## MORTALITY AND SICKNESS EXPERIENCE, 1871-1875.

---

*To the Executive Council of the  
Ancient Order of Foresters Friendly Society.*

GENTLEMEN,

At the High Court Meeting of the Order held in the Town of Newcastle-on-Tyne, August, 1878, the following resolution was passed :—

*"That as a complete and exhaustive analysis of the Quinquennial Returns of Sickness and Mortality Experience now at the Council Chambers, will necessarily involve a large expenditure for clerical and other assistance, the High Court Meeting do instruct and authorise the incoming Executive Council to expend such sums as may be necessary to carry out the said analysis and to publish the results to the Order."*

The Executive Council (Sheffield), after a full consideration of the subject, resolved, on the 5th December, 1878 :—

*"That to carry out the Resolution of the Newcastle High Court Meeting the Permanent Secretary be instructed to take steps for the preliminary tabulation of the Sickness and Mortality Experience of the Order (1871-1875), and that he consult with F.G.P. Neison, Esq., as to the best mode of proceeding, and that F.G.P. Neison, Esq., be retained to complete the analysis and deductions from such Sickness and Mortality Experience upon the Schedules being prepared."*

The determination of the main points which it was desired the investigation should embrace, the consideration of the mode of its conduction, the obtaining of estimates for, and the printing of, the cards it was resolved to employ, and finally the selection of an efficient staff of clerks, necessarily occupied some time, so that it was not practicable to commence active operations until February, 1879.

The first step taken was to examine the returns received from the branches (Courts) of the Order with the view of discarding such returns as were "*prima facie*" imperfect. The limits of this investigation into the mortality and sickness experience of the Society being fixed by the particulars which could be extracted from the original schedules, it is advisable to present an exact copy thereof.

(COPY OF RETURN.)

# Ancient Order of Foresters Friendly Society.

REGISTERED UNDER 38 &amp; 39 VICT. C. 60.

RETURN OF SICKNESS and MORTALITY for the Five Years ending 31st December, 1875, experienced by Court No. \_\_\_\_\_, held in the City, Town, or Village [*as the case may be*] of \_\_\_\_\_, in the County of \_\_\_\_\_, in the \_\_\_\_\_ District.

*N.B.*—This RETURN is called for pursuant to General Law 37, and is to be returned to the *Council Chambers*, 130, *Gilmore Place*, EDINBURGH, by the 24th of July, 1876, at the latest, but earlier if possible. The Return has been delayed in its issue by waiting for the Government Form, the Council being desirous of assimilating the Returns as much as possible. If the Court be in a District, the Return should be sent through the District Secretary.

*Date when the Court was established* \_\_\_\_\_, 18 \_\_\_\_.

## CONTRIBUTIONS PAYABLE BY MEMBERS TO THE SICK AND FUNERAL FUND.

---

---

---

---

## BENEFITS RECEIVABLE BY MEMBERS FROM THE SICK AND FUNERAL FUND.

A Member becomes “free” or entitled to claim all benefits in \_\_\_\_\_ months [*or weeks*] after entry.

Full pay of \_\_\_\_\_ shillings per week is allowed during the first \_\_\_\_\_ weeks of sickness; the pay is reduced to \_\_\_\_\_ shillings for the next \_\_\_\_\_ weeks; and to \_\_\_\_\_ shillings afterwards for the remainder of sickness [*or as the case may be*].

FUNERAL ALLOWANCES—Member’s, £\_\_\_\_\_; Member’s Wife, £\_\_\_\_\_.

(Signed) \_\_\_\_\_ *Chief Ranger.*

\_\_\_\_\_ *Secretary.*

Court No. \_\_\_\_\_, in the \_\_\_\_\_ District.

QUINQUENNIAL RETURN OF SICKNESS AND MORTALITY.

List of all the Members who have been assured for Benefits during the past Five Years, whether they have received Benefits or not, and where they have been sick, the duration or sickness experienced by each.

1	2	3	4	5	6	7	8	9	10
Initials of each Member in the Court [The number to be added up at the foot]	Occupation, trade, or calling of each Member in the Court	Age of each Member at the time of his admission into the Court	Year of admission of each Member into the Court	Date when each Member became eligible to receive Benefits	If any Member has at any time during the Five Years received Sick Pay, fill in the number of Weeks' and Days' Sick Pay each Year in these columns opposite to the Initials of the Member Sick. Where the allowance, although paid out of the Sick Fund, is really old age pay or a pension, mark the Weeks' Sickness with a star, thus *52. A Week to reckon as Seven Days	If a Member of the Court Died during the Five Years, state in this column the Date and Year of his Death opposite to his Initials	Name of disease or cause of Death, as stated in the Registrar's certificate	If a Member of the Court withdrew, was excluded, or ceased to be eligible for Sick Pay during the Five Years, state in this column the date on which he ceased to be a Member, or to be eligible for Sick Pay	
					In the Year 1871	In the Year 1872	In the Year 1873	In the Year 1874	In the Year 1875
					Weeks days	Weeks days	Weeks days	Weeks days	Weeks days

The returns from the branches were then sorted into three groups, the Courts held in localities having less than 5,000 inhabitants being classified as *Rural*; those in districts of 5,000 but less than 30,000 inhabitants as *Town*; all other branches being treated as *City* Courts. The line of demarcation between a town and city may not be very apparent, but by adopting a division of the Courts into three groups it obviated the necessity which would otherwise have existed of mixing up a purely rural with a town district, or a small town with a large city. In all three groups the density of population would probably vary materially. Further, by adopting this classification it enables a more complete comparison to be made of the results of this inquiry with those of other investigations into the mortality and sickness of the industrial classes.

Having discarded all defective returns, and sorted the remainder into the respective groups of *Rural*, *Town*, and *City* districts, the next step was to extract the requisite particulars from the schedules for each individual member. For this purpose cards ( $4\frac{3}{4}$  inches by 3 inches) were employed of the following patterns and colours:—

REMARKS.																																
REMARKS.																																
REMARKS.																																
MEMBER.....SICK	MEMBER.....NOT SICK	MEMBER.....DEATH.																														

The members were thereby separated into three groups, viz.:—

- (a) Members, not dying whilst under observation, who for any period of the quinquennium had been in receipt of sickness allowance;
- (b) Members, not dying whilst under observation, who during the five years did not make any claim; and
- (c) Members who died within the five years.

By adopting a different coloured card for each of these groups the summation of the facts in the succeeding schedules was materially facilitated, and by clipping the corner of each card their arrangement in packets for counting, &c., was rendered easier, as the eye of the sorter at once detected the fact of any card being inverted.

The successive stages of tabulation through which the entries recorded on the cards passed, the following statement exhibits:—

Form A consisted of columns for the record of the essential particulars given on each card, the entries being copied on to the schedule in the order of the year of birth of each member. The fact of a member becoming "Free," or leaving the Society whilst under observation, was signified by the insertion of the letter "F" or "x," as the case might be, in the column for the year in which the event occurred. The blank square on the top left-hand corner of each schedule was for the entry of either an *R*, *T*, or *C*, to show the locality in which the branch existed. (See page 6.)

Form B was of a more complicated character entailing considerable care in its compilation, the facts for each class of cards being kept throughout quite distinct. (See page 6.)

Form C.—The preceding form contained the complete experience for each individual branch, and the object of this schedule was to collect the experience for all the Courts of the same class in each county. (See page 7.)

Form D was a copy of Form B, the only difference in the results being that in the latter case was represented the experience of a group of Courts in each county in lieu of the facts for an individual branch.

Form E.—The form of return issued by the Order to its branches precluded any exact determination from it of the duration of the attacks of sickness, but in the early part of this year it was resolved to make an endeavour to partially remedy this defect in the original schedules; accordingly Form E was drawn up, in which were copied from Form A full particulars of the experience of any member who during the five years 1871-1875 had made a sickness claim of 26 weeks and upwards. (See page 7.)

### Form A.

Court No. \_\_\_\_\_ held at \_\_\_\_\_ in the \_\_\_\_\_ District.

Form B.

Court No. \_\_\_\_\_ held at \_\_\_\_\_ in the \_\_\_\_\_ District.

Form C.

Summary for Courts held in the County of \_\_\_\_\_

**Form E.**

A Schedule of the Members experiencing at any one time during the Five Years 1871-1875,  
a Sickness of Twenty-six Weeks and upwards.

---

Year of Birth, 18 \_\_\_\_\_

By a continuous employment of Forms C and D, summary schedules of the sickness and mortality experience of the members were obtained in respect of Rural, Town, and City Districts separately for

- (1) Each individual Court.
- (2) The Courts in each county.
- (3) The whole number of Courts in respectively England, Ireland, Scotland, and Wales.
- (4) The total Courts in Great Britain and Ireland (see Table A).

In this manner it was possible to determine the mortality and sickness rates of any given Court, or combination of Courts, and to view the results for either districts, counties, registration divisions, or any other section of the United Kingdom.

The accurate compilation of such a large body of facts as the investigation embraced necessitated very careful supervision over each process. Most explicit instructions were issued to the abstracters, so that no possible doubt should exist as to the exact nature of their duties, and, further, their work was in every instance checked by a special staff employed for that purpose. Similar precautions were taken in the tabulation of the different forms, and those of a more complicated character were done in duplicate and then compared, any differences being duly examined into and rectified. It was found advantageous to require each worker through whose hands any of the forms passed to initial his sheet, thus the responsibility for any fault could be at once fixed, and as the work progressed to the more difficult stages and a smaller staff was required, a knowledge was gained of the most efficient hands, whose services were of course retained.

On the final selection of the returns, it was found that the enquiry would embrace no less than 2,577 branches of the Order, with the experience of 369,655 of its members, the distribution for each division of the United Kingdom being as under:—

	Number of Courts.	Number of Members.
England .. .. ..	2,344	334,909
Ireland .. .. ..	26	3,372
Scotland .. .. ..	78	18,181
Wales .. .. ..	129	13,193
Total.. .. ..	2,577	369,655

Further, these 2,577 Courts were located as follows,

	Courts	Members
Rural Districts .. ..	996	115,437
Town     "     .. ..	648	107,323
City     "     .. ..	933	146,895
Total .. ..	2,577	369,655

To tabulate properly these facts occupied a large staff for a considerable period, and the task was materially augmented by the necessity under the Society's rules of the removal of its offices each year to a different centre, a portion of the work being thus performed in Sheffield, Dublin, and Northampton. These removals not only involved much loss of valuable time, but necessitated also on each occasion the re-engagement and fresh training of almost a new staff. Thus the final schedules (see Table A) were not completed until December 1880, since which time rapid progress has been made with the inquiry.

Before proceeding to state what has since been done, I would desire to place on special record my complete satisfaction with the thorough manner in which Mr. Shawcross (the able Permanent Secretary of the Order) and his son Mr. E. B. Shawcross, have superintended all the work involved in conducting the investigation to this stage. Only those who have had to go through a similar task can form any conception of the labour involved in this preliminary work. It is most arduous, and must necessarily be checked stage by stage, for on the complete accuracy of the summary schedules forming Table A depend the value of any conclusions arrived at in this report. Having carefully directed the inquiry step by step, no one can be better qualified than myself to speak of the manner in which it has been conducted, and I feel bound to state that the Order owes much to these gentlemen for the able and hearty manner with which they have thrown themselves into this work notwithstanding their other laborious duties.

The form in which the facts upon the cards were finally tabulated is displayed, as already stated, in Table A. The results for each class of card are kept distinct; for example, referring to column 2 of the table, "Number of Members in the Courts, 1st January, 1871," it is shown how many of these members either claimed the sickness allowance during the next five years, passed through the quinquennium without making any such claim, or finally within the same period died. In precisely the same manner the next column presents similar particulars for those persons who joined the Order within the period 1871-1875, and this system of division of the members according to the results of their experience is maintained throughout the table.

