To the Right Honourable THE EARL OF ROSEBERRY, &c. &c. &c.

My Lord,

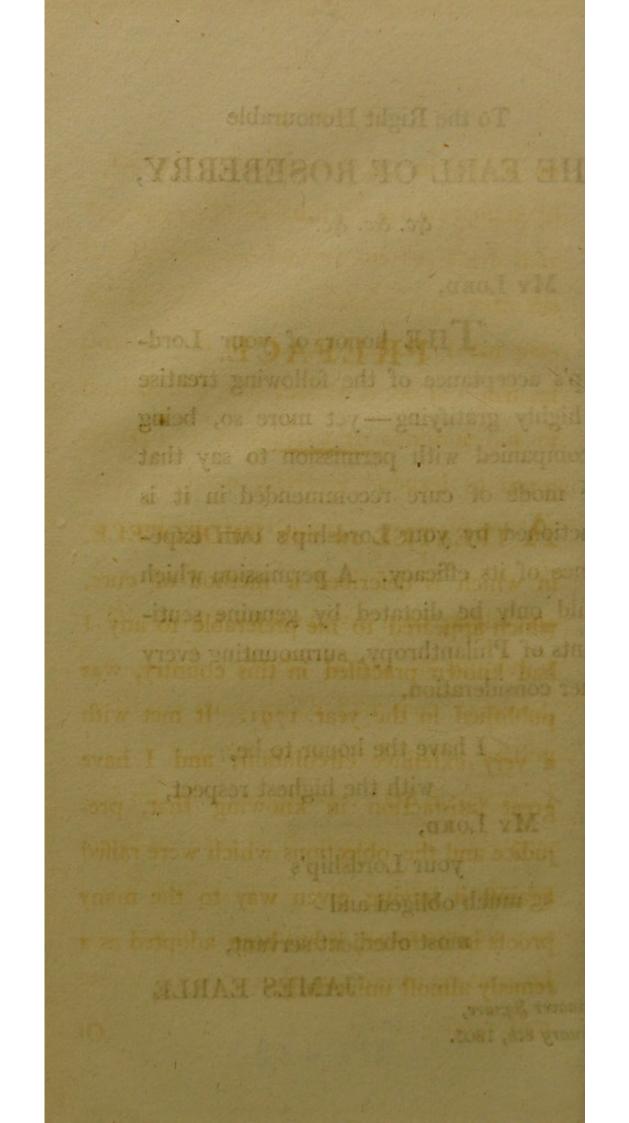

THE honor of your Lordship's acceptance of the following treatise is highly gratifying—yet more so, being accompanied with permission to say that the mode of cure recommended in it is sanctioned by your Lordship's own experience of its efficacy. A permission which could only be dictated by genuine sentiments of Philanthropy, surmounting every other consideration.

> I have the honor to be, with the highest respect, My Lord,

your Lordship's much obliged and most obedient servant,

JAMES EARLE

Hanover Square, February 8th, 1805.

PREFACE.

funded that the fubject is at the general

and en branchierefore, induced to bring

full be practicioners anaccontrate with the

A TREATISE ON THE HYDROCELE, in which is defcribed a method of cure, which appeared to me preferable to any I had known practifed in this country, was publifhed in the year 1791. It met with a very extensive circulation; and I have great fatisfaction in knowing that, prejudice and the objections which were raifed against it having given way to the many proofs in its favor, it has been adopted as a remedy almost univerfally. Of a fecond imprefion, to which an appendix was added, few, if any, remain in the Bookfellers' hands; and as there may ftill be practitioners unacquainted with the procefs and its falutary effects, I am perfuaded that the fubject is of too general concern to be fuffered to continue out of print, and am therefore induced to bring forward another edition.

in which is deterined a method which on

When first I introduced it to public notice, it was thought proper to fupport it by all the cafes which had then occurred, with a minute account of the operation and all its confequences. Of these cafes I therefore gave a description of fixty-one. I could now, were it necessary, make an addition to that number of more than four hundred, which under my immediate care and infpection (vii))

infpection have been perfectly and radically cured by the fame gentle means; but the method is now fo well eftablished, that I conceive it unneceffary to fwell the volume with more than appeared in the former edition. Most of these, the original proofs, having been drawn up with more attention to progrefs and fymptoms than has been fince thought requifite, and having received additional confirmation from the time elapfed fince they were performed, will be here repeated, and fome variations only, or peculiar circumstances, which have fince occurred, will be added.

My only Antagonist, at least the only one I know of, I have reason to think is by this time fatisfied with the mode of cure by injection, having heard nothing from him fince

adväntage, requires ant uprevious defeription of the diferie inclife through it may not be needlar, **J J J O N G Y H** what has been repeatedly difeated by more able

whiters, and is now pasty generally under-

IN my edition of the works of the late Mr. Pott was inferted an account of a method of curing the Hydrocele, which appeared to me preferable to any which I had known practifed in this country; but it having been fuggefted that the fuccefs of the operation was fearcely fufficiently eftablifhed by the cafes which were there exhibited, and the fubject being of importance to a confiderable part of mankind, I have been induced to refume it, and to relate what further obfervations on it have occurred.

flood.

My former tract, being joined to Mr. Pott's comprehensive account of every species of Hydrocele, rendered superfluous any other introduction; but this, not having the same advantage, requires some previous description of the difease itself; though it may not be necessary to enter very deeply into what has been repeatedly discussed by more able writers, and is now pretty generally understood.

The refearches after a fafe, eafy, and effectual cure for the Hydrocele have exercifed the ingenuity of many practitioners, and a variety of methods have been adopted; thefe, I prefume, it will not be unufeful to collect and bring into one point of view, to give fome account of the rife and progrefs of each, and to examine their refpective merits and defects.

THE term Hydrocele is ufually applied by furgeons to that fpecies of fwelling in the fcrotum

postnet of athentic fragministic y effectin midnife it do

fcrotum which is formed by an accumulation of a watry fluid; it is a difease to which all defcriptions and conditions of men are fubject, from the earliest infancy to the latest age, and to which the healthy, the infirm, the weak, the robust, the voluptuous, and the abstemious, appear to be equally liable. The original caufe, in fome inftances, may be traced, but generally is not to be difcovered. A blow, or a contufion, has been often known to produce it; fometimes it is fubfequent to a hernia humoralis: the most common caufe perhaps is relaxation, as appears from the frequency of it in warm climates.

There are varieties, in the fituation and appearances of the Hydrocele, which have been noticed by feveral writers. A collection of fluid is fometimes formed in the courfe of the fpermatic veffels, which is denominated the HYDROCELE of the SPER-MATIC CHORD, and this has been divided B 2 into into two kinds, one of which being an extravafation of lymph, diffufed through the cellular fubstance of the fpermatic veffels, is called the Hydrocele of the cells of the tunica communis.

(4)

When this difeafe is fimple it is perfectly local, that is, it is confined entirely to the membrane forming the tunica communis, and does not at all affect either the dartos, the tunica vaginalis, or any other part: while it is fmall it gives little trouble, and often paffes for a varix of the fpermatic chord; fometimes it arifes to fo large a fize, and gets into fuch a ftate as to become an object of furgery.

If the extravalation be confined to what is called the fpermatic process, the opening in the tendon of the abdominal muscle is not at all dilated, and the process passing through it may be distinctly felt; but if the cellular membrane which invests the spermatic vessels within the abdomen be affected, the tendinous dinous aperture is enlarged, and the increased fize of the diftended membrane paffing through it, produces to the touch a fensation not very unlike an omental rupture.

As it is not probable that this complaint can be cured by the ordinary methods of treating the common Hydrocele, it is not properly the fubject of our prefent enquiry. Mr. Pott has mentioned the incifion as the only method of cure which it admits, and which, he obferves, is far from being void of hazard.

The other species of the difease has been called the ENCYSTED HYDROCELE of the TUNICA COMMUNIS.

This, like the preceding complaint, has its feat in the tunica communis, or cellular membrane which invefts the fpermatic chord, with this difference, that in the former the fluid is diffufed through the cells of the membrane; in this it is collected in one cavity or bag, which is formed, as the coats

of

of encyfted tumors ufually are, by preffure and condenfation of the common membrane. It most frequently possesses the middle of the fpermatic process between the tefticle and groin; its growth is gradual, and when of the fize of the tefticle, forms with it the outline of the figure of 8, beyond which period it varies in fize and form, being fometimes oblong, though commonly continuing globular; whether it be large or fmall it is generally pretty tenfe, and the fluctuation of the water not eafily perceptible. When lightly ftruck on with the finger it gives the fenfation of a bladder diftended with air, and has been miftaken for a fpecies of pneumatocele, or wind rupture, a difease which does not exist; it gives no pain, nor unlefs it be very large, does it hinder any neceffary action. It is perfectly circumfcribed, and has no connection with the cavity of the tunica vaginalis below, or the abdomen above. The tefticle with its epididymis may

be

be diffinctly felt below the tumor, and is abfolutely independent of it; and the upper part of the fpermatic chord may generally be diffinguished above it: it undergoes no alteration from change of the patient's posture, and is not affected by the action of the abdominal mufcles in coughing, fneezing, &c.

Thefe marks fufficiently defcribe the complaint, while it is fimple and uncombined with any other; but when it is accompanied with a hernia, or a Hydrocele of the tunica vaginalis, it becomes more complex, and when the preffure from above or below is confiderable, the nature of it fometimes cannot be precifely determined till the other complaints are removed; that is, till the contents of the abdomen are returned into their proper cavity, or the tunica vaginalis is emptied.

These are the diseases for which it is most liable to be mistaken; but, as was observed,

B₄

it

it is eafy to be diffinguished from the Hydrocele of the tunica vaginalis by the tefficle being perceptible in its natural state below it; it fometimes indeed preffes so high upward as to make it impossible to feel the spearance of a defcent from the abdomen : however, absence from every symptom of confinement of the intestinal canal, and the diffinguishing symptoms and marks which have been noticed, will be sufficient to point out the true nature of this species of the difease, which does not very often occur.

The ordinary or moft common kind is the HYDROCELE OF THE TUNICA VAGI-NALIS, being formed between the coats which envelope the testicle; thefe are well known to be two only, the tunica albuginea, which is the immediate and proper covering of its vafcular ftructure, and the tunica vaginalis, which is a continuation of the the fame membrane, but being reflected forwards, loofely invefts the teftis and the greater part of its epididymis, without any connection except in the hinder part*. On the furface of thefe, as on every membrane which lines the various cavities in animal bodies, there is a conftant fecretion of a fluid which prevents any cohefion, and permits the eafy motion of contiguous parts: this fluid is ufually kept from increasing beyond what is neceffary for the above purpofes, by veffels deftined to abforb the redundancy. If either of these offices be not duly performed, that is, if the fecretion and abforption do not keep pace with each other, an alteration in the state of the parts must be the confequence: if either the fluid be fecreted too fast, or, what perhaps is most commonly the cafe, the powers of the abforbent veffels.

* For a more particular description of the structure of these parts, vid. Pott on the Hydrocele.

fail,

fail, a tumor is formed which gradually becomes more and more perceptible as the collection increases, and constitutes the Hydrocele.

The fize and appearance of the tumor vary in different perfons and under different circumstances. At its beginning is ufually rather round, but as it increases, if it meets with no resistance, generally affumes a pyriform figure, with its larger extremity downward; the nature of membranes being to ftretch and accommodate themfelves to gradual diftention, it fometimes increases to an enormous bulk, reaching in fome cafes almost to the knees. If the tumor in its growth meets with refiftance, as from a tight fuspenfory bandage, it fometimes takes a lateral direction fo as to reach toward the groin on one fide and into the oppofite fide of the fcrotum on the other.

It is perfectly indolent in itfelf, though its weight does fometimes produce a fmall degree degree of uneafinefs in the back. The transparency of the tumor, which is mentioned by fome writers as a characteriftic of the difeafe, is not always difcernable, being frequently prevented in adults by the thicknefs of the tunic and fcrotum, and fometimes by the opacity of the contained fluid. In infants, the thinnefs of thefe parts and the clearness of the water almost always fuffer the rays of light to pass through. In fome cafes it is fo diftended as to be hard and almost incompressible; in others, though the Hydrocele may have been of long ftanding, it is fo foft and lax that the tefticle is eafily perceptible; if the tunica vaginalis be thin, the tefficle may be perceived; but if the tunic be firm, or thickened, the teftis often cannot be felt diffinctly, though to an intelligent observer, there is almost always a fenfation where the tefticle is connected, fufficient to direct where a puncture ought not to be made: this is a point of the utmoft

utmost confequence to be ascertained, as a wound of the body of the teftis would not only mifs of evacuating the water, but would be productive of the most dangerous. confequence. The usual place where the teftis is fixed is in the posterior and middle part of the tumour; if the fwelling be not very large, it is rather towards the bottom; but as this fometimes varies, the fituation of it must be determined by the tactus eruditus of the examiner, and will be difcovered by the firmnefs and hardnefs arifing from the body of the teftis, together with its appendage the epididymis, being of a denfer or more folid texture than any of the contiguous parts. In every part of the tumor, the two membranes being unconnected, and affording a void fpace for the collection of water, the difference will always be diftinguishable.

veffels may be diffinetly felt above the tumor,

tumor, which is the first mark of the difease to be attended to; it however fometimes happens that the accumulating water meeting with refiftance below, rifes into the fuperior part of the tunica vaginalis, and diftends it quite up into the ring of the abdominal mufcles, fo as to make extremely difficult, if not impoffible, to feel the fpermatic process. This circumftance throws an obscurity on the nature of the cafe, and confounds it with the appearance of a descent of intestine, or omentum; other fymptoms and marks are then to be adverted to: in the hydrocele the tumor can never be made to difappear by any polition of the body, or any preffure of the hand; but in the hernia fcrotalis, unlefs it be adherent, or incarcerated, the tumor may be returned into the cavity of the abdomen by gentle pressure on it, assisted by a favourable or horizontal polition of the body. Or in cafe it cannot be returned, the patient being directed

directed to cough, a protrusion from the abdomen may generally be discovered by the impulse which it receives from the action of the abdominal muscles; from which the Hydrocele being unconnected with the contents of the abdomen, is wholly exempt.

The hiftory of the cafe often helps to point out the difference between the two difeafes, the Hydrocele begins below, the hernia above. Too great attention cannot be given to every mark of difcrimination, as a miftake of one for the other might prove fatal.

It is fometimes difficult to diffinguish the Hydrocele from a difeased and enlarged testis, particularly when the texture of the gland is become loose, or when there is fome fluid in the body of it, which often happens; the seel of the tumor is then precisely that of a Hydrocele. Other circumstances however there are which generally lead lead to determine its true nature; the greater proportionate weight of the tumor, the varicous state of the vessels, the inequality of the surface, and the painful fensation which usually attends the examination, or handling a difeased testicle, are distinguishing marks of it.

A collection of water frequently accompanies a fchirrous enlargement of the tefticle, and in fuch cafes is probably caufed by it; but a fimple Hydrocele will not produce a difeafe in the tefticle. Some degree of enlargement of the parts indeed we generally find accompanying Hydroceles, particularly those of large fize and long duration; but this is not difeafe, it is probably only the effect of the continued preffure of the accumulating water. It is the nature of membranes to thicken in proportion to the refiftance which they are obliged to make. We find this evidently in the tunica vaginalis, which ufually grows in thicknefs

thickness as it becomes more diftended, and we may reafonably conclude, that the tunica albuginea is thickened by the counter preffure from the fame caufe, which will give an apparent enlargement to the body of the teftis: when the preffure is removed by difcharging the water, and its return prevented by the radical cure, provided too great inflammation has not been excited by the operation, the teftis appears to grow fmaller at the termination of the cure than when the water was evacuated. This effect must be produced by both the tunics becoming thinner and more contracted, and is a fort of proof of the fact being as I have stated, that the most frequent increase in the fize of the teftis in Hydroceles arifes from the thickening of the tunics, and that it is caufed by preffure: the fame effect is produced in the peritonæum in cafes of the afcites, and still more evidently in hernial facs, in which great diffention caufes it to grow

(17)

grow thick and hard; fluids, collected in the ovaria, in the cavities of joints, in the thecæ of tendons, and I believe may be added, in every part of the body, have generally the fame effect to a certain degree, beyond which indeed the efforts of nature, to get rid of the contents, caufe the parities to become partially thin.

A flight enlargement therefore of the parts is not a prohibition to the radical cure of a Hydrocele, though a cancerous or fchirrous ftate of the teftis certainly is, as it would be highly imprudent and unfafe to irritate and inflame an already diftempered gland.

Confidering then the difeafe as a fimple, well defined Hydrocele, which, though not a painful complaint, is obftructive to the exertions of the indigent and laborious, a confiderable impediment to the active pleafures of the opulent, and is found to be fo unfeemly, inconvenient and troublefome by all, as to demand the affiftance of furgery;

we

we will next proceed to examine the various means which have been practifed for its relief.

(18)

THE PALLIATIVE CURE.

THE evacuation of the water is fufficient to remove the prefent inconvenience arifing from diftention, and fhould in general be performed at leaft once on those who determine to undergo a radical cure, as it gives an opportunity of examining the flate of the teftis, and also of permitting the cavity to be filled again, only to fuch a fize as may be thought to be best calculated to infure fucces in any future operation.

The palliative cure confifts in drawing off the water by a puncture made through the fcrotum and tunica vaginalis; for this purpofe fome have preferred the lancet, others the trochar. I make no fcruple in recommending the latter, as it completely evacuates the water with eafe and expedition. When When the wound is made by a lancet, nothing is left to maintain a communication between the opening in the fcrotum and that of the tunica vaginalis, confequently the water is often either prevented from coming out of the fac at all, or it escapes into the cellular membrane, and cannot find the paffage through the fcrotum; to obviate this, the practitioner, as I have often remarked, is obliged to introduce a probe, which cannot always be readily effected, and makes the operation painful and tedious. The only reafon for doing it with a lancet, which, in my opinion, can obtain, is when there is any doubt of the nature of the cafe, or the fituation of the teftis; under fuch circumstances a fmall incision may certainly be conducted more fuperficially, and with lefs hazard, by means of a lancet than by a trochar: but when no fuch circumstances exift, the trochar is preferable. The best method to do the operation is to grafp the C 2 upper

(19)

upper part of the tumor with the left hand, as tight as can be without giving pain, then to plunge a fmall trochar into the anterior part of it, rather lower than the middle, the finger being previoufly applied to the cannula to regulate the precife depth it is to penetrate, and any blood veffel which may be vifible being carefully avoided. The ftilet is then to be withdrawn, and the cannula left till the water is evacuated.

(20)

I have never found a patient, who has undergone both thefe operations, choofe again to fubmit to the lancet; they are, however, both eafily practicable by any one who is acquainted with the ftructure and fituation of the parts concerned; and the evacuation of the water, as was obferved, affords a temporary relief; but the neceffity of the frequent repetition of it, from the almost constant return of the complaint, the inconvenient magnitude which the tumor must attain before it can fafely be attempted, attempted, with the danger, and fometimes pain, attending the diftention, render the producing a permanent cure a most defirable object.

The methods which have been employed for the radical cure of the Hydrocele are many: in giving an account of them I fhall follow the order in which they are laid down by the learned Monf. Sabatier. Indeed this gentleman has confidered the fubject with fuch accuracy, that little can be faid with regard to the hiftory or defcription of them, which is not to be found in his excellent memoir.

The operations may be reduced to fix principal ones; the incifion, the excifion, the cauftic, the tent, the feton, and injections.

THE INCISION.

The Hydrocele, fo as to bring the naked C_3 teftis

(22)

teftis completely into view, is the most ancient operation we have any account of; it was practifed even before it was known that the complaint was fusceptible of a palliative cure. Galen was the first who mentioned that it might be relieved by evacuating the water through a cannula, introduced by means of a puncture; but Celfus, who preceded him by about a century, defcribed the operation of incifion. The operation, he obferves, fhould be done on the fcrotum at the time it is most full, and the fluid most abundant, and when the patient is adult. When the water is in fmall quantity, or the fubject is young, the operation fhould be performed in the groin, after having raifed the tumor towards that fide; it is not fufficient to evacuate the water, but part alfo of the coats which contain it fhould be removed; the wound fhould be cleanfed and washed with water in which falt and nitre are diffolved. This is all which C 3

which Celfus fays on the fubject. It is not very clear whether or not he means that the incilion fhould be made the whole length of the tumor, and how the dreffings were applied we are left to conjecture, unlefs he deemed it unneceffary to repeat the directions which he had given in another place, particularly in cap. 19, lib. 7, where he has defcribed at length the method of treating wounds after any operation of incifion into the fcrotum.

Paulus Egineta is much more exact in this refpect; he omits no precaution which may be neceffary to enfure the fuccefs of the operation. The patient, he fays, thould be placed on his back, his loins fuftained by pillows, and the forotum by a fponge placed underneath. The incifion is to commence at the middle of the tumor, and to be carried to the upper part of it, in a line parallel to the raphè. This incifion is only to go through the teguments; the bag which con-

tains

tains the water is then to be opened, and part of the fides of the fac to be taken away; after which a director is to be introduced, and conveyed to the bottom of the fcrotum, and a divifion is to be made to the bottom, that the difcharge of blood and matter may find a free exit: the cavity is to be filled with lint, and the neighbouring parts and the belly are to be fomented; when the wound is cleanfed, and partly incarned, the lint is to be leffened, and fimple dreffings continued till the whole wound is healed.

(24)

Albucafis defcribes the incifion with the fame exactnefs, and almost in the fame terms; but he adds two very material circumstances; the first is, that, after this method of treatment, the Hydrocele is liable to return, the fac not being destroyed; and the other is, that the testis fometimes escapes out of the lips of the wound. Great care, he observes, should be taken to return it, and keep it in its place. This accident depends

on

on the retraction of the fides of the fkin, and of the membrane which contained the water; for the teftis itfelf flews no difpolition to leave its original fituation, and can only give way to the action of the parts which furround it: neverthelefs, the precept which Albucafis gave is very important; and we meet with the fame caution in other authors.

(25)

Since the end of the eleventh century, when he wrote, we find no mention of this method for a great length of time; practitioners recommended others, as, the cauterization of the fac, the ufe of the tent, and of the feton. Hildanus first refumed the cure by incision, and appears to have practifed it; the fixty-fixth observation of the fourth century is a proof, and furnishes at the fame time an example of the fuccess which attended it. The patient was fortyfive years of age, of a robust constitution; he had long been subject to a Hydrocele of fuch fuch bulk as to be very incommodious to him. After the proper preparation, an incifion was made through the teguments, the tunica vaginalis was brought into view, and was then divided through the whole length: the cavity was filled with a large tent, which was placed the whole length of the teftis to the bottom of the fac. The patient recovered. Hildanus obferves, that this method fhould be ufed with great circumfpection, as it is fometimes followed with ferious confequences, which put the patient's life in moft imminent danger.

This is not the only author who has feen bad confequences from the operation by the incifion.

Dodonæus cites a cafe in which the incifion was followed by gangrene, and caufed the death of the patient.

Wifeman, one of the diftinguished furgeons of the last century, observes, that it is often followed by colic, fever, hiccough, not and and gangrene, when the patient is of a delicate conftitution.

(27)

Mr. Cheffelden, who was by no means a timid operator, fays he has done the operation by incifion, and feen it done by others; but never thought the cure worth the trouble and pain the patient muft neceffarily undergo.

According to Heifter's account the curatio perfecta, by which he means the incifion, confines the patient many weeks to his bed, is painful, and in fome meafure dangerous.

We find alfo inftances, in the moft modern authors, in which this operation has been the caufe of very ferious confequences. Mr. Sharp, in his treatife on operations, relates two cafes where the incifion produced very dangerous accidents. The firft is in a man of a robuft and good conftitution, whofe Hydrocele was opened the length of four inches. In the evening, after the operation, he he had a fever; the fcrotum and teftis began to inflame and tumefy; the patient felt fevere pains in the region of the loins: from the third day to the feventh he was in great danger till the fuppuration appeared to be eftablifhed, after which he grew better; but the tefticle fuppurated, and a large quantity of matter was formed. The difcharge did not begin to diminifh till the twenty-fourth day; adhefions were then formed between the tefticle and the membranes of the fcrotum, and the forty-third day the wound was entirely healed.

In the fecond cafe there was alfo a violent fymptomatic fever, which terminated in an abfeefs in the tefficle; the patient, who was only eight years old, very narrowly efcaped with life.—On the whole, he concludes, that both incifion and cauftic are attended with fo much danger, that, notwithftanding the fuccefs in the end, he believes whoever reads the cafes will be inclined to reject both methods, methods, and abide rather by the palliative cure; and again, that he has known a few examples in favour of the operation, but by no means enough to warrant the recommendation of it, unlefs to fuch perfons as are inconfolable under the diforder, and are willing to fuffer any thing for a cure.

Mr. Warner obferves he has never feen any fatal confequences arife from the incifion; but advifes that it fhould only be practifed upon those who are of a good habit of body, and who have not exceeded the middle stage of life.

The authorities which have been quoted are certainly adverfe to the operation of incifion; but to treat it with that impartiality which I would wifh to preferve, it is proper to remark, that it has been practifed by furgeons of the first reputation and abilities, and that it is still preferred by fome ingenious practitioners among the moderns to the feton or caustic.

Mr.

Mr. Bell, in his Syftem of Surgery, after having enumerated all the methods which have been employed for the cure of the Hydrocele, has reduced them to three as now generally in ufe, the incifion, cauftic, and feton; of these he prefers the incision: but his account does not convey a very favourable impreffion of either of them, as he fays " he has feen all the three methods produce troublefome fymptoms, fuch as great pain and tenfion of the abdomen, inflammation and fever: and again, if either of them be practifed on perfons otherwife difeafed, on old people, or of infirm habits of body, the fymptomatic fever is apt to run too high for the ftrength of the patient, and the fuppuration, produced by a high degreee of inflammation, tends afterward to deftroy entirely the remains of a conftitution already much impaired." aptorq lift at it forth brin

The fame writer recommends the incifion to be performed in cafes where, from accident,

dent, the Hydrocele is burft, and the water is diffused in the cellular membrane under the fcrotum : his words are, " Inftances of the fcrotal anafarca of a local nature have alfo occurred from the rupture of the Hy+ drocele of the tunica yaginalis teftis; when this species of Hydrocele, arrives at a great fize, jumping from a height, or a violent blow or bruife of any kind, will readily burft it, and the water not finding a paffage outwardly must necessarily diffuse itself over the whole fcrotum. Different inftances of this kind have been met with, two of which are related by Douglas; and the fame kind of fwelling has been produced by the water of a Hydrocele of the vaginal coat being improperly drawn off by the operation of tapping. When the orifice in the fkin is allowed to recede from the opening into the vaginal coat before the water is all difcharged, the remainder of the collection is necelbay very

very apt to diffuse itself through all the cellular substance of the scrotum.

" In whichever of thefe ways the fwelling is produced, the cure ought to confift in laying the tumor fufficiently open, not only for evacuating the diffufed water, but for effecting a radical cure of the Hydrocele of the tunica vaginalis."

Here I muft take the liberty to obferve, that I have feen and could enumerate many inftances of the accident of large and much diftended Hydroceles being burft by blows againft the pummel of a faddle, by falls from horfeback, and other caufes. I have known feveral times the cannula of a trochar flip out of the tunica vaginalis, and permit the water to run into the cellular membrane under the fcrotum; but I never faw a fingle inftance of the kind where the extravafated fluid was not perfectly and totally abforbed, in a very fmall fpace of time, without the neceffity neceffity of incision, puncture, or any other operation. After which the Hydrocele again increafed, as if the palliative cure alone had been performed, and became by degrees fit for a radical operation. So that, if the incifion in this cafe be used for evacuating the diffufed water, I apprehend it to be wholly unneceffary: and if it be intended to effect a radical cure of the Hydrocele, while the tunica vaginalis is in a collapfed flate, and the cellular membrane of the fcrotum loaded with water, probably also inflamed by the diftention, it must furely be a most improper time to undertake it; and I fhould conceive, few practitioners would think it right to perform fuch an operation under fuch circumstances.

When Mr. Pott first published on the Hydrocele, the incifion was the most ufual mode of obtaining its cure, and confequently came in for its full share of description in his general treatife on that complaint; from thence,

(34)

thence, however, it has been inferred, that he was the patron or advifer of that operation; but, though he gives an accurate account of the method of performing it, and prefcribes the best means of avoiding the evils which frequently arife from it, whoever will carefully confider the whole of his account, must observe the caution with which he fpeaks on the fubject; that he excludes the unhealthy and infirm, and only thinks it practicable on the young and vigorous; and he remarks, that it can never be faid to be totally void of danger, and that it bears the appearance of an operation of fome feverity. On the whole, it clearly appears that he was not fatisfied with it, and the fact is, that he did not perform it during the laft twenty-fix years of his life.

When I first engaged in the profession, the operation by incision for the cure of Hydroceles, was the only one employed at St. Bartholomew's, and indeed was the method thod almost universally practifed. I must confess I took an early and deep rooted diflike to it, which more mature observation and experience have not in the smalless degree removed, having always remarked it to be extremely fevere in the execution, and that great tension, pain, and fever, are generally its immediate confequences; after which the progress of the cure is often flow and tedious, requiring in fome cases, though under the care of the abless practitioners, many months for its completion.

