A NEW

MEDICAL DICTIONARY;

OR,

GENERAL REPOSITORY OF PHYSIC.

CONTAINING

AN EXPLANATION OF THE TERMS,

AND

A DESCRIPTION OF THE VARIOUS PARTICULARS,

RELATING TO

ANATOMY,
PHYSIOLOGY,
PHYSIC,
SURGERY,
MATERIA MEDICA,
CHEMISTRY, &c. &c. &c.

Each ARTICLE, according to its IMPORTANCE, being considered in every Relation to which its USEFULNESS extends in the HEALING ART.

By G. MOTHERBY, M.D.

"MEDICINE IS GOD'S SECOND CAUSE OF HEALTH."

THE FOURTH EDITION:

REVISED AND CORRECTED, WITH CONSIDERABLE ADDITIONS,

BY

GEORGE WALLIS, M.D.

Editor of Sydenham's Works, with Notes, &c. &c. &c. and Lecturer on the Theory and Practice of Physic.

LONDON:

PRINTED FOR J. JOHNSON, ST. PAUL'S CHURCH-YARD, G. G. AND J. ROBINSON, T. N. LONGMAN, PATERNOSTER-ROW; AND T. CADELL, JUN. AND W. DAVIES, STRAND.

PREFACE.

IT being the lot of few, compared with the multitude, to be placed in a ſtation that facilitates any conſiderable degree of knowledge, every method taken to advance improvement is doubtleſs laudable, and ſhould merit the approbation of the public: the utility of propagating what the ancients taught, and the moderns improved, muſt be obvious to thoſe who are entruſted with the care of health and life; many of whom are deſtitute of the means of acquiring this neceſſary information. To remove this impediment, in ſome degree, hath been the aſſiduous endeavour of the Editor, in the following ſheets; and he flatters himſelf that his attempt may be the means of exciting ſome abler perſon to improve upon his plan, and carry it much nearer to perfection. Mean while, if it enables thoſe for whom it is deſigned to extend their knowledge in the art they profeſs, he ſhall be fully ſatisfied with having ſucceeded ſo far.

That many books embarraſs rather than improve, is acknowledged; but an additional publication, which, in affording general inſtructions, enables the reader to *ſelect* rather than *increaſe* his volumes, cannot juſtly be ranked in this predicament. In the courſe of the following pages, each reſpective article will terminate with a reference to ſome of the moſt eminent writers on the ſubject.

It would be needleſs to apologiſe for publiſhing a Work of this kind in the alphabetical order, when it is conſidered for whom it is principally deſigned. Syſtematic productions are doubtleſs the beſt adapted for a ſtudent's regular purſuit; but ſpeedily to aſſiſt the memory in practical reſearches, alphabetical digeſts juſtly claim the preference.

Hippocrates was the firſt who methodiſed the healing art, by reducing his knowledge to a plain and uſeful ſyſtem: to add luſtre to his merit, he firſt made public what had been confined to the families of ſome of his predeceſſors; he hath deſcribed, with elegance and accuracy, moſt of the diſeaſes that are now known; the names by which he called them were the ſame as thoſe now in uſe; and his peculiar excellency conſiſted in deſcribing the diagnoſtics and prognoſtics of diſorders. The following is a liſt of the diſeaſes on which Hippocrates hath given us his inſtructions:

Abſceſſes
Achores
Alopecia
Anaſarca
Anchyloſis
Anus, inflamed
—— hard tubercles of, or near the
Appetite, canine
—— loſs of
Aphthæ
Apolepſis
Apoplexy
Arms, ſhortneſs of the
Aſcarides
Aſthma
Auante
Baldneſs
Barrenneſs
Biles
Bladder, tubercles in the
Blood, ſpitting of
—— vomiting
Blotches, red, on the legs, from ſitting by the fire
Brain, concuſſion of the
—— ruptured veſſels in the
Breath, fœtid
—— ſtraitneſs of the
Buboes
Carbuncle
Catamenia { diſordered / natural
Catoche
Cancers
Carus
Cataphora
Cachexy
Catarrh
—— a ſalt
—— a nitrous
—— a ſharp
—— a hot
—— a ſuffocative
Caries
Cheek, a ſphacelus of the
Chilblains
Cholera morbus
—— a dry
—— a moiſt
Chalk-ſtones in the joints
Cough
Coryza
Coma
—— vigil
Contractions of the fibres
Convulſions
Conſumption of the whole body
—— iſchiadic
—— nephritic
Colour, bad
Crookedneſs
Deafneſs
Delirium
Defluxion or rheum
Diarrhœa
Dreams, frightful
Dumbneſs
Dyſentery
Dyſpnœa
Dyſury
Ears, pains in the
—— redundant moiſture in the
—— ringing in the
—— tubercles about the
Ecchymoſis from contuſion
Empyema
Emproſthotonos
Epilepſy
—— in children
Epinyctides
Eryſipelas
Eruption on the ſkin
Evil
Eye, diſtortion of the
—— bleared
—— dry-bleared
—— clouds in the
—— cicatrices in the
—— pearls in the
—— white ſpots in the
—— ruptured
—— exulcerated
—— inflamed
—— dry inflammation of the
Eye-lids,
—— excreſcences on the
—— tumid outward
—— coaleſcence of the
—— ſcabby
—— tumors on the
Face, hard tubercles on the
Favi

Fainting,

Fainting
Fevers
Fiſtulas
Fractures
Freckles
Gangrene
Glaucoma
Green ſickneſs
Griping of the inteſtines
Gout
Gonorrhœa benigna
Gums, black
—— pain in the, from teething
—— tubercles on the
Hæmorrhages
Hæmorrhoids
Hearing, dull
Heartburn
Head, heavineſs of the
—— ach
—— ſcurfy
Herpes
Heſitation
Hiccough
Horror
Hoarſeneſs
Humours, diſcharge of morbid
Hyſterics
Hyperſarcoſis
Jaundice
Iliac paſſion
Impotence
Inflammation, external
—— —— internal
Itch
Itching
—— a pungent, in the mouth
Kidnies, diſorders of the
Labour, difficult
Leproſy
—— the white
Lethargy
Leucophlegmatia
Lientery
Lips, fiſſures in the
Limping
Liver, inflamed
Lochia, diſordered
Lungs, ſpaſmodically contracted
Lungs, varix in the
—— ſuppurated
Lungs, crude tubercles in the
Luxations
Madneſs
Melancholy
Mind, alienation of the
—— alienated through melancholy
Miſcarriage
Mole
Mouth, diſtorted
Naufeating food
Navel, inflamed
Neck, a hard tumor in the
Noſe, a diſcharge of pus in the
Nocturnal pollutions
Nyctalopia
Opiſthotonos
Orthopnœa
Pain
—— in the loins
Palpitation
Peripneumony
Phrenitis
Phrontis
Phlyctænæ
Placenta adhering
Plague
Pleuriſy
—— a dry
—— a moiſt
Polypus in the noſe
Pterygion
Puſtules from acrid ſweat
Pudenda, excreſcences of the
—— putrefaction of the
Pupil of the eye, too ſmall or angular
—— exulcerated
—— cicatrix of the
—— ſpoiled
—— removed from its natural ſituation
—— prominent
Quinſey
—— affecting the lungs
Reſtleſſneſs
Rheum, a defluxion of
Ruptures
Salivation, a ſpontaneous
Sciatica
Scurvy
Senſation, ſuddenly loſt
Shivering
Sight, a privation of
Skin, deſquamations of the
Speech, too volatile
Spleen, ſwelled
—— inflamed
Spine, diſtorted forwards
Sprains
Sphacelus
Stertor
Strangury
Stone
Stupidity
Stammering
Superfetation
Tabes dorſalis
Teeth, ſtupor of the
—— gnaſhing and grinding of the
—— ach
—— of both the jaws fixed together
Tetanus
Tetters
Teſticles ſwelled
Teneſmus
Terminthi
Tonſils, diſorders of the
—— ſwelled
Torpidneſs of the body
Tongue, fiſſured
—— tumor under the
Trichoſis
Tubercles of various ſorts
Tumors
Uvula, relaxed
—— retracted
—— putrified
Uterus, diſorders of the
—— falling down of the
Ulcers
Urine retained
Urethra, caruncles or tubercles in the
Voice, loſs of the
Varices
Vertigo
Warts
Worms
Whitlow
Wry neck
Wounds
White flux
Yawning.

The practice of HIPPOCRATES, with regard to the Materia Medica, was very conformable to that of the preſent period. Boerhaave obſerves, that the method of cure, purſued by the ancient phyſicians, was generally the beſt that could have been contrived with the materials of which they were poſſeſſed; though, ſince the time of Hippocrates, the ſmall-pox, meaſles, lues venerea, and a few other diſorders, have increaſed the preceding liſt; and the Arabians have greatly extended the catalogue of remedies.

The ancients have done little more than copy, comment, or vary the mode of communicating inſtructions, from what Hippocrates and a few of the primitive writers handed down to them. It muſt, indeed, be acknowledged, that in ſome inſtances the improvements of the moderns are little more than recurring to the inſtructions laid down by the great father of the Healing art. At the ſame time, without depreciating the merits of the ancients, it is juſtly aſſerted, that the moderns claim a degree of honour for having advanced medicine to its preſent ſtate: with regard to the former, their phyſiology was extremely defective, their ſkill in anatomy very imperfect, and their knowledge in chemiſtry proportionably confined; notwithſtanding their works are now frequently quoted either for confirmation or ornament. Galen, Celſus, and Ægineta, were the favourites of the great Boerhaave: his celebrated ſucceſſor follows his example; and to the ſame ends others are ſwayed in the choice of thoſe Greek or Latin authors, according to their reſpective prejudices. It may be proper here, to point out the diſtinguiſhing peculiarities of ſome of the moſt celebrated among the ancient writers.

ARETÆUS deſcribes diſeaſes with a picturesque accuracy; and in this reſpect he and Cœlius Aurelianus ſurpaſs all others among the ancients, except Celſus, who is called the Latin Hippocrates, and whoſe excellencies are ſimilar to thoſe of Aretæus: but it ought to be obſerved, that the former wrote in the Greek, the latter in the Latin tongue. In the curative part of his writings, Aretæus hath improved upon Hippocrates; and he is ſcarce equalled for method and elegance by any ſucceſſor. He begins his account of each diſeaſe with a deſcription of the part in which it is ſeated.

GALEN is an expoſitor of Hippocrates. The works of his predeceſſors receive improvement in various branches from his hands; and many valuable hints from the ancients are no where to be found but in his Collections. He ſurpaſſes all who wrote before him, with reſpect to the ſpecies, cauſes, ſeats, and ſymptoms of diſeaſes, eſpecially the acute. His maſterly treatiſe on the Seats of Diſeaſes greatly enhances the value of his Works: and what he hath left us on diet, is the baſis of moſt that his ſucceſſors have written on the ſubject.

ALEXANDER TRALLIAN is original in his plan: his diagnoſtics are remarkably exact, and his method of cure extremely rational. He confines himſelf to the deſcription of diſeaſes and their cure, in which he diſplays an extraordinary knowledge, and as nice a judgment; particularly in the curative part, in which he excels both Hippocrates and Galen. He flouriſhed in the ſixth century, from which, to the ſixteenth, we meet with but few improvements in medicine. A compendium of his excellent Works is tranſlated into Engliſh.

CŒLIUS AURELIANUS deſerves our attention: his deſcriptions of diſeaſes vie with thoſe of Aretæus, and he is very exact in pointing out the ſigns. His Works alſo contain many important paſſages from the ancients, which are not to be met with in any other productions handed down to us.

ORIBASIUS hath tranſmitted to us many excellent fragments of the ancients, which otherwiſe had been loſt; and to him we are indebted for the firſt deſcriptions of ſome few diſeaſes.

ÆGINETA is a great chirurgical writer; he hath chiefly copied from Alexander Trallian, and hath well ſupplied his omiſſions.

After the Grecian phyſicians had flouriſhed, the arms of Mahomet prevailing, ſcience was much ſuppreſſed; but at length the Arabians took the lead in phyſic: under their auſpices few improvements were made; ſo that this art rather loſt than gained by them.

RHAZES, in the beginning of the tenth century, was one of the moſt celebrated practitioners. He wrote too on every branch of phyſic and ſurgery, and introduced ſome new and uſeful inſtructions. He was the firſt who deſcribed the ſmall-pox: and ſuch are his deſcription and method of treatment, that the lateſt improvements in the management of this diſeaſe are chiefly founded on them.

HALY ABBAS, AVICENNA, AVENZOAR, AVERROES, and MESUE, have each made additions; but in general, the Arabians are entitled to little more merit than what they may claim from enlarging the Materia Medica, by introducing medicines that were generally milder and equally efficacious, and ſometimes of ſuperior efficacy to thoſe that were uſed by the Greeks and Latins.

About the middle of the fifteenth century, learning began to diffuſe itſelf throughout Europe; and in the ſixteenth, HIPPOCRATES and CELSUS were again received. GALEN and ARISTOTLE no longer maintaining their reputation as theoriſts ſolely, the Hippocratical method of concluding, from obſervations founded on experience, was again reſtored. VESALIUS now began to revive anatomy, and he improved ſurgery. EUSTACHIUS's anatomical tables are ſtill, in many reſpects, the admiration of the preſent age. Mechanical and experimental knowledge began to make advances. BACON, BOYLE, and NEWTON, cleared and extended the path of ſcience; aſtronomy appeared with new ſplendor, and medicine received freſh aids from every quarter. HARVEY aroſe to demonſtrate the circulation of the blood; ancient theories were now exploded; diſſection greatly improved; anatomy and philoſophy made rapid ſtrides; phyſiology received new lights; chemiſtry was proſecuted with ſucceſsful ardor, and every branch of medicine was thus amazingly improved.

It may eaſily be deduced, from what has been already ſaid, that, in the deſcriptions of diſeaſes, their prognoſtics, and cure, conſiſts the excellence of ancient authors; and with regard to whatever elſe relates to medicine, our recourſe muſt be to modern writers. FERNELIUS, one of the earlier moderns, hath carefully and judiciouſly collected all that is uſeful in the Works of the ancient Greek, Latin, and Arabian writers; he is alſo more perſpicuous and methodical, throwing more light on every ſubject than any of thoſe from whom he copied; hence much time and ſtudy may be ſaved by peruſing the ancients in his Works. LOMMIUS is alſo very accurate in his deſcriptions, compriſing all that is valuable in the writings of his predeceſſors. His Medical Obſervations are tranſlated into Engliſh, as are Hippocrates's Aphoriſms, the Aphoriſms of Celſus, and ſome other of the moſt valuable of their productions. With regard to the reſt of the ancient writings, their moſt intereſting parts may be met with in the ſubjoined pages. It is hoped that this Work will be found of general be-

neſit to thoſe whoſe circumſtances will not admit of an academic education, and who are nevertheleſs deſirous of obtaining a competent ſhare of medical knowledge.

By favour of the manuſcripts of ſeveral friends, who have made Medicine their principal ſtudy, the following Work is executed, in many inſtances, with an advantage that no individual unaſſiſted could poſſibly have obtained: to their judicious labours and generous aid, a general, but grateful acknowledgment is here paid; not but the importance of their ſupplies well deſerve that particular thanks ſhould be given in each article, the principal worth of which is derived from their ingenious contributions.

One principal uſe of a Medical Dictionary is, to diſcover in haſte what the preſent urgency requires; therefore, in the proſecution of what follows, peculiar care hath been taken that the buſy practitioner may refreſh his memory, or derive a hint, without the tedious labour of ſearching over many leaves. To convey a proper idea of this Work, and to aſſiſt in an uſeful and ſatisfactory peruſal of it, the following general deſign and arrangement are laid before the reader.

I. Technical terms, proper names, &c. have their etymology given; and where a farther explanation is required, it is added with conciſeneſs and perſpicuity.

II. That wanton variety to which ſome authors have yielded, in giving different names to the ſame ſubject, and the ſame names to different ones, ſerves but to perplex the inquirer; care hath, therefore, been taken to obviate this error, and each article is diſcuſſed under that name which is moſt in uſe; and its other names take their place in their reſpective order, referring to that under which the explanation is inſerted, except for the etymology.

III. Anatomical ſubjects have,

1. Their various names immediately ſucceeding that by which they are moſt commonly known.
2. A conciſe deſcription, as far as may be of ſervice to the medical practitioner.
3. Where an account of their uſe can contribute any advantage, as far as art hath enabled us, this is alſo regarded.

IV. Diſeaſes, according to their importance, either as to inconvenience to the patient, tedioufneſs in the cure, or danger of life, are conſidered with reſpect to ſome, or all the following particulars:

1. Their various names, or at leaſt thoſe moſt generally known.
2. —— general rank.
3. —— different ſpecies.
4. —— ſeat.
5. Who, and when they are moſt ſubject to them.
6. Their cauſes.
7. —— Signs, Diagnoſtic and Prognoſtic.
8. What diſeaſes they reſemble.
9. Their occaſional ſymptoms.
10. Preventives.
11. Indications of cure.
12. The proper regimen.
13. The methods of cure, both manual and medical.
14. Their uſual modes of terminating.

V. The articles of the Materia Medica are attended to, according to their importance in practice, under ſome, or all, the following conſiderations:

1. Their various names that are generally known.
2. Where had.
3. How produced.
4. The deſcription.
5. The marks of diſtinction directing to chuſe the beſt of each article reſpectively.
6. Their moſt manifeſt medical powers.
7. When the uſe thereof is hurtful.
8. The beſt remedies againſt their imprudent uſe.
9. Doſes.
10. The various preparations of, and from, the reſpective articles. In this part, the principles of pharmacy will neceſſarily be introduced. The directions given are the reſult only of experiments and obſervations made, according to the moſt approved practice.
11. The moſt agreeable modes of adminiſtering.
12. Subſtitutes.
13. How to detect adulterations.
14. What ſhould precede, accompany, or follow the uſe of any article, to render its effects more uſeful and certain.
15. The analyſis.

VI. At the concluſion of each ſubject, there is a reference to the moſt approved authors who have written upon it: the reader will hereby be enabled to proceed to an acquaintance with all that hath been ſaid (or at leaſt that merits his attention) reſpecting his enquiry, and thus, as inclination favours, he may proceed to obtain a competent ſkill in thoſe branches to which his avocations more directly lead, or extend his purſuits to every part that completes the character he profeſſes.

PREFACE

TO THE THIRD EDITION.

THE Medical Dictionary having met with ſo favourable a reception from the public, as to run through a ſecond Edition in a ſhort ſpace of time, is no inconſiderable teſt of its merit, and hence it may appear ſingular, that the Work ſhould fall into any other than the hands of the firſt editor, during his life, for farther correction and improvement.—Indeed, it is to be lamented, that the ill ſtate of Dr. Motherby's health, a man ſo well calculated for the execution of a Work of this nature, ſhould render the change unavoidable; for when he undertook a reviſion of this third edition, to which he had made ſome additions, he found, unfortunately, his memory inadequate to the attempt; and perceived it ſuffer much from the application requiſite to complete ſo laborious a taſk: diffident therefore of his own abilities from this cauſe, and unwilling to palm a work upon the world in too imperfect a ſtate, he ſolicited me to undertake it, and was very earneſt in his requeſt, as I had long been in habits of friendſhip with him, and from various converſations on this ſubject, perfectly underſtood the improvements he was deſirous of having adopted;—on theſe accounts he put the work into my hands, with full liberty to make ſuch alterations as I might think proper, ſupplying me with various hints as they occurred to him.

It will readily be conceived in how delicate a predicament a man thus ſituated muſt ſtand, attempting to correct and improve the work of a living author, and that author his friend—a work which has ſhowered upon him no ſmall ſhare of reputation, the reflection of which perhaps conſtitutes one of his greateſt pleaſures. To obliterate therefore any of his fixed principles, upon which he has founded a number of his theories, and reaſoning, though perhaps not totally according with my own modes of thinking, might be thought repaying friendſhip with cruelty, and ſacrificing confidence to vanity;—I have therefore let ſuch doctrines as he has adopted, ſtand unaltered; only, here and there, endeavouring, where it appeared neceſſary, to elucidate and place them in a clearer point of view; and purſued ſuch plans throughout the whole, as might co-operate with his wiſhes, centred in rendering himſelf not an unprofitable member to the community.

Knowing that his idea was to enrich the work with more practical documents, I have made that the principal conſideration; and have thrown out ſuch parts as ſeemed not cloſely connected with medical utility, in order to give place for other remarks which were more intimately united with, and eſſential to, a ſucceſsful practice.

Hence all the Foſſilogy of EDWARDS which belongs to Arts, Manufactures, and Commerce, is reſcinded, and ſuch parts only ſuffered to remain, as have been, or are, conſidered to belong to Medicine.

The Biographical part has alſo ſhared the ſame fate; becauſe I thought the hiſtorical accounts of the Lives of the Grecian, Arabian, and other Philoſophers and Phyſicians, were much too conciſe, as not comprehending ſufficient to do juſtice to the memories of men, whoſe abilities, improvements, and diſcoveries, were too partially and too vaguely collected, eſpecially as the Hiſtory of Phyſic has employed the pens of many able writers, who have gone more at large into the ſubject, and muſt be read by ſuch as wiſh for any information on that head:—beſides, being more calculated to gratify curioſity, than become beneficial, it was better omitted in a work of this kind.—And I flatter myſelf, ſuch defalcation will not be conſtrued detrimental, as more uſeful matter ſupplies the place; for in the former edition, wherever there appeared any omiſſions, which rendered the ſubject treated of incomplete, theſe have been corrected, and freſh materials added to make up the defect, and many references to thoſe authors annexed, who have written moſt clearly and copiouſly on the ſubject; and whoſe works have received the diſtinguiſhing marks of public approbation.

The powers and virtues of Medicines have been particularly attended to, and many additions inſerted in this department, from practice, as well as from the labors of authors, who have taken great pains in inveſtigating the modes of action of theſe ſo neceſſary materials, and hence identified their efficacy in many diſeaſes, particularly BOERHAAVE, CULLEN, LEWIS, HOME, DUNCAN, WHYTT, and ſeveral others; as well as the different periodical publications of London and Edinburgh, wherein opinions ſeem to be delivered from experiment, the fountain from whence dependence can only be derived with any degree of confidence.

Nor have the medicated ſprings, a knowledge of whoſe powers and peculiar effects forms ſo neceſſary a part of the practitioner's information, eſcaped attention, and in which points the former Editions were infinitely too defective.—Here the component parts are not only given as diſcovered by analyſation of the beſt phyſicians and chemiſts, who have turned their thoughts on this point, and have experimentally proved what they have delivered from repeated trials; but the conſtitutional effects have been marked; the doſe aſcertained; the method of adminiſtering them pointed out; the ſeaſon wherein they poſſeſs their greateſt vigor; and the dietetic, and medicinal plan deſcribed, which ought to accompany their exhibition, with the time requiſite for their continuance.

With regard to the Galenical preparations, all thoſe which have been proved uſeleſs are rejected, and alſo a number of farraginous maſſes, upon whoſe action there could be no dependence; for they ſerved only to perplex and foil the practitioner, in aſcertaining to which of the ingredients he was to attribute any effects produced by them, and were in general nauſeous, and offenſive to the ſtomach:—their places are ſupplied with other more ſimple, elegant, and efficacious compoſitions; and the new names, as adopted by the Royal College of Phyſicians of London, are added; ſo that we are generally led to the ingredients of which moſt of them conſiſt, and always to that which is conſidered by that body the moſt active: conſequently the preciſe nature of the compound will be at once found out with reſpect to its action,—an advantage peculiarly uſeful to the medical Tyro; nor are there any preſcriptions omitted which have ſtood in high eſtimation, and been confirmed by private practice, that have occurred to my obſervation, which might not have found their way into any Diſpenſatory, or been enumerated in any formulæ already given to the public.

Another improvement has been adopted, which will doubtleſs be eſteemed a very material one, and that is, a total alteration of the Index ſupplied by Dr. Motherby in the former Editions. For the Doctor had united a number of the Greek and Latin ſynonymes, with ſome of the Engliſh names of many diſeaſes, medicines, and other materials, though by no means ſo fully as to render the Index as uſeful as might be expected; beſides the apparent inaccuracy in ſuch an arrangement, blending together a number of original terms with thoſe which muſt be conſidered only as explanatory of ſuch terms. The ſynonymes are therefore embodied and referred to the word under which the particular deſcription of the diſeaſe, medicine, ſubſtance, or term, wanted to be defined, is given. For in many it will be found that ſome peculiarities are mentioned under the ſynonyme, that have eſcaped attention under the common, or generic term, an accident unavoidable in ſo complex an undertaking as a Dictionary of any Art or Science, conſiſting of ſuch a variety of diviſions; and this has been thought right upon another account. For as authors uſe different words to expreſs the ſame thing; and ſome have ſuch an amazing variety, not only in the ſame language, but adapted to ſeveral others, agreeable to the idiom of that in which any medical or chemical work is written; hence, in the peruſal of very ancient, or foreign authors, much eaſe will be derived to the reader; for in meeting with a term by no means familiar, he will, by turning to the word in this Dictionary, be immediately led to that, where the information wanted may be acquired, viz. MERCURIUS,—Mercury, has a multiplicity of denominations—*Hydrargyrus*; *Liquor metallorum*; *Metallum fluidum*; *Argentum juſum*; *Argentum mobile*; *Vomica liquoris æterni*; *Adibut*; *Alborca*; *Alcharith*; *Alembic*; *Alambic*; *Alkaut*; and a great number more, known I believe to few readers; by turning to any one of which in this Work, he will be referred to ARGENTUM VIVUM, from MERCURIUS. The ſame might be ſaid of a vaſt variety more, but what has been advanced will afford ſufficient proof of the benefit annexed to ſuch a ſcheme, and ſerve as a full explanation of the whole which ſo often occur.

And as the practice of phyſic is by no means confined to ſuch as are verſed in the Greek, Latin, Arabian, and ſome more modern, though foreign languages, from whence has been, and is deduced no ſmall ſhare of medical information, but on the contrary great numbers are almoſt totally ignorant of every other, except that of this country, amongſt whom this Work is likely to be in general uſe,—an Index of Terms purely Engliſh has been formed, ſuch as are moſt commonly in uſe, and by which diſeaſes and medicines, vegetable as well as mineral, are generally known, and a variety of other terms of art, which would not be diſcoverable by thoſe readers without ſuch aſſiſtance. The Engliſh names are therefore arranged alpha-

alphabetically, and referred to the page where each article may be found, rather than to the term under which they are placed: and this was done for the purpoſe of giving a greater number of words in a much ſmaller compaſs, and referring ſuch as might be mentioned in two, three, or more places from one point, and that any thing which was ſcattered in different parts of the Work on that particular ſubject, might be readily collected, and a view given at once of all the information here to be acquired; and, in order to catch the eye in ſearching for any term wanted, referred to from the Index to the page, the term will be found in ſmall Roman capitals, or Italics, viz. CASTOR OIL, will be found in p. 203; DOG'S TOOTH, p. 290; TOOTH SHELL, p. 291; by any inquirer looking into the Index, as well as by thoſe who know, they ſtand under CATAPUTIA, DENS CANIS, and DENTALIUM. Hence the commoneſt readers will be at no loſs in finding any word in this Dictionary, under however obſolete or ancient a term it may be placed. Though here it muſt be obſerved, every individual word is not included, as that was thought unneceſſary, where the Engliſh term comes ſo near to the Latin, that on looking for the word as written in our own vernacular language, the Latin word preſents itſelf in the ſame order, from the letters being ſimilarly arranged, and perfectly alike, except in the mode of Termination, viz. SINAPISMUS, Sinapiſm; BISMUTHUM, Biſmuth; CONFORMATIO, Conformation, &c. And here it ſhould be obſerved that ſeveral words in the body of the Dictionary, as well as in the Index, may not probably be found under the general term; the Reader is therefore deſired to look for the Epithet with which it is commonly joined, as CRURALES ARTERIÆ, EMPIRICA SECTA, &c. will be found under the words CRURALES and EMPIRICA.

Beſides theſe advantages, as the art of Midwifery is certainly one branch of medicine, and has been copiouſly treated of in this Work, and the former Editions had not ſupplied plates explanatory of any part of the Obſtetric Art, there are now added four double plates, containing nine views of the gravid uterus, in the different ſtages of pregnancy, in which is included one of twins; whereby the female organs of generation are given in a practical light, the different changes they ſuffer during gravidity, and the natural preſentations of the fœtus in utero; and theſe have been ſelected, in preference to all others, in order to give an idea of the nature of many complaints originating from pregnancy as a cauſe, particularly ſuch as depend upon the diſtenſion of the uterus, and the elevation and preſſure which other parts of the thorax and abdomen ſuffer on this account, by which means the moſt ſalutary modes of proceeding in delivery may be, with very little trouble, underſtood in the time of parturition; and the method not only of relieving a number of troubleſome and perplexing complaints during pregnancy, but the moſt rational means diſcovered of preventing them, and others, which might ariſe after delivery; advantages that cannot be aſcertained by the practitioner without a minute knowledge of theſe particulars.

Such then are the alterations, corrections, and improvements, under which this Dictionary has paſſed; and it is hoped that they will, in a proportionate degree, increaſe its value; particularly as all the uſeful parts in the former Editions ſtill remain in this, and nothing has been taken from them, but what has been ſupplied by more practical documents, to anſwer more perfectly and completely the primary intention of this publication. And though it may be preſumed, that many alterations might yet be advantageouſly made, ſtill few books will be found replete with more general utility, forming a copious memento to adepts in every department of medical ſcience; and furniſhing a large ſhare of knowledge, well arranged, and eaſy to be comprehended by thoſe who are entering into, or have not been long converſant with the practice of the Medical Art. Indeed if we conſider the great quantity of freſh matter, wherever any improvements preſented themſelves, which has been introduced, beſides the elegant engravings inſerted to elucidate particular ſubjects, and give clear deſcriptions of ſeveral parts, which would otherwiſe have appeared too embarraſſed and abſtruſe, it muſt be acknowledged that the Proprietors have ſpared no expence to render this Work ſtill further worthy of public approbation, of which I cannot avoid having ſome expectation, as Dr. Motherby, the former Editor of this Work, in a Letter to me, ſays, ſpeaking of the Medical Dictionary, the ſheets of which he had peruſed, "*the many alterations and improvements you "have made, I acknowledge with great pleaſure.*"

G. W.

PREFACE

TO THE FOURTH EDITION.

IT may not, perhaps, be expected by thoſe, who are inattentive to the daily progreſs made in Arts and Sciences, that, in a Work ſo recently publiſhed as the third Edition of the Medical Dictionary, ſo many Improvements can have occurred, as to render this Fourth, now offered to the public, much more valuable than the former.

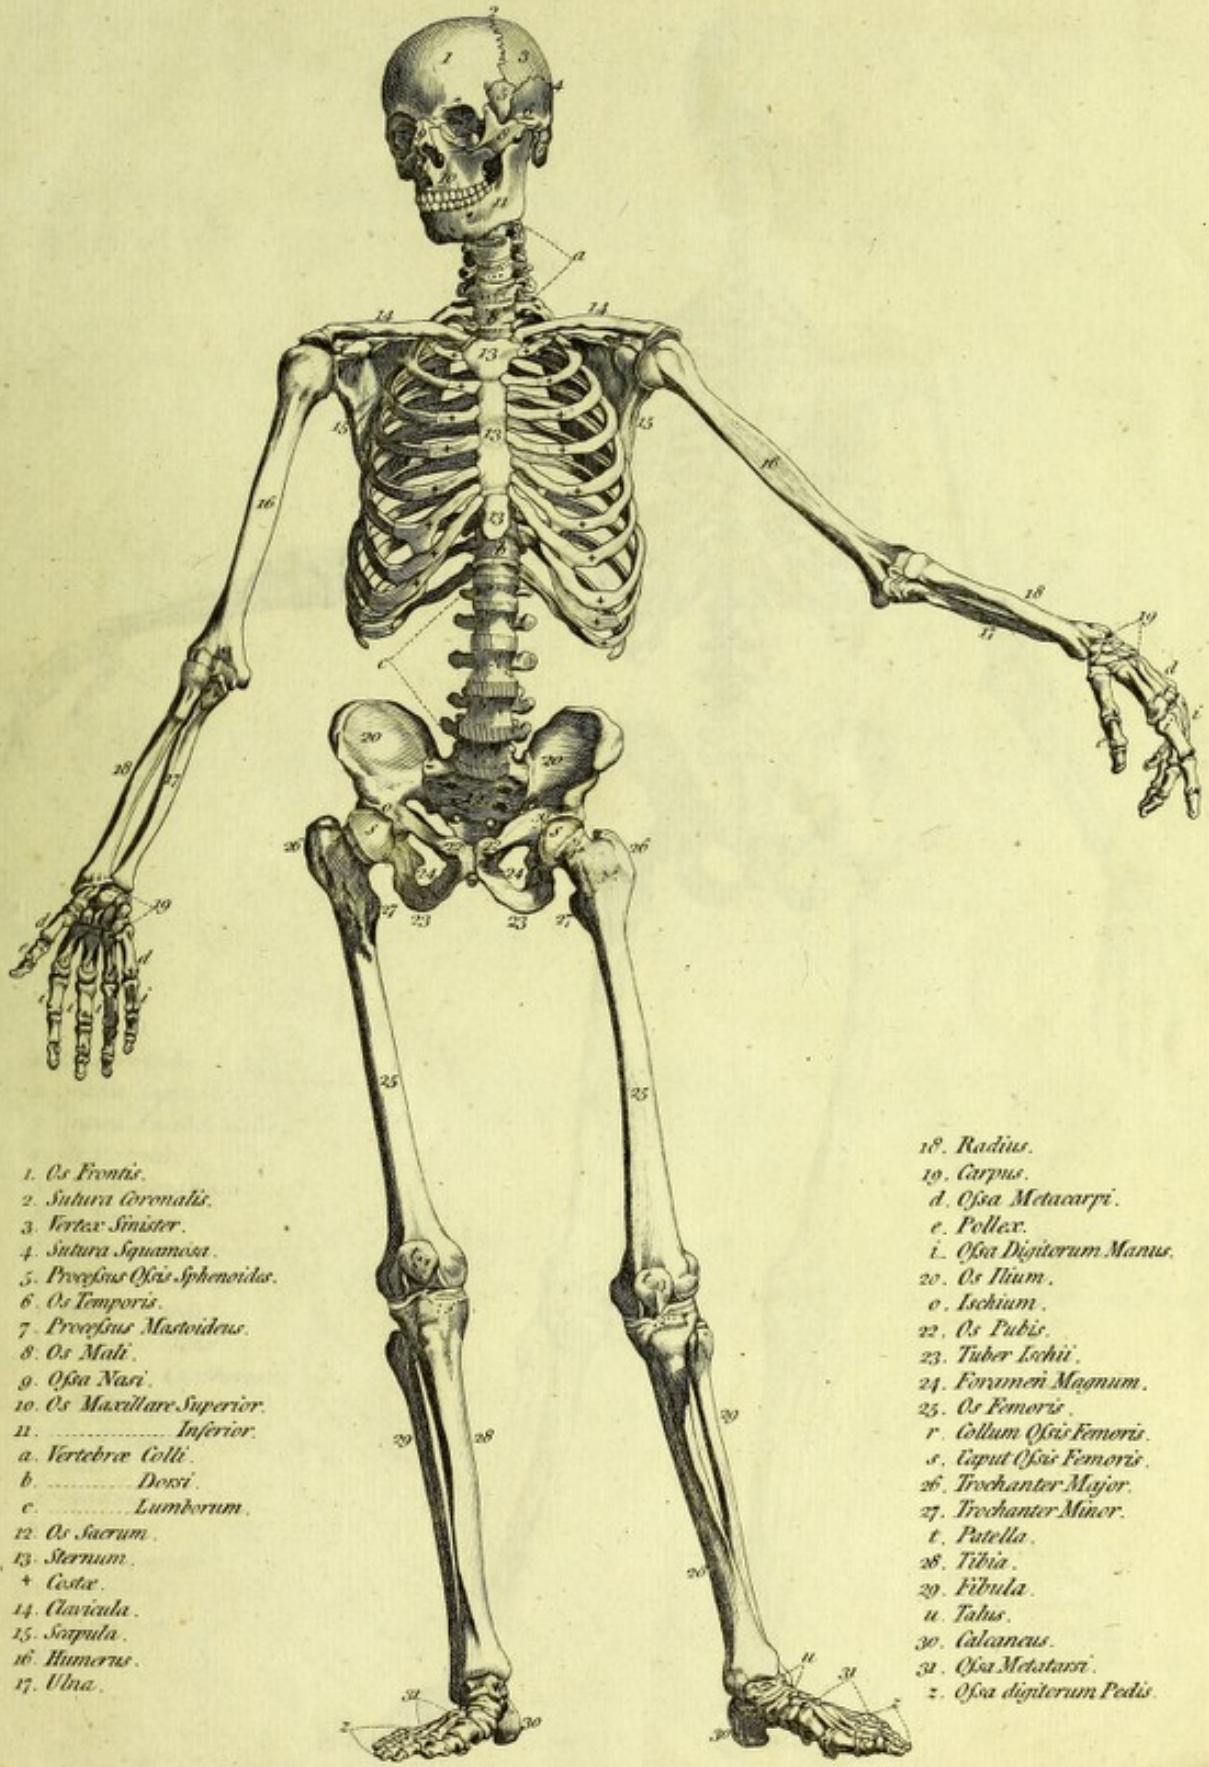
But if it be conſidered that Medicine has, for a long time, with moſt of its collateral branches, been obſcured by ſpeculative Ideas, falſe Theories, and Reaſonings from thence deduced, of conſequence equally fallacious—that a variety of fantaſtical opinions, imbibed from characters formerly held in high eſtimation, are not yet done away—that the method of inveſtigating Medical Subjects is almoſt totally changed; and that men of the firſt abilities are labouring to attain truth by indefatigable experiments,—the proſpect will alter, and it may, not without juſtice, be concluded, that a number of errors are corrected, and freſh improvements conſtantly added to that Science.

Beſides, practitioners long having ſeen and experienced the folly of paying *implicit* obedience to the opinions of any Man, or ſet of Men, from being ſo often deceived by bold aſſertions, have nobly broken thoſe ſhackles of ſurperſtitious ſlavery, and dared to think for themſelves, forming their own opinions from the real appearance of things, and not from imaginary cauſes; by which means greater are the number puſhing forward in purſuit of practical truths, whoſe labours are perceptibly rewarded by new diſcoveries, which more and more enrich the plan of rational Medicine; whilſt its auxiliary branches experience from the ſame ſources the ſame melioration. Indeed with ſuch ſucceſs has the ART OF CHEMISTRY been crowned, that it has proved, and made obvious to our ſenſes, that what were for ages held forth as univerſal principles or elements of which all bodies were compoſed, were themſelves, fire excepted, decompoſable, readily analyſed, and divided into the different materials of which they were formed. ANATOMY has demonſtrated to us, that many cauſes, from which a variety of diſeaſes were ſuppoſed to deduce their origin, exiſted not in the machine; but that they proceeded from ſources, of which at that time no conjecture was even formed: and hence, by ſhewing the neceſſity of minute hiſtories being taken of the beginning, progreſs, and termination of complaints, with the different effects produced by different applications, many diſeaſes before apparently complicated, and perplexed, have been ſimplified by obſervation, and reduced to a narrow compaſs; thus, reſting on experience, a clearer mode of reaſoning, and more certain deductions have preſented themſelves, contributing to promote the welfare of the patient, by making the path of information clear and eaſy to the practitioner.

Nor has BOTANY been tardy in its improvements: the generic and ſpecific marks of every plant have been pointed out with ſuch preciſion, in almoſt all the productions of the vegetable kingdom, that it is impoſſible to err in the ſelection of the different roots and plants which may be required. Add to this that Botanical writers have collected the Medical virtues attributed to each, and hence their labours prove more beneficial to practice—whilſt the CHEMICAL and PHARMACEUTICAL ARTS have made us acquainted with the parts of each, moſt active and effectual in producing thoſe various powers on the machine, which have been aſcertained by repeated trials, and confirmed by unwearied induſtry, and accurate diſcrimination; informing us at the ſame time of the moſt ſuperior, and ſucceſsful modes of application.

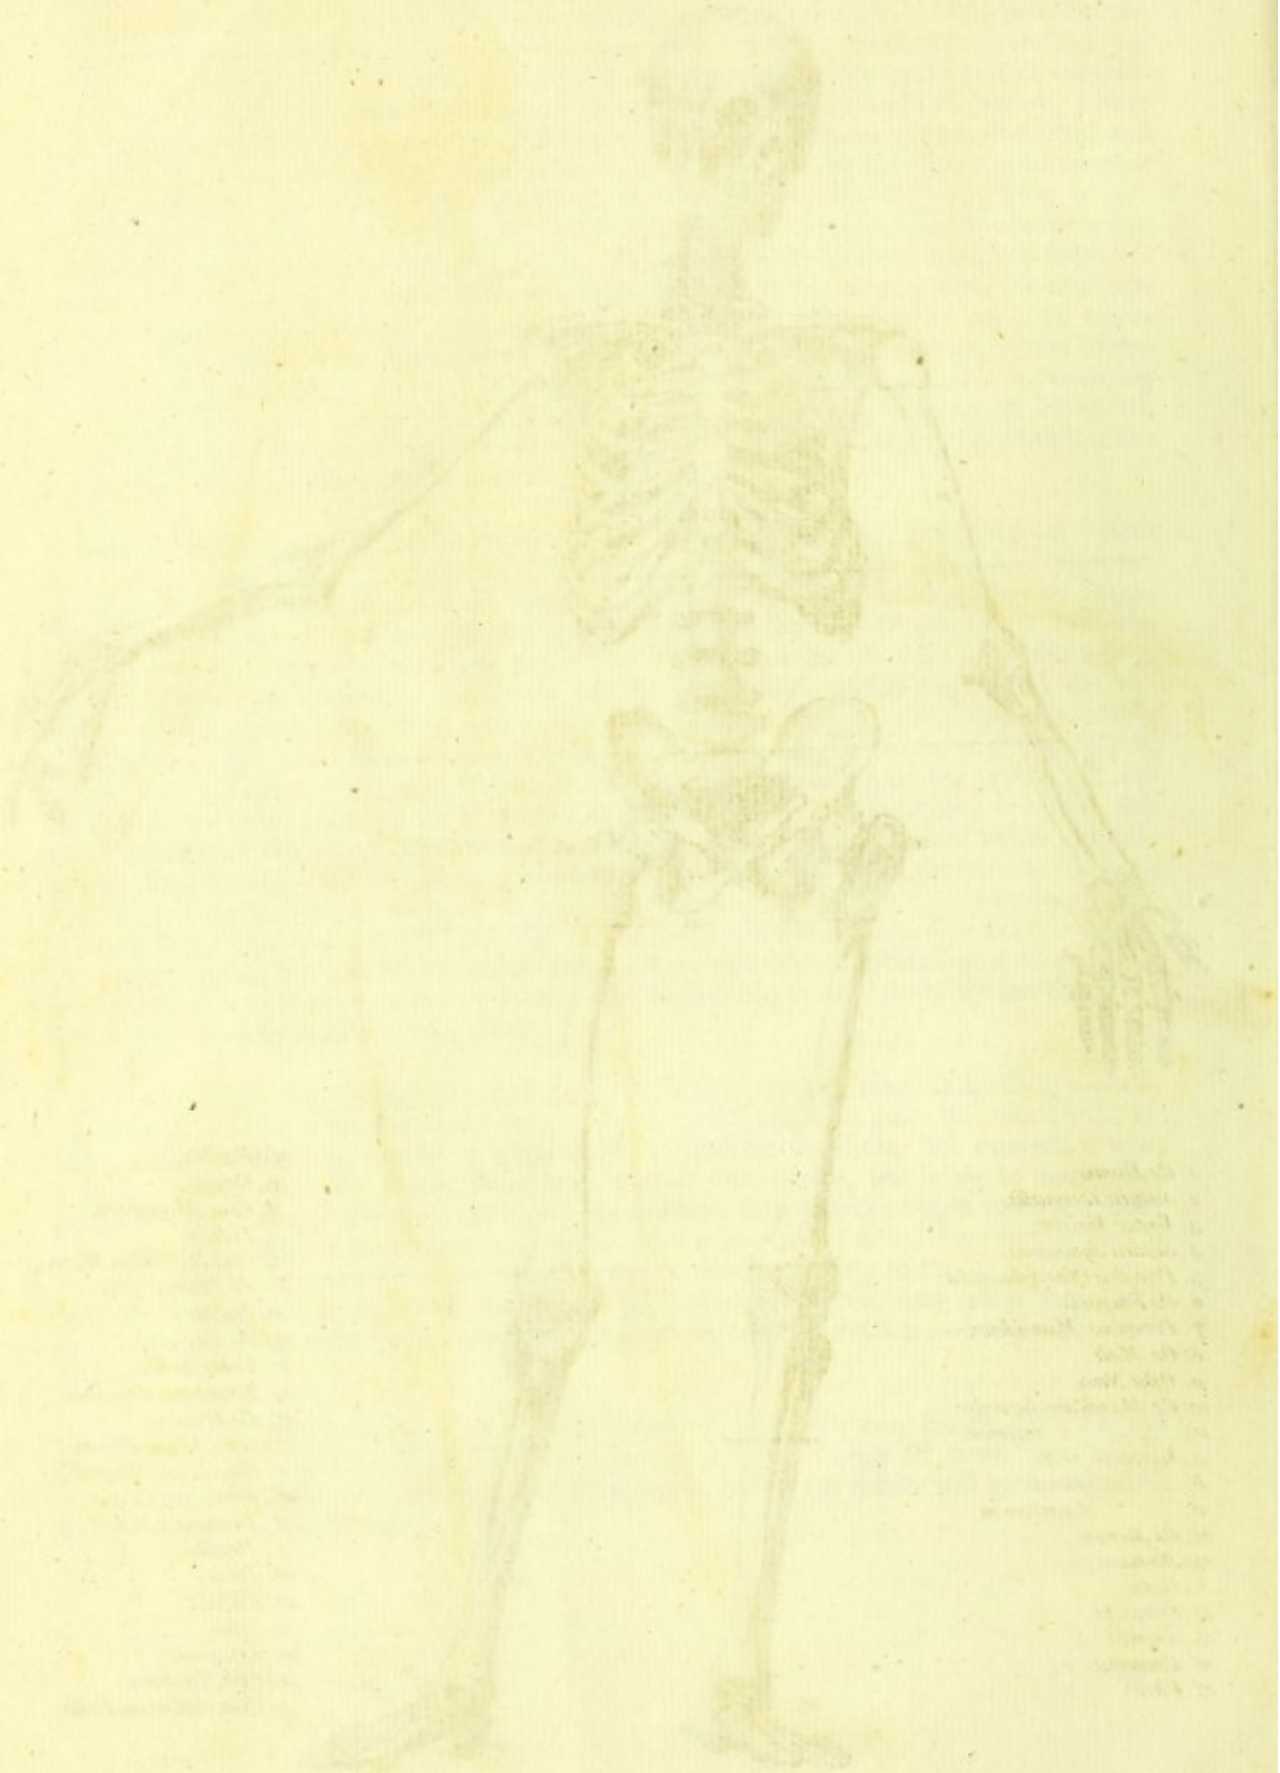
The

The Practice of Medicine then, with all its auxiliary arts, being purſued in this plain and ſimple manner, depending upon facts only where facts can be eſtabliſhed, is perpetually furniſhing freſh materials, of which it is the duty of every Author or Editor to take notice. But during the life of DR. MOTHERBY, who originally formed the plan of this Dictionary, delicacy prevented me from obliterating many parts of the work, as it would have been painful to him to have ſeen his labours too laviſhly curtailed, though it were done for the purpoſe of making room for more uſeful improvements. On this account, therefore, I was obliged to omit many things which appeared to me neceſſary for the more perfect completion of this Work. As, however, he has, ſome time ſince, paid the Debt of Nature, I have been ſet at liberty, and have availed myſelf of the opportunity of making ſuch alterations and additions, as to render theſe ſheets more uſeful to the practitioner by inſerting a great number of improvements; particularly with regard to the diſcovery of the ſpecific nature of diſeaſes, their pathognomic ſymptoms, and modes of cure, which occaſion this Work to deviate conſiderably from any of the former Editions. I have carefully inſerted CONCISE DEFINITIONS of every malady from the beſt authorities, given DESCRIPTIONS from the moſt approved Authors, and ſubjoined ſuch peculiarities as have been ratified by my own experience. THE POWERS OF MEDICINES, with their preciſe modes of action, where aſcertainable, I have cautiouſly marked down agreeable to the doſes adminiſtered; not omitting the various forms and compoſitions which are made uſe of in the practice of Hoſpitals, hence ſupplying a PHARMACOPOEIA CHIRURGICA, a matter not only much wanted in the former Editions, but alſo a deſideratum in general practice.



Some new plates are alſo added relative to the *Brain* and *Nerves*, as the nervous ſyſtem ſeems to be much more the object of Medical inquiry than formerly, and which promiſes the higheſt benefit to the Practice of Phyſic. A view is alſo given of the *Chemical Apparatus* of the Moderns, by which all the operations in that Art may be performed with the greateſt eaſe and certainty; and one explaining the *Inſtruments made uſe of in Midwifery*, by which means the operations themſelves will be much more readily underſtood, the neceſſity of having recourſe to them more clearly pointed out, and the beſt mode of applying them more exactly comprehended, than could have been conveyed to the mind of the ſtudent, by the moſt elaborate deſcription without them. In fine, every thing has been done, according to my conception, as far as the limits of one Volume would admit, to render this Work a practical Repoſitory of Medical Knowledge in all common caſes; and where any ſubject has been treated with conciſeneſs, which in many was unavoidable, perſpicuity has been ſtudied, and copious references made to particular Authors, for the uſe of thoſe who wiſh to go more deeply into any ſubject they may have treated of more at large.—Upon the whole, I have little doubt but this Work will be found of general utility; and though it cannot boaſt of perfection, it will amply repay thoſe who will condeſcend to conſult it, for the time they beſtow, by the information it will afford.

In an Art ſo extenſively diffuſive as that of Medicine, there are many intereſting particulars which may eſcape the memories even of the beſt informed: to them this work will, by aiding their recollection, not be an unprofitable memento; to others, leſs converſant with practice, it will not only ſupply them with careful information, but bring to their view, without much labour, the very principles upon which their practice ought to be founded; teach them to think for themſelves, and reaſon from well-atteſted facts; for every ſubject is diveſted of ambiguity, and ſet in the cleareſt point of view, according to the general received opinions: hence the young mind, having few particulars to obſerve, may retain them with eaſe;—purſue them with pleaſure;—reaſon from them with ſatisfaction;—and practiſe with ſecurity.



Fraught with theſe advantages, the Fourth Edition of this Dictionary is now offered to the Public.—On that candour it has hitherto experienced, it again relies for protection, which to merit, will be highly ſatisfactory to the Proprietors, and to the Editor will give a pleaſure better conceived than deſcribed.

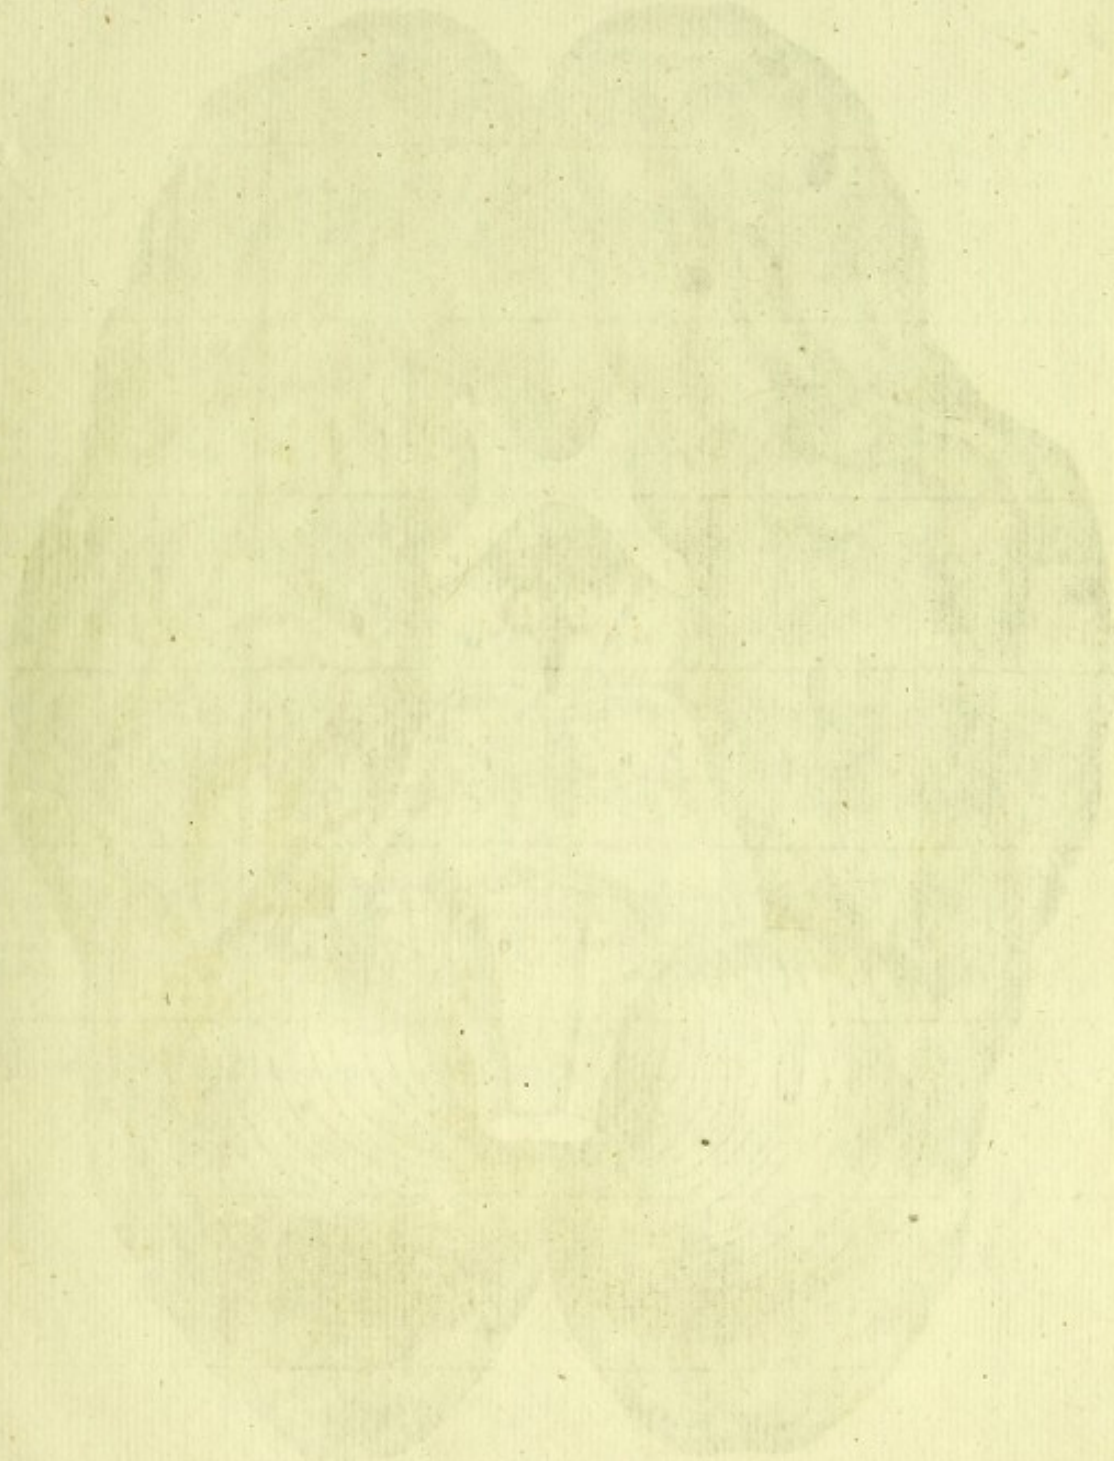
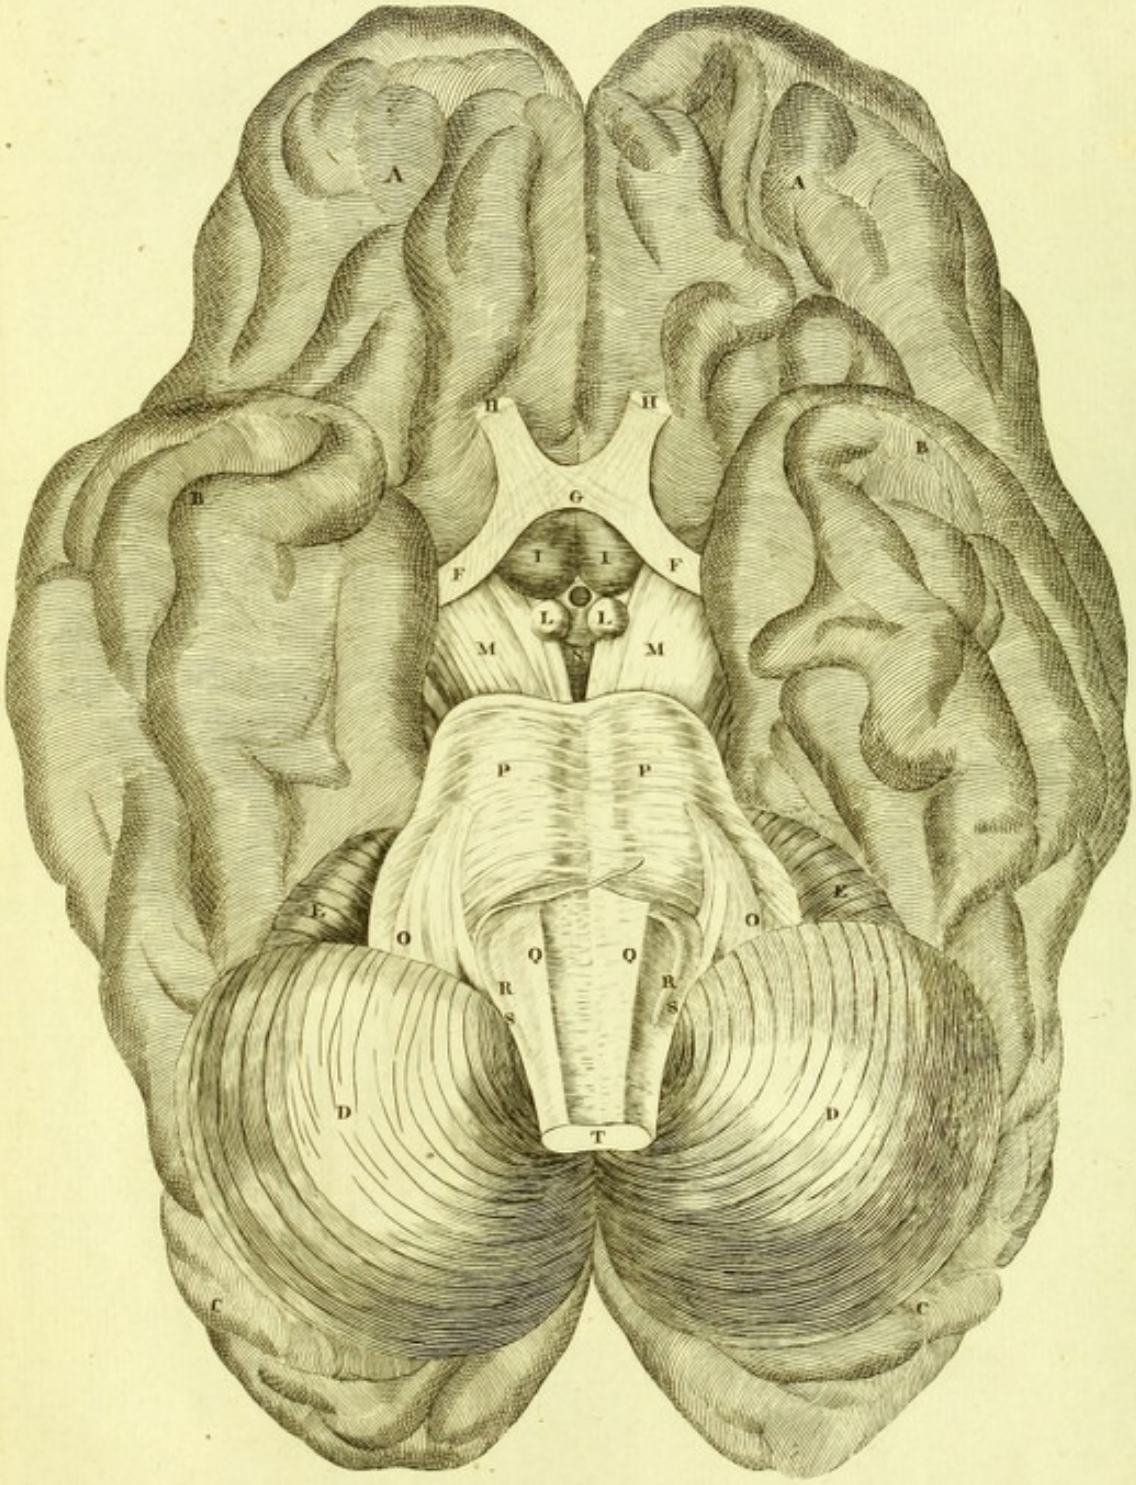
The situation of the principal Blood-Vessels from Eustachius.

1. The Heart.
2. The External Jugulars.
3. The Internal Jugulars.
4.4. The Subclavian Vessels.
5.5. The Axillary Vessels, arising from the Subclavians.
6.6. The Cephalic Veins.
7. The Median Veins.
8. The Basilic Vein.
9. The inferior part of the Aorta descendens.
10. The Vena Cava
11.11. The Emulgent Veins.
12.12. The Kidnies.
13. The Iliac Vessels.
14. The blood vessels of the Penis.



The Veins, as they appear in an Adult. From the Philos. Trans.



AA. The Orifice of the Vena Cava, as it appears when cut from the right auricle of the Heart.
a. The Orifice of the Coronary vein of the heart.
BA. The superior trunk of the Vena Cava.
CCA. The inferior trunk of the Vena Cava.
DD. The Subclavian Veins.
†. That part of the left Subclavian Vein, where the thoracic duct enters.
b. The Vena Azygos, with its branches going to the ribs c.c.
c. The Superior intercostal Veins.
d.d. The internal mammary Veins.
E.E. The right and left Iliac branches.
F.F. The internal Jugular Veins.
G.G. The external Jugular Veins
HH. The veins which bring blood from the lower jaw and its muscles.
I.I. The trunks of the internal Jugular veins, cut off at the basis of the Skull.
f. The Veins of the Thymus and Mediastinum.
g.g. The Veins of the Thyroid glands.
h. The Vena Sacra.
i. The internal Iliac branch.
k. The external Iliac branch.
KK. The occipital Veins.
L. The Axillary Veins.
M. The Cephalic Vein.
N. The Basilic Vein.
O. The Median Vein.
P. The trunk of the veins of the Liver.
Q. The Phrenic Vein of the left side.
R. The right Phrenic Vein.
r. A large vein from the glandula renalis of the left side and parts adjacent.
S. The left emulgent Vein.
T. The right emulgent Vein (in this Subject much lower than is usual)
uu. The two Spermatic Veins.
XX. Two communicant branches between the ascending trunk of the Vena Cava, and Vena Azygos, by which the wind passes into the descending trunk of the Cava, when we blow into the ascending at A.P.C. tho' the trunks at A.P. and C. is firmly tied on the blow pipe.
*. An uncommon branch between the lower trunk of the Vena Cava and the left emulgent Vein.
Y. A Vein which brings blood from the muscles of the abdomen, into the external Iliac branch.
Z. The epigastric Vein on the right side.
l.l. The Vena Saphena.
m. The Crural Veins.

ANATOMY.

A View of the Brain.

ANATOMY.

VIEW OF THE BRAIN.

TO FACE PLATE XV.—I.

In this Plate is given a View of the Human Crura Cerebri and Cerebelli, of the Tuber Annulare, and the Medulla Oblongata, after diſſecting away from them the Arachnoid coat and Pia Mater, in order to ſhew the general direction of the Medullary Fibres.

A A. B B. C C. The anterior, middle, and poſterior Lobes of the Brain, ſlightly ſketched.
D D. The Hemiſpheres of the Cerebellum.
E E. The ſuperior and anterior Vermiform Proceſſes of the Cerebellum.
F F. The two Optic Nerves cut horizontally.
G. The intimate intermixture of their Medullary Subſtance.
H H. The Optic Nerves cut acroſs, near the Foramina Optica.
I I. Cineritious ſubſtances intimately connected to the Optic Nerves, and furniſhing ſome part of their Medullary Subſtance. Between theſe there is a Fiſſure through which the Pia Mater and Blood Veſſels paſs.
K. A ſection of the Infundibulum.
L L. The Corpora Albicantia behind the Infundibulum.
M M. The Crura Cerebri, conſiſting, on their ſurface, of bundles of Medullary Fibres.
N. A Cineritious ſubſtance joining the Crura Cerebri, and Corpora Albicantia of oppoſite ſides of the Brain.
O O. The principal Crura Cerebelli.
P P. The Tuber Annulare or Pons Varoli, the ſurface of which conſiſts of Medullary Fibres laid chiefly in tranſverſe Bundles.
Q Q. Anterior, oblong, and ſomewhat pyramidal Bodies compoſed on their ſurface of bundles of Medullary Fibres, diſpoſed tranſverſely; and paſſing from one ſide of the Medulla Oblongata, to the other ſide of it; or joining theſe two pyramidal Bodies intimately together. Between theſe pyramidal Bodies there is a fiſſure above a quarter of an inch deep, into which the Pia Mater enters; and, ſtill deeper, Veſſels paſs between the decuſſating bundles of Medullary Fibres.
R R. The bodies commonly called *Olivaria*.
S S. A ſmall part ſeen of oblong, medullary, and ſomewhat pyramidal Bodies, which form the back part of the Medulla Oblongata
T. The end of the Medulla Oblongata, or top of the Spinal Marrow.

SECTION OF THE HUMAN BRAIN, CEREBELLUM, &c.

TO FACE PLATE XV.—II.

FIG. I.

Repreſents a Section of the human Brain and Cerebellum, with their Crura, and Tuber Annulare, and Medulla Oblongata, in order to ſhew a great intermixture of Cineritious Subſtance, with the Medullary, and very various directions, and interlacing of the Bundles of Medullary Fibres.

A B. The anterior and middle Lobes of the Brain, cut.
C. The poſterior Lobe of the Brain, entire.
D D. The Hemiſpheres of the Cerebellum.
E. The Corpus Striatum.
F. The Thalamus Nervi Optici.
G. One of the Corpora Albicantia, compoſed of a Medullary Cruſt containing Cineritious Matter.
H. The Crus Cerebri.
I. The Crus Cerebelli.
K. The Tuber Annulare cut perpendicularly from right to left.
L. The Tuber Annulare cut perpendicularly from before backwards to more than the depth of a quarter of an inch.
M N O. The Medulla Oblongata cut perpendicularly from right to left.
P. The Medulla Oblongata entire on the left ſide of the Fiſſure into which the Pia Mater enters.
Q. The End of the Medulla Oblongata, or the Top of the Spinal Marrow.

FIG. II.

Repreſents a tranſverſe or horizontal Section of the Spinal Marrow, in which A *and* B *repreſent the anterior and poſterior Fiſſures into which the Pia Mater enters.*

C C. D D. Cineritious Matter, of a cruciform appearance, incloſed in Medullary Subſtance.
E E. The joining of the two Chords which compoſe the Spinal Marrow.

FIG. III.

Repreſents a fore View of the Spinal Marrow of a Man after cutting away the Bodies of the Vertebræ, and laying open the Sheaths formed by the Dura Mater, and Arachnoid Coat, and cutting the anterior Bundles of the Spinal Nerves.

A B. The ſides of the Atlas or firſt Vertebra.
C D E F. The Sheaths, formed by the Dura Mater and Arachnoid Coat, laid open.
G. The upper End of the Spinal Marrow incloſed in its Pia Mater.
H. Its under part at the under part of the ſecond Vertebra of the Loins.
I K. Folds, Rugæ, and Joints of the Spinal Marrow.
L. The Cauda Equina.
1, 1. 2, 2. 3, 3. 4, 4, &c.
1, 1. Repreſent the firſt pair of Cervical Nerves, or rather Subcervical Vertebral Nerves, &c.
8, 8. Repreſent the firſt pair of Dorſal Nerves.
20, 20. The firſt pair of Lumbar Nerves, &c.
M. A Septum or Partition between the Holes in the Dura Mater for the paſſage of the anterior and poſterior Bundles of Fibres, which compoſe each of the Nerves of the Spinal Marrow.
N. The anterior Bundle, in its proper hole, covered by a Sheath of the Dura Mater, which covers the Spinal Marrow.
O. The poſterior Bundle with its proper Hole and Sheath.
P. A Ganglion in the poſterior Bundle.
Q. The anterior Bundle joined to the Nerves which iſſue from the Ganglion of the poſterior Bundle.
R S T U. The Acceſſory Nerve, taking its riſe from the ſide of the Spinal Marrow, and connected, by Filaments, with the poſterior Bundle of the firſt and ſecond Subvertebral Cervical Nerves.
V W X Y Z. Small Nerves which join the poſterior Bundles of the Subvertebral Cervical Nerves to each other.
a, b, c, d, e, f, g, h, i, k, l, m, n, o, p, q, r, s, t, u, v, w, x. The Ligamentum Denticulatum, fixed by a number of ſmall Filaments to the Pia Mater covering the Spinal Marrow, and, by Larger Cords, fixed to the Dura Mater. Theſe Cords, in ſome places, aſcend; in others, deſcend; in the greater number they are tranſverſe.
w x. A ſubſtance produced from the End of the Spinal Marrow, reckoned, by many authors, a Nerve; but which ought to be conſidered as the under part or Termination of the Ligamentum Denticulatum.

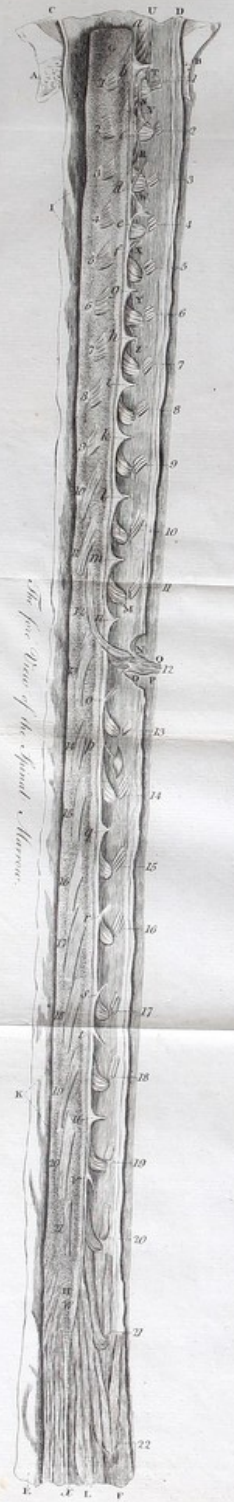


FIG. IV.

Shews, more fully than in the former figure, the way in which the Acceſſory Nerve is connected to the Spinal Marrow, and to the poſterior part of the Spinal Nerve.

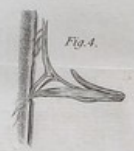
ANATOMY.

Section of the human Brain, Cerebellum &c.

Fig. 3.

The fore View of the Spinal Marrow.

Fig. 4.



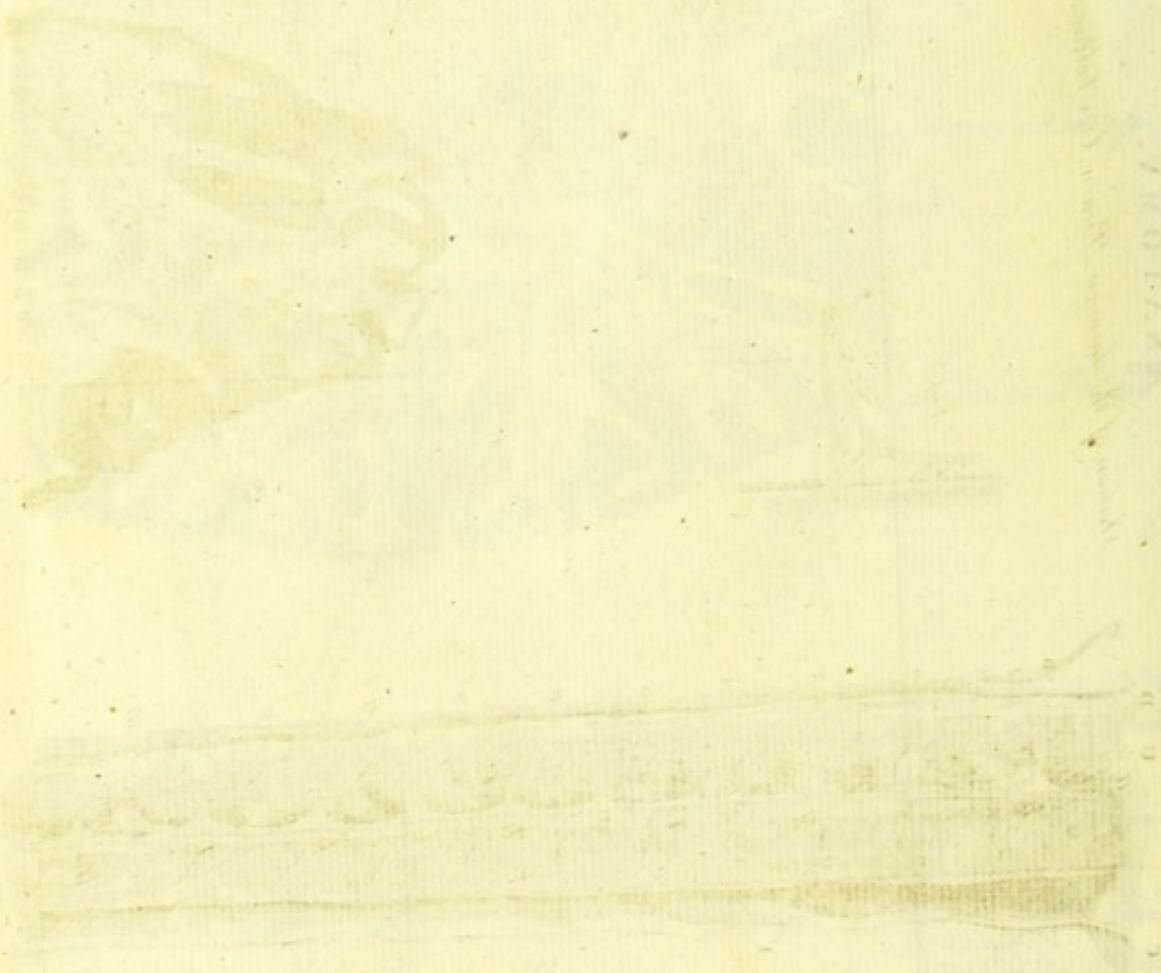


Fig. 1.

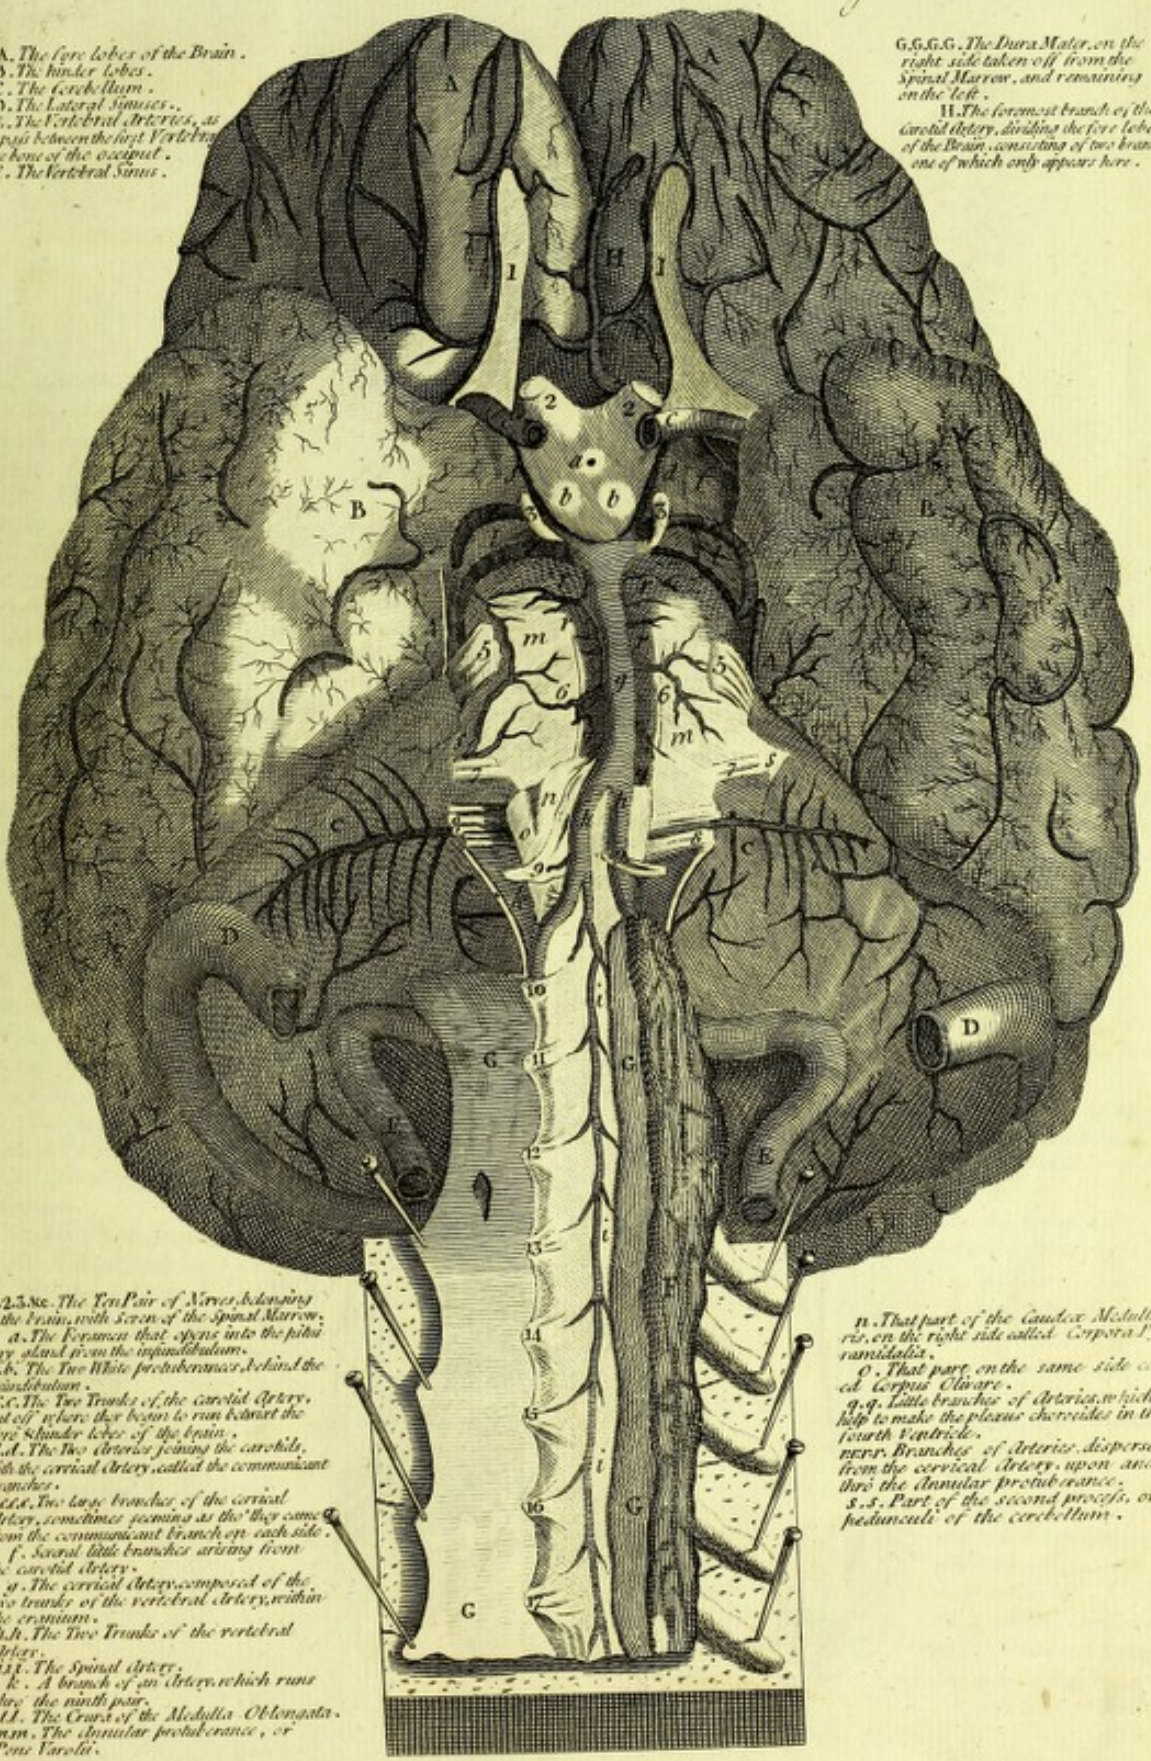

Fig. 2.

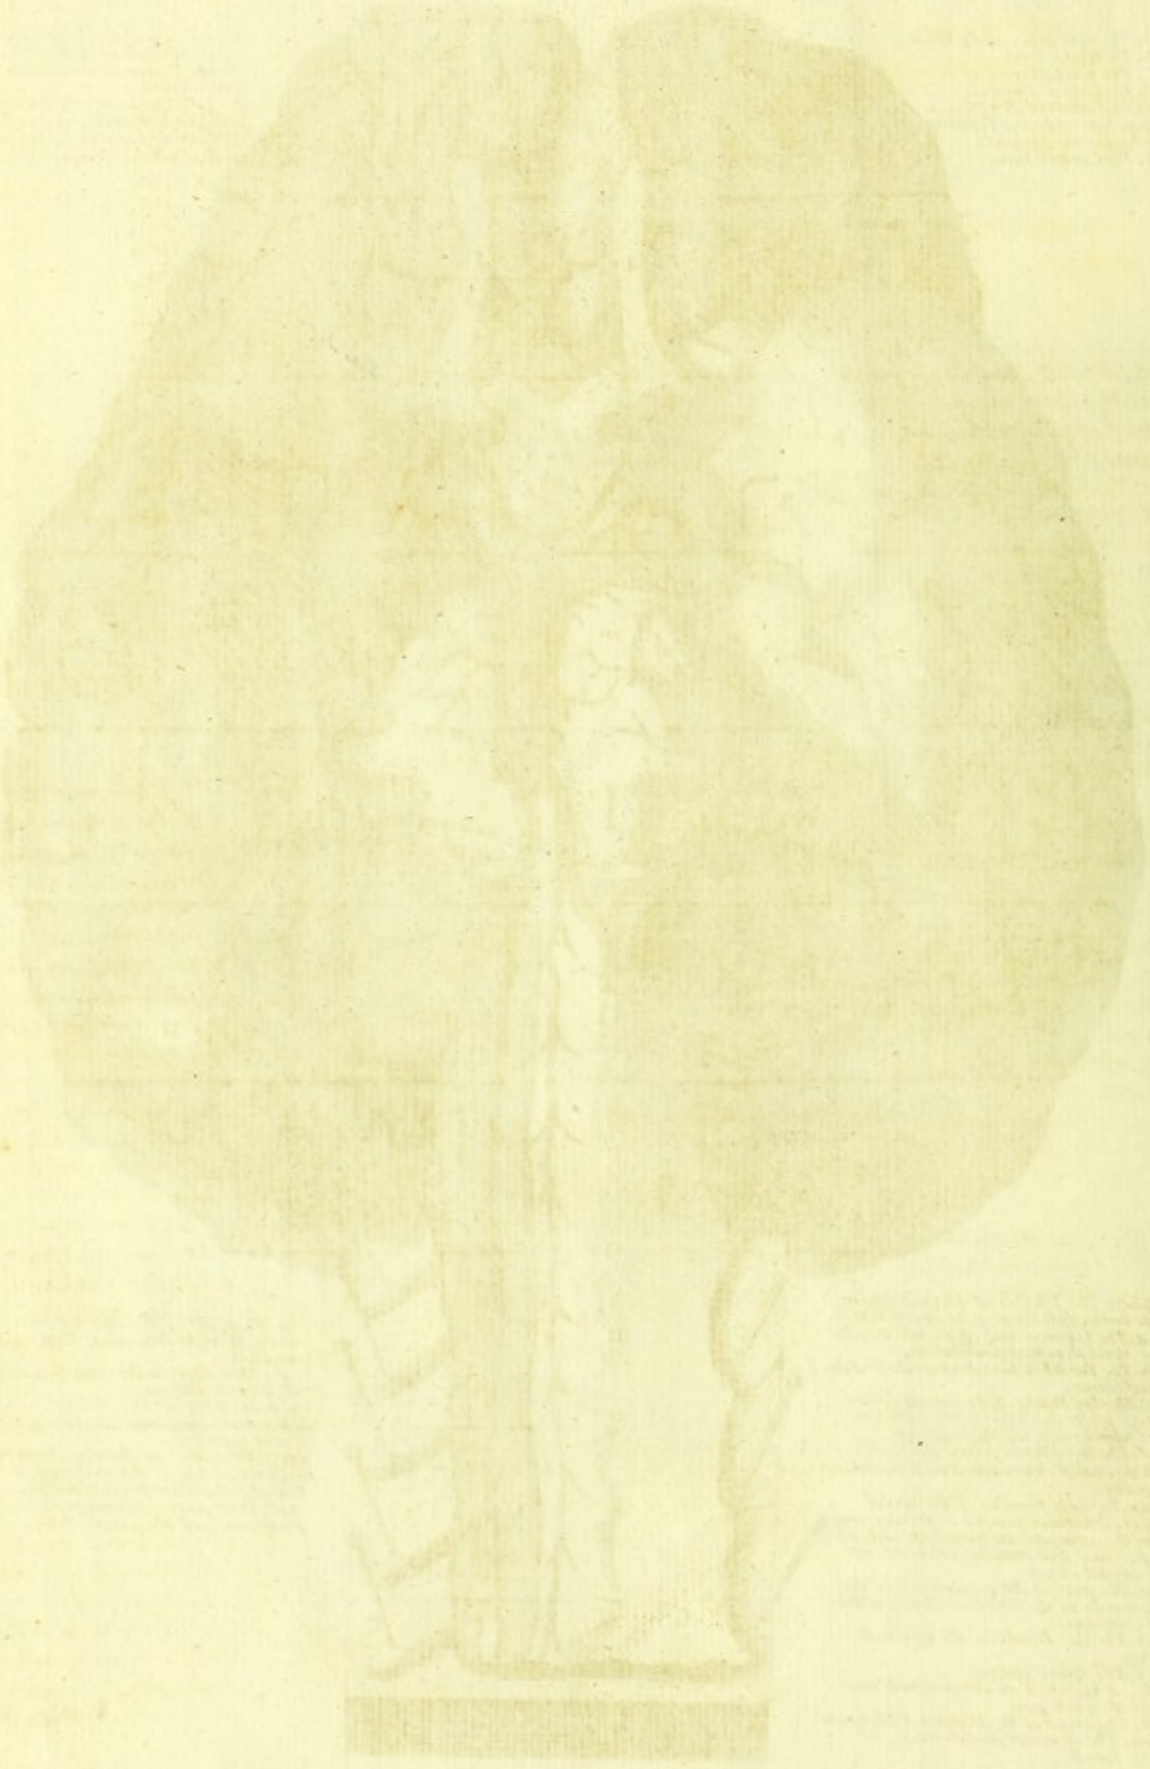
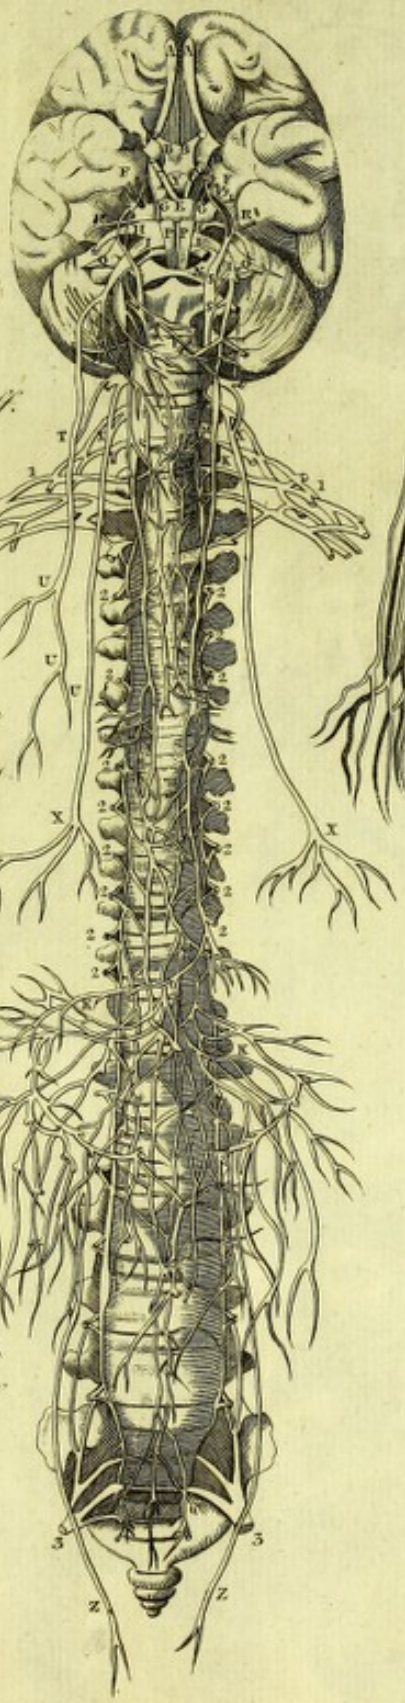
The Basis of the Brain. From Ridley. 3.



A.A. The fore lobes of the Brain.
B.B. The hinder lobes.
C.C. The Cerebellum.
D.D. The Lateral Sinuses.
E.E. The Vertebral Arteries, as they pass between the first Vertebra & the bone of the occiput.
F. The Vertebral Sinus.

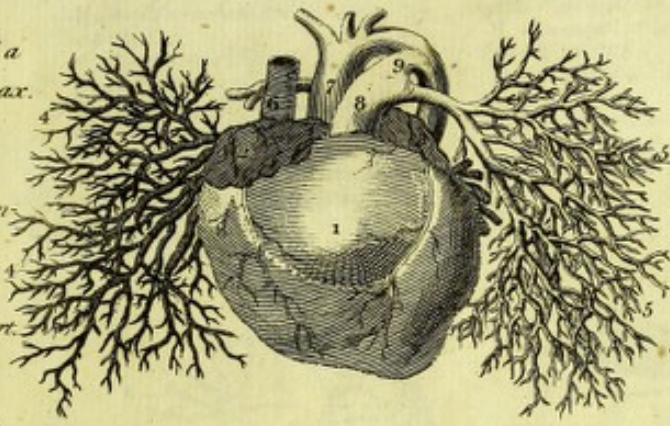
G.G.G.G. The Dura Mater, on the right side taken off from the Spinal Marrow, and remaining on the left.
H. The foremost branch of the carotid artery, dividing the fore lobes of the Brain, consisting of two branches one of which only appears here.



1.2.3.&c. The Ten Pair of Nerves belonging to the brain, with Seven of the Spinal Marrow.
a. The Foramen that opens into the pituitary gland from the infundibulum.
b.b. The Two White protuberances behind the infundibulum.
C.C. The Two Trunks of the carotid Artery, cut off where they begin to run betwixt the fore & hinder lobes of the brain.
d.d. The Two Arteries joining the carotids, with the cervical Artery, called the communicant branches.
e.e.e. Two large branches of the cervical Artery, sometimes seeming as tho' they came from the communicant branch on each side.
f. Several little branches arising from the carotid Artery.
g. The cervical Artery, composed of the two trunks of the vertebral Artery, within the cranium.
h.h. The Two Trunks of the vertebral Artery.
i.i. The Spinal Artery.
k. A branch of an Artery, which runs thro' the ninth pair.
l.l. The Crurs of the Medulla Oblongata.
m.m. The Annular protuberance, or Pons Varolii.

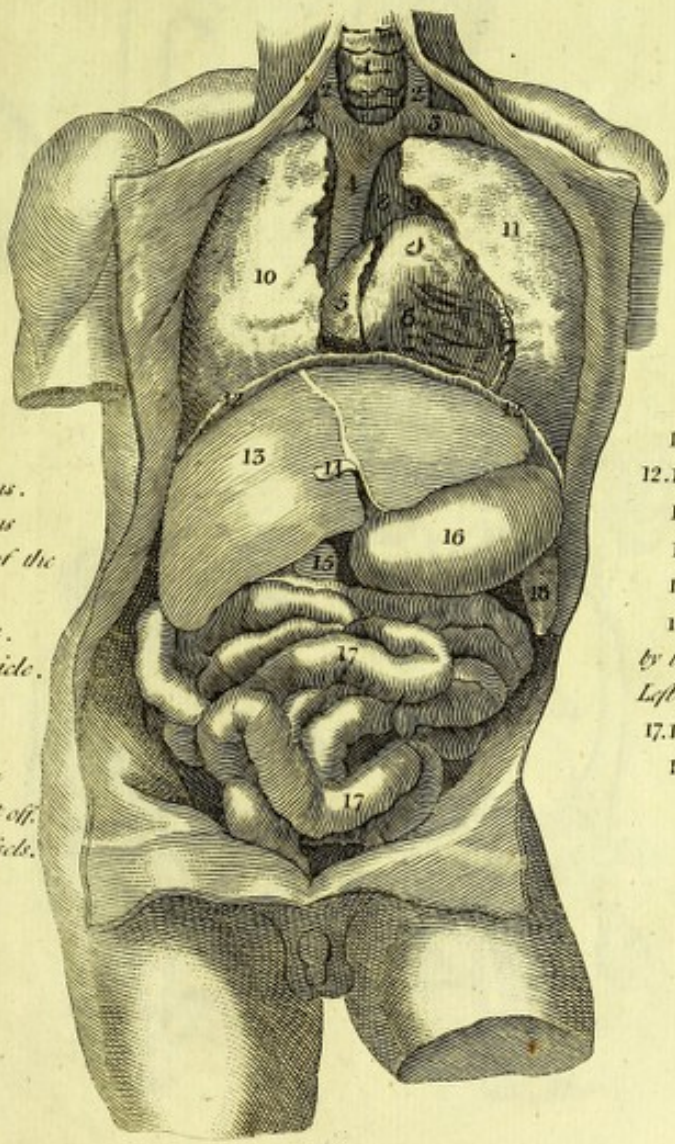
n. That part of the Caudex Medullaris, on the right side called Corpora Pyramidalia.
o. That part, on the same side called Corpus Olivare.
q.q. Little branches of Arteries, which help to make the plexus choroides in the fourth Ventricle.
nerv. Branches of Arteries dispersed from the cervical Artery, upon and thro' the Annular protuberance.
s.s. Part of the second process, or pedunculi of the cerebellum.

The Origin of the Nerves, from the Brain, and from the Spinal Marrow. From Lancisi.



A.A. The Olfatory Nerves.
B.B. The Optic Nerves cut off.
C.C. Motores Oculorum.
D.D. The Pathetic Nerves.
E. The Procejus Annulares.
F.F. The 3 Branches of the 5th pair.
G.G The Sixth pair.
H.H. The portions of the auditory Nerves.
I.I. The Origin of the 8th pair.
K.K. The large Trunks of the 8th pair.
M.M. The Recurrent Nerves
N. The left nerve of the 9th pair.
O. The right nerve of the 9th pair.
P.P. The Corpora Pyramidata.
Q.Q. The 10th pair cut off.
R.R. The extremities of the 11th pair.
S.S. The great Trunks of the Nerves.
T.U. The Auditory nerve of the 8th pair.
X.X. The Nerves of the Diaphragm.
Y. The Inferior aperture of the Infundibulum.
Z.Z. The Nerves which go to the testes. Uterus. &c.
1.1. The Nerves which go to the Arms.
2.2. The communications of the vertebral & intercostal Nerves.
3.3. The Crural & Sciatic Nerves cut off.

The Spinal Marrow, & the Nerves proceeding therefrom.



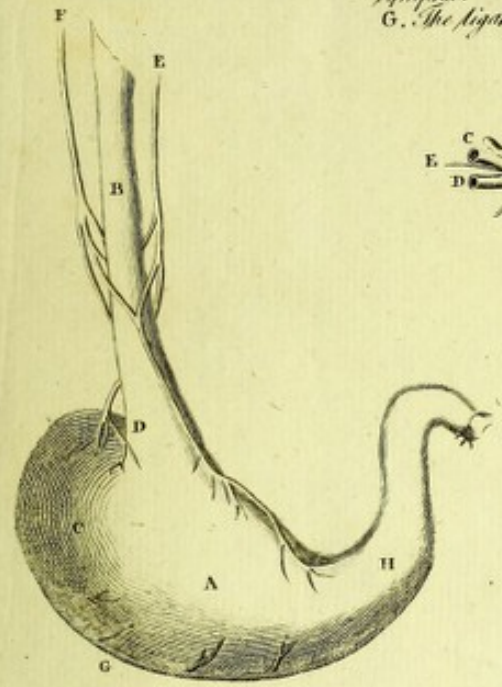
A.A. The Spinal Marrow
bbbb. A Series of nervous branches passing from the
P. Spinal Marrow.
C.C.C. The Body of the Spinal Marrow.
D.D. dd. Branches which arise from 3 pair of the Neck & 2 pair of the Breast proceeding to the Arms and Hands.
E. The plexus of these last mentioned Nerves
f.f. The first pair of the Hands.
g.g. The second pair.
h.h. The Third pair.
i.i. The Fourth pair.
k.k. The Fifth pair.
l.l. The Sixth pair that lye immediately under the Skin.
M. The First Crural Nerve.
N.N. The second Crural Nerve.
o.o.o. The Branch thereof which accompanies the Saphena vein.
P.P. The Third crural Nerve
Q.Q.Q. The Fourth Crural Nerve
r.r. The external branch.
s.s. The internal branch.

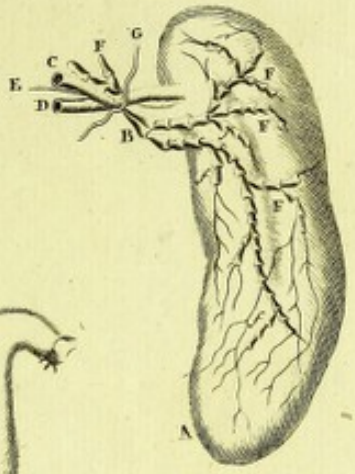
1 *The right ventricle of a fœtus distended with wax.*
2 *The right auricle.*
3 *The left auricle.*
4 *Branches of the pulmonary veins of the right lobe of the lungs, those of the left being cut off short.*

5. The arteries of the left lobe of the lungs.
6. The vena cava descendens.
7. Aorta ascendens.
8. Arteria pulmonalis.
9. Ductus arteriosus.

1. The Larynx.
2.2. The Jugular Veins.
3.3. The Subclavian Veins.
4. Vena Cava Descendens
5. The Right Auricle of the Heart.
6. The Right Ventricle.
7. Part of the left Ventricle.
8. Aorta Ascendens.
9. Arteria Pulmonalis
10. The Right Lobe of the Lungs, part of which is cut off to shew the great blood Vessels.

11. The Left Lobe.
12.12. The Diaphragm.
13. The Liver.
14. Ligamentum Retundum
15. The Gall Bladder.
16. The Stomach prest by the Liver towards the Left Side.
17.17. The small Guts.
18. The Spleen.

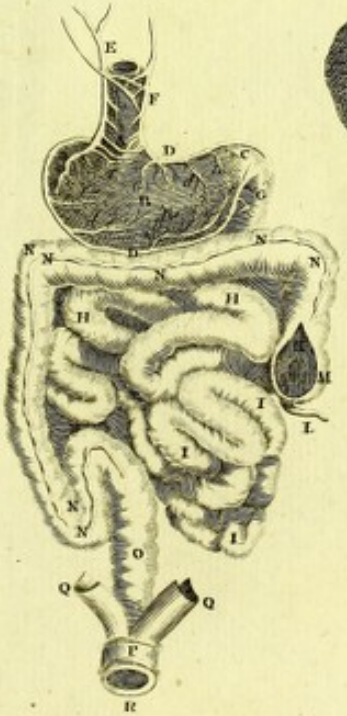




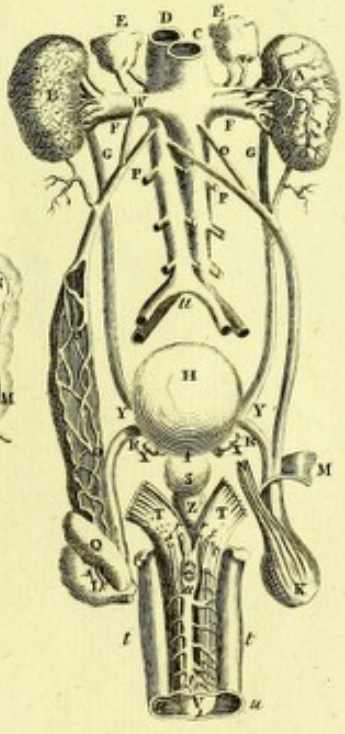
Anatomy

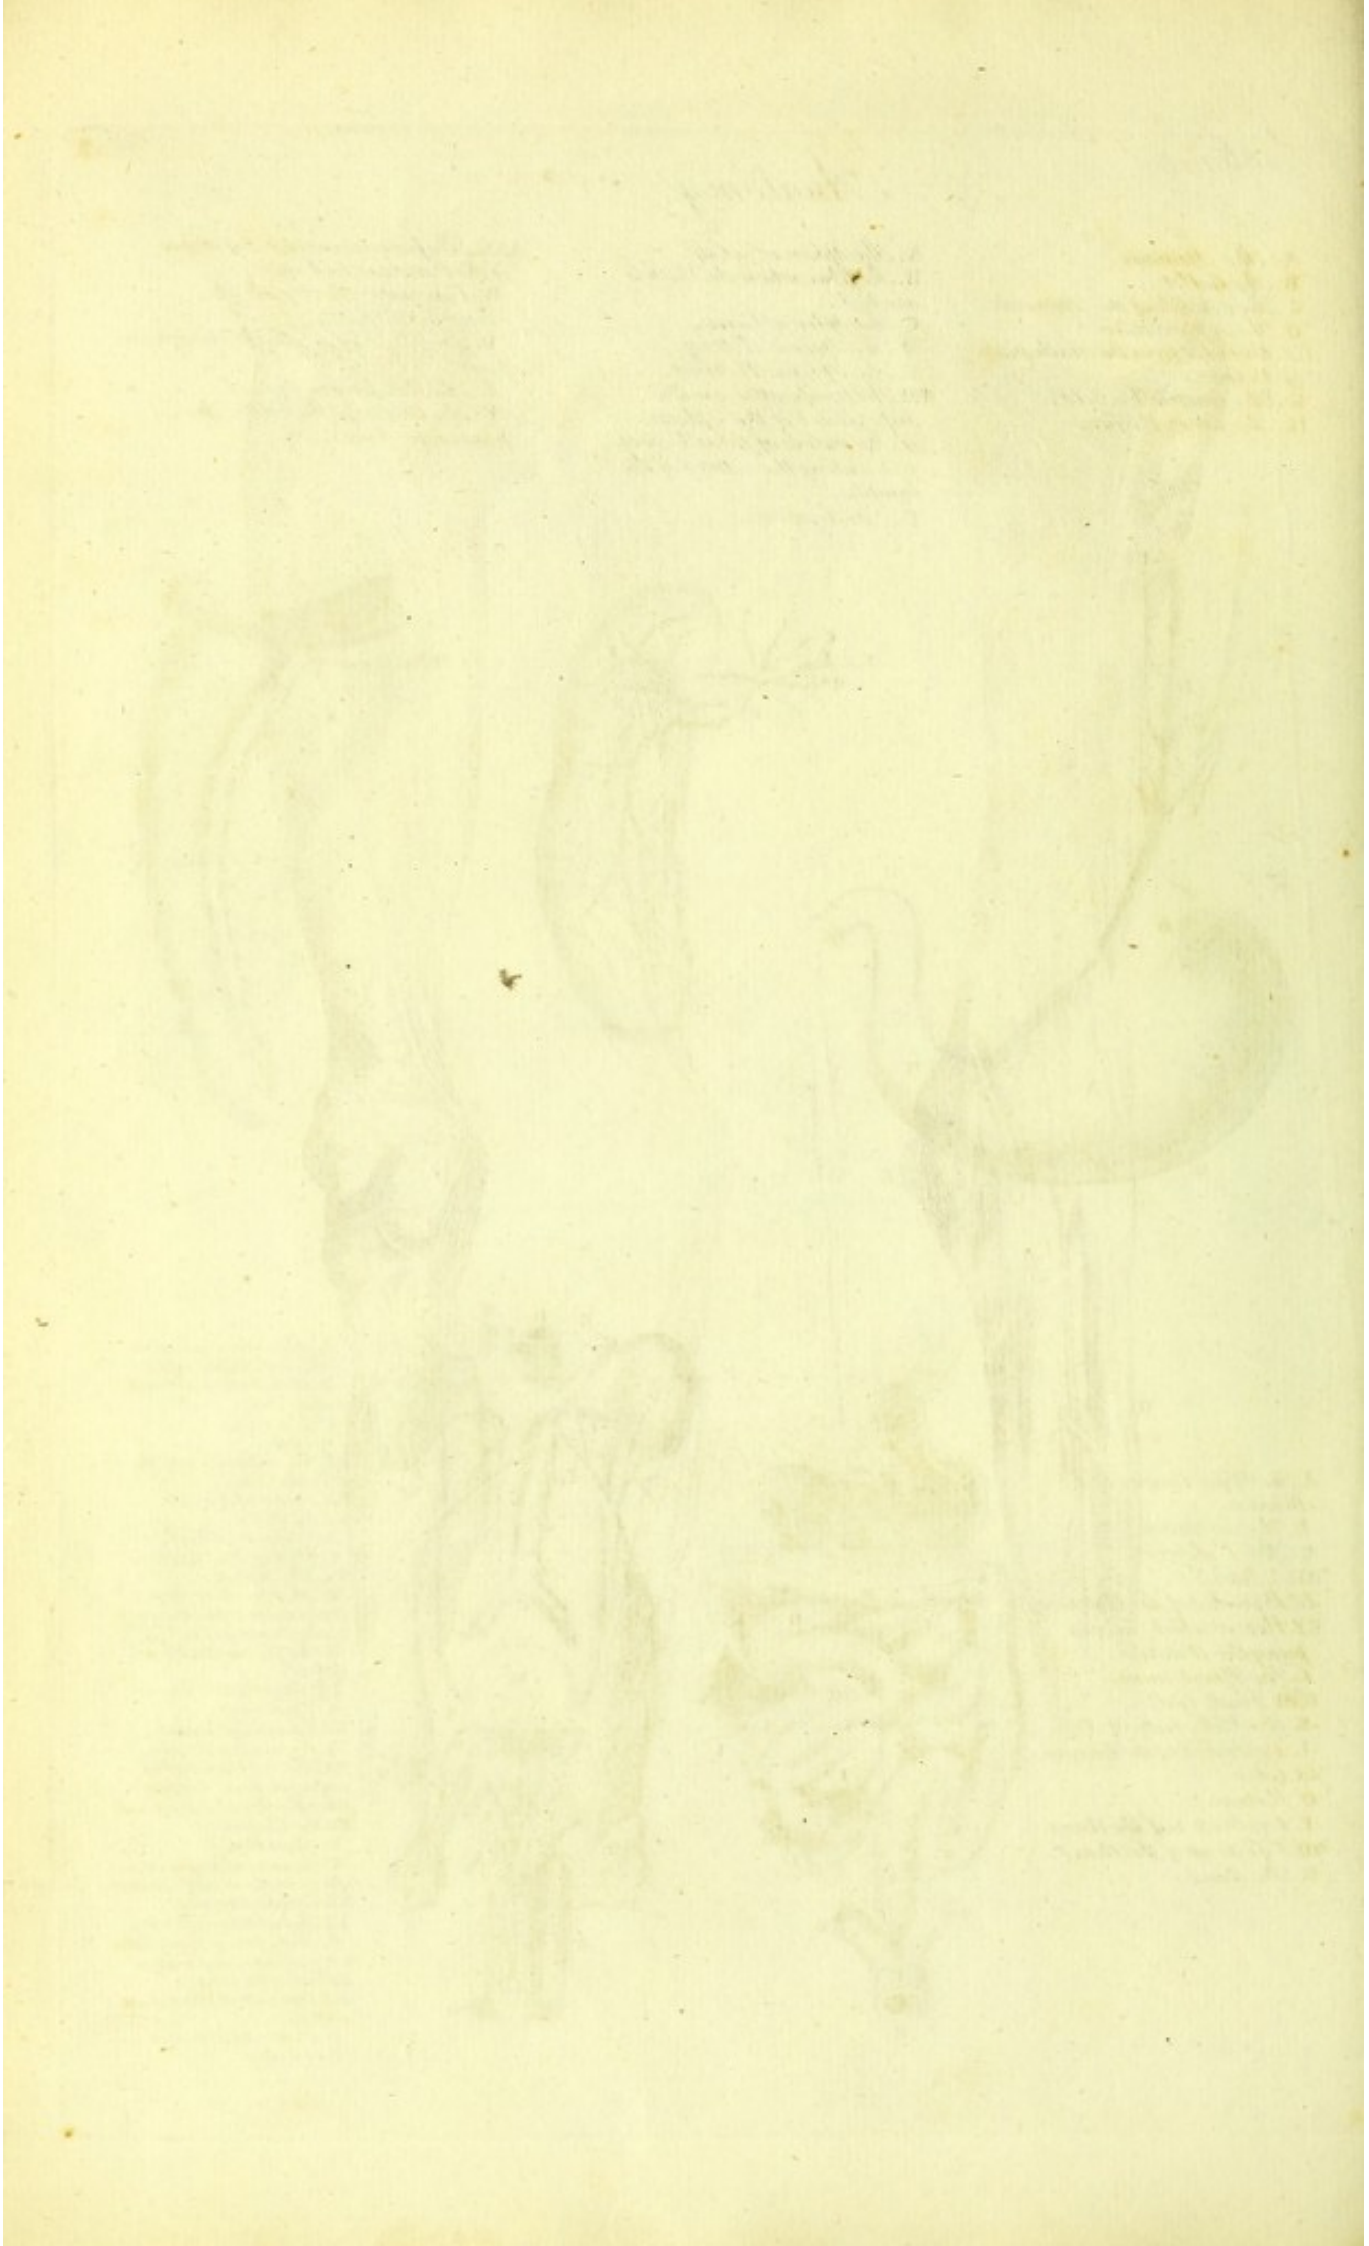
A. The Stomach.
B. The Gullet.
C. The left side of the Stomach.
D. The upper Orifice.
E.E. Branches from the sixth pair of Nerves.
G. The Gastric Vessels.
H. The lower Orifice.

A. The Spleen of a Calf.
B. The place where the Vessels are tied.
C. The Splenic Vein.
D. The Splenic Artery.
E. The Splenic Nerves.
FFF. The lymphatics on the superficies of the Spleen.
fff. The valves of those Vessels preventing the return of the lympha.
G. The ligature.



AAAA. The parenchymous substance of the Pancreas laid open.
B. Pancreatic Duct with its branches C.C.C.C.C.
D. The bile Duct joining the pancreatic Duct.
E. The Duodenum Opened.
F. The Orifice of the bile & the pancreatic Ducts.



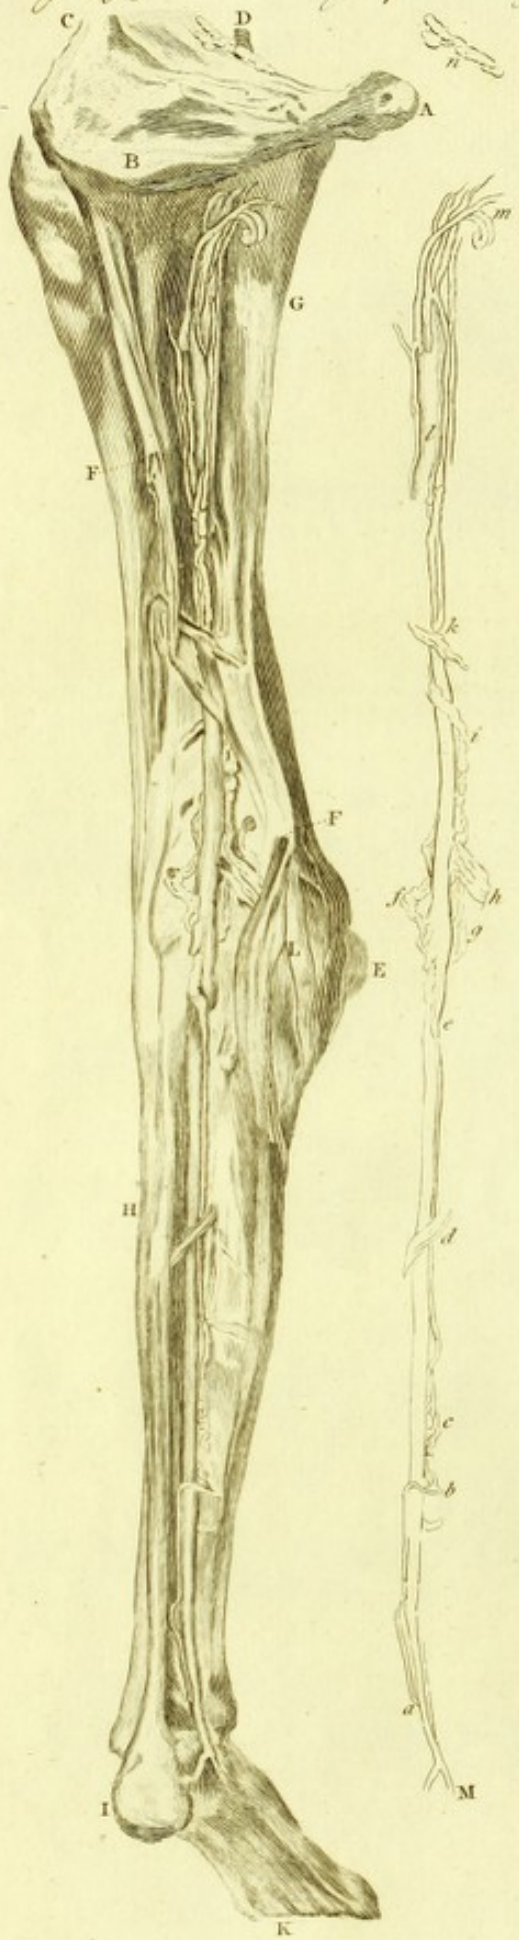


A. The Upper Orifice of the Stomach.
B. The Stomach.
C. The Pylorus.
D.D. Arteries.
d.d. Branches of the Arteries.
E.E. Nerves which accompany the Arteries.
G. The Duodenum.
HHHH. Small Guts.
K. The Valve in the Colon.
L. Appendicle of the Caecum.
MN. Colon.
O. Rectum.
P. Constrictor of the Anus.
QQ. Lifters up of the Anus.
R. The Anus.

A. A Kidney divested of its external coat.
B. A Kidney in its natural state.
C. Vena Cava.
D. Aorta.
E.E. Renal Glands with their Vessels &c &c.
F.F. Emulgent Vessels.
G.G. Ureters.
H. Urinary Bladder.
I. Neck of the Bladder.
K.L. The Testicles.
M. The process of the peritoneum in which the spermatic Veins go out off.
N. The Cremaster Muscle cut off.
O.O. Spermatic Vessels.
P.P.
Q. Epididymis.
R.R. Vasa Deferrentia.
S. Corpus Glandosum.
T.T. The Two Bodies which compose the penis & appear when the Skin t.t.s drawn aside.
u.u. The Prepuce.
V. Glans Penis.
W. The extraordinary insertion of the Spermatic veins into the Emulgent
X.X. Vesiculae Seminales.
Y.Y. The insertion of the Ureters
Z. The beginning of the Urethra.
r.r. Veins which run & unite on the back of the Yard.
s.s. Arteries with Nerves on each side.
u. Veins opened to shew their Valves.

Anatomy — Lymphatic Vessels. From M.r Hewson.

Fig. 3.



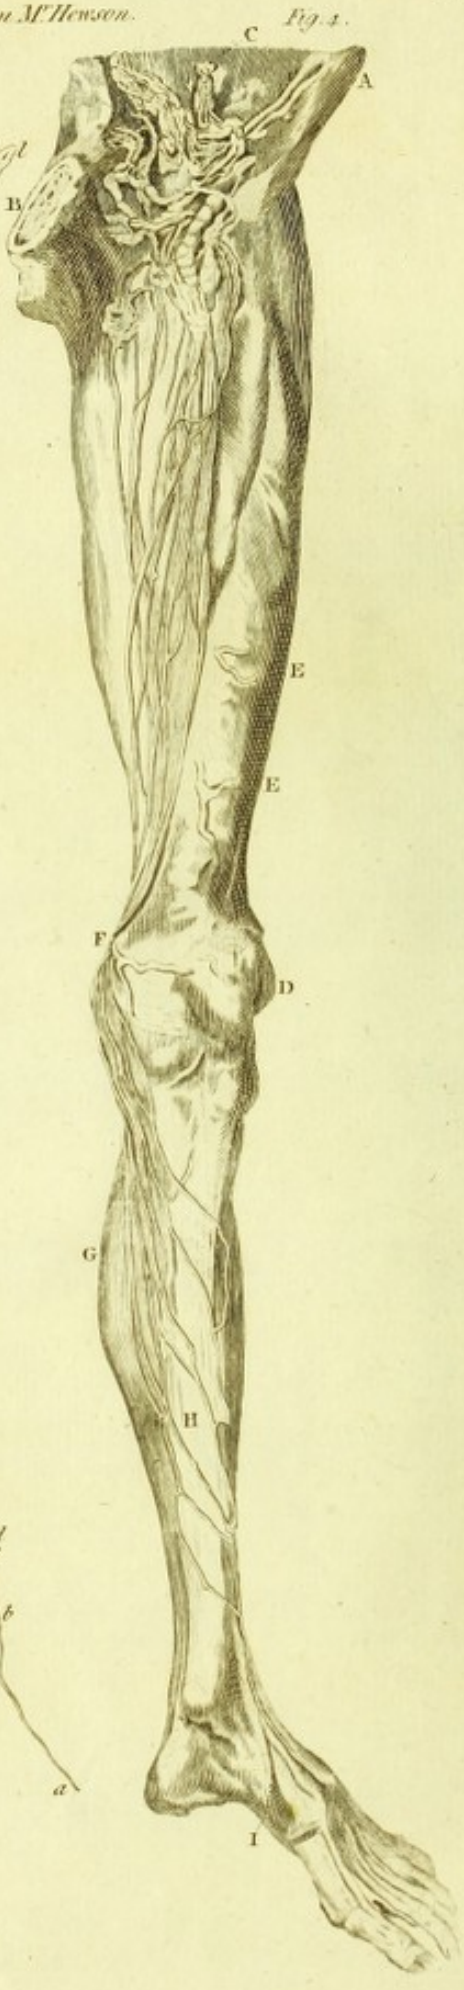


Fig. 4.

ANATOMY.

LYMPHATIC VESSELS.

TO FACE PLATE XIX.

FIG. III.

A Back View of the lower Extremity, diſſected ſo as to ſhew the deeper-ſeated Lymphatic Veſſels, which accompany the Arteries.

A. The Os Pubis.
B. The Tuberoſity of the Iſchium.
C. That Part of the Os Ilium which was articulated with the Os Sacrum.
D. The Extremity of the iliac Artery appearing above the Groin.
E. The Knee.
FF. The two cut Surfaces of the triceps Muſcle, divided to ſhew the lymphatic Veſſels that paſs through its Perforation along with the crural Artery.
G. The Edge of the Muſculus Gracilis.
H. The Gaſtrocnemius and Soleus, much ſhrunk by being dried, and by the Soleus being ſeparated from the Tibia to expoſe the Veſſels.
I. The Heel.
K. The Sole of the Foot.
L. The ſuperficial lymphatic Veſſels paſſing over the Knee, to get to the Thigh.
M. The poſterior tibial Artery.
a. A lymphatic accompanying the poſterior tibial Artery.
b. The ſame Veſſel croſſing the Artery.
c. A ſmall lymphatic Gland, through which this deep-ſeated lymphatic Veſſel paſſes.
d. The lymphatic Veſſel paſſing under a ſmall Part of the Soleus which is left attached to the Bone, the reſt being removed.
e. The lymphatic Veſſel croſſing the popliteal Artery.
f g h. Lymphatic Glands in the Ham, through which the lymphatic Veſſel paſſes.
i. The lymphatic Veſſel paſſing with the crural artery through the Perforation of the triceps Muſcle.
k. The lymphatic Veſſel, after it has paſſed the Perforation of the Triceps, dividing into Branches which embrace the Artery (*l*).
m. A Lymphatic Gland belonging to the deep-ſeated lymphatic Veſſel. At this place thoſe Veſſels paſs to the Forepart of the Groin, where they communicate with the ſuperficial lymphatic Veſſels.
n. A Part of the ſuperficial lymphatic Veſſels appearing on the Brim of the Pelvis.

FIG. IV.

The more ſuperficial Lymphatic Veſſels of the lower Extremity.

A. The Spine of the Os Ilium.
B. The Os Pubis.
C. The Iliac Artery.
D. The Knee.
EE F. Branches of the crural Artery.
G. The Muſculus Gaſtrocnemius.
H. The Tibia.
I. The Tendon of the Muſculus Tibialis Anticus.
a. A lymphatic Veſſel belonging to the Top of the Foot.
b. Its firſt Diviſion into Branches.
c c c. Other Diviſions of the ſame lymphatic Veſſel.
d. A ſmall lymphatic Gland.
e. The lymphatic Veſſels which lie between the Skin and the Muſcles of the Thigh.
f f. Two lymphatic Glands at the upper Part of the Thigh below the Groin.
g g. Other Glands.
h. A lymphatic Veſſel which paſſes by the Side of thoſe Glands without communicating with them; and, bending towards the Inſide of the Groin at (*i*), opens into the lymphatic Gland (*k*).
ll. Lymphatic Glands in the Groin, which are common to the lymphatic Veſſels of the Genitals and thoſe of the lower Extremity.
m. n. A Plexus of lymphatic Veſſels paſſing on the Inſide of the Iliac Artery.

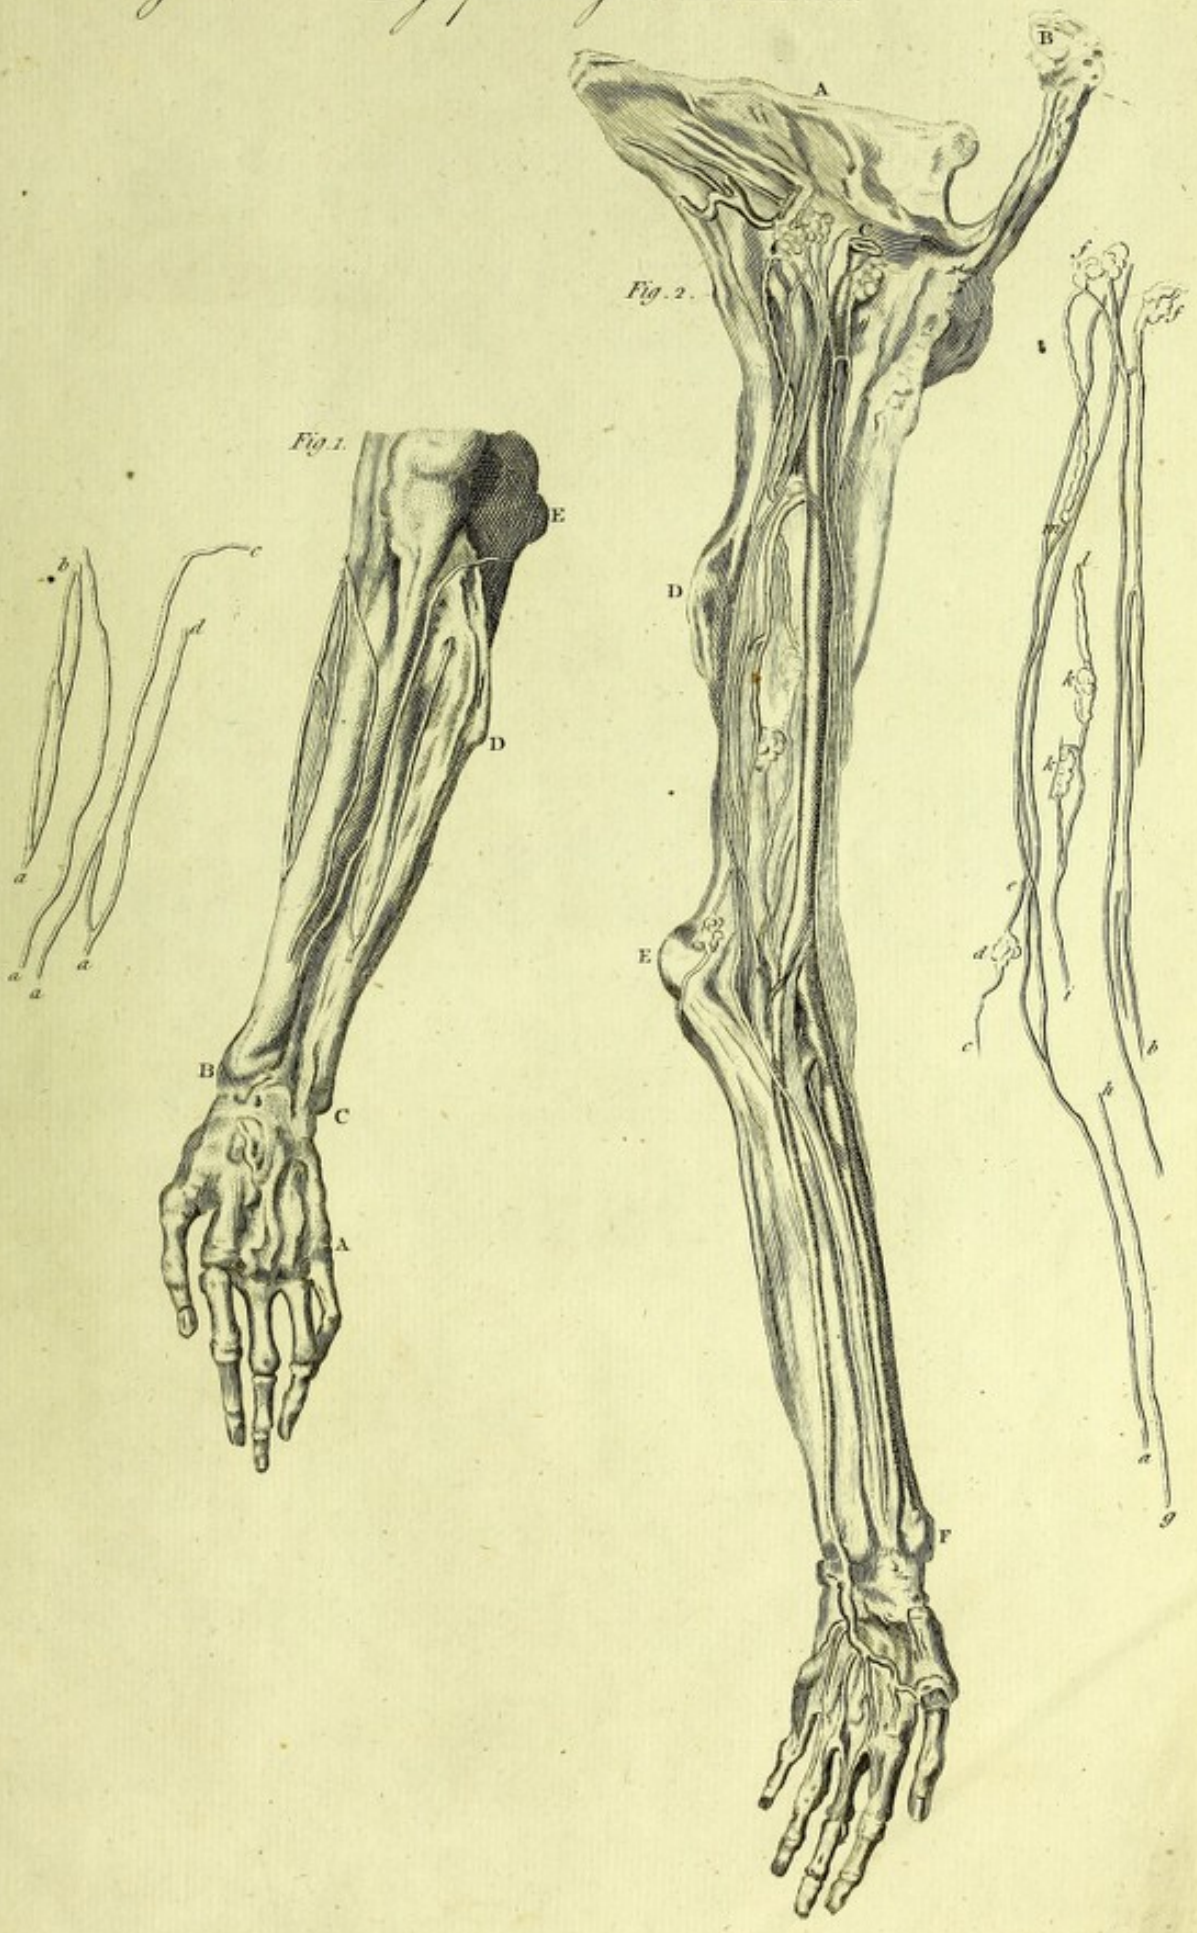
ANATOMY.

LYMPHATIC VESSELS. From Mr. HEWSON.

TO FACE PLATE XX.

FIG. I.

A Back View of the Fore Arm and Hand.



A. The Hand.
B. The lower Extremity of the Radius.
C. The lower Extremity of the Ulna.
D. The Muſcles on the Back of the Fore Arm turned aſide to exhibit a deep-ſeated lymphatic Veſſel, which perforates the interoſſeous Ligament to get to the Fore-part.
E. The Olecranon.
a a a. Lymphatics appearing on the Back of the Fore Arm, immediately under the Skin.
b. Some of the Lymphatics bending over the upper Extremity of the Radius to get to the Fore-part of the Arm.
c. A Lymphatic paſſing over the Ulna, immediately under the Olecranon, and under the inner Condyle of the Os Humeri, to get to the Fore-part of the Arm.
d. A Lymphatic which has penetrated the Muſcles, perforates the interoſſeous Ligament, and gets to the Fore-part of the Arm near the radial Artery.

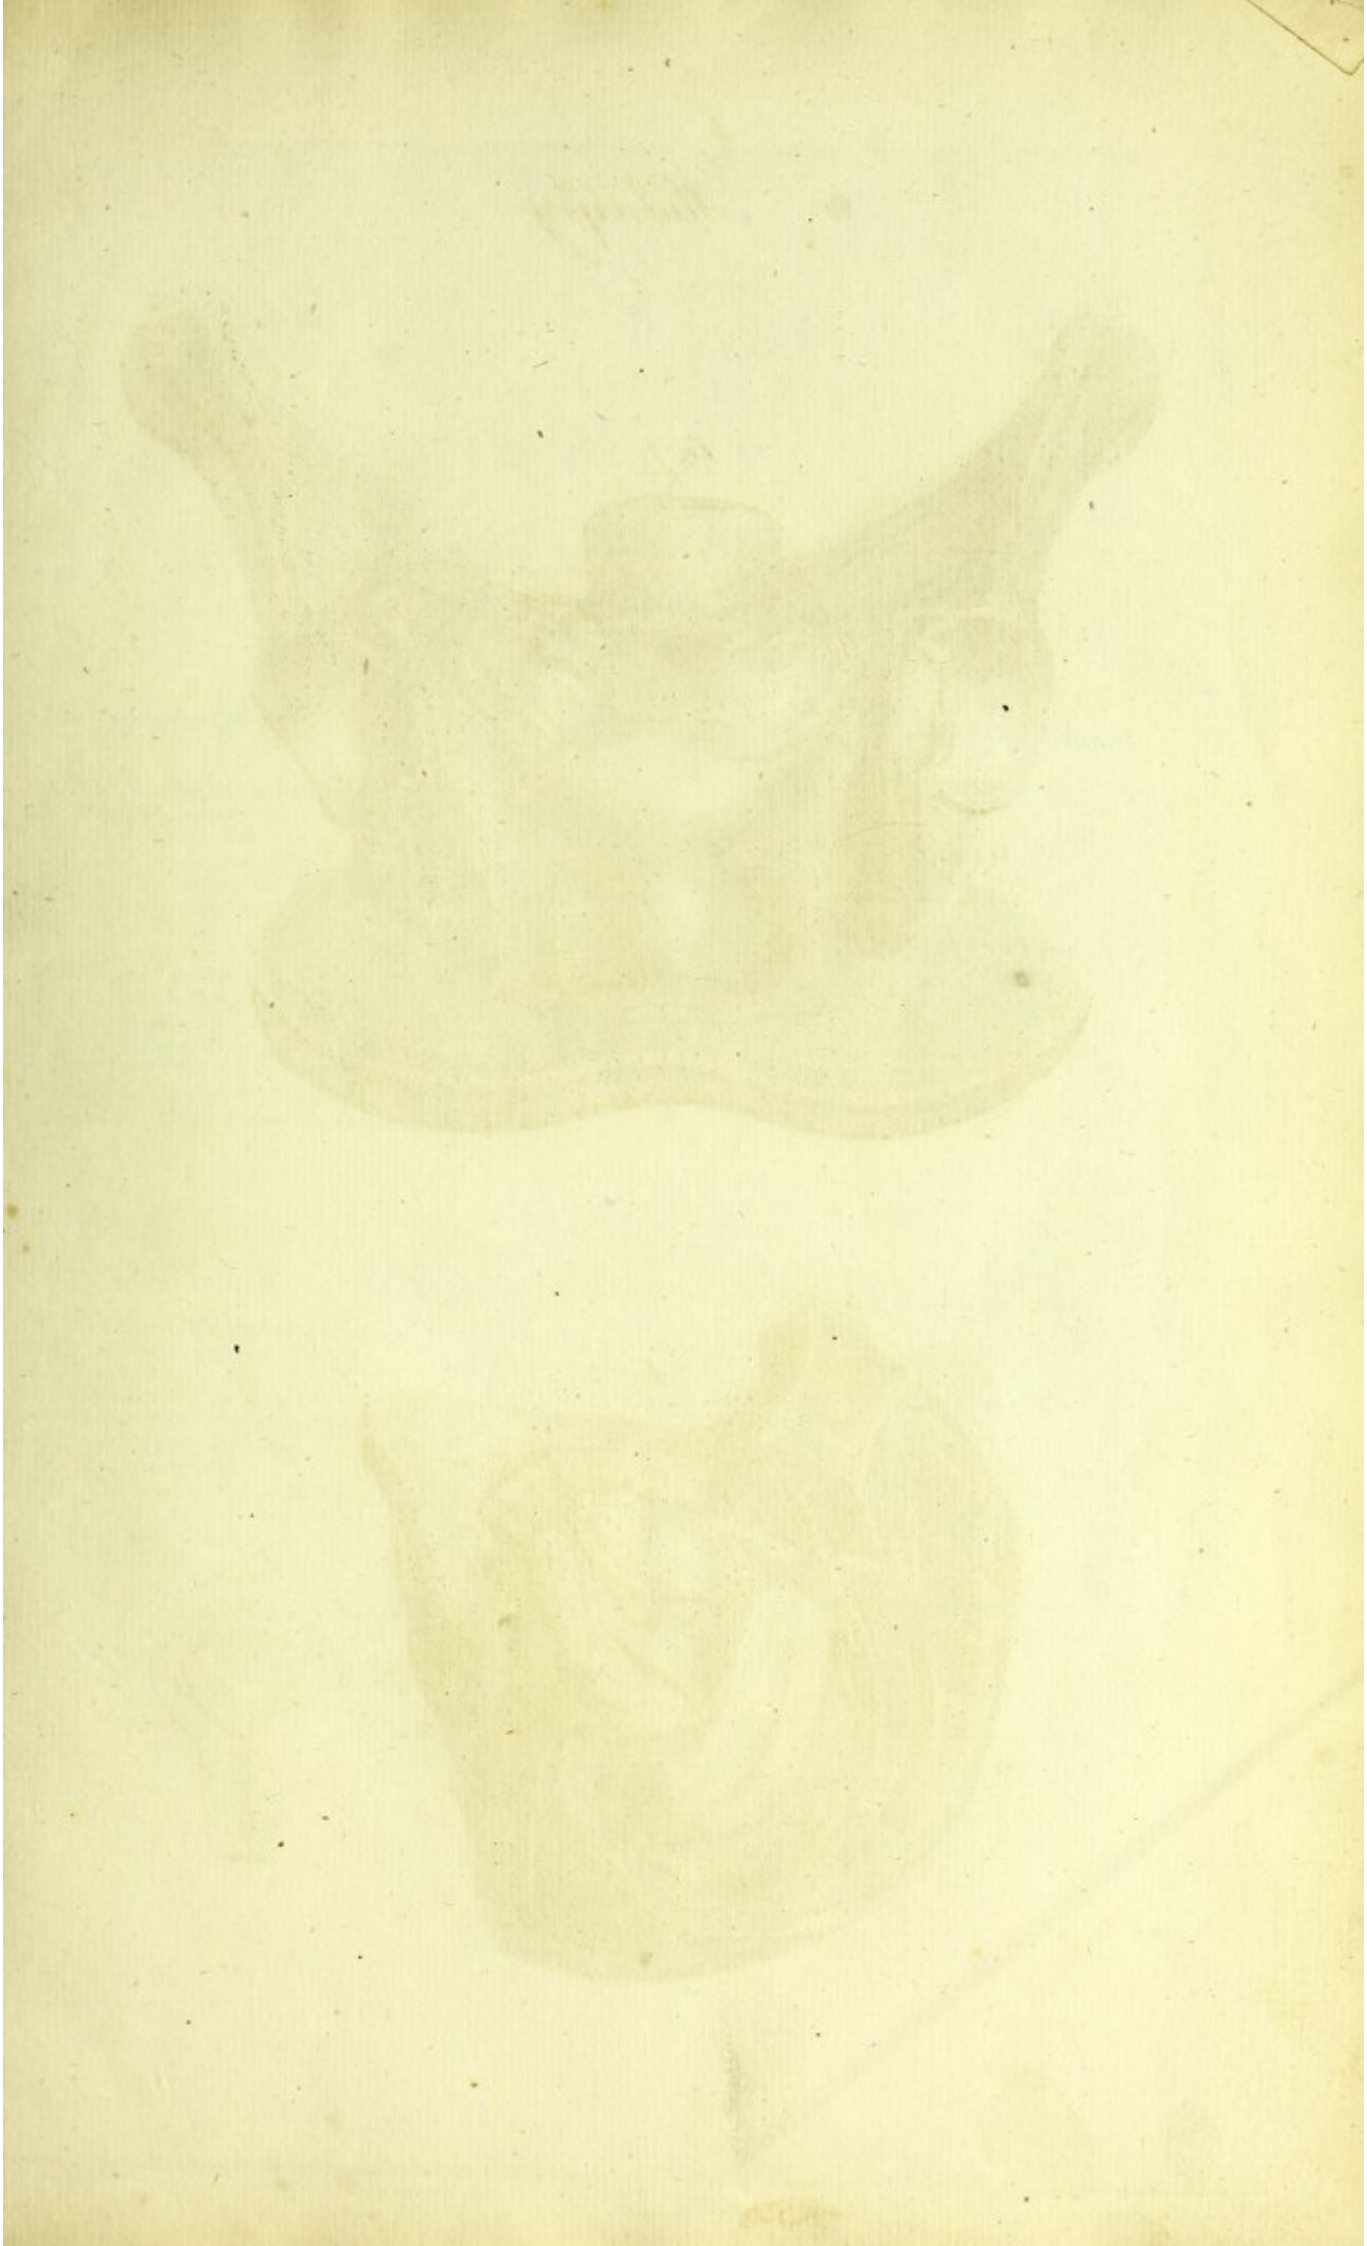


FIG. II.

A Fore View of the Upper Extremity.

A. The Scapula.
B. The Clavicle.
C. The Extremity of the brachial Artery.
D. The Muſcles lying on the Inſide of the Arm.
E. The inner Condyle of the Os Humeri.
F. The lower Extremity of the Radius.
a. A Lymphatic Veſſel which lies in the cellular Membrane immediately under the Skin, and paſſes up on the Inſide of the Arm to the axillary Glands.
b. Superficial lymphatic Veſſels paſſing over the Muſcles from the Back of the Fore Arm, and likewiſe over the Biceps to the Glands in the Axilla.
c. A ſuperficial Lymphatic from the Back of the Fore Arm.
d. A Gland through which it paſſes.
e. The Lymphatics from the anterior and the poſterior Part of the Fore Arm uniting.
f f. Lymphatic Glands in the Axilla. They are common both to the ſuperficial and the deep-ſeated Lymphatic Veſſels.
g. A deeper-ſeated Lymphatic Veſſel lying cloſe to the radial Artery, which it accompanies all the way to *h.*
h. The deep-ſeated Lymphatic Veſſel paſſing under the interoſſeous and ulnar Arteries, and appearing again on the Arm, at *i.*
i. The deep-ſeated lymphatic Veſſel lying cloſe to the brachial Artery.
k k. Two ſmall lymphatic Glands through which it paſſes.
l. The ſame Veſſel now become much larger and paſſing under a Branch of the Artery and ſome cellular Membrane, and appearing at *m.*
m. The Trunk of the deep-ſeated Lymphatic Veſſels paſſing upwards to the Axilla, where it enters the Glands, *f f.*

Lymphatic Vessels. From M.r Hewson.

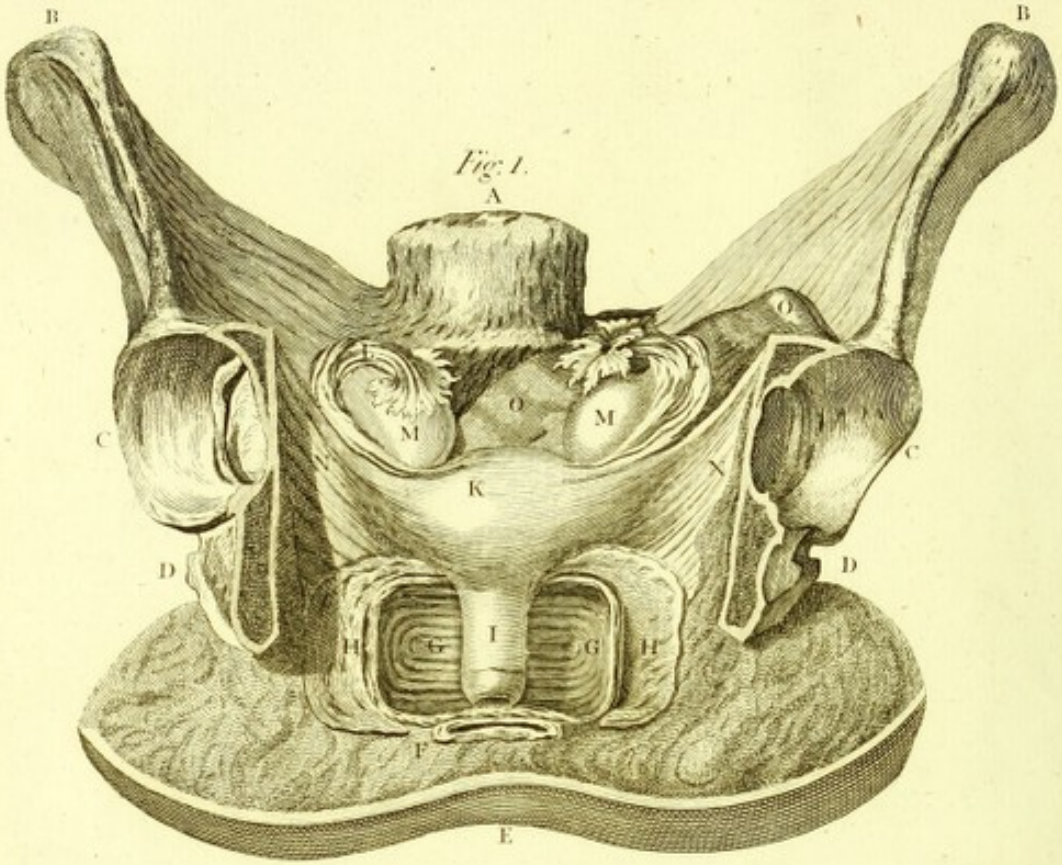

Fig. 1.

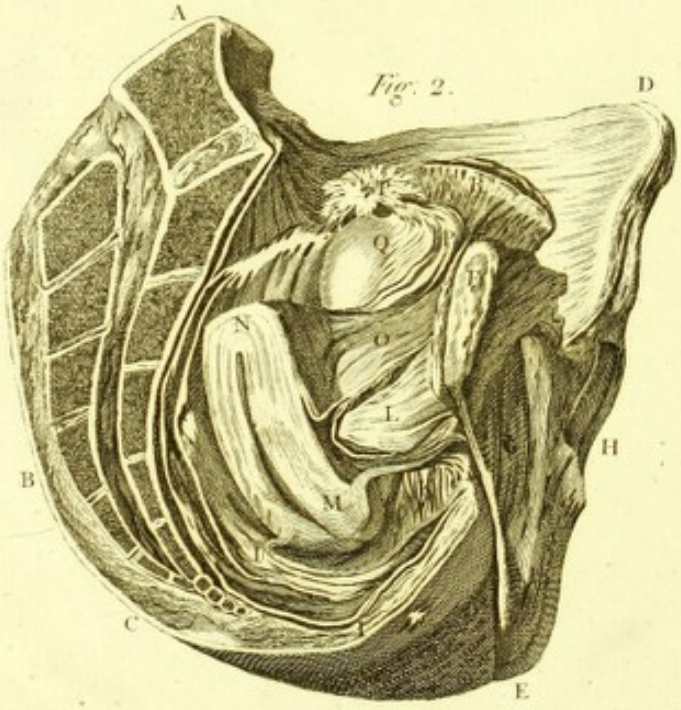

Fig. 2.

Fig. 3.

MIDWIFRY.

PLATE THE FIRST.

FIG. I.

This gives a front View of the Uterus ſuſpended in the Vagina. The anterior more external Part being removed, to ſhew thoſe which are more internal.

A. The Vertebra of the Loins.
B. The Oſſa Ilium.
CC. The Acetabulum.
DD. The inferior and poſterior Parts of the Oſſa Iſchii.
E. The Part covering the Extremity of the Coccyx.
F. The inferior Part of the Rectum.
G. G. The Vagina, cut open longitudinally, and ſtretched on each Side of the Collum Uteri, to ſhew in what manner the Uterus is ſuſpended in the ſame.
HH. Part of the Veſica Urinaria ſtretched on each Side the Vagina and inferior Part of the Fundus Uteri.
I. The Collum Uteri.
K. The Fundus Uteri.
LL. The Tubæ Fallopianæ, and Fimbriæ.
MM. The Ovaria.
NN. The Ligamenta Lata, and Rotunda.
OO. The ſuperior Part of the Rectum.

FIG. II.

This exhibits a View of the internal Parts, as ſeen from the right Groin, the Pelvis being divided longitudinally.

A. The loweſt Vertebra of the Loins.
BC. The Os Sacrum and Coccyx.
D. The left Os Ilium.
E. The inferior Part of the left Os Iſchii.
F. The Os Pubis of the ſame Side.
G. The Foramen Magnum.
H. The Acetabulum.
III. The inferior Part of the Rectum, and Anus
K. The Os Externum, and Vagina; the Os Uteri lying looſely in the ſame.
L. The Veſica Urinaria.
MN. The Collum and Fundus Uteri with a View of the Cavity of both. The Attachment of the Vagina, round the outſide of the Lips of the Mouth of the Womb, is here likewiſe ſhewn, as alſo the Situation of the Uterus, as it is preſſed downwards and backwards by the Inteſtines, and urinary Bladder, into the concave and inferior Part of the Sacrum.
O. The Ligamenta Lata, and Rotunda of the left Side.
PP. The Fallopian Tube, with the Fimbriæ.
Q. The Ovarium of the ſame Side.
R. R. The ſuperior Part of the Rectum, and inferior Part of the Colon.

MIDWIFRY.

PLATE THE SECOND.

FIG. I.

This ſhews the Uterus, as it appears in the ſecond and third Months of Pregnancy, its anterior Part being removed.

A. The Anus.
B. The Vagina, and its Plicæ.
C C. The poſterior and inferior Part of the urinary Bladder extended on each Side, the anterior and ſuperior Part being removed.
D D. The Mouth and Neck of the Womb, as raiſed up when examining the ſame by the Touch, with one of the Fingers in the Vagina.
E E. The Uterus, as ſtretched in the ſecond or third Month, containing the Embryo, with the Placenta adhering to the Fundus.

FIG. II.

This gives a View of the Uterus in the fourth or fifth Month of Pregnancy: but here the anterior Part of the Collum Uteri is not removed.

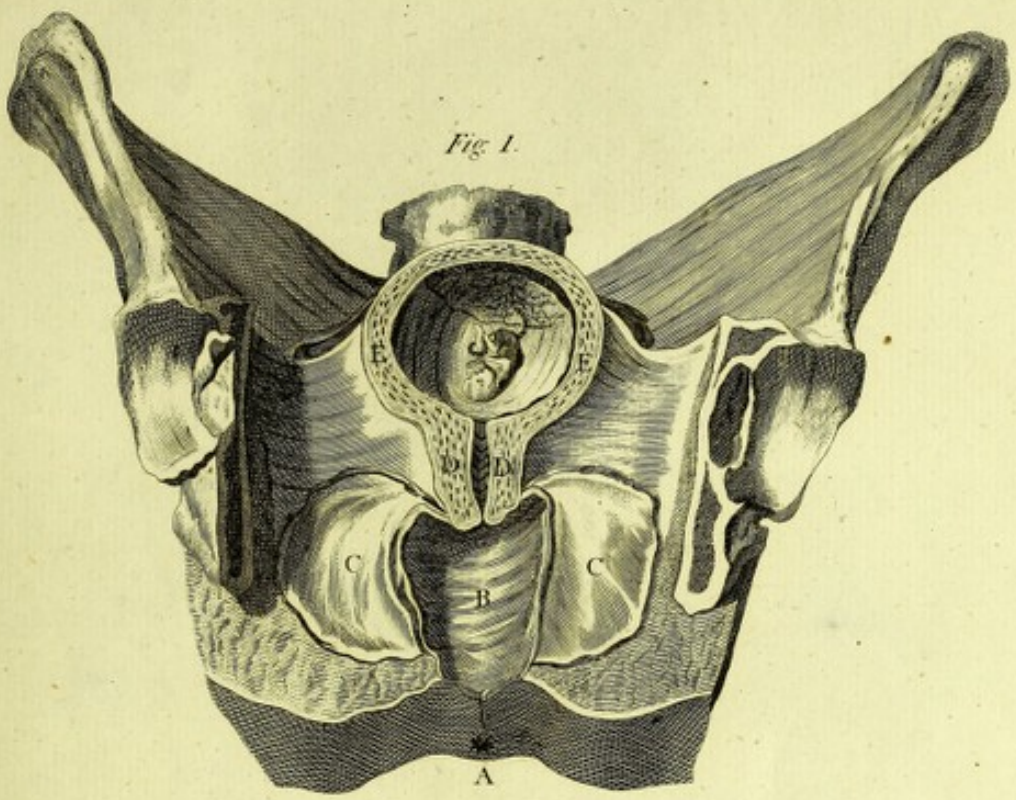
F. The Neck of the Womb, which appears in this Figure thicker and ſhorter than in the former, ſhewing the Diminution of it length as Pregnancy advances.
G. Occupies the Situation of C C in the former, but ſhould have been placed more interiorly, to ſhew the Vagina a little ſtretched from the Neck and Lips of the Womb, in order to ſhew the Parts more diſtinctly.
H. The inferior Part of the Fundus Uteri, the ſtretching of which can ſometimes be felt through the Vagina, by puſhing up a Finger, on the anterior or lateral Part of the ſame.

FIG. III.

This gives a front View of the Uterus in the Beginning of Pregnancy, the anterior Part being removed, that the Embryo might appear through the Amnios, the Chorion being diſſected off.

A. The Fundus Uteri.
B. The Collum Uteri, with a View of the rugous Canal that leads to the Cavity of the Fundus.
C. The Os Uteri.

Fig. 1.



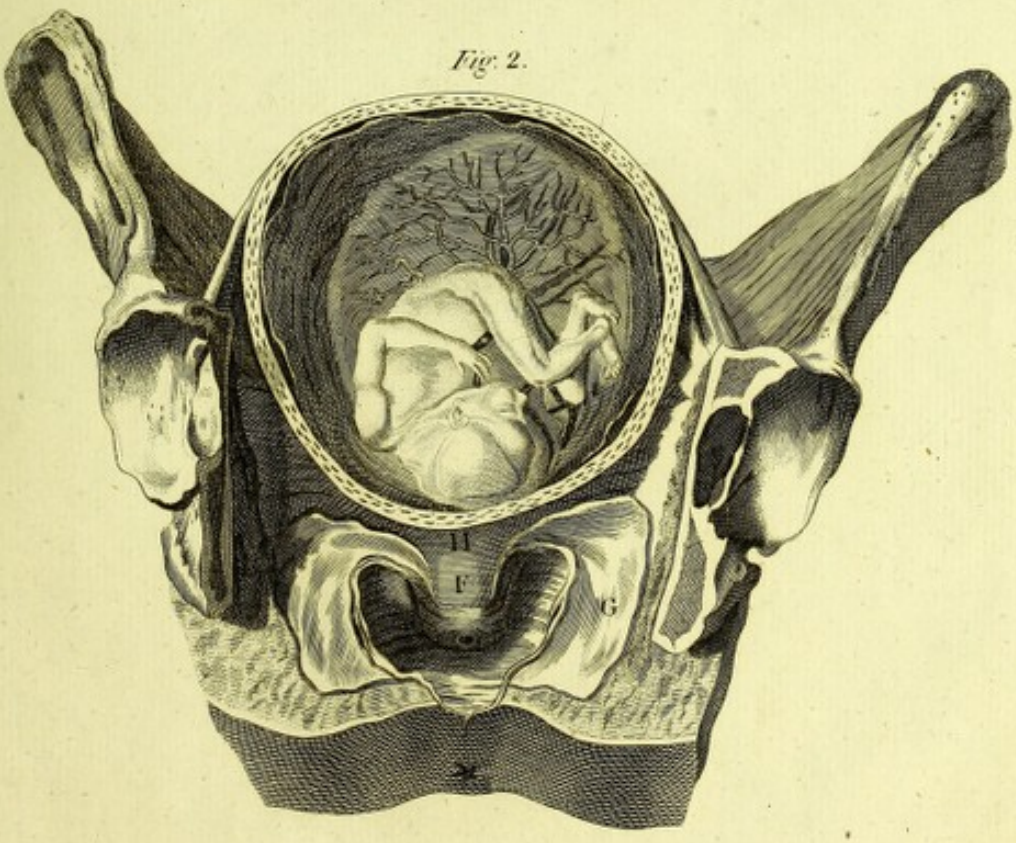


Fig. 2.

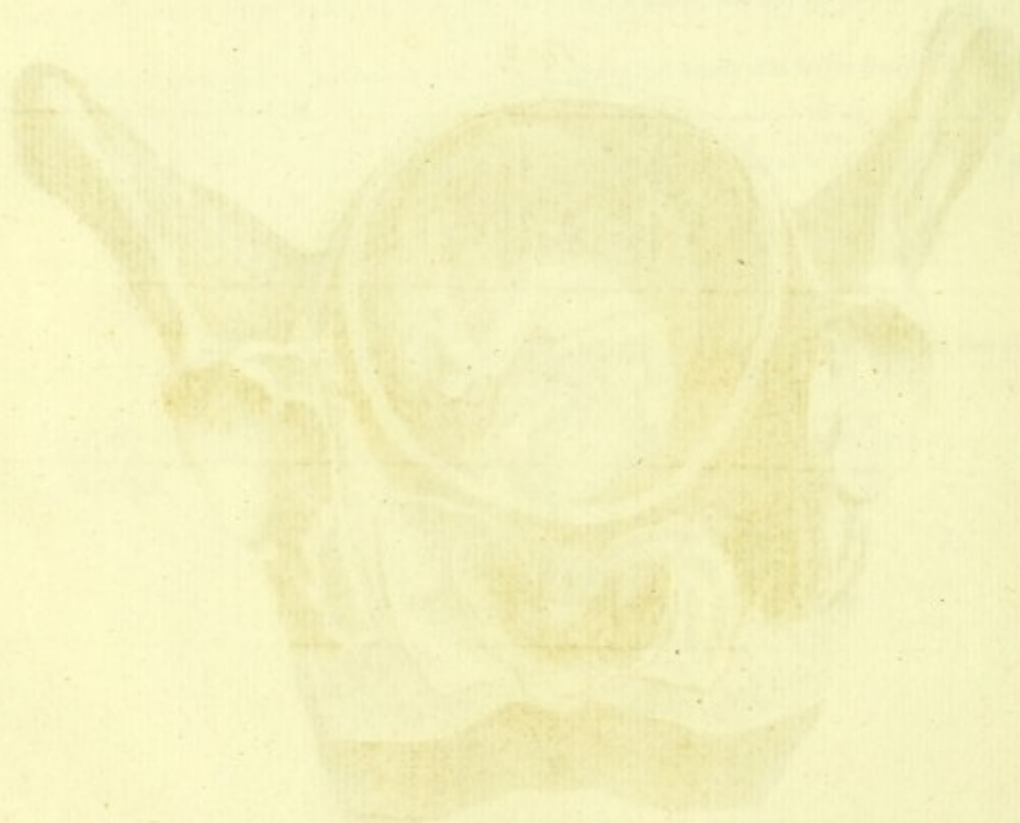

Fig. 1.

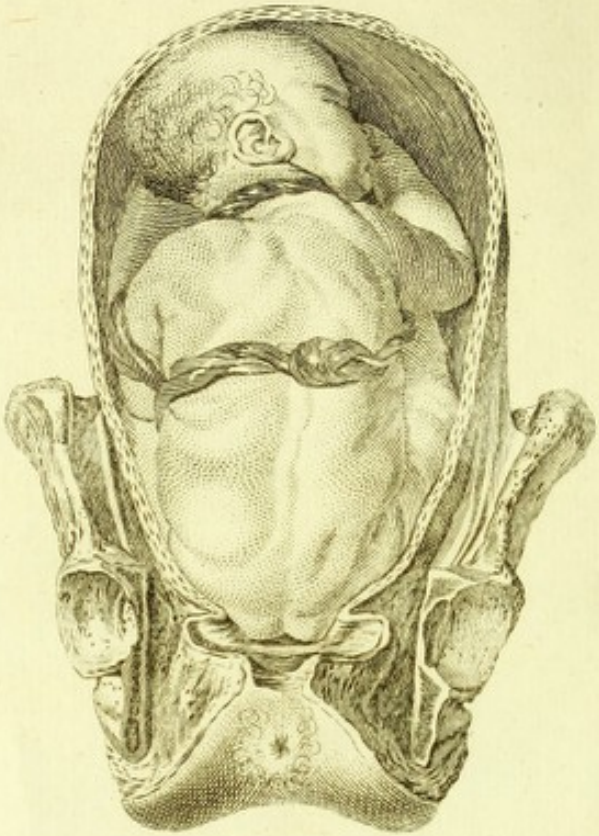

Fig. 2.

