INFLUENCE OF MARRIAGES OF CONSANGUINITY

UPON

OFFSPRING.

BY S. M. BEMISS, M.D.

EXTRACTED FROM THE

TRANSACTIONS OF THE AMERICAN MEDICAL ASSOCIATION.

PHILADELPHIA: COLLINS, PRINTER, 705 LODGE ALLEY. 1858.

REPORT.

Is the offspring of marriages of consanguinity equal physically and mentally to the offspring of parents not connected by ties of blood—both classes being supposed to be similarly circumstanced in respect to all other causes affecting the integrity of their issue?

A question of similar import to this has at times engaged popular attention probably for many ages, and yet no facts have hitherto been collected of sufficient number and authenticity to determine its solution. This neglect to accumulate statistical testimony as to the results of family intermarriage could not have proceeded from paucity of material, since, not only do the pages of history teem with instances of such marriage, but they are found in almost every social circle, and should receive the earnest scrutiny of physiologists. Surely, no questions can concern us more closely than those which relate to the prevention of the numerous congenital abnormities of our species, among the causes of which, intermarriage of members of the same family blood may appear not the least important.

Passing allusions to the evil consequences of marriages of consanguinity may be found in a number of authors, but the subject has not been made a point of special inquiry, so far as I have been able to learn, except by Rev. Charles Brooks in a lecture before the American Association for Advancement of Science in 1855; by two French writers, Rilliet and Menière in 1856, and by the present reporter in 1857.

To Dr. John Bartlett, of Keokuk, belongs the credit of having projected the first effort to set the question at rest by accumulating a sufficient number of facts to furnish positive testimony either corroborating or refuting the popular idea of deterioration of offspring from such marriages. A loss of health compelled him to abandon, for a time at least, his intentions, and he has generously placed his material in my hands for the benefit of the Association and profession at large.

Dr. H. P. Strong, of Beloit, Wisconsin, had also collected accounts of instances of family intermarriage for the purpose of deducing and publishing observations upon the subject. But so soon as he heard of the appointment of a committee by the American Medical Association to collect facts in regard to marriages of consanguinity, he placed his many carefully detailed cases at the disposal of the Association through their committee. Such instances of generous sacrifice of labor and purpose as the two foregoing demand our highest appreciation.

It was the design of the reporter to collect not only a sufficient number of observations of marriages of consanguinity to enable us to declare positively in regard to their own essential results, but also to collect a sufficient number of observations of marriage where no such influence obtains, to constitute an authoritative standard, so that by comparing the results of the two classes we might establish beyond controversy the affirmative or negative of the question premising this report.

With regard to the first class, or marriages of consanguinity, my success in collecting facts has been beyond my expectation; my tables will exhibit results of near nine hundred such marriages, a sufficient number to warrant the belief that any additions thereto, if procured in the same manner, would not materially affect the ultimate result. Of marriages of the second class, or between parties neither themselves related nor the descendants of blood relations, I regret to say that my exertions to collect observations have not been so successful. My tables comprise only one hundred and twenty-five observations of this character, which, however correct they may be in selection and statement, are not ample enough in number to justify me in offering them as the average results of marriage where no influence of consanguinity prevails. And unfortunately, there are no researches, so far as I have been able to learn, which establish the average fecundity and vital statistics of marriage in the United States.

The original statistics which appear in my report, have been furnished exclusively by reputable physicians in the various States to which they are credited. The respectable sources from whence they are derived should stamp them as high authority, and I bear cheerful testimony to their accuracy and reliability, feeling satisfied

that all future investigations in this field will bring additional evidence that they are faithful records of truths. But while indorsing the truthfulness of these statistics, it is my duty to state, that those which relate to marriages of consanguinity, should probably not be received as a completely true representation of the results of such marriages; some modification of the mean of results might occur if the statistics of all instances of in-and-in marrying, in the Union, for example, could be comprised in one report. It is natural for contributors to overlook many of the more fortunate results of family intermarriage, and furnish those followed by defective offspring or sterility. The mere existence of either of these conditions would prompt inquiry, while the favorable cases might pass unnoticed. Contributors have been particularly requested to furnish, without prejudice or selection, all instances of marriages of consanguinity within their various circles of observation, whatever their results. I have reason to believe that in every instance they have complied with this request so far as it was practicable to do so. Consequently, I have no further cause for supposing that the mean of defects would be lessened, were it possible to include every case of marriage of kindred existing in the population which affords those on my tables, than the mere inference that some cases with favorable results may have passed unnoticed.

