and urinary diseases.

Náráyana taila,² popularly known as Madhyama náráyana taila is made by taking of the bark of Ægle Marmelos (vilva), Premna spinosa (agnimantha), Calosanthes Indica (syonáka), Stereospermum suaveolens (páṭalá), Erythrina Indica (páribhadra), Pæderia fætida (prasárani), Withania somnifera (asvagandhá), Solanum Jacquinii (kantakári), Solanum Indicum (vrihati), Sida cordifolia (balá), Sida rhombifolia (atibalá), Tribulus terrestris (danshṭrá) and Boerhaavia diffusa (punarnavá), each twenty tolás, water sixty-four seers, and boiling down till reduced to one-fourth and straining. To the

प्रतावरी काथ कुथ खटं हा दिराशियां की कुथ क्या काथ मार्थ के स्वार्थ के स्वार्य के स्वार्थ के स्वार्थ के स्वार्थ के स्वार्थ के स्वार्थ के स्वार्थ के स

strained decoction add four seers each of the juice of Asparagus racemosus and prepared sesamum oil, sixteen seers of cow's or goat's milk and the following substances, namely, fennel seeds, wood of Cedrus Deodara (devadáru), jatámánsi root, liquid storax, Acorus Calamus (vachá), sandal wood, Limnanthemum cristatum (tagarapáduká), Aplotaxis auriculata(kushṭha), cardamoms, Desmodium gangeticum (sálaparni), Uraria lagopodioides (prisniparni), Phaseolus trilobus (mudgaparni), Glycine labialis (máshaparni), Withania somnifera (asvagandhá), Vanda Roxburghii (rásná), Boerhaavia diffusa (punarnavá) and rock salt, four tolás each in the form of paste and prepare an oil in the usual way. When ready, boil again with fragrant substances as directed in the introduction under the head of Medicated oils. This oil is much used by native physicians in rheumatism, diseases of the joints, stiff neck, hemiplegia and other diseases of the nervous system.

Vishnutaila. This is an oil much used in nervous diseases. It is prepared with sesamum oil, cow's or goats' milk, and the juice of Asparagus racemosus, with the addition of a number of substances in small quantities in the form of a paste.

Prameha mihira taila. This oil is prepared with the juice of Asparagus racemosus, sesasum oil, decoction of lac, whey and milk, with the addition of a number of substances in the form of a paste. It is rubbed on the body and more particularly over the pubic region in chronic gonorrhea, stricture of the urethra, and other diseases of the urinary organs.

ALLIUM SATIVUM, Linn.

Sans. रशुन, Rasuna, लम्बन, Lasuna. Vern. Rasun, Beng. Lasun, Hind.

Garlic is described as carminative, stomachic, alterative, tonic and useful in affections of the nervous system, flatulence, hysteria, etc. During its use, the diet should consist of wine, meat and acids.

Decoction of garlic.1 Take of garlic thirty-two tolás, water

[!] साधयेच्छुद्वशुष्कस्य जशनस्य चतुः पजम्। जीरोदकेऽत्र गुणिते जीरयेषञ्च पाययेत् । वातगुल्मसदावर्तः स्थूमीविषमञ्चरम् । इद्दोगं विद्रिधं योषं यभयत्याश्चतत्पयः । एवन्तु साधिते जीरे स्तीकमध्यत्नदीयते । चक्रदत्तः ।

four seers, milk four seers, boil together till the water is evaporated and strain. This decoction in milk is given in small doses in hysteria, flatulence, sciatica and heart disease.

Svalparasuna pinda. Take of garlic twelve tolás, assafætida, cumin seeds, rock salt, sonchal salt, ginger, long pepper and black pepper, each one-eighth of a tolá; powder them finely and mix. Dose, about twenty-two grains every morning with a decoction of the root of the castor oil plant, in facial paralysis, hemiplegia, sciatica, paraplegia and convulsive affections. This medicine should be continued for a month.

Garlic juice slightly warmed is used as a local application in otalgia. A bulb of garlic is sometimes introduced into the meatus for relief of pain in the internal ear.²

GLORIOSA SUPERBA, Linn.

Sans. बाङ्गबोका, Lángalíká, व्यक्तिश्वा, Agnisikhá, कविकारि, Kalikári. Vern. Bishalánguli, Beng. Karihári, Hind.

"The Gloriosa Superba is a native of the forests of India. It appears during the rainy season in Bengal, and is one of the most ornamental plants any country can boast of." Its bulb is one of the seven minor poisons of Sanskrit writers (see page 7). One of its Sanskrit synonyms is Garbhaghátini or the drug that causes abortion, but I am not aware of its being used as an abortive for criminal purposes. The root, powdered and reduced to a paste, is applied to the navel, supra-pubic region and vagina with the object of promoting labour pains. In retained placenta

a paste of the root is applied to the palms and soles while powdered nigella seeds and long pepper are given internally with wine. This root enters also into the composition of some complex prescriptions for internal use, as for example the Lángali guṭiká described in the Bhávaprakása.

NAT. ORDER SMILACEÆ. SMILAX CHINA, Linn.

Sans. चोविचनि, Chobachini. Vern. Chobchini. Hind.

FLUCKIGER and Hanbury state that "the use of this drug as a remedy for syphilis was made known to the Portuguese at Goa by Chinese traders about A.D. 1535." If this statement, which is given on the authority of Garcia d'orta, is correct, the history of this drug will enable us to fix the approximate age of the latest and most comprehensive treatise on Sanskrit Medicine, namely, the Bhávaprakása. In this work China root is described under its vernacular name of chobchini, as a root like Acorus Calamus, brought from a foreign country and useful in rheumatism, epilepsy, insanity and particularly in syphilis.² It is used in modern Hindu medicine as an alterative along with anantamul and other drugs of reputed efficacy in syphilis and rheumatism.

NAT. ORDER CYPERACEÆ. CYPERUS ROTUNDUS, Linn.

Sans. ষ্টানা, Mustaka. Vern. Muthá, Beng. Mothá, Hind. CYPERUS PERTENUIS, Roxb.*

Sans. नागरमुस्तक, Nágaramustaka, Vern. Nágarmuthá, Beng. Hind.

