## NOTICE.

---

IN the pharmaceutical part of this work, I have adopted the arrangement of the Pharmacopœia of the Edinburgh College, and have adhered strictly to its nomenclature, and to the details of its processes. To convey a knowledge, however, of Pharmacy as it is practised in this country, it is necessary likewise to take notice of the preparations of the London Pharmacopœia; and the plan I have followed, while it avoids that tedious and generally useless repetition which arises from giving a complete translation of the processes of both Pharmacopœias, answers the most important purposes such a translation could serve. Wherever the *formula* of the *London Pharmacopœia*, for any preparation, differs in no essential point from that in the *Edinburgh*, I have thought it sufficient to indicate merely the name given to it in the former, in a marginal note. But where there is any important difference, either in proportion, composition, or mode of conducting the process, I have deemed it proper to introduce it in the text. And to the end of each chapter, I have added those preparations which are peculiar to the London Pharmacopœia, or have none corresponding to them in the publication of the Edinburgh College.

PART III.

PHARMACY.

CHAP. I.

PREPARATIONS OF SOME SIMPLE MEDICINES.

CARBONAS CALCIS PRÆPARATUS, *olim Creta* Cancro-  
*Præparata et Cancrorum Lapilli, vulgo Oculi* rum Che-  
*Cancrorum Præparati.* PREPARED CARBO- læ.  
NAT OF LIME, formerly Prepared Chalk, and Creta.  
Prepared Crabs Stones, commonly called  
Crabs Eyes.

"CARBONAT of Lime, whether the softer va-  
riety, commonly named Chalk, or the  
harder, called Crabs Stones and Crabs Eyes, af-  
ter being rubbed to powder in an iron mortar,  
and levigated with a little water on a porphyry

stone, is to be put into a large vessel. Water is to be poured upon it, and after the vessel has been frequently agitated, it is to be poured off, loaded with a fine powder. On the water remaining at rest, a subtile powder subsides, which is to be dried. The coarse powder which the water could not suspend, is to be again levigated, and treated in the same manner."

CHALK is a native carbonat of lime, seldom perfectly pure. The crabs stones are concretions found in the stomach of the river crawfish, (*Cancer Astacus*), consisting of carbonat of lime, with a portion of animal gelatin. By the above process, both are reduced to a very fine powder, to render them more fit for medicinal use. They are employed as antacids in a dose of one or two drachms.

RED CORAL, (*Corallium Rubrum*), is ordered to be prepared in a similar manner in the London Pharmacopœia. As it has no qualities but those of carbonat of lime, there is no necessity for retaining it in the lists of the Materia Medica.

CARBONAS

CARBONAS FERRI PRÆPARATUS, *olim Rubigo Ferri Ru-*  
*Ferri Præparata.* PREPARED CARBONAT OF bigo.  
 IRON, formerly Prepared Rust of Iron.

“Purified Filings of Iron are to be frequently moistened with water till they fall into rust, which is to be rubbed to a fine powder.”

DURING exposure to air and moisture, iron is oxydated, and this oxyd is found to be combined with carbonic acid, absorbed probably from the atmosphere. As a chalybeate it is more active than the pure metal, and more mild than the other saline combinations of iron. Its dose is from 10 to 20 grains.

CARBONAS ZINCI IMPURUS PRÆPARATUS; *olim Lapis Calaminaris Præparatus.* PREPARED Lapis Calami-  
 IMPURE CARBONAT OF ZINC, formerly Pre- naris.  
 pared Calamine Stone.

“Impure Carbonat of Zinc roasted by those who make brass, is to be prepared in the same manner as carbonat of lime.”

CALAMINE is an ore of zinc, in which sometimes the metal is merely oxydated, and in

other varieties combined with carbonic acid. It is used as an application to superficial inflammation, dusted on the part, and as the basis of the common healing cerate. For these purposes, it requires to be very finely levigated.

FERRI LIMATURA PURIFICATA. PURIFIED FILINGS OF IRON.

"A sieve being placed over the filings, let a magnet be applied, that the filings may be drawn through the sieve upwards."

THE iron is in this manner obtained nearly pure, the interposition of the sieve in a great measure preventing particles of other metals, or impurities which are generally mixed with the iron filings got from the workshops, from being entangled in the cluster which adheres to the magnet. The process is a very necessary one, where iron is to be medicinally employed in this form, or where it is to serve for other preparations of this metal.

FERRI

FERRI OXIDUM NIGRUM PURIFICATUM, *olim Ferri Squamæ Purificatæ*. PURIFIED BLACK OXYD OF IRON, formerly Purified Scales of Iron.

“ Let the scales of black oxyd of iron, which are found at the anvils of the workmen, be purified by the application of the magnet ; for the magnet attracts only the more small and pure scales, leaving those which are larger and less pure.”

THE scales of iron are the small fragments struck off from the metal when it is heated red-hot. Passing through the atmosphere, at this temperature, they are oxydated, but so imperfectly, as to admit of this mode of purification by the magnet. They are used only in making some of the other chalybeate preparations.

OXIDUM ZINCI IMPURUM PRÆPARATUM, *olim Tutia Tutia Præparata*. PREPARED IMPURE OXYD OF ZINC, formerly Prepared Tutty.

“ To be prepared as Carbonat of Lime.”

TUTTY is a substance of which the origin is doubtful, but it appears to be artificial, and to consist chiefly of oxyd of zinc with argillaceous earth. It is used externally for the same purposes as calamine; and hence requires to be finely levigated.

Alumen  
Ustum.

SULPHAS ALUMINÆ EXSICCATUS, *olim Alumen Ustum.* DRIED SULPHAT OF ARGIL, formerly Burnt Alum.

“Let Sulphat of Argil be melted in an earthen or iron vessel, and exposed to the heat applied until it cease to boil.”

By this process the alum loses its water of crystallization, and becomes more active as an escharotic, for which purpose this preparation is used.

Flores  
Sulphuris  
Lot.

SULPHUR SUBLIMATUM LOTUM. WASHED SUBLIMED SULPHUR.

“Take of Sublimed Sulphur one pound; Water four pounds: boil the sulphur a little with the water, then pour off this water; by the affusion of cold water wash away all acid; lastly, dry the sulphur.”

A SMALL portion of sulphur in its sublimation sometimes suffers oxydation from the air of the chamber into which it is sublimed, and hence acquires a slight acidity, which the present process is designed to remove. This is so rarely the case, however, that it is one perhaps unnecessary.

SULPHUR PRÆCIPITATUM. *Pharm. Lond.* PRECIPITATED SULPHUR.

“Take of Sulphurated Kali (Sulphuret of Potash), six ounces; distilled water, one pound and a half; diluted vitriolic (sulphuric) acid, as much as is sufficient; boil the sulphurated kali in the distilled water until it is dissolved. Filter the liquor through paper, and add to it the diluted vitriolic acid. Wash the precipitated powder by repeated affusions of water until it become insipid.”

IN this process, sulphur is first combined with potash by fusion; and this compound, dissolved in water, is decomposed by sulphuric acid, which combines with the potash, and precipitates the sulphur. It might be supposed, therefore, to have no advantage. The sulphur, however,

from its state of aggregation, is of a much whiter colour than it can be obtained by any other means, and is therefore preferable in forming an ointment for external application.

Antimonium  
præparat.

SULPHURETUM ANTIMONII PRÆPARATUM, *olim Antimonium Præparatum*. PREPARED SULPHURET OF ANTIMONY, formerly Prepared Antimony.

“Let Sulphuret of Antimony be prepared in the same manner as Carbonat of Lime.”

It has been supposed, that this substance, when finely levigated, as it is by this process, acts with more certainty than when given in a coarser powder. It is still, however, very inactive. As a remedy in chronic rheumatism, it has been given in a dose of 5 or 10 grains daily.

MEL DESPUMATUM. CLARIFIED HONEY.

“Liquefy honey by a water-bath, and remove the scum.”

THIS is designed to render honey more pure, by removing completely the wax and other impurities it may contain, and which, when it is rendered

rendered liquid by heat, rise to the surface. It is seldom performed.

HERBARUM ET FLORUM EXSICCATIO. DRYING Herb. et  
OF HERBS AND FLOWERS. Flor. Ex-  
siccat.

“Herbs and Flowers are to be dried with the gentle heat of a stove, or a common fire, in such a quantity that the drying may be done as quickly as possible; for thus their virtues are best preserved. The mark of this is their retaining completely their native colour. The leaves of hemlock, and others containing a subtile volatile matter, are, immediately after drying, to be rubbed to powder, and kept in glass vessels well stoppt.”

By drying herbs and flowers, or expelling a great part of the water they contain, those chemical changes they would spontaneously suffer are prevented, and they are rendered capable of being preserved. The more quickly they are dried, they retain in general their virtues more completely. Care must be taken at the same time that too much heat be not applied, as part of their volatile principles would be dissipated, and their medicinal qualities impaired. Even  
when

when dried, they suffer some changes in keeping, probably from the action of the air; and some do so more than others. Hemlock has its colour and odour impaired in a very short time; it is therefore necessary to exclude it from the air, and likewise from exposure to light.

Scill. Ex-  
siccata.

SCILLA MARITIMA EXSICCATA. DRIED SEA  
SQUILL.

“Cut the root of the sea squill, its outer covering having been removed, transversely into thin slices, and dry it by a gentle heat. The mark of its being properly dried is, that although rendered friable it retains its bitterness and acrimony.”

By drying, the squill loses four-fifths of its weight, and with very little diminution of its virtues, if too much heat has not been applied. It is in this state that squill is commonly employed in medicine. Dose from 1 to 3 grains.

Pulparum  
Præpara-  
tio.

PULPARUM EXTRACTIO. EXTRACTION OF PULPS.

“Boil those fruits which afford a pulp, if unripe, or if ripe and dry, with a little water, that they may become soft. Then express the pulp  
through

through a hair-sieve, and boil it with a gentle heat in an earthen vessel, stirring it frequently that it may not burn, until it attain the consistence of honey. The pulp of Cassia Fistula is to be boiled from the bruised pod; and by evaporating the water, to be reduced to the due consistence. The pulps of ripe and fresh fruits are to be pressed through a sieve, without previous boiling."

THESE directions are given principally for the preparation of the pulps of several fruits, which enter into the composition of the Electuary of Senna. Pulps are seldom otherwise medicinally employed, and cannot be long preserved unchanged.

---

UNDER the Chapter corresponding with this in title in the London Pharmacopœia, are several additional preparations, of which it may be necessary to take notice.

AMMONIACI PURIFICATIO. PURIFICATION OF  
GUM AMMONIAC.

"If ammoniac seem not pure, boil it in water, until it soften; and by a press, force it through an hempen bag; then put it aside, that the resinous

finous matter may subside. Evaporate the water, mixing towards the end of the evaporation the resinous with the gummy part.

“Affafoetida and other fimilar gum-refins may be purified in the fame manner.

“Any gum alfo, which melts eafily, fuch as Galbanum, may be purified by putting it into an ox-bladder, and keeping it in boiling-water, till it become fo foft that it may be preffed through a ftrong linen-cloth, and freed from its impurities.”

By fuch proceffes, the qualities of the fubftances are always injured, and they are unnecessary, fince thefe gums, when not fufficiently pure, ought not to be ufed.

#### STYRACIS PURIFICATIO. PURIFICATION OF STORAX.

“Having diffolved Storax in alkohol, ftrain the liquor, and diftil it with a gentle heat to a proper confiftence.”

This is equally unnecessary with the preceding.

CORNU

CORNU CURVI USTIO. BURNING OF HARTSHORN.

"Burn pieces of hartshorn till they become perfectly white, then rub them to a very fine powder."

ANIMAL bones consist of gelatin with phosphat of lime; by burning, the former is destroyed, the latter remains. It was considered as an antacid, but it cannot be referred to that class. It is sometimes an ingredient in dentifrice compositions.

MILLEPEDÆ PRÆPARATIO. PREPARATION OF MILLEPEDES.

"Suspend flaters, inclosed in a thin linen-bag, over proof-spirit, heated in a close vessel, that they may be killed by the vapour, and rendered friable."

It is singular that this absurd preparation should have been so long retained in our Pharmacopœias as it has been.

SPONGIÆ

## SPONGIÆ USTIO. BURNING OF SPONGE.

“Bruise sponge cut into small pieces, and, when freed from stony matter, burn it in a close iron vessel until it become black and friable. Then rub it into a fine powder.”

BURNT sponge consists chiefly of carbonaceous matter, with a small portion of carbonat of soda. It has been celebrated as a remedy in scrofula, in a dose of a scruple or half a drachm.

## CHAP. II.

## CONSERVÆ.—CONSERVES.

IN these preparations, vegetable matter bruised is mixed with about three times its weight of sugar, and beat into an uniform pulpy mass. It was supposed that the sugar, by its antiseptic quality, would prevent the decomposition of the vegetable matter. This, however, is not the case. This form of preparation, therefore, is not applied to any active medicine, the few conserves that are retained being employed merely as vehicles for other medicines, and for giving them convenient forms. The conserves in the Edinburgh Pharmacopœia are the following:

CONSERVA *Corticis exterioris recentis fructûs* Conserv.  
 CITRI AURANTII, *Radulâ abrazi*: Conserve of Aurantii  
 the Outer Rind of the Orange rasped by a Gra- Hif. cort.  
 ter. exter.

Conferv. ter. CONSERVA *Fructus* ROSÆ CANINÆ *matu-*  
Cynosba-*ri, a seminibus eorumque pube sollicitè purgati :*  
ti. Conserve of the Fruit of Dog-hips carefully

Conferv. freed from the Seeds and included Down. CON-  
Rosæ ru-  
bræ. SERVA *Petalorum* ROSÆ GALLICÆ *nondum expli-*  
*citorum :* Conserve of the Unblown Petals of  
the Red Rose. In each of these, the vegetable  
substance is beat into a pulp, adding gradually,  
during the beating, three times its weight of su-  
gar.—To these the London College add, CON-  
SERVA ABSINTHII MARITIMI, Conserve of Sea  
Wormwood ; CONSERVA LUJULÆ, Conserve of  
Wood Sorrel ; CONSERVA ARI, Conserve of A-  
rum ; CONSERVA PRUNI SYLVESTRIS, Conserve  
of Sloes ; CONSERVA SCILLÆ, Conserve of Squill ;  
—preparations which scarcely require any par-  
ticular notice. To the first the form of conserve  
is very ill adapted ; and in the last, the active  
matter of the squill cannot be preserved long  
by this preparation.

---

CHAP. III.

## SUCCI.—JUICES.

VEGETABLE Juices are obtained by expression. They consist of various proximate principles of the plant, particularly of mucilage, extractive matter, tannin, fecula, and some saline substances dissolved or suspended in water, and when recent, may possess the medicinal virtues which belong to any of these principles. It is impossible, however, to preserve vegetable matter in solution in water for any length of time without suffering decomposition; and hence juices are unfit for officinal preparations. Only one is retained in the Edinburgh and London Pharmacopœias, and it might have been discarded.

Succus  
Cochlea.  
com.

SUCCUS COCHLEARIÆ OFFICINALIS COMPOSITUS.  
COMPOUND JUICE OF SCURVY-GRASS.

“ Take of Juice of Scurvy-Grass, Juice of Water-Cresses expressed from fresh-gathered herbs, Juice of the Fruit of the Orange, of each two pounds ; Spirit of Nutmeg half a pound : mix and put aside until the impurities have subsided ; then pour off the liquor.”

THIS juice was at one time celebrated as a remedy in scurvy, from 4 to 8 ounces being taken twice or thrice a-day ; but since the powers of the citric acid have been fully ascertained, it is very seldom prescribed, and is never kept in the shops.

---

  
CHAP. IV.

*SUCCI SPISSATI, vulgo EXTRACTA.*—INSPISSATED JUICES, commonly termed EXTRACTS.

WHERE the virtues of any vegetable reside in a principle which is contained in the juice obtained from it by expression, and where this principle is at the same time not volatile, inspissation by a moderate heat will contribute to its preservation, as the soft mass obtained by this process is much less liable to chemical changes than when the reaction of its constituent parts is favoured by dilution with water. The preparation, however, is still liable to disadvantages. By the heat employed in the inspissation, part of its active matter is generally dissipated, and another source of injury is derived from the oxygenation which the extract is liable to suffer when thus heated in contact with the atmos-

pheric air; and the preparation itself being still soft and humid, must gradually undergo chemical alterations. Hence, inspissated juices are generally variable in their medicinal qualities.

THE process for these preparations is described in the Edinburgh Pharmacopœia under the first of them,

SUCCUS SPISSATUS ACONITI NAPELLI. INSPISSATED JUICE OF ACONITE OR WOLFSBANE.

“ The fresh leaves of the aconite are to be bruised, and being inclosed in an hempen bag, are to be pressed strongly, that they may give out their juice, which is to be reduced by evaporation in open vessels, heated by boiling water saturated with muriat of soda, to the consistence of thick honey. The mass, after it has cooled, is to be kept in glazed earthen vessels, and moistened with alcohol.”

THIS inspissated juice is the form under which wolfsbane has been usually administered. It has been given principally in obstinate chronic rheumatism, in a dose of half a grain night and morning, and gradually increased to 5 or 6 grains.

In

In the same manner are prepared the following Inspissated Juices from the leaves of their respective plants.

SUCCUS SPISSATUS ATROPÆ BELLADONNÆ. IN-  
SPISSATED JUICE OF DEADLY NIGHT-SHADE.

This has been recommended in scirrhus and some convulsive affections, in a dose of one grain, gradually increased.

SUCCUS SPISSATUS CONII MACULATI. INSPISSA-  
TED JUICE OF HEMLOCK.

Succus  
Spissat.  
Cicutæ.

UNDER this form, hemlock was employed by Störck in scirrhus and cancer. The dose given is at first two grains, but it can be largely increased, and has at length been taken to the extent of several drachms in the day. In the preparation of it, the narcotic power of the hemlock seems always to be more or less impaired, and it is injured by keeping. It is, therefore, uncertain with regard to strength, more so, perhaps, than the dried leaves of the plant.

SUCCUS SPISSATUS HYOSCYAMI NIGRI. INSPISSATED JUICE OF BLACK HENBANE.

THIS plant resembling opium in its powers, has been employed frequently as a substitute for it. The dose is one grain, which requires, if continued, to be increased.

SUCCUS SPISSATUS LACTUCÆ VIROSÆ. INSPISSATED JUICE OF STRONG-SCENTED LETTUCE.

THIS preparation was recommended as a remedy in dropsy by the German practitioners, in a dose of 4 or 5 grains, gradually increased to 1 or 2 drachms in twenty-four hours. It has been little used in this country.

Succ.  
Spissat.  
Baccæ  
Samb,

SUCCUS SPISSATUS SAMBUCCI NIGRÆ, *vulgo Rob Sambuci*. INSPISSATED JUICE, or Rob of Elder.

THE preparation of this is peculiar. "Five pounds of the juice of Elder Berries, and one pound of Sugar, are to be boiled with a gentle heat to the consistence of thick honey."

It has been given as an aperient or moderate laxative and diuretic in a dose of half an ounce, or  
one

one ounce. It possesses no quality to recommend it. In the preparation of it in the London Pharmacopœia, it is merely inspissated without sugar.

SUCCUS SPISSATUS MOMORDICÆ ELATERII, *vulgo* Elaterium. INSPISSATED JUICE OF WILD CUCUMBER, or Elaterium.

“CUT the ripe fruit of the wild cucumber, and pass through a very fine hair-sieve the juice lightly expressed; boil it a little, and set it aside for some hours until the thicker parts subside. Pour off the thinner part which floats above, and separate the rest by straining. The thicker part which remains after the straining, being covered with a linen cloth, is to be dried by a gentle heat.”

THIS is not, properly speaking, an inspissated juice, but is considered rather as a fecula. It is a very violent cathartic, operating powerfully in a dose of one or two grains. It has been used as a hydragogue in dropsy, and as a cathartic in obstinate constipation, where others have failed. The violence, and in some measure the uncertainty of its operation, prevent its frequent use.

THE additional preparations of this kind in the London Pharmacopœia are *Succus spissatus ribis nigri*, INSPISSATED JUICE OF BLACK CURRANT, and *Succus spissatus lemonis*, INSPISSATED JUICE OF LEMON, which require no particular observation.

## CHAP. V.

*OLEA FIXA*.—FIXED OILS.

THE chemical properties of these oils have already been described. They exist unmixed in the fruit and seeds of vegetables, and are obtained by expression, or decoction with water. The former is in general to be preferred; and to afford the oil pure it must be performed without heat, which, though it favours the separation of the oil, communicates to it an unpleasant flavour. To preserve them from becoming rancid, they ought to be kept secluded from the air.

A process in pharmacy somewhat difficult is to mix these oils with any watery fluid, so that they may be conveniently exhibited. It is usually done by the medium of mucilage, or of an alkali. If triturated with mucilage, and a small quantity of sugar, the oil is diffused through the water, and a milky liquor formed. A combination still more permanent is effected, by adding a few drops of water of ammonia, or 2 or 3 grains of carbonat of potash.

THE

THE directions for preparing these oils in the Edinburgh Pharmacopœia, are given under the OIL OF ALMONDS.

Oleum  
Amyg-  
dalæ.

OLEUM AMYGDALÆ COMMUNIS.

“ Take of Fresh Almonds any quantity. Bruise them in a stone-mortar, inclose them in a hempen bag, and express the oil by a press without heat.”

THE oil thus obtained is the purest of the expressed oils, being entirely free from odour or taste, and is used for the general medicinal purposes of expressed oils.

Ol. e fe-  
min. Li-  
ni.

IN the same manner is to be expressed OLEUM LINI USITATISSIMI, OIL OF LINTSEED, from the seeds of the plant. Being rather less pure, it is used only as an external application.

To these the London College add OLEUM RICINI, CASTOR OIL, and OLEUM SINAP EOS, OIL OF MUSTARD. The former is usually prepared, however, in the West Indies by decoction, and is milder than when obtained by expression; and the latter is scarcely applied to any use. The olive oil, which of all the expressed oils is most largely employed, is imported from the South of Europe.

## CHAP. VI.

EMULSIONES.—EMULSIONS.

EMULSIONS are preparations in which the expressed oil of seeds or kernels is suspended in water by the medium of the mucilage, and perhaps also of the fecula which the seeds contain. They are always opaque and milky: as the oil is merely diffused through the water, it gradually collects and rises to the surface: and owing to the vegetable matter dissolved in the liquor, they are also liable to become sour. They likewise suffer decomposition from vinous spirits or acids.

EMULSIO AMYGDALÆ COMMUNIS. ALMOND Lac A-  
mygdalæ.  
EMULSION.

“ Take of Sweet Almonds one ounce ; Wa-  
ter two pounds and an half ; beat the blanched  
almonds carefully in a stone-mortar, adding the  
water gradually, then strain.”

THIS

THIS is used merely as a demulcent in catarrh and gonorrhœa, or during the application of a blister, being drunk *ad libitum*.

EMULSIO GUMMI MIMOSÆ NILOTICÆ, *vulgo Emulsio Arabica*. ARABIC EMULSION.

“THIS is made in the same manner, adding, while beating the almonds, two ounces of mucilage of gum Arabic.”

It is used in the same cases as the preceding, and is supposed to have a greater share of demulcent power.

EMULSIO CAMPHORATA. CAMPHOR EMULSION.

“Take of Camphor one scruple; blanched Sweet Almonds two drachms; Refined Sugar one drachm; Water six ounces: to be made in the same manner as the Almond Emulsion.”

CAMPBOR is less apt to induce nausea when given in a liquid than when in a solid form; and this is one of the best forms of preparation. Its dose is two ounces.

---

CHAP. VII.*INFUSA.—INFUSIONS.*

INFUSION is a term employed in Pharmacy, to denote that operation in which water on remaining for some time on vegetable matter dissolves part of it; and also to express the preparation which results from that operation. It is obvious, that infusion, understood in this sense, can be applied with propriety only to those plants whose virtues depend on principles soluble in water. The strength of the infusion is considerably influenced by the temperature of the fluid, hot water dissolving more of the soluble matter than cold, while cold water, from this circumstance, frequently affords a preparation which, if weaker, is more grateful. From dried vegetables, the soluble matter is in general more easily obtained than from those which are recent. Infusions are alway extemporaneous preparations;

preparations, and cannot be preserved in a sound state for more than a few days.

INFUSUM CINCHONÆ OFFICINALIS. INFUSION OF  
PERUVIAN BARK.

“ Take of Powdered Peruvian Bark, one ounce ; Water, one pound. Macerate them for twenty-four hours, and strain.”

By simple infusion, water is capable of dissolving only a small portion of the active matter of bark. This preparation is used principally in dyspepsia, in a dose of two ounces occasionally.

+ INFUSUM DIGITALIS PURPUREÆ. INFUSION OF  
FOXGLOVE.

“ Take of the dried leaves of Foxglove, one drachm ; Boiling water, eight ounces ; Spirit of Cinnamon, one ounce. Macerate for four hours, and strain.”

INFUSION is the form under which Dr Withering, who introduced the use of digitalis in dropsy, recommended it to be given. The dose is half an ounce taken twice a-day, and gradual-

ly

ly increased till the effects of the remedy appear.

INFUSUM GENTIANÆ LUTÆ COMPOSITUM, *vulgo* Infusum  
*Infusum Amarum.* COMPOUND INFUSION OF gentianæ  
 GENTIAN. composi-  
 tum.

“ Take of Gentian Root, half an ounce ;  
 Dried Orange-peel, one drachm ; Coriander  
 Seeds, half a drachm ; Diluted alkohol, four  
 ounces ; Water, one pound. First pour on the  
 alkohol, and after three hours the water ; then  
 macerate without heat for twelve hours, and  
 strain.”

THIS bitter infusion is employed in dyspepsia,  
 and is much better adapted to continued use  
 than the bitter tinctures. Its dose is two ounces  
 occasionally.

INFUSUM MIMOSÆ CATECHU, *vulgo* Infusum Ja-  
 ponicum. INFUSION OF CATECHU.

“ Take of Extract of Catechu, two drachms  
 and a half ; Bark of Cinnamon, half a drachm ;  
 Boiling Water, seven ounces ; Simple Syrup,  
 one ounce. Macerate the extract and bark with  
 the water in a closed vessel for two hours, then  
 strain, and add the syrup.”

THE

THE Extract of Catechu is completely soluble in water. This preparation, therefore, possesses all its virtues uninjured, and rendered more grateful, by the addition of the cinnamon. Its principal use is in diarrhœa. Its dose, one ounce every third or fourth hour.

INFUSUM RHEI PALMATI. INFUSION OF RHUBARB.

“ Take of the Root of Rhubarb, half an ounce ; Boiling Water, eight ounces ; Spirit of Cinnamon, one ounce. Macerate the root with the water in a closed vessel for twelve hours, then, adding the spirit, strain the liquor.”

THE infusion of rhubarb is supposed to have more of the purgative than of the astringent power. It is accordingly used as a mild cathartic. Dose, two ounces.

Infus. rosæ. INFUSUM ROSÆ GALLICÆ. INFUSION OF RED ROSE.

“ Take of the Dried Petals of the Red Rose, two ounces ; Boiling Water, five pounds ; Sulphuric Acid, one drachm ; Refined Sugar, two ounces

ounces. Macerate the petals with the boiling water in an earthen vessel, which is not glazed with lead, for four hours; then having poured on the acid, strain the liquor, and add the sugar."

THIS infusion is used principally as a moderately astringent gargle, in slight cases of cynanche. It owes little else than colour, and a pleasant flavour, to the petals of the rose; the astringency depending almost entirely on the sulphuric acid.

INFUSUM TAMARINDI INDICÆ CUM CASSIA SENNA.  
NA. INFUSION OF TAMARIND AND SENNA.

"Take of the Prepared Fruit of the Tamarind, one ounce; Senna Leaves, one drachm; Coriander Seeds, half a drachm; Unrefined Sugar, half an ounce; Boiling Water, eight ounces: Macerate them in a close earthen vessel, which is not glazed with lead, shaking frequently, and after four hours strain the liquor. It may be made also with double or triple the quantity of senna."

THIS combination affords a very pleasant purgative, mild in its operation. The whole quan-

tity may be taken at intervals as a dose. If we wish a more powerful cathartic, it must be made with an increased proportion of senna.

---

IN the London Pharmacopœia are two infusions, both of Senna. The first, *INFUSUM SENNÆ SIMPLEX*, (prepared from Senna, an ounce and a half; Ginger, one drachm; and Boiling Distilled Water, one pint; macerated for an hour, and strained), is given as a cathartic, in a dose to an adult from two to four ounces. The second, *INFUSUM SENNÆ TARTARISATUM*, is prepared, from Senna, one ounce and a half; Coriander Seeds bruised, half an ounce; Acidulous Tartrate of Potash, two drachms; and Distilled Water, one pint; the Crystals of Tartar being dissolved in the water by boiling, and the hot liquor being poured on the senna and coriander: the maceration being continued for an hour, in a covered vessel, and strained when cold. It is similar to the infusion of senna and tamarinds, rather less pleasant, but having the recommendation

dation of cheapness. From the larger proportion of fenna it is also more active. Dose from two to four ounces.

---

UNDER the Chapter entitled *Infusa*, in the Edinburgh Pharmacopœia, are several preparations which cannot properly be ranked as infusions. The first is an example of a Mixture.

POTIO CARBONATIS CALCIS, *olim Potio Cretacea*. Mist. Cretacea.

CHALK POTION.

“Take of Prepared Carbonat of Lime, one ounce ; Refined Sugar, half an ounce ; Mucilage of Gum Arabic, two ounces. Rub them together, and add gradually of Water, two pounds and a half ; Spirit of Cinnamon, two ounces.”

THE chalk in this mixture is merely suspended by the mucilage. It is used as an antacid, one or two ounces being taken occasionally.

WITH this may be noticed a few Mixtures which find a place in the London Pharmacopœia.

MISTURA CAMPHORATA. CAMPHORATED MIXTURE.

“Take of Camphor, one drachm ; Rectified Spirit of Wine, a little ; Refined Sugar, half an ounce ; Boiling Distilled Water, one pint. Rub the camphor with the spirit, afterwards with the sugar ; add the water gradually, and strain the mixture.”

THE use of boiling water in this mixture is injudicious, as it volatilizes part of the camphor, and as it dissolves it in less proportion than when cold. It is given as a stimulant, in the dose of one ounce every second or third hour, in fever accompanied with debility.

MISTURA MOSCHATA. MUSK MIXTURE.

“Take of Musk, two scruples ; Powdered Gum Arabic, Refined Sugar, of each one drachm ; Rose Water, six ounces. Rub the musk with the sugar, then with the gum, and add the rose water gradually.”

THIS is a convenient form for the exhibition of musk. The dose is one ounce, or an ounce and a half.

## LAC AMMONIACI. MILK OF GUM AMMONIAC.

“Take of Gum Ammoniac, two drachms; Distilled Water, half a pint: Triturate the gum-resin with the water poured on gradually, until it become an emulsion.”

IN this mixture the resin and oily matter is suspended in the water by the medium of the gum, and a milky-like fluid formed, from which the resin gradually subsides. It is given as an expectorant, in a dose from half an ounce to an ounce at a time.

## LAC ASSAFOETIDÆ.

THIS is prepared in the same manner. It is the resin of the assafoetida suspended by the intervention of the gum. In hysteria, it is given in a dose of half an ounce or an ounce, frequently repeated during the paroxysm.

MUCILAGO AMYLI. STARCH MUCILAGE. *Phar. Ed.* Mucilago Amyli.

“Take of Starch, half an ounce; Water, one pound. Rub the starch, adding gradually the water; then boil them for a short time.”

FECULA, of which wheat-starch is a variety, is soluble in boiling water, and forms a gelatinous solution. This starch-mucilage is principally used as a vehicle for giving opium, or other remedies, under the form of enema.

Mucilago Tragacanthæ. MUCILAGO ASTRAGALI TRAGACANTHÆ. MUCILAGE OF GUM TRAGACANTH.

“Take of Gum Tragacanth beat to powder, one ounce; Boiling Water, eight ounces. Macerate for twenty-four hours, and rub the gum carefully, that it may be dissolved; then strain it through linen.”

THIS gum gives a very viscid consistence to water; the mucilage, with the above proportion, is gelatinous, and is used principally in making troches. *If the m. is boiled it will be a more perfect one than by the usual way.*

Mucilago Arabici Gummi. MUCILAGO MIMOSÆ NILOTICÆ. MUCILAGE OF GUM ARABIC.

“Take of Powdered Gum Arabic, one part; Boiling Water, two parts. Digest with frequent agitation until the gum be dissolved; then strain through linen.”

THIS

THIS is the mucilage that is usually employed for pharmaceutic purposes ; such as suspending substances insoluble in water, rendering oils miscible with watery liquors, &c. It is also used as a demulcent.

MUCILAGO SEMINUM CYDONII MALI. *Lond.*

MUCILAGE OF QUINCE SEED.

“Take of Quince Seeds, one drachm ; Distilled Water, eight ounces. Boil with a gentle heat for ten minutes, and strain through linen.”

THIS mucilage is little employed, having no particular advantage, and being liable to spontaneous decomposition.

AQUA CALCIS. LIME WATER.

Aq. Calcis.

“Take of Lime recently prepared, half a pound : Put it into an earthen vessel, and sprinkle it with four ounces of water, keeping the vessel closed while the lime becomes hot, and falls into powder ; then pour on twelve pounds of water, and mix the lime with it by agitation. After the lime has subsided, repeat the agitation ; and do so about ten times, keeping the vessel always shut, that the free access of the

air may be prevented. Let the water be strained through paper, interposing between the filter and the funnel glass-rods, that the water may pass through as quickly as possible. Let it be kept in bottles well stoppt."

THE caution to exclude the air in this process, arises from the supposition that the lime would combine rapidly with the carbonic acid of the atmosphere. After the solution is strained, it is at least necessary that it should be kept in vessels well stoppt. A very small quantity only of lime is dissolved, about two grains to the ounce. The solution has a styptic taste. It is used as a tonic and astringent. Dose from one to two pounds daily.