The bad fymptoms which have attended this operation, have been attributed to the difficulty with which membranous parts fuppurate; on which account it has been advifed to touch the tunica vaginalis with gentle efcharotics, in order to bring on a fuppuration. It has been alfo recommended to fcarify it to promote its exfoliation.

That the operation of incifion, according to the method in which it has been ufually D 2 practifed,

practifed, may prove a radical cure of the Hydrocele, the whole interior furface of the fac must suppurate and granulate. That it is not calculated to procure an union by the first intention, as has been fuggested, must be evident, for whether the cavity be filled with lint, farinaceous matter, or any other fubstance, the coats are equally prevented from immediate union; after which, the next procefs which nature adopts in order to unite contiguous parts must take place, and if the cavity be not filled up with granulations, or if any part remains which does not contract an adhesion to the testicle, a new collection of fluid may take place, and thus the complaint be renewed. Albucafis mentions the poffibility of this, and it has been confirmed by the experience of the moderns. Many instances have been produced of this fact having happened after the wound has been healed. Mr. Sabatier mentions a cafe in which a collection took place

place on each fide of the cicatrix after it had been firmly eftablifhed, and required to be let out by two incifions; and another inftance in which the patient fubmitted twice to the operation by incifion, which were both done by a very able furgeon; but the water collected again, and he was afterwards obliged to fuffer the fides of the fac to be taken away before the cure was completed.

I have lately feen a gentleman, who underwent the incifion in Ireland, in whom a collection of water was again formed in the fame part, and fuch was his dread of what he had fuffered from the operation, that he permitted it to increase to an enormous fize before he would fubmit to any other means for his relief*.

* Since these observations were first published, I have seen three cases, in which the operation of incision failed to produce a permanent cure.

D 3

EXCISION.

EXCISION.

(38

IT is commonly fuppofed that the excision of the fac of a Hydrocele is as ancient as the incifion. Celfus is faid to have clearly defcribed it. It is true that this author, after having recommended to take away a part of the bag in which the water is contained, fays, if the complaint has its feat under one of the interior coats of the tefticle, an incifion through the fcrotum fhould be made, to lay the tumor bare, and to extirpate it intire; at least this appears to be the meaning of the Latin text, which is not always perfectly intelligible-fi fub medià imâve tunica, totæ hæ extra fcrotum collocandæ, excidendæque funt. But can Celfus mean that we fhould take away the whole of the tumor, and confequently that the tefticle fhould at the fame time be extirpated? or that we should only remove the membranes which ferve for the coat or covering

covering of the Hydrocele? This it is difficult to determine, but in another place he clearly recommends preferving the tefticle. Purgatus ita testiculus, per ipsam plagam cum venis & arteriis & nervo fuo leniter demittendus eft, lib. vii. cap. 19; and ftill more particularly in a paffage of the fame chapter before quoted. On the whole, I am perfectly fatisfied that Celfus means to diffect off as much of the fac, wherefoever it shall be fituated, as can be done confiftently with the prefervation of the tefticle, and expressly with a defign to obliterate the cavity, that there may be no future lodgment for a fluid.-Galen, who followed him, is of opinion that the part affected fhould be taken away with the difeafe .- Albucafis appears to be the first who has unequivocally defcribed the excision. When the teguments have been divided, he fays, we must diffect and open the membrane, and let out the water, after which " incide fyphac qualiter-

D 4

cumque

cumque est possibile tibi incidere ipsum aut cum totalitate fua, aut frustatim, præcipue ejus latus fubtile, nam fi non exquifite perfcruteris in incifione ejus non fit fecuritas quin aqua redeat. Si autem procedit ovum exterius a cute fua, in horâ operationis tuz, tunc, quando compleveris fectionem fyphac, reduc ipfum."-This last circumstance is decifive; if the tefficle is forced out of its fituation during the operation, it should be replaced after having taken away the membranous production which contained the water. It is clear then that Albucafis did not advise the extirpation of the teftis, he only prefcribed the excision of the fides of the bag which forms the Hydrocele .- Fallopius recommends the fame method, which he mentions as an invention of an old date; however he thinks it only applicable to particular Hydroceles.

Although the excision is clearly defcribed by Albucafis and Fallopius, it is not again taken

(40)

taken notice of till we meet with it among the moderns; either it was not underftood, or it was deemed too difficult and too cruel to be executed.

We find fome of the French writers recommending the excision of part or the whole of the fac, when it has been much diftended or is much thickened and hard.

Mr. Douglas has afferted that the excision of the fac is the only method which ought to be used, if we are obliged to use a cutting inftrument for the cure of the Hydrocele; he feems to have been determined in this opinion by the bad fuccefs which attended his first operation by the incision; his patient had very alarming fymptoms, fuch as great pain, inflammation, fever, and a tumefied hardness of the cyst. These fymptoms were not abated till the cyft was fcarified through its whole extent, and in a manner divided into flips. The feparation of thefe fmall portions being eafily accomplished,

plifhed, Mr. Douglas thought he fhould fucceed better if he took away the whole of the cyft; he foon had an opportunity of trying this new method, and it was attended with all the fuccefs which he expected. The fymptomatic fever which followed was lefs, the treatment more fimple, the cure completed in lefs time, and a return of the complaint impoffible. The method in which Mr. D. advifes the operation is as follows: The patient being properly placed, two incifions were to be made in the fcrotum forming an oval, and reaching from the upper to the lower part; this oval portion to be diffected off, after which an opening was to be made in the fac, and enlarged by fciffars; the tunica vaginalis was then to be extirpated entirely, clofe to where it is connected with the fpermatic veffels; an affistant supporting the testicle during the operation, and afterwards replacing it in its proper fituation; the cavity is then directed

ta

(42)

to be filled with dry lint.—Mr. D. directs the oval piece of fkin to be diffected off before the opening in the tunic was made, becaufe he had been embarraffed in a former operation in which he had omitted it; the lips of the wound turning in, he was not able eafily to get at the internal part of the tumor to diffect off the tunic; he recommends great caution not to injure the tefticle or fpermatic veffels.

This operation, though followed by Mr. White of Manchester, and many other furgeons of eminence and character, must have been tedious, and exquisitely painful in the performance; and, from the manner in which it was directed afterwards to be treated, must have been attended with violent and dangerous fymptoms. Yet I am decidedly of opinion, that the excision is lefs objectionable than the incision, provided it were necessary to open the Hydrocele at all in order to obtain its cure; but in that

that cafe I am alfo clear that the best method would be, after having removed the whole of the cyft, to bring the fides of the teguments into contact, and not to prevent their immediate union by any intervening fubftance whatever; by this method that exquifitely fenfible membrane the tunica albuginea would remain covered, and not be exposed to irritation from the air and from topical applications, which circumstances are the principal caufes of the violent inflammatory fymptoms which ufually follow fuch exposure; but I hope to be able to prove, that fuch an operation is feldom, if ever neceffary.

THE CAUSTIC.

Some of the earlieft practitioners were not content with fimply dividing the fac of the Hydrocele, in order to induce a fuppuration of the membranes, and confequently an adhefion of the furrounding parts to the tefticle; tefficle; nor in taking away the membrane to prevent the poffibility of a new collection: Some of them propofed to open the bag with the actual cautery. This is recommended by Paulus Egineta. In the operation which he defcribes, the fkin is to be deftroyed by a cautery of a particular form, the efchar which is left with the cellular membrane to be diffected away, a cautery of another fhape is then to be applied to the membrane.

On the pain and horror attending fuch a procefs it is unneceffary to remark. Franco fpeaks of this method, but in a curfory manner.—Marcus Aurelius Severinus practifed it; he fays he performed it with fuccefs on a friar and a citizen of diffinction in the town of Tarentum. The fenfations of thefe unfortunate patients may be readily conceived, and humanity bids us hope their fellow fufferers were few.

The caustic appears to be of later date. Sabatier

Sabatier fuppofes Hildanus to have been the first author who takes notice of curing a Hydrocele by the application of a cauftic. But it appears that, two hundred years prior to Hildanus, Guido de Cauliaco takes notice of the ufe of cauftics in two different modes, one after the incifion-Cum phlebotomo aperio & aquam extraho, deinde ad confumendum folliculum, modicum arfeneci appono cum xylo & cotone & poft cafum æscharæ, consolido & firmiter figillo, tract. 2d. doct. ii. cap. 7. He took this practice, he fays, from Avicenna and Halyabbas; he then adds-Nonnulli vero, ut Magister Petrus de Orlhiaco, caustico & corrofivo fuper pectinem locum aperiunt ulque ad didymi vacuitatem, postea perforando, ducendo caudam specilli usque ad locum aquæ, ipfam extrahunt, & post casum æscharæ consolidant & sigillant, alii autem cauterio actuali predictam operationem perficiunt, ibid.

Wifeman

Wifeman made use of caustic for the fame purpofe; he relates his having applied it to a very large Hydrocele, a copious quantity of water and bloody matter were difcharged, the wound was dreffed with a mild digeftive: The following night the patient was attacked with fever and pain in the abdomen. The dreffings were continued till the cyft entirely floughed .--- This patient had alfo a Hydrocele on the other fide, which was divided with a cutting inftrument; the fymptoms were nearly equally violent till the fac digested off, which happened in about twelve days. The cure was fooner completed by the fecond procefs than by the first, and Wiseman observes, the fuppuration of the cyft, fo neceffary for the radical cure, is not lefs certain by the incifion than by the effect of the cauffic.

Some modern authors recommend the cauftic for the radical cure of the Hydrocele. Dionis advifes to apply a line of cauftic the length

length of the tumor, and to caufe the fac to fuppurate; his commentator De la Faye is of a different opinion, and fays, that the inconveniences which practitioners have experienced from the use of caustics, have

caufed them to be laid afide; but he does not fpecify of what nature those inconveniences were.

Garengeot mentions feveral objections to the use of caustics; he fays the action of them is flow, and not fufficiently powerful, yet that they frequently are extended to a larger furface than is meant; that an inftrument must afterwards be used to divide the efchar, and that the cauftic particles fometimes mixing with the water of the Hydrocele, communicate their corroding qualities, and produce irreparable mifchief. The laft objection does not appear to have much weight, and indeed is completely contradicted by another practitioner, who recommends the application of a cauftic the length

length of the tumor, then to divide the efchar down to the fac; after which he advifes a fresh application of caustic to the fac, and does not fear any harm being communicated to the tefficle, becaufe fo foon as the caustic meets with the water, its power and action are blunted and ceafe.

The application of a large cauftic continued in use, for a confiderable time, among many practitioners. Mr. Gooch fucceeded equally in the cure of Hydroceles by removing an oval piece from the fcrotum, and diffecting away the tunica vaginalis, as by the application of a cauftic on the tumor; but, for reafons which he has affigned, he preferred the former.

Heifter appears to have feveral times ufed it with fuccefs .- Sharp fays he has feen material ill effects arife from it; he applied to a large tumor a cauftic, an inch broad and fix inches long, the day after he divided the efchar and let out the water; from the E third

third to the ninth day the patient complained of great pain in the part, in the back, and kidnies; the fymptomatic fever was violent, and there was no fign of digeftion in the wound. These fymptoms, more or lefs, continued to the thirty-third day, when the patient grew better; but two abscesses were formed, which it was necesfary to open. The patient got well in about fixty days. This cafe certainly does not tell in favour of cauftics for the cure of Hydroceles, yet the greatest part of the bad fymptoms related probably arofe from dividing the efchar, and letting the air have accefs to the tefticle; if the fcrotum had been fuffered to contract and throw off the floughy membrane by degrees, thefe fymptoms, if they had arifen at all, would have been much more moderate.

Cauftics have not always been employed with the fame views; inftead of being ufed to open Hydroceles through their whole length, length, as is done by a cutting inftrument, fome have propofed to make a fmall opening in the middle of the tumor, fufficient to difcharge the water, and to excite in the internal part of the fac an inflammation and fuppuration; after which an adhefion would take place between the teguments and the tefticle. This method has been practifed a confiderable time in this country. The late Mr. Elfe has left a well written account of it. The method which he recommends is as follows: "To lay a fmall cauftic upon the anterior and inferior part of the fcrotum, fufficiently large to produce an efcar about the fize of a shilling, which is intended to affect, and, if poffible, penetrate through the tunica vaginalis. Sometimes immediately after removing the cauftic, fometimes within twelve or twenty-four hours, the patient begins to complain of pain in the fcrotum and loins, has now and then fome cholic pains, the pulse a little quickened, E 2 and

and the tongue whitish; at different periods of time after removing the cauftic, an alteration is perceptible in the fcrotum; the tumor feels more tenfe or hard, in a few days the efchar of the fcrotum will loofen and come away, exposing to view the tunica vaginalis, which bears evident marks of its having been affected by the cauftic, and being prepared to flough off. As the cure proceeds, the floughy tunica vaginalis will project more through the orifice in the fcrotum; if the water be difcharged by puncture, the fcrotum by degrees collapfes, and the orifice in it is filled up with flough, which prevents the access of external air to the testicle. These floughs continue to come away with the dreffings daily, for about four, five, or fix weeks, and in proportion to their difcharge the hard tumor of the fcrotum leffens. Whoever will carefully attend to the feveral appearances that accompany this method, must be fatisfied that

(53)

that the caustic excites an inflammation of the tunica vaginalis, which spreads through the whole of it, in consequence of which the entire membrane suppurates and comes away in floughs."

This method was certainly a great improvement on the former manner of applying the cauftic; by not dividing the efchar, and no air being admitted, the inflammation was not violent; but, though preferable to many of the other operations, it appears to be in itfelf extremely exceptionable, as it caufes an unneceffary deftruction of the parts, and produces a tedious, painful, and offenfive fore: for it is evident, from the paffage which I have quoted, that it was Mr. Elfe's intention, and he generally fucceeeded in it, to produce a complete flough of the whole tunica vaginalis.

E3

ori i

(54)

THE TENT.

THE use of the tent for the cure of Hydroceles is not of very old date. It occurs first in the works of Franco, who seems to have had great confidence in it. An opening he recommends to be made in the forotum of two or three inches; but the length of the incision must depend on the age of the patient and the fize of the tumor. This wound, he observes, must be kept open with a tent of lint, linen, or sponge; the larger the opening, and the longer time it takes to heal, the greater is the certainty of the complaint not returning.

Pare, defcribing the fame method, fpeaks of it as having been fuccefsfully used by fome; but which himfelf had not practifed, as indeed is evident from the indiffinct and imperfect account of it which he has given. He appears to prefer the feton.

The

The method of using the tent is described by Guillemeau in this manner-The tumor is to be opened in its upper part by a right line, the incifion fhould not be large, and should penetrate into the cavity where the water is collected, great care being taken not to injure the teftis or the fpermatic veffels; the tent is then to be introduced .--The opening he advifed to be made in the upper part of the tumor, as leaft likely in that part to injure the fpermatic veffels; but this practice probably arofe from an idea, that the water of the Hydrocele came from the abdomen, and found a paffage by the fpermatic veffels, and that the cicatrix in that part would prevent its reproduction. If this method be followed, water and matter must be collected at the bottom of the tumor.

Covillard, in his accont of the different methods of curing the Hydrocele, does not forget the tent; he first speaks of the place

E 4

where

where the incifion ought to be made; Paulus Egineta and Celfus, he fays, advife it to be done from the middle of the fcrotum to the groin; while Avicenna and Gulielmus e Saliceto with it to be made in the lower part. Here he appears to be rather miftaken, as neither of those authors fay a word on the fubject of the tent. Covillard indeed recommends the incifion to be made nearly the length of the tumor, and to take away part of the cyft, by which means his operation did not greatly differ from the incifion which was practifed by the authors he has quoted; he then advifes to apply a large and long tent of lint, and, to prevent any return of the complaint, the wound is to be kept open a confiderable time by means of tents armed with digeftives: he concludes with faying this method of operating is very certain, but is not free from danger in fome habits, and may be followed with inflammation and gangrene.

The

(57)

The tent was in use at the time of Nuck; it was then the most common operation. Ruyfh, his compatriot and contemporary, fpeaks of it in the most positive manner, and fhews that he had particular experience of it; he fays, when a Hydrocele is opened by a trochar, or lancet, the tumor foon appears again: but, if an opening be made in the fcrotum in the upper part and on one fide, and a tent is introduced covered with ointment mixed with red precipitate, till a gentle inflammation, followed by a moderate fuppuration, has rotted the membrane in which the water is contained; and, if this membrane be taken away piecemeal, he obferves, it is a perfect cure, as he has feveral times experienced. The authority of Ruysh, who was well acquainted with furgical bufinefs, and held a diftinguished rank among anatomists, is not to be difregarded; yet how can we conceive fuccefs to have followed, if the incifion was made in the upper and lateral lateral part of the Hydrocele? Is it not probable that a collection of matter muft have been formed in the lower part of the tumor, from which there could have been no depending opening by the wound, as it was directed to be made?

Modern inftances might be brought of violent inflammatory fymptoms following fuch practice, attended with mortification, and even a fatal termination. If the tent be ufed, the opening for it fhould undoubtedly be made in the lower part of the fcrotum; one of the first and most ufeful principles in furgery is to gain a depending opening for matter, or any fluid which we wish to difcharge, and is particularly applicable in this cafe, where a contrary practice must be productive of the worst confequences, from the extreme irritability of the parts concerned.

Other authors have recommended the tent with little variation, fo that it is obvious that

that the use of the tent for the cure of Hydroceles was long practifed. It does not, however, appear to have been in ufe among the French furgeons before the middle of the fixteenth century, and I do not find it after the beginning of the prefent, except in Heister, who rather describes then advises the operation; but, if it was abandoned by the French, it continued to be the practice of the Italians, as it is much recommended in a work intitled, Pratica delle piu difficili operazioni di chirurgia che reguardono il Lithomomo e l'occulista; printed at Rome 1723, in octavo. This is the work of Jerome Marini, and, if we take the opinion of Haller, is a very moderate composition. Marini adds nothing to the manner of using the tent, except that it should be armed with medicaments of different qualities, according to the different states of the treatment.

Dr. Monro, in later times, conceived a procefs

procefs which had fome analogy to the ufe of the tent. This was to irritate the anterior part of the fac by leaving the cannula fome time within the cavity, but the confequences of them were very different; the tent was intended to caufe a fuppuration of the fac, and the external furface of the tefticle, at leaft the tunica albuginea. On the contrary, the intention of Dr. Monro was only to excite fuch an inflammation as might be followed by a cohefion of the parts; as he had often feen Hydroceles cured, in a manner fpontaneoufly, by an inflammation which was accidentally produced, he conceived he might bring about fuch an inflammation by art; but he was aware that this must require great care, and that the furgeon should always be able to regulate the degree of inflammation; he therefore rejected irritating remedies, of which he could not immediately prevent the effect. He thought he fhould fucceed better by

by the cannula of a trochar left in after the evacuation of the water, as the caufe of irritation might be removed whenever it was thought that fufficient inflammation was produced. Monro never practifed this plan himfelf, and he recommends it with great diffidence; the hint, however, was fufficient to induce Mr. Pott to try it, and to ground on it his operation of the feton.

Perhaps Monro's plan may be traced in Fabricius ab Aquapendente; after having advanced that the Hydrocele is fometimes cured by a fimple incifion in the lower part, although it be fuffered to clofe again immediately, Fabricius adds, that fome practitioners keep the incifion open during fome days with a cannula of filver; undoubtedly they only propofed to preferve an opening by which the water, if any fhould collect, might find a free exit; but every one muft fee that a cannula remaining in the cavity of the tunica vaginalis for fome days, muft rub rub and fret the teftis, and the infide of the tunica vaginalis, and bring on an inflammation. If we believe Fallopius, Galen has advifed to leave a cannula in the fac of a Hydrocele during fome days; but on confulting the works of that author in the place quoted, there is no expression fufficiently precife to determine that to have been his intention.

This method has not much obtained in practice; Mr. Pott tried it, and affures us that it was not followed by bad confequences: he only obferved that the prefence of the cannula was very inconvenient, and that the inflexibility of it hurt the teftis when the patient moved with inattention. The tent and bougie, which he fubftituted in its place, were not nearly fo incommodious, but the effects produced by them were very uncertain; and, on the whole, he was of opinion, that it was not to be depended on.

Mr.

Mr. Warner made fome trials of the tent, of which he has related four cafes; in the firft he introduced a piece of fponge, which continued twenty-four hours without producing any fenfible effect, and was fuffered to remain to the third day, when the fcrotum became hard and inflamed; the fourth day a finall quantity of matter tranfuded; this difcharge continued to increafe during ten days, after which a little abfcefs formed which furnifhed fome matter, the difcharge then diminifhed, and the membranes contracted an adhefion to the teftis.

This is the moft favourable cafe which Mr. Warner has recited, and he pronounces it an eafy, fafe, and fimple cure; but we muft remark, that there was an abfeefs formed, which was opened by an incifion.— In the fecond cafe the inflammation rofe to a much greater height; the third day after the operation the patient had ficknefs, attended with vomiting and fever; the fifteenth

teenth or fixteenth day the fcrotum burft in two places near the original puncture, from which openings there iffued a confiderable quantity of matter mixed with a flough .---In the third inftance the patient was attacked with a rigor on the eleventh day, the inflammation increased to a great degree, and matter was formed which burft its way through the fcrotum; yet, notwithstanding the violence of the inflammatory fymptoms, there appears to have been a beginning fresh collection of lymph in a portion of the tunic which had efcaped the inflammation.-In the fourth cafe the fymptoms were not much more favourable, the fcrotum imposthumated and burft, and a great deal of fetid matter was difcharged *.

As we which is opened by an inder

* The late Mr. John Hunter used to make an incision into the tunica vaginalis, and then fill the cavity with poultice or moistened linsfeed powder. I had not many opportunities of feeing the result of his practice; but one

(65)

As the introduction of a tent or other foreign bodies is a method which I have never practifed, I have been more particular in relating the practice and opinions of others; and, from what may be fairly collected from the general account, I conceive the operation does not ftand in a very favourable light.

which is to be lenored in the water is

entreiv evacuated.

a needle is to be paffed, carrying a feton,

No traces of the use of the seton for the cure of Hydroceles are to be found among the ancients; this remedy, which was invented by the Arabians, was not applied to

one gentleman on whom he performed it, and whom I afterwards attended, was attacked with moft violent and dangerous fymptoms. In this cafe I found an incilion made in the *upper part* of the fcrotum, which had been filled with linfeed meal, a great degree of fever was produced, matter formed in the lower part of the tumor, and was followed by gangrenous floughs of the fcrotum and tunica vaginalis.

TOUSUS

this

(66)

this difeafe till after the time in which they wrote. The first mention of it is in a work of Guido de Cauliaco in 1363; he fays the Hydrocele may be emptied by means of a feton, which may be done in this manner: the tumor is to be taken hold of by a pair of forceps, flat and pierced with an opening near the ends of the blades; through these a needle is to be passed, carrying a feton, which is to be left behind until the water is entirely evacuated.

Fallopius fpeaks of this method as new, but does not approve of the forceps recommended by Guido; he thinks it fufficient to pierce through the Hydrocele with a proper needle. Fabricius ab Aquapendente alfo mentions the feton, though he does not fuppofe it likely to produce a radical cure in every cafe.

We meet with the fame doubts of the certainty of fuccefs from this operation in a Treatife on Herniæ by Franco. This author

(67)

author afferts that the most certain method is to extirpate the cyft along with the tefticle, or, in other words, to caftrate, as after any other operation the tumor is fubject to return at the end of five or fix months or fooner. The manner in which he advises the feton to be paffed is the fame which is mentioned by Guido and Fallopius, and fays it may be done either with the forceps, through which the needle may be paffed, or the needle may be used alone; but then it must be curved. When the first method is used, the needle fhould be made red hot, and paffed quickly, that it may not cool in traverfing from one opening to the other. Sometimes it is neceffary to use the other method, as, when the bag is very full and much diftended, the forceps would require to be pinched with too great force in order to bring the blades fufficiently clofe, and he observes that no means ought to be neglected to prevent inflammation; if it rifes too high, the feton F 2 Arrel muft

(68)

must be removed, if not, the feton is to be only moved every day, to favour the difcharge of the water. Notwithstanding the ftrange awkwardness and inconvenience of conveying a feton by means of the forceps, it was the method which Pare made use of, and appears to have been his common practice, as it is the first of which he has given a defcription.

The feton, though not generally adopted, continued in ufe in the time of Covillard; it was conveyed by means of a needle half a foot in length, the point heated red-hot, and carrying filk nine or ten times double; he prefers this method, becaufe it is often difficult, from the fize of the tumor, to make the holes in the blades of the forceps meet; but fays this method is not always fuccefsful, owing to the inflammation of the openings not permitting the water to find a paffage out. Other authors fpeak of the uncertainty of the fuccefs of the feton as a radical cure, but but recommended it as a palliative cure in Hydroceles of the tunica vaginalis; others think it only applicable where the water is diffufed through the cellular membrane.

Heister, the faithful reporter of all the methods of operating which are known to him, in treating of the radical cure of the Hydrocele, does not omit the feton; he defcribes it as done with a needle; but adds, that the feton fhould be imbued with digeftive and cauftic medicines, and advifes it to be fuffered to continue in the fac a month, as the former failure of fuccefs he afcribes to not letting it remain long enough, by which, fufficient inflammation was not excited to produce the adhesion of the membranes with the tefticle; but, as by this process a knowledge of the ftate of the tefticle is not procured, he fays, practitioners in general prefer only procure an adhelion o bodtem radio

The objections which Heifter made are the fame which fince occurred to Mr. F 3 Douglas:

(70)

Douglas:—he obferves, that it is not neceffary to infift further on the ufe of the feton, for, befides that the application of it is extremely painful, it does not produce a fuppuration of the cyft, and gives no opportunity of knowing the ftate of the tefticle; the action of it alfo is fo flow, and productive of fo much irritation, that he does not think it an advifable operation.

The difadvantageous light in which almoft all the practitioners had left this method, did not prevent Mr. Pott from making trial of, and adopting it. The difguft which he had conceived for the painful operation of incifion, and the unneceffary deftruction of the fac, even in the beft way of employing the cauftic, led him to endeavour to fteer clear of both, by a method which fhould not be painful in the execution, and fhould only procure an adhefion of thofe parts which the cauftic made neceffary to come away. Having profecuted Monro's idea of letting

(71)

letting the cannula remain, Mr. Pott was convinced that a foreign body might be endured within the tunica vaginalis without rifk or danger; but, as the cannula was found inconvenient and troublefome, he was induced to fubftitute the feton, which was calculated to lie fmoother and fofter .--I attended his first effays, which were as follow :- After having pierced the Hydrocele with a middle fized trochar in the lower part, and let out the water, he introduced through the cannula, an eye-probe, carrying a feton of ten or twelve threads of candlewick cotton; he paffed this probe the whole length of the fac against the upper part, and there, on the blunt end of the probe, made an incifion fufficient to let it out with the feton which it conveyed; he then cut off the feton close to the probe, and tied the two ends of it loofely together; the wounds were covered with a pledget. The morning after, the feton was found to have contracted fuch TIM

firm

firm adhesion to the infide of the fac and the tunica albuginea, that an endeavour to detach it would have caused the patient great pain; but this was not necessary, as, while untouched, it remained without any inconvenience to the part.

In lefs than twenty-four hours after the operation, the fcrotum and tefficle began to inflame, and put on the appearance of a hernia humoralis, and was treated in the fame manner as is ufual in that complaint, with fomentation and poultices, and fupported in a bag-trufs; attention being paid to keep the patient cool.

The adhesion of the seton to the albuginea continuing firm, it was not meddled with, till, the inflammation lessening and the tumor subsiding, it became loose. This was generally in about a fortnight; by this time the parts had contracted a firm and solid cohesion; the seton was then withdrawn, and the orifices healed with a superficial pledget. Mr.

Mr. Pott practifed this method on many perfons, and fucceeded very well. The patients kept their beds a few days, after which they fat on a couch till the cure was complete, which was usually in three or four weeks; during which time no other regimen was neceffary, than an inflammation of the parts from any other caufe would require. However, Mr. Pott foon discovered that the manner of performing the operation might be improved; he found that it was extremely difficult to cut on the end of the probe which carried the feton, and required the affistance of another perfon. He remarked that the cotton paffed with difficulty, and by rubbing on the tunica albuginea gave pain ; that the feton, being made of cotton, adhered in fome inftances too long and too firmly; that, from the intimate union of its parts with each other, it could not be brought away but entire, which unneceffarily prolonged the cure, and in two cafes purpole it

(74)

it was neceffary to make an incition to fet it free.