The tubers of these two species of Cyperus are much used in Hindu medicine. Cyperus rotundus is the most common variety

मूलेन लाङ्गलिक्याः संलिप्ते पाणिपादेच। स्त्रमरापातनं मद्यैः पिप्पल्या-दिरजः पिनेत्। चक्रदत्तः ।

^{*} The Cyperus pertenuis of Roxburgh can hardly be maintained as a species; it is a variety of the C. rotundus of Linnæus. G. K.

and is used internally. Its tubers are about the size of a pigeon's egg and of a dark brown colour externally; internally white, and fragrant. Those growing in moist soil are preferred for use. The root of Cyperus pertenuis is somewhat tuberous with many dark coloured villous fibres. It grows in low wet places and is chiefly used in the preparation of medicated oils. The properties of both are said to be identical. They are considered diaphoretic, astringent, stomachic and useful in fever, diarrhæa and dyspepsia. The tubers of Cyperus rotundus are extensively used as an aromatic adjunct to numerous compound medicines.

Shadanga pániya. Take of the tubers of Cyperus rotundus, red sandal wood, root of Andropogon muricatus, (usira), Oldenlandia herbacea, (parpata), Pavonia odorata (bálá) and dry ginger each one drachm, water two seers; hoil down to one seer. This decoction is given as a drink for appeasing thirst and relieving heat of body in fever. It may be taken ad libitum.

NAT. ORDER GRAMINEÆ. SACCHARUM OFFICINARUM, Linn. ETC.

Sans. ₹ J, Ikshu. Vern. A'k, Beng. Uk, Hind.

The sugar-cane and its products sugar and treacle were known to the Hindus from a very early age. From the Sanskrit term sarkara are derived the Arabic sakkar, Latin, saccharum and English sugar.* Twelve varieties of sugar-cane are mentioned by

* In the Pharmacographia by Fluckiger and Hanbury it is stated; "Candy as sugar in large crystals is called, is derived from the Arabic kand or kandat a name of the same signification. An old Sanskirt name of Central Bengal is Gura whence is derived the word Gula meaning raw sugar, a term for sugar universally employed in the Malayan Archipelago, where on the other hand, they have their own names for the sugar-cane, although not for sugar. This fact again speaks, for Ritter's opinion that the preparation of sugar in a crystalline state is due to the inhabitants of Bengal." The Arabic kand is apparently derived from the Sanskrit khanda, that is treacle candied into white sand-like grains. Again the Bengali term Gura is derived from the Sanskrit Guda which is mentioned by such ancient writers as Charaka and Susruta. The manufacture of sugar therefore was evidently understood in Upper India before it was known in Bengal, at any rate there is nothing to shew that sugar was first prepared in Bengal.

¹ षड्क्रपानीयम् । सस्तपर्यटकोशीर चन्द्नोदीच्यनागरैः । स्तशीतं जनं दद्यात् पिपासाच्चर्यान्तवे । चक्रः ।

Sanskrit writers, but these can not all be identified at present. The products or preparations of the sugar-cane, as described by Sanskrit writers, are as follows:—

- 1. इच्रुरम, Ikshu rasa or sugar-cane juice.
- 2. फारिक्त, Phánita or sugar-cane juice boiled down to one-fourth. It can be drawn out in threads.
- 3. যাড়, Guḍa or sugar-cane juice boiled to a thick consistence, that is treacle.
- 4. भत्यि चिन्ना, Matsyandiká is sugar-cane juice boiled down to a solid consistence but which still exudes a little fluid on drawing.
- 5. We, Khanda is treacle partially dried or candied in white sand-like grains.
 - 6. यर्कर, Sarkara or white sugar.
 - 7. चितोपला, Sitopalá or sugar candy.
 - 8. गौड़ो, Gaudi or fermented liquor obtained from treacle.
- 9. बीच, Sidhu or fermented liquor obtained from sugar-cane juice.

The properties of these preparations are described separately, but it is scarcely worth while to reproduce these details here. The root of the sugar cane is considered demulcent and diuretic. Sugar and treacle are very largely used in Hindu Medicine. Old treacle is preferred to new for medicinal purposes.

Trinapancha mula. Under this name the roots of five sorts of grasses are used in combination. They are as follows .--

- 1. ま可, Ikshu. Saccharum officinarum, Linn.
- 2. Nt, Sara. Saccharum Sara, Linn.
- 3. काम, Kása. Saccharum spontaneum, Linn.
- 4. 雪叫, Kusa. Poa cynosuroides, Linn.
- 5. दर्भ, Darva. Imperata cylindrica, Beauv. Some practitioners substitute the root of Andropogon muricatus for that of Imperata cylindrica. A decoction of these roots is considered demulcent and diuretic and is largely prescribed as an adjunct to metallic medicines in gonorrhæa, strangury and suppression of urine. The following confection is also much used in these diseases.

¹ त्रणपञ्चम् लम् । क्षयः कायः यरो दर्भ इत्त्वेति त्रणोद्भवम् । मूल क्षत्र्व्य पञ्चम लंबस्ति वियोधनम् । भावप्रकायः ।

Kusávaleha. Take of the five roots above mentioned, eighty tolás each, water sixty-four seers, boil down to eight seers and strain. Then add sugar four seers, and reduce to the consistence of a thick syrup. Remove the syrup from the fire and add to it the following substances, namely, liquorice root, cucumber seeds, the seeds of Cucumis melo (karkati), bamboo-manna, emblic myrobalan, tejapatra leaves, cardamoms, cinnamon, bark of Cratæva religiosa (varuna), gulancha, seeds of Aglaia Roxburghiana (priyangu), and the flowers of Mesua ferrea (nágakesara), two tolás each in fine powder; stir them well with a ladle and prepare an electuary. Dose one to two tolás.

ORYZA SATIVA, Linn. ETC.

THE following varieties of food grains belonging to this important natural order, are mentioned by Sanskrit writers:—

धान्य, Dhánya. Oryza sativa, Linn. Vern. Dhán, Beng. Hind. गोधम, Godhuma. Triticum vulgare, Linn. Gam, B. Genhu, H. यत्र, Yava. Hordeum hexastichum, Linn. Jab, Beng. Jow, Hind.

These three are considered the best of grains. The following varieties pass by the name of কুখালা, Kudhánya or inferior grains and অ ইয়ালা, Kshudra dhánya or minor grains.

