DEDICATION.

DED CONTEON.

TO HIS

ROYAL HIGHNESS PRINCE WILLIAM-HENRY.

SIR,

THE following Work is the fruit of feveral years labour employed in the Public Service, chiefly under that great and fuccefsful Admiral, Lord Rodney, in a feries of Naval Operations, which have been productive of B events

DEDICATION.

ii

events more glorious than any recorded in the Annals of Britain. As your Royal Highnefs was prefent during fome part of the fervice which is the fubject of these Observations, and as You have not only honoured the Sea Service by embracing it as a profeffion, and enrolling your illustrious Name among its officers, but in undergoing the dangers and fatigues of actual fervice, which is fo neceffary to attain that practical Skill which Your Royal Highnefs is well known to poffefs, I have, upon these grounds, prefumed to lay this Work at Your feet. I should do this with greater fatisfaction,

DEDICATION.

tion, were it more worthy of Your acceptance; but however inadequate my abilities may have been to the tafk, it has been my fincere aim to produce a work of fome utility to that only Bulwark of our Country, the Britifh Navy, of which your Royal Highnefs is the Pride and the Hope.

Your Royal Highnefs's Permiffion to inferibe this work to You, and the perfonal Notice and Protection with which you have been pleafed to honour me, I confider as the first Diffinctions of my life, and of which I shall ever entertain a becoming B 2 fense, iv DEDICATION. fense, by cherishing those indelible fentiments of Respect, Gratitude, and Attachment, which are due to Your Royal Highness from

Your Royal Highnefs's Moft faithful,

Moft obedient, and

Moft devoted Servant,

GILBERT BLANE.

London, May 1, 1785.

PREFACE.

vl

HAVING been appointed by Lord Rodney Phyfician to the Fleet under his command, in the beginning of the year 1780, I determined to avail myfelf, to the utmost of my abilities, of the advantages which this field of observation afforded. This I was led to do, in order to fatisfy my own mind as a matter of duty, as well as to find out, if possible, the means of bettering the condition of a class of men, who are the bulwark of the state, but whose lot is hardship and difease, above that of all others.

B 3

A fleet,

A fleet, confifting feldom of lefs than twenty fhips of the line of battle, and fometimes exceeding forty, which I attended in the different fcenes of active fervice in that diffant and unhealthy region, for more than three years, has afforded me opportunities of making obfervations upon a large fcale.

My object has been prevention as much as cure; and as the former muft more particularly depend on a knowledge of the external caufes of difeafe, I have collected and arranged all the facts upon this fubject that came within my reach, confidering thefe as the only grounds from whence the remote caufes of health and ficknefs could be deduced.

When I entered upon my employment, the Commander in Chief gave an order, that every furgeon in the fleet fhould fend me a monthly

monthly return, stating the degree of prevalence of different difeafes, the mortality, and whatever elfe related to the health of the respective ships. This was done with a view to enable me to regulate the reception of men into hospitals, so that each ship might have a due proportion of relief, according to the degree of ficknefs on board, taking care at the fame time that the hofpitals should not be overcrowded; and also to acquaint the Commander in Chief, from time to time, of the state of fickness, or the predominance of particular difeafes, in order to recommend fuch articles of diet, or other means, as might tend to cure them, or to check their progrefs. Thefe returns have ferved alfo in this work as a method of collecting a multitude of well-established facts, tending to afcertain the caufes and course of disease,

B 4

While

VII

While the fleet was in port, I alfo fuperintended and vifited daily the hofpitals, of which there is one at almost every island on the station ; and having kept an account of the different kinds of difease that were admitted, and of their mortality, I have in this way likewise been furnissed with a number of facts that may throw light on the history of human maladies.

Neverthelefs, I do not boaft of having made great difcoveries; and every perfon of a correct judgement muft be aware how difficult it is to afcertain truths, and to draw fair and folid inferences, on medical fubjects. I have attempted little more than to amafs, from my own obfervation, and by the affiftance of the furgeons of the fleet, a number of well-eftablifhed facts, and to arrange them in fuch a methodical manner, as to prove a groundwork for inveftigation; and I am perfuaded that others, of more fagacity

viii

fagacity and enlarged knowledge than myfelf, may be able to deduce from them, obfervations that may have efcaped me, efpecially if thefe new, but imperfect, attempts fhould come to be compared with fimilar ones that may be made by other obfervers in other climates, and in other circumftances of fervice.

I met with feveral obstacles in instituting inquiries, purely medical, to the extent I could have wished. There is, in the first place, from the nature of the subject, a great difficulty attending all practical inquiries in medicine; for, in order to ascertain truth, in a manner that is satisfactory to a mind habituated to chaste investigation, there must be a series of patient and attentive observations upon a great number of cases, and the different trials must be vastied, weighed, and compared, in order to form

ix

form a proper effimate of the real efficacy of different remedies and modes of treatment.

But befides this difficulty belonging to the nature of the fubject, there were others connected with the nature of the fervice; for the hofpitals were at times fo inadequate in point of fize, and fo ill provided with neceffary articles and accommodations, particularly during the first part of my attendance, that my principal care was to remedy these defects by proper superintendance and representation.

A due attention to air, diet, and cleanlinefs, is not only more effential than mere medical treatment, but the fick cannot be confidered as fit fubjects for evincing the powers of medicine till they are properly provided for in thefe refpects. Thefe inconveniences were owing, in a great meafure, to the unufual extent of the fervice; 2 for

for there was a much greater naval force in those feas, at this period, than was ever before known, and there was of course a proportional want of accommodation for the fick. Towards the end of the war these difficulties were much obviated, so that a fairer field of observation presented itself.

Another obftacle to my practical inquiries was, that the fleets I belonged to feldom remained more than fix weeks or two months at any one place, fo that any feries of obfervations that might have been inftituted was interrupted, and I was in a great degree deprived of the fruits of them, by not feeing the event of cafes under my management.

The peace in the fpring of the year 1783 put an end to all my inquiries, and particularly prevented me from following out fome practical

xii

practical refearches. I have ventured, however, in one part of this work, to give the refult of my experience in fome difeafes, more especially such as are peculiar to the climate and mode of life.

Upon the whole, I have, in the following work, humbly attempted to follow what I conceive to be the only true method of cultivating any practical art, that is, to collect and compare a great number of facts. A few individual cafes are not to be relied on as a foundation of general reafoning, the deductions from them being inconclusive and fallacious, and they are liable to be turned and gloffed, according as the mind of the observer may be biaffed by a favourite prepoffession or hypothesis. It has been my fludy to exhibit a rigid transcript of truth and nature upon a large fcale, and to take the average of numberless particular facts, to serve as a groundwork for observation ;

vation; and I have endeavoured to analyfe and collate these facts, by throwing the monthly returns that were made to me into the form of Tables, as the most certain and compendious way for finding their general refult. If the materials are not fufficiently ample, or if the method fhould be found faulty and imperfect, let it be remembered, that I had no example to go by in this field of observation. It is to be regretted, that ages have paffed without any attempts being made to transmit regular records of this kind to posterity. It would not only be extremely curious, as a piece of natural knowledge, but would conduce greatly to medical improvement and public utility, were we poffeffed of fuch information concerning the caufes and nature of the difeases prevailing at sea, in various circumftances of weather, climate, and diet, in remote ages and countries, or even in our own age and country, as might enable

us

xiv

us to compare them with prefent facts, and to afcertain more precifely the means of preventing and removing fuch difeafes.

The favourable reception which the first edition of this work has met with, renders it neceffary to offer another to the Public; and though no new opportunities have occurred of making additional obfervations in the naval fervice, I have endeavoured, during the last two years, from a pretty extenfive experience in a large hospital, and from private practice, to add fome new information on fome practical points; and I hope this edition will be found throughout more full and correct than the former.

The method I propose to follow in this work, is, First, to deliver the history of the different voyages and expeditions, so far as relates to health, giving an account of the prevalence and nature of the difeases and PREFACE: xv and mortality on board of fhips and in hofpitals.

Secondly, To deduce, from obfervations founded on these facts, and also from the former experience of others, the causes of fickness in fleets, and the means of prevention.

Thirdly, To deliver fome practical obfervations on the cure of the most common difeases incident to fleets, particularly in hot climates.

OBSERVATIONS.

PART I.

BOOK I.

Comprehending the MEDICAL HISTORY of the FLEET, from March, 1780, till August, 1781.

CHAP. I.

Containing an Account of the HEALTH of the FLEET from March, 1780, till July following. ——— Five Ships of the Line arrive at Barbadoes from Europe in March — Join a large Squadron then on that Station — Their Health compared — Engagements with the Enemy in April and May producing Hardfhip and Expofure, but little Increafe of Sicknefs — Method of collecting the Returns of the Surgeons — Influence of Situation upon Health in Harbours — Courfe of the Seafons, and Temperature of the Weft Indies — The Fleet reinforced in June and July with Ships from England and North America — Their Health.

DURING the war, which broke out with France in 1778, and with Spain in 1779, the Weft Indies was the principal feat of naval operations, and much greater C fleets 18 DISEASES OF THE FLEET, 1780. PART I. fleets were then employed in that quarter of the world than in any former period.

Though there had been a great fquadron on the Caribbee station during the greater part of 1779, no physician was appointed to it till the beginning of the next year, when I arrived there in that character with my friend and protector, Lord Rodney.

There were then fixteen fhips of the line on that flation, most of which had been upwards of twelve months in the climate; and they were reinforced at this time by five more from England.

The fquadron which we found on the ftation was then extremely healthy, and in feveral of the fhips there was not a man unfit for duty. We were told, however, that they had all been fubject to ficknefs, particularly to the dyfentery, foon after their arrival in that climate. Of the five with which the fleet was at this time reinforced, all but the Intrepid left England at Chriftmas, making part of the fquadron which

BGOK I. DISEASES OF THE FLEET, 1780. 19

which effected the first relief of Gibraltar, under the command of Lord Rodney, who continued his route to the Weft Indies, in order to take the command on the Windward station, where he arrived on the 16th of March. The Intrepid had arrived with a convoy the day before. These five ships were all pretty healthy on their paffage, except the Sandwich and Terrible, in which a fever prevailed; but they had almost recovered from it before they arrived in the West Indies. A dysentery broke out in April in all the ships newly arrived, and it prevailed to the greatest degree in those which had been most affected with fevers in Europe, namely, in the Terrible and Intrepid. The Sandwich and Ajax were also affected, though in a less degree; but the Montagu, though this was her first voyage, and though fhe was just off the flocks, had been the most healthy of any of them from the time of leaving England, and continued fo during all this campaign. I have not observed that new ships are more unhealthy than others, unless they are built of ill-feasoned timber; and they have this C 2 advantage,

20 DISEASES OF THE PLEET, 1780. PART 1.

advantage, that there is no previous infection adhering to them. What may have contributed allo to the fuperior health of the Montagu, was the precaution that was taken when this fhip was first manned and fitted out, of stripping and washing the men that were brought from the guardship to complete the crew.

The Intrepid, while in England, had been afflicted with fevers to a most uncommon degree; for, being one of the fleet in the Channel cruize the year before, almost the whole crew either died at fea, or were fent to the hospital upon arriving at Portsmouth. This ship, after resisting, was pretty healthy for a little time; but, probably from the operation of the old adhering infection, safter joining our fleet, and fent two hundred men to the hospital the first two months after arriving in the West Indies. Most of these were ill of the dysentery.

The Pegafus frigate arrived with the fhips from Gibraltar, and we have here an in-

ftance

DISEASES OF THE FLEET, 1780. 21 BOOK I.

stance of the fuperior health commonly enjoyed by this clafs of fhips over fhips of the line; for when she was dispatched to England in the end of April, there had not been a man taken ill from the time of her arrival on the flation.

This feason was a very active one in the operations of war; for, befides the general battle of the 17th of April, there were two partial actions in May; and, from the 15th of the former month till the 20th of the latter, our fleet was conftantly in the face of the enemy's, except for a few days that it was refitting at St. Lucia after the first battle. This was extremely harraffing to the men, not only from the inceffant labour neceffary in the evolutions of the fleet, but by their being conftantly at quarters with the ships clear for action ; for, in that situation, they had nothing to fleep upon but the bare decks, the hammocks and bedding being removed from between decks, where they might embarrafs the men in fighting, and they become useful on the quarter deck, by ferving to barricade the ship, which is done by

22 DISEASES OF THE FLEET, 1780. PART 1:

by placing them in ranges on the gunwale, to cover the men from the enemy's grape and fmall fhot. Thefe hardfhips were productive of fome ficknefs, though much lefs than might have been expected; for the weather is at all times warm, and it was at this time extremely moderate and dry. Befides, we fhall fee in other inftances as well as this, that, in the ardour infpired by the prefence of an enemy, men are lefs exhaufted by their exertions than on ordinary and lefs interefting occasions.

Almost the whole of the fick and wounded, to the number of 750, were put on shore at Barbadoes, where all the fleet, except three ships *, arrived on the 22d of May.

I now began to keep regular and methodical accounts of the fickness and mortality in the fleet, though in a manner more imperfect and less accurate than was afterwards

* Thefe were the Conqueror, the Cornwall, and the Boyne, which were fo damaged in the battles, that they were obliged to bear away for St. Lucia.

1.0

adopted.

BOOK I. DISEASES OF THE FLEET, 1780. 23

adopted. I was embarked on board of the Sandwich, where the Commander in Chief had his flag, fo that I was always prefent with the main body of the fleet, whether at fea or in port.

A form of monthly returns* was adopted, which, as well as other points of method, was afterwards improved.

After

* The following may ferve as a fpecimen of these returns:

STATE of HEALTH of His Majesty's Ship ALCIDE. Carlifle Bay, Barbadoes, 1st June, 1781.

REMARKS.

During the courfe of last month we had one hundred and fourteen of the men, who contracted the fcurvy in C 4 the

After collecting the returns for each month, I made abftracts of them in tables; in one column of which the complement of each fhip is fet down, in order to form calculations of the comparative prevalence and mortality of different difeafes at different times. One of the abftracts is here inferted, (Table I.) by way of fpecimen, and the proportional refult of them for fourteen months is fet down in another table, (Table II.)

Though

the late long cruife, recovered by the use of limes, which were procured at Montferrat. A pint of wine, with an equal quantity of water, made agreeable with sugar and tamarinds, is ferved to each patient daily. The regimen is exactly the same as mentioned last month.

Since we came into port, very few have been feized with fcurvy, but feveral complain daily of fluxes and feverifh complaints, none of which feem at prefent to be of any confequence.

Four patients have laft month complained of an almost total blindness towards evening, accompanied with head-ach, vertigo, nausea, and a fense of weight about the precordia. The pupil is then extremely dilated, but contracts readily when a strong light is presented to it. Two of them had the foury in a high degree, one of them flightly, and the other seemed entirely free from it. I am

Though this laft exhibits a tolerably juft view, yet it may be remarked, as one imperfection, that there was no diffinction made at this time in my returns between the killed and those who died of difease; fo that in the month of May, which stands first, the proportion is too high; for there were fixty-four killed, and two hundred wounded, in the two actions of that month.

I am not well acquainted with the nature or cure of this difeafe, which I believe is called Nyctalopia by fome fystematic writers.

I gave those who were affected with it an emetic, which brought up a great deal of bile, and relieved the fymptoms both of the head and ftomach. This encouraged me to a repetition of it, which feemed alfo to be attended with benefit. I likewife applied blifters behind the ears, and gave bark and elixir of vitriol, with the antifcorbutic courfe, to those that required it.

I can form no probable conjecture concerning the caufe of this difeafe. I have obferved a dilation of the pupil in fcorbutic patients, and they complained of a cloud before their eyes, with imperfect vision, which difappeared as the fcurvy went off.

WILLIAM TELFORD.

To Dr. BLANE, Phyfician to the Fleet.

The

The main body of the fleet lay at Barbadoes till the 6th of June, and the men had recruited extremely by their flay there; for vegetables, fruit, and other refreshments, can be procured at an eafier rate, and in much greater plenty, at this island, than any other on the flation.

The fleet arrived at St. Lucia the next day after it failed from Barbadoes, and remained there till the 18th of June. The whole of this month was flowery at this ifland, though it is not accounted the common rainy feafon; for more rain falls here than at any of the other illands at that time in our poffeffion, being the most mountainous, as well as the most woody and uncultivated, of them all. Thefe rains produced fome increase of fickness, but very little, when compared to what took place at the fame time in the army on fhore, and in the fhips refitting at the Carenage. There died about this time from fifty to fifty five men every week in an army of not quite two thousand men.

The

The difference in point of health between the Carenage (which, as the word implies, is the place where fhips go to be hove down, or otherwife repaired) and Gros-Iflet Bay, where the main body of the fleet lay, affords a ftriking proof of the effects of fituation. The Carenage is a land-locked creek, with a marfh adjacent to it, whereas the other is a road open to the fine air of the fea, the only land fheltering it to windward being a fmall, dry ifland, confifting of one hill, of half a league in circumference, and fome of the cliffs of the main ifland of St. Lucia.

The increase of fickness here was farther prevented by the men having little labour to perform on fhore, nor any haunts to encourage intemperance, a vice which the Admiral endeavoured ftill more effectually to prevent, by ordering all the rum ftills in the neighbourhood to be deftroyed.

It may be proper here to introduce a general account of the feafons and temperature of the Weft Indies, as there will be frequent occasion hereafter to make allusions

to

to them. With regard to the heat, though the range of the temperature is very fmall, in comparison of what it is in Europe, the variations follow the fame feafons; for July and August are the hottest months, and December and January the cooleft. This we would naturally expect, as our plantations lie all in the northern hemisphere, between the 10th and 20th degree of N. latitude, and therefore bear the fame relation as Europe does to the fun's annual courfe. The hurricanes happen in the fame feafon in which the periodical rains chiefly fall, that is, in the months of August, September, and October, which are called the hurricane months, and this is also the most unhealthy feafon. The time of the year which is most apt to be rainy, next to this, is from the middle of May to the middle or end of June, but this is not invariable. The loweft I ever observed the thermometer was at 69°; it ftands very commonly at 72° at funrife, in the cool feafon, rifing to 78° or 79° in the middle of the day. In the hot feafon, the common range is from 76° to 83°. It feldom exceeds this in the fhade at fea; and the

the greateft height at which I ever obferved it in the fhade at land was 87°. This is far fhort of the extremes of heat which they experience at certain feafons on the continent of North America, even very far north. In Pennfylvania and New York, the thermometer, I have been affured, rifes frequently above 90°. It does fo commonly enough in the Eaft Indies ; but I believe it never was known to rife fo high in the Weft Indies, fo that the heat, comparatively fpeaking, may be called moderate and fteady.

The comparative mortality in June is fmall, owing to the fleet's having been cleared of all the bad cafes at Barbadoes before it failed from thence. Though the proportion of fick in July is lefs, that of the mortality is greater, (fee Table II.) which feems to be owing to this circumftance, that the cafes taken ill during the rainy weather of June did not terminate fatally till the fucceeding month.

In the courfe of this fummer the fleet was reinforced by feveral fhips of the line from

from England. The Triumph arrived in May, without any fick on board; but a flux prevailed a few weeks afterwards, without any evident caufe, except the influence of the climate, and the expofure and fatigues during the operations of May. The difeafe, however, foon fubfided, and the fhip being kept in excellent order and difcipline, continued healthy during all the remaining time in which fhe ferved with us.

In June, the Ruffel, of 74 guns, arrived from North America, and the Shrewfbury, a fhip of the fame rate, from England. The former left England in 1778, but was obliged to put back by ftrefs of weather and ficknefs, and upon arriving afterwards on the coaft of America, was extremely afflicted both with fevers and the fcurvy. Thefe were removed to the hospital, and this ship had become free of all fickness before failing for the West Indies, except that a few of the men were feized with fevers, and the remained healthy after arriving there, not fuffering from any regular attack of fickness, fuch as affected the ships in general from Europe.

Europe. The Shrewfbury left England healthy, but was foon attacked with a fever and flux, which continued to prevail till the end of the year.

The fever in these two ships refembled rather the low ship fever of Europe than the bilious one peculiar to the climate. This laft, indeed, feldom or never prevails to a great degree on board of a fhip, unlefs it has been caught on the watering duty, or from fome other exposure to the air of the land. I have, however, known a few instances of bilious fevers in men who never had been on fhore from the time they left England; I have even known men of the fame defcription attacked with intermittent fevers, which are fupposed to depend still more on land air. This is perhaps owing either to the quantity of water in a great thip, part of which is always more or lefs putrid, or to the fresh-cut wood of the country taken on board for fuel, the fteam of all which must refemble a good deal the effluvia of woods and marshes, which are supposed to give rife to intermittents.

In the beginning of July our fleet was reinforced with the Culloden, Egmont, and Centaur, all of 74 guns. In the end of the fame month we were joined by the Alcide and Torbay, of the fame rate, and alfo directly from England. The fleet was at this time at St. Chriftopher's, having arrived there on the 22d of the month, with a large convoy from England, which had joined it at St. Lucia, under protection of the Thunderer and Berwick, two fhips of the line, which being bound to Jamaica, I do not reckon as belonging to our fleet.

CHAP. II.

Account of the HEALTH of the FLEET from August, 1780, till December following. — The Fleet divided — The principal Squadron goes to North America — Fluctuation between Fevers and Fluxes — The Alcide and Torbay the most fickly Ships — Health mended by the Climate and Diet in North America — Hurricane in the West Indies — Sufferings in confequence of it — Fevers the chief Diseafe.

T HE hurricane months approaching, the feafon for active operations in the Weft Indies was now over. The whole force of the enemy, confifting of thirty-fix French and Spanish ships of the line, having gone to St. Domingo in the end of July, ten fail of the line were detached after them from our station, for the protection of Jamaica. The Admiral sailed for North America in August, with eleven sof the line, leaving fix for the protection of the islands.

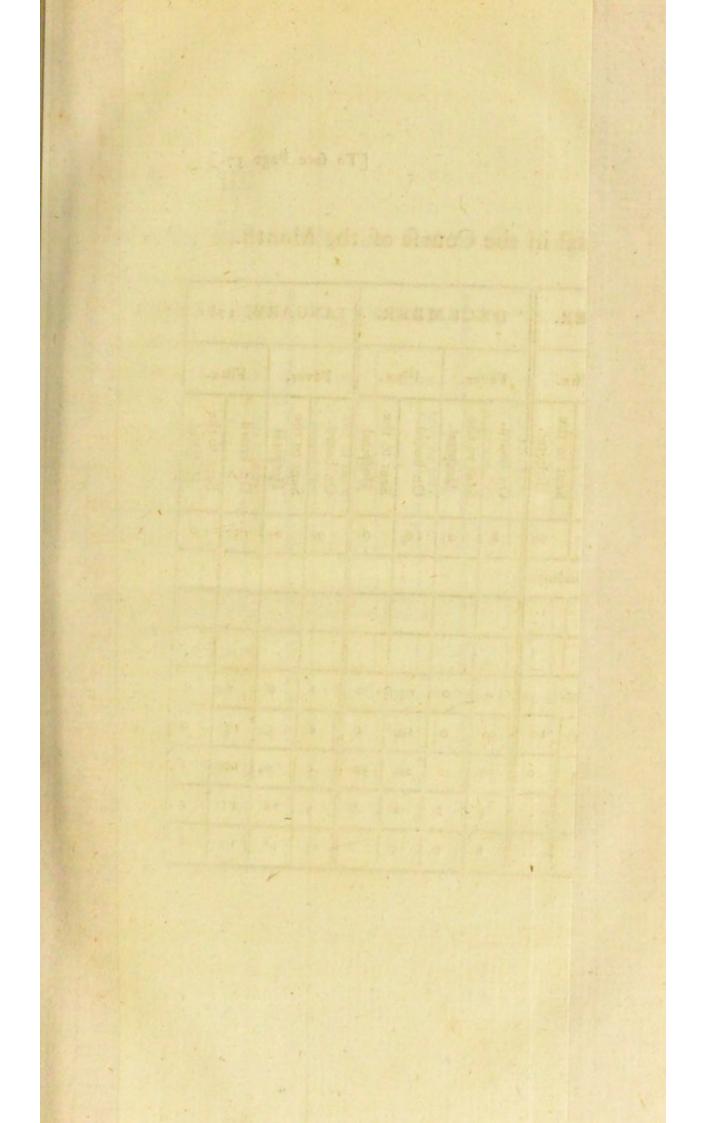

There was little alteration in the general ftate of the fick during the voyage to Ame-D 2 rica,

rica, and indeed we found no diminution of the West-India heat, which at this seafon is at the greatest height, until we came to the 33° of N. latitude.

The only material alteration in point of health was in the Alcide and Torbay, which had arrived from England with a few men ill of fevers; but in the courfe of this voyage thefe two fhips became as unhealthy as any that ever came under my observation. There was a greater number of fick on board of them than all the fleet befides, and it increased to fuch a degree, that upon their arrival at New York, which was in the middle of September, after a paffage of three weeks, near one half of their men were unfit for duty. In the Alcide it was a fever that raged; in the Torbay it was a dyfentery; and the unufual degree of fickness and mortality which appears in the Table for the month of September, was owing to the very fickly state of thefe two ships.

We shall hereafter see reason for supposing that fever and dysentery proceed from the fame

fame caufe; and as both thefe fhips arrived from England in a fimilar ftate with regard to health, fevers would probably have been the prevailing difeafe in both; but a part of the 87th regiment, then ferving as marines in the fleet, was put on board of the Torbay at St. Chriftopher's, and fome of them being ill of the dyfentery, gave this turn to the difeafe which afterwards prevailed on board. I have formed a Table to fhew the fluctuating ftate of thefe two difeafes, and this was one of my firft and moft imperfect attempts towards a medical hiftory of the fleet in a methodical way. (Table III.)

There was but little ficknefs in the reft of this fquadron, except in the Terrible, where the dyfentery prevailed a good deal. None of the fhips of the line which we found in the Weft Indies, upon our arrival there, were now in company, except the Yarmouth, and this was the moft healthy of all the fhips that went to North America.

The health of the fleet was very much recruited by its fhort flay in America; for the D 3 men

men were fupplied with fresh meat and spruce beer, and they enjoyed the two finest months of the year in that temperate climate. The squadron left New York in the middle of November, and though dispersed by a violent storm, all the ships arrived safe in the West Indies before the middle of December.

In October the fleet had attained fuch a degree of health, that though the calculation in the Table is made from five of the moft fickly fhips, no death happened in this month on board of any of them. In November the mortality was also inconfiderable, though the fhips left in the Weft Indies are included in the calculation; which, had it been made upon those only that went to North America, the deaths would have been no more than one in feven hundred and eleven in this month, which is rather lefs than that of any other month in the Table.

The amendment in health, in confequence of the change of climate, was most remarkable in the Terrible, which, by the time

time the left America, had entirely got rid of the violent dyfentery that had prevailed for fome time on board. This fudden change in the health of this thip was evidently owing to the great attention of the Captain to cleanlinefs and discipline, and no lefs to the affiduity and abilities of the Surgeon. The Alcide still continued fickly, though not fo much fo as the Torbay. The former had failed on a cruife in October, and having met with very rough weather, the fick lift was thereby increafed. The dyfentery now prevailed in that ship, as well as fevers, and those men chiefly were attacked with fevers who were ill of the fcurvy, or recovering from it. This was not very common ; and there were feveral other remarkable particulars with regard to the fevers in this ship; for her men were not only uncommonly fubject to this disease, both in America and the West Indies, but to all the various forms of it; the low, infectious, ship fever of Europe, the bilious remitting, and the malignant yellow fever of hot climates. It would appear from this, as well as other instances, that a ship may affume, as it were, a parti-D4 cular

cular conflictution, or a tendency to fome particular difeafe, for a length of time, and this depending on fome lurking and adhering infection, or the manner in which fhe may have been victualled, watered, difciplined, or manned.

The great benefit derived to the health of the fleet, from the change of climate, as well as other reasons, justified the Admiral in going to North America; and there was the more merit in this measure, as it was undertaken without precedent, and without instruction. Upon our return we found there was great good fortune in it, as well as wildom; for there had happened on the 10th of October a more violent hurricane than any in the memory of man, and the ravage it made both by fea and land is, perhaps, unparallelled in hiftory. Several of the fhips of the line were exposed to it; but though they fuffered extremely, and were in the utmost danger, none were lost. Two of them happened to be at Antigua, which was out of the track of this hurricane, as it extended only from the 12th to the 15th degree

degree of N. latitude; fo that the only iflands that fuffered by it were Barbadoes, St. Lucia, St. Vincent, and Martinico. — Four frigates, and as many floops of war, either foundered or were wrecked, and about one thoufand feamen perifhed in them. One of the buildings of the hofpital at Barbadoes was entirely demolifhed by the impetuofity of the fea, which, having rifen to a great height, dafhed a fhip againft it, and twentythree feamen were buried in the ruins *.

The

* Although this hurricane, in itfelf and its confequences, was fo deftructive to the lives and health of men, yet, with regard to the inhabitants on fhore, it had a furprifing and unexpected effect in mending their health. I wrote an account of this hurricane to the late Dr. Hunter, who communicated it to the Royal Society, and the following paffage is extracted from it :

"The confequences of this general tumult of nature, "on the health of man, was none of the leaft curious of "its effects. I made much inquiry on this head, not "only of the medical gentlemen who had the charge of "holpitals, and of the phylicians of the country, but of "the inhabitants, and every one had fome cure to relate "either of themfelves or their neighbours, in a variety of "difeafes. Nor could I find that either those who were "in

The Montague fuffered moft on this occafion, and was also most fubject to fickness and mortality, brought on in confequence of the great fatigue and hardships of the men in bringing her into port and refitting her; for the ship was almost torn to pieces both in the rigging and hull, and the bedding and other necessaries and conveniencies were entirely destroyed. The fever that prevailed on board at this time was of the most malignant kind known in this climate; and

" in health, or those who were ill of any difease what-" ever, fuffered from it, otherwife than by its mechanical " violence; but, on the contrary, that there was a general " amendment of health. This is a fact, which I could " neither credit, nor would venture to relate, were it not " fupported by fo many concurring teftimonies. It had " a vifible good effect on the acute difeafes of the climate. " The chronic fluxes, of which there were then fome at " the naval hospital, were cured or much relieved by it. "But the difeafes upon which it had most evident and " fenfible effects, were pulmonic confumptions. Some " recent cafes of phthifis, and even the acute state of " pleurify, was cured by it; and in the advanced and in-" curable ftate of it, the hectic fever was removed, and « remarkable temporary relief afforded. A delicate lady " of my acquaintance, who was ill of a pleurify at the " time,

and the worft cafes arole in watering, and the other neceffary duties on those, from which the men would fometimes return frantic, and die in a few hours. There was a party of foldiers on board; and as they were not called upon to perform any duties

⁴⁴ time, and paffed more than ten hours in the open air, ⁴⁴ fitting generally feveral inches deep in water, found ⁴⁴ herfelf free of complaint next day; had no return of it; ⁴⁴ and when I faw her a few weeks after, was in much ⁴⁴ better health and looks then ufual. The people ob-⁴⁵ ferved that they had remarkably keen appetites for ⁴⁶ fome time after, and the furviving part of them became ⁴⁷ uncommonly healthy; fome of both fexes, whom I ⁴⁶ had left fallow and thin a few months before, looking ⁴⁷ now frefh and plump.

"It is very difficult to account for this, as well as every thing elfe in the animal œconomy; but it was probably owing in part, at leaft, to the very great coldnefs and purity of the air from the upper regions of the atmofphere. Great agitation of mind fometimes alfo produces a revolution in health; and we know that the effect of external imprefions in general is very different when the mind is vacant, from what it is when occupied and interefted by objects, whether of pleafure and fatiffaction, or of danger and fuffering." 44 DISEASES OF THE FLEET, 1780. PART I. on fhore, they had but little ficknefs in comparifon of the failors.

The other fhips having fuffered lefs from the ftorm, were also lefs fickly, as it was not neceffary for them to remain fo long in the unhealthy Carenage to repair.

The only difease that prevailed at this time, in these two ships, was fevers; there being few or no fluxes, though they had been fo frequent in the former part of the year. Though fevers and fluxes depend on the fame general causes, yet when these caufes exift in a higher degree, it would appear that they are more apt to produce fevers. Thus the exhalations of the earth from marshes are more apt to produce fevers; and mere exceffes of heat and cold; or moisture, are more apt to produce fluxes; just as in Europe a catarrh, which may be confidered as a local febrile affection, as well as a dyfentery, will be excited by exposure to cold or damp, without any specific bad quality in the air.

The Ajax and Montague are the only two fhips of those left in the West Indies, which are included in the estimate of fickness and mortality in November and December, and they bear a very great proportion to the whole; for out of forty-four that died in fourteen ships of the line in November, twenty died in the Montague, and five in the Ajax; and out of forty-three, the whole number of deaths in December in twentyone ships of the line, ten were of the Montague, and eleven of the Ajax.

CHAP. III.

Account of the HEALTH of the FLEET from January, 1781, till July, 1781, both Months included. Arrival of feven Ships of the Line from England – Increafe of Sicknefs in confequence of a Defcent on St. Vincent's — Long Cruife to windward of Martinico — Great Prevalence of Scurvy — Difference of Health in different Ships — New Ships not more unhealthy than others — Why Frigates are more healthy than Ships of the Line — Remarkable Cure of Scurvy in two Ships — Effence of Malt — Vegetables moft antifcorbutic in their natural State — Advantage of fupplying Refreshments on board of Ships in preference to Hofpitals.

W E are now come to that period in which our fleet was reinforced with feven fhips of the line, which arrived at Barbadoes from England on the 5th of January, 1781, under the command of Lord Hood. This addition, with two which had arrived in November, made the force upon this flation again amount to twenty-one fhips of the line.

The whole fleet was tolerably healthy during this month, the feafon being dry and cool; there was, however, a fmall increase of fickness at this time, and it was owing to a defcent made on St. Vincent's in December. The foldiers, (of whom there was ftill a regiment on board of the fleet) the marines, and fome of the feamen, had been on fhore for one night only; but many of them having lain on the ground, fome having been intoxicated, or having eaten to excess of fugar-cane and fruit, caught fevers and fluxes, which increased the proportion of difeases and deaths the following months, as appears by the Table.

I have exhibited, in another Table, a view of the fickness and mortality of this fleet for the five fucceeding months. (Table IV.) This account, as well as most of those that are to follow, is confined to three difeases, that may be called the sea epidemics. These are, fever, flux, and scurvy.

The whole fleet met at Barbadoes on the 13th of January, and no fervice was undertaken.

taken till the accounts of the Dutch war arrived on the 30th of that month. In confequence of this intelligence, the greater part of the ships of war went against St. Eustatius, which was taken on the 3d of February.

Ten days after this a fquadron of feventeen fhips of the line was fent to cruife to windward of Martinico, with a view to intercept a French fquadron which was then faid to be on its paffage from Europe. The cruife was there continued for fix weeks; after which finall divifions of the fhips were fent to water and refit, by turns, at St. Lucia, and were relieved by the fhips left for the protection of that ifland.

Soon after this, the whole fquadron came to leeward of Martinico; and though the former intelligence had proved falfe, the greater part of our fleet still kept the fea, in order to block up the enemy in Fort-Royal Bay. This they continued to do till the 29th of April, when a French fleet of twenty-two ships of the line, from Europe, joined

joined by four from Martinico, forced their way into their own port, pushing to leeward our fleet, confisting only of eighteen ships of the line; fo that the greater part of them did not get into port till they came to an anchor at Barbadoes on the 23d of May.

It was in this feafon of cruifing, and keeping the fea, that the fleet contracted fuch a degree of fcurvy as had never before been known in the Weft Indies. This difeafe is not fo apt to arife in a hot climate as in a cold one; and the prevalence of it on this occafion was owing to the men having been for a great length of time upon fea victualling; for one part of the fleet had not had a fresh meal from the time of leaving America, that is, for fix months; and that part of it which came laft from England had been in the fame circumstances for feven months; nor had any of them been in a place capable of fupplying vegetable refreshments from the time they left Barbadoes in the end of January. But though no fresh meat or vegetables could be procured at St. Lucia or St. Eustatius, yet the fcurvy did E not

not make fuch progrefs in the fhips that lay at anchor there, as in those that were at fea; and it appears that the time in which it prevailed most was, while the greatest number of fhips was at fea, that is, in the month of March. It appears, indeed, by the Table, that there was a greater number ill of this complaint on the 1ft of May than on the 1ft of April; but it appears alfo, that more were fent to the hospital in March than in April, and very near half of the May lift muft have been taken ill in March *. The difference of being in port and at fea confifts chiefly, 1st, In there being plenty of water while in port, fo that it can be used freely, not only to drink, but to wash the clothes; and we know that cleanlinefs tends greatly to ward off the fcurvy. 2dly, Though no fresh meat nor vegetables could be procured at those ports, sugar, which may be confidered as a very antifcorbutic article of diet,

* In order to afcertain more exactly the degree of ficknefs in each month, a column was afterwards added to the form of the returns, expressing the number taken ill of the feveral difeases in the course of the month.

could

DISEASES OF THE FLEET, 1781. 51 BOOK I.

could always be procured at a very cheap rate, and the feamen, when in port, ufed to exchange their falt provisions for it. 3dly, There is at fea a difmal uniformity of life, favourable to indolence and fadnefs, and therefore tending to haften the progrefs and aggravate the fymptoms of the fcurvy; whereas the change of scene and variety of objects, when in port, tend to cheer and recreate the mind, and thereby to avert this difeafe.

The fquadron that came from England under Lord Hood, suffered, upon the whole, much lefs from acute difeafes, during the first months of their fervice in this climate, than the ships that arrived with Lord Rodney, which was probably owing, in part at leaft, to the former having arrived at the drieft and cooleft feason of the year. The Barfleur, however, had a large proportion of all the three prevailing difeafes; and large fhips are in general more fubject to them than those of a smaller rate. But of all the fhips in the fleet, the Alfred had the greatest proportion of the three fea epidemics. The Prince E 2

Prince William fuffered more than any other fhip in the fleet from the flux, and the Princeffa from the fcurvy. In fome inftances, reafons can be affigned for the prevalence of particular difeafes in particular fhips, fuch as accidental infection, or the manner in which they have been victualled, manned, or difciplined; but in many cafes the caufe is fo fubtile or obfcure as to elude our inquiry.

The moft healthy of the new fquadron, during this campaign, were the Belliqueux and Panther; the former was a new fhip, and came from England with a very irregular and ill-difciplined crew. Soon after arriving in the climate, fhe was threatened with a dyfentery, which, though it fpread a good deal, did not prove fevere nor mortal; but being left at St. Euftatius on this account, while the reft of the fleet was cruifing, fhe foon became very healthy, and remained fo. This is the fecond inftance we have had occafion to remark of a new fhip being healthy.

5. 11

The The

The Panther preferved her health by being on finall feparate cruifes, and frequently in port, not being attached to the main fquadron. The Sandwich was the only other fhip not engaged in the long cruife.

Of the ships lately from England, that were employed in this cruife, the Gibraltar feems to have been the leaft fickly. This ship left England healthy; but having received a draft of dirty men when upon the eve of failing, a fever of the infectious kind broke out on the paffage, fo that fhe arrived in the West Indies in a fickly state. This fever disappeared very foon after; and it is proved by this, as well as other facts, that a warm climate, fo far from tending to generate, or even to foster the infection of fever, tends rather to extinguish it. The Gibraltar had been put under excellent difcipline by her former commander, while in the Channel fervice; and this being afterwards kept up, the men were always clean and regular. This was the Spanish Admiral's ship, taken by the fleet under the command E 3

command of Lord Rodney off Cape St. Vincent's, in January 1780. She was then called the Phœnix, and was of a fingular excellence both with refpect to materials and conftruction. Whether the cedar, of which a great part of her timbers confifted, contributed to the healthinefs, by its balfamic effluvia, I will not pretend to determine.

The Invincible was also uncommonly healthy during this cruife, which may likewife be afcribed to good discipline, and to her having been more than three years in commission before failing from England, whereby the men were brought into order, and accustomed to each other and to a sea life. This ship was almost singular in having no acute diseases for several months after arriving from Europe; but at length paid the tribute to the climate in May and June, as may be seen in the Table.

From the account of the three frigates at the bottom of the lift in the Table, it appears how much more healthy they are than fhips of the line. The total complements

ments of the three is exactly equal to that of one feventy-four-gun fhip; but their whole ficknefs and mortality is lefs than that of any one fhip of the line of that clafs, although the Triton was uncommonly fickly for a frigate.

There feem to be feveral causes for the fuperior degree of health ufually enjoyed by this fmaller class of ships. There is less chance of mixtures of men in frigates, as their complement is fmaller, and it is more eafy for the captain and officers to keep an eye over a few men than a great number; for, in a great fhip, there are generally men, who, concealing themfelves in the most retired parts, no one takes cognizance of them, and they deftroy themfelves, and infect others, by their laziness and filth. In the next place, there is a greater proportion of volunteers and real feamen in frigates, and more landmen and preffed men in thips of the line, the former being more in requeft, on account of the greater chance of prize money. Laftly, a small ship is more eafily ventilated, and the mass of foul

E 4

air

56 DISEASES OF THE FLEET, 1781. PART I.

air iffuing from the hold, from the victuals, water, and other ftores, as well as the effluvia exhaling from the men's bodies, is lefs than in a large fhip.

Many other and more minute remarks might be made on different ships in this feason of hard fervice; but to do this would be tedious, and the infpection of the Tables may fuggeft obfervations to the reader, There is a firiking and inftructive fact, however, with regard to two ships, which I cannot help relating. The Alcide and Invincible, both of feventy-four guns, in working to windward, after the action with the French fleet, on the 29th of April, anchored at Montferrat on the 11th of May, in order to water. They remained there only part of two days, and they procured no refreshment, except a few bushels of limes. The fcurvy then prevailed to a great degree in both fhips; but between this time and the 23d of May, when they came to an anchor at Barbadoes, fixty men, who had been confined with this difeafe, were difcharged, as fit for duty, from the fick lift of the

BOOK I. DISEASES OF THE FLEET, 1781. 57

the Invincible, and a hundred and fourteen from that of the Alcide. Thefe were the only two fhips that had the advantage of the limes; and during thefe twelve remaining days of the voyage the fcurvy continued to increafe in all the other fhips. Dr. Lind is the firft author who gives a decided preference to lemons, limes, and oranges, over every other antifcorbutic; and the above-mentioned fact proves as demonstrably as possible the infinite advantage of this species of acid in fcurvy.

The fleet was fupplied with effence of malt during all this campaign; and though it was, no doubt, of fervice, it was far from having that powerful and manifeft effect that the acid fruits had, and certainly did by no means prevent the fcurvy in all cafes. I have ftrong teftimonies, however, of its beneficial effects from the furgeons of feveral of the fhips, particularly of the Gibraltar, Centaur, Torbay, and Alcide, in all of which it was found either to cure the fcurvy in its first beginning, to retard its progrefs, or to mend

58 DISEASES OF THE FLEET, 1781. PART I.

mend the appearance of fcorbutic ulcers, and difpofe them to heal.

I had conceived that melaffes, being a vegetable fweet, muft have been a very powerful antifcorbutic; but the greateft part of the laft reinforcement of feven fhips came from England furnifhed with this as an article of victualling, as a fubfitute for a certain proportion of oatmeal, which was withheld agreeably to a late very judicious order of the Admiralty. But though I am perfuaded that this article of diet mitigated the difeafe, it was very far from preventing it; and the Princeffa in particular, which fuffered moft from the fcurvy, was well fupplied with it.

There is reafon to think that it is not in the vegetable fiveet alone that the antifcorbutic principle refides, but in this in conjunction with the natural mucilage, fuch as exifts in the malt. I fufpect likewife that the change which the effence undergoes in its preparation tends also to rob it of some of its original virtue. But the melaffes are ftill

BOOK I. DISEASES OF THE FLEET, 1781. 59

still farther altered by being deprived of the natural mucilage by means of quick lime, with which all fugar is clarified in the boilers. Dr. Hendy, of Barbadoes, to whom I have been obliged for feveral remarks, informed me, that the liquor, before it undergoes this operation, has been found by him to produce the most falutary effects in the fcurvy; but as this cannot be had at fea, we had no opportunity of comparing it with other antifcorbutics. It is certain alfo that the medical effects of the native fweet juices are, in other respects, very different from what they are in their refined state; for manna, wort, and the native juice of the fugar cane, are purgative; whereas fugar itself is not at all fo*. This affords a prefumption, that they may be also different in their antifcorbutic quality; and there is reafon to think, from experience,

* I was informed by Captain Caldwell, that when he commanded the Hannibal, of 50 guns, his crew was fo much afflicted with the fcurvy, in a paffage of nine weeks from St. Helena to Crookhaven, in Ireland, that ninety-two men were confined to their hammocks in the laft ftage of that difeafe, though they had been fupplied with fugar at St. Helena, and ferved with it on the paffage.

60 DISEASES OF THE FLEET, 1781. PART I.

experience, that the more natural the ftate in which any vegetable is, the greater is its antifcorbutic quality. Vegetables, in the form of fallads, are more powerful than when prepared by fire; and I know, for certain, that the rob of lemons and oranges is not to be compared to the frefh fruit. Raw potatoes have been ufed with advantage in the fleet, particularly by Mr. Smith, of the Triton, who made the fcorbutic men eat them, fliced with vinegar, with great benefit. This accords alfo with what Dr. Mertans, of Vienna, has lately communicated to the Royal Society of London.

When the fleet arrived at Barbadoes on the 23d of May, it was found that the number of fick on board amounted to fixteen hundred, and that there was not accommodation for more than two hundred at the hofpital. As

fage. They remained three weeks at Crookhaven; at the end of which time every man was fit for duty: and though they had frefh provision, they had no frefh vegetables, fo that their cure is to be afcribed to the ufe of lemons and oranges, which the Captain very humanely ordered to be purchafed for them from on board of a foreign fhip that happened to put into the fame harbour. there

BOOK I. DISEASES OF THE FLEET, 1781. 61

there was hardly any complaint but fcurvy, the Admiral, at my reprefentation, iffued an order for ferving the fick on board of their own fhips with fruit and other vegetables and refrefhments, fuch as milk and foft bread. This courfe of diet commenced in the beginning of June; and as the greater part of the fleet was near four weeks thereafter in port, they enjoyed the advantages of it during that time; and the very great diminution of ficknefs and mortality, which appears by the Tables in that month, fufficiently evinces the benefit derived from it. In lefs than four weeks the fleet, from being very fickly, became extremely healthy.

It was remarked, that the men recovered fafter on board than on fhore; and it would appear that land air, merely as fuch, has no fhare in the cure of the fcurvy, and that the benefit arifes from the concomitant diet, cleanlinefs, and recreation. The expedient of curing men on board of their fhips was here fuggefted by neceffity; but it fucceeded fo well, that it was adopted afterwards in preference to an hofpital, which is indeed a uleful

62 DISEASES OF THE FLEET, 1781. PART 1.

useful relief to a fleet where there are contagious, acute diforders; but with regard to fcurvy, I am convinced, that on foreign ftations, at least, where the accommodations of the fick are more indifferent than in England, many advantages would arife from fupplying men with refreshments on board of their fhips. It appears that only four men died of this difease in the whole fleet in the month of June, though there were fo many ill of it; whereas it appears by the books of hofpitals, that fcorbutic men die there in a much greater proportion, and chiefly in confequence of other difeases, particularly the flux, which they catch by infection, or bring on by intemperance. It is farther in favour of this scheme, that great numbers of those fent on fhore are loft by defertion. It is alfo a great faving to Government, the expence not being a fourth part of what it would coft at an hospital.

The fleet left Barbadoes on the 10th and 12th of July, and continued healthy till the greater part of it failed for North America in the beginning of August.

PART

[63]

PART I.

BOOK II.

Continuation of the MEDICAL HISTORY of the FLEET, from August, 1781, till the Conclusion of the War in April, 1783.

CHAP. I.

Some Account of the Interval between the Campaign of 1781 and the Junction of the Reinforcement from England in April, 1782. — The main Body of the Fleet goes to North America — Lord Rodney goes to England, and returns to the Weft Indies with twelve Ships of the Line — Health of the Fleet in England — Sicknefs moft prevalent in the Beginning of a War — A natural Tendency to Recovery in Ships and Individuals — Advantages of this Squadron in point of Victualling.

WHEN the main body of the fleet went to America in August, Lord Rodney went to England for the recovery of his health. — Wishing 64 DISEASES OF THE FLEET, 1781. PART I.

Withing to lay before the public boards feveral reforms that fuggefted themfelves to me in the courfe of the late fervice, I accompanied the Admiral, purposing to return when the feason for hostile operations should have brought back the fleet from the coast of America.

Soon after arriving in England, I prefented a memorial * to the Board of Admiralty, proposing fuch means for the prefervation of the health of the fleet as had occurred to me during my past fervice.

The Board of Admiralty confidered this memorial with all the attention that could be expected in the general hurry of fervice, infeparable from a great and extensive war; and I am happy in being able to fay, that, in confequence of my application, most of the particulars recommended have fince been fo far carried into effect as to produce a practical conviction of their utility.

* See Appendix to Part II.

Lord

BOOK II. DISEASES OF THE FLEET, 1781. 65

Lord Rodney having recovered his health, hurried out to his flation with all the force that could then be equipped, as the enemy were expected at the Caribbee Iflands, with a fuperior force, after their fucceffes against us in the autumn campaign in America.

I had again the honour to accompany the Admiral. He first failed from Portsmouth, with four ships of the line, on the 14th of December, and was to have been joined by two more that lay ready at Plymouth; but by the time we arrived off this harbour the wind became contrary, whereby we were detained there till the 14th of January, 1782. During this time more ships were got ready, and fix were added to the squadron; for the public anxiety at that time called forth every exertion to strengthen this reinforcement, upon which the state of the whole West Indies was supposed to depend.

This fleet cleared the Channel in the midft of a florm, and with the wind at the fame time fo fcanty, that we barely weathered Ufhant; but Lord Rodney's perfeverance F and

66 DISEASES OF THE FLEET, 1781. PART 1.

and refolution, ftimulated by the exigency of the occafion, banifhed all hefitation and timidity. The rough weather, and contrary winds, continued through the variable latitudes; but having met with fresh blowing trade winds, common at that feason, we had the good fortune to get fase to Barbadoes with the whole squadron on the 19th of February.

All the twelve fhips * of this reinforcement had been on fervice for a confiderable length of time fince they had been laft commiffioned, except the Anfon, a new fhip, which had never before been at fea, and the Fame and Yarmouth, which had lately undergone a thorough repair, fince which time they had been only for a few weeks at fea in the Channel before they were ordered on this expedition.

The only fhip that was fickly when we left England was the Fame, on board of

* They were the Formidable and Namur, of 90 guns; the Arrogant, Conqueror, Marlborough, Hercules, and Fame, of 74 guns; the Yarmouth, Repulfe, Prothée, Anfon, and Nonfuch, of 64 guns.

which

BOOK II. DISEASES OF THE FLEET, 1781. 67

which fome preffed men, with the infection about them, had been received from the Conqueftadore guardfhip; and the fever which broke out in Plymouth Sound, where I was firft fent for to vifit that fhip, was probably owing to the infection which thefe men brought with them. The other fhips were, upon the whole, healthy; for it appeared by the weekly accounts delivered to the Admiral, that the mortality, including even that of the Fame, for the four weeks before we failed, had been only one in thirteen hundred, and that there had been about one in twenty-nine on the fick lift.

An opportunity offered on this occasion of comparing the health of ships of war in England with that in the West Indies. The health of the fleet in general at home was at this time about the proportion above mentioned; but it is to be remarked, that it was healthier then than in the former part of the war.

Plymouth hospital, which is calculated for twelve hundred men, was not half full; F 2 and

68 DISEASES OF THE FLEET, 1781. PART 1.

and there were not at this time more than fix hundred men at that of Haflar, which is calculated to contain two thousand; but the latter was generally full during the first two or three years of the war, from the great fleets that put into Portfmouth. At one time part of the fick were even obliged to be accommodated with tents in the neighbourhood of the hospital, for want of room. But towards the end of the year 1781 the infectious fever, which conftitutes a great part of the fickness in the European feas, was almost extirpated, and in a cruise of five weeks in the north part of the Bay of Bifcay, under Admiral Darby, in September and October of this year, only fix men were buried in that time from twenty-eight fhips of the line.

This was chiefly owing, as I apprehend, to the length of time which the war had continued, in confequence of which the men of the refpective fhip's companies had been accuftomed to each other, and habituated to the mode of life peculiar to a man of war, regulating themfelves according to certain

BOOK 11. DISEASES OF THE FLEET, 1781. 69

certain rules of good order and cleanlinefs. The causes of the fever above mentioned, as shall be more fully illustrated hereafter, are chiefly connected with the circumftances occurring in the beginning of a war, when men of all descriptions are mixed, without proper precautions being taken to guard against the infection imported from jails or guardships. The fickness in the French fleet was still greater in the beginning of the war than in the British; and this has been the cafe in all the wars of this century: In the fleet commanded by the Comte d'Orvilliers, in 1779, the fickness was fo great as to difable many of the ships from fervice, and great numbers of men were landed at Breft, with a fever fo malignant as to infect the inhabitants of the town and country adjacent. I believe, befides, that the general health prevailing at this time in the fleet in England, was, in part, owing to the four crout and melaffes, which were now fupplied more amply than had ever been done before. The entire exemption from fcurvy in particular is to be ascribed to these improvements in diet.

F 3

There

70 DISEASES OF THE FLEET, 1781. PART 1.

There is a tendency in acute difeafes to wear themfelves out, both in individuals that labour under them, and when the infection is introduced into a community. Unless there was such a vis medicatrix, there could be no end to the fatality of these distempers; for the infectious matter would go on multiplying itself without end, and would neceffarily deftroy every perfon who might be actually attacked, and would infect every perfon who might be exposed to it. But animal nature is fo conftituted, that this poifon, after exciting a certain fet of motions in the body, loses its effect, and recovery takes place; and those who happen not to be infected at first, become in some measure callous to its impression, by being habitually exposed to it. There is, therefore, a natural proneness to recovery, as well with regard to that indifposition which takes place among a fet of men living together, as with regard to a fingle individual who actually labours under the difeafe! Thus the most prevailing period of ficknefs is when men are new to their fituation and

te

BOOK II. DISEASES OF THE FLEET, 1782. 71 to each other, fo that time of itfelf may prove the means of prevention as well as of cure.

This confideration, however, ought not to fuperfede any part of our attention with regard to the fcurvy, which does not become fpontaneoufly extinct like acute difeafes.

During the three first weeks of this paffage from England to the West Indies, there was wet and boisterous weather, but it had very little effect in augmenting fickness; and though it not only fubjected the men to fatigue, cold, and damp, but prevented the still the 2d of February, but prevented the still the 2d of February, between the 31st and 32d degree of latitude, thereby producing close air and moisture where the men fleep, yet, in the whole squadron, from its leaving England till this time, there were only feven deaths, four of which were in the Fame.

The only fea epimedic that made its appearance was the infectious fhip fever, F 4 which,

72 DISEASES OF THE FLEET, 1782. PART 1.

which, in many cafes, was attended with pleuritic, rheumatic, and other inflammatory fymptoms, owing to the cold and wet, to which the men were exposed in the variable latitudes. The warm, dry, fresh breezes which we had during the remainder of the paffage, were probably what prevented any bad confequences from the former hardfhips, for there died only four men from the abovementioned date till we arrived at Barbadoes; and it appeared by the Admiral's weekly account, that the proportion of the fick neither increased nor diminished from the time we got into a warm climate and fine weather till our arrival on the 19th of February.

This fquadron left England with feveral advantages in point of victualling, which no fhips had before enjoyed. They were amply fupplied with four crout and melaffes; they had all more or lefs wine, of an excellent quality; and the Formidable had an entire fupply of it, in place of fpirits, of which none was put on board. This fhip had hitherto,

BOOK II. DISEASES OF THE FLEET, 1782. 73

therto, and did for fome months afterwards, enjoy an extraordinary, perhaps an unparallelled, degree of health. What farther contributed to the health of this fhip was, that fhe had been long in commission, and most of the recruits with which the crew had been completed were men turned over from other fhips. There was also extraordinary medical attention paid, particulary in watching the first beginnings of complaints.

Upon the arrival of the fquadron at Barbadoes, it was found, that, the two hoftile fleets having returned from North America in the beginning of December, the campaign had opened with the fiege of St. Chriftopher's, which had been invefted by twenty-eight fhips of the line, and a confiderable army. Our fleet, under Lord Hood, having attempted, with great enterprife and fkill, but without fuccefs, to relieve it, Lord Rodney made hafte to join them with the reinforcement he had brought from England. He remained at anchor at Barbadoes

74 DISEASES OF THE FLEET, 1782. PART I.

badoes only one night, and in a few days came off Antigua, where he was informed of the furrender of St. Christopher's; and here, on the 25th of February, he was joined by the reft of the fleet in their return to windward.

CHAP. II.

THE fleet which was found in the Weft Indies confifted of all the fixteen that went from thence to America in August, 1781, (except the Terrible, which had been lost) together with fix ships of the line* from the

* These were the Prince George, of 90; the Bedford, Canada, and Royal Oak, of 74; the America and Prudent, of 64 guns.

American

76 DISEASES OF THE FLEET, 1782. PART I.

American flation, the St. Albans, which arrived from England in November, and the Ruffel, which had remained in the Weft Indies during the hurricane months. They were all extremely healthy, having only one man in twenty-eight on the fick lift, and very few had been fent to hofpitals.