TABLE

By the classification of the members adopted in this table it is possible to draw some quite new deductions on sickness and mortality, and the labour in the preliminary stages of the investigation has not been unnecessarily extended; for the more, within reasonable limits, it is possible in the tabulation of such a vast body of facts as this inquiry embraces to sub-divide the subject, the easier does it become to check each separate stage. The particulars are given separately for the Rural, Town, and City Districts, and finally for a combination of the three groups, and the only deviation throughout the report from this principle of treatment is where the facts were either not deemed sufficiently numerous to justify it, or when, from the nature of the question under consideration, it was believed to be unnecessary to enter into a sub-division of this character.

From this table (Table A) the following facts are gathered in connection with the branches of the Order from which mortality and sickness returns were received:—

<i>Number of Members in the Courts 1st January, 1871</i>	...	...	217,464
Of these members during the five years 1871-1875 were sick	113,110	or 52·0 per cent.	
" " " " not sick	91,001	41·8 "	
" " " " died	13,353	6·2 "	
<i>Number of Members who joined the Courts 1871-1875</i>	..	..	152,191
Of these during the five years, were sick	48,106	31·6 "	
" " " " not sick	101,623	66·8 "	
" " " " died	2,462	1·6 "	
<b>TOTAL NUMBER OF MEMBERS WHO CAME UNDER OBSERVATION</b>			<b>369,655</b>
<i>Number of Members who withdrew 1871-1875</i>	...	...	57,967
Of these during the five years 1871-1875 had been sick	12,226	or 21·1 per cent.	
" " " " not	45,741	78·9 "	
<i>Number of Members who died</i>	...	...	15,815
<b>TOTAL CEASED TO BE MEMBERS</b>	...	...	<b>73,782</b>
<i>Difference, or Number of Members in the Courts 31st December, 1875</i>	...		<b>295,873</b>
<i>Total weeks of sickness paid for in respect of all the above members</i>	...	Weeks	days
		1,769,035	4
Of this amount, for members who died	...	348,222	4
" " remainder	...	1,420,813	0

The variation in the number of members sick, not sick, and dying during the quinquennium so far as relates first to those whose membership dated back before the 1st January, 1871, and secondly to the subsequent entrants, is mainly

due to the very different age distribution in the two groups, for, as will be demonstrated by statistics presented in a later portion of this report (see Abstracts B, H, and K), age exerts a most material influence on all these points. The very different proportion of the withdrawals among those who had been sick, and those who had not claimed the allowance, should not escape observation.

Similar particulars for the Rural, Town, and City Districts respectively are presented in the following abstract.

#### ABSTRACT A.

##### ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

	Rural Districts	Town Districts	City Districts

<i>Withdrew from the Courts, 1871-1875.</i>	100·0	100·0	100·0
Percentage of members sick ... ... ...	23·9	22·2	19·2
" " not sick ... ... ...	76·1	77·8	80·8
	100·0	100·0	100·0

It has already been stated that the proportion of members who were either sick, not sick, or died, whilst under observation varied with the age of the members, and the extent to which this is the case Abstract B shows.

### ABSTRACT B.

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

*R. T. & C. Districts Combined.*

Ages	To every 100 Members in the Courts 1st January, 1871, the number who whilst under observation were				To every 100 Members who became "Free" during the Five Years, the number who whilst under observation were				Ages

60-	54.9	24.2	20.9	100.0	...	...	...	...	60-
65-	54.9	16.6	28.5	100.0	...	...	...	...	65-
70-	45.7	12.2	42.1	100.0	...	...	...	...	70-
75-	36.4	12.3	51.3	100.0	...	...	...	...	75-

As regards the members in the Society's branches at the period when this investigation commenced, viz., 1st January, 1871, the proportion sick increases, it will be observed, as the members get older, the apparent deviation from this rule for ages above 70 being due to the fact that at this period of life either from sickness becoming more severe in its character, or from the capacity of the human frame to withstand its attacks having been weakened, death more frequently results, and consequently an increased ratio of deaths is observed at these ages. The percentage of members not sick gradually decreases with age, whilst the proportional number dying increases.

Referring to the members who entered the Society during the quinquennium, the proportions sick and dying are materially less at each age than for the other groups, apparently showing that at any rate for the first few years after admission into the Courts the medical selection employed is not without practical effect upon the Society's experience.

Viewing the facts contained in this Abstract it may be affirmed, taking an average Society with a normal admission of new members, that in the course of every five years nearly one half of the members may at one time or another be expected to make a claim upon the sick fund, whilst during the same period about 5 per cent. of them will die.

The number of members embraced within the scope of this inquiry was shown in Table A, but whilst a portion of these members were under observation throughout the whole period of five years, some either left or died at various intervals of time, and others only joined the Order subsequent to the commencement of the quinquennium. What it is essential to ascertain is the number of complete years of life during which the Courts were responsible for the liability ensuing from either the sickness or death of their members; the first step, therefore, is to deduce from the table the years of life at risk, and this will be found worked out in Table B. The results have purposely been exhibited in full, so that those disposed to devote greater attention to the subjects dealt with in this Report may possess every facility for following the process employed and conducting any further enquiry deemed desirable. By comparing the figures given in italics in Table A with the results presented in the first half of Table B, the connection between the tables will be at once seen. The proper determination of the "years of life at risk" is the main object of the table, and how this column has been arrived at, a consideration of the formula set out in the heading of the table will explain. The reason for making a deduction of one-half from the exposures in respect of the entrants and withdrawals is that taking one case with another it may reasonably be assumed that these members will have been under observation for one-half of the year in which the event occurred.

The total years of life exposed to risk in the Rural, Town, and City Districts respectively, and the Three Districts Combined; the rates of mortality and sickness; and the proportion of members sick, with the average duration of their disablement, Abstract C displays.

#### ABSTRACT C.

##### ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

District	Total Years of life at risk	Mortality per cent. per annum	Weeks of Sickness per Member per annum	To every 100 Members, the Number Sick	The Average Weeks of Sickness to every Member Sick
Rural Districts ... ... ...	421,793	1'045	1'258	22'596	5'567
Town " " " "	379,523	1'204	1'410	24'078	5'858
City " " " "	500,850	1'365	1'404	23'691	5'926
The Three Districts combined...	1,302,166	1'214	1'358	23'449	5'793

The rate of admission to the full benefits of the Order is highest in the City Districts, and how rapidly the rate falls with age is shown in the following statement.

**ABSTRACT D.**

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

The Rate of Admission per cent. per annum.

Ages	Rural Districts	Town Districts	City Districts	Three Districts Combined	Ages
20-	27'09	35'54	45'72	35'23	20-
25-	10'48	13'62	17'31	13'94	25-
30-	6'51	7'63	9'18	7'92	30-
35-	4'79	4'92	5'47	5'11	35-

45-	'05	'04	'04	'04	45-

The proportional age distribution of the members who became free is dealt with in the following abstract (Abstract E), and it will be observed that whilst in each district respectively the largest proportion of the members joined the Order at ages 20 to 24, in the Country Districts there exists a decided tendency for the members to enter at earlier periods of life than is the case for branches located in towns and cities. In the City Districts the largest proportion of elder members join the Order.

**ABSTRACT E.**

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

The proportional Age distribution of the Members who became "Free."

Ages	Rural Districts	Town Districts	City Districts	Three Districts Combined	Ages
18-	19'14	12'63	7'30	12'45	18-
20-	42'84	42'62	41'04	42'04	20-
25-	19'73	23'65	27'19	23'89	25-
30-	10'89	13'10	15'48	13'39	30-
35-	6'28	6'72	7'71	6'99	35-
40 and upwards	1'12	1'28	1'28	1'24	40 and upwards
Total	100'00	100'00	100'00	100'00	Total

The rate of admission materially influences the rate of withdrawal, for withdrawals are generally found to be greatest in intensity among the newly entered members, as has been ascertained from statistics of the duration of membership of those withdrawing. The percentage of admissions being highest in the City Districts, it would be expected therefore that the same would hold good with the withdrawals, which the following abstract shows to be the case.

**ABSTRACT F.**

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

The Rate of Withdrawal per cent. per annum.

Ages	Rural Districts	Town Districts	City Districts	Three Districts Combined	Ages
20-	6.26	9.25	14.04	9.50	20-
25-	4.44	6.15	8.84	6.58	25-
30-	3.11	4.05	5.83	4.48	30-
35-	2.12	2.77	3.78	3.01	35-
40-	1.36	1.62	2.18	1.79	40-
45-	.73	1.04	1.24	1.04	45-
50-	.44	.67	.69	.61	50-
55-	.15	.43	.49	.36	55-
60-	.13	.29	.36	.26	60-

In the proportional age distribution of the members who withdrew, the same relation will be observed to exist between ratios for the different districts as prevails in the rates of withdrawal per cent. per annum. For example, referring to the City Districts it will be found that at those ages in Abstract E at which the proportion of members becoming free was larger than in the Rural Districts, does a higher percentage of withdrawals likewise prevail in Abstract G.

Viewing the facts of the whole experience of the Order it appears that whilst 78 per cent. of the new members become free under 30 years of age, no less than 62 per cent. of the withdrawals occur within the same period of life.

**ABSTRACT G.**

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

For the practical management of a Friendly Society it is most useful to possess a knowledge of how many members per annum should claim upon the sick fund, and the next abstract (Abstract H) supplies this information.

#### ABSTRACT H.

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

The Number of Members Sick per annum to every 100 Members at Risk.

Ages	Rural Districts	Town Districts	City Districts	Three Districts Combined	Ages
20-	22·4	23·6	23·0	22·9	20-
25-	21·1	22·3	21·3	21·5	25-
30-	20·9	22·3	21·6	21·6	30-
35-	21·5	22·9	22·6	22·3	35-
40-	22·2	23·9	23·9	23·4	40-
45-	23·2	25·1	26·2	25·0	45-
50-	24·1	26·8	29·1	26·9	50-
55-	26·2	29·3	32·7	29·6	55-
60-	31·0	34·5	36·5	34·0	60-
65-	41·5	44·5	44·5	43·3	65-
70-	50·9	53·8	53·1	52·3	70-
75-	59·5	65·6	53·3	60·1	75-

The extent to which the proportional number of claimants on a sick fund increases with age this abstract well shows. The variation in the results for the different districts is not considerable, but the proportion of claimants would appear to be slightly less in the rural than in the other districts.

Another most useful aid in the conduct of a Society is the average duration of the disablement of those members who claim the sick pay. That the intensity of the attacks of sickness may be expected to increase as the members grow older is clear.

#### ABSTRACT I.

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

The Weeks of Sickness per Member per annum to every Member Sick.

Ages	Rural Districts	Town Districts	City Districts	Three Districts Combined	Ages
20-	3·57	3·52	3·62	3·57	20-
25-	3·93	3·95	4·01	3·96	25-
30-	4·36	4·43	4·62	4·48	30-
35-	4·93	4·92	5·44	5·15	35-
40-	5·46	5·69	6·23	5·86	40-
45-	6·31	6·85	7·14	6·83	45-
50-	7·37	8·71	8·90	8·42	50-
55-	10·41	10·80	11·22	10·86	55-
60-	12·89	14·15	13·47	13·50	60-
65-	17·49	20·51	17·32	18·39	65-
70-	22·07	25·33	21·13	22·93	70-
75-	28·21	32·30	27·18	29·37	75-

Though at the earlier ages the differences between the results for the various districts are not large, on the whole the duration of the attacks of sickness appears to be least among the branches existing in rural localities.