वावनान, Yávanála. Holchus Sorghum, Linn. Joár, Hind. Beng. कडू, Kangu. Setaria Italica, Kunth. Vern. Kángni, B. Korá, H. चीन, China. Panicum miliaceum, Linn. Chiná ghás, B. खामाक, Syámáka. ORYZA SATIVA. Rice is the principal and often the only food of the great mass of the Indian population. Dháyna the Sanskrit name of paddy, means the supporter or nourisher of mankind. It is regarded as the emblem of wealth or fortune. On a thursday in the month of Pausha (December, January) after the new paddy has been reaped, a rattan-made grain measure called rek in Bengali, is filled with new paddy, pieces of gold, silver and copper coins, and some shells called cauries, and worshipped as the representative of the goddess of fortune. This apparatus is preserved in a clean earthen pot and brought out for worship on one thursday in each of the following Hindu months, namely, Chaitra, Srávana, and Kártika. Such is the form of the domestic goddess of wealth of an agricultural people living chiefly on rice.¹

The three principal classes of rice are Sáli or that reaped in the cold season, Vrihi or that ripening in the rainy season, and Shashtika or that grown in the hot weather in low lands. This last is reaped within sixty days of its sowing. The varieties of each of these three classes of rice are numerous and confounding. Rakta sáli popularly known as Dáudkháni is the variety of rice that is considered superior to all others and suited for use by sick persons. The preparations of rice used in sick diet and described in Sanskrit medical works are as follows:—

यदानु, Yavágu or powdered rice boiled with water for the use of the sick and convalescent. It is made of three strengths, namely, with nine, eleven and nineteen parts of water, called respectively Vilepi, Peyá and Manda. Sometimes, instead of water, a decoction of medicinal herbs is used in preparing yavágu.

[ा] पीचे च दयमी यक्ता चैत्रको पञ्चमी तथा। नभस्ये पूर्णिमा चेया गुक्शारे विशेषतः। श्राइकं वास्य सम्पूर्ण नानाभरण भूषितम्। सन्धि शुक्त प्रस्थेन शुक्त पत्ते प्रपूज्येत्। काल चन्द्रिका।

Thus for example if it is ordered to give the patient yavágu made with ginger and long pepper, the process adopted in preparing it is as follows. Take of dry ginger and long pepper, one tolá each, boil in four seers of water till reduced to two and strain. Now take nine, eleven or nineteen parts of this strained decoction and one part of powdered rice for making yavágu of the strength ordered.

चाजा, Lájá, (Vern. Khai), is paddy fried in a sand bath. The husks open out and the rice swells into a light spongy body. It is considered a light article of diet suited to invalids and dyspeptics.

sand bath. This is also a light preparation of rice and is given to sick persons as a substitute for boiled rice. It is also much used by the poorer classes for tiffin and early breakfast.

tened and lightly fried. It is then flattened and husked. This preparation of rice is given with curdled milk (dadhi) in dysentry. It is well washed and softened in water or boiled before use.

पायस, Páyasa is a preparation of rice with nine parts of milk.
तराइ चान्त्र, Tandulámbu is water in which unboiled rice has been steeped. This sort of rice-water is sometimes prescribed as a vehicle for some powders and confections.

The products of the acetous fermentation of rice and other grains have been already described in the introduction.

TRITICUM VULGARE, Linn. Three varieties of wheat are mentioned in the Bhávaprakása, namely Mahágodhuma or large grained, Madhuli or small grained and Nihsuki or beardless, that is without awn. The first variety is said to come from the west and the second to be indigenous to the middle region comprising the modern provinces of Allahabad, Agra, Delhi, Oudh, etc. Wheat is considered the most nutritive of the food-grains, but less easily digested than rice.

HORDEUM HEXASTICHUM, Linn. Barley though less esteemed than wheat is more employed in the dietary of the sick. It is chiefly used in the form of saktu or powder of the parched

¹ अधूलकः खत्य गोधूमः इति चढीक द्व्यगुषः ११७।

grains. Gruel prepared with saktu is said to be easily digested and to be useful in painful dyspepsia.

ZEA MAYS, Linn. called makkái in the vernacular has no Sanskrit name. It is indigenous to America but is now largely cultivated in Behar and Upper India.

The minor food grains are not of any importance in a medicinal point of view. They are used as food by the poorer classes or for cattle.

Old rice is preferred to new as being lighter and more easily digested, but new wheat and barley are considered superior to old. These are said to loose in flavour and taste by long keeping.

Poultices made of rice, barley or wheat flour, with the addition of oil or clarified butter, are applied to abscesses for hastening suppuration.1

ANDROPOGON MURICATUS, Retz.

Sans. डगीर, Usira, वीरण, Virana, Vern. Bená, Beng. Khas, Hind.

The root of this plant is well known as the khas khas root of which tátis or door screens are made for watering during the hot weather. It is described as cooling, refrigerent, stomachic and useful in pyrexia, thirst, inflammation, irritability of stomach, etc. It enters into the composition of several cooling medicines, as for example the preparation called Shadanga pániya, (see Cyperus rotundus). A weak infusion of the root is sometimes used as a febrifuge drink.

Externally it is used in a variety of ways. A paste of the root is rubbed on the skin to relieve oppressive heat or burning of the body. This use of the drug appears to have been popular with the ancients. Kálidássa in his drama called Sakuntalá alludes to it as will appear from the passage quoted below.²

¹ तैनेन सर्पिवावापिताध्यां वा यक्तुपिण्डिका। सुखोष्णः भोश्रपाकार्थ-स्वयनाचः प्रमस्ति। चकः।

सनन्यस्तोगोरं प्रियिश्वनस्याजैकवलयं । प्रियायाः सावाधं तद्पि-कमनीयं वप्ररिद्म् । यज्ञन्तला ।

An aromatic cooling bath is prepared by adding to a tub of water the following substances in fine powder, namely, root of Andropogon muricatus, Pavonia odorata (bálá), red sandal wood, and a fragrant wood called padma káshtha. The same medicines are reduced to a thin emulsion with water and applied to the skin.

ANDROPOGON SCHENANTHUS, Linn. Sans. *** Bhustrina, Vern. Gandha bená, Beng.

ANDROPOGON IWARANCUSA, Roxb. Sans. ভাৰত্যক, Lámajjaka. Vern. Lámjak, Hind. Karankusá, Beng.

These two fragant grasses are occasionally used as aromatics and refrigerants like the roots of Andropogon muricatus. A. schænanthus is common in Bengal, being cultivated in gardens for the sake of its fragrant leaves. A. Iwaruncusa is "a native of the skirts of the Northern mountains of India." Its virtues seem to reside in the larger roots marked with annular cicatrices.

