Call No.	V

PREFACE.

ARNOLD & SONS, in presenting to the Profession the revised edition of their Illustrated Catalogue of Veterinary Instruments, take the opportunity of tendering their thanks for the liberal support they have received during upwards of *half a century*, and trust by still continuing to produce instruments, etc., of the newest construction, best quality, and highest finish, to merit a continuance of that patronage hitherto accorded them.

Only the best and most experienced workmen are employed in Arnold & Sons' Factory, and every instrument so manufactured is examined personally by one of the firm, thus enabling them to guarantee the quality of every article purchased.

**Quality
guaranteed.**

To meet the rapid development of their business, Messrs. Arnold & Sons have been compelled to enlarge their premises; they are, therefore, now enabled to keep in stock an extensive assortment of modern instruments of every description, so that orders can be executed without delay.

**Increase of
business.**

The prices affixed are extremely moderate, taking into account the superior workmanship, and will bear favourable comparison with other published lists.

Prices.

Orders from abroad must either be accompanied by a remittance or an order for payment in London, and Arnold & Sons request that when orders are sent through an agent, it be distinctly stated that the instruments are to be obtained direct from them, as

Orders.

many articles of inferior quality are frequently sold and represented as their manufacture.

Commissions. For the convenience of customers abroad, Arnold & Sons will procure any articles that may be required. Having a thorough knowledge of the best markets, they can purchase on advantageous terms, charging only the actual manufacturer's price for the same, thus enabling all requirements to be included under one indent.

References. Satisfactory London references required previous to opening new accounts. Cheques to be crossed Bank of England, and Post Office Orders to be made payable at Chief Office.

Cash Terms. Five per cent. allowed on cash payments, provided a draft for the amount accompanies the order.

Delivery in England. Orders of £1 and upwards will be delivered *carriage paid*.

Delivery Abroad. Orders of £5 and upwards. Goods are packed in tin-lined cases and delivered *freightage free*, provided a draft for the amount accompanies the order. A great saving will thus be effected, for customers will be able to order *direct* from us, instead of having to pay excessive local prices for very inferior instruments.

Freight. When carriage or freightage is paid by us, no discount can be allowed.

Genuineness. Every instrument is stamped *Arnold & Sons, London*.

35, 36, AND 37, WEST SMITHFIELD, LONDON, E.C.

January, 1886.

Fig. 4.

Portable Clyster Pump, Brass (Winton's), with pipes
for horse, foal, sheep, etc., with india-rubber tubing,
in leather case, complete, Fig. 4 £2 0 0

Extract from *Veterinary Journal*, April 1881:—"Messrs. Arnold, of West Smithfield, have made for me a very compact and handy little enema pump, and thinking it may prove a great boon to some of my professional brethren in the country who ride, I take the present opportunity of drawing their attention to it. It is easily carried in the coat-pocket, the flexible pipe being carried over the shoulder under the coat or vest (where, by-the-by, one should always carry the male catheter). Instead of using a stable pail I get a man to hold a hand-bowl or jug, which is much more handy. Many of my best clients, knowing my objection to carry my old-fashioned and cumbersome instrument when riding, used to ask me whether I had brought my piano to-day. The present instrument bears about the same comparison to the old one as a revolver pistol does to an old blunderbuss. One can fill the gut in a few minutes with the new instrument, and I have always found in cases of stoppage that the lower bowel is more irritable, and retains an enema slowly injected (and the gut only half or three-fourths full) much better than when thrown in quickly. The last, but not least, of its virtues is its cost, which is only about two guineas. It might be greatly improved in appearance by being well plated. Please accept my apology for trespassing so far on your valuable space.—I have the honour to be, sir,

"Yours faithfully,

"D. WINTON, V.S."

Rectum Tube (Smith's), with mount to connect with enema tube ...	1	5	0

F. SMITH, V.S., 12th Royal Lancers, writes:—"This is of priceless value in cases of constipation depending upon an accumulation of fæces, or any other obstruction in the single or double colon."

Extract from *Quarterly Journal of Veterinary Science in India*, July 1883:—"I accordingly sent Messrs. Arnold a description of the tube I required. It was to be six feet in length, made of gum elastic, the same calibre as the ordinary Read's enema tubing, and was to fasten on to this tubing when the ordinary wooden nozzle was unscrewed; its extremity was to be round and perforated. Messrs. Arnold sent me the exact article, which I have no hesitation in saying saved the life of the horse whose case I have just detailed."

DISSECTING INSTRUMENTS.

ARNOLD & SONS LONDON

Fig. 29.

Dissecting Instruments, in mahogany case, polished inside, Fig. 29, containing—

- Four Scalpels, in ebony handles.
- One pair Scissors.
- Dissecting Forceps.
- Blowpipe, German Silver.
- Set of Chain Hooks.

The above set, complete	£0	16	0
Ditto	ditto	in ivory handles	0	18	6

ARNOLD & SONS LONDON

Fig. 30.