Eight hundred and seventy-three observations of marriages of consanguinity of various degrees of relationship are arranged upon the tables. They were furnished from the following States :---

Maine .			12	Georgia			30
New Hampshire			44	Alabama		121 201	22
Vermont .	. 10.0		9	Mississippi			14
Massachusetts			87	Arkansas			7
Connecticut			35	Tennessee			53
New York .			57	Kentucky			137
Pennsylvania			34	Missouri			69
New Jersey	-		33	Illinois			16
Delaware .			7	Indiana			73
Maryland .			2	Ohio .			10
Virginia .			24	 Michigan			34
North Carolina			11	Wisconsin		-	42
South Carolina		4	3				
					Total	1 .	873

That these observations might be more readily studied, they have been arranged upon the tables, in classes corresponding with their estimated grades of relationship, as follows:-

7

REPORT ON

Classes	. Degree of relat						(Number of observations.

н.	Marriage irregularly reported, all	first	cous	ins				30
	Total					• •		873

The tables throughout the various classes corresponding to the degrees of relationship, are constructed in the same manner; first, there is a statement of temperament, health, and other circumstances relating to the parents and date of marriage; then the number, sex, and condition of children, the number dead, and causes of death. In a majority of instances, some important item of information is wanting to render the recital of the case complete, yet very few are so imperfect in detail as to be devoid of interest.

In compiling these cases from the numerous letters which brought me the facts, I have as nearly as possible preserved the language of the contributor. The descriptions of temperament have been copied verbatim, except in three instances, in all of which the reporter supposed the meaning of the contributors would be better apprehended by the employment of other language.

In some cases, I have from the tenor of the letters, supplied certain points of unstated information. For example, it has occurred that no statement was made of the health or habits of parents, but some circumstance detailed in the latter has authorized the reporter to describe them, inferentially, as either "good" or "bad," and they have been so entered upon the tables. These instances have been very rare, but it has more often happened that the date of marriage was not mentioned, and in such cases, when any given facts in regard to the age of children, or any other circumstance, led the reporter to infer that those marriages had occurred sufficiently long for the period of reproduction to have transpired, the dates have been denoted by the figures 1835, preceded by a dash. This rule has been adopted, because I have arbitrarily fixed twenty-two years as the extreme average length of time marriages set down upon these tables as having occurred before 1835, are supposed to be complete in their results, so far as it regards reproduction.

It is not impossible that some slight errors may have been committed by the reporter in respect to these two interpolations, but they are believed to be so trivial, even if they exist, as to exert no influence over the result; and I would not suppose it important to speak of these alterations except as an act of justice from myself to those who have been my co-laborers.

The attention of contributors has been especially solicited to the temperament and constitutional idiosyncrasies of parents. I have not, however, attempted to deduce any conclusions from the information supplied in regard to temperament. The mere fact that the term itself has a meaning so unfixed and so differently understood, that physicians would have different ideas of its application to the same individual, forms a difficulty at the very threshold of any effort to establish practical laws in regard to the influence which particular conjunctions of parental temperament might exert upon offspring.

In regard to constitutional predisposition and peculiarities of parents, the tables present some interesting facts. It will be perceived that parental infirmities are entailed with great certainty upon the offspring, and this, in the opinion of the reporter, constitutes the strongest argument against the intermarriage of relatives; the fact that family peculiarities, tendencies, and infirmities, either of mind or body, which may be so slight on the part of the parents as to remain latent, become so exaggerated by this "intensifying" of the same blood, that they are in the child prominent and ruinous defects. In this manner I account for the fact that so many of the offspring of kindred parents, who seem in other respects to be well endowed, possess characters so angular and peculiar as to unfit them for the ordinary avocations of life.

