L.6.27.

sumptâ, nutrimento et potu egemus; cibum itaque potumque appetimus, sumimus, concoquimus: concoctus uterque per totum corpus diffunditur, qua opus est apponitur; quod superest utriusque ejicitur. Putrescentes quoque vel aliter corrupti humores, a reliquis secreti, idoneâ viâ e corpore excernuntur. Plurimi denique a massâ generali succi, diversi ab illâ et diversi inter se, variisque intra corpus usibus accommodati, assiduè secernuntur.

(nos) egemus nutrimento et potû; itaque (nos) appetimus, sumimus, concoquimus cibum que potum; uterque (i. e. cibus et potus) concoctus diffunditur per totum corpus, (et) apponitur quà opus est; quod superest utriusque (potûs vel cibi) ejicitur. Quoque humores putrescentes vel aliter corrupti, secreti a reliquis excernuntur a corpore viá idoneá. Denique plurimi succi diversi ab illá (i. e. massa generali) et diversi inter se, que accommodati variis usibus intra corpus, secernuntur assiduè a massá generali.

9. Hæ vocantur functiones naturales, ad vitam quidem necessariæ, sed quæ paulisper facilè, et sine periculo suspendi possunt:

9. *Hæ functiones vocantur naturales, quidèm necessariæ ad vitam, sed quæ possunt suspendi paulisper facilè et sine periculo; sci-*

humors being removed, we stand in need of nourishment and drink; therefore we seek after, take and digest food and drink; each of them when digested is diffused through the whole body, and deposited where it is required; what remains of each is thrown out. Also humors disposed to putrify or otherwise corrupt secreted by other humours, are excreted from the body by a proper channel. Lastly, many juices differing from the general mass, and differing amongst themselves, and most fitted for various uses within the body, are constantly secreted from the general mass.

9. Those functions are called natural, necessary indeed to life, but which may be suspended for a short time, easily and without danger, such are digestion, secretion and excretion.

concoctio, scilicet, secretio et excretio.

10. Vitalibus, igitur, et naturalibus functionibus homo vivit, viget, reficitur, purgatur, ad animales exercendas idoneus evadit: nobile opus, nec nisi Uni excogitandum; certè omne humanum ingenium tantum excedens, ut mente quamvis sagace, toties exploratum, non capiatur; neque singularum, partium functiones, neque universarum nexus, neque fons et origo virium quibus machina movetur, hactenùs detegantur.

11. Nulla enim præter animalem machina proprio motu cietur; nulla alia, pe-

licet, concoctio, secretio et excretio.

10. *Igitur homo vivit, viget, reficitur, purgatur vitalibus et naturalibus functionibus (et ille) evadit idoneus ad animales (functiones) exercendas:*[4] *opus nobile, nec excogitandum*[5] *nisi Uni; certè (illud i. e. nobile opus) tantum excedens omne humanum ingenium, ut (quamvis) toties exploratum non capiatur mente quamvis sagace; neque functiones singularum partium, neque nexus universarum (partium) neque fons et origo virium, quibus (viribus) machina movetur, hactenùs detegantur.*

11. *Enim nulla machina præter (machinam) animalem cietur proprio motu nulla*

10. Therefore man lives, thrives, is replenished and cleansed, by the vital and natural functions, and becomes fitted for exercising the animal functions: a noble work not to have been contemplated but by the Supreme Being alone; so much exceeding human understanding, that (although) explored so many times, it cannot be comprehended by minds the most sagacious; nor can the functions of individual parts, nor the connection of the parts collectively, nor can the source or origin of the powers by which the machine is moved up to the present time be discovered.

11. For there is no machine besides the animal frame which is propelled by its own inherent motion; none other

---

4 & 5. *Gerunds* are sometimes used and construed as nouns adjective.

ricula sibimet imminentia suâ sponte summovet, nec res quibus eget sibi ministrat.

12. Primo statim aspectu, talis machina, nisi fortè causâ aliquâ externâ corrupta vel læsà, in omne ævum durabilis videtur: et quidem solâ experientiâ contrarium docemur. Homo enim, quamvis sanus et robustus et vegetus, labentibus annis, et ipse dilabitur, senescit, moritur, in pristina elementa solvitur, aliis animantibus pabulum futurus.

13. Hæc autem Naturæ lex, hoc consilium; ut singuli pereant homines, gens humana floreat. Hinc sexus,

alia (machina) suâ sponte summovet pericula imminentia sibimet, nec ministrat sibi res, quibus (rebus) eget.[6]

12. *Statim primo aspectû talis machina videtur (esse) durabilis in omne ævum nisi (sit) forte corrupta vel læsa aliquâ causâ externâ; et quidem (nos) docemur*[7] *contrarium solâ experientiâ. Enim homo, quamvis sanus et robustus et vegetus, annis labentibus et ipse dilabitur, senescit, moritur, (et) solvitur in pristina elementa, futurus pabulum aliis animantibus.*

13. *Autem hæc (est) lex Naturæ, hoc (est) consilium (naturæ) ut singuli homines pereant, gens humana floreat. Hinc sexus*

Digitized by the Internet Archive in 2016

removes spontaneously dangers which are impending over it, or furnishes to itself necessary supplies.

12. At first sight such a machine appears to be lasting to every age, unless it be by chance destroyed or injured by some external agent; but indeed we are taught the contrary by experience alone, for man, though healthy, robust, and lively, as the years glide on, sinks down himself, becomes old and dies, and is resolved into his pristine elements, about to become food for other animals.

13. Such is the law of nature, such is the design; that individuals may perish whilst the human race thrives.

---

6. Verbs of abounding, or the contrary, such as to stand in need, are coupled with an ablative case.

7. Verbs of thinking, knowing, &c. govern the accusative and infinitive.

https://archive.org/details/b24925354

hinc generatio et proles, et quicquid suavis, quicquid amari, alma Venus habet.

14. Sed ipse terrarum et quæ eas incolunt animalium dominus, parvus, debilis, fatuus, omnium rerum inops, nascitur: solâ parentum curâ diu conservatur, fovetur, alitur: paulatim crescit, pubescit, adolescit, sapit: forma et animi et corporis viribus parentes æquat; eadem gaudet exercere munera; tandem, ingravescentibus annis, communem sortem subiturus.

15. Hæc omnia universo generi communia; nec desunt multa singulis hominibus propria. Non secus

(est), hinc generatio et proles (sunt), et quicquid alma Venus habet suavis quicquid (habet) amari.

14. *Sed (homo) ipse dominus terrarum et animalium quæ incolunt eas, nascitur parvus, debilis, fatuus, inops omnium rerum; (ille i. e. homo) diu conservatur, fovetur, alitur solá curá parentum (ille) paulatim crescit, pubescit, adolescit, sapit; (ille) æquat parentes et formá animi et viribus corporis, (ille) gaudet exercere eadem munera; tandem annis ingravescentibus (ille) subiturus (est) communem sortem.*

15. *Hæc omnia (sunt) communia universo generi; nec multa propria singulis hominibus desunt. Enim*

Hence sex, generation and offspring, and the sweets and bitters which fond Venus imparts.

14. But man himself, lord of the earth and of the animals which inhabit it, is born diminutive, weak in body, feeble in mind, in want of all things; he is for a long time preserved, cherished and nourished by the sole care of his parents; by degrees he grows up to youth, to manhood, and old age, and becomes wise; and equals his parents both in the frame of his body and strength of his mind; he enjoys the exercise of the same functions, and at last, as years weigh upon him, he is about to undergo the common lot of all.

15. These qualities are common to the whole human race; nor are there wanting many things which are pecu-

enim ac vultus, corporis constitutiones variant. Hæ quidem varietates nullo modo exequendæ sunt, tamen ad certa capita non ineptè referri solent, quæ temperamenta κατ' ἐξοχήν dicuntur; quorum scientia medico haud parùm proderit.

16. Hujusmodi varietates non corporis modo, verum et animi quoque, plerumque congenitæ, nonnunquam hæreditariæ, observantur. Hoc modo parentes sæpè in prole reviviscunt; certè parentibus liberi similes sunt, non vultum modò et corporis formam, sed animi indolem, et virtutes, et vitia. —Imperiosa gens Claudia diu Romæ floruit, impigra,

constitutiones corporis variant non secus ac vultus. Quidem hæ varietates nullo modo sunt exequende, tamen solent referri ad certa capita haud ineptè, (illa) quæ dicuntur temperamenta κατ' ἐξοχήν; scientia quorum (temperamentorum) proderit medico haud parùm.

16. *Varietates hujusmodi non modo corporis, verum et animi quoque observantur, plerumque congenitæ, nonnunquam hæreditariæ. Hoc modo parentes sæpe reviviscunt in prole; certè liberi sunt similes parentibus non modo (secundum) vultum[8] et formam corporis, sed (secundum) indolem animi et virtutes et vitia. Imperiosa gens Claudia, impigra*

liar to individuals. For bodily constitutions vary no less than the countenance. These varieties are by no means to be defined, but are wont to be referred to certain heads, not without propriety, and are called temperaments for the sake of distinction; a knowledge of which will be of no trifling use to the medical man.

16. Varieties of this kind are observed not only in the body but in the mind also, they are frequently congenital, sometimes hereditary. In this manner, parents frequently revive in their descendants, not only as to the countenance and frame of the body, but in the disposition, virtues and vices. The imperious Claudian family lived for a long time

8. The accusative case is sometimes adjoined to adjectives and participles where the preposition *secundum* seems to be understood.

ferox, superba; eadem illachrymabilem Tiberium, tristissimum tyrannum, produxit; tandem in immanem Caligulam, et Claudium, et Agrippinam, ipsumque demùm Neronem, post sexcentos annos, desitura.

17. Quin et ab aliis causis, firmâ adhuc valetudine, corpus humanum multas et graves subit mutationes; et imprimis a vitæ genere et victu quo utimur, ab ipso sub quo degimus cœlo, et ab immensâ vi consuetudinis. Hæc quoque medicum oportet novisse.

18. Secunda, igitur, valetudo nullis est definienda verbis, neque profectò facilè

ferox, superba diù floruit Romæ; eadem (gens) produxit illachrymabilem Tiberium, tristissimum tyrannum; tandem desitura in immanem Caligulam et Claudium, et Agrippinam, que demùm ipsum Neronem post sexcentos annos.

17. *Quin corpus humanum subit multas et graves mutationes et ab aliis causis, valetudine[9] adhuc firmá, et imprimis a genere vitæ et victu quo utimur ab ipso cœlo sub quo (nos) degimus et ab immensá vi consuetu dinis. Oportet quoque medicum novisse hæc.*

18. *Igitur secunda voletudo definienda est nullis verbis, neque profectò facilè*

at Rome, restless, ferocious and haughty. The same family produced the tearless Tiberius, a most miserable tyrant, at length about to close its existence by the outrageous Caligula, Claudius, Agrippina, and lastly Nero himself, after a period of six hundred years.

17. Moreover the human body undergoes many and important changes also from other causes, the health being still unimpaired, in the first place from the mode of life and kind of food we make use of, from the atmosphere itself in which we exist, and from the unbounded sway of habit. It is necessary that the practitioner should be acquainted with these things.

18. Therefore good health cannot be defined, nor indeed

9. Nouns taken in an absolute sense, where no preposition is understood, and of which the sense is rendered evident by the word being, are put in the ablative case.

describenda ; quippè quam Natura ipsa, non sine sapiente consilio, variam fecerit. Scire tamen juvabit, perfectissimam florentis ætatis homini contingere sanitatem, cui mens sana, optimum Dei donum, data est; qualis non modò ad solita vitæ munera sufficiat, sed variis quoque casibus et studiis et negotiis facilè se accommodet ; quæ probè sentiens, et perspicax, et tenax, et percipit, et intelligit, et retinet, ut decet; quæ firma et serena, sive gravior fuerit sive hilarior, suique semper compos, neque suis inordinatis motibus neque externis casibus ludibrio est; sed propriis affec-

describenda (est); quippe[10] *quam natura ipsa fecerit variam non sine sapiente consilio. Tamen juvabit scire, sanitatem perfectissiman ætatis florentis contingere homini, cui mens sana optimum donum Dei, data est; qualis non modò sufficiat ad solita munera vitæ, sed (qualis) accommodet se quoque facilè casibus, et studiis et negotiis; quæ (mens sana) probè sentiens, et perspicax, et tenax, et percipit, et intelligit, et recipit, et retinet, ut decet; quæ (est) firma et serena sive fuerit gravior sive hilarior, que semper compos sui, (quæ) neque est ludibrio suis inordinatis motibus ne-*

easily be described by any terms ; inasmuch as nature has made it so varied, though not without some wise intention. However, it will be useful to know that the most perfect health of the flower of age, falls to the lot of him, who is possessed of sound intellect, the noblest gift of God, such as may not only suffice for the purposes of life, but such as can also easily accommodate itself to the accidents, and studies and affairs, which a sound mind correctly feeling, and discerning, and tenacious, perceives, understands, receives and retains as it should do ; such as is firm and calm, whether it be more oppressed or lively, and is always master of itself, and which becomes a laughing stock neither from its unmeasured emotions nor external accidents ; such as governs, not obeys its own affections,

10. *Quippe quam* come together, meaning, inasmuch as.

tibus imperat, non paret, rebusque secundis modestè fruitur, adversas fortitèr tolerat, et gravioribus, siqui acciderint, casibus, excitatur, non convellitur. Hæc, quidem, non modò sunt signa et indicia sanæ mentis, sed sani corporis quoque; et profectò ad hujus sanitatem haud parùm conferunt: scilicet donec in compage suâ corporeâ inclusa est, mens et corpus multùm afficit et ab eo afficitur vicissim.

que externis casibus; sed (quæ) imperat[11] *non paret*[11] *propriis affectibus, que fruitur modestè secundis rebus, tolerat fortiter adversas (res) et excitatur non convellitur gravioribus casibus siqui acciderint. Hæc quidem sunt non modò signa et indicia sanæ mentis, sed quoque sani corporis et profecto conferunt haud parum ad sanitatem hujus (i. e. sani corporis); scilicet mens, donec inclusa est in compage suá corporeá et afficit corpus multum, et vicissim afficitur ab eo.*

19. Quod ad hoc verò attinet, validissimum et ferè sanissimum est corpus justæ magnitudinis et benè formatum, neque procerum

19. *Verò quod attinet ad hoc (i. e. corpus), corpus ferè est validissimum et sanissimum justæ*[12] *magnitudinis*[12] *et benè formatum, neque*

which modestly enjoys prosperity, and bears adversity with fortitude, and is excited not distracted by the severer accidents if any fall to its lot. These qualities are not only the characters and evidences of a sound mind, but also of a sound body, to the health of which they afford no little support, for as long as the mind is confined in its corporeal frame, it both greatly affects the body and is in turn affected by it.

19. But as to the body it is commonly most powerful and healthy, when of average size and well formed, not too tall, nor too short, not thin nor oppressed with much fat;

It is finally the province of a healthy man to desire sexual intercourse, to be competent to it, and to procreate offspring. But there is a certain kind of health peculiar and belonging to women, inasmuch as they have certain parts which perform functions differing considerably from those bestowed upon men. Therefore, amongst their characters of health, it is necessary to observe a regular and free discharge of the menses, neither in excess nor too scanty, (also) a favorable state of pregnancy, easy labour, and a plentiful secretion of good milk, at the season in which it is required. Moreover, it is a character of a healthy and strong body of either sex, that it has not only performed its functions well,

14. *Sum*, implying the duty of a thing, requires the genitive case

tis secretionem.—Præterea, sani et validi corporis utriusque sexus est, non modò suis, nihil impediente, probè functum esse muneribus, sed, tenacis prosperæ suæ valetudinis, multis, cœli, victûs, vitæ generis, varietatibus semet accommodasse, et sic plurimas morborum causas impunè tolerasse, quales minùs firmum aut sanum corpus vel prorsùs fregissent, vel saltèm in grave valetudinis discrimen perduxissent. — Postremò, sanitas eidem homini quamvis semper sanissimo non prorsùs eadem est. Plurimæ enim et gravissimæ varietates corporis ab ætate omninò pendent: nec quisquam hominum ab aliis ejusdem ætatis tantùm dif-

quo tempore decet.—Præterea (signum) est sani et validi corporis utriusque sexus non modo probè functum esse suis muneribus, nihil impediente sed (signum est) suæ tenacis prosperæ valetudinis illud (i. e. corpus) accommodasse semet multis varietatibus, cœli, victûs, generis vitæ, et sic tolerasse impunè plurimas causas morborum, quales (causæ) vel prorsùs fregissent corpus minùs firmum vel sanum vel saltem perduxissent in grave discrimen valetudinis.—Postremò sanitas non est prorsus eadem eidem homini quamvis sanissimo. Enim plurimæ et gravissimæ varietates corporis pendent omninò ab ætate; nec quisquam hominum tantùm differt ab aliis

when nothing is impeding it, but it is a (mark) of its tenacious good health, that it has accommodated itself to the different varieties of the atmosphere, food, and mode of life, and has thus born with impunity such causes of diseases, as would have entirely broken down a body less firm or healthy, or would at least have brought it into great danger. Lastly, health is not entirely uniform in the same person, although always very healthy. For many, and most important changes of the body, depend entirely upon the age; nor does any man differ from other individuals so much, as he differs from himself at the different periods of his life, whether we look to his figure, the powers of the body, the energies of the mind, or lastly, we inquire into

fert, quantùm variis vitæ temporibus a se ipso discrepat; sive formam spectemus, sive corporis vires, sive animi dotes, sive demùm intima corporis penetralia muneraque ab iis pendentia perscrutemur. Quo fit, ut valetudo quam perfectissima, quæ corpus parvum et tenerum ad suum vigorem et perfectionem primò perduxit, et diu in hoc statu sustinuit, idem paulatim minuat, et tandem ad finem perducat; nam

(hominibus) ejusdem ætatis, quantùm discrepat a se ipso (in) variis temporibus vitæ; sive (nos) spectemus formam, sive (spectemus) vires corporis, sive dotes animi, sive demùm perscrutemur intima penetralia corporis que munera pendentia ab iis. Quo fit, ut valetudo quam perfectissima quæ primò perduxit corpus parvum et tenerum ad suum vigorem et perfectionem, et sustinuit (illud) diù in hoc statu, idem minuat paulatim et perducat tandem ad finem; nam

"Nascentes morimur, finisque ab origine pendet."

"Morimur nascentes, que finis pendet ab origine."

20. Harum rerum, quæ omnes ad sanum corpus pertinent, cognitio, Physiologia corporis humani vocatur.

20. *Cognitio, harum rerum, quæ omnes (res) pertinent ad sanum corpus, vocatur Physiologia humani corporis.*

21. Verùm enimverò, homo, non modò certo, se-

21. *Verùm enimverò, homo non modo nascitur, cres-*

the inward recesses of the body, and the functions depending upon them. Hence it is, that the most perfect health, which first conducted the small and tender body to its vigor and perfection, and long supported it in this state, by degrees reduces it, and at last conducts it to its termination, for scarcely born we die, and the end is connected with the beginning.

20. The knowledge of these things, all of which have reference to the healthy body, is called, the Physiology of the human body.

21. But indeed, man is not only born, grows up, is

cundum Naturæ leges, tempore nascitur, crescit, viget, senescit, moritur; sed variis quòque, propè innumeris, morbis obnoxius fit, qui formam quamvis pulchram corrumpant, vires frangant, singulas corporis actiones impediant, corpus sæpè gravibus doloribus excrucient, neque ipsi pepercerint "*Divinæ particulæ auræ.*"

cit, viget, senescit, (et) moritur certo tempore secundum leges Naturæ; sed (ille) quoque fit obnoxius variis morbis prope innumeris qui corrumpant formam quamvis pulchram, (qui) frangant vires, (qui) impediant singulas actiones corporis (qui) sæpe excrucient corpus gravibus doloribus neque pepercerint[15] *ipsi* "particulæ "Divinæ auræ."

22. Horum alii infantem, ferè nascentem, adoriuntur, nec rarò extinguunt. Alii juvenem viribus fidentem potiùs invadunt, nunc citâ morte rapiunt, nunc lentâ tabe consumunt; dum alii labentis ætatis semitam màgis obsident, quâ corpus, debile, exhaustum, prælio

22. *Alii horum (morborum) adoriuntur infantem ferè nascentem, nec rarò extinguunt (illum). Alii potiùs invadunt juvenem fidentem (suis) viribus, nunc rapiunt (illum) citâ morte, nunc consumunt (illum) lentâ tabe; dum alii (morbi) magis obsident semitam æta-*

vigorous (then) becomes old and dies at a certain time, according to the laws of Nature; but he is also exposed to various and nearly numberless diseases, which destroy his form, though so beautiful, which break down its strength, impede its separate actions, and often torment the body with excruciating pains, nor will spare the mind itself, "that particle of Divine essence."

22. Some of these diseases assault the infant at birth, nor unfrequently destroy him; others rather attack the youth, confident of his strength; at one time they snatch him away by sudden death, at another time they destroy him by slow consumption; whilst other diseases rather beset the path of declining age, when they more easily weigh down the body,

24. *Morbus adest, quum corpus tantùm deflexerit a statu sano, ut solitæ actiones impediantur vel prorsùs, vel perficiantur ægrè aut cum*

weak, exhausted, and unequal to the contest; or if they have not immediately overcome him, they waste him away by long recovery, until at last his life, quite helpless and wretched, is exchanged for a hoped-for death.

23. It is necessary that the causes of so many, so various and severe diseases should be numerous; a knowledge of their nature and situation and manner in which they affect the human body, is called Pathology. This Pathology is either general or special: the principles of the former only are treated of here.

24. Disease is present, when the body has so much declined from the healthy state, that the customary actions of the body are either entirely suspended or performed with

ciantur. Tunc dicitur homo ægrotare.—Unicuique corporis parti, tam fluidæ quam solidæ, unicuique functioni, sua accidere possunt vitia. Hæc verò vel singula occurrunt vel plura simul juncta. Hinc morbi simplices vel compositi.

25. Simplicissimi exemplum erit, si quælibet corporis partes ruptæ, vel quivis alio modo læsæ, propriis muneribus minùs idoneæ factæ fuerint: aut si, salvâ omninò singularum partium fabricâ, ipsæ, sive solidæ sive fluidæ, a statu sano aberraverint: veluti si, propriis amissis vel corruptis dotibus, alias et fortasse noxias sibi adeptæ sint; vel denique si vires moventes, aut nimiæ, aut

dolore.—Homo tunc dicitur ægrotare. Sua vitia possunt accidere unicuique parti corporis, tam fluidæ quam solidæ, (et) unicuique functioni. Verò hæc occurrunt vel singula, vel plura simul juncta. Hinc (sunt) morbi simplices vel compositi.

25. *Erit exemplum simplicissimi (morbi) si quælibet partes corporis ruptæ, vel læsæ quovis alio modo fuerint factæ minùs idoneæ propriis muneribus; aut si, fabricâ partium singularum omnino salvâ, ipsæ (partes) sive solidæ sive fluidæ aberraverint a statu sano; veluti si, dotibus propriis amissis vel corruptis, (illæ partes) adeptæ*[16] *sint sibi alias et fortasse noxias: vel denique si vires moventes fuerint nimiæ*

difficulty or pain. Man is in that state said to be ill. Its own peculiar injuries may happen to every part of the body whether fluid or solid, and to every function. These again occur singly or many united together. Hence there are simple or compound diseases.

25. There will be a specimen of a most simple case of disease, if any parts of the body, by being torn or injured in any other way, become less fitted for their proper functions; or if, the structure of individual parts being quite sound, the solids or fluids themselves have deviated from the healthy state: for example, if, their own qualities being lost or corrupted, they have acquired others, perhaps injurious;

16. *Adeptæ*, from *adipiscor*.

nimis parvæ fuerint, aut contra Naturæ normam directæ.

26. Hujusmodi verò morbos rarissimè spectamus, ferè solâ mentis acie attingimus; quippe nimirùm simplicissimi etiam, alios sive morbos, sive morborum indicia seu *symptomata* gignant, et his solis dignoscantur. Symptomata vel morbi indicia sunt singulæ quæ in ægro præter naturam observantur res; illorum verò præcipua, evidentissima, constantissima, morbum faciunt, definiunt; alia alia producentia, prima ab ipsâ morbi causâ provenientia.

27. Varia profectò et propè innumera in ægris observantur morborum signa,

27. *Profectò varia et propè innumera signa morborum observantur in ægris,*

or lastly, if the moving powers be too great, or too feeble, or directed contrary to the rule of Nature.

26. We very rarely see diseases of this kind, we generally reach them by the acuteness of the mind alone; for indeed, even the most simple diseases give rise either to other diseases or signs or symptoms of diseases, and are distinguished by them. Symptoms or signs of disease are all those circumstances which are observed in the sick man, as unnatural; but the principal, most evident, and most constant symptoms, form and define a disease; some giving rise to others, and the first arise from the cause of disease itself.

27. Indeed many and nearly numberless signs of diseases are observed in sick people; a knowledge of them will be

quorum notitia, tum ad cognoscendos, tum quoque ad sanandos vel levandos morbos, medicinam facientibus imprimis utilis erit. notitia quorum (signorum) erit utilis imprimis facientibus medicinam, tum ad cognoscendos[17] *(morbos), tum quoque ad sanandos*[17] *vel levandos*[17] *morbos. Verò immensa varietas talium signorum solet referri haud ineptè ad tria genera seu capita; scilicet (ad) functiones impeditas; (ad) sensus sive perceptiones molestas; et (ad) speciem que alias qualitates corporis mutatas aut vitiatas manifestas, vel quæ percipiuntur sensibus. Nimirùm omnis morbus maximè consistit in aliquâ læsâ functione. Verò nulla harum (functionum) ferè potest lædi vel impediri, quin brevi (tempore) facessat quandam molestiam ægro,*

especially useful to the medical practitioner, both in discovering diseases, and in curing or relieving them. The immense variety of such symptoms is accustomed to be referred, not improperly, to three genera or heads, namely, impeded functions, troublesome sensations or perceptions, change and disorder of appearance, and other qualities of the body, which are evident or perceived by the senses. Every disease principally consists in injury of some function; for none of the functions can commonly be injured or impeded, without in a short time producing some uneasiness to the sick man, so that he knows that he is not well; nor in common cases can any one be long ill, without

17. *Gerunds* are sometimes converted into nouns adjective, as *ad sanandos morbos, &c.*

bere. Nec quisquam ferè diù ægrotare potest, quin species et forma corporis, et vultûs color decens, quæ prosperæ valetudini contingere solent, eandemque tam pulchrè depingere (19) plùs minùsve corrumpantur.

28. Medico, igitur, inter adversæ valetudinis indicia imprimis notanda sunt læsarum functionum animalium signa; sensûs, scilicet, motûsque voluntarii malè se habentium indicia. Singuli enim sensus externi variis possunt vitiari modis, et reverà sæpè vitiantur; nempè aut deficiunt et torpent, aut nimis acuti fiunt, nec sine molestiâ exercendi, aut abnormes fiunt et depravantur. Sensus porrò interni sæpè a morbis afficiuntur. Hujusmodi verò

quâ sciat se malè habere (se). Nec quisquam ferè diù potest ægrotare, quin species et forma corporis, et color decens vultûs, quæ solent contingere prosperæ valetudini que (solent) depingere eandem tam pulchrè, corrumpantur plus minùsve.

28. *Igitur signa animalium functionum læsarum imprimis notanda sunt inter indicia adversæ valetudinis; scilicet, indicia sensûs que motûs voluntarii habentium se malè. Enim singuli sensus externi possunt vitiari variis modis et reverè sæpe vitiantur; nempè (sensus) aut deficiunt et torpent, aut fiunt nimis acuti, nec exercendi (sunt) sine molestiâ, aut fiunt abnormes et depravantur. Porro sensus interni sæpe afficiuntur à morbis. Vero affectiones*

alteration in the appearance and form of his body, and in the comely colour of his face, which are generally the attendants upon good health, and which give it so fair an appearance.

28. Therefore the character of impaired animal functions are especially to be observed amongst the symptoms of bad health; namely, indications of sensation and voluntary motion being disordered. For all the external senses may be disordered in various ways, and are in truth often impaired; they are either defective and torpid, or are too acute, and do not allow exercise without uneasiness, or become irregular and depraved. Besides, the internal senses are often affected by diseases. But of all diseases of the senses,

omnium sensuum affectiones medici attentionem optimo jure sibi vindicant, quatenùs non modò ipsæ haud levis momenti morbi interdùm fiant, sed quantum naturam et augmentum vel remissionem aliorum graviorumque morborum sæpè quam optimè ostendant.

29. Par ratio est cur ad conditionem et læsiones facultatis movendi semper sit respiciendum; sive illa defecerit, ut in omnibus ferè morbis solet, quod debilitas vocatur; vel perdita fuerit, ut in paralysi; vel præter naturam intensa, quod in quibusdam cerebri affectionibus nonnunquam accidit; sive demùm abnormis fuerit, veluti in convulsionibus aliisque similibus morbis.

hujusmodi omnium sensuum, vindicant sibi optimo jure attentionem medici, quatenùs non modo (affectiones) ipsæ fiant morbi haud levis momenti, sed quantum sæpè, quam optimè ostendant naturam, et augmentum, vel remissionem aliorum que graviorum morborum.

29. *Est par ratio, cur semper respiciendum sit ad conditionem et (ad) læsiones facultatis movendi; sive illa (facultas) defecerit, ut solet ferè in omnibus morbis, quod vocatur debilitas vel (illa facultas) fuerit perdita ut in paralysi; vel (sive illa sit) intensa præter naturam, quod nonnunquam accidit in quibusdam affectionibus cerebri; sive demùm (illa) fuerit abnormis, veluti in convulsionibus que (in) aliis morbis similibus.*

affections of this description by the greatest right claim the attention of the physician, inasmuch as they are not only diseases in themselves of no light importance, but they also frequently point out in the best possible manner the nature and progress and remission of other and more severe diseases.

29. There is equal reason why we must always look to the condition and injuries of the faculty of motion, whether it be defective, as is usual in nearly all diseases, and is called debility, or whether it be lost, as in paralysis, or whether it be unnaturally powerful, as it occurs sometimes in certain cerebral affections, or lastly, whether it be irregular as in convulsions and other like diseases.

30. Neque sanè ægri conditio quod ad somnum negligi debet: qui, sive ipse pro functione corporis, sive tantum pro vacatione ab aliis functionibus habendus sit, modum suum naturalem et sanitatis legibus consentaneum habet, qui modus in plerisque morbis haud parùm turbari solet; ita ut somnus vel nullus sit vel nimius vel interruptus vel diris somniis terrificus; neque somnus qui fuerit ægrum ut decet recreet.

30. *Neque sanè conditio ægri debet negligi quod (refert) ad somnum; qui sive ipse sit habendus pro functione corporis sive tantùm (habendus est) pro vacatione ab aliis functionibus, habet suum modum naturalem et consentaneum legibus naturæ, qui modus solet turbari haud parùm in plerisque morbis; ita ut somnus sit vel nullus vel nimius vel interruptus vel terrificus diris somniis, neque somnus qui fuerit, recreet ægrum ut decet.*

31. Signa autem læsarum vel malè se habentium functionum vitalium majoris adhuc momenti sunt; scilicet quæ non modò morbi naturam et ægri statum benè ostendant, sed suo quoque periculo, vehementiora saltem si fuerint, non careant.

31. *Autem signa functionum vitalium læsarum vel malè habentium se, sunt adhuc majoris momenti; scilicet (sunt illa) quæ non modò benè ostendant naturam morbi et statum ægri, sed quoque non careant suo periculo, si saltem fuerint*

30. Nor indeed should the state of the patient be neglected in reference to sleep, which, whether it be considered a function of the body, or an intermission of the other functions, has its own natural mode, according with the laws of health; which mode is deranged considerably in many diseases. So that sleep may be wanting, or excessive, or interrupted by frightful dreams, nor can sleep so obtained be refreshing to the patient in a due degree.

31. The signs of injured or deranged vital functions are of still greater importance; for they are those which not only will point out the nature of the disease and state of the patient, but are also not free from danger themselves,

Hujusmodi sunt omnes pulsuum varietates, nimirum quæ ostendant aut deficere sanguinis motum, aut nimium, aut abnormem esse, veluti in febribus, inflammationibus, animi defectionibus.

32. Proximum his locum tenent non immeritò spiritûs affectiones morbidæ, veluti omnis spirandi velocitas aut tarditas insolita, aut difficultas quævis, aut tussis, sternutatio, suspirium et similia; quibus fortassè adjicere licet varias vocis affectiones, quamvis profectò hæ potius ad primum (29) genus pertineant.

33. Porrò signa læsarum actionum naturalium (9) sedulò observanda sunt; famis, scilicet, aut sitis de-

vehementiora. Hujusmodi sunt omnes varietates pulsuum, nimirum quæ ostendant aut motum sanguinis deficere, aut esse nimium aut abnormem, veluti in febribus, (in) inflammationibus, (et in) defectionibus animi.

32. Morbidæ affectiones spiritûs non immeritò tenent proximum locum his, veluti omnis velocitas vel insolita tarditas spirandi, aut quævis difficultas, aut tussis, sternutatio, suspirium et similia; quibus (affectionibus) fortasse licet adjicere varias affectiones vocis, quamvis profectò, hæ potius pertineant ad primum genus. (29)

33. Porrò signa læsarum actionum naturalium (9) *sunt observanda sedulò; scilicet, defectus, excessus, deprava-*

provided they be of a rather more violent character. Of this description are the various kinds of pulses; for instance, such as show that the circulation of the blood is languid, or too rapid, or irregular, as in fevers, inflammations and faintings.

32. Morbid affections of respiration properly claim attention in the next place, such as unusual velocity, or retardation, or any difficulty of breathing, or cough, sneezing, sighing and the like; to which, perhaps, may be added various affections of the voice, although indeed these may rather be referred to the first kind of affections. (29)

33 Moreover the signs of injured natural functions are carefully to be observed; such as for instance, deficiency,

fectus, excessus, depravatio, conditio quævis insolita; actionis mandendi et devorandi et concoctionis varia vitia; et alvi status vel astrictæ præter naturam vel nimis solutæ; et secretionum, et quæ, magis sub nostris sensibus cadunt, excretionum, præsertim urinæ et sudoris excessus, defectus, difficultas, depravatio. —Neque sanè negligendæ sunt læsiones functionum utrique sexui, muliebri imprimis, propriarum.

34. Quod ad sensus ingratos vel molestos(27) pertinet; frequentissimi morborum comites et signa observantur; quorum pauci aliquâ saltèm molestiâ carent. Non aliter enim ac sanus suis facilè, nec sine

tio, (vel) quævis insolita conditio famis aut sitis; (scilicet) varia vitia actionis mandendi et devorandi, et concoctionis; et status alvi, vel astrictæ præter naturam, vel (alvi) nimis solutæ; et excessus, defectus, difficultas depravatio secretionum, et excretionum præsertim urinæ et sudoris, quæ (excretiones) magis cadunt sub nostris sensibus.—Nequè sanè læsiones functionum propriarum utrique sexui, imprimis muliebri, sunt negligendæ.

34. *Quod pertinet ad sensus ingratos vel molestos; (sensus ingrati et molesti) observantur frequentissimi comites et signa morborum, pauci quorum (morborum) saltem carent aliquá molestiá. Enim (homo) non aliter ac sanus fungitur suis*

excess, depravation, or any unusual condition of hunger or thirst; such as the various disorders of the action of mastication, deglution, and digestion; the state of the bowels, whether confined more than natural or relaxed; such as the excess or deficiency, a difficulty or depravation of the secretions and excretions, particularly of the urine and sweat, which fall most under our observation. Nor indeed are the injuries of the functions peculiar to each sex, especially the female, to be overlooked.

34. As to troublesome and uneasy sensations, they are very often observed to be attendants and symptoms of diseases, and indeed few of them are free from some degree of uneasiness. For man when healthy performs his numerous

voluptate quâdam, plerisque fungitur muneribus; sic æger, his impeditis, dolet, angitur variisque molestiis afficitur. Igitur ad hoc caput pertinent, dolor, anxietas, pruritus, sensusque lassitudinis, torporis, stuporis, caloris, frigoris, ponderis, et alii forsitàn benè multi sensus ingrati, nausea, vertigo, tinnitus, &c. quos medicis aliò relegare placuit: quorum omnium tanta vis et molestia est, ut magnam sæpè morbi partem efficiant, et ægros miserrimè agitent, fatigent, torqueant, terreant, tandem morte ipsâ terribiliores evasuri. Neque profectò periculo aliquo semper carent tales sensus molesti,

plerisque muneribus facilè, nec sine quâdam voluptate; sic æger his (muneribus) impeditis, dolet, angitur, que afficitur variis molestiis. Igitur (hæc) pertinent ad hoc caput (scilicet) dolor anxietas, pruritus, que sensus lassitudinis, torporis, stuporis, caloris, frigoris, ponderis, et forsitàn benè multi alii sensus ingrati (scilicet) nausea vertigo, tinnitus, &c. quos placuit medicis relegare aliò; omnium quorum (sensuum) tanta est vis et molestia ut sæpè efficiant magnam partem morbi et miserrimè agitent ægros, fatigent, torqueant, terreant tandem evasuri terribiliores[18] *morte ipsâ. Neque profectò tales*

functions with ease, and not without some degree of pleasure; but the sick man, when these functions are impeded, is in pain, fretted and affected with various uneasinesses. Therefore to this head belong pain, anxiety, itching, a sensation of weariness, languor, stupor, heat, cold, weight, and perhaps many other unpleasant sensations, such as nausea, vertigo, ringing of the ears, &c. which it has pleased medical men to place elsewhere; such is the influence and trouble of such sensations, that they often form a great part of the disease, and most frightfully agitate, fatigue, torment, and frighten those who are ill, and at last become more terrible than death itself. Nor, indeed, are such uneasy sensations free from danger, whatever may have been the causes of them.

---

18. Comparatives, when the sense is rendered complete by *quam*, require the ablative case after them, as *terribilior morte*, i. e. *quam mors*.

qualescunque fuerit eorum causæ.

35. Ad tertium genus signorum morbidorum (27), corporis nimirùm qualitates manifestas vitiatas, referuntur res omnes in ægro præter naturam observandæ, neque ad alia genera pertinentes, de quibus nostris sensibus, non ægri dictis aut querelis, certiores fimus. Cujusmodi sunt, color corporis et præsertim vultus vitiatus, et præter solitum pallidus, ruber, flavus, fuscus, lividus, varians; peculiaris quoque vultus aspectus, ab actione musculorum, aut motu sanguinis, et sæpè a statu animi pendens, nullisque describendus verbis, qui tamen ægri conditionem,

sensus molesti semper carent aliquo periculo,[19] *qualescunque fuerint causæ eorum.*

35. *Ad tertium genus signorum morbidorum nimirùm (ad) qualitates manifestas corporis vitiatas, referuntur omnes res, observandæ in ægro præter naturam, neque pertinentes ad alia genera de quibus fimus*[20] *certiores*[20] *nostris sensibus non dictis aut querelis ægri. 37. *Imprimis medici distinguunt causas morbi in proximam et remotas; iterum (distinguunt) remotas*

medical man; neither, in order to understand the disease, is there need of many questions, which are frequently very unpleasant.

36. Cause is described as of several kinds by medical men when they treat of diseases; and, indeed, in a sense somewhat different from the common acceptation of this term in the writings of philosophers or in common discourse. Therefore it is necessary that every one studying medicine should know the various medical meanings of the word cause, or at least of those most in use.

37. In the first place physicians distinguish the causes of diseases into proximate and remote, and again the remote

---

21. Verbs of teaching and concealing, &c. frequently govern two accusative cases after them, as *docebo te istos mores, non potest celare ea medicum.*

nentes et *occasionales* vel *excitantes* vel *potentias nocentes*.

38. Causa *proxima*, ut definiunt scriptores medici, est illa quæ præsens morbum facit, sublata tollit, mutata mutat.

39. Causa *prædisponens* est illa quæ corpus tantùm morbo opportunum reddit; scilicet ut admotâ causâ excitante in morbum incidat.

40. Causa demùm *occasionalis* vel *excitans* est ea quæ in corpore jam proclivi facto (39) morbum excitat.

41. Corrigenda, igitur, est corporis conditio quæ morbo obnoxium facit; evitandæ causæ remotæ quæ morbum excitant; tollenda proxima morbi causa; et mitiganda

in prædisponentes et occasionales, vel excitantes vel potentias nocentes.

38. *Causa proxima, ut scriptores medici definiunt (eam) est illa quæ præsens facit morbum, sublata tollit, mutata mutat.*

39. *Causa prædisponens est illa quæ tantùm reddit corpus opportunum morbo; scilicet ut, causâ excitante admotâ, (corpus) incidat in morbum.*

40. *Demùm causa excitans vel occasionalis est ea quæ excitat morbum in corpore jam facto proclivi* (39).

41. *Igitur conditio corporis quæ facit (corpus) obnoxium morbo, est corrigenda: causæ remotæ, quæ excitant morbum, sunt evitandæ; proxima causa morbi*

causes into predisposing and occasional, or exciting and noxious powers.

38. Proximate cause, as physicians define it, is that which when present constitutes disease, which when removed takes it away, and which when altered changes it.

39. A predisposing cause is that which only renders the body liable to disease; that is in such a way, that, an exciting cause being applied, the body may fall into disease.

40. Lastly, the exciting or occasional cause is that which excites disease in a body already predisposed to it.

41. Therefore the state of the body, which renders it obnoxious to disease, is to be corrected; the remote causes, which excite disease, are to be avoided; the proximate cause of the disease is to be removed; and the different symptoms

singula ejusdem indicia quæ maximè molesta sunt. Sic morbi præcaventur, sanantur, levantur.

42. Causa remotior, quæ proclivitatem tantùm ad morbos facit, in ipso corpore semper hæret, licet sæpè extrinsecùs primam originem duxerit: causa verò excitans vel intùs vel extrinsecùs esse potest. Concurrente utrâque fit morbus, quem neutra sola efficere potest. Neque enim in omni homine omnis causa morbi excitans morbum facit; neque omnes qui jam ad morbos proclives facti sunt, nullâ admotâ câusâ excitante, in morbos incidunt.

43. Corpus itaque morbo jam factum opportunum, a statu sano et perfectissimo

(est) tollenda; et singula indicia ejusdem, quæ sunt maximè molesta, sunt mitiganda. Sic morbi præcaventur, sanantur (et) levantur.

42. Causa remotior, quæ facit tantùm proclivitatem ad morbos, semper hæret in ipso corpore, licet sæpè duxerit originem primam extrinsecus; verò excitans (causa) potest esse vel intùs vel extrinsecùs. Utráque (causá) concurrente morbus fit, quem morbum neutra (causa) sola potest efficere. Enim neque in omni homine omnis causa excitans morbi facit morbum; neque omnes (homines) qui jam sunt facti proclives ad morbos, nullá causá excitante admotá, incidunt in morbos.

43. Itaque corpus jam factum opportunum morbo, videtur deflexisse nonnihil a

of it, which are particularly troublesome, are to be mitigated. In this way diseases are prevented, cured, and relieved.

42. The more remote cause, which produces only a tendency to diseases, always is inherent in the body, although it frequently derived its first origin from without; but the exciting cause can be either internal or external. Both of them concurring, disease is established; but neither of them alone can produce a disease. Every exciting cause does not produce disease in every person; nor do all men who are already become predisposed to diseases, without an exciting cause being applied, contract diseases.

43. Therefore the body, rendered liable to disease, appears

nonnihil deflexisse videtur, licet nondum actiones ejus adeò impediantur, ut verus morbus rectè dicatur adesse (24). Nonnunquam verò talis corporis conditio diu perstans eò usque ingravescit, ut sola, nullâ adjectâ causâ excitante, justum et manifestum morbum faciat; vel, ut quidam loqui amant, causa quoque excitans fiat. Solidarum partium debilitas generalis, partiumque solidarum, quæ, distinctionis causâ, vivæ dicuntur, mobilitas nimia, corporis plenitudo, a nimiâ sanguinis abundantiâ hujusmodi exempla sunt.

44. Nec quisquam hominum tam firmam valetudinem, tantumque corporis robur habet, quin, causis quibusdam excitantibus ad-

statu sano et perfectissimo, licet actiones ejus (i. e. corporis) nondum adeò impediantur, ut verus morbus rectè dicatur adesse (24). Verò nonnunquam talis conditio corporis diù perstans ingravescit adeò usque, ut sola (conditio), nulla causâ excitante adjectâ, faciat morbum justum et manifestum; vel, ut quidam amant loqui, fiat quoque causa excitans. Debilitas generalis partium solidarum, nimia mobilitas partium solidarum quæ, causâ distinctionis, dicuntur vivæ, plenitudo corporis a nimiâ abundantiâ sanguinis, sunt exempla hujusmodi.

44. *Nec quisquam hominum habet valetudinem tam firmam, que tantum robur corporis, quin quibusdam causis excitantibus admotis,*

somewhat to have declined from its healthy and most perfect state, although its actions are not yet so much impeded, that a real disease may be said to be established. But sometimes such a state of body, when long continued, aggravates to such a degree, that it alone forms a real and evident disease; or, as some like to express themselves, it becomes an exciting cause. General weakness of the solids, excessive mobility of the solids, which for the sake of distinction are called living, a full habit of body from too much blood, are instances of the above description.

44. There is no one who has such firm health, and such strength of body, but that, if certain exciting causes be applied, he may fall into very severe diseases. Small-pox

motis, in gravissimos morbos incidat. *Variola* semèl, *lues venerea* sæpè, etiam sanissimos inficiunt; venena necant; caloris vel frigoris nimium multimodis nocet.

45. Causa quoque excitans, quanquam non statim morbum induxerit, si diù perstiterit, constitutionem corporis, quamvis validissimam, paulatim corrumpet, et variis morbis obnoxiam reddet; scilicet alteram causam remotam, nempe quæ corpus morbo opportunum facit, gignit, vel in eam convertitur. Eadem igitur res nunc causa excitans, nunc rursus causa remotior, esse potest.—Cœli intemperies, desidia, luxus hujusmodi exempla sunt.

46. De his porrò tribus generibus causarum morbi,

(ille) incidat in gravissimos morbos. Variola semèl, lues venerea sæpe, inficiunt etiam sanissimos; venena necant; nimium caloris vel frigoris nocet multimodis.

45. *Quoque causa excitans, quanquam (illa) non statim induxerit morbum, si diù perstiterit, paulatim corrumpet constitutionem corporis quamvis validissimam, et reddet obnoxiam variis morbis; scilicet, gignit alteram causam remotam, nempe (talem) quæ facit corpus opportunum morbo vel convertitur in eam. Igitur eadem res nunc potest esse causa excitans, nunc rursus causa remotior.—Intemperies cœli, desidia, luxus sunt exempla hujusmodi.*

46. *Porrò, de his tribus generibus causarum morbi,*

attacks once; Lues Venerea infects frequently even the most healthy persons. Poisons destroy; and too much heat or cold is injurious.

45. An exciting cause also, although it may not directly have produced disease, if long continued, will gradually destroy the constitution of the body, although very strong, and will render it exposed to various diseases; for it generates another remote cause, such as renders the body liable to disease, or is converted into disease itself. Therefore the same circumstance at one time can be an exciting cause, at another time a more remote one. Inclemency of weather, idleness and luxury are instances of this kind.

46. But touching these three kinds of causes of disease,

scire juvabit, notionem causarum remotarum utriusque generis (37) justam esse, et magni momenti in re medicâ. Quamvis enim medici haud parùm sæpè erraverint de causis remotis variorum morborum, cum temerè de iis statuere ausi sunt; tamen notiones generales de iis quæ ipsis in animo versarentur sanæ fuerunt: multorumque sanè morborum causæ remotæ, tam *prædisponentes* quam *excitantes*, vel observando, vel experiendo, et cautè ratiocinando, jam satis cognitæ sunt et exploratæ: earumque notitia medicis utilissima est.

juvabit scire, notionem causarum remotarum utriusque generis (37) *esse justam, et* (*esse*) *magni momenti in re medicá.—Enim quamvis medici sapè erraverint haud parùm de causis remotis variorum morborum, cum ausi sunt temerè statuere de iis; tamen notiones generales de iis quæ versarentur in animo ipsis, fuerunt sanæ; que sanè causæ remotæ, tam prædisponentes quam excitantes multorum morborum jam satis cognitæ et exploratæ sunt, vel observando, vel experiendo et cautè ratiocinando; que notitia earum* (*causarum remotarum*) *est utilissima medicis.*

47. Causam verò proximam quod attinet, ipsa ejus notio generalis, si non prorsus falsa, saltem confusa

47. *Verò* (*de illo*) *quod attinet* (*ad*) *proximam causam, ipsa notio generalis ejus, si non est prorsùs falsa, saltem*

it will be useful to know, that the idea of both kinds of remote causes (38) is proper, and of great importance in the practice of medicine. For although medical men have erred consideraby concerning the remote causes of various diseases, when they rashly ventured to determine upon them; nevertheless the general ideas concerning them, which they had turned over in their mind, were correct: and, in truth, the remote causes of diseases, both predisposing and exciting, have become known and ascertained by observation, experience, and careful reasoning: a knowledge of such (remote causes) is most useful to medical men.

47. But as to the proximate cause, a general knowledge of it, if not entirely erroneous, is at least very confused and

admodùm est, et obscura, et temerè a rebus abstracta. Quærunt enim medici, et, non facilè invenientes, sibimet fingunt aliquid causæ omnis morbi, unde iste morbus oriatur, eodem ferè modo ac variæ mutationes vel effectus, quæ in rebus inanimatis observantur, a suis causis proveniunt. In plerisque autem affectionum, quas morbos vocare solemus, nihil istiusmodi existere videtur, neque profectò existere potest; et talis notio planè oritur a male intellectâ naturâ, tum corporis ipsius, tum quoque morborum qui in eo fiunt. Morbus enim non est unus et simplex eventus vel mutatio, qualem in rebus inanimatis contemplari solemus et effectum vocare; sed series, sæpè longa, talium

(est) admodum confusa et obscura, et temerè abstracta a rebus. Enim medici quæ runt, et non facilè invenientes (quod quærunt), fingunt sibimet aliquid causæ omnis morbi, unde iste morbus oriatur, ferè eodem modo ac variæ mutationes vel effectus quæ observantur in rebus inanimatis, proveniunt a causis suis. Autem nihil istiusmodi videtur existere in plerisque affectionum, quas solemus vocare morbos, neque (nihil) profectò potest existere; et talis notio planè oritur, a naturâ malè intellectâ, tum corporis ipsius tum morborum qui fiunt in eo. Enim morbus non est unus et simplex eventus vel mutatio, qualem solemus contemplari in rebus inanimatis et vocare effectum; sed (ille est) series

obscure, and injudiciously decided upon. For medical men seek, and not easily finding it, imagine to themselves some one cause of every disease, from which (cause) the disease may arise, almost in the same way as the various changes and effects observed in inanimate objects proceed from their causes. But nothing of that description appears to exist in many of the affections, which we are wont to call diseases; nor, indeed, can any such thing exist; such an idea evidently arises from the slightly understood nature, as well of the body itself as of the diseases which take place within it. For disease is not a single and simple event or change, such as we are accustomed to observe in

eventuum vel mutationum; quarum aliæ aliis causæ videntur esse (26). Fieri quidem potest, ut, sublatâ unâ alterâve harum, tota series vel abrumpatur, vel brevi desinat; et sic morbus in sanitatem mutetur. Sed hoc minimè perpetuum est, neque in omni morbo, neque in quolibet ferè morbo omni tempore. Prætereà, corpus ipsum longè aliter se habet ac res inanimata, quod ad mutationes quæ in eo fiunt, et causas, sive externas sive internas, unde hæ proveniant. Inest enim corpori vivo principium aliquod mutationis, simile quodammodò illi quod in herbis observatur, et longe alienum a natura materiæ inanimatæ, ægre definien-

sæpè longa talium eventuum vel mutationum; quarum (mutationum) aliæ videntur esse causæ aliis (26). *Quidem potest fieri, ut unâ alteráve harum sublatâ, tota series vel abrumpatur, vel desinat brevi (tempore); et sic morbus mutetur in sanitatem. Sed hoc est minimè perpetuum, neque in omni morbo, neque fere in quolibet morbo omni tempore. Prætereâ corpus ipsum habet se longe aliter ac res inanimata, quod ad mutationes quæ fiunt in eo, et (quod ad) causas, sive externas sive internas unde hæ proveniant. Enim aliquod principium mutationis inest corpori vivo, quodammodo simile illi (principio mutationis) quod observatur in herbis et longe alienum a*

inanimate objects, and to call an effect, but frequently (it is) a long series of such occurrences and changes; some of which appear to be causes to the others. It can indeed happen if one or other of these be removed, the whole series may be disconnected or shortly put a stop to; and thus disease may be changed to a state of health. But this is by no means a constant occurrence, neither in every disease, nor scarcely in any disease, on every occasion. Moreover the body itself is differently constituted to inanimate objects, both as to the changes which take place in it, and as to the external and internal causes from which they proceed. For there is some principle of change in the living body, in some degree like (the principle of change) observed

dum, nondum ea qua par esset diligentia et accuratione exploratum, vitale principium haud inepte nominandum, cui vix minus quam causis vulgo observatis tribuendæ sunt plurimæ mutationes, tam morbosæ quam salutares, quæ corpori eveniunt. Hæc quum ita sint, non mirum esse poterit multa medicorum commenta de causis *proximis* variorum morborum prorsus futilia esse, et non modo falsa, sed adeo confusa et obscura, ut vix possint intelligi, neque fortasse ab ipsis eorum auctoribus unquam satis intellecta fuerint.

naturâ materiæ inanimatæ, ægrè definiendum, (et) nondum exploratum ea diligentiâ et accuratione quâ par esset, (scilicet) vitale principium haud ineptè nominandum, cui (principio) plurimæ mutationes, tam morbosæ quam salutares quæ eveniunt corpori, tribuendæ sunt vix minus quam causis vulgò observatis. Quum hæc ita sint, non poterit esse mirum, multa commenta medicorum de causis proximis variorum morborum, esse prorsus futilia, et non modo falsa, sed adeò confusa et obscura, ut vix possint intelligi neque fortasse unquam satis intellecta fuerint ab ipsis auctoribus eorum.

48. Unde vero morbi, vel morborum causæ? Certe ab ipsa imprimis machinæ

48. *Vero unde (sunt) morbi, vel causæ morborum? Certè (illi sunt) imprimis*

in plants, and widely different from the nature of inanimate substance, difficult of definition, (namely) the vital principle, not inaptly designated; to it many of the changes both morbid and healthy which occur to the body, are to be attributed, not less than to the causes commonly observed. This being the case, it is not surprising, that many theories of medical men on the proximate causes of diseases are entirely futile, and not only erroneous, but so confused and obscure, as to be scarcely intelligible, nor perhaps have they ever been satisfactorily understood by the authors themselves.

48. But whence are diseases or the causes of them? They arise especially from the constitution of the animal machine.

animalis constitutione. Ut vitrum ex officina prodit fragile, sic homines debiles, caduci, morbis opportuni, nascuntur. Hinc multi morbi, causa modo excitante idonea admota, omnibus communes. Sed quidam præ cæteris homines aliis atque aliis plectuntur morbis. Hujus rei ratio multiplex.

49. Ut sanus sanam prolem, sic morbosus morbosam gignit. Hinc morbi hæreditarii in seros nepotes transituri. Hoc modo sæpe delicta majorum immeriti luimus. Sunt quidam ex his morbis qui prima ætate sese aperte produnt; sunt qui omnem ætatem invadunt pariter; nec desunt qui ad summam usque se-

ab ipsá constitutione machinæ animalis. Ut vitrum prodit fragile ex officiná, sic homines nascuntur debiles, caduci, (et) opportuni morbis. Hinc multi morbi communes omnibus, causá idoneá excitante modò admotá. Sed quidem homines præ cæteris plectuntur morbis aliis atque aliis. Ratio hujus rei (est) multiplex.

49. *Ut sanus homo gignit sanam prolem, sic morbosus homo (gignit) morbosam (prolem). Hinc morbi hæreditarii sunt transituri in seros nepotes. Hoc modo sæpe nos immeriti luimus delicta majorum. Sunt quidam ex his morbis, qui produnt sese aperte primá ætate; sunt (alii) qui invadunt pariter omnem ætatem; nec desunt (alii) qui occulti*

As glass issues from the manufactory brittle, so men are born weak, falling away, and liable to diseases. Hence many diseases, common to all mankind, provided a proper exciting cause be applied. But some men compared with others are afflicted with various diseases, and of this the reason is manifold.

49. As a healthy man begets healthy offspring, so a sickly man begets a sickly one; hence there are hereditary diseases, which pass down to the remotest descendants; and in this way we often pay undeservedly for the vices of our ancestors. There are some of these diseases which openly show themselves in infancy; others attack indiscriminately every age, nor are there wanting others which lie dormant

nectutem occulti delitescunt, neque suspecti, viresque paulatim nacti, suo quisque demum tempore, gravius erumpunt.

50. Sunt qui nobiscum nascuntur morbi vel vitia, neque tamen congenita: nempe, si, donec in utero lateret, matre forsan incolumi, fœtus tantum a casu quovis aliquid detrimenti acceperit. Sunt forsitan neque simul nati neque congeniti morbi, quos cum prima nutricis lacte infans suxisse videtur.

51. Porro, sunt qui varios ætatis gradus sequuntur, et suum quisque solum comitantur; nempe, qui ex iis quas corpus, variis ætatibus, mutationibus subit, originem ducunt. Hinc

delitescunt usque ad summam senectutem, neque suspecti, que nacti vires, paulatim erumpunt gravius, quisque (morbus) demùm suo tempore.

50. *Sunt (aliqui) morbi vel vitia qui nascuntur nobiscum, neque tamen congenita; nempe, si fœtus donec lateret in utero, matre forsan incolumi, acceperit aliquid detrimenti tantùm a casú aliquo. Morbi sunt forsitan neque simùl nati neque congeniti, quos (morbos) infans videtur suxisse cum primâ lacte nutricis.*

51. *Porro (morbi) sunt, qui sequuntur varios gradus ætatis et comitantur, quisque (morbus) suum (grudum) solum; nempe (ilii morbi) qui ducunt originem ex iis mutationibus, quas corpus*

even to extreme old age, not suspected, but gaining strength by degrees, burst forth with greater severity, each disease in its season.

50. There are some diseases or defects with which we are born which are nevertheless not congenital; for instance, if the fœtus, whilst in the womb, and the mother is uninjured, receives some injury by chance, or some accident; there are likewise diseases, neither congenital nor born with us, which the infant appears to have imbibed from the first milk of the nurse.

51. Moreover there are diseases which attend the different stages of age, each his own peculiar one; namely, those diseases which arise from the various changes which the

varii infantum, juvenum, senum, morbi.

52. Quin et uterque sexus, præsertim muliebris, suos morbos habet, cùm a generali corporis habitu provenientes, tum quoque a fabrica speciali, et statu, et usu, quæ generationi inserviunt partium. Sunt igitur et virorum et fœminarum morbi; sunt virginum, gravidarum, parturientium, lactantium, vetularum.

53. Cœlum ipsum, sub quo degunt homines, nonnunquam ægros facit. Unicuique nimirum regioni suum inest vitium: sive calidior justo, sive frigidior fuerit, sive varia, multisque et subitis tempestatis mutationibus obnoxia.

subit, variis ætatibus. Hinc (sunt) varii morbi infantum, juvenum, et senum.

52. Quin et uterque sexus, præsertim muliebris, habet suos morbos, cùm provenientes à generali habitú corporis, tum quoque a fabricá speciali et statu, et usu partium, quæ inserviunt generationi. Igitur morbi sunt virorum et fœminarum; (morbi) sunt, virginum, gravidarum, parturientium, lactantium et vetularum.

53. Cœlum ipsum, sub quo homines degunt, nonnunquam facit (illos) ægros; nimirum suum vitium inest unicuique regioni: sive (illa regio) fuerit calidior justo, sive frigidior, sive varia, que obnoxia multis et subitis mutationibus tempestatis.

body undergoes at different periods. Hence the various diseases of children, young and old men.

52. But, moreover, each sex, especially the female, has its own peculiar diseases, both arising from the general habit of body and from the special condition and use of the parts subservient to generation. There are therefore diseases of men and of women, likewise of virgins, of those child-bearing, parturient, of suckling, and of women of advanced age.

53. The sky itself under which men live sometimes renders them disabled, for it has its pernicious effect in every region, whether it be hotter or colder than is proper, or variable, or subject to many and sudden changes of weather.

54. Aer quoque ipse, qui purus sacram vitæ flammam alit, impurus factus, eandem vel statim extinguere potest, vel multis vaporibus onustus, aut nocivis quibusdam effluviis corruptus, ingentem morborum cohortem inducere.

55. Cibi etiam potusque quibus utimur sæpe corrumpuntur, rebusque interdum inquinantur sanitati et vitæ infestissimis: iidem vero, quamvis sua natura optimi, nimia copia sumpti, serius vel ocyus corpori nocebunt.

56. Existunt porro venena vi adeo lethali prædita, ut vel minima quantitate, sensibusque vix ac ne vix quidem detegenda,

54. *Aer ipse quoque, qui purus alit sacram flammam vitæ, factus impurus, potest vel statim extinguere eandem, vel onustus multis vaporibus, (et) corruptus quibusdam effluviis nocivis, inducere magnam cohortem morborum.*

55. *Etiam cibi que potus, quibus utimur, sæpe corrumpuntur, que interdum inquinantur rebus infestissimis sanitati et vitæ; vero iidem, quamvis (sunt) optimi suâ naturâ, sumpti nimiâ copiâ; nocebunt corpori serius vel ocyùs.*

56. *Porrò existunt venena prædita*[22] *vi adeo lethali, ut vel minimâ quantitate, que detegenda sensibus vix ac ne quidem vix, (cum) recepta*

54. The atmosphere itself also, which when pure keeps up the sacred flame of life, when vitiated, is enabled in an instant to destroy life, or when loaded with vapours, or corrupted with certain noxious effluvia, may induce a long series of diseases.

55. Food and drink also which we take, are frequently corrupted, and sometimes tainted with things most injurious to health and life; but the same, although good in quality, when taken in excess will injure the body later or sooner.

56. Moreover, there are poisons of so deadly a nature, that in a very small quantity, so as scarcely and not possibly detected by our senses, when received into the body, have

22. *Dignus, indignus, præditus,* &c. require an ablative case after them, as, *præditus vi, præditus ingenio.*

in corpus recepta, dirissimos morbos, vel fortasse inevitabilem mortem, induxerint.

57. Denique, innumeris casibus, nec raro maximis periculis, homo objicitur, plerumque quidem incolumis evasurus: sæpe tamen infelix succumbit; sæpe saucius, contusus, membra fractus aut luxatus, ægre evadit; nonnunquam prorsus insanabilis. Casusque hujusmodi, quanquam primam a causa externa originem trahant, haud raro in internos morbos desinunt.

58. Hæc omnia extrinsecus; nec minora intus pericula imminent.

59. Dum spirat homo

in corpus, induxerint dirissimos morbos, vel fortasse mortem inevitabilem.

57. Denique homo objicitur innumeris casibus, nec rarò maximis periculis, plerumque quidèm (ille) evasurus (est) incolumis; tamen sæpè (ille) infelix succumbit; sæpè ille saucius, contusus, fractus aut luxatus[23] *membra, ægre evadit; nonnunquam (ille) prorsus insanabilis (est). Que casus hujusmodi, quanquam trahant originem a causá externá, haud raro desinunt in morbos internos.*

58. Hæc omnia (sunt) extrinsecus; nec minora pericula imminent intus.

59. Dum homo spirat,

brought on most deleterious diseases, or perhaps inevitable death.

57. Lastly, man is exposed to innumerable accidents, and frequently very great dangers, from which he generally escapes: but frequently he is unfortunate and succumbs; sometimes wounded, bruised, with limbs fractured, and dislocated, he escapes with difficulty; but sometimes is entirely incurable. Accidents of this kind, although taking their origin from an external cause, not unfrequently terminate in internal diseases.

58. All these things are derived from without; but dangers of no less importance are threatening within.

59. As long as man breathes, he diffuses a poison, dele-

23. The accusative is sometimes put after adjectives and participles, where the preposition *secundum* seems to be understood, as *demissus vultum, luxatus membra.*

lethale sibi aliisque spirantibus venenum fundit. Neque solus pulmonis halitus adeo nocet: manat et ab omni cutis foramine materia subtilissima, venenata, fortasse putrescens, quæ diu collecta, neque per auras diffusa, et corpori denuo admota, aut iterum in id ipsum recepta, gravissimis morbis inficit; nec sistit gradum, sed veluti vires per pabulum nacta, longe lateque per populos grassatur.

60. Functiones quoque animales, quas nostro arbitrio regimus, sæpe aut negliguntur, aut nimis exercentur. Ex utroque periculum. Desidiâ, sive animi sive corporis, utriusque vires languescunt: nimia exercitatione, haud minus

fundit lethale venenum sibi aliisque animantibus. Neque halitus solus pulmonis adeò nocet: et materia subtilissima venenata forse putrescens, manat ab omni foramine, quæ (materia) diù collecta, neque diffusa per auras et denùo admota corpori, aut iterum receptum in id ipsum (i. e. corpus) inficit, gravissimis morbis; nec sistit gradum, sed veluti nacta vires per pabulum, grassatur longe que latè per populos.

60. *Quoque functiones animales quas regimus nostro arbitrio, aut sæpe negliguntur, aut nimis exercentur. Ex utroque periculum (est). Desidiá, sive animi sive corporis, vires utriusque languescunt; haud minùs læduntur nimiá exercitatione.*

terious to himself, as well as to other animals. Nor is the exhalation of the lungs alone injurious, (for) a very subtle and poisonous matter, perhaps putrid, flows from every pore, which having been long collected, and not scattered through the air, and again applied to the body, or again received into it, brings on most severe diseases. Neither does it stop its progress, but having, as it were, gained strength with its aliments, ranges far and wide.

60. The animal functions also which are under our control, are frequently either neglected, or too much exercised. There is danger from each extreme. By indolence either of the mind or body, the powers of both become weakened. They are not less injured by too much exercise. For the

lædunturs. Statuit enim provida rerum Parens, ut singularum partium, et universi corporis animique vires usu roborentur et acuantur; et huic iterum certos fines posuit: ita ut neque quem voluit natura usus impune omittatur, neque ultra modum intendatur. Hinc athletæ, et otiosi et desides, pariter morbis, sed singuli suis, obnoxii: hinc quoque damnum a nulla aut nimia mentis exercitatione: hinc quoque multi morbi, quibus varii obnoxii sunt artifices, morbosi fere et degeneres homines; scilicet qui eadem semper arte, ipsaque forsitan parum salubri, occupati, partes quasdam corporis plurimum, sæpe nimis, exercent, dum multis

Enim provida Parens rerum statuit, ut virès singularum partium, et universi corporis que animi roborentur et acuantur usú; et iterum posuit fines huic; ita ut neque usus omittatur, quem natura voluit, neque intendatur ultra modum. Hinc athletæ, et otiosi, et desides pariter (sunt) obnoxii morbis, sed singuli suis; hinc quoque (est) damnum a nulla aut nimiâ exercitatione mentis; hinc quoque (sunt) multi morbi, quibus varii artifices sunt obnoxii, fere morbosi et degeneres homines; scilicet, (illi) qui semper occupati eádem arte que ipsá forsan parùm salubri, exercent plurimùm sæpe nimis quasdam partes corporis, dum parùm utuntur multis aliis partibus; vel fortasse

provident Parent of nature has ordained, that the powers of individual parts, and of the body and mind in general, should be strengthened and rendered more acute by use; and she has likewise assigned limits to them, so that the exercise which nature intended should not be omitted, nor carried beyond moderation. Hence, athletics, the idle, and indolent, are liable to diseases, each to those peculiar to himself: hence also there is mischief from not any, or excessive exercise of the mind; hence also there are many diseases to which artisans are liable, (for) they are generally sickly and degenerate men: for instance, such as are always occupied in the same employment, and that perhaps not a healthy one; they often exercise too much certain parts of the body, whilst

aliis partibus parum utuntur; vel fortasse pravo corporis situ, aut malo vitæ genere, earundem functiones multum impediunt; et sic, dum mirum quarundam partium adipiscuntur usum et robur, generalem corporis vigorem, et, quæ ab illo pendet, prosperam valetudinem, male perdunt.

pravo sitû corporis aut malo genere vitæ, multum impediunt functiones earundem; et sic, dum adipiscuntur mirum usum et robur quarundam partium, male perdunt generalem vigorem corporis, et prosperam valetudinem, quæ pendet ab illo.

61. Cæterum et ab iis quas nullo nostro arbitrio regimus, tam animi quam corporis functionibus, valetudinis discrimen non leve esse potest. Animi imprimis affectus, qui modici grate excitant, vehementes, aut graves et diuturni, hujus pariter ac corporis vires frangunt; hominem interdum statim extinguunt, sæpius longa valetudine macerant. Somni etiam, quo

61. *Cæterùm discrimen valetudinis non potest esse leve, et ab iis functionibus tam animi quam corporis, quas (functiones) regimus nullo nostro arbitrio. Imprimis affectus animi (quum) modici gratè excitant, (quum) vehementes, aut graves et diuturni, frangunt pariter vires hujus ac corporis; interdum statim extinguunt hominem, sæpius macerant longâ valetudine. Ex-*

many others are but little used; they likewise obstruct the functions of the same, perhaps, either by a bad position of the body, or by a bad mode of living: in this way, whilst they acquire wonderful use and strength of certain parts, they sadly lose their general vigour of body, and that flourishing state of health, dependant upon it.

61. The health is in no slight risk of danger from the functions of the mind and body which are not under our control. In particular, the affections of the mind, which when moderate are agreeably exciting, when violent, or depressing, or long continued, equally break down its strength as well as that of the body: sometimes they destroy instantaneously, (but) more frequently waste man away by tedious

ad exhaustas vires reficiendas egemus, excessus vel defectus, et animo et corpori nocent.

62. Sunt multa in statu sanissimo e corpore semper excernenda. Hæc si retinentur, malum est: si plus justo excernuntur, malum quoque: si naturâ retinenda, sponte, vel casu, vel arte excernuntur, malum iterum. Ex his quoque (61, 62) facillime intelligetur, gravissimum sæpe oriri posse periculum ab inepto aut intempestivo remediorum usu: quippe quæ varias functiones, corpori proprias et necessarias, aut excitent et intendant præter naturam, aut sopiant et reprimant, secretionesque demum et excretiones sæpe minuant, sæpe ultra modum

cessus vel defectus somni quo egemus ad virès exhaustas reficiendas, nocent et animo et corpori.

62. *Multa sunt excernenda e corpore, in statú sanissimo. Si hæc retinentur, est malum: si excernuntur plus justo, quòque malum est; si retinenda (sunt) naturá, excernuntur sponte vel casú vel arte, iterum malum est. Quoque facillimè intelligetur ex his, sæpe gravissimum periculum posse oriri ab inepto aut intempestivo usú remediorum; quippe (illa) quæ aut excitent aut intendant præter naturam varias functiones proprias et necessarias corpori aut sopiant et reprimant que demum minuant sæpe que secretiones et excretiones, sæpe augeant ultra*

illness. Excess or want of that sleep which we stand in need of to repair the wasted strength, is injurious both to the mind and body.

62. There are many things to be secreted from the body in its most healthy state. If these are retained, there is mischief; if they are secreted in excess, there is also mischief; (and) if those which should be retained are excreted spontaneously, by accident, or by means of art, there is again also mischief. It will be easily understood from this, that frequently the greatest danger may arise from an undue and unseasonable use of remedies; namely, such as either excite or preternaturally force the various functions which are proper and necessary to the body, or allay or repress

augeant, vel denique novas efficiant excretiones et detractiones humorum, quales natura neque instituerat unquam in statu sano, neque sine damno ferre potest.

63. Ut solidæ partes interdum flaccescunt, molliuntur, fere solvuntur, propriis muneribus impares factæ; sic fluidæ nonnunquam spissantur, et in massas solidas etiam durissimas formantur: unde organorum actiones impeditæ, dolor insignis, et varii et graves morbi.

64. Postremo, animantia quædam inter morborum causas recensenda sunt: nimirum quæ suam vitam aliorum malo tolerant. Ipse animalium dominus hujus-

modum vel denique efficiant novas excretiones et detractiones humorum, quales natura neque instituerat in statú sano, neque potest fieri sine damno.