These inconveniences led him to change his plan, and were completely obviated by the inftruments he latterly made use of. Mr. Pott was always averfe to multiply inftruments in any operation, but in this he found it neceffary to make use of three; the first was a trochar, the dimension of whose cannula was about one fourth of an inch; another cannula, called the feton-cannula, made of filver, of fuch diameter as just eafily to pass through the cannula of the trochar, its length five inches, and a probe fix inches one half long, having at one extremity a fine steel trochar point, and at the other, an eye which carried the feton; which feton confifted of just fo much strong coarfe white fewing filk as would without difficulty pafs the cannula, but at the fame time would fill it. Of late years he made use of a much fmaller feton, and found it to answer the purpofe it

purpose better, giving more room to the discharge of any fluid which might be collected, and being more easily removed at the proper time.

With the trochar the inferior and anterior part of the tumor was to be pierced, as in the palliative operation. As foon as the perforator was withdrawn, and the water difcharged, the feton-cannula was paffed through that of the trochar, until it reached the upper part of the tunica vaginalis, and was felt in the upper part of the fcrotum; this done, the probe, armed with its feton, was conveyed through the latter cannula, the vaginal coat and integuments were pierced by its point, and the feton was drawn through the cannula until a fufficient quantity was brought out by the upper orifice; the two cannulas were then withdrawn, and the operation was finished. It was executed in two or three feconds of time,

time, and with little more pain than is felt in the palliative operation.

By this method every advantage of the former operation is retained, and every inconvenience which it was liable to is removed : the feton cannula, by its firmnefs, bears hard against the place where the feton should be brought out; the trochar point of the probe is prevented from deviating by its confinement, and its point pierces through the skin immediately, and exactly in the place intended; while the feton, by passing through the cannula, is prevented from rubbing rudely over the testicle.

The fymptoms, which this manner of placing the feton caufed, were nearly fuch as followed the former method, and required the fame treatment. When the fwelling was diminifhed, and the parts regaining their natural ftate, which happened about the tenth or twelfth day, the feton was gradually removed;

(77)

removed; the adhesion always made some force necessary to bring it away, but a few only of the threads being withdrawn at a time, the adhesive resistance was small; the dressings were, as before directed, a pledget over the whole scrotum.

I have been induced thus fully to relate Mr. Pott's plan, as I find it has been fometimes either not underftood, or not fufficiently attended to; fome perfons, though intending to purfue the fame idea, having acted very differently from his directions, and others having advifed alterations which, in fact, are a total fubverfion of its principles.

The process which he recommends must be allowed to have been carried to a great degree of perfection, and, if the operation be performed without deviating from the directions he has laid down, I am convinced it will be found preferable to any of the methods which have been usually practifed

in this country. I had opportunities of feeing many of these cases with him, and have myself often practifed it; but do not recollect more than two inftances in which the feton failed to produce a cure. I must therefore conclude, that the want of fuccefs which has been attributed to it, muft have arifen from a mifapprehension of the proper manner of conducting it; particularly I must remark a great mistake which has been made in treating it like a common feton, by drawing it upwards and downwards once or twice a day, and which is the more likely to miflead others as it is recommended by a modern writer of confiderable reputation. If we take into confideration the nature and texture of the parts which are to be thus rudely treated; that there is no gland or vifcus in the human frame fo fusceptible of inflammation, and which fwells inftantaneoufly to a greater degree, fuch treatment must appear

pear likely to produce exquisite pain and irritation. Interformed and and support

I must also take the liberty to reply to fome objections, which Mr. Bell has made to the feton; one of which is, that it does not give an opportunity of examining the state of the testicle. I am at a loss to know what better information of its state any man of fcience would defire, than he could acquire by the touch, after the water is evacuated, which is always done previous to the introduction of the feton when the operation is properly performed; but not, when the trochar is paffed into the upper part of the tumor, as Mr. Bell recommends, from having found difficulty in paffing the feton needle, while the vaginal coat is in a collapfed state .- If Mr. Bell had introduced the feton-cannula, which Mr. Pott has defcribed, I apprehend he would have found By the trochar being introduced at the lower part, the bag is completely emptied, and the tefficle is fubmitted to the moft perfect and fatisfactory examination; not to mention that the palliative cure is, or ought to be, in general performed at leaft once prior to any radical cure being attempted, which gives an additional opportunity of forming our opinion of it. It would be unfortunate indeed for mankind, if it were neceffary to divide the forotum, and lay bare every tefficle which requires examination, before we could determine whether it be or be not difeafed.

Another objection which this gentleman has made, and has given as a reafon why the feton fhould be entirely fet afide is, that it is ill fuited for evacuating hydatids: his precife words are, " It *frequently* happens that the water of a hydrocele *is contained in a number of hydatids*; a circumftance which cannot

cannot be discovered previous to the opening of the tumor. And as it will be readily admitted that the method of cure by feton is ill fuited for evacuating hydatids, this of itfelf is a very material objection to the practice. So that upon the whole, although the feton in every other respect should be equally eligible with the fimple incifion, which, for the reafons formerly given, I think it is not, yet the two last objections we have adduced are fufficient reafons for fetting it entirely afide." That hydatids are fometimes formed in various parts of the body must be allowed; but I will appeal to any man of experience, whether they frequently happen in the tunica vaginalis. During near thirty years attendance at a large hospital, besides the private practice of Mr. Pott and myfelf, I may prefume that as great a variety of Hydroceles have reached my notice as most individuals have feen; yet I do not recollect a fingle instance of hydatids G

hydatids in the Hydrocele,* though I have often met with them floating in collections of fluid in the abdomen, in the thorax, under the fascia of the thigh, and in other parts; but granting that inftances of the kind may happen, fuch particular cafes might require an incifion to let out hydatids which would not pafs through a cannula; but that an operation, recommended by one of the ableft Surgeons who has ever practifed in this or any other country, should be entirely set aside, on account of a deficiency in demonstrating that which it palpably points out, or the poffibility of the occurrence of a phenomenon, does not appear to me extremely reafonable.

The operation, as Mr. Pott practifed it, ftands on the most rational ground. The whole of his end and aim being to produce

* Since this remark was written, I have feen two cafes, and only two, of Hydroceles in which were collections of hydatids.

Ð

a cohefion

a cohefion without deftroying the tunic, or caufing it to flough. This the feton certainly effected; but it must be observed that it went beyond the intention; being a folid body, an adhesion also took place between that and the part of the fac with which it was in contact, and a fuppuration, at least in the track of it, became neceffary to loofen fo as to make it capable of being removed; add to this, that it was certainly productive of more inflammation than was requifite for the cohefion of the tunics, by which fever was fometimes produced, and absceffes were fometimes formed; and that the matter which was collected and difcharged was always peculiarly offenfive, owing to the putrid difposition it received from the air, which found a ready entrance through the orifices made by the feton.

by a caute when a could be transmissing

WHOEVER

WHOEVER confiders what has been related, must observe, that all the methods ufually employed to obtain a radical cure of the Hydrocele, when they have proved effectual, have been generally attended with great inconveniences, and fometimes with very alarming danger, both to the functions of the difeafed part and to the life of the patient; and all this rifk and danger were incurred to get rid of a complaint in which neither life nor general health were materially interested. No man could reflect on thefe circumstances without wishing that it were poffible to obtain the end by a milder procefs.

It is obvious that in every method which has been defcribed, inflammation was carried too far by continued irritation, from whence I drew a plain conclusion, that if a just and proper inflammation was raifed by a cause which could be immediately removed, it must be preferable to letting any irritating irritating foreign body remain, to be caft off by a further procefs, after the original intention, that of exciting merely an adhefive inflammation, had been anfwered; as it muft be evident to every man of common underftanding, that after the inflammation has completely taken place over the furface of the tunica vaginalis, the continuation of the caufe of it muft be not only ufelefs but highly prejudicial.

(85)

Imprefied with thefe ideas, I turned my thoughts to fluids, as alone being capable of caufing an immediate irritation, without the neceffity of their lodging and remaining in contact with fuch irritable and inflammable furfaces; the only difficulty remained in felecting the proper fluid, which flould do the bufines effectually, yet moderately.

relates a cure of a Plydrocole, which

attempted with fp. vin. but was not

INJECTIONS.

The floo se at an a

neinal inten-

ON further inveftigation, I do not find that injections for the cure of the Hydrocele were in use among the early practitioners; nor have I been able to trace any account of them till of late years.

Dr. Monro attributes the firft ufe of injection for this purpofe to an army furgeon of his own name. Mr. Monro firft made ufe of fpirits of wine, which cured the complaint; but the inflammation was fo violent that he thought it expedient to try a milder injection; he accordingly fubfituted wine, which anfwered the purpofe as well, with lefs violence: but what the quantity was, or how the injection was ufed, that is, how long it was fuffered to remain in the fac, does not appear.

Mr. Sharp, in his treatife on operations, relates a cure of a Hydrocele, which was attempted with fp. vin. but was not attained

(86)

tained without danger. The pain which immediately followed the operation was violent, and continued to increase to the day after, when the tumor became hardened and fwelled to a great degree. After remaining a month, it terminated in two abfceffes on the anterior part of the fcrotum. Mr. Sharp had been induced to make this trial, but he does not appear to have repeated it, nor do we find any thing relative to it in his critical enquiry on the flate of furgery, published more than ten years after, which is a fort of proof that it was not practifed in England at that time. Indeed the greater part of the English authors, who have written professedly on the different methods of curing the Hydrocele, do not mention it. Mr. Douglas speaks of it only to fhew his difapprobation of the practice; he fays that the vaginal coat is at fuch a diftance, and the furface of the tefticle fo unequal, owing to the epididymis, that it G4 feems

(87)

feems impoffible that thefe two parts fhould touch with exactnefs. Le Dran conceives that injections cannot fucceed, becaufe it would be impoffible to bring the fides of the cyft together fo as to touch, and befides that, the procefs would be liable to bring on inflammation. Thefe reafons, particularly the laft, had no weight with me, becaufe it is the very circumftance which is to make the cure.

Mr. Pott alfo, in his treatife on the Hydrocele, ranked injections among those operations which, "happily for mankind, were laid afide." From the deference, which I had always, with great reason, paid to his experience and abilities, this, I confess, was discouraging; but I have now the fatisfaction to fay, that he lived to alter his opinion on the subject, and that it was his intention to have made trial of them.

As I had frequently fucceeded in procuring an adhefion and confolidation of parts in finufes

finuses and other large cavities, by injections of various kinds, without caufing great inflammation, and had by those means avoided the neceffity of the destruction, or extensive divisions of the skin and integuments, which fhould be avoided as much as poffible, not only in the neck and face, or where we particularly with to preferve beauty, but in every part, as the loss of true skin is never perfectly reftored; I conceived the cure of Hydroceles might be effected by the fame gentle means, without deranging, in any great degree, the tender and fenfible organs which are the feat of the difeafe, and I was determined to make the experiment. While confidering the beft method of effecting my purpose, I was not a little pleased to find by Mr. Sabatier's account, that though injections had been neglected in England, they had been often used in France, and I learned that experiments had been made on a great variety of injections; that ardent **f**pirits

fpirits and folution of cauftic had been tried, which had caufed great inflammation and much mifchief; but that more mild injections had been ufed with fuccefs.

The proper object of all attempts to cure the Hydrocele without deftruction of the fac, is to produce fuch adhelion of the diftended vaginal coat of the teftis to the gland, as fhall annihilate the cavity in which the water conftituting the difeafe is contained. We know that this effect is produced by a certain degree of inflammation, and are unacquainted with any other procefs, either natural or artificial, by which it can be brought about.

Injections introduced within the tunica vaginalis, into the urethra, or into any cavity of the body, natural, or formed by difeafe, are certainly capable of doing mifchief; but the mifchief must arife from the nature of the injection : if it be violent or irritating it may produce too great inflammation. The caustic cauftic and highly ftimulating injections which had been most injudiciously made use of, and retained an unneceffary length of time, undoubtedly did harm, and were the caufe of bringing injections in general, and for the cure of Hydroceles in particular, into difcredit; but it is extremely abfurd to infer from fuch inftances, that all kinds of injections must be pernicious. If Mr. Sharp, inftead of being alarmed at the bad fymptoms which fucceeded the use of fpirits of wine, had diluted it, he would probably not fo eafily have decided against injections. In the use of injections we are not limited to any degree of ftimulus. Injections may certainly be prepared fo corrofive as to inflame, and even to diffolve the most indolent parts; on the contrary, they may be used fo bland as not to offend the most fensible membrane or furface in the human body, and they may be made to produce any intermediate effect. CUCHINE There

(9I)

There is no kind of ftimulus which admits of fuch various modifications.

Other great advantages of injections are, that they apply themfelves equally and univerfally over the whole cavity into which they are thrown, and when they have remained long enough to produce the requifite ftimulus, they are eafily and completely difcharged. Thefe are effential effects which cannot be derived from any folid body.

The injection, which, after fome confideration, I fixed on for the purpofe, was wine, which I made choice of for feveral reafons. I found that it had been ufed with fuccefs in France; I had experienced it to anfwer well in procuring adhefions in other parts. The ftrength of wine is never fo great as to render it an unfafe remedy, and it may be readily lowered according to the different fenfibility of the parts. Thus a vinous injection appeared capable of producing ducing all the good effects which could be defired, with fcarce a poffibility of doing harm. The fuccefs which has attended it has more than anfwered my expectation, and from every trial which I have made, I have no reafon to wifh for a different one. The pain which is produced is incomparably lefs than by any other operation; it does nothing more than is intended, and the curative effect, as far as my experiments have gone, is equally certain*.

In my edition of Mr. Pott's works was introduced a circumftantial account of all the experiments I had then made on the fubject of injections for the cure of the Hydrocele. As practice is best illustrated by examples, they were again introduced in

* Thirteen years are elapfed fince I wrote the foregoing account. I can now fpeak from experience, that I have found the plan uniformly fuccefsful, and confequently it has not been necessary to alter it in any refpect. my treatife on that fubject; and the method being rather new in this country, requiring therefore all the light which experience could throw on it, fuch further cafes and obfervations, as had then fallen within my notice, were added. Thefe being the original proofs of the efficacy of the plan, they will be here repeated; and fome few additional inftances, in which particular circumftances worthy of notice have fince occurred, will be mentioned.

His to inclose Case I. ala a Labourge

THE first cafe, in which I performed the operation, was in 1787. A man, about fifty years of age, was taken into St. Bartholomew's hospital with a large Hydrocele of many years standing. June 21, in the prefence of Mr. Pott, I passed into it a trochar, and let out a very large quantity of fluid of the usual colour and consistence. I found

I found the tunica vaginalis remarkably thickened and unpliable; to the feel not unlike tripe, or buff leather: the tefticle was much larger than the natural fize. On confidering every circumstance, it appeared to be a very unfavourable cafe for any operation except the palliative: however, as I was defirous to try the effect of injection, and there was no probability of doing mifchief, I filled it with port wine diluted with a decoction of red rofe leaves. The man felt not the fmallest pain; after retaining it a few minutes, I fuffered it to be discharged. The next day a fmall degree of inflammation had taken place; the third day from the operation it was increafed, and the whole fcrotum confiderably fwollen: the patient continued abfolutely free from pain and fever. By way of precaution a poultice was applied, and he took an opening draught. On the fixth day the inflammation continued, the fcrotum much fwollen, the patient

tient without any other complaint. In a few days the inflammation leffened, but the fcrotum was almost as large as before the operation, and, to all appearance, it now contained a fluid. It feemed extraordinary that water fhould be again fecreted and collected in fo very fhort a time; yet, as it was not attended with any pain or inflammation, I concluded that it was poffible; and, being the first attempt which I had made, I was rather inclined to think, with every one who had feen it, that the injection had failed, and that there was a fresh accumulation of water. Accordingly it was agreed that the operation by the feton should be performed. Saturday, July 8th, he was brought into the theatre for that purpofe; when, on examination, it appearing to Mr. Pott, and all who were prefent, that the fize of the tumor was leffened, he was fent back to his ward. From that time the tumor continued gradually to diminish till the

the tefticle was plainly perceptible, furrounded by the thickened tunica vaginalis, July 18 I examined with attention, and found it not only perfectly free from any fresh accumulation of fluid, but the testicle lefs in fize than when I first let out the water; and the patient being well in every refpect, I difcharged him.

On confidering all thefe circumftances I conceived that, if the method fucceeded fo well in this cafe, in which, from the fize of the tumor, the duration of it, and the thicknefs of the vaginal coat, I had defpaired of effecting a cure, there was every thing to hope from it in more favourable and more recent ones, and that it was infinitely preferable in every refpect to any other operation I had ever feen attempted for the cure of Hydroceles. No pain, no violent irritation, nor fever fucceeded; a gentle inflammation only took place, attended with a moderate tumefaction, just fufficient to produce

duce an adhesion of the tunica vaginalis to the testis, without the tedious process of suppuration, which, in some degree, is always the consequence of any other operation.

CASE II.

THE next cafe which occurred to me was in June 1787, in the perfon of a gentleman, who fhewed me a Hydrocele which he faid had gradually been increasing during feveral months. The integuments were remarkably thin, and in every respect it was the reverse of the cafe just described. He wished to have the radical cure performed, and it appeared a very good fubject for an operation. As he was a man of excellent understanding, and had applied his thoughts to furgical cafes, and more particularly to this which most materially concerned himself, I defcribed to him all the different operations which

which have been recommended for the cure of it, and pointed out what appeared to me their advantages and difadvantages, that he might form fome judgment, and choofe which he would fubmit to. He decided in favour of injection. After having evacuated about five ounces of yellowish fluid the testis felt larger than natural, but foft; I then threw in fome injection more diluted than in the preceding cafe. He complained of fome pain, on which account, after the injection had continued one minute, I fuffered it to be difcharged, and the pain foon ceafed; when, left I fhould not have done quite enough, I attempted to throw in fome more, but air had got into the fyringe, and I was rather foiled ; however fome went in, on which he again complained of pain, and I again difcharged it, and withdrew the cannula. He continued to feel a fmall degree of uneafinefs, and went to bed. I faw him again in the evening, when he told me H 2

the

(100)

the pain had gradually fubfided, and that he was then perfectly eafy. I ordered a fomentation and poultice to the part, and an opening draught. The next morning a very gentle inflammation had taken place, the parts were moderately tumefied, and he felt very little uneafinefs. The third day, being much the fame, he chofe to get up; the fourth day, encouraged by eafe and favourable accompaniments, he very imprudently exerted himfelf in moving a heavy table, by which he brought on his pain again, and the fcrotum looked larger and more inflamed. This fresh access was fortunately foon calmed, and the parts again gradually fubfided; and, though he continued to fit up, in nine days from the operation the gland bore to be examined as well as a found testicle. In a few days after, the inflammation was entirely gone; and, what appeared a circumstance very much in favour of this operation, as it is contrary

(101)

contrary to what happens after, I believe I may fay, every other operation for this complaint, the tefticle was become perceptibly, to the patient as well as to myfelf, fmaller than when I let out the water. Every one must allow that, after operations by which any folid foreign body is fuffered to remain within the tunica vaginalis, the teftis for a long time remains enlarged, owing to the great and unneceffary quantity of inflammation excited, and to the duration of it. A fluid may undoubtedly, be made fo powerful, and retained fo long, as to produce the fame ill effects; I must therefore observe, that the fuccess of the method which I am defcribing will probably be found to depend on two circumstances; the mildness of the injection, and the very fhort fpace of time which I have proved to be fufficient for its retention.

Finding himfelf perfectly well, he went to his country-houfe, where he caught cold,

(102)

by remaining in his garden after rain, and had a very fevere attack of fever; but notwithstanding, the testis continued perfectly quiet and easy. May 20th, in the following year, I had an opportunity of feeing him again; when, on a careful examination of the parts, I was convinced that the testis was become of its natural fize, that an adhesion had universally taken place between the tunics, and, in short, that the cure was complete. I have had many opportunities of feeing him fince, and he remains perfectly-well*.

* As the improbability of cures by injection continuing perfect for any confiderable length of time, was flarted as an objection by the only perfon who has objected to the operation, I can now, (Dec. 10, 1804,) with much fatisfaction affirm, that the gentleman, above alluded to, is in good health, and free from any appearance of ever having had a Hydrocele.

CASE

(103)

CASE III.

NOVEMBER 23, 1787, a young man shewed me a swelling of the fcrotum, of a few months duration, which I perceived to be a Hydrocele. After proper evacuations, I determined to attempt the cure by injection; I drew off a large tea-cup of ftrawcoloured water, and found the teftis rather enlarged, as ufual, but free from difeafe: I immediately filled the cavity with injection, which was kept in a couple of minutes; the patient complaining of fome pain fhooting up to his loins, it was discharged, and he went to bed. The next day I found him free from fever; he faid, he had felt fome pain fimilar to what he had felt during the operation; but the inflammation was not more than to be defired; the fcrotum gently diftended, with a fcarlet blush. I ordered a poultice and bag-trufs, and advifed him, what I always recommend, not to fuffer the

fcrotum

(104)

fcrotum to fall down between the thighs, but to fupport it by a fmall pillow, or by keeping the knees close. The 26th, the inflammation was very moderate, he had no pain, nor had felt any fince the fecond day; it continued gently to increase, and feemed about its height on the 28th, the fifth from the operation: and two days after, it appeared to be gradually decreafing; the patient, during the whole time, being entirely free from pain. December 4, the inflammation was diminished, the tumor about half its original fize. On the 10th, the feventeenth from the operation, all inflammation had left it, the adhesion of the membranes appeared complete, and the teftis in a perfectly quiet flate,

CASE IV.

differended with a frank black black. I deter

on serve pointernantier was no

On the fame day that I injected the laft mentioned Hydrocele, another cafe, exactly fimilar

fimilar in every respect, was put under my care; the age of the man nearly equal; his constitution, the duration and fize of his complaint, as nearly refembling the other as poffible. To give a fair trial to both methods, I paffed a feton in this; the complaint proceeded very well, with moderate inflammation: the feton was gradually removed, thread by thread, as they became loofe; in about ten days the fcrotum began to leffen and collapfe; a fmall abfcefs, however, was formed, the matter of which emptied itself by the lower orifice. On the whole, this cafe gave as little trouble, and ended as happily as this mode of treating it generally does. But I must most truly confess, that it did not feem comparable to the other, in which the inflammation was more moderate, the duration of it lefs, and no abfcefs was formed.

(105)

(106)

CASE V.

MARCH 12, 1788, in company with the late Mr. PITTS, I let out the water from the Hydrocele of an elderly man, which had been tapped about five years before. It appeared large before the operation; but the quantity of water which was evacuated, and which meafured confiderably more than a pint, proved the cavity to have been more capacious than we had apprehended. The tefticle was in a found state, very little larger than natural; I threw in fome injection, the patient felt no pain, and fcarcely any extraordinary fenfation, which induced me to use the remainder of the injection of a stronger quality, and to keep it in longer than ufual. I had not enough to fill the cavity; however, by handling and altering the position of the parts, I caused it to be diffused over the whole cavity: and, as I have observed, it is the chief excellence of this

(107)

this method, that we are enabled to irritate and affect every part equally, but moderately. From the capacity of the cavity, and the confequent improbability of the parts lying in contact with each other, after having been fo largely diftended for fuch a length of time, I formed a very unfavourable prognostic of the event. I faw him next morning; he faid he had perceived a flight pain in the afternoon, for about two hours, fince which he had been eafy; a fmall degree of inflammation and tumefaction had taken possession of the part. The 14th, the fecond day after the operation, they were moderately increased; I began, from the appearances, to have hopes of fuccefs, as the inflammation was just as I wished : the 15th, apperances were fimilar to those of the day before: the 17th, the inflammation continued moderate and unattended with pain : the 20th, the eighth from the operation, the inflammation and tumefaction tion were lefs, and continued gradually fubfiding, he was foon after difcharged well. I have had many opportunities of feeing him fince, and he remains perfectly fo.

As I have mentioned in the last cafe, that I threw up the injection ftronger than ufual, I will take this opportunity to obferve, that I have commonly ufed about two thirds of wine to one third of water; if the parts appeared infenfible, and no pain at all was produced by the first quantity thrown in, I have withdrawn the fyringe, and added to the proportion of wine; on the contrary, if the complaint was recent, and the parts irritable, I have increased the proportion of water, fo that I have hitherto been principally guided by the degree of fenfation which the patient has expressed. I have lately used pure water mixed with wine, and found it answer as well as when aftringents were added.

rioi3

The

The inftrument which I formerly ufed, was a pipe with a ftop cock; but finding this inconvenient, and requiring a third hand to turn it, I substituted a valve which permits the entrance, prevents the return of the fluid from the fac, and performs the bufinefs with much more eafe and precifion :- It is made to fit into the cannula of a trochar, and to receive the beak of a fyringe of a moderate fize, which may be applied and removed at pleafure. I have generally used the vegetable bottle, which answers extremely well; but great care fhould be taken, that it be perfectly filled with the injection, otherwife it will, by its elastic power, draw in a quantity of air, which may prove very embarraffing in the operation, it a ditive brievel si hole od omit

CASE VI.

cation

THE next cafe which came under my care was a Hydrocele in the perfon of a middle

middle aged man. As I was in fearch after a fafe and eafy method of curing this complaint, I was pleafed to find an external application ftrongly recommended as capable of difcuffing and curing it, by a gentleman of whofe judgment and humanity I have the highest opinion. Although I had fucceeded fo well by injection, an external wash being more eafily applicable, I was induced to give it a fair trial. May 5, the tumor was wrapped in cloths, wet with a folution of fal amoniac in acet. et fpt. vin. After using it two days the patient complained fo much of inflammation and irritation, attended with darting pains in the fcrotum, that I was obliged to omit it for a day or two; after which time he used it lowered with a little water. May 27, after having continued this application nineteen days, I could find no fenfible difference in the fize or appearance of the tumor, except that the skin was corrugated

gated and inflamed from the irritation of the application. May 30, no fenfible alteration; he continued to ufe it, with now and then a fmall interval, till the 22d of June, when, tired at finding no benefit, he would not fubmit to any other operation, as was propofed to him, but chofe to leave the hofpital.

CASE VII. COM CASE VII.

An intelligent gentleman, who had been in the medical line in India, fhewed me a Hydrocele on each fide; we talked over all the ufual modes of curing the complaint; but he did not feem fatisfied with either of them. I mentioned the folution of the fal amon. and recommended him to give it a fair trial. He accordingly applied it, as it is directed; but, as it happened in the inftance juft mentioned, it produced fo much inflammation, that he was obliged to defift. He

(112)

He afterwards used it for near three months, at the end of which period, May 31, 1789, he again shewed me the tumors; but there was no perceptible dimunition in their fize.

CASE VIII,

NOVEMBER 5, 1788, I took a young man under my care, who had apparently a Hydrocele; but it was one of those cases of which, on account of the tightness with which the coats enveloped the water, and from the thickness of the scrotum, we could not politively at once determine the nature: however, after repeated examination, being convinced that it was a Hydrocele, and, from its recent appearance, a favourable cafe, I immediately began to treat it with an external application of a folution of fal amon. but after seventeen days, finding no kind of advantage, and the man being impatient and anxious to return

(113)

return to his friends, I determined to ufe the injection. November 22, I let out about five ounces of clear fluid, found the teftis in a good ftate, though enlarged, which, as I observed, is frequently, I might fay generally, the cafe. I then filled the cavity with injection, in the prefence of a number of gentlemen, and kept it in a few minutes; he complained of fo little pain that I was apprehensive, and I believe all who were prefent concluded, that what I had done was to no purpofe; that is, that there would not be fufficient irritation to produce the neceffary inflammation. He continued without pain the whole of that day and the next; the third day he was perfectly eafy, but a gentle inflammation had taken poffeffion of the whole fcrotum, equally in every part: the fifth day the inflammation continued as before, and the swelling was to free from pain, that it had ftrongly the appearance

of

(((114))

of a fresh collection of fluid; but, as this deception had feveral times occurred to me before, I did not the lefs expect a cure. On the feventh day from the operation the appearances were very fimilar, the man void of pain, the forotum gently tumefied, from which time the forotum began to corrugate, and the tumour gradually to decrease, till in lefs than three weeks it became of the fize of the testicle, when the water was let out. I kept him in the house till the 21st of December, to observe if any fresh accumulation took place, when being perfectly well, he was difcharged.

CASE IX.

A gentleman was introduced to me by Dr. Grieve, with a Hydrocele which had been treated with the fame difcutient, and which he had found fo painful that the furgeon was obliged to lower it; it was continued,

28

as ftrong as he could bear, during five weeks, when the water, not being leffened, was let out, after which the application was again made use of during the evacuated state of the complaint; but it had not prevented the re-accumulation of the water.

It would certainly be a most defirable plan, to get rid of the difease without any operation; but we know too well how confined our powers are in dispersing collections of fluids within facculi mucofi, and fome kinds of encysted tumors, whose integuments are comparatively thin, and therefore must conceive, that much greater power would be requisite to act through the forotum and thickened tunica vaginalis, so as to produce absorption of the fluid and cohesion of the tunics.

Hydroceles have been accidentally difperfed by various means, particularly by a blow, by a fever, and by ficknefs at fea. I 2 I do

(116)

I do not entertain the fmalleft doubt, that the above remedy, which has been propofed by an ingenious and able practitioner, has produced the fame effect; but I cannot help doubting its capability of frequently producing it, from thefe and many other inftances I have been witnefs to, and have been informed of, in which it has been equally unfuccefsful.