MIDWIFRY.

PLATE THE THIRD.

FIG. I.

Repreſents, in a front View of the Pelvis, the Breech of the Fœtus, preſenting, and dilating the Os Internum, the Membranes being too ſoon broken. The Fore-parts of the Child are to the poſterior Part of the Uterus, and the Funis, with a Knot upon it, ſurrounds the Neck, Arm, and Body.

The Deſcription of the Parts of the ſubſequent Figure will ſerve for this.

FIG. II.

This repreſents the Uterus in the eighth or ninth Month of Pregnancy.

A. The Uterus, as ſtretched to very near its full Extent, with the Waters, and containing the Fœtus intangled in the Funis, the Head preſenting at the upper Part of the Pelvis.
BB. The Os Ilium.
CC. The Acetabula.
DD. The remaining poſterior Parts of the Oſſa Iſchii.
E. The Coccyx.
F. The interior Part of the Rectum.
GGG. The Vagina ſtretched on each Side.
H. The Os Uteri, the Lips of which appear large and ſoft; the Neck of the Womb being likewiſe ſtretched to its full Extent, or entirely obliterated.
II. Part of the Veſica Urinaria.
K. The Placenta at the ſuperior and poſterior Part of the Uterus.
L. The Membranes.
M. The Funis Umbilicalis.

MIDWIFRY.

PLATE THE FOURTH.

FIG. I.

This exhibits a front View of the gravid Uterus in the Beginning of Labour; the anterior Parts being removed, but the Membranes not being broken, form a large Bag containing the Waters and Fœtus.

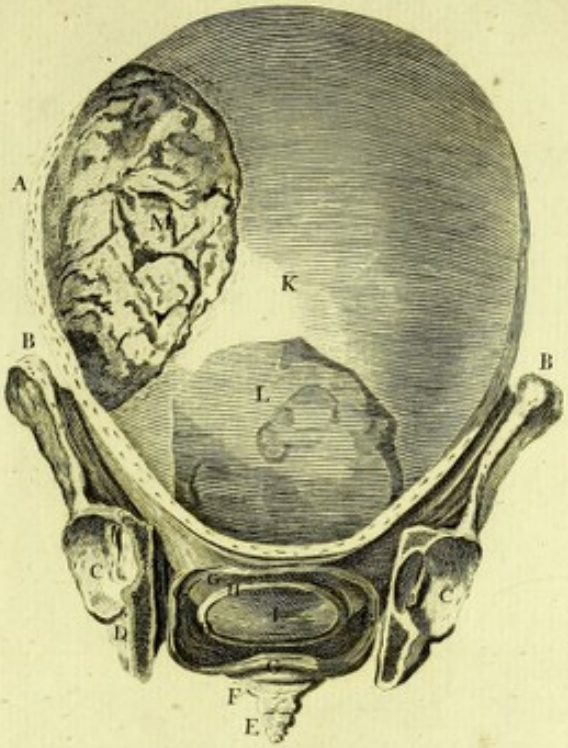
A. The Subſtance of the Uterus.
BB. CC. DD. The Bones of the Pelvis.
E. The Coccyx.
F. The inferior Part of the Rectum.
G. The Vagina.
H. The Mouth of the Womb largely ſtretched in Time of pain; with the Membranes and Waters, marked I.
K. The Chorion.
L. The ſame diſſected off at the inferior Part of the Uterus, in order to ſhew the Head of the Fœtus through the Amnios.
M. The Placenta, the external convex Surface of which, divided into a Number of Lobes, is here repreſented, its concave internal Part being covered by the Chorion.

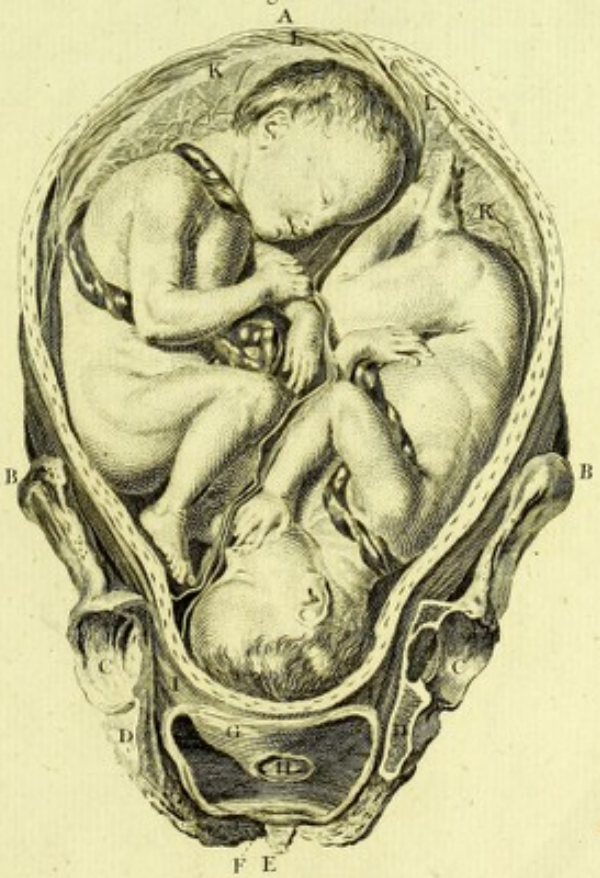
FIG. II.

This gives a front View of Twins in Utero, in the Beginning of Labour, the anterior Parts being removed.

A. The Uterus, as ſtretched with the Membranes and Waters.
B. The ſuperior Parts of the Oſſa Ilium.
CC. The Acetabula.
DD. The Oſſa Iſchii.
E. The Coccyx.
F. The lower Part of the Rectum.
GG. The Vagina.
H. The Os Internum, ſtretched open about a Finger's Breadth, with the Membranes, and Waters in Time of Labour-Pains.
II. The inferior part of the Uterus ſtretched with the Waters which are below the Head of the Child that preſents.
KK. The two Placentas adhering to the poſterior Part of the Uterus, the two Fœtuſes lying before them, one with its Head in a proper Poſition, at the inferior Part of the Uterus, and the other ſituated preternaturally with the Head to the Fundus: the Bodies of each are here entangled in their proper Funiſes, which frequently happens in the natural as well as preternatural Poſitions.
LLL. The Membranes belonging to each Placenta.

Fig. 1.





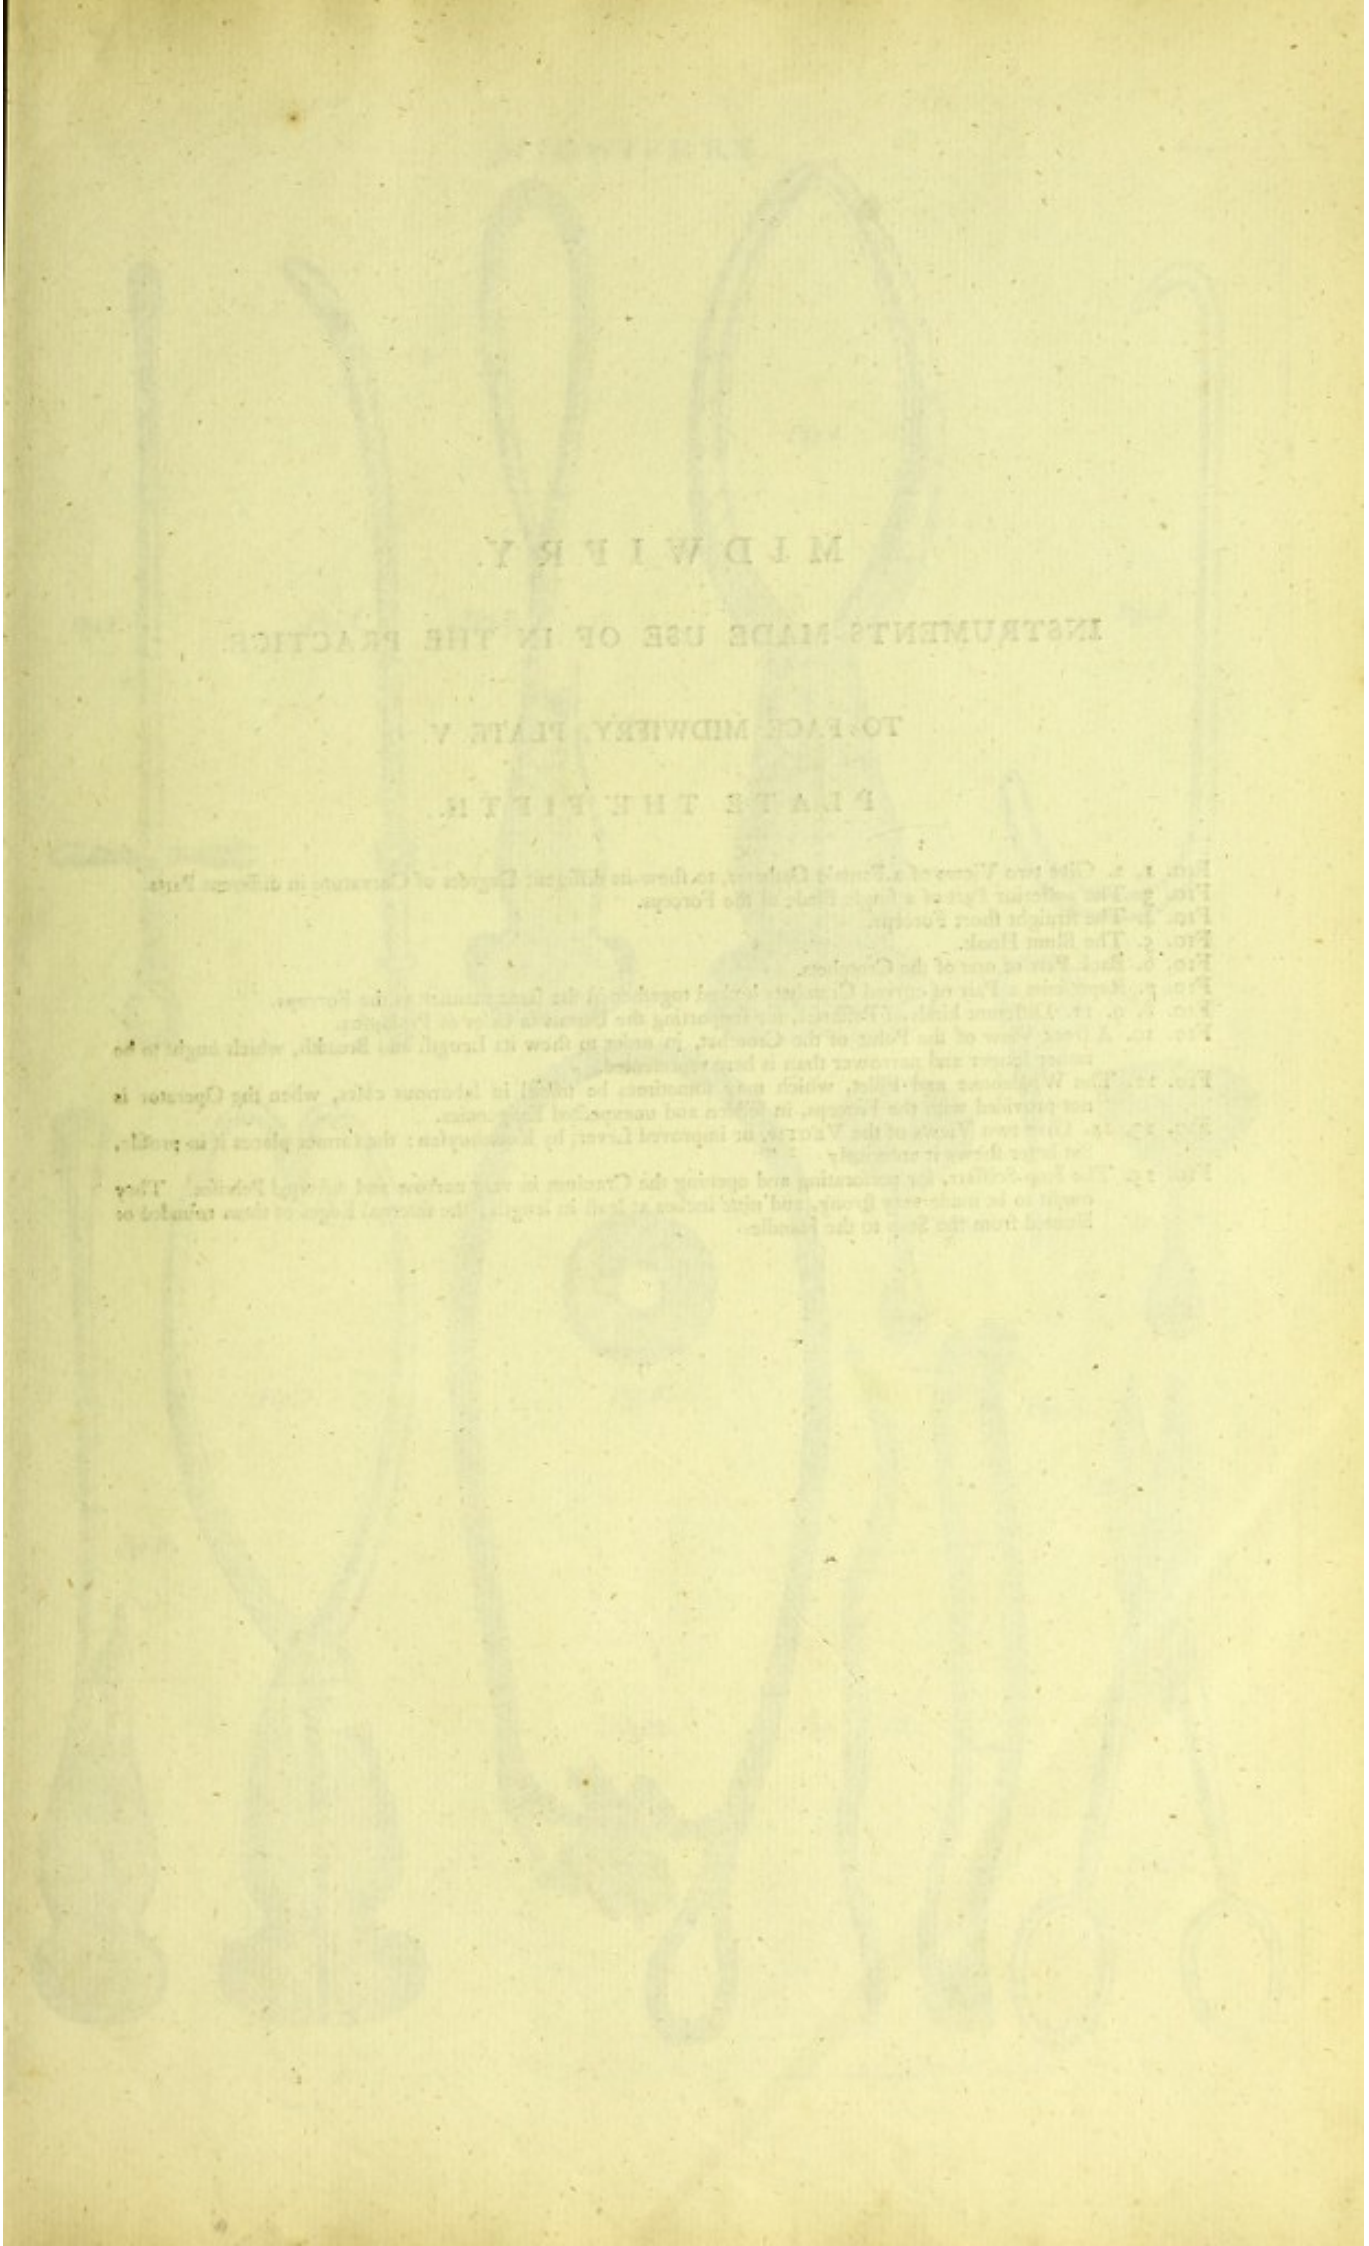


Fig. 2.

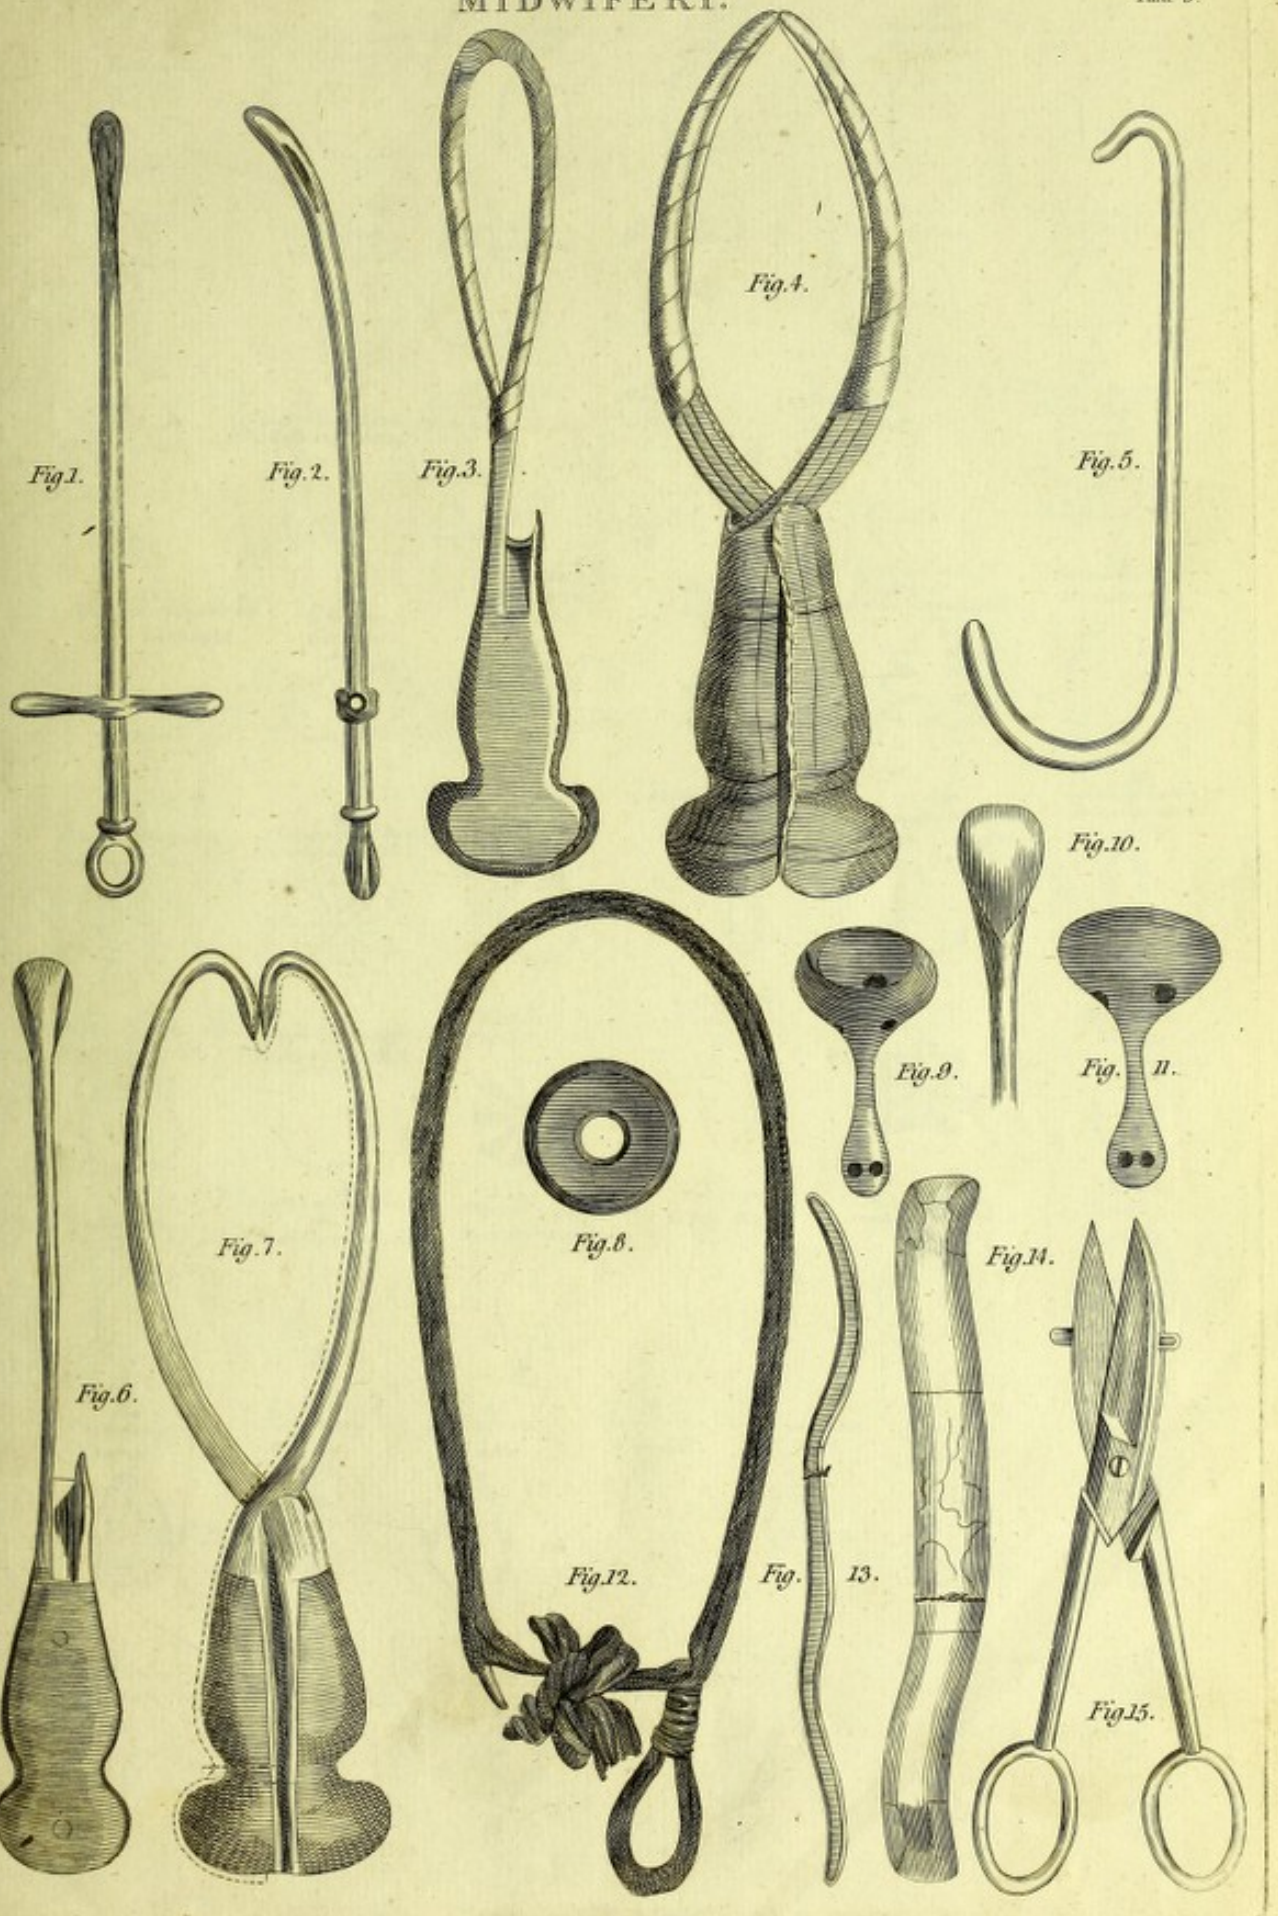
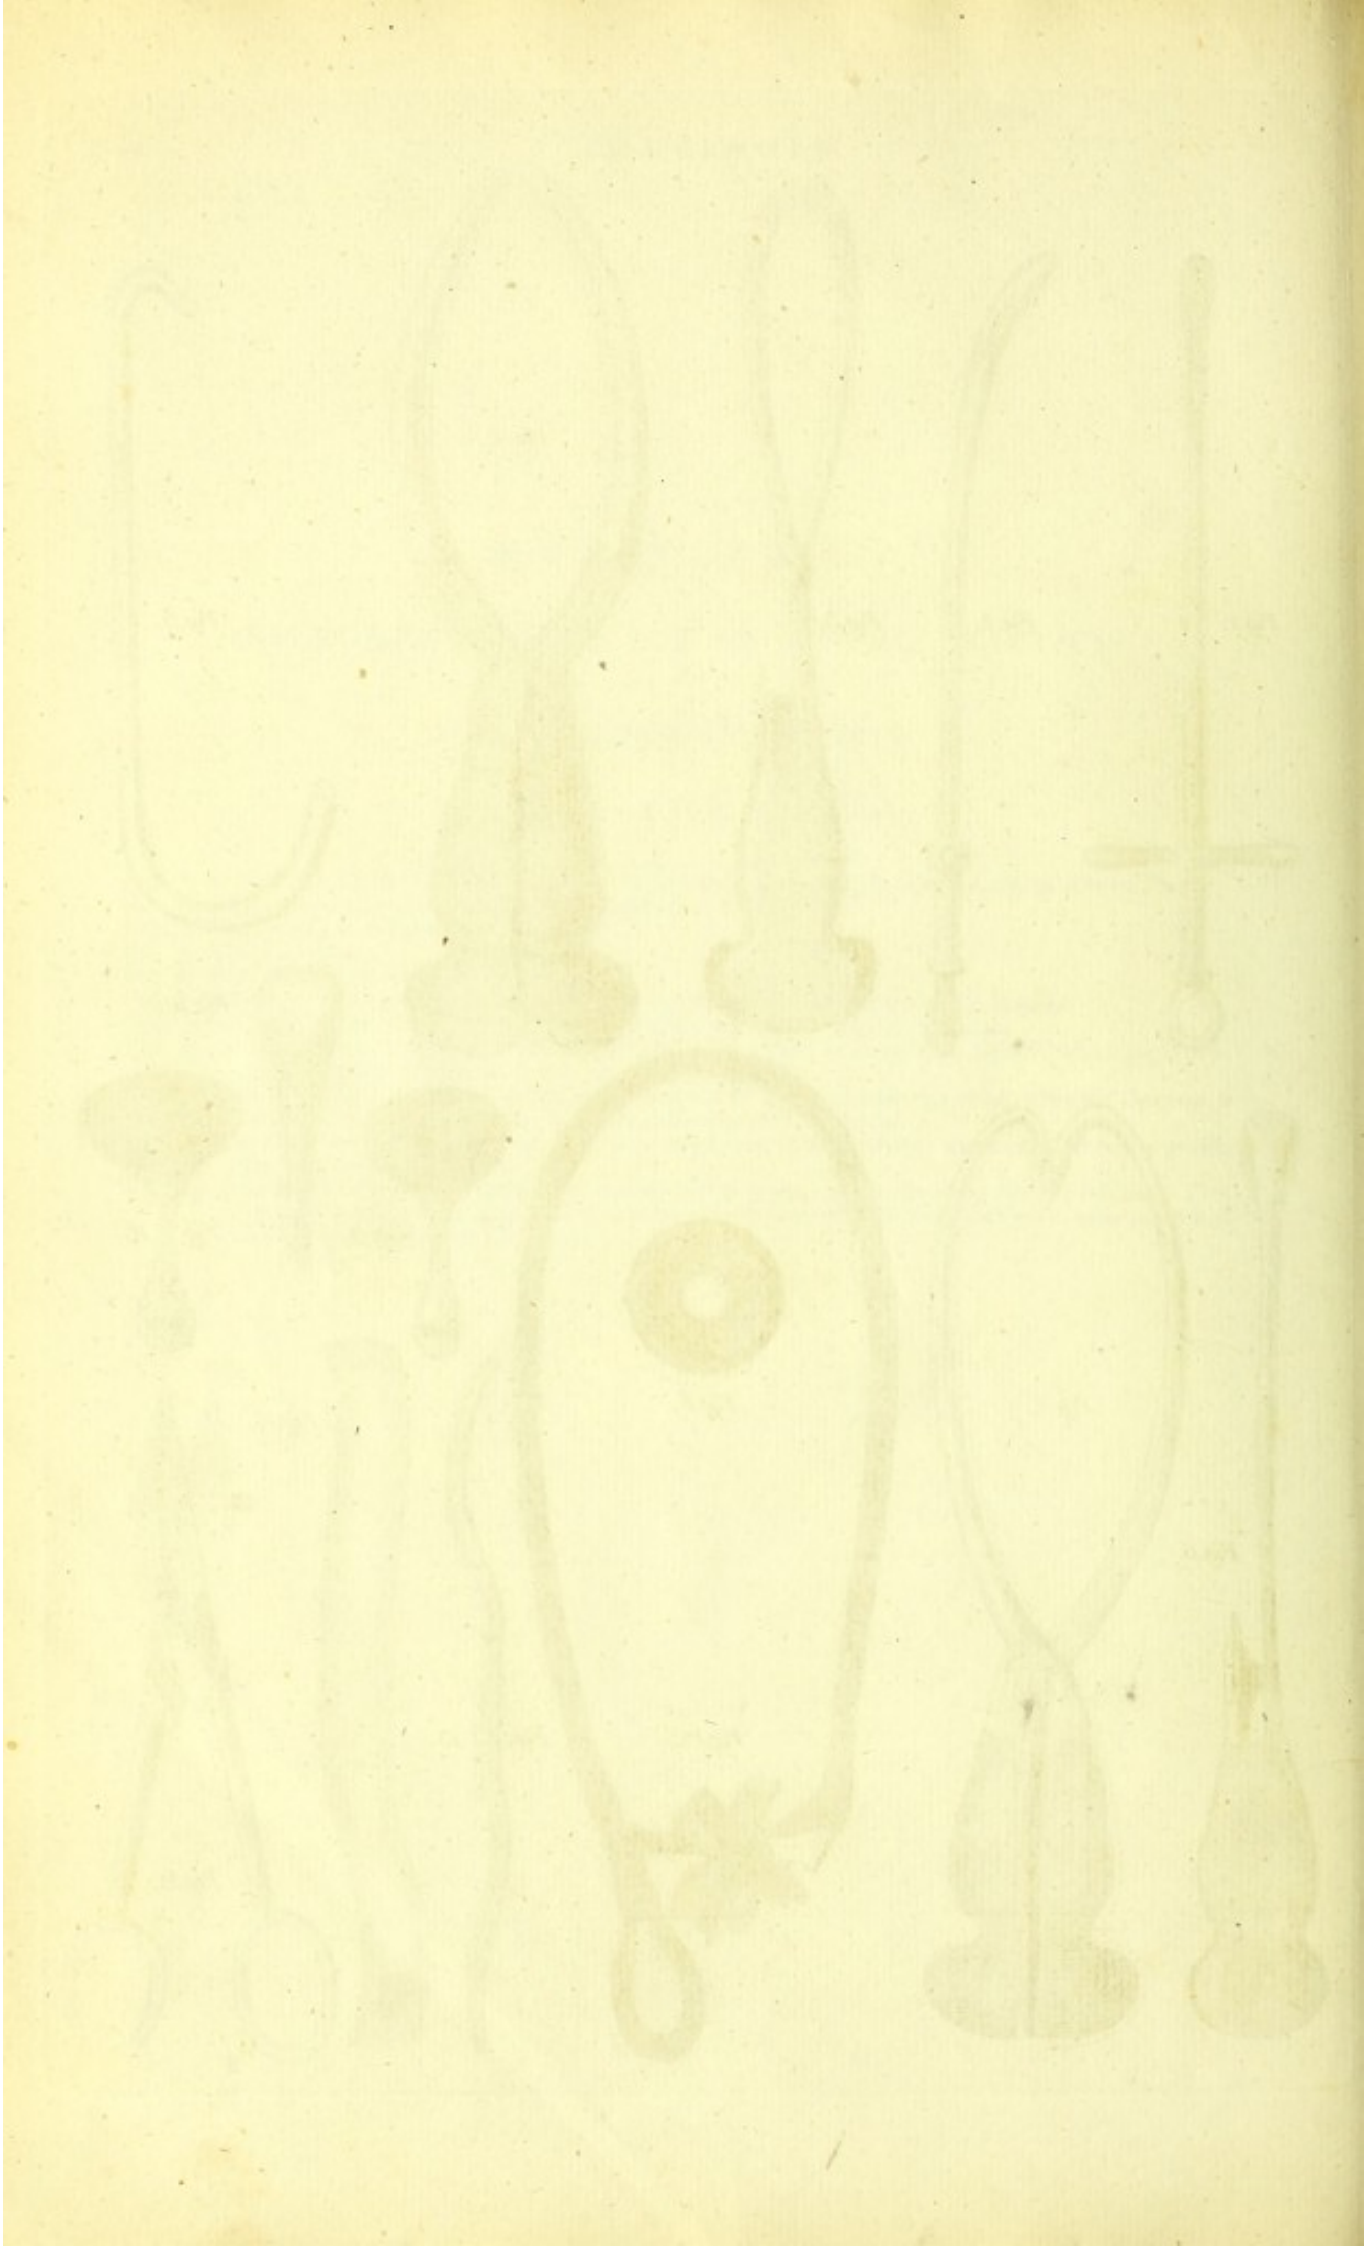


MIDWIFRY.



INSTRUMENTS MADE USE OF IN THE PRACTICE.

TO FACE MIDWIFRY, PLATE V.

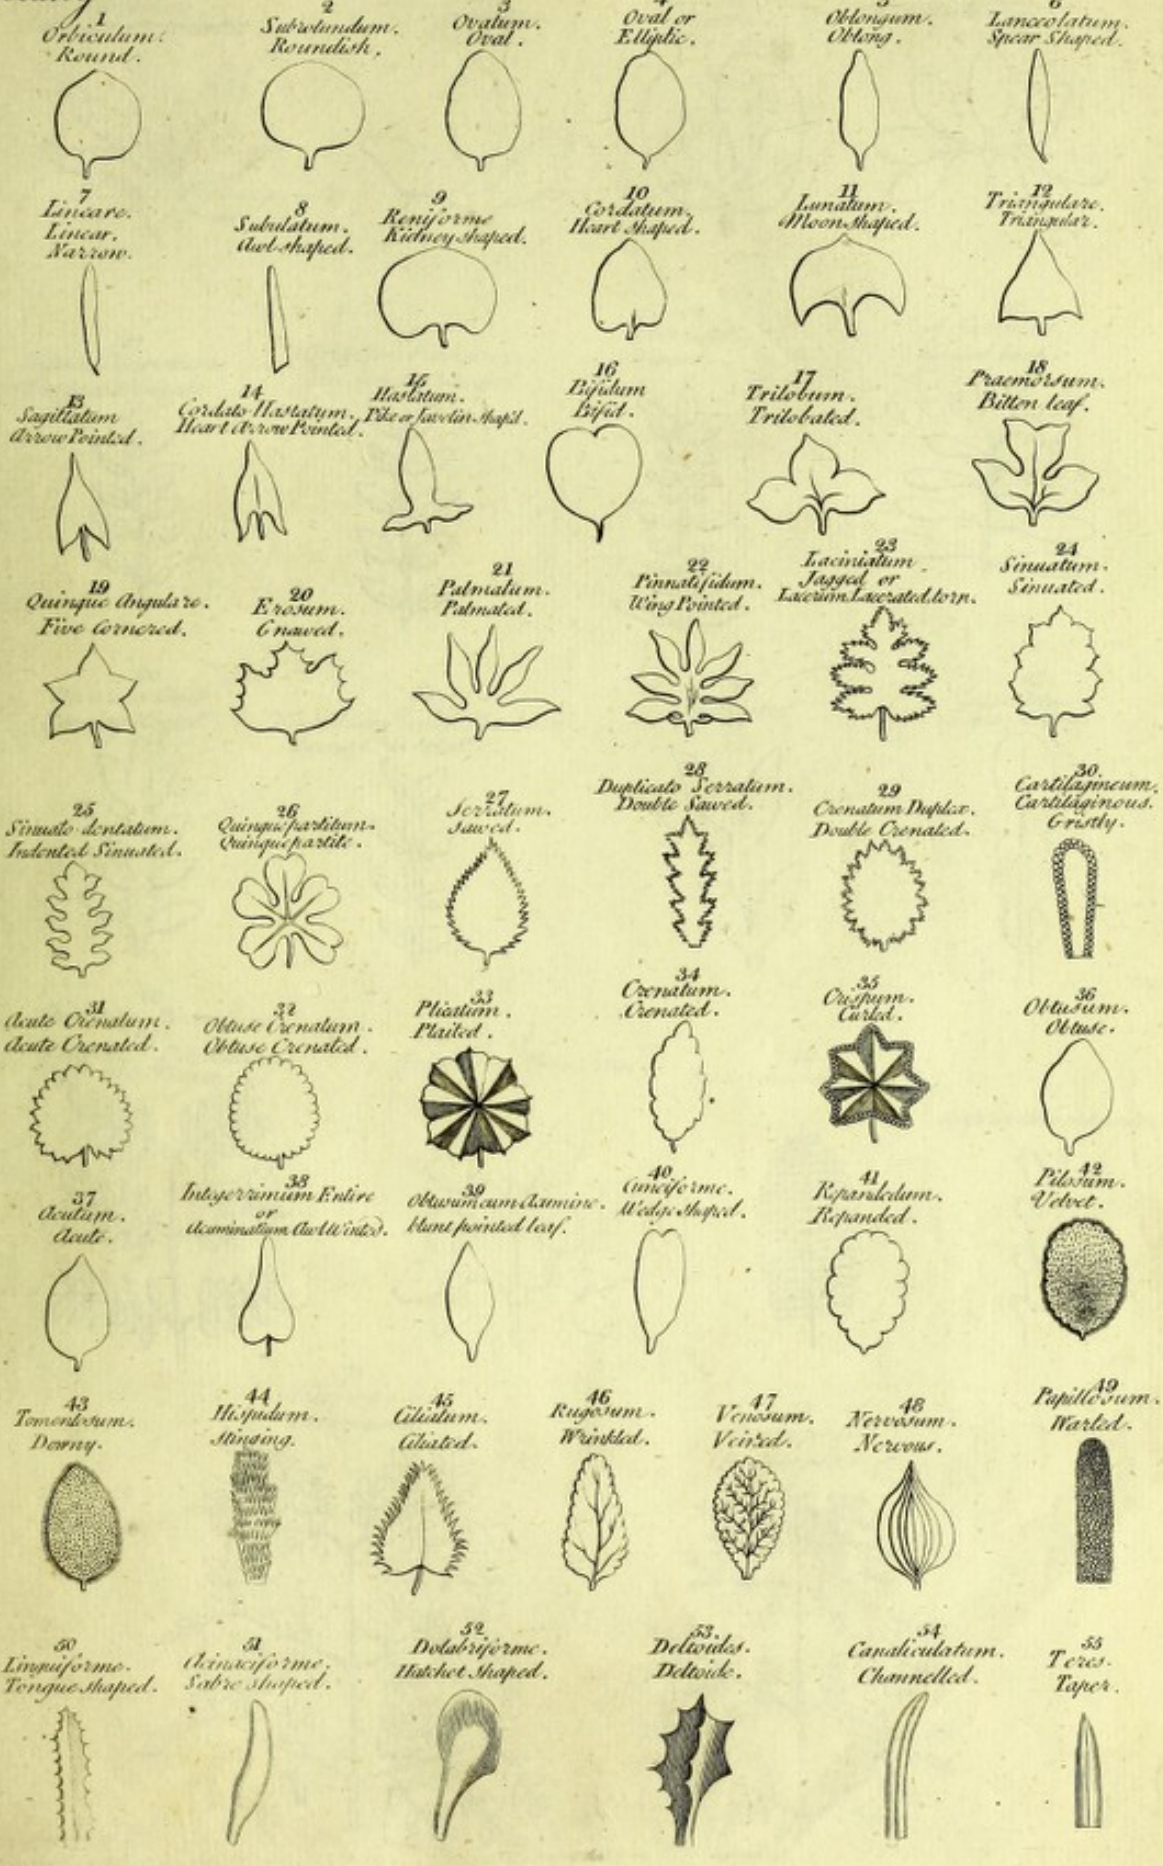


PLATE THE FIFTH.

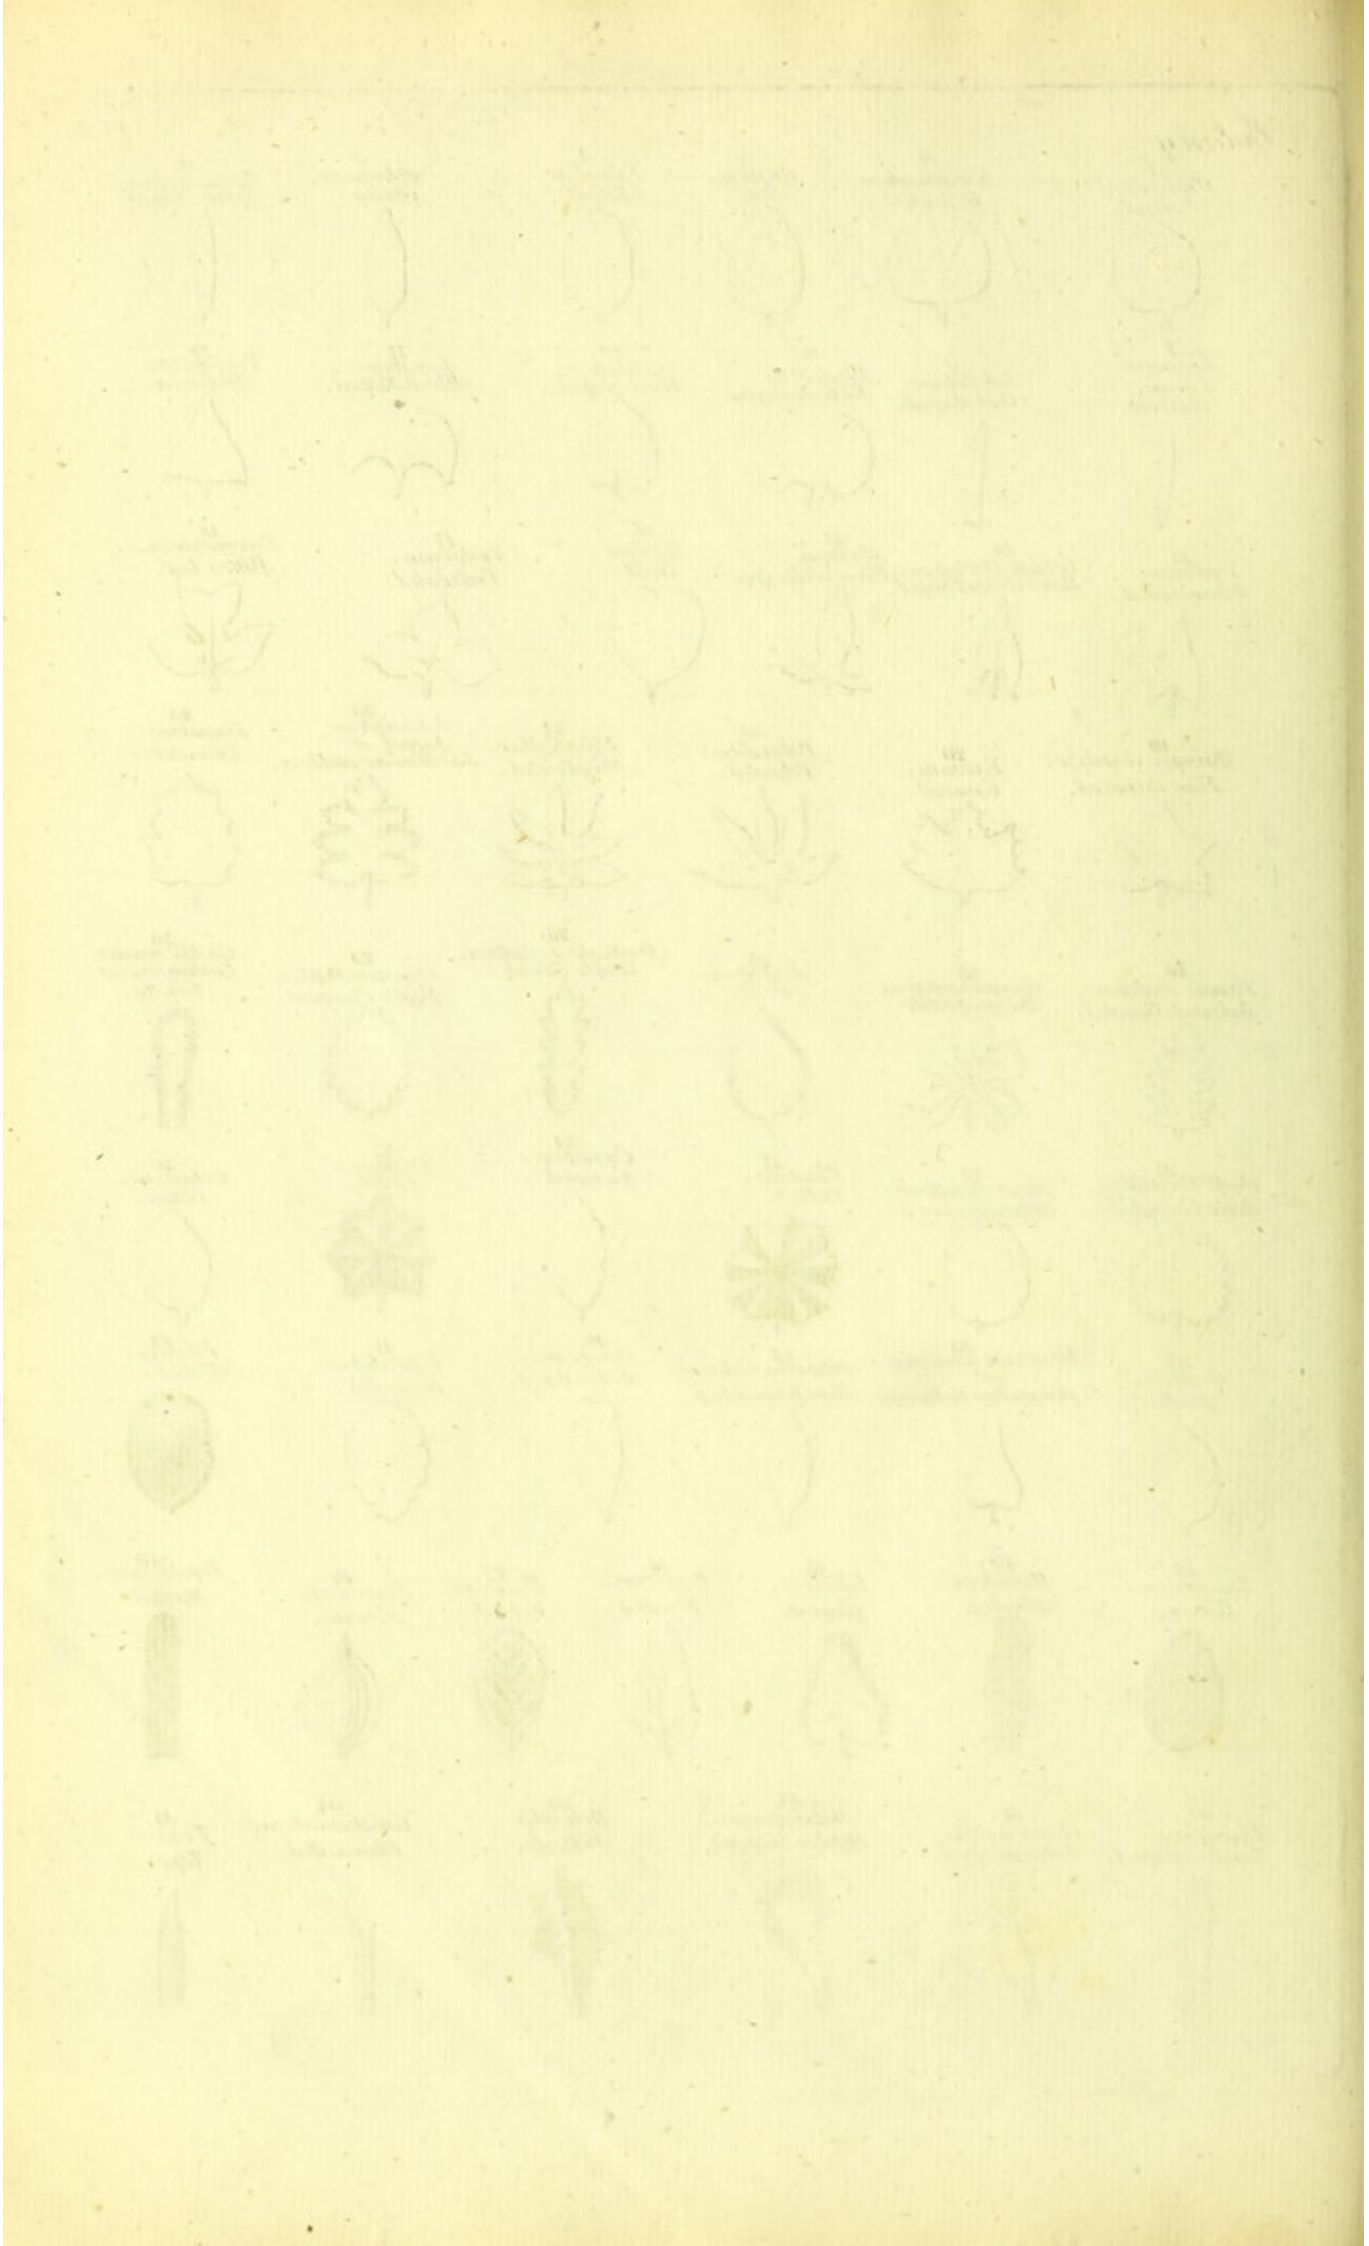

FIG. 1, 2. Give two Views of a Female Catheter, to ſhew its different Degrees of Curvature in different Parts.
FIG. 3. The poſterior Part of a ſingle Blade of the Forceps.
FIG. 4. The ſtraight ſhort Forceps.
FIG. 5. The Blunt Hook.
FIG. 6. Back Part of one of the Crotchets.
FIG. 7. Repreſents a Pair of curved Crotchets locked together in the ſame manner as the Forceps.
FIG. 8, 9, 11. Different kinds of Peſſaries, for ſupporting the Uterus in caſes of Prolapſus.
FIG. 10. A front View of the Point of the Crotchet, in order to ſhew its Length and Breadth, which ought to be rather longer and narrower than is here repreſented.
FIG. 12. The Whalebone and Fillet, which may ſometimes be uſeful in laborious caſes, when the Operator is not provided with the Forceps, in ſudden and unexpected Exigencies.
FIG. 13, 14. Give two Views of the VECTIS, or improved Lever, by Roonhuyſen: the former places it in profile, the latter ſhews it anteriorly
FIG. 15. The Stop-Sciſſars, for perforating and opening the Cranium in very narrow and diſtorted Pelviſes. They ought to be made very ſtrong, and nine inches at leaſt in length; the internal Edges of them rounded or blunted from the Stop to the Handle.

Botany

1 Orbiculatum. Round.
2 Subrotundum. Roundish.
3 Ovatum. Oval.
4 Oval or Elliptic.
5 Oblongum. Oblong.
6 Lanceolatum. Spear Shaped.
7 Lineare. Linear. Narrow.
8 Subulatum. Awl-shaped.
9 Reniforme Kidney Shaped.
10 Cordatum Heart Shaped.
11 Lunatum. Moon Shaped.
12 Triangulare. Triangular.
13 Sagittatum Arrow Pointed.
14 Cordato Hastatum. Heart Arrow Pointed.
15 Hastatum. Pike or Javelin shaped.
16 Bifidum Bifid.
17 Trilobum. Trilobated.
18 Praemorsum. Bitten leaf.
19 Quinque Angulare. Five Cornered.
20 Erosum. Gnawed.
21 Palmatum. Palmated.
22 Pinnatifidum. Wing Pointed.
23 Laciniatum. Jagged or Laciniim Lacerated torn.
24 Sinuatum. Sinuated.
25 Sinuato dentatum. Indented Sinuated.
26 Quinque partitum. Quinque partite.
27 Serratum. Sawed.
28 Duplicato Serratum. Double Sawed.
29 Crenatum Duplex. Double Crenated.
30 Cartilagineum. Cartilaginous. Gristly.
31 Acute Crenatum. Acute Crenated.
32 Obtuse Crenatum. Obtuse Crenated.
33 Plicatum. Plaited.
34 Crenatum. Crenated.
35 Crispum. Curled.
36 Obtusum. Obtuse.
37 Acutum. Acute.
38 Integerrimum Entire or Acuminatum Awl Pointed.
39 Obtusum cum Acumine. Blunt pointed leaf.
40 Cuneiforme. Wedge Shaped.
41 Repandatum. Repanded.
42 Pilosum. Velvet.
43 Tomentosum. Downy.
44 Hispidum. Stinging.
45 Ciliatum. Ciliated.
46 Rugosum. Wrinkled.
47 Venosum. Veined.
48 Nervosum. Nervous.
49 Papillosum. Warted.
50 Linguiforme. Tongue Shaped.
51 Acinaciforme. Sabre Shaped.
52 Dolabriforme. Hatchet Shaped.
53 Deltoides. Deltoide.
54 Canaliculatum. Channelled.
55 Teres. Taper.

56 Digitatum. Fingered or Handed.

57 Ternatum. Trifoliate.

58 Binatum. Two Lobes.

59 Ramosum. Branching.

60 Impari-Pinnatum. Unequal Winged.

61 Abruptum-Pinnatum. An Abrupt Winged.

62 Interrupt. Winged.

63 A Cirrhous. Winged Leaf.

64 Decurrentibus. Running Winged.

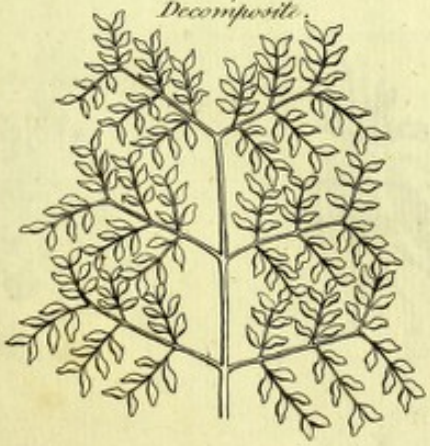
65 Winged Leaf. with Membranaceous Footstalks.

66 Conjugated.

67 Lyratum. Lyre shaped.

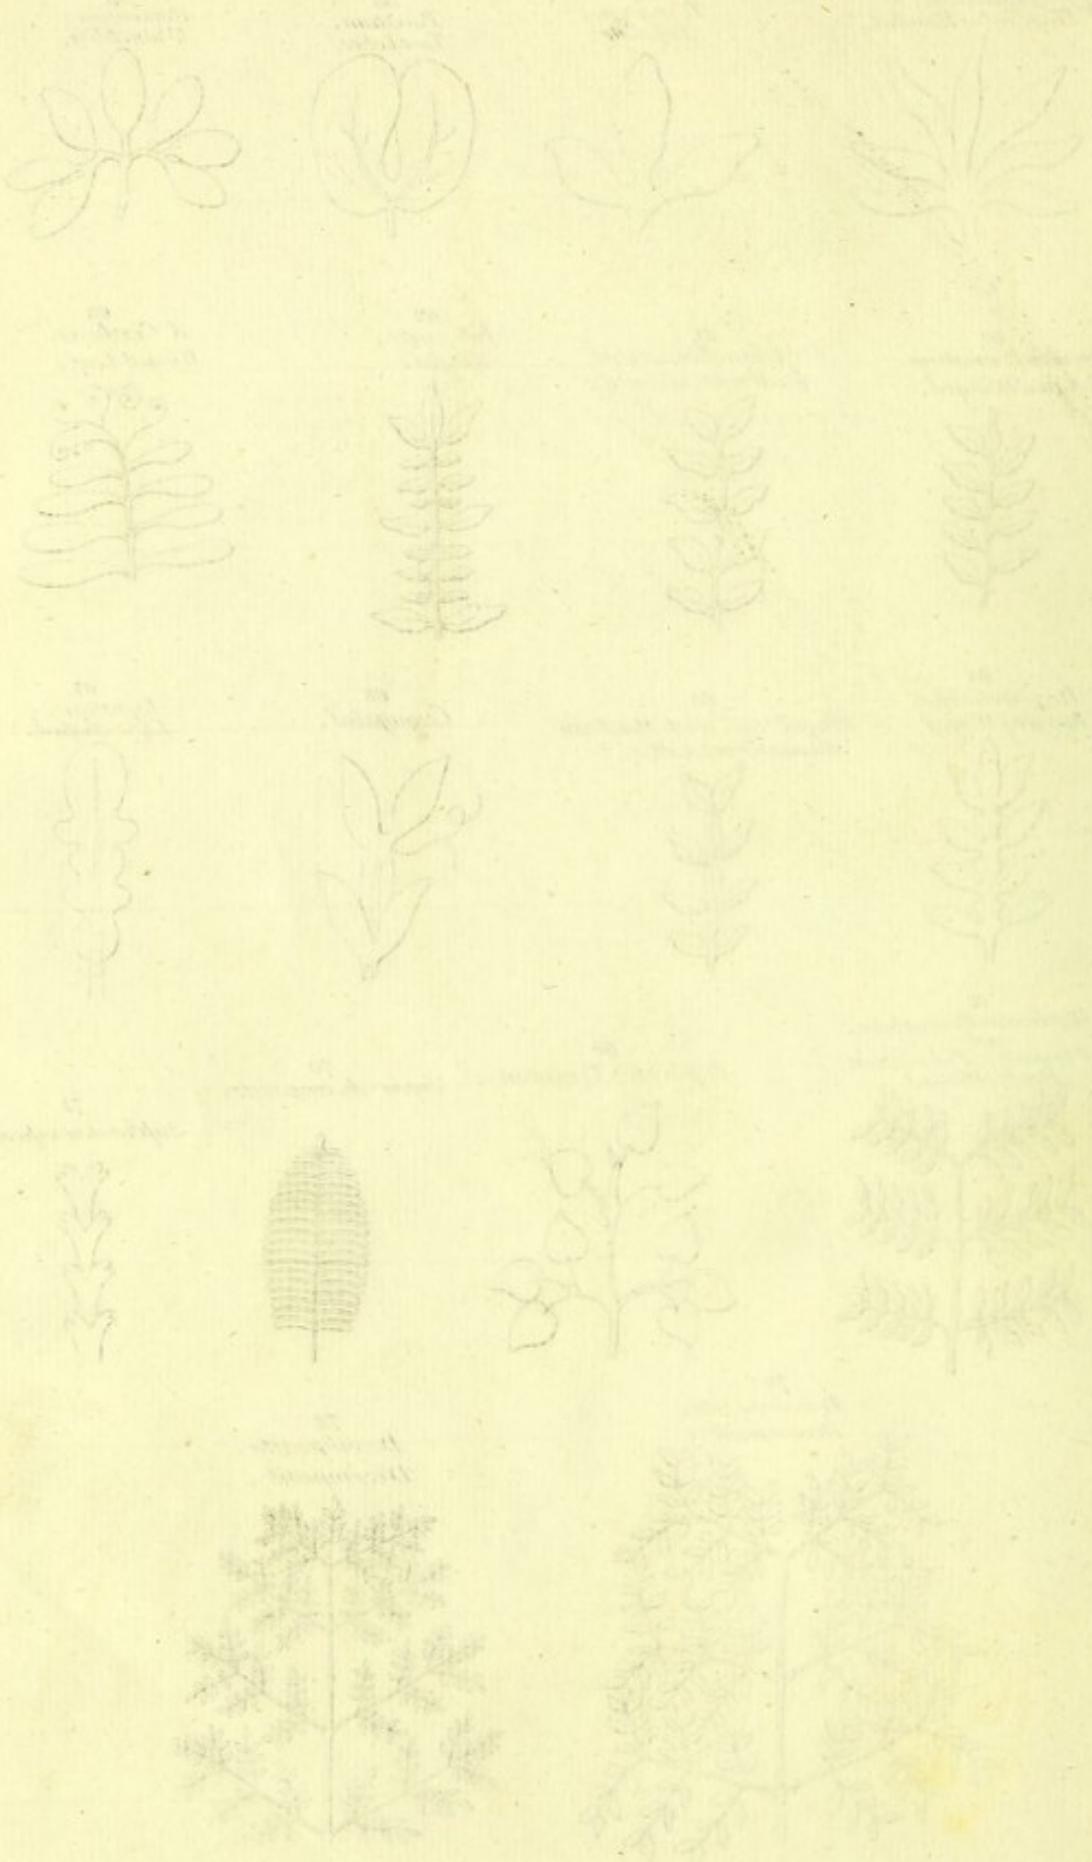
68 Duplicato-Pinnatum. vel Pinnato-Pinnatum. Double Winged.

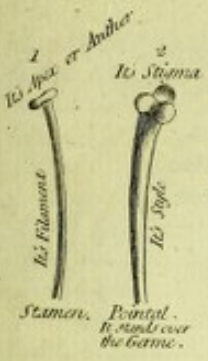
69 Triplicato-Ternatum.



70 Supra-decomposite.

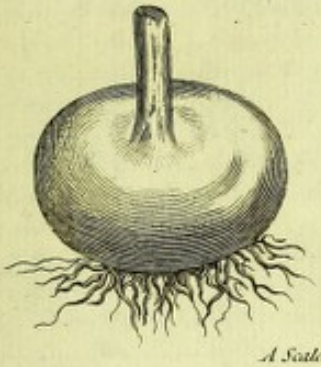
71 Supra-decomposite.





72 Decomposita. Decomposite.

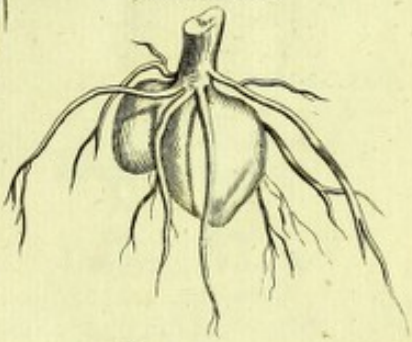
73 Decomposita. Decomposite.



4
A Fleshy Root.

5
A Tap Root.

6
A Solid Bulbous Root.

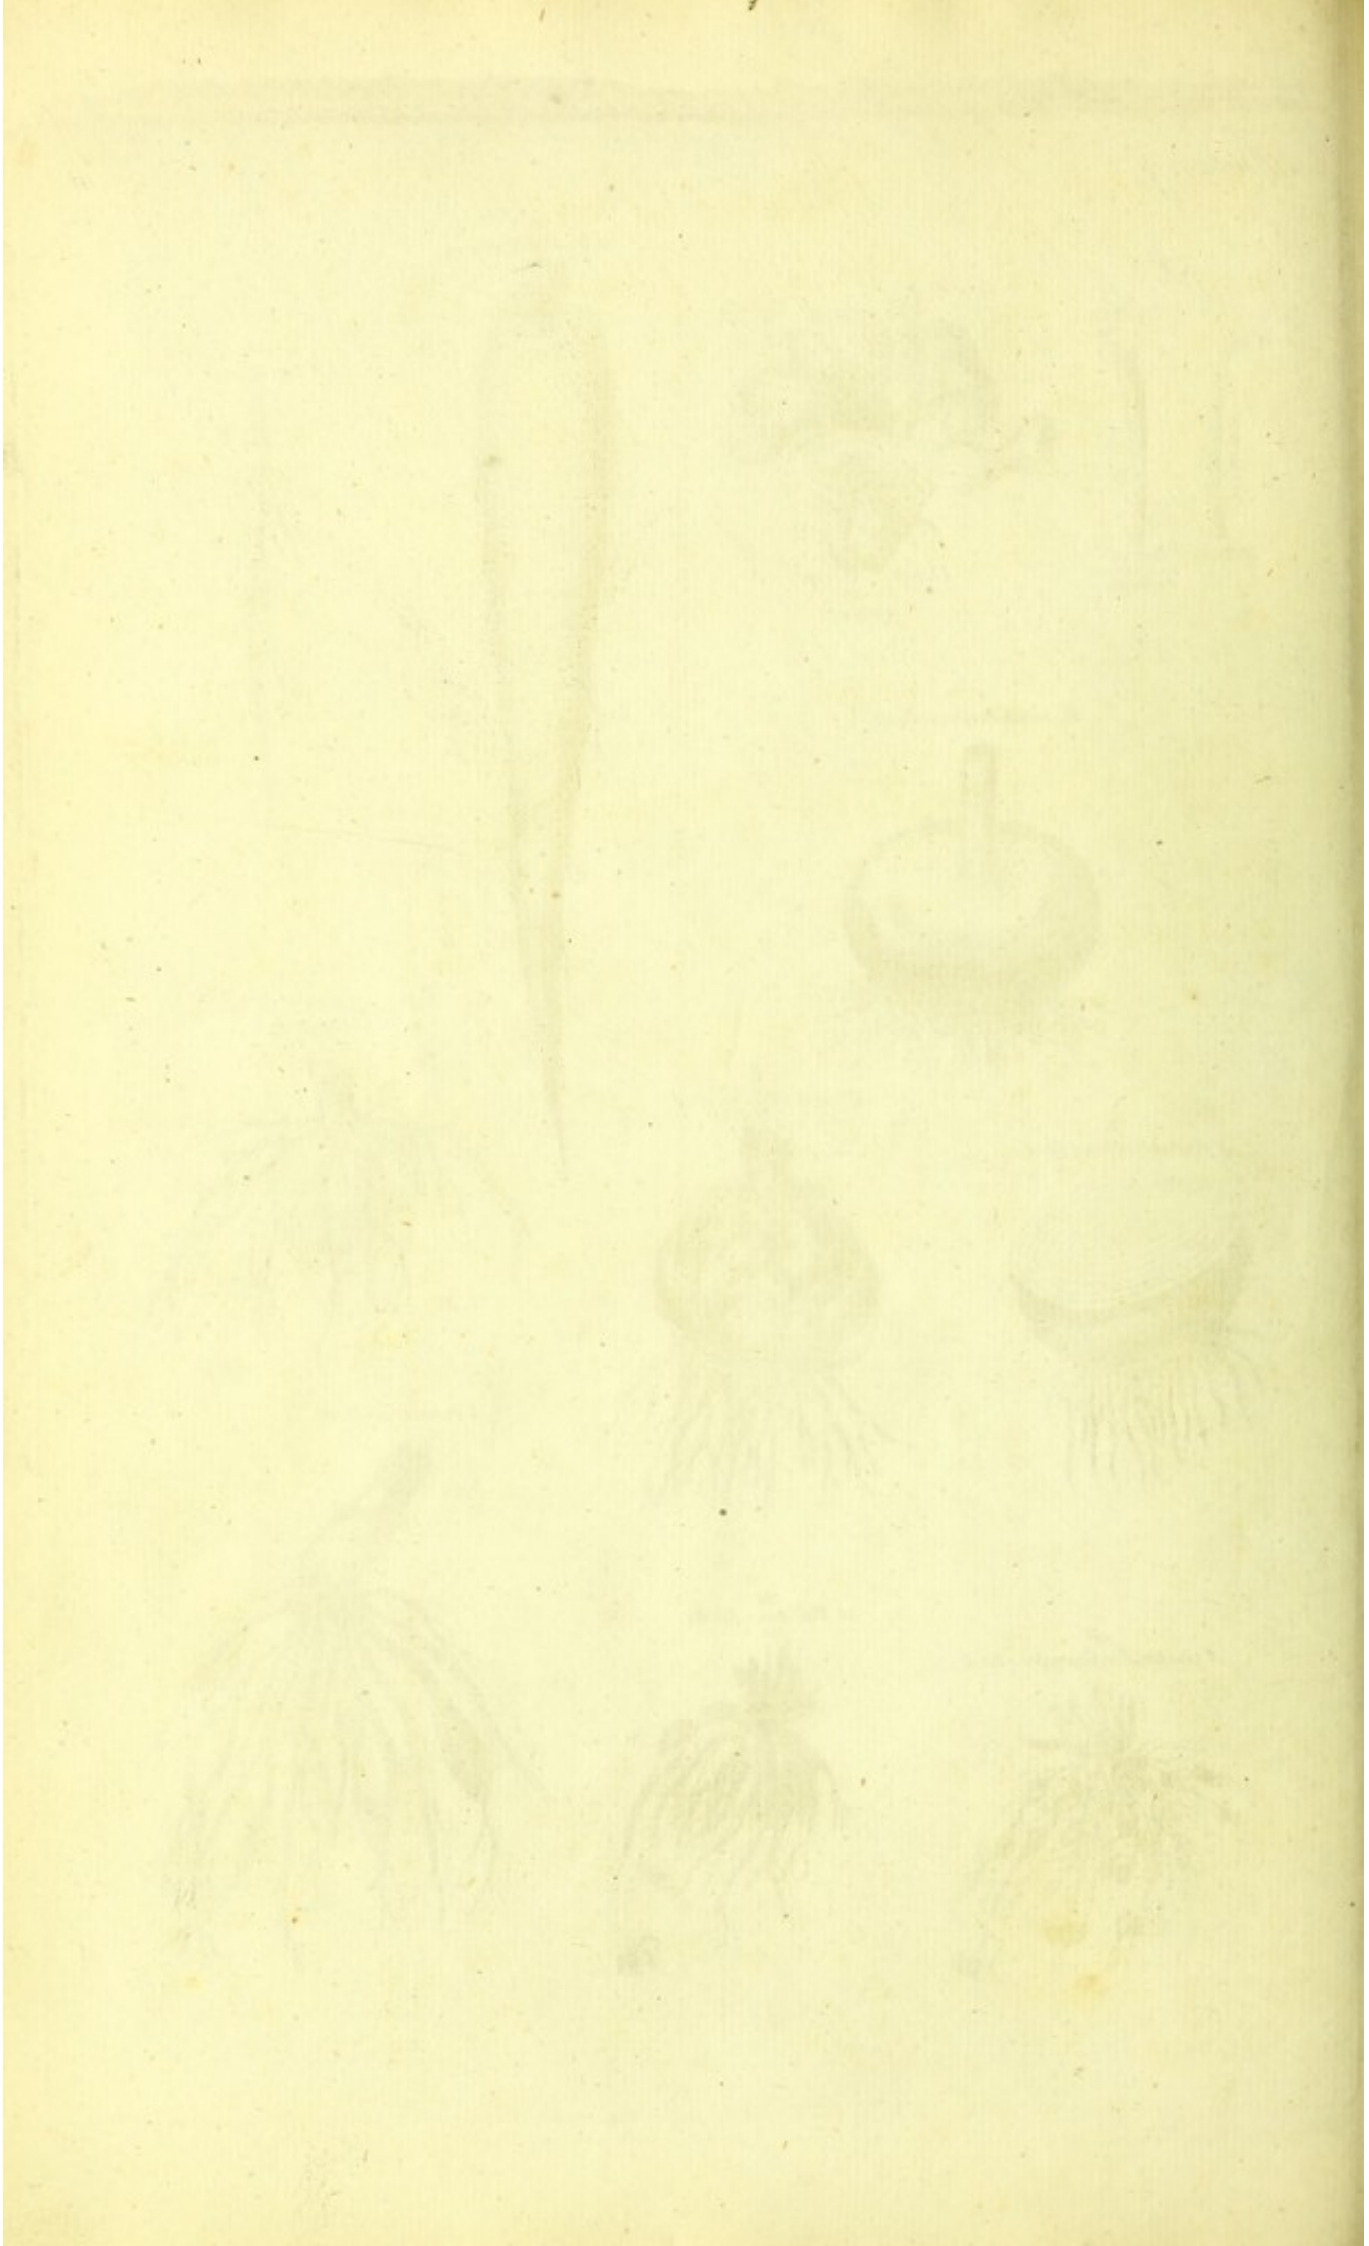


7
A Coated Bulbous Root.

8
A Scaled Bulbous Root.

9
A Double Bulbous, or Testiculated Root.

10
A Clustered or Granulous Root.



11
A Tuberous Root.

12
A Pendulous Root.

— Essent: ..... E ..... Essential Oils.
— Olivarum ..... Olive Oil.
Oppositio ..... Opposition.
Orichalcum ..... Brass.
Phlegma ..... Phlegm.
Phlogiston
Phosphorus
Pisces ..... The sign of the Zodiac.
Plumbum ..... Lead.
Præcipitatum ..... Precipitate.
Pugillus ..... P ..... A Pugil.
Pulvis ..... Powder.
Pumex ..... Pumice stone.
Purificare ..... To purify.
Putrificare ..... To putrify.
Præpar: ..... PP; pp. ..... To prepare.
Phiala ..... A Phial.
Partes Æquales ..... P E: p: aeq ..... Equal parts.

Quadratus ..... Quartile.
Quinta Essentia ..... QE ..... Quintessence.
Quantum Sufficit ..... q: s: ..... As sufficient quantity.
Quantum Vis ..... q: v: ..... What you please.
Recipiens ..... A Receiver.
Recipe ..... R; ℞ ..... Take.
Regulus
— Antimonii ..... Regulus of Antimony.
— Ant: Stellat: ..... Stellated Reg: of Antim.
— Stellatus ..... Stellated Regulus.
Retorta ..... A Retort.
Saccharum ..... Sugar.
Sal Alkali ..... Alkaline Salt.
— Ammon: ..... Sal Ammoniac.
— Commun: ..... Common Salt.
— Gem ..... ♉; ♉; ♢
— Marin: ..... ♍; ♍; ♍ ..... Sea Salt.
— Sedativum ..... SS ..... Sedative Salt.
Sapo ..... Soap.
Saturnus ..... ♄; ♄ ..... Lead.
Scorpius ..... The Scorpion in the Zodiac.
Semiss: ..... ß ..... Half.
Sextilis ..... Sextile.
Sigillare Hermet: ..... S·H ..... To seal Hermetically.
Sol ..... The Sun, or Gold.
Solvere ..... To dissolve.
Secundum Artem ..... s. a ..... According to Art.
Spiritus ..... Spirit
— Vini ..... Spirit of Wine.
— — R: ..... Rectified Spirit of Wine.
— — P: ..... Proof Spirit.
Stannum ..... Tin.
Sublimare ..... To sublime.
Stratum super Stratum ..... SSS ..... Layer upon Layer.
Succinum ..... BB ..... Amber.
Sulphur ..... Sulphur.
— Philos: ..... Sulphur of the Philosophers.
— Vivum ..... Mineral Sulphur.
Talcum ..... Talc.
Tartarus ..... Tartar.
Terra ..... Earth.
— Absorbentia ..... Absorbent Earth.
— Calcar: ..... C ♉; ♉ ..... Calcareous Earth.
— Sigillata ..... Sealed Earth.
— Silic: vel Vitr: ..... Siliceous Earth.
— Alumin ..... A ♉; ♉ ..... Earth of Alum.
Tinctura ..... R ..... Tincture.
Tutiae ..... Tutty.
Venus ..... Copper.
Vinum ..... V ..... Wine.
— Album ..... VA ..... White Wine
— Coctum ..... VC ..... Burnt Wine.
— Rubrum ..... VR ..... Red Wine.
Vitriolum
Vitrum ..... XX; ○–; ○– ..... Glass.
Uncia ..... An Ounce.
Urina ..... Urine.
Volatilis ..... Volatile.
Zincum ..... ♃; ♃ ..... Zinc.

Chemistry Old Apparatus

Two Bladders over a Body.

CHEMISTRY.

MODERN APPARATUS.

FIG. 1. CRUCIBLES, or POTS.

FIG. 2. CUCURBITS, MATRASSES, or BODIES.

FIG. 3. RETORT.

FIG. 4. RECEIVER.

FIG. 5. ALEMBIC. A, the Body; B, the Head adapted to it; C, the Nose or Beak; D, the receiver.

FIG. 6. ALEMBIC made in Metal, the Head contained in a Veſſel of cold Water.

FIG. 7. LARGE STILL for diſtilling ardent Spirits; the letter E ſhews the pipe at which the ſpirit, after its condenſation in its paſſage through the worm, makes its exit.

FIG. 8. COMMON SMALL FURNACE for melting. A, The Aſh hole where the Air enters; C, the Fire place, containing a covered crucible; D, is the paſſage into E, the Chimney.

FIG. 9. REVERBERATORY FURNACE. A, The fire place; B, the Dome and Chimney, which are moveable. C, the Veſſel in which any material is placed for fuſion, &c. The Dome reflects the flames and cauſes them to ſurround the Veſſel C, by which means the power of this furnace is exerciſed.

FIG. 10. Section of FURNACE FOR AN OPEN FIRE, formed in one Pot.

FIG. 11. WIND FURNACE, formed by the application of two Pots placed mouth to mouth.

FIG. 12. FURNACE conſiſting of two Pots ſeparated by an iron Hoop, in which an opening or door is cut. This ſerves for a reverberatory Furnace, for diſtilling with Retorts of earthen ware or coated Glaſs.

FIG. 13. An improved BLAST FURNACE. The letter A repreſents the moſt convenient Cover for it, an Iron plate with a round hole in the middle, and a handle projecting at one ſide for lifting it.

FIG. 14. BLOW-PIPE. B repreſents its Bowl or enlargement.

FIG. 15. SOME INSTRUMENTS FOR PERFORMING EXPERIMENTS ON AIR. A repreſents a wooden Veſſel or Tub, in which is fixed a Shelf, marked K, K, K.—B, G, F, are glaſs Jars inverted with their mouths downwards, which reſt upon the Shelf. C is a glaſs Body or Bottle whoſe bottom is blown very thin, that it may ſupport the heat of a Candle when applied ſuddenly, without cracking. D is a Tube fitted in its Neck by grinding, curved nearly in the form of the Letter S. H, a Glaſs Funnel, through which the Air may be poured into the Receiver when it has a narrow Neck. In the figure, the body, C, is repreſented as containing a fluid, in the act of combining with a ſubſtance that gives out Air, which paſſes through the tube into the Jar B, under whoſe mouth the other extremity of the Tube is placed. At E, is a ſmall Retort of Glaſs or Earthen ware, whoſe neck being plunged in the Water, beneath the Jar F, is ſuppoſed to emit the elaſtic fluid, extricated from the contents of the Retort which is received in the Jar.

FIG. 16. WIRE STANDS, very uſeful when a Gallipot or any thing is to be ſupported a conſiderable height within the Jar.

FIG. 17. Repreſents a ſimple mode of impregnating water with any aerial fluid with which it will combine. C, a quart Bottle filled with water, and inverted into the Baſon, F, which likewiſe contains a little water. The inverſion may be eaſily managed without any of the Contents of the Bottle eſcaping, if its orifice be covered with a card, and withdrawn after immerſion. A is a half pint Phial into which broken pieces of Marble or Chalk are put; and upon them is poured as much Water, rendered very acid by a mixture of the Vitriolic Acid, as may fill the Phial two thirds; B is a Bladder whoſe neck is tied faſt round a perforated Cork of a tapering figure; after the effervescence of the contained materials has begun, the Cork is to be thruſt into the neck of the Phial A; the Bladder being previouſly emptied by preſſure. Fixed air will eſcape from the Chalk, and inflate the Bladder. When this laſt is full, it muſt be diſengaged from the Phial; and the bended Tube E muſt be thruſt into the orifice of the Cork; the other open end of the Tube muſt be placed beneath the mouth of the Bottle C; and the Aerial contents of the Bladders muſt be diſcharged by preſſure. The Bottle C muſt be agitated without removing its Neck out of the water, by which means the abſorption of Air takes place in a few minutes. Two or three repetitions of the proceſs impregnate the Water fully. PYRMONT WATER is of this kind.

FIG. 18. An Inſtrument for the ſame purpoſe as the laſt, FIG. 17, but leſs troubleſome. In this the Bladder has two apertures, the one containing a perforated Cork conſtantly kept in the neck of the Phial A, and the other faſtened round the Tube E; which then conſtantly remains beneath the mouth of C, and the Air is preſſed up as occaſion demands.

FIG. 19. Dr. NOOTH'S APPARATUS for the ſame purpoſe, as FIG. 18—17. This conſiſts of three veſſels, A, B, C. The lower Veſſel C contains the effervescent materials; it has a ſmall orifice D, ſtopped by a ground Stopper, occaſionally to introduce either Acid or abſorbent Earth, &c. as it may be wanted. The middle Veſſel B is open both above and below; its inferior Neck is fitted by grinding into the Neck, H, of the lower Veſſel. In the former is a glaſs Valve formed by two pieces of Tube, and a Lens which is moveable between them, as repreſented in Fig. 20. This Valve opens upwards, and ſuffers the Air to paſs: but the water cannot return through the Tubes, partly becauſe the orifice is capillary, and partly becauſe the flat Lens covers the Hole. The middle Veſſel is furniſhed with a Cock E, to draw off its contents. The upper Veſſel A is fitted by grinding into the upper neck of the middle Veſſel. Its inferior part conſiſts of a Tube that paſſes almoſt as low as the centre of the middle Veſſel. Its upper orifice is cloſed by a ground Stopper, F. When this Apparatus is to be uſed, the effervescent materials are put into the lower Veſſel; the middle Veſſel is filled with pure Water, and put in its place, and the upper Veſſel is nearly ſtopped and put into its place. The conſequence is that the fixed air paſſing through the Valve at H, aſcends into the upper part of the middle Veſſel B, where by its elaſticity it re-acts on the water, and forces part up the Tube into the Veſſel A; part of the common Air in this laſt being compreſſed, and the reſt eſcaping by the Stopper, which is made of a conical figure that it may be eaſily raiſed. As more fixed Air is extricated, more Water riſes, till at length the Water in the middle Veſſel falls below the lower orifice of the Tube. Fixed Air then paſſes through the Tube into the upper Veſſel, and expels more of the common Air by raiſing the Stopper. Hence the Water in both Veſſels being in contact with a body of fixed Air, becomes ſtrongly impregnated with that fluid, after a certain time;—which effect may be haſtened by taking off the middle and upper Veſſels together, and agitating them.

FIG. 20. GLASS VALVE in the Apparatus, 19.

FIG. 21. AN APPARATUS IN WHICH ALL PRODUCTS IN AN AERIFORM STATE MAY BE EXAMINED. A is a Matraſs, which communicates with the receiver B, by a Tube which reaches very near the bottom of the latter: the upper part of this Receiver communicates in the ſame manner with the ſecond Receiver C, by a Tube reaching nearly to the bottom of C. In like manner C communicates with D, and from D proceeds a recurved Tube, which may be inſerted beneath an inverted Veſſel of Water or Mercury. Now in this apparatus it is evident, that whatever volatile matter eſcapes from the Veſſel A by heat or otherwiſe, will either be condenſed in B, C, or D, and that the aerial products will paſs through the whole ſet, and through the recurved Tube into the inverted Veſſel.

FIG.

FIG. 22. WOULFE'S IMPROVED RECEIVER IN DISTILLATION. A, the Retort; B, the adopter, which is occaſionally uſed; C, the Receiver having two Necks; one at D, inſerted into a bottle, which receives the products that are uſually condenſed in the receivers; and the other at E tranſmits the more volatile or aeriform products into a Baſon G, containing Water, beneath the ſurface of which the extremity of the Neck E is plunged. This Apparatus is particularly uſeful when the products are ſuch as combine with the fluids in G, and would otherwiſe eſcape.

FIG. 23, 24, 25, form the EUDIOMETER of Mr. Cavendiſh,—an Inſtrument for aſcertaining the purity of the Air, or rather the quantity of Vital, or truly reſpirable Air contained in any given Bulk of elaſtic Fluid. A (fig. 23.) is a cylindrical glaſs Veſſel, with braſs caps at top and bottom: to the upper cap is fixed a braſs Cock B: the bottom Cap is open, but is made to fit cloſe into the braſs Socket D, d, and is fixed in it in the ſame manner as a Bayonet is on a Muſket. The Socket D, d, has a ſmall hole in its bottom, and is faſtened to the Board of the pneumatic Tube by the bended Braſs F, f, G, in ſuch manner that b, the top of the Cock, is about half an inch under Water. Conſequently if the Veſſel A be placed in its Sockets with any quantity of Air in it, and the Cock be then opened, the Air will run out by the Cock, but will do ſo very ſlowly, as it can eſcape no faſter than the Water can enter by the ſmall hole E, to ſupply its place.

Beſides this Veſſel b, there are three glaſs Bottles M (fig. 24.) each with a flat braſs Cap at bottom, to make it ſtand ſteady, and a ring at top to ſuſpend it by, and alſo ſome meaſures of different ſizes, ſuch as B, fig. 25. Theſe are of glaſs, with a flat braſs Cap, and wooden handles. In uſing them, they are filled with Air required to be meaſured, and then ſet upon a braſs knob, c, fixed on a ſhelf of the Apparatus below the Water. This knob drives out ſome of the Air, and leaves only the proper quantity.

FIG. 26. Repreſents a different Apparatus for the ſame purpoſe. A is a Bottle containing nitrous Air, inverted into the Tub of Water D, E. B is a Bottle with a bent glaſs Tube C, fitted to its mouth. This Bottle is filled with common Air without any Water; and is firſt ſlightly warmed by the hand; the End of the glaſs Tube is then put into the Bottle of nitrous Air, as in the figure: conſequently as the Bottle B, cools, a little nitrous Air runs into it, which, by the common Air in it, is deprived of its elaſticity, ſo that more nitrous Air runs in to ſupply its place. By this means the nitrous Air is added ſlowly to the common, without coming in contact with water, till the whole of the nitrous Air has run out of the Bottle A, into B: then indeed the water runs through the glaſs Tube into B, to ſupply the vacancy formed by the diminution of the common Air.

For further explanation, the mode of uſing theſe different Apparatus, and the purpoſes they are chiefly intended to anſwer, our reader is referred to NICHOLSON'S Dictionary of Chemiſtry, 1795, and the Philoſophical Tranſactions, Vol. lxxiii. p. 106.

A NEW

MEDICAL DICTIONARY.

A. The letter a, with a line above it, thus ā, is used in medical prescriptions for ana, *of each*; sometimes it is written thus āā; e.g. ℞ Mel. saccharum & mann. ā vel. āā, ℥j. i. e. Take of honey, sugar and manna, of each one ounce.

A, in composition, implies a negative.

A. A. A. See AMALGAMA.

AABAM. See PLUMBUM.

ABACTUS VENTER. See ABORSUS.

ABACUS MAJOR. A trough used in the mines, wherein the ore is washed.

ABASIR. See SPODIUM ARABUM.

ABALIENATUS, *corrupted*. Celsus. When applied to the body, it signifies that a part is so destroyed as to require removal.—When applied to the senses, it expresses their total destruction. Scribonius Largus.—If the injury happens from sudden external violence, it may require immediate manual aid; but from internal morbid affection, the separation is best performed by nature.

ABANGA. See ADY.

ABAPTISTON, or ABAPTISTA, from α priv. and βαπτίζω, *immergo, to sink under*. The perforating part of the instrument called a TREPAN. This instrument hath had various contrivances to prevent its sinking suddenly upon the membranes of the brain, when the operator was perforating the skull: whence its name. But the present practice renders all precaution that relate to this instrument needless, by having substituted a much more manageable one. See TREPANUM.

ABARTAMEN. See PLUMBUM.

ABARTICULATIO. See DIARTHROSIS.

ABAS. See TINEA. ACHOR. EPILEPSIA.

ABBREVIATORIUM. See CIRCULUS.

ABDITUS, included. Thus; *abditus* vase, included in a vessel.

ABDITÆ CAUSÆ. These are the very remote or secret causes of distempers.

ABDOMEN, the BELLY. Some say, this word is from *abdo, to hide*; as its contents lay hid in it. Martinius, and others, derive it from *abdere, to hide*, and *omentum*, the *caul*. But Vossius says, in his Etymology, that it is only a termination; and, as from *lego, legumen*; so, from *abdo, abdomen*. It is also called *Imus Venter. Alvus. Gaster. Katoccelia*. FÆSIUS calls it *Dertron*; *Nedys*, and the viscera contained within, *Nedya*.

The body is generally divided into three cavities, called by anatomists, venters: viz. the head, or upper venter; the breast, or middle venter; and the abdomen, or lower venter. Indeed the word venter, though purely Latin, has been matriculated into our language, and used in the sense here particularised commonly; and in some other, though more rarely.

The belly is divided on its outer surface, into four regions, called the epigastric, the umbilical, the hypogastric, and the lumbar. See EPIGASTRIUM, UMBILICALIS REGIO, HYPOGASTRIUM, and LUMBARIS REGIO. These are all contained betwixt the circumference of the false ribs, and the bottom of the ossa innominata.

The belly is separated from the breast externally, by the extremities of the ribs; and internally by the diaphragm, and it is terminated below by the musculi levatores ani.

The bottom of the belly, called *Nelaya*, on its fore part, is called the pudenda; and on its back part, the buttocks, and anus; and underneath, betwixt the anus and the pubes, the perinæum.

The cavity of the belly, formed by the above-named parts, all which are covered with the membrana adiposa and the skin, is lined on the inside by the peritonæum. This cavity contains the stomach, intestines, mesentery, mesocolon, liver, gall-bladder, spleen, pancreas, glands of the mesentery, vasa lactea, receptaculum chyli, kidneys, renal glands, ureters, bladder, and the internal parts of generation.

The principal arteries of the belly, are the epigastric, which are the lowest portion of the internal mammary artery, the inferior aorta, the cœliac, the upper mesenteric, the hæmorrhoidal artery, the renal, called emulgent, the spermatic artery, the lower mesenteric artery, the lumbar, the iliac, the lower epigastric arteries, and the pudicæ.

The principal nerves of the belly, are the stomachic, formed by the extremity of the eighth pair, the lower portion of the great sympathetic nerves, the two semilunar or plexiform ganglions, the hepatic, splenic, renal, upper and lower mesenteric plexus, the nerves of the loins and sacrum, also the origin of the crural and sciatic nerves.

The appendix ensiformis of the sternum, the cartilaginous portions of the last pair of true ribs, those of the first four pairs of false ribs, all the fifth pair; the five lumbar vertebræ, the ossa innominata, the os sacrum, the os coccygis, form the bony sides of the cavity of the belly.

The diaphragm, the muscles called, particularly, musculi abdominis, the quadrati lumborum, the psoai, the iliaci, the muscles of the coccyx, and of the intestinum rectum, form the greatest part of the circumference of this cavity. As auxiliary parts, some portions of the sacro lumbares, longissimi dorsi, &c. might be added.

The muscles belonging to the belly are five pair; viz. the *obliqui externi*, the *obliqui interni*, the *transversales*, the *recti*, and the *pyramidales*. Galen in his Treatise on the Dissection of the Muscles, and that on the Preservation of Health, remarks, that the action of the abdominal muscles is necessary to the act of expiration, as they pull down the thorax, and are very useful in efforts to speak loud: he also says, that without their action we could have no stool, nor make water; for the actions of the sphincter muscles of the anus and of the bladder, are overcome by the actions of the abdominal muscles and diaphragm. He farther observes, in his work, De locis Affectis, that some people who find a difficulty in going to stool, or have a suppression of urine, relieve themselves by pressing the abdomen with their hand: and that the expulsion of the fœtus is the work of the abdominal muscles. De Naturalibus Facultatibus.—Mr. Pott, was of the same opinion. He said, that he had seen a child,

which lived nearly three weeks, though it had no abdominal muſcles; that this child could not either propel, or expel the fæces nor urine perfectly, without artificial aid. Beſides it has been proved that they are greatly inſtrumental in promoting the action of vomiting, by Mr. Haighton in the ſecond volume of the Medical Memoirs of London—for the moſt violent ſtimuli when applied to the ſtomach either externally or internally, were in his experiments inſufficient to produce a regurgitation of its contents, without the the concurring efforts of the diaphragm, and muſcles of the abdomen.

There is a ſinus on each ſide of the cartilago xiphoides, between the tranſverſalis and recti muſcles, into which, on the left ſide, the ſtomach is ſometimes puſhed by violent vomiting, which diſeaſe is called GASTROCELE. This tumor is in the upper part of the linea alba. The diſorder is attended with exceſſive pain, which is greater when the perſon is up, and gradually goes off when he lies in a horizontal poſture, which circumſtance is the pathognomonic ſign of the diſeaſe. There is a continual vomiting; every thing taken in is immediately rejected; and from hence ſucceeds an atrophy. All hernias of the linea alba require the ſame management; but this of the ſtomach requires particular attention. They are eaſily reduced, and ſhould be kept up by a truſs; if the rupture does not recede, it muſt be cut open and reduced in the ſame manner as in other ruptures. Winſlow's Anat. Happily this caſe is very rare; when it occurs, little more can be done than to alleviate general ſymptoms; if it cannot be returned by the hand, any operation will be a doubtful aid.

Pain, and other diſorders of the belly, ſometimes happen from keeping it too cool. The circulation of the blood from the viſcera in the belly, by the vena portæ to the liver, and afterwards in the liver, is greatly promoted by the alternate compreſſion, which the contents of the belly receive from its muſcles and the diaphragm: and it is of ſervice in diſſecting living animals, that when the viſcera of the belly are expoſed to the air, this circulation of the blood towards the liver, by the portæ, is much impeded, or totally ſtopped. Hence it follows, that in proportion as the action of the muſcles of the belly is impaired, and the cavity laid open, this circulation, ſo neceſſary to the animal œconomy, muſt be obſtructed.

The muſcles of the belly and other of the internal parts, are ſubject to inflammations, which have been miſtaken for inflammation in the liver: to diſtinguiſh them, ſee HEPATITIS. Heurnius ſays, that theſe muſcles have a very thick membrane, which will not readily admit of the exit of pus when it is formed; he, therefore, adviſes to open them by inciſion, ſooner than is uſual in other inſtances of abſceſſes. See inflammation of the Muſculorum Abdominis.

The rheumatiſm ſometimes affects the muſcles of the belly, and the caſe is miſtaken for a colic, or for an inflammation of ſome of the viſcera within: in this caſe, however, the uſual ſymptoms of inflamed viſcera are abſent, and the medicines which are uſeful in the colic, are without effect in this caſe.

See the article VULNUS, for the management of wounds in the belly.

ABDUCENS OCULI. See ABDUCTOR OCULI. N° 5.

ABDUCERE. Scribonius Largus uſes it for *bibere*, *to drink*.

ABDUCTIO, from *ab* and *duco*, *to draw*, a ſpecies of fracture, when a bone near the joint is ſo divided tranſverſely, that the extremities recede from each other; or the thruſting a bone, or other part, out of its place. Cælius Aurelianus uſes this word for a ſtrain. Abductio properly ſignifies leading from or drawing away. It is from the action of the muſcles, that the divided ends of fractured bones recede. *Abruptio* is uſed in the ſame ſenſe, as is alſo *Apoclaſma*, and *Apagma*.

ABDUCTOR, a leader from, or that draws away. From *abducere*, *to move* or *draw from*. Several muſcles are thus called, viz. 1. ABDUCTOR AURIS, called alſo *triceps auris*, and *retrahens auriculam*, *bicaudalis muſcularis*; *intricatus muſculus*, *detractor auris*; a muſcle of the external ear, called by Winſlow, the *poſterior muſculus auris*. It is called *triceps*, becauſe it hath ſometimes three beginnings. It is compoſed of a few fleſhy fibres, which ariſe from the ſuperior and fore part of the apophyſis maſtoideus, and deſcend obliquely to their inſertion, in the middle of the concha auriculæ. It covers the poſterior ligament. Dr. Hunter ſays, that he thinks the ear hath only two muſcles belonging to its external parts, that the retrahens auriculam ariſes from the mammillary proceſs of the temporal bone, and is inſerted into the lower external part of the ear, to pull it backward. 2.——DIGITI MINIMI MANUS. Riolan calls it *hypothenar*. It riſes from the os piſiforme of the carpus, runs upward on the inſide of the hand, and is inſerted into the external ſide of the little finger, or its firſt joint. It helps to ſeparate the little finger from the reſt, and alſo to bend it. It is the *flexor parvus minimi digiti* of Albinus. 3.————DIGITI MINIMI PEDIS. It riſes fleſhy and tendinous from the ſemicircular edge of a cavity on the outſide of the inferior protuberance of the os calcis; it hath another tendinous beginning from the os cuboides, and a third from the upper part of the os metarſi minimi digiti. It is inſerted into the upper part of the firſt bone of the little-toe externally and laterally. It draws the little-toe outwards from that next to it. 4.——INDICIS. It ariſes fleſhy by two heads from the metacarpal bone of the fore-finger, and the firſt bone of the thumb, and is inſerted by its tendon into the baſis, or firſt joint of the fore-finger, laterally next the thumb. It brings the fore-finger from the middle-finger, and near to the thumb. Cowper calls it *adductor pollicis*. Douglas ſays, its uſe is to bring the index towards the thumb; whence, in reſpect of this it may be ſtiled adductor, and, in reſpect of that, abductor. 5.————OCULI, called alſo *indignatorius*, or the ſcornful muſcle; *muſculus exterior*; alſo *abducens*, *iracundus*, and *rectus externus*. It riſes tendinous and fleſhy from the foramen lacerum, without the orbit. It is inſerted by a thin tendon into the ſclerotis, on that ſide next the noſe. It moves the eye towards the little angle. 6.————POLLICIS MANUS, called alſo *thenar* by Riolan; and abductor brevis pollicis manus, by Albinus. It riſes by a broad, tendinous, and fleſhy beginning, from the inner part of the traverſe ligament of the carpus, and from one of its bones which articulates with the thumb, and is inſerted tendinous into the ſecond joint of the thumb. It draws the thumb from the fingers. 7.————POLLICIS PEDIS, called alſo *thenar*. It riſes fleſhy from the inſide of the os calcis, and tendinous from the os naviculare, and forms a ſtrong tendon, which is inſerted at the inner part of the firſt bone of the great-toe, upon its ſeſamoid bone. It pulls the great-toe from the reſt. It often hath a tendinous origin from the edge of the os cymbiforme, receiving near this bone ſome tendinous filaments from the tibialis anticus. Theſe two muſcles, N° 6, 7, are called *Thenar*, becauſe they make part of the *Thenar*.

ABEBAEOS. Ἀβέβαιος, infirm, weak, inconſtant.

ABELICEA. A tall tree growing in Crete. See BRASILIUM LIGNUM.

ABELMOSCHUS. Ab-el-moſch, or *Granum Moſchi*, *Moſchus Arabum*. Alſo *Alcea Indica*, *Alcea Ægyptiaca villoſa*. *Bamia Moſchata*. *Belmoſchus*. *Ægyptia Moſchata*. *Abrette*. The ſeed of a plant which has the flavour of muſk, called the MUSK MALLOW. The plant is the HIBISCUS ABELMOSCHUS, of Linnæus. It is of the mallow kind; indigenous in Ægypt, and many parts both of the Eaſt and Weſt Indies. The ſeeds are flat, kidney-ſhaped, the ſize of a pin-head, grey or browniſh without, and white within. They are very fragrant, and their ſcent is like a mixture of amber and of muſk; to the taſte they are of a ſlightiſh aromatic bitter; they are cordial; the Arabs mix them with their coffee; though their chief uſe is as a perfume; but, from their peculiar flavour, as well as other ſenſible qualities, they ſeem to merit more attention than have hitherto been paid to them as a medicinal ſubſtance. The beſt comes from Martinico. Chuſe ſuch as appear new, plump, dry, and well ſcented.

ABERRATIO, ABERRATION, going aſtray; from *aberro*, *to wander out of the way*. In medical writings it expreſſes Nature's deviating from her uſual progreſs. See alſo LUXATIO.

ABESAMUM, dirt or clay.

ABESSI. See REBIS.

ABESUM. See CALX.

ABEVACUATIO, or ABVACUATIO, as uſed by ſome medical writers, is a partial or incomplete evacuation of the faulty humours, whether by nature or art, called *Apocenos*, partial fluxes—as watery eye—gonorrhœa, &c.

ABICUM, the ſame as *coopertoria*.

ABIES, FIR, called alſo *Elate Theleia*.

The fir-tree is an evergreen, and coniferous, with numerous

merous, narrow, ſtiff leaves, ſtanding ſolitary or unconnected at their baſes with one another.

Botaniſts have enumerated twelve ſpecies, if not more; but three or four of them as follow, which afford materials for medical uſe. Linnæus includes the *abies* in the genus of *pinus*.

1. *Picea*, the COMMON RED FIR, or PITCH TREE, with a reddiſh bark, long, ſlender, quadrangular, ſharp-pointed leaves, and long cones hanging downward. It is the *pinus abies picea of Linnæus*.

2. *Abies*, the YEW-LEAVED, or SILVER FIR, with a whitiſh bark, roundiſh pointed leaves, a little cloven at the tops, and ſhort cones ſtanding upward; the leaves are marked on the lower ſide with three green lines and two white depreſſions. It is the *pinus abies alba* of Linnæus.

Theſe two ſpecies are natives of the northern climes; the ſecond grows on dry, mountainous places; the firſt in lower and moiſter grounds. Norway produces abundance; Switzerland and ſome parts of Germany alſo afford great quantities of them. They are indigenous in ſome parts of Britain; but are chiefly to be met with as planted in the fields, where they grow with great luxuriance. The branches, and the fruit gathered in autumn, abound with a reſinous matter, and yield, on diſtillation, an eſſential oil, and a liquor impregnated with a peculiar acid, called ACIDUM ABIETIS; and, when added to water, is thought to communicate to it both the flavour and other properties of tar-water. It has produced good effects in ſome obſtinate coughs, particularly in that chronic catarrh which is benefited by diuretics. Decoctions of the wood and tops promote perſpiration and urine; are uſeful in ſome rheumatic caſes; and have been conſidered as ſerviceable in healing ſome internal ulcerations, particularly of the urinary paſſages. They, however, ſhould not be given in caſes where there are febrile affections of any conſequence, as they are apt to heat the habit; but may be uſeful where the machine is poſſeſſed of torpor, and too languid a circulation of the fluids.

3. *Abies Canadenſis, vel Virginiana*, the CANADA or VIRGINIAN FIR, with roundiſh pointed leaves, ſometimes cloven, ſtanding like the teeth of a comb in two rows on each ſide of the branches, and variegated underneath, with a double line of whitiſh dots. It is the *pinus abies Canadenſis* of Linnæus.

4. *Balſamea*, BALM of GILEAD FIR; ſo called from the fragrance of the leaves when rubbed. The leaves are roundiſh pointed, and ſlightly cloven, nearly like thoſe of the ſilver fir; the cones are long and pointed, and ſtand erect. It is the *pinus abies balſamea* of Linnæus.

All the parts of theſe trees contain a reſinous juice, impregnated with a bitteriſh, pungent, eſſential oil: turpentines are obtained by making inciſions in their trunks at a proper ſeaſon. For the different kinds of turpentines, ſee TEREBINTHINA.

The common red fir affords the greateſt quantity of turpentine, and from the turpentine is obtained white reſin, ſee RESINA; tar, ſee PIX LIQUIDA; pitch, ſee PIX NIGRA; and Burgundy pitch, ſee PIX BURGUNDICA.

The ſilver fir produces the Straſburg turpentine; it is far more grateful than the common ſort; it is called liquid-reſin, to diſtinguiſh it from the dry reſin, which reſembles frankincenſe.

From the Canada fir is obtained a ſtill finer and more grateful turpentine, called *Balſ. Canadenſe*; it is diſcharged, during the ſummer heats, through inciſions made in the trees; it is tranſparent, and almoſt colourleſs. It is a good ſubſtitute for the balſ. capivi. See CAPIVI BALSAMUM.

The balm of Gilead fir emits from its cones a turpentine with a fragrance reſembling the balm of Gilead, and that in large quantities. Spirit of wine extracts a reſin both from the cones and the leaves, of a ſimilar quality. See BALSAMUM.

Rectified ſpirit of wine, digeſted on fir, extracts all its active parts, with ſome of its mucilage. The cones of all the ſorts yield the moſt agreeable tincture.

Water, though it diſſolves little or nothing of the pure turpentines, yet by the mediation of the gummy matter in the fir itſelf, it extracts part of its reſin. The wood and the cones are taken in autumn, or its latter end, for their oil; and in diſtillation with water, a large quantity of eſſential oil ariſes. The oil drawn from the wood is nearly ſimilar to the oil of turpentine. That obtained from the freſh cones is ſuperior in ſubtilty and fragrance to all the oils of the turpentine kind uſually met with. See Zimmermann's Prælect. Chym. NEUMAN.

The tops and the cones of the fir-tree, moderately warm, promote perſpiration, and increaſe the diſcharge by urine. Four ounces of the freſh tops are put to a gallon of diet-drink.

A ſpirit diſtilled from the young leaves is a ſuccedaneum for the aq. Hungarica.

The *Eſſ. Abietis Pharmacop. Auguſt.* is the balſam of the fir-tree, joined with ſcurvy-graſs, as follows: the fir cones while young, tender, and of a red colour, are bruiſed and digeſted two days in four times their quantity of ſpirit of ſcurvy-graſs, then the tincture is preſſed out.

The tops and leaves of the ſilver fir are uſed in making BRUNSWICK MUM.

ABIETANUM OLEUM. See TEREBINTHINA.

ABIGA HERBA, a name for the *chamæpytis*, or ground-pine. It is probably ſo called from *abigo, to expel*, as it is ſaid to promote delivery. Blancard thinks its name is from its leaves reſembling the leaves of fir, which is called abies.

ABIT. See PLUMBUM, N° 2.

ABLACTATIO. ABLACTATION, or WEANING a child from the breaſt; from *ab* and *lacte*, the taking a child from the milk of the breaſt. Alſo called *Apogalactiſmus*. When the mother wants health, or ſtrength; hath too ſmall nipples, or ill formed ones; when the infant will not take the breaſt; the mother's milk is bad or in too ſmall a quantity; when the mother hath weak nerves, is apt eaſily to be ſurpriſed, theſe defects ſpoil the milk; if the child is ſuddenly taken ill, from the effects of the mother's frights, or anxiety; if the milk is often dried up quickly, when perhaps the infant hath the moſt occaſion for it: in ſuch caſes, it is adviſeable to wean the child, indeed often abſolutely neceſſary. It can never be uſeful to continue the breaſt more than eight or nine months; but generally, if a child is favoured with a good ſupply by ſucking, during its firſt three or four months, and is in a tolerably healthful ſtate, it will rarely be the worſe for weaning at this early period; ſo that, if it is not rather weakly, and if difficulties attend its being ſuckled, there need not be any heſitation about taking it from the breaſt. If it feeds tolerably with the ſpoon, and is free from diſorders in its bowels, a tendency to convulſions, &c. weaning may be attempted at any time. But, if feeding with the ſpoon is difficult; if the child is much ſubject to the gripes, &c. another nurſe ſhould be ſought for, and weaning muſt be deferred until more favourable circumſtances attend. In general, the ſooner a child is weaned, the more eaſily it parts with the breaſt. Prudence directs to accuſtom a child to early feeding with the ſpoon, and to continue the ſame until the breaſt may be wholly omitted.

Children, if healthy, may be weaned at any age; but as in general their digeſtion grows ſtrong enough at about nine or ten months, they ſhould only be fed once in ſix hours, at the moſt, during the firſt two months; ſhould be entirely weaned from the breaſt as ſpeedily as is convenient, and alſo from all feeding in the night; for night feeding bloats them, and if they are not uſed to it in the firſt week, they would never want it: if they are not diſturbed from their birth, in a week or two, the child will be formed to a habit of ſleeping moſt of the night very quietly, awaking only when wet, on which occaſion it ſhould be laid dry.

The food ſhould be ſimple and light; not ſpoiled with ſugar, wine, and ſuch like additions, for they produce the diſeaſes with which children are moſt troubled, *acidities in the primæ viæ*. *Unfermented flour* makes a viſcid food that turns ſour before it digeſts, and *well fermented bread* ſoon turns ſour; but if this latter is made into freſh panada every night and morning, or, in cool weather, every morning, the inconvenience of ſouring is prevented. To avoid acidity in the child's ſtomach by a daily uſe of vegetable food, give now and then a *little freſh broth*, made from either veal, mutton, or beef, once or twice in the day; ſuppoſe, for example, *a mixture of equal parts of the gravy which is diſcharged in cutting a joint that is brought hot on the table, and warm water, to which may be added a little ſalt*, and thus an excellent broth is readily made. This fills children with humours, only of the moſt nouriſhing kind. *Cows milk, a little diluted with water*, is an excellent ſubſtitute for the mother's; yet, as it is apt to turn ſour, add to it a little Liſbon ſugar. *Rice* is not ſo apt to turn ſour as wheat bread is; it therefore would be a more convenient food for children, and deſerves to be

attended

attended to. *Toaſted bread boiled in water* till it is almoſt dry, then mixed with freſh milk, not boiled, is an agreeable change. As the teeth advance, the diet may increaſe in its ſolidity.

As to the quantity, let the appetite be the meaſure of it; obſerving to ſatisfy hunger, but no more, which may be thus managed; feed the child no longer than he eats with a degree of eagerneſs. In feeding, let the child be held in a ſitting poſture, and thus continue it until the ſtomach has nearly digeſted its contents. The practice of violently dancing and ſhaking the child ſhould be avoided, though moderate exerciſe is eſſentially neceſſary.

Keep the child awake until it breaks wind after each time it is fed; divert it during the day as much as you can, and thus it will ſoon lay quiet all the night. Never awaken a child when it is aſleep, for thus ſickneſs and peeviſhneſs are often produced.

As ſoon as teeth appear, give the child now and then a piece of freſh meat in its hand to chew; but never give it any confectionaries. See Moſs on the Management and Nurſing of Children. Cadogan. Armſtrong.

ABLATIO. To take away from the body whatever is uſeleſs or hurtful to it. In ſome writings it expreſſes the leſſening of the diet with a medical view; alſo the interval betwixt two fits of a fever; and in chemiſtry, the removing any thing that needs not to continue in the proceſs any longer.

ABLEPSIA, Ablepsy, *a* priv. and Βλεπω, *video*. Blindneſs, want of ſight, raſhneſs, indiſcretion.

ABLUENTIA Medicamenta, from *abluo, to waſh off*. Medicines ſuited to waſh off, from the external or internal ſurfaces of the body, any matters improperly adhering to them. They are either water or other fluids, which can act by their fluidity, and may be in the form of lotion, gargle, or injection.—The term has been applied to diluting medicines. It is now, however, ſeldom employed, being involved in the terms Abſtergent or Detergent. See Abstergentia.

ABLUTIO, Ablution. A waſhing away; a waſhing off, or rinſing. In chemiſtry, it ſignifies the purifying of a body by repeated effuſions of a proper liquor: this is done various ways, by cohobation, circulation, &c. See Cohobatio, Circulatorium.

ABOIT. See Plumbum, N° 2.

ABOMASUM. The name of the fourth ſtomach of a beaſt that chews the cud. The firſt is called *venter*, or rather ventriculus, the word uſed for it in Ariſtotle being χοιλια. The ſecond *reticulum*, or *cecryphalos*; the third, *omaſum* or *omaſus*; the fourth *cnyſtron*, the ſame as *abomaſum*, which completes the digeſtion; according to Gorræus: Aristotle ſays it is the ſecond ventricle, or thick part of the ſtomach of ruminating animals in which the food is concocted.

ABOMINATIO. See Fastidium ciborum.

ABOLITIO, Abolition, or taking away; deſtroying.

ABORSUS, ABORTUS, ABORTIO; from *ab*, which, in compoſition, according to Martinius, implies *defect*, and *orior, to ariſe*. Aborior, intempeſtive otior, ut, *ab* ſignificet vitium. See Martinius in *Aborior*. Abortion or Miscarriage. The birth of a child before its due time; or, the deſtroying a child in the womb: termed alſo *convulſio uteri, deperditio, abactus venter, diaphthora, ectroſis, exambloma, exambloſis, ambloſis, apopailoſis, apopoſis, apophthora*.

Miſcarriages happen at any period of pregnancy, and from innumerable cauſes; moſt frequently in the third and beginning of the fourth month; but thoſe which happen in the ſixth, or later, are more difficult and dangerous.

Women who are very thin, or very fat; women who have miſcarried before, and who eaſily or without any particular inconvenience, during the time of miſcarriage, or ſoon after, part with their burden, are moſt ſubject to this accident.

The cauſes are various; *violent motions, frights, poiſons, violent purges*, an *obſtinate diarrhœa, the ſmall-pox*, and *other acute diſeaſes; too much blood, great loſs of blood*, and *yet* unfrequently *an incautious uſe of the lancet*: on this cauſe, ſee Dr. Wallis's Eſſay on Injudicious Bleeding in Pregnancy. Habitual miſcarriages happening at ſtated periods, without manifeſt cauſe, are very common among women of faſhion, from theſe general cauſes of weakneſs, viz. *indolence, lying long in the morning*, and *ſitting up late at night: fear, grief*, or indeed *whatever debilitates*, may be a cauſe; *longings not indulged*, &c. In general, the cauſes may be reduced to what immediately affects the child, the placenta, the membranes, or the mother.

Whatever cauſes the death of the child, cauſes abortion ſooner or later.

If the membranes are too weak, they may eaſily break, and ſo prove a cauſe againſt which no help can be propoſed.

The funis may be too ſhort, or the placenta ſeparated or diſeaſed, in which caſes no care can prevent the ill effects.

As to the mother, beſides the cauſes above enumerated, the two following are very common ones. The firſt is *too great a ſtricture of the uterus*; in which caſe it is not capable of a dilation ſufficient to make room for the fœtus as it increaſes in bulk: this is known *by a great tenſion* and *hardneſs of the belly*, and *violent pains therein*. Bleeding, and whatever relaxes, are indicated in this caſe. The ſecond is a *relaxation of the uterus*, which renders it unable to ſupport the inoſculations of the veſſels of the placenta into itſelf, after the fœtus and placenta, &c. are grown to a certain weight; and of all others this is the moſt frequent. In theſe two caſes, the miſcarriage always happens about a ſtated time of the woman's pregnancy.

An approaching miſcarriage is to be apprehended by the following ſigns: the *breaſts grow flabby on a ſudden; the loins have a painful weight*, which reaches to the thighs; *pains about the navel, head*, and *eyes*; a *gnawing at the ſtomach*; *coldneſs in the extremities*; *when violent means have been uſed to expel the fœtus, convulſions ſometimes come on*; *pains in the belly*, like a colic and *ſometimes more like labour pains*; *ſhiverings*; *fainting*; and, if it is paſt the time of quickening, *the motion of the fœtus is more languid*, and *leſs frequent than uſual*: as the miſcarriage draws nearer being affected, *the pains of the loins increaſe, extending to the hips*; *the orifice of the womb begins to be dilated*; *a watery diſcharge from the womb is perceived which becomes bloody*; at *length blood, pure or clotted, comes away*. The moſt certain ſign is the diſcharge of a fleſh-coloured flakey ſubſtance, which comes away with the waters; this is the tunica decidua, or ſpongy chorion, and when it peels off from the womb, and appears with the waters, a miſcarriage is unavoidable.

Healthy women, who have naturally a looſe belly, a moiſt uterus, and have brought forth large infants with eaſy labour, who are lean, but not very ſanguine, bear miſcarriages the beſt. But miſcarriages are ever to be conſidered as more dangerous than natural labours; for more violence is neceſſary to diſcharge the imperfect fœtus than when it hath arrived at its full maturity; alſo the placenta is more firmly attached during the growth of the fœtus, than when it is full grown; and beſides the danger of a fatal hæmorrhage from the adheſion of the placenta, the os tincæ does not ſo eaſily dilate, before the full period of geſtation. If a part of the placenta is ſeparated, until the burden is delivered, the uterus cannot contract ſufficiently to cloſe the bleeding veſſels; theſe hæmorrhages are extremely dangerous, and often fatal; miſcarriages are often attended with the moſt danger in the firſt pregnancy. Inflammation and laceration are ſometimes the conſequence.

In order to relief, in caſes threatening a miſcarriage, the attending circumſtances muſt be carefully obſerved.

If the fœtus is dead, which is ſuſpected by its ceaſing from its uſual motion, a ſenſe of weight in the bottom of the belly, which moves to which ever ſide the woman lies, pains about the navel, loins, and belly, with uneaſy ſenſations in the ſtomach, an unuſual coldneſs in the belly, and of the os tincæ, perceivable by the touch, hollowneſs of the eyes, and a loſs of their uſual luſtre, ſwelling and duſky paleneſs of the face, &c. *though the moſt, if not the only certain ſign, is a diſcharge of fœtid ſanies from the uterus*. In this caſe nothing can be prudently done; but the buſineſs being left to nature, the excluſion will be by her duly effected.

In conſtitutions ſubject to this misfortune, be careful to avoid whatever has been ſuſpected to cauſe it before, and alſo guard againſt every known cauſe that may poſſibly endanger the patient. In the firſt months keep the belly open with laxatives; if weakneſs do not forbid, bleed in the third month; if there is a ſanguinary plethora, apparent weakneſs is no objection to bleeding; the bark is proper as a ſtrengthener, though bleeding may have been required.

If pains come on, after bleeding give tinct. opii camphorata, or tinct. opii cum infuſ. cort. Peruv.

If an hæmorrhage attends the pains, beſides the anodyne with the infuſ. cort. Peru, and bleeding, give the pulv. ſtypt. Helvetii ʒſs. ſingulis ſemi-horis. After a few doſes this ſymptom abates, and then each doſe may be repeated at proportionably longer intervals.

If a cough attends, the pil. ſtyrac. at bed-time, has a moſt valuable effect.

If acute diſeaſes are the cauſe, their reſpective nature and cure are to be attended to.

If a teneſmus produces the danger, the enema ex amylo cum tinct. opii gt. xx ad xl. or a ſuppoſitory, as follows, may relieve. ℞ Sevi ov. ceræ. flav. ſp. cæti ā p. æq. pulv. croc. Anglic. part. ſext. totius.

When a tenſion of the uterus is attendant, all aſtringents are improper; in this caſe the miſcarriage muſt be promoted by bleeding and gentle opiates, for nothing will check the hæmorrhage here but emptying the uterus.

If the child is ſuppoſed to be dead, to attempt the reſtraint of the hæmorrhage will be injurious; and if the miſcarriage is ſo far advanced as not to be likely to be prevented, medicines will be quite unneceſſary.

As precautions to prevent miſcarriages during pregnancy, are not ſo efficacious as thoſe uſed betwixt a miſcarriage and the next impregnation, the advantage of this interval ſhould be embraced, the particular diſorders ſhould be attended to and removed, and the general vigour reſtored as far as poſſible: to this end cold bathing will greatly contribute, if it is uſed at bed-time, or after the dinner is well digeſted. The chalybeate waters excel in this caſe; they ſhould be drank at the ſpring, early in the morning, to the quantity of three or four half pints; their uſe muſt be continued two or three months, and exerciſe within the ſtrength ſhould be uſed at the ſame time.

Lime-water has been ſingularly uſeful in this caſe, both in curing a diſpoſition to, and preventing threatened miſcarriages, in thoſe who have often miſcarried before. If in theſe caſes the water was made freſh when uſed, and drank before the heat excited by the ebullition on quenching the lime was gone off, the efficacy would be the greater.

Reſt ſhould be complied with, as ſoon as the ſymptoms of a miſcarriage appear; and, if no particular reaſons forbid, it is beſt to keep the bed till danger is paſt; however, at all events, a recumbent poſture is neceſſary.

Opiates with reſtringents allay the pain, and ſo remove the ſtimulus which promotes and increaſes the hæmorrhage.

Convulſions and *Floodings* coming on pregnant women, demand immediate help from art, to extricate the fœtus from the womb; and though properly belonging to the article of midwifery, yet very naturally fall under this of *Abortion*.

Either of theſe caſes happening before or after labour comes on, they admit of no delay. However, in them both, there is the advantage of the waters to turn the child in, when happening before delivery.

Convulſions.] When convulſions come on in the beginning of labour, they are occaſioned by the nerves of the os internum being irritated, and put on the ſtretch. When they come on after labour has gone on well for ſome time, their cauſe may be paſſions of the mind, long continued pains, &c.

A cure is uncertain, when convulſions come on in time of labour, except you can deliver the child; and as in ſome caſes delivery is impracticable on account of the length of the neck of the womb, if the woman cannot be relieved by medicines, death muſt inevitably be the conſequence. If then the convulſions come on in the beginning of labour, bleed freely, and repeat the operation according to the ſtrength of the woman and the violence of the diſeaſe. Empty the bowels with a clyſter; if time admits, apply a bliſter on the nape of the neck and on the extremities, and give aſa fœtida, &c. If the fits go ſoon off, and at the intervals the ſenſes are entire, alſo if there is no fever, wait the event; but if there is vomiting, the pulſe be low, the patient comatoſe, we muſt endeavour to take the child away, and try bleeding, bliſtering, and opiates. If the patient is convulſed three, four, or five hours together, foams at the mouth, and the pulſe is diſordered, deliver if poſſible.

If convulſions come on after the labour is in ſome meaſure advanced, they will have the ſame effect as labour-pains, and the child will be delivered by them. If they have not this effect, if the head of the child is low enough for the forceps, uſe them. If the head of the child is jammed in the pelvis, and the uterus ſo contracted that it cannot be puſhed up, nor the forceps uſed, there is no remedy but the crotchet, and opening the head.

If the convulſions continue after delivery, the lochia are commonly obſtructed; in this caſe, bleed, bliſter, and apply to the belly a plaſter made thus: ℞ Gum. aſæ fœtid. ʒvj. camph. ʒſs. m. If the pulſe fail, give ſaffron, caſtor, &c. with ſuitable antiſpaſmodic mixtures, and bliſter. If the pulſe is full and ſtrong, bleed: and if bliſters are required, inſtead of the empl. cantharidis. ℞ empl. ſtimul. (ex empl. lytharg. cum gum. empl. canth. & gum. euphorb. āā p. æq.) ad plant. ped. applicand. If the convulſions continue twenty-four hours, or more, after delivery, the woman rarely recovers.

Floodings.] Floodings happening to pregnant women are very different in their effects, ſo are as differently to be regarded. Pregnant women have the menſes ſometimes to the laſt, but they are pale, thin, and do no harm. Thoſe fluxes which do not require delivery, come on gradually, but generally with the uſual pains of the menſtrual flux attending; they are not continual; and, with due care, they ceaſe. Thoſe, which cauſe miſcarriage or death, break forth ſuddenly, and, in large quantities, they flow without ceaſing, any otherways than as prevented by clots of blood now and then. In the firſt caſe, the os tincæ is not affected; in the latter it opens.

In the early months, the cauſes are violent ſhocks, ſudden or great frights, &c. but in the latter months, the ſeparation of the placenta, in whole or in part, is always the cauſe: the uterine arteries pour their blood into the cellular part of the placenta; hence, when any of theſe cells are torn through, all the blood carried by them muſt be diſcharged by the os internum. The placenta adhering to the os internum may be the cauſe of flooding; in which caſe, the diſcharge increaſes as the os internum dilates.

The ſigns of an approaching flooding are, *reſtleſs pains like labour, pain in the eye-balls, troubleſome dreams*; if the flooding is internal, *the os tincæ will be ſtopped with clotted blood, the belly will ſwell, the pulſe fail and flutter*, and *faintneſs with giddineſs come on.*

Floodings are more or leſs dangerous, according as pregnancy is advanced, becauſe the diameters of the veſſels are proportionably enlarged. If the os tincæ is not open, there is no danger. Flooding preceding delivery is, for the moſt part, followed with a dead child: and generally a flooding in the firſt months is followed by a miſcarriage.

If the flooding threatens ſpeedy danger, attempt nothing till the patient's friends are apprized of it, and inſiſt on your endeavours. It is ſeldom that any manual aſſiſtance is given in the firſt five months, for till after this time the os tincæ is but little altered, and indeed the pregnancy is often ſomewhat uncertain; but afterwards the os tincæ opens, ſo that if need be, the fœtus can be brought away by force. In latter months, if a flooding comes on, if at the ſame time the pulſe is tolerable, the colour remains, the loſs of blood not very conſiderable, and if there are any pains which are likely to deliver, do nothing in a hurry, but rather wait the effect of the pains. If the diſcharge abates on the rupture of the membranes, pains come on, and all elſe ſeems well, wait; but, if the flooding continues, if the pulſe is low and unequal, if the ſtrength fails, the face grows pale, fainting and cold ſweats come on, introduce the hand, and deliver by force; for in theſe caſes there is danger of convulſions ſucceeding, and delay may haſten them.

If death is not ſo near, take as much time as ſymptoms will permit: if called in time, ſuppoſe in the morning, the flooding juſt come on, the ſtrength and ſpirits not yet failed, wait two or three hours, or till the evening, then the os tincæ will be ſoftened by the longer diſcharge, it will more eaſily dilate, and the birth will be leſs difficult.

If the violence of the ſymptoms demand immediate help, proceed without waiting for pains, for they ſeldom return after the flooding is ſo violent as to cauſe fainting, or convulſions; nor muſt we wait for a conſiderable dilatation of the os tincæ, which without pains is not to be expected; indeed the pains are the leſs neceſſary, as the hæmorrhage aſſiſts in relaxing it.

If flooding happens during the firſt ſix months, bleed according to the ſtate of the pulſe, keep the patient ſtill in bed, and though ſhe is faint, cold, or low, give no warm

cordials, for they increaſe the diſcharge in proportion as they raiſe the ſpirits. If a vomiting attends, give the neutral mixture, and ſuch light food as paſſes ſoon into the circulation, ſuch as broths, ſalop, milk, &c. Let theſe be given in very ſmall quantities, leſt vomiting ſhould be excited, but let the ſupplies be frequent. If coſtiveneſs offends, relieve by clyſters that are barely laxative. If anxiety and wakefulneſs incommode, let opiates be repeated, at due diſtances, in ſmall doſes. The bark joined with opiates, and ſometimes with nitre, alſo is very effectual. The pulv. ſtypt. helv. above-named, is alſo not to be omitted, and cloths dipped in cold water may be applied to the region of the uterus.

If this diſaſter happens in the ſeventh or eighth month, the danger is far greater than in the former months; for the diameter of the veſſels are enlarged, and the neck of the uterus is long and rigid, ſo that if the flooding is violent, the woman may be loſt before the beſt helps can be of any uſe. In this caſe, as in the former months, it is the beſt not to attempt delivery, till a laxity of the parts is come on; for were we to attempt it in their rigid ſtate, we ſhould increaſe the flooding, tire ourſelves, and exhauſt the woman, and this without being able to deliver her.

The moſt dangerous time is the laſt month of pregnancy, for then the diameters of the veſſels are at their greateſt dimenſions. If in this caſe the blood runs off in a full ſtream, introduce the hand, break the membranes, and taking the advantage of the waters, turn the child, and bring it footling. If at this period a flooding happens, or in the time of labour, and the patient loſes not a great quantity in a ſhort ſpace of time, ſhe may bear it, and in the courſe of labour pains it will ſtop, and the labour will go on well. If the woman is plethoric, and not much weakened by the diſcharge; if the child preſents fair, break the membranes to reſtrain it, and allow time for the labour to come on afterwards.

If during labour a flooding is cauſed by a laceration of the placenta in delivering the firſt of twins, immediately introduce the hand, turn the remaining child, and bring it away by the feet, then the uterus will contract, and the diameters of the veſſels will be leſſened: but if the flooding precedes the delivery of a twin, and then abates, let the other remain a little, and recruit the woman with caudle or jelly; for in twin caſes the belly is vaſtly diſtended, and the veſſels are very much dilated and full, and a ſudden emptying of them may cauſe a ſyncope, or even death.

The placenta is not only ſometimes looſe, but alſo is ſometimes fixed over the os tincæ, in which caſe delivery muſt be effected with all convenient ſpeed. To deliver with ſafety when thus circumſtanced, introduce one finger into the os tincæ, then two, and gradually the reſt, until the whole hand is introduced; dilate the parts by degrees; then, if the membranes firſt offer, break them, and get the feet of the child, by which bring it away, and deliver the reſt at diſcretion. But if the placenta preſents at the os uteri; 1ſt, you will know by the touch, for on introducing the finger, neither the membrane nor the naked head is perceived; on the contrary, thick and ſoft fleſh is felt, diſtinguiſhed from that of a child by being ſofter, and alſo without form. 2dly, This caſe is always joined with a flux of blood, to the danger of both the mother and the child; therefore the birth muſt be haſtened without waiting for pains; a finger muſt be introduced into the os tincæ, and the placenta removed until the membranes can be reached; which done, tear them to come at the feet of the child: if you cannot puſh the placenta from the os tincæ, force your finger through its middle, and make way by dilating your fingers for the membranes to deſcend; this done break them, and by the running off of the waters the uterus will contract, and gradually leſſen the flooding: if on the waters being diſcharged the head preſents, endeavour to remove the placenta ſo as to give way to the head, then the pains may bring forth the child; but if it is in a præternatural poſture, bring it away by the feet.

If the flooding happens from a blow, and there is a great diſcharge in a little time, delivery muſt be haſtened as ſpeedily as poſſible; and if the hæmorrhage abates not on the child's being brought away, the placenta muſt be haſtened too. Remember, that during delivery an aſſiſtant ſhould gently preſs the belly of the woman, and continue the preſſure a little while after the placenta is delivered; the woman muſt be ſupported by frequent ſmall quantities of caudle.

The floodings which happen after delivery are ſometimes very dangerous; this kind is generally owing to the womb being ſuddenly emptied, and ſo not having time to contract the diameters of the veſſels, they remain open, and the blood by its own ſpecific gravity pours out. The chief intention here, is to contract the uterus; to which end the propereſt means is the application of cloths dipped in vinegar, or vinegar and water: theſe ſhould be laid on the back and the region of the womb. A hand may be placed on the belly, to preſs the uterus towards the pubes. *But the greateſt ſpecific in this caſe is an opiate: it ſhould be given in large doſes, for if the woman can be once compoſed, if it be but for a few minutes, the flooding will almoſt certainly ceaſe, and when it once ceaſes it rarely returns.* In ſome of theſe deſperate caſes Dr. Wallis ſuppoſes the uterus and uterine veſſels to be in a ſtate of torpor, and therefore thinks, in addition to the commonly adviſed remedies, a bliſter applied over the lower vertebræ of the back and os ſacrum might be highly uſeful. See his hint given on this ſubject, in his Notes to Sydenham's Works, Vol. II. p. 171.

To deliver a woman without pains, or to force labour, the ſubſequent directions ſhould be purſued: lay her on her back with her heels upon the bed, having aſſiſtants to keep her ſteady. The operator may be in any poſition that he finds moſt convenient, in the courſe of one labour he will generally find occaſion to ſit, ſtand, and kneel; the elbow of the introduced arm ſhould be ſupported by the knee, to give additional ſtrength, and to prevent the arm from being wearied. The hand of the operator being well ſmeared with hog's lard, or unſalted butter, he muſt gradually dilate the external parts, by introducing the fingers one after another, moving them in a rotary manner; then begin to dilate the os internum, proceeding gently and gradually, reſting at intervals both for his own and the woman's eaſe: when the hand has paſſed into the uterus, he muſt break the membranes, but permit not the waters to run off before he has found the feet, and the child is properly turned; the feet ſecured, proceed as in delivering by the feet. When the child is delivered, if the placenta adheres, but the flooding is not ſo violent as to render the bringing it away immediately neceſſary, opiates are the moſt likely means of promoting the ſeparation and excluſion of it, by relaxing the parts concerned, and removing the ſtricture which always accompanies the pain: give the tinct. opii gutt. xx. vel ſyr. papav. albi ʒ j. vel opii gr. j.

Though many later authors have written well on *abortion*, and ſome moderns have added many improvements, yet Hippocrates deſerves to be read on this ſubject.

See Dr. Leake's Medical Inſtructions, edit. 6. and alſo his Practical Obſervations. Denman's Aphoriſms on Uterine Hæmorrhages. Smith's Letters to Married Women. On the Management of Children, &c. by William Moſs, Surgeon. On Uterine Hæmorrhages, by M. Leroux, Surgeon. London Med. Journal, i. 59.

ABRACADABRA. See AMULETA.

ABRASA. Ulcers attended with abraſion of part of the ſubſtance; or, ulcers where the ſkin is ſo tender and lax as to be ſubject to abraſion. James.

ABRASIO, ABRASION. The ſame as *Apoſyrma*. A ſhaving away, a rubbing off, a ſuperficial exulceration. From *abrado, to rub off*. Sometimes it is the ſame as *Deſquamatio*.

ABRASUM. The part abraded from the ulcer; or the ſkin, &c. that is rubbed off.

ABRATHAN. See ABROTANUM.

ABRETTE. See ABELMOSCHUS.

ABRIC. See SULPHUR.

ABRODIETETICUS, Abrodietical ἁβρός, *delicatulus*; and Δίαιτα, *diæta*.

ABROTANUM, SOUTHERNWOOD, from ἁβρός, *ſoft*; alſo called abrathan.

It is the ARTEMISIA Foliis ramoſiſſimis ſetaceis cauli erecto ſuffrutico ſo, of the claſs SYNGENESIA. Ord. POLYGAMIA SUPERFLUA Linnæi Genera plantarum, 945. Mat. Med. p. 135. ſect. 385.

The male ſpecies, ABROTANUM *mas*, is a ſhrubby plant, with woody brittle branches, numerous greyiſh green leaves, divided into ſlender ſegments; and ſmall, yellow, naked, diſcous flowers, hanging downwards in cluſters along the ſides of the ſtalks and branches. It is a native of open mountainous places in warm climates, France, Spain, and particularly Italy. It flowers in July and Auguſt. In England it is raiſed in gardens from ſlips of cuttings, ſeldom producing ſeed, and not often flowers;

flowers; the leaves fall off in winter; the roots and ſtalks are perennial.

The female ſpecies, ABROTANUM *fœmineum*, *Chamæcedrys*, *Santolina*, *Chamæcyparissus*, is a buſhy ſhrubby plant, all over hoary, with oblong ſlender leaves, compoſed each of four rows of little knobs ſet along a middle rib, and naked, diſcous, yellow flowers, ſtanding ſolitary on the tops of the ſtalks. It is a native of the ſouthern parts of Europe, flowers in June, and continues to flower till winter approaches, and holds its leaves through all the winter.

They are both chiefly uſed for fomentations, in which caſe the one may at any time be uſed for the other; they are powerfully diſcutient and antiſeptic. Heiſter highly extols a decoction of either of them in ſea or in ſalt water, as an antiſeptic fomentation.

For internal purpoſes they are indiſcriminately uſed, and are commended as antihyſteric and anthelmintic; depending upon their being bitter, aromatic, and volatile; and Murray thinks they merit greater attention than has been beſtowed upon them. But the male ſpecies being both ſtronger and leſs diſagreeable, deſerves to be preferred. The female ſpecies is a better ſubſtitute for the artemiſia than for the abrotan. mas.

The tops and the leaves of the male ſpecies have a penetrating bitteriſh taſte, ſomewhat aromatic; are moderately antiſeptic, attenuating, diaphoretic, and diuretic. They have been alſo eſteemed to be ſtomachic, carminative, and deobſtruent; ſuppoſed to ſtimulate the whole ſyſtem, particularly the uterus. They loſe a little by drying, and are beſt if uſed when freſh; ℥ij. of the tops may be uſed for a quart of infuſion.

Spirit of wine brings over but little of the flavour, though it extracts a ſtrong tincture. Six pounds of freſh tops afford about a dram of an eſſential oil of a bright yellow colour, whoſe odour reſembles that of the plant.

ABROTANUM LILIFOLIO. See DRACO.

ABROTONITES, a wine impregnated with abrotanum. About one hundred ounces of one, to ſeven gallons of the other, are put together, and after ſtanding a few days, the wine is fit for uſe.

ABRUM. See AMBRA.

ABRUPTIO, See ABDUCTIO.

ABSCEDENTIA. Decayed parts of the body, which from a morbid ſtate are ſeparated from the ſound.

ABSCESSIO, } an *Abſceſs*; from *abſcedo*, *to depart*;
ABSCESSUS, } or, from *abs* and *cedo*, *to retire*. A cavity containing pus, or a collection of matter in a part. So called, becauſe hereby the parts which were joined, are now ſeparated; one part recedes from another to make way for the collected matter. Termed alſo *Diastema*; *Dubletus*, an Arabic term, *Exitura*.

Αποστημα and αποστασις, uſed by Hippocrates, are tranſlated by Celſus, *abſceſſus*, and ſometimes *vomica*. Paulus Ægineta ſeems to limit the ſignification of *abſceſſus* to ſuppuration, by defining αποστημα to be an *abſceſs*, or a corruption of the fleſhy parts, muſcles, veins and arteries. The words αφιστημι and αφιστημι, which ſignify *to recede* or *retire*, are uſed by Hippocrates with great latitude. He means by them any critical removal of offending humours, however diſcharged; alſo the change of one diſeaſe into another, as a quincy into a peripneumony, &c. See APOSTASIS. But the preſent practice ſeems univerſally to conſider an *abſceſs* as that tumor which follows an inflammation, for almoſt all of them are the conſequence thereof.

The proper ſeat of *abſceſſes* is the cellular membrane. The matter in *abſceſſes* is formed by the heat of the part acting on the humour collected there and diſſolving the adjacent fat; theſe two fluids are alſo concocted by the ſame heat. The formation of matter in *abſceſſes*, is well deſcribed by Mr. Deaſe, in his Introduction to the Theory and Practice of Surgery, page 36. He ſays, "The inflammation being now at the higheſt, and the different ſeries of veſſels loaded with fluids, ſtill urging the point irritated, the heat developed by the attrition between the ſolids and fluids, will, by rarefying the latter, diſtend the former, and dilate the exhalent veſſels; by which means there will be an exudation of ſerous humours into the cellular and adipoſe interſtices, whoſe texture in part will gradually be diſſolved, the coats of the ſmall veſſels ſlough off, and the different ſeries of humours being broke down and fermenting, will form, by a new combination, a white, opaque, unctuous liquor, without any offenſive ſmell, termed PUS. This matter, in circumſcribed tumors, will occupy the centre; but, in extended inflammations, we often find many points of ſuppuration, which running into one another, form large cavities and different ſinuſes in the cellular and adipoſe membrane."

The inflammatory heat continuing to increaſe during three days, and that in oppoſition to the uſual means, a ſuppuration will certainly follow. *If the patient feels frequent ſhiverings*, a formation of pus is certainly commenced. This ſhivering is produced by the abſorption of ſome of the pus, or its thinner parts; but when the matter is incloſed in a cyſt, or ſurrounded with an inflammatory matter, this abſorption rarely or never happens. In the cellular membrane are lodged many veſſels for the ſecretion and diſtribution of fat, and many other veſſels paſs through it in their way from one part to another. This membrane eaſily tumifies, and, being very ſlight, as eaſily divides, by which a cavity is formed, and in it is depoſited all that conſtitutes the ſubſequent diſcharge. Farther, by the rupture of the cellular membrane, the parts which were connected are ſeparated, and their tenſion removed, the many blood-veſſels which before were compreſſed are freed, the blood circulates freely, the heat abates, and the part is leſs red, but gradually becomes more ſoft.

In the progreſs of an *abſceſs* on the external parts, the tumor increaſes, ſo does the heat, pain, and redneſs thereof; a pulſation is alſo perceived therein, a fever ſometimes attends, which is increaſed every night: when the contents are all ſuppurated, and the pricking pain gives way, and an itching, with a growing numbneſs, is complained of, the hardneſs of the part at length yields to the touch, and the ſkin burſting, gives a vent to the contained matter.

An *abſceſs* ſhould be carefully diſtinguiſhed from a hernia, an aneuriſm, and from a varicous tumor.

If during the treatment of an *abſceſs*, the patient is ſleepleſs and feveriſh; if he breathes with difficulty and loaths his food; if the pus, when diſcharged, is ill-coloured, fetid, and ſanious; if irruptions of blood or ſpongy fleſh appear in the cavity of the ulcer; if faintings come on during, or after the times of dreſſing, the prognoſtic is unfavourable: on the contrary, if theſe ſymptoms are abſent, or but in a moderate degree, a favourable iſſue may be expected. By improper treatment a phlegmon is eaſily converted into a ſphacelus. Deep ſeated *abſceſſes* are ſometimes difficultly diſcovered by the touch; but as no conſiderable ſuppuration can happen in the body without being ſoon after accompanied with a hectic fever, the ſlighteſt appearance thereof at once determines the caſe.

When ſuppuration is to be promoted, endeavour,

1ſt, To convert into pus the congeſted humours.

2dly, To aſſiſt the diſcharge of the matter when it is duly digeſted.

3dly, To heal up the opening, or ULCER, for thus the *abſceſs* is denominated when the matter is diſcharged.

In order to the accompliſhment of the firſt intention, avoid all repellents, for their uſe at this time may convert the ſuppurating tumor into a ſchirrus, or other incurable induration; for this reaſon, camphorated ſpirit as a topic, and high cordials when the inflammation is internal, are alike improper. In general, apply to the tumor ſuch things as gently ſtimulate and moiſten; ſuch alſo as obſtruct the pores, and thus prevent the paſſage of the finer parts in their attempts to eſcape through the ſkin; to theſe ends the white bread poultice will ſuffice, if applied warm, every two, or at moſt, three hours, to keep up an equal heat. This application for its neatneſs, cleanlineſs, and freedom from offenſive ſmells, is deſervedly to be preferred; yet, at diſcretion, may be added a ſmall portion of the roots of lilies, the ointment of yellow reſin, or of the beſt gum galbanum. In ſlighter caſes, where the part is not too tender, or in ſome ſluggiſh tumors with but little pain, a plaſter of the gum galban. colat. or empl. gummi, may be applied alone, and renewed every four or five days; or, to expedite the efficacy thereof, a warm poultice may be laid upon it twice in the day.

While externals are applied, the ſtate of the conſtitution is not to be neglected; too much heat endangers a mortification, and with too little every attempt will be abortive. If the heat runs high, reduce it nearly to a ſtate of health by bleeding and a cooling regimen. Avoid purges; but if coſtiveneſs incommodes, a clyſter may be uſed. If a defective heat retards the ſuppuration, warming medicines, and a cordial diet, are required.

For a due fulfilling the ſecond intention, the whole of the

†

the tumor, or nearly ſo, muſt be converted into pus, before a diſcharge can be admitted; otherwiſe all that remains unſuppurated will digeſt with difficulty, and often become a faulty ichor. Again, if a due diſcharge is not obtained as ſoon as the pus is perfected, it putrifies and forms a fiſtula, &c. or it will be abſorbed, and cauſe a hectic fever. The time of opening is generally to be known *by the prominence obſerved being very thin, the matter fluctuating on the lighteſt preſſure, and an abatement of the pain, heat, and pulſation in the part.*

Abſceſſes are opened by either inciſion with the knife or lancet, or the cauſtic; but in general the firſt is to be preferred, for it is leſs painful than the cauſtic. The opening may be as far as the ſkin is diſcoloured, or a circular piece may be taken out if the diſcolouration ſpreads. The opening muſt be, if poſſible, in a depending part, though, where nature points out, the operation ſhould be performed. When the bad quality of an *abſceſs* is likely to retard its future incarnation, an opening made by a cauſtic beſt prevents the lips of the wound from growing callous. Venereal buboes, and ſome ſcrophulous tumors, if not in the face or neck, are ſooneſt healed after opening with a cauſtic; and ſuch of theſe as neither will give way to ſuppurating nor diſcutient medicines, are effectually deſtroyed by cauſtics, and the eſchar ſoon is cicatrized. See the article ESCHAROTICA.

Many adviſe not to open critical *abſceſſes* before they are digeſted. Sharpe ſays, that "very little of the morbid matter is depoſited in them before they are fully ripe, therefore till then ſhould not be opened." It is certain that by a premature diſcharge, the ulcer becomes foul, and heals with difficulty.

When the knife is uſed, if a nerve, vein, or artery is in danger, let a director guide the inciſion, which is beſt begun on the lower ſide, for then the matter is diſcharged moſt freely, and the operator leaſt incommoded by it. If poſſible, its courſe ſhould be according to that of the fibres of the ſubjacent parts: thus, if the ſkin is very near a nerve, the uſe of the part will not be injured by cutting it acroſs.

As to the third intention, it may be obſerved in general, that when the opening and diſcharge are made, the caſe is conſidered as a common wound, and the treatment is as directed in the article VULNUS. The firſt dreſſing may be dry lint, covered with pledgets of ſoft tow. Afterwards, if the part is tender, and the matter good, when the applications are removed, be content without wiping it very clean. Pledgets that are ſpread with ointments need not be warmed, except the patient makes complaints thereof, and then hold them to the fire, but not ſo long as that their ſurfaces will melt. Obſerve a proper poſture which will favour the diſcharge. Repeat the dreſſings once or twice a day, as the quantity or the quality of the diſcharge requires; the ſeldomer they need a repetition, the ſooner will the cure be perfected: and as the air offends not except by long expoſure to it, all hurrying therein is quite unneceſſary. Bell on Ulcers, edit. iii. p. 54. 93. Kirkland's Medical Surgery, vol. ii. 49. 62.

1. ABSCESSUS ABDOMINIS. *An Abſceſs of the Belly.* See INTL. MUSC. ABDOM. 2.———ANI. *An abſceſs of the Anus.* A large quantity of fat fills up the cavity on each ſide of the anus, and is the ſeat of this diſorder there. The cauſes are various; as *contuſions, wounds, inflammations, difficult labour, hard riding, a dyſentery, the venereal diſeaſe*, &c. *Abſceſſes* ſometimes are ſuddenly formed in this part; at others they advance very ſlowly. *In the firſt caſe*, the appearances are in the beginning no other than thoſe of a common boil, but the ſymptoms ſoon increaſe, quickly proceeding to a more formidable ſtate. *In the latter*, though the ſuppuration makes but little progreſs, the pain and tumor ſuffice to determine the nature of the complaint. The pus, whether it makes its way through the ſkin or through the inteſtines, is frequently ſo tedious in its paſſage, that the adjacent fat is more or leſs corroded, and rendered ſanious, whence ſinuſes are formed of different ſhapes and ſizes. Sometimes the maturation is extended on every ſide, rendering the cure both difficult and uncertain. When *abſceſſes* in this part are left to themſelves, they rarely fail to degenerate into fiſtulas, and occaſion troubleſome calloſities.

As ſoon as the tumor is formed, endeavour with all poſſible ſpeed to ſuppurate it; and when this is in ſome degree advanced, procure a ſpeedy diſcharge. To this end let the patient ſtand on the ground with his feet aſunder, and lean over a table upon his belly; then the operator introducing a finger into the anus, will perceive the matter in a fluctuating ſtate; in which caſe, without waiting for the external ſigns of ſuppuration, make an opening into it with a knife: by preſſing the finger in the anus on the *abſceſs*, and another on the external part, a judgment may be formed where to make the puncture; for, by the finger in the rectum, the pus may be preſſed externally ſo as to be perceived by the finger there. When the opening is made, endeavour to enlarge the wound as you withdraw the knife; and, for the better application of proper dreſſings to the bottom, another inciſion may be made tranſverſely. If the rectum is laid bare, an inciſion muſt be made in it alſo, as far as ſuch accident extends, in order to its reunion with the adjacent parts, for the regeneration of fleſh is obtained with great difficulty on the ſurface of an inteſtine when deprived of its fat. When the matter ſurrounds the anus, the cure is hardly to be performed without an abſciſſion of all that is denudated. See an extraordinary inſtance of this kind in the Med. Muſ. vol. iii. p. 251. 257.

A proper opening being made, the dreſſings, &c. are as in *abſceſſes* in general. Though Aetius obſerves, that when this diſorder extends round the anus, while the wound is filling up, there happens a conſtriction of the circumjacent parts, and an obſtruction of the paſſage of the anus; to prevent which he adviſes to introduce a canula there, and continue it till the cure is finiſhed. But how far a good habit of body, with other favourable circumſtances, may encourage our hope of ſucceſs this way, the practitioner can only judge by the occurring circumſtances, and his own experience.

When the cauſe is venereal, theſe tumors ſuppurate ſlowly; and without a gentle mercurial ptyaliſm, a cure is hardly to be effected. See Kirkland's Med. Surgery, vol. ii. 201. 3.———ARTHRITICUS. See ABSCESSUS *Inteſtinorum.* 4.———AURIS. *An abſceſs in the Ear.* The ſymptoms attending an *abſceſs* in this part have nothing peculiar, except that the pain is very exquiſite. See OTAGLIA. 5.———AXILLÆ. *An abſceſs in the Arm-pit.* *Abſceſſes* are often formed by injuries in the arm, hand, or fingers; ſometimes a fever at its criſis lodges matter here, and when the fever is of a malignant kind, theſe tumors ſuppurate but ſlowly. When ripe, an opening ſhould be made with the cauſtic. This diſorder when it terminates the plague, is uſually called a bubo, which ſee. See alſo ABSCESSUS INGUINIS, N° 16. 6.——CALCIS. *An abſceſs of the Heel.* The common cauſes of an *abſceſs* may produce it, but generally it is ſtrumous. The principal object of particular attention is, that if there is a caries, the beſt method is to paſs an actual cautery through a canula. Wiſeman ſays it ſaves much time, and that thus the caries ſeldom ſeparates in the form of a ſcale, but moulders away inſenſibly with the matter. 7.———CAPITIS. *An abſceſs on the Head.* Wounds on the head generally are the moſt ſpeedily healed; when an *abſceſs* is brought to the ſtate of a wound, the ſame advantages attend it, and the common methods ſuffice for the cure. When *abſceſſes* are ſeated on the ſutures, they may be troubleſome by inflaming the dura mater which paſſes through them, and is continued to the pericranium. Every where on the ſcalp, a cauſtic is the beſt for opening *abſceſſes* with, eſpecially if the long confinement of the matter hath rendered the ſkull carious, for it makes ſome way for the raſpatory, which is always uſed, except where the ſutures are: exfoliation here is very ſlow, therefore raſping is uſed, and then incarnation can immediately proceed.

Abſceſſes over the forehead are beſt opened by inciſion, but care ſhould be obſerved, that the direction of the fibres may be followed, for a tranſverſe wound may cauſe the eyelids to fall over the eye. 8.———CEREBRI. *An abſceſs in the Brain.* Inſtances of this kind have occurred, and if the trepan is uſed early enough, the caſe ends well. 9.———COLLI. *An Abſceſs of the Neck.* This part is affected with tumors of every kind, but generally the ſcrophulous and encyſted occupy it. *Abſceſſes* here are apt to become fiſtulous, but by proper compreſs and bandage this effect is often prevented. An opening in this part is beſt made with a lancet; but if the jugular vein is near, ſome care is required not to wound it. 10———DIAPHRAGMATIS. *An abſceſs of the Diaphragm.* See DIAPHRAGMITIS. 11.———DIGITORUM, MANUUM & PEDUM. *Abſceſſes of the Fingers and Toes.* See PARONYCHIA. 12.———DORSI & LUMBRORUM. *An abſceſs in the Back and Loins.* See PSOAS. For a particular account

account of this complaint, see Psoas, seu Lumbaris Abscessus. 13.———GINGIVARUM. *An abscess of the Gums*, also called *Parulis*, a *Gum Boil*. Dr. Cullen places this as a variety of phlogosis phlegmone. These tumors are very painful, the inflammation is often more diffused than in other parts, and more or less attended with a swelling in the cheek, or perhaps the whole face. The tooth-ach, the general causes of inflammation, a carious tooth, &c. are the causes of this complaint. Mr. John Hunter observes, that gum boils seldom arise from any other cause than inflammation in the cavity of a tooth, the effect of which extends all over the face, but more particularly in the gums; that sometimes this disease originates from a disease in the socket of the tooth, or in the jaw, without any connection with the tooth. Through bad management, or neglect, they are apt to degenerate into fistulous ulcers. During the inflammation, to assuage the pain, let the patient hold a decoction of barley, or of camomile or elder flowers, or other anodyne ingredients, constantly in his mouth, spitting it out, and taking fresh quantities, as may be needful to keep up an equal degree of heat, or, perhaps the suppuration cannot be avoided; in which case let figs be split and held in the month upon the boil, and white bread poultices, wrapped in thin linen cloths, applied hot externally upon the cheek of the affected side; and as speedily as is convenient, let the *abscess* be opened, for the contained matter soon corrodes the adjacent parts, and affects the bone. The discharge being made, the poultice may be continued a little longer, and the mouth washed three or four times a day with warm wine and honey of roses. If a bad tooth is the cause, it must be extracted before any attempts are made by medicines, or at least, as soon as the discharge of the *abscess* will permit. If the ulcer degenerates into a fistula, inject warm wine and honey of roses into it; and if it is suspected that the bone is carious, add to this injection a little of the tinct. myrrh. or of the vin. aloes. If these methods fail, proceed as for the exfoliation of a carious bone. On this subject, see Mr. John Hunter's Natural History of the Human Teeth, part ii. Bell's Surgery, iv. 203. 14.———GLANDULÆ LACHRYMALIS. *Abscess in the lachrymal Glands*. Whatever may be the causes of these *abscesses*, those to which they usually are attributed seem not to have any such effect; they usually end in a fistula lachrymalis, to prevent which, an opening must be made into them, for the performance of which Mr. Sharpe hath given very ample instructions in his Treatise of the Operations of Surgery; and as this is so generally possessed, the reader is desired to have recourse thereto for the needful instructions, and also to Wallis's Nosologia Methodica Oculorum. 15.——HEPATIS. *An Abscess of the Liver*. A suppuration is prognosticated if an inflammation continues in the liver more than three days; if the pain remits, and is followed by a pulsation in the same place, and if shiverings come on, with a continuance of an icterical or yellowish colour; soon after which a tumor is perceived in the region of the liver, and a sense of weight also; a hectic fever follows with thirst, and an extreme feebleness. Aretæus observes, that a pain generally extends to the throat, and to the extremity of the shoulder, and a dry, but not very frequent cough, afflicts the patient. He farther remarks, that this disorder is sometimes mistaken for a tumor of the peritonæum, which latter is more irregular, and is not circumscribed by the limits of the hypochondrium.

The consequences of an *abscess* in this viscus are:

1st, It is corroded and consumed. In this case, after a tedious icterical wasting, a slow fever, great anxiety, a sanious and fœtid diarrhœa, &c. the patient dies.

2dly, the *abscess* breaks inwardly, and discharges a sanious pus into the belly: thus the rest of the viscera become putrescent, a consumption of the whole body hastily advances, and an ascites, &c. usher in death to close the wretched scene.

3dly, The same sort of pus passes by the biliary ducts into the intestines, and regurgitating into the stomach, causes various coloured and offensive vomitings; or passing downwards produces a violent diarrhœa. Acid and acescent substances may palliate for a time, but the end is always fatal.

4thly, The ichorous matter passing through the ramifications of the vena cava into the blood, procures symptoms the most formidable, the functions soon are disturbed, and the disorder only ends with life.

5thly, the tumor may adhere to the peritonæum, and form an external *abscess*, evident both to the sight and touch. *Here alone is any hope to perfect a cure*; a caustic may be applied and left to separate: for, as is observed by Aretæus, an incision is not safe, because it endangers a sudden death by hæmorrhage, which in the liver cannot be restrained. He farther says, "If it is necessary to make a perforation, introduce a red-hot iron as far as the pus, which will cut and cauterise together." The same author farther remarks, that "If the pus is well conditioned, and the symptoms soon subside, the patient will recover; but otherwise this case is also fatal in its end."

6thly, and lastly, Aretæus again informs us, that if the tumor does not suppurate, the excrements have an offensive and putrid kind of odour; the food passes crude and undigested, because of the weakness of the stomach and of the intestines, for the liver, so disordered, sends forth a too defective bile to assist the digestion; whence some are afflicted with a sharp corroding heat, and are worse and worse every day, and death is soon their delivery. Some recover from both the dysentery and the *abscess*, but a dropsy cuts them off. But if these symptoms remit, and the pus in the stools become white and of a good consistence, and the patient can again digest his food, hope may be maintained in favour of his doing well. But as the best crisis, he notes that by urine, for thus the least offence is given. See Bell's Surgery, v. 387. Kirkland's Med. Surgery, ii. 185. London Med. Journal, vii. 22. 16.———INGUINIS. *An abscess in the Groin*. These are sometimes occasioned by injuries done to the parts below, as in the knees, legs, or toes; a pestilential fever may be the cause, but the venereal disease is the most frequent. See Bubo. If opened with a knife, be careful not to wound the inguinal artery. In venereal cases a caustic is the best for opening them, as it dissolves part of the induration which too often remains after the greatest part is suppurated, and also assists in digesting the remainder. If *abscesses* in the groin, or in the arm-pit, are from the crisis of a fever, open them with a caustic, and keep them running till all danger from the fever is over. In glandular parts all that is hardened should be perfectly dissolved; for instances have occurred of cancers proceeding from the remaining indurations. 17.——INTESTINORUM. *An Abscess in the intestines*. When an *abscess* in the intestines is discharged, the case is sometimes mistaken for a dysentery; indeed, if the exulceration continues long, its treatment will be the same as in the dysentery, though at the first the methods are far from similar. Before an *abscess* is formed in these parts, there is always a throbbing pain felt near the part affected. At the beginning of the suppuration there are unequal shiverings, which increase and remit; also a fever, with an exacerbation of the symptoms in the evening. When this accident follows an inflammation of the bowels, it begins in about four days after the attack of the inflammation, at which time a shivering comes on, which extends through the whole body, and an obtuse pain, with a sense of weight, is perceived by the part affected. After the pus is quite formed, the symptoms abate, and the pain nearly ceases, till the time of breaking approaches, and then the pain is renewed, and sometimes the belly is violently constipated; after the discharge, a quantity of aqueous pus is thrown out by stool. See Aetius Tetrabib. iii. serm. i. cap. 42. In about fourteen days the pus makes its way into the cavity of the belly, and produceth inconveniences similar to those arising from a discharge of the like kind from the liver: or, passing into the the intestines, it runs off by stool. In this case, entire membranes are discharged, and a consumption often follows.

If, on the first attack, the means commended against an inflammation of the intestines fail, little more is to be done than to supply the patient with emollient and gently detergent broths, until by the continuance of the excretions the dysenteric state is arrived, when the procedure is as in a dysentery.