Superior Dissecting Instruments, in mahogany case, polished throughout, Fig. 30, containing—

- Six Scalpels, in ebony handles.
- One pair Large Dissecting Scissors.
- One pair Small ditto.
- Dissecting Forceps, Large.
- Blowpipe, German Silver.
- Set of Chain Hooks.

The above set, complete	1	1	0
Ditto	ditto	in ivory handles	1	5	0

Complete set of Dissecting Instruments, in mahogany case, and polished throughout, containing—

Six Scalpels, in ebony handles.
 Large pair best Dissecting Scissors.
 Small ditto ditto
 Pair of Spring Forceps.
 Improved Blowpipe (Nicholls's).
 Improved Dissecting Hooks (Thomas's).

The above set, complete	£1 11 6
Ditto ditto in ivory handles	1 15 0

Blowpipe, German Silver...	0 1 6
Ditto improved (Keetley's)	0 3 0
Ditto and Stilette (Nicholls's)	0 3 6

Extract from the *Lancet*, January 21st, 1871 :—"The blowpipe now in use is continually getting blocked up in consequence of the necessity of having to thrust it through animal tissues."

Extract from the *British Medical Journal*, March 4th, 1871 :—"An improved form of blowpipe for dissecting purposes has been devised by Mr. Nicholls, and is manufactured by Messrs. Arnold & Sons, of West Smithfield. The instrument, if not used for dissection, may be employed as an ordinary trocar and canula."

HOBBLES, SLINGS, ETC.

NOTE.—Arnold & Sons have made the manufacture of Hobbles a spécialité; the leather work and furniture are of the best description, made by experienced workmen on the premises. The chains are tested and stamped with the test mark.

Fig. 32.

Fig. 33.

Hobbles (Arnold & Sons' latest improvement), by which the horse is set at liberty by simply removing the screw, free from the hobbles at pleasure, Fig. 32 ...	£5	0	0
Ditto with cross hobbles, complete, with double swivels (Sheather's), Figs. 33 and 34 ...	6	6	0
Ditto for castrating, improved ...	2	2	0

Extract from *Veterinarian*, December 1877 :—"The simplicity with which this arrangement of the hobbles can be used, with the assistance of people who do not understand them, is an additional advantage. In conclusion, I may say that

Messrs. Arnold & Sons have kindly arranged me a set of well-lined hobbles on this plan, and I have thoroughly tested them, and can advise their construction to the profession as being safe and easily used."

Fig. 38.

Horse Slings, with blocks, tackle, etc., made extra strong,								
... very superior, Fig. 38	£6	6	0	
Ditto ditto plain pattern	4	4	0	

Extract from Percival's "Hippopathology":—"The simplest mode of slinging a horse, and that which annoys him the least, at the same time that it affords him every opportunity of reposing himself that such a situation can, is to suspend him from a cross-beam by means of ropes and pulleys, connected with a very broad piece of sailcloth, spread underneath the animal's belly, which should be furnished with two breechings and two breast-girths (all broad and padded), in order to keep him from slipping out, either backwards or forwards. The ropes and pulleys (being a similar sort of apparatus to what sailors use for raising weights on board of ship) enable us to elevate or lower the animal at pleasure. In general it is not advisable to lift him quite off the ground. I have usually found my patient quietest and most at his ease when his feet have been suffered to touch the surface. At the same time, his head should be confined with two collar reins or ropes of considerable strength, and the head-stall itself should be well padded. Though horses in such strange situations may kick and plunge about a good deal at first, in general they are not long in becoming resigned to their trammels, and then turn altogether as quiet. The woodcut will serve to convey sufficient notion of what this slinging or suspensory apparatus should consist, as well as of its mode of application, to enable any person to fit up tackle of the kind. The additional breeching and breast-girth attached to the rings upon the sides of the belly-cloth will be found to contribute much to the comfort as well as security of the animal. The padded strap, or web, carried over the hind part of the neck, will prove serviceable in preventing the breast-girths from slipping down."

Fig. 42.

Écraseur, with wire (Arnold & Sons' improved), as recommended by Dr. Fleming, Fig. 42	3	3	0
---	--------	---	---	---

Extract from *Veterinary Journal*, December 1881 :—" I cannot speak too highly of my first trial of the single steel-wire écraseur. Without it operation in this case could not have been ventured upon, and the manner in which it cut through tissue that nothing but a chisel could have touched, but which it would have been the height of folly to have tried, was something marvellous. It can certainly be

commended, not only as by far the best polyptome in existence, but also for the removal of all dense tumours, supernumerary digits, limbs, etc., where the chain écraseur would be either too thick, not sufficiently strong, or, from its too great flexibility, not capable of being passed into a narrow canal."

Fig. 43.

Écraseur (Buckingham's), extra large, Fig. 43	£4	4	0
Ditto (Arnold & Sons'), straight or curved	3	3	0
Ditto for removing small tumours, etc.	2	2	0

Fig. 63.