The above gentleman, fome time after, put himfelf under my care; I let out a moderate quantity of fluid, and threw in fome injection. The inflammation which was produced in this cafe was fo moderate that he would not fubmit to be confined; but in two or three days after the operation, notwithftanding the teftis was evidently inflamed and larger than natural, went out and took his ufual exercife. This brought on fo much fwelling as made him content to ftay at home a fortnight, during which time it increafed in fize, and gradually

(117)

dually lessened; but at no time was at all painful, unlefs it was handled. Though, from the little attention paid to it at first, the tumefaction in this cafe had been rather obstinate, it was, in about three weeks, fo nearly fublided, that he went out of town, with every appearance of the accomplishment of a perfect cure. I have feen him many times fince, and there is no appearance of his ever having had a Hydrocele.

CASE X.

MR. PITTS evacuated a large Hydrocele of a middle aged man; the tefticle was found larger and harder than ufual; he permitted me to throw in an injection, which, on account of the fize and thicknefs of the parts, I had made rather ftronger than ufual; there was not quite enough to fill it, but I preffed it fo as to make 13

(811)

make it find its way over the whole cavity, and fuffered it to remain in fix minutes. I did not fee him again till the fifth day; the fcrotum was confiderably inflamed, and tender to the touch. I directed him to remain in bed, and to apply a poultice made with extract faturn. the next day the inflammation was leffened, and he was free from pain, and the tumor began to fubfide. There is fo great fimilarity in the progrefs of thefe cafes, that I have only to fay the inflammation continued gradually to leffen, and in lefs than a month the teftis was of its natural fize, and the man was difcharged. He has fince been in the hospital for another complaint, and we have had opportunities of examining the part; the adhesion appears to have univerfally taken place, and confequently there is not the least vestige of the Hydrocele.

5. 5.44

(119)

CASE XI.

FEBRUARY 7th, 1789, I emptied the Hydrocele of a young man, let out a moderate fize tea-cup of fluid, threw in the fame quantity of injection, and kept it in three minutes; the patient complained of fome pain fhooting toward his back : the 9th he had no pain; the inflammation very moderate: the 10th no great alteration; but I obferved, what indeed I had often before remarked, that the forotum appeared diftended, as if again filling with water. The inflammation continued to proceed moderately, and gradually to fubfide. The patient was fo free from pain and every complaint, that he chose to leave the house in lefs than three weeks; and, indeed before the fwelling was quite gone, to follow his occupation of a tide-waiter. I have fince had many opportunities of feeing I 4 him

him and examining the part; the adhesion appears perfect, and the disease completely cured.

(120)

CASE XII.

MARCH 6th, 1789, I went with Mr. R. Croft, of Burlington-Street, to fee a young man who had a Hydrocele on each fide. Mr. Croft had once performed the palliative cure on the left, which was now filled again, and was much larger than the other. I let out a large quantity of fluid, and found the teftis in a good state, though larger than natural. I introduced fufficient injection to diftend the bag, and kept it in four minutes; the man complained of fome pain when it was first thrown in, but was perfectly eafy before the four minutes were expired. I then proceeded to evacuate the other; but as the quantity of water was fmall, and I could

(121)

could not fafely introduce the inftrument which I generally use for the purpose of injecting, I contented myfelf with emptying it by means of a fmall trochar, and found the teftis large in proportion to the fize of the tumor; I withdrew the cannula, and recollecting the observation that " Tua res agitur paries cum proximus " ardet," left it to take the chance of what might follow from partaking of the neighbouring inflammation which I expected to take place. Mr. Croft faw him the next day, and gave me an account that heh ad rifen, and was walking about the room, and that the parts were beginning to fwell. As this was greater liberty than I had yet given, I begged he might immediately go to bed, and have a poultice applied. I vifited him next day, and found more inflammation than I had ever feen after this operation; and, what appeared extraordinary and fortunate, the fide which

which had not been injected was almost as much inflamed as the other; but he complained not of the fmalleft pain in either. The 14th, I faw him again; he continued free from pain, and the inflammation was very much abated. The fide which had not been injected appeared lefs likely to diminish than the other; and the apparent feel of fluid which I observed often follows, was more than ufually perceptible. On the 20th, a fortnight from the operation, the fide on which the injection had been used was perfectly well; in the other the water was evidently collecting very faft; which demonstrates how little effect external inflammation can have when it is to act through the fcrotum and tunica vaginalis, and points out the greater certainty which follows the application of the stimulus to the infide of the cavity: in this cafe, notwithstanding the water was evacuated, and confiderable inflammation was

(122)

was raifed on the fcrotum, no internal effect was produced. I took leave of him, recommending him to do nothing farther till it was fufficiently full to be treated in the fame manner.

CASE XIII.

regimen, in two-days the temor was left

MR. CROFT continued to fee him from time to time, and gave me an account that the fide which had been injected, remained perfectly well; but that the other was large, and he wished me to perform the fame operation on it. May the 2d, I examined it, and found the left fide perfectly well, and free from water; the right diftended, but not very large. I plainly difcovered, through the water, that the teftis was larger than it ought to be; and it was not without great care, that I was able to pass in the trochar without injuring it. I let out about five ounces of fluid, filled it with injection, and treated

(124)

treated it in every refpect like the other. I faw him two days after; he faid he had paffed a reftlefs night, and the part was more inflamed and tumefied than ufual; on inquiry, I found he had eaten a dinner of roaft beef and drank porter. After taking a little opening medicine, and ufing a lower regimen, in two days the tumor was lefs, and the inflammation more moderate. In about the ufual time he got well; and, I have been informed, he continues perfectly free from any complaint on either fide.

CASE XIV.

MAY 16, 1789, I let out about five ounces of a ftraw-coloured fluid from the Hydrocele of a young man, and threw in an injection; he complained of pain during the first three minutes, when he grew easy: in five minutes the injection was discharged. This proceeded, in every respect, like those I have I have related, with a very moderate inflammation, which decreafed gradually.

He has fince applied to me, with a venereal fwelling in both his teftes; which, by means of mercurial frictions in the internal parts of his thighs, are both decreafing, but there is not the fmalleft fign of his ever having had water in either.

CASE XV.

In the autumn of the fame year a gentleman came from Barbadoes, on purpole to be cured of a large Hydrocele. With his confent, I intended to use the method by injection; but, at the inftant when I had passed in the trochar, with a violent involuntary motion of his body he forced it out with the cannula, by which accident a second through the external orifice, but a confiderable portion escaped from the tunica vaginalis,

(125)

(126)

vaginalis, and infinuated itfelf into the cellular membrane of the fcrotum, making a large fwelling, which put a total ftop to the intended operation. As his time was limited, and he was anxious to return, he preffed me to perform immediately the operation by incifion, or by any other method; however, I perfuaded him to wait a fortnight, by which time the extravafated fluid was nearly abforbed : but, as the quantity which remained in the tunica vaginalis was fmall, and confequently the cavity was become lefs capacious; and as he was fo particularly circumftanced with regard to leaving this country, I did not choose to try the injection, but there being just fufficient room for the inftrument to pass fafely, I performed the operation by the feton.

This cafe terminated well, and the gentleman is returned perfectly cured; but it was attended in its progrefs with an abfcefs, the confequence of a much greater degree of

(127)

of inflammation than I have ever experienced from the use of injection, and indeed abundantly more than was necessary for the cure.

The accident by which the inftrument was forced out may ferve as a caution, and point out the propriety of placing the patient against a table, or upon a couch, or in any situation in which it will not be in his power to recede.

CASE XVI.

About the fame time I injected the Hydrocele of an Irifh gentleman, aged 30. He felt little pain while the injection was in; the next day the inflammation was moderate, and proceeded in a gentle manner, with fcarcely any variation from most of those cases in which I had used injection, and whose progress I have described; it is therefore unnecessary to take up more of the reader's

(128)

reader's time in particularizing the fymptoms. I will only add, that he was perfectly cured.

CASE XVII.

MARCH 9, 1790, a gentleman from Nottinghamshire applied to me with a Hydrocele on the left fide; fome few years before he had been troubled with the fame complaint on the other, which had been cured by Mr. Pott by the feton, and continued perfectly well. I mentioned to him the method which I had adopted, and he agreed to give it a trial. Affifted by Mr. Long, I emptied the bag, which was not large, and filled it with injection, which was retained about the ufual time; he complained of little pain either during the operation or afterwards; the inflammation increased gradually, and fo diminished; in a week after the operation he was permitted to walk, and

and in three weeks he was well enough to return into the country. In December, 1790, I received an account from himfelf, affuring me of his perfect recovery. As he had undergone the two different methods of cure, he was a competent judge with regard to pain and inconvenience attending both, and I make no fcruple in afferting, that he warmly declared his preference to the injection.

had formerly been let out by a lancet, and

forotum and tunica vaginalis, it would have

an adhefion he.IIIVX asea between the

THE Rev. Mr. —— fhewed me a very large Hydrocele, which he defired me to cure by injection. April 15, 1790, having drawn off a large quantity of water, I refilled it with injection of moderate ftrength, and retained it feven minutes, during which time he felt little pain; in the afternoon had a flight attack of pain; next day was perfectly eafy, though there had arifen a fuffi-K cient cient inflammation, which increafed gently, and gradually fubfided, without pain or inconvenience. On the 4th of May he was well enough to go to his living in Huntingdonfhire.

In November the fame year, he did me the favour to call in Hanover Square, and permitted me to examine the part; it appeared fo perfectly well, that, had it not been for a tuck in the fkin where the water had formerly been let out by a lancet, and an adhefion had taken place between the fcrotum and tunica vaginalis, it would have been difficult to have diftinguifhed the fide where the difeafe had been from the other.

CASE XIX.

I saw Captain —— with an uncommonly large and much diftended Hydrocele, which, from having been continually preffed on by a fufpenfory, and tight breeches, had a remarkably

markably broad bafis, which reached from high up on one groin across the fcrotum to the other thigh; I observed a large scar or cicattix almost the whole length of it : the account he gave me of it was, that about a year and a quarter before, the operation of incifion had been performed on it in Ireland; that fo foon as the wound was healed, the water began to collect again; that he had fuffered fo feverely by the operation, and by the fubsequent treatment, that he was determined to ask no further advice on it, till, having been fo long accumulating, it was from its fize become intolerable: it was indeed fo large, and the tunic fo much thickened, that I objected to performing any but the palliative operation, and recommended him to put off the attempt to cure it radically till it should fill again, and become of a more moderate fize : however, as it would have been very inconvenient to him to come back again from Ireland, and as the injec-K 2 tion

tion could do no harm, if it did not fucceed, I was induced to rifk the credit of it; accordingly I emptied the bag, and threw in a very large quantity of the injection. He complained of a good deal of pain during the greatest part of the time it remained in, which was about feven minutes; confiderable inflammation fucceeded, and next day it appeared nearly as large as before it was let out, but he was quite free from pain: it continued inflamed and fwelled for feveral days, when it gradually leffened; at the end of a fortnight it was nearly fubfided, and he was permitted to walk about the room: on the 6th of May he went to his friend's house at Hampstead ; the 7th I faw him; there appeared no more fwelling than was caufed by the still prodigiously large and thickened tunica vaginalis which had contained fo much fluid, but there was no fign of any fresh accumulation : he had not the fmallest pain, and took his exercise

(132)

as

as ufual. I faw him fome time after, and the whole tumor was confiderably leffened : he is fince returned to Ireland; but, from his friends who refide in London, I have continual opportunities of knowing that he remains perfectly free from any return of his complaint. This cafe is more in favour of injection than any I have feen, as, from the great diftention and fize of it, there was the greateft improbability of the parts being brought fufficiently into contact to bring about an univerfal cohefion.

CASE XX.

and send on a contract of the list

out of the fact of the Transels; whether

MAY 4, 1790, I injected the Hydrocele of a patient of Mr. Pitts, which was large, but the fac thin; he complained of fome pain during the operation, which ceafed before the injection was withdrawn: next day he was perfectly eafy; a gentle inflammation took place, which proceeded in K_3 ever

(134)

every refpect as usual. I have feen him fince, and he continues perfectly well.

CASE XXI.

THE following cafe may prove an ufeful caution to future operators. A gentleman attempted to perform the operation of injecting a Hydrocele; but after he had paffed the trochar and evacuated the water, before he had his apparatus and injection ready, by fome accident the cannula flipped out of the fac of the Hydrocele; when he attempted to throw in the wine it met with refistance, notwithstanding which he forced it in, till finding the whole fcrotum on both fides uniformly increafed in bulk, he began to fufpect that he was not filling the cavity of the tunica vaginalis, on which he attempted to evacuate it, and get rid of what he had thrown in, but it was impoffible. The injection having diffused itself among

(135)

among the cellular membrane under the fcrotum, he was obliged to leave it there; in confequence of which violent inflammation, and a mortification and flough of the fcrotum, followed, and left the teftes bare; the patient however recovered.

I have been informed of another cafe, in which fome portion of the injection was fuffered to be diffufed in the cellular membrane under the fkin, which formed fome fmall abfceffes. If the operation be rightly performed this can never happen; or if by chance the cannula fhould flip out of the tunic, the completion of the operation pro hâc vice fhould be fufpended *.

CASE

jection

* I have fince heard of feveral cafes in which this accident of caufing the injection to be diffufed into the cellular fubftance of the fcrotum has happened, and the confequence has been great inflammation and floughing of the parts. This most unpleasant and dangerous occurrence may always be prevented if the operator will use a cannula of fufficient length, and never throw in the in-

ne the cellutar methicage under the

(136)

CASE XXII.

SEPTEMBER 1790, a gentleman of the profeffion from Barbadoes applied to me; he faid he had had a Hydrocele on the right fide, which, after having tried to cure by the fal ammon. both in the full and empty ftate, in vain, had been cured by the feton, the marks of which were vifible by the tucking in of the fkin where the feton had paffed. It remained perfectly well; but he now laboured under the fame complaint on the left. I let out the water, which was in fmall quantity, as the teftis itfelf was very large and occupied the greateft part of the

jection till he feels the end of the pipe within the vaginal fac. However, if from awkwardnefs, inattention, or want of fkill, it fhould happen, I would recommend to make two or three punctures with a lancet, then to prefs or fqueeze out as much as possible, to dilute the remainder by throwing in warm water, and again to prefs or fqueeze it out.

tumor,

(137)

tumor, yet did not appear fo hard or fo difeafed as to forbid an attempt to cure the Hydrocele. I filled the cavity with injection, which gave little pain; fufficient inflammation fucceeded, which gradually fubfided : in lefs than a fortnight he was perfectly well, and went out about his bufinefs as ufual; he affured me he found the injection an incomparably eafier mode than the feton.

CASE XXIII. Ded and

expressed was very uncommon, it may sirve

OCTOBER 1790, a gentleman shewed me a Hydrocele of moderate fize, which he had been endeavouring to discuss with the folution of fal ammoniae, and had tried it to the full extent of its powers; but, though it had raifed great inflammation on the forotum, had produced no effect in lessening the tumor. In the prefence of Dr. Hallifax and Mr. Serjeant Hawkins, I drew off its contents, contents, which were not remarkable in quantity or quality.

The patient appeared to be of a very irritable habit, complained of pain in his teftis before the water was difcharged, and his pain increafed when the bag was empty; I threw in an injection of moderate ftrength, from which he also expressed more than ufual pain while it was retained, and after it was difcharged; this was much augmented by being obliged to go up ftairs to his bed. Though the fenfation which he expressed was very uncommon, it may ferve as a caution against performing the operation out of the bed room; when in bed he continued to complain, yet not of the teftis, but of an aching in his back and kidneys, to which, however, he faid he had been much subject : he took a gentle anodyne, and the pain fubfided in about an hour and a half, after which he grew eafy, and fo continued

continued all day. The next day there was fome tension on the part, but the patient was perfectly eafy; in the afternoon he got up and lay on a couch, and two days after went into the next room. The inflammation and tenfion increafed gradually, and feemed at the height about the feventh day, after which it leffened; he was now only fenfible of weight in the part. The tenth day he went down stairs, walked about, and fat on his couch; indeed, being of a lively and active difposition, he was not fo attentive to keep in a quiet posture as I could have wished; however no accident to the part, nor impediment to its diminution, occurred; it gradually fubfided, which, about the fourteenth, I hastened by a more powerful antiphlogistic application; soon after which time he went out in his carriage. November 12, three weeks from the operation, I examined the part; there was no inflammation remaining; it was free from fluid,

(140)

fluid, and no bigger than what was produced by the large and thickened tunic wrapping round the tefficle. I have repeatedly heard from him fince, and he remains perfectly well *.

On the fame day, 5th of October, I performed the palliative cure on the Hydrocele of a young gentleman, and the only reafon for my noticing it is, that on examining it

* This gentleman was afterwards attacked by a Hydrocele on the other fide: finding it confiderably enlarged and inconvenient, he was coming to London to fubmit to a fimilar procefs. On the road he caught cold, the roughnefs and the length of the journey caufed the fcrotum and tefficle to fwell and inflame; fo that when he arrived at the hotel, it was much increafed in fize, and in a diffended painful flate. To take off fome part of the tenfion, I evacuated the water; the inflammation leffened, but fufficient remained to produce a perfect cure of the complaint, without any additional flimulus; a rather uncommon inflance of fuch effect being produced by fuch a caufe. He is now (Dec. 10, 1804) without any fymptom of Hydrocele in either fide.

the

(141)

the 14th, nine days from the operation, there was an evident fluctuation of re-accumulated fluid, which is a proof that it is not neceffary to wait long before we may be convinced of the cure, or the return of the complaint, though the contrary doctrine has been advanced.

if dbidw dato CASE XXIV.d buil of digas

had paffed into the fac, though it was faf-

let the camula flip out. 1 was not able

FEBRUARY 1791, a gentleman from India confulted me on account of a large Hydrocele which had been collecting more than three years, and for which he withed to obtain a radical cure. As it was of confiderable magnitude, and had never been emptied, I advifed him to content himfelf, for the prefent, with the palliative cure; I let out about twenty ounces of ftraw coloured water, and found the teftis much enlarged and the tunics apparently much thickened; the water foon began again gradually to collect.

collect. I faw him now and then till May following, when it was full enough to be fubmitted to the radical cure, and the mode by injection was determined on. After having passed in the trochar, while the fluid was running out, by fome accident, the fac contracted quicker than the fcrotum, and let the cannula flip out. I was not able again to find the opening through which it had passed into the fac, though it was fufficiently open to permit part of the water to flow out of the fac, and infinuate itfelf into the cellular membrane of the fcrotum; I therefore immediately defifted from the intention of completing the operation at that time. Though the quantity of extravafated fluid was confiderable, it was attended with little inconvenience, and was foon abforbed : the Hydrocele filled again as ufual; and in June following, it not being then convenient to him to undergo a radical cure, I

again

(142]

again let out about the fame quantity as it first contained.

About the fame time a gentleman called on me from Oxfordshire, with a large fwelling in the fcrotum: the account which he gave me was, that the origin of it he could not account for, but that it had been gradually increasing for a great length of time, till about a twelvemonth preceding it was very large, and while it was in that state he had the misfortune of a fevere fall from his horfe; when he got home he perceived the whole fcrotum enlarged, and the part where was the original fwelling, fmaller and fofter; the skin was black from the bruise, but the whole of the fwelling gradually went away, and he concluded he had got rid of his Hydrocele. However, he foon found that he was mistaken, as it foon began to be again distended, and in fix months was as large as before. Notwithstanding the failure of fuccefs from it being thus burft, he was determined

determined to try a fimilar operation, and therefore imprudently ftruck it with violence against a table; the fame confequences followed as were produced by the fall, the fac was burft, the fluid found its way into the cellular membrane, and was, as before, gradually re-abforbed; and he again found himfelf difappointed of a cure, as the Hydrocele again began to collect, and in fix months more was as large as ever. He did not choofe to pufh his own experiments further, but came to London to confult me, and wished me to perform the radical cure. It now appeared large, and much distended; but, as it was impossible to fay what mifchief had been done to the tefticle by the violence which had been offered to it, and confequently I could not determine whether it was in a fit ftate to bear the neceffary inflammation, I recommended the fimple puncture to be first tried. On passing the trochar I was not furprifed to find the fluid

(144)

(145)

fluid very deeply tinged with blood; the teftis however did not appear to be much injured, though larger than natural. When he left me it was his intention to return to town as foon as it fhould again be filled.

I have mentioned thefe two inftances in confirmation of what I before advanced, that it is not neceffary in thefe cafes of extravafation to perform the incifion, or any other operation, only to wait with patience, and Nature will do her own work of abforption, which indeed may be promoted by the ufual difcutient applications.

CASE XXV. I Si Doctoonoo

as it was not clear how fur this taffici

with caution, and with the point of a las

JANUARY 1791, Mr. — fhewed me a large tumor in the fcrotum; he faid he had perceived a fmall fwelling in the part fome years; that it had been long ftationary as to fize, and foft; and he always imagined it to be air. This was, probably, one of those L, kinds

(146)

kinds of Hydrocele which do not increase without a fresh cause, of which I have seen fome inftances. He had lately been thrown from his horfe, and had bruifed it greatly; when he was recovered from his external bruifes he found the fcrotum much enlarged and diftended. I reprefented to him that it was filled with fluid, that probably the teftis had been bruifed, and that what before had been a fimple Hydrocele, was now increafed by an addition of blood. He wished the radical cure to be performed, but I recommended the fimple puncture to be first tried, as it was not clear how far the tefticle was concerned in the fwelling: this was performed with caution, and with the point of a lancet. As I expected, a fluid immediately rushed out, of which blood appeared to conftitute much the major part. As the nature of the cafe was now clear, which was all the information we wanted, and as the fluid did not freely follow through the fmall puncture,

(147)

ture, the orifice was closed and fuffered to heal. March 6, 1791, it appeared again very full and turgid. As he now choie to have the radical cure performed, I paffed in a trochar, and let out about three parts of a pint of pellucid straw-coloured water. Here I must remark a fact which perhaps is difficult to be accounted for ; the fluid which was left in the fac in January, was evidently composed of blood and water; from that time it continued to fill again, and when it was now let out it was perfectly free from blood, fo that the abforbents, on the furface of the membranes, appeared, in this cafe, to have had the power of feparating the red globules from the aqueous particles, and abforbing them; at the fame time the water, fo far from diminishing, was increased.

I threw in fome injection, and he complained of little pain; he continued with fcarcely any uneafiness all the day, but in the night was seized with a gouty cholic, to L_2 which

(148)

which he was much fubject, and which he thought he had now brought on by abftinence, which he had obferved fome days previous to the operation; this gave him a reftlefs night, but he did not feel pain in the part. The next day he was well of this attack, and the part looked well, with rather more inflammation than ufual, probably owing to the reftleffnefs of the night; however, the fixth day from the operation both fwelling and inflammation were gradually fubfiding, and on the fourteenth all inflammation and tendernefs were wholly diffipated; the feventeenth he went out in a carriage, free from any pain or inconvenience; the complaint was completely got rid of, and he remains perfectly well.

CASE XXVI.

APRIL 26, 1791, I was defired by Mr Long to use the injection in a Hydrocele o a middl (149)

a middle aged man; the perfon faid, feveral months before, he had overftrained himfelf in mowing, and had felt a violent pain, which he defcribed to have been in the fpermatic chord, reaching up to the loins; that the chord fwelled and inflamed, and afterwards, as that fubfided, the Hydrocele began to collect below. I had feen the complaint in confultation fome months before, when, though it was diftended uncommonly high into the ring, we had concluded it to be a Hydrocele of the tunica vaginalis, and Mr. Long let it out by a puncture. Immediately after the operation a violent and very unufual pain, with fubsequent inflammation, attacked the chord, which continued in a confiderable degree, but did not, as was expected, produce a cure; the water again began to accumulate, and on that taking place the inflammatory fymptoms feemed to fubfide. These unufual complaints shewed something peculiar in the L 3 cafe,

(150)

cafe, or an uncommonly irritable habit; but as the Hydrocele was again filled, I faw no objection to performing the operation for the radical cure. When I had punctured the bag, and was drawing off the water, in which there was nothing remarkable, he complained of great pain fhooting up towards the kidneys on that fide; on throwing in the injection he alfo complained more than common, but when the bag was completely filled, the pain fubfided, and the injection was retained the usual time. The next day the part was more tumefied, and the chord more affected than generally happens, his pulfe moderate, with no feverifh fymptoms; the following day he was fomewhat better. The 3d of May, feven days from the operation, the tumor was much leffened, he felt no pain, and the fcrotum was beginning to corrugate. I faw him again on the 9th of May, when he was able to walk and take his ufual exercife. In about

about three weeks from the operation he was well, and returned into the country, being perfectly cured of his Hydrocele.

CASE XXVII.

JUNE 26, 1791. A gentleman who had fuffered much in his own perfon by the operation of incifion for the cure of a Hydrocele, having been confined by it nearly fix months, defired me to fee his nephew, about nine years of age, who had a complaint of that kind. It was for fo young a fubject very large, the fac very thin and transparent. I was informed by his father that it had been emptied in the country, that it had filled again in a few days, and that in a fortnight it was as large as ever. This account was confirmed by the furgeon who performed the operation: the fhortness of the time in which the water had re-accumulated appeared extraordinary,

and

(152)

and very different from the common Hydrocele, which ufually is filled by fmall, and often by fcarcely perceptible degrees. Not long before, I had feen a complaint in a boy of about the fame age, in which there was fome fimilarity of circumftances with the prefent cafe, and which an attempt had been made to cure by incifion, but it filled again; after which it was fimply let out by a trochar, and the water returned in a very fhort time. This was fuppofed to happen from a communication with the abdomen, by which opening moifture, collected within the peritoneal lining of the abdomen, was faid to drop down into the tunica vaginalis teftis, and thus again quickly to diftend it. Though I had not an opportunity of being completely fatisfied of the nature of that cafe, I thought probably this arofe from a fimilar caufe, whatever that might be; at leaft it was evident that there were fome peculiarities attending it, and therefore, though preffed

preffed to perform the operation of injection, I declined doing it at first, and advised the fimple evacuation, to give me an opportunity of observing the manner of its refilling, and alfo of taking it at a more favourable period, when it fhould not be fo much diftended. Accordingly I let out a confiderable quantity of a straw-coloured fluid, and found the teftis in a good state. The next day fome water was palpably collected, and in two days after, there was a confiderable quantity-in lefs than a fortnight it was nearly as large as when I let it out. Thefe circumftances being new, and as I had not performed it on fo young a perfon, I thought proper to mention them to his friends, and not to give politive or even fanguine hopes of fuccefs. When the operation was refolved on, he caught the meafles, which obliged us to defer it. July 25, he was fufficiently recovered to undergo it; accordingly I let out the water, and taking care

care to prefs with my finger and thumb the upper part of the chord, fo as to prevent any communication with the cavity of the abdomen, introduced the injection of nearly the usual strength. He complained of some, but not violent pain, for a few minutes. In fix minutes it was discharged; in the evening a fmall degree of inflammation had taken place on the part; the following day it was increased in fize equal to what it was before it was emptied. The little patient had a perfectly good night, and had not felt any pain fince the operation. As he was becoming rather heated, though, as I conceive, more from the irritability of constitution, which he derived from the measles, of which he was just recovered, than from the inflammation of the part, which was moderate and perfectly indolent, a clyfter and fome faline draughts were administered. In the evening he was cooler and perfectly eafy, the part rather more fwelled, but without

.

without pain or apparent inflammation. The third day from the operation it continued to increase, and the whole scrotum was confiderably tumefied, and feemed aggravated by the fever, which still continued. I could not but look on the fever as independent of the complaint, as there was no inflammation or pain attending which could caufe it. The 4th day the fever was much better, and the fwelling began to diminish, and so continued in a gradual state of fubfidence. On the 7th it was evidently much diminished, and in a fortnight was reduced to little more than the previous diftention of the tunic might be fuppofed to produce-he foon after got well enough to be fent to fchool. November 9th, his father affured me he continued well; I have feen him fince, and he remains without any vestige of a Hydrocele. I may add, that he is now at the age of twenty-two perfectly

free from any complaint of the kind.

CASE

(155)

(156)

CASE XXVIII.

August 4, 1791, I injected the Hydrocele of a young man of the family of his Grace the Duke of B. which I had once previoufly evacuated, and had fuffered to gain a moderate fize. He felt some pain during about half an hour, in the afternoon-in the evening was perfectly eafy; a flight inflammation had feized the part, which was increased the next morning, attended with fome fwelling, but no pain. It went on as ufual, and though the man took improper liberties in using great exercife, particularly by running up and down stairs very early after the operation, no accident occurred, and he got perfectly well.

(157)

CASE XXIX.