Musgrave, in treating of the irregular gout, observes, that sometimes a gouty dysentery degenerates into an *abscess* in the bowels; hence properly called Arthriticus. Celsus indeed observes, that large *abscesses* in these parts are not seldom the consequence of fevers and pains, especially of pains in the belly. Gouty *abscesses* are formed in the œsophagus, stomach, and guts, and that without giving any reason to suspect them, till they break. However, as soon as the discharge is made,

the patient ſhould avoid all exerciſe. To dilute and to deterge, let the following be uſed for common drink: ℞ Hord. perlat. ℥ ſs. rad. conſolid. min. ℥ j. coq. in aq. puriſſim. ℔ iij. ad ℔ j. & cola. If the purulent diſcharges are exceſſive, moderate them with ſmall doſes of the tinct. opii; in caſe of faintneſs a glaſs or two of wine may now and then be allowed; avoid all acids, acrids, and high cordials, and let the diet chiefly conſiſt of jellies, agglutinating broths, &c. at laſt, when all appearances of purulency have vaniſhed, the following may be uſed both to reſtore, and to prevent a relapſe: ℞ Gum. myrrh. pulv. gr. v. balſ. Locat. q. f. f. pil. iij. bis die repetend. cum hauſt. decoct. ſupra preſcript. See Warner on the Gout. 18.———ISCHIATICUS. *An abſceſs in the Hip*, a ſpecies of *Arthropuoſis*. When an *abſceſs* forms itſelf in the ſocket, or the head of the thigh-bone, there is uſually a great ſwelling and lameneſs in the hip, and in time a collection of matter is made here alſo; however, this is not the only way it proceeds, for inſtances have occurred, in which it hath paſſed through the bottom of the acetabulum into the belly; and in theſe caſes when the patient went to ſtool, the matter, by ſtraining, was forced back, and through the external wound. Mr. Pott obſerves, that this diſeaſe originates in the hip-joint; yet, in this caſe, the leg of the affected ſide is ſhorter than the other, the pain begins where the diſeaſe originates, i. e. about the great trochanter. It is, he ſays, a diſtemper of the joints and ligaments that ſurround it. He farther adds, that, if we ſee ſcrophulous affections of any kind, in the beginning, if there is any remedy in art, I believe it to be iſſues; therefore, in ſcrophulous hips, apply a large cauſtic on the part large enough to admit of five or ſix peas, and keep up the diſcharge thereby as long as it appears to be neceſſary. Alas! though this method, if early uſed, is much to be depended on, like many other valuable means, it is uſually applied too late. 19.———LUMBORUM. See Pſoas, ſeu Lumbaris Abſceſſus. 20.———MANUUM. *Abſceſſes on the Hands*. For the moſt part they are ſtrumous; when not, the common methods ſuffice for their removal. 21.———PROPE MAXILLAS. *Abſceſſes about the Jaws*. Beſides the common cauſes, a carious tooth, the tooth-ach, an injury done to the ſocket of the jaw in extracting a tooth, &c. may produce an *abſceſs* in theſe parts. *Abſceſſes* under the chin are frequently found in children, but they eaſily give way to the common methods. The conglobate glands under the jaws are very ſubject to ſuppuration, and are often miſtaken for ſtrumous ſwellings, but they differ greatly from them. The ſtrumous kind are contained in a cyſt, which requires to be deſtroyed by eſcharotics after the matter is diſcharged; but theſe are managed and cured with eaſe by the ordinary methods of digeſtion. 22.———MEDIASTINI. *An abſceſs of the Mediaſtinum*. In ſuch ſituations there is but little to be done for the relief of the patient; however, it is obſerved by ſeveral practitioners, that in the venereal diſeaſe this diſorder is peculiar and frequent. See Kirkland's Med. Surgery, ii. 183. 23.———MESENTERII. *An abſceſs of the Meſentery*. Suppurations in this part are not ſuſpected by many, becauſe neither heat nor pain are always perceived in it; but theſe ſymptoms, though commonly attendant on, yet are not eſſential to inflammation and ſuppuration, on the ſenſibility of the parts theſe depend. It may be obſerved, that pus is no where more readily formed than in parts that are every where covered with fat, becauſe the fat itſelf, in ſome degree, conduces thereto. *Abſceſſes* in the meſentery are far from being rare, and are generally to be diſcovered by a continual hectic fever, an oppreſſive uneaſineſs in the belly, a diſcharge of a ſanious matter by ſtool, and ſometimes pain and heat in the inteſtines. The ſanious matter is alſo not unfrequently abſorbed by the veins, and being mixed with the blood, is conveyed to other emunctories, as the glands of the trachea, the kidnies, &c. Hence large impoſthumes of the meſentery are often accompanied with diſcharges of purulent urine, or a ſpitting of purulent matter, though at the ſame time no injury hath happened either to the lungs or to the kidnies. If the *abſceſs* is ſeated in a place leſs fit for the excretion of its contents, very troubleſome gripes, reſembling a colic, are produced: if the matter is diſcharged into a cavity of the belly, it produces a gangrene in the parts it touches; Horſtius, Bartholine, and Tulpius, giving inſtances of the pus being emptied into the cavity of the inteſtines, and ſo diſcharged by ſtool; but notwithſtanding all theſe circumſtances, for the moſt part the diagnoſtics are very obſcure; nay, theſe *abſceſſes* have been unſuſpected, and diſſection after death hath alone diſcovered them. If theſe ſort of tumors are ſuſpected, they muſt be diſtinguiſhed both from an inflammation and a ſcirrhus. In general, the prognoſtic is dangerous; for if the *abſceſs* breaks and diſcharges a very putrid matter into the belly, ſudden death follows: if after the rupture the ulcer is not ſpeedily cured, it acquires a bad quality, and induces a gangrene, a dropſy, or a conſumption.

If this complaint is manifeſt, and the tumor can be perceived, emollients may be applied externally, and internally may be adminiſtered aperient and gentle purgative medicines, and ſuch things as are uſed in obſtructions of the liver and ſpleen, &c. Theſe ſuppurations are generally in the glands of the meſentery, and are only one amongſt other ſcrophulous attendant ſymptoms. Theſe glands are often found after death in a ſcirrhous ſtate; and thus are frequently the companions of a cancer here, or in ſome other glandular part. Riverius ſpeaks largely and well on this ſubject. See his Prax. Med. lib. xiii. 24.———NARIUM. *An abſceſs in the noſtril. Ozæna*. Theſe, from the pain they occaſion, are exceeding troubleſome. If in the inflammatory ſtate they can be removed by bleeding, purging, bliſtering the back, &c. much trouble to the patient will be ſaved; if, in ſpite of all, ſuppuration advances, emollient injections may be thrown up the affected noſtril, and a warm cataplaſm laid upon the noſe. Wiſeman obſerves, that the matter when digeſted is very tough. See Bell's Surgery, iv. 76. Pearſon's Principles of Surgery, i. 255. White's Surgery, 265. 25.———NYMPHÆ. *An abſceſs in the Nymphæ*. See ALÆ. 26.———OCULI. *An abſceſs in the Eye*. From the ſmall-pox moſt frequently, though from other cauſes this accident ſometimes happens. When the ſeat is in the tranſparent part of the cornea, it is diſcovered by the peculiar whiteneſs of its appearance. When it is in the opake part of the cornea, the eye is ſwelled, but more particularly ſo where the *abſceſs* is ſeated. If its ſeat is deeper, the firſt evidence of its exiſtence is generally the extravaſation of its contents in the aqueous humour. Thoſe on the tranſparent cornea, are generally cured by cautiouſly opening them with the point of a lancet, carefully avoiding the pellicles of this coat which lay beneath. In the other two kinds there is great danger of loſing the ſight, for they diſcharge themſelves into the anterior chamber of the eye, though ſometimes a cure is effected without any remaining inconvenience. When the matter of theſe diffuſes itſelf ſo as to ſpread over all the pupil of the eye, then is formed the hypopyon; if only a part of the pupil is covered thereby, the matter forming itſelf into a ſpeck like thoſe at the bottom of our nails, it is called an onyx. Heiſter, in his Surgery, gives a different account of the hypopyon and the onyx.

In the cure of the chemoſis, firſt uſe remedies to reſolve the inflammation; if theſe fail, proceed as follows. While the contents of the *abſceſs* are yet not diſperſed, but extend into the hole of the pupil, place the patient fronting a good light, with his head laid on the back of an eaſy chair, then make an inciſion into the tranſparent part of the cornea, under the hole of the pupil, taking care that the point of the lancet does not touch the iris, which lays behind the pus; make the aperture long enough to give a free vent, then gently inject a little warm water therein. Afterwards apply a compreſs, wetted in a collyrium of roſe-water, well mixed with a little of the white of an egg; keep the compreſs conſtantly moiſt herewith by ſprinkling it from time to time, and drop ſome of it three or four times in the day, in the orifice on the cornea. Some days after the firſt diſcharge, a freſh collection of pus now and then preſents itſelf, in which caſe introduce a fine ſtiller into the inciſion, in order to its paſſage outward, and proceed as at the firſt. See on theſe ſubjects WALLIS's Noſologia Methodica Oculorum. 27.———OSSIUM. *An abſceſs of the bones*. Obſervations in practice prove, that not only in the cellular parts near the joints, but alſo in the middle cavities of the large bones, inflammations have degenerated into *abſceſſes*. The obſervation of Ruyſch, in which he ſays, that he found in the middle cavities of the large bones, round bony pipes, ſeparate from the reſt of the bones in which he ſaw them, may be referred to this article. See ABSCESSUS *Perioſtei*. 28.———PALPEBRÆ. *An abſceſs in the Eye-lid*, when externally ſituated, requires no peculiar management different from *abſceſſes* in general, except

except that in opening it when ſituated near the cilia, great care is required not to enter the lancet any deeper than is barely neceſſary to evacuate the *abſceſs*; if the edge of the eye-lid is cut, an incurable waterineſs is endangered. The direction of the inciſion is the ſafeſt in the courſe of the orbicular muſcle. An *abſceſs* ſituated on the inſide of the eye-lids may be opened with a lancet, and then waſhed with brine, or other proper collyria. 29.———PANCREATIS. *An abſceſs of the Pancreas.* This complaint is the moſt common in ſcorbutic habits. Riolan ſays, that its preſence is probably gueſſed at by a ſenſe of weight in the region of the ſtomach, no hardneſs nor tumor being manifeſt in the hypochondria, particularly if there are other marks of latent obſtructions in the abdominal viſcera; alſo a difficulty of breathing from the compreſſion of the diaphragm; and ſometimes by preſſing near the ſide of the ſtomach a tumor is perceptible, and then the preſſure cauſes pain. *Though for the moſt part the diagnoſtics are very obſcure or uncertain, yet it may be obſerved that a hectic fever, long watchings, ſhort ſleeps followed by a ſenſe of wearineſs, fainting, and cold ſweats, are certain attendants when this diſeaſe is preſent.* The cure is the ſame as in ſimilar diſorders of the other viſcera. See Riverius's Prax. Med. lib. xiii. cap. 4. 30.———PAROTIDIS. *An abſceſs of the Parotid Glands*, alſo called *parotis*. The parotid glands ſuppurate with difficulty; the leſs ſo when the general habit is diſordered, a venereal, ſcorbutic, peſtilential, or other affection attends. They are apt to become fiſtulous; though when they ariſe in children, unattended by any other diſeaſe, there is no danger of ill conſequences, and in ſuch circumſtances the beſt remedies are purgatives, mixed with ſmall doſes of the calomel frequently repeated. In more advanced life, Trallian lays it down as a rule, that if called early to aſſiſt in ſuch a caſe, the cure muſt begin with bleeding: and Celſus, with great judgment, propoſes, that, "When the parotis is unattended with any other diſorder, the cure may begin with repellents and diſcutients; but, on the contrary, if any other complaint hath preceded or attends, ſuppuration muſt be immediately promoted." The management under ſuppuration is the ſame as in other ſimilar caſes, viz. the BUBO, which ſee, and Kirkland's Med. Surgery, ii. 142. 31.———PECTORIS & MAMMÆ. *An abſceſs of the Breaſt.* Theſe are external; for the former, ſee VOMICA. Externally this diſorder happens, for the moſt part, to women. It is then called *Nacta*. Bruiſes ſometimes are the cauſe, but generally, a too active ſeparation of the milk, or taking cold while the woman continues to ſuckle. Inflammation of the lungs and pleura often produce *abſceſſes* in the breaſt, externally, and upon the ribs, which prove fiſtulous, and render the bones underneath carious. A frequent cauſe is from not letting the child ſuck until two or three days after its birth; an early application of the child to the breaſt, or otherwiſe employing the breaſts before they are turgid with the milk, would in general prevent this complaint. Another cauſe is the uſe of aſtringents, &c. to repel the milk. When an *abſceſs* ariſes from milk, it is called *ſparganoſis*. If theſe *abſceſſes* burſt at the top, ſinuous ulcers are ſometimes the conſequence; and this happens too from laxity in the habit, and a defective heat in the condition. When inflammatory tumors happen in the breaſts of pregnant women, or of thoſe who are nurſes, we ought to be very cautious in the uſe of repellents; in ſanguinary habits, bleeding and opening medicines are neceſſary, with a cooling regimen. If ſuch tumors do not very eaſily and ſpeedily give way, ſuppuration ſhould be promoted, for this is the beſt way of ſecuring againſt a ſcirrhus or a cancer.

The common white bread poultice, for neatneſs and efficacy, equals, if not excels, all others as a ſuppurant in theſe caſes; it ſhould be applied, and renewed as frequently as is neceſſary for keeping up an equal warmth, which will be every two or three hours, and continued till the *abſceſs* breaks of itſelf, and then we have only to enlarge the opening a little, if it be too ſmall. A ſmall opening is generally preferable to a large one, as it heals both ſooner and more kindly: ſome adviſe to make an opening during the ſtate of inflammation, becauſe of the pain which attends theſe tumors; but by theſe premature diſcharges freſh collections will be made, and thus may the whole breaſt be waſted; or by repeated inflammations a ſcirrhus will be formed, which ſeldom fails to introduce a cancer. An *abſceſs* here ſhould be opened by inciſion, never by a cauſtic, only if the lancet paſſes near the nipple, if poſſible it ſhould be directed ſemicircularly, both to avoid cutting it, or the areola, for thus the beauty of the part is beſt preſerved, and future ſuckling not prevented.

It ſometimes happens that in order to heal a preſent *abſceſs*, as alſo to prevent the formation of new ones, it is abſolutely neceſſary to wean the child, and gradually divert the milk from the breaſts. See Bell's Surgery, v. 396. Kirkland's Med. Surgery, ii. 160—175. Pearſon's Principles of Surgery, i. 73, &c. White's Surgery, 441. 32.———PEDUM. *Abſceſſes in the Feet.* Of all the ſorts that affect theſe parts, the ſtrumous are the worſt, for in theſe inſtances the bones are uſually affected; but *abſceſſes* of every kind are bad, as they are apt to form ſinuous ulcers, and cariate the bones. The applications and general managements are here as in other caſes. 33.———PERICARDII. *An abſceſs of the Pericardium.* Little has been ſaid by authors concerning this ſubject, any further than diſſections have proved that ſuch a diſeaſe exiſts, and that it has come on independent of any ſymptoms indicative of pneumonic affections, with which the ſtate preceding ſuppuration is often joined: in which ſtate if any good can be done, it muſt be then attempted, to prevent the formation of matter, as in caſes where the other membranes of the cheſt or lungs are affected with inflammation. 34.———PERINÆI. *An abſceſs in the Perinæum.* An *abſceſs*, if ſuſpected to be forming in this part ſhould, if convenient, be prevented, becauſe of its troubleſome effects; it retards, or totally prevents the diſcharge of urine; beſides, by the nearneſs of the os pubis, thoſe ſpongy bones may be affected, and conſequences to be dreaded have been the event. If a ſuppuration is actually begun, proceed as with other *abſceſſes*. See a ſingular caſe in Le Dran's Obſervations. See Kirkland's Med. Surgery, ii. 253. 35.———PERIOSTEI. *An abſceſs of the Periofteum.* This caſe is known *by evident inflammation and pulſation in the part, the fever, irregular ſhiverings,* and *particularly an abſence of the ſigns of reſolution. As the ſuppuration approaches and proceeds, all the ſymptoms are augmented; but the principal ſign* is the *irregular horripilation.* Sometimes the diagnoſtics are obſcure, becauſe the quantity of matter collected, though productive of violent ſymptoms, is too ſmall to raiſe a ſenſible tumor, and in ſuch caſes the pain does not remit, though the pus is formed; beſide, the matter gradually increaſing in quantity, unleſs it corrodes the perioſteum, it makes itſelf a paſſage between it and the ſubjacent bone, and, thus by gradually ſeparating them, keeps up a pain of the moſt intolerable kind. An accident of this kind ſoon lays the bone bare, and corrupts it by deſtroying the veſſels which nourith it. The pus becoming acrid, alſo corrodes the perioſteum, and ſpreading through the ſofter parts, produces fiſtulous ulcers.

When this diſorder is manifeſt, a ſpeedy diſcharge is to be aimed at, and the bone muſt be treated in the ſame manner as the ſkull when denudated. Firſt make an inciſion through the teguments only; for when the perioſteum is corroded, the matter generally ſoon makes a way betwixt the muſcles, in which caſe it is a guide to the operator in piercing to the bone, which when laid bare, the remaining procedure will be as in deep *abſceſſes*, and when the ſkull is deprived of its pericranium. 36.——PLEURÆ. *An abſceſs of the Pleura.* When this is ſuſpected, our utmoſt care is required to obtain a diſcharge externally, to which end an opening muſt be made into it as early as poſſible, leſt it burſt into the cavity of the breaſt, and form an empyema. See many ſatisfactory remarks on this ſubject in Sharpe's Critical Enquiry, and in Le Dran's Obſervations and Operations. 37.———PUDENDÆ. *An abſceſs of the Pudenda.* See ALÆ: 38.———PULMONUM. *An abſceſs of the lungs.* See VOMICA. 39.———RENIS. *An abſceſs in the Kidney.* When an inflammation in the kidney ſuppurates, it is known by the following ſigns, viz. a remiſſion of the pain, which is ſucceeded by a pulſation, a frequently returning horror, a weight and ſtupor in the part, with a heat and tenſion, the urine is purulent and fœtid ſometimes, and, at others, a whitiſh pus is diſcharged with it, in which is nothing offenſive. If this ſuppuration continues ſome time, the whole kidney being conſumed, it forms a kind of bag of no uſe; and in this caſe, a *tabes renalis* is frequently preſent; but if a ſmall quantity of the inflammatory matter remains coagulated in the minute folliculæ of the urine, it forms a baſis, to which the fabulous matter, which continually is paſſing

by

by it, will adhere, and gradually form a ſtone, and which alſo by the ſame means will be augmented.

When the *abſceſs* is burſt, the urine becomes purulent: and though in theſe caſes the diſcharge ceaſes, the kidney ſhrinks into a withered ſtate, and all complaints are ended at ſome certain period; yet to haſten this relief, diluting and gently diuretic liquors may be uſed, gentle laxatives and balſamics alſo, and probably the bark may much conduce to the expediting a cure. 40.———SINUS MAXILLARIS. *An abſceſs in the Maxillary Sinus, called the Antrum Highmorianum.* Drake mentions this as a ſpecies of ozæna. It is known by a pain which is deep-ſeated in the cheek, and a tumor there, on the outer and upper part; a diſcharge of offenſive matter from the noſtril of the affected ſide, eſpecially on inclining the head to the ſide that is ſound; ſometimes the breath is rendered very diſagreeable by the caries produced in the teeth by this diſorder. Mr. John Hunter obſerves, in his Natural Hiſtory of the Human Teeth, part ii. that, "The pain in this diſeaſe is at firſt taken for the tooth-ach; however, in theſe caſes the noſe is more affected than is obſerved in a tooth-ach. The eye is alſo affected, and it is very common for people with ſuch a diſeaſe to have a ſevere pain in the forehead, where the frontal ſinuſes are placed; but ſtill theſe ſymptoms are not ſufficient to diſtinguiſh the diſeaſe. Time muſt diſcloſe the true cauſe of the pain, for it will commonly continue longer than that which ariſes from a diſeaſed tooth, and will become more and more ſevere; after which, a redneſs will be obſerved on the fore part of the cheek, ſomewhat higher than the roots of the teeth, and a hardneſs in the ſame place, which will be conſiderably circumſcribed; this hardneſs may be felt rather highly ſituated on the inſide of the lip." The method of cure by drawing one of the dentes molares from the affected ſide was firſt propoſed and practiſed by Drake, and his improvement hath been continued with the happieſt ſucceſs. Draw the laſt tooth but one; and if rotten, draw the next on each ſide it, then through their ſockets make a perforation into the antrum with a large awl; the matter being diſcharged, the cure may be finiſhed by injecting a mixture of aq. calcis, tinct. myrrh. and mel roſæ. twice a day into the cavity, and retaining it with a tent. See Gooch's Caſes and Remarks, in which an extraordinary inſtance is related, with the ingenious and ſucceſsful management thereof. Mr. John Hunter propoſes to effect the cure as follows: 1ſt, if the diſeaſe is known before the deſtruction of the fore part of the bone, make an opening through the partition between the antrum and the noſe; or, 2dly, by drawing a tooth, as above: the latter method he prefers. Bell's Surgery, iv. 209. Kirkland's Med. Surgery, ii. 150. 41.———SPIRITUOSUS. See ANEURISMA. 42.———SPLENIS. *An abſceſs of the Spleen.* This viſcus is rarely affected herewith, but when it is, and the ſuppuration is completed, for the moſt part it is eaſily perceived by the preſſure of a finger; when this tumor is ready to break, the nauſea and anxiety are very great. Sometimes, indeed, an *abſceſs* is formed on this part, and eſcapes all obſervation, on account of its exciting no uneaſy ſymptoms. Lommius ſays, in his Medical Obſervations, that an *abſceſs* in the ſpleen is attended with nearly the ſame ſigns as the ſame complaint in the liver: and Aretæus obſerves, that a dropſical kind of ſwelling attends the patient, his ſkin is of a blackiſh and greeniſh colour, he is reſtleſs, breathes with difficulty, his belly is tumid with vapours, and there is a ſort of a cough, by which little is diſcharged. When this kind of *abſceſs* burſts, there is no pure digeſted pus but an aſh-coloured, or a brown or livid matter; and if it is deep, a blackiſh ſort of humour, with ſome of the juice of the tabid ſpleen, is evacuated. If the fæces are watery, and become more ſo, the diſorder ends well; but if the ulcer continues long, a loſs of appetite comes on with a general bad habit of body, livid-coloured and foul ulcers break out, particularly on the legs, and in ſhort a ſtop is put to affliction only by death's approach. Endeavours to prevent ſuppuration ſhould not be neglected as ſoon as the complaint is perceived; if thoſe fail, cataplaſms of the briony root are preferred as the moſt effectual digeſtive. See Oribaſ. de Morb. Curat. lib. iii. cap. 43. Paulus Ægineta, lib. iv. cap. 18. 43.———TEMPORALIS MUSCULI. *An abſceſs of the temporal Muſcle.* The violent pain occaſioned by an inflammation and ſuppuration in this part, is from the tendinous ſheath which covers it, by which the matter is ſo confined, that it can only eſcape downwards under the zygomatic proceſs, and ſo points into the mouth on the outſide of the dentes molares, where, when it hath advanced, it may be aſſiſted by a puncture to diſcharge itſelf. Dr. Hunter obſerves, that when the pain hath been violent, and the fever excited thereby conſiderable, he hath with advantage made an inciſion along the muſcles; and he adviſes, when an inflammation is conſiderable, that we open the part without delay, for we never can perceive any fluctuation there, as the faſcia is ſo tight. See Kirkland's Medical Surgery, ii. 133. 44.———TESTIUM. *Abſceſs of the Teſticles.* See HERNIA HUMORALIS. 45.———TONSILLARUM. *An abſceſs of the Tonſils.* *Abſceſſes* here endanger ſuffocation. In the beginning endeavour to obtain a cure by bleeding, purging, or bliſtering between the ſhoulders, and ſuch other means as the caſe may require, or diſcretion admit; but if, as ſometimes happens, all means failing, a ſuppuration ſhould take place, an inciſion or two may be made with a lancet into the body of tumor. Thus, by diſcharging ſome of the blood and humors before they are formed into pus, the dangerous degree of ſwelling is prevented. It is never prudent to leave the matter till it is formed into perfect pus, but, at the lateſt, the puncture ſhould be made as ſoon as the appearance of digeſted matter can be perceived. It happens ſometimes, that when the patient is on the point of ſuffocation, a ſudden ſpontaneous diſcharge gives inſtant relief; as ſoon as the tonſils have emptied themſelves, they contract, and by the aſſiſtance of a gargle, made with the decoct. cort. ulmi & mel roſæ, a cure is completed in a few days. 46.———UTERI. *An abſceſs in the Womb.* When an inflammation here begins to ſuppurate, bladders of warm water ſhould be applied over the part moſt aggrieved; frequent inceſſions are alſo to be adviſed. Oribaſius obſerves, that theſe *abſceſſes* ſometimes diſcharge themſelves into the cavity of the uterus, at others into the inteſtinum rectum, or into the bladder. Foreſtus ſays, that if the diſcharge is into the cavity of the womb, and is whitiſh, the patient may recover; but the ulcer continuing too often is productive of diſcouraging effects. 47.———VESICÆ URINARIÆ. *An abſceſs in the urinary Bladder.* An inflammation in the bladder is ſometimes followed by an *abſceſs.* When this happens, it is known by an exacerbation of the ſymptoms, and a ſenſe of weight in the parts about the perinæum and pubes. In order to the cure, inject emollient fluids, mixed with warm milk, into the bladder, very frequently, to haſten the ſuppuration, and to ſolicit the diſcharge into the cavity thereof. If the pus is not evacuated in due time, it acquires an acrimony, and corrodes the adjacent parts, produces fiſtulas, and other inconveniences. If the injections fail, there is no reſource but that of an operation, which, though rarely required, two examples are recorded in Bonet Sepulch. lib. iii.

Obſerve, when enquiry is made concerning an *abſceſs* of any particular part, the reader will do well if he turns alſo to what is ſaid on an inflammation and ulcer of the ſame. Authors to be conſulted on *abſceſſes* are Hippocrates, Aretæus, Celſus, Paulus Ægineta, Oribaſius, Aetius, Actuarius, Hildanus, &c. and among thoſe of later date, Boerhaave, Wiſeman, Turner, Heiſter, Sharp, Deaſe, and Bell.

ABSCISSIO, an ABSCISSION, or cutting off any thing, or a part of it. From *ab* and *ſcindo, to cut*; called alſo APOCOPE.

This word is uſed in many ſenſes, but moſtly to expreſs the cutting away an unſound part, and that a ſoft one; for the cutting away of bones is called amputation; though when ſmall fragments only are to be ſeparated, the word *abſciſſio* is ſometimes uſed. This word alſo expreſſes the ſudden termination of a diſeaſe in death, before it arrives at its decline. Celſus, to expreſs a loſs of voice, frequently ſays *abſciſſa vox.*

ABSINTHIUM. WORMWOOD.

Ἀψίνθιον, *unpleaſant.* Authors vary much in their account of the etymology of this word. However, the Engliſh name is originally an Anglo-Saxon one. It is one amongſt the moſt famous of the bitter plants, ſays Dr. Cullen, and has been uſed with much commendation for every purpoſe of bitters; the leaves of the *abſinthium* vulgare are the beſt.

Botaniſts enumerate no leſs than thirty-two different ſpecies.

The ſorts in uſe are as follow:

1. ABSINTHIUM VULGARE, called alſo *abſinthium* latifolium,

latifolium, *abſinthium* Ponticum ſeu Romanum officinarum *Batkypicron*, *Borypicron*. It is the ARTEMISIA ABSINTHIUM VULGARIS, foliis compoſitis multifidis, floribus ſubglobоſis pendulis, receptaculo pappoſo of Linnæus, who calls it artemiſia *abſinthium*. Cl. Syngeneſia. Ord. Polygamia ſuperflua. Linn. G. plant. 945. Mat. Med. 386.

Common wormwood.

Wormwood is a perennial plant, with hoary divided leaves, firm woody ſtalks, which die in winter, ſmall yellow diſcous flowers, hanging downwards along the ſides of the ſtalks and branches. It hath alſo thick woody roots.

The common ſort grows in lanes and waſte places, hath large leaves, divided into ſeveral deeply indented ſegments, of a whitiſh green colour above, and whiter underneath, they are broader than thoſe of any other ſpecies; it flowers in June and July. When the ſeeds are ripened, it dies almoſt totally, except a little tuft, which endures the winter.

2. Absinthium Romanum, called alſo *abſinthium* tenuifolium, *abſinthium* Ponticum, *abſinthium* minus. It is the ARTEMISIA ABSINTHIUM PONTICA tenuifolia, foliis multipartitis ſubtus tomentoſis, floribus ſubrotundis nutantibus receptaculo nudo of Linnæus. Of the ſame claſs and order as the former.

Roman wormwood.

It hath numerous and finely divided dark-coloured leaves, hoary only underneath, the ſtalks are purpliſh, and all its parts are ſmaller than thoſe of the other ſpecies. It is a native of Italy, ſome ſay of Hungary and Thrace; but as hardy and as eaſily raiſed as the other ſpecies; the roots ſoon ſpread, and ſend up new ſtalks in abundance.

3. Absinthium Maritimum, called alſo *abſinthium* ſeriphium, *abſinthium* marinum Anglicum. It is the ARTEMISIA MARITIMA, foliis multipartitis tomentoſis Racemis cernuis floſculis femineis ternis of Linnæus. Of the ſame claſs and order as the former.

Sea Wormwood.

This is alſo called Roman wormwood, but very improperly. Its leaves are finely divided, and hoary all over; it grows in our ſalt marſhes, and on the ſea coaſts. It is a ſtrong bitter, and was formerly much uſed in medicated ales, and wines, as a ſtomachic and corroborant.

All the ſpecies have nearly the ſame properties. The *abſinthium maritim.* is leſs unpleaſant than the *abſinthium vulg.* even its eſſential oil is more agreeable than the oil diſtilled from the other. This ſpecies is not ſo antiſeptic as the common ſort, but it is a better ſtomachic; and in this it differs but little from the Roman. The *abſinthium Romanum* is leſs diſagreeable than either the common or the ſea wormwoods, and is the moſt eligible of the three as a ſtomachic and corroborant; it agrees with the abrotanum fæmin. and with the flor. cham. better than with the *abſinthium* com. being not ſo ſtimulating; the *abſinthium maritimum* is often ſubſtituted for it.

The common wormwood hath a ſtrong ſmell, and is intenſely bitter to the taſte. Theſe qualities are moſt remarkable in the leaves, which loſe part of their ill ſmell by drying. The flowers are nearly as bitter as the leaves, but leſs naufeous; the roots are warm and aromatic, without the bitterneſs of the other parts of the plant.

The whole plant powerfully reſiſts putrefaction, hence it is a principal ingredient in antiſeptic fomentations. It is uſeful in all cold phlegmatic diſorders, and where there is a defect of bile; it is a warm ſtomachic; its extract, made with water, is a very agreeable and ſimple bitter, and is the beſt way of giving this medicine. Taken in vinegar, it removes the oppreſſion occaſioned by eating muſhrooms, and is an antidote againſt the poiſon of the white chamæleon, and of hemlock.

It is hurtful when the fibres are too tenſe: in ſuch conſtitutions a frequent uſe of it in wines, &c. produces a general waſting; the ſight is particularly injured by it.

This herb gives out all its virtues by maceration, either to water, or to ſpirit; but the watery infuſion without heat is the moſt grateful. Bergius conſiders this as an antiputreſcent, antacid, anthelmintic, reſolvent, tonic, and ſtomachic. It is alſo conſidered to produce good effects in a great variety of diſeaſes; in intermittent fevers, hypochondriaſis, obſtructions of the liver and ſpleen, gout, calculi, dropſy, worms, &c. and probably from its tonic power, and being grateful to the ſtomach, on which two accounts, it is now chiefly uſed. There is a queſtion whether it is imbued with any narcotic power? Dr. Cullen is ready to admit the general doctrine of ſuch a power, from ſeveral conſiderations; particularly from the Hiſtory of the Portland Powder, that there is in every bitter, when largely employed, a power of deſtroying the ſenſibility and irritability of the nervous power.

The preparations from wormwood, now in uſe, are not ſo numerous as formerly; the principal of them are as follow.

Tinctura Absinthii. Ph. Ed.

Take the flowering tops of wormwood, properly dried, ℥ iv. rectified ſpirits of wine ℔ ii. marcerate for two days, then preſs out the ſpirit, and pour it upon two ounces of wormwood; macerate for four days, then filter it through paper. Dr. Cullen thinks this a light and agreeable bitter.

Extractum Absinthii.

Boil the dried leaves of wormwood in water, ſupplying freſh water as required, until the herb hath given out all its virtues, ſtrain the liquor through flannel, and evaporate it with a gentle heat to a due conſiſtence for making into ſoft pills.

This extract hath all the bitter of the herb, without its ill flavour; the water carries off in evaporating all the oil, in which the offenſive flavour reſides; whence to ſave both trouble and expence, the liquor which remains after diſtilling the eſſential oil may be ſaved, to obtain the extract from, care being taken not to have uſed a dirty ſtill, nor let the liquor remain in it long before it is taken out for the intended evaporation.

An extract made with ſpirit, hath all the flavour as well as the bitter: but is now thrown out of the London Pharmacopœia of 1788.

Oleum Essent. Absinth.

Freſh wormwood leaves moderately dried, when diſtilled with water, give out their whole taſte and odour thereto: and with the water ariſes their eſſential oil, in which reſides their naufeous taſte and flavour, but none of their bitterneſs.

In ſome ſeaſons ℔ x. of this herb yields ℥ ij. or more of its oil, in others ℔ xx. will hardly yield ℥ j. In rainy ſeaſons, and in moiſt ſoils, it affords its oil in the greateſt quantities. In drier ſeaſons the oil is more reſinous, and of a green colour.

This oil is extolled by Hoffman as an antiſpaſmodic and anodyne. From one to three drops it is given as an antiſpaſmodic, or he diſſolves ʒ j. in ℥ j. of the ſp. vini. R. and directs ſix or ten drops for a dole in any convenient vehicle. Boerhaave commends it in tertian fevers, thus, R Ol. abſ. gt. vij. fac. alb. ʒ j. bene triturat. & adde ſal tartari ʒ ij. aq. abſ. ℥ vij. m. Of this mixture he orders the patient to take ℥ ij. two hours before the fit approaches, and to repeat the ſame quantity every quarter of an hour, until the two hours are expired; but before beginning with this medicine, the feet ſhould be bathed in warm water. He alſo orders this oil to be made up with the crumb of bread into pills, which are to be given two hours before each meal, to deſtroy worms. It has alſo, for the ſame purpoſe, been mixed up with a moderate portion of ſweet oil, and rubbed into the belly.

The oil of the *abſinthium* maritim. is more agreeable than that of the *abſinthium* vul. and it poſſeſſes all the virtues of the plant: this is alſo thrown out of the London Pharmacopœia of 1788.

Conserva Abs. Maritim.

Take the tender tops of the ſea wormwood, and pick from them all the harder part of the ſtalks; then beat them into a conſerve with tripple their weight of lump-ſugar.

This conſerve ſhould be made freſh every year; alone it is an uſeful medicine in ſome caſes where the herb is indicated, and deſerves a place in the ſhops as well as any of the tribe. It is a mild bitter, and ſtrengthener of the ſtomach.

Sal Absinth. Salt of Wormwood.

It is made by burning the dried herb to aſhes, as in making other fixt alkaline ſalts. See the article Alcali.

The kali preparatum is now uſed for the ſal *abſinthii*, no formula being inſerted in the London Pharmacopœia of 1788, for this preparation. And indeed no ſenſible

 difference

difference is manifeſted by their indiſcriminate uſe in practice.

ABSINTH SANTON. INDIC. See SANTONICUM.

ABSORBENTIA MEDICAMINA. ABSORBENTS; from *abſorbeo, to drink up.* All medicines which have the power of drying up redundant humours, either internally or externally, are thus denominated, or dry bodies ſuited to ſuck liquids into their pores; in this general ſenſe the term uſed to be applied, but now very ſeldom; it is almoſt ſtrictly confined to certain earths ſuited to take acids into their pores, and at the ſame time deſtroy their acid quality, ſuch as crabs eyes, coral, burnt hartſhorn, &c. which will be enumerated more copiouſly under Antacida. Abſorbents may in ſome caſes be conſidered as demulcents, and participate of other different properties, according to the materials which they abſorb, or with which they are reſiſted.

The fixed alcaline ſalts, beſides their *abſorbent* virtue, being joined with acids, incide and diſſolve viſcid and tough humours, and by a gentle ſtimulus either move the belly, promote urine, or become diſaphoretic.

Iron, coral, bole, chalk, &c. have a degree of aſtringency.

Abſorbents are not convenient where a viſcid colluvies abounds in the ſtomach, as is often the caſe in burning, bilious, and hectic fevers; but are very proper to prepare the body for evacuations when acidities abound in the firſt paſſages.

If the intention is to *abſorb*, conſtringe, and ſtrengthen at the ſame time, *chalk*, *coral*, *oyſter* or *egg-ſhells*, are eſteemed the moſt efficacious abſorbents; if to reſtrain a ſeminal flux, ſome prefer the *cuttle-bone*; if to looſen the belly, *magneſia*; if to provoke urine, *crabs-eyes*; if to promote perſpiration, *burnt hartſhorn*, if to diſſolve coagulated blood, *crab-eyes diſſolved in vinegar.*

ABSORBENTIA VASA, ABSORBENT VESSELS. Theſe are veſſels which take up any fluid from the ſurface of the body, or any cavity in the human machine, and carry it into the blood, and are denominated according to the liquids they convey. LACTEALS and LYMPHATICS, the former conveying the chyle, a milky liquid from the inteſtines, the latter lymph, or a thin pellucid liquor, from the places, from whence they take their origin; or any fluids that are extravaſated, and convey them into the circulating blood; ſome conſider ſmall venal ramifications, as the abſorbent ſyſtem. See LACTEA *Vaſa*, and LYMPHÆ *Ductus*. The following kinds of abſorption take place in our bodies, viz. the nutritious is abſorbed from the inteſtines, by the lacteals, which are the ſame *abſorbents* as are every where elſe; ſecondly, by bibulous orifices over the exterual parts of our bodies; thirdly, by the ſame kind on the internal ſurfaces of all cavities, as is evident from an aſcites going off from this abſorption ſometimes. Dr. Hunter ſays, that abſorption is ſolely the office of the lymphatics.

As to abſorption through the ſkin, let it be conſidered that the uſe of baths, fomentations, &c. are in a great meaſure founded thereon, and alſo that they demonſtrate how great a quantity of fluid may be received into the body this way. After rubbing the hand well, it hath, in a quarter of an hour, imbibed an ounce and a half of warm water; at the ſame rate then the whole body would have received ſix or ſeven pounds. And, as Dr. Hunter hath obſerved, this matter is demonſtrated beyond a doubt by the following experiment made on a living dog; an opening was made into the cavity of his belly, and three quarts of warm water were injected therein and ſecured; in about ſix hours after he was examined, and not above four ounces of the water was remaining there. But this power of abſorption has been obſerved by Dr. MONRO, ſenior, of Edinburgh, to leſſen with our ſtrength.

Farther ſatisfaction on this ſubject may be received from what is ſaid on the power of the external abſorption of the human body by Dr. Wilkinſon, in the Medical Muſeum, vol. ii. p. 117, &c. And with reſpect to abſorption in the internal parts, ſee Dr. Hunter's Medical Commentaries; alſo obſervations thereon by Dr. Garner, in the Med. Muſ. vol. ii. p. 229, &c.

ABSORPTIO, ABSORPTION. See the different kinds under ABSORBENTIA VASA.

ABSTERGENTIA, from *abſtergeo, to wipe off*, ABSTERGENTS or CLEANSING MEDICINES. Medicines, which not only by their fluidity waſh off adhering matters, but ſuch alſo, as are ſuppoſed to do it by their power of reſolving, and looſening the coheſion of the adhering matters; hence were they conſidered of a ſaponaceous nature, capable of diſſolving concretions formed of earth and oil, &c which water, ſimply as an abluent, cannot effect. Dr. Cullen, thinks their terms too general, and ought not to be employed, becauſe this power of reſolving viſcid ſubſtances, when uſed with reſpect to the internal parts, has generally been upon a falſe ſuppoſition. They are alſo called DETERGENTIA.

ABSTERSIVUS, Abſterſive, cleanſing, wiping away; of the ſame import with *Deterſorius.*

ABSTINENTIA, ABSTINENCE. This, when duly regulated, is moſt uſeful to the ſedentary, as a preventive of diſeaſes.

ABSTRACTITIUS, vel ABSTRACTIVUS, ABSTRACTITIOUS. Thus the native ſpirits of aromatic vegetables are called, to diſtinguiſh them from ſpirits produced by fermentation, and takes place in thoſe plants which abound with much volatile ſalt, as abſtractitious ſpirit of ſcurvy graſs, is better than that prepared by fermentation.

ABSUS. The EGYPTIAN LOTUS. See Raii Hiſt.

ABUTILON, an Arabic name for the YELLOW MALLOW. See ALTHÆA THEOPHRASTI, &c.

ABVACUATIO. See ABEVACUATIO.

ABVOLATIO, ABVOLATION, flying away.

ABYSSUS, ABYSS, *a priv.* and *βυσσος* vel *βυθος*, *Gurges profundus, a deep whirlpool or gulph.* It was a myſtic term of the followers of PARACELSUS. In chemical language, this word ſignifies a receptacle for the ſeminal matter, hollow, ſolid, for the moſt part moiſt, becauſe the ſeeds are ſpiritual and moiſt, from which all things are formed. Others uſe the word for the firſt matter of which all things are formed.

ACACIA, from *ακαζω, to ſharpen.* The EGYPTIAN THORN, or BINDING BEAN-TREE.

Several ſpecies are enumerated by botaniſts, but the two ſorts uſed in medicine are,

1. *Acacia* Vera, called by Caſpar Bauhine *acacia* foliis ſcorpioidis leguminoſæ; and by others, *acacia vera Egyptiaca; ſpina Egyptiaca.* It is the *mimoſa nilotica*, or MIMOSA EGYPTIACA, ſpinis ſtipularibus patentibus, fol. bipinnatis partialibus extimis glandula interſtinctis flore luteo, ſpicis globoſis pedunculatis of Linnæus. Cl. POLYGAMIA. ORD. MONÆCIA. Lin. Gen. Pl. 1158.

The TRUE ACACIA, or EGYPTIAN THORN, produces the true *gum arabic.* See GUMMI ARABICUM. It is remarkable that the leaves and flowers of the black thorns are purgative, though the juice from the other parts is binding.

The *acacia* uſed in medicine and brought from Egypt, is a mild, ſubaſtringent, gummy ſubſtance; we receive it in roundiſh pieces, wrapped up in bladders; it is of a blackiſh brown colour outwardly, but of a tan colour inwardly; of a hardiſh conſiſtence, but not quite dry. Lemery ſays, that "it is made, by expreſſion, out of the fruit of the Egyptian thorn, and *that* either ripe or unripe: from the ripe fruit there is a black juice, from the unripe a red or yellowiſh one, and of a ſweet ſcent: and that this laſt is what is intended by Dioſcorides." It hath no ſmell; applied to the tongue it ſoon ſoftens, is of a moderately rough but an agreeable taſte, which is followed by a ſweetiſhneſs: it totally diſſolves in water, ſo if any part is unaffected thereby, *that* is a fraudulent addition; rectified ſpirit diſſolves but very little of it, and in this it differs from moſt of the vegetable aſtringents, for they generally give out their virtue to ſpirit of wine as well as to water.

2. ACACIA GERMANICA, called alſo *Prunus Sylveſtris.* It is the PRUNUS SPINOSA; or PRUNUS SYLVESTRIS SPINOSA, foliis lanceolatis pedunculis ſolitariis of LINNÆUS. GERMAN ACACIA, or the GERMAN BLACK-THORN, or SLOE-TREE.

The German *acacia* is the inſpiſſated juice of the German wild ſloes; it is of the ſame nature as the true ſort: but in England, the inſpiſſated juice of unripe ſloes of our own growth is the general ſubſtitute; it is harder, heavier, darker coloured, being almoſt black, and ſharper taſted than the true ſort.

Succus Prunorum Sylveſt. ſive Acacia Germanica.

Over a very gentle fire inſpiſſate the juice of unripe ſloes.

The doſe is form ℈ j. to ʒ j. See PRUNUS SYLVESTRIS.

ACACIA ALTERA TRIFOLIA, ſee CYTISUS SPINOSUS; for that called *glorioſa*, ſee BONDUCH INDORUM;

RUM;—*acacia gummi*, see ARABICUM GUMMI;—*Indicana*, see TAMARINDUS;—*Malabarica globosa*, see INSIA;—*orbis Americani*, see POINCIANA;—*Zeylanica*, see CAMPECHENSE LIGNUM.

ACACIA FERREA, an iron spoon.

ACACOS, from α negative, and κακος, *bad*. It is applied to distempers that are more troublesome than dangerous: also to the *aphthæ* of children.

ACAHI, ALUM WATER.

ACAID. See ACETUM.

ACAJA, also called *prunus Brasilienſis*. It is a large tree growing in Brasil. It produces clusters of yellowish white flowers, which are followed by yellow plums, with a large stone in them. The leaves are acid and astringent, and are an agreeable sauce with meat; the wood is light as cork, and of a red colour; the buds and tops are used as pickles. Raii Hist.

ACAJAIBA, or ACAIAIBA. It is also called *pomifera & pruniferа Indica, anacardium, cajum, cassu, catee, cajou, cajous, acajou, and kapa mata*. It is the anacardium pruniferum Indicum, nuce reniformi of Linnæus. CL. DECANDRIA, ORD. MONOGYNIA. Gen. Plan. Linn. 520.

The CAJOU or CASSU-TREE.

There is but one species yet known, and this is the ACAJOU, or CASHEW NUT, so common in America, and in the West Indian islands. It produces its fruit in August and September, except in Brasil, where it is a native, and there it flowers in these months, and bears its fruit in December, which, when roasted, is as agreeable as an almond. If you bite the whole fruit when raw, it excoriates the mouth; therefore it must first be cut open, dipped in water, and sprinkled with salt.

The acrid oil in the shell destroys tetters, ring-worms, chiques, &c. The painters use it to make their black colouring durable.

The tree when wounded yields a gum, which resembles the gum arabic. Raii Hist.

ACAJOU. See ACAJAIBA.

ACALAI. See SAL.

ACALCUM. See STANNUM.

ACALEPHE, ακαλεφη, a NETTLE, from α, negative, καλη, *agreeable*, and αφη, a *touch*, because the touch, as it hurts, is not agreeable. See URTICA.

There is also a fish and sea-fowl thus named.

ACANOR, a chemical furnace.

ACANTHA, from ακη, *a point*, ακανθα, any sort of thorn; any thing prickly, or with sharp points; also the shin, or spine of the tibia; and sometimes the spina dorsi.

ACANTHABOLUS, from ακανθα, *a thorn*, and βαλλω, *to cast*, or *cast out*. It is an instrument described by Paulus Ægineta, for taking out thorns, or other such like things, when stuck into the flesh.

ACANTHACEUS ACANTHACEOUS, a botanic term applied to the plants of the thistle kind, which are prickly.

ACANTHALRUCA. See ECHINOPUS.

ACANTHICE, ακανθικη μαστιχη, supposed to be the product of the carline thistle.

ACANTHINA MASTICHE. See CARDUUS PINEA.

ACANTHINUM (gum.) See GUM ARABIC.

ACANTHION, the HEDGE-HOG. See ECHINUS.

ACANTHUS, from ακανθα, *a thorn*. It is also called branca ursina, *acanthus* sativus vel mollis Virgilii; ACANTHUS Mollis Sativus, foliis sinuatis inermibus, Linnæi. Mat. Med. 318, *carduus acanthus*, marmolaria. CLA. DIDYNAMIA, ORD. ANGIOSPERMIA. Linn. Gen. Pl. 793.

BEAR'S BREECH, or BRANK URSINE.

Miller mentions five species. It is a native of the southern parts of Europe, cultivated in our gardens, flowers in June and July, and is perennial.

The roots are very mucilaginous, and the leaves are so in a lesser degree. This mucilage is insipid, softening, and a good substitute for the marsh-mallow. It is not used in practice in this country, but where it is common it is applied to the same purpose, as marsh mallows, and other mucilaginous vegetables, are with us.

The herb-women too often sell the leaves of helleboraster, or bear's foot, or sphondylium, or cow's parsnep, for the bear's breech.

ACAPATLI. See PIPER LONGUM.

ACAPNON. See ORIGANUM, ANGLICUM.

ACARUS, a small insect which is said to breed in wax; also an insect in the skin like a louse. Vide PHTHIRIASIS.

ACARON. See MYRTUS BRABANTICA.

ACARTUM. See PLUMBUM, N° 4.

ACATALIS. See JUNIPERUM.

ACATAPOSIS. See DEGLUTITIO.

ACATHARSIA, from α, *non*, and καθαιρω, *to purge*. That impurity in a diseased body which is not yet purged off.

ACAULIS, } of α, negative, and καυλος, *caulis*, *a*
ACAULOS, } *stalk* or *stem*, without stem or stalk. A plant is said to be *acaulis*, whose flower rests on the ground, as in the carline thistle.

And Casper Bauhine calls the carline thistle, *acaulos magno flore*.

ACAZDIR. See STANNUM.

ACACTEM, or ACCATUM. See ÆSECAVUM.

ACCELERATORES URINÆ. Called also urinæ stimulatores. They hasten the ejection of the urine.

The *accelerator urinæ* arises fleshy from the sphincter ani, and superior part of the urethra, and tendinous from the ischium. It is inserted into the corpus cavernosum, from near their beginning to a little below their union. Douglas.

Dr. Hunter observes, that the *acceleratores urinæ* are fixed to, and surround the bulbous part of the urethra, meeting in a middle line or tendon, at its external posterior part. They are blended at the end of the bulbous part of the urethra, with the other muscles of the part; when these muscles are put into action, they contract upon the urethra, thereby making it narrower and expelling the last drops of urine. The semen also meets with a fresh propulsion from these muscles contracting upon it, when it is in the bulbous part of the urethra, which it is, and no farther, in the first conatus, and by being in this large cavity, would get no farther, was it not for their action; so that they are truly *accelerators* of the semen as well as of the urine; and this seems the chief reason of the bulbous part of the urethra, or its being larger in one part than another, that the semen and urine might meet with a reservoir in their passage, which had a fresh contracting force or power, to forward their expulsion.

ACCESSIO, ACCESSION. The beginning of the paroxysm of an intermittent fever, &c.

ACCESSORII, Nervorum octavum Par.

ACCESSORIUS. The name which Willis hath given to some branches from the eighth pair of nerves. They arise by several filaments from both sides of the medulla spinalis of the neck. Having advanced to the first vertebra, each is fixed to the back side of the ganglion of the nervus suboccipitalis, or tenth pair; then again run upwards into the cranium by the great occipital hole, communicate with the ninth and tenth, return out of the cranium, and in their passage join the eighth pair; afterwards turning backward, and perforating the musculus sterno-mastoideus, it terminates in the trapezius, having first sent some branches to the rhomboides.

ACCESSORIUS (*musculus*), Vide FLEXOR DIGITORUM ACCESSORIUS, and LONGUS PEDIS.

ACCESSORIUS-SACRO-LUMBARIS, vel LUMBALIS. See SACRO LUMBARIS (*Accessorius.*)

ACCIB. See PLUMBUM.

ACCIDENS. See SYMPTOMA.

ACCIPITRINA. See HIERACIUM, and SOPHIA.

ACCLIVIS. See OBLIQUUS ASCENDENS ABDOMINIS.

ACCRETIO, from *ad*, and *creſco*, *to grow to*; ACCRETION, GROWTH, and NUTRITION: also a growing together, as the fingers to one another. See NUTRICATIO.

ACCUMULATIO, an ACCUMULATION, or HEAPING TOGETHER.

ACCUSATIO, vide INDICATIO.

ACEPHALOS, from α negative, and κεφαλη, *a head*. This word is applied to monsters born without heads.

ACER, from *acris*, because of the hardness of its wood. The MAPLE TREE.

The great maple tree, falsly called SYCAMORE, is the pseudo platanus, or *acer* folii quinquelobis in æqualiter serratis, floribus racemosis of Linnæus of the CLASS POLYGAMIA, and ORDER MONOECIA. Linn. Gen. Plant. 1155. It is also called *platanus tragi*, the great maple tree.

Nine species of *acer* are enumerated by botanists.

The maple is a large tree, common enough in England, but a native of Austria and Switzerland.

It is not much in use as a medicine, though its juice, if drank whilst fresh, is said to be a good antiscorbutic. All its parts contain a saccharine fluid; and if the root, trunk, or branches are wounded in the spring, a large quantity of liquor is discharged, which, when inspissated, yields

yields a brown sort of sugar, and a syrup like the melasses. Large quantities of this sugar is obtained from the trees in New England and Canada, and is much used in France, where it is commonly known by the names of saccharum Canadense, and saccharum acernum, maple sugar.

ACER VIRGINIANUM, odorat. LIQUID AMBER.

ACERBITAS. ACERBITY, SOURNESS.

ACERBUS, Acerb, sour, harsh; or a sourness with astringency; also bitter.

ACERIDES. Ἀκηρίδες, from ἀ, negative, and κηρος, *wax*. Galen calls plasters so, that are made without wax.

ACEROSUS, of *acus*, from ἀχυρον, *chaff*. It is used to signify that brown sort of bread which is made without first separating the bran.

ACESTA, ακεσται, *famor*. Distempers which are curable.

ACESTIDES. The names of the chimnies of the furnaces where brass was made. They were narrow at the top to receive the fumes of the melting metal, and to collect them, that the cadmia might be produced more abundantly. Also the roof of the furnaces in which copper is fused, they are closed so as to detain the corpuscles which fly off.

ACESTIS. See BORAX.

ACESTORIS, ακεστορες, from ακος, *a cure*. It strictly signifies a FEMALE PHYSICIAN, and is used for a MIDWIFE.

ACESTRIDES. Midwives.

ACETABULUM. Κοτυλη, κοτυληδων, ὀξυβαφος, is a large cavity in a bone, to receive the convex head of another, for the advantage of a circular motion. The large cavity in the os coxendix is thus named, which receives the head of the os femoris. This cavity is called the cup from its likeness to an ancient saucer in which vinegar was brought to the table, and thence named acetabula, from *acetum*, *vinegar*, and *tabula*, *a table*. This derivation seems very probable, as ὀξυβαφος, which is the same measure as the ancients called *acetabulum*, seems to be derived from ὀξος, *vinegar*. The *acetabulum*, which receives the head of the thigh-bone, called also *cotyle*, is formed by the juncture of the os ilium, ischium, and os pubis; the edge of this cavity is called supercilium, and is very prominent on the upper part; the cavity is deeper on the upper and back part than on the lower and fore part. In the natural state, this cavity is increased by an additional elastic circle, which is united to its edge; it yields easily both ways to any pressure, but recovers itself when the force is removed.

Acetabulum also signifies a sort of glandular substance found in the placenta of some animals. See COTYLEDONES.

The ancient measure thus named, was about the one-eighth of a pint.

Acetabulum, see CRASSULA and COTYLEDONES.

ACETABULUM MAR. MIN. See ANDROSACE.

ACETAR, a sallad of raw herbs, to be eaten with vinegar.

ACETARIUM SCORBUTICUM. A kind of pickle in which Dr. Bates advises scorbutic patients to dip their victuals before they eat it. It is thus made: ℞ Fol. cochlear. marin. ℥ iij. sacchar alb. ℥ vj. sal cochlear. ℥ i. bene contund. simul. & adde succ. aurant. ℥ vj.

ACETOSA, or ACETOSUS, eager or sour; in English it is called SORREL, from the Saxon word, which signifies sour.

Miller hath reckoned up about eighteen different species, of which the following are sometimes used in medicine.

1. *Acetosa* vulgaris, called also *acetosa* pratensis, *acetosa* arvensis. It is the RUMEX ACETOSUS of Linnæus, i. e. rumex pratensis, foliis oblongis sagittatis, floribus dioicis of Linnæus, of the CLASS HEXANDRIA. ORD. TRIGYNIA. Gen. Plant. 451.

COMMON SORREL.

It is the *oxylapathum*, called SOUR DOCK, whose leaves are sour, but not the root, which is bitter. It grows in the meadows and common fields.

2. *Acetosa* Romana, called also *acetosa* rotundi folia hortensis. It is the rumex scutatus, or rumex Helveticus, foliis cordato hastatis, ramis divergentibus, floribus hermaphroditis of Linnæus.

The ROMAN, FRENCH, ROUND-LEAVED, or GARDEN SORREL.

It is common in our gardens, and in many places it is known by the name of GREEN SAUCE.

3. Acetosella, called also trifolium acetosum vulgare oxytriphyllum, panis cuculi, alleluja, lujula oxys. It is the OXALIS ACETOSELLA; or oxalis foliis ternatis, scapo unifloro, flore albo, capsulis pentagonis clasticis, radice squamoto articulata of Linnæus. Of the CLASS DECANDRIA. ORD. PENTAGYNIA. Gen. Plant. 582.

WOOD SORREL.

It grows wild in the woods, and flowers in April. The leaves are shaped like a heart, standing three together on one stalk.

All the sorrels lose much by drying. They are all mildly acid, without any particular smell or flavour; the common is the least, the wood the most agreeable; they cool, quench thirst, are antiputrescent, anticorbutic, and diuretic.

The seeds are slightly astringent, but neither sour nor bitter.

If the leaves are bruised, they afford a large portion of a green juice with very little pressure. If this juice is permitted to subside, a clear reddish fluid soon appears, which if poured from the fæces, is one of the most agreeable preparations from these herbs. It may be mixed with whey, and is then a most acceptable and useful drink in fevers of all kinds. A decoction of the whole plant is a very agreeable substitute for wine, when wine is coveted by a patient to whom we cannot prudently allow it. The leaves are as powerful suppurants as the roots of white lilies. If the leaves of any of the sorrels are boiled in milk, an agreeable whey is soon separated, which is inferior to none for its palatableness. It is chiefly used to quench thirst, and to allay heat; also esteemed an anticorbutic and diuretic.

A great part of the acid of sorrel may be obtained in the form of a concrete salt, which is more acid than that of tartar, more easily soluble in water, and less, if at all, purgative; the wood sorrel yields near one-hundredth part of the weight of the fresh leaves. As the usual method of obtaining essential salts from vegetables by depuration and evaporating their juices, then setting them to crystallize, is extremely tedious, the following processes are given as being more expeditious.

Spiessius orders the respective plant to be taken and gently dried in the shade, then, being cut small, to pour on it a proper quantity of the sp. vini R. to digest them in a gentle heat till there is a tincture of a deepish green colour; then pouring this tincture into a glass cucurbit, distil with the heat of a water-bath, until so much spirit is raised, as to leave the remainder as thick as honey; then suffering it to rest until it is perfectly cold, crystals of a pyramidal shape will be found on the sides of the vessel. See Miscel. Berol. continuat. ii. p. 91, 92.

Stahl advises us to cut the herb small, after gently drying it, and make a strong tincture with sp. vini R. then pouring off this tincture, add to the residuum a fresh portion of the sp. vini R. and digest as before: continue to add more spirit until the herb ceases to tincture it; then gently dry the residuum, and boil it in water to extract all the saline parts; pass this decoction through a filter, and evaporate to a due consistence; after which set it in a cool place to shoot. See Stahlii Fund. Chem. p. 68.

Of these two processes, the first is perhaps best adapted for plants of the sweet, and the second for those of the acid kind; both which sort of plants give out all their virtue with their essential salts, consequently with a small portion of them dissolved in a proper quantity of pure water, we may, as with the oleosaccharа, prepare the waters of those plants, without the trouble or a distillation, and also the waters of those plants which cannot be obtained by the use of a still.

The salt of wood-sorrel may be substituted for the salt or juice of lemons. An essential salt is prepared from this plant, known by the name of Essential Salt of Lemons, and commonly used for taking ink-stains out of linnen. This salt, when genuine, is composed of the vegetable alkali, and a peculiar acid, which seems more allied to the acid of sugar than that of Tartar. However, it is seldom procured pure. What is sold in this country, under this name, appears sometimes to consist of chryst. of Tartar, with the addition of a small portion of vitriolic acid.

Conserv. Lujulæ. Conserve of Wood Sorrel.

Take the fresh leaves of wood sorrel, and beat them into a conserve, with triple their weight of lump sugar.

This preparation keeps well, and of all the conserves this is the most palatable, being agreeably acid, and possessed of a flavour somewhat resembling fine tea.

ACE-

ACETOSA ESURINA. Eſurine ſpirit of vinegar. See ACETUM ESURINUM.

ACETOSELLA. See ACETOSA.

ACETUM. VINEGAR. *Acaid, alcol.* To this HIPPOCRATES applies the terms *Hyſterialges, Hyſteralgia.*

Vegetable liquors, in proportion to the quantity of their ſaccharine parts, ferment into a weaker or ſtronger kind of wine; a ſecond fermentation forms vinegar; to produce which, three cauſes are neceſſary. 1ſt, The exiſtence of mucilaginous matter, or mucilage. 2dly, A degree of heat between 18 and 25 degrees of Reaumur's thermometer; and 3dly, The preſence of Oxygenous Gas. The next change they undergo is the laſt, and that is into a putrid ſtate.

When malt liquor becomes acid, it is called *allicar*, ALLEGAR. It is not ſo proper either for medical uſe, or preſerving pickles, as the wine vinegar is; for it abounds too much with a glutinous matter that is productive of many diſadvantages.

If vinegar is diſtilled with a heat not exceeding that of boiling water, it yields firſt a phlegmatic liquor (which is a vinous ſpirit, and may be uſed as ſuch); then a ſlightly acid one, which is ſucceeded by ſtronger and ſtronger acids, till the matter remaining becomes thick as honey; if now it is urged with a ſtronger fire, an empyreumatic oil aſcends, and a penetrating acid ſpirit, tainted with the ill ſmell and yellow colour of the oil; and at laſt there remains a black coal, which, when burnt into white aſhes, yields a conſiderable proportion of fixt alcaline ſalt.

The ſtronger and more ſpiritous the wine, the ſtronger is the vinegar into which it is converted. Geoffroy ſays, that vinegars made of the German and French wines, ſaturate from one-fortieth to one-twelfth their weight of fixt acaline ſalt.

Vinegar is mixed with the mineral acids by ſome fraudulent dealers, but is thus detected: if a ſaturated ſolution of any calcareous earth, as chalk, made with ſtrong vinegar, be added to ſuch as is ſuſpected of containing the vitriolic acid, no change will enſue if the ſuſpected vinegar was pure; but if it contained only a minute portion of that acid, the mixture will immediately become milky, and on ſtanding a ſhort time depoſits a white ſediment. The diſtilled vinegar ſometimes contains a portion of lead, which is diſcovered by taking a ſmall portion thereof, and adding to it a little of the aqua kali. If on the mixture being made, a cloudineſs appears, or a white powder falls, there is lead diſſolved in it.

The fermentation which changes wine into vinegar, gives the latter ſeveral properties, extremely different from thoſe of the former, e. gr. the firſt diſtillation from vinegar extinguiſheth fire, but the firſt from wine feeds it. Fermented vegetable ſpirit is the only thing that intoxicates; and the ſpirit of vinegar is the antidote to intoxication. The ſame liquor, which is the ſtate of wine, became weaker by boiling, in the ſtate of vinegar becomes ſtronger thereby.

Vinegar diſſolves animal earths, if not very much mixed with gelatinous matter; the earth of alum; the mineral calcareous earths; ſeveral metallic ſubſtances, as zinc, iron, copper, tin, lead, biſmuth, and the regulus of antimony. It diſſolves the vegetable inſpiſſated juices, and extracts the virtues of many plants; but ſometimes its acidity ſpoils their medicinal qualities, though in other inſtances it improves them; as in the intention of uſing the gum ammoniacum, garlic, ſquills, &c. It mingles equally with the blood and its ſerum, and with moſt of the animal fluids, without thickening them; but rather, as Boerhaave obſerves, attenuates and reſolves. Dr. Alſton, of Edinburgh, ſays that, "It is antiſeptic, and poſſeſſes all the virtues of the acids in general; that it is preferable to lemon juice, or any mineral acid; it peculiarly corrects narcotics, as opium, hemlock, henbane, deadly nightſhade, &c. to the ill effects of which it is the antidote." In inflammatory and putrid diſtempers, in many inſtances, its efficacy is truly wonderful: in ardent fevers it is one of the moſt certain antiphlogiſtics and ſudorifics; in putrid diſorders it equally excels as a preſervative and reſtorer. Fainting, lethargic and hyſteric paroxyſms are much relieved by it, if applied to the noſe and mouth; even in many inſtances more than by volatile alkaline ſpirits, or fetid gums. In the ardent biliary fevers, as the miliary, it is a powerful aſſiſtant. It cures ſurfeits from animal food. It is ſaid to cure the bite of a mad dog. The vegetable acid has a peculiar power in reſtoring ſweetneſs to putrid bile. Though all acids can correct the putrid acrimony; but the power of ſweetening belongs to the vegetable alone. Beſides, when a putrid colluvies is lodged in the firſt paſſage, this acid gently tends to ſollicit its diſcharge by ſtool; an advantage not to be hoped for from the mineral tribe.

Externally applied vinegar is a powerful reſolvent and relaxant. When applied to any ſenſible membrane, it acts as an aſtringent; and, more or leſs diluted with water, is an excellent gargle for an inflamed throat, alſo for an injection to moderate the fluor albus. In ſhort, to relate its many good qualities as a medicine might well be the ſubject of a particular treatiſe. See ACIDA.

An imprudent uſe of vinegar is not without conſiderable inconveniences; large and frequent doſes too much coagulate the chyle, and produce not only a leanneſs but an atrophy; when taken to exceſs, to reduce a corpulent habit, tubercles in the lungs and a conſumption has been the conſequence: young children, old people, thoſe whoſe circulation is languid, vital heat defective, and digeſtion weak, ſhould be very ſparing in its uſe.

The doſe, according to the different circumſtances of the caſe requiring it, and the conſtitution of the patient, may be from ʒſs. to ʒiij.

See the Dictionary of Chemiſtry, tranſlated from the French of Mr. Macquer, edit. 2. article VINEGAR. Cullen's Mat. Med. Chaptal's Chemiſtry, vol. iii 268.

ACETUM DISTILLATUM, ſeu Sp. Aceti. DISTILLED VINEGAR.

Diſtil wine vinegar with a gentle heat as long as the drops fall free from an empyreuma.

The firſt pint that is drawn off is a weak vinous ſpirit, and ſhould be taken away, another receiver being placed for the acid. Malt vinegar, however ſtrong, by reaſon of its viſcid quality, is not only improper for diſtilling on account thereof, but alſo becauſe it ſo readily receives an empyreumatic taſte; a circumſtance to which the beſt wine vinegar is ſubject, if more than about two-thirds is drawn over. This given, the quantity of two or three ounces in a day for a continuance of time after bleeding, and purging where neceſſary, has been recommended in maniacal caſes. That called—COLCHICUM AUTUMN. See COLCHICUM.—ESURINUM, Hungry Vinegar. When vinegar is concentrated it creates an appetite, hence this name; called alſo *acetoſa eſurina.*—LYTHARGYRITIS. See PLUMBUM, N° 2.—PROPHYLACTICUM is thus made. ℞ flor. lavend. & roriſm. fol. rutæ, abſinth. ſalviæ, menth. āā m. i. aceti vini cong. i. infund. in B. A. per 8 dies. ℞ hujus tinct. ℔ i. camph. ʒ iij. m. f.—Acetum proph. alſo called the VINEGAR OF THE FOUR THIEVES; for during the plague at Marſeiles, four perſons by the uſe of it, attended many of the ſick unhurt; under the colour of their ſervice, they robbed the ſick and the dead, one of them being apprehended, ſaved himſelf from the gallows by diſcovering this remedy.—SCILLÆ. See SCILLA.

ACHAI. See AQUA ALUMINOSA under ALUMEN.

ACHARISTON, α, non, χαρις gratia. Achariſtus ſignifies *thankleſs.* Aetius and Galen deſcribe ſome compoſitions of ſingular efficacy under this name; becauſe, as they cured quickly, the patient valued them the leſs, and ſo made no returns of their benefits.

ACHICOLUM. The *fornix, tholus,* or *ſudatorium,* SUDATORY of the ancient baths, which was a hot room to ſweat in, called alſo *architholus.*

ACHILLEA. The *achilleas* take their name from *Achilles.* Linnæus uſes the word *achillea* as the generic term for yarrow, milfoil, or ſneezewort. See MILLEFOLIUM; for that called—AGERATUM.—LUTEA, ſee AGERATUM—GALLICA. Mountain ragwort or corn-marigold.—PTARMICA ſee PTARMICA.

ACHILLEION. A name for the ſponge of which tents are made; becauſe Achilles made them of it.

ACHILLES. A large ſort of barley which was uſed in Greece.

ACHILLIS TENDO, ſee TENDO ACHILLIS.

ACHIOTE. The red grains of achiotl made into lozenges.

ACHIOTL: alſo the *bixa orviedi, daburi.* A ſort of *orleana,* growing in New Spain and Braſil. The tincture made of the fruit and uſed in chocolate is thus made: take the grains when ripe, infuſe them in hot water; the ſettling is made into cakes, and is uſed as a paint for the face. The *roucou* which the Indians call achiotl or *urucu,* the DUTCH ORLEANE, and we roucou, is a meal or flour of a ſeed got in the Leeward Iſlands and the iſle

of St. Domingo; these seeds are of a vermilion colour. The roucou is made in these islands as we make starch. Chuse the roucou of the deepest violet colour, and very dry. Its chief use is among the dyers. See ORLEANA.

ACHLYS. A DIMNESS of sight: from ἀχλυς, *darkness* or *cloudiness*. It also signifies a small scar or mark over the pupil, of a light blue colour. It is synonymous with caligo corneæ, or blindness from opacity of the cornea. See Cullen's Nosology. It is the *Leucoma nephelium of* SAUVAGES, and is described a speck of the cornea, somewhat pellucid, which occasions objects to appear as if seen through smoke, or a cloud, and hence are more obscured. By inspection obliquely it is discovered to be different from the opacity of the aqueous humour, accompanying some diseases of the eye. This species often arises from a variolous ophthalmy, or moist one, or whatever can render the cornea opaque; in infants, as their years increase, it often vanishes spontaneously. The juice of pimpernel, either the blue or purple, drop into the eye twice a day for the space of a week; the juice of the common star-thistle, and blue-bottle are useful: sugar-candy powdered is often sufficient. Emetic wine, which is the least hurtful, may with advantage be dropt into the eye. The vapor of aniseed, or fennel-seed water, are of service. See Wallis's Nosologia Methodica Oculorum.

ACHNE. CHAFF or the FROTH OF THE SEA. Hippocrates expresses by it a whitish mucilage observed in the eyes of patients who have fevers: also a white mucus in the fauces thrown up from the lungs. Besides these it signifies LINT. See CARBASUS.

ACHOR. *Lactumen: ahas, acores, cerion; favus.* The *crusta lactea* of authors, and in England the SCALD HEAD. Trallian says, that it is a sore on the outside of the head, full of little perforations, which discharge a humour like ichor, whence its name. He farther says, that the *cerion* resembles an achor; but that the mouths of the perforations are larger, resembling the cells of a honey-comb, whence the name; the matter is also nearly of the consistence of thin honey. When these diseases spread, the serum which oozes out, dries, and forms a scab.

The *achor* differs from the *favus* and *tinea* only in the degree of virulence. It is called favus when the perforations are large; and tinea when they are like those which are made by moths in cloth: but generally by tinea is understood a dry scab on the hairy scalp of children, with thick scales and an offensive smell; when this disorder affects the face it is called crusta lactea, or MILK-SCAB. Mr. Bell, in his Treatise on Ulcers, says, that the tinea capitis & crusta lactea, may both be reduced to the same species of herpes, viz. the *herpes pustulosus*, they being naturally the same, differing only in situation; the tinea is on the hair scalp, and the crusta lactea on the face. Dr. Cullen places this disease under ULCUS; as a synonyme; where also he places the CRUSTA LACTEA, the class locales, and order dialyses. When it happens to children, if in other respects they are healthy, the best treatment, besides keeping the belly moderately lax, is cleanliness and a moderate diet; an issue may be made and continued till the disorder is cleared and the strength of the constitution is established; keep the hair short and wash the head with soap suds. Some instances of this sort are very difficult of cure, and attended with violent itching, a pale countenance, &c. but still the same method generally succeeds in all the species and degrees of virulence. Small doses of calomel may be given as an alterative rather than as a laxative, and the vin. antim. in such doses, at proper intervals, as the stomach will easily retain.

Externally the unguent e pice may be used two or three times in a week, or cream mixed with chalk in fine powder.

If the humour is repelled give warm sudorifics until it returns. Scabby eruptions on children should not be repelled when about the mouth, ears, or indeed on any part of the body. Though these eruptions depend not on the habit, but the difficulty of passing through the skin, yet cold bathing should not be used. Cleanliness and a frequent use of the warm bath are of great service. The practice of tearing up the roots of the hair is useless, therefore cruel. Keep the hair short and wash the part with aq. pur. ℔ i. in qua solut. est gr. x. hydrargyri muriati.

Among the ancients, Aetius, Ægineta, Trallian, Oribasius, Galen, &c. treat professedly on these disorders; amongst the later authors Heister and Turner may be consulted, with the still later writers, as Bell, in his Surgery, and his Treatise on Ulcers, p. 376. Moss on the Management of Children, &c. White's Surgery, p. 69.

ACHY Αχυ, a species of cassia growing in Arabia, called also, δαφνης.

ACICULARIS, from *acicula, a pin or needle*; Acicular, shaped like a small needle. The trivial name for a species of scirpus.

ACIDA. ACIDS. Acids form a species of salts, exciting upon the organ of taste what is called sour; which may be regarded as synonymous with Acid; still there is a difference that may be established between them: *sour* denoting the weakest sensation, such as we perceive from vegetable substances, as verjuice, tamarinds, lemons, &c. and, *acid*, the more powerful, such as is felt from the nitric, sulphuric, and muriatic acids. Every substance is called acid, which gives the impression above specified to the taste; will change certain blue vegetable colours into red, as the juice of turnsole, syrup of violets, &c. and will, in common, effervesce with alcalies: we say in common, because this property is not general. For the carbonic acid, and almost all weak acids, cannot be distinguished by this property; and the purest alkali, or what is called caustic, or deaerated combine with acids without motion or effervescence. By a variety of experiments in modern chemistry, acids are found to consist of different substances: to the name of one, they give the term, *oxygen*; and to the other, *radical*; the former considered to be the *acidifying* body, the latter the *acidifiable* base; and, they further prove, that the oxygenous principle in all the variety of acids, is universally the same; and that acids themselves only vary on account of the different radicals with which that principle is combined. Chemists have also altered the terms, in order to express the degrees of power acids possess; the weaker, they express by the termination *ous*, the stronger by *ic*, added to the base or radical; as sulphurous, sulphuric; carbonous, carbonic, &c. except the muriatic, and nitrous acid; for the lower order of the former, they say *muriatic*; for the stronger, *oxygenated muriatic*; taking the appellation from the acid, and not from the base.

Acids are animal, vegetable, and mineral. The vegetable are the native, as the juice of lemons, &c. or the product of fermentation, as vinegar and tartar. The mineral are those of sulphur or vitriol, nitre, and common salt. The animal is obtained from ants, and some other insects in considerable quantities; it is also contained in human fat, and in the suet of animals that ruminate, and in acetous fermentation is sometimes produced in some of the animal secretory organs, forming a kind of animal vinegar.

Whatever flames hath a latent or a manifest acid in it, for acids alone are convertible into flame. It is true that pure acid flames with difficulty; but when divided and diffused in the pores of other substances, it readily takes fire and blazes, or explodes most violently.

A vague acid, which is volatile and liquid, is in all parts of the earth; uniting with various substances, it forms different fossils. Except in the essential salts of vegetables or in tartar, acids are rarely found in a solid form. The air itself is replete with acid, and without it no creature could live.

There is great analogy betwixt acid and cold; the air abounds most with acid in still weather when the wind blows from the north and the east. The spirit of nitre increases the cold of ice. Acid and cold alike preserves from putrefaction, by increasing the cohesion of the component parts of the respective bodies. Strong acids, and excessive cold, it is true, when applied to the flesh of living animals, mortifies them; but this mortification differs greatly in its nature from that produced by fire, and by alkaline salts. South winds favour, but north winds check the progress of putrid disorders. Cold concentrated and joined to vegetable and mineral bodies, seems to be of the essence of the salts called acid.

Acids differ in their specific gravity when compared with water. They are as follows:

The acid of vitriol, as	18 to 10
Nitre	14 to 10, some say 15 to 10
Sea salt	12 to 10
Vegetables	10 plus to 10.

This difference shews, that some acids are more tenacious of water than others, and that when these acids are mixed with fixed alkali, so as to form neutral salts, if the alkaline salts are the same in proportion, it will be only increased to the same weight whether the vitriolic or the vegetable salt is used, e. g. to one ounce of fixed alkaline salt,

ſalt, add the vitriolic acid, and the neutral ſalt will weigh one ounce and three drams. The ſame will occur if you uſe nitrous acid, muriatic acid, or vinegar. If the weaker acids are uſed, you muſt pour on more of them to the ſame quantity of alkaline ſalt to ſaturate it, yet the ſalt will have only attracted the ſame weight of acid from each.

Acids differ in their colour, for the vitriolic is quite pale; the nitrous a dark yellow, always foaming; the marine a pale golden colour. If bottles containing theſe three acids are ſtopped with cork, the cork is ſoon tinged by the vitriolic acid with a black colour; by the nitrous, with a yellow; and by the marine, with a whitiſh one. The vitriolic acid emits no viſible vapours in the heat of the atmoſphere, but imbibes moiſture therefrom; the nitrous and muriatic emit copious corroſive fumes; the nitrous, a yellowiſh red; and the muriatic, white ones.

As to the virtues of the vegetable acid, ſee ACETUM.

The mineral acids, when intimately joined with vinous ſpirits, have effects ſo ſimilar to thoſe of the vegetable claſs, that their properties as medicines, are almoſt the ſame; but when in their ſeparate ſtate, their inward uſe tends to coagulate the blood. In other reſpects, the effects of all the kinds of acids are ſimilar.

Acids gently irritate and contract our fibres when taken in a dilute ſtate, and thus corroborate; they reſiſt a putrid tendency, and powerfully oppoſe putreſcence when actually exiſting; by the irritation they promote various ſecretions; they excite an appetite, and aid digeſtion; their cooling efficacy in fevers of every rank is not exceeded by any thing in uſe, nor equalled for their general ſafety, where cauſes ſo widely oppoſite produce ſuch ſimilar complaints: in ſome inſtances of coughs and aſthmas, by their irritation their efficacy is ſingular; if the vegetable acid is made uſe of, the breathing is never diſordered by it, though in ſome inſtances the mineral ſort may offend. In dyſenteries, and in diarrhœas, produced by unripe fruits, the foſſil acids allay the fermentation in the bowels, and when a putrid colluvies in the primæ viæ is the cauſe, at once they will be propoſed as the proper remedy. By their ſedative quality hæmorrhages are reſtrained; and as bitters are neuteralized by acids, ſo the exceſs and acrimony of the bile are allayed by their uſe. For farther ſatisfaction into their extent and uſefulneſs in the healing art, ſee FARR on Acids. Cullen's Mat. Med. vol. ii.

Acids, aſtringents, and bitters, have a great affinity with each other. By a mixture with each other they loſe their properties. Vegetable acids leſſen the aſtrictive power of galls on leather, &c. The mineral acids have a contrary effect. Bitters, both animal and vegetable, are neutralized by acids. See LAVOISIER, and CHAPTEL's Elements of Chemiſtry. Dictionary of Chem. Neuman's Chem. Works, Percival's Med. Eſſays.

Acids correct the deleterious effect of moſt, if not all narcotic plants; but injure the phlegmatic habit, where the circulation is languid, the bile defective, or the digeſtion naturally weak.

ACIDITAS, ACIDITY, alſo *Acor*. Diſeaſes from this cauſe are frequent.

The ſeat of acidity in our bodies, as a diſeaſe, is principally the ſtomach and the ſmall inteſtines. An acid acrimony is never ſenſibly prevalent in the blood: yet urine hath been fermented into wine.

An acid acrimony may derive its origin either from too great laxity and debility of the organs of digeſtion, or from an exceſs of aceſcent food. The ferment excited in our food by the ſtomach is ſui generis; if any part of our aliment is not digeſted by the proper ferment of the ſtomach, it will run into its own ferment, and if vegetable it will become ſour. The food of children is for the moſt part of the vegetable kind, and readily turns ſour in the ſtomach, if the body be any way diſordered; hence moſt of their diſorders are accompanied with the evident ſigns of acidity, as green ſtools, gripes, &c. Many aſſert a prevailing acid to be the cauſe of all diſeaſes in children, but acidity in their ſtomach, is oftener an effect than a cauſe of their complaints. It is not acidity, but its exceſs that injures.

The redundant acid in the primæ viæ is known by the ſourneſs of the eructations, the frequent cardialgia, with curdling of the chyle, &c. in the ſtomach, flatulence, and ſpaſms in the inteſtines; when this cauſe is exceſſive in its degree, the bile is inert, the belly coſtive, and the nouriſhment is unduly ſupplied, a paleneſs becomes general in the ſkin, an itching comes on, and puſtules appear here and there, and a train of nervous ſymptoms ſoon ſucceed. Indeed in all diſeaſes peculiar to children, there are for the moſt part the ſymptoms of an exceſs of irritation, the pulſe ſometimes beats one hundred, or one hundred and twenty in a minute, the ſtomach is ſick, the veſſels of the ſkin are contracted, and epileptic or convulſive ſymptoms appear.

Infants are frequently ſwept off by this diſorder. Among adults, the weakly and ſedentary are the only ſubjects of it, except among the poor, whoſe ſcanty ſupplies reduce them to this unhappy ſtate.

The cure when adults are the ſubjects, conſiſts of a diet fitted to oppoſe this faulty habit; animal food, and vegetables of the aromatic alkaline kind: theſe, with moderate exerciſe at proper intervals, bid fair for a recovery. Abſorbent medicine may palliate ſymptoms in the ſtomach and inteſtines, but the limat. ferri will moſt conduce to an effectual and laſting cure. Children ſhould be exerciſed more, and fed leſs than is uſual; irregularity in theſe begets flatus, acidity, &c. Antimonial emeties repeated at intervals of two or three days, until the more diſagreeable ſymptoms abate, are highly uſeful. Small doſes of P. Rhaei, with magneſ. alb. ſo as to keep the belly ſoluble, is better than purging; and to this end give ſmall doſes frequently. To free from flatulency, ℞ ol. eſſ. ſem. fænic. d. gr. i. ocul. 69. pp. gr. v—x. m. & rep. bis vel ter in die. As to abſorbents, a mixture of the magneſia alba with the ocul. 69. or other calcareous earths, ought generally to be preferred, and the doſes ſhould be very frequently repeated until ſome relief is obtained, and then their diſtances may be increaſed. Indeed in ſome caſes, ſmall doſes of fixed, or volatile alcali, particularly liquor. C. C. have been highly beneficial, and warm ſtimulant plaiſters applied to the umbilical region.

See Van Swieten's Commentaries on Boerhaave's Aphoriſms. Medicamentorum Formulæ, Dris. Hugh Smith. London Practice of Phyſic, edit. 4. Armſtrong on Diſeaſes fatal to Infants. Moſs on the Management of Children, &c.

ACIDULÆ. MINERAL WATERS that contain a briſk ſpirit when unaccompanied with heat are thus named; but if they are hot alſo, they are called thermæ. In Paracelſus *Fontale aceteſum* is of the ſame import.

As to the antiquity of their uſe, ſee Galen, Cœlius Aurelianus, Pliny, &c. who ſpeak largely of their virtues.

Hoffman and many authors highly extol them, whilſt others obſerve that a pure water, on account of its ſimplicity, ſuch as that from Malvern and Toplitz ſprings, is to be preferred both for drinking and for bathing; and that in want of theſe, they may be well ſupplied by diſtilled rain, or any other that is ſoft and pure. Objectors ſay, that the medicinal qualities in theſe waters only quicken their operation as water, but contribute nothing farther, and that ſolutions of the like materials are of equal efficacy: to which the beſt reply has been, that the mineral contents are often volatile, and of parts more ſubtile than thoſe of art's producing; and that when the powers of nature are expiring, experience proves their efficacy by their ſucceſs as a laſt reſource.

In general their views are according to the qualities of their contents; theſe known, their uſe is eaſily determined. See AQUÆ MEDICINALES.

Bleeding, or purging, or both, are frequently preſcribed before the uſe of mineral waters; but except a plethora attends, they are not to be admitted. As theſe waters are deſigned to paſs, ſo reſt or exerciſe muſt be adviſed; reſt and a cool ſituation, favour their diuretic tendency; exerciſe and a warm air determine them to the ſkin; theſe obſerved with temperance and moderation in the regimen, are the principal directions on which ſucceſs depends.

Their briſk ſparkling property is owing to the quantity of fixt air which they poſſeſs; and indeed to this, perhaps, is owing their chief uſe as medicine. To encreaſe this property when defective, or to communicate it where it is totally wanting, ſee Dr. Prieſtly's directions for impregnating water with fixt air.

For diſcovering the contents of waters, the following are the moſt common additions. But for minute inveſtigation, the taſk is ſo extremely difficult, that the reader is referred to the works of BERGMAN, FOURCROY, CHAPTAL, &c.

Galls.—When uſed they ſhould be freſh powdered, or a freſh infuſion of them in water ſhould be made. A ſmall quantity of the powder, or of the infuſion put into a cupful of the water to be examined, diſcovers the ſmalleſt

degree

degree of iron that can be productive of any ſenſible effects. If the water contains a coarſe oker, the colour ſtruck by the galls is very dark; the finer iron produces the inky purple; but the fineſt, ſuch as the Pyrmont water, gives the azure blue.

Syrup of violets.—Mix a dram with a ſmall wine-glaſs full of the water, and if a green colour is produced, there is an alkaline ſalt in it, or alum; though Dr. Rutty ſays, that if the ſyrup is new, alum turns it red. This green colour is alſo obſerved when a ſolution of iron is met with; with an acid it cauſes a red.

Aqua kali. A few drops let fall into the water diſcovers earthy matter, by precipitating it in the form of a white cloud; if a whitiſh cloud riſes to the top, and the water underneath remains clear, the quantity of earthy matter is extremely ſmall. This water precipitates the contents of all hard waters; from twenty to forty drops throws down all the ſelenities in lb. i. thereof. If it meets with a ſolution of the hydrargyrus muriatus or other mercurial particles, it diſcovers them by producing a yellow colour, and it ferments with acids.

Tinct. argenti—This tincture, if made with pure nitrous acid, is the moſt delicate addition for diſcovering ſea ſalt in water, which it joins with, and falls in a milky cloud.

Ammonia preparata.—This precipitates the contents of hard water; diſcovers quickſilver, or any of its preparations, by turning the liquor whitiſh, and throwing a part of it into a coagulum; it diſcovers copper by producing a blue colour.

Tinct. ſalph. vol.—It diſcovers lead in water, by turning it to a duſky brown colour.

Soap.—It readily determines whether or no the water is hard or ſoft by diſſolving therein: if hard, the ſoap curdles; but if ſoft, an homogeneous mixture is formed, and with a little agitation a froth is raiſed.

Acidum nitroſum. Nitrous acid.—If it turns the water of a green colour, it contains a ſolution of copper. See AQUÆ MINERALES.

ACIDUM ACETOSUM. ACETOUS ACID. Take two pounds of the coarſe powder of verdegris, let it be perfectly dried by a water bath, ſaturated with ſalt—afterwards diſtil it in a ſand bath, then diſtil the liquor again. Its ſpecific gravity is to that of diſtilled water, as 1.050 to 1.000. This is conſidered as the beſt mode of acquiring the acetous acid in its moſt concentrated ſtate; but it may be acquired by congelation, taking care to throw out the ice before it thaws, by diſtillation from alcalies, as well as metallic bodies, particularly copper; and by this laſt method it will ſaturate nearly its own weight of a fixt alkaline ſalt. This acid is called RADICAL VINEGAR. When the acid of vinegar is combined with alcalies, earths, or metals, the neutral ſalt ſo formed muſt be dried, and then the acetous acid may be ſeparated in a very concentrated ſtate by the addition of two thirds of their weight of ſulphuric acid, and diſtilling them in a ſand heat.

This acetous acid differs from all others in general in its particular odour; from the native vegetable acids in ſubtilty, and volatility, and in not being obtainable in the form of a concrete ſalt—from the mineral in its habitude to different bodies; and the nature of the compounds it forms with them: thus whatever the acetous acid joins, it is diſlodged by the approach of a mineral acid; and compounds formed of the acetous acid, and fixed alkalies, diſſolve in Sp. Vini Rect. but thoſe with mineral acid, and the ſame alkalies, will not.

The concentrated acid obtained from verdegris is not ſo pure as that acquired by congelation, or drawn from a neutral ſalt, being apt to retain a portion of the copper, which is eaſily to be proved by its turning blue when ſaturated with aqua ammonia. Its uſe on this account has been objected to by many, and therefore not been much employed; however, the medical virtues are ſuppoſed to be ſimilar to vinegar.

—— ÆTHEREUM.
—— ALUMINOSUM.
—— CATHOLICON.
—— PRIMIGENIUM.
—— SULPHUREUM.
} Acidum vitriolicum, vel ſulphuris.

—— MURIATICUM. Olim Spiritus Salis Glauberi. See MARINUM SAL.

—— NITROSUM. See NITRUM, N°. 5.

—— VITRIOLICUM, Olim Oleum Vitrioli, called alſo *Stagma*. See SULPHUR and VITRIOLUM VIRIDE, and alſo ACIDA.

—— VITRIOLI VINOSUM, i. e. Æther vitriolicus. See ÆTHER.

ACIES. STEEL. See CHALYBS.

ACINESIA, from *α, not, κινεω, to move.* A privation of motion.

ACINI. The diſtinct component parts of the fruit of the mulberry, blackberry, and raſpberry.

ACINIFORMIS. } The coat of the eye, call-
ACINOSA TUNICA. } ed uvea. See UVEA.

ACINOS. See BASILICUM.

ACINUS. Properly a grape, but is applied to other fruits or berries that grow in cluſters, as elder berries, privet, ivy, &c. Theſe are diſtinguiſhed from baccæ, or berries that grow ſingle, as thoſe of the laurel. But *acinus* is alſo uſed for the ſtone of the grape; hence UVÆ EXACINATÆ, grapes that have their ſtones taken out.

The glands which grow together in cluſters are called by ſome *acini glanduloſi.*

ACINUS. See STAPHYLOMA.

ACMASTICA. See SYNOCHUS.

ACMASTICOS, (*ακμαζω, vigeo*) the name of a ſort of fever ſpoken of by Actuarius, as follows:

"Fevers from putrefaction are continual or intermittent: of the former, ſome are called *iſcheni*, or acmaſtici, which during the whole courſe are at the ſame pitch; others are called *epacmaſtici*, or *anabaſes*, theſe proceed and increaſe to their time of ſolution; a third ſort called *paracmaſtici*, which diminiſh by degrees till they ceaſe."

ACME. THE HEIGHT OF A DISEASE. That ſtate of a thing in which it is at its utmoſt perfection. It is alſo a term in gymnaſtics, expreſſing the higheſt pitch of exerciſe.

ACMELLA, called alſo, Ahamella, ahmella, akmella, amella, admella. Bidens Urtica,—zeylanica, cannabina, cerato-cephalus, chryſanthemum bidens. A plant growing in the iſland of Ceylon, of which three ſpecies are noted by botaniſts. Two are the verbeſina acmella of Linnæus, and verbeſina lavenia of Linnæus. It is commended in nephritic diſorders, but rarely uſed. Raii Hiſt.

ACNE. A ſmall purple or hard tubercle on the face is thus called.

ACNESTIS, from *α*, negative, and *κνάω, to ſcratch.* That part of the ſpine which reaches from betwixt the ſhoulder blades to the loins. This name ſeems only applicable to quadrupeds, becauſe they cannot reach it to ſcratch.

There is a herb to which this name is given, but botaniſts ſeem not agreed what it is.

ACOE, (*ακουω, audio*) See AUDITUS.

ACOITUS, HONEY. See MEL. Pliny ſpeaks of it by this name, becauſe it has no ſediment, which is called *κοιτη.*

ACON, an inſtrument uſed in the ancient exerciſes like the diſcus.

ACONE, a MORTAR, or rather a hard ſtone, on which to levigate; or, more generally, a WHETSTONE.

ACONION, an ancient Greek name of a medicine prepared by levigation; probably a collyrium, or ſome form of powders for the eyes.

ACONITIFOLIA. See ANAPODOPHYLLON.

ACONITON, from *α*, negative, and *κονια, lime* or *plaiſter.* Not plaiſtered. This word is applied to veſſels not lined within.

ACONITUM, alſo called *Camarum, Canicida, Cynoctonum, Cynoctonum.* Various derivations are given by etymologiſts; as, 1ſt, *ακονη*, a *whetſtone*, or *rock*, becauſe it grows on bare rocks. 2dly, *α*, negative, and *κονις, duſt*, becauſe it grows without earth. 3dly, *ακων, ακη, dart*, becauſe they poiſoned darts therewith. 4thly, *ακοντιζομαι, to accelerate*, for it haſtens death.

WOLF'S BANE.

Miller takes notice of nineteen ſpecies; and ſome of them are called *lycoctonum*, or wolf's-bane, becauſe the hunters mixed them with fleſh, and laid it for the wolves, which were poiſoned by it. Theſe herbs are deſtructive by their cauſtic and ſuffocating quality; the animals that eat them have their ſwallowing ſtopped, and ſtomach corroded.

Againſt the poiſon of theſe plants, Galen commends rue taken in wine; but, perhaps, vinegar would be more uſeful.

The MONK'S-HOOD, or COMMON WOLF'S BANE, of which Dr. Storck ſpeaks ſo much in favour, is the ACONITUM NAPELLUS, or ACONITUM foliorum laciniis linearibus, ſuperne latioribus, linea exaratis, Linn. Spec. Plant. 1682. Claſs. POLYANDRIA, Ord. TRIGYNIA. It is cultivated in our gardens as an ornament. It is ſpontaneouſly produced in Germany, and ſome other northern parts of Europe.

The

The doctor expreſſed the juice of the freſh herb, and made it into an extract by a gentle evaporation, then for internal uſe made the following powder:

℞ extract. aconit. gr. ij

Sacchar. alb.— ʒ ij m. f. pulv. ſubtil.

In ſeveral inſtances this was given from gr. vj. to 3 ſs. three times a day, with the happieſt ſucceſs. Its chief ſenſible effect was its exciting a copious perſpiration.

The caſes in which Dr. Storck ſucceeded by the uſe of the above powder, were an inveterate gonorrhœa, pains that were obſtinate, and which followed after agues and intermittent fevers, tophs and nodes, ſcirrhous tumors, indurations of the parotid glands, ſpina ventoſa, itch, amauroſis, gouty and rheumatic pains, convulſive diſorders, and an anchyloſis. Some have given it in tincture; one part of the dried leaf to ſix of ſpirits of wine; the doſe, 40 drops. But it has often been given from one grain, gradually encreaſed to ten, for a doſe: indeed Stoll and ſome others carried it much further.

A perſon who had eaten a ſmall quantity of monk's-hood, was preſently attacked with the following ſymptoms, viz. a ſenſation of tingling heat in the tongue and jaws, the teeth ſeemed to himſelf as if they were looſe, and the face as if it was ſwelled. This tingling ſenſation gradually ſpread all over the body, particularly to the extremities; the knees and ankles loſt their ſtrength, and frequent twitching of the tendons came on; ſoon after he perceived a ſenſible check to the circulation of the blood through the limbs; at length a giddineſs came on, then a miſt ſeemed to collect itſelf before his eyes, in his ears was a humming noiſe, his ſenſes failed, and falling into a ſwoon, his eyes and teeth were fixed, his noſe contracted, breathing ſhort, and cold ſweats were perceived on his hands, feet, and forehead. All theſe ſymptoms followed in leſs than two hours from the time of eating the ſallad, in which the monk's-hood unfortunately was mixed. In order to his relief, as it was ſuſpected that he had eaten ſome kind of poiſon, his friends forced down into his ſtomach a quantity of oil and water, and afterwards carduus tea, by which he vomited; theſe were repeated ſo as to encourage a thorough diſcharge from the ſtomach, and in the intervals, a few ſpoonfuls of a ſtimulating cordial was given: and thus he ſoon recovered.

Some writers ſay, that the napellus is not poiſonous in Sweden, Poland, &c. but it ſhould be noted, that the napellus, which is not poiſonous, is the *aconitum* lycoctonum luteum majus of Bauhine, or yellow ſalutiferous monk's-hood. See Wilmer's Obſervations on the Poiſonous Vegetables in Great Britain. Storck, de Aconito, and the Article Venenum.

Aconitum Anthora, Salutiferum. See Anthora.—*Folio platani, Lycoctonum Ponticum & Luteum.* See Luparia.—*Hyemale. Luteum minus, unifolium luteum bulboſum.* See Helleboroides.—*Pardalianches.* See Herba Paris.—*Pardalianches minus.* See Doronicum romanum.—*Urens ricini fere foliis flore cæruleo magno.* See Staphisagria.

ACOPA, Acopon, α non, and κοπος, *laſſitude*. At firſt this word ſignified the quality of the *medicines* which was to relieve pain, ſtiffneſs, and other ill effects of exceſſive wearineſs; but afterwards it only ſignified the degree of conſiſtence which the medicines were of. Theſe medicines were always external ones. In time the word was uſed to expreſs thoſe kind of ſoft cerates which were applied to tumors, &c. It is alſo a name of the *trifolium paludoſum*.

ACOR. Sourness, acrimony, particularly an acid acrimony in the ſtomach. See Aciditas.

ACCORDINA. Indian tutty.

ACORES. See Achor.

ACORI (Rad.) The greater galangal root. See Galanga.

ACORIA, from α, negative, and κορεω, *to ſatiate*. Insatiability. Sometimes it ſignifies a good appetite, or digeſtion.

ACORITES VINUM, a wine made of the acorus and liquorice roots, each eight ounces; of wine, ſix gallons; infuſed cold for ſix months.

ACORUS, CALAMUS VERUS. See Calamus aromaticus.—*Adulterinus.* See Iris palustris.—*Aſſaticus.* See Calamus aromaticus asiat.

ACOS (ακεσμος, ſano). A remedy.

ACOSMIA. Irregularity, or diſturbed ſtate of things, particularly of the critical days of fevers, as κοσμος meant their regular order, from α, negative, and κοσμος, *ornament*, called alſo *madiſis, madroſes*. Bald people are called acoſmoi, becauſe they had loſt their great ornament. Blancard ſays it is an ill ſtate of health, joined with a loſs of colour in the face.

ACOUSTICA, medicines againſt deafneſs, from ακουω, *to hear*.

ACRAI. See Satyriasis, and Furor Uterinus.

ACRAIPALA, a Greek word for medicines againſt a ſurfeit or drunkenneſs, from α, non, and κραιπαλη, *crapula*.

ACRASIA, Intemperance, from α, negative, and κερανυμι, *to mix*. The ancients mixed one pint of wine with four or five of water. Aſclepiades ordered half wine and half water; hence wine unmixed was called *acraſia*, which we conſtrue Intemperance; for the Latin word *tempero* is of the ſame import as κερανυμι, *to mix*. Hence the word was applied to exceſs, as in eating, drinking, venery, &c. By Hippocrates, and ſome others, it ſignifies imbecility. By Phyſicians, it means the predominancy of one quality above another, either with regard to artificial mixtures, or the humors of the body.

ACRATIA, from α, negative, and κρατος, *ſtrength*. See Imbecilitas.

ACRATISMA, a breakfaſt. The derivation of this word is the ſame as that of acraſia, becauſe the wine uſed on this occaſion was not mixed with water. A breakfaſt among the old Greeks conſiſting of a morſel of bread ſteeped in wine. Children and weakly people ſhould not omit this meal.

Our breakfaſts ſhould conſiſt of the harder kinds of aliment, to promote a plentiful diſcharge of ſaliva.

ACRATOMELI. See Mulsum.

ACRE, ακρη. See Nasus Acroteria.

ACREA, alſo Acroteria, the extremities, i. e. the legs, arms, noſe, and ears. Coldneſs in the extremities, which do not eaſily warm, are bad preſages in fevers.

ACRETON, unmixed wine. Hippocrates expreſſes by it, vehement, exceſſive, intemperate.

ACRIDÆ. Acrid medicines.

Acrids are ſubſtances of a penetrating pungency: applied to the ſkin, they inflame it; chewed, they promote a diſcharge of the ſaliva; and ſnuffed up the noſe, they provoke ſneezing.

Conſidered as the ſubjects of pharmacy, they may be divided into claſſes, according as they yield their acrimony; which they do, 1ſt, by diſtillation. Thus muſtard, horſe-radiſh, ſcurvy-graſs, &c. give out their properties. 2dly, By infuſion only, as is the caſe with the greater celandine, pyrethrum, &c. 3dly, Neither by infuſion nor diſtillation, as happens with the arum, dracunculus, &c.

The general effects of acrid medicines are to ſtimulate the ſolids, and to diſſolve tenacious juices. In leucophlegmatic habits, they are powerful expectorants, deobſtruents, diuretics, and emmenagogues; and if the patient is kept warm, they are good diaphoretics.

In conſtitutions diſpoſed to inflammation, or where there is already a degree of irritation, where the juices are too thin and acrid, or the viſcera not ſound, theſe medicines are not to be uſed, for they aggravate theſe diſorders.

The trouble which acrid medicines give to the ſtomach, is that on which their virtue frequently depends.

ACRIFOLIUM, any prickly-leaved plant.

ACRIMONIA, Acrimony (from *acer, ſharp*). This term is applicable to any ſubſtances that produce particular ſenſations from the action of that ſtimulus which they poſſeſs, and which we expreſs by the different terms, ſharpneſs, eagerneſs, tartneſs, acid, alcali, &c. and it is alſo applicable to ſome ſtates of the humors in the human body, as acrimony of the bile, and other materials, which are, by the laws of the animal œconomy, conſtantly thrown out of the machine, in order that the humors may be kept in a ſound ſtate; for, except when in a morbid ſtate, they are free from all acrimony. When in a morbid ſtate, we have different ſpecies of acrimony; ſuch as acrimony of the *gout, rheumatiſm, ſcrophula, cancer*, &c. which are judged of, and denominated from the effects they produce on the habit. Hence, we ſay, complaints of this nature originate from an acrimonious humor, *ſui generis*.

ACRIS. The top of a mountain, alſo the ſharp extremities of fractured bones. It is alſo a locust, i. e. the inſect ſo called, and which the Indians, and ſome others, commonly eat.

ACRISIA, α, non, and κρινω, *judico*. It is when a diſtemper is in ſo uncertain and fluctuating a condition, that it is difficult to paſs a right judgment on it. Blancard.

ACRIVIOLA. Acer, sharp, and *viola, a violet.* See NASTURTIUM INDICUM.

ACROBYSTIA, from *ακρος, extreme*, and *βυω, to cover.* See ACROPOSTHIA.

ACROCHORDON, from *ακρος, extreme*, and *χορδη, a string.* This is one instance, which, as Galen observes, shews the oddity of the analogies by which the ancients gave names to things. This name they gave to a sort of warts, from their being situated on the skin. Wiseman calls them pensile warts. See VERRUCÆ.

Galen in his Def. Med. says it is a round excrescence on the skin, with a slender base; so that the excrescence seems to hang by a string.

Sometimes they suddenly disappear, at others they inflame or suppurate. Celsus observes, that if they are cut out, they leave no root, so do not grow again.

ACROCHORISMUS, from *ακρος, extreme*, and *χορευω, to dance.* An exercise of dancing, with violent motions of the legs and arms. Schulzius says, they joined head to head, and hand to hand, and strove to push one another out of their places.

ACROLENION. See OLECRANON.

ACROMION, } from *ακρος, extreme*, and *ωμος, the*
ACROMIUM, } *shoulder.* See SCAPULA.

ACROMPHALION, from *ακρος, extreme*, or *the tip*, and *ομφαλος, navel.* The tip of the navel, or the middle of the navel.

ACRON, in general means the top or summit; hence, in a medical sense, it is the best of its kind. In botany, it is the top or flower of thistles.

ACROPATHOS, from *ακρος, extreme*, and *παθος, a disease.* It literally signifies a disease at the height, or, a disease which affects any superior part of the body. Hippocrates applies it to the internal orifice of the uterus; when affected; to occult cancers, and to cancers on the surface of the body, to distinguish them from those that are inward.

ACROPIS, from *ακρος, extreme*, and *οψ, the voice*, when the voice cannot be exerted. An inarticulation of the voice, from an imperfection in the end of the tongue. It is once used adjectively in the spurious works of Hippocrates, but no where determined in its signification and orthography.

ACROPOSTHIA, from *ακρος, extreme*, and *ποσθη, the prepuce*; called also *acrobysthia.* That part of the prepuce which is cut off in circumcision.

ACROPSILON, from *ακρον, the extremity*, and *ψιλος, naked.* The extremity of the glans when naked.

ACROSAPES, from *ακρος, extreme*, and *σαπω, to putrefy.* Galen explains this, as soon changed in its superficies, or easy of digestion. This mode of speaking, it is remarked by VALESIUS, originates from a dogma of physicians, though a false one, that digestion was performed by a certain degree of putrescency; for often names originate from a false principle, which are retained by authors, who do not acquiesce in that principle; and this has been the source of much error.

ACROSPELOS, a name of the WILD OAT-GRASS, or BROMUS STERILIS. See ÆGYLOPS.

ACROTERIA. See ACREA.

ACROTERIASMUS. The amputation of an extremity. From *ακρωτηρια, extremities*, and this from *ακρον, summus.*

ACROTHYMIA. See NÆVUS.

ACROTHYMION, from *ακρον, extreme*, and *θυμος, thyme.* A sort of wart described by Celsus as hard, rough, with a narrow basis, and broad tops; the top is of the colour of thyme, it easily splits and bleeds. This tumor is also called *thymus.*

ACMO. See CORALLIUM RUBRUM.

ACT. MED. An abbreviation of Thomæ Bartholini Acta Medica & Philosophica Hafniensia, vol. i. 1673, 2 ib. vol. ii. 1677, &c. vol. v. 1680.

ACT. PHILOS. & TRANSACT. PHILOS. The Philosophical Transactions.

ACT. REG. SC. The Histories and Memoirs of the Royal Academy of Sciences at Paris.

ACT. S. R. Acta Societatis Regiæ, or Philosphical Transactions, London, 4to.

ACTE, *ακτη.* See SAMBUCUS.

ACTINE. See BUNIAS.

ACTINOBOLISMUS. IRRADIATION. It is applied to the spirits, conveying the inclinations of the mind to the body; it is also called DIRADIATIO, and IRRADIATIO.

ACTIO, vel FUNCTIO, also FACULTAS.

The actions or functions of the body are divided into the *vital, natural*, and *animal.*

The VITAL FUNCTIONS, or ACTIONS, are those which are absolutely necessary to life, and without which there is no life, as the action of the heart, lungs, and arteries. On the action and reaction of the solids and fluids on each other, depend the vital functions. The pulse and respiration are the external signs of life. Vital diseases are all those which hinder the influx of the venal blood into the cavities of the heart, and the expulsion of the arterial blood from the same.

The NATURAL FUNCTIONS are those which are instrumental in repairing the several losses which the body sustains; for life is destructive of itself, its very offices occasioning a perpetual waste. The manducation of food, the deglutition and digestion thereof, also the separation and destribution of the chyle and excrementitious parts, &c. are under the head of natural functions, as by these our aliment is converted into our nature. They are necessary to the continuance of our bodies.

The ANIMAL FUNCTIONS are those which we perform at will, as muscular motion, and all the voluntary actions of the body; they are those which constitute the senses of touch, taste, smell, sight, hearing, preception, reasoning, imagination, memory, judgment, affections of the mind. Without any, or all of them, a man may live, but not so comfortable as with them.

The ACTIONS PECULIAR TO THE SEXES are those of the organs of generation of either sex.

PRIVATE ACTIONS are such as regard particular parts.

PUBLIC ACTIONS are those which are performed for the sake of the whole body; such is the action of the stomach in digesting the aliment, &c. These are called functions.

But each part hath an action peculiar to itself. Thus the office performed by the muscles, vessels, glands, and viscera, are called their respective action. See professor Whytt's Treatise on Vital Motions.

ACTON, a town near London, where is a well that affords a purging water; from a gallon of which, Dr. Rutty got 340 grains, or five drams two scruples of sediment by evaporation: of this five drams and 21 grains were vitriolated magnesia, or vitriolated absorbent earth, called formerly nitrum calcarium; which took forty-eight times its own weight of water to dissolve it; and 19 grains of earth, which did not calcine to lime, but dissolved in the vitriolic acid. This is esteemed one of the strongest purging waters near London. It is drank from one to three pints in a morning. MONRO's Medical and Pharmaceutical Chemistry. See AQUÆ CATHARTICÆ AMARÆ.

ACTUALIS, ACTUAL. This word is applied to any thing endued with a property, faculty, or virtue, which acts by an immediate power inherent in it: it is the reverse of POTENTIAL; thus, a red-hot iron or fire is called an *actual* cautery, in contradistinction to cauteries, or caustics, that have the power of producing the same effect upon the animal solids as actual fire; these last are called *virtual* or *potential* cauteries. Boiling water is actually hot; brandy, producing heat in the body, is potentially hot, though of itself cold.

This is the medicinal sense of the word; in logic and metaphysics it is used otherwise.

ACTUATIO, ACTUATION. That change wrought on a medicine, or any thing else taken into the body, by the vital heat, which is necessary to make it act, and and have its effect.

ACUITIO, from *acus, to quicken.* This is applied often to medicines, which are added to others weaker than themselves, in order to encrease the stimulus; and consequently, their medicinal action, as vegetable acid, may be sharpened by the addition of mineral acid; or, mild purgatives may be quickened by the addition of small doses of those which are more powerful.

ACULEI, the prickles and thorns on vegetables.

ACULON, or ACULOS, the fruit or acorn of the *ilex*, or scarlet oak.

ACUMEN, A SHARP POINT. This term was introduced into anatomy by Daventer, in his Ars Obstetricandi; he calls the protuberances of the ossa innom. on which we sit, the *ossa sedentaria*, which he says are the acumina of the ossa pubis; and he calls the os coccygis the *sacri acumen ossis*, the pointed part of the sacrum.

ACUPUNCTURA, (from *acus, a needle*, and *pungo, to prick*) ACUPUNCTURE. Bleeding performed by making many small punctures with a silver needle on the part affected. This method is practised in Siam, Japan, and other oriental nations, on all parts of the body; and

and employed in headaches, lethargies, convulſions, colics, &c. In ſome parts of America this practice is alſo in uſe, according to the accounts given in Dampier's Voyages.

ACUREB. See PLUMBUM.

ACURON. See ALISMA.

ACUS, a NEEDLE. This inſtrument is neceſſary in confining the lips of wounds, taking up and tying blood-veſſels, &c. They are of various forms, according to the uſe they are deſigned for: it is of conſiderable importance that they ſhould be ſharp, and made of good metal that is well tempered. (See Bell's Surgery, vol. i.)

ACUS PASTORIS. See SCANDIX.——For that called MOSCHATA, ſee GERANIUM MOSCHATUM.

ACUSTICUS, from *ακουω, to hear*, belonging to hearing. It is applied to the auditory nerve, and to medicines or inſtruments uſed to aſſiſt, preſerve, or recover hearing.

ACUSTO. See NITRUM.

ACUTENACULUM, from *acus, needle*, and *teneo, to hold*. Heiſter calls the *portaiguille* by this name; it is a handle for a needle, to make it penetrate eaſily when ſtitching a wound. Bell's Surgery, i. 16.

ACUTUS MORBUS, ARCHIGENUS MORBUS. Acute diſeaſe, from *acuo, to quicken* or *ſharpen*.

An *acute diſeaſe* moves quickly to its termination, and always is attended with danger. Though there are diſeaſes without danger, of a ſhort duration, ſo are diſtinct from the *acute*, as an ephemeris, &c. *Acute diſeaſes* are the oppoſite to chronic, which are ſlow in their progreſs, and not ſo generally dangerous. Wallis's Sydenham, 1.

ACYISIS. In Vogel's Noſology it is a defect of conception, or barrenneſs in women.

ACYRUS. See ARNICA MONTANA.

ADAL. According to Paracelſus, it is the part of plants in which the medicinal virtue conſiſts, or the pure and active parts ſeparated from the impure and inert.

ADAMITA, ADAMITUM, names given to the hardeſt white ſtones; and, *adamita* is properly the ſtone in the bladder; *adamitum*, the lithiaſis, or diſeaſe called the ſtone. See CALCULUS.

ADAMUS. So is called the philoſopher's ſtone, by alchemiſts, who ſay that it is an animal; and that it has carried its inviſible EVE in its body from the moment they were firſt united by the Creator. It is alſo called *Aquila, Philoſophorum Lapis, Baſaliſcus, Benedictus, Beritis, Gryphus*; by way of eminence, *Antidotus*. This ſtone, the greateſt object of alchemy, is a long-fought-for preparation, which, *when found*, is to tranſmute, or exalt impurer metals, as tin, lead, and copper, into gold, and ſilver. Authors who have written on this ſtone, call *ſulphur* the *maritus*, or huſband; and mercury, the *uxor*, or wife.

ADANSONIA. See BAOBAB.

ADARCE, a ſaltiſh concretion found about the reeds and graſs in marſhy grounds in Galatia; it is alſo called *calomechanus*, or *calomechnus*. It is lax and porous, like baſtard ſponge. It is uſed to clear the ſkin with in leproſies, tetters, freckles, &c. Dr. Plott gives an account of this production in his Natural Hiſtory of Oxfordſhire.

ADARNECH. See AURIPIGMENTUM.

ADARIGES. See SAL AMMONIAC.

ADARTICULATIO. See DIARTHROSIS.

ADCORPORATIO, ADCORPORATION, or clinging together in one body.

ADDEPHAGIA, or ADEPHAGIA, from *αδην, abundantly*, and *φαγειν, to eat*, INSATIABILITY, a VORACIOUS APPETITE. It is the Bulimia Helluonum. See BOULIMUS.

ADDITAMENTUM, the ſame as *epiphyſis*. The large epiphyſis of the ulna is called additamentum necatum.

ADDITAMENTUM COLLI. See APPENDICULA VERMIFORMIS.

ADDUCENS, vide ADDUCTOR OCULI.

ADDUCENS HUMERI. See PECTORALIS MAJOR.

ADDUCTOR, a leader to, from *adducere, to move* or *bring towards*. A name of ſeveral muſcles. 1.——AD MINIMUM DIGITUM. It riſes from the unciform proceſs of the carpus towards the annular ligament, and is inſerted into the whole length of the inſide of the metacarpal bone of the little finger. 2.——AURIS. It is a common muſcle, being a part which Spigelius calls *quadratus buccas detrahens*; from its inſertion is a fleſhy fibrous elongation implanted into the root of the ear. 3.——DIGITI MINIMI PEDIS, called alſo *tranſverſalis pedis placentini*. It riſes from the fourth metatarſal bone, and going over the knobs of the toes, runs to the external ſeſamoid bone. Douglas ſays it brings the third and fourth leſſer toes nearer the other two, and the great one. 4.——FEMORIS PRIMUS VEL LONGUS. It ariſes from the os pubis, next the pectinæus, above the gracilis; which turning into a compact fleſhy belly, it begins to be inſerted tendinous about the middle of the linea aſpera, being continued down upon the ſame, five or ſix inches, ſending out a tendon which joins in with that of the fourth head. 5.—FEMORIS SECUNDUS vel BREVIS. It ariſes from the os pubis, immediately under the gracilis, by a broad, tendinous, but chiefly fleſhy beginning, and is inſerted into the linea aſpera, from a little below the leſſer trochanter, to the firſt inſertion of the laſt deſcribed muſcle. 6.——FEMORIS TERTIUS, vel MAGNUS. It ariſes lower down than the former, from the outer edge of the os pubis & iſchium; and running obliquely towards the trochanter minor, is inſerted near the glutæus maximus. This and the next muſcle, are deſcribed as one muſcle, by Albinus and Winſlow, under the names of ABDUCTOR MAGNUS FEMORIS, and *le troiſieme muſcle du triceps*. 7.——FEMORIS QUARTUS. It ariſes from the protuberance of the iſchium; and the adjoining interior part of that bone, by a tendinous or fleſhy origin. It is inſerted by a round and a long tendon into the upper and rough part of the inner and lower appendix of the os femoris, being affixed to that bone a little above the condyle, as alſo to ſome part of the linea aſpera. The above four muſcles are deſcribed by Dr. Hunter, &c. as one, and under the name of TRICEPS, which ſee. Their uſe is to adduce, or move the thigh inwards, according to their different directions. Douglas. 8.——OCULI, alſo called *adducens* and *rectus internus*. It riſes tendinous and fleſhy from the edge of the hole in the ſphenoid bone that tranſmits the optic nerve, and is inſerted by a thin tendon into the tunica ſclerotica, where it reſpects the great canthus. It brings the eye towards the noſe. Some call it *bibitorius*, as it directs the eye toward the glaſs in drinking. 9.——POLICIS MANUS AD INDICEM. Riolan calls it *antithenar*. It riſes from the fore part of the metacarpal bone of the fore-finger, joins with the anterior portion of the flexor ſecundi internodii policis, and is inſerted with it into the ſeſamoid bone. See ABDUCTOR INDICIS, N° 4. 10.——POLICIS PEDIS. It riſes by a long thin diſgregated tendon from the os calcis, under the tendinous part of the maſſa carnea, from the os cuboides, the os cuneiforme medium, and from the upper part of the os metatarſi of the ſecond toe; it is ſoon dilated into a pretty large belly, and is inſerted in the external os ſeſamoides of the great toe. Douglas ſays it brings the great toe near its next.

ADEC, SOUR MILK, BUTTER-MILK.

ADECTOS, from *α*, negative, and *δακνω, to bite*, an epithet given to medicines that relieve from the biting ſenſe of pain, by removing the uneaſineſs cauſed by ſtimulants; whence Celſus calls them *Lenia*.

ADENDENTES, ſee PHAGÆDENA.

ADELPHEA, a relation; ſo Hippocrates calls diſtempers that reſemble each other, from *αδελφος* frater.

ADELPHIXIS, the analogy, relation, or ſimilitude of one thing with another, or the communication, conſent, or ſympathy of a part with another.

ADEMONIA, of *α* negative, and *δαιμων, a genius* or *divinity* or *fortune*. Hippocrates uſes this word for uneaſineſs, reſtleſſneſs, or anxiety felt in acute diſeaſes, and ſome hyſteric fits.

ADEN, a gland. See GLANDULA. Sometimes it ſignifies the ſame as *bubo*. Blancard.

ADENES CANADENSES. See BATTATAS CANADENSIS.

ADENOIDES, from *αδην*, a *gland*, and *ειδος, a form*. Glandiform, or like a gland. This word alſo is uſed for the *proſtatæ*, which ſee.

ADENOSUS ABSCESSUS, a hard crude tubercle, reſembling a gland, difficult to be reſolved.

ADEPHAGIA. See ADDEPHAGIA.

ADEPS, FAT, called alſo *pinguedo, pinguis, axungia, butyrum, arvina, arabus*, &c. Fat is condenſed inflammable juice, contained in that part of the cellular membrane called *membrana adipoſa*. When it has been ſuperfluous, and found ſometimes in the upper eye-lids of children; it was then called *axirnach*. In the young fœtus is ſcarce any fat; the omentum ſeems only to contain a jelly, but in the

older fœtus, fat begins to appear. When the child is born, and during a few years after, it hath much fat immediately beneath the ſkin; in men the fat is moſt abundantly ſpread on the glutei muſcles.

How it is ſeparated from the blood, is not certainly known. There is alſo a fatty ſubſtance, got from the milk of animals, by agitating the oleaginous part of the milk ſeparated by ſtanding, in an inſtrument called a churn. This goes by the name of butter, and is uſed for culinary purpoſes chiefly, called alſo *alumbair*.

From the moſt accurate analyſis of CRELL, it appears that fat is a kind of oil, or butter rendered concrete by an acid. This, which is called ſebacic acid, exiſts ready formed in ſuet, two pounds affording ſomewhat more than ſeven ounces. It exiſts ready formed in the fat, ſince earth and alkalies diſengage it. CHAPTAL's Chemiſtry vol. iii. It is more fluid in living than in dead bodies; indolence renders it leſs fluid, whence by inactivity it is accumulated. Its uſes are to keep up the heat of the body and defend the viſcera from the impreſſion of external cold; to ſerve as nouriſhment or ſupport for the animal on the occaſion of want, ſickneſs, &c.

Fat differs from ſuet principally in the great quantity of water it contains, which being ſlowly evaporated, is converted into a ſebaceous ſubſtance. In the human body it ſometimes concretes into a hardiſh ſubſtance, forming tumors of the ſteatomatous kind.

In profuſe ſweating the fat is melted down, and paſſes off through the pores, and thus the perſon is much weakened. The human fat does not become fluid when Fahrenheit's thermometer riſes to the ninetieth degree; but when it begins to putrify, it eaſily, and with a ſmall degree of warmth, runs into oil.

In cetaceous fiſhes, the fat is thin as oil; in animals that live on herbage only, the fat is harder, and yet harder in thoſe that chew the cud.

The Arabians uſed a great variety of fat, in medicine; but to relax the parts to which they are applied, and to ſtop perſpiration, are all the chief virtues that experience manifeſts in them. In the preſent practice, three kinds only are met with, and theſe only on account of their different conſiſtence; they are the fat of vipers, hogs-lard, and mutton-ſuet. Their uſe is wholly external. As to vipers fat, it is well ſupplied by the oil of olives; for it does not appear that animal fats, and inſipid, flavourleſs, vegetable oils, of ſimilar conſiſtence, differ in their effects when uſed externally; in other inſtances too, there ſeems to be a greater ſimilarity of nature betwixt animal and vegetable fats, or inſipid oils, than in any other ſimilar animal and vegetable ſubſtances, ſuch as gums and animal jellies: animal fats, in their reſolution by fire, yield neither the peculiar ſtench, nor much, if any of the volatile alkaline ſalt, which ſubſtances completely animalized afford.

Animal fats are not ſoluble in ſpt. vin. R. nor in water. When ſcented with eſſential oils, the oils may be totally extracted by digeſtion in ſp. vini R. And by the ſame means alſo, in a leſſer degree by water. Fats may thus be freed from their ill-ſmell; and thoſe that are become very rancid, may be made very ſweet.

Animal fats preſerve ſteel from ruſt better than vegetable ones: mutton ſuet prevents braſs from growing ill-coloured, longer than any other fat; and if a little camphor and white lead is added, theſe ends are ſtill better anſwered.

ADIPIS SUILLÆ SEVIQUE OVILLI PRÆPARATIO.
The preparation of Hogs lard and Mutton ſuet.

Cut them into pieces, and melt them with a ſlow fire, then ſeparate them from the membranes by ſtraining. Ph. Lond. 1788.

The fat of vipers being ſeparated from their inteſtines, may be melted before a gentle fire, and run through a thin linen cloth.

See Haller's Phyſiology, in the chapter on the cellular membrane.

ADEPTA PHILOSOPHIA. ADEPT PHILOSOPHY. It is that philoſophy, whoſe end is the tranſmutation of metals, and an univerſal remedy. The profeſſors of this philoſophy are called ADEPTI, adepts. Paracelſus calls that, medicina *adepta*, which treats of the diſeaſes that are contracted by celeſtial operations, or communicated from heaven.

ADHATODA. The MALABAR NUT. There are two ſpecies, viz. the *adhatoda Zeylanenſium*, or, common Malabar nut; and the *adhatoda Indica*; *ſeu Hyſſopi folia*: the willow-leaved Malabar nut, commonly called the *ſnap-tree*. Theſe are of the genus called by Linnæus juſticia.

The virtue aſcribed to it, is to expel the dead fœtus; that being the meaning of *adhatoda* in the Zeylanic language. Miller's Dict.

ADHESIO, ADHESION, In medicine, a term uſed for two parts ſticking together, which are naturally ſeparate.

If any of thoſe parts in the thorax or belly lie in contact, and inflame, they commonly grow together. The lungs very frequently adhere to the pleura.

On this ſubject ſee Dr. Flemyng's treatiſe on adhæſions, or accretions of the lungs; or an abſtract from it in the Med. Muſ. vol. i.

ADIACHYTOS, from α negative, and διαχυω, *to diffuſe, ſcatter*, or *be profuſe*. Decent in point of DRESS.

Hippocrates thinks the dreſs of a fop derogatory from the phyſician: he ſays, that many in his day hid their ignorance under ornaments of dreſs, and ſtrove to get the good liking of the people by their appearance at the public games.

ADIANTHUM, ADIANTUM. MAIDEN-HAIR. Alſo called *polytrichon* and *polytrichum*, from πολυς, *much*, and θριξ, *hair*; expreſſive of a capillary herb.

Maiden-hair is an evergreen low plant, with ſlender, ſmooth, ſhining, blackiſh ſtalks, without any manifeſt flower: the ſeeds are a fine duſt, lying in roundiſh ſpecks about the edges of the backs of the leaves, which curl over and cover them.

Five ſpecies are noticed by botaniſts.

1. ADIANTHUM VERUM; called alſo capillus *Veneris*; *adianthum foliis coriandri*; *adianthum vulg.* It is the *adianthum capillis Veneris*. Lin.

THE TRUE MAIDEN-HAIR.

It is found in Cornwal, and in the mountainous parts of Wales; but it is moſt plentiful in the ſouth of Europe, as in France, Italy, &c.

2. ADIANTHUM CANADENSE; alſo called *adiant. fruticoſum Brazilianum*, avenqua; *adiant. Americanum*, & capil. Veneris *Canad.* It is the *adiantum pedatum* Lin.

AMERICAN, or CANADA MAIDEN-HAIR.

A native of America, but is cultivated in our gardens, and is the ſtrongeſt and moſt agreeable of all the ſorts.

3. ADIANTHUM NIGRUM; called *onopteris maſ.* adiant. foliis longioribus, *filicula*, *calliphillum*, *callitrichum*, *trichomanes*, and *polytrichum*. According to Linnæus it is the *aſplenium trichomanes*, or *aſplenium* frondibus pinnatis, *pinnis ſubrotundis crenatis*—CLASS; CRYPTOMANIA—ORDO; FILICES. Linn. Gen. Plan. 1178.

COMMON, or ENGLISH BLACK MAIDEN-HAIR.

It is perennial, grows wild on ſhady grounds, old walls, and rocks.

It hath a mucilaginous and roughiſh taſte, but little or no flavour. The ADIANTHUM ALBUM and AUREUM are the two others. But the three we have mentioned above only are in general uſe with us; *indeed the third ſupplies the place of them all.* Theſe plants, as do all of the capillary tribe, abound with a neutral ſaponaceous quality, approaching to nitre; they give out, with their mucilage, all their virtue to boiling water.

The beſt preparation is a ſtrong infuſion made with boiling water, and ſweetened with liquorice root. To be drank freely.

The French make a ſyrup of the true ſort, and flavour it with orange-flower water. The Canadians make a ſyrup of theirs, in which they uſe maple ſugar.

Our confectioners prepare a ſyrup as follows, which they ſell by the name of SYRUP OF CAPILLAIRE.

℞ Decoct. capil. Veneris Canadenſe, ℔ vj. mel Britan. ℥ xviii. fac. alb. opt. ℔ vii. ſp. m. & ſub finem, coct. adde aq. flor. aurant. ℥ iii.

Theſe ſyrups allay tickling coughs from defluxions of thin rheum, and aſſiſt the expectoration of phlegm.

As the virtues of theſe herbs are contained in their mucilage, they loſe nothing by drying. The flavour of the Canada ſpecies may ſuffer by the boiling; but, as a pectoral, that loſs is of no conſequence.

ADIAPNEUSTIA, from α, negative, and διαπνευω, *to perſpire*, or α, neg. δια, *per*, and πνεω, *to breathe*. IMPEDED PERSPIRATION, which was conſidered by the antients as the primary cauſe of fevers, from what they termed *vaporoſa & fuliginoſa effluvia*, not being permitted to paſs through the habits and cutaneous pores, hence productive of febrile affections.

ADIAPTOTOS, from α, negative, and διαπτωλω, *to ſtumble*,

ſtumble, or *ſlide*. The word ſignifies firm; but in medicine it is the name of a remedy againſt the colic, made of ſtone-parſley, henbane-ſeed, white pepper, &c. formed into an electary.

ADIARRHOEA, from α, negative, and διαῤῥέω, *perfluo, to flow out*, or *through*. It ſignifies a total ſuppreſſion of all the neceſſary evacuations.

ADIBAT. See ARGENT. VIVUM.

ADICE, ἀδίκη. See URTICA.

ADIPIS SUILLÆ PRÆPARATIO, OLIM AXUNGIÆ PORCINÆ CURATIO. See ADEPS.

ADIPOSÆ ARTERIÆ. They are branches from the phrenic arteries, which are ſpread on the fat that covers the kidnies. See CAPSULARES ARTERIÆ.

ADIPOSA MEMBRANA. See CELLULOSA MEMBRANA.

ADIPOSÆ VENÆ. Theſe ſpring from the emulgents, and go to the pinguious covering of the kidnies.

ADIPOSI DUCTUS. The bags or ducts containing the fat.

ADIPSIA. WANT OF THIRST. Dr. Cullen ranks this as a genus of diſeaſes, in the claſs locales, and order dyſorexiæ. But he thinks it is generally, if not always, ſympcomatic.

ADIPSON, Ἄδιψον, from α, negative, and δίψα, *thirſt*. See OXYMEL and PTISANA.

Medicines were thus named that allayed thirſt, if uſed for that end; and may be applied to ſuch as do not provoke thirſt.

Some cold things, by not exhaling the moiſture, and ſome hot ones by ſoliciting the ſaliva, are of this ſort.

The Greeks called liquorice-juice by this name. See GLYCYRRHIZA.

ADIPSOS. The Egyptian palm-tree is thus named by the Greeks. Its fruit, before it is ripe, is called *myrobalans*. Theophraſtus calls this tree βάλανος, i. e. *maſt*, from its fruit; but it is called adipſon, becauſe its fruit, before it is ripe, quenches thirſt.

ADIRIGE, i. e. Ammoniacum, moſt probably the ſalt.

ADJUTORIUM. See HUMERUS, or upper part of the arm, clearly deſcribed by ALBUCASIS. "Adjutorium is that bone which lies between the cubit and head of the ſcapula." It is alſo an external medicine uſed to aſſiſt internal ones.

ADJUVANTIA. See JUVANTIA.

ADMELLA. See ACMELLA.

ADMIRABILIS. An hyperbolical epithet to particular preparations: it was generally applied to factitious medical ſtones, and to Glauber's ſalt.

ADNATA, AGNATA, from *adnaſcor, to grow to*. The outer coat of the eye; called alſo *circumcalualis*, *circumoſſalis*, *albuginea*, *epipephycos*. It is that which makes the WHITE OF THE EYE, called alſo *exclopion*, and is thus formed: five of the muſcles which move the eye, take their origin from the bottom of the orbit, and the ſixth ariſes from the edge of it; they are all inſerted by a tendinous expanſion into the anterior part of the tunica ſclerotica; which expanſion gives the whiteneſs, peculiar to the fore part of the eye. It lies between the ſclerotica and conjunctiva. It is extremely ſenſible, and abounds with blood-veſſels, which are very viſible in inflammations. It covers ſo much of the eye as is called the white; and being reflected all round, it lines the two eye-lids, and thus hinders any thing from falling into the orbit. Where it covers the eye-lids, it is vaſcular and papillous. In paſſing over the orbit, it does not end at the cornea, but becomes tranſparent there, and is of different textures in different parts where it is ſpread. The ſclerotica appears under it.

When a foreign body gets between the eye and the eye-lid, it is hooked in the villi: the beſt way to extricate it is, to invert the eye-lid, and to introduce a probe armed with lint and dipped in oil, which will extract it.

The inverted eye-lid proceeds from this coat. Though it is exactly commenſurate to the orbit in health, yet in morbid habits, when it is inflamed, it is thickened and puffed out. If it does not yield to general remedies, as bleeding, purging, &c. ſcarify it, and if this alſo fails, cut off the redundant part.

ADNATA, alſo ſignifies ſuch parts of animal or vegetable bodies as are inſeparable, as the hair, wool, fruits, horns; or elſe accidental, as fungus, miſleto, and excreſcences.

ADNATA, ADNASCENTIA, are thoſe off-ſets which, by a new germination under the earth, proceed from the lily, hyacinth, &c. and afterwards grow to true roots.

ADOLESCENS, the iron bars that ſupport the fire in a grate or furnace.

Paracelſus would make a man without a woman, and digeſted ſemen maſculinum in a glaſs placed in a dung-hill, and produced ſomething like a man, according to the aſſertion of ſome of his diſciples; this was called homunculus Paracelſi; but would be as properly named adoleſcens.

ADOLESCENTIA. See ÆTAS.

ADOR, a ſort of corn called *ſpelta* and *zea*, SPELT CORN. Dioſcorides mentions two kinds of the monococcous and the dicoccous, that is ſuch as has only one grain or two in a huſk.

ADOS, water in which red-hot iron is extinguiſhed.

ADRARIZA. See ARISTOLOCHIA.

ADRAGANTH. See GUMMI TRAGACANTHA.

ADRAM. See GEMMÆ SAL.

ADROP. Rulandus calls it *azar*, *lapis ipſe*, and *azame*. Ripley calls it *uzifur*, or *plumbum rubeum*. It is a chemical term denoting the body itſelf, or lead, from whence mercury ought to be taken for the philoſophers ſtone; in which ſignification it is taken alſo by RIPLEY. Or it denotes the philoſophers ſtone itſelf. It is alſo called *ſaturnus*, i. e. antimony, or plumbum.

ADROBOLON, from ἀδρός, *large*, and βῶλος, *a globe*, *bole*, or *maſs*. The Indian *bdellium*, which is coarſer than the Arabian, being impure, black, and in large lumps.

ADROTERON. See ALICA.

ADSAMAR. See URINA.

ADSELLARE, to go to ſtool.

ADSTRICTIO, ADSTRICTION. It either expreſſes the ſtyptic quality of medicines, or the retention of the natural evacuations, by the rigidity of the reſpective emiſſories. See CONSTIPATIO.

ADSTRINGENTIA. Aſtringents. See ASTRINGENTIA.

ADULTERATIO. To adulterate, corrupt, or counterfeit. He who counterfeits medicines is often both a robber and a murderer.

ADUNATOS. See ADYNAMIA.

ADUSTA. Aduſt, burnt, ſcorched, or parched, from *aduro, to burn*, &c.

ADY, vel PALMA ADY. A palm-tree in the iſland of St. Thomas, which affords plenty of juice, that ferments into wine. The entire fruit is called by the Portugueſe *caryoces* and *carioſſe*, the natives call it *abanga*. The fruit externally is like a lemon, and contains a ſtone, the kernel of which, if heated in hot water, gives out an oil of a ſaffron colour, it concretes in the cold, and is uſed as butter: of theſe kernels the inhabitants give three or four as a reſtorative, two or three times a day.

ADYNAMIA, from α, negative, and δύναμις, *ſtrength*, *force*; LANGUOR, weakneſs, impotence from ſickneſs or diſeaſe: *adunatos*, *leipopſychia*. Alſo DROWSINESS, or SLEEPINESS, LASSITUDE, DEFECT OF VITAL POWERS. In Dr. Cullen's Noſology, this word diſtinguiſhes an order in his claſs neuroſes: he defines it to be diſeaſes conſiſting in a weakneſs or loſs of motion, in either the vital or natural functions. Theſe diſeaſes are alſo called *defectivi*.

ADYNAMON, A FACTITIOUS WINE. It is made of two parts muſt and one of water, which are boiled together till as much is conſumed as there was added of water. It hath the ſame derivation as adynamia.

ÆDOIA, from αἰδώς, *modeſty*. See PUDENDA.

ÆDOSOPHIA, from αἰδώς, *pudenda*, and ψόφος, *ſtrepitum edo*. In the Noſology of Sauvages, alſo of Sagar, it is defined to be a flatus paſſing from the uterus, or from the urinary bladder, through the vagina or the urethra; hence is it formed into two ſpecies, ÆDOSOPHIA URETHRÆ & UTERINA. This flatus is ſometimes very fœtid, which circumſtance cannot always be accounted for. It ſometimes happens when women are in labour, and hath been taken for a ſign that the child is dead, but this cannot be depended on; an intolerable ſtench ſometimes attends when the child is living. See Sauvages Noſologia Methodica, vol. ii. p. 417.

ÆGAGROPILA, from αἰγαγρος, and πίλος; Rubi-capra and πίλος, *pila* vel *globulus*, the ROCK-GOAT. See CAPRA ALPINA.

ÆGEIRINON. Αἰγειρος, *a poplar*. An ointment ſo called, becauſe the fruit of the poplar, or its catkins, are an ingredient in it.

ÆGEIROS. See POPULUS.

ÆGIAS. A white ſpeck on the pupil of the eye, which occaſions a dimneſs of ſight.

ÆGIDES, αιγιδες. Small white cicatrices of the eyes, cauſed by a ſharp humour there; or ſmall white concretions on the pupil; called alſo *aglia*.

In inflamations we ſee little white ſpecks on the pupil of the eye, like a film, if an afflux of humours are conſiderable; theſe always diſappear ſpontaneouſly when the inflammation is reſolved and the humours diverted; but if ſharp powders are uſed, or collyriums applied, they oft are hardened ſo as never after to be moved. Theſe ſeem to be what are meant by ægides. See ALBUGO.

ÆGIDION, from αιγιας, or αιγις. The name of a collyrium for inflammations and defluxions of the eyes, called alſo *ægoproſophon*.

ÆGILOPS. See ÆGYLOPS.

ÆGOCERAS, from αιξ, *a goat*, and κερας, *a horn*. See FÆNUM GRÆCUM.

ÆGOLETHON, from αιξ, *a goat*, and ολεθρος, *deſtruction*. Dioſcorides, Pliny, and others, take notice of this, and ſpeak of it as a tree, from the leaves of which bees gather honey about Heraclea in Pontus, which honey is ſometimes poiſonous, ſometimes not. Tournefort ſays it is the *chamærododendron*. See Mem. de l'Acad. Roy. des Sciences, 1704.

ÆGONYCHON, GROMWELL. So called from αιξ, *a goat*, and ονυξ, *a hoof*, becauſe of the hardneſs of the ſeed. See LITHOSPERMUM.

ÆGOPROSOPHON. See ÆGIDION.

ÆGRITUDO BOVINA. See BOVINA AFFECTIO.

ÆGYLOPS or ÆGILOPS. A diſeaſe in the inward corner of the eye; ſo called from αιξ, *a goat*, and ωψ, *an eye*, or *goat's eye*; becauſe, according to ſome, goats are ſubject to this diſeaſe.

Paulus Ægineta calls it *anchylops* before it burſts, and *ægylops* after. Avicenna calls it *garab* and *algarab*. Anchylops and *ægylops*, are but different ſtates of the diſorder called *fiſtula lachrymalis*. The *ægylops* is the fiſtula lachrymalis beginning to diſcharge pus. Dr. Wallis ſays, why the diſtinction of the ancients ſhould be at preſent neglected with reſpect to the anchylops and ægylops, and a general term adopted which is in itſelf highly abſurd will not be eaſy to account for. Surely to denominate a complaint fiſtulous, where no fiſtula exiſts, muſt be ridiculous, and the two different ſpecies as well as a third are ſtyled fiſtula lachrymalis by the moderns. Some of the ancient phyſicians conſidered the lachrymal ſac in its ſtate of tumefaction as an achylops; when ruptured an ægylops; and certainly the diſtinction ought to be preſerved. —See his Noſologia Methodica Oculorum. Article, *Epiphora a Rhyade*.

It is either ſcrophulous, atheromatous, or of the nature of a meliceris.

Sometimes it is a ſymptom of the lues venerea. Sometimes it is with, and at others without inflammation. If it is attended with eroſion, it terminates in a cancer. In opening this abceſs, we ſhould be careful not to cut the edge of the eye-lid, for thus an incurable waterineſs will there be occaſioned.

When it is ſtrumous, it proceeds from congeſtion, and the tubercle is round without diſcolouring the ſkin. If it is cauſed by fluxion, pain and redneſs appear, with inflammation all over the eye. Sometimes it begins with a weeping, and is not ſuſpected until a redneſs appears in the eye, and then by a gentle preſſure on the part, a matter is diſcharge, a part of which reſembles the white of an egg. If this matter makes its way into the noſe, it acquires a fœtid ſmell, and is diſcharged through the noſtril.

As to the cure, if the caſe is recent, we ſhould begin with a cautious uſe of bleeding and purging; or if theſe are contraindicated, give ſuch alteratives as are moſt eſteemed in ſcrophulous diſorders. The tumor may be reſolved by anodyne and diſcutient applications; but if there is a tendency to a ſuppuration it ſhould be haſtened, and the diſcharge of the pus, with all convenient ſpeed, leſt the bone underneath ſhould be affected; the abſceſs cleanſed and healed, with the tinct. of myrrh and aloes mixed with mel roſæ. If the matter had paſſed alſo under the cilium, a powerful deſiccative, ſuch as ſtrong lime-water, aſſiſted by a compreſs, ſhould be uſed.

If the perioſteum under the tumor is laid bare, an exfoliation muſt be haſtened by a cauſtic, and a paſſage opened into the noſe, after which dry lint alone may ſuffice. Too conſtricting medicines may produce a rhyas, ſee RHYAS; too digeſtive applications may give riſe to an encanthis. See FISTULA LACHRYMALIS; much alſo has been ſaid by Galen, Aetius, Celſus, Paulus Ægineta, Auctarius, Sennertus, Wiſeman, Heiſter, Pott, Bell, Kirkland, Ware.

ÆGYLOPS, or ÆGILOPS. Avena ſterilis, Bromus ſterilis, Feſtuca avenacea, Gramen avenaceum. *Bromus herba, Avæna, Græco, Acroſpelos.* The GREAT WILD OAT GRASS or DRANK. The roots are full of ſmall fibres, ſeveral ſtalks riſe from a root, and are joined. It grows in hedges and the ſides of fields in May. By culture it becomes a ſpecies of corn. In the northern parts of America it is improved to great advantage; and in the low wet boggy grounds in Great Britain, it would be profitable, perhaps, beyond any thing elſe, as it thrives beſt in water. It grows like oats, but in quality is more of the rice kind. A decóction of the roots kills worms.

ÆGYPTIA ANTIDOTUS, the Egyptian antidote. This is a name, not of one but of ſeveral compoſitions. ——*Moſchato.* See ABELMOSCHUS.—— ULCERA, alſo called SYRIAN ULCERS. Aretæus deſcribes an ulcer of the tonſils and fauces by theſe names; they are attended with a burning pain; the matter diſcharged from them infects the whole frame, and the patient is rendered miſerable by its offenſive ſmell.

ÆGYPTIACA. See PAPYRUS.

ÆGYPTIACUM BALSAMUM. Balſ. Gilead. See BALSAMUM.

ÆGYPTIACUM UNG. called alſo *mel Ægyptiacum*, an ointment ſo called from its being ſaid to be of an Ægyptian origin, though ſome ſay from its colour, but improbably. Meſue is its ſuppoſed author. This ointment now is properly rejected, and its place ſupplied by the following:

Oxymel Æruginis.

℞. Æruginis pp. i. p. ℥ ij. aceti. ℥ vij. Mellis deſpumati, ℥ xiv. Diſſolve the verdegris in the vinegar, and ſtrain it through a linen rag, then add the honey, and boil it down to a proper conſiſtence.—Ph. Lond. 1788. The principal uſe of this compoſition is to deterge foul ulcers, keep down the fungous fleſh, and to aſſiſt in the cure of venereal ulceration in the mouth and tonſils.

ÆGYPTION. See CATAPUTIA, alſo the name of a topic uſed by the ancients in uterine diſorders.

ÆGYPTIUM ALBUM. See CRINOMYRON.

ÆGYPTIUM CROCEUM UNG. Both theſe are deſcribed by Aetius.

ÆGYPTIUM PHARMACUM AD AURES. The name of one of Aetius's compoſitions.

ÆGYPTIUS PESSUS. A peſſary deſcribed by Paulus Ægineta: it is made of honey, turpentine, ſaffron, oil, verdegris, &c.

ÆICHRYSON, from αει, *always*, and χρυσος, *gold*. See SEDUM.

ÆIGLUCES, from αει, *always*, and γλυκυς, *ſweet*. A ſweet ſort of wine is thus named. As ſoon as the muſt is turned, the veſſel is placed under water, and their kept all the winter, that it may be cool, and not be completely turned into wine.

ÆIPATHIA, αει, *always*, and παθεια, *paſſion*. A paſſion of long continuance. BLANCARD

ÆITHALES, from αει, *always*, and θαλλω, *to be green*. See SEDUM MAJUS.

ÆIZOON, from αει, *always*, and ζωη, *life*, a name of the ſempervivum, or ſedum.

AEL. See ALLA.

ÆLUROPO, SYR. DE. See GNAPHALIUM MONTANUM.

ÆMBILLÆ. See LACCA INDICA.

ÆNEA, an epithet given to the inſtrument called a catheter, from the matter of which it was formed.

ÆON, αιων, *the whole age of a man*. But Hippocrates uſes it to ſignify the remains of a man's life. See alſo MEDULLA SPINALIS.

ÆONION. See SEDUM.

ÆORA, from αειρω, *to lift up*, to ſuſpend on high. Geſtatio, a ſpecies of exerciſe uſed by the ancients, and of which Aetius gives the following account:

GESTATION, while it exerciſes the body and limbs, ſtill they ſeem to be at reſt. Of the motion there are ſeveral kinds.

1ſt, Swimming in a hammock, which, at the decline of a fever, is beneficial.

2dly, Being carried in a litter, in which the patient either ſits or lies along. It is uſeful when the gout, ſtone, and ſuch other diſorders attend, that do not admit of violent motions.

3dly, Riding in a chariot, which is of ſervice in moſt chronical diſorders, eſpecially before the ſtronger exerciſe can be admitted.

4thly, Sailing in a boat or a ſhip. This produces various effects, according to the different agitation of the waters,

waters, and in many tedious chronical diſorders proves efficacious beyond what is obſerved from the moſt ſkilful adminiſtration of drugs. Theſe are inſtances of paſſive exerciſe, and are uſeful, particularly when active exerciſe would be improper, or impracticable. Aſclepiades was the firſt who brought paſſive exerciſe into practice, which was uſed after ſevere illneſs, in order to conquer debility, and invogarate the ſyſtem by gentle means.

ÆQUINOCTIUM, the equinox. This is when the days and nights are of equal length, when the ſun is in the equinoctial circle.

Ælius places their vernal equinox on the 23d of March, and the autumnal on the 25th of September. Paulus Ægineta makes the autumnal a day ſooner. The modern aſtronomers generally fix them on the 20th of March, and 23d in September. Theſe ſeaſons are conſidered as unfriendly to health.

AER, Ἀήρ, *air*, called alſo *Gas ventoſum*. It is that tranſparent, elaſtic, ponderous, compreſſible fluid, which ſurrounds the terraqueous globe, and which, when greatly agitated or driven in currents, is called wind. From a variety of experiments, atmoſpheric air is proved to conſiſt of a mixture of about 72 parts of nitrogene gas, to 28 of oxygene. Lavoisier ſays, of about 27 parts vital air, and 73 mephitic. But the proportion of theſe two gaſſes, is ſubject to variation, in the mixture which forms the atmoſphere; but this difference depends only upon local cauſes; the moſt uſual proportion, is that which we have here ſpecified. Before the preſent æra of chemiſtry, it was the only gaſeous ſubſtance known; and, indeed, almoſt all that has been written on the air, relates only to its phyſical properties. The chief of which are: First, That it is a fluid of extreme rarefaction, obedient to the ſmalleſt motion: the ſlighteſt agitation deranges it; and its equilibrium, which is continually deſtroyed, is continually endeavouring to reſtore itſelf. Though very fluid, it paſſes through the orifices with difficulty, through which groſſer fluids can paſs with eaſe. Second, It is inviſible; it refracts, but does not reflect the rays of light: it is inodorous, though the vehicle of odorant particles: it is inſipid; and it ought to be attributed to phyſical qualities when its contact affects us variouſly. Third, The weight of the *air* is not perceived but in large quantities; nor is the comparative weight eaſily, if at all to be aſcertained, as no two portions are ever of the ſame weight in two parts of the atmoſphere. However, from long and repeated obſervations, the greateſt gravity of the air in Europe is found to be equal, in equilibrio, with 30½ inches of quickſilver in the barometer, and the leaſt raiſes it only to 27½. The weight of the common *air* about the ſurface of the earth, at the time of the middle weight of the atmoſphere, and in every temperate ſeaſon, is to that of water as 1 to 850. Fourth, The elaſticity of the air is one of the properties upon which natural philoſophers have made the greateſt number of experiments, and it has ever been applied with conſiderable advantage in the arts. Fifth, *Air* is neceſſary to animal exiſtence. This is evident from the experiments made with the air-pump, though not without ſome exceptions, for toads, vipers, eels, inſects of all kinds, and fiſh, live in the exhauſted receiver. Sixth, The particles of *air* are too ſmall for any microſcope to diſcover, and yet they are larger than thoſe of fire, water, oil, and many other fluids. Fire pervades glaſs, oil, water, &c. will paſs through many compact ſubſtances, whilſt air is reſiſted by ſtrong paper. Seventh, *Air* is the vehicle of ſound, of the objects of taſte, of effluvia to the noſe, as is evident from obſervations made on the tops of high mountains, where our ſenſes become duller than when we are nearer the plains. Eighth, It is a part in the compoſition of all bodies. Ninth, It is a common medium, by which the union of the parts of bodies is formed and preſerved. Tenth, It is fluid, and cannot be rendered of itſelf ſolid by any known means. Eleventh, It is elaſtic; but by contact and coheſion in the parts of bodies, it becomes ſolid and unelaſtic; from whence again, by heat, fermentation, &c. it being ſeparated, its elaſticity returns. Heat rarifies, and cold condenſes it.

Numerous and important are the other known properties of the *air*; but this ſubject being too extenſive to admit of a minute detail of its peculiarities, after reciting a few of the moſt important obſervations on it, as it appertains to medicine, the reader will be referred to the authors who have written on this ſubject more copiouſly.

Air passing over clayey ground is *moiſt* and *thick*; dry and ſandy ground, it is *dry and duſty*; dry and ſtoney, it is *dry and pure*; on the tops of hills it is *thin, free from vapours, and cool*; in vallies, it is *groſs, impure, and hot*, though in winter, if the hills are very high, the vales are the coldeſt, becauſe they are overſhadowed: on the declivity of the hills, the *air* is generally *pure, and of moderate temperature*; and in an open country, ſuch as is proper for hunting, the *air* is generally *moderate in all its qualities of heat, coldneſs, dryneſs, and moiſture*.

North and north-eaſt winds are reckoned bracing and healthy, but the valetudinarian is moſt comfortable when the wind is ſouth and ſouth-weſt. Dry ſeaſons in general are more ſalutary than wet. We eat more and digeſt better in winter than in ſummer. Our diſpoſitions and tempers are greatly affected by the ſeaſons; long eaſterly winds will make chearful people very irritable and moroſe.

An excess of gravity in the air quickens the circulation, dilates the lungs too much; and by compreſſing the cutaneous veſſels, drives the blood copiouſly to the brain; whence pleuriſies, peripneumonies, quinſies, head-ach, vertigo, &c.

If the air is too light, by retarding the circulation of the blood, and diminiſhing the external reſiſtance to the fluids contained in the pulmonary veſſels, it cauſes an hæmoptyſis, hyſteric and hypochondriac diſeaſes, rheumatiſm, gout, nervous and intermittent diſorders.

Too hot an air weakens the fibres, by enlarging the bulk of the humours; it quickens the circulation, and too much increaſes perſpiration, whence an acrimony is induced in the remaining juices. If this ſtate of the air continues, or if cold ſuddenly comes upon it, ardent, bilious, and other fevers follow.

A cold air cauſes topical inflammations, ſuch as quinſies, pleuriſies, peripneumonies, by over-diſtending the lungs, from its gravity conſtringing the fibres, condenſing the humours, and leſſening the perſpiration.

Too dry air ſhrivels up the ſolids, incraſſates the fluids, and diſpoſes to fevers.

A too moist air is extremely injurious: it relaxes and debilitates, it leſſens perſpiration, renders the blood too watery, produces coughs, aſthmas, dropſies, intermittent and nervous diſorders.

From a mixture of theſe different qualities of the *air*, different diſorders are produced: *cold and moiſt air* are bad, but *hot, moiſt, and light air* is the worſt of all, becauſe of its relaxing putreſcent tendency. Beſides the above evident qualities, there are others that eſcape the ſenſe, though manifeſt by woeful effects; ſuch are from infections, malignant miaſmata, exhalations, &c.

It is obſerved, by ſome, that vaults, corn magazines, apple-garrets, &c. ſhould open to the north, for that point is invariably proper: but the ſouth and weſt are almoſt conſtantly improper. The moſt healthy expoſure, if a houſe is to be built, is found as follows: cut one of the trees that grows there tranſverſely with a ſaw, then cloſely obſerve the rings; the ſide of the tree on which the diſtances between each ring is wideſt, is the moſt healthy expoſure, and the windows of the houſe, all other circumſtances being the ſame, ſhould ever face that way.

The infirm and valetudinary ſuffer much from the diſpoſition and changes of the *air*. Dr. Keil obſerves that, bodies emaciated by ſickneſs or evacuations, draw more than full ones. Dr. Monro, ſen. aſſerts, that the body abſorbs more or leſs according to its vigour: hence, a reaſon may be given why thoſe who ſuffer by chronical diſtempers feel more uneaſineſs or pains in the evenings, particularly in the ſpring and autumn, than during the day, in the winter and ſummer ſeaſon. The abſorbing power of the body being increaſed by diſeaſe, and the *air* being more replete with matter, it is unſalutary at theſe times, and very eaſily accounts for their complaints during thoſe ſeaſons. Hence we diſcern why early going to bed is productive of advantages ſo manifeſt in thoſe diſordered perſons whoſe prudence leads them to early repoſe.

Beſides the common, or atmoſpherical *air*, there are various other ſorts, diſtinguiſhed by their reſpective characteriſtics. Some of which we ſhall here enumerate: 1ſt. Air, Fixed or Fixable. By Van Helmont, it was called *gas ſylveſtre*, from being produced in vaſt quantities from the burning of charcoal; from its noxious qualities, *mephitic air*, or *gas*; *azote*, or *azotic gas*; from its apparent acid properties, *aerial acid*, *cretaceous acid*, and *carbonic acid*; and *fixed air*, as readily loſing its elaſticity, and fixing itſelf

in

in many bodies. It is an invifible, and permanently elaftic fluid, fuperior in gravity to the common atmofpheric air, and moft other aerial fluids; exceedingly deftructive to animal life, and produced, in great quantities, naturally from combuftible bodies, and many chemical proceffes. It is found at the bottom of pits; it rifes from fermenting liquors; it is one and a half heavier than pure common *air*; water imbibes more than its own bulk of it, flame is extinguifhed, and animals are deftroyed by it, even vegetables fuffer by its influence; when the fixable *air* is feparated from chalk and other calcareous fubftances, they become cauftic; it is antifeptic, powerfully preventing and recovering from putrefaction, whence lime kilns, which difcharge great quantities of *air* would be ufeful in the neighbourhood of populous towns; in glyfters it hath been very advantageoufly adminiftered againft putrid diforders, and mixed with the drink, has been thought to conduce to the relief of patients labouring under putrid fevers; but, though it may be introduced into the ftomach and inteftines with advantage, if breathed into the lungs, it is mortal; to fixable *air*, the chief property of mineral waters is attributed; the Pyrmont and Seltzer water owe their brifk tafte and fparkling appearance to it; and it powerfully diffolves iron when it is mixed with water. This air is recommended as a vermifuge, adminiftering it, by diffolving kali. gr. xv. in aq. fimp. ℥iij. then in another veffel acidulate the fame fluid, about an equal quantity, with as much acidum vitrioli dilutum, as is requifite for faturating the kali. this done, the patient drinks one of thefe potions, and immediately after it, the other: thus an effervefcence takes place in the ftomach, where all the extricated *air* is retained, and from whence it is diftributed with the chyle, &c. with confiderable advantage in various other medical intentions. In order to convey fixable *air* in a feparate ftate into the ftomach, it is the practice of fome to ufe the natron cum crem. tart. gr. v. ad faturat. They obferve, that when the kali is ufed, the *air* is difcharged before the mixture is completely fwallowed; but with the natron, the difcharge of *air* requires fome time. Hence, in fuppreffing vomiting, and in all thofe cafes in which fixed *air* is ufefully conveyed into the ftomach, this method excels. Fixable *air* hath been found ufeful in cancerous, conſumptive, fcorbutic, and other diforders, where an antifeptic medicine might be expected to afford relief. It has not only been confidered as antiputrefcent, but alfo lithontriptic.

2. AIR, VITAL; called alfo *dephlogifticated, empyreal, highly refpirable air*. It is confidered to be, what chemifts term, the *oxygenous gas*, part of the atmofpheric *air*, and is the only gas proper for refpiration; the phenomena of which have been very imperfectly known till lately. The ancients are faid to have had the moft accurate ideas of refpiration. They admitted the *air* as a principle proper to nourifh and fupport life; hence called *Spiritabulum vitæ*; and HIPPOCRATES expreſsly fays, "*Spiritum etiam alimentum eſt.*" From a variety of experiments, modern philofophers have proved, that in refpiration, a portion of *air* is abolifhed: that the firft effect which is produced, is the blood aſſuming a vermilion colour, by combining with pure air. The fecond, is to eſtablifh a real focus of heat in the lungs, maintained and kept up by the *air* of refpiration; for perſons who have refpired vital *air*, have confeſſed, that they perceived a gentle heat vivifying the lungs, and inſenſibly extending from the breaſt into all the other parts of the body. *Vital air* is conſidered, by combining with the blood, to form carbonic acid, allowed to be an antiputrefcent, ſo long as it remains in circulation, but that it is afterwards emitted through the pores of the ſkin. It has been uſed with ſucceſs in certain diſorders of the human machine, particularly in conſumptions.

3. AIR, INFLAMMABLE. It is the pure and aqueous inflammable gas, improperly called *inflammable air*; is the lighteſt of all the aeriform fluids: ſome ſay it is uſually about ten times, others thirteen; but MORVEAU ſays that it has been obtained ſeventeen times lighter than atmoſpheric *air*. All animal and vegetable ſubſtances, which can be burned in the open *air*, charcoal excepted, will afford *inflammable air*, if heated in cloſed veſſels: this though is uſually mixed with *air* of other kinds, and with oleaginous matters. Charcoal, and ſeveral metals, afford *inflammable air* by heat, if water be preſent. Some metallic ſubſtances, during their ſolution in acids, afford, or extricate *inflammable air*, which is of the pureſt kind. The common proceſs for obtaining it, is by diſſolving iron filings or ſhavings in diluted vitriolic acid. It occupies the upper parts of ſubterraneous places; and has been commonly found in mines and coal-pits, where it is called FIRE DAMP; becauſe it is liable to take fire, and explode, like gunpowder. It extinguiſhes fire, kills animals as readily as fixable air; but, in ſome remarkable properties, theſe two *airs* are the reverſe of one another; takes fire by contact of the electric ſpark, provided vital *air* be preſent, or any combuſtible body already in a ſtate of ignition, and burning with a briſliant flame. If, about two parts, by meaſure, of *inflammable air*, and one of vital *air*, are mixed together, and ſet on fire in a veſſel ſtrongly cloſed, which may be done by the electric ſpark, the *air*, if pure, will almoſt totally diſappear, and the product be water, and an acid. Dr. PRIESTLEY thought, that this *air* conſiſted chiefly, if not wholly of the vitriolic or marine acid vapour, united with phlogiſton; but has ſince found, that *inflammable air*, and phlogiſton, are the ſame ſubſtance.

4. AIR, ACID. This is a ſpecies of factitious *air*, firſt produced from copper, by means of ſpirit of ſalt; afterwards expelled by heat from ſpirit of ſalt only, without any metallic ſolution, and alſo by the ſame kind of proceſs by which ſpirit of ſalt is made: this elaſtic fluid has a ſtrong and penetrating ſmell; it extinguiſhes candles, deſtroys the life of animals, reddens blue vegetable colours, abſorbs the vapors of water which float in the air, and forms with them a white fume. In water it becomes diſſolved, and loſes that heat which maintained its elaſtic ſtate. It renders the water with which it is mixed, very acid, but loſes its elaſticity when ſo combined. It cannot be condenſed by cold, as the vapors of water, and ſo may be called an *acid air*. It is heavier than common *air*: one-third, joined with two-thirds pure water, forms muriatic acid. This *air*, or gas, cauſes ice to melt with great rapidity, by reaſon of the heat it gives out, the inſtant of its combination with water: it is abſorbed by charcoal, and ſpunge; unites with all the alkaline baſe, and forms a muriatic ſalt, and diſſolves camphor. The nature of this *air* is not well known: it does not act on metals.