Caustic Clam, screw (Metherell's), for castrating Bulls,
Rams, etc., Fig. 63 £0 15 0

Extract from *Veterinary Journal*, April 1881 :—"This instrument consists of the ordinary caustic clams, but with a strong hinge at one end instead of being tied with string ; and at the other two holes are drilled for a small screw to work through. When one or both cords are enclosed in the clams, intense pressure is brought to bear upon the parts by means of the screw, enabling the operator, without assistance, to tie the clams prior to removing the screw ; whereas, in the old way, an assistant had to close the clams upon the cord with a pair of pincers, and so hold on tight until both ends of the clams were tied, which mode is far from satisfactory, as well as being clumsy and unscientific."

DOCKING INSTRUMENTS, ETC.

Fig. 114.

Docking Machine (McKenny's improved), patented, Fig. 114	2	2	0
---	-----	-----	-----	-----	-----	-----	---	---	---

The advantages claimed for this machine are :—

- 1st.—A forward motion is given to the knife by a slot made in the blade, moving on a fixed pin, thus giving a shearing cut instead of the squeezing effect of an ordinary docker.
- 2nd.—Great ease in use, performing the operation rapidly, and with less exertion.
- 3rd.—Less pain to the animal.

Thermo-Cautery (Pritchard's improved), with special platina instruments for firing, etc., complete, in case, Fig. 138 ... 7 10 0

Extract from *Veterinary Journal*, February 1880:—"Although Professor Pritchard recently brought this instrument before the notice of the Midland Counties Veterinary Medical Association, I think it may not be considered out of place to refer to this apparatus again, as the actual cautery is so frequently resorted to by veterinary surgeons."

TRACHEOTOMY INSTRUMENTS.

Fig. 139.

Intra Tracheal Syringe, for the injection of medicines into the trachea, with patent oil plunger and two needles, in morocco leather case, complete, Fig. 139 ... £1 7 6

Extract from *The Veterinarian*, February 1885 :—"It is pretty well known to country practitioners how deadly are the ravages of these strongyles when the disease which they induce is allowed to go unchecked. As many as thirty or forty per cent. of lambs will die, to say nothing of loss of condition, if no treatment is adopted ; and I have known eight calves perish out of a herd of twelve from the same cause. The disease, too, is pretty widely distributed, being general over England in the case of calves ; and in certain seasons the counties of Norfolk, Lincolnshire, Cambridgeshire, Cornwall, Devonshire, and some parts of Somerset suffer greatly from the *Strongylus filaria* in the lambs."

Extract from the *Veterinary Journal*, February 1885 :—"Acting on this suggestion, I have treated a large number of calves in the same way, and in almost every case with success ; instead of Tr. opii, however, I have substituted chloroform, ʒss, which I know to be a deadly parasiticide. The operation is very simple and easy to perform. I have procured a large syringe for the purpose from Messrs. Arnold & Sons, the needle of which I introduce about midway down the cervical portion of the trachea, without regard to an inter-annular space, and inject the fluid slowly. The exhalation of the turpentine can at once be detected at the nostril. The animal appears to suffer no inconvenience beyond a slight cough. So far, I have not found it necessary to repeat the operation, although some of my cases were apparently suffering from advanced broncho-pneumonia."

Extract from *The Veterinarian*, March 1885 :—"For the purpose of carrying out the system of intra-tracheal injection of remedies (especially in the treatment of lung-worm), Messrs. Arnold & Sons have constructed a form of syringe (see illustration) which seems to us to be perfectly well adapted for the purpose."

TOOTH INSTRUMENTS.

Fig. 157.

Tooth Forceps, large, for molars (Gowing's), Fig. 157 £3 3 0

Fig. 158.

Tooth Forceps, with lever (Santy's), Fig. 158 2 2 0

Extract from *Veterinary Journal*, September 1879 :—"As many have told me they have not attempted to extract the molar teeth of the horse, especially those posteriorly situated, I had the pleasure of demonstrating the method and the instrument (a drawing of which I send ; the instrument may now be had of Messrs. Arnold) before the members of the Norfolk and Eastern Counties Veterinary Medical Association, at their last meeting. To demonstrate the way of performing certain operations is often difficult, but to describe it is, in my opinion, much more so, though in this case my task is comparatively an easy one, as the whole business is very simple. The animal being cast, I use Professor Varnell's balling iron to extend the jaws, and have an assistant to hold the tongue, while another, with a long smooth iron, pushes the cheek out of the way, and make quite sure that I get my forceps on the right tooth, and that only ; when this is done I give a slight rotatory motion, then place my lever on the anterior tooth, immediately under the rivet of the forceps, and raise the tooth, which must come. When I know the tooth is loosened—which I can tell by a peculiar sucking noise—I take a fresh hold of it a little lower down, and incline it slightly to the inside, at the same time raising it—then out it comes without any injury to the jaw. In no case have I found injury at the time or afterwards to the anterior tooth from the pressure of the lever. I can extract the longest molars, and frequently the fifth one, without breaking a fang, and have seen Mr. Whitwell, my late partner, extract the sixth. I do nothing to the jaw subsequently, and merely order soft, nutritious food for the patient. I never saw anything but good results follow the operation. The instrument is an improvement on one invented by my predecessor, Mr. T. Wells, M.R.C.V.S., Norwich, and used by him successfully for a number of years."