The proportional age distribution of the members who died is exhibited in Abstract J. From this it appears that just one half of the total death claims arise in respect of members under 40 years of age, the explanation of this being that ages 18 to 40 embrace, as will be found from an examination of Table B, not less than 70 per cent. of the whole number of members. It is important to bear in mind this explanation of the larger proportion of the deaths occurring in respect of the younger members, for in ignorance of the cause it is not unfrequently assumed that the probability of dying is greater among these members, which Table I proves is decidedly not the case.

#### ABSTRACT J.

##### ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

###### The proportional Age distribution of the Members who Died.

To be enabled to draw any comparison between the general results disclosed by the present inquiry into the sickness and mortality experience of the Ancient Order of Foresters Friendly Society, and the conclusions of other investigations into the sickness and mortality of members of friendly societies it is essential to condense somewhat the facts presented in Table B, and therefore Table C presents a summary for quinquennial groups of age, of the mortality and sickness experience of the Order for the five years 1871-1875, and for all general purposes this table may be viewed as displaying the broad results of this investigation.

TABLE  
ANCIENT ORDER C  
Summary of the Mortality and Sickne

Naturally there will be a desire to know whether these results compare favourably unfavourably with those of other investigations conducted for a similar purpose, but the question raises many most difficult points. To speak of the results being either favourable or the reverse implies some standard of measurement, but on the sickness and mortality incidental to the industrial classes of this country it is very questionable whether such standard exists. Clearly no standard can apply unless the condition of the two things to be measured is precisely the same, and it is this very dissimilarity of the original facts which have been gathered, that renders any positive declaration of the rates of sickness and mortality of the working classes so difficult to determine from the various inquiries which have already been undertaken on the subject. All that can be done is to present a careful summary of these investigations, compare the results with those now adduced, and ascertain as far as possible how far variations can be accounted for.

Arranged in chronological order the most important investigations into the mortality and sickness of members of Friendly Societies have been as follows:—

1836-1840. Through the kindness of the late Mr. J. Tidd Pratt (the then Registrar of Friendly Societies), the Quinquennial Returns for 1836-1840, made under the Friendly Societies Act, 10 Geo. IV., c. 56, § 34, as amended by 4 & 5 Wm. IV. c. 40, § 6, were placed in the late Mr. Neison's hands, and the results deduced by him from an exhaustive analysis of the data were published in his "Contributions to Vital Statistics" issued in 1846.

## FORESTERS FRIENDLY SOCIETY.

Experience for the Five Years 1871-1875.—Males.

1846-1848. The Manchester Unity of the Independent Order of Odd Fellows being anxious to ascertain the rates of mortality and sickness throughout their body, the Executive caused forms of returns to be issued to the branches, and the results obtained by this investigation were published (1850) in an able report by the late Mr. H. Ratcliffe, the Corresponding Secretary of the Order.

1846-1850. In accordance with instructions received from the Government, Mr. A. G. Finlaison, in his capacity as Actuary to the Commissioners for the Reduction of the National Debt, presented a digest of the quinquennial returns made by Friendly Societies under the provisions of Act 9 & 10 Vict., c. 27. The results were published in 1853 in Parliamentary Return No. 955.

1856-1860. The experience of the Manchester Unity of the Independent Order of Odd Fellows for these years was collected and published (Colchester, 1862) by Mr. Ratcliffe, the Corresponding Secretary of the Order.

1866-1870. The same Society again issued (1872) a report displaying the results of an analysis of the sickness and mortality returns of its branches.

To enable a proper comparison to be made between the results of the present investigation and those of the data above enumerated, the facts in each case have been grouped on one common principle, and rates of mortality and sickness properly computed. The results are displayed in Tables D, E, and F.

## Summary of the Mortality and Sickness experience of Members of Friendly Societies according to

Ages	Rural Districts					Town Districts					Age

of the Independent Order of Odd Fellows." By Henry Ratcliffe, Corresponding Secretary. Manchester, 1850.

of the Independent Order of Odd Fellows." By Henry Ratcliffe, Corresponding Secretary. Colchester, 1862.

Order of Odd Fellows in July, 1872.

In the following abstract of these tables the rates of mortality and sickness according to the unadjusted results of the respective data are presented in such a form as will render easy comparison between them.

### ABSTRACT K.

\* The low rate of sickness claim disclosed by this investigation is due to the circumstance that Mr. Finlaison excluded from his inquiry all cases of chronic sickness.

Considerable variation will be observed in both the mortality and sickness results, and a few observations as to how these differences probably arise will not be out of place. The whole experience, viz.: the Rural, Town, and City Districts combined, of each investigation consists of an aggregation of a vast number of units, and if in every case the distribution of these units was similar, and their nature as to mortality and sickness also common, clearly the ultimate results deduced from each investigation would agree. But we have shown that considerable divergency occurs in the final results of each of these inquiries into the sickness and mortality of the industrial classes, and this notwithstanding that every care has been taken to ensure accuracy in both the collection and tabulation of the results, and therefore the question naturally

arises whether the data themselves are such as to be comparable, or, in other words, whether material differences do not exist in the units comprising the various investigations. For instance, no one would think of questioning the fact that occupation and habits of life materially influence the incidence of both mortality and sickness. Again, if recent research in vital statistics demonstrates one fact more clearly than any other, it is that the rate of mortality has relation to the density of population. Further, it is known that some localities prove more healthy than others, and even the same locality will possess a different effect on two persons. Nearly all the investigations relate likewise to different periods of years, and it is not at all improbable that some of the zymotic diseases which are too often epidemic in this country may have proved more disastrous among the persons embraced within the observations in one quinquennium than in another. The important influence also of trade being good or bad must not be ignored, for all those practically connected with Friendly Societies know how much this circumstance will determine the claims upon the box. The class of societies from which the original facts were gathered would moreover exert some effect on the final results. The rate of sickness not only depends upon the absolute incapacity for labour, but is more or less influenced by the degree to which the internal management of a society enables efficient supervision to be exercised. In large organizations this task is more difficult than is the case in most of the affiliated orders, but any observations based on the Government returns would necessarily include results from Friendly Societies of most varied characters.

However, it would be impossible in this report to discuss all the points just raised, even in relation to your own experience, and still less so in connection with the other data. Nor is it my intention to enter into a discussion of the differences in the original facts observed upon for all the data enumerated. Presumably the experience of the Manchester Unity of Odd Fellows (1866-1870) would possess most points in common with your own data, and I shall accordingly deal more particularly with those results, though most of my criticisms would be equally applicable to the other inquiries.

In all the investigations contained in Tables C, D, E, and F, the observations, it will be observed, are separated into Rural, Town, and City Districts respectively, the idea being that a rough division of this character would partially take into account not only the density of population, but also the influence of occupation, it being presumed that agricultural and most of the healthier outdoor pursuits would be found located in the rural districts, whilst on the contrary the principal unhealthy avocations would exist in large towns and cities. Until accurate research has been made into the value of life in every important occupation, and thus rendered it practicable to determine fairly the precise influence of locality, some such rough approximation of the

facts must be made as is here done, though of course it renders it impossible to declare how much of the difference in the results of any two groups is due to occupation and how much to locality. Assuming, however, as we are justified in doing, that this method does ensure a rough adjustment of the risks, the rates of mortality or sickness of the experience as a whole will clearly depend upon the proportions embraced in each inquiry of the three divisions of Rural, Town, and City Districts. In fact, given that the rates of mortality vary in each district, and granted also the power of distributing at will the units at risk, then the mortality for the whole experience could be made to fluctuate between the points of the highest and lowest rates for the districts.

That this distribution of the years of life at risk can operate materially is demonstrated in the following statement, which shows the proportional distribution of the units at risk in the Odd Fellows experience (1866-1870) and for the present investigation.

#### ABSTRACT L.

Ages	The Proportionate Distribution of the Total of Years of Life at Risk						Total		Ages	
	Rural Districts		Town Districts		City Districts					
	Odd Fellows (1866-70)	Foresters (1871-75)	Odd Fellows (1866-70)	Foresters (1871-75)	Odd Fellows (1866-70)	Foresters (1871-75)	Odd Fellows (1866-70)	Foresters (1871-75)		
18-	.27	.40	.48	.22	.15	.17	.90	.79	18-	
20-	3.87	5.65	7.21	4.03	3.39	4.27	14.47	13.95	20-	
25-	8.65	12.70	19.52	11.62	10.13	15.47	38.30	39.79	25-	
35-	4.58	8.08	10.89	8.06	5.62	11.77	21.09	27.91	35-	
45-	2.84	3.58	7.38	3.53	4.08	4.89	14.30	12.00	45-	
55-	1.55	1.38	4.48	1.25	2.48	1.52	8.51	4.15	55-	
65-	.39	.53	1.23	.40	.63	.36	2.25	1.29	65-	
75-	.02	.06	.11	.04	.05	.02	.18	.12	75-	
85-	.00	.00	.00	.00	.00	.00	.00	.00	85-	
95-	...	.00	.00	.00	...	...	.00	.00	95-	
All Ages	22.17	32.38	51.30	29.15	26.53	38.47	100.00	100.00	All Ages	

Thus to every 1,000 of the years of life at risk in each data the distribution in the respective districts have been—

Districts.	Odd Fellows. 1866-1870.	Foresters. 1871-1875.
Rural Districts ...	222	324
Town      , "      ...	513	291
City      , "      ...	265	385

The reduced percentage of the lives in the rural districts of the Odd Fellows experience is to a considerable extent counterbalanced by the much less number existing in the city, or most unhealthy district. The facts as a whole would lead one to expect a rate of mortality for the present inquiry somewhat in excess of the Odd Fellows rates, and reference to Abstract K proves this to be the case. It should be stated that in the grouping of the lives for the different districts, in both investigations the same principles of distribution have been observed.

The proportional distribution to each district of the years of life at risk for each group of ages, Abstract M deals with.

The extent to which the variable distribution of the units of life in the districts affects the results of the experience as a whole, can be practically tested by comparing the mortality for any group of ages as set forth in Abstract K with the average of the rates of mortality of each district for a similar group of ages (see Abstract N). Of course, so far as any individual district is concerned, or as regards the comparison of one district with another, the objection would not apply, and for this reason therefore the most correct test for any comparison between the results of this inquiry and the Odd Fellows data is that of district with district, which can be done by means of Abstract N. Even in this case, however, there would exist ample scope for variation in the results, from a different distribution in each district of the healthy and unhealthy occupations.

## ABSTRACT N.

Ages	Rural Districts		Town Districts		City Districts		Ages

It will be perceived that this element of the variable nature and distribution of the units composing each data is the main cause of their difference,

and further consideration of the subject may be well left until we come to the adjusted results of each experience.

Before the rates of mortality and sickness deduced from the original results could be used with advantage as a basis for the monetary tables which it was the main purpose of the investigation to draw up, it was necessary that the accidental irregularities in the rates at the individual ages should be removed or smoothed down, that the laws of mortality and sickness represented by the facts might be better brought out.

With respect to the mortality tables, a preliminary adjustment was made by Mr. Makeham's formula, which gives a perfectly smooth curve throughout life. These curves were not however adopted, as though agreeing fairly well with the original facts, it was considered advisable to adopt a method of adjustment that should make no assumption as to the law of mortality, and that should reproduce all the well marked peculiarities of each experience, viz.: the results for the Rural, Town, and City Districts respectively. The ratios between the observed rates of mortality at each age and the rates as given by Mr. Makeham's formula were therefore adjusted by a method giving to the rate of mortality at each age a weight consistent with the number of facts, and as these ratios seldom deviated greatly from unity throughout the table they lent themselves very readily to the process of adjustment. The rates of mortality finally adopted were tested by being multiplied into the numbers exposed to risk, and the table of the adjusted number of deaths were compared throughout with the original facts.