5. AIR, ALKALINE. This permanently elaſtic fluid, conſiſts of pure alkali itſelf: it is diſengaged by heat from the volatile fluor alkali; and ſtill more readily from a mixture of common, ſal ammoniac, and quicklime. This fluid is lighter than atmoſpheric *air*: it unites with water, giving out, at the ſame time, much heat: it melts ice, converts ſyrup of violets, and blue and red flowers to a green colour; combines rapidly with the acid gaſſes of chalk, ſulphur, and common ſalt. The volatile alkali is compoſed of about 120 parts of nitrogene gas to 32 of hydrogene. This gas, with water, forms the volatile alkali, commonly called ſpirit of ſal ammoniac, with lime. It kills animals, and corrodes the ſkin: ſuch is the irritation that it occaſions, that pimples have been ſeen to ariſe all over the bodies of ſome birds expoſed to its atmoſphere. It is not condenſible by cold.

6. NITROUS AIR. This elaſtic fluid is diſengaged during the action of a great number of combuſtible bodies on the nitrous acid; more eſpecially pyrites, metals, oils, mucilages, and ſpirit of wine: it extinguiſhes flame, deprives animals of life; is neither acid nor alkaline, and is not altered by pure water; with pure air it forms again the nitrous acid, becauſe it is itſelf nothing elſe but the nitrous acid, deprived of a part of the oxygene principle, and conſequently compoſed of the nephritic oxyginous principle, containing more of the former and leſs of the latter than the nitrous acid itſelf. Its uſefulneſs in ſome inſtances ſeem to excel the fixable *air*. One of its moſt conſpicuous properties is the great diminution of any quantity of common *air* with which it is mixed, attended with a turbid red or deep orange colour and a conſiderable heat: this is truly ſurpriſing, in this inſtance, a quantity of *air*, as it were, devours a quantity of another kind of *air* half as large as itſelf, and yet is ſo far from gaining any addition to its bulk, that it is conſiderably diminiſhed by it. The ſmell of the *air* much reſembles that of the ſmoaking ſpirit of nitre. Diſtilled water imbibes about one-tenth of its bulk of this kind of *air*, and then very obſtinately retains it. The nitrous *air* preſerves animal ſubſtances from putrefaction, and reſtores thoſe that are already putrid, in a degree far ſuperior to what is done by fixable *air*. Preparations of it may be uſed with ſucceſs for checking or correcting putrefaction in the inteſtinal canal, or other parts of the animal ſyſtem. It is peculiarly offenſive to ſeveral kinds of inſects, and probably

probably might be ſo managed as to be deſtructive of worms.

Air is injured by candles, &c. burning in it, or by crouds of people breathing in it. A common candle is ſaid to conſume (i. e. render unfit for uſe) a gallon of *air* in a minute; if ſo, how is the due reſtoration made of what is injured by the reſpiration of animals, by flames of every kind, &c. The diminution of common *air* by the burning candles, &c. is in part owing to the precipitation of the fixable *air* from it; which may be effected by ſomething emitted from the burning bodies which has a ſtronger affinity with the other conſtituent parts of the atmoſphere. In part, putrid and other kind of vapours are diffuſed in the *air*, by which it is greatly vitiated. But by the vegetation of plants, which imbibe the offending matter, injured *air* is in part reſtored to its former ſtate; the agitation of the waters, as ſeas, lakes, rivers, &c. contribute to the purification of the *air*. The burning of many materials ſets at liberty their fixable *air*, which in part becoming elaſtic, ſupplies the defect made in the atmoſphere, by the cauſes above mentioned; hence the ſeeming deſtruction of the *air* is but a circulation of it.

The extent of this ſubject and its influence in the healing art, renders an attention to it neceſſary, and the enquirer will meet with much light thrown thereon in his peruſal of the following, viz.

Hoffman, in his Med. Rat. Syſt. artic. de Aere.

Boerhaave on Air. Theſe two authors have treated on *air* both philoſophically and medically; the latter hath collected all that is valuable from both his predeceſſors and contemporaries.

Hale's Statical Experiments. Dr. Fr. Cliffton's tranſlation of Hippocrates on Air, &c. Arburthnot on Air. Huxham on Air and Epidemic Diſeaſes. Shaw's Abridgement of Boyle's Works, in the article Air. Macbride's Eſſay on the Nature and Properties of Fixed Air; and Prieſtley on Different Kinds of Air. Dictionary of Chemiſtry, edit. ii. Percival's Eſſays, vol. ii. and iii. Dobſon on Fixed Air. Chaptal's Elements of Chemiſtry, alſo Lavoiſiere, Fourcroy, Nicholſon, &c.

ÆRA. See LOLIUM.

ÆRDADI, ſo Paracelſus names certain ſpirits which he ſuppoſes to live in the air.

ÆREOLUM, a weight of about twenty grains.

ÆRIFICATIO. It is the producing of air from other bodies, or rather, converting them into air.

ÆRIS FLOS, FLOWERS of COPPER; called alſo *anthos*, *phraſium viride*, *hidrus*, *elzimar*, *eliz*, *attingat*, *alexanthus*, *diamaſcien*. Copper reduced to ſmall grains, by pouring cold water on it when in a ſtate of fuſion, is thus called. The cold water is poured on the copper as it runs out of the furnace into the receiver.——SQUAMÆ, FLAKES of COPPER. Theſe fly off in hammering this metal when heated. The beſt are of a deep yellow colour, and they ruſt if ſprinkled with vinegar. Theſe, from the Cyprian copper-works, are called *helitis*.——Vel VENERIS TINCTURA. ℞ Ærug. æris ʒj. aquæ ammon. &. ſp. vin. R. ää ʒ ß m. & ſient ſimul, donec, aqua colorem ſaphirinum acquiſiverit. This tincture is an admirable preparation, with which to make an injection for a gonorrhœa, if care be taken duly to dilute it, and ſkill enough is poſſeſſed to know when the infection is only in the urethra, a perſon may be ſoon and infallibly cured by it: to an ounce of pure water, add one drop of the above tincture.

Dr. W. Saunders obſerves, in his Lectures on the Mat. Med. that all ſolutions of metals are anti-inflammatory and ſedative, or eaſe pain, provided that the ſolution is not ſo ſtrong as to ſtimulate. VOLATALIS TINCTURA: ℞ Limaturæ cupri, ʒj. aquæ ammon. ʒxij. m. This ſolution hath been given internally to the quantity of four or five drops at a doſe, as a diuretic. Boerhaave directs to be given three drops, in a morning faſting, with a glaſs of mead, and this doſe to be daily doubled until the doſe is 24 drops, which continue for ſome days: thus he hath ſucceeded ſometimes in curing dropſies, though in other inſtances it failed him. When effectual, it produced very copious diſcharges of urine. This tincture is a good ſubſtitute for the cuprum ammoniacum of the Edinb. Diſp.

Metallic aſtringents are more active than alum, more powerful, more eaſily, and more quickly diſſolved in the ſtomach, are more diffuſive and extenſive in their influence on the habit, and to be preferred when ſpeedy effects are to be obtained. Of all the metals, copper is the moſt aſtringent, moſt ſoluble in the ſtomach; but the doſe is difficultly aſcertained, becauſe of the uncertainty of the acid in the ſtomach, whence it is rarely uſed. Dr. Saunders obſerves, that an over doſe of the ærugo æris, is active, ſtimulant, and aſtringent, and ſo quickly proves emetic, as be thrown up before it hurts: that an underdoſe excites a naufea, and that to uſe it to the greateſt advantage, is to give it in naufeating doſes. The tinct. Veneris vol. if given ſo as to purge and vomit, by its ſudden action, ſometimes does wonders.

Dr. G. Fordyce, in his Lectures on the Mat. Med. adviſes to withhold from the uſe cupreous preparations, when the intention is to ſtrengthen; but when it is deſigned to leſſen irritability, he ſays, they are extremely uſeful, particularly in hyſteric caſes attended with plethora, and in epileptic ſpaſms. In ſeveral inſtances of intermittents, and of mortifications, the preparations of copper, ſuch as were in a ſaline ſtate, as the cuprum ammoniac. the cuprum vitriolatum, and the tinct. Veneris vol. were equally efficacious with the bark; in this laſt uſe, the cuprum vitriolatum to gr. ſs. for a doſe, has effected wonders.

Dr. Brown, in his Natural Hiſtory of Jamaica, prefers preparations of copper, in thoſe dropſies which proceed from a general languor of the ſolid ſyſtem, in which caſe they prove very uſeful as diuretics and ſtrengtheners. He prefers the tinct. Veneris vol. to all other preparations of this metal. He farther remarks, that in hot climates where the body is much relaxed, the vitriol of copper is the beſt detergent of foul ulcers.

See Neuman's Chem. Works. Dict. of Chem. edit. ii.

ÆRITIS, ſee ANAGALLIS.

AEROLOGICE, *αηρ* and *λογος*, ſermo, that part of medicine which treats of air, explains its properties and uſe in the animal œconomy, and its efficacy in preſerving and reſtoring health.

AEROMELI. From *αηρ*, *air*, and *μελι*, *honey*. See MEL and MANNA.

AEROPHOBI, from *αηρ*, *air*, and *φοβος*, *fear*. According to Cœlius Aurelianus, ſome phrenetic patients are afraid of a lucid, and others of an obſcure air, and theſe he calls *aerophobi*. So that,

AEROPHOBIA, is a ſymptom of the phrenitis.

AEROSIS, an imaginary reſolution of the blood into vapour, ſuppoſed neceſſary to the ſupport of the vital ſpirits, and ſaid to be brought about by the ventilation of the air during inſpiration, in the manner that the flame of fuel is kindled by blowing it.

ÆROSUS Lapis, ſo Pliny calls the cadmia, which is ſuppoſed to be Galen's *cadmia lapidoſa*. See CADMIA.

ÆRUGINOSUS, Æruginous, of the colour of verdegriſe, or green. This word is often applied to what is diſcharged by vomiting of this colour, and to the bile.

ÆRUGO, the ruſt of any metal, but particularly of copper, called VERDEGRISE: it is alſo named *azagor*, *almizadir*. See Æs.

Theſe are the natural and artificial ſorts: of the firſt is a greeniſh marcaſite, like the drops of iron; it is found in copper mines, but is of no uſe. There is alſo on ſome mountains in Moravia a ſort of green grains like ſand, that is of a graſs green when uſed in painting. It is called the HUNGARIAN MOUNTAIN, OR SEA VERDEGRISE.——RASILIS. Hang a copper-plate over the ſtrongeſt vinegar ſo as not to touch it, and after ten days ſcrape off the ruſt, which is thus called.——SCOLECIA. Of this there are two ſorts, viz. the foſſile and the factitious; the foſſile is the beſt, the factitious is made as follows: put ij. ℔ of ſtrong wine vinegar into a Cyprian copper mortar, with a peſtle of the ſame, rub it round until it is ropy, when add a dram of alum, and the ſame quantity of tranſparent foſſil ſalt, or of nitre, beat them well in the ſun during the dog days until the whole is green and ropy, then draw it out in the form of worms.

Applied as a collyrium, being firſt mixed with gum ammoniacum, any of the verdegriſe deſtroys the calloſities of fiſtulas.

ÆRUGO ÆRIS, called alſo *viride æris*, *cupri rubigo*, *calcithos*, *aſagar*, *aſamar*, *aſigi*, *aſingar*, *aſmiar*, *aſugar*, *azagor*, *azragar*, *calcithiat*, *Hiſpanicum viride*, VERDEGRISE. It is copper corroded by a fermented vegetable acid, into a bluiſh green ſubſtance. The copper is made into very thin plates, which are ſuſpended over the vapours ariſing from wine, during its acetous fermentation: or the huſks and ſtalks of grapes are dried, and then being bruiſed, are dipped in wine and made into balls, which are left to ferment until they acquire the acetous quality; when they are broken with the

hand, and ſtratified with theſe copper-plates, and left until the verdegriſe is produced. The wine of Languedoc is the beſt for this uſe: but though, in reading a deſcription of the proceſs, the management ſeems very eaſy, yet trifles prevent ſucceſs, and render it very difficult to obtain. The beſt as well as the greateſt quantity is made at Montpelier, where there is one ſort in powder and another in lumps. The whole proceſs of making this article, as it is now practiſed in Montpelier, may be ſeen in the Cyclopedia under VERDIGREASE. The ſort which we receive from France is generally mixed with the ſtalks, &c. of grapes, which may be ſeparated by pulverization, they being more difficultly powdered than the verdegriſe itſelf. To purify it, diſſolve in ſix or ſeven times its weight of diſtilled vinegar, then decant and evaporate the ſolution. If good, it is dry, of a beautiful deep green, with a few white ſpots; and when rubbed on the hand with a little ſaliva or water, it forms a ſmooth paſte, free from grittineſs. It is adulterated by mixing pumice-ſtone, marble, vitriol, &c. The two firſt are diſcovered by wetting your thumb, and rubbing the ſuſpected verdegriſe betwixt it and your finger, by which the pumice-ſtone and marble becomes white: the latter is diſcovered by burning a little on a tile, by which the vitriol is turned into a red ſubſtance. In ſpirit of wine and in water, this concrete is partially ſoluble; in vinegar it is wholly ſo. If a faturate ſolution of it in vinegar is ſet to exhale in a warm place, the greateſt part of the verdegriſe may be recovered in a cryſtalline form; and if theſe cryſtals are diſtilled in a retort, the acetous acid aſcends from them in a highly concentrated ſtate, and the cryſtals are then called diſtilled or calcined verdegriſe, or the VITRIOL of VENUS; if ſet in a damp place to diſſolve, it is called the LIQUOR of VENUS. Verdegriſe is uſed by dyers, ſkinners, hatters, painters, &c. as well as in medicine: in miniature-painting the diſtilled ſort is the beſt. Its uſe, as an external medicine, is to deterge foul ulcers, being firſt mixed with other ingredients, as in the ung. baſil. virid. and the mel æruginis. If it is made into a paſte with ſaliva, or any thing not oily nor unctuous, hard calluſes may be diſſolved therewith. In phagedenic ulcers, and moſt unpromiſing ſores with ichor, fungus, ſtinking diſcharge, and turned edges, yaws, &c. copper applied to the ſore parts is uſeful. Foul chancres that yield not to mercury inwardly, have yielded to a ſolution of the cuprum vitriolatum. Whether venereal or ſcorbutic, or what elſe, apply the oxymel æruginis, or other preparations of copper; its ſtimulus helps nature to throw off ſloughs, particularly in ulcerated ſore throats. Internally taken, a vomiting is inſtantly provoked by a grain or two of verdegriſe, ſo for its ſpeedy effect it may be uſed to diſcharge any poiſonous matter received into the ſtomach. Large portions, as four drams or more, have been ſwallowed without any other inconvenience than the preſent vomiting; yet, in ſmaller quantities, beſides the vomiting, it excites a pain in the ſtomach and griping in the guts, cauſes a teneſmus, ulcerations, and bloody ſtools, difficult breathing, contractions of the limbs, &c. which often terminate in death. Hence great care ſhould be taken of copper or braſs veſſels in which acids or fats are boiled, leſt the verdegriſe obtained thereby ſhould be productive of diſeaſes: the ſcurvy in ſeamen is ſuppoſed to be produced by this, as one cauſe. See Lond. Med. Obſ. & Inq. vol. ii. Though acids, &c. while boiling, do not corrode the metal, a ſhort ſpace of time ſerves for the effect when the boiling heat is abated. In caſe of verdegriſe being ſwallowed, give oil and warm water, or large quantities of milk and water, both by the mouth and by the anus, in order to waſh away the whole of this offenſive matter, and endeavour to excite a diſcharge by vomiting with all poſſible ſpeed; after due evacuations an anodyne may be given; if there is great pain, muſk, or other cordials, with a milk diet, may then be preſcribed.

Verdegriſe cannot be reduced to powder but by levigation.

ÆS, called alſo *cuprum*, χαλκος, *Venus*, *Almatica*, *Almecaſide*, *Almechaſide*, *Bracium*, COPPER. It is found in many countries, but chiefly in Sweden, Hungary, and Germany.

The ores of copper are of various colours, from yellow to black, though generally they are blue, purple, violet, or green: the yellow is pure copper ore, the black contains a portion of ſilver. The ores of copper are ſmelted with great difficulty, and require many futions to render them pure. An eſſay may be thus made: firſt calcine a ſmall quantity of the ore, then take two ounces thereof and powder it fine, mix it with double its weight of black flux, intermixed with charcoal duſt, after which fuſe it briſkly in a wind furnace, that it may flow thin for half an hour, and the pure copper will be at the bottom.

Copper ſometimes reſembles gold: it is then named *chalcobaphinon*; LIBAVIUS calls it *Æs Corinarium*.

The chemical character for copper is ♀.

Its gravity is to ſilver as eight to ten; to gold, as eight to nineteen; and to water, as eight to one.

It is conderably but not entirely fixed in the fire.

It is malleable and ductile into a fine wire.

It is elaſtic and ſonorous.

It melts not before ignition, or a ſtrong white heat, and when melted, if a drop of cold water is let fall upon it, it flies about with violence, ſo that it is dangerous to the by-ſtanders.

It calcines by a weaker red heat into a red powder.

It readily diſſolves in any ſalt, and is perfectly diſſolved in aq. regia, and in the vitriolic acid, if made hot.

Diſſolved in any acid it gives a green tincture, though the acidum nitroſum ſoon becomes blue, after a portion of copper is diſſolved in it.

Diſſolved by fixed alkalies it is green, by the volatile it is blue. Dr. Lewis obſerves, that if the $\frac{1}{100}$ part of a grain of copper be diſſolved in a pint of water, a blue colour will be produced by adding a volatile alkali to it.

So great is its diviſibility, that one grain diſſolved in aqua ammonia, will tincture 385,200 times its weight of water.

A ſmall quantity of arſenic gives to copper a great degree of hardneſs and whiteneſs: thus pins may be made white and brittle by it. The hydrargyrus muriatus alſo whitens it.

Copper burns and gives a green flame in the fire or candle. If one part of copper filings is well ground with two parts or more of hydrargyrus muriatus, and then diſtilled in a glaſs retort, the mercury is ſent over pure and in its natural ſtate, and the copper remains intimately mixt with the ſalts in the form of a yelloviſh or reddiſh reſin, which is ſometimes tranſparent, at others opake; this reſin melts at a candle and gives a green flame.

If copper is calcined till all its ſulphur is waſted, it turns to a red aſh, which being expoſed on a tile to the focus of a great burning glaſs, is converted into a deep red glaſs. This glaſs melted on a piece of charcoal in the focus of the ſame glaſs becomes pure copper again. Hence copper evidently conſiſts of a red inflammable ſulphur and a vitrifiable earth, which laſt is its metallic part.

Copper and tin make a good BELL-METAL, which is uſeful in microſcopes add reflecting teleſcopes.

Copper and zinc form the PRINCE'S METAL.

Copper and the acid of grapes make verdegriſe.

ÆSECAVUM, BRASS, made by the union of copper and calamine ſtone, which is owing merely to the zinc contained in the calamine: this is called *aurichalcum*, *azoth*, *nuba*, *aracon*, *alcone*, *accotem* or *accatum*, *chryſo chalcos*. The alchemiſts found it out by attempting to turn copper into gold. Braſs is not ſo readily diſſolved as copper. The vapours of the zinc, which join with the copper in making braſs, increaſes the weight of the copper ſometimes to near one half more than its original weight.

Volatile ſpirits receive from a ſmall quantity of copper a deep blue, and if added to ſolutions of it in acids, when ſo far diluted as to appear almoſt or altogether colourleſs, it changes them immediately to the ſame fine colour. If a piece of bright iron be immerſed in the acid ſolution of copper, the acid quits the copper to attack the iron, and the copper, in its ſeparation from the menſtruum, adheres to the iron, which ſoon appears covered with a cuprous coat. On theſe principles very minute quantities of copper diſſolved in liquors may be readily diſcovered.

If copper is ſwallowed in its pure ſtate, it is inoffenſive. Some practitioners obſerve that copper when diſſolved is ſtrongly ſtyptic, ſo far from cauſing exulcerations of the inteſtines, that it heals them: it vomits by its naſeous ſtimulus, which will continue for ſeveral days. Dr. Alſton ſays, in his Lectures on the Materia Medica, that the ærata and the ferrata do not differ much in any thing but the ſtrong naufea that the firſt produces, and the corroſive quality that the latter poſſeſſes.

Lemery obſerves, that if water lies long in copper veſſels, it acquires a taſte of the metal. He cautions againſt a care-

a careleſs uſe of copper veſſels for boiling ſyrups, acids, &c. in; for, though while the ſyrup, &c. are in a boiling heat, if they are continued ſo all the day long, no inconveniency is diſcovered; but in any degree below the heat which keeps up a bubbling in the ſyrup, or whatever elſe, the metal will be corroded, and the preparation injured.

The following preparations are made from this metal:

ÆS CORONARIUM. See Æs.

ÆS USTUM, BURNT COPPER, called alſo *alcor*, *alfadidam*, *alfatida*, *alſelat*, *altemar*, *alzoſar*, *arcos*, *aycopper*, *azimar*, *callecamenon*. Thin plates of copper are laid ſtratum ſuper ſtratum in a crucible, with ſulphur and ſea-ſalt, then they are placed over a hot charcoal fire, and there continued till all the ſulphur is conſumed, or until the plates can be reduced to a powder. If good, it is of an iron grey on the outſide, of a reddiſh grey within, and if two pieces are rubbed together, a vermilion red is produced; it muſt alſo be brittle and glittering when broken. It was formerly uſed for deſtroying fungous fleſh.

If the burnt copper is made red-hot, and quenched in the ol lini nine times, then powdered, it takes the name of SAFFRON of COPPER.

ÆS PAUPERUM, copper ore diveſted of its ſilver, when it contains any, is thus named.

ÆSCHYNOMENE (from *αισχυνομαι, I am aſhamed*) SPINOSA. See CAACO.

ÆSCULUS HIPPOCASTANUM. See HIPPOCASTANUM.

ÆSTAS, SUMMER. As this is uſually a healthy ſeaſon, health may ſtill be prolonged, if, during the warmer months, we eat but a little at a time, and make a proportionable increaſe in the number of our meals.

ÆSTATES, FRECKLES in the face. See EPHELIDES.

ÆSTHPHARA. See INCINERATIO.

ÆSTUARIUM, STOVES or machines for conveying heat to all parts of the body at once. See CALDARIUM.

ÆSTUATIO, the boiling up, or rather the fermenting of liquors when mixed.

ÆSTUS VOLATICUS. Vogel places this word as ſynonymous with *phlogoſis*. It is a ſudden ſcorching heat, with redneſs of the face, that ſoon flies off.

ÆTAS, AGE. ONE LIFE; an HUNDRED YEARS; alſo A CERTAIN STAGE OF LIFE. The ancients reckoned ſix ſtages of life, viz, PUERITIA, childhood, which is the fifth year of our age; ADOLESCENTIA, youth, reckoned to the eighteenth, and properly ſo called, to the twenty-fifth year; JUVENTUS, reckoned from the twenty-fifth to the thirty-fifth, VIRILIS ÆTAS, man-hood, from the thirty-fifth to the fiftieth; SENECTUS, old age, from fifty to ſixty; CREPITA ÆTAS, decrepid age, which ends in death. Blancard.

Every age hath its diſeaſes; and Hippocrates obſerves, that thoſe of youth continuing after puberty are difficult to cure. In infancy and old age, many object to the uſe of medicine; but as in both theſe ſtages there is great infirmity, ſo there is a great ſcope both for the practice and the improvement of the medical art: neglect herein beſpeaks an equal ignorance and inhumanity: at a certainty ſome diſorders may be radically cured, and all may be palliated. Infancy may be aided in its advances, and the approaches of age, as to its infirmities, may be retarded.

ÆTHER, vel ETHER, from *αιθω, ardeo, ſplendeo*, bright and ſplendid; called *liquor æthereus vitriolicus, nitroſus, muriaticus*, according to the acid of which it is formed. So the ſky or firmament, and alſo the electric matter has been called; but what is here deſigned, is a chemical combination, merely of alcohol, with the oxygene of the acids made uſe of in the proceſs for its formation. The idea of MACQUER, who conſidered *æther* as a ſpirit of wine, dephlegmated, or deprived of water, had little foundation; for the diſtillation of the ſpirit of wine, from the moſt concentrated, or drieſt alkali, never affords any thing but a ſpirit of wine, more or leſs dephlegmated.

Various are the proceſſes by which ÆTHER is made. The following ſeems to be the beſt. Put a certain quantity of alchohol into a receiver, and very gradually add an equal quantity of concentrated ſulphuric acid, ſhaking them together, and waiting till the firſt addition is incorporated, before any more is put in; for, if they are poured together too rapidly, the ſucceeding heat and ebullition will diſſipate a part of the mixture, run the riſque of breaking the veſſel, and endangering the operation. After having mixed the whole in this gradual mode, the retort muſt be then placed on a heated ſand bath, a receiver adapted, and the mixture heated to ebullition. Alchohol firſt paſſes over; ſoon after which, ſtreams of fluid appear in the neck of the retort, and within the receiver, which denote the riſing of the æther. Its ſmell is agreeable; vapors of ſulphureous acid ſucceed the æther; and the receiver muſt be taken away the moment they appear. If the diſtillation be continued, ſulphureous æther is obtained; and the oil, which is called æthereal oil, or oil of wine, and that which remains in the retort, is a mixture of undecompoſed acid, ſulphur, and a matter reſembling bitumens. In this operation, the ſulphuric acid is decompoſed; and the oxygene, by combining with the hydrogene, and the carbone of the alcohol, has formed three ſtates, which we alſo find in the diſtillation of ſome bitumens.—1. A very volatile oil, or æther.—2. Æthereal oil.—3. Bitumen.—If the ſulphuric acid be digeſted upon æther, it converts the whole gradually into ætherial oil. When the æther is mixed with ſulphureous vapours, it muſt be rectified by a gentle heat—a few drops of alkali being firſt poured in to combine with the acid.

This fluid, beſides its appellation of *æther*, is by ſome named ACIDUM VITRIOLI VINOSUM; by others, SPIRITUS ÆTHEREUS; and in the Pharm. Edinb. it is entitled ſpt. vini æthereus; and as it may be obtained by means of the vitriolic, nitrous, and marine acids indifferently, ſo from the name of the acid employed, the terms vitriolic, nitrous, or marine *æther* have obtained, as in the London Pharmacopœia, 1788, ÆTHER VITRIOLICUS. It ſhould be noted, that *æthers* produced by the different mineral acids, poſſeſs particular different properties. The College of Phyſicians, London, in order to form the LIQUOR ANODYNUS MINERALIS HOFFMANNI, order ſpiritus ætheris vitriolicus ℔ ii. & oleum vini. ʒ iii. by weight. CHAPTAL ſays the compoſition is ſpirit of wine and æther; of each, two ounces, and twelve drops of the ætherial oil. See LIQUOR ANODYNUS HOFFMANNI.

Various modes of preparing this fluid may be ſeen in the different writers, particularly London and Edinburgh Pharmacopœias.

Some of the properties of this liquid are as follow:

It is the moſt *light*, *volatile*, and *inflammable* of all known liquids.

It ſwims on the higheſt rectified ſpirit of wine, as oil does upon water.

It is remarkably cold when dropped upon the hand; and it affects the thermometer in an extraordinary manner, cauſing the quickſilver to fall, when neither water nor ſpirit of wine would produce ſuch an effect.

It is neither acid nor alkaline, therefore perfectly free from that ſaline acrimony with which all the common volatile ſpirits abound.

It is one of the moſt powerful ſolvents known in chemiſtry. It will not mix with acids, alkalies, nor vinous ſpirits. It mixes with twenty times its weight of water, if well ſhook therewith; and is an effectual ſolvent of oils, balſams, reſins, gum reſins, gums, wax, &c.

Macquer obſerves, in his Dictionary of Chemiſtry, that *æther* does not mix with water, as ſpirit of wine does, in all proportions; but that ten parts of water are required to diſſolve one part of *æther*. But a larger proportion of water is more convenient, when the mixture is made to be taken as a medicine. He alſo adds, that *æther* diſſolves a ſmall quantity of water.

Its affinity with gold exceeds that of aqua regia.

It extracts gold, wherever it is, from any one, or all of baſer metals; and thus gold is better and ſooner purified than by any other means.

It is the lighteſt of all liquors; a bottle that holds 20 ounces of the oil of vitriol, holds but ſeven of the *æther*.

Agitated in a phial with the white of egg, lymph, or human blood, it ſeems rather to attenuate them.

The effects of this wonderful preparation, as a ſubject of philoſophy, are too numerous to inſert; the reader is therefore referred to the authors undermentioned, who have written profeſſedly on it. As to its antiquity, it is mentioned in ſeveral old books of chemiſtry; but they do not diſtinctly notice nor deſcribe it, nor yet the manner of producing it: the public attention to it was firſt excited by a publication in the Philoſophical Tranſactions, A. D. 1730, by a German, who calls himſelf Frobenius. On its medical properties, the moſt valuable, as well as moſt ſuited to the general deſign of this work, we proceed

ceed to obſerve, that the late Dr. Ward was the firſt who is known to have uſed it in England: with the *æther* it was that he ſo inſtantly relieved the head-ach, and other pains in the external parts: but for the firſt publication on its internal uſe, we are indebted to Mr. Turner, ſurgeon, in Liverpool, by whom it was prepared for a very extenſive ſale. He mixes two drams of *æther* with ſix or eight ounces of water, and gives from one to four large ſpoonfuls at a time, repeating the doſe as required. Its general effects internally, are anodyne and perſpirative; others give five or ſix drops for a doſe, firſt dropping it on ſugar; it is alſo ſo potent a diuretic, that an incautious uſe of it may produce a diabetes; this is the only inconvenience to which it manifeſts any tendency. In obſtinate head-achs, vertigos, epilepſies, convulſions, hyſteric and hypochondriac diſorders, the palſy, gout, rheumatiſm, flatulent, and other diſorders of the ſtomach and bowels, aſthmas, hiccough, whooping-cough, &c. by its application externally, or adminiſtration internally, or both, the moſt deſirable effects have followed. It is eſteemed an excellent antiſpaſmodic. It mitigates pains of the colic as if by enchantment, as it does likewiſe external pains. The celebrated BUCQUET, we are told, accuſtomed himſelf ſo much to this drink, that he took two pints per day; a rare example of the power of habit on the conſtitution. When it is applied externally, procure a bit of linen rag, of ſuch a dimenſion as to be conveniently covered by the palm of the hand; moiſten the rag with the *æther*, and inſtantly apply it to the part affected, preſſing it very cloſe, ſo as to prevent the eſcape of its fumes, for two or three minutes, in which time the rag will be found dry, and may be taken away. Fred. Hoffman indeed employed it, in as much as his liquor mineral. anod. may be ranked with it, as a ſedative and antiſpaſmodic.

As to the teſts of the goodneſs of *æther*, Mr. Turner informs us that the moſt perfect ſort is obtained by the aſſiſtance of the vitriolic acid; that it is colourleſs, and ſtrikes the noſe very ſtrongly with the ſulphureous ſmell; a drop let fall on the hand inſtantly vaniſhes, without leaving any moiſture behind; five or ſix drops dropped together upon a table will diſappear in a few ſeconds, and leaves only the appearance of a large oily ring behind. The beſt *æther* requires the greateſt quantity of water to be mixed with it; if, therefore, to ſix tea-ſpoonfuls of water, in a ſmall phial, you add one of the *æther* to be examined, cork it up, and ſhake them well together, and if, upon ſtanding a little while, ſome of the *æther* appears at the top, in form of oil, ſufficient to cover the ſurface of the mixture, it is good, provided alſo that it anſwers the other methods of trial; but if none appears, or not enough to cover the face of the mixture, it was either adulterated, or not well rectified: if to this mixture of *æther* and water you add a little ſalt of tartar, and any fermentation enſues, the *æther* was not well rectified. It may be uſeful to obſerve, that to obtain a powerful medicine, it is neceſſary that great pains be taken to render it free from all adherence of the ſulphureous acid, for in proportion to ſuch adherence, the virtues of it are greatly impaired.

See Malouin's Chimie Medicinale, tom. ii. p. 451. Macquer's Chimie Pratique, tranſlated by Reid. Dictionary of Chemiſtry, edit. ii. Dr. Frobenius's accounts of *æther*, inſerted in the Philoſophical Tranſactions for 1733 and 1741. Pharm. Col. Edinb. The Lond. Med. Obſ. and Inq. vol. ii. p. 176—186. An Account of the extraordinary Medicinal Fluid called *Æther*, by M. Turner, ſurgeon in Liverpool. Abridgment of the Philoſophical Tranſactions, vol. viii. p. 744. Cyclopedia, edit. A. D. 1788. Beaume's Diſſertation on *Æther*. This laſt is the moſt complete work on this ſubject. Cullen's Mat. Medica. Chaptal, Lavoiſier, Fourcroy, &c. Elements of Chemiſtry.

ÆTHEREA HERBA. See ERYNGIUM.

ÆTHIOPIS, ETHIOPIAN CLARY. Salvia Æthiopis. Lin. Its leaves are like thoſe of mullein, hairy and thick; the ſtalk is quandrangular, like that of balm; the ſeeds are two in a cell. A decoction of its root is commended in pleuriſies and rheumatiſms. Raii Hiſt.

ÆTHIOPICÆ (PILUL.) ℞ merc. pur. (cum mucilag. e gum. Arab. extinct. ʒvi. ſulph. ant. precip. ref. guaiac. & mellis ää ʒſs f. maſ. & divid. in pilul. No. ccxl. quarum detur i. ad iv. mane noctequc. Theſe from the Ph. Col. Edinb. are in every reſpect equal to Dr. Plummer's in point of uſefulneſs, but not ſo apt to run off by ſtool; ſee PLUMMERI PILULÆ.

ÆTHIOPS ANTIMONIALIS, ANTIMONIAL ÆTHIOPS. Dr. Cockburn gives this, in his treatiſe on the gonorrhœa, as follows: flux equal parts of antimony and ſea ſalt, in a crucible, and knock off the ſcoria, then rub equal parts of the regulus made in this manner, and mercury together, till they are incorporated. He extols it in cutaneous diſeaſes, glandular obſtructions, and many other chronical diſeaſes; a few grains are given at firſt, and the quantity is increaſed as the patient can bear it. Malouin, in his chemiſtry, gives various proceſſes for uniting antimony with mercury, ſome of which are more ſpeedy and others more perfect in forming this combination.

Dr. Huxham gives the following *æthiops antimonialis*: ℞ argent. viv. ʒiv. antim. crud. ʒiij. flor. ſulph. ʒij. m. per triturat.

Dr. Plummer highly commends his æthiops in the Edinb. Med. Eſſays, as curative of ſpots, pimples, and flushing in the face, virulent gonorrhœas, ſciatica, rheumatiſms, lues venerea, ulcers with pain and ſwelling in the feet, ſcrophulous diſorders, &c.——MARTIALIS, MARTIAL ÆTHIOPS. Put filings of ſteel into an unglazed earthen veſſel, with water enough to riſe four inches above the filings; the whole is to be ſtirred every day, and more water ſupplied, as that in the veſſels exhales, ſo that the filings remain always covered; continue this procedure till they are reduced to a powder of an inky blackneſs. This preparation hath nothing but its troubleſomeneſs to diſtinguiſh it from the common filings.——MINERALIS. Now called Hydrargyrus cum ſulphure, Lond. Ph. 1788. Æthiops, ſo called from its colour, which is like αἰθιοψ, *a blackmoor*, from αἴθω, *to burn*, and ὤψ, *the countenance*; when made without fire it is called *apyron*. ETHIOPS MINERAL. The uſual method of preparing this, is to rub equal parts of pure mercury and flowers of ſulphur in a mortar till the mercury diſappears, and a very black powder is formed; but a more intimate coalition of the mercury with the ſulphur may be effected by melting the ſulphur in an iron ladle, then adding the quickſilver, and ſtirring them together, till the mixture is cold. If the mixture ſeems diſpoſed to flame, which may be known by ſwelling up, and growing ſuddenly conſiſtent, carefully cover it; thus it is ſoon checked. The ſmall heat neceſſary here is in no danger of diſſipating either the mercury or the ſulphur.

As ſulphur ſo eminently abates the power of all the more active minerals, this medicine is thought by many to be no farther uſeful than as it is of efficacy in the ſtomach and bowels; others aſſert, that it enters the circulation, and is productive of very ſalutary effects. It is true, that a portion of the mercury may be ſeparated from the ſulphur, during the paſſage of the *æthiops* through the body. The doſe is from gr. v. to ʒſs. It is equally uſeful with the cinnab. ant. for fumigating venereal ulcers; and like the cinnabar, it is hard to ſay that it is uſeful any other way.——VEGETABILIS. VEGETABLE ÆTHIOPS. By burning the ſea-wrack in the open air, it is reduced into a black powder, and is then called *vegetable æthiops*. The ſoap-boilers call this kelp. The beſt is from Scotland. From ʒ i. to ʒ ij is given twice a day to remove ſcrophulous ſwellings.

ÆTHIOPUS ALBUS. See MERC. ALKALIZAT.

ÆTHOLICES, from αἴθω, *to inflame*, or *burn*. Superficial puſtules in the ſkin raiſed by heat, as boils, fiery puſtules, &c.

ÆTHUSA MEUM. See MEUM.

ÆTIA, αἰτία, THE CAUSE of a diſtemper.

ÆTIOLOGIA, Ætiology, from αἰτία, *a cauſe*, λόγος, *a diſcourſe on*. A treatiſe on the cauſes of diſeaſes, and their ſymptoms.

ÆTOI PHLEBES, EAGLE VEINS, ἀετός, *eagle*, φλὲψ, *vena*. According to Ruffus Epheſius, the veins that paſs through the temples to the head, were thus called.

ÆTOLION. See CNIDIA GRANA.

ÆTONYCHUM, from ἀετός, *an eagle*, and ὄνυξ, *a claw* or *nail*. See LITHOSPERMUM.

AFFECTIO, an affection. This is expreſſed in Greek by πάθος, hence *pathema*, *paſſio*. It is a diſorder of the whole body, or a part of it, as in the hyſterics, colic, &c. thus by adding a deſcriptive epithet to *affectio*, moſt diſtempers are expreſſed.

AFFECTIO HYPOCHONDRIÆ. See HYPOCHONDRIACUS MORBUS.

AFFEOS. FROTH OF FOAM

AFFIDRA. See PLUMIUM.

AFFINITAS, AFFINITY. *Attractio*, CHEMICAL AFFINITIES

FINITIES, alſo called ELECTIVE ATTRACTIONS, are defined a tendency which the different particles of matter have to unite and adhere together, whether theſe particles be heterogeneous or homogeneous.

The tranſlator of the Dict. of Chem: ſays, in a note under the article *affinity*, that "by the terms *affinity* and elective attraction, we ought to underſtand the power by which the conſtituent parts of bodies unite, and not to ſuppoſe that this power is exerted by any ſimilarity and homogeneity of parts, or by any mechanical traction, as theſe terms ſeem to imply. The cauſe of this power, or the manner in which this union of conſtituent part is produced, is unknown to us. For theſe terms, therefore, another leſs exceptionable, viz. the POWER OF COMBINATION, may be ſubſtituted. In Dr. Macquer's definition of *affinity* are comprehended not only the power by which the conſtituent parts of bodies unite, which is the proper object of chemiſtry; but alſo, the power by which the integrant parts unite, which he calls the *affinity* of aggregation, and which is treated of by writers on natural philoſophy and mechanics under the terms attraction, gravitation, and coheſion. Whether theſe two kinds of union are produced from the ſame cauſe, differently modified, as our author thinks, I know not; but their effects are ſo different, that they deſerve to be conſidered ſeparately: the union of integrant parts being only an appoſition of the parts, which are capable of being disjoined by mechanical means, and without any change produced upon their properties; and the union of conſtituent parts, or combination, being attended with conſiderable changes of properties, and being incapable of disjunction by mechanical means."

Attraction is of different kinds in nature, though probably they all depend ultimately on the ſame principles; they are, 1. The attraction of gravitation. 2. The magnetic attraction. 3. The attraction of electricity. 4. The attraction of coheſion or of aggregation. 5. Chemical attraction. The laſt, as already ſaid, is that tendency which bodies have, however different, to unite together and to remain in union: e. g. an acid unites with a metal, an earth, or an alcaline ſalt, and with either of theſe the acid forms one body; which body does not conſiſt of a combination of the properties of the acid and the metal, &c. but theſe loſing their original properties on their union, a new body, different from either, is formed.

Chemical attraction does not take place, but when the reſpective bodies or one of them are in a fluid ſtate. Before chemical attraction can take place betwixt two or more bodies, it is neceſſary to deſtroy their attraction of aggregation or coheſion; this is effected by diſſolving them. The component parts of bodies cannot come into the neceſſary contact with each other until the integrant parts of the bodies, which are to act and be acted on, are ſeparated, by a ſolution of them. Dry bodies, however finely powdered, do not unite chemically. Attraction of aggregation requires only the application of ſurfaces, but chemical attraction abſolutely requires fluidity.

The power in bodies on which their various tranſpoſitions and combinations depend, and which is called their *affinity*, is a term like the Newtonian attraction, which is deſigned to expreſs not the cauſe but the effect. When an acid ſpontaneouſly quits a metal to unite with an alkali, it is ſaid that it hath a greater *affinity* to the alkali than to the metal; this is only to ſay in other words, that it will unite with the alkali in preference to the metal.

The doctrine of the *affinities* of bodies is of very extenſive uſe in the chemical pharmacy; for as ſeveral proceſſes are founded on it, ſo if an error happens, and thereby the medicine proves unfit for its intended uſe, it may be rendered applicable to other purpoſes, by ſuch tranſpoſitions of their component parts as are pointed out by the knowledge of their *affinities*. Combinations and ſeparations that are chemical, depend on elective attraction.

Sir Iſaac Newton's table of attractions, which was with the nitrous acid, was the firſt; next to him, Geoffroy improved on the ſubject, then Gellert, Bergman, and many others; but all of them are conſidered as yet incomplete. The following is held in the greateſt eſtimation at preſent. Though before it is inſerted it muſt be obſerved, that the ſubſtances in which theſe *affinities* are expreſſed in capital letters on the top of each ſeries, have the greateſt *affinity* with that immediately under it, a leſs *affinity* with the next, &c. to the end of the ſeries, &c. If any of the remote bodies have been combined with the top one, the addition of any of the intermediate bodies will diſunite them; the intermediate body uniting with the uppermoſt of the ſeries, and throwing out the remote one. Thus in the ſeries of the *affinities* of water, N° 9, a fixed alkali being placed between the water and alchohol or inflammable ſpirit, wherever water and ſpirit are mixed, the addition of any fixed alkaline ſalt will abſorb the water, and occaſion the pure ſpirit to be ſeparated. Where ſeveral ſubſtances are expreſſed in one ſeries, it is to be underſtood that any one of theſe bodies which are neareſt to the uppermoſt, will in like manner diſengage from it any one of thoſe which are more remote.

TABLE OF AFFINITIES

1. VITRIOLIC ACID
Phlogiſton.
Fixed alkali.
Calcareous earth.
Zinc.
Iron.
Tin.
Copper.
Quickſilver.
Silver.
Volatile alkali.
Magneſia.
Earth of alum.

2. NITROUS ACID.
Phlogiſton.
Fixed alkali.
Calcareous earth.
Zinc.
Iron.
Lead.
Tin.
Copper.
Quickſilver.
Silver.
Volatile alkali.

3. MURIATIC ACID.
Phlogiſton.
Fixed alkali.
Calcareous earth.
Zinc.
Iron.
Lead.
Tin.
Copper.
Regulus of Antimony.
Quickſilver.
Antimony.
Silver.
Spirit of wine.
Volatile oils.
Gold.

4. KALI.
Vitriolic acid
Nitrous acid.
Muriatic acid.
Acetous acid.
Volatile vitriolic acid.
Sedative ſalt.
Fixed air.
Sulphur.
Expreſſed oil.

5. CALCAREOUS EARTH.
Vitriolic acid.
Nitrous acid.
Muriatic acid.
Acid of tartar.
Acetous acid.
Sedative ſalt.
Sulphur.

6. SULPHUR.
Fixed Alkali.
Calcareous earth.
Iron.
Nickel.
Copper.
Lead.
Tin.
Silver.
Regulus of Antimony.
Quickſilver.
Arſenic.

7. HEPAR SULPHURIS, is partially decompounded by
Quickſilver.
Solution of fixed alkali.
Lime water.
Volatile alkali.

8. FIXED AIR.
Calcareous earth.
Fixed alkali.
Magneſia.
Volatile alkali.

9. WATER.
Fixed alkali.
Alcohol.
Milk.
Alkaline ſalt and ſome neutrals.

10. ALCOHOL.
Water.
Oils and Reſins.

11. METALLIC SUBSTANCES, (LEAD, and REGULUS OF ANTIMONY, excepted)
Marine acid.
Vitriolic acid.
Nitrous acid.
Sulphur and acetous acid.

12. LEAD.
Vitriolic acid.
Muriatic acid,
Nitrous acid.
Acetous acid.
Expreſſed oils.

13. REGULUS OF ANTIMONY.
Vitriolic acid.
Nitrous acid.
Marine acid.
Acetous acid.

14. REGULUS WITH METALS.
Iron.
Copper.
Tin.
Lead.
Silver.
Gold.

15. ARSENIC.
Zinc.
Iron.
Copper.
Tin.
Lead.
Silver.
Gold.

16. QUICKSILVER.
Gold.
Lead, and Tin.
Copper.
Zinc.
Biſmuth, and
Regulus of Antimony.

17. SILVER.
Lead.
Copper.
Iron.

But in conſequence of heat, ſedative ſalt, and the other ſolid acids, decompound vitriolated tartar, nitre, and ſea ſalt.

What has been enumerated and ſpecified in the foregoing table, gives clearly the idea of ſimple elective attraction. But the nature of double elective attractions ought to be underſtood, for theſe may be conſidered as exceptions to what has paſt before.

TABLES OF DOUBLE ELECTIVE AFFINITIES, or ATTRACTIONS.

Iſt, WHAT OCCURS IN MIXTURES OF WATERY SUBSTANCES.

1.	Acids, mixed with Calcareous earths, or Metallic ſubſtances,		Volatile alkali, mixed with Fixed air.	From this may be experienced the nature of Double Elective Attraction when it takes place. Suppoſe the VOLATILE ALKALI, combined with any of the acids, and the FIXED AIR with FIXED ALKALI; theſe ſubſtances thus ſeparately combined, (N° 5.) will decompound each other; for the VOLATILE ALKALI will unite with the FIXED AIR, and the acid with the FIXED ALKALI.
2.	Vitriolic or marine acid, with Alkalies or earths,		Mercury, ſilver, or Lead, with Nitrous, or acetous acid.	
3.	Lead, Nitrous, marine or Acetous acid,	with	Vitriolic acid, Alkalies, earths, or M. S.	
4.	Silver, Vitriolic, nitrous or Acetous acid,	Join	Marine acids, Alkaline ſalts, earths, or M. S.	
5.	Volatile alkali, Acids,		Fixed air and Fixed alkali.	
6.	Nitrous, marine and Acetous acids, Calcareous earths,		Volatile alkali, magneſia, earth of alum, Vitriolic acid.	

IId. WHAT OCCURS IN DISTILLATION, OR SUBLIMATIONS, and REQUIRES HEAT.

1.	Volatile alkali, mixed with Acids,		Fixed air, mixed with Calcareous earths.
2.	Volatile alkali, with Vitriolic acid,		Nitrous, marine, or acetous acid, with Fixed alkali.
3.	Volatile alkali Nitrous, marine or Vitriolic acids,	Join with	Acetous acid. Fixed alkali, or Abſorbent earths.
4.	Regulus of antimony Sulphur,		Marine acid, Quickſilver.

IIId. WHAT OCCURS IN MIXTURES BY FUSION.

1.	Tin, mixed with Silver,		Iron, mixed with Lead.
2.	Copper, with Gold,		Sulphur, with Lead.
3.	M. S. Gold.		Sulphur. Regulus of antimony.

See Geoffroy on *Affinities*, in the Memoirs of the French Academy, for the year 1718—Geller's Metallurgic Chemiſtry—Dictionary of Chemiſtry, tranſlated from the French, edit. 2.—Dr. William Keir's Inaugural Theſis, De Attractione Chemica, Edinb. 1778. Dr. BLACK, CHAPTAL, FOURCROY, beſides thoſe above quoted, may be conſulted on this ſubject.

AFFION, an Arabian name of opium; alſo of an electary in which opium is a part of the compoſition.

AFFLATUS, or ADFLATUS. When a vapour or air ſtrikes any other body with a certain degree of violence, or as the country people call it, a BLAST: it affects the body ſuddenly with a diſeaſe; it is a ſpecies of eryſipelas.

AFFLICTIO, AFFLICTION. Though this is not a diſeaſe, it cauſes many. What excites anger, envy, hate, produces diſeaſes from tenſe fibres. What excites fear, or grief, beget diſeaſes from relaxation.

AFFODILUS. See ASPHODELUS LUTEUS.

AFFRODINA. See VENUS.

AFFUSIO. Pouring a liquor upon ſomething, and ſometimes it means the ſame as ſuffuſio. See CATARACTA.

AFIUN. See OPIUM.

AFROB. Alchymiſtical lead. See ANTIMONIUM.

AGALACTIA, from α, negative, and γαλα, *milk*, a defect of milk in child-bed; hence αγαλακτος, an epithet given by Hippocrates to a lying-in woman that hath no milk.

AGALLOCHUM, *aloe aromatica:* The AROMATIC ALOE. The accounts given of this wood are ſo different from each other, as well as from the ſpecimens of it that are met with in our ſhops, that it ſeems moſt likely to be unknown amongſt us. Other woods, as the *aſpalathum, aquilæ lignum*, and *calambour*, which are ſaid to be of the ſame nature, are ſubſtituted for it. Whatever this article is in reality, it is alſo expreſſed by different writers by the following names, viz. *aloe lign, xyloaloe, ſinkos, calambac, alud, haud, agalugi, agallugun, heud*, &c. The Arabians call it *cebar*, or *ſebar*, and ſometimes *al-cebar*. The Portugueſe *Pao-agula*.

It is brought from China, and the interior parts of the Eaſt Indies, in ſmall pieces. It is deſcribed as being compact, ponderous, of a yellow or ruſty brown colour, with black or purpliſh veins, ſometimes purple with aſh-coloured veins, and not unfrequently, as being all of a blackiſh colour. Such as is brought into Europe has a bitteriſh, reſinous taſte, and a light aromatic ſmell. Set on fire it ſeems to melt like wax, emitting while it burns an agreeable fragrance; the degree of this fragrance gives the proof of its goodneſs. That part which is betwixt the heart, and that part which is next the bark, is called *columbac*.

One ounce of this wood yields to ſpirits of wine three drams of a reſinous extract; and to water it yields two drams. If diſtilled with water, it yields an highly cordial oil, in the proportion of half an ounce from one hundred and ſixty ounces. Miller. Dale.

AGALUCI, AGALLUGUN. See AGALLOCHUM.

AGAPE, αγαπη, *love*; alſo an afternoon or evening's meal.

AGARICOIDES, a ſort of fungus.

AGARICUM, or AGARICUS, AGARIC, called alſo *fungus laricis*. Boerhaave calls it *fungus igniarius*, becauſe when it is beat out it will take fire at a ſpark, and blaze out. It is named *agaric*, from Agaria, a town in Aſia, where it grows moſt plentifully. It is the BOLETUS PINI LARICIS. Lin.

Above twenty ſorts are diſtinguiſhed by botaniſts, one of which is the TOUCH-WOOD, or SPUNK.

It grows on the trunks of larch trees, and alſo on ſome others, without any pedicle. Internally it is white, and of an uniform ſtructure; outwardly it is covered with a brown bark, full of ſmall holes underneath. In autumn this ſubſtance is cut off from the trees, ſeparated from its bark, then expoſed to the ſun, which both dries it, and increaſes its whiteneſs. The lighteſt, whiteſt, and moſt free from gritty matter, is the beſt. It hath but little ſmell; when chewed it is at firſt ſweet, then bitter. It gives out its active parts to watery menſtrua, and alſo to ſpirituous; it is with difficulty reduced to powder, except it be firſt moiſtened with a ſolution of gum arabic, and afterwards thoroughly dried. It is cathartic, but hardly ever uſed in the preſent practice, as its operation is both ſlow and unpleaſant, occaſioning ſickneſs, gripes, &c. The doſe is from ʒ i. to ʒ ij.

AGARICUS AURICULÆ FORMA. See AURICULÆ JUDÆ.

AGARICUS.—MUSCARIUS. Linnæus. The REDDISH MUSHROOMS, alſo called BUG AGARIC. This is one of the poiſonous vegetables that are indigenous in Great Britain. The pillar ſtalk is white, thick, and hollow; thicker towards the top; egg-ſhaped at its baſe; ſurrounded at its middle with a pendulous membrane, and furniſhed with a cap which is large, ſometimes ſix inches or more in diameter; almoſt flat; either white, red, or crimſon colour; and ſometimes beſet with angular, downy, white, or red warts. The gills are white, flat, and inverſely ſpear-ſhaped; the greater number extend from the rim of the cap to the ſtalk, the reſt only half way. When this muſhroom is decaying, the gills become browniſh. It is found in paſtures and woods.

If the juice of this *muſhroom* is rubbed where bugs retreat in the day, it will deſtroy them. If it is infuſed in milk, it is deſtructive to flies the inſtant they ſip it. Haller relates, that ſix perſons of Lithuania, periſhed at one time by eating this kind of muſhroom; and that others have been driven mad by it. Two or three may be taken without danger, but more will occaſion delirium. See Withering's Botanical Arrangements. Wilmer's Obſervations on Poiſonous Vegetables. Lightfoot's Flora Scotia, vol. ii. p. 1010.

—— PIPERATUS. Linnæus. PEPPER MUSHROOM, alſo called PEPPER AGARIC. It is the fungus piperatus albus, *lacteo ſucco turgens*. Raii. Alſo the *fungus albus acris* B. P. The ſtalk is about two inches high. The hat is convex when young: as it expands, it becomes nearly flat; its colour is a dirty white, with a mixture of grey; it contains a milky juice. The diſk is conſtantly bent inwards: when the fungus is decaying, the hat becomes in its centre, and is ſometimes ſeen funnel-ſhaped. The lamellæ are cloſe, numerous, and of a pale fleſh colour.

It is very common in woods, near the roots of trees. When freely taken, fatal conſequences are related by ſeveral writers. When this vegetable has loſt its acrid juice by drying, its cauſtic quality ſtill remains.

In caſe of injury from any of the muſhroom tribe, ſee AMANITA. See alſo Wilmer's Obſervations on Poiſonous Vegetables.

AGARICUS QUERCUS, AGARIC of the OAK, called *fungus igniarius*. AGARICUS pedis equini facie, fungi arborei ad ellychnia. FEMALE AGARIC, and, from its readineſs to catch fire, TOUCH-WOOD.

It grows in the form of a horſe's hoof; externally it is of a duſky aſh-colour, and internally of a duſky red; it is ſoft and tough. The beſt is ſaid to grow on the larger branches of oak trees; but that which is found on other trees is often as good.

It conſiſts of four parts, which preſent themſelves ſucceſſively. 1ſt. The outward rind, which may be thrown away. 2d. The part immediately under this rind, which is the beſt of all, and is uſed to reſtrain hæmorrhages from wounds, and after amputations; it ſhould be beat well with a hammer until it is ſoft and pliable, then ſlices of it of a proper ſize are to be applied upon the open blood-veſſel, whoſe diſcharge it reſtrains, not from its reſtringency, but its texture and adheſive quality: on the firſt application it adheres pretty ſtrongly, but about the end of two days it begins to ſeparate and ſoon falls off. 3d. A part which adheres to the ſecond, and which is an inferior ſort, may be uſed in leſs important caſes. The 4th, or laſt part, may be powdered, and then uſed for the ſame purpoſes as the ſecond and third ſorts. The beſt time for taking the fungous ſubſtance from the trees is in autumn, when the weather is fine, and after great heats.

As a ſtyptic, this fungus does not appear to poſſeſs any advantages greater than what may be expected from dry lint, as its ſucceſs hath not been manifeſted but when the circulation was ſo languid that lint would not have failed to have anſwered as well. This *agaric* grows on different trees, chiefly on the aſh; it is the *boletus igniarius*, of Lin. TOUCH-WOOD, or boletus acaulis pulvinatus lævis, poris tenuiſſimis. Lin.

See Warner's Caſes in Surgery, p. 133, &c. Neale's Obſervations on the Uſe of *Agaric*.

AGASYLLIS. See AMMONIACUM.

AGATHONIS ANTIDOTUS HEPATICA. Agathon's Antidote for the Liver.

℞. Gentian. ʒ vi. R. Enul. C. fol. abſ. & fol. nard. Ind. aā ʒ i. m.

AGENNESIA. α, non, and γενεσις, Generatio. See ANAPHRODISIA, and DYSPERMATISMUS.

AGER CHYMICUS. Dorneus ſays that water is the field [*ager*] in which God has ordained that the root of minerals ſhould be fixed, and from whence the trunk and branches ſhoot into the earth.

AGER, or AGRORUM TERRA, ſignifies the common earth or ſoil.

AGER NATURÆ. See UTERUS.

AGERATUM. α, non, and γηρας, Senectus. So called, becauſe its flowers preſerve their beauty a long time. It is alſo named *balſamita minor*; *coſtus hortorum minor*; *achillea & lutea, eupatorium Meſſuæ*; *herba julia*; *mentha corymbifera minor*, SWEET MAUDLIN, or MAUDLIN TANSEY. It is the ACHILLEA AGERATUM of Linnæus.

Botaniſts have enumerated ſeven or eight ſpecies.

It is a perennial ſlender plant, with undivided, indented, narrow leaves, and yellow naked diſcous flowers, ſet in umbels on the tops of the ſtalks: it is a native of the ſouthern parts of Europe, and cultivated in our gardens. It flowers in July and Auguſt, and hath an agreeable ſmell, and a warm bitteriſh taſte. It contains the virtues of coſtmary and tanſey, but is hardly ever uſed: infuſion in water is the beſt preparation.

AGERATUS LAPIS. A ſtone uſed by coblers to poliſh

poliſh women's ſhoes. It diſcuſſes, and is gently aſtringent.

AGES. See PALMA.

AGE VITA. The name of an antidote, rather ſuppoſed to be called *jugis vita*, long, or continual life. It is a medicated wine, made with galangal root, long and white pepper, ſage, ginger, cinnamon, ſaffron, and cloves, boiled in wine.

AGGLOMERATIO, an agglomeration or rolling together.

AGGLUTINATIO, AGGLUTINATION. Reunion, ſticking together: ſo healers are agglutinants.——PILORUM. A reducing the hair of the eye-lids that grow inward to their natural order, which is done by any glutinous matter on a probe, and drawing the hairs out, and fixing them where they ſhould remain.

AGGREGATÆ GLANDULÆ. Small glands are lodged in the cellular coat of the inteſtines next to the villous; but as they do not appear in an uninjected gut, many anatomiſts ſuſpect them only to be little bits of ſeparated wax.

AGGREGATUM, an AGGREGATE. A body reſulting from the union of many others which are ſmaller, of which the whole ſum is the aggregate.

AGHEUSTIA. α, non, and γευομαι, guſto. DEFECT OR LOSS OF TASTE, called alſo *Apogeuſia*, *Apogeuſis*. Dr. Cullen ranks this as a genus of diſeaſe, in the claſs locales, and order dyſæſtheſiæ. The cauſes are fever, or palſy, whence he forms two ſpecies; the firſt he calls, ORGANIC, ariſing from ſome affection in the membrane of the tongue, by which reliſhing things or thoſe which have ſome taſte, are prevented from coming in contact with the nerves: the ſecond, ATONIC, ariſing without any affection of the tongue. SAUVAGES ſays the cauſe of this diſeaſe is either in the brain, in the tongue itſelf, or in the paſſage of the lingual nerves;—he forms two ſpecies—Firſt, FEBRILIS, where a ſuppreſſion of taſte accompanies ardent and malignant fevers, on account of the extreme dryneſs of the tongue, when it wants moiſture, grows black and rough like wood; or from the delirium, or comatous ſtate into which patients ſometimes fall.—Second, PARALYTICA, when it accompanies a paralyſis of the tongue, or ſome comatous diſorder.—Noſ. Meth. v. i. 751.

AGIAHALID. See LYCIUM.

AGIS. See FEMUR.

AGLACTATIO. α, non, and γαλα, Lac. DEFECT OF MILK.

AGLIA. See ÆGIDES.

AGLITHES. The diviſion or ſegments of a head of garlick, which we call cloves.

AGLUTITIO. See DEGLUTITIO.

AGME, from αγω, *to break*. See FRACTURA.

AGNACAT. A tree which grows about the iſthmus of Darien; it reſembles a pear-tree, both as to its general appearance and its fruit, the pulp of which is highly provocative of venery. Raii Hiſt.

AGNATA. See ADNATA.

AGNIL. See INDICUM.

AGNINA MEMBRANA, vel PELLICULA. Aetius calls one of the membranes which involve the fœtus by this name, which he derives from its tenderneſs. This name is adopted by Drelincourt and Bartholine. See AMNION

AGNOIA, from α, neg. and γινωσκω, *to know*. It is when a patient in a fever forgets his acquaintance. So Hippocrates names this circumſtance, and obſerves that, when it is joined with a rigor, it is a dangerous ſymptom.

AGNUS CASTUS. The CHASTE TREE; ſee CATAPUTIA.

—— SCYTHICUS. The SCYTHIAN LAMB, called alſo in the Scythian language *barametz*, i. e. lamb, or *barometz*, or *baronetz*. *Borometz*, or *Boronetz*. This ſort of plant is ſaid to grow in Tartary, Ruſſia, &c. and is deſcribed as growing in the reſemblance of a lamb; but the truth ſeems to be, that when deſigning perſons have met with a plant which ſeemed to have ſome diſtant reſembance to a lamb, they increaſed the lamb-like appearance by art, and then covered their vegetable ſubject with the ſkin of a young lamb that had been cut out of the ewe for this purpoſe; thus thoſe who were not aware of the difference of a lamb's ſkin whilſt it is in the fœtal ſtate, and after it is yeaned, had theſe frauds of art impoſed on them for natural vegetable productions. The Perſian lamb-ſkins called PERSIANISH BARANKEN, are lamb-ſkins which are ſtripped from their lambs in their fœtal ſtate, and thus they being much finer or more delicate, are fitter for the ſumptuous dreſſes of the rich.

AGOMPHIASIS, or GOMPHIASIS. A diſtemper of the teeth; it is when they are looſe in their ſockets, and pained.

AGONE. See HYOSCIAMUS NIGER.

AGONIA, from α, negative, and γονος, *an offspring*. See STERILITAS.

AGONIA, from αγων, *a combat* or *ſtruggle*. AGONY, as when there is a ſtruggle between life and death. Alſo fear and ſadneſs of mind.

AGONOS, from α, neg. and γονος, *an offspring*, or γονη, *barren*.

Hippocrates calls thoſe women ſo who have not children, though they might have, if the impediment was removed.

AGOSTUS, from αγω, *to bring* or *lead*. That part of the arm from the elbow to the fingers; ſee alſo PALMA.

AGREDULA. A SPECIES OF FROG.

AGRESTA, VERJUICE. The juice of unripe grapes, or the ſour grape itſelf, called omphax, or the juice of the ſour apple. See MALUS HORTENSIS.

AGRESTEN. ACID STONE TARTAR.

AGRESTIS, WILD.

It is applied to vegetables that grow without cultivation. See MALUS SYLVESTRIS.

It expreſſes an ungovernable malignity in a diſeaſe.

It diſtinguiſhes wild from tame animals.

Wild animals afford better nouriſhment than tame ones, but are more heating: the fleſh of wild animals keeps longer than that of the tame, and affords leſs excrement. It is owing to their exerciſe that wild animals have their ſalt exalted, and ſo have a higher flavour.

AGRIA, HOLLY. Alſo a malignant puſtule, of which there are two ſorts; one is ſmall, and caſts a roughneſs or redneſs over the ſkin, ſlightly corroding it, ſmooth about its centre, ſpreads ſlow, and is of a round figure; this ſort is cured by rubbing it with the ſaliva before having breakfaſted: the ſecond ſort ulcerates, with a violent redneſs and corroſion, ſo as to make their hair fall off; it is of an unequal form, and turns leprous; its cure is the application of pellitory of the wall in the manner of a poultice.

AGRIAMPELOS, from αγριος, *wild*, and αμπελος, *a vine*. The WILD VINE. Bryonia alba. See alſo BRYONIA NIGRA.

AGRIC. The abbreviation by which is meant Georgius Agricola de Re Metallica, Natura Foſſilium, &c. Baſilian. 1657, fol.

AGRICULTURA. Agriculture is the art of cultivating the ground, tillage, huſbandry, as diſtinct from paſturage. But is not concerned with medicine any farther than in common with all exerciſes, except in the inſtance of benefit ſuppoſed to be received from the vapours which ariſe while ground is freſh or newly turned up, particularly the light gravelly ſoils: though it is to be wiſhed, that in reſpect of preſerving health, more exerciſe was uſed this way; thus many diſeaſes would be eaſily prevented, which, when preſent, are difficult to be removed. It is obſerved to have been the practice of the great Boerhaave, to prevent, by labour in his gardens at ſtated intervals, thoſe diſorders which others in vain attempt to remove, which through neglect of exerciſe in health they ſubject themſelves to.

On this ſubject the curious will meet with much ſatisfaction from the Georgical Eſſays by A. Hunter, M. D. Fordyce's Elements of Agriculture and Vegetation.

AGRIELÆA, from αγριος, *wild*, and ελαια, *an olive*. See OLEASTER.

AGRIFOLIUM. See AQUIFOLIUM.

AGRIMONIA, COMMON AGRIMONY, called alſo *eupatorium Græcorum*, vel *veterum*, vel *verum*, and *hociamſanum*. The common agrimony, is the AGRIMONIA EUPATORIA, or AGRIMONIA foliis caulinis pinnatis, foliolis undique ſerratis, omnibus minutis interſtinctis, fructibus hiſpidis of Linnæus.

It is a hairy plant with winged leaves compoſed of oblong indented ſegments, with ſmall portions between, ſet on middle ribs, which ſtand alternately on the ſtalk; on the top grows a long ſpike of pentapetalous yellow flowers, followed by little burs, containing each one or two ſeeds. It is perrennial, grows wild in hedges, and about the ſides of the fields, and flowers in May.

The leaves have a ſlight bitteriſh aromatic taſte, the flowers are ſmall, ſtronger and more agreeable; they give out their virtues to water and to ſpirit of wine.

It

It is beſt uſed while freſh, and the tops, before the flowers are formed, poſſeſs the moſt virtue. A conſerve is the beſt form of preparation; an infuſion in water or whey is good.

It is mildly corrobant, and of great efficacy in diſeaſes from a lax habit. Dr. Alſton, of Edinburgh, ſays, that the powder of this herb is the beſt mode of adminiſtering it, when the intention is to corroborate, and that if thus taken in a large quantity, we may expect many of the effects of the bark from it in agues. Dr. Cullen ſays it has ſome aſtringent powers, but they are feeble, and pays little attention to what has been ſaid in its favour.

The doſe is 5i. or more. The commom hemp, and Dutch agrimony, are called EUPATORIUM; hemp agrimony, BIDENS.

AGRIMONOIDES, called alſo pimpinella fol. agrim. nonnullis. It grows on the mountains in Italy; it is of the ſame nature as agrimony.

AGRIO CARDAMUM. See LEPIDEUM *folio graminco.*

AGRIOCASTANUM. See BULBOCASTANUM.

AGRIOCINARA. See CINARA SYLVESTRIS.

AGRIOCOCCIMELA, from *αγριος, wild, κοκκος, a berry,* and *μηλεα, an apple-tree.* See PRUNUS SYLVESTRIS.

AGRIOMELA. See MALUS SYLVESTRIS.

AGRION, AGRIOPHYLLON, } See PEUCEDANUM.

AGRIORIGANUM. See ORIGANUM ANGLICUM.

AGRIOSELINUM. See HIPPOSELINUM.

AGRIPALMA GALLIS. See CARDIACA.

AGRIPPÆ. Thoſe children which are born feet foremoſt, are ſo called, becauſe Agrippa the Roman was ſaid to be ſo born. Theſe births, though reckoned preternatural, are often more ſafe and eaſy than the natural. See PRÆSENTATIO.

AGRORUM TERRA. See AGER.

AGROSTIS. See BRYONIA ALBA.

AGRUMINA. ONIONS, LEEKS. See CEPA, and PORRUM.

AGRYPNIA, from *α*, neg. and *υπνος, ſleep.* See PERVIGILIUM.

AGRYPNOCOMA. See COMA VIGIL.

AGUARA QUIYA. See SOLANUM HORTENSE.

AGUL. See ALHAGI.

AGUTIGUEPOOBI BRASIL. See SAGITTARIA ALEXIPHARMACA.

AGYRTÆ, from *αγυρις, a croud of people*, or from *αγειρω, to gather together.* QUACKS, MOUNTEBANKS, or people who go from place to place to ſell medicines, were called *circulatores, circumforanei, ochlagogi, anacylei,* and *pharmacopolæ*; the laſt of which, though proper to any ſeller of medicine, yet was ſtrictly applied to mountebanks.

AHAMELLA. See ACMELLA.

AHIUS. SALT STONE.

AHMELLA. See ACMELLA.

AHOVAI THEVETICLUSII; or *Aiiouai,* HAOUVAY. The name of a fruit in Braſil, the ſize of a cheſnut, white, and ſhaped like the water caltrops; it is poiſonous. The tree is as large as a pear-tree, the bark white and full of juice, the leaves are always green, the flower conſiſts of one leaf, formed like a funnel, divided at the edge; a piſtil ariſes from the cup, which is the fruit. Inciſions in the bark emit a milky liquor that ſmells like garlick.

Miller take notice of two ſpecies.

AHUSAL. The SULPHUR OF ARSENIC.

AIES. See BATTATAS.

AIGRE DI CEDRE. See CITREUM.

AIIOAI. See AHOVAI.

AILMAD. See ANTIMONIUM.

AIPI, AIPIMA COXERA, AIPIPOCA, } See CASSADA.

AIRA. See LOLIUM.

AISTHETERIUM, from *αισθανομαι, to perceive.* See SENSORIUM COMMUNE.

AIX LA CHAPELLE, is a large imperial city, ſituated in the duchy of Juliers, on the confines of Flanders, ſeven leagues from Spa;—here there are a number of ſprings of hot ſulphureous waters, which ſupply a number of baths. On the vaults above the ſprings and aqueducts of theſe waters, is found every year, when they are opened, a quantity of fine white-coloured flowers of ſulphur, which has been ſublimed from the waters. The heat of the waters of the hotteſt ſpring, Dr. Lucas ſays, raiſes the quickſilver in Fahrenheit's thermometer to 136; Monſ. Monet to 146; and the heat of the fountain, where they commonly drink, to 112, according to Dr. Lucas. He evaporated a gallon of the water of the hotteſt ſpring from the emperor's bath, and procured 268 grains of a ſolid matter, compoſed of 15 grains of calcareous earth, 40 of ſelenites, and 243 of a ſaline matter, made up of natron and ſea ſalt. Sir T. Bergman obtained from a Swediſh kanne, 27 grains of lime, ſaturated with aerial acid, 29 grains of ſea ſalt, and 70 grains of mineral alkali. Theſe waters are powerfully diaphoretic, and diuretic; and, if taken in quantity, prove purgative. Some ſay the medical water at this place is volatile, ſulphureous, ſaponaceous, powerfully penetrating and reſolvent; it alſo contains a portion of iron; others, that it does not contain iron. Of the three hot European waters of note, viz. that of *Aix la Chapelle*, Bourbon, and Bath, the firſt abounds more eminently with ſulphur, whence it is the hotteſt, the moſt nauſeous, and purgative. The bath is the leaſt poſſeſſed of theſe qualities. With regard to the quantity of this water to be begun with, or the degree of heat to bathe in, in all caſes it is beſt to begin with ſmall quantities, and low degrees of heat, and gradually encreaſe them, agreeable to the effects and conſtitution of the patient. In caſes of dyſpepſia, and foulneſs of the prima viæ, they are ſaid to be efficacious in rheumatiſms, ſcurvy, ſcrophula, cutaneous diſeaſes; in hyſteria, and hypochondriaſis, melancholy, ſtone and gravel; in paralytic complaints, and many other caſes, they ſhould be conſidered as invigorators of the ſyſtem, deobſtruent, and evacuant; and that will point out their uſes, and alſo where their adminiſtration would be improper, as in all hectic caſes, putrid diſorders, where the blood is in a diſſolved ſtate, or the conſtitution much broken down. The times of drinking theſe waters, are from the beginning of May to the middle of June; or from the middle of Auguſt to the latter end of September. See MONRO's Medical and Pharmaceutical Chemiſtry, vol. ii. Dr. Williams on the Waters of Aix la Chapelle, &c. Encyclopædia Britannica.

AIZOON. See ALOIDES. It is alſo a name for *ſedum.*

AJAVA. So the Portugueſe call a ſeed which is brought from Malabar, and is celebrated in the Eaſt-Indies, as a remedy in the colic. When the gout affects the ſtomach, theſe ſeeds are very effectual in diſpelling the wind, and procuring ſpeedy relief from this painful diſorder: they ſometimes relieve by procuring a ſtool or two. Dr. Percival takes notice of theſe ſeeds in his Eſſays Med. and Exp. vol. ii.

AJUBATIPITA BRASILIENSIUM. A ſhrub bearing fruit like an almond; but it is black, and contains much oil.

AJUGA. See CHAMÆPITYS.

AJUGA. REPTANS. See BUGULA.

AKMELLA. See ACMELLA.

AL. The Arabian article which ſignifies *the*; it is applied to a word by way of eminence, as the Greek ὁ is. The Eaſterns expreſs the ſuperlative by adding God thereto, as, the mountains of God, for very high or the higheſt mountains; and that it is probable that *al* relates to the word alla, God; ſo alchemy may be the chemiſtry of God, or the moſt exalted perfection of chemical ſcience. See ALCHEMIA.

ALA, AN ARM-PIT, alſo A WING. In BOTANY, it is the two ſide petals in a papilionaceous corolla; alſo membranes affixed to the ſeeds. It uſed to be applied to the angle, formed by a branch with the ſtem; or by a leaf with the branch; but this is now named *axilla*, or *axil*, from its ſimilarity to the arm-pit.——AURIS, or *Pinna Auris.* It is the upper part of the external ear.—NASI, or *Pinna Naſi*, the cartilages which are joined to the extremities of the bones of the noſe, and which form its lower moveable part.

ALABANDICUS, ALABANDINUS. } LAPIS. A blackiſh ſtone intermixed with ſallow. It is pellucid, and looks as if it was divided by fiſſures into ſegments. Actius ſays, that the powder of this ſtone makes grey heirs black.

ALABARI. See PLUMBUM.

ALABASTRA. The green herbaceous leaves that encompaſs flowers: ſome ſay that it is the bud juſt peeping out.

ALABASTRON. An ointment ſo called. Myrep-

ſus

ſus gives a preſcription for it, and ſays that it is the ſame as that with which Mary anointed the feet of Jeſus Chriſt.

ALACAB. See AMMONIACUS SAL.

ALÆ. Aetius calls the *nymphæ* thus; and ſays, that if an abſceſs here, or in the pudenda, ſhould extend to the anus, we muſt avoid cutting, for a fiſtula will be the conſequence; but, if it extends to the meatus urinarius, an inciſion may be made.

ALÆ INTERNÆ, } CLITORIDES. See NYM-
——MINORES, } PHÆ.

——MAGNÆ OS SPHENOIDIS. So Ingraſſius calls the two temporal apophyſes of the os ſphenoides.

——PARVÆ OS SPHENOIDIS. So Ingraſſius calls the two thin, ſharp, tranſverſe apophyſes of the os ſphenoides, which form the ſuperior orbitary fiſſures.

ALÆMUS. INVINCIBLE.

ALAFI, } See ALCALI.
ALAFOR, and ALAFORT, }

ALAIA PHTHISIS, from ἀλαὸς, *blind*. A waſting from a flux of humours from the head.

ALAMAMDINA, ſuppoſed to be the alabandicus lapis.

ALAMBIC. See ARGENTUM VIVUM.

ALAMAD. ANTIMONY See ANTIMONIUM.

ALANA TERRA, ENGLISH OKER, called alſo ALHANNA. It is eſteemed drying and aſtringent; its principal uſe is to mix with ſalts in diſtillation, in order to keep them from melting. It is thought that this ſtone is what the ancients called the *Samian ſtone*. It is alſo called *Terra Tripolitana*, *Tripolis*.

ALANDAHAL. See COLOCYNTHIS.

ALANFUTA, a vein betwixt the chin and upper lip, formerly opened to cure a fetid breath.

ALA POULI. See BILIMBI.

ALAQUECA. A ſtone found in little poliſhed fragments in the Eaſt Indies, uſed externally to ſtop bleeding.

ALARE EXTERNUM. See PTERYGOIDES EXTERNUS.

ALARIS VENA. The inner of the three veins in the bend of the arm: this is attended with an artery, and the median with a nerve; but the outer one, as P. Ægineta long ſince obſerved, is ſafe for bleeding.

ALARTAR. BURNT BRASS. See ÆS USTUM.

ALASALET. AMMONIACUS SAL.

ALATAN See LITHARGYRUM.

ALATERNOIDES AFRICANA, } See CASSINE.
ALATERNUS. }

ALATI. Thoſe who have prominent ſcapulæ are ſo called. Such are ſubject to conſumptions.

ALATI PROCESSUS, or ALARES. The wing-like proceſſes of the os ſphenoides.

ALATUM FOLIUM. (from *ala*, *a wing*) winged leaf; as it were compoſed of ſeveral pinnated leaves.

ALAURAT. See NITRUM.

ALBA SIMPLEX. See OCIMASTRUM.

ALBA TERRA. The matter of the philoſopher's ſtone is ſo called.

ALBADARA. See SESAMOIDEA.

ALBAGIAZI. See SACRUM OS.

ALBAMENTUM. See ALBUMEN OVI.

ALBANUM. Salt of urine.

ALBARA. A ſpecies of the white leproſy, ſee ALPHUS. It alſo ſignifies the white poplar. *Albarus* nigra, is the *lepra Græcorum*. Avicenna calls thus the *lepra ichthyoſis*.

ALBATIO. Alſo ALBIFICATIO. A chemical term; which ſignifies to whiten metal, called blanching of metal.

ALBEDO. Whiteneſs. In urine is obſerved four ſorts of whiteneſs, viz. the cryſtalline, the ſnowy, the limy, and the limpid.

ALBERAS. See STAPHIS AGRIA.

ALBESTON. QUICK-LIME. See CALX.

ALBETAD. See GALBANUM.

ALBI. SUBLIMATE. See MERC. COR. ALB.

ALBICANTIA corpora, Willis's glands. See CEREBRUM.

ALBIFICATIO. See ALBATIO.

ALBIMEC. ORPIMENT. See AURIPIGMENTUM.

ALBINUM. See GNAPHALIUM.

ALBIN INS. The abbreviation for Albin Eleazar, a natural hiſtory of inſects. London, 1720, 4to.

ALBIR. Pitch got from the bark of the yew-tree.

ALBOR. URINE. See URINA.

ALBOR OVI. See ALBUMEN OVI.

ALBORA. A ſort of itch, or rather leproſy. Paracelſus ſays, it is a complication of the morphew, ſerpigo, and leproſy. When cicatrices appear in the face like the ſerpigo, and then turn to ſmall bliſters of the nature of morphew, it is the *albora*. It terminates without ulceration, but by fetid evacuations in the mouth and noſtrils; it is alſo ſeated in the root of the tongue. Internal medicines, as well as corroſive ones, are forbid.

ALBORCA. MERCURY. See ARGENTUM VIVUM.

ALBOT. See CRUCIBULUM.

ALBOTAT. CERUSS. See PLUMBUM. N° 1.

ALBOTIM, or ALBOTAI. See TEREBINTHINA.

ALBOTIS. See TERMINTHUS.

ALBUGINEA vel TENDINOSA TUNICA. The inner proper coat of the teſticle is thus named, from its white and tranſparent colour. It is a ſtrong, thick, white membrane, ſmooth on the outward ſurface, rough and uneven on the inner: into the upper part of this membrane, are inſerted the blood veſſels, nerves, and lymphatics, which ſend branches into the teſticles.

This coat being diſtended, is the cauſe of that pain which attends an inflammation on the teſtes.

Albuginea is alſo a name of the *adnata*, which ſee.

ALBUGINOSA HUMOR. See OCULUS.

ALBUGO CORALLII. A name of the magiſtery of coral, which it hath obtained from its whiteneſs.

ALBUGO OCULORUM. WHITE SPECK ON THE EYES. The Greeks generally named it *leucoma*; the Latins, *nubes*, *maculæ albæ*, *nebula*, and *nubecula*: ſome ancient writers have deſcribed it under the names of *pterygium*, *pannus oculi*, *onyx*, *paralampſis*, *argema*, and *ægides*. Sauvages makes it a ſpecies of leucoma, under the name leucoma. Albugo, called by Dr. WALLIS *the albuginous, or pearly corneal ſpeck*. The French name it *tache blanche*, if it ſhines: the Latins, *margaritta*; the Greeks, παραλαμπσις; the French, *perle*. It is a variety of Cullen's caligo corneæ. With us it hath various appellations, as, a CICATRICE, FILM, HAW, a DRAGON, PEARL, &c.

It may be obſerved, that all cicatrices appear white in the black part of the eye; for the cornea being thickened, the moſt eminent part turns white: aſtringents thicken theſe cicatrices.

Some diſtinguiſh this diſorder, by nubecula, when its ſeat is ſuperficial; and *albugo*, when it is deep. Others make the following diſtinctions, viz. when the ſpeck appears of a ſhining white, and without pain, it is called a cicatrice; when of an opake whiteneſs, an *albugo*; ſeated ſuperficially, it hath been termed a ſpeck; and more deeply, a dragon; if an abſceſs was the cauſe, its contents hardening between the laminæ of the cornea, cauſes it to project a little, and then it is called a pearl.

The cauſes are various; as inflammation in the eye, abſceſs in the cornea, eroſion, meaſles, ſmall-pox, wounds, burns, &c.

When deep, the cure is difficult; when the conſequence of a wound or ulcer, they are rarely cured; when cauſed by an imprudent uſe of vitriolic collyriums, and when they alter the natural ſhape of the eye, the prognoſtic is as unfavourable. Thoſe which follow an inflammation, generally diſappear ſpontaneouſly.

Happening after the ſmall-pox, meaſles, or other inflammatory cauſes, the utmoſt haſte ſhould be made to relieve, by bleeding, purging, bliſtering, diuretics, and an abſtemious diet. Avoid cold and aſtringent collyriums; but the fumes of coffee, or of the decoction of the woods, may be uſeful. When theſe ſpecks are very ſmall, they often ulcerate; but theſe ulcerations are ſoon healed by the application of the pulv. rad. irid. paucul. facc. cryſtal. or, as is juſtly preferred by many, the aq. cupri ammoniati. London Pharm. If the diſorder hath been of long ſtanding, the cure is very difficult; however, the following methods may be attempted. Expoſe the diſeaſed part of the eye to the fumes of camphorated ſpirit of wine directed through a quill: this, by a continued uſe, may abrade the ſpeck. This method ſeldom fails to excite ſome degree of inflammation, by which the cure is effected; though, when the inflammation is thus produced, it muſt be removed by the common methods with all poſſible ſpeed. To this end, the following have been alſo applied with ſome degree of ſucceſs, viz. the juice of celandine, the gall of eels, or of the pike, or of a partridge, and the oil of box: if theſe prove too ſharp, let them be diluted with water, or with a thin ſolution of

gum

gum dragon: apply any of these once in twenty-four hours; and half an hour after the application, wash it off with a little brandy and water. The aq. cupri ammon. alone sometimes succeeds. When the film is very tough, and the eye not inflamed, common glass finely levigated may be blown upon it through a quill, and repeated once in a day or two. Dr. Kirkland thinks, that in general, when small opacities upon the cornea are curable; and if the cure is undertaken as soon as the removal of inflammation admits, nature, assisted by strengthening the eye with cold water, will effect the cure. It is cured according to St. Yves, by beginning with the inflammation which accompanies it. BOERHAAVE prescribed the repeated use of calomel and cathartics to dissolve the lymph, and free the cornea from leucoma. See UNGUIS. See Kirkland's Inquiry, vol. i. p. 492. Bell's Surgery, iii. 356. Wallis's Nosology of the Eyes, p. 134. White's Surgery, 228.

ALBUM (Balf.) See CAPIVI BALSAMUM. A balsam also so called, is thus made. ℞ aquæ lythargyri acetati ad consist. mellis evaporat. & ol. rosar. ää p. æq. m.

ALBUM CANIS, } THE WHITE DUNG OF
ALBUM GRÆCUM. } DOGS; also called *spodium Græcorum, nihil album—gryseum, cynocoprus.* It is discutient, and was formerly applied to the inside of the throat in quinsies, being first mixed with honey; a cataplasm of alb. Græc. p. i. & conf. rosar. rub. p. ii. was applied across the throat. Neuman's Chem. Works.—HISPANIÆ, & HISPANICUM. SPANISH WHITE. It is also called *bianca Alexandrina.* It is made from tin, in the same manner that cerus is made from lead; also from bismuth. It makes the skin appear white.——JUS. WHITE BROTH. Boil whiting, haddock, cod, or any such white-grained fish, in water, with a little oil; also a small quantity of anise and leeks. When the fish is parboiled, add a little salt. ——NIGRUM. MOUSE-DUNG. ——OLUS. LAMB'S LETTUCE, or CORN SALLAD. See LACTUCA AGNINA.

ALBUMEN OVI. White of egg; called also *albumor ovi, ovi albus liquor, ovi candidum, albor ovi, albamentum, album ovi, clareta, &c.*

The white of an egg is a pellucid, viscous liquor; thinner towards each end, and thicker in the middle. That part which is more dense and close than the rest is called *gallatura.* It supplies the chick within the egg, during incubation, with its first nourishment, and bears a great analogy to the serum of the blood. In each egg there are two *albumens*, involved in their proper membranes: of these, the one is very liquid, and is next to the shell; the other is more dense and viscous; it immediately surrounds the yolk. There are also two branches of umbilical veins in the egg; one goes to the white, and the other to the yolk. The white is specifically lighter than the yolk; it is condensed by heat, in which the yolk retains its softness. The yolk is dried more in boiling than roasting: when it comes warm by incubation, it is more humid, and like melting fat.

The chick in the egg is first nourished by the thinner or outer *albumen*, then by the inner and more viscous, and lastly by the yolk. The umbilical veins that go to the white, when it is spent, wither, and leave no signs of their having existed, by the time that the chicken is hatched. During the whole incubation, the white is as sweet as when the egg was new laid.

Boerhaave observes, that the white of egg is neither acid, alkaline, nor spirituous; that it is inodorous, insipid, and so free from acrimony, that if it is applied to naked nerves, it is scarcely perceived; and yet, in twenty-one days, in the heat of 93 degrees by Fahren. thermom. a chicken is formed; that 80 degrees is insufficient, and 100 destroys the fœtus and the egg too, with respect to the production of a chicken.

If an egg is steeped in water heated to 80 degrees, it loses its tenacity; part exudes through the shell at the broad end, and the rest becomes ichorous and putrid. If the fresh white is thrown into boiling water, it instantly coagulates.

The white of egg forms a more solid coagulum than serum, but in other respects they are the same if put into boiling water; alcohol of wine coagulates the white of egg, and it does the same with serum, on which account alcohol is applied to bleeding wounds as a styptic.

A little putrid white of egg taken into the stomach, occasions a nausea, horror, fainting, vomiting, diarrhœa, and gripes; it inflames the bile, excites heat, thirst, fever, and dissolves the humours like the plague. On the contrary, the white of fresh-laid eggs, if taken while warm from the hen, is extremely nourishing to the infirm; it may be taken in luke-warm milk; but if any other heat is applied to it, the nutritious quality will be destroyed. The fresh white of egg prevents burns from rising in blisters, if it is used immediately after the accident: it mitigates inflammation of the eyes, and preserves the face from sun-burning. Eggs taken raw every morning, have been useful in some jaundices, and other bilious complaints. In PHARMACY, it is used as a medium to render balsams and turpentines, &c. miscible with aqueous fluids; but as it disagrees with many stomachs when thus taken, a mucilage of gum arabic may supply its place, it being as good a medium in similar circumstances, and not apt to offend the tendereſt stomach. The eggs of all birds, are pretty nearly similar with regard to their flavour and nutritious effects: some though are deeper coloured, and more tenaceous than others. It is surprising what a quantity of egg will be digested by some persons; but in most, this power is very limited; for a smaller bulk of this, than of any other food, will satisfy and occupy the digestive powers of most men. It is a more alcalescent food than any other animal substance; and, during digestion, is less stimulant.

ALBUMOR. See ALBUMEN OVI.

ALBURNUM. The softer and paler part of wood next the bark; artificers call it the sap, to distinguish it from the heart, which is deeper coloured, and harder. See SANTALUM ALBUM.

ALBURNUS AUSONII. A little river fish like an anchovy.

ALBUS LIQUOR. See ALBUMEN OVI.

ALBUS ROMANUS PULVIS. See MAGNESIA ALBA.

ALBUS, besides its well-known signification to express white, is also the name of a fish. See CAPITO LACCUSTRIS.

ALCAHEST, or ALKAHEST. THE UNIVERSAL MENSTRUUM, or DISSOLVENT. A name first used by Paracelsus, and derived from the German words *al* and *geest*, i. e. *all spirit.* Van Helmont borrowed the word, and applied it to his invention, which he called the universal dissolvent. As it is difficult to say whether the falsity or folly of what is handed down to us with respect to this article be the greatest, the curious are referred to the writers themselves, to whom we are obliged for what is said concerning it. See Paracelsus de Viribus Membranorum, lib. ii. cap. vi. Eph. Germ. D. xi. ann. 8. app. 3. Helmont Complexiorum atque Mistionum elementalium figmentum, sect. 27—29. Helmont Potest. Medic. sect. 3—24. Helmont Arbor Vitæ. Boerhaave's Chemistry. *Alcahest* is also a name of the liquor of flints.

ALCALI, or ALKALI, of *al*, and *kali*, i. e. *of* or *from kali.* Alkaline salt is called *alasi, alasor, alasort, alkahest glauberi*; according to some, *calcadis. Alkali*, because a great quantity of that kind of salt is obtained from a plant called *kali*; the name *alkali* hath been given to the fixed salt of all plants; and that because an effervescence does arise upon mixing an acid liquor with the salt; all volatile or fixed salts, and all terrestrious matters which ferment with acids, have come to be called *alkalies.* The herb kali, which grows on the sea coasts, when dried and burnt, affords a lixivium, which, if evaporated, is the fixt alkaline salt.

Alkalies are mineral, vegetable, and animal, which three were particularly distinguished by the term, adding to it the peculiar epithet belonging to the saline substance to be specified; but the College of Physicians of London have now rejected the term, and distinguished them by three different appellations; calling the vegetable alkali, KALI; the mineral, NATRON; the volatile, AMMONIA; but they are either earthy or saline.

Earthy *alkalies* are those substances, which of themselves scarce dissolve in pure water; but if added to acids, form a tertium quid. Of this sort are chalk, limestone, crab-eyes, oyster-shells, egg-shells, &c. Thus, if pure water is acidulated with oil of vitriol, scrape chalk into it, it ferments; and during the ferment, the water hath a brisk taste; and when enough of chalk is added, the acid is lost; so that no experiment can discover the acid, except you first separate it: and this is a certain characteristic, or the proper meaning of an *alkali*, viz. it is the reverse of, or natural opposite to acid.

The saline *alkalies* are fixed and volatile. The latter of which differ from the former only in volatility and its

conſequence; it riſes ſooner than the rectified ſpirit of wine, it regenerates nitre and ſea ſalt from their ſpirits; only the ſalts ſo recovered are ſemi-volatile, reſembling ſal ammoniac.

Tachenius is ſaid to have firſt made the fixed vegetable *alkali*: he eſtabliſhed the general uſe, but it was uſed long before his time. A fixed *alkali* is the baſis of ſea ſalt.

The College of Phyſicians of London have now rejected the ſaline ſubſtance *ſal abſinthii*, and ſupplied its place with the KALI PREPARATUM, which they order to be prepared in the following manner:

Take of pot-aſh two pounds, boiling water diſtilled three pints; diſſolve and filter through paper. Evaporate the liquor till a pellicle appears upon the ſurface, then ſet it aſide for a night, that the neutral ſalts which it contains may cryſtallize; after which, pour out the liquor, and boil away the whole of the water, conſtantly ſtirring leſt any ſalt ſhould adhere to the pot.

In like manner is purified impure kali from the aſhes of any kind of vegetables. The ſame ſalt may be prepared from tartar, burnt till it becomes of an aſh-colour; and indeed of all the ſubſtances from which a fixed alcaline ſalt is obtained, tartar yields the largeſt quantity, and with the leaſt trouble. The college has ordered the ſolution of pot-aſh to be ſet by a whole night for the neutral ſalts, which are part of the compoſition, to cryſtallize, but that is not ſufficient; for, in order to have the alkali in its pureſt ſtate, which is their intent, freed from thoſe ſalts, the ſolution will require to be expoſed to cryſtallization three times at leaſt, elſe will it retain too great a ſhare of vitriolized tartar. *Obſervations on the Pharmacopœia Collegii Regalis, &c. London*, 1788.

NATRON, or SAL SODÆ, prepared.

Take of barilla powdered two pounds, diſtilled water one gallon, boil the barilla in four pints of water for half an hour, then ſtrain it; boil the part which remains after ſtraining with the reſt of the water, and ſtrain it. Evaporate the mixed liquors to two pints, and ſet them by for eight days; ſtrain this liquor again; and after due boiling, ſet it by to cryſtallize. Diſſolve the cryſtals in diſtilled water, ſtrain the ſolution, boil and ſet it aſide to cryſtallize. This is ſimilar to the *ſal alkalinus ſalis marini*.

ALKALI MINERALE. This MINERAL FIXED ALKALINE SALT may be procured from ſea ſalt, and from the waters of many ſprings, by diſtilling the acid ſpirit from the former; and, by boiling the latter to dryneſs, a pure alcaline ſalt will be obtained. This proves the aſſertion to be falſe, that burning of vegetables is the only way of procuring fixed alkaline ſalt. This alcali differs from that of vegetables, by being milder, and leſs acrid to the taſte; melting more eaſily in the fire; requiring more water to diſſolve it; in its concreting into cryſtalline maſſes on evaporation after ſolution in water; not running into a liquid by expoſure to the air; and in being a leſs powerful ſolvent of the ſtone in the bladder. The cryſtals are priſmatic, reſembling thoſe of the ſal. glauberi, now called natron vitriolatum. With this mineral alkali, the Spaniſh ſoap is made. This ſalt, joined with the *vitriolic acid*, forms the NATRON VITRIOLATUM; with the *nitrous*, NITRUM CUBICUM; with the *muriatic*, SEA SALT; and with *vegetable acid*, the NATRON TARTARISATUM. For the different names this fixed alkaline ſalt has acquired, ſee ANATRON.

The *vegetable alkali*, or *potaſh*, and the *mineral alkali*, or *ſoda*, are the only two kinds of fixed alcalis that have hitherto been diſcovered, which poſſeſs the following general properties: they change the blue ſyrup of violets to a green colour; their taſte is peculiar, and diſagreeably cauſtic, even when diluted with water; they have a ſtrong attraction for water, with which they unite in all proportions. They combine with acids by a ſtronger affinity than is poſſeſſed by moſt other ſubſtances, at a moderate temperature. Moſt inflammable ſubſtances are acted upon by them. They melt in a moderate heat; and in a ſtronger, they are volatilized: in the dry way, they diſſolve earths, and the calces of metals.

Fixed alkaline ſalt is obtainable from ſea ſalt and nitre, and from all vegetables, except perhaps ſome of the volatile acrid kind, which impreſs the noſe ſharply with their ſcent, ſuch as muſtard-ſeed, garlic, &c. they contain parts that are volatile, and become volatile ſalt. The fixed ſalt of ſome plants vary greatly from one another, in ſtrength, &c. if taken in the ſtate wherein they are firſt extracted from the aſhes: they ſometimes contain a conſiderable proportion of neutral ſalt of the vitriolic or of the muriatic kind; to diſcover which, ſhake a ſtrong ſolution of the ſuſpected ſalt in a phial, and about an equal quantity of the ſp. vini R. if the ſalt is purely alkaline, the two liquors on ſtanding for a moment will ſeparate, the ſpirit riſing to the top, but both will be tranſparent as at firſt; but when neutral ſalts are mixed with the alkaline, though in a very ſmall proportion, the ſpirit produces inſtantly an opake milkineſs in the ley, and on ſtanding a few minutes, a ſaline matter falls to the bottom. Sometimes a bitter cryſtalline hard ſalt, that is neither acid nor alkaline, is found among the fixed alkaline ſalt; but as it does not eaſily diſſolve even in hot water, it is readily ſeparated by means of cold. (e. g.) Take ſix pounds of the ſuſpected ſalt, and put it into twenty pints of rain or other ſoft water, the parts that do not eaſily diſſolve falling to the bottom, the pure liquor may be preſently decanted, and the alkaline ſalt recovered by evaporation. This hard ſalt is never met with in making the ſalt of tartar, but in pot-aſh it is often found. The ſalts of the leaves, and other herbaceous parts of plants, are more difficultly brought to a ſtate of purity than thoſe of the more woody and compact, a portion of the oil being ſo tenaciouſly retained: it is true, ſome endeavour to retain this oil in the ſalt by burning the vegetables in a ſmothering heat until they are reduced to aſhes. They do this to render the ſalt more mild; but the mineral *alkali* is ſufficiently free from acrimony to ſit eaſy in the moſt irritable ſtomach, when adminiſtered in the uſual modes. Tachenius and Boerhaave, with many others, prefer theſe ſalts when their oil is retained: but as they had no view therein but what is anſwered in the mineral alkaline ſalt, the uſe thereof will at once appear more eligible, as its ſtrength is more certain, and its freedom from any empyreumatic oil ſecures it from exciting nauſea. Wormwood, broom, bean-ſtalks, mint, carduus, and all of the thiſtle kind, yield a good proportion of this ſalt, and that tolerably free from other kinds of ſaline matter.

The ſtrongeſt *alkali* is nitre diſſolved with the regulus of antimony, then ſet to cool, when the nitre will be found at the top, of a yellow colour. To diſcover the ſtrength of theſe ſalts, let a quantity of the muriatic acid be ſo diluted that ſixteen drams of it may exactly ſaturate one dram of pure *alkali*; if then a ſolution of a dram of any given ſalt be ſaturated with the ſame acid liquor, ſo many drams or parts of a dram of the acid as are required for the ſaturation, ſo many $\frac{1}{16}$ths or parts of $\frac{1}{16}$ths of pure *alkali* does the given ſalt contain.

Fixed *alkaline* ſalts are rendered more active, and even cauſtic, by the addition of quick-lime, as appears in the making of lix. ſapon. cauſtic. com. and by the union of lime and alkaline ſalt in a liquid ſtate, oils, fats, &c. are more powerfully diſſolved than by either of them in a ſeparate ſtate. The volatile alkaline ſalt is as greatly heightened in ſome of its qualities by quick-lime as the fixed is: lime renders the volatile alkaline ſalt permanently liquid, prevents its concretion, and alſo its effervecing with an acid, whence it is probable that the lime acts on *alkalies* by abſorbing their air.

The ebullition which ariſes on mixing an *alkali* with an acid is not from their antipathy, but affinity, or aſſociating principle; the acid and *alkali* ſo ſtrongly ruſh to each other, that the air and water are forcibly impelled, whence the commotion. Alkaline ſalts attract acids more forcibly than they attract water.

Alkaline ſalts obtained from different plants, purified by calcination from all their oil, and by deliquation in the air, by which only the *alkali* diſſolves, are all, except from ſome of the marine, ſo much alike as not to be diſtinguiſhed by any known method of trial. It is true, that ſo far as difference may ariſe from different management in the preparation, diſtinctions may be pointed out: a variation in the heat by which the plant is calcined occaſions a difference in the acrimony of the produce; uſing the aſhes freſh burnt, and after being long expoſed to the air, and applying the water hot or cold with which the ſalt is to be ſeparated from the aſhes, make a conſiderable difference; for by expoſure to the air, *alkalies* that have been made cauſtic by quick-lime loſe their adventitious acrimony; neutral ſalts are found in the aſhes of ſome vegetables, and boiling water takes them up with the alkaline; but cold water extracts from theſe aſhes the alkaline ſalts alone, except it be uſed in too large quantities, or permitted to ſtand too long upon them; and the reaſon why pot-aſhes have leſs neutral ſalt than the alkaline ſalt made by chemiſts, is, that the chemiſts uſe hot

hot water, but the pot-aſh makers uſe cold water to make the aſhes into ley. It is the ſame with the volatile as with the fixed ſalts, they do not differ from one another ſo much as they do from themſelves in different ſtates of purity.

Fixed alkaline ſalt is not ſimple and pure, but is an earth whoſe ſaline part in a ſeparate ſtate is volatile; this is evident in the preparation of the aq. kali, which ſee.

As a medicine, if largely diluted with water and taken in bed or a warm room, vegetable fixed alkali promotes perſpiration; but its tendency is more directly to become diuretic, and this is promoted by the patient reſting in a cool ſituation. It looſens the belly, and renders the effect of purgatives more laſting, and is peculiarly uſeful againſt that conſtipation of the bowels which is generally attendant on the ſtudious and ſedentary. It deſtroys acidity in the primæ viæ, converting them into a mild aperient ſalt, and thus removes a cauſe of many chronical diſeaſes. It reſolves viſcid and glutinous humors, by which, and its gentle ſtimulus, obſtructions are removed, and wherever it paſſes ſecretions are promoted. It looſens the texture of calcarious concretions by ſtrongly attracting their air; and made into a ley with a ſmall quantity of lime, this power is increaſed. In thoſe flatulent diſorders which riſe from a defective bile it affords great relief.

The doſe may be from gr. ij. to ʒij. twice a day, but always plentifully diluted; the doſe of ʒij. ſhould be mixed with at leaſt ℥xx. of water. Conſiderable doſes may be long continued, as is evident in thoſe who take the aqua kali puri to remove calculous complaints.

As a principal medical effect of alkaline ſalt is to attenuate the blood and humors, it is obviouſly improper in the ſcurvy, and all thoſe diſorders in which the texture of the blood is already too much enfeebled; in particular diſorders, this medicine is hurtful by increaſing that colliquation which is always obſerved to attend them. It is probable, that the reſtrictions on the Jews with reſpect to their diet, was in part from the ſpeedy putreſcence to which the prohibited ſubjects tend; animal food is all alkaleſcent, but ſome more ſo than others; all fiſh ſoon putrify, but thoſe without ſcales, and the ſhell fiſh, the ſooneſt.

ALCALI VOLATILE—AMMONIA, called alſo *Aſanon*. VOLATILE ALKALINE ſalt is either in a dry or liquid form; when dry it is called ſalt, when liquid, ſpirit, now water; the ſalt is obtained by ſublimation, the water by diſtillation. The water is only the ſalt diſſolved, and differs not from it but in the liquid form, and the conveniencies of its fluidity, ſuch as its more readily uniting oil with water, &c.

The volatile alkaline ſalt hath been chiefly obtained from the horns of deer, by diſtilling them in large iron pots, with a fire gradually increaſed to a ſtrong red heat; but in the ſame manner, as is below directed for the ſalt, liquor, and oil of hartſhorn; a ſimilar ſalt, liquor, and oil may be extracted from all animal ſubſtances except fat, from blood dried by a gentle heat, from urine firſt evaporated to the conſiſtence of honey, and putrified. Urine, diſtilled with the addition of quick-lime, yields an extremely pungent ſpirit. Ivory, and the bones of animals, are uſed for this purpoſe; bones are, indeed, ſo far preferable to hartſhorn, that without being defective in any perfection obſervable in the horns of their produce, the ſalt and ſpirit of bones require leſs rectification, are more palatable, and leſs diſguſtful to the ſtomach, and the ſpirit retains its limpid appearance longer than does that from horns; when bones are uſed, their fat muſt be extracted firſt by long boiling. Wood-ſoot affords a ſalt liquor and oil, not differing from thoſe from hartſhorn, except in that it is not ſo eaſy to rectify. Crude ſal ammoniac, being mixed with any fixed alkaline ſubſtance, its acid quits it, and joins the fixed *alkali*, *ſal volatilis ſalis ammoniaci*, the volatile alkaline ſalt of the ſal ammoniac from thence is obtained, and with very little trouble rendered perfectly pure; the ſpirit of ſal ammoniac is free from the inconveniences which attend thoſe ſpirits obtained from horns, ivory, bones, &c.

LIQUOR, olim SPIRITUS, SAL, & OLEUM CORNU CERVI.

The *liquor*, *ſalt*, and *oil of hartſhorn*:

Diſtil pieces of hartſhorn in an iron pot, furniſhed with an earthen head, and a large receiver well luted, on an open fire, gradually raiſed almoſt to the higheſt red heat. A phlegm ariſes at the firſt, a ſpirit follows, then comes a volatile ſalt mixed with an oil, this oil at firſt is yellowiſh, but the diſtillation being continued, its colour deepens to a dark red almoſt black: in the bottom of the pot there remains a black coal, called HARTS BLACK, from its being the remains of hartſhorn; it is as good as ivory black when ground fine; this reſiduum, if taken out and burnt to whiteneſs in the open air, is the BURNT or CALCINED HARTSHORN.

If the aqueous liquor is not removed before the ſalt comes over, a part of the ſalt diſſolves in it, and thus forms what is called ſpirit; but it is uſual to let all come over into the receiver that can be obtained, before any ſeparation is made; if it is required to have the whole of the ſalt ſolid and dry, the phlegm ſhould be removed as ſoon as the ſalt begins to ariſe, which may be known by the appearance of white fumes; and that this may be commodiouſly done, the receiver ſhould be left unluted until this firſt part of the proceſs is finiſhed.

The oil ſeparates from the phlegm and liquor by filtration through wetted paper, the two latter paſſing through, and the oil remaining on the filter.

The phlegm may be ſeparated from the ſpirit by diſtillation, in a tall veſſel with a gentle heat; the liquor will come over into the recipient, and the phlegm remain behind. In all diſtillations of the liquor, greateſt part of the ſalt comes over before the phlegm, and the proceſs ſhould be continued no longer than till ſo much of the phlegm has followed as is nearly ſufficient to diſſolve it; that part of the ſalt remaining undiſſolved may be a criterion to the purchaſer of the ſtrength of the ſpirit. The ſpirit may be rendered ſtill purer, if to every pint of it ʒij. of pot-aſh is added, and then being put into a retort the ſpirit is gently diſtilled, for thus any remaining oil is left behind with the fixed alkali. The liquor by this mode of procuring is not always of the ſame ſtrength; in different ſhops we find it vary much; we are therefore recommended, to obviate this inconvenience, to make the liquor in the following manner. Mix two pounds of the aqua ammonia with one dram of oleum animale, and hence a good volatile antiſpaſmodic ſpirit will be acquired, which may be improved by rectifying together, and a ſpirit always of a given ſtrength procured. *Obſervations on the Pharmacopœia of the London College of Phyſicians*, 1788.

The liquor may be divided into a volatile ſalt and phlegm by diſtilling it in a very tall and narrow cucurbit; the ſalt will ariſe and adhere to the head in a dry form, and the phlegm remain behind.

To free the ſalt from the oil, ſublime it from twice its quantity of pot-aſh, for the oil will be detained thereby, and the volatile ſalt riſes pure. But a ſpeedier method is, firſt to ſublime the ſalt from an equal weight of chalk, and afterwards from a little rectified ſpirit of wine.

SPIRITUS SALIS AMMONIACI,—called now AQUA AMMONIÆ, WATER OF AMMONIA.

Take of pot-aſh ℔ i. ſs. crude ſal ammoniac ℔ i. of pure water ℔ iv. mix in a retort, and with a gentle heat draw off ℔ ij. of ſpirit.

SAL VOLATILE SALIS AMMONIACI,—called now AMMONIA PREPARATA.

Take of crude ſal ammoniac ℔ ij. pure white chalk ℔ iv. mix them well, having firſt ſeparately powdered them, then ſublime the ſalt with a ſtrong heat.—Perhaps the following method for making this ſalt will be found preferable: Take the whiteſt ſal ammoniac, dry it well while in large pieces, picking out every part that ſeems diſcoloured; then take the cleaneſt chalk and dry it thoroughly, by heating it as hot as boiling water, but not hotter; powder it well and dry it again, mix the ſal ammoniac intimately with the chalk by trituration; while they are in this dry ſtate, in the proportion of five parts of chalk to four parts of the ſalt, put them into a retort with a thick ſhort neck and the orifice cut very wide; fit to it a ſmall receiver with a long neck and lute them well together; then put them into a ſand-pot, and ſublime the ſalt gradually, never ſuffering the lower part of the receiver to grow hot; let the fire, however, be raiſed to a ſtrong heat at the latter part of the operation. When the whole is grown cold, break the receiver, and ſeparate ſo much of the ſalt as appears white and pure from the diſcoloured; preſerve it from exhaling, which would not only leſſen its ſtrength, but alſo dull its tranſparent appearance: the leſs lightly pieces may be kept for making the ſpirit. ammoniæ compoſitus, or the fictitious ſpirit C. C. or it may be purified by reſubliming. Care muſt be taken that no air get to the ſalt and chalk after they are powdered, for they both will attract moiſture, which will leſſen the quantity of volatile ſalt, by melting it and running down the ſide of the receiver as a

ſpirit; the fire muſt not be hurried, leſt the retort or the receiver burſt; nor be too great, leſt the ſalt be prevented thereby from forming on the ſides. Sometimes a cake of crude ſal ammoniac is found at the top of the chalk after ſublimation, which may be uſed for making volatile ſpirit; this crude ſalt is alſo found in the ſide of the neck of the retort.

This volatile water and ſalt are more grateful to the ſtomach than thoſe of hartſhorn, and therefore are judiciouſly preſcribed in all the intentions which that ſpirit and ſalt are given to anſwer: they are the pureſt of all the medicines of this kind, though ſomewhat more acrid than thoſe produced directly from animal ſubſtances, which always contain a portion of the oil of the ſubject, and receive from thence ſome degree of a ſaponaceous quality; but diveſted of their oil, they differ not from the ammoniac water and ſalt.

The volatile alkaline ſalt is very penetrating and pungent to the ſmell and taſte, the only concrete ſalt that in its pure ſtate emits ſenſible effluvia; it diſſolves oils, reſins, fats, &c. more languidly than the fixed alkalies, on account perhaps of its not being ſuſceptible of any conſiderable heat by which its menſtrual power might be promoted. In the bodies of animals it operates more powerfully than the fixed alkaline ſalt, both as reſolvent and ſtimulant, and is more diſpoſed to paſs off by the pores of the ſkin, and leſs by the groſſer emunctories, and acts more remarkably on the nervous ſyſtem; it is peculiarly uſeful in lethargies, apoplexies, hyſteric and hypochondriac diſorders, languors, head-ach, flatulencies, and other ſymptoms attending theſe complaints: in languors and faintings, this ſalt often gives immediate relief; in low fevers, ſlow vernal intermittents, it is an efficacious remedy; it relieves rheumatic pains, and, joined with bliſters and aloetic purges, happy effects have enſued: ſome admit of volatile alkaline ſalts in putrid diſeaſes; but the vegetable acids, ſuch as the acet. diſtil. accompanied with bliſters, are not to be controverted in this caſe, as being the moſt eligible adminiſtration; and the ſpir. ætheris nitroſus far preferable, when fainting happens in putrid fevers, to the liquor C. C. In inflammatory fevers the uſe of alkaline ſalt is far ſuperior in the beginning to what it is in future periods, if joined with the acetous acid, as in the SPIRIT MINDERERI, or AMMONIACUS VEGETABILIS SAL, now AQ. AMMON. ACETATA, which is thus made: Take any quantity of prepared ammonia, and gradually pour upon it diſtilled vinegar, till the effervеſcence ceaſes; occaſionally ſtirring the mixture to promote the action of the vinegar, on the ſalt. In fevers, its doſe, from two to ſix drams every 4th or 6th hour. It is a diaphoretic, ſudorific, and diuretic, and acts without heating. To hit the neutralized point may be difficult; but, by dropping a few drops of ſyrup of violets into a part of it, if it turns red, it partakes too much of acidity; if greeniſh, too much of alcaleſcency.

The doſe of volatile alkaline ſalts may be from gr. ij. to ℈ i. given in a draught or in a bolus; in which latter form, to prevent the pungency of the ſalt from affecting the throat, it may be proper to mix it with a ſolution of gum tragacanth, or ſome other mucilaginous ſubſtance. See AMMONIA pp.

SP. SAL. AMMOM. DULC.—now called, SPIRITUS AMMONIÆ.

DULCIFIED OR SWEET SPIRIT OF SAL AMMONIAC.—SPIRIT OF AMMONIA.

Take of a fixed alkaline ſalt ʒ vi. of crude ſal ammoniac ℥ iv. of proof ſpirit ℔ iij. and mix: with a gentle heat draw off ℔ i. ß. the doſe is from fifteen drops to a dram or more.

The volatile *alkalies*, not cauſtic, are averſe to a union with vinous ſpirits by ſimple mixture; yet a ſolution of them in ſp. vin. R. is obtainable by adding it along with water, as in this proceſs. This preparation is deſervedly in great eſteem both as a menſtruum and a medicine; it is a ſolution of alkaline ſalt in ſpirit of wine, for though proof ſpirit is uſed, its phlegm does not riſe; it only ſerves to facilitate the action of the pure ſpirit upon the ammoniac ſalt: it might, perhaps for ſome purpoſes, ſuch as making the ſp. ammon. comp. &c. be more adviſeable to make a dulcified ſpirit with the ſpirit of ſal ammoniac that is made with quick-lime, for it may be mixed at once with rectified ſpirit of wine in any proportion, without any hazard of ſeparating the volatile *alkali*; ſuch a compoſition may be thus formed, and may be named.

An extemporaneous dulcified ſpirit of ſal ammoniac:

Take the ſpirit of ſal ammoniac prepared with quick-lime ℔ i. rectified ſpirit of wine ℔ i. mix.

SPIRITUS VOLATILIS CAUSTICUS, vel

SPIRIT. SAL. AMMON. CUM CALCE. VIV. PPT. NOW AMMONIÆ AQUA PURÆ.

The volatile cauſtic ſpirit, or ſpirit of ſal ammoniac, prepared with quick-lime.

Take crude ſal ammoniac ℔ ij. quick-lime ℔ ij. pure water lb iv. quench the lime in the water, and then put it into a retort, then add to it the powdered ſalt, immediately adapting a receiver, for the pungent ſpirit riſes on the firſt contact of the lime with the ſalt, and with a gentle heat draw off lb ij.

Or take crude ſal ammoniac lb iv. quick-lime lb v. pure water three gallons. Quench the lime in part of the water, and put it into a tin alembic, or a glaſs retort: then add the remaining part of the water, and the ſal ammoniac only broken into little pieces. Diſtil over a gentle heat lb x. or xij. for good ſpirit, then change the receiver, and diſtil as long as the ſpirit ſmells of ſalt, and keep it inſtead of water for the next operation.—The ſpirit is very ſtrong if five times the weight of the ſal ammoniac is drawn off. But to agree with this ſpirit of the London College, drawn with cineres clavellati, only three times the weight muſt be allowed.

This ſpirit, prepared with quick-lime, is thought to be too pungent and acrid for internal uſe, but in the dilute ſtate of adminiſtering this ſort of medicine it is as ſafe as that prepared with an alkaline ſalt. It is an excellent menſtruum for ſome vegetable ſubſtances, as the cort. Peruv. &c. and when ſaturated with ſuch ingredients, it is ſo ſheathed as to be as ſafe as the other. It is too common to meet with the liquor C. C. and the aqua ammon. cum ciner. clav. pp. mixed with this ſpirit prepared with lime; this fradulent practice is to increaſe the pungency of the liquor C. C. &c. and is thus detected: add to the ſuſpected ſpirit about one fourth of its quantity of rectified ſpirit of wine, which will precipitate a part of the volatile ſalt; but if mixed with that made of lime, no effect will be produced. The powder that is precipitated, may alſo be laid on a ſpoon and held over a candle, when, if it flies off, it is good; otherwiſe not.

The ſp. ſalis ammoniac. cum calce, viv. ppt. appears in many caſes preferable to that prepared with an alkaline ſalt. It is better ſuited for the ſp. ammon. compoſitus, and ſp. ammoniæ fætid. as being perfectly miſcible with the ſp. vini rect. in any proportion, without any ſeparation of its volatile alkaline part, and as being a more powerful menſtruum for ſome oils, difficult of ſolution. The EAU DE LUCE, for example, is made with the ſp. ſal. ammon. cum calce viv. & ol. ſuccin. rect. but the oil muſt be rectified until it hath loſt its ſmell, and is become limpid, and then the proceſs will be as follows:

℞. Ol. ſuccin. rect. ut ſupra gt. xxxvi. alcohol. vini ℥ſs. bene miſce, & adde paulatim ſp. ſal. ammon. cum calce viv. ppt. ℥ vi. f. eau de luce. This appears milky, but if required limpid, it may be made ſo by diſtillation; or if it is only deſigned for ſmelling to, it may be tinged of a fine blue colour, with a drop or two of a ſolution of copper. See Malouin's Chemie Medicinale.

The College of London give the following preſcription for making the EAU DE LUCE under the title of SPIRITUS AMMONIÆ SUCCINATUS. *Succinated ſpirit of ammonia.* Take one ounce of alcohol; water of pure ammonia four ounces; rectified oil of amber one ſcruple; ſoap ten grains; digeſt the ſoap and oil of amber in alcohol, until they are diſſolved; then add the water of pure ammonia, and mix them well by ſhaking;—it is chiefly uſed externally.

Divers mixtures of volatile and vinous ſpirits, flavoured with aromatic and other oils, or tinctured with different ingredients, according to the intention of the preſcribers, have been, and yet may be, uſed with great advantage. Of this are the following:

SPS. AMMONIÆ COMPOSITUS, inſtead of the ſps. volatilis aromaticus.

℞ Ol. n. m. eſſent. & ol. limon. eſſeint. ad ʒ ii. ſp. ammon. ℔ ij. m. Diſtil theſe with a gentle heat. This is from the Parmacop. Collegii Lond. 1788.

After this method a volatile oily ſpirit may be prepared occaſionally, and at pleaſure, adapted to particular purpoſes, by chuſing an eſſential oil proper for the intention; thus in hyſteric caſes, where the uterine excretions are deficient, a ſp. ammon. comp. may be made with the oils of rue, ſavin, penny-royal, aſſa fœtida, &c. For

weakneſs

weakneſs of the ſtomach, the oil of mint may be taken; for a cephalic, the oils of marjoram, lavender, and roſemary; againſt fainting and coldneſs, the oil of cinnamon; to remove flatulencies, the oil of anniſeeds and ſweet fennel. The ſpirits thus made by ſimple mixture, or by dropping eſſential oils into ſp. ammon. with which they eaſily mix, are no wiſe inferior in medical efficacy to thoſe prepared by diſtillation, though the tinge which they receive from the oil may render them to ſome perſons leſs ſightly.

SOME VEGETABLES are conſidered of an alcaleſcent nature, as they do not become acid by putrefaction; and from them no vinous ſpirit can be produced by fermentation; to this claſs belong moſt of the acrid aromatics; ſome of which are the alliaria, allium, arum, aſparagus, braſſica, capſicum, cardiaca, centaur min. cochlearia, cepa, naſturtium aquat. & hort. porrum, raphanus com. & ruſticus ruta, ſinapis, &c.

THE BLOOD alſo is ſubject to ALKALINE ACRIMONY, known to be preſent by the thirſt and deſire of ſour things, loſs of appetite, and averſion to alkaleſcent food, nidorous eructations, putrid ulcers on the lips, tongue, and other parts in the mouth, bitterneſs in the mouth, ſickneſs in the ſtomach, and a frequent diarrhœa, a ſenſe of heat, laſſitude, and general uneaſineſs, a diſſolution of the texture of the blood, the urine high coloured and red.

This alkaline acrimony producing a putreſcency in the blood, &c. is to be remedied by the ſame means as the ſea ſcurvy and other putrid diſorders.

ALCALINA, INFUSIO.

℞ Kali ʒ ſs. croc. Anglic. ʒ ſs. rad. liquorit. rec. ʒ ij. aq. font. bullientiſ. ℔ iij. infund per horas vi. vel vii. & cola. Vel,

℞. Fol. abſinth. vulg. ſicc. ʒ ſs. kali pp. ℥ ij. infund. in aq. font. bullient. ʒ xij. colaturæ; adde aq. juniperi ʒ ij.

Theſe are uſeful methods of adminiſtering the fixed alkaline ſalt; ſmall doſes may be given warm every three or four hours, interpoſing a purge now and then, when ſuch medicines are required. If intermitting fevers return, this method, for a few days, is an excellent preparation for the bark.

ALCALISATIO, ALCALIZATION. The impregnating any thing with alkaline ſalt.

ALKALINUS SAL. SALIS MARINI. See ANATRON.

ALCANCALI. See ANGELOCALOS.

ALCANNA. See ICHTHYOCOLLA, ANCHUSA, and LIGUSTRUM INDICUM.

ALCARNI. A name of a confect made by Meſſue.

ALCAOL. } The *loc aëtoſum*: ſo the ſolvent for
ALCOEL. } the preparation of the philoſopher's ſtone is called.

ALCARA. See ALKARA,

ALCE. The ELK. Its a large animal of the deer kind, met with in Muſcovy, Germany, and very cold countries. The hoof of the hind foot on the left ſide, hath been celebrated againſt epilepſies, from a ridiculous opinion that the *elk* is himſelf ſubject to diſorders of this kind, and prevents or removes them by ſcratching his ear with his hoof. The hoof ſhould be choſen that is heavy, compact, ſmooth, bright, and black.

ALCEA: *Alcea vulgaris major.* See DORONICUM GERMANICUM.——*Vervain mallow.* See MALVA VERBENACEA.——*Indica.*——*Ægyptiaca, Villoſa.* See ABELMOSCHUS.

ALCEBAR. See AGALLOCHUM.

ALCEBRIS VIVUM. i. e. SULPHUR VIVUM.

ALCEDO. A bird called the KING'S FISHER. It is alſo called *ipſida, halcyon, alcyon, fluviatilis, piſcator regis.* In China their neſts where formerly eat as dainties. It is ſaid to make its neſt in the ſea, and then it is a ſign of fair weather, whence the word halcyon days,—calm and peaceable times.

ALCHABRIC. See ALKIBRIC.

ALCHACHIL. See ROSIMARINUS.

ALCHAHOL. See ALCOHOL.

ALCHARITH. See ARGENTUM VIVUM.

ALCHEMIA, ALCHIMIA or ALCHYMIA, ALKIMIA, ALCHEMY. That branch of chemiſtry that relates to the tranſmutation of metals into gold; and alſo forming a panacea, or univerſal remedy; an alkaheſt, or univerſal menſtruum; an univerſal ferment; and many other abſurdities. Indeed the very idea of alchemy is now truly contemptible, rendered ſo from the frauds attempted to be paſſed among mankind, by its artful profeſſors. The Arabic particle AL is added by way of eminence, to diſtinguiſh it from common chemiſtry. See AL.

ALCHERON, LAPIS. The ſtone in the gall bladder of a bull, cow, or ox, called *bezoar bovinus.*

ALCHIBRIC. ALCHIBERT. See ALKIBRIC.

ALCHIEN. This word occurs in the Theatrum Chymicum, vol. V. and ſeems to ſignify that power in nature by which all corruption and generation are effected.

ALCHIMILLA, called alſo *branca*, and *pes-leonis*; *ſtellaria*; LADY'S MANTLE, and LION'S-FOOT. RULANDUS calls it *diapencia.*

It flowers from May to Auguſt, the leaves ſeem as if folded together, whence the name lady's mantle. The leaves are gently aſtringent, the root is of the ſame quality, but this plant is not in any repute as a medicine. For that called——*Supina Gramin. fol.* ſee KNAWEL.

ALCHITRAN. Oil of juniper; ſee JUNIPERUS. Alſo the name of a dentifrice of Meſſue.

ALCHIMIA. See ALCHEMIA.

ALCHOLLEA. A ſort of animal food made of beef or other fleſh, pickled and dried, then boiled and potted for keeping. It is uſed by the weſtern Moors. See Philoſ. Tranſ.

ALCHUTE. See MORUM.

ALCHYMY. A compoſition of copper with a ſmall quantity of arſenic, which mixture reſembles ſilver

ALCIBIADION. }
ALCIBIADIUM. } See ANCHUSA.

ALCIMAD. See ANTIMONIUM.

ALCOB. See AMMONIAC. SAL.

ALCOCALUM. See CINARA.

ALCOEL. See ALCAOL.

ALCOFOL. See ANTIMONIUM.

ALCOHOL, or ALCHAHOL; AL-KA-HOL. *Alcool; alkol; cohal*; it is an Arabian word, ſignifying an impalpable powder, which the Eaſtern women uſe as a kind of a paint for their faces, or otherwiſe as an improvement to their complexions. And as this powder, being an impalpable one, was called *alcohol*, this name was given to other ſubtile powders; ſo the name was given to ſpirit of wine exalted to its higheſt purity and perfection. See VINUM ADUSTUM.

—— MARTIS. It is the filings of iron ruſted by adding wine to them. When the whole is perfectly ruſted, pure ſpring water is repeatedly added, until all that is urinous is waſhed away, and the remaining powder is the *Alcohol.*

ALCOL. See ACETUM.

ALCOLA, APHTHÆ, which ſee. Paracelſus ſays it is the tartar or excrement of urine, whether it appears as ſand, mucilage, or otherwiſe.

ALCOLITA. See URINA.

ALCOLISMUS. Reducing any thing to powder by corroſion.

ALCONE. See ÆSECAVUM.

ALCOOL. See ALCOHOL.

ALCOR. See ÆS USTUM.

ALCTE. It is the name of a plant mentioned by Hippocrates; Foeſius thinks it is the elder.

ALCUBRITH. See SULPHUR.

ALCYON FLUVIATILIS. See ALCEDO.

ALCYONIUM. BASTARD SPUNGE. It is a ſpungy plant formed on the ſea ſhore, or rather a froth of the ſea hardened by the ſun: it is of different ſhapes and colours. It is difficult to ſay what the Greeks called by this name. Dioſcorides names five ſorts, viz.

1. *Alcyonium durum.* HARD BASTARD SPUNGE.

2. *Farrago.* Called alſo *favago auſtralis, alcyonium, veſſicaria marina nigra.*

3. *Alcyonium* vermiculatum or vermiculate. VERMICULATE BASTARD SPUNGE.

4 *Alcyonium* ſtuppoſum. Lemery calls this *alcyonium* molle. THREADY BASTARD SPUNGE.

5. *Alcyonium* tuberoſum. Lemery calls this *alcyonium* foraminoſum. TUBEROSE BASTARD SPUNGE.

There are many other ſpecies; they are calcined with a little ſalt as dentifrices, and are uſed to remove ſpots on the ſkin.

ALDABARAM. See ALBADARA.

ALECARITH. See Argentum vivum.

AL-ECSIR. } See Elixir.
AL-EKSIR. }

ALEFANTES, i. e. Flos Salis. Flower of salt.

ALEIMMA. A greasy ointment without wax, to give it a consistence.

ALEION. Copious. Hippocrates uses this word as an epithet for water.

ALEIPHA. Any medicated oil.

ALELAION. It is oil beat up with salt to apply to tumors. Galen frequently used it.

ALEMA. Boiled meat.

ALEMBACI. Burnt lead.

ALEMBIC. See Argentum vivum.

ALEMBICUS. This word is half Arabic and half Greek, from the Arabic particle *al* and ἀμβιξ, which is again derived from ἀμβαινω for ἀναβαινω, *to ascend*. Seneca calls it in the Latin language *miliarium*; *alembic*; Moor's head. It is also named *capella*, *capitulum*; it is a copper cap tinned in the inside, made like a head, in which the pipe, before worms were contrived, which passes through a tub of cold water, is fixed to receive the vapour from the heated cucurbit or body, to convey it to the receiver. Before retorts were used so commonly, the matter distilled was put into a vessel called a body, with a head placed on it to receive the vapour, whence it was conveyed by a canal, called the rostrum or beak, to the receiver; this head is properly the *alembic*, and is called *alembicus* rostratus, i. e. the beaked *alembic*, to distinguish it from *alembicus* cæcus, or blind *alembic*, which is without a canal, as it is to receive dry substances that are sublimed into it. The still-head is properly an *alembic*; the body of the *alembic* was placed over a fire or in hot water.

ALEMBROTH. A Chaldee word importing the Key of Art; some explain it by sal mercurii, or sal philosophorum & artis: others say it is named *elembrot & sal fusionis*, or *sal fixionis*. *Alembroth* deliccatum is said to be the sal tartari; hence this word seems to signify alcaline salt, which opens the bodies of metals by destroying their sulphurs, and promoting their separation from the ores.

ALEM ZADAR } See Ammon. Sal.
ALEMZADAD. }

ALEOPHANGINÆ PILULÆ; these are the pil. aromaticæ Mesue. Joined with the hellebore they have been called pil. *aleophang*. capitales & stomachicæ.

ALEOS, from αλεα, *heat*. Taken as an adjective it signifies *heaped*, *crouded*, *condensed*, *continued*; as a substantive, *heat* or *warmth*.

ALEPENSIS. See Manna.

ALES. The name of a compound salt. When this word is used as an adjective, it signifies *heaped*, or *crouded*, or *condensed*. Sometimes it signifies *contracted*, as the uterus being contracted.

ALESCH. See Alumen Plumosum, N° 2.

ALEURON. Meal, from αλεω, *to grind*. Strictly it is the meal of wheat, though commonly applied to other sorts. See Alphita.

ALEXANDRIA. See Laurus Alexandrina.

ALEXANDRI ANTIDOTUS AUREA. Alexander's golden antidote. Myrepsus gives the prescription; it is composed of animal, vegetable, and mineral substances, and contains about seventy ingredients.——Regis Collyrium siccam. King Alexander's dry medicine for the eyes. It was made of saffron, Celtic nard, and canal coal.

ALEXANDRINA. See Laurus Alexandrina.

ALEXANDRIUM EMPL. VIRIDE. A plaster described by Celsus, made with wax, plumose alum, &c.

ALEXANTHUS. See Æris Flos.

ALEXICACA. See Antidotus.

ALEXICACON, an amulet against poison, from αλεξω, *to repel*, and κακον, *evil*.

ALEXIPHARMACA. Alexipharmics, from αλεξω, *to repel*, or *drive away*, and φαρμακον, *poison*, called also *antipharmaca*, and *cacoalexeteria*. Medicines, supposed fit to preserve the body against the power of poisons, or to correct, or expel those taken into the machine; the words Alexeteria and Antidota have the same import; as also has the term Theriaca: hence sudorifics and diaphoretics may be considered of this class; and perhaps the whole power of the alexipharmics can only be of any service by acting in one of these modes. The term has been also applied for *Amuleta*. See Amuleta.

ALEXIPYRETICUM. Alexipyretos, or Alexipyretum, from αλεξω, *to drive away*, and πυρετος, *a fever*. A remedy for a fever, or πυρ, *fire*.

ALEXITERIA, *Alexiterials*, from αλεξω and τηρεω, *a preservative from contagion*. The term has also been applied for *Amuleta*. Hippocrates used the word *alexiteria* to express help or remedies; but later writers use it to express remedies against the poisonous bites of animals. See Alexipharmaca.

Aqua lactis alexiteria:
Alexiterial milk water.

Aq. alexiteria spirituosa: called also *epidemica aqua*.
Spirituous *alexiterial* water.
These medicines are now rejected from the Pharm. Lond. 1788.

Trochisci alexiteriales.
Alexiterial troches.

ALFACTA. See Distillatio.

ALFADIDAM. The scoria of gold, iron, or copper; also burnt copper. See Æs ustum.

ALFATIDA, burnt copper, or the scales flying off from copper. See Æs ustum.

ALFATIDE. See Ammoniacus Sal.

ALFESERA, or Alphesera. The name of a confect described by Mesue; from the Arabic particle *al*, and *fesera*, or *phisera*, the root of the vitis alba.

ALFIDAS. See Plumbum.

ALFOL. See Ammoniacus Sal.

ALFUSA. Tutty. See Tutia.

ALGA, called also *ulva*, *fucus marinus*, *bryon thalassium*, grass-wrack, wrake, sea-weed, or grass, and sea-moss.

There are three kinds, one broad, a second oblong and reddish, and a third sort which is white, &c. It is a submarine plant. The most noted species is the *alga marina*, which is gathered on the sea-coasts of Scotland and Ireland, to be burnt into ashes for the making of soap, glass, &c. Its leaves somewhat resemble those of the oak tree in shape, with bladders of slippery matter on them. On the coast of the Mediterranean sea, a species of *alga* is gathered and dried to feed oxen.

The seeds of the *alga* are more perfect than those of the fucuses, for its vessels gape when perfect, and the seeds fall out. Raii Hist. For that called ——Marina latifolia vulgatissima, the common Sea-wrack, see Kali.

ALGALI. See Nitrum.

ALGALY. An hollow leaden probe, or catheter.

ALGAMET. Coals.

ALGARAB. See Ægylops.

ALGAROT. ALGAROTHI. Algeroth. (Pulvis.) So called from Victorius Algaroth, a physician of Verona, and its inventor. It is the same with the *mercurius vitæ*. It is only the antimonial part of the butter of antimony, separated from some of its acid by washing it in water. It is tasteless, but violently emetic, in doses of two or three grains. It is prepared with antimony and sublimate, or by mixing water with the butter of antimony, which precipitates a white powder, &c.

ALGATIA. Civet. See Zibethum.

ALGEDO. Suppressed Gonorrhœa; when it has stop'd suddenly after it has appeared.

When it thus stops, a pain reaches to the anus, or to the testicles, without their being swelled, and sometimes to the bladder, in which case there is an urging to discharge the urine, which is with difficulty passed, and in very small quantities at a time. The pain is continued to the bladder by the urethra; to the anus by the accelerator muscles of the penis; and to the testicles by the vasa deferentia, and vesiculæ seminales.

In this case, calomel repeated so as to purge, brings back the running, and then all difficulty from this symptom ceases. If the pain is great, and a sanguinary plethora requires it, bleed, and give the following:

℞ Calom. ppt. gr. x. opii. gr. i. conf. rotar. q. s. f. bol. h. s. sumend. & mane proxim capt. haust. seq.

℞ infus. sen. cum tamarind. ʒiii. f. haust.

Musitanus and Cockburn have both of them written on this subject. In these and other disagreable symptoms, such

ſuch as ophthalmies, deafneſs, ſwelled teſticles, &c from the ſuppreſſion of the virulent gonorrhœa, where the common methods fail of reproducing the diſcharge, it has been recommended from experience to introduce a bougie into the urethra, which has been ſmeared with the virus of an infected patient; Dr. SWEDIAUR ſays, "The method propoſed has been tried many years ago in one of the firſt military hoſpitals in Europe, with conſtant ſucceſs, and has ſince been confirmed by Dr. LANGE in his Treatiſe on Ophthalmia."—In four cures of ſwelled teſticles and ſuppreſſion of urine from a retropulſed clap, the inoculation of the venereal poiſon, by means of a bougie, previouſly applied for about half an hour to a perſon afflicted with a clap, and then introduced into the urethra, has been attended with unexpected ſucceſs, under the doctor's inſpection. See his Practical Obſervations on Veneral Complaints, p. 53.

ALGEMA, or ALGEMATODES. UNEASINESS, PAIN. Hippocrates often uſes the word ἄλγημα to ſignify the diſeaſe whence the pain proceeds. James's Med. Dict. See DOLOR.

ALGERIÆ, or ALGERIE. LIME. See CALX.

ALGEROTH. See ALGAROTH.

ALGIBIC. See ALKIBRIC.

ALGIDA, ALGID. Numb, withered, chill.

ALGOR. In Sauvages and Sagar's Noſology, it ſeems to be a ſudden chillneſs affecting a perſon.

ALHAGI. The pliant thorny *Syrian broom*; called alſo *agul & almagi Arabibus, geniſta, Spartium ſpinoſum, ſpinoſum Syriacum.*

It is a ſpecies of thorn; it grows to about a cubit in height; it bears purple-coloured flowers, which are ſucceeded by pods and purple ſeeds. It is commonly met with in Perſia and Meſopotamia, where the inhabitants gather from it a ſort of manna, in grains about the ſize of coriander ſeeds. The Arabians call this *manna tereniabin*, or *trangebin*. Raii Hiſt.

There is another ſpecies called *alhagi* maurorum.

ALHANDALA. An Arabian name for the colocynth. See COLOCYNTHIS.

TROCH. ALHANDAL. The troches of *alhandal.*

℞ colocynth. pulv. gum. arabic. tragac. bdel. aa ʒvi. aq. font. q. ſ. f. troch.

This compoſition is as old as Meſſue, but is now not uſed.

ALHANNA. See ALANA TERRA.

ALHASEF. A ſort of puſtule, called HYDROA.

ALIA SQUILLA. The PRAWN.

ALICA. A ſort of food admired by the ancients; it is difficult to ſay whether it is a grain or preparation from ſome ſpecies thereof: many writers ſpeak of it as a ſort of wheat: but upon the whole it ſeems to be a kind of meal made into ſlummery, to be eaten with milk, &c. Salmaſius ſays that *alica* is one ſort of the chondros of the Greeks, which was grain broken into large fragments, or rather only freed from the huſks, but not ground in a mill, called alſo *aphæræma—adroteron—farinarium.*

ALICES. Little red ſpots in the ſkin, which precede the eruption of puſtules in the ſmall-pox.

ALICORNU. See UNICORNU.

ALIENATIO MENTIS. See DELIRIUM.

ALIENUM. In a medical ſenſe it is any thing foreign and troubleſome to the body. Sometimes it means corrupted.

ALIFORMIS, PROCESSUS. See PTERYGOIDES PROCESSUS. From *ala, a wing*, and *forma, the ſhape of.*

AL GULUS. See CONFECTIO.

ALILAT, or ἀλιλὰτ, an Arabian name for *Lucina*, or the goddeſs which the Greeks ſuppoſed to preſide over child-birth.

ALIMA. A ſort of ſand found in gold mines, from which lead is obtained.

ALIMENTA, ALIMENT; OR FOOD BOTH SOLID AND LIQUID: from *alo, to nouriſh.* Sometimes expreſſed by the word *Bios.*—Solid food is called *Broma.* It is ſuch matter as contains an oily, inſipid, or ſweetiſh mucilage, convertible by the actions of the body into an alkaleſcent glue, of which all our ſolids and fluids are formed, and by which their waſtings are repaired. Next to air, food is the moſt neceſſary thing for the preſervation of our bodies; and as on the choice thereof our health greatly depends, it is of as great importance to underſtand, in general, what is the propereſt for our nouriſhment; and in particular deviations from health, what is the beſt adapted to reſtore us.

Our blood and juices naturally incline to a putrid acrimonious quality: freſh chyle, duly received, prevents this deſtructive tendency, and preſerves in them that mild albuminous ſtate that is alone conſiſtent with health. An animal diet affords the moſt of this bland nutritious mucilage; watery fluids dilute the too groſs parts, and carry off what is become unfit for uſe.

From the ſtructure of the human ſtomach, which reſembles that of carnivorous animals, and from obſervations, which prove that the fleſh of animals alone contains the gelatinous lymph ready prepared, which is ſuited for the recruit of our frame, it is obvious what ſort of diet is the propereſt for mankind: it is only the ſmall portion of jelly which is ſeparated from the farinaceous parts of vegetable, that, after being much elaborated, is converted into the animal nature: yet in robuſt habits, and when ſtrong exerciſe is uſed, vegetables prevent both repletion and a too great tendency to an alkaleſcent acrimony of the blood. In hot climes, as well as againſt the conſtitutional heat of particular perſons, vegetables are demanded in the largeſt portion: in colder countries, and particularly in languid habits, they have but little ſhare in the liſt of *aliments.*

Animal ſubſtances then are the propereſt food for man; they only contain nutriment ready for our uſe; and they afford us the higheſt reliſh while our appetite continues. Fiſh is an inferior kind of animal diet, and even this will ſate the appetite before the ſtomach is duly filled. Vegetables may be eaten after either fleſh or fiſh; freſh herbs or fruits ſatiate ſo much that the ſtomach may not be filled with them, when it is already ſatisfied with fleſh or fiſh; whence it may be obſerved, that no diet which is very nouriſhing can be eat to fulneſs, becauſe its nutritious parts are oily and ſatiating.

AGAIN, health depends on a certain degree of heat in the body, and it is the craſſamentum of the blood that attracts and maintains it; it is alſo obſerved above, that animal food alone contains the proper matter for our ſupplies; whether then we regard the vigorous or infirm, one general rule prevails, viz. to exceed in the uſe of animal or vegetable food as the preſent habitual heat riſes or falls from that medium in which the individual's health conſiſts. In perfect health a mixture of vegetables in ſome degree is generally required, for a loathing is ſoon the conſequence of animal food alone, hence if not to nouriſh, yet to attemperate, they have their uſe: hot acrid habits too receive from milk and vegetables what is neceſſary to correct their exceſſes; but in cold, pituitous, and nervous habits, which want moſt nouriſhment from weak digeſtion, and the ſmalleſt quantity of food, animal diet is alone to be preferred.

Thus much being offered as general principles with reſpect to the matter and quality of our *aliment*, the valetudinarian may eaſily regulate his diet with ſome advantage to himſelf, by an attention to the few enſuing particulars.

In winter eat freely, but drink ſparingly; roaſt meat is to be preferred, and what is drank ſhould be ſtronger than at other ſeaſons: *in ſummer* let thirſt determine the quantity to be drank; cold ſtomachs never require much; boiled meats and vegetables, if not otherwiſe contradicted, may now be more freely uſed.

Lax habits require the winter's diet to be continued all the year, and rigid ones ſhould be confined to that of ſummer.

Fat people ſhould faſt at times, but the lean ſhould never do ſo.

Thoſe who are troubled with eructations occaſioned by their food, ſhould drink but little, lay long in a morning, and uſe ſome unaccuſtomed exerciſe.

The thirſty ſhould drink freely, but eat ſparingly.

In general let moderation be obſerved, and though no dinner hath been had, a light ſupper is at all times to be preferred.

After very high-ſeaſoned meats, a glaſs of water acidulated with the acidum vitriolicum dilutum, or in very weak ſtomachs the ſps. ætheris vitriolici, is far more aſſiſtant to the work of digeſtion than the common method of taking brandy.

See Haller's Phyſiology, on Hunger, Thirſt, Food, and Drink; Shebbear's Theory and Practice of Phyſic: among the ancients, what Galen hath ſaid on diet is the foundation of moſt that has been publiſhed ſince on the ſubject. Mackenſie on the Non-naturals. Cull. Mat. Med.

ALIMUM. See ARUM.

ALINDESIS, or ἀλινδὸς, from ἀλινδέω, *volvo.* A bodily exerciſe, which ſeems to be rolling on the ground, or rather in the duſt, after being anointed with oil. Hippocrates

pocrates says that it hath nearly the same effects as wrestling.

ALINTHISAR. See HYPOSTAPHYLE.

ALIOCAB. See AMMONIACUS SAL.

ALIPÆNOS. } from α, neg. and λιπαινειν, *to grow*
ALIPANTOS. } *fat*. Any external dry remedies that have no fat in them.

ALIPASMA, from αλειφω, *to anoint*. A powder which when mixed with oil is rubbed on the body to prevent sweating.

ALIPILI, from *alarum pilos*, evellentes. Servants who on baths were so called from their pulling off hairs from the arm-pits with tweezers.

ALIPTÆ, from αλιφω, *to anoint*. Servants of the baths whose office was to anoint the persons after bathing.

ALISMA MATHIOLI. See DORIA.

ALISMA; called *Acuron*. A name of Doria's wound wort, and of the German leopard's bane. See DORIA NARBONENSIUM, and ARNICAMONTANA.

ALISTELES. See AMMONIACUS, sal.

ALITH. See ASA-FŒTIDA.

ALITURA. See NUTRICATIO.

ALKAFIAL. ANTIMONY. See ANTIMONIUM.

ALKAHEST. See ALCAHEST.

ALKAHEST GLAUBERI, i. e. SALES ALKALINI. See ALCALI.

ALKAHOL. See ALCOHOL.

ALKALE. The FAT of a HEN.

ALKALI. See ALCALI.

ALKALI FIXUM, Sal. i. e. KALI, or the salt obtained from lixivium of the ashes of any burnt vegetables. Also the natron or mineral *alkali* made from barilla or other saline substances. See ALCALI.——VEGETABILE FIXUM CAUSTICUM. See KALI.

ALKALIA. See VAS.

ALKARA, or ALCARA. See CUCURBITA.

ALKASA. } See CRUCIBULUM.
ALKAZOAL. }

ALKAUT. See ARGENTUM VIVUM.

ALKEKENGI. WINTER CHERRY; also called *halicacabum*, *solanum veficarium*, *verficaria vulgaris*.

Miller takes notice of twelve species. The species used in medicine is the *physalis alkekengi*. Lin.

It is a low plant with unbranched stalks, heart-shaped acuminated leaves standing in pairs on the joints, and whitish bell-shaped flowers; the flower cup changes into a pentagonal bladder, which bursting discovers a red fruit like a cherry, which contains a juicy pulp and many small seeds. It grows wild in France, Germany, and Italy, and thrives well in our gardens. The fruit ripens in October, and continues to December, when the plant dies to the ground.

These cherries have an acidulous and not unpleasant taste, with a bitterishness, but their covering is very bitter.

They are diuretic, but neither heat nor irritate; five or six cherries, or an ounce of their juice, is a dose, and if given in the strangury from cantharides, a speedy relief is obtained. ℥ij. of the berries infused in a pint of water is extolled in the jaundice; but they are rarely called for in the English practice.

ALKERMES. See CHERMES.

ALKERVA. See CATAPUTIA.

ALKES. BURNT BRASS. See ÆS USTUM.

ALKETRAN. See CEDRIA.

ALKIAN. The spirit of which digests food, nourishes and supports man.

ALKIBRIC, ALCHIBRIC, ALCHIBERT, AGIBIC, ALKIBIC, ALCHABRIC, ALKIBRIE, according to some, the sulphur vivum is meant by these words; but others say they signify an incombustible sulphur.

ALKIMIA. See ALCHEMIA.

ALKIN. See CLAVELLATI CINERES.

ALKIR. SMOAK of COAL.

ALKITRAM, See PIX LIQUIDA.

ALKOL. See ALCOHOL.

ALKOSOR. See CAMPHOR.

ALKI PLUMBI. It seems to be the cerussa acetata. See PLUMBUM, N° 5.

ALLA, ALE. The ancient Saxons called it *ael*, as do the Danes now. The Germans first invented and brought it into use.

Ale is distinguished from BEER, by the first being fresh or new, and the other kept until the remaining gas sylvestre is destroyed, or incorporated with the liquor, so as to lose its elasticity, or at least a part of it.

BEER is called by the Latins CEREVISIA, from *cerere*, because corn, of which Ceres is the goddess, is its principal ingredient; also LIQUOR CERERIS, the *Liquor of Ceres*: VINUM HORDEACEUM, *barley wine*; VINUM REGIONUM SEPTENTRIONALIUM, because it is drank instead of wine by the northern people. It is also called *bira*.

Ale is flatulent, and so sometimes produces colics, and the cholera morbus; it is acescent, but it does not produce calcareous diseases, as is asserted by many. It is observed that those who drink *ale* constantly, are stronger than those who drink wine, and that those who do not drink any strong liquors cannot labour so well as those who do; but this does not appear to be the truth: men in health and accustomed to toil, but who never drink any strong liquors, undergo the most fatigue, and live longer than those who daily use them. Cordials are only designed for the infirm, and to fit the healthy for extraordinary exertions; but as they may occasionally enable the vigorous to execute great undertakings, they also proportionably destroy the power of nature, and cause a premature old age. A constant use of wine, ale, &c. keeps up a constant fever, in most who use them freely, by which, destruction is surely the consequence, though somewhat slower than the general confessed poisons. We must observe that by the word Beer, in common, is meant small or TABLE BEER—strong ALE;—or PORTER. The first of which, if kept to a proper age, is esteemed the best beverage to take with our food. Indeed they all ought to be kept till they have lost great part of their viscidity, and sweetness—hence will they be more readily digestible—and not so apt to create disagreeable flatulence in the primæ viæ—nor lay the foundation for visceral obstructions—However, they all are improper for delicate constitutions, whose digestive powers are in a state of debility, particularly if they are new, or recently brewed.

If malt liquor, of any degree of strength, is become flat and tartish, as it is used, it should be drawn out of the cask into a jug, in which as many drams of powdered chalk should be put as there are to be pints of liquor: thus a new ferment will be raised, a sprightly taste will be restored to the liquor, and its acidity will be destroyed.

Tart liquors of this kind are apt to produce a dysury, strangury, or a gonorrhœa, in which cases, give the person complaining a small quantity of brandy.

Ale being in some countries cheaper than wines, hath occasioned it to be medicated for the same purposes as wines so treated; and there are two ways of impregnating malt liquors with medicinal substances; *first*, by macerating the ingredients in the *ale*, after it is duly fermented; *secondly*, by adding them to the liquor while it is fermenting, that by the power of fermentation the medicinal virtues may more fully be extracted; nutmeg, for instance, one dram of it powdered will flavour a large vat of fermenting *ale*, but when the fermentation ceases, it flavours but a very small quantity.

The following is an agreeable bitter, and far preferable to any of the purls.

CEREVISIA AMARA. BITTER STOMACHIC ALE.

℞ rad. gent. cort. limon. rec. ad ℥ iv. piper. long. ℥ i. cerevis. Cong. i. infund. fine calore.

CEREVISIA ANTISCORBUTICA. ANTISCORBUTIC ALE.

℞ fol. cochl. hort. rec. m. viii. raf. guaiac. ℥i. sem. coriand. ℥ii. fol. senn. ℥ss. infund. in cerevis. recent. durant. fermentat. Of these medicated *ales* ℔ss. may be taken night and morning.

ALLABOR. LEAD. See PLUMBUM.

ALLABROT. A sort of FACTITIOUS SALT.

ALLANTOIDES, ALLANTOIS. The membrane so called which forms part of the secundines, from αλλας, *a sausage or hog's pudding*, because in some brutes it is long and thick. It is also called *alantoides furciminalis*, the URINARY MEMBRANE.

Some assert, and others deny, the existence of this in the human species. Dr. Hale says, if you first find the hole whence the urine came forth, if the *allantois* is not too much torn, you may blow up this membrane with a pipe, to its full dimensions, and thus you can separate much of it from the chorion. De Graaf says, that all the membranes of the secundines will appear distinct by blowing, with a pipe, into a hole made through the chorion; and that the *allantois* is no where perforated by the funis umbilicalis; for the funis does not pass through any of the membranes, it only adheres to the inside of the amnios. Dr. James says, that the *allantois*, or urinary membrane, does

does not cover the whole fœtus, but only that part of it which reſpects the chorion, and does not lie on the placenta; for the *allantois* cannot be extended any farther than to the edge of the placenta, where the amnois and chorion are ſo cloſely joined by fibres, that no membrane can come between them, wherefore the *allantois* is not every where faſtened to the chorion, and conſequently is not of the ſame ſhape as the other membranes.

This membrane contains, it is ſaid, the urine that is diſcharged from the bladder: what paſſes from the bladder into the urachus cannot, in a natural ſtate, return by it. There have been inſtances of perſons diſcharging their urine at the navel.

It is alſo aſſerted by ſome, that the liquor may be forced from the bladder to the *allantois* by fitting a pipe to it, and from the *allantois* to the bladder. If you raiſe the *allantois* a little, and ſqueeze it with the hand, you force the liquor into the bladder and through the penis.

Neither artery nor vein can be diſcovered in this membrane.

If any anatomiſts have ever demonſtrated this membrane, not one of them has given a diſtinct figure of it; all the engravings which are deſigned to repreſent it, are too incorrect to afford us a diſtinct idea. Dr. Hunter, in his lectures, abſolutely denies the exiſtence of this membrane, except in brutes.

See on this ſubject what Dr. Hales hath inſerted in the Philoſ. Tranſ. Abr. vol. iv. and Monſ. Littre in the Mem. Acad. de Sciences, 1701.

ALLARINOCH. See PLUMBUM.

ALLELUJA. See ACETOSA.

ALLENCE. See STANNUM.

ALLIAR ÆRIS. A term uſed in preparing the philoſopher's ſtone, to ſignify philoſophical copper, which is alſo called water of quickſilver, white copper, and many other names.

ALLIARIA. SAUCE ALONE, OR JACK BY THE HEDGE; alſo called *pes aſſininus*, and *heſperis allium*. It is the *eryſimum alliaria*, Lin.

This plant hath roundiſh, heart-ſhaped, ſlightly indented leaves, and firm upright ſtalks, on the tops of which and in the boſoms of the leaves, come forth cluſters of white flowers, followed by oblong bivalvous pods full of black ſeeds. It is biennial, grows in ſhady waſte places, and in hedges, and flowers in May.

The leaves are ſomewhat acrid, and of a garlic ſmell; on drying they loſe much of their ſcent, and alſo of their taſte. Its medical virtues are ſimilar to thoſe of the onion tribe, but not much in uſe.

ALLICAR. See ACETUM.

ALLICOLA. See PETROLEUM.

ALLIGATURA. Scribonius Largus uſes this word for *a ligature* or *bandage*. See FASCIA.

ALLIOTICUM, from ἀλλάσσω, *to alter*, or *vary*; an alterative medicine.

ALLIUM. COMMON GARLIC. Called alſo, from its antiputreſcent property, *theriaca ruſticorum*. It is the ALLIUM SATIVUM, or ALLIUM *caule planifolio bulbifero, bulbo compoſito, ſtaminibus tricuſpidatis*. CL. HEXANDRIA. ORD. MONOGYNIA. Linn. Gen. Pl. 409.

It hath long and graſs-like leaves, a ſingle ſtraight hollow ſtalk, bearing on the top a cluſter of ſmall white flowers, each of which is followed by a fruit about the ſize of a pea, full of dark-coloured roundiſh ſeeds. The roots are bulbous, of an irregular roundiſh ſhape, with ſeveral fibres at the bottom; each root is compoſed of a number of ſmaller bulbs, called cloves of garlic, incloſed in one common coat. A head of garlic, or garlic which hath a head, not diviſible into cloves, is called *Molyza*. It grows wild in Italy, Sicily, and other warm countries; but in England it is raiſed in gardens from ſeed; it flowers in July.

Miller and Dale enumerate eleven or twelve ſpecies.

The roots are the part uſed in medicine; their virtues conſiſt of a very acrid putreſcent volatile ſpirit, the principal effect of which is to warm and ſtimulate the ſolids, attenuate viſcid humours, and to reſiſt putrefaction. Applied to the ſkin they excite inflammation there; and ſometimes raiſe bliſters; they are uſed as a ſtimulating epithem applied to the ſoles of the feet, in the low ſtage of acute diſtempers, for raiſing the pulſe and relieving the head. Sydenham ſays, that garlic excels all other applications for occaſioning a derivation from the head in fevers of any kind; and he farther obſerves, that the efficacy of garlic thus applied, is more ſpeedy than that of cantharides, and this without a diſſolution of the juices being endangered, as when the common bliſtering plaſter is applied. The following is the method of making and applying this ſort of cataplaſm:

CATAPLASMA EX ALLIO.

℞ *allii* rec. cont. & micarum panis albi. ää p. æq. acet. acerrim. q. ſ. f. catapl. plantis pedis applic. & repet. omn. noct.

Sometimes this cataplaſm cauſes much pain, but this would not happen if it was removed as ſoon as an inflammation appeared, and immediately after another cataplaſm of bread and milk was to ſupply its place.

The cloves of freſh garlic are bruiſed, and applied to the wriſts as a cure of agues; and to the head of the arm to cure the tooth-ach; held in the hand they relieve hiccoughing; beat with common oil into a poultice, they reſolve ſluggiſh humours; and if laid on the navels of children, they deſtroy worms in the inteſtines.

If garlic is taken inwardly, its action manifeſts itſelf through the whole habit, the breath, urine, and the matter of perſpiration are all ſcented with it. Externally applied for ſome time it inflames the ſkin, and raiſes a bliſter; taken inwardly it ſtimulates, and favours digeſtion, and its ſtimulus alſo is readily communicated to the reſt of the ſyſtem, and is certainly heating and inflammatory to the whole. It not only ſeems to affect the perſpiration and ſecretion of urine, but to pervade every veſſel of the ſyſtem, hence its diaphoretic and diuretic powers have been uſeful in dropſy. It is a remedy for the ſcurvy, and in pituitous, and even in ſpaſmodic aſthma requiring expectoration, its uſe is admiſſible. It has been ſaid to be efficacious even in ſubduing the plague. Its ſtimulant powers may be employed for preventing the recurrence of intermittent fevers. Bargius ſays quartans have been cured by it, and uſes it in the following manner: he begins by giving one bulb, or clove, morning and evening, adding every day one more, till the four or five cloves be taken at a doſe. If the fever then vaniſhes the doſe is to be diminiſhed, and it will be ſufficient to take one or even two cloves twice a day, for ſome weeks.—This author alſo recommends it in deafneſs, and Dr. Cullen is inclined to believe it may be beneficial, as he has found the juice of onions in ſuch caſes very uſeful. A clove or ſmall bulb of this root wrapt in gauze or muſlin, and introduced into the meatus auditorius, is the mode of applying it, in theſe caſes. Where people cannot take the garlic in ſubſtance, the beſt forms are either in ſyrup, or oxymel. See CULLEN's Materia Medica. If cows happen to eat the leaves of garlic their milk will be ſtrongly impregnated with its flavour.

In cold phlegmatic habits it is highly uſeful by its corroborant, expectorant, and diuretic effects: hence its uſe in calculous diſorders; beſides in ſeveral inſtances, it is ſaid to have manifeſted a lithontriptic power; in humoral aſthmas it gives relief when the patient is oppreſſed with viſcid phlegm.

Hoffman ſays, that if the cloves of freſh garlic are boiled in milk, they are one of the beſt anthelmintics; but the beſt way of taking garlic is in the form of a pill or a bolus, freſh made, and they muſt never be kept any time, for the active part of this medicine ſoon evaporates; the ſyrup and oxymel of garlic have been thrown out of the Britiſh pharmacopœias. Swallowing the clove of garlic entire, or cut into pieces, after having been dipped in oil, is conſidered as the moſt effectual mode of adminiſtration.

In hot bilious conſtitutions, garlic is improper; for where there are irration and acrimony already, it produces flatulence, head-ach, thirſt, heat, and other inflammatory ſymptoms: a free uſe of it ſoon promotes the piles in habits diſpoſed thereto.

In drying this root it loſes $\frac{9}{10}$ths of its weight, but freſh or dry it equally gives out its virtues to boiling water, vinegar, or brandy; and an infuſion in the latter is highly uſeful to relieve or prevent uneaſineſs in the ſtomach and bowels from a gouty cauſe.

INFUSIO ALLII. *Infuſion of garlic.*

℞ rad. *allii* rec. inciſ. ℥ ij. ſp. vin. gal. lb. i. m. cochl. magn. vel ii. h. ſ. ſumend. vel bis in die.