In analyzing the defects of offspring, I have assigned a column to each of the four classes of infirmities which are so common in this country as to demand the construction of numerous institutions for their alleviation, viz: deaf-dumbness, blindness, idiocy and insanity; to these I have added a column for epilepsy and one for scrofula. It was my intention to insert a column for the deformed, but as a question arose in my mind as to whether certain personal peculiarities, such as different colored irises, or strabismus, or slight deviations from physical symmetry, should properly be classed under this caption, I determined to omit this

column, and to notice these defects under the head of "Condition of Offspring." Consequently, the deformed are in most instances excluded from enumeration under the head of "defective." Another observation will show that the numbers in the column marked "defective" under-estimate the sum of defects occurring to the offspring of the marriages of consanguinity upon these tables, that is this, in very many instances, where children have died young, their defects have escaped the attention of contributors, and often, perhaps, that of the parents likewise. This remark would hold especially true of congenital deaf-muteism and idiocy, either of which may exist unsuspected in very early infancy. It is not only a natural inference that many deaf and dumb, and idiotic children of the marriages upon these tables, have died without being reported as laboring under these defects, but the supposition finds complete corroboration in the fact that in classes B and D, in both which the percentage of early deaths is largely over that of any other classes, the percentage of defects is less than we are prepared to expect, and the reduction of mean of defects occurs precisely in the columns assigned to deaf-dumbness and idiocy, but more strikingly in the latter.

It has been a source of regret to me that these tables are so voluminous as to require so much space of the published transactions, but every case has been condensed as much as was compatible with its intelligible presentation. And to have omitted all detail of individual cases would have diminished the value of the report, since other statisticians and physiologists might desire to study these facts in relations different from those presented by the reporter. Another inconvenience attending the great compass of these tables, is that it will prevent their general diffusion through those circles where it is more important to awaken investigation and impart knowledge in reference to this subject. In some part, to obviate this difficulty, I have prepared a table of "Aggregates," which is an exhibit of the results of the marriages comprised on the large tables. The reader will find upon this table the whole number and sex of children, with the sum and percentage of each defect, running through all the classes formed by the various grades of relationship.

I have also prepared two tables of comparative results, which, considered in connection with the table of aggregates, present a condensed exposition of the questions involved in my report. The first of these tables is composed of observations of the results of

marriage where no influence of consanguinity prevails. The isolated observations upon this table are brothers and sisters of parties who have married their kindred, and whose cases are detailed among the consanguinity statistics, and are referred to in this table. The observations occurring in groups of from ten to twenty, have been furnished by highly respectable physicians in the various States to which they are credited. The correspondents who furnished these cases selected them as fair examples of the average results of marriage, under similar circumstances, in their various communities. They were chosen without any other restriction or requisition than that the husband and wife should neither themselves be related, nor have been the immediate descendants of kindred parents, and that the females should have ceased to ovulate, so that we might know that the results were complete as it regards fecundity.

The second table is made up in part from a report to the Secretary of State of Ohio, under an enactment of their legislature requiring a census of the deaf and dumb, blind, idiotic, and insane inhabitants of that State, and the number of each of those classes who were the offspring of marriages between blood relations. This latter clause of the enactment was totally neglected in many counties, and in others it seems to have been illy executed, yet this report contains a large amount of information valuable to my purpose, exhibiting as correlative statistics a remarkable correspondence with the facts furnished in my collection of cases. To illustrate more perfectly the coincidence between the statistics from these two sources, I have divided the observations of marriages of consanguinity furnished by the Ohio report into classes, corresponding as nearly as possible with the classification on my own tables; thus—

Classe	. Degree of rela	tionshi	p.				Number of bservations.
А.	Marriage or illicit intercourse be	tween	brother	and	sister,	or	
	parent and child						3
B.	Marriage between uncle and niece						1
C & D.	C and D were not noted in their so	hedul	es.				
E.	Marriage between first cousins .			10.00			47
	Marriage between second cousins						28
	Marriage between third cousins						4
	Irregular cases, or marriage between			thout	specific	a-	
	tion as to degree				•	•	72
	Total						155

Next, this table comprises the results of two hundred marriages

from the Ohio report, between the parties to which no ties of consanguinity were supposed to exist, yet each of which had given birth to deaf and dumb, blind, idiotic, or insane issue. These were taken—the first hundred from the commencing pages, and the last hundred from the concluding pages of the report, without other selection than that the parents should be reported as not related (and from those counties which had returned marriages of cousins), and that the defects of offspring should be congenital. The parties to these marriages were undoubtedly the subjects of some influences tending to the depravation of their issue, and yet a reference to the tables will show that the percentage of defects to their offspring is not so great as among the children of the consanguinity marriages. Lastly, the sum of results of marriage upon the first table of comparative results, is brought to this second table, and the percentage of defects and deaths carefully computed.