BAMBUSA ARUNDINACEA, Willd.

Sans. an, Vansa. Vern. Báns, Beng. Hind.

The siliceous concretion found in the joints of the female bamboo is called वंग रोचन, Bansa rochana in Sanskrit, and is described as sweet, cooling, tonic, aphrodisiac and useful in cough, consumption, asthma, fever, etc. It enters into the composition of numerous compound prescriptions for affections of the lungs. The following is an illustration.

Sitopaládi churna.3 Take of bamboo-manna eight parts, long

pepper four parts, cardamoms, two parts, cinnamon one part, sugar sixteen parts; powder the ingredients and mix. Dose, about a drachm with honey and clarified butter. This preparation is given in phthisis with pain in the sides, hæmoptysis, loss of appetite and burning of the hands and feet.

CYNODON DACTYLON, Pers. Sans. বুলা, Durvá. Vern. Durbá, Beng. Dub, Hind. This elegant and most valuable grass, like many other useful vegetables, has a niche in the temple of the Hindu religion. Medicinally the fresh juice of the leaves is considered astringent, and is used as a snuff in epistaxis. The bruised grass is a popular application to bleeding wounds.

PRODUCTS OF FERMENATION AND DISTILLATION.

WINES AND SPIRITS.

All fermented and distilled liquors causing intoxication, are called *Madya* or *Madirá* in Sanskrit. The following varieties are mentioned by the later writers.

मादिक, Máddhika, or spirit distilled from grapes.

बार्ज , Khárjura, do. do. dates.

ਸੀ ਚ Sidhu, do. do. sugar-cane juice.

ECI, Surá, do. do. rice.

के। इ.स. Kohala, do. do. barley.

समुचिका, Madhuliká, do. do. wheat.

पैने, Paishti, do. do. from different sorts of grain.

भभूत्राष्ट्रांस, Madhuka pushpottha, do. do. the flowers of Bassia latifolia and treacle.

जाम्बर, Jámbava, do. do. ripe fruits of Eugenia Jambolana. कादस्वरि, Kádambari, do. do. flowers of Anthocephalus Cadamba.

वन्त्रचि, Valkali, do. do. belleric myrobalan and treacle. वाह्यी, Váruni is the fermented juice of the palm and date trees.

¹ नस्यं दाडिनपुत्रीत्यो रसो दूर्गभगेऽयगा। स्त्राम्बास्थानः पत्तार्खोर्गा नासिकासुतरक्तित्। भावप्रकाशः।

Some of these spirituous liquors have several varieties. Thus two varieties of sidhu are mentioned, namely, that produced from boiled sugar-cane juice and that from the unboiled juice. The liquor distilled from rice receives different names according to its consistence. The clear transparent fluid which floats on the top is called prasanná; that below it, is called kádambari; jagala is a thicker fluid than kádambari; medaka in the thickest and weakest of all. The forms of medicated spirituous liquors have been already described in the introduction, (see page 31).

Spirituous liquors are described as stimulant, sedative, agreeable, heating, intoxicating, digestive and nourishing. They are easily assimilated but injurious to health in hot climates. New wine is disagreeable to the taste and smell, unpleasant in its effects, not easily assimilated, laxative, heating and injurious to health. Old wine is agreeable, light and appetizing. It promotes the circulation of the fluids in the vessels and renders the senses acute. In amiable and virtuous men, wine promotes mirth and a desire for musical entertainments. In passionate men it gives rise to rashness and evil actions. Used at the proper season, in proper doses and with suitable food, wine acts like nectar. If taken to excess it induces a host of diseases. Medicinally, spirituous liquors are said to be useful in emaciation, debility, anæmia, urinary diseases, dyspepsia, chronic bowel complaints, chronic fever, deficient secretion of milk, etc.

A mixture of ginger, cumin seeds, treacle, wine and warm water is given in ague with prolonged cold stage. In chronic intermittent fever with debility, spirit distilled from rice, together with the flesh of fowls is recommended to be given as diet by most writers, but their advice is not followed in the present day. Several preparations of spirit distilled from treacle with the

¹ शुरुठी जाजी गुड़ं पिष्टं पीतसुक्षेण वारिणा। जीर्णसद्धेन तक्रेण पीतं गीत ज्वरं जयेत्। भावप्रकाशः।

² सुरां समग्रुं पानार्थे भन्नार्थे चरणायुधान् । तिनिरों स मयूरां स ययञ्जरादिषमञ्जरे। सकः।

addition of various medicinal and aromatic substances are used in different diseases. The following is an example.

Mritasanjivani surá.1 Take of new treacle eight hundred tolas and steep it in thirty times its weight of water. Add to the mixture the following substances in the form of a paste, namely, ginger sixteen tolas, bark of Acacia Arabica two seers, of Ziziphus Jujuba (kola) two seers, of Symplocos racemosa (lodhra) half a seer, betle-nuts as many as desired; stir in a large earthen vessel, and keep the mixture for twenty days in a covered jar. After this period remove the fermented fluid to a distilling apparatus, and add to it, the following aromatic substances, namely, betlenuts, cloves, sandal wood, cumin seeds, ájowan, black pepper, ginger, nutmegs, cardamoms, cinnamon, tejapatra leaves, fennel seeds, nigella seeds, the fragrant substances called elaváluka, padma-káshtha and granthiparni, devadáru wood, khas khas root, zedoary root, jatámánsi root and the tubers of Cyperus rotundus (mustaka), each eight tolás, in coarse powder, and distil. This distilled liquor is used as a tonic, astringent and invigorating drink.

MATERIA MEDICA

OF THE HINDUS PART III.

ANIMAL MATERIA MEDICA.

THE LEECH.