Dental Incisor (Edgar's), Fig. 169	3	3	0
------------------------------------	-----	-----	-----	---	---	---

Extract from *Veterinary Journal*, February 1883:—"Its action is most humane, the operation being, so far as I have been able to form an opinion by the quietude of my patients, perfectly painless. There is no risk—as with the shears—of cutting the buccal membrane, or gingivæ, in excising a posterior molar. In this case, if the mouth, from the extreme length of the tooth, cannot be sufficiently opened with an ordinary mouth-iron, the leather mouth-expander should be used. The incisor is manufactured by Messrs. Arnold & Sons, West Smithfield, London."

SUTURE NEEDLES, WIRE, SILK, ETC.

Fig. 190.

Suture Instrument (Russell's), in leather case, complete,
 Fig. 190 £1 15 0

Extract from *Veterinary Journal*, January 1881 :—"The accompanying suture can be advantageously used in the place of wire, skewers, or string, in all deep-seated wounds where a deep suture is required to keep parts in apposition, and to prevent superficial sutures from being torn out, also to prevent protrusion or prolapsus of the vagina or uterus in herniæ of various kinds, etc. Some of the advantages of this suture are that it does not tear out ; if parts swell, it can be loosened, and when the swelling abates it can be tightened up again. It is easily and readily adjusted. It remains nicely as placed, looks what it is, and gives general satisfaction. When required for use, all that it is necessary to do is to put one of the 'plates,' with the bevelled edge inwards, over one end, and behind that a thumb-screw, and on the other end screw on the trocar point. Then push it through the parts, remove the point, and add a plate and thumb-screw as on the other end ; then screw up the thumb-screw as tight as necessary. I have had them made up in four pairs, measuring 3½, 5, 6½, and 8 inches long respectively. They are made of steel wire, about $\frac{3}{16}$ inch in thickness, slightly curved. At each end of the wire a deep thread is cut, upon which fit a trocar point on one end and a plate and thumb-screw on the other. For the requirements of the various sutures, plates of metal of different lengths are provided—viz., four plates with one hole in the centre of each, and two plates with two holes for a double suture ; the former are about 2 inches long, the latter 3¾ inches, the holes being from an inch to an inch and a half apart in the latter. The inside edges of all these plates are bevelled off to prevent undue pressure or cutting. There are two trocar points with each set of sutures, which screw on either end of the wires, and four thumb-screws, also interchangeable. The plates are made of steel, the nuts of brass, but all the parts are nickel-plated, to prevent rust or corrosion. The sets are neatly mounted in a case—viz., four pairs of sutures of different lengths, two trocar points, six plates, and four screw-nuts."

ARNOLD & SONS LONDON

Fig. 191.

Suture Instrument, patented, for approximating the
 edges of wounds (MacMunn's), Fig. 191. Box
 containing one dozen assorted sizes, nickel-plated,
 with corks, complete 0 6 0

Extract from *Veterinarian*, November 1884 :—"I submit to the notice of the profession a form of suture which, in my opinion, would be very useful, and might in certain cases and in certain situations supersede with advantage the ordinary means of approximating the edges of wounds. I am not aware that such a contrivance has been used before, although the age of the thread suture and the absence of recent attempts to modify its principles of fixation would seem to indicate that it has reached the stage when modification is unnecessary and impossible. Nevertheless, the suture is objectionable in ways which will immediately suggest themselves to any one who reflects for an instant on its application. It fails to approximate the walls of a wound in a desirable manner, only too often bringing into contact the limited superficial portions of the tissues corresponding to where the threads are inserted, and leaving the deep parts unapproximated. There is a circular constriction, which frequently leads to ulceration and strangulation of the tissues enclosed within it, and thus to uselessness of the suture ; while this defect is not at all times caused by a too tight application, but is indirectly owing to the smallness of the body which bears the strain of the tissues. The suture acts as a foreign body in the wound, and causes those conditions which are known to prevent early union. These are not imaginary objections, but based on experience. I would suggest the following form of suture as fulfilling indications not met by the ordinary interrupted suture, and being at the same time easy of application. These sutures may be very readily introduced by a torsion forceps, which is made to grasp the V-shaped bend, while the fingers of the left hand approximate the edges of the wound, after which, if the wound is not thoroughly closed, the wire may be clamped at the bend and the points brought closer together, with or without being held by a thread or a piece of cork fastened on them. A piece of folded lint may then be applied under the bend to afford support to the wound. The sutures may be introduced either in the long axis of the wound—which is preferable—or across it, when a foreign body would of course be present. These sutures may be had of various thicknesses, size, and curves, hardened lancet-shaped point, manufactured by Messrs. Arnold, of Smithfield."

 roughed inside, sharp hook, blunt hook roughed in-
 side, oval ring, hook with single and double spears
 to adjust with screws, curved knife, and small and
 large beech pessaries, etc. (Cooper's)

Fig. 220.