## CHAP. VIII.

## DECOCTA.—DECOCTIONS.

By *Boiling* vegetable substances in water, their active matter is more abundantly dissolved than by simple infusion. The preparation thus obtained is termed a Decoction.

In a number of cases, part of the matter dissolved by the assistance of the high temperature separates as the liquor cools, especially where it is of a resinous matter; in others, however, it is retained.

Though a larger portion of matter is dissolved by the water in this mode of preparation, yet it cannot be always advantageously employed. Wherever the virtues of the substance subjected to it depend, in whole or in part, on any volatile principle, they are necessarily injured by this being dissipated. At the temperature of  $212^{\circ}$ , humid extractive matter  
combines

combines too with oxygen from the atmospheric air; and perhaps at the same temperature, some vegetable principles suffer decomposition from the re-action of their constituent parts: hence many vegetables suffer injury from boiling, even where this cannot be ascribed to the dissipation of their volatile parts. These circumstances limit considerably the application of this form of preparation.

Decoctions are always extemporaneous preparations. In general, during the boiling the air should be excluded, and the liquor ought to be strained while hot.

—<—>—

DECOCTUM ALTHÆÆ OFFICINALIS. DECOCTION  
OF ALTHÆA.

“Take of Dried Althæa Root, four ounces; Raisins freed from their seeds, two ounces; Water, seven pounds. Boil to five pounds; put aside the strained liquor until the impurities have subsided, and pour off the clear liquor.”

THE gum of vegetables is not injured by decoction. As the virtues of the althæa depend  
on

on this principle, they are obtained entire in this preparation. It is used as a demulcent, being taken *ad libitum*.

DECOCTUM ANTHEMIDIS NOBILIS, *vulgo Decoctum Chamæmeli sive Commune*. DECOCTION OF CHAMOMILE, or *Common Decoction*.

“ Take of the Dried Flowers of Chamomile, one ounce ; Caraway Seeds, half an ounce ; Water, five pounds. Boil for a quarter of an hour, and strain.”

THIS decoction is designed to be used principally as an enema and fomentation. Similar preparations are inserted in the London Pharmacopœia, under the names of DECOCTUM PRO ENEMATE, and DECOCTUM PRO FOMENTO.

DECOCTUM CINCHONÆ OFFICINALIS, *vulgo Decoctum Corticis Peruviani*. DECOCTION OF PERUVIAN BARK. Decoctum Cinchonæ.

“ Take of Peruvian Bark in powder, one ounce ; Water, one pound and a half. Boil for ten minutes in a covered vessel, and strain the liquor while hot.”

As

As the active part of Peruvian bark is chiefly resinous-extractive matter, part of it dissolved by the hot water is deposited as the liquor cools. Hence the necessity of straining it while hot. As the same matter suffers oxygenation during boiling, the propriety is obvious of continuing the boiling for a short time only, and in a close vessel. This decoction is given in general when bark in considerable doses is requisite, and where the powder does not remain on the stomach. The dose is two ounces repeated occasionally.

**DECOCTUM DAPHNES MEZEREL. DECOCTION OF MEZEREON.**

“ Take of the Bark of the Root of Mezereon, two drachms ; of Liquorice Root bruised, half an ounce ; Water, three pounds. Boil with a gentle heat to two pounds, and strain.”

THE use of the liquorice is to cover the pungency of the mezereon. The decoction is given in a dose of 6 or 8 ounces, three or four times a day, in the cases in which mezereon is employed, principally in the secondary symptoms of syphilis. *vide Dr. Ruppel*

DECOCTUM

DECOCTUM GEOFFRÆÆ INERMIS. DECOCTION  
OF CABBAGE-TREE BARK.

“ Take of Cabbage-Tree Bark in powder, one ounce; Water, two pounds. Boil with a gentle heat to one pound, and strain.”

DECOCTION has been the form under which this medicine has been usually exhibited. It is given as an anthelmintic in a dose of two ounces to an adult.

DECOCTUM GUAJACI OFFICINALIS COMPOSITUM,  
*vulgo Decoctum Lignorum.* COMPOUND DE-  
COCTION OF GUAIAK.

“ Take of Guaiac Wood Shavings, three ounces; Raisins, two ounces; Sassafras Root, Liquorice Root, of each one ounce; Water, ten pounds. Boil the water with the guaiac wood, and raisins, on a gentle fire, to five pounds, adding the roots towards the end of the boiling; then strain without expression.”

UNDER this form guaiac wood is administered as a remedy in cutaneous diseases, and sometimes in chronic rheumatism. It is taken to the extent of two or three pounds daily.

DECOCTUM

Decoc-  
tum Hor-  
dei.

DECOCTUM HORDEI DISTICHI. DECOCTION OF  
BARLEY.

“ Take of Pearl Barley, two ounces ; Water, five pounds. First wash off with cold water the flour adhering to the barley ; then boil the barley for a short time with about half a pound of water, to extract the colouring matter. This being rejected, put the barley thus purified into five pounds of boiling water. Boil this to one half, and strain.”

THIS decoction is used merely as a diluent in febrile affections. A similar formula, in which figs, raisins and liquorice, are added to the barley, is inserted in the London Pharmacopœia, under the title of DECOCTUM HORDEI COMPOSITUM.

DECOCTUM POLYGALÆ SENEGÆ. DECOCTION  
OF SENEKA.

“ Take of Seneka Root, one ounce ; Water, two pounds. Boil to sixteen ounces, and strain.”

THIS has been used as a remedy in chronic rheumatism, and sometimes as an expectorant in

in pneumonia. Its dose is two or three ounces, three or four times a-day.

DECOCTUM SMILACIS SARSAPARILLÆ.      DECOCTION OF SARSAPARILLA.      Decoction of Smilax.  
 TION OF SARSAPARILLA.      faparillæ.

“ Take of Sarsaparilla Root cut, six ounces ; Water, eight pounds. Digest for two hours, in a temperature of about 195°, then take out the root and bruise it ; put it again into the liquor, and boil it with a gentle fire to two pounds ; then express it, and strain.”

UNDER this form sarsaparilla has been given in the secondary symptoms of syphilis. It is probably to be regarded only as belonging to the nutrientia, and as such, when taken largely, it may be of some advantage. It has been given also in dysuria.

A FEW decoctions which have a place in the London Pharmacopœia remain to be noticed.

DECOCTUM CORNU CERVI.      DECOCTION OF HARTSHORN.

“ Take of Burnt and Prepared Hartshorn, two ounces ; Gum Arabic, six drachms ; Distilled Water,

Water, three pounds. Boil, stirring constantly, to two pounds, and strain."

THE burnt hartshorn, consisting chiefly of phosphat of lime, is insoluble in water. In this useless preparation, therefore, the gum Arabic only is dissolved.

DECOCTUM HELLEBORI ALBI. DECOCTION OF  
WHITE HELLEBORE.

"Take of White Hellebore Root in powder, one ounce; Distilled Water, two pints; Rectified Spirit of Wine, two ounces. Boil the water with the root to one pint; when the liquor is cold, strain, and add the spirit."

THIS is used as an external application in some cutaneous diseases, principally in psora.

DECOCTUM SARSAPARILLÆ COMPOSITUM. COM-  
POUND DECOCTION OF SARSAPARILLA.

"Take of Sarsaparilla Root, slit and bruised, six ounces; Bark of Sassafras Root, Shavings of Guaiac Wood, Liquorice Root bruised, of each one ounce; Mezereon, three drachms; Distilled Water, ten pints. Macerate with a gentle heat for six hours; boil to five pints, adding the me-  
zereon

zereon towards the end of the boiling; then strain."

THIS decoction is an improvement of the Lisbon Diet-Drink, once highly celebrated for its power in removing some of the secondary symptoms of syphilis, and promoting the action of mercury. Its dose is four or six ounces three or four times a-day. From Dr Russell's experiments, its efficacy appears to depend on the mezereon.

DECOCTUM ULMI. DECOCTION OF ELM.

"Take of the Bark of the Elm, fresh bruised, four ounces; Distilled Water, four pints. Boil to two pints, and strain."

THIS decoction has been recommended as a remedy in cutaneous diseases.

## CHAP. IX.

## SYRUPUS.—SYRUPS.

SYRUPS are solutions of sugar in water either pure, or containing other substances dissolved. They are seldom active medicines; but are principally designed to render others pleasant. The proportion of sugar with which they are generally made is about two parts to one of fluid.

SYRUPUS SIMPLEX *five Communis.* SIMPLE or  
Common SYRUP.

“Take of Refined Sugar beat to powder, fifteen parts; Water, eight parts. Dissolve the sugar with a gentle heat, and boil a little so as to form a syrup.”

THIS solution of sugar is used merely to communicate sweetness of taste.

## SYRUPUS ACIDI ACETOSI.

“ Take of Acetous Acid, two pounds and a half; Refined Sugar, three pounds and a half. Boil so as to form a syrup.”

THIS acidulous syrup being sufficiently pleasant, may enter into mixtures in which it cannot occasion any chemical decomposition.

SYRUPUS ALTHÆÆ OFFICINALIS. SYRUP OF AL-  
THÆÆ.

Syrup.  
Althææ.

“ Take of Fresh Althæa Root cut, one pound; Water, ten pounds; Refined Sugar, four pounds. Boil the water with the root to one half, and expressing it strongly, strain. Put aside the strained liquor, that the impurities may subside, and to the purified liquor add the sugar; then boil it so as to form a syrup.”

THE quantity of mucilage this syrup can contain is so trifling, that it cannot be considered as receiving from it any virtue.

## SYRUPUS AMOMI ZINGIBERIS. SYRUP OF GINGER.

Syrup.  
Zinziber.

“ Take of the Root of Ginger, beat, three ounces; Boiling Water, four pounds; Refined  
D 2 Sugar,

Sugar, seven pounds and a half. Macerate the root in the water, in a close vessel for twenty-four hours; and, to the strained liquor, add the beat sugar, so as to make a syrup."

THE flavour of the ginger renders this syrup sufficiently pleasant; it is therefore not unfrequently used.

Syrup.  
Cortic.  
Aurant.

SYRUPUS CITRI AURANTII. SYRUP OF ORANGE-PEEL.

"Take of the Fresh Outer Rind of the Orange, six ounces; Boiling Water, three pounds; Refined Sugar, four pounds. Macerate the rind in water for twelve hours; then to the strained liquor add the sugar beat to powder, and, by the application of a gentle heat, form a syrup."

THIS syrup, like the former, is used merely on account of its grateful aromatic flavour.

Syrup.  
Limonis  
Succi.

SYRUPUS CITRI MEDICÆ, *olim Syrupus Limonum.* SYRUP OF LEMON.

"Take of the Juice of Lemons strained after the impurities have subsided, three parts; Refined

finer Sugar, five parts ; dissolve the sugar so as to form a syrup."

THIS pleasant syrup is used to sweeten and acidulate mixtures, especially those of the mucilaginous kind.

SYRUPUS COLCHICI AUTUMNALIS. SYRUP OF COLCHICUM.

" Take of the Fresh Root of Colchicum, cut into small pieces, one ounce ; Acetous Acid, sixteen ounces ; Refined Sugar, twenty-six ounces. Macerate the root in the acid for two days, shaking the vessel occasionally ; then expressing it gently, strain it ; to the strained liquor add the sugar, and boil a little, so as to form a syrup."

COLCHICUM has been used under this form as a diuretic in dropsy. The dose of the syrup is half an ounce or six drachms.

SYRUPUS DIANTHI CARYOPHILLI. SYRUP OF CLOVE JULY-FLOWER.

Syrup.  
Caryo-  
phill.  
Rub.

" Take of the Fresh Petals of the Clove July-Flower freed from the heels, one pound ; of Boiling Water, four pounds ; of Refined Sugar, seven pounds. Macerate the petals

in the water for twelve hours; then to the strained liquor add the beat sugar; which dissolve with a gentle heat, so as to form a syrup."

THIS syrup is valued principally on account of its deep red colour. Its flavour also is pleasant.

Syrup.  
Papav.  
Alb.

SYRUPUS PAPAVERIS SOMNIFERI. SYRUP OF WHITE  
POPPY.

"Take of the Dried Capsules of the White Poppy, freed from the seeds, two pounds; Boiling Water, thirty pounds; Refined Sugar, four pounds. Macerate the sliced capsules in the water for twelve hours; then boil until a third part only of the liquor remain; and pressing it strongly, strain; boil down the strained liquor to one half, and again strain; lastly, the sugar being added, boil a little, so as to form a syrup."

THE capsules of the poppy possess the narcotic power of the plant; and the matter in which this resides is soluble in water. In this preparation, therefore, it is extracted. The syrup is given as an anodyne principally to children. The dose to a child a year old is one drachm.

It

It is uncertain in its strength. The Dublin College have substituted for it a syrup of opium.

SYRUPUS RHAMNI CATHARTICI. SYRUP OF Syrup.  
Spinæ  
Cervinæ.  
BUCKTHORN.

“ Take of the Clarified Juice of ripe Buckthorn Berries, two parts ; Refined Sugar, one part. Boil, so as to form a syrup.”

THIS syrup is used as a cathartic ; the dose to an adult is an ounce, or an ounce and a half.

SYRUPUS ROSÆ GALLICÆ. SYRUP OF RED ROSE.

“ Take of the Dried Petals of the Red Rose, seven ounces ; Boiling Water, five pounds ; Refined Sugar, six pounds. Macerate the petals in water for twelve hours ; then boil them a little, and strain ; to the strained liquor add the sugar, and again boil, so as to form a syrup.”

IN this preparation the slight astringency of the red rose is supposed to be preserved ; and where a syrup having this quality is indicated, this is generally preferred.

Syrup.  
Rosæ.

SYRUPUS ROSÆ CENTIFOLIÆ. SYRUP OF DAMASK  
OR PALE ROSE.

“ Take of the Fresh Petals of the Damask Rose, one pound ; Boiling Water, four pounds ; Refined Sugar, three pounds. Macerate the petals in water for twelve hours ; then to the strained liquor add the sugar, and boil, so as to form a syrup.”

THIS syrup is a very mild purgative, and, as such, is given to children in a dose of two or three tea-spoonfuls.

SYRUPUS SCILLÆ MARITIMÆ. SYRUP OF SQUILL.

“ Take of the Vinegar of Squill, two pounds ; Refined Sugar, three pounds and a half. Dissolve the sugar with a gentle heat, so as to form a syrup.”

THIS is an active remedy, and is the form under which squill is generally given as an expectorant. Its dose is one or two drachms. It is also given to children as an emetic, especially in pertussis.

SYRUPUS

SYRUPUS TOLUIFERÆ BALSAMI, *vulgo Syrupus Balsamicus.* SYRUP OF TOLU BALSAM. Syrup.  
Tolutan.

“Take of Common Syrup, two pounds; Tincture of Tolu Balsam, one ounce. With the syrup newly prepared, and removed from the fire, when it has nearly cooled, mix the tincture gradually with agitation.”

THIS syrup, according to the formula of the London College, is prepared by boiling the Balsam of Tolu in water, and dissolving the sugar in this liquor. Prepared in either way, it can be valued only on account of its flavour.

SYRUPUS VIOLÆ ODORATÆ. SYRUP OF VIOLET. Syrup.  
Violæ.

“Take of the fresh flowers of the Sweet-scented Violet, one pound; Boiling Water, four pounds; Refined Sugar, seven pounds and a half. Macerate the flowers in water for twenty-four hours in a covered glass or earthen vessel. Then strain, without expression, and to the strained liquor, add the beat Sugar, so as to form a syrup.”

THIS syrup is a very gentle laxative, and as such is given to infants in a dose of one or two tea-spoonfuls.

It

---

It remains to notice those few syrups which have not a place in the Edinburgh Pharmacopœia.

SYRUPUS SUCCI FRUCTÛS MORI. SYRUP OF MULBERRY JUICE.

SYRUPUS SUCCI FRUCTÛS RUBI IDÆI. SYRUP OF RASPBERRY JUICE.

SYRUPUS SUCCI FRUCTÛS RIBIS NIGRI. SYRUP OF BLACK-CURRENT JUICE.

THE syrups prepared from these fruits, inserted in the London Pharmacopœia, are pleasant and acidulous. Some of them, however, are superfluous.

SYRUPUS CROCI. SYRUP OF SAFFRON. *Pharm. Lond.* is admitted on account of its colour, as is also the SYRUPUS PAPAVERIS ERRATICI. SYRUP OF RED POPPY.

MEDICATED

MEDICATED HONEYS differ in little or nothing from syrups, and are therefore rejected from the Edinburgh Pharmacopœia. In the London and Dublin Pharmacopœias, are retained, MEL ACETATUM. OXYMEL COLCHICI. MEL ROSÆ. MEL SCILLÆ. OXYMEL SCILLÆ; which, as the corresponding syrups, have been noticed, it would be superfluous to give at length.

## CHAP. X.

## CHAP. X.

## VINA.—WINES.

WINE, from its composition, and especially from the alcohol and water it contains, is capable of dissolving the active matter of many vegetables. Solutions of this kind are named *Medicated Wines*. They are more liable to decomposition from keeping than tinctures. To obviate this, it is usual to add to them, when prepared, a portion of alcohol.

Vinum  
Aloes.

VINUM ALOES SOCOTORINÆ, *vulgo Tinctura Sacra*. WINE OF SOCCOTORINE ALOES. *Sacred Tincture*.

“Take of Socotorine Aloes, reduced to powder, one ounce; Lesser Cardamom Seeds, Ginger Root, of each, beat, one drachm; Spanish White-wine, two pounds. Digest for seven days, shaking frequently, and strain.”

THE

THE aloes is entirely soluble in the wine; so that in this preparation all its virtues are obtained. It is a stimulating cathartic, producing its full effect in the dose of one ounce. In a dose of one or two drachms, it is given to excite the action of the intestines and neighbouring organs.

VINUM GENTIANÆ COMPOSITUM, *vulgo Vinum Amarum.* COMPOUND GENTIAN WINE.

“Take of Gentian Root, half an ounce; Peruvian Bark, one ounce; Orange Peel dried, two drachms; Canella Bark, one drachm; Diluted Alcohol, four ounces; Spanish White-wine, two pounds and a half. On the root and barks bruised, pour first the diluted alcohol; and after twenty-four hours, add the wine. Then macerate for seven days, and strain.”

THIS wine is designed as a stomachic; but from its tendency to become acedcent, it is not well adapted to administration in dyspepsia. Its dose is six drachms.

VINUM IPECACUANHÆ. IPECACUAN WINE.

Vinum  
Ipecac.

“Take of Ipecacuan Root bruised, one ounce; Spanish White-wine, fifteen ounces. Ma-  
cerate

cerate for seven days, and strain through paper."

THIS Medicated Wine is preferable to a Tincture of Ipecacuan, as being less pungent, while it holds the active matter of the root fully dissolved. Its dose as an emetic is one ounce to an adult.

VINUM NICOTIANÆ TABACI. TOBACCO WINE.

"Take of the leaves of Tobacco, one ounce; Spanish White-wine, one pound. Macerate for seven days, and strain through paper."

UNDER this form, Tobacco has been used as a diuretic in dropsy. Dose, thirty drops, gradually increased to sixty or eighty twice a-day.

Vinum  
Rhabar-  
bari.

VINUM RHEI PALMATI. RHUBARB WINE.

"Take of the Root of Rhubarb, cut, two ounces; Canella Bark, one drachm; Diluted Alcohol, two ounces; Spanish White-wine, fifteen ounces. Macerate seven days, and strain through paper."

THE dose of this wine as a purgative is from half an ounce to an ounce. The tincture of rhubarb is in general to be preferred to it.

## CHAP. XI.

*ACETA.*—VINEGARS.

VINEGAR is capable of dissolving several of the principles of vegetables. It frequently, however, alters their powers, or does not coincide with them in virtue. There are, therefore, few Medicated Vinegars in use.

## ACETUM AROMATICUM. AROMATIC VINEGAR.

“Take of the dried tops of Rosemary; the dried leaves of Sage, of each four ounces; dried Lavender Flowers, two ounces; Cloves, two drachms; distilled Acetous Acid, eight pounds. Macerate for seven days, and strain the expressed liquor through paper.”

FROM the impregnation of the vinegar with the flavour of these aromatic vegetables, it becomes a grateful perfume, to which purpose chiefly this preparation is applied.

ACIDUM

ACIDUM ACETOSUM CAMPHORATUM. CAMPHORATED ACETOUS ACID.

“ Take of the stronger Acetous Acid, fix ounces ; Camphor, half an ounce ; Alkohol, as much as may be necessary. Rub the Camphor with the alkohol into a powder, which put into the acid, that it may be dissolved.

THIS preparation, snuffed up the nostrils, is a powerful and grateful stimulant, used to obviate nausea, or relieve languor.

Acet.  
Scillæ.

ACETUM SCILLÆ MARITIMÆ. VINEGAR OF SQUILL.

“ Take of Squill Root dried, two ounces ; distilled Acetous Acid, two pounds and a half ; Alkohol, three ounces. Macerate the squill with the acetous acid for seven days : express the acid ; to which add the alkohol ; and when the impurities have subsided, pour off the liquor.”

VINEGAR is the proper menstruum of squill ; and this preparation possesses all its powers, unimpaired. It is seldom given under this form as a diuretic, but generally as an expectorant. The dose is from one to two drachms.

---

CHAP. XII.*TINCTURA.*—TINCTURES.

TINCTURES are solutions of vegetable, animal, and sometimes of mineral substances, in spiritous liquors. The solvent may be either pure alcohol, diluted alcohol, or alcohol impregnated with ammonia or ether. They generally contain the virtues of the substances dissolved, in a concentrated state, though sometimes altered, or lost in those of the menstruum. They are little liable to decomposition, and this gives them a superiority over those preparations in which the solvent power of water is employed.

Alcohol is the solvent of a number of the immediate principles of vegetables ; of resin, camphor, essential oil, and extract ; and hence is capable of extracting the virtues of many im-

portant remedies. Tinctures made with it are in general decomposed on the addition of watery liquors.

Diluted Alcohol or Proof-spirit is a still more general solvent; as the water it contains dissolves several principles which are not soluble in pure alcohol. It is therefore more generally employed.

Alcohol, impregnated with ammonia or ether, is employed in forming tinctures only of a few substances, whose operations are supposed to be promoted by these agents.

Tinct.  
Aloes.

TINCTURA ALOES SOCOTORINÆ. TINCTURE OF  
ALOES.

“ Take of Socotorine Aloes in powder, half an ounce; Extract of Liquorice, one ounce and a half; Alcohol, four ounces; Water, one pound. Digest for seven days with a gentle heat in a closed vessel, shaking the vessel frequently; (directions which, with regard to all tinctures, are to be observed).”

THIS

THIS is the only tincture in which the proportion of water is superior to that of alcohol. The aloes being principally gum, is entirely dissolved by the menstruum. Its dose as a cathartic is one ounce.

TINCTURA ALOES ÆTHEREA. ETHEREAL TINCTURE OF ALOES.

“ Take of Myrrh, Socotorine Aloes, of each one ounce and a half; English Saffron, one ounce; Spirit of Sulphuric Ether, one pound. Digest the myrrh with the spirit for four days in a closed phial; then add the saffron and aloes. Digest again for four days; and when the impurities have subsided, pour off the tincture.”

By first digesting the myrrh with the spirit, a sufficient quantity of it is dissolved, which it would not be were the aloes added alongst with it; and by the second digestion, a sufficient quantity of the latter is taken up. The formula is the improvement of one which has long kept its place in the different pharmacopœias. It is a stimulating purgative in a dose of one or two drachms.

Tinct.  
Aloes  
Comp.

TINCTURA ALOES CUM MYRRHA. TINCTURE OF  
ALOES AND MYRRH.

“ Take of Myrrh powdered, two ounces ; Alcohol, one pound and a half ; Water, half a pound. Mix the alcohol with the water ; then add the myrrh ; digest for four days ; and lastly, add of Socotorine Aloes, one ounce and a half ; English Saffron, one ounce. Digest again for three days, and pour off the pure tincture.”

THIS tincture differs in little from the former but in the menstruum. It is used principally externally as an application to bleeding wounds, and a stimulant to foul ulcers.

Tinctura  
Carda-  
momi.

TINCTURA AMOMI REPENTIS. TINCTURE OF  
CARDAMOM.

“ Take of Cardamom Seeds, four ounces ; Diluted Alcohol, two pounds and a half. Digest for two days, and strain through paper.”

THIS tincture is used for its moderate aromatic flavour and pungency. A compound tincture of cardamom, in which caraway, cinnamon and raisins, are introduced, is likewise inserted in the

London

London Pharmacopœia, and is used for the same purpose.

TINGTURA ARISTOLOCHIÆ SERPENTARIÆ.

TINGTURE OF SNAKE-ROOT.

Tinctura  
Serpent-  
tar.

“ Take of Virginian Snake-root, two ounces ; Cochineal, one drachm ; Diluted Alcohol, two pounds and a half. Digest for seven days, and strain through paper.”

SERPENTARIA is seldom exhibited under the form of tincture. As a grateful bitter, it may be given occasionally in dyspepsia in a dose of two drachms.

TINGTURA ASSAFOETIDÆ. TINGTURE OF ASSAFOETIDA.

Tinctura  
Assafœ-  
tid.

“ Take of Assafœtida, four ounces ; Alcohol, two pounds and a half. Digest for seven days, and strain through paper.”

THIS is a solution chiefly of the resinous part of the assafœtida. As a remedy in hysteria, it is sometimes given in a dose of one drachm.

Tinctura  
Benzoes  
Comp.

TINCTURA BENZOES COMPOSITA, *vulgo Balsamum Traumaticum*. COMPOUND TINCTURE OF BENZOIN.

“ Take of Benzoin, three ounces ; Balsam of Peru, two ounces ; Hepatic Aloes, half an ounce ; Alkohol, two pounds. Digest for seven days, and strain through paper.”

THIS is used only externally, and principally as an application to recent superficial wounds.

Spiritus  
Camphor-  
rat.

TINCTURA CAMPHORÆ ; *vulgo Spiritus Vinosus Camphoratus*. TINCTURE OF CAMPHOR.

“ Take of Camphor, one ounce ; Alkohol, one pound. Mix, so as to dissolve the camphor. It may be also made with a double or triple proportion of camphor.”

THIS solution is used externally as a stimulant and anodyne application in chronic rheumatism, bruises and strains. It is applied by friction to the part.

LINIMENTUM CAMPHORÆ COMPOSITUM. *Lond.*

“Take of Camphor two ounces; Water of Ammonia, six ounces; Spirit of Lavender, sixteen ounces. Mix the water of ammonia with the spirit, and distil sixteen ounces from a glass retort with a gentle heat. Dissolve the camphor in the distilled liquor.”

THIS liniment is applied to the same uses as the preceding. From the addition of the ammonia it is more powerful as a stimulant.

TINCTURA CASSIÆ SENNÆ COMPOSITA, *olim Elixir Salutis.* TINCTURE OF SENNA.Tinct.  
Sennæ.

“Take of the Leaves of Senna, two ounces; Root of Jalap, one ounce; Coriander Seeds, half an ounce; Diluted Alcohol, three pounds and a half. Digest for seven days, and to the tincture strained through paper add four ounces of Refined Sugar.”

THIS tincture is in very common use as a purgative. Its dose is one ounce, or one ounce and a half.

Tinct.  
Castor.

TINCTURA CASTOREI. TINCTURE OF CASTOR.

“ Take of Russian Castor, one ounce and a half; Alkohol, one pound. Digest for seven days, and strain through paper.”

IN the London, and likewise in the Dublin Pharmacopœia, this tincture is ordered to be prepared with diluted alkohol; but with pure alkohol it is more grateful. It is a feeble remedy, given sometimes as an antispasmodic, in a dose of from half a drachm to a drachm.

TINCTURA CASTOREI COMPOSITA. COMPOUND  
TINCTURE OF CASTOR.

“ Take of Russian Castor, one ounce; Affa-  
foetida, half an ounce; Ammoniated Alkohol, one  
pound. Digest for seven days, and strain through  
paper.”

THIS tincture is more active than the former;  
it is given in a similar dose.

Tinct.  
Cinchonæ.

TINCTURA CINCHONÆ OFFICINALIS. TINCTURE  
OF PERUVIAN BARK.

“ Take of Peruvian Bark in powder, four  
ounces; Diluted Alkohol, two pounds and a  
half.

half. Digest for seven days, and strain through paper."

THE active matter of bark is entirely extracted by diluted alcohol, but the powers of the menstruum itself do not allow of the use of bark under this form, where large doses of the remedy are necessary. It is used in dyspepsia, occasionally, in a dose of two drachms.

TINCTURA CINCHONÆ, *vulgo Corticis Peruviani*,  
COMPOSITA. COMPOUND TINCTURE OF PERUVIAN BARK. *Lond.*

"Take of Peruvian Bark in powder, two ounces; dried Orange-peel, one ounce and a half; Virginian Snake-root, three drachms; Saffron, one drachm; Cochineal in powder, two scruples; Proof-Spirit, twenty ounces. Digest for fourteen days, and strain."

THIS has been long known under the name of *Huxham's Tincture of Bark*. It is more grateful than the simple tincture, and is used like it in dyspeptic affections, in a dose of two or three drachms.

TINCTURA CINCHONÆ, *vulgo Corticis Peruviani*,  
AMMONIATA. *Lond.* AMMONIATED TINC-  
TURE OF BARK.

“ Take of Peruvian Bark in powder, four ounces ; Compound Spirit of Ammonia, two pounds. Digest in a closed vessel for ten days, and strain.”

THERE seems little propriety in employing spirit of ammonia as a menstruum of bark, as in scarcely any case can they coincide in virtue, and the activity of the ammonia must be much superior to that of the quantity of bark dissolved.

Tinct.  
Colomb.

TINCTURA COLOMBÆ. TINCTURE OF COLOMBO.

“ Take of the Root of Colombo in powder, two ounces ; diluted Alcohol, two pounds. Digest for seven days, and strain through paper.”

THIS is used merely as a bitter tincture in dyspepsia, in a dose of three or four drachms.

TINCTURA

TINCTURA CONVULVULI JALAPÆ. TINCTURE OF Tinct.  
JALAP. Jalap.

“ Take of the root of Jalap in powder, three ounces; diluted Alcohol, fifteen ounces. Digest for seven days, and strain through paper.”

THE activity of jalap resides in its resin, which in this preparation is extracted along with a portion of mucilage. The tincture may be given as a cathartic, in a dose of four or six drachms.

TINCTURA CROCI. TINCTURE OF SAFFRON.

“ Take of English Saffron, one ounce; diluted Alcohol, fifteen ounces. Digest for seven days, and strain through paper.”

THIS tincture is to be valued only for its colour.

TINCTURA DIGITALIS PURPUREÆ. TINCTURE OF  
FOXGLOVE.

“ Take of the dried Leaves of Foxglove, one ounce; Diluted Alcohol, eight ounces. Digest for seven days, and strain through paper.”

THIS

THIS is a very active preparation; it is the one in which the virtues of digitalis are longest preserved uninjured, and appears to be the best form under which that remedy can be exhibited, to obtain its *narcotic* effects. Its dose is ten drops, which, according to the general rules observed in the administration of digitalis, is to be gradually increased.

Tinct.  
Gentian.  
Comp.

TINCTURA GENTIANÆ COMPOSITA, *vulgo Elixir Stomachicum*. COMPOUND TINCTURE OF GENTIAN.

“ Take of Gentian Root, two ounces; dried Orange-peel, one ounce; Canella Bark, half an ounce; Cochineal, half a drachm; Diluted Alcohol, two pounds and a half. Digest for seven days, and strain through paper.”

THIS tincture is employed in dyspepsia, in a dose of two or three drachms given occasionally.

TINCTURA GUAJACI. TINCTURE OF GUAIAAC.

“ Take of the Resin of Guaiac, one pound; Alcohol, two pounds and a half. Digest for seven days, and strain through paper.”

THIS

THIS tincture may be given in a dose of two or three drachms, but it is inferior in activity to the one which follows.

TINCTURA GUAJACI AMMONIATA. AMMONIA- Tinct.  
TED TINCTURE OF GUAIAAC. Guaiac.  
Ammon.

“ Take of the Refin of Guaiac, four ounces ;  
Ammoniated Alkohol, one pound and a half.  
Digest for seven days, and strain through pa-  
per.”

THE ammonia coinciding in virtue with the guaiac, this affords a preparation of considerable efficacy. It is given in chronic rheumatism, in a dose from one to two drachms.

TINCTURA HELLEBORI NIGRI. TINCTURE OF Tinct.  
BLACK HELLEBORE. Helleb.  
Nig.

“ Take of Black Hellebore Root, four ounces ;  
Cochineal, half a drachm ; Diluted Alkohol, two  
pounds and a half. Digest for seven days, and  
strain through paper.”

THIS tincture has been used as an emmena-  
gogue, in a dose of one drachm.

TINCTURA

TINCTURA HYOSCIAMI NIGRI. TINCTURE OF  
BLACK HENBANE.

“ Take of the dried Leaves of Black Henbane, one ounce ; Diluted Alcohol, eight ounces. Digest for seven days, and strain through paper.”

THE tincture is a preferable form to the inspissated juice, the form under which black henbane used to be employed.

TINCTURA KINO. TINCTURE OF KINO.

“ Take of Kino, two ounces ; Diluted Alcohol, one pound and a half.”

THE dose of this tincture, is from half a drachm to a drachm.

Tinct.  
Cinnam.

TINCTURA LAURI CINNAMOMI. TINCTURE OF  
CINNAMON.

“ Take of Cinnamon Bark, three ounces ; Diluted Alcohol, two pounds and a half. Digest for seven days, and strain through paper.”

THIS is used merely as an aromatic.

TINCTURA

TINCTURA LAURI CINNAMOMI COMPOSITA, *olim* Tinct.  
*Tinctura Aromatica.* COMPOUND TINCTURE OF Cinnam.  
 CINNAMON. Comp.