63. *Ut interdum solidæ partes flaccescunt molliuntur, ferè solvuntur, (et sunt) factæ impares propriis munerîbus; sic fluidæ (partes) nonnunquam spissantur, et formantur in massas solidas etiam durissimas; unde actiones organorum (sunt) impeditæ, dolor (est) insignis, et (sunt) varii et graves morbi.*

64. *Postremò, quædam animantia sunt recensenda inter causas morborum; nimirum quæ tolerant suam vitam malo aliorum. Ipse dominus animalium est præ-*

them, or at length, frequently diminish both the excretions and secretions, or increase them immoderately, or lastly, give rise to new excretions and discharges, such as nature would never have established in the healthy state, nor could take place without injury.

63. As the solid parts sometimes become flaccid, are softened and nearly dissolved, and are rendered unfit for their proper functions; so the fluid parts are sometimes thickened and formed into very hard solid masses; by which means the organic actions are impeded, there is remarkable pain, and various acute diseases.

64. Lastly, certain animals may be enumerated amongst the causes of diseases, namely those that support their life by the disease of others. The lord himself of the animals

modi animantibus prædæ est et domicilio, quæ vel extrinsecus invadunt, vel intus habitant, et viscera adhuc vivi rodunt, sæpe cum insigni malo et vitæ discrimine, nec raro ipsius jactura.

65. Verum neque tot tantisque periculis homo inermis objicitur; neque, simul ac morbus invaserit, nulla superest salutis spes. Inest enim corpori vis prorsus mirabilis, quâ contra morbos se tueatur, multos arceat, multos jam inchoatos quam optime et citissime solvat, aliosque suo modo, ad felicem exitum lentiùs perducat.

66. Hæc *Autocrateia* seu *Vis Naturæ medicatrix* vocatur; medicis atque philosophis notissima, et mul-

dæ et domicilio animantibus hujusmodi, quæ vel invadunt extrinsecus, vel habitant intus, et rodunt viscera corporis adhuc vivi sæpe cum insigni malo et discrimine vitæ, nec raro jacturâ ipsius.

65. *Verum neque homo inermis objicitur tot tantisque periculis; neque, nulla spes salutis superest, simul ac morbus invaserit. Enim vis prorsus mirabilis inest corpori quâ (vi) corpus se tueatur contra morbos, arceat multos (morbos), solvat multos jam inchoatos, quam citissimè et optimè, que lentiùs perducat alios suo modo, ad felicem exitum.*

66. *Hæc (vis) vocatur Autocrateia seu Vis medicatrix Naturæ; notissima medicis atque philosophis et*

is a prey and habitation to vermin of this kind, which either attack externally or inhabit within, and corrode the viscera of the body whilst living, frequently producing great danger and risk, and not unfrequently the loss of life.

65. Man is not exposed defenceless to so many and great dangers, nor is he left hopeless as soon as a disease attacks him. For there is an astonishing power in the body, by which it protects itself against diseases, drives off many others, relieves those already commenced, in the speediest and best manner, and conducts others by a slower process, in its own way, to a favourable termination.

66. This power is called Autocrateia, or Vis medicatrix Naturæ, well known to medical men and philosophers, and

tum neque immerito celebrata. Hæc sola ad multos morbos sanandos sufficit, in omnibus fere juvat: quin et medicamenta sua natura optima tantum solummodo valent, quantum hujus vires insitas excitent, dirigant, gubernent. Medicina enim neque prodest cadaveri, neque repugnante natura quicquam proficit. — Hîc plane est aliquid similis et communis inter salutares vires remediorum, et nocentes causarum morborum, de quibus jam (47) dictum est.

67. His Naturæ viribus vulnera sanantur, sanguinis fluxus compescitur, ossa diffracta coalescunt, multa noxia e corpore ejiciuntur, et sic, quæ nulla ars attin-

celebrata multum neque immeritò. Hæc (vis) sola sufficit ad sanandos multos morbos, ferè juvat in omnibus (morbis); quin et medicamenta optima suá naturá, solummodo tantùm valent, quantum excitent, dirigant, gubernent vires hujus. Enim medicina neque prodest cadaveri, neque proficit quicquam, naturá repugnante. Hic planè est aliquid similis et communis inter salutares vires remediorum, et nocentes (vires) causarum morborum, de quibus jam dictum est (47).

67. *His viribus Naturæ vulnera sanantur, fluxus sanguinis compescitur, ossa diffracta coalescunt, multa noxia ejiciuntur e corpore, et sic mala quæ nulla ars*

much and deservedly celebrated. This power alone is sufficient to cure many diseases, and is generally useful in all; and medicines of the best description are only useful inasmuch as they excite, direct, and govern the powers of this principle. For medicine is neither of use to a dead body, nor of any avail if nature is opposed to it: there is something alike and in common between the salutary influence of remedies and the noxious causes of diseases, of which we have already spoken.

67. By these powers of nature wounds are healed, hæmorrhage is stopped, fractured bones are united, and noxious things are thrown out of the body, and thus maladies, which no art could reach, disappear spontaneously and without any external aid.

gere potuisset mala, sine ope externa sua sponte evanescunt.

68. Merito igitur his viribus Medici confidunt, easque conantur languentes excitare, aut si plane defecerint, tum solitas earum actiones arte imitari. Non tamen iis solis semper fidendum est; quippe quæ in quibusdam morbis nullæ sint, in multis vero nimiæ et adeo vehementes, ut sint quam ipse morbus magis metuendæ.

69. Leviores morbi Naturæ viribus satis tuto relinquuntur; sed nemo sanus, hydropem, vel *luem veneream*, vel visceris cujusvis inflammationem, iisdem commiserit: scilicet

potuisset attingere, evanescunt suá sponte sine ope externá.

68. *Igitur meritò medici confidunt his viribus, que conantur excitare eas languentes, aut si planè defecerint, tum imitari arte solitas actiones earum. Tamen non semper fidendum est iis solis; quippe*[24], *quæ*[24] *sint nullæ in quibusdam morbis, verò nimiæ et adeò vehementes in multis, ut sint metuendæ magis quàm ipse morbus (metuendus est).*

69. *Leviores morbi satis tutò relinquuntur viribus Naturæ; sed nemo sanus, commiserit hydropem, vel luem veneream vel inflammationem, cujusvis visceris iisdem (viribus); scilicet,*

68. Therefore medical men properly trust to these powers, and endeavour to excite them when languid, or if they have evidently failed, to imitate their actions by artificial means. However, we must not always trust to them alone, for in some diseases they are of no avail, and so excessive and violent in others, that they are more to be feared than the disease itself.

69. The more slight diseases are very safely left to the powers of nature; but no sensible man would trust dropsy, or Lues Venerea, or inflammation of any viscus to them alone; for in the former they are of no avail; but in the latter most

24. *Quippe, qui, quæ*, or *quod*, often occurs, and may generally be rendered by, as it, as she, or as they, or certain words may be considered as understood to complete the sense, as in the present case, for instance *quippe (sunt actiones) quæ.*

quæ in illis morbis nullæ sint; in his autem vehementissimæ, verum ineptæ, et valde periculosæ, et gangrænam, vel suppurationem fere haud minus exitialem, effecturæ.

70. A duplice errore igitur cavere oportet;—neque vires Naturæ spernere, neque nimis religiose colere. Tantum enim abest ut semper illius vestigia premere conveniat, ut sæpe necesse sit contrarium prorsus iter tenere, contraque ejus conatus summa ope niti.

71. Neque Medici officium tam arcto limite cohiberi ipsa Natura docet: suggerit enim prodiga, innumera remedia quæ maximis viribus in corpore hu-

quæ sint nullæ in illis morbis; autem in his, vehementissimæ, verùm ineptæ, et valde periculosæ, effecturæ et gangrænam, vel suppurationem ferè haud minùs exitialem.

70. Igitur oportet cavere a duplice errore;—neque spernere vires Naturæ, neque colere nimis religiosè. Enim tantum[25] *abest,*[25] *ut*[25] *semper conveniat*[25] *premere vestigia illius, ut sit sæpe necesse tenere iter prorsus contrarium, que niti summâ ope contra conatus ejus.*

71. Neque ipsu Natura docet officium Medici cohiberi tam arcto limite; enim illa suggerit prodiga (et) innumera remedia quæ pollent maximis viribus in cor-

potent, but inappropriate and very dangerous; tending to produce gangrene or suppuration, not much less destructive.

70. Therefore it is necessary to beware of the two-fold error—neither to disrespect the powers of nature, nor to rely upon them too scrupulously. For it is so far improper always to follow in her steps, that it is frequently necessary to take a directly opposite course, and to strive against her efforts with all our power.

71. Nature herself shows that the office of the medical man is not confined to such narrow limits; for she suggests innumerable and powerful remedies, which produce very

25. *Tantum abest, ut semper conveniat*, so far is it from being proper, like *tantum abest miles ut perturbaretur*, so far is the soldier from being frightened.

mano pollent, et varias et saluberrimas mutationes in eo efficere valent. Hoc modo etiam plurimæ morborum causæ a solerte medico in præstantissima auxilia converti queant; scilicet, quicquid corpus vehementer afficit, eidem nunc neci (53, 62), nunc iterum remedio, esse potest.

72. Medici vero est, cognita natura et causa morbi, judicare quid mutationis requiratur, ut morbus in sanitatem mutetur. Hæc quidem est medicina rationalis sive *Dogmatica*. Est et altera, *Empirica* nimirum, quæ, missis hujusmodi ambagibus, sola remedia

pore humano, et valent efficere varias et saluberrimas mutationes in eo. Hoc modo etiam plurimæ causæ morborum queant converti a solerti medico in præstantissima auxilia; scilicet quicquid afficit corpus vehementer, nunc potest esse neci[26] *eidem*[26]*, nunc iterum remedio (eidem).*

72. *Verò est officium Medici, naturâ et causâ morbi cognitâ, judicare quid mutationis requiratur, ut morbus mutetur in sanitatem. Hæc medicina quidem est (medicina) rationalis sive Dogmatica. Et est altera (medicina) nimirum Empirica, quæ, ambagibus hujusmodi*

great effects on the human body, and are able to effect many and very salutary changes within it. In this way, many causes of diseases may be converted by a skilful physician into most powerful auxiliaries; for whatever has a powerful effect upon the body, at one time may be its death, at another time its cure.

72. It is the duty of the physician, having become acquainted with the nature and cause of disease, to decide what change may be required, that disease may be converted into health. This kind of medical practice is called rational, or dogmatic. But there is another kind; namely, the empirical, which laying aside shackles and doubts of this description, seeks for single remedies, and brings them forward as

quærit et profert certa et definita vi prædita ad certos morbos delendos.

73. Hujusmodi remedia omnis circumforaneus medicus jactat, omnis anus se credit possidere; populusque, qui fere decipi quam sapere mavult, talibus remediis semper fidit; neque profecto, postquam sanitatem cum re amiserit, facile sinit gratissimum menti errorem eripi; scilicet quem nolit intueri, adeo blanda est sperandi pro se cuique dulcedo. Quàm pauca vero istiusmodi remedia adhuc reperta fuerint, peritissimi medici fatentur et dolent. Quod si remedia quædam fuerint quæ vi nondum explorata aut intellecta in cor-

missis, quærit sola remedia et profert illa prædita vi certâ et definitâ ad delendos certos morbos.

73. Omnis circumforaneus medicus jactat remedia hujusmodi, omnis anus credit se possidere, quæ populus, qui fere mavult decipi quam sapere, semper fidit talibus remediis; neque profecto, postquam populus amiserit sanitatem cum re, sinit facilè gratissimum errorem eripi menti; scilicet quem nolit intueri, adeo blanda est cuique dulcedo sperandi pro se. Vero medici fatentur et dolent quam pauca remedia istiusmodi adhuc fuerint reperta. Quod si fuerint quædam remedia, quæ pollent in corpore humano vi nondum exploratâ

possessing a certain and specific power, in eradicating certain diseases.

73. Every wandering quack boasts of remedies of this description, every old woman thinks that she possesses some, and the multitude, who would rather be deceived than instructed, always put confidence in such remedies; nor even after losing their health, together with their money, will they easily permit that most grateful delusion to be eradicated; a delusion they will not see, so sweet is the pleasure of hoping in their own cases. Medical men confess and lament, that so few remedies of this description have been discovered. That there should be remedies, which possess some undiscovered and unknown influence upon the human

pore humano pollent, id minime mirum; quippe quia tot existant morbi quorum natura et causæ prorsus lateant. Cæterum, quo perfectior fuerit scientia medica, eo facilius erit medicamentorum virium, et modi quo corpus afficiant, variisque in morbis prosint, rationem reddere.

74. Remedia igitur ordinari solent, secundum effectus manifestos quos in corpore humano præstant. —Afficiunt vel partes solidas vel fluidas. Illas alunt, consumunt, firmant, laxant, excitant, sopiunt. Has vel quantitate vel qualitate vitiatas, corrigunt, atque evacuant; idque vel viis naturalibus, vel aliis insolitis et arte factis. — Nec desunt

aut intellectá, id est minimè mirum quippe quia tot morbi existant, natura et causæ quorum (morborum) prorsùs lateant. Cæterum, quo perfectior scientia medica fuerit, eò faciliùs erit scientia virium medicamentorum et reddere rationem modi quò afficiant corpus, que prosint in variis morbis.

74. *Igitur remedia solent ordinari, secundùm effectus manifestos, quos præstant in corpore humano. Vel afficiunt partes solidas vel fluidas. (Illa remedia) alunt, consumunt, firmant, laxant, excitant, (vel) sopiunt illas (partes). Corrigunt atque evacuant has, vitiatas quantitate, vel qualitate; que id (factum est) vel viis naturalibus vel aliis*

body, is by no means surprising, because there are so many diseases, the causes and nature of which are hitherto concealed. But the more perfect medical science becomes, so much more easy will be the knowledge of the powers of medicines, both in explaining their modus operandi, and in what diseases they are useful.

74. Therefore remedies are usually ordered, according to the evident effects, which they produce in the human body: they either affect the solid or fluid parts. They nourish, consume, strengthen, relax, excite or depress them. They correct and evacuate them, when vitiated in quantity or quality; and this takes place either by the natural passages, or by others unusual, or produced by artificial means.

auxilia adversus concretiones intra corpus formatas, aut animalia in eodem hospitantia (63, 64).—Medicamentorum vero effectuum et modi quo corpus efficiunt, scientia, *Therapeia* vocatur.

(viis) insolitis vel factis arte. Nec auxilia desunt adversus concretiones formatas intra corpus, aut animalia hospitantia in eodem (63, 64). — *Vero scientia effectuum medicamentorum et modi quo afficiunt corpus, vocatur Therapæia.*

Nor are remedies wanting, for concretions within the body, or against animals lodging in the same, (63. 64). The knowledge of the effects of medicines, and their mode of operation, is called Therapeia or Therapeutics.

CAP. II.—*De solida materia ex qua corpora animalium fiunt, variisque ejus dotibus, tum chemicis tum mechanicis; de conjecturis circa ejus ultimam et minutissimam fabricam; de tela reticulata; necnon de adipis origine, natura, et usu.*

75. CORPUS humanum constat ex partibus solidis et fluidis; quarum mutuâ actione functiones vivi hominis (quatenus corporeæ sunt) peraguntur. Utræque assidue mutantur et renovantur; solidæ vero lentius. Ab his igitur incipiendum est; quippe quæ universo corpori formam et firmitatem dent.

CAP. II.—*De solidâ materiâ ex quâ corpora animalium fiunt, que de variis dotibus ejus, tum chemicis tum mechanicis; de conjecturis circa ultimam et minutissimam fabricam ejus; de telâ reticulatâ; necnon de origine, (de) naturâ et (de) usû adipis.*

75. CORPUS *humanum constat ex partibus solidis et fluidis, mutuâ actione, quarum (partium) functiones vivi hominis (quatenus illæ functiones sunt corporeæ) peraguntur. Utræque mutantur et renovantur assiduè; verò solidæ lentius. Igitur incipiendum est (nobis) ab his; quippe quæ dent formam et firmitatem universo corpori.*

CHAP. II. *On the solid substance of which animal bodies are formed, its various properties, both chemical and mechanical; on the conjectures respecting its ultimate and minute structure; on the cellular substance; and on the origin, nature, and use of the fat.*

75. The human body consists of solid and fluid parts, by the mutual actions of which the functions of living man (inasmuch as they are corporeal) are performed. They are both being constantly undergoing change and renewal; the solid ones more slowly. Therefore we must begin with the latter; for it is these which give form and strength to the entire frame.

76. Solidam materiam ex qua corpora animalium constant, solidum animale brevitatis causa, vocamus. Hoc autem varias habet dotes, *chemicas*, *mechanicas*, vitales; quarum nulla non medici attentionem meretur.

77. Exquisita hujus ævi *Chemia* diversas *substantias*, sive *principia* ut dicuntur, in variis solidis partibus humani corporis detexit; easque substantias seorsim exhibere docuit. 77. *Chemia exquisita hujus ævi detexit diversas substantias, sive principia ut dicuntur, in variis partibus solidis humani corporis; que docuit (nos) exhibere eas substantias separatim. Imprimis (Chemia) ostendit (esse) in ossibus præcipuè plurimam terram, nimirum calcem, non quidèm puram, sed conjunctam cum quibusdam acidis, præsertim (acido) phosphorico. Hic Phosphas Calcis, cum pauxillo Carbonatis Calcis, dat fir-*

76. We call the solid material of which animal bodies consist, the animal solid, for the sake of brevity. This again has different properties, chemical, mechanical, and vital; neither of which are undeserving the attention of the medical man.

77. The refined chemistry of the present age has discovered different substances, or principles, as they are called, in the various solid parts of the human body; and has taught us how to show these substances in a separate state. In the first place, chemistry shows that there is much earthy matter in bones; namely, lime, not in a pure state, but combined with certain acids, especially the phosphoric. This phosphate of lime, with a little carbonate, gives strength to

dat ossibus; et cum *Cartilagine*, et multa *Gelatina*, et *oleo crasso*, ossa fere tota efficit. Plurima quoque *Gelatina*, et pro rata parte parum terræ, inest *telæ cellulosæ*, et cuti, aliisque membranis quæ ex ea tela fiunt, et demum musculis. In his vero alia reperitur substantia animalis; plurima scilicet *Fibrina*. *Albumen* quoque in quibusdam partibus solidis corporis humani plane neque parce detectum est; maxime in *cartilaginibus*, et *tendinibus*, et *ligamentis*. Præter hæc multum *oleum crassum* in omnibus fere solidis animalibus reperitur; et *sales* quidam tam *acidi* quam *alcalini*; et interdum, ut videtur, sed multo parcius, aliæ quædam minoris

mitatem ossibus; et cum Cartilagine, et multâ Gelatinâ, et oleo crasso, fere efficit ossa tota. Quoque plurima Gelatina, et parum terræ pro rata parte, inest telæ cellulosæ, et cuti, quæ aliis membranis quæ fiunt ex eâ telâ, et (inest) demum musculis. Verò alia substantia animalis reperitur in his; scilicet plurima Fibrina. Albumen quoque planè neque parcè detectum est, in quibusdam partibus solidis corporis humani, maximè et cartilaginibus, et tendinibus, et ligamentis. Præter hæc multum oleum crassum reperitur ferè in omnibus partibus solidis; et quidam sales tam acidi quam alkalini; et interdum ut videtur sed multo parciùs, quædam aliæ substantiæ mino-

the bones, and together with cartilage, and much gelatine, and thick oily matter, forms them nearly entirely. Much gelatine and little earthy matter, compared with the part mentioned, is present in the cellular substance, in the skin, and in the other membranes which are formed by that network; and there is, lastly, (little) in muscles. But another animal substance is found in them; namely, fibrine, in considerable quantity. Albumen likewise has been discovered evidently, and not sparingly, in some solid parts of the human body; particularly in the cartilages, tendons and ligaments. Besides these, much thick oil is found in nearly all the solid parts, as well as certain acid and alkaline salts; and moreover, some other substances of less import, are sometimes

Munera vitæ in variis motibus pleraque consistunt: ad multa eorum validissimi motus requiruntur. Tantâ igitur adhæsione partium opus est, ut hi sine lacerationis periculo perficiantur: oportet quoque, ob eandem causam, partes solidæ, aliæ magis, aliæ minus, se flecti sinant: denique, necesse est, ut partes ita flexæ, vel loco dimotæ, figuram et situm pristinum suâ sponte recuperent, quam primum vis dimovens sublata fuerit.

80. Variant multum hæ dotes, non modo variis partibus, sed et iisdem partibus in variis hominibus, et sæpe in eodum homine diversis temporibus. Hujusmodi varietates, quamvis satis insignes, valetudinem sæpè pa-

liendi.— Pleraque munera vitæ consistunt in variis motibus; validissimi motus requiruntur ad multa eorum (munerum). Igitur opus est tantâ adhæsione partium, ut hi perficiantur sine periculo lacerationis; quoque oportet (ut), ob eandem causam, partes solidæ, aliæ magis aliæ minus, sinant se flecti: denique necesse est, ut partes ita flexæ, vel dimotæ loco, recuperent suâ sponte figuram et situm pristinum, quam vis dimovens primùm sublata fuerit.

80. *Hæ dotes variant multùm non modo in variis partibus, sed et in iisdem partibus in variis hominibus, et sæpe diversis temporibus in eodem homine. Varietates hujusmodi, quamvis satis insignes sæpe parùm afficiunt*

most powerful motions are necessary to many of them. There is need of such a degree of cohesion of parts, that these motions may be executed without danger of laceration; it is likewise necessary, for the same reason, that the solid parts, some more, some less, should allow of flexion; lastly, it is necessary, that the parts so bent, or removed from their situation, should recover spontaneously that shape and primary position, which the displacing power had previously taken away.

80. These properties vary considerably, not only in the different parts, but also in the same parts, in different persons, and frequently at different times in the same individual. Varieties of this description, although remarkable,

rum afficiunt. Nonnunquam verò, sanitatis limites transeuntes, manifestos et sanè haud leves morbos faciunt.

81. Duplice modo variare aut vitiari potest, quod ad dotes *mechanicas*, omnis pars solida; scilicet, aut nimia aut nimis parva adhæsione, aut mollitie, aut vi resiliendi. Auctâ adhæsione seu firmitate partis cujusvis solidæ, augetur plerumque ejus resiliendi vis; mollities autem necessario minuitur. Imminutâ vero adhæsione, mollities major fit et vicissim vis resiliendi minor.

82. Causæ horum effectuum certè multiplices sunt: tamen ad certa capita reduci possunt. Aut ipsa materiæ compositio *chemica* vitiatur, aut, salvâ omnino

valetudinem. Verò nonnunquam, transeuntes limites sanitatis, faciunt morbos manifestos, et sanè haud leves.

81. *Omnis pars solida potest variare, aut vitiari duplice modo (in eo) quod (attinet) ad dotes mechanicas; scilicet aut nimiá aut nimis parvá adhæsione aut mollitie, aut vi resiliendi. Adhæsione seu firmitate cujusvis partis solidæ auctá, plerumque vis resiliendi ejus, augetur; autem mollities necessariò minuitur. Verò adhæsione imminutá, major mollities fit, et vicissim minor vis resiliendi (fit).*

82. *Causæ horum effectuum sunt certè multiplices; tamen possunt reduci ad certa capita. Aut ipsa chemica compositio materiæ vitiatur, aut compositione om-*

have little effect upon the health. Still sometimes they overpass the limits of health, and produce evident diseases of no slight description.

81. Every solid part may vary, or be disordered, in two ways, in what relates to its mechanical properties; namely, either by excess or diminution of adhesion, flexibility, or elasticity. The adhesion or firmness of any part being increased, generally its elasticity is increased also; but the softness is necessarily diminished. When cohesion is diminished, there is more softness, and consequently less elasticity.

82. The causes of these effects are indeed manifold, but admit of being reduced to certain heads. Either the che-

compositione, particulæ ita disponuntur, ut plus minusve fortiter semet invicem attrahant. Quod compositionem ejus *chemicam* attinet, omnia fortasse elementa (77, 78), varia quantitate, solido animali inesse possunt, et suum quodque peculiare vitium efficere. Sed de multis horum nihil certi novimus: satis vero constat, materiam humidam, quæ fere aqua est, et siccam, quæ ex diversis elementis constat, multum variare: quo plus humidæ, eo minus adhæsionis aut vis resiliendi, plus vero mollitiei; et contra omnino, si nimium siccæ materiæ in compositione fuerit.

nino salvâ, particulæ ita disponuntur, ut attrahant semet invicem plus minusve fortiter. Quod attinet ad compositionem chemicam ejus, fortasse omnia elementa (77, 78) possunt inesse animali solido, variâ quantitate (et) efficere suum quodque peculiare vitium. Sed novimus nihil certi de multis horum; vero satis constat, materiam humidam, quæ est ferè aqua, et (materiam) siccam, quæ constat ex diversis elementis, variare multùm; quo plus sit humidæ (materiæ), eò minus (erit) adhæsionis aut vis resiliendi, vero erit plus mollitiei; et contra omnino, si fuerit nimium siccæ materiæ in compositione.

83. Variæ sunt causæ re-

83. *Variæ causæ remotæ*

mical composition of the substance is disordered, or with this composition entirely in a sound state, the particles may be so arranged, that they mutually attract each other more or less forcibly. As to its chemical composition, perhaps, all the elements may be present in the animal solid, in different quantities, and produce each of them its peculiar disorder. Of this we know nothing certain; but there is ample evidence, that the moist substance which is almost water, and the dry substance which consists of the different elements, vary amazingly; the more moisture there is, the less cohesion or elasticity, there will be, but more softness; and altogether the reverse, if there be too much dry matter in the composition.

83. There are various remote causes of excessive or

motæ (37 et seq.) alterutrius materiæ vel abundantis vel deficientis. Ipsa imprimis constitutio corporis congenita multum huc confert. Quidam, præ cæteris, homines et viri præ fæminis in universum, duriorem et sicciorem corporis compaginem habent, vix, ac ne vix quidem, ullo vitæ genere penitus mutandam.

84. Ætas vero majus adhuc discrimen facit; a prima enim ad ultimam usque siccius et durius evadit quotidie corpus: a fluido, nempe, et crudo fœtu, ad rigidum et exsuccum senem, cui vita, propter hanc ipsam causam, fere deficit.

85. Victus porro, quo homines utuntur, prout plus minusve aquosa fuerit, similem solidarum partium

sunt (37 et seq.) vel abundantis vel deficientis alterutrius materiæ. Imprimis ipsa constitutio congenita corporis multum huc confert. Quidam homines præ cæteris, et viri præ fæminis universum habent duriorem et sicciorem compaginem corporis, vix, ac ne quidem vix, penitus mutandam ullo genere vitæ.

84. *Verò ætas facit adhuc majus discrimen; enim corpus evadit quotidie siccius et durius a primâ usque ad ultimam (ætatem); nempe a fluido et crudo fœtu, ad rigidum et exsuccum senem; cui vita ferè deficit, propter hanc causam ipsam.*

85. *Porrò victus, quo homines utuntur, efficit similem conditionem partium solidarum, prout (victus) fuerit*

defective matter of either kind. The congenital constitution of the body especially contributes much to this. Some men, compared with others, and males compared with females in general, possess a harder and drier frame of body, which is scarcely susceptible of change by any mode of living whatever,

84. Age makes a still greater difference, for the body becomes daily harder and drier, from first to last; namely, from the state of the fluid and ill formed fœtus, to the rigid and sapless old man, in whom life fails on account of this very cause.

85. Moreover the food which men use produces a similar condition of the solid parts, according as the food is more or

conditionem efficit. Hoc, in aliis animalibus dudum observatum, in homine quoque, aliquatenus saltem accidere videtur. Neque ratio gravissima deest cur credamus, non corporis modo conditionem et vires, sed et animi indolem, a victus genere quodammodo pendere.

86. Multum quoque pendet a bonâ vel pravâ ejusdem cibi concoctione, et ab appositione nutrimenti ex eo parati.

87. Denique, status aëris, scilicet, quod ad humorem vel siccitatem, corpus haud parum afficit. Hinc monticolæ, vel qui siccas regiones habitant, ab incolis humidarum et paludosarum multum diversi.

plus minùsve aquosa. Hoc dudum observatum in aliis animalibus, videtur accidere, quoque in homine saltem aliquatenùs. Neque ratio gravissima deest cur credamus, non modo conditionem et vires corporis, sed et indolem animi pendere quodammodo a genere victùs.

86 *Quoque multum pendet a bonâ vel pravâ conditione ejusdem (cibi) concoctione, et ab oppositione nutrimenti parati ex eo.*

87. *Denique status aeris scilicet (in eo) quod (attinet) ad humorem vel siccitatem, afficit corpus haud parum. Hinc monticolæ vel (illi) qui habitant siccas regiones (sunt) multum diversi ab incolis (regionum) humidarum et paludosarum.*

less watery. This circumstance, already observed in other animals, likewise occurs in man, at least to a certain extent. Nor is there any very cogent reason why we should not consider, that not only the condition and strength of the body, but also the disposition of the mind, depends in some degree on the kind of food.

86. Much also depends upon the good and depraved state of the food, by boiling, and the disposal of the nutriment obtained from it.

87. Lastly, the state of the air in reference to moisture, or dryness, affects the body considerably. Hence the inhabitants of mountains, or those living in dry districts, are different from the inhabitants of damp and marshy countries.

88. Postremo, vitæ genus ad eundem effectum nonnihil confert. Exercitatio corporis, quod nimium humoris fuisset, exprimit atque exhalat. Ignavia contrarium prorsus effectum habet, partesque humidiores abundare facit.

89. Verum, salvâ omninò compositione *chemicá* soli darum partium, harum conditio ab aliis causis multùm affici potest. Densatio nimirum particularum, sive a causis *mechanicis*, sive a calore et frigore, variam efficiet partis cujuslibet firmitatem et vim resiliendi.

90. Quantum hic valeat compressio *mechanica*, clar. *Clifton Wintringham* experimenta luculentèr docent. — Distentio quoque *solidi animalis* dotes ejus jam memoratas haud pa-

88. *Postremò genus vitæ nonnihil confert, ad eundem effectum. Exercitatio corporis, exprimit et exhalat, quod humoris fuisset nimium. Ignavia habet prorsus contrarium effectum, que facit partes humidiores abundare.*

89. *Verum, compositione chemicá harum partium omnino salvá, conditio harum potest affici multùm ab aliis causis. Nimirum densatio particularum, sive a causis mechanicis, sive a calore et frigore, efficit variam firmitatem et vim resiliendi cujuslibet partis.*

90. *Quantum compressio mechanica hic valeat, experimenta clarissimi Clifton Wintringham luculentèr docent. Quoque distentio animalis solidi afficit haud parum dotes ejus jam memora-*

88. Lastly, mode of life contributes somewhat to the same effect. Exercise of the body presses out and exhales the fluid which is in excess; indolence has a contrary influence, and causes the more moist parts to be abundant.

89. But, even if the chemical composition of these parts be entire, the condition of them may be much affected by other causes; for instance, thickening of the particles, either from mechanical causes, or from heat and cold, produces a different degree of firmness and elasticity of any part.

90. The experiments of the illustrious Clifton Wintringham lucidly demonstrate the influence of mechanical pressure: distension, likewise, of the animal solid, affects

rum afficit. Quo plus tenditur, eo durius, et firmius, et magis resiliens evadit, eoque difficiliùs ulteriorem patitur distentionem, donec tandem, ampliùs distendi impatiens, novâ admotâ vi, distrahitur et dirumpitur, superatâ nimirum particularum adhæsione, quâ hæc debilior fuerit. Hinc ratio, non plenè quidem (nam multùm pendet a principio vitali, primâque corporis fabricâ) sed aliquatenus saltem, deducenda est multarum rerum quæ summi momenti sunt; corporis incrementi, status, imminutionis, firmitatis indies crescentis, et mortis senilis inevitabilis.

91. Varia fortasse solidarum partium densitas ab

tas. Quò plus animale solidum tenditur, eò evadit durius, et firmius, et magis resiliens, que eò difficiliùs patitur ulteriorem distentionem donec tandem, impatiens distendi ampliùs, vi novâ admotâ, distrahitur et dirumpitur, nimirum adhæsione particularium superatâ, quâ hæc fuerit debilior. Hinc ratio non plenè quidem (nam multum pendet a vitali principio, que fabricâ primâ corporis) sed aliquatenus saltem est deducenda multarum rerum quæ sunt summi momenti; (scilicet ratio) incrementi corporis, statûs, imminutionis, firmitatis crescentis indiès, et inevitabilis mortis senilis.

91. *Fortasse varia densitas solidarum partium deri-*

in no slight degree the properties already mentioned. The more the animal solid is stretched, the harder and firmer, and more elastic it becomes; and with so much more difficulty does it admit of further distension, until at length, not bearing increased distension, if a fresh force be applied, it is torn and ruptured; that is to say, the cohesion of the particles is overcome in the part in which it was weaker. Hence a reason, not manifest, indeed, (for much depends upon the vital principle, and the primary fabric of the body) is to be deduced, of many things of the greatest importance; namely, the reason of the increase of the body, of the stature, and decay, of the daily increasing strength, and of the inevitable death of old age.

91. The various density of the solid parts is possibly

ipsâ Naturâ derivatur. Sed magis constat de viribus exercitationis, aut ignaviæ, in statu earundem mutando. Quarum igitur effectus generales, tam boni quam mali, in partibus solidis, facile intelligentur.

92. Porro, diuturnâ quiete, pars quælibet natura mobilis, veluti junctura artus, paulatim rigescit, pristinam mobilitatem tardè, fortasse nunquam penitus, recuperatura: et contra, valido et crebro usu, modo hic non nimius fuerit, omnes fere corporis partes miram sæpe adipiscuntur mobilitatem. Neque profectò melius datur aut certius remedium ad superandam illam rigiditatem artuum quæ longâ quiete induci solet, quam frequens

vatur ab naturá ipsá. Sed magis constat de viribus exercitationis, aut ignaviæ, in mutando statú earundem effectus generales quarum (virium) tam boni quam mali, in partibus solidis igitur, facilè intelligentur.

92. *Porrò, quælibet pars mobilis naturá (suá), veluti junctura artús, paulatim rigescit, diuturná quiete, recuperatura tardè pristinam mobilitatem fortasse nunquam penitus: et contra, fere omnes partes corporis sæpe adipiscuntur miram mobilitatem valido et crebro usú, modo hic (usus) non fuerit nimius. Neque profectò melius aut certius remedium datur, ad superandum illam rigiditatem artuum, quæ solet induci longá quiete, quam frequens exer-*

derived from nature itself. But there is greater evidence of the influence of exercise, or indolence, in changing their condition; the general effects of these, either good or bad, upon the solid parts, will be therefore easily understood.

92. Any part naturally enjoying motion, as the joint of a limb, gradually becomes rigid by long continued rest, and recovers its former mobility slowly, and perhaps never completely: on the other hand, nearly all parts of the body often acquire a surprising degree of mobility, by active and frequent use, provided it be not in excess. Nor, indeed, is there a better or more sure remedy, for recovering from the rigidity of the joint, which is apt to be brought on by long rest, than frequent exercise; which (is) at first difficult, and

exercitatio, quæ primo difficillima, et diu exigua, fere indies facilior, liberior, et perfectior evadit.

93. Calor corpora omnia laxat atque expandit: frigus vero densat et durat. Utrumque effectum homines probè experiri solent. Quamvis corpus suum ferè semper calorem conservet, fieri nequit quin ejus superficies saltem ab aëre ambiente externo afficiatur. Neque exigua vis est, quâ calor hoc modo in universo corpore polleat. Quam longè aliter se habet, qui, fervido Austro spirante, hebes et languidus factus, membra sua ægrè trahit, ac ille, qui, sub frigido Aquilone, cursu glaciali se exer-

citatio, quæ primò difficillima, et diù exigua, ferè evadit indies facilior, liberior et perfectior.

93. *Calor laxat, atque expandit omnia corpora: vero frigus densat, et durat (omnia corpora). Homines probè solent experiri utrumque effectum. Quamvis suum corpus conservet ferè semper suum calorem, nequit fieri quin superficies ejus saltem afficiatur ab aëre externo ambiente. Neque est vis exigua, quâ calor polleat hoc modo, in universo corpore. Quam longè aliter (ille) habet se, qui factus hebes et languidus (sub) fervido Austro spirante trahit sua membra ægrè, ac ille, qui, sub frigido Aquilone, exercet se cursu glaciali, firmus (secundum)*

for some time of very limited, (but) commonly becomes daily, more practicable, more free, and more perfect.

93. Heat relaxes and expands all bodies; but cold thickens and hardens them. Men are accustomed to experience both effects. Although the body may commonly preserve its temperature, the surface at least must be affected by the external ambient air. Nor is that influence slight, by which heat prevails in this way, in the whole system. What a difference between the individual, who, exposed to the hot southern blasts, is rendered dull and languid, and scarcely drags his limbs along, and him, who, under the cold northern winds, exercises himself on the icy tracks, strong, active, and nimble in his entire frame.

cet, universum corpus firmus, mobilis, expeditus.

94. Variæ causæ, quæ singulæ tot modis dotes *solidi animalis* afficere solent, conjunctæ majores adhuc effectus præstant: docent experimenta a *Bryan Robinson* instituta; docent effectus balnei calidi; docet quotidiana experientia.

95. Ex hac materia variæ corporis partes, variis muniis aptæ, fiunt. Nondum certâ fide constat, quænam sit *solidi animalis* ultima et minutissima fabrica: Sive ex fibris, filis scilicet longis, parum latis, varie inter se textis, constet, ut docet *Boerhaavius;* sive ex fibris serpentinis, mirum in modum convolutis, ut quædam observationes nuper factæ

totum corpus, mobilis, (et) expeditus.

94. Various causes, which when separate affect the properties of the animal substance in so many ways, produce still greater effects when combined: this we are taught by the experiments made by Bryan Robinson, by the effects of the warm bath, and by daily experience.

95. Various parts of the body, adapted to the different functions, are formed by this substance. There is nothing known for certain, what is the ultimate and most minute structure of the animal solid; whether it is composed of fibres, or long threads nor broad, variously interwoven, as Boerhaave teaches; or of serpentine fibres admirably convoluted, as late observations seem to inculcate; or whether the cellular substance is composed of fibres and laminæ (or plates), and the chief

suadent; sive ex fibris laminisque *tela cellulosa* fiat, et ex hac maxima pars omnium partium corporis, ut celeb. *Hallerus* ostendere conatus est.

96. De fibris earumque dotibus, alibi locus erit dicendi (109, et seq.) *Tela cellulosa* ubique in corpore observatur; fibras ipsas, quæ in multis partibus satis manifestè apparent, circundat et nectit, et varias partes, quæ motum aliquem in vicinas habere debent, leviter conjungit. Eadem probè densata, firmissimas, et quæ videntur tenuissimæ, membranas facit: Quarum quæ simplicissimæ apparent, accuratiùs exploratæ, hanc structuram ostendunt.

97. Crescit sæpe mirum in modum *tela cellulosa*,

tiones nuper factæ suadent; sive tela cellulosa fiat ex fibris que laminis, et maxima pars omnium partium corporis fiat ex hâc, ut celeberrimus. Hallerus conatus est ostendere.

96. *Locus erit dicendi alibi de fibris que dotibus earum (109, et seq.) Tela cellulosa observatur ubique in corpore; circundat et nectit fibras ipsas, quæ apparent satis manifestè in multis partibus, et leviter conjungit varias partes quæ debent habere aliquem motum in vicinas (partes). Eadem probè densata facit membranas firmissimas, et quæ videntur (esse) tenuissimæ; quarum (illæ) quæ apparent simplicissimæ, exploratæ accuratiùs ostendunt hanc structuram.*

97. *Tela cellulosa sæpè crescit in mirum modum,*

part of the body is formed by it; as the celebrated Haller endeavoured to demonstrate.

96. There will be elsewhere a place for treating of fibres and their properties. Cellular substance is observed in all parts of the body; it surrounds and connects the fibres themselves, which are evident in different parts, and loosely unites various parts, which ought to exert some motion on those adjacent. The same substance being condensed forms the firmest and thinnest membranes; and those membranes which appear very simple, when examined more accurately, show this structure.

97. The cellular substance and parts composed of it, such

partesque ex ea factæ, membranæ, vasa, &c. imprimis lenta distensione; subita autem distentio eam vel rumpit, vel tenuiorem facit. Crescit quoque nonnunquam inter partes vicinas, easque jungit quas Natura liberas fecerat. Hujusmodi concretiones præter naturam sæpè observantur, post inflammationem pulmonis vel viscerum abdominis:—Et novæ istæ membranæ verè *cellulosæ* sunt.

98. Concrescit etiam suâ sponte, si secta vel alio modo separata fuerit. Quod si ingente inflammatione, et suppuratione facta, magna pars *telæ cellulosæ* destructa fuerit, tunc non renovatur, et fœda cicatrix relinquitur.

99. Quin et pars, ut fertur, vel ejusdem, vel alieni

quæ partes factæ ex eâ (scilicet) membranæ, vasa, &c. imprimis lentâ distensione; autem subita distentio vel rumpit eam, vel facit (eam) tenuiorem. Quoque nonnunquam crescit inter partes vicinas, que jungit eas quas Natura fecerat liberas. Concretiones hujusmodi præter naturam sæpe observantur, post inflammationem pulmonis vel viscerum abdominis:—Et istæ novæ membranæ verè sunt cellulosæ.

98. *Etiam (tela cellulosa) crescit suâ sponte, si fuerit secta vel separata alio modo. Quod si magna pars telæ cellulosæ fuerit destructa ingente inflammatione, et suppuratione factâ, tunc non renovatur, et fœda cicatrix relinquitur.*

99. *Quin et pars vel ejusdem vel alieni corporis*

as membranes, vessels, &c. frequently become enlarged to a wonderful extent, principally from slow distension; sudden distension ruptures it, or renders it more thin. It increases sometimes also between neighbouring parts, and unites those which nature had intended to be free. Unnatural adhesions of this description are observed, after the inflammation of the lungs or abdominal viscera. These new membranes are truly cellular.

98. It likewise increases spontaneously, if cut, or separated in any other manner; but if a considerable portion of it has been destroyed by slight inflammation or consequent suppuration, it is not renewed, but an ugly cicatrix is left.

99. Moreover a part of the same, or another body, as it is

corporis, alii interdum jungi potest hujusmodi concretione. Hoc, si ullo fundamento, nitebatur ars *Taliacotii;* et alia nupera multùm jactata, dentes transponendi.

100. *Tela cellulosa* est aliis partibus reticulata, aliis adipe referta. Scilicet, ubicunque magna moles, aut compressio, periculo aut incommodo fuissent, veluti in capite, pulmone, oculis, palpebris, pene, scroto, ibi nullum adipem colligit, sed laxa et pure reticulata est. At, inter musculos corporis et artuum, sub cute et in abdomine, imprimìs in omento et circa renes, plurimus adeps secernitur et colligitur.

101. Adeps purum oleum

(ut fertur), interdum potest jungi alii concretione hujusmodi. Ars Taliacotii nitebatur hoc, si ullo fundamento: et alia nupera multùm jactata (scilicet ars) transponendi dentes.

100. *Aliis partibus tela cellulosa est reticulata, aliis (est) referta adipe. Scilicet, ubicunque, (est) magna moles aut compressio, fuissent periculo aut incommodo, veluti in capite, pulmone, oculis, palpebris, pene, scroto, ibi colligit nullum adipem, sed est laxa et purè reticulata. At plurimus adeps, secernitur et colligitur inter musculos corporis et artuum, sub cute et in abdomine, imprimis in omento et circa renes.*

101. *Adeps est purum*

related, may sometimes be united to another, by a growing together of this description. The Taliacotian art rested in this, if there be any foundation for it; likewise the lately boasted art of transplanting teeth.

100. In some parts the cellular substance is reticulated, in others filled with fat; for wherever a great mass or compression would cause danger or inconvenience, as in the head, lungs, eyes, palpebræ, penis, and scrotum, there is no fat collected, but the membrane is loose and purely reticulated. Much fat is secreted and collected between the muscles of the body and limbs, under the skin, in the abdomen, especially in the omentum and about the kidneys.

101. Fat is a pure animal oil, slightly differing from the

animale est, ab oleis herbarum crassis et mitibus parùm diversus; in vita fluidus; sed variis partibus crassior aut tenuior. A sanguine secernitur, in ipsum facilè, et sæpè subitò, resorbetur, quamvis rarissimè sincerum oleum vel adeps in sanguine conspiciatur.

102. Verisimile est oleum per digestionem, partim in ventriculo et intestinis, partim in pulmone, in *fibrinam*, *gelatinam*, et *albumen* converti; et hæc iterum per secretionem in oleum revertere. Nulla profectò adipis organa secernentia ostenduntur. Oportet tamen istiusmodi sint, et fabrica quoque specialis *telæ cellulosæ* earum partium, quæ debent habere adipem,

oleum animale parùm diversus[28] *ab oleis crassis et mitibus oleis herbarum; (est) fluidus in vitâ; sed crassior aut tenuior variis partibus. (Adeps) secernitur a sanguine, resorbetur, facilè, et sæpe subitò in ipsum, quamvis rarissimè oleum sincerum vel adeps conspiciatur in sanguine.*

102. *Verisimile est oleum converti per digestionem in fibrinam, gelatinam, et albumen, partim in ventriculo et intestinis, partim in pulmone; et (verisimile) est hæc iterum revertere in oleum per secretionem. thick and bland oils of plants: it is fluid during life; but is thicker and thinner in the different parts. It is secreted from the blood, and is easily and often suddenly reabsorbed into it; yet pure oil or fat can very rarely be seen in the blood.

102. It is probable that oil is converted by means of digestion into fibrine, gelatine, and albumen, partly in the stomach and intestines, partly in the lungs, and that these are again converted by secretion into oil. No organs for the secretion of fat can be shown, still there must be such, as well as a particular structure of the cellular substance of those parts which ought to contain fat, that they may retain

28. *Diversus*, agreeing with *adeps*.

ut oleum jam secretum contineant neque ad alias transire sinant. Nam in partes purè reticulatas viam sibi nunquam aperit, quamvis per *telam cellulosam* facilis via sit aëri aut aquæ per totum corpus a capite ad calcem.

rum partium, quæ debent habere adipem, ut contineant oleum jam secretum, neque sinant (illud) transire ad alias (partes). Nam nunquam aperit sibi viam in partes purè reticulatas, quamvis sit facilis via per telam cellulosam aeri aut aquæ per totum corpus a capite ad calcem.

103. In tenero fœtu nihil adipis, in maturo parum reperitur. Infantes verò, modò benè aliti sint, ferè solent pinguescere, donec ambulare et propriis viribus semet exercere incipiant; tum graciles fiunt, et sic manent ad virilem usque ætatem, quâ minus crebrâ et validâ uti solent exercitatione. Tum quadrati fiunt et sæpè obesissimi: matura senectute, paulatim denuò marcescunt. Puellæ

103. *Nihil adipis reperitur in tenero fœtu parum (adipis reperitur) in maturo fœtu. Verò infantes modò sint bene aliti, solent pinguescere, donec incipiant ambulare et exercere semet propriis viribus, tum fiunt graciles, et manent sic usque ad virilem ætatem, quá (ætate) solent uti minûs crebrâ et validá exercitatione. Tum fiunt quadrati et sæpè obesissimi: denuò paulatim marcescunt matura*

the oil when secreted, nor allow its transit to other parts; for it never finds its way into parts purely reticulated, although they easily transmit air and water through the whole body, from the head down to the foot.

103. No fat is found in the young fœtus, and little when it is mature. Infants, however, if well nourished, usually become fat, until they begin to walk and exercise their own strength; they then become thin, and remain so till manhood, when they take less frequent and active exercise: at that period they become very corpulent; they gradually become again emaciated in mature old age. Girls in some degree become fat about puberty, whence their smooth, rounded,

vero quodammodo pinguescunt circa ætatem puberem; unde forma nitida, teres, amabilis adeo, et apta premi: et ferè omni ætate, fœminæ plus quam viri pinguescunt. Viri quoque habitum corporis laxi et flaccidi firmioribus obesiores fiunt.

senectute. Verò Puellæ pinguescunt quodammodo circa ætatem puberem; unde (est) forma nitida teres, adeo amabilis, et apta premi; et ferè omni ætate, fœminæ pinguescunt plus quam viri. Quoque viri laxi et flaccidi (secundum) habitum corporis, fiunt obesiores firmioribus.

104. Colligitur adeps usu multi cibi, oleosi, nutrientis, ex carnibus præsertim (modo concoctio bona sit) et potus validi, cerevisiæ imprimis, et animi et corporis quiete et tranquillitate, multo somno et torpore, castratione, frigore, sanguinis detractione repetita, multisque aliis exinanitionibus; quicquid scilicet, salvâ sanitate, vires vitales et animales, et imprimis solitas excretiones, minuit,

104. *Adeps colligitur usú multi cibi, oleosi, nutrientis, præsertim (cibi confecti) ex carnibus (modo sit bona concoctio) et potus validi, imprimis cerevisiæ, et quiete et tranquillitate animi et corporis, multo somno et torpore, castratione, frigore, repetitá detractione sanguinis, que multis aliis exinanitionibus; scilicet salvá sanitate, quicquid minuit vires vitales et animales, et imprimis solitas excretiones,*

lovely form, so suited for embraces; and almost at every age, females are more corpulent than men. Men also of a lax and flaccid habit of body, are more corpulent than those of firmer fibre.

104. Fat is accumulated by the use of much oily, nutritious food, particularly animal food (provided the digestion be good), by strong drink, especially beer, by rest and tranquillity of the mind and body, by much sleep and torpor, castration, cold, repeated blood-letting, and most other evacuations; for, in a sound state of health, whatever diminishes the vital and animal powers, and especially the usual excretions, is favourable to its production. A great deal however depends

huic favet. Multùm vero pendet ab ipsius corporis habitu, neque homo, ut bos, ad libitum saginari potest.

105. Certa, secundum ætatem hominis, obesitas, prosperæ valetudinis signum est et effectus. Nimia vero, ipsa morbus est, et aliorum morborum causa. Semper verò et certissimè debellanda, si modo fuerint bona voluntas et vis animi, validâ corporis exercitatione, brevi somno, parcâ et siccâ diæta. Nec facilè miles gregarius repertus fuerit, qui de tali morbo conqueratur.

106. Adeps semper partem haud exiguam corporis facit, aliquando maximam. Non est igitur dubitandum, quin suos usus habeat. Motum faciliorem et libe-

favet huic. Verò multum pendet ab habitû ipsius corporis, neque homo, ut bos, potest saginari ad libitum.

105. *Certa obesitas secundum ætatem hominis est signum et effectus prosperæ valetudinis vero nimia (obesitas) est ipsa morbus, et causa aliorum morborum. Verò (obesitas) semper et certissimè debellanda est, (modo si fuerit bona voluntas et vis animi), validâ exercitatione corporis, brevi somno, diætâ parcâ et siccâ. Nec facile miles gregarius repertus fuerit, qui conqueratur de tali morbo.*

106. *Adeps semper facit haud exiguam partem corporis, aliquando (facit) maximam (partem). Igitur non dubitandum est, quin habeat suos usus. (Adeps) reddit*

upon the habit of body, since man cannot be fattened at pleasure like an ox.

105. A certain degree of corpulency is an indication and effect of good health. Too great a share of it is a disease in itself, and a cause of other diseases. It may be always overcome (provided there be intention and firm resolution) by powerful exercise of the body, by little sleep, by sparing and dry diet. A common soldier is not easily found, who complains of such a disease.

106. Fat always forms a great part, and sometimes the greatest part of the body. Therefore beyond doubt, it has its uses. It renders motion more easy and free, by oiling

riorem reddit, partes movendas oblinendo, et sic frictionem minuendo. Hoc modo, ne abradantur solidæ partes, quod aliter fieret, impedit; nec sinit partes vicinas concrescere, quod aliquando fit, si ulcere vel alio casu, pars aliqua telæ quæ adipem continebat destructa fuerit.

107. Quin, et ad corporis formam et pulchritudinem haud parum confert, magna interstitia inter musculos implendo, quæ corpus deforme et horrendum redderent. Justa autem pinguedine, hoc, nitidum, teres, atque rotundum fit. Porro, adeps colorem dat candidum, cereum, qui, roseo mixtus, venustissimum oris colorem efficit. Hinc fit, ut puellæ, male metuentes

motum faciliorem et liberiorem, oblinendo partes movendas, et sic minuendo frictionem. Hoc modo, impedit, ne solidæ partes abradantur, quod fieret aliter; nec sinit partes vicinas concrescere, quod fit aliquando, si pars aliqua telæ, quæ continebat adipem, destructa fuerit ulcere vel alio casú.

107. *Quin confert haud parum ad formam et pulchritudinem corporis, implendo magna interstitia inter musculos, quæ (interstitia) redderent corpus horrendum et deforme. Autem hoc, (i. e. corpus) fit nitidum, teres atque rotundum justá pinguedine. Porrò, adeps dat colorem candidum, cereum, qui mixtus roseo, efficit colorem venustissimum oris. Hinc fit,*

the parts which are to be moved, and in this way diminishes friction. It thus prevents the abrasion of the solid parts, which must otherwise take place, and does not allow the neighbouring parts to grow together, as sometimes occurs when some part of the membrane, which contained the fat, is destroyed by ulceration or other accidents.

107. It contributes no little to the form and beauty of the body, by filling up the interstices between the muscles, which would produce horrible deformity. By means of a due degree of corpulency, the body becomes smooth and rounded. Moreover fat gives that fair, waxen colour, which when mixed with the rosy tint, forms the most beautiful complexion. Hence it is, that girls, foolishly fearing too much cor-

ne nimis pinguescant, et medicamentis, diæta, vitæ genere, marcescere conantes, cum nitido corporis habitu, oris quoque venustatem perdere soleant.

108. Nutrire creditur adeps ex suis cellulis in sanguinem resumptus. Sed hoc minus certum est. A frigore quodammodo defendit; animalibus regionum frigidarum magna copia datus.

ut puellæ male metuentes, ne nimis pinguescant, et conantes marcescere (se) medicamentis, diætâ, et genere vita, soleant perdere cum nitido habitû corporis, quoque venustatem oris.

108. *Adeps (cum) resumptus ex suis cellulis in sanguinem creditur nutrire. Sed hoc est minus certum. Quodammodo defendit a frigore: (adeps) datus (est) magnâ copiâ animalibus regionum frigidarum.*

pulency, and endeavouring to reduce themselves by medicines, diet, and mode of life, lose, together with their comely habit of body, their beautiful complexion.

108. Fat is thought to nourish, when reabsorbed from its cells into the blood. But this is by no means certain. In some manner it protects from cold, (hence a reason that) fat is supplied in such abundance to the animals of the cold regions.

CAP. III.—*De solido vivo, seu genere nervoso, ejusque dotibus, fabrica, et usibus; nec non de conjecturis quæ circa ejus naturam et functiones prolatæ sunt.*

109. SOLIDA *viva*, vel *vitalia*, dicuntur partes solidæ quæ sensum et mobilitatem habent. Hæ dotes, a vita pendentes, cum ea incipiunt et desinunt. Dotes vero partium solidarum, de quibus (75, et seq.) dictum fuit, etiam post mortem supersunt.

110. Partes autem, quæ vel sensum, vel mobilitatem, vel utrumque habent, sunt cerebrum, cerebellum, *medulla oblongata*, *medulla spinalis*, nervi ex his ori-

CAP. III.—*De vivo solido, seu (de) genere nervoso, que (de) dotibus, fabricâ et usibus ejus; nec non de conjecturis quæ prolatæ sunt circa naturam et functiones ejus.*

109. PARTES *solidæ, quæ habent sensum et mobilitatem, dicuntur solida viva, vel vitalia. Hæ dotes, pendentes a vitâ, incipiunt et desinunt cum eâ. Verò dotes partium solidarum, de quibus dictum fuit (75, et sequentibus) supersunt etiam post mortem.*

110. *Autem partes, quæ habent aut sensum vel mobilitatem vel utrumque, sunt cerebrum, cerebellum, medulla oblongata, medulla spinalis et nervi oriundi ex his,*

CHAP. III.—*On the living, solid, or nervous system, on the properties, structure, and uses of it; also on the conjectures which have been promulgated, concerning its nature and functions.*

109. The solid parts which enjoy sensation and motion are called, living or vital solids. These properties, depending upon life, begin and terminate with it. But those properties of the solid parts, which were spoken of at section 75, and following sections, remain even after death.

110. The parts which enjoy sensation or motion or both, are the Cerebrum, Cerebellum, Medulla Oblongata, Medulla

undi, per totum fere corpus diffusi, in varia singulorum sensuum organa et musculos impensi, et demum musculi ipsi.

111. Sensus multo magis generalis est quam mobilitas, quippe qui omnibus partibus jam recensitis communis sit, quamvis plane per nervos solos fiat. Mobilitas vero solis fibris musculosis est propria. Ubicunque igitur sensus est, ibi nervi; ubicunque vero mobilitas observatur, ibi fibræ musculosæ videntur esse.

112. Quin et mobilitas ipsa a nexu, quem musculi cum nervis, &c. habent, pendere videtur: nam resecto, vel compresso, vel ligato nervo, musculi quibus impendebatur, mobilitatem

diffusi ferè per totum corpus, impensi in varia organa sensuum singulorum et (in) musculos, et demum musculi ipsi.

111. *Sensus est multò magis generalis quam mobilitas, quippe qui sit communis omnibus partibus jam recensitis, quamvis fiat planè per nervos solos. Verò mobilitas est propria fibris musculosis solis. Igitur ubicunque est sensus, ibi nervi sunt; verò ubicunque mobilitas observatur, ibi fibræ musculosæ videntur esse.*

112. *Quin et ipsa mobilitas videtur pendere a nexú, quem musculi habent cum nervis, &c.: nam, nervo resecto vel compresso vel ligato, musculi quibus (nervus) impendebatur, brevi (tempore)*

Spinalis, and nerves arising from them, spread generally through the whole body, upon the various organs, separate senses and muscles, and lastly the muscles themselves.

111. Sensation is much more general than motion, for it is common to all the parts above-mentioned, although it takes place evidently by means of the nerves alone. Mobility is confined solely to the muscular fibres. Therefore, wherever there is sensation there are nerves; and wherever motion is observed there appear to be muscular fibres.

112. Mobility itself seems to depend upon the connection between the muscles and nerves; for if a nerve be cut, compressed, or tied, the muscles on which it was distributed, in a short time lose their mobility, or peculiar contractile

suam, seu vim propriam contrahendi, brevi amittunt; nec aliter res se habet, si cerebrum ipsum, vel origo nervorum, male affecta fuerint.

113. Sunt qui credunt musculos a nervis oriri et formari, et ex eadem materia constare. Utrique sane similem structuram habent, quatenus ex fibris valde minutis constent; utrique albi sunt, dummodo musculi probe eloti, et a sanguine, quem multum continent, purgati fuerint: Neque ope *microscopii* ullo modo distingui possunt fibræ nervosæ quæ bene multæ musculos subeunt, ab ipsis fibris musculosis. Porro, idem sensus utrisque est, et stimulantia et sedantia medicamenta eosdem plane effec-

amittant suam mobilitatem, seu vim propriam contrahendi; nec res habet se aliter, si cerebrum ipsum vel origo nervorum, male affecta fuerint.

113. *(Homines) sunt, qui credunt musculos oriri et formari nervis, et constare ex eadem materiâ. Sanè utrique habent similem structuram, quatenùs constent ex fibris valdè minutis, utrique sunt albi, dummodo musculi fuerint bene eloti, et purgati, a sanguine quem multum continent: Neque fibræ nervosæ quæ benè multæ subeunt musculos possunt ullo modo distingui ab ipsis fibris musculosis, ope microscopii. Porro est idem sensus utrisque; et stimulantia et sedantia medicamenta edunt planè eosdem*

power. The same takes place, if the brain itself, or commencement of the nerves, be disordered.

113. There are some men, who consider that the muscles arise from, and are formed by the nerves, and consist of the same substance. They both certainly have a similar structure, inasmuch as they consist of very minute fibres; both are white, provided the muscles be well washed and cleansed from the blood, which they contain in considerable quantity; nor can the very numerous nervous fibres which enter the muscles be in any degree distinguished from the muscular fibres themselves, by the assistance of a microscope. Moreover there is the same sensation in both, for stimulants and sedatives evidently produce the same effects in the mus-

tus in musculis edunt, sive ipsi musculo, sive nervo qui eum adeat, admota fuerint.

114. Quantis difficultatibus prematur scientia originis multarum corporis partium, alibi locus erit dicendi; sive omnes eodem tempore, sive alias post alias, certo ordine produci credamus. Interea tamen non dissimulandum est, partes quasdam musculosas perquam mature in fœtu conspici, et insignem vim et robur jam adeptas esse, quum cerebrum ipsum adhuc molle et fere fluidum reperitur; earumque actionem ad hujus functionem et augmen requiri; et musculos semper partibus vere nervosis multo firmiores esse, et vim propriam, irritabilem nimirum, habere,

effectus in musculis, sive admota fuerint ipsi musculo, sive nervo, qui adeat eum.

114. *Alibi erit locus dicendi, quantis difficultatibus scientia originis multarum partium corporis prematur; sive credamus omnes (partes) produci certo ordine eodem tempore, sive (credamus) alias (partes produci) post alias. Interea tamen non dissimulandum est, partes quasdam musculosas conspici perquam maturè in fœtû, et jam adeptas esse insignem vim et robur, quum cerebrum ipsum reperitur adhuc molle et fere fluidum; que actionem earum (partium musculosarum) requiri ad functionem et augmen ejus; et musculos semper esse multo firmiores partibus vere nervosis, et habere vim pro-*

cles, whether they be applied to the muscle itself, or to the nerve which enters it.

114. There will be elsewhere an opportunity of speaking of the difficulties which obstruct the knowledge of the origin of many parts of the body; whether we should consider them all as produced in certain order at the same time, or in succession one after the other. Nevertheless, it cannot be dissembled that certain muscular parts are observed very early in the fœtus, and have already acquired considerable power and strength, whilst the brain itself is found still soft and nearly fluid, and that the action of these parts is required for its functions and increase; and likewise that muscles are much firmer than parts merely nervous, and have a

quam nervi nunquam participant.

115. Oportet, igitur, vel ex diversa musculi constituti fuerint materia, ab ea ex qua nervi fiunt, vel, si ex eadem utrique constent, hæc fabricæ prorsus diversæ sit in his, ac in illis, ut vires adeo dissimiles habeat. Quod si, igitur, diversa sit musculorum ac nervorum substantia, tum facile patebit multam substantiam nervosam cum musculosa semper misceri. Nam *acicula* tenuissima non potest in musculum adigi, quin inde simul multi ramuli nervosi pungantur vel lacerentur; ut dolor clare testatur (111).

116. Igitur tam arctus inter musculos nervosque

priam, nimirum, irritabilem, quam (vim) nervi nunquam participant.

115. *Igitur oportet, (ut) vel musculi constituti fuerint ex diversa materiâ, ab eâ ex quâ (materiâ) nervi fiunt, vel, si utrique constent ex eádem (materiá), hæc (materia) sit prorsùs diversæ fabricæ in his ac in illis, ut habeat vires adeò dissimiles. Quod si, igitur, substantia musculorum ac nervorum sit diversa, tum facilè patebit multam substantiam nervosam misceri semper cum musculosá. Nam tenuissima acicula non potest adigi in musculum, quin inde multi ramuli nervosi simul pungantur vel lacerentur: ut dolor clarè testatur* (111).

116. *Igitur nexus tam arctus intercedit inter mus-*

peculiar property, namely irritability, of which the nerves never partake.

115. It must be, that the muscles are formed of matter different from that of the nerves, or if both are formed of the same, their structure must be different, in order that their properties should be so dissimilar. Therefore, if the substance of the muscles and nerves be different, it will be very clear that much nervous substance is mixed up with the muscles; for the finest needle cannot be inserted into a muscle without many nervous ramifications being pricked or lacerated; as pain evidently shows. (111)

116. Therefore, there is such a very close connection be-

intercedit nexus, tum quod ad officium attinet quo funguntur, tum quod ad fabricam quam habent, ut merito omnia *solida viva* pro partibus ejusdem generis habeantur, cui nomen *Genus Nervosum* a medicis imponi solet.

117. Miræ quas hæ partes possident dotes medicorum et philosophorum attentionem optimo jure sibi vindicarunt: plurimique et ingeniosissimi viri (inter quos summum *Neutonum* numerare oportet) operam haud exiguam collocarunt in causis earundem investigandis, modoque perscrutando quo variæ ipsarum functiones fierent; variasque quæ singulis placebant de his rebus conjecturas in medium protulerunt. Nondum vero ra-

culos que nervos, tum (in eo) quod attinet ad officium quo funguntur, tum quod ad fabricam, quam habent, ut meritò omnia solida viva habeantur pro partibus ejusdem generis, cui nomen Genus Nervosum solet imponi a medicis.

117. *Miræ dotes, quas hæ partes possident, vindicarunt sibi optimo jure attentionem medicorum et philosophorum: que plurimi et ingeniosissimi viri (inter quos oportet numerare summum Neutonum) collocarunt haud exiguam operam in investigandis causis earundem, que perscrutando (de) modo, quo variæ functiones ipsarum fierent; que protulerunt in medium varias conjecturas de his rebus quæ (conjecturæ) placebant*

tween the muscles and nerves, both in their functions and structure, that all the living solids may be considered as parts of one kind, to which the name of nervous system has been given by medical men.

117. The wonderful properties possessed by these parts, deservedly claimed the attention of medical men and philosophers: and many very ingenious men (amongst whom must be enumerated the illustrious Newton) took no little pains in investigating the causes of them, and inquiring into the manner in which their different functions were performed; they likewise published the various conjectures formed individually upon these matters. But as yet no rational mode of investigating the subject by experiment,

tio ulla proposita est rem per experimenta explorandi; et experientia bis mille annorum satis superque demonstravit sapientissimos etiam hominum Naturæ arcana conjectando rarissime detegere. Male omnino *Neutoni* nomine, nunquam non venerando, abusi sunt scriptores nonnulli, qui opinionem quam tueri cuperent in ejus auctoritatem rejecerunt totam: quamvis ille, solita modestia et prudentia (quas laudare quam imitari plerique auctores maluere) suam de hac re sententiam, pro conjectura tantum seu quæstione proposuerit, idoneis experimentis et argumentis aut refellenda aut confirmanda. Sed ne quidem *Neutoni* conjecturas pro veris sumere licet: non

singulis. Vero nondum ulla ratio explorandi rem per experimenta proposita est; et experientia bis mille annorum demonstravit satis superque, etiam sapientissimos homines rarissime detegere arcana Naturæ conjectando. Nonnulli scriptores omnino male abusi sunt nomine Neutoni, nunquam non venerando, qui rejecerunt opinionem quam cuperent tueri in auctoritatem ejus; quamvis ille, solitá modestiá et prudentiá (quas plerique auctores maluere laudare quam imitari) proposuerit suam sententiam de hác re, pro conjecturá tantùm seu quæstione, aut refellendá aut confirmandá idoneis experimentis et argumentis. Sed licet sumere conjecturas ne quidem Neutoni pro veris; ille non sic (est) imi-

has been proposed: and the experience of two thousand years has more than adequately shown, that the most learned can very rarely discover the arcana of nature by conjecture. Some writers have greatly and basely abused the name of Newton, ever to be venerated, by referring their opinion to his authority; although he, with his usual modesty and caution (which many authors would rather commend than imitate,) gave his opinion on this subject, as conjecture or a query only, to be refuted or established by proper experiments and arguments. But we must not receive the conjectures even of a Newton as truths: this is not the way to imitate him; nor in this way can science be advanced.

sic ille imitandus; non sic scientia promovenda.

118. Variæ profecto sententiæ, de modo quo sensus motusque in corpore animali fiunt, prolâtæ sunt; omnibus vero hoc fundamentum commune est, fortasse et vitium quoque, nempe, quod rationem utriusque petant a motibus quibusdam *Generi Nervoso* propriis et peculiaribus, ab organo sensus incipientibus, et per nervos ad cerebrum propagatis, dum sentimus; et a cerebro incipientibus, perque nervos (sive eosdem qui sensui inserviunt, sive alios omnino diversos et distinctos, quamvis in eundem fasciculum cum illis colligatos) ad musculos delatis, dum musculos nostros ad arbitrium movemus.

tandus; sic scientia non promovenda (est).

118. *Profecto variæ sententiæ prolatæ sunt de modo, quo sensus que motus voluntarius fiunt in corpore; verò hoc est commune fundamentum, fortasse et vitium quoque omnibus, quod petant rationem utriusque a motibus quibusdam propriis et peculiaribus Generi Nervoso, incipientibus ab organo sensûs, et propagatis per nervos ad cerebrum, dum sentimus; et incipientibus a cerebro, que delatis ad musculos per nervos (sive eosdem qui inserviunt sensui, sive alios omnino diversos et distinctos, quamvis colligatos in eundem fasciculum) dum movemus musculos nostro arbitrio.*

118. Various, indeed, are the opinions which have been advanced, concerning the manner in which the sensations and voluntary motion take place within the body; but the common foundation, and, perhaps, error of all, consists in this, that they seek for an explanation of both in certain motions, proper and peculiar to the nervous system, which, during sensation, beginning from the organ of sense, are propagated by means of the nerves to the brain; (and which), during voluntary muscular action, begin in the brain, and are conveyed to the muscles by the nerves, either the same which are subservient to sensation, or others quite different and distinct, although bound up into the same fasciculus.

119. Hos motus alii crediderunt per ipsam substantiam nervorum fieri, trementium vel vibrantium, ut vocabant, non secus ac lyræ chordæ tremunt plectro percussæ.

120. Alii, quibus bene perspectum erat quam male accommodati essent nervi et cerebrum ad tales perficiendos et propagandos tremores vel motus (quippe qui toti mollissimi existant, et vicinarum partium tactu multum impediti, vel sæpe etiam ad vicinas partes alligati sint) motus, quos fieri et necessarios esse contendebant, in humorem tenuem et valde mobilem rejecerunt, quem nervis inesse fingebant, inque iis suis legibus moveri, multasque et miras

119. *Alii crediderunt hos motus fieri, per ipsam substantiam nervorum, trementium vel vibrantium, ut vocabant, non secus ac chordæ lyræ (cùm) percussæ plectro.*

120. *Alii, quibus erat bene perspectum quam malè nervi et cerebrum essent accommodati ad perficiendos et propagandos tales tremores et motus (quippe qui existant toti mollissimi, et sint impediti multum tactú partium vicinarum vel (sint) etiam alligati ad partes vicinas) rejecerunt motus, quos contendebant fieri et esse necessarios, in tenuem et valdè mobilem humorem, quem (illi) fingebant inesse nervis, que moveri in iis suis legibus, que possidentem*[29]

119. Some considered, that these motions take place through the medium of the substance of the nerves, trembling, or vibrating as they term it, in the same way as the strings of the lyre, when struck by the plectrum.

120. Others, who perceived how ill the nerves and brain were fitted for perfecting and propagating such tremors and motions, (inasmuch as they are all very soft, and are much obstructed by contact, or by being bound down to neighbouring parts), referred the motions, which they admitted were produced and were necessary, to some subtile and very active fluid, which they imagined to be in the nerves, and is moved

29. *Possidentem* seems to be necessary to complete the sense of this sentence, for it refers to *humorem*, and if it stood in the present tense, indicative mood, it must be read *possidet*, with *qui* understood.

dotes et excellentias possident.

121. Alii demum ad Ætherem Universalem potius confugerunt, qualem et nuper et olim multis philosophis persuasum est totum mundum pervadere, implere, variisque legibus temperare; cujus ope et ministerio sidera mearent, sol fulgeret, mare cresceret decresceretque, flumina laberentur, venti spirarent, plantæ pullularent, Jupiter ipse tonaret.—Utilissimus certe et strenuissimus æther, sed nusquam prehensus, nusquam ad quæstionem deductus, ut sui rationem redderet, Proteo ipso mutabilior et fugacior, diu multumque jam frustra agitatus, tandem requiescat in pace.

multas et miras dotes et excellentias.