LEECHES have been employed by the Hindus from a very remote period. Susruta gives a detailed account of their varieties habits, mode of application, etc. His account of leeches has been translated in full by Dr. Wise. Pundit Madhu Sudan Gupta had also furnished a note on the subject for publication in the Bengal Dispensatory. I will not therefore attempt a new translation but will give an extract from Dr. Wise's work. "There are twelve varieties of leeches, six of which are venomous, and six useful. The venomous leeches are found near putrid fish or animals in foul stagnant and putrescent water. Such leeches are consequently to be avoided. The good leeches are found in clear and deep pools of water which contain water lilies, and are surrounded with sweet smelling plants. The middle sized leeches are the best. leeches are to be caught on a piece of leather or cloth, and placed in a new water pot in which some clay and pure water has been put. Some grass or leaves of aquatic plants are to be placed in the pot for them to lie upon, and the roots of water lilies and dry flesh are to be given them for food. The water is to be changed every third day, and the water pot every seventh day. If the leeches do not fix quickly, apply a drop or two of milk or blood

to the part, or make one or two very slight scarifications, which will induce them to fix themselves more readily. When the leeches are sucking, sprinkle a few drops of cold water upon their bodies. When the leeches have removed the necessary quantity of blood, sprinkle a small quantity of salt upon their heads to make them drop off. Put the gorged leeches upon some dry bran, put a little oil and salt upon their mouths and then strip them. Put them next in fresh water and, if they are lively, they will live and may be used again; but if they are languid, they will soon die and they should therefore be at once thrown away. The part upon which the leeches have been is to be smeared with honey, cold water and astringent substances. In other cases poultices may be applied."

LAC.

Sans. TITI, Lákshá Vern. Lákh, Hind. Gálá, Beng.

The lac insect (Coccus lacca), has been known to the Hindus from a very ancient period. The Butea frondosa is called Lákshá taru or lac plant in Sanskrit, this being the principal tree in which lac is said to be produced. The fluid lac-dye obtained by dissolving the crushed stick-lac in water is called A'lakta. It is used in colouring silk. Cotton coloured with this dye and pressed into flat circular pieces is sold in the bazars under the name of A'ltá and is used in painting the hands and feet of Hindu females. Shell-lac is used in the preparation of sealing wax, varnish for carpenters and ornaments for women. A decoction of shell-lac is much used in the preparation of several medicinal oils, such as Lákshádi-taila, Chandanádi taila, Angáraka taila, etc.

Laksháditaila.1 Take of shell-lac two seers, water sixteen

भावप्रकाशः।

seers, boil till reduced to four seers and strain. To this decoction of shell-lac add four seers of prepared sesamum oil, sixteen seers of whey, and two tolás each of the following substances, namely, Withania somnifera (asvagandhá), turmeric, devadáru wood, root of Sanseviera Zeylanica (murvá), Pandanus odoratissimus (ketaki), Vanda Roxburghii (rásna), dill seeds and liquorice root in the form of a paste and prepare an oil in the usual way; lastly add four tolás of camphor. This oil is much used for inunction in chronic fever and consumption. The other oils containing lac are prepared in a similar way, with the addition of various medicinal substances in the form of paste.

HONEY AND WAX.

Sans. मध, Madhu, माचिक, Mákshika.

Vern. Madhu, Beng. Shahad, Hind.

Eight sorts of honey are described by Susruta, namely:

- 1. Mákshika or the honey collected by the common bee called madhumakshiká.
- 2. Bhrámara, or the honey collected by a large back bee called bhramara.
- 3. Kshaudra, or honey collected by a sort of small bee of tawny colour, called Kshudra.
- 4. Pauttika, or honey collected by a small black bee resembling a gnat, and called puttika.
- 5. Chhatra, or honey formed by tawny or yellow wasps which make their hives in the shape of umbrellas.
- 6. Argha or wild honey collected by a sort of yellow bee like the bhramara.
- 7. Audálaka is a bitter and acrid substance like honey found in the nests of white ants.
 - 8. Dála or unprepared honey found on flowers.

Of these varieties the first four only are described by recent writers and the first alone is used in medicine. New honey is considered demulcent and laxative. Honey more than a year old is said to be astringent and demulcent. Old honey is preferred to new. It is much used in the preparation of confections and electuaries, and as an adjunct to decoctions, pills and powders.

Wax, called siktha in Sanskrit, is used in the preparation of ointments and ghritas for external application.

SERPENT POISON.

Sans. सर्पेविष, Sarpavisha, गरन, Garala.

Serpent poison has been used in Hindu Medicine since a very recent period only. Even the Bhávaprákasa which is not more than three centuries old does not mention it. Prescriptions containing it are found in such modern compilations as the Bhaishajya ratnábali, Sárkaumudi, etc.

The poison of the black cobra (Naga tripudians. Vern. Keute sáp, Beng.) is used. It is collected by making the reptile bite on a piece of stick or wood when the poison is poured out and received on a piece of plantain leaf. It is preserved in two ways. The liquid poison is allowed to congeal and dry in a cup or it is rubbed with a fourth part of mustard oil and spread out on a piece of plantain leaf. Thus treated it rapidly coagulates into a granular agglutinated mass of a yellowish-brown colour. When allowed to dry spontaneously, serpent poison coagulates into shining, crystalline yellowish white granules. It is used in complicated fever in combination with arsenic, aconite and other medicines. Numerous formulæ containing this poison are given in recent compilations. The following are a couple of examples.

Suchiká bharana rasa. Take of mercury, sulphur, prepared tin, aconite and cobra poison, equal parts, mix them together and soak the mixed powder in the bile of rohitaka fish (Cyprinus Rohita), wild boar, peacock, buffalo and goat successively and make into a pill-mass. This medicine is administered in doses

महित्ति। स्वामित्राभरणोरसः । रसगम्बन्धनागञ्च विषं स्थावरजङ्गमम् । मत्स्य-वराज्ञमायूरकागित्ते स्व भावयेत् । स्वित्ताभरणो नाम भैरवेण प्रकीत्ति तः । स्विकात्रेण दातव्यः सित्तपातकुलान्तकः । भैषज्यरत्नावली ।

that can be taken up by the point of a needle, hence it is called suchikábharana. It is given in remittent fever with cerebral complications.

Kálánala rasa. Take of black cobra poison, sulphur, white arsenic, aconite, black pepper, long pepper, ginger, borax, mercury, prepared iron and copper equal parts; soak them in the five kinds of bile mentioned above and make into one-grain pills with the juice of datura root. These are given in fever with coma, delirium and drowsiness.

MUSK.

Sans. स्मनाभि, Mriganábhi, कस री, Kasturi.

The Bhávaprákása describes three varieties of musk, namely, Kámrupa, Nepála and Káshmira musk. Kámrupa musk is said to be of black colour and superior to the others. It is probably China or Thibet musk brought via Kamroop. Nepála musk is described as of bluish colour and intermediate quality. Káshmira musk is of inferior quality.