“ Take of the Bark of Cinnamon, Cardamom-seeds, of each one ounce ; Long Pepper, two drachms ; Diluted Alcohol, two pounds and a half. Digest for seven days, and strain through paper.”

THIS tincture is used principally in combination with other medicines, to communicate to them an aromatic pungency and odour.

TINCTURA MELOES VESICATORII, *vulgo Tinctura* Tinct.  
*Cantharidum.* TINCTURE OF CANTHARIDES. Canthar.

“ Take of Cantharides, one drachm ; Diluted Alcohol, one pound. Digest for seven days, and strain through paper.”

THIS tincture is used principally externally as a rubefacient ; as an internal remedy, the dose in which it has been given is fifteen drops.

TINCTURA MIMOSÆ CATECHU ; *olim, Tinctura* Tinct.  
*Japonica.* TINCTURE OF CATECHU. Catechu.

“ Take of Catechu, three ounces ; Bark of Cinnamon, two ounces ; Diluted Alcohol, two pounds

pounds and a half. Digest for seven days, and strain through paper."

THIS solution of catechu, rendered more grateful by the cinnamon, is given in a dose of one drachm.

Tinct.  
Myrrh.

TINCTURA MYRRHÆ. TINCTURE OF MYRRH.

"Take of Myrrh in powder, three ounces; Alcohol, twenty ounces; Water, ten ounces. Digest for ten days, and strain through paper."

MYRRH being principally resinous, requires for its solution alcohol, not so much diluted as proof-spirit. The tincture is used principally as an external stimulant and antiseptic application.

Tinct.  
Opii.

TINCTURA OPII, *five Thebaica; vulgo, Laudanum liquidum.* TINCTURE OF OPIUM.

"Take of Opium, two ounces; Diluted Alcohol, two pounds. Digest for seven days, and strain through paper."

THIS tincture is the usual form under which opium is administered. The proportion of opium to the solvent, is five grains to the drachm; but by evaporation it is found that one drachm of  
the

the tincture holds three grains and a half dissolved. The usual dose is twenty-five drops.

TINCTURA OPII AMMONIATA; *olim, Elixir Purgoricum.* AMMONIATED TINCTURE OF OPIUM.

“ Take of Benzoic Acid, English Saffron, of each three drachms; Opium, two drachms; Volatile Oil of Anise, half a drachm; Ammoniated Alcohol, sixteen ounces. Digest for seven days in a shut phial, and strain through paper.”

THE operation of the opium cannot be much influenced by the substances with which it is combined in this formula. The common application of it is as a remedy in catarrhal affections. Its dose is from half a drachm to a drachm. The proportion of opium is one grain to a drachm.

TINCTURA OPII CAMPHORATA. *Lond.*

“ Take of Hard Purified Opium reduced to powder, Flowers of Benzoin, of each one drachm; Camphor, two scruples; Oil of Anise, one drachm; Proof-Spirit, two pounds by measure. Digest for ten days, and strain.”

THIS tincture, known like the preceding one by the name of Paregoric Elixir, differs from it not only in some of the ingredients and in the menstruum, but in the proportion of opium. Half an ounce of it contains only one grain. Its dose is two or three drachms.

TINCTURA RHEI PALMATI. TINCTURE OF RHU-  
 Tinct. BARB.  
 Rhabarb.

“ Take of the Root of Rhubarb, three ounces ; Lesser Cardamom Seeds, half an ounce ; Diluted Alcohol, two pounds and a half. Digest for seven days, and strain through paper.”

THIS tincture contains all the virtues of rhubarb. Its dose is from half an ounce to an ounce.

TINCTURA RHEI CUM ALOE ; *olim, Elixir Sacrum,*  
 TINCTURE OF RHUBARB WITH ALOES.

“ Take of the Root of Rhubarb, ten drachms ; Socotorine Aloes, six drachms ; Lesser Cardamom Seeds, half an ounce ; Diluted Alcohol, two pounds and a half. Digest for seven days, and strain through paper.”

THIS

THIS is frequently employed as a stimulating cathartic, in a dose of six drachms, or an ounce.

TINCTURA RHEI CUM GENTIANA ; *olim, Tinctura Rhei Amara.* TINCTURE OF RHUBARB WITH GENTIAN.

“ Take of Root of Rhubarb, two ounces ; Gentian Root, half an ounce ; Diluted Alcohol, two pounds and a half. Digest for seven days, and strain through paper.”

THIS combination of gentian with rhubarb is supposed to render it a more useful remedy in dyspeptic cases. Its dose is from two to four drachms.

TINCTURA RHEI COMPOSITA. *Lond.* COMPOUND TINCTURE OF RHUBARB.

“ Take of Rhubarb cut, two ounces ; Liquorice bruised, half an ounce ; Ginger in powder, Saffron, of each two drachms ; Distilled Water, one pound ; Proof-Spirit, twelve ounces. Digest for fourteen days, and strain.”

THIS tincture differs in little from the simple tincture, except in the use of a menstruum, con-

taining less alcohol. It may be given in a similar dose.

Liniment.  
Sapon.  
Comp.

TINCTURA SAPONIS, *vulgo Linimentum Saponaceum.* TINCTURE OF SOAP.

“ Take of Soap, four ounces ; Camphor, two ounces ; Volatile Oil of Rosemary, half an ounce ; Alcohol, two pounds. Digest the soap in the alcohol for three days ; then add the camphor and oil to the strained liquor, agitating it.”

THIS is a powerful stimulant used as an external application in strains and rheumatic pains.

TINCTURA SAPONIS CUM OPIO ; *olim, Linimentum Anodynum.* TINCTURE OF SOAP WITH OPIUM.

“ This is made in the same manner, and from the same ingredients, as the tincture of soap ; only adding at first one ounce of opium.”

IT is used for the same purposes as the preceding tincture, but is a more powerful anodyne.

Tinct.  
Balsam.  
Tolut.

TINCTURA TOLUIFERÆ BALSAMI ; *olim, Tinctura Tolutana.* TINCTURE OF TOLU BALSAM.

“ Take of Balsam of Tolu, one ounce and a half ; Alcohol, one pound. Digest until the  
balsam

balsam is dissolved, and strain through paper."

THIS tincture is scarcely used but on account of its flavour, and for making the Syrup of Tolu.

TINCTURA VERATRI ALBI. TINCTURE OF WHITE  
HELLEBORE.

"Take of White Hellebore Root, eight ounces; Diluted Alcohol, two pounds and a half. Digest for seven days, and strain through paper."

WHITE HELLEBORE is a medicine perhaps never prescribed internally, its operation is so violent. The dose of this tincture cannot exceed a few drops.

---

THE following are the Tinctures peculiar to the London Pharmacopœia. In each of them the pound is by measure, or is equivalent to a pint.

TINCTURA AURANTII CORTICIS. TINCTURE OF  
ORANGE-PEEL.

"Take of Fresh Orange-peel, three ounces; Proof-Spirit, two pounds. Digest for three days, and strain."

It may be used as stomachic and as a grateful bitter.

TINCTURA BALSAMÆ PERUVIANI. TINCTURE OF PERUVIAN BALSAM.

“ Take of Peruvian Balsam, four ounces ; Rectified Spirit of Wine, one pound. Digest until the balsam is dissolved.”

THIS tincture is scarcely applied to any use.

TINCTURA CASCARILLÆ. TINCTURE OF CASCARILLA.

“ Take of Cascarilla in powder, four ounces ; Proof-Spirit, two pounds. Digest with a gentle heat for eight days, and strain.”

CASCARILLA being a remedy little employed in modern practice, this tincture is scarcely used.

TINCTURA GALBANI. TINCTURE OF GALBANUM.

“ Take of Galbanum cut into small pieces, two ounces ; Proof Spirit, two pounds. Digest with a gentle heat for eight days, and strain.”

TINCTURE

TINCTURE of Galbanum has been used in hysteria, flatulence and asthma, in a dose from one to three drachms.

TINCTURA SABINÆ COMPOSITA. COMPOUND  
TINCTURE OF SAVIN.

“ Take of Extract of Savin, one ounce ; Tincture of Castor, one pound ; Tincture of Myrrh, half a pound. Digest until the extract of savin is dissolved, and strain.”

THIS tincture has been recommended as an emmenagogue, in a dose of half a drachm twice a-day.

TINCTURA SCILLÆ. TINCTURE OF SQUILL.

“ Take of Squill recently dried, four ounces ; Proof-Spirit, two pounds. Digest for eight days, and pour off the liquor.”

As vinegar best covers the nauseous taste of squill, it is generally used as its menstruum. This tincture contains, however, the active matter of this root, and may be given in a dose of from twenty to sixty drops.

TINCTURA VALERIANÆ. TINCTURE OF VALERIAN.

“ Take of Wild Valerian in coarse powder, four ounces ; Proof-Spirit, two pounds. Digest with a gentle heat for eight days, and strain.”

TINCTURA VALERIANÆ AMMONIATA. AMMONIATED TINCTURE OF VALERIAN.

“ Take of Wild Valerian in coarse powder, four ounces ; Compound Spirit of Ammonia, two pounds. Digest for eight days, and strain.”

Of these two tinctures, the latter is the more powerful, and is a remedy not unfrequently employed in hysteric affections. Its dose is from one to two drachms.

TINCTURA ZINGIBERIS. TINCTURE OF GINGER.

“ Take of Ginger in powder, two ounces ; Proof-Spirit, two pounds. Digest with a gentle heat for eight days, and strain.”

THIS tincture contains the pungency of the ginger, and may be used as an aromatic in combination with other remedies.

---

CHAP. XIII.*EXTRACTA.*—EXTRACTS.

WHEN vegetable matter is dissolved in water or alcohol, by evaporation of the solvent, a concrete tenacious mass is obtained, termed an Extract. When prepared from an aqueous solution, it is named a Watery, when from one in alcohol pure or diluted, a Spiritous extract. The former must consist chiefly of those proximate principles which water can easily dissolve; mucilage, tannin, extractive and saline matter: the latter of a portion of these with resin. In either preparation, the volatile principles must necessarily be dissipated; and in many cases, especially in the preparation of the watery extracts, decomposition or oxygenation of the more fixed parts take place. Hence there are few vegetables whose virtues are obtained uninjured in their extracts.

I.—*EXTRACTA*

I.—*EXTRACTA PER AQUAM.* EXTRACTS BY WATER.

THE directions for preparing these are given in the Edinburgh Pharmacopœia, under the Extract of Gentian.

Extract.  
Gentian.

EXTRACTUM GENTIANÆ LUTÆ. EXTRACT OF GENTIAN.

“ Take of Gentian Root, any quantity. Having cut and bruised it, add eight times its weight of Distilled Water. Boil to one half, and strain, expressing the liquor strongly. Reduce it immediately to the consistence of thick honey, by evaporation in a bath of boiling water, saturated with muriat of soda.”

THIS extract is intensely bitter. It is generally used to form other medicines into pills.

IN the same manner are prepared the following Extracts :

EXTRACTUM

EXTRACTUM RADICIS GLYCYRRHIZÆ GLABRÆ. Extract.  
Glycyrr.  
EXTRACT OF LIQUORICE ROOT.

It consists chiefly of mucilage and saccharine matter, and is used as a demulcent in catarrh. It is seldom prepared in the shops, but on a large scale; and in some of the foreign Pharmacopœias, the extract of liquorice of commerce is ordered to be purified by solution in water, straining, and a new evaporation. This is named Refined Liquorice.

EXTRACTUM RADICIS HELLEBORI NIGRI. EX- Extract.  
TRACT OF BLACK HELLEBORE ROOT. Helleb.  
Nig.

THE spiritous extract of this root is extremely violent in its operation. The aqueous which is received in the Edinburgh Pharmacopœia is comparatively mild. Its dose is from ten to twenty grains.

EXTRACTUM FOLIORUM RUTÆ GRAVEOLENTIS. Extract.  
Rutæ.  
EXTRACT OF RUE.

As the virtues of Rue reside chiefly, if not entirely, in its essential oil, this extract received  
in

in both Pharmacopœias must be regarded as an injudicious preparation.

Extract. Sennæ.    EXTRACTUM FOLIORUM CASSIÆ SENNÆ.    EXTRACT OF SENNA.

SENNA has its activity much impaired by decoction. The extract, therefore, cannot be regarded as a proper preparation of it.

Extract. Chamæmeli.    EXTRACTUM FLORUM ANTHEMIDIS NOBILIS.    EXTRACT OF CHAMOMILE.

THE unpleasant flavour of chamomile is entirely dissipated by decoction. The extract is, therefore, a pure and grateful bitter.

Extract. Papaveris Albi.    EXTRACTUM CAPITUM PAPAVERIS SOMNIFERI.    EXTRACT OF POPPY.

*By E. P. L. de Chiro*  
*in H<sub>2</sub>O at 60°*  
*Boiled up with*  
*sugar into a*  
*syrup*  
THIS extract from the capsule of the poppy retains its narcotic quality, but is not uniform in strength. Sometimes it is used in making the Syrup of Poppy.

Extract. Hæmatoxyli.    EXTRACTUM LIGNI HÆMATOXYLI CAMPECHENSIS.    EXTRACT OF LOGWOOD.

THE astringency of the logwood is obtained entire

entire in this extract. It is sometimes used as the basis of astringent mixtures. Its dose is from ten to twenty grains.

---

THE watery extracts in the London Pharmacopœia are the same with those in the Edinburgh, with the addition of Extract of Broom, of Savin, of Peruvian Bark.

EXTRACTUM CACUMINIS GENISTÆ. EXTRACT OF  
BROOM TOPS.

AN infusion of broom tops has been used as a diuretic ; but the extract can scarcely be considered as possessing any power.

EXTRACTUM SABINÆ. EXTRACT OF SAVIN.

THIS is liable to the same objection as the extract of rue,—that its virtues reside chiefly in its essential oil, which must be dissipated during the process.

EXTRACTUM CINCHONÆ, *vulgo Corticis Peruviani*. EXTRACT OF PERUVIAN BARK.

“ Take of Peruvian Bark, in coarse powder,  
one

one pound ; Distilled Water, twelve pounds. Boil for an hour or two, and pour off the liquor, which, while hot, will be red and pellucid ; but as it cools, becomes yellow and turbid. Pour on again the same quantity of water ; boil as formerly ; and repeat the boiling, until the liquor, when cold, remains limpid. Then reduce all these liquors, mixed together and strained, to a proper consistence, by evaporation.

“ This extract ought to be prepared under two forms ; one *soft*, fit to form pills ; the other *hard*, so that it may be reduced to powder.”

THE active matter of bark is in a great measure of a resinous nature, but this the water, when assisted by a boiling heat, is capable of dissolving. During the boiling and evaporation, however, it suffers a chemical change to a certain extent ; and the extract obtained is far from being equal in efficacy to the quantity of bark from which it is prepared. Its medium dose is ten grains, and is supposed to be equivalent to half a drachm of the bark in substance. In the above process the boiling is continued

tinued too long, and the direction to strain the liquors is improper.

II.—*EXTRACTA PER AQUAM ET ALKOHOL.* EXTRACTS BY WATER AND ALKOHOL.

EXTRACTUM CINCHONÆ OFFICINALIS. EXTRACT OF PERUVIAN BARK.

Extract.  
Cinchon.  
vulgo  
Cortic.  
Peruv.  
cum Ref  
na.

“Take of Peruvian Bark in powder one pound; Alkohol, four pounds. Digest for four days, and pour off the tincture. Boil the residuum in five pounds of distilled water for a quarter of an hour, and strain the decoction while hot through linen. Repeat this boiling, and straining with an equal quantity of distilled water, and reduce the liquor by evaporation to the consistence of thin honey. Draw off the alkohol from the tincture by distillation, until it is reduced to a similar consistence. Then mix the liquors thus inspissated, and reduce to a proper consistence by a bath of boiling water, saturated with muriat of soda.”

THIS

THIS preparation is undoubtedly preferable to the watery extract of bark. By the joint action of the alcohol and water, every principle adhering to the mere ligneous fibre of the bark is dissolved. And in the subsequent evaporation, the dissolved matter suffers less injury, partly from less heat being required to bring it to the due consistence, and partly perhaps from the alcohol resisting the oxygenation of the extract. It is, however, much more expensive; and the extract of bark to be found in the shops is generally that prepared by the preceding formula. The dose of this extract is ten grains.

Extract.  
Jalapii.

EXTRACTUM RADICIS CONVULVULI JALAPÆ.  
EXTRACT OF JALAP.

THIS is ordered to be prepared in the same manner as the Extract of Bark. It is a cathartic capable of operating fully in a dose of ten or twelve grains.

---

BESIDES these two, there are some other Spiritous Extracts in the London Pharmacopœia.

EXTRAC-

EXTRACTUM CASCARILLÆ. EXTRACT OF CAS-  
CARILLA.

It may be regarded as bitter and tonic. Its dose is one scruple or half a drachm.

EXTRACTUM COLOCYNTHIDIS COMPOSITUM. COM-  
POUND EXTRACT OF COLOCYNTH.

“ Take of the Pith of Colocynth cut small, six drachms ; Socotorine Aloes in powder, one ounce and a half ; Scammony in powder, half an ounce ; Lesser Cardamom Seeds freed from the husks, powdered, one drachm ; Proof-Spirit, one pound. Digest the colocynth in the spirit with a gentle heat for four days. To the expressed tincture add the aloes and scammony. These being dissolved, draw off the spirit by distillation ; then evaporate the water, adding the seeds towards the end of the evaporation. Make an extract fit for forming pills.”

THIS composition, formerly known by the name of Cathartic Extract, is a cathartic of much power, sometimes employed in obstinate constipation. Its dose is from five to twenty grains.

## OPIUM PURIFICATUM. PURIFIED OPIUM.

“ Take of Opium cut into small pieces, one pound ; Proof-Spirit, twelve pounds. Digest with a gentle heat, agitating frequently until the opium is dissolved ; strain the tincture through paper, and distil it thus prepared to a proper consistence. Purified opium ought to be kept under two forms ; soft, so as to be fit to form pills ; and hard, so as to be capable of being reduced to powder.”

A PROCESS similar to this had a place in the Edinburgh Pharmacopœia, but has properly been expunged. It has been clearly proved, that during this process the opium suffers decomposition, probably from the action of the oxygen of the air, and that the solid purified mass is not equal in narcotic power to the opium from which it has been prepared. It is a process, too, entirely unnecessary, as the impurities of the opium are not considerable ; they neither alter its virtues, nor add much to its bulk.

---

CHAP. XIV.*AQUÆ STILLATITIAE.*—DISTILLED  
WATERS.

By distillation of water from vegetable substances, it is frequently impregnated with their flavour and taste. This is owing to their essential oil being volatilized at the temperature at which water boils, and being dissolved in small proportion by the water condensed. It is very seldom that any important virtue of vegetables resides in that principle, and hence the different distilled waters are more used as vehicles of other remedies, than as being themselves active medicines. It is evident that it is only those vegetables which contain a sensible quantity of essential oil, that can be subjected with advantage to this process, and that any quality residing in the other principles of the vegetable will not be

obtained in the distilled water. To preserve the distilled waters from decomposition, to which they are liable, from the small quantity of vegetable matter they contain, a proportion of alcohol, about one fiftieth of their weight, may be added to them; and they require to be kept secluded from the air.

AQUA DESTILLATA. DISTILLED WATER.

Aq. Distillata.

“ Distil Water in clean vessels until about two-thirds have come over.”

IN nature no water is found perfectly pure. Spring or river water always contains a portion of saline matter, principally sulphat of lime; and, from this impregnation, is unfit for a number of pharmaceutic preparations. By distillation a perfectly pure water is obtained.

AQUA CORTICIS CITRI AURANTII. WATER OF ORANGE-PEEL.

“ Take of Fresh Orange Peel two pounds. Pour on these as much water, that when ten pounds shall have been drawn off by distillation,

a quantity shall remain sufficient to prevent empyreuma. After due maceration distil ten pounds."

THIS distilled water has merely the odour of the orange-peel.

IN the same manner are prepared the following ; which require no particular observations, since they possess merely the odour, and some of them the taste and pungency of the vegetables from which they are prepared. Ten pounds of water are to be drawn by distillation from the quantities annexed to each :

AQUA CORTICIS FRUCTUS CITRI MEDICÆ RECEN-  
TIS. (Fresh lemon peel, two pounds.)

AQUA CORTICIS LAURI CASSIÆ. (Bark of Cassia,  
one pound.)

AQUA CORTICIS LAURI CINNAMOMI. (Bark of Aq. Cin-  
Cinnamon, one pound.) namomi.

AQUA MENTHÆ PIPERITÆ FLORENTIS. (Fresh Aq.  
peppermint, three pounds.) Menth.  
Pip.

AQUA MENTHÆ PULEGII FLORENTIS. (Fresh pen- Aq. Pu-  
nyroyal, three pounds.) legii.

Aq. Pi-    AQUA FRUCTÛS MYRTI PIMENTÆ. (Pimento, half  
mento.    a pound.)

Aq. Rosæ.    AQUA PETALORUM ROSÆ CENTIFOLIÆ RECEN-  
TIUM. (Fresh petals of the rose, six pounds.)

IN the London Pharmacopœia are likewise  
inserted,

AQUA ANETHI, DILL-SEED WATER.

AQUA FOENICULI, FENNEL-SEED WATER.

AQUA MENTHÆ SATIVÆ, SPEARMINT-WATER.

## CHAP. XV.

*SPIRITUS STILLATITII.*—DISTILLED SPIRITS.

THESE are prepared by distilling pure alcohol or diluted alcohol from vegetable substances. Alcohol in its pure state, seldom receives any sensible impregnation ; because, although it is capable of dissolving the essential oils of plants, there are very few of them which it can bring over in distillation ; a higher temperature being necessary to volatilize them than the alcohol. But, by employing diluted alcohol, a liquor is obtained more odorous and pungent. When heated with the vegetable, the alcohol first distils over, and afterwards the water with the essential oil, and the whole, when condensed, forms a transparent fluid. These distilled spirits, like the distilled waters, are in general merely agreeable vehicles for the exhibition of other medicines, or grateful stimulants, sometimes used to

relieve nausea or flatulence. The directions for preparing them are given, in the Pharmacopœia, under the Spirit of Caraway.

Spirit. Carui. SPIRITUS CARI CARVI. SPIRIT OF CARAWAY.

“ Take of Caraway Seeds, half a pound. Pour on of Diluted Alcohol, nine pounds. Macerate during two days in a close vessel ; then add a sufficient quantity of water to prevent empyreuma, and draw off nine pounds by distillation.”

IN the same manner are prepared the following spirits, Nine Pounds being drawn from the quantities affixed to each :

Spirit. Cinnamom. SPIRITUS CORTICIS LAURI CINNAMOMI. (Bark of Cinnamon, one pound).

Spirit. Menth. P. SPIRITUS MENTHÆ PIPERITÆ FLORENTIS. (Herb of peppermint, one pound and a half).

Spirit. Myrist. SPIRITUS NUCIS MYRISTICÆ MOSCHATÆ. (Nutmeg, two ounces).

Spirit. Pimento. SPIRITUS FRUCTUS MYRTI PIMENTÆ. (Fruit of pimento, half a pound).

To

To these may be added from the London Pharmacopœia,

SPIRITUS MENTHÆ SATIVÆ. SPIRIT OF SPEARMINT.

SPIRITUS PULEGII. SPIRIT OF PENNYROYAL.

OF Compound Spirits, the following have a place in the Pharmacopœias :

SPIRITUS JUNIPERI COMMUNIS COMPOSITUS.

COMPOUND SPIRIT OF JUNIPER. *Pharm. Ed.*

Spirit.  
Junip.  
Comp.

“ Take of Juniper Berries bruised, one pound ; Caraway Seeds, Fennel Seeds, of each one ounce and a half ; Diluted Alcohol nine pounds. Macerate for two days ; and, adding as much Water as is sufficient to prevent empyreuma, draw off nine pounds by distillation.”

THIS has been used as a carminative and diuretic.

SPIRITUS ANISI COMPOSITUS. COMPOUND SPIRIT OF ANISE. *Pharm. Lond.*

“ Take of Anise Seeds, Angelica Seeds, of each bruised half a pound ; Proof-Spirit, one gallon ;

lon; Water as much as is sufficient to prevent empyreuma. Distil one gallon."

USED also as a carminative.

SPIRITUS RAPHANI COMPOSITUS. SPIRIT OF  
HORSE-RADISH. *Pharm. Lond.*

"Take of fresh Horse-radish root, dried Orange Peel, of each two pounds; fresh Garden Scurvy-grafs, four pounds; Nutmegs bruised, one ounce; Proof-Spirit, two gallons; Water, as much as is sufficient to prevent empyreuma. Distil two gallons."

THIS was at one time recommended as an antiscorbutic. It has justly fallen into disuse.

THERE remain, lastly, those Distilled Spirits prepared with Pure Alcohol.

Spirit.  
Lavend.

SPIRITUS LAVANDULÆ SPICÆ. SPIRIT OF LA-  
VENDER.

"Take of fresh Lavender Flowers, two pounds; Alcohol, eight pounds. Draw off seven pounds by distillation in a water-bath."

THIS

THIS is scarcely applied to any purpose but that of a perfume.

SPIRITUS LAVANDULÆ SPICÆ COMPOSITUS. COM-  
POUND SPIRIT OF LAVENDER.

Spirit.  
Lavendu-  
læ Com-  
posit.

“Take of Spirit of Lavender, three pounds ; Spirit of Rosemary, one pound ; Cinnamon Bark, one ounce ; Cloves, two drachms ; Nutmeg, half an ounce ; Red Saunders Wood, three drachms. Macerate seven days and strain.”

THIS tincture is a grateful cordial in common use, as relieving languor and faintness. Its dose is thirty or forty drops.

SPIRITUS ROSISMARINI OFFICINALIS. SPIRIT OF  
ROSEMARY.

Spirit.  
Rosmar.

“Take of Fresh Rosemary Tops, two pounds ; Alcohol, eight pounds. Draw off seven pounds by distillation in a water-bath.”

THIS spirit is a very fragrant perfume.

ALCOHOL.

## ALCOHOL.

THERE is no process in the Edinburgh Pharmacopœia for the preparation of alcohol. The following is given by the London College :

“ Take of Rectified Spirit of Wine, one gallon; Prepared Kali (Sub-carbonat of Potash) hot, one pound and a half; Pure Kali (Potash), one ounce. Mix the vinous spirit with the pure kali, and then add one pound of the prepared kali, while hot. Agitate and digest for twenty-four hours. Pour off the spirit; add to it the remainder of the prepared kali, and distil from a water-bath. Preserve the alcohol in a vessel well stoppt. The prepared kali ought to be heated to 300°.

“ The specific gravity of alcohol is to that of distilled water as 815 to 1000.”

THE Rectified Spirit of Wine, employed in this process, is prepared by distillation from the spiritous liquors of commerce. It consists of alcohol with a portion of water. The Potash, employed

employed in the present process, abstracts the greater part of this water, by the strong attraction it exerts to it ; and, by a careful distillation, the alcohol is obtained, if not entirely, at least nearly pure.

The specific gravity required in the alcohol employed in the processes of the Edinburgh Pharmacopœia, is only 835 ; and, though at that standard, it must contain a portion of water, it is sufficiently strong for all pharmaceutical purposes.

## CHAP. XVI.

*OLEA VOLATILIA, olim OLEA STILLATITIA  
vel ESSENTIALIA.* VOLATILE OILS, DIS-  
TILLED OR ESSENTIAL OILS.

THE chemical properties of essential oils have already been described. They differ somewhat in their sensible qualities, but all of them are highly odorous and pungent ; and, as medicines, they possess a stimulating power. They are generally employed as corrigents, to improve the flavour and taste of the medicines with which they are mixed, to cause them to sit easier on the stomach, or obviate any unpleasant symptoms they may be apt to produce.

As these oils frequently exist in distinct vesicles in the vegetable, some of them may be obtained by expression ; but, in general, they are procured by distillation. The rules given in the Edinburgh Pharmacopœia are the following :

“ These

“These oils are to be prepared in the same manner as the Distilled Waters, except that a smaller quantity of water is to be added. Seeds and roots are to be previously bruised or rasped. The soil accompanies the water, and is afterwards separated from it, according as it is lighter or heavier, by swimming on the surface or falling to the bottom.

“It is also to be observed with regard to the preparation of these distilled waters and oils, that, from the goodness of the substances, their texture, the season of the year, and similar circumstances, so many differences must arise, that it is scarcely possible to give any certain and general rules which shall apply strictly to every example. Many things therefore are omitted, to be regulated according to the judgment of the operator, the most general precepts only being delivered.”

THE qualities of these oils are considerably varied by a number of circumstances, more especially by climate, soil, and season. They are likewise injured by too long keeping. Being high priced, they are also frequently adulterated by dilution with alcohol, by the addition of an expressed

pressed oil, or by intermixture with each other, the cheaper being used to adulterate the more valuable. The first is detected by the milkiness produced and continuing for some time, on dropping the adulterated oil on water; the second, by the sophisticated oil leaving a permanent greasy spot on paper; and the third may, in general, be discovered by the smell of the coarser oil, rendering it more ardent if necessary, by the application of a gentle heat.

It is not necessary to notice particularly the different essential oils, as they possess merely the aromatic quality of the vegetables from which they are prepared. The following are those inserted in the Edinburgh Pharmacopœia:

Oleum Menth. Pip.	OLEUM HERBÆ MENTHÆ PIPERITÆ FLORENTIS. OIL OF PEPPERMINT.
	OLEUM HERBÆ JUNIPERI SABINÆ. OIL OF SAVINE.
Ol. Rorif- mar.	OLEUM SUMMITATUM FLORENTIUM RORISMARI- NI OFFICINALIS. OIL OF ROSEMARY.
Ol. La- vend.	OLEUM SPICARUM FLORENTIUM LAVANDULÆ SPICÆ. OIL OF LAVENDER.
Ol. Eff. Anisi.	OLEUM SEMINUM PIMPINELLÆ ANISI. OIL OF ANISE.

OLEUM

OLEUM BACCARUM JUNIPERI COMMUNIS. OIL Ol. Ju-  
OF JUNIPER. nip. Bacc.

OLEUM RADICIS LAURI SASSAFRAS. OIL OF SAS- Ol. Rad.  
SAFRAS. Sassafras.

OLEUM FRUCTUS MYRTI PIMENTÆ. OIL OF PI-  
MENTO.

THE London College have also ordered,

OLEUM ESSENTIALE CARUI. OIL OF CARAWAY.

OLEUM MENTHÆ SATIVÆ. OIL OF SPEARMINT.

OLEUM ORIGANI. OIL OF WILD THYME.

OLEUM PULEGII. OIL OF PENNYROYAL.

OLEUM SUCCINI ET ACIDUM SUCCINI. OIL AND  
ACID OF AMBER.

Sal et O-  
leum Suc-  
cini.

“ Take of Amber in powder, Pure Sand, equal parts. Put them mixed into a glass retort, of which they shall fill one-half. Having adapted a large receiver, distil from a sand-bath, with a fire gradually raised. First, a watery liquor with a little of a yellow oil, will distil; then a yellow oil with an acid salt; afterwards, a reddish and black oil.

Pour the liquor out of the receiver, and let the oil be separated from the water. Let the acid salt, collected from the neck of the retort, and the sides of the receiver, be pressed between folds of bibulous paper, and freed from the adhering oil. Then purify it by solution in hot water and crystallization."

AMBER is a bitumen which suffers decomposition by heat. The acid which it affords is one *sui generis*; the oil approaches in its properties to the other empyreumatic oils. The acid is never used in medicine; the oil is sometimes employed externally as a stimulant, and internally as an antispasmodic, but is also falling into disuse. A process is ordered in the Pharmacopœia for its purification.

Ol. Succin.  
Rec-  
tif.

OLEUM SUCCINI PURISSIMUM. PURIFIED OIL OF  
AMBER.

"Distil Oil of Amber mixed with six times its quantity of Water, from a glass retort, until two-thirds of the water have passed into the receiver. Then separate this purified volatile oil from the water, and keep it in vessels well stoppt."

THE

THE oil thus purified, is at first nearly colourless, but gradually acquires a brown tinge. Its odour is extremely unpleasant, its taste acrid. Its dose as an antispasmodic is ten drops.

OLEUM TEREBINTHINÆ VOLATILE PURISSIMUM.  
RECTIFIED OIL OF TURPENTINE.

Ol. Tere-  
binth.  
Rect.

“Take of Volatile Oil of Turpentine, one pound; Water, four pounds. Distil as long as any oil comes over.”

OIL of turpentine as obtained, by distillation, from what is termed common turpentine (the juice of the larch), is in general sufficiently pure; this process seems therefore unnecessary.

Two other empyreumatic oils are inserted in the London Pharmacopœia.

OLEUM ANIMALE. ANIMAL OIL.

“Take of Oil of Hartshorn, one pound. Distil three times.”

THIS oil is formed during the decomposition

H<sub>2</sub> of

of bones by heat. By repeated distillations, it is rendered rather less offensive. It was once celebrated for its antispasmodic power, but has long been little used.

OLEUM PETROLEI. OIL OF PETROLEUM, or Mineral Tar.

“ Distil Petroleum in a sand-bath.”

THIS has been used principally as an external stimulating application.

## CHAP. XVII.

## CHAP. XVII.

## OLEOSA.—OILY PREPARATIONS.

OLEUM AMMONIATUM, *vulgo Linimentum Volatile.* AMMONIATED OIL, commonly called Volatile Liniment.

“Take of Olive Oil, two ounces; Water of Ammonia, two drachms. Mix them.”

A MUCH stronger preparation is ordered in the London Pharmacopœia, LINIMENTUM AMMONIÆ FORTIUS, consisting of Water of Pure Ammonia, one ounce; Olive Oil, two ounces. Another is inserted under the title LINIMENTUM AMMONIÆ, composed of Water of Ammonia (or rather Carbonat of Ammonia), half an ounce; Olive Oil, an ounce and a half, which, both from the nature and proportion of its ingredients, is milder.