Haith of the Mane In

This fleet, after arriving from America, had lain at anchor for three weeks at Barbadoes, where it had the advantage of the vegetable refreshments which that island affords; but during three weeks that it lay at anchor, in the face of the enemy, at St. Chriftopher's, the men were excluded from all communication with the shore, and had no vegetable food, except fome yams, with which they were fupplied from Antigua, in place of bifcuit, of which there was at this time a fearcity. These ships had therefore been in no port for fix weeks, except for a few days that they lay in the road of Antigua refitting, and putting the fick and wounded on fhore.

The

BOOK II. DISEASES OF THE FLEET, 1782. 77

The men had also been deprived of their natural reft, and exposed to the air during all the time that the fleet was at anchor before St. Chriftopher's; for they had been twice attacked by the enemy in that fituation, and were therefore under the neceffity of keeping the fhips conftantly clear for action; yet no increase of fickness followed. This might partly be owing to the eagerness and alacrity of fpirits naturally excited in fuch a fituation, and alfo to the fleet not lying under the lee of any land, and having fprings upon their cables, fo that they had all the perflation and all the purity of air which ships enjoy when at sea. The fumigation which ships undergo in battle, has alfo been thought to contribute to their health.

To whatever caufe it was owing, the fleet we found in the Weft Indies was at this time healthier than that which had juft come from England; and there was but little difference in the degree of health of the different fhips that compofed it. Of those which left the Weft Indies in August, and returned in December, the only one that could be faid

78 DISEASES OF THE FLEET, 1782. PART I.

faid to have any epidemic difeafe was the Prince William, which had never got entirely free from the dyfentery that was formerly mentioned as prevailing fo much on board of this fhip laft year. The difeafe was kept up, by the fhip never having been cleared of the men affected with it, and by the crew in general being ill provided with flops *, a circumftance that would render them more fufceptible of whatever infection they might be expofed to.

There were also fome remains of the fame difeafe in the Intrepid, the feeds of it having been more or lefs continued from the fummer of 1780, at which time it prevailed to a most violent degree. The Alfred had a few of all the fea epidemics, and had been for a long time before more or lefs in the fame fituation, from a neglect of cleanlinefs, particularly of the men's perfons.

The only ship in which there was any thing like an epidemic was the Canada.

* This is a term in use for the different articles of feamen's cloathing, particularly shirts and trowsfers.

This

BOOK II. DISEASES OF THE FLEET, 1782. 79

This ship, when at home, had for many months before the failed been in unremitting fervice, and very little in port. On the paffage from England to America, in August, 1781, there broke out a severe dysentery, to which the fcorbutic habit of the men, from being fo long at fea, probably pre-difposed them. Though it had abated much in February, 1782, it was then by no means extinct, and continued till April. The Prince George had been in commission all the war, and was a model of discipline and cleanlinefs, and confequently of health. This continued till the paffage from America, when, upon the first cold weather after leaving New York, there broke out a violent dyfentery, of which fixteen men died. This is agreeable to what Dr. Lind observes, that the flux may be brought on by a fudden transition, either from cold to heat, or from heat to cold. All the men that were ill of this difease having been fent to the hospital at Barbadoes, and the usual attention to cleanlinefs having been kept up, the difcafe entirely vanished.

SO DISEASES OF THE FLEET, 1782. FART I.

All the other fhips of the American flation had been more or lefs vifited with ficknefs after they left England, except the Bedford. This was probably owing to this fhip having been longer in commission than any of the others, that is, for four years, and all that time under the fame commander. This laft circumftance falls to the lot of few fhips; but a great advantage attends it; for the mutual knowledge and attachment of the captain and fhip's company is naturally productive of regularity and good difcipline, and thereby of health.

The Royal Oak, Prudent, and America, which left England with the Bedford, though they had been afflicted with the fcurvy and other complaints foon after arriving in America, had been quite healthy for fome time before coming to the Weft Indies, and were fo much fo at this period, that, though there were a few fores and flight complaints on their fick lifts, there was not a man confined with illnefs, fo as properly to be called fick. The Royal Oak, having been the flag fhip of Admiral Arbuthnot,

BOOK II. DISEASES OF THE FLEET, 1782. 81

buthnot, was manned with choice feamen, which is a circumftance generally conducive to health; for these being accustomed to a sea life, are more provident, more handy and methodical in all that relates to diet; cloathing, and cleanlinefs. The fcurvy, which infefted her upon first arriving in America, was fuccefsfully treated on board by ferving to those who were ill of it a mefs, composed of foft bread, baked on purpofe, and mixed with wine and effence of malt.

The Prudent, though now quite healthy, had been fickly foon after being put into commission in Europe, and upon first arriving in America. She had been uncommonly fickly, when a new fhip, upon her first voyage, which was to the East Indies, during the peace. This remarkable degree of fickness was probably owing to a particular experiment that was made in preparing the wood of which fhe was built. This experiment confifted in foaking the timber for a length of time in a ftrong pickle, in order to make it lefs corruptible. The only other G

82 DISEASES OF THE FLEET, 1782. FART D.

other fhip on which the trial of this was made was the Intrepid; and it has been already mentioned that this was an extremely fickly fhip. The effect of it upon the wood was to caufe a conftant moifture and mouldinefs in the orlops and holds. In the Intrepid, the ficknefs was never conquered till a practice was followed of pumping and bailing her with great care, and putting a fire into the well for fix hours every day, by which means the dampnefs, and the mildew produced by it, were removed and prevented, and the fhip thereby rendered healthy.

The two fquadrons being united, and confifting of thirty-four ships of the line, proceeded to St. Lucia, where they arrived on the 1st of March.

I received monthly returns as formerly, and the form of them was improved by adding a column for the numbers taken ill of the feveral difeafes in the courfe of the month. The returns of February are not complete, there being none for the 1ft of that

BOOK II. DISEASES OF THE FLEET, 1782. 83

that month, as we had not then arrived; but as the returns of the 1ft of March have relation to the preceding month, a judgement may be formed of the fickness and mortality of February from the following table:

EXTRACT from the RETURNS of the ift of March, 1782.

DISEASES.	Put on the Sick Lift laft Month.	Died laft Month.	Sent to the Hofpital laft Month.
Fevers	553	15	9
Fluxes	263	67	0
Scurvy	121	014 2	5
Other Complaints	618	25	59
Total	1555	109	73

This account is abstracted from the returns of twenty-nine ships of the line, and two frigates.

G 2

The

84 DISEASES OF THE FLEET, 1782. PART 1.

The difeafes and deaths under the head of "Other Complaints," is much more numerous in this month than ufual, which is chiefly owing to the preceding actions with the enemy, and to the prevalence of the fmall pox. Of the deaths under this head, feventeen were in confequence of wounds, fix from fmall pox, one from a mortification * in the fhoulder, and one from confumption.

None of the epidemics affected one part of the fquadron more than another, except that the fhips laft from England had a lefs proportion of the flux than the reft; and the few cafes of this difeafe that were in thefe fhips arofe after their arrival in the climate. The Conqueror and Fame, which

* The mortification in the fhoulder, mentioned above, was fomewhat fingular. It happened to a man in the Yarmouth, who, after being for a week ill of a fever and flux, was one day, early in the morning, feized with a pain in the upper part of the right arm, which immediately began to mortify. He foon after became convulfed, and died the fame day about two o'clock.

were

were the two most fickly ships, had no complaints but fevers.

The fevers had now begun to take on fome of the characteristic fymptoms of the climate; the chief of which is a greater abundance of bile. In the Repulse, two men had the yellow colour of the skin, which is so peculiar to the severs of this climate.

The crew of the Anfon caught an infectious fever from a guardfhip in England; and when the Prothée failed, there was a fever of the fame kind on board; but from the change of climate, the fymptoms became milder, and the difeafe difappeared in both thefe fhips in the courfe of this month.

The finall pox prevailed more at this time in the fleet than I have ever known it to do either before or fince, and that both in the fquadron from England and in that from North America. There were fix cafes in the Formidable, all of which did G_3 well, 86 DISEASES OF THE FLEET, 1782. PART I. well, though two were of the confluent kind.

Though there needs hardly any additional proof of the extraordinary efficacy of lemon juice in curing the fourvy, yet it may be of fervice to impress fo useful a truth on the mind by mentioning fuch ftriking proofs of it as occurred from time to time. The Arrogant fpoke with a Portuguese veffel near Madeira, from which fome of this fruit was procured, and the only fcorbutic man on board happening to have fome of the most desperate symptoms, fuch as putrid gums, contracted hams, the calves of the leg hard and livid, and frequent faintings, a fair opportunity offered for trying its virtues. The man was allowed two of them daily, and was perfectly well in fixteen days, during all which time the ship was at sea, fo that it was impossible to ascribe the cure to any other caufe.

The fleet remained at St. Lucia from the ift till the 18th of March, completing the water, provisions and ftores, landing the fick at

BOOK II. DISEASES OF THE FLEET, 1782. 87

at the hospital, and also watching the motions of the enemy, who arrived about the fame time at Martinico from the fiege of St. Christopher's. During this time we were reinforced with the Duke, of 90 guns, and the Warrior and Valiant, of 74 guns, from England. On the 18th the whole fleet, except the Invincible, which was detached with a convoy to Jamaica, failed on a cruife to windward of Martinico, in quest of a French convoy expected from Europe; which having eluded us, and got into their own harbour, the whole fleet returned to St. Lucia on the 30th of March, excepting the Prudent, which was fent to Barbadoes.

We found at St. Lucia the Magnificent, of 74, and the Agamemnon, of 64 guns, which were the last reinforcement of this campaign, making the British fleet on this flation amount to forty ships of the line, a much greater force than was ever before employed on foreign service. They were all copper bottomed.

G4

The

88 DISEASES OF THE FLEET, 1782. PART 1:

The weather continued fine all this month, yet there was fome increase of fickness, owing chiefly to the hardship the men underwent in wooding and watering. In Choc Bay, where the fleet watered, there was at this time a higher furf than was ever remembered, which made the operation of watering (at all times noxious in this climate) uncommonly toilfome and dangerous. It was, indeed, next to impracticable; for many longboats were flaved on the beach, by which feyeral men had their limbs broken, and fome loft their lives, by being crushed or drowned; but the necessity of the fervice admitted of no relaxation or delay. There was no increase of wind to account for this furf, fo that it was owing either to fomething in the currents, or to fome fubterraneous caufe; and there had been felt at Barbadoes and St. Lucia, about this time, a flight fhock of an earthquake *, to

* Earthquakes are frequent in the Weft Indies, and perhaps proceed from a weaker operation of the fame caufe that originally produced the islands themfelves, which feem all to have been raifed from the fea by fubterraneous

BOOK 11. DISEASES OF THE FLEET, 1782. 89

to which many imputed this extraordinary furf. In other refpects, there were fewer caufes of ficknefs than ufually occur to a fleet in port in this part of the world; for the air of the road is remarkably pure, and there were fewer temptations and opportunities of intemperance than at the other iflands.

The monthly returns of the furgeons were very full and complete; but as it would be tedious to infert at length those of every particular ship, and as the number of ships fluctuated in different months, I shall do no more hereaster than set down the general results from calculation, so as to shew the proportional prevalence of difease and mortality in each month.

TABLE,

terraneous fire. There are evident veftiges of volcanoes in them all, except Barbadoes; but there are other unequivocal marks of this ifland having been raifed from the bottom of the fea; for it is entirely formed of coral, and other fub-marine productions, of which the ftrata are broken, and the parts fet at angles to each other, as might be expected from fuch a caufe. There is, perhaps, at all times in the caverns of the earth, elaftic vapour

90 DISEASES OF THE FLEET, 1782. FART 1.

TABLE, shewing the proportional Sickness and Mortality in March.

	12 mar 1	San Andrewson		
DISEASES.	Proportion of thole taken ill in the Courfe of this Month.		Proportion of thefe who died, in rela- tion to the Num- bers of the Sick.	
Fevers Fluxes Scurvy Other Complaints	ONE IN	20 35 126 33	ONE IN	64 71 0 108
General Proportion		9		76

The first column is formed by dividing the whole number on board by the number taken

vapour ftruggling to vent itself, and when near the furface, it may fometimes overcome the incumbent maffes of matter, and produce certain convultions of nature. In the account of the hurricane which I wrote to Dr. Hunter, I gave reafons for believing, from the testimony of the inhabitants, that hurricanes are attended with earthquakes;

BOOK II. DISEASES OF THE FLEET, 1782. 91

taken ill. The fecond column is formed by first adding the number ill on board on the first of the month to the number taken ill during the month, subtracting from this fum the number fent to the hospital, and dividing the remainder by the number of deaths.

The number on the fick lift of twentyeight fhips of the line, and two frigates, on the firft of this month, was eight hundred and forty-five; the number put on the lifts in the courfe of the month was one thoufand eight hundred and eighty-four; and the number fent to the hofpital in the fame time was three hundred and feventythree; and there died on board thirty-one.

earthquakes; and if a conjecture might be advanced concerning the caufe of this, it might be faid, that as the atmosphere is lighter at that time, by feveral inches of the barometer, the elastic vapour, confined by the weight of the incumbent earth and atmosphere, being less compressed, may exert some sensible effects, producing a fort of explosion.

The total mortality this month, in relation to the whole number of men on board, was one in fix hundred and feven.

It almost always happens, that ships of war are more or less short of complement, and allowance is made for this in all the calculations; for having had an opportunity of inspecting the weekly accounts delivered to the Admiral, it was always in my power to be informed how many there were short of the legal complement of men in each ship.

It appears, from comparing the Tables of this month with those of the preceding, that there had been a great increase of fevers and fluxes, particularly of the latter. The fevers prevailed chiefly in the states lately from England, especially the Fame and Conqueror. In the Duke there were a great number ill of fevers; but this ship not having arrived from England till after the first of the month, is not included in the calculation. The fluxes were most prevalent in the ships we found on the station, particularly

particularly the Canada, Refolution, and Nymph frigate. The fcurvy had increafed very little, but prevailed most in the ships we found here. The only ships of the new squadron that had this difease to a considerable degree, were the Conqueror and Nonsuch. The former had indeed a good many ill of it; but the return having been made in an imperfect manner, this ship is not included in the calculation.

But the fhips that were by far the moft healthy were those that had been the longest from England, the Ajax, Russel, Montague, Royal Oak, and Prudent. There had been formerly a great mortality in all these since formerly a great mortality in all these since and it would appear that this uncommon degree of health was owing, in some meafure at least, to this circumstance, that the most weakly had been swept off by the different distempers to which they were exposed; so that only the more hardy and robuss had furvived.

Under the head of "Other Complaints," a much smaller number were put on the list,

lift, and still fewer died, in this than the preceding month. This difference is owing to the number that died of wounds last month.

There died on board, in the course of this month, thirteen of fevers, seven of fluxes, and seven of other complaints, of whom five died of small pox, one of afthma, and one of wounds he received at St. Christopher's.

In order to fhow more fully and minutely what are the complaints incident to fleets in this climate, I fhall fet down a lift of the numbers taken ill of the different difeafes and accidents during this month, extracted from the returns of twenty-eight fhips of the line, and two frigates.

Fevers - - 806 Pectoral com-Fluxes - - 463 plaints - } 40 Scurvy - - 130 Venereal com-Ulcers - - 129 plaints - } 32 Small pox - 49 Colds - - 30 Rheumatifm

BOOK II. DISEASES OF THE FLEET, 1782. 99 Rheumatism - 18 Abscess -Angina - - - 10 Fractures -3 Gravel - - - 3 Various flight Dropfy - - - 1 accidents, as 163 Ophthalmia - - 1 bruifes, cuts, fcalds, &c. Leprofy - - I Fistula in ano - 3 Total 1884 Hernia humoralis 1

The number of ulcers bears here a fmaller proportion to the whole than it does in general to the fum total of the fick lift; for being the moft tedious of all complaints, they confequently accumulate more than any other. Thus many of the cafes now fet down as flight accidents, will, in the enfuing month, be in the flate of obftinate ulcers.

Most of the difeases of one hot climate refemble those of another, so far as I know; but there is one difease which we hear of as being extremely prevalent all over the East Indies, which is hardly ever met with in the tropical regions of the West. This is the inflammation of the liver, of which I remember

remember to have feen only one well-marked cafe, and it was that of a gentleman who had been in the Eaft Indies, and had been fubject to it there : nor do I recollect more than one, or at most two, cafes of this fort out of feveral thousand cafes of various difcafes that were reported to me. This is either owing to the greater heat and dryness of the air in the East Indies, or some other peculiarity with which we are not acquainted*.

Every other inflammatory complaint exifts more of lefs, though they are much rarer than in cold and temperate climates. The phthifis pulmonalis is not fo common as in cold climates, but proves fooner fatal to moft

* Since the publication of the firft edition of this work I have been informed that this complaint is not fo rare on fhore as in the fleet, which may be partly owing to the greater coolnefs of the air at fea, and partly from the feamen not having been a fufficient length of time in the climate to be affected with this difeafe, as few of them had been more than two years from England. But as this affection of the liver was very common in the fleets and naval hofpitals in the Eaft Indies, it is evident that

moft conftitutions. There are certain pulmonic complaints, particularly those of the afthmatic kind, to which the climate of the Weft Indies is remarkably favourable; but those in which there are tubercles and ulceration feem to be hurried faster to a fatal termination. The climates, from the thirtieth to the fortieth degree of latitude, feem to be best fuited to confumptive complaints. The rheumatisms that occur in hot climates are mostly of the chronic kind.

that there is a great difference of the climates in this refpect. It is worth remarking, that it fometimes breaks out in the Weft-India Iflands like an epidemic. The complaint, for inflance, was very little known in the ifland of Grenada, till about the year 1785, when it became very frequent in a particular quarter of the ifland; and the gentleman who fent the defciption of it to England alledged, that there were the moft unequivocal proofs of its being contagious. It was moft fuccefsfully treated by very copious bloodletting, and in exciting a falivation by mercury. See Dr. Duncan's Medical Commentaries, Decad. 2, vol. I.

H

CHAP.

[98]

CHAP. III.

State of Health of the Fleet in April 1782 — Battles on the 9th and 12th — The Fleet very healthy — from the Quality of Provisions — from the Effects of Victory — Advantages of close Action — What Diseafes most prevalent—Extraordinary Degree of Health in the Formidable.

THIS month being interesting, on account of the memorable engagements that happened in it, the remarks shall, for this reason, be somewhat more full and particular.

Three fhips of the line having been fent to protect convoys to Jamaica, and one having been fent to protect a convoy to Barbadoes, there remained thirty-fix at St. Lucia in the beginning of this month. By the end of the first week their damages were repaired, their water and provisions complete, and the fick in a great measure recovered.

An

An equal force of the enemy lay over against us at Martinico, the two powers of Britain and France being to make this distant quarter of the world the theatre for trying their strength, and deciding the fovereignty of the seas. In the view of this great event, our commander forwarded the necessary duties of the fleet with such zeal and diligence, and watched the motions of the enemy with such vigilance, that he overtook their grand squadron a few hours after they left their own port, and engaged them two feveral days, with a fucces, glorious and complete.

Nothing had been wanting to equip this fleet for the great and decifive exertion it was to make. Every fhip, except two, might be faid to be healthy, moft of them were complete in men, well appointed with officers, and well found in flores and provisions.---Conformable to this was the eargements, the confidence, and refolution, which led them to fuccefs and victory.

After this battle, the whole fleet, with the prizes, bore away for Jamaica, where part H 2 of

of it arrived on the laft days of April, but the greater part of it kept the fea, till after the middle of May.

As this month is more than ufually interefting, the tables are given at full length, and a column is added for the wounded.

The fum total, of the numbers of the men on board of the thirty-fix fhips that composed the line of battle on the 12th of April, was 21,608, and the mortality during the month, exclusive of those who were killed or died of wounds, was one in 862.

There was lefs ficknefs, and lefs death, from difeafe in this month, than any of the former twenty-three months, in which I kept records of the fleet, and lefs than in any fubfequent month, till the fleet got to the coaft of America.

To account for this, it is to be obferved, that the men had not been exposed to the noxious air of the fhore in watering, as in the preceding month : they had received from

N. B. The Ships marked thus, *, came from England in February and March, $17\,\delta\,a$.

All the Ships named in the Table were in the Engagements in April, except the Ramillies and the two Frigates.

In the Spaces marked thus, §, no Return was made.

from England a frefh fupply of provisions; among which was four krout, melaffes, and effence of malt, all in addition to the ordinary articles of victualling : many of the fhips were fupplied with wine, in place of rum, and as the weather was all along dry and fine, the men fuffered the lefs from the exposure and want of fleep, which are the neceffary confequences of keeping fhips clear for battle for feveral days and nights together.

Might not this extraordinary degree of health have alfo been owing, in part, to the effects of fuccefs upon the fpirits of the men ? It is related*, that, when the fleet under Admiral Matthews was off Toulon, in daily expectation for fome time of engaging the combined fleet of France and Spain, there was a general ftop put to the progrefs of difeafe, particularly of the fcurvy, from the influence of that generous flow of fpirits, with which the profpect of battle infpires Britifh

* Dr. Lind, on the authority of Mr. Ives, furgeon) to Admiral Matthews.

feamen

feamen. But if the mere expectation and ardour of a battle, without any happy event, could have fuch a fenfible effect, what muft have been the effect of the exultation of vic-TORY, a victory in which the naval glory of our country was revived and retrieved, after a feries of misfortunes and difgraces, which had well nigh extinguished the national pride in every department of fervice! The plain and honess, though unthinking feaman, is not lefs affected by this than the more enlightened lover of his country. Even the invalids at the hospital demonstrated their joy, upon hearing of this victory, by hoisting fhreds of coloured cloth on their crutches.

It would appear, that there is fomething in fituations of exertion and danger, which infufes a fort of preternatural vigour. When the mind is interefted and agitated by active and generous affections, the body forgets its wants and feelings, and is capable of a degree of labour and exertion, which it could not undergo in cold blood. The quantity of mufcular action employed in fighting at a great gun for a few hours, is perhaps more than

that what is commonly employed in a week in the ordinary courfe of life, and though performed in the midft of heat and fmoke, and generally with the want of food and drink, yet the powers of nature are not exhaufted nor overftrained; even the fmart of wounds is not felt; and the future health of those who furvive unburt by external violence is fo far from being injured, that it is sometimes mended by this violent, but falutary agitation.

The lofs in action, and the number of mortal wounds, were not fo great as might have been expected in a battle continued for a whole day. This advantage was owing to the fuperiority of our fire, as well as to the closeness of the fight, of which the Commander in Chief fet the illustrious example, by penetrating the enemy's line with his own thip; a bold and fingular effort which first decided the event of the day. When fhips in action are opposed to each other at a small distance, the velocity of cannon balls is fo great, that in penetrating a ship's fide, few or no splinters are torn off; and by thefe more men are commonly killed and wounded, than by the ball itfelf H₄

itself. For the fame reason, a close shot does lefs damage alfo to the fhip itfelf, than a diftant one; for a quick-flying ball makes an aperture less than its own diameter, whereas a fpent one produces inumerable deadly fplinters, at the fame time fhivering the object it ftrikes, and making wide and extensive rents in it. The proportion of the wounded to the killed, is also greater in distant, than in close. fight, on account of the great number of fmall fplinters; and we have an experimental proof of this, in comparing the action in Fort Royal Bay in April 1781, with this near Diminica in April 1782. In the former, the enemy having kept far to windward, and engaged at a great diftance, the proportion of the wounded to the killed was confiderably more than four to one*; whereas in the latter, where the greater part of the battle was close, the proportion of the wounded to the killed, was little more than three to one +.

Though

* London Gazette, June, 1781.

+ This is well illustrated by the manner in which Captain Nott, of the Centaur, was killed in Fort-Royal Bay.

Though it is a remark not belonging to a medical work, yet it may be obferved, that the greateft advantage that arofe to us from clofe action was, that the fire of the enemy was thereby filenced; for the advantages would be mutual and equal, on the fuppofition, that the French, in fuch a fituation, were to keep the deck, and ftand to their guns equally well with the Britifh feamen.

It appears, by examining the table, that the fhips in which the fevers chiefly prevailed this month, were those that came last from England, and that those in which the fluxes prevailed most were chiefly of the squadron we found on the station, namely, the Canada, Resolution, and Prince William. The latter however recovered greatly in the course

Bay. This brave man, having carried his Ship nearer the enemy than the reft of the line, but neverthelefs at a great diffance, had his fignal made to keep the line, and having gone into his cabin, as it is faid, to examine the import of the fignal, a cannon ball ftruck him in the groin, and it was fo far fpent, that it fluck in his body. It tore away a whole plank of the fhip's fide, the fplinters of which killed a young gentleman, the only perfon near him.

of this month. Some of the Ships that arrived laft from England, namely, the Arrogant, Prothée, and Anfon, were also confiderably afflicted with fluxes, but they were of an extremely mild kind; and the fmall number of deaths from this difease in comparison with those from fevers, is a proof of a former observation, that this is the fafest form in which an acute difease can shew itself. This fmall degree of mortality was also owing to the judicious method of treating it which was in general practifed throughout the fleet; and it is but justice to the medical gentlemen to fay, that they shewed on this, as well as every other occafion, great skill and attention in the treatment of the fick and wounded.

The fum total of fevers and fluxes that have been put on the lift this month, is much the fame as that of the preceding month; but the proportion of fluxes in April is much greater.

The proportion of fcurvy is fomewhat increafed; which is not to be wondered at, when it is confidered, that though the fleet 3

had not been fo long at fea as is neceffary to produce it, efpecially in this climate, yet the men having had no refreshments when last in port, may be confidered as having been all that time at fea.

The fuperior degree of health in this month will appear in a ftill ftronger light, if we caft our eye on the column expressing the number fent to the hospital, the proportion of which is, comparatively, very fmall.

The fhips that had been the longeft from England, were ftill among the moft healthy. But of all the fleet, none was fo free from ficknefs and mortality as the Formidable. No man belonging to this fhip died of difeafe for the firft four months after failing from Plymouth, though there were at times 900 men on board, and never lefs than the eftablifhed complement, which is 750; and fo few were taken fick in that time, that only thirteen were fent to hofpitals, and their complaints were fmall-pox and ulcers.

This fhip left England provided with every thing that could be fuppofed to conduce to the health of men, and may be confidered as an experiment to prove what degree of health may be attained by proper management and attention. She was furnished not only with abundance of four krout, melass, and effence of malt, in common with the other ships; but what was peculiar to ber, was an entire supply of excellent wine, in place of spirits, of which none was used during the period mentioned.

Fevers	NI	26 18 57 627 44	IN	29 63 34 60 127	
General Proportion, } including wounded } General Proportion, } exclusive of Wounds }	ONE	7± 8	ONE	46 48	

The

The whole number of fick on board on the first of this month, in thirty-fix ships of the line and two frigates, upon which the preceding calculation is formed, was one thousand four hundred and eighteen. The whole number taken ill in the course of the month was two thousand eight hundred and twenty-eight; the number sent to the hospital was one hundred and seventy-three; and there died on board ninety-four.

The proportion of those who died this month, in relation to the whole number on board, was one in two hundred and eightyfeven.

There was a confiderable increase of ficknefs and mortality this month in all the common difeases, and chiefly in that part of the squadron which was in port. There was less increase in the number of severs than either of the other two epidemics; but such was their increased malignancy, that more died of them than of both the others. The number of fluxes was more than double of what it was the preceding month,

month, and the mortality from them was alfo in a much greater proportion, as may be feen from the Tables.

The fevers prevailed chiefly in port, and the fluxes at feas A good many of the latter, indeed, arofe in the Alcide, though conftantly in port; but this feemed to be owing to contagion conveyed by fome British foldiers, who were fent on board of this thip after being retaken in one of the French men of war, feveral of whom were ill of this difeafe. But there were few fluxes in those ships at Jamaica in which the most malignant fevers appeared. There were a few in those in which the fevers arole from the air of the marshes on the watering duty; but there were none on board of the French prizes, nor in those thips in which that fort of fever was which proceeded from a fimilar caufe, that is, filth and animal effluvia. Upon the. whole, in those ships in which the fever was most malignant, there the fewest fluxes were found.

I

Several

Several circumftances contributed to the increase of fickness and mortality this month.

ift. The infection, or rather the foul air, of the French prizes, in most of which a very bad fever broke out among the officers and men that were fent from the ships of our fleet to take charge of them.

The discipline and internal œconomy of the French thips of war are greatly inferior to those of the British. Their decks are never washed, and there is a great defect in every point of cleanlinefs and order. The free course of the air is obstructed by lumber of every kind, and by bulkheads, which are not taken down even in the time of battle: and the gratings are covered night and day with tarpaulins, even in a hot climate. There are not even fcuppers opened on the lower deck as outlets to the water and filth, which neceffarily accumulate there, and for which the only vent is a pipe contrived on purpose, passing from that deck along the thip's fide into the hold, which becomes thereby

thereby a common fink, inconceivably putrid and offenfive. And in addition to the ordinary caufes of corruption, there was one peculiar to the occafion ; for the blood, tthe mangled limbs, and even whole bodies of men, were caft into the orlop, or hold, and lay there putrifying for fome time. The common failors among the French have a fuperstitious aversion to the throwing of bodies overboard immediately after they are killed, the friends of the deceafed withing tto referve their remains, in order to perform a religious ceremony over them when the hurry and danger of the day shall be over. When, therefore, the ballaft, or other conttents of the holds of these ships, came to be firred, and the putrid effluvia thereby let lloofe, there was then a visible increase of ficknefs. For the first three weeks after the ccapture, the ftench proceeding from the numbers of wounded men contributed alfo tto taint the air.

The Ville de Paris was much more fickly than the other prizes, not only from her being larger, and thereby containing a greater I 2 mafs

mafs of foul air, but by receiving the furviving part of the crew of the Santa Monica, one of our frigates, which had been caft away on the Virgin Islands, and whofe men were fo reduced by hardship and intemperance, that most of them were taken ill as foon as they came to breathe the unwholefome air of the French prize. To whatever cause it was owing, the fever was much more violent here than in the other prizes, and it generally carried men off on the third or fourth day; and what is remarkable, the officers were affected by it in a greater proportion than the common men. One lieutenant, and every warrant officer, except the boatfwain, died of it. This was a proof that the ficklinefs was owing to the bad air, and not to the intemperance and irregularity fo ufual on board of prizes, which only the common men give into; and the probable caufe of the officers being most affected is, that they were accustomed in common to a purer air, by living in the most clean and airy parts of the fhip.

It

It is alfo remarkable, that the Ville de Paris was healthy when taken, and had been fo ever fince leaving France in March, 1781; nor had any other of the captured fhips of the line been fickly for fome time before, except the Ardent, when fhe arrived at Martinico four months before, at which time the greater part of the crew were fent to the hofpital with fevers. This, as well as other facts of the fame kind, tends to prove, that when men come to be much habituated to bad air, their health is not affected by it.

The French fhips were purified by wafhing and foraping, by fumigating daily with gunpowder and vinegar, and by the ufe of wind fails; but nothing feemed to contribute fo much to fweeten the air in them as burning fires in the hold; for this tended both to make the putrid matter exhale, and to carry it off, by producing a perpetual change of air. Captain Curgenven, who at this time commanded the Ville de Paris, had great merit from his very affiduous and fuccefsful endeavours in fo difficult a duty as the management and equipment of this great fhip. In confequence of I 3 the

the judicious measures taken, and the men becoming more used to the bad air, the fickness ceased in the course of a few weeks.

In the accounts given in the tables, the French prizes are not included, for the diforderly flate in which they were at this time prevented my receiving regular returns : but having made inquiry concerning the mortality in the Ville de Paris, I found, that of a crew of three hundred and twelve men, there died ten in the month of May, and there were thirty fent to the hofpital, whofe cafes were fo unfavourable, that about one half died. The only difeafes were fevers. The furgeon of the Ardent told me about the fame time, that one third of the crew of that fhip was ill of fevers.

The fecond caufe of the prevalence of ficknefs, while the fleet was at Jamaica, was, the watering duty, which was carried on at Rock-fort, about three leagues from Port Royal. It was the practice of many of the fhips to leave the water cafks on fhore all night, with men to watch them; and as there

DISEASES OF THE FLEET, 1782. 119 BOOK IL.

there is a laud wind in the night, which I blows over fome ponds and marshes, there were hardly any of the men employed on that duty who were not feized with a fever, of a very bad fort, of which a great many died. The fhips that followed a different practice were fomewhat longer in watering; but this was much more than compensated by their preferving the health and faving the lives of their men.

The land wind which blows on the fhore in the night time, is a circumftance in which Jamaica differs from the fmall iflands to windward, over which the trade wind blows without any interruption : but though this land wind blows upon Port Royal from fome marshes at a few miles distance, it does not feem to produce fickness, for it is a very healthy place, and feveral of the fhips enjoyed as good health as in the beft fituations on the windward station. The bay which forms this harbour is bounded towards the fea by a peninfula of a fingular form, being more than ten miles in length, and not a quarter of a mile broad at any part. Great part of it

I4

it is fwampy and overgrown with mangroves, and though of fuch fmall extent, we fancied that fome of the fhips that lay immediately to leeward of this part were more fickly than those that were close to the town of Port Royal, which stands at the very extremity of this long peninfula upon a dry, gravelly foil.

The weather this month was uniformly dry in port; but at fea the air was moift and hazy. Between Jamaica and Hifpaniola, where part of the fquadron was left to cruife, dead calms prevailed; and this, joined to the moisture of the air, was probably what caufed the flux to prevail chiefly in this part of the fleet. At Port Royal, on the contrary, there was a ftrong dry breeze, which fet in every day about nine o'clock in the morning, and blew all day fo fresh, that there was frequently danger in passing from one ship to another in boats. This is called, in the language of the country, the fiery fea breeze, an epithet which it feems to have got not from its abfolute heat, but from the feverish feeling which it occasions by drying up the perfpiration. It was remarked, that this

this breeze was ftronger this feafon than had ever been remembered; and it fometimes even blew all night, preventing the land breeze from taking its ufual courfe. This year was farther remarkable for the want of the rains that were wont to fall in the months of May and June. We fhall have occafion to remark hereafter, that this was a very uncommon feafon also in Europe and America. The heat, by the thermometer, this month, on board of a ship at Port Royal, was, in general, when lowest in the night, at 77°, and when highest in the day, in the shade, at 83°.

There was a confiderable increase of fcurvy in this month, compared with the former months of this campaign; but very inconfiderable, compared with what had occurred in cruises of the fame length in former years. The last division of the fleet had been at fea feven weeks, all but one day, when it arrived at Port Royal; and though the fcurvy had appeared in feveral of the ships, it did not prevail in any of them to a great degree, except in the Nonfuch. Out of fourteen deaths

deaths which happened in the whole fleet from this difeafe, in May, feven of them were in this fhip, and feveral were fent from her to the hofpital in the last and most defperate stage of it. But, upon the whole, the cafes of the true fea fcurvy in the fleet, in general, were few and flight, and a great many of those given in the reports under the head of fcurvy, were cutaneous eruptions or ulcers, not properly to be claffed with it.

The cruife in the preceding year to windward of Martinico, may be compared with that in May of this year; for the fleet in both cafes had been at fea about the fame length of time. But the comparison is very greatly in favour of the latter, which is most probably to be imputed to the plentiful fupply of melaffes, wine, four krout, and effence of malt. But no adequate reason that I could difcover can be affigned for the prevalence of it in the Nonfuch to a degree fo much more violent than in the other fhips; and it was here farther remarkable, that it attacked every description of men indiferiminately; for I was affured by the officers and

and by the furgeon, that not only the helplefs and difpirited landfman was affected, but old feamen, who had never before fuffered from it on the longeft cruifes. I have been led by this, and fome other facts, to fufpect that there may be fomething contagious in this difeafe.

JUNE.

The greater part of the fleet remained at Jamaica during this month, refitting and watering. Twelve thips of the line were fent to fea on the 17th, under the command of Rear-admiral Drake, but not being able to get to windward on account of the fresh breezes that prevailed, they returned to Port Royal on the 28th. Such of these ships as were fickly, became more healthy while at fea; but fome bad fevers arofe, particularly in the Princeffa; and it is a curious circumftance, that these fevers attacked only those men who had been on fhore on the watering duty; from which it would appear, that fomething caught or imbibed, which is the caufe of the fever, lies inactive for fome time

time in the conftitution, fome of the men not having been affected for more than a week after they had been at fea,

The weather continued dry and windy, as in the former month; but the heat was in general about two degrees higher, the thermometer varying from 79° to $84\frac{1}{2}$ °,

TABLE, shewing the proportional Sickness and Mortality in June.

DISEASES.	-	taken ill in the Courfe of this Month.	Proportion of thofe who died, in rela- tion to the Num- bers of the Sick.		
Fevers Fluxes Scurvy Other Complaints	ONE IN	11 20 47 37	ONE IN	19 83 231 97	
General Proportion	3.4	6		39	

The

The proportion of deaths in relation to the whole numbers on board, was one in one hundred and thirty-eight.

There was only one in thirty of the fick fent to the hospital in the course of this month.

There was an increase both in the numbers and fatality of fevers. This increase was chiefly in that fort of fever which depends on the air and climate, the greater part of which was caught on the watering duty. There was a diminution of those fevers depending on infection, and the foul air of ships, which arose in the French prizes. The care that was taken in purifying thefe fhips was very effectual; for only four died this month in the Ville de Paris, and fewer also were fent to the hospital than in May. The increase of the other kind of fever was chiefly owing to there being a greater number of thips in port, the crews of which were employed in watering, and partly, no doubt, to the increase of heat in the weather. The fhips in which the fevers 3 were

126 DISEASES OF THE FLEET, 1782. PART I.

were most fatal were the Monarch, the Duke, the Torbay, and the Refolution. The fickness in the Duke was still in a great measure owing to the fame infection that had hitherto prevailed; for this fhip had never been cleared of the infectious fever, for want of room at the hospital. That which broke out in the Torbay was also of the low infectious kind, few of them having the fymptoms of that which is peculiar to the climate, which prevailed in the other ships. This ship, though formerly very fubject to infectious complaints, had been remarkably healthy for fome time paft; but it would appear that there was a large flock of latent infection, which shewed itfelf. from time to time.

Some fhips, particularly the Montague and Royal Oak, had no increase of fevers or other complaints, though the one lay in port for feven, and the other for eleven weeks, and were more or less exposed to the causes of fickness which affected the rest of the fleet. This is a proof, among many others, that a particular combination of causes

caufes is neceffary to produce a difeafe : no fingle one, however powerful, being fufficient, without the concurrence of others. What feemed to be wanting here was the predifposition requisite for the admission of difeafe into the constitution; for the ships that enjoyed this happy exemption were fuch as had long-established and well-regulated crews, accustomed to the fervice and climate.

There had been this month a diminution both of the numbers and mortality of fluxes, which is agreeable to what was before remarked, that fevers were more apt than fluxes to prevail in the bad air of a harbour *. It was also before remarked, that there were few or no fluxes in those flips in which the fever was most malignant; and now that the fever

* I have feen an account of the difeafes of the army at St. Lucia for a whole year, kept by Mr. Everard Home, an ingenious gentleman belonging to the army hofpital, and it appears, that, during ten months out of the twelve, the dyfentery was the predominant difeafe. This feems to contradict the opinion, that the land air

15

128. DISEASES OF THE FLEET, 1782. PART IS

fever began to grow more mild in the French prizes, the flux began to appear. In the Barfleur, Duke, and Namur, both difeafes feemed to prevail equally; but the fevers, though numerous, were more of the low nervous kind than bilious or malignant; and the fluxes chiefly attacked those who were recovering from fevers. We may farther remark, that these three men of war were three-decked ships, of 90 guns, the crews of which being more numerous, and composed of a more mixed fet of men, were confequently fubject to a greater chance of infection, and a greater variety of complaints. The Formidable still remained healthy to an extraordinary degree. Some fevers were indeed imported from the Ville de Paris by men that had been lent to that fhip, and who were taken ill after their return. Of these, a few of the worst cases were sent

is more apt to occafion fevers than fluxes; but it is to be remarked, that the ficknefs of the foldiers on this illand was not fo much owing to the malignant influence of the air, the fituation of the garrifon being high and airy, as to the bad accommodations and provisions, together with hard labour.

to the hospital, and two died on board, who, with one that died the preceding month, make the whole mortality of this ship, since leaving England, amount only to the lloss of three men.

There has been little or no increase of fcurvy this month; for though the num-Ibers put on the lift appear to be greater, the mortality is much lefs. It may indeed appear a matter of furprife that there should have been any fourvy at all, confidering that the greater part of the fleet was at anchor all this month. But as this was the greateft fleet that had ever vifited Jamaica, it was impossible to find fresh provisions for the whole; and the fmall fupply they had did not amount to one fresh meal in a week. Port Royal is also remote from the cultivated part of the ifland, fo that fruit and vegetables were both fcarce and high priced, particularly this year, on account of the usual rains in May and June having failed. There was, however, an allowance of fresh provisions and vegetables made to the fick by public bounty; for as the hofpital could K contain

130 DISEASES OF THE FLEET, 1782. FART 1.

contain but a fmall proportion of the ficlt and wounded, an order was given for the fupply of fresh meat, fruit, and vegetables, to the fick, and five hundred pounds of Peruvian bark were also distributed as a public gratuity, besides fugar, coffee, and wine.

With these aids, and the various good articles of victualling from England, the fleet was preferved uncommonly healthy for a West-India campaign : for though the mortality had increased confiderably during our ftay at Jamaica, yet the loss of men, upon the whole, was finall, compared with that of other great fleets in this climate on former occasions. The greatest squadron, next to this, that had ever been on this station was that under Admiral Vernon in the year 1741, at the fame feafon. From this fleet upwards of eleven thousand men were fent to the hospital in the course of that and the preceding year, of whom there died one in feven, befides what died on board of their own fhips and in two hospital ships *.

* See Effay on the Yellow Fever, by Dr. Hume, in a Collection of Effays published by Dr. D. Monro.

11.3007

The difproportion of fickness in the two fleets will appear still greater, when it is confidered that Admiral Vernon's contained only fifteen thousand feamen and marines *; whereas that under Lord Rodney contained twenty-two thousand. What added to the ficknefs of the former was the unfortunate expedition to Carthagena in April, 1741; to which probably it was owing that a much greater proportion of yellow fevers were landed from the fleet at that time than from ours, as appears by the papers left by Mr. Hume, who was then furgeon of the hofpital. The hospital was then at a place called Greenwich, on the fide of the bay oppofite to Port Royal, and was very large; but it was found to be in a fituation fo extremely unhealthy, that it was foon after abandoned and demolished, and the hospital has fince been at Port Royal.

It appears by the tables, that a greater number was put on the lift under the head of

* Campbell's Lives of the Admirals, Vol. IV.

K 2

other

132 DISEASES OF THE FLEET, 1782. PART I.

ether complaints in this month than the laft. This was owing to the great number of ulcers which I have remarked to keep pace with feverifh as well as foorbutic complaints; for when the conflictution of the air is favourable to difeafe, or the habit of body prone to it, wounds and fores are found then to be more difficult of cure. There were twelve deaths befides those occasioned by what have been called the three epidemics. Of these, five perished by drowning and other accidents, three died of ulcers, one of wounds received in action, one of *cholera morbus*, and one of an abscels.

It has appeared that very few fhips of this numerous fleet preferved their health while lying at anchor; and it would feem that flort and frequent cruifes are very conducive to health. It was eleven weeks from the time that the first of our fleet came to anchor at Jamaica till the main body of it failed for America on the 17th of July. Great fleets are in time of war under the neceffity of being at one time longer at fea, and

and at another time longer in port, than iseconfiftent with the health of the men, the thips being obliged to act in concert and to co-operate with each other. This is one creafon, among others, for thips of the line being more fickly than frigates. As thips cof war must be guided by the unavoidable exigencies of fervice, it would be abfurd to confider health only; but if this were to be the fole object of attention, a certain falustary medium could be pointed out in dividing the time between cruifing and being in lharbour; and it is proper that this should be Known, that regard may be had to it, as far as may be confiftent with the fervice. I would fay, then, that in a cold climate men cought not to be more than fix weeks at fea at one time, and need not be lefs than five weeks, and that a fourth part of their time fpent in port would be fufficient to replenish their bodies with wholefome juices. In a warm climate men may be at fea a confiderable time longer, without contracting fcurvy, provided they have been under a courfe of fresh and vegetable diet when in port.

K 3

Though

134 DISEASES OF THE FLEET, 1782. PART 14

Though contagion is not fo apt either to arife or to fpread in this climate as in colder ones, there were feveral circumstances about this time tending to prove that it may exist in a hot climate. Those ships which had their men returned to them from the French prizes, in all of which fevers prevailed, had an increase of fickness not only in the men that were returned, but in the reft of the crew. There was another prefumption of contagion, from the proportion of mortality among the furgeons and their mates, who were by their duty more exposed to the breath, effluvia, and contact. of the fick. There died, during our flay at Jamaica, three of the former, and four of the latter, which is a greater proportion than what died of any other clafs of officers or men.

It has been the opinion of fome, that fevers do not arife from any putrid *effluvia*, except those of the living human body, or fome specific infection generated by it while under the influence of disease. It has been alledged

alledged in proof of this, that the putrid air in fome great cities is breathed without any bad effects; and a celebrated profeffor of anatomy* used to observe, that those employed in diffecting dead bodies did not ccatch acute difeafes more readily than other rpeople. I believe this may be true, in a climate like Europe, where cold invigorates the body, and enables it to refift the effects of foul air; but I am perfuaded it is otherwife in tropical climates. The external lheat of the air induces great languor and relaxation, and we cannot breathe the fame portion of air for the fame length of time in a hot as in a cold climate, without great uneafinefs. The want of coolnefs must, therefore, be compensated by a more frequent change of air, and by its greater purity: any foulness of the air is accordingly more felt in a hot climate; and, according to the modern theory, air, already loaded with putrid phlogistic vapour, will be less qualified to abforb the fame fort of vapour

* The late Dr. William Hunter.

from

K 4

136 DISEASES OF THE FLEET, 1782, PART I.

from the blood in the lungs, in which, according to this theory, the use of respiration confifts. Be this as it will, there is fomething in purity of air which invigorates the circulation, and refreshes the body; and the contrary state of it depresses and debilitates, particularly in a hot climate; and in this way foul air may induce difeafe, like any other debilitating caufe, independent of infection, or any specific quality. There was no reason to suspect any such infection in the Ville de Paris; for there was no fickness on board of this ship when in poffeffion of the enemy, and the fickness that prevailed after her being captured feemed to proceed from what may be called fimple putrefaction. There was an inftance of the fame kind in one of our own fhips of the line, in which a bad fever broke out in the beginning of July, which feemed to be owing to the foul air of a neglected hold; for there was a putrid ftench proceeding from the pumps, which pervaded the whole fhip. I perceived this very fenfibly one day, when visiting fome officers who were ill of fevers; and

and before I left the fhip an alarm was given of two men being fuffocated in what is called the well, which is the loweft acceffible part of the hold. This fever was of a very mallignant kind, and fell upon the officers more than the men; for fix of them were feized with it, of whom three died on the third day after being taken ill.

The feyers, which were of the greatest imalignity at this time, affected the officers more than the common men. Only one captain died at Jamaica while the fleet was there, and it was of this fever. We loft five lieutenants, of whom four died of it; and this was the difeafe which carried off the three furgeons, But foul air was not the only caufe that produced this fever among the officers, feveral of whom brought it on by hard drinking, or fatiguing themfelves by riding or walking in the heat of the fun. It cannot be too much inculcated to those who visit tropical countries, that exercife in the fun, and intemperance, are most pernicious and fatal practices, and that it

138 DISEASES OF THE FLEET, 1782. PART I.

it is in general by the one or the other that the better fort of people, particularly those newly arrived from Europe, shorten their lives.

Before leaving Jamaica, I fent to England a Supplement to the Memorial given in, laft year*.

CHAP. V.

Account of the HEALTH of the FLEET, from its leaving Jamaica on the 17th of July, till its Departure from New York on the 25th of October.
What Difeafes most prevalent on the Passage to America — Rapid Increase of the Scurvy during the last Week of the Passage — Method of supplying the Sick at New York — The Fleet uncommonly healthy in October — State of the Weather and of Health in America in Summer and Autumn, 1782.

T HE feafon of the hurricanes approaching, and all the convoys deftined for England this year being difpatched, the main body of the fleet, confifting of twenty-four fhips of the line, left Port Royal on the 17th of July, under the command of Admiral Pigot, in order to proceed to the coaft of America. A great convoy for England had been fent off a few days before, protected by the Ville de Paris and fix other fhips of the line, which we overtook and paffed

140 DISEASES OF THE FLEET, 1782. PART I.

paffed at the weft end of the ifland. When we arrived off the Havannah, a large fquadron of the enemy was feen there in readinefs to fail, which induced the Admiral to wait in fight of it for the convoy, which did not come up till ten days after. Owing to this delay, and our meeting with baffling winds on the reft of the paffage, we did not arrive at New York till the 7th of September. We found there the Invincible and Warrior, which failed after us, but arrived before us, by having taken the windward paffage.

TABLE, shewing the proportional Prevalence of different Diseases, and their Mortality, in July, 1782.

General Proportion		. 5 ¹ / ₂		33

The mortality this month, in relation to the whole numbers on board, was one in a hundred and thirty.

There were only one in thirty-eight of the fick fent to the hofpitals.

The

142 DISEASES OF THE FLEET, 1782. PART 1.

The fevers arofe chiefly during the first two weeks after leaving Jamaica, which renders it probable that the feeds of them were brought from thence. Had they been owing to the heat fimply, they would have been as apt to arife in fome fubfequent part of the passage; for the tropical heats at this feafon of the year extend to the 30th degree of latitude, which we did not crofs till the 22d of August, that is, near five weeks after leaving Jamaica. The only fhips in which the fever could be imputed to infection or foul air were the Barfleur, Alcide, and the Aimable frigate. The first had received, as recruits, at Jamaica, men who had been confined for fome time before in a French jail, and a fever of a bad kind fpread on board of her foon after. The Aimable was a prize from the French; and the ficknefs was here fo evidently owing to foul air, that, whenever the contents of the hold were ftirred, fo as to let loofe the putrid effluvia, there was then an evident increase of fickness. The fever in the Alcide was of a peculiar flow kind, to be defcribed hereafter, and feemed to be a continuation

continuation of the fame infection which had fo long exifted in that fhip.

The Duke, which had hitherto been by far the moft fubject to fevers of any fhip in the fleet, became more and more free from them even in the moft early part of this paffage, and might be faid to be entirely fo at the time fhe arrived in America. The fever had been fo very prevalent in this fhip fince leaving England, that there was hardly a man who had efcaped it. Could this have any effect in making them lefs liable to catch it a fecond time ?

In the courfe of this paffage the dyfenteries came to prevail over the fevers, as we have found to be commonly the cafe at fea. It appears by the former table, compared with the next, that the mortality in fevers was much the fame, and that in the dyfentery it was greater than while the fleet was at Jamaica. This does not argue, however, that the difeafes were equally malignant, but was owing to the want of an hofpital, and of thofe comforts of diet which the

144 DISEASES OF THE FLEET, 1782. PART I.

the fick enjoyed on board while in harbour. This laft was particularly felt in the dyfenteries, in the cure of which more depends upon diet than in moft other difeafes. In all the calculations of mortality on board of fhips, if any have been fent to the hofpital, they are to be deducted from the number; and thefe make a greater difference in the mortality on board than their numbers fimply would indicate; for only the worft cafes, and thofe therefore who were moft likely to die, ufed to be fent to the hofpital. But as the fleet was at fea during the whole of this month, no allowance of this kind is to be made.

teries came to previe over the never, se we have fored to be destinically the cale at les. It sppens by the destinical table, compared with the next, that the contestity in reverwith the next, that the contestity in reverdenous it was much the fame, and the set of the denous it the destine and the set of the denous it the destine and the set of the destine of the difference of the set of the picture and of the fame, to the want of an cole picture and of the destine to the want of an cole picture and of the destine contracts of destine the field, and of the destine contracts of destine the box

TABLE, fhewing the proportional Sicknefs and Mortality in August.

DISEASE 3.	Proportion of thofe taken ill in the Courfe of the Month.		Proportion of Deaths, in relation to the Nembers of the Sick.	
Fevers Fluxes Scurvy Other Complaints General Proportion	ONE IN	$ \begin{array}{c} 3^{1} \\ 4^{6} \\ 2^{5} \\ 2^{7} \\ 7^{\frac{1}{2}} \end{array} $	ONE IN	17 35 66 43 31

The mortality this month, in relation to the whole numbers on board, was one in one hundred and fixty-nine.

The fcurvy began to appear very foon upon this paffage; for by the end of August, at which time the fleet had only been fix weeks at fea, and that in a warm cli-L mate,

146 DISEASES OF THE FLEET, 1782. BART L.

mate, and in dry weather, it had made confiderable progrefs. It first appeared and prevailed most in the Prince George and Royal Oak, though they had been ten weeks at Jamaica. This was the first ficknefs with which the latter had been affected fince arriving in the West Indies; and there was no perceivable peculiarity in either of them to account for their being fubject to it more early, or more violently, than the reft of the fleet. If the difease is contagious, as has been fufpected, there might be a few men on board of them, who, being uncommonly prone to the difeafe, would be foon affected, and communicate it, or at leaft haften the fymptoms in those who might be lefs predifposed to it. But this is only conjecture. Before the end of the voyage, the whole freet was more or lefs afflicted with it, though it had been only feven weeks and three days at fea; but the men had received fo few refreshments while in port, that their conftitutions were prepared to fall into this difeafe. The Barfleur, Alfred, and Princeffa, were most affected with it next to the two ships mentioned above.

The

The feventeen fhips which arrived from England in February and March were much llefs affected with it than the reft of the ffleet, which was, no doubt, owing to the wine, melaffes, and four krout, with which they were fo amply fupplied. Though thefe articles were all expended before leaving Jamaica, yet the good effects of them on the conftitutions of the men were visible in the courfe of this paffage.

The America was the moft free from it of all the fhips of the old fquadron; and this was owing to the great humanity and attention of the captain *, who, as foon as any of the men were taken ill, allowed them wine and other refrefiments from his private flore: There was another proof in the Conqueror of the great importance of attending to this difeafe in its earlieft ftage: Mr. Lucas, the furgeon of this fhip, by watching the firft beginnings of it, by a proper regulation of diet, and the administration of the effence of malt and juice of limes, not

* Captain Samuel Thompson.

L 2

only

148 DISEASES OF THE FLEET, 1782. FART 1.

only prevented the progrefs of the difeafe, but proved, that, with great attention, it may even be cured at fea. It is of the utmoft confequence in this difeafe to put the men on the fick lift on the very firft appearance of the fymptoms, fo that they may early have the advantage of proper treatment and regimen. It is only at this period of it that the effects of effence of malt are fenfible; but we have feen that the juice of certain fruits will cure it in more advanced ftages.

There is a very important remark fuggefted by comparing the two preceding tables with that which follows. It appears that in the month of September a much greater number was taken ill of feurvy, and alfo that there died of this difeafe a greater proportion than in the two preceding months. All the mifchief from it in that month happened in the firft week of it, during which as many died as in the whole month of Auguft; for the fleet came to an anchor on the 7th of September at New York, where the worft cafes were immediately fent to the hofpital, and thofe that remained on board were fupplied

plied with every neceffary refreshment. Had the fleet remained longer at sea, the mortality would probably have increased in the stame progression; and this circumstance cought to be well confidered in undertaking ccruifes.

TABLE, flewing the proportional Prevalence of Sicknefs and Mortality in September.

DISEASES.	Proportion of thofe ta- ken ill in the Courfe of the Month.	Proportion of Deaths, in relation to the Numbers of the Sick.

L 3

The

150 DISEASES OF THE FLEET, 1782. PART I.

The proportion of deaths, in relation to the whole numbers on board, was one in three hundred and ninety-eight.

About one third of all the fick were fent to the hofpital.

As the proportion of ulcers was uncommonly great, I thought it worth while to make a calculation of it. The Barfleur had the greatest number; and this ship, for causes I cannot affign, was more afflicted with bad ulcers than any other in the fleet, for several months together.

The fleet having arrived at New York in this unhealthy flate, the firft care was to make provision for the fick. There were fomewhat more than fifteen hundred on the fick lifts of all the fhips, and the hospital could accommodate little more than fix hundred. In order that it might not be overcrowded, and that each ship might have a just share of relief, I went round the fleet to afcertain the due proportion of those cafes that were the most proper objects for being fent

fent on fhore. All the infectious and acute complaints, and fome of the worft fcorbuttics, were accordingly fent to the hofpital. Those who were kept on board being chiefly fuch as were affected with the fcurve, were fupplied with various refreshments in their respective ships, and seemed to recover as 1 foon as if they had been fent on fhore. 'They had indeed almost every advantage eni joyed by those at the hospital; for, befides Ifresh meat thrice a week, and spruce beer daily in common with the other feamen, each man on the fick lift was fuppled every week at the public expence with four pounds of apples and half a pound of fope. There were also thirty cafks of limes taken in a prize, which were distributed among the fcorbutic men, and proved of infinite ufe. Admiral Pigot's great zeal for the good of the fervice, as well as his natural humanity, induced him to listen to whatever was proposed for the benefit of the men.