Musk is regarded as stimulant and aphrodisiac and is used in ow fevers, chronic cough, general delibity and impotence. In low lifevers with prostration, two grains of musk with two of Makaradhvaja are given every three hours with the addition of honey.

Svalpa kasturi bhairava.2 Take of cinnabar, aconite, borax, nutmeg, mace, long pepper, black pepper and musk, equal parts

and make into four-grain pills. These are given in remittent fever of low type.

Mriganávyádyavaleha. Take of musk, cardamoms, cloves, cinnamon and dates, equal parts and make into a linetus with honey and clarified butter. This is given in hoarseness and loss of speech.

Vasantatilaka rasa.² Take of prepared gold one part, tale and tin two parts each, iron three parts, the preparation of mercury called rasasindura and calcined pearls and coral, four parts each; mix them together, soak for seven days in the juice of sugar-cane, of the fruits Tribulus terrestris (gokshura) and of other strengthening vegetables. Enclose the mass in a covered crucible and roast it in a sand-bath for three hours. Lastly add to it four parts of camphor and four of musk and make into four-grain pills. These are given as an alterative tonic in a variety of diseases, but more especially in chronic affections of the lungs supposed to be caused by deranged phlegm.

CIVET CAT.

Sans. गन्द्रमार्जोर, Gandha márjára. Vern. Khátási, Beng. The pouch of the civet cat (Viverra Zibetha, Linn.) contains an unctuous odorous secretion which is extracted and used in perfumery. The

pench together with the secretion contained in it, are used by native physicians in scenting medicated oils.

HARTSHORN. Sans. **ETTER, Mrigasringa. The antler of the deer incinerated in closed vessels is used in painful affections of the heart, pleurodynia, sciatica and lumbago. It is given in doses of about twenty-two grains with clarified butter. Burnt hartshorn leaves 57.5 per cent of phosphate of lime.

MILK AND ITS PRODUCTS.

The properties of the milk of various animals are described in great detail by Sanskrit writers. Milk in general is considered cooling, nutritive, strengthening and vitalizing. Cow's milk is pleasant to take and very wholesome. It promotes memory, strength and longevity and increases the secretion of semen. Buffalo's milk is said to be sweeter, heavier and more cooling than cow's milk. It induces sleepiness, spoils the appetite and brings on cold. Goat's milk is sweet, cooling and astringent. It promotes the digestive power and is useful in hæmorrhagic diseases, phthisis, bowel complaints, etc. Ewe's milk is saltish, disagreeable and not easily digested. Mare's milk is saltish, acidulous and easily digested. Ass's milk is saltish, easily digested, and useful in debility and urinary complaints. Camel's milk is light, sweet, saltish, laxative and useful in dropsical affections. Human milk is light, cooling, nutritive, strengthening and useful as a collyrium or wash in eye diseases. All milk except human milk should be taken boiled. Warm milk just as it comes out from the teats is said to be like nectar.

As an article of diet, milk is considered demulcent, laxative, and especially adapted for children, old men, consumptive people or those reduced by debauchery, for women who are suckling and for patients suffering from chronic fever, mental diseases, dyspepsia,

¹ यरावसंप्रटे दग्धं ख्ङ्कं हरियाजं प्रिवेत्। गव्येन सिपंधापिष्टं हृच्छू लं नश्चिति धुवस्। याङ्कें धरः । दग्धमनिगेतधूमं मृगख्ङ्कं गोष्टतेन सहपीतस्। हृदयनितस्वजयनं हरितिथिखीदारुनिवहिमव। चक्तः।

diarrhea, urinary complaints, ascites and anasarca. A pure milk-diet to the exclusion of every other article (not excepting even salt and water) is often prescribed in the later stages of anasarca, ascites and chronic bowel complaints. Along with this milk diet, some sort of medicine, such as Dugdha vati, Svarnaparpati, or Mána manda, is usually prescribed.

described, namely ghola or pure butter-milk without admixture of water, takra or butter-milk with one-fourth part of water, udasi or that mixed with half its bulk of water, and chhachchhiká or very dilute butter-milk. The second form called takra is used in medicine and as an article of sick diet. It is regarded as astringent, light, cooling, appetizing, nutritive, tonic, and useful in diarrhæa, dysentery, dyspepsia, urinary diseases, ascites, poisoning, etc. It is not suited to the weak, or consumptive nor to those sufferfrom fever and nervousness. The habitual use of butter-milk is said to be conducive to health and a preservative against disease.

or a little curdled milk as a ferment to milk previously boiled. In the course of twelve hours the whole of the milk thus acted upon is changed into a more or less thick, acidulous, jelly-like mass. It is considered agreeable, digestive and cooling, and is much used as an aricle of diet by all classes of natives. Taken to excess it causes biliousness and catarrh. It is useful in fever, diarrhear dysentery, urinary disorders and disinclination for food.

of curdled milk. In particular it is said to favour the circulation of the animal fluids and to be useful in constipation.

বিভাৰে Kilátaka or curd of milk (Vern. chhená, Beng.) is hard of digestion, but is nourishing, tonic and suited to persons with strong digestive powers.

चनानिका Santániká or cream is also hard of digestion but nourishing, agreeable and demulcent.

नवनीत Navanita or butter is tonic, astringent, invigorating, stomachic and useful in phthisis, piles, facial paralysis, etc. It agrees best with the old and young.

of diet and in pharmacy. Clarified butter obtained from cow's milk is considered superior to that prepared from the milk of the buffalo and is preferred for medicinal use. Clarified butter is considered cooling, emollient and stomachic. It increases the fatty tissues and mental powers, improves the voice, beauty and complexion and is useful in eye diseases, retained secretions, insanity, tympanites, painful dyspepsia, ulcers, wounds, etc. It is the basis of a form of medicinal preparation called ghritapáka already described in the introduction, (see page 14).