Lini-  
ment.  
Ammon  
Fort.

They are all used as rubefacients; and, for this purpose, the liniment of the Edinburgh College seems best adapted.

OLEUM LINI CUM CALCE. LINSEED OIL WITH  
LIME.

“Take of Linseed Oil, Lime Water, of each equal parts. Mix them.”

THIS is used as an application to burns.

OLEUM CAMPHORATUM. CAMPHORATED OIL.

“Take of Olive Oil, two ounces; Camphor, half an ounce. Mix them, so as that the camphor may be dissolved.”

THIS is a form under which camphor is frequently applied externally as a stimulant and anodyne.

Ol. Sul-  
phur.

OLEUM SULPHURATUM. SULPHURATED OIL.

“Take of Olive Oil, eight ounces; Sublimed Sulphur, one ounce. Boil with a gentle fire, in a large iron pot, stirring constantly until they unite.”

THIS solution of sulphur in oil was once recommended as an expectorant, in a dose of  
twenty

twenty or thirty drops, and was used in asthma and phthisis, but is now altogether discarded from practice.

Besides this preparation, which has a place in the London Pharmacopœia, there is also ordered to be prepared in the same manner, a solution of oil in petroleum, PETROLEUM SULPHURATUM. Its qualities are the same with those of the other.

---

CHAP. XVIII.

## SALES ET SALINA.—SALTS AND SALINE SUBSTANCES.

It is not easy to give a precise definition of the term Salt. It was formerly supposed to denote a body eminently sapid, soluble in water, crystallizable, fusible, and unflammable. But these properties are not possessed by many bodies supposed to belong to the class of Salts, and they belong to others which are arranged under other classes of chemical agents.

The definition of Salts, in the language of modern chemistry, seems rather to be taken from their composition, than from their properties. It is thus understood to be applied to the substances known by the name of Acids, to those entitled Alkalies, and to all the compounds formed by the Combinations of Acids with Alkalies, Earths, and Metallic Oxyds. The acids and alkalies

kalies are termed Primary, the other Secondary or Neutral Salts.

The general chemical qualities of the Acids, Alkalies, and Neutral Salts, and their nomenclature, have already been noticed in the first part of this work. The first saline combinations in the Pharmacopœia are those of the Acids.

ACIDUM ACETOSUM DESTILLATUM. DISTILLED Acetum  
Distillat.  
ACETOUS ACID.

“ Distil eight pounds of Acetous Acid in glass vessels, with a gentle fire. The two pounds that first come over are to be rejected as too watery ; the four pounds which follow are the distilled acetous acid. The residuum affords a still stronger acid, but too much burnt.”

VINEGAR, as it is produced by fermentation, consists of acetous acid, largely diluted with water, and mixed with a number of other substances, —tartarous acid, extractive, mucilaginous, and saccharine matter. From these it is purified by distillation, but it is still largely diluted with water, as the pure acid is not even so volatile as water ; and, in general, it receives from the distillation

tillation somewhat of an empyreumatic odour. The process should be conducted in glass vessels, as directed in the Pharmacopœia ; as, from metallic ones, the acid would receive an impregnation that might prove noxious.

Distilled acetic acid is chiefly employed as a solvent of some vegetable substances, and in making some of the salts.

ACIDUM ACETOSUM FORTE. STRONG ACETIC ACID.

“ Take of Dried Sulphat of Iron, one pound ; Acetate of Lead, ten ounces. Rub them together. Put them into a retort, and distil from sand with a moderate fire, as long as any acid comes over.”

ACIDUM ACETOSUM. ACETIC ACID. *Pharm. Lond.*

“ Take of Verdigrise, in coarse powder, two pounds. Dry it perfectly in a bath of water, saturated with sea salt. Then distil in a sand-bath, and distil the liquor a second time. Its specific gravity is, to that of distilled water, as 1050 to 1000.”

THESE

THESE two processes furnish a powerful acid ; but the result of researches on this subject is such, that it is somewhat uncertain whether these two concentrated acids differ essentially from each other, and whether they differ except in strength from the diluted acetous acid.

In the first process, that of the Edinburgh Pharmacopœia, the sulphuric acid of the dried sulphat of iron combines with the oxyd of lead of the acetite of lead, and disengages the acetous acid, which, with a portion of water of crystallization, distils over. Its odour is pungent, its taste acrid, and its acid powers considerable. It seems most probable that it is merely the concentrated acetous acid.

In the second process, the acid contained in the verdigrise is expelled by the action of the heat from the oxyd of copper, with which in that substance it is combined. But it has been generally supposed, that at the same time it suffers a chemical change. According to the opinion once received, it receives a portion of oxygen from the oxyd of copper. The experiments of Chaptal appeared afterwards to prove that it was rather deprived of a portion of its carbon, which

which remained mixed or united with the oxyd of copper ; while Adet, and still more lately Darracq, have concluded from experiments, that no difference exists between those acids but in strength, the acetous acid being more diluted than the other, and, according to Darracq, containing a portion of mucilaginous and extractive matter. The concentrated acid from verdigrise is the Acetic Acid of the new nomenclature, the Radical Vinegar of the older chemists.

These strong acids are principally used as powerful stimulants, applied to the nostrils in languor and asphyxia. Their odour is pungent and grateful. They are capable also of acting as powerful rubefacients.

Flores  
Benzoës.

ACIDUM BENZOICUM. BENZOIC ACID.

“ Take of Benzoin in powder, any quantity. Put it into an earthen pot, to the mouth of which there has been previously adapted a paper cone ; apply a gentle fire, that the acid may be sublimed. If it be contaminated with oil, let it be purified by solution in hot water, and crystallization.” (Or, according to the direction of the London College, its purification may be effected by

by mixing it with white clay, and again subliming it).

THIS acid exists ready formed in benzoin, and all the balsams, and, as it is volatile, is easily sublimed by heat.

Another process, supposed to be more economical, was proposed by Scheele, in which the benzoin powdered is boiled with lime or potash, which combines with the benzoic acid; and the benzoat thus formed is decomposed by some other acid. The following is the process of this kind, inserted in the Prussian Pharmacopœia :

“ Take of Powdered Benzoin, twenty-four ounces; Carbonat of Soda, eight ounces. Mix them, and boil in sixteen pounds of Water, stirring constantly for half an hour. Strain. To the remaining benzoin add six pounds of Water. Boil them together, and strain. Mix both liquors, and evaporate to two pounds. Filter the liquor, and add to it, Diluted Sulphuric Acid to saturation. The benzoic acid, precipitated under the form of a light greyish powder, is to be dissolved in boiling water; and the solution, strained, while hot, through linen, is to be set aside,

aside to crystallize. The crystals are to be washed with cold water and dried."

Benzoic acid has been supposed to possess some expectorant power, and, on this supposition, enters into the composition of the paregoric elixirs of the Pharmacopœias.

Acid.  
Muriat.

# ACIDUM MURIATICUM. MURIATIC ACID.

"Take of Muriat of Soda, two pounds; Sulphuric Acid, sixteen ounces; Water, one pound. First expose the muriat of soda in a pot to a red heat for a short time; when cold, put it into a retort. Then pour the acid, mixed with the water, and cold, on the muriat of soda. Distil from a sand-bath with a moderate fire, as long as any acid comes over. Its specific gravity is to that of distilled water as 1170 to 1000."

THIS process is an example of single affinity. The sulphuric acid combines with the soda of the muriat of soda, and the muriatic acid is disengaged. It combines with the watery vapour, and is thus easily condensed. It has generally a yellowish tinge, from the presence of a small quantity of iron, from which it can be freed by a second distillation.

The

*There is likewise a colour given to the acid from the Animal matter contained in the salt and from which it is not entirely free & by*

The principal use of this acid is for pharmaceutical purposes. It can scarcely be said to be employed as a medicine.

ACIDUM OXY-MURIATICUM.      OXY-MURIATIC  
ACID.

THOUGH no process is inserted in any Pharmacopœia for the preparation of this acid, it is applied, both in its pure state and in its combinations, to medicinal uses.

Uncombined, it has been employed to destroy contagion, and is perhaps the most effectual of any of the agents that have been used for this purpose. It is prepared by adding to the materials from which muriatic acid is prepared, black oxyd of manganese, in the proportion of one-third of the weight of muriat of soda, and applying heat. The sulphuric acid disengages the muriatic acid, and this immediately attracting oxygen from the black oxyd of manganese, forms oxy-muriatic acid; the vapours of which are diffused through the place where the contagion is to be destroyed.

Combined with potash, it forms a salt employed as an anti-venereal remedy. To prepare this  
salt,

salt, sixteen ounces of sub-carbonat of potash are dissolved in four pounds of water, and the solution is repeatedly agitated with eight ounces of lime, to abstract the carbonic acid. The solution of pure potash is to be poured into the bottles of Woulfe's apparatus, which are to be connected with a retort, containing three pounds of muriat of soda, one pound of black oxyd of manganese, and two pounds of sulphuric acid, previously diluted with one pound and a half of water. On applying a moderate heat to the retort by a sand-bath, the oxy-muriatic acid is disengaged, and passes through the solution of potash. Instead of combining directly, however, with the potash, it suffers decomposition; one part of it returns to the state of muriatic acid, the other becomes, what is properly speaking, a super-oxygenated acid. Both saturate themselves with potash; and the two salts are separated, from their different degrees of solubility: the common muriat remains dissolved, the super-oxygenated muriat crystallizes. The crystals are washed with a small quantity of cold water. They are in small plates of a silvery white colour.

The

The medical uses of this salt have been already mentioned. It is given in syphilis in a dose of 10 grains three or four times a-day.

ACIDUM NITROSUM. NITROUS ACID.

Acid.  
Nitros.

“ Take of Pure Nitrat of Potash, beat to powder two pounds ; Sulphuric Acid, sixteen ounces. The nitrat of potash being put into a glass report, pour upon it the sulphuric acid, and distil from a sand-bath with a fire gradually raised, until the iron pot is of an obscure red heat. The specific gravity of this acid is to that of distilled water as 1550 to 1000.”

IN this process the sulphuric acid combines with the potash, and disengages the nitric acid. The latter acid, however, partly from the heat employed in the distillation, and partly perhaps from the exertion of a disposing affinity, suffers a slight decomposition ; a small portion of it loses part of its oxygen, and a quantity of nitrous gas is formed ; this is absorbed by the nitric acid, and forms the nitrous, which is more or less coloured and fuming, according to the degree of heat employed in the distillation. The residuum is sulphat of potash, with an excess of sulphuric acid.

Nitrous acid is extensively employed as a pharmaceutic agent: from the facility with which it parts with oxygen, it is one of the most important. Its powers as a tonic and anti-syphilitic remedy, have been already considered. In the state of vapour, it has been employed under the form of fumigation to destroy contagion; and, though perhaps inferior to oxy-muriatic acid, it has the advantage that it can be applied without requiring the removal of the sick.

Acidum  
Nitros.  
Dilut.

ACIDUM NITROSUM DILUTUM. DILUTED NITROUS ACID.

“Take of Nitrous Acid, Water, equal weights. Mix, avoiding the noxious vapour.”

IN combining nitrous acid with water, the greater part of the nitrous gas of the former is disengaged. The diluted acid is employed in a number of the chemical processes of the Pharmacopœia.

ACIDUM NITRICUM. NITRIC ACID.

“Take of Nitrous Acid, any quantity. Put it into a retort, and a receiver being adapted, apply a very gentle heat until the reddest part shall

shall have passed over, and the acid which remains in the retort shall have become nitric."

By the heat applied, the nitrous gas contained in the nitrous acid, and which gives to it the yellow colour and highly fuming property, is expelled, and condenses in the receiver, combined still with a small portion of acid. The nitric acid remains colourless. It is applied to the same purposes as the nitrous. Little or no difference can exist between them in medicinal powers, but the nitric is perhaps more uniform in strength.

**SPIRITUS ÆTHERIS NITROSI. SPIRIT OF NI-** Spirit.  
TROUS ETHER. Æther.  
Nitros.

"Take of Alcohol, three pounds; Nitrous Acid, one pound. Pour the alcohol into a large phial, placed in a vessel full of cold water, and add the acid gradually, with constant agitation. Close the phial lightly, and set it aside for seven days in a cool place; then distil the liquor with the heat of boiling water, into a receiver kept cool with water or snow, as long as any spirit comes over."

THIS is a solution of nitrous ether in alcohol.

To prepare pure nitrous ether is difficult, and not without danger, from the violent chemical action which takes place when so much nitrous acid is added as is necessary to convert the whole alcohol into ether. This pharmaceutic preparation therefore has been preferred, and, as a medicine, answers perhaps all the purposes which could be derived from the other. Even it requires caution in its preparation.

The theory of the action of acids on alcohol, and of the formation of ethers, is, notwithstanding modern researches, obscure; and that of nitrous ether is very imperfectly elucidated. It is ascertained, however, that during its production, portions of oxalic and acetous acids are formed; and the experiments of Bayen have clearly proved, that a very considerable portion of the nitric acid is decomposed or combined in such a manner with the principles of the alcohol, that it is no longer capable of saturating an alkali. Perhaps it may be inferred, that the acid, by parting with oxygen to the elements of the alcohol, causes the formation of the oxalic and acetous acids, and that the remaining elements of the

the alkohol unite to form the ether. It appears to contain more carbon than sulphuric ether.

The spirit of nitrous ether always contains a very sensible portion of acid, from which it may be freed by a second distillation, with the addition of magnesia or potash. But on this acid perhaps some of its virtues depend.

Its odour is extremely fragrant, its taste pungent and acidulous; it is very volatile and inflammable; soluble in alkohol and water. It is employed as a refrigerant and diuretic, sometimes as an antispasmodic. Its dose is from thirty to fifty drops.

*It may be given every two or three hours.*

ACIDUM SULPHURICUM DILUTUM. DILUTED  
SULPHURIC ACID.

Acidum  
Vitriolicum  
Dilut.

“Take of Sulphuric Acid, one part; Water, seven parts (in the London Pharmacopœia eight parts). Mix them.”

THE preparation of Sulphuric Acid being carried on on a large scale, for the purposes of commerce, no process is given for it in either of the Pharmacopœias. It is obtained by burning sulphur mixed with from one-eighth to one-tenth of nitrat of potash, in large leaden chambers. By

the oxygenation of the sulphur, the acid is formed, and is absorbed by water placed in the bottom of the chamber. This liquor, when sufficiently acidulated, is concentrated by boiling in glass retorts, and an acid obtained thick and unctuous in its appearance, colourless and transparent, having a specific gravity of 1850.

Sulphuric acid prepared in this manner is never perfectly pure. It contains a quantity of sulphat of potash, and sometimes a small portion of sulphat of lead. From these it is in a great measure purified by dilution with water, the diluted acid being incapable of holding them dissolved. Its dose is also more manageable than that of the concentrated acid. As an astringent it is taken to the extent of thirty drops.

ACIDUM SULPHURICUM AROMATICUM. AROMATIC SULPHURIC ACID.

“ Take of Alcohol, two pounds; Sulphuric Acid, six ounces. Drop the acid gradually into the alcohol. Digest the mixture with a very gentle heat in a close vessel for three days, then add of Bark of Cinnamon, one ounce and a half; of Ginger, one ounce. Digest again in a close vessel

vessel for six days ; then strain through paper placed in a glass funnel."

SOME chemical action may be exerted on the alcohol by the acid during the digestion, but the acidity is little impaired. The aromatics render it more pleasant, and the preparation may be considered as a grateful one for the exhibition of sulphuric acid. Its dose is thirty drops.

ÆTHER SULPHURICUS. SULPHURIC ETHER.

Æther  
Vitrioli-  
cus.

"Take of Sulphuric Acid, Alcohol, of each thirty-two ounces. Pour the alcohol into a glass retort, capable of bearing a sudden heat. Then pour on the acid in an uninterrupted stream. Mix them gradually by frequent and gentle agitation ; then immediately distil from a sand-bath, previously heated for this purpose, into a receiver kept cool with water or snow. But regulate the heat in such a manner that the liquor may be made to boil as soon as possible, and continue to boil until sixteen ounces have distilled over ; then remove the retort from the sand. To the distilled liquor add two drachms of Potash, then distil again from a high-necked retort, with a very gentle heat, into a receiver

kept cool, until ten ounces have passed over. If to the acid remaining in the retort after the first distillation, sixteen ounces of Alkohol be added, and the distillation repeated, ether will again be produced. And this may be often repeated."

IN the formation of sulphuric ether, it is found by experiment that the alkohol suffers decomposition; a portion of its carbon is separated in a sensible form, and renders the residual liquor thick and dark coloured; a quantity of water is formed, and the remaining elements of the alkohol unite to form the ether. Ether differs from alkohol in containing less carbon, or rather more hydrogen; and this difference is established, not only by the facts with regard to its formation, but likewise by the comparative products of their combustion.

With regard to the agency of the sulphuric acid, by which these changes are effected in the composition of the alkohol, two opinions are at present maintained by chemists. According to the older doctrine, part of the sulphuric acid is decomposed; its oxygen combines with a portion of the hydrogen of the alkohol, and forms water; the balance of attractions among the elements

ments of the alkohol being broken, carbon is deposited, and ether formed from a new combination of these remaining elements.

Fourcroy and Vauquelin have denied that any decomposition of the acid is necessary for the formation of ether. They suppose that it acts solely by a disposing affinity causing part of the oxygen and part of the hydrogen of the alkohol to enter into a binary combination to form water; whence results the exertion of new affinities, by which carbon is separated and ether formed.

The experiments from which this latter opinion has been deduced, are not unexceptionable; and the facts that no acid which does not part with oxygen can form ether, while acids which part with that principle readily, form it with facility, favour the supposition that the sulphuric acid occasions the formation of ether, by yielding part of its oxygen to the hydrogen of the alkohol.

The principal difficulty in conducting this process, is to stop it at the proper period; that is, when the formation of ether ceases, and sulphurous acid begins to be disengaged. This is  
best

best known by the neck of the retort being obscured with white fumes: when these appear, the fire must be immediately lowered or removed, as otherwise the liquor in the retort would swell up and pass over into the receiver.

The ether obtained by the first distillation is impure. It is diluted with water and alcohol, and impregnated generally with fulphurous acid. It is rectified, according to the directions in the Pharmacopœia, by distilling it a second time with a very gentle heat, with the addition of potash, which attracts the fulphurous acid; or, what succeeds better, with the addition of black oxyd of manganese, which converts that acid into sulphuric.

Ether properly prepared, has a penetrating diffusible odour, and a very pungent taste. It is highly volatile, evaporating rapidly at the common temperature of the atmosphere. It is soluble in ten parts of water, and combines with alcohol in every proportion.

Its virtues as a narcotic and antispasmodic have been already stated. Its dose is half a drachm.

ÆTHER

ÆTHER SULPHURICUS CUM ALCOHOLE. SUL-  
PHURIC ETHER WITH ALKOHOL.

“Take of Sulphuric Ether, one part ; Alkohol,  
two parts. Mix them.”

By this dilution of ether with alkohol, little  
is gained, except that it is more soluble in wa-  
ter. It was formerly known by the name of  
Spirit of Vitriolic Ether. The London College  
apply that name (*Spiritus Ætheris Vitriolici*)  
to ether obtained by the first distillation and un-  
rectified. They order also a COMPOUND SPIRIT  
OF VITRIOLIC ETHER to be prepared by mixing  
two pounds of unrectified ether with three  
drachms of oil of wine,—a substance of an oily-  
like appearance, which distils over when the  
formation of ether has nearly ceased. All these  
preparations may be regarded as superfluous.

Spirit.  
Æther.  
Vitriolic.  
Composit.

ÆTHER SULPHURICUS CUM ALCOHOLE AROMA-  
TICUS. AROMATIC SULPHURIC ETHER WITH  
ALKOHOL.

“This is made from the same materials, and  
in the same manner as the compound tincture  
of

of cinnamon, unless that Sulphuric Ether with Alcohol is used in place of diluted alcohol."

THE additions to the sulphuric ether in this formula, are of so little importance, that the preparation is scarcely ever used.

Ammonia Præparata.

CARBONAS AMMONIÆ: *olim Ammonia Præparata.* CARBONAT OF AMMONIA.

"Take of Muriat of Ammonia, one pound; Carbonat of Lime, commonly called Chalk, dried, two pounds. Each being separately reduced to powder, mix them and sublime from a retort into a receiver kept cold."

THIS process is an example of double elective attraction. The muriatic acid of the muriat of ammonia combines with the lime of the carbonat of lime, and the carbonic acid of the latter unites with the ammonia of the former. The carbonat of ammonia which is formed is sublimed, and is obtained in a crystalline cake. When the process is carried on in the large way, the sublimation is generally performed from an iron pot, to which the heat is directly applied.

According to the experiments of Mr Davy, carbonat of ammonia varies much in the proportion  
of

of its ingredients from the heat applied in its preparation ; that formed at a temperature of  $300^{\circ}$  containing 50 parts of alkali in the 100 ; while that produced at a temperature of  $60^{\circ}$  contained only 20 parts. Its smell is always pungent and ammoniacal : it is easily volatile, very soluble in water, and efflorescent on exposure to the air. Its medicinal applications are as a stimulant to the nostrils in fainting, and as a stimulant and diaphoretic, taken internally in a dose of from five to fifteen grains.

AQUA CARBONATIS AMMONIÆ: *olim, Aqua Ammonia.* WATER OF CARBONAT OF AMMONIA.

Aq. Ammonia.

“ Take of Muriat of Ammonia, Carbonat of Potash, of each sixteen ounces ; Water, two pounds. To the salts, mixed and put into a glass retort, add the water ; then distil from a sand-bath with a fire gradually raised, to dryness.”

IN this preparation of carbonat of ammonia by the humid way, carbonat of lime could not be employed to decompose the muriat of ammonia ; carbonat of potash is therefore employed. The potash attracts the muriatic acid, the ammonia the carbonic acid. The carbonat of ammonia

monia is volatilized, and dissolved by the watery vapour. The solution is applied to the same medicinal purposes as the concrete ammoniacal carbonat.

LIQUOR VOLATILIS, SAL, *et* OLEUM CORNU CERVI.

VOLATILE LIQUOR, SALT, *and* OIL OF HARTSHORN. *Pharm. Lond.*

“Take of Hartshorn, ten pounds. Distil, increasing the fire gradually. A volatile liquor, salt, and oil, come over. The oil and the salt being separated, distil the liquor three times. To the salt add an equal weight of prepared chalk, and sublime three times, or until it become white. The same volatile liquor, salt, and oil, may be obtained from any of the parts of animals except fat.”

By exposing bones to heat, the gelatin they contain suffers decomposition; its principles enter into new combinations, forming chiefly carbonat of ammonia and empyreumatic oil. These are the products of the above process; the carbonat of ammonia being partly dissolved by the water which distils over, and obtained partly in a concrete state. It is scarcely possible, however, to free it entirely from the empyreumatic oil, which renders

renders it nauseous ; and, though at one time it was supposed to be possessed of some peculiar virtues, it is now justly rejected from practice ; and the carbonat of ammonia, obtained pure by the preceding processes, is preferred.

AQUA AMMONIÆ: *olim, Aqua Ammonia Causticæ.* Aq. Am.  
WATER OF AMMONIA. moniæ  
Puræ.

“ Take of Muriat of Ammonia, sixteen ounces ; Lime, fresh prepared, two pounds ; Water, six pounds. To one pound of water in an iron or earthen vessel, add the lime broken down, and close the vessel for twenty-four hours, until the lime fall into a fine powder, which put into a retort. To this add the Muriat of Ammonia, dissolved in five pounds of Water, and, shutting the mouth of the retort, mix them by agitation. Lastly, distil with a heat so moderate, that the operator can easily apply his hand to the retort, into a receiver kept cold, until twenty ounces have distilled over. In this distillation the vessels are to be so luted as to confine effectually the penetrating vapours.”

THE lime in this process attracts the muriatic acid of the muriat of ammonia, and the ammo-

nia

nia is disengaged. By itself it is incondensable, but it combines with the watery vapour, and forms an aqueous solution. To conduct the process to advantage, a series of receivers is necessary in which water is disposed, to absorb entirely the ammoniacal gas.

When water is perfectly saturated with ammonia, 100 grains are found to combine with 34; but, in the usual mode of preparing this solution, this perfect saturation is never effected. The solution has a strong pungent smell, a very acrimonious taste, and inflames the skin. It is used in medicine as a powerful stimulant and diaphoretic internally, in a dose of twenty drops; externally, as a stimulant and rubefacient.

Spiritus  
Ammoniacæ.

ALCOHOL AMMONIATUM, *five Spiritus Ammoniacæ.*

AMMONIATED ALCOHOL.

“Take of Diluted Alcohol, four pounds; Muria of Ammonia, four ounces; Carbonat of Potash, six ounces. Mix, and draw off by distillation with a gentle fire, two pounds.”

THOUGH in this process carbonat of ammonia is the principal product, from the decomposition of the muria of ammonia by the carbonat of potash,

potash, yet, from the potash not being fully saturated with carbonic acid, a quantity of pure ammonia is disengaged, and combines with the alcohol. A part of the water also of the diluted alcohol distilling over, dissolves a portion of the carbonat of ammonia. The compound has the pungent ammoniacal smell. It is used principally as the menstruum of some vegetables with which ammonia coincides in medicinal operation.

ALCOHOL AMMONIATUM AROMATICUM, *five Spiritus Ammoniae Aromaticus.* AROMATIC AMMONIATED ALCOHOL.

Spirit.  
Ammon.  
Comp.

“Take of Spirit of Ammonia, eight ounces; Volatile Oil of Rosemary, one drachm and a half; Volatile Oil of Lemon, one drachm. Mix so as to dissolve the oils.” In the London Pharmacopœia, Oil of Cloves is ordered in place of oil of rosemary.

By this combination of the ammonia with the alcohol, and the addition of the aromatic oils, it is rendered more grateful than the water of ammonia. This preparation is therefore sometimes used in preference to the other, as a stimulating

perfume, and even for internal exhibition. Its dose is from fifteen to thirty drops.

Spirit.  
Ammon.  
Fœtid.

ALCOHOL AMMONIATUM FOETIDUM, *five Spiritus Ammoniae Fœtidus*. FOETID AMMONIATED ALKOHOL.

“Take of Spirit of Ammonia, eight ounces; Affafoetida Gum-Resin, half an ounce. Let them digest in a close vessel for twelve hours; then distil eight ounces by the heat of a water-bath.”

THE impregnation of the ammoniated alcohol with part of the affafoetida in this process, though it may communicate a foetid smell, can scarcely add to its activity. It has been given in hysteria in a dose of thirty drops.

SPIRITUS AMMONIÆ SUCCINATUS. *Pharm. Lond.*

SUCCINATED SPIRIT OF AMMONIA.

“Take of Alcohol, one ounce; Water of Pure Ammonia, four ounces; Rectified Oil of Amber, one scruple; Soap, ten grains. Digest the soap and the oil of amber in the alcohol, until they are dissolved. Then add the water of pure ammonia, and mix by agitation.”

THIS

THIS has been principally used as a stimulating perfume, under the name of *Eau de Luce*. For the preparation of the compound, sold under this name, the above formula is imperfect. }

CARBONAS POTASSÆ. CARBONAT OF POTASH.

Kali  
Præparatum.

“ Let impure Carbonat of Potash, (which in English is named Pearl-Ashes,) be put into a crucible, and brought to a red heat, that the oily impurities, if any are present, may be burnt out ; then rubbing it with an equal weight of water, mix them thoroughly by agitation. The liquor, after the impurities have subsided, being poured off into a clean iron-pot, is to be boiled to dryness, stirring the salt constantly towards the end of the boiling, that it may not adhere to the vessel.”

THE Pearl-Ashes of commerce are obtained by the incineration of the wood of land vegetables. They consist of sub-carbonat of potash, with sulphat and muriat of potash, siliceous earth, and a small quantity of metallic matter. From these they are in a considerable degree purified by the present process. The one given in the London College is, in one respect, preferable;

the solution obtained from the pearl-ashes being evaporated till a pellicle appears on its surface, and being then set aside, before farther evaporation, that the sulphat or muriat of potash which it may contain in solution may be separated by crystallization. The salt obtained by either process is a sub-carbonat of potash, or potash imperfectly saturated with carbonic acid. It is in white grains, is deliquescent, and possesses the alkaline properties.

CARBONAS POTASSÆ PURISSIMUS, *olim, Sal Tartari.* PURE CARBONAT OF POTASH, *formerly Salt of Tartar.*

“ Take of impure Super-Tartrite of Potash, any quantity. Having wrapped it up in moist bibulous paper, or put it into a crucible, burn it into a black mass, by placing it among live coals. Having reduced it to powder, subject it to a moderate heat, in an open crucible, until it become white, or at least of an ash-grey colour, care being taken that it do not melt. Then dissolve it in warm water, strain the liquor through linen, and evaporate it in a clean iron vessel, stirring the matter constantly towards the end of the evaporation, with an iron spoon, that it may  
not

not adhere to the bottom of the vessel. A very white salt will remain, which is to be left a little longer on the fire, until the bottom of the vessel is nearly at a red heat. When cold, it is to be kept in glass vessels, well stopp'd."

By exposing the super-tartrite of potash to heat, the tartarous acid is decomposed. Part of its carbon and oxygen unite, and form carbonic acid, which is attracted by the potash; and, by continuing the heat, the remaining carbonaceous matter is burnt out. By dissolving the saline matter, the portion of lime, and any other earthy or metallic matter which the super-tartrite may have contained are separated, and, by evaporation, a salt is obtained, which, like the former, is a sub-carbonat of potash, but more pure.

The uses of this salt as an antacid and diuretic, have been already mentioned.

AQUA POTASSÆ, *vulgo Lixivium Causticum*. WATER OF POTASH. Aqua Kali Pur.

"Take of newly prepared Lime, eight ounces; Carbonat of Potash, six ounces. Put the lime into an iron or earthen vessel, with twenty-eight ounces of warm water. The ebullition

being finished, immediately add the salt; and the whole being well mixed, close the vessel till they become cold. Let the cold materials, previously well agitated, be poured into a glass funnel, the throat of which is obstructed with clean linen. Cover the upper orifice of the funnel, while the neck of it is inserted in another glass vessel, that the water of potash may gradually drop through the linen into the lower vessel. When it first ceases to drop, pour into the funnel some ounces of water, but cautiously, so that it may swim above the matter. The water of potash will again begin to drop. In this manner the affusion of water is to be repeated, until three pounds have filtered, which will be in the space of two or three days. The upper parts of the liquor are to be mixed with the lower by agitation, and it is to be kept in a vessel well stoppt."

LIME having a stronger attraction to carbonic acid than potash has, attracts that acid from the sub-carbonat, and leaves the potash pure. Strictly speaking, indeed, the whole of the carbonic acid is not abstracted; since, in consequence of the law of chemical affinity, that quantity, to a certain

certain extent, counteracts the force of attraction, a part of the carbonic acid still remains combined with the potash, and, to obtain potash perfectly pure, a process much more operose is necessary. But, for any medicinal or pharmaceutical purpose, the potash existing in this solution is in a state of sufficient purity, at least if the directions in the Pharmacopœia are strictly observed. Its medicinal uses as a lithontriptic and antacid have been already considered.

AQUA SUPER-CARBONATIS POTASSÆ. WATER  
OF SUPER-CARBONAT OF POTASH.

“ Take of Water, ten pounds; Pure Carbonat of Potash, one ounce. Dissolve, and expose the solution to the current of Carbonic Acid Gas which arises from three ounces of Powdered Carbonat of Lime, three ounces of Sulphuric Acid, and three pounds of Water, gradually and cautiously mixed. The chemical apparatus invented by Dr Nooth is well adapted to this preparation. But, if a larger quantity of the solution is required, the apparatus of Woulfe is preferable. The colder the air is, and the great-

er the pressure, the better will be the liquor. It ought to be kept in vessels well stoppt."

POTASH, when used as a lithontriptic, irritates the stomach and bladder so much, that its use cannot well be long continued. But, when super-saturated with carbonic acid, as it is in this preparation, it is much more pleasant and less irritating; and, though its lithontriptic or real solvent power is diminished, or perhaps entirely lost, it is capable of acting as a palliative, and of being continued for any length of time. It is taken to the extent of one, or even two pounds in the day. When properly prepared, it is pungent and acidulous, and sparkles when poured into a glass.

Natron  
Præpara-  
tum.

CARBONAS SODÆ, *olim Sal Alkalinus Fixus Fossilis Purificatus.* CARBONAT OF SODA.

"Take of Impure Carbonat of Soda, any quantity. Bruise it, and boil in water until all the salt is dissolved. Strain the solution through paper, and evaporate it in an iron vessel, that after it has cooled crystals may form."

IMPURE Carbonat of Soda, the Barilla of commerce, is obtained from the incineration of cer-  
tain

tain marine plants. It consists of carbonat of soda, with charcoal, oxyd of iron, and various other impurities. From these it is in a great measure freed by solution and crystallization. The crystals are rhomboidal, and contain a large quantity of water of crystallization. This salt has been used principally as a lithontriptic, under the form of the watery solution super-saturated with carbonic acid, or that of the Soda Pill.

AQUA SUPER-CARBONATIS SODÆ. WATER OF SUPER-CARBONAT OF SODA.

“ This is prepared from ten pounds of Water, and two ounces of Carbonat of Soda, in the same manner as the water of super-carbonat of potash.”

It is used as a lithontriptic, in the same dose as the water of super-carbonat of potash, and has generally been preferred to it, on the supposition of being more pleasant.

AQUA ACETITIS AMMONIÆ, *vulgo Spiritus Min-  
dereri.* WATER OF ACETITE OF AMMONIA.

Aqua  
Ammo-  
niæ Ace-  
tatæ.

“ Take of Carbonat of Ammonia, any quanti-  
ty.

ty. Pour on it as much Distilled Acetous Acid as may be necessary to saturate exactly the ammonia."