For the rates of sickness a more simple method sufficed, as the irregularities in the unadjusted rates were not large. The function selected for adjustment was the logarithm of the rate of sickness, and the sum of these values at ages  $x-1$  and  $x+1$  was added to twice the value at age  $x$ , and one fourth of this sum was taken as the adjusted value at age  $x$ . By a continuation of this method of adjustment a smooth curve was obtained. A similar test was finally employed as was assumed with the mortality rates, viz.: a comparison of the adjusted and unadjusted weeks of sickness.

At the older ages the facts obtained from the returns of mortality and sickness of the branches of the Order were insufficient to form of themselves a reliable basis for the final tables. In the case of mortality there seemed a general tendency for the rates of the three districts to converge about 80 years of age, and it was therefore thought well to adopt some common standard from that point. The English Life Table No. 3 for several reasons seemed most suitable, and has the advantage of not under-estimating the present value of pensions, a point of some importance. A few unimportant alterations were made in the final ages to avoid prolonging the table beyond age 100. In the sickness results a similar tendency in the rates of the different districts to converge at the extreme ages was noticed, with a further

tendency to approach a constant value; it was accordingly assumed that after age 85 the uniform rate of 26 weeks of sickness per annum might be taken as representing the rates in each of the three districts. The rate at these extreme ages however has practically but little effect upon the monetary values at the younger ages.

The unadjusted and adjusted rates of mortality and sickness are given in parallel columns in Tables G and H.

The next abstract (Abstract O) contains a comparison of the rates of mortality in various periods of years according to the adjusted results of different inquiries, and as it is upon the adjusted results of any investigation into the mortality and sickness of members of Friendly Societies that the financial tables determining the premiums for assurance are based, it is to these figures more particularly that attention should be devoted, when considering for either valuation or other purposes the precise bearing of the data to be employed.

#### ABSTRACT O.

The rates of mortality by the present investigation are higher throughout than the results for the Odd Fellows experience 1866-1870, the difference being largest for the period of life 50 to 60. Comparing the experiences as a whole it may be affirmed that the Foresters data discloses a mortality about 8 per cent. in excess of that for the Odd Fellows (1866-1870) results. The much lower rate of mortality in both the data based on an analysis of the Government returns of Friendly Societies will not escape observation, the explanation being that in these instances the inquiries embraced a preponderating section of the more healthy occupations, the years of life at risk in the rural districts forming about 60 per cent. of the total experience.

The comparative rates of mortality in various periods of years according to the adjusted results of this inquiry for each district (Rural, Town, City), and the Three Districts Combined, Abstract P displays.

#### ABSTRACT P.

**The Comparative Rates of Mortality in various periods of Years according to the Adjusted Results of the Ancient Order of Foresters Experience, 1871-1875.  
(Table G.)**

From Age	Summation of the Rates of Mortality per Cent. in each Period of Years				From Age
	Rural Districts	Town Districts	City Districts	Three Districts Combined

40 " 70	.86	1·01	1·13	1·00	40 " 70

Throughout the table the Rural Districts stand better in point of longevity than the Town, and the Town better than the City Districts. Speaking generally it may be affirmed that whilst the rate of mortality in the Town Districts closely approximates to the experience for the whole Order, the results for the Rural branches are just as much (about 15 per cent.) below the average for the Three Districts Combined as the experience of the City branches is above that standard.

It is well to observe that the influence of locality cannot be measured by the difference between the results for any two districts. To determine simply the influence of locality, similar classes of occupation should be compared in the respective districts. Too much stress cannot be laid upon this point, for too often fallacious deductions are drawn as to the salubrity of districts merely by a comparison of the respective rates of mortality, ignoring altogether the element of causes affecting the duration of life, such as the classes of occupation prevailing, which independent of locality itself would often suffice to account for the divergency in the rates. When it is stated that the mortality in some trades is three times as great as it is in others it will be clear that a preponderance of the unhealthy to the exclusion of the more healthy occupations would of itself amply account for an increased mortality rate, and that the position of the respective districts might be changed by an enforced migration of such pursuits, if such a course was either practicable or advisable. A reduction of the mortality would equally result from an improvement in the sanitary conditions under which the employment was carried on, and that this has often resulted is known to such persons as have had occasion to study the reports issued under the Factory and Workshops Acts.

Abstract Q exhibits the comparative amount of sickness in various periods of years according to the adjusted results of different inquiries

It will be observed that in each group of ages the weeks of sickness by the results of the Foresters data are slightly in excess of the Odd Fellows rates. This difference may arise either from the somewhat different distribution of the lives in the two data, or else from the circumstance that in the one Order (the Foresters) there are not so many as in the other of the class of members who, notwithstanding any disability for work which they may experience in consequence of illness, seldom declare upon the funds in respect of it, which of necessity would reduce somewhat the apparent sickness of the branch.

The much lower rates of sickness from age 40 upwards represented in Mr. Finlaison's tabulation of the Government Returns for 1846-1850, is due to the circumstance that for the reasons given in his report he thought proper to discard from the inquiry all cases of chronic ailment. Undoubtedly in diseases of the brain and nervous system will be found the highest ratio of permanent and protracted sickness, and after age 40 this class of diseases

grows rapidly in intensity. As no record appears to have been retained of the cases excluded from the inquiry, it is impossible to form an opinion of what would have been the sickness rates, but for this adjustment.

### ABSTRACT Q.

**The Comparative Amount of Sickness in various periods of Years according to the Adjusted Results of different Inquiries.—R. T. & C. Districts Combined.**

From Age	Amount of Sickness in each period of Years, expressed in Weeks						From Age	
	Neison, Government Returns 1836-1840	Finlaison,* Government Returns 1846-1850.	Manchester Unity of Odd Fellows (Ratcliffe)			Ancient Order of Foresters 1871-1875 (Table II)

\* The less rate of sickness-claim disclosed by this investigation is due to the circumstance that Mr. Finlaison excluded from his enquiry all cases of chronic sickness.

The comparison of the rates of sickness in each of the three districts, and in the three districts combined, according to the results for the present investigation is shown in the following abstract.

## ABSTRACT R.

The Comparative Amount of Sickness in various periods of Years according to the Adjusted Results of the Ancient Order of Foresters Experience, 1871-1875.  
(Table H.)

From Age	Amount of Sickness in each period of Years, expressed in Weeks				From Age
	Rural Districts	Town Districts	City Districts	Three Districts Combined	
20 to 30	8·2	8·6	8·5	8·4	20 to 30
30 " 40	9·9	10·6	11·2	10·6	30 " 40

20 " 80	.92	1·07	1·01	1·00	20 " 80

Until age 60 the districts stand in much the same relation to one another in sickness as they did for mortality, but after that period of life the Town Districts present the highest sickness experience.

Table I, besides exhibiting the numbers living and dying each year in a stationary population, displays also the probability of either living or dying in a year, and likewise the number living out of whom one dies in a year. Taking 100,000 members of the Order all aged exactly 18 years, the table shows how many would attain the age of 18, 19, 20 and so on, supposing that they all retained membership until death. The influence of the rates of mortality in the different districts is well shown in the following abstract :—

The following Abstract (Abstract T) shows the number of members living, out of whom one dies in a year.

#### ABSTRACT T.

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

The number Living out of whom One Dies in the Year.

Age	Rural Districts	Town Districts	City Districts	Three Districts Combined	Age
20	156·2	138·5	117·5	137·2	20
25	155·5	139·9	118·5	135·7	25
30	137·7	129·0	113·4	123·9	30
35	117·2	101·2	87·4	98·7	35
40	101·8	87·9	70·9	82·8	40
45	87·3	65·3	57·1	66·2	45
50	62·3	57·8	46·1	53·6	50
55	46·9	36·8	33·6	38·1	55
60	34·0	30·6	25·8	29·7	60
65	22·9	19·2	18·8	20·3	65
70	14·7	13·8	12·2	13·9	70
75	10·1	10·0	9·4	10·0	75
80	7·0	7·0	7·0	7·0	80

The most important columns in Table J are the first two which show the probable lifetime at any age, and the average duration of life at age  $x$ . The "Probable Lifetime at Age  $x$ " represents the terms of years for which there is an equal probability of living, and is the best function for determining the value of life in different classes, or different districts, within the same period of years, as the expression is affected by the mortality within those ages only. The "Average Duration of Life at Age  $x$ " is synonymous with the common expression "Expectation of Life," and expresses the true average duration in years of a certain number of individuals at a given age, and involves the consideration of the decrements of life at every age to the end of the table. At the earlier ages the probable lifetime will always exceed the expectation of life, as at these ages there is always an even chance of outliving the period of years represented by the average duration of life, but the converse is the case at the older ages, as reference to Table J will demonstrate.

The "Probable Lifetime" at various ages for the Rural, Town, and City Districts, and the Three Districts Combined, Abstract U exhibits.

#### ABSTRACT U.

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

Age	Probable Lifetime				Excess in favour of Rural over		Age
	Rural Districts	Town Districts	City Districts	Three Districts Combined	Town Districts	City Districts	
20	45·82	43·37	40·74	43·10	2·45	5·08	20
30	37·16	34·88	32·76	34·78	2·28	4·40	30
40	28·66	26·64	25·10	26·70	2·02	3·56	40
50	20·48	18·97	17·95	19·10	1·51	2·53	50
60	13·22	12·31	11·58	12·46	0·91	1·64	60

By aid of the facts presented in Table K it is possible to draw some interesting deductions connected with the experience of the Order. For instance, it has been pointed out already that the whole of the weeks of sickness recorded in Table A was experienced by two groups of members, viz.: the "Members Sick," and the "Members who Died." The average weeks of sickness to each of these groups as compared with the average for the whole of the members was as follows.

#### ABSTRACT V.

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

*R. T. & C. Districts Combined.*

**The average Weeks of Sickness per Member per annum.**

Ages	Members Sick at any one time during the Five Years 1871-1875	Members who Died during the Five Years 1871-1875	The whole Experience of the Order 1871-1875	Ages
20-	1'542	5'357	.819	20-
25-	1'440	5'877	.853	25-
30-	1'553	5'879	.968	30-
35-	1'781	6'176	1'150	35-
40-	2'029	6'552	1'373	40-
45-	2'432	6'953	1'707	45-
50-	3'116	8'114	2'265	50-
55-	4'331	8'848	3'210	55-
60-	5'587	11'260	4'594	60-
65-	9'179	13'699	7'971	65-

Another point which can be ascertained, is the rate of withdrawal among those members who at any time of the quinquennium had received sick pay, as compared with the members who had made no claim upon the fund. The rate of withdrawal differs materially, those members who had experienced practically the advantage of their foresight in making provision against the risk of sickness apparently being more careful to maintain their connection with the Order.

#### ABSTRACT W.

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

*R. T. & C. Districts Combined.*

**The Rate of Withdrawal per cent. per annum among the Members who had been Sick and those who had not been Sick during the Five Years 1871-1875.**

No fact is more certain in connection with friendly societies than that some portion of the members will sooner or later cease their membership through non-payment of the requisite subscription. If every friendly society had been founded on adequate rates of contribution, could retain its risks within proper limits, and invest its accumulated funds in a remunerative manner, it would necessarily follow that the society would prove solvent on valuation, and very little would then be heard of the element of secession. Unfortunately all societies are not thus circumstanced, and in these cases it often becomes essential to consider what relief to the funds may safely be allowed in respect of the secession of members.