प्राण्डत Purána ghrita. Clarified butter more than ten years old, passes by this name.1 It has a strong pungent odour and the colour of lac. The longer this old butter is kept the more efficacious it is said to prove as an external application. Clarified butter a hundred years old is often heard of. The richer natives always have a stock of old ghrita of this description which they preserve with care for their own use as well as for distribution to their poorer neighbours. I have seen some specimens of old clarified butter which were quite dry and hard and nearly inodorous. They looked more like some sort of earth than an animal substance. Old clarified butter is used externally. It is first repeatedly washed with cold water, and then rubbed with it till it is reduced to a soapy frothy fluid which is used as a liniment. It is regarded as cooling and emollient and is much used in nervous diseases such as insanity, epilepsy, neuralgia, paralysis, cephalalgia and asthma, in rheumatic affections, stiff joints, burning of the body, hands or feet, affections of the eyes, etc.2

The following treatment is recommended for reducing the temperature of the skin in strong fever. The patient's body should be anointed with an emulsion of sandal wood and of old clarified butter that has been washed a hundred times in cold

water. He should then enter a tepid bath for a short while. His bedding should be made of the leaves of Nelumbium speciosum (kamala). 1

BILE.

Sans. पत्त, Pitta.

The bile of the buffalo, wild boar, goat, peacock and rohitaka fish (Cyprinus Rohita), is used in medicine, either singly or in combination under the designation of Pancha pitta or the five biles. Bile is considered laxative and is chiefly used in soaking powders intended for being made into pill-masses.

Udakamanjari rasa.² Take of mercury, sulphur, calcined borax, and black pepper each one part; sugar and the bile of rohitaka fish, four parts each; rub them together for three days and make into six-grain pills. These are given with ginger juice in recent bilious remittent fever. If there is much heat of head, cold water should be applied to it. For other preparations containing bile, see under serpent poison, page 278.

बोरोचना Gorochaná, or the concretions found in the gall-blad der of the ox, are considered cooling, aromatic and useful in abortion and diseases supposed to be caused by evil spirits. Gorochana is sometimes given to infants in small doses as a laxative, It enters into the composition of some medicines for skin diseases.

URINE. Sans. मृत, Mutra.

THE properties of the urine of various animals, such as the cow, buffalo, goat, sheep, horse, elephant, ass, and camel are minutely described. Of these, cow's urine is much used both internally and externally, in the purification of various metals and in the

1 श्रीतास्त्रः सानुशतयस विलोखितेन गव्येनचन्दन युतेन धनेनदिग्धा । दाइज्बरी सक्तमलोत्पलमात्राधारी चिप्रंविश्रेत् सिल्बकोष्णमनल्पकालं । काञ्चिकाद्र पटेनावगुग्छनं दाइनाश्रनम् । दप्पः ।

Goat's urine is sometimes given internally as for example in the prescription quoted under Nardostachys jatamansi. In congestive fever with constipation, flushed face and headache, an ounce of fresh and warm cow's urine is given as a domestic medicine. It is sometimes given as the vehicle for administering castor oil, (see page 231). Cow's urine is used in the preparation of various medicines for jaundice, anasarca and allied diseases. The following is an illustration.

Punarnavá mandura.¹ Take of Boerhaavia diffusa (punarnavá) Ipomæa Turpethum (trivrit), ginger, long pepper, black pepper, báberang seeds, devadáru wood, plumbago root, pátchak root, the three myrobalans, turmeric, wood of Berberis Asiatica, (dáruharidrá) root of Baliospermum montanum, (danti), Piper Chaba (chaviká), indrajava seeds, root of Picrorrhiza Kurroa (katuki), long pepper root and the tubers of Cyperus rotundus (mustaka), equal parts; iron rust in weight equal to twice that of all the other ingredients; mix them together and boil the mixed powder in eight times its weight of cow's urine till the watery part is evaporated. Dose, about twenty-two grains, in jaundice, ascites, anasarca, enlargements of the abdominial viscera, painful dyspepsia, etc.

Marichádya taila. Take of mustard oil four seers, cow's urine sixteen seers, aconite eight tolás, orpiment, realgar, black pepper, milky juice of Calotropis gigantea (arka), root of Nerium odorum (karavira), root of Ipomæa Turpethum (trivrit), colocynth root, Aplotaxis auriculata (kushṭha), turmeric, wood of Berberis Asiatica (dáruharidrá), devadáru wood, and red sandal wood, each

four tolás, and prepare an oil in the usual way. This oil is said to be useful in leucoderma, chronic prurigo and other obstinate skin diseases.1

ANIMAL FLESH.

In describing the properties of the flesh of various animals, Sanskrit writers divide them into two classes, namely sign Jángala or land, and sign Anupa or water animals: Animals living on land are sub-divided into eight orders as follows:—sign Jángalá or animals living in the wilderness as deers, antelopes, etc.

िवस्थाः Vilasthá, or animals living in holes under ground, as

serpents, liz ards, porcupines, etc.

য়ন্ত্রাম্বাঃ, Guhásayá or animals living in caverns, as tigers lions, bears, etc.

पर्थेन्द्रगाः, Parnamrigá or animals living on trees, as monkeys

sqirrels, etc.

বিল্পিন:, Vishkirá or birds which take their food after tearing or scattering it, as peacocks, quails, partridges, etc.

সন্তহা:, Pratudá or birds which strike with their beaks, as pigeons, wag-tails, cuckoos, etc.

मसहाः, Prasahá or birds of prey, as the hawk, falcon, etc.

पास्या:, Grámyá or domestic animals, as ox, goat, horse, sheep, etc.

Animals living in water or marshy lands are sub-divided into five classes as follows:—

कुलेचरा:, Kulechará, or animals grazing in marshes, as buffalos, yak, rhinoceras, etc.

श्रावा:, Plává, or birds which swim in water, as geese, ducks cranes, etc.

कोगस्या:, Kosasthá, or animals enclosed in shells, as conchshells, bivalve-shells, etc.

मादिन: Pádina, or footed aquatic animals as tortoise, crocodile porpoise, etc.

¹ मरिवाद्यं तैलम् । मरिवालिशिलाह्वार्कपयोश्वारिजटात्मिष्टत् । श्रक्ट्स-विश्वालाह्यः निश्वायुग्दाह्यन्दनेः । कटुतैलात्पचेत्प्रस्थं द्वार्लिविषणलान्तिः । सगोमूनं तद्भ्यङ्गाद्द् श्वित्विनाश्यनम् । सब्बेष्विषिच कुछेषु तैलमेतत् प्रश्च-स्थते । चन्नदत्तः ।

मतस्य Matsya or fishes.

Of these classes, Jángalá or animals living in the wilderness, and Vishkira or birds which scatter their food are considered superior to the others in an alimentary point of view. The different properties of the meat of various animals are desribed by Sanskrit writers in great detail. The flesh of the goat, domestic fowl, peacock and partridge is said to be easily digested and suited to the sick and convalescent. The meat of the deer, sambar, hare, quail, and partridge is recommended for habitual use. Fish, beef and pork are considered hard to digest and unsuited for daily use.