The fupply of fope was a thing entirely new in the fervice; but the good effect of all the other articles would most probably L4 have

152 DISEASES OF THE FLEET, 1782. PART I.

have been defeated, unlefs the men had been furnished with the means of cleanlines, which is the most effential requisite of health. The advantage of this method will appear by the returns of next month to have been very confpicuous; and it was on this occasion more than any other that I faw realifed in every particular the plan proposed in the memorial to the Admiralty. It may be added, that the fick that were left on board were not even without the recreation of the fhore enjoyed by these at the hospital; for most of the captains had the attention to fend daily on shore, for amusement and exercife, fuch as were able to walk. Thus there were all the advantages of an hospital obtained at much lefs expence to Government, and without the rifque of intemperance, defertion, or infection, which are the inconveniencies connected with an hofpital. What farther contributed to health at this time was, a large quantity of excellent wine with which the fleet was fupplied.

and Mortality in October.					
DISEASES.		Proportion of thofe ta- ken ill in the Courfe of the Month.		Proportion of thofe died, in relation to the Numbers of the Sick.

TABLE, shewing the proportional Sickness and Mortality in October.

The proportion of deaths in this month, in relation to the whole number on board, was only one in fourteen hundred and fewenty-eight,

About one in twenty-nine of the fick was fent to the hofpital.

There

154 DISEASES OF THE FLEET, 1782. PART 1.

There was, upon the whole, lefs ficknefs and mortality in this month than in any other during which I kept records of the fleet. This was, no doubt, owing in part to the climate, but was chiefly the effect of the extraordinary attention paid to the refreshments of the men. The fleet was here exactly in the fame fituation, and at the fame feason, two years before, but was not near fo healthy.

Nor were the advantages derived from the great plenty of refreshments, procured at this time at New York, merely temporary; for the men's conflictutions were fo much improved by them, that the part of the fleet which remained under the command of Lord Hood was at fea for twelve weeks without being affected by the fcurvy. This was chiefly to be afcribed to the previous refreshments; for we have feen, that, in a paffage of feven weeks from Jamaica to New York, the fleet was greatly affected with the fcurvy, in confequence of not having had the advantages of fresh meat and vegetables when laft in port. The climate had, no doubt, alfo

also a fhare in keeping off the fcurvy; for the greater part of the twelve weeks was taken up in a cruife off St. Domingo; and, I believe, it never was known that a fleet was fo long at fea, in a cold climate, withpout being greatly affected with this difeafe.

It appears, that though the proportion of fevers had increased fomewhat this month over that of fluxes, yet the former were lefs fatal; and, I think, the true dyfentery is more frequent in this climate, and more apt to prove fatal in its acute ftate, than in the West Indies. I have indeed preferred the term flux to that of dyfentery, for this reafon, that the fymptoms in many cafes did not rife fo high as properly to conflitute dyfentery; and the difease proves fatal in the West Indies more frequently in the chronic than in the acute flate. The fluxes were daily gaining ground when we left New York, and continued to prevail to a great degree in the Magnificent, which remained in that climate feveral weeks after us.

156 DISEASES OF THE FLEET, 1782. PART 1.

The climate and fituation of the fleet had a greater effect in diminishing ulcers than any other complaints; for the proportion of them in this month is little more than one third of what it was in the last.

The calculation for October was made upon thirteen ships of the line, which failed from New York on the 25th of that month.

The weather had then begun to grow cold; but few or none of the difeafes peculiar to a cold climate had appeared. There occurred, while we were at New York, feveral cafes of inflammation of the liver among the officers and men who came from the Weft Indies. It was remarked formerly, that this complaint hardly ever occurred in the Weft Indies; but it would appear that the refiding there difpofes to an inflammation of this organ upon changing to a colder climate.

The preceding fummer had been uncommonly cold, not only in North America, but in the whole temperate part of the northern

morthern hemisphere, so far as I could learn by inquiry. In confequence of this, the ccrops failed in Europe, America, and the morthern parts of Afia. The fame circumfance had a remarkable effect on the reigning difeases of the feason at New York; for, inftead of the bilious complaints common in the end of fummer and in autumn. a flight fever of the inflammatory kind had prevailed. An epidemic catarrh had fpread call over Europe, and fome part of Afia, in tthe earlier part of the year; and perhaps this was connected with the peculiar flate of the atmosphere about this time. It was before obferved, that there was fomething unufual in the state of the weather at Jamaica while the fleet lay there; and it is poffible that this might be owing to the fame general caufe.

CHAP. VI.

Account of the HEALTH of the FLEET from its Departure from New York till the Conclusion of the War. — Paffage to the Weft Indies — Account of the Ships there during our Abfence — Arrival of a Squadron from England — Of thefe, two Ships only were healthy — Caufes of this — Inflammatory Complaints in the Union — Probable Caufe of thefe — Comparison of the two Squadrons — Increase of Sickness from Recruits brought from England — from French prisoners.

THIRTEEN ships of the line failed from America for the West Indies on the 25th of October, under the command of Admiral Pigot, and the other half of the fleet was left under Lord Hood, to watch the motions of the French squadron, which was then at Boston.

The day on which we left the coaft of America a ftorm came on, which lasted two

two days; but the reft of the paffage being fair and moderate, we arrived at Barbadoes on the 20th of November, where the fleet continued for the remainder of the month.

All the above-mentioned fquadron, except two fhips, is comprehended in the calculation of the following table, and alfo the Magnificent, Prudent, and Nonfuch. The two laft had continued in the Weft Indies during our abfence.

TABLE,

160 DISEASES OF THE FLEET, 1782. PART 1:

TABLE, fhewing the Prevalence of Sicknefs and Mortality in November.

DISEASES.	Proportion of those ta- ken ill in the Courfe of the Month.	Proportion of Deaths, in relation to the Number of Sick,
Fevers Fluxes Scurvy Ulcers Other Complaints - General Proportion -	54 78 86 94 46 15	25 132 0 132 0 103 77

About a fixth part of the whole fick were fent to the hofpital this month, and one half of these were sent to the hospital at Halifax from the Magnificent.

The proportion of deaths this month, in relation to the whole number on board, was one in eight hundred and eighty-feven.

Fewer

Fewer were taken ill this month than the preceding, but more in proportion died; which might partly be owing to the fleet having been more at fea, and partly to the change of climate.

Fevers were now more numerous; and alfo more fatal than any other difeafe; and we fee them follow the contrary proportion to Huxes in the progress to the fouthward, that they did in our progress to the northward. These fevers prevailed chiefly in the Formidable and Warrior. In the former it first appeared among fome men that had been prefied at New York from a privateer, fome of whom were feized a few days after our arrival at Barbadoes with the yellow fever, and they were the only inftances of it at this time in the fleet.

The fourvy continued to diminish, but the ulcers increased as we came into the torrid zone:

Difeafes in general were fo flight and fo few at this time, that the whole fquadron M from

162 DISEASES OF THE FLEET, 1782. PART 1.

from America fent only forty-eight men to the hofpital at Barbadoes from its arrival to the end of the month.

It may be proper here to give an account of fome of the fhips that remained on this ftation, while the main body of the fleet was in America.

The Prudent, when the left us, was extremely healthy, and continued fo till a flux broke out in July, which was communicated by fome men from a cartel, who were ill of this difeafe. It fpread among the fhip's company, and prevailed for three months. The only deaths during the feven months that this fhip was feparated from the fleet were, two from flux, and one from fcurvy, and only twenty-five were fent to hofpitals. This is a proof how much more healthy the windward station is than that of Jamaica. The fcurvy arofe at one time, in a cruife of five weeks, though there was no appearance of it at another time in a cruife of fix weeks. The caufe of this feems to be the difference of the weather at the two periods;

BOOK IL DISEASES OF THE FLEET, 1782. 163

periods; for it was very wet in the former, and very dry in the latter. The time in which this fhip was most exposed to fickness was while fhe was under repair at Antigua, a fituation in which hardly any fhip escapes a fevere visitation of fickness; yet this fhip was not at all affected by it, which seemed to be owing to the uncommon pains taken by the captain to prevent the men from labouring in the fun during the hot part of the day.

The Nonfuch was five months feparated from the fleet, during which time ten men died. Nine of these died of fevers, and one of the dyfentery. She failed from Jamaica for Barbadoes about the fame time that the fleet failed for North America, and was nine weeks on the paffage. A fever was the prevailing difeafe, and the men probably inhaled the feeds of it at Jamaica, in common with most of the other ships' companies that were there. The fcurvy, which had formerly prevailed fo much, appeared at this time; but it was in a very moderate degree, confidering the length of the paffage. M2 None

164 DISEASES OF THE FLEET, 1782. PART I.

None died of it, and few were fo ill as to require being fent to the hofpital. Had this fhip gone into a colder climate, like the others, it would probably have prevailed to a greater degree. The whole number fent to the hofpitals for various complaints, during the five months, was only thirteen.

The Nymph frigate was the only other ship left in the West Indies which is included in the tables. There happened only two deaths in her from June to October, both months included. One of thefe was from fcurvy, the other from afthma. She was in that time upon two cruifes, each of which lasted eight weeks. During the first the weather was dry and fine, and during the other it was wet and fultry, with the fame effect upon health as in the Prudent; for in the fecond cruife the fcurvy prevailed to a confiderable degree, but not at all during the first. This difease was prevented from becoming violent or fatal, on either occasion, by the great attention of Mr. Anderfon, the furgeon. He found great benefit from the effence of malt, when given early

BOOK 11. DISEASES OF THE FLEET, 1782. 165

early in the complaint; and fome limes having been taken in a prize, while this difeafe was at the worft, the fcorbutic men were fo much recovered by the ufe of them, that they were all able to return to duty before the fhip arrived in port.

M₃ DECEM-

166 DISEASES OF THE FLEET, 1782. PART I.

DECEMBER.

The whole fquadron remained at anchor at Barbadoes, and nothing worth notice occurred till the arrival of a reinforcement of eight fhips of the line, under Sir Richard Hughes, on the 8th of December. This fquadron had been detached by Lord Howe, after the relief of Gibraltar, and the action with the combined fleets on the 20th of October. It confisted of one ship of 90 guns, one of 80, three of 74, and three of 64. They failed from England on the 9th of September, and from that time till their arrival at Barbadoes they had not been in port, except for ten days that they were at Madeira, where they were fupplied with fresh meat, fruit, and vegetables, by which means the fcurvy, which had begun to prevail to a confiderable degree, was almost entirely eradicated, and the health of the men was furprifingly reftored, for fo fhort a time.

When they joined us, however, there was a good deal of ficknefs on board of them all, except

SOOK II. DISEASES OF THE FLEET, 1782. 167

except the Union and Ruby. The former had been more than three years in commiffion, and in that time had never been fickly, and had now all the advantages of a longeftablished and well-regulated ship's company. All the reft had been newly commiffioned and manned when they left England, The fuperior health of the Ruby was owing to her having been manned with the ccrews of other ships, some of which had just arrived from the West Indies; whereas tthe others had been manned chiefly by draughts of preffed men from guardships, cor by raw volunteers, of whom a great many were raifed in Ireland about this time. The Bellona and Berwick having been fomewhat longer in commission than the rest, were lefs fickly.

The following tables will fhew the comparative flate of health of the fquadron formerly on the flation with that which had newly arrived from England.

The proportion of the deaths this month to the whole number of men belonging to this part of the fleet, was one in four hundred and forty.

There

170 DISEASES OF THE FLEET, 1782. PART I.

There were one hundred and eighty-nine fent to the hofpital; but the proportion to the whole number of fick cannot be afcertained, as we do not know how many were on the lift on the first of the month.

The increase of fevers in the old squadron was chiefly owing to their having spread in the Nonfuch; and they seemed to partake more of that kind which originates in jails and ships, than of that which is peculiar to the climate. The body of one of the men who died of this fever was inspected at the hospital, and there was found to be inflammation and even perforation of the inteftines, without any previous symptom that could lead to expect such an appearance, a circumstance more likely to happen in the former fort of fever than the latter,

The increase of fcurvy was owing to the numbers that were taken ill of it in the Magnificent on the paffage from Halifax, from whence she failed in the beginning of this month, and joined the fleet at Barbadoes in the end of it. There was a great deal of fickness BOOK II. DISEASES OF THE FLEET, 1782. 171

bicknefs in this fhip at Halifax, and on the paffage, owing to the want of fuch clothing as was fuitable to that fevere climate. One of the principal complaints was an inflammatory fore throat.

There was no change in the fituation of the fleet, only that four fhips of the line were fent on the 16th to cruife near Guadaloupe, and they continued at fea till the beginning of February.

The new fquadron was much afflicted with the jail fever, brought from England; and it was much more prevalent, as well as malignant, on board of the Suffolk than any of the reft. During the paffage it prevailed most in the Princess Amelia, not less than twenty having died of it. It subsided in this ship before the arrived in the West Indies; but on board of the Suffolk it continued to rage for fome months after.

As the hofpital at Barbadoes was too fmall to contain all the fick of this fquadron, only the cafes of greateft danger and the moft infectious

172 DISEASES OF THE FLEET, 1782. PART 1.

fectious were fent on fhore, and those that remained were provided with fresh vegetables and milk on board of their own ships, in the fame manner as had been formerly practifed with fuch fuccess on similar occasions. This was continued for four weeks, during which time they all got into tolerable health, except the Suffolk.

There appeared, by the returns of the new fquadron, to be a greater number under the head of "Other Complaints," which was owing to the number of pulmonic complaints, the confequence of the influenza which prevailed in Europe, at fea, as well as on fhore, in the fpring and beginning of the fummer of this year.

Though inflammatory complaints are rare in this climate, yet in a few of the fhips there was fome appearance of them; and I remarked that they occurred in those fhips which were in other respects most healthy, and most free from infection. A good many of the men were feized with inflammatory fore throats in the Bellona a few days before fhe

BOOK II. DISEASES OF THE FLEET, 1782. 173

The arrived at Barbadoes, and this was in other respects the most healthy ship next to the Union and Ruby. In the Union there was no violent acute complaint whatever, which was very fingular among fo great a body of men; but feveral rheumatifms, coughs, and catarrhs, arofe in her this month, and there even occurred two pleurifies in the following month. The bowel complaints which occurred on board of this ship were also of an inflammatory nature. These difstempers feemed to proceed from accidental exposure and irregularity; and is it not highly probable that these causes, instead of producing local inflammatory complaints, might have been the means of exciting bad fevers and fluxes, as in the other fhips, had the men been equally predifposed to them, by living in foul air, or under the influence of infection ?

The following tables will fhew the comparative flate of health of the two fquadrons in the three first months of next year.

180 DISEASES OF THE FLEET, 1783. PART 1.

The main body of the fleet remained at Barbadoes till the 12th of January, when they went to cruife to windward of Martinico, in order to intercept a French fquadron expected from North America. This cruife lafted four weeks; and intelligence being received of the enemy's having taken a different route, the whole fleet bore away for St. Lucia, where it came to an anchor on the 8th of February.

In the courfe of the three months above mentioned, we fee the two fquadrons approaching to each other, in point of health, till they became pretty equal and fimilar; and the new fquadron became even fomewhat more healthy than the old.

The increase of fevers in the old squadron was owing to two cases. One was the importation of new-raised recruits brought from England by some ships that arrived in the beginning of January. These were diftributed to such ships as shood most in need of men; and being very dirty and ill cloathed, were likely to harbour infection. They were

BOOK II. DISEASES OF THE FLEET, 1783. 181

were evidently the caufe of ficknefs in the Warrior and Royal Oak; for thefe fhips were before that time healthy, and the fever began with thefe ftrangers, and fpread amongft the former crew. It is remarkable that the fhips that brought them from England were not affected by them.

It was caught in the Royal Oak from fix men that came from England in the Anfon, which men, though first put on board the Namur, communicated no fever there, having been kept feparate from the reft of the men; but being fent to the Royal Oak, they were themfelves first taken ill with a fever, which afterwards fpread to about thirty of the other men. What was fingular in this fever was, that the eyes and fkin of all that were affected by it became yellow, though without any particular malignancy; for only two died on board, and one in the hospital. There was one whose skin was very yellow, yet his complaint was fo flight as never to confine him to his bed.

 N_3

The

182 DISEASES OF THE FLEET, 1783. PART I.

The other cause of the increased proportion of fevers in the old squadron was, the great number of these complaints that arose in the Magnificent. This ship having been fent on a cruife about the middle of February, and the weather being rainy, fqually, and uncommonly cold, for the climate, many fevers of the inflammatory kind appeared. During this cruife fhe made prize of a large French frigate, called the Concord, and the greater part of the prifoners being taken on board, the fever from that time affumed a different type, with new and uncommon symptoms; for, instead of being inflammatory and requiring bleeding, as before, it became more of a low, putrid kind, and was attended in most cases, if not in all, with a continual fweating; fo that, inftead of evacuations, the remedies that were found most effectual were the Peruvian bark, blifters, and opium. Thus we fee fevers varioufly modified according to men's conftitutions, the state of the air, and the noxious effluvia of the strangers that intermix with them.

BOOK II. DISEASES OF THE FLEET, 1783. 183

We find the proportion of fluxes increafing in the new fquadron in January and February, as they had formerly done in moft of the fhips foon after their arrival from England. They were obferved alfo to prevail principally in those fhips that had formerly been most fubject to fevers, and not to arise till the fever had fubfided. They were found, for inftance, to arise later in the Suffolk, where the fever was obstinate and malignant, than in the Princes Amelia, where the fever had been at one time general and fatal, but not fo violent and lasting as in the other.

The four fhips that were fent to cruife near Guadaloupe continued at fea for feven weeks; and it was owing to the prevalence of fcurvy in thefe and in the Magnificent that the proportion of that difeafe was greater at this time in the old than in the new fquadron,

The fleet remained at St. Lucia till the accounts of the peace arrived in the beginning of April. The fervice was then at an N 4. end,

184 DISEASES OF THE FLEET, 1783. PART 1.

end, and I returned to England with the first division of the fleet, which failed from St. Lucia on the 12th of April, under the command of Rear-admiral Sir Francis Drake, who was at this time in extremely bad health, and requested me to accompany him.

BOOK III.

Of the Numbers and Mortality of different Difeafes fent to Hofpitals.

CHAP. I.

Hofpital at Gibraltar, 1780 — at Barbadoes, 1780 — Caufes of Mortality from various Difeafes — Accidents — the Hurricane — Wounds — Amputations — Scorches — Fluxes very apt to arife at the Hofpital — Proportion that were received and died at Antigua — St. Chriftopher's — St. Lucia, and at Barbadoes, 1782 — at Jamaica, 1782 — at New York, Autumn, 1780 — 1782 — General View of the Admiffions and Mortality at all the Hofpitals during the War.

IN order to judge of the loss fuftained by difeafe, in the courfe of that fervice of which a relation has been attempted, the fick fent to the hospitals must be taken into account. I shall, therefore, give a short view of the different difeases admitted, and their mortality, at the several hospitals connected with the several hospitals conn 186 ACCOUNT OF THE HOSPITALS. PART 1. that different fituations have upon the health and recovery of men *.

The fleet which effected the first relief of Gibraltar, under the command of Lord Rodney, confisting of twenty ships of the line, arrived there in the third week of January, 1780, after a passage of three weeks and a few days from England, in which they had an action with the Spanish fleet, and obtained a victory over them, on the 16th of that month. The whole fleet, except one ship, failed from Gibraltar on the 13th of February, and while it lay there, the difeases fent to the hospital, and their respective mortality, were as follows +:

Fevers

* As my own ftay at different ports was fhort, and as my own knowledge could not extend beyond that period, Dr. Farquarfon, Firft Commissioner of Sick and Wounded Seamen, very politely gave me leave to infpect the books of the different hospitais at his office, and I collected from them the fate of all the men that were landed.

+ It is proper to mention, that the name of the difeafe in the hofpital books being taken from the ticket fent on OOK III. ACCOUNT OF THE HOSPITALS,

* This comprehends not only the deaths in the time the fleet remained there, but all that happened afterwards. The mortality,

on fhore with each fick perfon, great accuracy is not to be expected, as this is frequently done in a carelefs manner. My returns were made with great exactnefs; and, in the latter part of the war, the hospital books may also be depended upon in this respect, the tickets, at my request, having been made out with accuracy.

* In this, and the other tables, the smaller fractions are neglected.

from

188 ACCOUNT OF THE HOSPITALS. PART 1.

from wounds and ulcers, is greater than might be expected in fo fine a climate, and at the cooleft feafon of the year; but as the place was then befieged, the fick and wounded could not be fupplied with those refreshments that were necessary to the recovery of the men, and wounds and ulcers are complaints very apt to be affected by the quality of the diet.

The main

The

The following is an Account of the Men admitted at the Hofpital at Barbadoes in the Campaign of 1780, that is, from the 16th of March till the end of June:

DISEASES.	Admitted.	Died.	Proportion.
Fevers	277	43	61

Ulcers Wounds	92 167	16 61	I N 0
Other Complaints	129	23	51
Total	943	212	41

The fevers were chiefly from the five lineof-battle fhips that came immediately from Europe in March. Upon their arrival they fent on fhore one hundred and ninety-three men 190 ACCOUNT OF THE HOSPITALS. PART I. men ill of fevers, only one with the flux, fifteen with the fcurvy, and five with ulcers.

When these ships returned to Barbadoes in May, along with the rest of the fleet, the greater part of the fick were then also on board of them. By that time the flux and scurvy had broke out. The former prevailed chiefly in the Terrible; the latter in the Intrepid. That part of the fleet which we found on the station fent on shore a very small proportion of all the classes of complaints, except wounds.

Of the wounds, nineteen were amputations, of which there died nine, mostly of the locked jaw. There were forty-fix fcorched by gunpowder, of whom there died fourteen; fo that, besides those who were killed outright, and those who died on board in confequence of accidents of this kind, before they could be sent to an hospital, about one fourth of all the wounds, and the same proportion of all the deaths from wounds, at the hospital, was owing to this cause. This circumstance ought to induce commanders

to

BOOK III. ACCOUNT OF THE HOSPITALS. 191

co take every precaution to prevent fuch accidents. In the fubfequent part of the war they were lefs frequent, in confequence of that greater caution, and more accurate method of working great guns, which were acquired by practice and experience *.

In the account of the mortality, I have included only fuch as died before the 1ft of January, 1781; for if any were carried off after that time, it was most probably by fome incidental complaint. There were fixtty-five of them at that time remaining, and they were chiefly men difabled by lamenefs waiting for a paffage to England as invalids.

Out of the twenty-three that were killed by the fall of the houfe in the hurricane on the 10th of October, eight were of the number above accounted for; but thefe are not included in any of the claffes of deaths.

The mortality among the men admitted at this time was greater than what occurred

* See the laft chapter of Part III.

afterwards

192 ACCOUNT OF THE HOSPITALS. PART 1,

afterwards in any of the hofpitals that I attended, except that at Jamaica. The principal caufe of this was, that as the fleet was fo much greater than had ever been known here before, there was not fuitable accommodation for fuch numbers as it was neceffary to fend on fhore, and we had not then fallen on the method of fupplying refreshments to the men on board of their fhips. The circumftance by which the men fuffered most was, the great crowding which the want of room made neceffary. There is here no public building appropriated for an hospital; so that this, as well as every thing elfe, being found by contract, and the number of fick being fo much greater than it was usual to provide for, the whole was at this time conducted in a manner not very regular.

It appears that the greateft mortality in any class of difease was that of the fluxes, of which the greatest number sent to hospitals are such as have languished for some time under this difease, in which state it generally

BOOR III. ACCOUNT OF THE HOSPITALS. IS

generally proves fatal in the West Indies, in confequence of incurable ulcers in the great intestines, to which the heat of the climate, as well as the foorbutic habit and fea diet, is particularly unfavourable. But the whole of the mifchief arifing from it does not appear in the table; for it was the most apt of any difease to supervene upon other complaints which were under cure at the hofpital. It more particularly attacked those who were recovering from the fcurvy, and was the caufe of the greater number of deaths under this head in the table. It was found to be more contagious than fevers, either becaufe the men's conftitutions were more predifposed to it, or, perhaps, because tthe infectious matter of it being more grofs and lefs volatile, it is not fo readily diffipated by the heat of the climate; for, either from tthis, or some other circumstance, infectious fevers are not fo eafily generated, nor fo apt Ito fpread, as in Europe. That thefe fluxes were owing to infection may be inferred from hence, that, when men ill of the fcurvy were cured on board of the ships they

193

194 ACCOUNT OF THE HOSPITALS. PART I.

they belonged to, they were not liable to this difeafe, neither did they prevail at thefe hofpitals afterwards, when great care was taken to feparate infectious difeafes from the others.

The only regular hospital on this station is that at Antigua. This island being the feat of the royal dock yard, there is an establissed hospital in time of peace as well as war. It so happened, that great fleets never came here to put their fick and wounded on shore, as at Barbadoes; so that the greater number of those received into it were from fingle ships that came to careen. As there was, therefore, less necessity for crowding, and as the slighter cases could be admitted, there was a less proportion of deaths here than at most of the other hospitals.

There were two other eftablishments for the reception of the fick and wounded on this station, but they were only temporary. These were at St. Lucia and St. Christopher's, where the men being received in great

BOOK III. ACCOUNT OF THE HOSPITALS. 195

egreat numbers at a time from large fleets, and as there were accommodations only for the moft urgent cafes, the mortality approached more nearly to that of Barbadoes. There died at St. Chriftopher's, in the years 1780 and 1781, in the proportion of one in fix, and at St. Lucia, in the fame time, one in five and a half, or two in eleven. The rair of the hofpital at St. Lucia was remarkably pure, and this degree of mortality was to wing to the fick having been accommoidated in tents and huts. In the two laft years of the war, when an hofpital was built, and regularly eftablifhed, the mortality was not much above one half of this.

Some authors have endeavoured to form an effimate of the fuccefs of practice from the different rates of mortality; but this is extremely fallacious; for the fatality of difeafes will depend on their violence, the proportion of deaths being very different in cafes that are flight, from what it is in thofe that are dangerous. We fhall take a view, however, of the hofpital at Barbadoes at O_2 another

196 ACCOUNT OF THE HOSPITALS. FART I.

another period, in which there feemed little or no difference in the violence of the difeafe, and when the fuperior fuccefs feemed to be owing to the hofpital's not being fo crowded, and to the better attendance and treatment of the fick. The following is a view of the difeafes that were admitted in the laft three months of the year 1782, the greater part of which were landed from the reinforcement of eight fhips of the line that joined the fleet at Barbadoes in the beginning of Decembér:

Fevers

It happened on this, as on the former occafion, that none were fent on fhore but fuch as were very ill, or had contagious complaints, the reft being provided with refrefhments on board of their fhips. There were no wounds at this time, but there was a greater proportion of fevers; fo that the complaints, upon the whole, might be faid to be about equally dangerous. The mortality now was, how ever, confiderably lefs, and this is to be imputed to the more favourable fituation of the hofpital, which I O_3 did

198 ACCOUNT OF THE HOSPITALS. PART I.

did not allow to be overcrowded; and the men had all manner of justice done them in point of attendance and accommodation.

I shall give another example of the fame kind in the hospital at Jamaica, when our fleet went there after the battle of the 12th of April. All the men accounted for here were landed from the fleet under Lord Rodney in May, June, and July, 1782*.

following is the account of the men fent to the hospital in May and June:

There was on board of this fleet about two thirds of the number of men that was on board of the fleet in 1782. I cannot afcertain how many died on board of the fhips in Admiral Vernon's fleet; but the deaths at the hofpital alone are fomewhat more than what happened to our fleet both on board and at the hofpital.

04

fmall,

200 ACCOUNT OF THE HOSPITALS. PART I.

fmall, those only were fent to it who were very ill. There were at this time upwards of forty ships of the line at Jamaica, and an hospital, containing only three hundred beds, could afford but a very inadequate relief. Some officers are unwilling that any man should die on board of their ships, for fear of dispiriting the others; and many were fent to the hospital, in the most desperate stage of sickness, that they might there die.

There cannot be a ftronger proof than this of the fallacy of judging of the fuccefs of practice by the proportion of the deaths; for the fick on this occafion were better accommodated, better provided for in every refpect, and as regularly attended, as at any other period of my fervice in the Weft Indies, yet the mortality was greater than at any other time.

Having given inftances of the common rate of mortality in hospitals in Europe and the West Indies, I shall next give examples of the fuccess we had in North America, when when the fleet was there in the autumns of 11780 and 1782.

The difference of mortality here, from what occurred in the Weft Indies, is partly imputable to climate, and partly to the finaller number of acute difeafes. In the two accounts laft flated, the difference in favour

BOOK III. ACCOUNT OF THE HOSPITALS. 203

favour of the latter feemed chiefly to arife from the fuperior attention to the fick, and the better treatment of them. It was menmoned before, that in autumn, 1782, at New York, they were better fupplied, both at hospitals and on board of their ships, with every thing that could be wifhed, and that on this occasion almost every scheme I had proposed was realised. The extraordimary fuccefs in the fcurvy was owing to the great quantities of vegetables that were fupplied; for feveral fields of cabbages had been planted in the neighbourhood of the hospital for the use of the fick. This was cowing to the humane attention of Admiral Digby, who had alfo caufed cows to be purchased to supply the hospital with milk. Cleanlinefs, and the feparation of difeafes, were alfo firictly attended to; and I am perfuaded that many of the fcorbutic men were faved by keeping them feparated from the fevers and fluxes; for it has been obferved, that men ill of the fcurvy, or recovering from it, are very apt to be infected, particularly with the flux.

204 ACCOUNT OF THE HOSPITALS. PART I.

It appears, that the difeafe in which climate makes the greateft difference is the flux. It was obfervable, that though the dyfentery at this time was more fatal on board of the fhips at New York than in the Weft Indies, yet it was lefs fo at the hofpital. The caufe of this feems to be, that the acute ftate of this difeafe, of which men die on board before there is time to remove them to an hofpital, is more fatal in a cold climate; but when it becomes more protracted, which is the cafe with moft of the cafes fent to hofpitals, they then do much better in a cold than in a hot climate.

I fhall here fubjoin an account of the numbers that were admitted, and died, during the whole war, at the hofpitals of the different parts at which the fleets I was connected with touched.

At

I have been able to calculate the numbers of deaths from difeafe in this great fleet, both on board and at hofpitals, during the period of my own fervice, which was three years and three months, and they amounted to three thousand two hundred *, independent

* I was enabled, after coming to England, to afcertain the deaths in that part of the fquadron from which I happened

205

dent of those that were killed and died of wounds.

There died of difeafe in the fleet 1 belonged to, from July, 1780, to July, 1781; about one man in eight, including both thofe who died on board and at hofpitals *: But the annual mortality in the Weft-India fleet, during the laft year of the war, that is, from March, 1782; to March, 1783; was not quite one in twenty +. This difference was partly owing to the general increafe of health in fleets as a war advances, partly to fome improvements in victualling, and partly to better accommodations as well as regulations in what related to the care of the fick.

Though

happened at any time to be absent, by having leave from the Navy Board to inspect the ships' books deposited at their office.

* See Appendix to Part II.

The mortality of the army in the Weft Indies is much greater; for it appears by the returns of the War Office, that there died in the year 1780, two thousand and thirty-fix foldiers, which being calculated by the numbers on the station, and those who arrived in the convoy

BOOK III. ACCOUNT OF THE HOSPITALS. 207

Though the mortality in fleets in the Weft Indies is, upon the whole, greater than in Europe, yet it has fo happened, that, in the late war, the fleet at home has, at particular periods, been confiderably more fickly than that in the Weft Indies was at any one time. I was informed by Dr. Lind, that, when the grand fleet arrived at Portfmouth in November, 1779, a tenth part of all the men were fent to the hofpital. It appears *,

woy in March and July, the annual mortality is found to be one in four. The greatness of this mortality will appear in a still stronger light, when it is confidered that those who serve in the army are the most healthy part of the community. When I was at the encampment at Coxheath in the year 1779, I was politely favoured with a fight of the returns, both of the general officers and phyfician, and it appeared that in an army of ten thoufand and eighty-nine men, there died, from the 10th of June to the 2d of November, forty-three, exclusive of twelve who died of fmall pox. This being calculated, is equal to an annual mortality of one in a hundred and mine; and it was not half fo much in the encampment of the former year. It appears by Mr. Simpfon's tables. what the mortality of mankind in England, from the age of twenty to forty-five, which includes the ufual age of those who serve in the navy and army, is one in fifty.

* See Table II.

208 ACCOUNT OF THE HOSPITALS. PART I.

that in the years 1780 and 1781, a period at which the fleet in the Weft Indies was moft fickly, the medium of the numbers on the fick lift was one in fifteen, and many of thefe were very flight complaints; whereas, in the fleet alluded to in England, the difeafes were moftly fevers, and fo ill as actually to be fent to the hofpital. It appears likewife, that there was the greatest proportion of fick in our fleet when it was on the coast of America in September, 1780*. This difference is owing to the greater prevalence of the spipe for the foury, in a cold than in a hot climate.

With regard to the mortality at hospitals, the comparison is greatly in favour of those in England. This is owing to the greater regularity, and the better accommodation and diet, which an hospital at home admits of, as well as to the difference of climate. It has also been mentioned, that, on most occasions, the hospitals I attended abroad were so limited as to contain only the worst cases, in confequence of which there would of course

* See Table II.

be

BOOK III. ACCOUNT OF THE HOSPITALS. 209 De a greater proportional mortality than in the great hospitals of England.

The following is an account of the whole lofs of lives from difeafe, and by the enemy*, in three years and three months, in the fleets and hofpitals with which I was connected :

Died of difease +		-	-	3200
Killed in battle	-	-	-	648
Died of wounds	•	-	-	500
To	ota	1‡	. 1	4348

* None are comprehended but those who were killed for wounded in battles in which the whole fleet was predent, this account not including those who fell in fingle actions in frigates or other ships.

It would appear, that, anciently, though the flaughter in battle was greater than in modern times, yet that difeafe was still more destructive than the sword. One of the oldest testimonies to this purpose is in the History of Alexander's Expedition, by Arrian — τους μεν is ταϊς μαχαις άπελαλεκασιο, δι δι in των τραυματων άπομαχει γεγισημεσοι, δι πλικοῦ; δε 107ω άπελαλεσαι. — Arrian. OF THE

CAUSES OF SICKNESS IN FLEETS,

AND THE MONT SUMMERICA

T TO THE THE T

MEANS OF PREVENTION.

INTRODUCTION.

IN the year 1780 I printed a fmall treattife for the use of the fleet, containing gemeral rules for the prevention of fickness; and this part of the work is chiefly taken from it.

My own opportunities of experience, as exhibited in the preceding Part, have been fufficiently extensive to suggest many observations on this subject; but as my object is utility, rather than the praise of originally, I shall not confine myself to these. Great P 2 put

212 CAUSES AND PREVENTION PARTII,

part of what is to be advanced is taken from books * and converfation, as well as my own experience, my defign being to exhibit a concife view of all the difcoveries on this fubject that have come to my knowledge. I have affumed nothing, however, from mere report or teftimony, having had opportunities, from my own obfervations, of verifying or difproving the affertions of others.

More may be done towards the prefervation of the health and lives of feamen than is commonly imagined; and it is a matter not only of humanity and duty, but of intereft and policy.

Towards the forming of a feaman a fort of education is neceffary, confifting in an habitual practice in the exercise of his profeffion from an early period of life; fo that if

* The authors from whom I have borrowed have been chiefly Dr. Lind and Capt. Cook. To the former we are indebted for the most accurate observations on the health of feamen in hot climates; of the improvements made PART II.

OF DISEASES.

if our flock of mariners fhould come to be exhaufted or diminished, this would be a loss that could not be repaired by the most flourishing state of the public finances; for money would avail nothing to the public defence without a sufficient number of able and healthy men, which are the real refources of a state, and the true finews of war.

In this view, as well as from the peculiar dependence of Britain on her navy, this order of men is truly ineftimable; and even confidering men merely as a commodity, it could be made evident, in an œconomical and political view, independent of moral confiderations, that the lives and health of men might be preferved at much lefs expence and trouble than what are neceffary to repair the ravages of difeafe.

made by the latter, an excellent compendium may be feen in Sir John Pringle's Difcourfe before the Royal Society, on the occasion of adjudging a prize medal to Capt. Cook for his paper upon this fubject.

P 3

213

214 CAUSES AND FREVENTION

It would be endlefs to enumerate the accounts furnished by history of the loss and difappointments to the public fervice from the prevalence of difease in fleets. Sir Richard Hawkins, who lived in the beginning of the laft century, mentions, that in twenty years he had known of ten thousand who had perifhed by the fcurvy. men Commodore Anfon, in the courfe of his voyage of circumnavigation, loft more than four fifths of his men chiefly by that difeafe. Hiftory fupplies us with many inftances of naval expeditions that have been entirely frustrated by the force of difease alone: that under Count Mansfeldt in 1624; that under the Duke of Buckingham the year after; that under Sir Francis Wheeler in 1693; that to Carthagena in 1741; that of the French under D'Anville in 1746; and that of the fame nation to Louisbourg in 1757*.

That

* In the late war fickness alone was not the caufe of want of fuccefs in any inftance, except in the laft action in the East Indies, in which so many men were ill of the fcurvy, that there were not hands enow to manage the guns.

There

PART II.

OF DISEASES.

That the health of a fhip's company depends in a great meafure upon means within our power, is ftrongly evinced by this, that different fhips in the fame fituation of fervice enjoy very different degrees of health. Every one who has ferved in a great fleet must have remarked, that out of fhips with the fame complement of men, who have been the fame length of time at fea, and have been victualled and watered in the fame manner, fome are extremely fickly, while others are free from difeafe. Is it not naturally to be inferred from hence, that the health of men at fea depends in a great meafure upon circumstances within the

There is another fact in hiftory, which, though not fo applicable to this fubject as those above recited, forcibly evinces how important a ftudy the health of men ought to be in military affairs. When Henry V. was about to invade France, he had an army of fifty thoufand men; but owing to a fickness which arose in the army, in consequence of some delays in the embarkation, their number was reduced to ten thousand at the battle of Agincourt. The difease of which they chiefly died was the dysentery. RAPIN.

P 4

power

215

216 CAUSES AND PREVENTION PART II. power of officers, and, indeed, upon their exertions, much more than medical care*?

It has appeared in the preceding part of this work, that the difeafes most prevalent among feamen are fevers, fluxes, and the icurvy. These are indeed fome of the most fatal that can attack the human body; but there is a numerous tribe of complaints, which are also some of the most fevere tcourges of human nature, from which they are in a manner entirely exempt. -These are the diseases to which the indolent and luxurious are fubject, and which fo far embitter their life as to render their portion of worldly enjoyment nearly on a level with that of the poor and laborious. The difeafes alluded to are chiefly the gout, ftomach complaints, hypochondriac and other ner-

* It is not meant by this to infinuate that every commander is abfolutely accountable for the health of his fhip's company, and cenfurable when they are fickly; for this may depend on his predeceffor in command, or a ftubborn infection may have prevailed from the original fitting out or manning of the fhip which he may not have fuperintended.

and he had an unay of thity then

vous

OF DISEASES. 217

PART II.

vous diforders. In all countries it is the better fort of people that are most fubject to thefe; for they are owing to the want of bodily exercife, to the great indulgence of the fenfes, and a greater keennefs and delicacy in the paffions and fentiments of the mind. Man being formed by nature for active life, it is neceffary to his enjoying health that his mufcular powers fhould be exercifed, and that his fenfes should be habituated to a certain ftrength of impreffion. Animal and vegetable nature may be aptly enough compared to each other in this refpect; for a tree or plant brought up in a greater degree of shelter and shade than what is fuitable to its nature, will be puny and fickly; it will neither attain its natural growth nor ftrength of fibre, nor will it be able to bear the influence of the weather. nor the natural vicifitudes of heat and cold to which it may be exposed.

It is to be remarked, however, that exercife and temperance may be carried to excefs, and that in these there is a certain falutary medium; for when labour and abstinence

218 CAUSES AND PREVENTION PART II.

nence amount to hardfhip, they are equally pernicious as indulgence and indolence. This is ftrongly exemplified in feamen; for, in confequence of what they undergo, they are in general fhort lived, and have their conftitutions worn out ten years before the reft of the laborious part of mankind. A feaman, at the age of forty-five, if fhewn to a perfon not accuftomed to be among them, would be taken by his looks to be fifty-five, or even on the borders of fixty *.

The moft common chronic complaints which a long courfe of fatigue, exposure to the weather, and other hardships, tend to bring on, are pulmonary confumptions, rheumatisms, and dropsies. It is also to be confidered, that these complaints, particularly the last, are farther fomented by hard drinking, which is a common vice among

Dire is the ocean, dread in all its forms ! Man must decay, when man contends with storms.

POPE. this

OF DISEASES.

PART II.

this clafs of men, and they are led to indulge in it by the rigorous and irregular courfe of duty incident to their mode of life.

With regard to gout, indigeftion, hypochondriac complaints, and low fpirits, there is fomething in hard labour of every kind that tends to avert them, and particularly in that rough mode of it peculiar to a fea life. There is also fomething in the harsh fenfations from the objects which feamen are in use to see, hear, and handle, which so modifies their conftitutions and hardens their nerves as to make them little liable to what may be called the difeafes of exceffive refinement, fuch as those above mentioned. I have, indeed, met with fuch difeafes at naval hospitals; but I always remarked that they were in landfmen who had been preffed, and who had been bred to fedentary and indolent occupations,

The difeafes above enumerated, as well as most other chronic complaints, being the offspring of indolence and luxury, while fevers and feverish complaints fall equally on

222 CAUSES AND PREVENTION PART II.

The prevention of difeafes is an object as much deferving our attention as their cure; for the art of physic is at best but fallible, and ficknefs, under the best medical management, is productive of great inconvenience, and is attended with more or lefs mortality. The means of prevention are also more within our power than those of cure; for it is more in human art to remove contagion, to alter a man's food and cloathing, to command what exercise he is to use and what air he is to breathe, than it is to produce any given change in the internal operations of the body. What we know concerning prevention is alfo more certain and fatisfactory, in as much as it is eafier to inveftigate the external caufes that affect health than to develope the fecret fprings of the animal æconomy.

This part of the work, therefore, is chiefly addreffed to those who direct the navy either in a civil or military capacity; for the general health of ships depends fo much upon the victualling and manning in the

OF DISEASES, 223

PART II.

the first instance, and, afterwards, on the degree of difcipline and order which are kept up, that I am perfuaded that a certain degree of attention on their part would almost entirely eradicate difeafe from our fleets.

Several remarks in this part of the work will be found fo obvious, that it might feem fuperfluous to mention them. But it has been my intention to omit nothing that I have heard of or observed as a matter of afcertained utility, and, I believe, the most experienced will find either fomething new, or what they had not before fufficiently attended to. Though the defign of it is that of being extensively useful, yet my trouble would be compenfated, fhould it prove the means of health and comfort to a fingle thip's company; nay, I thould not repent my labour, could I enjoy the confcious certainty of its being the means of faving the life of one brave and good man.

The prevention of difease has relation only to the external caufes that affect health, and 274 CAUSES AND PREVENTION PARTIL and I shall confider these under the four heads of

OF DISEASES.

CHAP. I.

AIR.

UNDER this head I shall not only confider the natural state of the air of the atmosphere in point of heat and cold, moifture and dryness, purity and corruption, but also the different artificial impregnations of it from the holds or other parts of a ship, or from the perfons of men who have been neglected in point of cleanliness.

The common air of the atmosphere at fea is purer than on fhore, which gives to a fea life a very great advantage over a life at land. This advantage is ftill greater in the tropical regions, where the land air, especially fuch as proceeds from woods and marshes, is so fatal, and where the heat is also confiderably less at sea than on shore. But this superior purity of the air at sea is 0 more

226 CAUSES AND PREVENTION PART II.

more than counterbalanced by the artificial means of propagating difeafes on board of a fhip. Since a fea life, however, has this great natural advantage to health, the caufes of difeafe peculiar to it are chargeable rather to the mifmanagement of men than to any thing unavoidable in nature; and we are from this encouraged to exert our endeavours in removing them.

The effects of land air, however, are not to be neglected by those who are studious of preferving the health of a ship's company, for scamen are exposed to it in various ways while they are in harbour; and this is what we shall first treat of.

allo contration has so see that on facto.

· · · · · · · · · · · ·

SECT.

OF DISEASES.

SECT. I.

Of the noxious Effects of LAND AIR in particular Situations.

ALL the difeases incident to a fleet, except the fcurvy, are more apt to arife in a harbour than at fea, and particularly the violent fevers peculiar to hot climates. There are generally woods and marshes adjacent to the anchoring places in the Weft Indies, and the men are exposed to the bad air proceeding from thence, either in confequence of the fhip's riding to leeward of them, or of people's going on fhore on the duties of wooding and watering. Inftances of this, without number, might be adduced from the accounts of voyages to all the tropical countries. Our fatal expeditions to the Baftimentos, and to Carthagena, in former wars, are firiking proofs of it; and we have feen the fame effects, though in a much lefs degree, while the fleet was at Jamaica in 1782.

I have

228 CAUSES AND PREVENTION PART IT.

I have known a hundred yards in a road make a difference in the health of a fhip at anchor, by her being under the lee of marfhes in one fituation, and not in the other *. Where people at land are fo fituated, as not to be exposed to the air of woods and marfhes, but only to the fea air, they are equally healthy as at fea. There was a remarkable inftance of this on a finall ifland, called Pidgeon Ifland, formerly defcribed, where forty men were employed in making a battery, and they were there from June

to

* If the experiments of modern philosophy are to be depended on, they go a certain way to account for the unwholesomeness of air from woods in hot climates, and in wet weather; for Dr. Ingenhousz found that the effluvia of plants in the night time, and in the shade, are more poisonous in hot than in cold weather; but though there is a falubrity in the effluvia in funshine, the heat of the weather makes no difference with regard to this. He found also that vegetables, when wet, yield an unwholesome air.

It is difficult to afcertain how far the influence of vapours from woods and marshes extend; but there is reafon to think that it is to a very small distance. When the ships watered at Rock Fort, they found that if they anchored OF DISEASES.

SECT. I.

to December, which includes the moft unhealthy time of the year, without a man dying, and with very little ficknefs among them, though they worked hard, lived on falt provisions, and had their habitations entirely deftroyed by the hurricane. During this time near one half of the garrifon of St. Lucia died, though in circumftances fimilar in every refpect, except the air of the place, which blew from woods and marfhes.

anchored clofe to the fhore, fo as to fmell the land air, the health of the men was affected; but upon removing two cables length, no inconvenience was perceived. I was informed of the following fact, in proof of the fame, by the medical gentlemen who attended the army in Jamaica: — The garrifon of Fort Augufta, which flands very near fome marfhes, to which it is to leeward when the land wind blows, was yet remarkably healthy; but it became at one time extremely fickly upon the breaking in of the fea in confequence of a high tide, whereby the water which was retained in the hollows of the fort produced a putrid moifture in the foil, exhaling a vapour offenfive to the fmell, and with all the noxious effects upon health commonly arifing from the 'effluvia of marfhes.

The

229

230 CAUSES AND PREVENTION PART II.

The duties of wooding and watering are fo unwholefome, that negroes, if poffible, fhould be hired to perform them. In general, however, the employing of feamen in filling water and cutting wood is unavoidable, but it fhould be fo managed as not to allow them, on any account, to ftay on fhore all night; for, befides that the air is then more unwholefome, men, when afleep, are more fufceptible of any harm, either from the cold or the impurity of air, than when awake and employed,

As the fervice neceffarily requires that men fhould be on fhore more or lefs, however unwholefome the air may be, means are to be ufed to prevent its pernicious imprefions on the body. Certain internal medicines, fuch as bitters, aromatics, and fmall quantities of fpirituous liquors, tend to preferve the body from its bad effects. Of the bitters, Peruvian bark is, perhaps, the beft; and there is a well-attefted inftance of its efficacy in the account given by Mr. Robertfon of a voyage in the Rainbow to the coaft of Africa; and by the fame means Count OF DISEASES.

231

SECT. I.

Count Bonneval and his fuite efcaped ficknefs in the camps in Hungary, while half of the army were cut off by fevers. In confequence of Mr. Robertfon's reprefentation of the effects of bark in curing and preventing the fevers of that climate, the fhips of war fitted out for the coaft of Guinea have been fupplied with it gratuitoufly, and Government would find its account in extending this bounty to all the tropical flations.

We have feen, in the former part of this work, that the fever produced by the impure air of marshes may not appear for many days after the noxious principle, whatever it is, has been imbibed; men having been fometimes feized with it more than a week after they had been at fea. It naturally occurs, therefore, that fomething may be done in the intermediate time to prevent the effects of this bad air; and nothing is more advifeable than to take fome dofes of Peruvian bark, after clearing the bowels by a purgative. Some facts, related in the first part of this work, flow that an interval of ten days or a fortnight may elapse between the ' Q_4

232 CAUSES AND PREVENTION PART II.

the imbibing of the poifon and its taking effect. And, in order to guard against the difeases of this climate in general, it would be more proper to take fome large dofes of bark once in either of these periods, than to make a conftant practice of taking a little, as I have known fome people do, by which they may also render their body in some measure infensible to its good effects. I knew a phyfician of fome eminence in the Weft Indies, who always enjoyed uninterrupted health, and he imputed it to his taking from half an ounce to an ounce of bark every change and full of the moon, as he thought that fevers of the intermitting and remitting kind, were more apt to occur at thefe periods. Whether this idea be well founded or not, the practice is proper, upon the other principle that has been mentioned, and the phases of the moon will at least ferve as an aid to the memory.

The fpices of the country, fuch as capficum and ginger, for which nature has given the inhabitants of the torrid zone an appetite, have also been found powerful in fortifying OF DISEASES.

SECT. I.

fying the body against the influence of noxious air. Either these, or the bark, or similar substances, of a bitter and aromatic nature, given in a glass of spirits to men going upon unwholesome duty, have been found to have a powerful effect in preventing them from catching the fevers of the climate. The practice may be thought too troublefome in the hurry of fervice in a great fleet; and I in general avoid mentioning any thing but what is easily practicable, and highly important to the body of feamen at large; but fuch a precaution may be of fervice at least to officers, or to a spirit company, when fervice is easy, or on a small scale.

But befides the poifonous effluvia of woods and marfhes, the fenfible qualities of the air are alfo to be attended to. If I were required to fix on the circumftances moft pernicious to Europeans, particularly thofe newly arrived in the Weft Indies, I would fay, that they are too much bodily exercife in the fun, and fleeping in the open air; and the practices moft hurtful next to thefe are, intemperance in drinking, and bad hours. The

233

234 CAUSES AND PREVENTION PARTIN.

The ficknefs and mortality among new comers may, in general, be imputed to fome one of these causes. It is in favour of this opinion that women are not subject to the fame violent fevers as the other fex, which is probably owing to their not giving into the above-mentioned irregularities.

The laft direction I shall mention with regard to the prefervation of health in a harbour is, that the ship should be made to ride with a spring on the cable, that the fide may be turned to the wind, whereby a free ventilation will be produced, and the foul air from the head, which is the most offensive part, will not be carried all over the decks, as it must be when the ship rides head to wind.

Having little experience of my own with regard to difeafes at fea in cold climates, I cannot recommend any particular precautions; but Dr. Lind thinks that garlick infufed in fpirits is one of the beft prefervatives against the bad effects of cold and wet. The French ships of war are furnished with great SECT. I.

OF DISEASES. 235

great quantities of garlick as an article of victualling, and its effects feem to be very falutary. It would appear, that fubftances of this kind are very conducive to health in hot climates alfo. I was informed by Capt. Caldwell, that, when he commanded a floop of war on the coaft of Guinea, he was fupplied with a large quantity of shalots by a Portuguese about the time he left the coaft, and his men were remarkably healthy on the paffage to the Weft Indies, while the other ships in company, who wanted this supply, were very fickly.

But befides the obvious and fenfible qualities of the air above mentioned, there are certain obscure properties which we do not understand, and which we find difficult to inveftigate; for there are difeafes prevailing in certain places which feem to depend on fome latent state of the air. Of this kind is the complaint of the liver, fo common in the East Indies, yet almost entirely unknown in the Weft Indies; and in the Weft Indies there are certain diseases which prevail in one island and not in another; fuch as the elephantiafis

236 CAUSES AND PREVENTION PART II.

elephantiafis* of Barbadoes, which is an affection of the lymphatics peculiar to that ifland. In the climates of Europe there are alfo certain obfcure conditions of the air that favour one epidemic more than another, and in fome years more than others +. All this is very mysterious to us; and although we could detect these properties of the air, we probably could not prevent their bad effects, fince man must every where breathe the air, whatever its qualities may be.

* Dr. Hendy has lately published an ingenious treatife upon this difease.

in and many the tube

Of Foul Air from the Neglect of Cleanlinefs in Men's Perfons — INFECTION.

NATURE has wifely fo contrived our fenfes and inftincts, that the neglect of cleanlinefs renders a perfon loathfome and offensive to himself and others, thereby guarding against those fatal difeases that arife from bodily filth. The noxious air we fpeak of is generated by men keeping the fame clothes too long in contact with the body, while they are at the fame time confined and crowded in fmall and ill-ventilated apartments. Such is the origin of the jail fever, otherwife called the fhip and hofpital fever; and it feems to be with reason that Dr. Cullen afcribes the low, nervous fever of Britain to a fimilar origin, being caufed, as he thinks, by an infection of a milder kind, arifing in the clothes and houses of the poor, who, from flovenlinefs or indigence, neglect

238 CAUSES AND PREVENTION PART II. neglect to change their linen, and air their houfes.

Man is evidently more fubject to difeafe than any other fpecies of the animal creation, owing partly to the natural feeblenefs of his frame, but ftill more perhaps to the artificial modes of life which his reafon leads him to adopt. There is no circumftance of this kind by which health is more affected than by clothing. Some of the moft fatal and peftilential difeafes are produced and communicated by it; for we fee that the greater number of fevers, particularly thofe of the low and malignant fort, may be traced to the want of perfonal cleanlinefs.

There are few fubjects more mysterious and difficult of investigation than this of infection. The origin of specific contagions, such as the small pox and the venereal difease, seems to be almost beyond the reach of a conjecture; and why all the contagions we know, excepting that of the bite of a mad dog, should be confined to one species of OF DISEASES.

SECT. II.

of animal, their effects not being communicable to any other, is equally unaccountable. Why is the body incapable of being affected more than once by certain morbid poifons; and whence comes the ftriking and curious differences of fufceptibility to infection in different individuals at the fame time, and of the fame individual at different times ?

It would appear that the infection of fever, which we are chiefly to confider here, does not, like fome of the difeafes above mentioned, depend on the continued propagation of a certain poifon, but that it may fpontaneoufly arife from a concurrence of circumftances, producing a long ftagnation of the effluvia of the body on the clothes, for want of clean linen, while people are excluded from the free air, as in jails, hofpitals, or fhips.

In order, therefore, to preferve the crews of fhips from fuch difeafes, means fhould be taken not only to prevent the introduction of infection already exifting, but to prevent the generation of it on board.

1. Means

1. Means of preventing the Introduction of Infection.

WAR being a state of violence and confusion, in which the hurry and emergency of fervice may be fuch as to render it impoffible to put in practice all the rules which might be laid down concerning the prefervation of health, yet it is neceffary that those who direct the navy, either in a civil or military capacity, should be aware of the caufes of fickness and mortality, in order to guard against them as far as is practicable. From an indolent acquiefcence in this idea of the hardships and inconveniences of war being unavoidable, I have known neglect to arife in the conduct of officers with regard to those under their command, as if it was not the duty of a commander to employ his utmost attention to alleviate the misfortunes and mitigate the fufferings of his fellow creatures; and we have feen that much more of the calamities of war arife from difease than from the fword.

SECT. II. OF DISEASES.

fword. The like excufe might be framed for the neglect of ftores and arms, which the hurry of fervice might equally expose to injury. We fee, indeed; infinite pains taken to prevent cordage from rotting, and arms from rufting; but however precious thefe may be as the neceffary refources of war, it will not be difputed that the lives of men are still more fo; yet, though there is the additional inducement of humanity to watch over the health of men, I do not think that this, in general, is fludied with a degree of attention equal to what is beftowed on fome inanimate objects.

Ships of war are exposed to infection chiefly by receiving fuch men as have been raifed by preffing, who are frequently confined in guardships; under fuch circumftances of bad air and bodily filth as tend to generate the most virulent infection. The fervice alfo requires fometimes that men be received from jails, and they are either criminals delivered over by the civil jurifdiction of the country, or captives who have been reftored by the enemy after a courfe of confine-

241

242 CAUSES AND PREVENTION PART M.

confinement in their prifons. It may happen too, as we have feen *, that the enemy, who are made prifoners at fea, may have infection about them, and will communicate it the more readily that they are ftrangers.

There are few fevers but what are infectious at fome ftage or other of the difeafe; but it is not neceffary that fever fhould actually exift in order to create infection. In the most violent and petilential fevers, fuch as have fometimes originated in the jails of England, the perfons who communicated them were not affected with it themfelves +. Infection, like fome other poifons, does not affect those who are accustomed to it, and therefore those who are in the habit of being exposed to it frequently escape its bad effects, especially if it is gradually applied, as must be the case with those about whose perfons it is generated. For the like reason, physi-

* See Part I. Book II. Chap. VI.