OCTOBER 28, 1791, I was defired to fee a gentleman in Artillery-Place, who had a very large Hydrocele, of the caufe of which he gave the following account: that he was afleep in his bed-room up two pair of ftairs, when he was alarmed with his houfe being on fire; he ran to the window and opened it, at the inftant a large quantity of fpirit of turpentine below ftairs took fire, and made a violent explosion; exceffively terrified, and fcarcely awake, he threw himfelf out of the window, and fell into the road. Though bruifed and injured in the greatest degree in many parts of his body, limbs, and face, he miraculoufly recovered. Soon after he was able to move about, he perceived a fwelling in the fcrotum, which increased to a great degree, and formed a Hydrocele. This, at different periods, he had fuffered to be evacuated

cuated fix times. Tired of the continuance of fo great an inconvenience, he wished to have a radical cure performed, and difapproving of the ufual methods, he preferred the mode by injection. It had now been collecting nine months, and was fo large that I doubted of the fuccefs, but as I had fucceeded in one of greater magnitude, and he was defirous to try it, I was induced to make the attempt. He was of a fallow unhealthy complexion, having never perfectly recovered of his internal bruifes; and I was informed that he was of a very irritable habit, and had always felt great pain after the fimple evacuation. I therefore prepared the injection much more diluted than ufual. I let out above three half pints of a greenish fluid, and returned a large quantity of injection. He now complained of confiderable pain leading up toward the kidney on the fame fide, but he faid little more than he had been accustomed to feel from simple evacuation.

(158)

evacuation. After detaining the injection the usual time he was put to bed; as he still continued to feel pain, an opiate was given. However, as I afterwards learned, he grew fick, as was his cuftom after the fimple evacuation, and brought up the opiate, fo that its effect was loft, and as it was not repeated, his pain continued. In about three hours it left him; he paffed a good afternoon and an eafy night; the next day I found him with the fcrotum confiderably enlarged and tumefied, but perfectly eafy .- The following day it was more enlarged, being more than half the fize before the water was evacuated. On the 4th day, as I had left him fo well the day before, I miffed feeing him; but on the 5th, I found that he had been feized with ficknefs, a complaint to which he was very fubject, and had vomited inceffantly for two hours, notwithstanding every assistance from his very intelligent apothecary. He was languid, the part was confiderably more fwelled,

fwelled, and he felt a pain in the chord leading toward the kidney and bladder. It was however, on the whole, much better than could have been expected from fuch violent efforts of straining. A stool was procured by a clyfter, and the next day he was better, the tumor nearly the fame. November 10, he still complained of pain in the chord, which was harder, and had partaken more of the inflammation than ufual, owing to the violence of vomiting, and the whole tumor continued very large. 11th, The patient informed me that it was certainly diminishing. On enquiry why he fpoke fo politively, he informed me that when it was at the largeft he had meafured it by a rule, when it was in length feven inches and a half by fixteen inches in circumference, that now it was fix inches and a half in length; and afterwards it continued to leffen daily near half an inch in length, and fomething more in diameter. Thus by line

line and rule we were fatisfied that the fize of the tumor arofe from inflammation only, and not from accumulating fluid. 16th November, it was leffened to four inches and a half by ten; in about a week after it fabfided to lefs than three inches; foon after he got perfectly well, and has continued ever fince free from any fresh collection. This is an inftance of the impropriety of performing the operation on a Hydrocele when fo much diftended. I was induced to do it by the defire of the patient, but it is better to take an opportunity when it is fmaller, as the quantity of inflammation, and the continuance of it, is generally in proportion to the fize. any ton as a normal of I'm ent

on hoorna any CASE XXX. second add not

bafere, aud in every refpect a good fubject

OCTOBER 30, 1791, a gentleman from a diftant county fhewed me a Hydrocele, with an intention of fubmitting to a radical cure; M but (162)

but as it was remarkably large, and had not before been evacuated, I perfuaded him to have it fimply let out, and to wait till it should fill again to a more moderate fize. At the inftant when the trochar was paffed in, he jerked back with fuch velocity as to pull it out again, by which means only a part of the water was drawn off, fo that there was not fufficient to admit of any other operation, nor was it totally emptied. Nothing remarkable appeared in the fluid which came away, and it was determined that the radical cure should be performed when more fhould be collected. He went into the country, and returned February 11, 1792. The tumor was not quite fo large as before, and in every refpect a good fubject for the operation which it was agreed to perform. As he appeared to be of a difpofition timorous and eafily fusceptible of alarm, and as he had given me the flip on the former occasion, with a view to effectually fecure

(163)

fecure him, he was laid on a bed. The trochar was then fairly paffed in, the water all drawn off, and thus the most difficult part of the operation being over, no doubt was entertained of the completion of it; accordingly I began to throw in the injection : the first fyringe full was nearly thrown in, when he faid he felt a pain, and being greatly alarmed, he contrived to draw himfelf backward with velocity on the bed. When he was quiet I attempted to throw in more, but foon perceived that what paffed from the fyringe did not fill the fac; it was now evident that in the effort which he had made he had forced the cannula out of the fac, and it was in vain to endeavour to throw in more. This was an embarraffing circumstance, however the only thing which remained to be done, was to get it out again both from the fac and alfo what was diffufed in the cellular membrane of the fcrotum, left by remaining it fhould do mifchief by

M 2

raifing

(164)

raifing an inflammation, as was mentioned to have happened in Cafe No. XXI. I therefore preffed it out of the fac, and it formed a finall fwelling at the lower part of the fcrotum; this I opened with the point of a lancet, and emptied as accurately as I was able, by taking great pains, and repeated preffure, which was necessary, as it was not in one cavity, but diffused through the cells: this was continued till it became nearly of the fize of the other teftis. I then left it, much doubting if fufficient had been thrown into the fac to complete the cure. In the evening he complained of a good deal of pain in his back. In a few days the fcrotum became moderately tumefied, and the teftis appeared enlarged-a fign that fome injection had entered. The inflammation continued moderate, both in the teftis and fcrotum; he got up the third day, and was free from pain, but the part was very tender on being touched; the teftis gradually fubfided,

fided, but a flough took place in the lower part of the dartos, where the injection had been, which by degrees came away; and what appeared to be part of the tunica vaginalis, followed by the fame wound, which foon after contracted and healed, and he got perfectly well .-- I have thought proper to mention this cafe fully, that, fhould fuch accident again occur, we may be aware of it, and endeavour to avoid the effect of it, by getting out as much of the injection as poffible; if it had been fuffered to remain, the inflammation and floughs would have been much more extensive and mischievous. With the attention I paid to avoid fuch effects, the cure was completed with little more inconvenience than would have happened from the application of Mr. Elfe's caustic. But I have fince thought I might still have fucceeded better if I had thrown in warm water to have diluted what necessarily M 3 remained

(165)

remained behind, and then have endeavoured to have again preffed out the dregs.

CASE XXXI.

NOVEMBER 9, 1791, a French gentleman, driven from his country at the age of fixtythree, shewed me a Hydrocele of moderate fize, which he faid had been collecting about two months fince it had been laft evacuated; being defirous of obtaining a radical cure, I let it out and filled it with injection. He complained of little pain, which went off before it was discharged. I faw him in the evening, he faid his pain had continued about an hour, but that he was then perfectly eafy. The teftis was beginning to fwell a little; this continued to increafe fo gently, that he got up the fecond day, and was not confcious of any thing but a fense of weight in the part. This continued

(167)

continued to the feventh day without appearance of diminution. He was then attacked with a fit of the gout, for which he increafed his quantity of wine; this, with an obftinate coftiveness which enfued, brought on a pain in the part for two or three days. By paying attention to his general health this went off, and the swelling began visibly to diminish. By the end of the month he got perfectly well.

CASE XXXII.

mentionen i herred debrer and

DECEMBER 17, 1791, I evacuated the Hydrocele of a young man at the hofpital: the teftis was larger than natural; but as no material difeafe appeared to affect it, I filled it with injection. He fuffered little or no pain, but walked by choice down ftairs and up another pair to his own ward. The third day the inflammation was gentle and moderate; the feventh it continued fwelled

(168)

without pain. In about a fortnight this man was entirely well.

CASE XXXIII.

FEBRUARY 10, 1792, I affisted a gentleman in injecting the Hydrocele of a middle aged man. The obfervation I made at the time was, that the cannula of the trochar was preffed with too great violence against the teftis both before the evacuation and afterwards, from which I apprehended more inflammation than ufual. This accordingly happened, but was of little confequence, as it foon fubfided by the ordinary means, and I only curforily mention it by way of caution. The 26th I faw him; the teftis was nearly of its natural fize, and there was not the smallest appearance of a return of water.

(169)

CASE XXXIV.

an examination and a light of

MARCH 4, 1792, I performed the cure by injection on the Hydrocele of the late Col. Ironfides, which I had previoufly evacuated feveral times. There always remained a confiderable tumor or fwelling after it was emptied, owing to the great thickness of the fac, and a fulnefs about the chord, chiefly owing to obefity; but as the teftis appeared to be in a good state, I did not hesitate to use the injection. He complained of confiderable pain and ficknefs, which lasted about two minutes, but got better before it was evacuated. Soon after he went to bed he felt a good deal of pain in the neighbourhood of the kidneys, which he faid was like what he had felt in fits of the gravel. I faw him in the evening; he was perfectly eafy, and paffed a good night. Next morning the teftis was gently tumefied, which increafed

(170)

increased by next day. The third day he faid he had felt more of the gravelly pain, and had voided fome gravel, and was after that perfectly eafy. The teftis was fwelled, but fcarcely tender to the touch. This cafe proceeded remarkably well. The Colonel's active difpolition gave him little repole, the fourth day I found him in his ftudy amufing himfelf with books and the converfation of his friends. The fixth day from the operation the teftis began to fubfide. On the ninth he went out in his carriage; and in a few days the teftis was nearly fubfided; and though he paid little more attention to it, but walked and took his usual exercise, and lived in his usual manner, the complaint gave him no trouble afterwards, nor has there ever been the fmalleft return of water .--- I may now add, that the Colonel remained perfectly well of any complaint of the kind till his death, which happened in 1802.

CASE

(171)

CASE XXXV,

THE following Cafe differed from the generality of those I have defcribed, and had many peculiarities in its nature, progress, and cure.

I was defired to perform the radical operation on the Hydrocele of a gentleman from Scotland. The tumor certainly had the appearance of a Hydrocele, but on examining it, felt heavy, and had not the feel of water alone, but as if an enlarged teftis made part of the difease. I mentioned my fufpicions, and faid the evacuation of the water only could determine the propriety of attempting the radical cure. I let out about three ounces of ftraw-coloured fluid from the lower part of the tumor, but found I had not evacuated the whole fwelling. On examining I found another Hydrocele of the chord, perfectly feparate and independent

(172)

independent of the other, and the teftis itfelf much indurated and enlarged. I let out about two ounces from the fuperior Hydrocele, but on account of the difeafed state of the testis, advised no further operation. In confultation with a physician, he was put under a course of cicuta and mercurial frictions. The teftis in one week became lefs, and the water did not appear to return. However, after feveral weeks had elapfed, the water began again to collect in finall quantity in the lower tumor, and the upper became as large as ever; it was now determined that he fhould leave off the mercury and cicuta, and from an idea that it might arife from a fcrophulous difpofition, he was advifed to try the effect of fea bathing. As the fuperior tumor began to be inconvenient from the fize, I let it out the day before he intended to go. No inflammation having followed the former puncture I expected none from this, therefore

(173)

fore faw no more of him; but was furprifed to receive a letter from Brighton, informing me that he had felt some pain in the part during the night after the puncture, and that it was inflamed in the morning, notwithstanding which he fat off and travelled the whole way-when arrived the part was greatly fwollen and painful, and, in fhort, ne was confined to his bed; the inflammation increased, and an abscess formed, which was opened. As foon as he was able he reurned to London. I found the fuperior Hydrocele divided through its whole extent; this foon granulated and healed. The colection which was again beginning below, and also a disposition to a Hydrocele in the other teftis, difappeared.

CASE XXXVI.

MARCH 10, 1792, I evacuated the water from the Hydrocele of a middle aged man

(174)

at the hofpital, which had not before been emptied. He complained of fome pain during the evacuation, apparently more from apprehension than reality, as he faid he felt but little more when the injection was introduced. After the proper time it was difcharged, when being relieved from his fears, he became eafy. The next day he faid he had felt pain for about an hour in the afternoon, but fince had continued eafy. The part appeared gently tumefied; it grew larger for four or five days; by the feventh it was fo much leffened, that the man had liberty to walk about as ufual, and was difcharged in a fortnight.

CASE XXXVII.

MARCH 13, 1792, another unfortunate French gentleman, forced to abandon his native country, fhewed me a Hydrocele of uncommon fize; he faid it had been before let

(175)

let out, but had been now three years collecting; it was larger confiderably than his head, and gave me at first fight the idea of a foldier's knapfack, being precifely of that shape, yet he contrived to keep it almost cout of fight by a bandage that drew it backward. It was much too large to admit of any thing but the fimple evacuation, which accordingly I did with a large trochar, and let out more than fix full pints of water ringed with blood, which he attributed to a poruife he had received in it lately. The ceftis was in a good state, the chord enlarged and fufficiently elongated to admit of the ceftis lying at the bottom of the fwelling. Notwithstanding the immensity of the tumor pefore evacuation, the fcrotum almost imnediately contracted comparatively to a mall fize. I wished to have observed the further progress of this extraordinary cafe, out he either wanted gratitude or an opportunity

(176)

portunity of repeating his vifit, as I have not feen him fince *.

* This was the largeft fimple Hydrocele, I mean, unaccompanied with any protrusion from the abdomen, that ever came under my observation. I have seen some of greater length, but they not having been obstructed in their growth, had taken a pyriform figure : particularly I recollect a double Hydrocele in the perfon of a tall young man from Westmoreland, which, from the nature of the complaint not being known, had been fuffered to increase, till on both fides it reached uniformly down almost to his knees, appearing exactly of the shape, but much larger, than the fcrotum of Jove when transformed to delude the fair Europa. The tunica vaginalis of both teftes had fuffered diffention with great and equal facility, and were very little thickened; fo that when the water was drawn off, the corrugating powers of the fcrotum reduced the whole of the tumor to a fmall fize. They were afterwards permitted to fill again to a proper degree of fullnefs, and were both radically cured.

CASE

(177)

uf al, only complaining of a little

CASE XXXVIII.

THE Rev. Mr. ----- had a large Hydrocele, which I had emptied in June 1791. As he was defirous now to get rid of it entirely, I was induced to use the injection, though it was larger than I fhould have preferred, and probably by the preffure of a fufpenfory bandage it was apparently divided into two tumors, but the communication was evident, and they both were emptied by a puncture in the lower part. I threw in the injection, and he complained of a good deal of pain for a couple of minutes, but was eafy before it was let out. He passed a good night and got up the next day; the third day the part was tumefied, but fo eafy that he dreffed himfelf and came down into the coffee room where he lodged. The following day he chofe to take a long walk, and continued to follow his amufements as ufual, N

ufual, only complaining of a little tendernefs of the part on being handled. Notwithftanding the little care he took of himfelf, no material interruption to the progrefs of the cure took place; in lefs than three weeks he returned into the country well.

CASE XXXIX.

I HOPE Mr. Dunning will excufe the liberty I take in giving the following obliging letter in his own words.

SIR,

I take the liberty to communicate the following cure of Hydrocele, becaufe it is the firft cafe, I believe, in this neighbourhood in which the injection has been ufed. This circumftance is not enough perhaps to juftify me in giving you this trouble; I will not therefore add to the interruption by making

(179)

making any longer apology, but will just observe, that as I write from a principle of respect, I shall be extremely forry to offend.

A gentleman of great refpectability, about two months fince, confulted me for a Hydrocele. He had noted the first approaches of it about a year ago, and could not refer it to any caufe within his knowledge. As the cafe was fairly marked, and he was a temperate middle aged man, of good conflitution, I immediately proposed the radical cure by a fmall cauftic as recommended by Mr. Elfe, a practice I had hitherto adopted, and always with very complete fuccefs. My patient now put into my hands your valuable Treatife, faid it had made a wonderful impression on his mind, that he was very unwilling to fubmit to any other method of cure than that by injection, and earneftly requested me to read the Effay. I never read any thing with more fatisfaction, for, partial

(180)

partial as I was to the cauftic, all my prepossessions in its favour immediately gave way to the fuperior advantages of care and expedition, which fo remarkably characterize your management of the complaint. Accordingly on the 10th of December ult. having drawn off by the trochar feventeen ounces of a bright citron coloured fluid, I injected about eight or ten ounces of wine and water in the proportion of two parts of the former to one of the latter. The gentleman fpoke of confiderable pain on the introduction, and indeed during the retention of it, which was precifely five minutes; the pain, however, foon left him. The acceffion of inflammation was announced the next day by a flight thickening of the parts only; indeed it was fo moderate, and the whole procefs had been fo gentle, my patient, apprehensive that a sufficient degree of excitement had not been produced, did abfolutely on the fecond day exercise himfelf

felf about the room, with a view to increase the irritation, and it was from this conduct, I believe, that he complained the following day of fome pain along the courfe of the fpermatic procefs, which, however, foon went off. About the fifth day the tumefaction had attained its height; the fcrotum was now about the fize of a middling man's fift, attended with rather a fense of fulness than of any pain; it continued in this state two or three days, and then going off gradually in the clevereft way imaginable. At the end of a fortnight from the commencement of the cure, my patient had to congratulate himfelf on the riddance of a difease, which had long given him the greatest anxiety. When I reflect on the eafe and fimplicity of the operation, which really is not more formidable than that of common blood-letting, and oppose it to the many painful and operofe modes of cure hitherto, and indeed at this time too often N.3 employed,

employed, the cure by injection appears in a most striking point of view, must be ranked among the greatest improvements of modern furgery, and commands the gratitude of mankind. I have too long trefpassed on your attention, shall therefore beg leave to subscribe myself,

d'nom vailblitten Yours, &c.

Plymouth, Dec. 8, 1792.

I fhall take this opportunity of transcribing another letter, from Barbadoes, which perhaps I might have fupprefied, as conveying too high a compliment, had it not tended materially to prove that the injection may be fafely used in climates where any other operation for the Hydrocele cannot with fafety be performed. Indeed I have received affurances of its having been adopted and performed with fucces in most parts of the civilized world.

employed.

SIR,

When in London in 1793-4, I became acquainted with the very elegant improvement in furgery, which thousands are indebted to you for, namely, cure of Hydrocele by injection; and as I was that winter a pupil of St. Bartholomew's, I had the pleasure to see you perform the operation I allude to.

Its fimplicity and fafety ftrongly recommended it to me, and as foon as I had an opportunity, after my arrival here, in the course of my practice I put it into execution.

In feveral cafes which I have had under my care, the injection has anfwered even beyond my expectation. I have never failed to effect the cure by the first attempt, and I have never found caufe to be apprehensive of too much inflammation. In one cafe, of a man of near fixty years of age, of a bad habit of body, and who had had Hydrocele

for

for fifteen years, the cure was rather tedious; but I think if any cure at all was made in fuch a cafe, it was fucceeding where no attempt of a radical cure would have been made, by a prudent furgeon, by any other mode of operation whatever. In general I have effected the cure in lefs than three

(184)

weeks, and I have known the patient go out in eleven days, although, no doubt, fome fwelling and hardnefs of the tefficle would remain a little longer. This has even happened when I performed on both fides, in cafe of double Hydrocele, at once.

If you, Sir, are difpofed to confider with me that the advancement of fcience fhould not be fettered with forms and ceremonies, then no apology is neceffary for the liberty I take in communicating facts, which may tend to fupport your practice, in an improvement which will ever rank you among medical philofophers—a fet of men, in my opinion, very diftinct from medical artifts. I need

(185)

I need not give you any farther proof of the univerfality of the practice of curing Hydrocele by injection, than by affuring you that no perfon will now fubmit to any other operation here, and that I have had patients from Martinique up here to be operated on that way.

I have the honour to be, With the greateft refpect, SIR, Yours, &c. &c. &c.

JOHN L. SMITH.

Bridge Town, Barbadoes, May 8, 1798.

CASE XL.

NOVEMBER 10, 1792, a perfon applied with a very large fwelling, which appeared fo hard and heavy, that there was every reafon to fufpect that the teftis bore the greater fhare; however there was evidently fome fluid, which it was agreed to evacuate. On paffing in a trochar a larger quantity of

(186)

of fluid came away than was expected. The tunica was remarkably thick, which had made the feel of the fluid obfcure; and the teftis was very large, but as no pain nor any bad circumstances attended, it was determined to proceed no further, but to endeavour to foften and lessen it by medicine, which was the more likely to be effected now that the preffure of the water was removed. No means that were used had any apparent effect, as the water foon began to reaccumulate, and in fix weeks there was as large a quantity of fluid as before. On being now more certain of the nature of it, I again let it out, and as the teftis, though enlarged, was still without pain, I was tempted to endeavour to cure the Hydrocele. It was certainly a very unfavourable cafe, and not unlikely to bring difcredit on the injection, as I could fcarcely have room to hope that the very thick tunica and enlarged testis would unite. I threw in injection; he complained

complained of more pain than ufual; when it was evacuated he was easier, but still in pain. He went to bed and was ordered an opiate, but by the mistake of the nurse it was not given, fo that his pain, not being at all checked, continued longer than neceffary; however he was perfectly eafy in the evening, and paffed a good night. The next morning the teftis was fwelled more than ufual, probably owing to the greater length of time the pain had been fuffered to remain, and to the difeafed ftate of the parts; the inflammation and fwelling alfo remained longer than ufual, and there was reafon to fuspect that the water was again collecting: however after nine days the fwelling began to diminish.

(187)

When it was confiderably fubfided, and no water was felt, the teftis continued fo large and hard, and the patient complained that it would be fo exceedingly inconvenient

to him in his bufinefs, that it was in comfultation agreed to be removed. On paffing in a trochar to afcertain the fact of the water being gone, about one ounce of deep strawcoloured fluid came away; as this diminished the fize of the teftis, which, though enlarged, did not now feel fcirrhous or dangeroufly difeafed, I was again induced to try if any means could further reduce it; accordingly I ordered what I have repeatedly known of great fervice in these cases; small quantities of mercurial ointment to be rubbed into the thigh: by continuing this procefs a fufficient length of time, the teftis fubfided, and became fo fmall as to take away every reafon for the removal of it, and there was not the smallest return of water; thus, both the Hydrocele and Sarcocele being cured, he took leave of me, happy and well. If in this cafe the tunica vaginalis had been opened for inspection, I conceive it would have

(188)

have terminated very differently, and that the lofs of the tefficle would have been the inevitable confequence.

As this was the moft unfavourable cafe I ever trufted the injection in, I fhall clofe my account with it, though there have been many more cafes under my own care, and more have come within my knowledge, which have fucceeded; but I do not think it neceffary to trouble the reader with any further relation of them.

SUCH has been the fuccefs which has followed this mode of practice; and though there are who ftill prefer the painful operation of dividing the forotum and laying bare the teftis, or the tedious, loathfome cure by cauftic, I have the pleafure to know that many practitioners have followed the plan recommended in my treatife on this fubject, and

(190)

and have fucceeded to their complete fatiffaction. And hereafter, when contemporary prejudices are laid afide, and old habits, though ftrongly woven, are worn out; when all the different methods of curing the Hydrocele fhall have been fairly and impartially tried; I have the gratification to think that the pains I have taken to introduce a mild and eafy method will not be in vain.

THUS terminated the Appendix to the former edition, and I had taken leave of the fubject, but fome circumftances having led me again to take it into confideration, I conceived that I fhould improve confiderably the utility of the foregoing work, by making an addition of a few more cafes, felected from a great number, either on account of fome particular circumftances attending them—or to point out the ill effects arifing from from a mode which has fometimes been adopted of performing the operation—or to throw more light on a fact which appeared to me of confiderable importance. The fame reafons still existing, I am again induced to give them a place in the prefent edition.

(191)

THE TWO FIRST SHORT CASES ARE INTRO-DUCED MERELY TO SHEW THE EASE WITH WHICH THE OPERATION WAS CONDUCTED, AND THE LITTLE CONFINEMENT WHICH WAS NECESSARY TO COMPLETE THE CURE.

CASE XLI.

JUNE 1793. A gentleman lately from the Weft Indies had a moderate fized Hydrocele, which he wifhed me to cure by injection. The day was fixed for the operation, when, from indifposition, I was unable

(192)

able to leave my houfe. As the gentleman had made his arrangements for the purpofe, and it would have been inconvenient to him to postpone the operation, I agreed to perform it at my house. He complained of little pain, and afterward walked to his lodging, which was not far off. He ftaid at home all the afternoon, was generally on the bed, in expectation of pain, which however was very inconfiderable. The tumor, as ufual, became gently inflamed, and increafed in fize till the fifth day, when it began to fubfide: after which he found fo little inconvenience that he was able to go out in his carriage, and alfo to walk in his ordinary way. Though the liberty my patient took in using exercise fo foon produced no material mifchief, it probably prevented the fwelling from diminishing fo quickly as it would otherwife have done, yet in lefs than three weeks it became fo fmall as to convince

(193)

convince him that he was cured of his Hydrocele, and he continues perfectly well.

CASE XLII.

DECEMBER 30, 1793, I let out a large quantity of water from the Hydrocele of the Rev. Mr. —, and returned fome injection. He felt little pain either during the operation or afterwards. On the fourth day from the operation he walked between two and three miles, and continued afterwards to go out every day. Notwithstanding which the fwelling came on gradually, and fo retired. The liberty he took prolonged the cure, but he got perfectly well in about three weeks.

THE TWO FOLLOWING CASES POINT OUT THE DANGER OF LETTING OUT THE WATER BY A CUTTING INSTRUMENT, AND SHEW THE UNFITNESS OF A FLAT TROCHAR TO CONVEY INJECTION FOR THE RADICAL CURE OF THE HYDROCELE.

CASE XLIII.

FEBRUARY 1794. Col. ——— applied for cure of a Hydrocele which had been three times relieved by the palliative method, and which after the laft time, to his furprife, was renewed in a day, the tumor having been nearly as large as when he fhewed it to me. I fufpected this to have been caufed by the infufion of blood from fome veffel opened in the operation, and was lefs furprifed at this accident when I was informed that the puncture had been made with a flat trochar. On paffing in my trochar my fufpicions were confirmed by the difcharge of a large

(195)

large quantity of blood mixed with fome water; I faw no reafon to doubt of the injection fucceeding in this state of the cafe, but as I had not tried it under fuch circumstances, I thought it prudent to defer the radical cure till the bag fhould be again filled, particularly as my patient made no objection to the delay. From this time he was too much engaged to notice his complaint, till June following, when it became fo confiderable as to arreft his attention. On the 17th of that month, his activity making him unwilling to lofe a day, I made use of the injection at night. He felt little pain in the operation, none after, flept as ufual, and in the morning was refreshed and well, a little tumefaction only appearing on the part. In the afternoon he got up and went into another room, the next day I found him perfectly easy and transacting bufinefs, in the evening he fent for me in hafte, and informed me that the com-02 mander

(196)

mander in chief had granted him this time to undergo the operation as the most leifure, and when his prefence would be leaft liable to be required, but that, contrary to expectation, his corps was fuddenly called out to active fervice. He feemed much distressed at being absent on the occasion, faid he found himfelf easy, and was determined immediately to get into a chaife and join his regiment. Reprefenting strongly to him the danger he would incur by fuch a ftep, I prevailed on him not to go. The agitation of his mind on this occasion raifed a little fever, which however was foon calmed. He paffed a tolerable night, the next morning was cool and temperate, and the part flightly swelled. After this time, though my patient's active disposition made me apprehenfive of too great inflammation, the fymptoms proceeded much to my fatisfaction, and at the end of a fortnight he left London. I wat, and informed as that the come

mander

faw him the fucceeding autumn, in every refpect perfectly well.

Some time fince I had occafion to fee another Hydrocele which had been tapped by a lancet, by which a blood veffel was opened in its paffage, and the tunica vaginalis in a few hours became diftended with blood to fuch a degree as to caufe great pain and inflammation. The blood was fuffered to remain feveral months, till it became partly confolidated and partly organifed, and produced fuch hardnefs and apparent difeafe as to make it neceffary to extirpate the teftis. Several other inftances of nearly a fimilar nature I could enumerate arifing from the ufe of a lancet or a flat trochar.

CASE XLIV.

This cafe, befides flewing the fault of the flat trochar, is well worth notice on account O_3 of

(198)

of the extraordinary fize of the difeafe, and other circumstances, which will be told in as concife a manner as poffible .- In November, 1795, I faw, in confultation with the late Mr. Rush, a gentleman who came from Barbadoes expressly for the radical cure of a Hydrocele of long standing. The state of his health was bad; he faid he had been much troubled with bilious complaints, which his countenance teftified, being yellow as faffron. The tumor was very large and mifhapen, evidently flewing that though it contained much fluid, the teftis made a very confiderable part of it. He had also a Hydrocele on the other fide, too fmall at that time to be an object of cure. Though the gentleman anxioufly wished to have the radical cure performed, that he might return to his family, I ftrongly recommended the palliative cure to take place first, on account of the fize of the tumor, and also that I might have an opportunity of

(199)

of examining the ftate of the parts: accordingly it was performed, and a very large quantity of fluid was let out highly tinged with bile. The mafs which remained was a teftis greatly enlarged, with the coats prodigioufly thickened, but in no part giving the idea of fcirrhous, or active mifchief of any kind. It was therefore agreed to endeavour to cure the Hydrocele by injection, when it fhould be again large enough to admit the trochar.