The number of members withdrawing from the Order during the five years 1871-1875 was shown in detail for each age in Table B. The observations were not sufficiently numerous to justify deductions for each district separately, but from the facts there exhibited a properly adjusted rate of secession for the experience of the "Rural, Town, and City Districts combined" has been drawn up, and the results of a combined mortality and secession experience are shown in Table L. It will be observed that the rate of secession has been deemed to cease at age 60. The rate of secession according to Table L is high particularly at the younger ages, and extreme caution will be requisite in making any use of these results for monetary calculations, as it yet remains to be proved whether the rates now adduced can be assumed to represent what will be the ultimate experience of the Order on this point. The large extent to which secession reduces the members remaining in the Society is well illustrated by a comparison of the facts in Table L with those of Table I. That the rate of secession in your Order is at present high the following facts show.

#### ABSTRACT X.

**Summation of the Rates of Secession per cent. in various groups of Age according to your own Experience (Table L) and the Odd Fellows inquiry.**

With but few exceptions, friendly societies reduce the amount of a member's sickness allowance in protracted illness. It may appear a somewhat hard course to follow, for clearly the more protracted the disease the member may experience, the less the probability of his means being sufficient to combat against this inability to labour, and consequently the greater the hardships to be borne by himself and those dependent upon him. However, the practical experience of friendly societies demonstrates that unless the sickness allowance is liable to reduction in chronic illness, not only will the strain upon the society's funds often become insupportable, but the difficulty of guarding against imposition is immeasurably increased. Mainly for these reasons the principle of decreasing the sickness allowance in protracted illness is almost universal, and in the few instances of a different course being adopted the experiment has not been satisfactory. The only method by which a reduction of the allowance could be obviated would perhaps be by societies co-operating for the purpose of spreading the risk of protracted sickness over a larger area than is now practicable, and appointing a special machinery for maintaining due safeguards against the fund being imposed upon. What we have to consider at present, however, is the adjustment which should be made in the results of this investigation into the sickness experience of the Order to meet the operation of the practice generally in force of reducing the sickness allowance in claims of protracted duration.

In a previous portion of this report it was stated that the form of return\* originally issued by the Order to its branches precluded any exact determination of the duration of the attacks of sickness, but by aid of Form E (page 7) it was endeavoured to partially remedy this defect, by extracting separately from Form A (page 6) full particulars of the experience of every member who during the five years 1871-1875 had in any one year made a sickness claim of 26 weeks and upwards. These particulars having been extracted, it was ascertained that 7,719 members would come within the scope of this definition, their distribution in the respective districts being as follows:—

Rural Districts 2,307 or 2·0 per cent. of the total members in the district coming under observation.					
Town	"	2,338 or 2·2	"	"	"
City	"	3,074 or 2·1	"	"	"
Total	7,719 or 2·1		"	"	"

The proportion of members who suffer from protracted sickness does not

\* This return was not framed by the Order itself, but was to all intents and purposes a copy of that issued by the Friendly Societies Registry. For the recent quinquennial return (1876-1880) the Order availed itself of the best scientific advice, and the schedule for the record of the sickness and mortality experience of the branches is one of the most complete yet issued, and the results, when properly tabulated, should prove of incalculable value.

appear therefore to vary materially in the respective districts. Of these 7,719 members, 6,970 were members of the Courts on the 1st January, 1871, and 749 became "free" to benefits during the quinquennium.

The facts recorded in respect of these members having been properly tabulated, Table M exhibits their mortality and sickness experience in a form similar to that in which the experience for the whole Order has already been presented (see Table B).

The rates of mortality and sickness for this section of the members as compared with the results for the remainder of the Order, the following abstract displays.

#### ABSTRACT Y.

##### ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY (1871-1875).

*R. T. & C. Districts Combined.*

Ages	Rate of Mortality per cent. per annum		Weeks of Sickness-claim per Member per annum		Ages
	The Members embraced within Table M (Protracted Sickness)	The remainder of the Members (Table B)-(Table M)	The Members embraced within Table M (Protracted Sickness)	The remainder of the Members (Table B)-(Table M)	
20-	9·492	·670	15·595	·697	20-
25-	9·554	·633	16·834	·679	25-
30-	7·653	·784	17·523	·718	30-
35-	8·734	·936	18·891	·786	35-
40-	7·605	1·121	20·339	·885	40-
45-	8·594	1·410	21·071	1·013	45-
50-	8·651	1·706	23·937	1·153	50-
55-	7·930	2·556	25·627	1·324	55-
60-	8·522	3·135	25·733	1·608	60-
65-	9·128	4·952	29·821	2·045	65-
70-	10·474	6·776	31·438	2·363	70-

The extent to which the members coming within the scope of Table M are vitiated lives, the rates of mortality and sickness in this abstract well show. That the risks incurred in respect of these members are extremely onerous must be apparent to all.

Table M exhibits the total weeks of sickness experienced by those members whose illness had, at any one time during the quinquennium, exceeded the given period (26 weeks), and the next question was how these weeks of sick-claim should be distributed with relation to the duration of the attacks of illness. Several difficulties here arose, not the least being that from the nature of the original return it was impossible in many cases to state with certainty whether the sickness recorded against a member's name in any year was in respect of one continuous attack of illness, or was made up of several attacks each of short duration. For an entry of 52 weeks in one year no doubt could arise, but when the recorded sickness was for any less amount, it would clearly be possible for it not to have arisen from one continuous ailment. Again, viewing two years in combination, when 52 weeks of claim were recorded

TABLE M.

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY.—R. T. &amp; C. Districts Combined.

THE Mortality and Sickness Experience for the Five Years 1871–1875 of those Members who at any one time during the Quinquennium made a Sickness-claim of Twenty-six Weeks and upwards.

Age	Number of Members in the Courts 1st Jan., 1871	Became Free during the Five Years	TOTAL (b) + (c)	Members withdrew (d)	Members Died (e)	Number of Members in the Courts 31st Dec., 1875 (f)	TOTAL (g) + (h)	Number under Observation from Age preceding (i) + (j)	Total Number under Observation at each Age (d) + (k)	Years of Life at risk j - ½(c + e)	Members Sick (l)	Sickness experienced (m)	Age (n)

in respect of each year, the continuity of the sickness was apparent, but this was not so clear with say 33 weeks of illness in 1871, and 15 weeks in 1872, for the question at once arose as to whether the latter 15 weeks did not represent the continuation of the illness contracted in the preceding year. After mature consideration of these and other somewhat similar points which turned up during the process of investigating these claims, it was determined to adopt the following assumptions in respect of every case in which from the character of the recorded facts it was possible for the sickness to have been continuous.

- (1) That every entry of a sickness of 26 weeks and upwards in any year was a case of *continuous sickness*.
- (2) When in addition to an entry of 26 and under 52 weeks of sickness in any year, a further claim was recorded in either the preceding or succeeding year, that the whole weeks of claim were in respect of one *continuous sickness*.

Occasionally instances would arise of records of sickness in three consecutive years, in which case the general experience of the individual member was carefully viewed, before deciding which two years should be bracketed together as embodying a continuous sickness.

These assumptions of the continuous character of the claims are not unjustifiable, inasmuch as nearly every branch possesses a rule, the practical bearing of which is that, in the determination of either reductions in the sickness allowance, or its restoration to its original amount, it is essential that a member should be off the fund for a specified period (generally 6 months) before being again entitled to the full privileges of a healthy member. Thus for example two attacks of sickness interposed by an healthy interval not exceeding say 6 months in duration would be viewed in practice as one continuous sickness so far as regarded the number of weeks of full pay the member would be qualified to receive.

After the determination of a definition of what should be deemed continuous sickness, the first task was to go carefully through the experience of each member, and eliminate those weeks of sick claim which under no view of the subject could be otherwise than in respect of merely temporary illness. The next course was to ascertain how many of the weeks of claim were in respect of the following periods of sickness:—

- (1) Sickness of a duration not exceeding 6 months.
- (2) " " exceeding 6 but under 12 months.
- (3) " " " 12 " 24 "
- (4) " " " 24 " 36 "
- (5) " " " 36 months, *i.e.*, 3 years.

In this stage another difficulty arose, from the original schedules not stating the date of the commencement of those sickness claims which were running at the time of the commencement of the investigation (1st January, 1871), many of which had evidently been in existence for lengthened periods. To have ignored this circumstance would have placed an undue stress upon the earlier periods of claim, and accordingly it was resolved to send the following circular (see next page) to each branch in respect of—

- (1) Members who were sick for the whole of 1871.
- (2) Members who were sick from the 1st January, 1871, until their death in the same year.
- 

It was found necessary to communicate with 747 branches in respect of 1,480 members. After much labour and correspondence a response to my appeal was received from all but 72 branches, in 37 instances the information being defective either from—

- (1) The Courts being under suspension, or having ceased to exist.
- (2) The secretary having died, left the Order, or being unable to trace any record beyond the last few years.
- (3) The books of the Court having been destroyed.

In all cases in which from one cause or another accurate information could not be obtained, it was resolved to err on the side of safety and treat these members as first coming on the sickness fund at the 1st January, 1871.

The practical effect of most of the assumptions, which in the absence of precise information it was requisite to adopt in the consideration of the subject of protracted sickness, will be to throw an increased percentage of the claims on to the full pay period, and this margin of safety will be still further augmented by those cases which should strictly have come under observation, but which escaped record from the members not having experienced at least 26 weeks of sickness in any one year. For example, to take an extreme instance, a member ill for the last 25 weeks of one year, and the first 25 weeks of the ensuing year, altogether escaped notice.

All sickness experienced by the members embraced within Table M having been carefully distributed in accordance with the method above stated, the results were summarized for the Three Districts Combined, the facts not being of sufficient magnitude to justify the treatment of each district separately. Table N presents the final results.

The large number of weeks of claim (181,391) in respect of sickness exceeding three years in duration will not escape observation, and as explanatory of this circumstance attention should be directed to Abstract Z, which affords an analysis of the members continuously sick within the quinquennium for periods of from one to five years. At quite young ages some members

ANCIENT ORDER OF FORESTERS FRIENDLY SOCIETY.

REGISTERED PURSUANT TO 36TH AND 39TH VICT., CH. 60.

SICKNESS AND MORTALITY RETURNS, 1871-5.

To the Secretary of Court No.

DEAR SIR AND BROTHER,

From the Quinquennial Return of Sickness and Mortality for the five years ending December, 1875, forwarded by your Court in 1876 under General Law 37,  
the entries below given have been extracted.

Mr. NEISON, the Actuary, to whom has been entrusted by the ORDER the analysis and tabulation of these Returns, is desirous of knowing the *year and date* when these MEMBERS *first commenced* to experience the protracted sickness which the RETURN displays. No doubt in many cases these Members will have been on the funds *continuously* for years, but it is information on this point which is required.

Kindly fill in the date in the last column of this Schedule, and forward the Return to the COUNCIL CHAMBERS, NORTHAMPTON, with as little delay as possible, for every effort is being made to have the investigation complete by the ensuing High Court Meeting, and by aid of the particulars now asked for it is hoped to much enhance the practical value of the Actuary's Report.

I am, Yours truly,

*1 Chambers,  
20, Derngate, Northampton.  
March, 1881.*

Some of the members embraced within this abstract had been continuously in receipt of sick pay for lengthened periods, and though in several instances it was only possible to trace the member back for a period of about 10 years the books previous to that date having either been misplaced or destroyed, yet, as the following statement shows, there were many cases of sickness extending over a long series of years.