* We have a proof of this fact in particular, in the account of the jail diftemper, which broke out at the Old Bailey in the year 1750.

cians

OF DISEASES.

cians and nurfes are lefs fufceptible than others; and ftrangers, who are accuftomed to a pure air, are the most fusceptible of any. It is obferved by Dr. Short, that contagious epidemics are more frequent and fatal in the country than in London, and this may probably be accounted for on the fame principle; for every perfon in a great town is exposed to the breath and effluvia of others, and to a variety of putrid exhalations, which are unavoidable where multitudes inhabit together; but they are fo used to them, that they are not affected by them; whereas in the country, where people are lefs accuftomed to each other's company, and lefs used to impure air in general, they are the more readily affected when infection is introduced among them. It may even admit of a doubt if any fociety of men, living together, are entirely free from morbid contagion. It certainly fometimes happens, that a fhip, with a long-established crew, shall be very healthy; yet, if strangers are introduced among them, who are alfo healthy, fickness will be mutually produced. This principle in the human confti-R 2 tution,

243

244 CAUSES AND PREVENTION PART II.

tution, by which the prefence of ftrangers affects it, is well illustrated by a fact *, founded on the best testimony, that, in one of the fmall western islands of Scotland, which is fo remote, that the inhabitants are frequently without any communication with ftrangers for feveral months together; they become fo fusceptible, in confequence of this long interruption of intercourfe, that they are feized with a catarrh when ftrangers of any defcription come among them. It was faid before, that cleanlinefs was founded on a natural averfion to what is unfeemly and offenfive in the perfons of others; and there feems alfo to be implanted in human nature, for the fame purpofe, an inftinctive horror at ftrangers, as is visible in young children and uncultivated people. In the early ages of Rome, one word fignified both a stranger and an enemy +.

Thefe

* See Martin's Hiftory of the Weftern Iflands, and Medical Communications, Vol. I. page 68.

There are fome contagious difeafes which cannot be propagated but by their own peculiar infection, as has been before obferved, juft as the feeds of vegetables are neceffary

OF DISEASES.

Thefe obfervations naturally fuggeft feveral ufeful and practical remarks. It would appear

neceffary to continue their feveral fpecies; fo that if the infectious poifon were loft, fo would the difeafe. Of this kind are the finall pox, and the other difeafes to which man is fubject but once during life. There are other difeafes which produce infection without having themfelves proceeded from it. Of this kind are fevers and fluxes.

But there is no infection of any kind, however virulent, that affects indifcriminately all perfons exposed to it. If a number of perfons, who never have had the fmall pox, are equally exposed to it, fome will be feized. while others will efcape, who will be affected at another time, when they happen to be more fusceptible. It is doubtful how far the habit of being exposed to fuch fpecific infections renders the body infenfible to them, as was faid with regard to fevers; but there is another principle of the animal æconomy laid down and illuftrated by Mr. Hunter, which goes at least a certain length in explaining this variable flate of the body with respect to its susceptibility of infectious difeases. This principle is, that the body cannot be affected by more than one morbid action at the fame time. If a perfon is exposed to the small pox, for instance, while he labours under a fever, or while he is under the influence of the meafles, he will not catch the first till the other has run its courfe. It may happen, therefore, that people cfcape

R 3

245

the

246 CAUSES AND PREVENTION PART II.

appear that the utmost attention is necessary not only to guard against the actual prefence of

the effect of contagion in confequence of being at the time under the influence of fome other indifpofition, either evident or latent : and fuppofing the body to be expofed to a number of noxious powers at the fame time, one only could take effect. But it feems difficult to explain why fome of those who are actually feized, and who have previoufly been to all appearance in equally good health, shall have it in a very mild degree, while in others it will be malignant and fatal. This is very remarkable with regard to the fmall pox, which are in fome cafes fo ilight, that they can hardly be called a difeafe, while in others they are fo malignant, as hardly to admit of any alleviation from art. May not this, in fome measure, be explained from some of the principles above mentioned, in the following manner : - The fmall pox, in their mildeft form, are attended with little or no fever, which, therefore, is not effential to them; and when we fee them attended with various forms of fever, and thereby prove fatal even in the most hale constitutions, we ought not to attribute this to any thing in the nature of the fmall pox, but rather to fay, that they have ferved as an agent in exciting a fever, for which there happened to be fome previous latent difpofition, that would not otherwife have exerted itfelf, and that this disposition, or contamination, as it may be called, may have been induced by fome paft exposure to morbid effluvia, which either from habit, or fome other circumftance,

OF DISEASES.

of difease, but to be jealous of all new draughts of men, especially if they should come

ftance, may not have been fufficiently powerful to excite the conftitution to fever without fome fuch ftimulus. Any other occafional circumstance producing difturbance or irregularity in the functions of the body, may, in like manner, excite any particular kind of fever to which the body may at that time be difposed. Thus the amputation of a limb will have this effect; alfo exposure to cold or fatigue, and intemperance in eating or drinking.

It would appear from these confiderations, that there are certain circumftances, or temporary fituations of conflitution, which invite infection, and render its effect more certain and violent in one cafe than another. There are artificial methods, however, of obtruding it, as it were, upon the conflitution, though not particularly difpofed, or even though averfe to receive it; and may not this, in fome meafure, account for the greater fafety of fome difeafes when communicated by inoculation, than when caught in the natural way?

But these, as well as many other facts in animal nature, do not admit of a fatisfactory explanation upon any principle as yet known. Even the most common operations of the body, fuch as digeftion and generation, when confidered in their caufes and modes of action, are fo obfcure and mysterious, as to be almost beyond the reach of rational conjecture. A little reflection will teach us R4 the

247

248 CAUSES AND PREVENTION PART 11.

come from guardships, jails, or tenders, and have been turned over from ships where difease

the utmost modesty with regard to our knowledge of fuch things; for nature feems to have innumerable ways of working, particularly in the animal functions, to which neither our fenfes can extend, nor perhaps could our intellects comprehend them. Had we not, for inftance, been endowed with the fenfe of fight, nothing could have led us even to fuspect the existence of such a body as light; and there may be numberlefs other fubtile and active principles pervading the univerfe, relative to which we have no fenfes, and from the knowledge of whofe nature and exiftence we muft for ever be debarred. We have, indeed, become acquainted with electricity by an operation of reafon; and animals have lately been difcovered to which the electric fluid ferves as a medium of fenfe through organs calculated to excite it, and to receive and convey its impreffions.

But there are few fubjects we can fludy that are more fubtle and obfcure than the influence of one living body on another. There is a familiar inflance of the great fubtilety of animal effluvia, and alfo of the finenefs of fenfe in a dog's being able to trace his mafter through crowds, and at a great diftance; and we can conceive that infectious matter may adhere, and be communicated in a fimilar manner. We have endeavoured to illuftrate the great obfcurity of its operation by an allufion to generation, digeftion, and other animal functions, with which

OF DISEASES,

difeafe is known to have prevailed; nay, that it is beft to avoid mixtures of any kind,

The infection of fevers feems different from most others in this, that it is very various in its degrees of virulence. There is reason to think that the poison of the fmall pox, and that of the venereal difease, are in their own nature invariable, and that the difference of these difeases, in point of malignancy, depends on the constitution and other

which it is equally obfcure and inexplicable. It is fimilar to generation in this, that its influence does not pafs from one fpecies of animal to another; for the poifon of the plague, that of the fmall pox, that of fever, and the venereal difeafe, do not affect brutes *, nor do the infectious difeafes of brutes affect different fpecies of them, nor the human fpecies. The only exception to this, that we know of, is the bite of a mad dog.

From these facts, and also from what was formerly mentioned of contagion not affecting indiferimately all that may be exposed to it, it would appear that fome nice coincidence of circumflances is necessary to modify an animal body, fo as to receive its action. There must be

* Mr. Hunter's Experiments.

250 CAUSES AND PREVENTION PARTIL.

other circumftances of those affected; whereas that of fevers being of different degrees of activity, and being frequently obscure and latent, is, on that account, the more treacherous, and ought to be watched with the greater circumspection.

The mode of manning the navy by preffing, I take it for granted, is unavoidable; at any rate, it would not become me to arraign a practice which has had the public fanction for ages. It is, however, one of the princi-

a fort of unifon, as it were, or fympathy, betwixt different living bodies, fo as to render them fufceptible of each other's influence.

It is none of the leaft curious facts with regard to infection, that there are fome fpecies of it by which the body is liable to be affected only once in life. When this is confidered, it is indeed conformable to what happens in the courfe of the difeafe itfelf; for, unlefs there was in the body a power of refifting it, there could be no fuch thing as recovery. Where the difeafe actually exifts, the continued prefence of the poifon, which is alfo infinitely multiplied, would infallibly prove fatal in all cafes, unlefs the living powers were to become infenfible to it *.

Mr. Hunter's Lectures.

pal

pal means both of generating and fpreading the feeds of difease, in confequence of the indiferiminate feizure of men for the public fervice, and the confinement that is neceffary to fecure them. And as the exigences of the fervice make it neceffary to admit perfons of every defcription, there is no other remedy for this evil but to annihilate. if poffible, the contagion that may thus be conveyed into thips of war. This is done by ftripping and washing the new recruits who may be fufpected of importing infection; also by cutting off their hair, clothing them with new clothes, and deftroying the old, before they are allowed to mix with the fhip's company in which they are to enter.

Those who have put these methods firstly in practice, have been sensible of their great utility; and the most exact attention is necessary, as a single infected man, or even any part of his clothing, may spread fickness through a whole ship's company. When we reflect what havock an infectious fever sometimes makes in a ship, it will appear

252 CAUSES AND PREVENTION PARTII.

pear how very important this fort of attention is; and when the caufe of the ficklinefs of particular fhips is traced to its fource, it will generally be found to have originated from taking on board infected men at Spithead, or wherever elfe the fhip's company may have been completed.

After the first edition of this part of the work was printed, an excellent infitution was established at Portsmouth for the prevention of infection. A ship was appointed for the reception of the recruits of the fleet to which they were carried, to be stripped, washed, and provided with new apparel, before they joined their respective ships. This had a visible good effect on the health of the fleet; and it was planned and executed by Sir Charles Middleton, Comptroller of the Navy, whose unwearied affiduity, as well as integrity and ability in that important post, claim the highest praise and gratitude from his country.

It follows farther, from the preceding obfervations, that there is a fort of rifque in mixing

OF DISEASES.

mixing two different forts of men, even when there is no actual difeafe or fufpicion of infection; for, whether it is from dormant infection, or merely from the circumftance of change of air, fuch mixtures are known from experience to be fometimes productive of ficknefs. The late Admiral Bofcawen was fo fenfible of this, that he avoided it, unlefs when fome evident utility or neceffity of fervice made it proper; and upon this principle he ufed to refift the folicitation of captains when they requefted to carry men from one fhip to another upon changing their command.

One probable reafon, among others, for fhips of the line being more fickly than frigates or fmaller fhips is, that in greater numbers there is a greater chance of men of various defcriptions and modes of life being mixed together.

. Means

2. Means of preventing the Production of Infection.

THE infection of fever is not always imported from without, but may be originally and fpontaneoufly generated on board. The caufes of this, as mentioned before, are want of perfonal cleanlinefs, and alfo confinement and crowding in clofe apartments.

In order to promote cleanlinefs, care fhould be taken that every man, on his first entering into the fervice, be provided with a proper change of linen, and that a frequent muster and review be made, in order to infpect their perfons, and to examine their flock of apparel. A true feaman is in general cleanly, but the greater part of men in a ship of war require a degree of compulsion to make them so; and such is the depravity of many, that it is common enough for them to dispose of their clothes for money to purchase spirituous liquors. A muster and review, therefore, wherein men spiritual spi SECT. H. OF

OF DISEASES.

should be obliged once in the week to prefent themfelves clean before their officers, and to produce a certain necessary quantity of clean apparel, would conduce both to fobriety and cleanlinefs. The exertion of authority, and the infliction of punifhment, is fo far from being confidered by the men as a hardfhip, that they expect it; and it is the duty of an officer, as it is of a parent to a child, to constrain those entrusted to his care to perform what is for their good. It is common allo for men to lay up their clothes in a wet and unwashed state, which in time is productive of the most offensive and unwholefome vapours; and this can be prevented only by their chefts and bags being frequently infpected by their fuperiors.

It must be evident to any one who reflects on this subject, that a regulation of this kind is as necessary as any other part of duty; and it deferves to be made an article in the public instructions, instead of being left to the difference of officers. This fort of diffeipline is particularly necessary in subject of

256 CAUSES AND PREVENTION PART IT:

of the line, in which one caufe of the greater unhealthinefs is the difficulty of taking cognizance of fo great a number; for, unlefs fome regular method, as by mufter, is eftablifhed, there will be men who will efcape notice, and fkulk below, indulging in lazinefs and filth.

The good fenfe and humanity of many captains in the late war, led them to adopt certain methodical regulations for the prefervation of cleanlinefs and order. The only public fanction given to this fort of difcipline, was that of Lord Howe, who gave it in orders to those under his command, that each ship's company should be divided into as many divisions as there were lieutenants, and that these should be divided into squads, with a midshipman appointed to each; and that the officers should be respectively responsible for the good order and difcipline of the men affigned to them.

It is an excellent cuftom, and pretty general in the navy, to allow the men one day in the week for washing, when the weather and

and other circumftances will admit of it. It would be a farther improvement in the rules of the fervice to fupply fope in the fame manner as tobacco and flops are fupplied, that is, to let the men have what quantity they want from the purfer, who is allowed to charge it againft their wages *.

Next to want of cleanlinefs, the circumftances most apt to give rife to infection are, close air and crowding. A certain length of time is necessary, in order that these should have this effect, and the longer they take

* It is fincerely to be wifhed that this were adopted, and it is furprifing that an article fo falutary and neceffary, and fo difficult to be procured on foreign flations, fhould not have been the object of public attention, rather than a mere article of luxury, fuch as tobacco. But in order that it might not be a matter of choice with feamen, it would be worth while to fupply them with it at prime coft, or even as a gratuity, and then they might be compelled to ufe it for the purpofe of cleanlinefs. There are other articles of lefs importance, but being neceffary to enable men upon foreign flations to keep themfelves neat and clean, deferve to be made the object of public inftruction. Thefe are handkerchiefs for the neck, thread, worfled, needles, buckles, and knives.

place,

258 CAUSES AND PREVENTION PART IL.

place, the more certainly will infection be produced, and it will be the more virulent *.

In

* At the time I am writing this, (March 8th, 1785) there has occurred a fact which proves the effect of time in generating infection. There now prevails a contagious fever in feveral of the hospitals in London; and, among others, in that to which I am physician. In another hofpital it has been fo violent, that there has been a vulgar report that the plague had broke out in it. The fame fever alfo prevails among the poor at their own houfes. The caufe of it feems to be, that the cold weather has been uncommonly long and fevere; for the froft began early in December, and the cold has hitherto been more like that of winter than fpring. The thermometer all this month has varied from 30° to 35°. Cold is favourable to infection, by preventing ventilation; for people exclude the air in order to keep themfelves warm, and the poor in particular do fo on account of their bad clothing, and their not being able to afford fuel to make good fires. Heat is the great deftroyer of infection, and feems to act by evaporating, and thereby diffipating it; and the effect of fires in apartments is to produce a confant change of air, thereby preventing its flagnation and corruption, and the accumulation of unwholefome effluvia. With this view, a chimney is of great use, even though no fire fhould be kept in it, as it ferves for a ventilator. But if an aperture were to be made in an apartment merely with a view to ventilation, it fhould be placed

OF DISEASES.

In order to admit air freely, the ports fhould be kept open whenever the weather will permit this to be done. The great objection to free ventilation is the danger of exposing men to the air in cold climates. But it fortunately happens, that fire, while it is the most effectual means of counteracting the cold air, is also the best means of promoting ventilation; for wherever there is fire, there is a constant change of air taking place by means of the draught to which it gives occasion. This cannot be done with fafety and convenience in all parts

placed in that part of the wall next the cieling; for foul air naturally tends upwards, and the external air entering at the top of a room, would not be fo apt to fubject thofe within to the effect of cold, as it would not blow directly upon them. There would alfo be this advantage in jails, that apertures in this fituation would not be fo liable to be forced for the purpofe of efcape as if they were nearer the floor; and in hofpitals they would be out of reach of thofe who, wifhing to indulge in warmth at the expence of pure air, might be induced to fhut the windows. But an external communication with the air any where is of the utmost importance; and it is observable in Mr. Howard's account of prisons, that the jail diftemper was most frequently to be met with where there was no chimney.

259

260 CAUSES AND PREVENTION PART II.

of the fhip; but frequent fires in the lower parts of a fhip will prove extremely falutary by drying up the moifture, and producing a change of air, and alfo in a cold climate by the warmth it produces.

The hammocks and bedding fhould alfo be aired by exposing them upon deck, efpecially after the ports have been long fhut in confequence of bad weather. They cannot be thoroughly aired unlefs they are unlafhed; and as this could not be conveniently done daily in men of war, it might be done from time to time by the different divisions in rotation *. When the men come to fleep upon them after these operations, they experience the fame agreeable fensations as from a change of linen; and this must conduce to health as well as pleasure, like all other natural and moderate gratifications. It may be farther remarked in favour of cleanlines,

* It is of fome confequence to attend to the materials of the feamen's beds; for, inftead of flock, they are frequently fluffed with chopped rags, which, confifting of old clothes, emit a difagreeable finell, and may even contain infection.

that

OF DISEASES.

that it is not only directly conducive to health, but is naturally connected with habits of good order, fobriety, and other virtues. The most cleanly men are always the most decent and houest, and the most flovenly and dirty are the most vicious and irregular.

A fhip of war must have a much greater number of men on board than what are neceffary to navigate her; for, befides the marines, a great many hands are neceffary to man the great guns in time of action. For this reason, there is a greater risque of the inconveniences of overcrowding than in thips intended for commerce, and therefore much greater attention is neceffary with regard to ventilation and cleanlinefs. There is a piece of management which tends also in some measure to obviate the necessity of crowding. This is to berth the watches alternately, by which it is meant, that one half of each watch should lie on different fides. whereby they do not fleep fo clofe, and are not fo much exposed to each other's breath and to the heat and effluvia of each other's bodies.

261

262 CAUSES AND PREVENTION PART II. bodies. This has the farther advantage of preferving the trim of the ship.

What has been faid of the fhip and men in general, applies still more strongly to the fick, and the berth * affigned to them; for there is nothing fo apt to increase, and even generate, contagion, as a number of fick together, unlefs uncommon attention is paid to cleanlinefs and ventilation. This is fo true, that, unlefs where the complaint is very catching, it is beft not to feparate the fick; for if they are a good fet of men on board, those who are confined by fickness will be better nurfed and tended by their meffinates than in a fick berth. But if the state of infection renders separation necesfary, the best part for the accommodation of the fick, in a fhip of the line, is under the forecastle in a warm climate, and on the fore part of the main deck in a cold one.

* By a berth is underftood the interval between two guns, or any fpace between decks, which is fometimes formed into a fort of apartment by means of a partition made of convafs.

When

OF DISEASES

SECT. II.

When they are under the forecaftle, however, they ought to occupy only one fide, as they would otherwife be diffurbed by the men who muft pafs to and from the head, and the men in health would, in this cafe, be exposed alfo to contagion. As infection is most likely to arife among the fick, attention to cleanlines and air is doubly requisite where they lie; and it has a good effect to sprinkle hot vinegar and diffuse its steams among them once or twice a day.

Thus we fee that cleanlinefs and difcipline are the indifpenfable and fundamental means of health, without which every other advantage and precaution is thrown away. Government never bestowed more attention and expence upon the victualling of the navy than during the late war; but it would be to little purpose to provide the most nourishing and antifcorbutic diet, the most wholefome and cordial wines, the most efficacious remedies, and the most skilful phyficians and furgeons, if the men are not conftrained to keep their perfons fweet, their clothing and bedding clean, and their S 4 berths

264 CAUSES AND FREVENTION PART IL.

berths airy and dry. It is, therefore, upon officers more than any others that the health of the fleet depends; and I fhould be excufed in the frequent mention I make of this, were it known how often I have been the witnefs of the fatal effects of the neglect of thefe rules.

3. Means of eradicating Infection.

WHEN, from a neglect of the means above mentioned, an infectious fever comes actually to prevail, and the infection, perhaps, adheres obstinately to the ship in spite of cleanlines, good air, and diet, and all the other means, which, if employed in due time, would have prevented it, then some measures are to be taken for eradicating this subtile poison.

The first step towards this is, to prevent the difease from spreading, and this is done by separating the fick from the healthy, and cutting off all intercourse as much as possible. For this end, it is necessary to appropriate a particular berth to contagious complaints, SECT. IL

OF DISEASES. 205

complaints, and not only to prevent the idle vifits of men in health, but to difcover and separate the perfons affected with fuch complaints as foon as poffible, both to prevent them from being caught by others, and becaufe recent complaints are most manageable and curable. Officers might be very useful in making an early difcovery of complaints, by obferving those who droop and look ill in the courfe of duty; for feamen think it unmanly to complain, and have an averfion to be put on the fick lift. I have heard of a method practifed in fome fhips, of keeping a book on the quarter deck for the officer to mark the names of fuch men as might look ill, or might be miffed from duty upon calling the roll, in order to afford the furgeon a means of finding out those who should be the objects of his care.

Those whose profession it is to superintend the health of the ship, would find it for their eafe and interest, and should confider it as their duty, to walk over the different decks once a day, or every other day, in order

266 CAUSES AND PREVENTION PARTIL.

order to make an early difcovery of those who may be taken ill. Though I have laid great stress on the duty of the commander, as the proper guardian of health, yet his affiduity will not avail unless the furgeon alfo does his part, by fuch acts of attention as I have mentioned, joined to skill in his profession.

Surgeons are, perhaps, more regarded in our fervice than in that of other nations : but it would be for the public benefit if they were still more respected and encouraged. To men of liberal education and fentiments, as furgeons ought to be, and generally are, the most effectual inducements for them to do their duty are flattering attentions, and a certain degree of estimation in the eyes of their officers. Liberality of manners, on the part of fuperiors, is the most likely means of encouraging a confcientious performance of duty in this profession; for though ftrict and diftant behaviour may operate upon the minds of those whose functions are merely mechanical, how can it infuse that tender attention to human fufferings,

OF DISEASES.

ings, and that fenfe of duty, which may induce a man entrufted with the health and lives of his fellow creatures to act his part with propriety and effect?

In order to prevent ficknefs from fpreading, it is not fufficient to cut off all perfonal intercourfe. The clothes of men are as dangerous a vehicle of infection as their perfons; and it fhould be a ftrict and invariable rule in cafe of death from fever, flux, or finall pox, to throw overboard with the body every article of clothing and bedding belonging to it.

Upon the fame principle, in cafe of recovery from any contagious difeafe, as it would be too great a wafte to deftroy the clothes and beds, they fhould be fmoked, and then fcrubbed or wafhed before the men join their meffes and return to duty. This precaution is the more neceffary, as infection in a fhip is extremely apt to be communicated by bedding, from the cuftom of ftowing the hammocks in the netting, by which they are brought in contact with each

268 CAUSES AND PREVENTION PARTIE.

each other. This, however, is an excellent cuftom, as it not only clears the fhip below, and ferves to form a barricade on the gunwale, but tends to air the bedding; and this falutary effect fhould not be prevented, except in cafe of rain, by the coverings, called hammock-cloths, by the ufe of which utility is evidently facrificed to an excefs of neatnefs.

It fometimes happens that the number of fick in a fhip is fo great, that it is not poffible to take proper and effectual measures on board for ftopping the progress of difease. But when the can be cleared of the fick by fending them to an hospital, no pains thould be spared to extirpate the remaining feeds of infection.

For this purpofe, let their clothing and bedding be fent along with them; let their hammocks, utenfils, and whatever elfe they leave behind, be finoked, and either fcrubbed or wafhed before they are ufed by other men, or mixed with the fhip's flores; let the decks, fides, and beams of their berths, be

SECT. II. OF DISEASES.

be well washed, fcraped, smoked, and dried by fire; then let them be sprinkled with hot vinegar, and, finally, white-washed all over with quick lime.

Should any officer object to the trouble and inconvenience of all this, let him reflect for a moment how much more troublefome and inconvenient, as well as noifome and difagreeable, ficknefs itfelf proves to be; let him reflect that the efficiency of the fhip, confidered as a bulwark of defence, or an engine of annoyance, depends on the number of healthy hands, and that his own character is to depend on the exertions to be made by them in the day of battle, not to mention the attention due from him as a man to the fufferings of the objects themfelves.

But befides thefe recent infections, it fometimes happens that the feeds of difeafe adhere to the timbers of a fhip for months and years together, and can be eradicated only by a thorough cleanfing and fumigation. Sweeping, washing, fcraping, and airing, are not fufficient entirely to remove

269

270 CAUSES AND PREVENTION PART It.

remove the fubtile infectious matter; but they will affift and will prepare it to be acted upon by heat and fmoke, which are the only means to be depended upon. A complete fumigation can only be performed when the fhip is in dock; and I fhall here tranfcribe a method recommended by Dr. Lind.

" It will be proper to remove every thing out of the fhip, fo that the hold may be fwept, and, when the men have withdrawn, to light a number of charcoal fires in different parts, and to throw a handful or two of brimftone on each. The fteam of thefe fhould be clofely confined by fhutting the ports and hatchways from morning till evening, no perfon in the mean time being allowed to go below, nor for fome time after opening the ports and hatchways, that the fteam may be difperfed.

" In order to purify the men's clothes, it would farther be proper to fumigate the hulk into which they are removed

" with

OF DISEASES.

SECT. II.

with tobacco once or twice a week whiletheir fhip is in dock, the men remainingbelow as long as they can bear it.

"The clothes and hammocks of the men "fhould be exposed in the hulk to the fmoke of the tobacco, and those which are more particularly suspected may be hung up the ship, and exposed to the feam of the charcoal and brimstone.

"The fhip having been already fumigated with tobacco, it will be fufficient to use the fumigation of charcoal and brimftone above described for three days, and, after the last day's fumigation, the infide of the ship should be well washed with boiling vinegar, and, before the men return on board, all the decks should be for aped and washed."

When a fhip is at fea, thefe precautions cannot be taken fo completely; but if infection is prefent, or is fufpected, then cleanfing and fumigating may be practifed in a lefs degree. I have known a fhip at fea

272 CAUSES AND PREVENTION PART II.

fea fumigated with gunpowder kneaded with vinegar, fo as to prevent it from exploding, and to make it burn flowly with a fpattering flame. Flowers of fulphur*, with about

* It is remarkable that this method of purifying was practifed in the most ancient times, as we learn from the following passage in Homer, where Ulysses is represented fumigating the apartments of his palace in which the fuitors had been flain :

> Την δ'άπαμειδόμενος σροσεφη Πολυμητις Όδυσσευς Πυς του μοι πρώτις ου ένι μεγάςοισι γενίσθω. Ως έφαθ'. έδ' άπίθησε φιλη τροφός Έυς ύκλεια "Ηνεγκεν δ' άςα πυρ κη θήϊον. άυτας Όδυσσευς "Ευ διεθείωσεν μέγαςου κη δώμα κη άυλήν.

> > ΟΜΗΡ. ΟΔΥΣ. Χ.

Bring fulphur firaight, and fire, the Monarch cries; She heard, and at the word obedient flies. With fire and fulphur, cure of noxious fumes, He purg'd the walls and blood-polluted rooms.

POPE.

This practice was probably founded in fuperflition, rather than the knowledge of nature. That fome divine influence fhould be afcribed to fire was very natural, as the principal deities of the ancients were only perfonifications of the elements; and it is worthy of remark, that their name for fulphur fignifies *fomething divine* to Saior, which was probably owing to its being found in those SECT. II.

OF DISEASES.

about an eighth part of nitre, will answer still better. A quantity of these is placed in each interval of the guns between decks, every perfon being turned up, and the ports

those chaims of the earth, in Sicily and Italy, which were supposed to communicate with the infernal regions; for the whole Greek mythology relating to thefe was taken from the phænomena attending the fubterraneous fires in those parts. It is curious farther to remark, in other inftances, how facts useful to mankind, the truth of which has been confirmed in later times by the more enlightened knowledge of nature, were first suggested by fome fuperflitious circumflance. Thus the wound received by Sarpedon could not be cured, according to the Poet, till, by divine intimation, he was defired to apply to it the ruft of the fpear with which it had been inflicted, in confequence of which it healed. But the weapons in those days were made of brafs, fo that the ruft of the spear must have been the ærugo æris, which has been found by the experience of modern furgery to be one of the best detergents in ill-conditioned fores. It is probably, from a falfe analogy, founded on fome fuch incident, that an idea prevails among the vulgar, which has become proverbial, that fome part taken from the offending body is good in all external injuries. Thus fome part of a mad dog is faid to have a virtue in curing his bite. Herein may be feen the difference of that knowledge which is fuggested by superstition, and that which is acquired by the obfervation of nature.

T

and

274 CAUSES AND PREVENTION FART IL

and hatches shut till they are confumed, and till the fmoke has difperfed. It has also been recommended to burn refinous bodies, fuch as the woods of fir, fpruce, and juniper, as the fmoke of thefe is more falutary. Upon the fame principle, the effluvium of tar is thought wholefome; and the cables that are coiled in the lower parts of a thip being foaked with tar, like most of the other ropes of a ship, probably conduce to the health of a place otherwife dank and unwholefome. Fumigation may alfo be performed by means of tar, either by throwing it on red-hot irons, or a wood fire,' which may be carried about between decks in a pot or moveable grate, or over fome cannon balls in a tub, or by immerfing a red-hot loggerhead * in a bucket of tar. If this is done in the place occupied by the fick, it will have a still better effect; and it will be of fervice to them to be removed for a fhort time under the half deck or forecaftle till this or other means of purification

* A loggerhead is a large round mais of iron, with a long handle to it.

6100 3

are

SECT. II.

OF DISEASES.

are put in practice. In whatever manner fumigation is performed, it will be of fervice to fpread out the clothes and bedding of the men, or to hang them upon lines, that they may be exposed to the heat and fmoke.

It will also be of great fervice to make the men expose their frowfy clothes to the fun and wind. If a strong infection is fufpected, and it cannot be afforded to destroy the clothes, the best means of eradicating the poison is to hang them for a length of time over pots of burning brimstone in a large cask standing endways, with small apertures to admit air enough for the brimstone to burn.

Fire in every fhape is to be confidered as the principal agent of purification, by its heat and the ventilation it occafions, perhaps, ftill more than its fmoke. It has already been repeatedly inculcated, that the great enemies of infection are ventilation and heat. I have mentioned fmoke and the effluvia of balfamic bodies, but thefe are not

275

to

276 CAUSES AND PREVENTION PART IL

to be depended on ; and it is the more neceffary to mention this, as the attention beftowed on more trifling means may divert the mind from a proper regard to what is more effential. It is mentioned by the benevolent Mr. Howard, that it is the cuftom in fome parts abroad to fcatter fresh branches of pine or fpruce in the hospitals, in order to purify the air; but, trufting to this, they neglect the admission of fresh air, which is the only effectual method of fweetening the air.

There is reafon to think that the open air very foon diffipates and renders inert all infections of the volatile kind, and of courfe the warmer the air is the more readily it will have this effect. It is accordingly obferved, that infection is much lefs apt to be generated about the perfons of men, and that it adheres to them for a much lefs fpace of time in a hot climate than in a cold or temperate one. This is a remark, which, fo far as I know, has not been made by any author; and, till obfervation fuggefted it to me, I fancied the reverfe to be the truth. I have feen fo many inftances of filth and crowding SECT. II.

OF DISEASES.

crowding in fhips and hofpitals in the Weft Indies, without contagion being produced, and which in Europe could hardly have failed to produce it, or to render it more malignant, that I am convinced there is fomething in tropical climates unfavourable to the production and continuance of infectious fevers *. The fhips which bring this fever from Europe in general get rid of it foon after arriving in a warm climate; and nothing but the higheft degree of neglect can continue or revive it.

The facts above mentioned brought into my mind what is related of the plague at Smyrna and other places, that it difappears at the hotteft part of the year. It is alfo curious and important to remark, that the

* A fact, related in Anfon's Voyage, is alfo ftrongly in proof of the fame opinion. When the rich Spanish prize was taken, it was necessary to crowd the prisoners into the hold, for fear of an infurrection, which was to be dreaded from their numbers; yet, when they arrived in China, none of them had died, nor had any difease broke out. They fuffered only in their looks, being wan and emaciated to a great degree.

T 3

true

277

278 CAUSES AND PREVENTION PART II.

true pestilence never has been heard of between the tropics. It is not eafy to affign the caufe of this effect of heat upon infection, as every thing relating to this fubject is very obscure. We can conceive it to be owing to the greater degree of airinefs which the heat of the climate makes neceffary, or to the use of fewer woollen clothes. There may be fomething in the ftate of the body, particularly in the pores of the fkin, which difposes them less to imbibe or produce the poifonous effluvia, or, when imbibed, it may more readily be thrown out by perfpiration with the other acrimony of the blood; or more probably, as has been hinted above, the virulent matter is of fuch a degree of volatility as to be readily diffipated in a certain degree of heat *.

* It may be brought as a farther proof of a warm climate being unfavourable to every fort of infection, that though the itch is very common in fhips and hofpitals in Europe, I do not remember ever to have met with it in the Weft Indies, except in fhips newly arrived from England.

There

SECT. II.

OF DISEASES

There is a fact, which, though feemingly of a contrary tendency, yet is in reality in proof of the fame opinion. It is, that thefe fame difeases difappear in circumstances of great cold. When England was laft vifited by the plague, it difappeared in winter; and the fame is observed at Moscow and other places. In this cafe the infectious matter is rendered inert, but not extinct, and the return of heat fets it afloat in the atmosphere, fo as to expose it to human respiration. Dr. Guthrie informs us, that infection is entangled and fixed by the cold of winter on the doors and walls of the houfes of the Ruffian peafants, and that upon the return of the warm feafon it is fet loofe by the thaw, and then becoming active, produces difeafes.

With regard to the Weft Indies, the precautions that have been laid down are chiefly neceffary when a fhip newly arrives in the climate; for it is during the first three or four months that fickness is apt to prevail.

T4

This

280 CAUSES AND FREVENTION PARTIN.

This does not depend upon any thing peculiar to the climate; for I have known fhips arrive without being vifited with any ficknefs. It feems to be owing, for the most part, to that stock of infection and difease imported from Europe exerting its effects, and when this has spent itself, the men remain in good health, unless exposed to the land air or other accidents; for the air at fea in those climates, as well as every where elfe, is extremely pure and wholefome, and there is no where that feamen are more healthy or comfortable.

SECT.

SECT. III,

Of the Four AIR generated in a Ship,

MEAN here to diftinguish the unwholefome vapour produced by the contents of the ship from the infection produced by the effluvia of men's persons, which was treated of in the last fection.

The means of preventing this foul air from being generated are, cleanlinefs, drynefs, and ventilation.

All parts of a fhip may, if neglected, become dirty, and emit an offenfive vapour; but the parts under water confifting of the orlop and hold, are more particularly fo from the materials they contain, and from the want of free accefs to the frefh air; accordingly, there is always more or lefs ftench in those parts, even in the best-regulated ships,

282 CAUSES AND PREVENTION PART II.

It was mentioned in the first part of this work, that an opinion was entertained by fome that no foul air was productive of fevers but fuch as proceeds from the living human body. I alledged that this was otherwife, at least in hot climates; and fome proofs of this opinion were adduced, particularly from the French prizes. Though the neglect of perfonal cleanlinefs is the principal fource of difease, yet cleanlines of every kind, and purity of the air in every respect, is to be anxiously studied.

With regard to general cleanlinefs, it is hardly neceffary to mention fweeping, wafhing, and fcrubbing of the decks; for the natural propenfity of the English * nation

to

* This circumftance, in the character of the English, is only of modern date; for we learn from Erasmus, who was in England about two hundred and fifty years ago, that they were then extremely flovenly. The following passage is extracted from a letter he wrote to a physician in York, after his return to Holland:—" Conclavia folâ " fere strata funt argillâ, tum scirpis palustribus, qui fu-" binde sic renovantur ut fundamentum maneat aliquo-" ties annos viginti sub se fovens sputa, vomitus, mic-" tum SECT. III.

OF DISEASES.

to neatnefs feldom allows any neglect of thefe. Lord Howe, to whofe virtues as a man, and abilities as an officer, his country is

" tum canum et hominum, projectam cerevifiam et pif-" cium reliquias, aliasque fordes non nominandas." He adds, that the windows were very ill calculated for ventilation, and imputes to the closeness and filthiness of the houfes the frequent and long continued plagues with which England was infefted, and particularly the fweating ficknefs, which, he fays, feemed peculiar to this country. He mentions that his own country had been freed from the peftilence by certain changes that the State had made in the houses, in confequence of the advice of some learned man. Erafm. Lib. xxii. Epistol. 13. - It is probable that the greater number of those epidemics, called plagues, were only bad infectious fevers. What would contribute ftill more to the production of infection was the want of linen, which was hardly in use in those days. The disappearance, or at least the great diminution of fuch complaints in modern times, particularly in London, has been afcribed to the great increase in the proportion of vegetable food; but it is certainly more owing to the improvement in perfonal cleanlinefs, and to the greater fpacioufnefs and neatnefs of houfes. As a farther proof of this, it may be mentioned that in the charity, called the Charterhoufe, in London, founded by Henry the Eighth, for the maintenance and education of poor boys, their fustenance is all animal food, as it was at the original inftitution, yet they are extremely

283

284 CAUSES AND PREVENTION PARTIES

is fo much indebted, gave it in general orders to wash the upper decks every day, the lower decks twice a week, and the orlop

tremely healthy. The fame observation applies to Winchefter school, which was founded fome ages before that.

There are fome paffages in ancient hiftory in confirmation of the fame opinion. Herodotus relates, that the ancient Egyptians were the most healthy of all the nations, except the Libyans, and he imputes this to the invariablenefs of their weather, and the ferenity of their fky. But he mentions in another part of his works, that they were also the most cleanly of all people, not only in their household utenfils, but in their perfons, and that their clothing was chiefly of linen, which it was one of the principal fludies of their life to wash and keep clean - בוועמדמ לב אוובמ לספבטקו מובו ובניהאטדמ בחודחטבטבודבה דטדם עמאורמ. Herodot. Euterp. 37. - It is remarkable that he makes no mention of the plague, though he gives a very minute account of the country from his own obfervation, from whence it may be naturally inferred, that it did not then exist there, though Egypt is now fo fubject to it, that the plague is fuppofed by many to be an endemial difease in it. It would appear also from another passage in this historian, that he uses the word rospos, which we translate plague in a loofe fense to fignify any violent acute distemper; for he relates that a great part of the army of Xerxes, in their retreat from Greece, perifhed by the plague house and dysentery, in consequence of famine, Herod. Lib. viii, cap. 115.

once

SECT. III. OF DISEASES.

once a week at leaft. He also ordered that every washing, fmoking, mustering, and review of clothes, or any other means taken for the health of the fhip, fhould be marked in the logbook, and the reason to be affigned there if omitted at the flated times. These rules are a good specimen of the order that ought to prevail in every branch of public duty; for it is well known to every experienced officer that it is a methodical proceeding of this kind which can alone render fervice either eafy or effective.

The lofs of men's lives from the foul air of the well is a common accident in thips, and I have been myfelf witnefs to feveral inftances of it. Where there is the leaft fufpicion of this, a candle fhould previoufly be let down, and if it should be extinguished, it may be concluded that the air is deadly. It becomes fafe for men to breathe in it by leaving it open for fome time, or, more expeditioufly, by letting down fire in a pot or grate, which foon changes the air, by producing a draught of it upwards.

285

286 CAUSES AND PREVENTION PART II.

It is a very falutary practice to let down fires frequently into the well, both in order to purify the air and to dry the furrounding parts. It was formerly mentioned that this was daily done in the Intrepid, and the effect of it was to remove the wetness of the ballaft and the mouldinefs which had overfpread the fides and beams; and having had the effect of fweetening and purifying the air, it feemed to be the principal circumfance that tended to make this fhip extremely healthy from being the most fickly of all the fleet. This precaution, as well as every other point of cleanlinefs, is more neceffary in large ships, because the mass of foul air, as well as the quantity of corrupting materials, is greater *.

* It is proper alfo to obferve here, that those ships which are built of winter-felled timber are much drier than those built of what is summer felled; and this circumstance should have been mentioned with regard to the Montague, for the cause of her healthines, notwithstanding her being a new ship, was probably from being built of winter-felled timber. It should, therefore, be strictly enjoined to fell the wood in winter; for those who are employed to do it have an interest in doing it in summer, on account of the value of the bark.

The

SECT. III. OF DISEASES. 287

The following fact ftrongly evinces the good effect of fire and finoke : - When it was the cuftom for frigates to have their kitchens between decks, they were much more healthy than in the prefent conftruction, in which they have them under the forecastle, where the heat and finoke are diffipated without being diffused through the thip, and caufing a draught of air upwards. as formerly. The men derived then alfo great benefit and comfort from having a large fire, round which they might affemble to warm and dry themfelves in a sheltered place. I leave it to those who preside in the conftruction of the navy to determine how far it would be advisable to return to the old manner of conftruction. The French ships of the line have their kitchens and ovens between decks, and this must tend to counteract the effects of their want of cleanlinefs. The Dutch ships of the line have their kitchens on the orlop deck, which must be still more conducive to the general purity of the air.

ad as fermidde l angelw crobastance cicili

Moifture

288 CAUSES AND PREVENTION PART II.

Moisture is pernicious both in itself and as the inftrument of putrefaction. All the complaints, called colds, are more owing to wet than cold; and moisture may be the means of producing, or at leaft of exciting dangerous fevers, when they would not otherwife appear. It befides contributes greatly to the production of fcurvy. Ships built of ill-feafoned wood are found to be very unhealthy on account of the moisture contained in it. The moisture of timber arifes not only from being used too foon after being felled, but alfo, as I am informed, from being stripped of its bark and outer furface when piled and exposed to the weather in dock yards. This method of fmoothing and piling the wood is only a late practice; and the advantage in point of convenience and neatnefs feems to be more than overbalanced by the detriment it thereby receives.

A wet hold diffufes moift vapour all over the fhip; and it was a rule with fome of those commanders whom I observed to be most SECT. III. OF DISEASES.

most fuccessful in preferving the health of their men, not only to have daily fires in the well, but to bail out the water when the pumps could not exhaust it all, and never to allow it to collect to more than the depth of a few inches. It is, therefore, very doubtful whether it is a good practice to let in water, as is very commonly done in order to fweeten the hold, for the fame fweetness will be preferved if it is kept ftrictly dry. If it should happen, indeed, that there should be a great deal of putrid matter in the lower parts of the ship, from previous neglect or unavoidable leakage, it may be adviseable to let in a quantity of water in order to loofen and wash off what is offenfive, and then to pump it out.

There is a circumftance in the first fitting out of a ship well worth attention, as highly conducive to the dryness and cleanness of the hold. I mean the choice of the ballast; for that which is called *shingle*, confisting all of pebbles, is far preferable to that which is fandy and earthy, as it does not fo readily U foak

290 CAUSES AND PREVENTION PART IN.

foak and retain the moifture and filth. Water or fluid of any kind readily fubfides in it, and fhould any putrid matter be entangled in it, there will be lefs difficulty in washing it out.

The decks fhould not be wafhed to often when the weather is moift as when it is fine, as it will be more difficult to dry them, and more harm may arife from the moifture than benefit from the cleannels. Wafhing fhould alfo be performed very early in the morning, even in the beft weather, in order that there may be time for the decks to become dry in the courfe of the day. It is after a general wafhing that the moveable fires, formerly defcribed, are moft proper and ufeful.

Every contrivance should be fallen upon to change the air in the orlop and hold. Ventilators and windfails * are well adapted

* A windfail is a long cylinder of canvafs, open at both ends, kept extended with hoops, and long enough to reach from the lowermost parts of the ship through all the hatchways into the open air.

I

for

SECT. III.

293

SECT. IV.

Means of guarding against INFECTION and BAD AIR.

INFECTION never prevails to fuch a degree, as to affect every perfon indifcriminately who is exposed to it. Even where the plague and fmall-pox prevail to the greateft degree, there are some persons who, though fusceptible of these diseases, yet escape them. There are certain other infections of a weaker nature, as was before obferved, and thefe will remain entirely inactive, till they find conftitutions fo difposed as to be fit subjects of their action. The feeds of difease may be compared to those of vegetables, which lye dormant, unlefs they happen to fall into a fituation peculiarly adapted for exciting their activity. It is very difficult to account for this uncertainty in the operation of infection, but it is extremely providential, that under the most calamitous state of fickness, there

are

294 CAUSES AND PREVENTION PARTIN.

are always fome who are in health and who furvive, for the neceffary purposes of life. If this were not the cafe, it might happen that every perfon on board of a ship might perish from sickness in the course of a voyage, a circumstance which I believe has never been known to happen.

There is an endless variety in the conftitution of the human frame, both in mind and body, as well as in the features of the face. There are, perhaps, no two individuals in the world in whom the fame effect precifely is produced by the fame food, air, medicine, poifon, or paffions of the mind. The different effects of infection, therefore, upon different people, feem to depend, in many cafes, on peculiarities of conflictution too obfcure to be explained; but there are also known circumftances which refift or encourage its effects.

The great power of habit * in taking off the effect of infection, has already been mentioned,

* Since the first edition of this work, I have met with a fact in confirmation of this principle, with regard to the cutaneous complaint called the *ring-worm*. This had prevailed SECT. IV.

OF DISEASES.

ed, and it would appear that novelty gives an increafed energy and activity to all impreffions, as well as those on the fenses. If a perfon, therefore, escapes the first attack of infection, he will be more likely to continue exposed to it with fafety in future.

There are certain precautions neceffary to be attended to by thofe who are unavoidably exposed to contagion, particularly in the first instance. Those who can afford a full diet, and a liberal use of wine, have been observed to result instant that is meagre and watery. It is also a good rule not to go among the fack, nor otherwise to expose one's felf to instant air, with an empty ftomach; for whether it is that the body is then more fusceptible, or that the pores of the skin and lungs are in a more highly abforbing state, fo as with greater readiness to inhale the poison of difease, it is certain that

prevailed in a private fchool in the neighbourhood of London, which I vifited, but it had to all appearance become extinct; yet it neverthelefs affected those boys who were newly fent to the fchool.

U4

a perfon

296 CAUSES AND PREVENTION PART II.

a perfon in that fituation is more apt to catch harm from foul air of any kind. Whatever elfe weakens and exhaufts the body, renders it alfo more fufceptible of noxious imprefions, Under the head of weakening powers, I comprehend not only what empties the body of its fluids, fuch as lofs of blood, or a diarrhœa, but intoxication, fatigue, fafting, watching, and certain affections of the mind, fuch as care and grief,

Cold and moifture may alfo be enumerated among the caufes that invite the attack of infectious difeafes. They are of themfelves fimply productive of catarrhs, rheumatifms, and the like diforders; but if an infection fhould be accidentally prefent when the body is exposed to them, then inftead of thefe complaints, the difeafe peculiar to that infection will be produced *. This was illuf-

* It is mentioned by Thucydides, that while the plague raged at Athens, the people were affected with no other difeafe; from which it would appear that those perfons who would otherwise have been attacked with some particular indisposition, were feized with the plague in place of it. Vide note p. 247.

trated

OF DISEASES.

SECT. IV.

trated in the laft reinforcement we had from England; for while bad fevers were breaking out in most of the other ships, the * Union was affected with those complaints only which are simply the effects of cold and moisture. It would be more proper, perhaps, to fay, exposure to the air, than to call it cold; for exposing the naked body to the open air, even in the warmest climate, is prejudicial to health. This holds at least with regard to Europeans who are accustomed to clothing, however the natives of hot climates who are naked, may expose themfelves with impunity.

It is of the greateft confequence to afcertain the extent of the influence of infection, for the means of avoiding and preventing it will very much depend upon this. It is now known, that infection extends itfelf to a very fmall diftance. There are, indeed, fome morbid poifons, fuch as that of the bite of a mad dog, and that of the venereal difeafe, which require actual contact to

* Part I. Book II. Chap. VI.

make

298 CAUSES AND PREVENTION PART II.

make them take effect. Others are more volatile, and feem to be inhaled by the breath, or abforbed by the fkin, but thefe do not extend far. That of the plague * does not reach above a few yards, and that of the fmall-pox and of fevers is probably equally limited. This difcovery is very valuable, by afcertaining the limits of danger; for when a perfon imagines he runs the fame rifk when at a confiderable diftance from the feat of difeafe, as if he were in contact with the perfon affected, he will be apt to expofe himfelf wantonly and unneceffarily to the infection.

It feems to be owing to the ignorance of the extent of its influence, that the plague has in general been fo fatal; for in confequence of the opinion that the whole furrounding atmosphere was affected, it was

* It is related by the travellers into Turkey, that the Chriftians fave themfelves from it, merely by flutting themfelves up in their houfes, and the inhabitants, who fleep on the open roofs of the houfes, do not catch it even from those of the adjacent buildings, though the wall that separates them is of no great heighth.

CHAP. II.

Of ALIMENT,

SECT. I. Of Solid Food,

THE most unnatural circumstance in a fea life is the food which men use, and the disease most peculiar to it is one which is owing chiefly to the nature of the aliment; for though other causes confpire in aggravating the scurvy, the depraved state of the INGESTA is the main and fundamental cause of it.

It is this difeafe that is moft fatal to feamen next to fevers. It was formerly as fatal, if not more fo; but fome modern improvements have rendered it lefs frequent and violent. The habitual ufe of falt provifions, befides producing evident fymptoms of fcurvy, begets fuch a ftate of the conftitution, that, upon the leaft fcratch being received, particularly on the lower extremities, a large and incurable ulcer enfues; and this tH. II. SEC. I. OF DISEASES.

this circumftance, triffing as it appears, is the caufe of lofing an incredible number of men to the fervice, especially in the West Indies. The greater part of the food of a fhip's company is neceffarily falted meat. Bifcuit and peafe, though of a vegetable nature, are hard of digeftion ; and though they qualify the animal food, they do not answer the purpose of fresh vegetables. Though officers have a fupply of live flock even for the longest voyages, it would be impracticable to carry a quantity fufficient to preferve a whole crew from the fcurvy. But certain articles have of late been introduced into use, of a durable and portable nature, which fo qualify the falt provisions, that they can be used without inducing this difeafe. Thefe are either fuch as are articles of common diet, viz. melaffes and four krout, or those which are intended only for the fick and recovering, fuch as portable foup and the preferved juice of lemons and oranges.

It is one of the most ancient and real grievances in the fervice, that there has not been

302 CAUSES AND PREVENTION PARTIN

been a fufficiently ample fupply of nourifhment and cordials for the weak and recovering. This complaint is made by * Dr. Cockburn, who was phyfician to the fleet in the end of the laft century; and it is a complaint that has not yet been entirely redreffed, nor has the fubject been confidered with the attention it deferves. The only improvement in the fea victualling that I know of from that time till of late, has been the ufe of raifins for puddings, and the occafional ufe of vinegar, which is an article extremely falutary; and was looked upon as the great prefervative of health in the Roman armies.

After the force of difeafe has been fubdued at fea, men are frequently loft by relapfes, or pine away in dropfies and other chronic complaints, for want of being fupported by fome cordial and nourifhing diet. It is mentioned in my memorial to the Admiralty, how infufficient the fmall quantity of furgeon's neceffaries are; and it is recommended that a large quantity of certain fpe-

* See Effay on Sea Difeafes.

cies

CH. II. SEC. I. OF DISEASES.

cies of refreshment should be put in the purfer's charge, which, being fubflituted for the common fea victualling while men are ill or recovering, would coft Government little or nothing. Befides the articles already mentioned, it was recommended to fet apart a quantity of the best wines, and to be provided with brown fugar, dried fruits, barley, rice, fago, and falep. To thefe might be added eggs, which, if greafed and put in falt, may be preferved fresh for a great length of time. Carrots and other roots might also be preferved for the longest voyages by means of fugar; and green vegetables might in like manner be preferved by means of falt. But of all the articles, either of medicine or diet, for the cure of the fcurvy, lemons and oranges * are of much the greateft efficacy. They are real fpecifics in that difease, if any thing deferves that name. This was first afcertained and fet in a clear light by Dr. Lind. Upon what principle their fuperior efficacy depends, and

* Limes, fhaddocks, and perhaps all the other fruits of that clafs, poffers the fame virtues; but I have most frequently observed good effects from lemons.

303

304 CAUSES AND FREVENTION FART III

in what manner they produce their effect, I am at a lofs to determine, never having been able to fatisfy my mind with any theory concerning the nature and cure of this difeafe, nor hardly indeed of any other. An ingenious treatife has been published on this fubject by Dr. Milman, to which I refer the reader, meaning to confine myself in this work chiefly to what is practical.

Every perfon who has beheld with attention and feeling the tedious and languifhing feries of fuffering which the fick and recovering endure for want of the means of fupporting and recruiting their ftrength and fpirits, must wish that those who prefide in the civil department of the navy would feriously confider this subject, and complete the reform that has already been begun.

With regard to the victualling of men in health, a most commendable attention has been paid to the improvement of it. The ordinary articles of victualling have not only been of excellent quality, but fome new articles have been added, from which the greatest CH. II. SEC. I. OF DISEASES.

greateft benefit has been derived. The chief of thefe are four krout and melaffes. The latter was first brought into use by Captain Ferguson in the beginning of the late war. He ordered it to be ferved with rice to the men who were affected, or threatened with the fcurvy, in the ship under his command. The benefit experienced from it in this and other instances was so great, that during the lass two years of the war it was made a regular article of sea victualling, and substituted in place of a certain proportion of oatmeal*.

As

* In the course of the passage from England to the West Indies in February, 1782, the following directions for using the sour krout and melasses were given in public orders by the Admiral to the different ships of the squadron:

"The allowance of four krout made by the public boards in England, is two pounds to each man every week; and the Admiral orders that from a pound and a half to two pounds (beginning with the leffer quantity, and increasing as the men may find it palatable) be boiled with every gallon of pease on a pease day. The cooks are defired not to wash it, nor to put it into the coppers till the pease are fufficiently broken. X "Half

306 CAUSES AND PREVENTION PART IL.

As bread is one of the principal articles of diet, the utmost care should be taken in preferving it, and great advantage would arise from stowing it in casks that are water

" Half a pound is directed to be iffued raw to each man " on beef days, and a quarter of a pound on pork days. " It is recommended that the allowance of vinegar be " faved, particularly on meat days. When four krout " runs fhort, the peafe and beef days to have the prefe-" rence; when fhorter still, the peafe days. Melasses " having been allowed in lieu of part of the oatmeal, in " the proportion of eleven pounds to two gallons, the " Admiral directs, that a pound of melaffes be boiled " with every gallon of oatmeal on Mondays, Wednef-" days, and Fridays, mixing it and flirring it round " with the burgoo immediately after it is drawn off. " He directs that half a pound of melaffes be iffued " with every three pounds of flour over and above the " common proportion of raifins; and to prevent any " abufe, it is directed that the purfer's fleward pour it " into the platter with the flour of which the pudding is " made. The Admiral forbids the use of pease in lieu of " oatmeal, as has fometimes been the practice."

These rules were fuggested by Sir Charles Douglas, captain of the fleet, whose benevolence is equal to his known professional skill; and he had ascertained the utility of the preceding directions when captain of the Duke in the former part of the war.

tight,

OF DISEASES. CH. 11. SEC. I.

tight, instead of keeping it in bags, or letting it lie loofe in the bread room. Captain Cook, by this method, and by giving it a caft in the oven in the courfe of the voyage, preferved his bifcuit found in every refpect for more than three years. But the greatest improvement in this article of diet would be to have, in the form of flour, a greater proportion of what is now allowed in bread. The flour might be made into puddings, and feems, in this form, to be more nutritious and antifeorbutic than bifeuit which has undergone a ftrong force of fire. This fort of mefs would be still more proper and agreeable now that melaffes is a ftated article of diet. Flour, by being well preffed and rammed, will keep as long as bifcuit, and it can be flowed in one fifth part of the fpace; it will, therefore, cost much lefs in freight than the fame quantity of it in that form, and it may be baked abroad if neceffary*. Malt, by being well rammed, may alfo be preferved for a great length of time:

* In the French ships of war there is an oven large enough to fupply not only all the officers and fick, but part of the crew, with foft bread every day. The ad-

X 2

vantages

307

308 CAUSES AND PREVENTION PART M.

Of all the former articles of fea victualling, there was none more abufed than oatmeal. The quantity allowed to each man was twice as much as he could confume, and the overplus went to the purfer's profits, or was wafted by being given to the hogs, or even wantonly thrown overboard. Melaffes have, with great advantage, been fubfituted for part of it, in the proportion of

vantages attending the use of flour in place of bread are fo great and obvious, that the former will probably, in time, be fubftituted entirely for the latter. There is a proof of its being practicable to use it in place of bread in British ships of war, even with their present conveniences, communicated to me by Captain Caldwell. When he commanded the Agamemnon, of 64 guns, at New York, in the end of 1782, there happened to be no bread in flore to fupply that fhip on her paffage to the Weft Indies, and flour was given in place of it. The men, without any inconvenience, were able to bake it into bread for themfelves, and it proved fo falutary, that Captain Caldwell afcribed the uncommon degree of health which his men enjoyed to the use of the flour. The only objection that can be made to it is the greater confumption of wood occafioned by baking; but this may be obviated by adopting the grates invented by Mr. Brodie, in which the ovens are heated by the fame fire with which the victuals are boiled.

eleven 4

CH. II. SEC. I. OF DISEASES.

eleven pounds for two gallons of oatmeal. The first trial of melasses was in the *Foudroyant, and it answered fo well, that, in a cruise under Admiral Geary in 1780, this was the only ship free from the fcurvy, and out of two thousand four hundred men that were landed at the hospital with this difease, there were none from this ship. It appears to be so similar in its nature and effects to effence of malt, that it seems hardly worth while for Government to be at the expence of providing the latter.