Embryotomy Knife (Cole's), Fig. 220 £0 7 6

Extract from *Veterinary Journal*, June 1883 :—"The annexed woodcut represents a new form of embryotomy knife, and its advantages are—1st. It can be effectually used with the hand and arm in a straight position, whereas with the ordinary slide knife the wrist must be somewhat bent in order to bring the cutting edge to bear. This, in a constricted passage, is always difficult, and sometimes well-nigh impossible. It is particularly useful in making the longitudinal incision in the skin, previous to the removal of a fore limb. 2nd. The *perfect safety*, as, should the animal struggle or suddenly drop, the instant the operator leaves off using it the cutting edge disappears. It is manufactured by Messrs. Arnold & Sons, of London."

Embryotomy Chain Saw (Hoole's), Fig. 226	£1 15 0
Ditto ditto and Sector, both fitting same handle (Hoole's), complete, Figs. 225 and 226	3 3 0

Extract from *Veterinarian* and *Veterinary Journal*, March 1879 :—"Sir,—Since my communication advocating the use of the chain saw and chain sector in the operation of embryotomy, Messrs. Arnold & Sons have kindly made for me the above instruments. I have been waiting for an opportunity to give them a practical trial, but a case requiring their use not having occurred, I have tried them on foetal calves, *ex utero*, and am fully convinced, from the ease and rapidity with which the neck was cut through, and the fore and hind limbs detached, that some of the greatest difficulties met with in obstetric practice will now be easily overcome.

"I remain, yours respectfully,
"J. HOOLE."

Shoeing Pads for stopping horses' feet (Cherry's patent),
 Fig. 268 per pair 0 2 6

Arnold & Sons have purchased Cherry's Machinery for making these Patent Pads.

Shoeing Pads, india-rubber (Downie & Harris's patent).

Prices, per set of four Pads:—

No. 0, 6s.; No. 1, 7s.; No. 2, 7s. 6d.; No. 3, 8s. 6d.; No. 4, 9s.;
 No. 5, 10s.; No. 6, 11s.; No. 7, 12s.

Frog Pad or Sole, Price per pair :—

No. 1, 3s. ; No. 2, 3s. 6d. ; No. 3, 3s. 9d. ; No. 4, 4s. ; No. 5, 4s. 3d. ;
No. 6, 4s. 6d. ; No. 7, 4s. 9d.

These are generally used for fore-feet only.

These pads (or cushions) are moulded in *soft rubber* to fit into the *frog* of the *horse's foot*, and *under the iron shoe*. They prevent lameness in *horses* by affording an elastic support and protection to the frog and foot, diminishing concussion, and thereby assisting those parts to perform more freely their natural functions.

				per doz.			

Fig. 278.

Shoe, with hole punched as a pattern for the farrier, Fig. 278	0	1	0
---	-----	-----	-----	-----	-----	-----	---	---	---

The above Woodcuts are the exact sizes of the Frost Cogs suitable for light work.

Extract from "Practical Horse-Shoeing," p. 114.—"This merely consists of a square piece of steel, about the same length as the screw-stud, which is pointed and tempered at one end (that which comes into contact with the ground or ice), and flat at the other end. This fits into a similar-shaped hole at the extremity of each branch of the shoe, and, if thought necessary, in the middle or at each side of the toe. This hole should be very slightly tapering from the lower to the upper (or foot) surface, and it should be of such a size that the square stud will require a

slight tap or two to make it fit in tightly, yet without projecting at all beyond the level of the foot-surface of the shoe. I was at first in doubt as to whether the studs would remain in during work, or while the horse was standing in the stable; but, to my surprise, they were firmly retained in the shoes for a month, though subjected to every kind of test except on ice, which the season has not afforded. A few blows on each side are sufficient to slacken them when they require to be removed as no longer necessary, when worn out, or when they require to be re-sharpened. The weight of the horse evidently keeps them tightly fixed in the shoe, and, from their being of the same thickness throughout, there is little risk of their breaking. It would be advisable, I think, to have the shoes a little thicker and broader at the places where the holes are to be made. I anticipate that this mode of rendering all kinds of horses efficient during frost will be found eminently successful and very inexpensive, and one readily carried out anywhere in a very short time."

Extract of Letter received from S. J. SOUTHEY, Esq., The Firs, Wretham.

"I have used your 'Frost Cogs' for the last five years with the greatest satisfaction, and without losing a single one, and can strongly recommend them as the best and simplest means of roughing horses."

Extract of Letter received from C. T. S. BIRCH-REYNARDSON, Esq., Holywell Hall, Stamford.

"The 'Frost Cogs' that I had from you last year answered so well, that I should be glad if you would be so good as to send me a few of your circulars and drawings of the shoes, cogs, punches, etc., etc., and I only hope that they may be the means of opening people's eyes to a very simple way of keeping their horses on their legs, and from breaking their knees, and perhaps their owners' necks, in frosty weather."