121. *Alii demùm potiùs confugerunt ad Ætherem Universalem, qualem et nuper et olim persuasum est multis philosophis pervadere implere, que temperare totum mundum variis legibus, ope et ministerio cujus, sidera mearent, sol fulgeret, mare cresceret que decresceret, flumina laberentur, venti spirarent, plantæ pullularent, ipse Jupiter tonaret. Certè æther est utilissimus et strenuissimus, nusquam deductus ad quæstionem, ut redderet rationem sui, mutabilior et fugacior Proteo ipso, agitatus jam frustra que diu multum, tandem requiescat in pace. Nam quæ spes prehendendi (illud)*

in them by certain laws, and possesses many wonderful properties and virtues.

121. Lastly, others have had recourse to an universal æther, such as formerly and lately many philosophers were persuaded, pervaded, filled, and governed the whole universe by certain laws; by the aid and attendance of which, the stars moved, the sun shone, the sea rose and fell, the rivers glided along, the winds blew, the plants shot forth, and Jupiter himself thundered. Truly æther is a very useful and powerful agent, but has never been brought to give an account of itself, more changeable and fleeting than Proteus himself, agitated so long, and to no purpose, at last let the subject rest in peace: for what hope is there of catching "what is allowed to assume so many forms?"

Nam quæ spes prehendendi "*cui in plures jus est transire figuras?*"

"Nam modo te juvenem, modo te videre leonem,
"Nunc violentus aper; nunc quem tetigisse timerent.
"Anguis eras; modo te faciebant cornua taurum:
"Sæpe lapis poteras, arbor quoque sæpe videri.
"Interdum, faciem liquidarum imitatus aquarum,
"Flumen eras; interdum, undis contrarius ignis."

"*cui jus est transire in plures figuras?*" *Nam modo (illi) vidêre te (quam) juvenem, modo (vidêre) te leonem; nunc (eras) violentus aper; nunc eras anguis, quem (homines) timerent tetigisse: modo cornua faciebant te taurum: sæpe poteras videri lapis quoque sæpe (poteras videri) arbor; interdum, eras flumen imitatus faciem limpidarum aquarum; interdum eras ignis contrarius undis.*

122. Male vero de his aut similibus commentis medici prius disputaverint, quam vel observando vel experiendo, demonstratum fuerit, talem æthera existere, talesque in *genere nervoso* motus fieri; vel saltem credibile factum fuerit, talibus conjecturis nodum solutum iri. Concessis enim omni-

122. *Autem medici, male disputaverint de his aut similibus commentis prius, quam demonstratum fuerit, vel observando vel experiendo, talem æthera existere, que tales motus fieri in genere nervoso; vel saltem fuerit factum credibile, nodum solutum iri talibus conjecturis. Enim omnibus con-*

"*For now a man's or lion's form it takes,*
"*Now a rude boar's, and now an odious snake's;*
"*A bull's majestic front is oft thine own;*
"*And oft thou seem'st a tree, and oft a stone:*
"*Now in a bubbling stream thou dost aspire;*
"*And water's foe, now creep in crimson fire.*"

ORGER'S OVID, book 8th, line 941.

122. But medical men did wrong to discuss these and similar conjectures, before it was demonstrated either by observation or experience, that such æther exists, and that such motions take place in the nervous system, or it was at least made probable, that the difficulty would be solved

bus de æthere et motibus in *genere nervoso* postulatis, parum omnino proficitur; nam tremores nervorum vel motus ætheris, qualescunque commentorum hujusmodi amantissimi sibimet fingere potuerint, nusquam aut sensus erunt, aut sensui similes, aut in sensum, secundum notas Naturæ leges, unquam mutabiles.

123. Nec facilè quisquam ostenderit quo pacto voluntas animi, cui voluntati nihil inest corporei, tenuissimum, et subtilissimum, mobilissimumque æthera, facilius aut melius quam saxum afficeret, eumque in motus conjiceret.

124. Nec melior hoc modo aut magis perspicua ratio redditur sensuum qui dicuntur interni; memoriæ

cessis de æthere et motibus postulatis in genere nervoso, omnino parum efficitur; nam tremores nervorum vel motus ætheris, qualescunque (illi) amantissimi commentorum hujusmodi potuerint fingere sibimet, nusquam erunt aut sensus, aut similes sensui, aut unquam mutabiles in sensum secundum notas leges Naturæ.

123. *Nec quisquam facilè ostenderit quo pacto voluntas animi (cui voluntati nihil corporei inest) afficeret tenuissimum, et subtilissimum que mobilissimum ætherem faciliùs aut melius quam saxum, que conjiceret eum in motus.*

124. *Nec hoc modo melior aut perspicua ratio redditur sensuum, qui dicuntur interni; scilicet (ratio) memo-*

by such conjectures. For every thing being admitted concerning æther, and the necessary motions in the nervous system, little is gained by it; for the tremours of the nerves, or motions of the æther, of whatever description the warmest admirers of such conjectures imagined them to be, will never be sensation, or like sensation, or capable of being changed into it, by any of the known laws of nature.

123. No one will easily be enabled to show, in what way volition of the mind, (in which volition there is nothing corporeal,) can affect that finest, most subtile, and most active æther, more easily than a stone, and could put it into motion.

124. There is no better or clearer explanation of the sen-

scilicet, imaginationis, et judicii. Vix credibile erit motus ullos in *genere nervoso* retineri et condi, nostro arbitrio denuo erupturos et renovandos; neque impressiones, aut vestigia, aut imagines ullas eorum motuum in cerebro imprimi, veluti sigilli in cera, quas ad arbitrium nostrum iterum iterumque contemplemur, motusque qui eas primo effecissent denuo integremus. Tamen validissima sæpe est sensuum præteritorum renovatio, recordantibus, imaginantibus, somniantibus.

riæ, imaginationis et judicii. Erit vix credibile ullos motus retineri et condi in genere nervoso, denuò erupturos et renovandos nostro arbitrio; neque impressiones aut vestigia, aut imagines ullas eorum motuum imprimi in cerebro, veluti sigilli (imprimuntur) in cerâ, quas (imagines) contemplemur iterum iterumque ad nostrum arbitrium, que denuò integremus motus, qui primò effecissent eas. Tamen est sæpe validissima renovatio sensuum præteritorum, recordantibus, imaginantibus somniantibus.

125. Quod si tales motus ad internorum æque ac externorum sensuum actionem necessarii sunt, tum plane oportebit, vel motus sensum præcedant, vel hic

125. *Quòd si tales motus sunt necessarii æque ad actionem internorum ac externorum sensuum, tum planè oportebit (ut) vel motus præcedant sensum, vel hic*

sations which are called internal, namely, memory, imagination, and judgment. It can scarcely be believed, that any motions can be retained and accumulated in the nervous system, again to burst forth and be renewed at our pleasure, nor that impressions, or traces, or any images of those motions, can be impressed upon the brain, like a seal upon wax, that we may contemplate them again and again, and may renew the motions which primarily produced them. Nevertheless there is frequently a very powerful renovation of past sensations, in memory, imagination, and dreaming.

125. But if such motions are equally necessary to the action of the internal and external senses, it must evidently be, either that motion precedes sensation, or vice versâ, or

illos, vel denique uno eodemque temporis puncto utrique fiant.—Si prior est sensus, a motu quovis fluidi nervorum oriri nequit, et aliam igitur debet habere causam.—Si prior est motus ille, causa ejus quærenda erit, scilicet qui minime pendere possit a sensu aut voluntate quæ sequuntur. Si demum uterque, motus nimirum et sensus, simul fit, utriusque aliam fingere oportet causam; neuter enim alterius causa esse potest, prius quam ipse existit.

126. Vix sane, aut ne vix quidem, animo concipere possumus mutationem ullam in rebus corporeis fieri, quæ a motu quodam non pendeat, vel saltem cum motu aliquo modo conjun-

(i.e. sensus) (præcedat) illos (motus), vel denique utrique fiant uno que eodem tempore.—Si sensus est prior, nequit oriri a quovis motû fluidi nervorum, et igitur debet habere aliam causam.—Si ille motus est prior, causa ejus erit quærenda, scilicet qui possit pendere minime a sensû aut voluntate quæ sequuntur. Si demum uterque, nimirum motus et sensus, simul fit, oportet fingere aliam causam utriusque; enim neuter potest esse causa alterius, prius quam ipse existit.

126. *Vix sane, aut ne quidem vix, possumus concipere animo, ullam mutationem fieri in rebus corporeis quæ (mutatio) non pendeat a quodam motû, vel saltem conjungatur cum motû*

lastly, that both take place in one and the same time. If sensation is first, it cannot arise from any motion of the fluid of the nerves, and therefore must have some other causes. If the motion precedes, its cause must be sought for, since it can by no means depend upon the sensation or volition which follows. Lastly, if both of them, namely motion and sensation, occur simultaneously, some other cause of both must be assigned, for neither can be the cause of the other, before its own existence.

126. We can scarcely, and indeed not possibly conceive, that any change can take place in bodies, which does not depend upon some motion, or be connected with it in some degree. But the subjects treated of here, namely external

gatur. Res vero de quibus hic agitur, sensus nimirum, tum externus tum internus, et voluntas, et conatus demum ad musculos vel artus movendos, non sunt corporeæ, neque iisdem ac tales res principiis explanandæ.

127. Missis igitur hujusmodi commentis de rebus quas Natura forsitan visibus humanis negaverit, tanquam ad inutilia, et incomprehensibilia, vel absurda fortasse, ducentibus, magis e re sua erit, si medici ad singulas res factas et veras de hoc argumento investigandas semet gnaviter accinxerint.

aliquo modo. Vero res, de quibus hic agitur (nobis), nimirum sensus tum externus tum internus, et voluntas, et demum conatus ad movendos musculos vel artus, non sunt corporeæ, neque explanandæ iisdem principiis ac tales res.

127. *Igitur commentis hujusmodi missis, de rebus, quas Natura forsitan negaverit visibus humanis, tanquam ducentibus ad inutilia, et incomprehensibilia, vel fortasse absurda, erit magis e suá re, si medici gnaviter accinxerint semet ad investigandas singulas res factas et veras de hoc argumento.*

and internal sensation, volition, and the efforts to move the muscles or limbs, are not corporeal, nor explicable on principles which may be applied to them.

127. Therefore, conjectures of this kind being laid aside concerning things which nature perhaps has hidden from men's eyes, as conducing to useless, incomprehensible, and absurd ideas, it will be more to the purpose, if medical men vigorously apply themselves to investigate the truths and facts connected with this subject.

CHAP. IV.—*On sensation generally, on its varieties, uses, pleasures, and disorders.*

128. Sensation requires no definition, nor indeed can it be easily defined; for there is scarcely any thing more simple, or better understood. However it is usually described, but hardly explained, by a long, inaccurate, and indeed inappropriate circumlocution of this description: "A change in the state of mind, of which we are conscious, produced by some change in the state of the body."

129. But however simple sensation may appear at first sight, philosophers who have inquired into the subject more

accuratiùs perscrutati, duplicem ejus naturam se detexisse crediderunt, et ideo monent probe esse distinguendum inter duas res ad sensum pertinentes, quæ vulgo sub uno eodemque nomine comprehendi solent; quamvis profecto nemo sanus existat tam stupidus qui res ipsas confuderit; et sane perperam omnino talem vulgo hominum errorem objecerunt philosophi.

130. Harum rerum altera (mutatio nimirum quæ in animi statu efficitur) ad animum solum spectat, et huic propria est, suâ naturâ fugax et peritura, et simul simplicissima, nullisque aut definienda aut describenda verbis, rei externæ quæ sensum excitat dissimillima,

tati rem accuratiùs crediderunt se detexisse duplicem naturam ejus, et ideo monent probe distinguendum esse inter duas res pertinentes ad sensum, quæ res vulgo solent comprehendi sub uno que eodem nomine; quamvis profectò nemo sanus existat tam stupidus qui confuderit res ipsas; et sanè philosophi objecerunt omnino perperam talem vulgo errorem hominum.

130. *Altera harum rerum (nimirum mutatio quæ efficitur in statú animi) spectat ad animum solum, et est propria huic, fugax et peritura suá naturá, et simul simplicissima, que aut definienda aut describenda nullis verbis, dissimillima rei externæ quæ excitat sensum,*

minutely, have thought, that they have discovered it as being of twofold description, and therefore teach us, that distinction is to be made between the things which relate to sensation, in which those things are commonly comprehended in the same name; although, in truth, no sensible man can be so stupid as to confound them: but indeed philosophers have rashly set this forth as a common error.

130. One of these, namely, the change made in the state of the mind, refers to the mind only, and is peculiar to it, fleeting and perishable in its nature, at the same time most simple, and capable of being defined or described by no terms, most unlike the external object which excites sensation, very different from every state and nature of the body,

ab omni corporea conditione atque natura alienissima, ita ut neque ipsa, nec quicquam ipsi simile, in re externa quam percipimus inesse possit.

131. Altera vero res quæ vulgo sub nomine sensus comprehenditur, qualitas nimirum quævis rei externæ quam contemplamur, quam sensus (mutatio scilicet in animi statu) nobis representat vel suggerit, longe diversæ videtur esse naturæ.—Qualitates enim rerum externarum, quas sensus ope percipimus, ad illas res solas pertinent; neque animo ullo pacto inesse possunt, nec quicquam cum animo, variisque ejus statibus, simile aut commune habent, sua natura constantes et durabiles, sive perceptæ a

alienissima ab omni corporeâ conditione atque naturâ, ita ut neque ipsa, nec quicquam simile ipsi, possit inesse in re externâ, quam percipimus.

131. *Verò altera res quæ vulgò comprehenditur sub nomine sensûs, nimirum qualitas quævis rei externæ quam contemplamur, quam sensus (scilicet mutatio in statû animi) representat vel suggerit, videtur esse naturæ longè diversæ. Enim qualitates rerum externarum, quas percipimus ope sensûs, pertinent ad illas res solas; neque possunt inesse animo ullo pacto, nec habent quicquam simile aut commune cum animo que variis statibus ejus, constantes et durabiles suâ naturâ, sive fuerint perceptæ a nobis sive*

so that neither itself, nor any thing like it, can exist in the external objects which we perceive.

131. The other thing which is commonly understood by the word sensation, that is, any quality of an external object which we contemplate, which the sensation (namely the change in the state of mind) represents or suggests, appears to be of a very different nature. For the qualities of external things, which we perceive by the aid of sensation, relate to them alone, nor can exist in the mind in any degree, nor can they have any thing alike or in common with the mind or its different states; (they) are constant and lasting in their nature, whether they are perceived by us, or unknown and neglected, nor are (they) so simple, but that many of them

nobis fuerint, sive ignotæ aut neglectæ, neque adeo simplices, quin multæ saltem earum, facile et accurate definiri aut describi, et inter se invicem comparari, possint.

(fuerint) ignotæ aut neglectæ, neque adeo simplices, quin saltem multæ earum possint facilè et accuratè definiri aut describi, et comparari inter se invicem.

132. Plurimam profecto et utilissimam de rebus externis scientiam, facillimo et simplicissimo modo, per varios sensus, visum præsertim et tactum, sine ullo studio aut labore acquirimus; ita ut bene perspicuum sit, hoc (quadam saltem ex parte) consilio, istas sentiendi facultates a Supremo Opifice nobis esse datas. Non omnes vero sensus hunc usum præstant; neque tam facilis ad totius Naturæ scientiam patet via: et sane multa ostendunt, varios quibus instruimur

123. *Profectò acquirimus plurimam et utilissimam scientiam de rebus externis, facillimo et simplicissimo modo, per varios sensus, præsertim (per) visum et tactum sine ullo studio aut labore: ita ut sit bene perspicuum (saltem ex quadam parte), istas facultates sentiendi datas esse nobis a Supremo Opifice, hoc consilio. Vero non omnes sensus præstant hunc usum; neque via tam facilis patet ad scientiam totius Naturæ: et sane multa ostendunt, varios sensus, quibus instruimur,*

admit of ready and accurate definition or description, and may be mutually compared with each other.

132. Truly, we acquire much and most useful knowledge, concerning external objects, in a most easy and simple manner, (that is) by means of the various senses, particularly by sight and by touch, without any study or difficulty; so that, it is very evident, (to some extent at least,) that these faculties of the senses were given by the Supreme Maker for those very purposes. All the senses do not answer this purpose, nor is there so clear a path to the knowledge of all nature: but many things show that the various senses, with which we are supplied, are frequently subservient to other important uses.

sensus, aliis sæpe et eximiis usibus inservire.

133. Fit sensus in homine sano et vigili, quandocunque status partis cujusvis *generis nervosi* aliquantum mutatus fuerit, sive ista mutatio ab externa causa, sive ab interna, facta sit.—Qui a priore causa fiunt sensus, ab impressione vel impulsu; qui a posteriore causa fiunt, a conscientia, apud medicos, dicuntur esse.

134. Neque ab omni sane impulsu in *genus nervosum* fit sensus. Ut sentiamus, oportet certa vi aut impetu in partem sensu præditam impulsus factus sit. A leviore enim impulsu, sensus obscurus aut plane nullus est; ab impulsu autem multo vehementiore, dolor

133. Sensation takes place in a man, healthy and awake, whenever the state of any portion of the nervous system be in some degree changed, whether that change arises from an external or internal cause. Sensations which occur from the former cause, are said by medical men, to be from impression or impulse; but those arising from the latter cause, (are said to be) from consciousness.

134. Sensation is not produced by every impulse upon the nervous system. In order that we have perception, it is necessary that the impulse be made with a certain force and impetus on the part endowed with sensation. For sensation is dull, or quite unperceived from a slighter degree of impulse, but pain is produced if the impulse be much more

fit, sine ullo distincto sensu; quod si impulsus demum vehementissimus fuerit, tantaque vis parti sentienti illata fuerit, ut organi ipsius fabrica lædatur, tum stupor fere oritur.

135. Neque perbrevis impulsus sive impressio, quamvis alioquin satis vehemens, distinctum sensum efficit; nimirum ad quem temporis aliquod, et diuturnitas quædam impressionis, requirantur.—Docent corpora, et quidem satis magnæ molis, tanta velocitate mota, ut conspici nequeant.—Par quoque ratio est multorum dolorum, quos præstigiatores solent exhibere; quibus hominibus, *Axioma*, et quasi artis totius fundamen-

tiore, sine ullo distincto sensú; quod si impulsus demùm fuerit vehementissimus, que tanta vis fuerit illata parti sentienti, ut fabrica organi ipsius lædatur, tum ferè stupor oritur.

135. *Neque impulsus sive impressio perbrevis, quamvis alioquin satis vehemens, efficit distinctum sensum; nimirum ad quem, aliquod temporis, et quædam diuturnitas impressionis requirantur.—Corpora docent, et quidem molis satis magnæ mota tantá velocitate, ut nequeant conspici.—Quoque est par ratio multorum dolorum,*[30] *quos præstigiatores solent exhibere; quibus hominibus, solet esse, Axioma, et quasi fundamentum totius artis,*

powerful, and there is no distinct sensation; and, lastly, if the impulse be of a most violent character, and so much violence be applied to the sentient part, that its structure is injured, stupor is then generally produced.

135. A rapid impulse or impression, although otherwise sufficiently powerful, does not produce a distinct perception; for instance, such an one as requires some time, and a certain period of impression. We are taught this by bodies of some magnitude, which are moved with such velocity that they cannot be seen. There is the same explanation of the tricks which jugglers are accustomed to exhibit, with which men, it is an axiom, and as it were a fundamental

30. *Dolorum* is the genitive plural of *dolus*, i. deceit, a trick, a plot, &c.

tum, esse solet, motum visu multo esse velociorem.

136. Cessante vero impulsu, sublataque ideo externa sensûs causa, ipse qui excitatur sensus, per aliquod, quamvis exiguum, temporis spatium, durare solet.—Docet circulus flammeus, quem conspicimus a rapida rotatione baculi ardentis.

137. Sensus autem non adeo est corporeus quin multum pendeat a statu mentis. Hac enim aliis rebus occupata, impulsus satis validi in organa sensuum facti, vix, aut ne vix quidem, percipiuntur. Contra, si probe animum attendimus, neglectis vixque perceptis gravioribus, levissimos sæpe

motum esse multo velociorem visû.

136. *Verò impulsû cessante, que causâ externâ sensûs idèo sublatâ, ipse sensus qui excitatur, solet durare per aliquòd, quamvis exiguum tempus. Circulus flammeus docet, quem (circulum) conspicimus a rapidâ rotatione baculi ardentis.*

137. *Autem sensus non est adèo corporeus, quin multum pendeat a statû mentis. Enim hâc (i. e. mente) occupatâ aliis rebus, impulsus satis validi facti in organa sensuum, vix aut ne quidem vix percipiuntur. Contrà si probe attendimus animum, gravioribus (impulsibus) neglectis que vix*

principle of their art, that motion is much more rapid than vision.

136. But when the impulse ceases, and consequently the external cause of sensation be withdrawn, the sensation, which is excited, usually lasts for some, although for a short time. The fiery ring, which we see by rapidly rotating a burning stick, is a proof of this.

137. But sensation is not so corporeal, that it does not depend considerably on the state of mind. For, if this be employed on other things, impulses, though not inconsiderable, exerted upon the organs of the senses, are scarcely, or not even possibly perceived. On the other hand, if the mind be properly applied, more powerful impulses are neglected and scarcely perceptible, and we are often able with ease to perceive the slightest impressions.

impulsus facile percipere possumus.

138. Hoc ut videtur fundamento, magnâ saltem ex parte, nititur mirum illud et fere incredibile singulorum sensuum externorum acumen et perfectio, quæ varii homines, variis occupati negotiis, multo usu solent adipisci: quamvis satis sit verisimile perfectionis hujusmodi nonnihil tribuendum esse conditioni organorum, quæ variis modis acui possint crebra exercitatione, et ad propria munera melius aptari. Bene notum est organa motûs hoc modo haud parum proficere.

139. Attentio a voluntate quodammodo pendet; tamen plerumque datur sensibus validis, novis, jucun-

perceptis, sæpe possumus facilè percipere levissimos impulsus.

138. *Illud mirum et fere incredibile acumen et perfectio singulorum sensuum externorum, quæ varii homines occupati variis negotiis solent adipisci multo usû, nititur hoc fundamento, ut videtur, saltem ex magná parte: quamvis verisimile sit, nonnihil perfectionis hujusmodi esse tribuendum conditioni organorum, quæ possint acui crebrá exercitatione variis modis, et melius aptari ad propria munera. Bene notum est organa motûs hoc modo proficere haud parùm.*

139. *Attentio pendet quodammodo a voluntate: tamen plerumque (attentio) datur sensibus validis, novis, jucun-*

138. That surprising and nearly incredible acuteness and perfection of the individual senses, which various men occupied in different branches of business, are accustomed to acquire by constant exercise, rests on this principle, as it appears, at least in a great degree; although it is probable, that some of the perfection of this kind, is to be attributed to the condition of the organs, which may be rendered acute, by frequent exercise in different ways, and better fitted to their proper functions. It is well known that the organs of motion receive no inconsiderable benefit in this way.

139. Attention depends in some degree upon the will; yet, it is generally directed to powerful, new, pleasant, and

dis, ingratis, iisque demum qui mentem quivis modo præter solitum afficiunt vel commovent.

140. Hinc tot res vix ac ne vix quidem perceptæ, quamvis idonei in organa sensuum impulsus ab iis facti sint, vel si quodammodo, quamvis minus accurate, perceptæ fuerint, statim oblivioni traditæ. Hinc novæ semper res, cæteris paribus, maxime observatæ, novique sensus validissimi. Hinc sæpe repetiti sensus, quamvis validi, brevi familiares fiunt, et fere negliguntur; debiliores vero impulsus, qui tamen sensum satis validum dare solebant, sæpe repetiti, neque omnino percipi-

dis, ingratis, que demum iis qui afficiunt vel commovent mentem præter solitum quovis modo.

140. *Hinc tot res vix et ne quidem vix perceptæ, statim (sunt) traditæ oblivioni, quamvis idonei impulsus sint facti ab iis in organa sensuum, vel si quodammodo perceptæ fuerint quamvis minus accurate. Hinc semper novæ res, cæteris paribus, (sunt) maximè observatæ, que novi sensus (sunt) validissimi. Hinc sensus sæpe repetiti, quamvis validi, fiunt familiares brevi (tempore) et fere negliguntur; vero debiliores impulsus, qui tamen solebant dare satis validum sensum, sæpe repetiti, neque omnino percipiuntur, neque*

disagreeable sensations, and lastly to those which affect or excite the mind in any unusual manner.

140. Hence so many things which are scarcely and not in any degree perceived, although proper impulses have been made by them upon the organs of the senses, and likewise others in some degree perceived, although less accurately, are immediately committed to oblivion. Hence new things, other circumstances being equal, are always most noticed, and new sensations are the most powerful. Hence sensations often repeated, although powerful, become familiar in a short time, and are commonly neglected; but weaker impulses, which were accustomed to excite sufficiently strong sensation, when frequently repeated, are not at all perceived, nor leave any traces of them in the mind.

untur, neque ulla sui vestigia in animo relinquunt.

141. Sunt qui strenue contendunt hominem inter sentiendum unicum tantum sensum vel rei externæ perceptionem semper contemplari; sed tam facile tamque subito ad suum quodammodo arbitrium ab uno ad alium sensum ire atque redire, ut primo intuitu multos simul capere sibi videatur.—Sed hoc minus certum est.

142. Certissimum vero est hominem sæpe plures sensus ejusdem generis simul percipere, dummodo hi ita conjungi et quasi misceri possint, ut unam perceptionem, a singulis diversam, et ex iis composi-

relinquunt ulla vestigia sui[31] *in animo.*

141. *(Homines) sunt, qui strenuè contendunt inter sentiendum, hominem semper contemplari unicum sensum tantùm vel perceptionem rei externæ; sed (illum) ire atque redire tam facilè atque subitò, ab uno ad alium sensum quodammodo ad suum arbitrium, ut primo intuitú videatur sibi capere multos simul.—Sed hoc est minùs certum.*

142. *Vero certissimum est hominem sæpe percipere plures sensus ejusdem generis simul, dummodo hi possint ita conjungi et quasi misceri, ut efficiant unum perceptionem, diversam a singulis, et compositam ex iis. Hæc*

141. There are some men who strenuously contend, that during sensation, man always contemplates only one sensation or perception of an external object; but, that it goes and returns so suddenly and easily, from one sensation to another, as it were, at its pleasure, that at first glance, he seems to himself to comprehend many at the same time. But this is by no means certain.

142. It is very certain, however, that man often perceives several sensations of the same description at the same time, provided they be so combined, and, as it were, mixed, that they effect one perception, differing from the single ones, and composed of them. This union may be produced, either

31. *Sui*, of himself, of herself, of itself, is likewise used as a plural pronoun, as *sui*, of themselves.

tam, efficiant. Hæc conjunctio fieri potest vel singulis impulsibus simul factis, vel novis impulsibus prioribus tam subito succedentibus, ut prior sensus nondum desiverit, cum posterior jam inceperit. Sensus enim sæpe diutius quam ipse impulsus durat, præsertim si idonea adhibita fuerit animi attentio (136, 137). Docet sonorum compositio musica; docet charta variis coloribus tincta, quæ rapide in circulum acta, eundem colorem medium vel mixtum, ex aliis compositum, exhibet, ac ipsi colores mixti efficerent. Odores quoque et sapores, singuli, ut videtur, suo genere, pares compositiones accipiunt; quarum aliæ gratæ, aliæ ingratissimæ repe-

by separate impulses, made simultaneously, or by fresh impulses, so suddenly succeeding the first, that the first sensation has not subsided before the latter sensation has commenced. For sensation often lasts longer than the impulse, particularly if proper attention of the mind be applied, (136, 137). The musical combination of sounds is an instance; there is an example of this in paper tinged with various colours, which, if rapidly moved in a circle, shows the same mean or mixed colour, compounded of the others, as the separate colours, if mixed, would produce. Also smells and tastes admit of like combinations, each in its kind: some of them are found agreeable, others most disagreeable; the art of the cook and perfumer, in a great

riuntur. Hoc fundamento, magna saltem ex parte, nititur ars coqui et unguentarii. Perceptiones vero sive sensus quos tactus dat, tot tamque diversi sunt, ut vix ita conjungi queant, ut unum, quasi medium vel compositum, sensum efficiant.

unguentarii nititur hoc fundamento, saltem ex magná parte. Vero perceptiones sive sensus quos tactus dat, sunt tot que tam diversi ut queant vix ita conjungi, ut efficiant unum sensum medium vel compositum.

143. Ex causâ quavis externa, impulsu nimirum in organum sensus certa vi facto, et certum tempus durante, varius esse poterit sensus, propter multas res internas corpori sentienti proprias, multasque partes quæ ad sensum efficiendum necessariæ sunt. Animi imprimis ratio habenda est, quod ad attentionem ; tum quoque cerebri, quod ad delirium, torporem, somnum, vigiliam, &c. ; tum nervorum qui organum sentiens

143. *Sensus poterit esse varius (si) ex quávis causá externá, nimirùm impulsú facto in organum sensús certá vi, et durante certum tempus, propter multas res internas proprias corpori sentienti, que (propter) multas partes, quæ sunt necessariæ ad efficiendum sensum. Imprimis ratio animi habenda est quod ad attentionem tum quoque (ratio) cerebri (in eo) quod (attinet) ad delirium, torporem, somnum, vigilium, &c. ; tum*

degree, is dependant upon this. But the perceptions or sensations afforded by touch are so numerous and diversified, that they can scarcely be combined, so as to produce one mean or compound sensation.

143. Sensation may vary, if, from any external cause, an impulse be produced on an organ of sense, with a certain degree of force, and continuing a certain time, on account of many internal things, peculiar to the sentient body, and on account of the numerous parts which are necessary to produce sensation. In the first place, account is to be taken of the mind, as to attention of the brain, as to delirium, torpor, sleep, watchfulness, and then of the nerves

adeunt, prout integri, liberi, sani, vel prout compressi, aliterve læsi fuerint; tum finium nervorum ipsius organi, prout magis minusve sentientes fuerint, vel a prima corporis fabricatione, vel ab aliis impulsibus antea factis, vel a calore aut frigore, vel a statu vasorum sanguinem vehentium, quæ minutas nervosas fibras comitantur inseparabilia, quæque vel præter solitum laxari vel distendi, vel demum inflammari possunt; tum denique partium, qualescunque fuerint, rationem habere oportet, quæ fines nervorum tenuissimos et acerrime sentientes tegunt et defendunt, et vim impressionum vel augent vel temperant. Quales sunt cuticula ubique corporis, auris

(ratio) nervorum qui adeunt sentiens organum, prout fuerint integri, liberi, sani, vel prout compressi ve aliter læsi; tum (ratio habenda est) finium nervorum ipsius organi, prout fuerint magis ve minus sentientes, vel a primá fabricatione corporis, vel aliis impulsibus anteà factis, vel a calore aut frigore, vel a statú vasorum vehentium sanguinem, quæ (vasa) inseparabilia comitantur minutas nervosas fibras, que quæ possunt vel laxari vel distendi præter solitum vel demum inflammari: tum denique oportet habere rationem partium, qualescunque fuerint, quæ tegunt et defendunt fines nervorum tenuissimos et acerrimè sentientes, et vel augent, vel temperant vim

which enter the sentient organ, whether they are sound, free, healthy, or compressed, or otherwise injured: then of the extremities of the nerves of the organ itself, as to being more or less sentient, either depending on the primary structure of the body, or other impulses previously made, or on heat, or cold, on the state of the blood-vessels, which inseparably accompany the minute nervous fibres, and which may be unusually relaxed, or distended, or, lastly, undergo inflammation; we must, lastly, take into account the parts, whatever they be, which cover and protect the very minutely and finely sentient extemities of the nerves, and (which) either increase or modify the force of impressions. Such are, the cuticle of every part of the body, the

tum externa tum interna, ejusque meatus uterque; et varii demum oculi humores.

144. Porro a multis causis internis, nulla aut juvante aut concurrente externa, sensus nonnulli oriuntur. Ipsa mens sui conscia, et varii ejus status, cogitatio, memoria, imaginatio, voluntas, affectus omnes, huc referri possunt. Tum quoque varii corporis status, vigor, debilitas, alacritas, torpor, lassitudo, dolor, anxietas, pruritus, appetitus, veluti fames et sitis, propensiones demum multæ, quales ad tussim, vomitum, alvum evacuandam, et similia, impellunt. Plerosque vero horum sensuum, quatenus corporei

impressionum. Quales sunt cuticula ubique corporis, tum externa tum interna auris, que uterque meatus ejus; et demùm varii humores oculi.

144. *Porro nonnulli sensus oriuntur a multis causis internis, nullá causá externá aut juvante aut concurrente. Ipsa mens conscia sui, et varii status ejus, (scilicet) cogitatio memoria, imaginatio, voluntas, omnes affectus, possunt huc referri. Tum quoque varii status corporis, scilicet, vigor, debilitas, alacritas, torpor, lassitudo, dolor, anxietas, pruritus, appetitus, veluti fames et sitis, demum multæ propensiones, quales impellunt ad tussim, vomitum, (ad) alvum evacuandam et similia. Verò solemus referre ad sensum tactús, plerosque*

external and internal ear, both its passages, and lastly, the different humors of the eye.

144. Many sensations arise from many internal causes, without any external cause either assisting or concurring. The mind, conscious of itself, and various states of it, such as thought, memory, imagination, will, and all affections, may be referred to this cause. Likewise the various states of the body; such as vigour, debility, cheerfulness, torpor, weariness, pain, anxiety, itching, appetites, such as hunger or thirst; lastly, many inclinations which urge us to cough, vomit, evacuate the bowels, and the like. We are accus-

sunt, ad sensum tactus referre solemus.

145. Sensus, tum externi, tum interni, nunquam accurate ad classes vel genera relati sunt. Externi vero, semper et ubique ad quinque genera referuntur, nempe visum, auditum, olfactum, gustum et tactum. Quod priores quatuor spectat, paucæ corporum externorum qualitates, quas unusquisque eorum percipit, facile in classes a se invicem diversas reducuntur, et ad unum et proprium sensum referuntur. Imprimis, quia sensus ipse singulare et proprium organum habet, neque alibi in corpore insidet, aut quivis modo excitari potest; tum quoque quia sensus organum ab uno genere impul-

horum sensuum, quatenùs (hi sensus) sunt corporei.

145. *Sensus, tum externi tum interni, nunquam sunt relati accuratè ad classes vel genera. Verò (sensus) externi semper et ubique referuntur ad quinque genera, nempe, visum, auditum, olfactum, gustum et tactum. Quod spectat (ad) quatuor priores, paucæ qualitates externorum corporum, quas (qualitates) unusquisque eorum percipit, facilè reducuntur in classes invicem diversas a se, et referuntur ad unum et proprium sensum. Imprimis, quia ipse sensus habet singulare et proprium organum, neque insidet alibi in corpore, aut potest excitari quovis modo; tum quoque quia organum sensûs afficitur ab uno genere impulsûs,*

tomed to refer many of these sensations, inasmuch as they are corporeal, to the sense of touch.

145. Both the external and internal sensations have never been accurately referred to classes or genera. But the external ones are always and universally referred to five genera; namely, sight, hearing, smell, taste, and touch. As to the first four, the few qualities of external bodies which each of them perceives, are easily reduced into classes, differing together, and are referred to one and the proper sense. Especially, because the sense itself has its own peculiar organ, nor resides, nor can be produced, in any other part of the body; and because the organ of sense is affected by only one kind of impulse, as of light, tremors of

sus afficitur, veluti lucis, tremorum aëris, particularum volatilium; tum denique quia perceptiones ex singulis istorum sensuum, quantumvis inter se differre videantur, aliquid semper commune habent, ita ut comparari possint earumque similitudines et differentiæ detegi.

146. Hoc verissimum est de rebus quas aures, nares, vel lingua percipiunt. Oculi vero plures res capiunt, easque satis dissimiles; colorem scilicet, figuram, magnitudinem et motum. Omnes tamen hæ perceptiones ad unum sensum facile referuntur, quia per idem organum idemque *medium*, ut vocatur, idemque genus impulsus, percipiuntur. Reliquæ autem perceptiones,

veluti lucis, tremorum aëris, volatilium particularum; tum denique quia perceptiones ex singulis istorum sensuum, quantumvis videantur differre inter se, semper habent aliquid commune, ita ut possint comparari que similitudines et differentiæ, earum possint detegi.

146. *Hoc est verissimum de rebus, quas aures, nares vel lingua percipiunt. Verò oculi capiunt plures res, que eas (res) satis dissimiles; scilicet colorem, figuram, magnitudinem et motum. Tamen omnes hæ perceptiones facile referuntur ad unum sensum, quia percipiuntur, per idem organum que idem medium, ut vocatur, que (per) idem genus impulsûs. Autem reliquæ*

the air, or volatile particles; and, lastly, because the perceptions of the individual senses, although appearing to differ, have always something in common, so that they may admit of comparison, and their resemblance and differences may be detected.

146. This is very true concerning things which the ears, nostrils, or tongue, perceive. But the eyes take in more objects, and of a dissimilar description; namely, colour, size, and motion. Nevertheless all these perceptions are easily referred to one sense, because they are perceived through the same organ, the same medium, as it is called, and the same kind of impulse. But the other perceptions, however dissimilar, are referred to the sense of touch.

utcunque dissimiles fuerint, ad sensum tactus referuntur.

147. Sensus plerique vel grati vel ingrati reperiuntur: scilicet non modo nos de rebus externis monent, earumque qualitates nobis representant, sed animum simul ita afficiunt, ut eosdem sensus vel cupiamus vel nolimus, continuari aut repeti.

148. In quibusdam sensuum exemplis, sensus ipse, mutatio scilicet quæ in animi statu efficitur, jucundus est, et ab eo solo voluptas nascitur. In aliis vero exemplis, non tantum sensus quam perceptio, qualitas nimirum seu conditio rei externæ quam percipimus et sensus ope cognoscimus, voluptatem dat.

perceptiones, utcunque fuerint dissimiles, referuntur ad sensum tactûs.

147. *Sensus plerique reperiuntur grati vel ingrati; scilicet non modo monent nos de rebus externis, que representant nobis qualitates earum, sed simul ita afficiunt animum ut vel cupiamus aut nolimus eosdem sensus, continuari aut repeti.*

148. *In quibusdam exemplis sensuum, sensus ipse, scilicet mutatio quæ efficitur in statû animi est jucundus, et voluptas nascitur ab eo solo. Verò in aliis exemplis, sensus non dat voluptatem tantum quam perceptio, nimirum qualitas seu conditio rei externæ quam percipimus et cognoscimus ope sensûs.*

147. Most of the sensations are agreeable or disagreeable: for, they not only admonish us of external objects, and represent to us their qualities, but at the same time so influence the mind, that we desire or dislike those sensations to be continued or repeated.

148. In some instances of sensations, the sensation itself, that is, the change produced in the state of the mind, is agreeable, and pleasure is derived from it alone; but in other instances, sensation does not so much afford pleasure as perception, that is, the quality or condition of an external object, which we perceive and know by means of the organ of sense.

149. Prioris generis exempla sunt, jucundi sensus seu voluptates quas gustus, olfactus, auditus nobis suggerunt; quibus adjungere oportet sensus quosdam, veluti caloris, quos tactus dat. In his nimirum exemplis ad sensum solum attendimus, neque ab eo quicquid docemur de causa seu qualitate corporis externi quæ sensum efficit. Siquid istiusmodi novimus, id, ope aliorum sensuum et judicii, observando, periclitando, ratiocinando, plane didicimus.

149. *Jucundi sensus seu voluptates, quas, gustus, olfactus, auditus suggerunt nobis sunt exempla prioris generis; quibus oportet adjungere quosdam sensus, quos tactus dat, veluti caloris. Nimirum in his exemplis attendimus ad sensum solum, neque docemur quicquid ab eo, de causá seu qualitate corporis externi, quæ qualitas efficit sensum. Si novimus quid istiusmodi, planè didicimus id, ope aliorum sensuum et judicii, observando, periclitando, ratiocinando.*

150. Posterioris exempla sunt, perceptiones quædam jucundæ qualitatum rerum externarum, quas vel visus vel tactus nobis suggerunt: veluti pulchritudinis omnis visibilis, formæ, propor-

150. *Quædam jucundæ perceptiones qualitatum rerum externarum, quas (qualitates) vel visus vel tactus suggerunt nobis, sunt exempla posterioris (generis), veluti (qualitas) omnis visi-*

149. The agreeable sensations or pleasures afforded by taste, smell, and hearing, are instances of the first kind; to these we must add certain sensations, as of heat, which is oft conveyed by the touch. In these instances, indeed, we refer the mind to the sensation only, nor learn from it any thing concerning the cause or quality of the external body, which produces sensation. If we have known any thing of it, we have truly learned it by means of the other senses and of judgment, by observation, experiment, and reasoning.

150. Certain agreeable perceptions of qualities of external objects, conveyed to us by sight or touch, are instances of the latter kind: as of every kind of visible beauty,

tionis, motus, et forsitan coloris quoque; vel denique formæ tactilis, aut lævoris aut mollitiei. In his scilicet exemplis perceptio ipsa placet: neglectoque sensu, seu mutato animi statu, ad rem seu qualitatem quam sensus ille suggerit statim transimus, eamque sæpe cum voluptate contemplamur.

bilis pulchritudinis, formæ, proportionis, motûs, et forsitan quoque coloris; vel denique formæ tactilis, aut lævoris, aut mollitiei. Scilicet ipsa perceptio placet in his exemplis: que sensû neglecto, statû animi mutato, statim transimus ad rem seu qualitatem quam ille sensus suggerit, que sæpe contemplamur eam cum voluptate.

151. Difficillimum profecto explanatu videtur, cur tot diversi sensus a variis impressionum generibus in certa corporis organa factarum oriantur (145, 146). Multo autem difficilius explanatu est, cur ab omni fere genere impressionum in varia corporis organa, tales excitentur sensus, quales non modo suam singuli

151. *Profectò videtur difficillimum explanatu, cur tot diversi sensus oriantur a variis generibus impressionum factarum in certa organa corporis* (145, 146). *Autem est multo difficilius explanatu, cur tales sensus excitentur ferè ab omni genere impressionum in varia organa corporis, quales non modo singuli representave-*

form, proportion, motion, and perhaps also of colour; or, lastly, of tangible form, smoothness, or softness. For, the perception itself pleases in these instances; and, if the sensation be neglected, and the state of the mind be changed, we immediately make a transition to the object or quality which that sensation suggests, and often contemplate it with pleasure.

151. It appears, indeed, very difficult of explanation, why so many different sensations should arise from the various kinds of impressions made upon the organs of the body, (145, 146). But it is much more difficult to be explained, why sensations should be excited by nearly every kind of impression upon the different organs of the body, such as

perceptionem (130, 131,) animo representaverint, sed eundem simul vel plurimum delectaverint, vel insigni dolore, angore, molestia, fastidio, affecerint.

152. Sensus enim, utcunque inter se, secundum varia eorum organa, resque quæ hæc afficiunt, diversi, tamen constantes sunt, easdemque semper singuli causas agnoscunt; neque eidem homini, variis temporibus, eadem impressio varium dat sensum seu perceptionem; neque ratio ulla existit, cur credamus eandem rem seu impressionem diversum diversis hominibus sensum aut perceptionem dare, nisi in nonnullis rarissimis exemplis, in quibus verisimile est vitium aliquod, neque sane leve, in corpore

rint suam perceptionem animo (130, 131), *sed delectaverint eundem simul vel plurimum, vel afficerint insigni dolore, angore, molestiá, (vel) fastidio.*

152. *Enim sensus, utcunque diversi inter se, secundum varia organa eorum, que (secundum) res quæ afficiunt hæc (i. e. organa,) sunt tamen constantes, que semper singuli agnoscunt easdem causas; neque eadem impressio dat varium sensum seu perceptionem eidem homini, variis temporibus: neque ulla ratio existit, cur credamus eandem rem, seu impressionem dare diversum sensum seu perceptionem in diversis hominibus, nisi in nonnullis rarissimis exemplis, in quibus verisimile est aliquod vitium, neque sanè*

not only represent to the mind each its individual perception, (130, 131), but at the same time either afford it considerable delight, or affect it with great pain, anguish, trouble, (or) aversion.

152. For sensations, however different amongst themselves as to their organs, and the circumstances which affect them, are nevertheless constant, and always individually subject to the same causes: the same impression does not afford a different sensation or perception to the same man at different times; nor is there any reason, why we should suppose that the same object or impression affords a different sensation or perception in different men, unless in some very rare instances, in which it is probable that there is

subesse, vel hujus saltem sensuum organa a solito et naturali statu multum alienari.

153. Voluptas vero, vel molestia, vel fastidium, quæ tot sensus comitantur, variant, quam maxime, cum in variis hominibus, tum in iisdem, variis temporibus.

154. Insignis quoque, et fere incredibilis, est vis consuetudinis in voluptates aut molestias sensus; exigua autem in sensum ipsum, et nulla omnino in perceptionem qualitatis rei externæ quam sensus suggerit. Nemo enim sanus, vel naturâ vel ullâ consuetudine, durum pro molli, aut rubrum pro viridi, aut mel pro absinthio, aut absinthium pro melle, percipere potest; quamvis vel singu-

leve, subesse in corpore, vel saltem organa sensuum hujus (corporis) multum alienari a solito et naturali statû.

153. *Verò voluptas, vel molestia vel fastidium, quæ comitantur tot sensus, quam maximè variant, cum in variis hominibus, tum in iisdem, variis temporibus.*

154. *Quoque vis consuetudinis est insignis et ferè incredibilis in voluptates aut molestias sensûs; aut (illa est) exigua in ipsum sensum, et omnino nulla in perceptionem qualitatis rei externæ quam sensus suggerit. Enim nemo sanus, vel naturâ vel consuetudine, potest percipere durum, pro molli, aut rubrum pro viridi, aut mel pro absinthio, aut absinthium pro melle; quamvis vel (a) singulari constitu-*

some disorder, (and that not slight) in the body, or at least, that the organs of sense of this body, are much changed from their usual and natural state.

153. The pleasure, uneasiness, or aversion, which attend so many sensations, vary very much, both in different men, and in the same men at different times.

154. The power of habit also, upon the pleasures and troubles of sensation, is astonishing, and nearly incredible; but it is slight upon sensation itself, and lost completely, upon the perception of the quality of an external object, which is suggested by sensation. For no sensible man, either by nature or habit, can mistake hard for soft, red for green, or honey for wormwood; although, either by pecu-

lari corporis constitutione, vel demum sola consuetudine, amarissima ista herba Hymettio melle gratior et jucundior gustui fieri possit.

155. Quamvis sensus plerique plus minus grati sint, tamen non est negandum, insigne eos inter hac de re discrimen intercedere, et alios naturâ fere omnibus hominibus esse gratissimos, alios valde ingratos, nonnullos demum adeo indifferentes, ut neque voluptatem neque molestiam ullam dent. Hujusmodi sensuum discriminum ratio nulla hactenus reddita est.

156. Est quoddam tamen novisse, unumquodque fere sensuum genus, vel gratum

tione corporis, vel demum solâ consuetudine, ista herba amarissima potest fieri gratior et jucundior gustui melle Hymettio.[32]

155. *Quamvis plerique sensus sint plus (vel) minùs grati, tamen non est negandum, insigne discrimen intercedere inter eos de hâc re, et alios naturâ ferè esse gratissimos omnibus hominibus, alios (esse) valdè ingratos, nonnullos demum (esse) adeo indifferentes ut dent neque voluptatem, neque ullam molestiam. Nulla ratio discriminum sensuum hujusmodi hactenus est reddita.*

156. *Tamen, est quoddam novisse, ferè unumquodque genus sensuum, esse vel*

liarity of constitution or by habit alone, that bitter herb may be more acceptable and agreeable to the palate than Hymettian honey itself.

155. Although most of the sensations are more or less agreeable, it cannot be denied, that there is a great difference between them in this respect, and that some of them are by their nature most pleasing to all men, and that others are very unpleasant, and lastly, that some are so indifferent, as neither to give pleasure or uneasiness. There is no reason given for differences of this description.

156. Nevertheless, it is worth being known, that every

---

32. Mount Hymettus, in Attica, was celebrated for its honey, hence mel Hymettium is used proverbially, to express the best honey.

esse, vel ingratum, natura ejus nil mutata, secundum ipsius vehementiam. Nullus enim existit sensus adeo jucundus, quin ultra modum intensus, ingratus evadat, nonnunquam fere intolerabilis. Et contra omnino, qui natura solitaque vehementia, multum offendunt, leviores facti, tolerabiles sæpe fiunt, et interdum admodum jucundi.

157. Par fere ratio est quod multi sensus, primo grati, delectare cessent, si sæpius repetiti fuerint, quamvis semper ejusdem naturæ et vehementiæ fuerint, quantum ipsam impressionem attinet; et multi primo ingrati displicere desinant, et tandem placeant, quamvis neque natura neque vehementia impressio-

gratum vel ingratum, naturá ejus mutatá nil, secundum vehementiam ejus. Enim nullus sensus existit adeò jucundus, quin intensus ultra modum, evadat ingratus, nonnunquam ferè intolerabilis. Et contrà omnino, (sensus), qui multum offendunt, naturá que solitá vehementiá, (cùm) facti leviores, fiunt sæpe tolerabiles et interdum admodum jucundi.

157. *Ferè est par ratio quòd multi sensus, primò grati, cessent delectare, si fuerint repetiti sæpiùs, quamvis fuerint semper ejusdem naturæ et vehementiæ, (in tanto) quantum attinet (ad) ipsam impressionem; et multi (sensus) primo ingrati desinant displicere, et tandem placeant, quamvis neque natura neque vehe-*

kind of sensation is either pleasant or unpleasant, without any change in its nature, according to its force; for there is no sensation so agreeable, but that, if immoderately extended, it may become unpleasant, and sometimes nearly intolerable; on the other hand, those sensations which are troublesome by their nature, and applied with their usual force, if rendered milder, often become supportable, and occasionally very agreeable.

157. There is nearly the same reason why many sensations, which were at first agreeable, cease to be so if often repeated, although they are always of the same nature and force, as far as the impression is concerned; and many sensations, unpleasant at first, please at length, although neither

nis vel minimum mutatæ fuerint. Scilicet, sola consuetudine familiares facti, sensus sæpe repetiti, segnius percipiuntur (140), et tandem negliguntur penitus, nulla animi attentione adhibita.

158. Hinc quoque ratio reddi potest, cur novi sensus fere magis placeant; cur varietas adeo jucunda; cur validiores sensus, vel saltem impressiones in organa sensus cujuslibet, cupiamus, ut voluptatem vel augeamus vel continuemus; cur ad tot voluptates vix ac ne vix quidem attendamus, neque fere tales ante extitisse sciamus quam eas amiserimus; cur tot voluptates, tamque constantes et puræ, tantaque ideo et tam continua animi hilaritas, pueris præ senibus.

mentia impressionis vel minimum fuerint mutatæ. Scilicet, sensus sæpe repetiti, facti familiares solâ consuetudine, percipiuntur segniùs (140), *et tandem penitùs negliguntur, nullâ attentione animi adhibitâ.*

158. *Hinc quoque ratio potest reddi, cur novi sensus ferè placeant magis; cur varietas (est) adeò jucunda; cur cupiamus sensus validiores, vel saltem impressiones in organa cujuslibet sensus, ut vel augeamus, aut continuemus voluptatem; cur vix ac ne quidem vix attendamus ad tot voluptates, neque ferè sciamus tales extitisse, antequam amiserimus eas; cur (sunt) tot voluptates, que tam constantes et puræ, que ideo tanta et tam continua hila-*

the nature nor force of the impression be in any degree changed: that is to say, sensations often repeated, and having become familiar by habit alone, are perceived less forcibly, and at length are quite neglected, from no attention of the mind being applied.

158. Hence likewise is a reason why new sensations are generally more pleasant; why variety is so charming; why we desire stronger sensations, or impressions, upon the organs of each sense, in order that we may increase or continue our satisfaction; why we scarcely and not at all attend to many pleasures, nor are conscious that they existed before we have lost them; why there are such numerous pleasures, so constant and pure, and consequently such constant

Quantum enim cunque voluptatis, nova sentiendi facultate subito donatus, aut cæcus visui denuo redditus, haberet, tantum, omnes, ab omnibus sensibus olim habuimus, quamvis longus usus et consuetudo istam voluptatem jam pene deleverint.

159. Sensus plerique satis validi ut facile et accurate distinguantur, suo quisque genere et modo fere placent maxime. Varia autem existunt voluptatum genera; variique igitur sensus variis modis animum delectare possunt. Neque profecto aut splendor solis, aut pulchra et vivida totius Naturæ facies meridiana, sola hominum oculos, neque magni concentus soli aures eorum delectant; scilicet

ritas animi, pueris præ senibus. Enim quantum cunque voluptatis homo haberet subito donatus novâ facultate sentiendi, aut cæcus denuò redditus visui, tantum (voluptatis), omnes olim habuimus ab omnibus sensibus, quamvis longus usus et consuetudo jam pene deleverint istam voluptatem.

159. *Plerique sensus, satis validi ut distinguantur facilè et accurate, quisque suo genere et modo, ferè placent maximê. Autem varia genera voluptatum existunt; que igitur varii sensus possunt delectare animum, variis modis. Neque profectò aut splendor solis, aut pulchra et vivida facies totius Natura, sola delectant oculos hominum, neque magni concentus soli, (delectant) aures eorum, scilicet qui,*

cheerfulness in boys more than in old men. For whatever degree of pleasure a person might derive, who is suddenly endowed with some new sentient faculty, or a blind man again restored to sight, we have all formerly derived as much pleasure from all the senses, although long use and custom have now almost obliterated that pleasure.

159. Most of the sensations, which are sufficiently powerful to be distinguished with ease and accuracy, each in its peculiar manner, please the most; but there are various modifications of pleasures; and, therefore, different sensations delight the mind in different ways. For neither does the splendor of the sun, nor the fair and glowing face of

qui longe diversa, sed tamen haud exigua voluptate, obscura Numinis templa spectant, et umbrosos lucos per lunam adeunt, noctisque demum nigram formidinem lubentes contemplantur; et zephyrum sylvas agitantem, aut apum susurrum, aut fluminis murmur, auscultant. Quin et tempus est, quo tenebræ, silentium, omnisque demum sensus absentia, sola placent.

voluptate longe diversâ, sed tamen haud exiguâ, spectant obscura templa Numinis, et adeunt umbrosos lucos per lunam, que demum lubentes contemplantur nigram formidinem noctis; et auscultant zephyrum agitantem sylvas, aut susurrum apum,[33] *aut murmur fluminis. Quin est et tempus, quo tenebræ, silentium, que demum omnis absentia sensûs, sola placent.*

160. Sui igitur sunt, et quidem satis arcti, limites voluptatibus sensuum; quippe quæ neque multum augeri, neque nimis sæpe repeti, neque diu produci aut continuari possint: quasi ipsa Natura hoc modo

160. *Igitur sunt sui limites, et quidem satis arcti, voluptatibus sensuum; quippe quæ possint neque multum augeri, neque nimis sæpe repeti, neque diù produci aut continuari: quasi ipsa Natura modo moneret, ho-*

all nature alone delight the eyes of men, nor do great concerts alone please the ears of those who, with a very different, but not inconsiderable degree of pleasure, review the obscure temple of the deity, and enter the shady groves by moonlight, and from inclination contemplate the dark horrors of night, and listen to the zephyr shaking the woods, or the hum of the bees, or the murmur of the stream. Moreover there is a time when darkness, silence, and the loss of every sense, alone give delight.

160. Therefore limits, and those rather narrow, are assigned to the pleasures of sensation; for they cannot be much increased, nor too often repeated, nor long called

33. *Apum* is the genitive plural of *apis*, a bee; in some Latin authors it is found *apium*.

moneret, non solis voluptatibus, saltem non hujusmodi voluptatibus, hominem esse natum: omnes enim nimis cultas languor aut fastidium abrumpunt; nonnullas insignis molestia aut dolor tandem excipiunt. Et profecto, ut voluptas in molestiam aut dolorem tam facile transit, sic, pari fere ratione, doloris, saltem magni, cessatio subita, incredibilis aliquando voluptas est, qualis nimirum, si minore aut alio quovis pretio emendi facultas esset, certe non deessent emptores. Voluptas et dolor, ut pulchra Socratis fabula docet, sorores fuerunt, utcunque dissimiles, diversamque sortem expertæ; altera nimirum optata et grata omnibus, altera pariter invisa;

minem non esse natum voluptatibus solis, saltem non voluptatibus hujusmodi: enim languor aut fastidium abrumpunt (voluptates) nimis cultas; insignis molestia aut dolor tandem excipiunt nonnullas. Et profectò, ut voluptas transit tam facile, in molestiam aut dolorem, sic, ferè pari ratione, cessatio subita doloris, saltem magni, aliquando est incredibilis voluptas, qualis nimirùm certè emptores non deessent, si esset facultas emendi minore aut quovis alio pretio. Voluptas et dolor fuerunt sorores, ut pulchra fabula Socratis docet, utcunque dissimiles, que expertæ diversam sortem: nimirum altera optata et grata omnibus; altera pariter invisa; quas (so-

forth, or continued; as if Nature, in a manner, admonished that man is not born for pleasures of this description alone; for languor or loathing break off those too much followed; great uneasiness or pain at length cut off others. And, indeed, in the same way as pleasure passes easily into uneasiness or pain, so in the same way sudden cessation of severe pain is sometimes an inconceivable pleasure, in such a degree that purchasers would not be wanting, if this were to be purchased at any price. Pleasure and pain were sisters, as the beautiful fable of Socrates informs us, however dissimilar, and experiencing diversity of lot: for the one is longed for and acceptable to all, the other is equally detested: Jupiter has so associated and united them in an

quas tamen Jupiter ita sociavit, et tam indissolubili vinculo conjunxit, ut quamvis natura contrarias, et diverse spectantes, quicunque alterutram amplectitur, alteram trahat simul.

161. Magna autem hac de re inter varias sentiendi facultates, variasque quas dant voluptates, differentia observatur. Quædam brevi fatiscunt, neque res quas debent, distinguunt bene, neque amplius delectantur rebus ipsis quas satis distinguunt, et quæ primo gratissimæ fuerant: aliæ diutius ad sua munera valent, et magis diuturnâ fruuntur voluptate. Sic olfactus et gustus fere brevi satiantur; auditus tardius; visus omnium externorum sensuum longe tardissime. Volup-

rores) Jupiter sociavit ita, et conjunxit vinculo tam indissolubili, ut quamvis contrarias naturâ, et spectantes diversè, quicunque amplectitur alterutram, simul trahat alteram.

161. *Autem magna differentia observatur de hác re, inter varias facultates sentiendi, que varias voluptates quas dant. Quædam (facultates) fatiscunt brevi, neque bene distinguunt res, quas debent, neque amplius delectantur rebus ipsis, quas satis distinguunt, et quæ fuerant primò gratissimæ; aliæ (facultates) valent diutiùs ad sua munera, et fruuntur magis diuturná voluptate. Sic olfactus et gustus ferè satiantur brevi; auditus (satiatur) tardiùs; visus (satiatur) longè tar-*

indissoluble bond, that, although opposite in their nature, and looking in opposite ways, whoever embraces the one must take the other with him.

161. Great difference is observed in this respect, between the various faculties of sensation and the different pleasures produced by them. Some of them are quickly fatigued, nor distinguish properly the things that they ought, nor are longer pleased with the objects themselves, which are distinguished and which were at first very agreeable: others are longer competent to their functions, and enjoy a longer source of pleasure. Thus, generally, smell and taste are quickly satiated, but hearing more slowly, and sight slowest of all the external senses. The pleasures which are derived

tates autem quæ a sola mente seu sensibus internis derivantur, sunt omnium maxime longævæ. Omnes demum voluptates, eas variando, aliasque cum aliis miscendo, vel sæpe minus gratas res iis quæ magis delectant interponendo, ita ut ne quid nimis sit, haud parum producere possumus.

162. Supersunt et aliæ quædam res, a jam memoratis plane diversæ, quæ nonnullas sensuum voluptates multum regunt; variæ nimirum conditiones vel universi corporis, præsertim nervorum, vel quorundam præ aliis organorum aut functionum, quibus functionibus, organa quædam sensus, fortasse et sensus ipsi, magna ex parte, in-

dissimè omnium sensuum externorum. Autem voluptates quæ derivantur a mente solâ, seu sensibus internis, sunt longævæ maximè omnium. Demum possumus producere haud parum omnes voluptates, variando eas, que miscendo alias cum aliis, vel sæpe interponendo res minùs gratas iis quæ magis delectant, ut ne sit quid nimis.

162. *Et quædam aliæ res supersunt, planè diversæ a (rebus) jàm memoratis, quæ multum regunt nonnullas voluptates sensuum; nimirum variæ conditiones universi corporis, præsertim nervorum, vel quorundam organorum aut functionum præ aliis, quibus functionibus, quædam organa sensûs, et fortasse ipsi sensus, ex magnâ parte inserviunt. Et*

from the mind alone, or internal sensations, are much more permanent. Lastly, we may protract considerably all our pleasures, by varying them, and blending them together, or by interposing things less pleasant with those which are most so, that there may be no excess of either.

162. There are other circumstances remaining, quite different from those already mentioned, which influence considerably the pleasures of the senses: they are the different states of the system generally, particularly of the nerves, or certain organs or functions compared with others, to which some organs of sensations, and perhaps the sensations themselves, are in great part subservient. This is one

serviunt. Et hæc inter alias causas est, quod multæ, et quæ maxime coluntur, voluptates, immortales esse nequeant. Sitienti pura aqua pro nectare est; esurienti omnis cibus gratissimus, etiam cibi odor jucundus: æstuanti aut febricitanti frigus, frigenti calor, placet. Iisdem vero hominibus, aliis temporibus, eædem res non modo non gratæ sunt, sed sæpe valde ingratæ, veluti cibus aut potio, utcunque delicatus, statim post pastum aut potum; vel odor cibi statim post prandium: neque profecto aut epulæ perpetuæ, aut alterum prandium statim a primo, perditissimum possunt delectare helluonem: neque Venus ipsa,

hæc est (causa) inter alias causas, quod multæ voluptates, et (illæ) quæ maximè coluntur, nequeant, esse immortales. Aqua pura est pro nectare (homini) sitienti; omnis cibus (est) gratissimus, (et) etiam odor (est) jucundus esurienti; frigus placet æstuanti aut febricitanti, calor (placet) frigenti. Verò eædem res non modo non sunt gratæ, sed sæpè valdè ingratæ iisdem hominibus, aliis temporibus, veluti cibus aut potio, ut cunque delicatus, statim post pastum aut potum; vel odor cibi statim post prandium: neque profectò aut perpetuæ epulæ, aut alterum prandium statim a primo (prandio) possunt delectare perditissimum helluonem: neque ipsa Venus semper placet

amongst other causes, why many pleasures, and those too much cultivated, cannot be permanent. Plain water is like nectar to the thirsty man; every kind of food is most acceptable, and even its odour is grateful, to the hungry man; cold is pleasant to him, who is over-heated and feverish, but heat is agreeable to him suffering from cold. But the same things are not only not pleasant, but often very unpleasant to the same men, at different times; as food or drink, however delicate, immediately after eating or drinking, or the smell of food, directly after dinner; nor indeed can a series of feasts, or a second dinner, directly after the first, be acceptable to the most desperate gormandizer;

strenuissimis etiam cultoribus, semper placet.

163. Quin et ab aliis sensibus præter illos qui ab impressione externa (133, 144) fiunt, voluptas aut molestia oriri possunt :—ab actione musculorum, quatenus, hæc fortis, facilis, alacris, fuerit, neque ad fatigationem continuata, voluptas percipitur ; contrarii vero ab actione musculorum sensus, hebetudinis nempe, lassitudinis, difficultatis, debilitatis, semper molesti sunt : varii demum animi status, affectus, exercitationes variæ memoriæ, imaginationis, judicii, pari fere ratione, nunc grati nunc molesti reperiuntur.

164. Ex his omnibus, ut videtur, concludere æquum sit, tanta benignitate et li-

etiam strenuissimis cultoribus.

163. *Quin voluptas aut molestia possunt oriri ab aliis sensibus præter illos, qui fiunt ab externâ impressione* (133, 144) :—*voluptas percipitur ab actione musculorum, quatenus hæc (actio) fuerit fortis, facilis, alacris, neque continuata ad fatigationem ; verò contrarii sensus ab actione musculorum, nempe (sensus) hebetudinis, lassitudinis, difficultatis, debilitatis, semper sunt molesti : demum varii status animi, affectus, variæ exercitationes memoriæ, imaginationis, judicii, ferè pari ratione, reperiuntur nunc grati nunc molesti.*

164. *Sit æquum concludere ex his omnibus, ut videtur, Naturam providisse*

nor does Venus herself always attract her most strenuous votaries.

163. Moreover pleasure or pain may arise from other sensations, besides those produced by an external impression (133, 144). Pleasure is derived from the action of the muscles, inasmuch as it is powerful, vigorous, not continued to fatigue ; but the contrary sensations, from the action of the muscles, namely, of dullness, lassitude, difficulty, and debility, are always troublesome ; lastly, different states of mind, affections, different degrees of exercise, as of memory, imagination, and judgment, are commonly for the same reason, at one time agreeable, at another painful.

164. We may conclude from all these circumstances, as

beralitate hominibus providisse Naturam, totque iis voluptates suppeditasse, ut non modo viverent, sed vita quam dedit fruerentur.

165. Neque sane suis et eximiis usibus carent sensuum voluptates. Suavitas illa generalis quæ omnes fere sensus, præsertim prima ætate, comitatur, invitat nos ad varias sentiendi facultates probe exercendas, et sic acuendas, plurimamque simul et utilissimam scientiam (131, 132) nobismet quotidie acquirendam.

166. Pari fere ratione ad sua organa motus modice et crebro exercenda invitantur homines, præsertim pueri, quorum sic vis insita promovetur, et facilis et promptus usus discitur.

hominibus, tantâ benignitate et liberalitate, que suppeditasse tot voluptates iis, ut non modo viverent, sed fruerentur vitâ, quam (illa dedit.)

165. *Neque sane voluptates sensuum carent suis et eximiis usibus. Illa generalis suavitas, quæ comitatur ferè omnes sensus, præsertim primâ ætate, invitat nos ad probè exercendas varias facultates sentiendi, et sic acuendas, que simul acquirendam nobismet quotidie plurimam et utilissimam scientiam* (131, 132.)

166. *Ferè pari ratione homines præsertim pueri invitantur ad exercenda modicè et crebrò sua organa motûs, quorum sic vis insita promovetur, et usus facilis et promptus discitur.*

it appears, that Nature has provided for man with such kindness and liberality, and has supplied him with such an abundance of pleasures, that he might not only live, but enjoy the life which she gave him.

165. The pleasures of the senses are not without their important uses. That general satisfaction, which generally attends all our sensations, particularly in early age, invites us properly to exercise the various faculties of sensation, and thus to sharpen them, and at the same time to acquire daily for ourselves much and most useful knowledge.

166. In the same way, men, and boys in particular, are invited to exercise moderately and frequently, their organs of motion, the innate power of which is thus promoted, and easy and free use is acquired.

167. Quin et ad quasdam et maximi momenti actiones, qualibus nimirum aut singuli homines conservantur, aut genus humanum propagatur, egregiæ voluptatis præmio invitamur.

168. Postremo, voluptate illa quæ a modica mentis exercitatione oritur, ad nobilissimas ejus facultates exercendas et excolendas inducimur; quæ neglectæ et otiosæ, exiguæ sunt, probe cultæ, pene divinæ fiunt.

169. Singuli demum quibus instruimur sensus, tum externi tum interni, variis obnoxii sunt vitiis; unusquisque scilicet, præsertim externorum, potest esse vel

167. *Quin invitamur præmio egregiæ voluptatis, et ad quasdam actiones et maximi momenti, (talibus) quabus nimirum singuli homines conservantur, aut humanum genus propagatur.*

168. *Postremò, inducimur, illâ voluptate quæ oritur a modicâ exercitatione mentis, ad exercendas et excolendas nobilissimas facultates ejus, (i. e. mentis): quæ sunt exiguæ, cùm neglectæ et otiosæ, fiunt pene divinæ, cum probè cultæ.*

169. *Demum singuli sensus quibus instruimur, tum externi tum interni, sunt obnoxii variis morbis; scilicet, unusquisque (sensuum), præsertim externorum, po-*

167. We are invited by a recompense of extreme pleasure to certain actions of the greatest importance, by such as individuals are preserved, and the human race is propagated.

168. Lastly, we are induced by the pleasure which arises from moderate exercise of the mind, to exercise and cultivate its most noble faculties; they are slight, indeed, when neglected and unemployed, but become nearly divine, if properly cultivated.

169. The senses with which we are supplied, both external and internal, are exposed to various diseases; for, each and particularly the external ones, may be either too

nimis acutus, vel nimis obtusus, vel abolitus, vel denique depravatus. — Huc fortasse referri quoque possunt multi sensus molesti, qui, sive ipsi primarii morbi, sive tantum aliorum morborum signa sint, medici, attentionem optimo jure sibi vindicant (34).

test esse vel nimis acutus, vel nimis obtusus, vel abolitus, vel denique depravatus. — Fortasse huc quoque multi molesti sensus possunt referri, qui, sive sint morbi primarii, sive (sint) tantùm signa aliorum morborum, optimo jure vindicant sibi attentionem medici (34).

acute, or too obtuse, or destroyed, or lastly, depraved. Perhaps several painful sensations may be referred here, and whether they be primary diseases or only symptoms of diseases, claim to themselves the attention of the medical man.

CAP. V.—*De tactu ejusque vitiis ; nec non de dolore, anxietate et pruritu.*

170. OMNIUM sensuum externorum tactus simplicissimus est, et maxime generalis; quippe qui toti *generi nervoso* communis sit: sed certis partibus acutior, veluti cuti, et imprimis apicibus digitorum. Hi papillas nervosas habere dicuntur, quæ, influente sanguine, quodammodo in tactu erigantur, sensum accuratiorem daturæ; sed potius conjectura a linguæ fabricâ derivata, quæ non gustus modo, sed tactus quoque delicatissimum organum est,

CAP. V.—*De tactû que (de) vitiis ejus ; nec non de dolore, (de) anxietate et pruritû.*

170. TACTUS *est simplicissimus et maximè generalis omnium externorum sensus ; quippe qui sit communis toti nervoso generi ; sed (est) acutior certis partibus, veluti cuti, et imprimis apicibus digitorum. Hi (digiti) dicuntur habere nervosas papillas, quæ, sanguine influente erigantur quodammodo in tactû, daturæ sensum accuratiorem : sed hæc opinio nititur potiùs conjecturâ derivatâ a fabricâ linguæ, quæ est non modo organum gustûs, sed etiam*

CHAP. V. *On the sense of touch and its disorders ; also on pain, anxiety, and itching.*

170. Touch is the simplest and most general of all the external senses ; for it is common to the whole nervous system ; but is more acute in certain parts, as in the skin, and particularly in the points of the fingers. These are said to have nervous papillæ, which are erected in some way during touch, by blood flowing into them, so that they may render the sensation more accurate ; but this opinion is rather based on conjecture, derived from the structure of the tongue, which is not only an organ of taste, but also a very

hæc opinio nititur, quam certis rei ipsius observationibus.

171. Varias corporum qualitates tactus percipit; duritiem, mollitiem, asperitatem, lævitatem, calorem, frigus, molem, figuram, distantiam, pressuram, pondus; raro fallax vel depravatus; quia scilicet corpora, quorum qualitates sunt explorandæ, proxime ad ipsum organum admoventur, nullo interposito medio, cujus varietates sensum fallere vel corrumpere possint.

172. Quod ad vitia tactus pertinet, nimis acutus in universum rarissimis si ullis in exemplis observatus est. Parti singulari vero acutior justo sæpe sit, vel a cuticula nimis tenui, aut

delicatissimum organum tactûs, quam certis observationibus ipsius rei.

171. *Tactus percipit varias qualitates corporum; (scilicet), duritiem, mollitiem, asperitatem, lævitatem, calorem, frigus, molem, figuram, distantiam, pressuram, pondus: (est) rarò fallax vel depravatus; scilicet quia, corpora, qualitates quorum sunt explorandæ, admoventur proximè ad ipsum organum, nullo medio interposito, varietates cujus (medii) possint fallere vel corrumpere sensum.*

172. *(De eo) quod pertinet ad vitia tactûs, (ille i. e. tactus), observatus est in universum nimis acutus in rarissimis si (in) ullis exemplis. Verò (tactus) fit sæpe acutior justo parti*

delicate organ of touch, than on any certain observations of the fact itself.