The flesh of various animals is used in medicine chiefly in the form of ghrita or taila páka. The following is a list of the more important and commonly used ghritas and oils made with the flesh of different animals.

Hansádi ghrita, prepared with the flesh of geese, and used in cephalalgia and nervous diseases.

Kukkutádi ghrita, prepared with the flesh of fowls, and used in chronic cough.

Sivá ghrita, prepared with jackal's flesh and used in insanity.

Chhágaládi ghrita, prepared with goat's meat, and used in nervous diseases.

Sámbukáditaila, is an oil prepared with the flesh of snails and used externally in ear diseases.

Nakuládya ghrita is prepared with the flesh of the mungoose and used in nervous diseases.

The following are two illustrations of preparations with animal flesh.

Chhágaládya ghrita. Take of goat's meat six seers and a quarter, the ten drugs called dasamula six seers and a quarter in

¹ कागनायं घतम्। खानं चम्म विनिर्मृतां त्यक्त ग्रह्मनखादिकम्। पञ्च मूलीदयच्चैव जनहोणे विपाचयेत्। तेन पादावणेषेण घत प्रस्थं विपाचयेत्। जीवनीयैः सयख्याच्चैः चीरच्चैव गतावरी। खागनाद्यमिदं नाम्ना सम्बेवात विकारतत्। अद्दिते कर्णम्यने च वाधियौ मूकमिन्तिने। जङ्गदुगद पद्भनां खच्चे ग्रम्भिकुजयोः। खपतानेऽपतन्त्रे च सपिरेतत् प्रगस्ति। खन्नयिः मधु भागदयमिति गिवदासः। भेषन्त्रस्तावनी।

all, water sixty-four seers; boil till the latter is reduced to one-fourth and strain. Take of clarified butter, milk and the juice of Asparagus racemosus (satamuli), four seers each; and the following substances in the form of a paste, namely, Tinospora cordifolia (guruchi), bamboo-manna, Withania somnifera (asvagandhá), Hemidesmus Indicus (sárivá), berries called kákoli, bulbs called kshira-kákali, pulse of Phaseolus trilobus (mugáni), and of Glycine debilis (masháni), Calogyne ovalis, (jivanti), and liquorice root (one seer in all); boil them together and prepare a ghrita. This preparation is given in facial paralysis, deafness, loss of voice or indistinct speech, convulsions, hysteria, sciatica, paralysis and other diseases of the nervous system.

Máshataila.1 Take of goat's meat eight seers, water sixty-four seers; boil together till the latter is reduced to sixteen seers. Take of the pulse of Phaseolus Roxburghii (másha), linseed, barley, root of Barleria Prionites (kuranțaka), of Solanum Jacquinii, (kanțakári), Tribulus terrestris (gokshura), bark of Calosanthes Indica syonáka), jatámánsi root, seeds of Mucuna pruriens (kapikvachchhu), each one seer, water sixty-four seers; boil down to sixteen seers. Take of cotton seeds, seeds of Crotolaria juncea (sana), pulse of Dolichos uniflorus (kulattha), dried pulp of Ziziphus Jujuba (kola), each two seers, water sixty-four seers; boil down to sixteen Take of ginger, long pepper, dill seeds, root of Ricinus communis (eranda), of Bærhaavia diffusa (punarnavá), Pæderia fætida (prasárani), Vanda Roxburghii (rásná), Sida cordifolia (berelá), Tinospora cordifolia (gulancha) and Picrorrhiza Kurroa (katuki) equal parts; in all one seer, and reduce them to a paste. Boil the above mentioned decoctions and the paste with four seers of sesamum oil in the usual way. This oil is rubbed externally in convulsions, paralysis, wasting of limbs and other diseases of the nervous system.

THE END.

NIDANA: A SANSKRIT SYSTEM OF PATHOLOGY.

TRANSLATED INTO BENGALI

BY UDOY CHAND DUTT,

CIVIL MEDICAL OFFICER.

EXTRACTS FROM REVIEWS.

"Nidána is a Sanskrit treatise on Hindu Medicine, compiled by Madhub Kur, a Sudra, who lived many hundred years ago. It was intended for the benefit of the ordinary class of students, who, for certain reasons, had no access to the more learned works of Charaka and Susruta. It may, therefore, be accepted as one of the text-books of the Hindu Medical Schools. It gives a clear and concise account of all the diseases and injuries known to the Hindu physicians up to the time when it was written, including their diagnosis and prognosis. The whole work is evidently based on clinical experience, and, as a didactic record of facts, it is very valuable. But, for the explanations of these facts, they are often interwoven with absurd theories and doctrines which take the place of physiology and pathology. The object of this work was simply to teach diseases, leaving their treatment to be dealt with in a separate book; and it would be a great thing if we could have a similar book composed in Bengali, with the light of modern science, for the use of our vernacular medical students. That is a great want which, however, could only be supplied by oriental scholars like Baboo Udoy Chand Dutt, the learned translator of this work. As it is, the Baboo has done great service to vernacular medicine, and our best acknowledgments are due to him for it.

"Being free from barbarous interpolations and foreign words, it is calculated to chasten the language of the new vernacular medical literature. On this account we trust Government will insist on a knowledge of this work by all their licentiates in Bengali or English. In that way alone can a proper taste be created for the careful study of Bengali, the want of which is painfully apparent in many of the recently issued vernacular medical publications."—

Indian Medical Gazette, January, 1874.

"The author before us belongs to the pre-university era. A good English scholar, a reputed master of the healing art, with an inquisitive turn of mind, and thoroughly alive to the merits of the indigenous system of medicine, he possesses many qualifications for expounding the principles of the Sanskrit system of medicine, and has performed well his self-elected task. In his preface to the work before us he says that it is a literal translation of the Sanskrit treatise on pathology, compiled by Mádhava Kar, and generally known under the name of Nidána. It gives a pretty full account of the diseases known to the ancient Hindus, and it has been the text-book on medicine for native physicians from a long time past. With a view to enable the reader versed in English medicine readily to identify the diseases described in this work, our author, wherever it has been practicable, has given their equivalent English names in foot-notes. This translation is a valuable contribution to Indian Medical Literature."—Hindoo Patriot, October 20, 1873.