I faw him again in about a month, when it appeared that the tumor had filled fo rapidly, and grown already to fuch a fize, that I recommended the radical cure without further lofs of time. Accordingly I attended to affift at the operation, which was performed with propriety; but the trochar which was ufed being flat, and confequently cutting as it went in, and the cutting part perhaps rather wider than the cannula, the opening which it made in the tunica vagi-

nalis

(200)

nalis did not bind fufficiently on the cannula; fo that when the operator had thrown in fome injection, I observed that part of it returned; and though he threw in the contents of feveral fyringes, made with the vegetable bottle, he was never able to diftend the bag. The upper part confequently was not affected by the injection, the patient complained of a good deal of pain, which continued for a fhort time after he was put to bed. Some inflammation followed, and there was hope that this might be fufficient to produce a cure; but in a fortnight a fluctuation became evident in the upper part, though an adhesion or consolidation feemed to have taken place on the teftis. It was therefore determined to make a further trial fo foon as fufficient fluid should be collected to allow the inftrument to be introduced with fafety.

This interval was thought favourable for performing

performing an operation on his negro fervant, that he might be well time enough to attend his mafter in his next operation. This man had a Hydrocele of uncommon magnitude, and in a very relaxed flate, the teftis alfo was nearly as large as his mafter's. On the whole it was as difcouraging a cafe, and as unlikely to be cured by injection, as any I had ever attempted. However it was agreed to give him the chance. January 1st, 1796, a great quantity of fluid was let out, and a large relaxed bag was left, with a teftis equal in fize to the largeft baking pear, and fomething of that fhape. The injection was properly thrown in by means of a round cannula, and retained : he fuffered very little pain, went to bed, and was treated as ufual. In ten days from the operation he was able to go about his business and wait on his master. The Hydrocele was perfectly cured, but the teftis remained

(201)

remained of a large fize, and was fuspended in a bag.

(202)

The man being well, the mafter determined to undergo the fecond operation; accordingly, January 14, a proper round trochar was used. A confiderable quantity of fluid was evacuated from the tumor, which feemed principally to have its feat in the - chord, though the teftis was of a great fize, and the tumor confequently remained very confiderable after the water was drawn off. On throwing in the injection it was remarkable that the patient was not fenfible of the fmallest pain, which being fo contrary to what he had felt in the former operation, agreeably furprifed him. This circumstance I readily accounted for, and it is well worthy of being remarked, as it tends to prove what I have always fufpected, but have never had an opportunity of afcertaining, that the cure by injection is caufed by adhefion.

(203)

hefion*. In the prefent cafe it feemed yond a doubt that by the adhefion of the nica vaginalis to the teftis in the first opetion, the injection in the fecond was fhut and prevented from touching the teftis, hich is the only part fensible to the ftimulus the injection, fo that by the adhefion is, which originally was a Hydrocele of the tunica vaginalis teftis, appeared to be onverted into a Hydrocele of the chord, which the injection never causes any ain +.

When the injection had remained the fual time it was withdrawn, and the other

* I have fince had opportunities of examining feveral iftes on which the cure by injection has been perfomed, and have found a complete adhesion of the tunica vaginalis the tunica albuginea. There is a specimen of it in the Museum of St. Bart. Hosp.

+ In general the injection into the Hydrocele of the hord produces little or no pain; but from fubfequent experience I find that in fome cafes a good deal of pain has followed the operation, but it has been of fhort duration, and has not returned.

teftis

(204)

teftis examined. It appeared that the Hydrocele was now grown large enough to allow of the introduction of a very fmall trochar, which was accordingly done, and about two ounces of fluid were difcharged. The teftis was rather larger than natural, but in a found state. On throwing in some injection, he complained of more pain than is ufually expressed; perhaps to his fensation it might be fomewhat increased by contrasting it with the eafe which attended the operation on the other fide. The tumors on both fides gradually increased to a large fize; in about a fortnight from the operation they began to fubfide, and gradually diminished, leaving not the smallest doubt of the Hydrocele being perfectly cured on both fides. I have had feveral opportunities of feeing both thefe patients fince; in each of them the fize of the teftis continues to leffen, and they are preparing to recrofs the Atlantic. On confidering all the circumfrances

ances of the preceding cafes, I fhall leave tto the judgment of other practitioners to termine whether any operation but a mild jection could with fafety or impunity have cen practifed.

CONTRACTOR OF STREET, STREET,

(205)

WO CASES WILL BE NOW RELATED TO NOVE THE LITTLE DISTURBANCE OR MIS-HIEF WHICH ENSUES FROM THE FLUID OF HYDROCELE BEING LET OUT FROM THE UNICA VAGINALIS TESTIS, AND SUFFERED O REMAIN DIFFUSED THROUGH THE CEL-LULAR MEMBRANE OF THE SCROTUM.

CASE XLV.

JULY 9th, 1793, I examined the Hydroele of a gentleman in the city, which had wice been fuffered to grow fo large as to ave been burft by fome accidental blow, o that the fluid found its way into the cellular

(206)

Iular membrane, and remained there, without producing any confiderable inconvenience, until it was abforbed. To prevent a fimilar accident in future, I let out about four ounces of fluid, and intended to throw in the fame quantity of injection, but found that the gentleman who affifted me had fuffered the fyringe to be half filled with air. The pain which he felt was very flight, and the inflammation which followed equally moderate. On the day after the operation he went down stairs, and on examining the part on the 9th day the tumor did not diminish, as is commonly the cafe. Whether this was owing to its having burft before, or to air having been introduced, it was difficult to fay; but it had for a longer time than ufual an appearance as if more water was forming. The fwelling however at laft gradually fubfided, and in about five weeks he was cured. The gentleman whofe cafe is here related, I have by chance had an opportunity

portunity of feeing this day, April 6th, 1796, and he affures me that he continues per-

(207)

CASE XLVI.

cout, to which he had been often fulgeet

In the autumn 1793, a trochar was paffed nto a Hydrocele. After the first gush no water followed, but the fcrotum became reatly tumefied; on this occasion I was alled in, and found that the cannula had lipped out of the tunic, and that the fcroum was filled with the effused fluid. The annula was withdrawn, and we endeavoured o prefs out fome of the fluid by the orifice; out as this method was more likely to do narm than good by bruifing the parts, I dvifed nothing more to be done, only recommending a difcutient application. The vater gave no trouble, and was abforbed. When the Hydrocele was again fufficiently. ull the operation of injection was performed.

(208)

formed, and the patient got perfectly well, notwithstanding he was attacked a few days after the operation by a violent fit of the gout, to which he had been often fubject.

THE NEXT CASE IS NOTICED ON ACCOUNT OF THE TARDINESS WITH WHICH THE IN-FLAMMATION CAME ON, OWING TO SOME PARTICULAR CIRCUMSTANCES.

CASE XLVII.

A gentleman about *feventy* years of age, who had paffed many years in the Eaft Indies, fhewed me a large Hydrocele, which I evacuated feveral times at different intervals. The repetition becoming irkfome and difagreeable to him, he afked me how long I thought he would be obliged to fubmit to this palliative method. I informed him that probably it would be neceffary to have

(209)

have recourfe to it during the remainder of life, and related a cafe in point of a gentleman who applied to Mr. Pott for the radical cure of a Hydrocele, about the year 1760; being then fixty years of age, Mr. Pott thought him too old to undergo fo fevere an operation as the incifion, which at that time was ufually practifed; and advifed him not to fubmit to it, but to be content with the palliative cure. The gentleman found it neceffary to vifit Mr. Pott for this purpofe four times a year during the remainder of Mr. Pott's life. He has fince done me the honour to call on me at about the fame intervals: though now in his ninety-fourth year, he is able to walk with activity, and the faculties of his mind are unimpaired and vigorous. His last visit to me was in 1795; foon after which he left this world in the ninety-fifth year of his age. I am glad of an opportunity of producing this instance, as it may be a pleafing fatisfaction to many, P who

who think their life and health concerned in this complaint, to fhew that it does not affect either the one or the other, and that the conftitution receives no injury, provided the accumulation of the fluid be not too long neglected.

(210)

When my patient heard the account, and was fenfible of the great probability of the continuance of the complaint, he defired to have the radical operation performed if I thought he was not too old. I informed him that the operation which I had to propose might be performed without danger at any period of life; on which he agreed to fubmit to it. January 3d, 1794, the injection was made use of, which caused very little pain; and he was fo eafy afterwards that I did not find it neceffary to give him an anodyne. He passed a good night, and the next day, as there was neither pain nor fwelling, left his room. The following day there was fo little appearance of inflammation,

mation, that, fearing there would not be fufficient, I advifed him to live in his ufual manner, and drink fome wine. Several days however paffed without any appearance of inflammation. I was confidering how to account for this, when I observed that he generally fat with the door partly open, that there was a current of cold air, and that he complained of his legs and feet being cold. Whether this circumstance, or his advanced age, prevented the accefs of inflammation, I could not fay, but thought it right to recommend him to keep himfelf warmer. At the diftance of ten days from the operation, fome degree of inflammation arofe, and the whole tumor gently fwelled, exactly as is usual immediately after the operation. He felt no pain, but the tumor, as it had been remarkably lingering and tedious in its access, was equally flow in its progrefs and retreat; however, it at length fubfided, and he got perfectly well by the 16th

(212)

16th of February, and has continued fo ever fince. He is now, January 5, 1805, alive and well, without any return of his complaint.*

* I lately, in confultation, faw a gentleman whole Hydrocele had been injected in the method here recommended, but though upwards of a fortnight had paffed fince the operation, the teftis remained fo large and hard that the patient, who was of a nervous timid disposition, and had been reading fome more favourable cafes in my treatife, was alarmed and apprehenfive that there was fomething materially wrong in his cafe, and that the fize of it would never diminish. I affured him I had feen fome remain a confiderable time before they began to leffen, and did not doubt of his getting well, though it might take fome more time. The furgeon who attended him had prepared a blifter to put on the fcrotum, to accelerate the diminution. To this I took the liberty of objecting, as likely to produce a very troublefome excoriation on a part which is particularly and painfully affected by bliftering, and as it appeared to me in this cafe without any neceffity. I recommended fome leeches, fomentations, and poultices to be applied, and faw him about a week after, when the whole tumor was fo leffened and fostened as to make the patient perfectly easy with regard to a favourable termination of his complaint.

1101

IN THE NEXT CASE IT WILL APPEAR THAT THE INJECTION SUCCEEDED AFTER OTHER METHODS OF CURE HAD BEEN ATTEMPTED.

(213)

CASE XLVIII.

FEBRUARY 25, 1794, I was defired by his benevolent master to see the Hydrocele of an Indian boy, which was very large, and on which the operations of the cauftic and of the incifion had been feparately tried, in this country, and had failed. On the 26th, I let out a confiderable quantity of water, but not in proportion to the fize of the tumor, which was in a great degree kept up by a very large tefticle, and great thickness of the fcrotum and tunica vaginalis. As it appeared to me that these circumstances probably were more owing to the repeated inflammations which the parts had undergone, than to difeafe, I was not deterred from rifquing the credit of the injection .- He complained of a little pain during the operation, but felt

P 3

none

11/11/1

(214)

none after it. On the third day from the operation, the tumor was increafed to a confiderable fize, which was treated in the ufual way, and the Hydrocele did not return. The teftis however continued very large; but the preffure of the water being removed, and as I had prognofticated, there being no inherent difeafe in the gland, by the affiftance of proper difcutients he became perfectly well, to the entire fatisfaction of his mafter, William, brother to the great orator and ftatefman, Edmund Burke.

THE SUCCEEDING ACCOUNT IS ATTENDED WITH SOME PECULIARITIES, AND MAY BE THE MEANS OF PUTTING PERSONS ON THEIR GUARD WHO MAY BE OBLIGED TO OPERATE UNDER SIMILAR CIRCUMSTANCES.

CASE XLIX.

APRIL 14, 1794, Mr. — had a Hydrocele on each fide, which I had evacuated feveral

feveral times. On the right was a hernia, which in the infancy of both fwellings he had been able to keep up with a trufs, but as the protrusion became larger, and the Hydrocele alfo increafed in fize, it was by degrees difficult, and latterly impracticable, to apply a trufs, fo as to keep the protruded intestine within the abdomen. On this account, though otherwife not inclined, he wished to undergo the radical cure of the Hydrocele. I was aware that I might meet with some embarrassing circumstances in this complicated cafe, but the neceffity outweighed the difficulty, and I propofed to cure it by injection. In order to do this, I returned the protruded parts within the abdomen, and directed an affiftant to fupport, and keep them from coming out again. Having fuccefsfully evacuated the tunic, I threw in fome injection, which gave him fome pain; on increasing the quantity he ftarted involuntarily, and by the exertion his

(215)

rupture

rupture was forced down, which pressed on the tunica vaginalis, and drove out the cannula. By this accident a ftop was put to the operation, and fome of the injection paffed into the cellular membrane of the fcrotum. This in a great measure was preffed out through the opening made by the trochar; fufficient however remained, to caufe a dull, painlefs tumor, which was not very inconvenient, and did not prevent the gentleman from going out as ufual. At the end of five weeks there was an evident fluctuation, fome matter was difcharged, attended with a flough of part of the tunica vaginalis, foon after which the wound healed, and the Hydrocele was cured. Notwithstanding the accident, I am confident that this cafe was attended with lefs pain and inconvenience, than would have been caufed either by the cauftic, feton, or incifion. I may add that this day, April 17th, 1796, I have feen this gentleman, and have had

(217)

had the fatisfaction of knowing that he continues perfectly well.

IN THE FOLLOWING CASE THE INJECTION APPEARS NOT TO HAVE BEEN COMPLETELY SUCCESSFUL.

CASE L.

OCTOBER 1793, I evacuated the Hydrocele of Mr. ——, let out about half a pint of fluid and returned fome injection; he complained of a little pain, and fome inflammation followed, which gradually and favourably fubfided. In about the ufual period he got apparently well, but fome time afterwards a fmall tumor appeared in the lower part of the fcrotum. On examination I plainly perceived that an adhefion had taken place all round the teftis, but in the lower part a fmall diftinct tumor was formed, filled with fluid.

(218)

It will appear from this cafe that the operation of injection is not infallible. At the fame time, I can with confidence add, that it is the only inftance, felected from nearly one hundred, which I have treated in this way, in which it has not completely fuceeeded, and I have no doubt but that if I had had an opportunity of repeating the injection, that the cure would have been accomplifhed.*

* The account above recited remains as it appeared in the former edition; eighteen years are now elapfed fince I began to ufe injection, during which time I have performed the operation on more than 400 Hydroceles, and do not recollect more than two inftances, befides the one just mentioned, in which it failed. One of these was in a perfon belonging to the family of Lord Pomfret, on whom I used spirits of wine lowered with water. Being apprehensive of using it too strong, I did not make it fufficiently so, to produce the necessary inflammation, and the complaint confequently returned.

The other was in the cafe of a right honourable gentleman, whofe Hydrocele I had emptied in the palliative way feveral times. In August, 1802, having some leifure, he wished to be radically cured. The weather being extremely hot, I begged him to permit me to let it out simply as usual; and so determined was I against the operation peration, that, though I went by appointment for the prefs purpose of doing it, I did not bring my own ine, as from precaution I ufually do. However, he mufifted fo ftrongly to prefs me, that I was obliged to omply. His fervant brought wine from the fideboard, hich I afterwards found had been opened feveral days; ad f arful of producing too much inflammation during ch hot weather, I diluted it much more than ufual, Idding two parts water to one part wine. The confeequence of all this abundant caution was, that not fficient inflammation was produced, and the water sturned. In October following it had rifen to a good tee, and was again fubmitted to the operation. I took are this time to carry my own wine, and diluted no more than ufual : nevertheless little pain folowed; indeed to little that we were apprehenfive of fecond failure; to guard against which the patient could fubmit to no precaution, but went up and down airs the next day, and in a few days went out and took exercife as usual, except on horfeback, which I refolutely orbid. All this while a gentle fwelling was perceivable oming on gradually and increasing to about the feventh ay, after which it as gradually retired. Perhaps the ttle fenfation produced in the last operation might arife com the fenfibility of the tunics being in fome degree lunted by the former injection. However, from whatver caufe it proceeded, I do not know that I have feen a afe in which the injection had lefs immediate or apparent ffect, nor one in which it ended more happily. At the nd of a fortnight I ventured to pronounce the complaint completely cured, and fo it continues, January 20, 1805.

THE NEXT CASE POINTS OUT THE DANGER OF LETTING THE FLUID REMAIN TOO LONG IN THE SAC OF A HYDROCELE, AND MAY NOT BE AN UNINSTRUCTIVE INSTANCE TO BOTH PATIENTS AND SURGEONS.

CASE LI.

to one isit wine.

1794. A gentleman, aged about 60, fhewed me a very large Hydrocele, which he faid had been twice evacuated. The firft time by the late Mr. Pyle, the fecond time, at the diftance of fome years, by the late Mr. Watfon; when a thick dark coloured fluid came away. Four years had elapfed fince the laft operation. The tumor was now of the full fize of the egg of an oftrich, every part of it felt fo hard and heavy, and had fo little the appearance of a Hydrocele, that I fufpected, though the fac might contain a confiderable quan-

tity

y of fluid, that the teftis would be und in a very difeafed state. After having Illy explained my ideas of the cafe, I inoduced a trochar, which paffed in with fficulty, as if going through buff leather, ad nearly a pint of fluid, thick, and coured like chocolate, was difcharged; after is evacuation a large tumor was left per-Etly infenfible; on withdrawing the canda, it was fo tightly clafped by the tunica ginalis that confiderable force was neceffary difengage it. I informed the patient that was apprehensive the teltis had received uch injury, from the fluid being fuffered remain in too long: he faid he had folwed the advice of both his furgeons, not have it let out till it became troublefome, ad as it had given no pain, he had not tended to it. us shedw odt bas sifter seit I cannot pafs by this opportunity without entioning as my decided opinion, that it is addiman biog extremely

(221)

(222)

extremely prejudicial to let the fluid remain long in a Hydrocele, as it muft either diftend the fac to an immoderate fize, or if the tunica vaginalis be fufficiently ftrong to refift the preffure, it will become extremely thickened, and the counter preffure will equally thicken the tunica albuginea, and the whole body of the teftis will become enlarged.

No inflammation or ill confequence followed the puncture, and the gentleman went into the country, where he caught cold, attended with a confiderable degree of fever, in confequence of which an inflammation took place in the forotum, and was followed by a mortification, by which the tunica vaginalis partially floughed. The Hydrocele was cured, but a large difcharge of matter continued to come away from the body of the teftis, and the whole tumor remained very large.

On confultation with Mr. Howard, of Southampton

Southampton Street, it was agreed that the extirpation of the teftis was the only means lleft to reftore the patient to health, or indeed tto fave his life. When the parts had regained a quiet state, the operation was performed. In the body of the teftis a quantity of matter appeared to have been collected, and on the furface of the tunica vaginalis, which was of an immense thickness, feveral offifications were formed. The gentleman got perfectly well; and I fhould not have given this long hiftory, but to fhew the effects which I conceive to have been produced by fuffering the fluid to remain too llong in the fac, for as far as we could judge from previous circumstances, and actual appearances, there was no reafon to think that there was original difease in the teftis, but that this was brought on by preffure, and had the tumor in its early stage been treated properly as an Hydrocele, it was highly probable

(224)

probable that fo fevere an operation as the extirpation of the organ might have been prevented*.

* The late Mr. — , between fifty and fixty years of age, laboured under a difeafe of a fimilar nature, in which the teftis had grown to an enormous bulk, being more than *twice the fize* of the cafe juft related. This I could never trace from any other caufe than a long neglected Hydrocele. The removal of it became abfolutely neceffary. Though afflicted with many other complaints, principally arifing from corpulency, and that from want of exercife, which he had been unable to take, he was much relieved by the operation, and paffed the fhort remainder of his life with comparative eafe and comfort.

(225)

THE REMAINING CASES PROVE THE INNOCUOUS YET POWERFUL EFFECT OF THE INJECTION, WHICH IS RECOMMENDED, AND THAT IT MAY MOST ADVANTAGEOUSLY AND SAFELY BE EM-PLOYED WHERE IT WOULD BE IN THE HIGHEST DEGREE HAZARDOUS TO PERFORM THE OPERA-TION OF INCISION, OR INDEED ANY OF THE OTHER ORDINARY MEANS OF CURE.

CASE LII.

NOVEMBER 1793. In my abfence Mr. Harvy injected the Hydrocele of a patient in the hofpital, who had alfo confiderable difeafe of the teftis. The gland partook of the inflammation, and the whole appeared in a few days as large as before the water was evacuated; in a fortnight it was evident that no fluid was collected, but that the whole tumor, large as it was, confifted of the teftis only; this remained flationary many weeks, but by perfevering in rubbing mercury into the thigh, and keeping him in Q a horizontal a horizontal polition, it gradually leffened till it became nearly of its natural fize; and the man went out cured of both difeafes.

If this had been opened by incifion, and the teftis *infpected*; I believe few practitioners would have thought it right to attempt the cure of the Hydrocele only, and have left the teftis in fo enlarged and indifpofed a ftate.

The soushing wa CASE LIII. ARMENTER

JUNE 21, 1794, I let out a large quantity of fluid from the Hydrocele of a young man at the hofpital. I found the teftis very large, and the tunic remarkably loofe and flaccid, fo much fo, that I defpaired of its being capable of contracting and adhering to the teftis, and of perfecting a cure. However, as there was neither pain nor partial hardnefs in the teftis, and as I had fucceeded in fome cafes nearly as bad, I determined

determined to use the injection. No pain was felt either at the operation or afterwards, and very little inflammation enfued. At the end of a fortnight the difease appeared to be returning; after waiting a little time we did not perceive any accumulation of water to take place: but the teftis continued fo large that the patient complaining that it would abfolutely prevent him from getting his bread, defired to part with it, and the operation was refolved on; but as the mercurial frictions began to take effect, and the tumor feemed to leffen, the extirpation was postponed; after which it gradually leffened, and actually became of a moderate fize; and being in a perfectly eafy and indolent state, the patient left the hospital.

(227)

CASE LIV.

JULY 6, 1794, the porter of Mr. Martindale, of Bond Street, applied to me with

two

two Hydroceles of fuch magnitude, and fo unfeemly an appearance, that he faid no perfon would hire him. Both were emptied, and the teftes were found prodigioufly enlarged. He fuffered them to fill again to the fame fize, when I proposed to him to go into the hofpital, to obtain a radical cure. It being extremely hot weather, it was thought advisable not to operate on both at once; the left fide therefore was fimply evacuated, the other, though fo large as to be very unfavourable for any operation, was filled with injection, which was made particularly ftrong. This man felt little pain either at or after the operation, the part became inflamed, and fwelled to nearly its original fize, and gradually fubfided without the occurrence of any particular circumstance, except that the progress of the cure was flow, and of longer duration than usual, which from the fize of the tumor was to be expected. The uninjected fide,

fide, not at all affected by the neighbouring inflammation, through the whole procefs was lax, and foft, and fo continued till it gradually filled with fluid.

(229)

October 1st, it was nearly as large as ever, when I let out a pint of fluid, and afterwards used a strong injection. He fcarcely felt any pain, the inflammation came on gradually, and proceeded in every respect like the other. He remained in the hospital some time after the Hydroceles were well, to give time and opportunity for the fize of the teftes, which were still of great bulk, to be leffened : with the affistance of ung. hydrarg. they were in no great length of time much diminished; when they became of moderate fize the man left the hospital, happy in having got rid of two grievous burthens.

100

(230)

CASE LV.

The following is the laft cafe I fhall notice, as no inftance can more ftrongly prove the facts which I have endeavoured to eftablifh.

JULY 16, 1795, a gentleman applied to me for the radical cure of a Hydrocele. I plainly perceived a large quantity of fluid in the tunica vaginalis, but also sufpected much difease of the testis. His state of health was at that time extremely bad, he was gouty, rheumatic, and debilitated to a great degree; on these accounts, and to have an opportunity of examining the flate of the teftis, I recommended the fluid to be fimply let out; accordingly a pretty large quantity of fluid was evacuated, which however appeared to have conftituted not more than one third of the tumor; the remainder confifted of a teftis much enlarged. So foon as

(231)

as his general health by the affiftance of Dr. Turton was reftored, he rubbed finall quantities of mercurial ointment into the thigh, and fuch applications were made to the part as were most capable of affisting in its diminution. In about fix weeks the fac became again fo full as to require to be evacuated. As we were now perfectly acquainted with the difeafed state of the parts, nothing but the palliative cure was thought of. On tapping it, however, we were pleafed to find that the water bore a much greater proportion to the fize of the tumor, than at the first evacuation, making now at leaft half the bulk of the whole. The teftis alfo was confiderably fmaller. As these appearances were so favourable, and his health grew better, he purfued the fame plan. The latter end of August he went to the fea-fide, and used the warm fea bath; still continuing his gentle mercurial frictions. In October he returned to London in good health, Q 4

health, and determined to get rid of his Hydrocele by the radical operation. Before I would agree to this, I defired a confultation might be held, and in the prefence of two other furgeons I let out the fluid, when it was unanimoufly agreed that the teftis was not in a ftate to bear the irritation of any method of curing the Hydrocele, but was not fo difeafed as to require removal.

(232)

The water foon beginning to collect again, he grew tired of the profpect of repetitions of the palliative cure, more particularly as the dread of having it performed by a ftranger prevented him from going into the north, where he had bufinefs of confequence. Among many arguments to induce me to perform the radical cure, he obferved that the teftis always appeared to him to diminifh moft during the time that the fluid remained in the fmalleft quantity; that is, immediately after the evacuation. On attentive examination I thought his obfervations

(233)

ions well founded, and conceived hopes that the total absence of the water might produce confiderable effect, and perhaps cure the complaint. As the water continued to collect, he became more anxious to have the Hydrocele cured, and to take his chance about the teftis, which was certainly become confiderably lefs, and in a quiet state. On a fecond confultation it was agreed that the method by injection might be tried, but that no other operation could with any degree of fafety or propriety be attempted, as there was not a question but that the loss of the teftis would be the confequence. At the beginning of December I let out a large quantity of fluid, and found the teftis fomewhat lefs, and in a quiet state; I threw in fome injection more diluted than ufual. The pain which followed was very moderate and of fhort duration; the next day much inflammation had taken place, the tumor fwelled to a confiderable fize, but was perfectly

(234)

fectly eafy. It continued increasing to the fifth day, when it began gradually to fubfide. At the end of a fortnight there was no appearance of water. The teftis was fmaller than at the time of the operation, and appeared to have received no injury from the inflammation which had been produced. It was however still much too large, but from that time gradually leffened to a moderate fize. At the end of December the Hydrocele was perfectly cured; the teftis fo free from pain, and attended with fo little inconvenience, that the gentleman went out of town, and has fince undertaken a journey to a great diftance from London.

This gentleman called on me in September, 1804, and affured me that he continues perfectly well, is married, and the father of feveral children. To the cafes which have been related I could now, as before obferved, add more han four hundred inftances of complete uccefs; but it appears to me fuperfluous and unneceffary to advance any thing furlher on the fubject.

THERE only remains to take notice of the Hydrocele of the Spermatic Chord, of which a defcription has been given in page 5 preceding.

In the former edition two inftances only of this fpecies of Hydrocele, blended with common cafes, were mentioned, no others lhaving at that time been fubmitted to the cure by injection. It is not a very common complaint; however, as I have fince frequently met with it, I fhall now place it under a diffinct or feparate head.

HYDROCELE

HYDROCELE

OFTHE

SPERMATIC CHORD.

CASE I.

A perfon from Feversham, about fiftyfour years of age, applied to me. On examination there appeared a tumor in the fpermatic chord, about the fize of a moderate orange, hard and incompressible; he imagined it proceeded from a blow, and had perceived it a confiderable time growing larger, without caufing much pain; but it was now becoming more and more uneafy, from the differition of the increasing fluid.

Below this fulnefs the teftis with its epididymis was perfectly diftinct, neither enlarged, nor in any manner altered, and the termination of the tumor above was perfectly Hy free from any connection with the intents of the abdomen; the chord between and the ring being to be felt in its natural ite, though fomewhat larger than ufual, made no doubt of the difeafe being a ydrocele of the fpermatic chord.

The patient preffed me to make a permaent cure of his complaint, as he faid his infinefs was on board a fhip, and the fwellig was a great inconvenience to him.

As this was the first of this species of Hyrocle that I had seen fince I began to use ijection, I hesitated about the mode of reatment, and endeavoured to recollect that other practitioners had recommended. In looking into various authors, I found nat some had proposed to cure it by appliation of caustic. This at once appeared to me highly dangerous, from the possibility of the caustic penetrating too deep and inuring the spectratic vessels.