171. Touch teaches us to perceive various qualities of bodies, such as hardness, softness, roughness, smoothness, heat, cold, size, figure, distance, pressure, and weight; it is rarely fallacious or depraved; because, bodies, the qualities of which are to be examined, are closely applied to the organ itself, without the intervention of any medium, the varieties of which might mislead or corrupt the sensation.

172. As to the disorders of touch, it is observed to be too acute in the body generally, in very rare, if in any instances; but it is often too acute in some single part, either from the cuticle being too thin, or soft, or raised, or

molli, aut sublata, vel parte ipsa inflammata, vel nimio calori exposita.

173. Nimis obtusus fit, aut plane aboletur in universo corpore, vel in magna ejus parte, a variis vitiis cerebri nervorumque, compressione, vulnere, vis vitalis defectu: hoc *Anæsthesia* vocatur, paralyseos aliquando comes; et nonnunquam in altero latere observatum sine paralysi, dum alterum, sensu integro, paralyticum factum esset.

174. Deficit in parte singulari, vel a vitio ejus nervi, compressione, obstructione, vulnere, &c. vel parte ipsa nimio frigori exposita; vel demum, cuticula quæ tegit

singulari, vel a cuticulâ nimis tenui, aut molli, aut sublatâ, vel parte ipsâ inflammatâ, vel expositâ nimio calori.

173. *Tactus fit nimis obtusus, aut aboletur planè in universo corpore, vel in magnâ parte ejus, a variis vitiis cerebri, que nervorum, compressione, vulnere, ac defectû vis vitalis: hoc vocatur Anæsthesia aliquando comes paralyseos: et nonnunquam observatum (est) in altero latere sine paralysi, dum alterum (latus) factum est paralyticum, sensû integro.*

174. *(Tactus) deficit in parte singulari, vel a vitio nervi ejus, (scilicet) compressione, obstructione, vulnere, &c. vel parte ipsâ expositâ nimio frigori: vel*

from the part itself being inflamed, or exposed to too much heat.

173. Touch is rendered more obtuse, or is quite destroyed in the body generally, or in great part of it, by different disorders of the brain and nerves, by compression, a wound, or loss of vital power. This is called anæsthesia, sometimes an attendant on paralysis, and sometimes observed on one side without paralysis, whilst the other side is rendered paralytic, with sensation still entire.

174. It is defective in particular parts, from its nerve being disordered, by compression, obstruction, a wound, &c.; from the part being exposed to too much heat; from the covering cuticle being disorderéd, too thick, or hardened,

vitiatâ, nimis crassa, aut dura facta, asperorum aut nimis calidorum corporum contrectatione, quod vitrariis, fabrisque ferrariis accidit, vel a subjecta cute elevata, interposito, sanguine, sero, pure; vel ipsa cute macerata, laxata, torpida facta, quod hydropicis nonnunquam accidit; vel demum toto organo corrupto, gangrænâ, ustione, algore, contusione.

demum, (a) vitiatâ cuticulâ quæ tegit eam, nimis crassâ, aut factâ durâ, (a) contrectatione asperorum aut nimis calidorum corporum, quod accidit fabris vitrariis, que (fabris) ferrariis: vel cute subjectâ elevatâ, sanguine, sero, (vel) pure interposito: vel (ab) ipsâ cute maceratâ, laxatâ, factâ torpidâ, quod accidit nonnunquam hydropicis: vel demum a toto organo corrupto, gangrænâ, ustione, algore, (vel) contusione.

175. Rarissime depravatur tactus, nisi forte inter delirium, quum omnes cerebri functiones mirum in modum turbantur.

175. *Tactus rarissimè depravatur, nisi forte inter delirium, quum omnes functiones cerebri, turbantur in mirum modum.*

176. Ut a reliquis sensibus, sic etiam a tactu, voluptas aut dolor oriri possunt. Lævorem, mollitiem, calorem modicum cum vo-

176. *Ut voluptas aut dolor possunt oriri a reliquis sensibus, sic etiam (possunt oriri) a tactu. Solemus contemplari, lævorem, mollitiem,*

as it occurs to glass workers and blacksmiths; from the subjacent skin being raised, by blood, serum, or pus, intervening; from the skin itself being macerated, relaxed, rendered torpid, which sometimes occurs to dropsical patients; or, lastly, from the whole organ being corrupted by gangrene, burning, cold, or contusion.

175. Touch is seldom depraved, except during delirium, when all the functions of the brain are disturbed in a surprising manner.

176. Pleasure and pain may arise in the same way, from the sense of touch, as they arise from the other senses. We

luptate contemplari solemus. Levis quoque pruritus, seu titillatio, quæ pro voluptate habenda est, ad hunc sensum pertinet, quamvis sæpe a causis internis oriatur.

177. Dolorem ad hunc sensum referimus, cæterosque fere sensus molestos, anxietatem, pruritum, &c.; quamvis revera ab omni sensu vehementiore dolor oriri possit.

178. Dolor est sensus ingratus, vehemens, acer, quem ad certam corporis partem referimus; idque minus accurate, si pars interna dolet; sed magis accurate, si corporis superficies afficitur. Neque tamen causa doloris semper in parte dolente hæret. Nascitur a magna vi parti sen-

modicum calorem cum voluptate. Quoque levis pruritus, seu titillatio, quæ habenda est pro voluptate, pertinet ad hunc sensum, quamvis sæpe oriatur a causis internis.

177. *Referimus dolorem ad hunc sensum, que ferè cæteros sensus molestos, (scilicet) anxietatem, pruritum, &c.; quamvis reverà dolor possit oriri ab omni vehementiore sensú.*

178. *Dolor est ingratus vehemens, acer, sensus quem (sensum) referimus ad certam partem corporis; que (facimus) id minus accuratè, si pars interna dolet; sed magis accuratè, si superficies corporis afficitur. Tamen neque causa doloris semper hæret in parte dolente. (Dolor) nascitur a magná*

are accustomed to contemplate smoothness, softness, and moderate heat, with pleasure. Also, slight itching or titillation, which may be esteemed a pleasure, appertains to this sensation, although it often arises from internal causes.

177. To this sense we refer pain, and nearly all the troublesome sensations, as anxiety, itching, &c.; although, in truth, pain may arise from every sensation of a more violent description.

178. Pain is an unpleasant, powerful, keen sensation, which we refer to some precise part of the body; and we can do that with less accuracy, if an internal part is in pain, but more accurately, if the surface of the body be affected.

tienti illata, sive intus sive extrinsecus illa vis fuerit. Quicquid igitur pungit, secat, lacerat, distendit, comprimit, contundit, percutit, rodit, urit, vel ullo modo vehementer stimulat aut irritat, dolorem creare potest.

179. Hinc tot morbis frequentissimum, molestissimum comitem se jungit; sæpe ipso morbo intolerabiliorem. Modicus dolor partem affectam, et paulatim totum corpus, excitat, majorem sanguinis et vis nervosæ fluxum ad partem facit, et ad motus necessarios et salubres sæpe stimulat, fidelis, quamvis ingratus monitor. Hinc inter præsidia vitæ nonnunquam numerandus.

180. Vehementior autem

vi illatá parti sentienti, sive illa vis fuerit intus sive extrinsecus. Igitur quicquid pungit, secat, lacerat, distendit, comprimit, contundit, percutit, rodit, urit, vel stimulat aut irritat vehementer ullo modo, potest creare dolorem.

179. *Hinc (dolor) jungit se, (quam) frequentissimum et molestissimum comitem tot morbis: sæpe intolerabiliorem ipso morbo. Modicus dolor excitat partem affectam, et paulatim totum corpus, facit majorem fluxum sanguinis et vis nervosæ ad partem, et fidelis, quamvis ingratus monitor, sæpe stimulat ad necessarios et salubres motus. Hinc (dolor) est nonnunquam numerandus inter præsidia vitæ.*

180. *Autem vehementior*

The cause of the pain, however, is not always seated in the affected part. Pain arises from great violence applied to a sentient part, whether it come from within or without. Therefore, whatever pricks, cuts, tears, distends, compresses, bruises, strikes, corrodes, burns, or stimulates, or irritates actively in any way, may produce pain.

179. Hence (pain) is such a frequent and troublesome attendant upon diseases. Moderate pain excites the part affected, and by degrees the whole body; it produces a greater afflux of blood and nervous energy to the part; and (like) a faithful, but unpleasant monitor, it stimulates to necessary and healthy motions. Hence it is sometimes to be enumerated amongst the safe-guards of life.

dolor nimiam irritationem fecit, inflammationem, ejusque consequentias, febrem, et omnia mala quæ a nimio humorum motu profluunt; totum genus nervosum convellit, et pervigilium, convulsiones, delirium, debilitatem, animi defectionem inducit.

181. Immanem dolorem neque animus neque corpus diu ferre potest; et profecto certos fines Natura posuit, quos ultra dolorem intendi non permiserit, quin delirium, aut convulsio, aut animi defectio, vel demum ipsa mors miserum supplicio eripiat.

182. Diuturnus dolor, quamvis mitior, sæpe partis affectæ debilitatem, torporem, paralysin et rigiditatem inducit.

dolor facit nimiam irritationem, inflammationem, et consequentia ejus, (facit) febrem, et omnia mala quæ profluunt a nimis motû humorum; convellit totum nervosum genus, et inducit, pervigilium, convulsiones, delirium, debilitatem (et) defectionem animi.

181. *Neque animus neque corpus potest diù ferre immanem dolorem: et profectò Natura posuit certos fines, ultra quos non permiserit dolorem intendi, quin, aut convulsio, aut defectio animi, vel demum ipsa mors eripiat miserum supplicio.*

182. *Diuturnus dolor, quamvis mitior, sæpe inducit debilitatem, torporem, paralysin et rigiditatem affectæ partis.*

180. More violent pain produces too much irritation, inflammation and its consequences, (likewise) fever, and all the evils which arise from excessive motion of the fluids; it agitates the whole nervous system, and induces great watchfulness, convulsions, delirium, debility, and syncope.

181. Neither the mind nor body can long endure intense pain; for Nature indeed has set limits, beyond which she does not allow pain to be extended, without convulsions, or syncope, or, finally, death itself snatching the victim from its sufferings.

182. A long continued pain, although of milder description, often produces debility, torpor, paralysis, and rigidity, of the affected part.

183. Doloris tolerantia pendet multum a vi animi quam æger possidet: et, prout ipse tulerit, mala quæ a dolore nascuntur graviora vel leviora erunt. Nam in hoc, uti in aliis exemplis, leve fit quod bene fertur onus.

184. Dolor, si non nimis vehemens fuerit, neque eum febris aut anxietas comitetur, ad claritatem et acumen ingenii aliquando conferre videtur. Hoc qui podagra laboraverunt se expertos fuisse testantur.

185. A dolore quem sentiunt, homines judicium aliquod ferunt de modo quo causa ejus agit: veluti pungendo, lancinando, lacerando, urendo, &c.; scilicet inter res quas viderint, vel alio modo noverint, et res

183. *Tolerantia doloris multum pendet a vi animi, quam æger possidet: et, prout ipse tulerit, mala, quæ nascuntur a dolore, erunt graviora vel leviora. Nam onus, quod bene fertur, fit leve, in hoc, uti in aliis exemplis.*

184. *Dolor, si non fuerit nimis vehemens, neque febris aut anxietas comitetur eum, aliquando videtur conferre ad claritatem et acumen ingenii. (Nonnulli), qui laboraverunt podagrâ testantur expertos fuisse hoc.*

185. *Homines ferunt aliquod judicium, a dolore quem sentiunt, de modo quo causa ejus agit: veluti pungendo, lancinando, lacerando, urendo, &c.: scilicet fingunt quandam convenientiam et similitudinem inter res,*

183. Tolerance of pain depends much upon the strength of mind possessed by the patient; and according as he bears them, the evils arising from pain will be more severe, or more slight. For the burthen which is borne patiently is light, in this, as in other instances.

184. Pain, if not too violent, nor attended by fever, appears sometimes to contribute to the brightness and acumen of the genius. Some sufferers from gout, bear witness of having experienced this.

185. Men form some judgment, from the pain they feel, of the mode in which it acts; as in pricking, piercing, lacerating, burning, &c.: that is to say, they imagine a certain correspondence or resemblance between things, which they

magis obscuras, convenientiam et similitudinem quandam sibi fingunt.

186. Alius sensus molestus est anxietas, a dolore plane diversa, obtusior, minus accurate ad partem singularem referenda, et sæpe omni dolore intolerabilior. Probe distinguendum est hanc inter anxietatem de qua sensu medico agitur, eamque de qua communi sermone loquimur. Hæc nimirum a mente est, neque a statu corporis pendet; quippe quæ oriatur a metu periculi cujusvis prævisi, vel magni mali impendentis. Illa autem vere corporea est, non secus ac dolor, a certo corporis statu originem ducens. Nihil vero obstat, quo minus utraque simul adsit, vel al-

quas viderint, vel noverint alio modo, et res magis obscuras.

186. *Anxietas est alius molestus sensus, plane diversa a dolore, obtusior, minùs accurate referenda ad singularem partem, et sæpe intolerabilior omni dolore. Probè distinguendum est inter hanc anxietatem de quâ agitur medico sensû, que eam, de quâ loquimur communi sermone. Hæc nimirum est a mente, neque pendet a statû corporis: quippe quæ oriatur a metû cujusvis prævisi periculi, vel magni impendentis mali. Autem illa est verè corporea, non secus ac dolor, ducens originem a certo statû corporis. Vero nihil obstat, quo minus utraque adsit simul, vel altera sit causa*

have seen or known in any other way, and things which are more obscure.

186. Anxiety is another troublesome sensation, quite different from pain; (it is) more obtuse, (and) less accurately to be referred to some individual spot, (and) is often less supportable than pain itself. Distinction is to be drawn between the anxiety, taken in a medical sense, and that understood in common discourse. The latter is connected with the mind, and does not depend upon the state of body; for it arises from the fear of some foreseen calamity, or impending misfortune. The former is truly corporeal, as much as pain, deriving its origin from a particular state of the body. There is nothing which prevents their being

tera alterius causa sit. Revera ingens anxietas corporea metum et animi anxietatem firmissimo pectori incutiet. Et hæc vicissim, si gravis fuerit et diuturna, fractis corporis viribus, imprimis quæ sanguinis cursum efficiunt, alteram inducere poterit.

187. Anxietas, medico sensu, oritur imprimis a causa quacunque sanguinis motum, per cor vasaque magna prope cor pulmonemque, turbante vel impediente. Hinc vitia cordis ejusque vasorum multiplicia, amplificationem, constrictionem, conversionem in os, polypum, palpitationem, *syncopen*, inflammationem, debilitatem, et ideo nonnullos animi affectus, comitatur.

alterius. Reverà ingens corporea anxietas incutiet pectori firmissimo metum et anxietatem animi. Et hæc vicissim, si fuerit gravis et diuturna, viribus corporis fractis, imprimis (illis) quæ efficiunt cursum sanguinis, poterit inducere alteram.

187. *Anxietas, medico sensû, oritur imprimis, a quácunque causá turbante vel impediente motum sanguinis, per cor, que magna vasa prope cor que pulmonem. Hinc comitatur multiplicia vitia cordis que vasorum ejus, (scilicet) amplificationem, constrictionem, conversionem in os, polypum, palpitationem, syncopen, inflammationem, debilitatem, et ideo nonnullos affectus animi.*

co-existent, or the one being the cause of the other: for, indeed, great corporeal anxiety will strike fear and anxiety of mind into the firmest bosom; and this, on the other hand, if it be acute and long continued, and the bodily powers be broken down, especially those which maintain the circulation, will be enabled to bring on the other.

187. Anxiety, taken in a medical sense, arises especially from every cause disturbing or impeding the motion of the blood through the large vessels near the heart and lungs. Hence it accompanies the numerous disorders of the heart and its vessels; such as enlargement, narrowing, ossification, polypus, palpitation, syncope, inflammation, debility, and, consequently, some affections of the mind.

188. Oritur quoque ab omni spirandi difficultate, qualiscunque ejus causa fuerit; impedita nimirum exhalatione mephitis e pulmone, et mutatione ista salutari sanguinis quæ per spiritum fit; et sanguine forsan ipso minus libere per pulmonem transuente. Hujusmodi anxietas profunde in pectora sentitur.

188. *(Anxietas) quoque oritur ab omni difficultate spirandi, qualiscunque fuerit causa ejus: nimirum ab impeditá exhalatione mephitis e pulmone, et (ab) istá salutari mutatione sanguinis, quæ (mutatio) fit per spiritum; et forsan (ab) ipso sanguine transeunte minus libere per pulmonem. Anxietas hujusmodi sentitur profundè in pectore.*

189. Dicitur quoque oriri a difficiliore transitu sanguinis per jecur, cæteraque viscera abdominis.

189. *(Anxietas) quoque dicitur oriri a difficiliore transitu sanguinis per jecur, que (per) cætera viscera abdominis.*

190. Genus quoddam anxietatis *hypochondriacis* familiaris, et molestissimæ, oritur a stomacho et intestinis, vel multo crudi atque corrupti cibi potusque onere gravatis, vel aëre per con-

190. *Quoddam genus anxietatis familiaris et molestissimæ hypochondriacis, oritur a stomacho et intestinis, vel gravatis multo onere crudi atque corrupti cibi que potûs, vel distentis aëre extri-*

188. It also arises from all kinds of difficulty of breathing, whatever may be the cause; namely, from impeded exhalation of mephitic air from the lungs; from that salutary change which takes place in the blood by breathing; and, perhaps, from the blood itself circulating less freely through the lungs. Anxiety of this kind is felt deeply in the chest.

189. Anxiety is also said to arise from a difficult circulation of blood through the liver, and other abdominal viscera.

190. A certain kind of anxiety, common and very troublesome to hyhochondriacs, arises from the stomach and intestines, either being oppressed with a great accumulation of crude and corrupted food and drink; or from being distended

coctionem minus sanam extricato distentis. Tali onere, vel distentione, ventriculus, organum delicatissimum, male afficitur. Nil mirum igitur si sensum ingratum dat; quin et ejus distentio liberum septi transversi descensuum impedit, et sic respirationi obest. Hujusmodi anxietas, expulso aëre, multum et subito levari solet, et hoc, et aliis pravæ digestionis signis, facile dignoscitur. In his exemplis, anxietas, ad ventriculum, sed parum accurate, referri solet.

cato per concoctionem minùs sanam. Ventriculus, delicatissimum organum male afficitur tali onere. Igitur est nil mirum, si dat ingratum sensum: quin et distentio ejus impedit liberum descensum transversi septi, et sic obest respirationi. Anxietas hujusmodi solet levari multum et subito, aëre expulso, et facilè dignoscitur ab hoc, et (ab) aliis signis pravæ disgestionis. Anxietas solet referri in his exemplis ad ventriculum, sed parùm accuratè.

191. Febres quoque omnigenas anxietas sæpe comitatur, nunc gravior nunc levior: tum propter generalem debilitatem, tum propter sanguinem a superficie corporis pulsum, inque

191. *Quoque anxietas, nunc gravior nunc levior sæpè comitatur febres omnigenas; tum propter generalem debilitatem, tum propter sanguinem pulsum a superficie, que accumulatum mag-*

with gas, which is extricated in consequence of less healthy digestion: the stomach, which is a most delicate organ, is distressed by such an accumulation or distention. Therefore, it is no wonder if it affords an unpleasant sensation; and besides, its distention impedes the free descent of the diaphragm, and in this way is an obstacle to respiration. Anxiety of this kind is much and suddenly relieved by the expulsion of flatus, and is known by this and other symptoms of bad digestion. Anxiety is usually referred, in these cases, to the stomach, but with little propriety.

191. Greater or less anxiety also frequently accompanies all kinds of fevers; both on account of the general debility, and on account of the blood being driven from the surface,

magnis vasis accumulatum, veluti ingruente febre intermittente; tum quoque propter ventriculum male affectum, et onere cibi crudi aut corrûpti gravatum, vel multo potu, imprimis calido, medicato, distentum et nauseantem. Ingravescente febre, æger magis magisque angitur, insigniter, ut testantur medici, mox ante crisin, vel nocte quæ eam præcedit, veluti ante eruptionem super cutem, vel sanguinis profluvium, vel sudorem, vel alvi fluxum, quales febres aliquando solvunt. Angitur quoque æger a repulsa eruptione, vel translatione salutari.

nis venis, veluti ingruente intermittente febre tum quoque propter ventriculum male affectum, et gravatum onere crudi aut corrupti cibi, vel distentum et nauseantem multo potû imprimis calido, (vel) medicato. Febre ingravescente, æger insigniter angitur magis que magis, ut medici testantur, mox ante crisin, vel nocte quæ præcedit eam (crisin), veluti ante eruptionem super cutem, vel profluvium sanguinis, vel sudorem, vel fluxum alvi, quales aliquando solvunt febres. Quoque æger angitur a repulsâ eruptione, vel translatione salutari.

192. Quin et febres, et plerosque morbus pariter

192. *Quin anxietas pariter comitatur et febres, et*

and being accumulated in the large veins, as in the commencement of intermittent fever; as well as, on account of the stomach being disordered, and oppressed with a load of crude or corrupted food, or distended and nauseated with much drink, especially warm, or medicated. As the fever increases, the patient becomes much more and more anxious; and (as medical men assert), just before a crisis, or during the night which precedes it; for instance, before an eruption on the skin, or a discharge of blood, or sweat, or diarrhœa, which occurrences sometimes carry off fevers. A patient is also rendered anxious by a repelled eruption, or salutary metastasis.

192. Moreover, anxiety equally accompanies fevers and

anxietas comitatur, quum, vita jam deficiente, mors instat, cujus prænuncia est et signum. Fit, nimirum, quum vires vitales, propriis muneribus impares factæ, circuitum sanguinis absolvere nequeunt. Qualis autem sit hæcce anxietas, cætera appropinquantis mortis signa satis superque docent.

193. Porro, inter somnum ab iisdem causis anxietas oriri potest. Hinc dira somnia, quæ somnum sæpe subito et cum terrore rumpunt.

194. Pruritus, sensus scilicet inquietans, cum scalpendi cupiditate sæpe molestissimus est, quamvis voluptati magis quam dolori affinis sit.

plerosque morbos, quum, vitâ deficiente, mors instat, cujus (mortis anxietas) est prænuncia et signum. Nimirum fit, quum vitales vires, factæ impares propriis muneribus, nequeunt absolvere circuitum sanguinis. Cætera signa appropinquantis mortis docent satis superque, qualis sit hæcce anxietas.

193. *Porro, anxietas potest oriri inter somnum, ab iisdem causis. Hinc dira somnia, quæ sæpe rumpunt somnum subitò et cum terrore.*

194. *Pruritus, scilicet sensus inquietans, cum cupiditate scalpendi, est sæpe molestissimus, quamvis sit magis affinis voluptati quam dolori.*

most diseases, at the time that life fails, and death is at hand, of which it is a forerunner and indication. For it comes on when the vital powers are rendered incompetent to their proper functions, and are unable to carry on the circulation of the blood. The other symptoms of approaching death show sufficiently, and more than sufficiently, what kind of anxiety this is.

193. Anxiety may arise during sleep, from the same causes. Hence, frightful dreams, which often break the slumbers suddenly, and with terror.

194. Itching, that is, a teazing sensation combining a desire of scratching, is frequently very troublesome, although more allied to pleasure than to pain.

195. Ut dolor a gravi irritatione, tam *mechanica* quam *chemica*, sic pruritus a leviore fit. Titillatio, seu frictio, veluti indusii lanei minus assueto homini, et delicatiore cute prædito, pruritum excitat; et multa acria ex animalibus, aut herbis, aut fossilibus rebus derivata. Sic primus sensus a *cantharidibus* cuti admotis, pruritus est, quamvis idem auctus dolor fiat.

196. Acria quædam in cutem delata, veluti in febribus quas eruptio super cutem comitatur, aut morbo regio, aut demum varii ipsius morbi, scabies, lepra, eundem effectum edunt.

195. *Ut dolor fit a gravi irritatione, tam mechanicâ, tam chemicâ, sic pruritus (fit) a leviore. Titillatio seu frictio, veluti lanei indusii, excitat pruritum homini minus assueto, et prædito delicatiore cute: et multa acria derivata ex animalibus, (ex) herbis, aut (ex) rebus fossilibus. Sic pruritus est primus sensus a cantharidibus admotis cuti, quamvis idem auctus fiat dolor.*

196. *Quædam acria delata in cutem, veluti in febribus, quas (febres) eruptio super cutem comitatur, aut morbo regio, aut demum varii morbi ipsius, (i. e. cutis) scabies (vel) lepra, edunt eundem effectum.*

195. As pain is produced by great irritation, either mechanical or chemical, so itching is produced by irritation of a slighter kind. The tickling or friction, as of a flannel shirt, excites itching in a person unaccustomed to it, and in one who possesses a more delicate skin: likewise many acrid substances obtained from animals, herbs, and fossils, (possess the same properties). Thus itching is the first sensation produced by cantharides, when applied to the skin, although the same when increased becomes pain.

196. Certain acrid substances conveyed to the skin, as in fevers accompanied by an eruption, or in jaundice, or, lastly, different diseases of the skin itself, as itch, or lepra, produce the same effect.

197. Pediculi, vermes, *ascarides* imprimis, vel cutem vel intestina irritantes, molestum pruritum excitant.

198. Species quædem pruritus interni, homines ad multas et necessarias, tam sani quam morbosi corporis, actiones impellit; urinæ et alvi excretionem, tussim, sternutationem, et similia.

197. *Pediculi, vermes, imprimis ascarides, irritantes, vel cutem vel intestina, excitant molestum pruritum.*

198. *Quædam species pruritûs interni impellit homines ad multas et necessarias actiones, tam sani tam morbosi corporis; scilicet, excretionem urinæ et alvi, tussim, sternutationem, et similia.*

197. Lice, worms, and especially ascarides, irritating the skin or intestines, excite troublesome itching.

198. A certain kind of itching urges us to many and necessary actions of the body, both in health and disease; for instance, the excretion of urine and fæces, coughing, sneezing, and the like.

CAP. VI.—*De gustu ejusque usibus, varietatibus et vitiis.*

199. HUJUS organum princeps est lingua: eaque quo proprior apici, eo acutiorem; quo proprior gutturi, eo obtusiorem sensum, habet; quamvis revera acria nonnulla, circa apicem vix gustata, prope radicem linguæ, vel in ipso gutture, acerrimum sensum excitent.

200. Lingua insignibus et pulcherrimis papillis nervosis instruitur, quæ proxima gustus sedes videntur esse. Hæ inter gustandum elevantur, et eriguntur, quo acutiorem sensum habeant.

CAP. VI.—*De gustû, de usibus, varietatibus, (de) vitiis ejus.*

199. LINGUA *est princeps organum hujus: que ea habet sensum eo acutiorem, quo est proprior apici, (sed) eo (habet sensum) obtusiorem, quo proprior gutturi: quamvis reverà, nonnulla, acria vix gustata circa apicem, excitent acerrimum sensum prope radicem linguæ, vel in ipso gutture.*

200. *Lingua instruitur insignibus et pulcherrimis nervosis papillis, quæ videntur esse proxima sedes gustûs. Hæ elevantur et eriguntur inter gustandum, quo habeant sensum acutiorem.*

CHAP. VI. *On taste, its uses, varieties, and disorders.*

199. The tongue is the principal organ of the taste; it has most acute sensibility nearest the tip, and the most obtuse sensibility nearest the throat: however, some acrid substances, which are scarcely tasted at the tip, excite a sharp sensation near the root of the tongue, or in the throat itself.

200. The tongue is supplied with remarkable and very beautiful nervous papillæ, which appear to be the proximate seat of taste; these are elevated and erected during taste, in order that they may have more acute sensibility.

201. Nihil gustare possumus, nisi quod in saliva, quæ fere aqua est, solubile sit, ut fluida forma linguæ admotum involucra ejus pervadat, pulpamque nervosam afficiat. Hinc terræ insolubiles nullius saporis sunt.

202. Neque sat est solubile esse corpus, ut id gustemus. Oportet salis, vel saltem acrimoniæ nonnihil in se habeat, quod nervosam substantiam stimulet. Quicquid igitur quam ipsa saliva minus salsum aut acre est, nullum habet saporem.

203. Saporum varia genera facile distinguuntur, et ideo nomina peculiaria etiam in communi sermone sibimet nacta sunt: veluti sapor acidus, dulcis, ama-

201. *Possumus gustare nihil, nisi quod sit solubile in salivâ, quæ est ferè aqua, ut admotum linguæ formâ fluidâ pervadat involucra ejus, que afficiat nervosam pulpam. Hinc insolubiles terræ sunt nullius saporis.*

202. *Neque est sat corpus esse solubile, ut gustemus id. Oportet, (ut) habeat nonnihil salis, vel saltem acrimoniæ in se, quod stimulet nervosam substantiam. Igitur quicquid est minus salsum aut acre quam ipsa saliva, habet nullum saporem.*

203. *Varia genera saporum facilè distinguuntur, et ideò nacta sunt sibimet nomina peculiaria etiam in communi sermone: veluti, sapor acidus, dulcis, amarus,*

201. We can taste nothing, unless it be soluble in saliva, which is almost water; so that when applied to the tongue in the fluid state, it may pervade its coverings, and affect the nervous pulp. Hence, earths which are insoluble, are devoid of taste.

202. It is not sufficient that a body be soluble, that we may taste it: it is necessary that it contains some saltness, or at least some acrimony within it, which may stimulate the nervous substance. Therefore, whatever has less saltness or acrimony than the saliva itself, has no taste.

203. Different kinds of tastes are easily distinguished, and therefore have obtained appropriate names, even in common discourse; as, acid, sweet, bitter, salt, acrid,

rus, salsus, acer, aromaticus, putridus; hic vero cum odore quoque jungitur. Omnium saporum varii sunt gradus, omnesque varie inter se conjungi possunt.

204. Sapores alii suavissimi et gratissimi sunt; alii ingrati, vixque tolerandi. Mira tamen de hac re hominum diversitas: ita ut quod aliis maximæ voluptati est, alii non sine nausea et horrore respuant.

205. Quin et suavissimos sapores, qui magnam primo voluptatem dederant, homines brevi fastidire solent; dum pessimos et ingratissimos, quales sunt *nicotianæ tabaci, ferulæ assæfœditæ,*

salsus, acer, aromaticus, (vel) putridus: vero hic quoque jungitur cum odore. Sunt varii gradus omnium saporum, que omnes possunt jungi variè inter se.

204. *Alii sapores sunt suavissimi et gratissimi: alii (sunt) ingrati, que vix tolerandi. Tamen (est) mira diversitas hominum de hác re: ita ut quod est maximæ voluptati aliis, alii respuant non sine nauseá et horrore.*

205. *Quin homines solent brevi (tempore) fastidire et suavissimos sapores, qui primo dederant magnam voluptatem: dum consuetudine (homines) discunt amare et appetere pessimos et ingratissimos (sapores), quales sunt (sapores) nicotianæ*

aromatic, or putrid, tastes: this last is combined with smell. There are different degrees of all the tastes, and they may all be variously combined together.

204. Some tastes are very sweet and agreeable; others are unpleasant and scarcely to be endured. But there is much diversity amongst men in this respect; so much so, that what affords great pleasure to some, others reject with loathing and horror.

205. Moreover, persons are accustomed in a short time to take a dislike to the sweetest tastes, which at first afforded much pleasure; whilst (on the contrary), by habit, persons learn to like and long for the worst and disagreeable tastes; as tobacco, assafœtida and the like.

et similium, consuetudine amare discunt et appetere.

206. Usus gustus præcipuus videtur esse, ad cibum bonum et salubrem invitare, a noxio aut minus idoneo divertere. Plerique et optimi cibi gustui grati sunt. Qui vero gustui incorrupto mali saporis sunt, ii fere nocent. Hujusmodi instinctu, raro fallace, quem olfactus quoque juvat, bruta animalia ad idoneum cibum perducuntur, et a noxio arcentur.

207. Hic vero instinctus, non secus ac reliqui, minus perfectus homini quam belluis datur; quippe qui tali auxilio minus egeat, aliis facultatibus præditus. Ipse vero qui datur instinctus,

tabaci, ferulæ assæfœtidæ et similium.

206. *Præcipuus usus gustûs videtur esse, invitare ad bonum et salubrem cibum, (et) divertere a noxio aut minus idoneo (cibo). Plerique et optimi cibi sunt grati gustui. Vero (cibi) qui sunt mali saporis incorrupto gustui, ii ferè nocent. Bruta animalia perducuntur ad idoneum cibum, et arcentur a noxio, instinctû hujusmodi, raro fallace, quem olfactus quoque juvat.*

207. *Vero hic instinctus, non secus ac reliqui (instinctus) datur minus perfectus homini quam belluis: quippe qui præditus aliis facultatibus, minus egeat tali auxilio. Verò ipse instinctus qui datur, sæpe*

206. The principal use of taste appears to be, to invite to good and wholesome food, and to divert from what is noxious and improper. Most, and the best kinds of food, are pleasant to the taste; but the food which has a bad taste, with the palate unimpaired, is generally injurious. The brute creation are directed to proper food, and are kept from what is noxious, by instinct of this kind, seldom deceptive, and which is also assisted by the smell.

207. This kind of instinct, like the rest, is less perfect in man than in brutes; for he is endowed with other faculties, and has less need of such assistance; and the instinct which is supplied, is generally vitiated by an unnatural mode of life.

vitæ genere parum naturali sæpe corrumpitur.

208. Statuit porro alma rerum Parens, ut actio ad vitam alendam adeo necessaria, et sua natura quodammodo voluntaria, voluptate aliqua non careret. Grato cibi sapore, tanquam præmio, ad cibum sumendum et conficiendum allicimur. Revera ista voluptas pendet multum a statu ventriculi, et a necessitate novi cibi sumendi. Vilissimus enim cibus, et fere insulsus, homini esurienti gratissimus est, saturi vero fastidium crearet. Porro, inter mandendum saliva copiosior affluit, quo accuratior evadat gustus, et cibi sapor gratior. Fluit etiam saliva esurienti ad conspectum, vel etiam

corrumpitur parum naturali genere vitæ.

208. *Porro alma Parens rerum statuit, ut (hæc) actio adeo necessaria ad alendam vitam, et quodammodo voluntaria suâ naturâ, non careret aliquâ voluptate. Allicimur ad sumendum et conficiendum cibum, grato sapore cibi, tanquam præmio. Reverà ista voluptas multum pendet a statú ventriculi, et a necessitate sumendi novi cibi. Enim vilissimus cibus et ferè insulsus, est gratissimus homini esurienti, vero crearet fastidium saturi. Porro, inter mandendum, copiosior saliva fluit, quo gustus evadat accuratior, et sapor cibi gratior. Etiam saliva fluit esurienti ad conspectum, vel*

208. The kind Parent of Nature has ordained, that this action, which is so necessary to support life, and in its nature in some degree voluntary, might not be devoid of some pleasure. We are allured to take and prepare food, by its agreeable taste, as if it were by way of remuneration. Still that pleasure much depends upon the state of the stomach, and the necessity of taking fresh food: for the most common food, and what is almost unsavoury, is most acceptable to a hungry man, but would create disgust in one that is satisfied. Moreover, during mastication, there is a more copious flow of saliva, in order that the taste may be more accurate, and the savour more agreeable. The saliva flows at sight only, in a

ad imaginem aut recordationem grati cibi, quem appetit.

209. Gustus raro nimis acutus observatur, nisi a vitio cuticulæ, quæ linguam tegit. Hæc, si sublata fuerit, aut vulnerata, aut ulceribus, *aphthis*, similibusque malis, obsessa, tum gustu nimis acri facto, sapores non sine dolore percipiuntur; vel aliquando sapor nullus distinguitur, solus dolor sentitur.

110. Deficit, non secus ac tactus, a cerebri variis ipsius nervorumque vitiis. Hujusmodi vero exempla rara sunt. Nonnullis hominibus admodum obtusus datur. Hi quoque parum olfactus habere solent. Deficit sæpissime propter defectum sa-

etiam ad imaginem aut recordationem grati cibi, quem appetit.

209. *Gustus rarò observatur nimis acutas, nisi a vitio cuticulæ, quæ tegit linguam. Si hæc fuerit sublata, aut, vulnerata, aut obsessa ulceribus, aphthis, que similibus malis, tum gustû facto nimis acri, sapores percipiuntur non sine dolore; vel aliquando nullus sapor distinguitur, (et) dolor solus sentitur.*

210. *(Gustus) deficit, non secus ac tactus a variis vitiis cerebri, que nervorum ipsius. Vero exempla hujusmodi sunt rara. (Gustus) datur admodum obtusus nonnullis hominibus. Hi quoque solent habere parum olfactûs. Sæpissime deficit*

hungry man, or (even) at the idea or recollection of the pleasant food, which he longs for.

209. Taste is seldom observed too acute, unless from disorder of the cuticle covering the skin. If this be raised, or wounded, or covered with ulcers, aptha, and similar diseases, the taste becomes too acute, and the savours are perceived with pain; or sometimes taste is not distinguished, and pain alone is felt.

210. Taste, like touch, is defective from various disorders of the brain and its nerves; but instances of this kind are very rare. It is very often obtuse in some men, who likewise possess little smell:—it is most frequently lost on account of

livæ: nam sicca lingua gustare nequit. Hinc in multis morbis obtusus est, febribus imprimis, gravedine, &c. tum ob salivæ, tum quoque ob appetitus defectum, qui in sano homine adeo juvat; vel propter linguam ipsam tenace et fœdo muco obductam.

211. Depravatur sæpe gustus. Scilicet, vel gustamus nihil omnino linguæ admoto; vel, si quid ei admotum fuerit, saporem percipimus a vero et solito alienum. Hoc fit plerumque a vitio salivæ quæ ipsa gustatur. Hoc modo sapor dulcis, salsus, acer, amarus, putridus, rancidus, percipi potest, prout saliva, vel a statu generalis massæ

propter defectum salivæ: nam sicca lingua nequit gustare. Hinc obtusus est in multis morbis, imprimis febribus, gravedine, &c. tum ob defectum salivæ, tum quoque ob (defectum) appetitus, qui adeo juvat in sano homine: vel propter linguam obductam tenace et fœdo muco.

211. *Sæpe gustus depravatur. Scilicet vel gustamus omnino nihil admoto linguæ: vel siquid admotum fuerit ei, percipimus saporem alienum a vero et solito. Hoc plerumque fit, a vitio salivæ, quæ ipsa (saliva) gustatur. Hoc modo sapor dulcis, salsus, acer, amarus, putridus, rancidus, potest percipi, prout saliva fuerit corrupta, vel a statu gene-*

a deficiency of saliva; for a dry tongue is unable to taste. —Hence, it is obtuse in many diseases; particularly in fevers, catarrh, &c., both on account of a want of saliva, as well as on account of loss of appetite, which is so useful in a healthy person; or on account of the tongue being coated with thick and filthy mucus.

211. The taste is often depraved; that is to say, we either taste no substance when applied to the tongue; or if something be applied, we perceive a taste different from what is proper and usual. This generally occurs from disorder of the saliva, which is tasted: in this way, a sweet, salt, acrid, bitter, putrid, or rancid, taste, may be perceived, according as

humorum, vel organorum quæ ipsam secernunt, vel oris ipsius, vel ventriculi, unde vapor et ructus, præsertim si male se habet, ad os surgunt, corrupta fuerit.

212. Verum, præter salivæ vitia, ab aliis causis gustus vitiatur, veluti papillarum nervosarum conditione; cujus vero parum hactenus notum est. Nam gustus nonunquam plane alienatur, quamvis saliva psa aliis hominibus nullius saporis sit.

213. Ad linguæ conditionem medici in omnibus morbis, præsertim febribus, multum solent attendere; nec immerito. Nam ex ea judicare possunt de statu ventriculi, de siti, vel po-

ralis massæ humorum, vel organorum quæ secernunt ipsam, vel ipsius oris vel, ventriculi, unde vapor et ructus surgunt ad os, præsertim si habet se male.

212. *Verò præter vitia salivæ, gustus vitiatur ab aliis causis, veluti conditione nervosarum papillarum cujus verò parum est notum hactenus. Nam nonnunquam gustus planè alienatur aliis hominibus, quamvis ipsa saliva sit nullius saporis.*

213. *Medici solent multum nec immeritò attendere ad conditionem linguæ in omnibus morbis, præsertim febribus. Nam possunt judicare ex eá, de statú ventriculi, de siti vel potius de*

the saliva has been corrupted by the condition of the general mass of the fluids or organs which secrete it, or of the mouth itself, or of the stomach, whence gas and eructations rise to the mouth, particularly if it be disordered.

212. But besides the disorders dependent upon the saliva, the taste is vitiated from other causes : as by the state of the nervous papillæ ; but of this fact we hitherto know little : for sometimes the taste is evidently altered in some persons, although the saliva itself possesses no taste.

213. Medical men are accustomed to attend much, and very properly, to the state of the tongue, in all diseases, (and) particularly in fevers : for they are enabled to judge

tius de necessitate potus sumendi, cum æger, propter delirium, stuporem, &c. neque sitim sentit, neque de ea potest conqueri; et demum de natura, et augmento, vel remissione febris, ab inspecta lingua, medici judicium aliquod deducere conantur.

necessitate sumendi potús, cum æger propter delirium, stuporem, &c. neque sentit sitim, neque potest conqueri de eâ: et demum medici conantur deducere aliquod judicium ab linguâ inspectâ, de naturâ, et augmento, vel (de) remissione febris.

from it, concerning the state of the stomach; of thirst, or rather of the necessity of taking drink, at a time that a patient on account of delirium, stupor, &c., is neither sensible of thirst, nor able to complain of it; and, lastly, medical men are accustomed to form some judgment from inspection of the tongue, of the nature, and increase, or remission, of fever.

CAP. VII.— *De olfactu; ejusque usibus, varietatibus et vitiis: nec non de natura odorum, eorumque effectibus in corpore humano.*

214. HUJUS sensus sedes est in membrana illa mollissima, delicatissima, nervorum et vasorum sanguinem vehentium referta, quæ naribus internis, variisque sinibus et antris, quibus iter ex iis est obducitur. Acutior sensus circa medium septum, ossaque spongiosa, quibus membrana crassior, et mollior datur, quam in antris profundioribus, ubi membrana tenuior, minus

CAP. VII.—*De olfactú—que de usibus varietatibus, et de vitiis ejus; necnon de naturâ odorum, que (de) effectibus eorum, in humano corpore.*

214. SEDES *hujus sensús est in illa mollissimá et delicatisssimá membraná, refertá nervorum et vasorum vehentium sanguinem, quæ obducitur naribus internis, que variis sinibus, et antris, quibus est iter ex iis (i. e. internis naribus). Sensus (est) acutior circa medium septum, que ossa spongiosa, quibus crassior et mollior membrana datur, quam in profundioribus antris, ubi*

CHAP. VII.—*On the sense of smelling, its uses, varieties, and disorders: also on the nature of odours, and their effects on the human body.*

214. The seat of this sense is, in that very soft and delicate membrane, abundantly supplied with nerves and blood-vessels, which is spread over the internal nares, and the various sinuses and cavities which open into them. Smelling[34] is more acute about the central septum and spongy bones, which are supplied with a thicker and softer membrane, than the deeper cavities ; where the membrane is

34. The term *smelling* is applied, in this translation, to the sense, or power of perceiving smells; and *smells*, to the quality of the substance producing the impression called smell, odour, scent, &c. Some writers use the terms synonymously.

nervosa, et vasis minus referta est: quamvis hæ quoque, ut videtur, partes olfactu non omnino careant.

115. Ut gustu de partibus corporum solubilibus, sic olfactu de partibus volatilibus, quæ subtilissimæ per aëra volitant, judicamus. Ut accurate olfaciat aliquis, apertis quantum possit naribus, clausoque ore, aëra fortiter inhalat, quo plures particulæ volatiles, majoreque vi, olfactus organo admoveantur.

216. Organum quoque olfactus, non secus ac organum gustus, quo acutiorem sensum habeat, madidum servatur; partim proprio muco, partim lachrymis quæ ex oculis assidue destillant.

membrana est tenuior, minus nervosa, et minus referta vasis: quamvis hæ partes quoque, non omnino careant olfactú.

215. *Ut judicamus de partibus solubilibus corporum gustú, sic (judicamus) de partibus volatilibus quæ subtilissimæ volitant per aëra, olfactú. Ut aliquis olfaciat accuratè, inhalat aëra fortiter, naribus apertis quantum possit, que ore clauso, quo plures volatiles particulæ, que majore vi, admoveantur organo olfactûs.*

216. *Quoque organum olfactûs, non secus ac organum gustûs, servatur madidum, quo habeat acutiorem sensum; partim proprio muco, partim lachrymis, quæ assiduè destillant ex oculis.*

thinner, less supplied with nerves and blood-vessels; although these parts, likewise, are not entirely devoid of the power of smelling.

215. As we judge of the soluble particles of bodies, by the taste, we judge of the volatile subtle particles floating in the air, by smelling. In order to smell accurately, it is necessary to inhale the air forcibly, with the nostrils opened as wide as possible, and with the mouth closed; so that most of the volatile particles may be applied, with greater force, to the organ.

216. The organ of smelling, likewise, like the organ of taste, is kept in a moist state, that it may possess more sensibility; partly by its own mucus, and partly by the tears, which are constantly flowing down from the eyes.

217. Ut gustus cibi itineri, sic olfactus ostio viarum, quas aër subire debet, custos præponitur, moniturus ne quid noxii, via quæ semper patet, in corpus admittatur. Porro, ut gustus, hic quoque sensus ad cibum salutarem invitat, a noxio aut corrupto, putrido imprimis vel rancido, deterret.

217. *Ut gustus præponitur (ut) custos itineri cibi, sic olfactus (præponitur custos) ostio viarum, quas (vias) aër debet subire, moniturus ne quid noxii admittatur in corpus, viâ quæ semper patet. Porro, ut gustus, hic sensus quoque invitat ad salutarem cibum, (et) deterret a (cibo) noxio, aut corrupto, imprimis putrido, aut rancido.*

218. Quin et odores quidam insigni vi in *genere nervoso* pollent, et mirandos nonnunqam effectus edunt. Alii grate excitant, et animo fere deficientem statim recreant: alii animo linqui faciunt, et aliquando, ut fertur, hominem plane extinguunt. Huc quoque pertinent quæ vocantur antipathiæ, ridiculæ profecto,

218. *Quin et quidam odores pollent insigni vi in nervoso genere, et nonnunquam edunt mirandos effectus. Alii (odores) excitant gratè, et statim reficiant (illum) fere deficientem animo: alii (odores) faciunt hominem lingui animo, et aliquando, ut fertur, planè extinguunt (illum). Quoque (illa) quæ vocantur anti-*

217. As taste is appointed as a guardian to the passage of the food, smelling (performs the same duty) to the opening of the air-passages; warning lest any thing noxious be admitted into the body, by that passage, which is always open. Moreover, like taste, it invites us also to wholesome food, and keeps us from that which is hurtful, or corrupted, particularly the putrid and rancid.

218. Some odours possess remarkable influence over the nervous system, and sometimes produce surprising effects: some excite agreeably, and immediately restore a person, when approaching to syncope; others bring on fainting, and sometimes (as it is reported) completely deprive of life: antipathies likewise may be referred to this place, truly

sed sæpe nulla vi animi debellandæ.

pathiæ pertinent huc, profectò ridiculæ, sed sæpè debellandæ nullá vi animi.

219. Olfactus interdum nimis acutus fit, tum propter vitia quædam organi ipsius, quod rarius observatur, tum quoque propter universum *genus nervosum* nimis sentiens; ut in febribus quibusdam, in phrenitide, in *hysteria*, aliquando observatur.

219. *Interdum olfactus fit nimis acutus, tum propter quædam vitia ipsius organi, quod observatur rariùs, tum quoque propter nimis sentiens universum nervosum genus: ut aliquando observatur in quibusdam febribus, in phrenitude, (et) in hysteriâ.*

220. Obtunditur sæpius, aut a vitiis cerebri nervorumque, veluti a vi capiti illata, vel a causa interna, provenientibus; aut a vitio ipsius organi, aridi, propter solitos humores suppressos, vel alio versos, vel nimia muci lachrymarumque copia obruti. Utriusque exemplum est in gravedine, ubi initio morbi nares ares-

220. *(Olfactus) sæpiùs obtunditur, aut a vitiis cerebri que nervorum, veluti (illis) provenientibus a vi illatâ capiti, vel ab internâ causâ: aut a vitio organi ipsius, aridi propter suppressos solitos humores, vel versos aliò, vel obruti nimiâ copiâ muci que lachrymarum. Est exemplum utriusque in gravedine, ubi initio*

ridiculous, but frequently to be subdued by no power or resolution.

219. Smelling becomes sometimes too acute, either on account of disorders of the organ itself, which is seldom observed, or on account of a too sentient nervous system in general, as is observed in certain fevers, in phrenitis, and in hysteria.

220. Smelling more frequently becomes obtuse, either from diseases of the brain and nerves, such as proceed from force applied to the head, or from an internal cause; or from disorder of the organ itself, being dry on account of a suppression of the usual fluids, or their being diverted elsewhere, or overwhelmed with an excess of mucus or tears.

cunt, postea vero vel multo humore inundantur, vel spissiore muco obstruuntur. Sed in his aliisque bene multis exemplis, membrana nasi ipsa afficitur inflammatione, relaxatione, tensione nimia, qua fieri non potest quin nervi, qui magnam ejus partem efficiunt, vitientur. Porro, quicquid liberum aëris in nares introitum, aut ipsius per eas transitum impedit, olfactui non obesse non potest.

morbi nares arescunt, postea vel inundantur multo humore, vel obstruuntur spissiore muco. Sed, in his que in bene multis aliis exemplis, ipsa membrana nasi, afficitur inflammatione, relaxatione, vel nimiá tensione, qua non potest fieri, quin nervi vitientur, qui efficiunt magnam partem ejus. Porro, quicquid impedit liberum introitum aëris in nares, aut transitum ipsius (aëris) per eas (nares), non potest non obesse olfactui.

221. Depravatur nonnunquam olfactus, et odores percipiuntur, ubi nihil odorati fuit, vel odores rerum percipiuntur a veris et solitis alieni. Particulæ odoratæ, post longam in antris moram, demum erumpentes,

221. *Nonnunquam olfactus depravatur, et odores percipiuntur, ubi fuit nihil odorati, vel odores rerum, alieni a veris et solitis (odoribus) percipiuntur. Odoratæ particulæ, post longam moram in antris, demum*

There is an instance of both disorders in catarrh, when the nostrils are dry in the beginning of the disease, and are afterwards inundated with fluid, or obstructed with a thicker mucus than natural. In this, as in many other cases, the membrane itself is attacked by inflammation, relaxation, or excessive tension; hence, as a necessary consequence, the nerves are disordered, which form a considerable portion of it. Besides, whatever impedes the free entrance of air into the nostrils, or its egress through them, cannot fail to be an obstacle to smelling.

221. Smelling is sometimes depraved, and odours are perceived, when there is no odorous body; or odours of things unlike the real and true ones, are perceived. Odorous particles after long detention in the cavities, emerging at length,

et organum denuo afficientes, hujusmodi depravationem, in sanissimo etiam homine, nonnunquam efficiunt. Multa quoque vitia narium partiumque quibus ad eas iter patet, ulcera, caries, cancer, corruptio quævis oris, dentium, gutturis, pulmonis, prava etiam in ventriculo concoctio, vaporem fœtidum, exhalando, olfactum corrumpere possunt. Depravatur interdum fortasse a vitiis cerebri nervorumque, quorum ratio magis obscura est.

erumpentes, et denuò afficientes organum, nonnunquam efficiunt depravationem hujusmodi, etiam in sanissimo homine. Quoque multa vitia narium, que partium quibus iter patet ad eas, scilicet, ulcera, caries, cancer, quævis corruptio oris, dentium, gutturis, pulmonis, etiam prava concoctio in ventriculo, exhalando fœtidum vaporem, possunt corrumpere olfactum. Fortasse interdum depravatur, a vitiis cerebri, que nervorum, ratio quorum est magis obscura.

and again affecting the organ, sometimes produce depravation of this kind, in a perfectly healthy man. Likewise many diseases of the nostrils and of the parts opening into them; such as ulcers, caries, cancer, any corruption of the mouth, teeth, throat, or lungs; also bad digestion in the stomach, by exhaling a fetid vapour, may vitiate the sense of smelling. It is possibly sometimes disordered by diseases of the brain and nerves; the reason of which is more obscure.

CAP. VIII.—*De auditu, sonis, et vitiis auditus.*

222. HIC sensus excitatur tremoribus aëris, quos corpora sonantia faciunt. Hos auris externa, cartilaginosa, et meatus auris uterque, colligunt, ad tympanum deferunt, et simul intendunt, quo majore vi membranam tympani feriant. Hæc membrana, ipsa commota et tremens, malleum sibi annexum commovet, et junctam sibi incudem ferire facit; juvantibus simul propriis mallei musculis. Incus vero suum motum ossi *orbiculari* et *stapedi* impertit, qui iterum, tum hoc motu, tum quoque

CAP. VIII.—*De auditû, (de) sonis, et (de) vitiis auditûs.*

222. HIC *sensus excitatur tremoribus aëris, quos (tremores) corpora sonantia faciunt. Cartilaginosa externa auris, et uterque meatus auris colligunt hos (tremores), deferunt (illos) ad tympanum, et simul intendunt, quo feriant membranam tympani majore vi. Hæc ipsa membrana commota et tremens, commovet malleum annexum sibi, et facit ferire incudem junctam sibi: propriis musculis mallei simul juvantibus. Verò incus impertit suum motum ossi orbiculari et stapedi, qui iterum trahitur, tum*

CHAP. VIII.—*On hearing, on sounds, and the disorders of hearing.*

222. The sense of hearing is excited by the tremors of the air, occasioned by sonorous bodies. The cartilaginous external ear, and both auditory passages, collect these tremors, and carry them to the tympanum, and at the same time give them intensity, that they may strike the membrane of the tympanum with greater impetus. This membrane agitated and tremulous, moves the malleus annexed to it, and makes it strike the incus, which is articulated with it; the proper muscles of the malleus at the same time assisting. The

actione sui musculi, ita trahitur, ut pars posterior ejus baseos in fenestram *ovalem*, ipsumque vestibulum, impellatur. Porro, tremores membranæ tympani, cum aëre per *tubam Eustachianam* in tympanum delato, simul communicantur; qui demum aër fenestræ rotundæ membranam ferit, qua in labyrinthum, seu aurem intimam, pervenitur. Duplice igitur, ut videtur, modo, tremores ad labyrinthum perveniunt, qui totus, mollissima et admodum sentiente nervosa membrana, obductus, et aquula pellucida, subrubra, ad omnes tremores suscipiendos et propagandos aptissima, plenus, ultimum auditus organum est.

hoc motú, tum quoque actione sui musculi, ita, ut pars posterior baseos ejus impellatur in ovalem fenestram, que (in) vestibulum ipsum. Porro, tremores membranæ tympani, simul communicantur, cum aëre delato per Eustachianam tubam in tympanum; qui aër demùm ferit membranam rotundæ fenestræ, quá pervenitur in labyrinthum, seu intimam aurem. Igitur tremores perveniunt, duplice modo, ut videtur, ad labyrinthum, qui totus obductus mollissimá et admodum sentiente nervosá membraná, et plenus, aquulá pellucidá, subrubrá, aptissimá ad suscipiendos, et propagandos omnes tremores, est ultimum organum auditûs.

incus imparts its motion to the orbicularis and stapes, which again is drawn in such a direction, both by this motion, and by the action of its own muscle, that the posterior portion of its base is forced into the fenestra ovalis, and the vestibule itself. Moreover, the tremors of the membrane of the tympanum, communicate at the same time, with the air conveyed by the Eustachian tube to the tympanum, which (air) at last strikes the membrane of the fenestra rotunda, by which it is conveyed to the labyrinth, or internal ear. Therefore tremors, as it appears, arrive in two ways to the labyrinth, which is the ultimate organ of hearing, and is entirely lined with a very soft, sensitive, nervous membrane, and filled with a pellucid, reddish fluid, best adapted to receive and propagate all tremors.

223. Neque sane quicquam certa fide de singularum auris internæ partium actionibus notùm est, præterquam ossicula ipsa ad tremores suscipiendos et reddendos vel propagandos aptissima esse, et ideo ad auditum conferre: ita ut per dentes et maxillam, et petrosum os, soni ad ultimam nervosam organi partem perveniant, et sic homo fere surdus, neque per aëra audiens, musica quadammodo fruatur. Potius confitendum est, multum hic subesse obscuri, et actionem et usus multarum partium, quæ in aure sunt, parum adhuc intelligi.

224. Soni sunt fortes vel debiles, graves vel acuti. Soni magnitudo vel claritas pendet a vi seu magnitudine

223. *Neque sanè quicquam est notum certâ fide, de actionibus singularum partium internæ auris, præterquam ossicula ipsa esse aptissima ad suscipiendos, et reddendos vel propagandos tremores, et ideò conferre ad auditum: ita ut soni perveniant per dentes et maxillam, et petrosum os ad ultimam nervosam partem organi, et sic homo ferè surdus, neque audiens per aëra, quodammodo fruatur musicâ. Potius est confitendum, hic multum obscuri subesse, et actionem et usus multarum partium, quæ sunt in aure, adhuc parum intelligi.*

224. *Soni sunt fortes vel debiles, graves vel acuti. Magnitudo vel claritas soni pendet a vi seu magnitudine*

223. There is nothing certain known of the actions of the separate parts of the internal ear, beyond, that, the little bones are best adapted to receiving, and returning or propagating tremors, and on that account contribute to hearing; so that sounds may reach by means of the teeth, maxillary and petrous bone, to the deepest nervous part of the organ; and thus a man who is nearly deaf, and not hearing through the medium of the air, may enjoy music to some extent. We must confess that here there is much obscurity, and that the action and uses of many parts in the ear, are still little understood.

224. Sounds are loud or low, deep or acute:—the extent or clearness of the sound depends upon the force or extent

tremorum, quos corpus sonans aëri impertit; gravitas a numero tremorum qui dato tempore absolvuntur. Sunt tamen certi fines, quos citra et ultra, vel nullus sonus est, vel acerrimus, et auri ingratissimus, vixque tolerabilis.

225. Porro, vis soni intenditur repercussu multorum corporum, quæ tremores a tremente aëre suscipiunt et reddunt. Soni itaque reflexi, quotquot cum primario concordant, una cum eo aures feriunt, eumque fortiorem faciunt: hinc vox sub pleno Jove debilior quam in cubiculo. Quod si, certo post intervallo, reflexi soni ad aures perveniunt, a primario distincti audiuntur, et sic echo fit.

tremorum, quos sonans corpus impertit aëri; gravitas (pendet) a numero tremorum, qui absolvuntur dato tempore. Tamen sunt certi fines, citra et ultra quos, sonus est vel nullus vel acerrimus, et ingratissimus auri, que vix tolerabilis.

225. *Porro, vis soni intenditur repercussû multorum corporum, quæ suscipiunt et reddunt tremores, a tremente aëre. Itaque reflexi soni, quotquot concordant cum primario (sono), feriunt aures unà cum eo, que faciunt eum fortiorem: hinc vox est debilior sub pleno Jove, quam in cubiculo. Quod si, reflexi soni perveniunt ad aures, post certo intervallo, audiuntur distincti a primario (sono), et sic echo fit.*

of the tremors, which a sounding body imparts to the air; their depth depends upon the number of tremors produced in a given time. Nevertheless, there are certain sounds within and beyond which, sound is lost or very shrill, and most unpleasant to the ear, and scarcely supportable.

225. The strength of a sound is increased by repercussion of many bodies, which receive and return the tremors, from the tremulous air. Therefore, reflected sounds, which agree with the primary one, strike the ears simultaneously, and render it stronger; hence the voice is weaker under the open air than in a room. But if the reflected sounds reach the ear after a certain interval, they are heard distinct from the primary one, and echo is produced.

226. Sonorum immensa varietas est: quippe quorum vel levissimæ mutationes et conjunctiones, ab acuta et docta aure, percipiantur. Insignis quoque eorum vis est in animum hominis, et ideo in corpus. Varios animi affectus, tristes imprimis et lætos, inspirant; multique hominem ex hoc inexhausto fonte puras et suavissimas voluptates hauriunt. Auris vero, quæ vocatur musica, non omnibus datur; cujus rei ratio hactenus latet. Nullo modo pendet ab acutiore vel obtusiore auditu. Semi-surdi nonnunquam musica satis periti sunt et amantissimi, qua bene audientes parum sæpe fruuntur: et vir, auditu integro manente, au-

226. *Est immensa varietas sonorum; quippe quorum, vel levissimæ mutationes et conjunctiones percipiantur ab acutá et doctá aure. Quoque vis eorum est insignis, in animum hominis, et ideò in corpus. (Illi soni) inspirant varios affectus animi, imprimis tristes et lætos; que multi hominem hauriunt puras et suavissimas voluptates ex hoc inexhausto fonte. Vero auris, quæ vocatur musica, non datur omnibus: ratio cujus rei adhuc latet. Pendet nullo modo ab acutiore vel obtusiore auditú. Semi-surdi sunt nonnunquam satis periti et amantissimi musicæ, quá (musicá illi), bene audientes sæpè parum fruuntur; et vir, integro auditú*

226. There is an immense variety of sounds, the slightest changes and combinations of which may be perceived by an acute and tutored ear. Their influence is remarkable upon the mind of man, and consequently upon the body: they inspire different mental affections, especially those that are sad and cheerful; and many persons derive pure and most sweet pleasures from this inexhaustible source. An ear, which is called musical, is not supplied to all persons; and the reason of this is rather obscure.—It does not depend in any degree upon more acute or obtuse hearing. Persons nearly deaf are sometimes skilful in and very fond of music, which, persons, whose hearing is good, often enjoy in a very slight degree; and a person, with his hearing still perfect, has lost suddenly, without any assignable cause, his musical

rem suam musicam, quam eximiam habebat, subito et sine nota causa amisit. Neque ratio ulla est cur defectum talem inæquali per binas aures auditui imputemus. Facultas ipsa Naturæ donum est, nullo studio acquirenda: cultu vero et usu, non secus ac reliquæ hominis facultates, mirum in modum acuitur et roboratur.

227. Auditus fere omnium sensuum sæpissime vitiatur; quod profecto nil mirum; scilicet, quia organum habet delicatissimum, et ex plurimis et valde minutis partibus compositum.

228. Sæpe acutior justo fit auditus, vel a generali corporis habitu nimis irritabili, qualem fœminæ *hysteri-*

manente, amisit subitò et sine notâ causâ, suam musicam aurem, quam habebat eximiam. Neque est ulla ratio cur imputemus talem defectum inæquali auditui per binas aures. Ipsa facultas est donum Naturæ, acquirenda nullo studio: verò acuitur, et roboratur in mirum modum cultû et usû, non secus ac reliquæ facultates hominis.

227. *Auditus vitiatur sæpissimè ferè omnium sensuum; quod profectò (est) nil mirum; scilicet, quia habet organum delicatissimum, et compositum ex plurimis et valde minutis partibus.*

228. *Auditus fit sæpe acutior justo, vel a nimis irritabili generali habitû corporis, qualem hystericæ aut*

ear, which he possessed in an exquisite degree. There is no reason why we should impute such a defect to unequal hearing in the two ears.—It is a faculty given us by Nature, to be acquired by no kind of study; but (which) is rendered acute, and strengthened to a wonderful extent, by cultivation and use, like the other faculties of man.

227. Hearing is the most frequently disordered of all the senses; which is by no means surprising, since it is seated in such a delicate organ, composed of numerous and very minute parts.

228. Hearing becomes more acute than is proper, either from a too irritable general habit of body, such as hysterical

ricæ aut puerperæ sæpe habent; vel a cerebro ipso nimis sentiente, quod in febribus haud raro observatur; tum quoque in phrenitide, et aliquando, licet rarius, in vera insania; vel ab aure ipsa male se habente, et inflammatione, dolore, tensione nimia, affecta.

229. Obtunditur vel plane aboletur hic sensus, ita ut æger vel graviter audiat, vel omnino surdus fiat, similibus fere causis, et gradu tantum seu magnitudine diversis; et imprimis a defectu auriculæ externæ, aut meatu vel altero vel utroque, muco, *cerumine*, pure, rebus externis, obstructo; ejusque concretione, qualis post suppurationem, nonnunquam post *variolam*, observata est; vel propter

puerperæ fœminæ sæpe habent; vel a cerebro ipso nimis sentiente, quod haud raro observatur in febribus; tum quoque in phrenitide, et aliquando, licèt rariùs, in verâ insaniâ; vel ab ipsâ aure male habente se, et affectâ inflammatione, dolore, (et) nimiâ tensione.

229. *Hinc sensus obtunditur vel planè aboletur, ita ut æger vel audiat graviter, vel fiat omnino surdus, fere similibus causis, vel diversis tantùm gradû seu magnitudine; et imprimis, a defectû externæ auriculæ, aut vel altero vel utroque meatû, obstructo, muco, cerumine, pure, (vel) externis rebus; que concretione ejus, qualis est observata post suppurationem, nonnunquam post variolam; vel propter mem-*

or puerperal females possess; or from the brain itself being too sensitive, as is often observed in fevers; likewise in phrenitis, and sometimes, though not so frequently, in real insanity; or from the ear itself being disordered, and affected with inflammation, pain, and too much tension.

229. This sense is rendered obtuse, or is completely destroyed, so that a patient is either hard of hearing, or is quite deaf, from similar causes, or causes differing only in degree or magnitude; (such as) particularly, from a defect of the external ear, or from one of the auditory passages being obstructed by mucus, wax, pus, or extraneous bodies; also by its concretion, such as is observed after suppuration or small-pox; or on account of the membrane of the tym-

membranam tympani rigidam factam, aut relaxatam, aut erosam, aut ruptam; vel tympanum ipsum vel tubam *Eustachianam* aliquo modo obstructam; vel propter ossiculorum, aut membranarum, aut musculorum aliquem labyrinthi ipsius, concretione, *spasmo*, paralysi, torpore, affectum; et denique propter varia cerebri nervorumve vitia, salva omnino ipsius organi fabrica. Hinc sæpe morbus *nervosi generis* surditas, subito invadens et sponte decedens. Hinc quoque senibus familiaris, quibus omnes partes solidæ rigent, omnes nervosæ minus sentiunt.

branam tympani factam rigidam, aut relaxatam, aut erosam, aut ruptam; vel (propter) ipsum tympanum vel Eustachianam tubam obstructam aliquo modo; vel propter aliquem ossiculorum, aut membranarum, aut musculorum ipsius labyrinthi, affectum concretione, spasmo, paralysi, (aut) torpore; et denique propter varia vitia cerebri que nervorum, fabricâ organi ipsius omnino salvâ. Hinc surditas (est) sæpe morbus nervosi generis, subito invadens, et decedens sponte. Hinc quoque (surditas est) familiaris senibus, quibus omnes solidæ partes rigent, (et) omnes nervosæ (partes) sentiunt minùs.

230. Febre laborantes, illo imprimis febris genere, quod debilitas insignis et

230. *(Homines) laborantes febre, imprimis illo genere febris, quod (genus)*

panum being rigid, or relaxed, or eroded, or ruptured; or on account of the tympanum itself, or Eustachian tube, being destroyed in any other manner; or on account of some one of the little bones, or membranes, or muscles of the labyrinth being affected by concretion, spasm, paralysis, or torpor; and, lastly, on account of various disorders of the brain itself and nerves, whilst the structure of the organ itself is perfectly sound. Hence deafness is frequently a disease of the nervous system, suddenly coming on and as speedily departing. Hence also, deafness is common to old persons, in whom all the solid parts are rigid, and all the nervous parts are less sensible.

230. Persons suffering from fevers, particularly that kind

stupor comitari solent, sæpe surdi fiunt: quod forsitan aliquando, cum aliis signis cerebri valde oppressi, viriumque ægri exhaustarum accedens, malum signum erit. Plerumque vero optimi ominis est, quamvis etiam sopor aliquis comitetur. Hujus rei ratio satis obscura; neque alia fortasse, quam quod talis surditas pendeat a statu cerebri morbido certe, sed sua natura vix periculoso; cum acutior justo auditus fit propter aliquid inflammationis cerebro obrepentis, quæ semper valde periculosa est.

insignis debilitas et stupor solent comitari, sæpe fiunt surdi; quod forsitan erit aliquando malum signum, cùm accedens cum aliis signis valdè oppressi cerebri, que exhaustarum virium ægri. Verò plerumque est optimi ominis, quamvis etiam aliquis sopor comitetur. Ratio hujus rei est satis obscura; neque fortasse (est) alia (ratio), quàm quod talis surditas pendeat a statú cerebri certè morbido, sed vix periculoso suá naturá; cum auditus (est) acutior justo, fit propter aliquid inflammationis obrepentis cerebro, quæ (inflammatio) est semper valde periculosa.

231. *Sæpe auditus depravatur potissimum hac ratione, ut soni, veluti tym-*

attended by great debility and stupor, often become deaf: this may perhaps be sometimes a bad symptom, when coming on combined with other symptoms of oppression of the brain, and exhausted powers of the patient; but it is generally a good indication, even if attended by a certain degree of drowsiness. The reason of this is quite obscure; nor perhaps can any other be given, than that such deafness depends upon a state of brain, morbid indeed, but still not dangerous in its nature; whereas, hearing, if too acute, takes place on account of some inflammation stealing upon the brain, which is always a very dangerous occcurrence.

231. Hearing is often depraved, particularly in such a way, that sounds like those of a drum, or bell, or of a water-

pani, campanæ, lapsus aquarum, audiantur, cum nullus in aëre tremor est, neque sanus homo quidquam audit. Hoc malum tinnitus aurium vocatur, cujus varia genera observata sunt. Leve plerumque et fugax malum: nonnunquam vero pertinax, diuturnum, molestissimum, diu noctuque vexat.

232. Tinniunt sæpe aures a levissima causa, meatum ipsum vel tubam *Eustachianam* pro parte obstruente, ita ut imperfectus, interruptus aëri aditus concedatur; quo fit ut hic membranam tympani, vel fortasse partes interiores, inæqualiter, et impetu nimio, feriat. Hinc bombi, tinnitus species,

pani, campanæ, lapsûs aquarum, audiantur, cum nullus tremor est in aëre, neque sanus homo audit quidquam. Hoc malum vocatur, tinnitus aurium, cujus varia genera sunt observata. Plerumque est leve et fugax malum; verò nonnunquam (est) pertinax, diuturnum, molestissimum, (et) vexat diu que noctu.

232. *Sæpe aures tinniunt a levissimâ causâ, pro parte obstruente ipsum meatum vel Eustachianam tubam, ita ut imperfectus, (et) interruptus aditus concedatur aëri; quo fit, ut hic (i. e. aër) feriat inæqualiter et nimio impetû, membranam tympani vel fortasse interiores partes. Hinc bombi, species tinnitûs, audiuntur*

fall are heard, when there is no tremor in the air, and a healthy person hears nothing: this malady is called tinnitus, or ringing of the ears, of which different kinds have been observed. It is generally a slight and fleeting disorder; but sometimes is obstinate, long continued, and very troublesome, and harasses both by day and by night.

232. The ears often ring from a very slight cause, partly obstructing the meatus itself, or Eustachian tube; so that there is an interrupted and imperfect access to the air; hence it happens, that it strikes unequally, and with too much impetus, the membrane of the tympanum, and perhaps, the internal parts. Hence, bombi, a species of ringing of the ears, are heard during the action of gaping, even by a man in perfect health.

etiam a sanissimo homine, inter hiandum audiuntur.

233. Frequentior et molestior tinnitus multos morbos, tum febres, tum *nervosi generis* affectiones, comitatur: partim ab aucto sanguinis caput versus impetu, auctoque simul *nervosi generis* sensu, ita ut ipsarum arteriarum ictus audiantur; partim ab aucto nervorum et musculorum auris labyrinthi sensu et mobilitate; quo fit, ut partes quæ debebant quiscere, donec aëris tremoribus excitatæ essent, sua sponte motus concipiant, eosdemque aliis partibus, jam nimis sentientibus, impertiantur.