Members who had been continuously in receipt of sick pay for	Number of Cases.		
	20 years and upwards	15 to 19 years	10 to 14 "
"	"	"	17
"	"	"	69

"	"	"	66
"	"	"	66
"	"	"	82

In response to my appeal for the date at which the chronic sickness first commenced, some secretaries further supplied the cause to which the sickness was due, the most generally assigned reasons being limbs lost or broken through accident, blindness, lunacy, paralysis, rheumatism, &c. The amount of sick pay which had been already received by some of these members was

considerable, and to all appearances many would be upon the funds for the remainder of their lives.

Referring to Table N it will be observed that the 7,719 members who at any one period of the quinquennium (1871-1875) suffered from illness of a duration of 26 weeks or upwards, are accountable for the following weeks of sickness-claim.

	Total Weeks and Days of Sick-claims.
Sickness of a duration not exceeding 6 months . . . . .	230,386 weeks 4 days
"        "    exceeding 6 but under 12 months . .	141,517   "   6   "
"        "    12   "    24   " . . . . .	108,921   "   4   "
"        "    24   "    36   " . . . . .	61,478   "   2   "
"        "    36 months, i.e., 3 years . . . . .	<u>181,391   "   2   "</u>
Total . . . . .	723,695 weeks 4 days

According to Table A (page 24) the total weeks of sickness experienced by the whole of the members embraced within this investigation was 1,769,035 weeks 4 days, and deducting from this amount the sickness due to the 7,719 members above referred to, it leaves a total of 1,045,340 weeks of sick-claim in respect of the members who only experienced sickness of a temporary character during the 5 years 1871-1875.

By aid of the facts exhibited in Tables B and N it is practicable to view the average weeks of sickness-claim per member per annum, distributed in accordance with the duration of the claim, and this is done in Table O.

The proportionate distribution of the sickness-claims varies considerably with the member's age, in early life as much as 93 per cent. of the total sickness being of a very temporary character, whereas as life advances, the quantity of temporary sick-claims rapidly diminishes to ultimately a minimum of 20 per cent. of the total sickness. From the results exhibited in this table have been deduced Tables P and Q which display for every age the average weeks of sick-claim per member per annum, distributed in accordance with the duration of the attacks of sickness, and also the proportionate distribution for each age of these various classes of sick-claim. The facts recorded in respect of protracted sickness after age 79 not being sufficiently numerous to justify detailed observation, after careful consideration of their general bearing it was determined to adopt the following hypothesis in respect of sickness from that age upwards.

That of every 100 weeks of sickness after age 79 the distribution would be as under.

Sickness of a duration not exceeding 6 months . . . . .	20 weeks
"        "    exceeding 6 but under 12 months	14   "
"        "    12   "    24   " . . . . .	16   "
"        "    24 months, i.e., 2 years . . . . .	<u>50   "</u>
Total . . . . .	100 weeks

Practically the Manchester Unity of Odd Fellows has tabulated the only data of recent years with which the results of the Foresters experience of protracted sickness can be compared, and even in this case the means of comparison are not altogether satisfactory. In determining the influence of continuous sickness upon the cost of sick pay, Mr. Ratcliffe, so far as can be judged from his reports, appears to have confined his investigation strictly to the original quinquennial return from which his facts were obtained, though this schedule did not afford any information as to when those attacks of sickness therein entered, which were in force at the date of the commencement of the investigation, first began. In fact he had to deal with difficulties of a precisely similar character to those already noticed in connection with the existing inquiry, but which obstacles have in the present case been fairly overcome by means of the additional particulars obtained from the branches (see special schedule, page 95). In the analysis of the experience for the Manchester Unity of Odd Fellows all continuous sickness occurring, for example, in the first six months of the first year embraced in the quinquennial return, has been treated as sickness which commenced on the 1st January of that year, though as has been already shown in another portion of this report (see page 96) most probably a large number of these members had been recipients of the allowance for periods varying from one to twenty years and upwards. The practical effect of this mode of treating the subject would be of course to throw a larger quantum of sickness upon the first period of claim than was actually the case. Bearing in mind this qualification, Tables R and S may be viewed, which respectively contain the results of the protracted sickness experience of the Manchester Unity of Odd Fellows for the five years 1856-1860, and for the later inquiry of 1866-1870.

The results contained in Tables R and S are condensed for sake of comparison in Abstract AA, and there is also shown the ratio of the experience for 1856-1860 to that of the subsequent investigation (1866-1870). It should not escape observation that so far as concerns these inquiries into the experience of the Manchester Unity of Odd Fellows there would appear to exist a tendency for the proportionate amount of sickness occurring in the earlier periods of claim to increase. This circumstance is well illustrated by reference to the proportionate distribution in each inquiry of the sickness exceeding a duration of two years, and demonstrates how necessary it is to be cautious in the employment of these ratios for the purpose of adjustments in the financial arrangements of friendly societies. It must be remembered that at the present time little can be predicated with certainty as to the duration of attacks of sickness, no data of any magnitude yet tabulated having gone as thoroughly into the question as could be desired. The deficiencies in the returns on which the present investigation is based, have fortunately been carefully remedied in the schedules your Order recently issued.

A comparison is instituted in Table T between the rates of sickness when distributed in accordance with the duration of the claims as deduced from the experience (1866-1870) of the Manchester Unity of Odd Fellows, and the results of this investigation of the Ancient Order of Foresters.

TABLE T.

The Weeks of Sickness-claim in various periods of Years, distributed in accordance with the Duration of the Claims.

From the more exact method adapted in the present investigation of distributing the weeks of sick claim into their respective periods of duration, it follows that in your data the proportionate amount of long protracted illness exceeds the results obtained in the Manchester Unity of Odd Fellows experience. Omitting all sickness in respect of a duration not exceeding six

months, the differences between the results of the two data, so far as regards the aggregate sickness remaining, are not great. Viewing the ratio of the two experiences for sickness of a temporary character, *i.e.*, under six months in duration, it should not escape observation that at most ages the difference in the results closely approximates to the differences for the whole weeks of sick claim irrespective of duration; thus showing that the slight excess of sickness in the Foresters over the Odd Fellows data is due to the sick claims occurring among the former body in the first six months of illness. With the extended knowledge now obtained on the subject of protracted sickness, it will be possible to determine with more exactitude than has hitherto been feasible, the operation of rules restricting the duration of the sick pay in friendly societies.

The questions of secession and the reduction of the sickness allowance in protracted illness have already been dealt with, and the experience cards taken out from the original returns were filled up in view of an inquiry into the comparative health of different occupations, but bearing in mind the time and expense such an additional analysis of the facts would entail, it has been deemed judicious to let this important branch of the subject stand over for the present, and, if thought advisable, to take it up at some future date.

It would have been instructive also to determine what is the effect of duration of membership on the mortality and sickness experienced. The age of the Court would likewise be not without some influence, for presumably as the Court grows older its officials should become more efficient, which would show itself in its sickness and mortality experience in several ways. Further, the sickness prevailing among those seceding as compared with that for the remainder of the members would be a branch of inquiry worth more full investigation. However, these and other points can, if thought advisable, be taken up subsequently from either the results of the present returns, or from the more recent and complete ones which the Order now possesses for the five years 1876-1880.

In the Appendix to this Report (Tables 1 to 4) is given an additional summary of the mortality and sickness investigations contained in Tables C, D, E, and F. The object of presenting the facts in these groups of ages is that comparisons can be then drawn with the local mortality, &c., experience of the district, as contained in the valuable reports issued by the Registrar General of Births, Deaths, and Marriages, which will in many instances prove useful, and more particularly so when the experience of a society is of an abnormal character.

## MONETARY VALUES.

So far this report has dealt with, first, the actual mortality, sickness, and withdrawal experience of the Ancient Order of Foresters Friendly Society for the five years 1871-1875, and then with the adjustment of these results and the deduction from them of such rates of mortality, sickness, and withdrawal as would be of use in the practical operations of the branches comprising the Order. Further, the conclusions drawn from the present investigation have been compared with the results of other inquiries of a similar character. It only remains, therefore, to present monetary tables founded on the data this report submits for the consideration of the Order.

In the determination of the cost of the benefits which friendly societies usually undertake, in addition to the probabilities of death, sickness, &c., appertaining to the special risk under consideration, another element, viz., interest, enters into the account. What rate of interest should properly be employed in connection with the financial arrangements of a friendly society only comes incidentally within the scope of this report, and so far as concerns any particular society this matter must plainly be resolved by the special circumstances of the case. It may, however, be affirmed generally, that as regards the rates of subscription members are called upon to pay in respect of their benefits, in 99 societies out of 100, a 3 per cent. rate of interest is the proper basis to assume in their computation. Possibly under exceptional conditions a higher rate of interest may be justified, and therefore the tables appended to this report have made due provision for such instances. The rates of subscription having been settled, the next occasion on which the question of interest would arise would probably be in respect of the determination of the society's financial position, and here points of a complex character calling for serious consideration at once present themselves. The rate of interest to be employed in the valuation of a society should be determined not merely by a view of the circumstances affecting the individual society, but due regard should be paid to those influences outside its immediate sphere which concern the value of money in all commercial transactions. A practice I notice is springing up among those unskilled in financial matters to employ too readily in the valuation of friendly societies a rate of interest in excess of the normal standard (3 per cent.), and it is to be feared much mischief will result from this action. Whilst little harm can ultimately ensue from the assumption in a valuation of a rate of interest somewhat lower

than perhaps for a period, the society may be realising, much positive evil may result from the adoption of a rate of interest higher than what in course of time the society will be enabled to maintain. In the latter case by diminishing the reserve fund requisite on valuation, fanciful profits are created, and if, as very probably will be the case, a portion of this assumed surplus is appropriated, it is not difficult to foresee the harm which sooner or later will result. Instances of societies could be adduced in which the hardships experienced by those members who survived longest have been considerable, and this from the injudicious and inequitable lavishness with which predeceased members had been treated. Far the wisest and safest course for a friendly society to follow is not to share any profits resulting from the favourable character of the society's investments, until such profits have actually accrued; if this principle had always been followed many a society would now be in a much better financial condition than it is. Not only is this plan simple enough and such as could be understood by any member, but it would be the means of continually bringing home to the management the advantages resulting from an efficient control of the society's funds. For example, supposing that the contracts between the members and their society, as represented by the subscriptions payable, are based upon a 3 per cent. rate of interest, and that at the end of say five years it was found that the revenue from interest was at a rate, taken of course on the whole of the society's funds and not merely on its investments, in excess of this amount, then after retaining a portion of this excess to meet possible losses of capital in the future, the remainder might fairly be deemed applicable for either increasing the benefits or decreasing the contributions of members. It is essential to retain as a reserve fund a portion of this excess interest, for speaking generally the higher the rate of interest yielded by any investment the greater the risk incurred by the capital, and this contingency must of course be provided against. That societies have by judicious and skilful investment of their accumulated moneys benefited their members considerably is well known, and that similar results may in future be attained, is probably quite true; and for such cases no doubt monetary tables at interest higher than 3 per cent. are extremely useful. Similar tables would also be of real practical value when, from the necessities of the society's finances, it is essential for a readjustment of the risks to specially provide for the accumulation of its money at a rate of interest somewhat above the average. The complex character of the question as to what rates of interest may be employed in the computation of monetary tables for the general use of friendly societies, is not diminished by the fact, clear to all who watch the movements of the money market, that the rate of interest in this country is gradually falling. Securities which a few years since might have been trusted to produce from 4 to  $4\frac{1}{2}$  per cent. interest, now

only yield  $3\frac{3}{4}$  to 4 per cent. The fact also that several times recently consols have been above par will not have escaped the observation of those concerned in the management of friendly societies. When it is remembered that in the valuation of a society's risks, contracts are discounted for periods varying from 1 to 80 years, the full extent of these considerations can be better appreciated. It may safely be affirmed that in 9 cases out of 10 the proper rate of interest for the valuation of a friendly society is 3 per cent., and bearing in mind the points to which I have above alluded, and in addition thereto the knowledge of the general conduct of friendly societies which I have acquired during my professional career, I have, after the most careful deliberation, arrived at the conclusion that it would be injudicious to adopt in the valuation of friendly societies a rate of interest greater than 4 per cent. Consequently in the tables appended to this report interest has been assumed at the rates of 3,  $3\frac{1}{2}$ , and 4 per cent.