Garlic ſhould never be boiled; its virtues reſides in an oil that eaſily evaporates in a boiling heat, and thus leaves it quite inert. This oil is ſmall in quantity, but very active; it is yelloviſh and ropy: but the juice may be inſpiſſated into an extract by a gentle heat.

Rectified ſpirit of wine digeſted on dry garlic roots, extracts its virtues more readily, and more perfectly, than either water or vinegar. For thoſe called

ALNUS. THE ALDER-TREE, of which Miller enumerates ſeven or eight ſpecies. The ſorts known in medicine are the following, but are rarely if ever uſed in the preſent practice.

ALNUS, and Alnus rotundi folia glutinoſa viridis. The COMMON ALDER-TREE, called *amendanus*, alſo ——NIGRA vel *Frangula*. The RHAMNUS FRANGULA. Lin. The BLACK ALDER, called alſo AVORNUS.

The common alder is tall and coniferous, grows in watery places, with little branches; its leaves are clammy, the bark is of a blackiſh brown, and the wood is reddiſh.

All the parts of this tree are aſtringent and bitter, the bark is more aſtringent; a decoction of it hath cured agues, and is often uſed to repel inflammatory humours in the throat.

The BLACK, or BERRY-BEARING ALDER, is alſo found in moiſt woods; it is rather of the ſhrub kind. The inner yellow bark of the trunk or root given to 3 i. vomits, purges, and gripes, but joined with aromatics it operates more agreeably: though an infuſion, or decoction of it in water, inſpiſſated to an extract, acts yet more mildly. The berries of this ſpecies of alder are purgative; they are not in uſe under their own name, but are often ſubſtituted for buckthorn berries; to diſcover which, obſerve that the berries of the black alder have a black ſkin, a blue juice, and two ſeeds in each of them; whereas the buckthorn berries have a green juice, and commonly four ſeeds.

ALOE, called alſo *Fel Naturæ*; a plant which affords the purging gum of the ſame name; all the ſpecies, of which Miller enumerates thirty-ſeven, have thick fat leaves, like thoſe of the houſe-leek, but much larger, running two or three feet higher; the inſpiſſated juice of the whole plant is GUM ALOE. An erroneous notion prevails, of the *aloe* plant blowing but once in a hundred years; any ſkilful gardener makes them flower at any time by ſetting them in a bed of tanner's bark. The beſt is ſaid to grow in India, but all Aſia produces excellent plants; in moſt warm climes they are produced, as in the Weſt Indies, &c. It is reported that Alexander landing on the iſland of Succotria, or Zocotria, at the mouth of the Red Sea, in one of his expeditions, took notice of the *aloe* plant, and from that it was brought into uſe, and called SOCOTORINA.

Of the gum we have three kinds in the ſhops.

1. ALOE SUCCOTORINA vel ZOCOTORINA; SUCCOTORINE ALOE.

It is imported from the iſland Succotria, in the Indian ocean, wrapped in ſkins; it is obtained from the *aloe* Socotorina anguſti-folia ſpinoſa flora purpurea. Com. Hort. i. p. 9 t. 48. The ALOE PERFOLIATA, *foliis caulinis dentatis, amplexicaulibus vaginantibus, floribus pedunculatis cernuis corymboſis ſubcylindricis*. CL. HEXANDRIA; ORD. MONOGYNIA. Lin. Gen. Pl. 430. The gum is bright on its ſurface, and of a reddiſh colour, with a purple caſt; but when powdered it is of a golden hue; it is hard and friable in very cold weather, but in ſummer it ſoftens very eaſily betwixt the fingers. It is extremely bitter, and alſo accompanied with an aromatic flavour, but not ſo much as to cover its diſagreeable taſte. Its ſcent is rather agreeable, being ſomewhat ſimilar to that of myrrh.

2. ALOE HEPATICA, vel ALOE BARBADENSIS. The COMMON, or BARBADOES, or hepatic *aloes*, called *kadonaku*; *catevala*. ALOE *perfoliata floribus pedunculatis cernuis corymboſis ſubcylindricis, vera. foliis ſpinoſis confertis dentatis vaginantibus planis maculatis*, Lin. The beſt is brought from Barbadoes in large gourd-ſhells; an inferior ſort in pots, and the worſt in caſks. It is darker coloured than the Succotorine, and not ſo bright; it is alſo drier and more compact, though ſometimes the ſort in caſks is ſoft and clammy; to the taſte it is intenſely bitter and nauſeous, being almoſt totally without that aroma which is obſerved in the Succotorine; to the ſmell it is ſtrong and diſagreeable.

3. ALOE CABALLINA, vel ALOE GUINEENSIS, caballina vulgari ſimilis ſed tota maculata; HORSE ALOES. It is not eaſily to believe, as is generally reported, that this is only the more impure part of the Barbadoes *aloe*, becauſe the difference does not conſiſt in the purity, but in the quality. It is very diſtinguiſhable from both the others by its ſtrong rank ſmell; in other reſpects it ſo agrees with the Barbadoes ſpecies as to be often ſold for it. Sometimes its purity and clearneſs are ſuch, that they cannot diſtinguiſh it from the Succotorine *aloe*; but either its offenſive ſmell, or its want of the aromatic flavour, betrays it. This aloe is not admitted into the materia medica; but employed chiefly by farriers.

The general nature of theſe three kinds are nearly the ſame; their particular difference only conſiſt in the different proportions of gum to their reſin, and in the flavours they poſſeſs, which renders them more or leſs diſguſtful for internal uſe. From their intenſe bitterneſs they have received the name of *fel naturæ*.

ALOES conſiſt of a ſmall portion of reſin, and a large one of gummy matter; to ſeparate which, boil four ounces of *aloes* in a quart of water, until it is diſſolved; let this ſolution ſtand in a cool place all the night, by which time the reſin will be depoſited at the bottom of the veſſel, the gum continuing in its diſſolved ſtate, but by evaporation is recovered in a ſolid form. Twelve ounces of the Barbadoes *aloes* yields nearly four ounces of reſin, and eight of a gummy extract. The ſame quantity of the Succotorine yields three ounces of reſin, and nearly nine of gummy extract.

The *aloes* may be purified by ſolution in water, and an evaporation ſo immediately after, that the reſin may not have time to ſettle.

When the reſin ſettles from the watery decoction of the *aloes*, the impurities ſubſide therewith, and are to be ſeparated by diſſolving the reſin in ſpirit of wine; then, after a due ſeparation of the ſolution from its ſediment, the reſin is to be reſtored by evaporating the ſpirit with a gentle heat.

The reſin of *aloes* hath but very little ſcent; that from the

the Succotorine hath very little taſte, from the Barbadoes a ſlight bitter, and from the caballine ſomewhat more of the aloetic flavour.

The gummy extracts are leſs diſagreeable than the crude *aloes*; that of the Barbadoes ſmells rather ſtronger than that of the Succotorine; but in taſte is leſs ungrateful than it; that of the Succotorine has very little ſmell, and is ſcarcely unpleaſant to the taſte; that of the caballine *aloes* hath a rank ſmell, but its taſte is not worſe than that of the Succotorine.

In the reſinous part conſiſts the healing qualities, hence for *external uſes* the Barbadoes is the beſt; *internally*, however prepared, the reſin hath very little cathartic power. In the gummy extract reſides the purgative, and all the other qualities. The gum of the Succotorine aloes purges more, and with greater irritation, than the gum of the Barbadoes; the former is therefore to be preferred where a ſtimulus is required, as when the menſes are to be excited; the latter may be preferred for common purges. Of all the known purges, this gum is ſuppoſed to be almoſt the only one that is friendly to the ſtomach; ſome are eaſily moved by it, others not; ſometimes it operates immediately, and its effects ceaſe, as is common with other purges; and ſometimes it produces no ſenſible effect with the firſt doſes; but when it does anſwer, it continues the effect longer than any other purgative, keeping the body ſoluble during ſeveral days; and it does not induce a coſtiveneſs after its purging effects are over; hence good in coſtive habits. In ſmall doſes, twice a day, it occaſions a conſiderable irritation about the anus, and ſometimes a diſcharge from the hæmorrhoidal veſſels; hence it is an excellent remedy, when, to relieve nervous diſorders, we would promote ſuch an evacuation: when this effect is not the conſequence of ſmall doſes, they cleanſe the firſt paſſages, attenuate viſcid humours in the remote parts, warm the habit, and promote the ſecretions. When nervous affections diſturb the phlegmatic and ſedentary, this drug is peculiarly proper; cachectic habits, and oppreſſions in the ſtomach from viſcid crudities, when cauſed by irregularity, are particularly relieved by it. It is powerfully antiſeptic, and in common with bitters and purgatives, is an anthelmintic. In all diſeaſes of the nervous tribe, aloes is the ſtrongeſt purge; and the beſt preparations for this purpoſe are the pilulæ ex aloe cum myrrha, the tinct. ſacra ſpirituoſa, or extractum colocynthidis comp. Its efficacy in the jaundice is very conſiderable; it promotes an appetite, and for this end the vin. aloet. alk. is peculiarly beneficial. It is a ſuccedaneum to the bile, and is neceſſary in all caſes where the bile is defective either in quantity or quality.

Aloes purge in flatulent cold habits where there is no inflammation; but when the blood is inflamed, the belly very coſtive, the urine high-coloured, then it produces no ſuch effect: on the contrary, the oftner this medicine is repeated in this latter habit of body, the more aſtringent it will prove. In hot, bilious conſtitutions, it is injurious by heating the blood, and inflaming the bowels; in ſuch habits, if it is required, it will be neceſſary to mix a ſmall quantity of nitre with each doſe, or to uſe the elix. proprietatis vitriolicum. In diſpoſitions to the gravel, as well as during the paſſage thereof from the kidnies, through the ureter, aloetic purges are improper. *Aloes* ſeems only to act on the large inteſtines, and produce in moderate doſes one or two copious evacuations of alvine contents; by a long uſe they bring on the piles. They ſeldom produce liquid ſtools in leſs doſes then twenty grains, and then they gripe, ſometimes ſeverely.

The doſe of crude *aloes*, or of the gummy extract, may be from gr. x. to ʒ i.

Alcaline ſalts leſſen the purgative quality of *aloes*; and long boiling quite deſtroy it.

This gum is ſometimes adulterated with acacia, at others with gum arabic.

Accompanied with heat, the crude *aloes* may be all diſſolved in water; but when it is cold, it lets fall its reſin. A mixture of pure water two parts, and proof ſpirit one part, perfectly diſſolves it without heat; but rectified ſpirit of wine diſſolves it moſt ſpeedily. If water or wine is the menſtruum, the *aloes* become tenaceous, and diſſolve ſlowly; in this caſe, white ſand ſhould be well mixed with the powdered *aloes*, before being added to theſe laſt mentioned fluids.

Cloves cover the offenſiveneſs of *aloes* the moſt perfectly, but their heat admits not of a due quantity being uſed for this purpoſe. The canella alba anſwers tolerably, and without any inconvenience; but ſome prefer the caſſia caryophyllata for this purpoſe.

The following are the principal preparations of *aloes*.

1. TINCTURA ALOES COMPOSITA—*compound tincture of aloes.*

℞ Tinct. myrrh. lb. ij. *aloe* Succot. & croc. Anglic. ää ʒ iij. m. Ph. Lond. 1788.

This was called *elix. aloes*, & *elix. proprietatis*, and was the elix. prop. of Paracelſus, who attributed to it very extraordinary properties, and ſo named it the Elixir of Property to Man. The original method of preparing it is improved in the above preſcription; for if myrrh, *aloes*, and ſaffron, are digeſted together, the menſtruum will ſoon ſate itſelf with the *aloes* and ſaffron, ſo as ſcarce to take up any of the myrrh, whilſt a tincture already extracted from myrrh, readily diſſolves the *aloes* and ſaffron in a large quantity.

The doſe to children may be from gtt. x. ad xl. and to adults to a tea ſpoonful.

The pilula ex aloe cum myrrha, and this elixir, may be ſubſtituted for each other.

2. ELIX. PROPRIETATIS VITRIOLICUM. *The vitriolic elixir of property.*

℞ Myrrh pulv. ʒ ij. *aloe* Succot. ʒ i. croc. Anglic. ʒ ſs. ſpirit. ætheris vitriolic. lb. i. ſs. m. digere, 6 dies in B. A.

The mineral acid, as uſed formerly, precipitated the ingredients; but when this acid is previouſly combined with the vinous ſpirit, it neither precipitates them, nor reſtrains the diſſolving power of the vinous ſpirit. In hot conſtitutions, and weakneſs of the ſtomach, this is preferable to the compound tincture of *aloes*.

3. TINCT. ALOETICA VOLATILIS. *The volatile aloetic tincture.*

℞ Pulveris aloetici ʒ i. ſpt. ſal. ammoniac. dulc. vel ſpt. ſal ammon. cum calce viv. fact. ℔ i. m. f. tinct.

This is an elegant preparation of its kind, requiring very little, if any aſſiſtance, from aromatics, to render it agreeable to the palate; the ſpirit abating the offenſiveneſs of the *aloes*, and the *aloes* ſheathing the pungency of the ſpirit. The ſpt. ſal. ammon. cum ſal. tart. fact. does not diſſolve near the quantity of *aloes* that the ſpirits preſcribed do.

4. VINUM ALOETICUM ALKALINUM.

℞ Kali pp. ℔ ſs. *aloe* Succot. croc. Anglic. & myrrh ad ʒ i. ſal ammon. crud. ʒ vi. vin. alb. mont. bl. ij. m.

Let theſe be macerated cold for a week, then the clear liquor may be poured off for uſe. If the myrrh and ſaffron are macerated firſt, and after them the reſt of the ingredients are added, a more perfect medicine will be obtained.

This is the elix. proprietatis of Helmont, with ſome little alteration. It is a better ſtomachic than the elixir of *aloes*, for which it may be uſed; it is more effectual too in promoting the ſecretions; and, with good advantage, it is adminiſtered to promote the urinary diſcharge, and to cleanſe the kidnies; and, in moſt reſpects, excels the compound tincture of *aloes*.

The doſe is from ʒ i. to ʒ iij.

5. TINCTURA ALOES. *Tincture of aloes.*

Take of Socotorine *aloes*, powdered, half an ounce; extract of liquorice, an ounce and half; diſtilled water, proof ſpirit of wine, of each eight ounces, by meaſure; digeſt in a ſand heat, now and then ſhaking the veſſel until the extract is diſſolved, then ſtrain. Ph. Lond. 1788.

Other preparations, whoſe principal ingredient is *aloes*, as *aloeticus pulvis*.——See HIERA PICRA.——*Aloeticus pulvis cum Myrrhâ*. See AROMATICÆ PILULÆ; for which it is a ſubſtitute.—*Aloes Vinum*. See SACRA TINCTURA.——*Aloes Pilulæ cum Myrrha*, ſee PILULÆ RUFI. *Extractum Colocythidis cum Aloe, aut compoſitum*. See CATHARTICUM EXTRACTUM. Of this kind are ſuppoſed to be the famed SCOT's and HOOPER's female pills.

ALOE PURGANS. See ALOE.——AROMATICA LIGN. See AGALLOCHUM.——BRASILIENSIS. See CARAGUATA.——PALUSTRIS. See ALOIDES.

ALOEDARIA. Compound purging medicines, ſo called from having aloes as one ingredient.

ALOHAR, } See ARGENTUM MOBILE.
ALOHOC. }

ALOED. The abbreviation of aloedaria.

ALOIDES, WATER-ALOES, or FRESH-WATER SOLDIER; alſo called *aloe paluſtris, aizoon, militaris aizoides, ſtratiotes*.

Its leaves reſemble thoſe of the aloe, it grows in water, and on watery grounds; the leaves and flowers are always above the water. It is met with in ſeveral parts of England, and flowers from June to Auguſt.

Mountebanks ſhew the fibres, which are its roots, for worms. They put them in bottles of water to make them appear thicker.

ALOMBA. } See PLUMBUM.
ALOOC. }

ALOPECES. Lat. Vulpes. See PSOÆ.

ALOPECIA. BALDNESS, the FALLING OFF of THE HAIR, from αλωπηξ, *a fox*, becauſe the fox is ſubject to a diſtemper that reſembles it, called alſo *capillorum defluvium*. *Athrix*, *Depilis*, *Phalacrotis*; when particularly on the ſinciput *Calvities* and *Calvitium*: which GALEN ſays, is owing to a defect of moiſture. When the bald part is ſmooth and winding, like the track of a ſerpent, it is called *ophiaſis*; but the general name of all the different appearances of bald places is AREA, which name is taken from the area in a garden, a ſpot on which not any thing grows; though Blanchard ſays, that the hair falls off areatim, by ſhedding; whence in general this diſeaſe is called *area*.

Theſe diſorders ſeem to have been more common among the ancients than they are in our days. Celſus ſays, that the *alopecia* comes at any age, but the ophiaſis only affects infants; and Sennertus obſerves, that they both are common to all ages, though they are moſt frequently met with in childhood, and often ſucceed the tinea, achores, and favi.

The cauſe is a faulty humour that deſtroys the roots of the hair, and that ſometimes only perverts the humour that nouriſhes them, in which caſe the hair turns white, yellow, &c. according to the different quality of the morbid humour. Galen ſays, that eating muſhrooms may cauſe that bad quality in the humours which produce theſe diſorders; and alſo that malignant and contagious diſeaſes of various kinds may produce the ſame effect.

The *alopecia* ſpreads itſelf on the beard, as well as on the hairy ſcalp, and is irregularly formed. The ophiaſis uſually begins at the back part of the head, and creeps about the breadth of two fingers, till it hath extended its two heads to both the ears, and ſometimes to the forehead, till both heads meet in one. The ophiaſis ſeems to be more malignant than the *alopecia*, ſince that in it not only the roots of the hair, but alſo the cuticle is corroded as far as the roots reach; the ſkin alſo changes its colour, and is ſometimes pale; at others, darker coloured, and if gricked, a ſerous blood iſſues out.

Theſe diſorders differ from the tinea: in the latter the excoriations and exulcerations are deeper, and often the hair does not grow again.

In infants theſe diſorders commonly go off as age advances; but in adults, the cure, eſpecially of the ophias, is very difficult. If the part does not grow red with friction, a cure is vainly attempted; but in proportion as a redneſs appears readily on rubbing the part, the cure may be expected to be eaſy and ſoon effected. If a leproſy is the cauſe, the caſe is incurable. The beſt prognoſtic is when hairs begin to puſh out on the edges of the areas.

As to the cure, if any other diſeaſe attends, begin by removing it, which done, it often falls out that the *alopecia*, &c. depending thereon is removed alſo. Before the hair falls off, if ſigns of the approaching diſeaſe attend, gentle repellents and corroborants may be uſed; but if the diſeaſe is formed, repellents muſt be omitted, the head muſt be ſhaved, then waſhed with ley in which is infuſed the abrotanum and ſuch like herbs, after which let the part be rubbed with a flannel or other coarſe cloth until the ſkin grows red; this done, applications of muſtard, white lily roots, nitre, tar, the aſhes of ſouthernwood may be directed, as the preſcriber's intention ſeems not likely to be anſwered by one or the other.

The topics uſed in the achor, which ſee, are well adapted to this caſe.

Begin with the milder applications and proceed gradually, as diſcretion admits. If the ſkin grows more red, or is more eaſily made ſo by rubbing the part, moderate the applications; the milder ſort of dreſſings may continue all the day and night; but the more active only until the ſkin is ſenſibly affected by them. See CELSUS, SENNERTUS.

ALOSA. SHAD, called alſo *Clupea*.

A ſea-fiſh the ſize of a ſalmon, with large ſcales, but thin and eaſily taken off. In its head is a ſtoney bone of an alkaline nature. This fiſh is the beſt for eating in ſpring, but if pickled it keeps well all the year.

ALOSAT, } See ARGENT. VIVUM.
ALOSOHOC, }

ALOSANTHI. FLOWER OF SALT.

ALPHENIC. An Arabian word for ſugar-candy, or barley-ſugar. See SACCHARUM.

ALPHESERA, ſee ALFESERA.

ALPHITA, the plural of αλφιτον. The meal of barley that has been huſked and parched. Hippocrates uſes this word for meal in general. GALEN ſays, that κριθινα, is coarſe; αλευρα, fine; and αλφιτα, middling ſort of meal.

ALPHITEDON. It is when a bone was broken into ſmall fragments like alphita, i. e. bran, alſo called *caryedon*; and *catagma*, when like a broken nut.

ALPHITON. A HASTY-PUDDING. Thus the Greeks call it, but the Roman name is *polenta*; it is made of barley meal, moiſtened with water, wine, mum, or any other liquor. The ſoldiers had it in common uſe.

ALPHUS, αλφος from αφαω, an old word for *to change*, becauſe it changes the colour of the ſkin. M. A. Severinus calls it *Baras*.

This diſorder is a ſpecies of that ſort of white leproſy called *vitiligo*, and which is divided into the *alphus*, *melas*, and *leuce*, called alſo *albara*; in the *alphus* the ſkin is white and roughiſh, not all over, but in ſpots, ſometimes the patches are broad; it has the ſame origin as the lepra, and bears the ſame analogy to the leuce as the ſcabies to the lepra; the firſt is ſuperficial, chiefly affecting the ſkin: the ſecond ſinks deeper into the fleſh: but theſe are all diſorders that only differ in their degrees of inveteracy. See LEPRA.

Oribaſius commends lime-water as a lotion in all the ſpecies of this diſorder, and ſays that the *alphus* requires a thin lime-water, the ſcabies a thicker or ſtronger, and the lepra the ſtrongeſt. Aetius commends, as equally proper for the white or the black *alphus*, the following liniment:

℞ Fol. ficus, ſulph. viv. & alum. rup. ää. æq. p. acet. acerrim. q. ſ. f. linim. cum qua inung. partes affectæ.

Purging medicines ſhould precede externals.

The baln. tepid. vel frigid. with the ſal nitri, & decoct. cort. ulmi, taken internally, generally ſucceed. See ULMUS.

See Celſus. Actuarius Method. Medend. Oribaſius de Morb. Cutan. Curat. Aetius's Tetrab. iv. Germ. cap. i. 132.

ALPHINI, Balſ. BALM OF GILEAD. See BALSAMUM.

ALPIN. ÆGYPT. The abbreviation for Proſperus *Alpinus* de Plantis Ægypt.

ALP. EXOT. The abbreviation for Proſperus *Alpinus* de Plantis exoticis.

ALP. PL. ÆG. The ſame author de Plantis Ægypti.

ALRACHAS. LEAD. See PLUMBUM.

ALRATICA. A partial or total imperforation of the vaginia. It is an Arabic word.

ALSAMACH, or ALSEMACH, an Arabic name for the great hole in the os petroſum. See TEMPORUM OSSA.

ALSECH. See ALUMEN PLUMOSUM VERUM.

ALSELAT. BURNT COPPER. See ÆS USTUM.

ALSINE, from αλσος, *a grove*, becauſe it delights in ſuch places on account of their ſhade. It is alſo called *morſus gallinæ*, *centunculus*; in Engliſh, CHICK-WEED and MOUSE-EAR; this laſt name is from it leaves reſembling the ears of mice, *Auricula Muris*.

There are twenty-two ſpecies.

It is a ſmall creeping herb, and too generally known to need a deſcription; in ſhady cultivated ground it is to be met with the greateſt part of the year, but it is alſo in more expoſed places, where it appears in the middle of winter, and dies in the middle of ſummer.

It is cooling, but of too little conſequence to be noted as a medicine. It is uſed to promote an appetite in linnets and Canary-birds. This is a name of a ſpecies of ſaxifraga, or the whitlow-graſs. See PARONYCHIA.

ALSIRACOSTUM. The name of a compound medicine in Meſſue, called alſo *ſiracoſtum*.

ALSURENGIUM. See HERMODACTYLUS.

ALT. The abbreviation for alter and Altdorf.

ALTAFOR. See CAMPHORA.

ALTARIS ET ALTARIT. See ARGENT. VIVUM.

ALTERANTIA. ALTERATIVES. They are thoſe medicines that are ſuppoſed to make a change in the blood particularly from a morbid, to a ſound ſtate, without any manifeſt operation or evacuation; and the term is alſo employed for medicines ſuited to clear the blood from certain impurities ſuppoſed to remain in it. Whatever other general operations may be proper to any medicines, all of them may be uſed as *alteratives*, and the moſt powerful *alteratives* are evacuants, given in diminiſhed doſes, if repeated at proper intervals; by adminiſtring them thus, or mixed with ſuch *alteratives* as the caſe may

may indicate; though the diſcharge they promote, when given in full doſes, is not increaſed, they paſs into the blood, and the ſecretions are promoted, whereby the faulty natural excretions are regulated.

ALTERCANGENON. ALTERCUM. See HYOSCIAMUS NIGER.

ALTEY PLUMBI. Moſt probably the CERUSSA ACETATA.

ALTHÆA, from *αλθω, a remedy*; called alſo *biſmalva, hibiſcus, ebiſcus, malvaviſcus, ibiſcus, malaviſcus, bolus judaica, hebiſcos, anadendromalache, anadendron, ariſtaltheca*, in Engliſh, MARSHMALLOW. It is the ALTHEA OFFICINALIS *foliis ſimplicibus tomentoſis*. CL. MONADELPHIA; ORD. POLYANDRIA. Linn. Gen. Plant. 839.

It is a ſoft hoary plant, with oblong undivided leaves, and pale fleſh-coloured monopetalous flowers cut deeply, in five ſections, ſet in a double cup, the outermoſt of which is divided into nine parts, the inner into five; the fruit conſiſts of a number of capſules ſet in form of a flat diſk, containing each a ſingle ſeed; the roots are long and ſlender, with ſeveral fibres, of a pale yelloviſh colour on the outſide, and white within. It grows wild in marſhes and other moiſt places in England, though it is frequently cultivated in gardens. It is perennial, and flowers from June to near the end of ſummer.

All the parts of this plant abound with a mucilaginous matter, almoſt both inodorous and inſipid. The dry roots, if boiled in water, give out near half their weight of gummy matter, which in evaporating, the aqueous fluid forms a flavourleſs yelloviſh mucilage; the leaves afford nearly one-fourth of their weight, the flowers and ſeeds ſtill leſs.

All its virtues depend on its ſoft mucilage; hence is it recommended for its demulcent and emollient qualities, where the membranes become abraded, or the mucus acrid; it obtunds and incraſſates acrimonious fluids, moderates tickling coughs which proceed from defluxions on the fauces and lungs, gives relief in hoarſeneſſes, eroſions of the ſtomach and inteſtines, dyſentry, difficulty and heat of urine, and relaxes the paſſages in nephritic complaints; in which laſt caſe the decoction, which is the beſt preparation, ſhould not be ſlimy; two or three ounces of the freſh roots may be boiled in a ſufficient quantity of water to a quart, to which one ounce of gum arabic may be added, and two drams of nitre.

A decoction is the beſt preparation and moſt agreeable to be taken, but requires that large quantities be uſed. An ounce of the dried root may be boiled in water, enough to leave two or three pints to be poured off for uſe: if more of the root is added, the liquor will be diſagreeably ſlimy; if it is ſweetened by adding a little of the root of liquorice it will be very palatable. Some prefer the infuſion, as long boiling deſtroys part of the viſcidity of this plant.

The London College gives the following form for a ſyrup:

SYR. ALTHEÆ.

℞ Rad. *alth.* ſic. ℔i. coq. in aq. font. lb. viij. ad lb. iv. colaturis adde ſacc. alb. lb. iv. f. ſyr. Boil the water with the marſhmallow root to one half, and preſs out the liquor when cold. Set it by twelve hours, and after the fæces have ſubſided, pour off the liquor, add the ſugar, and boil it to the weight of ſix pounds. Phar. Lond. 1788.

The form for this ſyrup is from Riverius, but the firſt preſcription was from Fernelius.

The cuſtom of throwing marſhmallow-leaves into hot water when uſed to ſit over for curing the piles, is uſeleſs, for nothing of the mucilage ariſes therefrom with the watery vapours.

There are many ſpecies of the *althea*, but this alone is in uſe.

The great comfrey root is preferable in all the caſes wherein the *althea* is uſed.

ALTH. THEOPHRASTI FLORE LUTEO, called alſo *alth.* Indica, *ibiſcus Theophraſti, alutilon*, and in Engliſh the YELLOW MARSHMALLOW.

It is cultivated in gardens, and flowers in July. Its appearance, except in the colour of the flowers, and its medical virtues, are ſimilar to the above ſpecies.

Miller enumerates ſixteen ſpecies of this yellow flowered kind.——ARBOREA MARITIMA. See MALVA ARBOREA MARITIMA.——FOLIIS CANNAB. See BANGUE.

ALTHANACA, or ALTHANACHA. See AURIPIGMENTUM.

ALTHEBEGIUM. An Arabian name for a ſort of ſwelling, ſuch as is obſerved in cachectic and leucophlegmatic habits, and ſuch as is ſeen under the eye-lids of thoſe who ſleep too much

ALTHEXIS, from *αλθω, to cure*, or *heal*. It ſignifies the cure of a diſtemper.

ALTHIT. See LASERPITIUM.

ALTIMAR. BURNT COPPER. See ÆS USTUM.

ALTIMIO. The SCORIA of LEAD.

ALTINCAR. A ſort of factitious ſalt uſed in the purgation and ſeparation of metals.

ALTINGAT, RUST of COPPER, or FLOWERS of COPPER. See ÆRIS FLOS.

ALTINURAUM. See VITRIOLUM.

ALITH. See ASSA FOETIDA.

ALTUS. When this word is joined to *ſopor* it means found ſleep, as in a lethargy, &c.

ALUACH, or ALUECH. See STANNUN.

ALUD. See AGALLOCHUM.

ALUDEL. A CHEMICAL SUBLIMING VESSEL, called alſo *Cementerium*. Many are to be employed at once; the matter to be ſublimed is put into a body or pot, the upper part is fitted into the *aludel*, and this *aludel* into another, &c. to the top *aludel* a head or alembic is fixed to receive the ſublimed matter.

ALUDIT. See ARGENT. VIVUM.

ALUFIR. REDNESS.

ALUM. See CONSOLIDA.

ALUMBAIR. BUTTER. See ADEPS.

ALUMBOTI. CALCINED LEAD. See MINIUM under PLUMBUM, N° 4.

ALUMEN. ALUM. It is a ſalt. There is a ſpecies made in the Iſland of Melos, called from thence Meleios. The Greeks called it *στυπτηρια*. *Aſſos, azub, Aſeb*: and when extremely hard, as iron, *Elamula*. In natural hiſtory, it is a genus of ſalt, in the order of earthy netural ones. Its generic character; it it conſiſts of the vitriolic acid and a pure clay, and changes the purple juices of vegetables into a red colour. It is not made for the purpoſe of commerce by a direct combination of the vitriolic acid and clay, but is extracted from ſubſtances uſually called alum ores, which either are, or probably were originally compoſed of clay and ſulphur.—From ſuch as contains the alum ready formed, as is the caſe with earth of this kind, it is extracted by lixiviation in water; and ſubſequent evaporations.

The preſent practice employs only the two laſt of the following ſpecies, but as all the four have been in uſe they all demand a ſhare of our attention.

1. *Alumen* plumoſum officinarum. EARTH FLAX.

It is entirely rejected from medicine, being more dangerous than uſeful; it is a ſpecies of amianthus, which from its plumated appearance obtained the name of *alumen* plumoſum: and thence too it is probable its admiſſion into the number of medical articles. See AMIANTHUS.

2. *Alumen* plumoſum verum, alſo called *alumen* ſciſſile, *alumen* jamenum, *alumen* plumeum, *alumen*, trichites; *aleſch, aieſch, amentum, azephi, azeff*. The PLUMOSE, FEATHERED, or HAIRY ALUM.

It ſometimes ſhoots upon the ſurface of thoſe minerals that afford the factitious *alum*, and is alſo found on other bodies in the form of fibrous efflorescences, and from this form hath obtained the names of *alumen plumoſum*. It ſeems to be the native *alum* of the ancients; and is formed by a natural evaporation of water that hath paſſed over beds of *alum* ſtone.

3. *Alumen* com. COMMON ALUM, alſo called *alumen* cryſtallinum, *alumen* rupeum, *alumen* factit. FACTITIOUS or ROCK ALUM; alſo ENGLISH ALUM.

4. *Alumen* Romanum. ROMAN ALUM; alſo called *alumen* rubrum, *alumen* rutilum, *alumen* rochi Gallis. ROCK, RED, or ROCH ALUM, by the French.

Theſe two latter agree in their general qualities. The greateſt quantity of them are artificially produced from different minerals, ſuch as a blue ſlate, which is found about Scarborough in Yorkſhire, Preſton in Lancaſhire, a whitiſh ſtone at Tolfa near Rome: theſe ſtones by calcination become richly aluminous; they are then ſteeped in water, freſh ſtones being put to the ſame water ſeveral times; to this water, after having obtained what it can from calcined ſtones, is added a ley made with pot-aſh, and after this a quantity of urine: this laſt is to caſt off ſome improper parts, and to prevent the *alum* from being too hard; the alcaline lixivium is neceſſary for bringing the *alum* into a ſolid form: it is by evaporation that the cryſtals are obtained.

A bituminous earth is met with near Hall, in Saxony, which

which by expoſure to the air, grows hot, and at length burſts into a flame. In Sweden are ferrugineous pyritæ, from which both *alum* and vitriol are obtained.

The Engliſh, or common *alum*, is colourleſs, and commonly in large maſſes, into which it is caſt by melting the cryſtals after the *alum* is perfectly made, and then pouring the fuſed matter into veſſels, whoſe cavities give the forms it appears in. The Roman *alum* is of a reddiſh colour, and in ſmall cryſtalized maſſes; but its chief difference from the Engliſh, is in its being leſs ſtyptic, and leſs nauſeous. The name of roch, or rock *alum*, is applied to the Engliſh by us, on account of the hardneſs and ſize of the maſſes; but foreigners apply it to the Roman, on account of the hard ſtone, or rock, from which it is extracted.

Alum hath a peculiarly ſharp, rough, aſtringent taſte; it melts over a gentle fire, ſending up in a vapour a ſixth part or more of its weight, and becomes a light, white, ſpongy ſubſtance, called ALUMEN USTUM, burnt *alum*; it is the only ſalt that, with other animal ingredients, or vegetable matters, will make the black phoſphorus; it diſſolves in about twelve times it weight of water; ſolutions of it change the blue colours of vegetables into a purple or red, and an infuſion of galls, turbid and whitiſh. Upon adding a fixed alkaline ſalt to a diſſolution of *alum*, its earth is precipitated, and its acid uniting with the alkali, forms a tart. vitriolatum.

It is uſed by dyers to ſtrike, fix, clear, and brighten their colours: it is the ſoul of the art of dying, and ſerves as the Mordant to all colours: by dipping paper in it, ink is prevented from ſpreading on it; vintners fine their liquors with it; fiſhers uſe it to dry codfiſh with; and bakers mix it with flour to make their bread white.

Medicinally, it is uſed as a powerful aſtringent; as ſuch it is preſcribed to preſerve the gums, alſo to reſtrain uterine hæmorrhages, and check the fluor albus; but though in theſe ſort of fluxes it is highly commended, it is rarely and with great caution to be admitted in dyſenteries, particularly in the beginning. Though celebrated as an aſtringent in ſome caſes, it is no leſs extolled in the colic and other painful diſorders of the bowels, attended with obſtinate conſtipation. See Percival's Eſſays Med. and Exp. vol. ii. The doſes in theſe caſes are from five to twenty grains, and may be repeated every four, eight, or twelve hours; and when duly perſiſted in, proves gently laxative, mitigates the pain, abates flatulence, mends the appetite, and ſtrengthens the organs of digeſtion. *Alum* is powerfully tonic, and it is reaſonably ſuppoſed to contribute to the relief of pain in the inteſtines, by blunting the morbid ſenſibility of their nerves As the mineral acids do, it coagulates the blood and juices. In robuſt habits, after due bleeding and purging, it cures agues: either of the following uſual forms may be given in a morning faſting, until the deſired relief is obtained. Dr. Cullen thinks it ought to be employed with other aſtringents in diarrhœas. In active hæmorrhages it is not uſeful, though a powerful medicine in thoſe which are paſſive. It ſhould be given in ſmall doſes, and gradually increaſed. It has been recommended in the diabetes, but tried without ſucceſs; though joined with nutmeg it has been more ſucceſsful in intermittents, given in a large doſe an hour, or a little longer, before the approach of the paroxyſm. In gargles, in relaxations of the uvula, and other ſwelling of the mucous membrane of the fauces, diveſted of acute inflammation, it has been uſed, and advantageouſly; alſo in every ſtate of the cynanche tonſillaris.—It is alſo preferable to white vitriol, or acetated ceruſs, in the ophthalmia membranarum, from two to five grains diſſolved in an ounce of water. Cullen's Mat. Med.

℞ Nuch. moſch. major. alum. rup. ää gr. 45. f. pulv. in tres partes divid. cujus cap. i. omn. mane jejuno.

Vel.

℞ Cort. Peruv. ſubtil. pulv. ʒ i. ſeri *alum.* ʒ vi. m. hauſt. mane jejun. ſumend.

The Roman *alum* is counterfeited with common *alum* coloured; but break it, and the counterfeit will be found pale within, while the true is of a deeper red.

Alum conſiſts of the vitriolic acid, a metallic earth, and water; of which laſt its contents are nearly one half of the weight of the whole. Expoſed to a moderate heat, great part of the water flies off in vapour: urged by a ſtronger heat, the acid ſpirit ariſes, leaving the earth behind. The earth may be ſeparated by diſſolving *alum* in water, then adding a ſolution of alkaline ſalt to it until a milkineſs appears, when on ſtanding a little, the earth is precipitated; and by a few ablutions, in boiling water, is totally freed from all its alkaline parts. From this earth *alum* may be regenerated by the addition of the oil of vitriol.

There are many preparations of this drug in uſe, the chief of which are as follow: See STYPTICUS HELVETII PULVIS.

ALUMEN FEBRIFUGUM, *Febrifuge* Alum.

℞ *Alum.* ʒ iij. in aq. card. ℔ i. ſs. ſolut. cui adde paucul. ſang. drac. colatur evapor. add ſicc.

Doſ. ℈ i. ante paroxyſma.

It is alſo called *ſaccharum* aluminis, or ſugar of *alum* and *azab.*

AQ. ALUMINOSA.

℞ *Alum.* rup. ʒ i. aq. font. ℥ vi. m. This is of excellent uſe if ſpungy ulcers are waſhed with it. This is called *achai, acahi.*

AQUA ALUMINIS COMPOSITA, P. L. 1788. *Compound water of alum.* ℞ aluminis, zinci vitriolati ää ʒ ſs. Aquæ ferventis ℔ ij. pour the water on the ſalt in a glaſs veſſel, and ſtrain it. This was formerly called *aqua aluminoſa Batcane.*

In ſome of our public hoſpitals, two ounces of each of the ingredients are added to a quart of water.

ALUM. USTUM, *Burnt* Alum.

It is only *alum* dried in an iron ladle or an earthen veſſel over a gentle fire, by which it becomes white, light, and ſpungy. It is uſed as an eſcharotic when fungous fleſh riſes in ulcers; but it makes the edges of the part to which it is applied callous. Mixed with the ſugar which is uſed to ſweeten cordial waters, it precipitates the milkineſs that appears when newly diſtilled, and which ſometimes continues if not prevented.

COAGULUM ALUMINIS, Alum *Curd.*

℞ Albuminis ovi N° ij. & cum paucul. *alum.* conquaſſat. donec coagulum. form.

Riverius firſt gave this preſcription; it is a uſeful application in chronic inflammation of the eyes attended with much weeping; if applied at bed-time: bleeding and purging ſhould precede, and bliſters accompany its uſe. Alſo ſee CATAPLASMA ALUMINIS.

ALUMINIS PURIFICATIO. P. L. 1788. Purification of Alum. ℞ Aluminis. p. ℔ j. Cretæ p. ʒ i. aquæ diſtillatæ M: ℔ j. boil theſe a little, ſtrain, and ſet it by to cryſtallize.

ALUMINOSUM SERUM, ALUM WHEY. Take of cows milk, one pint; alum in powder, two drams; boil them till the milk is curdled, and then carefully ſeparate the whey; doſe 4 oz. three or four times a day.

ALUMEN CATINUM. A name of the pot-aſh. See CLAVELLATI CINERES.——GLACIALE. So *alum* that appears like ice was called by the ancients.——PLUMOSUM.——USTUM. See ALUMEN.

ALUMINOSÆ, AQ. Are thoſe impregnated with the particles of that ſalt; and they make a ſpecies of theſe called mineral, or medicinal waters. What gives efficacy to theſe waters, is ſaid to be an acid aluminous mineral ſalt, preying on and diſſolving a ſlight mixture of iron, and being mixed with other materials; hence become they deobſtruent, and ſo beneficial to hypochondriac and cachectic patients; and not aſtringent, or incraſſating, as the idea of their being ſolely impregnated with alum would induce us to conclude.

ALUMINATIO. TO NOURISH OR FEED.

ALUNSEL. A DROP. See GUTTA.

ALUS, — GALLICA. } See CONSOLIDA.

ALUSAR. See MANNA.

ALUTA. LEATHER, ſuch as plaſters are ſpread on. called alſo *Aluta Ægyptia*, and Byrſa.

ALVEARIUM, from *alveare, a bee-hive.* The bottom of the concha or hollow of the external ear; it terminates in the meatus auditorius. It is in this cavity where the ear-wax is principally lodged.

ALVEOLARIS PROCESSUS. See MAXILLARIA SUPERIORA OSSA.

ALVEOLI, called alſo *botrion*, or *bothrion*; *frena*, *mortariolum.* The ſockets in the jaws in which the teeth are ſet; they are lined with a very ſenſible membrane, which alſo incloſes the roots of the teeth. There are uſually ſixteen of theſe *alveoli* or ſockets in each jaw.

ALVEOLUS. A little ſocket or trough.

ALVEUS. Medicinally, it is applied to many tubes or canals, through which ſome fluid flows, particularly to ducts which convey the chyle from the receptacle thereof to the ſubclavian vein.

ALVIDUCA. Applied to medicines, it means thoſe which purge. See PURGANTIA.

ALVI FLUXUS. See DIARRHOEA.

ALVUS. The BELLY. Celſus uſes this word for the belly, relative to the inteſtinal diſcharge, as Hippocrates and others uſe the words κοιλια, or κοιλη, *cœlia*. See alſo ABDOMEN.

ALYCE. See ALYSMOS.

ALYPIA, ALYPIAS, ALYPUM, from α, neg. and λυπη, *pain*. The HERB TERRIBLE. It is alſo called WHITE TURBITH *Frutex terribilis, empetrum, thymelæa, & globularia fruticoſa*.

It is of no account in medicine; it is a ſpriggy plant, reddiſh, with ſlender ſprays, fine leaves, and thin ſoft flowers; the root, like that of beet, are ſlender, and full of an acrid juice; the ſeeds have a purgative quality: it is found in maritime places: it is alſo the name of a ſpecies of ſpurge.

ALYSMOS, ALYCE, from αλυω, *to be uneaſy*, or *anxious*. ANXIETAS, ANXIETY. Hippocrates uſes it to expreſs that uneaſineſs that is attendant on acute diſeaſes, which makes the patients toſs about, ſo that they cannot reſt long in the ſame poſture. Duretus diſtinguiſhes between the αλυσμος αιτιατος and the αλυσμος ταυτολογος. The firſt is cauſed by an oppreſſion of the vital powers, the latter by ſickneſs in the ſtomach; but of this *alyſmus* there are reckoned four ſorts. It is alſo called *Diaporema—Aporia*.

The 1ſt and 2d of which are without, the 3d and 4th with fever; and thus accounted for. 1ſt. By ſomething uneaſy in the ſtomach; hence an irregular contraction of the heart, a difficult paſſage of the blood through the lungs; and conſequently this *anxiety*. Uneaſineſs of the ſtomach by ſympathy, as from a ſtone in the kidneys, &c. produces this diſorder.

2d. By vapours or ſpaſms in the ſtomach, or other viſcera of the belly, as in the cholera morbus, hyſteria, &c.

3d. From a difficulty in the paſſage of the blood through the lungs, which may be from a ſpaſmodic ſtricture in the ſmaller veſſels, in which caſe the blood is thrown by gluts into the larger. In inflammatory fevers, this ſymptom is attended with a low puſſe, oppreſſion in the breaſt, and difficult breathing.

4th. It happens when a ſtricture of the vena porta prevents a free circulation of the blood in the lower belly. In this caſe there is great weight and oppreſſion of the hypochondria. This often ends in a polypus; and ſo, by conſequence, death, or a gangrene in the liver; whence a fatal putrid diarrhœa.

ALYSSUM. MADWORT, from α, neg. and λυσσα, that madneſs which the mad dog occaſions by his bite.

The flowers conſiſt of four leaves expanded in the form of a croſs; the fruit is ſhort and ſmooth, containing many round ſeeds.

Boerhaave takes notice of twenty ſpecies, all which are eſteemed diaphoretic.

The *alyſſum* of Galen is thought to be a ſpecies of marrubium.

The *alyſſum* of Pliny is ſuppoſed to be the *mollugo*.

ALYSSUM VERTICILLATUM. See MARRUBIUM VERTICILLATUM.

ALZEMAFOR. See CINNABARIS.

ALZILAT. The name of a WEIGHT of three grains.

ALZOFAR. BURNT COPPER. See Æs USTUM.

AMA, AME, or AMES. A ſort of ſmall CAKE. Aretæus uſes this word to compare the quantity of hellebore for a doſe.

AMALGAMA, from αμα, *ſimul*, and γαμειν, *nubere*, vel μαλαττειν, *mollire*. Its chemical character is A. A. A. In chemiſtry, it is a ſubſtance produced by mixing mercury with a metal.

All metals may be amalgamated with mercury, except iron; but gold amalgamates the moſt readily of any of them, ſilver next, lead and tin next; copper with difficulty, and iron ſcarce at all.

To amalgamate gold, is to reduce it to a paſte by uniting it with quickſilver: with this paſte, ſilver, and other metals are gilt.

AMALGAMA of GOLD.

Diſſolve pure gold in aqua regia until the liquor is ſaturated, dilute the ſolution with twelve times its quantity of pure water, put into it ſome poliſhed plates of copper, and the powder of gold will fall upon them; let it ſtand in a due degree of heat until the liquid is no longer turbid by adding copper; ſhake the plates, that all the gold may fall to the bottom, pour off the liquor, waſh the precipitated powder with water, dry it, and in a glaſs mortar reduce it to an *amalgama* with quickſilver. After the *amalgama* is once formed, this, and all the reſt, will receive more and more quickſilver, at the pleaſure of the operator.

By amalgamation we ſee that quickſilver is the true ſolvent fluid of metals. All the metals may be mixed together by being firſt made into an *amalgama*.

There are various methods of making *amalgamas*, which may be ſeen in any of the ſyſtematical chemical writings.

All *amalgamas* are white, from whatever metal prepared.

AMALGAMA of SILVER.

Precipitate pure ſilver from aqua fortis, and proceed as with copper.

AMALGAMA of LEAD.

Melt pure lead in an iron ladle, then put to it an equal quantity of pure quickſilver made hot, ſtir them with an iron rod, to mix them; let them cool, and then you take out a ſilver-coloured maſs which is hard; but by rubbing becomes ſofter; put this maſs into a glaſs mortar, and rub it, and add what quantity of quickſilver you pleaſe, and it will be united to it moſt intimately.

AMALGAMA of TIN.

Proceed as with lead.

AMALGAMA of COPPER.

Saturate the beſt aqua fortis with pure copper, then dilute the ſolution with twelve times its quantity of pure water; into the liquor, when it is hot, put plates of poliſhed iron, and the copper will precipitate as the iron diſſolves; proceed till no more copper falls, pour off the liquor, and waſh the precipitated powder with hot water until it is inſipid, dry the powder perfectly, put it in a glaſs mortar, and by rubbing, incorporate an equal quantity of quickſilver.

AMALGAMATIO. AMALGAMATION. Rulandus defines it, a calcination of metals by mercury. It is uſed, when ſpeaking of metals, ſometimes to ſoften; but its general ſenſe is confined to the mixing of metals with quickſilver.

AMALT. The abbreviation for *amalthæum*.

AMAMELIS. The *amamelis* of Hippocrates is generally allowed to be the ſame with the *epimelis* of Dioſcorides, which is the ſmall baſtard medlar.

There is another medlar in Italy, called the *epimelis*, alſo *ſetanium*. See MESPILUS.

AMANITA, *Fungi* et *Tubera*. The fungous productions called MUSHROOMS, TRUFFLES, &c.

Among the ancients theſe are not taken any notice of, except by Oribaſius, Paulus Ægineta, and N. Myrepſus.

Tournefort enumerates eighty-three ſpecies.

Nero called muſhrooms βρωμα θεων, *the victuals of the gods*, becauſe the emperor Claudius died by eating them, and was afterwards deified.

The different ſpecies are alſo called *boletus cervi, tuberca cervina*; CHAMPIGNONS by the French, MORILLE, MUSHROOM, &c.

Amanitæ now are underſtood of the fungus terræ, the only ſorts of which in uſe, are the MUSHROOM and the MORILLE.

The true muſhroom, called by the French champignon, is known by its external whiteneſs, and by being of a pale red within, when young, and of a deeper red when older; it is, at its firſt appearance, of a round figure, and not much larger than a ſmall nut; after they have a little unfolded their membranes, they appear red, full, and cloſe; on the top is a diſagreeable ſoftneſs, equal and white, the matter within is very white, with ſhort and thick ſtalks. They grow in meadows and commons that have a good ſoil: they ſhould be gathered for eating as ſoon after ſpringing up as poſſible, for they contain an oily and a ſaline part; and if they ſtay long before they are gathered, their ſalts become more active and hurtful; hence thoſe which grow on hot-beds, having more oil, are the beſt.

To various cauſes are attributed the diſagreeable effects, which ſome perſons experience after eating them, among which the following is noted by many as probable: in the ſtalks, the globular parts, and between the little membranes, may be obſerved, with a good glaſs, many ſmall worms ſhaped like adders, and with ſcarlet heads; ſome muſhrooms contain more, others fewer of theſe animalculæ; to avoid which, examine the muſhrooms well, and

waſh thoſe that are to be eaten in ſalt and water, throwing away thoſe that have many of theſe worms. As muſſels, and a variety of other ſubſtances produce ſimilar effects upon peculiar conſtitutions, it rather is to be attributed to that cauſe than any other. See MYTILLUS.

When offended by eating them, ſome of the following ſymptoms are produced; a qualmiſhneſs firſt affects the patient, which increaſes to a conſiderable degree of ſickneſs, ſwelling of the ſtomach or of the belly, reſtleſſneſs, giddineſs, a palpitation of the heart, heartburn, colic, hiccough, diarrhœa, accompanied with a teneſmus, flushing heat in the ſkin, with more or leſs of redneſs there, and ſwelling in the face, and ſometimes a ſenſation all over the body, which reſembles what is felt from a general ſwelling; the patient ſtares in an unuſual manner, all objects appear different from what they did before; a difficulty of breathing comes on, and the mind is ſtrangely confuſed: delirium, trembling, watching, fainting, cold ſweats, apoplexies, and convulſions, have been conſequences following the eating of this ſort of fungus.

For the relief of perſons under theſe circumſtances, ſpeedily as poſſible, give from gr. x. to ʒi. of white vitriol, diſſolved in a draught of warm water; and if the ſickneſs is ſtill urgent, repeat the ſame quantity two or three times, that the ſtomach may be well emptied; after which give a draught now and then, made of ſharp vinegar, a large ſpoonful in a glaſs of water, which ſweeten to the palate. The poiſon is not of the acid kind, ſo fat broths and oily medicines are uſeleſs. After evacuations upwards, procure a paſſage downwards; if the patient cannot ſwallow purgatives, let cathartic glyſters be given. After due evacuations upward and downward, beſides the vinegar as above, cyder, and perry, that is briſk and ſparkling, may be now and then given. Dr. Mead extols the ſaline mixture. If any paralytic ſymptoms appear, apply ſinapiſms or bliſters. Perhaps electricity may be happily uſed in ſuch like inſtances.

The MORILLE is a kind of ſpring muſhroom, as large as a nut, oblong, ſhrivelled, tender, porous, and cavernous, like the honeycomb, of a yellowiſh white colour, or inclining to red, and ſometimes blackiſh; they are not ſo frequently hurtful as the common muſhrooms. They are met with on moiſt graſſy ſoils, in woods, and on the roots of trees. Theſe fungi have originally been conſidered of a vegetable nature; but later experiments prove them to participate more of animal; becauſe, on analyzing them, they afford the ſame product as animal ſubſtances; for, diſtilled without addition, they afford no acid but a large proportion of volatile alkali; and expoſed, ſo as to undergo fermentation, become immediately putrid; hence are they conſidered more nutritious than any other of the vegetable claſs. See Dr. CULLEN's Materia Medica.

AMARA. BITTERS. Bitterneſs is a ſimple perception which cannot be defined, but muſt be referred to a matter of experience, in which mankind are commonly agreed. What is the nature of the ſubſtances poſſeſſed of it, in a chemical view, we cannot determine; therefore the nature of bitters cannot be explained. However, medicinally they are to be conſidered as aſtringent and tonic; and they are often united with an aromatic principle. Their general effects are, to conſtringe the fibres of the ſtomach and inteſtines, to warm the habit, and to promote the natural evacuations, particularly of ſweat and urine. In weakneſs of the ſtomach, loſs of appetite, indigeſtion, and the like diſorders, proceeding from the laxity of the fibres, or a coldneſs of the habit, medicines of this tribe do ſingular ſervice. On the contrary, when the fibres are too tenſe, or when the heat of the conſtitution exceeds what health requires, bitters very ſenſibly increaſe theſe diſorders; and if their uſe is perſiſted in, the conſequences may be fatal.

Strong *bitters* are the moſt diaphoretic; and agreeable ones, the moſt ſtomachic: as ſtomachics, *bitter* infuſions ſhould not be ſtrong, but light and agreeable. They are alſo diuretic, deobſtruent, reſolving viſceral obſtructions, and of great ſervice in intermittents, and preventing their return; they are conſidered alſo as emenagogues, and large doſes as laxative

Bitters are ſuppoſed to be powerful anthelmintics, but worms live longer in an infuſion of aloes than in roſe water; hence they do not ſeem likely to deſtroy them in our bodies.

As *bitters* neutralize acids, their uſe, when acidities prevail in the ſtomach, is obvious. In ſuch caſes they may be conſidered as indicated on a double account, viz. to correct the diſeaſe when preſent; and by their bracing and corroborating effects, to remove the cauſe of it. When given with ſuch intentions, they ſhould be infuſed in brandy, or in ſome of the ſtrongeſt wines.

It is generally ſaid, that *bitters* are adminiſtered as a ſubſtitute to the bile; but though with this direct view they are improperly employed, as being antiſeptic, retarders, and moderators of fermentation, and conſequently oppoſite in their effects to the bile; yet, in diſorders, where the bile is defective, they are adminiſtered with conſiderable advantage, as they check the general tendency to fourneſs in the firſt paſſages, which is ſo conſtantly an attendant on a defective bile; and alſo tend to allay the troubleſome ferment there, which is ſo injurious by producing flatulencies. *Bitters* loſe their bitterneſs by the addition of alkaline ſalts; and yield their virtues both to watery and ſpirituous menſtrua: they yield very little of their taſte by diſtillation, either to water or ſpirit; nay, the bitterneſs is ſo tenaciouſly detained, as to be improved in many extracts.

AMARA DULCIS. See SOLANUM LIGNOSUM.

AMARA, Tinct. } See GENTIANA.
AMARUM SIMPLEX, Infuſ. }

AMARACUS SAMPSUCHUS. See MAJORANA MAJORI FOLIO.

AMARANTHUS LUTÆUS, goldilocks. See ELICHRYSUM.

AMARELLA. See POLYGALA.

AMARUS DULCIS ORIENTALIS. See COSTUS.

——— SAL. See CATHARTICUS SAL.

AMATORIA FEBRIS. See CHLOROSIS. In Vogel's Noſology, *amatoria* is defined to be a fever of a few hours continuance, beginning with a great degree of coldneſs, and ariſing from expectation of marriage.

——— VENEFICIA. See PHILTRON.

AMATORIUS. Thus the muſculus *obliquus ſuperior*, or *trochlearis*, and the *obliquus inferior oculi*, are named by ſome; from *amo*, *I love*: ogling is performed by this muſcle.

AMATZQUITL, vel *uncda papyracea*.

The wood is of a light texture, the leaves reſemble thoſe of the lemon-tree, but are hairy, and more pointed; the fruits are large as Pontic nuts, divided into white grains of the ſame ſhape and nature with thoſe of a fig. It is met with in warm countries only. A decoction of the bark of its root is commended in fevers.

AMAUROSIS, from *αμαυρωσις*, *obſcure*. It is a DECAY or LOSS OF SIGHT, when no fault is obſerved in the eye, except that the pupil is ſomewhat enlarged and motionleſs. The Latins call this diſorder a *gutta ſerena*: *cataracta nigra*; *offuſcatio*; *cæcitas minor*, *mydriaſis*. The *tabes pupillæ*, or the waſting away of the pupil, may be conſidered as a ſpecies of this diſeaſe. Some call it *amblyopæia*; which ſee.

Mr. de St. Yves diſtinguiſhes this diſeaſe into the perfect and imperfect kinds. The perfect is when there is a total blindneſs; the imperfect is when there is at leaſt a power of diſtinguiſhing light from darkneſs. There is a periodical ſort, which comes on inſtantaneouſly, continues for ſome hours, and ſometimes days, and then diſappears; but it often returns, as in hyſterical and hypochondriacal people, &c. In another ſpecies, the pupil is always contracted, whether the unaffected eye is open or ſhut. In infants, attended with this complaint, the pupil is oft of its natural ſize, but no movement is obſerved there, however expoſed to the light. The nyctalops is ſuppoſed by ſome to be a ſpecies of this complaint.

The different cauſes are a palſy in the optic nerve, or the retina, proceeding from a ſlight apoplexy, &c. a tumor, or a plethora in the adjacent parts; a tranſlation of morbid matter from ſome other part of the optic nerve, to the retina; a venereal, or a rheumatic humour, may, by falling on the eye, be the cauſe. Suppreſſed periodical evacuations, vapours, hyſteric and other nervous ſymptoms, external injuries, a preternatural contraction, as well as too great a dilatation of the iris, or whatever intercepts the nervous influence in the eye, may produce this diſeaſe. In the middle of the optic nerve runs that branch of the carotid artery which enters into the eye; this artery being diſtended, may preſs the nerve, and render it paralytic: this ſeems to be the cauſe of the periodical ſpecies. Depletion enters too into the liſt of cauſes, whether it is natural or artificial; but of all the kinds, that from the genitals knits the eyes the moſt.

Dr. Cullen, in his Syn. Noſol. Method. ranks this genus

nus of diſeaſe in the claſs locales, and order dyſæſthesiæ: and enumerates the ſpecies from the following cauſes, viz. compreſſion, debility and its cauſes, ſpaſm, and the applications, or the ſwallowing of poiſons.

On diſſection after the death of patients who had been afflicted with this kind of blindneſs, in ſome the optic nerve was found too much extenuated, flaccid, and by far too ſmall; in others it was compreſſed by extravaſated blood, or by a tumor, or by a turgeſcency of the artery which paſſes through it.

The phlegmatic, cachectic, aged, thoſe with weak nerves, or that have been ſubjected to ſeverities or exceſſes, and perſons labouring under irregular or ſuppreſſed periodical diſcharges, are the principal ſubjects of this diſorder.

The ſigns that indicate the preſence of this diſorder are generally the blackneſs of the pupil of the eye, its ſize being larger or leſs than uſual, and its not contracting nor dilating when expoſed to a great degree of light. Its approach is generally attended with pain in the head; and as the pain decreaſes, this diſorder increaſes, though ſometimes an abſolute blindneſs comes on without any previous complaint. When it comes on without pain, and one eye only is affected, no defect is perceived until the ſound eye is cloſed, then the pupil of the diſeaſed eye dilates, though expoſed to a ſtrong light; and when the other eye is opened, it contracts to its natural ſize again. In infants, the pupil is ſometimes of a natural ſize, though it hath no movement, and thus they continue during many months, or perhaps a year or more, before they can ſee. When pregnancy, ſuppreſſed periodical diſcharges, nervous diſorders, or vapours are the cauſe, a head-ach, vertigo, drowſineſs, noiſe in the ears, &c. often uſher in this diſorder; but as in theſe caſes it is periodical, ſo it frequently returns, but ſoon ſpontaneouſly paſſes away.

The prognoſtics are generally unfavourable: if this blindneſs ſucceeds a fever, comes on in the aged or very infirm, a cure is not to be expected; if one eye fails, the other uſually ſoon follows; but if the caſe is ſlight, the habit of body robuſt, if it happens after the meaſles or the ſmall-pox, or in pubertine virgins, it is ſometimes cured.

Obſerve to diſtinguiſh this diſorder from the glaucoma or the cataract, and a vertigo.

In order to the cure, an attention to the cauſe will be the firſt ſtep to the direction of proper remedies.

According to the plethora attending, let the evacuations be directed; if it is ſanguine, make a free uſe of the lancet; if ſerous, purges, diuretics, and bliſters will be proper; and an emetic may be adminiſtered, if indicated by any diſorder in the ſtomach.

In phlegmatic habits, and when a rheumatiſm is the cauſe, alſo when a palſy in the retina is ſuſpected, valerian may be mixed with the bark, and taken in as large a doſe as will agree with the ſtomach, every night and morning, waſhing them down with a draught of the infuſion of ſage, roſemary, or other aromatic herbs, and forty drops of thincture of ſoot mixed in it.

Be particularly careful to keep the bowels lax, and to this end ſmall doſes of calomel, mixed with aloetic purgatives, are to be preferred.

If bliſters are applied to the nape of the neck, place them high thereon; but if a palſy in the retina be the ſuſpected cauſe, the propereſt place for a bliſter will be over the ſupra orbital hole, through which the nerves paſs and ſpread on the forehead.

The forehead may be rubbed twice in the day with the linimentum ammoniæ of the London Diſpenſatory, and a flannel rag moiſtened in the ſame may remain there in the interval; but a bliſter is preferable.

Bliſters and iſſues ſhould be kept open as long as poſſible. Setons on the back part of the neck are uſeful.

If periodical evacuations are ſuppreſſed, endeavour to promote their return; and, in caſe of failure, ſubſtitute ſome proper artificial diſcharge.

In caſe of any acrid humour being tranſlated from the ſurface of the body, endeavour to eject it by gentle aperitives, and proper ſudorifics.

Externally: let the ſteams of hot ſpirit of wine or of coffee, be paſſed two or three times a day through a funnel to the eye; this, with a cooling light diet, and repeated purging, hath been followed by a complete cure.

Sternutatories are ſometimes of ſingular ſervice; two or three grains of the reſin of guaiacum ſnuffed up the noſe, diſcharges a large quantity of ſerum; and to the ſame purpoſe any of the volatile alcaline ſpirits may be uſed, being firſt diluted properly.

Heiſter aſſerts the ſucceſs of aromatics, carminatives, and attenuants, particularly of mercurials in ſmall doſes. Pitcairn declares the ſame. Coward ſays, that volatiles, chalybeats, mercurials, cephalics, and nervous medicines, are the proper ones. Riverius informs us, that cupping, with ſcarification on the back part of the head, hath been ſpeedily followed with ſucceſs.

If all the above fail, a ſalivation has ſucceeded, and ſo may be tried; but ſmall doſes of calomel, or rather the following ſolution, may be given and continued two, three, or more months. It anſwers the ends of a ſalivation, and is both more agreeable and ſafe.

AMAZONUM PASTILLUS. The AMAZONS TROCH. Theſe troches were formerly prepared of the ſeeds of ſmallage and aniſe, the tops of wormwood, of myrrh, pepper, &c.

AMBA. See MANGA.

AMBAIBA. It is a tall tree growing in Braſil, with but few branches at the top; the trunk is hollow its whole length, except that its cavity is divided by a tranſverſe membrane at every two or three inches diſtance, in the middle of which is a ſmall hole. The root is very hard, even ſo as by a gentle friction to afford fire enough to burn cotton, and ſuch like matter. The buds afford a juice that is cooling, if mixed with gruel. This the Indians call tipioca. See Raii Hiſt. Plant.

AMBALAM, an Indian tree, alſo called *manga*. It ſo reſembles the cat-aboiam, that few care to deſcribe their difference. The root, uſed as a peiſary, promotes the menſes; the bark and the juices are effectual againſt dyſenteries; and a decoction of the wood is commended againſt a gonorrhœa. See Raii Hiſt. Plant.

AMBAR. See AMBRA.

AMBARUM. AMBERGISE, ſee AMBRA CINERACEA.

AMBARVALIS, FLOS, from the Latin word *ambire*. See POLYGALA.

AMBE, } ἀμβὴ, a LIP, EDGE, or BORDER.
AMBI, }

An inſtrument uſed in diſlocations of the humerus. Hippocrates has taken notice of it in his treatiſe de Articul. ſect. vi. and it is called Hippocrates's *ambe*. Galen explains the word *ambe*, by ἀρχὴν τινὰ προεξοχὴς, *an eminence like a border*; and ſays, that the whole machine takes that name, becauſe its extremity runs out with an edge like the lip or brim of a pot towards the interior cavity, which, as well as the edge or border of any thing on the top or extremity, are ſignified by the word *ambe*.

When the head of the humerus reſts in the axilla, this inſtrument is ſometimes of ſervice, but in no other caſe; and even here it is rarely uſed, for when gentle methods fail, violence ſeldom ſucceeds.

Heiſter gives an account of the *ambe* in his Surgery; and ſo does Petit in his Diſorders of the Bones.

Ambe is alſo a name of the tree called *manga*.

AMBEGU. See MYROBALANI EMBLICI.

AMBI. See AMBE.

AMBIA MONARD. A yellow liquid bitumen, ſmelling like tacamahaca. It flows from a fountain near the Indian ſea; its medicinal properties are the ſame as thoſe of tacamahaca, or of caranna.

AMBIDEXTER. AMPHIDEXIOS. A man equally active with both hands, ready at all points.

AMBLOSIS, from ἀμβλόω, *to cauſe abortion*. See ABORTUS.

AMBLOTICA. Medicines which occaſion abortion.

AMBLYOGMOS, AMBLYOSMOS, from ἀμβλὺς, *dull*: DIMNESS OF SIGHT.

Hippocrates often uſes this word. He ſays this dimneſs of ſight, and corruſcations of light ſeeming to dart before the eyes, are among the ſymptoms of an approaching hæmorrhage in continual fevers and genuine tertians. Sometimes he uſes the word amblyoſmos to expreſs the ſame thing. Galen explains this word by abortus, but he miſtakes it.

AMBLYOPIA, from ἀμβλὺς, *dull*, and ὤψ *the eye*.

Viſus

Visus debilis Aetii: Visûs Hebetudo. — Boerhaave. This is a debility of sight, absolute or relative, with ocular inopacity. The principal symptom of which disease is an obscurity of sight without any apparent opacity of the cornea, or interior part of the eye. See Amaurosis.

Hippocrates means by this word, in his Aph. xxxi. sect. 3. the dimness of sight to which old people are subject.

Paulus and Actuarius use it to express a *gutta serena*.

Actuarius says, that there is a manifest, but not a visible cause of this dulness of sight, for neither the coats, nor the humours of the eye, are disordered; and that a defect of the nervous influence is the probable cause. See his work, De Meth. Med. lib. ii. cap. 7.

The *amblyopia* is said by some others to be fourfold: see, 1st, *Myopia*, or *short-sightedness*: 2dly, *Presbytæ*, or *seeing only at a great distance*: 3dly, *Nyctalopia*, or *seeing only in the night*, which Celsus names *Imbecillitas Oculorum*. 4thly, *Amaurosis, dulness of sight*. Dr. Cullen places this word in his Nosology as synonymous with the word Dysopia, which is his generic term for those disorders in and of the eye, called myopia, &c. The *amblyopia* of some writers, is the amaurosis of Dr. Cullen; for the different species of which see Dysopia. See Wallis's Sauvages's Nosology of the Eyes, p. 151. &c.

AMBLYOPIA Hydrophthalmica, i. e. Caligo Humorum. See Caligo.

AMBLYOSMOS. See Amblyogmos.

AMBO. See Manga.

AMBON. The edge of the sockets in which the heads of the large bones are lodged.

AMBRA, ABRUM. See Succinum.

AMBRA ARABIBUS. See Ambra cineracea.

AMBRA-CINERACEA, } also named *succinum-gri-*
——GRISEA, } *seum*, *succinum-cinereum*, *ambarum*, *ambra arabibus*, and in English ambergrise.

Much of it is met with in the Indian ocean; pieces of a considerable weight have been found in the northern seas. Sometimes it is seen floating on the surface of the seas, at others adhering to rocks, and not unfrequently found in the stomachs of fishes, and now and then it is thrown on the shore; but it is found most plentifully about the island of Madagascar and the Molucca islands; but the most of the ambergrise which is brought to England comes from the Bahama Islands, from Providence &c. where it is found on the coast. According to an account in the Philosophical Transactions, No. 385, and 387, this drug is only the produce of the male spermaceti whale; it is there said to consist of balls from three to twelve inches diameter, lying loose in a large oval bag three or four feet deep or wide, nearly in the form of an ox's bladder, with a pipe running into and through the penis, four or five feet below the navel, and three or four feet above the anus. This bag is almost full of a deep orange-coloured liquor, not quite so thick as oil, of the same scent as the *ambergrise* which swims in it. These balls of *ambergrise* seem to be in lamina like onions, and in the fluid, pieces of the laminæ are found. There are two, three, or four balls in a bag. Where one whale hath these balls, three or four hath only the liquor in the bag. Some fishermen observe that these balls are only in the old and well-grown whales. The rarity of catching a female whale renders it difficult to say that they do not produce any *ambergrise*. It may be observed that, as there is only one bag, it is probably the urinary bladder, and the balls preternatural concretions formed there, as the bezoars are in their respective situations. Neumann thinks it is a bitumen; see his Chem. Works; and of the same opinion are many others; but a paper hath very lately been presented to the Royal Society, by Dr. Swediar, which asserts its animal production, and declares it to be the indurated fæces of the spermaceti whales. It is remarkable that Messue saith, it is the spawn of the whale-fish.

Pure *ambergrise* is so light that it swims in rectified spirit of wine; it grows soft in a very gentle heat; it is opake, rugged, of a greyish ash-colour, mingled with yellow and blackish veins, and speckled with greenish spots; it breaks like wax; it hath no particular taste, though softish, oily, and somewhat aromatic; it affords but little to the smell, except it is heated, and then it is very fragrant; set on fire, its odour is like that of burning amber; with a small degree of heat it melts into an oil, and in a great heat it is volatile.

The genuine is speckled with green; the more it is variegated, the worse; the best is of an ash-colour, the worst sorts approach to a deep black.

It is soluble in boiling spirit of wine: from which, if the saturated solution be set in a very cold place, a part of the *ambergrise* concretes into a whitish unctuous substance. Distilled it yields an aqueous phlegm, a brown acidulous spirit, a deep-coloured oil, a thicker balsam, and sometimes a little concrete salt. The spirit, oil, balsam and salt, are similar to those obtained from amber, except that the oil is more agreeable to the smell.

Rectified spirit of wine takes up near $\frac{1}{10}$th of its weight of *ambergrise*. According to Neumann, if the spirit is impregnated with a little essential oil, the *ambergrise* will dissolve more readily in it. A deeper coloured tincture is made with alcohol, but not a stronger. Dulcified acids and alkaline spirits have no effect upon it; water and expressed oils have as little.

It is one of the most agreeable perfumes, it heightens the natural odour of other bodies; but the great secret to this end is, to add it so sparingly, that while it improves the smell of that to which it is added, its own may not be discovered. From two grains to a scruple it is a high cordial and powerful antispasmodic; though the common dose is from two to four grains, which may be given in an egg lightly poached. Riverius says that *ambergrise* is a specific against the fames canina.

A counterfeit, as well as adulterated sort, is too often to be met with; the first generally consists of musk, civet, storax, labdanum, aloes wood, mixed together; the latter of a large quantity of bullock's blood duly flavoured with musk and civet.

Essent. vel Tinct. Ambragris.

℞ *Ambrageæ* opt. ℥ ij. spt. vini R. ʒ ij. m.

Vel,

℞ *Ambrageæ* opt ʒ ij. mosch. opt. gr. iij. spt. vin. R. ʒ xij. m.

Essent. vel Tinct. Ambragriseæ Comp. vel Regia.

℞ *Ambrageæ* opt. ℥ ij. mosch. ℥ i. zibeth. gr. x. ol. cinnam. gut. vi. ol. Rhodii gut. iv. spt. vin. R. (cum flor. rosar. & flor. aurant. impregn.) ʒ iv. fs. m.

A few drops of any of these tinctures, strongly flavours a large quantity of inodorous matter.

The best way to prepare these tinctures is to make the spirit simmer with the *ambergrise* until it is duly dissolved, after which the other ingredients may be added; the vapours exhaled during the simmering, possess hardly any of the flavour of the *ambergrise*, though water is so strongly scented with it by distillation.

The tincture is best for medicinal purposes when made with *ambergrise* alone. Hoffman observes, that it then does not affect the patient with that vapourishness usually complained of when musk, &c. are in the composition. If the tincture is of a due strength, and is dropped into a little water, a very milky appearance immediately follows. See Neumann's Chem. Works, Lewis's Mat. Medica.

AMBRAM. See Succinum.

AMBRETTE. The French name of *abelmoschus*, which see.

AMBROSIA. The name of a sweet shrub, anciently made use of for making of garlands.

It is a name of the Botrys, which see; this is the modern *ambrosia*. The ancients seem to have given this name to various plants, as the lily, the greater houseleek, &c. Gerard.

AMBULATIO, walking. Every species of exercise should be adapted to the strength of the person using it, and the purposes intended to be promoted by it. Walking therefore in some cases is preferable to any other species of exercise, particularly in gouty and rheumatic habits, in order to prevent the return of these complaints, and to recover the use of the lower extremities after a fit of either of these maladies. Celsus says, that *walking*, reading moderately loud, fencing, and playing with the ball, all strengthen a weak stomach. *Walking*, he says, is best if it is up and down hill, except in cases of great weakness: because ascending and descending exercises the whole body more than the plain does. If the viscera are weak, riding is to be preferred to *walking*. *Walking* preserves and riding recovers health the best.

AMBULATIVA. See Herpes, Spec. 3 and 4.

AMBULO. The name of a disease, called also *furiosus*, *flatulentus*, and also *fœtus furiosus*. It is a distention or inflation attended with pain, and variously periodical.

riodical. It is caufed by vapours fhooting through various parts of the body. See D. D. Joh. Michael. Prax. Clin. Special. Caf. 19.

AMBUSTA. BURNS, or SCALDS, called alfo *cauſis*, *Ambuſtio*, *ambuſtura*. Dr. Cullen places this cafe as a variety of the phlogofis erythema.

Burns and fcalds differ not as to any conſideration reſpecting the cure. A *burn* is from ſolid ſubſtances, but conſidered in the effect on the injured body: a ſcald is a *burn* from any hot fluid, or ſolid when in a fluid ſtate.

Their danger is according to the degree, the part injured, the peculiarity of the conſtitution, and conſequent ſymptoms. And wounds from *burns* are more liable to form a cicatrix than when they are produced by other cauſes.

Burns may be ranked into four kinds.

1ſt. When a rednefs in the part is attended with heat and pain.

2dly. When after the *burn* there ariſe puſtules or blifters with pain.

3dly. When the ſkin and ſubjacent fat are *burnt* to a cruſt.

4thly. When the *burning* goes to the bone.

The two firſt reſemble an inflammation, and are to be conſidered as ſuch, from an external cauſe; the third a gangrene, and the fourth a ſphacelus.

In general, *burns* and ſcalds of any conſequence require bleeding and repeated gentle purging, to prevent or to reduce inflammation. If lightning was the cauſe, the internal uſe of cordials are required. And if the pain is great, though a fever attends, anodynes internally will be neceſſary.

In order to the Cure of the Firſt Kind.

Medicines that neither heat nor cool in a great degree are to be preferred. Cold water may be uſed in the ſlighter cafes, by means of linen rags dipped into it, and the application repeated as often as they become either dry or warm. In the ſame manner brandy and rectified ſpirit of wine may be applied, repeating the dreſſings until the pain abates, and then, in their ſtead, the camphorated ſpirit of wine is to be preferred.

Vinous ſpirits, if applied before the blifters ariſe, generally prevent them, and always moderate the inflammation; as do alſo any volatile ſpirits; but, if the injury is on a membranous or tendinous part, it is beſt to mix oil with the ſpirit, otherwiſe it will too much criſp the part, and may occaſion a contraction there.

To the ſame purpoſe as the above, and in want of them, any of the following may be uſed:—The white of eggs beat thin; vinegar, in a quart of which one handful of common ſalt is diſſolved; the pickle from olives; the brine from cabbage; oil of turpentine; any cooling oil or liniment.

The Second kind.

Emollients are here required to ſoften the corrugated ſkin and contracted veſſels, by which the circulation will be ſet free: if the *burn* is ſuperficial, only raiſing the cuticle in blifters, the frequent uſe of olive oil or linſeed oil, applied with a feather twice a day, and then a plaſter of the white cerate, or the white camphorated ointment, will ſuffice; if the blifters are conſiderable, ſnip them immediately, to diſcharge the humour and prevent eroſion; but do not ſeparate the cuticle; then dreſs with the cerat. ſperm. ceti, vel ung. alb. camph. the inflamed circumference may be rubbed with any cooling oil.

If an eſchar is threatened, or the ſore requires digeſting, dreſs with either of the following twice a day.

℞ Ung. reſinæ flavæ, & ung. ſpermatis ceti, ää p. æq.

Or,

℞ Ung. reſinæ flavæ, & cerat. lap. calam, ää p. æq.

If this kind of *burn* or ſcald is extenſive, bleeding and purging will be required; if infants are the ſubjects, their bowels muſt be kept conſtantly lax; a cooling liquid diet, ſuch as is uſed in inflammations: if there is any tendency to fever, the following is preferred by many practitioners to all other means:

Acidi muriatici cujus detur gt. x. vel xv. in hauſt. aq. font 2da vel quarta quaq. hora.

The Third Kind.

If a cruſt is formed, the cure is effected by emollients and ſuppurants, as in the caſe of gun-ſhot wounds; ſee SCLOPETOPLAGA.

If the accident hath happened in the face, avoid whatever can tend to increaſe the cicatrix; emollients folded in linen cloths, and applied thereon, are the beſt applications; an emollient fomentation, in which is about two ounces of the camphorated ſpirit to a pint, may be uſed at the renewal of the other dreſſings, during the firſt three or four days, or until the cruſt is ſeparated; after which the procedure will be as in any common wound.

If the cruſt remains firm above three days, make inciſions through it, to diſcharge the matter underneath. And to prevent a cicatrix, as the ſkin forms, let it be often expoſed to the ſteam of hot water, and apply a cerate of wax and the oil of eggs.

The Fourth Kind.

Where all is deſtroyed, even to the bone, Heiſter ſays, that the only method is amputation; but the attentive ſurgeon will ſometimes conſider this is only a worſe degree of the third kind, and proceeding according thereto, the operation may often be avoided, and the limb reſtored.

A violent head-ach in one perſon, and pain in the limbs of another perſon, were removed by the parts affected being accidentally burnt, and that only in the firſt kind of *burns*. Homberg thinks that burning with moxa, with cauteries, &c. cure by quickening the motion of the humours and thinning them, and by deſtroying the ends of the veſſels by which the humours flow leſs that way. After all, *burns* can only be judiciouſly treated, by conſidering them as high inflammations, of the phlegmonoid or erythematous kind, which of the two the general habit will determine, and the treatment muſt accord, by evacuants in the firſt, and by bark in the ſecond; attending in each to the material benefit ariſing from removing pain by proper opiates, without which but little advantage will be gained, whatever other means are uſed. For BURNS, or SCALDS, the following preparations are eſteemed as highly uſeful. LINIMENTUM OLEOSUM, *oily liniment*. ℞ Olei olivarum ℥ i. ſs. aquæ calcis ℥iij. This is more particularly adapted to burns, eſpecially where the ſkin is ſcorched, or deſtroyed, from its ſoftening qualities: repeated affuſion of, or continual immerſion in, cold water more conveniently relieves ſcalds. CATAPLASMA RADICIS SOLANI TUBEROSI—*potatoe cataplaſm*—pound a proper quantity of potatoes to the conſiſtence of a poultice, and apply it cold; this reſiſts ſtrongly the progreſs of inflammation.——LOTIO LITHARGYRI ACETATI CAMPHORATI—*camphorated lotion of acetated litharge*. ℞ ſps. camphorati ʒ ij. aq. lithargyri acetati ʒ j. gradatim commiſceantur, deinde modo eodem adjiciantur aq. diſtillatæ lb j. In topical inflammations, having a tendency to become eryſipelatous, this poſſeſſes much efficacy.——LOTIO SPIRITUOSA—*ſpirituous lotion*. ℞ ſpt. vini rectificat. ℥ iv. aq. calcis, lb ſs. This acts as a ſedative, and alleviates the pain of parts inflamed.

Bell's Surgery, vol. V. 357. Pearſon's Elements of Surgery, part I. 159. White's Surgery, 24.

AMBUSTIO, AMBUSTION, from *amburo*, *burning*, or *ſcalding*. See AMBUSTA and CALCINATIO.

AMBUTUA. See PAREIRA BRAVA.

AMENDANUS. See ALNUS.

AMELLA. See ACMELLA.

AMELPODI. See BELLUTTA TSJAMPACAM.

AMENE. See GEMMÆ SAL.

AMENORRHOEA, from α, neg. μηνιαῖος, *monthly*, and ῥέω, *flux*. A DEFECT OR WANT OF THE MENSES, or MONTHLY FLUX. See MENSES DEFICIENTES.

AMENENOS, from α, negative, and μένος, *ſtrength*. Weak, feeble. In this ſenſe Hippocrates often uſes this word.

AMENTACEÆ. The name of the ſixteenth order of LINNÆUS's fragments of a natural method in *Philoſophia Botanica*, and of the fiftieth at the end of *Genera Plantarum*; alſo, of a Claſs in Tournefort's, Boerhaave's, and Royen's Syſtems.

AMENTACEI FLORES. AMENTACEOUS FLOWERS. In BOTANY, they are ſuch as have an aggregate of ſummits hanging down in form of a rope or of a cat's tail, as the male flowers of the mulberry, ſwallow wort, hazel, birch, &c. Theſe are alſo called IULI, *catulus*; *nucamenta*, and in Engliſh, KATKINS.

AMENTIA. MADNESS, IDIOTIC INSANITY, Linn. STUPIDITY, from α, privat. and *mens*, *the mind*; alſo *auoia*; *anæa*, *fatuitas*; *oblivio*, WITHOUT UNDERSTANDING, FOOLISHNESS, IDIOTISM, &c. Some uſe *amneſia* as a ſynonimy. Dr. Cullen defines it to be the weakneſs of the mind in judging, from either not perceiving or not remembering the relations of things. He ranks this genus of diſeaſes in the claſs neuroſis, and the order veſaniæ.

His ſpecies are, 1. *Amentia* congenita, NATURAL STUPIDITY, i. e. from the birth. 2. *Amentia* ſenelis, DOTAGE, or CHILDISHNESS, from the infirmities of age. 3. *Amentia* acquiſita, when from accidental injuries a perſon becomes ſtupid or fooliſh. The laſt of theſe ſeem only to come within the reach of the medical art, to afford any relief; and this ſpecies ariſes from the powers of the conſtitution being greatly debilitated by preceding illneſs, ſuch as nervous and putrid fevers, long continued intermittents, and other complaints where the nervous ſyſtem has been long and ſeverely affected: chearful company, gentle exercile in a pure clear air; generous mode of living, properly regulated, and cordial medicines, if neceſſary, bid the faireſt for performing a cure. For the whole idea belonging to the cure of this complaint, is to invigorate the ſyſtem by proper means, already reduced to too great a ſtate of debility, whence the thinking faculty participates too much of that weakneſs. For other ſpecies of infanity, ſee MANIA, MOROSIS, and MELANCHOLIA.

AMENTUM. SCISSILE ALUM. See ALUMEN PLUMOSUM. In BOTANY, the calyx, ſo called, when proceeding from a common receptacle, it is alternately mixed with the flowers, ſomewhat like the chaff in an ear of corn. See AMENTACEI FLORES.

AMERI. See INDICUM.

AMERICANUM, BALS. See PERUV. BALSAMUM.

——————— TUBEROSUM. See BATTATAS CANADENSIS.

AMETHODICA. An irregular proceeding, from *α*, *not*, and *μεθοδος*, *method*.

AMETHYSTA PHARMACA, from *α*, neg. and *μεθυ*, *wine*. Medicines which either prevent or remove inebriating effects of wine.

AMIANTHUS, } Alſo called *aſbeſtus*, *aſbeſtinum*,
AMIANTUS. } *linum foſſile*, *linum aboeſtinum*, *linum vivum*, *linum Indicum*, *linum Creticum*, *linum carpaſium*, *linum cariſtum*, *linum Cypricum*, *alumen officinarum*, *conſoides*, *corſoides*, *Sparta poſia*, *ſalamandria*, EARTH FLAX and SALAMANDER'S WOOL.

It is a mineral ſubſtance, found in lumps of different ſizes, of a greyiſh colour, with a ſilvery gloſs, and compoſed of ſmall filaments. It is met with in many of the iſlands of the Mediterranean ſea; in Italy there is abundance, and it is worked there either into linen or paper, both which reſiſt the moſt violent flame. It is dug up alſo in the iſland of Angleſey, and in Oxfordſhire.

Some, with very great probability, ſuppoſe it to be iron calcined in its ore, by ſubterraneous fire.

It can be ſpun into thread, then wove into cloth, and afterwards made into paper. The cloth thus made is not cleaned by waſhing, but burning; and the paper writ upon, becomes clean again by the ſame proceſs.

To work it into thread, &c. it is firſt ſteeped in water to diſſolve its earthy parts, which makes its threads ſeparate, then the flaxy part is dried in a ſieve, afterwards they card it like wool, then with the fingers wetted with oil, it is twiſted as it is drawn round upon a reel, which is firſt wound over with fine thread; but mixing the aſbeſtus with flax, on a diſtaff, and ſpinning them together, works the aſbeſtus into a thread, which is afterwards ſeparated in the fire, and thus the aſbeſtus thread is left in a proper ſtate, and in this way, carding is not needful. The cloth, when made, is beſt kept by being moiſt with oil.

AMICULUM. A covering for the pubes when the boys exerciſed in the gymnaſium. It is alſo uſed in the ſame ſenſe as the word amnios.

AMIDUM. See AMYLEON.

AMINÆA, gum. See ANIME.

AMINÆUM VINUM. WINE of AMINIA, called afterwards *Falernum*, in Italy. It is a ſtrong kind of wine.——ACETUM. Vinegar of Aminæan wine, or any very ſtrong wine vinegar.

AMISADU. See AMMONIACUS SAL.

AMMA. See BRACHERIUM.

AMMAN. CHAR. PLANT. The abbreviation for *ammani*, character plantarum.

AMMI, or AMMIUM VERUM, called alſo AMMI CRETICUM, *ammi* parvum foliis fœniculi, *ammi* ſemine tenuiſſimo & odoratiſſimo, *cuminum Æthiopicum*, *fœniculum annuum origani odore*, ROYAL CUMMIN, and TRUE BISHOP'S WEED.

The ſeeds of theſe plants only are uſed in medicine: The common ſort is a native in the ſouthern parts of Europe; it is plentifully propagated by ſeeds, which fall in autumn, and ſpring up in the following ſummer; the ſeeds of this ſpecies are larger, paler, and very different in flavour, as well as in medical power, from the true. The true ſpecies is a native of Egypt, the ſeeds are of a reddiſh brown colour, ſmall, and flat on one ſide, convex and furrowed on the other. We very rarely meet with them in our ſhops, the ſeeds of the amomum, and of parſley, being too often ſold for them.

The ſeeds of the true biſhop weed are an agreeable carminative, of a warm pungent taſte, having a reſemblance of origanum in their ſmell. By diſtillation with water, they yield much oil of a yellowiſh colour, and containing their whole flavour; ſpirit of wine alſo carries off their odour.

AMMION. See CINNABARIS.

AMMIUM. See AMMI VERUM.

AMMOCHOSIA. A remedy for drying the body, by covering it with hot ſand, or ſalt, which is preferable.

AMMONIA MURIATA. See AMMONIACUS SAL.

AMMONIA PRÆPARATA, *olim* SAL VOLATILIS SALIS AMMONIACI.——AMMONIÆ ACETATÆ AQUA, *olim* SPIRITUS MYNDERERI.——AQUA *olim* SPS. SALIS AMMONIACI.——AQUA PURA, *olim* SPS. VOLATILIS CAUSTICUS.——SPS. *olim* SPIR. SALIS AMMON. DULCIS.——SPS. COMPOSITUS, *olim* SPIR. VOL. AMM. all which ſee under ALCALI. There are ſeveral preparations wherein *ammonia* is conſidered the principal ingredient, and upon which, in many caſes, practitioners fix their chief dependence; if not totally, ſtill in a great meaſure.——LINIMENTUM AMMONIÆ —*volatile liniment*. ℞ Olei olivar. ℥ i. ſs. aq. ammon. ℥ ſs. m.—if required ſtronger, 1 oz. of ammonia is added to 2 oz. of the oil. This is an excellent topical application in rheumatic affections, deep ſeated inflammations, and ſore throats.——LINIMENTUM AMMONIA OPIATUM—*opiated liniment of ammoniæ*. ℞ Aquæ ammon. puræ ℥ ij. opii purificati. ℥ i. ſs. ſps. vinis tenuioris lb i.—digerantur ſimul donec opium omnino ſolvatur.—In rigid and painful ſwellings of the joints, this is conſidered as poſſeſſed of much efficacy.——LINIMENTUM PETROLEI BARBADENSIS AMMONIATUM —*ammoniated liniment of Barbadoes tar*. ℞ petrolei Barbadenſis ℥ i. ſs. aquæ ammoniæ puræ ℥ ſs. m. In diſeaſes of the hip, and other joints, this remedy is employed, and been ſtrongly recommended by Dr. Kirkland.——LINIMENTUM CAMPHORÆ AMMONIATUM—*ammoniated liniment of camphor*. ℞. Aq. ammon. puræ ℥ iij. olei olivarum ℥ j. camphoræ ʒ ij. In oleo ſolvatur camphora, deinde adjiciatur gradatim aqua ammonia pura. This is employed by ſome practitioners in deep ſeated inflammations, or to parts that ſuppurate imperfectly, in order to quicken their action.——LOTIO AMMONIÆ ACETATÆ—*lotion of acetated ammonia*.—℞ Aquæ ammoniæ acetatæ, ſpt. vini rectificati, aq. diſtillat. ãã p. æ. m. This is uſed in external inflammations, and applied in the ſame cures as the lotio ammoniæ muriatæ. See AMMONIACUS SAL.

AMMONIACI EMPLASTRUM *cum* HYDRARGYRO *olim*.——EX AMMONIACO *cum* MERCURIO. P. L. 1788. ℞ ammoniaci colat. p. lb j. hydrargyri purificati p. ℥ iij. olei ſulphurati p. ʒ j. vel quod ſatiſht. Rub the quickſilver with the ſulphurated oil, until the globules diſappear, then add gradually the ammoniacum in a liquid ſtate, and mix. Five ounces of this plaſter contains an ounce of quickſilver. This plaſter is conſidered as a diſcutient, and applied to indurated glandular tumors, in order to diſperſe them.

AMMONIACUM. Gum. Called alſo *armoniacum*, but improperly; *hammoniaci lacryma*, *aſſac*; *azac*; and in Engliſh GUM AMMONIAC.

Ammon took its name from *αμμος*, *the ſands*, but the gum and the *ſal ammoniac*, from the country called *Ammonia*.

It is a concrete gummi-reſinous juice, produced in the Eaſt Indies, whence it is brought in maſſes, conſiſting of little lumps, which inwardly are very white, but outwardly yellowiſh or browniſh; its whiteſt parts become yellow on being expoſed to the air. From what plant it is obtained, we know not certainly; but according to DIOSCORIDES, it is from a ſhrub called AGASYLLIS. It has been ſuppoſed to be an exudation from a ſpecies of ferula; another ſpecies of which produceth aſſafœtida. It hath a ſtrong ſmell, ſomewhat like that of galbanum, but not ſo ungrateful, a naſeous ſweetiſh taſte mixed with a bitterneſs.

Such pieces as are white, clear, free from foreign matter, dry, and large, ſhould be preferred for internal uſe.

Thrown on live coals it burns away in flames: it is ſoluble

ſoluble both in water and vinegar into a kind of milk; but the reſinous part, which is nearly one half of the whole, ſubſides on ſtanding: ſpirit of wine diſſolves near one half of it, taking up all its active parts.

Dr. Dedier ſays, that lb i. of this gum, afforded by diſtillation of phlegm ʒ vi. volatile ſpirit ʒ ij. a volatile fœtid oil ʒ vi. and the remainder was a caput mortuum. But other ſkilful chemiſts have failed to obtain any oil from it by this proceſs. Water is very ſlightly impregnated with it by diſtillation.

This drug is an excellent deobſtruent in hyſterics, when cauſed by retarded menſes, and in other abdominal obſtructions: diſſolved in the acet. ſcillæ it is a powerful expectorant, for vinegar greatly exalts its virtue in this particular: in old ſtanding colicky ſymptoms, proceeding from viſcid matter in the inteſtines, it produces very happy effects: it is on a par with the aſſa fœtida for virtues of the ſame kind as the aſſa fœtida poſſeſſeth, though it is leſs nauſeous and leſs antiſpaſmodic; but its principal virtues are attributed to its expectorant powers in aſthmas, and difficult breathing: it gently moves the belly, and externally applied, it has been recommended for reſolving indurated tumors, though the theory of this ſeems to many very doubtful. See AMMONIACI EMPLASTRUM cum HYDRARGYRO.

The fœtid gums agree in their effects with oily aromatics, but have alſo acrid poignant ſalts conjoined, and ſo more forcibly raiſe, ſtimulate, and promote ſecretions; but the *gum ammoniac* is peculiar, as its oil, which is but little, is not aromatic, but inodorous, and it is not ſo heating and rarefying as the others are; but it hath the ſame acrid ſalts; therefore, it may be uſed in fevers with turgid blood, and in robuſt habits, having ſo excellent a ſtimulus, without the power of rarefaction. Of this ſort, among plants, are the viſcus and dracontium, among roots the arum and ſcilla, and moſt of the vegetable emetics.

The doſe may be from gr. x. to ʒ ß. three times a day.

Given in pills is the moſt agreeable form.

It is adulterated with common roſin.

The method of purifying it, is by ſoftening it in a bladder, which is immerſed in boiling water; and while fluid, ſtrained; but for inward uſe, the beſt is the largeſt and moſt unpurified pieces.

Diſſolved in water it is called LAC AMMON. *Ammoniacal milk.*

℞ *Gum ammon.* opt. ʒ ij. aq. diſtillatæ ℔ ß m. P. L. 1788. Thus adminiſtered, it is more active than in pills; the doſe may be two large ſpoonfuls three or four times in twenty-four hours. It varies only from the old formula, by having the diſtilled water ſubſtituted for that of penny royal.

PIL. AMMON. MAGISTR.

℞ *Gum ammon.* ʒ ij. aloes Suc. ʒ ß. myrrh. maſtic. & Benz. āā. ʒ ß croc. Anglic. ʒ ij. acet. ſcillit. q. f. f. mas.

AMMONIACUS, Sal, *ammonia muriata*, called alſo *cyreniacus ſal*, AMMONIAC SALT and ARMONIAC; but improperly; likewiſe *alemzadar*, *alemzadad*, *adarige*, *aquila*, *alſol*, *alacab*, *alazalet*, *alcob*, *alfatide*, *aliocab*, *aliſteles*, *almiſadar*, *almeſadir*, *almizadat*, *almizadir*, *amiſadu*, *anotaſier*, *haſacium*, *muſadi*.

Many writers ſpeak of the natural and artificial.

The natural ſort, ſpoken of by the ancients, according to Dioſcorides, is only the ſal gem, and is reckoned by them among the alimentary ſalts; but many others ſay that it was made from the urine of camels, and was depoſited in the ſands near the temple of Jupiter Ammon. We have no evidence of native *ſal ammoniac* of this ſort being found. Tournefort obſerves, that out of the ſimple native ſalts other compounded ſalts are naturally produced, viz. the eſſential ſalts, which naturally are concreted from the juices of plants, among which are native ammoniacal ſalts.

The artificial is the only ſort known and uſed in the ſhops. It is a neutral ſort, compoſed of a volatile alkaline ſalt, and the acid of ſea-ſalt; hence the term ammonia muriata; this is the only genuine ſort, though it may be made with the vitriolic or with the nitrous acid. The different ſorts formed of the different mineral acids, are thus diſtinguiſhed; by dropping oil of vitriol on that made with the acid of ſea-ſalt, white fumes immediately ariſe; red fumes from that made of the nitrous acid; and no effect follows from that made with the oil of vitriol.

Sal Ammoniac is brought to us generally in round cakes, convex on one ſide, and concave on the other, from the ſhape of the veſſels into which they are ſublimed. When theſe cakes are broken, the ſalt appears of a needled texture, or compoſed of ſtriæ, running tranſverſely and parallel to one another; the internal part is generally pure, and of an almoſt tranſparent whiteneſs; the outſide, for the moſt part, is foul, and of a yellowiſh green or black hue.

In England, this ſalt is obtained from burnt cow's dung; urinous ſalt, joined with an acid, produceth ammoniacal ſalt; it is obtainable from every ſpecies of ſoots by ſublimation or ſolution. At Newcaſtle, it is made from the bittern, which remains after making common ſalt, and old urine; from one hundred pound weight of the bitter cathartic ſalt, and three hogſheads of urine, fifty-ſix pound weight of *ſal ammoniac* is obtained. In Ægypt it is made from the burnt dung of quadrupeds that feed only on vegetables: this dung is collected only in the firſt four months in the year, when the cattle feed on ſpring graſs, which is a ſort of clover: at other ſeaſons, and when the cattle eat other ſort of food, it is unfit for this purpoſe. As to the camel, its excrements are not preferable to thoſe of any other of their cattle which feed on graſs, nor is their urine ever uſed, though ſo commonly declared by writers on this ſubject. Mr. Haſſelquiſt ſays, that the ſalt-workers in Egypt pretend, that the excrements from men, goats, and ſheep, are preferable to all others; and he farther tells us, that March and April are the only times in which they make this ſalt. See the account in his voyages.

It may alſo be produced from

		Ammonia acetata.

The *ammoniac ſalt* hath many and uſeful properties.

It is ſoluble in water, and in ſpirit of wine, and in the air alone.

It renders water extremely cold while continuing to diſſolve in it. The crude ſalt, when diſſolved in water, and mixed with a vitriolic acid, effervеſces violently, and produces a ſenſe of cold; the volatile ſalt treated in the ſame manner, effervеſces likewiſe, but produces heat.

After ſolution in water, it ſhoots into cryſtals, which reſemble feathers, or into long ſhining ſpicula.

Mixed with a fixed alkaline ſalt, and then ſublimed, it affords a dry volatile ſalt; but mixed with quick-lime, its volatile parts are only to be obtained in a liquid form.

When unmixed with other matters, it may be ſublimed with a conſiderable degree of heat, without ſuffering the leaſt change in its nature or properties; but if the fire is haſtily raiſed during its ſublimation, it remarkably volatilizes many kinds of bodies, if mixed with it.

On account of its ſea-ſalt, it turns acidum nitroſum dilutum into aqua regia.

Crude *ammoniac ſalt* does not curdle milk, nor alter the colour of an infuſion of roſes.

Rubbed with quick-lime, or with a fixed alkaline ſalt, it emits an urinous ſmell,

Diſſolved in lime-water, then a little hydrarg. mur. being added, the mixture becomes of a yellow colour.

In ſoldering, tinning, and caſting ſhot, the crude ſalt is much uſed.

It becomes volatile in a heat ſomewhat greater than that of boiling water.

As a medicine, its effects are to be ranked among the moſt valuable of its tribe. Boerhaave ſays, that it preſerves all animal ſubſtances from putrefaction; that its brine penetrates their moſt inward parts; that it is the nobleſt aperient, attenuant, reſolvent, errhine, ſternutatory, diaphoretic, ſudorific, and diuretic.

When uſed externally as a diſcutient, or deterſive, it is mixed with ſome proper fomentation in the proportion of ʒ vi. or ʒ i. to lb ij. of the liquid.

It is more pungent to the taſte than common ſalt, but is leſs antiſeptic; it paſſes off more freely through the pores than common ſalt, but does not move the belly ſo freely.

It is perfectly neutral; attenuates viſcid juices; promotes a diſcharge through the ſkin, or by urine, according

ing as the patient is kept warmer or cooler, or according to the peculiar circumſtances of the conſtitution; in larger doſes, as ʒ ij. it opens the belly, and in yet larger, it proves emetic; it is an excellent febrifuge, and peculiarly aſſiſtant to the bark; in many inſtances where the bark and emetics failed in agues, the crude ſalt given to ℈ i. every four hours, with an infuſion of camomile flowers, for ſome days; then every ſix, and at leaſt every eight hours, hath ſucceeded; it is uſed both as an antiſeptic and a repellent in gargles; when the throat is inflamed, or otherwiſe requires ſuch remedies, it powerfully diſſolves viſcid mucus in the mouth and fauces; in violent hypochondriac caſes, it hath been of ſingular efficacy by a daily uſe of it in doſes juſt within what are required to render the bowels lax; after taking it ſix, eight, and twelve months, the cold bath hath completed the cure. From ʒ i. to ʒ ij. diſſolved in ℥viij. of any ſimple water, is a good ſubſtitute for the common ſaline mixture, and may be given, as to quantity and time, in the ſame manner. Great as are the powers attributed to this medicine, they are ſome of them much doubted by practitioners of eminence, particularly Dr. CULLEN. He does not admit of its reſolving powers by attenuating or diſſolving the fluids; but, like other ſaline matters, in paſſing by the excretions, they may be ſuited to promote them. In being coupled with the Peruvian bark, it may be of ſome uſe as a diaphoretic; but he doubts, that in obviating the conſequences apprehended from the uſe of the bark, it can be of any ſervice; nor does he allow that, externally applied, it has the power of diſcuſſing tumors, otherwiſe than by giving a moderate ſtimulus to the veſſels on the ſurface; not by entering the pores and by that means attenuating the viſcid fluids. Materia Medica, Vol. ii.

However, there are ſome compoſitions in which this is a principal ingredient, and upon which ſurgeons have much dependence. Mr. Juſtamond ſtrongly recommends the following in the cure of the milk breaſt. ℞. ammoniæ muriatæ ʒ j. ſps. roris marini lb j. m. Linnen rags ſhould be dipped into this and kept continually on the part affected As a diſcutient this lotion is much employed. ℞ ammoniæ muriatæ ʒ ſs. aceti. ſps. Vinoſi rectificati. āā lb i. m.

It may be purified by ſublimation, or perhaps more perfectly as follows: diſſolved in pure water, then filter and cryſtalize in the ſame manner as is directed for nitre.

The impurities of this ſalt are commonly ſuch as will not diſſolve in common water, and hence the purification is effected by the ſolution and filtration. The very laſt cryſtals ſeldom betray any mixture of other kinds of ſalt.

Preparations of this drug are, the ammonia prepared.

FLOS SALIS AMMONIACI.

Flowers of the *ſal ammoniac*.

Take dry crude *ſal ammoniac* powdered, put it into an earthen cucurbit, and having fitted on a blind head, ſublime the ſalt with a fire gradually increaſed.

This hath been called *aquila alba philoſophorum*, and *aquila Ganymedis*.

AMMONIACUS VEGETABILIS, Sal. See SP. MINDERERI, under alkali.

AMMONIÆ ACETATÆ IN IMENTUM. See AMMONIA.

AMMONITRUM, from ἄμμος, *ſand*, and νίτρον, *nitre*. See FRITTA.

AMMONII COLLYRIUM, called alſo *hygidion*. It is a mere farrago.

AMNA ALCALIZATA. Paracelſus ſays it is water which runs through lime-ſtones, and ſo is impregnated with lime. Rulandus calls *amnis alcalizatus*.

AMNESIA, or AMNESTIA, ἀμνησία, from ἀ, priv. and μνήσις, *memoria*. FORGETFULNESS. See AMENTIA.

AMNION, or AMNIOS. Martinius thinks it is derived from, or hath its name in alluſion to ἄμνιον *a veſſel*, which the ancients uſed for the reception of blood in ſacrifice. It is alſo called *armatura*, *agnina membrana*, and *pellicula*, *charta virginea*, *galea*, *induſium*, *amiculum*. THE INTERNAL MEMBRANE WHICH SURROUNDS THE FOETUS. It is a fine, thin, tranſparent membrane, ſoft but tough, ſmooth on its inſide, but rough on the outer. Dr. Hunter ſays, that it runs over the internal ſurface of the placenta, and that this membrane, which ſeems not vaſcular in the human ſubject, makes the external covering of the navel-ſtring, to which it is moſt firmly united; and that viewed in a microſcope, it appears to have blood-veſſels, but they are lymphatics.

However the exiſtence of the allantois may be diſputed in the human ſubject, the *amnion* is found in all animals both viviparous and oviparous.

AMNIS, ALCALIZATUS. See AMMA ALCALIZATA.

AMOGABRIEL. See CINNABARIS.

AMOMI. See PIPER JAMASCENSE.

AMOMUM STONE-PARSLEY.

Botaniſts enumerate three ſpecies, viz. the true, the baſtard, and as a third ſort the tree nightſhade is included.

The *amomum* verum is alſo called *amomum* racemoſum, *caropi*, *elettari primum*, Hort. Malab. TRUE AMOMUM, or TRUE STONE-PARSLEY.

The ſeed is the only part that is conſidered as medicinal, but is not known whether the true *amomum* of the ancients exiſts or not; the moſt probable account is that of P. G. Gamelli, in the Philoſ. Tranſ. which is, that the *tugus*, called by ſome *biras*, and by others *caropi*, is the genuine *amomum* of Dioſcorides. See Dr. James's Dict. article AMOMUM.

Many confound the *amomum* with great cardamom. It is a native of China. In Armenia the amomus is ſubſtituted for the *amomum*. The college of Edinburgh ſupply the place of the *amomum* verum with the caryoph. aromat. The college of London have rejected it.

The *amomum* vulgare is alſo called *ſiſon*, *ſium*, *ſinaon*, *amomum* Germanicum, *ſium aromaticum*, BASTARD STONE-PARSLEY. The *amomum*, Linn.

It is a perennial plant, grows wild under moiſt hedges and by the ſides of ditches: it flowers in July, and its ſeeds, which are the only part uſed in medicine, are ripe in Auguſt; they have a light agreeable ſmell, and a warm aromatic taſte, are eſteemed as carminative and diuretic; they are not ſo hot and pungent as, by the beſt accounts, the true *amomum* ſeeds are, nor is their flavour of the ſame kind.

They give over all their virtue with water in diſtillation, but by boiling in an open veſſel, their virtue is ſoon loſt in the air, and by way of tincture they give out their virtue to ſpirit of wine.

The virtues of the third ſort are the ſame as thoſe of common nightſhade.

See Dale and Miller. It is alſo a name of the *caſſia caryophyllata*, and *piper Jamaicenſis*, for that called—— CARDAMOMUM. See CARDAMOMUM.——SCAPO NUDO. See ZEDOARIA.——GRANI PARADISI. See CARDAMOMUM MAJUS.

AMONGABRIEL, or AMOGABRIEL, See CINNABARIS.

AMOR, LOVE. Though it is not a diſeaſe, it is productive thereof.

The ſymptoms produced by this paſſion are as follow: the eye-lids often twinkle, the eyes are hollow and yet appear as if full with pleaſure; the pulſe is not peculiar to the paſſion, but the ſame with that which attends ſolicitude and care: when the object of this affection is thought of, particularly if the idea is ſudden, the ſpirits are confuſed, the pulſe changes, and its force and time are very variable; in ſome inſtances the perſon is ſad and watchful; in others, the perſon not being conſcious of his ſtate, pines away, is ſlothful, and regardleſs of food; though the wiſer, when they find themſelves in love, ſeek pleaſant company and active entertainments.

As the force of love prevails, ſighs grow deeper, a tremor affects the heart and pulſe, the countenance is alternately pale and red, the voice is ſuppreſſed in the fauces, the eyes grow dim, cold ſweats break out, ſleep abſents itſelf, at leaſt until the morning, the ſecretions become diſturbed, and a loſs of appetite, a hectic fever, melancholy, or perhaps madneſs, if not death, conſtitute the ſad cataſtrophe.

On this ſubject the curious may conſult Ægineta. lib. iii. cap. 17. Oribaſ. Synop. lib. vii. cap. 9. or a treatiſe profeſſedly written on love, as it is a diſtemper, by James Ferrard, Oxford, printed 1640.

AMORIS POMA, alſo called *lycoperſicon*, *ſolanum pomiferum*, *mala aurea*, LOVE APPLE. SOLANUM LYCOPERSICUM, Linn. Is a ſpecies of ſolanum about the ſize of a cherry, green at the firſt, and when full ripe is of a yelloviſh red colour; the flowers reſemble thoſe of nightſhade; the fruit is carnous, and ſoft; it contains many flat whitiſh ſeeds in a juicy pulp, which being ſown in gardens, the plant flowers in July, and the fruit ripens in September.

Their quality is cooling. In Italy they are eaten with oil and vinegar.

See

See Miller Bot. Off.

AMORGE. See AMURCA.

AMOSTEUS. See OSTEOCOLLA.

AMOTES. See BATTATAS HYSPANICA.

AMPAR. See AMBRA.

AMPELION. VINE-LEAVES, or THE TENDRILS OF VINES. Hippocrates commends them for making into peſſaries to promote the menſes.

AMPELITIS. CANAL COAL. Named alſo *terra ampelites*, *ampelites* lapis, *pharmacitis*, *obſidianus lap. carbo*.

Dioſcorides gives us a character of the canal coal, that it will diſſolve if oil is poured on it; but in that it differs from ours.

A ſpecies of it is found in France, with which they blacken the hair of people's heads, and call it *Pierre noire*.

This ſpecies of coal is a bituminous earth, black as jet, and ſo hard that it takes a good poliſh, and is made into boxes, baſons, and various other utenſils. It contains much ſulphur and ſalt, is divided into ſcales, and eaſily powdered; when old, that is, when long kept after taking it out of the mines, it falls into powder, and then it gives out a quantity of ſalt-petre.

It burns more bright than any other kind of coal; powdered and ſtrewed upon vine trees it deſtroys the worms that injure them; it is rarely uſed in medicine, but is commended as being more drying than terra Samia, or than many of the earths that have obtained in medicine.

AMPELOCARPUS. See APARINE.

AMPELOS. See BRYONIA.

AMPHARISTEROS. It is the reverſe of ambidexter, that is, not having a proper uſe of either hand. Figuratively it ſignifies unlucky or unfortunate.

AMPHEMERINOS, AMPHEMERINA. It is the continued fever of Linnæus and Vogel, from αμφι, a Greek prepoſition, ſignifying *a revolution*, and ημερα, *a day*; a quotidian intermittent. See QUOTIDIANA FEBRIS.

It is, though, by ſome conſidered a remittent fever, and properly put in contradiſtinction to the febris quotidiana, which is an intermittent, and is defined a kind of remittent fever, whoſe paroxyſms return every day of a ſimilar nature, though it is rarely obſerved to be regular. Sauvages enumerates no leſs than 24 ſpecies. See Sauvages' Nolol. Meth. 4to. Amſtelod 1768. Vol. ii. p. 322.

AMPHIARTHROSIS. A mixed ſort of articulation, partaking of the diarthroſis and the ſynarthroſis; it reſembles the firſt in being moveable, and the later in its connection. The ſpecies which compoſe it have not a particular cartilage belonging to each of them, as in the diarthroſis, but they are both united to a common cartilage, which being more or leſs pliable, allows them certain degrees of flexibility, though they cannot ſlide upon each other; ſuch is the connection of the firſt rib with the ſternum, and of the bodies of the vertebræ with each other. See ARTICULATIO.

AMPHIBIUS, AMPHIBIOUS, of αμφι and βιος, *life*. Animals are thus called that are capable of living as well by land, or in the air, as by water: and of dwelling in either conſtantly, at pleaſure; but it will be difficult to find any animal that is equally qualified for either. Dr. PARSONS, an ingenious naturaliſt, in a paper read before the Royal Society, from conſidering their œconomy reſpectively, divides them into two orders: 1ſt. Such as enjoy their chief functions by land, but occaſionally go into the water; ſuch as otters, beavers, ſome kinds of rats, &c. 2d. Such as chiefly inhabit the water, but occaſionally go aſhore, as eels, and water ſerpents or ſnakes, of every kind: for a further account, ſee ENCYCLOPEDIA BRITANNICA. The *amphibia*, according to Linnæus, are a claſs of animals, whoſe heart is furniſhed with one ventricle and one auricle, in which reſpiration is in a conſiderable degree voluntary.

AMPHIBLESTROIDES, from αμφιβληστρον, *a net*; the RETINA, or NET-LIKE COAT OF THE EYE; alſo the ſame as RETIFORMIS, which ſee; and VERRICULARIS TUNICA.

AMPHIBRANCHIA, from αμφι, *about*, and βραγχια, *the gills of a fiſh*, ſome ſay βραγχια, *the ſauces*, and ſome ſay *the jaws*. The ſauces or parts about the tonſils.

AMPHICAUSTIS. A ſort of wild barley. See alſo PUDEND. MULIEBRE.

AMPHIDEON, or AMPHIDEUM. See OS INTERNUM.

AMPHIDEXIOS. See AMBIDEXTER.

AMPHIDIARTHROSIS. So Winſlow calls the articulation of the lower jaw, which is partly by a ginglymus, and partly by an arthrodia.

AMPHIMERINA HUNGARICA, called alſo *morbus hungaricus*; *cephalonoſa*; *febris hungarica*;—*caſtrenſis*; and *caſteris*; *languor pannonicus*, is ſaid to be a kind of tertian remittent fever. SAUVAGES ſtates it *aſthenia pannonica*, and doubts whether or no it differs from *typhus*. It is deſcribed a ſpontaneous debility, affecting chiefly ſoldiers in camp; or it is epidemic; it gradually deſtroys the functions of the machine, and in the end proves fatal.——For that called—CATARRHALIS. See CATARRHALIS FEBRIS AMPHEMERINA.——TUSSICULOSA. See CATARRHUS.——ANGINOSA. See SCARLATINA ANGINOSA.

AMPHIMETRION, from αμφι, *about*, and μητρα, *the womb*, the parts about the womb.

AMPHIPLEX. According to Rufus Epheſius it is the part ſituated betwixt the ſcrotum, anus, and internal part of the thighs.

AMPHIPNEUMA, from αμφι, *about* or *around*, and πνευμα *breath*. See DYSPNŒA.

AMPHISBÆNA, from αμφι, *either way*, and βαινω, *to go*. GALEN ſays, it is an animal with two heads. AETIUS deſcribes it as a venomous ſerpent, which moves with either end forward, from which circumſtance it hath its name: it is not ſhaped with a thick body tapering into a ſlender tail, but it is of an equal thickneſs through its whole length. LEMERY ſays its colour is of a ſhining white, with reddiſh ſpots, and that its cheeks are ſo large that they conceal its eyes, and from this circumſtance it is ſaid to be blind. It is found in ſome of the Grecian iſles, and in different parts of Africa. Another ſpecies was lately met with in North America. AETIUS ſays the bite is much like the ſting of a bee, as to its effects, though ſomewhat more violent, but it is cured much in the ſame manner.

AMPHISMILA, from αμφι, *on each ſide*, and σμιλη, *an inciſion knife*. A diſſecting knife with an edge on each ſide.

AMPHITANE. See TINCAL.

AMPHODONTA, from αμφι, *on both ſides*, and οδους, *a tooth*. By this word Hippocrates expreſſeth animals that have teeth in both jaws.

AMPHORA. A Roman meaſure for liquids, from αμφιφορευς, by a ſyncope αμφορευς, it ſo is called from the two handles for carriage. Its contents are ſeven gallons and one pint Engliſh.

AMPOTIS. The RECESS OF EBB OF THE TIDE. Hippocrates uſed this word to expreſs the receſs of the humours from the circumference to the centre of the body.

AMPULLA. A veſſel ſhaped with a belly, as a bottle or jug In chemiſtry all bellied veſſels are called *ampullæ*, as BOLT-HEADS, *excipula*, or RECEIVERS, CUCURBITS.

AMPULLASCENS. The alvus *ampullaſcens* is the moſt tumid parts of Pecquet's duct.

AMPUTARE VIRES. To render a perſon weak.

AMPUTARE Nervos. To take away the ſtrength.

AMPUTATIO, AMPUTATION. It is the cutting off a limb. From *amputo*, *to cut off*. *Ectome*, *exciſio*, and *extirpatio* is uſed in the ſame ſenſe: *exciſio* may indeed be applied to the operation where one part is cut out of another, as in ſome encyſted tumors.

Hippocrates ſays, when ſpeaking of a mortification, that what is putrified muſt be cut off, but does not mention the taking off of limbs. Celſus is the firſt who deſcribes this operation. Till the ſixteenth century, we have no account of any method to prevent the hæmorrhage, which happens in this ſort of operation, except Celſus's, of making a ligature about the veſſels. Pare tells us, that previous to making this inciſion, a ligature, with a thin fillet, muſt be made above where the *amputation* is to be performed, which, he ſays, firſt, keeps up the ſkin and muſcles in a raiſed poſture; ſecondly, prevents an hæmorrhage; and, thirdly, leſſens the ſenſe of feeling: he is the firſt who clearly ſpeaks of preventing the hæmorrhage when theſe operations are performed. In 1674, Mr. Morel, a French ſurgeon, introduced the tourniquet, as it is now uſed; but the firſt mention of this inſtrument, is in the Currus Triumphalis e Terebintho, publiſhed in London by an Engliſh ſurgeon in 1679. About the end of the ſixteenth century, Meſſrs. Verduin and Sabourin, one a Dutchman, the other of Geneva, left a label of the

fleſh

fleſh and ſkin to wrap over the ſtump, and called it l'operation de *l'amputation* à lambeau; but they probably learnt it from an Engliſhman, who publiſhed this practice in 1679; ſee Curtius Triumphalis è Terebintho. Paulus Ægineta uſed the actual cautery, but Ambroſe Pare ſecured the veſſels by drawing them a little out with the forceps, then making a ligature round them, as is often mentioned by Celſus, though neglected by ſo many of his ſucceſſors. In the preſent eighteenth century, improvements are both many and important in this branch of ſurgery; the crooked needle, and moſt other parts of the apparatus, &c. either being now introduced or improved.

CASES REQUIRING THE LIMB TO BE TAKEN OFF.

After all that can be laid down on this particular, in many inſtances the experience and ſagacity of the attending ſurgeon alone, can properly determine for or againſt an operation. Mr. Bilguer, an eminent practitioner in the armies of the king of Pruſſia, during his late wars, reduces them to ſix, as follows:

1. A mortification, which ſpreads until it reaches the bone.
2. A limb ſo hurt, that a mortification is highly probable.
3. A violent contuſion of the fleſh, which at the ſame time hath ſhattered the bones.
4. Wounds of the larger blood-veſſels of the limb, when recourſe is had to amputation, as the only method of ſtopping the hæmorrhage; or through an apprehenſion that the limbs ſhould periſh for want of nouriſhment.
5. An incurable caries of the bones.
6. A cancer, or humour in danger of becoming ſuch.

Perhaps Mr. Bilguer may have reſtrained this operation rather too much: however, his humanity is manifeſt herein, and his ingenuity is ſuch as renders his inſtructions deſerving of attention.

In caſes from mortification, Mr. Sharp hath well eſtabliſhed the propriety of waiting until it ceaſes, and granulations of new fleſh beſpeak a better ſtate of the blood. He obſerves that gun-ſhot wounds are beſt, if the neceſſary amputation is immediately performed; and that the diſorders of the joints, ulcers of long ſtanding, and all ſcrophulous tumors, generally return on other parts, after amputation.

On this important ſubject, Mr. Pott obſerves, that in the inſtances generally demanding *amputation*, if the rule is adhered to, a limb will now and then be taken off that poſſibly might have been reſtored; but the number of thoſe who would be ſo lucky, is ſo ſmall in proportion to thoſe who under the ſame apparent circumſtances would end fatally, that it can make no difference in the general treatment. Selection of one caſe from another is what conſtitutes judgment in ſurgery; and happy is the man who, amidſt the following demands for *amputation*, ſingles out a caſe in which he will ſucceed, and ſave the threatened part. In general, then, *amputation* is neceſſary.

1. In ſome compound fractures. See FRACTURA, when *amputation* is neceſſary in them.

2. A wound in the principal artery of a limb: alſo in ſome aneuriſms, a large wound with loſs of ſubſtance, from arteries not contained within the cavity of the body, as thoſe of the thigh, leg, or arm, they are often ſo circumſtanced as to render *amputation* the only poſſible means of ſaving the patient's life. It is true, every inſtance of a wounded humeral or crural artery, does not demand this operation; but if the wound is ſuch, as that the collateral branches in their neighbourhood are prevented from carrying on the circulation, a ſpeedy *amputation* will be neceſſary. See ARTERIA, FEMORALIS ARTERIA, POPLITEA ARTERIA, TIBIALIS ARTERIA, HUMERALIS ARTERIA, &c.

3. When joints are wounded, violently injured, or otherways diſeaſed. When the heads of bones are diſeaſed, their ligaments lacerated, &c. in moſt inſtances *amputation* is neceſſary. See VULNUS, SCLOPETOPLAGA, SPINA VENTOSA, &c.

4. A caries of the whole ſubſtance of a bone, or of the bones which compoſe a limb. See CARIES.

5. Some Mortifications. See MORTIFICATIO.

6. Many inſtances of gun-ſhot wounds. See SCLOPETOPLAGA.

7. Cancers. See CANCER.

Large bones ſhould not be amputated in the joint, on account of the extreme thinneſs of the fleſh in thoſe parts, which cannot eaſily be brought to cover the bone, and heal over it, whence a caries may ariſe, and other inconveniencies; but if there is a probability of making the ſkin grow over the bone, the operation might be performed here as well as in the fingers and toes.

If the ſtrength of the patient is thought ſufficient for him to undergo an *amputation*, and his caſe is ſuch as is thought to require it, the following ſhould be in readineſs:

1. A tourniquet.
2. A ſmooth fillet, an inch broad and half an ell long.
3. The amputating knife.
4. A catlin.
5. A ſaw.
6. A forceps.
7. Crooked needles armed with wax thread.
8. Lint and tow, made into compreſſes ready for uſe.

Calomel mixed with ſtarch, and ſtrewed on a pledget of lint, is perhaps the beſt application to the ſtump of an amputated limb.

9. A retractor.
10. A roller of five ells in length.
11. Pledgets of ſponge.
12. Cordials, as wine, &c. to raiſe the patient's ſpirits.
13. Attendants appointed to their proper offices.

A general idea of the procedure will be beſt obtained by a peruſal of the directions given below for the *amputation* of the particular parts; to them, therefore, the reader is referred, and to ſuch authors alſo as opportunity may favour his attending to.

AMPUTATION *of the* ARM.

In moſt *amputations*, the operation ſhould be a finger's breadth, or more, above the ſphacelated, or otherwiſe injured part.

Apply the tourniquet ſo, as that it may preſs upon the chief artery of the limb to be taken off. When the arm is the part to be amputated, it is adviſed by ſome, for an aſſiſtant to preſs on the artery as it paſſes over the firſt rib.

Then let an aſſiſtant draw the ſkin back, while the operator binds the fillet round where the inciſion is to be made. This fillet both guards the knife, and keeps the fleſh tight, ſo that it more eaſily yields to the knife; or more exactly to make the circular inciſion, a ſlip or two of plaſter may be preferred to the fillet for directing the knife; this ſlip of plaſter may be applied double, that is, two thickneſſes may be laid, the one upon the other; and if another ſlip is placed about three-fourths of an inch higher, its effect will greatly aſſiſt thoſe of the lower. On the exact cutting the ſkin, muſcles, &c. the ſpeedy cure of the ſtump very much depends.

Having proceeded thus far, give the patient a cordial, and cheer him.

Two aſſiſtants holding the limb in a ſtrait line, an inciſion muſt be made quite round through the ſkin and fat to the fleſh; this done, firſt take away the fillet or ſlips of plaſter; then the aſſiſtant, who holds the upper part of the limb, muſt draw the ſkin as far back as he can; after which, as near the edge of the retracted ſkin as poſſible, the fleſh muſt be divided, at twice, to the bone: and if there are two bones, divide the fleſh between them with the point of the ſame knife; then, that the bone may be ſawed off as near to the fleſh as poſſible, obſerve as follows: it is neceſſary to cut the ſkin, &c. to the muſcles firſt, that you may draw it back and cut the fleſh as far under the ſkin as poſſible, in order to having the ſkin to reach over the fleſh and the bone of the ſtump as ſoon as it is dreſſed up: if the inciſion was made at firſt to the bone, then the ſkin would not contribute to the covering of the ſtump. Again, to aſſiſt this intention of bringing the ſkin over the end of the ſtump, the retractor is contrived, which muſt be put on after the inciſion is made through the muſcles, to draw them up with, as forcibly as the patient can eaſily bear: thus the bone can be ſawed off more cloſely to the edge of the fleſh, and with leſs danger of tearing it with the teeth of the ſaw. When there are two bones, as in the fore-arm, after having cut through the muſcles, and divided the interoſſeous ligament, ſome recommend, inſtead of the retractor to paſs a compreſs between the bones, and therewith to draw back the divided parts until the bones are ſawed through.

Where there are two bones, apply the ſaw in ſuch a manner that both may drop together, to prevent making ſplinters, and alſo to avoid the painful jar which the patients feels when this is neglected. While the ſaw is working,

working, the affiſtant who holds the lower part of the limb ſhould gently depreſs it, that the ſaw may have room to paſs; and the operator ſhould make his ſtrokes with it as long as poſſible.

The limb taken off, if the larger arteries are not eaſily ſeen, the tourniquet may be ſlacked, and by the blood ſpinning out, they will be diſcovered; then with the curved needles ſecure them, as directed in wounds of the arteries: when the tenaculum can be uſed for drawing out the artery, it will always be the beſt method; and having ſo done, tie the end of the artery with a narrow flat tape. If an oſſified artery is cut through, a cautery, either actual or potential, muſt be applied. In the fore-arm compreſſes generally ſuffice for checking the hæmorrhage.

The arteries ſecured, bring the ſkin over the end of the bone as far as poſſible, then apply a pledget of ſoft lint, and over it another of ſoft tow, or more if required; over theſe lay a pledget of tow ſpread with the common cerate, and then with two long ſlips of ſticking-plaſter placed acroſs each other, confine the whole by fixing the ends of theſe ſlips along the ſides of the ſtump; after this finiſh the dreſſing, by turning a worſted nightcap over the whole. It is properly obſerved by ſome ſurgeons, that dry lint, as an extraneous body, in which light it ſhould be conſidered, and as which it always acts, when clotted with blood, occaſions pain, ſwelling, and inflammation, therefore ſhould be laid aſide, and in its place a large quantity of flour ſhould be ſtrewed over the whole ſtump; this forms a natural cataplaſm with the blood, ſerum, &c. over this, apply dry lint, or what other dreſſings you like, which may all be removed the next day, if on any account needful, and this without pain to the patient or trouble to his aſſiſtants.

The cuſtom of finiſhing by a roller from below upward, or indeed any way applied, is now omitted by the ableſt ſurgeons, as by its compreſs it cauſes inflammation, pain, and fanies, inſtead of a well-digeſted matter.

In the 2d vol. of the London Med. Obſ. and Inq. Mr. Kirkland propoſes the uſe of ſponge for a part of the dreſſing, as ſoon as digeſtion is begun in the ſtump, after an *amputation*. He obſerves, that the greateſt danger after this operation is from an abſorption of the matter from the wound after the inflammation is gone off, particularly if the digeſtion proceeds not very kindly; and to prevent this inconvenience, as ſoon as the ſtate of digeſtion is well advanced, he directs a thin layer of fine lint to be applied to the ſtump, and, immediately upon that, ſome thin pieces of fine ſponge, which have juſt then been made wet, but are ſqueezed as dry as can be by the graſp of one's hand. The thinner matter of the diſcharge from the wound being abſorbed by the ſponge, the fever, diarrhœa, and other ſymptoms which it occaſions when taken up into the circulation, are prevented; and where from the thinneſs and acrimony of the diſcharge, ſponge pledgits are neceſſary, he orders antiſeptic diuretics to be adminiſtered internally, and if needful, the bark.

The dreſſing finiſhed, the beſt place for the patient is bed, as his poſition will then be eaſier.

An aſſiſtant ſhould gently and conſtantly hold his hand on the ſtump during ſome hours, not only to guard againſt an hæmorrhage, but alſo by the gentle preſſure to make the dreſſings adhere more firmly.

The tourniquet may be gradually raiſed to admit the circulation of the part more freely, and if no danger ſeems to threaten, it may be removed the next day.

From plethoric habits, as ſoon as the patient is in bed, take away ſome blood, to prevent a fever.

On the third or fourth day, remove the dreſſings, and proceed as in a common wound. If any part of the lint, &c. adheres, leave it to digeſt away with future applications.

The *amputation* of the arm, and of the fore-arm, are the ſame, except that in the fore-arm the brachial artery dividing into branches, ſometimes demands the uſe of the needle, more than when the operation is in the arm. In general, when the arm is amputated above the elbow, the ſame procedure will be neceſſary as is directed for the *amputation* of the thigh juſt above the knee.

See Bell's Surgery, vol. vi. 425. White's Surgery 200, 201, 202.

The AMPUTATION *of the* ARM *at its* JOINT *with the* SCAPULA.

Mr. Morand, the elder, firſt took off the arm at the ſhoulder. Mr. Bromfield performed it with ſucceſs in London. Dr. Home, in his Medical Facts and Experiments, ſays it is a dangerous operation, though attended with all poſſible advantages. Here the tourniquet cannot be applied. But Dr. Hunter obſerves, that, when we conſider the ſituation of the blood-veſſels as they paſs over the firſt rib to the arm, it evidently appears, that by turning the ſhoulder outwards, and making a proper preſſure with compreſſes and bandage, we might abſolutely make ourſelves maſters of the blood in amputating the humerus, at its articulation with the ſcapula, which is the moſt intimidating circumſtance in the operation.

The patient's arm being held horizontally, make an inciſion through to the fleſh, from the upper part of the ſhoulder, acroſs the pectoral muſcles, down to the arm-pit; and, to ſave as much ſkin as you can, begin it about two inches below the joint, then turning the knife with its edge upwards, divide that muſcle, and part of the deltoid, and thus the great artery and vein are expoſed, and which ſhould immediately be ſecured by ligatures, at leaſt two fingers breadth below the axilla, in order to which carry the arm a little backward; then divide theſe veſſels at a conſiderable diſtance below the ligatures, and purſue the circular inciſion through the joint, cutting firſt into that part of the burſal ligament which is neareſt to the axilla; for if you attempt to make way into the joint on the upper part of the ſhoulder, the projection of the proceſſus acromion, and proceſſus coracoides, will very much embarraſs the operation: in the next place diſcover the true ſituation of the acromion, which having done, draw back the ſkin, and in dividing the fleſh introduce the knife two or three fingers breadth under the acromion, for thus, much of the deltoid muſcle is ſaved, which will fill up the wound, and expedite its healing. Theſe parts cut through, raiſe the arm, that the head of the biceps muſcle may be more eaſily found and divided; divide the ligament on the upper part, then on the ſides, after which, the head being lifted out of the ſocket, cut away all that detains it, taking care not to divide the artery, &c. above the ligatures. The remaining fleſh at the arm-pit ſhould be nearly of a triangular figure, the broad part being next to the axilla. Apply the remaining fleſh immediately to the ſocket of the ſcapula, and lay over them dry lint and pledgets, which may be ſecured by a plaſter of the ſhape of a Malteſe croſs. To prevent the force of the artery, lay a bolſter in the arm-pit, to preſs upon it; ſecure the whole with the bandage called the ſpica deſcendens.

See Bell's Surgery, vol. vi. p. 417.

AMPUTATION *of the* BREAST.

In this caſe women only are the ſubjects.

The patient being placed on a high chair, hold her arm horizontally backward, and a very little downward; thus the pectoral muſcle is more readily expanded, and the diſordered part more eaſily ſeparated from it; then make a circular inciſion through the teguments, and diſſect the morbid part out. This done, if ſtrength admits, take away blood. The compreſs and bandage are generally ſufficient to prevent hæmorrhages, the needle being ſeldom required; yet ſometimes the branches of the mammary arteries which come out between the cartilages of the ribs into the breaſts, will create ſome trouble, eſpecially one larger than the reſt from towards the arm-pits, near the edge of the pectoral muſcle, which is commonly more troubleſome to ſtitch than the reſt. Now proceed as in wounds in general.

If in the courſe of the cure a fever comes on, with pains about the præcordia, and a difficulty of breathing, death is the conſequence. Be careful by proper and timely bleeding to prevent theſe ſymptoms. See Bell's Surgery, vol. ii. 434.

AMPUTATION *of the* FINGERS *and* TOES.

Sometimes a finger or toe that is nearly cut through with a ſharp inſtrument, if clapped too again whilſt it is warm, will unite; at leaſt it is better to give ſuch caſes the trial than to cut them away at the firſt. When cut obliquely, their reunion may be more certainly expected, than when tranverſely.

The fingers and toes are beſt amputated in their articulations; a ſtraight knife muſt be uſed, and the inciſion of the ſkin ſhould be made not exactly upon the joint, but a little towards the extremity of the finger or toe, that more off it may be preſerved for the eaſier healing of it afterwards: it will alſo facilitate the ſeparation of the joint, when the finger is cut from the metacarpal bone, to make two ſmall longitudinal inciſions on each ſide of it firſt. When the lower joints are ſeparated, the firſt inciſions ſhould be from a little above to a little below the joint on each

each ſide, and ſo deep as to divide the ligaments; and after this proceed as above. The ſkin grows over the caltilage very readily. If the cartilage is removed by the knife point, or any accident happening to the part, the ſkin heals better, and unites ſpeedily to the bone, but this is not neceſſary. If the patient is plethoric, let the blood run from the amputated joint, and no hæmorrhage will happen thereafter. It is never neceſſary to take up an artery here.

In caſe of ſupernumerary fingers or toes, if troubleſome, cut them off: ſometimes there is no bone where they are to be cut off, in this caſe a knife may be uſed; but if there is any bone, a ſtrong pair of ſciſſars may be uſed, for in infants theſe bones are not hard.

See Bell's Surgery, vol. vi. p. 411. White's Surgery, 199.

AMPUTATION *of the* HAND.

Heiſter thinks it beſt to amputate the hand with a knife only, at the joint of the wriſt; but the uſual method is to cut through the bones above the wriſt, in which caſe, ſee AMPUTATION OF THE ARM.

AMPUTATION *of the* METACARPAL *and* METATARSAL BONES.

If any one of theſe bones is carious, it may be adviſable to cut away only ſo much as is diſordered; a ſmall ſpring-ſaw is the moſt proper to divide the bones with here. After theſe operations, the parts heal ſoon, and a part of a hand or foot is better than to loſe the whole.

In theſe caſes carry your knife firſt along the ſide of the bone that is to be removed, and as cloſe to it as you can, at the ſame time making the wound as ſmooth as poſſible. If one of the middle bones is to be removed, we muſt of courſe make two inciſions, one on each ſide: having done this, divide the integuments, &c. from the bone above and below tranſverſely, then ſcrape off the periofteum, and ſaw through the bone with the ſaw called the metacarpal ſaw. Hold the ſaw very ſteady, and make long ſtrokes when uſing it. If two bones are to be removed, we ſhould proceed as above in general; alſo remember to divide the integuments, &c. tranverſely between the two bones, as is done between the tibia and fibula, or between the radius and ulna in *amputations* of thoſe parts. As in *amputations* of the fingers and toes, ſo in this caſe, the tourniquet is not required.

White's Surgery, 300.

AMPUTATION *of the* LEG.

If the leg is to be amputated, though the injury is ever ſo near the ankle, as a long ſtump is thought more inconvenient than a ſhort one, it is preferred to amputate it at about four or five fingers breadth below the tuberoſity of the tibia; if it is cut higher, the aponeurotic expanſion of the flexor muſcle will be hurt; beſides the ſtump would be too ſhort for an eaſy ſupport on the wooden leg; and an artery which runs into thickneſs of the tibia to be diſtributed to the marrow, would be unneceſſarily wounded.

As the gaſtrocnemei muſcles draw back the ſkin more ſtrongly than it is drawn elſewhere, it is proper, in order to keep the ſkin equal after the operation, to cut ſo that the wound on the calf of the leg is farther from the middle of the ham, than the wound in the fore part is from the middle of the patella.

In amputating the upper limb and the breaſt, a chair is the propereſt to place the patient on; but for the lower limbs, a table about two feet and a half high is to be preferred.

The tourniquet muſt be placed three or four inches above the patella, and ſo as to preſs more particularly on the artery in the ham. The ſlips of plaſter directed in the *amputation* for guiding the knife, muſt be placed four or five fingers breadth below the patella; and the operator muſt ſtand on the inſide of the leg, becauſe the fibula will then be ſawed at the ſame time with the tibia: but if on the contrary the ſaw is laid on the inſide of the leg, the tibia will be firſt divided, and the fibula, being too weak to bear the force of the ſaw, will be apt to ſplinter, ſo not only render the operation tedious, but alſo the cure more difficult afterwards.

Though the practice of making a ſhort ſtump hath ſo generally obtained, Mr. White, the ſurgeon of Manchester infirmary, prefers amputating betwixt the calf of the leg and the ankle, in caſes that will admit of ſaving ſo much of the leg; he gives inſtances of his practice this way, and aſſures us, that the motion of the long ſtump is more eaſy than that of the ſhort one.

After the ſeparation of the limb, the dreſſing, and general treatment, will be the ſame as in *amputation* of the arm. See Medical Obſ. and Inq. iv. 168. Bell's Surgery, vi. 374. White's Surgery, 204.

AMPUTATION *of the* PENIS.

If a cancer, or a ſphacelus, in conſequence of a ſcirrhous gland, ſhould appear in the penis, then every part to which the contagion had reached is ſpeedily to be extirpated, leſt the taint diffuſe itſelf farther.

Some cut off the penis with a knife; ſee Le Dran's Operations: but the following method is to be preferred:

Paſs a ſmall tube of lead, or of ſilver, into the urethra, a little farther than the affected part; then with a ſilken thread make a ligature upon the ſound part, near to that which is diſeaſed; make this ligature tighter every day until that which is faulty falls off. See Bell's Surgery, i. 538.

AMPUTATION *of the* THIGH.

In this operation on the lower part of the thigh, the firſt inciſion is to be made a little more than two inches above the patella.

The tourniquet muſt preſs upon the crural artery, on the upper and inner part of the thigh, where the head of the vaſtus internus muſcle and the triceps meet.

In amputating above the knee, we are adviſed to cut down to the bone at once; but as there is a great thickneſs of the ſkin, &c. it is almoſt impoſſible. However, in cutting, we ſhould remember that the ſtump ſhould be of a conical form. In this caſe it is of no conſequence on which ſide of the bone you ſtand for operating.

When *amputation* is performed on this limb, the muſcles not being attached to the body of the bone, they frequently retract, and leave the bone ſticking out; this never happens in the arm, but it may be remedied, by placing the patient on his ſide, and keeping the muſcles in as relaxed a ſtate as poſſible. The method of amputating with flaps was firſt invented to remedy this inconvenience, which hath occaſioned the contrivance of a new mode of amputating by Mr. Allanſon, of Liverpool, which is as follows: he firſt makes an inciſion through the ſkin, then diſſects a ſufficient quantity of it from the muſcles to cover the ſtump; this done he divides the muſcles down to the bone, where he finiſhes the diſſection, and then ſaws through the bone at the ſame place, in the uſual manner. He afterwards takes up the veſſels with the tenaculum, brings the ſkin over the ſtump, leaves the ligature hanging out at the external orifice, and applies no kind of dreſſings except ſomething to cover it ſuperficially.

After the operation, the roller that is to keep down the ſkin, ſhould go down the waiſt, and deſcend down the thigh to the ſtump: thus abſceſſes are prevented, which otherwiſe would form themſelves on the upper part of the thigh. It has been recommended in *amputations* of this limb, to diſſect away the cellular ſubſtance, as this has been thought to produce all the ſuppuration and diſcharge: it hath been tried, indeed, and with ſeeming ſucceſs: but others omit this part of the operation, and think the cellular membrane is a convenient cuſhion for the ſtump to reſt on.

Another circumſtance deſerving attention is, after the operation, to preſs the crural artery the whole length of the thigh by a long bolſter.

If the operation is made on the upper part of the thigh the danger is very great; the diſcharge from the wound when it digeſts being ſo copious, that the patient's ſtrength is ſoon gone, and death is a ſpeedy conſequence. If a caſe is ſo circumſtanced as to render *amputation* in the upper part of the thigh neceſſary, it would be beſt to be performed in the articulation, for then the crural artery would be better ſecured, and many other inconveniences avoided, which attend in the uſual method; but in the moſt deſperate circumſtances, taking off the thigh at the articulation is not yet encouraged. Bull's Surgery, vol. vi. 338. White's Surgery, 201.

A complete Treatiſe on the Gangrene and Sphacelus, with a new method of *Amputation*, by Mr. O'Halloran. Allanſon's Practical Obſervations on *Amputation*. Mynors's Practical Thoughts on *Amputations*, &c. London Med. Journal, vol. i. 231. Bell's Surgery, vol. vi. 301. White's Surgery, 190.

AMPUTATIO VOCIS, implies a loſs of ſpeech.

AMPUTATURA. A wound from the entire ſeparation of a part from the body.

AMUCTICA, from ἀμυσσω, *to vellicate*. Remedies that by vellicating and ſtimulating the bronchia raiſe a cough,

cough, and so contribute to the discharge of what is in the lungs. They are given against disorders of the voice, and the aspera arteria; and are also called *arteriaca*.

AMULETA. AMULETS.

Amulets and charms are so nearly allied, as to be considered in the same light.

Before the days of Moses, idolatry had diffused its baleful influence over the minds of most men; so doubtless magic, and the ridiculous attempt to cure diseases by those means, had a date nearly as ancient. The dispute lays betwixt kings and priests, as to which gave rise to follies of these kinds; it seems clearly owing to their designs and arts that they had their origin; to them therefore we may leave the decision concerning it.

Three things occur to most men who favour *amulets*: the 1st, the palate is not offended; the 2d, the price is small; 3d, superstition is indulged.

The words usually spoken when *amulets* were used, are called by the Greeks ΕΠΑΟΙΔΑΙ; by the Latins INCANTAMENTA, or CARMINA; by the English INCHANTMENTS and CHARMS, being a sort of song pronounced over any one, for the words were either in verse, or spoken in the manner of a song.

Sometimes words were written and carried by the patient on some part of his body, or in some of his garments. These the Latins called *amuleta*, probably from *amovere*, *to remove*, or *take away*. They also called them PROEBIA, or PROEBRA, from *prohibere*, *to guard* or *defend*. The Greeks call them APOTROPOEA, PHYLACTERIA, AMYTERIA, ALEXITERIA, and ALEXIPHARMACA, because they imagined that these remedies could defend them, not only against such diseases as proceed from natural causes, but also against the power of other inchantments.

These *amulets* were formed of any materials which fancy suggested.

Serenus Samonicus invented the ABRACADARA for the cure of the fever called hemitritæa. The Jews attributed the same virtue to the word ARACALAN. The Arabians had much ceremony, and also care, to see if the stars favoured them, and call it TALISMA, i. e. IMAGE.

Amulets were tied about people for the removal of disease, hence called PERIAPTA, and PERIAMMATA, from περι, *circum*, and απτω, *necto*, *to tie about*. BLANCHARD says that they are medicines which being tied about the neck, are believed to expel diseases, especially the plague. The royal touch to cure the king's evil! Whether hath folly in the patient, or villany in the impostors, the greatest share here?

Charms seem to have been artfully introduced, to impose a belief in people not in the secret, that those who were exercising them were in particular favour with some superior being. This gave the world a venerable idea of the practitioner, and so the vulgar were more easily prevailed on to submit implicity to them; and as the mind affects the body, thus in some cases the persuasion of the patient might contribute to a cure.

AMURCA. AMORGE: some take *Byssa* to be the same. It is the sediment from olive oil, found after the new pressed oil hath deposited it gross contents.

AMYCHE, from αμυσσω, *to scratch*. A superficial exulceration, laceration, or scarification of the skin.

AMYCTICA. STIMULATING, VELLICATING.

AMYGDALÆ. ALMONDS. The fruit of the AMYGDALUS, ALMOND TREE.——AMARÆ. BITTER ALMONDS.——DULCES. Called also *amygdalæ* sativæ, SWEET ALMONDS.

The leaves and flowers of the *almond* tree resemble those of the peach tree. It is a native of Africa, cultivated in the southern parts of Europe, and even in England: it produces fruit very little inferior to that from abroad; it flowers earlier in the spring than most other trees, though its fruit is not quite ripe until autumn.

Of the fruit we have two sorts, the sweet and the *bitter*; the eye distinguishes no difference betwixt the trees, nor between the kernels themselves. It is said that by altering the soil the *bitter* brings forth sweet, and the sweet brings forth *bitter almonds*. The *almonds* from Barbary, where the tree is indigenous, are *bitter*, while those cultivated in Europe are sweet. Linnæus describes the two trees as only varieties, which follow: AMYGDALUS COMMUNIS; or, AMYGDALUS foliis serraturis infimis glandulosis floribus sessilibus geminis. AMYGDALÆ DULCES. SWEET ALMONDS. AMYGDALÆ AMARÆ. BITTER ALMONDS.

The almond tree is of the CLASS ICOSANDRIA. ORD. MONOGYNIA. Linn. Gen. Plant. 619.

The *bitter almonds* agree with the sweet in yielding the same quantity of oil, not to be distinguished from that of the sweet sort, and in all cases to be used for the same purposes; the matter remaining after the expression of the oil retains all the *bitter*, and tastes stronger than it did at the first. Most of the *bitter* matter dissolves with a little heat in water and in spirit of wine, and a part arises with both in distilling; but spirit seems to extract the most, and water to elevate the greatest quantity. A simple water is distilled from them after the oil is pressed out, which is substituted for and possesseth the same qualities in the same degrees as that drawn from cherry-stones; it is made as follows;

℞ *Amygd.* amar. post express. olei ℔ vi. spt. vini ten. cong, ii. elic. cong. ii.

℞ Hujus sp. ℥ iv. aq. font. ℥ xii. m. et *aq. cerasor. nigr.* vocata.

It is more than probable that the noxious matter is that in which the *bitter* resides, and that the activity of it is increased by its separation from the gross oil and farinaceous substance. The kernels of other fruits that have any bitterness or particular flavour appear to have the poisonous principle of the *bitter almonds*. See a small publication, entitled, Experiments on Almond and Black-Cherry water.

The distilled water of *bitter almonds*, being strongly impregnated with the noxious matter which gives them their bitterness and flavour, may prove a poison to man, as in the case with the common laurel, to which it appears extremely analogous. *Almonds* are commended as being destructive of worms, if four or five, or more, according as the stomach will bear them, are taken in a morning fasting: they are diuretic, but not safe; they occasion sickness and vomiting; to dogs, foxes, fowls, storks, horses, especially while very young, to pigeons, cats, and some other animals, they are poisonous.

The sweet kind, of which those called JORDAN ALMONDS, are the best, should be chosen free from rancidness; and, if in the shells, free from all appearance of being affected by insects, a species of which penetrates them, and eats away the kernel. They difficultly digest in our stomachs, and afford very little nourishment, unless extremely well comminuted. As a medicine, they obtund acrimony in the primæ viæ, are softening, and relaxants. They are a good intermedium for uniting with water several substances, which of themselves are not miscible with it: camphor and many resinous substances, triturated with six times their quantity of *almonds*, easily dissolve into a milky liquor. Six or eight sweet *almonds* peeled, sometimes cure the heart-burn.

Sweet *almonds* are usually blanched, i. e. freed from their skin, by steeping them in hot water until it easily slips off; then triturated with water, their oil unites therewith, by the mutation of their mucilaginous and farinaceous matter, into an emulsion or milky liquor.

LAC AMYGDALÆ. ALMOND MILK.

℞ *Amygd.* dulc. decort. ℥ i ß. sacch. alb. ʒ iv. aquæ distillatæ lb ij. gum. arab. (in aq. hord. solut.) ℥ ß f. emulf.

Beat the sugar with the *almonds*; then rubbing them together, and the water gradually, and strain. Ph. Lond. 1788.

But the pure oil of *almonds* triturated with a thick mucilage of gum arabic, forms a more permanent emulsion; from which the oil does not separate either on standing two or three days, or on the addition of a moderate quantity of acid. One part gum, made into mucilage, is enough for four parts of oil. The white of egg, or syrup with a little spirituous water, will form an emulsion, but not near so well as the gum.

℞ Gum arab. op pulv. ʒ ß. aq. distillatæ ʒ i. f. mucilag. per tritur. & adde ol. *amygd.* ʒ i. ß. sacch. alb. ℥ ß. postea paulatim adde aq. distillatæ lb i. f. emulf.

If to this emulsion half an ounce of gum arabic be added, it is called the ARABIC EMULSION.

If half an ounce of chalk be added, it is named the ABSORBENT EMULSION.

If half a dram of camphor be added, it is called the CAMPHORATED EMULSION.

The emulsions partake of the quality of the oil, and are prescribed in the same intentions, particularly heat of urine and the strangury, whether arising from spontaneous acrimony, or from irritating food or medicines.

When these emulsions have stood a while, they throw up a cream to the surface, and the whey beneath turns sour. Acids joined to them forms curd and whey, just as they do in milk.

These milky solutions of *almonds* in water, though

containing the oil, and owing all the virtue to it, yet have this advantage, viz. that they may be given in acute and inflammatory fevers, without danger of the ill effects which the oil may produce, ſince emulſions do not become rancid, or acrid by heat, as all the oils of this kind ſoon do; and in moſt caſes the aceſcency is rather an advantage in the emulſion.

The expreſſed oil of *almonds* is obtained from the ſweet or the bitter ſorts equally; no difference can be diſcovered in their oils by any known method of trial; the oil of *bitter almonds* was called *metopium*, becauſe the Egyptians uſed to make an oil in which *bitter almonds* and galbanum were ingredients; they named their compound oil metopium, from the plant ſo called, from which the galbanum is produced; and others give the ſame name to the ſimple expreſſed oil of this fruit.

By bruiſing, then preſſing the *almonds*, they afford nearly one half of their weight in oil: by boiling *almonds* in water, part of their oil ſeparates, and is collected on the ſurface; but that obtained by preſſure, without heat, is the moſt agreeable.

As a medicine, this oil is uſeful *externally*; like that of the olives and linſeed, it is uſed to ſoften and relax the ſolids; *internally*, to ſheath acrimonious bile, or other humors; and gives relief when a tickling cough, hoarſeneſs, coſtiveneſs, or nephritic pains affect the patient; though in infants, to whom it is given as a laxative, it generally proves binding, by diminiſhing the ſtrength of their bowels. Oils are commonly given in the form of emulſion, mixed with ſome aqueous menſtruum, united by mucilage, yolk of an egg, or volatile alkaline ſpirit, in the proportion of one ounce and an half, or twenty-two ounces to half a pint of water, and ſweetened with half an ounce of ſome agreeable ſyrup. Draughts of manna and oil of *almonds*, at the ſame time uſing the common emulſion as common drink, are of ſingular ſervice in the gravel, and in dyſuries. Some women who have hard labours, experience much benefit by taking repeated doſes of this oil for ſeveral days before the time of delivery: the teneſmus, to which ſome pregnant women are ſubject, and which endangers abortion, is moſt ſpeedily relieved by clyſters of it, with a few drops of laudanum. THEBESIUS commends almonds highly for the cure of hydrophobia, having experienced their good effects in twelve cures, in which a few were eaten every morning. And BERGIUS ſpeaks of the emulſion of bitter almonds curing obſtinate intermittents after the bark had proved unſucceſsful.

AMYGDALÆ. See TONSILLÆ.

AMYGDALATUM. The emulſion of almonds.

AMYGDALIA. So Hippocrates de Morbis, lib. ii. calls the tonſils. See TONSILLÆ.

AMYGDALUS SIMILIS, GUATIMALENSIS. See CACAO.

AMYGDALOIDES, alſo *Cometes*. Thus Oribaſius calls the ſpecies of tithymalus, which is named tithym. maſticus.

It is a name for the white ſpecies of the gum benzoin. And in natural hiſtory, to a ſtone which reſembles the kernel of an almond in figure. It is no natural foſſil, but the petrified ſpine of the echinus marinus, or ſea-urchin, of the nature of the lapis judaicus, but wanting the pedicle and ſtalk of that ſpine. It is alſo a name for the *gobius* or GUDGEON.

AMYGDALOPERSICUM. The ALMOND PEACH.

AMYGDALUS. See AMYGDALÆ.

AMYLA. Any ſort of chemical fæcula.

AMYLI TROCHISCI. See BECHICA.

AMYLEON. AMYLION. AMYLUM. From *α*, neg. and *μυλη*, *a mill*, becauſe it is made of corn without a mill, or without grinding. It is the fæcula of wheat, and with us called STARCH: named alſo *Amidum*.

It is the pureſt farina of the wheat, but deprived of its ſalt and oil. It is made from all kinds of wheat, from potatoes, &c. It was invented in the iſle of Chios, and is valued by its lightneſs, newneſs, and ſmoothneſs. It is in common the magiſtery or finer part of wheat, made in the following manner.

THE METHOD OF MAKING STARCH.

Put the beſt wheat into water to ferment in the ſun in ſummer, change the water twice a day, for eight or twelve days, in which time the grain eaſily burſts, and is then alſo ſufficiently fermented; now put it, by little and little, in a canvas bag, to ſeparate the flour from the huſk, by rubbing and beating on a plank, which is laid acroſs the veſſel appointed to receive the flour: as the veſſels are filled with this liquid flour, a reddiſh water is ſeen ſwimming at the top, and is to be ſkimmed off, and clean water muſt be put in its place; after ſtirring the whole, ſtrain through a ſieve, and what ſtays behind muſt be put into freſh water, and expoſed to the ſun; and as the ſediment falls, the water muſt be decanted off; what ſettles is the *ſtarch*, and muſt be dried in the ſun. Scheele obſerves, that three ounces of wheat will yield eleven drams of fine ſtarch.

As a medicine, this article is often very uſeful; as a mild glutinous aſtringent, mixed with milk, it is an excellent kind of aliment in fluxes and catarrhs; ʒ i. of *ſtarch* diſſolved and boiled in ℥ iij. of water, with a little ſugar, forms an elegant jelly, of which a table ſpoonful may be taken every hour or two. If it is diſſolved in thin gruel it is lenient, incraſſating, and of ſervice againſt ſharp defluxions, hoarſeneſs, a dry cough, ſpitting of blood, a diarrhœa, a dyſentery, internal ulcers, heat of urine, a gonorrhœa, &c.

The doſe is from gr. v. to ʒ ß. of the dry powder.

ENEMA EX AMYLO. *The ſtarch glyſter.*

℞ *Amylum* ʒ iij. aq. font ℥ viij m. & coq. parum. Vel.

℞ Galatin. ex. *amylo*. ʒ vi. ol. lini ℥ ß. f. enem.

In diarrhœas and dyſenteries, when the ſtools are bloody, and the inteſtines are relaxed, the following far exceeds aſtringents, or any other kind of clyſters in the relief it affords.

℞ Galatin ex. *amylo*. ʒ iv. vel. ℥ vi.

Sp. vini. Gallic. opt ℥ ß vel. ʒ i. m. enem. pro re nata injiciendum.

In ſpaſmodic affections of the neck of the blader, and in that diſtreſſing ſenſe of weight and uneaſineſs when, in Gonorrhœa, the proſtate gland is affected, the ſucceeding glyſter of ſtarch, with opium, is an uſeful remedy.

ENEMA AMYLI CUM OPIO. ℞. Mucilaginis amyli ℥ viii. tinctur. opii ʒ ij. (& ſi opus fuerit augeatur tinctura—) miſce.

AMYRIS OPOBALSAMUM. —— GILEADENSIS. See BALSAMUM.——ELEMIFERA. See ELEMI.

AMYON, from *α*, priv. and *μυς*, *a muſcle*. A limb ſo emaciated that the muſcles ſcarce appear.

AMYTERIA. See AMULETA.

AMYTHAONIS, Empl. Amythaon's plaſter.

℞ Gum ammon. cer. flav. gum bdel. ää ʒ viij. tereb. rad. irid. illyr. gum. galb. ää ʒ xx. m.

ANA. This is the Greek prepoſition *ανα*; it is not peculiar to medical authors, though it is common among them. It ſignifies *of each*. Thus, ℞ aloes, thuris, myrrhæ ℥, or ää. for *ana* ʒ i. take of aloes, frankincenſe, myrrh of each one ounce.

ANABASES, from *αναβαινω*, *to aſcend*. See ACMASTICOS.

ANABATICA. See SYNOCHUS.

ANABOLE, from *αναβαλλω*, *to caſt up*. The diſcharging any thing as by vomit.

ANABROCHISMOS, or ANARROCHISMUS, from *ανα*, *ſurſum*, and *βρυχω*, *a nooſe*. An operation which was uſed to be performed on the hair of the eye-lids when they are offenſive to the eye.

ANABROSIS, from *αναβρωσκω*, *to devour*. A corroſion of the ſolid parts by ſharp humors, or any medicine. The ſame as *diabroſis*; it occaſions a diſcharge of blood, and often happens in the lungs.

ANACAMPSEROS. See CRASSULA.

ANACARDIOS ANTIDOTUS THEODORETUS. *The Antidote of Anacardium. A divine gift.*

It is a confect made up of many warm ingredients, but without opium.

ANACARDIUM, ANACARDUS. Alſo called *anacardium* orientale, *æpata*, the MALACCA BEAN TREE. It is the *Avicennia tomentoſa*, Linn.

It is externally of a ſhining black colour, of the ſhape of a heart flattened, with a thick pedicle occupying almoſt the whole baſis. The tree is found only in the Eaſt Indies, and is called by Ray, arbor Indica fructu conoide cortice pulvinato nucleum unicum nullo officula, tectum claudente.

It is ſaid that the Indians uſe the cauſtic oil of the nuts of this tree to ſtain their chints and callicoes, which ſets the colours ſo as not to waſh out.

The kernel, like that of the caſhew-nut, is mild and agreeable to the taſte, and yields, by expreſſion, an oil like that from almonds, and equally good as a medicine.

A confect was formerly made of the kernels, called by Meſſue,

Meſſue, *confectio ſapientium*; and by others, *confectio anacardii*.

ANACATHARSIS. EXPECTORATION, from ανακαθαιρομαι, *to purge upwards*; ſo many include the effect of emetics, maſticatories, ſternutatories, &c.

ANACATHARTICA. Medicines purging upwards; ſometimes employed for emetics; ſometimes to promote or encreaſe the ſalivary diſcharge; but moſt commonly implying, agreeable to the ſenſe made uſe of by HIPPOCRATES, *expectorants*, or medicines promoting the diſcharge of matter, whether mucous, or puralent from the lungs. See EXPECTORANTIA.