A certain proportion of barley has alfo of late been fubfituted for part of the oatmeal, which being more light and palatable, makes a pleafing variety, particularly to the fick and recovering. Captain Cook carried wheat with him, and found it to anfwer equally well. Might not potatoes alfo be a proper and falutary fubfitute, as they will keep a

* Mr. Napeane, afterwards Under Secretary of State, was at that time purfer of the Foudroyant, and acted a very benevolent and difinterested part, by being instrumental in introducing this reform in the navy victualling.

X 3

309

confi-

310 CAUSES AND PREVENTION PART 11.

confiderable length of time in a warm climate, and they have been fuccefsfully employed in their raw flate for the cure of fcurvy? It would not be right, however, to abolifh oatmeal entirely; for there is a certain preparation of it which is an antifcorbutic of equal efficacy with any whatever, except the juice of lemons and oranges. This is flummery, or fowins, which is prepared by letting oatmeal and water fland together till they grow acidulous, and then boiling them into a jelly. I know of fome well-attefted inflances of the crews of flips being faved from the fcurvy by this alone,

Butter is a good article of victualling in fo far as it renders that part of the diet which confifts of grain and vegetables more palatable, and thereby induces men to eat more. But as it is extremely corruptible in a warm climate, hardly any being ufed by the feamen but what is more or lefs rancid, it fhould never be fent to a tropical flation. Greater quantities of it are condemned than of any other article of victualling, and it is therefore the moft expensive to Government. There CH. 11. SEC. I.

OF DISEASES.

There are certain articles that are the natural produce of the Weft-India iflands, which may be fubfituted for it with the greateft advantage. These are fugar and cocoa*, which, during the last year of the war, were ferved in place of butter with great fuccess, and this proved an alteration in diet not only falutary, but agreeable to the feamen, whose inclinations are always to be confulted in fuch changes +.

When.

* Half a pound of cocoa, and as much fugar, was allowed in place of a pound of butter.

This

312 CAUSES AND PREVENTION PART II.

When a fhip is in port, encouragement fhould be given to the fale of roots, greens, fruits, and fugar. The men have a good cuftom of exchanging part of their bread, beef, and pork, for what they can get from the fhore; but as they in general prefer fpirituous liquors to the above-mentioned articles, the greateft care and vigilance fhould be ufed to preclude men from fuch opportunities of injuring themfelves *. Every fhip fhould be furnifhed with a feine, and other implements for fifhing, when in harbour.

When

This has continued from the laft century till the alterations above mentioned, all of which, except the introduction of vinegar, have been made in the three laft years of this war. When the flock of fmall beer is exhaufted, half a pint of fpirits is allowed daily, diluted with four or five times its quantity of water. When wine is fupplied, the daily allowance of it to a man is one pint.

* Inftead of leaving this to the management of the men themfelves, it might be done with greater advantage to them by inftituting fhort allowance in the following manner :— Let a certain proportion, fuppofe one third, of the falt provisions, bread, and peafe, particularly CH. II. SEC. I. OF DISEASES.

When captures are made, in which there are fuch articles as fugar, wine, rice, or fruits, it would be much better in many cafes to allow the immediate use of them at fea, where the men may be disposed to fourvy or other diseases, than to wait for the conversion of them into money,

Though it has been my object to introduce as many articles of diet as poffible, independent of falt provifions, it does not follow that thefe are in themfelves unwholefome. They are pernicious by being made almost the fole and exclusive article; but if used in moderate quantity, they are even in fome respects well adapted for the food of

larly the first, be stopped, and let the amount of this for the whole crew be thrown into one estimate. Let the agent victualler pay into the purser's hands the value of these provisions in money, at the contract price, with such a discount as will allow for the use of the money. Let the purser, in return, give him a receipt, as if for so much provisions checked. This money, being distributed in the name of short allowance, will enable the men to purchase vegetables, and the provisions will be faved for a time of want, or for a cruise.

feamen.

314 CAUSES AND PREVENTION PART II.

feamen. The nature of their life gives them a ftrong digeftion : in their duties they not only employ violent exercife, but ufe more mufcles and a greater variety of poftures and motions than men of any other profeffion. To fuch conflitutions may not food of a refractory nature and hard of digeftion have even an advantage over what is more delicate and digeftible ?

It does not appear that it is the falt quality of the provisions used at fea that makes them productive of fcurvy, but the want of their native juices and of the nutritious principle. A finall quantity of falt is neceffary to make all food palatable and wholefome, in fo much that it is reckoned one of the necessaries of life. All animals have a craving for fea falt, and nature has kindly made it the most abundant and universal of all faline bodies. Food, without this feafoning, not only comes to be loathed, but the want of it renders the animal weak and flabby. As it not only affifts digeftion, but invigorates all the bodily functions by ftimulating

CH. II. SEC. I. OF DISEASES.

ftimulating and bracing the fibres, it is in fome cafes a valuable medicine. It is remarkable that men are very apt to tire of a long continuance of frefh provifions*, but never of what is falt; and even under the fcurvy the latter will be relifhed, and fometimes preferred to most other kinds of food. It has been a practice with fome to make the fcorbutic men drink fea water; but though it is not attended with any manifest benefit, I never heard that it aggravated the difeafe.

I was told by the gentlemen of the army at New York in 1780, that the foldiers in cantonments were not near fo fubject to agues as the people of the country; and the only difference in their mode of life was, that the former had in their allowance a certain proportion of falt provisions.

* The failors in the fquadron of Commodore Anfon never murinured more under any of their hardfhips than when they were fed with fresh turtle for a length of time in the South Sea.

345

310 CAUSES AND PREVENTION PART II.

In an unhealthy country I fhould think a free use of falt, as well as spice *, would be falutary; and when ships are in port it would perhaps be better to allow a certain proportion of falt provisions, because it would not only be wholesome and agreeable, but the men's constitutions would probably be more reconciled to an entire falt diet when neceffary: but I would except from this the crews of such ships as have newly arrived from a long cruise or voyage, in which it may be necessary to alter the constitution as quickly as possible by a diet entirely fresh.

Nothing that I have collected from my own observation, or that of others, has been

* Since the first edition of this work was printed, I have met with a book published by Mr. Fletcher, a navy furgeon, in which he mentions that spices, being antifeptic bodies, might be fubstituted for part of the falt in curing provision, and this would, no doubt, be an improvement in the fea victualling. The quantity of spice he proposes for every barrel of beef or pork is four ounces of black pepper, and as much allspice, and also eight ounces of nitre in powder. It may be farther alledged as an advantage of spice over falt, that it would be lefs apt to run into brine, which robs the meat of the greater part of its nouristment.

neglected

CHI II. SEC. I. OF DISEASES. 317

neglected under this head, except one particular caution with regard to the preparation of the victuals. The large utenfils employed to boil the provisions are made of copper, and it fometimes happens from negleft that thefe are allowed to contract a ruft, which is one of the most active poifons we know. The neglect confifts chiefly in allowing any thing acid, or what is liable to become acid, fuch as gruel or burgoo, to remain for a length of time without being washed out; for when victuals have been prepared in the boilers thus uncleaned, they produce the most violent effects, even to the lofs of life, as once happened in a fhip belonging to our fleet *.

* This accident happened in the Cyclops frigate in September, 1780. Mr. Gordon, the furgeon, favoured me with the following account of it :

" Mr. Smith, an officer, John Barber and Anthony " Wright, feamen, having eat fome victuals prepared in " a foul copper, complained foon after of violent gripes, " giddinefs, and vomiting, and they had a few loofe " ftools. There was intense heat; the pulse was quick, " full, and hard; a tremor of the hands and tongue, " and wildness of the eyes. The loofeness was foon " fucceeded

318 CAUSES AND FREVENTION PART II.

" fucceeded by obfinate coffivenels, tenfion of the abdomen, difficult breathing, and lofs of deglutition. In the night, towards the morning, there came on infenfibility, with an increase of all the fymptoms, except the heat. The body was violently convulfed, with cold clammy fweats and coldnels of the extremities. The abdomen fubfided a fhort time before they died, and, before they expired, a fmall quantity of greenish matter, mixed with phlegm, issued from the mouths of two of them.

" Thirty three other men were put upon the fick lift with fimilar fymptoms in a lefs degree, and fome of them continued on the lift for five or fix weeks before they perfectly recovered."

It is not faid what means were attempted for the recovery of thefe men; but, befides emetics and milk, or oil, a dilute folution of the fixed alkali in water has been recommended against this poison.

SECT.

CH. II. SEC. II. OF DISEASES. 319

SECT. II. OF DRINK.

AS the folid part of fea diet is very dry and hard, and as the falt it contains is apt to excite thirst, a freer use of liquids than at land is necessary, particularly in a hot climate.

It has been the cuftom, as far back as we know, to allow feamen the ufe of fome fort of fermented liquor. We need hardly inquire if this is falutary or not; for it would be impofiible at any rate to withhold it, fince it is an article of luxury, and a gratification which the men would claim as their right. There is a great propenfity in feamen to intoxicating liquors, which is probably owing to the hardfhips they undergo, and to the variety and irregularity of a fea life. But there is reafon to think that all forts of fermented liquors, except diffilled fpirits, are conducive to health at fea.

3

There

320 CAUSES AND PREVENTION PARTIE.

There is no doubt that malt liquor is extremely wholefome and antifcorbutic. The common quantity of finall beer allowed daily is fo liberal, that few men make ufe of their whole allowance; and there is no objection to the conftant ufe of it, except that it is apt to fpoil in the courfe of a few weeks, and that upon foreign flations the flock can feldom be renewed. One of the greateft improvements that could be made in the victualling of the navy would be the introduction of porter*, which can be preferved in any climate for any length of time that may be neceffary.

Spruce beer feems to poffefs fimilar and equal virtues with malt liquor; and it has this

* I was furnished by Dr. Clephane, physician to the fleet at New York, with the following fact, as a strong proof of the excellence of this liquor :

In the beginning of the war two flore fhips, called the Tortoife and Grampus, failed for America under the convoy of the Dædalus frigate. The Grampus happened to be fupplied with a fufficient quantity of porter to ferve the whole paffage, which proved very long. The other two CH. II. SEC. II. OF DISEASES.

this advantage, that the materials of it can at all times be carried about and ufed occafionally. It agrees with malt liquor in being a fermented vegetable fweet, the principal ingredient of it being melafles. The other ingredient, from which it takes its name, being a balfamic fubftance, feems to be more medicinal and antifcorbutic than hops, and is therefore, perhaps, preferable to malt liquor. There have been fufficient proofs of its virtues in fingle fhips; and all the men of war that go to America and the Weft Indies might be conveniently fupplied with it. Admiral Pigot provided a fufficient quantity for the whole fleet; but the peace coming on prevented the trial of it.

The most falutary kind of drink next to malt liquor, and spruce beer, is wine. The

two fhips were furnished with the common allowance of spirits. The weather being unfavourable, the passage drew out to fourteen weeks, and, upon their arrival at New York, the Dædalus sent to the hospital a hundred and twelve men; the Tortoise fixty-two; the greater part of whom were in the last stage of the scurvy. The Grampus sent only thirteen, none of whom had the fcurvy.

321

benefit

322 CAUSES AND PREVENTION TART M.

benefit which the fleet derived from it at different times, and the advantage it has over fpirits has been often taken notice of in the former part of this work. It feems to be owing to this that the French fleet fometimes enjoys fuperior health to ours, and is lefs fubject to the fcurvy *. Wine is alfo preferable to every other medicine in that low fever with which fhips are fo much infefted; and there is no cordial equal to good wine in recruiting men who are recovering.

Spirits differ from wine in this refpect, that they are a mere chemical liquor, incapable of affimilation with our fluids, having loft in diffillation the native vegetable principle in which the whole of its nutritious quality and great part of its medical virtue refides.

* We have a remarkable proof of this in comparing the fleet under the command of Admiral Byron with that under the Count d'Eftaing, when they both arrived from Europe on the coaft of America in the year 1778, fome of the British shaving been unferviceable from the uncommon prevalence of fcurvy, while the French were not affected with it.

The

CH. II. SEC. II.

OF DISEASES.

The abufe of fpirituous liquors is extremely pernicious every where, both as an interruption to duty, and as it is injurious to health. It is particularly fo in the Weft Indies, both becaufe the rum is of a bad and unwholefome quality, and becaufe this fpecies of debauchery is more hurtful in a hot than in a cold climate.

It is with reafon that the new rum is accufed of being more unwholefome than what is old; for, being long kept, it not only becomes weaker and more mellow by part of the fpirit exhaling, but time is allowed for the evaporation of a certain naufeous empyreumatic principle which comes over in the diftillation, and which is very offenfive to the flomach; therefore, though this is the produce of the Weft-India iflands, yet what is fupplied there is inferior to that which is brought from England.

It was originally the cuftom to ferve feamen with their allowance of fpirits undiluted. The method now in ufe, of adding water to it, was first introduced by Admiral Y 2 Vernon

323

324 CAUSES AND PREVENTION PART IL.

Vernon in the year 1740, and got the name of grog. This was a great improvement; for the quantity of half a pint, which is the daily legal allowance to each man, will intoxicate most people to a considerable degree, if taken at once in a pure state.

The fuperiority of wine over fpirits in any fhape was fo confpicuous, that towards the end of the war the fleets in the Weft Indies and North America were fupplied with nothing but wine, and with a fuccefs fufficient to encourage the continuance of the fame practice in future.

OF WATER.

As water is a neceffary of life, and as the health and comfort of men at fea depend upon its quality, it deferves particular attention.

Spring water is to be preferred to running or stagnated water; for, unless it is taken at the source, or near it, it is apt to be impregnated CH. II. SEC. II. OF DISEASES.

impregnated with decayed vegetable and animal fubftances, fuch as leaves, grafs, wood, and dead infects. This inconvenience is greateft in a hot climate, where every thing teems with life, and where the materials of putrefaction are both more abundant and more prone to corruption. This is the most pernicious kind of impurity; for the mineral impregnations common in fprings are feldom, in any degree, unwholefome, and do not tend, like the other, to make the water corrupt. At many of the Weft-India watering places the water is found stagnated just above high-water mark; and care should be taken to go higher up to take it where it is running,

The pureft water is apt to fpoil by producing a putrid glare upon the inner furface of the cafk which contains it. There is a great difference in this refpect between a new cafk, efpecially if made of moift wood. and that cafk which has been hardened and feasoned by age and use. Several contrivances have been propofed for preparing the veffels that hold the water; but none have Y 3 been

326 CAUSES AND PREVENTION PARTIL.

been found by experience fo effectual as letting them stand for fome time full of fea water; and it is a great advantage of this method, that it is fo eafily practicable.

It is in few places we meet with water fuch as that of Briftol, which, in clean veffels, may be kept for any length of time. We'may confider all water kept in wooden veffels as more or lefs liable to putrefaction ; but there is a fubstance, which is neither rare nor coftly, that effectually preferves it fweet. This is quick lime, with which every fhip should be provided, in order to put a pint of it into each butt when it is filled. It has the advantage of not being injurious to health; but, on the contrary, is rather friendly to the bowels, tending to prevent and check fluxes. In the year 1779 feveral ships of the line arrived in the West Indies from England, and they were all afflicted with the flux, except the Stirling Caftle, which was the only ship in which quick lime was put into the water. Nor does it fpoil the water for any culinary purpofe. Its action in preventing putrefaction confifts,

CH. II. SEC. II. OF DISEASES.

fifts, in part at leaft, in deftroying vegetable and animal life. An addition of putrefcent matter is produced in water by the generation of finall infects; and the glare that collects on the fides of cafks, and alfo what collects on the furface of the water, is a fpecies of vegetation of the order called by naturalifts algae*. Quick lime is a poifon to this fpecies of vegetable life as well as to infects; but upon whatever principle it depends, the property of it in preferving water fweet is fo well afcertained, that it is inexcufable ever to neglect the ufe of it.

Quick lime is equally efficacious for this purpofe, whether flacked or unflacked; and though the latter form is more convenient for flowage, by having lefs weight and bulk, yet the other is to be preferred for the fake of fafety; for if water flould by chance reach the unflacked lime, a great degree of heat is thereby produced, which has been known to give occafion to the moft formidable accidents.

* See an article in Rozier's Journal de Medicine for July, 1784, by Dr. Ingenhoufz.

The

327

.328 CAUSES AND PREVENTION PART II.

The only other objection I know of to the use of quick lime is, that it converts the water into a lime water, rendering it thereby difagreeable to the palate and stomach: but the quantity necessary to preferve it makes but a very weak lime water; for part of the lime is precipitated by the mephitic air, or the aerial acid, as it is otherwise called, of which there is some contained in the water. The accidental expositive to the atmosphere, which also abounds with this fort of air, tends farther to leffen the acrimony of the quick lime *.

There are other fubftances which have been found ufeful in correcting bad water. Alum and cream of tartar, as antifeptic bodies, have been employed for this purpofe. Vinegar

* Since I came to England I have met with a pamphlet publifhed by Mr. Henry, of Manchefter, in which an ingenious method, founded on chemical principles, is proposed for feparating the quick lime from water; but I fear it is too nice and complex to be brought into common practice. It would certainly be worth the trouble; but there are fo many duties in a ship of war to call off the attention of the men, and they are fo little accuftomed CH. II. SEC. II. OF DISEASES.

Vinegar and the vegetable acid juices and fruits, fuch as tamarinds, may be used occasionally to take off the putrid offensive taste which may have arisen in case the use of quick lime has been neglected. In the fleet under Sir Charles Saunders, the water of the river St. Lawrence having been found to produce fluxes, this quality was removed by throwing four pounds of burnt bifcuit into each cash before it was used. But there is nothing so effectual, and subject to so few inconveniences, as quick lime.

The next method to be mentioned of purifying water is filtration, which not only feparates the grofs impurities, but removes the putrid fmell and tafte. It is performed with a dripping flone, which is a convenient

tomed to nice operations, that it would be difficult to perfuade officers to attend to it and enforce it. If a fufficient quantity fhould not be precipitated by the air in the water, and by the accidental expofure to the atmofphere, it might be more effectually expofed to the air by Ofbridge's machine, to be defcribed hereafter, or by a long-nozzled bellows, and if a finall impregnation fhould be left, this is rather to be defired than avoided.

contrivance

330 CAUSES AND PREVENTION PARTIL. contrivance for officers, but cannot furnish a supply for a whole ship's company.

When the water of wells or brooks is found loaded with mud, the following expeditious method of filtration, defcribed by Dr. Lind, has been practifed with fuccefs : - Let a quantity of clean fand or gravel be put into a barrel placed on one end, without the head, fo as to fill one half or more of it, and let another barrel, with both ends knocked out; of a much fmaller fize, (or let it be an open cylinder of any kind) be placed erect in the middle of it, and almost filled with fand or gravel. If the impure water be poured into the finall barrel or cylinder, it will rife up through the fand of both barrels, and appear pure above the fand of the large one in the interval between it and the fmall one.

But when water is offensive in confequence of being long kept, the most effectual and expeditious method of fweetening it is by exposing it to the air in as divided a state as possible. Boiling will not expel the putrid effluvia CH. II. SEC. II.

OF DISEASES.

effluvia contained in water; but fuch is the attraction of air for this offenfive matter, that the water need only be thoroughly exposed to it to be rendered quite sweet. This is beft done by a machine invented by Mr. Ofbridge, a lieutenant of the navy. It confifts of a hand pump, which is inferted in a fcuttle made at the top of a cafk, and by means of it the water, being raifed a few feet, falls through feveral fheets of tin pierced like cullenders, and placed horizontally in a half cylinder of the fame metal. The purpose of it is to reduce the water into numberless drops, which being exposed in this form to the open air, is deprived of its offenfive quality. The fame method will ferve to separate the superfluous quick lime in the water. It is a machine very defervedly in common ufe, and the working of it is a moderate and falutary exercise to men in fair weather.

The following contrivance will be found to afford a fufficient fupply of fweet water to particular meffes, and may be confidered as an artificial and more expeditious fort of dripping

331

332 CAUSES AND PREVENTION FART IL.

dripping ftone. — Let the narrow mouth of a large funnel be filled with a bit of fponge, over which let there be a layer of clean gravel or fand covered with a piece of flannel, and over the whole another layer of fand. Muddy or offenfive water being poured upon this, runs or drops out clear; and care muft be taken to change the fand, fponge, &c. frequently, as they will become loaded with the impurities of the water *.

There fhould be in every fhip an apparatus for diffilling water in cafe of diffrefs. This confifts merely of a head and worm adapted to the common boiler, and diffillation may go on while the victuals are boiling. More than eight gallons of excellent frefh water may be drawn off in an hour from the copper of the fmalleft fhip of war +. I refer for a more particular account of

* See Dr. Lind on the Health of Seamen.

The want of this apparatus may be fupplied, in cafe of exigency, by a contrivance mentioned by Dr. Lind, confifting of a tea-kettle with the handle taken off, and inverted upon the boiler, with a gun barrel adapted to the fpout,

CH. II. SEC. II. OF DISEASES.

of all this to the works of Dr. Lind, who was the original inventor and recommender of this method.

This invention feems to have efcaped others fo long, from the idea that the *defideratum* in freshening fea water was fome fubstance to be added to it while under diftillation. No fuch substance is necessary, and the more simple the mode of diffillation, the fresher the water will prove.

Rain water at fea is always pure and wholefome, and may be faved occafionally by means of a fail or awning.

fpout, paffing through a barrel of water by way of refrigeratory, or kept conftantly moift with a mop.

In this place I cannot help mentioning alfo, that in cafe of great extremity it has been found that the blood may be diluted, and thirft removed, by wetting the furface of the body even with fea water, the vapour of which is always fresh, and is inhaled by those pores of the skin whose natural function it is to imbibe moisture, of which there is always more or less in the common air of the atmosphere.

CHAP. III.

Of CLOTHING.

NATURE has made man so defenceles, that even the rudeft nations, in the hotteft climates, in general, adopt fome fort of covering to guard themfelves from the weather. We may affirm, that clothing is the most artificial circumstance in the life of man; and there is none, of which the errors fubject him to more inconvenience and hardfhip. Infenfible perfpiration is performed by the pores of the fkin, and being one of the most important functions of the body, the fuppreffion of it feems to be one of the principal caufes, or at least one of the most frequent attendants on feverish and inflammatory complaints; and one of the most common causes of this suppression is the application of cold to the fkin.

In order to keep up perfpiration, it is neceffary that the orifices of the pores of the skin CH. III. SEC. II. OF DISEASES.

fkin fhould be bathed, as it were, in the vapour already fecreted from them; and clothing feems to act in confining this, as well as in preventing the efcape of the natural heat and the accefs of the external air. Though the air fhould not be cold, it will check perfpiration by carrying off this vapour and drying the fkin. In the warmeft climates exposure of the skin to the external air is unfafe; for it not only produces a feverish and uneasy fensation at the time, but occasions the most dangerous internal diforders. In confequence of the great fenfibility and fympathy of the body, and from the pores of the fkin being open in a warm climate, exposure is in some respects even more dangerous than in a cold one. Nothing is more apt to bring on the locked jaw and tetanus than fleeping in the open air; and it was observed in Jamaica, that when it was the cuftom to wear cotton and linen clothes, the dry belly-ache was much more common than now that it is the cuftom to wear woollen cloth.

335

336 CAUSES AND PREVENTION PART II.

We know befides, that the pores of the fkin can abforb not only the moifture that floats in the atmosphere, but a variety of foreign bodies, whether noxious or medicinal, which may be applied to their orifices; and as the air is in certain places loaded with noxious matter, may not clothing be confidered as a filter, as it were, to feparate the impurities of the air before it comes in contact with the furface of the body?

It is therefore every where of the utmost confequence that fufficient and fuitable clothing should be provided.

It would certainly be for the benefit of the fervice that an uniform fhould be eftablifhed for the common men as well as for the officers. This would oblige them at all times to have in their poffeffion a quantity of decent apparel, fubject to the infpection of their fuperiors. It would also be lefs eafy to difpofe of their clothes for money without detection, and defertion would also thereby be rendered more difficult.

OF DISEASES.

CHAP. III.

It is of great confequence that the purfer should lay in a fufficient flock of clothing and bedding fuited to the climate for which the fhip is deftined, in order that there may be a fufficient fupply after having been on a diftant flation for a certain length of time. I have known men fuffer the greateft inconvenience and hardfhip, and infectious difeafes kept up, from the neglect of this,

The greateft evil connected with clothing is the infection generated by wearing it too long without fhifting; for to this caufe we have attributed the jail, hofpital, or fhip fever. The great importance of cleanlinefs appeared when we were treating of infection, from whence we may judge of what confequence it is that men fhould be provided with a fhift of linen, as that part of the clothing which is in contact with the fkin is moft likely to harbour infection *.

As

* When we confider that linen was not in use among the ancient Romans, we might be apt to wonder that Z they

337

338 CAUSES AND PREVENTION PART 11.

As clothing is not the gift of nature, being left to man's own reason, it is subject to caprice, and thereby productive of inconvenience and difeafe. The necessity of it depends very much upon habit, like every thing elfe relating to the human body, and therefore fudden and unfeafonable changes of apparel are very unfafe to health. It is alfo found that a partial exposure of the. body is more pernicious than a general expofure. If I were writing for the more delicate part of the world, I should illustrate this by the danger of exposing the feet alone to cold or wet. It is feldom that feamen are fusceptible to fo great a degree, for their hardy and exposed life fteels them against

they were not more unhealthy; but their fubfitute for this was frequent bathing, which not only ferved to remove the *fordes* adhering to the furface of the body, but to air that part of the clothing which was ufually in contact with the fkin. The wafhing of the bodies of men fufpected of infection upon their first entrance into a fhip, has already been mentioned, and I have known fome commanders who made their men frequently bathe themfelves with great feeming advantage.

fuch

CHAP. III.

OF DISEASES.

fuch impressions. But there is another circumstance which renders it of the utmost confequence to defend the feet against external injury. It frequently happens, that, without any visible fymptoms of fcurvy, the conflitutions of feamen are fuch, that, upon the leaft fcratch being received on the feet or legs, a large fpreading incurable ulcer arifes, which fometimes ends in the lofs of a limb; but at any rate difables them from duty till a cure can be effected by the use of a fresh and vegetable diet, or a change of climate. Next to acute difeafes and fcurvy, this is the most destructive complaint incident to a fea life, particularly in a hot climate; and I have known great numbers of good men thereby loft to the fervice. It is, therefore, of the utmost confequence that men should not only be fupplied with fhoes, but be obliged to wear them, which is found to require a degree of compulsion; for in the West Indies it is observed that feamen always with to go barefooted.

Since the first edition of this work was published, I have been favoured with feveral Z 2 valuable

340 CAUSES AND PREVENTION PART IL.

valuable remarks on this fubject, by Captain Caldwell, an officer of great humanity and experience. Among other remarks, he obferves, that the different articles of clothing fupplied to failors are, in general, too flight, and of too fmall a fize, which renders them expensive and inconvenient to large men. The trowfers, he observes, should be much thicker, and larger, as the leaft shower goes through them; and, in a cold climate, those made of fear-nought *, which do not coft more than the others, should also be allowed. What a fituation are men in when topfails are reefing in the winter feafon while it rains, when cold and wet, with their trowfers flicking to them, (which would not be the cafe if they were of flannel) and it is not practicable that they should have change of clothing for every time they are obliged to be wet? Thick, double-milled caps are much wanted in bad weather to cover the head and ears. Dutch caps do not keep out the weather, and will not flay on the head. It is commonly re-

* A coarfe woollen fluff fo called.

marked

CHAP. III. OF DISEASES.

marked that the men who wear the thickeft linen fhirts are the most healthy.

Men, upon first entering into the fervice, are allowed the advance of two months wages, in order to provide neceffaries: but this, inadequate as it is for a long voyage, is not extended to preffed men. It is alfo argued against making large stoppages in feamen's wages; that, by diminishing what they have to receive when paid off, a difcouragement is thereby given to the fervice. But as we see men deferting from men of war when several years wages are due to them, the most reasonable and effectual encouragement seems to be to render their lives as comfortable and healthy as possible.

But why might not most of the articles mentioned be fupplied gratuitously? In favour of which Captain Caldwell makes use of an argument frequently inculcated in this work, viz. that fo much advantage would accrue to Government by preferving the health and lives of men, and fo much would be faved in hospitals, as would much

CHAP.

CHAP. IV.

Of EXERCISE.

T commonly happens in a fhip of war that a great proportion of the hands is landfmen; for, befides the men required to navigate the fhip, a great number is neceffary to fight the guns, as well as for other duties, and their health may be affected by the want of exercife.

It has been obferved before, that one ufe of frequent reviews and mufters in a numerous crew is, to call forth men that would otherwife be overlooked, to oblige them to come into the open air, to keep themfelves clean, and to prevent them from indulging in filth and lazinefs. It is obferved, that feamen are in general lefs fubject to fcurvy than marines and landfmen, which feems to be owing to the greater activity of their life and alacrity of their minds.

Z 4

There

344 CAUSES AND PREVENTION FART II.

There is an effay on the caufes of the peftilence, by an anonymous author, publifhed at Edinburgh in 1759, in which this difeafe is faid to be entirely the offspring of idlenefs, and he illustrates this by its being more apt to arife in befieged towns than any other fituation; and he alledges that a falfe alarm of the plague will actually produce it by throwing people idle, as was the cafe, he affirms, when the plague was laft at Meffina.

There are always numbers who have been prefied into the fervice, to whom a fea life is new, and who are therefore prone to indolence, low fpirits, and felf-neglect. Men of this defcription are by far the moft apt to fall into the fcurvy; and next to the quality of the food, there is nothing contributes more to promote the fcurvy than fuch a difpofition. It is indeed both a caufe and a fymptom of this difeafe, and therefore idlenefs and *fkulking* fhould be rigidly difcouraged, unlefs the complaint is fo far advanced as to render it cruel and even impoffible to force men to take exercife.

The

OF DISEASES.

CHAP. IV.

The Conqueror, of 74 guns, one of our fquadron in the laft year of the war, was an inftance of a fhip in which only the prime feamen were attacked with the fcurvy, and this is to be accounted for upon the fame principle, for it proceeded from their having been exempted from the duty of pumping, in which the inferior claffes of men were conftantly employed, owing to the leaky ftate of the fhip.

As low fpirits and indolence have fuch an unfavourable effect upon health, it would be wife, as well as benevolent, to promote whatever produces jollity, contentment, and good humour, fo far as is confiftent with fobriety and regularity. There are certain rough fports which are now almost in difuse; and whoever would revive and encourage them, would perform a useful office to the fervice.

A fea life frequently demands violent temporary exertions, from the uncertainty of the weather, and other incidents; fo that men are more exposed to extreme fatigue and

346 CAUSES AND PREVENTION PART II.

and fudden calls of duty in this than in any other fituation of life. Nothing tends more to fhorten life than exceflive bodily labour and watching; and it is for this reafon that feamen in general are fhort lived, and that their countenance and general appearance make them appear older than they really are by feveral years. This is remarkably the cafe when a feaman comes to be upwards of forty; and it has been mentioned before, that a perfon not acquainted with this circumftance will make a miftake of ten years in gueffing at the age of a feaman from his looks.

Fatigue being therefore frequently the means of bringing on difease and breaking the conftitution, as much tenderness is due to men as is confistent with the neceflary duties of fervice. This is a circumstance in which young officers are apt to forget themselves; and they should take care how they call all hands wantonly, and oblige men to make exertions beyond their strength, especially as this will be submitted to more readily CHAP. IV.

OF DISEASES.

readily by failors than any other fet of men, from the generous alacrity of their nature.

It would be well if it could be rendered convenient at all times, except in cafes of danger or emergency, to put the men at three watches inftead of watch and watch. By the former arrangement they have eight hours fleep and reft; by the latter only four hours are allowed, which is not fufficient for refrefhment, nor is there time for them to get dry, in cafe they have been expofed to wet.

It would be a good rule to have as few men as poffible out of bed in the nighttime, unlefs where active fervice renders it neceffary; for, if unoccupied, they lie about the decks, fall afleep, and catch cold. In fuch fituations, might not all the topmen but one remain on the forecaftle, where they might take exercife, which they could not do aloft? I am indebted for this remark to the Rev. Mr. Ramfay, who joins to a great knowledge of the fea fervice a warm and difinterefted zeal for its profperity, and has been

483 CAUSES AND PREVENTION PARTIL.

been fo good in feveral other inftances as to communicate to me the refults of his experience and obfervation.

The good effects refulting from the indulgent treatment of men are, that it' encourages them to enter into the fervice, and to do their duty with cheerfulnefs and refolution. There is fomething more daunting to the mind of man to fee his companions fuffering under oppreffion and languishing in difeafe, or perifhing miferably from fores or ficknefs, than in the terrors of fire and fword, which, as we have feen, make the least part of the calamities of war. The good treatment of feamen, in fo far as it regards their health, is by no means incompatible with ftrict discipline. Indeed ftrictnefs and even feverity is neceffary with feamen; for it is observed with regard to men who are used to arbitrary government, that they cannot bear indulgence and relaxation. But the fleady enforcement of difcipline and regularity is fo far from being akin to cruelty, that it tends to prevent both ficknefs and the commission of crimes, confequently rendering

OF DISEASES.

CHAP. IV.

rendering the infliction of punishment lefs frequent and neceffary. The chief excellence in the character of an officer feems to confift in uniting ftrict difcipline with indulgence and humanity.

CONCLUSION.

THE fubject of the preceding remarks has been the prevention of difeafe, and it has appeared that the means of this are not fo much in the province of the medical profeffion as of those who are entrusted with the direction of the navy in a civil or military capacity; and that with regard to cure and recovery alfo, a great deal depends upon them, by their having it in their power to make a fuitable provision of proper diet and cordials. The great importance of the fubject will plead my excuse for again calling to mind, that fuch attentions are not only dictated by humanity, but would be the greateft wifdom in an œconomical and national light, confidering

350 CAUSES AND PREVENTION PART II.

confidering how expensive it is to replace men and to fupport invalids, not to mention that it is upon the health and lives of men that every public exertion effentially depends, and upon which may depend not only the character of officers, but the national character in the day of battle.

It must be confessed, that though there is fill room for improvement, the navy is now on a better footing with regard to the health and comfort of feamen than it appears to have been in former times. The victuals were in general in the late war of excellent quality; the civil branch has shewn in many instances a readines to adopt the means and to furnish the articles that were recommended for the health of the men*; and most of the commanders whom I have the honour to know are humane, attentive, and intelligent.

To conclude; there is no fituation of life in which there is room for more virtues,

* See Part I.

more

CHAP. IV. OF DISEASES. 251

more conduct and address, than that of a fea officer. The men are thrown upon his humanity and attention in more views than one: they are fubject to a more arbitrary exertion of power than the conflitution of the state authorises in civil life, Englishmen giving up into his hands, from confiderations of public expediency, that which they hold most dear, and of which they are most jealous, their LIBERTY. It is the character of feamen to be thoughtlefs and neglectful of their own intereft and welfare, requiring to be tended like children; but from their bravery, utility, and other good qualities, they feem entitled to a degree of parental tendernefs and attention from the flate they protect and the officers they obey.

APPENDIX

APPENDIX TO PART II.

In order to exhibit a concife view of the most material observations contained in this part of the Work, a Memorial, delivered to the Board of Admiralty in October, 1781, is here subjoined.

MEMORIAL,

Proposing Means for preventing the Sickness and Mortality prevailing among His Majefty's Seamen in the Weft Indies.

HAVE for the two laft years attended a fquadron, confifting feldom of lefs than twenty fhips of the line, in quality of phyfician to the fleet at Barbadoes and the Leeward Iflands. I received, by the order of the Commander in Chief, a monthly return from the furgeon of each fhip, fetting forth the difeafes, deaths, and other circumftances of the refpective fhips companies. I alfo

APPENDIX.

OF DISEASES.

I also superintended the hospital of the place where the fleet happened to lie when in port. These advantages have afforded me an intimate knowledge of the nature and causes of the sickness and mortality among the seamen, both on board of their ships and in hospitals.

It appears by my returns, that there died in the courfe of the twelve months preceding July laft, on board of fhips, feven hundred and fifteen feamen and marines, of whom only fifty-nine died in battle and of wounds. There died in the fame time in hofpitals eight hundred and fixty-two: fo that out of twelve thoufand one hundred and nine men, which is the fum total of the complement of twenty fhips of the line, there have perifhed in one year one thoufand five hundred and feventy-feven, that is nearly every feventh man.

There were also fent to England in the fame year, three hundred and fifty men, disabled by lameness and chronic complaints,

Aa

the

354 CAUSES AND PREVENTION PART II. the greater part of whom will be for ever loft to the fervice.

The degree of ficknefs is very different at different times; but it appears by the returns, that, at a medium, there has been one man in fifteen on the fick lift.

Having employed all the attention of which I was capable to find out the caufes of this ficknefs and mortality, in order, if poffible, to point out the means of prevention, I flatter myfelf with being able to affign the moft general caufes, and to propofe fome effectual remedies.

When it is confidered that ficknefs is almost entirely confined to ships of two and three decks, and that some of these are as healthy as frigates and merchant ships, though in the same circumstances of service with others that are extremely sickly, we are led from hence to infer, that sickness is not in its own nature unavoidable, and we are encouraged to hope, that the attainment of

APPENDIX.

OF DISEASES.

of general health is within the compass of human management.

I humbly and earneftly folicit attention to fome of the moft material obfervations and conclusions which have occurred in the courfe of a fervice, which, though fhort, has been extensive; and whatever is here proposed has this recommendation, that it is easily practicable, and is no addition to the public charges.

First, I hardly ever knew a ship's company become fickly which was well regulated in point of cleanlinefs and drynefs. It is the cuftom in some ships to divide the crew into fquads or divisions under the infpection of refpective officers, who make a weekly review of their perfons and clothing, and are anfwerable for the cleanlinefs and regularity of their feveral allotments. This ought to be an indifpensable duty in ships of two or three decks; and when it has been practifed, and at the fame time ventilation, cleanlinefs, and drynefs below and between decks, have been attended to, I have never Aa 2 known

356 CAUSES AND PREVENTION PART 14.

known feamen more unhealthy than other men. The neglect of fuch attentions is a never-failing caufe of ficknefs.

I would, therefore, with all becoming deference, fuggest, that such a regulation, instead of being left to the difference of officers, should be made a part of the public instructions. From some commanders, who already practise these rules, the advantage of them comes to be known; and would not a public fanction not only render them general and permanent, but facilitate the duty of the officer, by making such a regulation appear a matter of legal necessity, instead of his own arbitrary act?

Secondly, Scurvy is one of the principal difeafes with which feamen are afflicted, and this may be infallibly prevented, or cured, by vegetables and fruit, particularly oranges, lemons, or limes. Thefe might be fupplied by employing one or more fmall veffels to collect them at different iflands, and fuch an expedient would prevent much ficknefs, and fave many lives. I am well convinced that more

APPINDIX.

OF. DISEASES.

more men would be faved by fuch a purveyance of fruit and vegetables, than could be raifed by double the expence and trouble employed on the impreft fervice; fo that policy, as well as humanity, concur in recommending it. Every fifty oranges or lemons might be confidered as a hand to the fleet, inafmuch as the health, and perhaps the life, of a man would thereby be faved.

Thirdly, The use of wine, in place of rum, has been found extremely conducive to health. In the course of my observation I have met with the most unquestionable proofs of the benefit that would arise from this substitution. It is a farther reason for fuch a change, that good rum is feldom or never supplied in the West Indies.

Fourthly, The neceffaries provided for the fick by the prefent effablishment are not at all adequate, especially on a distant station, where the supply is not regular, and the quantity at best is such as can contribute but little to their comfort and recovery. An ample provision might be made for the sick, A a 3 without 358 CAUSES AND PREVENTION PART IL. without any additional expence, in the following manner:

It is a rule in the fervice, that though men are fick, their ordinary allowance of falt meat and other victuals is neverthelefs ferved out, and is either used by the other feamen, who fland in no need of it, or is wasted. Now, if the purfers were instructed to provide themfelves with certain fpecies of neceffaries, fuch as Madeira wine, fugar, rice, and dried fruits, to ferve to the fick, in place of rum, and the common provisions of the ship, such a regulation would be productive of the very best effects, in recovering the health, and preferving the lives of those men who have the misfortune to be taken ill in a fituation neceffarily deftitute of most of the comforts that can alleviate their fufferings. I cannot help here applauding a late regulation, by which melaffes are fubstituted for part of the oatmeal; for the quantity of the latter heretofore legally allowed was fo much greater than what was neceffary, that one half of it has commonly been wafted. It

APPENDIX.

OF DISEASES.

It is to be obferved, in general, with regard to the Weft Indies, that fhips on fervice are to be confidered, in a great meafure, in the light of fhips conftantly at fea; for, excepting the ifland of Barbadoes, there is no other port in which frefh meat and vegetables can be procured in any quantity, and therefore four krout, melaffes, and fuch other articles of antifcorbutic diet as can be fupplied on board, are abfolutely neceffary. Fleets could hardly exift here, were it not that a warm climate is naturally more unfavourable to the fcurvy than a cold one.

Fifthly, Though the health of a fhip's company depends chiefly on diet, and that difcipline and order which is the bufinefs of officers, yet much depends alfo on the medical art, particularly in the Weft Indies; and as furgeons frequently cannot do juffice to the men without wronging themfelves, in a country where the price of every thing is exorbitant, and medicines often unfound, Government would find its account in fupplying gratuitoufly fome of the moft coftly A a 4 articles,

360 CAUSES AND PREVENTION FART II.

articles, particularly Peruvian bark in a fresh state, from time to time, from England.

Sixthly, It is now the general cuftom to fend every fick perfon on fhore to an hofpital, where there is frequently worfe air and worfe accommodation than on board, from overcrowding the apartments. Contagious difeases, though not fo common as in Europe, are here often mixed with those that are not fo, whereby numbers are infected and carried off; and, befides this, the land air is infinitely more unwholefome in the Weft Indies than the air at fea or in a road. The fcurvy is perhaps not at all contagious, nor is it very difficult of cure; but a number of cafes of it terminate fatally from the flux or fever, caught either by contagion in hofpitals, by the noxious influence of land vapours, or by intemperance. I beg leave, therefore, humbly to fuggeft, that as few fick as poffible of any difeafe, but what is contagious, be fent to hofpitals, and that fome method be established for the supply of vegetables and other refreshments to the fick on board of their fhips.

Seventhly,

APPENDIX. . OF DISEASES.

Seventhly, Crowding, filth, and the mixture of difeafes, are the great caufes of mortality in hofpitals. There fhould be a fpace of five hundred cubic feet allowed for each man; and in general the fick had better remain on board than be crowded beyond that degree; or relief fhould be provided to the hofpital by an hofpital fhip, which, for reafons already given, is preferable to any accommodation on fhore; and fuch an inftitution would be more particularly proper for the reception of convalefcent men.

I would beg leave, therefore, earneftly to recommend that cleanlinefs, the feparation of difeafes, and a competent fpace, be regularly enjoined and ftrictly enforced in hofpitals; and in order to make this more practicable in the great fcale of fervice now going on, I would farther propose that hofpital ships be established for the reception of the fick or recovering. I know from extenfive experience and close observation, that these circumstances are more estential than even medicine and diet.

364

Thefe

352 CAUSES AND PREVENTION PART IL.

These are a few remarks extracted from a feries of observations, and derived from great opportunities of experience. Many other remarks would suggest themselves; but I purposely confine myself to what is highly important, and easily practicable, with little or no addition to the public expense. Some of the improvements recommended are indeed an immediate, and all of them will be an eventual, faving to the public.

The alterations that have been proposed are,

1ft, The eftablishment of a certain method and discipline, in order to secure regularity and cleanliness among the men, and to render the ships clean and dry.

2dly, The fupply of fruit and other vegetables for the cure of the fcurvy.

3dly, The fubflitution of wine* for rum,

* Had I then known the falutary effects of porter and fpruce beer, of which I have fince been convinced, I fhould have proposed them as fubstitutes for rum.

4thly,

APPENDIX.

OF DISEASES.

4thly, The provision of an adequate quantity of neceffaries for the fick.

5thly, The gratuitous fupply of certain medicines.

6thly, The curing of certain difeafes on board inftead of fending them to hofpitals; and,

Laftly, The preventing of filth, crowding, and the mixture of difeafes in hofpitals, by proper regulations, and by eftablishing hofpital ships.

I beg leave again to call to mind, that 1518 deaths from difeafe, befides 350 invalids, in 12,109 men, in the courfe of one year, is an alarming wafte of British feamen, being a number that would man three of His Majesty's ships of the line; and what I advance is from a real conviction that a due attention to the above-mentioned propositions would fave more than two thirds of the feamen that would otherwise die in that climate. It was to fet this in a proper light that

364 CAUSES AND PREVENTION PARTIL

that I requefted leave to quit my duty during the abfence of the greater part of the fquadron in the hurricane months; and fhould any thing I propose meet with public approbation, and be carried into effect, I should efteem it a recompence far above any other gratification I can derive from the service.

LONDON, October 13, 1781.

To the Right Hon. the Lords Commissioners of the Admiralty.

Next year the following Supplement to the preceding Memorial was fent to the Board of Admiralty;

SUPPLEMENT to the MEMORIAL delivered last Year to the Board of Admiralty.

SINCE my return to my duty on this ftation, additional experience has afforded me farther practical confirmation of the utility of the former propofals.

The

OF DISEASES.

APPENDIX.

The great fquadron employed on this flation has, by the attention of the Commissioners of Victualling, and also of the Commander in Chief, been supplied with most of the articles recommended, in such quantities as to prove their efficacy; and indeed the small degree of mortality in comparison of former times, is a sufficient demonstration of this.

I beg leave to give an inftance in the Formidable of the great and falutary effects of the proposed improvements. This ship left England, furnished not only with four krout and melasses, in common with most others in the squadron, but what was peculiar to herfelf was, an entire supply of good wine in place of spirits; and an experiment has been made in this instance, under my own eye, to ascertain what degree of health it was possible to attain in a great ship in this climate. With the above advantages, together with good discipline and medical care, no man* died of diseafe from December, 1781,

* The authenticity of this fact, as well as every other affertion in this work relating to the mortality in the fleet,

366 CAUSES AND PREVENTION PART 11.

1781, to May, 1782, and only thirteen were fent to hofpitals, whofe complaints were finall pox and ulcers. In the months of May and June laft, when at Jamaica, there died of difeafe in this fhip, three men, and feventeen were fent to the hofpital, most of whom had contracted their fickness on board of French prizes.

In the reft of the fleet the health was in proportion to the wine and other refreshments, and the cleanlines, good order, and discipline observed.

In the fquadron I attended the laft five months, which feldom confifted, during the laft three months of that time, of lefs than forty fhips of the line, there have died of difeafe about 350 men, and about 1000 have been fent to hofpitals; a degree of ficknefs and mortality which, though not greater than what frequently prevails in Europe, I am perfuaded would have been ftill lefs,

fleet, may be proved from the ship's books, deposited at the Navy Office.

had

OF DISEASES,

APPENDIX.

had the improvements proposed been complied with in a manner more extensive and complete, and had the general rules of difcipline and cleanliness been kept up with due and equal strictness throughout the fleet.

This laft article, which, being the moft important, I have placed firft in the preceding memorial, it is only in the power of fupreme authority to enforce; and my additional experience and obfervation have fo far confirmed me in the opinion of the utility of this, as well as the other articles, that I hope to be again pardoned for repeating my humble and earnest folicitations that these regulations may be farther extended and enforced.

FORMIDABLE, At Port Royal, Jamaica, July 16, 1782.

PART

[368]

PART .III.

DESCRIPTION AND TREATMENT

OF THE

DISEASES

MOST COMMONLY OCCURRING IN

FLEETS IN HOT CLIMATES.

I T was mentioned in the Introduction to this work, that though my opportunities of experience were extensive, feveral obftacles had prevented me from making obfervations fo accurately as could have been wifhed. Thefe were chiefly the bad accommodation of the fick at fome of the hofpitals, and the fhortness of our stay at any one place, which feldom exceeded fix weeks or two months, and prevented me from completing fuch observations as I have happened to be engaged in. But having practifed among great numbers, observations necessarily arose from

PART III. OBSERVATIONS ON FEVERS.

from the comparison of so many cases; and amidst the variety of situations connected with the emergencies and hardships of war, nature is seen in certain positions and under certain trials which are not met with in common life. I shall therefore describe the diseases such as they occurred, and shall add fuch remarks on practice as I could ascertain.

The following observations shall be confined chiefly to what I have called the sea cpidemics, viz. Fevers, Fluxes, and the Scurvy.

Bb

CHAP.

370

CHAP. I.

Of FEVERS.

T HOUGH it is impoffible to refer every particular cafe of fever to a diffinct clafs, on account of the mixed and anomalous fymptoms that arife, yet there are certain diftinguifhing features which afford fufficient ground for dividing them into different kinds, and fuch a divifion will at leaft ferve to facilitate defeription, and to afford room for laying down the outlines of practice.

The fevers which occurred moft frequently on board of fhips, and at naval hofpitals belonging to the fleet in which I was employed, were the infectious fhip fever, (which is the fame with the jail and hofpital fever) the bilious remitting fever, and the malignant yellow fever.

I. Of the infectious SHIP FEVER.

This does not occur fo frequently in hot as in cold climates, both becaufe it is the difeafe of fhips newly fitted out, which they feldom are in the Weft Indies, and becaufe there is fomething in the warmth of a climate which prevents the production of contagion, as has been formerly remarked. But as great fleets arrived from time to time in the Weft Indies from Europe, with numbers of men labouring under this fever, there were fufficient opportunities of making obfervations upon it.

It has been fo well defcribed by Sir John Pringle, Dr. Lind, and other writers, that it is unneceffary to enter into a minute detail of all its different appearances in its feveral ftages; and I fhall content myfelf with recounting fome of the moft diffinguifhing fymptoms, and with marking the peculiarities that arofe from the influence of the climate.

Bb 2

This

372 OBSERVATIONS ON FEVERS. PART 111.

This fever is extremely various in its fymptoms and in its degree of malignity and fatality. We are told in fome of the hiftories of the jail diftemper, that, upon its firft attack, few efcaped that were feized with it; but that afterwards it grew more mild; and it has been already obferved, that the contagious poifon of fever differs from that of fmall pox and other fpecific infections, by varying in its degrees of virulence.

There are, however, certain characteristic fymptoms pretty constant in this fever in all its forms.

One of the moft remarkable of thefe is a greater degree of mulcular debility than what takes place in other fevers, and it deferves to be mentioned firft, as being one of the moft conftant. It is alfo a tolerably true index of the degree of malignity, the danger being in proportion to this fymptom. In the more advanced ftages of the fever, a tremor of the hands, and of the tongue when put out, is a conftant fymptom, and feems to be connected with this weak ftate of the mulcular fibres.

CHAP. I. OBSERVATIONS ON FEVERS.

fibres. I have feen, however, extreme debility without tremor in cafes too of the greatest danger, and it was observable in these that there was little or no delirium.

Another striking character of this fever is the delirium of a particular kind which ufually attends it. Senfation and reafon are here in a flate uncommonly depraved; and it is in this fort of fever oftener than any other that we find a total deprivation of them in the fymptom called coma. The delirium is feldom of a wild, ungovernable kind, fuch as occurs in inflammatory continued fevers, in the violent paroxyfms of intermitting and remitting fevers, or in inflammations of the brain. It is, however, connected with great fuffering; and this confifts in anguish rather than pain, flewing itfelf by outward tremor, agitation, and what is called the floccorum collectio ; alfo by fighing, mumbling, and moaning, fymptoms always indicating danger.

Delirium is a fymptom, to the nature and appearances of which I have been particu-B b 3 larly

374 OBSERVATIONS ON FEVERS. FART III.

larly attentive, in confequence of a painful and diligent attendance upon fome cafes in which I was particularly interefted from friendship and affection, and in which this was a remarkable fymptom. It feems chiefly to confift in a falle reference of our fenfations, whether external or internal; and this is in no fort of fever more evident than in this. When any painful impreffion, for instance, is made by an external body, the patient, if in a flate of delirium, does not refer it justly to the part affected; but the general agitation and incoherence of fentiments will be aggravated for the time. I have known a degree of heat applied to the extremities fufficient to blifter them, yet the part did not shrink, though the raving and general uneafinefs were increafed, In like manner, with regard to internal fenfations, when an irritation is excited to expel the urine or feces, the mind does not recognize it as fuch, but from a fense of uneafinefs, probably miftaken for fomething elfe, an effort is made to relieve nature, which is done without a proper confcioufnefs, and certain fymptoms are produced which are well-

CHAP. I. OBSERVATIONS ON FEVERS.

well-known marks of danger in this fever. In watching those who have been under the influence of delirium, I have observed it increafe when any particular want of nature urged, and this would continue for fome time, the patient being incapable of procuring himfelf immediate relief on account of the falle reference of fenfation that has been mentioned : but he would become calm after voiding the urine or feces, or after receiving fomething to drink, according to the particular want that was prefent at the time. So great is the diforder in the common course of sensation in this fever, that a perfon ill of it has been even unconfcious of inflammations of vital parts, which, in the natural state of the nerves, would have excited the most acute pain, and would have been diffinctly referred to the part affected, but were not difcovered nor fuspected till inspection after death *. I remember one cafe in which

* I fancied that my reafoning on this fubject was in a great meafure new; but I lately met with the following paffages in Celfus and Hippocrates, which feem to be illuftrative of the fame idea : -Quibus caufa doloris, B b 4 neque

OBSERVATIONS ON FEVERS. PART III,

376

which there were found large erofions, and even holes in the inteftines, without any preceding complaint that could have led to fuspect fuch an appearance. It would appear that the motions excited in the brain and nerves in fuch cafes, inftead of producing the fenfations naturally belonging to them, ferve to excite difagreeable emotions of a different kind, in which delirium confifts. It feems to be from the fame depraved state of fenfation, that when a phthisical perfon is feized with this fort of fever, his cough is for the time fufpended. I have feen the fame circumstance occur in a maniacal cafe. From a like caufe it fometimes happens in dangerous cafes of fever, that in the height of delirium the epiglottis lofes its natural irritability, fo that liquids in the act of fwallowing are apt to get into the

neque fenfus ejus est, his mens laborat. Celfus, Lib. ii. cap. vii. which is nearly a translation of the following aphorism of Hippocrates:—'Οκοσοι ποικοιτες τι τΕ σώματος, τὰ πολλὰ των πονων ἐκ ἀ.σθανονται, τετεοισιν ἡ γνώμη νοσεει. Hippoc. Aphor. Lib. ii. Aphor. 6.

The fame principle is ingenioufly explained by Mr. Hunter in his Lectures.

windpipe,

CHAP. I. OBSERVATIONS ON FEVERS.

windpipe, fo as to excite coughing and threaten fuffocation, as I have observed in fome cases that came under my care.

All these different forms of delirium are figns of a body extremely difordered in its functions, and forbode great danger.

The next fymptom I shall mention as most characteristic of this fort of fever is, the fpots known by the name of petechiæ and vibices, which, though far from being conftant, are, perhaps, more peculiar to it than any other fymptom. They occur only in the latter stages of the difeafe, and in cafes of confiderable danger. The common opinion concerning their caufe is, that the blood is in fuch a diffolved flate, that the red part of it is effused into the cellular membrane. The appearance in fuch bodies as I have infpected, feems to favour this opinion; for there was hardly any coagulation of the blood in the great veffels, and instead of those firm substances, called polypi, in the heart, there were only foft grumous bodies, which were fo tender in their confistence,

378 OBSERVATIONS ON FEVERS. PART III.

confiftence, that, upon being handled, they, as it were, diffolved. Since the improved method of treating there fevers has been generally adopted, this fymptom feldom occurs; for in most cafes it may be called an artificial fymptom, chiefly arifing from close apartments and the heat of bed clothes.

It may be confidered as a peculiarity of this fever, that it is more indefinite in its crifis than moft others. In continued fevers of the inflammatory kind, there are frequent attempts at remiffion, there are certain periodical exacerbations, and there is generally a diftinct crifis marked by a freedom of the fecretions and turbid urine : but in the fever of which we are treating, though the patient is generally fomewhat worfe towards the evening and during the night, its courfe is more equable, and the transition from ficknefs to health is infenfible and gradual, being feldom marked with any perceptible crifis.

The fymptom next to be taken notice of, though a minute one, is very conftant and charac.

CHAP. I. OBSERVATIONS ON FEVERS.

characteristic in this fort of fever. It is a peculiar heat in the fkin, communicated to the hand of another perfon. It is ufual to grafp the wrift of the patient after feeling his pulfe, in order to examine the flate of the fkin in point of heat and moifture; and in doing this a glow of heat is imprefied on the palm of the hand, which lafts for fome hours, if one fhould neglect fo long to wafh the hands. I have never met with this fymptom in any of the fporadic fevers of England, though I am informed it fometimes occurs in thefe.