It is unnecessary in this report to deal separately with each one of the large number of tables annexed thereto; abstracts of the more important results will suffice.

Table I displays for the Rural, Town, and City Districts separately, and the Three Districts Combined, the following values of annuities of £1, viz.:—

- (a) £1 per annum for the Whole of Life.
- (b) " " until attaining either 60, 65, or 70 years of age.
- (c) " " commencing at either 60, 65, or 70 years of age.

It will be observed that all the annuity values in the table are "complete;" that is to say, the annuity is payable until the moment of death, or the attainment of a pre-arranged age.

The extent to which occupation and locality influence the values is measured by viewing the divergencies in the cost of an annuity at any given age in each of the districts separately, which can easily be done in Abstract A.B.

It should not escape notice how much the cost of a superannuation allowance is decreased by postponing for a few years the age for its commencement, as is exemplified in the relative value of a deferred annuity at age 60 compared with the cost of a similar benefit 5 or 10 years later in life. Reference to Table I (pages 64-71) affords the explanation of this fact, for on turning to the table it will be observed how rapidly in advanced life the members drop off by death.

By aid of the figures in this abstract, and of those presented in Abstract A.D, the cost of a sickness benefit to age 60, 65, or 70, and then a superannuation allowance, can be readily compared with the premium requisite to provide a sickness benefit for the whole of life. The advantages of the former method of assurance are so considerable, that when practicable it should certainly be adopted; and that it is in every way practicable when provision for the respective benefits is made early in life, an examination of the figures given in the tables will demonstrate. Compare for example the cost of a sickness allowance of 10s. per week for the whole of life (no reduction of pay in protracted illness), and the premium for a sickness benefit of 10s. per week until age 70 (no reduction of pay in protracted illness), and

then a pension of 5*s.* per week. These risks can be easily computed from the abstracts above referred to.

Member's Age at Entrance	The Premium per Annum Payable by Weekly or Monthly Instalments to insure the following Benefits.

The greater cost of the combination of sickness and annuity benefits is mainly attributable to the fact that at age 70, a permanent pension of one-half the sickness allowance entails a liability larger than that due to the whole of life sick pay at this age, for it will be observed on turning to Table H that not until age 85 do one-half of the members practically become permanently sick. However, there is no absolute reason why the pension should be in the proportion of exactly one-half the sickness allowance, and accordingly it is merely a matter of adjustment to equalise the cost of the respective benefits. It is to be remembered that by combining a temporary sickness allowance with a deferred annuity, the members benefit, first, by the cessation of all payments to the society from the period when the annuity commences, and, secondly, by being relieved from all vexatious restrictions on their right to do some slight labour in their old age if their state of health permits, a privilege which for their own safeguard many societies find necessary to restrict when the member is assured against inability to labour. On the other hand the society escapes the difficult and unenviable task of determining in advanced life whether or no a member's incapacity for labour is such as strictly to qualify him for the sickness allowance, or whether this incapacity arises from the inability naturally attendant upon old age, and which it is not within the intention of the society to provide against. The attempt to meet this difficulty made by those societies which allow a member at this time of life to draw a portion of the sickness allowance and to do what work he can get, is not successful in its results, and has been a fruitful source of imposition.

Table V is concerned with those risks which are dependent upon the joint lives of husband and wife, and in the computation of these tables it was requisite to assume, in the absence of precise knowledge, first, that the wives were of the same ages as the husbands, and secondly that their mortality was identical. These assumptions will not interfere with the practical usefulness of the tables. That column in them exhibiting the value of an annuity to the wife after the husband's death, should with proper restrictions for the assumed age and mortality of the wives prove useful to Widow and Orphans' Funds.

Abstract A.F displays for purpose of comparison the single and annual premiums at different rates of interest for various benefits. The influence of the assumption of a higher rate of interest upon the prime cost of a benefit, more especially when, as in a pension, the receipt of the allowance is deferred for a long period, the abstract well shows. Turning to the annuity values it will be observed that a higher rate of interest in a valuation has the effect of decreasing in value the contributions, but the decrease in the single premiums for the benefits being relatively greater, the gain resulting from the employment of a higher rate of interest in the determination of a society's financial position is that it renders necessary a less reserve fund to meet the respective risks.

The next group of tables deals with the question of secession. It has already been observed, that if every friendly society had been founded on adequate rates of contribution, retained its risks within proper limits, and invested its accumulated fund at the assumed rate of interest, it would necessarily follow that, on the valuation of its assets and liabilities, the society would be found financially sound, and very little would then be heard of the influence of secession in reducing a friendly society's risks. Unfortunately a number of societies have not from one circumstance or another been established on a sound and self-supporting basis, and therefore it sometimes becomes a question as to what extent the risks it has undertaken can be modified, in respect of the expected withdrawal of a portion of its members. In other words it desires to anticipate the profits which may accrue from the members not adhering to their portion of the contract, and by non-payment of the requisite subscription breaking off their connection with the society. To what extent an abatement can be made in the reserve fund which should be held by a friendly society in consequence of the probable withdrawal of a portion of its members, is a difficult question and one presenting no slight dangers. Secession, it must not be forgotten, is the result of the members' own volition, may arise from an infinity of causes, and is essentially a selection against the society. This constitutes the special danger incurred in an abatement of liabilities from this cause, for not only may the rates of secession vary in either different periods of years or among different groups of persons (see Abstract X), but it may result that the very assumption in the valuation of the element of secession may be the cause of its cessation. For example, in restoring the equilibrium between the assets and liabilities of a society the withdrawal of a proportion of its members in accordance with what has been its past experience may be assumed, but the doubt as to the capacity of the society to meet all its contracts, which probably influenced some of the previous withdrawals, being now apparently removed, probably to a certain extent the former rate of secession would in its entirety cease to operate.

Further, the state of trade is known to possess an influence upon the volume of the sickness-claims, and no doubt this same cause would not be without its effect upon secessions. Again, the causes of secession in a society may be of quite a local character, of either temporary or permanent duration, and the extreme danger of applying any general law would in such an instance be apparent. Quite another source of danger arises when, as is occasionally the case, no absolute profit would arise to the society from the secession of a member, but on the other hand, unless negative values had carefully been guarded against in the valuation, a positive loss might accrue. This would be the case when the contribution paid by the member at entrance was in excess of what the risk strictly demanded, for clearly in such a contract it is to the interest of the society that, at any rate for the first few years of membership, the connection between the society and the member should be kept intact. Losses sustained by societies through ignorance of this danger are by no means uncommon, and it only shows the necessity of every care being taken in the selection of an efficient valuer.

These few observations demonstrate how necessary it is to be extremely cautious in making an abatement of liability in respect of the element of secession. Tables XVI to XIX illustrate what would be the cost of specific benefits on the assumption of the prevalence of a rate of secession as set forth in Table L, which represents the experience of the whole Order of Foresters for the five years 1871-75. What would be the prime cost of similar benefits without any assumption as to secession is shown in Tables I to IV and XX to XXIII, and how much of the difference between these results can with safety be allowed as a set off against the liabilities of a society must be resolved by a consideration of matters affecting the individual society, and which necessarily it is impossible to take into account in the present report. The Monetary Tables (with Secession) have been prepared solely in consequence of what I understand to be the strong feeling on this subject of your members, and I can only urge extreme caution in their application to the practical work of your branches. I would desire it to be quite understood that I have no personal objection to the proper employment when necessary of the element of secession in connection with the risks of a friendly society, my fear is that such general results as must be given in a report of this character may be misapplied.

In Abstract A.G is presented a summary of the values of various benefits with and without secession, the rate of secession employed being that shown in Table L.

45	4'389	4'441	.052	45
50	5'538	5'557	.019	50

At the younger ages particularly the influence of secession on the rates of premium is considerable, the reason being that, as was shown in Abstracts D and F, the withdrawals are at their highest intensity at pretty much the same period of life at which most members join the Order. Thus the employ-

ment of a rate of secession in a valuation mainly influences the reserve fund which should be maintained in respect of the most recent entrants into the society. It is advisable to bear this fact in mind, for it is not uncommon in the discussion of the financial position of a friendly society, when a deficit has been shown on valuation, to hear it freely stated that of course the effect of secession would suffice to readjust the financial balance, and members are often disappointed to see the small extent to which in an old society this is the case.

The values of temporary sickness allowances with secession are not presented in the tables for the reason that as such risks would only be undertaken when it was intended to supplement the benefits by a pension on attaining the age at which sick pay ceased, the improbability of the members withdrawing and sacrificing their pension payments would reduce to a minimum the chance of secession.

Monetary tables with secession have also not been computed for a rate of interest in excess of 3 per cent., and the propriety of this course will I think be apparent to all.

It may also be observed in connection with the secession of members, that already in some of the larger county friendly societies a member desiring to withdraw receives in the form of a surrender value an equitable settlement of his interests in the society. This principle, which is in accordance with the practice of insurance companies, is a good one, and it can only be a question of time before it is adopted by the affiliated orders. In such an event of course secession would cease to have any financial influence.

The group of Tables numbered XX to XXXII have relation to the reduction of the sickness allowance in protracted illness. It will be perceived that in these tables what has been done has been to split up the premiums for the assurance of sickness without reduction of the pay into the proportional parts which represent sickness of various durations. By this method it is easy to determine the cost of a sickness allowance subject to different restrictions in protracted illness, by merely apportioning the premium here set forth to the reductions of pay to be effected. For example, if it was desired to ascertain the cost of a sickness allowance for the whole of life, with full pay for the first twelve months, half pay for another twelve months, and then one-quarter pay, it is only requisite to add to the total of the premiums set out in the first two columns, one-half the amount given in the third column, and one-fourth that shown as "Remainder of Sickness" in the fourth column. Any other modification of the sickness allowance can as easily be determined, it only being necessary to adjust the premium in precisely the same manner to that in which the sickness allowance is to be affected.

The considerable extent to which rules affecting the duration of the sickness allowance may modify the liability of a society, this abstract very clearly exhibits. The objects of a friendly society so far as concerns the well

being of the individual member are however best attained by not reducing the pay in protracted illness to any greater extent than is necessary to preclude the funds being imposed upon by evil disposed persons.

All the monetary values in this report are presented in decimals of a £1, and for the benefit of any not accustomed to this notation, Table 5 (Appendix) contains the decimal parts of a £1 corresponding to any number of shillings, pence, and farthings.

Bearing in mind the limitation which, for the reasons given on page 108 of this report, has been placed upon some of the subsidiary branches of inquiry which cropped up during the investigation, I believe it will be found that all the points essential to the practical value of the results have been dealt with, and that the Ancient Order of Foresters Friendly Society now possess a data for the conduct of their affairs befitting the magnitude of the interests involved in the sphere of its operations. Not only should this inquiry tend to increase the success and financial stability of the Order, but the public spirited manner in which it has resolved to disseminate the results for general information, must prove of incalculable service to the friendly societies of this realm, and the large proportion of the population dependent upon their welfare.