A division through the whole length of the

the tumor is the only method which Mr. Pott has propofed; but he obferves, that though the operation may in general be performed with great eafe and perfect fafety, he has feen it prove troublefome, hazardous, and fatal. Of fuch confequence are wounds in membranous parts in some particular habits. Mr. Pott, with his usual candour, has related two cafes of the encyfted Hydrocele of the chord on which he performed the operation of incifion; the first was laid open through its whole length, and a perfect cure was obtained: the other was in the fame manner divided, but did not end fo fortunately; the patient, though at the time of the operation apparently healthy, proved of an ill conditioned habit of body; the wound neither became tumid nor inflamed, his pulfe hard and frequent, accompanied with thirst, restlessness, and a languor in his countenance. On the fourth day the incifion still remained cold, lax, and flabby; and

nd was fo far from fhewing any tendency o fuppurate, that, on the contrary, the dges began to look livid, and, notwithtanding every medical affiftance, he died on the feventh day.

This was certainly a most difcouraging account, and added much to the repugnance felt at the division of fuch membranous parts; I therefore determined to try the iffect of injection.

As the extreme fenfibility of the tunics of the tefficle had always appeared to me the raufe why fo mild an injection as I ufually imploy in the common Hydrocele, is found to be fufficiently ftimulating to produce the oroper effect, I had much doubt whether in his cafe, in which it would not meet with uch irritable furfaces, it would be powerful mough to raife the neceffary inflammation : cowever, as the worft that could have hapoened would have been difappointment, I cetermined to try it of the ufual ftrength. March

(240)

March 22, 1791, the trochar was paffed through a very thick cyft, and let out a quantity of ftraw-coloured fluid, fimilar to what is ufually found in the common Hydrocele; on the cavity being filled with injection no pain nor fenfation was excited, on which account it was fuffered to remain in near half an hour, and was then difcharged. The injection having been fo perfectly innocent, I expected the effect from it to be proportionally fmall; but was pleafed to find, next day, fome inflammation on the part, and the patient faid he had felt fome pain. From that time it proceeded in every refpect like a Hydrocele of the tunica vaginalis, it gently fwelled, and had the appearance of a fresh collection of fluid; in about a week it began to fubfide, and gradually decreafed, till, in lefs than three weeks, it came to the fize of a fmall walnut, and felt to be only the remaining folid thickness of the cyft; after which it feemed stationary, and no alteration appearing

appearing likely to take place, about the end of the month from the operation he went into the country.

I had an opportunity of feeing him the icth of May following, and the part which had been the feat of the difeafe was become fo nearly of the fize of the reft of the chord, that the difference was fcarcely perceptible. This is an additional inftance of membranous parts growing thick from preffure, and again becoming thin, and of their natural texture, from the abfence of it,

CASE II.

JULY 1, 1792, a gentleman applied to me with a Hydrocele which had once before been emptied. It was pretty large, but what made it remarkable was, that the teftis could be felt diftinctly under the tumor, fo that the water appeared to be collected in the chord, but yet the fwelling R could

could not be diftinctly feparated from the upper part of the teftis. It was fufficiently evident that the cavity of the tunica vaginalis teftis was not the feat of the complaint. He wished the injection to be used. I thought proper to inform him that this was not a common cafe; but as I had fucceeded in one where the water was collected in the chord, I had hopes of being equally fuccefsful in the prefent; and as the coats of the teftis were not affected, I imagined the fenfation which the injection would produce would be in a very fmall degree. I let out about five ounces of water; when the injection was introduced, he complained, as I expected, of very little pain; he went to bed to meet any pain which might arife, but he continued eafy all the afternoon; the next morning I found him up and dreffed. The part was attended with fome fwelling, which continued increasing to the fixth day, when he complained of fome uneafinefs, and was glad bluez

(242)

(243)

glad to keep his bed for a few days, which, with the affiftance of a faturnine application, foon reduced it. After which it gradually fubfided as a common Hydrocele, and in lefs than three weeks he went out of town, The chord rather larger than the other, but without the leaft appearance of a fresh collection of water.

CASE III,

MARCH, 1794, I faw a gentleman, in confultation, who had a Hydrocele on each fide. In both the water was collected in the chord, yet feemed to be in contact with the upper part of the teftis, the body of which was plainly perceptible from not being furrounded with fluid, which plainly proved them both to be Hydroceles of the fpermatic chord. We agreed, with the approbation of the patient, fimply to evacuate one, and to use the injection in the other. The left R 2 tumor tumor was accordingly punctured, and about two ounces of clear ftraw coloured fluid was evacuated; the other was alfo emptied and filled with injection. He felt fome little pain and ficknefs, which foon went off; I faw him next morning, when he faid he had not had occafion to take the opiate, which was prefcribed if neceffary, and had paffed a good night. The part continued fwelling about four days; it then began to diminifh, and foon fubfided.

The other Hydrocele which had been relieved by the fimple puncture, became enlarged from the increase of its contents, and in about fix weeks was of fufficient fize to admit of the cure by injection, which was accordingly determined on. The furgeon who performed the operation thought proper to use a flat trochar, which let out the contents very well, but on throwing in the injection it appeared that the fac was not diftended by it; a fecond fyringe-full was then

(245)

then injected. This also did not appear to distend the bag, but part of it ran back again, and on opening the ftop-cock none returned through the cannula, which was therefore withdrawn, and it was evident that great part of the injection had found its way into the cellular membrane of the fcrotum; by repeated preffure this was in a great measure evacuated through the puncure, but fufficient remained to produce an obstinate fwelling, which continued indeed without much inconvenience, till at length t: was diffipated : the Hydrocele on that fide owever returned, whilst the other which vas completely injected was effectually large as to be trodblefome, and ' m. boru

I have, as I obferved, fince these cases were ritten, met with many fimilar, in which I ave performed the same operation with jual fuccess, and without any bad symp-R 3 toms

in 1900's roman a basel to that is

a very final orange on the oner

toms; but as the progress of them all was very much alike, and I did not think it neceffary to take notes of them, I shall only mention the two last, which of course are most fresh in my recollection.

pit to anatomo CASE IV. out of

1804. A gentleman, of a remarkably irritable habit of body, whom, in 1796, I had cured of a Hydrocele of the tunica vaginalis teftis, after an attempt to cure it by paffing a feton had failed, fhewed me a fwelling which he faid he had perceived coming on feveral months, but now was fo large as to be troublefome, and fometimes painful. I found a tumor about the fize of a very fmall orange on the chord, on the fame fide as the former Hydrocele, which remained perfectly firm and well. It was evidently a collection of fluid, and I had no doubt of it being a Hydrocele. I explained the (247)

the nature of it to him, and proposed to treat it in the fame manner as I had done the former, only telling him he would probably feel lefs pain in the operation. The injection, however, gave fome uneafiness from the preffure, and when he got into bed fome pain followed, but in a flight degree; in the evening a good deal of fwelling and tenderness had taken place. The inflammation continued near a fortnight, at the end of which it fubfided, gradually went down, and the complaint was perfectly cured.

CASE V.

SEPTEMBER 21, 1804, I injected the Hydrocele of a gentleman of the law, which was of confiderable fize, and fituated on the fpermatic chord. I had previoufly affured him that the tunica vaginalis and teftis being perfectly free from any connexion with his complaint, the pain and inflammation would

 R_4

be very moderate; both, however, were more than I expected, though lefs than in the common Hydrocele. He had a good night, the next morning the part was fwelled and very tender. The fourth day it was diftended to the full fize it had been of before the evacuation. A few days after it began to fubfide, but a confiderable fwelling remained for three weeks: by poultices and proper attention this gradually decreafed, and afterwards gave him no further trouble. I faw him again in December following, and the part which the complaint had occupied was fcarcely perceptible.

(248)

FROM what has been related, I conceive we may fairly conclude that the injection appears to anfwer as well, and with as much certainty in this fpecies of Hydrocele, as in that of the common Hydrocele of the tunica

(249)

tunica vaginalis: on which fo much has been faid, and the treatment of both is fo fimilar, that it is unneceffary to make any further obfervations on it, or indeed to take up any more of the reader's time than for the perufal of a few general remarks which occur on a review of the whole which has been advanced.

WE have now confidered all the methods which have been ufually employed for the cure of this complaint, and I have endeavoured, with fairnefs and impartiality, to ftate the respective advantages and inconveniences attending them. The proportional merit however of different remedies can never be exactly determined; few men have opportunities of feeing a variety of remedies repeatedly tried, and perhaps still fewer posses a fufficient state of candour to weigh the merits and defects of each in an equal balance; confequently medical practice practice is never fettled in any cafe till it be nearly perfect, or at leaft, till fome one proposed remedy bears no comparison in point of excellence with the reft.

Thus far however I think we may fairly gather from what has been related, that there are fome fo painful in the execution, and dangerous in their confequences, that they ought to be laid afide. Such appears to me the opening the fac of the Hydrocele, and laying bare the tefticle, whether it be done with the knife or caustic; for although the operation of INCISION may have been improved by the ingenuity of fome among the moderns, and the whole of the fubfequent treatment rendered lefs violent than former methods, yet as far as my opinion goes, the practice is still fevere, unneceffary, and therefore wrong.

The TENT, after having been practifed for two hundred years, has been fo little ufed (251)

used of late that we have fcarcely sufficient data to judge of its effects and confequences; the inftances which I have quoted are certainly not in its favour. On the whole, I should conceive it would have the principal inconvenience of the feton, that of being a folid body, without an equal extent of fervice. As the operation of it must neceffarily be more confined, and touch a fmaller furface, the inflammation which should follow would be lefs likely to be fpread over the whole cavity of the tunica vaginalis than that induced by the feton, which paffes through the whole of it; and when the Tent is introduced from an opening in the upper part it must be highly dangerous.

There remain the excision, the application of the fmall caustic, the seton, and injections.

The Excision may poffibly be neceffary in fome old cafes, where the coats, from long long and repeated diftention, are become thick and rigid: fuch, however, very rarely happen; nor can it be neceffary in thefe until the milder methods have been tried and have failed.

With regard to the SMALL CAUSTIC and SETON, they have each fo many advocates, that I am far from determining which deferves the preference: but for the reafons given, and which I repeat, the cauftic being defigned to deftroy, and caufe to flough away a portion of the fcrotum, and the whole of the tunica vaginalis, which produces a painful and offenfive ulcer; on the contrary, the object of the feton being to preferve, as much as poffible, the natural and perfect ftate of all the parts, I am inclined to give my vote in favour of the latter.

They are both certainly great improvements, in comparison of all the preceding operations;

(253)

perations; yet, as there are objections to ce made to both, I efteem myfelf fortunate, n having been the means of introducing nto this country a method, which is not able to the inconveniences attending either if them; and I flatter myfelf I have related infficient inftances to prove that the cure y INJECTION really deferves a preference. There is one merit which I am confident. me injection possession a very superior deree, that the inflammation which is excited wit is fo gentle, that it may be fafely used most under any circumstances, and at any eriod of life; and if it fhould not fucceed, at is, if the inflammation should not be ifed to a fufficient degree to effect the urpose of cohesion, it can do no harm, or produce the smallest ill effect or inconnience, provided it is properly performed. he fame confequences alone would take ace as ufually follow the mere letting it out

(254)

out by puncture. There would be a fresh accumulation of water, and we should not be prevented from another trial to cure it, by injection, by the seton, by caustic, or any other method, just as if no previous operation had been attempted.

FINIS.

POSTSCRIPT.

HE improvements in Surgery, within the prefent century, are undoubtedly numerous nd of confiderable importance; but as the rt is still progressive it feems the duty of wery practitioner to memorife whatever by xperience he finds useful, and to endeavour o increase a fund of knowledge which suceffive observations have gradually accumuated. Yet he who ventures to introduce ny method which cuftom has not famiarifed must expect the opposition of habit nd prejudice, and after all his pains will not ifrequently find his intentions frustrated by nifconception or mifreprefentation: fuch reexions refult from the perufal of a treatife

on

on the Hydrocele not long fince published at Edinburgh, which contains fome observations on " A late attempt to bring forward " again the use of Injections for the cure of " Hydroceles, which has been long difused " in this country."

This fummary definition appears to be intended to characterize a treatife which I had publifhed on that fubject, in which the whole of the attempts to bring it forward confifts in relating my reafons for ufing injection in that difeafe—a defcription of the means employed—an exact flatement of the progrefs made, and of the cures effected by it; all which are unrefervedly laid open and fubmitted to the opinion of others, with no further claim to credit than that which their obfervation may allow and their experience confirm.

The motives which induced me to prefer the cure by injection are faid by this author to arife from a dread of the operation by incifion,

cifion. I own I have a dread of it, as I ever shall have of giving unnecessary pain. Having long had the care of a large hospital in this metropolis, my practice has been open to public obfervation; and though I have ever most studiously endeavoured to lessen the neceffity of operations, no one, I am confident, will accuse me of shrinking from any which I am convinced will prove advantageous to the patient. Incifion for the cure of the hydrocele always appeared to me, as was fully explained in my treatife on the fubject, one of the most cruel and painful operations in the practice of furgery, merely to remove a complaint, which, though burthensome, is neither painful nor hazardous to life, and may even be prevented from being inconvenient, by occasionally having recourfe to what is commonly called the palliative cure. It is true that I have not lately feen the operation of incision, as it has not been performed at St. Bartholomew's hofpital during the laft twenty-five years; but I continue

continue to hear and read fuch accounts of it as make me ftill think it my duty to contend againft it, and I fhall ever efteem myfelf particularly fortunate if I have in any degree contributed to introduce a mild method, which, like the difeafe it is intended to cure, produces little pain in its performance, and lefs hazard in its confequences.

In a fubfequent part of the work alluded to, it is observed, that " at one period a " practitioner in this country got into notice " by announcing frequent cures of the fif-" tula in ano and other finuses by injection, " but that his reputation was not of long " duration, not having been fuccefsful in " one of twenty cafes which he undertook." How far injections may answer in other cases is foreign to the prefent subject, but with regard to their effect on the hydrocele I can affure the author, that if my reputation were to stand on any fingle basis, I should have no objection to trust it on this alone.

The

The motives which could give rife to fuch infinuations, I would willingly impute to the zeal which Mr. Bell feels for the method he has been accustomed to, at the fame time I am much inclined to believe that he would have altered his fentiments, if he had had any experience of the method of cure by injection. If Mr. Bell had not thought proper to make the experiment himfelf, he needed not to go out of his own neighbourhood to learn its fuccefs. Indeed this mode of cure has met with a favourable reception from fo many practitioners, that I should have been induced to pafs over in filence an attempt to leffen its credit, had not this been the production of a gentleman eminent in the profession, and a voluminous writer, whofe opinions may be fuppofed to bias the judgment of the student, and to attract the notice of those more immediately concerned. Having been thus powerfully affailed, I thought it would be almost culpably negligent not to perfevere in the fupport of the

plan

plan which on good grounds I had recommended, more efpecially as I continually fee fresh reasons to be fatisfied with what I have advanced. With this view I had thoughts of publishing a new collection of cafes, having by me memoranda of at least forty in addition to those already described, which have fucceeded under my own care, befides the histories of many which have been obligingly, and in the most flattering terms, transmitted to me, from various parts of the world, by gentlemen whom I have not even had the honour of being acquainted with. However, on confideration that, befides the original treatife, an appendix has been published in which the former arguments are ftrengthened with additional inftances of fuccefs, and fince the practice has already ftood the teft of inquiry and experience, I think it unneceffary to trouble the reader with more obfervations on the fubject, than will barely be neceffary to refute the objections which have been brought against it, to point out the

(vi)

the errors which have been committed by fome in their method of performing it, and to add a felection of a few particular cafes, principally to exemplify and eftablifh fome circumftances of confiderable importance. But before I conclude this preface, it will only be taking a reciprocal liberty, and not irrelevant to the fubject, to make fome remarks on what Mr. Bell has produced on his favourite operation by incifion, and his reafons for thinking that the method by injection " fhould not be adopted."

Mr. B. in his advertisement fets out with a promife of improvements in the operation of incifion, which "he conceives to be im-"portant, and that they render the opera-"tion eafy, fafe, and certain." In what refpect he has improved the fafety of it, I cannot clearly comprehend, for though formerly this practice was attended with exceffive pain, and often accompanied with violent fever, the confequence was feldom fatal. As to the certainty of cure by incifion, that alfo,

a 4

I con-

I conceive, cannot depend on any improvement of Mr. Bell's, for though it has fometimes failed, as I have known, in general it is allowed to be an operation of certainty; indeed it would be wonderful, if, after dividing the bag, and laying bare the tefticle, fufficient inflammation were not excited to perform a cure; I only argue that it is infinitely more than is neceffary to produce the proper effect. With regard to the eafe which is promifed in the operation, I prefume it must respect the operator, not the patient; for however lightly and dexteroufly the knife be ufed, the nerves must still be fensible of its edge; the exquisitely tender coats of the tefticle also must still be exposed to the irritation of handling, the contact of air, and preffure of dreffings.

I fhall pafs over the firft part of Mr. Bell's treatife, containing an anatomical account of the peritonæum and defcent of the teftis, which, if neceffary to the knowlege of a difeafe that cannot happen till the teftis is completely completely in the fcrotum, may be found in Pott and other writers on herniæ; to which Ifubject it is perhaps more peculiarly appropriate.

In Mr. Bell's obfervations on the anafarcous hydrocele, he properly notices, and very truly describes the dangerous consequences which often are produced by making long fcarifications on parts loaded with water, and fays in many inftances they have caufed gangrene and ended fatally. It is fomewhat fingular that the fame author, a few pages further, after having described the anafarca, which fometimes takes place from the burfting of a hydrocele, by which the cells of the fcrotum are loaded with fluid, fhould advife an incifion to be made through it in that ftate, and the operation for the hydrocele to be then performed; the paffage which I shall beg leave to lay before the reader is as follows:

" The fcrotal anafarca, of a local nature, has also happened from the rupture of a " hydrocele

" hydrocele of the tunica vaginalis teftis: " when the hydrocele of the tunica vaginalis " arrives at a great fize, jumping from a " height, or a violent blow or bruife, will " readily burft it; and the water, not find-" ing a paffage outwardly, must necessarily " diffuse itself over the scrotum. Different " inftances of this have been met with, two " of which are related by Douglas *; and " different instances of it have fallen within " my own observation. A swelling of a " fimilar kind is also fometimes induced by " the water of a hydrocele of the tunica va-" ginalis being improperly drawn off in the " operation of tapping. When the orifice " in the fkin is allowed to recede from the " opening into the vaginal coat, before the " water is all discharged, as is apt to happen " when the operation is done with a lancet, " the remainder of the collection diffuses it-" felf through the cellular fubstance of the " fcrotum, an inconvenience that may be al-

* Treatife on the Hydrocele, by John Douglas, p. 8.

ways prevented, by using a trocar for this operation, instead of a lancet.

" In whatever way the fwelling is produced, the cure fhould confift in laying the tumor fufficiently open, not only for evacuating the diffufed ferum, but for effecting a radical cure of the hydrocele of the tunica vaginalis.

" Some have imagined that danger may " enfue from performing the radical cure for " the hydrocele in this fituation; but I have "done it in different inftances, and no harm " has ever enfued from it. The patient, in fome cases, may decline the operation, and, in others, his habit of body may ren-"der it improper; but, when this does not " happen, few will doubt of its being bet-" ter to give a patient, in fuch circumstances, " immediate and effectual relief, by perform-" ing the radical cure at once, than to fub-" ject him, in the first instance, to a good " deal of confinement, for removing the " diffused fwelling of the fcrotum, and to " leave

(xi)

" the hydrocele of the tunica vaginalis."

I confess that I am among those who entertain strong doubts of the propriety of operating in fuch a state of the complaint, for many reasons; first, I doubt of " a good deal " of confinement" being neceffary after the burfting; I have feen the accident feveral times. It happened to a gentleman in the city twice, whom I afterwards cured. Another person I faw who once burst the tunica by accident, when finding no great inconvenience from the diffusion of the fluid, and that it was a confiderable time before the hydrocele returned, was induced to burft it afterwards on purpose, by running against a table in hopes of getting rid of his complaint altogether, yet no ill consequences followed; and another gentleman put himfelf under my care, who met with the accident in London, and was obliged to go two days afterwards into Oxfordshire, which

he

(xiii)

te did without experiencing any material nconvenience. I have alfo feveral times feen lhe fcrotum loaded with water, owing to come awkward attempts to perform the paliative cure, but in no inftance that I have teen, did the extratunicated water caufe much more inconvenience than while it remained within the tunica vaginalis teftis, and *no* confinement was neceffary; but in a fhort time it was abforbed, and the hydrocele again began to fill.

The next reafon for my doubting of the propriety of performing the operation in the loaded ftate of the fcrotum, may be drawn from what Mr. Bell himfelf has faid on the Hanger of fcarifications, that is making wounds in parts fo circumftanced.

My third reafon for being feeptical on this coccafion, is this. If the anafarcous state of the ferotum arifes from the fluid which was contained in the tunica vaginalis testis, being llet out, this bag must confequently be colllapsed, and lie in contact with the testis. I believe

I believe every one will allow that it would be extremely difficult, if not impracticable, to perform the incifion, or any other operation, on it in fuch a state. But, supposing a perfon dexterous enough to do it, would it not, at least, be more prudent to wait till fufficient water was again collected to direct the incifion, and to ferve as a guard to prevent the knife from the poffibility of injuring the tefticle? On the whole, fo far from agreeing that few will doubt of its being right " to give a patient under fuch " circumstances immediate and effectual re-" lief by performing the radical cure at " once," I am inclined to think there are very few who would not be fenfible that neither the loaded fcrotum nor the collapfed tunic are in a fit and eligible state to admit of fuch an operation. This doctrine was before taught in Mr. Bell's syftem, to which, in my treatife on the Hydrocele, I took the liberty to object. Although I had no reason to expect that my opinion would have any weight 4

weight with Mr. Bell, yet it appears rather extraordinary, that on reflection he should ftill perfift in his former practice, more especially, as afterwards, fpeaking of the operation of incifion, he feems fenfible of the difficulty of doing it on the collapsed tunic. His words are, "When the tumour is first " opened below, the water is inftantly dif-" charged; and as this is followed by an " immediate collapse of the tunica vaginalis, " the direction in which it should be cut is " not afterwards eafily difcovered." Now where can be the difference between a tunic collapfed by letting out water by an inftrument, or by an accidental burfting, except indeed that by the accident the water not being able to find a paffage out, diffuses itfelf into the cellular membrane under the fkin, confequently the fcrotum becomes loaded, more untractable, and more unfit to be the fubject of an operation. In fhort, in the one cafe the collapfed tunic makes all the difficulty, in the other both the loaded fcrotum

(xv)

tum and the undiftended bag forbid the operation.

(xvi)

Mr. Bell then gives an account of the hydrocele of the tunica vaginalis teftis, and states that no internal medicine nor topical application has power to ftop the progrefs of the complaint, which is only to be got rid of by the palliative or radical operation. Speaking of the palliative cure by means of a trocar, Mr. B. observes, that " Indeed " the ordinary triangular form of this in-" ftrument makes it both difficult and un-" fafe to introduce it; but the trocar, of a " flat form, an improvement which I pro-" pofed a good many years ago, enters with " as much ease as a lancet. This inftru-" ment is reprefented in plate iv. fig. 3; " and, in plates 1 and 2, other forms of " the trocar are delineated : With any of " thefe, an opening may be made into the " tunica vaginalis with perfect fafety, and " the water with this inftrument being " much more freely drawn off than by a " puncture " puncture with a lancet, by which effufions are often produced into the cellular fubftance of the fcrotum; the mode of doing it by the lancet fhould therefore be laid afide."

On this fubject I must take the liberty to differ from Mr. Bell. The triangular trocar, according to my experience, is neither unfafe nor difficult to be introduced; by dilating, instead of cutting in its passage it makes nearly a fimple puncture, and when the stilet is withdrawn, the circular cavity of the cannula is the most capacious and best possible form for evacuating any fluid, particularly if it should chance to be thick, or ropy, which, though rarely the cafe in hydroceles, frequently happens in dropfies of the abdomen; and I would wish it to be observed, that the observations I am now making on the operation of tapping are equally applicable in both cases. To the flat trocar, which, if I am not mistaken, was invented by the late Mr. André, I have great objection; it cerb tainly

(xviii)

tainly enters with as much ease as a lancet, but it also cuts on both fides like a lancet, by which it is equally liable to open a blood veffel in the neighbourhood. I have many times been confulted in cafes where the fac of the hydrocele has been filled very foon after the operation, and has become as large as before the water was evacuated, the contents of which on being let out proved to be principally blood poured out from fome veffel which had been opened by the inftrument in its passage, and I have traced the accident from the operation having been done by a lancet or a flat trocar. I do not fay that by the passage of a triangular trocar, a blood veffel may not chance to be punctured, but it must be obvious, that a flat instrument which cuts its way on both fides must be infinitely more liable to produce fuch mifchievous confequences. But though I conceive there is great reason to discommend the operation of tapping by the lancet or flat trocar, I cannot agree with Mr. Bell that the lancet VITIE

7

lancet should be wholly " laid afide," as I think in fome cafes it is highly neceffary and useful; for instance, if there be any doubt or uncertainty concerning the nature of the contents of the hydrocele, if we fuspect it to be complicated with an enlarged and difeafed testicle, or conceive that a portion of inteftine may be protruded into the fcrotum, or if on any other account we think it unwife to plunge in a trocar, the lancet is infinitely the fafest and best instrument to make use of, fince by that the smallest superficial puncture may be made through the bag fo as to determine its contents without any rifque or hazard, and if it prove to be fluid, the fmall opening may be followed by the introduction of a trocar, through the cannula of which the remainder of the water may eafily. be evacuated. On the whole therefore I would recommend that the flat trocar, but not the lancet, be " wholly laid afide."

Again Mr. Bell obferves : " If a common " round trocar is ufed, a fmall opening b 2 " about " about a quarter of an inch in length " should be made through the skin with " the fhoulder of a lancet on that point " where the trocar is to enter." To this alfo, whether the trocar be used in the abdomen or in the fcrotum, I cannot help offering an objection, as fuch division of the skin prolongs the operation, gives additional pain, and is wholly unneceffary. Not long fince I was fent for to perform the operation of the paracenthefis on a lady at a diftance from the metropolis, which was accomplished without any difficulty by the common round trocar, and a large quantity of water was evacuated; fome time afterwards it collected again, and the operation again became neceffary. As the nature of the cafe, which at first was obscure, had been completely ascertained, it was thought more convenient to employ a gentleman in the neighbourhood, who following Mr. Bell's instructions, began first by making an incifion through the integuments with a lancet,

lancet, and then paffed in a trocar. This procefs fo prolonged and increafed the pain of the operation, that the patient would never fuffer it to be repeated, but when it became neceffary to draw off the water again, as it did feveral times afterwards, fhe always either fent for me, or came to London for this purpofe. I have thought it worth while to mention this circumftance, becaufe a fimple fact fometimes outweighs much reafoning.

Mr. Bell then gives an account of the different operations employed by the ancient practitioners for the cure of hydroceles. Speaking of the views of modern operators, Mr. Bell obferves, "Parts of the human "body, in a ftate of inflammation, very "readily adhere to each other. Indeed, fo "eafily do they do fo, that fome art is re-"quired to prevent the adhefion of con-"tiguous inflamed parts, of which every "practitioner muft have met with examples. "Hence abfceffes and encyfted tumours b 3 "are

(xxii)

" are more eafily cured by exciting inflam-" mation over their internal furfaces, after " their contents are evacuated, than by any " other means; and, in like manner, it is " now known, that the hydrocele of the " tunica vaginalis may be treated upon the " fame principles, and with the fame general " effects." And again, " The intention, " then, of every means now in use, for the " radical cure of this species of hydrocele, " is, to induce fuch a degree of inflamma-" tion on the parts in which it is feated, as " may tend to obliterate entirely the cavity " of the tunica vaginalis, by making it ad-" here firmly to the tunica albuginea the " furface of the tefticle." Is it not rather extraordinary that this writer fhould not be contented with fuch gentle means as are proved to answer his apparent intention, but should think it necessary to lay open the whole tumour to produce the effect? And alfo (as will be fhewn when we come to confider his directions in the operation of incifion)

(xxiii)

incifion) fhould pafs a piece of linen dipped in a greafy composition between the coats and tefticle? Surely at least there is great appearance of inconfistency in first agreeing that the cure is to be effected by union of parts, and then to lay them open and pafs in a dreffing, to prevent them from uniting, for though after suppuration, an union may take place, the union by the first intention, which is the rational plan, must certainly be prevented by such treatment.

Mr. Bell obferves, " when the fac has " become unufually thick, or hard, it proves " fometimes ufeful to remove those parts of " it that are most particularly difeased; and " when it has been distended to fuch a de-" gree as entirely to have loss its tone, re-" moving a part of it may forward the " cure." In answer to this I cannot help remarking that I have succeeded by means of injection in several cases of this defoription, which will be found at the conclusion of this work; but that to which b 4 I would

(xxiv)

I would particularly refer, is No. 1, as it was the first in which I tried the injection, and where the coats of the teftis were fo large and thick, refembling buff leather, that neither had I nor any perfon prefent an idea that adhesion would take place, and in which I have not the fmallest doubt, if incision had been employed, that it would have been judged neceffary, on inspection, to cut away the coat, and probably remove the tefficle, which was proportionally enlarged. The difeafed appearances in this cafe, I am confident, from the experience I have fince had, and the observations I have fince made, (though they much refembled a fcirrhous affection of the parts) arole from long continued diftention. The complete fuccefs I had in this extraordinary cafe first stamped a value on the method which I recommend, and which fo many fubfequent trials have confirmed.