IN this preparation, the acetous acid combines with the ammonia, and the carbonic acid is disengaged with effervescence. The acetite of ammonia remains dissolved in the water. As the strength of distilled vinegar is not always the same, that of this solution must be variable; an inconvenience not easily obviated. It is given as a diaphoretic, in divided doses of one ounce.

Kali A-  
cetatum.

ACETIS POTASSÆ. ACETITE OF POTASH.

"Take of Pure Carbonat of Potash, any quantity. Boil it with a gentle heat in four or five times its weight of Distilled Acetous Acid, and add more acid at different times, until, on the watery part of the former portion being nearly dissipated by evaporation, the acid newly added excite no effervescence: this will happen when about twenty parts of acid have been consumed. Then let it be slowly dried. Let the remaining impure salt be liquefied with a gentle heat, for a short time; then dissolved in water, and strained  
ed

ed through paper. If the melting has been properly done, the strained liquor will be limpid; if not, of a brown colour. Afterwards evaporate with a very gentle heat this liquor, in a shallow glass vessel, stirring the salt while it concretes, that it may more quickly be brought to dryness. Lastly, the acetite of potash ought to be kept in a glass vessel, well closed, that it may not liquefy by the action of the air."

It is obvious, that, in this process, the acetous acid combines with the potash, disengaging the carbonic acid. The acetite of potash, obtained by the evaporation, is of a brownish colour, from the presence, either of some extractive matter contained in the vinegar, or of carbonaceous matter, from a partial decomposition of the acid. It is freed from this by the fusion which is directed; and, by the second solution and evaporation, it is obtained in the form of a white foliated mass, extremely deliquescent.

This salt was at one time celebrated as a diuretic, in a dose of one or two drachms; but it has now nearly fallen into disuse.

Kali  
Purum.

POTASSA, *olim Causticum Commune Acerrimum.*

POTASH.

“Take of Water of Potash, any quantity. Evaporate it in a covered clean iron vessel, until, when the ebullition is finished, the saline matter flow smoothly like oil, which will happen before the vessel is at a red heat. Then pour it on a clean iron plate; cut it into small masses before it hardens, and immediately put them into a phial well stopd.”

POTASH in this form is used as a caustic; it quickly erodes animal matter, and, mixed with soap, has been used to open an ulcer.

Calx cum  
Kali  
Puro.

POTASSA CUM CALCE, *olim Causticum Commune Mitius.* POTASH WITH LIME.

“Take of Water of Potash, any quantity. Evaporate it to one-third in a covered iron vessel; then mix with it as much newly flaked Lime as may be sufficient to give it the consistence of a solid paste, which is to be kept in a stopd vessel.”

As a caustic, this is milder than the former, and is also less deliquescent.

SULPHAS

SULPHAS POTASSÆ : *olim, Tartarum Vitriolatum.* Kali Vi-  
triat.

## SULPHAT OF POTASH.

“ Take of Sulphuric Acid, diluted with six times its weight of Water, any quantity. Put it into a large glass vessel, and gradually drop into it, of Carbonat of Potash, dissolved in six times its weight of Water, as much as may be necessary to the perfect saturation of the acid.

The effervescence being over, strain the liquor through paper ; and, after due exhalation, put it aside, that crystals may form. Sulphat of Potash may also be conveniently made, by dissolving the residuum of the distillation of Nitrous Acid in Warm Water, and saturating it with Carbonat of Potash.”

IN the former of these processes, the sulphuric acid unites with the potash of the carbonat of potash, and expels the carbonic acid with effervescence. In the latter, which is the one generally followed, the excess of sulphuric acid attached to the sulphat of potash, which remains after the distillation of nitrous acid, is saturated by the addition of a sufficient quantity of potash. The salt forms an irregular crystalline mass ; it has a very bitter taste, and is sparingly soluble

soluble in water. Its virtues are those of a cathartic; its dose half an ounce.

SULPHAS POTASSÆ CUM SULPHURE, *olim Sal Polychrestus*. SULPHAT OF POTASH WITH SULPHUR.

“Take of Nitrat of Potash in powder, Sublimed Sulphur, equal weights. Throw them well mixed, in small quantities at a time, into a red-hot crucible. The deflagration being finished, let the salt cool, and keep it in a glass phial, well stoppt.”

THE nitrat of potash being decomposed by the red heat, affords oxygen to the sulphur, in such proportions as to convert it into sulphuric and sulphurous acids. Both acids are attracted by the potash. In its medicinal qualities, this saline compound does not appear to differ from the sulphat of potash; and it is soon converted into it, by exposure to the air.

Kali  
Tartari-  
fatum.

TARTRIS POTASSÆ, *olim Tartarum Solubile*.

TARTRITE OF POTASH.

“Take of Carbonat of Potash, one pound;  
Super-Tartrite of Potash, three pounds, or as  
much

much as may be necessary ; Boiling Water, fifteen pounds. To the carbonat of potash dissolved in the water, add, by small quantities, the Super-Tartrite of Potash rubbed to a fine powder, as long as it excites effervescence, which generally ceases before three times the weight of the carbonat of potash have been thrown in. Then strain the liquor, when cold, through paper ; and, after due exhalation, put it aside that crystals may form."

THE excess of tartarous acid in the super-tartrite of potash, is saturated by the potash of the carbonat of potash, and the proper neutral salt formed. It is not easily crystallized. In its preparation, therefore, the solution is usually evaporated to dryness.

This salt has a bitter taste ; it is very soluble in water, requiring only four parts of cold water for its solution. As a purgative, it is given in the dose of one ounce.

TARTRIS POTASSÆ ET SODÆ, *olim Sal Rupellen-*  
*sis.* TARTRITE OF POTASH AND SODA.

Natron  
Tartari-  
fatum.

" This is prepared from Carbonat of Soda and  
Super-

Super-Tartrite of Potash, in the same manner as Tartrite of Potash."

THE excess of tartarous acid in the acidulous tartrite of potash, being saturated in this preparation with soda, a triple salt is formed. It crystallizes in rhomboidal prisms; is soluble in five parts of water at  $60^{\circ}$ ; has a bitter saline taste. It is employed as a cathartic, in the dose of one ounce; and is often preferred, as being less disagreeable than the greater number of the saline cathartics.

PHOSPHAS SODÆ. PHOSPHAT OF SODA.

"Take of Bones, burnt to whiteness and reduced to powder, ten pounds; Sulphuric Acid, six pounds; Water, nine pounds. Mix the powder in an earthen vessel with the sulphuric acid; then add the water, and again mix. Keep the vessel in a water-bath for three days; at the end of which, dilute the matter, by adding other nine pounds of Boiling Water, and strain through a strong linen-cloth, pouring over it gradually, boiling water, until the whole acid is washed out. Put aside the strained liquor, that the impurities may subside, from which  
pour

pour it off, and, by evaporation, reduce it to nine pounds. To this liquor, again poured off from the impurities, and heated in an earthen vessel, add Carbonat of Soda dissolved in warm water, until the effervescence cease. Then strain, and put it aside, that crystals may form. These being removed, add, if necessary, to the liquor, a little Carbonat of Soda, that the phosphoric acid may be exactly saturated; and prepare it by evaporation, again to form crystals, as long as these can be produced. Lastly, let the crystals be kept in a vessel well stoppt."

THE white residuum of burnt bones consists chiefly of phosphat of lime. The sulphuric acid decomposes it, by combining with the lime; the phosphoric acid, which is disengaged, dissolves, however, a portion of undecomposed phosphat of lime, forming a soluble compound. When carbonat of soda is added to the acidulous liquor obtained by washing the materials, the soda combines with the free phosphoric acid; the neutral phosphat of lime, which was combined with that acid, is precipitated, and the phosphat of soda crystallizes on evaporation of the strained liquor. Its crystals are rhomboidal, efflorescent,

and require for solution only four parts of cold water. They consist, according to Thenard, of 19 of soda, 15 of acid, and 66 of water. Its taste is purely saline, without any bitterness; its medicinal operation is that of a mild cathartic, and, from being less nauseous to the taste than the other salts, it is entitled to preference. Its dose is one ounce.

Natron  
Vitriola-  
tum.

SULPHAS SODÆ: *olim, Sal Glauberi.* SULPHAT OF  
SODA.

“ Dissolve the Acidulous Salt remaining after the distillation of muriatic acid, in Water; and add to it Chalk, to remove the superfluous acid. Put it aside until the impurities have subsided; then, having poured off the liquor, and strained it through paper, reduce it by evaporation, that crystals may be formed.”

IN the decomposition of muriat of soda by sulphuric acid, to prepare muriatic acid, more sulphuric acid is used than is barely sufficient; and hence the necessity of saturating this excess by the addition of chalk or carbonat of lime. The neutral sulphat of soda crystallizes in hexahedral prisms; they are efflorescent and soluble in rather

ther less than three parts of cold water. This salt has been long in use as a cathartic, and its value is only lessened by its nauseous taste. Its dose is an ounce and a half.

SULPHURETUM POTASSÆ: *olim, Hepar Sulphuris.* Kali Sulphuratum.

“ Take of Carbonat of Potash, Sublimed Sulphur, of each eight ounces. Having rubbed them together, put them into a large coated crucible; and a cover being adapted to it, apply the fire to it cautiously, until they melt. The crucible, after it has cooled, being broken, remove the sulphuret, and preserve it in a phial well stoppt.”

DURING the fusion of these two substances, the sulphur and potash combine, and the carbonic acid is disengaged. The compound is easily fusible, and is of a brown colour, and inodorous. It is immediately partially decomposed by water, and portions of sulphat of potash and sulphurated hydrogen formed. It has been proposed to be used as an antidote to some of the metallic poisons, from the supposition that the sulphur would combine with the metallic preparation, and render it inert. From a similar theory, it has been imagined that it

might obviate the effects of mercury on the system when these are too violent : but it is very seldom had recourse to with either intention. The dose in which it has been proposed to be given, is from ten to twenty grains three or four times a-day. It is said, in some cases of cancer, to have increased the efficacy of cicuta as a palliative, in doses of five grains.

HYDRO-SULPHURETUM AMMONIÆ.      HYDRO-SULPHURET OF AMMONIA.

“ Take of Water of Ammonia, four ounces. Expose it in a chemical apparatus to the stream of gas which arises from Sulphuret of Iron, four ounces ; Muriatic Acid, eight ounces, previously diluted with two pounds and a half of Water. The sulphuret of iron for this purpose is conveniently prepared from three parts of Purified Iron Filings, and one part of Sublimed Sulphur, mixed together, and exposed in a covered crucible, to a moderate heat, until they unite.”

THE fulphurated hydrogen is produced in this process by the muriatic acid *disposing* the iron to decompose part of the water. The hydrogen disengaged

disengaged immediately combines with a portion of the sulphur present, and this compound escaping in the state of gas, is passed through the water of ammonia, with which it unites, and forms a liquor of a dark green colour, and very foetid odour.

The medicinal qualities of hydro-sulphuret of ammonia have been already noticed. It is capable of powerfully depressing the actions of the stomach and general system, and has been used, principally in diabetes, in a dose of three or four drops, three or four times a-day.

MURIAS BARYTÆ. MURIAT OF BARYTES.

“ Take of Sulphat of Barytes, two pounds ; Wood Charcoal in powder, four ounces. Roast the sulphat, that it may be the more easily reduced to a fine powder, with which is to be mixed the powdered charcoal. Put the matter into a crucible, to which a cover is adapted, and urge it with a strong fire for six hours. Put the matter well rubbed into six pounds of Boiling Water, in a closed glass or earthen vessel, and mix them by agitation, preventing, as much as possible, the access of the air. Let the vessel stand

in a water-bath, until the part not dissolved has subsided ; then pour off the liquor. Pour on the residuum four pounds of boiling water, which, after agitation and subsidence, add to the former liquor. While it is yet hot, or, if it has cooled, after it has been heated, drop into it Muriatic Acid as long as effervescence is excited. Then strain it, and evaporate, that it may crystallize."

SULPHAT of Barytes may be decomposed by carbonat of potash by double affinity, and perhaps this is the least troublesome process; but, when done with a view to the medicinal application of the barytes, it has been supposed defective, as it does not separate the metallic substances with which the native sulphat is so frequently intermixed. The process of decomposing it, therefore, by charcoal, has been deemed preferable. The carbonaceous matter attracts the oxygen of the sulphuric acid; the sulphur remains united with the barytes. This sulphuret of barytes, as well as a portion of hydro-sulphuret formed during the solution, are soluble in water; on dropping in muriatic acid, it combines with the barytes, the sulphur is precipitated, and the sulphurated hydrogen disengaged.

By straining and evaporating the liquor, the muriat of barytes is obtained crystallized. It is used under the form of solution, for which also a formula is given:

SOLUTIO MURIATIS BARYTÆ. SOLUTION OF  
MURIAT OF BARYTES.

“Take of Muriat of Barytes, one part. Distilled Water, three parts. Dissolve.”

THE saturated solution of muriat of barytes was introduced by Dr Crawford, as a remedy in microfulous affections, and has been regarded as a tonic of considerable power. It is by no means inert, and the dose requires to be regulated with some care. Five drops are given twice a-day, and gradually increased to twenty or more.

SOLUTIO MURIATIS CALCIS. SOLUTION OF MU-  
RIAT OF LIME.

“Take of Pure Carbonat of Lime (namely White Marble), in small pieces, nine ounces; Muriatic Acid, sixteen ounces; Water, eight ounces. Mix the acid with the water, and add gradually the pieces of carbonat of lime. The

effervescence being finished, digest for an hour. Pour off the liquor, and reduce it by evaporation to dryness. Dissolve the residuum in its weight and a half of water, and strain."

THE muriatic acid, it is obvious, combines with the lime, and disengages the carbonic acid. The solution of muriat of lime has been strongly recommended as a tonic, similar, and not inferior to the muriat of barytes. The dose is from fifteen to twenty grains of the dried salt, or thirty drops of the saturated solution. *to get 0*

Magnesia CARBONAS MAGNESIÆ: *olim, Magnesia Alba.*  
Alba.

CARBONAT OF MAGNESIA.

"Take of Sulphat of Magnesia, Carbonat of Magnesia, of each equal weights. Let them be dissolved separately in twice their weight of warm water, and either strained or otherwise freed from impurities. Then mix them, and immediately add eight times their weight of boiling water. Boil the liquor a little, stirring it at the same time; then allow it to remain at rest, until the heat be diminished a little, and strain it through linen, on which the carbonat  
of

of magnesia will remain. Wash it with pure water, until it be perfectly tasteless."

THIS is an example of double affinity, the sulphuric acid of the sulphat of magnesia combining with the potash of the carbonat of potash, and the carbonic acid uniting with the magnesia. The use of adding the boiling water, and boiling the liquor, is, partly to dissolve the sulphat of potash, which is a salt sparingly soluble, and partly to give the carbonat of magnesia a smoothness which it has not when this precaution is not observed. Carbonat of magnesia, however, is generally prepared on a large scale from the Bittern, or liquor remaining after the crystallization of muriat of soda from sea-water, which is principally a solution of muriat of magnesia: and there are some niceties of manipulation requisite to give it the lightness and smoothness which are valued as marks of its goodness.

Carbonat of magnesia, properly prepared, is nearly insipid; it is extremely light, white, and smooth to the touch; is insoluble in water. It is given as an antacid in a dose from a scruple to a drachm; and the magnesia, by combining  
with

with acid in the stomach, forms a salt which acts as a laxative.

Magne-  
fia Usta.

MAGNESIA : *olim, Magnesia Usta.* MAGNESIA.

“ Let Carbonat of Magnesia be exposed in a crucible, to a red heat, for two hours. Then preserve it in glass phials well stop’d.”

By a red heat, the carbonic acid of the carbonat is expelled, and the pure magnesia remains. It loses about half its weight. A smaller quantity, therefore, of the pure magnesia, will produce the same effect as a larger of the carbonat. It is preferred to the latter, where, from the abundant acidity on the stomach, flatulence is occasioned by the disengagement of carbonic acid when the carbonat is employed.

---

CHAP. XIX.*METALLICA.*—METALLIC PREPARATIONS.

THE following metals are employed in medical practice : Silver, Quicksilver, Copper, Iron, Tin, Lead, Zinc, Antimony, and Arsenic.

It has already been observed, that metals, in their pure state, do not appear to exert any action on the living system ; their combinations only possess medicinal virtues.

The oxydation of metals, and the combination of their oxyds with acids, are the chemical changes which communicate to them activity. In general they are more active, in proportion as they are more highly oxydated, and are still more so when combined with acids. Oxygen is not, however, to be regarded, according to a modern hypothesis, as the source of their activity : each metal possesses powers, which, though

i & crease &

increased or diminished according to the degree of oxydation, are peculiar to itself, and remain in all its preparations.

### ARGENTUM.—SILVER.

Argen-  
tum Ni-  
tratum.

NITRAS ARGENTI : *olim, Causticum Lunare.* NI-  
TRAT OF SILVER.

“ Take of the Purest Silver, extended in plates and cut, four ounces ; Diluted Nitrous Acid, eight ounces ; Distilled Water, four ounces. Dissolve the silver in a phial with a gentle heat, and evaporate the solution to dryness. Then put the mass into a large crucible, which is to be put on the fire, which must be at first gentle, and gradually increased until the mass flow like oil. Then pour it into iron pipes, warmed and rubbed with grease. Lastly, keep it in a glass vessel well stoppt.”

THE silver in this process is oxydated and dissolved by the nitrous acid. By the subsequent fusion, part of the acid is expelled, so that this is rather a sub-nitrat than a nitrat of silver. It is a strong caustic, and possesses the advantage of  
being

being easily applied. It is therefore the one in most general use.

---

*ANTIMONIUM.—ANTIMONY.*

SULPHURETUM ANTIMONII PRÆPARATUM: *olim*, Antimonium Præparatum.  
*Antimonium Præparatum.* PREPARED ANTIMONY.  
 MONY.

“Let Sulphuret of Antimony be prepared in the same manner as carbonat of lime.”

THIS preparation has been already noticed, (page 8.)

OXIDUM ANTIMONII CUM SULPHURE VITRIFICATUM: *olim*, *Vitrum Antimonii.* VITRIFIED SULPHURATED OXYD OF ANTIMONY.  
 Antimonium Vitrificatum.

“Strew Sulphuret of Antimony, rubbed to a coarse powder like sand, on a shallow unglazed earthen vessel, and apply to it a gentle fire, that the sulphuret of antimony may be slowly heated; at the same time stirring constantly the powder, that it may not run into lumps. White vapours, smelling of sulphur, will arise from it. When these, while the same degree of heat is kept up, cease, increase the heat a little, that vapours

vapours may again exhale ; and proceed in this manner, until the powder, raised at length to a red heat, exhales no more vapours. This powder being put into a crucible, is to be melted with a strong fire, until it assume the appearance of fused glass ; then pour it upon a heated brass plate."

IN the first stage of this process, the greater part of the sulphur of the sulphuret of antimony is dissipated, and the antimony is imperfectly oxydated. This oxyd is then vitrified by the more intense heat applied. According to Thénard, it contains 16 of oxygen in the 100 ; but it is farther combined, according to the researches of Proust, with a portion of sulphuret of antimony ; and, from the experiments of Vauquelin, it appears also to contain from 9 to 10 parts in the 100 of siliceous earth, derived probably from the crucibles in which it is prepared. It is violent and at the same time uncertain in its operation, and is not used but in preparing some of the other antimonials.

## OXIDUM ANTIMONII VITRIFICATUM CUM CERA :

*olim, Vitrum Antimonii Ceratum.* VITRIFIED  
OXYD OF ANTIMONY WITH WAX.

“ Take of Yellow Wax, one part ; Vitrified Sulphurated Oxyd of Antimony, eight parts. To the wax, melted in an iron vessel, add the oxyd rubbed to powder, and roast them with a gentle fire, for a quarter of an hour, stirring constantly with a spatula ; then pour out the matter, which, when it is cold, rub to powder.”

It is probable that during this process the oxyd of antimony loses part of its oxygen, from the carbonaceous matter of the wax attracting it, as it diminishes in weight, and becomes much milder in operation. Though once highly recommended in dysentery, it may be regarded as an obsolete remedy. The dose in which it was given, was from five to fifteen grains, and its principal operation was that of a cathartic.

## OXIDUM ANTIMONII CUM PHOSPHATE CALCIS :

*olim, Pulvis Antimonialis.* OXYD OF ANTI-  
MONY WITH PHOSPHAT OF LIME.

Pulvis  
Antimo-  
nialis.

“ Take of Sulphuret of Antimony, rubbed to

a coarse powder, Hartshorn Shavings, of each equal parts. Mix and throw them into a wide iron pot, red hot, and stir them constantly until they are burnt into a matter of an ash colour, which remove from the fire, rub to powder, and put into a coated crucible. Lute to this crucible another inverted, in the bottom of which a small hole is drilled; apply the fire, which is to be gradually raised to a white heat, and kept at this increased heat for two hours. Lastly, rub the matter, when cold, into a very fine powder."

THIS has been introduced into the Pharmacopœias, as affording a preparation similar to the celebrated empirical remedy, *James's Powder*. For the process we are indebted to Dr Pearson. By analysis he found the genuine powder of James to consist of 43 parts of phosphat of lime, and 57 of an oxyd of antimony, part of which was vitrified; and by the above formula he was able to prepare a powder similar to it in qualities and chemical composition. The theory of the process is sufficiently obvious. During the first stage, the animal matter of the bones is decomposed and burnt out; the sulphur of the  
sulphuret

fulphuret of antimony is expelled, and the metal imperfectly oxydated. In the second, the metal is more completely oxydated, partially vitrified, and perhaps brought into combination with the phosphat of lime, which is the residuum of the bones. From Mr Chenevix's experiments, it appears, that, in this preparation, more of the oxyd of antimony is vitrified than in the genuine James's powder.

Mr Chenevix has likewise proposed a method of obtaining this preparation in the humid way. It consists in dissolving equal weights of the white powder, precipitated by water, from muriat of antimony, and of pure phosphat of lime, in as much muriatic acid as may be necessary, with the assistance of a moderate heat, and pouring this solution into ammonia diluted with distilled water. The ammonia combines with the muriatic acid, and the oxyd of antimony and phosphat of lime are thrown down intimately mixed. This preparation may be more uniform in composition than that obtained by heat, as, in the latter, variations are liable to be introduced, from the different degrees of oxydation, of which antimony is susceptible, and from the volati-

lity of the antimonial oxyds ; but it is uncertain if it be the same chemical compound, or if it produce the same medicinal effects. It is believed, that, in the powder prepared by the old process, the oxyd of antimony and phosphat of lime are in a state of combination, while in that of Mr Chenevix, they are only in a state of mixture, and in the former, part of the oxyd is also always vitrified ; differences which may give rise to some difference in their powers.

James's powder has been long celebrated as a remedy in febrile affections. It acts as a very general evacuant, occasioning sweat, purging, and frequently vomiting ; and, by this general action, appears to arrest the progress of the disease. Its dose is five or six grains, repeated every six hours, till its effects are obtained. It is better adapted to fevers of an inflammatory nature than to those of the typhoid kind.

It has been affirmed, that the preparation obtained by the above process, is not so certain nor so powerful in its operation, as the powder of James, eight grains of the former being not more than equal to six of the latter. The difference, if it exist, may be owing to some peculiarity in the  
the

the process, by which, perhaps, a difference of oxygenation, or of vitrification of the oxyd may be occasioned; or, according to the opinion of Dr Fordyce, to the intermixture of a portion of tartarized antimony in the empirical preparation.

SULPHURETUM ANTIMONII PRÆCIPITATUM.

PRECIPITATED SULPHURET OF ANTIMONY.

Sulphur  
Antimo-  
nii Præci-  
pitatum.

“ Take of Water of Potash, four pounds; Water, three pounds; Prepared Sulphuret of Antimony, two pounds. Boil them in a covered iron pot, on a gentle fire, for three hours, stirring frequently with an iron spatula, and adding water as it may be necessary. Strain the hot liquor through a double linen cloth, and to this strained liquor add as much diluted sulphuric acid as may be necessary to precipitate the sulphuret, which is to be carefully washed with warm water.”

FROM the analysis of this compound by Thénard, it appears to be composed of 68.3 of the orange-coloured oxyd of antimony, (which consists of 18 of oxygen, and 82 of antimony), 17.8 of sulphurated hydrogen, and 11 or 12 of sul-

M 2

phur.

phur. The theory of its formation is somewhat intricate. In boiling the sulphuret of antimony with the potash, a sulphuret of potash is formed, and this decomposing part of the water, hydro-sulphuret of potash is also produced; the antimony appears to be at the same time oxydated. This oxyd is retained in solution by the sulphuret and hydro-sulphuret of potash. When sulphuric acid is added, it unites with the potash, and the antimonial oxyd, combined with part of the sulphurated hydrogen and sulphur, is precipitated. In the foreign Pharmacopœias, an equal part of sulphur is added to the sulphuret of antimony, by which the product is increased.

When the liquor obtained by boiling the solution of potash on the sulphuret of antimony is strained, and allowed to cool, it deposits a red-coloured powder, which has been known by the name of *Kermes Mineral*, and has been much used on the Continent. From the analysis of it by Thénard, it appears to be a compound of brown oxyd of antimony and sulphurated hydrogen, with a small portion of sulphur, the last being probably accidental. Trommsdorff attributes the difference between these two preparations, to the one *essentially*

*essentially* containing sulphur combined with the oxyd of antimony and sulphurated hydrogen; the other not. Thenard ascribes it rather to a difference of oxygenation, the oxyd in the *kermes* being less highly oxydated than in the other.

They agree nearly in their medicinal qualities, which are similar to those of the other antimonials. They have been used principally as diaphoretics and sudorifics, but are always uncertain in their operation. The dose of the precipitated sulphuret of antimony, or, as it should rather be named, the Hydro-sulphurated Oxyd of Antimony, is five or six grains.

(OXIDUM ANTIMONII CUM SULPHURE, PER NITRATUM POTASSÆ : *olim, Crocus Antimonii.* OXYD OF ANTIMONY WITH SULPHUR, BY NITRAT OF POTASH.

Crocus  
Antimo-  
nii.

“ Take of Sulphuret of Antimony, Nitrat of Potash, of each equal weights. Triturate them separately, and, having mixed them well together, throw them into a crucible red hot. The deflagration being over, separate the reddish matter from the white crust, and rub it to a powder

der, which is to be frequently washed with warm water, until it remain insipid.”

DURING the deflagration, the nitric acid of the nitrat of potash is decomposed ; its oxygen is attracted, partly by the sulphur, and partly by the antimony. The sulphurous acid, which is the principal product of the oxygenation of the sulphur, is in part dissipated, and in part combined with the potash, and forms the white crust which is directed to be removed. By the union of another portion of the oxygen with the antimony, a brown or reddish oxyd is formed. It appears also that part of the sulphuret of antimony escapes decomposition or oxygenation, and unites with the oxyd. The preparation, therefore, is an imperfect oxyd of antimony with sulphuret of antimony.

As an antimonial, this preparation is so uncertain in its operation, that it is never prescribed ; it is used in making some of the other preparations of this metal.

Antimo-  
nium Mu-  
riatum.

MURIAS ANTIMONII. MURIAT OF ANTIMONY.

“ Take of Oxyd of Antimony with Sulphur by Nitrat of Potash, Sulphuric Acid, of each one pound ; Dried Muriat of Soda, two pounds.

Pour

Pour the sulphuric acid into a retort, adding gradually the muriat of soda and the oxyd of antimony, previously mixed. Then distil from a warm sand. Expose the distilled matter for some days to the air, that it may deliquesce; then pour the liquid part from the impurities."

IN this mode of forming muriat of antimony, the muriat of soda is decomposed by the sulphuric acid combining with the soda; the muriatic acid disengaged, unites with the oxyd of antimony, and the compound is volatilized. It is at first of a soft consistence, but soon attracts a sufficient portion of humidity to render it fluid. If water be poured on it, it is decomposed, and a sub-muriat of antimony is precipitated.

This preparation is unfit for internal use; externally it has sometimes been used as a caustic. Decomposed by potash, it affords an oxyd which has been used in preparing the tartrate of antimony.

TARTRIS ANTIMONII: *olim, Tartarus Emeticus.*

TARTRITE OF ANTIMONY.

Antimonium  
Tartarifatum

"Take of Oxyd of Antimony with Sulphur by Nitrat of Potash, three parts; Super-Tartrate of Potash, four parts; Distilled Water, thirty-

two parts. Boil them in a glass vessel for a quarter of an hour. Strain through paper, and put aside the strained liquor, that crystals may be formed."

THE excess of tartarous acid in the super-tartrate of potash, is capable of combining with a number of the metallic oxyds, and forming ternary compounds. With oxyd of antimony, when not too highly oxydated, it unites with facility, forming a combination of this kind, which constitutes the present preparation. As the tartarous acid is saturated, partly by potash, and partly by oxyd of antimony, it is not a pure tartrate of antimony, but a tartrate of antimony and potash. According to the analysis of it by Thenard, it consists of 38 parts of oxyd of antimony, 34 of tartarous acid, 16 of potash, and 8 of water.

As this is the most important of the antimonial preparations, the processes for obtaining it have been often varied, principally in the selection of the oxyd of antimony employed. The object is to obtain an oxyd, not too expensive in its preparation, and which shall combine with facility with the tartarous acid. The oxyd precipitated by potash from muriat of antimony, recommended

recommended by Bergman, and employed in the process given in the preceding edition of the Edinburgh Pharmacopœia, is liable to the former objection. The oxyd which is at present ordered in the processes, both of the London and Edinburgh Pharmacopœias, answers sufficiently well, if it has been properly prepared. As met with in the shops, it is, however, almost always unfit for this purpose ; as, from not being prepared with the due proportion of nitrat of potash, it is not sufficiently oxydated. The vitrified oxyd is, perhaps, the most unexceptionable ; it contains, indeed, a portion of siliceous earth, which accompanies the oxyd of antimony in its combination with the tartarous acid, and, when the liquor is considerably evaporated, gives to it a gelatinous consistence : but, before this happens, the greater part of the tartrate of antimony and potash may be procured by crystallization ; or, according to Vauquelin's method, the solution may be directly evaporated to dryness, and, on again dissolving the saline matter in water, the filix remains undissolved.

Tartrate of antimony and potash crystallizes in small triedral pyramids, which are efflorescent.

cent. Its solubility has been variously stated, and appears to vary according to the quantity of antimonial oxyd contained in it, from proper preparation. According to Dr Saunders, one ounce of water at 60° dissolves 52 grains of the fully saturated salt, while of that generally met with, it dissolves from 32 to 35. This affords even a mode of judging of the strength of this preparation. It is very susceptible of decomposition, suffering it not only from alkalies, earths, acids, and a number of neutral salts, but even from vegetable infusions and decoctions, the vegetable matter attracting apparently part of the oxygen of the oxyd. If kept dissolved in water, it is also decomposed, from the spontaneous decomposition of the tartarous acid.

This preparation is undoubtedly superior to the other antimonials, in the certainty of its operation; and, from its solubility, is more manageable with regard to dose. Its medicinal applications have been already noticed. It is given as an emetic in a dose of from one to three grains, dissolved in water; and, in smaller doses, as an expectorant and diaphoretic.

VINUM TARTRITIS ANTIMONII : *olim, Vinum Antimoniale.* WINE OF TARTRITE OF ANTIMONY.

“ Take of Tartrate of Antimony, twenty-four grains ; White Wine, one pound. Mix, so that the tartrate of antimony may be dissolved.”

THIS salt, dissolved in wine, can be preserved longer without decomposition than when dissolved in water ; but, even on long keeping, part of the antimonial oxyd is deposited. It is given as an emetic in the dose of one ounce ; as a diaphoretic, in a much smaller dose.

VINUM ANTIMONII TARTARISATI. *Pharm. Lond.*  
WINE OF TARTARISED ANTIMONY.

“ Take of Tartarised Antimony, two scruples ; Boiling Distilled Water by measure, two ounces ; Spanish White Wine by measure, eight ounces. Dissolve the tartarised antimony in the boiling distilled water, and add the wine.”

It is to be regretted, that preparations so similar in name as these two wines, should differ materially in strength ; this containing four grains

grains of tartrate of antimony in the ounce, the other only two grains. The dose of this wine as an emetic, is half an ounce.

VINUM ANTIMONII. ANTIMONIAL WINE.  
*Pharm. Lond.*

“Take of Vitrified Antimony, in powder, one ounce ; Spanish White Wine, one pound and a half. Digest for twelve days with frequent agitation, and strain through paper.”

THIS is the old formula for the preparation of antimonial wine. The tartarous acid, contained in greater or less quantity in all wines, acts on the oxyd of antimony, and renders part of it soluble. But the quantity must be uncertain, and the wine cannot be uniform in strength.

ANTIMONIUM CALCINATUM. CALCINED ANTIMONY. *Pharm. Lond.* WHITE OXYD OF ANTIMONY.

“Take of Antimony (Sulphuret of Antimony) in powder, eight ounces ; Nitre in powder, two pounds. Mix them, and throw the mixture gradually into a red hot crucible. Burn the matter remaining after the deflagration, for half an

an hour, and, when cold, rub it to powder ; then wash it with distilled water."

So much nitrat of potash is exposed to heat with the sulphuret of antimony, in this process, that a quantity of oxygen is afforded by its decomposition, sufficient to acidify the sulphur, and completely oxydate the metal. The perfect oxyd remains after the washing, combined with a small quantity of potash. The preparation is one of little activity ; it was supposed to be diaphoretic, and was given in a dose from five to ten grains, as a substitute for James's powder ; but it is now seldom employed.

---

CUPRUM.—COPPER.

AMMONIARETUM CUPRI : *olim, Cuprum Ammoniacum.* AMMONIURET OF COPPER.

