Tables showing the total number of persons assured in the Equitable Society from its commencement in September, 1762, to January 1, 1829 : distinguishing their ages at the time of admission into the society, and exhibiting the number of years during which they have continued members of it, the periods of life at which their assurances have terminated, and the ages which the surviving members had attained on the 1st of January, 1829, to which are added tables of the probabilities and expectations of the duration of human life, deduced from these documents, a statement of the disorders (as certified to the Court of Directors) of which 4095 persons assured have died in thirty-two years ending December 31, 1832, and a supplement showing the mortality of the society for the years 1829, 1830, 1831 and 1832.

INTRODUCTION TO THE TABLES.

FROM the time when the Equitable Society was first established, until within the last few years, it certainly was never contemplated, by those who were engaged or consulted in conducting its affairs, that the probabilities of life amongst its members would afford sufficient data for constructing Tables of the Expectations of the Duration of Human Life, or of the values of Life Annuities which might be safely available for any practical purposes ; nor were the accounts arranged with a view to the exhibition of a distinct statement of the duration of the lives assured at each particular age, as displayed in the following Tables, although an annual comparison of the probabilities of life in the Society with those in the Northampton Tables has been regularly made, in conformity with a plan suggested by Dr. Price to the Court of Directors in the year 1776 *. The great value, however, which has of late been attached to the information supposed to be contained in the records of the Equitable Society, with regard to the duration of human life, and the important measures, founded upon its experience in this respect, which were proposed in the General Court previously to the last decennial investigation, have induced the Directors to give to this subject their most serious attention : and under a conviction that the accounts hitherto given of the mortality which has taken place amongst the Members of the Equitable Society have not been stated with perfect accuracy nor sufficiently detailed, they have directed the minute and laborious investigation to be made, the results of which are now presented to the Society.

The first of the following Tables (TABLE A.) is so formed as to exhibit in one view the duration (as far as the same can be traced) of *all* the lives which have been assured in the

This, which was one of three methods recommended by Dr. Price for ascertaining the state and progress of the Society, consists in an annual enumeration of the number of Members living in the Society at the beginning of every year, arranged in decennary periods according to their respective ages: the number of deaths occurring in each decade in the course of the year being then carefully noted, and compared with the number of deaths which should have occurred according to the Tables from which the premiums have been computed, proof is afforded how far the Society has been secure in the use of those Tables.

EXAMPLE.

Comparison for the year 1832.

Ages.	Number living Jan. 1, 1832.	Of whorn died in the year.	Should have died.
10 to 19	55	0	
20 - 29	249	1	4
30 39	873	4	16
40 - 49	1531	21	36
50 - 59	1909	30	63
60 - 69	1311	58	63
70-79	573	60	50
80 - 89	94	34	17
90 96	6	4	2
	6601	212	251

The result of a register of this kind, of the experience of 30 years ending on the 31st of December 1799, was published in an Address delivered by Mr. Morgan at a General Court of the Society in April 1800; and from this, and a subsequent account published in a note to Dr. Price's Work on Annuities and Reversionary Payments, have been deduced the Tables of mortality and of the values of Life Annuities according to what has been termed the "Equitable Experience": these Tables vary in some degree from each other, and are necessarily inaccurate from the imperfect nature of the documents from which they were computed.

INTRODUCTION.

Equitable Society from the time of its commencement in September 1762 to the 1st of January 1829*, a period exceeding 67 years. It contains a marginal column, in which are exhibited the ages at which the several Members have been admitted into the Society, and 88 other columns, each containing four subdivisions. In the first subdivision of each column are inserted the numbers of persons who have attained, or been admitted at, the age which stands at the head of that column; these, consisting of persons who have entered the Society at various periods of life, are placed in classes one beneath another, in numerical order, from 7 to 66, so as to show the number of years they may have been severally assured.

In the second subdivision is the number of persons of each class who had on the 1st of January 1829 attained, and were living at, the several ages stated at the head of these columns respectively.

In the third subdivision is the number of persons of each class who have discontinued their assurances after they had attained the age stated at the head of the column, and before they had completed the next following year of age.

In the fourth and last subdivision is the number of persons of each class, who have died after they had attained the age stated at the head of the column, and before they had completed the next successive year of age. The sum of the numbers in the last three subdivisions, namely, the number *still existing*, the number who discontinued their assurances, and the number who died between any one year of age and the next succeeding year of age,—being deducted from the number who attained to the former, and who are contained in the *first* subdivision, the remainders are carried forward as survivors from one age to another, to the extremity of life : for example, under the age of 30 and opposite to 25, in the column showing the age of admission, we find the number 421, which is the exact number of persons, out of all who have assured at the age of 25, who continued Members of the Society until they completed their 30th year of age ; of these, 10 (the number in the second subdivision) were *existing* on the 1st of January 1829, and would enter upon their 31st year of age in the course of that year; 29 ceased to be Members of the Society between the ages of 30 and 31; and 2, the number in the 4th and last subdivision, died between those ages : deducting therefore the number still existing . 10

The number	who	discor	ntinued						29
The number	who	died		•		•		•	2
						In	all		41

from 421, there remain 380 persons who have survived, out of the 421 persons first mentioned, to the age of 31, and entered whilst Members of the Society upon their 32nd year of age.