The fever we are treating of differs alfo from the fporadic nervous fever of England, and from most others of the continued kind, in being attended with a more copious fecretion of bile, which, when thrown up, is generally green, or, as it is otherwife called, of a porraceous colour. This fymptom takes place in all climates ; but is more remarkable in a hot climate, as might be expected.

Thefe

These are the chief characteristic symptoms of this fever. I shall next point out such modifications of it as occurred in the West Indies from the influence of climate.

In the first place, when this feve prevailed on board of any ship that arriv 1 from a northern climate, it was soon after succeeded by, or, as it were, converted into, a dyfentery; for those ships that arrived either from England or North America with the greatest stock of feverish infection, were the most subject to fluxes, after being two or three months in the West Indies. This was formerly made use of as an argument, to prove that the dysentery proceeds from the fame cause with fever, taking a different determination, from circumstances of climate and constitution.

Secondly, It fometimes happens that men, under the influence of this infection, are more apt than others to be affected with fymptoms peculiar to the climate upon their first arrival. A very striking instance of this has been mentioned in the case of men that were

were prefied into the Formidable at New York, fome of whom had the common fhip fever on the paffage; others, upon our arrival at Barbadoes, were feized with the yellow fever, and were the only men in the fleet who had it at that time. There was another infrance in the recruits brought from England by the Anfon, who were feized with a fever on board of the Royal Oak; and in this fever the fkin and eyes were yellow, though without any fymptoms of malignancy *.

Thirdly, It happened in fome fhips + that the infection was kept up for feveral months after arriving in the climate, from a neglect of cleanlinefs, or the want of an opportunity of removing those who were infected to an hospital. It did not in these take a dysenteric turn, as in most of the other ships, but differed from the ship fever of colder climates, as above described, in some particulars, which I shall here enu-

* See page 181. + See pages 125 and 126.

merate.

382

merate. All the fymptoms were milder: it was more protracted, and lefs dangerous. In the beginning there was but little difference, only the fymptoms were lefs violent ; but in the fucceeding period of the difeafe the pulse deviated very little from the natural standard, and the skin felt cold and clammy. The tongue was white; and this did not feem fo much owing to any fur covering it, as to its being itself of a pale, lifeless colour, as well as the face, and it appeared larger in fize than natural. The teeth were clogged with a white fur. Those affected with this fever were subject to faintings, and had a conftant uncomfortable languor and liftleffnefs. Most of them had a deep-feated pain in the occiput, and an opprefiion at the ftomach, but without any inclination to vomit. The unfavourable fymptoms were coma, delirium, and a yellowness of the skin. I never remember to have feen petechiæ in any of them. The favourable fymptoms were a warm moisture, or a miliary eruption on the skin, and a gentle diarrhea, which, however, if neglected, was in danger of degenerating into an incurable flux. A great

A great number were feized with this fever in the Alcide, in July, 1783, and what is remarkable, most of them had the tape worm, as I was informed by Mr. Telford, the furgeon of that ship, who frequently obliged me with valuable remarks; and he observed also, that it was evidently infectious, and that the skin communicated the fame difagreeable feeling to the hand as was mentioned above.

Though the inflammatory fever does not often occur in hot climates, yet, as it is of great confequence to diffinguifh it in all cafes from the infectious fever of which we are treating, it may not be improper, nor uninftructive, here to point out the moft remarkable differences. There is more refemblance in their fymptoms, efpecially towards the beginning, than might at first be fuppofed; and as it is very material to avoid error with regard to the practice, which, in thefe two forts of fevers, ought to be very different, and even oppofite, I have taken particular pains to difcriminate them.

The continued inflammatory fever is very uncommon in the Weft Indies; but in the form in which I have met with it in North America and England, there are cafes in which the blood is fizy during the whole course of the difease, even without local affection, though, in general, there is more or less rheumatisin, or pulmonic inflammation. The fymptoms which chiefly diftinguish fuch cafes from the fever before defcribed are, a greater degree of muscular ftrength, a more violent delirium, pale urine, a more parched tongue and skin, greater heat and thirst, and a pulse more frequent and ftrong, with a particular fharpnefs. There is another fymptom fometimes occurring, which I confider as ftrongly characteristic of a fever of an inflammatory nature. This is a watery diarrhœa, without faces and without gripes, the stools confisting chiefly of the drink as it was taken in. There feems here to be a fufpenfion of the power of abforption as well as fecretion in the bowels, in confequence of a general fpasm on the extreme veffels; for there is hardly even bile or mucus in the ftools. There

There is alfo a particular appearance of the mouth connected with this type of fever, which is better learned by the eye than by defcription. It confifts chiefly in a want of moifture on the lips, and a drynefs and fhining appearance of the teeth. With thefe fymptoms, it will be found that the patient will bear the lancet in very advanced ftages of the difeafe. Thefe fevers feldom occur but in a fporadic way, unlefs when there is fome peculiarity of feafon, as at New York in autumn, 1782. They are alfo more frequent among the better than the lower fort of people.

By comparing thefe fymptoms with those of the infectious fever above described, there will appear an obvious difference in their nature, and evident reasons for varying their treatment.

Gc

TREAT-

TREATMENT of the SHIP FEVER.

WHEN the body is thrown into diforder by an attack of fever, the first step to be taken is to clear the flomach and bowels of their crude and acrid contents, confifting either of the food imperfectly digefted, or the depraved natural fecretions. So great is the diffurbance produced by fuch offending-matter, that, when nature is freed from this embarrasiment, the functions of the body are frequently by this alone reftored to their proper exercife, and a remiffion produced. It feems probable alfo, that this evacuation proves falutary not only by removing the morbid ftimulus, but by preventing the abforption of corrupted or illconcocted juices into the mafs of blood, which would tend still farther to derange the functions of life. But perhaps the circumftance that first fuggested the utility of evacuating the ftomach, as the first step in the cure of fevers, was the naufea fo com-

3

mon

mon in the beginning of them, which may be confidered as a natural indication of this practice. It farther appears rational, that, as acute difeafes generally come on fuddenly, and find the body in a flate of repletion from the recent ingesta, the most obvious means of relief should be to free the bowels, and particularly the flomach, from what is foreign and oppreffive to it. It feems alfo probable, that the naufea and the act of vomiting have a falutary effect independent of evacuation ; for I have feen relief produced from thefe when nothing was evacuated. Such, indeed, is the great and universal influence and fympathy of the flomach, that the operation of vomiting affects every fibre of the body, and has been known to refolve tumours in the most distant parts. An early administration of an emetic is therefore the first step to be taken in the treatment of this as well as most other fevers.

If it is given in fmall divided dofes, it will most probably evacuate the bowels downwards; and the most convenient form for this purpose is a solution of emetic tartar. If

Cc2

387

it

it fhould not have this effect, fome brifk purgative medicine fhould be given foon after the operation of it.

I mention thefe evacuations before blood letting; for though this ought to be firft in thofe cafes in which it is proper, it is here feldom neceffary, and we may pronounce it to be a remedy very ill adapted to this fort of fever, particularly in a hot climate. It fometimes happens, however, that there is violent head-ach, pain of the back and limbs, with a throbbing pulfe; and thefe fymptoms may in the very beginning not only juftify, but require the lofing fome blood before the adminiftration of the emetic or purgative.

The next means of relief I fhall mention, and also the most probable means of cutting short the difease, is to excite universal sweat. This being an imitation of nature, is founded on reason as well as experience; for it is by sweating that the fit of an intermittent is relieved and terminated; and continued fevers in general, if not always, begin

gin with a fit of the fame kind. A dry fkin, accompanied with heat, is one of the most conftant as well as troublefome and uneafy fymptoms in all fevers; and it would appear from the peculiar heat of the fkin in this fort of fever, that there is either a more than common acrimony of the matter of perspiration, or fomething peculiar in the mode of circulation on the furface of the body. Sweating does not feem to operate entirely by the evacuation of acrimony, for no relief is procured by it if it is partial; and it is evident from a number of facts that the state of the brain and viscera depends on that of the external furface of the body; for a free flate of the pores of the fkin, provided it is general, tends more than any other circumstance to relieve internal pain, and also to take off delirium. The good effect of fweating feems, therefore, chiefly to depend on a general relaxed ftate of the finall veffels on the furface of the body; and it ought to be effected, if poffible, by gentle, foothing means, and not by fuch regimen and medicines as heat the body and accelerate the circulation. This inten-Cc 3 tion

390

tion is best answered in the beginning by moderate dofes of antimonial medicines, and either James's powder or tartar emetic may be employed. The first is a more certain fudorific, being lefs apt than the other to run off by the bowels; and its effect will be still more certain, if accompanied with a mild opiate, rendered diaphoretic by spiritus Mindereri, which will both prevent the antimonial from acting roughly, and will determine its operation to the skin. A fweat kept up by these means, together with plentiful warm dilution, from twelve to twenty-four hours, is the most probable means of bringing about a complete remiffion of the fever; and in this cafe a fresh accession is to be prevented by the immediate administration of the bark.

Thefe are the means proper for ftopping the fever in the beginning, or tending to render its future progrefs more fafe; and though, with this view, free evacuations have been recommended, yet, if the fever fhould go on, great caution is neceffary in this refpect in the future treatment, debility being

391

being the fymptom chiefly to be guarded againft. Purgatives may, indeed, be occafionally neceffary, in confequence of accumulations of bile taking place; but, in general, the evacuations by ftool fhould not be more frequent than in health; and fome of the cafes which were most unmanageable and fatal, were those in which there was a fpontaneous diarrhæa. With regard to blood letting, it is always hurtful after the first two days, unles fome inflammatory affection of a vital part fhould arife.

The natural evacuation, which may with moft fafety and advantage be folicited and encouraged in this difeafe, is, that by perfpiration; and it is obfervable, that in those cafes for which nature does most, there is a univerfal warm fweat, which has generally a very offensive smell, and seems to be a falutary effort of the constitution to cure the difeafe. Where this takes place, little medical affistance is neceffary, except to keep it up chiefly by warm dilution; and there is no circumstance in which the judgement of a physician is shewn more than in dif-C c 4 cerning

392

cerning those cases in which his chief businefs is to look on, where nature, being equal to the task, ought not to be disturbed by the active and officious interposition of art. We should not, however, aim at producing a profuse sweat, except with a view to effect a remission immediately after the first evacuations. In the course of the disease, it is only necessary to keep up a gentle moisture or softness of the skin.

The head being particularly affected in this fort of fever, the patient is extremely reftlefs and delirious, efpecially at night; and there is a medicine which has a moft pleafing effect in procuring both reft and perfpiration. This is a combination of an opiate with an antimonial medicine, which was administered in the evening with great fuccefs; and the fudorific effect is rendered more certain by the addition of fome faline neutral, efpecially *fpiritus Mindereri**. I tried

* The form of administering this medicine was to add twenty drops of thebaic tincture, from half a grain to a grain of emetic tartar, and from five to ten grains of nitre,

tried pure opiates in the early ftage of this fever, but found them not to anfwer; though in the low * fevers of England, and

nitre, to two ounces of water or camphorated julep, of which one half was given about two hours before the common hour of reft, and the remainder at that hour. If fpiritus Mindereri is preferred to the nitre, it may be given from two drachms to half an ounce for a dofe, and it is better to administer it feparately; for if it should not be exactly neutralized, it may decompose the antimonial, and render it inactive.

* Since the publication of the first edition of this work, there has appeared a fmall tract on the treatment. of low fevers, by Dr. Wall, of Oxford, and as his ingenuity and learning give him a just claim to the high rank he holds in his profession, attention is due to what he advances. The principal fcope of the work is to recommend, from his own observation, the early use of opiates in those feyers, and the Doctor's authority, as well as my own experience, convince me of the propriety of this practice in many cafes occurring in this country, particularly among the lower fort of people, for whom fpare diet and hard labour render evacuations lefs neceffary than among the better fort. The inferior class of people are also more subject to this fort of fever from their houfes and perfons being lefs clean, and their apartments being worfe ventilated; fo that practice in thefe, as well as other cafes, is to be varied according to the conflitution and previous habits of life.

394

in the advanced ftages and convalescent state of this fever, they are extremely fafe and useful. Pure laudanum is also given by Dr. Lind, at Haslar, with great success in the height of the difease; but in the West Indies there is a greater tendency to acrid excretions, and the effect of pure opium in causing a retention of these, seems to be the cause of its difagreeing in that climate in the first stage of this fever.

It may here be obferved, that the addition of a little neutral falt alone will fometimes fo qualify the operation of opium, as to prevent its bad effects, fuch as the increafe of febrile heat and delirium, and the ftupor and head-ach which, when given alone, it frequently induces the following day. I have generally employed nitre with this intention; but this does not feem fo well adapted to this difeafe as fome other neutral falts, as it tends too much to lower the powers of life.

But with a view to perfpiration, the *spi*ritus Mindereri is the most effectual neutral medicine

medicine when conjoined with an opiate, and there is not, perhaps, a more fafe and pleafing diaphoretic known than a combination of it with fyrup of poppies*. There is fome neutral falt in Dover's powder, and this has more effect than could be expected from fo fmall a quantity of an inert medicine; for I know from trials of my own, as well as those of others, that ipecacuanha and opium given together, in the proportions prefcribed in that powder, will not have the fame effect as when joined with the neutral falt. This is an inftance of those useful combinations of medicines which can be difcovered only by experience, but which every physician ought gladly to adopt in practice upon good testimony and fair trial, though he may not be able to account for their effects, nor to explain their mode of operation.

* I first learned this, as well as many other useful and practical facts, from Mr. Farquhar, Surgeon in London, who has laid me under the greatest obligations by communicating many of his observations, derived from the most extensive experience and a truly penetrating fagacity.

There

There is nothing more important than plentiful warm dilution; and the infufion of fauge, or any fuch light aromatic, is rather more proper than farinaceous decoctions, or any compositions in which there is wine or fpirits. Succefs in this, as well as other difeafes, depends on attention to nurfing as much as upon medicine; for what would it avail here to administer medicines for promoting perfpiration, unless they were affisted with fluids to allay thirst, to dilute the acrimony in the first passages and in the vessels, and to furnish the materials of free perfpiration?

But however defirable it may be to procure fweat, this is not to be attempted by clofe rooms and bed clothes, nor by hot medicines, fuch as volatile falts, ferpentary, fpirituous tinctures, or aromatics. Thefe, according to the teftimony of Sydenham, tend to increafe the heat and delirium, and to produce *petechiæ*, miliary eruptions, or local inflammations. In the intervals of the anodyne diaphoretic above defcribed, *fpiritus Mindereri* and fmall dofes of camphor, with proper

proper dilution, may be fafely employed to procure a foft fkin.

The only other means I fhall mention with this view is, the application of warm moifture to the furface of the body, which may be done by foaking the feet and hands in warm water, or by fomenting the feet and legs with flupes*. Thefe operations have the effect of bringing on a general relaxation on the fkin, thereby taking off febrile agitation and delirium, and inducing fleep. I fometimes, with feeming benefit, ordered cataplafms to be applied to the feet, merely of the emollient kind, without muftard or any other acrid fubftance, being intended to relax, and not to ftimulate.

In the use of pediluvia and fomentations, there is a difference worth attending to between the practice in this fever, and that in the inflammatory fever before described, for they are as hurtful in the latter as they are

* I owe this piece of inftruction, as well as many others, to Dr. Cullen's Lectures.

beneficial

beneficial in the former. I have obferved, in general, that they have a bad effect in all cafes where there is fizy blood, particularly where the breaft is affected.

398

Delirium is one of the most constant and alarming fymptoms in this difeafe, and the removing of it depends much upon the attendants as well as the phyfician. It has been faid before, that it depended on a falfe apprehension of the impressions or natural fensations. When a person, for example, labours under delirium, and is affected with thirst, the minds is either fo agitated with other objects, that this fenfation is overlooked, or, inftead of producing a craving for drink, it excites fome other difagreeable emotion in confequence of the difordered itate of the fenforium. This last feems to be probable from the ceflation of delirium, which will take place upon any natural want being fatisfied. I have feen a temporary ftop put to the patient's raving by making him drink, or upon his difcharging his urine or feces; for he is then unconfcious of thirst and other natural wants, is therefore

fore ignorant of the means of fatisfying them; and when he does fo, he fancies he is about fomething elfe which is the fubject of his delirious thoughts. This obfervation leads to a material practical purpofe; for it follows from it, that unremitting attention fhould be given to the patient's feelings and all his poffible wants, as those natural notices and inftinctive cravings which occur in health are now wanting, in confequence of the depraved flate of fenfation.

Most of the remarks that have hitherto been made apply to the earlier stages of the difease. The principal remedies applicable in the more advanced stages are, blisters, Peruvian bark, opium, and wine.

I have found what Dr. Lind fays concerning the efficacy of blifters confirmed by my own experience, especially in those fevers in which there was great delirium, *coma*, and head-ach; but I have not experience enough to fay whether they were as useful in the beginning of the difease in the West Indies as he found them to be in England.

The

The men that were brought from the fhips to the hospitals were affected with the difeafe in various stages; but as we had in general a very inaccurate hiftory of the feveral cafes, the method of treatment upon their first admission was pretty nearly the fame in all; and it confifted, in the first place, in washing their face, hands, feet, and legs, with warm water and vinegar, from which they derived the greateft comfort, being commonly very dirty. There ought to be a * warm bath at every naval hofpital kept in conftant readiness; for there are fo few conveniences on board of a ship for preferving bodily cleanlinefs among the fick, that the furface of the body becomes loaded with filth, fo that the operation of

* In a review of Haflar hofpital made in perfon by that excellent officer, Vice-admiral Barrington, in 1780, it was very judicioufly proposed, among other falutary improvements, that there should be two apartments for the reception of the fick upon their first landing; one wherein they should be stripped of their dirty clothes, and another in which they should go into the warm bath, and put on the hospital dress, that they might not carry infection into the wards.

400

the

the warm bath could not fail to be highly comfortable and falutary as the first step to their cure when brought on fhore. We had generally very indiffinct information about the state of their bowels, as well as other circumstances, on account of their delirium; but it was at any rate useful, or at least fafe, to give them a clyfter. They were enjoined plentiful dilution; and if they were low, fome wine and water was allowed. In the evening, the anodyne diaphoretic medicine was administered, and a blifter applied to fome part of the body. In confequence of this method, we feldom failed to find the patients better next morning; and it was tried in fuch numbers, that the efficacy of it was fufficiently afcertained. It happened in fome cafes, that these means were omitted, and a comparison of these with the others ferved to afcertain the true efficacy of the medicines; the stationary state of the fymptoms, when the difease was thus left to itfelf, fufficiently proving the propriety of the treatment above defcribed.

Dd

It .

402

' It is an important queftion to what circumstances of this fever the Peruvian bark is adapted. An early and indifcriminate use of it is recommended in fome late publications, upon the authority of which I tried it without regard to the stages or symptoms, and without any prejudice either for or against the practice; but I found that this powerful remedy was in danger of doing much harm, unless great attention was paid to circumstances, in order to afcertain the proper feafons for giving it. The fymptoms that forbid the use of bark are chiefly foul bowels, hard pulfe, fizy blood, great delirium, dry tongue, a hot and dry fkin, and inflammatory affections of the vifcera. It was found extremely pernicious in an early ftage of the difease previous to evacuations; and the object of practice at this time should be to relieve the habit by means of thefe, in order to produce a general relaxation of the fecretions, and to render the fkin cool and foft, thereby paving the way for the bark.

It is not neceffary, however, efpecially in the advanced stages of the difease in this climate, to wait for an abfolute remiffion, in order to administer the bark. In a cold or temperate climate it will feldom be found advisable to give it in any period of this fever; but in a hot climate it is fometimes admiffible where there are fymptoms of general debility, fuch as a fmall pulfe and mufcular weaknefs, even though the frequency of the pulse, delirium, and a dry fkin and tongue, fhould indicate fome degree of fever. It may be remarked, by the bye, that a dry tongue is a fallacious fymptom, for it may happen in confequence of the patient's breathing through the mouth instead of the nose, without any fault in the fecretions of the fauces. The fymptom which forbids the ufe of the bark more abfolutely than any other is an inflammatory or dyfenteric flate of the bowels, in which cafes it feems to be invariably pernicious.

Where it happens that we are extremely anxious to throw in the bark, as we ufually are in the Weft Indies, where fevers are Dd 2 very

404

very rapid and dangerous, and yet the fymptoms feem hardly to admit its ufe, it was very commonly tried either in conjunction with fome antimonial medicine or neutral falt, or thefe were given alternately with it, in order to foften and qualify its effects by preventing it from heating or otherwife aggravating the fymptoms. Antimonial wine or *fpiritus Mindereri* were conveniently employed with this intention.

With regard to the quantity of bark to be given, it may be proper in doubtful cafes of this kind to begin with fmall dofes, in order to feel how far it agrees or not; but in general it may be laid down as a rule with regard to this medicine, that, where it is really proper, and the medicine to be depended on, it is to be given in as large dofes and as frequently as the ftomach will eafily bear it.

The next remedy mentioned was opium. It is a medicine more admiffible and ufeful in this than any other kind of fever. The fame cautions nearly apply in the adminiftration

OBSERVATIONS ON FEVERS.

CHAP. I.

ftration of it as have been given with regard to the Peruvian bark. The caution with regard to foul bowels is particularly neccffary in a hot climate, where an over fecretion of bile is fo apt to take place. When the Boreas frigate arrived from England in March, 1783, there was a very bad fever of the infectious kind on board, some cases of which being fent to the hospital at St. Lucia, were treated unfuccefsfully with bark and opium, which I had been induced to try upon the authority of the authors above alluded to. I attributed this want of fuccefs to the neglect of previous evacuation; for, upon infpecting the bodies, the inteftines were found full of bilious feces. I profited from this, and was more fuccefsful in the other cafes. It were to be wifhed that phyficians could oftener bring themfelves to confefs their errors in practice, and their writings would be more instructive; for it is of confequence to know what we are to avoid as well as what we are to follow.

It has been mentioned that the beft effects arife from the conjunction of an antimonial D d 3 with

406

with an opiate; but, in this fort of fever, antimonials, and even most of the neutral falts, are hurtful after the first stage, and opiates may after this be given alone or combined with camphor. With regard to the precise period of leaving off antimonials, it must be left to difcretion, and the constitution of the patient is the best guide. There is fo great a difference in patients in this refpect, that all practical precepts should be qualified by a due diferimination of conftitutions. Absolute and dogmatical rules are fo far from applying in the practice of physic, that there are some cases of the fame difease that require a treatment even opposite to what is in general most adviseable. This may be very aptly illustrated by the fmall pox, of which there are cafes that ought to be treated very differently from the general method laid down by Sydenham, and in which cordial medicines are highly proper and neceffary. This difference in difeafes themfelves feems to be one great caufe of the difference of opinion among phyficians on practical points, each party finding fome countenance in experience for their

their general doctrine, do not make allowance for the varieties that exist in nature; fo that, in one fenfe, both may be faid to be in the right. If the patient is not 'very much funk, and if there are bilious fymptoms, or an obstinate dryness in the skin, a few grains of James's powder may be given with advantage even in an advanced period of the difease. If a hot and dry fkin should at this period be the only troublefome fymptom, it will be more fafely and effectually removed by camphor combined with fomething opiate and the spiritus Mindereri, which is the only neutral now admiffible, than by autimonials, which, at this time, would be in danger either of ruffling the patient by their operation on his ftomach and bowels, or of weakening him too much either in this way, or by exciting profuse fweats. Evacuant medicines of every kind being then improper, clyfters are the only laxatives to be employed in cafe the ftate of the bowels require them.

Having mentioned camphor, it may be proper here to remark, that it is a medicine D d 4 of

408

of which I have found it extremely difficult to afcertain the virtues and effects; and in confequence of this ambiguity, I believe there are few articles of the materia medica more abufed in practice. In all inflammatory affections, and in the beginning of all fevers where there is much heat and thirft, I think I have obferved it to aggravate the fymptoms. It feems in no cafe to be more proper than at certain periods of this fever, and efpecially when there happens to be fpafmodic pains of the ftomach, or tremors and cramps in the extremities.

In this advanced ftage of the fever, in which the moft common fymptoms are weaknefs, reftleffnefs, tremors, and low delirium, no medicine was found fo much to be trufted to as opium, which here acts as a cordial as well as an anodyne and antifpafmodic. It may be given, in the camphorated julep, in the form of tincture, from five to ten drops every fix or eight hours, or fome of the officinal compounds, fuch as the theriaca or mithridate, may be employed with advantage. I have thought alfo, that, at this period,

riod, caftor conjoined with opium feemed to improve its virtue. This was firft fuggefted to me by Mr. Crudie, an ingenious German furgeon, whom I employed as an affiftant at the hofpital at St. Lucia; and fince I have been phyfician to St. Thomas's hofpital, I have found the most pleafing effects, in fimilar cafes, from a composition used there, the principal ingredients of which are opium and caftor *.

In this flate of the fever I have alfo ufed with advantage the decoction of Peruvian bark and ferpentary, as recommended by Sir John Pringle; and when the fkin is cold and the circulation is very languid, as is fometimes the cafe, volatile falts and powder of ferpentary may very properly be employed.

* The following is the form of it, and it was first introduced by Mr. Whitfield, apothecary to the hospital, under the name of Bolus Sedativus: — R. Confection. Damorat. Zfs. Castor. Russic. pulv. Əfs. Tinct. Thebaic. g^{tt.} iv. Syr. fim. q. f. Fiat bolus fexta quaque hora famendus.

409

But

But in the advanced ftate, and in the worft forms of this difeafe, there is perhaps no medicine fuperior to wine. This was given either pure, or diluted with water for common drink, and fometimes to the quantity of a quart in twenty-four hours. In delicate people, fuch as we meet with in private practice, the quantity ought to be lefs.

There is this caution neceffary with regard to the ufe of wine, that when the fever is gone off, and only extreme debility remains, the free ufe of it is not fafe nor proper; for, in a weak and exhausted ftate, a perfon is more apt to be *heated and intoxicated by any fermented liquor, than in health, or even in the preternatural and difturbed

* Great nicety is required in all cafes with regard to the times and dofes cf cordials; for it by no means follows that thefe fhould be in proportion to the lownefs and lofs of ftrength. This is well illustrated by Mr. Hunter in his Lectures, where he explains the diffinction between the *powers* of the body and its *actions*. There must be a certain degree of ftrength to bear the excitement

turbed state of actual difease, such as occurs in this fever.

After the difease is removed, a long state of weaknefs is apt to fucceed, efpecially in a warm climate. The most proper remedies, then, are bitters, fuch as decoctions of Peruvian bark, infufions of quaffia bark, gentian, or camomile flowers. These answer better than the bark in fubftance, which is now apt to nauseate and load the stomach, and the patient is apt to take an averfion to this and whatever elfe he took in a state of ficknefs. The beft ftrengthening medicines are fuch as comfort the flomach and create appetite; and we may mention Huxham's tincture of bark, in fmall dofes, and a moderate use of wine, as the most proper for thefe purposes. Where colliquative fweats take place, elixir of vitriol is ferviceable,

excitement occafioned by flimulating and flrengthening medicines or diet; for nothing is more pernicious, or even fatal, than that any part or function flould make exertions beyond its flrength; and there is the more danger in ill-timed remedies of this kind, as a flate of weaknefs is generally a flate of irritability.

and

and with this intention I have joined it, with evident advantage, to the evening anodyne, which, without fuch a corrector, tends rather to aggravate this fymptom. I have known affafætida prove a ufeful ftimulus to the ftomach at this time, and it may even be ufed while the fever fubfifts, efpecially where the fecretions of the fauces are fcanty. This medicine is recommended by Sir John Pringle in the fame circumftances. But I confider the prudent ufe of opiates, particularly at bedtime, as the moft effectual cordial and ftrengthening medicine in this convalefcent ftate.

But with regard to the management of the fick at this time, as much depends on diet as medicine. Nothing has been faid concerning this in the acute flate of fever, becaufe no nourifhment is then neceffary. In that flate there is a loathing of all food, and the powers of digeftion and affimilation feem to be then fufpended, fo that alimentary fubflances become not only an ufelefs load, but offenfive and hurtful by turning acid or putrid. It is likewife evident from fact,

fact, as well as reason, that nature, in this fituation, does not require fustenance; for we frequently fee people labouring under fevers who do well and recover, dough they have been entirely without nourin ment for a length of time in which the like abftinence in a state of health would have proved fatal. The friends and attendants of the fick, from a prejudice not unnatural, but not confidering the difference between health and that state of derangement which takes place in fever, are for ever withing to fupply the patient with nourishment, and every phyfician meets with trouble in counteracting this officioufnefs. Neverthelefs, when the fever draws out to a confiderable length, and the principal fymptom is that state of weakness which, in low fevers, runs infenfibly into that of convalescence, then it is neceffary to pay the utmost attention to nourishment, and nothing tends more to infure and haften recovery than the affiduous administration of light and nourishing food, the fame cautions being obferved which have just been mentioned with regard to cordials. One of the greatest hardships of a fea

a fea life is the want of those articles of diet that are fuitable to a recovering state, and many lives are lost from this circumstance, after the force of the difease has been subdued

With regard to the peculiar form, before defcribed +, which this fever affumes a few months after fhips have been in a hot climate, we found camphor, volatile falts, and ferpentary, the beft remedies. As there was a remarkable coldnefs of the fkin, I was induced in one cafe to try the hot bath, and with good effect, from which it feems probable that a fhort ftay in a bath, of a heat from 96° to 100°, fo as to have its warming and ftimulating, without its relaxing effects, would anfwer well in fevers of this kind.

* See a method propofed for obviating this, page 358.

- Page 381 et seq.

2. Of the BILIOUS REMITTING FEVER.

THIS is peculiar to tropical climates, and arifes in the fame fituations in which intermitting fevers arife in temperate and cold climates. It feldom arifes at fea, unlefs where there has been previous expofure on fhore, of which fome examples have been mentioned in the first part of the work. It may generally be traced to the air of woods or marshes; and in our fleet hardly any men were attacked with it but those who were employed in the duties of wooding and watering.

The most diffinguishing fymptom is a copious fecretion of bile which attends it. Its courfe, in general, is shorter than that of the fever before described; and though the symptoms are more violent, they are not so equal and steady, owing to the tendency there is to remission. The symptoms are particularly violent at the beginning, in so much

much that fome of the men, after being expofed upon duty to the heat of the fun and the air of marshes and woods, would become frantic, being feized almost instantaneoufly with delirium refembling madnefs. This fever, when it arifes merely from the effluvia of woods and marshes, has a natural tendency to remit; nay, fome fevers at St. Lucia, proceeding from this caufe, were of the pure intermitting form from the beginning. But in many of those that arose at Jamaica little or no remission was to be perceived; and it was diftinguished from the ship fever by the bilious vomits and stools, more violent delirium, and head-ach, and by being attended with lefs debility. The greater tendency to the continued form at this time was probably owing to this circumstance, that the men who were exposed to the land air in wooding and watering, were then exposed alfo to fuch caufes as naturally produce continued fevers, fuch as infection, the foul air of the French prizes, intemperance, and hard labour. There was in fome cafes a yellownefs of the eye, and even of the whole skin, but without the other

other fymptoms that characterife the yellow fever, properly fo called.

In cafes that proved fatal, the fymptoms, for fome time before death, refembled very much those of the fever before described at the fame stage. There was either coma or constant delirium, great seeming anguish, the mouth and tongue very dry, or with only a little ropy slime, a black crust on the teeth, picking of the clothes, and involuntary stools.

TREATMENT of the Bilious REMITTING FEVER.

THE measures proper to be taken in the beginning of all fevers are pretty nearly the same. There is little difference in the first treatment of this from that of the ship fever, except that blood letting is here more frequently proper, and that a more free evacuation of the bowels is necessary on account of the more copious secretion of bile.

In full and athletic habits the difeafe very commonly begins with pains in the limbs, back, and head, with a ftrong throbbing pulse; in which case it is proper first of all to let blood at the arm. This is alfo highly proper and neceffary in those cases mentioned above, in which the patient becomes fuddenly frantic. But though the cafes requiring blood-letting are more frequent in this fort of fever than that already treated of, yet great caution and nice difcernment are neceffary with regard to it, in all cafes, in a hot climate. As fevers in fuch a climate run their course faster, the fymptoms fucceeding each other in a more close and hurried manner, greater expedition, as well as difcernment, are required in timing the different remedies than what are neceffary in a cold climate. Blood letting unfeationably and injudicioufly employed either endangers life, or has a very remarkable effect in protracting recovery, by the irrecoverable weaknefs it induces.

With regard to the evacuation by the bowels, it has already been mentioned in another

another part of the work, when on the fubject of prevention, that, before the fever comes on, there is a languor and general feeling of indifposition, and that then an emetic and a purgative, followed by fome dofes of the bark, were the most likely means of preventing the attack of the difeafe. If the fever has properly begun, which is announced by a rigor taking place, then no time is to be loft in procuring evacuation; and, after blood letting, if the fymptoms should require it, the best medicine is tartar emetic, which, if given in fmall divided dofes, at fhort intervals, will most probably evacuate the whole inteffines by vomiting and purging, and may even prove fudorific. But it will neverthelefs be proper to administer a purgative medicine foon after; and what we found to operate with most eafe, expedition, and effect, was, a folution of purging falts and manna, either in an infufion of fena, or in common water, or barley water, with fome tincture of fena added to it.

Ee 2

The

420

The next step towards procuring a remiffion is, to open the pores of the skin, which is beft done by fmall dofes of James's powder or emetic tartar, affifted by the common faline draughts, which will be given with most advantage in the act of effervescence, or by spiritus Mindereri, together with plentiful warm dilution. I once, by way of comparison, tried the two antimonial preparations above mentioned in a number of men ill of this fever, who were fent to the hospital at one time, giving emetic tartar to one half, and James's powder to the other, and their effects were fo fimilar, that I could perceive no reason for preferring the one to the other. Antimonial medicines feem better adapted to this than any other fort of fever, and may be more freely given in it. drive starting of barbol sur talle

Thefe are the most likely means of bringing about a remission; and if this is effected, nothing remains to be done but to throw in as much Peruvian bark as the stomach will bear.

But

But whether from a fresh accumulation of bile, or fome other circumstance, it may happen that the fever is kept up; and in this cafe there is commonly a fenfe of weight or uneafinefs about the hypochondria, which feems to indicate that the redundant bile is in the gall bladder or ducts of the liver. In this cafe a repetition of evacuants is neceffary, and calomel will be found to answer remarkably well as a purgative, its fiimulus being fo extensive as to loofen and bring away bile when the faline purgatives, fuch as that above mentioned, had failed of having that effect. I have known thefe to pafs through the inteffines without relieving the uneafy fenfation about the flomach as calomel is found to do; and it will be ftill more effectual for this purpole, if given alone in a dofe, from five to ten grains, and followed fome hours afterwards by fome other purgative. After this, antimonial medicines are again to be had recourfe to; and thefe, as well as purgative and neutral medicines, are fafe and ufeful in a more advanced ftage of this fever than they are in the fhip fever; for the ftrength is not fo apt to fink, and

Ee 3

421

the

the flate of the bowels requires them more. Antimonials, however, are to be used fparingly and cautiously as the fever advances; for I have known them, when given only a few days after the first attack, to have the effect, in some constitutions, of making the ftomach swell, and of producing a general fense of heat and uneafines.

After the evacuations of the bowels, the anodyne diaphoretic may be very feafonably given in the manner formerly mentioned; for it will not only tend to footh and procure fleep after the commotion that has been excited, but by its gentle fudorific effect will affift in completing the remiffion.

The principal point of management in the fevers of this climate is, to throw in the Peruvian bark in proper feafon. I formerly took occafion to differ from the opinion of those who alledge that little or no discrimination is neceffary with regard to the circumstances in which bark is proper in continued fevers. I made fair and unprejudiced trials of this, but always found that fome

fome fort of remiffion, especially towards the beginning of the difeafe, was neceffary, in order to make the use of this medicine fafe and proper. The greateft vigilance is indeed required that the administration of it be not omitted when it is at all adviseable, as the courfe of fevers is very quick and critical in this climate. I have watched many nights with fome friends in whofe health I was particularly interefted, to catch the hour when it might be allowable to give it; and where the propriety of it was fomewhat ambiguous, it was usual to qualify it. either by conjoining fome antimonial or neutral falt with the first doses, or by giving them alternately with it, as has been formerly mentioned.

Under the use of these means, the favourable fymptoms are, a warm moift skin, a strong steady pulse, with the pulsations under a hundred in a minute, a natural countenance, and being free from delirium. But if the fever should not yield during the first week, but takes an unfavourable turn, the pulse then becomes more small and frequent, E e 4 there

there is a general agitation, the tongue is tremulous when put out, there is great thirft and delirium, with a dry and hot fkin. In thefe circumftances, befides the continuation of the antimonials in fmaller dofes, with the anodyne diaphoretic, and the occafional ufe of purgatives, blifters now become proper; and we found alfo camphor combined with nitre an excellent medicine at this period of the difeafe.

Should the patient furvive to the end of the fecond week, the treatment then comes to refemble more and more that of the infectious fever already defcribed. Bark may be given, though there fhould be no proper remiffion, and cordials and opiates may be more freely used. Attention to the state of the bowels will still be necessary, fince repeated accumulations of bile are apt to occur even in the most advanced stage, and gentle emetics of ipecacuana, as well as laxatives, may be neceffary. For the fame reason also, greater caution is requisite in the use of pure opiates than in the infectious thip fever before treated of. In order to keep

keep the bowels foluble, it was a very ufual practice, and found very ufeful, to conjoin a few grains of rhubarb with each doie of the bark.

3. Of the YELLOW FEVER:

THE fever laft treated of may be faid to be peculiar to a hot climate; but the hot feafons of temperate climates produce fomething refembling it. That now to be defcribed never occurs, fo far as I know, except under the influence of tropical heats. Such a fever is indeed known without the tropics; for it is very common in Carolina in the hot feafon; but there the heat is even greater than that of the Weft Indies. In order to produce it, there muft be, for fome length of time, a heat feldom falling below feventy-five degrees on Fahrenheit's thermometer.

Though it differs from the fever last defcribed, both in its causes and symptoms, it is not meant to fay that it is so diffinct as to form

form a feparate fpecies of difeafe, like the meafles and fimall pox. Unlefs the characters of fevers are ftrongly marked, it is difficult, and even impoffible, to refer them to any particular fpecies; and the different concurrence of caufes and conflictutions is fo various, that great numbers of ambiguous cafes occur.

With regard to the caufe of the yellow fever, it differs from the bilious remittent in this, that the air of woods and marfhes is not neceffary to produce it; for it moft commonly arofe from intemperance or too much exercife in the heat of the fun. It was obfervable, however, that it was more apt to arife when, befides thefe caufes, men were expofed to unwholefome air, particularly the foul air of fhips, whether from infectious effluvia, or proceeding merely from the putrefaction that takes place in neglected holds.

It is alfo remarkable with regard to it, that it is confined almost entirely to those who are newly come from a cold or temperate

rate climate. The fame remark is made by the French, who therefore call it fievre de matelot *, confidering it as peculiarly incident to those who have newly arrived from a long voyage. It would appear alfo, from what has been formerly mentioned +, that those men, who have been exposed to that fort of infection that prevails in ships in cold climates, are more particularly the fubjects of the yellow fever when they arrive in a hot. climate. It is farther in proof of the fame opinion, that there are medical gentlemen, natives of the Weft Indies, who have hardly ever feen it, their practice lying at a distance from any fea-port town where ftrangers ufually arrive. Of these strangers, those who are young, fat, and plethoric, are most apt to be attacked; and more of our officers in proportion were feized with it than common men.

It has been faid, that it never attacks either the female fex or blacks. This is in

* Sailor's fever.

4 See pages 161, 181, and 380-1.

general,

general, though not abfolutely, true; for I knew a black woman, who acted as nurfe to fome men ill of this fever at Barbadoes, who died with every fymptom of it.

This fever affumes various forms, according to the peculiar conflitutions of different men, and other circumstances; but in the following description I shall enumerate the most common appearances : - In general it begins with fhort alternate chills and flushes of heat, feldom with those rigors which conftitute the regular cold fit, and with which most other fevers begin. These are immediately fucceeded by violent head-ach, pain in the back, univerfal debility, ficknefs, and anguish at the stomach. There is commonly, in the beginning, a good deal of bile on the ftomach, which is thrown off by vomiting, either natural or excited by an emetic. Those men who were taken ill of this fever in the Alcide, in the end of the year 1781, had a fore throat in the beginning; but this is not a common fymptom.

In

OBSERVATIONS ON FEVERS.

CHAP.I.

In the courfe of this difeafe there is by no means a free fecretion of bile, and leaft of all in those cases that are most violent, and prove the foonest fatal. In cases that are more protracted, and less desperate, there are frequent accumulations of it, as appears by the vomits and flools *.

ofThe in as appears by its not being evacuated either by

I have in the whole of this work been extremely cautious in reafoning concerning caufes, from an opinion that they are very obfcure, and that the theoretical part of physic is very imperfect and fallacious. This is perhaps in no inflance more remarkable than in those opinions that prevail concerning the nature and influence of bile in producing difeases. An increased fecretion of bile commonly attends the feverifh complaints of hot climates, and those of the hot feasons of temperate and cold climates. It is not unnatural, therefore, to impute the difeafe then prevailing to this redundancy of bile: but, upon confidering the matter more closely, it will appear to be rather a concomitant fymptom, or effect, than a caufe of those fevers; for, in the first place, in those cases in which there is the greatest fecretion of bile, as in the cholera morbus, there is no fever. The only danger in this difeafe arifes from the violent irritation produced in the bowels by fuch an extraordinary quantity of this fecretion which commonly paffes downwards; though I have feen it prove fatal when it flowed into the flomach, and produced perpetual retching and excoriation

The eye in a few hours takes a yellow tinge, which foon after extends more or lefs over

excoriation of the fauces; but in this cafe alfo without any fever. Secondly, in the most fatal of all fevers, in the West Indies, there are no marks of an increased fecretion of bile, but, on the contrary, a preternatural defect of it, as appears by its not being evacuated either by ftool or vomiting, by the white ftools which fometimes attend the yellow fever, and by its not appearing in the first passages, nor in its own receptacles after death. Perhaps also that flate of the bowels which renders it fo difficult to procure ftools may be in part owing to the want of this natural stimulus. It is nevertheless true. that in the intermitting and remitting fevers of hot climates and feafons there is perhaps always an accumulation of bile at the beginning, and an increased fecretion of it during their courfe. It is farther true, that this adds to the patient's uneafinefs, and aggravates the fymptoms, and that the cure confifts partly in the evacuation of the bile. But it is alfo true, that in the very worft fort of fevers in hot climates it is a favourable fymptom where the fecretion of the liver is reftored and increased, a bilious diarrhœa being one of the most aufpicious fymptoms that can occur in a yellow fever; and in those that are protracted and afford hopes of recovery, there is generally a gush of bile from time to time. - We may therefore lay down the following pofitions: 1. That in cafes in which bile is most freely and copioully fecreted no fever exists, as in cholera morbus. 2. That in the worft fort of fevers there is no preternatural

over the face and whole skin. This is a symptom so striking and constant, that it gives

tural fecretion of bile, but, on the contrary, a defect of it. 3. That neverthelefs there is an uncommon quantity of bile fecreted in most of the fevers of hot climates, and that part of the cure confists in evacuating it.

I am extremely diffident, as I have faid, in all matters depending on our fuppofed knowledge of the animal œconomy; but the preceding circumftances feem to countenance the following reafoning :- The bile, according to Dr. Maclurg, who has given one of the best differtations on its nature and properties, is composed of two parts : the grofs part, which is coagulable by acids, and that part in which the bitter principle refides. The first conflitutes the principal part in point of quantity, and feems to be that portion of the mais of fluids which lofes the property of found healthy blood, by a tendency to putrefaction, and is thrown out by this fecretion. I will not undertake to youch for the truth of this, but shall assume it as true in the following reasoning : - According to this theory, therefore, the greater part of the bile is what may be called the effete part of the circulating mass, or perhaps only of the red globules or gluten, the watery and faline part, which paffes off by urine being the corrupted part of the ferum. This part of the bile being very liable to putrefaction, the bitter part is confidered by Dr. Maclurg as intended to correct this, and alfo to answer fome good purpofe

gives name to the difease, though it is not absolutely either peculiar or effential to it. There

432

purpose in digestion. One of the effects of the bile in this operation is to extinguish acidity, whether proceeding from fubftances taken in, or generated in the ftomach. The blood in all climates, and in all fituations of life, is subject to have part of it thus corrupted, which, being feparated from the common mais by the liver, is mingled and discharged with the common feces; but external heat continued for any length of time tends to augment this corruption of the fluids, and therefore to increase the fecretion of bile; and it has been obferved both by myfelf and others, that the bile found in those bodies that have been inspected after death, in consequence of fevers in hot climates, is less bitter, and not fo penetrating to the fingers, being therefore deficient in the antifeptic principle. But fince external heat makes no alteration in the degree of temperature of the fluids themfelves, this effect must take place through the medium of the folids, in confequence of that general languor and want of energy which too much external heat induces in the functions, particularly in that power by which the living body preferves itfelf from putrefaction. Now if this portion of the blood, thus altered and depraved, is readily fecreted and fpeedily thrown out, as in chalera morbus, no harm befals the conftitution, nor any inconvenience but what arifes from the irritation of the primæ viæ. But this may not take place if the body fhould be otherwife deranged; for the removal of this noxious matter from the mafs of blood depends

There is fomething contagious in this fymptom, which feems fomewhat fingular, and difficult to be accounted for. It was obferved

depends upon a due irritability of the blood veffels, the liver, and the bowels, whereby they are ftimulated to contract, and thereby expel it. According to the principle of Mr. John Hunter, (whofe deep and industrious refearches into the animal æconomy place him high in the lift of those few on whom nature has bestowed real genius, and who are capable of adding fomething new to the flock of human knowledge,) there is in a flate of health a relative habitude or mutual harmony exifting between the folids and fluids, whereby they flimulate and produce actions in each other, in which the healthy state of the functions confists, whether employed in the formation of what is found, or the expulsion of what is noxious: fo that where it happens that the folids have a morbid infenfibility to the impreffions of corrupted and acrimonious fluids, the retention of these adds ftill more to the general derangement. To illustrate this, it may be observed, that the ftomach and bowels, when they are endowed, as it were, with their natural perception, immediately expel any preternatural accumulations of bile that may take place; but when they are infenfible to this ftimulus through difease, no effort is made to relieve nature till it is excited by medicine. The fame reafoning may be applied to the various veffels and ducts. Thus when we fee the liver gorged with bile, without any free excretion of it into the gall bladder, as I have fome-

OBSERVATIONS ON FEVERS. FART 111.

ferved in the Royal Oak and Alcide to extend to men who were but flightly indifpofed; and at the hofpital it fpread to men in

434

fometimes found to be the cafe upon infpecting the body in fome of the worft cafes of fever, would it not appear that the gall ducts have loft that natural irritability whereby the bile is expelled? Or, in confequence of 2 depraved flate of action, connected with febrile affection, may it not happen that the abforbents, which, in their natural flate, only abforb particular fubflances, and in a given quantity, will fuffer a change in this natural action, and abforb whatever happens to be applied to their orifices? In cafe of jaundice, the bile, which is perhaps not at all abforbed in a ftate of health, is taken up in large quantities, and mingled with the mafs of blood, which proves a feafonable relief in the flate of accumulation and diffension occasioned by the obstruction. This may happen in cafes of fever, not indeed as a relief to nature, but from a depraved flate of irritability in the lymphatics, induced by difeafe. Though no increafed quantity of bile, therefore, is found in the gall bladder, there may have been an increafed excretion of it, a preternatural abforption having been excited. So that it may admit of a queftion whether the colour of the fkin, in the yellow fever, is owing to this, or if the idea of it given in the text * is more just; but in either cafe it feems probable that the extreme tendency to putrefaction in the whole body is owing either to the prefence

* See page 437-8.

of

in the adjoining beds, without imparting any malignity to their difeafes.

There is fomething very peculiar in the countenances of those who are feized with it, difcernible from the beginning by those who are accustomed to see it. This appearance confists in a yellow or dingy flushing or fullness of the sace and neck, particu-

of bile, in confequence of abforption, or the retention of fomething in the blood from a defect of its fecretion.

This reafoning concerning the bile in hot climates may, in fome fort, be illustrated by what happens to the urine in cold climates. The urine is the vehicle of an excrementitious part of the blood, of which an increased proportion is generated in certain fevers, and if it is thrown out in the form of high-coloured; turbid urine; the fever will most probably be flight and fhort; but if it becomes pellucid, or *erude*, as it is called, the general derangement will be increased, the fever will be more violent and dangerous, and the first fign of returning health will be a turbid appearance and fediment.

If the reafoning in the above diffuffion fhould appear to fome readers unfatisfactory, or ill connected, I can only fay that if it is deferving of this character, I am willing to have it confidered not only as an illustration, but an example of the nicety and fallacy of theoretical difquifitions.

larly

larly about the parotid glands, where the yellow colour of the fkin is commonly firft perceived. There is alfo in the eye and muscles of the countenance a remarkable expression of dejection and diffres.

One of the most constant and diffinguishing fymptoms of this fever is an obstinate, unremitting, and painful *pervigilium*, which is the more tormenting, as the patient is extremely defirous of fleep. It is feldom that even a *delirium* comes to his relief to make him forget himfelf for a moment; but he continues broad awake, night and day, with his reafon and fenfes found, in a state of the most uneafy agitation.

But the most diffinguishing fymptom, and that which is expressive of the greatest danger, is, an unconquerable irritability in the stomach, which can be brought to bear nothing. An almost incessant retching takes place, which commonly, on the third day, ends in what is called the *black vomit*, the most hopeless of all the fymptoms attending it. When this is examined, the colour is 4 found

found to be owing to finall dark flakes, refembling the grounds of coffee, and feems to be blood which had oozed from the furface of the ftomach, a little altered. Indeed pure blood is fometimes thrown up, and we know that the red globules enter the fmallerorder of veffels, and iffue by them; for bleeding at the nofe is a common fymptom about this time; and fome relate that it alfo efcapes by the ears and pores of the fkin, which I never faw, but can readily believe it. At the fame time, the ftools grow black, and the urine is frequently of a very dark colour, which feem to be owing to the fame caufe. I never remember to have feen any one recover after these fymptoms came on.

There feems to be a general error loci of the more tenacious and globular parts of the blood into the fmaller order of veffels, to which the yellow colour is in a great meafure owing; and when any part of the fkin is ever fo little preffed upon, a damafk red colour remains for fome time, the fmall veffels readily admitting the red globules. Ff 3 It

438 OBSERVATIONS ON FEVERS. PART 111,

It is certain that a yellow colour of the fkin may be produced by fuch an *error loci*, without any fufpicion of the prefence of bile, We have an illustration of this in the ecchymofis which follows upon an external contustion. In this case the red part of the blood is mechanically forced either into the fmaller order of veffels, or into the cellular membrane, which occasions a livid appearance, and in the course of the recovery the fame parts become yellow, probably in confequence of fome of the gluten of the blood affuming this colour after the red parts have been removed by abforption or otherwise,

In the worft form of this difeafe there is all, along an uncommonly diffreffing fenfation of univerfal anguish, particularly about the stomach, where there is a fense of burning heat, which, as the miserable fufferers themselves express it, becomes unspeakable torture.

A fenfe of weight at the breaft, deep and frequent fighing, and a great failure of mufcular

cular strength, are dangerous symptoms in all stages of the difease.

Upon the first attack the skin is extremely hot and dry, and the pulfe hard and frequent; but the external heat foon becomes very little different from the ufual standard of health, and the skin feels foft and moift. There fometimes happens an eruption of finall puftules, with white heads, on the trunk of the body, which is a favourable fign; and I have feen a head-ach difappear upon this breaking out. The pulfe does not ferve as an index of danger; for, after the hurry of the first attack, it becomes very moderate in point of frequency, varying from eighty to a hundred pulfations in a minute, and is natural in point of regularity and strength.

In these circumstances this fever differs from that which was last described; and it also differs from it in being attended with little delirium. I have seen cases in which the series were not affected from beginning to end; and I never observed that violent Ff_4 and

440 OBSERVATIONS ON FEVERS. PART III. and inceffant delirium which attends other dangerous fevers.

The ftate of the *fauces* is alfo different from that of most other fevers, for there is no exceffive thirst. The tongue is somewhat white and foul; but I do not remember ever to have seen it black and dry.

A want of action in the bowels, and an infenfibility to purgative medicines, indicate great danger; and, next to the black flimy ftools, one of the moft unfavourable fymptoms is, when the *feces* are like white clay, as I have feen in fome cafes that ran out to the length of a week before they proved fatal. When the black vomit and ftools occur, death commonly happens on the third or fourth day. A bilious diarrhœa fpontaneoufly coming on, is a very favourable fymptom.

In more unpromifing cafes the urine is fcanty, and in the laft ftage of life it becomes of a very dark colour, as was mentioned before. A plentiful fecretion of urine is

is a very favourable circumftance, and feems to be one of nature's methods of curing the diseafe ; for fuch cases are observed to terminate well. I remember one cafe in particular in which feveral quarts were made daily for feveral days together, and it was of a very dark faffron colour, but looked green where the furface was in contact with the fide of the pot. I infpissated a small quantity of it, and found a large refiduum, which was very deliquefcent, and feemed to be all faline. In a hot climate the urine does not fhew that feparation and deposition which denote the crifis of fevers in cold climates, and this is perhaps owing to there being lefs mucilage and more alkali in the former, on account of the more putrescent state of the fluids. Upon adding a little vinegar to the urine in the cafe above mentioned, it became turbid like the critical urine of the fevers of Europe.

At the approach of death, cold clammy fweats come on; the pulfe continues regular and of a certain degree of ftrength, but grows gradually flower. I have counted it

441

at

442

at forty pulfations in a minute. The patient is frequently fenfible to the laft moment; nor does the countenance fink into what is called the *Hippocratic* appearance. In other cafes I have feen, at this time, *coma*, and not unfrequently convultions. Broad livid fpots fometimes alfo appear on the fkin. Extreme mufcular debility, a great difficulty of deglutition, and a dimnefs of the eye-fight, are likewife common fymptoms in the laft fcene.

The different ftages which lead to diffolution following each other thus rapidly, there is not that gradual failure of the powers of nature that ufually give warning of approaching death; but the fprings of life run down, as it were, at once, the wretched fufferer expires, and is happily delivered from the most extreme milery of which human nature is capable.

Such is the general train of fymptoms in this fever, taken entirely from my own obfervation; but great varieties occur both in the fymptoms and duration, fo great indeed, that

that it is hardly recognifable for the fame difeafe. I fhall give fpecimens of fuch anomalous cafes in two that occurred at Port Royal, on board of the Canada, in July, 1782.

A lieutenant of that thip had been fubject, for four days, to fits of retching, without any bilious difcharge or pain in the ftomach; and, except a white tongue, he had no fymptom of fever in that time, nor any thing to prevent him from doing his duty. On the fourth day, when I first faw him, he began to complain of a fixed pain in the pit of the flomach, which was not very violent, and about the fame time a yellownefs began to appear on the white of the eye. He took a laxative medicine, which had the defired effect, and fome volatile fpirits, with fome drops of thebaic tincture in fimple mint water, for the pain in his ftomach. He had a good night. Next day the complaint of the ftomach was better; but there was great muscular debility. He had feveral natural ftools; and as there feemed little indication but debility, he took nothing

thing that day except an infusion of fome bitters and aromatics in wine. As he did not want for appetite, he eat fome broth and chicken; and nothing to give any alarm happened this day, except a fhort qualm, in which he was faint, with a fenfe of cold, feeling to himfelf, as he faid, as if he should have expired. In the afternoon he began to have black-coloured ftools, which was the first fymptom that clearly betrayed the nature of the difease. He was then ordered as much Peruvian bark as he could take with red wine, and thefe his ftomach bore. Decoction of bark was also given him in clyfters. He had a ftrong voice, and was quite fenfible, but grew weaker and weaker with frequent returns of the qualms, and he expired that evening before ten o'clock.

I have not the leaft hefitation in ranking this cafe with the fevers laft defcribed, though fo many of the ufual fymptoms were wanting. This gentleman, though of a lively, active difposition, was of a flender make, and of a dingy, doughy complection, and

and his cafe gave me the idea of a difeafe attacking a conftitution which, not having powers to ftruggle with it, is overwhelmed without making refiftance *. In those robuft, plethoric habits, which are most commonly attacked, there is a fufficient degree of ftrength to excite the violent fymptoms before enumerated.

A few days after this gentleman's death, another officer of the fame fhip was taken ill with the fame fort of fever, and it was alfo attended with feveral unufual fymptoms. Neither his fkin nor eyes were yellow; the fkin was hot and dry throughout the difeafe, and during the three first days there

* I have been very cautious of admitting any theory into this work; but I cannot help adopting the doctrine of my much-valued mafter, Dr. Cullen, on this point, viz. that a great part of the fymptoms of fever arife from reaction, or that effort which nature makes to overcome the morbid caufe. I am happy in any opportunity of acknowledging my obligations to this learned profeffor, to whom the medical world in general is fo much indebted, as well for the rational views of the animal œconomy, which he teaches, as for that fpirit of ftudy and inquiry which he infufes into the minds of his pupils.

was a diarrhœa, which was neither bilious, putrid, nor mucous, but confifted in watery ftools. There were no gripes, nor any local pains whatever; but I never remember to have feen more fuffering from that general anguish, particularly about the ftomach, which attends this fort of fever. On the third night he began to vomit and purge blood, which foon terminated in that darkcoloured discharge which is a symptom for characteristic and fatal in this difease. He continued fenfible till within eight hours of his death, which happened on the fourth night. The pulse was full and pretty strong during the whole course of the difeafe; but there was all along great debility and frequent fighing, fymptoms that ought always to create alarm.

