ARMY MEDICAL MUSEUM

WASHINGTON, D. C.

January 10, 1901

GENERAL: In compliance to your order of December 15, 1899, I have the honor to submit the following report of the condition of the Army Medical Museum on January 1, 1901.

The Museum was established in pursuance of your order in 1862. It has since that time contained specimens of anatomical and pathological interest, and their number is being daily augmented.

The collection at present consists of skeletons, bones and teeth, and objects of anatomical and pathological interest, and is arranged in six main divisions, and subdivided into smaller divisions. The first division, which is the most important, contains the skeletons of the human race, and is arranged in two main groups, the first group containing the skeletons of the human race, and the second group containing the skeletons of the human race, and is arranged in two main groups, the first group containing the skeletons of the human race, and the second group containing the skeletons of the human race.

The second division contains the skeletons of the human race, and is arranged in two main groups, the first group containing the skeletons of the human race, and the second group containing the skeletons of the human race.

The third division contains the skeletons of the human race, and is arranged in two main groups, the first group containing the skeletons of the human race, and the second group containing the skeletons of the human race.

The fourth division contains the skeletons of the human race, and is arranged in two main groups, the first group containing the skeletons of the human race, and the second group containing the skeletons of the human race.

The fifth division contains the skeletons of the human race, and is arranged in two main groups, the first group containing the skeletons of the human race, and the second group containing the skeletons of the human race.

The sixth division contains the skeletons of the human race, and is arranged in two main groups, the first group containing the skeletons of the human race, and the second group containing the skeletons of the human race.

The seventh division contains the skeletons of the human race, and is arranged in two main groups, the first group containing the skeletons of the human race, and the second group containing the skeletons of the human race.

ARMY MEDICAL MUSEUM,

SURGEON GENERAL'S OFFICE,

WASHINGTON, D. C., *January 10, 1863.*

GENERAL: In obedience to your order of December 15, 1862, I have the honor to submit the following report of the condition of the Army Medical Museum on January 1, 1863:

This Museum was established, in pursuance of your orders, in the month of August last. All of the contained specimens have been collected since that time, and their number is being daily augmented.

The collection at present consists of thirteen hundred and forty-nine objects. Of these, nine hundred and eighty-five are surgical specimens, one hundred and six are medical, and one hundred and thirty-three are missiles, which, for the most part, have been extracted from the body. This latter class includes round and conical bullets, shot, grape, canister, fragments of shell, arrows, arrow-heads, etc. Not the least interesting portion of the cabinet is a series of projectiles for small arms, field and heavy guns; and also a complete set of the bayonets now in use in our own and foreign services. For this valuable collection, prepared at the Washington arsenal, under the supervision of Lieut. Col. Geo. D. Ramsay, U. S. A., the Museum is indebted to the Ordnance Department of the Army.

Every object in the Museum has been appropriately and permanently mounted—the dried preparations on stands, and the wet ones in glass anatomical jars, of the most approved patterns, and constructed for the purpose. Every specimen bears a label, on which is inscribed its Catalogue number and the name and rank of the medical officer from whom received.

In the accompanying Catalogue—prepared by Assistant Surgeon William Moss, U. S. V., Assistant Curator of the collection—the Museum number of every object is given, and its character is briefly described. The name of the medical officer contributing it will be found on the same line in a separate column.

As the value of all pathological preparations depends, to a great extent, upon the completeness of their history, strenuous efforts have been made to procure an accurate surgical and medical account of every case from which a specimen has been taken. I regret to state that, in many instances, the desired success has not been obtained. In order that this evil may, as far as possible, be remedied, the number of every specimen in the Catalogue for which a sufficient history has been received has been marked with an asterisk. For all others, neither history nor description have as yet been furnished. It is hoped that medical officers, recognizing the objects contributed by them, will exert themselves at once to remedy this deficiency.

In presenting to you, General, this catalogue, you will please remember that it is offered simply as a numerical list of the objects in the Army Medical Museum. No attempt has as yet been made to classify the various injuries,

nor has any description of the preparations been entered upon. Such a work must be deferred for the future. It will then be found to demand volumes. The labor of the present hour is simply to collect and to preserve—the study must be made hereafter.