With a view to ascertain the character and degree of influence exerted upon the vital statistics of marriage by the great diversity of climate of the United States, I have arranged the observations comprised in the three most comprehensive letters, representing classes of consanguinity marriages, viz., C, E, and F, in "climatic divisions," or belts, bounded by the degrees of latitude between which they were obtained. Thus all observations, in each of these classes from between the 32d and 36th degrees of latitude are embraced in the first division, under the caption of "South;" those obtained from the 36th to the 40th parallel, constitute the second, or "Middle" division; those from the 40th to 44th parallels, the third and "North" division. This table would have been of some practical utility, could I have been successful in obtaining a sufficient number of observations of vital statistics of marriage, where no kinship existed, to have admitted of a similar division and comparison of results; now, however, it has nothing to recommend it, except that it has been prepared with much labor, and is free from errors.

The mortuary statistics of the offspring of marriages of consanguinity, and of the offspring of marriage between non-related parties, are interesting subjects of comparison. I am compelled, from lack of time and space, to refer those who seek for precision in regard to the causes of death among the children of kindred parents, to the large tables; here I can only give an abstract containing all the causes of death, so far as known, among the children of nonrelated parents, and some of the chief causes of mortality to the offspring of marriages of consanguinity.

Of the former, one hundred and thirty-four died young; sixtynine of this number have the causes of death assigned—the remainder unknown. Eight hundred and eighty-three of the children of consanguinity marriages died young; the cause of death is given in four hundred and eighty-six of this number—the remainder unknown.

Total .

I have made great effort to ascertain the probable proportion of the deaf and dumb, blind, idiotic, and insane, in our asylums, who are the descendants of blood intermarriages. This effort has not been successful, from the difficulty principals of such institutions

. 475

2

find in gaining the requisite facts. Parents are frequently sensitive on this point; and it is a delicate matter for principals to attempt investigations which the friends of the beneficiaries supposed to be unauthorized by the regulations of their various institutions.

I feel satisfied, however, that my researches give me authority to assume that over ten per cent. of the deaf and dumb, and over five per cent. of the blind, and near fifteen per cent. of the idiotic, in our State institutions for subjects of those defects, and throughout the country at large, are the offspring of kindred parents, or of parents themselves the descendants of blood intermarriage.

The principal of an institution for deaf-mutes communicates the following statement:-

"Of one hundred and eighty-three cases of congenital deaf-dumbness, twenty-eight were known to be the offspring of blood relations. My inquiries have not extended to more than half of the hundred and eighty-three. My impression is that of those born deaf and dumb, at least one-fourth are the children of cousins. It is very difficult, as you are aware, to get reliable information on this subject. * * * One man in this State denied that he had married a blood relation; I have since learned that he and his wife are first cousins, and have six children, three of whom are deaf and dumb."

The principal of another deaf and dumb asylum—a close observer, and one who has long occupied the position—writes as follows: "Since I wrote to you, a day or so ago, I have remembered that we recently received four sisters, the children of parents who were own cousins. They were all the children they had, I believe. The further I extend my inquiries, the greater the number of deaf mutes I find who are the children of near relatives; I have no doubt that at least ten per cent. are the offspring of persons so related."

From another institution for deaf mutes, the following tabular statement was received :--

Whole number of pupils.	Males.	Females.	Scrofulous.	Consumptive.	Idiotic.	Known to be offspring of kindred parents.	Parents not related.	Doubtful as to relationship of parents.
139	71	68	67	7	10	21	32	58

This estimate shows over fifteen per cent. of the whole number of pupils to have been offspring of consanguinity marriages.

With regard to the frequency of idiocy as a result of intermarriage of relatives, and the probable proportion of those laboring under this defect who are descendants of such unions, I have received the following statement from a highly respectable physician of Connecticut:—

"Two years ago circulars were issued to every physician in Connecticut, to clergymen, to town-clerks, and to the first selectman of every town in the State, containing minute questions relative to the probable causes of the cases of idiocy reported. The question, Whether consanguinity was a cause or not, was answered in 160 cases, and assigned as a cause in 20 of them. An adequate cause of idiocy was reported in 310 cases, but the question concerning consanguinity was answered in only 160 cases. Taking it for granted that every instance of relationship of parents, in the 310 cases, was reported, we find that consanguinity of parentage is a cause of $\frac{1}{15}$ th of the idiocy in Connecticut. If we follow the idea that no attention whatever was paid to the question, except in the 160 cases, then we find it a cause of $\frac{1}{5}$ th—taking the mean, it is the cause of $\frac{3}{15}$ ths of all the idiocy in the State."