TREATMENT of the YELLOW FEVER.

I FEEL this as the moft painful and difcouraging part of this work, the yellow fever being one of the moft fatal difeafes to which

which the human body is fubject, and in which human art is the most unavailing.

447

It feems hardly to admit of a doubt that there are particular inftances of difeafe, in their own nature, determinedly fatal, that is, in which the animal functions are from the beginning fo deranged, that there are no poffible means in nature capable of controlling that feries of morbid motions which lead to diffolution. Of this kind appear to be the greatest number of cases of the plague, many of the malignant fmall pox, and fome of fevers, particularly of that kind now under confideration. It is extremely difficult to afcertain fuch cafes from obfervation; and it may be faid that the opinion of the existence of them is favourable to ignorance and indolence. But, on the other hand, it may be queftioned if more harm is not likely to arife in medicine by being too fanguine and officious, than by a diffidence of art and trufting to the powers of unaffifted nature ? Were we thoroughly acquainted with the animal æconomy, we fhould perceive a priori in what inftances the feeds of difeafe

difease would either operate fo as neceffarily to terminate in death, or when they were within the command of art. But we can derive little or no information from this fource, on account of our great ignorance of the fecret operations of the living body; fo that the only grounds of judging are our observation and experience concerning the usual event of difease, and the effects of remedies. Though these are circumstances attended with great uncertainty and ambiguity, yet I believe it will be admitted as the opinion of the most chaste and expetienced observers, that there do really exist difeafes whofe course cannot be diverted by any means that can be employed. This opinion, I have faid, is, in one view, extremely difcouraging; yet, to the mind of a feeling and confcientious practitioner, who must often find his best endeavours baffled in many difeafes as well as this, and who might be apt to look back and accuse himfelf of fome fault or omiffion, it affords this fatisfaction to his reflections, that the want of fuccess may have been owing to fomething

fomething in the nature of the difease, and not to his want of skill and attention.

But though the fatality of this difeafe is difcouraging, let us not defpond, but rather redouble our diligence in obferving what affiftance and relief nature may admit of.

It is proper in this as in every other fever of this climate, to begin the cure by cleanfing the firft paffages. This does not produce the fame relief as in the common bilious fever, probably becaufe there is a lefs free fecretion of bile, and therefore lefs oppreffien from the collection of it.

With regard to blood-letting, the moft that can be faid in its favour is, that if there fhould be a hard throbbing pulfe, with violent pain in the head and back, it is *fafe* in the first twelve hours. This limitation is neceffary, at least with regard to common feamen, who do not bear evacuations fo well as officers and others, who are used to a better diet, and to whom the loss of blood has, in fome cases, been found useful in the Gg early

early ftage of this fever. It is, however, in all cafes extremely dangerous, except in the circumftances mentioned above. The blood is faid to fhew a buff in the beginning of the difeafe, but in the fecond ftage, it is mentioned by a French author *, that it hardly coagulates or feparates. But even the appearance of a buff, without confidering other circumftances, does not always argue the propriety of blood-letting +.

The great object in the cure of this fever is, to bring the ftomach to bear the bark.

* M. Desportes, who wrote a treatife on the difeafes of St. Domingo.

 \Rightarrow There is a difference in the appearance of the blood when fizy, perhaps not fufficiently infifted on by practical writers; for though there fhould even be a very thick buff, yet, if the furface is flat, and the *craffamentum* tender, no great inflammation is indicated, in comparifon of that flate of the blood wherein the furface is cupped, the *craffamentum* contracted fo as to afford the appearance of a large portion of *ferum*, and where it feels firm and tenacious, though perhaps but thinly covered with buff. This is a diffinction well worth attending to in practice; for it is in thefe laft circumflances that blood-letting gives moft relief, and where the patient will bear the repetition of it with moft advantage. 3

There are here wanting most of the circumflances that in the other cafes forbid the ufe of it; for there is no preternatural quantity of bile in the ftomach and inteftines, nor is there a hot and dry fkin, nor violent delirium. The only obstacle to its administration is the great irritability of the ftomach, which is the most fatal fymptom of the difease; and the principal part of the management of the patient confifts in the prevention or removal of this. The ftomach is to be treated with the utmost tendernefs and attention. One gentle emetic at the beginning is all that is allowable; and as fresh collections of bile are less apt to occur, the repetition of it is lefs neceffary.

It is beft to abstain altogether from antimonial medicines, and to render every thing, whether food, drink, or medicine, as grateful as possible. The liquid most apt to stay upon the stomach is the juice of the acid fruits of the climate, such as *oranges and

* See the fame observation in Mr. Hume's Effay on this Disease, published by Dr. Donald Monro.

lemons,

PART III. OBSERVATIONS ON FEVERS.

452

lemons. It happens frequently, however, that acids come to be loathed extremely, fo as to naufeate the flomach and to encourage retching. In this cafe I have found a composition of wine and water with lemon juice and nutmeg, fweetened with fugar, and given warm, to be a very grateful and falutary drink. The patient fometimes prefers the decoction of farinaceous fubstances to every other liquid; and in one cafe in particular, which did well, the patient was led by tafte to prefer warm water gruel to every thing elfe, and the great quantity he drank feemed to have a confiderable share in his recovery, by keeping up a warm moift fkin and producing a great flow of urine.

In order to check vomiting, the faline draught, in the act of effervescence, has been employed with evident advantage; but in most cases this symptom is so obstinate as to difcourage all attempts to remove it. I have known magnefia in mint water have a visible effect in soothing the stomach, particularly when given immediately after some acid beverage. GEZ

I was

EHAP. I. OBSERVATIONS ON FEVERS.

I was informed by Dr. Young, phyfician to the army, that he found an infusion of chamæmile flowers one of the beft medicines in this vomiting; and a furgeon of one of the line-of-battle fhips informed me, that he alfo found advantage from it in alleviating this fymptom. The French author above mentioned affirms, that milk, boiled with fome flour or bread, given in the quantity of a fpoonful at a time, and frequently re-. peated, had more effect than any thing he tried in flopping the vomiting in this fever. I have feen this fymptom relieved by fomenting the flomach with flupes wrung from the decoction of bark, and fprinkled with camphorated fpirits and tincture of bark *.

But nothing I have ever feen tried had fo great an effect in removing this irritability

* The flate of the flomach is very much affected by that of the external furface of the body; and it is fagacioufly obferved by Sydenham, that the flomach being commonly very irritable in the plague, the moft effectual means of making it retain what was administered internally was to excite a fweat.

Gg 3

of

454

of stomach as a blister applied to it externally; and it is a remedy which, fo far as I know, has not been hitherto recommended. In other fevers, when the head was not particularly affected, I preferred this part for the application of a blifter, for it is in fome refpects more convenient than between the shoulders, and the stomach is the part more affected perhaps than any other in all fevers. But in this fever I was led to apply it to this part, both from its being affected in an uncommon degree, and from obferving, upon infpecting the bodies of those who died, that the only morbid appearance that could be difcovered was an inflammatory fuffusion on the inner membranes of the ftomach.

I have employed opiates both externally and internally to allay this fymptom, but without the effect that might have been expected from fo powerful a fedative.

As the flomach will feldom, even in the most favourable cases, bear fuch a quantity of bark as to fubdue the difease, it must be exhibited

CHAP. I. OBSERVATIONS ON FEVERS.

exhibited in every other way that can be thought of, fuch as by clyfter and by external fomentation, both of which I have employed with good effect. I used to order a pint of decoction of bark to be injected every three or four hours, and the fomentation to be employed nearly as often. I have heard of the decoction of bark being used as a warm bath with success; but I cannot decide concerning this practice from my own experience.

I have no other internal remedy to recommend; for whatever power of retention the ftomach may have fhould be employed in taking bark. If it fhould become tolerably retentive, camphor will be found of fervice; and if given in the evening with an opiate, perfpiration and fleep will probably be procured, by which the patient will be greatly relieved.

Blifters to the thighs and legs feemed to coincide with the general intention of cure, and they appeared to be of advantage in the cafes in which they were tried.

Gg4

4. Of

Of the Effects of Flowers of Zinc and White Vitriol in the Cure of obstinate INTERMITTENT FEVERS.

IT frequently happens in the Weft Indies that intermittent fevers are fo obftinate as to refift the common means of cure by the Peruvian bark; fo that thefe complaints become extremely diftreffing to the medical practitioner as well as to the patient. Indeed this was a difficulty that occurred fo often, that I was fometimes tempted to think, either that the great reputation of this medicine is not fo well founded as is commonly believed, or that the bark generally in ufe in thefe times is not of fo good a quality as that employed by the phyficians who firft eftablifhed its character.

But, in the first place, the experience upon which its reputation was first built was in a temperate climate, where very few agues are found to refist it when properly administrend. In the next place, there is reason to believe

CHAP. I. OBSERVATIONS ON FEVERS.

believe that, in fact, the medicine itfelf now commonly in ufe is not equally powerful with what was first employed; and a species of it, called the Red Peruvian Bark, has lately been discovered, or rather, perhaps, revived, which is certainly of a superior quality, and has been found to cure intermittents in which the common fort had failed *.

However this may be, it is an undoubted fact that obftinate agues are much more frequent in the Weft Indies than in Europe; and fomething to fupply the infufficiency of the bark feemed to be a *defideratum*.

I was informed by Dr. Hendy, of Barbadoes, that he had found the flowers of zinc to answer in cases of intermittent fever, in

* The red bark was brought to England in a Spanish prize in the year 1781, and a very accurate account of its medical and chemical properties was published the year after by Dr. William Saunders, of Guy's hospital. None of it had been brought to the West Indies before the peace, so that I had no opportunity of trying it in that climate.

which

which even the bark and every other remedy and mode of treatment had failed. It was found very fuccefsful in the like cafes, both in my own trials at the hofpitals, and by the furgeons of the men of war to whom I recommended the use of it. In order to judge what may be expected from it, I shall give a specimen of its success in some cases, at the hospital at St. Lucia, of which I kept an accurate account, in the months of February and March, 1783.

About the time the fleet arrived there, fix cafes of intermittent fevers were fent to the hofpital from different fhips. One was of fix weeks continuance, and had been fometimes of the tertian, fometimes of the quartan type. Two were quartans; one of which was of two months, the other of eight months duration. Two were regular tertians; of which one had only had two fits, but was a relapfe after a week's exemption from an attack of feveral weeks. The other was of three months continuance, attended with an eruption on the hands and arms.

CHAP. I. OBSERVATIONS ON FEVERS.

arms. The fixth cafe was a quotidian of three weeks, attended with a cough of the fame ftanding, and joined with fea fcurvy.

In all of them the bark had been given at fome period or other; and the flowers of zinc were now tried in all, except the laft. In three out of the five this medicine had the most visible good effects. In one the difease was so speedily removed, that there was only one fit after the first day of taking this medicine, and the other two had recovered perfectly after it had been used for feven days.

In these cases there can be little or no ambiguity with regard to the real efficacy of the medicine, as the difease had lasted from two to fix months, and there was no other circumstance of change in the fituation or treatment of the patients that could account for their recovery,

Of the two cafes in which it failed, one was the tertian of three months, attended with

. 459

460 OBSERVATIONS ON FEVERS. PART IIL.

with the eruption; the other was the relapfed tertian of three days.

With regard to the dofe, I began with giving it in the quantity of two grains thrice a day, which, in fome, produced the defired effect, and without the leaft fenfible operation on the flomach or bowels. If this dofe did not flop the fits after a few days trial, it was increafed to three grains, which, in fome, would produce a little ficknefs. I found that four grains ruffled the flomach a good deal; but if the patient is gradually habituated to it, even more than this may be given without inconvenience.

In those cases in which it was fuccessful it was not found necessary to give more than two grains at a dose, except in one of them, in which three were given the day before the fit ceased. In the two unfuccessful cases the medicine had a fair trial for a fortnight; but one of them getting no better, and the other feeming to get worse, it was left off.

The

CHAP. I. OBSERVATIONS ON FEVERS.

The cafes to which this medicine is adapted are those that have extremely diftinct remissions, with no fymptoms of bile nor any local affection. When agues come to be long protracted, they are frequently what may be called nervous; that is, confisting of certain morbid motions that feem to be induced by habit, after the original cause is removed, and with a tolerable enjoyment of appetite, fleep, and all the functions of life, during the intermission.

The two cafes in which the zinc failed recovered by the ufe of the bark. This had been unfuccefsfully tried before, and its good effects now might either depend on its having been left off for fome time, whereby the body recovered its fenfibility to its virtues, or it might be in confequence of adminiftering it in ardent fpirits with a few grains of capficum and ginger, additions which I found to improve its effects in other cafes, and is a mode of giving it well fuited to this climate.

2

The

The zinc was not tried in the fixth cafe, on account of the local affection and the remission being short and imperfect.

The white vitriol, being a falt of zinc, might be fuppofed to poffers the fame virtues; and it would appear to do fo from fome facts* that were reported to me in the Weft Indies, and alfo from fome trials made by me at St. Thomas's hofpital fince I came to England.

Though

* Mr. Telford related to me, that he had cured feveral intermittents that had baffled the bark, by means of white vitriol, whilft he was furgeon of the Yarmouth in 1779. He gave it in dofes of five grains every four hours in the intermiffion, and was fuccefsful in every cafe except two, in which the patients were far advanced in the dropfy.

He met with feveral cafes of the fame kind in the Alcide, in 1782, in which he was fuccefsful with the flowers of zinc, after having given large quantities of bark to no purpofe. He preferred, however, the white vitriol, as being milder in its operation, and lefs apt to difagree with the patient's flomach.

CHAP. I. OBSERVATIONS ON FEVERS.

Though this is a medicine of very confiderable powers, I do not mean to put it in competition with the bark, by proposing it as a fubflitute for it, or by reprefenting it as fuperior to it in all circumftances; but only to propofe it as a valuable fubfidiary in particular cafes. The account I have given is faithfully extracted from a diary of my practice; and were I to fay more in its favour than the future experience of others may warrant, I should do more harm than fervice to its reputation. Many good medicines have had their characters hurt by being over-rated by the first proposers of them, who are naturally fanguine and partial, without, perhaps, intending to deceive. But when others find that their virtues do not come up to what has been afferted, they are apt to run into the other extreme, and ex-

He did not employ either of them in the recent flate of the difeafe, nor does he affert that they are univerfal or infallible remedies; but only alledges, that he has experienced the most evident good effects from them in an advanced flage of the difeafe, and a reduced flate of the patient, where the common remedy had failed.

plode

plode them altogether; fo that what was given out as good for every thing, is now found to be good for nothing *.

* Dr. Huck Saunders, whofe recent loss the world has reafon to regret on account of his experience and fagacity as a phyfician, as well as his virtues as a man, communicated to me, in conversation, fome observations on the cure of obstinate intermittents, which deferve to be mentioned here. When he was physician to the army at the Havannah he cured a number of agues which had refisted the bark, by giving two ounces of the vinous tincture of shubarb and fix drams of the tincture of fena feven or eight hours before the fit. This being repeated two or three times, carried off the difease. He also informed me, that he had met with agues in England which did not yield to the bark; but, upon leaving it off, and putting the patients on a course of the bark.

Arfenic has also been found to be an effectual remedy in intermittent fevers. I was informed by Dr. Huck Saunders, that when he was in North America, in the war before the last, there was an expedition undertaken against the Cherokee Indians, whose country is extremely subject to agues; and as an adequate quantity of bark would have been very cumbersome where light fervice was necessary, Mr. Russel, who had the medical management of the expedition, provided a great number of pills, containing each one eighth part of a grain of arfenic,

CHAP. I. OBSERVATIONS ON FEVERS.

nic, by the proper use of which he was enabled to cure the intermittent fevers with which the troops were feized.

I fhall here mention another unufual remedy in intermitting fevers; and though I can bring only one inftance in proof of its efficacy, yet this is fo ftrong as to make it deferve farther trial. A man, on board of the Sandwich, had an obftinate intermittent which had refifted the bark, and was ftopped by applying to the ftomach a plafter, composed of gum plafter, epispaftic plafter, and opium, in proportions which I do not now recollect.

Hh

CHAP.

CHAP. II.

OF FLUXES.

THESE feem to arife in the fame circumftances, and to be owing to the fame general caufes, as fevers. They may, in fome fenfe, be confidered as fevers, attended with peculiar fymptoms in confequence of a determination to the bowels, juft as fevers in cold climates are fometimes attended with rheumatifm and catarrh. We have feen, in the first part of this work, that the dyfentery arofe chiefly in those ships which had been fubject to fevers.

This determination to the bowels is owing to a variety of caufes, but is chiefly connected with external heat; for it is most common in hot climates, and towards the end of fummer or in the autumns of cold climates, owing probably to a greater acrimony of the fecretions of the inteftines, and particularly

particularly of the bile. Dyfenteries arife in camps also at the fame feasons, and in the fame circumstances as bilious fevers *.

Befides climate and feafon, the other circumftances determining to the one difeafe more than the other are, 1. A difference in the conftitutions of different men; for in the fame ship it fometimes happens that both difeafes prevail equally, though all the men are using the fame diet and breathing the fame air. 2. The nature of the occafional caufe. A dyfentery, for inftance, is more likely to arife from an irregularity in eating or drinking; a fever from being expofed to the weather, particularly marfh effluvia. 3. The particular fpecies of infection that may happen to be introduced. Suppose, for example, that a ship's company is predifposed to acute diftempers, and one man or more ill of the dyfentery fhould be brought on board, this will become the prevailing difeafe, as happened in the Torbay in August, 1780. If the like number of

* Sir John Pringle on the Difeafes of the Army.

Hh 2

fevers

fevers should be introduced, then fevers will be the prevailing difease.

These two diseases may therefore be confidered as vicarious, the one fubftituting itfelf for the other according to particular accidents, and both proceeding from the fame general caufes; and this is no new idea of mine, but feems to have been Dr. Sydenham's, when he calls the dyfentery a febris introversa. It may be farther added, that dyfentery is the fafeft form in which this cause, which is common to both, can exert itself; for it is a difease more within the reach of art; and fome of the most dangerous fymptoms attending fevers, particularly delirium, seldom occur in dysentery. When it proves fatal, it is in confequence. of violent local affection, and that in general after it has taken a chronic form. When an incipient fever turns into a dyfentery, all the fymptoms, and particularly the headach, delirium, and coma, if there should be any, are immediately relieved. And the most favourable cafes of the yellow fever are thofe in which a bilious diarrhœa comes on, while

while the most fatal are those in which the bowels are fo torpid as to be infensible to any stimulus either from their own contents or from medicine.

I shall not enter into a minute description of this difease in all its stages, as this has been so ably executed by Sir John Pringle, Sir George Baker, and other authors, but shall only give a sketch of some of the most remarkable symptoms, particularly such as are peculiar to the climate and manner of life, so as to explain the varieties that may be necessary in the mode of treatment.

The fluxes that arofe in the fleet were either what may be called the acute idiopathic dyfenteries, or a dyfenteric flate of the bowels from neglected diarrhœas, which was moft apt to occur in the convalefcent flate of fevers, or in men labouring under the fcurvy. The body is more fufceptible of infection in a flate of weaknefs from thefe or any other caufes; and in hot climates the dyfentery feems to be more infectious than fevers; for at hofpitals it was fo fre-H h 3 quently

quently communicated to men who were ill of other complaints, that it was in thefe the principal caufe of mortality. For this reafon, I was at more pains with regard to this difeafe than any other, in keeping thofe who were ill of it in a feparate ward.

I have met with fome violent and untractable cafes which proved fatal in the acute state; but, in general, this difease draws out to a chronic form in this climate, and does not prove mortal for many weeks. The usual cause of death appears, from the infpection of the bodies, to be an ulceration of the great intestines, particularly of the defcending colon and the rectum. This part of the inteftinal tube is most affected from its being the receptacle of all the acrid fecretions from the reft of the canal; and it is naturally more fubject to congestions of the fluids and incurable ulcers, as appears from the rectum being fo liable to the hæmorrhoids and the fiftula. This ulceration of the great intestines is fo common, that, out of eight cafes which I infpected after death, feven had this appearance. The cafe in

in which there was none was not fo much a cafe of dyfentery as of inflamed bowels, brought on by the man having drank to excefs of fpirits while he was recovering from a dyfentery. The acute tormina which always occur in the first days of the difeafe feem owing to an inflammation, which terminates in ulcers; and thefe being conftantly irritated by the fharp humours, produce the tenesmus, which is the fymptom most effential to dyfentery in the after part of the difeafe. Any diarrhœa may in this manner become dyfenteric. During the acute griping at the beginning, the ftools are loofe and copious; but as foon as the tenefmus takes place, they are fcanty, which is most probably owing to the fpafmodic ftrictures in the great intestines, in confequence of irritation upon their excoriated furface. The inflammatory flate is more lafting and violent in a cold than a hot climate, the gripings are more fevere, and the danger is alfo greater in this stage of it.

The ftate which the great inteffines fall into in old dyfenteries feems to have fome-Hh 4 thing

472

thing in it peculiar to itfelf: the feveral coats become thick and fpongy; their texture is obliterated and deftroyed; and they become of a black or very dark purple colour. This, however, cannot be called mortification; for the fibres of the gut do not lofe their tenacity, nor is there that putrid and diffolved ftate in which gangrene confifts; but it advances in time to fuch an extreme ftate of difeafe as to be entirely incapable of recovering its natural appearance and functions, and proves therefore the caufe of death.

The greater frequency and obfinacy of thefe chronic fluxes in hot than in cold climates feems to be owing to the fame weakening of the powers of life which make recovery in general fo tedious, and particularly that of wounds and ulcers. The greater quantity of acrid bile will alfo tend to keep up the ulceration. Dyfenteries have this difadvantage, that the Peruvian bark, which is the most powerful reftorative in other complaints of this climate, is here found to be inadmissible on account of the heat,

heat, thirft, and other febrile fymptoms, which it feldom fails to induce in all stages of this difeafe.

TREATMENT OF FLUXES.

THERE are few difeafes in which a prudent employment of art is more useful, or in which early means of relief are more requisite than in this *.

Where the dyfentery is the original difeafe, and when the patient is robuft and plethoric, with acute pain and a ftrong pulfe, blood-letting may be practifed with advantage in the beginning of the complaint. But there is no part of the practice

* This is elegantly expressed as follows, in Sir George Baker's learned Differtation on this difease :- " Primo " neglectus tractatu asperior occurrebat : etenim corpus " extenuatum atque confectum ut morbo fervido impar " erat, ita ipsi impar curationi. Itaque optimum erat " occurrere ipsis principiis atque auxilia mature præri-" pere. In hoc enim corporis affectu aliquod certe in " medicina opus est, haud multum in nature beneficio."

474

in this difeafe in which the climate and manner of life makes a greater difference than in this; for in a temperate climate it frequently happens that repeated blood-letting is neceffary; but in a hot climate, where the fibres are relaxed, and in the conftitutions of feamen, whom we feldom or never find plethoric, the inflammatory fymptoms requiring this evacuation do not run fo high, nor continue fo long.

It is in all cafes of the utmoft confequence to adminifter as early as poffible a brifk faline purgative. An ounce and a half or two ounces of purging falts may be diffolved in a quart of barley water or water gruel, and given warm in cupfuls, at fmall intervals, till a free and copious evacuation is produced. If there fhould be much fever, or ficknefs at ftomach, two grains of emetic tartar will be a great improvement of this medicine; and there will be this farther advantage from its ufe, that if the ftomach fhould be loaded with bile, in which ftate it is more irritable, an evacuation upwards will

will also be excited to the great relief of the patient.

This early and feafonable meafure will, in many cafes, put a ftop to the difeafe, efpecially if the patient is thrown into a fweat immediately after the bowels have been thus thoroughly evacuated. It is of great fervice in this difeafe to promote free perspiration, and even a plentiful fweat, which may be effected with great advantage by giving, at bed time, a medicine composed of opium, ipecacuana, and a little neutral falt, accompanying it with plentiful warm dilution. Nothing tends more to relieve griping and tenefimus than a general warm moisture on the skin. The ipecacuana, which is an ingredient in this medicine, is one of the best anti-dysenteric remedies we know; the opium procures reft; and this, joined to the fudorific effect of the whole, not only gives a temporary relief, but tends to carry off the difease. It is most properly given in the evening; for there would be this inconvenience in conftantly encouraging a fweat, that if the tenefmus fhould return,

it

476

it would either be checked by the patient getting frequently out of bed, or there would be danger of his catching cold. I am well aware that we cannot be too cautious with regard to the ufe of opium in the beginning of this difeafe; but it is admiffible more early in a hot climate than a cold one, as the inflammatory fymptoms are lefs violent and can be fooner fubdued; befides, it becomes an entirely different medicine when conjoined with the other ingredients that have been mentioned.

The beft medicine in the day time we found to be fmall dofes of ipecacuana alone twice or thrice a day; and if there fhould be frefh collections of bile, fmall dofes of the faline purgative will be neceffary. Ipecacuana, in this intention, may be given in the dofe of two grains in athletic conflitutions, fuch as those of feamen; but in the more delicate conflitutions, fuch as are commonly met with in private practice, one grain is a fufficient dofe. I have found manna and tamarinds a good addition to this medicine in the earlier ftages of the difeafe, where

where there was much bile; but in a more advanced stage of it they are apt to produce gripings and flatulence.

The marks of a redundance of bile are, a ficknefs at ftomach, a fenfe of fcalding at the anus when the ftools are paffing, and the yellow or green colour of the ftools themfelves. It is apt alfo to excite fymptoms of fever, fuch as a foul tongue, a hot and dry fkin, with thirft. When collections of it are fufpected in this difeafe, it is beft to evacuate it by vomiting, for it is thereby prevented from irritating the bowels, and from arriving at the inflamed parts with, perhaps, increafed acrimony, acquired in paffing through the whole length of the inteftines.

Some gentlemen of the fleet informed me that they found oil of almonds a ufeful addition to the purgative. Others as well as myfelf made a practical comparison of the faline purgative with that composed of rhubarb and calomel, as recommended by Sir John Pringle, and we gave the preference to the former,

478

former, as more eafy, fpeedy, and effectual in its operation, efpecially in the firft ftage. Cafes may occur, however, in which the other may be more advifable; for where there is a fenfe of weight about the ftomach, which moft probably arifes from the biliary organs being clogged with bile, and where emetics have failed to remove it, or the weaknefs of the patient may render them improper, then calomel has the beft effect : for it was formerly obferved, that it tends to loofen the fecretions, and to ftimulate the more diftant excretories, fuch as the biliary ducts.

It is very important to caution young practitioners concerning the employment of opium in all ftages of this difeafe, but effecially in the beginning; for though it is an excellent remedy when feafonably and judicioufly employed, it is very liable to abufe, particularly in the hands of the inexperienced, who may be tempted to give it improperly from an anxiety to relieve; but as more harm may arife from an unfeafonable adminiftration of it than could be compenfated by the beft-timed ufe of it, it is beft

to err on the fide of caution and omiffion. The principal caution to be obferved with regard to this remedy is, to premife fuitable evacuation, fuch as blood-letting, if neceffary, but more efpecially purging. It is always pernicious to give it in its pure flate during the *tormina*, fo common in the firft days. By thefe I mean the abdominal gripings, which denote inflammation, and are entirely different from the *tenefmus*, which is a more conftant and characteriftic fymptom of the difeafe, and feems to arife from irritation and fpafms of the rectum and colon.

It was in this difeafe that I first observed the good effects of a small quantity of neutral falt in taking off the inconveniencies attending opium, such as the feverish heat and confusion of the head, which it is apt to produce in many constitutions; and as the administration of the anodyne coincided with the evening dose of ipecacuana, I was led to adopt a form similar to that of Dover's powder, but with only half the quantity of opium; or, it was given in a liquid 2

form, by combining twenty drops of thebaic tincture and a drachm of ipecacuana wine, with nitre from five to ten grains, in any fimple vehicle in form of a draught. There is a very obfervable difference, in fome cafes, between opium given in a liquid and in a folid form; and the former is much more certain in its effect when the intention is to procure fpeedy and effectual eafe.

I have observed great benefit from the use of external remedies in dyfentery, and thefe have, perhaps, been too much neglected by authors and practitioners. The warm bath is of great fervice, especially where the gripes and tenefimus are fevere, and where the fever has been taken off by previous evacuation. Fomentations or warm applications of any kind to the abdomen give temporary relief; and it will be found of advantage to keep those parts, at all times, well defended from the cold air. Blifters to the abdomen were also found of use, and likewife acrid liniments, composed of oil, volatile spirits, and tincture of cantharides. Where the flomach has been much affected, I have

I have perceived relief from fomenting it with flupes, upon which thebaic tincture and camphorated fpirits were fprinkled, as recommended by Dr. Lind. I was once affected with a bad dyfentery in the Weft Indies, and I thought myfelf much relieved by the warm bath and a blifter. Strangury is not an uncommon fymptom in this difeafe, independent of cantharides, and the most fensible and effectual relief is derived from fomentations to the pubis and perinæum, as I alfo experienced in my own cafe.

What has been hitherto faid regards chiefly the acute dyfentery; but the moft frequent and troublefome complaint that occurred at the hofpital, was the fame difeafe in what may be called its chronic ftate.

There is a confiderable variety of fymptoms in all the ftages of this difeafe, but particularly in the more advanced or chronic ftate, fo that a corresponding variety is neceffary in the modes of treatment, and there are few difeafes in which there is more room for exercifing the judgement.

In all flages of it an accurate difcernment is neceffary with regard to the use of opiates, and great part of the practice here confifts in timing these well. They are least admissible in the beginning, where evacuation is the principal object; but as the difeafe advances they become more and more allowable and useful. The principal cautions necessary in their administration are, 1. To premise fufficient evacuation, fo that the intestines may not be loaded with bile, fcybala, or any other irritating matter at the time of giving the opiate. 2. To obviate the effects which an anodyne has of caufing a retention of the contents of the inteffines. This may be done, either by giving fomething purgative along with it, or after it has produced its quieting effect. The former method feems preferable; for as foon as the effect of the opiate is over, the purgative is ready to act; and in this way it is to far favourable to the operation of the purgative, that large feculent stools will be discharged: whereas, had the purgative been given alone, it would have been more apt to produce fcanty

fcanty griping ftools, attended with tenefmus. Rhubarb anfwers well in fuch cafes, and may be given in a dofe from twelve to twenty grains, according to the age and conftitution. 3. To prevent feverifh heat and delirium. This was proposed to be done in the first stage of the difease, by combining it with ipecacuana and a little neutral falt. With the same intention, it may now be joined with a few grains of Dr. James's powder, or vitrum ceratum antimonii, in which form it would not be so ftrongly fudorific, an effect not so much required in the chronic as in the acute state.

The principal caufes that keep up the flux, and render it fo obftinate, are, 1. A too great fecretion of bile, either continual or frequently recurring. 2. Ulcers in the great inteffines. 3. A lienteric flate of the bowels. 4. A retention of *fcybala*.

The first cause is much less frequent than might be expected by those who fancy that every disease of this climate proceeds from I i 2 bile.

bile. When there does occur a redundancy of bile, there is more occafion for the employment of evacuant medicines, and more need of caution in that of opiates. A medicine that will difpofe the liver, or the circulating fyftem in general, to form lefs bile, is a *defideratum* in phyfic; but, in cafe of an exceffive flow of it, emetics and mercurial purgatives, as has been already mentioned, are the beft means of evacuating it; and care fhould be taken that it be difcharged before it accumulates too much, or becomes acrid by too long retention.

In order to obviate that irritation in which tenefmus confifts, fome benefit was found from the injection of emollient and anodyne clyfters, to wafh off and dilute the acrimony, and to footh and heal the parts. A ftrong infufion or decoction of linfeed or ftarch may firft be given to the quantity of near a pint, to be evacuated after a fhort retention, and then a few ounces of the fame, with thirty or forty drops of laudanum, to be retained for a length of time, in order to procure reft. Inftead of this laft, I have known

known a fmall quantity of warm milk, with fyrup of poppies, ufed with advantage in private practice.

I was at first tempted to think that a very frequent injection of fuch clyfters would be. very useful, by washing and healing the colon and rectum, and preventing farther exulceration. But befides the objection arifing from the tenderness of the parts, which, in fome cafes, renders the operation itfelf painful, I found that if they were given oftener than once a day, they rather increased the uneafinefs, and made the patient feel languid and exhausted; fo true it is that no practical rule can be established from reason alone without being brought to the teft of experience. The rectum feems to have a peculiar fenfibility, and a remarkable confent with the whole fystem; for a stool will induce fyncope, or even death, in a state of great debility. Clyfters may be pernicious, even though they produce no evacuation of feces; and Sydenham has remarked, with refpect to other difeases, that their unseasonable or too frequent use greatly debilitates

Ii 3

and

and diffurbs the patient. When not abused, however, they are of the most eminent fervice in this and other complaints.

Certain medicines, which have been called Sheathing, have been recommended to be taken by the mouth. Of this kind are mucilage, oil, and wax. I have made trial of mucilage, fuch as flarch, without any fenfible effect, probably because it loses its qualities by the powers of digeftion before it reaches the part upon which it is intended to act. With regard to oil, I have hardly enough of experience of my own to decide; but fome of the furgeons of the fleet informed me that they found advantage from combining it with the purgatives. I was discouraged from using it by finding that it was apt, in the Weft Indies, to become rancid on the ftomach, and, for this reason, I feldom, in any cafe, employed the caftor oil, which, though produced in that climate, seems to answer better as a medicine in Europe. But fince my return to England I have used, with great benefit, at St. Thomas's hospital, a medicine, composed of tincture

tincture of rhubarb and oil, in old dyfenteries, attended with discharges of blood. I took the hint of this from finding it of great fervice in deep-feated piles, as recommended by Dr. Griffith *. It is neceffary to combine fomething purgative with the oil, otherwife it might be altered by digeftion, or abforbed, or might become rancid by too long retention in the first passages. Wax is a body not changeable by digeftion, and feems therefore well fuited for the purpofe of fheathing the bowels; and I have found advantage from the preparation of it recommended by Sir John Pringle +, on the authority of Dr. Huck. I have alfo feen fome advantage in old fluxes, in St.

* In Dr. Griffith's form of his medicine for the piles, fix drachms of frefh-drawn linfeed oil are joined with two drachms and a half of the vinous tincture of rhubarb, and given twice a day in a draught. I commonly ufed oil of almonds at the hofpital. This may be confidered as another inflance of those useful combinations of medicines, which experience alone fometimes difcovers. I have found it of use also in other internal hamorrhages.

+ See Difeases of the Army, p. 273. 6th Edit.

Ii4

Thomas's

488 OBSERVATIONS ON FLUXES. PART III.

Thomas's hofpital, from the use of spermaceti, given with an equal quantity of conferve of roses and half as much absorbent powder, agreeably to a form in use at that hospital.

The climate has a great influence in preventing thefe ulcers from healing, upon the fame principle that it prevents the cure of external fores and wounds, fo that there are cafes that admit of no cure but from a change of climate. I have feen in fome cafes of old dyfentery, fmall, round, illconditioned ulcers break out on the furface of the body, which feemed to proceed from the fame general habit that produced those of the inteffines. There was fomething peculiar in the appearance of those external fores, being like fmall round pits, as if a part of the fkin had been removed by cauftic, and with little or no difcharge. In a cafe of this kind, which proved fatal, I found the whole furface of the great inteftines befet with fmall ulcers, not unlike those on the fkin.

Since

CHAP. II. OBSERVATIONS ON FLUXES.

Since the first edition of this work was published, I have met with a pamphlet, written by Dr. Houlston, of Liverpool, in which the friction of mercurial ointment on the abdomen is recommended as a cure for old fluxes; and I have tried this practice in fome very obstinate cases in St. Thomas's hospital with evident fuccess. In these cases it is probable the disease is kept up by a vitiated state of some of the various secretions belonging to the intestinal canal, which the mercurial alterative tends to correct.

The next caufe that was mentioned of the long continuation of fluxes, was a lienteric ftate of the bowels. This confifts in a great irritability of the whole alimentary canal, whereby all the *ingefta* are transmitted fo faft, that there is no time for affimilation. Liquid aliment, such as broth, is particularly subject to this inconvenience. There are few cafes of long-protracted fluxes in the West Indies, without this symptom in fome degree.

490 OBSERVATIONS ON FLUXES. PART III.

The remedies that are here found of most fervice are fuch as counteract irritability or relaxation. It is in cafes where this is the prevalent fymptom that opium may be most freely used. Frequent and fmall doses of the compound officinals, fuch as theriaca, pulvis e bolo compositus, or diascordium, have been found of fervice. Though the relaxation would feem here to indicate the Peruvian bark, yet I have hardly ever known it employed in any form in this or any other stage of the difease, without being hutful. But there are other bitters not only fafe but useful in reftoring the tone of the bowels; of this kind are fimaruba, quaffia, and chamomile flowers. The first has been reckoned a specific in this fort of flux; but though its powers are undeniable, it will be found frequently to fail*. I have also used, with advantage, a tincture of gentian and cinnamon in Port wine. Something aromatic

* Since coming to England, I have been informed by Dr. Garden, a learned and ingenious practitioner from South Carolina, that this medicine, in order to produce its proper effect, should be given in a very weak decoction;

CMAP. II. OBSERVATIONS ON FLUXES.

matic has a good effect when added to the bitter, being adapted to prevent or obviate flatulence, which is a common and troublefome fymptom in this complaint.

That clafs of remedies which may be called pure aftringents, might feem at firft fight well calculated for cafes of this kind. Of this fort are the *terra Japonica* and *extractum campechenfe*; but though I have feen evident benefit from this laft, there are few cafes in which fuch medicines are found by experience to be of material fervice. Where the caufe confifts in fimple relaxation, they will effect a cure; but it more frequently happens that the difeafe is kept up by a vitiated flate of the fecretions, or a depraved action of the bowels.

The abforbent earths are a more ufeful

tion; for that after having almost abandoned it in confequence of its failure when he gave it in strong decoctions, and in substance, he was again convinced of its efficacy by using it in a very weak decoction, a scruple being boiled in a pint of water to half a pint.

remedy

492 OBSERVATIONS ON FLUXER

PART III.

remedy in this form of the difeafe. They have, perhaps, a reftringent effect independent of their power of absorbing acid. It is certain, however, that great part of their use confists in the destruction of acid, which is very apt to be generated in that depraved state of digestion which takes place in advanced fluxes, particularly in this lienteric ftate of the bowels. In the early and acute state the vegetable purgatives, fuch as cream of tartar, tamarinds, and manna, are proper; but in this advanced stage they are hurtful by the acidity and flatulence which they produce, and both the food and medicines thould be fo calculated as to avert and correct those inconveniencies. There is fomething in vegetable acids extremely unfriendly to a weak state of the bowels in general, tending to bring on fpafmodic gripings, and preventing a healthy digeftion and affimilation, as we know in the cafe of heartburn, and of those who make use of vinegar to check corpulency, by preventing the formation of blood. Vegetable acids, however, are admissible where there is a redundancy of bile, or where the excrements are putrid ;

CHAP. II. OBSERVATIONS ON FLUXES.

putrid; and Dr. Zimmerman recommends tamarinds as a useful medicine in what he calls the putrid dyfentery.

493

Lime water has been recommended in old flaxes, and I tried it in feveral cafes; but, except in one, I could not perceive any benefit from it.

Abforbents may very properly be combined in prefcription with fome of the compound-officinal opiates, and a medicine will thereby be formed, which will have at once the advantage of an anodyne, a bitter, an aftringent, a carminative, and abforbent. As these earths have little or no taste, they may also be added, with propriety, to the common drink, as in the form of the chalk julep, or decoctum album. It may be thought that here and elfewhere I have not been fo particular as I ought to be concerning the forms and dofes of medicines; but circumstances, fuch as age, constitution, and fymptoms, make these, in a great measure, difcretionary; and any one who is fufficiently conversant with physic to be entrusted with the

OBSERVATIONS ON FLUXES. PART III.

494

the charge of the fick, will have fufficient judgement to vary his practice accordingly. It has, therefore been my object rather to give the general principles of treatment than the particular forms of medicines.

A proper regulation of diet, as well as medicine, is of the utmost confequence in this difease. A free indulgence of animal food is pernicious, particularly in the first stage of it. In the chronic state, a moderate use of it is allowable, and in the lienteric state it anfwers better in a folid form than that of broth, which is apt to gripe and to run quickly through the bowels. The best general articles of diet are farinaceous bodies; and thefe are greatly improved by being toasted brown before they are used. It was observed, in a former part of this work, that the flux was fuppofed to have been prevented, in the fleet commanded by Sir Charles Saunders, by throwing burnt bifcuit into the water used by the crews of the ships. It is a good practice to put a well-burnt toast into all that the patient drinks, and toasted bread, or panada made of toasted bread

CHAP. II. OBSERVATIONS ON FLUXES.

bread or bifcuit, is one of the beft articles of diet. Brackifh water ought to be avoided, as it ruffles the bowels when in fo delicate a ftate. Fermented liquors are improper, except when the difeafe is advanced, and where weaknefs and relaxation are the prevailing fymptoms. Malt liquor will hardly ever agree, on account of its acidity and flatulence. Of wines, Port is to be preferred as the moft ftrengthening; Madeira as the leaft fubject to acidity : and, for the common men, no drink of the fermented kind is fafer than a moderate quantity of fpirits diluted with water.

Warm clothing is of the utmost confequence in this difease, and external warmth of the abdomen tends greatly to sooth the bowels. I have seen good effects from a warm gum plaster constantly worn on that part. Though cold is in general hurtful and unfase, I have nevertheless known the failors, who, by their habits of life, are commonly heedless, bathe in the sea when labouring under what they call the white flux, without any bad effects.

OBSERVATIONS ON FLUXES. PART III.

It fometimes happens that this difeafe baffles every effort both of medicine and diet, fo that a change of climate becomes the only refource.

The laft caufe of habitual flux that was mentioned was the retention of fcybala, which keep up the irritation and tenefmus. It is very natural to neglect purgative medicines when there feems already to be too great a discharge by the bowels; but there is this inconvenience from omitting them for a length of time, that those hard lumps of feces, called scybala, are apt to collect in the cæcum and cells of the colon, as I have feen upon infpecting the dead bodies; and the fibres of the inteftines being weakened, their natural ftrength is not fufficient to expel them without being ftimulated by a purgative. It is therefore necessary to give fome evacuant medicine from time to time, even though there fhould be no griping nor any marks of acrimony in the inteftines. Rhubarb is allowed to be one of the best medicines for this purpofe; and I have alfo known a combination of falts and fena have a good

CHAP. II. OBSERVATIONS ON FLUXES.

a good effect after a long neglect of purgative medicines. It is probable, from the durable effects produced, that thefe do not operate merely by the expulsion of *fcybala*; and we can conceive that they may be of fervice by the removal of certain depraved fluid fecretions, or that they may flimulate the veffels to a more healthy action and a more natural fecretion. Be this as it will, experience teaches that in all fluxes it is of advantage to interpofe from time to time fome purgative medicine.

From the preceding view of the variety of caufes which tend to keep up this difeafe, it will appear that great judgement and diferimination are neceffary in varying the practice according to circumftances; and there is no difeafe in which there is room for more attention and nicety in adapting the different remedies to the different fymptoms. We can hereby alfo account for the various characters that different remedies have had, fome having been extolled by one practitioner while they have been pronounced infignificant by another; for no one remedy will K k

OBSERVATIONS ON FLUXES. PART MIT.

fuit all the various cafes of this difeafe. As it is of the greateft confequence to diffinguifh thefe cafes, I have been more particular and diffufe on this article than any other; and having laboured under this complaint myfelf, I was naturally led to take a greater intereft in its treatment, and had alfo thereby a better opportunity of making obfervations on it.

CHAP.

CHAP. III.

Of the SCURVY.

A SHALL not be fo minute either in the défcription or treatment of the fcurvy, as of the preceding difeafes. A detail of this kind would lead to unneceffary prolixity and repetition; for the prevention and cure of it confifting in diet rather than medicine, have been fully handled in the former parts of this work; and the fubject, in the defcriptive as well as the practical part, has, in a manner, been exhausted by Dr. Lind. With regard to the theoretical part, I refer the reader to the ingenious treatife lately published by Dr. Milman.

It has appeared that the principal fource of fcurvy is a vitiated or fcanty diet, and that it is very much promoted by cold, moifture, filth, floth, and dejection of mind. Hard labour has been affigned by fome as a caufe; but this is not conformable to my K k 2 obfer-

500 OBSERVATIONS, ON THE SCURVY. PARTIES.

obfervation in general, and what has been related to have happened in the Conqueror*, more particularly led me to be of a contrary opinion.

The principal differences of the fymptoms of the feurvy in hot and cold climates, fo far as I have obferved, are, that in the former the livid hardnefs on the extremities is an earlier fymptom, and in the latter the gums are fooner affected, and the difficulty of breathing is a more frequent and more uneafy fymptom. This difficulty of breathing is one of the moft fatal fymptoms, and is moft frequent in those cases in which there are the fewest external marks of the difease, and is probably that form of the complaint which attacks a vital part by a fort of translation form the extremities.

* See page 345. A fact mentioned in Capt. Cooke's Voyage to the North Pacific Ocean, may be alfo alledged in favour of this opinion. He remarks, that the Kamfchadales, who were habituated to hard labour, were free from feurvy, while the Ruffians and Coffacks, who were in garrifon in their country, and led indolent lives, were fubject to it.

There

- John L

There is a remarkable fymptom fometimes attendant on this difeafe which has efcaped authors, and is mentioned in Mr. Telford's Report, page 23. This is the *nyEtalopia*, or weaknefs of the eye-fight, which was alfo common in the garrifon of Gibraltar *, among those who were affected with the fcurvy, a difeafe that prevailed much during the late fiege of that place.

With regard to the cure, enough has been faid in the preceding parts of this work to prove that frefh vegetables are the most effectual antifcorbutics. I shall here mention a fact farther in proof of this, which has not before been taken notice of. When the fleet arrived at Barbadoes in May, 1781, part of the foldiers, who ferved as marines, were affected with the fcurvy, and being fent to the army hospital, where, at that time, no fresh animal food was allowed, they recovered much faster by being confined to ve-

* I was informed of this fact by Mr. Cairnerofs, an ingenious furgeon belonging to one of the battalions that ferved there during the fiege.

Kk 3

getable

302 OBSERVATIONS ON THE SCURVY. PART III.

getable articles, than the feamen who were fed upon fresh animal food without any fresh vegetables.

It has farther appeared, that there is something in a particular clafs of fruit of the lemon and orange kind, which far furpaffes every other remedy, whether dietetic or medicinal. Numberless instances have occurred, in the preceding part of this work, of men having recovered at fea from using the juice of this fruit alone, even under all the inconveniences of a fea diet. When the juice is intended to be kept for a length of time, it should be expressed and bottled, a fmall quantity of fpirits being added to preferve it; for if fire is used in preparing it, as in the form of a rob, I know for certain that its virtues will be thereby very much impaired. It is very difficult to fay upon what principle these fruits act, for no fenfible effects are produced by them except a small increase of some of the fecretions.

It ought to be mentioned here as a fact of great confequence, though very little known, 1 and

and never, I believe, published before, that the juice of limes and lemons is the beft detergent of any external application that has yet been tried in fcorbutic ulcers. Nothing was found fo effectual in preventing thefe from fpreading, and in difpofing them to heal, as an emollient poultice with # lemon or lime juice sprinkled on its surface; or it was applied by foaking in it the lint with which the fore was dreffed, and alfo as a lotion, in which cafe it was used diluted with two or three times its quantity of water; for if used pure, it was found too irritating, and was apt to bring on a fungous disposition. This precaution is particularly neceffary with regard to limes, the juice of which is a much more concentrated acid than that of lemons. Mr. Lucas, furgeon of the Conqueror, favoured me with feveral valuable remarks in proof of this practice. A poultice was always found a good applica-

* I imagined that this was a new practice; but I find, fince the first edition of this work was printed, that it has been recommended by Pere Labat in his voyage to the Antilles.

tion

504 OBSERVATIONS ON THE SCURVY. FART 111.

tion in thefe cafes, by its power of abforbing the acrimonious difcharge, which would otherwife irritate the neighbouring parts. I have been informed by a navy furgeon, who ferved in the former war, that he has known the most obstinate ulcers cured by applying a passe of oatmeal and water, the furface of which was sprinkled with Goulard's preparation of lead.

The fleet was furnished with effence of malt; but its powers were fo inconfiderable, that fome of the furgeons denied that it had any. In trials, however, that were made in an early state of the disease, it was found to have a fenfible effect in checking and removing it. It was also found of evident use in the bad ulcers fo apt to arife in fcorbutic habits, and in this intention was fuperior to the Peruvian bark as an internal alterative. Indeed, in those ulcers that were truly fcorbutic, the bark was found to be of very little use; and, next to what has been already mentioned, joined to the advantages of diet, opium was found of the greatest fervice in difpofing

difpofing these, as well as all other ill-conditioned fores of hot climates, to heal.

I have mentioned the fcorbutic habit as diffinguished from the fcurvy, but there feems to be no difference except in degree; for a perfon may be faid to labour under the difeafe before it betrays itfelf by any obvious fymptom, and it must have gathered a certain degree of force before visible symptoms are produced. The chief mark of this latent and incipient flage of the difeafe is that incurable state of ulcers that has been mentioned, whether they appear fpontaneoully or in confequence of flight accidents. There is another mark of this fcorbutic habit which is not mentioned in any defcription of the disease I have ever seen. It is a fost, indolent tumour which arifes under the fkin on a part which has received a fmall blow, or contufion, fo flight as not to break the fkin. It most commonly appears about the elbow or fore-arm, and generally difappears without any inconvenience, what it contains being abforbed. A fungeon, who opened one of them, (a practice, however, not to be approved

506 OBSERVATIONS ON THE SCURVY. PART III.

approved of) informed me that it confifted of fluid blood. We may alfo reckon a languor, or fenfe of weight, as one of those marks of fcurvy which occur before the more obvious fymptoms appear.

In this state of the difease, the articles of lesser powers, such as malt and melasses, may be of service by preventing its farther progress, or the appearance of actual symptoms, and by restoring the constitution.

In fome of the early ftages of this difeafe the effervescing mixture of acids with fixed alkali may probably also be of use. I never could perceive any fensible benefit in those cafes in which I tried it, though fome of the gentlemen of the fleet reported to me that they thought it of fervice.

There is no article of the Materia Medica yet known that poffeffes any confiderable power over this difeafe without the affiftance of proper diet. With this affiftance, however, it is found, that whatever tends to increafe the fluid fecretions, haftens very much the

the recovery of the fcorbutic patient. I have observed a very striking instance of this in the effects of a fpontaneous diarrhœa; for I have feen those hard livid fwellings on the legs, that form one of the most conftant fymptoms of this difeafe, almost difappear, and the hams, from being contracted, become flexible in the courfe of twelve hours after the purging came on. I have endeavoured to imitate this with purgatives, but never with the fame effects as the natural loofenefs. A free flow of urine is alfo found to promote the recovery, and vinegar of fquills is one of the most effectual medicines in this intention. It is likewife of fingular fervice to excite fweat; for an obftruction of perspiration feems to be one of the principal conftituents of the difeafe. The goofe fkin, which is an early and conftant fymptom of this difease, seems to be owing to a confriction of the exhaling veffels. Dover's powder has been employed with advantage as a fudorific, with decoction of the woods drank warm, and plentiful warm dilution. Camphor, combined with nitre, has

508 OBSERVATIONS ON THE SCURVY. PART III. has been found one of the best remedies, and it acts both as a diaphoretic and diuretic.

Such external applications as relax the fkin are found alfo to forward the cure. The contraction of the hams and the livid hardnefs of the calves of the legs are relieved by emollient cataplaims. Burying the legs in the earth, which has a fenfible good effect, feems to act on the fame principle, for it makes the parts fweat profusely.

There can be no doubt that in the fcurvy there takes place in certain parts of the body a ftagnation of the humours in the fmall veffels, particularly of the lower extremities, and that it is to this circumftance that the livid hardnefs of the flefhy parts of the legs is owing. The effect of medicine in removing this, must be to reftore the action of those torpid veffels, fo as to bring the ftagnated fluids again into circulation **. Purgatives

* There is a fymptom which takes place when men are beginning to recover from feurvy, (particularly when the cure is rapidly effected by the use of lemon and orange

Purgatives feem to act upon it as they do in the dropfy, by exciting abforption. The irritation of the bowels and their increafed fecretion thus affecting the minute veffels in all parts of the body, is the refult of that fympathy or balance eftablished between every part of the fystem, in order to support the harmony and effect the purposes of the animal economy.

It has long appeared to me, that the fcurvy is owing rather to a defect of nourifhment than to a vitiated flate of it. In fact, that fort of food which is fuppofed most commonly to induce the fcurvy, is, in most cafes, not putrid, but is in an unnatural and depraved flate by being drained of its juices, which run off in brine; and perhaps fome

orange juice) upon which I have frequently reflected, but for which I have never been able to account. This confifts in acute pains, which are felt in the breaft and limbs, refembling rheumatic pains. I once knew the crew of a fhip which was much affected with feury, and had about ninety men under cure by lemons and oranges, who were most of them affected with this fymptom in one night, and made fuch a noife by crying out as to alarm the officers who were upon duty.

10 OBSERVATIONS ON THE SCURVY. FART III;

of the more fubtile and nutritious parts are wafted by evaporation. It is not found that falt of itfelf has any effect in inducing the fcurvy, and indeed it can be induced under a state of diet in which there is no falt, as we know from fome inftances quoted by Dr. Lind; and fome cafes are related by Dr. Monro and Dr. Milman, in the Medical Transactions, which are in proof of the same opinion. But the cafe most in point to prove that it depends on a defect of aliment, is that of Dr. Stark, who, by way of experiment on himfelf, reduced his diet to the leaft quantity he could fubfift upon, and was thereupon affected with the fymptoms of the fea fcurvy. I have also known some symptoms of it arife in old people in confequence of long abstinence, owing to the want of appetite.

It would appear that the aliment we take in acts in two ways in increasing the vigour of the body. First, by affimilation, whereby it affords the matter of which the folids of the body are made, in order to carry on growth in youth; and to repair the waste of parts

parts in adult age. A very fmall quantity of matter is neceffary for these purposes; and as a proof of it, we fee people supported equally well with very different quantities and qualities of food. Secondly, Food is neceffary as a ftimulus, either by a power it has of foothing the nerves of the ftomach, and the other furfaces to which it is applied, or by its volume in diffending the inteffines and blood veffels. It is upon this principle that luxury renders the great quantities of food we take in neceffary ; and those species of food which fatisfy most by their stimulus are by no means fuch as are the most nutritious. It is also upon this principle, that in cafes of accidental hardship from want of food, or in barren and inclement countries where food is fcarce, the body is fupported, in fome measure, by what contains little 'or no nutritious matter, fuch as pure water, or the bark of trees powdered and kneaded into a fort of bread, as we are told of the inhabitants of Lapland.

There are other familiar and well-established facts, which prove, that either from the

512 OBSERVATIONS ON THE SCURVY. PART III.

the influence of difease, from habits of life, or the nature of particular animals, life can go on for a length of time with little or no aliment. This is the cafe in fevers, in feaficknefs, in certain fingular cafes that have been recorded *, in torpid animals, and in animals of cold blood. Though a man in health will die if deprived of food for a very few days, it does not follow that this is owing to the want of matter to repair the wafte of the body. The craving for food, and the faintness from long abstinence, arife from the want of the accustomed stimulus, efpecially in those who are used to live well; and a perfon feels himfelf most refreshed by food and drink when newly taken in, and before it can be applied to the purpose of nutrition.

As there is a continual wafte and decay, however, both of our fluids and folids, fome degree of reparation is abfolutely neceffary, efpecially to animals of warm blood; and

* See the Medical Effays of Edinburgh. Sennertus, lib. iii. part i. fect. ii. — Haller Elem. Physiolog. lib. xix. fect. ii. fuch

fuch *ingefta* as would give the ftimulus of food, without being poffeffed of any nutritious principle, would indeed continue life for a certain time; but difeafe would enfue. The provision used at fea answers, in a great measure, to this description; for unless the powers of digestion and assimilation are remarkably strong, falt beef and bifcuit, which have been long kept, do not contain much more nourishment than faw-dust, or the bark of a tree, and the difease induced by this diet is the fcurvy.

The nature and fymptoms of the fcurvy countenance this opinion : for as the means of renewing the animal matter of our bodies is withdrawn under this courfe of diet, nature, in confequence of an accommodating principle, obferves a fort of frugality, and the animal œconomy adopts fuch meafures as may be productive of the leaft poffible wafte and corruption of the fluids. Accordingly all the fecretions become fcanty ; and, in particular, one of the first fymptoms of this difeafe is a fupprefion of perfpiration, as appears by the goofe-fkin that attends it.

514 OBSERVATIONS ON THE SCURVY. PART III.

There is a paucity of urine. There is alfo a great languor in the circulation, which may be confidered either as a means adopted by nature to prevent that vitiated and effete ftate of the fluids which a brifker action might induce; or it may happen from a want of that due fupply of nourifhment neceffary to produce a vigorous action of all the functions.