234. Oritur quoque tinnitus a vehemente animi affectu; interdum a ventriculo male se habente, nasci-

inter hiandum, etiam a sanissimo homine.

233. *Frequentior et molestior tinnitus comitatur multos morbos, tum febres tum affectiones nervosi generis: partim ab aucto impetú sanguinis versus caput, que simul aucto sensu nervosi generis; ita ut ictus ipsarum arteriarum audiantur; partim ab aucto sensú et mobilitate nervorum et musculorum labyrinthi auris; quo fit, ut partes, quæ debebant quiescere, donec essent excitatæ tremoribus aëris, concipiant motus suá sponte, que impertiantur eosdem (motus) aliis partibus, jam nimis sentientibus.*

234. *Quoque tinnitus oritur a vehemente affectú animi; nascitur interdum a ventriculo male habente*

233. A more common and more troublesome ringing of the ears attends many diseases; such as fevers, and affections of the nervous system: partly (depending) upon an increased impetus of the blood towards the head, and at the same time the sensibility of the nervous system being increased, so that the pulsations of the arteries themselves are heard; partly upon increased sensibility and mobility of the nerves and muscles of the labyrinth of the ear; hence it occurs, that the parts which ought to be at rest, until they were excited by the tremors of the air, receive motion of their own accord, and impart it to other parts, already too sensitive.

234. Ringing of the ears likewise arises from a powerful affection of the mind; it sometimes arises from a disordered

tur: interdum a malo *rheumatico* caput et aures afficiente, vel a gravedine quæ tubam afficere solet: nonnunquam vero tinnitus solus invadit, malum profecto non exiguum.

235. Variæ tamen causæ, tum hujus tum aliorum auditus vitiorum, sæpe difficillime dignoscuntur, non magis propter abditum organi situm, quam propter notitiam variarum ejus partium actionum, quam parum accuratam habemus. Ex utraque vero causa fit, ut multiplices auditus affectiones neque certe neque facile sanentur.

se: interdum a rheumatico malo afficiente caput et aures, vel a gravedine quæ solet afficere tubam: vero tinnitus solus nonnunquam invadit, profectò non exiguum malum.

235. *Tamen variæ causæ, tum hujus, tum aliorum vitiorum auditûs, sæpe dignoscuntur difficillimè, non magis propter abditum situm organi, quam propter notitiam actionum variarum partium ejus, quam (notitiam) habemus parùm accuratam. Vero fit ex utráque causá, ut multiplices affectiones auditûs, neque certè neque facilè sanentur.*

stomach; sometimes from rheumatism attacking the head and ears; or from catarrh, which usually affects the tube; but ringing of the ears sometimes comes on alone, and is no slight disorder.

235. The various causes of this, as well as of the other disorders of hearing, are generally distinguished with difficulty; not more on account of the concealed situation of the organ, than on account of our inaccurate knowledge of the actions of its different parts.—And it so happens from both causes, that the numerous affections of hearing are cured neither with certainty nor ease.

CAP. IX.—*De visu, ejusque varietatibus et vitiis.*

236. CHAP. IX.—*On the sense of sight, its varieties and disorders.*

236. The rays emanating or reflected from every point of a luminous or illuminated body, which we contemplate, fall upon the cornea, a membrane of the eye: the rays which are very oblique, are either reflected, or buried in the uvea, or in the pigmentum nigrum, which is spread over the ciliary processes, and never reach the inner parts of the eye; but the rays which fall more directly upon the cornea, transmitted through that transparent membrane, and the aqueous humour, which is next to it, being already somewhat refracted, reach the crystalline lens. By means of this lens,

jus *lentis*, et vitrei humoris qui proximus est, magis adhuc refringuntur, et in punctum, seu *focum*, ut vocatur, demum colliguntur, pulcherrimam, distinctam, quamvis inversam, corporis unde profluxerant imaginem super *retinam* depicturi.

237. Hæc vero delicatissima nervosa membrana, ultimum visus organum est; et ex imagine corporis inversa super eam depicta, homo, cerebrum nervumque opticum sanus, corpus ipsum, erectum, distinctum, propriisque coloribus expressum, videt.

238. Varii dantur oculi humores a Natura nihil frustra moliente, quamvis unus ad radios refringendos,

tallinam lentem. Vi hujus lentis, et (vi) vitrei humores qui est proximus, (illi radii) adhuc magis refringuntur, et demum colliguntur in punctum seu focum (ut vocatur), depicturi super retinam, pulcherrimam, distinctam, quamvis inversam imaginem, corporis, unde profluxerant.

237. *Verò hæc delicatissima nervosa membrana est ultimum organum visûs : et ex inversâ imagine corporis, depictâ in eam (membranam) homo sanus (secundum) cerebrum que opticum nervum, videt ipsum corpus, erectum, distinctum, que expressum propriis coloribus.*

238. *Varii humores oculi dantur a Naturâ moliente nihil frustrâ, quamvis unus (humor) sufficisset, ad re-*

and the vitreous humour next to it, these rays are still more refracted, and are at length collected into a point or focus (as it is called), so as to depict upon the retina a very beautiful and distinct, although inverted image of the body, from which they emanated.

237. This very delicate nervous membrane (namely the retina), is the ultimate organ of vision ; and from the inverted image of a body depicted upon it, a man who is healthy as to the brain and optic nerve, sees the object itself erect, distinct, and expressed in its proper colours.

238. Different humours of the eye are given by Nature, who forms nothing without an object, although one would

et in *focum* colligendos, imaginemque in *retinam* exprimendam suffecisset, hoc potissimum, ut videtur, consilio, ut ab alieno colore, quem una et simplex *lens* dare solet, propter radios lucis inæqualiter refractos, præcaveretur: et sic homo, qua oportebat accuratione, de veris corporum coloribus judicare posset. Certissimis enim experimentis constat *lentem*, certa ratione compositam, hoc non levi simplicioris incommodo carere. Ad eundem finem haud parum conferre videtur, varia singulorum oculi humorum variis partibus densitas: qua fortasse varia vi refringente, diversa ipsorum radiorum ad refringendum facilitas compensatur.

fringendos radios et colligendos in focum, que (ad) exprimendam imaginem in retinam, potissimùm, ut videtur hoc consilio, ut præcaveretur ab alieno colore, quem una et simplex lens solet dare: et sic homo posset judicare de veris coloribus corporum, accuratione quá debebat. Enim constat (ex) certissimis experimentis, lentem compositam certá ratione, non carere hoc levi incommodo simplicioris. Varia densitas singulorum humorum oculi, variis partibus, videtur haud parum conferre ad eundem finem: qua variá refringente vi, fortasse diversa facilitas radiorum ipsorum, ad refringendum, compensatur.

have sufficed to refract the rays, and gather them into a focus, and to express the image upon the retina, as it appears, with the intention of guarding against strange colours, which one simple lens is apt to produce; so that man, in this way, might judge of the true colours of bodies, with the necessary accuracy. For it appears from very accurate experiments, that a lens constructed upon a certain principle, is free from this serious inconvenience, which attaches itself to one of a more simple nature. The various density of the separate humours of the eye in the different parts, appears to contribute no little to the same object; and perhaps by this various refracting power, the different capability of refraction of the rays themselves, is compensated.

239. Neque profecto minima humoris vitrei, qui omnium oculi humorum longe maximam partem efficit, utilitas est, globum oculi implere, *retinamque* probe distendere, ita ut fere sphæram concavam repræsentet, quo plura ejus puncta imagines rerum visibilium distinctas et accuratas accipiant: nam si planior fuisset oculi fundus, vel cujuslibet fere alius figuræ quam rotundæ, propter inæqualem variarum ejus partium a centro oculi distantiam, unum tantum *retinæ* punctum, puta centrum ejus, distinctum visum habuisset. Qui vero in alia puncta incidissent radii, vel nondum satis refracti, vel postquam in *focum* semel collecti es-

239. *Neque profecto est minima utilitas vitrei humoris, qui omnium humorum oculi efficit longe maximam partem, (scilicet) implere globum oculi, que probè distendere retinam, ita ut fere representat concavam sphæram, quo plura puncta ejus accipiant distinctas et accuratas imagines visibilium rerum: nam si fundus oculi fuerit planior, vel cujuslibet alius figuræ quam rotundæ, unum punctum tantum retinæ, puta centrum ejus, habuisset distinctum visum, propter inæqualem distantiam variarum partium ejus a centro oculi. Vero radii, qui incidissent in alia puncta, vel nondum satis refracti, vel dimanantes iterum, postquam semel essent collecti*

239. The use of the vitreous humour is not inconsiderable; (for) it forms by far the largest portion of the humours of the eye; (it is of use) in filling up the globe of the eye, and in accurately distending the retina, so that it nearly represents a concave sphere, (and) so that many points of it may receive distinct and accurate images of visible objects. For if the fundus of the eye were more inclined to a plane surface, or of any other shape than the round, one point only of the retina, suppose its centre, would have distinct vision, on account of the unequal distance of its various parts from the centre of the eye. And the rays, which would have fallen upon other points, either from not being sufficiently refracted, or again emanating, after they were once collected into a focus, would have injured vision

sent, dimanantes iterum, imagine confusa super *retinam* depicta, visum multum corrupissent.

240. Rotundus est oculus, ut radii per eum transeuntes in justum *focum* prius colligantur quam in *retinam* incidant. Par ratio est *corneæ* convexæ, prominentis, quæ fere tanto magis prominet, quanto planior oculus animali datus est. Quin et rotunditas oculi ad liberrimum et rapidissimum ejus motum haud parum confert.

241. Mira conspiratio vel consensus inter binos oculos, interque varias oculi partes, observatur. Alter oculus motum alterius sua sponte sequitur, hac ratione, ut axes utriusque semper paralleli sint; et non nisi ho-

in focum, multùm corrupissent visum, confusá imagine depictá super retinam.

240. *Oculus est rotundus, ut radii transeuntes per eum, colligantur in justum focum, priusquam incidant in retinam. Est par ratio prominentis convexæ corneæ, quæ prominet fere tanto magis, quanto oculus planior est datus animali. Quin et rotunditas oculi confert haud parum, ad liberrimum et rapidissimùm motum ejus.*

241. *Mira conspiratio vel consensus observatur, inter binos oculos, que inter varias partes oculi. Alter oculus sequitur motum alterius (oculi) suá sponte hác ratione, ut axes utriusque sint semper paralleli; et*

considerably, by a confused image being depicted upon the retina.

240. The eye is round, that the rays passing through it may be collected into a proper focus, before they strike upon the retina. There is the same reason for the transparent cornea being convex, which is more prominent in proportion as a flatter eye is supplied to any kind of animal. Moreover the rotundity of the eye contributes considerably, to its very free and rapid motion.

241. A wonderful harmony or sympathy is observed between the two eyes, and the various parts of them. The one follows the motion of the other spontaneously, in such a way, that the axes of both are always parallel, and directed

minis conatu, levi quidem illo, et per instinctum et quasi sponte facto, in idem punctum corporis, quod contemplatur, dirigantur; quo fit, ut imago ejus prope centrum utriusque *retinæ* exprimatur; nam ibi loci fere semper perfectissimus est visus.

242. Pupilla in tenebris patula, admissa vel vividiore facta luce, statim contrahitur: et hoc consensui inter *retinam* et musculum qui pupillam regit, eamque vel arctat vel amplificat, plane tribuendum est, neque omnino irritationi ipsius musculi. Nam sano prorsus musculo isto, si nullus visus est, nulla fit pupillæ contractio. Quin et musculi pupillarum utriusque oculi conspirant; ita ut,

dirigantur in idem punctum corporis, quod contemplatur, non nisi conatú hominis, illo quidem levi, et facto per instinctum et quasi sponte; quo fit, ut imago ejus exprimatur prope centrum, utriusque retinæ; nam visus est fere semper ibi loci perfectissimus.

242. *Pupilla patúla in tenebris, statim contrahitur luce admissá vel factá vividiore; et hoc plane tribuendum est consensui inter retinam et musculum, qui regit pupillam, que vel arctat vel amplificat eam, neque omnino (est tribuendum) irritationi musculi ipsius. Nam isto musculo prorsus sano, si est nullus visus, nulla contractio pupillæ fit. Quin et musculi pupillarum utriusque oculi conspirant; ita*

towards the same point of a body which we contemplate, not indeed without an effort, although slight, and executed by instinct, and as it were, spontaneously: in this way the image of an object is expressed near the centre of each retina; for in that part vision is nearly always most perfect.

242. The pupil (which is) dilated in the dark, is immediately contracted by light being admitted or rendered more vivid: this is to be attributed to a sympathy between the retina and the muscle, which controuls the pupil, and contracts or dilates it, and not entirely to irritation of the muscle itself. For if that muscle be in a sound state, and there be no vision, no contraction of the pupil takes place. Moreover, the muscles of the pupils of the two eyes harmonize,

admissa ad alterum oculum luce, utriusque simul pupillæ contrahantur.

243. Contrahitur quoque pupilla, siquid oculo proprius quam soliti limites distincti visus accurate intuemur; hoc, ut videtur, consilio, ut radii superflui et maxime obliqui, et quos vires oculi refringentes in justum *focum* vix potuissent colligere, excludantur. Par videtur esse ratio, quod pupilla infantibus et junioribus admodum patula, senibus fere contractior sit, quibus oculi planiores fieri solent. Nondum pro certo constat, num aliis quoque modis, oculus ad varias rerum quas contemplatur distantias, semet accommodet: hunc vero nonnulli putarunt esse usum *processuum ciliarium;*

ut, luce admissá ad alterum oculum, pupillæ utriusque simul contrahantur.

243. *Quoque pupilla contrahitur, si intuemur quid propriùs quam limites soliti distincti visús: hoc consilio, ut videtur, ut superflui et maxime obliqui radii, et (ut radii) quos vires, refringentes oculi vix potuissent colligere in justum focum, excludantur. Par ratio videtur esse, quod pupilla sit admodum patula infantibus et junioribus, (sed) fere contractior senibus, quibus oculi solent fieri planiores. Nondum constat pro certo, num, quoque aliis modis, oculus accommodet semet ad varias distantias rerum quas contemplatur: vero nonnulli putarunt hunc esse usum ciliarium*

in such a way, that, if light be admitted into one eye, the pupils of both are simultaneously contracted.

243. The pupil is likewise contracted if we view any thing nearer than the usual limits of distinct vision; which appears to be for this purpose; (namely) that the superfluous and most oblique rays, and the rays which the refracting powers of the eye could scarcely collect into a proper focus, may be excluded; there seems to be the same reason for the pupil being very much dilated in infants and young persons, but is generally more contracted in old people, whose eyes are usually more flattened. There is nothing certain known, as to whether the eye can accommodate itself in any other way to the different distances of objects

nempe ut *lentem* a solita sede dimoveant, et longius a *retina* trahant, quo magis refringantur radii, priusquam in eam incidant. Certissimum autem est, oculum, vel his viribus tum musculi qui pupillam regit, tum *processuum ciliarium*, vel aliis minus cognitis, quoddammodo mutari, et ad varias rerum quas contemplatur distantias, intra certos limites, accommodari.

processuum; nempe ut dimoveant lentem a solitá sede, et trahant (illam i. e. lentem) longiùs a retiná, quo radii magis refringantur, priusquam incidant in eam (scilicet retinam). Autem est certissimum, oculum mutari quodammodo vel his viribus, tum musculi qui regit pupillam, tum (viribus) ciliarium processuum, vel aliis (viribus) minùs cognitis, et accommodari ad varias distantias rerum quas contemplatur, intra certos limites.

244. Diu multumque disputatum est inter *physiologos*, *mathematicos*, *metaphysicos*, quo pacto fiat, ut, ab inversa super *retinam* depicta imagine, rem ipsam rectam videamus; et cur a

244. *Est disputatum diù que multum inter physiologos, mathematicos, (et) metaphysicos, quo pacto fiat, ut videamus rem ipsam erectam, ab inversá imagine depictá super retinam; et cur una*

which it contemplates; but some have supposed that this is the use of the ciliary processes: namely, that they remove the lens from its usual situation, and pull it further from the retina, so that the rays may be more refracted before they fall upon it. Nevertheless, it is very certain, that the eye is altered in some way, either by these powers, by those both of the muscle which governs the pupil, and of the ciliary processes, or by others less known, and that it is accommodated to the different distances of objects which it contemplates, within certain limits.

244. It has long been a subject of much dispute amongst physiologists, mathematicians, and metaphysicians, how it occurs, that we see an object erect, from an inverted image painted upon the retina, and why one object only is seen

duplice imagine, una nimirum in utroque oculo expressa, una tantum res spectetur.

245. Res ipsæ parum utiles vetant medicum in hanc arenam descendere, ubi tot magni nominis viri non sine laude semet exercuerunt. Scire tamen juvat, ad hoc tandem ventum esse, simplicem de hac re latam esse a Natura legem, scilicet, ut omne visibile spectetur secundum directionem rectæ lineæ a puncto *retinæ*, super quod depicta fuerit ejus imago, per centrum oculi transeuntis. Nondum prolata sunt experimenta neque argumenta, quæ ostendant dictam directionem, mathematica accuratione, esse veram: sed neque error ullus, vel levis-

res tantùm spectetur, a duplice imagine, nimirum (ab) unâ expressâ in utroque oculo.

245. *Ipsæ res parum utiles vetant medicum descendere in hanc arenam, ubi tot viri magni nominis exercuerunt semet non sine laude. Tamen juvat scire, tandem ventum esse ad hoc, scilicet, ut omne visibile spectetur secundum directionem rectæ lineæ a puncto retinæ, super quod imago ejus fuerit depicta, transeuntis per centrum oculi. Nondum experimenta neque argumenta sunt prolata, quæ ostendant dictam directionem esse veram, mathematicâ accuratione; sed neque ullus, neque levissimus error est detectus in hâc re. Igitur oportet (ut) concluda-*

from the double image—that is, from one expressed in each eye.

245. Such subjects being in themselves of little use, forbid the medical man entering into such a field of dispute, where so many men of great repute have exercised themselves with no slight degree of honour. It is, however, useful to know, that it is at last concluded, that every visible thing is seen in the direction of a straight line from the point of the retina, upon which was painted the image of the object passing through the centre of the eye. Neither experiments, nor arguments, have yet been brought forward to prove that the said direction is true, with mathematical accuracy; but there is not any, even the slightest error,

simus, in hac re detectus est. Oportet igitur ex jam institutis experimentis concludamus, directionem, qua punctum visibile spectatur, esse vel hanc, vel huic quam proximam. Homo igitur sic constitutus, hujusmodi nimirum videndi lege lata, si imago erecta fuisset, rem ipsam inversam vidisset; et pari ratione, quæ inversæ depinguntur, easdem erectas videt.

246. Nec verum est, quod primo intuitu simplicius et clarius videretur, rem spectari secundum verum quem habet situm et directionem; vel secundum directionem radiorum lucis, aut in *corneam* aut in *retinam* incidentium: facili enim experimento spectari potest cor-

mus ex experimentis jam institutis, directionem, quâ (directione) visibile punctum spectatur esse vel hanc, vel quam proximam huic. Igitur homo sic constitutus, nimirum lege latâ videndi hujusmodi, vidisset, ipsam rem inversam, si imago fuisset erecta; et par ratione, videt, easdem erectas, quæ depinguntur inversæ.

246. *Nec est verum quod videretur primo intuitû simplicius et clarius, rem spectari secundum verum situm et directionem quem habet: vel secundum directionem radiorum lucis, incidentium aut in corneam aut in retinam; enim facili experimento omne corpus potest*

which has been detected, on this head. Therefore we must conclude from the experiments already performed, that the direction in which a visible point is seen, is either of this kind, or very nearly allied to it. Man thus constituted, that is, according to the law of vision already laid down, would have seen the object itself inverted, if the image had been erect; and for the same reason he sees those objects erect which are painted in an inverted direction.

246. It is not true, although at first sight it might appear more clear and simple, that the object is seen according to its true situation and direction; or according to the direction of the rays of light striking either upon the cornea, or the retina: for by an easy experiment, any body may be

pus omne, loco non suo, vel pluribus locis eodem tempore; et radii lucis a puncto quovis dimanantes, vel quum primum in oculum incidunt, vel postquam, a variis humoribus refracti, ad fundum oculi perveniunt, tot diversas directiones habent, ut si visus inde penderet, omne visibile, variis eodem tempore directionibus spectatum, multiplex et confusum videretur.

247. Quæstio de simplice visu a duplice imagine, parum accurate primo proposita, postea ad majorem accurationem redacta est: neque profecto verum est, visum in homine sanissimo semper esse simplicem. Simplex vel duplex est, prout oculi varia ratione in rem quam spectamus con-

spectari, loco non suo, vel pluribus locis eodem tempore; et radii lucis dimanantes a quovis puncto, habent tot diversas directiones, vel quum primum incidunt in oculum, vel postquam perveniunt ad fundum oculi, refracti a variis humoribus, ut, si visus inde penderet, omne visibile, spectatum variis directionibus eodem tempore, videretur multiplex et confusum.

247. *Quæstio de simplice visú a duplice imagine, primo proposita parum accuratè, est postea redacta ad majorem accurationem; neque profectò est verum, visum esse semper simplicem in sanissimo homine. (Visus) est simplex vel duplex, prout oculi fuerint conversi variâ ratione in rem quam spec-*

seen out of its place, or in many places at the same time; and the rays of light emanating from any point possess so many directions, either at the time that they first fall upon the eye, or after they arrive at the bottom of the eye, having been refracted by the various humours, that, if vision depended upon this, every visible object seen in different directions at the same time, would appear multiplied and confused.

247. The question concerning simple vision from a double image, at first explained with little accuracy, has since been reduced to a greater degree of precision; nor, indeed, is it true, that sight is always single in a perfectly healthy person. Sight is either single or double, according as the eyes are

versi fuerint. Si axes binorum oculorum in idem punctum directi fuerint, duplex imago ejus puncti, una nimirum in centro utriusque *retinæ* expressa, simplicem visum efficit. Porro, res quotquot pari ab oculo distantia ad utrumque latus talis puncti sitæ sunt, simplices simul spectantur: quarum scilicet imagines super *retinam* utramque depictæ, similem cum centro ejus comparatum situm habent. Centra igitur binarum *retinarum*, et puncta in iis quæ similem quod ad centrum situm habent, supra, nempe, vel infra, vel dextrorsum, vel sinistrorsum, consentire dicuntur, vel simplicem visum dare. Res vero propius vel remotius ab oculo positæ, quam

tamus. Si axes binorum oculorum fuerint conversi in idem punctum, duplex imago ejus, nimirum una (imago) expressa in centro utriusque retinæ, efficit simplicem visum. Porrò, quotquot res sunt sitæ pari distantiá oculo ad utrumque latus talis puncti, simul spectantur simplices; scilicet (illa res) quarum imagines depictæ super utramque retinam, habent similem situm comparatum cum centro ejus. Igitur centra binarum retinarum, et puncta in iis, quæ habent similem situm quod ad centrum, nempe supra, vel infra, vel dextrorsum vel sinistrorsum, dicuntur consentere vel dare simplicem visum. Verò res positæ propiùs, vel remotiùs oculo, quam punctum,

turned in a different manner towards the object we are viewing. If the axes of both eyes are directed towards the same point, the double image of it, that is, the one expressed in the centre of each retina, produces single vision. Moreover, all the objects situated at an equal distance from the eye, on each side of such point, are at the same time seen single; that is to say, the images of the objects painted on each retina, have the same situation relatively to its centre. Therefore, the centres of the two retinæ, and the points in them which possess the same situation in relation to the centre, namely above, or below, or to the right or left, are said to correspond, or produce single vision. But objects placed nearer, or further from the eye, than the point to

punctum in quod axes oculorum conveniunt, simul cum illo spectari possunt, earumque duplex visus est. Facile ostenditur imagines earum rerum partes *retinæ* utriusque occupare, quæ dissimiliter quod ad centrum ponuntur: nempe, in dextra parte alterius oculi, in sinistra alterius, depingi. Partes igitur *retinarum*, dissimiliter quod ad centra positæ, non consentiunt; hoc est, duplicem ejusdem rei, cujus super utramque imago depicta fuerit, visum efficiunt.

248. Varietates quædam, seu vitia leviora hujus sensus, quæ vix morbosa habentur, sæpe observantur. *Myopes* dicuntur, qui visum

in quod (punctum) axes oculorum conveniunt, possunt spectari simul cum illo, que visus earum est duplex Ostenditur facilè imagines earum rerum occupare partes utriusque retinæ, quæ ponuntur dissimiliter quod ad centrum: nempe, depingi in dextrâ parte alterius oculi, in sinistrâ (parte) alterius. Igitur partes retinarum, positæ dissimiliter quod ad centra, non consentiunt: hoc est, efficiunt duplicem visum ejusdem rei, imago cujus fuerit depicta super utramque.

248. *Quædam varietates, seu leviora vitia hujus sensús, quæ vix habentur morbosa, sæpe observantur. (Illi) dicuntur Myopes,*[35] *qui habent*

which the axes of the eyes are directed, may be seen simultaneously, and the vision resulting from them is single. It is easily shown that the images of those objects occupy parts of each retina, which are situated differently in regard to its centre; that is to say, they are painted on the right side of one eye, and on the left of the other. Therefore, the parts of the retina, situated dissimilarly in respect to its centre, do not correspond: they produce double vision of the object, the image of which was painted upon them.

248. Certain slight disorders of this sense, which are scarcely to be considered diseases, are often observed. Those

35. *Myopes*; this word is derived from two Greek words, μύω, to wink, and ὤψ, the eye, which is again derived from ἔπτομαι I see.

brevem habent, scilicet, qui nil clare et accurate vident, nisi proxime ad oculum admoveantur. Hoc fit propter radios lucis nimis refractos, in *focum* nimis cito collectos, et iterum a *foco* dimanantes, priusquam ad *retinam* perveniant; quo fit ut indistinctam super eam imaginem depingant. Causa hujus vitii frequentissima est, nimia totius oculi vel humoris ejus cujusdam convexitas, veluti *corneæ* nimis prominentis, &c. quæ radios lucis per oculum transeuntes nimis refringit. Incommodum, junioribus familiare, dum senescunt, aliquando, ut fertur, sublevatur: quod tamen minime perpetuum est. Quum primo levius hujusmodi vitium observatur,

brevem visum, scilicet, qui vident nil accuratè et clarè, nisi admoveantur proxime ad oculum. Hoc fit propter radios lucis nimis refractos, collectos nimis cito in focum, et iterum dimanantes a foco, priusquam perveniant ad retinam; quo fit ut depingant indistinctam imaginem super eam. Frequentissima causa hujus vitii est, nimia convexitas totius oculi, vel cujusdam humoris ejus, veluti corneæ nimis prominentis, &c. quæ nimis refringit radios lucis transeuntes per oculum. (Hoc) incommodum, familiare junioribus, aliquando sublevatur, ut fertur, dum senescunt: quod tamen est minimè perpetuum. Quum levius vitium hujusmodi primo observatur, po-

persons are called myopes, or near-sighted, who see nothing accurately or clearly, unless it be brought close to the eye. This occurs from the rays of light being too much refracted, too soon collected into a focus, and again diverging from that focus, before they reach the retina; hence it is, that they paint an indistinct image upon it. A most common cause of this disorder is too great a convexity of the whole eye, or of either of its humours; as the cornea being too prominent, and too powerfully refracting the rays of light in their passage through the eye. This inconvenience, common to young people, is said sometimes to be alleviated in old age: this, however, is by no means a constant occurrence. When a disorder of this kind is first observed, it may in some degree be overcome by a habit of looking at distant

consuetudine res remotas contemplandi, oculosque a valde minutis et vicinis rebus cohibendi, quodammodo vinci, non secus ac contrario usu idem vitium acquiri, potest: nimirum, quia oculus quodammodo ad rerum, quas contemplatur, distantias sese accomodat (243). Vitrum concavum, quod radios plus facit dimanare priusquam in oculum incidant, simplicissimum est, et certissimum *Myopibus* auxilium.

249. *Presbyopes* vocantur, qui visum longum habent, vicinarum rerum confusum, remotiorum satis distinctum. Contrarias hoc vitium ac alterum agnoscit causas; oculum imprimis

test quodammodo vinci consuetudine contemplandi res remotas, que cohibendi oculos a valde minutis et vicinis rebus, non secus ac idem vitium (potest) acquiri contrario usú: nimirum, quia oculus quodammodo accommodat sese ad distantias rerum, quas contemplatur (243). *Concavum vitrum, quod facit radios plus dimanare priusquam incidant in oculum, est simplicissimum et certissimùm auxilium Myopibus.*

249. *(Illi) vocantur Presbyopes,*[36] *qui habent longum visum, confusum (visum) vicinarum rerum, (sed) satis distinctum (visum) remotiorum rerum. Hoc ac alterum vitium ag-*

objects, and keeping the eyes from those which are small and near, and in the same way the same disorder may be acquired, by an opposite use of it; for the eye accommodates itself, in a manner, to the distances of the objects which it contemplates (243). A concave glass, which makes the rays diverge more, before they fall on the eye, is the most simple and most certain auxiliary which can be afforded to the near-sighted.

249. They are called Presbyopes, who are long-sighted, whose vision of things that are near is indistinct, but sufficiently distinct of more distant objects.—This is subject to different causes from those of the former: amongst them is,

---

36. *Presbyopes*, derived from πρέσβυς, old, and ὤψ, the eye, on account of occurring most frequently to old persons.

nimis planum, quo spatium refringendis radiis non datur; hinc senibus, etiam iis qui florentibus annis bene viderant, malum familiare, ratione haud obscura, usu vitri convexi sublevari solet.

noscit varias causas: imprimis (unam causam, scilicet) oculum nimis planum, quo spatium non datur refringendis radiis: hinc, (hoc) malum familiare senibus, etiam iis qui bene viderant florentibus annis solet sublevari usû convexi vitri, haud obscurâ ratione.

250. *Hemeralopes* dicuntur, qui interdiu tantum, scilicet in vivada luce, vident; crepusculo vero, aut nocte, vel per lunam, vel per lucernas, pene vel penitus cæci sunt. Hujusmodi vitium, in quibusdam exemplis, oriri visum est a pupilla nimis contracta et rigida, neque sat lucis debilioris in oculum admittente;

250. *(Illi homines) dicuntur Hemeralopes,*[37] *qui vident tantùm interdiu, scilicet in vividâ luce; vero sunt penè vel penitùs cæci, crepusculo, aut nocte, vel per lunam, vel per lucernas. Vitiam hujusmodi est visum oriri, in quibusdam exemplis a nimis contractâ et rigidâ pupillâ, neque admittente sat debilioris lucis in oculum: au-*

particularly, an eye too flat; so that sufficient space is not afforded for refracting the rays; hence this disorder, which is so common to old persons, even in those whose sight had been good in the vigour of their age, is usually alleviated by the use of a convex glass, for reasons which are well known.

250. Those persons are called Hemeralopes, who see only during day-light, that is, by a powerful light; and they are almost or completely blind by twilight, by night, or moon-light, or by candle-light. A disorder of this kind has appeared to arise in some cases, from a too contracted and fixed pupil, not admitting sufficient of that fainter light into the eye; it has appeared to arise in others from loss of sensation

37. *Hemeralopes*, derived from ἡμέρα, a day, and ὤψ, an eye.

in aliis autem, a deficiente ipsius retinæ sensu; et aliis magis adhuc obscuris causis, veluti cum multos homines eodem tempore et loco prehenderit, quod interdum observatum est.

251. *Nyctalopes* dicuntur, qui noctu quam interdiu, hoc est, luce valde debili, quam vividiore, melius vident: rarum hominibus vitii genus, *retinæ* nimis sentienti, pupillæ nimis patulæ, ad debitam contractionem minus valenti, imputandum. Hujusmodi incommodum, sed leve et fugax, sanissimi etiam patiuntur, qui postquam diu in tenebris versati sunt, denuo ad lucem subito prodeunt.

tem (visum est oriri) in aliis (exemplis) a deficiente sensu ipsius retinæ; et causis adhuc magis obscuris, veluti cum prehenderit multos eodem tempore et loco, quod est observatum interdum.

251. *(Illi) dicuntur Nyctalopes,*[38] *qui melius vident noctu quam interdiu, hoc est, luce valde debili, quam vividiore (luce): (hoc) genus vitii rarum hominibus, (est) imputandum nimis sentienti retinæ, nimis patulæ pupillæ, minùs valenti ad debitam contractionem. Etiam sanissimi (homines) patiuntur incommodum hujusmodi, sed leve et fugax, qui postquam sunt diu versati in tenebris, denuò subito prodeunt ad lucem.*

of the retina itself, and from other causes still more obscure; as when it seizes many persons at the same time, which has sometimes been observed.

251. Those persons are called Nyctalopes, who see better by night than by day; that is, better by a weak, than by a more vivid light: this kind of disorder which is uncommon in man, is to be imputed to a too sensitive retina, to a pupil too much dilated, and less competent to its proper contraction. Even the most healthy persons are subject to inconvenience of this kind, which is slight and not permanent, who are long engaged in some dark place, and at length are exposed to a full light.

---

38. *Nyctalopes*, derived from νὺξ, the night, and ὤψ, the eye.

252. Sublinitur totius oculi interna superficies pigmento nigro, quod ad *choroideam* tunicam et *ligamenta ciliaria*, pertinet; hoc fortasse consilio, ut oculus perfectissima camera obscura fiat, et imago super *retinam* depicta accuratior evadat, nullis radiis reflexis corrupta. Constat tamen miseros esse quosdam, albos Æthiopes vulgo dictos, quibus *choroidea* rubra, non secus ac cunicilis albis, data est. Homines vero tali *choroidea* instructi interdiu parum vel nihil vident, noctu melius.

252. *Interna superficies totius oculi sublinitur nigro pigmento, quod pertinet ad choroideam tunicam et ad ciliaria ligamenta: fortasse hoc consilio, ut oculus fiat perfectissima obscura camera, corrupta nullis reflexis radiis. Tamen constat esse quosdam miseros, vulgo dictos albos Æthiopes, quibus rubra choroidea est data, non secus ac (est data) albis cuniculis. Verò homines instructi tali choroidea vident parùm vel nihil interdiu (sed vident) melius noctu.*

253. Animalia vero, quæ sub nocte prædam quærunt, genus felis, bubo, et similia, *chroideam* habent coloratam, splendentem, quæ radios lucis bene reflectit. Hoc

253. *Verò animalia, quæ quærunt prædam sub nocte, (scilicet), genus felis, bubo, et similia, habent coloratam, splendentem choroideam, quæ bene reflectit radios lucis.*

252. The inner surface of the whole eye is smeared over, with the pigmentum nigrum, or black pigment, which pertains to the choroid coat and ciliary processes; perhaps with the intention, that the eye may become a most perfect camera obscura, which is corrupted by no reflected rays. Nevertheless, it is evident that certain unfortunate creatures, commonly called white Æthiopians, or Albinos, are supplied with a red choroid coat, in the same way as white rabbits. Persons supplied with such a choroid coat, see little or nothing during the day, but (far) better by night.

253. Animals that seek their prey by night, such as the cat and owl tribe, and the like, have a coloured shining choroid coat, which powerfully reflects the rays of light.

modo, ut quidam putant, visum parum distinctum, sed quæ ad prædam captandam sufficiat, etiam in tenebris, habent; quod tamen nondum bene explicatum est. His quoque animalibus pupilla datur mobilissima, a tenuissima vixque visibili rima, in magnum circulum, secundum lumen quod est, sese dilatans, et *retina*, ut videtur, valde sentiens. Quædam ex his animalibus, albi Æthiopis instar, fulgente sole minus vident. An omnibus par vitium est? Non videtur. An arctissima pupillæ contractione corrigitur, qua parum lucis in oculum admittitur? An credibile est plus minusve reflectere lucis *choroideam* ipsam, prout tali auxilio opus

Hoc modo, habent, ut quidam putant, parum distinctum visum, sed qui sufficiat ad captandam prædam, etiam (in) tenebris: quod tamen est nondum bene explicatum. Porro mobilissima pupilla datur his, dilatans sese, a tenuissimâ que vix visibile rimâ, in magnum circulum, secundum lumen quod est, et valdè sentiens retina, ut videtur, (datur). Quædam ex his animalibus, instar albi Æthiopis, minùs vident fulgente sole. An est par vitium omnibus? Non videtur. An (visus) corrigitur arctissimâ contractione pupillæ, quâ parum lucis admittitur in oculum? An est credibile choroideam ipsam reflectere plus ve minus lucis, prout sit opus tali auxilio,

In this way, some think they have rather indistinct vision, but sufficient to catch their prey, even in the dark: this, however, has not been well explained. They have likewise a very moveable pupil, which dilates itself from the thinnest and nearly invisible slit, into a large circle, according to the quantity of light (admitted), and as it appears (also) a very sentient retina. Some of these animals, like the white Æthiopian, see less perfectly by sunshine. Is there an equal defect in all of them? It does not appear so. Is the sight corrected by the very close contraction of the pupil, so that little light is admitted into the eye?—Or is it to be believed, that the choroid itself reflects more or less light, according as there is necessity for such assistance; and

sit, et facultatem illam lucem reflectendi pendere iterum a sanguinis in membranam vasculorum plenam influxu, quem animal quodammodo regat? Validior sanguinis motus, et ideo varii animi affectus, oculos omnium animalium, et hominis ipsius, splendescere facit: deficiens hebetat; penitus demum cessans eorum splendorem prorsus extinguit.

et illam facultatem reflectendi lucem, pendere iterum ab influxû sanguinis in membranam plenam vasculorum, quem (influxum) animal quodammodo regat? Validior motus sanguinis, et ideo varii affectus animi, facit splendescere oculos omnium animalium, et hominis ipsius; (motus) deficiens hebetat; (et motus sanguinis) demum cessans prorsùs extinguit splendorem eorum.

254. Multis et gravibus vitiis obnoxius est visus. Acuitur interdum ultra modum, ita ut æger vel nihil distincte videat, vel non sine magno dolore, pari ratione ac alii sensus, a generali corporis habitu nimis sentiente, a singulari cerebri statu, phreniticis, vel etiam

254. *Visus est obnoxius multis et gravibus vitiis. Interdum acuitur ultra modum, ita ut æger vel videat nihil distinctè vel non sine magno dolore, pari ratione ac alii sensus, (scilicet) a generali nimis sentiente habitû corporis, a singulari statû cerebri, familiari*

again, that that faculty of reflecting light depends upon the influx of blood into the vascular membrane, which the animal governs in some way? A more active motion of the blood, and, consequently, various affections of the mind, give brightness to the eyes of all animals, and of man himself: when the circulation is languid it dulls them; and when ceasing at last, it utterly destroys their splendour.

254. The sense of sight is obnoxious to many severe disorders.—Sometimes it is rendered immoderately acute, so that a patient either sees nothing distinctly, or with great pain, in the same manner as the other senses; namely, from a too sensitive general habit of body, or from the peculiar state of the brain, such as is common to phrenitic patients, or

aliis febricantibus, familiari, veluti inflammatione cerebri vel ejus membranarum; sæpius vero a conditione ipsius oculi, lucis impatientes fimus. Inflammatio tunicæ *adnatæ*, et partis anterioris *scleroticæ*, ad posteriores partes oculi serpere solet; et ideo ad *chroideam*, et *retinam* ipsam; hinc lucis impatientia, dolor, magnaque irritatio, delirium nonnunquam inducens vel augens.

255. Obtunditur sæpe visus, vel plane aboletur, ipsa ætate, cum ob oculum planiorem factum, aquoso humore non bene suppleto, et *cornea*, et *lente*, vel vitreo humore marcescentibus; tum quoque propter *corneam* siccam et obscuram factam, quod languenti sanguinis

phreniticis, vel etiam aliis febricitantibus, veluti in inflammatione cerebri vel membranarum ejus: verò fimus impatientes lucis a conditione oculi ipsius. Inflammatio tunicæ adnatæ et anterioris partis scleroticæ, solet serpere ad posteriores partes oculi; et ideo ad choroideam, et retinam ipsam: hinc impatientia lucis, dolor, que magna irritatio, nonnunquam inducens vel augens delirium.

255. *Visus sæpe obtunditur, vel plane aboletur, ætate ipsa, cum ob oculum factum planiorem, humore aquoso non bene suppleto, et corneâ, et lente, vel vitreo humore marcescentibus; tum quoque propter corneam factam siccam et obscuram, quod est imputandum lan-*

those feverish in any other manner, as in inflammation of the brain, or its membranes; but we become intolerant of light, from the state of the eye itself. Inflammation of the conjunctiva and front part of the sclerotic, usually creeps along to the posterior parts of the eye; and, therefore, to the choroid coat and the retina itself: hence, the intolerance of light, the pain, and excessive irritation, which sometimes brings on delirium.

255. The sight is often weakened or completely destroyed by age itself, both on account of the eye becoming flatter by the aqueous humour not being well supplied, and the cornea, lens, or vitreous humour wasting away; as well as on account of the cornea becoming dry and opaque, which

motui imputandum est, et plurimis vasis minoribus obstructis, conclusis, excæcatis; tum propter *lentem* flavescentem, instar electri factam, et ipsam *retinam* minus sentientem. Nam omnem sensum senectus minuit.

256. Interdum visus prorsus aboletur, cerebro, nervo *optico*, vel *retina*, variis modis læsis, salva ipsius oculi fabrica. Hujusmodi vitium *amaurosis*, vel *gutta serena* vocatur: dilatata et immota pupilla, humoribus pellucidis manentibus, facile distinguendum; compressioni, congestioni sanguinis, stupori nervi fere tribuendum. Si pars tantum retinæ torpet, maculæ nigræ in rebus quas spectamus

guenti motui sanguinis, et plurimis minoribus vasis obstructis, conclusis (et) excæcatis; tum propter lentem, flavescentem, factam instar electri, et (propter) retinam ipsam minus sentientem. Nam senectus minuit omnem sensum.

256. *Interdum visus prorsus aboletur, cerebro, nervo optico vel retinâ, læsis variis modis, fabricâ oculi ipsius salvâ. Vitium hujusmodi vocatur amaurosis, vel gutta serena; facilè distinguendum, dilatatâ et immotâ pupillâ, humoribus manentibus pellucidis; fere tribuendum compressioni, congestioni sanguinis, (vel) stupori nervi. Si tantùm pars retinæ torpet, nigræ maculæ conspiciuntur in rebus, quas*

(circumstance) is to be imputed to a languid motion of the blood, and to many of the little vesssels being obstructed, closed, and choaked up: also, on account of the lens becoming yellow, like amber, and the retina itself being less sensitive, old age impairs every kind of sensation.

256. Sometimes the sight is quite lost, by the optic nerve or retina being injured in various ways, (yet) with the structure of the eye sound. A disease of this kind is called amaurosis, or gutta serena, easily to be distinguished by the dilated and fixed pupil, (and) by the humours of the eye remaining transparent; (it) is generally to be attributed to compression, sanguineous congestion, or stupor of the nerve. If part only of the retina be torpid, black specks are seen in the objects we look at; and muscæ volitantes, or flies dancing

conspiciuntur, et muscæ ante oculos volitantes, signum in febribus frequens, sed pessimum, et vix non lethale.

257. Visus porro haud raro aboletur partium quavis, per quas radii transire et refringi debent, obscura aut opaca facta; veluti si *cornea* maculis obsessa luci impervia evaserit; vel humor aquosus sanguine, sero, pure, corruptus fuerit; vel si *lens*, quod sæpe accidit, et *cataracta* dicitur, fuscum colorem adepta, vel humor vitreus simili modo corruptus, vel omnes denique oculi humores inflammatione, suppuratione, soluti, confusi, mixti, lucem vel non transmittant, vel parcius et inæqualiter transire sinant. Quo fit ut vel nulla, vel ob-

spectamus, et muscæ volitantes ante oculum, frequens sed pessimum, et vix non lethale signum in febribus.

257. *Porro visus haud raro aboletur quávis partium factá obscurá aut opacá, per quas (partes) radii debent transire et refringi: veluti si cornea evaserit impervia luci, obsessa maculis: vel aquosus humor fuerit corruptus sanguine, sero, (vel) pure: vel si lens adepta fuscum colorem, quod sæpe accidit, et dicitur cataracta, vel vitreus humor corruptas simili modo, vel denique omnes humores oculi, soluti, confusi, (vel) mixti inflammatione, (vel) suppuratione, vel non transmittant lucem, vel sinant (illam) transire parcius et inæqualiter.*

before the eyes, are a frequent, but very bad and nearly fatal symptom in fevers.

257. Moreover, the sight is not unfrequently lost, by obscuration or opacity of some of the parts, through which the rays ought to pass and be refracted: for instance, if the cornea becomes impervious to light, being crowded with specks; or the aqueous humour be corrupted with blood, serum, or pus; or if the lens has acquired a dark colour, which often happens, and is called cataract; or the vitreous humour be diseased in a similar manner; or, finally, all the humours of the eye being dissolved, confused, or mixed up together, either transmit no light, or allow it to pass more sparingly and unequally. Hence, either none, or an ob-

scura, distorta, imperfecta, et male colorata imago super *retinam* depingatur.

258. Impedimenta visus, quod ad oculum, externa, vitia scilicet palpebrarum partiumque vicinarum tumentium, concrescentium, inflammatarum, nulla explicatione egent: neque profecto ipsius sensus vitium est, si quis non viderit, nulla luce ad oculum admissa.

259. Depravatur visus aliquando, et res colore non suo, vel etiam, quod rarius accidit, figura et situ alienis, spectantur. Hoc fit si humores insolito colore tincti fuerint, ut in morbo regio fertur accidere, quod tamen valde dubium est, vel a sanguine ex propriis vasis

Quo fit, ut vel nulla, vel obscura, distorta, imperfecta, et male colorata imago depingatur super retinam.

258. *Externa impedimenta visús, quod ad oculum, scilicet vitia palpebrarum que vicinarum partium, tumentium, concrescentum, (vel) inflammatarum egent nullá explicatione: neque profectò est vitium ipsius sensús, si quis non viderit, nullá luce admissá ad oculum.*

259. *Aliquando visus depravatur, et res spectantur colore non suo, vel alienis figurá et sitú quod rariùs accidit. Hoc fit, si humores fuerint tincti insolito colore, ut fertur accidere in regio morbo, (quod tamen est valde dubium) vel a sanguine elapso ex propriis*

scure, distorted, imperfect, and badly coloured image is painted upon the retina.

258. The external obstructions of vision, in regard to the eye, such as diseases of the palpebræ and neighbouring parts, swollen, growing together, or inflamed, require no definition: nor, indeed, is there any disorder of the sense of sight, if a person does not see, when no light is admitted into the eye.

259. Vision is sometimes depraved, and objects are seen with colours not their own, or with other forms and situations, which seldom occurs. This takes place, if the humours be tinged with an unusual colour, as is said to occur in jaundice (which, however, is very doubtful); or from blood

elapso et cum aquoso humore mixto. Mira depravatio, vel defectus visus constans et perpetuus, in hominibus alioquin sanissimis, et bene videntibus, non semel observatus est; nempe, ut certos colores, viridem, exempli causa, a rubro, distinguere nequeant. Alia depravatio est, quum, nulla ad oculum admissa luce, scintillas, guttulas flammeas, aureas, colores varios conspicimus. Leve plerumque et fugax mali genus, constitutione corporis valde sentiente et mobili præditis familiare, a levi, ut videtur, impulsu in *retinam* oritur, arteriarum imprimis vehementius solito aut inordinante micantium : ab ipso digito oculum premente, clausis palpebris, circulus

vasis, et mixto cum aquoso humore. Mira depravatio, vel constans et perpetuus defectus visús, est observatus non semel, in hominibus alioquin sanissimis et bene videntibus; nempe, ut nequeant distinguere certos colores, viridem causá exempli, a rubro. Alia depravatio est, quum conspicimus, scintillas aureas flammeas guttulas, (vel) varios colores, nullá luce admissa ad oculum. Plerumque leve, et fugax genus mali familiare, (illis) præditis valde sentiente et mobili constitutione corporis, oritur ut videtur a levi impulsú arteriarum in retinam, imprimis micantium vehementiùs solito, aut inordinate; flammeus circulus conspicitur, ab ipso digito premente ocu-

having escaped from its proper vessels, and mixed up with the aqueous humour. A surprising depravation, or constant and permanent defect of vision, is occasionally observed in persons in other respects healthy, and whose sight is good : namely, they cannot distinguish certain colours, for instance, green from red. There is another depravation, when we see sparks, gold-coloured fiery drops, or various colours, when no light is admitted into the eye. A slight, for the most part, and fleeting kind of disorder, common to persons endowed with a very sentient and mobile constitution, arises from a slight impulse of the arteries upon the retina, especially beating more powerfully than usual, or irregularly : a fiery circle is seen, by pressing a finger upon the eye, with

flammeus conspicitur. Par fortasse ratio est scintillæ, quam vident aliquando morbo comitiali laborantes, in immensum et splendidum jubar crescentem mox antequam convulsi corruant. Simile jubar se vidisse testantur homines, ad vitam reduces postquam strangulati, aut sub aquis mersi fuissent. Cohibita nimirum respiratione, venæ capitis sanguine turgentes, totum cerebrum, partesque nervosas quæ in capite sunt, feriunt, et comprimunt. Observantur porro istiusmodi scintillæ, haud secundo omine, ab iis quibus febre laborantibus phrenitis aut ferox delirium imminent; tum quoque ab iis quibus graviora capitis mala, paralysis, *apoplexia*, *epilepsia*,

lum, clausis palpebris. Fortasse est par ratio scintillæ, quam (illi) laborantes comitiali morbo aliquando vident, crescentem in immensum et splendidum jubar, mox antequam corruant convulsi. Homines testantur se vidisse simile jubar, (cum) reduces ad vitam postquam fuerint strangulati, aut (fuerint) mersi sub aquis. Nimirum respiratione cohibitá, venæ capitis turgentes sanguine, feriunt et comprimunt totum cerebrum, que nervosas partes, quæ sunt in capite. Porro scintillæ istiusmodi observantur, haud secundo omine, ab iis laborantibus febre, quibus phrenitis aut ferox delirium imminent; tum quoque ab iis, quibus graviora mala capitis (scilicet) paralysis, apoplexia,

closed palpebræ. Perhaps there is the same reason for the spark which persons under an attack of epilepsy sometimes see, increasing to an immense and splendid beam, immediately before they fall into convulsions. Persons attest that they have seen a similar beam of light, when returning to life, after strangulation, or submersion in water. Respiration, indeed, being checked, the veins of the head, turgid with blood, strike and compress the whole brain and nervous parts within the head. Besides, sparks of that kind are observed as no favourable omen, by persons suffering from fever, or over whom phrenitis or violent delirium are impending, as well as by those in whom more important diseases of the head, as paralysis, apoplexy, or epilepsy, are at hand.

instant. An ipsis fibris nervosis *retinæ*, motum sponte concipientibus, perceptio lucis, ubi nulla lux est, recte tribuitur?

260. Visus distinctus, sed falsus, rerum visibilium nimirum quæ non sunt, quod genus vitii, utcunque mirum et explanatu difficile videatur, non valde rarum est, læso cerebro, insaniæ, delirio, non oculo ullo modo laboranti, imputari debet.

261. Frequens visus vitium est oculorum distortio, quæ *strabismus* apud medicos vocatur. Strabo est, qui axes oculorum præter solitum obliquos habet, neque ad idem punctum directos. Hinc visus imper-

epilepsia instant. An perceptio lucis ubi est nulla lux, recte tribuitur nervosis fibris ipsis retinæ, sponte concipientibus motum.

260. *Distinctus visus, sed falsus, nimirum visibilium rerum, quæ non sunt, quod genus vitii, utcunque videatur mirum et difficile explanatu, est non valde rarum, debet imputari læso cerebro, insaniæ, delirio, non oculo laboranti ullo modo.*

261. *Distortio oculorum, quæ vocatur strabismus apud medicos, est frequens vitium oculorum. (Ille) est strabo,*[39] *qui habet axes oculorum obliquos præter solitum, neque directos ad idem punctum. Hinc visus (est) imperfec-*

Is the perception of light, where there is no light, properly attributed to the nervous fibres of the retina, spontaneously receiving motion?

260. Distinct but false vision, of truly visible objects, which do not exist, is a kind of disorder, although it may be wonderful and difficult of explanation, is not very uncommon, and ought to be imputed to injury of the brain, insanity, or delirium, and not to the eye suffering in any other way.

261. A distortion of the eyes, which is called strabismus, amongst medical men, is a frequent disorder of the eyes. He is a strabo, who has the axes of the eyes unusually oblique, nor directed towards the same point. Hence the

---

39. *Strabo*, a squinting person; this word is derived from στρεβλος, distorted, and that again from στρεφω, I turn, or twist.

fectus, incertus, aliquando duplex, ideoque confusus, et sæpe ingens deformitas. Malum plerumque congenitum, haud raro conatibus, quos infans nondum conscius sui vitii, facit ad visum jucundiorem et accuratiorem reddendum, corrigitur. Idem, imitatione, quæ omnes homines, imprimis infantes, etiam inscios, multum regit, facillime discitur. Haud ita facile dediscitur.

262. Causam tanti vitii musculis oculorum sæpissime inesse verisimile est, qui male conformati, vel paralysi, rigiditate, contractione, corrupti, oculos ordinate et æqualiter regere nequeant.

263. Inducitur nonnun-

tus, incertus, aliquando duplex, que ideo confusus, et sæpe (est) ingens deformitas. (Hoc) malum plerumque congenitum, corrigitur haud raro, conatibus, quos infans nondum conscius sui vitii, facit ad reddendum visum jucundiorem et accuratiorem. Idem facillimè discitur imitatione, quæ multum regit omnes homines, imprimis infantes etiam inscios. Dediscitur haud ita facilè.

262. *Est verisimile causam tanti vitii sæpissime inesse musculis oculorum, qui (musculi) male conformati, vel corrupti paralysi, rigiditate (aut) contractione nequeant regere oculos ordinate et æqualiter.*

263. *Hoc vitium nonnun-*

sight is imperfect, uncertain, sometimes double, and therefore confused, and often there is great deformity. This evil, generally congenital, is frequently corrected by the attempts which an infant, unconscious of its defect, makes to render the vision more agreeable and accurate. This evil is acquired by imitation, which has considerable influence upon all persons, especially children, even ignorant of it.—It is unlearned not so easily.

262. It is probable that the cause of so great an evil, very often exists in the muscles of the eyes, which being badly formed, or attacked by paralysis, rigidity, or contraction, are unable to govern the eyes in a regular and equal manner.

263. This disorder is sometimes brought on by epilepsy,

quam hoc vitium *epilepsia*, in qua vehementissimæ omnium musculorum, et oculorum imprimis, convulsiones fiunt. Unde fortasse eorum distortiones et lacerationes, aut alia mala immedicabilia.

264. Morbos quosdam capitis, hydropem præsertim, nonnunquam comitatur. A magna vi capiti illata aliquando inducta est oculorum distortio; aliquando, sed rarissime, sine nota causa subito accedit.

265. Est vel alterius vel utriusque oculi: quorum distortio, major, minor, quaquaversum esse potest.

266. Sunt qui sibi persuaserunt malum nonnunquam oriri a vitio *retinarum*; veluti si solita earum puncta, centra scilicet, et

quam inducitur epilepsiá, in quá vehementissimæ convulsiones musculorum, et imprimis (illorum musculorum) oculorum fiunt, unde fortasse sunt distortiones aut lacerationes eorum, aut alia immedicabilia mala.

264. *Nonnunquam comitatur quosdam morbos capitis, præsertim hydropem. Aliquando distortio oculorum est inducta a magná vi illatá capiti; aliquando sed rarissimè subitò accedit sine notá causá.*

265. *Est vel alterius vel utriusque oculi; distortio quorum, potest esse major, (vel) minor, quaquaversum.*

266. *Sunt (homines) qui persuaserunt sibi (hoc) malum nonnunquam oriri a vitio retinarum; veluti si solita puncta earum, scilicet*

in which the most violent convulsions of the muscles, and especially of those of the eyes, take place; whence, perhaps, the distortions and lacerations of them, and other irremediable evils.

264. It sometimes accompanies certain diseases of the head, especially dropsy. Sometimes distortion of the eyes is brought on by great force applied to the head: sometimes, but very seldom, it has come on without any known cause.

265. This (disorder) is of either or both eyes; the distortion of which may be greater or less in any direction.

266. There are persons who have persuaded themselves, that this disorder sometimes arises from disorder of the retinæ: for instance, when their usual points, that is, their

similiter quod ad centra posita, non consentiunt: contorsio enim ibi erit, ne visus duplex fiat. Hæc quoque videtur esse ratio quod eadem horrendum in modum augeatur, cum strabo rem prope oculum admovet, ut contempletur. Vel si centrum alterius aut utriusque retinæ parum vel nihil sentiret, ut videret homo, necesse foret ut oculos contorqueret: sic, verbi gratia, si nervus *opticus* non oblique oculum adiisset, sed centrum retinæ occupasset, omnes vel strabones fuissemus, vel duplicem habuissemus visum.

centra, et similiter posita quod ad centra, non consentiunt: enim contorsio erit ibi, ne visus fiat duplex. Hæc quoque videtur esse ratio quod eadem augeatur in horrendum morbum, cum strabo admovet rem prope oculum, ut contempletur. Vel si centrum alterius aut utriusque retinæ sentiret parum vel nihil, foret necesse, ut homo contorqueret oculos, ut videret: sic, gratiá verbi, si opticus nervus non adiisset oculum obliquè sed occupasset centrum retinæ, omnes fuissemus strabones, vel habuissemus duplicem visum.

267. Sensum quendam molestissimum, quem vertiginem vocamns, medicis placuit ad visum referre, quamvis revera ad tactum,

267. *Placuit medicis referre ad visum, quendam molestissimum sensum, quem vocamus vertiginem, quamvis revera æque pertineat*

centres, and parts similarly situated relatively to their centres, do not correspond. This appears to be the reason why this is increased in a frightful manner, when a person who squints applies the object he is viewing near the eye. Or if the centre of the one or the other retina possessed little or no sensibility, it would be necessary that a person twisted his eyes, in order to see; so, for example, if the optic nerve had not entered the eye obliquely, but had occupied the centre of the retina, we should all have been subject to squinting, or have had double vision.

267. Some medical men have thought proper to refer to the sense of sight, a certain very troublesome sensation, which we call vertigo, although, in truth, it may as much

vel potius ad conscientiam, æque pertineat; neque enim in tenebris, neque clausis palpebris, malum fugatur.

268. Vertigo vocatur malum, siquando nosmetipsos et res vicinas, quamvis revera immotas, titubare, circumferri, tremere, vel ullo modo moveri, videre aut sentire credimus. Si gravior est vertigo, neque videre potest æger, præ caligine velut oculis obducta, neque firmiter incedere aut stare, quippe cui vires quæ artus regunt, deficiant. Vertiginem nausea solet comitari, alteraque alteram inducere.

269. Multorum et gravium quorundam morborum comes, et signum, et prænuncia observatur vertigo; *apoplexiæ, epilepsiæ,*

ad tactum, vel potiùs ad conscientiam: enim malum fugatur neque in tenebris, neque clausis palpebris.

268. *Malum vocatur vertigo, siquando credimus videre aut sentire nosmetipsos et res vicinas, quamvis revera remotas, titubare, circumferri aut tremere, vel moveri ullo modo. Si vertigo est gravior, æger neque potest videre, præ caligine velut obductá oculis, neque incedere aut stare firmiter, quippe cui vires quæ regunt artus, deficiant. Nausea solet comitari vertiginem, que altera (solet) inducere alteram.*

269. *Vertigo observatur comes, et signum, et prænuncia multorum et quorundam gravium morborum; (scilicet) apoplexiæ, epilepsiæ,*

appertain to touch, or rather to consciousness: for the disorder is not dispersed by darkness, nor by the palpebræ being closed.

268. That disorder is called vertigo, whenever we imagine that we see or feel that we ourselves and objects near us, although distant, stagger, are carried round, tremble, or are moved in any way. If vertigo be more intense, a patient can neither see, for the darkness, spread as it were over the eyes, nor walk or stand firmly, for, the powers which direct his limbs, fail. Nausea usually accompanies vertigo, and the one may bring on the other.

269. Vertigo is observed an attendant, symptom, and forerunner of many and certain severe diseases; such as

hysteriæ, sanguinis profluvii e naribus vel aliis partibus, mensium suppressorum, magna corporis plenitudinis, febrium, tum quas debilitas, tum quas auctus caput versus sanguinis impetus, comitatur. Vis quoque capiti illata, raro quæ ipsis oculis infertur vis, nisi quatenus totum caput afficiat, vertiginem inducit. Ingens et subita sanguinis aliorumque humorum jactura, debilitas, *syncope*, varii morbi intestinorum, ventriculi imprimis, venena multa in corpus admissa, *narcotica* præsertim, opium, et similia, et vinum, et omnis potus meracior, vertiginem inducere solent. Hinc

hysteriæ, profluvii sanguinis e naribus vel (ex) aliis partibus, suppressorum mensium, magnæ plenitudinis corporis, febrium, tum (earum) quas debilitas comitatur, tum (earum) quas auctus impetus sanguinis versus caput (comitatur). Quoque vis illata capiti, quæ vis raro infertur oculis ipsis, nisi quatenus afficiat totum caput, inducit vertiginem. Ingens et subita jactura sanguinis que aliorum humorum, debilitas, syncope, varii morbi intestinorum, imprimis ventriculi, multa venena admissa in corpus, præsertim narcotica, opium, et similia, et vinum, et omnis meracior[40] potus solent

apoplexy, epilepsy, hysteria, a discharge of blood from the nostrils, or other parts, suppressed menses, great fullness of the body, fevers, both such as are attended by great debility, and those attended with determination of blood to the head. Also force applied to the head, which force is seldom applied to the eye, except inasmuch as it affects the head generally, brings on vertigo. A great and sudden loss of blood and other fluids, debility, syncope, various diseases of the intestines, especially of the stomach, many poisons admitted into the body, particularly narcotics; (as) opium and the like, wine, and every kind of strong liquor, usually

40. *Meracior* literally means more pure, simple, unmixed or clean; but as it is so commonly connected with *vinum*, it is here intended to imply some strong, unmixed, spirituous liquor.

ebrietatis omnigenæ signum. Varii quoque motus inassuetis hominibus vertiginem creant: veluti rotatio capitis vel universi corporis, jactatio maritima, præsertim si navis parva, et mare turgidum, fuerint, et similia. In his et similibus exemplis, insoliti et inordinati motus sanguinis excitantur, et cum partibus nervosis quæ in capite sunt communicantur; vel hæ per consensum cum aliis partibus male affectæ, sensum confusum, quasi rotationis, dant.

inducere vertiginem. Hinc (vertigo est) signum omnigenæ ebrietatis. Quoque motus creant vertiginem (in) hominibus inassuetis: veluti rotatio capitis vel universi corporis, maritima jactatio, præsertim si navis fuerit parva, et mare (fuerit) turgidum, et similia. In his et similibus exemplis, insoliti et inordinati motus sanguinis excitantur, et communicantur cum nervosis partibus quæ sunt in capite; vel hæ male affectæ per consensum cum aliis partibus, dant confusum sensum, quasi rotationis.

270. Quin et ex animo, certa ratione affecto, veluti conspectu rotationis rapidæ, vel prærupti aquarum lapsus, vel præcipitii horrendi, vel etiam sine ullo visu a cogi-

270. *Quin vertigo aliquando oritur et ex animo, affecto certá ratione, veluti conspectú rapidæ rotationis, vel prærupti lapsús aquarum, vel horrendi præcipitii*

produce vertigo. Hence vertigo is a symptom of every kind of intoxication. Different motions produce vertigo in persons unaccustomed to them; as rotation of the head or body, tossing upon the sea, especially if the vessel be small and the sea rough, and the like.—In this, as in other instances, unusual and irregular motions of the blood are excited, and communicate with the nervous parts in the head; or these being disordered by sympathy with other parts, afford a confused sensation, like rotation.

270. Besides, vertigo sometimes arises from the mind being affected in a certain manner; as by the sight of rapid

tatione intensa et veloce, vertigo aliquando oritur.

271. Aliorum morborum plerumque comes et signum, nonnunquam tamen princeps vel solus vertigo morbus, per intervalla rediens, paulatim ingravescens, functiones animi pariter atque corporis impedit et labefacit: neque firmissimum et vividissimum *Swiftii* ingenium tanto malo potuit resistere.

vel etiam sine ullo visú, ab intensá et veloce cogitatione.

271. *Vertigo plerumque comes et signum aliorum morborum, tamen nonnunquam princeps et solus morbus, rediens per intervalla, paulatim ingravescens, impedit et labefacit paritur functiones animi atque corporis: neque firmissimum et vividissimum ingenium Swiftii potuit resistere tanto malo.*

rotation, or a broken waterfall, or frightful precipice; or even without vision, from intense rapid thought.

271. Vertigo, the attendant and symptom of other diseases, and sometimes the principal and sole disease, recurring at intervals, and gradually increasing, equally impedes and wears away the functions both of mind and body; nor could the very powerful and vigorous mind of Swift resist so great a disorder.

CAP. X.—*De sensibus qui dicuntur interni, memoria, imaginatione, judicio; eorumque varietatibus et vitiis.*

272. PRÆTER jam descriptos sensus, seu facultates, homo et alios possidet; qui ideo interni vocantur, quod sine impulsu vel ope externa suis fungantur muneribus; et organa quæ iis maxime inserviunt, interna, abdita, externis rebus inaccessa, propriis viribus agant.

273. Perceptio re externa excitata, sua natura fugax et peritura, brevi desinit: quod si eadem res organo denuo admota fuerit,

CAP. X.—*De sensibus, qui dicuntur interni, (scilicet) memoriâ, imaginatione, judicio; que (de) varietatibus et vitiis eorum.*

272. PRÆTER *sensus et facultates jam descriptos, homo possidet et alios: qui ideo vocantur interni, quòd fungantur suis muneribus sine impulsú vel ope externá; et (quòd) organa quæ subserviunt iis, (sunt) interna, abdita et inaccessa externis rebus, (et) agant propriis viribus.*

273. *Perceptio excitata externá re, fugax et peritura suá naturá, desinit brevi; quod si eadem res fuerit denuo admota organo,*

CHAP. X. *On the senses which are called internal; viz. memory, imagination, (and) judgment, and on their varieties and disorders.*

272. Besides the senses and faculties hitherto described, man possesses also others, which are called internal, because they perform their functions without external impulse or aid; and because the organs subservient to them are internal, hidden, and inaccessible to external objects, and act by powers peculiar to themselves.

273. The perception excited by an external object, fugitive and perishable by its nature, ceases in a short time; but if the same object be again applied to an organ, it not

non modo perceptionem renovat, sed homo simul pristini quem habuit sensus reminiscitur; novit, scilicet, se eundem antea habuisse.

274. Hæc prima et simplicissima memoriæ species primæ ætati contingit, quippe quam infans semestris ostendat, dum parentes aut nutricem agnoscit, ignotos homines declinat. Hæc facultas recordatio vocatur, distinctionis causa, et principium et fundamentum perfectioris memoriæ videtur esse.

275. Quin et nihil omnino ad organa sensuum externorum admoto, nullaque juvante externa causa, et internis sæpe causis parum

non modo renovat perceptionem, sed homo simul reminiscitur[41] *pristini sensûs, quem habuit; scilicet, novit se antea habuisse eundem (sensum).*

274. *Hæc prima et simplicissima species memoriæ contingit primæ ætati, quippe quam infans semestris ostendit, dum agnoscit parentes aut nutricem, (et) declinat ignotos homines. Hæc facultas vocatur recordatio, causâ distinctionis, et videtur esse principium et fundamentum perfectioris memoriæ.*

275. *Quin et omnino nihil admoto ad organa externorum sensuum, que nullâ causâ externâ adjuvante, et sæpe causis internis parum*

only renews the perception, but man recollects at the same time the primary sensation which he had; that is to say, he knows that he had the same sensation previously.

274. This primary and most simple kind of memory falls to the lot of the earliest age, such as an infant of six months old evinces, when he recognizes his parents or nurse, and shrinks from strangers: this faculty is called recollection, for the sake of distinction, and appears to be the beginning and foundation of more perfect memory.

275. Moreover, even if nothing at all be applied to the organs of the external senses, and no external cause assist, and often internal causes be little perceived, sensations felt

41. *Reminiscor*, to remember, governs a genitive, as well as an accusative case; as, *datæ fidei reminiscitur*, *reminiscitur pristini sensus*.

perspectis, sensus diu ante percepti, obliti, sopiti, homini invito nec opinanti renovantur, reviviscunt. Hujusmodi recordatio invita propius adhuc ad perfectam memoriam accedit.

276. Vera et optima memoria dicitur facultas illa, qua varias cogitationes præteritas, veluti sensus, perceptiones, &c. eodem quo fuerant receptæ ordine, ad arbitrium nostrum revocamus, detinemus, contemplamur, dimittimus.

277. Hæc, prima ætate, nulla est; paulatim accedit atque augetur. Puerili ætate, promptissima, validissima, tenacissima fit; juvenili et virili viget; senili nonnihil fatiscere solet; summa senectute dilabitur, et tandem aboletur; et fere

perspectis, sensus percepti diu ante, obliti, sopiti, renovantur (et) reviviscunt homini invito nec opinanti. Invita recordatio hujusmodi adhuc propiùs accedit ad perfectam memoriam.

276. *Vera et optima memoria dicitur illa facultas, quâ revocamus, detinemus, contemplamur, dimittimus ad nostrum arbitrium varias præteritas cogitationes, veluti sensus, perceptiones, &c. eodem ordine quo fuerint receptæ.*

277. *Hæc (memoria) est nulla in primâ ætate: paulatim accedit, atque augetur. Fit promptissima, validissima, tenacissima, (in) puerili ætate: viget juvenili et virili (ætate): solet fatiscere nonnihil senili (ætate): dilabitur et tandem aboletur*

long before, forgotten, and put to rest, are renewed, and revive in a person against his will, and not thinking upon them. Involuntary recollection of this kind makes still further approaches to perfect memory,

276. The true and best kind of memory, is that faculty by means of which we recal, detain, contemplate, and dismiss, at our pleasure, various past thoughts, as sensations, perceptions, &c., in the same order as they were received.

277. This kind of memory does not exist in early infancy; (but) by degrees it comes on and is increased: it is most ready, powerful, and retentive in boyhood; it is vigorous in youth and manhood; it usually somewhat fails when approaching advanced age; in extreme old age it falls away,

hac ratione, ut novas res dimittat facile, veterum, quas florente ætate recondiderat, adhuc tenacissima; ingravescentibus vero annis, omnes res novæ pariter atque antiquæ, e memoria penitus delentur.

278. Aliis hominibus promptior et tenacior, aliis debilior datur: cultu et usu, modo hi non nimii fuerint, incredibiliter augetur. Variis hominibus, iisdemque variis temporibus, plus minus vivada aut prompta est: ita ut vel lente admodum vel incredibili fere velocitate suo fungatur officio. Multum hic pendet a secunda aut adversa qua homo utitur valetudine; a statu animi, vel gravi affectu commoti, vel placida quiete

summâ senectute; et fere hac ratione, ut facilè dimittat novas res, (sed) adhuc tenacissima veterum (rerum) quas recondiderat florente ætate: verò annis ingravescentibus omnes res pariter novæ atque antiquæ penitùs delentur a memoria.

278. *(Memoria) datur promptior et tenacior aliis hominibus, debilior aliis: augetur incredibiliter cultû et usû, modo hi non fuerint nimii. Est plus (vel) minus prompta aut vivida variis hominibus, que iisdem variis temporibus: ita ut fungatur suo officio vel admodum lente, vel fere incredibili velocitate. Hic multum pendet a secundâ aut adversâ valetudine, quâ homo utitur; a statû animi, vel commoti gravi affectû, vel fruentis*

and is at length completely lost; and nearly in this ratio: viz. it easily dismisses new matters, but is still very retentive of the older ones, which it had stored up in the vigour of life; but as years weigh down, all matters, equally new and old, are completely swept away from the memory.