A complete view is thus exhibited of the number of persons who have made assurances with the Equitable Society at each particular age, the number of each class who survived from year to year, so long as they continued Members of the Society, and the rate of mortality which has prevailed in each class distinctly, as well as amongst the whole body of assurers taken collectively.

From this Table, containing a complete detail of all the facts which the experience of the Equitable Society can furnish connected with the subject of the duration of human life, other tables may without difficulty be formed, with such modifications as on an attentive consideration of the results may be thought necessary for the purpose of applying them to practical purposes: these alterations will of course be made according to the discretion and judgement of those who may undertake the labour.

By the summary, page 18, it appears that of the whole number assured in the Society, amounting to 21,398 persons, there have died, who continued Members till their death 5144

there have ceased to be Members, by Surrender, Forfeiture or expiration of their Policies 9324 and there remained, Members living January 1, 1829 . 6930

Total 21,398

It is obvious, therefore, that the data afforded by the experience of the Equitable Society towards a conclusive inference respecting the duration of lives of all ages, are as yet very imperfect, little short of one half of all those on whose lives assurances have been commenced—have

^{* 185} new Members were admitted into the Society, in the course of the whole year 1829, at various ages: these are not included in the Table A., although the mortality of that year is included in that Table. The reason for this omission will be apparent from a consideration of the principle upon which tables of this kind are formed, and of the information they are intended to convey, namely, the number of deaths which have happened, or may be expected to happen, out of a certain

INTRODUCTION.

withdrawn-more than half of the remainder are still alive-and those upon whose lives full information is afforded, do not amount to one quarter of the whole number assured.

The second Table (B.) contains an account of the duration of the lives of those persons only, who, having effected assurances in the Society between September 1762, and January 1st 1829, either lived and continued their assurances to the close of the latter year, or died in the intervening period. It is derived from Table A., by subtracting in the first instance, from the numbers of all who have entered the Society at each age, found in the first subdivisions, the sum of all the numbers opposite to them in the third subdivisions of the columns in that Table, and deducting from the remainder, the numbers in the second and fourth subdivisions of the columns in the same Table; namely, the numbers of those who have died, or still exist at or between every year of age subsequent to the age of admission in each class respectively.

EXAMPLE.

The total number of persons who have commenced assurances at the age of 30 is 762; of these, 162 discontinued their assurances between the ages of 30 and 35, namely,

between	1 30	and	31					1		
betweer	1 31	and	32					36		
betweer	1 32	and	33		-			53		
betweer	33	and	34	1				42		
betweer	34	and	35					30	-	 162
and between	1 35	and	40							101
between	a 40	and	45	 						
between	1 45	and	50							20
between	1 50	and	55	1				-		8
between	1 55	and	60		14		10		2	2
between	1 60	and	65					•		4
										327

The above number of 327 being deducted from 762, there remains 435, the number opposite to the age of 30, in the marginal column of ages in Table B.; of these, two died before they attained the age of 31, and 433 survived, of whom four had not completed their 32nd year on the 1st of January 1829, and four died before they attained the age of 32: only 425 persons therefore survived to the age of 32, out of the 435 persons first mentioned.

In deducing the Tables of the probabilities and expectations of life from the general results in Table A., it has been assumed that one half of those who discontinued their assurances between one year of age and another, completed a *whole* year, that is, one half of them has been constantly deducted from the numbers of persons living, out of whom the deaths have been reckoned to have happened. Thus, the average number of *all* who have lived in the Society between the ages of 30 and 40 is 62,915; the number who have discontinued their assurances between those ages is 2715;—the half of this number, or 1357, being deducted from 62,915, there remains 61,558. The number of deaths between the ages of 30 and 40 has been 572, which, upon a population of 61,558, gives the rate of mortality for that decade as one in 108 very nearly.

This may be considered a fair correction, since some of these persons quitted the Society immediately after they had completed the age at which they are stated to have discontinued their assurances, others not until they had nearly entered upon another year of age. With this correction, the rate of mortality which has prevailed in the Society amongst all the lives assured, taken collectively, on an average of 67 years, ending January 1st 1829, will be found

number of individuals at any given age before they shall attain to the next year of age, in other words, how many persons out of a given number existing at any age will survive to the next succeeding year of age. In conformity with this principle, the duration of the lives of those, who are, or have been Members of the Society, is reckoned according to the number of entire years of age, which they have completed since the time of their admission.

A person, therefore, making assurance in the course of the year 1829, in the 31st year of his age, cannot be reckoned as having lived a year in the Society, on the 31st of December 1829; and is not to be added until 1830, when he must be classed under the age of 31, as he would complete his 32nd year in 1830, and have entered his 33rd year on the 1st of January 1831, should his life have so long endured.