I have the honor to be,

Very respectfully, your obedient servant,

JOHN H. BRINTON,

Surgeon, U. S. V., and Curator Army Medical Museum.

Brigadier General WILLIAM A. HAMMOND,

Surgeon General, U. S. A.

SUGGESTIONS
TO THE
MEDICAL OFFICERS OF THE ARMY,
AS TO THE
PREPARATION AND FORWARDING OF SPECIMENS TO
THE ARMY MEDICAL MUSEUM, SURGEON GEN-
ERAL'S OFFICE, WASHINGTON, D. C.

The objects which the Surgeon General desires to collect for the Museum may be thus enumerated:

1. *Specimens illustrative of surgical injuries and affections; such as—*

- Fractures, compound and simple—fractures of the cranium.
- Excised portions of bone.
- Diseased bones and joints.
- Exfoliations, especially those occurring in *stumps*.
- Specimens illustrative of the structure of stumps, (obliterated arteries, bulbous nerves, rounded bones, etc.)
- Integumental wounds of entrance and of exit, from both the round and conoidal ball.
- Wounds of vessels and nerves.
- Vessels obtained subsequent to ligation and to secondary hemorrhage.
- Wounded viscera.
- Photographic representations of extraordinary injuries, portraying the results of injuries, operations, or peculiar amputations.
- Models of novel surgical appliances, and photographic views of new plans of dressing.

2. *Specimens of Disease.*

Specimens illustrating morbid processes of every kind; especial consideration being paid, however, to the degree in which the morbid condition will probably be demonstrable in the preparation when preserved. All unnecessary or extraneous appendages to be dissected away. In addition to specimens of diseased organs, malformations, parasites, concretions, and calculi are desirable. Microscopical specimens should, for uniformity sake, be mounted on slips of glass 3 inches by 1 inch.

It is not intended to impose on medical officers the labor of dissecting and preparing the specimens they may contribute to the Museum. This will be done under the superintendence of the Curator.

In forwarding such pathological objects as compound fractures, bony specimens, and wet preparations generally, obtained after amputation, operation, or cadaveric examination, all unnecessary soft parts should first be roughly removed. Every specimen should then be wrapped separately in a cloth, so as to preserve all spiculæ and fragments. A small block of wood should be attached, with the number of the specimen and the name of the medical officer sending it inscribed, in lead pencil; or a strip of sheet-lead, properly marked with the point of an awl, may be employed for this purpose. In either case, the inscription will be uninjured by the contact of fluids. The preparation should be then immersed in diluted alcohol or whiskey, contained in a keg or small cask. When a sufficient number of objects shall have accumulated, the cask should be forwarded directly to the Surgeon General's Office. The expenses of expressage will be defrayed in Washington. The receipt of the keg or package will be duly acknowledged by the Curator of the Museum.

In every instance, a corresponding list or history of the cases should, *at the same time*, be forwarded to this office by mail. In this list the number and nature of every specimen should be clearly specified, and, when possible, its history should be given. The numbers attached to the specimens themselves, and the numbers in the list forwarded, should always correspond, and should be accompanied by the name and rank of the medical officer by whom sent. Every specimen will be duly credited in the Catalogue to the medical officer contributing it.

Much confusion has hitherto arisen from the fact that considerable periods of time have often been allowed to elapse between the sending of the specimen and the forwarding of its history. In many cases no history whatever has been received. It is hoped that it is not yet too late to remedy this deficiency.

If any errors exist in the present Catalogue, they will be corrected on due notification being sent to the Curator.

The following medical officers have been authorized by the Surgeon General to collect and forward specimens to the Museum from the cities and localities in which they are respectively stationed:

- Surgeon Lavington Quick, U. S. V., Baltimore.
- Acting Assistant Surgeon Edward Hartshorne, U. S. A., Philadelphia.
- Acting Assistant Surgeon George Shradly, U. S. A., New York.
- Surgeon M. Goldsmith, U. S. V., Louisville.
- Surgeon J. F. Carpenter, U. S. V., Cincinnati.
- Assistant Surgeon F. L. Town, U. S. A., Nashville.
- Surgeon John S. Hodgen, U. S. V., St. Louis.
- Surgeon H. S. Hewit, U. S. V., Army of the Mississippi.