278. Memory is supplied more prompt and retentive to some, and more feeble to others: it is surprisingly increased by cultivation and use, provided they are not carried to excess.—It is more or less prompt or vivid, in different men, and in the same men, at different times; so that it either performs its function very slowly, or with incredible velocity. This depends much upon the good or bad state of health which a man enjoys; on the state of mind, either

fruentis, et ad suas cogitationes accurate attendentis. Tum quoque corporis ratio habenda est, magis minusve sentientis aut mobilis; sanguinis motus quoque multum hic facit, incitatior, aut languescens: veluti ab exercitatione, febre, dolore, torpore, sopore, &c. Pueris, junioribus, et præter solitum vividis, rapidior solet esse memoria; et hæc inter alias causas est, cur hi judicio minus firmo aut certo polleant.

279. Viget inter somnum, saltem leviorem, memoria; sed parum accurata, neque res suo ordine, ut sano et vigilanti homini solet, profert.

280. Plerasque res novas,

placidâ quiete, et accurate attendentis ad suas cogitationes. Tum quoque ratio est habenda corporis, sentientis aut mobilis magis ve minus: quoque incitatior aut languescens motus sanguinis hic facit multum; vel ab exercitatione, febre, dolore, torpore, sopore, &c. Memoria solet esse rapidior, pueris, junioribus, et vividis præter solitum: et hæc est (una causa) inter alias causas, cur hi polleant minus firmo aut certo judicio.

279. *Memoria viget inter somnum, saltem leviorem (somnum) sed (est) parum accurata, neque paret voluntati, neque profert res suo ordine, ut solet (proferre) homini sano et vigilanti.*

280. *Memoria potissimum*

excited by some depressing affection, or in the enjoyment of placid rest, and accurately fixing attention upon its thoughts. Account is likewise to be taken of the body, whether too sensitive, or more or less irritable; likewise, a more excited or languid circulation has much influence here, either from exercise, fever, pain, torpor, drowsiness, &c. Memory is usually more rapid in boys, in young persons, and in those who are unusually lively; and this is one, amongst other causes, why they are less supplied with steady or accurate judgment.

279. Memory is active during sleep, at least during the lighter kind, but is slightly accurate, and does not present circumstances in that order, which it usually does in persons healthy and awake.

sæpe repetitas, jucundas, ingratas, vel quæ mentem ullo modo magis solito afficiant, memoria potissimum retinet. Juvat, præ omnibus, ordo rerum, eoque tanquam auxilio præsentissimo uti solemus, ad rem quamlibet in memoriam revocandam. Scientiæ omnigenæ, et judicii, memoria fons et origo est, et igitur ordo fere maxima pars, nimirum sine quo aut nulla foret memoria, aut vaga et prorsus inutilis, qualis somniantibus et delirantibus contingit.

281. Minuitur aut turbatur memoria, aut prorsus deletur, variis morbis, imprimis qui cerebrum afficiunt, *apoplexia*, paralysi, *epilepsia*, tumoribus intra caput, vi externa eidem il-

retinet, plerasque novas res, sæpe repetitas, jucundas, ingratas, vel quæ afficiant mentem ullo modo magis solito. Ordo rerum juvat præ omnibus, que solemus uti eo tanquam præsentissimo auxilio, ad revocandam quamlibet rem in memoriam. Memoria est fons et origo omnigenæ scientiæ et judicii, et igitur ordo est maxima pars, nimirum sine quo memoria foret aut nulla, aut vaga et prorsus inutilis, qualis contingit somniantibus et delirantibus.

281. *Memoria minuitur aut turbatur, aut prorsus deletur variis morbis, imprimis (illis morbis) qui afficiunt cerebrum, (scilicet) apoplexiâ, paralysi, epilepsiâ, tumoribus intra caput,*

280. Memory retains, especially, most new circumstances, those which are often repeated, (or) agreeable, unpleasant, or those which affect the mind in an unusual degree. Order is useful above all things, and we are accustomed to make use of it, as the most ready auxiliary in recalling any thing to memory, Memory is the fountain and source of every kind of science and judgment, and, therefore, order is the chief part of it; for without it, memory would be null, or vague and quite useless, such as belongs to persons dreaming, or delirious.

281. Memory is weakened, disturbed, or quite destroyed by various diseases, particularly by those which affect the brain; as apoplexy, paralysis, epilepsy, tumours within the head pressing upon it, force applied to the head, and fevers,

lata, febribus, imprimis quibus auctus est caput versus sanguinis impetus, aut cerebrum quacunque ratione valde affectum.

282. Rarissime depravatur memoria, ita ut res ordine non suo menti repræsentet: quod si tale vitium acciderit, ad læsam imaginationem vel delirium referendum est.

283. Imaginatio est facultas qua homo varias res, quas memoria recondiderat, ad arbitrium suum conjungit, dividit, et novo ordine disponit; veluti si mixtis et compositis, viri et equi, mulieris et piscis, formis, Centaurum aut Sirenem sibi finxerit.

284. Imaginatio quam

externâ vi illatâ eidem (i.e. capiti), febribus, imprimis (illis) quibus impetus sanguinis est auctus versus caput, aut cerebrum (est) valde affectum, quâcunque ratione.

282. *Memoria depravatur rarissime, ita ut non representet menti, res suo ordine: quod si tale vitium acciderit, est referendum ad læsam imaginationem, aut (ad) delirium.*

283. *Imaginatio est (illa) facultas quâ, homo conjungit, dividit, et disponit novo ordine, varias res quas (ille) recondiderat memoriâ; veluti, si finxerit sibi Centaurum aut Sirenem (ex) mixtis et compositis formis, viri et equi, mulieris et piscis.*

284. *Imaginatio est vivi-*

especially by those in which there is great determination of blood to the head, or the brain be very much affected in any kind of manner.

282. Memory is very seldom injured in such a way as to represent circumstances to the mind in a false order; but if such an evil occurs, it must be referred to diseased imagination, or delirium.

283. Imagination is that faculty by which man connects, divides, and arranges in a new order, various circumstances which he had treasured up in his memory: as, if he fancies to himself a Centaur, or a Siren, from an admixture and union of the forms of a man and a horse, of a woman and a fish.

284. Imagination is more vivid than memory, and has a

memoria vividior est, et latius imperium in animum, ejusque affectus, et *genus nervosum*, habet: quamvis memoria ipsa nonnihil hujusmodi vis possideat.

285. Cogitationes, quas hæc facultas suggerit innumeras, vix unquam in sano homine, cum rebus præteritis quas memoria contemplatur, multo minus cum rebus veris et præsentibus, quas sensus percipiunt, confunduntur: neque sanus homo, sobrius, et vigilans, res quas imaginatio, ad suum arbitrium, fingit, aut esse veras, aut unquam fuisse, credit. Si talis error acciderit, pro morbo habendus est.

286. Imaginatio infanti parva, juveni maxima, viro

dior, quam memoria, et habet latius imperium in animum, que (in) affectus ejus, et (in) genus nervosum: quamvis memoria ipsa possideat nonnihil hujusmodi vis.

285. *Cogitationes, quas innumeras hæc facultas suggerit, vix unquam confunduntur in sano homine, cum præteritis rebus, quas memoria contemplatur, multo minus cum veris et præsentibus rebus, quas sensus percipiunt: neque sanus homo, sobrius, et vigilans, credit res aut esse veras, aut unquam fuisse (veras), quas imaginatio fingit ad suum arbitrium. Si talis error acciderit, est habendus pro morbo.*

286. *Imaginatio (est) parva infanti, maxima*

more extensive controul upon the mind and its affections, and upon the nervous system; although memory possesses some influence of this kind.

285. The thoughts, which this faculty supplies without number, are scarcely ever confounded in a healthy person with past occurrences which the mind contemplates, and much less, with true and present matters, which the senses perceive: nor does a man in health, sensible and awake, believe those things to be true, or ever were so, which imagination frames at its will. Should such an error occur, it must be accounted a disease.

286. Imagination is slight in the infant, most powerful in

temperatior, seni fere reprimitur: eadem hilaribus, irritabilibus, mobilibus, et præter solitum acriter sentientibus, vividior; torpidis, frigidis, stupidis, fere nulla. Neque solis poëtis utilis facultas; quippe cujus species, rerum similitudines et convenientias, a vulgo hominum non observatas, fingat, quærat, detegat, ad conjecturas primo, ad veram scientiam, ope judicii, tandem perducens. Huic forsitan *Neutonum* pariter ac *Homerum* debemus.

juveni, temperatior viro, (sed) fere reprimitur seni: eadem est vividior hilaribus, irritabilibus, mobilibus, et (illis) acriter sentientibus præter solitum; (est) fere nulla torpidis, frigidis, et stupidis. Neque est (hæc) facultas utilis poëtis solis; quippe species cujus, fingat quærat et detegat similitudines et convenientias rerum non observatas a vulgo hominum, primo perducens ad conjecturas, tandem (perducens) ad veram scientiam ope judicii. Forsitan debemus huic, Neutonum, pariter ac Homerum.

287. Imaginationi et memoriæ hoc commune est, quod in perceptiones visus et auditus tantum imperium habent: neque profecto alio-

287. *Hoc est commune imaginationi et memoriæ, quod habent tantum imperium in perceptiones visûs et auditûs; neque profectò*

the young man, more temperate in manhood, and is nearly checked in old age: it is more vivid in those that are cheerful, irritable, restless, and possessed of unusually acute sensibility; it is next to nothing in those that are torpid, cold, and stupid. This faculty is not of use to poets alone, for one kind of it imagines similarities and correspondence between things not observed by the bulk of men, seeks out and detects them, at first leading to conjectures and at last to real science, with the aid of judgment. Perhaps we are indebted to this kind of imagination for a Newton, as well as a Homer.

287. There is this in common to imagination and memory, that they possess considerable influence upon the percep-

rum sensuum externorum perceptiones, aut accurate, aut fortiter renovare possunt.

288. Judicium facultas est, qua perceptiones et cogitationes omnigenas, sensus, memoriæ, imaginationis, contemplamur, comparamus, earum similitudines et differentias detegimus, variasque inde conclusiones deducimus. Hæc facultas infanti et puero debilis est; consistente ætate, firmior et certior; ætate paulatim corrumpitur, et morbis quotquot memoriam minuunt; nam sine memoria nullum potest esse judicium.

289. Omnes hæ facultates tam pure mentis sunt, ut primo intuitu haud quicquam corporei iis inesse

possunt renovare aut accuratè aut fortiter perceptiones aliorum externorum sensuum.

288. *Judicium est facultas, quâ contemplamur, comparamus omnigenas perceptiones et cogitationes, sensûs, memoriæ, et imaginationis, (que) detegimus similitudines et differentias earum que inde deducimus varias conclusiones. Hæc facultas (est) debilis infanti et puero: firmior et certior consistente ætate; paulatim corrumpitur ætate, et (illis) morbis, quotquot minuunt memoriam, nam nullum judicium potest esse sine memoriâ.*

289. *Omnes hæ facultates sunt tam purè mentis, ut primo intuitû haud quicquam corporei videatur in-*

tions of sight and hearing; and cannot, indeed, renew either with accuracy or force the perceptions of the other external senses.

288. Judgment is the faculty by which we contemplate and compare all kinds of perceptions and thoughts, of the sensation, memory, and imagination, and detect their resemblances and differences, and thence deduce various conclusions. This faculty is weak in the infant and boy; is firmer and more accurate in established age: it is by degrees gradually corrupted by age, and by such diseases as diminish the memory, for without it no judgment can exist.

289. All these faculties are so purely of the mind, that at first sight, there seems to be nothing corporeal in them:

videatur: docent tamen morbi qui eas impediunt, certum cerebri statum, ut bene exerceantur, requiri: idque sensuum internorum primarium esse organum. Nec desunt philosophi et medici non parvi nominis, qui negant ullam in mente mutationem vel cogitationem fieri, quem certa et quæ eidem respondet cerebri mutatio non comitetur. Res parum certa, parum utilis, neque facile ad experimentum reducenda (120, et seq.) Tantum enim abest, ut ullam mutationum quæ in cerebro fiunt, vel modi quo variæ ejus partes operantur, dum memoria, imaginatio, judicium exercentur, scientiam habeamus, ut ne quidem sana de his rebus

esse; tamen morbi, qui impediunt eas, docent, certum statum cerebri requiri, ut bene exerceantur: que id (i. e. cerebrum) esse primarium organum internorum sensuum. Nec philosophi, nec medici non parvi nominis desunt, qui negant ullam mutationem aut cogitationem fieri in mente, quem, certa mutatio et (mutatio) cerebri quæ respondet eidem, non comitetur. Res (est) parum certa, parum utilis, neque facile reducenda ad experimentum (120, *et seq.*) *Enim tantum abest, ut habeamus ullam scientiam mutationum, quæ fiunt in cerebro, vel modi quo variæ partes ejus operantur, dum memoria, imaginatio, (aut) judicium exercentur, ut ne*

however, diseases, which impede them, shew that a certain state of the brain is required for their being well exercised; and that it is the primary organ of the internal senses. Neither philosophers, nor medical men of no little report, are wanting, who deny that any change or thought takes place in the mind, which a certain change, and that also of the brain, does not accompany. The matter itself is of little certainty or use, nor can it be reduced to experiment, (120, and following sections). For we are so far from having any knowledge of the changes which take place in the brain, and of the operations of its various parts, whilst memory, imagination, or judgment are being exercised, that no reasonable

conjectura hactenus fuerit prolata.

290. Functionis igitur, cujus ratio in sanitate tam atra caligine obscuratur, morbos parum intellectos esse oportet. Suos tamen morbos habet, graves, molestos, miserandos, omni attentione dignos: nimirum qui mentem ipsam, qua cæteris animalibus præstamus, vitient, et inutilem reddant.

291. Alienatur mens, siquando homo cogitationes memoriæ aut imaginationis cum perceptionibus sensuum externorum confundit, et sic, quæ non sunt, vel nunquam fuere, adesse credit: vel si judicium de rebus male sanum, et a com-

quidem sana conjectura fuerit hactenus prolata de his rebus.

290. *Igitur oportet morbos (hujus) functionis esse parum intellectos, ratio cujus in sanitate obscuratur atrâ caligine. Tamen habet suos morbos, graves, molestos, miserandos, dignos omni attentione: nimirum, qui vitient et reddant inutilem, mentem ipsam, quâ præstamus cæteris animalibus.*

291. *Mens alienatur, siquando homo confundit cogitationes memoriæ aut imaginationis cum perceptionibus externorum sensuum, et sic credit (res) adesse, quæ non sunt, vel nunquam fuêre: vel si fert judicium male sanum et alienum a com-*

conjecture has hitherto been brought forward on these subjects.

290. Therefore it is a necessary consequence, that diseases of this function are little understood, the reason of which, in a state of health, is concealed in utter darkness. Nevertheless, it has its diseases, acute, troublesome, pitiable, and deserving all our attention; for they vitiate and render inert the mind itself, in which respect we excel other animals.

291. The mind is deranged, whenever a person confounds the thoughts of the memory or imagination with the perceptions of the external senses, and believes things to be present which are not, and never were; or, if he forms a judgment unsound, and different from the common sense of men on

muni hominum sensu alienum, fert. Hoc autem rarissime, si unquam, accidit. Judicium sanum mente captus ferre solet a falsis principiis: neque male ratiocinatur, sed potius decipitur furens, qui, Jovem se credens, Jovis fulmina posceret.

292. Mentis alienatio vesania generatim vocatur; si ex febre est, delirium; citra febrem, generalis furor insania appellatur; dementia vero minus generalis, scilicet de re una alterave, sana de omnibus aliis mente, melancholia vocatur: quicum insignis aliquando tristitia conjungitur. Nullus tamen existit limes accuratus inter sanam mentem et vesaniam. Omnis præter

muni sensû hominum de rebus. Autem hoc accidit rarissime, si unquam. (Homo) captus mente solet ferre sanum judicium a falsis principiis: neque furens male ratiocinatur, sed potius decipitur, qui credens se (esse) Jovem, posceret fulmina Jovis.

292. *Alienatio mentis vocatur generatim vesania; (vocatur) delirium, si est ex febre; citra febrem, generalis furor vocatur insania; vero minus generalis dementia, scilicet de uná vel alteráve, mente saná de omnibus aliis, vocatur melancholia: quicum insignis tristitia aliquando conjungitur. Tamen nullus accuratus limes existit inter sanam mentem et vesaniam,*

those subjects. This, however, occurs very seldom, if ever. A deranged person is accustomed to form a sound judgment, but on false principles; nor does the raving madman reason badly, but is rather deceived, who thinking himself Jupiter, asks for his thunderbolts.

292. Aberration of intellect is called generally vesania; delirium, when it arises from fever; (when) without fever, general derangement is called insanity: but a less general derangement, that is on one particular subject, but collected on others, is called melancholy, with which, remarkable sadness is sometimes combined. However, there exists no precise limit between a sound mind and vesania; every kind

solitum hilaritas ad insaniam vergit; et mœstus et meticulosus animus ad melancholiam appropinquat.

293. Delirium varii generis febres comitatur: aliquando leve, facile discessurum, et vix mali ominis: sæpe tamen grave, et pessimi ominis, magnam curam et attentionem postulat.

294. Delirium ferox est vel mite. Ferox præcedunt et comitantur, vultus rubor, capitis dolor, ingens arteriarum pulsus, aurium tinnitus, oculi rubri, inflammati, truces, micantes, lucis impatientes, et vel nullus somnus, vel dira quies horrendis somniis rupta, mores soliti exuti, novi induti, pro

omnis hilaritas præter solitum vergit ad insaniam; et mœstus et meticulosus animus appropinquat ad melancholiam.

293. *Delirium comitatur febres varii generis: aliquando (est) leve, facilè discessurum, et vix malì ominis: tamen sæpe grave, et pessimi ominis, postulat magnam curam et attentionem.*

294. *Delirium est ferox vel mite. Rubor vultûs, dolor capitis, ingens pulsus arteriarum, tinnitus aurium, oculi rubri, inflammati, truces, micantes, impatientes lucis, et vel nullus somnus, vel dira quies rupta horrendis somniis, soliti mores exuti, novi (mores) induti, morosi, et immansuetì pro*

of unusual cheerfulness verges to insania, and a sad and timid mind approximates to melancholy.

293. Delirium accompanies fevers of different kinds: sometimes it is slight, easily going away, and scarcely a bad symptom. However it is often severe, and a very unfavourable prognostic, and requires great care and attention.

294. Delirium is furious or mild. Redness of countenance, pain of the head, great arterial excitement, ringing of the ears, eyes red, inflamed, fierce, glistening, and intolerant of light, either no sleep, or frightful rest broken by horrible dreams, usual manners shaken off, new ones put on, morose and uncouth instead of gentle, passion, derangement first

mitibus morosi et immansueti, iracundia; animi alienatio, primo inter somnum et vigiliam observanda, imaginationi fides data, perceptiones ex sensibus externis nullæ vel neglectæ, et cogitationes memoriæ sine ordine prolatæ, furor demum, et nonnunquam insolita et incredibilis vis artuum, ita ut plures homines unum ægrotantem vix possint compescere.

295. Mite, contra, delirium, cum pulsu sæpe debili, vultu pallido, collapso, vertigine a situ erecto, prostratis viribus, sæpe observatur. Dolor capitis quoque adest, sed minus acutus quam in altero genere; raro iracundia, sæpe stupor, aliquando mœror insignis et

mitibus, iracundia, alienatio animi primo observanda inter somnum et vigiliam, fides data imaginationi, perceptiones ex externis sensibus nulla vel neglectæ, et cogitationes memoriæ prolatæ sine ordine, demum furor, et nonnunquam insolita et incredibilis vis artuum, ita ut plures homines vix possint compescere unum ægrotantem, præcedunt et comitantur ferox (delirium).

295. *Contra mite delirium sæpe observatur, cum pulsû debili, cum pallido collapso vultû, vertigine a erecto sitû, prostratis viribus. Dolor capitis quoque adest, sed minus acutus, quam in altero genere; raro est iracundia, sæpe stupor, aliquando insignis mœror et*

perceived between sleeping and waking, faith placed in the imagination, the perceptions of the external senses lost or neglected, and the thoughts of memory brought forth without order, at length rage, and sometimes an unusual and incredible strength of the limbs, so that many men can scarcely hold one patient, precede and accompany furious delirium.

295. On the other hand mild delirium is often observed, with a weak pulse, with a pale countenance, with vertigo from the erect position, and with prostration of strength: there is also pain in the head, but less severe than in the other kind; there is seldom rage, often stupor, sometimes

metus: in semisomni primo observatur mentis alienatio, admissa luce, alloquentibus amicis, pro tempore aliquando pellenda; æger multum sibi mussitat, quæ circum fiunt parum curat; tandem stupidus factus, neque famem, nec sitim qua fauces arescunt, percipit, nec alias solitas propensiones; quo fit, ut urina et stercus, inscio ægro, elabantur. Ingravescens malum, in *subsultus tendinum*, tremores, convulsiones, animi defectiones, mortem, desinit. Alterum quoque delirii genus, deficientibus ægri viribus, in hoc sæpe mutatur.

metus: alienatio mentis primo observatur in semisomni, aliquando pellenda pro tempore, luce admissâ, amicis alloquentibus; æger multum mussitat sibi, parum curat, (illa) quæ fiunt circum; tandem factus stupidus, percipit neque famem, neque sitim quâ fauces arescunt, nec alias propensiones; quo fit, ut urina et stercus elabantur, ægro inscio. Malum ingravescens, desinit in subsultus tendinum, tremores, convulsiones, defectiones animi (et) mortem. Quoque alterum genus delirii sæpe mutatur in hoc, viribus ægri deficientibus.

296. Docent quæ utrumque comitantur signa, insolitum, inordinatum, inæqua-

296. *Signa quæ comitantur utrumque, docent, insolitum, inordinatum, inæqua-*

remarkable sadness and fear; derangement is first observed when half-sleeping, and may be dispersed for a time by the admission of light, and conversation of friends: the patient often mutters to himself, and cares little about the things done around him; at length become stupid, he neither feels hunger, nor the thirst by which his lips are parched, nor other propensities; hence the urine and fæces escape involuntarily. The malady increasing terminates in subsultus tendinum, tremors, convulsions, syncope, and death. The other kind of delirium, likewise, is often changed into this one, by the strength of the patient failing.

296. The symptoms which accompany both kinds, shew that an unusual, irregular, and unequal motion of the blood,

lem sanguinis per cerebrum motum, statum ejus qui ad sanam mentem requiritur mutare: inflammationem cerebri, vel magis vel minus generalem et vehementem, aliquando subesse satis verisimile est, quamvis generalia inflammationis in corpore signa levia fuerint: docent cadaverum inspectiones, quæ sæpe ostenderunt insolitum, vel totius cerebri vel partis ejus, ruborem; et effusionem, suppurationem, &c. intra caput.

297. Verum et ab aliis causis, præter sanguinis motum, cerebri status multum affici potest, et delirium induci. In multis febribus, veluti in iis quas insignis debilitas ab ipso initio co-

lem motum sanguinis per cerebrum, mutare statum ejus qui requiritur ad sanam mentem: est satis verisimile, inflammationem cerebri vel minus vel magis generalem et vehementem subesse aliquando, quamvis generalia signa inflammationis in corpore fuerint levia; inspectiones cadaverum docent, quæ sæpè ostenderunt insolitum ruborem, vel totius cerebri vel partis ejus; et effusionem, suppurationem, &c. intra caput.

297. *Verum status cerebri potest multum affici et delirium induci et ab aliis causis, præter motum sanguinis. In multis febribus, veluti in iis, quas insignis debilitas comitatur ab initio,*

through the brain, changes that state of it, which is necessary for a sound mind: it is very probable that inflammation, more or less general and acute, is sometimes present, although the general symptoms of inflammation in the body were slight; post mortem examinations shew this, and often have shewn unusual redness, either of the whole brain, or of part of it; also effusion, suppuration, &c. within the head.

297. The condition of the brain may be much affected, and delirium brought on also from other causes, besides the motion of the blood. In many fevers, as in those attended by great weakness from the beginning, the nervous system is affected before, and more than the circulation: and very

mitatur, *genus* ipsum *nervosum* prius et magis quam sanguinis motus laborat: cujus vitia bene multa, non secus ac sanæ actiones, sensibus non obvia erunt. Signa vero læsionis plane ostendunt inæqualem, inordinatam ejus actionem, vel incitationem, ut multi vocant, fieri. Delirii a venenis hæc quoque ratio est.

298. Ex dictis, ratio non plene quidem sed aliquatenus redditur, cur varii generis, vehementiæ, ominis, delirium; cur sæpe motu, luce, strepitu, animi affectibus, medicamentis stimulantibus, calore, auctum; cur nunc misso ex venis sanguine, et tenui diæta, nunc vino et stimulantibus tollatur; cur aliquando visu

ipsum nervosum genus laborat priùs et magis, quam motus sanguinis: bene multa vitia cujus, non erunt obvia sensibus, non secus ac sanæ actiones. Verò signa læsionis planè ostendunt inæqualem actionem ejus, incitationem ut multi vocant, fieri. Hæc quoque est ratio delirii a venenis.

298. *Ex dictis, ratio redditur, non quidem plene sed aliquatenus cur delirium, (sit) varii generis, vehementiæ, ominis; cur sæpe auctum, luce, strepitû, affectibus animi, stimulantibus medicamentis, (et) calore; cur tollatur nunc sanguine misso ex venis et diætâ, nunc vino et stimulantibus; cur levetur vel com-*

many disorders of it will not be obvious to the senses, no more than healthy actions. But the symptoms of an injury clearly shew that an unequal action of it, an excitement as some call it, takes place: this is the reason of the delirium from poisons.

298. From what has been above said, a reason is given, not clearly indeed, but to some extent, why delirium is of various kinds, violence, and prognostic; why it is often increased by light, noise, affections of the mind, stimulant medicines, and heat; why, at one time, it is removed by taking away blood from the veins, and by diet at another time, by wine and stimulants; why it is relieved or checked,

et colloquio amicorum et adstantium, rerumque bene notarum conspectu, levetur vel compescatur; cur sæpe ingravescat si æger in lecto detineatur, mitius evasurum si surrexerit, et paulisper erectus sederit.

299. Melancholiæ et insaniæ ratio multo densioribus tenebris obtegitur: scilicet, quæ sine febre sunt, aut motu sanguinis ullo modo turbato; sæpe quoque hæreditariæ, a prima et congenita corporis, et præsertim cerebri, fabrica, ut videtur, pendentes, cujus tamen vitium a subtilissimo *anatomico* non detegi posset: quæ per intervalla recurrunt sæpe longa, quibus homines mente sana in cor-

pescatur aliquando visú et colloquio amicorum et adstantium, que conspectú bene notarum rerum; cur sæpe ingravescat, si æger contineatur in lecto, evasurum mitius si surrexerit, et sederit erectus paulisper.

299. *Ratio melancholiæ et insaniæ obtegitur multò densioribus tenebris: scilicet, quæ sunt sine febre aut motú sanguinis turbato ullo modo; sæpe quoque sunt hærediturіæ, pendentes, ut videtur, a primá et congenitá fabricá corporis, præsertim cerebri, vitium cujus tamen non posset detegi a subtilissimo anatomico: quæ sæpe recurrunt post longa intervalla, quibus homines videntur frui saná mente in*

sometimes by the sight and conversation of friends and bystanders, and by the sight of familiar objects; why it is often increased if the patient be kept in bed, becoming slighter if he gets up, and sits for awhile in an erect posture.

299. The reason of melancholy and insania is veiled in still greater obscurity; for they exist without fever, or the circulation of the blood being disturbed in any way; they are also often hereditary, depending, as it appears, on the primary congenital structure of the body, and especially of the brain, the disorder of which, nevertheless, cannot be detected by the most minute anatomist: they often occur after long intervals, during which persons appear to enjoy a sound mind in a sound body; and they, lastly, often arise

pore sano frui videntur: et quæ denique a malis mentis, gravibus nimirum affectibus, sæpe oriuntur, quorum effectus in cerebrum, et ratio qua adeo nocent, prorsus ignota sunt.

300. Notum tamen est varia cerebri vitia, obstructiones, tumores, vel ipsius, vel calvariæ in id prementis, vim capiti illatam, et, ut ferunt scriptores medici, cerebri ipsius duritiem, siccitatem, et irritamenta quædam *genus nervosum* stimulantia, malum inducere. Et profecto tanta irritatio mente captis est, ut sæpe per longum tempus parum vel nihil dormiant, neque solitis remediis facile sopiantur.

301. Sed neque hæc,

sano corpore: et quæ dæniique sæpe oriuntur a malis mentis, nimirum gravibus affectibus, effectus quorum in cerebrum, et ratio quâ nocent adeo, sunt prorsùs ignota.

300. *Tamen notum est varia vitiacerebri, (scilicet) obstructiones, tumores, vel ipsius (cerebri) vel calvariæ prementis in id, vim illatam capiti, et, ut medici scriptores ferunt, duritiem, siccitatem cerebri ipsius, et quædam irritamenta stimulantia nervosum genus, (posse) inducere malum. Et profectò est tanta irritatio captis mente, ut sæpe per longum tempus dormiant parum vel nihil, neque facile sopiantur solitis remediis.*

301. *Sed hæc, quamvis*

from disorders of the mind, namely, depressing affections, the effects of which upon the brain, and the reason of their being so noxious, are entirely unknown.

300. However it is well known that various diseases of the brain, such as obstructions, tumors, either of the brain itself, or of the skull-cap pressing upon it, that force applied to the head, as medical writers relate, that hardness and dryness of the brain itself, and certain irritating substances stimulating the nervous system, may bring on this disorder. And, indeed, there is such irritation in deranged persons, that for a long time they sleep little, or not at all, and are not easily put to sleep by the usual remedies.

301. This slight, but imperfect knowledge concerning

quamvis exigua et imperfecta, de cerebri et mentis morbis, scientia, suis difficultatibus caret: nam facta cerebri vel partis ejus cujusvis læsione, tumore, osse in mucronem crescente et irritante, &c. nemo prædixerit quidnam mali talis læsio factura sit; *epilepsiam, apoplexiam, hemiplegiam,* stuporem, melancholiam, furorem, dolorem capitis, aut nil præter solitum. Non desunt enim exempla hominum, qui, post amissam haud exiguam cerebri partem, convaluerunt, et diu vixerunt; vel qui, corrupta magna cerebri parte, nil incommodi perceperunt, donec tandem subito corruerint convulsi et moribundi.

exigua et imperfecta scientia de morbis cerebri et mentis, neque caret suis difficultatibus: nam læsione cerebri vel cujusvis partis ejus factá, tumore, osse, crescente in mucronem et irritante, &c. nemo prædixerit, quidnam mali, talis læsio sit factura: (an) epilepsiam, apoplexiam, hemiplegiam, stuporem, melancholiam, furorem, dolorem capitis, aut nil præter solitum. Enim exempla non desunt hominum, qui convaluerunt aut diu vixerunt, post amissam haud exiguam partem cerebri; vel qui perceperunt nil incommodi, magná parte cerebri corruptá, donec tandem corruerint convulsi et moribundi.

302. Superest et aliud

302. *Et aliud vitium in-*

diseases of the brain and mind, is not without its difficulties; for if the brain or any part of it be injured, no person could have foretold what mischief such an injury is about to produce; whether epilepsy, apoplexia, hemiplegia, stupor, melancholy, rage, pain of the head, or any thing unusual. Instances are not wanting of men, who have recovered and lived a long time, after having lost no inconsiderable portion of the brain; or, who have felt no inconvenience by a large portion being corrupted, until at last they sunk, convulsed, and moribund.

302. There remains another disorder of the internal senses,

sensuum internorum vitium, ab his omnino diversum, fatuitas scilicet. Fatui sunt qui judicium de rebus nullum, et memoriam aut nullam, aut vitæ muneribus imparem, habent. Fatuitas quædam revera omnibus infantibus communis, naturalis, neque morbosa est: quod si ultra infantiam permanserit, tum morbus est gravis, et plerumque insanabilis. Similes ac alia sensuum internorum vitia fatuitas agnoscit causas, quantum hæ oculis vel scalpello detegi possint: *epilepsiæ* frequens comes et effectus observatur. Hæc, si a causis extra caput sitis originem duxerit, veluti a vermibus in intestinis hospitantibus, expulsis vermibus,

ternorum sensuum omnino diversum ab his superest, scilicet fatuitas. (Illi) sunt fatui qui habent nullum judicium de rebus, et aut nullam memoriam, aut imparem muneribus vitæ. Reverà quædam fatuitas est communis omnibus infantibus, naturalis, neque morbosa: quod si permanserit ultra infantiam, tum est gravis, et plerumque insanabilis morbus. Fatuitas agnoscit similes causas ac alia vitia internorum sensuum, quantum hæ (causæ) possint detegi oculis vel scalpello: (fatuitas) observatur frequens comes et effectus epilepsiæ. Si hæc (scilicet epilepsia) duxerit originem a causis sitis extra caput, veluti a vermibus hospitantibus in intestinis, vermibus

quite different from these, namely, fatuity. They are fatuous who possess no judgment of things, and no memory, or one unequal to the duties of life. In truth, a certain kind of fatuity, common to all infants, is natural, and not morbid; but if it remains beyond infancy, it becomes an important, and generally an incurable disease. Fatuity is brought on by the same causes as the rest of the external senses, as far as they can be detected by the eyes and the knife: it is observed as a frequent attendant, and effect epilepsy. If this has derived its origin from causes external to the head, as from worms dwelling in the intestines; if the worms be

sanataque *epilepsia*, mens fatuo aliquando accedit.

203. Haud absimile est, fatuitatem infantum, et memoriæ, ideoque judicii defectum, qui senibus accidit, a statu cerebri in his nimis duri et rigidi, in illis vero nimis mollis, oriri.

expulsis, que epilepsiá sanatá, mens aliquando accedit fatuo.

303. *Est haud absimile, fatuitatem infantum, defectum memoriæ, et ideo judicii, qui accidit senibus, oriri, a statû cerebri nimis duri et rigidi in his (i. e. in senibus) verò nimis mollis in illis (i. e. in infantibus).*

expelled, and the epilepsy be cured, intellect sometimes returns to a fatuous person.

303. It is not improbable, that the fatuity of infants, and loss of memory, and consequently of judgment, which happens to old men, arises from a state of brain too hard and rigid in the latter, but too soft in the former.

1828.

ENTERED AT STATIONERS' HALL.

TO THE

Rev. R. J. BRYCE, A.M.

(Principal of the Belfast Academy.)

Rev. and Dear Sir,

I feel highly honoured, in being permitted to express thus publicly, the obligations under which I have been laid, by the assistance which your kind advice and candid criticism have afforded me, in the preparation and publication of this little Work.

The satisfaction which I feel, in enjoying the approbation of so valuable a contributor to classical literature, is accompanied with only one cause of regret--that it is not in my power to affix your name to something which, by its own intrinsic excellence, would evidence the extent of my gratitude, and the value at which your friendship is estimated, by,

Dear Sir,

Your much obliged,

Humble Servant,

JOHN LANKTREE.

PREFACE.

THERE are in all Roman histories so many allusions to popular practices and national economy, and in every Latin book so many peculiar phrases founded on prevalent customs, that it is almost impossible any one could profitably read the annals, or critically understand the language, of the ancient Romans, without some knowledge of their customs in public and private life.

A conviction of this truth excited many learned men to the laborious task of collecting, from the most ancient and authentic sources, all that could immediately or remotely elucidate the annals of that extraordinary people. Some of these exhausted all their learning on one particular subject,

and others, profiting by their research, condensed into a single treatise whatever information was most important respecting all of those subjects usually classed together under the title of Roman Antiquities.

Of this kind are the works of Kennet and Adams, which seem to be most generally known and used as school-books. The former received universal approbation, and merited all that it received; the latter is more copious—it is, however, too brief to serve as a book of reference, and too large to be generally used as a school-book. The excellent author perceived this himself, and, therefore, in the advertisement to the second edition, mentioned his intention to write an abridgment so soon as he could find leisure. That leisure having unfortunately never arrived, such an epitome as the present was still left a desideratum.

In constant hope that some abler hand would have undertaken what is attempted in this little volume, its publication was delayed for a few years.

The manuscript during this time underwent many alterations. It was revised by several literary gentlemen, whose kindness in this respect the compiler has much reason to acknowledge with gratitude. It was at first catechetical, but afterwards changed to the present form, which will, it is hoped, be found more satisfactory. As there are many, however, who would prefer it in its former state, for their sake a catechism has been subjoined; in which way, even for schools, it will have many advantages which it could not have had incorporated with the text. There are many private persons also, who, having read the Synopsis in connexion with Roman Antiquities, might find it a useful and interesting exercise to examine themselves, by these queries, as to the extent of their acquaintance with a subject so important.

It was at first intended to insert authorities; but it was afterwards thought, that however desirable such references would be for the advanced student, they might tend to perplex beginners, for whom this work was principally designed—

the very appearance of whose elementary works ought to be simple. In a subsequent edition, however, if deemed advisable, they may be inserted in an appendix, or after the manner of Leisner's Annotations to Bos's Grecian Antiquities.

Those who may take the trouble of comparing this with other works of the same kind, will perceive, that, though the compiler has freely availed himself of whatever helps they afforded, he has not slavishly followed any; but, on some points, mentioned authentic particulars which all had omitted. He was careful throughout to give respecting every subject all the information that was necessary, and yet to be as brief as a regard to perspicuity would permit,—lopping off all redundancies, and avoiding that confusing assemblage of Latin phrases of which in some similar works there is a vast repletion. His object was to facilitate that knowledge which is the best and only proper key to a right understanding of the classics. He submits his attempt to the candour of an en-

lightened public. He may have fallen into some errors; but being unconscious of any, he solicits criticism, for the sake of that correctness which ought to be dearer to every author than his own reputation.

Belfast, May 9, 1828.

ERRATA.

Page 117... For *Gubenator* read *Gubernator.*
122... For *luqueus* read *laqueus.*

In consequence of some alteration which it was found necessary to make in the arrangement of this Treatise, after part had been put to press, a few trifling errors occurred in three or four of the headings and numbers of the sections, which the reader will easily perceive and rectify.

SYNOPSIS

OF

ROMAN ANTIQUITIES.

BOOK I.

OF ROME ITSELF.

I. ANCIENT ITALY is separated, on the north, by the Alps, from Germany. It is bounded on the east and north-east, by the Adriatic Sea, or *Mare Superum;* on the south-west, by a part of the Mediterranean, called the Tuscan Sea, or *Mare Inferum;* and on the south, by the *Fretum Siculum*, called at present the Strait of Messina.

II. The south of Italy, called *Græcia Magna*, was peopled by a colony from Greece. The middle of Italy contained several states or confederacies, under the denominations of Etrurians, Samnites, Latins, Volsci, Campanians, Sabines, &c. And the north,

containing *Gallia Cisalpina* and *Liguria*, was peopled by a race of Gauls.

III. The principal town of the Latin confederacy was ROME. It was situated on the river Tiber, at the distance of sixteen miles from its mouth.

IV. Romulus is commonly reported to have laid its foundations on Mount Palatine, A.M. 3251, B.C. 753, in the third year of the 6th Olympiad.

V. Rome was at first only a small fortification; under the kings, and the republic, it greatly increased in size; but it could hardly be called magnificent, before the time of Augustus Cæsar. In the reign of the emperor Valerian, the city, with its suburbs, covered a space of fifty miles; at present it is scarcely thirteen miles round.

VI. Rome was built on seven hills, viz. the Palatine, Capitoline, Quirinal, Esquiline, Viminal, Cœlian, and Aventine; hence it was poetically styled "Urbs Septicollis."

VII. The greatest number of inhabitants in Rome was four millions, but its average population was not more than two millions.

VIII. The city was divided by Romulus into three parts: one appropriated to religious services—another for the revenue of the king and state—and the third, which was the largest, he subdivided into thirty portions, one for every curia or parish of the people. —[See Book II. chap. 3. s. x.]

IX. By Augustus, it was divided into fourteen regions, distinguished by various names, which, in all,

contained 204 streets, 19 luci, 91 temples, 80 ædes, 10 public baths, 16 triumphal arches, 303 public granaries, 317 mills, 2077 great houses, 754 private baths, the huge shambles, 8 columns, 23 porticos, 4 circi, 7 fora, 10 curiæ, 10 basilicæ, 5 theatres, 2 amphitheatres, besides the colossus of the sun, above 200 reservoirs of water, and many other public buildings of less note, in addition to all the houses of private individuals.—*Kennet's Antiq. of Rome—M. Nodot's Visite, tom.* ii.

X. Rome had eight bridges, of which the largest and most beautiful was the Ælian; and in the time of Pliny it had thirty-seven gates. Of these, the most remarkable were *Porta Flaminia, Capena, Latina, Carmentalis, Salaria.—Plin.* iii. 5. *s.* 9.

XI. Rome exceeded all the other cities of the world, in the number and magnificence of its public and private edifices. We will first consider the former, and then mention a few particulars concerning the most distinguished of the latter.

XII. The principal public buildings were temples, theatres, fora, basilicæ, baths, porticos, columns, arches, circi, aqueducts, and sewers.

XIII. Of TEMPLES, the chief were:

1. The *Capitol*, which was built on the Tarpeian hill. As this was the most elevated and best fortified part of Rome, the Capitol was sometimes emphatically called Arx.

The foundation of the Capitol was laid by Tarquin I., and the building carried on with spirit by his grand-

son, Tarquinius Superbus; but its consecration was reserved for the times of the republic.

The Capitol was computed to contain 200 feet in breadth, and 215 in length. It fronted southwards, looking towards the Forum, from which the ascent was by 100 steps, which contained at certain distances wide landing places, in order to give those who were going up sufficient breathing time, before they reached the portico. The front was composed of three rows of lofty pillars, rising one above the other; and the two sides were adorned with a peristyle consisting of a double row of pillars. The threshold and gates were of brass, and the entire roof was magnificently gilded both within and without. It is said that the gold used for this purpose alone amounted to 1200 talents, or about two millions of our money.

This amazing edifice was three times burned, but always rebuilt in the same style and proportions, and with increasing splendour. The last erection was reserved for Domitian, who employed, for this purpose, money which he had exacted from the Jews.

The Capitol contained in it three temples—one to Jupiter, one to Juno, and one to Minerva: Jupiter's was in the centre, whence he was poetically called "Media qui sedet æde Deus."

As the Capitol was a place of great security, the riches which were deposited in it were beyond all calculation.

2. The *Pantheon*, a round temple, built by Agrippa,

and dedicated to all the gods. It was about 150 feet high, and as many broad. The roof was of solid silver, and supported by rafters of brass, forty feet long. The inner walls were either of solid marble or incrusted; and the outer, of brazen plates gilt. It stands to the present day, dedicated to St. Mary and all the saints, with little alteration, except that, in its roof, lead has been made to supply the place of silver.

3. The *Temple of Apollo*—built on the Palatine hill, attached to which was a valuable library.

4. The *Temple of Saturn*—remarkable for its strength and solidity, on which account it was made the public treasury.

5. The *Temple of Janus*—a square building, formed entirely of brass, sufficiently high to contain a statue of the two-faced god. It had two huge brazen gates, which were only shut in times of peace, and open in war. It is worthy of remark, that these gates were only nine times closed from the commencement to the downfal of the Roman empire, which clearly points out the martial character of the people.

6. There were eighty-six temples at Rome of less note, besides a great number of *Ædes*, *Delubra*, *Sacella*, &c.

7. *Ædes Sacra* was a temple that had not been formally dedicated to some god by the augurs—*Delubrum* properly signifies that part of a temple where the idol stood; its more general meaning is

a place consecrated to several deities—*Sacellum* was a place dedicated to the gods, without a roof. The words *sacrarium*, *fanum*, and even *pulvinar*, were sometimes used as synonimous with temple.

8. *Luci* were sacred groves dedicated to certain gods, and generally contiguous to temples. Of these there were nineteen.

XIV. THEATRES.

1. The theatre of M. Scaurus, though temporary, was calculated to contain 80,000 spectators. Its scenes were raised partly of marble and partly of glass, and sustained by 300 pillars of gilded wood, between which were placed 3000 statues of metal, and many of the finest paintings.

2. The theatre of Pompey was built of hewn stone, and calculated to contain 40,000 people.

3. In the early ages of the Roman state it was forbidden by law to make seats in a theatre, lest the morals of the people should be corrupted. Hence the famous theatre of Curio was of wood. But Pompey eluded this law, by dedicating his theatre to Venus, with this inscription, "Veneris Victricis."

4. The parts of the theatre allotted to performers, were—1. *Scena*, the scene; 2. *Postscenium*, the dressing room; 3. *Proscenium*, where the actors appeared.

XV. AMPHITHEATRES.

1. The principal amphitheatre at Rome was that commenced by Vespasian and finished by Titus.—It was built of Tiburtine stone, and calculated to contain 87,000 spectators. 30,000 Jews are said to

have been employed in its erection. It was erected on that part of the palace of Nero where stood the Colossus, and hence called the *Coliseum*. Its vast remains form to this day perhaps the most interesting object to the traveller at Rome, although the materials used in the erection of the Farnesian Palace, the Chancellery, and other modern buildings, were taken from it.

2. An amphitheatre differed from a theatre: the former was oval—the latter in form of a semicircle; the former chiefly subservient to the games of gladiators, &c.—the latter to scenic representations.

3. An amphitheatre contained—1. *Arena*, the place where gladiators fought, which was covered with sand, to prevent them from sliding, and to absorb the blood—2. *Suggestus* vel *suggestum*, the emperor's seat—3. *Podium*, where the senators and ambassadors sat; both of these were near the arena, to command a better view—4. *Popularia*, the seats of the people, which were of bare stone—5. The equites occupied fourteen rows of seats between the podium and popularia.

XVI. The FORA of the Romans. These were of two kinds—*Civilia* and *Venalia*.

1. *Fora Civilia* were courts for distribution of justice.

2. The *Forum Romanum*, situated between the Palatine and Capitoline hills, is frequently simply called the FORUM, by way of pre-eminence. In it

assemblies of the people were held, and great public business transacted.

3. There were four other fora civilia, viz. of Julius, of Augustus, of Nerva, and of Trajan. The last was amazingly magnificent and extensive. It was built by the famous architect Apollodorus, and adorned with porticos containing numerous elegant statues. On the top were large figures of horses of gilded bronze, with military corselets. The celebrated statue of Augustus, made of gold and silver, was here; and that of Nicomedes, king of Bithynia, which was of ivory. There were also a great library and museum, under the direction of the lawyer Ulpian, which were not the least considerable ornaments.

4. The *Fora Venalia* were markets, viz. *Forum Boarium*, for cattle: *Piscarium*, for fish: *Olitorium*, for herbs and fruit: *Suarium*, for pigs.

XVII. BASILICÆ were no mean ornaments of Rome. They were spacious halls built around the Forum, adorned with pillars, porticos, and statues. They were adapted for public business, and might be occasionally used as courts of justice.

XVIII. BATHS were splendid edifices, either attached to the houses of private gentlemen, for their use, or built by eminent individuals for the use of the public, where any one, by paying a farthing *(quadrans)*, to the bathkeeper *(balneator)*, had liberty to bathe.

2. Of the famous Bagnios of Rome, those of Diocesian and Caracalla stand in great part to this day,

and afford much interest to the traveller, with their stately pillars, arches, and marble. These edifices had formerly fine libraries attached to them, and various courts for the exercises of young men.

XIX. PORTICOS were built as piazzas, in which gentlemen might walk or ride. They took their names from the temples to which they were nigh, and are justly celebrated for their elegance of architecture.

XX. COLUMNS were erected to commemorate illustrious actions.

1. The columns most celebrated at Rome were those of Trajan and Antoninus Pius.

2. On Trajan's pillar were sculptured his martial achievements, particularly against the Dacians. It was 144 feet high, yet composed of only 24 stones, and these so curiously wrought as to seem but one. There are inside 185 winding stairs, and 40 windows. On the top stood a gigantic statue of Trajan, clad in armour.

3. The pillar of Antoninus was similar. Pope Sextus V. took down the original statues, and substituted that of Saint Peter instead of Trajan, and of Paul instead of Antoninus.

XXI. ARCHES were raised in honour of conquerors. They were in later times built entirely of marble. The triumphal arches of Constantine, Gratian and Valentinian, Severus, Titus, and Marcus Aurelius, have been greatly admired.

XXI. CIRCI were semicircular or oblong build-

ings, completely walled in, and seated up to the top, designed for the celebration of several games.

1. The *Circus Maximus*, situated between the Palatine and the Aventine hills, was remarkably grand. It was 2187 feet long and 960 broad, a whole mile in circumference, and calculated to contain 300,000 spectators. On one end were several openings or lists called *carceres*, from which the horses or chariots started; on the other, columns called *metæ*, round which they turned. Julius Cæsar improved it, by introducing canals of water, which could be immediately covered with vessels, to represent a naval engagement. (For this purpose the *Naumachiæ* were afterwards erected.) In the midst of the circus was a brick wall four feet high, ten feet broad, called *Spina*, on which Augustus raised two great obelisks brought from Egypt.

XXIII. The CAMPUS MARTIUS was a large plain along the Tiber, containing *palestræ*, *gymnasia*, and *xysti*, places for exercising combatants and wrestlers. In this plain, young men practised every military exercise, and assemblies of the people were held. It is the most populous and beautiful part of modern Rome, and it must have been the most magnificent part of the ancient city. In its centre stood an obelisk of the sun, 116 feet high, covered with Egyptian hieroglyphics. This obelisk served to mark the hour of the day upon an enormous sundial of white marble, which had brazen ciphers a yard long. It was surrounded by splendid edifices; among which we may

number the mausoleum and obelisks of Augustus; the baths of Nero, Adrian, and Agrippa; the circi of Severus and Flaminius; the Pantheon; the theatres of Pompey and Marcellus, &c.; besides a great number of porticos, fountains, temples, palaces, pillars, and naumachiæ.—*Trap's Travels of Capt. Archenholtz—Mon. Nodot's Visite, tom.* ii.

XXIV. There were twenty AQUEDUCTS at Rome, the water of which was brought from a great distance, through mountains and every impediment. In some places the arches which sustained them rose to upwards of a hundred feet high. The first aqueduct was the *Appian*; that which conducted the best water was the *Julian*, made by Agrippa.

XXV. The CLOACÆ, or Sewers, were subterranean aqueducts more wonderful than the former.—They were cut under the seven hills on which Rome was seated, for the purpose of conveying away the filth into the Tiber. So strongly were these canals built, that many remains of them may be seen at present. One of the largest of them went directly under the Pantheon. They were so high, that a waggon loaded with hay might pass under them.

XXVI. The ROADS which led to Rome were good. The *Via Appia* has been the admiration of all ages: it led to Capua, 300 miles distant, through Brundusium. The *Via Flaminia* was little inferior: it led to Ariminum.

2. The roads of the Romans were so constructed as to command a view of the country every way.—

They were made of, first a stratum of rough stones, then a stratum of gravel, and over this the paved work.

3. The stones used in the Via Appia were large blue stones of great strength and solidity, varying in size from one to five feet square, and so artfully joined together, over the whole way, as to seem but one stone. Many vestiges of this road have lasted above two thousand years, even till the present day.

XXVII. Before Rome was burned by the Gauls, it had little other in it than cottages and thatched houses.

1. After that time, until the invasion of Pyrrhus, though the houses were larger and better, yet they were for the most part only covered with planks.

2. In the reign of Augustus, houses were only of one story, but they were sometimes made so high as seventy feet.—*Archenholtz' Trav.*

3. But from the time of Nero, the city was amazingly splendid. Marble was then in more frequent use than common stone had been in the earlier ages.

4. Amid this profusion of every thing beautiful, Nero himself constructed a palace, the equal of which, perhaps, was seldom seen, for extent or grandeur. It obtained the appellation of *Aurea*, the golden ; but seven years after its erection it was burned to the ground.

6. The lower floors of the houses of the great were at this time either inlaid marble or mosaic work. Every thing curious and valuable was used

in ornament and furniture. The number of stories was generally two, with under-ground apartments. On the first, were the reception rooms and bed chambers; on the second, the dining room and apartments of the women.

6. The Romans used portable furnaces in their rooms, on which account they had little use for chimneys, except for the kitchen. It is not known what they used in their windows instead of glass, except that Nero used a transparent stone like alabaster.

7. Houses not joined with the neighbouring ones were called *Insulæ*, as also lodgings or houses to let. The inhabitants of rented houses or lodgings, *Insularii* or *Inquilini*.

BOOK II.

OF THE RELIGION OF THE ROMANS.

CHAP. I.

Of their Deities.

I. The Romans were, as a people, remarkably attached to the religion they professed; and scrupulously attentive in discharging the rites and ceremonies which it enjoined.

II. Their religion was Idolatry, in its grossest and widest acceptation. It acknowledged a few general truths, but greatly darkened these by fables and poetical fiction.

III. All the inhabitants of the invisible world, to which the souls of people departed after death, were indiscriminately called *Inferi*. *Elysium* was that part of hell *(apud Inferos)*, in which the good spent a spiritual existence of unmingled enjoyment, and *Tartarus* (pl. *-ra*) was the terrible prison house of the damned.

IV. The Romans had 30,000 deities, of whom they had imaginary histories, which more frequently detailed infamous or foolish than noble actions. These were celebrated in the songs of poets, the traditions of priests, and by pictures or statues, placed around within the temples.

V. Some deities were said to inhabit heaven, others to dwell upon the earth, and a few to have their thrones and dwellings in the infernal regions.

VI. These deities were generally supposed to have some concern in the world and its inhabitants.

VII. All the deities of the Romans were comprehended under two denominations—the Dii Majorum Gentium, and the Dii Minorum Gentium.

VIII. The DII MAJORUM GENTIUM were twelve great celestial gods, and eight others, called Dii Selecti.

The names of the twelve are given in these two lines of Ennius :

"*Juno, Vesta, Minerva, Ceres, Diana, Venus, Mars,*
"*Mercurius, Jovi'*, Neptunus, Vulcanus, Apollo.*"

1. *Jupiter* was the chief of these. He was called the son of Saturn, and usually represented as sitting on a throne of ivory, with a sceptre in his left hand and a thunderbolt in his right. Epithets common to him are *Tonans*, the thunderer; *Pater Omnipotens, Rex Deorum, Olympi Regnator*, &c.

2. *Juno* was the sister and queen of Jupiter. She presided over marriage and childbirth, and was represented in a magnificent robe or stola, sitting on a light car drawn by peacocks. She is styled also Lucina.

---

* Jovi' is a contraction for Jovis, which was the ancient nominative instead of Jupiter.

3. *Minerva* or *Pallas* was goddess of wisdom and war. She was generated in the brain of Jupiter, and delivered from that by the sharp axe of Vulcan, who cleft the skull of Jupiter in twain, and immediately out sprang Minerva, clad in full armour, with a shield called Ægis on her left arm, and in her right hand a spear, in which array she is generally represented. She is called Tritonia, from the lake Tritonis, where she appeared in the habit of a virgin; also Lanifica, because she was said to be the inventress of spinning.

4. *Vesta*, the goddess of fire. In her temple were preserved the image of Minerva, called Palladium, and a perpetual fire, which was kept alive by virgin priestesses, called Vestals. She is often confounded with Rhea, Ceres, Hecatè, Proserpine, Tellus.

5. *Ceres*, the goddess of corn and husbandry, worshipped chiefly in Eleusis, in Greece. Her rites were celebrated with great secresy, and called Eleusinia. She is represented having her head crowned with ears of corn or poppies, her robe falling down to her feet, and with a torch in her hand.

6. *Neptune*, god of the sea, and brother of Jupiter. He is represented with a trident in his right hand, drawn in a chariot by sea horses, and attended on either side by a Triton. Epithets—Tridentifer, Aquarum, Ventorum, Oceani Pater, Cœruleus, &c.

7. *Venus*, the goddess of love and beauty, said to have been produced by the foam of the sea, and hence called Aphroditè. She was attended by her

son Cupid, by Hymen, the god of marriage, by the Graces, and the Hours. The myrtle was sacred to her. She was called Cypria, Cytherea, Paphia, Erycina, from the places where she was peculiarly adored. Her epithets of beauty, power, and love, are innumerable.

8. *Vulcan*, the husband of Venus, son of Jupiter, and god of fire and smiths. The Cyclops, giants with one eye, were his workmen, and their forge was in the island of Lemnos, or a cave of Mount Ætna. He was called Lemnius, from Lemnos, into which he was thrown, by Jupiter, out of heaven—Claudus, because he was lamed by the fall. Ep.—Mulciber, Niger, Ignipotens, &c.

9. *Mars*, the son of Juno, and god of war. His worship was much cultivated by the Romans. He was also called Mavors and Gradivus. Every terrible and sanguinary epithet was given to him.

10. *Mercury*, the son of Jupiter and Maia—messenger of the gods, and god of eloquence. He is distinguished by a winged cap, called Petasus; by winged shoes, called Talaria; and by a rod entwined with serpents, called Caduceus. He is well known by the names Hermes, Cyllenius, Majugena, Atlantiades.

11. *Apollo*, son of Jupiter and Latona, the god of poetry, music, augury, medicine, and archery. He had a famous temple at Delphi, in Phocis of Greece. He is usually represented as a young man, crowned with laurel, holding in his right hand a bow and ar-

rows, and in his left a lyre. He was also called Phœbus, Titan, Sol, Cynthius, Delius, with the usual epithets of Arcitenens, Citharædus, &c.

12. *Diana*, sister of Apollo—the goddess of woods and hunting; represented as a tall beautiful virgin, with a quiver on her shoulder, and a javelin or bow in her hand. She was called Diana on earth, Luna in heaven, and Hecatè in hell.

13. The Dii Selecti were:

(1). *Saturn*, son of Cœlus and Terra—father of Jupiter, and the god of time. When Saturn was driven from his throne by his son Jupiter, he fled to Italy, and during his reign there, that happy period, called the golden age, took place.

(2). *Janus*, god of the year, and of peace and war. He was also porter of heaven, and is usually represented with two faces.

(3). *Rhea*, the wife of Saturn, called also Ops, Cybelè, and Magna Mater. She is pictured sitting in a chariot drawn by lions, having her head crowned with towers.

(4). *Pluto*, brother of Jupiter, and king of hell. He was married to Proserpine, who presided over sorcery.

(5). *Bacchus*, son of Jupiter and Semelè—the god of wine. His sacred rites, called Orgia, Bacchanalia, or Dionysia, were celebrated every third year, in March, at night, and with very confused revelry.

(6). *Sol*—the sun—generally the same as Apollo, but sometimes distinguished.

(7). *Luna*—the moon—sister of Sol.

(8). *Genius*—the tutelary god. The Romans believed that every man had genii attending him—one good and the other bad. Places had their genii, as well as persons.

X. The DII MINORUM GENTIUM were divided into *Indigetes* and *Semones*.

1. *Indigetes* were deified heroes, of which some of the principal were Hercules, Castor and Pollux, Æneas, and Quirinus.

2. *Semones* were such as the Fauns, Satyrs, Nymphs, &c. The principal were—Pan, the god of shepherds, and inventor of the flute; Faunus, supposed to be the same as Pan; Terminus, the god of boundaries; Vertumnus, presiding over the change of seasons; Hymen, the god of marriage; Minos, Æacus, and Rhadamanthus, the judges of hell; Charon, the ferryman of hell.

3. *Nymphs* were female deites, who presided over fountains, woods, hills, and all the parts of the earth. They were called by various names, as Dryades, Hamadryades, Naiades, Nereides, &c.

4. The *Nine Muses* were daughters of Jupiter and Mnemosyne. Their names were Calliope, Clio, Melpomene, Thalia, Erato, Euterpe, Terpsichore, Polyhymnia, Urania. They were frequent visitors of the mountains Parnassus, Helicon, Pierus, &c. and the fountains Castalius, Aganippe, &c. from which they derived various names.

5. The *Parcæ*, or Fates, decided the destinies of

men, by spinning. Clotho held the distaff, Lachesis spun, and Atropos cut the thread.

6. The *Furies* were Alecto, Tisiphone, and Megæra. They are represented with snakes instead of hair, having wings, and holding in their hands a torch and whip to torment the wicked.

7. *Lares* were household gods of human origin, which presided over families. Their images were clad in skins of dogs, and placed around the hearth, in the atrium or hall.

8. *Penates* were likewise household gods; but differed from the Lares, by their heavenly origin.—They were worshipped only in the innermost part of the house called *Penetralia*.

CHAP. II.

Of Divine Worship.

I. The worship of the gods consisted in prayers, lustrations, sacrifices, and festivals.

II. PRAYERS were sometimes made in a standing posture; but in times of danger or urgency, on the knees. He who prayed, first raised his hand to his mouth, and then extended it towards the deity, which ceremony was called *ad-ora-tio*. He afterwards turned towards the east, and stretching forth both hands to the sky, mentioned his requests.

III. LUSTRATIONS were made of water, fire, eggs, &c.; and they were used before entrance on any

important religious duty, viz. before setting out to the temples, before the sacrifice, before initiation into the mysteries, and before solemn vows and prayers.

2. Lustrations were also made after acts by which one might be polluted; as after murder, after intercourse between the sexes, or after having assisted at a funeral.

IV. SACRIFICES were made of victims whole and sound *(integræ et sanæ)*. But all victims were not indifferently offered to all gods.

2. A white bull was an acceptable sacrifice to Jupiter; an ewe to Juno; black victims, bulls especially, to Pluto; a bull and a horse to Neptune; the horse to Mars; bullocks and lambs to Apollo, &c. Sheep and goats were offered to various deities.

V. The ceremonies used in sacrificing were as follow:

1. The victim, having its horns tipped with gold, and its head crowned with wreaths and garlands, was led along by the servants of the priest, called *Popæ*.

2. When it reached the altar, the officiating priest prayed to all the gods, beginning with Janus, and ending with Vesta, during which time the people observed profound silence.

3. A salted cake *(mola)* was now sprinkled on the head of the victim, which part of the ceremony was called *immolatio*, and the frankincense and wine were poured between the horns, the wine having been first

tasted by the priest and bystanders. This was called *libatio.*

4. When the libation was over, the priest pulled the longest hairs from between the horns, and threw them, as first oblations *(libamina prima)*, into the fire.

5. The victim was felled by the *Cultrarius*, and stabbed; but the blood was caught in goblets, and sprinkled on the altar.

6. After these ceremonies, it was cut open and flayed. The *Aruspices* inspected the entrails, to discern if the sacrifice were acceptable; and the thighs, being covered with fat, were placed upon the altar, and burned.

7. If the whole victim were burned, the sacrifice was called *holo-caustum;* if only a part, the remainder was feasted upon, after the people had been dismissed by the word "*ilicet*," you may go.

8. There was a difference in the manner of sacrificing to the celestial and infernal gods.

9. In sacrificing to the celestial gods, it was requisite that the priest, and those who sacrificed, should, after purification, be clothed in white, and that, when they prayed, their hands and eyes should be raised towards heaven. The victim was also white, and its head raised.

10. Those who sacrificed to the infernal gods were clad in black, and they lowered to the earth their hands and eyes in prayer. Their victim was dark-coloured, and its head also bent towards the ground.

11. Human sacrifices were offered among the Romans. From Romulus, so late as to the times of Augustus Cæsar, persons guilty of certain crimes were devoted to the infernal gods.

12. The general of an army might devote, not only himself, but any soldier in the legion, to die for the public.

13. A law was made against human sacrifices; but they were continued, in despite of this, by the fights of gladiators in the amphitheatre.

VI. SACRED FESTIVALS formed an important part of the religious services of the Romans.

1. They were instituted in honour of various deities. Some were celebrated every month.

2. They became, in process of time, so numerous, that the emperor Claudius was obliged to make an edict for their abridgment.

3. The *Saturnalia*, sacred to Saturn, were the most celebrated festivals. Several days during their continuance, slaves were indulged in unbounded liberty of speech, and their masters were obliged to wait in attendance upon them.

4. *Lupercalia* was the festival of Pan.—[See its description, Book II. chap. 4. s. iv. 2.]

5. *Festum Anciliorum* was the festival of Mars.—[See Book II. chap. 4. s. v. 2.]

6. *Hilaria* was the festival of Cybele.—[See Book II. chap. 4. s. vii. 2.]

7. Days among the Romans were divided into *festi, profesti, intercisi*. *Dies festi* were, like our Sab-

baths, sacred to religious services only; on these, therefore, festivals were celebrated: *dies profesti* were for the transaction of business: and *dies intercisi* were half holidays, either for religion or business.

CHAP. III.

Of the General Ministers of Religion.

I. The ministers of religion at Rome were either *general* or *particular*—those who had a right to interfere in the services of all the gods, or those whose duty was confined to the worship of one.

II. The principal *general* ministers were the Pontifices, Augurs, Epulones, Haruspices, Quindecemviri, and Rex Sacrorum; the Fratres Ambarvales, Curiones, and Feciales, were also general, but not of so much consequence or authority.

III. The PONTIFICES were a college of the most respectable men of the state, into whose hand every thing relative to religion was committed.

2. They were instituted by Numa, who directed that their number should be only four; but they were afterwards encreased to eight; and then, by Sylla, to fifteen.

3. The chief of the college was called Pontifex Maximus. His power, in some cases, was superior to that of even the Consul or Tribune. In all solemn public acts, his presence was requisite. He superintended the writing of the public annals, and the

continuation of the calendar called Fasti Kalendares. It was particularly his duty to regulate and protect the virgin priestesses of Vesta. The house in which he lived was public, and called Regia.

4. In certain circumstances, Pontifices had the disposal of life and death; and all difficult cases and questions, arising out of the confused traditionary system of Roman policy, were perpetually referred to their sacred tribunal and unalterable decision.

5. The college of Pontiffs subsisted from the reign of Numa down to the emperor Gratian, with undiminished authority.

IV. The AUGURES were another college, next in order and importance to the Pontiffs, and, like them, consisting of fifteen, under the direction of one, called Magister Collegii. It was their duty to explain all omens; and in such estimation was their science held, that no action of great public interest was undertaken without their advice.

2. They derived their knowledge of futurity from five sources:

(1) From appearances in the heavens,
(2) From birds,
(3) From chickens,
(4) From quadrupeds, and
(5) From unusual occurrences.

3.—(1)—To take an augury from observation on the heavens, the Augur ascended to some elevated place, and after sacrifice and prayer, sat down, with his head covered, and his face towards the east, so

that the south was on his right hand and the north on his left.

With his *lituus*, or wand, he marked out different regions in the sky, within which his observations should be made. Those portents which happened on the left hand were lucky; those on the right, unlucky; but thunders on the left hand, which were a good omen for every thing else, were unlucky for holding *comitia*, or public assemblies.

Sometimes the Augur looked toward the south, instead of the north, and in this case, the prodigies on the left hand were bad, and those on the right hand favourable. Auguries from thunder and lightning could only be taken by the Magister Collegii.

4.—(2)—Crows, pies, owls, &c. furnished the Augurs with observations, from their manner of croaking or singing, and were therefore called *oscines:* eagles, vultures, buzzards, from their manner of flying; and these were therefore called *præpetes*.

5.—(3)—The Augurs kept some sacred chickens *(pulli)*, under the care of one of themselves, called *Pullarius*. To these pullets they threw down corn: if they flew and eat it greedily, the omen was good; but if they took no notice of it, or scattered it with their wings, it was bad. Their other observations were silly enough, but this exceeds in absurdity.

6.—(4)—If wild or tame beasts appeared in an unusual place—if they crossed the way—if they ran to the right hand or the left; the Augurs could discern, from such trifles, some presage of futurity.

7.—(5)—All unusual occurrences, called *diræ*, were important. If salt were spilled on the table, if a person sneezed, if strange voices were heard, strange sights observed, or any thing of this kind—the most urgent journeys might be prevented—the leading affairs of the state altered in their course—and even wars undertaken or avoided.

8. Besides these methods, the Augurs sometimes determined matters by lots of various kinds, by names of various kinds, &c.; and all such diviners were called *Sortilegi*.

9. There were other Augurs, who foretold by the stars, and these were denominated by the various titles of *Astrologi*, *Mathematici*, and *Genethliaci:* sometimes also called *Chaldæi* and *Babylonii*, because astrology was a favourite science in Chaldee and Babylon.

10. *Cerriti* were persons disordered in their imagination, whose unconnected and silly talking was thought to have a reference to futurity, as if these persons were inspired by Ceres. The *Larvati* were like these, only that they were under the supposed influence of the Lares. Those influenced by the moon were called *Lunatici*.

V. HARUSPICES or Aruspices were those who prophesied from inspecting the entrails of victims—thence properly called *Extispices*. If the victim came up to the altar quietly—fell by one stroke—bled freely, &c.—the omens were good: if the reverses of these, then they were bad. The art of Haruspices was called *Haruspicina*.

2. Haruspices sometimes divined from various prodigies, as well as the Augurs; but their profession was not accounted so honourable as augury. Their chief was called Summus Haruspex.

VI. EPULONES were seven men whose duty it was to regulate all that related to the feasts and entertainments of the gods—the procession and feast of Jupiter especially. They were sometimes called Septemviri, and accounted little, if at all, inferior to the Augurs.

VII. The QUINDECEMVIRI were fifteen men appointed to consult the Sibbyline books, on affairs of great moment and emergency.

2. Their origin was this: An old woman from a foreign country came to king Tarquinius Superbus with nine books, which she offered to sell for a certain sum of money. The king refused to purchase; and she returned, after having burned three, to demand the same price for the remaining six. Tarquin laughed at her folly, and she burned three more—then demanded, for the remaining three, her former price. Having consulted the Augurs, the king did at length purchase; and the books were found to contain prophecies, supposed to relate to the fate of the Roman empire.

3. Two men, the Duumviri, were appointed at first to take care of them. In the year U.C. 387, ten men were charged with this duty, called Decemviri, and Sylla afterwards added the five.

4. The Sibbyline books were deposited in a stone

chest, below the ground of the Capitol; but this building having been burned in the Marsic war, the Sibbyline books were consumed also.

5. After this catastrophe, ambassadors were sent into various parts, to collect all the prophecies of the Sibbyls which they could find; and their collection formed the books of which the Quindecemviri had charge.

6. The college of the Quindecemviri was accounted very honourable. All the members were exempt from serving in the army, and from all other obligations whatever.

VIII. Rex Sacrorum was the high priest next in authority to the Pontifex Maximus. No person could hold this office in conjunction with any other. The name of Rex was given because he who succeeded to this dignity executed the duty of superintendence over all the sacred rites, which by ancient usage had devolved upon the kings themselves.

IX. The Fratres Ambarvales were a highly respectable college of twelve men, instituted by Romulus, who offered up sacrifices for the fertility of the ground. They bound their brows, during sacrifice, with ears of corn, while the people were crowned with oak leaves.

X. Curiones were parish priests, thus instituted: When Romulus divided the city into three wards, and each of these into curiæ or parishes, he ordained that there should be two persons set apart in each curia, to sacrifice for all the parishioners. Sixty

persons, who were separated for this purpose, were, therefore, properly called Curiones.

XI. FECIALES were a college of sacred persons, into whose charge all concerns relating to the declaration of war or conclusion of peace, were committed.

2. Feciales were supreme judges in every thing relative to treaties. The head of their college was called Pater Patratus.

3. All the members of this college, while in the discharge of their duty, wore a wreath of vervain around their heads; and bore a branch of it in their hands, when they made peace, of which it was an emblem.

CHAP. IV.

Of the Ministers of particular Gods.

I. The ministers of *particular* deities, whose names most frequently occur, are the Flamines, Vestals, Luperci, Salii, Potitii and Pinarii, and the Galli.

II. FLAMINES were the particular priests of any god; but there were three who had this name particularly appropriated to themselves, viz.

1. *Flamen Dialis*, the high-priest of Jupiter, who was next in authority to the Rex Sacrorum, and honoured by the attendance of a lictor, by the curule chair, and the toga prætexta. This priest was subject to many little restrictions. He might not take

an oath, nor stay one night out of the city, nor ride on horseback, &c.; besides which, he was obliged to relinquish his office if his wife died.

2. *Flamen Martialis*, who was high-priest of Mars.

3. *Flamen Quirinalis*, the high-priest of Romulus.

These were three chosen from amongst the patricians by the people, and solemnly inaugurated to their office by the Pontifex Maximus and college of Augurs.

II. VESTALES VIRGINES were the virgin priestesses of the goddess Vesta. It was their duty to preserve alive continually the sacred fire of the goddess—to perform all the rites of her worship—and to keep, with faithful secresy, the image of Minerva, called Palladium, on the safety of which the prosperity of the Roman empire was foolishly supposed to depend.