Extract of Letter received from W. B. HULTON, Esq., Hulton Park, Bolton-le-Moors.

"I purchased from you last winter some small cogs and two punches, for a pony, with which I am well pleased, and shall now be obliged if you will send me about four dozen cogs and pair of punches, suitable for full-sized carriage-horses, 16.1 hands."

Extract of Letter received from THOMAS BLAND GARLAND, Esq., Hillfields, Reading.

"Please to send me six dozen by post to-morrow, exactly like these. I used them last winter, and several times this winter, for carriage work, two in the heels of each shoe, and have only lost one cog, from, I believe, a defect in punching the hole."

The above cogs are all hand-made, and of the very best steel, filed perfectly square to fit accurately, and are properly hardened and tempered.

The above Woodcuts are the exact sizes of the Frost Cogs.

TRUSSES FOR THOROPIN, BOG SPAVIN, PROLAPSUS, UMBILICAL HERNIA, ETC.

Fig. 279.

Thoropin Truss (Arnold & Sons' improved), pads and straps covered with felt, Fig. 279 1 1 0

This truss supersedes firing, blistering, and the necessity of turning out, as the animal may be kept at gentle work.

DIRECTIONS FOR APPLYING THE TRUSS.

Place the pads on each bursal enlargement, the pad with the studs in it on the outside of the limb; pass one strap round *above* the hock, and fasten on to the stud in the pad outside, and the other strap *below* the hock in like manner. When first commencing treatment, be careful it is not worn too long at a time (not more than about two or three hours), gradually increasing the action daily.

ASPIRATORS.

Fig. 284.

Aspirator (Fleming's), with needles, etc., complete in mahogany case, Fig. 284 £7 7 0

Extract from *Proceedings of the British National Veterinary Congress* :—" Mr. Fleming said : Messrs. Arnold have listened to my propositions in regard to improvements in the aspirator, with a view to using the instrument without much injury to the animal. The action of the instrument, and the method of using it, are of the simplest character. You have a pump which exhausts the air of the vessel, and you pump the air out of the vessel ; there is then a vacuum, and you perform your operation. If the skin is tender, you leave it tight, and cut it with a small pair of scissors, and then gradually pass the sharp point into the cavity. By turning the stop catch the pus is sucked out. You empty your bottle, use your pump again to make a vacuum, and so go on. I wish this instrument were more generally known in our practice. I think where you have extreme distension of bursæ or capsules of joints you have more chance of saving your patient with this than with the ordinary means. It is not so barbarous as using more ordinary means. I think it is well worthy your attention."

CLINICAL THERMOMETERS, ETC.

Arnold & Sons have succeeded in producing Clinical Thermometers with sensitive bulbs, thereby effecting a great saving of time in registering temperature.

Notice.—The greatest care is taken in packing these delicate instruments; from their fragile nature, they are easily broken; therefore it must be distinctly understood that we do not hold ourselves in any way responsible for damage sustained in transit.

Ditto ditto in German silver case	0	11	6
Ditto ditto in aluminium case ...	0	10	6

Any of the above can be divided with Centigrade scale in addition at an extra cost of 0 2 6

Arnold & Sons guarantee the accuracy of every Thermometer, tested by a New Apparatus invented by themselves expressly for that purpose, and which has been verified at Kew.

The woodcut A shows the thermometer with case attached; C, the instrument without the case; and B, the thermometer when closed.

Extract from *Lancet* (Second Notice), December 19th, 1874:—"Of all the pocket companions now essential to the practitioner, none is more indispensable than a good Thermometer. It is a gratifying circumstance to find instrument-makers taking pains to make the instrument more useful by making it more reliable and more easy of use. The Messrs. Arnold & Sons have attempted to make the scale more legible by colouring it red and indelibly, and the attempt has been successful. The instruments also have been carefully tested as to accuracy."

Fig. 294.

Extract from *Medical Times and Gazette* (Second Notice), February 27th, 1875.—“One of the latest and best forms of this useful instrument has been forwarded to us by Messrs. Arnold & Sons, of 35 and 36, West Smithfield.”

Extract from *British Medical Journal* (Second Notice), May 15th, 1874 :—“Messrs. Arnold & Sons have improved their Clinical Thermometers. The scale is indelible ; the one we have examined is *very accurate*, and they are all carefully adjusted ; it is an extremely neat and useful form of instrument.”

Extract from *Lancet*, May 10th, 1873 :—“It will at once be seen that by a very simple arrangement a thermometer of $3\frac{1}{2}$ in. long can instantly be increased to one of 7 in. in length, and at the same time when closed can be carried in the waistcoat pocket, and is less cumbersome than a common pencil-case.”

Extract from *British Medical Journal*, June 7th, 1873 :—“This is certainly a most ingenious instrument, and one of the best hitherto brought out. It is very simple and portable, and mechanical means are taken which very much reduce its chances of being broken.”