" Take of Pure Sulphat of Copper, two parts ; Carbonat of Ammonia, three parts. Rub them thoroughly in a glass mortar, until all effervescence is finished, and they unite uniformly into a violet-coloured mass, which being wrapt in  
bibulous

bibulous paper, is to be dried, first on a chalk stone, and afterwards with a gentle heat. It is to be kept in a glass phial well stoppt."

THE sulphat of copper is decomposed by the carbonat of ammonia. One portion of ammonia combines with the sulphuric acid, another portion of it unites with the oxyd of copper, and the violet-coloured mass which is formed, is a mixture of the two resulting compounds: the carbonic acid is disengaged with effervescence. A compound somewhat similar is obtained, according to a formula inserted in several of the foreign Pharmacopœias, in which a saturated solution of sulphat of copper is decomposed by ammonia, the ammonia being added in excess, so as to re-dissolve the oxyd of copper; to this solution alcohol is added, by which the ammoniuret of copper is precipitated in small crystals.

The present preparation has been chiefly employed as a remedy in epilepsy. It is given in a dose of at first half a grain twice a-day, which is gradually and slowly increased to two or three grains, and continued for some time.

SOLUTIO

SOLUTIO SULPHATIS CUPRI COMPOSITA: *olim*,  
*Aqua Styptica*. COMPOUND SOLUTION OF SUL-  
PHAT OF COPPER.

“ Take of Sulphat of Copper, Sulphat of Alum, of each three ounces ; Water, two pounds; Sulphuric Acid, one ounce and a half. Boil the sulphats in water, that they may be dissolved ; then to the liquor strained through paper add the acid.”

THIS is merely a combination of powerful astringents. It has been applied topically to check hæmorrhage, and, largely diluted with water, as a wash in purulent ophthalmia.

AQUA CUPRI AMMONIATI. WATER OF AMMONIATED COPPER. *Pharm. Lond.*

“ Take of Sal Ammoniac (Muriat of Ammonia), one drachm ; Lime Water, one pound. Allow them to remain in a copper vessel until the ammonia is saturated with copper.”

IN this indirect mode of combining oxyd of copper with ammonia, the lime decomposes the muriat of ammonia, by combining with the muriatic acid ; the disengaged ammonia disposes  
the

the copper to oxydation from the atmospheric air, and combines with the oxyd, forming a dilute solution of ammoniureted oxyd of copper. It has been applied, diluted with an equal part of water, as a gentle escharotic, to remove specks from the cornea. A similar preparation had formerly a place in the Edinburgh Pharmacopœia, under the name of *AQUA ÆRUGINIS AMMONIATA*.

---

*FERRUM*.—IRON.

*FERRI LIMATURA PURIFICATA*. PURIFIED FILINGS OF IRON.

“Having placed a sieve over the filings, apply a magnet, that they may be drawn through the sieve upwards.”

THIS preparation has been already noticed, (page 4).

Rubigo  
Ferri.

*CARBONAS FERRI*: *olim, Ferri Rubigo*. CARBONAT OF IRON.

“Let Purified Filings of Iron be frequently moistened with water, that they may fall into a rust, which is to be rubbed to a fine powder.”

THIS

THIS process for preparing a carbonat of iron has been likewise already taken notice of (p. 3.).

CARBONAS FERRI PRÆCIPITATUS. PRECIPITATED CARBONAT OF IRON.

“ Take of Sulphat of Iron, four ounces ; Carbonat of Soda, five ounces ; Water, ten pounds. Dissolve the sulphat of iron in the water ; then add the carbonat of soda, previously dissolved in as much water as may be necessary, and mix them well. Let the carbonat of iron, which is precipitated, be washed with warm water, and afterwards dried.”

ON mixing the solutions of carbonat of soda and sulphat of iron, the soda attracts the sulphuric acid, the carbonic acid combines with the oxyd of iron ; the sulphat of soda remains in solution ; the carbonat of iron is precipitated. The green sulphat of iron, which is that employed, contains the metal at its *minimum* of oxydation, and this imperfect oxyd combines with the carbonic acid ; but it quickly attracts more oxygen from the atmospheric air, and the precipitate of carbonat of iron, in drying, changes its colour,

from this cause, from a dark green to a reddish brown.

Carbonat of iron is a mild, and not inactive preparation. It is given as a tonic in a dose of five or ten grains. The formula of Dr Griffiths, which has been highly celebrated as a chalybeate, is an extemporaneous preparation of this kind.

FERRI OXIDUM NIGRUM PURIFICATUM: *olim,*  
*Ferri Squamæ Purificatæ.* PURIFIED BLACK  
OXYD OF IRON.

“Let the scales of iron, gathered at the anvils of the workmen, be purified, by applying a magnet. The magnet attracts only the smaller and purer scales, leaving the larger and less pure.”

THIS, it has been already observed (page 5), is used only in making some of the other preparations of iron.

Ferrum  
Vitriola-  
tum.

SULPHAS FERRI. SULPHAT OF IRON.

“Take of Purified Filings of Iron, six ounces; Sulphuric Acid, eight ounces; Water, two pounds and a half. Mix them; and the effervescence being over, digest for a short time in a sand-

sand-bath; then strain the liquor through paper, and, after due evaporation, put it aside that crystals may form."

THE sulphuric acid, by a disposing affinity, enables the iron to attract the oxygen of the water with rapidity, and unites with the oxyd thus formed. This oxyd is at the *minimum* of coxydation, and the salt which it forms is named the Green Sulphat of Iron, to distinguish it from the Red Sulphat, in which the metal is more highly oxydated. This green sulphat is prepared for the various purposes to which it is applied in the arts, on a large scale, by exposing the native sulphuret of iron to air and moisture; but, by the present process, it is obtained in a purer state.

Sulphat of iron is one of the most active preparations of the metal. Its medium dose is from three to five grains.

SULPHAS FERRI EXSICCATUS. DRIED SULPHAT  
OF IRON.

"Take of Sulphat of Iron, any quantity. Heat it in an unglazed earthen vessel, on a gentle fire, until it become white and perfectly dry."

THIS is merely the sulphat of iron freed from its water of crySTALLIZATION. It was never medicinally employed, and has a place in the Pharmacopœia only from being used in one or two pharmaceutical preparations.

OXIDUM FERRI RUBRUM. RED OXYD OF IRON.

“ Let dried Sulphat of Iron be exposed to a violent heat, until it is converted into a red-coloured matter.”

By an intense heat, sulphat of iron is decomposed ; its acid is partly expelled, and in part suffers decomposition. The red oxyd is the residuum. It is scarcely medicinally employed, but is used in some pharmaceutical preparations.

Tinctura FerriMuriati. TINCTURA MURIATIS FERRI. TINCTURE OF MURIAT OF IRON.

“ Take of the Purified Black Oxyd of Iron, in powder, three ounces ; Muriatic Acid, about ten ounces, or as much as may be sufficient to dissolve the powder. Digest with a gentle heat, and, when the powder is dissolved, add as much alcohol as that there shall be of the whole liquor two pounds and a half.”

THE black oxyd of iron combines with the muriatic acid, and, during the solution, acquires more oxygen, partly by absorption from the atmosphere, and partly by decomposition of the water, which is promoted by the heat applied. The muriat of iron, in which this more perfect oxyd is contained, is soluble in alkohol. The present preparation is such a tincture, diluted with the water of the muriatic acid. When first prepared, it contains a portion of muriat of iron, in which the metal is imperfectly oxydated; but this soon attracts more oxygen, and hence the colour of the tincture deepens on keeping.

It is a very active preparation, and is given in the diseases in which iron is employed, in a dose of ten or fifteen drops.

MURIAS AMMONIÆ ET FERRI: *olim, Flores Martiales.* MURIAT OF AMMONIA AND IRON.

Ferrum  
Ammoniacale.

“ Take of Red Oxyd of Iron, washed and again dried, Muriat of Ammonia, of each equal weights. Mix them well together, and sublime.”

OXYD of iron decomposes muriat of ammonia, by attracting the muriatic acid, and, in the present process, this decomposition takes place. But, from the proportions of the substances employed, part of the muriat of ammonia escapes decomposition; it is sublimed by the heat applied, and elevates along with it part of the muriat of iron that had been formed. The process is therefore rather an unscientific mode of obtaining a muriat of iron: the preparation too has been found uncertain in strength, more or less of the muriat of iron being sublimed, according to the heat applied; and, accordingly, it has now fallen into disuse. It was principally employed as a remedy in rickets, in the dose, to children, of two or three grains.

TINCTURA FERRI AMMONIACALIS. *Pharm. Lond.*

“ Take of Ammonical Iron, four ounces; Proof Spirit, by measure, one pound. Digest and strain.”

THIS is an unnecessary preparation, as it differs little from the Tincture of Muriated Iron.

FERRUM TARTARISATUM. TARTARISED IRON.  
*Pharm. Lond.*

“ Take of Filings of Iron, one pound ; Crystals of Tartar (Super-Tartrate of Potash), powdered, two pounds ; Distilled Water, one pound. Mix them, and expose the mixture to the air in an open glass vessel for eight days ; then rub the matter, dried by a sand-bath, into a very fine powder.”

By exposure to air and moisture, the iron is oxydated, and its oxyd combines with the excess of acid in the super-tartrate of potash, a triple salt resulting, composed of potash, oxyd of iron, and tartarous acid. It is very soluble in water. As a medicine, it is milder in its operation than some of the other saline preparations of the metal. Its dose is from five to fifteen grains.

VINUM FERRI. WINE OF IRON. *Pharm. Lond.*

“ Take of Filings of Iron, four ounces ; Spanish White Wine, four pounds. Digest with frequent agitation for a month, and strain.”

THIS is a similar preparation ; the tartarous acid present in the wine oxydating and combi-

ning with the iron : it must always, however, be uncertain in strength. Its usual dose is one or two drachms.

---

### HYDRARGYRUS—QUICKSILVER.

Hydrar-    HYDRARGYRUS PURIFICATUS. PURIFIED QUICK-  
gyrus  
Purificat.    SILVER.

“ Take of Quicksilver, four parts ; Iron Filings, one part. Rub them together and distil from an iron vessel.”

QUICKSILVER is sometimes adulterated with other metals. To obtain it perfectly pure is the design of this process. The addition of the iron filings renders the distilled quicksilver more bright and mobile ; an effect not perfectly explained, but ascribed to the iron retaining combined with it any foreign metal, or any portion of carbon that might have been contained in the quicksilver.

Hydrar-    ACETIS HYDRARGYRI. ACETITE OF QUICK-  
gyrus A-  
cetatus.    SILVER.

“ Take of Purified Quicksilver, three ounces ; Diluted Nitrous Acid, four ounces and a half,  
or

or a little more than may be requisite to dissolve the quicksilver; Acetite of Potash, three ounces; Boiling Water, eight pounds. Mix the quicksilver with the diluted nitrous acid; and towards the end of the effervescence, digest, if necessary, with a gentle heat, until the quicksilver be entirely dissolved. Then dissolve the acetite of potash in the boiling water, and immediately on this solution, while hot, pour the other, and mix them both by agitation. Then put aside, that crystals may be formed. These being placed in a funnel, wash them with cold distilled water; and, lastly, dry them with a very gentle heat.

“In preparing the acetite of quicksilver, it is necessary that all the vessels and the funnel which are employed should be of glass.”

ACETITE of Mercury is, in some of the foreign Pharmacopœias, formed by digesting the red oxyd, or rather sub-nitrat of mercury, in distilled vinegar; but, in the process adopted by the Edinburgh and London Colleges, it is obtained by the exertion of a double elective attraction. On mixing the solutions of nitrat of mercury and acetite of potash, the oxyd of mercury attracts

tracts the acetous acid, and the potash combines with the nitric acid. The acetite of mercury crystallizes as the liquor cools. The observations of Proust seem just, that by these two processes different acetites of mercury are obtained; by the former, one in which the oxyd is at the *maximum* of oxydation, and, by the other, one at the *minimum*. It is this latter only which forms the soft flaky substance that has been usually employed in medicine. It may be doubted whether the use of so large a proportion of acid, and the application of heat, ordered in the process of the Pharmacopœia, be proper; the process in the former edition seems indeed preferable to that which is now adopted.

Acetite of mercury crystallizes in small brilliant flakes. It is soluble in hot, and insoluble in cold water. As an antisyphilitic remedy, it is very mild in its operation; but its effects are not considered as sufficiently permanent to allow of it being relied on in effecting a radical cure. Its dose is a grain, night and morning.

MURIAS HYDRARGYRI: *olim, Mercurius Sublimatus Corrosivus.* MURIAT OF MERCURY. Hydrargyrus  
Muriat

“ Take of Purified Quicksilver, two pounds ; Sulphuric Acid, two pounds and a half ; Muriat of Soda, dried, four pounds. Boil the quicksilver with the sulphuric acid in a glass vessel placed in a sand-bath, until the matter become dry. Mix the cold matter in a glass vessel, with the muriat of soda ; then sublime it in a glass cucurbit with a heat gradually raised. Separate the sublimed matter from the scoriæ.”

IN the first stage of this process, the sulphuric acid oxydates the mercury, and combines with the oxyd ; and, by the heat applied, the salt thus formed is that which contains the metal in a high state of oxydation. This salt, in its dry state, is mixed with muriat of soda, and, by the application of heat, a double decomposition is effected ; the soda attracts the sulphuric acid, and the muriatic acid combines with the oxyd of mercury. The muriat of mercury being easily volatilized, is separated from the sulphat of soda by sublimation. The process formerly used, was, to mix sub-nitrat of mercury, muriat of soda,

foda, and dried sulphat of iron, and expose the mixture to a heat sufficient to sublime the muriat of mercury: And there is some reason to doubt, notwithstanding the expence of the nitrous acid in this process, whether it is not more economical, or whether it does not more certainly afford the whole mercury in the form of corrosive muriat, than the one now adopted.

According to the analysis of muriat of mercury by Mr Chenevix, it consists of 82 of oxyd of mercury (this oxyd being composed of 85 of mercury and 15 of oxygen), and 18 of muriatic acid; or, its ultimate constituents are, quicksilver, 69.7, oxygen, 12.3, and muriatic acid, 18. By slow sublimation, it is obtained crystallized in slender prisms; by a more hasty sublimation, in a compact crystalline mass. It is easily soluble in water, requiring 20 parts at  $60^{\circ}$  for its solution, and 2 parts at  $212^{\circ}$ . It is likewise soluble in alcohol. Its taste is acrid and metallic. It turns to a green several vegetable colours; is decomposed by the alkalies and earths, and by a number of compound salts, and likewise by vegetable infusions.

It is the most powerful of the mercurial preparations.

parations. Its dose cannot safely exceed the fourth of a grain, nor can more than one grain be given in twenty-four hours. As an antisyphilitic remedy it has long been established in practice, and it possesses some advantages. It acts speedily, and its action is more general on the system, or less determined to particular parts; but these are more than counterbalanced by the occasional violence of its operation, and by the circumstance which seems now admitted, that it cannot be so much relied on in establishing a permanent cure. It is given in the form of solution in water or alcohol, the dose being increased from the sixth to the fourth of a grain, night and morning, and mucilaginous diluents being freely taken, with the occasional use of opium. As the solution has a very disagreeable taste, it is sometimes made into pills with crumb of bread. In other diseases besides lues venerea, it is occasionally exhibited, particularly in cutaneous affections. Externally, its solution is employed as an escharotic in chancre and venereal ulcers of the mouth; and a very dilute solution of it has been used as an injection, to excite inflammation in obstinate gleet.

Calome-  
las. SUB-MURIAS HYDRARGYRI: *olim, Calomelas.*  
SUB-MURIAT OF QUICKSILVER.

“Take of Muriat of Quicksilver, rubbed to powder in a glass mortar, four ounces; Purified Quicksilver, three ounces. Rub them together in a glass mortar, with a little water, that the operator may be guarded against the acrid powder which would otherwise arise, until the quicksilver is extinguished. Put the dried powder into an oblong phial, of which it shall fill only one-third, and let it be sublimed in a sand-bath. The sublimation being finished, and the phial broken, the red powder at the bottom and the white one about the neck of it are equally to be rejected; the remaining mass is to be again sublimed, and rubbed into a fine powder, which is lastly to be washed with boiling distilled water.”

IN this process, the directions for performing of which are sufficiently explicit, an additional quantity of quicksilver is brought into chemical union with the constituent principles of muriat of mercury. In *that* compound, the metal is highly oxydated, and the oxyd is combined with

a considerable proportion of muriatic acid. In converting it into the Sub-Muriat of Mercury, as it is named, the portion of metal which is added attracts part of the oxygen of the oxyd, and the whole becomes an oxyd of mercury with a comparatively small proportion of oxygen; and this oxyd requiring less muriatic acid for its saturation than the one more highly oxydated does, finds a sufficient quantity in the pre-existing muriat. The one is merely imperfect oxyd of mercury combined with muriatic acid; the other perfect oxyd of mercury united with the same acid, the latter at the same time containing more acid in its composition than the former. Mr Chenevix's analysis has fixed the proportions with accuracy. Those of the Muriat, as it has been named, have been already stated; those of the Sub-Muriat are, muriatic acid, 11.5, oxyd of mercury, 88.5, (this oxyd being composed of quicksilver, 89.3, and oxygen 16.7.) So that the ultimate constituent parts of Sub-Muriat of Mercury, are, quicksilver, 79, oxygen, 9.5, muriatic acid, 11.5.

The names which have been chosen to distinguish these two muriats of mercury, are not the best

best that might have been selected. In a chemical point of view, the prefixing the syllable *sub*, to denote the one, is incorrect, since the use of that syllable is restricted to those salts in which the base is the same, but where there is a deficiency of acid; and in the muriat to which it is here applied, the base is not the same, and there is no such deficiency of acid, the metallic oxyd being saturated, or combined with as much as it is disposed to unite with. As a medical nomenclature, the adoption of it is still more to be regretted, as the merely prefixing the syllable to the same name is insufficient to guard effectually against the dangerous mistake of confounding preparations which differ so widely in their powers. The epithets *corrosive* and *mild* have long been used to discriminate them; they do so more clearly, and, as systematic names, they are preferable, as according with the established nomenclature of the metallic salts, which draws the distinctions between the salts formed from different oxyds of the same metal united with one acid, from some quality in which they differ. The one preparation ought to have been named *Murias Hydrargyri Corrosivus*, the other *Murias Hydrargyri Mitis*.

This

This preparation of mercury differs from the former, in being perfectly insipid, and insoluble in water or alkohol. By sublimation it may be obtained in small short prisms, but it is usually in the form of a mass somewhat ductile, semi-transparent and very heavy. It is decomposed by the alkalies, earths, and various compound salts.

Sub-muriat, or mild muriat of mercury, is one of the most useful preparations of the metal. As an anti-venereal it is given in the dose of a grain night and morning, its usual determination to the intestines being prevented, if necessary, by opium. It is the preparation which is, perhaps, most usually given in the other diseases in which mercury is employed, as in affections of the liver or neighbouring organs, in cutaneous diseases, chronic rheumatism, tetanus, hydrophobia, hydrocephalus, and febrile affections especially those of warm climates. It is employed as a cathartic alone, or to promote the operation of other purgatives. Its anthelmintic power is justly celebrated; and it is perhaps superior to the other mercurials, in assisting the operation of diuretics in dropsy. From its great specific

gravity, it ought always to be given in the form of bolus or pill.

Hydrar-  
gyrus  
Muriatus  
Mitis.

SUB-MURIAS HYDRARGYRI PRÆCIPITATUS. PRE-  
CIPITATED SUB-MURIAT OF MERCURY.

“ Take of Diluted Nitrous Acid, Purified Quicksilver, of each eight ounces; Muriat of Soda, four ounces and a half; Boiling Water, eight pounds. Mix the quicksilver with the diluted nitrous acid; and, towards the end of the effervescence, digest with a gentle heat, shaking the vessel frequently. It is necessary, however, that more quicksilver should be mixed with the acid than this can dissolve, that the solution may be obtained fully saturated. Dissolve at the same time the muriat of soda in the boiling water: pour the other solution on this while warm, and mix them quickly together. After the precipitate subsides, pour off the saline liquor, and wash the sub-muriat of mercury, by frequently adding warm water, pouring it off after each time the precipitate subsides, until it come off tasteless.”

MILD Muriat of Mercury is in this process obtained by a double elective attraction. On  
mixing

mixing together the solutions of nitrat of mercury and muriat of soda, the nitric acid is attracted by the soda, and the muriatic acid by the oxyd of mercury. In order that the mild, and not the corrosive muriat should be formed, it is evident that the mercury in the nitrous acid should be in its least oxydated state. In the original process of Scheele, by whom this mode of preparing mild muriat of mercury was proposed, the nitrous acid was directed to be boiled or digested on the mercury, with the view of saturating it more fully with the metal. This direction has been retained in the different Pharmacopœias in which the process has been adopted; and even lately, Mr Chenevix seems to incline to the opinion on which it is founded,—that, by adding a large proportion of mercury to nitrous acid, and promoting the solution by heat, the combination is obtained in which the metal is imperfectly oxydated. It will be found, however, on experiment, that this is not the case. When the solution is made slowly and in the cold, on adding it to muriat of soda, much more mild, and less corrosive, muriat of mercury is formed, than when the usual directions are com-

plied with. We thus also avoid the precipitation of sub-nitrat of mercury, which takes place on mixing the two solutions, when heat has been applied in preparing the mercurial solution. It is always necessary, however, to wash the precipitate carefully, as a small portion of corrosive muriat is formed, even when the process is most properly conducted.

Mild muriat of mercury, prepared in this mode, is precisely the same in its chemical composition as when formed by the former process of sublimation. It has been supposed, however, that it differs somewhat in its operation, and that in particular it is more liable to produce purging. If such a difference ever exist, it is probably owing to the presence of the sub-nitrat of mercury, which, when the usual directions are observed, may be mixed with the mild muriat. If the latter is pure, its operation must be the same as that of the muriat prepared by sublimation, as it differs from it only in being in a much finer powder than what the other can be reduced to, and this has been supposed to give it some superiority.

OXIDUM

OXIDUM HYDRARGYRI CINEREUM. ASH-COLOURED OXYD OF QUICKSILVER.

“Take of Purified Quicksilver, four parts; Diluted Nitrous Acid, five parts; Distilled Water, fifteen parts; Water of Carbonat of Ammonia, as much as may be sufficient. Dissolve the quicksilver in the acid. Add gradually the distilled water. Then pour on as much of the water of carbonat of ammonia as may be sufficient to precipitate the oxyd of quicksilver, which is to be afterwards washed with pure water and dried.”

IN this process the nitric acid oxydates the mercury, and combines with the oxyd. The action of ammonia on the nitrat of mercury is peculiar: it does not merely decompose it by combining with the acid, and separating the oxyd, but it exerts a farther action on the oxyd, partially de-oxydating it, by part of its hydrogen attracting a part of the oxygen. The oxyd precipitated, therefore, is that in which the metal is combined with the least proportion of oxygen.

In order, however, that this may be the nature of the precipitate, it is necessary that the solu-

tion of the mercury in the nitric acid should have been made in the cold, and with a diluted acid. When, from these circumstances not having been attended to, the mercury has been too highly oxydated, ammonia throws down from the solution a white precipitate; and the present preparation is often met with of a light grey colour, from the intermixture of this precipitate with the dark-coloured oxyd. When properly prepared, it is of a dark blue colour.

Ash-coloured oxyd of mercury is very fimilar in its operation to the preparations in which quicksilver is oxydated by trituration. It is given as an anti-venereal in the dose of one grain night and morning, generally in the form of pill.

Hydrar-  
gyrus Ni-  
tratus Ru-  
ber.

OXIDUM HYDRARGYRI RUBRUM PER ACIDUM  
NITRICUM: *olim, Mercurius Præcipitatus Ru-  
ber.* RED OXYD OF QUICKSILVER BY NITRIC  
ACID.

“ Take of Purified Quicksilver, one pound;  
Diluted Nitrous Acid, sixteen ounces. Let the  
quicksilver be dissolved. Evaporate the solution  
with a gentle fire to a white dry mass, which  
being

being reduced to powder, is to be put into a glass cucurbit, a thick glass plate being put over its surface. Then a capital being adapted, and the vessel placed in sand, apply to it a fire gradually raised, until it pass into very red small scales."

THE quicksilver is in this preparation first oxydated by the nitrous acid, and then combined with a portion of it. By the increase of heat, this nitrat is decomposed, and the greater part of the acid expelled: it is doubtful, however, if it be ever wholly expelled, so as to leave a pure oxyd, the preparation being different in appearance from the red oxyd obtained by heat, and being always much more acrid. It is too much so for internal use. It is principally used externally as an escharotic.

SUB-SULPHAS HYDRARGYRI FLAVUS: *olim, Turpethum Minerale.* YELLOW SUB-SULPHAT OF QUICKSILVER.

Hydrargyrus Vitriolatus,

"Take of Purified Quicksilver, four ounces; Sulphuric Acid, six ounces. Put them into a glass cucurbit, and boil in a sand-bath to dryness. The white matter remaining at the bot-

tom of the vessel being powdered, is to be thrown into boiling water. It will thus be converted into a yellow powder, which must be frequently washed with warm water."

THE quicksilver is first oxydated by the sulphuric acid, and afterwards combined with it, forming super-sulphat of mercury. By the continuance of the heat, this is partially decomposed, and a sub-sulphat of mercury remains. On this, boiling water is poured; a portion of sulphat of mercury still present in the saline matter is dissolved; and the yellow powder which remains is an oxyd of mercury, with a small quantity of sulphuric acid combined with it.

As a medicine, it is too violent in its operation to be administered internally. Sometimes, however, it has been given as a powerful emetic, in a dose of five grains, particularly in cases of swelled testicle. This practice is probably now relinquished. It is a violent errhine, and has been employed as such mixed with any mild vegetable powder.

SULPHURETUM

ULPHURETUM HYDRARGYRI NIGRUM: *olim*, Hydrargyrus  
*Æthiops Mineralis.* BLACK SULPHURET OF cum Sul-  
 QUICKSILVER. phure.

“ Take of Purified Quicksilver, Sublimed Sulphur, of each equal weights. Rub them together in a glass mortar with a glass pestle, until the globules of quicksilver entirely disappear.”

By this trituration a chemical combination appears to be effected between the quicksilver and sulphur, and perhaps the metal is at the same time imperfectly oxydated. It is in the form of a very black powder.

It is the most inactive, perhaps, of the mercurial preparations. As an anthelmintic it is sometimes given in a dose of five or ten grains, according to the age.

---

SOME additional preparations of mercury have a place in the London Pharmacopœia, and are used in practice.

HYDRARGYRUS

HYDRARGYRUS SULPHURATUS RUBER. RED SULPHURATED QUICKSILVER.

“Take of Purified Quicksilver, forty ounces ; Sulphur, eight ounces. Mix the quicksilver with the melted sulphur. If the mixture inflame, extinguish it by covering the vessel ; then reduce it to powder and sublime.”

IN this preparation it was conceived, that, during the inflammation of the materials, the quicksilver was oxydated, and that therefore the resulting compound was a combination of sulphur and oxyd of mercury. The extrication of heat and light, which arises from the mutual action of the ingredients, appears however not to be an example of oxygenation, but to be rather of the same kind as that which takes place from the combination of different metals with sulphur ; and, according to the analysis of Proust, Cinnabar, as this preparation is named, consists of sulphur with metallic mercury, in the proportion of 15 of the former to 85 of the latter.

Red sulphurated quicksilver is used medically, principally under the form of fumigation, to check the progress of venereal ulcers.

HYDRARGYRUS

HYDRARGYRUS CUM CRETA. QUICKSILVER WITH  
CHALK.

“Take of Purified Quicksilver, three ounces ;  
Prepared Chalk, five ounces. Rub them together  
until the globules disappear.”

IN this, as in other cases of the trituration  
of mercury, it suffers oxydation more or less  
completely ; and on the quantity of oxyd form-  
ed, must depend the activity of the prepara-  
tion. It is very little employed.

HYDRARGYRUS CALCINATUS. CALCINED QUICK-  
SILVER. *Red Oxyd of Quicksilver.*

“Take of Purified Quicksilver, one pound.  
Expose the quicksilver in a glass cucurbit having  
a flat bottom, in a sand-bath to a heat of  $600^{\circ}$ ,  
until it concretes into a red powder.”

THIS operation of oxydating quicksilver, by  
atmospheric air, with the assistance of heat, is  
troublesome and expensive, owing to the quick-  
silver being volatilized at nearly the same tempe-  
rature as that at which it is capable of attracting  
oxygen. The red oxyd is in the form of scales ;  
it is decomposed by the heat of ignition, giving  
out

out very pure oxygen gas. It contains seven parts of oxygen in the 100.

The high price of this preparation prevents it from being employed in common practice. It has been regarded as one of the most active of the mercurials, and, at the same time, one of the most permanent in its effects, and has been recommended in confirmed *lues*, where other preparations have failed. Its dose is half a grain or a grain.

CALX HYDRARGYRI ALBA. WHITE CALX OF QUICKSILVER.

“Take of Muriated Quicksilver, Sal-Ammoniac (Muriat of Ammonia), Water of Prepared Kali, of each half a pound. Dissolve first the sal-ammoniac, and then the muriated quicksilver, in distilled water, to which add the water of prepared kali. Wash the powder until it is tasteless.”

THE theory of this process is somewhat complicated. The potash decomposes the muriat of ammonia, by combining with the muriatic acid, and the disengaged ammonia decomposes the muriat of mercury. Hence, if to a solution  
of

of corrosive muriat of mercury, ammonia be added, the same preparation is obtained as by this process. The action of the ammonia in decomposing the corrosive muriat of mercury is also somewhat peculiar. It does not merely attract the muriatic acid, and separate the pure mercurial oxyd, but this oxyd retains combined with it a portion both of the ammonia and acid. It is therefore a triple compound, consisting, according to Fourcroy's analysis of it by decomposing it by heat, of 81 parts of oxyd of mercury, 16 of muriatic acid, and 3 of ammonia. This preparation, *Murias Hydrargyri et Ammoniaë*, formerly known by the name of *White Precipitate of Mercury*, is used only externally in the form of ointment, as an application in some cutaneous affections.

---

*PLUMBUM.—LEAD.*

ACETIS PLUMBI: *olim, Saccharum Saturni.* A- Cerussa  
CETITE OF LEAD. Acetata

“Take of White Oxyd of Lead, any quantity. Put it into a cucurbit, and pour upon it twice  
its

its weight of Distilled Acetous Acid. Let the mixture stand on warm sand until the acid become sweet ; then pour it off, and add a fresh quantity as often as may be necessary, until it cease to acquire sweetness. Then evaporate the whole liquor, freed from impurities, in a glass vessel, to the consistence of thin honey, and put it aside in a cool place, that crystals may concrete, which are to be dried in the shade. Evaporate the remaining liquor, that there may be a new formation of crystals, and repeat this evaporation until no more are formed."

THE oxyd of lead is in this preparation combined with acetous acid ; the salt formed concretes in acicular crystals. The process is generally carried on on a large scale, to furnish it for various purposes in the arts.

The medicinal uses of acetite of lead have been already noticed. It is principally employed externally as an astringent,—as a collyrium in ophthalmia ; an injection in gonorrhœa ; and a wash in superficial inflammation.

AQUA

AQUA LITHARGYRI ACETATI. WATER OF ACETATED LITHARGE. *Pharm. Lond.*

“ Take of Litharge, two pounds and four ounces ; Distilled Vinegar, one gallon. Mix them and boil to six pounds, stirring constantly ; then put aside the liquor. After the impurities have subsided, strain it.”

THIS preparation has been long in use under the name of *Goulard's Extract of Lead*. It is merely a solution of acetite of lead in water with an excess of acid, and must be always variable in strength. It is applied to the same purposes as the acetite of lead.

---

### ZINCUM.—ZINC.

OXIDUM ZINCI. OXYD OF ZINC.

“ Let a large crucible be placed in a furnace filled with burning fuel, in such a manner that it shall be somewhat inclined to its mouth ; and, when the bottom of the crucible is at a moderate red heat, throw in pieces of Zinc, about the weight, each of them, of one drachm. The  
zinc

zinc soon inflames, and is converted into white flocculi, which are to be removed, from time to time, from the surface of the metal, with an iron spatula, that the combustion may proceed more perfectly ; and, when the inflammation ceases, remove the oxyd of zinc from the crucible. Another piece of zinc being thrown in, the operation is to be renewed and repeated as often as may be necessary. Lastly, let the oxyd of zinc be prepared in the same manner as carbonat of lime."

ZINC is the most inflammable of the metals. At the temperature of ignition, it attracts the oxygen of the atmospheric air, and burns vividly. The product is a white oxyd, insipid, insoluble, and infusible. In medicine it is employed principally as an antispasmodic in epilepsy and chorea. Its dose is from two to five grains twice a-day, and gradually increased.

SULPHAS ZINCI: *olim, Vitriolum Album.* SULPHAT OF ZINC.

"Take of Zinc, cut into small pieces, three ounces ; Sulphuric Acid, five ounces ; Water, twenty ounces. Mix them, and the effervescence

cence being finished, digest for some time on warm sand. Then strain the liquor through paper; and, after due exhalation, put it aside, that crystals may be formed."

THE sulphuric acid, by a disposing affinity, enables the zinc to oxydate itself by decomposing the water, and then combines with this oxyd. The salt is obtained in acicular crystals. The process, however, is scarcely ever performed in the shops, the sulphat of zinc being prepared on a large scale, from certain varieties of the native sulphuret of the metal. As the crystallization of it is difficult, it is always in the form of hard white masses. This salt is ordered to be purified, in the London Pharmacopœia, by dissolving it in water, adding a small portion of sulphuric acid, and crystallizing.

Sulphat of zinc is used principally as an astringent, in the form of solution,—as an injection in gonorrhœa, and a collyrium in ophthalmia.

SOLUTIO SULPHATIS ZINCI. SOLUTION OF SULPHAT OF ZINC.