2. They entered upon their office at the age of six—were employed four years in learning the ceremonies of their ministry—spent the following ten years in the exercise of their sacerdotal functions, and ten years more in instructing noviciates.

3. Vestals were made to vow the strictest chastity until they were thirty years old, after which they might marry if they chose. If any one broke this vow, she was buried alive in the Campus Sceleratus, and her guilty paramour whipped to death in the Forum.

4. These priestesses enjoyed many honours and some important privileges. In public they had a lictor to attend them; prætors and consuls, when

they met them, lowered their fasces, and went out of their way to show them respect; and if a criminal, going to be executed, accidentally met them, he was pardoned.

5. The order of vestal virgins, which existed before the building of Rome, was abolished by Theodosius the Great, after having remained for upwards of a thousand years.

IV. LUPERCI were the priests of Pan, and thought to be the most ancient order at Rome. They were divided into three companies, viz. Fabiani, Quintiliani, and Julii.

2. *Lupercalia* was the festival of Pan. It was celebrated annually in the month of February. On this occasion, after the sacrifice of a goat and dog, two naked boys being sprinkled with their blood, ran through the city, beating every person whom they met with lashes provided for the purpose; and the young married women by no means sought to avoid them, supposing that to be thus whipped rendered them more fruitful.

V. SALII were the twelve priests of Mars, appointed to take care of the sacred ancilia or shields, one of which was supposed to have dropped from heaven, in the reign of Numa, and to have been the cause of healing a great plague, which had destroyed many people.

2. The *Festum Anciliorum* was celebrated in the month of March. The priests, during the procession, were arrayed in scarlet embroidered tunics, with

broad belts bound by brazen clasps. On their left arm was one of their ancilia, by their side a sword, on their head a helmet with a long apex or cone, and in their right hand a spear. During the procession they clashed these arms together, and danced at the same time to the sounds which they were making.

3. The luxurious living of the priests of Mars became proverbial—hence, "*saliares dapes*" for sumptuous entertainments. The three seniors of the order of the Salii were called Præsul, Vates, and Magister.

VI. Potitii and Pinarii were the priests of Hercules, instituted by Evander, and reported to have been instructed in his rites by Hercules himself.

VII. Galli were the priests of Cybele, who is the same as Rhea. They were all eunuchs. Various names were given to them, viz. Curetes, Idæi, Corybantes, and Dactyli. Their chief priest was called Archigallus.

2. *Hilaria* was the name of the festival of Cybele. The priests celebrated it with all the antics and gestures of mad people, dancing, like the Salii, in armour, and shouting, making a confused noise with various musical instruments, particularly drums and cymbals; sometimes also cutting themselves, and uttering the most dreadful imprecations.

BOOK III.

OF THE CIVIL GOVERNMENT OF THE ROMANS.

CHAP. I.

Concerning the various forms of Government.

I. Three forms of government were at different periods established at Rome—the Regal, Republican, and Imperial. The Regal continued for nearly 250 years; the Republican for about 450; and the Imperial, until the abdication of Augustulus, for a little more than 500 years.

II. The REGAL government conferred upon the king the honour of generalship over the national armies, in war; the authority of chief magistrate, in peace; and supremacy in all matters relative to religion.

2. The king had a senate of aged and wise men for his counsellors: to these he mentioned his plans, which, after having obtained their sanction, were afterwards referred for ratification to the people.

3. To connect his subjects more firmly together, Romulus divided them all into Patricians and Plebeians. Patricians were the patrons of the Plebeians, and it was their duty to protect them, give them counsel, and be to them, in all respects, what a father

is to his family. It was the duty of Plebeians, on the other hand, to support in every case their patrons, both with their most active exertions and their property. He who broke these engagements was deemed infamous, and an outlaw.

4. The people, therefore, though in name the least, were in reality the highest order in the original state of the regal government of the Romans. But the policy of Servius Tullius deprived them of their power.

5. Under former kings, Roman citizens voted in any public affair—either individually, and then a majority of votes decided—or by parishes, [Curiæ, see Book II. chap. 3, s. x.] and then the majority of parishes carried. In both cases the vote of a poor man was equal to that of the richest, so that *numbers* always had the preponderating influence in the state. Now it was the policy of Servius Tullius to have the constitution governed by a balance of *property*, rather than by a balance of *numbers*. To effect this, he divided all the subjects of the state into six classes, according to their property, and again subdivided each of these classes into smaller divisions, called centuries. He then ordained that assemblies of these centuries should be held; that the most important business of the state should be transacted in them; and that every business brought before them should be decided by the votes of the centuries, and not, as before, by the votes of individuals or parishes.

6. The scheme which he devised was thus regulated:

	Asses.		£	*s.*	*d.*		*Class.*	*Centuries.*
Those who were worth	100,000	value in British currency,	322	18	4	were admitted into the	First,	98
	75,000		242	3	9		Second,	21
	50,000		161	9	2		Third,	21
	25,000		80	14	7		Fourth,	21
	11,000		35	10	5		Fifth,	31
	—			—			Sixth,	1
							Total.....	193
							Subtract first class	98
							Remainder	95

7. By this view it will be seen that the first class, which was composed of all the wealthiest citizens, and which contained in reality a smaller number of persons than any other of the classes, had yet three votes more than they all put together; so that the power was entirely wrested out of the hands of the poor. It was one consolation to them, however, that the necessary taxes were now to be levied according to the centuries; so that, if the rich possessed in the assemblies of centuries an hundred times more influence than the poor, they were obliged to pay an hundred fold more of taxes towards the necessary supplies of the state.

III. The REPUBLIC of Rome was at first composed of an ultra aristocracy and a jealous democracy, kept together by persons who, under different names, exercised the full authority of kings.

2. The union of three so different forms of government was likely to produce a system which would for the most part be free from the greater evils incident to each, and in which we might expect to find a proper balance of power nicely preserved.

3. Yet the Roman republic was far from being a happy, regular, or peaceful government. The senate and people were frequently at variance; and the result of their dissentions would on various occasions have proved fatal, if extraordinary officers had not been opportunely created, endowed with absolute authority to put into hasty execution the mature counsels of wisdom which such emergencies required.

4. The republic owed its glory to the emulation and ambition of its Consuls, who, being annually elected, endeavoured to advance the general good as much as possible during the continuance of their authority. And it owed its stability to that love of country which animated every bosom, and had been inspired by their religion and the liberty of citizenship.

5. The legislative bodies of the republic, its officers, and laws, are described in the following chapters.

IV. The IMPERIAL government vested all the au-

thority in one man, who, though absolute, *(legibus solutus,)* governed under the forms of the republic.

CHAP. II.

Of the Legislative Authorities.

I. The legislative authorities of the republic were the Senate, and the Comitia Curiata, Centuriata, and Tributa.

II. The SENATE was the supreme court of the ancient Romans.

2. Its ordinary sittings, which were usually in some temple (for there was no regular senate-house) took place on the kalends and ides of every month, and formerly on the nones also.

3. The magistrates who had power to convene the senate were the Dictator, Consuls, Prætors, Tribunes, and Interrex.

4. The power of the senate chiefly consisted in the direction of the public money—the guardianship of religion—the gift of provinces to the Consuls and Prætors—the cognizance of public crimes—the reception of foreign ambassadors—the decision of disputes between the rival cities of their allies—the absolute interpretation of the laws—the postponement of the assemblies of the people—and the power of creating a Dictator.

5. Sometimes Consuls were invested by the senate

with dictatorial or absolute authority over the lives and property of the people, and with full powers to raise armies and carry on war without the sanction of the people. The decree of the senate conveying this authority was couched in these words: "*Dent operam Consules ne quid detrimenti respublica caperet*"—(let the Consuls take care that the republic receive no harm); and this was called the *extremum* vel *ultimum decretum*.

6. Senators, before they came to the senate, were always supposed to have made their private devotions before an altar to that god in whose temple the senate should be held, with offerings of frankincense and wine.

7. Before the business of the senate commenced, the presiding magistrate first offered sacrifices and consulted the Aruspices. The president then asked, concerning the subject of meeting, the opinion of all present, beginning with the Consuls elect, the *Princeps Senatus* (he that was first on the roll of senators which was kept by the Censor) and so on with the others, according to their rank and standing.

8. A decree of the senate was made by a separation of the members *(per discessionem)*, that is, by those who were of the same opinion going to one side of the house, and those who were of a different sentiment going to the other side; hence the phrase "*Ire pedibus in sententiam alicujus.*"

9. An ordinary meeting of the senate was called *senatus legitimus;* an extraordinary meeting, *senatus*

edictus: to ask an opinion relative to a motion, *rogare sententiam:* to cause delay to a motion, *moram facere:* to make a motion, or lay any business before the senate, *referre ad senatum:* a decree of the senate, *senatus consultum* vel *decretum:* an opinion of the senate, when the passing of its decree was prevented by a Tribune, *senatus auctoritas:* and the interference of a Tribune was called *intercessio.*

10. After all the business had ended, the presiding magistrate exclaimed, "*Non amplius vos moramur,*" (we detain you no longer); and by these words he was said, *mittere senatum,* to dismiss the senate.

III. SENATORS were distinguished by a particular habit called *tunica laticlavia,* and by shoes called *calcei lunati.*—[See Book V. chap. 2.]

2. The age which qualified for admission into the senate was twenty-seven, when the office of treasurer *(Quæstor)* might be held; and the least value of property requisite was 800 *sestertia.* Augustus raised this to 1200, and supplied the remainder to those senators who were not so rich. A sestertium was equal to £8 : 1 : $5\frac{1}{2}$.

3. The number of senators varied with the times. Under Romulus, it was 100. From his time until the dictatorship of Sylla, it averaged about 300. After the death of Julius Cæsar, it was 1000; but Augustus reduced it to 600.

4. The senators whom Brutus added, after the expulsion of Tarquin, were called *Conscripti,* (the

enrolled). In process of time, this title was applied to them all indiscriminately.

IV. COMITIA were assemblies of the people, lawfully convened, to decide, under the presidency of some magistrate, concerning the expediency or inexpediency of public measures.

V. COMITIA CURIATA were assemblies of the various curiæ or parishes into which the city was divided. They met in that part of the Forum called *Comitium*.

2. These assemblies were held for the purpose of conferring military command, and establishing laws relative to religion or testaments; but they were not so frequent towards the latter end of the commonwealth as at the beginning.

3. No person was entitled to vote in the Comitia Curiata who did not actually reside in some one of the parishes into which the city of Rome was divided.

VI. COMITIA CENTURIATA were assemblies of the various centuries into which the six classes of the people were divided.—[See Book III. c. 1. s. iv.]

2. Those who belonged to the first class were termed *classici*, by way of pre-eminence—hence *auctores classici*, respectable or standard authors; those of the last class, who had no fortune, were called *capite censi*, or *proletarii*; and those belonging to the middle classes were all said to be *infra classem* —below the class.

3. Comitia Centuriata were the most important of all the assemblies of the people. In these, laws

were enacted, magistrates elected, and criminals tried. Their meeting was in the Campus Martius.

4. It was necessary that these assemblies should have been summoned seventeen days previously to their meeting, in order that the people might have time to reflect on the business which was to be transacted.

5. Candidates for any public office, who were to be elected here, were obliged to give in their names before the comitia were summoned. Those who did so were said to *petere consulatum* vel *prætoram*, &c.; and they wore a white robe, called *toga candida*, to denote the purity of their motives, on which account they were called *candidati*.

6. Candidates went about to solicit votes *(ambire)*, accompanied by a nomenclator, whose duty it was to whisper the names of those whose votes they desired; for it was supposed to be an insult not to know the name of a Roman citizen.

7. *Centuria prærogativa* was that century which obtained by ballot the privilege of voting first.

8. When the centuria prærogativa had been elected, the presiding magistrate, sitting in a tent *(tabernaculum)*, called upon it to come and vote. All that century then immediately separated themselves from the rest, and entered into one of the enclosed places for the centuries, called *septa* or *ovilia*. Going into these, they had to cross over a little bridge *(pons)*; hence the phrase *de ponte dejici*—to be deprived of the elective franchise.

9. At the farther end of the *septum* stood officers, called *Diribitores*, who handed waxen tablets to the voters, with the names of the candidates written upon them. The voter then putting a mark *(punctus)* on the name of him for whom he voted, threw the tablet into a large chest, and, when all were done, the votes were counted.

10. If the votes of a century for different magistrates, or respecting any law, were equal when counted, the vote of the entire century was not reckoned among the votes of the other centuries; but in trials of life and death, if the tablets pro and con were equal, the criminal was acquitted.

11. The candidate for whom the greatest number of centuries voted, was duly elected, *(renunciatus est)*: when the votes were unanimous, he was said *ferre omne punctum*—to be completely successful.

12. When a law was proposed, two ballots were given to each voter; one, with U. R. written upon it, for *Uti Rogas*—as you propose; and the other with A. for *Antiquo*—I am for the old one.

13. In voting on an impeachment, one tablet was marked with A. for *Absolvo*—I acquit; hence this letter was called *litera salutaris;* the other with C. for *Condemno*, I condemn; hence C. was called *litera tristis.*

VII. Comitia Tributa were assemblies of the tribes, instituted for the purpose of restraining the influence which the rich possessed in the comitia centuriata.

2. In comitia tributa, rich and poor, who had the right of citizenship, possessed equal votes; and every individual had privilege to vote who had the full right of a Roman citizen, whether he dwelt in Rome or not.

3. The number of tribes was at first three, afterwards thirty-five. The country tribes (*tribus rusticæ*) were accounted most honourable.

4. In these assemblies, all inferior city magistrates, such as Ædiles, Quæstors, &c. were created; priests, such as Pontifices, Augures, Feciales, &c. were ordained; those laws were made called *Plebiscita*; and trials were held concerning fines.

5. Comitia tributa were held in the Campus Martius, when magistrates were to be elected; but when laws were to be made, or trials held, they were commonly in the Forum, and sometimes in the Capitol and Circus Flaminius.

6. These assemblies were summoned in the same manner as other comitia; but thunder or lightning put a stop to their transactions. It was a constant rule from the beginning of the republic, *Jove fulgente cum populo agi nefas esse*—'tis impious to transact business with the people if Jupiter thunder.

CHAP. III.

The ordinary Magistrates under the Republic.

I. The principal ordinary magistrates under the republic were the Consuls, Prætors, Censors, Tribunes of the people, Ædiles, and Quæstors.

II. Consuls, two in number, were the chief magistrates of the Roman republic. They had authority over all others, except the Tribunes. They commanded the armies in war, levied soldiers, appointed their pay, and named their officers. They assembled the senate and people when they chose, laid before them what they pleased, and executed their decrees. They received all letters from foreign provinces and kingdoms; gave audience to ambassadors; and, in fine, succeeded to all the powers, without the name, of kings.

2. The insignia of Consuls were: a robe, called *toga prætexta*—an ivory chair of state, called *sella curulis*—an ivory sceptre, *scipio eburneus*—and the *fasces*, a bundle of rods tied together, with an axe in the centre, carried before them by sergeants called *lictors*.

3. Consuls were elected annually. Their election took place towards the latter end of July or the beginning of August; but their entrance into office was not until the 1st of January following. This interval was allowed them that they might make themselves well acquainted with the affairs of the republic; and

during its continuance they were called *Consules designati.*

4. The Licinian law ordained that one of the Consuls should be Plebeian. The insignia above mentioned were enjoyed by the Consuls alternately every month; but their authority was equal, except in some minor matters, where he who had most children was allowed the presidency.

5. It was requisite, before obtaining a consulship, that the candidate should have previously filled the offices of Quæstor, Ædile, and Prætor. The legal age, therefore, for entering on the consulship, must have been forty-three.

6. Consuls, immediately on their entrance into office, cast lots, (provided they could not otherwise agree,) for the provinces which they were to have in charge, if this matter had not been previously settled by the senate.

7. Under the Emperors, the authority of the Consul became little more than nominal, though their insignia were apparently more honourable. Under the Emperor Justinian, in the year U. C. 1293, Consuls ceased to be elected.

III. PRÆTORS were officers elected annually, and next in dignity to the Consuls, whose duty it was to administer justice to the people during the occasional absence of the Consuls on foreign war.

2. The whole authority of the Prætor was comprehended in the words *do, dico, addico*—I give, pronounce, adjudge; i. e. it was confined to the giving

of forms of writs, &c., the pronouncing sentences, and the adjudication of the goods of a debtor to a a creditor, or matters of this kind.

3. There were two Prætors for the city of Rome—one for strangers, who was thence called *Prætor Peregrinus;* and the other for citizens, *Prætor Urbanus.* On their entrance into office, they drew lots among themselves for these situations.

4. Beside the city Prætors, there was an indefinite number of others sent to the provinces, over many of which they were supreme governors.

5. Prætors were honoured with the toga prætexta, the curule chair, and with two lictors within the city and six without, bearing the fasces without the securis.

6. When the Prætor Urbanus entered upon his office, he swore to observe the laws, and then published an edict or system of rules, according to which he was to administer justice for the year. These, if framed by himself, were called *Nova Edicta;* if copied from others, *Tralatitia.* All of these edicts were collected, in the reign of the Emperor Hadrian, into one code, called *Edictum Perpetuum.*

IV. CENSORS were two officers, chosen every five years, to guard and inspect the morals and estimate the fortunes of the people. They were generally chosen from among those individuals who had filled the consular office with most respectability; and on this account they were honoured with all the insignia of Consuls, except the fasces.

2. Censors had it in their power to exclude a senator from the senate, and make him pay a fine; they could deprive a knight of his horse; remove a respectable citizen from his own tribe to one that was lower; and deprive any one of all the rights of citizenship, except liberty, for any base or improper conduct.

3. The authority of Censors did not extend to public, but private crimes, such as—if one contracted debt without reason, behaved cowardly in war, or perjured himself; if a man remained too long unmarried, he was obliged to pay a fine, called *Æs uxorium*.

4. As the sentence of Censors *(Animadversio Censoria)*, only affected a person's character, it was therefore properly called *Ignominia*. Yet even this was not unchangeable; the people or next censors might reverse it.

5. In addition to the revision of morals, Censors had the charge of paving the streets--making roads, bridges, and aqueducts—preventing private persons from occupying public property—and frequently of imposing taxes.

6. A census was taken by these officers, every five years, of the number of the people, the amount of their fortunes, the number of slaves, &c. After this census had been taken, a sacrifice was made of a sow, a sheep, and a bull—hence called *suove-taurilia*. As this took place only every five years, that space of time was called a *lustrum*, because the sacrifice was

a lustration offered for all the people; and therefore *condere lustrum* means to finish the census.

V. TRIBUNES were ten officers elected annually in the comitia tributa, for the purpose of defending the rights of the people against the tyranny of patricians.

2. Tribunes were always plebeian, either by birth or adoption. They entered on their office the 10th of December, but were allowed no external marks of dignity, except a viator or beadle, who accompanied them.

3. The entire authority of Tribunes was comprehended in one word, *Veto*—I forbid. Their interference in any case, with this word, was called *Intercessio*.

4. The persons of Tribunes were sacred. This made them gradually so presumptuous, that they did almost whatever they pleased. They negatived the decrees of the senate—prevented the enrolment of armies—the payment of tribute—the election or the actions of other and superior magistrates.

5. One Tribune might negative by his veto the proceedings of all the others. This law furnished those who wished to check the tribunitian authority with the most effectual means. They had only to gain over one of the Tribunes to their party, and when his veto was interposed, the others were of little value.

6. Comitia tributa were convened by the Tribunes and the laws of the people *(Plebiscita)* enacted under their authority.

7. In the time of the Emperors, the office of Tribune continued, but the power was only a shadow. Their authority was decreed by obsequious senators to the Emperors themselves; hence they were *Tribunitia potestate donati.*

VI. ÆDILES were created to take care of all public buildings and works of the city; also to superintend markets, taverns, &c.

2. There were two kinds of Ædiles—*Curules* and *Plebis.* Ædiles Plebis were chosen from among the people: Ædiles Curules, who were the more respectable, from among the patricians. These derived their name from the privilege which they enjoyed of using the ivory chair of state, *(Sella Curulis).*

3. The exhibition of public games belonged to the Ædiles, especially the Curule; and as these were frequently young men, aspiring to the higher honours, they usually went to the greatest expense with them, in order to gain favour with the people.

4. The persons of Ædiles were sacred, as well as Tribunes. They enjoyed an honourable distinction in the senate, and were allowed to wear the toga prætexta.

VII. QUÆSTORS were the lords of the treasury, which was kept in the temple of Saturn. They entertained foreign ambassadors, exacted public taxes, preserved the silver military standards, superintended the funerals of those who were buried at public expense, had a seat in the senate, and were possessed of a certain jurisdiction.

2. Two Quæstors remained at Rome, called *Quæstres Urbani.* Besides these, there were *Quæstores Provinciales* or *Militares,* whose office it was to attend Consuls or Prætors to their provinces.

3. When the governor of a province was absent, Quæstors usually filled his place. For the legions, they performed all the duties that usually devolve upon the commissaries of our armies, and that part of the camp where was their tent, was called *Quæstorium.*

CHAP. IV.

Of Extraordinary Officers under the Republic.

I. The principal extraordinary officers under the republic were the Dictator, Decemviri, and Military Tribunes.

II. The DICTATOR was an officer created only in times of great danger and emergency, by the advice of the senate and nomination of the Consul—supreme both in peace and war, and above all law.

2. He was attended by twenty-four lictors with their fasces and secures, and had an officer to assist him, called *Magister Equitum,* who was of great respectability, being commonly chosen from among those who were of consular or prætorian dignity.

3. It was the design of the republic that a Dictator should resign his authority so soon as the business for which he was created had been settled.

4. Though the authority of the Dictator was absolute, yet it must have been a great check on him, that he was liable to be arraigned for any impropriety of conduct, by the people, as soon as he had abdicated.

5. While a Dictator continued in office, all other officers either entirely relinquished their duties, or acted without their usual insignia.

III. DECEMVIRI were ten men appointed, U.C.300, to frame a code of laws which would be constant and immutable. The twelve tables, which were the constant rule of public and private right, were framed by them.

2. The Decemvirs were endowed with supreme power so long as they were engaged in executing the work for which they were appointed; but after two years, having abused their authority, and begun to act tyrannically, they were deposed, and all either perished in prison or died in exile.

IV. MILITARY TRIBUNES, with consular power, were officers, six in number, created instead of Consuls, at the instigation of the people, in order that they might not be entirely excluded from civil honours.

2. Of Military Tribunes, three ought to have been plebeian, and three patrician; but this was little attended to, and the order itself subsisted only from the year U. C. 310 to U. C. 387, after which the regular consulship was again established.

CHAP. V.

Of Provincial Officers.

I. The principal provincial governors employed under the Roman name were Proconsuls, Propræ-tors, Quæstors, Legati, and Procurators.

II. The difference between PROCONSULS and PRO-PRÆTORS was little more than nominal.

2. Every province, whether consular or præto-rian, was divided into a certain number of circuits, *(conventus)*; the principal towns in each of which were visited by the governor, (Proconsul or Pro-prætor,) in rotation, until he had finished the annual term of his authority. The object of this visitation was to administer justice to the people, like our judges, and to decide between them those matters which were of the greatest importance.

3. The retinue of Proconsuls and Proprætors was composed of young officers, the sons of noblemen, who went out to learn the art of war, and become acquainted with public affairs. These, from the inti-macy which they usually had with the governor, were called *Contubernales*.

4. If a provincial governor behaved improperly in office, he was liable to a trial, when he had to vacate his situation. Usual charges were—for extortion *(repetundarum)*, for embezzling the public money *(peculatus)*, or for treason *(crimen majestatis)*.

III. QUÆSTORS were next in dignity to the Proconsuls and Proprætors.

IV. LEGATI were those next in authority to the Quæstors, and appointed either by the senate or president of the province, who was then said to *aliquem sibi legare.*

2. The office of Legati was very dignified and honourable. They acted as lieutenants or deputies in any business for which they were appointed, and were sometimes allowed the honour of lictors.

V. Under the Emperors, beside the governor of a province, there was an officer called PROCURATOR. It was his duty to manage the affairs of the revenue.

2. A Procurator was sometimes entrusted with the authority of Proconsul in some district of a province which was too large for the visitation of the governor. Pontius Pilate was Procurator of Judea, which was only a part of the province of Syria.

CHAP. VI.

Of Imperial Magistrates.

I. Distinguished imperial officers were the Præfectus Urbi, Præfectus Prætorio, Præfectus Annonæ, Præfectus Militaris Ærarii, and Præfectus Classis.

II. PRÆFECTUS URBIS was, as it were, the substitute of the Emperor *(vicarius)*; an officer whose

authority was very great, not only in the city, but within a hundred miles of it *(intra centesimum ab urbe lapidem)*. Except that the Præfectus Urbis possessed more power, his office was very like that of Lord Mayor amongst us.

2. The Præfect of the city executed many of the duties of Prætor and Ædile. He administered justice between masters and slaves; punished civil fraud, and all transgressions against public order; and he superintended the provisions and buildings of the public.

III. PRÆFECTUS PRÆTORIO, the commander of the Prætorian cohort, or Emperor's body guard.

2. The authority of this officer depended on the caprice of the Emperor; but it was sometimes so great, as to be, in fact, little, if at all, inferior to the Emperor's, *(non multum abfuerat ab principatu)*. Trials and appeals were brought before the Prætorian Prefect, and from his decision there was no appeal but to the Emperor himself.

3. The office of Prætorian Prefect was divided by Constantine among four; and its duties were changed from a military into a civil character.

IV. PRÆFECTUS ANNONÆ—he who had the charge of procuring corn for the people. As the subsistence of the Romans depended, in a great measure, on the exertions of this officer, he was consequently possessed of much authority.

V. PRÆFECTUS MILITARIS ÆRARII—the treasurer of the army fund.

VI. PRÆFECTUS CLASSIS—the lord admiral. Two fleets were stationed, by Augustus, one at Ravenna, on the Hadriatic, and the other at Misenum, on the Tuscan Sea. Each of these had its own Præfect.

VII. Besides these, there were many offices of great importance constituted under the Emperors; but in general the names of those who filled them sufficiently explain their duty.

CHAP. VII.

Of Inferior Officers.

I. Inferior public characters, whose names are most frequently met with in Roman history, are—Præcones, Scribæ, Lictores, Accensi, Viatores, and the Carnifex.

II. PRÆCONES—public criers or heralds. They commanded silence in court by saying "*silete*," or "*tacete*;" and at sacrifices, by crying aloud "*favete linguis*," or "*ore favete*." In assemblies of the people, they called upon the tribes and centuries to vote, proclaimed the names of those who were elected, and many other things of this kind. Their office was much more profitable than honourable.

III. SCRIBÆ were scriveners or notaries, who wrote out the laws and proceedings of magistrates. They kept the public accounts, and were employed by private individuals to execute for them writings similar

to those which we get done by our attorneys. Their profession was a regular one, and not disreputable.

IV. LICTORES, who carried the fasces and securis before Consuls and other high officers. They opened a way through the crowd for the Consul, saying words like these—"*cedite, Consul venit,*" or "*date viam Consuli.*" It was their duty also to inflict punishment on the condemned.

V. ACCENSI—those who summoned people to the comitia. Before the invention of chronometers, an Accensus called out in court when it was the third hour, *i. e.* nine o'clock, when it was midway, &c.

VI. VIATORES—public attendants on the Tribunes. Those who formerly summoned senators from the country were also called Viatores.

VII. CARNIFEX—the public executioner or hangman. His office was held in equal detestation among the Romans as among ourselves. He was not permitted to reside in the city, but at a place called Sestertium, where slaves were burned or thrown out unburied, and which was full of gibbets and crosses.

CHAP. VIII.

The various Orders of the People.

I. Romulus divided all his subjects into two distinct orders, by the names of PATRICIANS and PLEBEIANS; the former being the wealthy and respect-

able, and the latter the poorer of the people.—[Vide Book III. c. I, s. vi.]

II. The EQUITES were a third order of Romans, intermediate between the Patricians and Plebeians. No one could be admitted into this order who was not worth, in entire property, £3,229 : 3 : 4—(400 sestertia).

2. The Equites, who may be called knights, were allowed a horse and gold ring at the public expense; hence the phrases *annulo aureo donari*—to be made a knight; and *adimere equum*—to degrade a knight.

3. The duty of Equites was at first only to serve as cavalry in the army; but afterwards they were permitted to act as judges or jurymen, and to farm the public revenue (*vectigalia conducere*).

IV. There was another division of the Roman people into Nobiles, Novi, Ignobiles.

2. Nobiles were those whose ancestors had borne any curule office, that is, any of the offices of Censor, Prætor, Consul, or Curule Ædile.

3. Novi were those who were the first of their family that had risen to any curule office. The Nobiles had what was called the *jus imaginum*, or right of keeping the images of their ancestors, which was equivalent to the right of bearing a coat of arms among us. The Novi had only the right of making their own images. And the Ignobiles were those who had no privilege either to make images of their ancestors or themselves.

CHAP. IX.

The Names of the Romans.

I. The Romans were divided into various clans *(gentes)*, and every clan into several families.

II. Those Romans who were of respectable lineage had generally three names—the *Prænomen*, the *Nomen*, and the *Cognomen*. The prænomen denoted the *individual*, and was therefore the first written; the nomen pointed out the *gens*, and the cognomen distinguished the *family*. Thus, in the name Publius Cornelius Scipio—Publius, is the prænomen—Cornelius, the nomen—and Scipio, the cognomen; from which we perceive that Publius was of the clan called the Cornelian *(gens Cornelia)*, and one of the family of the Scipios.

III. When children were nine days old, they got their prænomen. The eldest son usually received that of his father, and the other sons were named from their uncles or other relations.

IV. Girls were usually called by the name of the gens. In the gens Cornelia, were the families of Scipiones, Lentuli, Cethegi, Dolabellæ, Cinnæ, Syllæ, &c.: any daughter, therefore, of these families might be called Cornelia. If there were two daughters, the elder would be called Cornelia *Major* —the younger, Cornelia *Minor;* and if there were more daughters than two, they were commonly dis-

tinguished by their number: thus, *Prima*, *Secunda*, *Tertia*, *Quarta*, &c.; or more softly thus, *Tertulla*, *Quartilla*, &c.

CHAP. X.

Slaves.

I. All Roman citizens who might act as they pleased were called *Liberi:* those who were born of parents that had been always free, *Ingenui.*

II. Persons became slaves *(Servi)* among the Romans in two ways.

1. By being born in servitude, and such persons were called *Vernæ.* The children of any female slaves were legally the slaves of her master.

2. By sale. Criminals, for various offences, might be deprived of their freedom. In such cases, the goods of the condemned were usually confiscated, and his body scourged. He was then led beyond the Tiber to be sold. Those enemies also to the state, who were taken in war, were sold by auction.

III. At Rome there was a continual market for slaves. Those who dealt in that trade were called *Mangones* or *Venalitii.* These were obliged always to give a warranty with those whom they sold. Hence slaves who were exposed to sale were commonly naked, and bore about their necks a scroll, on which their good and bad qualities were specified.

IV. Slaves were made free by getting their names enrolled on the Censor's books, with their master's consent; or by will, or by manumission.

2. In manumitting a slave, these ceremonies were observed: The master brought his slave before the Prætor or Consul, and laying his hand upon his head, said, "I wish this man to be free, after the manner of the Romans," and let him go. The magistrate then, laying a rod upon his head, called *Vindicta*—declared him free. After this, his master or the lictor turning him round, struck him several times on the face or back with the same rod, and he was then bestowed with the cap called *Pileus*, in token of his liberty; hence, *Pileo donari* means to be made free.

CHAP. XI.

The Judges, Judicial Proceedings, and Punishments of the Romans.

I. The judicial proceedings of the Romans were either civil or criminal: the civil, were *private* cases, and the criminal, *public*.

II. PRIVATE CASES.

1. The Judges who presided in private cases were—the PRÆTOR, who was the supreme magistrate, and the ARBITRI, RECUPATORES, and CENTUMVIRI, who received their appointment and confirmation from the Prætor.

Arbitri were appointed to judge in easy cases, which did not properly come under the cognizance of the laws. Their office and duty seem to have been very much the same with those of a jury in a court of equity among us.

Recupatores were appointed to decide about receiving or recovering things lost or taken away.

Centumviri were the usual judges in private causes. Their number was properly 105—three from each of the 35 tribes. Cases respecting testaments and inheritances were commonly referred to them. Under the Emperors, the Centumviri formed the council of the Prætor; and they were sometimes entrusted with trials of the greatest importance.

2. The following is the manner in which private suits were carried on:

The plaintiff *(actor)* summoned the defendant *(reus)*, by a verbal message, and the latter was bound either to go immediately, or give a bond for his appearance. When both parties came before the Prætor, the plaintiff demanded a writ to prosecute, and required, of the defendant, bail for his appearance on a certain day.

On the appointed day, the Prætor ordered the writs to be read, and the parties to be called. If both were present, the plaintiff preferred his suit, and demanded a judge or judgment. No judges, however, could be determined upon without the concurrence of the defendant.

It was usually on the third day after the appoint-

ment of the judges, that the trial took place. The judges, before they took their seats, made solemn oath at the altar, called *Puteal Libonis*, that they would decide according to law. The advocates then began their pleadings, and the examination of witnesses on both sides.

After all had finished, the judges gave sentence. If the judges were not unanimous, the majority was sufficient to decide; if they were equally divided, the defendant was actually cleared; and if half condemned him to pay one sum, and the other half a less sum, the small damages only were required to be paid.

III. PUBLIC OR CRIMINAL CAUSES.

1. The judges in criminal cases were the PRÆTORS, who at first were only competent to try civil cases; but afterwards their jurisdiction extended also to public cases. After their election, it was customary with the Prætors to determine by lot what description of trials they should hold, viz. two of them took cognizance of private cases, and the rest presided, one at trials for extortion, another at trials concerning bribery, and so on.

2. QUÆSITORES or INQUISITORS were another class of judges in criminal cases. They were only invested with temporary authority to try particular actions, and so soon as the trial was over, they became private individuals as before.

3. The PEOPLE were chief judges in many criminal cases of great importance. Capital trials were

brought before the comitia centuriata, and trials concerning a fine were held in the comitia tributa. In both of these assemblies the method of proceeding was the same.

4. The manner of conducting a trial before the people was this :

The magistrate who was to be the accuser (for none but a magistrate could accuse any one before the people), having called an assembly, mentioned in it his intention, upon a certain day, to prefer certain charges against such an individual; and on the appointed day he ordered the criminal to be cited by a herald. If he were absent, he was straightway condemned; but if he were present, the magistrate began his charge, which he repeated three times within six days, and endeavoured each time to substantiate by proof.

After the third charge, a bill was published for three successive market days, in which the crime of the accused person, and the punishment which it deserved, were expressed.

On the third market day, the accuser again repeated his charge, and the criminal or his advocate was permitted to defend. When the people heard all that could be said for and against, they gave their votes either for the condemnation or acquittal of the criminal, and the votes of the majority of the centuries decided.

IV. The PUNISHMENTS inflicted among the Romans were—fine *(damnum)*, bonds *(vincula)*, stripes

(verbera), retaliation *(talio)*, infamy *(ignominia)*, banishment *(exilium)*, slavery *(servitus)*, and death. The methods of inflicting death were various; the chief were—beheading *(percussio securi)*, strangling in prison *(strangulatio)*, throwing a criminal from that part of the prison called *Robur (precipitatio de robore)*, throwing a criminal from the Tarpeian rock *(dejectio e rupe Tarpeia)*, crucifixion *(in crucem actio)*, and throwing into the river *(projectio in profluentem)*. The last punishment was inflicted upon parricides, or the murderers of any near relation. As soon as any one was convicted of such crimes, he was immediately blindfolded as unworthy of the light, and in the next place whipped with rods. He was then sewed up in a sack, and thrown into the sea. In after times, to add to the punishment, a serpent was put in the sack; and still later, an ape, a dog, and a cock. The sack which held the malefactor was called *Culeus*, on which account the punishment itself is often signified by the same name.

CHAP. XII.

Of the Laws of the Romans in general.

I. So soon as Romulus had divided his subjects into thirty curiæ or parishes, he began to call assemblies of those parishes, and to lay before them the laws by which he wished the state to be regulated. This laudable practice was followed by seve-

ral of his successors; and all the laws thus enacted were collected into one body by Sextus Papirius, who lived in the reign of Tarquinius Superbus. This collection was called, from him, *Jus Papirianum.*

II. After the expulsion of Tarquin, and the establishment of republicanism, many of these laws, those especially which related to the monarchy, were abolished, and the rest, not had in so much respect as before; on which account the people suffered inconvenience from the judicial proceedings which depended, for the most part, on the judgment of the court, under the direction of custom.

III. To remedy this inconvenience, commissioners were sent into Greece, that they might collect the best laws extant there; and upon their return, the Decemviri—[see chap. 4, s. iii.]—were created, to draw up a perpetual code for the regulation of the concerns of religion, and the affairs of the public and of private individuals.

IV. When the laws of the Twelve Tables, framed by the Decemvirs, had been published, the people understood their rights, but knew not how to obtain them. A scheme, therefore, of forms and cases, by which prosecutions ought to be directed, was invented by learned men, and called *Actiones legis.* The Patricians, however, contrived to keep the knowledge of these from the people, as well as the rules according to which the Pontifices regulated the calendar of court days *(Fasti)*, non-court days *(Nefasti)*, and half holydays *(Intercisi)*. But Cn.

Flavius, a man of ignoble birth, who had been raised to the ædileship, got a proper description and account of these things, and published them. His book was called *Jus Civile Flavianum.*

V. In addition to the laws of the Twelve Tables, the other great sources of Roman jurisprudence were, —the laws enacted in the Comitia Centuriata, *(Populiscita)*—the laws passed in the Comitia Tributa, *(Plebiscita)*—the decrees of the senate, *(Senatus Consulta)*—the edicts of Prætors, *(Jus Honorarium)* —and lastly, when the government was entrusted in the hands of one man, those decrees which he made, *(Principales Constitutiones).*

VI. In the reign of the Emperor Justinian, A. D. 529, the imperial constitutions were published in one book, called *Codex Justinianus.* There were then extant 2000 volumes respecting laws. These he directed an eminent lawyer, called Tribonian, with the assistance of sixteen others, to inspect, and to make from them a general collection of the whole Roman jurisprudence. This collection was finished A.D. 533, and called *Digestæ* or *Pandectæ.*

In the same year, an abridgment of the Digest, containing the first principles and elements of law, was published, under the title of *Institutes.*

In the course of his reign, Justinian made 168 constitutions and 13 edicts of his own; and as these made considerable alteration in the ancient law, they were called *Novellæ.* These four books, therefore, the *Code*, *Digest*, *Institutes*, and *Novels*,

make up the body of the civil law as reduced by Justinian.

VII. There were two ways by which the laws of the ancient Romans were usually distinguished, viz.

1. By the name of the person who proposed the law, as the *Papiria Lex*, by L. Papirius, a Tribune of the commons.

2. By the subject matter of the law itself, as the *Leges Agrariæ*, laws relating to lands—*Leges de Majestate*, laws concerning treason.

CHAP. XIII.

The Laws of the Twelve Tables.

Fragments of the Twelve Tables of laws before mentioned, as they have been collected and digested by the learned Jesuits Catrou and Rouillé.—*Hooke's Rom. Hist. vol.* i.

Table I.

OF LAWSUITS.

I. Law.—Go immediately with the person who cites you before the judge.

II. If the person you cite refuses to go with you before the judge, take some that are present to be witnesses of it, and you shall have a right to compel him to appear.

III. If the person cited endeavours to escape from

you, or puts himself in a posture of resistance, you may seize his body.

IV. If the person prosecuted be old or infirm, let him be carried in a *jumentum*, or open carriage. But if he refuse that, the prosecutor shall not be obliged to provide him an *arcera*, or a covered carriage.

V. But if the person cited find a surety, let him go.

VI. Only a rich man shall be security for a rich man. But any security shall be sufficient for a poor man.

VII. The judge shall give judgment according to the agreement made between the two parties by the way.

VIII. If the person cited has made no agreement with his adversary, let the Prætor hear the cause from sun-rising till noon; and let both parties be present when it is heard, whether it be in the Forum or Comitium.

IX. Let the same Prætor give judgment in the afternoon, though but one of the parties be present.

X. Let no judgments be given after the going down of the sun.

XI. When the parties have pitched upon a judge or arbitrator by consent, let them give securities that they will appear. Let him who does not appear in court pay the penalty agreed upon, unless he was hindered by some great fit of sickness, or by the performance of some vow, or by business of state, or by some indispensable engagement with a foreigner.

If any one of these impediments happen to the judge or arbitrator, or either of the parties, let the hearing be put off to another day.

XII. Whoever shall not be able to bring any witnesses to prove his pretensions before the judge, may go and make a clamour, for three days together, before his adversary's house.

Table XX.

OF ROBBERIES.

I. Law.—He that is attacked by a robber in the night, let him not be punished if he kills him.

II. If the robbery be committed by day, and if the robber be taken in the fact, let him be beaten with rods, and become the slave of him whom he robbed. If the robber be a slave already, let him be beaten with rods, and thrown down headlong from the top of the Capitol. If he be a child under the age of puberty, let him be corrected according to the Prætor's discretion, and let reparation be made to the injured party.

III. When robbers attack any person with arms, if the person attacked has cried out for help, he shall not be punished if he kill the robbers.

IV. When, upon a legal search, any stolen goods are found in a house, the robbery shall be punished upon the spot, as if openly and publicly committed.

V. For robberies committed privately, the robber

shall be condemned to pay double the value of the things stolen.

VI. Whosoever shall cut down trees which do not belong to him, he shall pay twenty-five asses of brass for every tree so felled.

VII. If any one comes privately by night, and treads down another man's field of corn, or reaps his harvest, let him be hanged up, and put to death, as a victim devoted to Ceres. But if he be a child under the age of puberty, let the Prætor order him to be corrected as he shall think fit, or let double satisfaction be made for the damage he has done.

VIII. If a robber and the person robbed agree together upon terms of restitution, no farther action shall lie against the robber.

IX. Prescription shall never be pleaded as a right to stolen goods; nor shall a foreigner have a right to the goods of any Roman citizen by the longest possession.

X. If any one betrays his trust, with respect to what is deposited in his hands, let him pay double the value of what was so deposited to him who entrusted him with it.

XI. If any one finds any of his goods in another man's possession, who became possessed of them by a breach of trust, let the Prætor nominate three arbitrators to judge of it; and let the wrongful possessor pay double the value of what he has gained by detaining them.

XII. If a slave has committed a robbery, or done

any damage with the privity and at the instigation of his master, let the master deliver up the slave to the person injured, by way of compensation.

Table III.

OF LOANS, AND THE RIGHT OF CREDITORS OVER THEIR DEBTORS.

I. Law.—Let him who takes more than one per cent. interest for money, be condemned to pay four times the sum lent.

II. When any person acknowledges a debt, or is condemned to pay it, the creditor shall give his debtor thirty days for the payment of it, after which he shall cause him to be seized and brought before a judge.

III. If the debtor refuses to pay his debt, and can find no security, his creditor may carry him home, and either tie him by the neck, or put irons upon his feet, provided the chain does not weigh above fifteen pounds; but it may be lighter if he pleases.

IV. If the captive debtor will live at his own expense, let him; if not, let him who keeps him in chains allow him a pound of meal a day, or more, if he pleases.

V. The creditor may keep his debtor prisoner for sixty days. If in this time the debtor does not find means to pay him, he that detains him shall bring him out before the people three market days, and proclaim the sum of which he has been defrauded.

VI. If the debtor be insolvent to several creditors,

let his body be cut in pieces on the third market day. It may be cut into more or fewer pieces with impunity; or if his creditors consent to it, let him be sold to foreigners beyond the Tiber.

Table IV.

OF THE RIGHT OF FATHERS AND FAMILIES.

I. Law.—Let a father have the power of life and death over his legitimate children, and let him sell them when he pleases.

II. But if a father has sold his son three times, let the son then be out of the father's power.

III. If a father has a child born which is monstrously deformed, let him kill him immediately.

IV. Let not a son, whose father has so far neglected his education as not to teach him a trade, be obliged to maintain his father in want; otherwise let all sons be obliged to relieve their fathers.

V. Let not a bastard be obliged to work to maintain his father.

Table V.

OF INHERITANCES AND GUARDIANSHIPS.

I. After the death of a father of a family, let the disposition be made of his estate, and his appointment concerning the guardianship of his children be observed.

II. If he dies intestate, and has no children to succeed him, let his nearest relation be his heir; if he has no near relation, let a man of his own name be his heir.

III. When a freed man dies intestate, and without heirs, if his patron be alive, or has left children, let the effects of the freed man go to the family of his patron.

IV. After the death of a debtor, his debts shall be paid by his heirs, in proportion to the share they have in his inheritance. After this, they may divide the rest of his effects, if they please, and the Prætor shall appoint three arbitrators to make the division.

V. If the father of a family dies intestate, and leaves an heir under age, let the child's nearest relation be his guardian.

VI. If any one becomes mad or prodigal, and has nobody to take care of him, let a relation, or, if he has none, a man of his own name, have the care of his person and estate.

Table VI.

OF PROPERTY AND POSSESSION.

I. Law.—When a man conveys his estate to another, let the terms of the conveyance create the right.

II. If a slave, who was made free on condition of

paying a certain sum, be afterwards sold, let him be set at liberty if he pays the person who has bought him, the sum agreed upon.

III. Let not any piece of merchandize, though sold and delivered, belong to the buyer till he has paid for it.

IV. Let two years' possession amount to a prescription for lands, and one for moveables.

V. In litigated cases, the presumption shall always be on the side of the possessor; and in disputes about liberty or slavery, the presumption shall always be on the side of liberty.

Table VII.

OF TRESPASSES AND DAMAGES.

I. Law.—If a beast does any damage in a field, let the master of the beast make satisfaction, or give up the beast.

II. If you find a rafter or a pole which belongs to you, in another man's house or vineyard, and they are made use of, do not pull down the house or ruin the vineyard, but make the possessor pay double the value of the thing stolen; and when the house is destroyed, or the pole taken out of the vineyard, then seize what is your own.

III. Whoever shall maliciously set fire to another man's house, or a heap of corn near his house, shall be imprisoned, scourged, and burnt to death. If he

did it by accident, let him repair the damage; and if he be a poor man, let him be slightly corrected.

IV. Whoever shall deprive another of the use of a limb shall be punished according to the law of retaliation, if the person injured does not agree to accept some other satisfaction.

V. If he has only dislocated a bone, let him pay 300 pounds of brass, if the sufferer be a freedman; and 150, if he be a slave.

VI. For common blows with the fist, and injurious words, the punishment shall be 25 asses of brass.

VII. Whoever slanders another by words, or defamatory verses, and injures his reputation, shall be beaten with a club.

VIII. Let him who has once been a witness, and refuses to bear witness again, though a public person, be deemed infamous, and made incapable of bearing witness any more.

IX. Let every false witness be thrown down headlong from the Capitol.

X. Whosoever shall wilfully kill a freedman, or shall make use of magical words to hurt him, or shall have prepared poison for him, or give it to him, shall be punished as a homicide.

XI. Let all parricides be thrown into the river, sewed up in a leather bag, and with their heads veiled.

XII. The guardian who manages the affairs of his ward ill, shall be reprimanded; and if he be found to have cheated him, he shall restore double.

XIII. A patron who shall have defrauded his client shall be execrable.

Table VIII.

OF ESTATES IN THE COUNTRY.

I. Law.—Let the space of two feet and a half of ground be always left between one house and another.

II. Societies may make what bye laws they please among themselves, provided they do not interfere with the public laws.

III. When two neighbours have any disputes about their bounds, the Prætor shall assign them three arbitrators.

IV. When a tree planted in a field does injury to an adjoining field by its shade, let its branches be cut off fifteen feet high.

V. If the fruit of a tree falls into a neighbouring field, the owner of the tree may go and pick it up.

VI. If a man would make a drain, to carry off the rain water from his ground to his neighbour's, let the Prætor appoint three arbitrators to judge of the damage the water may do, and prevent it.

VII. Roads shall be eight feet wide, where they run straight, and where they turn, sixteen.

VIII. If a road between two fields be bad, the traveller may drive through which field he pleases.

Table XX.

OF THE COMMON RIGHTS OF THE PEOPLE.

I. Law.—Let not privilege be granted to any person.

II. Let both, debtors who are got out of slavery, and strangers who have rebelled and returned to their duty, be restored to their ancient rights, as if they never offended.

III. It shall be a capital crime for a judge or arbitrator to take money for passing judgment.

IV. Let all causes, relating to the life, liberty, or rights of a Roman citizen, be tried only in comitia by centuries.

V. Let the people appoint Quæstors to take cognizances of all capital cases.

VI. Whoever shall hold seditious assemblies in the city by night shall be put to death.

VII. Let him who shall have solicited a foreigner to declare himself against Rome, or shall have delivered up a Roman citizen to a foreigner, lose his life.

VIII. Let only the last laws of the people be in force, (i. e. let the last supersede all former ones, in the same case made and provided.)

Table X.

OF FUNERALS, AND ALL CEREMONIES RELATING TO THE DEAD.

I. Law.—Let no dead body be interred or burnt within the city.

II. Let all costliness and excessive wailings be banished from funerals.

III. Let not the wood with which funeral piles are built, be cut with a saw.

IV. Let the dead body be covered with no more than three habits bordered with purple; and let no more than ten players upon the flute be employed in celebrating the obsequies.

V. Let not the women tear their faces, or disfigure themselves, or make hideous outcries.

VI. Let not any part of a dead body be carried away, in order to perform other obsequies for the deceased, unless he died in war, or out of his own country.

VII. Let no slaves be embalmed after their death. Let there be no drinking round a dead body; nor let any perfumed liquors be poured upon it.

VIII. Let no crowns, festoons, perfuming pots, or any kind of perfume, be carried to funerals.

IX. If the deceased has merited a crown in the public games, by any exploit of his own, or the expertness of his slaves, or the swiftness of his horses, let his panegyric be made at his funeral, and let his relations have leave to put a crown upon his head,

as well during the seven days he remains in the house, as when he is carried to be buried.

X. Let no man have more than one funeral made for him, or than one bed put under him.

XI. Let no gold be used in any obsequies, unless the jaw of the deceased has been tied with a gold thread; in that case, the corpse may be interred or burnt with the gold thread.

XII. For the future, let no sepulchre be built, or funeral pile raised, within sixty feet of any house, without the consent of the owner of the house.

XIII. Prescription shall never be pleaded against a man's right to his burial place, or the entrance to it.

Table XX.

OF THE WORSHIP OF THE GODS, AND OF RELIGION.

I. Law.—Let all persons come with purity and piety to the assemblies of religion, and banish all extravagance from thence. If any one does otherwise, may the gods themselves revenge it.

II. Let no person have particular gods of his own, or worship any new or foreign ones in private, unless they are authorized by public authority.

III. Let every one enjoy the temples consecrated by his forefathers, the sacred groves in his fields, and the oratories of his Lares. And let every one observe the rites used in his own family, and by his ancestors, in the worship of his domestic gods.

IV. Honour the gods of heaven, not only those who have always been esteemed such, but those likewise whose merit had raised them thither, as Hercules, Bacchus, Æsculapius, Castor, Pollux, and Romulus.

V. Let those commendable qualities, by which heroes obtained heaven, be ranked among the gods; as understanding, virtue, piety, fidelity; and let temples be erected to them. But let no worship ever be paid to any vice.

VI. Let the most authorized ceremonies be observed.

VII. Let lawsuits be suspended on festivals, and let the slaves have leave to celebrate them after they have done their work. That it may be known on what days they fall, let them be set down in the kalendars.

VIII. Let the priests offer up in sacrifice to the gods, on certain days, the fruits of the earth, and berries; and on other days, abundance of milk and young victims. For fear this ceremony shall be omitted, the priests shall end their year with it.—Let them likewise take care to choose for every god the victim he likes. Let there be priests appointed for some gods, Flamines for others, and Pontifices to preside over them all.

IX. Let no woman be present at the sacrifices which are offered up in the night, except at those which are made for the people, with the usual ceremonies. Nor let any one be initiated in

any mysteries brought from Greece, but those of Ceres.

X. If any one steals what belongs or is devoted to the gods, let him be punished as a parricide.

XI. Leave perjury to be punished with death by the gods, and let it be punished with perpetual disgrace by men.

XII. Let the Pontifices punish incest with death.

XIII. Let every one strictly perform his vows; but let no wicked person dare to make any offerings to the gods.

XIV. Let no man dedicate his field to the service of the altar; and let him be discreet in his offerings of gold, silver, or ivory. Let no man dedicate a litigated estate to the gods; if he does, he shall pay double the value of it to him whose right it shall appear to be.

XV. Let every man constantly observe his family festivals.

XVI. Let him who has been guilty of any of those faults which make men execrable, and are not to be atoned for by expiations, be deemed impious. But let the priest expiate such as are to be expiated.

Table XII.

OF MARRIAGES, AND THE RIGHTS OF HUSBANDS.

I. Law.—When a woman shall have cohabited with a man for a whole year, without having been

three nights absent from him, let her be deemed his wife.

II. If a man catches his wife in adultery, or finds her drunk, he may, with the consent of her relations, punish her even with death.

III. When a man will put away his wife, the form of doing it shall be, by taking from her the keys of the house, and giving her what she brought. This shall be the manner of the divorce.

IV. A child born of a widow, in the tenth month after the decease of her husband, shall be deemed legitimate.

V. It shall not be lawful for the Patricians to intermarry with the Plebeians.

CHAP. XIV.

Heads of some of the most important Laws passed in the Assemblies of the People, on the Motion of a Magistrate.

I. LAWS relative to the RIGHTS of Roman citizens.

Valeria lex, de Provocatione.—That any person should have liberty of appeal from the sentence of a magistrate to the people; and that no magistrate should punish a Roman citizen in case of such appeal.

Porcia lex.—That no magistrate should execute, or punish with rods, a Roman citizen; but that upon sentence of condemnation, he should give him permission to go into exile.

Sempronia lex, de Capite Civium.—That sentence should not be passed on the life of a Roman citizen without the order of the people.

Papia lex, de Peregrinis.—That all strangers should be expelled from Rome.

Junia lex.—That no strangers should be allowed the privilege of citizens.

Servilia lex.—That if any Latin accused a Roman senator, so that he was convicted, he should be honoured with the privilege of a citizen of Rome.

Licinia Mutia lex.—That all the inhabitants of Italy should be enrolled, in the list of citizens, in their own cities.

Julia lex, de Civitate.—That all those people who continued firm to the Roman interest, during the social war, should have the privilege of citizens.

Sulpicia lex.—That the new citizens who composed the eight tribes should be divided among the thirty-five old tribes, as a greater honour.

II. LAWS relative to MAGISTRATES.

Genutia lex.—That no person should be elected to the same magistracy twice within ten years, nor be invested with two offices in one year.

Sextia Licinia lex.—That one of the Consuls should be chosen out of the body of the commons.

Genutia lex.—That it might be lawful to elect both Consuls out of the commons.

Cornelia lex.—That the Prætors should always use the same method in judicial processes.

Martia lex.—That no one should be twice Censor.

Clodia lex.—That no Censor should put a mark of infamy on any person in his surveys, without the concurrence of his colleague.

Cæcilia lex.—That the Censors should be restored to their ancient power and dignity, which had been retrenched by the former law.

Antonia lex.—That no proposal should be ever made in future for the creation of a Dictator; and that no one should accept that office on pain of incurring capital penalty.

Valeria lex.—That the public treasure should be laid up in the temple of Saturn, and that two Quæstors should be created to take care of it.

Junia Sacrata lex.—That the persons of the Tribunes should be sacred; that an appeal might be made to them from the Consuls; and that no senator should be capable of filling the tribuneship.

Atinia lex.—That any Tribune of the commons should have the privilege of a senator, and, as such, take his place in the house.

III. Laws relative to the Senate.

Cassia lex.—That no person who had been condemned, or deprived of his office, by the people, should be allowed to enter the senate.

Claudia lex.—That no senator, or father of a senator, should possess a sailing vessel of above 300 *amphoræ*. (An amphora contained nine gallons English.)

Sulpicia lex.—That no senator should owe above 2000 *drachmæ*. (A drachma was equal to about 8d.)

Gabinia lex.—That the senate should be convened from the kalends of February to the kalends of March, every day, for the purpose of giving audience to foreign ministers.

Tullia lex.—That those to whom the senate had granted the privilege of a *Libera Legatio*, should not hold it above one year. (Libera Legatio was a titular office granted to those who wished to go into any of the provinces on private business, in order to influence their affairs favourably.)

IV. LAWS relating to LAWS.

Hortensia lex.—That whatever was enacted by the commons should be observed by the whole Roman people.

Cæcilia Didia lex.—That in one motion only one single matter should be proposed; and that before any law was preferred at the comitia, it should be exposed to public view three market days previously.

Licinia Æbutia lex.—That when any law was preferred relative to any charge or power, not only the person who brought in the bill, but likewise his colleagues in office, and all his relations, should be incapable of being vested with the said charge or power.

Cornelia lex.—That no person should be exempted from any law by the votes of senate, unless 200 senators were present in the house; and that no person, even thus excused, should hinder the bill for his exemption from being afterwards brought before the people for their approbation.

V. LAWS relative to ASSEMBLIES.

Ælia lex.—That in all assemblies of the people, the Augurs should make observations from the heavens, and that the magistrates should have the power of declaring against the proceedings, and of interposing in the decision of any matter.

Curia lex.—That no comitia should be convened for the election of magistrates without the approbation of the senate.

Gabinia lex.—That in the comitia for electing magistrates, people should not give their suffrages *viva voce*, but by tablets.

Papyria lex.—That in the comitia for passing or rejecting laws, suffrages should be given by tablets.

Sempronia lex.—That the centuries should be chosen by lot to give their votes, and not according to the order of the classes.

Another.—That the Latin confederates should have the privilege of giving their suffrages, as well as the Roman citizens.

Manilia lex.—That freed men should have the privilege of voting in all the tribes.

VI. Leges Agrariæ—laws relating to lands.

Licinia lex.—That no person should possess above five hundred acres of land, nor keep above one hundred head of great, or five hundred head of small cattle.

Flaminia lex.—That Picenum, a part of Gallia, whence the Senones had been expelled, should be divided among the Roman soldiers.

Sempronia lex prima.—That the Licinian law

should be enforced, and that all who held more land than that law allowed, should resign it immediately, to be divided among the commons.

Sempronia lex altera.—That all ready money found in the treasury of King Attalus, who left the Roman people his heirs, should be betowed on the poor citizens; and that the King's lands should be farmed, by the Censors, for a certain rent, which should be divided among the people.

Thoria lex.—That no person should pay any rent to the people for the land which he possessed.

Cornelia lex.—That the lands of proscribed persons should be common.

Julia lex or *lex Campania.*—That all the land in Campania, which used to be farmed of the state for a fixed rent, should be divided among the commons; and that all senators should swear to confirm and defend this law.

VII. LAWS TO REGULATE EXPENSES.

Fannia lex.—That upon high festivals, no one should expend more than a hundred *asses* per day; on ten other days in every month, thirty asses; and at all other times, ten asses. (An as was a piece of money, value about one farthing and a half.)

Didia lex.—That the laws for regulating expenses should reach all Italians; and that guests, as well as hosts, should incur a penalty for their offence.

Julia lex.—That two hundred sestertii should be allowed for provisions on the dies profesti; three hundred on the common festivals of the kalendar;

and a thousand at marriage feasts, and such entertainments. (A sestertius was worth about twopence.)

Oppia lex.—That no woman should have above half an ounce of gold—wear a party-coloured garment, or be carried in a chariot to any city or town, or to any place within a mile's distance, unless upon account of celebrating some sacred solemnity.

VIII. Laws relative to Military Affairs.

Sacrata lex Militaris.—That no soldier's name which had been entered on the muster-roll should be struck out without the party's consent.

Sempronia lex.—That soldiers should receive their clothes gratis, at the public expense, in addition to their usual pay.

Maria Porcia lex.—That a penalty should be inflicted on such commanders as wrote a false account to the senate of the numbers slain in battle; and that they should be obliged, as soon as they entered the city, to take an oath that the number which they returned was true, according to the best of their knowledge.

IX. Laws relative to Money and Wills.

Valeria lex.—That all creditors should discharge their debtors upon the receipt of a fourth part of the whole.

Gabinia lex.—That no action should be granted for the recovery of money which was first borrowed on small interest, and then lent out for greater.

Claudia lex.—That no usurer should lend money to

any person in his nonage, to be paid after the death of his parents.

Furia lex.—That no person should give, by way of legacy, above a thousand asses, except to the relatives of the master who gave him his freedom, or some other parties specified.

Voconia lex.—That no woman should be left heiress to an estate; and that no *Census* should will above a fourth part of what he was worth to a woman. (A Census was one who stood high in the Censor's book.)

X. Laws relative to Judges.

Sempronia lex.—That the right of judging should be transferred from the senatorian order to the Equites.

Aurelia lex.—That the privilege of being judges should be divided between the Senators, Equites, and Tribuni Ærarii, (Tribuni Ærarii were officers elected for the purpose of paying the expenses of the army.)

Pompeia lex.—That the judges should be chosen out of the richest in every century, according to the regulation of the Aurelian law.

Julia lex.—That the Tribuni Ærarii should be excluded from the list of judges.

XI. Laws relative to Crimes.

Cornelia lex.—That it should be treason to lead an army out of a province, or to engage in war, without special commission; to ingratiate one's self with an army to serve a private purpose, &c.; and that the punishment for such offences should be banishment, *(aquæ et ignis interdictio.)*

Julia lex.—That all treason be punished with banishment.

Antonia lex.—That those who were condemned for treason should be allowed an appeal to the people.

Julia lex.—A rigorous law against adultery.

Scatinia lex.—That all catamites, and the keepers of them, be liable to a fine. (Augustus made this offence capital.)

Cornelia lex Falsi.—That all forgers, and such like criminals, be punished with banishment.

Pompeia lex.—That parricides be punished after the manner described in chap. II, iv.

Plautia lex.—That those convicted of any violence or assault be punished with banishment.

Clodia lex.—That all those should be brought to trial who had executed Roman citizens without the formality of a trial.

Acilia Calpurnia lex.—That no person convicted of bribery should bear any office, or come into the senate, besides being obliged to pay a large fine.

Tullia lex.—That senators convicted of bribery should be banished for ten years; and that commoners should be more severely punished than the above law decided.

Junia lex.—That persons guilty of extortion, besides the *litis æstimatio*, or paying the estimated damages, should be banished.

Cornelia lex.—This law was the same, in fact, as the foregoing Junian law.

Julia lex.—This was another very severe law against

extortion. It was said to have contained one hundred heads, setting forth various kinds of misdemeanours, &c.

XII. LAWS relating to RELIGION.

Sulpicia Sempronia lex.—That no person should consecrate any temple or altar without order of the senate, and the major part of the Tribunes.

Papiria lex.—That no person should have the liberty of consecrating any edifice, place, or thing, without the order of the commons.

Papia lex.—This law described the manner of choosing Vestals. Their punishment was grounded on the laws of Numa.

Ogulnia lex.—That whereas there were (U.C. 453,) but four Pontifices and four Augurs, five more should be added to each order out of the commons.

Domitia lex.—That the right of choosing priests should be transferred from the college to the people.

Cornelia lex.—That the Domitian law should be abrogated, and the college of priests be allowed their former privileges.

Attia lex.—That the Cornelian law should be repealed, and the Domitian law enforced.

Antonia lex.—That the Attian law should be repealed, and the Cornelian restored.

XIII. MISCELLANEOUS LAWS.

Julia lex.—That all magistrates should be preferred according to the number of their children, and married men before bachelors: that a man should be the sooner capable of filling an office, if he had as

many children as he wanted years to make up the legal age requisite for bearing such a dignity; and that whosoever had three children in the city, four in other parts of Italy, and five or seven in the provinces, should be excluded from all troublesome offices in the place where he lived.

That law also ordained that unmarried persons should be incapable of receiving any inheritance by will, unless from near relations; and that even married persons, if they had no children, should not be heirs to above half an estate.

Atinia lex, de furtis.—That no prescription should secure the possession of stolen goods; but that the owner should have an eternal right to them.

BOOK IV.

THE MILITARY AND NAVAL AFFAIRS OF THE ROMANS.

CHAP. I.

The Levying of Soldiers.

I. As the Romans were a very warlike people, every citizen between the ages of seventeen and forty-six was obliged, if his services were at all required, to become a soldier, except he was prevented by infirmity, or united to the priesthood.

II. A Roman regiment was called a *Legion*, and composed of infantry and cavalry. The footmen were obliged to serve sixteen or twenty years; the horsemen, ten years.

III. LEVIES of soldiers, to supply the places of those who had fallen in battle, or of those who, having served the regular time, were entitled to exemption from further duty, were usually made every year, at appointed periods.

IV. So soon as the Consuls entered upon office, if it were thought expedient to make a levy *(habere delectum)*, they published an edict, whereby all citizens of military age were obliged to attend, on an appointed day, at the Capitol or Campus Martius.

V. On an appointed day, the Consuls, accompanied by twenty-four Military Tribunes, whom they or the people had nominated at the time of the election of Consuls, took their seats.

VI. To choose the Foot Soldiers, they ordered the various tribes of the people to divide into their proper centuries, and out of each century cited whomsoever they pleased. If four legions were to be raised, so soon as four men were called, the Tribunes of the first legion chose one; the Tribunes of the second legion, another; and so on, to the Tribunes of the fourth legion, who were obliged to take the last man. When four others were called, the Tribunes of the second legion chose first; those of the third legion, second; and so on alternately—those Tribunes choosing last the next time, who had chosen first the time before. The names of those who were thus chosen were written upon tablets.

VII. After men had been enlisted in this manner, they were not accounted soldiers until they had taken the military oath called *Sacramentum*, which obliged them to obey their officers, and never to desert their standard. In order to administer this oath, one man was chosen, who repeated the words of it aloud, and the rest swore after him—each one, as he passed along, saying, "*idem in me*," the same to me.

VIII. Cavalry were chosen from among the Equites; they were, therefore, more honourable than foot soldiers. Their horses, and a certain sum of money to each man, were granted by the public. The

cavalry of a regiment were called *Alæ*, wings, because of the quickness of their motions, and their being always stationed on each side of the main body.

CHAP. II.

Of the Legion and various kinds of Infantry.

I. The army of the Romans was composed of several legions. At the beginning of the commonwealth, it contained four legions, of which each Consul commanded two; but afterwards, the number of legions was greatly increased. In the second Punic war, there were twenty legions; in the time of Sylla, forty-seven; and during the triumvirate of Antony, Lepidus, and Octavius, they amounted to sixty-six. The Emperor Hadrian kept up a standing army of thirty legions, which, probably, with auxiliaries, amounted to about 375,000 men.

II. The number of soldiers requisite to compose a legion was not always the same. At first, it consisted only of 3000 foot and 300 horse; under the republic, it was made up, for a long time, of 4000 foot and 300 horse; but towards the decline of the republic, it had more or less than that number, according to the various circumstances of the state. Under the Emperors, the number of men in a legion was more stationary: the infantry of an imperial legion amounted to 6100, and the cavarly to 726.

III. A legion was uniformly divided into ten battalions, called *Cohorts;* every cohort into three companies, called *Manipuli;* and every manipulus into two centuries;—so that each legion contained sixty centuries, thirty manipuli, and ten cohorts. The cavalry of a legion was divided into ten troops, called *Turmæ*, and each turma into three *Decuriæ*.

IV. The foot soldiers composing a legion were of three kinds, viz. the *Hastati*, so called from *hasta*, a spear, because they anciently fought with spears—the *Principes*, who were better soldiers than the Hastati —and the *Triarii*, so called because they occupied the third line of battle, and were old and experienced veterans; they were also called *Pilani*, from a certain javelin which they used, called *pilum*.

2. There was another kind of infantry, instituted in the second Punic war, called *Velites*, who did not form an essential part of the legion, but usually commenced the battle, by fighting before the lines. They were lightly armed; some had slings *(funditores)*, others bows and arrows *(sagittarii)*, and they commonly fought in scattered parties.

3. *Evocati* were veteran soldiers, who had served the regular time, but who were again induced to enlist, at the earnest request of the Consuls or other high magistrates. In battle, the custody of the chief standard was given to them; they were exempted from all the drudgery of other soldiers, and were accounted almost equal in rank to the Centurions.

CHAP. III.

The Arms, Armour, and Ensigns of a Legion.

I. The arms and armour of the Hastati, Principes, and Triarii, were in a great measure the same. They fought with the sword and javelin, and were defended by a helmet, a shield, a coat of mail, and greaves.

2. The swords of the ancient Romans *(gladii* vel *enses,)* were commonly worn on the right side, that they might not interfere with the shield, which was held on the left arm. They were two-edged and sharp pointed, equally adapted for cutting or thrusting.

3. The javelin of the Romans, called *pilum*, was a weapon so formidable, that, when firmly launched, no armour could resist its force. Its utmost length was about six feet, and it terminated in a weighty, ragged point of steel, eighteen inches long. Each soldier carried two pila.

4. The helmet *(galea)* was made for the most part of brass or iron, surmounted with a lofty crest of waving plumes or hair. It defended the head, leaving the neck uncovered.

5. The shield, called *scutum*, was an oblong buckler, four feet long and two feet and a half broad, joined together by little plates of iron, covered entirely with a bull's hide, and bordered with an iron plate on the outside and the inside. In the centre of it was an iron boss, called *umbo*, which was more

prominent than the rest of the shield, the better to cast off stones and press the enemy.

There was another kind of shield, called *clypeus*, which was less than the scutum, and quite round.

6. *Lorica* was the coat of mail which defended the body. It was generally made of leather, and wrought all over with little hooks of iron twisted in one another, so as to seem like chains.

Instead of the coat of mail, a plate of brass was sometimes worn on the breast, called *pectorale* or *thorax*.

7. *Ocreæ* were greaves for the legs of the Romans; they were a kind of high boots covered with iron.

II. The Velites were not armed in the same manner as legionary soldiers. Their helmet (*galea* or *galerus*) was generally made of the skin of a wild beast, that it might make them appear the more formidable. Their shield (*parma*) was a light round buckler made of wood, and covered with leather; and their weapons, in addition to the sword above mentioned, were seven spears, made very slender, that they might be thrown the farther.

III. Horsemen used at first only a small round shield, a helmet, and two javelins; but they began afterwards to arm themselves more heavily, much like the Triarii.

IV. The general ENSIGN of every Roman legion was an eagle with its wings extended, holding in its talons a thunderbolt. It was about the size of a pigeon, and made of gold and silver, with a small pe-

destal of the same metal. It was borne on the top of a pike, by an officer called the eagle-bearer.

2. Besides the general ensign, every cohort, manipulus, and century, had its own standard, with its rank and the name of the legion, inscribed upon it.

The first ensign in use among the Romans seems to have been a bundle of grass (*manipulus fœni*), tied on the top of a pole. From this, the manipulus took its name. The standards substituted in its stead were figures of the wolf, the minotaur, the horse, the boar, &c.

3. The veneration which the Romans had for their standards was remarkable. They saluted them whenever they passed—placed the spoils and prisoners of war beside them, as in a secure asylum—swore by them when they wished solemnly to confirm any assertion—and considered death less grievous than to desert them.

CHAP. IV.

The Officers of the Army.

1. IMPERATOR was the general of the army; horse and foot, legions and auxiliaries, were under his command. During the continuance of his commission, he was possessed of unlimited authority either to fight or refrain from fighting—to advance or retreat—or take any bold or decisive step which he

chose, without delaying for the reception of further orders from the senate. The Consul was usually general of the army, except when a Dictator was created. His departure from Rome, on any important expedition, was a period of great interest to the people. Public prayers and sacrifices were offered up for his success, and he marched out of the city arrayed in full military costume, attended by a vast concourse of men and women of all ages.

II. LEGATI were lieutenant-generals, next in authority to the Imperator. They were at first chosen by the senate, merely to accompany and advise the general; but afterwards they owed their nomination, for the most part, to the Consuls. They managed all kinds of business by the permission of the general, and in his occasional absence were honoured with the fasces.

III. TRIBUNES were next in power and respectability to the Legati. There were six to every legion, each of whom had, therefore, for the most part, 1000 men under his command. They superintended the work of the soldiers, regulated the affairs of the camp, gave the word to the watch, decided the controversies, &c. &c.