Extract from *Medical Times and Gazette*, May 24th, 1873 :—“To the end of the thermometer is secured part of the case, which mount is so formed that the instrument is not liable to slip through the fingers and thereby get broken.”

Extract from *Medical Record*, June 25th, 1873 :—“The great desideratum of furnishing a really good Pocket Clinical Thermometer has been secured by a very ingenious device patented by Messrs. Arnold & Sons. We have used it, and can recommend it as trustworthy, portable, and very convenient.”

Extract from *Students' Journal*, April 24th, 1875 :—“The colouring has the merit of being indelible. Those who use these thermometers may rely on their accuracy, as they are all tested by a New Standard Thermometer.”

Extract from the *Medical Press and Circular*, June 4th, 1873 :—“In the ordinary thermometer cases the instruments are constantly being broken, whereas in the thermometer referred to this is almost a matter of impossibility.”

Extract from *Students' Journal*, June 7th, 1873 :—“The new Pocket Clinical Thermometer, invented and manufactured by Messrs. Arnold & Sons, is the most portable ever introduced to the notice of the medical profession.”

Extract from *Medical Record*, March 17th, 1875 :—“This little Pocket Clinical Thermometer has many advantages. It is portable, firmly mounted with a well-devised bayonet catch and graduated very legible and indelible reading scale.”

Extract of letter received from Dr. W. Bathurst-Woodman, Translator and Editor of *Wunderlich's Medical Thermometry*, for the New Sydenham Society :—“The Patent Clinical Thermometer I bought of you is a *decided* improvement on all the thermometers I have ever seen. It was a very carefully and beautifully-made instrument, and exceedingly sensitive.”

Extract from *Guy's Hospital Gazette*, September 24th, 1873 :—“Arnold & Sons' Clinical Thermometer is a conveniently-devised instrument, small enough to have all the conveniences of a small instrument, but which, by means of its case, can be so elongated as to have the advantages of the larger instruments.”

Dr. Robert Ellis writes :—“I like the thermometer you have sent better than any I have ever used, and I will never again use any other, if I can help it.”

Dr. Moorhouse, of Ellesmere, writes :—“I have used the thermometer constantly for two years, and have not the least hesitation in saying that it is the most portable, safe, convenient, and at the same time reliable Clinical Thermometer I have met with.”

Fig. 326.

Garden Pump and Fire Engine combined (Arnold & Sons' Patent Simplex), with jet and rose complete, Fig. 326	2	0	0
--	---	---	---

Prize Medals awarded by the Royal Horticultural Society, 1881 and 1882.

First-class Certificate Crystal Palace Flower Show, 1882.

It is the most simple, portable, and durable pump extant.

Reprint from the *Ironmonger*, April 10th, 1880:—"Messrs. Arnold & Sons, 35 and 36, West Smithfield, E.C., who are well known for their 'Simplex' enema injecting apparatus, have further developed the idea, and now produce a garden pump worked on precisely the same principle as the instrument referred to, and differing from it only in dimensions and power. In application this article possesses the requirements of a garden pump, the *modus operandi* being sufficiently indicated by the illustration; or, should the emergency occur, equally effective work may be performed by its aid in extinguishing fire in any ordinary apartment. Most other apparatus have either a packed piston or an india-rubber air-ball, and it is well known that the packing of pistons requires frequent attention, for if not constantly used and kept greased it dries and rots, and when required is absolutely useless. On the other hand, all india-rubber articles, however good, in time undergo some molecular change, and in the course of a few years, at most, become absolutely valueless. In hot climates especially, and in dry weather, these defects are apparent. These two serious drawbacks are entirely obviated in the 'Simplex,' and among the advantages claimed for it may be mentioned that it has no india-rubber air-chamber, the water itself, by an ingenious arrangement, forming its own packing. It is so effective that a continuous jet of water may be thrown to a considerable distance with the greatest ease. But what is more important is, that the 'Simplex' is always ready for immediate use, no matter how long it has lain by. Many of Messrs. Arnolds' 'Simplex' enemas have been kept for years in India, and have been found in perfect working order when required."

Medicine Chests for stables fitted to order.				

Fig. 333.

Nasal Insufflator (Allman's), for nasal gleet, catarrh, etc.,								
Fig. 333	0	7	6				

Extract from *Veterinary Journal*, April 1881 :—"The operation is of the simplest character; about one drachm of P. Iodoformi Co. is placed in the 'Insufflator'; the instrument is then gently passed into the nose as high as it will conveniently go; the india-rubber ball is then pressed, when it will send the powder into the nose and its various cavities. This should be repeated night and morning. Simultaneously with its use, the nasal membrane may be occasionally washed out by means of a syringe with the sulphocarbolate of zinc, one scruple to the pint of tepid water: this syringing helps to clear out any decomposed matter that may hang about the turbinated bones."

Copy of Letter received from SIR PAUL HUNTER, Mortimer Hill, Mortimer, Berks.