"Take of Sulphat of Zinc, sixteen grains;  
Water, eight ounces; Diluted Sulphuric Acid,  
VOL. II. P sixteen

sixteen drops. Dissolve the sulphat of zinc in water ; then the acid being added, strain through paper."

THIS solution is principally used as a collyrium in ophthalmia.

AQUA ZINCI VITRIOLATI CUM CAMPHORA. WATER OF VITRIOLATED ZINC WITH CAMPHOR. *Pharm. Lond.*

"Take of Vitriolated Zinc, half an ounce ; Camphorated Spirit, half an ounce by measure ; Boiling Water, by measure, two pounds. Mix them, and strain through paper."

THIS also is used as a local application in ophthalmia. It requires, in general, to be diluted with water.

SOLUTIO ACETITIS ZINCI. SOLUTION OF ACETITE OF ZINC.

"Take of Sulphat of Zinc, one drachm ; Distilled Water, ten ounces. Dissolve it. Take also of Acetite of Lead, four scruples ; Distilled Water, ten ounces. Dissolve it. Mix the solutions. Let the liquor remain at rest a little ; then strain it."

THE

THE sulphuric acid of the fulphat of zinc is attracted by the oxyd of lead, the acetous acid of the acetite of lead by the oxyd of zinc: the fulphat of lead being insoluble, is precipitated; the acetite of zinc remains in solution. This solution is used as an injection in gonorrhœa; it is considered as more astringent than the acetite of lead, and less irritating than the fulphat of zinc.

## CHAP. XXI.

*PULVERES.*—POWDERS.

THIS is the simplest form of composition of medicines, the different articles being merely reduced to powder, and mixed together. It is adapted to the exhibition of such remedies as are not ungrateful, and such as are not liable to lose their virtues by keeping. The powder, when it is to be taken, is mixed with any convenient vehicle.

Pulv. Aromatic.

*PULVIS AROMATICUS.* AROMATIC POWDER.

“Take of Bark of Cinnamon, Smaller Cardamom Seeds, Ginger Root, of each equal parts. Rub them into a very fine powder, which is to be kept in a glass phial well stoppt.” In the London Pharmacopœia the proportion of cinnamon is larger, and one part of long pepper is likewise added.

THIS

THIS combination of aromatics is designed merely to add to other compositions, to communicate fragrance and pungency.

PULVIS ASARI EUROPÆI COMPOSITUS.

COM- Pulv. A-  
fariCom-  
pos.

POUND POWDER OF ASARABACCA.

“ Take of the Leaves of Asarabacca, three parts ; the Leaves of Marjoram, Flowers of Lavender, of each one part. Rub them together to a powder.”

THIS is used as a mild errhine, and, when snuffed in the quantity of a few grains, occasions sneezing and a discharge of mucus.

PULVIS CARBONATIS CALCIS COMPOSITUS: *olim,*  
*Pulvis Cretaceus.*

“ Take of Prepared Carbonat of Lime, four ounces ; Bark of Cinnamon, one drachm and a half ; Nutmeg, half a drachm. Rub them together to powder.”

PULVIS CRETÆ COMPOSITUS. COMPOUND POWDER  
OF CHALK. *Pharm. Lond.*

“ Take of Prepared Chalk, half a pound ;  
Bark of Cinnamon, four ounces ; Tormentil,

Gum-Arabic, of each three ounces ; Long Pepper, half an ounce. Reduce them separately to powder, and mix them."

THESE powders are designed as antacids, and are used principally in diarrhœa. The addition of the tormentil in the powder of the London Pharmacopœia must render it more astringent than the other. The dose of either is from a scruple to a drachm.

PULVIS CRETÆ COMPOSITUS CUM OPIO. COM-  
POUND POWDER OF CHALK WITH OPIUM.  
*Pharm. Lond.*

" Take of Compound Powder of Chalk, eight ounces ; Hard Purified Opium, rubbed to powder, one drachm and a half. Mix them."

THE addition of opium to astringents and antacids when given in diarrhœa, is a common practice, and this formula affords a convenient composition of this kind. Its dose is one scruple, or half a drachm. Two scruples contain very nearly one grain of opium.

PULVIS CHELARUM CANCRI COMPOSITUS. COM-  
POUND POWDER OF CRABS CLAWS. *Pharm. Lond.*

" Take of Prepared Crabs Claws, one pound ;  
Prepared

Prepared Chalk, Prepared Red Coral, of each three ounces. Mix them."

THESE different articles being merely carbonates of lime, more or less pure, the mixing of them together must be entirely superfluous.

PULVIS JALAPÆ COMPOSITUS. COMPOUND  
POWDER OF JALAP.

"Take of the Powder of the Root of Jalap, one part; Super-Tartrate of Potash, two parts. Rub them together into a very fine powder."

By this addition of the acidulous tartrate of potash to jalap, the operation of the latter is supposed to be rendered less irritating and more refrigerant. It is an excellent cathartic, operating freely, in a dose of a drachm and a half.

PULVIS IPECACUANHÆ ET OPII: *olim, Pulvis* Pulvis I-  
Doveri. POWDER OF IPECACUANHA AND OPIUM. pecacu-  
anhæ  
Comp.

"Take of the Powder of the Root of Ipecacuanha, Opium, of each one part; Sulphat of Potash, eight parts. Rub them together into a fine powder."

In this composition we have an example of the power which one medicine has of modifying

the action of another, the ipecacuan rendering the operation of the opium, as a sudorific, much more certain than it otherwise would be, and appearing also to diminish its narcotic effect. This powder is the most certain sudorific we possess, and as such is established in practice. The medium dose is fifteen grains; the operation of which is to be assisted by the sweating regimen; and frequently it is necessary to give additional smaller doses at intervals, to produce sweat. Its principal use is in rheumatism.

PULVIS OPIATUS. OPIATE POWDER.

“Take of Opium, one part; Prepared Carbonat of Lime, nine parts. Rub them together to a fine powder.”

PULVIS OPIATUS. OPIATE POWDER. *Pharm. Lond.*

“Take of hard Purified Opium, rubbed to powder, one drachm; Prepared Burnt Hartshorn nine drachms. Mix them.”

IN these powders the opium is merely divided by the substance mixed with it. Ten grains contain one grain of opium.

PULVIS

PULVIS SCAMMONII COMPOSITUS. COMPOUND  
POWDER OF SCAMMONY.

“Take of Scammony, Super-Tartrite of Potash, of each equal parts. Rub them together into a very fine powder.”

IN this powder the operation of the scammony is supposed to be rendered milder as a purgative, by the super-tartrite of potash. It is also preferred to the scammony alone, as a hydragogue cathartic. Its dose is from ten to twenty grains.

PULVIS SCAMMONII COMPOSITUS. COMPOUND  
POWDER OF SCAMMONY. *Pharm. Lond.*

“Take of Scammony, Extract of Jalap, of each two ounces ; Ginger, half an ounce. Rub them separately to powder, and mix them.”

THIS composition, though under the same name as the preceding, is of a very different nature ; the stimulating operation of the scammony not being corrected, but rather increased by the extract of jalap, and the ginger. It is a strong cathartic. Its medium dose is ten grains.

PULVIS SCAMMONII COMPOSITUS CUM ALOE.  
COMPOUND POWDER OF SCAMMONY WITH  
ALOES. *Pharm. Lond.*

“Take of Scammony, fix drachms ; Extract of Jalap, Socotorine Aloes, of each one ounce and a half ; Ginger, half an ounce. Rub them separately to powder, and mix them.”

THE addition of the aloes, in this formula, cannot alter very materially the operation of the other ingredients. As a stimulating cathartic, it may be given in a dose from ten to fifteen grains.

PULVIS SCAMMONII CUM CALOMELANE. POW-  
DER OF SCAMMONY WITH CALOMEL. *Pharm.*  
*Lond.*

“Take of Scammony, half an ounce ; Calomel, Refined Sugar, of each two drachms. Rub them separately to powder, and mix them.”

THIS combination is used, both as a cathartic and anthelmintic. Its dose is from ten grains to one scruple.

PULVIS

PULVIS SULPHATIS ALUMINÆ COMPOSITUS : *olim,*  
*Pulvis Stypticus.* COMPOUND POWDER OF  
SULPHAT OF ARGIL.

“ Take of Sulphat of Argil, four parts ; Kino,  
one part. Rub them into a fine powder.”

THIS has been sometimes used internally in  
menorrhagia, in repeated doses of ten or fifteen  
grains, and externally as a styptic application  
to bleeding wounds.

PULVIS ALOES CUM CANELLA. POWDER OF  
ALOES WITH CANELLA. *Pharm. Lond.*

“ Take of Socotorine Aloes, one pound ;  
White Canella, three ounces. Rub them sepa-  
rately to powder ; then mix them.”

THE canella covers the unpleasant flavour of  
the aloes ; and this combination is sometimes  
used as a warm stimulating cathartic. It is  
generally made into a tincture, by infusing it  
in spirit.

PULVIS

PULVIS ALOES CUM GUIACO. POWDER OF ALOES  
WITH GUAIAIC. *Pharm. Lond.*

“Take of Socotorine Aloes, one ounce and a half; Guaiac Gum-Refin, one ounce; Aromatic Powder, half an ounce. Rub the aloes and guaiac separately into powder; then mix them with the aromatic powder.”

THIS combination of aloes with guaiac is seldom used. As a stimulating aperient, it may be given in a dose of fifteen or twenty grains.

PULVIS ALOES CUM FERRO. POWDER OF ALOES  
WITH IRON. *Pharm. Lond.*

“Take of Socotorine Aloes, one ounce and a half; Myrrh, two ounces; Dried Extract of Gentian, Sulphat of Iron, of each one ounce. Rub them separately to powder, and mix them.”

THIS combination affords a remedy of considerable power in amenorrhœa, though the form of powder is not the most proper under which it might be exhibited. Its dose is from ten to fifteen grains at bed-time.

PULVIS

PULVIS CERUSSÆ COMPOSITUS. COMPOUND  
POWDER OF CERUSE. *Pharm. Lond.*

“Take of Ceruse, five ounces; Sarcocolla, one ounce and a half; Tragacanth, half an ounce. Rub them together into a powder.”

THIS is used as an external application to superficial inflammation, diffused in water, and sometimes as a collyrium, or an injection in gonorrhœa.

PULVIS CONTRAYERVÆ COMPOSITUS. COMPOUND  
POWDER OF CONTRAYERVA. *Pharm. Lond.*

“Take of Contrayerva, rubbed to powder, five ounces; Compound Powder of Crabs Claws, one pound and a half.”

THERE seems little necessity for combining contrayerva with carbonat of lime, which can add nothing to its virtues. The dose of the powder may be half a drachm, or two scruples.

PULVIS MYRRHÆ COMPOSITUS. COMPOUND  
POWDER OF MYRRH. *Pharm. Lond.*

“Take of Myrrh, Dried Savin, Dried Rue, Russian Castor, of each one ounce. Rub them together to a powder.”

THIS

THIS is a combination of some of the more powerful emmenagogues. It may be given in amenorrhœa in the dose of one scruple, or half a drachm.

PULVIS SENNÆ COMPOSITUS. COMPOUND POWDER OF SENNA. *Pharm. Lond.*

“Take of Senna, Crystals of Tartar, of each two ounces; Scammony, half an ounce; Ginger, two drachms. Rub the scammony separately, the others together, into a powder, and mix them.”

THIS may be employed as a purgative, in a dose of from half a drachm to a drachm.

PULVIS TRAGACANTHÆ COMPOSITUS. COMPOUND POWDER OF TRAGACANTH. *Pharm. Lond.*

“Take of Tragacanth, rubbed to powder, Gum-Arabic, Starch, of each one ounce and a half; Refined Sugar, three ounces. Rub them together into powder.”

THIS combination of mucilaginous substances may be employed for the general purposes of demulcents, in the dose of a drachm, or more frequently repeated.

## CHAP. XXII.

*ELECTUARIA.*—ELECTUARIES.

ELECTUARIES are compositions of the consistence nearly of honey, and are generally made by adding to any powder a sufficient proportion of syrup or mucilage. It is a form adapted to the exhibition of such medicines as are not ungrateful in taste or flavour. The ingredients are so proportioned, that the dose shall not be less than a tea-spoonful, and not more than twice or thrice that quantity, at a time.

ELECTUARIUM AROMATICUM.	AROMATIC E-	Confect
LECTUARY.		Aromat

“Take of Aromatic Powder, one part; Syrup of Orange Peel, two parts. Mix, beating them well together, so as to form an electuary.”

THIS

THIS is a grateful aromatic preparation, frequently combined with other medicines, or made the basis of cordial mixtures.

Elect.  
Cassia.

ELECTUARIUM CASSIÆ FISTULÆ. ELECTUARY  
OF PURGING CASSIA.

“ Take of the Pulp of Cassia in pods, four parts ; Pulp of Tamarind, Manna, of each one part ; Syrup of Pale Rose, four parts. Dissolve the manna beat in a mortar, with a gentle heat, in the syrup ; then add the pulps, and, by a continued heat, reduce the mixture to a proper consistence.”

THIS electuary is scarcely ever used. It is a mild laxative in the dose of an ounce.

Elect.  
Senna.

ELECTUARIUM CASSIÆ SENNÆ : *olim, Electuarium  
Lenitivum.* ELECTUARY OF SENNA.

“ Take of the Leaves of Senna, eight ounces ; Coriander Seeds, four ounces ; Liquorice Root, three ounces ; Figs, one pound ; Pulp of Tamarind, Pulp of Cassia, Pulp of Prunes, of each half a pound ; Refined Sugar, two pounds and a half. Rub the senna with the coriander seeds, and separate by passing through a sieve ten ounces

ounces of the mixed powder. Boil the residuum with the figs and the liquorice, in four pounds of water to one half; then express and strain. Reduce the strained liquor, by evaporation, to about one pound and a half. Afterwards add the sugar, so as to make a syrup. Add this syrup gradually to the pulps; and, lastly, mix in the powder."

THIS electuary is in very common use as a mild and pleasant purgative. Its dose is six drachms, or an ounce.

ELECTUARIUM CATECHU: *olim, Confectio Japonica.* ELECTUARY OF CATECHU.

"Take of Extract of Catechu, four ounces; Kino, three ounces; Bark of Cinnamon, Nutmeg, of each one ounce; Opium, diffused in a sufficient quantity of Spanish White Wine, one drachm and a half; Syrup of Red Rose, boiled to the consistence of honey, two pounds and a quarter. Reduce the solid ingredients to powder, and, mixing with them the opium and syrup, form an electuary."

THIS electuary affords a combination of the more powerful astringents, rendered grateful by

aromatics, and having its efficacy, as a remedy in diarrhœa, increased by the opium. It is the basis of the common extemporaneous astringent mixture. One grain of opium is contained in rather more than three drachms.

Confectio Opiata. ELECTUARIUM OPIATUM: *olim, Electuarium Thebaicum.* OPIATE ELECTUARY.

“ Take of Aromatic Powder, six ounces; Virginian Snake-root, rubbed to a fine powder, three ounces; Opium, diffused in a sufficient quantity of Spanish White Wine, half an ounce; Syrup of Ginger, one pound. Mix, so as to form an electuary.”

THIS has kept its place in the Pharmacopœias as a substitute for the Mithridate and Theriaca Andromachi; officinal preparations once highly celebrated, but now discarded. Each drachm, prepared according to the formula in the Edinburgh Pharmacopœia, contains a grain and a half of opium; and rather more in that prepared by the prescription of the London College.

ELECTUARIUM

ELECTUARIUM SCAMMONII. ELECTUARY OF  
SCAMMONY. *Pharm. Lond.*

“Take of Scammony, rubbed to powder, one ounce and a half; Cloves, Ginger, of each six drachms; Oil of Caraway, half a drachm; Syrup of Roses, as much as may be sufficient. Mix the aromatics, rubbed together into a powder, with the syrup; then add the scammony, and, lastly, the oil of caraway.”

THIS is a stimulating cathartic; its medium dose is one drachm.

## CHAP. XXIII.

*PILULÆ.*—PILLS.

PILLS are formed from a mass sufficiently stiff and adhesive to preserve the round form which is given to them; this due consistence being obtained by adding to powders a sufficient quantity of syrup, mucilage, or conserve. It is a form adapted to the exhibition of such medicines as are nauseous in taste or flavour, and such as operate in a small dose. A pill ought not to exceed five grains in weight, or twelve may be formed from a drachm of the mass.

*PILULÆ ALOETICÆ.* ALOETIC PILLS.

“ Take of Socotorine Aloes, in powder, Soap,  
of each equal parts. Beat them with Simple  
Syrup,

Syrup, so as to make a mass fit for forming pills."

PILULÆ ALOES COMPOSITÆ. COMPOUND ALOES  
PILLS. *Pharm. Lond.*

"Take of Socotorine Aloes, in powder, one ounce; Extract of Gentian, half an ounce; Oil of Caraway, two scruples; Syrup of Ginger, as much as necessary. Beat them together."

UNDER either of these simple forms aloes is very commonly exhibited as a cathartic. Two pills are a medium dose.

PILULÆ ALOES CUM ASSA FOETIDA. PILLS OF  
ALOES WITH ASSAFOETIDA.

"Take of Socotorine Aloes, Assafoetida, Soap, of each equal parts. Beat them into a mass with mucilage of gum Arabic."

THESE pills have been given in dyspepsia and amenorrhœa, two or three being taken at bedtime occasionally.

PILULÆ ALOES CUM COLOCYNTHIDE. PILLS OF  
ALOES WITH COLOCYNTH.

"Take of Socotorine Aloes, Scammony, of  
Q<sub>3</sub> each

each eight parts; Colocynth, four parts; Sulphat of Potash with Sulphur, Oil of Cloves, of each one part. Let the aloes and scammony be reduced, with the salt, to powder; then let the colocynth, rubbed into a fine powder, and the oil, be added. Lastly, beat them with mucilage of gum Arabic into a mass."

THIS is a more powerful cathartic than the simple aloetic pill, and is used in constipation, or to obviate habitual costiveness. Two pills are a common dose.

Pilulæ  
Aloes  
cum  
Myrrha.

PILULÆ ALOES CUM MYRRHA. PILLS OF ALOES  
WITH MYRRH.

"Take of Socotorine Aloes, four parts; Myrrh, two parts; Saffron, one part. Beat them into a mass with Simple Syrup."

THIS composition has long been in use in medical practice as a stimulating aperient. Two or three pills are taken at bed-time.

PILULÆ ASSÆ FOETIDÆ COMPOSITÆ. COM-  
POUND ASSAFOETIDA PILLS.

"Take of Assafoetida, Galbanum, Myrrh, of  
each

each eight parts ; Rectified Oil of Amber, one part. Beat them into a mass with Simple Syrup."

THESE pills are used in hysteria and amenorrhœa, two or three of them being taken at bedtime.

PILULÆ GALBANI COMPOSITÆ. COMPOUND

PILLS OF GALBANUM. *Pharm. Lond.*

" Take of Galbanum, Opoponax, Myrrh, Sagapenum, of each one ounce ; Assafœtida, half an ounce ; Syrup of Saffron, as much as may be sufficient. Beat them together."

THESE pills are similar to the preceding ; are used in the same cases, and in the same dose.

PILULÆ AMMONIARETI CUPRI. PILLS OF AMMONIURET OF COPPER.

" Take of Ammoniuret of Copper, sixteen grains ; Crumb of Bread, four scruples ; Water of Carbonat of Ammonia, as much as may be sufficient. Beat them into a mass, which divide into thirty-two equal pills."

It is under this form that ammoniuret of copper is given in epilepsy and the other spasmodic diseases in which it has been employed. Half

a grain of it is contained in each pill. One pill is given at first, night and morning, and the dose is gradually increased.

Pilulæ  
Hydrar-  
gyri,

PILULÆ HYDRARGYRI. MERCURIAL PILL.

“ Take of Purified Quicksilver, Conserve of Red Rose, of each one ounce ; Starch, two ounces. Rub the quicksilver with the conserve, in a glass mortar, until the globules entirely disappear, adding, as there may be occasion, a little mucilage of gum Arabic ; then add the starch, and beat, with a little water, into a mass, which is to be immediately divided into four hundred and eighty pills.”

DURING the trituration of the quicksilver with the conserve, it is not merely mechanically divided, but oxydated by the atmospheric air, and the efficacy of the pill depends on the grey oxyd formed : hence much depends on the proper trituration. It is the preparation of mercury that is most generally employed for internal use ; and, while it is much milder in its operation than some others, it is perhaps capable of answering every purpose which the remedy can serve. The common dose, given with the view

of

of inducing the usual mercurial action, is two pills at bed-time and one in the morning, which, in particular cases and habits, requires to be increased. Four or six pills given at once generally excite purging.

PILULÆ OPIATÆ : *olim, Pilulæ Thebaicæ.* OPIATE Pilulæ  
Opii.

PILLS.

“ Take of Opium, one part ; Extract of Liquorice, seven parts ; Jamaica Pepper, two parts. Mix the opium and the extract separately, softened with diluted alcohol, and beat them into a pulp ; then add the Jamaica pepper rubbed to powder, and, beating them well, reduce them to a mass.”

THIS affords a form under which the exhibition of opium may be concealed from the patient. Two pills contain one grain of opium. In the formula of the London College, the aromatic is omitted, and the proportion of opium increased ; so that each pill contains one grain.

PILULÆ RHEI COMPOSITÆ. COMPOUND PILLS  
OF RHUBARB.

“ Take of the Root of Rhubarb, one ounce ;  
Socotorine

Socotorine Aloes, fix drachms ; Myrrh, half an ounce ; Oil of Peppermint, half a drachm. Beat them into a mass with syrup of orange peel."

THIS is a moderate laxative much employed, especially in dyspeptic affections to obviate costiveness, and stimulate gently the stomach and intestines. Two pills are taken at bed-time.

Pilulæ  
Scillæ.

PILULÆ SCILLITICÆ. SQUILL PILLS.

"Take of the dried Root of Squill, rubbed to a fine powder, one scruple ; Gum-Ammoniac, Smaller Cardamom Seeds, in powder, Extract of Liquorice, of each one drachm. Beat them with Simple Syrup into a mass."

UNDER this form squill is often given as an expectorant in asthma and chronic catarrh. Two pills are taken twice a-day.

## CHAP. XXIV.

*TROCHISCI.*—TROCHES.

TROCHES, or Lozenges, consist of powders brought to a solid form by the addition of mucilage. When moist, they form a soft paste, in which state they are cut into small square or round pieces, and these are hardened by drying. It is a form adapted principally to such medicines as are designed to dissolve slowly in the mouth; and hence they are always rendered pleasant by the addition of a large proportion of sugar. They are seldom active remedies.

TROCHISCI CARBONATIS CALCIS. TROCHES OF *Trochisci*  
CARBONAT OF LIME. *Cretæ.*

“Take of Prepared Carbonat of Lime, four  
ounces; Gum Arabic, one ounce; Nutmeg, one  
drachm;

drachm ; Refined Sugar, six ounces. Rub these to powder, and make it into a mass with water, fit for forming troches."

THIS is a pleasant form under which carbonat of lime may be given as an antacid. The London College, in their formula, order Cinnamon instead of Nutmeg.

Trochif.  
Gly-  
cyrrhiz.

TROCHISCI GLYCYRRHIZÆ. LIQUORICE TROCHES.

"Take of Extract of Liquorice, Gum-Arabic, of each one part ; Refined Sugar, two parts. Let them be dissolved in warm water, and strained. Then evaporate the solution, with a gentle heat, into a mass, which form into troches."

THESE, from their demulcent quality, may be used to allay coughing, in catarrh ; but the simple Extract of Liquorice is equally effectual, and they are scarcely ever used.

TROCHISCI GLYCYRRHIZÆ CUM OPIO. LIQUORICE TROCHES WITH OPIUM.

"Take of Opium, two drachms ; Tincture of Tolu Balsam, half an ounce ; Simple Syrup, eight ounces ; Extract of Liquorice, softened with

with Warm Water, Gum Arabic, in powder, of each five ounces. First, rub the opium with the tincture; then add gradually the syrup and the extract; afterwards sprinkle in the powder of gum Arabic; and, lastly, dry the mass, that it may be formed into troches, each weighing ten grains."

THESE troches are very effectual in relieving the tickling cough frequently attending catarrh. The opium is the active ingredient; the others cover its taste and flavour, and render the composition pleasant, adding at the same time a demulcent quality. One drachm, or six troches, contain one grain of opium; and from six to twelve may be taken in twenty-four hours.

TROCHISCI GUMMOSI. GUM TROCHES.

"Take of Gum Arabic, four parts; Starch, one part; Refined Sugar, twelve parts. These being powdered, are to be formed into a mass, with rose water, fit for forming troches."

THIS composition is designed as a demulcent, but is not in use; gum Arabic, when pure, answering the same purpose equally well.

Troch.  
Nitri.

TROCHISCI NITRATIS POTASSÆ. TROCHES OF  
NITRAT OF POTASH.

“Take of Nitrat of Potash, one part; Refined Sugar, three parts. Beat them to powder, and, with mucilage of gum tragacanth, make them into a mass proper for forming troches.”

UNDER this form, nitrat of potash is sometimes used as a refrigerant in angina tonsillaris, and to allay the sense of heat attending salivation.

---

TROCHISCI AMYLI. STARCH TROCHES. *Pharm. Lond.*

“Take of Starch, one ounce and a half; Licquorice, six drachms; Florentine Orris, half an ounce; Refined Sugar, one pound and a half. Rub these to powder, and, with mucilage of tragacanth, form troches. They may be made, if it be preferred, without the orris.”

THESE troches may exert some demulcent power, and may therefore be employed in catarrh; but they are little in use.

TROCHISCI

## TROCHISCI MAGNESIÆ.      MAGNESIA TROCHES.

*Pharm. Lond.*

“Take of Burnt Magnesia, four ounces ; Refined Sugar, two ounces ; Ginger, in powder, one scruple. Rub them together, and, adding mucilage of gum Arabic, form them into troches.”

THIS is a pleasant form for giving magnesia as an antacid.

## TROCHISCI SULPHURIS.      SULPHUR TROCHES.

*Pharm. Lond.*

“Take of Washed Flowers of Sulphur, two ounces ; Refined Sugar, four ounces ; Mucilage of Quince Seeds, as much as may be sufficient. Rub them together, and form troches.”

THIS is designed as an agreeable form for the exhibition of sulphur.

## CHAP. XXV.

*LINIMENTA, UNGUENTA, ET CERATA.—**LINIMENTS, OINTMENTS, and CERATES.*

THESE are fimilar forms, confifting of unctuous matters, and differing merely in the degree of confiftence. A Liniment is of the confiftence of thin honey ; an Ointment is firmer ; and a Cerate ftill harder. Oil or lard is their common bafis ; the due confiftence is given by wax or fpermaceti, and to the compofition may be added any fubftance which is to be ufed under this form. The following general directions are given in the Edinburgh Pharmacopœia for their preparation :

“ In making thefe compofitions, fat and refinous fubftances are to be melted with a gentle heat, ftirring them constantly, fprinkling in, at the fame time, dry ingredients, if there are any, in fine powder, until the mixture, by cooling, become ftiff.”

LINIMENTUM

LINIMENTUM SIMPLEX. SIMPLE LINIMENT.

“Take of Olive Oil, four parts ; White Wax, one part.”

UNGUENTUM SIMPLEX. SIMPLE OINTMENT.

“Take of Olive Oil, five parts ; White Wax, two parts.”

CERATUM SIMPLEX. SIMPLE CERATE.

“Take of Olive Oil, six parts ; White Wax, three parts ; Spermaceti, one part.”

Ceratum  
Sperma-  
tis Ceti.

THESE compositions differ merely in consist-  
ence. They are applied spread on linen, as  
usual dressings to slight wounds and excoriations.

UNGUENTUM ADIPIS SUILLÆ. OINTMENT OF  
HOGS LARD. *Pharm. Lond.*

“Take of Prepared Hogs Lard, two pounds ;  
Rose Water, three ounces. Beat the lard with  
the rose water until they are mixed ; then li-  
quefy with a gentle heat, and put it aside, that  
the water may subside. Afterwards pour off  
the ointment, stirring it constantly until it has  
cooled.”

THIS is fimilar to the preceding, and is ufed for the fame purpofes. It is perhaps more liable to become rancid.

Unguent.  
Refin.  
Flav. UNGUENTUM RESINOSUM. RESINOUS OINTMENT.

“Take of Hogs Lard, eight parts; White Refin, five parts; Yellow Wax, two parts.”

THIS is more ftimulating than the preceding, and is ufed as a dressing where the object is to promote fuppuration.

Cerat.  
Cantharid. UNGUENTUM PULVERIS MELOES VESICATORII:  
*olim, Unguentum Epispasticum Fortius.* OINTMENT OF THE POWDER OF CANTHARIDES.

“Take of Refinous Ointment, feven parts; Powder of Cantharides, one part.”

THIS is the ointment commonly employed to eftablifh a purulent difcharge, or form an iffue in the part to which a blifter has been applied; which it does from the acrid and ftimulating quality of the cantharides.

Unguent.  
Canthar. UNGUENTUM INFUSI MELOES VESICATORII:  
*olim, Unguentum Epispasticum Mitius.* OINTMENT OF INFUSION OF CANTHARIDES.

“Take of Cantharides, White Refin, Yellow Wax,

Wax, of each one part; Venice Turpentine, Hogs Lard, of each two parts; Boiling Water, four parts. Macerate the cantharides in the water for a night, and strain the liquor, pressing it strongly; having added the lard, boil the liquor till the water is evaporated; then add the wax and resin. These being melted and removed from the fire, add the turpentine."

THE ointment with the powder of cantharides sometimes occasions too much pain and irritation. In such cases, the ointment from the infusion of cantharides being milder, is employed, and is still sufficiently stimulating to keep up the purulent discharge.

UNGUENTUM SUB-ACETITIS CUPRI: *olim, Unguentum Æruginis.* OINTMENT OF SUB-ACETITE OF COPPER, or VERDIGRIS.

"Take of Resinous Ointment, fifteen parts; Sub-Acetite of Copper, one part."

THIS ointment is used as an escharotic, applied to foul ulcers. It in general requires to be mixed with an additional proportion of resinous or simple ointment.

UNGUENTUM

UNGUENTUM HYDRARGYRI: *vulgo, Unguentum Cæruleum.* OINTMENT OF QUICKSILVER.

“Take of Quicksilver, Mutton Suet, each one part; Hogs Lard, three parts. Rub them carefully in a mortar, until the globules of quicksilver disappear. It may be made also with a double or triple proportion of quicksilver.”

UNGUENTUM HYDRARGYRI FORTIUS. STRONGER OINTMENT OF QUICKSILVER. *Pharm. Lond.*

“Take of Purified Quicksilver, two pounds Prepared Hogs Lard, twenty-three ounces Prepared Tallow, one ounce. Rub first the quicksilver with the tallow and a little lard, until the globules disappear; then add the remaining lard, so as to form an ointment.”

UNGUENTUM HYDRARGYRI MITIUS. MILD OINTMENT OF QUICKSILVER. *Pharm. Lond.*

“Take of the Stronger Ointment of Quicksilver, one part; Prepared Hogs Lard, two parts. Mix them.”

DURING the trituration of mercury with unctuous

unctuous matter, it cannot be doubted that an oxydation of the metal is effected; and the efficacy of the ointment depends in a great measure on this oxyd of mercury. It has been also supposed, with sufficient probability, that the portion of sebatic acid formed in animal fat, when exposed to the air, may promote this oxydation, and combine with the oxyd; and the improvement of the ointment on keeping, a fact long observed, it is probable is owing to this gradual formation of sebat of mercury.

Mercurial ointment is the form under which mercury is introduced into the system by external friction. It is a mode employed with advantage in cases where the preparations administered internally are liable to be too much determined to the intestines, so as to occasion griping and purging, and when it is necessary to introduce a large quantity of mercury speedily into the system; likewise in some local affections, particularly bubo. One drachm of the strong ointment, (that containing equal parts of mercury and lard), is introduced by friction in the evening, and frequently also in the morning, until the system is affected. The weaker oint-

ments ought not to be employed, as they merely give unnecessary trouble, by the necessity of rubbing in so much lard.

UNGUENTUM OXIDI HYDRARGYRI CINEREI.

OINTMENT OF GREY OXYD OF QUICKSILVER.

“ Take of Grey Oxyd of Quickfilver, one part ; Hogs Lard, three parts.”

THIS is designed as a substitute for the mercurial ointment, and, as the quickfilver is fully oxydated, it has been supposed that it will prove more active.

UNGUENTUM OXIDI HYDRARGYRI RUBRI. OINT-

MENT OF RED OXYD OF QUICKSILVER.

“ Take of Red Oxyd of Quickfilver by Nitric Acid, one part ; Hogs Lard, eight parts.”

THIS is applied as a mild escharetic to remove the diseased surface of ulcers, and as a stimulant to promote suppuration.

UNGUENTUM CALCIS HYDRARGYRI ALBÆ. OINT-

MENT OF WHITE CALX OF QUICKSILVER.

*Pharm. Lond.*

“ Take of White Oxyd of Quickfilver, one drachm ; Ointment of Hogs Lard, one ounce and

and a half. Mix them so as to form an ointment."

THIS ointment is sometimes used as an application in psoa, and other cutaneous affections.

UNGUENTUM NITRATIS HYDRARGYRI FORTIUS : Unguent  
*vulgo, Unguentum Citrinum.* STRONGER Hydrar-  
 OINTMENT OF NITRAT OF QUICKSILVER. gyr. Ni-  
 trat.

" Take of Purified Quicksilver, one part ; Nitrous Acid, two parts ; Hogs Lard, twelve parts. Digest the quicksilver with the nitrous acid, in a sand-bath, until a solution is obtained, which, while it is hot, is to be mixed with the hogs lard melted and beginning to cool. Beat the mixture thoroughly in a glass mortar, so as to form an ointment."

IN this ointment the nitrat of quicksilver is combined with the lard ; and as there is also an excess of nitric acid, it acts chemically on the fat, and gives to the composition a very firm consistence. It is an excellent application to certain cutaneous affections, a small quantity being rubbed on the part.