ANACHREMPSIS, from ανα for ανω, *upwards*, and χρεμπτομαι, *to hawk*. The hawking up any thing from the lungs.

ANACHRON, ſee ANATRON.

ANACLISIS, from ανακλινω, *to recline*. Hippocrates uſes this word to expreſs the decubiture of the ſick.

ANACLISMOS. That part of a chair on which the back of a ſick perſon leans.

ANACOELIASMUS. A remedy uſed by Diocles, which ſeems to have been gentle purges, with a view to relieve the lungs.

ANACOLLEMA, from ανακολλαω, *to agglutinate*. It is the ſame as *frontale*, only that it is always made of glutinants. See CATAPLASMA.

ANACOMIDE, from ανακομιζω, *to repair*, or recover a perſon after ſickneſs.

ANACTORION. See GLADIOLUS.

ANACTORIUM. See ARTEMESIA.

ANACYCLEI, from κυκλεω, *to wander about*. It anſwers to the word circulatores, mountebanks. See AGYRTÆ.

ANACYRIOSIS, from κυρος, *authority*. Hippocrates, in his treatiſe of decency, adviſes phyſicians to keep up their authority, and the dignity of their profeſſion, which he expreſſeth by this word.

ANADENDROMALACHE, } See ALTHÆA.
ANADENDRON. }

ANADIPLOSIS. A frequent reduplication of fevers. Blancard.

ANADOSIS, from αναδιδωμι, *to diſtribute*. See DISTRIBUTIO.

ANADROME, from δρομος, *to run*. Hippocrates uſes this word to ſignify pains from the lower to the upper parts of the body.

ANÆSTHESIA, ANAISTHÆSIA, from α, non. and αισθησις, *ſenſe*; alſo *anodynia*. INSENSIBILITY, or LOSS OF FEELING BY THE TOUCH. A reſolution of the nerves occaſioning a loſs of feeling: the ſame as *ſtupor*. Dr. Cullen ranks this genus of diſeaſes in the claſs locales and the order dyſæſtheſiæ.

ANAGALLIS, called alſo *corcheron*, *pimpernela*, *bibinella*, *bipemulla*, *bipinella*, & *æritis*. The ſpecies generally noticed are,

The MALE, or RED; and
The FEMALE, or BLUE.
Ray adds three more ſpecies.

It ſhould be obſerved, that the *anagallis* of the Greeks is the *macia* of the Latins. The ſpecies uſed in medicine is the ANAGALLIS ARVENSIS Linn.

This plant is low and ſucculent, differing in its appearance from chickweed by the ſpots underneath its leaves, in having no pedicles, in the ſeed-veſſels opening not at the top but horizontally, in the flowers not being white but red or blue; it is annual, grows wild in corn-fields and other cultivated ground, and flowers from May to Auguſt.

The expreſſed juice inſpiſſated to an extract, manifeſts a pungent ſaline auſterity, and any other preparation ſeems uſeleſs; it is reſolvent and detergent.

ANAGALLIS AQUATICA See BECABUNGA.

ANAGARGALICTON, } See GARGARISMA.
ANAGARGARISTON. }

ANAGYRIS NON FŒTIDA. See CYTISUS ALPINUS.

ANAGLYPHE, from ανα, *to engrave*. See CALAMUS SCRIPTORIUS.

ANAISTHESIA. See ANÆSTHESIA.

ANAISTHESIS. It has been conſidered by ſome as a true PARESIS: though Aretæus ſays it is not properly ſuch, but only a defect of ſenſation; in which ſenſe the word *pareſis* is now uſed by many. See PARESIS.

ANALCES, from α, neg. and αλκη, *ſtrength*; weak, effeminate. Hippocrates uſes this word as an epithet for the Aſiatic nations.

ANALDES, from α, neg. and αλδω, *to increaſe*. Not receiving nouriſhment nor increaſing. Hippocrates applies this word to fruits growing about the river Phaſis.

ANALENTIA. A ſpecies of epilepſy mentioned by Paracelſus.

ANALEPSIA. Johannes Anglicus calls that ſpecies of epilepſy thus, which proceeds from the ſtomach being diſordered. So alſo does Riverius; and it is by ſome put ſynonymouſly with epilepſy in general. See EPILEPSIA.

ANALEPSIS, from αναλαμβανω, *to recover* and *regain vigour after ſickneſs*. Hence,

ANALEPTICA. ANALEPTICS. They are ſuch things as reſtore, particularly ſuch alſo as exhilerate the ſpirits, and likewiſe promote fleſh and ſtrength. See CARDIACA and RESTAURANTIA.

Dr. CULLEN ſays, they are medicines ſuited to reſtore the force of the body when loſt, and ſometimes employed with reſpect to ſtimulus; but more commonly with reſpect to thoſe ſubſtances, which ſupply a deficient nouriſhment. The term he conſiders as attended with ambiguity, and would not have it employed at all.

Beſides the nutritious quality of reſtoratives, they have a ſweet fragrant, ſubtile, oleous principle, which immediately affects the nerves, and gives a kind of friendly motion to the fluids.

In diſeaſes, the ſpeedieſt way to reſtore ſtrength, is to remove the cauſe occaſioning the debility; but this is not to be done merely by the force of medicines, which increaſe the vital heat; for in convulſions and fevers, the motions are very ſtrong, and yet the natural ſtrength is languid: whence it is concluded, that true ſtrength depends upon congruous aliments, turned into laudable blood and juices, yielding plenty of animal heat, the true and only ſource of firmneſs and vigour.

Cordial flowers and herbs, muſk, ambergriſe, oil of cinnamon made into olea ſacchara, chocolate, ſhell-fiſh, &c. are *analeptic*.

ANALGESIA, from α, neg. and αλγος, *pain*, or *grief*. Indolence, or abſence of pain and grief. A ſtate of eaſe.

ANALOGIA, from ανα, *per*, *by*, and λογος, *ratio*, *reaſon*. ANALOGY. It is the mode of reaſoning of things not perfectly known, by compariſon with others which are better underſtood, and drawing concluſions from their ſimilitude. Hence, in medicine, it is a comparing of cauſes of diſeaſes with each other, and the remedies preventive and curative, and fixing our ideas reſpecting them from their likeneſs to each other.

ANALTHES, from α, neg. and αλθω, *to cure*. Incurable.

ANALTOS, from α, neg. and αλς, *ſalt*. Unſalted.

ANALYSIS, from αναλυω, *to reſolve*. In chemiſtry, it is the term uſed for decompounding any mixed body, and reducing it into its conſtituent parts; and this indeed is the chief object of the art of chemiſtry. The chemiſts make uſe of two modes of analyzation. 1ſt. By fire. 2. By menſtrua. Indeed the modes of decompounding bodies, are all founded on the difference of the properties belonging to the different principles of which the body to be analyſed is compoſed. Suppoſe, for inſtance, a body be compoſed of ſeveral principles, poſſeſſed of different degrees of volatility, and of ſome which are fixed, the volatile parts will riſe in proportion to the degrees of volatility which they poſſeſs; the moſt volatile firſt, on the application of gradual heat; then the next in degree, whilſt the fixed, capable of reſiſting the action of the fire, will remain at the bottom of the veſſel. This is called ANALYLYSIS BY FIRE. But when a body is compounded of ſeveral ſubſtances; one of which for inſtance is ſoluble only by ſpirits of wine; a ſecond is ſoluble only by water; and a third is ſoluble only by æther; theſe ſubſtances may be very eaſily ſeparated from each other, by ſubmitting ſucceſſively the compound body to the action of theſe menſtruums, each of which diſſolves that particular ſubſtance to which it has an affinity, and from which it may afterwards be readily ſeparated. This is called the ANALYSIS BY MENSTRUA. See on this ſubject, Macquer's Chemical Dictionary; Memoirs of the Royal Academy of Sciences for the Years 1719, 1720, 1721; Elements and Principles of Chemiſtry, by Lavoiſier, Fourcroy, Nicholſon, Chaptal, &c.

In anatomy, the diſſection of the human body is called ANALYSIS.

ANAMNESTICA. Medicines which are ſaid to improve the memory, or reſtore it when loſt; from ανα, and μνασομαι, *recordor*, *to remember*. This is a general title, and ſeems, like many others, to have no foundation

at all, but confounds the practice of physic; for as this defect of memory may depend upon different causes, and such as may require different, nay opposite remedies, students cannot be properly instructed, unless remedies are pointed out as suited to the particular cause and peculiar circumstances of the disease; and this observation will hold good in a variety of other instances.

ANAMNESTICA SIGNA. COMMEMORATIVE SIGNS; signs which discover the preceding state of the body, as demonstrative signs shew the present state; and prognostics shew the future state.

ANANAS. The PINE APPLE. The *bromelia* of Linn. called also *carduus Brasilianus foliis aloes, nana*, or *naras*.

Monf. Le Cour, of Leyden, was the first who raised this fruit in Europe: they were brought from the East Indies to the West, and from thence into Europe. It resembles the cone or fruit of a pine-tree, whence it is supposed to take its name.

Miller enumerates six species, and others add more to his list.

The flower is funnel-shaped, consisting of one leaf; the seeds are in the tubercles; they are small, and shaped like a kidney-bean; the fruit is fleshy, and full of a juice, which is esteemed the richest of all others in its flavour; the leaves resemble those of aloes.

ANANAS, WILD. See KARATAS.

ANANCE, from ανανκη, *necessity*. Any desperate surgical operation.

ANANDROI. Hippocrates uses this word joined with γυναικες, *women*, to express their never having known men.

ANAPALIN. On the contrary side, as if nature endeavoured to free herself from some disease, by her exertions on the side opposite to that wherein the affection arose; it is opposed to CATI'XIS, which see.

ANAPHALANTIASIS, from ανα and φαλαντος, *a bald person*. Baldness of the eye-brows.

ANAPHONESIS. A species of exercise which consisted in vociferation, from ανα, and φωνη vox.

It exercises the breast and organs of speech, increases the natural heat, improves the complexion, and is useful for the phlegmatic. It is commended to those who have the heart-burn, bad digestion and want of appetite, the cachectic, &c. but singing is yet a gentler exercise. See Hieron Mercurialis de Arte Gymnastica.

ANAPHORA, from αναφερω, *to bring up*, or *upwards*. In a medical sense it imports spitting of blood if joined with αιματος. Hippocrates uses it for thanks due to an obligation.

ANAPHORICOI. Those who spit blood; or, according to Actuarius, those who spit difficultly.

ANAPHRA, from α, neg. and αφρος *froth*. Hippocrates uses it as an epithet for stools, to express that they are not frothy.

ANAPHRODISIA, from α, neg. and αφροδισια, *venery*, called also *agenesia*; *atechnia*. IMPOTENCE WITH RESPECT TO VENEREAL COMMERCE. Dr. Cullen makes this a genus of disease, in the class locales, and order dysorexiæ.

This inability and sterility arises from various causes, either from an abolition of all passionate desires, appetite, or power of action, necessary for the propagation of our species, from a defect in erection, emission, or want of fertile semen. Sauvages has given us five species, which Dr. Cullen thus divdes. The *true species* are the paralytic and gonorrhoic—the *spurious species*, or where impediments occur to prevent the act, from piles, or some fault in the urethra; *what is called false or fictitious*, that is, supposed to arise from magic. See Sauvages Nosologia Methodica, vol. i. 770.

The cure of this disease depends upon the removal of its separate causes; when it arises from paralysis, such medicines as are necessary for the conquering that complaint must be had recourse to, particularly eating stimulants. SAUVAGES gives us an account of a man being cured by immersing the penis often in the day in a strong decoction of mustard seed. If it is occasioned by simple gonorrhœa, such aids are to be called in as are calculated to invigorate the system, tonics and corroborants are to be made use of, particularly cold bathing, avoiding high-seasoned foods and cordial stimulants. If from the piles, or faults in the urethra, such means must be used as the nature and particular circumstances of the case demand.

ANAPHROMELI, from α, neg. αφρος *froth*, and μελι *honey*. It is honey so despumated that it will not froth.

ANAPLASIS, from αναπλασσω, *to restore to the original form*. Hippocrates uses this word for the replacing a fractured bone, and for a restoration of flesh.

ANAPLEROSIS, from αναπληροω, *to fill up*. The restitution of any wasted part. INCARNANTIA, incarnatives are called anaplerotica.

ANAPLEUSIS, from αναπλεω, *to fluctuate* or *float upon*, or *waste out*. Hippocrates used this word to express when faulty humours rot the bone, so that it falls out of its joint, as happens to the jaw sometimes. Vogel expresses by this word, the scaling or separation of the carious parts of a bone.

ANAPNEUSIS, from αναπνεω, *to respire*. REESPIRATION, PERSPIRATION. Aretæus uses it to express a truce from pain.

ANAPODOPHYLLON, of *anas, a duck*, πους, *a foot*, and φυλλον, *a leaf*. DUCK'S FOOT, or *pomum maiale*, MAY APPLE, called also *podophyllum peltatum, aconitifolia*.

The cup of the flower hath but one leaf, the flower is hexapetalous, the foot-stalk of the flower comes from the stalk of the leaf; the fruit is the shape of an urn, in which are round fimbriated seeds.

The Americans calls it BLACK SNAKE-ROOT.

It bears the hardest winter in an open ground, and is increased by parting the root in August.

ANAPSYXIS. REFRIGERATION, i. e. cooling.

ANARISITESIS, from α neg. and αριστον, *a dinner*. Hippocrates uses this word for the substraction of a dinner from a patient.

ANARRHINUM. See ANTIRRHINUM.

ANARRHŒA, from ανω, *upward*, and ρεω, *to flow*. A flux of humours from below upwards.

ANARTHROI, from α, neg. and αρθρον, *a joint*. Fat, even to be bloated, so that the joints are obliterated.

ANAS. The DUCK. See ANSER.

ANASARCA, from ανα, *through*, and σαρξ, *flesh*, or in the flesh, called also *cataſarca, epiſarcidium, intercus. Pituita alba, hypoſarca, hypoſarcidion, vetternum*. Galen applies the term *hyderos* to this disease. In its beginning it is called *phlegmatia, phlegmatitia*. A species of dropsy from a serous humour, spread between the skin and flesh or rather a general accumulation of lymph in the cellular system.

Dr. Cullen ranks this genus of diseases in the class cachexia, and order intumescentiæ: in his third section of watery intumescencies or dropsies, he enumerates the following species, viz. 1. *Anaſarca ſeroſa*, from serum, retained on account of the suppression of some accustomary evacuations, or from an increase of serum, from too much water thrown into the habit, &c. 2. *Anaſarca oppilata*, when the veins are considerably pressed, which happens to many pregnant women, &c. 3. *Anaſarca exanthematica*; this happens after eruptive disorders, and particularly after the erysipelas. 4. *Anaſarca anæmia*, when the blood is rendered extremely poor from considerable losses of it. 5. *Anaſarca debilium*, when debility is induced by long illness in weak constitutions, or from other causes.

An œdema in any part hath the same appearance as the *anaſarca*, but it is partial; a leucophlegmatia is general; and an *anaſarca* is the worst state of the leucophlegmatia.

Its seat is the cellular membrane; if only one limb, or a particular part, hath its cellular membrane filled, it is called an ŒDEMATOUS SWELLING.

It is known by the sight and the touch; the skin of the part is bloated, and considerably larger than in a natural state; its colour is paler, and upon pressing it with a finger, the impression remains some time: if the belly is affected, the navel appears to be sunk in, and in a morning the eye-lids, or the whole face, appears fuller than is usually observed in the latter part of the day.

The occasional causes are scirrhous glands, a bad habit, voracious eating when recovering from a disease, suppression of periodical evacuations, and every cause that will impoverish the blood, and debilitate the system of the solids. The more immediate causes are a defect of red globules in the blood, and want of power in the absorbent vessels to carry off the portion of fluid conveyed into the cellular membrane.

Persons recovering from lingering diseases are very subject to this kind of dropsy, particularly if they keep late hours, or replenish their weak vessels too fast by full diet. Exposure to cold and damp air, particularly in the night, perhaps the check it gives to the natural discharge by the skin, dispose to and produces this complaint.

The

The ſpeedieſt cure, when the caſe is recent, is calomel, given to gr. x. at proper intervals to prevent a ſalivation, eſpecially if aſſiſted with ʒ vi. or viii. of a ſtrong decoction of garlic, two or three times a day.

Muſtard and horſe-radiſh may be freely eaten, or infuſions of them in white wine, ale, or water, may be drank three or four times a day. Infuſions of garlic or of juniper berries may be taken night and morning, with from ʒ i. to ʒ iij. of any fixed alkaline ſalt in each draught. Bitters, mild aromatics, chalybeate tinctures, and the ſquill pills, greatly aſſiſt in the cure. Dover's ſudorific powder, given from ℈ i. to ℈ ij. at bed-time, two, three, or four nights ſucceſſively, do the ſame. Dr. Leake obſerves, that as this diſeaſe generally ariſes from a ſtoppage of the pores, ſweating in flannels will be a rational attempt to relieve; to this end the pulv. ſudorif. Doveri, in a ſufficient quantity, may be repeated every other night. A moderate ſweating ſhould be kept up, and the patient ſupported with occaſional doſes of the mixtura e camph. This ſweating abated, let the patient gradually cool, then his ſkin may be rubbed with hot flannel, after which dry linen may be put on.

The crem. tartari is recommended by Dr. Home, taken from one to two ounces in a day, diſſolved in ten or twenty times its quantity of water; this dilution contributes, it is thought, much to the diuretic power of this medicine, as it is by this means that moſt diuretics are determined to the kidneys.

During the intervals of ſweating, endeavour to ſtrengthen by the uſe of the bark, chalybeates, acidum vitrioli dilutum, exerciſe, &c. To prevent a relapſe, if the viſcera will admit, the cold-bath will be the moſt adviſeable.

Scarifications with a knife are much commended when the legs and thighs are turgid with extravaſated ſerum, and indeed the water is ſpeedily diſcharged this way; but ſome inconveniencies attend this practice; firſt, the lips of the wound will cloſe in two days, ſo as to admit of no diſcharge; from a defect of heat in the conſtitution, the part is apt to mortify. To obviate theſe difficulties, Dr. Fothergill adviſes this operation to be performed with the "common ſcarificator uſed in cupping, and the inſtrument to be placed ſo as to make the wounds tranſverſely; if the ſkin is thick the lancet may be ſo ſet as to make deeper and conſequently wider inciſions: thus a large quantity of water will often drain from the legs or thighs, without riſk of inflammation, or deterring the patient from a repetition, if it is neceſſary. To proceed with the greateſt utility, let the punctures be made in the moſt depending part, viz. the foot; their number and repetition muſt depend on the circumſtances of each individual caſe. The application of glaſſes, either before or after ſcarifying, is unneceſſary, but the inſtrument muſt be gently preſſed upon the ſkin, until a ſurface is formed ſufficiently flat to admit the lancets, in the ſcarificator, to take effect equally. By making theſe openings tranſverſely, the fluid is more freely diſcharged, and they are longer before they unite. In all caſes where the ſkin is ſo ſtretched as to threaten inflammation, a rupture, or a gangrene, theſe openings ſhould be made without delay; alſo when the breath is much affected." There is one thing to be obſerved, not only in this but every ſpecies of dropſy, attempted to be cured by internal means; that however they may be relieved by different evacuations, promoted by art, or now and then the effect of nature, without the urinary paſſages are made to exert, and continue their evacuating power, the cure of dropſical complaints will never be laſting. See Lond. Med. Obſ. and Inq. vol. iv. p. 120, 122. Dr. Leake's Medical Inſtructions, edit. v. Cullen's Firſt Lines, vol. iv. edit. iv. Le Dran's Operations, edit. ii. p. 113—116. The London Practice of Phyſic, edit. v. Bell's Surgery, v. 499. Wallis's Sydenham on the Dropſy.

ANASPASIS, from ἀνὰ and σπάω, *to draw*. Hippocrates uſes this word to expreſs a contraction of the ſtomach.

ANASSUTOS, from ἀνὰ for ἄνω, *upwards*, and σεύω, *to move*. Hippocrates uſes this word as an epithet to air, when ſpeaking of the ſuffocation obſerved in hyſteric fits, and the air ruſhing out with violence upwards, as alſo in fighting.

ANASTALTICA, from ἀναστέλλω, *to contract*. See ASTRINGENTIA.

ANASTASIS, from ἀνίστημι *to cauſe to riſe*. Hippocrates uſed this word to expreſs a riſing up to go to ſtool; alſo a migration of humours, and a riſing up or recovery from ſickneſs.

ANASTOICHEIOSIS, from στοιχεῖον, *a principle* or *element*, of which bodies are compoſed.

A waſting of the ſolids or fluids of the body.

ANASTOMOSIS, from ἀναστομόω, or ἀνὰ, *per*, and στόμα, *a mouth*, alſo *exanaſtomoſis inoſculatio*. To RELAX or OPEN THE MOUTHS OF THE VESSELS. The opening of the mouths of the veſſels to diſcharge their contained fluids. Anatomiſts uſe the word to expreſs the inoſculation of the arteries and veins, or their running into one another.

The menſes, &c. diſcharged, are ſaid to be diſcharged per *anaſtomoſin*, i. e. by the opening the mouths of the veſſels.

The blood tranſuding through the ſides of the veſſels, the diſcharge is ſaid to be per *diapedeſin*, tranſudation.

If the veſſels are corroded by acrid humours, the diſcharge is by *diabroſis*, eroſion.

ANASTOMOTICA. Medicines are thus called that are ſuited to open the mouths of the extreme blood veſſels, or it is a term ſometimes of the ſame import with *aperientia*.

ANAT. The abbreviation of anatomica.

ANATES. A diſeaſe of the anus.

ANATHRON. A ſort of ſalt which vegetates on rocks in the form of white ſtoney moſs. It is a ſort of nitre.

ANATHYMIASIS, from θυμιάω, *to fumigate*. See EVAPORATIO.

ANATICA PROPORTIO, from *ana*, equal parts.

ANATOMIA, ἀνατομὴ, from ἀνὰ, *through*, and τέμνω, *to cut*, or from διατέμνω, *to diſſect*.

Celſus obſerves, that "though many things do not belong to the arts themſelves, yet thoſe very things prove uſeful to them." So though *anatomy* does not form the phyſician, it renders him better qualified for the practice of his profeſſion. *Anatomy* is the art of diſſecting an animal, eſpecially the human body, in order to demonſtrate the matter, ſhape, ſtructure, connection, and ſituation of the parts; this, though it does not teach to cure, hath a tendency to make the cure proceed both more ſafely and agreeably. In ſhort, whatever perfection the art of healing might have riſen to, by the aid of practical experiments and obſervation, it cannot be denied that its greateſt lights were received from *anatomy* and phyſiology. To know the peculiar ſtructure of each part, its uſe, what functions it performs, what connection it hath with other parts, and influence on them, whether near or remote, are advantages too obvious to be denied.

In applying topical remedies, *anatomy* bids us expect leſs effect from them on the hip than on other parts of the body, becauſe of the quantity of fat there, and the thickneſs of the muſcles. The fat about the region of the ſtomach forbids external medicines for the relief of that viſcus from being applied there, but directs them on the ſpine of the back, or rather on the left ſide of the ſpine, about and under the falſe ribs, not but medicines do ſervice on all theſe parts. The linea alba, being the tendons of almoſt all the abdominal muſcles, applications on it are peculiarly uſeful; hence fat rubbed on the navel procures ſtools; gall rubbed there, expels worms; civet rubbed on this part relieves in the convulſive colic; and a ſuppreſſion of urine is removed by applying the oil of turpentine to the ſame place.

The ſympathy of the nerves leads us to diſtinguiſh many diſeaſes, the ſeat of which is in one part of the body, whilſt a very diſtant one is the part complained of. The intercoſtal branch, and the eight pair of nerves, run almoſt all over the body.

The greateſt geniuſes find that their enquiry cannot be too minute in this branch of phyſic, and the moſt eminent profeſſors and practitioners have, at all times, endeavoured to increaſe their acquaintance therewith.

Hippocrates, though he only once had the opportunity of viewing a human ſkeleton, yet uſed every method in his power to inform himſelf in this branch of his art, and hath left behind a tolerably good deſcription of the human bones.

After Hippocrates, ſucceeded Alcmæon of Crotona. Ariſtotle, Herophillus, Eraſiſtratus, Aretæus, Praxagoras, Galen, Oribaſius, Nemeſius, Mundinus, Alexander Achilinus, Guido de Cauliaco, Jacobus Berengarius Carpenſis, Nicolaus Maſſa, Andreas Veſalius, Jacobus Sylvius, Michaelas Servetus, Realdus Columbus, Ambroſius Paræus, Bartholomæus Euſtachianus, Volcherus Coiter, Andreas Cæſalpinus, Hieronymus Fabricius ab Aquapendente, William Harvey, Theophilus Bonetus,

William Cooper, James Douglas, Clopton Havers, Marcellus Malpighius, Nathaniel Highmore, Anthony Nuck, Pecquet, Monro, ſen. Morgagni, Needham, Nicholls, Ruyſch, Steno, Winſlow, Cheſelden, and many others, who, as phyſicians, ſurgeons, or both, did honour to their profeſſion.

The firſt anatomical publication in the Engliſh language was, The Engliſhman's Treaſure, or the true *Anatomy* of Man's Body, by Thomas Vicary, Surgeon in London. It was printed and reprinted three or four times between the years 1548, and 1633.

It is the advice of the greateſt anatomiſts, that authors on this ſubject ſhould not be read before an acquaintance with the parts is in ſome degree obtained, by ſeeing bodies diſſected; until then, books rather tend to retard than to facilitate the progreſs. When by ſeeing all the parts demonſtrated, and their uſes explained, the ſtudent hath a clear idea of them; then reading will be neceſſary, both to fix the impreſſion on the mind, and to inform him of different opinions and diſputed points: for now there is not ſo much danger of being prejudiced in favour of this or that doctrine, as he is in ſome degree qualified for ſettling what is juſt and good, and of rejecting what is erroneous.

Thoſe whoſe ſituation, &c. does not favour their attendance on diſſection, may acquire a good general knowledge of the *anatomy* of a human body, from the peruſal of Keil's Abridgment of *Anatomy*, Cheſeldon's, and Northcote's *Anatomy*. Heiſter's Compendium is alſo uſeful. Winſlow's *Anatomy* ſeems beſt calculated for the attention of thoſe who have already been familiar with diſſections, and the demonſtrations given by able anatomiſts. But one of the moſt uſeful works for ſtudents is a Syſtem of Anatomy and Phiſiology publiſhed at Edinburgh, 1791.

The Anatomical Tables of Albinus and of Euſtachius ſhould be attended to. Albinus's edition of Euſtachius is the beſt. Cooper's Tables are the moſt elegant. Jenty's are alſo truly valuable.

ANATON. See ANATRON.

ANATRESIS, from ανα, and τρεω, *to perforate*. Galen uſes this word to expreſs trepanning.

ANATRIS. See ARGENTUM VIVUM.

ANATRON, alſo called *natron*, *nataron*, *anachron*, *ſoude blanche*, *nitrum antiquorum*, *litron*, *aphronitrum*, *baurach*, *ſal alkalinus ſalis marini*, *barilla*, *ſoda*, *ſalitron*, *bariglia*; *anaton*, *anatrum*.

The *anatron* of the ancients, called natron by the Egyptians, is the MINERAL FIXED ALKALINE SALT. For the account of which, ſee ALCALI.

On the Peak of Teneriffe, the inhabitants call it SALITRON, which is their name for ſalt-petre alſo.

Anatron is a name of the ſpume or gall of glaſs, which bubbles on the ſurface while in the furnace: it is alſo the name of the *terra Saracenica*, of which are three kinds, the red, black, and azure; and laſtly, of a white ſtoney excreſcence which is found on rocks, growing there ſomewhat in the form of moſs.

ANATROPE, from ανατρεπω, *to ſubvert*. A ſubverſion or relaxation of the ſtomach, with loſs of appetite and naufea. Vogel ſays it is a want of appetite with naufea.

ANATRUM. See ANATRON.

ANATUM. See OVORUM TESTA.

ANAUDIA. } See CATALEPSIS.
ANAUDOS, }

ANAUDOS, from α, neg. and αυδη, *ſpeech*. Galen ſays it means one who hath loſt the uſe of ſpeech, but retains his voice; whereas aphonia ſignifies the loſs of voice.

ANAXYRIS. See LAPATHUM VULGARE.

ANBAR. See AMBRA.

ANCHA. See FEMUR.

ANCHE, os. See FEMORIS OS.

ANCHILOPS, or ANCHYLOPS. See ÆGYLOPS.

ANCHOAS. The Mexican name for the male ginger.

ANCHORALIS, PROCESSUS. See PROCESSUS CORACOIDES.

ANCHUSA, from αγχω *ſtrangulo*, *ſuffico*, *quod ſerpentes ſtrangulet*, *necetque*; called alſo *alcibiadion*, *alcibiadium*, *bugloſſum radice rubra*, *anchion*, *onochelis*, *onochyles*, *doris*, *enchuſa*, *enchyſa*, *onoclea*, *alcanna*, DIER'S BUGLOS, or ALKANET ROOT. It is the *anchuſa* tinctoria, or ANCHUSA TOMENTOSA, foliis lanceolatis obtuſis, ſtaminibus, corolla brevioribus. CLASS PENTANDRIA—— ORD. MONOGYNIA, Lin. Gen. Plant. 182.

The alkanet plant is rough, hairy, and perennial, with unbranched procumbent ſtalks. It is of the bugloſs kind, and differs from the common bugloſs chiefly in the red colour of the roots. It grows wild about Montpelier, and in the eaſtern countries; it is cultivated in ſome of our gardens, but the roots produced in this clime are paler coloured than thoſe from abroad.

The roots are of a deep purpliſh colour outwardly, they give out a deep red colour to oil, wax, all unctuous ſubſtances, to ſpirit of wine, and ſpirit of turpentine. $\frac{1}{40}$th part of the bark of this root colours $\frac{1}{2}\frac{1}{8}$ths of any of the above matters; by a gentle heat they moſt perfectly extract its colour. It is now only uſed for colouring oils, ointments, and plaiſters; formerly it was conſidered to poſſeſs aſtringent powers, and recommended in many diſorders.

There is another ſpecies called *alcibiadium*, *onochiles*, *onochelis*, and *rexis anebion*. Its principal difference is, that its leaves are ſmaller.

A third ſort, with ſmaller ſeeds, is ſaid to deſtroy the broad worm, if taken in doſes of half an ounce.

ANCHYLE, ſee ANCHYLOSIS. A contraction of a joint; or the back part of the knee.

ANCHYLOMERISMA. In Sagar's Noſology, it ſignifies a concretion, or growing together of the ſoft parts.

ANCHYLOPS, from αγκυλη, *a ſtricture*. See ÆGILOPS.

ANCHYLOSIS, from αγκυλος, *crooked*; it is alſo called *ancyle*, *ancyloſis*, *anchyle*, a STIFF JOINT, a ſpecies of which is called *orthocolon*. It is a ſpecies of contracture, in Cullen's Noſology. Some diſtinguiſh this diſorder thus: *ancyle*, is when the bones are immoveable, and the joint in a bent poſition; but if the limb is ſtraight, and cannot be bended, it is named *orthocolon*. Petit divides this caſe into the true and falſe; the true are ſuch wherein the bones are united ſo as to become as it were one; the falſe is when from the tendons being contracted, or other parts about the joint are diſeaſed, the limb is rendered immoveable.

The bones are covered at their ends where they form joints, with cartilages, to facilitate their motion, and to prevent any farther production of bone; and if theſe cartilages ſhould be eroded, there will be an excreſcence conſequently thereon, which will produce this diſorder: however, it is ſometimes a cure of ſome other worſe misfortune.

The general cauſes are a caries, abſceſſes in the joints producing caries, oſſification of the ligaments, ſtrumous and ricketty diſorders, contraction of the tendons.

When the bones are united, the cure is impoſſible; and whatever elſe is the cauſe, the cure is very uncertain, on account of the difficulty of coming at the ſeat of the diſeaſe; and, indeed, often from the difficulty of knowing what part about the joint is the part primarily and principally affected, or even in any degree the cauſe.

The moſt ſimple caſe of this kind is that from a long confinement of the limb to one poſition; an inflammatory affection of the ligaments, from external injuries, is generally very difficult to remove; rheumatic and arthritic matter falling on the joint is hardly to be removed; but the worſt is what is commonly called a white ſwelling, which is moſt probably owing to a ſcrophulus virus.

If the cauſe is a rigidity of the tendons, emollient topics are the proper means of relief. Dr. Lobb, from obſerving the glovers ſoften hard leather with a mixture of the yolk of egg and water, propoſed it in ſome inſtances of this kind, it is ſaid, with the beſt ſucceſs: his preſcription is as follows:

EGG LIQUOR.

Take the yolk of a new-laid egg, beat it with a ſpoon to a water, then, by a ſpoonful at a time, add ſix table ſpoonfuls of pure water, ſhaking the mixture well, that the water and egg may be well mixed; this done, apply it by gently rubbing it on the contracted part three or four times a day; rub it for a few minutes each time, and let a freſh mixture be made every day.

Others commend mucilaginous oils, of which the ol. e pedib. bovin. neat's foot oil, is the beſt.

If an inflammatory ſtate of the ligaments is the cauſe, remedies that are known to reſolve inflammation in deep ſeated parts are the moſt proper; theſe are medicaments of the aſtringent and ſtimulant kind, and not emollients. Bliſters, the moſt powerful remedies of this ſort, have in many inſtances ſucceeded in this caſe, whilſt it was in a recent ſtate.

In more inveterate caſes a few cures have been effected by

by the pump. Warm water pumped upon the diſeaſed part, and falling from a conſiderable height upon it, hath by repetition been ſucceſsful. The warm bath hath had the like happy effects by continuing an hour or more at a time in it, and repeating the ſame for ſeveral days ſucceſſively. After the bath or the pumping, emollients muſt be applied.

In ſcrophulous caſes, all means hitherto uſed have failed; however, as palliatives, when the tumor burſts into ulcers, the aqua lithargyri compoſita, and ſuch like preparations, are conſiderably beneficial.

See Petit on the Diſeaſes of the Bones. Heiſter's Surgery. Mem. de l'Acad. Royale des Sciences, ann. 1721, and 1728. Aikins's Obſ. on the Preparations of Lead. Bell's Surgery, vi. 283. White's Surgery, 431.

ANCHYNOPES. See LOLIUM.

AMCHYROIDES. See CORACOIDES.

ANCI, alſo *galiancon*, *ancus*, WEASEL-ELBOWED, from γαλη, *a weaſel*, and αγκων, *an elbow*. As when the head of the humerus is in the arm-pit. Theſe patients are alſo called *muſtelanci*. The diſorder which this name expreſſes, is, when the humerus is luxated in the uterus, or in infancy when an abſceſs thruſts out the head of the bone.

ANCINAR. See BORAX.

ANCON. See OLECRANON.

ANCONÆUS, from αγκων, *the elbow*, MUSCULUS, called alſo *cubitalis muſculus*. It riſes by a round ſhort tendon from the outer condyle of the os humeri backwards; it ſoon grows fleſhy, and is inſerted into the ulna about three inches below its head, ſerving to extend the arm. This muſcle is reckoned by ſome as a part of the *brachiæus externus*; from which in diſſection it cannot be ſeparated without violence.

ANCORA. See CALX.

ANCORALIS. See CORACOIDES PROCESSUS.

ANCOSA. See LACCA.

ANCTER, ANCTERIASMOS. The Greek term for the fibula, or button, by which the lips of wounds are held together, which operation Galen calls αγκτηριασμος anctériaſmus.

ANCUBITUS. That affection of the eyes in which they ſeem to contain ſand. It is alſo called *petrificatio*.

ANCUNULENTÆ. Women are ſo called during the time of menſtruation. *Ancunulenta* is compoſed of *am*, for αμφι, and *cunia*, *quaſi*, κοινω, *to pollute*. From the Greek κοι ς, comes the Latin *cœnum*, *mud* or *filth*, whence are derived *cunire* and *inquinare*, to defile.

ANCUS, a name for ſuch as have an arm bent, ſo that they cannot extend it, from αγκων, *an elbow*. See ANCI.

ANCYLE, & ANCYLOSIS. See ANCHYLOSIS.

ANCYLOBLEPHARON, from αγκυλος, *bent*, and βλεφαρον, *an eye-lid*. A diſeaſe of the eye which cloſes the eye-lids. Vogel defines it to be the gluing together of the upper and under eye-lid.

Sometimes the eye-lids grow together, and alſo to the tunica albuginea of the eye, from careleſſneſs when there is an ulcer in theſe parts. Both theſe caſes are called *ancyloblepharon* by the Greeks.

SAUVAGES ſays, "That it is an adheſion of the ſuperior with the inferior eye-lid; whence the eyes lids wink, and the rays of light are either totally or partially intercepted. This diſorder derives its origin from glutinous diſcharges, ſuch as attend moſt ophthalmies, chiefly in ulcerated eye-lids, and is cured by warm milk, and abſorbent powders, commonly tutty; or the coalition is a perfect concretion of the palpebræ with each other, or often with the eye." In theſe caſes ſometimes there is a ſmall aperture, which is generally in the great angle of the eye; if there ſhould not be any, a perforation muſt be made in either angle, a probe with a groove then introduced, and with a fine-edged knife let the parts be ſeparated. This done, ſee if the eye-lids adhere to the globe; if that ſhould be the caſe, they muſt be carefully divided from each other, in the operation being more ſparing of the eye-lid than ſclerotica. If the adheſion is only to the conjunctiva, blindneſs is not the conſequence; if on the cornea, the ſight is inevitably loſt. The re-union is better prevented by injection, or lint placed between the eye-lid and ball of the eye, after dipping it in ſome mild liniment, than by a plate of lead, as recommended by SAUVAGES, be it ever ſo thin, as that might from its hardneſs bring on a ſevere inflammation.

Mr. Bell ſays, when the adheſion of the eye-lids is ſlight, and has not been of long duration, it may be ſeparated by the end of a blunt probe inſinuated behind it, ſo as to tear it aſunder; but when they adhere firmly, or to the eye-ball, he adviſes ſlow diſſection of every adhering fibre, and then the eye only to be covered with a piece of ſoft lint ſpread over with Goulard's cerate, or any other cooling emollient ointment; and after the firſt dreſſing, a ſmall portion of the ſame daily inſinuated between the eye-lids.—Perhaps in preference to all others the following may be uſed; the unguentum hydrargyri, cum hydrargyri parti unâ, adipis ſuillæ pp. partibus quatuor, bis de die utendum: the parts may be bathed twice a day with a weak ſolution of the zincum vitriolatum purificatum, or ceruſſa acetata. See Wallis's Noſologia Methodica Oculorum, p. 51. Bell's Surgery, vol. iii. p. 297. Cullen's Firſt Lines, vol. i. p. 271. Edit. 4.

ANCYLOGLOSSUM, from αγκυλος, *crooked*, and γλωσσα, *the tongue*. A contraction of the ligaments of the tongue: TONGUE-TIED. Vogel defines it to be an adheſion of the tongue to the adjacent parts, ſo as to hinder ſucking, ſwallowing, and ſpeaking.

Some have this imperfection from their birth, others from ſome diſeaſe. In the firſt caſe the membrane which ſupports the tongue is too ſhort or too hard; in the latter, an ulcer under the tongue, healing and forming a cicatrix, is ſometimes the cauſe; theſe ſpeak with ſome difficulty, and are called by the Greeks μογιλαλοι. See MOGILATIA.

The *ancyloglooſſi* by nature are late before they ſpeak, but when they begin they ſoon ſpeak properly: theſe we call tongue-tied. Mauriceau ſays, that in this caſe it is a ſmall membranous production, which extends from the frænulum to the tip of the tongue, that hinders the child from ſucking, &c. He forbids the cruel practice among nurſes, of tearing this membrane with their nails, for thus ulcers are ſometimes formed, which are of difficult cure: and he adviſes to ſnip it with ſciſſars in two or three places, being careful not to extend the points of the ſciſſars ſo far as the frænulum. When the child's tongue is tied, it is obſerved not to ſuck very freekly, he loſes his hold of the nipple very frequently, and whilſt ſucking he makes a chucking kind of a noiſe. The inſtances rarely occur which require any kind of aſſiſtance, for if the child can thruſt the tip of its tongue to the outer edge of its lip, this diſeaſe does not exiſt; and if the tongue is not greatly reſtrained, the frænulum will ſtretch by the child's ſucking and crying. Beſides, without an abſolute neceſſity for it, an operation ſhould not be admitted; for without great circumſpection, by cutting the frænulum, the nerves paſſing there may be alſo cut, and then a loſs of ſpeech is the conſequence.

Sometimes the tongue is bound down with a fleſhy ſubſtance; when that is the caſe, it ſhould never be cut through, becauſe a dangerous hæmorrhage would follow, without any attending advantage; all that is adviſable in this circumſtance, is to direct the nurſe, now and then, to ſtretch it gently by a light preſſure on it with her finger end. When in conſequence of delivering a child by the feet, a ſwelling is obſerved under the tongue, the nurſe ſhould be forbid to uſe any means, for the complaint will be increaſed thereby: this tumor will ſoon ſubſide.

See Hildanus in Cent. iii. Obſ. 28. where he gives an accurate account of the nature, cure, and bad effects that may follow on improper methods being uſed for the cure of this diſorder. He never cuts more of the frænum than appears ligamentous, and then orders it to be gently rubbed two or three times a day with honey of roſes. Bell's Surgery, vol. iv. p. 336.

ANCHYLOMELE, from αγκυλος, *crooked, and* μελη, *a probe*, called alſo *ancyromele*. A crooked probe, or a probe with a hook.

ANCYLOSIS. See ANCHYLOSIS.

ANCYLOTOMUS, from αγκυλος, *crooked*, and τεμνω, *to cut*. Any crooked knife uſed in ſurgery.

ANCYROIDES, a proceſs of the ſcapula, ſo called from αλκυρα, *uncus*, *a beak* or *hook*, and ειδος, *form*. See CORACOIDES PROCESSUS.

ANCYROMELE. See ANCYLOMELE.

ANDA. A tree growing in Braſil, with fruit which taſtes like the cheſnut, and is purgative: two or three kernels are ſufficient for a doſe. The rind of theſe kernels is aſtringent.

ANDARAC. See AURIPIGMENTUM.

ANDENA. Steel which melts in the fire, and may be caſt into any form.

ANDHURA. See ANDIRA ACU.

ANDIRA,

ANDIRA, called alſo *angelym & arbor nuciſera*. It is a tree which grows in Braſil, whoſe wood is proper for building. The fruit is a yellow kernel; it is bitter, aſtringent, and, if taken inwardly, it deſtroys worms; ℈ i. of it in powder is a doſe.

There is another ſpecies, which only differs in not being bitter.——The ANDIRA ACU, or ANDIRA GUACU, is a large kind of BAT, nearly as large as a pigeon. They are met with in Braſil; and are called by ſome horned bats, becauſe of a pliant excreſcence above the beak. They perſecute all ſorts of animals, alſo get to the beds of men, and ſuck their blood.

ANDRACHNE. See PORTULACA.

ANDRANATOME, or ANDROTOME, from ανηρ, *a man*, and τεμνω, *to cut*. The diſſection of a human body, eſpecially of a male.

ANDRAPHAX, or ANDRAPHAXIS, ſee ATRIPLEX FŒTIDA.

ANDRIA, from ανηρ, *a man*. See HERMAPHRODITUS.

ANDRIUS. MANLY. It is metaphorically applied to ſtrong wine, or wine from the iſland of Andros.

ANDROGENIA, from ανηρ, *a man*, and γινομαι, *to generate*. A ſucceſſion of males.

ANDROGYNE, } from ανηρ, *a man*, and γυνη, *a*
ANDROGYNI, } *woman*. EFFEMINATE MEN, and HERMAPHRODITES. See GYNANTHROPUS. In BOTANICAL LANGUAGE it means, a plant bearing male and female flowers on the ſame root, without any mixture of hermaphrodites; ſuch plants are to be found chiefly in the Claſs MONOECIA: IN FLOWERS, it means having ſtamen or piſtils only.

ANDROMACHI THERIACA.

This medicine of *Andromachus* hath above ſixty ingredients in it, but the vipers are what gives it its name of *theriaca*; for the word θηριον, imports all fierce animals in general, but more particularly the poiſonous ſort. It is needleſs to repeat the univerſal good aſcribed to this compoſition by its author; it was his catholicon, and conſidered as an antidote acting as an alexipharmac. See ALEXIPHARMACA.

As to crowding ſo many drugs into one medicine, ſome ſay it was, that a concurrence of ſimilar ingredients might be more effectual; but Pliny ſays, it was only to make the people imagine ſomething more in their favour.

The treacle of *Andromachus* is called VENICE TREACLE, becauſe great quantities of it was made there, and thence tranſported to other countries. It is now rejected from the preſent Pharmacopœia of the London College, very properly.

ANDRONION, i. e. Andronis paſtilli, or the TROCHES OF ANDRON. They are made with alum, balauſtines, &c.

ANDROPOGON NARDUS. See NARDUS ITALICA.

ANDROPOGON SCHÆNANTHUS. See JUNCUS ODORATUS.

ANDROSACE, alſo called *umbilic. marin. cochlea cælata, acetabulum marinum minus, fungus petræus marinus, cotyledon marina*, and SEA NAVELWORT. It is a ſubmarine production, found on the rocks and ſhells of fiſhes about the coaſt of Montpelier, and elſewhere. It conſiſts of numerous, ſlender, ſhort filaments, more or leſs bent or arched, of a whitiſh or grey colour, hard and brittle, bearing each upon the top a ſtriated concave body, nearly of the figure of an inverted cone.

In powder it is given as a vermifuge. It does not differ very materially from coralline. If the dried *androſace* is held in the flame of a candle, it yields a dazzling brightneſs, and this repeatedly for ſeveral times, and the coralline does the ſame.

ANDROSACES, SUMMER NAVEL-WORT.

This is a plant which is found growing on the ſea-coaſts of Syria. It is called *androſace* from its bringing relief to men. It is ſlender, hath thin ſtalks which are bitter; it is without leaves, but hath ſmall pods on the top of the ſtalks, in which are the ſeeds. The flowers are white.

Two drams of this herb, or of its ſeed, taken in wine, powerfully promotes urine.

ANDROSÆMUM, or ANDROSÆMON. Alſo called *Siciliana, clymenum Italorum, aſcyroides, aſcyrus, aſcyrum, aſcyos, hypericum, ciciliana, dionyſias*. In Engliſh it is named TUTSAN, or ALL-HEAL, PARK-LEAVES, and ST. PETER'S WORT. It grows in hedges and thickets, the leaves reſemble thoſe of laurel, the ſtalks are red, and the flowers, which blow in July and Auguſt, are yellow. Two drams of this are moderately purgative, but it is rarely uſed.

The name *androſæmum*, is from ανηρ, *a man*, and αιμα, *blood*, for it makes the fingers red if they rub it. *Tutſan* is a corruption of the French words *tout-ſain*, which ſignifies all-heal.

ANDROTOME. See ANDRANATOME.

ANDSJUDÆN. See ASAFŒTIDA.

ANEBION. See ANCHUSA.

ANECPYETUS, from α, neg. and εκπυησις, *ſuppurated*, not ſuppurable.

ANEILEMA, or ANEILESIS, from ανειλεω, *to roll up*, or *involve*. An involution, ſuch as is cauſed by flatulence and gripes.

ANEMIA. The name of a diſorder which Hippocrates mentions, but does not deſcribe. It is unknown what it is.

ANEMONE. WIND-FLOWER. Called alſo *phenion*. There are the garden and the wild ſorts, each of which are divided into many ſpecies. They are much admired in gardens, but rarely uſed in medicine. The root of the ſcarlet *anemonies* are deterſive if bruiſed while freſh, and applied to ulcers, and on the ſkin it raiſes bliſters. The herb hath been uſed in collyriums and errhines.

ANEMONE HEPATICA. See HEPATICA NOBILIS.

ANEMONE PRATENSIS. See PULSATILLA NIGRICANS.

ANEMONOIDES, alſo called *nemoroſa, ranunculus phragmitis albus vernus*. The wood anemone. Miller enumerates ſix ſpecies of it.

Its virtues as a medicine are ſimilar to thoſe of the garden anemone.

ANENCEPHALOS, from α, neg. and εγκεφαλος, *the brain*. Brainleſs, or thoſe who are born without brains; alſo thoſe who are fooliſh or mad.

ANEOS. Struck with the loſs of voice and reaſon.

ANEPITHYMIA. ERROR OF APPETITE BY DEFICIENCY, as in inſtances of anorexia.

ANERIC, } See SULPHUR VIVUM.
ANERIT, }

ANESIS. REMISSION.

ANESUM. See ANISUM.

ANETHOXYLA. The woody root of dill.

ANETHUM. } DILL or ANET. It is the ANETHUM
ANET. } GRAVEOLENS: or, ANETHUM fructibus ſubovatis compreſſis ſtriatis. Petala involucra, integra. CL. PENTANDRIA; ORD. DIGYNIA. Lin. Gen. Plant. 364.

It is an annual umbelliferous plant, with finely-divided leaves, and yellow flowers. The ſeeds are brown, and of an oval ſhape, flatted on one ſide, convex, and marked with three longitudinal ridges on the other; about their edges they are ſurrounded with a yellow leafy margin. It is a native of Spain and Portugal. By cultivation it thrives in our gardens. It flowers in July, and in September ſheds its ſeeds, by which it is propagated.

The herb, flower, and ſeeds are medicinal, but the ſeeds only are uſed in the ſhops. They are carminative and antiſpaſmodic in the primæ viæ. Cullen's Mat. Medica; ʒ i. to a doſe is reckoned ſpecific in hiccoughs. In ſome ſymptoms of indigeſtion ariſing from a relaxation of the ſtomach, they are ſaid to be ſerviceable, and more efficacious than the other ſeeds, from promoting a ſecretion of milk. They give over all their virtue by diſtillation to water, but not by digeſtion or infuſion. With the diſtilled water there ariſes a conſiderable portion of oil, which, as a carminative againſt hiccoughing, from two to four drops are given for a doſe. Rectified ſpirit of wine obtains all the virtue by digeſtion, but takes very little over with it by diſtillation. The London college orders a ſimple water from theſe ſeeds, as follows:

AQUA ANETHI, DILL WATER.

Take of *dill* ſeed one pound, of water ſufficient to prevent an empyreuma, draw off one gallon.

ANETHUM FÆNICULUM, } See FÆNICULUM VUL-
FRUCTIBUS OVATUS. } GARE.

ANETICA, from ανιημι, *to remit*. See ANODYNA.

ANEURISMA, from ανευρυνω, *to dilate much*; and that from ανα, *aſunder*, and ευρυς, *broad*: called alſo *Hæmatocele arterioſum, abſceſſus ſpirituoſus, emboryſma*.

The *aneuriſm* is a tumor, ariſing from the dilatation or rupture of the coats of an artery. Arteries only are the ſeat of this diſorder; and any artery, in any part of the body,

body, may be thus affected, as any vein may be the ſeat of a varix.

Dr. Cullen ranks this genus of diſeaſes in the claſs locales, and order tumores, and deſcribes it, a ſoft pulſating tumor, upon an artery.

Dr. Hunter divides *aneuriſms* into four kinds, viz. the true, the falſe, the mixed, and the varicoſe.

Firſt, OF THE TRUE ANEURISM.

The true *aneuriſm* is formed by a dilatation of the artery. It may happen in any part of the body, but moſt frequently is found in the curvature of the aorta, which is ſubject to this diſorder from the extraordinary impulſe of the blood there; from the curvature it runs upwards along the carotids, or the ſubclavians, generally increaſing, till by its great diſtention it is ruptured, and the patient dies.

The degrees of the dilatation of the aorta in caſes of this kind are various; in ſome the curvature of this artery hath been ſo enlarged as nearly to fill the upper part of the breaſt. And what is peculiar, and deſerving our attention, is, that the ſpot of the veſſel, which is the weakeſt, and where the diſeaſe begins, is apt to be ſtretched more in proportion than other arteries, and to form particular cells, where they meet with firm reſiſtance, more than where their ſupport is ſoft and yielding.

The ſac formed by the diſtenſion of the artery is not a diſtention of a particular coat, but of the whole ſubſtance of the veſſel: but the thickneſs of the coats of theſe ſacs will laſt only to a certain period; for when the veſſels of the coats can no longer conform to the extenſion, the circulation grows languid, the ſac becomes thinner at its apex, and ſoon after burſts: farther, as the *aneuriſmal* tumor increaſes in ſize, it meets with reſiſtance from the neighbouring parts, and as the coats will be more or leſs affected, according to the degree of the reſiſtance; in ſome places they will be ſimply diſtended, in others abſolutely deſtroyed, e. g. where the *aneuriſm* preſſed againſt the diaphragm, it will be thinner than where it ſuffers no preſſure; it is ſtill thinner where it preſſes againſt the tendinous part of the diaphragm; and where it preſſeth the ſpine, it is the ſooneſt eroded through. A proof that all preſſure muſt be avoided in all inſtances of this ſort.

The blood that fills theſe tumors is always fluid, by being conſtantly renewed; that is, as faſt as one drop enters another paſſes out, and continues its courſe in the circulation; but, notwithſtanding this blood is fluid, its paſſage in the tumor is retarded, and this remiſſneſs in its motion, which is more or leſs conſiderable, according to the ſize of the *aneuriſm*, occaſions ſome of the fibrous parts of the blood to ſeparate from the red part, and adhering to the internal coat of the *aneuriſm*, it there forms fibrous ſtrata, which may eaſily be taken for real membranes by thoſe not accuſtomed to obſerve them. Theſe fibrous ſtrata cannot be diſperſed by any means, either external or internal, and preſſure cannot be uſed, becauſe thereby the coats of the artery are ſoon deſtroyed.

Secondly, OF THE FALSE ANEURISM, called *Ecchymoma Arterioſum*.

It is formed by a rupture or wound in the coat of the artery, and is of two kinds, viz. the diffuſed and the circumſcribed.

THE DIFFUSED is that in which the extravaſated blood runs through the cellular membrane, in the interſtices of firmer parts; this generally makes a rapid progreſs, may extend itſelf to a great diſtance, and hath little or no pulſation, except very near the aperture of the artery; but theſe circumſtances will ſomewhat vary, according to the ſize of the opened artery and the ſtrength of the circulation. With regard to the lodgment of the fluid, this ſpecies of falſe *aneuriſm* is analogous to the emphyſema, and is the higheſt ſpecies of ecchymoſis.

THE CIRCUMSCRIBED TUMOR beats, and ſinks under preſſure, like the true *aneuriſm*, and indeed cannot be diſtinguiſhed from that, except by the knowledge of its cauſe, or by a careful diſſection of the part: it appears ſoon after the accident which gave riſe to it, and is commonly ſlow and gradual in its progreſs. It happens when the orifice in the artery is very ſmall, ſo that the blood flows but leiſurely, and finds the adjacent membranes ſo firmly united as to keep it within a certain channel. It conſiſts of one bag with a ſmooth inſide, and communicates by an aperture with the cavity of the artery. This ſpecies of *aneuriſm* is, perhaps, the moſt common among thoſe that happen in the arm after bleeding, eſpecially when a conſiderable preſſure hath been made uſe of immediately after the accident.

Thirdly, OF THE MIXED ANEURISM.

This is formed partly by a wound or rupture in the artery, and partly by a dilatation of the reſt. It cannot eaſily be diſtinguiſhed from the circumſcribed ſpecies of the falſe *aneuriſm*; and will often ſo emulate the true one, as not to be diſtinguiſhed from it but by a careful diſſection.

Fourthly, OF THE VARICOSE ANEURISMS, OR THE ANEURISMAL VARIX.

This is when there is an anaſtomoſis, or an immediate communication between the artery and the vein of the part where the patient hath been let blood, in conſequence of the artery being wounded through the vein, ſo that blood paſſes immediately from the trunk of the artery into that of the vein, and ſo back to the heart.

This ſpecies differs from the common ſpurious *aneuriſm* in one circumſtance only, viz. the wound remaining open in the ſide of the vein as well as in the ſide of the artery. But this one circumſtance will occaſion a great difference in the ſymptoms, the tendency of the complaint, and in the proper method of treating it.

Dr. Hunter firſt deſcribed this ſpecies of *aneuriſm*, and to him the world is indebted for many improvements reſpecting the other kinds.

Mr. Bell, in his ſyſtem of Surgery, divides the *aneuriſm* into two ſpecies, viz. the encyſted, and the diffuſed. The *encyſted* includes all thoſe inſtances in which the coats of the artery, being only dilated, the blood is confined in its proper coat: of this kind he reckons the varicoſe *aneuriſm*. The *diffuſed* includes all thoſe in which from an aperture in the artery, the blood is ſpread about in the cellular membrane, out of its proper courſe.

The cauſes of *aneuriſms* are various. In the true *aneuriſm*, a particular natural weakneſs in a part of an artery is the immediate cauſe; and in general the cauſes of all the ſpecies may be one or other of the following: *internally*, a fulneſs of the arteries concurring with ſome violent motion, or other particular cauſe; an internal tumor preſſing on ſome part of an artery; or where there is no particular turgidneſs of the veſſels, violent action, ſudden anger, vomiting, &c. by propelling the blood too forcibly to ſome particular part; thus, by ſtretching the artery, a true, or by burſting it, a falſe *aneuriſm*, or the mixed one, will be formed: convulſions, and other violent ſpaſmodic ſymptoms, and perhaps an acrimony in the blood, by favour of ſome other concurring cauſe, may itſelf be ranked in the number of internal cauſes: *externally*, ſtrains, blows, and punctures are the moſt frequent; preſſure uſed on a true *aneuriſm*, by burſting the coats of the artery, produces a falſe one; ſuſpending the breath, as in lifting great burdens, wreſtling, &c.

It hath been ſaid that a polypus exiſting internally, ſometimes occaſions an *aneuriſm*; but Dr. Hunter obſerves, that it rarely or never happens that a polypus is formed till the laſt moments of life, when the heart's power having nearly ceaſed, the whole blood cannot be propelled from the heart, but ſtagnates, forming polypuſes; which being found after death, have been ſuppoſed to have pre-exiſted, and to have been the cauſe of what they were only the effect.

As to internal *aneuriſm*, there is no certain criterion by which to aſcertain their exiſtence before they approach to the ſurface of the body; whatever ſymptoms they occaſion before they form a tumor externally, as they may be produced by other cauſes, they are but equivocal ſigns. The pathognomonic ſign of all the ſpecies of *aneuriſm* is, a perceptible pulſation in ſome part of the tumor, more or leſs manifeſt, as the artery is ſeated ſuperficially or deep. The true *aneuriſm* is generally of an oblong figure, and hath a ſtrong pulſation in it; it ſubſides on depreſſion; if it is an *aneuriſm* of the aorta, a ſtrong pulſation is perceived againſt the ſternum and ribs on every ſyſtole of the heart, and when it extends above the ſternum, there is a tumor with pulſation. Theſe tumors are without diſcoloration in the ſkin, except on the point of burſting; there is no pain in them; they ſubſide by preſſure while the blood is fluid, but when it is coagulated, they diſappear but very little thereby; if there is a ſac with a narrow baſis, the blood re-enters the artery with a hiſſing noiſe when the tumor is preſſed. Sometimes there is a redneſs from the expanſion of the parts beyond their capacity, or from the putrefaction of the blood, in which caſe there are generally a fever and fainting alſo. The

common appearances of an *aneuriſm* from the wound of a lancet, are a diſcharge of blood through the orifice of the ſkin, by jerks, inſtead of an uniform ſtream; and upon being ſtopped from bleeding outwardly, an inſinuation of it among all the muſcles, as far as it can ſpread, in the ſhoulder and arm, conſtituting the diffuſed *aneuriſm*: in this caſe the arm becomes livid from the ecchymoſis, and the blood coagulating prevents any ſenſible pulſation.

In the falſe kinds of *aneuriſm* the cyſt is probably formed of a portion of the aponeuroſis that runs over the veſſel, which admitting of ſome extravaſated blood underneath, it becomes exceſſively thickened and expanded; that this membrane is the cyſt, ſeems to be confirmed by our ſo readily diſcovering the puncture in the artery upon opening the tumor: or it may be formed of the cellular membrane, which admits both of thickening and expanſion.

The appearances of the varicoſe *aneuriſm* will differ from the common falſe one as follows: the vein that was punctured will become varicous, and will have a pulſatile jarring motion, on account of the ſtream from the artery; there will be a hiſſing noiſe, which will be found to correſpond with the pulſe for the ſame reaſon; the blood in the tumor will be almoſt entirely fluid, becauſe it is kept in conſtant motion: it is ſoon formed to its largeſt ſize, and there remains, if it is not diſturbed by imprudent management; there are no conſiderable inconveniences conſequent. That this ſort of *aneuriſm* is preſent, may be further known by placing a finger over the orifice in the artery: thus the ſtream of blood propelled into the vein, at every pulſation, is felt; by applying the ear to the tumified vein, a tremulous motion and noiſe are perceived; by preſſing the correſponding artery, this motion, noiſe, &c. ceaſe, and on the removal of this preſſure, the motions, &c. return; the artery becomes larger in the arm and ſmaller in the wriſt; the vein being emptied by preſſure, inſtantly fills again on taking the preſſure off; the pulſe at the wriſt grows weaker as the artery above enlarges.

The beginning *aneuriſm* in the aorta ſhould be diſtinguiſhed from a palpitation of the heart; from hyſterics, in which ſymptoms of ſuffocation ſometimes attend; from fever with fainting, both which are ſometimes the conſequence of a falſe *aneuriſm*; from varices of the veins and their effects; from an emphyſema; from an ecchymoſis; from encyſted ſwellings in the neck, in which are often perceived a ſtrong pulſation from the ſtroke of the adjacent artery; and from tumor formed from ruptured veins.

The *aneuriſm* of the aorta may prove fatal many ways: it more and more injures the general health, as it continues to increaſe in its ſize; it may be ſupported during many years, but there can be no cure attempted, nor other palliatives uſed than what conſiſts in compoſure of mind and quietude of the body. All *aneuriſms* are incurable that lay too low for the operation; and, if unadviſedly opened, the patient's life is in immediate danger, for bandages, which are the only palliatives in ſuch caſes, are but uncertain dependants. The diffuſed *aneuriſm* is not only ſubject to hæmorrhages, but alſo to a mortification.

The method of cure is the ſame in the true, the falſe, and the mixed *aneuriſms*; the varicous needs but little, if any aſſiſtance: if it is enlarged by exerciſe, and becomes painful, indulge a little reſt, and moderate the future labour; perhaps bathing the part with a little ſpirit may afford ſome ſmall relief, but bandages and all other means muſt be avoided.

To palliate, when the operation is impracticable, bleed as often as is required to keep the force of the circulation moderate; let the diet be temperate, and the exerciſe very gentle; keep the bowels conſtantly ſoluble; where preſſure is uſed, it muſt be ſuch as only checks the force of the blood, not reſiſt it; flannel bandages, or knit ſtockings, &c. are the moſt proper for this purpoſe. But all preſſure is beſt avoided when the aorta is the ſeat of the *aneuriſm*, however the tumor may appear externally: it is true that, if the integuments give way, and the coagulum formed on the inſide of the tumor thereby hath loſt its ſupport, the aſſiſtance of a bandage is immediately neceſſary, as it is the only means to prevent a fatal hæmorrhage; in this dilemma, if the ſubſtitutes to the integuments are judiciouſly applied and accompanied with ſuch topical medicines as reſiſt both ſuppuration and putrefaction, the life of the patient may be preſerved for ſome time.

When the operation can be admitted, it is adviſeable firſt to attempt the cure by compreſſion; becauſe it ſometimes proves effectual, is always a good preparatory ſtep to the operation, by its enlarging the collateral anaſtomoſing branches, and thereby diſpoſes the part to have a more free circulation after the diviſion of the artery; but when the tumor is large, the palliative method ſhould not be long continued, becauſe it injures the neighbouring parts, and will occaſion more inflammations, ſloughings, &c. when the operation is performed.

The preſſure, whether before or after the operation, ſhould be confined as much as poſſible to the affected part, that the paſſage of the blood through the anaſtomoſing veſſels may be free, by which we may prevent the mortification which ſometimes enſues, for a want of a free circulation.

Some few inſtances of ſmall *aneuriſms* and punctures of the artery from bleeding, have ſucceeded by the uſe of bandage, but they almoſt all require the operation at laſt, which is performed nearly in the ſame manner in every part; but larger *aneuriſms* cannot receive any advantage from the preſſure, therefore, where it hath been uſed long enough as a preparative to the operation, the ſooner it is performed the better.

Mr. Bell obſerves, in his Syſtem of Surgery, that in diffuſed or falſe *aneuriſms*, preſſure cannot be applied to the artery alone, without at the ſame time affecting the refluent veins; and as this circumſtance, by producing an increaſed reſiſtance to the arterial pulſations, muſt undoubtedly force an additional quantity of blood to the orifice in the artery, that therefore no advantage is to be expected from it; but on the contrary, that on many occaſions there is reaſon to ſuppoſe it hath been productive of miſchief. But though preſſure ought never to be attempted in any period of the diffuſed *aneuriſm*, yet in ſome ſtages of the other ſpecies of this diſeaſe, it may be often had recourſe to with advantage. In their early ſtages, while the blood can be yet preſſed entirely out of the ſac into the artery, if often happens, by the uſe of a bandage of ſoft and ſomewhat elaſtic materials, properly fitted to the part, that much may be done in preventing the ſwelling from receiving any degree of increaſe; and on ſome occaſions, by the continued ſupport thus given to the weakened artery, complete cures have been at laſt obtained. Yet, though preſſure to a certain degree hath ſometimes proved uſeful, it ought never to be carried to a great length; tight bandages in theſe caſes always counteract the intention. Indeed, the greateſt length to which preſſure ought to go, ſhould be to ſerve as an eaſy ſupport to the parts affected, and no farther. With compreſſion, other means ſhould at the ſame time be uſed, ſuch as low diet, occaſional bleeding, a lax ſtate of the bowels, freedom from ſtrong exerciſe, &c.

The Operation for the Aneurism, in the Humeral Artery.

Having taken away ſome blood, and promoted ſuch other diſcharges as ſeemed needful, apply the tourniquet near the ſhoulder, tighten it ſo that the pulſe cannot eaſily be perceived; lay the arm in a convenient ſituation; then make an inciſion on the inſide of the biceps muſcle, above and below the elbow, a conſiderable length, which being in the courſe of the artery, will diſcover it as ſoon as the coagulated blood is removed, which muſt all be cleared away, the wound being dilated for that end. Be careful not to cut the larger veins, nor the bag; the ſame attention is neceſſary in cutting the aponeuroſis of the biceps; for this aponeuroſis, the capſula, the bag, and the ſkin ſeem all united.

If the orifice does not readily appear, let the tourniquet be looſened, and the effuſion of blood will direct you to it; then carry a crooked needle armed under it, tie the veſſel juſt above the orifice, and when you have ſecured the upper part, ſlacken the tourniquet a little; for if on ſlackening it there is any hæmorrhage from the inferior parts of the artery, it plainly appears that the collateral branches are open, and that there is a free circulation. The firſt ligature ſecured, make a ſecond a little below the orifice, and leave the intermediate ſpace of the artery to ſlough away without dividing it.

Avoid taking up the nerve with the ligature, if you conveniently can; the readieſt method to do which is, as it lays on the inſide, at a little diſtance from the artery, to relax that veſſel by bending the arm moderately, and to raiſe the artery from its bed by a probe introduced into its orifice, or by pinching it up with the finger and the thumb: the nerve is eaſily diſtinguiſhed from the artery by

by feeling, ſo the artery may be drawn from the nerve. If the nerve ſhould be taken up, a portion of the adjacent fleſh being taken up with it, no inconvenience need be feared.

After the operation, the limb is generally ſome little time without pulſation, which, if it does not recover in twenty-four hours, amputation is not to be deferred.

In the Lond. Med. Obſ. & Inq. vol. ii. page 360, is an inſtance of an *aneuriſm* in the arm being cured, by proceeding in general as above; but inſtead of the ligatures, a ſteel pin was paſſed through the lips of the orifice in the artery, and ſecured by twiſting thread about it, as is done on the hare-lip; after a few days the pin came away with the dreſſings.

See inſtances of *aneuriſms* in the thigh being cured, in the Lond. Med. Obſ. and Inq. vol. iii. p. 106. And in the Edinb. Medical Commentaries, vol. ii. p. 176. Alſo in Warner's Caſes of Surgery.

AN-FIR-FILIUS. See ARGENTUM VIVUM.

ANFRACTUOSUS. ANFRACTUOUS. Full of windings: called anfractuoſities.

ANG. ET ANGUIL. The abbreviation of Simplici del. excellente m. luigi Anguillara. Venet. 1561, 8vo.

ANGEIOLOGIA. See ANGIOLOGIA.

ANGEIOTOMIA, from αγγειον, *a veſſel*, and τεμνω, *to cut*. An opening of the veſſels as in arteriotomy and phlebotomy. It alſo ſignifies a particular diſſection of the veſſels for anatomical purpoſes.

ANGEIOTOMISTA. An ANGEIOTOMIST. A perſon ſkilled in the courſe of the blood-veſſels, or who can diſſect them readily.

ANGELICA ARCHANGELICA. } called alſo *imperatoria ſativa*, *pectoraria herba*. It is the *angelica*, *archangelica* foliorum, impari lobato. Fructu, ſubrotundo angulato ſolido, ſtylis reflexis; corollis æqualibus: petalis incurvatis. CL. PENTANDRIA. ORD. DIGYNIA. Linn. Gen. Plant. 138.

——— SATIVA, }

GARDEN ANGELICA. It hath the odd leaf at the end of each rib, and generally ſome of the others cut into two or three lobes. It is found by the ſides of rivulets, on the mountains of Lapland, and is cultivated in gardens all over Europe; the beſt is ſaid to be produced in Bohemia and Spain; but Linnæus ſays, that the beſt is that which grows on the mountains in northern countries. It is a biennial plant; but if the ſtalks are cut down before it flowers, the roots ſend forth new heads, and may thus be continued for many years. The roots are in the greateſt perfection in the ſecond ſpring; they ſhould be well dried, and kept in a dry place, and frequently aired, or they grow mouldy, and are the prey of worms. The whole plant is uſed, and by ſome hath been ſo much eſteemed as an alexipharmac, as to have obtained the name of PRINCEPS ALEXIPHARMACORUM. Many hold the Engliſh *angelica* in as much eſteem as the Spaniſh, and ſay that the latter differs from the former only in having been long kept, by which the diſagreeable flavour of the freſh roots is loſt. Though all the parts of this plant poſſeſs the ſame virtues in a great degree, yet the root is the ſtrongeſt. It reſembles zedoary as a medicine, but is milder, and it is a good carminative. Externally applied, it diſcuſſes inflammatory tumors in cold habits. By ſome authors it has been ſpoken highly of, not only as a *carminative*, but as a *ſtomachic*, and *ſuderific*; alſo in obſtructed lochia, or menſes; in difficult labor; and conſidered as a ſpecific againſt ſome poiſons, and malignant fevers; however, in preſent practice, it is ſeldom employed.

The ſeeds come neareſt to the roots in point of medical virtue, but ſcarcely retain either their vegetative or medicinal power until the following ſpring. The leaves loſe nearly all their virtue in drying. A ſtrong water is obtained from either the leaves or ſeeds by diſtillation; but ſpirit of wine beſt extracts the reſin, in which the virtues reſide in the dried roots.

The ſtalks and the roots are candied by the confectioners.

Dale reckons up four ſpecies of *angelica*, they have all ſimilar virtues, chiefly differing in the degree, but the above is the beſt. The wild ſort in uſe, is the *angelica* ſylveſtris, foliis æqualibus ovato-lanceolatis ſerratis. Linnæus.——*Angelica montana perennis paludapii folio.* See LEVISTICUM.——*Pratenſis apii folio.* See OREOSELINUM. Alſo a name of the *Saxifraga Anglica.*

ANGELICUS, PULVIS. See MERC VITÆ.

ANGELOCALOS. The true name of the twenty-fourth name of Myrepſus, and not, as is commonly writ, alcancali.

ANGELYN. See ANDIRA.

ANGIGLOSSI. STAMMERERS.

ANGINA, from αγχω, *to ſtrangle*. Alſo called *cynanche*, *kynanche*, *ſynanche*, *lycanche*. QUINSEY, thus named, from an abbreviation of the French word *ſquinancie.*

It is an inflammation in the parts of the throat that are ſubſervient to reſpiration, ſpeech, and deglutition; by ſome it is called a STRANGULATION OF THE FAUCES, by others, and moſt properly, an INFLAMMATION OF THE INTERNAL FAUCES. ARETÆUS ſays, it is named *lynanche*, from dogs either being ſubject to it, or elſe, when in health, they hang out their tongues at times; as in this ſpecies of quinſey, it has been ſaid the tongue is inflamed, and ſo ſwelled, that it hangs out beyond the teeth. CŒLIUS AURELIANUS ſays, that the voice of a patient in the quinſey, reſembles that of a dog, or a wolf; hence called *lycanche*; or, perhaps, the word cynanche is derived from κυων, *canis*, and αγχω, *ſtrangulo*; becauſe when dogs are hanged, their bodies are not heavy enough to make ſtrong compreſſion of the rope, they ſtruggle long with their eyes turgid, their tongues hang out of their mouths, &c. and, becauſe a ſet of ſimilar ſymptoms affect the patient in a ſpecies of quinſey, this name is given to it. Though this is truly an inflammation of the fauces, or ſome part of it; yet ſome aſſert it is not eaſy to diſcern whether theſe parts are inflamed or not, except there is alſo ſome degree of ſwelling; for the degree of redneſs, in a natural ſtate, admits of little or no change of colour in conſequence of inflammation. But when there is really an inflammation, there is generally tumor enough to diſcern the true ſtate of the parts.

When the diſorder is epidemic, it is ſo uſually between the ſpring and ſummer, and after a long continuance of cold and rainy weather.

The true *quinſy*, the *cynanche tonſillaris* of Cullen, is an acute inflammatory diſorder.

The baſtard *quinſy* is a lymphatic and catarrhal one, and its fever is not acute, but rather chronical, being of the catarrhal kind.

The Greeks give different names to the true *quinſy*, according to the reſpective parts on which this diſorder falls; but various authors among them alſo differ in naming them; ſo the Latins, conſidering the diſorder as one, wherever its violence might have more peculiarly been manifeſted, included them all under the name *angina*: and we, after their example, under that of *quinſy*. The curious may ſee the various appellations given to the different circumſtances of this diſorder, in the writings of Aretæus, Cœlius Aurelianus, Hildanus, and Alexander Trallian.

Dr. Cullen's generic name for *quinſy* is CYNANCHE, which he places in the claſs pyrexiæ, and order phlegmaſiæ; and defines it—a fever, ſometimes of the typhodal kind; redneſs and pain of the fauces; deglutition and breathing difficult, with a ſenſe of ſtraitneſs in the fauces; and diſtinguiſhes five ſpecies. 1. CYNANCHE TONSILLARIS, when the inflammation begins in the tonſils and affects only the mucous membrane of the fauces with redneſs and tumor, having an inflammatory fever attendant. 2. CYNANCHE MALIGNA, alſo *ulceroſa gangræноſa*, and *ulceroſa* when it affects the tonſils, and mucous membrane of the fauces, with tumor, redneſs, and mucous ſloughs of a white or aſh colour, ſpreading

and

and covering ulcers, attended with a typhodal fever, and eruptions. 3. CYNANCHE TRACHEALIS, when it is attended with difficult reſpiration, ſhrill inſpiration, hoarſe voice, clangous cough, ſcarce any tumefaction appearing in the fauces, little or no difficulty of ſwallowing, and the fever inflammatory. This among the Scotch is called the CROUP. See SUFFOCATIO STRIDULA. 4. CYNANCHE PHARYNGÆA OESOPHAGEA, when there appears a redneſs, particularly at the lower part of the fauces, ſwallowing becomes extremely difficult and painful; the reſpiration is ſufficiently free, and the fever inflammatory. 5. CYNANCHE PAROTIDÆA, when the external parotid and maxillary glands are tumified, reſpiration and deglutition ſlightly affected, and the fever a mild inflammatory one. This ſpecies is called the MUMPS amongſt the Engliſh; in Scotland, the BRANKS; with the French, OURLES. There is alſo a ſpecies of *quinſy* to which children are ſubject, called PÆDANCHONE.

The ſeat of the cynanche tonſillaris, is properly in the upper part of the throat, particularly thoſe parts of it that form the pharynx and the larynx, at the root of the tongue, the os hyoides, the paſſages of the noſtrils which open into the mouth, the pharynx, the internal and external muſcles of the larynx and pharynx, which are thirteen in number, the muſcles which move the jaws, the fine ramifications of the blood and the lymphatic veſſels, and the adjacent nerves; alſo the tonſils, the epiglottis, uvula, tongue, and cheeks.

The young, the ſanguine, and thoſe in whom an inflammatory diatheſis is attendant, are moſt diſpoſed to the true *quinſy*. A diſpoſition to it is often acquired by a few repetitions of its returns.

The cauſes are the ſame as are productive of inflammation in general; particular conſtitutions, &c. determine the inflammation to particular parts.

Cœlius Aurelianus gives the following accurate deſcription of the true *quinſy*. The ſymptoms are, firſt, pains without any evident cauſe, a difficulty of moving the neck and throat, a conſiderable diſcharge of ſaliva without any viſible tumor, with a dull pain and ſenſible aſperity of the fauces, a difficulty of ſwallowing the uſual fluid which gathers in the mouth like ſpittle; after theſe, an impediment of reſpiration, as if clogged with ſome groſs humour. As the diſeaſe increaſes, the part grows red, with a manifeſt tumor, at length the fauces uvula, parts about the tongue, and upper part of the throat, are elevated by the humour to a remarkable degree, which is attended with a difficulty of ſwallowing, beſides a ſtrangulation in proportion to the tumor, a difficulty of breathing, and a nauſea: if the mouth be opened, a dry tenſion of the tongue is perceived when it is preſſed with the finger. When this diſorder is increaſed to a great degree, the tumor ſpreads over the neck and face, the mouth flows with ſaliva and a viſcid humour; the eyes are prominent and blood-ſhot, and the veins are diſtended. As the diſeaſe increaſes, the tongue ſwells, and is forced over the teeth; there is a dryneſs of the fauces, a cold numbneſs of the joints, a frequent pulſe, a difficulty of lying on the back or the ſide, with a deſire to ſit up, and an inarticulate confuſed ſpeech, not without pain. As this complaint tends to deſtroy the patient, he grows worſe, becomes livid in the face, and ſpeechleſs; there is a ſtertor in the throat and breaſt, and all he ſtrives to drink regurgitates at the noſe, the pulſe fails; ſome utter a voice like a dog, others only froth at the mouth; upon theſe ſymptoms death neceſſarily enſues.

If the diſorder is without a manifeſt tumor, there is a ſlenderneſs of the neck, with an inflexible erection or extenſion of the ſame; the face and eyes are hollow, the forehead is diſtended, the colour livid, reſpiration extremely difficult, but with no manifeſt tumor either inwardly or outwardly, the patient is extremely feeble and dull, and dies under a very quick and acute ſuffocation. See Acut. Morb. lib. iii. cap. 1, 2.

Boerhaave obſerves, that if the internal muſcular membrane of the aſpera arteria is the ſeat of the diſeaſe, a tumor, heat, burning pain, and acute fever are excited, without any external ſigns of the diſtemper; in this caſe the voice is ſmall, ſhrill, and uttered with a hiſſing noiſe, inſpiration is very painful, reſpiration is ſmall and frequent, and ſcarcely performed but in erect poſture; hence the circulation through the lungs is impeded, and the pulſe ſoon ſinks, great anxiety comes on, and the patient ſoon dies. The nearer the ſeat is to the glottis and epiglottis, the more fatal it is.

If the inflammation is ſeated in the muſculus albus of the glottis, together with the fleſhy muſcles which cloſe it, the paſſage of the air to the lungs is ſoon cloſed up. The ſigns of this ſpecies are the ſame as the preceding, only that the pain is exquiſite during the elevation of the larynx in order to ſwallow, and is remarkably increaſed by ſpeaking, the voice is ſhrill and acute, exceſſive anxiety comes on, and death approaches ſooner than in any other ſort of the true *quinſy*.

If only the muſcles which elevate the os hyoides and larynx are inflamed, it is thus known, reſpiration is tolerably free and eaſy, but the firſt part of the action of ſwallowing is very painful

When the pharynx alone is affected, the ſpecific ſigns are ſeen by examining the fauces; breathing is tolerably eaſy, ſwallowing very painful, or ſometimes impoſſible; and then that which is attempted to be ſwallowed, returns by the noſe, no aliment can be taken; and in this caſe, the fluids of the body are apt to become the more acrid; however, the fever, in this caſe, is not ſo acute as in ſome others, nor is death ſo ſpeedy.

If the tonſils, uvula, and velum pendulum palati, with the muſcles called pterygoſtaphlini, are much inflamed, nearly the ſame ſymptoms will ariſe as in the preceding caſe, reſpiration is rather more laborious, and is little or not at all performed through the noſe, and by the fauces not without ſome difficulty. What is attempted to be ſwallowed, is forced through the mouth again by reaſon of the great pain which it excites, there is a perpetual diſcharge of ſaliva, by hawking, and a continual copious diſtillation of phlegm into the cavities of the tonſils, an acute pain is left in the internal ear, and in the Euſtachian tube, a crackling noiſe is perceived in the ear during the action of ſwallowing, and ſometimes a deafneſs comes on. The venereal diſeaſe often cauſes this ſpecies, which then is dangerous.

If all or moſt of theſe parts, are inflamed, the caſe is indeed deſperate; for the return of the blood through the compreſſed jugulars being intercepted, the fauces, lips, tongue, and face ſwell, the tongue hangs out of the mouth, and is greatly inflamed, the eyes are red, prominent, and ghaſtly, the brain is glutted with blood; hence the ſight, hearing, and feeling are all dull; hence alſo a delirium, yawning, ſtertor, impoſſibility of lying down, becauſe of the ſtrangulation attending that poſture, and a manifeſt redneſs, tumor, pain, and puſſation in the breaſt and neck; whence the jugular and frontal veins, and the venæ raninæ, become varicoſe.

To theſe obſervations of Boerhaave may be added, that the proper ſymptom of a *quinſy* is, the difficulty of ſwallowing as well with reſpect to ſolids as fluids; for if a large tumor affects the top of the œſophagus, and contracts it, the liquids, but not ſolids, may paſs through it: but if the tumor be ſeated in the top of the larynx, where it is covered with the epiglottis, ſolid ſubſtances, by preſſing the tumid epiglottis, find a way to the œſophagus, while liquids, not preſſing with that force which the ſolids do, ſlide through the gaping ſpace by the tumor, into the aſperia arteria, and there cauſe great uneaſineſs.

The true *quinſy* muſt be diſtinguiſhed from the baſtard ſpecies, particularly that called the dry; from the prunella alba; from ſwellings that ariſe from a ſcirrhous, ſcrophula, or a dropſy; from that difficulty of ſwallowing and breathing which ariſes from a catarrh, exulceration, a ſpaſmodic contraction of the muſcles, and paralyſis; from the gangrenous *quinſy*; from a tumor of the tonſils and of the uvula; from that pain in the glands in and about the fauces, and tumor obſerved in ſome ſcorbutic and venereal patients, when their diſorders are obſtinate and accompanied with eroſion; and from aphthæ. It ſhould be remembered, *that every inflammation in the throat is not a* quinſy, *that only being one which is attended with fever, difficult reſpiration, and difficult ſwallowing.*

The moſt violent, and alſo moſt dangerous kind, is that which is ſeated in the internal muſcles of the larynx; but the danger is generally eſtimated by the degree of the fever, and the difficulty of breathing, which laſt is the worſt when the thyroarytænoid muſcles are affected, as their office is to cloſe the larynx. A ſudden tranſlation of the inflammation from the external parts is dangerous; for ſometimes a delirium and convulſions follow, or perhaps a mortal peripneumony; if the troubleſome ſuffocation abates, and the pain, with the inflamation, appears more outwardly, the diſeaſe may end well; if otherwiſe, an abſceſs will be formed in the throat, and danger will

attend

attend its diſcharge: a ſymptomatic *quinſy* is dangerous, on account of the weakneſs from the original diſeaſe; a frothing at the mouth, a conſiderable ſwelling in the neck, a duſky redneſs of the tongue, coldneſs of the extremities, a great contraction of the præcordia, anxiety, and a hard convulſive intermitting pulſe, are dangerous prognoſtics; a gangrene in moſt parts of the throat are fatal. If an eryſipelas appears on the neck and breaſt, and continues, it is a good prognoſtic; but ſuddenly diſappearing, it is fatal: much viſcid ſaliva is a bad ſign in the height of the diſeaſe, becauſe it indicates a great degree of ſtrangulation; but in the decline it is a favourable ſymptom, ariſing then from relaxation: great pain in the head, or elſewhere, is very unfavourable.

The diet ſhould chiefly conſiſt of thin cooling liquids, as thin water-gruel, barley-water, very weak whey, chicken-broth, &c. all which ſhould be drank at leaſt as warm as new milk.

The patient ſhould ſit up in the day for ſome hours at leaſt; he ſhould avoid ſpeaking as much as is convenient; his feet and legs ſhould be put into warm water for ſome minutes twice a day; and his neck ſhould be kept warm with flannel.

In general, the treatment ſhould be the ſame as in the inflammatory fever; for in this diſeaſe, the particular inflammation being reduced, the cure is effected.

Begin the cure with a free bleeding from a large orifice in the arm, and repeat the operation according to the violence of the fever; if the heat and ſtrength of the pulſe require it, the bleeding may be ad deliquium, in order to which the patient may ſtand up during the diſcharge of the blood, aſſiſtants being ready to ſupport him when the fainting comes on: though ſuch free bleeding will not often be required. Bleeding under the tongue hardly ever ſeems neceſſary; a few leeches ſet on the external fauces, would be far more uſeful; the ligature uſed about the neck, by retarding the circulation above it, may be as prejudicial as the ſmall diſcharge of blood therefrom is uſeful.

According to the ſeverity of the ſymptoms, let bliſters be applied to the back and behind the ears: theſe latter may be larger or leſs, that they may extend down the ſide of the neck, and in ſome degree round it. For the encouragement of the humours outwardly, ſir John Pringle, beſides the application of a bliſter on the back, commends another to be laid acroſs the throat. The application of bliſters needs not take place until after a free bleeding, and the operation of at leaſt one briſk purge; after which, or during its operation, apply a bliſter to the back, and the next day another on the throat: thus a more uſeful effect is obſerved to follow than if both had been applied together. Keep them running until the diſorder is overcome, elſe, as the parts heal, the inflammation will be apt to return.

As ſoon as the patient is bled, let a briſk but cooling purge be given, ſuch as the following:

℞ Infuſ. ſenæ ℥ iij. natri vitriolati, ℥ ß. ad ℥ i. m.

The paſſage of this purging draught may be haſtened down by a clyſter, in which ʒ i. of nitre may be diſſolved, if the fever runs high. This, or ſome other cooling purgative ſhould be daily repeated during the firſt three or four days; if they cannot be ſwallowed, purging clyſters, with nitre in them, muſt be daily adminiſtered until medicines can be taken by the mouth. Gentle purging ſhould be continued through the whole courſe of the diſeaſe.

Gargariſms are immediately to be uſed, but acid ones are to be avoided until the decline of the diſeaſe, for they are hurtful by contracting the emunctories of the ſaliva and the mucus, and by thickening thoſe diſcharges: the following ſhould be uſed at this time, for it thins the ſaliva, and cauſes the glands to ſecrete and excrete their contents more freely.

℞ Decoct. hordei compoſiti ℔ i. ſal ammoniaci crudi ʒ ij. m.

As inflammations about the fauces are differently circumſtanced, the following obſervations, with reſpect to gargles, ſhould not be unnoticed:

1. In caſe of great pain and heat, avoid the uſe of a ſyringe, and encourage the patient in frequently waſhing his mouth and throat, with whatever is appointed for that end: hartſhorn jelly, or the julep of roſes, with a little nitre and camphor, would be adviſeable here.

2. If the throat is dry, the tongue burns and ſwells, and the breathing and ſwallowing is difficult.

℞ Alb. ovi (bene conquaſſat. ad liquor. aquoſ.) ℥ ij. aq. roſar. & ſyr. moror. ää. ℥ i. ſal prunel. gr. xv. m.

3. If the *quinſy* is of the latent internal kind, waſh the mouth and throat frequently with milk and ſal prunellæ.

4. The inflammatory pain, from the ſtagnation of a ſharp ſaline ſerum in the glandulous part of the throat, near the ſeat of the pharynx and larynx; attended with a redneſs, and a copious diſcharge of ſaliva, but not a fever, is beſt diſcuſſed in the beginning by a gargariſm of brandy alone, that is ſomewhat below proof.

5. When a copious foul ſerous humour falls upon the glands of the palate and throat, detergent gargariſms, ſuch as the following, are to be freely uſed:

℞ Zinci vitriolati purificati ʒ i. aq. puriſſim. ℔ i. m.

6. If the mouth only is dry and parched, an emollient gargle, ſuch as that with the compound decoction of barley and ſal ammon. ſuffices.

7. In inflammatory *quinſies*, acid gargles may be uſed after the inflammation is ſomewhat abated, and not before; at which time,

℞ Infuſi roſæ ℥ iij. acidi vitrioli diluti gt. xv. m.

In the intervals, when purging medicines are not operating, give cool nitrous and ſaline medicines, with ſmall doſes of the antimonium tartariſatum in them, as is uſual in the ardent and inflammatory fevers.

The promoting of external inflammation about the throat leſſens that which is internal; hence ſtimulants, ſuch as the linim. ammoniæ have been applied to the neck and throat, by means of flannel dipped therein; or the following may be uſed:

℞ Ol. olivar. ℥ i. ſp. ammon. compoſiti, ʒ ij; ad ℥ ß camphor. ʒ ß. m. f. linim. cum quo inung. fauces externæ ſæpius. But if a bliſter acroſs the throat can be complied with, its effects will be more advantageous.

If the external inflammation is conſiderable, a diſcutient fomentation and cataplaſm may be applied, or, in their ſtead, the following liniment may be rubbed on the neck and throat three or four times a day, and flannel rags may be conſtantly kept on, being moiſtened with the ſame.

℞ Camph. q. v. ol. oliv. q. ſ. fiat linim. molle.

If a ſpeedy ſuffocation is threatened, proceed to bronchotomy, while the ſtrength of the patient gives ſome flattering hope that he may recover.

If ſuppuration cannot be prevented, forbear evacuation and all repellents. When the ſuppuration takes place, the ſwelling abates, and the ſymptoms are leſs violent, the pus opens itſelf a way either externally or internally; if externally, the ulcer is eaſily cured, if it does not form ſinuſes; if internally, the matter may probably fall into the lungs and produce ulcers there. That the abſceſs is formed, may be known by a general uneaſineſs, a pain in the mouth, ſhivering, and tranſient heats, a ſenſation of thickneſs and heavineſs in the tongue, ſmall white eruptions on the gums, and inſide of the cheeks and lips, with a diſagreeable taſte and odour. In this caſe cataplaſms ſhould be applied warm on the throat, and the ſteam of warm vinegar, mixed with water, ſhould be received with the breath; and as ſoon as a fluctuation of matter can be perceived, puncture the abſceſs, that the matter may, if poſſible, be diſcharged at the mouth; after which gargle with the following:

℞ Infuſi roſæ ℥ vi. tinct. myrrh. ℥ ß. acidi vitrioli dilut. gt. xx. m.

If the patient is not deſtroyed by reſpiration, deglutition, or the brain being affected, this diſorder terminates as other inflammations, by reſolution, ſuppuration, or a mortification.

We ſhould obſerve, that when a difficulty of ſwallowing is not attended with acute pain, or inflammation, it is generally owing to an obſtruction of the glands about the throat; it only requires that the patient be kept warm, and the throat gargled with ſome gentle ſtimulant, as a decoction of figs, with a little vinegar or honey, or the flour of muſtard: this ſort of *quinſy* is called the pap of the throat, the falling down of the almonds of the ears, &c.

See Aretæus, Cœlius Aurelianus, Hildanus, Trallianus, Hoffman, Boerhaave, Le Dran's Operations, Wallis's Sydenham, and Fordyce's Elements, part ii. Cullen's Firſt Lines, i. 279, edit. 4.

ANGINA AQUOSA, Œdematoſa. Boerhavii Aphor. 791. This is a ſpecies of dropſy, arranged by Dr. Cullen under Anasarca, the ſecond ſpecies, which ariſes from obſtruction, occaſioned by compreſſion of the veins; ſee Anasarca oppilata. It is called Loweriana, being produced upon a dog by Lower's tying up the jugular veins, which brought on the angina

aquoſa, that occaſioned ſuffocation; ſee Sauvages Noſ. Meth. vol. i. p. 678.

ANGINA GANGRENA, called alſo *angina maligna*, *angina ſuffocativa*, *angina garotilla*, ERYSIPELATOUS, ULCERATED, MALIGNANT, or PUTRID SORE THROAT. It is the CYNANCHE MALIGNA of Dr. Cullen.

It is a putrid remittent fever, accompanied with an ulcerated ſore throat, or with an inflammation of the mucous membrane. Though this is generally conſidered to be a diſeaſe of the whole habit; ſtill there are ſome circumſtances attending oftentimes the cure, to make us believe it may now and then only be local, for at the onſet it will not unfrequently yield to vomits, and gargles, and local bliſtering; though at others all the different ſymptoms attending this ſpecies have been preſent without any ulcers in the throat.

This malady is moſt frequent in autumn, generally attacking children and weakly relaxed adults.

It is often produced by expoſure to infectious vapours; when it is not, cold is the moſt probable cauſe, in habits already hereto prediſpoſed. The breath of theſe patients is infectious.

It ſometimes begins with rigor, horror, and coldneſs, which are followed by a great heat; when an inflammation affects the throat, there is firſt a fiery redneſs there, ſometimes without any ſwelling; at others there is a conſiderable but puffy one, which does not prevent the ſwallowing nor the breathing in any great degree; a forenefs rather than pain is felt in the throat; the parotid glands often ſwell and are painful; whitiſh ſloughs appear in the fauces, not riſing above the ſurface of the membrane, which are often ſurrounded by a redneſs, and, according to the degree of the diſeaſe, are from a very florid colour to that almoſt black; theſe ſloughs generally change to an aſh colour, and ſometimes to a black one; they give an offenſive ſmell to the breath, ſpread wider, and run deeper, until the patient is cut off, or the ſloughs fall off, leaving ulcers; but ſometimes the patient recovers without any ſenſible ſeparation. If the diſeaſe is violent, the mucous membrane in other parts of the body are affected; head-ach, faintneſs, and anxiety, with ſickneſs, vomiting, or purging, attend at the beginning. Theſe uſually go off in about twenty-four hours, but if they continue, the danger is much increaſed thereby: the eyes appear red and watery, the noſtrils are inflamed, and they diſcharge a thin and acrid fetid matter, which excoriates the noſtrils and lips; and ſometimes an hæmorrhage comes on by the third or fourth day, or perhaps later. After two or three days from the beginning, an eryſipelatous inflammation appears externally on the throat, and alſo on the extremities; this eruption relieves the ſickneſs, purging, and other diſagreeable ſymptoms. The pulſe is ſeldom hard or full, but is often frequent and ſmall; the fever in the evening is inconſiderable, being often attended with a delirium; but in the morning a moderate ſweat comes on, which for the preſent relieves the patient; though the ſymptoms regaining their ſtrength, the patient ſometimes falls a victim to their force in three, four, or ſix days.

Care ſhould be had to diſtinguiſh this ſort of complaint from the catarrh, the ſpurious quinſy, aphthæ, and other exulcerations in the mouth.

A fœtid ichorous diſcharge from the ears often attends the worſt and fatal caſes; but when the patient recovers, indurated parotids and deafneſs enſue.

THE INDICATIONS OF CURE *are*,

1. To ſupport the vis vitæ.
2. To promote perſpiration, or evacuate the accumulated ſerum.
3. To reſiſt the putrefaction.

The whole danger depends on the ſtate of the blood, which is a putrid one, accompanied with that which is attendant on low nervous fevers: though the pulſe, and other ſymptoms, may ſeem to indicate evacuations in the beginning, they are cautiouſly to be admitted, for the nature of this kind of *quinſy* is ſuch, as ſoon to produce the ſame effects in the conſtitution as are brought about by bleeding, purging, &c.

The patient ſhould be kept in bed, but not much warmer by the uſe of cloaths than when in health; the air may be refreſhed and purified not only by opening the windows now and then, but alſo by the vapours from boiling water, in which is infuſed myrrh, roſemary-flowers, or vinegar; ſtrong whey, made with good Mountain or other wine, may be the common drink; and if there is much ſickneſs, give mint tea, or red wine and water acidulated with the acid of vitriol diluted.

Begin the cure with an emetic, which ſhould be given as ſpeedily after the attack as poſſible; thus the ſymptoms are rendered much more mild.

℞ Antim. tartar gr. ß. ad gr. i. ſs. aq. font. ℥ iv. mixturam bibat æger calidam, ſuperbibendo infuſ. flor. cham. & poſt operat.

℞ Conf. aromaticæ ʒ ß. p. rad. contray. gr. x. aq. alex. ſp. cum aceto ʒ ij. aq. put. ℥ i. ſs. m. f. hauſt. & 4ta. quaq. hora repetend.

This kind of emetic tends to more advantages than any other in this diſorder; and if there is either a vomiting, or purging, or both attendant, the patients are much alleviated by it.

If the purging continues, check it with either ſtimulants or opiates.

℞ Spec. e ſcord. ʒ iij. aq. cinnam. ℥ vi. ſpt. cinam. ℥ i. ſumat. cochl. i. ſs. poſt ſingulas ſedes liquidas.

Though in other fevers bliſtering is not adviſeable in the beginning, in this the earlieſt uſe of them is to be encouraged, and the following method of preparing them is recommended by Dr. Percival of Mancheſter.

℞ Empl. ſtomach. vel e cymino p. ii. veſſicator. p. i. Camphor. pulv. ʒ i. ſs. m. f. empl. inter ſcapul. applic.

He farther obſerves, that in this caſe the ſkin is eaſily inflamed, ſo that this mild plaſter ſufficiently diſcharges the ſerum, and at the ſame time is antiſeptic. In the firſt ſtage of this diſeaſe, a bliſter to the back, or to each ſide of the throat, produces very ſalutary effects; but as the ſkin is particularly diſpoſed to inflammation, inconveniencies ſometimes ariſe from the too powerful ſtimuli of the common bliſter plaſters, whence the above preſcribed one is preferred. When the plaſter is ſpread, warm it gently, and lay on its ſurface a thin piece of muſlin; thus it irritates leſs, produces leſs ſtrangury, and thus it may ſafely be applied even where the ſkin is eryſipelatous.

Gargles made of acids and aſtringent ingredients, may be thrown into the fauces by means of a ſyringe, if the patient cannot uſe them without.

℞ F. roſar. ℥ viij. acidi vitrioli diluti gt. xii. alum. rup. ʒ ß. tinct. myrrh. ℥ i. m. f. garg.

vel

℞ Decoct. hordei compoſ ℔ i.

Rad. ſerpentar. virg. ʒ ij. coque per ſemi horam, colatur, & adde acetum acerrim. & tinct. myrrh. ää ʒ i. mel. opt. ℥ ij. m.

One of theſe gargles ſhould be frequently uſed, the mouth and throat ſhould be conſtantly kept clean therewith; and always before the patient ſwallows any thing, let him waſh his mouth and throat well with it.

The contrayerva is alſo uſed in gargles for this kind of ſore throat; but as an antiſeptic it is better to uſe myrrh diſſolved inſtead of it.

The bark is the principal medicine, and the moſt to be relied on. It ſhould be given with red wine, if the pulſe does not forbid, which it rarely does; but if it increaſes the anxiety, it muſt be omitted.

If the ſloughs do not ſeparate, touch them with an armed probe dipped in the following:

℞ Infuſi roſæ ℥ ij. oxymellis æruginis, ʒ ij. m.

vel

℞ Aq. puræ ℥ ij. acidi muriatici q. ſ. ad grat. acid.

If the ulcers ſpread faſt, the bark muſt be given, or a cold infuſion of it, as freely as the ſtomach will admit.

If the tonſils are much ſwelled, bliſter the back, and behind the ears, and uſe one or other of the above gargles, freely.

If the heat is exceſſive, add to the bark the ſp. æther nitroſi, or the ſp. febrif. Di. Clutton. It ſhould be obſerved that the vegetable acids are apt to produce a diarrhœa, and nitre does more harm by leſſening the vis vitæ than it does good by its antiſeptic property, ſo neither of them are to be admitted in theſe caſes; but the mineral acids are free from thoſe ill effects, and are both good antiſeptics and diaphoretics, and the above named ones may be freely given in all that the patient drinks.

If any eryſipelatous appearance is obſerved about the fauces, &c. or if they are tumid and ulcerated, immediately uſe the ſteam from vinegar, myrrh, and honey, as hot as can be borne, and uſe it often. It is detergent and antiſeptic, and preferable to any of the gargles.

A cataplaſm of the bark and camomile flowers, boiled in vinegar, with the addition of camphor ʒ i. ſs. or ʒ ij.

laid

laid acroſs the throat, and renewed every four hours, greatly ſoftens and relaxes the glands of the neck, it exhales an antiſeptic vapour, which is drawn in by the mouth at every inſpiration, and much is alſo abſorbed from it. In caſes leis important, inſtead of this cataplaſm, flannels may be applied to the neck, after being dipped in ſpirit of wine camphorated, and ſharp vinegar, mixed in equal parts.

A pediluvium made with the bark and camomile flowers boiled in vinegar and water, may be uſed three or four times a day; if the patient is too feeble to ſit up, let flannels be wrung out of this decoction, and applied to his limbs. Beſides the relaxing and antiſpaſmodic effects of this remedy, it tends to produce a ſwelling in the feet, which relieves very much.

Fixed air, ſeparated during the fermentation of an alcaline ſalt with the vitriolic acid, is advantageouſly adminiſtered by way of clyſter, or mixed with ſome proper one.

See Aratæus de Cauſis & Signis Morborum, lib. i. cap. 9. Dr. Fothergill's Treatiſe on the Putrid Sore Throat. Dr. Huxham. Le Cat, Johnſon, and Chomel, on this diſeaſe. Northcote's Treatiſe on the ulcerated ſore Throat. Dr. Percival's Eſſays. Dr. Fordyce's Elements, part ii. Cullen's Firſt Lines, i. 284. edit. 4.

ANGINA, ERYSIPELATOSA;—MUCOSA. See SCARLATINA ANGINOSA.

ANGINA PECTORIS. For the firſt account of this diſeaſe the world is indebted to Dr. Wm. Heberden of London.

The patient is ſeized whilſt walking, and more particularly if he walks ſoon after eating, with a painful ſenſation in his breaſt; the moment he ſtands ſtill this uneaſineſs vaniſhes: but after this complaint hath continued ſome months, it does not ceaſe ſo ſuddenly after reſting; it will now come on even while the perſon is in bed, obliging him to riſe every night for ſeveral months together. In ſome inveterate caſes it hath been brought on by very trivial accidents, ſuch as coughing, going to ſtool, by ſwallowing, or by ſpeaking, or any ſlight diſturbance of mind. Sometimes, though rarely, it attacks while the patient ſtands or ſits ſtill. In ſome perſons it is the worſt in winter, in others during the ſummer ſeaſon. When a fit approaches whilſt the patient is walking, its duration is ſhort; but if it comes on in the night, it will continue an hour or more. Now and then, though rarely, there are ſeveral days before any remiſſion is manifeſt; and, during this time, the greateſt danger ſeems to be attendant. The pulſe is, at leaſt, ſometimes not diſturbed with the pain, conſequently the heart is not affected by it.

Perſons of fifty years of age and upwards, with ſhort necks, and who are inclined to be corpulent, are the moſt ſubject to this diſeaſe; it is, though rarely, met with in thoſe who are far younger.

The natural tendency of this complaint is, to kill ſuddenly, yet ſome continue affected with it for twenty years.

The ſeat ſeems to be in or about the os ſternum, but always more to its left ſide than to any other part of it: and a pain in the middle of the left arm is ſometimes attendant.

The cauſe is moſt probably a ſpaſm or cramp, or an ulcer, or both. A ſpaſm, or convulſion, appears moſt likely, from the ſuddenneſs of the attack, and as ſpeedy departure, the long intervals of eaſe, the relief afforded by wine and ſpirituous cordials, its generally bearing the motion of a horſe or carriage ſo well; which circumſtance often diſtinguiſhes ſpaſmodic pains from thoſe which ariſe from ulcers, and its coming on in the night after the firſt ſleep, at which time aſthmas, the night-mare, convulſions, and other diſorders attributed to the diſturbed functions of the nerves, are peculiarly apt to return, or to be aggravated. That an ulcer may alſo contribute to this diſorder, ſeems to be ſuggeſted, becauſe the patient ſometimes ſpits blood mixed with a purulent matter, which ſeems too to come from the ſeat of the diſorder.

In order to the cure, evacuations have been tried, but to no purpoſe; though wine, and other cordials, taken at bed-time, will prevent or weaken the night fits: yet nothing does this ſo effectually as opium; ten, fifteen, or twenty drops of the tincture of opium taken at bed-time will enable thoſe patients to keep their bed until the morning, who had been forced to riſe, and ſit up two or three hours every night for many months. This quantity, or more, may ſafely be continued as long as it is required. Dr. Bergius, a Swediſh phyſician, ſays, that this diſorder is a kind of ſpaſmodic aſthma, and that it is relieved by a ſtrong ſolution of the gum. ammon. e. g. gummi ʒ ß. in aq. puleg. vel hyſſop. ℔ ß. cap. cochl. ij. bis in terve die. See the Lond. Med. Tranſ. vol. ii. p. 59. iii. 1, 37. Medical Obſ. and Inq. v. 233, 252. London Med. Journal v. 162. Memoirs of the medical Society of London, 238, 306.

ANGINA EXTERNA. See CYNANCHE PAROTIDÆA.

——— *Inflammatoria infantum—interna—latens & difficilis—membranoſa—perniciosa—polyposa.* See SUFFOCATIO STRIDULA.

ANGINA MALIGNA & SUFFOCATIVA. See ANGINA GANGRÆNA.

——— SPASMODICA. See CRAMPUS.

ANGINO DEI. The name of a diſeaſe.

ANGIOLOGIA, ANGEIOLOGIA, ἀγγειον, *vas*, and λογος, *ſermo*. ANGIOLOGY. It treats of the glands, lacteals, lymphæducts, nerves, arteries, veins, and other veſſels.

ANGIOSPERMIA, from ἀγγειον, *a veſſel*, and σπερμα, *a ſeed*. The name of the ſecond order in the Claſs DIDYNAMIA, of the Linnæan ſyſtem. It is ſo called becauſe the ſeeds are incloſed in a veſſel or capſule, in oppoſition to the firſt order, GYMNOSPERMIA, which has naked ſeeds.

ANGOLAM. A large tree growing in Malabar. It runs up to the height of one hundred feet, and is twelve feet thick. It is an ever-green, its fruit reſembles a cherry.

The expreſſed juice of the root purges, and kills worms. Raii Hiſt. Plant.

ANGONE. A nervous ſort of quinſy. Vogel defines it to be an acute ſtopping up of the fauces, without inflammation. He ſays that the convulſive quinſy, and hyſteric ſuffocation, are its ſpecies.

ANGOR. A concentration of the natural heat of the body, cauſing a palpitation of the heart, and anxiety. In the beginning of a fever it is a bad prognoſtic.

ANGOS, a VESSEL; a receptacle of humors. See VASO.

ANGSANA, vel ANSAVA, called alſo *draco arbor*.

It grows in the Eaſt Indies; the liquor which diſtils from a wound made in this tree is uſed as a medicine, when it is condenſed into a gummy conſiſtence. It is of a red colour, aſtringent, and is ſold for dragon's blood: Raii Hiſt. Plant. Dale.

ANGU. See CASSADA.

ANGUILLA. The EEL.

Eels are nouriſhing. Thoſe that are met with in rivers, or other clear running waters, are the beſt; as to their ſize it is immaterial; the liver and the gall are extremely acrid. Boerhaave ſays, that no fiſhes have a more acrid gall; and that with a mixture of the galls of the *eel* and the pike, made into pills, he hath cured many rickety children with hard and ſwelled bellies.

The TORPEDO, or TORPORIFIC EEL, found in Guiana, in South America, if caught by a hook, violently ſhocks the perſon who holds the line: the ſame *eel* touched with an iron rod, held in the hand of a perſon whoſe other hand is joined to another, &c. communicates a violent ſhock to ten or twelve perſons thus joining hands, in a manner exactly ſimilar to that of the electric machine. Hence it is called the ELECTRIC EEL. No ſhock is perceived by holding the hand in the water near the fiſh when it is neither diſpleaſed nor touched; but if it is angry, it can give a ſhock to a perſon at five or ſix inches diſtance. This ſhock is produced by an emiſſion of electric particles, which the fiſh diſcharges at pleaſure. On the death of the animal no ſuch electric property remains, and then the Indians eat it.

ANGUIS, alſo called *ſerpens anguis*, *anguis* coluber, *natrix torquata*, the SNAKE.

Our *ſnakes* in England, and thoſe in other cold countries, do not injure us with their bite. Their fat is as good as that of the viper.

ANGUIS ÆSCULAPII. It is the only ſpecies of ſerpents that can be made ſo tame as to be innocent. It is found in Italy, Poland, Germany, and in all the quarters of the world.

ANGUIUM SENECTÆ, called *exuviæ*. The SKINS of SERPENTS that are caſt in ſpring; the ſlough or caſt ſkin of a ſnake is as good. A decoction of it boiled in wine is ſaid to cure deafneſs, pain in the ears, &c.

ANGULARIS ARTERIA. See MAXILLARIÆ ARTERIÆ.—MUSCULUS. See LEVATOR SCAPULÆ & PATIENTIÆ.

ANGULATUM,

ANGULATUM, vel ANGALATUM, Folium (from Angula, an Angle) an angular leaf; it is when the margins are cut into several angles.

ANGULI OCULI. See CANTHI.

ANGULUS ACUTUS TIBIÆ. The spine of the tibia, or the shin.

ANGURIA. See CITRULLUS.

ANGUSTATIO, ANGUSTIA, } Anxiety, restlessness in distempers. They also signify a narrowness of the vessels.

ANGUSTIFOLIA PLANTAGO. See PLANTAGO MINOR.

ANGUSTURÆ CORTEX. ANGUSTURA BARK. } This bark, at first imported in the year 1788, was supposed to be the production of a tree on the coast of Africa; but it is now found to come from the Spanish main; Dr. BRUCE pronounced it to be the bark of a tree called *wosgines*, by which he was cured of the dysentery, in Abyssinia; and having brought over some seeds, and planted them in Kew gardens, their product he calls BRUCEA ANTIDYSENTERICA, vel FERRUGINEA; but, in the Medical Commentaries of Edinburgh, 1790, they are, on comparison, proved to be very different. This bark, however, is much of the same colour and thickness as the *cascilla aromatica*, and powders very freely. It is a powerful bitter, joined with an aroma, not much more pungent than cascarilla, having a portion of pure oil, which approaches in its nature to camphor. It seems also to possess a narcotic principle; hence differs from the Peruvian bark; and has been considered more powerful than it, both as a tonic and antiseptic; the virtues reside more in its gummy than resinous extract; but is still more powerful having both dissolved, which warm water effects, extracting also the oily portion; hence it is best prepared by infusion. The diseases in which this medicine has been employed are those in which the Peruvian bark has been useful. In intermittents, it is not always superior, sometimes inferior; in low fevers, and those of the putrid kind, it has seemed superior. In head achs, attended with fever, but arising from the stomach; in dysentery and dyspepsia, it has been of great service. From various experiments that have been made, the Angustura bark seems to claim the highest rank as an antiseptic. An extract is made in the following manner:

Take four ounces of the Angustura bark, put it into a flannel bag of a conical shape, pour upon this boiling water; and repeat it till the filtering liquor has but little taste or colour. Let this be evaporated by a gentle heat, there will remain 13 drams and 20 grains of extract, of the full flavour of the bark, containing two drams of resinous matter. See BRANDE's Experiments and Observations on Angustura Bark.

ANHALDINUM. An epithet of a corrosive, described by Hartman.

ANHALTINA REMEDIA. Medicines which facilitate respiration.

ANHALTINA AQUA. ANHALT WATER. It is in the Brandenburg Dispensatory, and is the sp. vini rect. distilled from turpentine, and twelve or thirteen other ingredients of the aromatic kind; but a more elegant spirit of this kind may be obtained by mixing a proper quantity of the essential oils of rosemary, lavender, sage, or other such like, with the common oil of turpentine, and then distilling them. This water is an excellent cordial.

ANHELATIO, ANHELO, ANHELITUS, PANTING. A shortness of breath, or a difficult and small, but quick respiration, which happens to sound persons, especially fat people, and valetudinarians, after strong exercise. In fevers, dropsies, asthmas, pleurisies, &c. there is always an anhelitus. To express this HIPPOCRATES often uses the word *pneuma*.

But this amongst the chemists signifies SMOAK, and also HORSE DUNG; this last is termed also, when hot, *caninpericon*.

ANHIMA. An aquatic bird of prey in Brasil, larger than a swan. Its horn is esteemed an antidote against poison.

ANHUIBA. See SASSAFRAS.

ANICETON, INVINCIBLE. An epithet for a plaster ascribed to Crito, and so called because it was an infallible remedy for the acores.

ANICETUM. See ANISUM.

ANIDROS, ANIDROSIS, ANIDROTI. } From α, neg. and ἱδρὼς, *to sweat*. Without sweat.

ANIMUM. See ANIME.

ANIL. See INDICUM.

ANIMA MUNDI. The SOUL of the WORLD. An ubiquitarian principle, supposed by Plato to do the same feats as Des Cartes's æther, pervading and influencing all parts and places. It is a kin to the Archæus of HELMONT and PARACELSUS ——PULMONUM. A name given to saffron on account of its use in asthmas. See CROCUS.

ANIMÆ. The VESICLES of HERRINGS. They are diuretic.

ANIMAL. All bodies endowed with life and with spontaneous motion are called *animals*. Hence are animals distinguished in general from vegetables. But this gives us no perfect definition; for there are entire classes of animals which are fixed to a place; as the lithophytes, and zoophytes, which are produced, and die upon the same spot; and, on the other hand, certain Vegetables have as much motion in their leaves and flowers as certain animals; for example, shell-worms. However, by attending to the most general characters, we may define animals to be bodies endued with sensation, and motion, necessary to preserve their life. They are all capable of reproducing their like: some, by the union of the two sexes, produce small living creatures; others lay eggs, which require a due temperature to produce young: some multiply without conjunction of sexes; and others are reproduced when cut in pieces, like the roots of plants.

After man, all other animals have been divided into eight classes, in the following manner:

DAUBENTER's DIVISION *and* CHARACTERS *of the Eight Classes of* ANIMALS.

Having an head.						The most part having no head.	
With nostrils.						Without nostrils.	
With ears.						Without ears.	
Two ventricles in the heart.	One ventricle in the heart.					The heart variously formed or unknown.	
Warm blood.	Blood nearly cold.					A whitish fluid instead of blood.	
Inspiring and expiring air frequently.	Inspiring and expiring air at long intervals.			Admitting the air by gills.		Admitting the air by spiracula.	No apparent entrance or aperture to admit air.
Viviparous.	Oviparous.						
With teats.	Without teats.						
1st Ord. Quadrupeds.	2d Ord. Cataceous animals.	3d Ord. Birds.	4th Ord. Oviparous quadrupeds.	5th Ord. Serpents.	6th Ord. Fishes.	7th Ord. Insects.	8th Ord. Worms.
Four feet and hairy skin.	Fins and no hair.	Feathered.	Four feet and no hair.	Scaly without feet or fins.	Scaly with fins.	Having antennæ.	Having neither feet nor scales.

All ſubſtances proceeding from *animals* are ſaid to belong to the *animal* kingdom, to diſtinguiſh them from the vegetable and the mineral claſſes.

The earth of *animals* differ not from that of vegetables in any reſpect yet diſcovered. Yet there are certain differences betwixt one *animal* earth and another, ſome being calcareous, others not, &c. See TERRA.

The oils and fats of *animals*, like the groſs oil of vegetables, are not of themſelves ſoluble, either in water or in ſpirit of wine; but by the intervention of a third body, as of mucilage of gum, &c. may be rendered miſcible therewith. The oils of *animals* differ from thoſe of vegetables: 1. The finer *animal* oils are not, like the vegetable, procured by a moiſt, but by a dry diſtillation, that is, by combuſtion, and hence all *animal* oils have an empyreumatic ſmell. 2dly. Though an acid is found in the fat of *animals*, yet in the diſtilled oils of *animal* matter, a volatile alcaline property is found in them; whereas in the diſtilled oils of vegetables there is always in acid. The volatile alkaline ſalts, therefore, contained in the oils of *animals*, is the reaſon why they are more penetrating than the diſtilled oils of vegetables, and have a more immediate tendency to put the blood into commotion. Two drops of the ol. c. c. intimately mixed with the ſp. vini R. ℥ ß. are ſufficient to produce a copious ſweat for four men, if divided into four doſes; hence *animal* oils ſhould be cautiouſly given to the young and ſanguine.

The odorous matter of ſome *animal* ſubſtances, as muſk, caſtor, &c. is like the eſſential oils of vegetables, ſoluble in ſp. vini R. and volatile in the heat of boiling water.

The gelatinous principle of *animals*, like the gum of vegetables, diſſolves in water, but not in ſpirit or in oil. Like the gums alſo it renders oil and fats miſcible with water.

However, many *animal* juices differ greatly even in theſe general kinds of properties, from the correſponding ones of vegetables. Thus *animal* ſerum, which appears ſimilar to vegetable gummy juices, hath this remarkable difference, that though it mingles with cold or warm water, yet, on conſiderably heating the mixtures, the *animal* matter ſeparates from the watery fluid, and concretes into a ſolid maſs, if the heat is about one hundred and fifty by Fahrenheit's thermometer.

Animal ſubſtances become putrid much ſooner than vegetable ones, and when corrupted are much more offenſive. See PUTREDO.

Animal matter, burnt in the open air, is reſolved, like vegetables, into ſoot and aſhes, but with this difference, that no fixed alcaline ſalt can be obtained from the aſhes, and no acid vapour accompanies the ſmoak. Expoſed to the fire in cloſe veſſels, after the watery moiſture, a volatile alcaline ſalt is obtained, together with an empyreumatic oil that is more fetid than that from vegetables.

ANIMAL BEZOARDICUM OCCIDENTALE. The leſſer American deer.——BEZORADICUM ORIENTALE. The bezoar goat.——MOSCHIFERUM. The muſk animal. See MOSCHUS.——ZIBETHICUM; See ZIBETHUM.

ANIMALCULÆ. A diminutive of the word *animal*; that is, they are ſuch little creatures as require to be viewed through glaſſes, to diſcern them diſtinctly. Rain, as ſoon as it falls, contains many *animalculæ*, but ſnow ſtill more; the dew on glaſs windows is full of them. In boiled water they retain their ſhape, and ſometimes revive.

The *animalculæ* get in ſhoals in the fluid they ſwim in, and if diſturbed, they ſeparate as fiſh in a pond, and will be many hours before they are collected together. They follow their liquor, in which they ſwim to the laſt drop, and then for want of it, they ſeem to ſtruggle and die; after their apparent death, put water to them, and they revive. When ſeemingly dead they are very flat, but if not paſt regain, they ſoon recover their plumpneſs.

Animalculæ chuſe the ſurface of liquors, probably for the want of air.

Dip a needle point into the oil of vitriol, then into a drop of liquor in which theſe *animalculæ* are, and they inſtantly ſpread about to evade the acid, and ſoon drop down dead. If the needle is dipped in a ſolution of common ſalt, or in the tincture of ſalt of tartar, the ſame is obſerved to follow. Sugar, urine, and blood, ſpeedily deſtroy them.

Vinegar contains *animalculæ*.

Deſault, and ſome others, endeavour to prove that all diſeaſes are owing to *animalculæ*; but it does not appear, that any animal ſubſtance contains *animalculæ* until it becomes putrid, and then theſe are the effect rather than the cauſe of diſeaſes. See PRURITUS and PHTHIRIASIS.

The white matter which ſticks to the teeth, abounds with *animalculæ*, and vinegar deſtroys them.

See Philoſ. Tranſ. Abr. vol. iii. Dr. Hook's Micrographia.

ANIMALE DIPPELII, OLEUM. DIPPEL'S ANIMAL OIL.

The College of Phyſicians of London, in their Pharmacopœia, have given the following preſcription for making it:

℞ olei c. cervi. ℔ j. ter diſtillata—this will ſeldom produce it ſufficiently pure, it will require, five, ſix, and ſometimes more diſtillations, before it becomes the quid deſideratum. Mixing it with quick-lime or powdered charcoal into a paſte, is ſaid to be a great improvement, ſhortens the proceſs, and makes the product more limpid as theſe ſubſtances keep down more of the groſs matter, than would remain without ſuch an addition. After it is made pure, it ſhould be kept guarded from the acceſs of air, elſe it will ſoon be ſpoiled, by its free abſorption of dephlogiſticated air, on being too much expoſed to the atmoſphere. Obſervations on the Pharmacop. Londinenſis, 1788.

Animal oils thus rectified are thin, limpid, and of a ſubtil, penetrating, not diſagreeable ſmell and taſte. They are antiſpaſmodic, ſedative, and diaphoretic, in doſes from five to thirty drops. Hoffman highly extols them; he ſays that a doſe excites ſweat, and ſupports it for twenty-four hours, without cauſing any languor or debility. He farther obſerves, that if twenty or more drops are given on an empty ſtomach, ſix hours before the acceſſion of an intermittent fever, they frequently remove the diſorder; and that they are effectual againſt chronical epilepſies and other convulſive ſymptoms, eſpecially if given before the uſual time of the attack, and preceded by proper evacuations.

They loſe much of their quality by keeping.

The empyreumatic oils of vegetables, rectified in the ſame manner, become poſſeſſed of the ſame effects as thoſe of the animal kind.

All empyreumatic oils diſſolve in ſp. vini R. and the more they are rectified, their ſolution therein is the eaſier: a circumſtance in which they differ from eſſential oils, which by repeated diſtillations become more difficult to diſſolve.

ANIMALIS FACULTAS. See FACULTAS & ACTIO.——ANIMALIS MOTUS. ANIMAL MOTION.

This is the ſame as we call muſcular motion, and is divided into two ſpecies, voluntary, and involuntary. The mode in which it has been performed, though it has employed the pens of men of the greateſt eminence, ſtill lays at preſent involved in equal obſcurity. All we know on this ſubject is, that animal motion depends upon different principles, which, by deſtroying, animal motion is prevented. In order, therefore to produce this motion, muſcles have an ELASTIC, and a TONIC POWER; they muſt alſo be poſſeſſed of IRRITABILITY, and be cloſely connected with the NERVOUS SYSTEM; for, upon theſe powers, properly apportioned to each other is it, that all motion in the human machine depends for its regularity and continuance. There is no doubt, but muſcles, thoſe inſtruments of motion, are poſſeſſed of an ELASTIC POWER equal with the other ſolid parts of the animal machine, which remains even after death; and whatever motion it has beſides, that depends upon the living principle, and the connection which occurs betwixt it and the brain and nerves.

By TONIC POWER, is underſtood that ſtate of diſtenſibility by which muſcles are kept in a proper ſituation to exert their ſtrength and activity; for diſtenſion itſelf is a ſtimulus to which every muſcle is obedient; and almoſt all the muſcles of the living machine is more or leſs diſtended beyond its natural ſtate; that is, that ſtate, which left to themſelves, they would poſſeſs; becauſe the diſtenſion is created by the bone encreaſing to which the muſcles are joined; alſo by the action of the oppoſite muſcles, as well as by the weight of certain parts which muſcles are deſtined to ſupport; and, laſtly, by the fullneſs of the hollow organs, or viſcera, which muſcles ſurround, or to which, in ſome mode or other, they are connected. Hence then, the tonic power, and vigour of muſcular action, are at the ſame time encreaſed by a ſtrong, and diminiſhed by a weaker diſtenſion. But this

tothe power, as far as it depends upon diſtenſion, muſt have limited degrees; for, ſo much from ſtrong and long continued diſtenſion of the muſcular fibres making their contraction eaſier and more powerful, it diminiſhes, and often totally deſtroy it.

By IRRITABILITY, is meant that condition of a muſcle, by which action is promoted by the application of any ſtimulus to a muſcle not more than uſually diſtended. This ſtate Phyſicians alſo call VIS INSITA.

NERVOUS INFLUENCE is known to exiſt, and be productive of animal motion: if a ſtimulus is applied to the nerve which ſerves any muſcle, and the muſcle itſelf is untouched, ſimilar motion in that muſcle will be excited as before ſpecified. And laſtly, we can excite motion in many muſcles by the power of the will alone, without the application of any ſtimulus either to the muſcles, nerves, or brain; and this power is properly called ANIMAL, becauſe it belongs to animals alone.

But all muſcles are not ſubject to the controul of the will; for many actions are performed, and thoſe of very great moment, in the machine, without the mind being conſcious of ſuch motion, nay even contrary to its power. Hence then we ſee there are voluntary and involuntary motion in the human machine; and, indeed, a ſpecies of motion between the two, which the muſcles of reſpiration poſſeſs, viz. the diaphragm, the muſcles of the abdomen, thoſe which lie between the ribs, and as many as are ſo joined with the ribs, that by their action they can either fix, elevate, or depreſs the ribs. From what has been advanced, it appears highly probable, that as the muſcular fibres are the inſtruments of all motion, that by their being poſſeſſed of elaſticity, tone, and irritability, ſubject alſo to the power of the nerves, that all animal motion is performed by their being put into action by means of the vital principle, be it of whatever nature it may. There is, however, a variety of other notions concerning this ſubject, which may be found by conſulting different authors; but this appears the moſt rational, as the moſt eaſily comprehenſible.

See the Theory and Practice of Phyſic, by J. Shebbeare, M. D. Maganiſe's Doctrine of Inflammation, p. 31—52. Haller's Phyſiology, the Lecture on Muſcular Motion. Kirkland's Diſſertation on the Brain, and Nerves. GREGORY'S Conſpectus Medicinæ Theoreticæ. WALLIS on the Moving Powers of the Conſtitution, in his Work on Diſeaſe and Health.—SPIRITUS. —ANIMAL SPIRITS. See CALIDUM INNATUM.

ANIMATIO. ANIMATION. The particular effect produced by the vis vitæ in all animated bodies, by which life is begun, and ſupported. Alſo, an ænigmatical word uſed by alchemiſts in their employ of tranſmuting metals. Quickſilver is ſaid to be animated, when, by conjunction with a perfect metal, it is reduced to a certain ſpecies.

ANIME. The Portugueſe corrupted the word *animæ*, into *anime*.

The GUM ANIME is alſo called RESINA ANIME & *courbaril rezina, aminæa, animum*. Piſo calls the tree from whence it is obtained, *jetaiba*, and the Indians call it *courbaril*. It is the HYMENÆA COURBARIL of Linnæus.

J. Bauhine reckons up five ſpecies, but the whiteſt is the beſt.

The gum *anime* is a tranſparent, yellowiſh-white, reſinous gum, obtained from a large tree in Braſil and New Spain, and alſo in the eaſtern parts of the world. That from the Eaſt, Dioſcorides calls it by the names *myrrha* and *minæa*; but, in our ſhops, we have no other than the American ſorts. The ſmall tears are the pureſt. It hath but little taſte, though to the ſmell it is very agreeable. It eaſily breaks between the teeth; but if chewed for ſome time, it ſoftens and becomes adheſive. If it is laid on a red-hot iron, it immediately melts, catches flame, and burns quickly away, leaving only very little white aſhes.

It diſſolves in ſp. vini R. but is very little affected by water, except in diſtillation, by which it gives a part of its flavour, and a ſmall quantity of oil. The Braſilians are ſaid to uſe it in fumigations for pains aud aches from a cold cauſe. With us it is eſteemed diuretic.

The doſe is ℈ i.

The gum copal is often ſold for it.

ANIMELLÆ. The glandules under the ears, and all along under the lower jaw, called *lacticinia*.

ANIMI, & ANIMÆ DELIQUIUM. See LIPOTHYMIA.

ANIMIFERA ARBOR BRASILIANA. See COURBARIL.

ANIMI PATHEMATA. AFFECTIONS of the MIND.

ANIMOMETER. An inſtrument that meaſures the ſtrength of the wind.

ANIMUS. The MIND. The body and the *mind* reciprocally affect each other with reſpect to health and diſeaſe; whatever invigorates the body, renders the faculties of the ſoul proportionably active and ſtrong.

Ariſtotle hath long ſince obſerved, that thoſe animals whoſe blood abounds with thick fibres are bold and furious, and that a thick hot blood contributes to ſtrength, but not to underſtanding. He alſo obſerves that a thin blood is better calculated for the different purpoſes of ſenſation and underſtanding.

The circulation of the blood not only unites the ſoul with the body, but alſo governs and directs its operations; with the circulation of the blood, the animal and vital functions continue, and they vary, and ceaſe to be, according as the circulation varies or ceaſes.

Would then any one preſerve the faculties of the *mind*, and a due order of the paſſions, let his care be to continue the blood in its due healthy ſtate. Examples daily occur, in which it is ſeen that the chearful glaſs raiſes the man as it were above himſelf; alſo, that its undue uſe enervates and deſtroys him.

On the other hand, a diſordered *mind* injures the body; violent paſſions make great ravage in its conſtitution; and leſs violent ones, if continued ſomewhat longer, have as dreadful an effect. Fear and terror contract the veſſels in the exterior parts of the body, and force the blood into the larger ones about the heart and lungs; which again produce coldneſs in the extremities, a palpitation of the heart, uneaſineſs in the bowels, &c. Sadneſs greatly leſſens the vis vitæ, whence a diſpoſition to a chronical diſorder. Anger increaſes the ſtrength, quickens the pulſe and breathing, but throws the whole frame into a tumult, and its conſequences are ſometimes fatal.

ANINGA, alſo called *iba, Braſil arbor aquatica*.

Ray takes notice of three ſpecies, two of which grow in water, the third in moiſt and ſhady woods; the roots of the firſt two ſorts are bulbous, and poſſeſs medical virtues; they are uſed for fomentations againſt inflations of the hypochondres. Of that ſpecies which is found in the woods, the leaves are the medicinal part; they are bruiſed and applied as a general remedy for healing ulcers. Raii Hiſt. Pl.

ANISATUM. A wine in which aniſeeds are infuſed thus; take of Aſcalon wine, this was a ſtrong wine, ℔ xxx. honey ℔ x. aniſeeds ℥ v. mix them and let them ſtand together a few days, then ſtrain off the clear liquor.

ANISCALPTOR, from *anus, the breech*, and *ſcalpo, to ſcratch*. See LATISSIMUS DORSI.

ANISUM. ANESUM, ANICETUM, ANISE. It is the PIMPINELLA ANISUM, *fructus ovato-oblongus, petala inflexa, ſtigmata ſubgloboſa*. CL. PENTANDRIA. ORD. DIGYNIA. Lin. Gen. Plant. 366. Aniſum Herbariis. COMMON ANISE.

Hoffman calls the ſeeds *ſolamen inteſtinorum*, by way of eminence, for their ſervice in complaints of the bowels.

The common *aniſe* is a ſmall, annual, umbelliferous herb; its ſeeds are roundiſh, ſtriated, flatted on one ſide, pointed at one end, and of a pale colour inclined to green; the upper leaves are divided into fine ſegments, the lower are entire and roundiſh, and ſerrated about the edges. It is a native of Egypt, Crete, and Syria: is cultivated in the ſouthern parts of Europe, and grows in our gardens in England; but it does not arrive at any great degree of perfection with us. The ſeeds only are uſed in medicine; and thoſe which are produced in Spain are ſmaller than thoſe obtained in other countries, and are generally the moſt eſteemed.

Anniſeeds have an agreeable aromatic odour, and to the taſte they are gratefully warm, with a degree of ſweetneſs; they are carminative; much uſed in flatulent complaints; in which caſe, a ſcruple of the powder has been given for a doſe; griping of the bowels: they are alſo moderately anodyne, diaphoretic, diuretic, and diſcutient; an infuſion of them in water moderates the thirſt in a dropſy, and abates the diarrnœa; the fume received up the noſtrils abates the head-ach in ſome inſtances; they promote an appetite, and check hiccoughing, when a flatus and coldneſs in the ſtomach are the cauſes. They are ſuppoſed to increaſe the milk in nurſes. Geoffroy ſays the odour is perceptible in that fluid. Cullen's Mat. Med.

Thoſe who are offended with the ſeeds, may take the ſpirituous

ſpirituous preparation of them, for the ſpirit in ſome meaſure covers their flavour.

Water and ſpirit of wine both completely extract the virtues of aniſeeds; but in diſtillation very little of the ſeeds are carried over with the ſpirit; however, after its evaporation, a powerful and agreeable extract remains.

The London College, 1788, gives a compound aniſeed water, called Sp. ANISI COMPOSITUS, *olim*.

AQ. SEM. ANISI COMP.

℞ Sem. *aniſi* & angelic. ää lb. ſs. ſpt. vini ten cong. ſ. Aquæ, q. ſ. ad præcavendum empyreuma. elic. cong. i.

The angelica ſeeds are added to improve the flavour of thoſe of the *aniſe*. This water is apt to be milky if drawn ſo low as directed above: it has been conſidered an elegant cordial ſtomachic medicine; a glaſs of it aſſiſts digeſtion after full meals, and when vegetables have been too freely eaten.

Along with the water in diſtillation, their eſſential oil, called by Van Helmont *Inteſtinorum Solamen*, ariſes to the quantity of ʒ i. from lb. iii. it poſſeſſes the taſte, ſmell, and all the virtues of the ſeeds in the higheſt perfection; it congeals when the air is not ſenſibly cold into a butyraceous conſiſtence; hence, in diſtilling, the water in the refrigeratory ſhould not be kept too cool; it ſhould rather be warm, particularly towards the end of the proceſs, or the oil will congeal in the worm of the ſtill.

The doſe is from two to twenty drops, which may be made into an elegant draught, thus:

℞ Ol *aniſi* gut. ii. vel q. v. mucilag. e gum. arab. ℈ i. ſp. vin. ten. ʒ. ii. aq. puræ ʒ i. ſs. m. f. hauſt.

This oil is alſo obtained from *aniſeeds* by expreſſion; it is of a greeniſh colour, grateful to the taſte, and ſtrong of the ſeeds, of which, if ſixteen ounces are lightly moiſtened by expoſure to the ſteam of boiling water, about an ounce of oil may be obtained from them. This oil conſiſts of a groſs inſipid inodorous one, ſimilar to the common expreſſed ones, and of a part of the eſſential oil of the ſeed, on which laſt its flavour wholly depends. If this expreſſed oil is digeſted in rectified ſpirit of wine, the eſſential oil is extracted from it; or if it is diſtilled in water, the eſſential oil ariſes and leaves the inodorous one behind. The groſs oil ſeems to reſide in the kernel of the ſeed, the eſſential in the cortical part.

ANISUM INDICUM,—*Stellatum*,—*Peregrinum*,—*Sinenſe*,—*Phillipenſe*; *Badian Semen*; *Fæniculum Sinenſe*; *Cardamomum Siberienſe*; *Zingi*. INDIAN or STELLATED ANISE. The ſeed veſſel of this ſpecies conſiſts of ruſty, brown-coloured, hard, wrinkled capſules, half an inch or more long, joined by their baſes to the number of ſix or more in the form of a ſtar, each of which includes one ſeed, externally gloſſy, and of the colour of linſeed, internally white. It is the produce of a ſmall tree which grows in Tartary, China, and the Philippine iſlands.

The huſks contain the chief of the flavour, which is the ſame as that of the common *aniſeed*, but not ſo fiery; if they are digeſted in ſpirit of wine, they yield a moſt acrid reſinous extract. The ſeeds afford much eſſential oil by diſtillation in water, which is thinner, more limpid, and more fragrant than that from the common ſort.

This ſpecies of *aniſeed* is not yet common in the ſhops, though they are deſerving of a preference to thoſe in uſe.

ANISUM fructicoſum Galbaniferum;—Africanum fructeſcens, folio, & caule vere cæruleo tinctis. See GALBANUM.

ANNETESTES. So Paracelſus calls the Galeniſts, by way of deriſion, becauſe he thought them ignorant of the cauſes and principles of things.

ANNORA. See OVORUM TESTÆ & CALX.

ANNOTATIO. The very beginning of a febrile paroxyſm, called alſo the attack of the paroxyſm. There is another *annotatio* or *epiſemaſia*, which is proper to hectic fevers, happening an hour or two after eating: in this there is no ſhivering with cold, as in the other ſort.

ANNUENTES MUSCULI, ſee RECTUS INTERNUS MINOR.

ANNULARIS CARTILAGO, is thus named from its ſhape, *annulus*, *a ring*. See CRICOIDES. ——DIGITUS. The ring-finger, or that next to the little one.—VENA. The vein betwixt the ring and little finger.

ANNUS. The YEAR. The ancients divided the *year* into winter and ſummer; their ſucceſſors divided it into ſpring, ſummer, autumn, and winter. It is a ſyſtem or cycle of ſeveral months, uſually twelve: YEAR properly, and by way of eminence, ſo called, is the *ſolar year*, or the ſpace of time, wherein the ſun moves through the twelve ſigns of the ecliptic. This contains 365 days, 5 hours, and 39 minutes, according to the obſervations of CASSINI, and others; but in the civil or popular account, this year only contains 365 days; except every 4th, which contains 366. The viciſſitude of ſeaſons ſeems to have given riſe to the firſt inſtitution of the year; which is owing to the proximity and diſtance of the ſun; and, upon this, the name YEAR was given to that ſpace of time wherein the grand luminary performs his whole courſe, and returns to the ſame point of his orbit.

A philoſophical *year* is a common month.

ANNUS AMADIN. LONG LIFE.

ANNI TEMPORA CONSTANTIA, vel INCONSTANTIA. Conſiſtent ſeaſons, ſuch as keep their uſual temperature. Or inconſiſtent ſeaſons, when the weather is unſettled.

ANO, ἄνω, UPWARDS. Alſo ANOTHEN. The ſuperior parts. Emetics are thus called, as purging medicines are called κάτω, *downwards*.

ANOCATHARTICA. Medicines which purge upwards, as emetics.

ANOCHEILON, from ἄνω, and χεῖλος, *a lip*. The UPPER LIP.

ANOCCŒLIA. See CŒLIA.

ANODMON, from ἀ, neg. and ὀδμὴ, *a ſmell*. WITHOUT SMELL. It ſtands oppoſed to fetid.

ANODUS. A word uſed by chemiſts for what is ſeparated from the nouriſhment by the kidneys. The Greek word ἄνοδος, *anodus*, from ἀ, neg. and ὀδὼς, *a tooth*, ſignifies *toothleſs*.

ANODYNA, from ἀ, neg. and ὠδὶν, *pain*.

Anodynes are medicines which eaſe pain, and procure ſleep. They are divided into three ſorts, viz.

1. *Paregorica*. Παρηγορέω, *mitigo*, called alſo *anetica*. Paregorics, or ſuch as aſſuage pain.

2. *Hypnotica*, *Hypnopœos*. Hypnotics, or ſuch as relieve by procuring ſleep, ὕπνος, *ſomnus*.

3. *Narcotica*. Narcotic, or ſuch as eaſe the patient by ſtupifying him; νάρκαω, *ſtupefacio*.

Opiates and narcotics deſtroy ſenſation. Some hypnotics and paregorics procure eaſe and ſleep by removing the offending cauſe, as nitre, camphor, &c. But the term anodyne is now generally employed for thoſe means only which relieve pain by diminiſhing or deſtroying ſenſibility.

The doſes of theſe medicines are generally regulated by the pulſe; yet this rule is not without exceptions. If the pulſe is ſtrong, a larger doſe is ſafe; if weak, a leſs doſe muſt be given.

Camphor is the beſt anodyne in nervous caſes, and at the decline of fevers.

Hemlock procures eaſe and ſleep without cauſing that head-ach, next morning, uſually complained of after taking opium.

Anodynes ſhould not be given without great caution, on a full ſtomach, nor in dropſies.

ANODYNA. INDOLENCE, or abſence from pain. Synonymous with anæſtheſia.

ANODYNUM. Alſo ANTIPODAGRICUM. BALS. THE ANODYNE BALSAM.

Bates's anodyne balſam is uſually made thus:

℞ Linim. ſapon. lb. i. tinct. theb. ʒ iv. m.

Bateman's drops are thus made, only with a weaker ſpirit, and tinctured with aniſeeds.

BALS. ANODYN. GUIDONIS, *Guido's* Anodyne Balſam.

℞ Tacamahacæ pul. tereb. Venet. ää p. æq.

Fill a retort nearly to two-thirds of its capacity, and diſtil with a fire gradually increaſed; then ſeparate the red oil or *balſam* from the liquor which ſwims above it. Its virtues are much the ſame as thoſe of all other empyreumatic oils.

ANODYNUM MINERALE. See NITRUM, N° 3. and NITRUM STIBIATUM.

ANODYNUS FOTUS. ANODYNE *Fomentation*.

℞ Capit. papav. contuſ. ʒ ij. Flor. ſambuc. & flor. chamem. ää ʒ i. coq. in aq. font. ad lb ij. & colatur, adde acet. acerrim. ʒ vi. aq. ammoniæ ʒ i. m.

ANŒA, ANOIA, from ἀ, neg. and νοῦς, *the mind*. STUPIDITY. See AMENTIA.

ANOMALIA, ANOMALOUS. From ἀ, neg. and ὁμαλὸς, *equal* or *ſmooth*. Unequal, irregular.

ANO-

ANOMŒOMERES, from α, neg. ὁμοιος, *like*, and μερος, *a part*. Conſiſting of parts of different kinds. The ſame as heterogeneous.

ANOMŒOS. Diſſimilar or heterogene. Hippocrates uſes this word for viſcous or unnatural humours.

ANOMPHALOS, from α, neg. and ὀμφαλος, a navel. Without a navel.

ANONIS, called alſo *ononis*, *reſta bovis*, *arreſta bovis*, *remora aratri*, PETTY-WHIN, CAMMOCK, and REST-HARROW. This ſpecies formerly uſed, was the ONONIS SPINOSA of Linnæus.

Miller reckons up twenty-ſix ſpecies.

It is a ſmall flexible plant, growing in waſte grounds; its roots are long and tough, have a faint ſmell and a ſweetiſh bitter taſte: their medicinal virtue reſides chiefly in the cortical parts. The doſe is ʒ i. It is diuretic and aperient.

ANONYMOS, from α, neg. and ονομα, *a name*. Nameleſs.

It was formerly a name of the cricoid cartilage; and many exotic trees and ſhrubs are ranked now under this name.

ANONYMOS AMERICANA. A ſort of wild madder. See RUBIA SYLVATICA LÆVIS.

ANORA, ſee OVORUM TESTÆ & CALX.

ANORCHIDES, from α, neg. and ορχις, *a teſticle*. Such as are born without teſticles.

ANOREXIA, ANOREXY. From α, neg. and ορεξις, *appetite*: alſo *apoſitia*, *aſitia*. A WANT OF APPETITE, WITHOUT LOATHING OF FOOD. The Greeks call ſuch as take no food, or have no appetite, anorecti and *aſiti*; but thoſe who have an averſion to food, they call *apoſitoi*.

This diſorder is either original or ſymptomatic; when it is original, its cauſes are, bad diet, too free drinking, voraciouſneſs, &c. In old age it may proceed from feebleneſs. But it is more frequently a ſymptom of ſome other diſorder, and the cure depends on the removal of of the original one. Dr. Cullen ranks this genus of diſeaſe in the claſs LOCALES and order DYSORĔXIÆ. He ſeems to think it always ſymptomatic. Yet points out two ſpecies, viz. 1. ANOREXIA HUMORALIS, when the ſtomach is offended with mucous, bilious, or other humours. 2. ANOREXIA ATONICA, when the fibres of the ſtomach loſe their tone. He uſes this word anorexia as ſynonymous with dyſpepſia.

If the ſtomach is oppreſſed with a ſenſe of weight, begin the cure with a vomit of ipecac. or if the patient is hyſterical, a doſe or two of the vinum aloës vel pil. ex aloe cum myrrhâ may be directed in its ſtead, and afterwards.

℞ Tinct. ſerp. v. tinct. cinamomi compoſitæ āā ʒ i. acid. vitriol. diluti ʒ ij, m. cap. cochl. parv. ii. duabus horis ante prand. ex hauſt. infuſ. flor. chamæmel.

If the offending humours in the ſtomach are alcalious or bilious, give the acidum vitrioli dilutum bis terve in die in aqua fontana.

If drinking ſtrong liquors is the cauſe, beſides temperance and a light but cordial nouriſhing diet, with daily exerciſe, give the dilute acid of vitriol with the bark; and when circumſtances admit, the ſulphureous water ſhould be drank at the ſprings, ſuch as thoſe at Bath, Harrowgate, Llandrindod, &c.

If acids prevail in the primæ viæ, avoid vegetables, and let the diet be chiefly of the animal kind. The drink may be Seltzer water, or any of the chalybeate kind; beſides which,

℞ Infuſ. gentian comp. lb. i. tinct. cinam. comp. ℥ i. ſs. m. cap. cochl. iii. magn. ter die, & horis intermediis cap. pulv. & julep. ſeq.

℞ Magneſ. alb. ℈ i. ſulph. precip. ℈ ſs. ol. carui gt. i. m.

℞ Tinct. ſtypt. Ph. Lond. antiq. ℥ ij. aq. font. ʒ vi. m. cap. cochl. ii. magn. cum ſing. pulv. ut ſupra.

When the appetite is deſtroyed by the uſe of narcotics, ſharp vinegar is commended, in ſmall doſes.

If there is a great defect of the bile, the extract. fellis bovini is preferable to the vegetable bitters.

And if there is a nauſea and averſion to food, the ſame remedies in general ſucceed as in a ſimple loſs of appetite, the difference of the caſes conſiſting only in the degree. Hoffman particularly commends mint and its preparations. Emetics are not to be omitted. See APEPSIA.

ANOSIA, from α, neg. and νοσος, *a diſeaſe*. The abſence of a diſeaſe.

ANOSMIA, α, non. and οσμη, *odor*. A diminution or loſs of ſmelling, which is thus accounted for. The effluvia exhaling from bodies, and drawn into the noſtrils by the means of inſpiration, and there by the humidity of the pituitary membrane, act upon the olfactory nerve; and thence ariſes the perception of odours, which may be deſtroyed in various ways, from a dryneſs of the pituitary membrane; its too great mucoſity, as in a coryza; its infarction, as in ozæna;—in an obſtruction of the noſtrils, as in a polypus, and other circumſtances. Hence all the ſpecies may be reduced to two heads, though SAUVAGES enumerates ſeven: 1ſt. when it ariſes from a catarrh; 2d. from an ozæna; 3d. from a polypus; 4th. from venereal affections; 5th. from worms; 6th. from dryneſs; and 7th. from paralyſis. Dr. CULLEN arranges this genus of diſeaſe in the claſs locales and order dyſæſthesiæ. And mentions two ſpecies, viz. 1. *Anoſmia organica*, when there is ſome evident fault in the membrane that lines the noſtrils, as a catarrh, a polypus, a venereal infection, &c. 2. *Anoſmia atonica*, when the membrane of the noſtrils has no perceptible imperfection as in paralyſis. In theſe different inſtances an attention to the cauſe will lead to the means for relief.

ANOTASIER. See AMMONIACUS, SAL.

ANOTHEN. See ANO.

ANPATER. See SULPHUR.

ANSAVA. See ANGSANA.

ANSER. The GOOSE.

There are many ſpecies of *geeſe*; but the *anſer* domeſticus, or tame *gooſe*, is the chief of thoſe that are in uſe with us. Its fleſh is hard, but agreeable food, though not very proper for the ſedentary: it is beſt in autumn. Its qualities approach near to that of ſwan; but as leſs exerciſed, and living much upon vegetables, is of a more tender ſubſtance; but was it not for its alcaleſcency, it would be a ſubſtance of difficult digeſtion; upon this account the ANAS DOMESTICA, or *tame duck* living more upon animal food is ſtill more alcaleſcent, and of eaſier ſolution. Of both theſe ſpecies, the young animals of a more viſcid texture are more ſlowly digeſted than thoſe ſomewhat more advanced. Of each ſpecies there is a tame and a wild kind; and the latter, as of more alcaleſcency, are more eaſily digeſted than the others: and more proper for weak ſtomachs that are cold, and abound with acids.

The fat of *geeſe* is penetrating and diſcutient beyond that of any other animal.

ANSJUDEN. See ASSA-FOETIDA.

ANTACIDA. ANT-ACIDS. Such remedies as reſiſt or deſtroy acids.

There was a time when it was ſuppoſed that moſt diſeaſes depended on a quantity of acid and alkali contained in the fluids. It is true, they both exiſt in the blood, but altered by chemical combination; ſo that it is very ſeldom, if ever, that we find any mark of acidity there; none that can be rendered ſenſible to any chemical experiment. But when a quantity of acid is thrown in, it flows to the kidnies, and proving diuretic, paſſes off with urine: indeed it cannot exiſt long in any quantity in the veſſels, without being neutralized by decompounding the ammoniacal ſalts of the blood, and uniting with the volatile alkali which is detached.

We have no occaſion to employ any remedies to deſtroy either acidity or alkaleſcency in the veſſels, for it does not appear to be contained in them; though acids may be in the firſt courſe of the circulation, being ſenſibly perceived in the kidnies, and increaſing the ſecretion of the glands of the breaſt. And if vegetable food be not thoroughly digeſted, a ſickneſs, vomiting, heart-burn, and in infants, frequency of the pulſe to a fatal degree, may be produced, and this from the acid produced from the food in the ſtomach going into its own aceſcent fermentation.

Though the fundamental cure of ſuch acidity of the ſtomach be ſtrengthening it, yet if the quantity of acid in the primæ viæ be very conſiderable, it is better to evacuate it by an emetic: if it is not ſo very conſiderable in its quantity, yet, as it will act as a ferment, it will accumulate again; we muſt therefore employ ſome ſubſtances which will combine with it, ſuch as lime-water, chalk, and other abſorbent powders; all the alkalies, borax, ſoluble tartar, ſoap, ruſt of iron, prepared; for this laſt not only acts as an abſorbent, but ſtrengthens the ſtomach, &c. Mild alkali is thought to hurt, if given freely, but this is imaginary: it is preferable to abſorbent earth. The magneſia becomes laxative when it meets with an acid, the calcareous earths are rather aſtringent, ſo if either of theſe effects are required, they may be mixed in

ſuch

ſuch proportions as to anſwer the deſired end. The foſſile alkaline ſalt hath its advantages in ſome inſtances. The mild alkali is always to be preferred, for it does not diſſolve the mucus in the firſt paſſages ſo freely as the volatile. For children, the doſe of fixed alkali may be from gr. iij. to v. for adults from gr. x. to ℈ i. if the foſſile alkali in cryſtals is uſed, allow for its water, which is at leaſt one half of the whole; as diet, animal food, and ſhell fiſh are peculiarly agreeable.

It is not ſufficient that we deſtroy the preſent acidity in the ſtomach; but put it into ſuch ſtate, as that its digeſtive power may be encreaſed in ſuch a degree, as to prevent future diſturbance from this cauſe; for which purpoſe, ſee ANOREXIA, and APEPSIA.

ANTAGONISTA, from αντι, *againſt*, and αγωνιζω, *to ſtrive*. One acting in oppoſition to another.

This word is applied to muſcles which counteract each other.

ANTALE. See ANTALIUM.

ANTALGICUS, from αντι, *againſt*, and αλγος, *pain*. Such remedies as eaſe pain.

ANTALIUM, alſo called *antale* and *tubulus marinus*. It is a ſhell like a pipe, of the thickneſs of a ſmall quill, and about an inch and half in length; it is hollow, and hath hollow lines running from one end to the other: its colour is white, or a greeniſh white. A kind of worm is the natural inhabitant of this ſhell, and its medical uſes are the ſame with the ſhells of oyſters, &c.

ANTAPHRODISIACOS, } from αντι, *againſt*, and
ANTAPHRODITICA. } Αφροδιτη, *Venus*. Anti-venereal, or ſuch medicines as extinguiſh amorous deſires.

ANTAPODOSIES, from αναποδιδωμι, *to reciprocate*. Returns of the paroxyſms of fevers.

ANTARTHRITICUM. Anti-arthritic. From αντι, *againſt*, and αρθριτις, *the gout*. Medicines againſt the gout.

ANTASTHAMATICA. ANTI-ASTHMATIC. From αντι, *againſt*, and ασθμα, *an aſthma*. Remedies againſt an aſthma.

ANTATROPHON, from αντι, *againſt*, and ατροφια, *a conſumption*. Medicines againſt conſumptions.

ANTECEDENS CAUSA. See PROEGUMENE.

ANTECEDENTIA SIGNA. ANTECEDENT SIGNS, ſuch ſigns as precede the diſeaſe.

ANTELABIA, αντιχειλα, from προ and χειλος, *a lip*. The extremities of the lips.

ANTELIX, or ANTIHELIX. It is that part of the ear which is oppoſite to the helix.

ANTEMBALLOMENOS, } from αντι, *inſtead of*,
ANTIBALLOMENA. } and εμβαλλω, *to contribute*. Subſtituted. Called alſo *ſuccedanea*, ſuccedaneous.

ANTEMBASIS, from αντι, *mutually*, and εμβαινω, *to enter*. A mutual inſertion or ingreſs, applied by Galen to the bones.

ANTEMETICA, from αντι, *againſt*, and εμετικος, *vomiting*. Remedies againſt vomiting.

ANTENDEIXIS, from αντι, *againſt*, and ανδειξνυμι, *to indicate*. *Contra-indicatio*. A contra-indication. As when one ſymptom requires a remedy which another ſymptom forbids the uſe of. *Prohibens* is uſed in the ſame ſenſe.

ANTENEASMUS. } The ſame with enthuſiaſmus.
ANTENEASINUM. } A particular kind of madneſs; in it the patient is furiouſly irritated, and endeavours to lay violent hands on himſelf. Theſe people are apt to be ſeized with ſudden convulſive ſtartings of the hands and feet; and therefore is thought to coincide with the *chorea ſancti viti* in ſome degree.

ANTEPHIALTICUS, from αντι, and εφιαλτης, *the night-mare*. A name for the remedies adapted to the cure of the ſaid diſorder.

ANTIEPILEPTICA, from αντι, *againſt*, and επιλεψις, *the epilepſy*. Remedies againſt an epilepſy and other convulſive diſorders.

ANTERA. See ANTHERA.

ANTERIOR MALLEOLUS, Muſc. See Muſc. EXTERN. AURIS.

ANTERIORES NASI, Muſc. See PYRAMIDALIS NASI.

ANTERIT. MERCURY. See ARGENT. VIVUM.

ANTHEA, in the plural ſignifies REDNESS.

ANTHELIX. See AURICULA.

ANTHELMIA, alſo called *ſpigelia*, *caryophyllus Indicus*. INDIAN PINK, and WORM-GRASS of JAMAICA. It is the SPIGELIA MARILANDICA vel *ſpigelia caule tetragono, foliis omnibus oppoſitis*. Linn. S. N. 166. vel ſpigelia anthelmia. Linn. CL. PENTANDRIA. ORD. MONOGYNIA. It was called ſpigelia by LINNÆUS, in honour of the BOTANIST SPIGELIUS.

It is found in different parts of the iſland of Jamaica, and other of the windward iſlands. It riſes from a ſmall tapering root, well charged with fibres on all ſides, by a ſtraight, ſmooth, roundiſh, and hollow ſtalk, which ſeems to grow thicker as it riſes to the height of five, ſeven, or nine inches; at the top are generally four leaves, oblong, ſharp-pointed, and almoſt equal, with veins, which running obliquely towards the ſides or edges of the leaf, turn off and terminate towards the point; out of the centre of the croſs, formed by theſe four leaves, riſe one, two, or more ſpikes, bearing flowers, which ſpikes are from half an inch to two or three inches long, and range the flowers and ſeeds on one ſide of them pretty thick; the mother-ſtalk hath generally one, two, or three joints, out of which ſpring twice as many leaves oppoſite, and like thoſe at the top, and as many branches in an alternate order, which terminate like the mother-ſtalk.

The uſual method of adminiſtering this medicine is as follows:

℞ Herb. *anthelm.* ℥ ſs. coque in aq. font. ℔ xii. ad. ℔ viii. colaturæ adde ſacchar. alb. & ſuc. limon. q. ſ. ad gratam acid. dulcedinemque, detur cochl. ii. magn. h. ſ. & i. mane proxim.

Half a dram of this herb may be infuſed five or ſix hours in a quarter of a pint of boiling water; one half of the ſtrained liquor may be given to a child of twelve years old, and the other half the next morning: if no inconvenience is manifeſt from this doſe, the infuſion may be made ſtill ſtronger.

For adults who are not remarkably feeble, ℥ iii. of this herb may be boiled down to ℔ i. and the doſes may be from two to ſix common ſpoonfuls, according to its effects on the patient.

In moſt perſons it procures ſleep; in many, after taking a full doſe, their eyes are obſerved to ſparkle, and alſo to be diſtended after the ſleep is over; and if there was a fever from worms, the pulſe becomes more regular, and the heat moderate, and by the uſe of a purge or two afterwards, worms are diſcharged; this medicine muſt be continued as long as the worms are obſerved to paſs away with the ſtools. If its effect on the eyes of children is ſuch as to produce a painful diſtention in them, it is better omitted. An emetic ſhould generally precede its uſe; in large doſes, it ſometimes proves emetic, purges much, producing vertigo, dimneſs of ſight, and remarkable convulſions of the eyes. It ſhould therefore be cautiouſly adminiſtered, with the intervention of a purge of calomel and rhubarb.

ANTHELMINTICA, from αντι, *againſt*, and ελμινς, *a worm*. Remedies againſt worms: *antiſcolica is a word of the ſame import*. And,

VERMIFUGES Thoſe medicines are called ſuch as either deſtroy, or expel worms, ſituated in any part of the primæ viæ. BOERHAAVE uſed to divide them into two ſpecies; thoſe which deſtroy, and thoſe which expel worms. Modern authors into four, becauſe there may be caſes where the exhibition of either of theſe two may be improper, as the particular ſtate of the ſtomach and inteſtines may be unable to bear their action.

The diviſion is:

1. VENENOSA, { Quickſilver and its preparations. Powder of tin. Sulphur.
2. Cathartica, { Scammony. Jalap. Aloes. Gamboge.
3. Lubricantia, { Oil of olives. Linſeed oil.
4. Tonica, { Sabine. Worm-ſeed. Tanzey infuſion, and Powder.

Beſides, for this purpoſe a number of other articles are exhibited: Indian pink root; fern powder; cowhage; ſalt in ſtrong ſolution; camphor; bitters; oil in glyſters; harrowgate waters. But to the exhibition of vermifuges, there are particular exceptions, if the inteſtines ſhould be inflamed or abraded, the VENENOSA ſhould be avoided; if there ſhould be any accumulation of ſordes in the firſt paſſages, the LUBRICANTIA; if a peculiar ſenſibility of

ſtomach, the TONICA; and the CATHARTICA, if any topical affection ſhould occupy the inteſtines, or ſhould the conſtitution labour under any conſiderable deficiency of fluids.

ANTHEMIS. WILD CHAMÆMILE. See CHAMÆMELUM VULGARE.—NOBILIS. See CHAMÆMELUM FLORE PLENO.—COTULA. See CHAMÆMELUM FOETIDA.—PYRETHRUM. See PYRETHRUM.