After defcribing the operation by the cauftic and the feton, Mr. Bell proceeds to his

his favourite operation by incifion, which I have perused with great attention, but am wholly at a lofs to difcover the eafe which is promised in the preface. It appears to be conducted much in the old way, and likely to produce fimilar fenfations, but I shall beg lleave to let the author speak for himself: " The patient being laid upon a table of " convenient height, and properly fecured " by affiftants, with the fcrotum lying nearly on the edge of the table, the operator, with one hand, fhould grafp the tumor " behind, fo as to hold it firm, and make it " fomewhat tenfe on the anterior part of it: With a common round-edged fcalpel in " the other, he should now divide the external teguments by one continued incifion from the upper end of the tumor, all " along its anterior furface, down to the " most depending point of it.

" If the incifion has been properly made, the divided fcrotum will retract, and the tunica vaginalis will be laid bare, for the " breadth

(xxvi)

" breadth of about half an inch, from one " end to the other. An opening is now to " be made in the vaginal coat, with a fharp " pointed biftoury, just at the upper end of " the tumor, where the first incision com-" menced. This opening fhould be of fuch " a fize, as freely to receive the finger of the " operator; which, being inferted, the bif-" toury is to be conducted upon it, and the " fac divided to the very bottom, directly in " the course of the first incision. By the " previous division of the skin, with the " fcalpel, inftead of the biftoury, the ope-" ration is done with more accuracy, and " lefs pain; for the scalpel, from its con-" vexity, admits of a finer edge than an in-" ftrument of any other form is capable of " receiving, and hence it cuts with more " eafe.

" By making the incifion of the teguments and tunica vaginalis together, as in fome inftances I have feen done, the operation may be fomewhat fhortened; but the time gained gained by it is not more than two or three feconds, while the incifion is apt to be ragged and unequal: for when done in this manner, particularly when the opening is made at the under extremity of the tumor, as fome have advifed, the parts cannot be kept fufficiently tenfe during the time of making it.

" I have defired that the first opening in " the vaginal coat may be fo large, as eafily " to receive the finger of the operator, " which ought to be pufhed in behind the " biftoury, without withdrawing the inftru-" ment, as is commonly done. In this " manner, we fhorten the operation, and, " by giving a free vent to the fluid contain-" ed in the fac, we prevent it from spread-" ing and forming vefications in the cellular " fubstance of the vaginal coat, and conti-" guous parts, as it is apt to do when the " opening in the fac is too fmall. By mak-" ing the first opening in the upper end of " the fac, much trouble and inconvenience is " prevented,

(xxviii)

" prevented, which always occur from mak-"ing it below. For as I have before re-"marked, when the tumor is first opened below, the water is instantly discharged; and, as this is followed by an immediate collapse of the tunica vaginalis, the direction in which it should be cut is not afterwards easily discovered: whereas, by making the first opening above, as the water is thereby gradually emptied as the opening is carried downwards, the vaginal coat continues distended at the bottom, till the operation is finissed.

"With a view to fave fome pain to the patient, the late Mr. Hunter advifed the incifion both of the fcrotum and tunica vaginalis, to be only two-thirds of the length of the tumor; and others have thought even that one half of this is fufficient. But the difference of pain between incifions of thefe different lengths is inconfiderable, and not to be regarded when compared with the effects which reufult " fult from them. When the incifion is carried the full length of the tumor, the operation will fucceed, perhaps, in every inftance, if the fubfequent part of the treatment meets with due attention; whereas, I have known various inftances of thefe partial openings being followed with a return of the difeafe.

" It is particularly proper to carry the in-" cifion of the tunica vaginalis down to " the most depending point of the tumor; " otherwife, in the first instance, the con-" tents of the fac will not be completely dif-" charged, while room will be given for col-" lections of matter during the cure. It is " alfo proper to remark, that, in making " this incifion of the fac, it ought to termi-" nate at fome diftance from the teftis; for " I have, in different inftances, observed, " where the vaginal coat has been divided " near to the tefficle, that the inflammation " was particularly fevere. The incifion " being completed, the tefticle, covered with " its

(xxx)

" its tunica albugina, is brought fully in " view. In fome inftances, the teftis pro-" trudes from the furrounding parts; in " which cafe, it fhould be immediately re-" placed, and covered as quickly as poffible " from the air; and if no part of the tunica " vaginalis is to be removed, the dreffing " may be finifhed directly on the fac being " opened.

"Unlefs the fac is difeafed, or fo much diftended as entirely to have loft its tone, no part of it, as I have obferved above, fhould be removed: but when hardened to the firmnefs of cartilage, as I have more than once feen, as, in this ftate, it is apt to excite pain when applied to the tender furface of the teftis, it ought to be removed; and as, in this ftate, it commonly feparates with eafe from the furrounding cellular fubftance, it is eafily and quickly cut away with a fcalpel or biftoury."

Thus far I think we have arrrived at nothing new or pleafant; but he proceeds, "Hitherto

(xxxi)

Hitherto we have been fuppofing that the difease is confined to one fide of the fcro-... tum; but, in some instances, as I have remarked above, we meet with a hydrocele in 66 " both fides at once. In this cafe, the com-" mon practice is, to do the operation twice " in all its parts, both in the fcrotum and " tunica vaginalis, by laying each collection " open, from top to bottom, by double inci-" fion. Some advife both operations to be " done at the fame time; but in general, " practitioners are afraid of too much in-" flammation being induced by this; fo that " one fide is commonly allowed to heal be-" fore the other is opened. In this manner, " the patient is exposed to delay, uncer-" tainty, and to the confinement the confe-" quence of two operations.

" This, however, is not neceffary, as the operation may be done on both fides at once, with little more pain, and fo far as I have feen, with no more hazard, than in the ufual method of doing them feparately. " The

(xxxii)

" The method in which I have done it is " this:

"After finishing the operation on one " fide, an opening is made into the vaginal " coat of the oppofite tefticle, at the upper " extremity, through the feptum fcroti; and " the incifion being carried down to the bot-" tom of the tumor, the cyft is thus equally " well laid open, the water is completely " evacuated, and the difeafe is not more " liable to return, than by doing the opera-" tion, in the ufual manner, and at different " times." There is indeed fomething very ingenious and novel in performing both operations at once by dividing the feptum fcroti; I must confess I never heard of it before, but fhould rather conceive that there would be fome difficulty in ftuffing the dreffings, which we shall find are afterwards recommended through the division of the feptum, and I fhould imagine it would greatly retard the healing of the other fide; fo that I cannot but fuspect that the patient would be moft

(xxxiii)

most feverely " exposed to delay, uncertainty, " and to the confinement the confequence " of two operations." However it is a mode of practice which I believe will not be often imitated.

Mr. Bell then goes on to fhew how the wound fhould be dreffed. "Whether the "hydrocele is double, or confined to one fide, as foon as the incifion is finished, if the teftis is found, the wound should be quickly dreffed; and, I think it right to obferve, that, on the manner in which this is done, much of the fuccess of the operation at all times depends, more indeed than is commonly imagined.

" If the vaginal coat is merely wrapped about the tefficle, without the interpofition of dreffings, or if the divided fides of it are immediately united with futures, as fome have advifed, partial adhefions are apt to take place, before a degree of inflammation is produced over the whole, fufficient for rendering the cure complete.

C

(xxxiv)

" In this manner, cavities are left, which " either fill with pus during the cure, and " require to be laid open, or they afterwards " give rife to collections of water, and thus " occasion a return of the difease, different " inftances of which have fallen within my " observation. And again, the practice of " ftuffing the cavity of the fore with dreff-" ings, is also a frequent cause of mischief. " By rubbing, or preffing upon the furface of " the teftis, fuch a degree of inflammation is " fometimes induced, as excites much pain, " inflammation, and fever. But this is al-" most always the fault of the operator; for, " in a great proportion of cafes, if the dreff-" ings are properly managed, no fymptoms " of violence ever occur.

" After having tried various ways of dreff" ing the parts, the method I have now long
" purfued, and which, in no inftance I have
" found to fail, is this: The tefficle being
" properly placed in the newly divided fac,
" two pieces of foft old linen, exactly the
" length

(XXXV)

" length of the cut, previoufly dipped in a " liniment of wax and oil, are by the help " of a probe, inferted to the bottom of the " fac, one on each fide of the tefticle, be-" tween it and the vaginal coat, care being " taken to leave a fufficient quantity of each " pledgit hanging out of the wound, to ad-" mit of its being eafily withdrawn at the " firft or fecond dreffing; otherwife, if the " fwelling, which afterwards takes place, " fhall be confiderable, they may, for fome " days, be entirely covered, and even at laft " removed with difficulty, as I have feen in " different inftances where this piece of at-" tention has been omitted.

" If the tefficle has pufhed forward, and " is with difficulty retained in its fituation, " as it will be *apt to flip out* between the " lips of the wound between one dreffing " and another, no means fhould be omitted " that can, with fafety, be employed for " preventing it, as it cannot afterwards be " fo eafily replaced; and, from want of at-C 2 " tention

(xxxvi)

" tention to this, I have known the tefficle " entirely extruded from the fcrotum, and, " in one inftance, from fufficient pains not being taken to replace it, the cure was " completed with the teftis in this fituation; " when, inftead of being covered with the " vaginal coat and fcrotum, it was covered " with fcarf fkin only.

"The beft method of preventing fuch a "misfortune, is, to draw the edges of the divided tunica vaginalis and fcrotum near-"ly together, after the teftis has been properly placed, and the pledgits of oiled linen inferted; and, in this fituation, to fecure them, either with a couple of futures, at proper diffances from each other, or with flips of plafter, fufficiently adhefive "for retaining them.

" This being done, the whole ferotum is covered with a large pledgit of faturnine cerate, or common wax ointment, by which the parts are kept much more foft and eafy, than when covered, in the ufual " way,

(xxxvii)

" way, with dry lint, at the fame time that " the dreffings are much more eafily re-" moved. A cufhion of foft tow, with a " proper comprefs, is placed over the pled-" git of ointment, and the whole are retained " by the T bandage, or common fufpenfory " bag. The patient is now carried to bed: " a quieting draught fhould be given; and " he fhould be enjoined to remain as much " as poffible in the fame pofture; for much " motion at this period certainly does mif-" chief.

"The intention of this operation being to "induce a moderate degree of inflammation "in the tunica vaginalis and furface of the "tefticle, if the pain, inflammation, and "fwelling, which, in fome degree, always fucceed, do not run to a great height, nothing is to be done for the first two or three days after the operation; but, when "thefe fymptoms become violent, and efpecially when much fever is induced, means "muft be employed to leffen or remove them."

(xxxviii)

In feveral parts of Mr. Bell's tract, as I have shewn, he appears thoroughly fensible that the adhefive inflammation is all that is required or is necessary : yet we find, after all this painful process of getting at the teftis, and the inflammation which must be brought on by handling and exposing it to the air, he thinks the adhefive inflammation is not to be trufted, but fears it may only take place in parts, and leave hollows which may reproduce the difeafe. On this account he thinks it neceffary to infert a foreign body between the coat and the teftis. Surely by this all idea of adhefive inflammation is given up, and fuppuration must be the confequence.

Mr. Bell proceeds in his account, p. 106, In most cases, the inflammation of the tefticle does not rife higher than it does in the fimple hernia humoralis from gonorrhœa; and it gradually substites as the suppuration advances. The abatement of the inflammation is also affisted by continuing " a cool

(xxxix)

" a cool diet, the occasional use of opiates, and keeping the belly open.

" Often in two days, and always by the " end of the third, I remove all the dreff-" ings, except the pledgits inferted between " the teftis and tunica vaginalis. This is " one important advantage we derive from " covering large fores with pledgits of oint-" ment. The dreffings are eafily removed " at any period; fo that, without waiting " for a plentiful fuppuration, as is com-" monly done, the patient may, at any time, " be relieved from that diffressful uneafiness, " of which all those complain, in whom the " first dreffings are feveral days in being " taken away. They are always rendered " ftiff and uncomfortable by the blood dif-" charged upon them after the operation; " and the matter at first fecreted being thin " and acrid, I have, in various instances, " feen, when the dreffings have not been re-" moved for fix or feven days, and in fome " cafes even in lefs, that the whole contigu-

" ous

(x1)

" ous parts have been efcoriated by the acri-"mony of the matter alone, and by which "more uneafinefs has been induced during "the courfe of the cure, than by any circumftance connected with the operation : "Nay, in fome, the inflammation induced "in this manner has an obvious influence on that of the tefficle, and tends to render "it much more fevere than it otherwife "would be.

" On fome occafions, at the first dreffing, and always at the fecond or third, the pledgits inferted between the tunica vaginalis and tefticle come away; and, whenever this happens, they fhould be renewed. It is alfo proper to renew them daily, for the first fourteen or fifteen days after the operation; not, however, of the fame depth as the first, as, during the latter part of the cure, it proves fufficient, if they are merely inferted fo far as to prevent the divided edges of the tunica vaginalis from adhering to the tefticle before the adhefive "procefs procefs has taken place in the parts more
deeply feated. To this point, I muft obferve, the moft particular attention is neceffary; for, when this mode of operating
fails, that is, when the difeafe returns, it
is, almoft in every inftance, from this precaution being overlooked."

In this place perhaps it would be not improper to make fome apology for introducing fuch long quotations. I can only fay, they appeared to me neceffary for the exposition of certain facts; and if quotations are made, lhey fhould be made fully and fairly. The passfages which have been transcribed need no comment, they fufficiently point out the tediousness, the pain, the hazard and diffiulty which attend on every part of this mode of cure.

After more directions and obfervations on the manner in which he conceives the cure performed, Mr. Bell concludes with faying, " In fome the cure is complete in three weeks, I have known it in lefs, while in " others

" others it runs on to the fourth, fifth, and " in a few cafes to the fixth week." Mr. Bell might have extended his latitude to fix months, which I have known employed in completing this method of cure, under two furgeons of established character in this country; but take it as it is defcribed with all its circumstances, and let any one contrast it with the fimple operation of throwing in an injection, which produces fometimes only a flight pain and irritation during a few minutes, and frequently never gives any trouble afterwards; and though the pain is fometimes rather more confiderable, it is always of fhort duration. The day after the operation, in general, the patient may get up, change his room, and often in ten days or a fortnight, be free from all confinement. In fhort, let any practitioner read the account of the incifion as given by one of its most fanguine admirers, and the cafes which are fubjoined of the cure by injection, which, confirmed by the practice of others, prove, that it is at least equal in certainty

(xliii)

certainty of producing a cure to the operation of incifion, or any other which has been recommended, and then let him determine which deferves the preference.

Here I would willingly conclude, and truft the decifion to what has been faid, but really Mr. Bell in the latter part of his book has introduced fuch affertions on the cure by injection, that it becomes abfolutely neceffary to take notice of them; I hope therefore not to be charged with unneceffary prolixity, if I make fome further comments.

After fome obfervations on the comparative advantages of the cauftic, feton, and fimple incifion. Mr. Bell fays, "I have feen all " the three produce troublefome fymptoms, " fuch as tenfion of the abdomen, inflam-" mation, and fever. But from much obfer-" vation, I can without hefitation fay that " the feton is more frequently productive of " thefe than either of the others."

Having adopted a better method, I do not ftand up for the excellence of the feton. It certainly

(xliv)

certainly produces more imflammation than is neceffary, but I do not think it liable to all the objections which Mr. Bell has brought againft it, particularly that it does not allow of the examination of the tefticle. I infift that when the water is let out the tefticle may be accurately examined, as well, and in my opinion much better, by the touch, than by the fight. I fhould be glad to be informed what appearance on in/pestion of the tunica albuginea, for that is all that can be feen, denotes the existence of fcirrhofity or difease, which cannot be afcertained by the tactus eruditus of an experienced furgeon.

Mr. Bell obferves, p. 119, "I have been " concerned in different cafes, where the " most experienced furgeons were at a loss " to determine the real nature of the difease; " that is, whether the fwelling in the fcro-" tum was a fimple hydrocele of the vaginal " coat, or an effusion into that bag produced " by a real farcocele. In all fuch cafes of " doubt, the furgeon should proceed as if " the " the tumor was a real farcocele. If, on " laying open the fwelling, the tefticle is found difeafed, that is, if it is in fuch a " ftate to require extirpation, it should be " removed immediately." I am forry to adrance any thing which appears fo directly opposite to Mr. Bell's directions, yet cannot nelp giving it as my decided opinion, that, in Ill fuch cafes of doubt, the furgeon should not proceed as if the tumor was a real farcoele, but should use such methods as often cemove a hardness which appears to be schircous. It is time enough to think of laying ppen and extirpating when every method has been tried to foften, and leffen the comlaint, and has failed. I have fucceeded in educing many enlarged teftes which have ween in a most critically doubtful state; which, if they had been exposed to examination by the view, I have not the finallest coubt it would have been thought neceffary o extirpate. It is further observed by Mr. Bell, that " In feveral inftances of this kind, 8

(xlv)

" where,

(xlvi)

"where, by different practitioners, a mere collection of water was expected without any other affection, the tefticle has been found to be fo much difeafed, as to render immediate extirpation proper. Now, if in fuch circumftances a cure had been attempted by the feton, the tefticle would have been allowed to remain expofed to the irritation produced by the cord, which probably would have induced very troublefome and even alarming fymptoms; for we know that every fymptom of a fcirrhous tumor, is uniformly rendered worfe by irritation."

In feveral inftances alfo where hydroceles have been complicated with an enlargement and hardnefs of the teftis which have had the appearance of fcirrhofity and have been deemed fcirrhous, I have made ufe of injection, and have cured the hydroceles without producing any alarming or even troublefome fymptoms, and afterwards the tefficle has become fofter and nearly of its natural fize. (xlvii)

In these cases I confess I would not have ventured to use the feton, incision, or any other remedy for the cure of the hydrocele, having no doubt but that the great degree of inflammation produced by contact or expofure would have aggravated the difeafe, and probably brought on irreparable mifchief; but the ease with which the injection operates emboldened me to try it; and now from repeated observation I can positively affert that the apparent scirrhofity which often accompanies hydroceles of long ftanding, is often nothing more than a thickness of the coats of the tefticle from long diftention, and an enlargement of the gland itfelf from preffure, which being removed, the parts become tthinner, fofter, and gradually affume nearly their natural state. This was the fact, which II deemed important, and which I prefume will be proved and elucidated by fome infances inferted among the fubjoined cafes.

Mr. Bell remarks, that " It fometimes " happens, as will be more particularly no-" ticed

(xlviii)

" ticed in the next fection, that a portion " of gut is contained in the upper part of a " hydrocele. Of this I have met with feveral " cales, in fome of which, no sufpicion was " entertained of it, till the fac was laid open, " although in two of them the water had " previoufly been drawn off with a trocar." I am really furprifed at the foregoing affertion, conceiving that any judge of the complaint could readily diftinguish by the feel if any thing were protruded from the abdomen; of which, if there be room for the smallest fuspicion, a lancet, as I before observed, will be the best instrument to be used, and a fuperficial fcratch may be made to determine the nature of the contents, which, if it prove fluid, may be fafely evacuated by paffing a probe through the opening, or rather a flender flat cannula, one of which I have caufed to be made for this purpose of a conical form, and terminating fufficiently fine to pass through a fmall aperture; when the bag is thus emptied and in a flaccid state, fuch a circumstance (xlix)

circumftance as a portion of inteftine coming down by the fide of the fpermatic procefs, must I should conceive be obvious to every one, in any degree acquainted with the natural state of these parts.

The laft objection which Mr. Bell makes to the feton is this, " In other inftances, " the water of a hydrocele is contained in " hydatids*; a circumftance which cannot " be difcovered previous to the opening of " the tumor: and as it will be readily ad-" mitted, that the method of cure by feton, " is ill fuited for difcharging hydatids, this " of itfelf is a material objection to the " practice. So that, although the feton, in " every other refpect, fhould be equally eli-" gible with the fimple incifion, which, for " the reafons formerly given, I think it is " not, yet the three laft objections I have

* "Thofe who doubt of the existence of hydatids in "cafes of hydrocele, as some have done, will find different instances of them recorded in Morgagni de causis et sedibus Morborum."

d

" adduced

(1)

No one will queftion the authority of fo refpectable an author as Morgani, but he is a recorder of curious and extraordinary facts; Had the complaint been frequent, it muft probably have come under Mr. Bell's immediate notice, and if fuch cafes had occurred in his practice it is to be prefumed that he would have produced them on his own authority. In upwards of thirty years experience, I do not recollect to have feen one cafe of the kind. From all which it is clear that the existence of hydatids in a hydrocele is fo very uncommon, that the objection which is made to the feton on this account appears to me not " material," but frivolous.

Mr. Bell then confiders the cure by cauftic, of which he fpeaks favourably, but ftill greatly prefers the incifion, on the fubject of which he again dilates. " I may farther mention " one important advantage of this operation " in addition to what I have faid of it, that " it " it may be confidered as an abfolute fecu-" rity against a return of the difease." Notwithstanding this position I feel myself obliged to fay that, according to my experience, the operation of incision is not always fuccessful; two instances of its failure will be related (Cases XIX and LIV) both of which were afterwards cured by injection.

As another argument in favour of incifion, Mr. Bell obferves, that " for thefe laft " twenty years fcarcely any cure has been " attempted through the greatest part or " perhaps the whole of Scotland but by in-" cifion." I cannot perceive what this is calculated to fhew, except it be the fource whence Mr. Bell's deep-rooted prejudice in its favour is derived. After bestowing many encomiums on the operation of incifion, Mr. Bell concludes with, " For my own " part I now confider it as a matter of " nearly the fame fimplicity as the treat-" ment of a common abfcefs in any part of " the body." This observation proves to d 2 what

what degree a man may be biaffed in favour of that which has once taken poffeffion of his mind, and yet, that it fhould fo quickly follow the defcription of the operation, and its confequences, is rather aftonifhing.

I muft prefume that the patients would be fenfible of a very material difference between the exposition of the tender coats of the tefticle, in the manner which has been related, and " the treatment of a common abfcefs." However I fincerely congratulate my countrymen in North Britain, that the candour and good fenfe of feveral practitioners in Edinburgh have led them to break through a prejudice and custom confirmed by twenty years practice, by making trial of what was propofed as an eafier cure; and I have received much pleasure from being informed that it has answered to their fatisfaction *.

* The observation of Dr. Duncan, in his preface to the last volume of his Medical Commentaries, is so strong a confirmation of what I have afferted concerning injections, and comes from such respectable authority, that I should be After touching lightly on Mr. Elfe's method of cure by the fmall cauftic, Mr. Bell proceeds to give his animadverfions on the cure by injection, and having ftated that it was formerly practifed, produces reafons why it came into difufe. " The injection either " excited fevere pain, on being firft thrown " in, and was fucceeded by violent inflam-" mation, and this, in fome, by diftrefsful " collections of matter; or the cure did not " prove permanent. In a few cafes, the dif-" eafe returned almost immediately, that is, " in the courfe of two or three weeks; but

be wanting to myfelf not to infert the paffage. "But be-"fides hypothefes ftill requiring further confirmation, the "reader will find in the prefent volume many important practices recommended on the folid balls of extensive "experience, which have not perhaps been hitherto adopted fo generally as they deferve; thefe it is unneceffary, and would perhaps be improper to particularize. We muft, however, be permitted to fay, that, in our opinion, the mode of operating in the hydrocele which has proved fo fuccefsful in the hands of Mr. Earle, caninot be too foon adopted by every practitioner who is anxious to confult the eafe and fafety of his patient."

d 3

" this was not frequent. For the most " part, the cure appeared to be complete, " and continued to be fo, till at fome diftant " period, to the great difappointment both " of the patient and furgeon, a recurrence " of the fwelling was obferved. In fome, " this happened in five or fix months; in " others, not till three or four years had " elapfed." Violent fymptoms are certainly likely to be caufed by violent remedies; but this cannot by any means apply to the injection recommended in my treatife, which is fo diluted as to produce a gentle irritation, and nothing more. No violent inflammation, no distressful collections of matter ever take place after the use of it; of these truths abundant proofs may be collected from the cafes which I have produced, and from the practice of others.

With regard to the return of the hydrocele, it is allowed that if not cured it certainly will return; but Mr. Bell must know that the return is evident in *a very fort time*,

as

as is always the cafe after the palliative cure. But if any one ignorant of the nature of the difease should object to this, and fay duration of time is neceffary for the confirmation of the cure, I answer that cases of this private mature can very feldom be brought forward, lbut that proofs of cure are as readily to be produced after the injection as after any other operation for the fame purpose; and if it were neceffary, I could quote fome of those on whom I first practised this method. Particularly I am at liberty to mention the gentleman alluded to in Cafe No. 2, on whom iit was performed in 1787, whom I have frequently the pleasure of seeing; and instances cof many others I could produce of an early date, who continue perfectly well. Mr. Bell's observation, that " In hospital practice pa-"tients are feldom heard of after being dif-" miffed," I cannot help thinking erroneous and nugatory, because if they were not cured they certainly would apply again, as they continually do after the palliative cure.

Of

Of all those on whom I have performed the radical cure by injection none have returned with a reaccumulation of water on the fame fide, though fome have applied with a new hydrocele on the other fide, and many for other complaints, by which means I have had frequent opportunities of examining the feat of their former disease. But these inftances of duration are wholly unneceffary, becaufe every one knows, who knows any thing of the fubject, that if the cure of a hydrocele is incomplete, the water begins to collect immediately. I am well grounded in afferting that, in general, if it does not fhew itfelf in three weeks, or fooner, provided the distention arising from the operation has fubfided, there remains no doubt of the cure being complete. Nothing can be more fimple than the explanation of this fact; either the cavity which held the fluid is closed by the operation, or it is not; if the means employed to produce the adhefive inflammation have been partial, or infufficient for the purpofe,

8

(lvii)

pofe, and confequently a cavity ftill remains, there is nothing to prevent a reaccumulation of fluid; but this muft happen immediately, or not at all, becaufe, if the adhefions have taken place, and are fufficient to prevent the return of the fluid in the firft inftance, the additional ftrength and firmnefs, which they are continually acquiring, muft prove an effectual barrier againft any future collection.

Mr. Bell's affertion therefore, page 153, " that although in many a complete cure is " obtained (by injection), the difeafe returns " early, that is in the fpace of a few weeks " in a ninth or tenth part of all on whom " the operation is performed, and in five of " eight or nine at fome uncertain period in " future," I must take the liberty positively to contradict; and however harsh my comment on this passage may appear, truth obliges me to affirm that it is contrary to the nature of the difease, diametrically opposite to what can be proved, and, fo far as I am authorifed

(lviii)

authorifed by my own practice to affert, abfolutely without foundation.

Mr. Bell then gives an account of the method of injecting nearly as defcribed in my treatife, but I must observe that in my opinion he has made an alteration greatly to the difadvantage of the operation by introducing a flat trocar instead of the round one which I have recommended. The flat trocars, I mean those which have the split cannula, are particularly improper in these cafes, as their stilets, or cutting points, being rather larger than their cannulæ, the opening they make will not confine the injection, but fuffers it to trickle down by the fides of the cannulæ; but, without exception, I think all flat trocars are bad for this purpofe, as a division being made by the cutting fides of the stilets to make way for their cannulæ, when they are withdrawn the cannulæ are unconfined, and liable to conftant motion; whereas the round cannula which follows a fimple puncture, being firmly embraced by the opening in the fcrotum

tum and tunica vaginalis, maintains its fituation properly and fteadily, and fuffers none of the injection to efcape. I have more than once, as will be noticed, (Cafes XLVIII, XLIX, and L) known the operation not fucceed from the use of the flat trocar, and think it must be very liable to fail from that cause.

Mr. Bell alfo, though he fo much difapproves of the operation, has given an elegant plate of the elastic bag and stop-cock as recommended in my treatife. Plates are ornamental to a work, otherwife fo fimple a machine perhaps might have been described lby words; but I must take this opportunity of observing, that I have long fince discontinued the use of the flop-cock, as, not being well able to fpare a hand during the operattion, to turn it, I found it awkward and embarraffing. A pipe, one end of which is made to fit into the cannula of a trocar, the other adapted to receive the neck of an elastic bottle, with a valve or ball in the center of the pipe to permit the entrance and

prevent

prevent the exit of the injection, will be found infinitely more convenient and useful.

Perhaps if Mr. Bell had beftowed a little more confideration on the fubject, or had made any trial of the inftrument, which he has thought proper to delineate, he would have difcovered the inconvenience of it, as I have done; but thus it frequently happens that practical defects are handed down, and placed out of the reach of their original authors, to rectify or amend; for there is an error to which compilers of fyftems are too often liable, that while eagerly engaged in collecting and appropriating the thoughts of others, they fometimes forget to think for themfelves.
