S. MAW, SON & THOMPSON, in submitting to the attention of the Trade a new and improved Edition of the Book of Illustrations to their Quarterly Price-Current, tender their sincere thanks for the liberal support they have hitherto received, and earnestly solicit its continuance.

Having had so many proofs of the value of Illustrations in former Catalogues, and received such flattering acknowledgments of their utility, S. M., S. & T. have added to their number considerably in the present work, and spared no expense to render it as complete as possible.

LONDON, 1882.

BIGELOW'S EVACUATION APPARATUS.

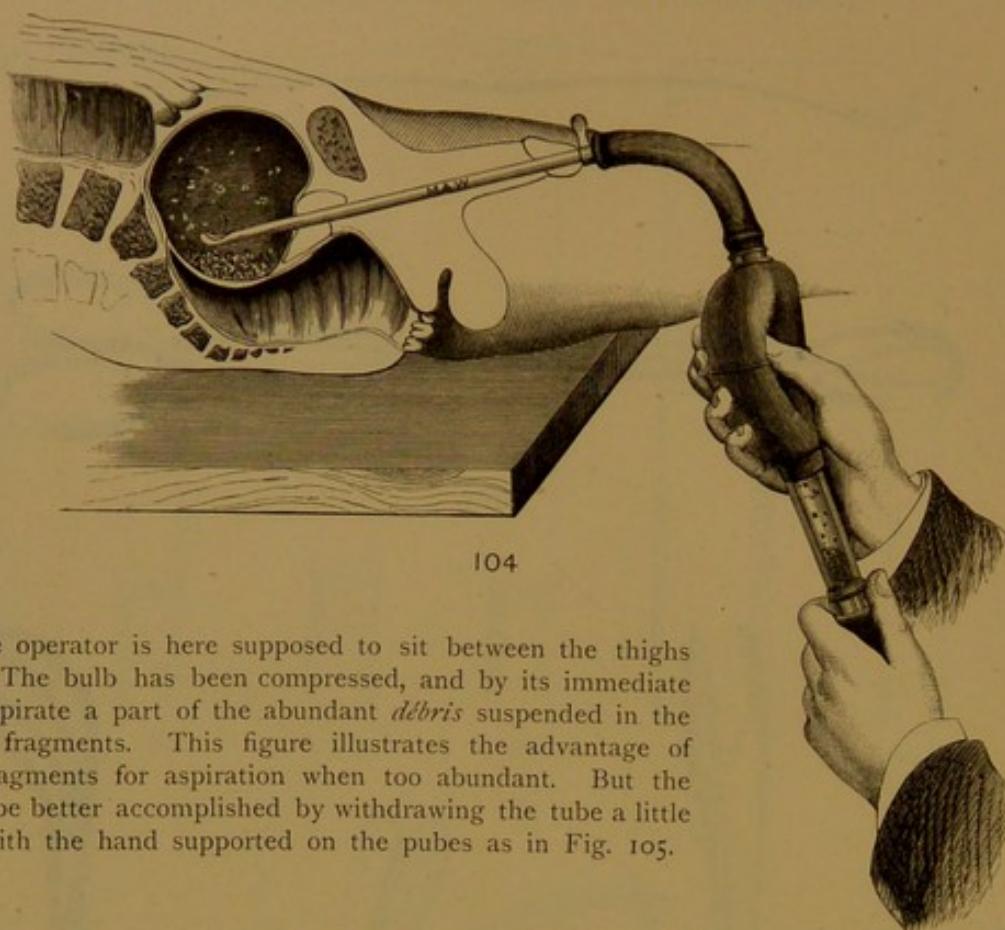

Fig. 104.—The operator is here supposed to sit between the thighs of the patient. The bulb has been compressed, and by its immediate expansion will aspirate a part of the abundant *débris* suspended in the fluid above the fragments. This figure illustrates the advantage of dispersing the fragments for aspiration when too abundant. But the same result can be better accomplished by withdrawing the tube a little from the floor with the hand supported on the pubes as in Fig. 105.

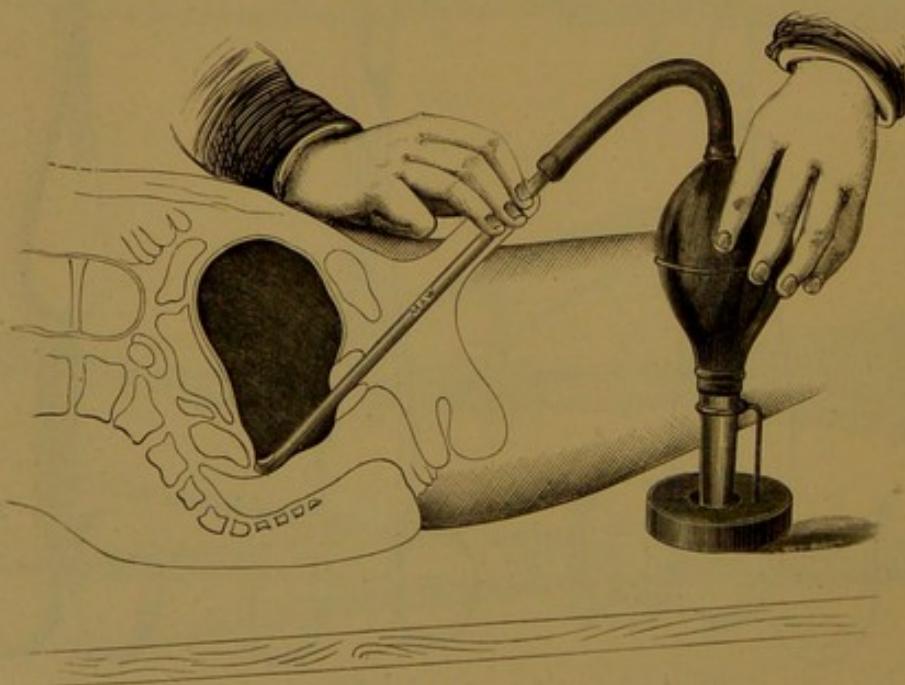

Fig. 105.—The Trap is here placed in a stand upon the table. The remaining fragments are few, and the capacious bladder is depressed to assemble them. The operator stands on the patient's left, and supports his right hand firmly upon the pubes. This position is, on the whole, the most advantageous.