We have a proof of this general languor not only from the great aversion to motion, and the great difposition to fyncope, but from the infpection of the dead body, from which it appears that the whole circulating fystem, being more flaccid and lefs elastic, is fubject to preternatural diffention. The heart is accordingly found enlarged in bulk, the fize of the cavities being increased; and in the extremities, where the circulation is naturally most languid, the fmall veffels carrying the colourless part of the blood, are fo far enlarged as to admit the red part of it, as appears by the livid colour; and where this is the cafe, thefe veffels being unable to carry on the circulation, a stagnation enfues, 25

as is evident in those livid appearances most common about the calves of the leg, which feel like a hard cake. I have examined those parts in the dead fubject, and found a want of fluidity in the contents of the veffels, but could not difcover any thing like *eechymofis*; from which I concluded that the colour was owing to an *error loci*, and the hardness to stagnation and coagulation of the fluids, and a want of action of the veffels.

The incurable flate of ulcers, fo common in this difeafe, is alfo what we might expect from the defect of frefh affimilated juices; for where a breach is made, either by nature or accident, in the folids, particularly of the extremities, the proper fuppuration is prevented by the depraved flate both of the fluids and veffels; and we cannot expect that renewal of folid parts in which healing confifts, where both the inflruments and materials of its formation are fo defective.

LIZ

I fhall

516 OBSERVATIONS ON THE SCURVY. PART III.

I shall conclude what I have to fay on this fubject, by shortly confidering whether or not this difease is ever contagious.

There is fomething in the nature and hiftory of the fcurvy that would lead us at once to pronounce that it is not infectious; for the external caufes on which it depends are fo obvious, and feem fo adequate to account for its appearance and prevalence upon certain occafions, as at first fight to exclude every other external caufe.

But it feems extremely unphilofophical to deny the reality or poffibility of any thing in Nature, from our fuppofed knowledge of the means and caufes fhe employs, particularly in a branch of fcience fo obfcure as the animal œconomy. Could we, therefore, prove the point as a matter of fact, it would be in vain to deny it, from our fancied acquaintance with Nature's modes of operation.

The facts which give a fufpicion of the fourvy being infectious are, 1st, What is related

related by Dr. Lind, that the fea fcurvy fpread at one time from the naval hofpital to the people of the adjacent country. 2dly, There occurred feveral inftances, in the first part of this work, of this difeafe prevailing to a much, greater degree in fome * particular fhips than others, though upon the most accurate inquiry there was found no difference in the diet, or any other external or predifpofing caufe adequate to account for this. We can conceive, that those ships having accidentally a few men, whole constitutions were remarkably predifposed to this difease, might catch it earlier than in other fhips, and communicate it to the reft of the crew.

The only practical inference that would lie from the eftablifhment of this fact would be, that when the difease begins first to appear, the men affected should be separated from the rest; and this is a good practice, whether this opinion is true or not; for such men

* In the Princessa, 1781, and the Nonfuch, Prince George, and Royal Oak, in 1782.

518 OBSERVATIONS ON THE SCURVY. PART III.

ought to be put in one mefs, in order that they all may live upon the fame antifcorbutic articles of diet, and that they may more eafily be debarred from the ufe of their common provisions, of which this difeafe does not make them lofe the relift.

CHAP. IV.

Of the WOUNDS received in the Actions of April, 1782.

Lofs in the Battle and from Wounds — Fatality of the locked Jaw — Treatment of it — Some Ships more fubject to it than others — Different from other Cafes of Tetanus — It is not cured by the Removal of the Part — It may come on after the Part is cured — Effect of Climate in producing it — Accidents from the Wind of a Ball — Accidents from the Explosion of Gunpowder — Means of preventing them — General Obfervations on Sores and Wounds.

THOUGH furgery was not properly in my department, yet, having had a fair opportunity of collecting facts concerning this branch of practice, I thought it my duty to pay fome attention to it.

The whole number of men wounded in the actions of April, 1782, amounted to eight hundred and ten,

520 OBSERVATIONS ON WOUNDS. I

PART III.

Of thefe, fixty died on board before the end of the month, five in the courfe of the following month, and two in June.

There were ninety-feven wounded men fent to the hofpital at Port Royal, of whom there had died twenty-one when the fleet left Jamaica on the 17th of July.

So that the whole lofs of men in the battles of April, and their confequences, is as follows:

Killed o	utright		-	-	-	-	-	266
Died of	their w	vounds	on	boa	urd	-	-	. 67
Died of	their w	vounds	at 1	the	hof	pita	1	21

Total 354

Of those who died on board, fifteen * were carried off with the fymptoms of the locked jaw;

* Since this was first written, the melancholy tidings have arrived of another cafe to be added to this fatal list. It is that of the amiable and gallant Lord Robert Manners, who commanded the Resolution on the 12th of April,

CHAP. IV. OBSERVATIONS ON WOUNDS. 521

jaw; but of those fent to the hospital, only one. The reason that so few in proportion were affected with it in the hospital may have been, that none of the wounded were landed till near the end of the third week after the principal action. The danger of this symptom was then, in a great measure, past, though I have known it to take place in every period from the second or third day till the sourth week.

Only three men in the whole fleet recovered from this alarming complaint; and as it is interefting to know every thing relating to fo defperate a fymptom, I fhall give a fhort account of each.

The first was a seaman of the Montagu,

April, and having loft his leg, befides receiving a wound in his arm and breaft, died of this untractable fymptom on his paffage to England; and though he fhared a fate to be envied by every lover of true glory, his lofs can never be enough deplored by his country and friends, being formed by his great virtues and accomplifhments, joined to the luftre of his rank, to hold out an example of all that was good and great as a man and an officer.

OBSERVATIONS ON WOUNDS.

PART III.

who had his thigh wounded by a fplinter which carried away part of the integuments and membrana adipofa, and lacerated in a fmall degree the vastus externus muscle. The wound did extremely well till the 23d day, when the jaw became almost entirely fixed, and the whole mufcles of the wounded fide were thrown into frequent spafms. Mr. Young, the furgeon, who was always anxious and affiduous in his duty, confulted with me, and we had immediate recourfe to the warm bath, which gave a degree of inftantaneous relief, and was repeated twice a day for half an hour. He was fenfibly better every time; in nine days was entirely free of the fymptom, and continued afterwards to do well. The only other means taken for this man's recovery, befides what were used with the other wounded men, were from three to five grains of opium, which he took every day, in divided doses.

The next was a feaman of thirty years of age, belonging to the Magnificent, who had the *humerus* broken and fhattered by a fplinter which entered the deltoid muscle. Seyeral

CHAP. IV. OBSERVATIONS ON WOUNDS.

veral large portions of bone were extracted, and the artery was laid bare on the infide. On the fifth day there came on a large ichorous discharge, with a low quick pulse and depreffed spirits, and the jaws began to close, with pain and stricture on both fides about the articulation of the lower jaw. He had every day fince the accident taken half an ounce of Peruvian bark, combined with opium or rhubarb, according as it made him loofe or coffive. This was continued, and the part externally was kept confantly moift all round with volatile liniment, to which a fourth part of tinetura thebaica was added. Next day the jaw was almost entirely fixed, fo that it was with difficulty that a little wine and water could be introduced with a fpoon. Mr. Harris, the furgeon, now wifely determining to do fomething vigorous in this unpromifing fituation, beat up twelve ounces of opium moistened to the confiftence of a cataplasm with the thebaic tincture, and applied one half to each fide of the jaw. The patient this day fwallowed a pint of the bark decoction with half an ounce of nitre, and took a diaphoretic draught

draught of twenty drops of thebaic tincture and thirty of antimonial wine. He had also the fmoke of tobacco thrown up his noftrils.

On the third day after the attack he could open his mouth half an inch. The cataplafins were taken off, beat up afrefh with the tincture, and applied anew. The bark and other medicines were continued. On the fourth day the ftricture and pain of the jaw went entirely off, but the cataplafm and volatile liniment were applied for three days longer. The wound produced a laudable ditcharge, every fymptom became favourable, and he continued to recover.

The only other perfon who recovered from this fymptom was a man in the Bedford. Several died of it on board of this fhip; and as the fame means of relief were fkilfully employed in all the cafes by Mr. Wickes, the furgeon, the fuccefs feemed owing more to fomething favourable in the man's conflitution, than any thing peculiar in the treatment, which confifted in the administration of

of the warm bath, opium and camphor, with mercurial friction on the jaw.

This accident affected fome fhips remarkably more than others, particularly the Barfleur and Bedford, though their wounds had nothing peculiar, nor were in a greater proportion than in the reft of the fleet. Four were carried off by it in each of these ships. It has formerly been observed, that great fhips acquire peculiar habits, or difpolitions, which incline the conflictutions of the men to one difease more than another. This complaint took a run in fome particular ships last year alfo after the battle of the Chefapeak ; and I have known it prevail in fome particular hospitals more than others. In the present instance, it may have been owing either to fomething peculiar in the conftitution, or air of the fhips; or we can conceive it to be owing to fome fort of nervous fympathy, just as the epilepsy * has been known to fpread from one boy to another, at

* See Kaau Boerhaave's account of this epilepfy in a fchool at Harlaem, in a book, entitled Impetum faciens dictum

526 OBSERVATIONS ON WOUNDS.

at a fchool, in confequence of imitation, dread, horror, or fome fuch delicate nervous or mental affection. We have in yawning an example of a fpafmodic affection fpreading from one perfon to another. If this is the cafe in the locked jaw, those affected by it fhould be removed from the prefence of the other wounded men, left the idea of the fufferings of others fhould be fo fixed in their mind, or fo imprefs them with the fear of the like, as to invite the attack of the fame complaint.

Though the locked jaw, in confequence of wounds, refembles frequently in its fymptoms the tetanus which arifes without any external accident, yet there are many cafes of the former which differ materially from the violent fymptoms of the other, as defcribed by authors. In most cafes of the locked jaw from wounds the spafms are not

dictum Hippocrate per corpus confentiens (page 355.) A fact of the fame kind is alfo related in a pamphlet, entitled Rapport des Commiffaires chargés par le Roi de l'examen du Magnetifme Animal.

10

PART III.

fo general, fo violent, nor attended with fuch exquisite pain. It fometimes happens that the convultive twitchings are even accompanied with a fort of pleafure, as in the cafe of a lieutenant of the Montagu, whofe cafe was related to me by Mr. Young, the furgeon of that ship, a man of skill and obfervation in his profession, and upon whose fidelity and accuracy I could perfectly rely. This officer had been wounded in the elbow at the battle of St. Christopher's by a splinter, whereby the capfular ligament of the joint was injured. On the ninth day, fymptoms of the locked jaw came on, and foon after the whole muscles of the wounded fide were affected with frequent convultive twitchings, which, as he himfelf faid, afforded a pleafant fenfation, exciting laughing like an agreeable titillation. He died on the fourth day after it came on, and had no pain to the laft.

The locked jaw from accident differs alfo from other cafes of tetanus, in refpect to its cure; for the latter has been fuccefsfully treated by cold bathing, as is related by Dr.

Dr. Wright * and Dr. Cochrane +; but it is acknowledged by the latter that this treatment did not anfwer when the complaint proceeded from a wound.

It is to be remarked, that the locked jaw did not take place in those cases in which the wounds had a foul and gangrenous appearance more than others; for those that digested and cicatrized favourably, were equally apt to be affected by it; and though amputations are most liable to this symptom, the slightest injuries, even a scratch, will sometimes bring it on.

It would be difficult, therefore, to effablifh any particular treatment that would tend to prevent accidents of this kind; but Mr. Baffan, furgeon of the Arrogant, one of the line-of-battle ships engaged on the 12th of April, mixed laudanum with the dreffings of all the wounds, and no locked jaw occurred.

* London Medical Obfervations and Inquiries, Vol.VI. Medical Commentaries, Vol. III., and a Thefis printed at Edinburgh, 1784.

In the Bedford there occurred a curious circumftance concerning this complaint. In one of the cafes that proved fatal, the fymptoms did not come on till the wound was fo far healed that all dreffing had been laid afide.

529

Mr. Wood, furgeon of the hofpital at Jamaica, informed me, that in cafes of the locked jaw from injuries to fmall members, fuch as fingers, he had tried the effect of amputating the part after the fymptoms had come on, but without any effect in putting a ftop to them.

Would it not appear, from the two laftmentioned facts, that this fymptom is not kept up, nor even takes place in the first instance, from an immediate prefent irritation, but that the constitution comes to be fo modified, or receives fuch an impulse, as it were, that the complaint runs its course independent of the prefence of that *simulus* which excites it ?

It would be difficult to affign a fatisfactory reafon why this accident is more frequent in hot than in cold climates. The effect of M m external

external heat upon the living body is not to raise its temperature even when the heat of the air exceeds that of the body *; fo that we are to feek for the effects of it in fome of those affections peculiar to animal life. And as the outward temperature of the air does not affect the general mafs of the body, all the effects produced by it must depend on impreffions made on the external furface of the body and lungs; and the fkin, which may be confidered as a large expanded tiffue of nervous fibres endowed with univerfal fympathy and great fenfibility, affects every organ and every function of the body, according to the flate of the air in contact with it, whether cold or hot, moift or dry, pure or vitiated. This fympathetic fenfibility of the fkin is chiefly affected by the flate of the perspiring pores on its surface; for it is only when these are open that the impression of the air on the skin produces catarrhs, rheumatifms, and internal inflammations in cold climates; and the external temperature in hot climates being fuch as to keep the

* See experiments on a heated room. Philosophical Transactions, 1775, Vol. LXV.

pores

pores almost always open, this feems to be a principal reason of that universal irritability prevailing there, and of the general fympathy that prevails between every part, particularly as connected with the organs of perfpiration *. This readiness of one part to be affected by another in hot climates is well illustrated by the fudden translation of certain difeases. I have seen, for instance, a catarrh cease, and be converted, as it were, into a diarrhœa, and this as quickly difappearing, a pain in the soot would arise, like an attack of the gout. All this would happen in the source of a few hours.

But, in cold climates, wounds are by no means exempt from the locked jaw; for it fometimes occurs in England, where I have feen it even in the winter feafon +.

* That species of locked jaw, called by authors the *Trifmus Infantium*, to which children are liable the first week after birth, is probably owing to the contact of the external air upon the skin, which is accustomed in the womb to a moist and warm medium.

* Aretæus Cappadox fays, that tetanus in general is even more apt to occur in winter than in fummer. De Cauf. & Sign. Morb. Acut. lib. i. cap. vi.

Mm 2

Since

Since my return to England I have received fome new and ufeful information on this fubject in converfing with Dr. Warren, phyfician to the King; and as any obfervations derived from fo much acknowledged fkill and fagacity muft be valuable, I fhall here relate what he was fo kind as to communicate to me.

This eminent physician, in attending a cafe in which he was nearly interested, and in which his endeavours were rewarded with fuccefs, found the greatest benefit from opium and the warm bath. The opium was given in the form of tincture, in moderate, but pretty frequent, dofes. The bath was composed of milk and water, and the addition of milk was, no doubt, an improvement; for there is fomething in this as well as oil extremely foothing to the human nerves. Dr. Warren had intended to make trial of a bath of oil in cafe this had failed. He mentioned the following observation, with regard to the external application of oil, which could only have been fuggefted by that anxious attention that was paid to the cafe. It was found, that the uneafinefs arifing

arifing from the fpafm was allayed by conftantly drawing a feather wetted with oil over the temples, which had an evident effect in lulling the pain and fpafm; for when this operation was left off, there was an immediate recurrence of thefe fymptoms *.

It would appear, therefore, from this as well as the former cafes, that opium and the warm bath are the only remedies yet known which are of fervice in this complaint, and much will depend on the judicious management of them. The method of adminiftering the opium, recommended by Dr. Warren, feems to be the most judicious, efpecially in conflictutions not habituated to this medicine.

* There are feveral valuable practical remarks on this complaint in fome of the ancient authors, efpecially Aretæus. Their principal means of cure confifted in the application of warm oil to the whole furface of the body, particularly of the part affected. This author alfo recommends clyfters of warm oil, occafionally combined with a medicine called *biera*, which confifted of certain fpices and gums, with fome purgative, fuch as aloes or colocynth. Aretœus Cappad. de Curat. Morb. Acut. cap. vi. Celfus, lib. iv. cap. iii. Goræus in vocabulum, inpa.

Mm 3

There

There is a certain medium in giving opium, by which its best effects are obtained, for in an under dose it will produce disturbance inftead of reft; and when it is given in large quantities it frequently defeats the very end for which it is given, by throwing the body into convultions which terminate in death. The rule for judging of the proper limits of this dofe is, by its effect in inducing that ftupor or infenfibility which renders the fenses incapable of irritation; for in this, as well as in every other cafe of difeafe, the cure feems ultimately to be the work of nature, the effect of medicine being only a fecondary operation, by which it removes fome obstacle to the natural efforts of the constitution. Though a dose of opium greater than ordinary is required to produce this infenfibility in cafes of spafm, and though the conftitution in that fituation will bear more, yet even here it may be given to excefs; and by beginning with fmall quantities, and giving it in frequent rather than large doses, the constitution will thereby be better reconciled to it, and it will also with more convenience admit of that gradual increafe which is peculiarly neceffary with this medicine.

OBSERVATIONS ON WOUNDS. 535 CHAP. IV.

medicine. These ideas were suggested to me by Dr. Warren; and it may be farther added, in recommendation of his method, that the liquid form is preferable to the folid, as the effects of it will fooner be feen, and a better judgement can be formed how far it is proper to push it.

Great attention is also necessary in regulating the heat of the bath; for if it is not fufficiently warm, it will not have the effect of producing a due relaxation; and if it should be too hot, it will stimulate too much, and will have the farther inconvenience of making the patient very faint in a fhort time. It cannot be well regulated without a thermometer, and 93° upon Fahrenheit's scale is perhaps the best temperature. I have kept a patient in a bath of that heat for fix hours, which he could not have endured for half an hour had the heat been three or four degrees higher

The circumftance next in confequence, in the cure of this complaint, is the keeping up a moisture on the skin, and guarding the furface of the body from the access of the Mm 4 air

air. This is particularly neceffary with regard to the part itfelf, which fhould be conftantly envelopped in warm, anodyne, and emollient applications. The good effects of this is particularly exemplified in the cafe which recovered under the care of Mr. Harris, who gave the diaphoretic medicine, composed of antimonial wine and laudanum, and applied the anodyne cataplasm to the external fauces. It was remarked, that the locked jaw was most incident to those wounded men who lay in parts of the hofpital where they were exposed to a current of air; and the cafes of tetanus that most usually occur in the West Indies, independent of wounds, are those of flaves who fall afleep in the night-time in the open air.

Since the first edition of this work, there has appeared an Effay on the Locked Jaw by Dr. Rush, physician to the American army in the late war, in which he recommends, from his own observation, Peruvian bark, wine, and blisters, and to dress the wounds with mercurial ointment, in the cure of this complaint. From some trials I have fince made of the bark in St. Thomas's hospital,

hofpital, I have reafon to think well of it as a remedy in this difeafe.

There is a fingular fpecies of accident to which engagements at fea are liable, the WIND OF A BALL, as it is called. If a cannon ball in its flight paffes clofe to any part of the body, it renders it livid and numb for fome time *. It is most dangerous when it approaches the ftomach ; and there was an inftance of a man in the last battle, who, upon a ball paffing close to his ftomach, dropped down dead inftantaneously, without the least visible marks of injury. Another, in confequence

* This is a fact which does not admit of doubt; but the manner in which the effect is here produced is a matter of conjecture. It is most probably owing to the compression and tremor of the air in consequence of its resistance to the motion of the ball. We can also conceive, that, with regard to an yielding part, such as the store from a body flying with great velocity may even, for a moment, displace a portion of it by passing through the same space, without any other mechanical injury than contustion, in a manner similar to what happens to two balls in the act of collision in philosophical experiments made to illustrate the nature of elasticity; or the compressed air may even, in this case, act, as it were, like a cushion, preventing the fudden impulse

538

quence of a ball paffing close to his belly, remained without sense or motion for some time, and a large livid tumor arose on the part, but he recovered. I attended a man at the hospital at Barbadoes, who had the buttons of his trowfers carried off by a cannon ball, without its having touched the body. The pubis was livid and fwelled for some time after : he suffered exquisite pain from ftrangury, which feemed to proceed from a paralyfis of the bladder, for he voided no water without a catheter for near three months, after which time he recovered. I know a brave young officer * in the army, who had his epaulette carried off by a cannon ball at Charlestown, in confequence of which the shoulder and adjacent parts of the

impulse and contact of the ball. This explanation furnishes a reason why the parts of the body above mentioned should be more liable to be affected by accidents of this kind than the head. Perhaps this difference may also, in part, arise from the principle laid down by Mr. Hunter, that the stomach is more effential to life, and more immediately the seat of it, than the head or any other member or organ of the body, and that an injury to this part is more immediately destructive of life than any other.

* The honourable Captain Fitzroy.

neck

neck were affected for fome time. A like accident happened to a marine officer in one of the late engagements; but in neither of thefe was the head materially affected, nor is it fo apt to be affected in this way as the ftomach. I never knew death the confequence of the wind of a ball on the head; though an officer ** in the Sultan, at the battle of Grenada, was fo ftunned by a fhot paffing near his temple, as to be infenfible for fome time, but he recovered entirely in a few hours \ddagger .

The class of wounds most peculiar to a fea engagement are forches from the accidental explosion of gunpowder; and in most of the campaigns in which I have ferved they have been very frequent and fatal. Few accidents, however, of this kind happened in the late engagements; fo that we had but little experience of this fort of wounds in April, 1782. But on former occasions they were very frequent, and the best application to the burnt

* Colonel Markham.

* Animals are affected by these accidents as well as men. A cow in one of the ships was killed in one of the actions in April, by a double-headed shot passing close to the small of her back.

parts

539

parts was found to be linfeed oil, which fome of the furgeons mixed with lime water, others with ceruffe, and both compositions answered well. Opium was found of great use in alleviating pain and procuring reft, care being taken to guard against coftiveness by the use of clysters. In the battles of 1780 and 1781, one-fourth part of the whole killed and wounded was from this fort of accident; but on the 9th and 12th of April, 1782, only two accidental explosions of gunpowder happened in the whole fleet, by one of which one life was loft, by the other, two. This difference was owing partly to greater experience and habits of caution acquired in the course of the war, and partly to certain improved methods in working the artillery introduced by Sir Charles Douglas, which, like all his other valuable improvements, tend to give facility and expedition, as well as to fave the lives of men. The circumftances which tend to prevent explosions are, 1st, The wetting of the wads, which prevents their inflaming and blowing back when they fight the weather fide of the ship; a circumstance which, without this precaution, gives occasion to a number

54I

ber of accidents by the burning parts catching the loofe powder, or fetting fire to the cartridges. 2dly, The ufe of goofe-quill tubes and fmall priming boxes, made of tin, inftead of the large horns formerly in ufe, whereby great quantities of powder were fcattered about and exposed to accidental fire. 3dly, The ufe of locks, which was practifed with great fuccess in feveral ships, and was found to make the operation both more fafe and more expeditious.

It frequently happens that men bleed to death before affistance can be procured, or lofe fo much blood as not to be able to go through an operation. In order to prevent this, it has been proposed, and on some occafions practifed, to make each man carry about him a garter, or piece of rope-yarn, in order to bind up a limb in cafe of profuse bleeding. If it should be objected, that this, from its folemnity, may be apt to intimidate common men, officers at least should make ufe of some fuch precaution, especially as many of them, and those of the highest rank, are stationed on the quarter deck, which is one of the most exposed situations, and far removed

removed from the cockpit, where the furgeon and his affiftants are placed. This was the caufe of the death of Captain Bayne, of the Alfred, who, having had his knee fo fhattered with a round fhot, that it was neceffary to amputate the limb, expired under the operation, in confequence of the weaknefs induced by lofs of blood in carrying him fo far. As the Admiral, on these occasions, allowed me the honour of being at his fide, I carried in my pocket feveral tourniquets of a fimple conftruction, in cafe accidents to any perfon on the quarter deck should have required their use.

It fometimes happens, however, that no hæmorrhage arifes from a limb being carried off by a ball. The furgeon of the Fame related to me an inftance of this, in which the thigh was cut through by a flot near its upper part, all except a little flefh and fkin, and yet not the leaft hæmorrhage followed. This may have been owing to the limb being entirely fevered, or nearly fo, whereby the veffels contracted more eafily than if they had been partially divided. All that was done for this man was to remove the limb, and to faw

faw off the jagged end of the bone. He furvived fix days, ftill without bleeding, and died of the locked jaw.

I was informed by feveral of the furgeons, that the method of taking up the veffels by the *tenaculum* was found to anfwer extremely well; and many of them imagined that the locked jaw was not fo apt to be brought on by this mode of operation as by that of the needle. But it is hardly to be attempted in time of action, for want of fteadinefs and a good light, and it was chiefly at the hofpitals that this practice was found fo fuccefsful.

Mr. Alanfon's method of amputation by a great retraction of the mufcles, fo that the flefhy parts fhall meet over the bone and unite in the firft intention, was attended with great fuccefs in the Weft Indies, particularly at the hofpital at St. Lucia, under the care of Mr. Bulcock.

It may be remarked, that though all fores and wounds in the foot and leg are difficult of

of cure in a hot climate, I have observed, that, where the conftitution is good, those in the thighs, arms, trunk, and head, are rather more eafy of cure than in Europe, and that parts divided by incifion very readily unite by the first intention. In reasoning upon this, it may be faid, that as healing depends on a certain degree of vigour in the powers of life, this should not err either on the fide of excess or defect. If it is too great, as in the cafe of a hale, plethoric conftitution in a cold climate, too much inflammation is apt to be excited; and if too feeble, as happens in a hot climate, in the lower extremities, which are far removed from the fource of life and circulation, the falutary effort is not ftrong enough to generate new organised parts. But in the trunk of the body, in fuch a climate, the powers of the animal œconomy are in that just medium which is most favourable to this operation of nature.

THE END.

[545]

APPENDIX

PART III.

TO

T has been fuggefted to me, that it would add to the utility of this Work to fubjoin a lift of the remedies beft fuited to the practice of phyfic at fea, with their quantities, and to give a fet of formulas for the direction of young practitioners. I have accordingly made out a groß computation of the requifite quantities of the most useful and neceffary articles of the Materia Medica, and alfo a few of the most commodious and fimple forms of administering fome of the most efficacious remedies for the most common difease.

It is of confequence every where, but efpecially on board of a fhip, to fimplify practice, as much as poffible, with regard to the number, the preparation, and the adminiftration of medicines. Where a great number of compound medicines are given, it is extremely difficult to afcertain, by accurate and fatisfactory obfervations, what N n are are their real effects; and as there are not conveniences at fea for great pharmaceutical nicety, the plaineft forms fhould be adhered to. And as all operations are rendered more practicable and eafy by being reduced to a ftated method, this is an additional inducement for ftudying plainnefs and fimplicity in preparing and adminiftering remedies. This uniformity is more attainable in the public fervice than in private practice; for in the former all the patients are of one fex, they are all adults, and they are generally of robuft conftitutions.

In the lift hereto fubjoined the articles are diffinguished into PRINCIPAL and SECON-DARY; and when a furgeon confiders how limited his funds are, I hope he will not think that I have made a disproportionate affortment in reducing the number and quantities of the latter, my view in this having been that he may better afford an ample proportion of fuch medicines as are really efficacious and indifpenfable in the cure of diseases. It may be affirmed, without vanity or arrogance, that the printed lift of articles with which the navy furgeons are enjoined to fupply themfelves is very injudicious confidering the prefent improved state of the medical art; and it is of great importance that the due proportion of each article should be afcertained as nearly as poffible,

546

poffible, that no unneceffary expence may be incurred, and that the cheft may not be encumbered with unneceffary articles.

There are no fimple diffilled waters in the following lift, as they are very corruptible, and too bulky to carry to fea. Their place is fupplied by a fmall quantity of oil of mint, which may be occafionally added to common water, in the proportion of a drop to an ounce. There are no tinctures inferted, except laudanum, the traumatic balfam, and compound fpirit of lavender, as the furgeon, having a proper fupply of fpirit of wine or rum, may make them on board of the fhip.

In the following lift the furgical articles are not enumerated. There is a new article which I beg leave to recommend, as it has lately been found extremely ufeful, and is now ufed in large quantities in the hofpitals in London. This is linfeed meal for poultices. The furgeon fhould alfo be provided with a fufficient quantity of linfeed oil, as it has been found to be one of the beft ingredients in dreffings for fcorches. See page 540.

The quantity of each article is adapted to an hundred men for one year, fo that a calculation can eafily be made for any number of men, and for any length of time.

ASSORT-

[548]

OF MEDICINES ASSORTMENT

TO BE

CARRIED TO SEA,

FOR

ONE HUNDRED MEN, FOR ONE YEAR.

PRINCIPAL ARTICLES.

PERUVIAN bark, ten pounds, and if the fhip is deftined for a hot climate, twenty pounds. This article should be provided by the Public. See p. 359 .- Calomel, two ounces and a half - a Emetic tartar, one ounce and a half-Ipecacoanha, four ounces-Opium, one ounce-b Purging faits, ten pounds -Senna leaves, two pounds.

SECONDARY ARTICLES.

ALOES, half an ounce-Ammoniacum, two ounces-Balfam of copaiva, three ounces-c Traumatic balfam, four ounces-Camphor, three ounces - Cantharides, one ounce-Capficum, three drachms - Caftor, an ounce and a half - Chamæmile flowers, or hops, two pounds - Cinnamon, an ounce - Prepared chalk, or oyfterfliells, fix ounces - Conferve of rofes, half a pound -d Cordial confection, two ounces - e Cathartic extract, half an ounce - Extract of hemlock, three ounces -Extract of logwood, one ounce - Gentian, five ounces - Ginger, three ounces-Guin arabic, four ounces-Gum guaiacum, three ounces - Powder of jalap, one ounce and a half - f Laudanum, four ounces - Linfeed, one pound - Magnefia, fix ounces - Manna, eight ounces - Whole mustard feed, half a pound-Myrrh, four ounces-g Crude mercury, two ounces-

Names in the lass Edition of the London Pharmacopæia.

a Antimonium tartarifatum. - b Either Glauber's falts, natron vitriolatum, or fal catharticus amarus, magnefia vitriolata. Glauber's falt answers better in a hot climate, being less deliquescent from the heat and moissure of the climate. - e Balfamum benzoes compositum. - d Confectio aromatica. - e Extractum colocynthidis compositum.-f Tinctura opii. -g Hydrargyrus.

Corrofive

" Corrofive fublimate, an ounce - Nitre, eight ounces - Oil of almonds, one pint - b Caftor oil, half a pint - Linfeed oil, three pints - Effential oil of mint, one ounce - c Jamaica pepper, four ounces-d Bliftering plafter, ten pounds-Quaffia, eight ounces — Salt of hartfhorn, two ounces — e Salt of feel, half an ounce-f Salt of wormwood, ten ounces - Caffile fope, half a pound - Sarfaparilla, three pounds - Serpentary, four ounces - Spermaceti, four ounces - Rectified fpirit of wine, one pint -g Weak fpirit of vitriol, half a pint -b Volatile aromatic fpirit, half a pint -i Spirit of Mindererus, two pints, or the volatile falt and vinegar may be kept feparately, and added occafionally - Spirit of turpentine, four ounces-Dried fquills, half an ounce - Flowers of fulphur, one pound - Golden fulphur of antimony, half an ounce-Cream of tartar, one pound - Vinegar, fix pints - i White vitriol, fix drachms -Wormwood, one pound - k Flowers of zinc, two drachms.

NECESSARIES to be put in charge of the Purser, and served out to the Sick in place of the common sea provisions. See page 358.

BARLEY, three hundred pounds—Eggs, greafed and put in falt, twenty dozen—Extract of fpruce, twelve pounds—Lemon juice clarified, and preferved by adding to it a fmall proportion of ardent fpirits, five gallons — Raifins, fifty pounds — Rice, two hundred pounds—Coarfe fugar, one hundred pounds —Sago, twenty pounds — Salep, ten pounds — Portable foup, fifty pounds—Tamarinds, ten pounds—Beft white wine, three hundred gallons—Beft red wine, one hundred gallons.

Names in the last Edition of the London Pharmacopæia.

a Hydrargyrus muriatus. — b Oleum ricini. — c Pimento. d Emplaftrum cantharidis. c Ferrum vitriolatum. — f Kali præparatum. — g Acidum vitriolicum dilutum. — h Spiritus ammoniæ compofitus. — i Aqua ammoniæ acetata. — j Zincum vitriolatum. — k Zincum calcinatum.

FORMULÆ

[550]

FORMULÆ QUÆDAM MEDICAMENTORUM IN MEDICINA FACIENDA APUD NAUTAS ACCOMMODATIORES.

FEBRE CONTINUA. IN

PULVIS EMETICUS COMMUNIS.

R. PULVERIS radicis ipecacoanhæ grana decem, antimonii tartarifati grana duo, mifce.

MISTURA CATHARTICA COMMUNIS.

R. Foliorum fennæ uncias fex, aquæ ferventis libras fex. Macera donec pene refrixerit & adjice vel natri vitriolati vel magnefiæ vitriolatæ libram unam cum femiffe. Dein cola & admisce tincturæ sennæ uncias octo. Dofis est ad uncias tres .- Interdum conducit adjicere fingulis dofibus, vel pulpæ tamarindorum femunciam, vel mannæ femunciam, vel antimonii tartarifati semigranum, vel pulveris jalapii grana decem.

ENEMA COMMUNE.

Aquæ marinæ tepidæ uncias duodecim.

POTUS COMMUNIS.

Decoctum hordei. - Conveniat adjicere fingulis libris pro re nata, vel pulpæ tamarindorum unciam dimidiam, vel crystallorum tartari drachmam unam, vel nitri fcrupulum unum, vel acidi vitriolici diluti guttas decem, vel succi limonum unciam unam, vel gummi arabici fcrupulos duos, vel vini uncias quatuor, vel fruitum panis tofti.

VINUM EMETICUM.

* R. Antimonii tartarifati ferupulos duos, aquæ ferventis uncias duas, vini albi uncias octo. Solve antimonium in aquâ & adde vinum. Affumatur drachma una omni quadrante horæ, donec vel vomitus cieatur, vel alvus moveatur. Deinde affumatur femi-drachma fexta quâque hora.

PILULA FEBRIFUGA.

B. Pulveris antimonialis, (Pharm. Lond.) vel pulveris febrifugi Dris. James drachmam unam, confervæ rofæ quan-

* Hæc formula ex Pharmacopœia Nofocomii Sti. Thomæ excerpta cft.

tum

tum fatis fit. Simul contunde & divide in pilulas duodecim. Deglutiatur una quartâ vel fextâ quâque horâ.

MISTURA SALINA ET ANTIEMETICA.

R. Kali præparati drachmam unam, fucci limonum, vel aceti, vel acidi vitriolici quantum fatis fit ad faturandum falem, aquæ puræ uncias fex. Bibatur tertia pars ter die.—Conducit pro re nata adjicere, vel pulveris antimonialis grana quinque, vel acidi vitriolici diluti guttas quinque, vel cretæ præparatæ fcrupulum unum, vel aquæ menthæ femunciam. — Interdum conducit fumere hanc mifturam ftatim poftquam Kali & fuccus limonum mixta fuerit, fcilicet in ipfå ebullitione. Hoc imprimis utile eft quando vomitus vel naufea moleftus fit, & licet adhibere magnefiam vice Kali, & acetum vice fucci limonum.

* PILULA DIAPHORETICA.

R. Opii purificati grana duodecim, antimonii tartarifati grana fex, confervæ rofæ femi-drachmam, farinæ glycirrhizæ, vel tritici quantum fatis fit. Contunde fimul & divide in pilulas viginti quatuor. Devoretur una horâ fomni. Interdum profit dare unam bis die.

+ MISTURA SEDATIVA.

R. Misturæ camphoratæ uncias sex, tincturæ opii guttas vi ginti. Misce. Bibatur tertia pars ter die.—Aliquando conducit admiscere singulis dosibus aquæ ammoniæ acetatæ drachmas tres, vel vini emetici guttas triginta.

I BOLUS SEDATIVUS.

R. Confectionis aromaticæ ferupulum unum, opii purificati grani quartam partem, castorei Russici grana decem, tincturæ opii guttas quatuor. Misce. Assumatur sextâ quâque horâ.

BOLUS SERPENTARIÆ COMPOSITUS.

R. Pulveris ferpentariæ Virginianæ grana decem, camphoræ grana quatuor, confectionis aromaticæ quantum fatis fit.

* Hæc formula ex Pharmacopœia Nofocomii Sti. Thomæ deprompta eft.

+ Vide pag. 408.

[‡] Vide pag. 409. Hæc formulæ ex Pharmacopœia Nofocomii Sti. Thomæ excerpta eft, fed vice confectionis Damocratis hodie obfoletæ, adhibentur confectio aromatica & opium purificatum, ratione habitâ ad portionem fingulorum adeo ut parem edant effectum ac in vetere formulâ.

Affum-

Affumatur ter die.—Interdum conducit addere pulveris corticis Peruviani drachmam dimidiam, vel fuperbibere decocti corticis Peruviani uncias duas.

ELICTUARIUM AD CONVALESCENTES.

B. Pulveris corticis Peruviani, florum chamæmeli, fingulorum unciam unam, pulveris zinziberis ferupulos duos, fyrupi quantum fatis fit. Dofis eft circiter drachma ter die.— Interdum adjiciantur vel rubiginis ferri drachmæ tres, vel pulveris ferpentaria Virginianæ drachmæ duæ.

IN FEBRE INTERMITTENTE.

Adhibeantur in initio eadem medicamenta ac in initio febris continuz. Deinde

Sumatur corticis Peruviani drachma una, fecundâ vel tertiâ quâque horâ, vel etiam fingulis horis, abfente paraxyfmo febrili. — Interdum confert dare fingulas doses ex spiritûs vini tenuis (rum dicti) uncià unà.

Si cortex frustra adhibeatur fauste adhiberi possint medicamenta infra præscripta.

• R. Zinci calcinati femi-drachmam, confervæ rofæ quantum fatis fit. Contunde fimul & divide in pilulas quindecim. Sumatur una ter die, augendo dofim fi premerit morbus & fi ferat ventriculus.

Vel,

R. Zinci vitriolati grana duodecim aquæ puræ uncias tres Sumatur tertia pars ter die augendo dofim fi opus fuerit & fi ferat ventriculus.

Vel,

+ R. Tincturæ rhabarbari uncias duas, tincturæ fennæ drachmas fex. Mifce. Sumatur paucas horas ante paroxyfmum.

Vel,

Cortice Peruviano frustra dato, aliquando conferat dare ægro quotidie, vel calomelanos, vel pilularum ex hydrargyro quantum & quamdiu fufficiat ad levem ciendum ptyalifmum, & deinde instituere curam de integro cum cortice Peruviano.

Vel,

§ Sumantur tincturæ opii guttæ viginti quinque, incipiente æstu. febrili, ex poculo potûs communis.

Vide pag. 4=6.

[553]

IN DIARRHOEA SIMPLICI.

BOLUS AD DIARRHOEAM.

- R. Cretæ præparatæ fcrupulum unum, pulveris rhabarbari grana quindecim, pulveris corticis cinnamomi grana fex, opii purificati granum dimidium, tincturæ opii guttas quinque, fyrupi quantum fatis fit. Semel fumatur.
- B. Mifturæ cretaceæ (Pharm. Lond.) cum duplici gummi arabico libram unam, tincturæ opii guttas decem. Abfumatur totum partitis vicibus nychthemero, incipiendo duodecim horas post datum medicamentum novissime præfcriptum.—Interdum adjiciatur tincturæ cinamomi uncia dimidia.

IN CHOLERA MORBO.

B. Decocti hordei vel avenæ libras tres, pulveris gummi arabici unciam unam cum femifie, tincturæ opii guttas triginta. Hauriatur quam primum libra una, & deinde libra dimidia omni horâ ufque ad levamen mali.—Si parabilis fuerit caro vitulina, vel pullus, jufculum tenue ex altero utro factum vice decocti fupra dicti adhibeatur.

IN DYSENTERIA ACUTA.

Sumat æger quamprimum emeticum commune.

- R. Decocti hordei libras duas, falis cathartici unciam unam cum femiffe, antimonii tartarifati grana duo. Mifce. Hauriatur tepide primò libra dimidia, & deinde unciæ quatuor omni horâ donec alvus copiofe & iteratim dejecerit.
- B. Pulveris ipecacoanhæ grana duodecim, confervæ rofæ quantum fatis fit. Contunde fimul & divide in pilulas duodecim. Sumatur una ter die. Si æger vehementer febricitårit fatius erit dare ter die vini emetici drachmam unam ex cyatho amplo decocti hordei tepidi.
- * R. Pulveris ipecacoanhæ grana duo, pulveris opii purificati exficcati granum unum, nitri grana octo. Milce. Sumatur horâ fomni.

ENEMA EMOLLIENS.

R. Amyli unciam dimidiam, aquæ puræ uncias decem. Coque ad idoneam fpiffitudinem.

Vel,

B. Seminum lini drachmas fex, aquæ puræ uncias duodecim. Coque per quadrantem horæ & cola liquorem pro enemate.

* Vide pag. 479.

ENEMA ANODYNUM.

R. Enematis emollientis uncias quatuor, tincturæ opii guttas quadraginta. Mifce.

IN DYSENTERIA CHRONICA.

BOLUS CATHARTICUS.

R. Pulveris rhabarbari grana quindecim, calomelanos grana quinque, confervæ rofæ quantum fatis fit ut fiat bolus. Mane fumendus, & repetendus post paucos dies fi opus fuerit.—Vice hujus interdum conducat dare misturæ catharticæ communis uncias duas.

SOLUTIO CAMPECHENSIS.

R. Extracti ligni Campechenfis drachmam unam cum femisse, tincturæ cinamomi unciam unam. Tere fimul & admisce aquæ puræ uncias quinque. Sumatur uncia una ter die,

DECOCTUM AMARUM.

R. Corticis fimaroubæ vel quaffiæ drachmam unam, aquæ puræ libram unam cum femiffe. Decoque ad libram unam. Abfumatur totum quotidie tribus vicibus. Adjici poffint fingulis dofibus pro ratione fymptomatum, vel cretæ præparatæ fcrupulus unus, vel pulveris ipecacoanhæ granum unum, vel tincturæ cinamomi drachmæ duæ, vel tincturæ opii guttæ quinque:

* In cafibus rebellibus confert illinere quotidie hypogastrium unguenti ex hydrargyro drachmâ dimidiâ.

Sit pro potu communi in hoc morbo aqua pura, frusto panis recens tosti adjecto, & pauxillo spiritus vini tenuis (rum dicti) admixto. Sit pro victu communi falab, vel farina tritici in pulmentum tenue ex aquâ purâ cocta.

IN INTESTINIS INFLAMMATIS.

+ SOLUTIO SALIS CATHARTICI.

B. Decocti hordei libram unam, magnefiæ vitriolatæ uncias duas. Misce ut fiat folutio. Bibatur, post fanguinis missionem, uncia una omni semihorâ donec alvus bis dejecerit.

Adhibeantur hypogastrio cucurbitulæ cruentæ, vel hirudines plures. Applicetur ibidem epispasticum fatis amplum. Injiciatur enema cum oleo & pauxillo fale cathartico.

* Vide pag. 489.

† Ex auctoritate Cl. Heberden apud Cl. Pringle in opere fue de morbis caftrenfibus.

IN ILEO, vel COLICA PICTONUM, vel morbo in regionibus æftuofis DRY BELLY ACHE dicto.

* PILULÆ CATHARTICO-ANODYNÆ.

B. Extracti colocynthidis compositi drachmam dimidiam, opii granum unum & dimidium, olei mentl æ guttam unam. Contunde in massam & divide in pilulas decem. Sint pro una dosi. Paucas post horas, si alvus non rite responderit, exhibeantur missuræ catharticæ unciæ duæ, vel † olei ricini uncia una, & repetantur ut opus suerit.—Interdum in hoc malo divexat vomitus cui auxilio est, mistura antiemetica. Vide page 551.

Perfricetur hypogastrium oleo tepido.

Ineat æger in balneum tepefactum ad 93° therm. Fahren, per horam unam vel etiam diutius.

Denique suffletur in anum fumus nicotianæ.

Vel,

B. Nicotianæ drachmas duas aquæ puræ ferventis libram unam.—Fiat infufum & cola pro enemate.

IN HÆMORRHOIDE.

BOLUS HÆMORRHOIDALIS.

R. Florum fulphuris drachmam dimidiam, confervæ rofæ, vel pulpæ tamarindorum quantum fatis fit. Aflumatur bis die.

> Si fanguinis ex ano profluentis magna fuerit vis, & præcipue fi ex alto fonte effluxerit, valde proderit medicamentum infra præscriptum.

‡ R. Olei lini recens expressi drachmas fex, tincturæ rhabarbari drachmas duas. Misce. Sumatur bis die.—Vice olei lini adhibere licet olei amygdalæ unciam dimidiam, cum mucilaginis gummi arabici drachmis duabus.

IN ALVO ASTRICTA.

PILULÆ LAXANTES.

R. Aloes focotrinæ drachmam unam, fyrupi quantum fatis fit. Contunde & divide in pilulas viginti. Sumantur duæ pro re natâ.—Aliquando conducit adjicere vel pulveris zinzi-

* Hæc formula ex Pharmacopæia Nofocomii Sti. Thomæ, excerpta eft.

+ Vice olei ricini dare licet olei amygdalæ unciam unam cum tincturæ fennæ uncia dimidia. Vide Pharm. Nofoc. Sti. Thomæ.

[‡] Hæc formula ex auctoritate Cl. Griffiths. In periculis a me ipfo factis feliciffimum fucceffum ex hoc medicamento percepi.

beris

beris vel pulveris capfici grana quindecim, vel olei menthæ guttas decem. - Vice aloes licet adhibere extractum colocynthidis compositum.

ELECTUARIUM ECCOPROTICUM.

R. Pulveris jalapii unciam dimidiam, pulpæ tamarindorum unciam unam, pulveris zinziberis femi-drachmam, fyrupi melasses dicti quantum fatis fit. Sumatur circiter drachma pro re natà. - Interdum profit adjicere crystallorum tartari drachmas duas.

CATARRHO. IN

LINCTUS.

R. Confervæ rofæ unciam unam, mucilaginis gummi arabici unciam dimidiam, olei amygdalæ drachmas duas, fucci limonis, vel acidi vitriolici quantum fatis fit ad gratum faporem conciliandum. Mifce. Sumatur pauxillum fæpius.-Interdum adjiciatur vel falis nitri drachma una, vel tincturæ opii guttæ decem.

Sit pro potu communi decoctum hordei in quo coquatur uvarum paffarum uncia una, & fub finem cocturæ feminum lini drachmas duas pro fingulis libris decocti.

Si febricitârit æger, fumantur mistura salina & pilula febrifuga ter die.

IN PLEURITIDE ET PERIPNEUMONIA.

R. Decocti hordei libras duas, pulpæ tamarindorum quantum fatis fit ad gratum faporem, nitri drachmam unam. Mifce. Hauriatur affatim pro potu communi. N. B. Si tamarindi moverint alvum sæpius quam semel aut bis die adhibeatur vice ejus syrupus melasses dictus.

Sumatur mistura falina & pilula febrifuga sextâ vel quarta quâque hora.

IN HÆMOPTOE.

Hauriat æger infufi rofæ uncias tres quater die. Interdum adjiciatur vel tinctur æopii guttæ quatuor, vel nitri grana decem. HAUSTUS OLLOSUS.

" R. Olei amygdalini, aquæ menthæ fimplicis fingulorum unciam unam, mannæ drachmas tres. Mifce. Sumatur ter die. Sæpe conducit adjicere fingulis dofibus tincturæ opii guttas quatuor vel quinque.

* Hoc medicamentum speciatim his hæmorrhagiis accommodatum quæ ex aliquo viscere læso vi externa exoriantur quales in nave fæpius quam alicubi accidere folent, ex piæcipitiis & ex corpore collifo a molimine machinarum & tormentorum. - Prodeft quoque in his cafibus pulvis ipecacoanhæ compofitus.

IN TUSSI ASTHMATICA.

PILULÆ PECTORALES.

* R. Gummi ammoniaci drachmas tres, faponis Hifpanienfis drachmas duas, pulveris radicis feillæ grana fex opii purificati grana tria, fyrupi *melaffes* dicti quantum fatis fit. Contunde fimul & divide in pilulas quadraginta octo. Sumantur quatuor bis die.

IN ASTHMATE A DIATHESI HYDROPICA PROVENIENTE.

PILULÆ SCILLITICÆ.

R. Radicis feillæ aridæ grana duodecim, confervæ rofæ quantum fatis fit. Contunde fimul & divide in pilulas duodecim. Sumatur una vel duæ bis vel ter die.

Vel,

+ HAUSTUS DIURETICUS.

R. Aquæ puræ unciam unam & dimidiam, pulveris feillæ aridæ grana duo, tincturæ lavendulæ compositæ guttas triginta, kalipræparati grana decem. Misce. Sumatur bis vel ter die.—Interdum adjicere liceat haustui vespertino tincturæ opii guttas viginti.

Vel,

BOLUS CÆRULEUS CUM SCILLA.

2 R. Pilularum ex hydrargyro grana quinque vel ufque ad decem, pulveris radicis feillæ grana duo. Mifee. Sumatur horâ decubitûs, per tres vel quatuor noctes confequentes.

IN RHEUMATISMO ACUTO.

MISTURA DIAPHORETICA.

R. Aquæ puræ uncias tres, aquæ aminoniæ acetatæ unciam unam & dimidiam, pulveris antimonialis grana quindecim.' Sumatur tertia pars ter die.—Interdum adjiciantur nitri grana quinque fingulis dofibus.

Bibatur affatim decoctum hordei tepidum, cum nitri ferupulis duobus in fingulis libris.

* Hæc formula ex Pharmacopœia Nofocomii Sti. Thomæ deprompta eft.

† Hæc eft quam proxime formula a Cl. Mead legata Nofocomio Sti. Thomæ ubi olim munere medici functus eft, & ibi cx eo tempore ufque hodie feliciter in hydrope adhibita eft.

[‡] Cl°. Huck Saunders qui dyspnœâ hydropicâ laboravit ipfe, anxilio notabili erat hoc medicamintum. In talibus malis interdum summopere prodest decoctum digitalis purpureæ, ut medicus supra memoratus in suo casu compertus est.—Vid. Medical Transactions, Vol. 111.

HAUSTUS

HAUSTUS SUDORIFICUS.

R. Misturæ camphoratæ unciam unam & dimidiam, aquæ ammoniæ acetatæ unciam dimidiam, vini emetici guttas quadraginta, tincturæ opii guttas viginti. Misce. Sumatur horâ fomni, vel etiam fæpius fed cum dimedia tinctura.

IN RHEUMATISMO CHRONICO.

- R. Tincturæ guaiaci volatilis drachmas duas. Sumatur ex cyatho potûs communis ter die. Vel fumatur gummi guaici femidrachma fuper bibendo hauftum ex falis cornu cervi ferupula aquæ unciis tribus.
- R. Pulveris ipecacoanhæ compositi (Pharm. Lond.) fcrupulum unum. Sumatur hora fomni alternis noctibus.

In cafibus rebellibus pro remedio efficaci compertum est dare quotidie calomelanos granum unum vel grana duo.

HYDROPE. IN

PULVIS HYDRAGOGUS.

R. Crystallorum tartari unciam dimidiam, pulveris jalapii grana quindecim, pulveris zinziberis grana quinque. Mifce fiat pulvis, fumatur alternis diebus.

MISTURA DIURETICA.

R. Infusi gentianæ uncias decem, spiritus vini tenuis uncias duas, kali præparati drachmam unam. Misce. Hauriantur unciæ tres bis die. * Vice infusi gentianæ licet adhibere infufum abfynthii.

TINCTURA SCILLÆ. Pharm. Lond.

Sumatur drachma una bis die ex hauftu potûs communis.

PILULA EX ELATERIO.

R, Elaterii grana duodecim, fyrupi quantum fatis fit. Dividatur in pilulas fex. Sumatur una bis die.

+ Ægro licet, imo prodeft hoc morbo laboranti bibere ad libitum ex liquore aliquo fiti extinguendæ accommodato, veluti aqua hordei cum crystallis tartari.

ERYSIPELATE. IN

- * R. Pulveris corticis Peruviani drachmam unam. Sumatur omni horâ vel interpofitis duabus vel tribus horis.
 - * Vide Cl. Pringle in opere fuo de morbis castrensibus.

+ Hujus doctrinæ auctor est Hippocrates, quæ restaurata est suctaque a Cl. Milman in opufculo fuo de hydrope.

t Hæc methodus medendi quæ æque efficax ac fimplex eft, primo excogitata fuit a Cl. Georgio Fordyce medico nofocomii Sti. Thomæ, ubi & ipfe feliciffimo cum fuccesfu eandem expertus fum, in muneribus meis ibi fungendis.

[559]

IN MORBO VENEREO.

I. IN GONORRHOEA.

Hauriatur ad libitum infufum lini, vel decoctum hordei cum gummi arabici drachmis fex in fingulis libris.

Sumantur calomelanos grana duo quotidie per viginti circiter dies.

* R. Aquæ puræ diffillatæ uncias octo, hydrargyri muriati granum unum. Mifce. Injiciatur pauxillum in urethram bis vel ter die.

IN GONORRHOEA BENIGNA.

R. Balfami capaivæ drachmam unam, tincturæ lavendulæ compofitæ guttas triginti. Mifce. Sumatur bis die.

2. IN ULCUSCULIS.

In initio feliciter adhibetur caufticum.

R. Calomelanos drachmam dimidiam, confervæ rofæ quantum fatis fit. Contunde in maffam & divide in pilulas triginta. Sumatur una quotidie, vel interdum dimidia ter die, ut cieatur ptyalifmus modicus. Perstet æger in usu medicamenti hujus per dies acto postquam fanata fuerint ulcufcula.

Pro medicamento topico, utile crit infpergere ulcufculum cum pulvere hydrargyri nitrati.

3. IN BUBONE.

Illinatur artus lateris affecti infra inguen cum unguenti ex hydrargyro drachmâ dimidiâ quotidie.

Si abierit bubo in ulcus mali moris omittatur pro tempore ufus hydrargyri & fumatur quotidie + opii purificati granum unum primo femel, dein bis, denique ter die vel etiam fæpius, & pulveris corticis Peruviani drachma una ter quaterve die.— Interdum conducit fumere pulveris farfæparillæ drachmas duas ter die, vel extracti cicutæ grana tria ter die, augendo paullatim ufque ad grana decem.

4. IN VERA LUE, angina scilicet osteocopiis, exostofibus & defædatione cutis.

Illinantur membra quotidie cum unguenti ex hydrargyro

* Vide opus Cl. Johannis Hunter de morbo venereo:

† Vires opii in isto morbo primo innotuerunt ex experientia Cl. Nooth, dum præfuit nosocomiis mulitaribus in America, & pro optimo remedio a peritissimis medicis & chirurgis jam habetur.

drachmas

drachmis duabus quotidie ufque dum cieatur ptyalifmus per dies triginta ad minimum vel donec evanuerint fymptomata. — Interdum vice litûs adhibere conveniat vel calomelanos granum unum ter die, vel pilularum ex hydrargyro grana quinque bis die, vel

R. Hydrargyri muriati grana octo, fpiritus vinofi tenuis libram unam. Fiat folutio, & fumatur uncia dimidia bis die. In ulceribus tonfillarum pernotabili est auxilio fussitum ex cinnabare in fauces inhalare femel vel bis quotidie.

Si ulcera mali moris exorta fuerint in quavis corporis parte, eadem, ut jam de bubone dictum est, fiant.

IN SCORBUTO MARINO.

Sumat æger quotidie fucci limonum unciam unam ter quaterve die.

- R. Aquæ puræ paullulum tepefactæ congios triginta, fyrupi melaffes dicti libras fedecim pondere, extracti pini uncias octo pondere, fpumæ vel fæcis cerevifiæ libras duas menfurå. Mifce & agita valide cum baculo, dein finatur abire in fermentationem, ut fiat cerevifia, deinde fervetur in vafe claufo. Ut diutius fervari poteft, proderit admifcere fpiritûs vini tenuis Gallici, vel qui *rum* dicitur, libras duas aut tres. Si infirma fuerint vifcera adjicere juvabit vel lupuli vel fummitatum abfinthii vel quaffæ, vel zinziberis quantum fatis fit. Hauriat æger libras duas quotidie.
- R. Farinæ avenaceæ libras tres, aquæ puræ congios quatuor. Mifce. Macera donec liquor fiat acidulus, dein effunde dimidium & adjiciatur par copia aquæ puræ, & coque ad idoneam fpiffitudinem, ut cogatur in pulmentum. Sit pro victu affiduo cum vini & facchari non purificati, vel fyrupi melasse dicti quantum fufficiat ad gratum faporem conciliandum.

Ad alvum folvendam commode adhiberi potest electuarium eccoproticum cum crystallis tartari. Vid. p. 556.

* Non hic intelligitur ptyalifmum veram effe caufam qu'a efficitur medela morbi, fed præcipitur ut pro argumento fit hydrargyrum in vafa minima permeaffe adeo ut effectum edat in fubigendo morbo. Vide Opus Hunteri.

THE END.