UNGUENTUM NITRATIS HYDRARGYRI MITIUS.

MILDER OINTMENT OF NITRAT OF QUICK-SILVER.

“ This is made in the same manner as the preceding, with a triple proportion of lard.”

It is of course a much milder application, and is designed to be also of a softer consistence ; but, to obtain the latter convenience, it is better to reduce the strong ointment with the requisite proportion of lard.

UNGUENTUM ACIDI NITROSI. OINTMENT OF NITROUS ACID.

“ Take of Hogs Lard, one pound ; Nitrous Acid, six drachms. Mix the acid gradually with the melted lard, and beat the mixture thoroughly while it cools.”

IN this preparation part of the acid is decomposed, and part of it combined with the lard. It is designed as an application in cutaneous affections, and is similar in its effects to the preceding ointment.

UNGUENTUM

UNGUENTUM OXIDI PLUMBI ALBI. OINTMENT  
OF WHITE OXYD OF LEAD.

“ Take of Simple Ointment, five parts ;  
Oxyd of Lead, one part.”

THIS has been used principally as an appli-  
cation to burns and superficial inflammation.

UNGUENTUM ACETITIS PLUMBI : *vulgo, Unguen-* Unguent  
*tum Saturninum.* OINTMENT OF ACETITE OF Ceruffæ  
LEAD. Acetata.

“ Take of Simple Ointment, twenty parts ;  
Acetite of Lead, one part.”

THIS ointment is applied to the same purposes  
as the preceding, and is more frequently used.

CERATUM LITHARGYRI ACETATI COMPOSITUM.  
COMPOUND CERATE OF ACETATED LITHARGE.  
*Pharm. Lond.*

“ Take of Water of Acetated Litharge, two  
ounces and a half ; Yellow Wax, four ounces ;  
Olive Oil, nine ounces ; Camphor, half a drachm.  
Rub the camphor with a little of the oil. Melt  
the wax with the remaining oil, and as soon as  
the mixture begins to become thick, pour on  
gradually

gradually the water of acetated litharge, and stir constantly until the mixture has cooled; then mix with it the camphor rubbed with the oil."

THIS ointment, usually named *Goulard's Cerate*, differs little from the preceding, and is applied to similar uses.

Cerat.  
Lapid.  
Calam.

CERATUM CARBONATIS ZINCI IMPURI: *olim*,  
*Ceratum Lapidis Calaminaris.* CERATE OF  
IMPURE CARBONAT OF ZINC.

"Take of Simple Cerate, five parts; Prepared Impure Carbonat of Zinc, one part."

THIS is the common healing cerate applied to slight wounds, excoriations, &c.; and as a dressing to ulcers. The carbonat of zinc seems to give it merely a stiffer consistence.

Unguent.  
Tutia.

UNGUENTUM OXIDI ZINCI IMPURI: *olim*, *Unguentum Tutia.*

"Take of Simple Liniment, five parts; Prepared Impure Oxyd of Zinc, one part."

THIS has been used principally as an application in chronic ophthalmia.

UNGUENTUM

UNGUENTUM OXIDI ZINCI. OINTMENT OF OXYD  
OF ZINC.

“Take of Simple Liniment, fix parts; Oxyd  
of Zinc, one part.”

OINTMENT of oxyd of zinc is sometimes used  
as a dressing to ulcers, and sometimes as an ap-  
plication in ophthalmia.

UNGUENTUM PICIS. OINTMENT OF TAR.

Ungue  
Picis.

“Take of Tar, five parts; Yellow Wax, two  
parts.”

THIS stimulating ointment is sometimes ap-  
plied to foul ulcers, and has been also used with  
advantage in tinea capitis.

UNGUENTUM SULPHURIS. OINTMENT OF SUL-  
PHUR.

Ungue  
Sulph.

“Take of Hogs Lard, four parts; Sublimed  
Sulphur, one part. To each pound of this oint-  
ment, add of Effential Oil of Lemon, or Effential  
Oil of Lavender, half a drachm.”

UNDER this form, sulphur is applied, by fric-  
tion, as a remedy in psora.

UNGUENTUM

—

UNGUENTUM ELEMI COMPOSITUM. COMPOUND  
OINTMENT OF ELEMI. *Pharm. Lond.*

“ Take of Elemi, one pound ; Common Turpentine, ten ounces ; Prepared Suet, two pounds ; Olive Oil, two ounces. Melt the elemi with the suet, and having removed it from the fire, mix it immediately with the turpentine and oil ; then strain the mixture.”

THIS ointment is moderately stimulating, somewhat similar to the resinous ointment.

UNGUENTUM HELLEBORI ALBI. OINTMENT OF  
WHITE HELLEBORE. *Pharm. Lond.*

“ Take of White Hellebore, rubbed to powder, one ounce ; Ointment of Hogs Lard, four ounces ; Essence of Lemon, half a scruple. Mix them, so as to form an ointment.”

HELLEBORE is used, under this form, as an application to psora. It is sometimes effectual, and is less disagreeable than the sulphur ointment.

UNGUENTUM

UNGUENTUM SAMBUCI. OINTMENT OF ELDER.  
*Pharm. Lond.*

“ Take of the Flowers of Elder, four pounds ; Prepared Mutton Suet, three pounds ; Olive Oil, one pound. Boil the flowers of elder with the suet and the olive oil until they become friable ; then press out the fluid, and strain it.”

THE elder flowers communicate nothing to the unctuous matter, but a rich green colour.

CERATUM SAPONIS. CERATE OF SOAP. *Pharm. Lond.*

“ Take of Soap, eight ounces ; Yellow Wax, ten ounces ; Litharge, in powder, one pound ; Olive Oil, one pound ; Vinegar, one gallon. Boil the vinegar with the litharge on a gentle fire, stirring constantly until the mixture become uniform and thick ; then mix with it the other ingredients, so as to form a cerate.”

THIS composition must derive any efficacy it has, principally from the acetite of lead, formed by the boiling of the vinegar on the litharge.

## CHAP. XXVI.

## EMPLASTRA.—PLASTERS.

PLASTERS differ from Ointments in their much firmer consistence, which is such, that they do not adhere to the hand, and require to be heated in order to be spread. They owe this consistence, in general, to a larger proportion of wax, or sometimes to the addition of certain metallic oxyds, particularly those of lead, which unite chemically with the unctuous matter. The same rules are to be observed in their preparation, as in that of Ointments.

Empla-  
strum  
Cerae  
Compo-  
sit.

EMPLASTRUM SIMPLEX: *olim, Emplastrum Cereum.* SIMPLE PLASTER.

“Take of Yellow Wax, three parts; Mutton Suet, Resin, of each two parts.”

THE

THE principal use of this plaster is as a dressing, when spread thin on linen, to the part to which a blister has been applied.

EMPLASTRUM OXIDI PLUMBI SEMI-VITREI: *olim*, Emplastr.  
*Emplastrum Commune.* Lithar-  
 gyr.

“Take of the Semi-vitreous Oxyd of Lead, one part; Olive Oil, two parts. Having added water, boil them, stirring constantly, until the oil and the oxyd unite into a plaster.”

THIS is a chemical combination of the expressed oil with the oxyd of lead, and is of a consistence sufficiently hard to form a plaster. It is used, spread on leather or linen, as an application to excoriations, or slight wounds.

EMPLASTRUM RESINOSUM: *olim*, *Emplastrum* Empla-  
*Adbæsum.* RESINOUS PLASTER. strum Li-  
 thargyr.  
 cum Re-  
 sina.

“Take of Plaster of Semi-vitreous Oxyd of Lead, five parts; Resin, one part.”

THE plaster of litharge is rendered more adhesive, and somewhat stimulating, by this intermixture of resin.

EMPLASTRUM

EMPLASTRUM OXIDI FERRI RUBRI : *olim, Emplastrum Roborans.*

“ Take of Plaster of Semi-vitreous Oxyd of Lead, twenty-four parts ; Refin, fix parts ; Yellow Wax, Olive Oil, of each three parts ; Red Oxyd of Iron, eight parts. Rub the red oxyd of iron with the oil, and add it to the other ingredients melted.”

THIS, spread on leather, is sometimes used as an application in flight cafes of lumbago, and seems to prove useful, merely by affording a mechanical support.

EMPLASTRUM ASSÆ FOETIDÆ. ASSAFOETIDA PLASTER.

“ Take of Plaster of Semi-vitreous Oxyd of Lead, Assafoetida, Galbanum, Yellow Wax, of each one part.”

THIS plaster is sometimes applied to the breast or side, as a remedy in hysteric affections.

EMPLASTRUM GUMMOSUM. GUM PLASTER.

“ Take of Plaster of Semi-vitreous Oxyd of Lead, eight parts ; Ammoniac, Galbanum, Yellow wax, of each one part.”

THIS

THIS plaster has been used as an application to indolent tumours, and sometimes to promote suppuration.

EMPLASTRUM HYDRARGYRI. QUICKSILVER PLASTER.

Emplastrum  
Litharg.  
cum Hy-  
drargyro.

“Take of Olive Oil, Resin, of each one part ; Quicksilver, three parts ; Plaster of Semi-vitreous Oxyd of Lead, six parts. Rub the quicksilver with the oil and resin melted together, and then cooled, until the globules disappear ; then add, gradually, the plaster of semi-vitreous oxyd of lead, melted, and mix the whole carefully.”

THIS plaster is applied as a discutient to indolent tumours.

EMPLASTRUM SAPONACEUM. SOAP PLASTER.

Emplastrum  
Saponis.

“Take of Plaster of Semi-vitreous Oxyd of Lead, four parts ; Gum Plaster, two parts ; Soap sliced, one part. Mix the soap with the plasters melted together ; then boil a little, so as to form a plaster.”

THIS has likewise been supposed to possess a discutient quality ; but it is much inferior to the mercurial plaster, and is scarcely ever used.

Emplast.  
Cantha-  
rid.      EMPLASTRUM MELOES VESICATORII: *olim, Em-  
plastrum Vesicatorium.* PLASTER OF CANTHAR-  
RIDES.

“Take of Mutton Suet, Yellow Wax, Refin, Cantharides, of each equal weights. Mix the cantharides, rubbed into a fine powder, with the other ingredients, melted together, and removed from the fire.”

THIS is the plaster usually employed to raise a blister. It is of a softer consistence than the other plasters, that it may admit of being spread without the assistance of heat, which would impair the acrid quality of the cantharides. It requires to be applied twelve hours to produce a perfect blister: it is then removed; the vesicle is cut, and the inflamed surface dressed with simple cerate or plaster.

EMPLASTRUM MELOES VESICATORII COMPOSITUM. COMPOUND PLASTER OF CANTHARIDES.

“Take of Burgundy Pitch, Turpentine, Cantharides, of each twelve parts; Yellow Wax, four parts; Sub-acetite of Copper, two parts; Mustard Seed, Black Pepper, of each one part.

To

To the Burgundy pitch and wax melted, add the turpentine. When this is melted, and while the fluid is still warm, add the other ingredients mixed and rubbed to a fine powder, stirring constantly, so as to form a plaster."

It occasionally happens, that the common plaster of cantharides is insufficient to excite a blister, even when its surface has been sprinkled over with powdered cantharides. In such cases, or even in others, where it is necessary that a blister should be quickly raised, this more powerful composition may be employed. Its operation is accompanied with a very pungent sensation of heat.

---

EMPLASTRUM AMMONIACI CUM HYDRARGYRO.

PLASTER OF AMMONIAC WITH QUICKSILVER.

*Pharm. Lond.*

"Take of Strained Ammoniac, one pound ; Purified Quicksilver, three ounces ; Sulphurated Oil, one drachm, or as much as may be sufficient. Rub the quicksilver with the sulphurated

oil, until the globules disappear ; then add gradually the melted ammoniac, and mix them."

THIS is similar in its powers to the simple mercurial plaster, and is applied to the same purposes.

EMPLASTRUM CUMINI. CUMIN PLASTER. *Pharm. Lond.*

" Take of Cumin, Caraway, Bay Berries, of each three ounces ; Burgundy Pitch, three pounds ; Yellow Wax, three ounces. With the pitch and wax melted, mix the other ingredients rubbed to powder."

THIS has been applied to the region of the stomach as a moderate stimulant, certainly with no great effect.

EMPLASTRUM LADANI COMPOSITUM. COMPOUND PLASTER OF LADANUM. *Pharm. Lond.*

" Take of Ladanum, three ounces ; Frankincense, one ounce ; Cinnamon in powder, Expressed Oil of Nutmeg, of each half an ounce ; Oil of Spearmint, one drachm. To the melted frankincense add first the ladanum, softened by heat, then the expressed oil of nutmeg ; afterwards

wards mix these and the cinnamon with the oil of spearmint, and beat them in a warm mortar. Keep the plaster in a close vessel."

THIS plaster has been applied, like the former, to relieve nausea and flatulence, and is undoubtedly a more powerful stimulant.

EMPLASTRUM LITHARGYRI COMPOSITUM. COM-  
POUND LITHARGE PLASTER. *Pharm. Lond.*

"Take of Litharge Plaster, three pounds; Strained Galbanum, eight ounces; Common Turpentine, ten drachms; Frankincense, three ounces. Mix the frankincense, rubbed to powder, with the galbanum and turpentine melted, and add the litharge plaster, melted with a slow fire."

THIS is similar in its qualities to the gum plaster, and is used, like it, as a discutient, and to promote suppuration.

EMPLASTRUM PICIS BURGUNDICÆ COMPOSITUM.  
COMPOUND BURGUNDY PITCH PLASTER.  
*Pharm. Lond.*

"Take of Burgundy Pitch, two pounds; Ladanum, one pound; Yellow Refin, Yellow Wax,

of each four ounces ; Expressed Oil of Nutmeg, one ounce. To the pitch, resin and wax, melted together, add first the ladanum, then the oil of nutmeg."

BURGUNDY Pitch, with the addition of a little wax to give it more tenacity, is in common use as a rubefacient, under the form of plaster. The addition of the other ingredients of this compound plaster, may render it rather more stimulating.

EMPLASTRUM THURIS COMPOSITUM. COM-  
POUND FRANKINCENSE PLASTER. *Pharm.*  
*Lond.*

"Take of Frankincense, half a pound ; Dragons Blood, three ounces ; Litharge Plaster, two pounds. To the litharge plaster melted, add the others rubbed to powder."

THIS is similar to the Plaster of Red Oxyd of Iron of the Edinburgh Pharmacopœia, and is applied to the same uses.

---

*CATAPLASMATA*.—CATAPLASMS.*CATAPLASMA ALUMINIS. ALUM CATAPLASM.**Pharm. Lond.*

“ Take the Whites of two Eggs: agitate them with a piece of Alum, until a coagulum is formed.”

THIS is sometimes employed as an astringent application in some cases of ophthalmia.

*CATAPLASMA CUMINI. CUMIN CATAPLASM.**Pharm. Lond.*

“ Take of Cumin, one pound; Bay Berries, Dried Scordium, Virginian Snake-root, of each three ounces; Cloves, one ounce. Rub them all together into powder; and having added three times their weight of honey, form a cataplasma.”

THIS has been used as a stimulating cataplasma to parts shewing a disposition to gangrene.

## CATAPLASMA SINAPEOS. MUSTARD CATAPLASM.

*Pharm. Lond.*

“Take of Mustard in Powder, Crumb of Bread, of each half a pound; Vinegar, warm, as much as is sufficient. Mix, so as to make a cataplasm.”

THIS is the common sinapism which is applied with advantage, as a powerful stimulant, to the soles of the feet, in typhus where there is a determination to the head, and in comatose affections.

## APPENDIX, No. I.

TO this Appendix I have, for the reasons stated in the Preface, referred the medical history of the Gases, of Electricity, and Galvanism.

### OF THE GASES EMPLOYED AS REMEDIES.

SUBSTANCES existing in the aërial form, might *a priori* be supposed capable of producing important effects on the system, as by respiration they are brought to act directly on the mass of blood, and induce in it chemical changes. And they actually occasion immediate and striking alterations in the functions of life.

Though the expectations that were at one time formed, with regard to their medicinal efficacy

efficacy, have not been realized, and the use of them has now been nearly relinquished; yet since they are capable of producing important changes in the state of the functions, and of the general system, and since the proposition must be admitted, that every substance possessed of such powers may be capable of acting as a powerful remedy, they ought not to be entirely lost sight of, or be discarded from the *materia medica*. In the aerial kingdom, we have actually the two extremes of Stimulant and Sedative Power.

The modes of preparing these gases are, in a great measure, peculiar to each of them. The manner of administering them is nearly the same. They may be breathed from a jar placed in water; but this is difficult, from the effort required to sustain the column of water within the jar. This may be partly remedied, by poisoning the jar in water, or, more completely, by breathing from the Gazometer. But the easiest mode is, for the patient to breathe the gas from a silk bag, to which a tube with a stop-cock is affixed. In inspiring and expiring the gas, the nostrils require to be closed.

The

The gases that have been employed in medicine, may be considered under the divisions of those which *excite*, and those which *depress* the functions of life. To the former order belong,

GAS OXYGENIUM. OXYGEN GAS.

GAS OXYDUM NITROSUM. NITROUS OXYD GAS.

OXYGEN GAS is procured from black oxyd of manganese by heat. A quantity of the oxyd is put into an iron tube, and exposed to a red heat: the gas is transmitted through water, and is allowed to stand over it for some hours before it is breathed.

As oxygen is so immediately necessary to the support of life, it might be supposed, that when afforded in a more pure and concentrated state than that in which we breathe it in atmospheric air, it would prove a salutary agent of no inconsiderable power. To this inference, however, independent of any experience, an objection occurs, founded on some experiments made by Lavoisier, and repeated by Davy, which prove, that when animals are supplied with pure oxygen, or with oxygen mixed with a portion of atmospheric

atmospheric air, still less of it is consumed than in ordinary respiration. But though this fact should be admitted, the greater activity of pure oxygen gas on the system is undoubted. It is shewn by the effects which result from its inspiration, and still more forcibly by the fact ascertained by Priestley, Lavoisier, and Davy, that animals confined in air, with an increased proportion of oxygen, die before it is exhausted, and even while the air which they breathe contains more oxygen than common air, and can enable another animal to live.

Oxygen, when respired, acts partly by communicating a stimulating quality to the blood, by which the left side of the heart and the arterial system are excited to action. The phenomena of asphyxia from its abstraction, prove that it likewise exerts some other operation more immediately subservient to the functions of life.

The diseases in which oxygen gas has been administered, are principally those of chronic debility,—chlorosis, asthma, scrofula, dropsy, paralysis, and some cutaneous affections. It requires to be diluted with from ten to twenty or more parts of atmospheric air, increasing the proportion

proportion of oxygen according to the effects produced. From one to two quarts of oxygen are given, by breathing it in its diluted state, at intervals, in the course of the day. It generally increases the force and velocity of the pulse.

NITROUS OXYD GAS.—This gas, a compound of oxygen and azot, in the proportion of 37 of the former to 63 of the latter, is most economically obtained, and in greatest purity, from the decomposition of nitrat of ammonia by heat. When this salt is exposed to a temperature about  $400^{\circ}$  of Fahrenheit's scale, its principles re-act on each other, and enter into new combinations. The hydrogen of the ammonia attracts part of the oxygen of the nitric acid to form water; and the remaining oxygen combining with the azot both of the acid and of the ammonia, forms this particular compound, nitrous oxyd, which is disengaged in the gaseous form. It requires to stand some hours to deposit a small portion of saline matter, before it is fit to be breathed.

The effects of nitrous oxyd gas on the system, when it is respired, are scarcely analogous to those

those of any other agent. The excitement which it produces is extended to the functions of body and mind with more rapidity and force than that arising from the action of the most powerful stimulants. It is accompanied with sensations as various as they are peculiar; and, what still more marks the singularity of its operation, this high excitement of the functions of life and exhilaration of mind are not followed by proportional languor or debility; the state of the system gradually returns to the healthy standard, without any apparent waste of power. A substance capable of acting in such a manner, we might suppose, would prove one of our most valuable remedies. The transient nature of its operation must undoubtedly limit its medicinal efficacy; but still, in diseases of extreme debility, we seem justified in expecting from its administration the most beneficial effects. It has not, however, been very extensively employed. In paralysis it has been used with advantage. In diseases of increased sensibility, it may prove hurtful; and when breathed by delicate females, it has, in more than one instance, induced hysterical affections. The dose which is requisite to  
produce

produce its peculiar effects varies from four to nine quarts, which may be breathed pure or diluted with an equal part of atmospheric air. It cannot be breathed undiluted for more than four minutes and a half, insensibility being induced.

Nothing satisfactory can be said as to its mode of action, since we know so little of the connection which subsists between the phenomena of life and the chemical changes which go on in the system. We can only mark the dissimilarity of its operation to that of any other physical agent.

UNDER the second sub-division of the Gases,—those which depress the functions of life, might probably be placed all the substances existing in the aerial form, oxygen and nitrous oxyd excepted. The following are those which have been medicinally employed :

GAS HYDROGENIUM. HYDROGEN GAS.

GAS AZOTICUM. AZOTIC GAS.

GAS ACIDUM CARBONICUM. CARBONIC ACID GAS.

GAS HYDROGENIUM CARBONATUM. CARBONATED  
HYDROGEN GAS.

HYDROGEN GAS, when it is to be breathed, is to be procured by passing water in vapour over pure iron heated to the temperature of ignition. The iron attracts the oxygen of the water, and the hydrogen assumes the aerial form.

Hydrogen gas received into the lungs does not appear to exert any positive deleterious power: all its effects seem referable merely to the exclusion of oxygen. In a pure state, if the lungs have been previously emptied as much as possible of atmospheric air, it cannot be breathed above three quarters of a minute. It quickly occasions a giddiness and sense of suffocation; the countenance becomes livid, and the pulse sinks rapidly; but, when diluted with two-thirds or an equal part of atmospheric air, it can be safely breathed; nor does it appear to produce any very important effect. It occasions some diminution of muscular power and sensibility, and a reduction of the force of the circulation. It has been used in catarrh, hæmoptysis, and phthisis, but its powers seem merely those of a palliative.

AZOT.

AZOT.—What has been said of hydrogen applies likewise to azot. It seems to exert no positive action on the system, but to produce its effects by excluding oxygen. As it is not so easily obtained pure as hydrogen, it has been less employed.

CARBONIC ACID GAS.—To obtain this gas in a proper state of purity for breathing, carbonate of lime (chalk or white marble), is exposed to a strong red heat in an iron tube. The carbonic acid which is disengaged is collected over water, as it is not immediately largely absorbed by that fluid.

This acid gas, when it is inspired, proves more speedily fatal than azot or hydrogen. It appears to excite spasmodic contraction of the epiglottis, so as very speedily to induce suffocation; and it has this effect, even when diluted with nearly an equal part of atmospheric air.

The respiration of carbonic acid gas was employed at an earlier period than that of the other gases. It was celebrated as a remedy in phthisis. In the many cases however in which

it has been tried, though it might lessen the expectoration, diminish the hectic fever, and act as an anodyne, there is little evidence of its having ultimately effected a cure. It is given diluted with four or six parts of atmospheric air.

Carbonic acid has likewise been employed as a local application to cancer and painful ulceration, and has at least been serviceable as a palliative. A stream of it is directed on the part by means of a flexible tube. A cataplasm, formed of substances in a state of fermentation has, in some measure, a similar effect.

**CARBONATED HYDROGEN GAS.**—The gas which has been used in medicine under this name, is obtained by passing the vapour of water over charcoal at the temperature of ignition, in an iron tube. The oxygen of the water unites with one part of the charcoal, forming carbonic acid; the hydrogen combines with another part of it, and forms this species of carbonated hydrogen. The carbonic acid is abstracted by agitating the gas in lime-water.

This is the most active of those gases which operate by depressing the functions of life, and is perhaps the most powerful agent of this kind.

Even

Even when largely diluted with atmospheric air, it occasions immediate vertigo, sickness, diminution of the force and velocity of the pulse, reduction of muscular vigour, and in general every symptom of diminished power. It can scarcely be breathed in an undiluted state. Mr Davy found, that at the third inspiration, total insensibility was induced, and symptoms of extreme debility continued for a considerable time.

As a medicinal agent, it is the gas of which the evidence in favour of its efficacy is greatest. In phthisis, in many cases, it unequivocally relieved the symptoms, and at least arrested the progress of the disease. Much caution is requisite with regard to the dose. At first, one pint of the carbonated hydrogen gas, diluted with twenty parts of atmospheric air, may be respired; the quantity may be slowly increased, and with less dilution, taking care to avoid the production of great vertigo or muscular debility. Not more than from two to four quarts can be taken in the day, even when the patient has been accustomed to it for some time. It is always more powerful when recently prepared, than when it has been kept for some days.

---

## ELECTRICITY.

THE medicinal operation of electricity may be referred to its stimulant power. It produces forcible contractions in the irritable fibre; excites therefore to action, if duly applied; and, when in excess, immediately exhausts irritability. It possesses the important advantages of being easily brought to act locally, and of being confined to the part to which it is applied, while it can also be employed in every degree of force.

Electricity is applied to the body under the form of a stream or continued discharge of the fluid, under that of sparks, and under that of a shock; the first being the most gentle, the second being more active, and the last being much more powerful than either of the others. The stream is applied by connecting a pointed piece of wood, or a metal wire, with the prime conductor of the electrical machine, and holding it  
by

by a glass handle one or two inches distant from the part to which it is to be directed. A very moderate stimulant operation is thus excited, which is better adapted to some particular cases than the more powerful spark or shock. The spark is drawn by placing the patient on the insulated stool connected with the prime conductor, and, while the machine is worked, bringing a metal knob within a short distance of the part from which the spark is to be taken. A sensation somewhat pungent is excited, and slight muscular contractions may be produced; these effects being greater or less, according to the distance at which the knob is held, if the machine be sufficiently powerful. The shock is given by discharging the Leyden phial, making the part of the body through which it is intended to be transmitted, part of the circuit. The sensation it excites is unpleasant, and the muscular contractions considerable, if the shock is moderately strong.

At the first introduction of electricity as a remedy, it was very highly celebrated for its efficacy in a number of diseases; its use is now confined to a few. In paralysis it is very gene-

rally had recourse to, to excite muscular contraction, and perhaps with some advantage. It is usually applied under the form of sparks, the application of it requiring to be continued daily for a considerable time. Sometimes moderate shocks are also employed ; but the propriety of this practice is somewhat doubtful. In ammenorrhœa, as the stimulant operation can be excited, in some measure, in the vessels which are affected, advantage may be derived from electricity ; and it is occasionally used, both under the form of sparks taken from the pelvis, and that of moderate shocks transmitted through it. Ophthalmia, and some other varieties of inflammation, have been removed by the electric stream ; it has also sometimes succeeded in discussing tumours, and relieving pain. The general rule for the medical employment of electricity, is to apply it at first under the milder forms, and gradually to raise it, if necessary, to the more powerful.

---

## GALVANISM.

THE peculiar power which is generated when two metals moistened are in contact, at first named Animal Electricity, since Galvanism, has been recently applied as a remedy in various morbid affections. Its effects on the animal system are such as warrant this application. Its activity is shewn by its exciting strong sensations in sensible parts, and powerful contractions in parts endowed with irritability.

Between galvanism and electricity there are so many points of resemblance, that they have been considered as ultimately the same power, or as the same subtile matter in different states. Whether this opinion be just or not, the effects of galvanism on living matter are different from those of electricity. The sensation which the former excites, though somewhat analogous to that produced by the latter, is still dissimilar ;  
the

the action of galvanism is more extended, both to the nervous and muscular systems, than that of electricity, which is more local in its action. The galvanic excitation produces sensations and contractions in parts, which, from disease, are not sensible to electrical impressions; and the stimulant power which both exert, appears in galvanism, to be greater in proportion to its intensity than in electricity; or the sensations and muscular contractions which the galvanic discharge excites, are more than proportioned to its power of producing electrical phenomena.

The diseases in which galvanism has hitherto been employed, are principally those of the nervous kind. In paralysis, it has been affirmed to have restored the capability of muscular contraction, and consequently the power of motion. Cases of chorea, tetanus, and some other spasmodic affections, have been related, in which perfect cures were accomplished by its application. It appears, in several instances, to have relieved deafness, particularly that species of it arising from torpor of the auditory nerve; and it has been successful in dissolving indolent tumours.

Galvanism

Galvanism is applied by connecting two metallic wires with the two extremities of a galvanic battery, and bringing them in contact with the part affected, so that it shall form part of the circuit of the galvanic discharge: the one wire is kept in contact with the part it touches; the other is alternately applied for a moment and removed. If the skin is moistened, the galvanic influence is communicated more readily and effectually; and still more so if a small piece of metallic leaf be laid on the parts to which the wires are applied. Sometimes even the cuticle has been previously removed by a blister, but the application of the galvanism is then attended with pain.

## APPENDIX, No. II.

### ON MEDICAL PRESCRIPTIONS.

THE principal objects designed to be attained by the Composition of Medicines, are, to communicate an agreeable taste or flavour; to give a convenient form; to correct the operation of the principal medicine, or obviate some unpleasant symptom it is liable to produce; to promote its action, by the additional article exerting one of a similar kind; to obtain the joint operation of two remedies, having different powers; or to alter their usual effects, by the power which one may have of modifying the action of another.

A prescription has been usually divided into four parts, which compose it,—the *basis*, or principal

principal article ; the *adjuvans*, or that designed to promote the action of the former ; the *corrigens*, or that which is intended to correct its operation, or obviate any unpleasant symptom which it may be apt to produce ; and the *constituens*, or that which gives to the other ingredients consistence or form. These are not necessarily present in every formula ; nor is the division of much importance, except as perhaps affording the best principle for regulating the order in which the ingredients of a prescription should be enumerated.

The following are the principal circumstances to be attended to in forming a prescription.

1<sup>st</sup>, Simplicity should be attained, as far as is consistent with the objects of the prescription. Nothing ought to enter into the composition which does not add to its virtue, render it less ungrateful, give it a convenient form, or which is not necessary to conceal any particular ingredient ; and, in general, the practice of accumulating a number of articles in one prescription is to be avoided.

*2dly*, Substances, it is evident, ought not to be mixed together, which are capable of entering into chemical combination, or of decomposing each other, unless it be with the view of obtaining the product of the combination, or decomposition, as a remedy.

*3dly*, Those mixtures are also to be avoided, in which one medicine, by its peculiar action on the stomach or general system, modifies and changes the action usually exerted by another, unless where the object is to obtain the effects of that modified operation.

*4thly*, The error of contra-indication is to be guarded against, or those medicines ought not to be combined, the virtues of which are not merely different, but are, in some measure, opposed to each other.

*5thly*, The ingredients which are to be mixed, must be such as will mix properly together, so that the form in which the remedy is designed to be exhibited, may be easily obtained and preserved.

*Lastly*, The form under which a medicine is prescribed, must be adapted to certain circumstances; principally to the nature of the disease,

the

the nature of the remedy itself, and, as far as may be possible, to the taste of the patient.

---

THE Doses of Medicines are not reducible to any general rules, from their general similarity of operation, or any other circumstance. The principal circumstances by which they are influenced are, Age, Sex, Temperament, Idiosyncrasy, Habit, and Disease.

*Age.*—From infancy to manhood, a larger dose of any medicine is requisite to produce its effect, in proportion to the advance in life. From manhood to old age, there is a similar gradation with regard to diminution of dose, though in a much less proportion than that which regulates the increase. The following table has been supposed to shew these proportions.

TABLE.

## TABLE.

Let the dose for a person of middle age be 1 or 1 drachm.

For one from xiv to xxi years, it

will be	—	—	$\frac{2}{3}$ or 2 scruples.
—	vii	to xiv,	— $\frac{1}{2}$ or half a dr.
—	iv	to vii,	— $\frac{1}{3}$ or 1 scruple.
— of	iv	years of age,	— $\frac{1}{4}$ or 15 grains.
—	iii	—	— $\frac{1}{6}$ or half a scr.
—	ii	—	— $\frac{1}{8}$ or 8 grains.
—	i	—	— $\frac{1}{12}$ or 5 grains.

*Sex.*—Women, in general, require smaller doses of any medicine than men, a difference probably owing to their greater sensibility from their habits of life.

*Temperament.*—Those of the sanguine temperament are supposed to be more affected by medicines, and therefore to require smaller doses than those of the phlegmatic or melancholic; but in what has been said on this subject, there is so much uncertainty, that little reliance can be placed on it.

*Idiosyncrasy.*—This denotes that disposition in individuals to be affected by certain causes, in a manner different from the generality of mankind. Such idiosyncrasies are observed with

regard to medicines, as well as to other agents ; and, where they are known, require to be attended to by the prescriber.

*Habit.*—This has an important influence on the operation of medicines. In general, they lose some of their power by having been long continued. This is particularly the case with all strong stimulants and narcotics, and is even observed, to a certain extent, in some of the other classes of the *materia medica*. In a few instances, the reverse has been supposed to hold true.

*Disease.*—This has an influence on the doses of medicines not less important ; the susceptibility to external impressions, and to action, being much varied in morbid affections, and the operations of remedies of course being modified by such variations. The state of susceptibility being in general apparent, when it varies much from the healthy standard, the doses of the medicines administered are easily regulated.

## TABLES

TABLES  
OF  
CHANGED NAMES.

---

# T A B L E S OF C H A N G E D N A M E S IN

## THE NEW EDINBURGH AND LONDON PHARMACOPOEIAS.

In drawing up these Tables, it has not been thought necessary to insert the names of the Simple Medicines, as both the proper names of the articles, according to the nomenclature of natural history, and their common or trivial names, are inserted in the index to the work; and thus the old or the new name of any simple substance may be easily found. In these tables, therefore, the names of the Compound Medicines only are inserted, and the catalogue of them has been extended so far as to include not only the synonyms inserted in the present editions of the London and Edinburgh Pharmacopœias, but a number of older names, once generally established, and still occasionally used.