"Sir Paul Hunter begs to inform Messrs. Arnold that the insufflator has been most useful, and that he has made a perfect cure of two horses suffering from nasal gleet by using the Iodoformi Co., which horses Mr. D. Allman saw yesterday."

Nasal Douché (Rey's)	0	15	0

Trephine and Gimlet, improved (Mannington's), Fig. 346 £0 12 6

Extract from *Veterinarian*, April 1885:—"Sirs,—Messrs. Arnold & Sons, of West Smithfield, E.C., have requested me to send you a short description of an improved trephine they have made according to my directions, stating the advantages it possesses over the old pattern, for insertion in the forthcoming number of your journal. I have had substituted for the usual trocar point a curved steel centre-piece, slightly roughened at the curved portion. This may be made more or less prominent as required, by means of a screw, which, when loosened, allows it to move freely. The advantages gained by using this modified instrument are : that after the bone has been perforated by means of a gimlet supplied with the trephine, the centre-piece is inserted in it, and a fixed point is thus obtained to work upon. There is no chance of the piece of bone separated by the circular saw falling into the sinus, as it is retained by the curve ; and the time required for operating is much shortened. There is also, to my mind, an appreciable gain in having the handle secured to the trephine by a set screw with milled head, working from one end of it, as seen in the woodcut. This arrangement makes the instrument much pleasanter to hold.

"I am, etc."

"To the Editors of the '*Veterinarian*.'"

Lamp, Microscopic (Arnold & Sons'), Fig. 361 12s. 6d. £0 15 0

Fitted with HAILES'S porcelain shade and all necessary adjustments ; the glass reservoir is protected by a brass case, from which it can be readily removed, and in which it rotates, so that either the edge or flat side of the flame can be turned towards the opening in the shade. The shade can be adjusted to its proper height in relation to the frame, and clamped in that position by means of the screw facing the observer ; the whole can then be moved up or down upon the pillar and clamped at the required height by the screw to the left of cut, without deranging the adjustment of the shade. The lamp mount is hinged so that the gallery, etc., may be turned back to facilitate the cutting and trimming of the wick.

Section Knife (Johnson's), Fig. 363, in case £0 12 6

"LIVERPOOL, 5th May, 1884.

"DEAR SIR,—We find the Section Knife you have devised, and which we have thoroughly tested, admirably adapted for cutting the thinnest possible sections; it combines many advantages, and is particularly light, well balanced, and handy to use.

"Very truly yours,
"ARTHUR C. COLE."

Fig. 364.

Microscopist's Stand (Walsham's), containing—Wash bottle, lamp, four stoppered bottles, two capped bottles, two dozen slides, two needles, two razors, scissors, scalpel, Valantin's section knife, covering glasses, Chalk's drop bottle, six covered glass jars, funnel with stand, forceps, filtering paper, labels, Fig. 364	3 10 0
Microscopist's Case (Klein's), containing—Six capped bottles, two scalpels, two hollow-ground razors, two needles, two forceps, six watch glasses, covering glasses, one dozen slides, spear-pointed needle, and section lifter	2 5 0
Microscopist's Case, Student's, containing—Hollow-ground razor, embedding box, forceps, scissors, scalpel, two needles, section lifter, covering glasses, glass slides, watch glasses, and labels	0 17 6

Portable Bichromate Battery (Arnold & Sons' improved),

Fig. 368 £4 4 0

By a simple mechanical arrangement the zinc plate can at once be withdrawn from the solution, and the action is thereby suspended. It can be left for any time without exhausting the plates; when required for use again, by simply letting down the zinc plate the action is immediately resumed. The current is easily regulated, and almost continuous. The solution will last a length of time is inexpensive, and can be renewed without trouble.

Fig. 369.

Universal Electric Lamp (Arnold & Sons'), Fig. 369 ... 1 10 0
 Ditto ditto with battery, complete 3 0 0

This lamp, which is portable and easily worked, can be used for all examinations in which the ordinary hand lamp was employed; the advantages claimed for it being powerful illumination without the inconveniences of smoke or smell. The battery can be readily connected or detached.

Electric Lamp and Battery (Trouve's), for ophthalmic and other delicate operations. Can be worn on the forehead, or placed upon a table, at the option of the operator 7 7 0

Razors (Heiffor's), hollow ground	...	each	0	2	6

In an article on "Methods of obtaining Sections of Frogs' Eggs," the writer states:—"I find the best razor for this purpose, and, indeed, *for all microscopic purposes*, to be the flexible-edged razors made by John Heiffor, Sheffield, and stamped 'Made for the Army.' In order to render the edge flexible, these razors have their surfaces ground hollow; this hollow holds a great deal of spirit, and thus renders it easier to float the sections off. Moreover, the edge is extremely thin, and does not act as a wedge on a brittle substance like a frog's egg, and break the section in half. . . . Again, these razors are extremely easy to sharpen, and every microscopist ought to be able to put a fine edge on his own razor. . . ."