Galen ſays the Anthemis is the ſame as *Enanthemon*.

ANTHERA, from ἀνθος, *a flower*. Alſo *Antera*. A compound medicine uſed by the ancients, ſo called from its florid red colour. There are various compoſitions which had this name. *Antheræ*, indeed, were prepared for any particular part of the body, in the form of powders, electaries, &c. and were uſed as collyriums, dentrifices, &c.

ANTHERÆ. ANTHERS. In Botany a part of the flowers, big with pollen, or farina, a fine duſt, which it emits, or explodes when ripe; or big with granulated pollen, and that with fovilla; or it may be defined a veſſel deſtined to produce and emit a ſubſtance for the impregnation of the germ. It forms a part of the ſtamen, and is placed on the top of the filament. It is the *apex* of RAY—*Capſula ſtaminis* of MALPIGHI; SUMMIT, SEMET, PENDENT, or TIP of GREW, and other Engliſh writers.

ANTHEREA. See ANTHORA.

ANTHEREON. Called alſo *Geneion*: Hippocrates uſes this word to expreſs the chin, and all that part of the face where the beard grows.

ANTHERICOS. Dioſcorides ſays it is the flower of the aſphodel; others ſay it is the ſtalk only. See ASPHODELUS.

ANTHERICUM. See ASPHODELUS LUTEUS.

ANTHINES, from ἀνθος, *a flower*. A name of ſome medicated oils and wines.

ANTHOPHYLLUS. The AROMATIC CLOVE, when ripe, is thus named. See CARYOPHILLI AROMATICI.

ANTHORA, } called alſo *anthercа*, *aconitum ſalu-*
ANTITHORA, } *tiferum*, WHOLESOME HELMET-FLOWER, WHOLESOME WOLF'S BANE, COUNTERPOISON, MONKSHOOD, and YELLOW HELMET-FLOWER: it is the ACONITUM ANTHORA of LIN.

This plant is diſtinguiſhed from the poiſonous aconites, by the leaves not being gloſſy, by their being cut entirely down to the pedicle, and by the ſegments being very narrow, and of nearly the ſame width from end to end. It is a native of the Alps and Pyrenees, from whence we have the dried roots, which are of an irregular roundiſh ſhape, a little oblong, brown on the outſide, white within, hard to break, but not tough; to the taſte it is acrid and bitter, to the ſmell it is faint; if chewed a little conſtringes the fauces, and a nauſeous ſweetneſs is perceived. It is ſuppoſed to be an antidote to the poiſonous aconites, particularly to that ſpecies called *theſra*, whence its name *antithora*.

ANTHOS, ἀνθος, a FLOWER. Hippocrates means by this word, *flowers* in general; and if Galen is right in his comment, Hippocrates includes the ſeeds with the *flowers*. It is alſo uſed for *æris flos*. And when uſed alone ſignifies the flowers of roſemary, and is ſometimes taken for the plant, but improperly. See ÆRIS FLOS, and ROSMARINUS.

ANTHOSMIAS, from ἀνθος, *a flower*, and ὀσμη, *ſmell*. A name applied to ſweet-ſcented wine.

ANTHOUS. Properly roſemary, but transferred to metals; it ſignifies the fifth eſſence, or elixir of gold.

ANTHRACIA, ANTHRACOSIA, or ANTHRAX. A BURNING COAL. A ſore kind of ſwelling, which is often a ſymptom in the plague, ſo called from its burning nature. See CARBUNCULUS.

ANTHRACOSIS OCULI. A ſcaly corroſive ulcer of the eye, attended with a defluxion.

ANTHRAX. See CINNABARIS, and alſo CARBUNCULUS.

ANTHRISCUS. See CAUCALIS.

ANTHROPE, from ἀνθρωπος, *a man*. See CUTIS.

ANTHROPOLOGIA, from ἀνθρωπος, *a man*, and λογος, *a diſcourſe*. A deſcription of man.

ANTHROPOMORPHOS, from ἀνθρωπος, *a man*, and μορφη, *ſhape*. See MANDRAGORA.

ANTHROPOSOPHIA, from ἀνθρωπος, *a man*, and σοφια, *wiſdom* or *knowledge*. The knowledge of the nature of man.

ANTHYPNOTICA, from ἀντι, *againſt*, and ὑπνος, *ſleep*. Medicines againſt ſleepineſs.

ANTHYPOCHONDRIACA, from ἀντι, *againſt*, and ὑποχονδρια, *the hypochondria*. Medicines againſt the diſorders of the hypochondria.

ANTHYPOCHONDRIACUM, } SAL. it is the re-
ANTHYSTERICUM. } ſiduum remaining after the diſtillation of the water, and ſublimation of the ſal ammon. which conſiſts of the marine acid and the fixt alkaline ſalt, or the alkaline earth, according as one or the other was uſed in the proceſs; or rather, the ſalt obtained by ſolution and cryſtallization from this reſiduum

ANTHYSTERICA, from ἀντι, *againſt*, and ὑστερα, *the uterus*. Medicines againſt the hyſteric paſſion. Theſe medicines might as well be called uterines, for many of them remove the diſorders of the uterus, that produce hyſteric fits.

ANTIADES. See TONSIL. It ſometimes ſignifies the *tonſils* when inflamed. From ἀντιαω, *to be oppoſite*, becauſe they anſwer one another.

ANTIAGRI, from ἀδηδες, *the tonſils*, and ἀγρα, *a prey*. Tumors of the tonſils.

ANTIARTHRITICA. ANTIPODAGRICA. Medicines againſt the gout.

ANTIBALLOMENA. See ANTEMBALLOMENOS.

ANTICACHECTICA, from ἀντι, *againſt*, and κακχεξια, *a cachexy*. Medicines againſt a cachexy.

ANTICADMIA. A third kind of foſſile cadmia, alſo called pſeudocadmia. Anti is here joined to expreſs it being ſubſtituted for the true cadmia.

ANTICAR. See BORAX.

ANTICARDIUM. The hollow at the bottom of the breaſt. From ἀντι, *againſt*, and καρδια, the upper orifice of the ſtomach, and the pit of the ſtomach. Called alſo SCROBICULUS CORDIS.

ANTICATARRHALIS. A remedy againſt a catarrh.

ANTICAUSOTICUS, from ἀντι, *againſt*, and καυσος, *a burning fever*. Remedies againſt burning fevers.

ANTICHEIR, from ἀντι, *againſt*, and χειρ, *the hand*. The thumb of a perſon's hand. See POLLEX.

ANTICIPANS. The Greeks expreſs this by προλαμβανων; it is applied to diſeaſes whoſe ſucceeding paroxyſms anticipate the time of the preceding fit, that is, each of whoſe fits begin ſomewhat ſooner than the preceding. If the catamenia arrive before their ordinary period, they are ſaid to anticipate.

ANTICNEMION, from ἀντι, *overagainſt*, and κνημη, *the calf of the leg*. Hippocrates uſes this word to expreſs that part of the tibia which is bare of fleſh.

ANTICOLICA. Remedies againſt the colic.

ANTICONTOSIS, from ἀντι, *againſt*, and κοντος, *a ſtaff* or *pole*. In Hippocrates it ſignifies the ſupporting a perſon with a ſtaff or crutch.

ANTIDINICA, from ἀντι, *againſt*, and δινος, *circumgyration*. Medicines againſt a vertigo.

ANTIDOTARIUM. See DISPENSATORIUM.

ANTIDOTOS EX DUOBUS CENTAURÆ GENERIBUS. See CHAMÆDRYS.

ANTIDOTUS, or ANTIDOTUM. The Chaldee word for which is *beluzaar*, alſo called *alexicaca*. An antidote, from ἀντι, *againſt*, and διδωμι, *to give*. See ALEXIPHARMACA, and ADAMUS.

ANTIDYSENTERICA. Medicines againſt a dyſentery.

ANTIFEBRILE. Remedies againſt a fever.

ANTIFIDES. The calx of metals.

ANTIGONI COLLYRIUM NIGRUM. The black collyrium of Antigonus. It is made of cadmia, antimony, pepper, verdigriſe, gum arabic, and rain-water.

ANTIHECTICA. Remedies againſt a hectic fever.

ANTIHECTICUM POTERII. A medicine invented by Poterius, alſo named *antimonium diaphereticum jovialc*: formerly extolled as effectual in hectic fevers, but from long experience now diſregarded, as of no conſequence. For its mode of preparation, ſee LEWIS's Diſpenſatory Improved. Ed. 8vo. Edinb. 1786.

ANTIHELIX. See AURICULA.

ANTILEPSIS, from ἀντιλαμβανω, *to lay hold of*. Hippocrates ſpeaking of ſecuring bandages from ſlipping, uſes this word: alſo *apprehenſis*, and *apprehenſorium*, are uſed in this ſenſe.

ANTILOBIUM, from ἀντι, *againſt*, and λοβος, *the bottom of the ear*. See AURICULA.

ANTILOMICA, from ἀντι, *againſt*, and λοιμος, *the plague*. Remedies againſt the plague.

ANTILOPUS, called alſo *gazella Africana*, *capra ſtrepſiceros*, *ſtrepſiceros*, the ANTELOPE.

It

It is an African beaſt which reſembles a deer. The hoofs and horns have been uſed in medicines againſt hyſterics and epilepſy.

ANTILYSSUS, from ἀντὶ, *againſt*, and λύσσα, *the madneſs cauſed by a bite of a mad dog*.

It is the name of any medicine for the cure of this ſort of madneſs.

ANTIMONIAL PILUL. Dr. WARD. WARD'S ANTIMONIAL PILL.

Take well levigated glaſs of antimony four ounces, mix it well with one ounce of dragon's blood, then beat them into a maſs with a little mountain wine, after which divide it into pills of about one grain and half each.

Mr. Clutton, the chemiſt, ſays that they contain a portion of arſenic.

One of theſe pills is a full doſe for a full grown perſon.

——PULVIS. The ANTIMONIAL POWDER.

Take of *antimony* coarſely powdered, hartſhorn ſhavings, of each two pounds; mix and put them into a broad red hot iron pot, ſtirring conſtantly till the maſs acquires a grey colour. Powder the matter when cold, and put it into a coated crucible; lute it to another crucible inverted, which has a ſmall hole in the bottom, augment the fire by degrees to redneſs, and keep it ſo for two hours; laſtly, reduce the matter when cold to a very fine powder; this is ſaid to be a preparation equally efficacious as that of Dr. James's, and produces ſimilar effects. It is adopted by the London College, and inſerted in the New Pharmacopœia, and is certainly preferable to the tartariſed *antimony* joined with the teſtaceous powder which uſed to be ſubſtituted for that of James's This powder is a calx intimately blended with the reſiduum, or abſorbent earth of the hartſhorn. From three to ſix grains in a doſe, and if joined with a quarter of a grain of opium, acts as a diaphoretic, and which is conſidered as alterative. In inflammatory fever of the rheumatic kind, by repeating the doſe properly, every ſix or eight hours, it has frequently proved beneficial.

ANTIMONIUM. Sometimes *ſaturnus* is uſed for *antimony*, called alſo *ſtibium*, *alcimad*, *alcotol*, *ſtimmi*, *platyophthalmon*, *larbaſon*, *ſatanus devorans*, *lupus philoſophorum*, *aurum leporoſum*, *ens primum ſolare*, *alamad*, *madail*, *duenech*, *afrob*, *alcefolo*, *alkafialo*, *coſmet*, *calmet*, *gynæcium*, the RED LION, and ANTIMONY.

Antimony is ſometimes found in a particular ore, but moſt frequently mixed with other metals; and hence its name may have been derived, *antimony* being the ſame with ἀντιμονος, *an enemy to ſolitude*. BASIL VALENTINE, a German monk, gave it, as tradition relates, to ſome hogs, which after purging, it greatly fattened; thinking in like manner to feed his brother monks, he gave it to them, who all died by the experience; hence the name ANTIMONY, ANTI-MONK. It is called *ſatanus devorans*, and *lupus philoſophorum*, from its power of devouring or deſtroying as it were all metals when in fuſion with it. It is a ſemi-metal, of a whitiſh or ſilver colour.

Its chemical character is a circle, denoting the body of gold, and a croſs to ſhew it is corroſive, which as it prevails, it is placed at the top thus ♁.

There are mines of *antimony* in Hungary, Tranſylvania, Germany, France, and in England ſome are met with. The French *antimony* is about equal parts regulus and ſulphur; but the beſt is from Hungary. The Engliſh is, of all the ſorts, the leaſt fit for medical uſe, for it is often mixed with lead or tin, from which, however, if ſeparated, it is as good as any other: that which is ſpotted with red, Dr. Alſton, of Edinburgh, thinks it poſſeſſed of ſome arſenic, ſo ſhould be rejected.

The *antimony* is generally found mixed with hard ſtones or ſpar, from which it is ſeparated by eliquation; ſome ores are mixed with arſenic or with cobalt; ſome are dug up which are compoſed of fine ſhining lines like needles, ſometimes diſpoſed in regular ranks, at others without any obſervable order; this is termed male *antimony*; ſome are diſpoſed in thin broad plates or laminæ, and called female *antimony* by Pliny; and from their different mixtures and appearances other names are given to them.

The mineral being broken into pieces, it is put into earthen pots whoſe bottoms are perforated with ſmall holes, and a moderate fire is applied round them; as the *antimony* melts, it runs through the holes in the bottom of the pots, and is received into conical moulds that are placed underneath; in theſe moulds the lighter and more droſſy part riſes to the ſurface, while the purer and more ponderous falls to the bottom; whence it is that the broad part of the loaves are leſs pure than the apex or ſmaller end. The *antimony* thus ſeparated from its ore, is called crude; which yet is but an ore, or a combination of a particular metal with common ſulphur.

The goodneſs of crude *antimony* is diſcovered by its weight, from the loaves not being ſpongy, from the largeneſs of the ſtriæ, and from its totally evaporating on a ſtrong fire.

Its general appearance is a ponderous brittle mineral, or ſemi-metal, compoſed of long ſhining ſtreaks like needles, mixed with a dark leaden-coloured ſubſtance, and hath no particular taſte or ſmell, and is brought to the ſhops in the form of conical loaves.

Antimony, like moſt of the beſt medicines, found its way as an internal one in the medical practice with great difficulty; the ancients conſidered it as a poiſon, and only fit for external uſes. Baſil Valentine, in the fifteenth century, firſt brought it into vogue as an internal medicine, publiſhing a work called Currus triumphalis Antimonii; but it ſoon loſt its repute, until Paracelſus raiſed its credit again, after which it was received and rejected ſeveral times, until, by the ſucceſs of empyrics, it acquired an eſtabliſhed place in regular practice; and is now juſtly ranked with the moſt valuable part of the materia medica.

In the ſtate of crude antimony, notwithſtanding what has been ſaid by many authors of its efficacy in rheumatic, cancerous, and other caſes; it appears from repeated trials, to be an inert ſubſtance with regard to the human body. Notwithſtanding it is ordered by ſome phyſicians to be taken from one ſcruple to a dram, two or three times a day, in ſome cutaneous and leprous diſorders, in its levigated ſtate, ſee below N° 8. Its preparations are, in general, uſed both as alteratives and evacuants, and hardly any article in the materia medica will admit of ſo extenſive a uſe in acute diſeaſes, as well as chronical; ſome of them are equally a principal in the cure, the varieties of theſe complaints requiring ſome difference in their adjuncts. In fevers of the inflammatory and putrid kinds, antimonials are alike the proper remedy; and in chronical diſeaſes, whether from the rigid or lax habit, they may be depended on.

They promote all the ſecretions and excretions, particularly thoſe of the ſkin, inteſtines, urinary paſſages, and ſalival ducts, by gently irritating the whole nervous and vaſcular compages. If given in ſmall doſes, gradually increaſing them, yet keeping to that proportion which excites no ſenſible diſcharge, they are efficacious in regenerating a healthy ſtate of the blood; for this purpoſe their effects are not ſo ſpeedy as thoſe of iron, but they are more laſting.

Thus it is eaſy to perceive how juſtly it is aſſerted that antimonials are curative in ſo many diſorders, and thoſe too of oppoſite natures. As auxiliary to other medicines, on which the cure more directly depends, their efficacy is no leſs to be admired; they quicken their action and increaſe their powers, particularly thoſe by which any evacuation is to be promoted, mixed in under-doſes with ſuch medicines, their operation is generally more eaſy too; as an expectorant, ſome of its preparations excel; and provoke the ſalivary diſcharge in the ſame manner as when mercury hath been freely taken; but that made by *antimony* is ropy, whereas that with mercury is very thin.

If any preparation of *antimony* is too free in its operation upwards, it may be carried through the inteſtines by taking a little common ſalt in any ſmall drink made warm, or it is reſtrained by a draught of water acidulated with the acidum vitrioli dilutum.

The preparations of this drug are numerous, and vary in their ſtrength according to the quantity of nitre employed in the deflagration, or the diſcharge of the ſulphur; but except that which is called the muriated antimony, they only differ from each other in their degrees of activity, and may be conſidered generally as evacuants, proving emetic, cathartic, diaphoretic, and ſudorific chiefly; but the juſt named preparation, the antimonial wine, emetic tartar, and pulvis antimonialis, are the only ones which deſerve our notice, out of the great variety which ſwell the diſpenſatories. Beſides theſe we may indeed add two private preſcriptions, which are deſervedly celebrated, viz. the febrifuge powder of Dr. James, and that of Edinburgh; the latter of which is recommended to us on the beſt authority, as poſſeſſed of thoſe very deſiderata, the want of which was the cauſe of other preparations being complained of. It is called *antimonial ſalt*, and ſeems to be a preparation ſimilar to that of tartariſed antimony, though kept a ſecret by thoſe who prepare it.

It

It is ſoluble in water—invariably of the ſame ſtrength—and a grain or two under or over the doſe, is not attended with any inconveniences. It is probably prepared with the mercurius vitæ, inſtead of antimonium vitrificatum; thus forming an *antimonium tartariſatum*. See TARTAR EMETICUM.

After naming ſome of the pharmaceutic properties of crude *antimony*, the chief of its preparations follow.

Antimony conſiſts of a metallic part, called regulus, and of common ſulphur.

It is eaſier of fuſion than its pure metal.

It melts before it is red hot, but not before its containing veſſel is ſo.

All its medicinal virtue is in its metallic part.

Water neither diſſolves the ſulphur nor the metal.

Rectified ſpirit of wine affects not the metal, but takes up a ſmall portion of the ſulphur.

Wine, or any vegetable ſaponaceous acid, acts on both the ſulphur and the metal.

Vitriolic acid takes up the inflammable part of this ſemimetal, and unites with it into an actual mineral ſulphur.

The muriatic acid, and the aqua regia, are its proper ſolvents; the other diſſolvers of metals convert it into a calx.

Crude *antimony* is volatile on the fire, and volatilizes all metals except gold, ſo as to make them fly away with it in the form of a vapour; hence its uſe in refining gold.

The ſolution of it in aq. regia, or in the muriatic acid, is precipitated by the addition of water.

United with ſulphur, or partly calcined with nitre, its virulent activity in the primæ viæ is much abated.

When entirely deprived of its phlogiſton by calcination, it becomes quite inert, acquiring additional weight.

It is ſoluble in hepar ſulphuris.

N° 1. ANTIMONIUM CALCINATUM—*olim* CALX ANTIMONII.

The London College directs to take of powdered *antimony*, and mix it well with thrice its weight of nitre, then to throw it by degrees into a red-hot crucible, calcine the white matter about half an hour, and when cold let it be powdered; afterwards waſh it with diſtilled water. The doſe is from ten grains to thirty, which have been given repeatedly in fevers, and inflammatory diſorders; but has long given way to the more active preparations of antimony.

For this, formerly called *antim.* diaphoreticum, is conſidered by many, a perfect inert metallic earth, and hath been taken to the quantity of half an ounce, without producing any ſenſible effect; but if the nitre is not perfectly free from ſea-ſalt, this calx will be emetic, becauſe, in this caſe, there is not the due quantity of nitre for the proportion of the ſea-ſalt. Huxham ſays, that one eighth of nitre makes as inert a calx as any larger quantity doth.

The unwaſhed calx is called *antim.* diaph. nitratum; when waſhed it is called calx *antim.* lota, vel dulcis.

Cheap as this calx is, it is ſometimes adulterated with whiting.

2. ANTIMONIUM CATHARTICUM, *D. Wilſon.* MR. WILSON'S PURGING ANTIMONY.

Take four ounces of the glaſs of *antimony* finely powdered, gradually pour thereon twelve ounces of the vitriolic acid; digeſt them forty-eight hours, then diſtil them in a ſand-heat; when the whole is cold, waſh the powder which remains at the bottom of the retort, until all its acrimony is loſt; then dry and grind it with an equal weight of natrum vitriolatum, and a double quantity of the vitriolated tartar; keep this mixture a quarter of an hour in gentle fuſion, in a crucible placed in a wind-furnace, then taking it away from the fire, when it is cold powder it, afterwards waſh and dry it again for uſe.

Its inventor ſays that it is the moſt certain *antimonial* purge; that it operates without naſeating the ſtomach; and that it may be given from three grains to ten for a doſe.

3. CERUSSA ANTIMONII. *The* CERUSS OF ANTIMONY.

This preparation differs not from the *antim.* calcinatum above, though the regulus of *antimony* is ordered in it, inſtead of the crude mineral, as in making the calx.

4. CROCUS ANTIMONII. CROCUS OF ANTIMONY.

The London College now directs to take of pure crude *antimony* and nitre, of each equal parts, to powder them ſeparately, muriatic ſalt one ounce, then mix, and gradually to throw it into a hot crucible, and melt it by increaſing the heat; after which, the matter being poured out, it is to be ſeparated from its ſcoriæ when cold.

It is alſo called *crocus metallorum*, and hepar *antimonii*, but improperly.

The crucible ſhould be heated to a white heat, or the mixture will not be duly melted; and the longer it is kept in fuſion, the deeper its colour will be. But as commonly made there is leſs nitre uſed, and a ſmall quantity of common ſalt thrown into it, to promote the fluxion.

This preparation is violently emetic, much of the ſulphur of *antimony* is conſumed; but the variety found in the ſtrength of different parcels, and the rugged effects of it in general, renders it almoſt unfit for any uſe, except amongſt horſes.

5. CROCUS ANTIMONII MEDICINALIS. MEDICINAL CROCUS OF ANTIMONY.

Take eight ounces of *antimony* and one ounce of nitre; powder, mix, and deflagrate them, then the matter being immediately taken from the fire and cooled, powder it for uſe.

This is ſomewhat more active than the crude *antimony*: from gr. eight to twenty operates gently both upward and downward.

6. CROCUS ANTIMONII MITIOR. *The* MILDER CROCUS OF ANTIMONY.

Take of crude *antimony* two pounds, and of nitre one pound, powder and deflagrate them.

Be careful to remove theſe two laſt from the fire as ſoon as the deflagration ceaſes, and before the metal melts.

In all theſe proceſſes only a little of the compoſition muſt be thrown in at a time, and no more muſt be added until the deflagration ceaſes, leſt the violence of the deflagration would throw out much of the matter into the fire.

This laſt preparation is called mitior, with reſpect to the crocus *antimonii*, commonly called crocus metallorum; but it is ſtronger than the crocus *antimonii* medicinalis.

7. ANTIMONIUM MURIATICUM—MURIATED ANTIMONY. *Vide* CAUSTICUM ANTIMONIALE. ANTIMONIAL CAUSTIC, and BUTYRUM ANTIMON. BUTTER OF ANTIMONY, and OLEUM.

According to the London College it is thus made:—Take the crocus of *antimony* in powder, and vitriolic acid, of each one pound; muriatic, or ſea-ſalt dried, two pounds; pour the vitriolic acid into a retort, adding gradually the muriatic ſalt and crocus, firſt mixed together, then let them be diſtilled by a ſand heat. Let the matter procured by diſtillation be expoſed ſeveral days to the air, and afterwards the liquid part poured off from the fæces.

This preparation is a cauſtic, but not in much uſe at preſent; though it is ſaid by ſome to be the ſpeedieſt eſcharotic, and gives leſs pain than any of the other kinds. Inwardly it may be taken from one to two drops, in broth.

8. ANTIMONII PREPARATIO. PREPARATION OF ANTIMONY. *Olim*, Antim. *Crud. ppt. Crude* Antimony *prepared.*

As fine powder diſcovers but little medical effects, it ſhould be levigated to a great degree of ſubtilty, and then probably may become ſomething more active. If it is not duly comminuted, it ſtimulates the ſtomach and bowels to an ejection of their contents, without any valuable ends being anſwered. The levigation ſhould be continued until the whole is fine enough to be ſuſpended in water for ſome time; then the levigated matter muſt be put into a large quantity of water in a large veſſel, which muſt be repeatedly ſhaken, that the finer parts of the powder may be diffuſed through the water; then the liquor muſt be poured off and ſet by until the powder ſettles; and the groſſer part, which the water would not take up, is to be farther levigated and treated in the ſame manner.

9. ANTIMONII FLORES. FLOWERS OF ANTIMONY.

If the pure regulus of *antimony* is continued in fuſion in an open veſſel, being volatile, it gradually exhales in thick white fumes, which condenſe on the adjacent bodies into white flowers, called *Nix Antimonialis*, which is violently emetic.

In hypochondriac complaints, their efficacy is ſaid to be as great as that of the bark in intermittents; and they are ſaid to be a ſpecific in manias, if a ſpecific in any diſeaſe really exiſts.

10. AN-

10. ANTIMONII PANACEA. The PANACEA of ANTIMONY.

Take of crude *antimony* ſix ounces, of nitre two ounces, common ſalt an ounce and a half, charcoal an ounce. Mix, powder, and deflagrate them in a red-hot crucible, and after the injection of the laſt portion, continue the fire a quarter of an hour longer, then removing it from the fire, let the matter be cold.

The addition of the common ſalt is unneceſſary, and the charcoal only haſtens the alkalization of the nitre.

At the bottom of the crucible is the regulus, in the middle is a compact liver-coloured ſubſtance, and at the top more ſpongy maſs; this laſt, when powdered and edulcorated by various waſhings in water, is called the *panacea*. The liver-coloured part is a churliſh kind of croc. *antimonii*.

This *panacea* is no other than a fulph. *antimonii* precipitat. it is ſaid to be the baſis of Lockyer's pills: and that of Dr. WILSON, is SULPH. ANTIM. PRECIPITAT.

11. ANTIMONII REGULUS. The REGULUS of ANTIMONY, called *luna philoſophorum*.

The metallic part of *antimony* is called its regulus. It is a metal of a particular ſpecies, of a bright white colour, a leafy texture, very brittle, near ſeven times ſpecifically heavier than water, and melts in a low white heat; if continued in fuſion, in an open veſſel, it gradually exhales in thick white fumes; melted with common ſulphur it becomes ſimilar in appearances and qualities to the crude *antimony*; no known art can render it malleable; in it is contained all the medicinal qualities of *antimony*; it is corroded by the vitriolic and nitrous acids into a white powder, but the marine acid perfectly and properly diſſolves it; it will not diſſolve in acidum nitroſum dilutum, nor is it ſo readily ſoluble as the glaſs of *antimony*.

The largeſt quantity of regulus hitherto obtained from *antimony*, is by calcining it without addition, as in making the glaſs of *antimony*, and then reviving the calx by fuſion, with an equal weight of the black flux. As ſoon as it is fluid, pour it into the cone, and the pure regulus will fall to the bottom.

The regulus of antimony hath been caſt into pills, in which form it hath acted as a cathartic. Theſe pills being ſeparated from the ſtools after their diſcharge, they have been taken again and again with the ſame effect, but without any ſenſible loſs of their weight or quality. Theſe pills are called PERPETUAL PILLS. A cup made with this regulus was called the ANTIMONIAL CUP; wine poured into it preſently became emetic, and no loſs of the cup was obſerved thereby.

12. ANTIMONII, REGULUS MARTIALIS.

Take horſe-ſhoe nails, for they are the ſofeſt iron, and fuſe moſt ſpeedily, one part, and of crude *antimony* in powder two parts. Throw the nails into a crucible, and make them white hot; then throw in the *antimony*, and increaſe the heat until the whole is in perfect fuſion. As this proceſs requires great heat, the fuſion may be accelerated by adding two parts of nitre, which being thus alcalized, forms a hepar ſulphuris, which diſſolves a part of the regulus, and renders the ſcoria more fluid.

Sulphur hath a ſtronger attraction to iron than to *antimony*, whence the uſe of nails in this proceſs: but this regulus does not materially differ from that preſcribed above.

If this regulus diſcovers by its dull, grey colour, ſponginеſs, hardneſs, and difficulty of fuſion, that it retains much of the iron, a little freſh *antimony* muſt be added. When the regulus is ſeparated from the ſcoria, it may be purified farther, by fuſing with one-ſixth or one-eighth of its weight of nitre, until the nitre receives from it no more yellow colour.

When a ſtarry appearance is formed on the top of this regulus, it is called REGULUS ANTIMONII STELLATUS. This appearance chiefly depends, after perfect fuſion, on its cooling ſlowly, and without being moved. The ſimple regulus is more regularly made to exhibit a ſtarry appearance on its ſurface than the martial, which it will by a ſingle fuſion.

The ſcoria remaining after the firſt fuſion for making this martial regulus, is little other than a ſulphurated iron, ſcarcely retaining any of the metal of the *antimony*; but, expoſed to the air in a ſhady place, it falls into a black powder, whoſe finer parts waſhed off with water and deflagrated with thrice their weight of nitre, are the CROC. MARTIS APERITIVUS STAHLII. The groſſer part treated in the ſame manner is his CROC. MART. ASTRINGENS.

The amber-coloured ſcoriæ ariſing in the purification with nitre, are a ſtrong cauſtic alcali, called NITRUM CAUSTICUM, vel SCORIÆ REGULI ANTIMONII SUCCIN. which is powdered, and thrown whilſt hot into rectified ſpirit of wine, then well agitated and digeſted, you have the tinct. *antimonii* acris ph. brand. which is of a paler, or deeper red colour, as the ſpirit is leſs or more oily.

13. ANTIMONII REGULUS MEDICINALIS.

Take of crude *antimony* eight parts, of nitre one part, powder, deflagrate, and fuſe the whole together; then pouring the fluid into a cone, ſeparate the regulus from the ſcoria when cold.

It is milder than the croc. *antimonii* mitior, but equally uncertain. It is, when powdered, the genuine *pulv. febrifug.* Crænii.

14. ANTIMONII SCORIA. The DROSS of ANTIMONY.

The whole of the *antimony* may be reduced to a *droſs* by fuſion, with a mixture of ſulphur and alkaline ſalt. This ſcoria conſiſts of an alkaline ſalt, a liver of ſulphur, a part of the regulus diſſolved by the hepar ſulphuris, and ſome vitriolated tartar.

15. ANTIMONII SULPHUR PRÆCIPITATUM. PRECIPITATED SULPHUR OF ANTIMONY. See alſo ANTIMONII PANACEA.

The London College of Phyſicians, 1788, have ordered two pounds of *antimony* to be mixed with four pints of the water of pure kali, and three of diſtilled water, then boiled with a ſlow fire for three hours, conſtantly ſtirring and adding diſtilled water as it ſhall be wanted; afterwards the hot ley to be ſtrained through a linen cloth, and into the liquor, whilſt in this ſtate of heat, as much diluted vitriolic acid to be dropped gradually as is ſufficient to precipitate the ſulphur, and the vitriolated kali to be waſhed off with warm water; by this proceſs ſcarce two ounces of the *antimony* has undergone a ſolution. A different mode has been recommended which deſerves adoption. Let one pound of pure vegetable alkali, five ounces of antimony, and three of ſulphur, be put into a crucible, covered, and gently melted for a few minutes; then, in an iron mortar, let the maſs, whilſt it is quite hot, be pulverized, and about two gallons of boiling water be poured on it. Let it ſtand for ten minutes, and then be ſtrained. This ſolution ſhould be immediately mixed with four gallons of water, acidulated with twelve ounces of vitriolic acid, and thus will the medicine wanted be acquired. *Obſervations on the Pharmacop. Lon.* 1788.

It was formerly called *ſulphur auratum antimonii*, the golden *ſulphur of antimony*; becauſe if it was rubbed on ſilver, it gave it the colour of gold. It hath been called *embryonatum, kermes mineral, chartreux poudre de*, Carthuſianus *Pulvis*, RUSSEL'S POWDER, UNIVERSALLY PURGING SULPHUR. *Centaureum minerale*. This ſhould be taken at firſt in ſmall doſes from 3 gr. to 6. In diſeaſes of the ſkin, it is chiefly uſed as an alterative and diaphoretic. Five grains if taken on an empty ſtomach, will prove emetic. In venereal and other eruptions, the following are eſteemed an efficacious alterative:

℞ Calomelanos pp. Antimonii Sulph. precipitat. aa gr. xxx. Opii gr. x. Conſerv. Roſæ q. s. ut fiant pilulæ N° xxx. ſum. ab unâ ad quinque bis de die.

Lemery firſt publiſhed an account of it.

ANTIMONIALE, VINUM. ANTIMONIAL WINE. Alſo called *emeticum vinum, benedictum vinum, & antimonii eſſentia*.

Take of vitrified antimony powdered, one ounce and an half, and mix it with a pint and an half of Spaniſh white wine. Let them ſtand without heat during twelve days, now and then ſhaking up the powder; then filter through paper for uſe. Ph. Lond. 1788.

Haller calls this *eſſentia ſtibii*, and adds an ounce of the yellow part of lemon-peel to the above.

Madeira wine is the leaſt apt to become ſour in hot weather, and is by many preferred. As to the glaſs of antimony, it is preferable to any of the calces, or even to the regulus itſelf; becauſe the firſt containing more or leſs of the ſulphur of the antimony, the wine ſaturates itſelf therewith, to the excluſion of the ſame proportion of the metallic part; and the latter does not yield its virtue ſo readily and copiouſly to this ſolvent.

The pure metallic part of the antimony diſſolved in

mild vegetable acids, forms the moſt ſafe and certain of all the *antimonial* preparations; and is capable of being ſo managed as to anſwer all the ſalutary purpoſes that can be rationally expected from them.

The wine is good in all caſes in which antimony is found uſeful, either in its crude ſtate, or otherwiſe managed.

Dr. Huxham juſtly aſſerts this to be the beſt of all the *antimonial* preparations. He obſerves, that it quickly acts on the human conſtitution, and as quickly paſſes through the body; that it is an admirable attenuant and deobſtruent, without heating one-tenth part ſo much as the volatile alcaline ſalts; and that in moſt caſes it is more ſafe and efficacious, particularly in the peripneumonia notha. From ten to fifty drops, or more, is a doſe, as a diaphoretic; in painful, and inflammatory ſymptoms, about one-fourth of tincture of opium renders it an excellent diaphoretic; three or four drams prove in moſt habits ſtrongly emetic; in ſmaller doſes, it is adminiſtered in fevers; but for the relief of maniacal, and apoplectic diſorders, in larger.

The ſtrength of this wine depends on the acidity of that with which it is made; the more acid it is, the more ſtrongly it will be impregnated, and vice verſa: and as *the weaker the impregnation is, the ſafer it will be as a medicine, ſo the ſoft ſweet wines are preferred to the ſourer.*

This wine admirably aſſiſts other medicines, where it alone could not be depended on: thus, in the gout it may be uſed as an alterative, if joined with perſpiratives; in nervous diſeaſes, with nervines; in leprous caſes, with nitre and the woods; as a diuretic, mixed with opiates and terebinthinates; as a diaphoretic, with camphor; as an expectorant, with camphor, or with the fetid gums, particularly the gum ammoniacum; as an alterant and deobſtruent, with the extract of hellebore, with the bark, with myrrh, &c.

When mixed with camphor, larger doſes may be taken without offending the ſtomach; and when perſpiration is to be promoted, or putreſcence to be reſiſted, is a proper addition.

Huxham aſſerts it to be as ſafe an emetic as any, in doſes of an ounce or more.

As a purging medicine, to be taken into the ſtomach, from one to two drams generally ſuffices: but clyſterwiſe an ounce and a half, or two ounces are required.

One dram or leſs is a proper doſe for a perſpirative, or diuretic, according as the patient is managed for thoſe ends; or this doſe may be adminiſtered as an alterative or deobſtruent.

It acts more powerfully than the quantity of metal contained in it would do by itſelf, though it does not ſo much diſturb the conſtitution; nor is aceſcent, nor even acid food ſo neceſſary to be ſhunned when this preparation is uſed, as when the crude antimony, or any other of its preparations are.

As to the certainty of its ſtrength and conſtancy to the ſame degree, a very ſmall care will aſcertain them, an advantage which gives it the preference to the tartarized antimony, the different parcels of which are extremely different in their metallic contents.

It may be proper to caution againſt mixing alcaline ſalts, either fixt or volatile, with any other medicines that are to accompany it, leſt they decompoſe it.

Beſides this, the London College, 1788, have given the following preſcription for another wine, which they call ANTIMONIALE VINUM TARTARISATUM. *Wine of tartariſed antimony.* Take of tartariſed antimony, two ſcruples; boiling diſtilled water, two ounces by meaſure; Spaniſh white wine, eight ounces by meaſure. Diſſolve the tartariſed antimony in the boiling diſtilled water, and add to it the wine. Its uſes are ſimilar to the former, though it is ſtronger, from 3 j. to 3 ij. acts as an emetic; and from ten to forty drops is the doſe for other purpoſes.

ANTIMONIUM VITRIFICATUM. *Vitrified Antimony*

Olim, VITRUM ANTIMONII. GLASS of ANTIMONY. It is called by LIBAVIUS, *obſidianum*; becauſe PLINY ſays, it was a ſort of colour with which veſſels were glazed.

Take of powdered antimony, by weight, four ounces, burn it in a broad earthen veſſel, with a fire gradually increaſed, ſtirring with an iron rod, until it no longer emits a ſulphureous ſmoke. Put this powder into a crucible, ſo as to fill two-thirds of it. A cover being fitted on, make a fire under it, at firſt moderate, afterwards ſtronger, until the matter be melted. Pour out the melted glaſs. Phar. Lond. 1788.

This glaſs is chiefly prepared for making the *antimonial* wine, and the tartarized antimony; for by itſelf it is too active for internal uſe; though united with wax or raiſins it may be given in ſmall quantities.

ANTIMONII VITRUM CERATUM. The cerated glaſs of antimony.

Take of the glaſs of *antimony*, in fine powder, one ounce, and of bees wax one dram. Melt the wax in an iron ladle, then add the powder, ſet them on a ſlow fire, without flame, for the ſpace of half an hour, continually ſtirring them with a ſpatula; then take it from the fire, pour it upon a piece of clean white paper, powder it, and keep it for uſe.

The glaſs melts in the wax with a ſlow fire; when the whole is become nearly of the colour of Scotch ſnuff, it may be removed therefrom.

The ſtrength of this medicine is uncertain. It is milder than the glaſs, becauſe the wax hath reſtored ſome phlogiſton to it.

The ordinary doſe is from two to three grains, up to twenty, according to the ſtrength of the patient; but they begin with ſmall doſes, and gradually increaſe the quantity, as the ſtomach will admit. To a boy of ten years old, three grains may be given. Sickly children may begin with one grain, and more may be added as it is obſerved to affect them.

Dr. Young of Edinburgh firſt publiſhed this in the Edinburgh Med. Eſſays. It is commended as a ſpecific in dyſenteries, either with or without a fever. It commonly acts by vomit or ſtool; yet has ſometimes effected a cure without producing any perceptible evacuation. Sir George Baker ſpeaks highly of it in his work de Dyſenteria; but it is an uncertain medicine, and often ineffacious. If the firſt, or any other doſe, purge the patient ſo as to fatigue him, wait until the next day before another is given. Cures often follow upon taking one doſe; and it very rarely happens that more than five or ſix are required.

Pregnant women may take it; and infants at the breaſt may have half a grain given to them.

Let nothing be drank during three hours after taking it, except a diſpoſition to vomit requires it, and then give water-gruel.

In diarrhœas, alſo, and in colic pains from viſcidities in the inteſtines, it is a ſafer and better method of cure than the uſual ones. In uterine hæmorrhages it hath been given and followed with the happieſt effects.

Dr. Alſton of Edinburgh ſays, that if this medicine is made with crude *antimony*, it is more ſafe and equally effectual. If it is long kept, the wax ſeparates from the metallic part, and it then is too active.

See Huxham on Antimony: alſo the Dict. of Chem. and Neumann's Chem. Works, in the article ANTIMONY. De Antimonio per Gul. Saunders, M. D.

ANTIMON. DIAPHORETICUM. ——— NITRATUM. } See

ANTIMONIUM TARTARISATUM. See TARTARUM EMETICUM.

ANTIMONIUS LAPIS. Some reckon the antimonial ore amongſt ſtones.

ANTIMOROS, from ἀντὶ, *againſt*, and μόρος, *death*, or *diſeaſe*.

diſeaſe. The name of an antidote, which Myrepſus calls *diatamaron*, but improperly.

ANTINEPHRITICA, from ἀντι, and νεφριτις, *a pain in the kidnies.* Remedies againſt diſorders of the kidnies.

ANTIPARALYTICA, from ἀντι, *againſt*, and παραλυσις, *the palſy.* Medicines againſt a palſy.

ANTIPATHES. A black ſort of coral. See CORALLIUM NIGRUM.

ANTIPATHIA, from ἀντι, *againſt*, and παθος, *an affection.* ANTIPATHY. It is oppoſite to ſympathy; an averſion to particular objects.

ANTIPERISTASIS, from ἀντι and περιστημι, *to ſurround.* A compreſſing on all ſides, as the air preſſes.

ANTIPHARMACUM, from ἀντι, *againſt*, and φαρμακον, *poiſon.* An ANTIDOTE or PRESERVATIVE. See ALEXIPHARMACA.

ANTIPHLOGISTICA. Ἀντι, *againſt*, and φλογωσις, *inflammatio.* ANTIPHLOGISTICS. Medicines or remedies ſuited to reſiſt, diminiſh, or cure inflammation, or an inflammatory diatheſis of the conſtitution. Under which head may be claſſed all watery diluents, cooling ſaline aperients, diaphoretics, and diuretics; antimonials in ſmall doſes; but particularly BLEEDING, *general*, and *topical*. See PHLEBOTOMIA, CUCURBITULA, and HIRUDINES. The uſes of which peculiar operations are there explained. Beſides living on watery cooling vegetables, drinkling copiouſly of ſimple watery liquids, and abſtaining totally from all animal food and ſtimulating diet, may be claſſed not amongſt the weakeſt of the materials proper for promoting the deſired intent, under circumſtances where antiphlogiſtics are required.

ANTIPHTHISICA, from ἀντι, *againſt*, and φθισις, *a conſumption.* Remedies againſt a conſumption.

ANTIPHTHISICA TINCTURA, i. e. Tinct. Saturnina. See PLUMBUM, N° 5.

ANTIPHTHORA, from ἀντι, *againſt*, and φθορα, *corruption.* A ſpecies of wolf's-bane, which reſiſts corruption.

ANTIPHYSICA, from ἀντι, *againſt*, and φυσαω, *to blow.* Remedies againſt wind. See CARMINANTIA.

ANTIPHYSON. See MAGNES.

ANTIPLEURITICUM, from ἀντι, *againſt*, and πλευρις, *a pleuriſy.* A remedy againſt a pleuriſy.

ANTIPODAGRICA. See ANTIARTHRITICA.

ANTIPODAGRICUM, BALSAMUM. See ANOPYNUM BALSAMUM.

ANTIPOPLECTICA. See APOPLECTICA.

ANTIPRAXIA, from ἀντι, *againſt*, and πρασσω, *to work.* A contrariety of functions and temperaments in different parts, and was uſed by the ancients to expreſs the variety of concurring, and often contrary ſymptoms.

ANTIPYRETICON, } from ἀντι, *againſt*, and πυρετος,
ANTIPYRETON, } *a fever.* A remedy againſt a fever, called alſo antipyreuticon.

ANTIQUARTANARIUM, or ANTIQUARTIUM. A medicine againſt a quartan.

ANTIQUI MORBI. Old or inveterate diſeaſes, or chronical diſeaſes.

ANTIRRHINUM, alſo called *caput vituli*, *bucranion*, *os leonis*, *anarrhinum*, *lychnis ſylveſtris*, *atochium*, SNAPDRAGON, and CALF'S SNOUT.

The ſtalk and the leaves reſemble thoſe of pimpernel, the flowers are purple, and like thoſe of the ſtockgilly-flower, but ſmaller, whence it is called lychnis ſylveſtris. Its fruit reſembles a calf's ſnout, and is of a carnation colour. It grows in fields and ſandy places.

There are many ſpecies, but all have prickly mouths, whence Columella calls it *ſæva leonis ora.*

A decoction is ſaid to be uſeful in the jaundice, but is chiefly uſed as a charm.

ANTIRRHINUM LINARIA. See LINARIA.

ANTISCOLICA, from ἀντι, *againſt*, and σκωληξ, *a worm.* The ſame as *anthelmintica*; which ſee.

ANTISCORBUTICA. Medicines againſt the ſcurvy.

ANTISCORBUTICUS, CORTEX. See WINTERANUS, CORTEX.

ANTISCORODON, from ἀντι, *againſt*, and σκορδον, *garlic.* A large ſpecies of garlic, called alſo *allium ultricum*, and APHROSCORODON, from ἀφρος, *froth*; becauſe, when beat with vinegar, it generates much froth.

ANTISEPTICA, ANTISEPTICS, from ἀντι, *againſt*, and σηπω, *ſeptics* or *purifiers.* Such things as reſiſt or correct putrefaction. A complete putrefaction is not a complaint of the human machine, that can be an object of practice, becauſe it cannot take place in any conſiderable portion of the body without extinguiſhing life: it is therefore a tendency to it in any conſiderable degree, which producing various morbid diſorders, requires the utmoſt aid of the medical art to prevent. Now, as this tendency may be brought on by exceſs of heat and motion, as well as receiving any ferment into the vaſcular ſyſtem; as it, when once fixed, and begun to exert its deleterious action, induces languor and great debility in the moving powers: the reaſon may be obſerved, why our antiſeptic claſs of medicines exhibit, according to the conception received of their action, ſuch apparently contradictory views; for we find both volatile and neutral ſalts in the ſame arrangement; the former conſidered as highly heating, and ſtrongly ſtimulant of the moving powers; the other, cooling the ſyſtem, and mitigating vaſcular action. Hence then, it is apparent, that they are only applicable in different ſtates of putreſcent action, or in different conſtitutions affected with putreſcency. And not unlikely the ſame may hold good with acids and alcalies; for they both are enumerated under antiſeptics. They have properly been divided into four heads.——
1ſt. *Such as are cooling*—acid ſalines, neutral ſalts.——
2d. *Stimulant*—wine, alcohol, oil of turpentine.——
3d. *Tonic*—Peruvian bark, wormwood, chamomile.——
4th. *Antiſpaſmodic*—camphor, aſafœtida, muſk. All which furniſh examples of the particular diviſions. From the nature of theſe, we ſhall readily know in what particular ſtates each is inapplicable: where there is peculiar ſenſibility of the ſtomach, the TONIC are to be avoided; the REFRINGERANT, where a debility of the vital powers is manifeſt; the STIMULANT, when there is too great a degree of irritability, the circulation too highly accelerated, and ſtrong diſpoſition to profuſe bleeding; the SEDATIVE ANTISPASMODICS, when there is too languid a circulation, a lethargic diſpoſition, or a conſiderable degree of torpor in the ſyſtem.

See MACBRIDE'S Eſſay on the reſpective Powers of Antiſeptics, &c. Remarks on Mr. ALEXANDER'S Eſſays on Putrid Diſeaſes. CULLEN'S Materia Medica. WALLIS on Health and Diſeaſe.

ANTISPASIS, from ἀντι, *againſt*, and σπαω, *to draw*, A REVULSION. The turning the courſe of the humours whilſt they are actually in motion. The doctrine of revulſion is the invention of Hippocrates.

ANTISPASMODICA, from ἀντι, *againſt*, and σπασμος, *a convulſion.* Medicines ſuited to cure ſpaſmodic affections. Some remove ſpaſms by immediate contact, as aſſes milk, cream, oil of almonds, &c. others by repelling animal heat, as the gas ſulphuris, nitre, ſal ammoniac, &c. and where the ſtrictures are produced by inanition, or defective vital heat, ſpaſms are removed by thoſe means that reſtore the vis vitæ, ſuch as valerian, caſtor, muſk, &c.

Opium, balſam. Peruv. and the eſſential oils of many vegetables, are the moſt powerful of this kind. Opium, for its immediate effects, excels; balſ. of Peru, in many inſtances, produces more laſting benefit than opium, and indeed it ſometimes ſucceeds where opium hath failed; the eſſential oils differ as *antiſpaſmodics* from opium; in this, they act more upon a particular part than upon the ſyſtem in general, and have no ſoporific effect.

Dr. Home, in his Chemical Experiments, hath attended to the comparative ſtrength of this kind of medicines; he does not pretend to poſitiveneſs in his concluſions, but from what aroſe to his obſervation, is led to arrange them as follows:

Amongſt the firſt or weaker claſs, are the fol. aurant. flor. cardamines, artemiſia, pæonia, viſcus quercinus, extr. hyoſciami, caſtor, moſch. cuprum ammoniacum, and electricity.—Amongſt the ſecond claſs, are ſcar, camphor. zincum calcinatum, and bliſters.—The third are aſſafœtida, æther, and hydrargyrus.—The fourth and ſtrongeſt are, cort. Peruv. opium, and bleeding.

He farther obſerves, that moſt of the *antiſpaſmodics* have, beſides their *antiſpaſmodic* quality, other ſecondary ones, which have as much influence in their effects: beſides, ſome of them poſſeſs many laxative and ſudorific powers, which others do not: they may be diſtinguiſhed into the ſtimulant or inflammatory, and ſedative, or anti-inflammatory. Of the ſtimulant or inflammatory, are electricity, valerian, the bark, quickſilver, aſſafœtida, opium, &c. Of the ſedative, or anti-inflammatory, are bleeding, muſk, caſtor, flor. cardamin. cupr. ammon. bliſters, camphor, æther, zincum calcinatum, &c.

Antiſpaſmodics are a very uncertain ſpecies of medicines in their effect on the diſorders for which they are

generally

generally eſteemed uſeful. They are beſt adapted for thoſe ſpaſmodic affections which are attended with great mobility, and which are uſually known by the name of ſpaſmodic diſeaſes. They are more uſeful in preventing the approach, and in removing ſpaſms which are more immediately preſent in weaker habits; and in preventing the returns of ſpaſms when given in the remiſſion of the ſpaſm in ſtrong habits: on the contrary, they are leſs uſeful in preventing the return of ſpaſms in weak habits than in ſtronger ones; nay, they rather increaſe the tendency to ſpaſmodic complaints in weakly people, if given in the interval of thoſe diſorders; and are leſs uſeful in removing the preſent fit, in ſtrong habits, than they are in weak ones. Sometimes, indeed, in ſtrong habits they both remove the preſent fit and prevent returns. Cullen's Mat. Med.

ANTISPASTICON. A general epithet for any medicine that works by way of revulſion.

ANTISTERNON, from ἀντι, *oppoſite to*, and στερνον, *the ſternum*, or *breaſt*. The back is ſo called, becauſe it is oppoſite to the breaſt-bone. See DORSUM.

ANTITASIS, from ἀντι, *againſt*, and τασις, *to extend*. A contra-extenſion.

ANTITHENAR, from ἀντι, *againſt*, and θεναρ, *the palm of the hand*. See ABDUCTOR POLICIS MANUS INDICEM.

Dr. Hunter applies this name to a muſcle of the foot, and ſays it ariſes from the os cuneiforme, and is inſerted in the external ſeſamoid bone.

ANTITHORA. See ANTHORA.

ANTITRAGICUS, } from ἀντι, *againſt*, and τραγος,
ANTITRAGUS. } *the thick part of the anthelix*.

See AURICULA.

ANTITYPUS. Ab ἀντι, & τυπτω, *percutio*. See RENISUS.

ANTIVENEREA. Medicines againſt the lues venerea.

ANTIVENEREALIS, AQUA PRESERVATIVA. It is a ſolution of cauſtic alcali or corroſive ſublimate in water, to be injected up the urethra in men, and the vagina in women, and to waſh the parts with, after coition; but care muſt be taken that the ſolution ſhould not be too ſtrong, leſt it ſhould occaſion excoriation and inflammation. It will be ſufficient if the ſolution be of ſuch a ſtrength only, as will give a ſlight ſenſation of pungency on the tongue, or inſide of the lips.

ANTIZEUMIC. Preventers of fermentation in general.

ANTONII SANCTI IGNIS. See ERYSIPELAS.

ANTONOMASTICA. See COCHLÆA CÆLATA.

ANTOPHYLLON, or ANTOPHYLLUS. The male caryophyllus, or the large full grown ones. See CARYOPHILLI AROMATICI.

ANTRAX. See CARBUNCULUS.

ANTRUM BUCCINOSUM. See COCHLEA.—GENÆ,—HIGHMORIANUM MAGNUM, called alſo ſinus maxillaris, and antrum maxillæ ſuperioris. MAXILLARY SINUS. Highmore boaſts of the diſcovery, but Caſſerius takes notice of this part before him, under the firſt name.

All the body of the upper jaw-bone is hollow, and its cavity forms this antrum; each hath a winding paſſage into the noſtril, called *ductus ad naſum*, on the ſide on which it lies; this cavity and the ſockets of the teeth are often divided by interpoſition of only a very thin bony plate. The membrane which lines this cavity is ſometimes inflamed, and matter forming there is diſcharged by drawing one of the dentes molares. See ABSCESSUS SINUS MAXILLARIS.

ANTYLION. The name of an aſtringent uſed by P. Ægineta.

ANUCAR. See BORAX.

ANUS. In botany, ſignifies the poſterior opening of a monopetalous flower.

ANUS, called alſo *archos*, *culus*, *hedra*, *cyrſeon*, *cyſſaros*; and in Hippocrates, *cathedra*; ſome name it *perin*. It is the loweſt part of the inteſtinum rectum, commonly called the FUNDAMENT. The extremity of the rectum contracts into a narrow orifice, the ſides of which are diſpoſed in cloſe folds. This is called *ſphincter ani*, which ſee. It hath ſeveral muſcles belonging to it, ſome of which ſurround it as ſphincters; the reſt are broad and fleſhy planes inſerted in it, and which being inſerted likewiſe into other parts, ſuſtain it in its natural ſituation, and reſtore thereto, when it is diſturbed by the force neceſſary for excluding the fæces; the latter muſcles are termed levatores *ani*. Two ligaments belong to the *anus*, viz. the ligamentum cutaneum oſſis coccygis, and the ligamentum pubis interoſſeum; which ſee under LIGAMENTUM. The nerves of the *anus* and its muſcles are from the ganglions of the plexus hypogaſtricus, the inferior rope of both the ſympathetici maximi, and the common arch of the extremities of both ropes. The margin or edge of the *anus* is formed by the union of the ſkin and epidermis, with the internal coat of the inteſtinum rectum. This part is extremely vaſcular; hence the troubleſome hæmorrhage when the operation is performed for the fiſtula in this part.

The *anus* is ſubject to many diſorders, and they are generally ſomewhat difficult of cure, becauſe of the irritability of the part, which ſubjects it to receive freſh injury from many accidents; Aetius obſerves, that aſtringents are acrid, and the ſenſibility of the *anus* cannot bear them; alſo that aſtringents which are not acrid, ſuch as metals, ſhould be applied here. On the diſeaſes of this part, ſee Aetius, Celſus, P. Ægineta, Turner, Heiſter, and Wiſeman. See alſo the article RECTUM below. Diſcharges of wind from the anus are called *crepitus*.

EXCRESCENCES ABOUT THE ANUS.

Various excreſcences are found about the verge of the *anus*; many of theſe are produced merely by relaxation, which are ſafely removable: theſe are unattended with pain, any diſagreeable diſcharge, and are ſingle or diſtinct, let their number be what they may. In removing them, prefer the ligature, for the ſake of avoiding a troubleſome hæmorrhage.

When they diſcharge a bloody fluid matter, and are painful, they are alſo generally in cluſters, or not diſtinct, and for the moſt part diſpoſed to, if not already become cancerous. Mr. Pott obſerves, that in cancerous caſes of this kind, there is rarely a ſingle excreſcence, but the gut is for the moſt part ſurrounded with them; and if a finger is paſſed into the inteſtine, thoſe tumors produce the idea of puſhing the finger into a rotten pomegranate. Beyond palliation, no relief can be afforded.

The ANUS IMPERFORATED.

Sometimes children are born with a membrane acroſs the *anus*, which obſtructs the ejection of the excrements. If the ſituation of the *anus* cannot be diſcovered, by reaſon of the thickneſs of the ſuperfluous ſubſtance which cloſes it up, a cure cannot be expected; for much, if not the whole rectum is cloſed up or wanting. If the caſe admits of a cure, the ſituation of the *anus* will be ſeen by a prominence, or by a little hollow.

This accident is generally ſpoken of as if always circumſtanced alike. Mr. Pott very judiciouſly divides it into four claſſes. 1ſt. Where there is no mark or veſtige of an *anus* perceptible; in this caſe the rectum is as it ought to be until it arrives at the bulb of the urethra; from this there is no inteſtine, ſo no *anus* externally. If the rectum reaches too near the part where the *anus* ſhould be, the impulſe of the fæces againſt the ſkin will diſcover where a perforation may be made; but if no ſuch impulſe is to be felt when the child coughs or cries, relief cannot be afforded. 2d. Where there is a circle or mark in the ſkin which points out where the *anus* ſhould be; in this inſtance the difficulty is not conſiderable. However, it may be proper to obſerve here, that the perforating inſtrument ſhould be introduced in the direction of the os ſacrum; if it paſſes forward, the bladder, or the uterus, or both, may be injured; if it is to be introduced far up, to divide a membranous obſtruction in the rectum, in cutting it ſhould be moved not upward, but from ſide to ſide; thus you avoid cutting the proſtate gland, or the veſiculæ ſeminales, and perhaps the neck of the bladder. 3d. Where there is a well formed *anus*, and perforated, but hath no communication with the inteſtinal tube, from the rectum being imperforated: in this inſtance if the child is not duly attended to, it dies in great agonies. If an infant hath had no ſtools during the firſt or ſecond day after its birth, a finger ſhould be dipped in oil, and thruſt up the rectum, to diſcover whether or no the obſtruction is there. 4th. Where there is neither *anus* nor rectum, but the inteſtinal canal terminates in the colon; in this caſe there is no relief to be expected. Another equally unfortunate kind, is that in which there is a ſort of rectum, but it is rolled up like a bit of catgut. Here all attempts to aſſiſt are vain; for, though for the preſent a diſcharge was obtained, as the inteſtine is deficient, evacuations could not be continued.

The means, &c. of relief, in the firſt three of the above claſſes,

claſſes, are the ſame. In either of them the operation ſhould be performed without delay or regard to any objections; for, if it is not conformed to, death will inevitably follow. The beſt inſtrument is a large trocar, ſuch as is employed for tapping in the aſcites, and to be uſed as follows: keep the point of the trocar within the canula until it is fixed againſt the obſtructing part; then puſh the trocar forward; and if you ſucceed, the meconium will inſtantly be diſcharged; this diſcharge may be left to itſelf for three or four hours, or until the belly is well emptied. After a due diſcharge, paſs a finger up the rectum to diſcover whether or no there is any ſtricture. If a ſtricture is met with, introduce a probe-pointed knife on the back of your finger, and divide it on each ſide. To finiſh the cure, let a ſmall candle be introduced up the gut every two or three hours, until the *anus*, &c. is quite pervious, and no more aid appears to be required. In two or three weeks the ſtools will paſs properly, and all inconvenience will generally be ended. See Bell's Surgery, vol. ii. p. 275. Edinb. Med. Comment. vol. iv. p. 164. White's Surgery, p. 379.

ANI ABSCESSUS. See ANUS.

ANUS, a contraction of *annulus, a ring.*

ANUS. See CEREBRUM.

ANI INFLAMMATIO. See PROCTALGIA.

ANXIETAS. See ALYSMOS.

ANYPEUTHYNA. In medicine this ſignifies events that cannot be charged on the phyſician, nor render him accountable for them.

AORTA. The name of the great artery proceeding from the left ventricle of the heart, of which all other arteries, except the pulmonary, are but the branches: called alſo *Craſſa arteria.—Magna arteria.* From the heart it extends itſelf, by its various branches, to the moſt diſtant parts of the body. Each of the diviſions and ſubdiviſions of the *aorta* receive different names, e. g. the *aorta* gives riſe to the carotid and the ſubclavian arteries, the branches of theſe again receive other names, &c. Theſe branches are in pairs, except the cœliaca, the two meſentericæ, ſome of the œſophageæ, the bronchialis, and ſometimes the ſacræ.

The beginning of the *aorta* is furniſhed with ſemi-lunar valves, as the pulmonary artery is, and the ſame triangular bodies to cloſe up the little ſpace left by the valves. It is larger in women than in men. It is called the aſcending *aorta* from the heart ſo far as it goes upwards; and deſcending, from the curvature to the os ſacrum, where it terminates in the iliacs. The deſcending *aorta* is divided into the ſuperior, which reaches from the curvature to the diaphragm, and the inferior, which extends thence to the biſurcation, where the iliacs begin.

The *aorta* goes from the baſis of the heart, nearly oppoſite to the fourth vertebra of the back, and aſcends obliquely, with reſpect to the body, from the left to the right ſide, and from before backwards; then bends obliquely from the right to the left ſide, and from before backwards, reaching as high as the ſecond vertebra of the back, from whence it runs down again in the ſame direction, forming an oblique arch; from thence it deſcends in a direct courſe along the anterior part of the vertebræ, all the way to the os ſacrum, lying a little towards the left hand, and there terminates in its two ſubordinate branches in the iliacæ.

The *aorta* aſcendens is principally diſtributed to the thorax, head, and upper extremities: the ſuperior portion of the *aorta* deſcendens furniſhes the reſt of the thorax: the inferior portion furniſhes the abdomen and the lower extremities.

To conceive more diſtinctly of the general courſe of the arteries, or of the particular courſe of any individual alone, a view of the figure of the arteries will greatly aſſiſt.

The *aorta* is ſubject to many diſorders, as inflammation, ulcers, polypuſes, aneuriſms, oſſification, &c.

AOVARA. A fruit about the ſize of a hen's egg; many of them are included in one pod; it is the produce of a kind of palm-tree which grows in Africa and the Eaſt Indies. The kernel of this fruit is white: to the taſte it reſembles cheeſe: it is of an aſtringent quality; and when preſſed, an oil is forced out which is very much like palm-oil.

APAGMA. See ABDUCTIO.

APALACHINE GALLIS. See CASSINE.

APALLAGE, from ἀπαλλαττω, *to change.* Hippocrates means by it ſuch a change as implies deliverance from a diſeaſe.

APANCHOMENOI, from, ἀγχω, *to ſtrangle.* Strangled.

APANTHISMUS. A ſcarcely perceptible line, properly in painting, to which Galen reſembles the ſmall capillary veins.

APANTHROPIAI, from ἀπο, *from*, and ἀνθρωπος, *a man.* An averſion to company, or love of ſolitude.

APARACHITUM VINUM. Wine not mixed with ſea-water.

APAREGORETOS, from ἀ, neg. and παρηγορεω, *to comfort, mitigate*; what affords no comfort, or relief.

APARINE, called alſo *philanthropus, ampelocarpus, omphalocarpus, ixus, aſparine, aſperula, gratterona,* GOOSE-GRASS, CLIVERS, and CLEAVER'S BEES. CLEAVERS, GOOSE-SHARE. HAYRIFF. It is the *Galium Aparine* of Linn.

It is a ſlender rough, annual plant; ſpreads upon buſhes, and ſticks to whatever it touches. The ſtalks are ſquare, brittle, and jointed; the leaves are oblong and narrow; the flowers are white and followed by little round burs.—It has been tried in ſcrophula but without ſucceſs; and alſo in ſome cancerous caſes, the juice given internally and the herb applied by way of cataplaſm externally, which was ſuppoſed to mitigate the ſeverity of the pain.

An extract made of its juice is poſſeſſed of a pungent ſaline bitterneſs. The freſh juice in doſes of two or three ounces is diuretic. It is beſt if gathered when half grown.

LATIFOLIA. See ASPERULA.

APARTHROSIS, from ἀπο, *ab*, and ἀρθρον, *a joint.* See ARTICULATIO.

APATHES, from ἀ, neg. and παθος, *an affection* or *paſſion.* Thoſe who ſeem to be void of human paſſions. This temper is alſo carried to that inflexible ſternneſs which extinguiſhes the affections of humanity, as was inſtanced in Diogenes the Cynic, and Timon.

APATHIA. Apathy expreſſes the quality of not feeling, a freedom from the impulſes of paſſion and mental perturbation.

APECHEMA, from ἀπο, and ηχος, *a ſound, apochophema.* Properly a reſounding, or the repercuſſion of the ſound, an echo; but in medical ſenſe it ſignifies a CONTRA-FISSURE.

APEIROI, from ἀ, neg. and πειρα, *an experiment.* Unexperienced, unaccuſtomed.

APELLA. Shortneſs of the prepuce. Galen gives this name to all whoſe prepuce, either through diſeaſe, ſection, or otherwiſe, will not cover the glans.

APEN. A ſort of bread made with the juice of the ambalam-tree and rice, in India.

APENSALUS. A veſſel with a narrow neck to hold oil.

APEPSIA. INDIGESTION. From ἀ, neg. and πεπτω, *to digeſt*: alſo *dyſpepſia.* That genus of diſeaſe which Dr. Cullen names dyſpepſia, or *indigeſtion*, he arranges in the claſs NEUROSES and order ADYNAMIÆ. The ſymptoms are, a want of appetite, a ſqueamiſhneſs, ſometimes vomiting, ſudden and tranſient diſtenſions of the ſtomach, eructations, heartburn, pain in the region of the ſtomach, a greater or ſmaller number of theſe ſymptoms occur at the ſame time, attended moſt commonly with coſtiveneſs; and theſe without any other diſorder either in the ſtomach itſelf, or any other part of the body. In this caſe, when what ought to be digeſted and form materials for good chyle, becomes acid, or poſſeſſed of other morbid qualities, a variety of other ſymptoms occurs, according to the nature of the materials thus morbidly changed. But *indigeſtions* is very frequently a ſecondary and ſympathetic affection, though the above ſymptoms are eſſential to this diſeaſe, as idiopathic. All theſe ſymptoms may ariſe from one cauſe, viz. weakneſs, or loſs of tone in the muſcular fibres of the ſtomach: and this weakneſs is the proximate cauſe of this diſorder when an original one. The remote cauſes are various, as tumor, &c. in the ſtomach itſelf; or ſome diſorder of other parts communicated to the ſtomach, as in the gout, &c. in both which caſes the indigeſtion is ſymptomatic.

In moſt caſes of *indigeſtion*, as an original diſeaſe, the *weaker action of the muſcular fibres of the ſtomach, is the chief cauſe*; perhaps a depravity or defect of the gaſtric juice may ſometimes be the cauſe, but even here, perhaps the weakneſs juſt mentioned, and which in all caſes is attendant, is that to which we can attend uſefully in practice. To ſucceed in the cure, avoid the occaſional cauſes, remove ſuch ſymptoms as tend to aggravate the diſeaſe or to continue it, and invigorate the tone of the ſtomach.

In order to which the patient muſt be informed of the neceſſary changes in his conduct; for though he often purſued ſuch a practice without ſenſibly ſuffering, except he conforms to a contrary one, the preſent complaints will not be overcome. Crudities, acidity, and coſtiveneſs muſt be removed, at leaſt in their exceſs, as they tend both to aggravate and continue *indigeſtion*. The ends accompliſhed, the reſtoration of the tone of the ſtomach alone remains for perfecting relief.

Abſtemiouſneſs and exceſs are like cauſes of *indigeſtion*. An over diſtenſion of the ſtomach may in ſome meaſure injure its proper tone; and long faſting, by inducing a bad quality in the juices ſecerned into the ſtomach, render it feeble, and generate wind. Hard drinking, and any of the cauſes of an anorexy, alſo injure digeſtion.

Little need be added in order to the cure, for the treatment of the ANOREXY is the ſame as is required in this caſe. See ANOREXIA.

The COLUMBO ROOT, not mentioned in the article ANOREXIA, is particularly uſeful when the ſtomach is languid, the appetite defective, digeſtion with difficulty carried on, or when a nauſea with flatulence attends. It may be given in ſubſtance with any grateful aromatic, or infuſed in Madeira wine, now and then interpoſing gentle doſes of the tincture of rhubarb. In caſe of a defective bile, make pills of this root with a ſoft extract of ox's gall.

A mixture of muſtard ſeed with the columbo root is of admirable utility in complaints of this kind; particularly where acidity and flatulence prevail much in the primæ viæ.

The Bath waters, aſſiſted with warm nervines and corroborants, are not to be omitted, when circumſtances admit of their uſe.

See Percival's Eſſays in the Reflections on Exper. 4, 5. and 6. Cullen's Firſt Lines, v. iii. p. 217, edit. iv.

APEPTON. Crude or indigeſted.

APER. The BOAR, This appellation is given to the ſwine, in his wild ſtate: when tamer, *ſus ſcropha*, and *porcus*. See PORCUS.

APERIENS PALPEBRARUM RECTUS. See LEVATOR PALPEBRÆ SUPERIORIS.

APERIENTIA, APERIENTS, from *aperio*, *to open*. Theſe are medicines which have the power of opening the mouths of veſſels, hence clearing obſtructions of the vaſcular, and glandular kind, as well as the pores of the ſkin. In this ſenſe, they are ſynonymous with the *anaſtomatica*, *deobſtruentes*, and *deoppilativa*. But thoſe medicines which render the bowels gently laxative, are now generally called *aperients*; the removal of other obſtructions is more confined to the term *deobſtruents*.

APERISTATON, from α, neg. and περιστασις, *affliction* and *danger*. An epithet in Galen for an ulcer that is neither troubleſome nor dangerous.

APERITTOS, from α, neg. and περιττος *redundant*. Such aliment as generates but little excrement. The oppoſite quality is called *perittomatices*.

APERTUS. It is uſed for exulceratus, as in ſaying an open cancer, &c. in which caſes the tumor is become ulcerated.

APES. BEES, called by the ancients BUCONES; which ſee.

If they are dried and powdered they are ſomewhat diuretic; but their chief uſe is for the preparing of honey and wax.

Bees collect the farina fœcundans from the apices of the flowers, and eat it; they receive nouriſhment from it, then caſt it up and mould it into wax: art hath been exerciſed to make wax of this farina, but in vain; it is only the ſtomach of the bee that can effect it.

The belly of the bee is inwardly divided into four parts, containing the inteſtines, the bag of honey, the bag of poiſon, and the ſting. The bag of honey is tranſparent as cryſtal, and is emptied at proper times into the cells of the comb, for the maintenance of the community during the winter.

APETALI. So Tournefort names the fifteenth claſs of vegetables. See FLOS APETALUS.

APEUTHYSMENOS, from ευθυς, *ſtraight*. See RECTUM INTESTINUM.

APHÆREMA. See ALICA.

APHÆRESIS, from αφαιρεω, *to take away*. To take away any ſuperfluous thing in a medical way.

APHASSIOMENOS, from αφασσω *to handle*. Hippocrates often applies this word to the touches of the pudenda, in order to diſcover diſorders of theſe parts. It is the ſame as *tactus*.

APHEBRIOC. See SULPHUR.

APHELICESTEROS, of απο, *from*, and ηλικια, *youth*, One paſt the flower of age.

APHEPSEMA, from εφθω, *to boil*. See COCTIO.

APHESIS, from αφιημι, *to remit*. Hippocrates generally ſignifies the remiſſion or ſolution of a diſeaſe by this word.

APHILANTHROPIA, from α, neg. and φιλανθρωπια, *the love of mankind*. The firſt degree of melancholy, when a perſon hates ſociety, and delights in ſolitude.

APHLEGMANTON, from α, neg. and φλεγμα, *phlegm*. Void of phlegm.

APHONÆ. See PEMPHIGODES.

APHONI. So Hippocrates calls thoſe who labour under a caros.

APHONIA. See CATALEPSIS. It is alſo a name for the palſy of the tongue; one of the ſpecies of partial palſy. See PARALYSIS.

APHONIA, from α, the part. priv. and φωνη, *a voice*. One who hath loſt his voice, called alſo by ſome *anaudia*, though Galen makes a diſtinction. See ANAUDOS.

Hippocrates uſes the word to expreſs thoſe who, with the loſs of voice, loſe all voluntary motion; as in epilepſies, apoplexies, *carus*, ſyncope, &c.

Dr. Cullen ſpeaks of this loſs of voice as a ſuppreſſion of the full ſound, which happens without coma or ſyncope. He ranks this genus of diſeaſes in the claſs LOCALES, and order DYSCINESIÆ, and obſerves three ſpecies, viz. 1. *Aphonia* gutturalis; when the glottis and fauces are ſwelled. 2. *Aphonia* trachealis, when the trachea is compreſſed. 3. *Aphonia* atonica, when the nerves of the larynx are wounded. He alſo in many caſes conſiders it as ſymptomatic.

If one of the recurrent nerves, which is formed by the par vagum and the nervus acceſſorius, and reaches the larynx, is cut, the perſon is capable as it were of only a half pronunciation: but if both are cut, the ſpeech and voice are both loſt. The loſs of ſpeech happening in hyſteric patients is alſo called *aphonia*; but more properly that loſs of ſpeech is thus named which depends on ſome fault of the tongue.

Seeing that the motion of any part is deſtroyed, or leſſened at leaſt, by the interception of nervous influence, and that the nerves deſtined for the motion of the tongue, ariſe principally from the fifth pair, it appears that the ſeat of this diſorder is in the ſaid fifth pair of nerves, and that the immediate cauſe is a diminution or total loſs of nervous energy. Hence, a palſy of the tongue, which is either antecedent or ſubſequent to hemiplectic or apoplectic diſorders, demands our utmoſt attention.

If an *aphonia* appears alone, it generally beſpeaks an approaching hemiplexy or apoplexy; but if it ſucceeds theſe diſorders, and is complicated with a weak memory, and a ſluggiſhneſs of the mental powers, it threatens their return. That *aphony* uſually terminates the beſt, which proceeds from a ſtagnation of ſerous humours compreſſing the branches of the fifth pair of nerves, which run to the tongue; but it is no leſs afflictive to the patient, and is very obſtinate of cure.

Other cauſes of this diſorder are, the ſtriking in of eruptions on the ſkin, a congeſtion of blood in the fauces and tongue, obſtructed periodical evacuations in plethoric habits, ſpaſmodic affections, worms, a crumb of bread falling into the larynx, fear, too free a uſe of ſpirituous liquors; alſo whatever deſtroys the ligaments which go from the arytænoid to the thyroid cartilages, will deſtroy the voice.

The prognoſtics vary according to the cauſe or cauſes. That ſpecies which is owing immediately to ſpaſms, ſoon gives way in the removal of them. If a palſy of the tongue is the cauſe, it is very apt to return, if relieved; but often continues incurable.

In order to the cure, endeavour firſt to remove whatever impedes nervous influence on the tongue; and ſecondly, to ſtrengthen the weak parts. Theſe general intentions, in all caſes, being regarded, the particular cauſes muſt be removed as follows:

If worms are the cauſe, antiſpaſmodics give preſent relief; but the cure depends on the deſtruction of theſe vermin.

In caſe of a congeſtion of blood about the head, bleeding and nitrous antiſpaſmodics are to be uſed.

That ſpecies of *aphony* which remains after the ſhock of an hemiplexy or apoplexy, requires bliſters to be applied

plied to the nape of the neck: other means are rarely effectual.

If ſpaſmodic conſtrictions about the fauces and tongue are the cauſe, external paregorics are of the greateſt ſervice: anodyne antiſpaſmodics may be laid under the tongue, and the feet bathed in warm water; carminative clyſters alſo are uſeful.

When a palſy of the tongue produces this complaint, evacuations, according to the patient's habit, muſt be made, and warm nervous medicines externally applied, and internally adminiſtered; bliſters alſo ſhould be placed between the ſhoulders.

In caſe of repelled cuticular eruptions, ſudorifics ſhould be given, and the patient's drink ſhould be warm. The liquor c. c. ſuccin. or the vin. antim. may be mixed with tinctura benzoës compoſita, or with the balſ. Peruv. and given, at proper diſtances of time, in the patient's drink, or on a lump of ſugar.

Sometimes the ſerum flows ſo rapidly to the fauces and adjacent parts, in a ſalivation, as to deprive the patient of all power to ſpeak; in this caſe diaphoretics and laxatives, with a forbearance of all mercurials, are the ſpeedieſt remedies.

APHORISMUS, from ἀφορίζω, *to ſeparate* or *diſtinguiſh*. A ſhort ſentence, briefly expreſſing the properties of a thing; or which ſerveth as a maxim, or principal to guide a man to any knowledge, eſpecially in philoſophy and phyſic.

APHORME, of ἀπο, from ὁρμη, *a motive*. Hippocrates expreſſes by this word, whatever gives riſe to a diſeaſe, by a ſort of metaphor: for this word hath relation to human actions, and their motives.

APHRINON, from α, neg. and φρονεω, *to be wiſe*. One who has loſt the uſe of his reaſon.

APHRODES, from ἀφρος, *froth*. Spumous or frothy. Hippocrates applies this word to the blood and excrements.

APHRODISIA. } from Ἀφροδιτη, *Venus*. Ve-
APHRODISIASMUS, } nereal commerce. Some expreſs by this word the age of puberty, or the venereal age.

APHRODISIASTICON CLIDION. A TROCH, ſo called by Galen; it was uſed againſt ſpitting of blood and dyſenteries: P. Ægineta ſpeaks of its being made of balauſtines, rhubarb, opium, and other aſtringents.

APHRODISIUS MORBUS. See LUES VENEREA.

APHRODITARIUM. A powder recommended by P. Ægineta for hollow ulcers.

APHROGALA, from ἀφρος, *froth*, and γαλα *milk*. It is alſo called *capilacteum*, *lac ſpumoſum*; *lactis flos*. It ſeems to be milk ſo agitated, that the whole is converted into froth. This was a remedy recommended by GALEN againſt habitual heat of the ſtomach. Some though aſſert no writer hath deſcribed this; but what the Romans uſed under this name, appears to be ſomething ſimilar to what we call, SYLLABUB.

APHROLITRUM. See APHRONITRUM.

APHRON. A wild kind of POPPY. Alſo the name of a cephalic plaſter deſcribed by Actius in his Tetrabib. 4. ſerm. iii. cap. 13.

APHRONITRUM, from ἀφρος, *ſpume*, and νιτρον, *nitre*, alſo *aphrolitrum*. SPUME OF NITRE. Salts formed of the vitriolic acid and a terrene or gypſeo-calcareous element are thus called. It is a name alſo of the natron. See ANATRON.

APHROSCORODON. See ANTISCORODON.

APHROSYNE, from ἀφρων, *ſilly*; folly, or dotage. See AMENTIA.

APHTHÆ, called alſo by Celſus *ulcera ſerpentia oris*, SPREADING ULCERS IN THE MOUTH, and in England *puſtula oris*, THE THRUSH, named likewiſe *alcola*, *lactucimina*; *veſiculæ gingivarum*; *acacos*.

Dr. Cullen ranks this genus of diſeaſe in the claſs *pyrexia*, and order *exanthemata*. Gen. 35.

This diſorder appears in white ſpecks upon the tongue, and the back part of the palate in children: theſe ſpecks gradually ſpread all over the inſide of the mouth, and from thence all the way though the ſtomach and inteſtines: the ſize of theſe ſpecks increaſe as the violence of other ſymptoms are augmented; and they are then more yellow, or of other more unfavourable colours.

Dr. Hunter ſays, that theſe white ſpecks are inflammatory exudations, and not ulcers; which ſeems to be confirmed by their falling off, and being ſucceeded by other thicker ones, which falling off alſo, are again ſucceeded by others, &c.

Sometimes no other ſymptoms attend, but more frequently they are the reſult of inward fits, and are accompanied with ſour belchings, gripes, diarrhœas, fever, or ſoreneſs of the mouth.

Infants are the moſt frequent ſubjects of this diſorder, and amongſt them, thoſe fed by the hand more than thoſe that have the breaſt. In adults, they are often accompanied with miliary eruptions.

Celſus obſerves that *aphthæ* are moſt dangerous in infants; and Boerhaave, that in adults they are frequent in acute diſeaſes, and are then attended with inflammation of ſome of the viſcera. The more they ſpread, the danger is increaſed in all caſes.

In adults, the *aphthæ* in the mouth are diſtinguiſhed from the ulcerations in the angina gangrena, by the whiteneſs of the ſloughs, by the edges not being red and angry, and by their not being a ſhining redneſs all over the fauces, with other ſymptoms that uſually attend this ſort of quinſy.

If the cure is not ſoon effected in children, the contents of the bowels become more acrid, and produce vomitings, ſour and curdled ſtools, gripings, convulſions, and often death.

Firſt cleanſe their ſtomach and bowels, with as much of the following mixture as will operate both upward and downward:

℞ Mannæ Calab. ʒ ſs. aq. puræ ʒ ij. f. ſolutio colaturæ adde vin. antim. gut. xx. m. detur cochl. mediocr. pro re nata.

If the child is coſtive, due attention muſt be had thereto.

The beſt topical applications are as follow:

℞ Boracis opt. ſubtilif. pulv. ʒ j. mel Britan. ʒ i. m. f. litus.

In ſeverer caſes, double this quantity of the borax may be added in this litus. Whichever of them are uſed, a ſmall tea ſpoonful ſhould be rubbed well about the mouth, one in an hour or two, and gradually ſwallowed.——GARGARISMA ALUMINIS—*alum gargle*. In two pints of barley-water diſſolve two drams of alum, and three ounces of honey of roſes. GARGARISMA MYRRHÆ—*myrrh gargle*. To ſix ounces of lime-water add one ounce and an half of honey of roſes, and half an ounce of tincture of myrrh: MIXTURA MYRRHÆ COMPOSITA—*compound mixture of myrrh*. To two drams of tincture of myrrh, and the ſame quantity of honey of roſes, add one ounce and a half of lime-water. All theſe are very proper for ulcerations in the mouth, throat, gums, &c. but the *alum gargle* is ſerviceable in relaxations of the uvula and other caſes requiring topical aſtringents; and the *myrrh mixture* is conſidered uſeful for ſcrophulous ſores, were greaſy applications are inadmiſſible.

If after the removal of the ſpecks the mouth is very ſore, let a thin ſolution of the gum. tragac. in roſe-water, be frequently held in the mouth.

As a purge in this diſorder, when infants are the ſubjects, Dr. Canvane extols the ol. Ricini. and at the intervals of purging, he ſays, that much relief is obtained by giving the ſpecacuanha as a perſpirative.

That ſevere degree of the *thruſh* which is ſo frequent in the Weſt Indies, requires the application of perpetual bliſters, which ſhould be kept open with the ung. cantharidis, and in this caſe much relief is given to the patient by a due uſe of a proper detergent.

℞ Boracis opt. ſubtil. pulv. ʒ iij. mel roſar. ʒ ij. acidi vitriolici diluti. ʒ ij. m. f. litus ut ſupra utend.

Dr. Cullen conſiders this complaint as aſſociated with a ſynochus, and ſays the tongue is ſlightly ſwelled; and alſo is, with the fauces, of a purpliſh colour; the eſchars, appearing firſt in the fauces, and at the margins of the tongue, afterwards ſeizing the whole internal part of the mouth, are white; and, if abraded, ſoon return, and continue a very uncertain time. There is only one which he conſidered idiopathic, and that is the APHTHA INFANTUM, called *lactucimen* or *milk thruſh*. The reſt appear to be ſymptomatic, and are either called *febrile*, *malignant*, *ſyphilitic*, *ſcorbutic*; and are attendant on petechial fevers.

The black thruſh rarely occurs; when it does, it is always a putrid ſymptom.

Hippocrates ſpeaks of aphthæ of the pudenda of pregnant women, and of aphthæ of the aſpera arteria.

See Celſus, Aretæus, Oribaſius, Actuarius, Hoffman, Med. Rat. Syſt. Boerhaave, Blackrie's Diſquiſition on Solvents of the Stone, Canvane's Diſſ. on the Ol. Palm.

Chriſti.

Chriſti, Hillary on the Diſorders of Barbadoes. Cullen's Firſt Lines, edit. iv. vol. ii. p. 254.

APHTHÆ SERPENTES. See CANCRUM ORIS.

APHTHOSA. APHTHOUS; belonging to aphthæ.

APHYA. See APUA.

APIASTRUM. See MELISSA.

APICES, of *apex*, a *top* or *point*. See ANTHERÆ.

APITES. See APITES.

APINEL. A root which is met with in ſome of the American iſlands; it is called by the natives *yabacani*. Its name *Apinel*, was that of a captain of horſe, who firſt made the Europeans acquainted with it. If, with a rod, a piece of this root is put into the mouth of a ſerpent, the reptile is ſoon deſtroyed. If a perſon chews it, and rubs his hands and feet with it, the ſerpents ſhun him, nay, if he takes the ſerpent it cannot hurt him. See Hiſt. de l'Acad. Roy. an. 1724.

APIOS. The PEAR-TREE. See PYRUS.

APITES, or APITES VINUM, from απιος, *the pear-tree*, called alſo *opites*. The wine of pears, or PERRY. Its virtues are much the ſame as thoſe of cyder.

APIUM. SMALLAGE. APIUM GRAVEOLENS. LINN.

Miller enumerates thirteen ſpecies.

It is an umbelliferous plant, with bright green-winged leaves, cut ſlightly into three winged portions, ſerrated about the edges; the ſeeds are ſmall, oval, plano-convex, furrowed, of a pale brown, or aſh-colour; the root long, about the thickneſs of a finger, with a number of fibres of a pale yellowiſh colour on the outſide, and white within. It is biennial, flowers in Auguſt, grows wild in rivulets and watery places, and is frequently cultivated in gardens.

The freſh roots of *ſmallage*, when produced in their native watery places, partake in ſome degree of the quality of thoſe of hemlock, have an unpleaſant ſmell, and bitteriſh acrid taſte; but by drying they loſe the greateſt part of their ill flavour, and become ſweetiſh; they are aperient and diuretic, but the ſeeds are to be preferred in all medical purpoſes, and are good carminatives. In diſtillation theſe ſeeds yield an eſſential oil, and they give out their virtue to ſp. vini. rect. ſo completely, as, on evaporation, to leave an excellent extract.

The cicuta aquatica, growing naturally in the ſame places, may be miſtaken for it; but is thus diſtinguiſhed: the leaves of this cicuta are deeply divided, quite to the pedicle, into three long, narrow, ſharp-pointed ſegments; whereas thoſe of *ſmallage* are only ſlightly cut into three roundiſh obtuſe ones.

The *apium* is alſo called *apium dulce*,—*paluſtre*, *eleoſelinum*, *helleoſelinum*, *paladapium*, and *celeri Italorum*.

By culture this plant hath been improved, and is the CELERY of our gardens, called APIUM SATIVUM; in this ſtate the roots have an agreeable warm ſweetiſh taſte, without any of the ill flavour of the original *ſmallage*: but Ray obſerves, that if neglected, it degenerates into its firſt diſagreeable ſtate. However, as by culture this plant is improved for the table, it is rendered leſs powerful as a medicine.

HELEOSELINUM, or *hydroſelinum*. The MARSH SMALLAGE is a larger ſort, growing alſo in watery places, of the ſame nature as the celery.

APIUM HORTENSE, called alſo *petroſelinum* vulg. *apium*, ſelinum, common or GARDEN-PARSLEY. APIUM PETROSELINUM, or *apium* hortenſe, fructu ovato, ſtriato, involucro monophyllo; petalis æqualibus, foliolis caulinis linearibus, involucris minutis. CLASS PENTANDRIA. ORD. DIGYNIA. LINN. Gen. Plant. 367. It is too well known to need deſcription. The roots are diuretic, and are beſt in a decoction, which ſhould be drank plentifully. Diſtilled with water a ſmall portion of eſſential oil is obtained; ſp. vini. rect. extracts the whole of their virtues, and, after evaporation, leaves a good extract. The leaves are warmer than the roots, and afford more eſſential oil; but the ſeeds are the beſt part of the plant: they are warming, carminative, bitter, and diuretic. Three pounds of the ſeeds yield about ʒ i. of eſſential oil, the moſt of which ſinks in water. Sp. vini rect. beſt takes up their virtues, and an extract made therefrom loſes nothing. The roots are ſaid to be aperient and diuretic, and have been employed in apozems to relieve nephritic pains, and obſtructions of urine. The bruiſed leaves have been ſucceſsfully uſed, as a diſcutient poultice to many tumors. Though commonly eat at table, there are not facts wanting to prove that in ſome conſtitutions they occaſion epileptic fits, or at leaſt aggravate them in thoſe ſubject to this diſeaſe.

APIUM MACEDONICUM. *Petræum*, *Petroſel. Macedon. daucus Macedon. patrapium.* MACEDONIAN PARSLEY. *Bubon Macedonicum.* Linn. We have only the ſeeds in the ſhops, which differ from the common ſort in being dark-coloured, and covered with a rough hoarineſs: their virtues are ſimilar to, but weaker than the common ſort.—That called MONTANUM. See OREOSELINUM.——PALUSTRE. See SIUM ANGUSTIFOLIUM.——PEREGRINUM. See SELINUM MONTANUM.——SYLVESTRE. See BUNIUM.——SYLVESTRE LACTEO SUCCO TURGENS. See OELSNITIUM.

APLYTOS, from α, neg. and πλυνω, *to waſh*. Unwaſhed. An epithet of wool, called by the Latins LANA SUCCIDA, which ſee.

APNŒA, α, non, and πνεω *ſpiro*. A defect of reſpiration, ſuch as happens in a cold, &c.

APOBAMMA, απεβαπτω, *leniter intingo*. See EMBAMMA.

APOBRASMA, απεβρασω, *per æſtum exſpuo*. The bran of wheat, or the froth of the ſea.

APOCAPNISMUS. FUMIGATION. From καπνος, *ſmoak*.

APOCATASTASIS. To reſtore, an amendment, a ceſſation, or ſubſiding.

APOCATHARSIS. An EXPURGATION.

APOCENOS. See AREVACUATIO.

APOCERUGMA. A declaration, that is, ſuch declarations as are thought proper to be made to the patient reſpecting his danger.

APOCEPACULISMENON. It is when a bone is broken after the manner of a ſtalk, near the joint.

APOCHOPHEMA, αποκωφεω, *multum reddo*. See APECHEMA.

APOCHREMMA. The matter of ſpit hawked up.

APOCHREMPSIS. A hawking up of ſpit.

APOCHYLISMA. See SAPA.

APOCHYMA. The pitch which is ſcraped from ſhips, formerly eſteemed in medicine.

APOCLASMA. See ABDUCTIO.

APOCLEISIS. An EXCLUSION, from αποκλειεσθαι, *averſari*. But Hippocrates uſes the word from whence it is derived to expreſs a loathing of food.

APOCOPE. From απο, *from*, and κοπτω, *to cut*. See ABSCISSIO.

APOCRISIS. See ECCRISIS.

APOCRUSTICON, from απωθεω, *to repel*. An epithet for a remedy of a repelling and aſtringent quality.

APOCYESIS, αποκυεω, *pario*. A birth, or bringing forth of a child.

APOCYNON. A little bone in the left ſide of a frog, formerly held in great eſteem.

APOCYNUM. See HIPPOMANES, and PERIPLOCA.

APOCYRTUMENA. It is ſpoken of humours forming into a kind of cone, when ſuppurated and ready to be diſcharged.

APODACRYTICA, from απο, ſignifying *negatively*, and δακρυ, *a tear*. They are medicines which firſt excite, and then evacuate, the ſuperfluous moiſture of the eyes, and thus preventing preternatural moiſture there. Such are onions, celandine, hellebore, &c.

APODYTERIUM, from αποδυομαι, *to unclothe*. A private room before the entrance into the baths, where the bathers undreſſed themſelves. It is alſo called *coniſterium* and *ſpoliarium*.

APŒUM, from α, neg. and πως, *of ſome quality*. Void of all ſenſible qualities, poſſeſſing neither aſtringency, nor acrimony, nor any other remarkable faculty, as water amongſt moiſt ſubſtances, and ſtarch amongſt dry. It is ſimilar to *inſipidus*, of which inſipid ſubſtances GALEN ſays, they nouriſh more than acrimonious, or bitter ones.

APOGALACTISMUS. See ABLACTATIO.

APOGEUSIA. } See AGHEUSTIA.
APOGEUSIS. }

APOLEPSIS from απολαμβανομαι, *to be ſuppreſſed, retained*, &c. alſo *dialepſis*, *interceptio*. An interception, ſuppreſſion, or retention, which may be of urine or any other natural evacuation. HIPPOCRATES means by the term *dialepſis*, the ſpace left in a bandage for a fracture in which the dreſſings are applied to wounds.

APOLEXIS, from απολεγω, *to ceaſe*, or *end*. A decaying time of age, and oppoſed to the flower of age.

APOLINOSIS. from λινον, *flax*. See OMOLINON.

APOLLINARIS. See HYOSCYAMUS NIGER.

APOLYSIS, from απολυω, *to releaſe*. A ſolution or releaſe. Such as the excluſion of a child, the ſolution of a diſeaſe, or untying of a bandage.

APOMAGNA,

APOMAGNA, from αποματτω, *to abſterge*. Any thing uſed to wipe away ſordes, as a hankerchief, or a ſponge, &c.

APOMATHEMA, from απο, neg. and μανθανω, *to learn*. Hippocrates expreſſes by it, a forgetfulneſs of all that hath been learnt.

APOMELI. A ſweet liquor made with honey combs, diluted and boiled with water. Galen ſays, that Hippocrates, and others, called apomeli by the names of *oxyglici*, and *oxyglicum*, and that ſome were made with, and others without vinegar, ſome being ſweet, and others ſour and ſweet. It is ſimple oxymel.

APONENCŒMENOS, from απονεω, *to be negligent*, or *averſe*. An adverb importing an utter averſion to any thing.

APONEUROSIS, of απο, *from*, and νευρον, *a nerve*. Any tendinous expanſion. The tendon or tail of a muſcle, called by Hippocrates, τενων, *a tendon* or *cord*.

Theſe expanſions of tendons, called *aponeuroſes*, or faſciæ, grow thinner and thinner, till they are loſt in the cellular membrane. Inſtances of theſe are frequently met with, e. g. the outward muſcles of the thigh are bonnd down by one of theſe expanſions, viz. the FASCIA LATA, which ſee. Dr. Hunter deſcribes this *aponeuroſis* as proceeding from the muſculus faſciæ latæ, called *membranoſus muſculus*, on the external part of the thigh, and from the gluteus maximus on the poſterior part.

There are other faſciæ, as thoſe of the legs, which, like thoſe of the thighs, cover the muſcles. The ſoles of the feet are ſtrong faſciæ, which prevent the flexor muſcles of the toes being hurt, when we tread. The faſciæ on the thighs and legs bind down the muſcles while in action, and alſo increaſe their ſtrength by compreſſing them.

When matter is formed immediately under any of the faſciæ, it cannot point where it was firſt formed, but runs under them to ſome diſtance, to gain an exit: to prevent inconveniencies from this cauſe, as ſoon as matter can be felt under a faſcia, it is right to give it vent immediately, and not to wait for its pointing, as in other ſituations; when this happens under the temporal muſcle, great difficulties attend. See TEMPORALIS MUSCULUS.

APOPALLESIS, } from αποπαλλω, *to throw off in a*
APOPALSIS, } *haſty manner*. An expulſion of the fœtus, as in abortions. See ABORSUS.

APOPHLEGMATICA, } of απο, *from*, and
APOPHLEGMATIZANTIA, } φλεγμα, *phlegm*.
APOPHLEGMATIZONTA, } Medicines ſuited to promote a diſcharge of mucus or phlegm, from the mouth and noſe, and according to the part from whence the diſcharge is made, ſo are they denominated. If from the mouth, *maſticatories*. If from the Schneiderian membrane—*Errhines*. Hence *Pellitory of the wall—Horſe radiſh*, &c. Snuff alſo, and whatever occaſions an excretion of mucus, or ſerum from the head and parts above the throat, come under this denomination—Any medicine poſſeſſed of this power is called *Maſticatorium* and *commanſum*, CAPUT—PURGIA. See ERRHINÆ.

APOPHRADES, from the ſingular αποφρας, *unfortunate*. Thoſe days in which an acute diſtemper comes to a fatal criſis, or on which there is no criſis at all, when expected.

APOPHTHARMA. A medicine to procure abortion.

APOPHTHORA. An abortion. From αποφθειρω, *to corrupt*. See ABORTUS.

APOPHYADES. The ramification of the veins.

APOPHYAS, of απω, *from*, and φυω, *to grow*. An appendix. Any thing that grows to, or proceeds from another.

APOPHYSIS, from αποφυω, *to produce*, or from απω, and φυω, *to grow*. Any thing that grows to, or proceeds from another, as boughs and branches; IN ANATOMY it moſtly ſignifies the projection of a bone. It is alſo called *appendix*, *probole*, *echphyſis*, *proceſſus*, *productio*, *projectura*, and *protuberantia*.

APOPHYSIS GRACILIS. The apophyſis of the neck of the malleus in the ear.

APOPLECTA. See JUGULARES VENÆ.

APOPLECTICA. Medicines againſt the apoplexy, ſo called inſtead of antipoplectica. Vogel ſays it is a continued fever coming on upon an apoplexy.

APOPLECTICÆ VENÆ. See JUGULARES VENÆ.

APOPLEXIA, from αποπλησσω, *to ſtrike or knock down*, or *ſmite ſuddenly*; the Latins call it *attonitus morbus*. The APOPLEXY. It is called *ſideratio*, *attonitus*, *ſtupor*, *palperia*, *palpezia*, *gutta*; when it is ſlight it is called *parapoplexia*.

Dr. Cullen ranks this genus of diſeaſe in the claſs NEUROSES, and the order COMATA. Gen. 42; which he defines, a diminution commonly of all voluntary motion, attended with ſleep, more or leſs ſound, the motion of the heart and arteries ſtill continuing; to which may be added an oppreſſed reſpiration, and frequently a ſnorting. SAUVAGES makes fifteen ſpecies. *Noſolog. Method. Vol.* II. *p.* 845. Dr. Cullen reduces them to nine. *Synopſis Noſol. Meth. Vol.* II. *p.* 183, &c. viz. 1ſt. *Apoplexia* ſanguinea, with ſigns of an univerſal plethora, and chiefly fullneſs in the head. Here comes the *Carus à frigore* & *ſpontaneus*; *Cataphora Coma*. 2d. *Apoplexia* ſeroſa, which happens generally in aged and leucophlegmatic people; *Carus à hydrocephalo*. 3d. *Apoplexia hydrocephalica*; ſee HYDROCEPHALUS. 4th. *Apoplexia* atrabilaria, obſerved in perſons diſpoſed to melancholy. 5th. *Apoplexia* traumatica; when the head is hurt by violent external force. 6th. *Apoplexia* venenata, from ſtrong ſedatives, whether externally applied, or internally taken. *Carus ab inſolatione*, *carus à frigore*, &c. 7th. *Apoplexia* mentalis; *Carus à pathemate*, from paſſions of the mind. 8th. *Apoplexia* cataleptica, in which the reſpiration is not ſtertorous, and though the limbs maintain any accidental poſition, yet they give way to external force applied to them, 9th. *Apoplexia* ſuffocata, which happens from any external ſuffocating power; as in caſes of hanging and drowning. See SUBMERSIO.

Dr. Cullen conſiders the CARUS; CATAPHORA; COMA; HÆMORRHAGIA CEREBRI; CATALEPSIS; CEREBRI AFFECTIO SPASMADICO—ECSTATICA; and the ECTASIS, as apoplexies; the TYPHOMANIA, and LETHARGUS, as ſymptomatic apoplexies. And often there is a ſymptomatic apoplexy of, 1. *Intermittent fever*. 2. *Continued fever*. 3. *Inflammation*. 4. *Exanthema*. 5. *Hyſteria*. 6. *Epilepſy*. 7. *Gout*. 8. *Worms*. 9. *Iſchury*. 10. *Scurvy*; for ſpecifications of which ſee the place referred to above. There are alſo a number of ſpecies of Aſphyxy which come properly under this head. See ASPHYXIA.

To the definition of *apoplexy*, he adds, that the abolition of the powers of ſenſe and motion, is in ſome degree only; meaning by this to imply, that under the title of *apoplexy*, are comprehended thoſe diſeaſes, which, as differing from it in degree only, cannot, with a view either to pathology or practice, be properly diſtinguiſhed from it. Such are the diſeaſes named above. LOMMIUS obſerves, that this diſorder is generally *uſhered in* by ſudden and acute pains in the head, vertigo, dimneſs of ſight, grinding the teeth during ſleep, a coldneſs of the whole body, eſpecially the extremities; then, as though thunder-ſtruck, the patient falls down ſometimes with ſhrieks; immediately after the eyes are ſhut, a ſnorting comes on, the difficulty of breathing is great, endangering ſuffocation, the breaſt ceaſes to heave, juſt as if it was bound in cords; ſenſe and voluntary motion are entirely loſt.

There are different ſpecies of *apoplexies*, which demand our utmoſt attention, as the cure is very different in each, particularly the two firſt, the others agreeing more with the ſecond. The firſt is the SANGUINEOUS APOPLEXY, in which we find a ſtrong full pulſe, a red and bloated viſage, the patient's neck ſwelled, an oppreſſed loud reſpiration, with a little hoarſeneſs. This ſpecies prevails amongſt the robuſt who have much blood, loaded with craſſamentum. The ſecond is the SEROUS APOPLEXY, in which the ſymptoms are, in general, like thoſe in the former ſpecies, except that the pulſe is weaker, the countenance pale, or at leaſt far leſs ruddy, and the breathing leſs oppreſſed. The third is the SPASMODIC APOPLEXY; the ſame ſigns attend this as are uſual in the ſecond ſpecies, only it is ſooner removed, and rarely degenerates into a palſy. The fourth is the SYMPTOMATIC, ſuch as from flatus in the ſtomach, the gout, &c,

In the ſanguinary *apoplexy*, there can be little doubt but the prediſpoſing cauſe is a plethora, and that this determines to the head by ſome remote cauſe, ſuch as will induce the proximate or immediate cauſe, a compreſſion of the brain. Indeed the immediate cauſe may be brought on by different means, and though different in their nature, ultimately produce ſimilar effects, a ceſſation, or defect of nervous influence in the parts ſubſervient to voluntary motion. Of which we ſhall readily be convinced by an enumeration of the remote cauſes. As, ſurfeits, indigeſtion, too long expoſure to the ſun; inordinate drinking, particularly about the age of ſixty, hyſteric affections, convulſions, ſerous collections in the brain, libidinous exceſs, particularly in old men. Repulſion of acrid matter, ſuppreſſion of urine, ſalivation interrupted

by cold, and other cauſes ſuddenly, blows and wounds of the head, poiſons, noxious effluvia, an hereditary taint. Now if the cauſes here preſented be examined reſpecting their conſequences, it will appear that they are either calculated to encreaſe the volume of blood, or occaſion a ſtagnation in the brain, or produce ſuch effects there as will prevent the nerves from exerciſing their influence. And whatever will produce theſe, will produce apoplexy.

Dr. Cullen thinks that *the proximate cauſe is*, in general, whatever interrupts the motion of the nervous power, whether from the brain or to it. Of APOPLEXIES *from internal cauſes*, he thinks the motion of the nervous power is interrupted by ſome compreſſion on the origin of the nerves; and this compreſſion is occaſioned by an accumulation of blood in the veins of the head. In APOPLEXIES *from external cauſes*, the motion of the nervous power is interrupted by directly deſtroying its mobility; as when mephitic air, fumes from charcoal, &c. are admitted to the nerves.

From an attention to the ſymptoms of an *apoplexy*, and the appearances obſerved on diſſecting thoſe to whom it had proved fatal, the brain is moſt probably its ſeat. Wepfer, in his hiſtories of thoſe ſubjects, obſerves, that the veſſels in their brains were often ruptured, or very turgid; at other times the ventricles of the brain were filled with a watery humour; or a portion of ſerum, &c. was found betwixt the brain and its membranes.

Old men, the indolent,—thoſe who indulge in gluttony or drunkenneſs, are corpulent and full of blood—hard drinkers at an advanced period of life—ſhort necked people, are the moſt ſubject to *apoplexy*.

This diſorder ſhould be diſtinguiſhed in its ſpecies, and alſo from thoſe other maladies to which it bears a reſemblance.

The danger ſeems to be chiefly proportioned to the difficulty of reſpiration; if it is tolerably eaſy, and the patient can ſwallow, there is good hope; but if reſpiration is very difficult, or intermittent, and what is given the patient to drink, returns immediately by the noſe, a recovery is hardly to be effected.

Thoſe who have been attacked with any kind of *apoplexy*, are ſubject to relapſes, each of which are more dangerous than the preceding; to prevent which, due regard ſhould be had to all that can conduce thereto, that it may be avoided: ſuppers, hot rooms, violent exerciſe, particularly in the ſun, going to bed late, long ſleeps, continuing in the cold, eſpecially if the feet are ſubject to be ſo, and whatever is ſuſpected to diſpoſe to this diſorder muſt be carefully attended to, and prevented.

In order to the cure, in caſe of the SANGUINE SPECIES, immediately uncover the patient's head, raiſe it up as high as poſſible, and give him the advantage of freſh air.

If it can conveniently be done, bleed ad deliquium, to take off the plenitude; ten or fifteen ounces may be taken away immediately, and the ſame quantity may be repeated in an hour or more, according as the pulſe will admit. Some aſſert an extraordinary efficacy from opening the temporal artery during the fit. Dr. Cullen obſerves, that when an attack of *apoplexy* is immediately threatened, *blood-letting is certainly the remedy to be depended on*, and blood ſhould be taken largely, if it can be done from the jugular vein, or the temporal artery. But, when no threatening turgeſcence appears, the obviating plethora is beſt effected by leeches applied to the temples, or ſcarifications of the hind head: and theſe are more ſafe than general bleedings.

Lenient clyſters, with a table ſpoonful of common ſalt in each, ſhould be given as ſpeedily as poſſible, and repeated every three or four hours until proper means can be adminiſtered by the mouth.

Cooling medicines ſhould be given as ſoon as they can be ſwallowed; let the firſt be a briſk but cooling purge with nitre.

In the fit, ſome aſſert that a handful of common ſalt, diſſolved in a pint of water, if poured down the patient's throat, will ſpeedily recover him: the trial is eaſy, and nothing to be feared in caſe of failure.

Bliſters may be applied all over the feet. Dr. Cullen prefers the application of them to the head.

Keep the patient ſtill and calm, and let his diet be aqueous, and ſuch as affords the leaſt nouriſhment.

Iſſues, ſeatons, or *pea*-iſſues near the head, have been adviſed, but theſe can be of no avail during the fit; they may be ſerviceable afterwards in preventing a relapſe, by acting as a conſtant drain to the habit, without weakening it, and thus avoiding ſanguinary accumulation.

IN THE SEROUS KIND, bleeding is rarely to be admitted, but purging with the tinct. aloes (or ſuch like) will be abſolutely neceſſary, as ſoon as the patient can be made to ſwallow, and repeat the doſe every third day.

Raiſe his head high, as already adviſed, and try to pour down the ſolution of common ſalt, above hinted at.

Wrap the feet warm in hot flannels.

Clyſters may be repeated twice a day, and made as directed in the ſanguine *apoplexy*.

Dr. George Fordyce thinks that the compreſſion producing *apoplexy*, ſeldom or never ariſes from the ſerous part of the blood being extravaſated; but adds, whether blood or ſerum be the cauſe, the ſame methods muſt be purſued for relief; and beſides bleeding, to relieve the brain, he urges the advantage of purging, which he ſays diminiſhes the circulation from the brain as well as from the inteſtines. The more active purgatives he recommends, and to repeat them ſo as to keep up the ſecretion that way.

Apply bliſters to the ſhoulders, and on the fleſhy parts of the legs.

Volatile ſpirits, with valerian, aromatics, and ferruginous medicines, are to be directed. Theſe, as indeed all ſtimulants, are leaſt hazardous and moſt uſeful, when the fit is not preſent.

The diet muſt be light, but cordial and nouriſhing.

In groſs habits muſtard-ſeed may be ſwallowed whole two or three times a day, to the quantity of a table ſpoonful each doſe. Horſe-radiſh may be eaten freely.

In the ſpaſmodic, or other ſymptomatic kinds of *apoplexies*, an attention to the general habit of body, and the nature of the diſeaſe attending, will lead moſt directly to the cure.

Dr. Flemmyng recommends trepanning as a powerful aſſiſtant in the cure of *apoplexies*, by taking off a degree of preſſure from the brain. See his obſervations on this ſubject, in the Med. Mus. vol. ii. page 300, &c. Some of the ASPHIXIÆ are conſidered as belonging to this diſeaſe. See ASPHYXIA.

Cœlius Aurelianus, Lommii Opuſc. Aureum, Aretæus, Philumenus, Galen, Paulus Ægineta, Baglivi, Boerhaave, HOFFMAN, STHAL. Tiſſot's Practical Obſ. on the *Apoplexy*. WALLIS, on Diſeaſe and Health. Cullen's Firſt Lines, vol. iii. edit. iv.

APOPLEXIA CATALEPTICA. See CATALEPSIS.

APOPSYCHIA. See LIPOTHYMIA.

APOREXIS. A play with balls in the gymnaſtic exerciſes.

APORIA. See ALYSMOS.

APORRHŒA, ἀπόῤῥοια, defluxus. See CONTAGIO

APOSCEPARNISMUS, from ἀπὸ, *from*, and σκεπαρνίζω, *to ſtrike with a hatchet*. A ſpecies of fracture, when part of a bone is chipped off, alſo called *deaſciatio*.

APOSCHASIS, APOSCHASMUS, } From ἀπὸ, and χαράσσω, *to ſcarify*. See SCARIFICATIO.

APOSITIA, } See ANOREXIA. A loathing of food.

APOSITOI, } Thoſe who are averſe to food.

APOSPHACELISIS, from ἀπὸ, *from* σφακελὸς, *a ſphacelus*. A mortification of the fleſh in wounds or fractures, cauſed by too tight bandage.

APOSPHAGMA, ἀπὸ, and σφάλλω, jugulo, according to Galen's interpretation of the ſenſe in which Hippocrates uſed the term, it is the fæces ready for ſtraining, or after they have been ſtrained: and according to Pliny it is applicable to the blood of an animal whoſe throat is cut, flows into a veſſel placed underneath, and by different proceſſes formed into food.

APOSPONGISMUS, ἀπὸ, and σπογγίζω, ſpongia tergo. It is the uſing of a ſponge either dry or moiſt, for the deterging of the filth from the ſkin, or for alleviating pains, and itching, recovering the ſpirits, or for other purpoſes.

APOSTAGMA, } ἀποστάζω, diſtilled. The ſweet

APOSTALAGMA, } liquor that diſtils from grapes before they are preſſed.

APOSTASIS, from ἀφίσταμι, *to abſcede*. It is when a fragment of bone comes away by a fracture. It is the ſame as ABSCESSUS, which ſee. Hippocrates uſes the word alſo, *firſt*, when a diſtemper paſſes off by ſome outlet, and this is an *apoſtaſis* by excretion: *ſecondly*, when the morbific matter, by its own weight, falls and ſettles on every part; this is an *apoſtaſis* by ſettlement: *thirdly*, when one diſeaſe turns to another; this is an *apoſtaſis* metaſtaſis. So Pliny calls the *apoſtema*.

APOSTAXIS, alſo *Staxis*. Hippocrates uſes the word to expreſs a ſmall and inſufficient diſtillation of blood

blood from the nose. It means any distillation or defluxion of humours.

APOSTEMA, from ἀφίστημι, *to disjoin*; or from ἀπὸ, *ab*, and ἵστημι, *sto*, *to stand*. See ABSCESSUS.

APOSTEMATIÆI. So Aretæus calls those who, from an inward abscess, void pus downwards.

APOSTERNA See APOSTASIS.

APOSTOLORUM (UNG.) The APOSTLES OINTMENT, so called because it is made with twelve ingredients, exclusive of the oil and vinegar; called also *dodecapharmacum*.

℞ Tereb. Venet. rezin. flav. ceræ. flav. gum ammon. ää. ʒ xiv. rad. aristol. L. gum. oliban. & bdel. ää. ʒ vi. gum. myrrh. & galban. ää. ℥ ss. gum. opoponac. ʒ iii. æruginis æris. ʒ ii. litharg. ʒ ix. ol. olivar. ℔ ii. acet. q. s. gummi solv.

APOSTROPHE, from ἀποστρέφω, *to turn away*. Thus P. Ægineta expresses an aversion to food.

APOSYRMA, from ἀποσύρω, *to rub off*. See ABRASIO.

APOTHECA, from ἀποτίθημι, *to lay aside* or *reposit*. A shop where medicines are sold; also a GALLYPOT, whence

APOTHECARIUS. A preparer of medicines, or an apothecary.

APOTHEGM. See AXIOMA.

APOTHERAPIA. A perfect cure, also a particular sort of exercise used for health.

APOTHERAPEUTICA. That part of medicine which teaches concerning the *apotherapia*.

APOTHERMUM. An acrimonious kind of pickle, as with mustard, vinegar, &c.

APOTHESIS, from ἀποτίθημι, *to reposit*, or from ἀπὸ and τίθημι, *to place*. The reduction of a dislocated bone.

APOTHLIMMA. The dregs, or the expressed juice of a plant.

APOTOCOS. ABORTIVE.

APOTROPŒA, or APOTROPAIA. See AMULETA.

APOZEMA, from ἀποζέω, *to boil*. A decoction. See COCTIO.

APOZYMOS, from ζύμη, *to ferment*. Fermented.

APPARATUS, from *apparco*, *to appear*, or *be ready at hand*. IN SURGERY, it is the collection and regular disposition of all the instruments necessary for the exercise of the art, or of any particular operation. The word is applied also to CHEMISTRY, and to any art or science, where a number of instruments are necessary to be made use of, either for explaining, or performing any process, by way of elucidation.

APPARATUS, the greater or lesser. See LITHOTOMIA.

APPENDICULA VERMIFORMIS, or CŒCI. On one side of the bottom of the cœcum, lies an appendix resembling a small intestine, nearly of the same length with the cœcum, but more slender. It is thus called from its resemblance to an earth-worm. Its common diameter is about a quarter of an inch. By one extremity it opens into the bottom of the cœcum, the other extremity is closed. Its structure is like that of the intestines in general; its internal coat is folliculous, like that of the duodenum, and is reticular too. Its use is not known; it is also called *additamentum coli*, and by some *ecphyas*.

APPENDIX, from *appendo*, *to hang by* or *to any thing*. See EPIPHYSIS and APOPHYSIS.

APPENSIO. The suspension of a broken arm in a scarf.

APPETENTIA, } APPETITE. In a general sense it
APPETITUS, } is the inclination of any being towards any particular thing: but in the common acceptation it is a desire of food, and of this *appetite* there are two kinds, viz. hunger and thirst.

APPETITUS CANINUS. See BOULIMUS;—*erronei*, and *deficientes*. See DYSOREXIA.

APPLUDA. The chaff of millet, panicum, and sesamum.

APPREHENSIO. A name of the *catalepsis*, also antilepsis, which see.

APPREHENSIS, } See ANTILEPSIS.
APPREHENSORIUM, }

APPROPRIATIO. That action of the natural heat or vital flame, by which the fluids are so united with the solids of our bodies, as to enable them to perform their functions. Medicines are said to be *appropriated*, which are believed to be destined for a particular part of the body.

APRONIA. See BRYONIA NIGRA.

APPROXIMATIO. A method of cure by transplanting a disease into an animal or vegetable, by immediate contact.

APROXIS. An herb, so called by Pythagoras, which is said to take fire at a distance, like the naphtha.

APSINTHATUM, from ἀψίνθιον, *wormwood*. A sort of drink accommodated to the stomach.

APSYCHIA. See LIPOTHYMIA.

APTYSTOS, from ἀ, neg. and πτύω, *to spit*. A denomination for disorders in which spitting, though an usual symptom, is yet wanting, as in what is called a dry asthma, a dry pleurisy, &c.

APUA, called also *aphya*. The fish called ANCHOVY. They are taken near Genoa and Provence, and are pickled in salt. When pickled they are said to warm the stomach, and to promote an appetite.

APULOTICA. See EPULOTICA.

APYETOS, from ἀ, neg. and πύον, *pus*. An epithet for a tumor that will not suppurate.

APYRENOMELE. See APYROMELE.

APYREXIA. The absence of a fever.

APYRINA, the currant vine.

APYROMELE, from ἀ, non, πυρὴν, nucleus, and μήλη, specillum. A probe without a button: *a malotris*; called also *apyrenomele*.

APYRON, from ἀ, neg. and πῦρ, *fire*. A name of sulphur vivum; also of the Æthiops mineralis, which see.

APYROTHIUM. See SULPHUR VIVUM.

AQUA. WATER, called also *Alma*. Natural philosophers define water to be an *insipid*, *ponderous*, *transparent*, *colourless*, *uninflammable*, and *highly fluid* body, susceptible of the different states of aggregation from solidity to that of elastic vapor. It owes its fluidity to a certain degree of heat, since with a heat two-thirds less than that of our blood, it congeals; and with about twice the heat of our blood, it boils, beyond which it cannot be made hotter.

Water is more compressible in winter than in summer, contrary to most, if not all other fluids; it is also elastic. See Philos. Transf. vol. liii. p. 640.

It is found in almost every natural body; though there are many substances with which art cannot unite it, yet it is continually done in nature; it is obtained from wood, and the most solid bones; it exists in the hardest and most compact calcareous stones, and forms the greater part of the fluids, and a considerable proportion of the solid parts of animal bodies. It is contained in bodies, in a greater or less quantity, and may be considered in two states, either in that of simple mixture, or in a state of combination; in the first case, it renders bodies humid, is perceptible to the eye, and may be disengaged with the greatest facility; in the second, it exhibits no character which shews that it is in a state of mixture. In this form it exists in crystals, salts, plants, animals, &c. water existing in a state of combination in bodies, concurs in imparting to them hardness and transparency; salts, and most stony crystals lose their transparency, when deprived of their water of crystallization. Some bodies are indebted to water for their fixity; the acids acquire fixity only by combining with water. Under these various points of view, water may be considered as the general cement of nature, and has been reckoned amongst the number of elements; but by a number of experiments, has been proved to be a compound body, formed by the combination of OXIGENE and HYDROGENE. On which subject our readers may consult the works of modern chemists, particularly LAVOISIER, FOURCROY, and CHAPTAL; as our business is to consider it only in a *dietetic* and *medical* point of view.

Water, as it is the most ancient, so is it the best and most common fluid for drink, and ought to be esteemed the most commodious for the preservation of life and health; for not only all kinds of animals, but the greatest part of mankind, preserve life by drinking water alone. If moderately drank, it *assists digestion, quenches thirst, cools the habit, dilutes the fluids, opens obstructions, dissolves viscidities, corrects acrimony, promotes the fluid secretions, and carries all acrid excrementitious fordes out of the machine*, and *is an universal vehicle for solid food*. It is superior to all other liquids, because it is purer, more simple, more fluid, and less loaded than others used for drinking, with heterogeneous and solid parts. The more pure the water, the better, and that is certainly the best which falls in rain, collected from high situations in the country, then boiled a little, and afterwards distilled, the half which comes over first only to be used. This, from its purity, is also recommended to all chemists, where this fluid is to be employed; but indeed, such as nature affords, it is a proper drink for mankind; if there is no impregnation to the taste or smell of a person of common

sensibility

ſenſibility drinking it. The ſofter and purer waters, however, are to be preferred for uſe; though the harder waters, or ſuch as are impregnated with ſelinites, or other earthy matters, have not been diſcovered, by any good and clear evidence to have produced the bad effects aſcribed to them.

Good water is known by readily mixing with ſoap and not curdling therewith; and by quickly boiling peaſe, pulſe, &c. ſoft and tender; and it keeps beſt in large veſſels in cold places, and in earthen or glaſs veſſels.

Muddy *water* may be cleared by adding two or three grains of alum to each pint, and thus the *water* is not injured. If hard, it may be rendered ſoft by adding ten grains of the ſalt of tartar to each pint, after which it will be both agreeable and free from all inconveniences. In want of the ſalt of tartar, chalk may be added.

River *water* is the beſt for ſhort voyages; but the ſpring *water*, being longer before it putrifies, anſwers better for long ones.

Stagnant *waters*, *water* in which is much melted ſnow or ice, dew, *water* from mines and high rocks, ſuch as riſes in low flat lands, and particularly from ſprings, in which are an unctuous, earthy, bituminous matter at the bottom, are bad: but good *waters* are obtained from ſprings which are on high lands, that conſiſt much of a clean earth and gravel; from the clouds, by rain falling at a diſtance from great towns; rivers and rivulets; but the diſtilled is the moſt pure, and a regular drinking of it would doubtleſs be as beneficial as any of the moſt celebrated mineral *waters*. See Dr. F. Cliſton's Tranſlation of Hippocrates, on Air, Water, Situation. CULLEN's Materia Medica. HOFFMAN's Syſtema Rationale. CHAPTAL's Chemiſtry.

AQUA MULSA. See HYDROMELI.

AQUA SULPHURATA. See GAS SULPHURIS.

——— SALIS. See CIRCULATUM.

AQUÆ MEDICINALES, vel MINERALES. MEDICINAL, or MINERAL WATERS.

Waters which contain minerals in ſolution, are diſtinguiſhed by the name mineral waters; but as there is no water found in nature, even among thoſe reckoned the pureſt, unimpregnated by ſome of theſe ſubſtances, the name of mineral waters ought to be confined to ſuch as are ſufficiently impregnated to produce a ſenſible effect on the animal œconomy, ſo as to cure or prevent the diſorders to which we are liable; hence the term MEDICINAL is more applicable. They participate more or leſs of the matters over which they run in their ſubterraneous paſſages, and with ſome prevailing ingredient from which they receive their names.

The ſubſtances which are contained in waters, are either held by SUSPENSION or SOLUTION; by the firſt, are meant CLAY, SILEX, (quartzoſe, vitrifiable earth), in a ſtate of diviſion; CALCAREOUS EARTH; MAGNESIA, &c. By the ſecond, PURE AIR; the CARBONIC ACID; PURE, or COMPOUND ALCALIES; LIME, MAGNESIA, the SULPHATES, MURIATES, the EXTRACTIVE MATTERS of PLANTS, HEPATIC GAS, &c. Though the moſt ancient, the moſt general, and the moſt ſimple diviſion of mineral waters, is into cold, hot or thermal waters, accordingly as their temperature is the ſame, or exceeds that of common water.

Modern chemiſts of allowed abilities, have arranged all mineral waters into four claſſes; called ACIDULOUS, or GASEOUS; SALINE, or SALT; SULPHUREOUS; FERRUGINOUS, or MARTIAL WATERS.

1. The ACIDULOUS or GASEOUS, are thoſe in which the cretaceous acid abounds, and are known by their ſharp penetrating taſte; the facility with which they boil, and affording bubbles by ſimple agitation, or even by mere ſtanding; the property of turning the tincture of turnſole red, and precipitating lime-water and liver of ſulphur. Theſe are diviſible into two orders, cold and hot; the *firſt* comprehening cold, acidulous and alkaline waters; ſuch as Seltzer, St. Myon, Bard, &c. In England, Tilbury and Cliſton; the *ſecond*, hot, or thermal, acidulous, alkaline waters, as thoſe of Mount D'Or.

2. The SALINE or SALT, properly ſo called, by which are to be underſtood ſuch as contain a ſufficient quantity of neutral ſalt, to act ſtrongly on the animal œconomy, ſo as moſt commonly to purge. They are known by their ſaline taſte, which is modified according to the ſalt they contain. They perfectly reſemble the ſolution of ſalt made in chemical laboratories; but they almoſt always contain two or three ſpecies: the muriatic of magneſia, the ſulphates of ſoda, of lime, &c. Glauber's ſalt is very rare.

3. The SULPHUREOUS. Moſt of theſe waters are impregnated with hepatic gas merely, as Aix la Chapelle, though ſome hold true liver of ſulphur in ſolution, as thoſe of Bareges. Hence are the firſt named *hepatic Waters*, and the laſt *hepatized*. This water is known by a ſmell ſimilar to rotten eggs.

4. The FERRUGINOUS, or MARTIAL. Theſe are the moſt common and moſt abundant of all mineral waters, becauſe iron of all metals abounds the moſt, and the moſt ſuſceptible of alteration. How diſcoverable, ſee AQUÆ CHALYBEATÆ. This iron is held in ſolution, either by the *carbonic* or *ſulphuric* acid; of theſe, three orders are formed.

The FIRST is where the iron is held in ſolution by the carbonic acid, whoſe ſuperabundance renders them briſk and ſubacid, as thoſe of Spa, Pyrmont, Tunbridge.

The SECOND, where the iron is diſſolved without exceſs of the carbonic acid; theſe waters are not acidulous, ſuch as thoſe of forges, as well as the greater number of ferruginous waters of this order.

The THIRD, though ſome of them are found, are extremely rare, have iron combined with the ſulphuric acid, and the water holds in ſolution a true ſulphate of iron; ſuch mineral waters as theſe are frequently found in the vicinity of the ſtrata of pyrites.

From hence, all mineral or medicinal waters may be divided into four CLASSES, and nine ORDERS.

CLASS FIRST. GASEOUS or ACIDULOUS WATERS

Orders, { 1. Cold, 2. Hot, } Acidulous Waters.

SECOND. SALINE WATERS.

Orders, { 3. Vitriolic, 4. Muriatic, } Waters.

THIRD. SULPHUREOUS WATERS.

Orders, { 5. Hepatic, 6. Hepatized, } Waters.

FOURTH. FERRUGINOUS, or MARTIAL WATERS.

Orders, { 7. Martial Acidulous, 8. Simple Martial, 9. Martial Vitriolic, } Waters.

Some of the waters may be placed indiſcriminately in ſeveral of the claſſes, viz. there are ſaline waters, which may be confounded with gaſeous waters, becauſe air is conſtantly diſengaged from them, &c.

The arſenical and cuprous waters are omitted, and thoſe which contain volatile alcali, ſal ammoniac, and extractive ſubſtances produced by the putrefaction of organic matters upon which they have ſtood, are omitted, becauſe the firſt are true poiſons, and the laſt not medicinal.

To the quantity of fixed air contained in mineral waters, is owing the whole virtue of ſome, and a principal one of them all, proved by the experiments of Dr. PRIESTLEY, and others. See ACIDULÆ, & CONSULT. Dr. Prieſtley's Experiments for impregnating mineral *waters* with fixed air; Dr. Brocklesby's Experiments on Seltzer *water*, inſerted in the London Med. Obſ. and Inq. vol. iv. and Dr. Walker's Theſis de *Aqua* Sulphurea Harrowgatenſi, 1770. Hoffman on acidulæ, Shaw's Improvement on Mineral *Waters*. CHAPTAL and FOURCROY's Elements of Chemiſtry. MONRO's Medical and Pharmaceutical Chemiſtry.

AQUÆ MINERALES ARTIFICIALES. ARTIFICIAL MINERAL WATERS.

The mode of making them. See MINERALES ARTIFICIALES AQUÆ.

AQUÆ ALKALINÆ. ALKALINE WATERS.

The *waters* of thoſe ſprings which afford alkaline contents, are more or leſs charged with the mineral alkaline ſalt, or with a calcareous earth, which they diſcover in the reſiduum left after evaporation. Theſe are of the order of cold, acidulous, alkaline waters. Of this kind are the *waters* of SELTZER; in England, CLIFTON and TILBURY, which ſee

AQUÆ CATHARTICÆ AMARÆ. BITTER PURGING WATERS: theſe are the ſaline or ſalt waters.

The dry matter left on evaporating theſe *waters* conſiſts of the ſal catharticus amarus, intermixed with different earths, of which the magneſia alba is the principal, and in ſome inſtances a ſmall portion of other ſaline matters. The quantity of ſalt in different waters is from ʒ iii. to ʒ i. ſs. of ſalt in a gallon; conſequently their powers will be proportionately different. Theſe waters taken in ſmall quantities,

quantities, act as diuretics, and in large quantities they prove purgative: some of them are strong, and a pint proves a brisk purge to most people; others are weaker, and require two, three, or more pints to produce the same effects; the weaker kind are used as alterative diuretics and deobstruents; then they may be mixed with milk, whey, wine, &c. and drank as common drink, not exceeding such a quantity as just keeps the bowels lax.

If they create flatulence, griping, or other uneasiness in the bowels, a little brandy, or any aromatic tincture taken with them, prevent such effects. The less powerful waters of this kind, are those of *Coelchester*, *Barnet*, *Bagnigge*, *Cobham*, *Dog and Duck*, *Dulwich*, *Streatham*, and some others, the more active, chiefly *Epsom*, *Acton*, *Kilburn*, &c.

Formerly waters of this kind were much used in scorbutic and scrophulous disorders; and prescribed for easing the pain of cancerous sores, and for preventing relapses, after cancerous tumors had been extirpated.

AQUÆ CHALYBEATÆ. CHALYBEATE or STEEL WATERS, called also Ferratæ.

They discover a very evident astringent taste, and their irony contents, by striking a purplish or bluish black colour on the addition of powdered galls; though if the quantity of acid in the *water* is considerable, then astringents give no notice of the iron: but a tincture made with Prussian blue, by digesting it in volatile alkaline spirits, succeeds universally, and a blue colour is produced on mixing it with any *water* in which iron is a part, or the whole of its mineral contents.

These *waters* differ in their contents. See AQUÆ MEDICINALES. 4. CL.

The spontaneous separation of the iron, which happens in many of these *waters*, is owing to the loss of their fixed air. It is this air that is the solvent of the iron of them, and also that causes the sparkling and sprightly taste observed in them whilst fresh. See ACIDULÆ.

Their use is the same with that of iron itself; in all cases where the one is advisable, the other may be administered. See FERRUM.

From one to three pints may be drank in a day, the same precautions being observed as when the artificial preparations of iron are taken.

The most proper seasons for drinking them are the warmer months, and when the weather is clear and dry. During their use, the patient should sup early, use moderate exercise, and rise early in the morning.

Of this sort of *waters* are those of Pyrmont, Spa, Tunbridge, Hampstead, Islington, Hartfel, &c. The Pyrmont and Tunbridge are the best. See Monro's Med. and Ph. Chemistry.

AQUÆ SULPHUREÆ, and THERMÆ. SULPHUREOUS WATERS and HOT-BATHS.

These receive their name from their sulphureous impregnation, and their heat. See Aquæ Medicinales. CL. 3d.

The three principal European hot *waters*, are those of Aix-la-Chapelle, Bourbon, and *Bath*. The first abounds more eminently with sulphur, which makes its heat, nauseousness, and purgative quality, considerable. The second is of a middle nature. And the last, by not partaking so much of the sulphur, and more of the iron, is less offensive, and more agreeable in its operations.

In England, the best hot *waters* are those at Bath, Buxton, Bristol, and Matlock, which see under their respective titles. The HARROWGATE SULPHUR-WATERS stand high in the list of merit.

Their excellency is in their usefulness to weak stomachs, that are injured by severe attacks from the gout, hard drinking, &c. to constitutions enfeebled by tedious illnesses; in relieving pains in the limbs; in restoring the paralytic, and those who labour under nervous disorders. They are also used to bathe in; and where a total immersion either cannot be complied with, or is not thought necessary, they are used in the manner of the stillicidium. In general, wherever the vital heat is defective, they are calculated for usefulness; but, where it abounds, they should be foreborne; they should not be admitted of in any cases attended with hemorrhages, though in other respects they may be required.

AQUÆ CRETACEÆ vel calc. CHALK, or LIME-WATERS.

These are either natural or artificial. The best natural spring of this kind in England is that at Bristol; and the propereſt season for drinking it, is from April to September. See BRISTOLIENSIS AQUA.

They are of use to cleanse the urinary passages when ulcerated, for which purpose they should be drank freely and constantly; indeed, in most internal ulcerations, they are of considerable service; the Bristol *water* is found peculiarly efficacious in spasmodic complaints, and in such as take their rise from the acrimony of the humours; and, in the diabetes, it is esteemed a specific, if applied to in its early stages: in consumptions, it is extremely beneficial, if applied to in the early period of those complaints.

Whatever advantages these *waters* possess, perhaps they may not exceed a proper use of *lime-water*, if it is made fresh each time it is to be drank, and is swallowed whilst the heat remains which arises from the ebullition of the lime.

Dr. James Keil observes, that the best way of using mineral waters as alteratives, is to take frequent small draughts. And to this it may be added, that they should be continued a month or two, to reap any considerable advantage.

If they render the stomach uneasy, omit them, until by other means this viscus is repaired, and the appetite somewhat restored. If they cause a drowsiness, put it off by exercise, and not an indulgence of sleep. See BATHONIÆ AQUÆ. Hippocrates de Aëre, Aquis, & Locis. Percival's Essays Med. & Exp. 2d edit. Dr. William Heberden's Observations on the *Waters* in and about London, inserted in the Lond. Med. Transf. vol. i.

AQUÆ PAVOR. See HYDROPHOBIA.

AQUÆ STILLATITIÆ SIMPLICES. The SIMPLE DISTILLED WATERS, now called only *aquæ*—the word simplex is omitted, viz. *Aqua menthæ piperitidis*, &c.

Distilled *waters* are only *water* impregnated with the essential oil of the subjects distilled with them. When more oil is brought over than the *water* can take up, it swims at the top, or sinks to the bottom, and is to be separated by a funnel. Cohobating may answer for obtaining more essential oil, but it does not increase the strength of the *water* first distilled. And such plants as do not sufficiently impregnate the *water* at the first distilling, are improper subjects for this operation; other methods are to be used to obtain their virtues. See DISTILLATIO.

Distilled *waters* are extemporaneously made with the olea sacchara, or with the essential salts. See OLEO SACCHARUM.

When simple *waters* are used alone, or as the principal medicine, they are agreeable enough; but when used only as vehicles for other more powerful remedies, distilled *water* is by far more elegant; and as but few of the simple *waters* are of sufficient efficacy to be used alone, they are hardly worth the trouble of making.

AQUÆ STILLATITIÆ SPIRITUOSÆ. SPIRITUOUS DISTILLED WATERS, now called only spiritus, viz. *spiritus pulegii*, &c.

All the virtues of distilled *waters* are owing to the essential oil they take up. Spirit of wine differs from water in this; it keeps all the oil that rises with it perfectly dissolved in a limpid state: but yet as spirit of wine boils in about one-fifth less of heat than water does, it is an improper vehicle for substances that require the heat of boiling water. Thus in distilling cinnamon with a proof spirit, the spirit rises with very little flavour of the cinnamon, but when the water follows, it brings with it the oil of this spice.

Distilled spirituous *waters* are of the proof spirit strength, and formerly were called compound *waters*, in contradistinction to those that consist only of simple or common *water*. The most agreeable spirituous *waters* are made by using a pure rectified spirit of wine, covered with a proper quantity of pure *water*.

When the distilled liquor is as strong as rectified spirit of wine, it is called distilled *spirit*. See CARMES, EAU DE.

AQUA MARINA. SEA-WATER, called by SERENUS SAMONICUS, *doridis humor*.

It contains, besides the common alimentary salt, a portion of the bitter purging salt, which remains dissolved after the common salt hath crystallized; and after the bitter purging salt hath been separated, there remains a small portion of a pungent saline liquor which refuses to crystallize, and which appears to be a solution of the earth called magnesia alba, in the marine acid.

The quantity of salt in different seas, is from about

one-fiftieth to near one-twentieth of the weight of the *water*. In the colder ſeas there is leſs ſalt; the greateſt quantity is in the ſeas under the line.

In the Engliſh Channel a pint of *water* yields about an ounce of ſalt.

Sea *water* hath been uſed with much ſucceſs in many caſes of glandular ſwellings, but in the inflammatory ſtate of theſe ſwellings, when they tend to ſuppurate, it is better omitted, until the inflammation abates, or the pus is diſcharged.

The doſe is from ℔ ſs. to ℔ i. or more, to be drank every morning for ſome months. It gently purges, promotes the ſecretions in general, warms, and ſtrengthens.

On the firſt uſe of this *water* it creates thirſt, but this effect ſoon wears off; and ſleeping quickly after taking the doſe, ſpeedily palliates this complaint.

In inflammatory caſes it ſhould be refrained from, becauſe it excites heat; from the ſtimulus, it is not therefore proper where there is much feveriſh diſpoſition; if neceſſary, the body ſhould be properly cooled by bleeding, purging, nitrous, and other cooling medicines; low diet, before the courſe of ſea water is begun. In many caſes, bathing in ſuch waters aſſiſts the internal uſe of it as a general corroborant, topical diſcutient, and antiſeptic. It has been employed for removing rheumatic pains, where no heat or fever contra-indicated its uſe; for bracing the habits of cachectic and ſcrophulous patients, and removing œdematous, and other ſwellings, and alſo found uſeful in the cure of many cutaneous eruptions. It has alſo been employed topically as a waſh or fomentation to diſeaſed parts.

Though the efficacy of this *water* hath been extolled againſt glandular ſwellings, its advantages have been as peculiarly manifeſted where the bones have been carious, and in the deſtruction of worms. See RUSSEL on ſea-water.

AQUÆDUCUS, FALLOPII. } See TUBA EUSTA-
AQUÆDUCTUS. } CHIANA.

AQUALA. See ARSENICUM, and SULPHUR.

AQUALICULUS. That part of the belly from the navel to the pubes. Sometimes it is uſed to expreſs the ſtomach, or the inteſtines. It is the ſame with *hypogaſtrium*.

AQUARIUS. See FERRUM.

AQUA SALIS. See CIRCULATUM.

AQUATUM, vel AQUEUM, watery, diluted. Alſo the *chalaza* of an egg. See CHALAZA.

AQUIDUCUS. See HYDRAGOGOS.

AQUIFOLIUM, of ἀκὶς, *a prickle*, and *folium*, *a leaf*. It is alſo called *agrifolium*, *ilex aculeata baccifera*, HULVER-TREE, HOLM, or COMMON HOLLY.

Miller enumerates thirty-three ſpecies.

It is a prickly buſh, ſo commonly known that a deſcription is unneceſſary. Its bark is uſed for making BIRDLIME; it is alſo made of *miſſeto*, and ſeveral other vegetable matters.

The berries of the *holly* are warming, ten or twelve of them diſcharge wind and ſlime by ſtool.

AQUILA. Is a chemical name for *ſal ammoniac*. Paracelſus uſes this word for mercurius præcipitatus; and it is a name for arſenic, for ſulphur, and for the philoſopher's ſtone.

AQUILA ALBA, a name of calomel, and ſublimate, &c.——ALBA PHILOSOPHORUM, & *Ganymedis*. See AMMONIACI SALIS FLORES.——COELESTIS. It is the panacea, or cure for all diſeaſes. It is prepared of mercury eſſentificated.——VENERIS. A preparation made with verdegriſe and ſublimed ſal ammoniac.

Aquila hath many other epithets joined with it, as rubra, ſalutifera, volens, &c.

AQUILÆ. The veins were ſo called which paſs through the temples into the head.——LIGNUM. EAGLE WOOD. It is generally ſold for the agallochum. It is that part which is next to the bark.

AQUILONES. North-eaſt winds. See ETESIÆ.

AQUOSUS HUMOR OCULI. The WATERY HUMOUR of the EYE. It is a limpid water that fills all the ſpace between the cornea of the *eye*, and the anterior part of the cryſtalline *humour*. The ſpace in which this *humour* is confined, is called the anterior and poſterior chambers: the firſt is betwixt the cornea and the iris, this is the larger of them. The ſecond is betwixt the iris and the cryſtalline *humour*. The veſſels which furniſh this *humour* are too ſmall to be deſcribed. If a wound diſcharges this fluid, it is reſtored in two or three days again. In old age it is not ſo limpid, whence probably one cauſe of obſcure ſight at that time. The chief uſe of it ſeems to be to keep the cornea diſtended, ſo that the rays of light may be duly refracted in paſſing to the retina for the iris to float looſely in, whereby its actions may be eaſily performed. See OCULUS.

AQUULA. A diſorder of the eye-lids is thus called. P. Ægineta, in lib. vi. cap. xiv. ſays, that it is a pinguious ſubſtance under the ſkin of the eye-lid, and is alſo called *hydatis*. It is the *hordeolum hydatidoſum*, of Sauvages' HYDATIDOUS or WATERY STIAN. In children it is ſometimes ſo troubleſome as to produce much uneaſineſs. The upper eye-lid appears watery, and cannot be elevated; the eyes are very tender, diſtilling a rheum, eſpecially in a morning, if expoſed to the light. In order to the cure, an inciſion is made through the ſkin of the eye-lid, and the cyſt is to be diſſected out, if it will not come by gently pulling and moving it about.

Mr. St. Yves takes notice of a complaint on the edge of the eye-lids, or on the tunica conjunctiva, which reſembles the bladders that appear on the ſkin after a burn; he calls theſe alſo *hydatis*. The method of cure which he propoſes, is to open the tumor with the point of a lancet, which when done, nothing farther is wanted. But if all the circumference of the globe is covered with water, the conjunctiva will be inflamed, and in this caſe bleeding, purging, and a collyrium of aq. calcis will be neceſſary. See Wallis's Noſologia Methodica Oculorum. Bell's Surgery, vol. i. p. 264.

ARA PARVA, A LITTLE ALTAR. A neat way of applying a bandage, ſo as to reſemble the corner of an *altar*.

ARABICUM, GUMMI. See GUMMI ARABICUM.

ARAC. See ORYSA.

ARACALAN. See AMULETA.

ARACA MIRI. A ſhrub growing in Braſil. It bears fruit in March and September which taſtes like a mixture of muſk and ſtrawberries, and when candied or made into a marmalade, is cooling and moderately aſtringent. The leaves and buds have the ſame qualities, and the root is diuretic and antidyſenteric. Raii Hiſt.

ARACHNE. See ARANEA.

ARACHNOIDES, ἀραχνὴς, *a ſpider*, and εἶδος, *a form*. See ARANEA, and PIA MATER.

ARACON. See ÆSECAVUM, under ÆS.

ARACUS AROMATICUS. See VANILLA.

ARADOS. Hippocrates means by it, the perturbation excited in the ſtomach by digeſting the aliment there. It alſo ſignifies any perturbation in the body.

ARÆON. Thin, rare, flow. It is applied to breathing, as when we ſay the breathing is not frequent, nor thick. The air is alſo ſaid to be rare, when not too much condenſed.

ARÆOTICA. Things or medicines which rarefy.

ARALDA. See DIGITALIS.

ARALIA. BERRY BEARING ANGELICA, or angelica tree. The flowers conſiſt of many leaves, which expand like a roſe, and are naked, growing on the top of an ovary. Theſe flowers are ſucceeded by a globular fruit, which is ſucculent, and full of oblong ſeeds. There are four or five ſpecies, one of which grows in Canada, and is there called *ſarſaparilla*, becauſe its roots and virtues are like it. See Miller's Dict. and Philoſ. Tranſ. Ab. vol. v.

ARALIA HUMILIS. See GENSING.

ARANEA, called alſo *arachne araneus*, the CATCHER, the WOLF, and SPIDER.

As is common to moſt inſects, *ſpiders* abound with volatile ſalt, in conſequence of which they are ſometimes uſeful in agues, if taken inwardly. A ſcruple of the *ſpider's* web, it has been ſaid, in many inſtances hath proved ſucceſsful, given an hour before the fit of an ague, and an hour after it. This produces no ſenſible effect, and may be given when the bark is not ſafe. By this name is alſo called the coat and capſula of the cryſtalline humour of the eyes, named alſo *ſpeculum cryſtalloides tunica*. It is furniſhed with veſſels from the ciliary proceſſes, and from an artery which enters the bottom of the retina, and runs through the vitreous humour.

Aranea is alſo a name of the coat of the vitreous humour of the eye, given from reſembling a ſpider's web, called alſo *arachnoides*; which name was added to it by HEROPHILUS, according to Celſus. It is now called VITREA TUNICA. Dr. NICHOLLS, and ALBINUS, on injecting it, ſay that the veſſels run upon it like rays from a centre.

ARANEOSA URINA. URINE, in which is ſomething like ſpider webs, with a fatneſs at the top. It indicates a colliquation.

ARANEOSUS PULSUS. A SPIDER-LIKE PULSE. This is, according to Galen, a ſmall *pulſe* that moves as if ſhaken by ſhort puffs of air.

ARANEUS. See ARANEA; alſo ASTCHACHILOS.

ARANGIA, ARANTIA. See AURANTIA HISPALENSIS.

ARARA FRUCTUS SECUNDUS, or ARARA FRUCTUS AMERICANUS. It grows in Cayanca, and, when bruiſed, is applied to ulcers. Raii Hiſt.

ARASCON. See FUROR UTERINUS.

ARAXOS. See FULIGO.

ARBOR. A TREE. It is defined to be a plant of the largeſt growth, whoſe trunk is perennial and ſingle, and divided into many large branches, which are again ſubdivided into ſmall twigs, called ſprigs, on which the leaves, flowers, and fruit are produced. —For that called ARBOR AQUATICA BRASILIENSIS See ANINGA.

ARBORESCENS, *Arboreſcent.* See DENDROIDES.

ARBUSCULA CORALLII, or CORALLOIDES. See CORALLODENDRON. —— GUMMIFERA BRASILIENSIS. See CAAIOPIA.

ARBUTUS, PAPYRACEA, called alſo *unedo papyracea, comarus, comaroides, fragaroides, ferentis, fragaria.* The STRAWBERRY-TREE.

In common with the ſummer fruits in general, the fruit of this tree, called *mæmacylon*, is cooling and relaxing, antiſeptic, aperient, and a promoter of the urinary and alvine ſecretions: mixed with watery liquors, their juice is thereby rendered more miſcible with the blood, and ſo is of uſe in fevers. The jellies, and inſpiſſated juices, are leſs flatulent than the raw fruit. See FRAGA.

This *tree-ſtrawberry* is like a quince-tree, and is common in the ſouth of Europe. It is the fruit which properly is called *unedo* and *comarus*.

ARBUTUS UVA URSI. See UVA URSI.

ARCA ARCANORUM. See Philoſophorum Mercurius.

ARCÆI, BALS. vel Linim. vel Ung. See ELEMI.

ARCANNE. See OCHRA

ARCANUM. A ſecret, or a medicine whoſe preparation is kept from the world to enhance its value.—WITH THE CHEMISTS it is a thing ſecret, incorporeal, and immortal, and which can only be known by experience, for it is the virtue of every thing which operates a thouſand times more than the thing itſelf. For that called —— CORALLINUM. See MERCURIUS CORALLINUS. —— DUPLEX, or DUPLICATUM. See NITRUM, N° 6. —— JOVIALE. It is a preparation of tin and quickſilver, amalgamated and digeſted in ſpirit of nitre, &c. but now not in uſe. —— MATERIALE. AMONG THE CHEMISTS it is a ſpecific extract, nearly allied to the matter of our bodies. —— SPECIFICUM. It is an extract of the interior nature of things, and is of two ſorts, aſtral and material.

Many medicines have the name of ARACANUM. —— TARTARI. TERRA FOLIATA TATARI. See DIURETICUS SAL. —— THEOPHRASTI. It is the quinteſſence of any thing moſt high, exalted, or, as he ſays, it is the virtue of a thing refined by a thouſand exaltations. He boaſts of four *arcana* eſpecially. 1. The *arcanum* of the firſt matter. 2.—of the philoſopher's ſtone. 3.—of the mercury of life. 4.—of tincture. Blancard.

ARCEUTHOS. See JUNIPERUS.

ARCHÆUS, from *ἀρχη, the principal, chief,* or *firſt mover.* A ſort of primum mobile ſet up by Helmont, to ſuperintend the animal œconomy, and preſerve it. It is akin to Plato's *anima mundi.* Hippocrates uſes the words *ἀρχαιη φυσις,* to ſignify the former healthy ſtate before the attack of the diſeaſe.

ARCHANGELICA. See ANGELICA and LAMIUM ALBUM.

ARCHE, *ἀρχη.* The firſt attack of a diſeaſe, its firſt ſtage, that time of the diſorder in which the patient firſt takes to his bed, or in which help might be effectual.

ARCHENDA. A powder prepared of the Egyptian privet, to be applied to the feet to check their fetid odour.

ARCHEUS. A term coined by Paracelſus; by it he would expreſs the ſole active principle in the material world.

ARCHEOSTIS. See BRYONIA ALBA.

ARCHIATER. The principal phyſician at a court.

ARCHIGENI MORBI, ACUTE DISEASES, ſo called from *ἀρχη, the chief,* and *γινομαι, to be,* becauſe they hold the principal rank amongſt diſeaſes. See ACUTUS MORBUS.

ARCHIMAGIA, See CHEMIA.

ARCHIMIA. The art of changing imperfect into perfect metals.

ARCHITHOLUS. See ACHICOLUM.

ARCHOS. The ANUS. Alſo the INTESTINUM RECTUM.

ARCHOPTOMA, in Vogel's Noſology, is defined a bearing down of the rectum,

ARCION. } See BARDANA.
ARCIUM. }

ARCOS. See ÆS USTUM.

ARCTATA PARS. So Scribonius Largus calls a part compreſſed, or cloſed by a fibula.

ARCTATIO, vel ARCTITUDO. It is when the inteſtines are conſtipated from an inflammation. Alſo a preternatural ſtreightneſs of the *pudendum muliebre.*

ARCTION. See BARDANA ARCTICUM

ARCTIUM LAPPA, vel ARTIUM MAJOR. See BARDANA MAJOR.

ARCTOSCORDON. BEAR GARLICK.

ARCTOSTAPHYLOS. SPANISH WORTLES.

ARCTURA. Inflammation, &c. of the finger, from a curvature of the nail. Linnæus.

ARCUALIA vel NERVALIA OSSA. The SINCIPUT; but ſome ſay, the temple bones.

ARCUALIS SUTURA. See CORONALIS SUTURA.

ARCUATIO. A gibboſity of the fore parts, with a curvation of the bone of the ſternum.

ARCUATUS MORBUS. See ICTERUS.

ARCULÆ. The caverns in which the eyes are lodged.

ARDAS. SORDES, FILTH.

ARDENS FEBRIS. The ARDENT FEVER, from *ardeo, to burn.* It is alſo called *lipiria, de urens febris, cauſodes febris, cholerica febris.* A BURNING, or HIGHLY ARDENT FEVER. By the Greeks, this fever was ſtrictly and properly called CAUSUS, from *καιω, uro, to burn*; becauſe it was attended with an ardent, and burning heat of the whole body. The ancients conſidered the extreme heat, and unextinguiſhable thirſt, as characteriſtic ſymptoms of this diſeaſe. HIPPOCRATES ſuccinctly deſcribes it, *a fever attended with extreme heat, ſtrong thirſt, a rough and black tongue, complexion rather yellowiſh, and the ſpits bilious.* It is alſo elegantly deſcribed by ARETÆUS and LOMMIUS. SAUVAGES arranges it under tritæophya, the ſecond ſpecies; and Dr. CULLEN places it among his examples of tertian remittents. At the beginning of this fever, the heat to the touch is fiery, though unequal in different places; internally, at the vital parts, it is violent; the breath heating the air in expiration, though often the heat in the extremities is much leſs ſevere: ſometimes indeed they are cold; the whole ſurface of the body, noſe, mouth, and tongue, are dry; the breathing is thick, ſhort, and quick; the tongue is dry, yellow, ſometimes black, rough, and chapped; the thirſt is inextinguiſhable, and often goes off ſuddenly; there is a loathing of all ſolid food, naufea, accompanied often with a gnawing pain at the ſtomach, and heat of the præcordia; vomiting, great axiety, reſtleſſneſs, and extreme laſſitude; a ſlight cough alſo attends with a hoarſe voice; now and then comes on delirium, with which, very often, are aſſociated an inflammation of the brain and pervigilium, to which ſucceed coma, convulſions: and, in this fever, there are exacerbations, though not always on regular days.

†

days. This fever, as it is very violent, is ſeldom of long continuance. If, therefore, from the beginning, the ſymptoms are favourable, it almoſt always terminates on the fourth day; ſeldom exceeds the 7th; but then, either a vomiting, diarrhœa, ſweat, or natal hæmorrhage, proves critical. This diſeaſe ſeldom attacks old men, when it does, it is full of extreme danger. Young ſubjects are ſeized oftener, but bear it with more eaſe and ſafety. The cauſes are, too great labour, long journey, heat of the ſun, long continued thirſt, the uſe of heating, fermented, aromatic, acrid ſubſtances; venereal exceſs; too ſevere fatigue, particularly in hot weather; and, indeed, all ſuch things may be enumerated among the cauſes, which, by diſſipating the thinner parts, inſpiſſates the blood, gives too great acrimony to the humors, and by their ſtimulus, encreaſes the motion of the fluids. From ſuch things, the moſt healthful conſtitution may experience this diſeaſe, particularly at times when the epidemic conſtitution of the air favours the production of theſe fevers; but, in general, it may be concluded, that an acrid ſtate of the bile, abſorbed into the habit, is the moſt common cauſe. An inflammation of the aorta, and vena cava, forms a ſpecies of this fever. WITH RESPECT TO THE CURE. Firſt bleed freely from a large orifice; and if the patient is robuſt, and the heat exceſſive, let him be ſupported on his feet, until the operation is ended, that he may faint, if poſſible; the heat is always leſs after fainting than when the ſame quantity of blood is diſcharged without this accident happening. If a repeated loſs of blood ſeems needful, proceed therein at proper intervals until the pulſe and the heat contraindicate it.

Immediately after bleeding, let a briſk, but cooling purge be adminiſtered. Sydenham obſerves, that purging immediately after bleeding, cools to a great degree; alſo, that the method of curing *fevers* by perſpiration, is not only leſs certain, but more troubleſome and tedious; nay, that it prolongs the diſeaſe, and endangers the patient. Among the cooling purges, none excels the ol. Ricini, and may be thus given.

℞ Ol. Ricini ver. ℥ ſs. ad ℥ ij.

Aq. menth. pip. ℥ i. ad ij. m. f. hauſt. ſtatim ſumend. & repet. alterna quaq. die.

In want of the ol. Ricini, draughts with ſal nitri & electar. e caſia may be given, or an infuſion of tamarinds, and ſuch like.

During the intervals of purging, let frequent ſmall draughts of acidulated ſubtepid liquors be taken, and the doſes of cooling medicines ſhould be repeated every two hours, or oftener, ſo that the effect of one may not be loſt before its power is aſſiſted by the repetition of another; a fault very manifeſt in the common methods of adminiſtering them. Nitre, kali acetatum, and ſal ammon. crud. will be proper on this occaſion; and if to each doſe of them as much antimonium tartariſatum, or vin. antim. is added as the ſtomach will eaſily retain, or, in want of them, the vin. ipecacuanh. their advantages will be increaſed.

If there is a conſiderable naufea during the firſt two or three days after the attack, a grain or more of the antim. tartar. may be added to the purge, which is adminiſtered after the firſt bleeding, and thus the ſtomach will be relieved by the ſame medicine by which the general complaint is oppoſed. Barley and oatmeal gruels are the propereſt kind of aliment; and all ſuch as contribute to keep the habit cool, and dilute the ſanguinary maſs.

If this kind of *fever* hath attended four or five days before aſſiſtance is obtained, the above method muſt not be put in practice; yet if the heat is great, and the pulſe ſtrong, a moderate bleeding may be of uſe. A gentle laxative that is cooling may alſo be given by the mouth; and, until the criſis, let gentle diaphoretics, and light broths, be duly continued; for after the fifth or ſixth day of an *ardent fever*, there is generally ſome difficulty to keep up the vital heat to that degree which is neceſſary to health, or the due procedure of the ſecretions and excretions.

If a naufea continues after the emetic is worked off, the common ſaline draughts may be given at proper intervals.

A diarrhœa may be critical, ſo ſhould be attended to with care; and until the patient's ſtrength is affected by it, there is nothing to be done. When a check to it is judged neceſſary, give the following:

℞ Pulv. ipecacuanh. gr. iii.

℞ Pulv. contray. c. gr. xv. m. f. chart. 2da vel 3tia quaq. hora ſumend.

℞ Mixturæ Cretaceæ. ℥ iv. tinct. catechu ℥ ſs. m. ſumat. cochl. ii. poſt ſingulas ſedes liquidas.

Deliriums coming on, demand attention to diſtinguiſh whether their cauſe is inflammatory or ſpaſmodic. If from inflammation, bleed, inject cooling clyſters with nitre frequently, and ſupply the patient with cooling medicine by the mouth. In caſe of ſpaſms, with low ſpirits and a weak pulſe, apply bliſters to the neck and arms, and ſinapiſms on the feet: Sydenham aſſerts, that garlick bruiſed and applied thereto, quiets the delirium more effectually and ſpeedily than bliſters. For the general management, ſee FEBRIS. HOFFMAN'S Syſt. rat. Med. BOERHAAV. Aphoriſm. § 738. SAUVAGE'S Noſol. Method. CULLEN'S Pract. of Phyſ. on Remittents. LOMMII Opuſculum Aureum, &c.

ARDENTIA. Things obnoxious to combuſtion, as turpentine, &c.

ARDENTES PAPULÆ. See ECBRASMATA.

ARDESIA HIBERNICA. See HIBERNICUS LAPIS.

ARDOR. A very intenſe acute heat raiſed in our bodies. ——URINÆ. See DYSURIA.——VENTRICULI. See CARDIALGIA.

AREA. See ALOPECIA.

ARECA. Ray takes the *bahei coyolli* to be this nut. Alſo called *fauſel*, *avellana Indiana verſicolor*. *Caunga*. The INDIAN and the MALABAR NUT.

It is the fruit of a ſpecies of palm-tree which is met with in the Eaſt Indies, though ſome reckon this nut among the ſpecies of cocoa nuts. The outward coat is about the ſize of a pullet's egg, under it is the fruit, which is brown on the outſide, in ſhape like a nutmeg at one end, and flat at the other; within, it is white and marbled with purpliſh veins: it is rather inſipid to the taſte; the Indians chew it to help digeſtion; it is moderately aſtringent.

The inſpiſſated juice of this fruit is called terra Japonica; now catechu, but it is generally adulterated with other matters. See TERRA JAPONICA.

ARECÆ INDICÆ. See NUX MOSCHATA.

AREMAROS. See CINNABARIS.

ARENA. SAND or GRAVEL in the KIDNIES.

ARENA LITORADIS.——MARIS MARINA. SEA SAND.

It is heated in bags and applied to parts that are pained. Hydropic people are alſo ſweated by being covered with hot *ſand*.

ARENAMEN. See BOLUS ARMENIA.

ARENATIO, or SABURRATIO. It is the caſting of hot ſand on the bodies of patients.

ARENTES. A ſort of cupping-glaſſes uſed by the ancients.

AREOLA, called alſo *Halo*, is the circle which ſurrounds the nipple on the breaſts: in virgins it is little and red; in pregnant women it is larger and more brown.

ARES. A word of Paracelſus's, by which he would expreſs that power of nature in the whole material world, by which ſpecies are diſtributed into individuals.

ARESTA BOVIS. See ANONIS.

ARET ÆNOIDES. See ARYTÆNOIDES.

AREUS. The title of a peſſary mentioned by P. Ægineta.

ARFAR. See ARSENICUM ALBUM.

ARGAL. See TARTARUM.

ARGASYLLIS. See AMMONIACUM GUM.

ARGEMA, or ARGEMON, from ἀργος, *white*. See ALBUGO OCULORUM. Vogel defines it, an ulceration of the cornea.

ARGEMONE MEXICANA. See PAPAVER SPINOSUM.