Ages.	Equitable, Table A.	Equitable, Table B.	North- ampton.	Chester. Males and Females.	Carlisle,
	One in	One in	One in	One in	One in
20 to 29	139.	71.	64.	80.	132.
30 - 39	108.	73.	54.	71.	94.
40 - 49	81.	62.	42.	50.	70.
50 - 59	46.	40.	30.	40.	54.
60 - 69	24.6	22.	21.	22.1	24.
70 - 79	11.9	11.	11.	11-	12.
80 - 89	6+	6.	5.4	6.	5.7

to be as stated in the following Table, which also contains the rate of mortality from Table B., and for the sake of comparison, according to the Northampton, Chester, and Carlisle Tables.

The method adopted in the construction of Table A. is similar to that pursued by M. De Parcieux with respect to the Table which he formed from the list of various tontines in France. This method is liable to the objection that it does not accurately represent the mortality of lives selected at any one particular age. In a body of lives of the same age, all selected as healthy from the general mass of mankind, it is obvious that the rate of mortality must be considerably less for the first ten or twenty years after selection, than amongst those from whom they are thus chosen. As, however, these selected lives advance in age, their general health, and the rate of mortality amongst them will naturally approximate to the common standard. This approximation cannot be accurately estimated, if the observations be taken from a blended mass of lives, selected at the age of 20 for instance, which have attained the age of 50, and of lives *selected at* the age of 50. The rate of mortality will for the former class be less, for the latter greater, than that which occurs in either class separately.

The correct method, therefore, (if sufficient data existed,) would unquestionably be, to make distinct tables from the mortality of each distinct class. The numbers of each separate class in the tables now presented are insufficient for that purpose, and there is a variance observable in the rates of mortality at different ages when estimated in this manner which renders it scarcely possible to graduate a table from them.

This will be readily seen on a careful inspection of the following comparisons, which at the same time clearly show the effect of mingling together lives selected at various ages, in altering the rates of mortality of each respective class.

					Rate	of Mortal	ity of			
Ages.	Rate of Mortality on all Classes taken collectively.	762 Persons assured at the Age of 30,	726 Persons assured at the Age of 33.	743 Persons assured at the Age of 35,	659 Persons assured at the Age of 38,	615 Persons assured at the Age of 40.	525 Persons assured at the Age of 43.	470 Persons assured at the Age of 45.	370 Persons assured at the Age of 48.	321 Perso assured a the Age of 50.
30 to 35 33 - 38 35 - 40	102 [.] 95 [.]	One in 142 [.] 	One in 182.	One in 92°	One in	One in				
$ \frac{38 - 43}{40 - 45} $ $ \frac{43 - 48}{45 - 50} $	88' 87' 74'	72- 58-	97* 82* 57*	79- 69-	124· 99·	93. 	91• 	92-	46.	
	53° 50° 40°	49• 34•	52.	57· 27·	48 [.]	58. 50.	58.	56. 41.	53.	
18 - 63 10 - 65		21.	35.	23-	36.	26.	42.	26.	38.	28.

Of the lives assured in the Equitable Society, by far the greater number have been admitted between the ages of 30 and 50, and a very large proportion between the ages of 30 and 40; whilst comparatively few of those who have been admitted under the ages of 28 or 30 have continued their assurances for more than seven or eight years, or beyond the age of 35: it is therefore between the ages of 30 and 50 that the rate of mortality is chiefly affected by the circumstance of recruiting lives selected at early ages, which have in the course of years approximated to the general average of mortality, with other lives selected at more advanced ages.

INTRODUCTION.

In the Tables derived from Table B., from which the lives of all persons are excluded whose assurances have been terminated otherwise than by death, of whom the greater number were under 50 years of age, the probabilities of life between the ages of 30 and 50 will be found to be given considerably lower than in Table A. But as the numbers who have thus left the Society have been replaced by the annual admission of new members, this Table (B.), may be considered as representing more nearly than Table A. the mortality of a stationary body of select lives, or rather a population in which the waste of each year is supplied by the admission of fresh lives, so as to keep up the mass of those in being together, to a certain number. It has the advantage also of being the safer Table of the two for most of the practical purposes of a Life Assurance Office, giving the probabilities and expectations of Life somewhat lower than those deduced from the mortality of separate classes, in a few cases where these latter have been sufficiently numerous to form some estimate from. * But it is unnecessary to enlarge further upon this subject at present; the facts contained in these documents will admit of almost numberless arrangements and modifications, and it may be truly said, in the words of an eminent mathematician + particularly distinguished by his writings upon Life Annuities, that "there neither is, nor can be a table of observations on the degrees of mortality of mankind but what may be objected to."

The compiler of these tables, nevertheless, is not without hope that they will be found to contain a useful and important, as well as curious addition to the branch of Statistics with which they are connected.