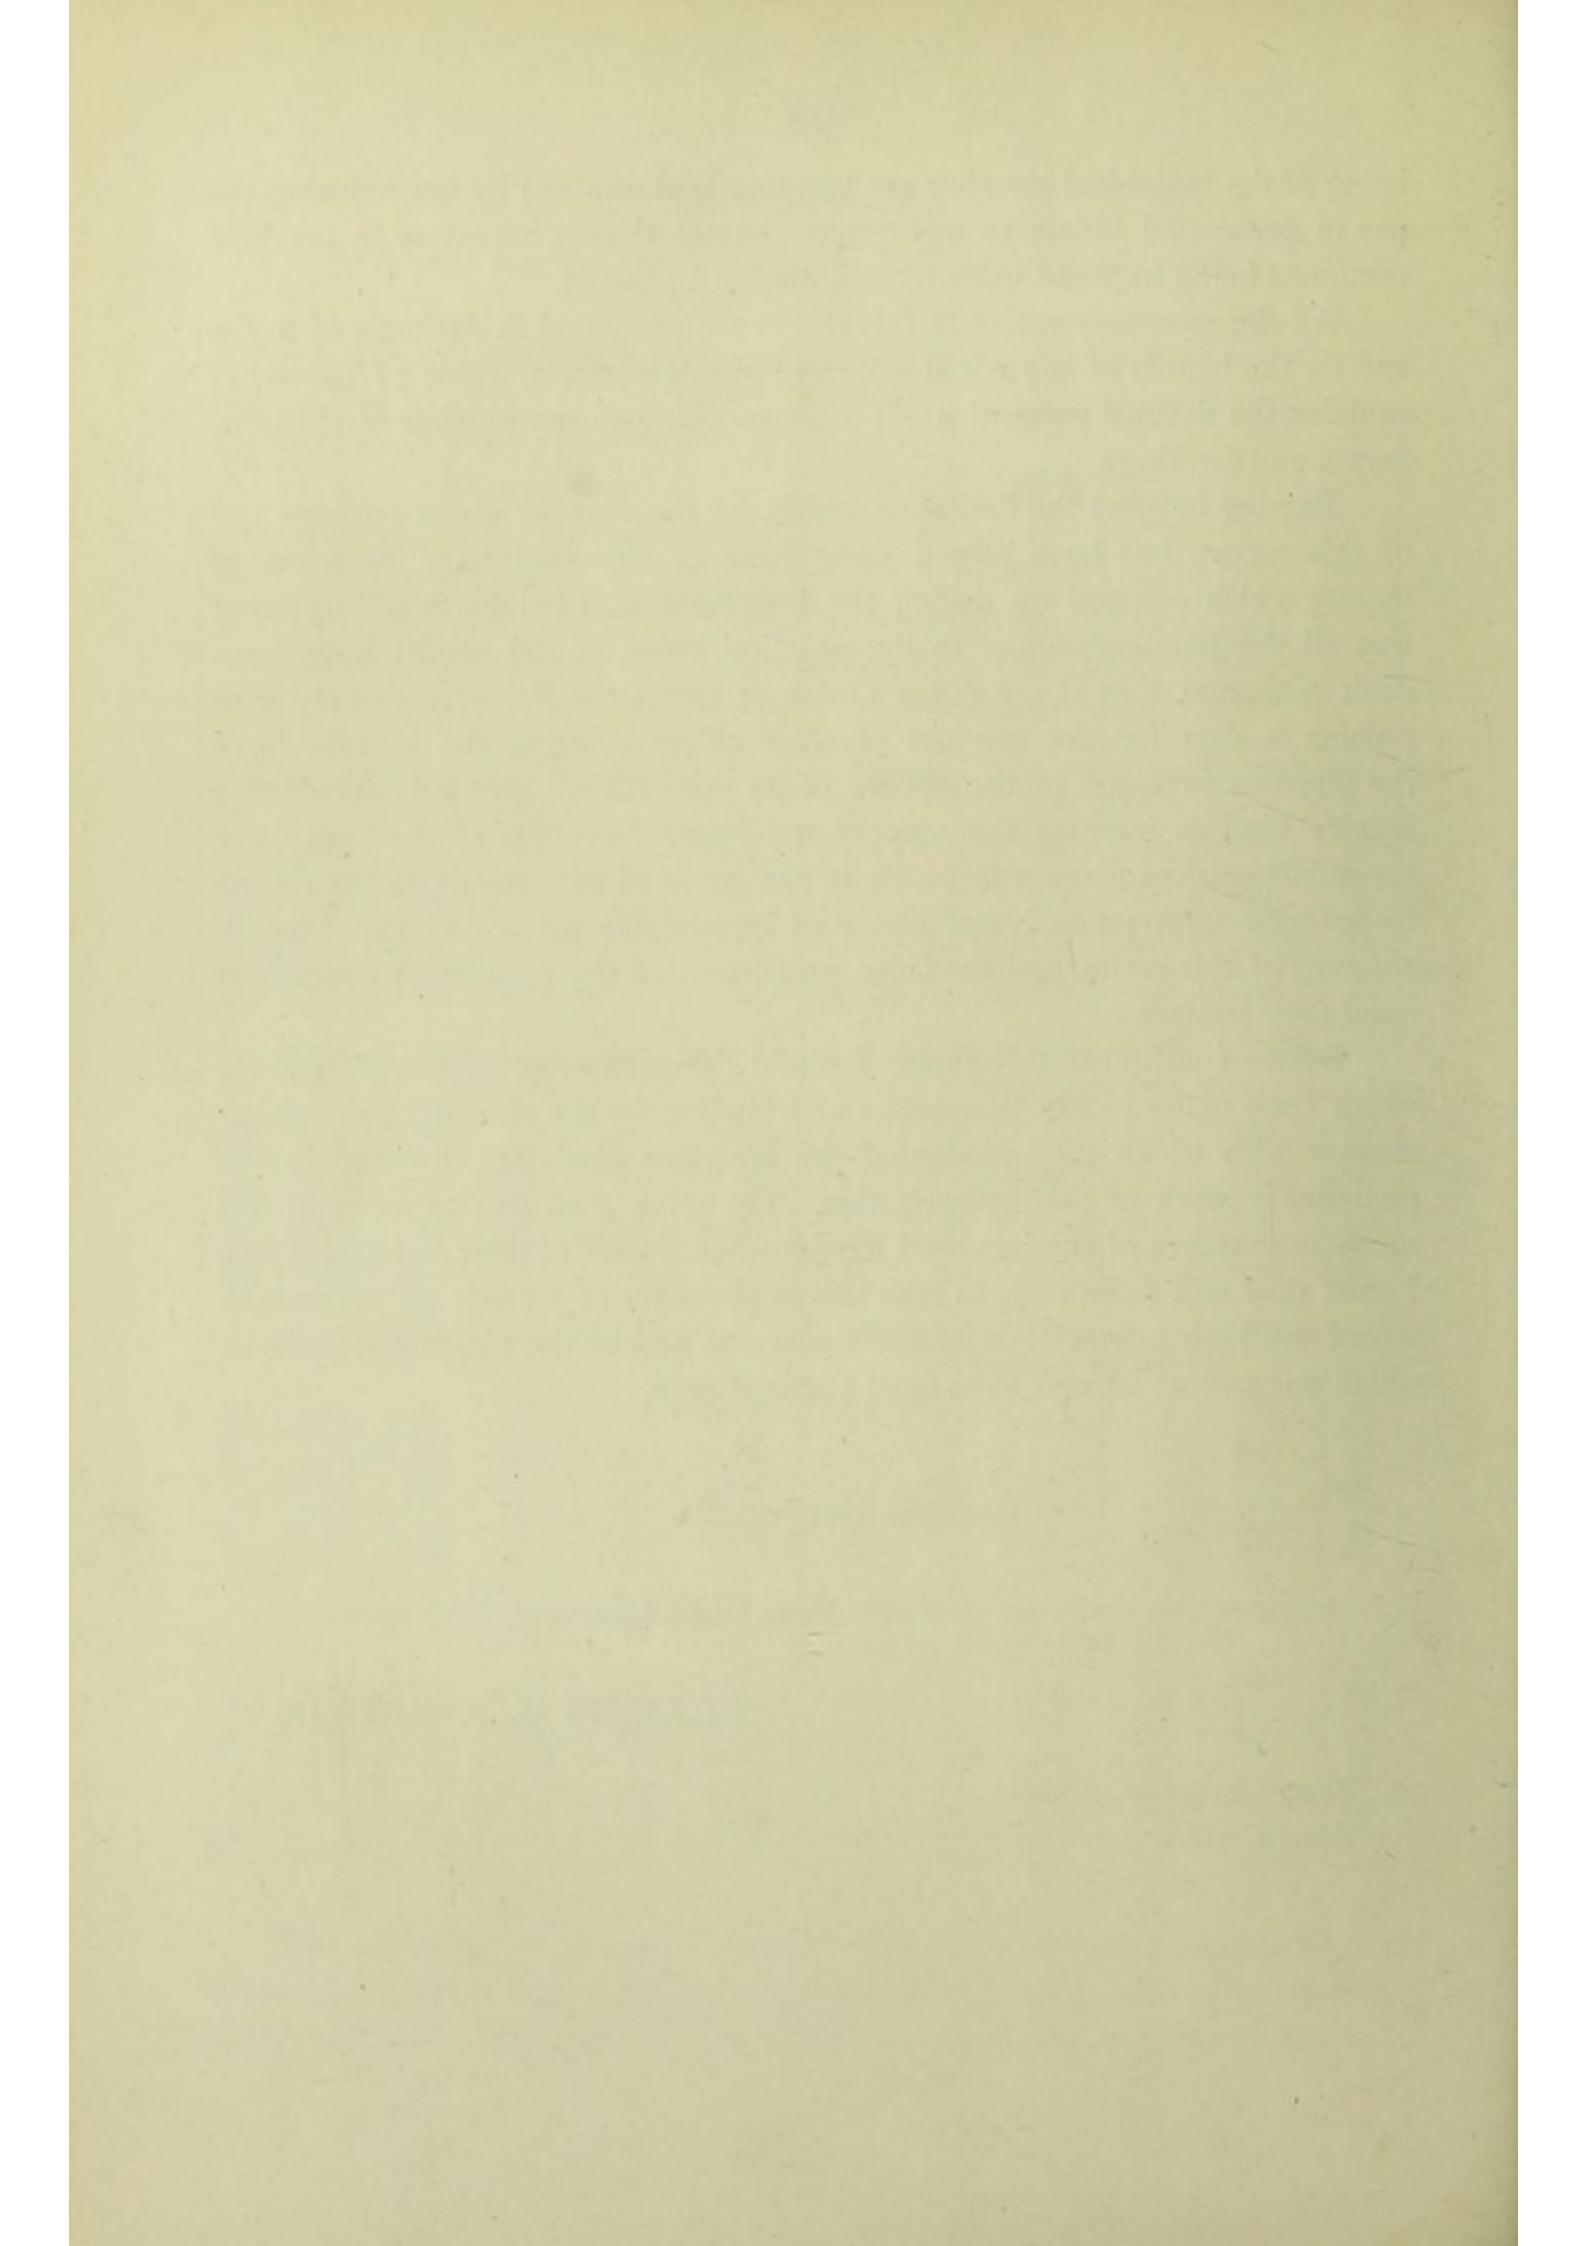

Before concluding this report I would desire to reiterate the obligations which I am under to Mr. Shawcross and his Son for the able and painstaking manner with which they conducted the laborious processes involved in the preliminary work of this investigation. On more than one occasion in the subsequent stages of the inquiry I have availed myself of their assistance, and I trust they will permit me to take this opportunity of placing on permanent record my high appreciation of their services, and of the pleasant manner in which our mutual labours have been accomplished.

I remain, Gentlemen,

Your faithful Servant,

FRANCIS G. P. NEISON.

30, Moorgate Street, London.  
March, 1882.