In addition to these facts, and others which I have gained by correspondence with gentlemen who have given close attention to these points, the following perfectly legitimate process of computation confirms me in the opinion that the previously announced estimates are very nearly correct. The classes C, D, E, F, G., of the consanguinity tables, comprise 787 marriages of cousins, 246 of which have given issue to deaf and dumb, blind, idiotic, or insane children.

Admitting the same ratio to prevail, the Ohio report, which contains 151 marriages of cousins, followed by deaf and dumb, blind, idiotic, or insane offspring, would indicate the existence of 332 other marriages of cousins in the same population, not followed by such defects. The counties which furnish this 151 marriages, as above, and which are supposed to comprise in their limits 332 unreported marriages, making a total of 483, contained in 1850 a population of 1,528,238. If the same ratio be supposed to exist throughout the Union, there would be found to the twenty millions of white in habitants, six thousand three hundred and twenty-one marriages of cousins, giving birth to 3,909 deaf and dumb, blind, idiotic, and insane children, distributed as follows:—

Deaf and d	umb				1,116
Blind .					648
Idiotic .					1,854
Insane .					299

Then, if the figures of the last United States Census still applied to our population, there would now be found in the Union :---

9,136 deaf and dumb, of whom, 1,116, or 12.8 per cent., are children of cousins.
7,978 blind, of whom 648, or 8.1 per cent., are children of cousins.
14,257 idiotic, of whom 1,844, or 12.93 per cent., are children of cousins.
14,972 insane, of whom 299, or 1.9 per cent., are children of cousins.¹

I invite the attention of gentlemen of this Association to this calculation of probabilities either to confute or confirm it by any facts in their possession.

A very cursory examination of the tables of my report will suffice to show that *pari-passu* with the increment of the same blood the sum of defects of offspring is likewise increased. Classes D and G present exceptions to this rule. As it regards D, the supposed reason for this deviation has been already stated, namely: that its mortality list is so large; while class G presents so few observations as to satisfy us that they attracted notice solely because of their unfavorable results.

But notwithstanding these two exceptions, the increase and diminution of calamities to offspring correspond so closely with the increase and decrease of relationship, as to fix the conviction firmly in the mind of the reporter, that multiplication of the same blood by in-and-in marrying does incontestably lead in the aggregate to the physical and mental depravation of the offspring. And if we admit the above statement, which the observations here presented abundantly prove—that defects of offspring multiply precisely as we multiply the same blood—and to this admission join the fact that all those contingent circumstances of parental health, habits, proclivities of constitution, sexual incongruity, &c., are as liable to affect one class as another, we cannot rationally assign these effects to any other influence than that of consanguinity.

I am constrained to express my sincere regret that this report must be offered in a crude, unfinished state. The study of this interesting subject is, if thoroughly investigated, an elaborate science,

16

¹ The reader will perceive that since these estimates were made, some cases have been added to the consanguinity tables; also, that in the computations small fractions have been occasionally left off, or slightly altered when appearing in the quotient.

and the reporter labored under erroneous impressions when he supposed that the important facts bearing upon it could be collected, arranged, and properly elucidated in the short period of a year. I cannot prosecute these researches any further, having already devoted more time to them than it was proper to spare from the more practical and important branches of the profession. It was impossible to incorporate more than a mere tithe of the large' amount of interesting and valuable information in my possession; the remainder I will carefully preserve, and hold subject to the call (under certain limitations) of any physiologist' whose tastes, attainments and leisure, qualify him for the task of completely elaborating the subject.

The thanks of the Association are eminently due to those physicians whose love of science induced them to assume the disagreeable office of eliciting and supplying the information comprised in these tables. Their contributions were furnished under a pledge that no individualization of contributors was to enter my report; consequently, no other motive could have actuated them than an earnest interest in science, and in all questions touching the wellbeing of their species. Personally, I offer them my grateful acknowledgments for their co-operation. I trust they will concur with me in the opinion that the chief merit of my report is, that the facts they have furnished me have been fairly and honestly transferred to its pages.

¹ Should Dr. Bartlett recover his health, and desire to prosecute his work, his claims are entitled to first consideration.

TABLE I.—Comparative Results of Marriages between parties not pre-

Note.—Thirty-one marriages of parties not known to be related or descendants of relations, occurring in and around a small village in Kentucky, produced two hundred and seven children, ninety-eight males, one hundred and nine females. The number dying before maturity not stated. Two of these unions were followed each by thirteen children—the greatest number born to any one marriage; three