IV. CENTURIONS were officers of a hundred men. The badge of their office was a vine rod or sapling *(vitis)*; hence the phrases *vitem gerere*, to hold the office of a centurion—*vitem poscere*, to ask the office —*vite donari*, to receive it.

2. There were sixty centurions in a legion—

twenty to each of the orders of Hastati, Principes, and Triarii. The Centurions of the Hastati were the least honourable; those of the Triarii the most honourable. The first Centurion of the Triarii was called *Primipilus*, *Dux Legionis*, *Primus Centurionum*, or *Primus Centurio*. He presided over all the other Centurions, and usually gave the word of command to the legion, by order of the Tribune. It was his especial duty to guard the eagle standard; hence, the phrase *aquilæ præ-esse*, means, to bear the office of Primipilus.

3. There was a regular gradation among the Centurions, from the last of the order of the Hastati, through the Principes and Triarii, up to the Primipilus. The sixtieth Centurion of a legion was the lowest who held the office; above him was the fifty-ninth; above him, the fifty-eighth, and so on; each Centurion rising higher than another until they came to the first Centurion: so that the Roman army opened a wide field for promotion to the diligent and faithful soldier.

V. OPTIONES were sergeants or corporals, assistants or deputies of the Centurions; called also *Succenturiones*.

VI. VEXILLARII were standard-bearers, two of whom were chosen by every Centurion for his century. The strongest and most courageous soldiers were usually selected for this office.

VII. PRÆFECTUS. Each of the three divisions of the Roman cavalry was commanded by an officer of

its own; but the first of these three had also the general command of the whole. He was called the Præfect, and the other two were called *Decuriones*.

CHAP. V.

The Discipline and Camp of Roman Soldiers

1. Discipline and exercise were so much attended to among the Romans, that their word for an army *(exercitus)*, was derived from a verb signifying to exercise *(exerceo)*.

2. In the exercise of their arms, they were accustomed to weightier weapons than those wherewith they fought in battle. One method of practising was to set up a post *(palus)*, and to strike at this as they would do at the enemy, using, however, a staff instead of a sword: this was called *exercitium palarium*. The exercises comprehended under the term *armatura*, were, the throwing of all kinds of missiles, in which young soldiers were practised with very strict discipline.

3. Besides the dexterous use of their arms, the Roman soldiers were accustomed to use much bodily exercise. Three times in a month they had to walk out of the camp, to the distance of sometimes five, and sometimes ten miles, and back again, in order that they might be the better able to endure the hardships of marching. They were practised in run-

ning also, that they might be capable of charging with impetuosity; and in leaping and swimming, that they might the more easily surmount the ramparts and cross the ditches of the enemy. Vaulting upon horses of wood was a necessary exercise of the cavalry.

4. A Roman soldier, on march, carried a load which the delicacy of a modern soldier would be but little able to support. Besides his arms, which were not considered any part of his burden, he was obliged to carry food for many days, and a variety of necessary utensils—a saw, a basket, a mattock, an axe, a hook and thong, a chain, a pot, and several stakes; the whole, not including his arms, weighing sometimes four stones and upwards. Under this load, they commonly marched twenty miles per day.

II. The excellence and strictness of the military discipline of the Romans were particularly observable in their ENCAMPMENTS. They never passed a night, even on the longest marches, without pitching a camp and throwing up intrenchments; and the soldiers were accustomed to perform these laborious works without quitting their arms.

2. If the camp were to be only temporary, it was surrounded with a trench three feet deep and five feet wide, the earth of which was thrown up on the inside next the camp, and strengthened with palisades. But if it were to be stationary for more than two or three nights, the trench was made from eleven to twelve feet broad, and proportionably deep,

behind which they threw up a rampart of earth, strengthened with fascines and flanked with towers, at the distance of eighty feet from each other, with parapets and battlements. It was in this manner they constructed their *Castra Hyberna*, or winter quarters.

3. The camp was a perfect square. It had four gates—Porta Prætoria, next the enemy; Porta Decumana, opposite to the Prætorian; Porta Principalis Dextra; and Porta Principalis Sinistra.

4. It was divided into two divisions—the upper and lower; one, containing the tents of the generals and other chief officers; and the other, the common soldiers. The space which marked this division was called *Principia*. No tents were placed here; but the standards of the army and altars of the gods were erected, together with the tribunal where the general administered justice or harangued the army.—Besides this space, there was another which went entirely round the camp, two hundred feet broad, to allow the troops room to draw up behind the intrenchment, in case of an attack.

5. There were eight streets *(viæ)* in the camp; five running parallel, and three others intersecting the five. By these streets, the different divisions of the troops were separated, and the utmost regularity preserved.

6. The general's tent, called *Prætorium*, was situated in the centre of a square, each side of which was a hundred feet distant from it, and in the four

corners of which were the tents of his guard. Near the general's tent was that of the Quæstor, called *Quæstorium*, in which the military chest was kept.—Nigh to this was the *Forum*, where things were sold and meetings held. And surrounding all these, the tents of the Tribunes, Præfects, Evocati, &c.

7. In the lower division of the camp, the cavalry of the legion were placed in the centre; next to them, on both sides, the Hastati, Principes, and Triarii; and next to these, on both sides, the infantry and horse of the allies.

8. The tents were covered with skins extended by ropes. In each tent there were usually ten soldiers, under the charge of one man called *Decanus*. The tents of the Centurions and standard-bearers were at the heads of their respective companies.

9. Watches were constantly kept in the camp, both by day *(excubiæ)*, and by night *(vigiliæ)*. Before the evening watches were appointed, a token or watch-word *(symbolum)*, by which they might distinguish their friends, was distributed through the army by means of a tablet of wood, called *Tessera*, on which the watch-word was inscribed. This tessera was given from one centurion to another, quite through the whole army, till it came again to the Tribune by whom it was first distributed.

CHAP. VI.

The Order of Battle.

I. The order of battle in which a Roman army was drawn up, was thus: The Hastati occupied the first line; they had each three square feet allowed them, in which to exercise their arms. The Principes formed the second line; but there were larger spaces for each individual, in order that, if need be, the Hastati might be received into their ranks. The Triarii, as their name imports, brought up the third line of battle; and their spaces were wide enough to receive both the Principes and Hastati, if necessary.

II. Thus the Romans had always three separate chances in battle; for, if the Hastati were beaten, the enemy had to engage with the Principes; and if both these were vanquished, the victors, wearied with their obstinate fighting, had to engage, as it were, a third army of fresh men, far more formidable than the preceding, before they could secure the conquest.

III. The cavalry were usually posted at the two corners of the army. The general, with his Legati, and the Tribunes, (unless the latter were ordered to command the wings, or some other part of the army,) for the most part took his station between the Principes and Triarii, this being the fittest place for giving orders and beholding the progress of the fight.

IV. The above was the common method of drawing up in form of battle; but there were other methods, according to their situation, the circumstances in which they were placed, or the disposition of the enemy's forces. They sometimes drew up in form of a wedge *(cuneus)*; or if the enemy had taken that form, they then formed in two lines, like an open pair of scissars *(forfex)*. Sometimes, in cases of great extremity, they formed themselves into a firm round body *(globus)*; and occasionally into an oblong square figure, resembling a tower *(pyrgus)*.

CHAP. VII.

The Payment and Diet of the Soldiers.

I. The payment given to the Roman soldiers was not always the same. It was at the siege of Veii, 347 years from the foundation of the city, that the soldiers first received any remuneration; all military services, before that time, having been performed gratis. The common soldiers then received three asses per day, (about two pence halfpenny), and the Centurions six. Julius Cæsar doubled the legionary pay; Augustus raised it to ten asses; and in the times of Domitian, it was twenty-five asses, (about one shilling and eight pence) per day.

2. Besides his pay, each soldier received clothes from the public. A certain allowance also of corn,

usually four bushels per month—the Centurions double, and the Equites triple—was given to the army; but for this, a proportionable deduction was made from their pay.

II. The usual food of the soldiers was bacon, cheese, and biscuit; their drink, water, mingled with a little vinegar, which they called *posca*. They sometimes prepared their own corn for use, pounding it with stones, or grinding it in little hand-mills, which they carried about with them. Sometimes the Generals and Emperors condescended to partake of the same food as the common soldiers, so long as they encamped together.

CHAP. VIII.

Of Triumphs, and other Military Rewards—Also of Military Punishments.

I. MILITARY REWARDS were either given by the people to the general of an army, or they were given by the general to his soldiers, on account of distinguished merit and valour.

II. A TRIUMPH was the highest honour that Rome could bestow upon a victorious general. It consisted of a splendid procession, which began at the Capene Gate, and went through the city, by the Triumphal Street, which was strewed with flowers and adorned with arches, up to the Capitol, where it ended.

2. A triumph was granted, by a decree of the se-

nate and people, to the general who had slain, in one battle, above 5000 enemies to the state; and who had thereby procured the addition of new territory to the empire: but it was not granted for a victory in a civil war, nor over rebels.

3. The triumph granted to Paulus Æmilius, after the taking of Perseus, King of Macedon, as related by Plutarch, in his life of Æmilius, took up three days. On the first day, the statues, pictures, and images of the vanquished, were exhibited in pomp, upon 750 chariots. On the second day, their most beautiful and valuable armour and arms were borne upon a great number of waggons; and after these proceeded 3000 men, carrying the coined silver in 750 vessels, each of which weighed three talents, and was supported by four men. These were followed by others carrying silver bowls, goblets, and cups, of great value on account of their size and workmanship. On the third day, early in the morning, the trumpeters sounded a charge, and the procession began with young men, who led 120 stalled oxen to the sacrifice, having their horns gilt, and their heads adorned with ribbons and garlands; and along with these, were boys carrying salvers of silver and gold. The gold coin was now brought, in 77 vessels, each weighing three talents; and after these, the consecrated bowl made by Æmilius, which weighed ten talents, and was richly set with gems—followed by those who carried the cups of Antigonus and Seleucus, and the gold plate of Perseus' table. Then

advanced the chariot of Perseus, bearing his armour and diadem; then his captive children, with a long train of nurses, masters, and governors, followed by Perseus himself, clad in black, and attended by many of his friends. After this mournful train, 400 golden crowns were exhibited, which were bestowed to Æmilius by as as many cities; and after these, came Æmilius, seated in a magnificent chariot, arrayed in garments of purple and gold, and holding in his right hand a branch of laurel. Last of all, came the army, holding, in like manner, laurel branches in their hands, and chanting, in triumphal songs, the praises of Æmilius.

4. It is painful to think how miserable a catastrophe was made to conclude a triumph. The generals, in turning their chariot from the Forum to the Capitol, have sometimes ordered the captive kings and leaders to be led to prison and murdered, and then waited in the Capitol until they had received intelligence that their savage orders had been obeyed!

III. An OVATION was a less kind of triumph, granted to those who had achieved victories over their enemies, without the shedding of human blood, or with but little loss. The procession commenced at the Albanian Mount, with the peaceful music of flutes. The general walked on foot into the city, crowned with myrtle, and dressed in a white robe bordered with purple, preceded by the soldiers and his retinue.

IV. OTHER MILITARY REWARDS were Crowns of various kinds. The Civic Crown *(Corona Civica)*, made of oak leaves, was a soldier's highest honour. It was given to him who had saved the life of a citizen in battle; and exempted the wearer, together with his father and grandfather, from the necessity of ever after bearing any troublesome offices. A golden Crown, called *Corona Vallaris* vel *Castrensis*, was the reward of him who first forced the enemy's intrenchments. A Mural Crown *(Corona Muralis)*, was given to him who first scaled the walls of a besieged city; and a Naval Crown to him who first boarded a ship of the enemy.

2. Smaller rewards than crowns were frequently given in honour of general valour; as the *Hasta Pura*, a spear of wood without any iron in it; chains or collars of gold and silver *(Torques)*; bracelets *(Armillæ)*; armaments for horses *(Phaleræ)*; and banners *(Vexilla)*. All of these were very honourable, and preserved with great care.

V. MILITARY PUNISHMENTS, for capital crimes, were generally very severe. In case of a mutiny, every tenth man was sometimes taken by lot, and killed; this was called *Decimation*. *Fustuarium* was, when the Tribune struck the condemned with a stick, and bade him fly. If he could escape from the soldiers, who all fell upon him with sticks and stones, he was allowed to live in a foreign country; but he was generally killed on the spot. To be scourged and sold for a slave, to be beheaded, crucified, stoned

and left unburied, were also punishments occasionally inflicted on capital offenders.

2. For small crimes, punishments were various; such as, degradation of rank—to be removed from the camp, and employed in various labours—to be deprived of pay—to be beaten with rods, &c.

CHAP. IX.

Of Military Engines.

I. The OFFENSIVE MILITARY ENGINES of the Romans, which were the same to their armies as artillery to ours, were:

1. *Aries*—a battering ram, composed of a long beam of wood, covered with wet leather, and headed with iron, suspended by a chain from another beam that lay across two upright posts. A hundred men, more or less, worked it as it hung thus equally balanced; and by main strength dashed it against a wall or rampart, until they had made a breach by which they could enter.

2. To prevent the effects of the battering ram, the besieged were accustomed to lower wool-packs or bags of straw, which deadened its blows. A machine also, called the wolf, was invented, to grapple the ram, and either break it or draw it up to the besieged.

3. *Balista* was a large engine, in the nature of a cross-bow, by which they were enabled to shoot large stones to a great distance. With the balista they shot also fire-darts, called *Falaricæ*, the end of which was a piece of iron three feet long, ending in a sharp point: round this iron, tow, steeped in oil, sulphur, and various combustibles, were wrapped, which were set on fire before they were discharged.

4. *Catapulta* was a machine purposely made for casting darts and spears.

5. *Scorpio* was a small cross-bow, carried in the hand. The darts sent from it had small iron points extremely sharp, like the stings of scorpions, from which circumstance it took its name.

II. The DEFENSIVE ENGINES of the Romans were:

1. *Vineæ*—roofs or screens, supported upon posts that rested on little wheels. They were covered with materials that could not be easily inflamed, such as raw hides and earth, and were usually placed over battering rams, to defend those that worked them; or close to the walls, to defend those that were undermining.

2. *Testudo*—a tortoise. This was a general name among the Romans, given to every kind of defensive engine. That which was properly speaking the tortoise, was a kind of roof, similar in its construction and uses, to the vineæ, beneath which, those who were working, seemed safe as the tortoise under the shell.

Soldiers sometimes put themselves into a form

called the tortoise, which was when they joined their shields together above their heads, so as to form a kind of roof, against which the darts of the enemy would be of no avail.

3. *Musculi* and *Plutei* were also defensive engines, strongly made, but not so large as the vineæ.

4. Moveable towers were made by the Romans, with bridges to lay upon the walls of a besieged town, and thereby effect an entrance. They were covered with whatever could best prevent them from being set on fire. They were sometimes made so prodigiously large, that it seems wonderful how they could make them move. When these could be brought up to the walls of a place, it was seldom able to hold out much longer.

CHAP. X.

The Naval Affairs of the Romans.

I. There are few subjects connected with the antiquities of the Romans which are less understood than their naval affairs. They knew their own superiority over other nations by land, and they did not much care to have any concern with the sea, unless they were impelled to it by necessity. A superstitious belief also, that the spirits of the unburied dead were compelled to wander in sorrow a century of years, along the infernal river Styx, disinclined them

to run the hazard of shipwreck: so that they had neither much skill in ships, nor much desire to tell posterity the little that they knew.

II. Merchant vessels *(Naves Onerariæ)* were deep, clumsy, slow-sailing hulks, generally driven with sails, but, when there was no wind, managed with oars. These ships were guided, in their voyages during the day, by the knowledge which their captains had of the coasts in sight; and, during the night, by the stars. For the Romans were unacquainted with the mariner's compass; and, therefore, they were as timorous as they were unfit to undertake long voyages.

III. Ships of war *(Naves Longæ,)* were chiefly impelled by oars. Some of these vessels had several rows of oars on each side, and appellations were given them according to the number of these rows; thus, those which had two rows on each side were called *Biremes;* those which had three rows, *Triremes;* those that had four, *Quadriremes*, and so on. It is yet a problem among learned men, how these rows of oars were placed so as not to interfere with each other.

IV. In ships of war, some of the military engines described in the foregoing chapter, particularly balistæ, were used. Grappling irons also, called crows *(Corvi)*, some of which were dreadful instruments, were generally kept in each vessel.

V. For the security of the provinces, Augustus stationed two fleets—one at Misenum, in the territory of Naples, on the Tuscan Sea, and another at

Ravenna, on the Hadriatic. Ships were stationed also on the rivers Rhine and Danube, at Frejus, in Provence, and other places.

VI. A little vocabulary of words, connected with the subject of ships, will save much explanation :—*Navarchus*, the captain—*Gubenator*, the pilot—*Nautæ*, the sailors—*Prora*, the prow of a vessel—*Puppis*, the stern—*Malus*, the mast—*Carina*, the keel—*Gubernaculum*, the helm—*Vela*, the sails—*Antennæ*, the yard-arms—*Rostrum*, the beak of the prow—*Anchora*, the anchor—*Remi*, the oars—*Funes*, the ropes—*Bolis*, the plummet—*Armamenta*, the rigging.

BOOK V.

MISCELLANEOUS MANNERS AND INSTITUTIONS OF THE ROMANS;—RELATING PRINCIPALLY TO THEIR PRIVATE LIFE.

CHAP. I.

Their Amusements.

I. The Romans governed the world; and every citizen dwelling at Rome was personally interested to know how affairs were going on. To inquire after news, and to transact private business, it was necessary to go out to the Forum. On this account, as well as by reason of their attendance at public shows and assemblies, the Romans had in general little time to spend at home. Hence, we do not read that they had among them so many foolish diversions, to beguile their private hours, as we.—They sometimes, however, played at chess (*Latrunculi*); and they used different kinds of dice (*Tali* and *Tesseræ*), the best throw of which they called *Venus*, and the worst, *Canis*.

II. Public shows and exercises occupied, however, a great deal of their time and attention. Under the

Emperors particularly, there was scarce a day, in which there were not some public amusements for the people. The Circus, the Amphitheatre, and the Theatre, were the places to which they more frequently resorted for pleasure. We shall consider, in order, what kinds of representations were usually exhibited in each of these.

III. CIRCENSIAN SHOWS and EXERCISES.

1. The principal amusements of the Circus were Chariot and Horse Racing. The chariots used in racing were handsomely decorated; but not having springs, their structure would appear clumsy if compared with ours. They had more frequently two wheels than four; and they were drawn by four horses, in honour of the Sun, to whom the Circus was dedicated. They were driven from certain openings, called *Carceres*, around a goal at the other extremity of the Circus, called *Meta*, which was composed of three columns situated on the same base: hence the phrase, *a Carceribus ad Metam*, from beginning to end. Seven times round the goal was considered one heat *(missus)*; and this usually terminated the race.

The charioteers *(Aurigæ)* were dressed each in a different colour, such as red, blue, white, green.—The people often divided themselves into various factions, in favour of one or other of these colours; and, by their animosities, were the occasion of much tumult and bloodshed. The signal for starting was at first the blowing of trumpets; afterwards, it was the dropping of a napkin *(mappa)*.

In horse races, there were some who managed two horses at the same time, leaping frequently from the one horse to the other, after the manner of the Numidians.

2. The Trojan game *(Ludus Trojæ)*.—This play was performed only by boys, the chief of whom *(Princeps Juventutis)* was heir apparent to the crown, or son of some principal senator. They were all beautifully dressed, and rode on steeds splendidly caparisoned. They were divided into companies of twelve each, under the guidance of one of superior family, who, at a given signal, led out his little troop to engage with others; thus representing a general battle.

3. *Quinquertium*, or *Pentathlon*, was a general term, under which were comprehended the five exercises of running, wrestling, leaping, throwing, boxing. In the foot races, there were persons who ran in complete armour, to show their strength as well as agility.—Wrestlers *(Athletæ)* exercised stark naked, and rubbed themselves with oil, that they might not be easily or effectually seized. These athletæ tried also to excel in leaping. Throwing was, for the most part, confined to the quoit called *discus*, which was of a round shape, very heavy, and made of brass, iron, or stone; and which they were enabled to send to a vast distance, by means of a leathern thong fixed round the hand of the thrower. Boxers either fought with their naked fists, or with a rude and terrible gauntlet, composed of various thongs of leather filled with lead,

called *cestus*. Those who fought with this were called *Cestiphori*: all their combats generally terminated in death.

4. *Venatio* was a show of beasts, wild and tame.—This show was of three kinds: 1st. When those beasts which were rarely seen, were merely exposed to gratify the curiosity of spectators. 2d. When the people were permitted to hunt the animals so exhibited, and take away whatever they could get for their own use. To make this venatio still more extraordinary, the Circus was covered with grass and lofty trees, to give it the appearance of a natural forest; and the swine, deer, oxen, sheep, &c. were sent out from the dens *(caveæ)*, underneath. 3d. When one species of wild beasts was permitted to encounter another; and when men, either confident of their own strength, voluntarily engaged with wild beasts; or when, by way of punishment, they were compelled to do so: such persons were called *Bestiarii*. Sometimes canals of water were introduced, and the monsters of the deep compelled to fight with savage land animals.

5. Naval engagements *(Naumachiæ)* were also exhibited in the Circus, by introducing water from the canal that surrounded it, which was in an instant covered with armed vessels. These vessels were usually manned with captives or condemned malefactors, who contended unto death, unless saved by the clemency of the Emperor.

II. Concerning the Gladiators.

1. Fights of gladiators were exhibited frequently

at funerals, and frequently in the Forum; but the most usual place of their exhibition was an amphitheatre.

2. Gladiators were at first only condemned slaves and criminals, who were compelled to kill one another, as a sacrifice to the spirits of some deceased person of quality: afterwards, freedmen became gladiators merely to earn a livelihood.

3. Gladiators had various names, derived from their arms or manner of fighting: Thus the *Retiarii*, or net-men, were so called because they held in their left hand a net, which they strove to throw around the head of their adversary, that they might dispatch him with an instrument like a trident, which they held in their right.

The *Secutores*, or followers, whose arms were a sword or leaden bullet, a helmet, and a shield: these were commonly matched against the net-men.

The *Mirmillones*, or fish-men, so called because they wore a brazen fish on their helments. They were armed with a hooked sword *(sica)*, and a buckler.

The *Essedarii*, or charioteers—those who fought from chariots *(esseda)*.

The *Laquearii*, or halter-men, who used a halter *(luqueus)*, in the same way as the Retiarii did their net, for the purpose of entangling their opponent.

The *Andabatæ*, who were obliged to fight blindfold, though on horseback: hence the phrase, *Andabatarum more pugnare*—to fight in the dark.

4. Before gladiators fought against one another, they first walked solemnly round the arena, to show themselves to the spectators: they were then matched. After this, they practised, in presence of the multitude, with foils and headless spears; which practising was called *Prælusio*. The prelude ended when the trumpet sounded, and they then fought for life and death.

5. The lookers on had a strange way of expressing their approbation or disapprobation of the manner in which gladiators fought. If they thought favourably of a man who lowered his arms in token of submission, they raised their hands and pressed their thumbs *downward*, and by this means saved his life: but if they were unfavourable, they turned *up* their thumbs; and by this sign ordered his antagonist to slay him.

6. The rewards given to gladiators were a palm—a palm crown, decorated with ribbons, *(Palma Lemniscata)*—money—a cap called *Pileus*, which gave to slaves their freedom—and a rod, called *Rudis*, which, if bestowed upon a slave, freed him from any obligation to serve again as a gladiator; and if given to one who had formerly been free, restored him to the full enjoyment of his liberty.

III. Of Scenic Representations.

1. For a long time, the Romans were entirely ignorant of the amusement of the theatre; but after it had been introduced among them, they became fond of it, and cherished it, notwithstanding that it had

been condemned by the legislature, as being injurious to morals.

2. The origin and progressive advancement of the drama at Rome may be told in few words.

3. Nearly four hundred years after the building of the city, a great plague burst out among the people; and after having tried every other method in vain to stop its progress, the senate imagined that some new game should be instituted in honour of the gods, which might have the tendency of disarming their resentment. Accordingly, certain mimics or buffoons were brought from Etruria, who danced to the sound of the flute, and amazed the multitude by their ridiculous gestures. This was called a scenic representation, because the mountebanks exhibited on a stage, the name for which was *Scena*.

4. This amusement failed to appease the gods; but it pleased the people, and they continued it. At their sacred festivals, the Roman youths imitated the actions of the players, as an accompaniment to certain verses of their own composition, in which they threw out railleries one against the other. These rude attempts at poetry were called Fescennine verses.

5. Fescennine verses improved into satires; and satires furnished to Livius Andronicus a hint, which led him, after the example of his countrymen the Greeks, to the composition of the first regular Roman play.

6. The plays of Andronicus were acted by himself

alone, until he became hoarse. He was then allowed a boy, who sang the words of his play, while he merely accompanied the song with his ordinary gesture.—The Romans having seen and heard Andronicus, were soon disgusted with the players by whom they had been formerly delighted, and acquired a taste for higher intellectual gratification.

7. Livius Andronicus was followed by Nævius, Ennius, Plautus, Cæcilius, Terence, Afranius, Pacuvius, Accius, &c.—eminent men, who, having an opportunity of studying the Grecian models, brought the writing of plays, both tragic and comic, to great perfection.

8. Comedians wore, during their performance, a loose low shoe, called *soccus:* hence this word has been poetically used to signify comedy. Tragedians, on the contrary, wore a high-heeled buskin, called *cothurnus;* which word, in like manner, is used to signify tragedy.

9. Roman plays were divided, like our own, into various acts and scenes; but our plays have no chorus, which was often introduced, with great beauty, into the plays of the ancients. The chorus might consist of many or of few—of males or of females. It represented the persons who were present where the business was supposed to be acted. Whatever they said or sung ought, therefore, to have had relevancy to the play.

10. The music, used by the chorus, or without the chorus, to accompany a play, was chiefly wind-music.

The Romans had a musical instrument which seems to have been, in its use and construction, much like what we call a first and second flageolet. It was composed of two flutes, joined together with one top, blown by one hole, and played with both hands.—That which the right hand played was called *tibia dextra:* it seems to have had a low full sound, and few holes. The one played by the left hand—*tibia sinistra*—had sharper tones and more holes. If two right hand flutes were joined together, the instrument was ealled *tibiæ pares dextræ;* if two left hand flutes were joined, *tibiæ pares sinistræ;* if flutes for each hand were joined in one, the instrument was *tibiæ impares* or *tibiæ dextræ et sinistræ.*

CHAP. II.

The Dress of the Romans.

I. Body Clothes.

1. The principal garment of the Romans, and which, therefore, procured for them the appellation of *Gens Togata*, was called Toga. It was a species of cloak, composed of one large semicircular piece of cloth, generally of a white colour, and without sleeves. It had a long flowing skirt, which was ordinarily drawn over the right shoulder, and fastened on the left. To permit the skirt to hang loosely down was commonly considered a sign of effemi-

nacy, or dissolute manners. In case of rain, or an accident, this skirt was thrown over the head; for the Romans did not in general wear any hats or caps.

2. The toga was anciently worn as well by women as by men; but the matrons afterwards changed it for the STOLA, a robe like the toga, which reached down to the feet, and was bordered with a deep fringe. Courtezans were never permitted to wear the stola, in order to create an honourable distinction between them and modest women.

3. There are various kinds of togas mentioned in the classics: the most worthy of notice are:—

(1). The TOGA PRÆTEXTA, which was bordered with purple, and worn by the sons of respectable citizens, from the age of thirteen years until they attained the age of seventeen, when they assumed the *Toga Virilis*, or manly gown, which they did with much solemnity and ceremony.

The toga prætexta was also worn by the superior magistrates, and by the high priests, the Augurs, and the Decemviri.

Young women wore the toga prætexta until they were married; and on a particular festival, married women were permitted to appear in it instead of the stola.

The toga prætexta was not only a robe of great dignity, but also a sacred habit: hence it was given to boys and young women, as a kind of defence to them against injury; and hence also it was worn by

magistrates, to signify that their persons should be inviolate.

(2). The *Toga Pulla* was of a black colour, and worn by the people in mourning.

(3). The *Toga Picta* was a richly embroidered robe.

(4). The *Toga Purpurea*, one that had purple ground.

(5). The *Toga Palmata*, one whose border was probably inwrought with figures of palm.

The three last-mentioned togas were for generals during a triumph.

(6). The *Trabea* was the most splendid of all togas. Its colour was white, adorned with scarlet, and bordered with purple. It was sometimes superbly set with gems, and inwrought with gold, on which account it was only proper to Consuls and Emperors.

4. The TUNICA was a close warm coat, worn under the toga, which reached down to the knees, and had wide sleeves as far as the elbow. It was usually made of white wool, and bound round the waist by a girdle *(Cingulum)*. The poor people, who were not able to afford a toga, wore only tunics, and were hence called, by Horace, *Tunicatus Popellus*.

(2). The *Tunica Laticlavia* was only worn by senators, and by the sons of senators, after they assumed the toga virilis. It was called Laticlavia from a broad purple stripe or galloon, which edged its two sides, where they joined in the middle.

(3). The *Tunica Angusticlavia* was the under dress

of the Equites. It was only distinguished from the laticlave by a narrower galloon. It is not thoroughly known whether the use of the Angusticlave belonged exclusively to the Equites or not.

(4). Tunics were the ordinary dress of women inside the house. Their tunics, however, were made longer than the men's. An ornament also was added to their girdle, which marked the separation of the breasts, and helped to support them; for the Roman ladies were unacquainted with stays. This ornament they called *Strophium*, and those who were able, generally had it inset with jewels and pearls of great value.

(5). Under the outer tunic there were sometimes one or two others, worn for the sake of warmth. The innermost one, which they called *Indusium*, was made of finer wool, and answered the same end as our shirt; for the Romans had not the comfort of linen in common use, as we have.

5. LACERNA was a short cloak, generally of a dark colour, open before, and fastened with clasps *(fibulæ)*, to which was attached a hood *(cucullus)*, which screened the head in a time of rain. It was worn over the toga, or by the common people, instead of a toga, over their tunics. Similar to this, in its shape and use, were the *Pennula* and *Læna*.

6. PALUDAMENTUM was, properly speaking, the uniform of a General, being of a scarlet colour, and bordered with purple. It is a general term, however, to signify any military robe.

7. The Romans never wore any stockings; and

seldom put on breeches, except when they assumed the military habit for exercising on horseback. The drawers which they wore on such occasions were called *Campestre*.

8. SAGUM was the principal military cloak of the Romans. It was thrown over the other clothes or armour, and fastened in the front with clasps.

9. SYNTHESIS was a large commodious garment, fitted for reclining on sofas, which was put on at dinner instead of the toga.

II. HEAD DRESS.

1. The Romans usually went bare-headed; but upon extraordinary occasions they put on:

(1). The *Pileus*, a woollen cap or bonnet, worn especially by freedmen, to whom it was given in token of emancipation.

(2). The *Galerus*, which was like a helmet or broad-rimmed hat; worn chiefly by priests, or by persons on a journey.

(3). The *Petasus*, similar to the galerus, and, like it, worn by travellers.

III. SHOES.

1. CALCEII were a kind of buskin, made of black leather, which came midway up the leg. The *Calceus Lunatus* had in the front a gold, silver, or ivory crescent, which probably was used as a clasp. By this ornament, Patrician senators were distinguishedfrom senators who were not Patrician, as well as from the rest of the people. Calcei were worn for going out, along with the toga.

2. PERONES were boots, coarsely made of skins, reaching up the calf of the leg, worn by Plebeians and countrymen.

3. SOLEÆ were slippers or sandals, made of leather, wood, or iron, without uppers—being bound with straps round the foot and leg. It was accounted indecent for men to wear these when they went out; but it was customary to wear them at feasts. *Crepidæ* are said to have differed from soleæ, by having two soles.

4. CALIGÆ were like the brogues used by some of our own poor, having wooden soles thickly set with nails. These were the shoes of soldiers.

5. Besides these, there were other coarse shoes, as the *Udones*, *Sculponeæ*, &c. not to mention the cothurnus and soccus, already mentioned.

IV. WOMEN'S DRESS.

What has been mentioned respecting the dress of the women, it will be perhaps satisfactory to recapitulate:

1. They wore long and handsome tunics, tightly bound round the waist with a girdle, on which was a stomacher of rich workmanship. Over this tunic, they wore a long fringed robe, called stola, which courtezans were forbidden to wear. Both of these garments, though at first only white, were afterwards dyed with various colours, according to the fancy of the wearer.

2. They had no bonnets, but took much pains to curl and dress their hair in various forms; and when

they went abroad, usually covered it with a veil.—Sometimes they put on a kind of cap, called *Mitra*, which they bound beneath their chin.

3. Around their neck, and on their left arm, they usually had bracelets. There is mention made also of certain ornaments worn around the legs, called *Periscelides*. Long pendants for the ears were much in use; and rings were sometimes worn on every finger of the hand, except the middle one. As to jewels, they were accounted so essential among a lady's ornaments, that Lollia Paùlina had of them a hundred and fifty thousand pounds worth for her own use.

CHAP. III.

Of Marriage.

I. Marriage was accounted very honourable among the Romans; but celibacy was punishable with a fine.

II. There could be no legal marriage except among citizens. The children of a Roman (whether man or woman) and a foreigner, were accounted spurious. They were called *hybridæ*, or mongrels, and their condition was little better than that of slaves.

III. The legal age for marriage was fourteen years for men, and twelve for women.

IV. Young persons were not allowed to marry

without the consent of their parents or guardians. The friends of the parties usually settled among themselves the articles of the marriage contract, and both parties signed them.

V. At the time of signing the settlement, the wedding-day was usually fixed; but care was taken to fix upon a fortunate time: for there were certain days reckoned very unfortunate; such as the calends, nones, and ides, and the days after them, the whole month of May, &c.

VI. There were three ways of contracting marriage among the Romans, viz. by use *(usu)*; by purchase *(coemptione)*; and by eating together a particular kind of cake *(farre)*.

1. A marriage *by use* was considered perfectly valid if a man and woman had lived together, for one whole year, without being three nights absent one from the other.

2. A marriage *by purchase* took place, when the man handed to the woman a piece of money, asking her, at the same time, whether she was willing to become the mistress of his family, and when she returned the money to him again, saying that she was willing.

3. The most solemn kind of marriage was called *Confarreatio*. It was performed by the Pontifex Maximus, or by the high priest of Jupiter, and accompanied by sacred rites. It was necessary that there should have been at least ten witnesses present. After a set form of words had been gone through,

the bride and bridegroom partook together of a consecrated cake, made of flour, salt, and water, which they called *far;* and by this ceremony pointed out the peaceful union that should subsist between them. Such a marriage could only be dissolved by another solemnity called *Diffarreatio.*

VII. By marriage, a husband possessed over his wife the same power which a father had over his daughter: all her goods *(parapherna)* and dowry became his; and the wife, if her husband died intestate, inherited an equal share of property with the children; and if they had no children, the whole.

VIII. There were many ceremonies necessary to be attended to, on a marriage occasion among the Romans.

1. The Haruspices were consulted, and sacrifices offered to the gods, especially to Juno, the goddess of marriage.

2. Her maids divided the hair of the bride into six tresses with the point of a spear; which being customary with the vestal virgins, intimated how chastely she should live with her husband.

3. The dress of the bride was a long white robe, bound round the waist by a zone, which was tied in a knot called the *Herculean.* Her head was crowned with the flowers of vervain, and other herbs, which it was necessary that she herself should have gathered. Over this crown was thrown a flame-coloured veil. Her shoes were of the same colour with her veil.

4. The marriage ceremony was performed in the house of the bride's father, or of her nearest relation. In the evening, when it was finished, she was conducted to the house of her husband.

5. Five nuptial torches were carried in the front of the bridal procession by as many children, called *Pueri lauti*, because they were washed for the occasion. Three other boys attended the bride; one went immediately before her, bearing the torch of Hymen—the other two supported her arms.

6. Women followed the bride, carrying the distaff, spindle, and wool, to intimate the necessity of industry.

7. A great number of friends attended the procession, shouting, as they went along, "Hymen! Hymenæe!" and invoking Thalassius in nuptial odes.

8. When the bride reached the door of her husband's house, she bound the posts, which had been previously adorned by wreaths of flowers, with fillets of wool anointed with tallow, as a charm against enchantments.

9. She either stepped over the threshold, or was lifted over it, because it was sacred to Vesta, the goddess of virgins; and it would, therefore, have been ominous to touch it.

10. When she entered, the keys were delivered to her. She and her husband touched fire and water together together; for all things were supposed to have been produced from these elements.

11. All parties sat down at length to the wedding

feast. The bridegroom scattered nuts among the children, intimating that he had done with the trifles of boyhood. Elegant music accompanied hymeneal songs during the entertainment; and when all their festivity was over, the bride was conducted to her chamber by matrons.

12. To unloose the Herculean knot of the bride's girdle, was the duty of the bridegroom. Virgins remained outside the chamber-door, singing until midnight. Their song was called *Epithalamium;* and with it, all the marriage ceremonies were ended.

IX. It was not thought extraordinary in Rome for men to marry a second time; but it was considered very decent for a woman to remain the widow of only one man: hence the honourable epithets, *Univira* and *Uni-nupta.*

X. DIVORCES were permissible at Rome for various causes. If the divorce was occasioned by infidelity, or any other fault of the wife, her dowry was retained; but if she were guiltless, her dowry was restored to her again.

2. Sometimes the husband and wife agreed between themselves to separate; and this mutual acquittal from marriage vows was called a *bona gratia* divorce.

3. The marriage called Confarreatio, as we have already said, could only be disannulled by a contrary ceremony called Diffarreatio. In like manner, a marriage by purchase was dissolved by a release called *Remancipatio.*

4. A simple method of divorce sometimes pre-

vailed. The marriage contract was torn in the presence of seven witnesses, and the keys taken from the wife.

CHAP. IV.

The Meals of the Romans.

I. Upon ordinary occasions, the manner in which the ancient Romans generally passed the day, was this:

1. The first two hours of the day, that is, six and seven o'clock, were spent by the patrons with their clients; from the third to the fifth hour, was occupied by breakfast, attendance at the bar, or some particular business.

2. From eleven o'clock until two or three o'clock, they rested themselves, and took a slight repast; after this, they exercised in various ways; then bathed, and prepared for their principal meal, which was usually at four or five o'clock The rest of the evening was commonly spent in the house, by prolonging the time at wine, or taking supper.

II. BREAKFAST they called *Jentaculum.* This was a very slight meal, and not universally taken.

III. *Prandium*, usually translated DINNER, was nothing than a lunch, taken without any regularity or particular etiquette.

IV. CŒNA was the principal meal of the Romans. It is in general called supper, but it would be better translated DINNER. It differed in no respect, except as to the manner in which it was taken, from that which we call dinner; and it answered, in no respect whatever, to that which we call supper.

2. The cœna was sometimes composed of three courses, or even of a greater number, if the entertainment were very sumptuous. The first consisted of sallad and shell-fish, together with eggs; the second, of beef, fish, and other substantial dishes; and the last, of pastry and fruit.

3. The dining-room, called *Cœnaculum*, was in an upper story. It was furnished with more or less splendour, according to the ability of the owner; but it usually contained one table, and three sofas surrounding it: hence the room itself was called *Triclinium;* or if it had only two couches, *Biclinium.*

4. The Romans, at dinner, did not sit around their tables, upon chairs, as we do; but reclined on sofas, which were adapted to the form of the table. These sofas had no backs; they were large enough to hold three or four people, and they were furnished with bolsters, one for each guest.

5. The guests lay with the head a little raised—the back supported by a bolster, and the body reclining on the left arm. The feet of the first were stretched out behind the back of the second, and his feet behind the third. It is probable that our Lord occupied the middle seat of a sofa at the last sup-

per, and John the third seat; on which account, his his head being towards the breast of our Lord, he might be said to lie in his bosom.

6. The most honourable seat in a sofa was the middle; therefore the most honourable in a room was the middle seat of the middle sofa; but the consular seat was the last of the middle sofa, in order that the Consul might, with less interruption to the company, receive any messages.

VIII. Much WINE was generally drunk by the Romans after dinner.

2. It was customary to appoint a person to regulate the toasts, and determine the quantity to be drunk. This appointment they made by the casting of dice, and they called the person so appointed *Arbiter Bibendi.*

3. A libation was first poured out to the gods, and then they drank to one another, saying, "*bene mihi,*" (my own health,) or "*bene vobis,*" (your health), or the like. In drinking to a friend or mistress, they would sometimes take as many *cyathi*, or glasses, as there were letters in the name, or as they wished years to them.

4. The Romans were very fond of old wines.—Some has been kept by them, it is said, above one hundred years, and some above two hundred.

5. Their wines were in general distinguished by the names of the places in which they were made. The Italian wines most frequently mentioned were Falernian, Massic, Cæcuban, &c.: foreign wines in

great repute, were, Chian, Lesbian, Leucadian, Coan, &c.

IX. SUPPER *(Commissatio)* was sometimes taken after the cœna. In great houses, this meal was frequently laid out in a different room from the cœnaculum. It was luxurious to partake of supper: hence the word *commissari*—to revel.

CHAP. V.

The Divisions of the Year.

I. At first, there were only ten months in the Roman year, of which March was the first. Numa Pompilius afterwards added January and February; but the length of these months being measured by the moon, made the year to consist of only 354 days, on which account an intercalary month was added every second year by the Pontifices.

II. Julius Cæsar put an end to this confusion, by regulating the months according to the course of the sun: so that from his time, the Roman year, like our own, consisted of 365 days, 5 hours, and 49 minutes.

III. The names of the months were the same among the Romans as those which we now have.

IV. The division of months into weeks was not introduced until nearly two hundred years after Christ. The names of the days were: *Dies Solis*,

Sunday—*Dies Lunæ*, Monday—*Dies Martis*, Tuesday—*Dies Mercurii*, Wednesday—*Dies Jovis*, Thursday—*Dies Veneris*, Friday—*Dies Saturni*, Saturday.

V. The ordinary method of dividing the months among the Romans was into *Calends*, *Nones*, and *Ides*. The first day of a month was calends of that month; the fifth day was the nones; and the thirteenth, the ides: but in four months, viz. March, May, July, and October, the nones were on the seventh day, and the ides on the fifteenth.

VI. The manner of computing the day of the month, was by counting its distance from the calends, nones, or ides following: thus, January the second was *quarto nonas*, or *quarto nonarum Januarii*, i. e. the fourth day before the nones. January the sixth was *octavo idus*, i. e. the eighth day before the ides; and January the fourteenth was *undevigesimo kalendas Februarii*, the nineteenth day before the calends of February; January the thirty-first was *pridie kalendas Februarii*, the day before the calends of February.

The following table will show at once the Roman computation of any day of any month throughout the year:

A TABLE of the CALENDS, NONES, and IDES.

CHAP. VI.

The Weights and Measures of the Romans.

I. The principal WEIGHT in use among the Romans, was the pound, called *As* or *Libra*, which was equal to 12 oz. avoirdupoise, or 16 oz. 18 pwts. and $13\frac{3}{4}$ grains, troy weight. It was divided into twelve ounces, the names of which were as follow: *Uncia*, 1 oz.—*Sextans*, 2 oz.—*Triens*, 3 oz.—*Quadrans*, 4 oz.—*Quincunx*, 5 oz.—*Semis*, $\frac{1}{2}$ lb.—*Septunx*, 7 oz.—*Bes*, 8 oz.—*Dodrans*, 9 oz.—*Dextans*, 10 oz.—*Deunx*, 11 oz.

II. The As and its divisions were applied to any thing divided into twelve parts, as well as to a pound weight. The twelfth part of an acre was called Uncia, and half a foot, Semis, &c. &c.

III. The MEASURES of CAPACITY for things dry, were *Modius*, equal to one peck English. One Modius contained 2 *Semimodii*—each Semimodius contained 8 *Sextarii*—each Sextarius, 2 *Heminæ*—each Hemina, 4 *Acetabula*—each Acetabulum, $1\frac{1}{2}$ *Cyathi*—each Cyathus, 4 *Ligulæ*.

IV. The LIQUID MEASURES of CAPACITY were the *Culeus*, which was equal to $144\frac{1}{2}$ gallons—it contained 20 *Amphoræ* or *Quadrantales*—each Amphora, 2 *Urnæ*—each Urna, 4 *Congii*—each Congius, 6 Sextarii—and each Sextarius, the parts described in the foregoing sentence.

V. The MEASURES of LENGTH in use among the Romans were, *Milliarium*, or *Mille*, a mile—each mile contained 8 *Stadia*, or furlongs—each Stadium, 125 *Passus*—each Pace, 5 feet.

VI. The *Pes*, or foot, was variously divided. It contained 4 *Palmi* or handbreadths, each of which was therefore 3 inches long—it contained 16 *Digiti*, or finger-breadths, each of which was therefore three-quarters of an inch long—and it contained 12 *Unciæ*, or inches; any number of which was used to signify the same number of ounces.

VII. *Cubitus*, a cubit, was 1½ feet long—*Pollex*, a thumb's breadth, 1 inch—*Palmipes*, a foot and hand's breadth, i. e. 15 inches long—*Pertica*, a perch, 10 feet long—the lesser *Actus* was a space of ground 120 feet long by 4 broad—the greater Actus was 120 feet square—two square Actus made a *Jugerum*, or acre, which contained therefore 28,000 square feet.

CHAP. VII.

Of Money, and the Computation thereof.

I. The first money in use among the Romans was nothing more than unsightly lumps of brass, which were valued according to their weight. Servius Tullius stamped these, and reduced them to a fixed standard. After his reign, the Romans improved

the old, and added some new coins. Those in most frequent use, were the As, Sestertius, Victoriatus, Denarius, Aureus.

II. The *As* was a brass coin, stamped on one side with the beak of a ship, and on the other with the double head of Janus. It originally weighed one pound; but was afterwards reduced to half an ounce, without suffering, however, any diminution of value. It was worth three and one-tenth farthings.

III. SESTERTIUS was a silver coin, stamped on one side with Castor and Pollux, and on the obverse with the city. This was so current a coin, that the word *Nummus*, money, is often used absolutely to express it. It was worth one penny and three and three-fourths farthings.

IV. DENARIUS was a silver coin, value for ten Asses; that is, $7\frac{3}{4}$d. of our money. It was stamped with the figure of a carriage drawn by four beasts, and on the obverse side, with a head covered with a helmet, to represent Rome.

V. VICTORIATUS was a silver coin, half the value of a Denarius. It was stamped with the figure of Victory, from whence its name was derived. Being worth five Asses, it was called *Quinarius*.

VI. *Libella*, *Sembella*, *Teruncius*, were also silver coins, but of less value than the above. Libella was of the same worth as the As—Sembella was half a Libella, equal to one farthing and a half—and the Teruncius was half of a Sembella.

VII. AUREUS DENARIUS was a gold coin, about the

size of a silver Denarius, and probably stamped in a similar manner. At first, forty Aurei were made out of a pound of gold; but under the Emperors it was not so intrinsically valuable, being mixed with alloy.

2. The value of the Aureus, which was also called *Solidus*, varied at different times. According to Tacitus, it was valued and exchanged for 25 Denarii, which amounted to 16s. $1\frac{3}{4}$d.

VIII. The ABBREVIATIONS used by the Romans to express these various kinds of money, were—for the As, L.—for the Sesterce, L. L. S. or H. S.—for the Quinary, V. or Λ.—for the Denarius, X. or : ! :

IX. Sesterces were the kind of money in which the Romans usually made their computations.—1,000 Sesterces made up a sum called *Sestertium*, the value of which, in our money, was £8 : 1 : $5\frac{1}{2}$.

2. The art of reckoning by Sesterces was regulated by these rules :

First—If a numeral adjective were joined to Sestertii, and agreed with it in case, it signified just so many Sesterces; as *decem Sertertii*, 10 Sesterces = 1s. $7\frac{1}{2}$d.

Second—If a numeral adjective, of a different case, were joined to the genitive plural of Sestertius, it signified so many thousand Sesterces; as *decem Sestertiūm*, 10,000 Sesterces = £80 : 14 : 7.

Third—If a numeral adverb were placed by itself, or joined to Sestertiūm, it signified so many hundred thousand Sesterces; as *Decies*, or *decies Sestertiūm*, 100,000 Sesterces = £8,072 : 18 : 4.

Fourth—When the sums are expressed by letters, if the letters have a line over them, they signify also so many hundred thousand Sesterces: thus, H. S. $\overline{\text{M. C.}}$ denotes the sum of 1,100 times 100,000 Sesterces, i. e. 110,000,000 = £888,020 : 16 : 8.

The table on the next page will show, at one view, the value of all the principal coins and sums of money in use among the Romans. The three first were borrowed from the Grecians.

A TABLE *of the principal* ROMAN COINS *and* SUMS *of* MONEY, *with their relative value in English Currency.*

							£	s.	d.
TALENTUM—equal to 60 Minæ							193	15	0
MINA—equal to 100 Drachmæ and 1 Libra							3	4	7
DRACHMA—equal to a Denarius							0	0	$7\frac{3}{4}$
SESTERTIUM							8	1	$5\frac{1}{2}$
10	AUREUS						0	16	$1\frac{3}{4}$

10,000	1,000	40	20	10	4	2 TERENTIUS ...	0	0	$0\frac{73}{320}$

CHAP. VIII.

Of Funerals.

I. The religious opinions of the Romans made them, as a people, scrupulously strict in performing the obsequies of their dead.

II. Their manner of disposing with dead bodies was, either to bury them in graves or sepulchres, as we do, or to burn them upon a funeral pile. Burying, as it is more natural, so it was the more ancient practice. Burning became prevalent at the latter end of the republic and under the Emperors, until the Christian religion became universally diffused; after which, interments were again practised.

III. Children before they got their teeth might not be burned. Persons struck with lightning, also, were not burned, but usually buried in the place where they were killed.

IV. Private funerals *(funera tacita* vel *plebeia,)* were made at small expense, and commonly attended only by the relatives of the deceased: but public funerals *(funera indictiva)* were celebrated with great magnificence, and at vast expense.

V. Those who mourned for the dead, or attended a funeral, were accustomed to lay aside all ornaments, to relinquish their ordinary occupations, and to change their usual clothes for others of a black

colour. Sometimes they yielded to extravagant grief, cursing the gods, tearing their hair, allowing their beard to grow, &c. Magistrates, it is said, sometimes laid aside their official robes, and assumed those of senators; and senators sometimes put on the equestrian habit.

VI. A PUBLIC FUNERAL was proclaimed aloud by a herald, who went through the city, inviting all that wished to attend. The procession was composed, besides the relatives of the deceased, of musicians, torch-bearers, freedmen, and mourners; and, if the deceased had been a general, of the soldiers whom he commanded, and the lictors, who went along, bearing their arms and fasces reversed.

2. When the bier reached the Forum, some near relation or public functionary recited an oration, filled with the praises of the deceased.

3. The funeral then proceeded to the Campus Martius, or whatever place had been determined upon without the city, and the body was placed upon the pyre, which had been previously erected there, with a piece of money in its mouth, to pay Charon, the ferryman of hell, for a sail over the river Styx.

4. The pyre was inflamed by the nearest relatives of the deceased, who turned their faces aside while they held their torches to it, in order that they might seem necessitated to perform so painful a duty.

5. After the pyre began properly to blaze, the clothes, arms, &c. which the deceased most fre-

quently wore and most delighted in, were thrown into the flames. Sacrifices were then made, and the victims also thrown into the fire.

6. Combats of gladiators generally closed the funeral. These have been already described in Chap. I. of this Book. This horrible practice originated in an ancient custom of murdering prisoners of war around the funeral pile of those who had been slain in battle, as a sacrifice to their manes.

7. When the body had been consumed, its ashes were gathered up, and placed in an urn. Those who had the charge of funerals knew how to distinguish the ashes of the body from those of the wood; but sometimes, for the purpose of being more certain, the body was wrapped in a kind of cloth, called Asbestos, which being spun out of a mineral substance, possessed the singular property of remaining unconsumed in fire, and therefore entirely preserved the ashes of the dead from mingling with those of the pile.

VII. The FUNERAL PILE (*Rogus* vel *Pyra*) was a high heap of such wood as was most easily inflamed, built in regular order, in the shape of an altar. Around it, cyprus trees were sometimes set, to prevent any disagreeable smell from spreading; and for the same purpose, costly perfumes were frequently thrown into it while burning.

VIII. The instant in which any person was observed to expire, the nearest relation present kissed his lips, in hope of receiving his soul. His eyes and

mouth were closed, to give him the appearance of a person sleeping; and he was loudly and repeatedly called upon, by name, to awaken, for fear he might only have fallen into lethargy.

2. The body was then given to the undertakers, and by them washed or embalmed. In the art of embalming, the Romans were greatly superior to the Egyptians. It is supposed that they used for this purpose a mixture of myrrh, or aloes, and turpentine.

3. When the body had been thus prepared, it was dressed, and the head was crowned with flowers, or with some of the coronets, which the valour of the deceased, in battle, had merited.

4. It was usual to keep the corpse in this manner seven days. A branch of cypress tree was placed, in the meantime, outside the door, which was known by the passers-by to be an emblem of death.

IX. UNDERTAKERS *(Libitinarii)* were entrusted with the charge of providing every thing requisite for funerals. They derived their name from the temple of Venus Libitina, in which were registered the names of all those that died at Rome.

2. *Pollinctores* were those persons to whom the undertakers permitted the washing and embalming of the body.

3. Other persons employed to assist at funerals were, *Vespilliones* or *Sandapilones*—those who carried the bier.

4. *Siticines*—musicians of various kinds, that went before the bier, playing to the pyre.

5. *Præficæ*—mourners; a company of women, practised to sing, with a plaintive voice, a funeral dirge, commemorating the praises of the deceased. Women of this description are found in many parts of Ireland at present.

6. *Ludii* and *Histriones*—players and buffoons, who danced and sung before the bier. Such characters would seem to us very improper actors in a funeral solemnity.

X. Private burial places were usually in fields or gardens contiguous to the highway, where the inscriptions might catch the eye of the traveller, and thus put him in remembrance of his latter end.—Public burial places were the Campius Martius, for illustrious individuals, and the Campus Esquilinus for the poor, both of which were without the city, as it was unlawful to inter within it.

XI. SEPULCHRES were at first small buildings, in the interior of which, along the walls, were certain recesses, called *Columbarii*, from their resemblance to pigeon-holes, in which the urns were deposited, and underneath which the inscriptions were written.

2. When the Romans became luxurious, they made their sepulchres equally magnificent with their other buildings. They were usually under ground, (hence called *Hypogæa*), and divided into various apartments, which were adorned with very expensive

paintings in fresco, mosaic work, and marble figures in relief, of great beauty and value.

3. It was not an uncommon thing for men to erect sepulchres for themselves; which explains some ancient inscriptions, such as *V. F.* for *Vivus fecit*, he made it in his life time, &c. Sepulchres were also raised for those whose bodies could not be found, or who were elsewhere buried: being empty, they were properly called Cenotaphs.

XII. APOTHEOSIS was a political service, whereby some great person was, after death, entitled to enrolment among the gods, and to all the adoration paid to gods. This honour was conferred by a decree of the senate, and confirmed by the ceremony which followed.

2. So soon as the funeral obsequies of the person whose consecration was designed, had been performed, a waxen image, bearing exact resemblance to him, was laid in some public place or porch, and for seven days a show of mourning was manifested among the people. The higher orders of both sexes attended round his couch, and the physicians approached from time to time to report that he was gradually getting worse, until the seventh day, when they declared him dead.

3. After this ridiculous farce had been performed, the image was carried, attended by a gorgeous procession, similar in many respects to that of a triumph, along the Via Sacra, to the Forum or other public place, where a panegyric was pronounced, usually

by the successor of the deceased in office. When the panegyric was over, the pomp advanced to the place where a magnificent funeral pile had been previously erected.

4. The pile was constructed in form of a pavilion, four or five stories high, each gradually diminishing towards the top. The inside was composed of various combustibles; but the outside of each story was made like a portico supported by pillars, and superbly decorated with gold, ivory, and paintings.

5. On this pile the waxen image was laid, and when a profusion of spices and perfumes were thrown in, the whole was inflamed by the torches of the principal persons present. When it was perceived that it was properly enkindled, an eagle was let fly from the top, if it were the consecration of an Emperor; or a peacock, if it were of an Empress: and the bird, as it ascended in the air, glad to regain its freedom and escape from the smoke of the pyre, was foolishly supposed to carry the soul of the person up to heaven.

END OF THE SYNOPSIS.

QUESTIONS

UPON

THE PRECEDING TREATISE,

ARRANGED CONSECUTIVELY,

Designed for the use of the Scholar, and the convenience of the Master.

☞ The numeral refers to the section, and the figure to the paragraph similarly marked under that section.

BOOK I.

What were the boundaries of ancient Italy? I.
How was ancient Italy peopled? ... ... II.
What was the chief town of Italy? ... III.
When were the foundations of Rome laid? IV.
What were the dimensions of Rome? ... V.
How was it situated? ... ... VI.
How many inhabitants did it contain? ... VII.
How did Romulus divide the city? ... VIII.
How did Augustus divide it? ... ... IX.
Do you recollect the numbers of the various kinds of buildings contained in those regions? ... ... —
How many bridges had Rome? ... ... X.
What were its principal public buildings? XII.
What were the names of the most remarkable temples? ... ... XIII.

Mention the most interesting particulars respecting each of these. ... ... XIII. 1, &c.
How many other temples were there at Rome? ... ... — 6
Is there any difference of meaning between the words Ædes, Delubrum, Sacellum, and others? ... ... — 7
How many sacred groves were there? ... — 8
Mention what you recollect respecting the theatres of Scaurus and Pompey. ... XIV. 1, 2.
Did the laws of the Romans sanction theatres? ... ... — 3
Which was the principal amphitheatre at Rome? ... ... XV. 1
What was the difference between a theatre and an amphitheatre? ... ... — 2
Which were the principal parts of an amphitheatre? ... ... — 3
What were the Fora Civilia of the Romans? ... ... XVI. 1
Which were the most remarkable of these? — 2, 3
What were the Fora Venalia? ... ... — 4
What were Basilicæ? ... ... XVII.
What were the Baths? ... ... XVIII.
Which were the most famous of these? ... — 2
Of what use were Porticos? ... ... XIX.
For what purpose were Columns erected? XX.
What Columns were most celebrated? ... — 1
Do you recollect any thing worthy of note respecting these? ... ... — 2, 3
Which were the most admired triumphal Arches? ... ... XXI.
What were Circi? ... ... XXII.
Describe the Circus Maximus. ... ... — 1
What was the Campus Martius? ... ... XXIII.
How many Aqueducts were there at Rome? ... ... XXIV.

Do you recollect any thing respecting the Sewers?		XXV.
Were the Roads good that led to Rome?		XXVI.
How were those roads constructed? ...	—	2
How was the Via Appia made?	—	3
Describe the progressive improvement of the city.	—	1,2,3
What kind of a palace was Nero's? ...	—	4
How were the houses of the nobility made in Nero's time?	—	5
How did the Romans warm their rooms?	—	6
* Is it known of what their windows were made?	—	—
What were lodgings, and the inhabitants of them called?	—	7

---

* Since the paragraph to which this question refers was written, I find, by Miss Starke's letters from Italy, that some of the houses of the city of Pompeii, which was buried by an eruption of Mount Vesuvius A. D. 79, were glazed with a thick kind of glass not perfectly transparent, and that others had isinglass, split into thin plates, for windows.—But glass perfectly transparent was reckoned so valuable, that Nero is said to have given a sum equal to £50,000 for two perfectly transparent cups with handles.

BOOK II.

CHAP. I.

Were the Romans a religious people? ... I.
What was the nature of their religion? ... II.
What were the Roman names for heaven and hell? ... ... III.
How many deities had the Romans? ... IV.
Where did they suppose these deities to dwell? ... ... V.
How did they classify their gods? ... VII.
Who were the Dii Majorum Gentium? ... VIII.
Name the twelve great gods. ... ... —
Who was the chief of these? ... ... — 1
Who was the queen of Jupiter? ... ... — 2
Who was Minerva, and how was she generated? ... ... — 3
Who was Vesta? ... ... — 4
Who was Ceres, and what were her rites called? ... ... — 5
Who was the god of the sea, and what epithets were usually given him? ... — 6
Who was Venus? ... ... — 7
What do you recollect respecting Vulcan? — 8
Who was Mars? ... ... — 9
Who was the messenger of the gods? ... — 10
Relate some particulars concerning Apollo. — 11
Who was the sister of Apollo? ... ... — 12
What were the names of the Dii Selecti? — 13
Mention some of the most important particulars respecting each of these. ... (1, &c.)
How were the Dii Minorum Gentium divided? ... ... X.
Who were the Indigetes? ... ... — 1

What kind of deities were the Semones? x. 2
Who were the Nymphs? ... ... — 3
What are the names of the Muses? ... — 4
What was the occupation of the Fates? — 5
How were the Furies represented? ... — 6
What were the Lares? ... ... — 7
Wherein did the Penates differ from the Lares? ... ... — 8

CHAP. II.

In what did the worship of the gods principally consist? ... ... I.
In what manner were prayers made? ... II.
With what, and when, were lustrations usually made? ... ... III.
What kind of victims were fit for sacrifice? IV.
Might any victim be offered to any god? ... — 2
Detail, as circumstantially as you can, the ceremonies used in sacrificing. ... V. 1 to 7
Wherein did the sacrificial ceremonies to the celestial and infernal gods differ? — 9, 10
Did the Romans ever offer human victims? — 11 to 13
Were sacred festivals often celebrated? ... VI. 1, 2
Which were the most remarkable festivals? — 3
Describe the Lupercalia. ... ... — 4
Mention what was most particular in the festival of Mars. ... ... — 5
How did the priests of Cybele celebrate the Hilaria? ... ... — 6
What distinction of days did the Romans make? ... ... — 7

CHAP. III.

What do you understand by the terms, general ministers of religion and particular ministers? ... ... I.

Name over the various kinds of general ministers. ... ... II.
Mention the most important particulars concerning the Pontifices. ... ... III.
Who were the Augurs, and what were their duties? ... ... IV.
From what sources did the Augurs derive their pretended knowledge of futurity? — 2
What ceremonies did they use in taking observations from the heavens? ... — 3
Specify something particular concerning the other modes of observation. ... — 4 to 8
Did the Augurs ever foretell by astrology? — 9
What kinds of persons were the Cerriti, Larvati, and Lunatici? ... ... — 10
Who were the Haruspices? ... ... V.
Who were the Epulones? ... ... VI.
Who were the Quindecemviri? ... ... VII.
What was their origin? ... ... — 2
Who was the Rex Sacrorum? ... ... VIII.
Describe the Fratres Ambarvales? ... IX.
Upon what occasion were the Curiones instituted? ... ... X.
Describe the college of Feciales. ... XI.

CHAP. IV.

Mention the various kinds of particular ministers. ... ... I.
Who were the Flamines? ... ... II.
Mention the most particulars respecting the Vestals. ... ... III.
Who were the Luperci? ... ... IV.
Who were the Salii? ... ... V.
Who were the priests of Hercules? ... VI.
Who were the Galli? ... ... VII.

BOOK III.

CHAP. I.

How many forms of government were established in ancient Rome? ... ... I.
What authority did the regal government confer on the King? ... ... II.
What method did Romulus take to unite his subjects? ... ... — 3
Who had in reality the highest power at Rome under the Kings? ... ... — 4
What scheme did Servius Tullius devise and execute to deprive the people of their power? ... ... — 5
Can you repeat the table in which this is exemplified? ... ... — 6
What kind of a government was the Roman republic? ... ... III.
Was the republic a happy government? ... — 3
To what causes may its glory and stability be attributed? ... ... — 4
What was the nature of the imperial government? ... ... IV.

CHAP. II.

What legislative authorities had the republic? ... ... I.
Which was the supreme court of the ancient Romans? ... ... II.
At what times did the senate regularly sit? — 2
What magistrates had power to convene the senate? ... ... — 3
In what did its power chiefly consist? ... — 4

Could it not also confer dictatorial power on the Consuls? ... ... II. 5
How did the business of the senate commence? ... ... — 7
How was a decree made? ... ... — 8
Mention some of those Latin words and phrases that are most common in speaking of the senate. ... ... — 9
How was a meeting of the senate ended? — 10
What dress did senators wear? ... ... III.
What age and property were requisite for a senator? ... ... — 2
What was the number of senators? ... — 3
How did senators get the title of Conscript? ... ... — 4
What were Comitia? ... ... IV.
What were the Comitia Curiata? ... V.
Where, and for what purposes, were they held? ... ... — 2
Who were entitled to vote in them? ... — 3
What were the Comitia Centuriata? ... VI.
What terms did the Romans use to designate the people of the various classes? — 2
Where, and for what purpose, were Comitia Centuriata held? ... ... — 3
How long previously should these assemblies have been summoned? ... — 4
Whence was the word candidate derived? — 5
What was the duty of a Nomenclator? ... — 6
What was the Centuria Prerogativa? ... — 7
How did it and the other centuries vote? — 8
What was the office of the Diribitores? — 9
If the votes of the centuries, in trials of life and death, were equal, what was the consequence? ... ... — 10
How did the centuries vote about a law? — 12
How did they vote on an impeachment? — 13

What were Comitia Tributa? ... ... VII.
Had the rich any advantage over the poor in these assemblies? ... ... — 2
How many tribes were there? ... ... — 3
What business was transacted in these assemblies? ... ... — 4
Where were they held? ... ... — 5
How were they summoned? ... ... — 6

CHAP. III.

Which were the principal ordinary magistrates of the republic? ... ... I.
Which were the chief magistrates? ... II.
In what did the authority of Consuls consist? ... ... —
What were their insignia? ... ... — 2
When were they elected? ... ... — 3
Had both Consuls equal authority? ... — 4
What offices was it requisite to have filled before one could obtain the consulate? — 5
How did Consuls settle with regard to their provinces? ... ... — 6
Had they much authority under the Emperors? ... ... — 7
Who were the Prætors? ... ... III.
What three words described the whole extent of their authority? ... ... — 2
How many Prætors were elected for the city of Rome? ... ... — 3
Were there other Prætors besides those of the city? ... ... — 4
What public honours did the Prætors enjoy? ... ... — 5
What were the Edicta Nova and Tralatitia? ... ... — 6
Who were the Censors? ... ... IV.

What punishments were they empowered to inflict? ..... IV 2
What kind of private crimes came under their cognizance? ..... — 3
What was the Censors' sentence called? — 4
Had they any other duties besides the revision of morals? ..... — 5
How often did they take a census of the people? ..... — 6
Who were the Tribunes? ..... V.
Whether were they Patricians or Plebeians? ..... — 2
What one word described all their authority? ..... — 3
Was the sanctity of their persons productive of good results? ..... — 4
Was there any way to check their authority? ..... — 5
Which of the assemblies of the people could they summon? ..... — 6
Was their power great under the Emperors? — 7
Who were the Ædiles? ..... VI.
How many kinds of Ædiles were there? — 2
Had they any concern with the public games? ..... — 3
What honourable privileges did they enjoy? — 4
Who were the Quæstors, and what were their duties? ..... VII.

CHAP. IV.

Which were the principal extraordinary officers of the republic? ..... I.
Who was the Dictator? ..... II.
By whom was he attended? ..... — 2
How long ought the power of the Dictator to have continued? ..... — 3

Was there any consideration to prevent the Dictator from abusing his authority? II. 4
Who were the Decemviri? .... III.
Who were the Military Tribunes? ..... IV.

CHAP. V.

Which were the principal provincial officers? I.
Was there much difference between Proconsuls and Proprætors? .... II.
What was the duty of these officers? ..... — 2
Who were their retinue? .... — 3
Could any of their actions be called in question? .... — 4
Who were next in dignity to Proprætors? III.
Who were Legati, and what was their office? IV.
What was the Procurator of a province? V.

CHAP. VI.

Which were the most distinguished Imperial Officers? .... I.
Who was the Præfectus Urbis? ..... II.
What was his duty? .... — 2
What was the Prætorian Præfect? ..... III.
Who was the Præfectus Annonæ? ..... IV.
What was the treasurer of the army called? V.
Who was the Præfectus Classis? ..... VI.
Were there any other imperial officers? ..... VII.

CHAP. VII.

Do you recollect the names of any inferior officers? .... I.
Who were the Præcones? .... II.
What was the duty of the Scribes? ..... III.
Who were the Lictors? .... IV.
Who were the Accensi? .... V.
Who were the Viatores? .... VI.
What was the office of the Carnifex? ..... VII.

CHAP. VIII.

Into how many orders did Romulus divide the people? .... I.
Was there any other order? .... II.
What property was requisite for knights? —
How do you explain the phrases, "Annulo aureo donari," and "Adimere equum?" — 2
What was the duty of knights? .... — 3
Was there any other division of the people? IV.
Explain the nature of this division. .... — 2, 3

CHAP. IX.

Was there any division of the Roman people which influenced the giving of names? I.
How many names had the respectable people in general, and what did these names signify? .... II.
When did children receive the Prænomen? III.
How were girls usually called? .... IV.

CHAP. X.

What distinction do you make between the words Liberi and Ingenui? .... I.
By how many ways might persons become slaves? .... II.
Was there not a slave market at Rome? III.
How were slaves enfranchised? .... IV.
Which were the ceremonies of manumission? — 2

CHAP. XI.

How were the judicial proceedings of the Romans classified? .... I.
In private cases who were the judges? .... II.
Of what nature were the cases over which the Arbitri, Recupatores, and Centumviri presided? .... — 1

Detail circumstantially the manner in which private suits were carried on. ..... II. 2
Who were the judges in criminal cases? III. 1,2,3
What was the usual manner of conducting a trial before the people? .... — 4
What species of punishments were usually inflicted on malefactors? .... IV.

CHAP. XII.

What was the manner in which Romulus and some of his successors enacted laws? I.
Were these laws equally respected after the expulsion of Tarquin? .... II.
How did the people remedy the inconvenience arising from unsettled laws? ..... III.
What was the nature of Cn. Flavius' book on the civil law? .... IV.
In addition to the laws of the Twelve Tables, what other sources were there of Roman jurisprudence? .... V.
What was the nature of the Codex Justinianus, Digests or Pandects, Institutes, and Novels? .... VI.
How were the laws of the Romans usually entitled or distinguished? .... VII.

CHAP. XIII.

What was the title of the first of the Twelve Tables of Law?
Do you recollect what was the nature of any of the laws of that table?

[The teacher may repeat these questions for the eleven remaining Tables. It might be well, perhaps,

sometimes to ask separate questions respecting some particular laws; by which means a deeper impression would be made on the mind and memory of the learner.]

CHAP. XIV.

Do you recollect the titles of any laws relative to the rights of Roman citizens? I.
What did the Valerian law ordain? ..... —
What did the Porcian law ordain? ..... —
What did the Sempronian law ordain? ..... —
Do you recollect the titles of any laws relative to Magistrates? .... II.
What were the Genutian laws? ..... —
What did the Antonian law ordain? ..... —
What was enjoined by the Junia Socrata lex? .... —

[Similar questions may be asked respecting the eleven following sections.]

BOOK IV.

CHAP. I.

Might any Roman in a case of emergency refuse to enlist? ..... I.
What was the Roman word for a regiment? II.
When were levies usually made? ..... III.
What was the first thing which the Consuls did when they wished to make a levy? ..... IV.
Were there any persons to assist the Consuls in making levies? ..... V.
How did they choose foot soldiers? ..... VI.
What was the military oath, and how was it administered? ..... VII.
From amongst whom were the cavalry chosen? ..... VIII.

CHAP. II.

How many legions constituted an army? I.
What was the number in a legion? ..... II.
Which were the divisions of a legion? ..... III.
Were all the soldiers of the same kind? IV.
Who were the Velites and Evocati? ..... — 2, 3

CHAP. III.

Had the various orders of legionary soldiers the same arms? ..... I.
What is there worthy of remark respecting their swords? ..... — 2
What was the Pilum? ..... — 3
How was their helmet made? ..... — 4

Describe their shields Scutum and Clypeus. I. 5
How was their coat of mail formed? .... — 6
What was the Pectorale or Thorax? .... — 6
What were Ocreæ? .... — 7
How were the Velites armed? .... II.
How were horsemen armed? .... III.
What was the legionary ensign? .... IV.
Besides the general ensign, were there any others in a legion? .... — 2
From what did the Manipulus derive its name? .... — —
Did the Romans respect their standards? — 3

CHAP. IV.