ARGENTUM, alſo called *Argyrus*; *Cames*, *Camet*; *Diana*; *Brumazer*; LUNA, SILVER.

This is ſometimes found pure in the mine, but generally mixed with tin or with lead; and it is by means of the latter it is ſeparated from all the baſer metals; and from gold by diſſolving it in the acidum nitroſum.

It is inſoluble by any vegetable or animal juice; hence, if ſwallowed, is neither uſeful nor hurtful. Its only medical uſe is as a cauſtic.

Cauſticum LUNARE. LUNAR *Cauſtic*, *Lapis infernalis*, now ARGENTUM NITRUM. SILVER NITRATED.

Diſſolve pure *ſilver* by a ſand-heat in about four times its weight of diluted nitrous acid: then dry away the humidity

midity with a gentle fire; afterwards melt it in a crucible, that it may be poured into proper moulds, carefully avoiding overmuch heat, leſt the matter ſhould grow too thick. Pharm Lond. 1788.

The crucible ſhould be large enough to hold five or ſix times the quantity of the dry matter, for it bubbles and ſwells greatly, and the operator ſhould guard againſt the drops that ſpirt up; keep the fire moderate until the ebullition ceaſes, and till the matter becomes conſiſtent in the heat that firſt made it boil, then quickly increaſe the fire until the matter is thin at the bottom, like oil; on which immediately pour it into moulds, without waiting until the fumes ceaſe to appear.

The moulds may be of iron, or of pipe-clay that is ſoft enough to admit of a greaſed ſtick into it.

When it is cold, break the moulds, wrap each piece of the cauſtic in paper, and keep it from the air, or elſe it will diſſolve. For its mode, &c. of application, ſee CAUTERIA, under ESCHAROTICA.

If this cauſtic is diſſolved in water, and then ſome thin plates of copper be added, the pure *ſilver* will be precipitated.

Some call it INFLAMMABLE SILVER, for it flames like nitre until it is reduced to the pure ſtate of *ſilver*, if laid on a red-hot turf.

The PILULA LUNARIS is only a milder kind of lunar cauſtic, and is now wholly neglected.

TINCT. ARGENTI. *The Tincture of* SILVER.

Take a quantity of pure *ſilver*, melt it in a clean crucible, then directly pour it into fair cold water, eight inches high, in a cylindrical veſſel; the *ſilver* is thus ſcattered into grains, which are called GRANULATED SILVER. Put an ounce of this granulated *ſilver* into a clean urinal glaſs; then take two ounces of the nitrous acid, put thereto one grain of refined *ſilver*; and if it be ſoon perfectly diſſolved, ſo as that the liquor is ſtill limpid, the ſpirit is good; if not, it is not fit for this uſe. If the ſpirit is good, pour two ounces of it upon one ounce of the granulated *ſilver* in the urinal glaſs; upon which it ſoon becomes hot, and diſſolves the *ſilver*. A little of a black powder is always obſerved to ſettle, that is pure gold; ſo pour off the clear ſolution into a clean glaſs for uſe.

At one touching, this tincture eats away the callous lips of ulcers: it ſoon deſtroys warts: it makes a laſting black ſtain in all animal ſubſtances; and is alſo uſed for making artificial agates.

The *ſilver* never gives any tincture to the ſpirit: if therefore any colour is obſerved, it is probably from ſome copper which the *ſilver* retains: however, it is not fit for the nicer experiments in which this tincture is uſed.

Pure ſtrong nitrous acid diſſolves half its weight of *ſilver*, in a moderate heat; but it will not diſſolve in aqua regia; hence the method of ſeparating gold from *ſilver*.

ARGENTUM VIVUM, called alſo *hydrargyrus*, and now uſed by the College of Lond. *mercurius, liquor metallicus, metallum fluidum, argentum fuſum, mobile, mercurius chemicorum, vomica liquoris æterni; aludit; anatris; an-ſir-filius; adibat, alembic; alambic; alborca anterit arohot; avvaric; dædalus; alcarith, alccarith, alkaut, ebeſmech; fons chemiæ; geryon; guma; ignis; almarkaſita; alshar, alohoc, muſſalis; maſſariam; mater metallorum; ziback; aloſat, aloſohoc, altaris, altarit*; by PARACELSUS, *Cleizi*, when he ſpeaks of minerals; QUICKSILVER.

Its chemical character is ☿, which denotes that the inſide is pure gold, but the outer part is of the colour of *ſilver*, with a corroſive underneath. In the chemical alphabet B is quickſilver.

Some diſpute its being a metal; others aſſert it to be a proper one: it hath all the properties of metal except malleability, and, according to the experiments of profeſſor Braun, it is rendered malleable by expoſing it to a due degree of artificial cold, that is, to about 528 below the freezing point on Fahrenheit's thermometer, whence it may properly be deemed a perfect metal.

In the Venetian territories are the greateſt quantity of mines producing *quickſilver*; we have much from the Eaſt-Indies; Spain and Hungary both afford great quantities of it; in China, Japan, and many other places, it is met with; about Montpelier, in France, there are ſome mines in which it is found.

It conſiſts of a volatile vitrifiable earth and ſulphur.

It is found in the earth in a fluid form ſometimes, and ſo pure as not to need any refining; it is then called VIRGIN QUICKSILVER; but moſt frequently it is found mixed with other ſubſtances; the moſt general ſtate in which it is met with in the mines, is mixed with ſulphureous ores, of a red colour, called *cinnabar*, and the richer the ore, the redder it is.

From the ore, it is ſeparated by waſhing in water; grinding with vinegar and a little ſalt, which diſſolves the metalline impurities; and by diſtillation, either alone or with the addition of lime, pot-aſh, or iron filings.

The people who work in the *quickſilver* mines ſoon die: at the firſt of their being affected, they are ſeized with tremors; after which a ſalivation comes on, their teeth drop out, and pains ſeize them all over, particularly in the bones.

Hippocrates does not ſeem to have been acquainted with this mineral; Ariſtotle and Dioſcorides rank it amongſt poiſons; Galen ſays that it is corroſive; Meſſue, the Arabian, was the firſt who uſed it medicinally, and he only applied it in the form of an ointment in cutaneous diſtempers. Avicenna obſerves that it may be ſwallowed crude, and that it paſſes through the body. About the end of the thirteenth century it was introduced into Europe as a medicine, but not eſteemed a ſafe one until the venereal diſeaſe was found to yield to its efficacy. The firſt internal mercurial medicine which gained real credit was the pilul. Barbaroſſæ, which was compoſed of *quickſilver*, rhubarb, muſk, &c.

The Characters are as follow:

It is the heavieſt of all bodies except gold. Gold is to *mercury* nearly as 4 to 3.

When well purified it is as ſimple as pure gold.

It is totally volatile in the fire by heat not much greater than that of boiling water, and by a far leſs heat it is calcinable into a red powder.

The fumes raiſed by fire are ſcarcely viſible, and yet by being received into cold water, may be reduced to the ſtate of pure *quickſilver*.

It amalgamates moſt readily with gold, next with lead, next with ſilver, next with tin, ſcarcely at all with iron, and with great difficulty with copper.

By the aſſiſtance of trituration or of heat it diſſolves all metallic bodies except iron.

The vitriolic acid hath no effect upon it until it is concentrated by heat; the nitrous acid acts quickly upon it; fixed ſalts make no impreſſion, and the ſpirit of ſalt hath little or no effect upon it; vegetable acids have as little; nor do neutral ſalts alter it any way.

It is allowed to be pure when a little held over a fire, in an iron ladle totally evaporates.

It is often adulterated with lead, a large quantity of which may be incorporated with it by the intervention of biſmuth, in a moderate heat; and in this caſe the lead cannot be ſeparated by preſſure through leather. This abuſe may be diſcovered by the *mercury* ſtaining paper blackiſh; by its not running into round globules; by its leaving a powdery matter, or a coloured ſpot on the bottom of the veſſel; and by its producing a turbid milkineſs during its diſſolution in aqua fortis.

As a medicine it is uſed to promote the ſecretions in general, particularly the ſaliva. The more perfectly it is divided, the more powerful and penetrating is its action, which is chiefly exerted in the ſmall lymphatic veſſels. Whether uſed internally or externally, it affects all the juices in our bodies, and may be ſo managed as to promote excretions through all the emunctories. If not reſtrained it firſt fuſes the humours, then determines them to the mouth, and cauſes inflammation, tumors, and ulcerations there.

No taſk is perhaps more difficult than to dwell on the modus operandi of medicines; yet an obſervation of Dr. Kirkland, in his Inquiry, vol. i. p. 496, &c. deſerves attention. He ſays that its effects, ſpeaking of the ophthalmia, are not entirely to be aſcribed to removing obſtruction in the vaſa minima, as it corrects more kinds of acrimony than one. I have ſeen good effects from different preparations, but I prefer very ſmall doſes of pure *quickſilver* to all the boaſted chemical preparations of this mineral. A ſingle grain of *quickſilver*, extinguiſhed in ſtarch, repeated in the manner we give the ſolution of ſublimate, will have powerful effects, without troubling the patient, as too often happens in the uſe of the ſublimate. It is happy for the patient that the ſpiculæ added to it by the chemiſts, are diſſolved in the primæ viæ. *I believe all the preparations of* mercury *are decompoſed in this paſſage*; and am of opinion, that *giving ſmall doſes, adds to its efficacy*, becauſe a grain of *quickſilver*

taken twice a day, very often affects the teeth, if not prevented in a very short time. I have repeatedly seen twenty grains of *quickſilver* affect the teeth: would a ſcruple taken at once produce the ſame effect? A large quantity of pure divided *quickſilver* ſometimes paſſes off without any remarkable effects.

Dr. George Fordyce obſerves, in his Chemical Lectures, that *quickſilver* is a powerful ſtimulant in ſlow inflammations to forward ſuppuration, as in ſcrophulas particularly. Indolent tumors which frequently ariſe, and are of long continuance, may often be diſperſed by the uſe of mercury, the ſtimulus of which occaſions the abſorbents to act ſo ſtrongly as to cauſe the tumors to be diſſolved, and the obſtructing matter reabſorbed. In old ulcers, the efficacy of *quickſilver* is often valuable. In chronic rheumatiſms, when there is no conſiderable degree of inflammation, and where it is required to keep up a conſtant ſtimulus, mercury will generally remove the diſeaſe. It is advantageouſly uſed as a ſodorific in cutaneous eruptions, which it very powerfully removes; it keeps the ſkin moiſt, and diſpoſes the little inflammations to heal. Beſides the property of *mercury* in its being a ſtimulant, it is ſaid to have a peculiar power in deſtroying the venereal virus, and alſo various other inſtances of acrimony. *Quickſilver* is the only known ſalivant; many things ſtimulate the glands in the mouth, and increaſe their uſual diſcharge; but *quickſilver* alone produceth this effect by being abſorbed, and carried into the circulation. In ſloughs and in eryſipelatous ulcers it is improper; alſo in caſes of ſcirrhous or of cancerous tumors; in ſpaſmodic complaints, inſtances of ſtupor, or of gout, it ſhould be avoided. Some employ it as a purgative, but this is not vindicable. Beſides the ſalivary glands, *quickſilver* ſeems peculiarly to affect the throat, the inteſtines, and the joints, a circumſtance to be regarded in the uſe of this powerful medicine; and from which, if due care is not taken to prevent them, the effects will be injuriouſly active.

It hath been ſwallowed crude, as an univerſal remedy. Dr. Dover and Dr. Cheney commend it in the following diſorders:

1. Joined with the gum guaiacum and a little aloes, it hath been ſucceſsfully uſed in the eryſipelas, gout, and defœdations of the ſkin.

2. In hyſteric complaints its advantages are conſiderable, if joined with the bark, valerian, aloetics, or the gum pills, as circumſtances may require.

3. In conjunction with preparations of iron, it ſucceeds in ſuppreſſion of the menſes.

4. In intermittents it avails, when joined with the bark and iron.

5. In ophthalmias it hath been effectual when accompanied with millepedes and laxatives.

6. The hydrargyrus cum cretâ joined with gum guaic. and the antimonial wine, does wonders in chronical rheumatiſms.

7. In the jaundice, ſciatica, and anaſarcous dropſy, the hydrargyrus cum cretâ is ſucceſsful to admiration.

And to theſe of Dr. Cheyne may be added, that old foul ulcers are ſometimes brought to digeſt by its uſe.

The hard bellies of children are relieved by it, if accompanied with ſuch other medicaments as the particular caſe may require.

By boiling two or three ounces of *quickſilver* in four pints of water to two pints, and uſing the clear liquor for common drink, it deſtroys worms.

And in the venereal diſeaſe it is by many conſidered as a ſpecific.

The true ſecret of curing diſeaſes with mercury is to cauſe it to circulate with the blood as long as poſſible, without producing any evacuation at all.

A long uſe of *quickſilver* weakens the habit and ſo ſhould be accompanied with mild antimonials, the bark, or ſarſaparilla, &c. as circumſtances ſeem moſt to require.

Quickſilver is divided by earthy powders, balſams, mucilages, &c. but with nothing more advantageouſly than the mucilage of gum arabic. Mr. Plenck, of Vienna, directs a dram of it to be mixed with two drams of gum arabic in powder, by degrees to add a little water, and to continue the trituration of them together until the globules totally diſappear. This is called MERCURIAL MUCILAGE; to which half an ounce of any ſyrup, and half a pint of water may be added, and two common ſpoonfuls of the mixture may be taken every night and morning in ſuch caſes as require its uſe.

Gum arabic powerfully reſtrains the mercury from running off by the ſalivary glands; and if a ſalivation is already excited, it may aſſiſt like any other mucilaginous ſubſtance, in checking it.

Crude *quickſilver* in general is of equal advantage with any of its preparations; yet, in particular conſtitutions, one or other of them may demand a preference.

Many are the preparations made from this metal, and the moſt uſeful are inſerted in the courſe of theſe pages.

ARGENTI VIVI *Purificatio*, now HYDRARGYRI *Purificatio. The Purification of* QUICKSILVER, Ph. Lond. 1788.

Take of *quickſilver*, and iron filings, of each four pounds; rub them well together; and diſtil from an iron veſſel.—This is a ſhorter proceſs, and more perfect than that of the old London Pharmacopœia. For a variety of mercurial preparations, ſee HYDRARGYRUS, and MERCURIUS.

ARGENTUM MOBILE, & FUSUM. See ARGENTUM VIVUM.

——— NITRATUM. See CAUSTICUM LUNARE under ARGENTUM.

ARGILLA ALBA. } See CIMOLIA ALBA TERRA.
——— CANDIDA. }

ARGISTATA. Incorporated with wax.

ARGOL. See TARTARUM.

ARGUS. The name of a ſort of pheaſant. PHASIAS.

ARGYRITIS. See LYTHARGYRUM, and LYTHARGYRUS ARGENTEUS.

ARGYROPHORA. The name of an antidote.

ARGYROPŒIA. The art of making ſilver out of more imperfect metals.

ARGYRUS. See ARGENTUM.

ARGYROTROPHEMA. A cooling food, made with milk.

ARHEUMATISTOS. An epithet given to the external parts, particularly the joints, while free from gouty rheums.

ARI. See MONOPIA.

ARIA. The WHITE BOAM, or WILD SERVICE-TREE. Called alſo *Chamæmeſpilus*, *Cratægus alpinus*. It grows in woods upon rocky mountains, and flowers in April. The fruit mitigates coughs and promotes expectoration. Dale.

ARIA-BEPOU. See AZEDARACH.

ARICYMON, alſo ENARICYMAN. Theſe are terms applied to a fertile woman who ſoon conceives, and is quickly impregnated.

ARIDA MEDICAMENTA. DRY MEDICINES, ſuch as powders, &c.

ARIDITAS CORPORIS. See MARASMUS.

ARIDURA. A WASTING or LEANNESS, ſuch as appears in hectic or conſumptive habits; or, according to others the withering of a particular part, as a limb.

ARILLA. A GRAPE-STONE.

ARILLUS. The proper exterior coat of a ſeed, which falls off ſpontaneouſly, exemplified in coffee, &c. or incloſing the ſeed partially, and is either cartilagineus, or ſucculentus. See CALYPTRA.

ARIMASPES. See MONOPIA.

ARIS. The name of an inſtrument uſed by the ancients, and alſo of an herb.

ARISTA. IN BOTANY, that ſharp-pointed needle which ſtands out from the huſk or covering in corn or graſſes. This uſed in common to be called AWN or BEARD. But this laſt term is now otherwiſe applied. In pubeſcence, parallel hairs; or a tuft of ſtiff hairs terminating the leaves; RIVINUS and others give this name to the lower lip of a ringent corolla.

ARISTALTHÆA. See ALTHÆA.

ARISTIONIS MACHINAMENTUM. A machine for reſtoring luxations, invented by Ariſtion.

ARISTOLOCHIA. BIRTH-WORT. It is ſo called becauſe eſteemed for promoting the lochia in child-bed women, from ἀριστος *optimus*, and λοχια, purgamenta poſt partum in utero relicta. Alſo called *Adra Riza*.

There are ſeveral ſpecies of this plant; they are natives of the ſouthern parts of Europe, whence we are ſupplied with the dry roots. Moſt of them bear the cold of this clime. The roots of all the kinds are aromatic and bitter; they give out their virtues both to water and to ſpirit; but to the latter moſt perfectly. Though they hurt the appetite and produce a languidneſs in weakly conſtitutions. Any one of them may be uſed for the other; though Dr. Alſton of Edinburgh thinks that the roots of the creeping ſort are the beſt. The doſes are from gr. v. to ʒ i.

ARISTOLO-

ARISTOLOCHIA TENUIS vel CLEMATITIS. CREEPING BIRTH-WORT. Foliis cordatis, caule erecto floribus axillaribus confertis. CLASS, GYNANDRIA. ORD. HEXANDRIA, LINNÆI Mater. Med. 415. Alſo called *piſtolochia, ariſtolochia polyrhizos.* BUSHY ROOTED OF SLENDER BIRTH-WORT.

This is a long ſlender root, rarely exceeding the thickneſs of a gooſe's quill, and ſeems to be preferred for medicinal purpoſes to either the *longa*, or *rotunda*, though they are generally allowed to be ſimilar in their medicinal qualities. They have been conſidered as powerful deobſtruents, particularly of the uterine ſyſtem, and warm ſtimulants; Dr. ALSTON thinks this root equal to the Virginian ſnake root, for all the purpoſes in which it is uſed. Dr. Cullen ſays it has been eſteemed for its emenagogue virtues; and in ſome caſes of retention and chlorоſis, as a warm and ſtimulating medicine, he has found it uſeful; but never in caſes of ſuppreſſion. It has been long commended as a cure for the gout, and makes a conſiderable part of the Portland powder, and has often been employed by itſelf in the ſame manner as that powder, to be taken every day for a great length of time. It has the ſame power of preventing fits of the gout, and commonly with the ſame conſequences. Cullen's Mat. Med.

ARISTOLOCHIA LONGA. LONG ROOTED BIRTHWORT, called alſo *ariſtolochia maſcula.* This hath uncut leaves, ſtanding on pedicles, and oblong roots not tapering to a point, browniſh on the outſide, and yellow within, ſometimes the ſize of a finger, ſometimes as thick as a man's arm.

——— ROTUNDA. ROUND ROOTED BIRTHWORT, called alſo *malum terræ*; and according to PARACELSUS the GREAT MATRIX ROOT. This has ſcarce any viſible difference in its root from the other than its roundiſh ſhape.

ARISTOLOCHIA ROTUNDA CONCAVA. See MOSCHATELLINA.

ARISTON. Alſo PRANDIUM. DINNER.

ARISTON MAGNUM ET PARVUM. Avicenna ſays they are remedies againſt a phthiſis when attended with a fever, &c.

ARLADA, or ARLADAR, ſee REALGAR.

ARMALA. See RUTA.

ARMALGOL. See CORALLIUM.

ARMATURA. See AMNION.

ARME. A coalition of wounds, alſo the joining of the ſutures of the head.

ARMENA. An inſtrument with all the apparatus for any work we are about.

ARMENIACA MALA, called alſo *præcocia.* The APRICOT-TREE. Theophraſtus calls it *perſica*, to diſtinguiſh it from the peach; it was afterwards called *perſea-præcox.* The Latins called it *præcoqua*, whence the latter Greeks formed their *bericocca*, whence the French word *abricots.*

This fruit is more uſed for pleaſure than health: of the kernels in the ſtones is made ratifia.

ARMENUS LAPIS, alſo called lapis Armenius, *azutum, cæruleum foſſile.* The ARMENIAN STONE.

It is a copper ore, of a pale blue colour. It operates inſtantly as an emetic in a doſe of four grains: it is very little different, if at all, from the lapis lazuli.

ARMILLA. The round ligament that confines the tendons of the carpus. From *armus, an arm.*

ARMONIACUM. See AMMONIACUM.

ARMORACIA. WATER-RADISH. See SISYMBRIUM. Alſo WILD RADISH and HORSE-RADISH. See RAPHANUS RUSTICAN.

ARMORUM PUGNA. A ſort of gymnaſtic exerciſe, conſiſting of a mock duel, the antagoniſt being only a poſt.

ARMUTHEUS LAPUS. Corruptly written for armenius lapis.

ARNABO. See ZEDOARIA.

ARNALDIA. A malignant flow diſeaſe of the chronical kind, attended with an alopecia; it was formerly very common in England.

ARNICA MONTANA. GERMAN LEOPARDS BANE, called alſo *Doronicum Germanicum, auſtriacum quartum aliſma, doronicum plantaginis folio calendula alpina, alcea vulgaris major, lyrus, acyrus; panacea lapſorum.* It is the ARNICA PLANTAGINIS folio, foliis ovatis integris caulinis geminis oppoſitis. CL. SYNGENESIA. ORD. POLYGAMIA SUPERFLUA; LINNÆI Gener. Plant. 958. This plant grows in ſeveral parts of Europe, particularly Germany, and flowers throughout the ſummer. It has oval pointed ribb'd leaves like thoſe of plantain, ſet in pairs upon the ſtalk and oblong roots. The leaves and flowers have a penetrating bitteriſh taſte, and when bruiſed their odour provokes ſneezing. Bath water, and rectified ſpirit extract their virtues, by infuſion, or diſtillation. The roots are more aromatic, though their active matter ſomewhat leſs volatile. BERGIUS conſiders this plant, as emetic, errhine, diuretic, diaphoretic, and emenagogue. From its ſuppoſed power of attenuating the blood, it has been eſteemed peculiarly efficacious in obviating the bad conſequences occaſioned by falls and bruiſes, and hence acquired the title of PANACEA LAPSORUM. Dr. COLLINS has written a work on this ſubject, De arnicâ in febribus, & aliis morbis putridis; in which he highly extolls its febrifuge and antiſeptic virtue, &c. Dr. BRUCKNER recommends a decoction of the *arnica vera* in fevers attended with hæmorrhages, efforeſcences, &c. LEWIS ſpeaks much of its power, as does alſo NEUMAN. In fevers of the putrid and intermittent kind it has been ſucceſsful, both the flowers made into an electary, and their watery extract. In putridity and debility, malignant dyſenteries, and gangrene, it has manifeſted conſiderable efficacy; alſo as an antiſpaſmodic, in ſome caſes of paralyſis, and amauroſis. It has been given in the following forms: Nine drams of the flowers powdered, and mixed with a proper quantity of honey into an electary, and this taken in two days. Or one ounce of the flowers infuſed in a ſufficient quantity of boiling water for half an hour; afterwards in a veſſel cloſely ſtopped, boiled for a quarter of an hour, two pints ſweetened agreeably with ſyrup of capillaire formed a decoction, of which two ounces were taken every two hours. Or, two ounces of the root in powder was digeſted with thirty ounces of water in a phial cloſely ſtopped, and placed deep in a ſand bath, for twelve hours, and this ſweetened with ſyrup of marſhmallows, of which two or three ounces were taken every two or three hours. It is much extolled in Germany, though not much uſed in England; however it certainly merits attention.

ARNOGLOSSUM. See PLANTAGO LATIFOLIA.

ARNOTTO. See ORLEANA.

AROHOT. See ARGENT. VIV.

AROMA. Any thing fragrant or odorous; ſometimes it is taken for myrrh.

AROMA GERMANICUM. See ENULA.

AROMA PHILOSOPHORUM. See CROCUS.

AROMATICA.

Aromatics, or *ſpicy* drugs, are of a warm pungent taſte, with more or leſs of a fragrant ſmell; ſome are purely *aromatic*, as cinnamon, nutmegs, &c. others have a ſweetneſs mixed with them, as in the angelica root, aniſeed, &c. ſome have an aſtringency, as cinnamon; others a mucilage, as the caſſia lignea, &c. ſome a bitterneſs, as orangepeel; and others are alſo bitter and aſtringent, as the bark.

The ſeveral medicinal virtues of theſe mixed *aromatics*, are extracted by the ſame means as from thoſe which are leſs compounded; thus the *aromatic* part of lemon-peel ariſes in diſtillation with water, whilſt the bitter remains behind in the extract, &c.

The *aromatic* matter contained in different ſubjects differs much in their pharmaceutic properties. The virtues of all *aromatics* are extracted by ſp. vini rect. water extracts a portion from ſome, but from many none at all.

In diſtillation they ariſe with water more perfectly than with ſpirit, though in ſome few inſtances the *aromatic* matter wholly riſes in diſtillation, both with ſpirit and with water, as of lemon-peel, whilſt pepper ſtill retains part of its *aromatic* matter, though diſtilled with water.

In the eſſential oil and reſinous part of *aromatics*, all their peculiar qualities reſide. The more eſſential oil any vegetable affords, the weaker the oil is, and vice verſa.

Aromatics warm the ſtomach, and by degrees the whole body, hence are uſeful where the vital heat is below the par of health; they promote the natural ſecretions; they reſiſt putrefaction, hence ſo plentifully produced in hot climes.

AROMATICA AQUA. See PIPER. JAMAICENSE——NUX. See NUX. MOSCH.——TINCTURA COMPOSITA. See CINNAMOMUM.——CONFECTIO AROMATICA. See CONFECTIO.

AROMATICÆ PILULÆ. AROMATIC PILLS.

In ſmall doſes, as of ten grains or more, this warms the

the ſtomach, and by degrees the whole habit, and is alſo gently aperient. Theſe were called *diambræ pilulæ*.

The College of Phyſicians of London have in the place ſubſtituted the following compoſition, and called it—PULVIS ALOETICUS cum GUAIACO—*Aloetic powder with Guaiacum.*

℞. Aloes Socotorinæ, p. ʒ i. ſs. Gummi guaiaci, p. ʒ i. Pulveris aromatici, p. ʒ ſs. rub the aloes and gum guaiacum ſeparately to powder, then mix them together. Phar. Lond. 1788.

AROMATICÆ SPECIES, now PULVIS AROMATICUS. The AROMATIC POWDER.

Take of cinnamon two ounces, the leſſer cardamoms freed from their huſks, ginger, and long pepper, of each one ounce, mix, and make them into a powder.

This is an improvement of the *diambræ ſine odoratis ſpec.*

AROMATICUM LIGNUM. See CANELLA ALBA.

——————— ROSATUM. ROSE SPICE. An aromatic powder, formerly kept in the ſhops in which roſes were a part of the compoſition.

AROMATICUS, CORTEX. See CANELLA ALBA.

——PULVIS. See AROMATICÆ SPECIES.

ARON. See ARUM.

AROPH. See CROCUS. Alſo a name which Paracelſus gave to the flowers raiſed by ſublimation, from lap. hæmat. and often uſed by him for *lithontriptics.*

ARQUATUS MORBUS. See ICTERUS.

ARQUEBUSADE. It is the name of a water which is alſo called *aqua vulneraria, aqua ſclopetaria,* and *aqua catapultarum.* The name *arquebuſade* is a French word, that implies, it is good for gun-ſhot wounds. It is mint, ſage, mugwort, &c. diſtilled in wine.

ARQUIFOU. See ALQUIFOU.

ARRAC. See ORYZA, and PALMA COCCIFERA.

ARRACHE. See ATRIPLEX.

ARAPHON. Without future. The word is applied to the cranium when naturally without futures.

ARRHŒA. The ſtoppage of a flux: and by Hippocrates appropriated to the ſuppreſſion of the menſes.

ARRHOSTIA. Infirmity, ill health.

ARRHYTHMUS. See ARYTHMUS.

ARSAG. See ARSENICUM ALBUM.

ARSALTOS. See BITUMEN.

ARSANECK. ARSENIC SUBLIMED.

ARSATUM. See FUROR UTERINUS.

ARSENICUM ALBUM, called *cryſtallinum, riſagallum, arſag, aquala, arſar, aquila, zarnick, artaneck,* WHITE ARSENIC, and RAT'S BANE.

Arſenic, though it ſeems to have an affinity both to ſulphur and to a ſemi-metal, yet is not manifeſtly either. It is contained more or leſs in moſt kinds of ores, as thoſe of tin, biſmuth, the white pyrites, and particularly *cobalt,* ſee COBALTUM; from which laſt the greateſt quantity is obtained: the ore of the cobalt being broken in pieces, is placed over a fire, and the *arſenic* ſublimed from it, which reſting on the ſides of long chimnies deſigned for its reception, is ſwept off into proper veſſels to be reſublimed, or at leaſt melted, by which it is formed into the ſhining maſſes which are met in the ſhops.

What we have in England is chiefly brought from the mines in Saxony and Bohemia. Some ſmall quantities are ſublimed in Cornwall from the cobalt that is found there.

Large portions of ſulphur render it inert.

The pure *white arſenic* hath a penetrating corroſive taſte, and taken into the body is a violent poiſon; it produces ſpeedy dryneſs in the throat, and inflammation, dejection, fainting, ſtupor, delirium, tremors, convulſions, palſy, thirſt, burning in the ſtomach, gripes, vomiting, cold ſweats, hiccoughing, and at laſt death. Beſides the effects which it hath in common with other poiſons, it remarkably attenuates the coats of the ſtomach, and perforates the inteſtines, occaſions a ſwelling and ſphacelation of the whole body, and a ſudden putrefaction after death, and particularly of the pudendæ.

When the quantity taken is not fatal, it occaſions tremors, palſies, or lingering hectics.

Though there is but little hope, after this poiſon is ſwallowed, yet if aſſiſtance is to be had, immediately give a ſcruple of the white vitriol to excite a vomiting, and repeat it two or three times; give the patient plentifully of warm water mixed with ſweet oil, after each doſe of the vitriol, that if poſſible the ſtomach may be well cleared of the poiſon; large draughts are peculiarly proper, as they diſtend the ſtomach, and ſo more effectually waſh away what may be lodged in its villous rugæ. After ſufficient vomiting, give mucilages and demulcents, particularly plenty of gum arabic, new milk, and oil, both by the mouth and clyſterwiſe; fat broth ſhould be continued ſome time, and the bowels muſt be kept lax. If the poiſon hath had time to get into the blood, let cordial perſpiratives be added, ſuch as rad. ſerpent. V. &c.

Arſenic has been given with ſome ſucceſs in caſes nearly approaching to cancerous, and by ſome ſaid even to have cured cancers when they have been confirmed, and alſo have been adminiſtered with great efficacy in the ague; troches made of arſenic, are called *calcaton.* See CANCER and INTERMITTENS FEBRIS.

In reading ancient authors on the yellow and *red arſenics,* it ſhould be obſerved, that their *arſenics* are not the ſame as ours. Among the Greeks two kinds were in uſe, viz. *the yellow,* which we now call ORPIMENT, and AURIPIGMENT; and the red, which they call *ſandaraca.* The Arabians had alſo two kinds, viz. *the yellow,* which they call SCANDARACA; and the red, which they call REALGAR. It was the foſſil ſulphurated *arſenics* that the ancients uſed medicinally, and only thoſe which were yellow and flaky like talc, and which alone they call *arſenicon.* The white *arſenic* is a diſcovery of later times. The auripigment we meet with is of the yellow ſort, its taſte is not very acrimonious. The beſt mineral orpiment is brought from Turkey; it is very little, if at all, poiſonous.

Our yellow and red *arſenics* are artificial, being no other than the white, mixed with different proportions of ſulphur. The white is the ſtrongeſt, the yellow weaker, and the red weakeſt. See AURIPIGMENTUM & REALGAR.

ARSENICON. } CITRINUM, vel CROARSENICUM FLAVUM. } CEUM. See AURIPIGMENTUM.

——————— RUBRUM FACTITIUM. See REALGAR.

White *arſenic,* ſublimed with one tenth its weight of ſulphur, is yellow; and with one-fifth it is red.

Both the yellow and the red foſſil *arſenics,* when of a ſmooth texture, are called zarnichs, but when compoſed of ſmall ſcales or leaves, they are called auripigmenta.

ARSIORA. See PLUMBUM.

ARTABA. An Egyptian meaſure containing about five of our pecks.

ARTANECH, or ARTANECK. See ARSENICUM ALBUM.

ARTEMISIA, called alſo *mater herbarum, abſinthium alpinum, herens ſecum, parthenicum, cingulum ſancti Johannis, herba regia, toxiteſia, anactorium, bubaſtecordium,* the HEART of EUBASTUS, and COMMON MUGWORT, named by the Gauls *Bricumum.* The ſpecies uſed by the direction of the Edinburgh college is the *artemiſia* vulgaris, or *artemiſia* foliis pinnati fidis planis inciſis ſubtus tomentoſis, racemis ſimplicibus recurvatis, floribus radio quinque-floro. CL. SYNGINESIA. ORD. POLYGAMIA SUPERFLUA. Lin. Gen. Plant. 945.

It is a plant with firm ſtalks, of a purpliſh colour, with deeply-divided leaves, reſembling thoſe of common wormwood, of a dark green colour above, and hoary underneath. The flowers are ſmall, purpliſh, naked, and diſcous; they ſtand erect on ſpikes on the tops of the branches. It is perennial, grows wild in the fields and on waſte grounds, the flowers appear in June.

It hath been highly and much ſpoken of by Hippocrates and Dioſcorides, as promoting the uterine evacuations, hence called *Chariſtolochia.* Galen, in form of fomentation, applied it for this purpoſe: it has been alſo conſidered uſeful for moderating hyſteric ſpaſms, uſed in theſe caſes, in infuſions, for common drink and in baths. The flowers and tops are the ſtrongeſt; however, now the powers of this medicine are thought very weak, and therefore rejected by the London College.

It is a name of the BOTRYS, and ABROTANUM, which ſee.

ARTEMESIA ABSINTHIUM VULGARIS. } See ABSIN——————— PONTICA. } THIUM.
——————— MARITIMA. }

For that called CHINENSIS. See MOXA.——AUSTRIACA—JUDAICA—SANTONICA. See SANTONICUM.

ARTEMONIUM. The name of a collyrium deſcribed by Galen.

ARTERIA, ἀρτηρία. An ARTERY. From ἀηρ, *air,* and τηρεω, *to keep.*

By the word *artery* Hippocrates meant what is now known

known by the name of aſpera *arteria*; nor were the veins diſtinguiſhed from the *arteries* in the oldeſt times; for *phleps*, amongſt the ancients, was applied both to arteries and veins; and indeed, ſome of our more modern writers uſe the term *vena*, when ſpeaking of the pulſe.

An *artery* is a ſtrong elaſtic ramifying tube ariſing from the heart. The *arteries* are properly but two; they riſe from the two ventricles of the heart, one of them is called AORTA, which ſee; the other is named the PULMONARY ARTERY, for it ſprings from the right ventricle of the heart, and is wholly confined to the lungs. See PULMONES.

The figure of an *artery* ſomewhat reſembles a tree; the ſmaller ramifications of the *arteries* frequently anaſtomoſe with each other, as may be obſerved in the coats of an inteſtine when they are injected. The largeſt appearance of this kind is in the vertebral *arteries*, which unite in the ſkull. The uſe of the anaſtomoſis is to keep up an equal circulation; they likewiſe ſerve to mix the blood better.

It is generally ſaid that the *arteries* are of three ſorts, viz. the ſanguine, which circulate red blood: the ſerous, through which ſerum only is naturally conveyed; and the lymphatic, whoſe contents are lymph: it is alſo ſaid, that if the blood is puſhed into ſerous veſſels, it is there obſtructed, but they are all the ſame tube continued, which gradually divides into branches, and theſe branches grow ſmaller the farther they are from the heart; near to the heart, the thicker blood circulates, the force of the circulation is there ſtronger; and far from the heart the circulation leſſens in its vigour, ſo the thinner fluids only run there; but if by exerciſe, or other means, the heat of our bodies is increaſed, the circulation is puſhed forward, the red blood and other orders of thinner fluids, can proceed to where ſtill thinner fluids only circulated before; for the ſmaller veſſels not being conſtructed to receive only ſuch certain ſized globules, can diſtend to the capacity required by ſuch degrees of circulation as are occaſionally happening, and contract again to their former dimenſions, as ſoon as the diſtending force is removed.

Arteries terminate three ways; the moſt common is that into the veins. Harvey diſcovered, or demonſtrated, the circulation of the blood; but Malpighius firſt obſerved, that the laſt branches of an *artery*, running into minute diviſions, diſpoſe themſelves on a membrane as on a firm baſe, and there open into one another by the mutual intercourſe of ſmall canals: he firſt traced out theſe canals through numerous mazes and windings, through which they convey the blood; but here the ſmall branches, diſpoſed with great nicety, extend over equal ſpaces, and deſtitute of lateral ſhoots, as being no longer ſubdivided, changing their figure, conſtitute the origins of the veins and lymphæducts, with their ſinuſes.

The next termination of *arteries* is into little cavities or ſinuſes, as into the corpora cavernoſa penis, &c.

The laſt is into excretory ducts.

The *arteries* generally lie deep, and always run on the inflected ſide of the limb, as in the axilla, the inner part of the cubit, &c. this ſituation prevents their being either ſtretched or compreſſed in the various motions of the body.

In the beginning of each of the large *arteries* before mentioned, there are three valves, which appear like purſes, and prevent the return of the blood to the heart, ſee COR; the other parts of the *arteries* are free from valves.

The coats of the *arteries* are three in number.

1. The EXTERNAL; it contains a great number of blood-veſſels, and many nerves run through it; it is elaſtic, and its fibres run quaquaverſim.

2. The MIDDLE; it is made of fibres which are diſpoſed nearly circularly, and parallel to each other.

3. The INTERNAL is a thin membrane, whoſe ſurface is very ſmooth, to give an eaſy paſſage to the blood.

Notwithſtanding the diſputes which have occurred among anatomiſts, relative to the ſubſtance of theſe coats, it is pretty well underſtood that they are formed of muſcular fibres, and elaſtic ligaments, the inner being membranaceous; and that the muſcular fibres themſelves are poſſeſſed of elaſticity, as well as the ligament.

Vim reſiliendi haud exiguam, non ſecus ac omnis pars ſolida corporum animalium, manifeſte poſſident muſculi, etiam poſt mortem ſuperſtitem. Gregory. Conſpect. Med. vol. i. 177.

The cellular membrane is improperly numbered among the coats of the *arteries*, for it only connects the real ones.

The nearer to the origin the weaker are the arterial coats, whence the frequency of aneuriſms in the beginning of the aorta.

Arteries are often met with of a ſerpentine form, but they are not ſo in a natural ſtate of health, except during particular actions, &c. and then they recover their original ſtate as ſoon as the temporary cauſe is removed. The cauſe is the dilatation; the coats are elaſtic, therefore whatever diſtends them, muſt at the ſame time lengthen them, and thereby produce ſerpentine turns. This frequently happens in injecting the *arteries* of dead bodies; in the viper it is very apparent in an *artery* which runs along the outſide of its lungs; every time that the heart beats, this *artery* is ſeen in a ſerpentine form. The *arteries* of the uterus are more convolved in the laſt months of pregnancy than they were before conception; ſo far is the common obſervation from being true, that the uterine *arteries* have naturally a ſerpentine courſe, to admit of the enlargement of that organ in pregnancy, without ſtretching the *arteries*.

The *arteries* are liable to oſſification, particularly the iliac and crural. This happening where an amputation is performed, requires a cauſtic. The oſſification begins in the internal membrane, which firſt thickens, then grows ſpongy, by degrees becomes griſtly, and at laſt like bone; and then this diſorder extends to the outer coats. From this circumſtance a mortification is ſometimes produced. See MORTIFICATIO.

The particular *arteries* may be ſeen under their reſpective names, but their general courſe runs thus. From the right ventricle of the heart ariſes the PULMONARY ARTERY, which is wholly diſtributed in the lungs.

The AORTA ariſes from the left ventricle of the heart, and immediately ſends off the CORONARY ARTERIES into the heart and its auricles.

From the upper part of the arch of the aorta riſe the CAROTIDS, which ſupply the head.

Near the carotids riſe the SUBCLAVIAN ARTERIES, which ſend off the internal MAMMARY, the UPPER DIAPHRAGMATIC, and others, which are diſperſed in the breaſt: when the ſubclavian hath paſſed out of the thorax, it receives the name of the AXILLARY ARTERY, and when in the arm the HUMERAL, and in the forearm the CUBITAL.

The upper portion of the aorta deſcendens ſends off the BRONCHIALES, ŒSOPHAGEÆ, INTERCOSTALES, &c.

The inferior portion of the aorta ſends off the inferior DIAPHRAGMATIC, CŒLIAC, MESENTERIC, SPERMATIC, EMULGENTS, &c. then dividing into two, forms the iliac ARTERIE, which ſend off branches about the lower part of the belly, then deſcending into the thighs, legs, and feet, form the CRURAL, TIBIAL, &c.

Wounds of the large blood-veſſels require amputation too frequently; the great quantity of blood which would be loſt, if the uſual methods to reſtrain hæmorrhages ſhould fail, would endanger, if not deſtroy the patient. After a ligature is formed, the circulation may or may not be duly carried on; if it ſhould not, the operation will be indiſpenſible. The collateral branches are not always ſufficient for carrying on the circulation, ſo as to prevent a mortification. The intercoſtal *artery*, when wounded, is fatal. Wounds of the *arteries* in the hands are dangerous. The POPLITEAL ARTERY in the ham, if injured, abſolutely demands amputation. The HUMERAL ARTERY, if injured high up, requires the amputation of the arm, &c. and various other inſtances. Bell's Surgery, i. 97, &c. White's Surgery, 173.

ARTERIA ASPERA. See ASPERA ARTERIA.

——— VENOSA. The pulmonary *artery* was ſo called by the ancients, from a miſtaken notion that the veins came ſolely from the right, and the *arteries* from the left ventricle.

ARTERIACA. See AMUCTICA.

ARTERIOSUS, DUCTUS, alſo called *canalis*, and *canaliculus arterioſus*. This, in the fœtus, ariſes from the extremity of the arteria pulmonalis, juſt where it is going to give off the two branches, and opens by its other end into the beginning of the deſcending aorta, juſt below the great curvature. In the adult it is obliterated, but in the fœtus it is open, and conveys the blood, which hath no paſſage, or a very ſlight one, through the lungs in this ſtate of the animal, from the pulmonary artery to the aorta.

ARTERIOTOMIA, from ἀρτηρία, *an artery*, and τέμνω, *to cut*. It is the opening of an *artery* for the discharge of blood.

Galen, Antyllus, Oribaſius, P. Ægineta, and ſeveral others, highly extol this practice in inveterate head-achs, which reſiſt all other means; alſo as a remedy againſt violent inflammations of the eyes, the epilepſy, &c. The operation is generally confined to the head, becauſe of the bone being immediately under, and giving the advantage of a proper compreſs. When the temporal *artery* is opened, a ſmall knife, ſuch as is uſed for the fiſtula lachrymalis, is better than a lancet, and the inciſion muſt be ſo as to divide the *artery* tranſverſely, then the inconvenience of an aneuriſm is avoided.

Heiſter condemns *arteriotomy*, eſpecially before every other method hath been tried. See Bell's Surgery, i. 146. White's Surgery, 178.

ARTETISCIUS, or ARTETISCOS. One who ſuffers the loſs of any member, or who hath a very defective one.

ARTHANITA, called *cyclamenus*, *cyclamen*, *panis porcinus*, called in *Myrepſus*, *Caſamum*, SOW-BREAD. It is the *cyclamen Europæum* Lin.

It is a low plant without any other ſtalk than the ſlender pedicles of the leaves and flowers; the leaves are green, with white ſpecks above, and purpliſh beneath; the flowers are purpliſh, monopetalous, deeply divided into five ſegments, followed by round ſeed-veſſels; the roots are large, ſomewhat globular, with ſeveral fibres, blackiſh on the outſide and whitiſh within. It is perennial, a native of the ſouthern parts of Europe.

The root when freſh, has an extremely acrimonious biting taſte, which it loſes almoſt entirely on being dried; it is recommended chiefly in cataplaſms, for ſcirrhous and ſcrophulous tumors, and as a ſternutatory, though internally it proves cathartic, detergent, and aperient; but operates ſlowly, and with great virulence, inflaming the fauces and inteſtines: one dram of the powder purges.

ARTHETICA, or ARTHRETICA, from ἄρθρον, *a joint*. The herb GROUND-PINE. It is uſeful againſt diſorders of the joints. See CHAMÆPITYS.

ARTHOICUM, or ARTOICUM, or PANNONIUM, from ἄρτος, *bread*. A red oil formerly made by digeſting ſeveral roots with bread.

ARTHREMBOLUS, from ἄρθρον, *a joint*, and ἐμβάλλω, *to impel*. An inſtrument for reducing luxated bones.

ARTHRITICA, belonging to the gout.

ARTHRITIS, from ἄρθρον, *a joint*. The GOUT. Called alſo FLERESIN.

Dr. Cullen, in his Noſology, gives it the name of *podagra*, from πούς, *pes*, *the foot*, becauſe that he conſiders the ſeat of the idiopathic gout. In his 24th genus of diſeaſes of the claſs of febrile complaints, and the order of inflammations, he divides it into four ſpecies. 1. PODAGRA REGULARIS, REGULAR GOUT, when the inflammation appears in the joints to a due degree, and after continuing a while, gradually diſappears, and the patient recovers his uſual health. 2. PODAGRA ATONICA, ATONIC GOUT, when there is manifeſtly the *gouty* diatheſis, but from ſome cauſe it does not produce the inflammatory affections of the joints, but digeſtion is diſturbed, and the general health is variouſly affected. 3. PODAGRA RETROGRADA, RETROGRADE or RECEDENT GOUT, when inflammation hath as uſual attacked the joints, but not with either its uſual degree or the uſual pain, and then ſuddenly abates, an internal part as ſuddenly being affected thereby. 4. PODAGRA ABERRANS, MISPLACED GOUT, when the gouty diatheſis produces inflammation in ſome internal part, inſtead of the joints of the extremities. It is generally, and concifely defined, "an hereditary diſeaſe, ariſing without any external evident cauſe, but preceded for the moſt part by an unuſual affection of the ſtomach; febrile ſymptoms; pain in the joint, particularly of the great toe, but certainly in thoſe of the feet and hands; returning at intervals, and often alternating with affections of the ſtomach, and internal parts." The gout is called *nodoſa*, knotted, when it forms knots at the joints.

The ancients called all kinds of pain, which was ſeated in the joints or the external parts, by the common name of *arthritis*. The word rheumatiſmus was not known amongſt them; but in the ſixteenth and ſeventeenth centuries, ſome celebrated French phyſicians have called the pains which afflict the intermediate ſpaces, between the joints and muſcles of the neck, or of either arm, or of the anterior or poſterior part of the thorax, the ſhoulders, ſcapulæ, thighs, and hands, by the name of rheumatiſm. And thoſe they ſtyle arthritic which affect the joints, though according to the different part, they diſtinguiſhed the ſame gouty pain by a different name, as *podagra* in the feet, *chiragra* in the hands, *omagra* and *pechyagra* in the elbow, *gonagra* in the knee, *dentagra* in the teeth, *cleiſagra* in the articulations of the clavicles with the ſternum, *lumbago* in the vertebræ of the back, *dolor iſchiadicus* in the articulations of the os iſchium; of the humerus with the ſcapula *omagra*; in the ſpine of the back *rachiſagra*; ſometimes it ſeizes the larger tendons, then it is called *tenontagra*. Cæl. Aurelianus, lib. v. cap. 2. but the difference betwixt the *gout* and the rheumatiſm is conſidered as very great, both in their cauſe, ſeat, ſymptoms, and cure.

It is divided into REGULAR, and IRREGULAR. The FIRST chiefly affects the nerves, tendons, membranes, and ligaments of the joints, particularly the ſmall joints and feet. The LAST afflicts the patient variouſly, and ſeizes the internal parts, chiefly the viſcera, as the lungs, ſtomach, &c. but it is the tunica cellularis of the reſpective parts that is affected, which is the proper and immediate ſeat of the diſeaſe.

The firſt approaches of the *gout* are generally ſudden, and happen very early in the ſpring, or in the beginning of winter. The regular fit is uſually preceded by indigeſtion, drowſineſs, head-ach and ſickneſs; a wearineſs, dejection of ſpirit, pain in the limb, with a ſenſation as if wind or cold water were paſſing down the thigh, are alſo complained of; the appetite is ſometimes very keen a little before the fit approaches, a ſlight pain is felt in paſſing the urine: ſoon after midnight a pain attacks the great toe, or ſome other part of the foot, or ancle, though now and then it is fixed in the calf of the leg; this pain is accompanied with a ſenſation as if cold water was poured thereon, and ſoon followed by a ſhivering, with ſome degree of fever: after this the pain increaſes, and fixing in the ſmall bones of the foot, the patient feels a variety of torturing pains there for about twenty-four hours, which then abate, the part becomes inflamed and ſwelled; towards the morning the patient falls aſleep, a perſpiration comes on, which terminates the fit; but what is commonly called a fit of the *gout*, conſiſts of ſeveral ſuch as theſe; and though a recovery proceeds from the firſt remiſſion, ſome uneaſineſs returns every night, and goes off the following morning. The firſt fit may continue two or three weeks, but a tenderneſs where the pain was ſeated remains much longer. It may be that the patient remains free from any return during the ſucceeding, or a ſecond year, but when it does, it is ſtill more painful; and ſoon after this the returns grow more and more frequent, increaſing until the ſtrength failing, and ſenſation is diminiſhed, then, though the patient is ſeldom free, he is not violently afflicted.

Much has been ſaid by different authors concerning the cauſe of the gout. BOERHAAVE conſiders it to be a vitiated diſpoſition of the very minute veſſels and nerves in the machine, from their too great ſtraitneſs and rigidity; and alſo, of the liquid which nouriſhes the nerves, from its acrimony, and greater tenacity. HOFFMAN ſays it is a ſaline tartareous ſubſtance, while ſome conſider it a corroſive bilious ſalt; others, as an acid: ſome as an auſtere ſtyptic principle. IN GENERAL, it is thought that the gout depends upon a certain morbific matter, always preſent in the body; and, that this matter, by certain cauſes, thrown upon the joints, and other parts, produces the ſeveral phenomena of the diſeaſe. Dr. KIRKLAND ſays, the *prediſpoſing* cauſe, is a largeneſs of the lacteals, and ſtraightneſs of the ſmall veſſels, particularly thoſe of perſpiration; and the *immediate*, the acrimony of earthy particles undiſſolved.

Dr. CULLEN, in his Pathology of the Gout, ſays, in ſome perſons there is a certain vigorous and plethoric ſtate of the ſyſtem, which, at a period of life, is liable to a loſs of tone in the extremities. This is, in ſome meaſure, communicated to the whole ſyſtem, but appears more eſpecially in the functions of the ſtomach. When the loſs of tone occurs, while the energy of the brain retains its vigour, the vis medicatrix naturæ is excited to reſtore the tone of the parts, and accompliſhes it by exciting an inflammatory affection in ſome part of the extremities: when this has ſubſiſted for ſome days, the tone of the extremities, and of the whole ſyſtem, are reſtored, and the patient returns to his ordinary ſtate of health; and, it is owing to a deviation in ſome of theſe principles, that he

accounts

accounts for the difference in the ſpecies. Dr. CULLEN, and, indeed, ſeveral others, conſidered the gouty matter as an effect, and not a cauſe of the diſeaſe.

This diſeaſe generally attacks men of robuſt and large bodies, men of large heads, plethoric habits, and men whoſe ſkins are covered with a thicker rete mucoſum, which gives a coarſer ſurface; particularly if the earlier period of their life has been ſpent in indolence and luxury; or whoſe minds have been much harraſſed with vexation and painful reflection. It ſeldom attacks perſons employed in conſtant bodily labour, or perſons who live much upon vegetable aliment; and, it is leſs frequent among people who make no uſe of wine, or other fermented liquors. It ſeldom ſeizes men before the age of thirty-five; oftener, by much, at a later period. Neither children nor youths are exempt from it; and the females, who are liable to it, are thoſe of the more robuſt and full habits; though it ſeldom attacks that ſex, or eunuchs, unleſs they are ſtrong, lead indolent lives, and live very full.

In order to the cure, there is little to be done in the fit: and out of it, the beſt intentions are, firſt to increaſe the digeſtive powers; and ſecondly, to promote and ſupport the natural perſpiration.

On the approach of the fit, and until its departure, a ſlender diet is generally preſcribed; but ſo various are the conſtitutions of different perſons, that this article is moſt properly determined by the attending phyſician. Sydenham's rule, viz. moderation, is perhaps the beſt general one on this ſubject: he ſays, let the patient take no more than is eaſily digeſted, nor leſs than is neceſſary to keep up the ſpirits; and, as to the quality, the palate and appetite may determine; for that which is beſt reliſhed, is the moſt eaſily digeſted, though it be what is uſually eſteemed the contrary. One kind of fleſh meat he confines the patient to, at one meal, and that to be eaten only at noon; but in different days a variety may be allowed. It is good neither to oppreſs by exceſs, nor induce feebleneſs by needleſs reſtrictions. Mead ſeems to be an unexceptionable cordial.

An early going to bed is ſtrictly to be conformed to, but early riſing is not ſo neceſſary.

When circumſtances admit, *gouty* patients ſhould always endeavour to be in a good air when they expect the return of the fit. In the country, perſpiration is moſt eaſily ſupported, and there the patient recovers the ſooneſt. A warm and dry air is almoſt alone both a preſervative from, and a cure of the *gout*.

How neceſſary exerciſe is, as ſoon as the pain will admit of it, and that daily, during the intervals of the fits, need be no farther noticed than by obſerving how much a due and conſtant perſpiration preſerves from this diſeaſe. Frictions with coarſe flannel, the fleſh-bruſh, &c. riding in a carriage, or on a horſe, and, when ſtrength admits, ſome regular daily labour, ſhould be the methods that nothing ſhould interrupt. And here we ſhould obſerve, that along with general exerciſe, that which is topical ſhould be particularly attended to; that is, the parts that have been affected, and are left in a debilitated ſtate, ſhould, by proper means, be put into and kept in proper action.

Paſſions unreſtrained, and cloſe attention, by weakening the digeſtive powers, conduce to the violence of this diſeaſe, and to the frequency of its returns.

In the fit, cover the affected limb with new combed wool, or the ſofteſt flannel; and, ſhould the pain be exceſſive, nothing ſhould be applied to the foot, except ſome gentle emollient poultice; perhaps that of bread and milk is the moſt eligible.

If there is a ſickneſs, or uneaſineſs in the ſtomach, give carduus, or camomile tea, to excite two or three evacuations; or if ſomething ſtronger is required, give a little ipecacuanha. Vomits promote perſpiration; and if uſed when a ſickneſs, or other uneaſineſs, is already felt in the ſtomach, no danger need be apprehended.

If a ſanguine plethora is obſerved, the loſs of a little blood ſhould precede the emetic. The heat of the body, and the ſtrength of the pulſe, will ſafely direct the quantity to be taken away: as bleeding can only be uſeful by unloading the veſſels, it ſhould be taken away with caution, by a little at a time, and repeated as required.

The day after the emetic, a gentle purge may be given, if in a ſanguine and robuſt habit.

℞ Infuſ. ſenæ, ℥ ij. vel iij. natri vitriolati, ʒ ij. ſps. menth. ʒ iii. m. f. hauſt.

But if not remarkably ſtrong, and unattended with great heat:

℞ Tinct. aloes, tinct. rhubarb. aā ʒ vi. vel ℥ i. m. f. hauſt.

If this latter draught was taken, and repeated once or twice, as ſoon as any ſymptoms of an approaching *gout* appear, the violence of the ſucceeding diſorder would be much leſſened, if not the whole of the complaint prevented. If the pain is conſiderable after the operation of the purging medicine is over, an anodyne may be adminiſtered, and repeated at other times, if the urgency of the pain requires it.

Purges ſuited to the ſtrength of the conſtitution, and the peculiarities of any habit, if repeated at proper intervals, are of ſingular benefit either for haſtening away the preſent, or retarding the approach of an abſent *gout*; and as the pain is chiefly ſpaſmodic, opiates may be uſed without the uſual apprehenſions. The ſoap pill may be preferred: but if a draught is deſired, the tincture of opium may be uſed; eaſe and ſleep promote perſpiration, and thus a principal intention in preſcribing is anſwered.

When *gouty* people have been troubled with flatulency, acrid eructations, reſtleſs nights, &c. much relief hath been afforded from calomel, aſſiſted by gentle purges. Hence it ſeems clear, that the true method of relieving the *gout* is, to ſupport nervous energy and evacuate the *gouty* matter. When a regular fit occurs, nature accompliſheth the deſired relief; but when ſhe is interrupted in this effort, no method gives ſpeedier relief, under an inflammatory ſtate, than proper purging. Dr. Cheyne obſerves, that many have given an active purge every morning, and quieted its tumult with an anodyne in the evening; and thus continued until the fit was overcome. If required, beſides the anodyne at night, a cordial may be directed. The pain abated, and ſwelling ſubſiding, to reſtore the former ſtrength, was attempted by gentle ſtomach-purges, aromatics, and warm alteratives. When the diſeaſe is not determined to one point, alſo when it affects the head, ſtomach, or bowels, proper purges give the moſt ſpeedy relief. In adminiſtering purges in *gouty* habits, however proper and neceſſary, no diſeaſe requires more prudence in the management of them, on account of the deficiency of the nervous power ſo generally attendant on the *gout*. Therefore, except inflammation forbid, the nervous energy muſt be ſupported during the operation of purgatives; and the patient's ſtrength muſt be duly attended to, leſt evacuation by purgatives ſhould too much enfeeble.

If a fever accompanies, plenty of ſmall diluting drink muſt be ſupplied, ſmall white wine whey may be given at night, with a little of the ſp. ammoniaci compoſitus. Sage tea acidulated with the jelly of any acid fruit, or with the diluted vitriolic acid, is alſo an uſeful mixture for common drink.

Let the vis vitæ determine the quantity of cooling and of cordial medicines. *To ſupport perſpiration, and to preſerve the heat of the body as nearly as poſſible to that of health, are leading points of management through the whole of the paroxyſm.*

In the decline of the fit, when the ſkin begins to peel, and the urine depoſits a laudable ſediment, a few gentle bitter purges ſhould be given, and frictions, or rather exerciſe, ſhould be uſed to recruit the ſtrength: three common ſpoonfuls of the following infuſion may be given twice a day:

℞ Cort. Peruv. opt. ℥ ij. —— aurant. ficc. ℥ i. ſs. rad. ſerpent. V. ʒ iij. cort. cinnam. aā ʒ ij. ſp. vini Gallic. ℔ i. ſs. m.

Or, if the ſtomach will bear it, a tea ſpoonful of the bark may be taken, in fine powder, with a glaſs of good wine.

The Bath water is almoſt a ſpecific in enfeebled conſtitutions.

The flannels ſhould be gradually caſt off as ſoon as the pain is gone, though a ſwelling and lameneſs ſtill continue. Then to ſtrengthen the weak part, immerſe it every night at bed time in cold water, then wipe it quite dry before laying down. *Local bliſters are here uſeful; to abate the ſwelling left remaining, and give ſtrength to the parts.*

Rye-meal poultices are a faſhionable application, but topical remedies are moſt ſafely ommitted.

Iſſues juſt above the knee, on the inſide, ſhould be made in *gouty* patients; their diſcharge contributes much to the preventing the *gout* from affecting the viſcera.

Dr.

Dr. Dawſon's ſucceſs, with the uſe of the tinct. guaiac. and an occaſional bleeding, deſerves the attention of medical practitioners. He recommends it in the *gout*, with or without fever, and in both the acute and chronical rheumatiſms. His general mode of preſcribing it, is as follows:

℞ Tinct. guaiac. ℥ ſs mucilag. e gum. arab. q. ſ. deinde adde gradatim decocti hordei ℥ i. ſs. ſyr. Tolutan. ℥ ſs. m. fiat hauſt. h. ſ. ſumend. & repet. bis vel ter in die. See his Caſes in the Acute Rheumatiſm and *Gout*.

The INTERNAL GOUT appearing before a fit of it hath manifeſted itſelf on the extremities, cannot be diſtinguiſhed from other diſeaſes which affect the particular part on which it is fixed. The internal, or irregular *gout*, generally ſeizeth the ſtomach or the inteſtines, cauſing a loſs of appetite, colic, diarrhœa, &c. though ſometimes it attacks the head, and produces a vertigo, head-ach, or an apoplexy; or, falling on the lungs, it reſembles a peripneumony; if it takes its ſeat on the nervous ſyſtem, a palſy is the conſequence. But whatever part it reſts in, the only proper cure is the expulſion of it into the extremities, by cordials, diaphoretics, and chalybeates. Mild bliſters may alſo be applied to the feet. The ſudden tranſitions of the *gout*, which are ſometimes inſtantaneous, Dr. Kirkland thinks, are effected by the conſent of parts. He obſerves that pains in many inſtances have vaniſhed, though in very diſtant parts, when a medicine hath been applied to the ſtomach; that ſpaſms have been inſtantly produced in the ſide, when a wound in the ancle hath been wiped with a ſoft rag. May not then a diſtant *gouty* pain be inſtantly brought on by a local affection of the nerves?

The GOUT in the STOMACH. It is ſometimes invited here by acrid matter lodged in this viſcus, and ſometimes repelled from other parts by injudicious management, and other accidents. In this caſe there is ſickneſs, loathing of food, eructations, cardialgia, vomiting, heat, a conſtriction or pain, &c. Some one or more of theſe appear, at the ſame time the extremities are free and eaſy. Old people who have lived freely in their youth, but are now become ſober and abſtemious, are ſometimes affected with hypochondriac ſymptoms in the ſtomach, which reſemble *gouty* ones; but they are to be diſtinguiſhed by the manner in which they ſeize the patient, their vehemence, and intervals.

If a ſanguine plethora with an ardent heat is obſerved, bleed, then apply a mild bliſter to the feet. If the breathing is difficult, the ſtomach oppreſſed, eructations, nauſea, or vomiting, are troubleſome, a gentle vomit may be adviſed; and ſoon after its operation, if coſtive, let a ſolutive clyſter be injected, and afterwards a doſe of Venice treacle.

Three or four times a day give a doſe of ſome warm bitter ſtomachic, and now and then purge gently with the pil. ex aloe cum myrrha, or with the tinct. aloes made with brandy, or the tinct. rhab. Here proper purging is generally required.

If, notwithſtanding the above, the ſickneſs continues, give ten drops or more of the tinct. opii, with a glaſs of mint or cinnamon water, and repeat it every four or five hours until the ſtomach can retain its contents; after which, to haſten the diſorder into the extremities, let the patient take two large ſpoonfuls of an infuſion of garlic in brandy, adding to each doſe ten or fifteen drops of the tinct. and repeat it two or three times in the day; or ℈ i. of powder of ſnake-root, with five grains of volatile ſalt, mixt into a bolus, may be taken every ſix or eight hours.

A glaſs of ſtrong wine may be mixed with ſome agreeable ſpice, heated, and drank betwixt each doſe of the medicine.

The ARTHRITIC COLIC, or the GOUT in the INTESTINES:

Any part or the whole of the inteſtinal tube may be affected. It often happens to the aged and infirm, and ſometimes the more robuſt ſuffer this way. A general uneaſineſs, loſs of appetite, a nauſea, or a wandering pain in the bowels, uſhers it in; but the pain ſoon fixing on one part of the belly, confirms the diſorder; by this time a remarkable oppreſſion is felt in the breaſt. To theſe two ſymptoms, pain in the belly and oppreſſion in the breaſt, which are capital ones, are added one or more of the following; a rumbling in the bowels, frequent eructations, coſtiveneſs, a vomiting of bilious matter, low ſpiritedneſs, want of ſleep, &c.

A peculiar weakneſs in the bowels, and an accumulation of impurities in them, may invite the *gouty* matter; error in diet, repellents imprudently applied to the extremities, &c. may determine it to this part.

If the pain in the inteſtines, and the oppreſſion in the breaſt, continue long, the danger is hardly to be overcome, nor, indeed, is there much ſafety until the complaint is wholly in the extremities again.

A bilious fever ſometimes attends; in which caſe, if the heat and ſtrength of the patient will admit, begin the cure with bleeding; but be careful not to reduce him much. If the ſtomach ſeems oppreſſed by its contents, a gentle emetic will be adviſeable; and, preſently after let a warm bitter purge be adminiſtered; or, opening glyſters with aſſafœtida in them. During the intervals of purging, if an acid is prevalent in the firſt paſſages, magneſia alba ſhould be given frequently; or if a bilious matter abounds, bitter infuſions, that are alſo laxative, muſt be preferred. That complied with, chalybeates may be had recourſe to, joined with ſtimulants and aromatics.

PULVIS CHALYBEATUS.

℞ Ferri rubiginis g. v. ad x. pulveris radicis ſerp. virg. ℈ j. f. pulvis bis terve de die ſumendus.

A glaſs of ſtrong wine may now and then be taken. If the ſpaſms in the bowels prevent the efficacy of purging medicines, apply a warm fomentation to the belly; or if they are ſo weak as that the medicines run off too faſt by ſtool, proper aſtringents muſt be uſed. Red port wine, from half a pint to a quart in twenty-four hours, will produce ſingular advantage; and as ſoon as any medicine is perceived to agree with the ſtomach, let that be adhered to until the diſorder is fixed in the extremities. If after this the belly is greatly diſtended with wind, let an oily emollient clyſter be now and then adminiſtered, and this ſymptom will ſubſide.

To prevent returns, the Bath water is the ſpecific.

A GOUTY DIARRHOEA. If in *gouty* patients, and during a fit, a diarrhœa comes on, the pain and ſwelling at the ſame time gradually vaniſhes, the diarrhœa is evidently cauſed by the *gout*. The effect of this diarrhœa is very uncertain. If it ſoon abates, and is not exceſſive, it often proves uſeful; but when the inteſtines are enfeebled by previous irregularities, &c. great danger attends.

If the cauſe be crudities in the firſt paſſages, a doſe of the tincture of rhubarb will be neceſſary, and then reſtringents, with perſpiratives, muſt be given, tinct. opii in ſmall doſes, accompanying. The decoction of burnt hartſhorn will be a proper drink, now and then adding red wine. When this diſorder is abated, to prevent a return, give the chalybeate powder. Sydenham recommends a ſweat, and to repeat it night and morning for ſeveral days when this caſe proves obſtinate.

A GOUTY DYSENTERY. When this mode of the *gout's* attack is preſent, there is a gnawing pain, a quick pulſe, and a ſmall fever. If at the time there is any *gouty* ſymptoms in the feet, they ſoon diſappear, fly to the inteſtines, where the diſtended arteries at length dilating, or burſting, blood is diſcharged, and paſſes off by ſtool, and ſometimes a quantity is thrown up by the mouth. Subſequent to this, are great languors, loſs of ſtrength, coldneſs of the extremities, and the utmoſt danger.

In this caſe, keep the patient as free from motion as poſſible. Cordials muſt be given with caution, leſt the blood ſhould be too much rarefied; juſt ſo much as to keep off ſwooning will be then needful. If the loſs of blood is conſiderable, give five or ſix drops of the tinct. opii in a ſpoonful of ſtrong cinnamon water now and then. The decoction of hartſhorn may be drank, but any other food or medicine muſt be omitted until the danger is leſſened. Great care is required to keep the bowels in a proper ſtate, for a tendency to either conſtipation or laxity are equally pernicious. Jellies are the moſt proper diet, rice milk for a change, and ſuch other aliment as is eaſily digeſted, nouriſhes much, and is agglutinant. As ſoon as the patient is a little recruited, ſteel waters may be uſed; and after a while, preparations of the iron itſelf may be adminiſtered.

A GOUTY MELANCHOLY. The tender and delicate are often reduced to this ſtate, during regular fits of the gout in the extremities. Theſe perſons are chearful in the intervals, but when the paroxyſms ceaſe or are imperfect, the appetite fails, and the digeſtion is depraved, rumblings in the bowels are troubleſome, and an almoſt conſtant pain is felt in the inteſtines; hence a melancholy is induced. When the *gout* is afflictive, this melancholy

choly abates; but when the *gout* gives way, the melancholy increaſes ſo that the intervals of health are very ſhort.

For relief from this deplorable ſtate, begin with an emetic, then give the pill. ex aloe cum myrrha, and in the evening after its operation, a cordial inſtead of an opiate. On the days that are free from purging, the tinct. aloes may be directed as an alterative. Let chearfulneſs be encouraged, daily exerciſe on horſeback, and ſuch means as may duly regulate the vital powers be attended to.

A Gouty Swooning. This may be from an imprudent uſe of cold liquors, from irregularities in the diet. The patients complain of general indiſpoſition, a paleneſs, and general cold ſweat comes on, the pulſe is ſlow and unequal, and, at length, they faint: whatever degree of the *gout* was in the extremities, now retires, and without ſpeedy help death cloſes the ſcene.

Speedily adminiſter cordials in a liquid form and large doſes; repeat them as often as the leaſt tendency to ſwooning may require; let frictions be uſed on the feet, and flannels wrung out of hot wine or brandy be applied to the belly: proceed thus until a recovery is effected. If the ſtomach ſeems oppreſſed with improper aliment, let it be diſcharged with an emetic of zincum vitriolatum purificatum, worked off with warm wine. One of the beſt cordials is brandy, mixed with as much hot water as the patient can bear to ſwallow with it.

The Gouty Asthma. Thoſe who are conſtitutionally inclined to an aſthma, are the moſt ſubject to this ſpecies of it. An injudicious uſe of opiates, and of repellents, a ſuppreſſion of any uſual evacuations may be the cauſe of the *gout* appearing in this form; an aſthmatic *gout* ſometimes follows an interrupted fit of the regular *gout*, as a fit of the *gout* ſometimes cures an aſthma. The *gouty* aſthma is of two kinds, viz. the dry and the moiſt. Thoſe who have been accuſtomed to drink ſpirituous liquors are moſt ſubject to the dry ſpecies, in which the breathing is ſhort and difficult, attended with oppreſſion in the breaſt; but there is little or no cough, nor any ſpitting. Thoſe of a thin lax habit are more ſubject to the moiſt kind, in which a viſcid matter is freely coughed up, and which relieves a little until a freſh quantity is accumulated. The *gouty* matter is ſometimes ſo diſcharged this way, that *gouty* perſons are kept clear from all other indiſpoſitions, whilſt free from returns of the regular *gout* by it. Sometimes the *gout* appears originally in the form of an aſthma, and cannot be diſtinguiſhed until a regular fit falling on the extremities frees the lungs. The dry aſthma is the moſt dangerous.

Where there is a ſanguine plethora, bleed. Where this is not attendant, repeated purging, with ſuch medicines as determines the *gout* to the extremities muſt be uſed. To relieve the cough, the uſual medicines are proper here. To prevent a return of either the dry or moiſt kinds, freſh air, an exact regimen, and particularly avoiding ſuppers, are of great ſervice. A tendency to the dry aſthma is beſt oppoſed by gum ammoniacum, with the chalybeate powder recommended above. The moiſt requires diuretics, perpetual bliſters between the ſhoulders, and iſſues above the knee on the inſide of the limb.

A Gouty Peripneumony. Thoſe with a tender conſtitution, and a bad conformation of the breaſt, or whoſe lungs have been hurt by ſome accident, are ſubject to this diſorder when alſo *gouty*. If a regular fit of the *gout* hath not previouſly affected the extremities, it is hardly poſſible to know that the *gout* is the cauſe when the ſymptoms of a peripneumony come on; but when a perſon who hath been uſed to regular fits of the *gout*, is more rarely, or more mildly affected by them than uſual, or when a regular fit is interrupted in its courſe, a heavineſs in the breaſt is perceived, a cough, and a load of phlegm in the lungs, which at the firſt is thin, but gradually grows thicker, and more abundant in quantity, after which there is an hoarſeneſs, with difficulty of breathing. As the ſpitting increaſes, the *gout* in the extremities declines. This ſpitting, if not ſo exceſſive as to greatly weaken the patient, is uſeful. Of all the above accidents a cough is the moſt frequent, and generally follows a regular fit, though it rarely accompanies it. It alſo ſometimes ends in a regular fit, eſpecially if aſſiſted by ſome briſk warming purge. A catarrh or defluxion is always accompanied with an aſthma and inflammation of the lungs. This is not dangerous, except the lungs are naturally very weak, or have been much hurt by any accidents. Theſe coughs and defluxions are rarely attended with any fever; but a ſlight cold, or a ſmall degree of imprudence in the uſe of ſpirituous liquors, endanger an inflammation of the lungs.

If the conſtitution is not very weak, bleed; and in all caſes of this kind give repeated purges. After the firſt purge, join pectorals to ſuch other remedies as tend to drive the *gout* to the extremities. In inveterate caſes the bark is very uſeful. If great care is not had to produce a regular *gout*, the cough increaſes, and the patient falls into a fatal conſumption. Diaphoretics, and externals to bring the *gout* into the feet, muſt be early uſed, or other means will be ineffectual. If this diſorder hath continued any time, the treatment will be wholly as in the peripneumony, without any regard to the *gout*, i. e. bleeding, gentle vomits, bliſters, and expectorants.

A Gouty Quinsy. This complaint ſometimes ſeizes the patient at the ſame time that the pain attacks the joints, at others it follows a regular fit. When it forms an abſceſs that diſcharges plentifully, it always ſupplies the place of a *gouty* fit. This quinſy ſometimes ends in a regular fit in the extremities. Perſons with ſhort thick necks are the moſt ſubject to this diſorder. A greater degree of fever precedes this quinſy than any other ſpecies of regular *gout*; and the blood, when taken away, is more ſizy than in any other inſtance of it. If a nauſea and ſickneſs, a heavineſs, numbneſs, and wandering pain hath preceded this diſorder, the cauſe may be ſuſpected to be *gouty*, if the patient was formerly ſubject to regular fits of the *gout*, and which have been ſome time paſt interrupted.

Begin the cure by a free bleeding; immediately after let a clyſter be injected; the next day let a gentle purge be given, a bliſter applied to the neck, and from the beginning uſe gargariſms.

In a day or two more, if the ſymptoms run high, repeat the bleeding. If the pain is conſiderable in the throat, a cataplaſm, may be applied warm acroſs it; and if danger of a ſuffocation attends, proceed to bronchotomy.

Whatever medicines are uſed, thoſe that drive the *gout* down to the feet muſt not be neglected. If the tumor in the throat ſuppurates, aſſiſt it with an emollient gargariſm, and when it is diſcharged, an aſtringent one ſhould be uſed.

The antimonial wine may be uſed in this caſe to moderate the fever.

A Gouty Consumption. The *gouty* matter affecting the already diſordered lungs, ſometimes produces a conſumption. At the firſt, a heavineſs in the breaſt, a difficulty of breathing, and hoarſeneſs comes on; then a thin phlegm is diſcharged, which ſoon grows thicker, and as it increaſes in quantity the patient waſtes away: in the mean time the extremities are free from all ſymptoms of the *gout*. A violent cough, which is always an attendant, brings on an hæmoptoe; at length a hectic comes on, followed by violent ſweats. Old men, and women after the time of child-bearing, are alone the ſubjects of this diſorder.

Bleeding and purging, ſo as not too much to diminiſh the vis vitæ, are proper remedies. If the leaſt appearance of *gouty* ſymptoms are obſerved in the extremities, apply ſtimulating topics to the part uſually affected: with proper linctuſes join the uſual remedies for determining the *gouty* matter to the feet; opiates muſt be uſed with great caution. After the lungs are quite relieved, chalybeate waters ſhould be drank for ſome time. Riding and iſſues are alſo not to be neglected.

The Gouty Head-ach. This is generally an attendant of thoſe who have been afflicted many years with the *gout*, and who indulge in luxury and eaſe. It is frequently preceded by the ſigns of an approaching fit of the *gout*, which ſigns end in a regular one; but the pain flies to the head, and continues there for ſome weeks or months, and, unleſs relief can be obtained, the reſult is an apoplexy. A giddineſs, noiſe in the ears, a large pulſe, difficulty of breathing, wandering pains in the limbs, a florid colour of the face, are attending ſymptoms, but they all vaniſh as ſoon as this head-ach is changed into a regular fit of the *gout* in the extremities.

Begin the cure with bleeding, eſpecially if accompanied with dimneſs of ſight, and a pulſation of the temporal arteries; but have regard to the *gout*, and be cautious of leſſening the powers of the conſtitution below what health requires. If the ſtomach is very uneaſy, order carduus, or camomile tea, to provoke two or three evacuations. A mild ſtomach purge ſhould alſo be given, and occaſi-

onally repeated. The uſual methods for producing a regular *gout* ſhould be uſed, but with caution, as ſometimes they rather aggravate the head-ach. The head may, however, be rubbed with ſp. ammoniæ compoſitus, and a bliſter applied betwixt the ſhoulders.

A GOUTY GIDDINESS. What is ſaid of the ſubjects, cauſes, &c. of the head-ach, are applicable here; but it may be obſerved, that this giddineſs does not terminate in an epilepſy as does the common ſort; but if a regular fit of the *gout* does not terminate it, an apoplexy may be the conſequence, and then the uſual ſymptoms of a common giddineſs leads on to thoſe of the apoplexy; ſo that its *gouty* nature muſt be diſcovered by attending to the ſtate of the conſtitution, and by conſidering what ſort of paroxyſms have preceded.

To remedy this diſorder proceed as in the head-ach, avoid waſhing the head with cold applications, keep the feet always warm, and the bowels lax.

The GOUTY APOPLEXY. In this caſe the head is heavy, the face bloated and red, the tongue often faulters, the motions of the body are diſorderly, and the ſteps are unequal, the diſorder increaſes, ſenſe and voluntary motion are loſt, the eyes become like thoſe of a corpſe, a ſnorting, &c. as in the genuine apoplexy, ſo that its *gouty* nature is to be diſcovered only by enquiring whether or not any *gouty* ſymptoms have preceded. One comfort attends this that does not in the common apoplexy, viz. that if the patient recovers of his diſtemper, he afterwards enjoys a much better ſtate of health.

The cure conſiſts in removing the *gout* into the extremities. Bleed as freely as the ſtrength and heat of the conſtitution will admit; inject a clyſter, in which are two large ſpoons full of common ſalt; and as ſoon as it can be ſwallowed, let a briſk purge be given. Keep the feet very warm, and apply to the joint that was laſt affected a ſtimulating plaſter. If the patient is not thus relieved, apply a bliſter to his neck, or all over his head; and one on each ancle, if the *gout* uſed to be moſt in the feet; or to the wriſts, if it chiefly affected the hands. Horſe-radiſh may be chewed to excite a diſcharge of ſaliva; the uſual medicines for expelling the *gout* are not to be omitted, the feet or hands may be ſtrongly rubbed two or three times a day. After recovery make iſſues.

The GOUTY PALSY. The *gouty* matter ſo affects the nerves in ſome inſtances as to be the cauſe of a palſy, and this more particularly in plethoric habits, thoſe who reſide in damp ſituations, live ſedentarily, indulge in exceſſes, &c. Affecting the tongue, it renders the ſpeech defective, or deſtroys it. Sometimes the appetite is diminiſhed, and an averſion to aliment is occaſioned by the ſtomach being affected: a member only ſuffers in ſome; in others, one ſide of the body, or the whole of it. If this diſorder happens in bilious conſtitutions, particularly if it occurs after a bilious colic, the patient loſes his appetite, he waſtes away, and his eyes have a yellow hue. Succeeding an apoplexy it is difficult of cure, and, if the apoplexy returns, it is fatal.

Begin the cure with bleeding, if the pulſe and heat admit of this evacuation, or at leaſt cup with ſcarifications on the back; preſently after inject a clyſter; ſtimulating purges muſt be repeatedly given to agitate the blood, and drive the *gout* into the extremities, and apply to the joints, that are moſt frequently the ſeat, ſome ſtimulating plaſter. After theſe, if a tumor appears on the extremity to which the application is made, lay a bliſtering plaſter on it, and another on the neck. The chalybeate powder ſhould be given with the bark; frictions and baths may alſo be uſed. Guard well againſt coſtiveneſs, and forget not to inſert iſſues.

The WANDERING GOUT. Gouty people often feel pains wandering in the back, loins, ſhoulders, external parts of the head, &c. which remove and return without fixing long any where; theſe are often miſtaken for rheumatic. The pain in this caſe reſembles that from a ſtone in the kidnies, but it is ſeated in the cellular membrane about the ſpine. The *gouty* matter falling on the eye cauſes an inflammation in its coats; an eryſipelas terminating in a *gout*, ſhews that its cauſe was a *gout*. Theſe kinds of *gouty* ſymptoms are leſs dangerous than when the viſcera are affected, and it is very rare that they fall on the internal parts, though they are often transferred to the extremities, cauſing regular fits of the *gout*. The teeth are ſometimes the ſeat of the wandering *gout*, ſo are the noſe, lips, tongue, and indeed any part of our frame.

When the back, ſhoulders, and external parts of the head are affected, if the pain is violent, and the ſtrength and heat will admit, begin with bleeding, then give an aloetic purge, and repeat it as occaſion requires. After which, if the diſorder is not thereby ſent into the joints, repeated ſweatings may be tried. The ſame method may be obſerved in wandering pains, or an eryſipelas from this cauſe. If the inflamed eye does not give way to this method alſo, waſh it with the following collyrium.

℞ Camphor. gr. vi. ſpi. vini Gal. & aq. puræ ää ℥ ii. m.

If this inflammation does not thus give way, bleed in the jugular vein, and the next day give a briſk purge; after which apply a bliſter to the neck, which keep open with the ung. cantharidis as long as poſſible, and, at the ſame time, uſe ſuch other means as bring the *gout* into the feet. If the pain in the teeth is obſtinate, proceed in the ſame manner as when the eye is inflamed; only inſtead of the collyrium, let horſe-radiſh, or other means be uſed, which promote a diſcharge of the ſaliva: or the tooth may be pulled out, and immediately put into its place again.

If the muſcles of the belly, ſide, breaſt, or the calves of the legs are the parts pained, apply bags of hot ſand, or bladders of hot water thereto, and if required, aſſiſt nature to drive the complaint to the extremities.

When this diſorder imitates the gravel, beſides the application of bladders filled with hot water upon the loins, inject clyſters, in which from ten to thirty drops of the tinct. opii are mixed.

The GOUT complicated with the STONE. This caſe ſhould not be confounded with the arthritic colic, in which the pain is about the navel, and not in the loins.

For relief in this painful ſituation, let the patient drink plentifully of a decoction of marſhmallow roots, ſo as to puke with it. Direct him a lubricating clyſter; as ſoon as this hath paſſed, a draught with tinct. opii, twenty or twenty-five drops will be proper; or let the enem. terebinth. be injected every hour, and opiates in ſmall quantities given by the mouth: but be careful in the uſe of aromatics leſt inflammation ſhould be excited in the part aggrieved. Purging with manna, diſſolved in whey, will alſo be proper, and may be repeated in three or four days, not forgetting an opiate after its operation.

In thoſe inſtances in which there is great debility without inflammation, bliſters, ſinapiſms, ſmall doſes of James's powder in the conf. aromat. powerfully remove the complaint. But even in the vague and miſplaced *gout*, where the nerves of the viſcera are rendered torpid, and almoſt inſenſible to the effects of ardent ſpirits, and warm active cordials are neceſſary to give warmth, and enable them to exert themſelves in this oppreſſed ſtate; yet gentle purging is alſo highly uſeful: here the warm aloetic purgatives carry off the offending matter, and thus afford great eaſe and relief. Sometimes, advantage is not to be expected from purgatives, as when the *gouty* ſymptoms are produced, not by a ſuperabundance of *gouty* matter, but by the *gout* affecting the nerves. In enfeebled ſubjects, medicines which invigorate the nerves are chiefly to be relied on; ſuch as the generous warm cordials, volatile ſalts, fœtid gums, warm ſtomachics, iron, &c.

Of the GOUT in the intervals of the FITS. It is only by the uſe of proper means, when no manifeſt diſorder attends, that any laſting advantages are to be reaped from medicine; and, even then, no ſpeedy relief is to be expected. The patient muſt be informed, that perſeverance muſt accompany patience, if any degree of durable benefit is obtained.

The means now uſed are reſidence in a good air, diet, exerciſe, and medicine. Theſe are to be attended to daily, and through life, becauſe the diſeaſe being habitual or conſtitutional, it neceſſarily requires continued oppoſition. Air, diet, and exerciſe, are to be ſuch as experience manifeſts to be the moſt ſuitable, and, as to medicines, thoſe which ſtrengthen the digeſtive powers, and ſuch as keep up the diſcharge through the ſkin, are to be properly adhered to. In order to prevent the gout, Dr. CULLEN ſays, that he is firmly perſuaded that any man, who early in life, will enter upon the conſtant practice of bodily labour, and abſtinence from animal food, will be preſerved entirely from the gout.

See Sydenham's Works, who admirably deſcribes the regular *gout*, with notes by Dr. Wallis; Muſgrave on the *Gout*; he excels in his deſcription of the irregular *gout*. See Warner's full and plain Account of the *Gout*, he includes the chief of what his predeceſſors have written on this

this ſubject. CULLEN's Firſt Lines, vol. ii. edit. 4. KIRKLAND's Inquiry, vol. i. Dr. CADOGAN's Diſſertation on the *Gout*. HOFFMAN de Dolore Podagrico. BOERHAAVE de Podagrâ. CAJETANUS TACCONUS Experiments on *Gouty* Matter. Dr. KIRKLAND and CHEYNE on the *Gout*.

ARTHROCACE. An ulcer of the cavity of the bone, with caries. See SPINA VENTOSA.

ARTHRODIA, from αρθρον, *a joint*, and δεχομαι, *to receive*. See DIARTHROSIS.

ARTHRODYNIA, αρθρον, *joint*, and οδυνη, *pain*. See RHEUMATISMUS.

ARTHRON. A JOINT. See ARTICULUS.

ARTHROPUOSIS, from αρθρον, *articulus*, and πυον, *pus*. This word is variouſly uſed. Dr. Aitkin, in his Elements of Surgery, expreſſeth by it, inflammation of a joint; and then by *phlegmone articuli*, he means the ſame thing. In another part of the ſame work he expreſſeth by it an abſceſs in a joint. And, in a third place in the ſame Elements, he with others uſes it as ſynonymous with inflammation in the loins, particularly in the cellular membrane lying under the pſoas muſcle, &c. as by Dr. Cullen.

Dr. Cullen by this word expreſſes a genus of diſeaſe which he ranks in the claſs pyrexiæ, Gen. 25. and order phlegmaſiæ; and as its ſynonyms, he places it with the *lumbago pſoadica*, *lumbago apoſtamatoſa*, *lumbago ab arthrocace*, *iſchias ex abſceſſu*, and *morbus coxarius*. In this diſeaſe he ſays there are pains in the joint or the muſcular parts which happen oftentimes after bruiſes, they are deep, dull, of long continuance; the ſwelling is either none, or but little diffuſed; no inflammation; the fever at firſt is gentle, but at laſt hectic; and to conclude, the part apoſtemates. See ABSCESSUS DORSI & LUMBORUM, and ISCHIATICUS, under ABSCESSUS, alſo PSOAS; Bell's Surgery, vol. v. 419. Kirkland's Med. Surgery, vol. i. p. 427.

ARTHROSIS. See ARTICULATIO.

ARTIA. According to ſome it is the ſame as *arteria*; and others ſay it is only the *aſpera arteria*.

ARTICOCA, or ARTICOCALUS. See CINARA.

ARTICULARIS MORBUS. When the gout riſes from the toes to the ancles and knees, and they ſwell and inflame, it is thus named.——VENA. Called alſo *ſubhumeralis*. Under the head of the os humeri the baſilica vena ſends off this branch. It paſſes almoſt tranſverſely round the neck of that bone from within backwards, and from behind outwards, and runs upon the ſcapula, where it communicates with the venæ ſcapulares externæ.

ARTICULATIO, ARTICULATION; alſo *Arthroſis*; *coarticulatio*; *aparthroſis*; *proſarthroſis*; *aſſarthroſis*; *campe*; *junctura*; *commiſſura*, is the joining of bones together, and is of two kinds, viz. *articulation* and *connection*. *Articulation* is of two kinds, 1ſt, DIARTHROSIS. 2dly, SYNARTHROSIS. There is a ſpecies compoſed of theſe two, which ſome call AMPHIARTHROSIS. See each under their ſeparate terms. CONNECTION is of three kinds. See SYMPHYSIS.

Articulation, in BOTANY, is the connection of parts that conſiſt of joints or knees, ſuch as the pods of French honeyſuckles, which, when ripe, divide into ſo many parts as there are knees or joints; alſo thoſe parts of plants which ſwell into nodes or joints, and which uſually ſend forth branches.

ARTICULUS. A JOINT; alſo, *Arthron*. The diſeaſes of the *joints* are luxatio, ſubluxatio, and anchyloſis, which ſee. The inſertion of a number of tendons into the ligament, ſerves not only to ſtrengthen it, but, by their action, to hinder it from being pinched in the motion of the limb, which is a mechaniſm obſerved in every *joint* of the body. Wounds here often require amputation. See VULNUS.

ARTIFICIALE. Whatever is made or prepared either of the native ſtone of cinnabar itſelf, or from the vein of cinnabar.

ARTIFICIALIS SAL. See MARINUS SAL.

ARTISCHOCUS LÆVIS. See CINARA.

ARTISCUS, from αρτος, *bread*. Troches are thus called, becauſe formed like a loaf.

ARTIYPOCHROS COLOR. A paliſh yellow colour which attends a diſorder of the ſpleen.

ARTIZOA, from ζωη, *life*. SHORT-LIVED.

ARTOICUM. See ARTHOICUM.

ARTOMELI, from αρτος, *bread*, and μελι, *honey*. A ſort of cataplaſm prepared of bread and honey.

ARTOPTICIUS PANIS. TOASTED BREAD.

ARTOS, αρτος, *bread*. See PANIS.

ARTYMA. See CONDIMENTUM.

ARUBUS. } BUTTER. See ADEPS.
ARVINA. }

ARUM, called alſo arum maculatum, *aron*, *jarus*, *iſaros*, *pes vituli*, *barba aronis*, *ſacerdotis virile*, *ſerpentaria min.* *dracontia minor*. *alimum*; LORDS and LADIES, CUCKOW-PINT, WAKE ROBIN.

Ray enumerates ten ſpecies. That directed by the college of Edinburgh, is the ARUM MACULATUM, or *arum* acaule, foliis haſtatis integerrimis, ſpadice clavato. CL. GYNANDRIA. ORDO. POLYANDRIA LINN. Gen. Pl. 1028.

It is a low perennial plant, grows wild under hedges, and by the ſides or banks in ſhady places. In March it ſends out two or three leaves ſhaped like a ſpear, a naked ſtalk follows theſe, which bears a purpliſh piſtil incloſed in a long ſheath, followed in July by a bunch of red berries. Some of the plants have leaves that are ſpotted black, others with white, and others have none. The black ſpotted are the ſtrongeſt of all the three. Thoſe that grow in moiſt ſhades are ſtronger than thoſe that grow in dry expoſed places.

The root is irregularly round, tuberous, about an inch thick, ſending off many long ſimple fibres, and in the medicinal part of this plant, it is brown on the outſide, and white within. It is acrid and pungent to the taſte. If chewed, the tongue will be affected with a burning ſenſation, which continues for ſome hours, but may ſoon be relieved with a little milk. The firm, hard roots ſhould be choſen. They loſe too much by drying to be worth keeping, for by heat they become a bland farinaceous aliment; but a ſyrup made with them would keep as well as the ſyrup made of garlic does. They afford nothing by diſtillation, nor infuſion; yet if buried in freſh ſand, they will keep very well for ſeveral months, provided that they are kept juſt moiſt only; and, in every ſeaſon, they are in full virtue alike. BERGIUS conſiders this root as ſtimulant, aperient, inciding, and diuretic. And indeed, the more ancient writers ſpeak highly of it both as an internal, and external remedy. Upon account of its ſubtile and volatile particles, it moſt powerfully attenuates, and reſolves the thick viſcid mucus of the ſtomach, and that adhering to the ſides of the inteſtines. BERGIUS conſiders it as uſeful in a pituitous colluvies, loſs of appetite, ſympathetic headach, (in which laſt, though of the moſt violent kind, the powder had been ſucceſsful, when they had reſiſted every other means), humoral aſthma, and intermittent fever. Arum is certainly a very powerful ſtimulant, and by promoting the ſecretions, may be advantageouſly employed in chachectic, chlorotic, and rheumatic affections; and in various other complaints of phlegmatic and torpid conſtitutions; but more eſpecially in a weakened relaxed ſtate of the ſtomach, occaſioned by a prevalence of a viſcid mucus.

As a warm ſtimulant it may be given, if mixed with a mucilage of gum arabic; or as follows:

℞ Rad. *ari* recent. bene contus. Pulv. gum. arab. ãã part. ij. Spermat. cæti, part. i. Syr. alb. q. ſ. f. electar.

A continued uſe of this firſt warms the ſtomach, excites the activity of the digeſtive powers when they happen to be languid, and ſtimulates the whole ſyſtem. Bergius tells us it manifeſtly promoted perſpiration, and frequently produced a plentiful ſweat—the doſe of the freſh root from 10 gr. to i. ℈. It hath been uſed in deep-ſeated pains of the rheumatic kind ſucceſsfully.

The root anſwers, as well as garlic, for cataplaſms to be applied on the feet in deliriums, &c. Cullen's Mat. Med.

The London college in the Pharmacopœia of 1788, order the following formula.

CONSERVA ARI. *Conſerve of wake-robin*. Take the freſh root of *wake-robin* bruiſed, half a pound; clarified ſugar one pound and a half; beat them together in a mortar: the doſe is one dram.

ARUM MOSCHATUM. See PIPER.——POLYPHYLLUM, DRACUNCULUS. See DRACONTIUM.

ARUNDO FARCTA INDIÆ ORIENTALIS. The DRAGON'S BLOOD CANE. It grows in the Eaſt Indies. The juice of its fruit is called dragon's blood in drops.

ARUNDO INDICA. See SAGITTARIA ALEXIPHARMACA.——MAJOR. A name of the TIBIA, which ſee.——MINOR. A name of the fibula.——SACCHARIFERA.——VIVA BRASILIENSIBUS. See SACCHARUM.——SYRIACA. See CALAMUS AROMATICUS.

ARVISIUM. See MALVASIA.

ARYTÆNO-EPIGLOTTICI. Theſe are ſmall fleſhy

fleſhy faſciculi, each of which is fixed by one end in the head of one of the arytænoid cartilages, and the other in the neareſt edge of the epiglottis.

ARYTENOIDEÆ CARTILAGINES. See ASPERA ARTERIA.

ARYTÆNOIDES, vel ARETÆNOIDES, from ἀρυταινα, *a funnel*, and εἶδος, *ſhape*. The *arytænoid*, or EWER-LIKE CARTILAGE. Called alſo *Guttalis*, *Gutturiformis*. An epithet of two cartilages, which, together with others, conſtitute the head of the larynx.

ARYTÆNOIDEI MUSCUL. MINOR, vel Obliquus, vel Tranſverſalis. They are ſituated on the back part of the *arytænoid* cartilage. They are very ſmall muſcles which run upon the ſurface of the greater *arytænoid* muſcles; they ariſe from that part of each of the cartilagines *arytænoideæ*, next the cricoides on the other ſides, and terminating in that part of the other or adjoining the *arytænoidal* cartilage, that is fartheſt from the cricoides on the other ſides. Their uſe is to aſſiſt the *arytænoidei majores* in their action, which is much ſtrengthened by the manifeſt decuſſation of their fibres. Douglas.——MAJORES. They are under the *arytænoides* minores. They have an inſertion into the annular cartilage, and help to cloſe the glottis. They ariſe fleſhy from the *arytænoid* cartilages near their junction with the cricoid cartilages, and running tranſverſely of an equal breadth, with ſtrait fibres. They are inſerted into the ſame ſide of the other cartilage. Their uſe is to ſhut the rimula, or chink called glottis, by bringing theſe two cartilages nearer one another.

ARITHMUS, ARRYTHMUS, ENRYTHMOS, from ἀ, *negative*, and ῥυθμος, *a modulation*, or modification of time and ſound in muſic; but uſed to expreſs order and harmony in other things. Galen applies it to the pulſe not modulating according to nature. It is oppoſed to eurithmus, or juſtly modulated. The pulſus *arythmus* is of three kinds.

Every age hath its natural pulſe, which, as long as it keeps in its due RYTHMUS, or modulation of time and force, is called EURITHMUS; but if it deviates, it is a pulſus *arythmus*. But,

1ſt, If it runs into a modulation proper to the next age, it is pulſus PARARYTHMUS.

2dly, If it changes to a pulſe proper for any other age, it is called pulſus HETERO-RYTHMUS.

3dly, If it paſſes into a modulation not proper to any age, it is then a pulſus ECRYTHMUS, diſorderly or irregular.

AS, It was a weight and a meaſure amongſt the Romans, each of twelve ounces. See CYATHUS.

ASA. HEALER.

—— DULCIS. } See BENZOINUM.
—— —— ODORATA. }

—— FOETIDA, vel ASSA FOETIDA. *Alith*, *andjudæn*. The STINKING HEALER. Alſo called *hingiſch*, *laſer*, *laſer-pitium*, *ſilphium*, *hin*, *hing*, *cyrenaicus ſuccus*, *hindiſch*, DEVIL'S DUNG. It is the fetid concrete juice of a plant which grows in Perſia, and other parts of the eaſtern countries. Kempfer ſays, that the plant is a-kin to lovage, and that it is the root which yields the gummy juice. See Kempfer's Amænitates Exoticæ. It is the juice of the FERULA ASSA FŒTIDA, or FERULA PERSICA *umbellifera*, *foliolis alternatim ſinuatis obtuſis*, *floribus ex viridi luteis*. CLASS PENTANDRIA. ORD. DIGYNIA. LINN. Gen. Plant. 343. But from Dr. Hope's deſcription of it in the Philoſophical Tranſactions vol. lxxv, it is thought probable, from the difference being ſo conſiderable, that aſſa fœtida may be produced by different ſpecies of the ferula. This juice is whitiſh at the firſt, but it gradually becomes brown, and grows harder alſo. The beſt pieces that are brought into Europe are of a pale and red colour, variegated with white. This gum hath a ſtrong fetid ſmell like that of garlic, and a nauſeous bitter biting taſte, but loſes much by keeping. Its ſmell and taſte reſide in the reſinous part, ſpirit is therefore the beſt to digeſt it in; though water extracts the greateſt part of it by the aid of the gummy matter. In diſtillation with water there is a ſtrong impregnation, and thus a pale-coloured eſſential oil is received; the remaining decoction affords a bitter extract.

As a medicine it is in high eſteem; it is the ſtrongeſt of all the deobſtruent fetid warm gums; it is more diaphoretic and expectorant than the gum ammoniacum. When it diſagrees by reaſon of its ſtrength, the milder gums of ſimilar efficacy ſhould be uſed in its ſtead. The next to it is the gum galbanum, which if too ſtrong muſt give way to the gum ſagapenum, or to the ſtill milder gum ammoniacum, or to myrrh, or to the wild valerian root which is the mildeſt of them all. In flatulencies, and all the ſymptoms called nervous, it acts as an anodyne and antiſpaſmodic; though ſometimes the addition of muſk, or opium, or both, greatly improves its efficacy. It is by far more quick in its effects than any other of the fetid gums; and it is the ſpeedieſt in relieving the anxieties and oppreſſions of the precordia, which frequently attend nervous diſorders, and malignant fevers: but in ſuch caſes its efficacy is increaſed by joining it with valerian, one part of the former to two parts of the latter may be a general proportion. Large doſes of *aſſa fœtida*, with a bliſter on the back, hath relieved in epilepſies, and in palſies that ſucceed epilepſies; proper evacuations premiſed. It is a ſovereign remedy if joined with ſalt of amber and bliſters. In the nervous aſthma, joined with an equal quantity of the gum ammoniacum, it relieves to admiration; however, it muſt be owned that it ſometimes fails in this caſe, and then the bark is to be tried. In hyſteric complaints, fetids are only palliatives; in hyſteric ſuffocations a plaſter of *aſſa fœtida* ʒ vi. and camp. ʒ ſs. mixed, by far excels thoſe made of the gum galbanum: for its quick operation, it is beſt diſſolved in volatile ſpirits. In nervous caſes it acts as an opiate ſometimes where opium fails, and without leaving any lowneſs on the ſpirits, and where neither ſucceed ſeparately, they often anſwer if joined. Cullen's Mat. Med.

The officinal preparations are the

Pilulæ Gummoſæ, *now Pilulæ e Gummi*. GUM PILLS. Ph. Lond. 1788.

Take galbanum, opopanax, myrrh, and ſagapenum, of each an ounce; of *aſſa fœtida*, half an ounce; with the ſyrup of ſaffron, beat them together.

At the firſt taking of theſe pills, much diſorder is occaſioned in ſome nervous conſtitutions; but this effect ſoon wears off, or may be relieved by a doſe of opium taken at bed time.

SPIRITUS VOLATILIS FŒTIDUS. FETID VOLATILE SPIRIT. *Now*, *Spiritus Ammoniæ* Fœtidus. FETID SPIRIT *of* AMMONIA.

Take of any fixed alkaline ſalt, a pound and a half; of ſal ammoniac, a pound; *aſa fœtida*, four ounces; of proof ſpirit, three quarts. Diſtil off, with a gentle heat, five pints. Ph. Lond. 1788.

The doſe from one to two ſcruples; and is ſuppoſed to be an improvement on the volatile alkali, by giving it more activity in ſpaſmodic aſthmas, and other nervous complaints.

Tinctura Fœtida. *The* FETID TINCTURE. *Now*, *Tinctura* Aſæ Fœtidæ. TINCTURE of ASA FOETIDA.

Take of *aſa fœtida*, four ounces; of rectified ſpirit of wine, one quart; digeſt with a gentle heat for ſix days, and ſtrain.

The doſe is from ʒſs. to ʒ j. or more, in any proper vehicle. The gum, though, is conſidered as beſt given in a watery ſolution. In ſtrong convulſions from one to two drams of the ſubſtance, diſſolved in four or ſix ounces of diſtilled water, have been adminiſtered by way of glyſter, with ſucceſs. The doſe in ſubſtance is from ten to twenty grains.

ASAB. See BOROZAIL.

ASABA HERMES. See HERMODACTYLUS.

ASABON. See SAPO.

ASAGAR. See ÆRUG. ÆRIS.

ASAGEN. See SANG. DRAC.

ASAGI. See VITRIOLUM.

ASAMAR. See ÆRUG. ÆRIS.

ASAMAZ. See VITRIOLUM.

ASANON. PREPARED SAL AMMONIAC. See ALKALI.

ASAPHATUM. A ſort of ſerpigo, impetigo, or intercutaneous itch, generated in the pores like worms. When the ſkin is impreſſed, they come out like long threads, with black heads.

ASAPHEIS, from ἀ, *negative*, and σαφης, *clear*. Such patients as do not utter their words diſtinctly are thus named.

ASAPHIA. } It is the *paraphonia palatina* of
ASAPHODES. } Cullen. See PARAPHONIA. It is derived from ἀ, neg. and σαφης, *clear*. Hippocrates uſes this word to expreſs that utterance of words that is not clear;

clear; a muffled hesitating tongue that hath no plain utterance; such a confusedness of voice as proceeds from an indisposition of the organs of speech. Sometimes this word signifies a dubious kind of delirium not easy to be discovered.

ASARABACCA. See ASARUM.

ASARCON, *a*, non, from *σαρξ, caro*. VOID of FLESH.

ASARI PULVIS COMP. See ASARUM.

ASARITES. The wine of asarum, made with must, lb. vi. and asarum three ounces.

ASARON, ASARUM, } called also *nardus rustica, nardus montana*, WILD NARD, and COMMON ASSARABACCA. The species in use is the ASARUM EUROPEUM, foliis reniformibus obtusis binis. CL. DODECANDRIA. ORD. MONOGYNIA. Linn. Gen. Plant. 589.

It is a low plant, without stalks, the leaves are stiff and roundish, with two little ears resembling a kidney, of a dark shining green colour, set on pedicles three or four inches long. The flowers consist of purplish stamina, standing in a cup, and are followed each by a capsule containing six seeds. It is perennial and evergreen, a native of the southern parts of Europe and the warmer climes, and raised in our gardens. The dried roots are brought from the Levant, but those of our own growth are nearly as good.

The roots and leaves have a strongish, but not unpleasant smell, somewhat like that of nard, and a nauseous, bitter, acrid taste. They both have the same effect as a medicine; but when dry, three times the quantity should be given that is required of the fresh: twenty grains is emetic and cathartic. In small doses this herb promotes the menses, is diuretic, and perspirative. Spirit of wine extracts its virtues, and, infused in water, it gives out a considerable portion of them. Boiled in water its virtues are destroyed, but not if boiled in wine.

Its operation is rugged, and its use in practice confined to that of an errhine; amongst which class it is found the most useful and convenient. A grain or two of the powdered root snuffed up the nose, procures a considerable evacuation, without causing the patient to sneeze. The leaves, though as strong as the roots in all other respects, in this of an errhine are milder. The herb snuffs have this plant for their basis. Cullen's Mat. Med.

An ounce of juice expressed from the fresh leaves, operates as an emetic in maniacs, when antimonials fail.

The London college directs the following sternutatory:

PULVIS STERNUTATORIUS. SNEEZING POWDER. *Now*, PULVIS ASARI COMPOSITUS. COMPOUND POWDER of ASSARABACCA.

Take the dried leaves of assarabacca, of marjoram, of Syrian maslich, thyme, and dried lavender flowers, of each an ounce. Mix, and make them into a powder.

This powder was called pulv. cephalicus.

ASARUM VIRGINIANUM, called also *serpentaria nigra*, asarum cyclamina BLACK SNAKE-WEED.

This hath leaves like those of pistolochia, and are spotted like *arthanita* or fow-bread. The roots are brought from Virginia, mixed with the rad. serpent. Virg. and are used as being the same.

ASBESTINUM. } See AMIANTHUS. Also
ASBESTOS, or ASBESTUS. } a name for *Calx viva*.

ASCALONIA. A species of ONIONS.

ASCALONITIDES. ESCHALOTS, BARREN ONIONS, or SCALLIONS.

ASCALONITES. A species of ONIONS, called SCALLIONS.

ASCARDAMYCTES. One who keeps his eyes long fixed and immovable, without twinkling.

ASCARIDES. See VERMES.

ASCENSUS MORBI. The ascent or increase of a disease.

ASCETÆ. WRESTLERS.

ASCHIA. The GRAYLING or UMBER. The fish is remarkable for its delighting in rapid streams that are shallow and clear.

ASCIA. See DELICATIO.

ASCITES, from *ασκος, uter*, a *bottle*, or *water bottle*, It is termed also *ascites, hydrocele peritonæi*. It is the DROPSY of the BELLY. When water is accumulated in the cavity of the belly, betwixt the peritoneum and the viscera, in the dilated cavities of the glands or other vessels contained in the abdomen; or in the duplicature of the peritoneum, it constitutes this disease. See Kirkland's Med. Surgery for an instance of an encysted *ascites*, vol. ii. p. 165.

Dr. Cullen ranks this genus of disease in the class CACHEXIÆ and order INTUMESCENTIÆ; which he defines, a tensive, slightly elastic, but fluctuating intumescence of the abdomen, of which he enumerates two species. 1st. ASCITES ABDOMINALIS, *abdominal ascites*: when there is a regular and equal intumescence of the abdomen, and a perceptible fluctuation; the varieties of which arise are formed according to the cause, either FROM OBSTRUCTION OF THE VISCERA, FROM DEBILITY, or from THINNESS OF THE BLOOD; or on account of the liquid effused, whether *pus, urine, chyle*, or *oily fluid*. 2d. ASCITES SACCATUS, SACCATED ASCITES; when the ovaries, &c. are the seat of the disease, wherein the tumor of the abdomen, at least in the beginning, is partial, and the fluctuation less evident than in the former species.

SAUVAGES forms a different division, and by no means an useless one, he arranges the ascites into; 1st, *the serous abdominal*, of which he forms thirteen varieties. 2d. *Serous not abdominal*, of which are six varieties. 3d, *Abdominal not serous*, of which there are five. 4th, *Neither serous nor abdominal*, of which he forms six varieties. See NOSOLOGIA METHODICA, vol. ii. p. 498.

We, however, in this place consider such species only where a preternatural accumulation of water is the cause, from which no age or sex are exempt, though it generally occurs in old men, and women after child-bearing.

The causes are various; the jaundice, long continued intermittents, an asthma, a rupture of some lymphatic vessel, obstructions in any of the viscera, most frequently a scirrhous liver, and, in short, whatever can lessen the quantity of crassamentum in the blood, and weaken the system, may be a general cause: but the immediate causes are either a rupture of the lymphatics, in which case the fluid appears whitish when tapping is performed; or the exhalent vessels throwing off more than the absorbents can take up again.

This kind of *dropsy* is sometimes very rapid in its approach and progress, then continues many years without making any progress; at others its advances are very slow, even a number of years before it manifests itself in a confirmed state. One of the first signs is a pitting of the ankles towards the evening, with a shortness of breath; though it should be observed that the pitting of the ankles is not conclusive, for it often attends pregnant women, and old men with gross habits, and who have laboured many years under an asthma, who, when suddenly freed therefrom, have an œdematous swelling in their ankles. However, if after the swelling of the feet, the legs and thighs swell too, the case is plain, and this usually happens in the progress of the *ascites*. Besides these symptoms, the inside of the hands are dry and hard; transpiration is greatly diminished; the urine is less and less in quantity, appears turbid, high-coloured, and deposits a large quantity of a lateritious sediment; the belly gradually swells; and in proportion the breathing becomes short, the appetite for solid food fails, and thirst increases; a slow fever attends, the face and arms are emaciated; a paleness at first, and afterwards a yellowish colour, is seen in the skin; these symptoms growing worse, a dry cough comes on; the belly is greatly distended; and, *except the water is contained in cysts, or hath rendered the integuments too tense*, it may be felt to fluctuate by gently tapping one side of the belly with one hand, while the other is placed on the opposite side; at length little blisters arise on the feet, which containing an acrid liquor, corrodes, inflames, and ulcerates them; when this symptom appears the bowels are also inflamed, and death is at hand. Many other symptoms occur, owing to different constitutional circumstances, &c. but these already recited are the more constant attendants.

The *ascites* must be distinguished from pregnancy, from excrescences, and other tumors in the belly; and from a tympany.

If a scirrhus in any of the viscera is the cause, a cure is not to be expected. A purging, by preventing the efficacy of medicines, is a dangerous, generally a fatal circumstance. If an *ascites* succeeds other diseases, in which the viscera were injured, if the thirst is great, and other symptoms violent, there is but little hopes of recovery. An hæmorrhage, or an erysipelas coming on, with an increase of the fever, are destructive visitants. It is a bad sign, if, when diuretics are judiciously used, the urine is not discharged in a proper quantity. If the fluctuation, when the hand is laid on one side of the belly and struck with the other on the other side, can be felt only partial-

ly, the operation of tapping is even then vindicable, as it will afford a temporary relief; though in ſuch a caſe you are not to promiſe an emptying of the belly totally; for if you do, ſeven times in ten you will be deceived, except you can feel the fluctuation by ſtriking on any point of the belly. But on the other hand, if perſpiration encreaſes, or the diſcharge of urine becomes plentiful, theſe afford favourable prognoſtics. Indeed, without the urine continues to flow tolerably freely, there remains very little hope of a perfect recovery.

IN ORDER TO THE CURE, the intentions are, firſt, to promote the natural ſecretions, that the water may be evacuated; and ſecondly, to increaſe the activity of the ſyſtem in general, and of the abſorbents in particular; which, if the viſcera are unſound, cannot be effected. Whatever increaſeth bodily ſtrength, will aſſiſt in carrying off the water, by giving power to the abſorbent veſſels. Some dropſies, therefore may be cured in the beginning by exerciſe, the bark, chalybeates; but this method will not ſucceed, except where the ſtrength is but little impaired, the vital parts ſound, and abſorbing powers ſtrong. In general, more ſucceſs may be expected from attempting an increaſe of the urinary diſcharge, particularly if the complaint is of long ſtanding, and the bowels are weak.

The diet ſhould be cordial and nouriſhing; and vinous liquors are to be preferred for drink to all other kinds; the following medical one may be daily uſed:

℞ Rad. raph. ruſt. rec. ſem. ſinap. non contuſ. ſummit. abſinth. āā ʒ i. vin. alb. lb. iii. m. infunde frigid. & colaturæ cap. ℥ iv. ter quaterve in die. Muſtard-whey may be made for a change, and with conſiderable advantage.

Frictions, exerciſe without fatigue, and a dry air, conduce much to the patient's relief.

The application of the CAMPHORATUM OLEUM, ſee CAMPHORA, has been attended with ſucceſs, particularly in relieving the pain of the abdomen attendant on this complaint, and has been thought to aſſiſt much in reabſorption of the effuſed fluid: perhaps the friction uſed in this caſe, which ſhould be continued for twenty or thirty minutes at leaſt, two or three times a day, may add to its efficacy.

Proper evacuations being made, proceed with antimonials, chalybeates, aromatics, diuretics, or ſudorifics. In the uſe of evacuations the choice of them may be directed by conſidering the cauſe of the diſeaſe; as when obſtructed perſpiration gave riſe to it, ſudorifics will be indicated, &c.

Stimulating, acrid, and aromatic medicines, ſhould accompany the uſe of evacuants, that the extravaſated fluids may be abſorbed and determined to the reſpective emunctories; in weakly habits, diuretics and ſudorifics may accompany them; in the more robuſt, emetics and cathartics may be uſed.

As to purges, in anaſarcous caſes, ſtrong doſes of the draſtic kind are often neceſſary; but in the *aſcites* ſome caution is to be had in their uſe, leſt an inflammation ſhould be produced: in a beginning complaint of this ſort, briſk doſes, and of the active kind, ſometimes do well; but when the patient's ſtrength is reduced, more moderate ones, or purgatives mixed with emetics, will be the beſt, and they may be thus adminiſtered; moderate doſes of them may be alternately repeated, and in their intervals diuretics and corroborants are to be duly ſupplied.

Purges ſhould be repeated as often as the patient's ſtrength will admit; when their uſe is thought neceſſary, during their operation, cordial liquors inſtead of the uſual ſimple ones, ſhould be given, and at night an opiate muſt not be omitted. It is true that different purging medicines will be required for different patients, and ſometimes for the ſame at different times; but in general for the ſtronger calomel and jalap, and for the weaker calomel and rhubarb, will be proper: as ſoon as they are worked off, the following, or ſuch like draughts, will be neceſſary, the belly being quickly diſtended again, if it is neglected. In general, if emetics and purgatives are given, it ſhould only be in the early ſtate of the diſeaſe, where the patient is young, and the internal parts yet remain firm and uninjured; for if due ſkill and caution do not direct, they will increaſe the patient's weakneſs, and aggravate the diſeaſe. Sometimes, indeed, they promote urine, when diuretics fail, and in ſuch caſes they may be continued with advantage; but after their operation, it will be judicious to direct ſome proper ſtrengthener, that the veſſels may be braced as the water is drained off.

℞ Syr. papaveris ℥ ſs. vel ʒ i. ſps. menth. pip. aquæ ammoniæ acetatæ āā ʒ ſs. tincturæ cardamomi compoſitæ ʒ ij. ſal ſuccin. gr. vi. m. f. hauſt.

Many other forms are to be met with in Brookes's, or in the London Practice of Phyſic, by which the preſcriber may be directed to an agreeable and uſeful variety.

When the water of an *aſcites* is carried off by any other method than by a puncture through the peritoneum, it is done by that operation of nature called abſorption; purging, ſweating, and diuretics of all other medicines, moſt promote it, whence their principal uſe.

Vomiting, when the viſcera are ſound and the ſtrength will admit, by the ſhock it gives to the belly in particular, and its efficacy in promoting abſorption, is highly beneficial.

If the ſwelling is moderate, or the conſtitution feeble, diuretics will be more ſuitable than emetics and cathartics; though they require to be accompanied with warm ſtrengtheners; and when the cure is attempted this way, purgatives ſhould be wholly omitted. In cold pituitous habits fixt alkaline ſalts are the beſt diuretics; kali may be added to every pint of wine that is drank, and a common wine-glaſs full may be taken every three hours; brandy or rum may be given with a watery infuſion of juniper berries. Of the varieties for drink, thoſe to which the conſtitution is the leaſt accuſtomed, generally paſs off the ſooneſt; and hence a frequent change of liquors may be attended with advantage. But where a fever attends, inſtead of the fixt alkaline ſalts, the neutral are to be preſcribed; and here the following forms have generally the moſt deſirable effects:

℞ Ferri rubiginis ʒ ij. ad ℥ ſs. rad. ſcillæ pulv. ʒ i. pulveris aromatici, ʒ ij. conf. abſ. maritimi, ʒ ii. ſyr. q. ſ. f. electar, cujus capt. q. n. m. bis terve in die cum hauſt. ſeq.

℞ Kali acetati ʒ ſs. ad ʒ i. ſs. aq. diſtillat. ℥ i. ſs. ſps. raph. comp. ʒ ij. m.

If the ſaline ingredient runs off by ſtool, it muſt be checked. The bark, joined with iron, ſoap, and rhubarb, ſucceeds very well, when accompanied with this neutral ſalt. Diuretics ſometimes fail from a ſpaſm affecting the kidneys; in which caſe give, now and then, a teaſpoonful of oxym. ſcillæ. and tinct. aſæ fœtidæ in the patient's drink; and afterwards, to relieve the pain in the bowels, &c. give magneſia and powdered galangal root.

Dr. Leatherland obſerves, that an *aſcites* is the leaſt apt to return when removed by diuretics.

Hellebore, joined with lixivial ſalts, is powerfully diuretic. The tonic pills of Dr. BACHER are celebrated in *dropſies*; their operation is purgative and diuretic: hellebore is the chief part in their compoſition; they are thus prepared.

℞ Extract. hellebori nigri, myrrhæ ſolutæ, āā ℥ i. card. bened. pulv. ʒ iij. & ♃ i. m. f. maſſa, aere ficco exſiccanda, donec formandis pilulis apta ſit, ſingul. ad gran. ſemis.

The extract is made from the helleborus niger foliis anguſtioribus of Tournefort, and is obtained thus: bruiſe the roots, cover them with ſpirit of wine, in which ⅛th part of a fixt alcaline ſalt was previouſly mixed; let them ſtand twelve hours, now and then ſtirring them about; pour off this, and add a freſh quantity of ſpirit; treat it as before, then pour on as much Rheniſh wine as will riſe about ſix inches above the ſurface of the hellebore, and now and then add a little, to keep it to the ſame height for forty-eight hours, after which ſet it over the fire to boil for half an hour, then ſtrain by the aſſiſtance of ſtrong expreſſion: repeat the whole of this proceſs with the remaining root. Mix the liquors obtained at both expreſſions, and add to the whole twice the quantity of boiling water; then evaporate to the conſiſtence of a ſyrup: and to it again about twice the quantity of boiling water, and evaporate as before. Then add about a ninth part of the ſpirit of wine, and evaporate the whole to the conſiſtence of turpentine. Thus the volatile, naſeous, and acrid parts are diſſipated, the uſeful active parts being ſtill retained.

The ſolution of the myrrh is made by diſſolving it in water over a gentle fire, ſtraining through a linen cloth, and then evaporating to the conſiſtence of a thin extract. As to the carduus, the dried leaves gathered before the ſeeds appear, are to be powdered fine.

Theſe pills have been given in different numbers up to thirty for a doſe, taken by ten at a time, and an hour between

tween each portion. As they brace up the ſolids, they are prohibited where inflammation, ſuppuration, or tendency to a gangrene is ſuſpected; but in cold pituitous habits they are greatly to be relied on. Though it hath been generally ſaid that the thirſt of hydropic patients is not to be gratified by a free uſe of liquids, Dr. Bacher orders them without any reſtraint, and aſſerts that the efficacy of his medicine very much depends on the unreſtrained uſe of milk ones. He alſo ſays, that, whatever may be the principle of cure, in all dropſical caſes, the patient ſhould drink in proportion to the requirement of his thirſt. This practice of allowing the patient to drink is farther confirmed by the ſucceſs of ſeveral inſtances collected by Sir Geo. Baker, and related in the Lond. Med. Tranſ. vol. ii.

The urinary diſcharges are alſo much promoted by opium, in caſes that are attended with much pain, eſpecially when it is ſeated about the kidneys.

The forms of diuretics are numerous, and ſo abound in all practical writers, as to render a long liſt of them unneceſſary here: however, as ſquills are generally uſed in theſe caſes, it may be obſerved that they are moſt diuretic when neither very dry nor very moiſt. The common doſe is from two to three grains, night and morning, and it is to be obſerved that they ſeldom are uſeful without they create a nauſea, and ſome vomiting; this is pretty clearly proved in the clinical experiments of Dr. Home.

Horſe-radiſh may be eaten freely, and whole muſtard-ſeed may be ſwallowed two or three times a day, to the quantity of a table ſpoonful at a time. And as the vehicle in which diuretics are adminiſtered may leſſen or improve their effects, it may be obſerved that whey is one of the moſt convenient; in want of which an infuſion of juniper berries, or other materials of ſimiliar quality, may be ſubſtituted; or a decoction of the ſeneka root may be uſed. Diuretics are a very uncertain kind of medicines; and ſo diverſified they are in their effects on different habits, that until trial is made, it will be difficult to fix on any thing: they operate the beſt when the patient is much in the open air. Great benefit has been derived from the uſe of the digitalis purpurea, *fox-glove*, in ſmall doſes, from one to two, three, or four grains, twice a day, in powder or in decoction. Dr. Withering thinks it one of the moſt certain diuretics in the whole materia medica, on which he has written a pamphlet well worth conſulting.

Sudorifics have ſucceeded, but are very uncertain; of theſe none ſeems to excel the pulv. ſudorific. Doctoris Doveri, now called pulvis ipecacuanhæ compoſitus. Ph. Lond. 1788. Their happieſt effects are, when ſome relief is already obtained by ſome other means. Dr. Percival gives an inſtance of ſucceſs, in the ſecond vol. of his Eſſays, from rubbing the ſkin every night and morning with dry cloths fumigated with camphor, and giving internally the mixtura e camphor. ſo as that a dram of camphor was taken in a day.

Cream of tartar has been highly extolled; for an account of which, and ſome others, ſee ANASARCA.

A ſalivation raiſed with mercury hath ſucceeded after the failure of all the other uſual means.

When the *aſcites* is attended with an anaſarca, ſcarifications made in the legs may be tried before tapping; but there is no direct method by which the water of an *aſcites* can be expected to be thus diſcharged.

When other methods fail, tapping ſhould be tried, it is at leaſt a palliative; and if earlier uſed than it commonly is, it might be often abſolutely curative. When this operation is performed, the water is drawn off too ſpeedily, by which the patient ſometimes ſwoons, and ill ſucceſs enſues. Some adviſe this operation as ſoon as there is water enough to make it ſafe and practicable, without waiting for a diſtenſion: Dr. Fothergill adviſes to this purpoſe, ſee Lond. Med. Obſ. and Inq. vol. iv. p. 114. And though Dr. Hunter is ſomewhat doubtful in this reſpect, his objections rather plead for, than againſt it. Dr. Baker too urges an early operation; for the mode of performing which, ſee PARACENTISIS.

The *aſcites* happening to pregnant women, palliatives only are to be uſed until her delivery, unleſs danger of ſuffocation, from the exceſſive diſtenſion, demands it.

When the duplicature of the peritoneum is the ſeat of the *aſcites*, tapping is alone the remedy. For the relief of occaſional ſymptoms, ſee HYDROPS. See Milman on the Dropſy. Leake's Medical Inſtructions, edit. 5. Cullen's Firſt Lines, vol. iv. White's Surgery, 304, and *Wallis's* Sydenham.

3

ASCITES UTERINUS. See HYDROPS UTERI.

ASCITICUS. One who labours under an *aſcites*.

ASCLEPIAS, called alſo *hirundinaria*, *contrayerva vincetoxicum alba*; *germanorum*, TAME POISON, SILKEN CICILY, and WHITE SWALLOW-WORT.

This plant hath unbranched ſtalks, ſmooth leaves ſet in pairs, and cluſters of monopetalous flowers, followed by two long pods full of a white cottony matter, with ſmall browniſh ſeeds. The root is large, compoſed of many ſlender ſtrings hanging from a tranſverſe head, brown externally, and white internally. It is perennial, grows wild in gravelly places, and flowers in July. It is reckoned a ſpecies of apocynum, or dog's-bane; but is diſtinguiſhed from all the other ſpecies by its affording a limpid juice, that of all the reſt being milky.

The roots, when freſh gathered, ſmell like valerian root, but loſes its odour by drying; chewed it is ſweetiſh at the firſt, then bitteriſh. In doſes from ℈ i. to ʒ i. it is ſudorific and diuretic; in the firſt characters it hath been ſo commonly uſed by the Germans as to have obtained the name of *contrayerva Germanorum*.

ASCLEPIOS, ATHENIPPUM. The name of a dried ſmegma deſcribed by P. Ægineta; of a troche in the writings of Actius; and a collyrium in Galen.

ASCLITES. See ASCITES.

ASCOMA, from *ασκος*, *a bottle*. The eminence of the pubes at the years of maturity.

ASCOS, from *ασκυτος*, *leather*. A BOTTLE. They were formerly all made of *leather*, and Hippocrates uſed to apply them when filled with hot water to pained parts.

ASCYROIDES, ASCYOS, ASCYRUM, ASCYRUS. See ANDROSÆMUM.

ASDENIGI. See HÆMATITES.

ASE, or ASSE. Hippocrates by theſe words means a loathing of food, from a conflux of humours in the ſtomach.

ASEB. See ALUMEN.

ASEDENIGI. See HÆMATITES.

ASEF. See HYDROA.

ASEGEN. See SANG. DRACONIS.

ASELLI, alſo called *millepedes*, *polypedes*, *cutio*, *cyamus*; *multipedæ*; *cubaris*, *oniſci*, *centipedes*; SLATERS, HOG-LICE, CHURCH-BUGS, SOW-BUGS, and WOOD-LICE.

Theſe are inſects, according to Linnæus, of the CLASS, APTERA, and GENUS, ONISCUS. This genus diſtinguiſhes thoſe inſects that are without wings, have fourteen feet, are ſetaceous, have bent attennæ, a mouth furniſhed with two palpi, the head intimately joined to the thorax, and an oval body. It comprehendeth fifteen ſpecies. One ſpecies is the *wood-louſe*, and *the variety which is of a bluiſh colour, and, if touched, rolls itſelf up into the form of a pill*, is the ſort that is generally ordered in medicine; they are found under ſtones and logs of wood, in cold moiſt places. There are different ſpecies, but the pale, brown, and the bluiſh black ſorts are indiſcriminately uſed. Thoſe found in vaults are ſaid to contain the moſt ſalts, and ſo are the moſt eſteemed.

The London College directs them to be dried by ſuſpending them in a thin canvas bag, placed within a covered veſſel and over the ſteam of hot proof ſpirits, that being killed by the vapour they may become friable.

They are preſcribed, both freſh and dry, in hepatic, and other viſceral obſtructions, and ſuppreſſion of urine; the doſe in powder, from ℈ i. to ʒ i. in an expreſſed vinous infuſion, ℥ ij. repeatedly. They have been ſwallowed alive in great numbers daily; and though reckoned diuretic, the effects uſually attributed to them are doubtful.

ASELLUS MAJOR. The COD-FISH; it is called alſo *merlucius*, *cabeliau*, *morhua*, *molva*, and the KEELING. It is a ſea-fiſh, and ſhould be choſe by its whiteneſs. It is very nouriſhing.——MOLLIS, vel MINOR. The WHITING, a fiſh more delicate than the cod, and extremely eaſy of digeſtion.——MARINUS. This is the name of a fiſh called MERLUCIUS, or SEA-PIKE; it was ſometimes allowed to be eaten by thoſe who laboured under febrile affections, and has been greatly commended by Langius.

ASEMOS, from *α*, neg. and *σημα*, *a ſign*. An epithet applied to events that fall out contrary to all appearance, and without any manifeſt cauſe. A criſis happening beyond hope.

ASEPH. PLUMOUS ALUM. See ALUMEN.

ASEPTA, from *α*, neg. and *σηπω*, *to putrify*. Unputrified; but Hippocrates uſed this word to ſignify unconcocted or undigeſted.

ASIA-

ASIATICUM, Bals The balm of Gilead. See Balsamum.

ASIGI. See Ærugo Æris.

ASIMION. An ingredient mentioned by Myrepsus, but not known.

ASINGAR. See Ærugo Æris.

ASINUS. The ass. Its milk is in much esteem as a medicine. See Lac.

ASITI. } Those are so called who take no food for
ASITIA. } want of an appetite. See Anorexia.

ASIUS, Lapis. See Assius Lapis.

ASJOGAM. A tree growing in Malabar and the East Indies, whose juice is used against the colic. Raii Hist.

ASMAGA. A mixing of certain metals.

ASMIAR. See Ærugo Æris.

ASODES. See Assodes.

ASOPER. See Fuligo.

ASPADIALIS, *Ischuria*. A suppression of urine from the urethra being imperforated. See Ischuria.

ASPALATHUM, called also *agallochum*. Calambac wood. It is brought from the East Indies; it is of a bituminous and fatty kind, or resinous, and of a bitter taste. It is sold very often for the agallochum, having similar virtues, but weaker. See Agallochum.

ASPALATHUS, called also *Rhodium lignum, diacheton, dipsacon, lignum rosæ odoræ, genista canariensis, lign. thuris, erysisceptrum, Rhodina radix, Rhodium*, or rose-wood.

Rose-wood is the root, or the wood of a thorny shrub, but of which we have no certain account. It is brought from the Canary islands in long crooked pieces, externally of a whitish colour, internally of a deep yellow with a reddish cast. The heaviest and the deepest coloured is the best.

When rubbed or scraped it smells like roses. To spirit of wine it gives out all its virtue, but this tincture sends nothing off by distillation except the spirit, hardly affected with the smell or taste of the wood; water also extracts its virtues, and carries them with it in distillation; this distilled water resembles that from damask roses. Fifty pounds weight of good wood afford one pound of essential oil, which is used as a perfume; it is weaker than the oil of roses, but of the same odour.

An agreeable cordial tincture is made by macerating ℥ iv. of this wood with a pint of rectified spirit of wine; from ten drops to a tea-spoonful is a dose.

ASPALTUM. See Bitumen.

ASPARAGI. The young shoots, or first tender sprouts of an herb from the ground, before any leaves unfold themselves.

ASPARAGUS, called also *aspharagus, sparagus*; sperage, and sparrow-grass.

It is a perennial plant, chiefly used as aliment; in the spring a number of shoots appear (the tops of which are named *turio* or *cyma*), they rise to the height of two or three feet, then divide into slender firm spreading branches, clothed with soft green capillary leaves, the flowers are of a pale green colour, and succeeded by shining red berries. It grows wild in Cornwall and some other parts of England.

Though confined to the kitchen, it affords very little nourishment; the young shoots only are eaten; a decoction of the roots is diuretic, a strong infusion of them is preferred by some.

ASPARINE. See Aparine.

ASPASIA. The name of a constrictive medicine for the pudenda muliebria, consisting of wool moistened with an infusion of galls.

ASPER. A small river-fish found in the Rhone. It is so named from the roughness of its scales and jaws. It is good food, and very nutritious.

The oil of *asper* is commonly enquired for as a means of catching fish with ease and certainty. It is probably the oil of ospray which is meant, for there is a fable, that the bird so called, as it flies, drops something on the surface of the water, by which the fish is allured; hence the oil of the bird is supposed to have the same effect: but as there is no such oil, the oil of box, or any other such like, is sold for it.

ASPERA ARTERIA, from *asper, rough*, called also *trachea arteria*. Windpipe is formed of the Larynx, the Bronchia, and the Vesiculæ Malpighianæ. The Larynx hath five cartilages; it forms the upper part of the aspera arteria; the *first* of the cartilages is the Thyroidea *peltata*, or clypealis; called also *cooperteria, obicum*, placed just under the basis of the os hyoides, of a quadrangular figure, and stands in the anterior part of the neck, where the pomum Adami is seen; the lateral portion runs back, and ends in two processes; one of which runs up, the other down, and are connected to the os hyoides; the *second* is the Cryeoid, called also *cymbularis cartilago*; it stands beneath the preceding, is of an annular figure; the back part stands between the two processes of the thyroid cartilage, to which it is articulated. It is narrow before, thick behind, and serves as a base to all the other cartilages; being, as it were, let into the thyroides; it is by means of this that the other cartilages are joined to the trachea, on which account it is immoveable. The *third* and *fourth*, are the two Arytænoid cartilages, joined to the superior and posterior parts of the cricoid, by peculiar articulations, that the glottis may the more readily be opened and contracted; each of these have a protuberance for the insertion of the muscles, which protuberance stands over the cricoid cartilage, and each have a process where the ligament of the epiglottis is fixed; they are small at their base, and large at their upper part. The *fifth* is the epiglottis, shaped like the leaf of a plant: Winslow says *that* of the purslane. It is joined to the anterior and superior part of the thyroid cartilage, over which it appears erected behind the root of the tongue, to which it is connected by ligaments fixed to the cornua of the os hyoides; it is also connected with the arytænoid cartilages. It covers the glottis whilst we swallow to prevent any thing getting into it. These form the beginning of the aspera arteria, which passing down from behind the tongue into the lungs, is situated before the œsophagus, and surrounded, laterally and before, by the thyroid gland. It enters the cavity of thorax behind the upper part of the sternum, where it is crossed by large vessels which run up to the head. At about the fourth vertebra of the back it divides into two branches; the other which goes into the left is divided into two; these branches are called bronchiæ, and are divided again into numberless other ramifications, which are distributed through the substance of the lungs, and which consist of cartilaginous segments, and contractile membranes; then they are expanded into oblong vessels, after having lost their cartilaginous nature, called Vesiculæ Malpighianæ; some say they terminate in vesicles like clusters, which adhere to the small bronchial ramifications, constituting the chief part of the lungs. The use of the bronchia is to afford an ingress of the air into the lungs, and a free return of it thence; with such superfluous matters as is ready to be carried out of the body with it. The aspera arteria is cartilaginous forward, and membraneous backward.

When any small substance falls into the trachea, it occasions much uneasiness until it is thrown up. To assist its discharge, Aetius commends sternutatories; some commend expectorants and emetics, which may also be safely used; but to excite a cough, as some advise, is too hazardous.

ASPERATA. See Asperum.

ASPERATUM SPECILLUM. See Blepharoxystum.

ASPERGINES. See Catapasma.

ASPERGULA. See Asperula.

ASPERIFOLIUS, of *asper, rough*, and *folium, a leaf*. An epithet for such plants as are rough-leafed, having their leaves placed alternately, or without any certain order, on their stalks. They have monopetalous flowers, cut or divided into five, and after each flower there commonly follow four seeds.

ASPERITAS. Roughness, *asperity, sharpness*.

ASPERSIO. Sprinkling. See Catapasma.

ASPERUGO, } called also *aspergula, aperine latifolia*,
ASPERULA, } *hepatica; stellaris, stellata, matrisylva Germanica, rubeola montana odora*; woodrow, and woodroof. Asperula odorata, Linn.

It is a low umbelliferous plant, grows wild in woods and copses; it flowers in May, hath an agreeable odour, which is much improved by moderate drying: the taste is a little austere. It imparts its flavour to vinous liquors, and is commended as a cordial and deobstruent. It is also a name for aperine; Rubia synanchica.

ASPERUM, Asprum, *asperatum, aspretudo*. Rough. An epithet applied to bodies with uneven surfaces. Galen observes, that every *rough* body is uneven, but every uneven body is not *rough*; and that roughness is occasioned by too great dryness, or from acrimony.

ASPHALATHUS. See Cytisus spinosus.

ASPHALITIS. A name of the last vertebra of the loins.

ASPHAL-

ASPHALTOS. ASPHALTUM. See BITUMEN.

ASPHARAGUS. See ASPARAGUS.

ASPHODELUS. The ASPHODEL.

Ray takes notice of five ſpecies, three of which are but a baſtard kind; the others are, the

ASPHODELUS ALBUS. WHITE ASPHODEL.——LUTEUS, *yellow aſphodel*, alſo called *haſta regia, Bernhardi teſticulus, anthericum, aſſodilus, iphion, erizamba*, KING'S SPEAR, and YELLOW ASPHODEL.

The *aſphodel* roots reſemble an acorn, are acrid, heating, diuretic, &c. The leaves are like thoſe of a leek; the ſtalk is ſmooth, bearing on its top a flower called ANTHERICOS.

Theſe plants are natives of Italy, France, and other warm parts of Europe. The freſh roots are commended in the form of a cataplaſm, to be applied to ſcrophulous ſwellings.

ASPHYXIA, from α, neg. and σφυγμος, *a pulſe*, from σφιζω, *to leap*, or *beat*, like an artery. It is ſo named, becauſe the pulſe is not perceptible to the touch; but the characteriſtic ſigns of this deſeaſe are, the ſymptoms of apparent death, for the moſt part, ſuddenly coming on. If a patient gradually growing worſe, at length dies, that ſtate is not an aſphyxy, becauſe it never has yet been obſerved, that any one recovered from ſuch a ſtate; but it not unfrequently happens, that people have appeared to die ſuddenly; indeed ſome of them have been buried, who certainly might either recover by the help of art or ſpontaneous. This ſtate indeed, whether it ariſes from the brain, the heart, or lungs, powerfully affected, is called aſphyxy; the moſt obſcure kind of diſeaſe, and requires the moſt diligent inveſtigation of phyſicians. Moſt inſtances of *aſphyxy* are varieties of apoplexy; the reſt are inſtances of ſyncope, for the moſt part, if not all. See LIPOTHYMIA and APOPLEXIA.

The ſpecies which are conſidered as belonging to *apoplexy*, are the following:

ASPHYXIA SPINALIS. i. e. APOPLEXIA SANGUINEA.
—— a MEPHITIDE. }
—— a MUSTA. }
—— a FUMIS. }
—— a CARBONE. } h. f. APOPLEXIÆ VENENATÆ.
—— FORICARIORUM. }
—— SIDERATORUM. }
—— CONGELATORUM. }
—— a PATHEMATE, i. e. APOPLEXIA MENTALIS.
—— SUSPENSORUM. } h. f. APOPLEXIÆ SUFFOCATÆ.
—— IMMERSORUM. }
—— FLATULENTA. }

ASPHYXIA IMMERSORUM See SUBMERSIO.

—— FEBRICOSA & HYSTERICA, are SYMPTOMATIC APOPLEXIES.

Thoſe which belong to the SYNCOPE are,

ASPHYXIA VALSALVIANA—SYNCOPE CARDIACA.
—— a PATHEMATE. }
—— TRAUMATICA. } SYNCOPE OCCASIONALIS.
—— NEOPHYTORUM. }

It is however neceſſary to remark, that thoſe who appear to die ſuddenly, ſhould be kept till they begin to grow putrid, and offenſive, or at leaſt till they can bear without any perception a red hot iron applied to the feet: and this ſhould be obſerved in general, without reſpect to phyſicians, who cannot diſcover the cauſe of the diſeaſe; for if ſigns of an aneuriſm being burſt, or of an apoplexy, or of an inveterate vomica have preceded this ſudden death, a phyſician knowing theſe can more certainly judge, whether it is in reality death, or only an aſphyxy. See LANCISIUS, WINSLOW, and BRUHIER on this ſubject.

ASPIC. See LAVANDULA.

ASPIDISCOS, from ασπις, *a buckler*. By metaphor it was applied to the ſphincter muſcle of the anus, as we are informed by Cœlius Aurelianus. See SPHINCTER ANI.

ASPIS. The ASP. A venomous kind of ſerpent, of which Galen reckons up three ſpecies. Paulus Ægineta, in lib. v. and cap. xviii. ſays, that amputation is the only remedy when a limb is bit; and to cut away the fleſh to the bone of the bite, is where amputation cannot be performed.

ASPLENIUM, alſo called *ſplenium, hemionium, ceterach*;—MILT-WASTE, and SPLEEN-WORT. It is the ASPLENIUM CETERACH, or aſplenium frondibus pinnate fidis lobis alternis confluentibus, Linn. SPLEEN-WORT.

This is a ſmall buſhy plant, growing on fiſſures of rocks and on old walls; it conſiſts of capillary blackiſh roots, long narrow leaves, cut down to the rib on each ſide alternately, into a number of oblong, obtuſe, narrow ſections, with broad baſes. It hath no ſtalk or flower; the ſeeds are a yellow powder, produced on the backs of the leaves.

The leaves are ſimilar to maiden-hair, as a pectoral; they are diuretic, and, uſed by way of infuſion, they clear away fabulous matter from the urinary paſſage.

ASPLENIUM TRICHOMANES, or ASPLENIUM FRONDIBUS PINNATIS, &c. See ADIANTHUM NIGRUM.

—— SCOLOPENDRIUM. See LINGUA CERVINA.

ASPRITUDO. See ASPERUM.

ASSAC. See GUM AMMONIACUM.

ASSA FŒTIDA. See ASA FOETIDA.

ASSALA. See NUX MOSCHATA.

ASSANEGI. The powder that falls off from the walls of ſalt in the ſalt mines.

ASSANUS. A weight conſiſting of two drams.

ASSARABACCA. See ASARUM.

ASSARE. In the ſpagirical language, it is to dry a thing fit for powdering.

ASSARTHROSIS. See ARTICULATIO.

ASSATIO, ASSATION, or ROASTING, from *aſſo, to roaſt with fire*. Frying, toaſting, broiling, are different ſpecies of *aſſation*.

ASSATURA. A ſpecies of any thing juſt removed from the fire after roaſting.

ASSE. See ASE.

ASSERAC. See ASSIS.

ASSERVATIO. See CONSERVATIO.

ASSIDENS SIGNUM. An affident ſign, that is, ſuch an one as *uſually* accompanies a diſeaſe; but is not, as the *pathognomonic*, inſeparable from it.

ASSIDUUS. See CONTINUA FEBRIS.

ASSIMULO, to ASSIMILATE, from *ad* and *ſimilis, to make like to*; as when what we eat is converted into our fleſh. *Aſſimilation*, when ſpoken of our aliment, differs in name only from nutrition; but beſides, it is made uſe of in another ſenſe; when the morbid matter of any diſeaſe converts the whole or part of our juices to their ſpecific nature; our juices are then ſaid to be aſſimilated to the nature of thoſe morbid materials.

ASSIS. ASSERAC. The Ægyptian name for *bang*, or *bangue*, which ſee, and alſo CANNABIS.

ASSISTENTES. See PARASTATÆ.

ASSITRA. See MANDARU.

ASSIUS LAPIS, called alſo *aſius* and *azius lapis, ſarcophagum*, ASSIAN STONE. Theſe ſtones receive their name from Aſſos, a city of Troas, in the Leſſer Aſia, where they are found. They are of a tophous, ſoft, friable, and looſe ſubſtance, with a powdery matter growing on them like meal, ſuch as is ſeen on the walls of mills; it is called the FLOUR OF THE ASSIAN ROCK. This flour conſumes looſe ſpongy fleſh; hence called *carnivorus*: the ſtone poſſeſſeth the ſame virtue in a leſs degree.

ASSODES. ASODES. From ασις, *faſtidium*, and αδω, *ſatio*. A continual fever, in which the outward parts are moderately warm, but inwardly there is great heat, an inſatiable thirſt, perpetual toſſing, great nauſea, and loathing of food, watching, and raving. It is called by SAUVAGES, *tritæophya aſſodes*; and is alſo arranged by CULLEN, under *tertian remittents*. An account of fevers of this kind may be found in HUXHAM de Aëre, lib. i. p. 97. LANCISIUS de noxiis paludem Effluviis; and MORGAGNI Epiſt. 49. 14.

ASSOS. See ALUMEN.

ASTACUS, or ASTACUSMARINUS. The LOBSTER and CRAB hardly differ in any quality one from the other. They ſeem to contain leſs of animal ſubſtance than the fleſh of quadrupeds, birds, and even of the amphibia, from the ſmall proportion of volatile alcali obtainable from their ſubſtance. Notwithſtanding which, they more quickly neutralize acidity in the primæ viæ than any other animal food of quadrupeds and birds. They are without oil, or have at leaſt a ſmall proportion, and therefore are conſidered leſs nutritious. Sometimes a ſmall portion taken upon the ſtomach of thoſe with whom they are apt to diſagree, will occaſion violent colic, and nettle raſh, as occurs from eating muſſels, &c. which is attributed to idioſyncraſy of particular perſons. *Lobſters, crabs*, and *crayfiſh*, are exanguous, and oviparous; they are greedy of fleſh, eat frogs; and, if they meet with a carcaſe, though it lays out of the water, they never leave it till it is conſumed. Their

fleſh is beſt in ſummer; and, in common with all ſhell-fiſh, it is peculiarly uſeful to thoſe whoſe primæ viæ abound with acid, though it is conſidered rather difficult of digeſtion. The black tips of the claws of the *ſea-crab*, and thoſe ſtony concretions in the heads of the *aſtacus fluviatilis*, found in rivers, form ſome of the abſorbent preparations of the ſhops. See CANCER FLUVIATILIS, and OCULI CANCRORUM.

ASTACUS FLUVIATILIS. The CREVIS or CRAYFISH. See ASTACUS.

——— FLUVIATILIS. The Lobſter.

ASTAPHIS. See UVA PASSA.

ASTARZOF. The name of an ointment, and of a mixture, which were uſed by Paracelſus. The firſt conſiſted of litharge, houſe-leek juice, &c. The ſecond, of camphor and roſe-water.

ASTCHACHILOS. So Paracelſus names a malignant gangrenous ulcer, which ſpreads from the feet upwards. Some call it *araneus*.

ASTER. OMNIUM MAXIMUM. See ENULA.——ATTICUS. HYOPHTHALMOS. See ERYNGIUM.——PALUSTRIS PARVO FLORE GLOBOSO. SMALL FLEA-BANE. See CONYZA.——PERUANUS. POTATOES. See BATTATAS CANADENSIS.——THALASSIUS, is named *Stella marina*. SEA-STAR. A certain zoophyte or inſect, of which there are many ſpecies, and of which Aldrovandus hath wrote prolixly. Hippocrates hath recommended it with braſſica, and ſweet-ſcented wine, againſt what is called the aſcent of the uterus, and hyſteric pains.

ASTERIAS. STAR-STONE. Is a foſſile gem, very hard, reſembling half a globe, extremely full of black radiated appearances, reſembling ſtars; from whence its name. In medicine it was conſidered as a charm againſt marks of the mother.

ASTHENIA, ἀ, non, and σθένος, *robur*. EXTREME DEBILITY.

ASTHENIA a HYDROCEPHALO. APOPLENIA HYDROCEPHALICA. See APOPLEXIA.——PANONICA. See AMPHIMERINA HUNGARICA.

ASTHMA, from ἄω, or ἄημι, *ſpiro*, or rather ἀάζω, *anhelo*, to breath ſhort. This is an impeded, and very laborious reſpiration, joined with inexpreſſible anxiety, and ſtraitneſs of the præcordia, preventing a free circulation of blood through the lungs, ariſing from various cauſes, and not free from the danger of ſuffocation. The characteriſtic ſymptom of this diſeaſe is a *chronical* and *periodic* difficulty of breathing; hence it differs from ORTHOPNÆA, becauſe that is acute; from DYSPNÆA, becauſe that is continued.

This diſeaſe has generally been conſidered to be of two kinds; the *humoral*, *pituitous*, or *moiſt*; the *ſpaſmodic*, *dry*, *nervous*, or *convulſive*. Both which are properly included in the ſubſequent definition. "The *aſthma* is "a difficulty of breathing, coming on at intervals, with "a ſenſe of ſtraitneſs in the breaſt, and ſibilating "reſpiration; at the beginning of the paroxyſm, attend-"ed with an uneaſy cough, or no cough at all; to-"wards the concluſion, a free cough, often attended "with a copious expectoration of mucus." Dr. CULLEN ranks this genus of diſeaſe in the Claſs NEUROSES, and Order SPASMI, dividing it into three ſpecies. 1ſt. *Aſthma ſpontaneum*; to which belong the *orthopnœa ſpaſmodica*, and *hyſterica*, when there is no manifeſt cauſe, or any other diſeaſe attending.——2d. *Aſthma exanthematicum*, when it ariſes from the retropulſion of ſome acrid humors from the ſurface of the machine.——3d. *Aſthma plethoricum*, when it is the conſequence of ſome accuſtomed ſanguinary evacuation ſuppreſſed, or a ſpontaneous plethora.——The *hypochondriac*, *arthritic*, and *venereal* ſpecies, are truly ſymptomatic.

He alſo ſays, "That the *aſthma* depends upon a par-"ticular conſtitution of the lungs: that the *proximate* "*cauſe* is a præternatural, and in ſome meaſure, a ſpaſ-"modic conſtriction of the muſcular fibres of the bron-"chiæ, which not only prevents the dilatation of the "bronchiæ, neceſſary to a free and full inſpiration; but "gives alſo a rigidity, which prevents a full and free ex-"piration;" and adds, "This præternatural conſtric-"tion, like many other ſpaſmodic and convulſive affec-"tions, is readily excited by a turgeſcence of the blood, "and other cauſes of any unuſual fullneſs and diſtenſion "of the veſſels of the lungs."

Dr. Withers on the *aſthma*, ſays, "The attack of the convulſive *aſthma* is ſudden, and at its firſt appearance the fit is ſhort. The ſymptoms which uſually precede it are languor, flatulency, head-ach, ſickneſs, pale urine, diſturbed ſleep, a ſenſe of ſtraitneſs and fulneſs about the pit of the ſtomach. In ſome caſes there is an uncommon ſtupor, drowſineſs, and heavineſs. The fit is frequently obſerved to come on about one or two o'clock in the morning, or at any hour after the firſt ſleep. The patient wakes ſuddenly, and feels a great tightneſs and conſtriction around the cheſt, with a difficulty of breathing, and an impediment to the free admiſſion of air into the lungs. Both inſpiration and expiration are ſlow, laborious, and accompanied with conſtant wheezing, particularly the latter. Great bodily anxiety always attends this diſorder. As the lungs cannot be ſufficiently dilated with air, the paſſage of the blood through the pulmonary veſſels is not free. Hence the face, in full and plethoric habits, appears red and bloated, and the veſſels of the eyes are unnaturally turgid with blood. The action of the heart is greatly diſturbed, as is evident by the weakneſs, irregularity, and increaſed quickneſs of the pulſe. During the fit the patient has generally a longing inſtinctive deſire for cool freſh air, which always revives him. A ſmall cloſe room with a fire in it is extremely offenſive to him, and all warm things, given internally, increaſe the flatulency in the ſtomach and bowels, which is always the moſt troubleſome after a full meal. When the fit has continued a few minutes, half an hour, or an hour, it leaves the patient; his reſpiration becomes free and natural, his pulſe ſlow and regular, his complexion puts on its uſual appearance, and the bodily anxiety goes off. The urine is generally pale, and the ſkin ſomewhat dry before the fit, and during its progreſs; but at the termination of it the urine, for a day or two, is high coloured, and depoſits a ſediment, and the ſkin feels ſoft and moiſt. FLOYER. This is the deſcription of a firſt and moderate attack of the diſorder. In ſome caſes it appears in a more violent form, even at its commencement, and continues for ſeveral days before the fit terminates. Sometimes the patient will have one fit, and then remain free from a relapſe for many months. At other times fits come on for ſeveral nights together, the patient appearing almoſt perfectly well during the day, with his appetite and pulſe both natural. When the *aſthma* once makes its attack, it ſeldom or never fails to recur, though the intervals between the fits are very uncertain. When the *aſthma* is rooted in the conſtitution, it often makes its attack in the ſpring and autumn. In many caſes it attacks periodically, once in ten days or a fortnight. Sometimes it occurs regularly at the full and change of the moon. Floyer mentions a caſe where the fits occured for ſeven weeks together, and the patient was obliged to ſleep in a chair. But from the ſtricteſt obſervations it is found upon the whole that there is no certainty or regularity obſervable in the attacks of the aſthma. The reaſon why the fits ſo often occur, firſt in the night, is thought to be owing to the heat of the bed, and the horizontal poſture in which the patient lies. Relapſes are commonly attended with an increaſe of the ſymptoms, and the vigour of the conſtitution is gradually impaired, till, by length of time, general or chronic weakneſs is induced. The difficulty of breathing in the fits ariſes to a much higher degree, and the ſenſation of tightneſs over the breaſt is ſo great and diſtreſſing, that the patient feels as if he were bound with cords. His anxiety at this period is inexpreſſible, and he labours in reſpiration, as if every moment would be his laſt. Severe vomiting frequently occurs, and the matter diſcharged is ſlimy and frothy, or of a greeniſh or yellow colour. The hands and feet are cold, and the patient is ſubject to palpitations and faintings. Cool freſh air becomes abſolutely neceſſary. The eyes are prominent, the face is ſometimes pale, and ſometimes high coloured, bloated, or livid; the pulſe is extremely weak, irregular, and even intermitting; there is a difficulty of ſwallowing, the patient can ſcarce ſpeak, cough, or expectorate during the fit, and the ſtomach and bowels are violently diſtended with wind. While thus labouring for breath, he is obliged to riſe from his bed, he cannot bear even the weight of the bed-cloaths upon him. His ſhoulders are conſtantly elevated, to give the muſcles of the cheſt their greateſt power of action, in raiſing the ribs in inſpiration. At this time too the patient, though before coſtive, will frequently have a looſe ſtool. When the violence of the fit abates, and reſpiration becomes free, the cough returns, and the patient begins to expectorate phlegm, which is ſometimes intermixed with blood. As ſoon as an eaſy copious expectoration takes place, it affords great relief, for the evacuation is made immediately

diately from the parts affected, from the very veſſels which have been contracted with ſpaſm. This expectoration is one of the moſt certain ſigns of the abatement of the complaint, as it denotes the ſolution of the ſpaſmodic contraction of the bronchial air veſſels; particularly if a moiſture and ſoftneſs of the ſkin, and a ſediment in the urine make their appearance. The blood which is ſpit up in this complaint, proceeds generally from a rupture or dilatation of blood-veſſels in the lungs. In ſome caſes, indeed, the quantity of blood which is ſpit up, is in full habits very conſiderable, and at the ſame time critical, being accompanied with an abatement of the ſymptoms. But all free diſcharges of blood from the lungs, though they afford relief, yet they are unfavourable ſigns, as they denote greater violence of the diſeaſe, during the courſe of which the very efforts of nature to relieve are in themſelves ſo alarming. The noſe too will ſometimes guſh out with blood during the ſeverity of the fit, from the obſtruction given to the return of the blood through the pulmonary veſſels into the left auricle of the heart. Thus in a ſhort time the fit of the convulſive aſthma goes off. In a courſe of years one fit ſucceeds another, and the diſorder increaſes in the violence and duration of the fits, as well as in the frequency of their returns. The expectoration from the mucous glands of the lungs, which ſtill continues to relieve at the termination of the fits, becomes itſelf a very troubleſome ſymptom. The mucous glands are relaxed, and the diſcharge of mucus greater than natural. Hence the bronchial or air-veſſels are frequently obſtructed with phlegm, and from this cauſe the freedom of reſpiration is diſturbed: the patient breathes with unuſual difficulty, although his convulſive fits be not upon him. When he firſt wakes in the morning he has generally a ſevere fit of coughing, which continues till he has got up the phlegm that provoked the cough, by preventing the free admiſſion of air into the air-veſſels. Through the day, at different times, the cough ſtill recurs, but with leſs violence, and in the evening it is often very teaſing and diſtreſſing, eſpecially on any ſudden motion of the body, or in cold damp foggy weather, which obſtructs the exhalation of the perſpirable matter from the lungs. Thus the HUMORAL ASTHMA is united with the convulſive, and both together exiſt in the ſame patient. The HUMORAL ASTHMA is a diſorder of the mucous glands of the lungs, in conſequence of which they are relaxed, and the diſcharge of mucus, being unnaturally copious, obſtructs the freedom of reſpiration. This part of the diſorder is more conſtant; the convulſive *aſthma* is more violent and of ſhorter duration. The humoral *aſthma* is more ſevere both with reſpect to the cough and difficulty of breathing in winter, but in ſummer, when the weather is warm, and perſpiration free, it often diſappears totally between the intervals of the fits of the convulſive *aſthma*. The convulſive *aſthma* too is ſometimes ſeverer in winter than in ſummer, eſpecially when combined with the humoral, or with a catarrh. But it often happens that the warm weather affords little or no relief, nay even in many caſes it is obſerved, that the irritability of the conſtitution and the rarefaction of the blood is ſo much increaſed by the warmth of the weather, that the frequency and ſeverity of the fits are greater in the warm and ſultry, than in the cold ſeaſons of the year. In this caſe the humoral *aſthma* is continued on during the ſummer months by the convulſive *aſthma*, as a ſymptom of the natural and critical ſolution of the fits. But even in this ſituation of the patient, the ſymptoms of the humoral *aſthma* are greatly alleviated by the warmth of the weather, which is by no means conſtantly the fact with reſpect to the convulſive *aſthma*. Along with or after the convulſive *aſthmas*, either when pure or when complicated with the humoral, there is often a great foreneſs in the breaſt, partly from the obſtructed circulation, partly from the ſpaſmodic contraction of the muſcular fibres of the air-veſſels, and partly from the frequency and ſeverity of the cough. Sometimes too there are rheumatic ſtitches in the ſides, which are extremely painful and alarming to the patient; but the judicious practitioner will eaſily diſtinguiſh them from internal affections of the breaſt, by the external foreneſs and the acuteneſs of the pain in conſequence of motion. The frequent returns of fits ſometimes cauſe obſtructions in the lungs, which, as the diſſection of dead bodies clearly aſcertains, appear full of knots or tubercles. Theſe tubercles are moſt liable to occur in thoſe who have naturally a narrow contracted cheſt, in which the lungs have not a free and eaſy motion; theſe render the diſorder very obſtinate, they cauſe a long continuance of the cough after the aſthmatic fit, and frequently end in ſmall inflammations of the lungs, attended with internal pains, difficulty of breathing, feveriſhneſs, profuſe ſweats, and waſting of the fleſh. I have already obſerved, that the humoral *aſthma* often ſupervenes on the convulſive. It is neceſſary alſo to obſerve, that the convulſive often attacks thoſe who have long been previouſly afflicted with the humoral *aſthma*. Patients ſubject to catarrhs and winter coughs, during which they expectorate a conſiderable quantity of thick or frothy phlegm, are ſometimes ſuddenly ſeized with violent difficulty of breathing, and great tightneſs over the breaſt, ſo as to dread even inſtant ſuffocation. This new complaint, after having tormented them for ſome hours, or perhaps a day or two, leaves them almoſt as ſuddenly as it at firſt attacked them, and they look back with ſurprize at their happy deliverance from ſo formidable and unexpected an enemy. Their old habitual cough and aſthma, with foreneſs and ſtuffing in the breaſt, ſtill remains upon them, but after what they have lately ſuffered, they bear it without repining. In this manner they continue for ſome time, till the convulſive *aſthma* attacks them again, and perhaps with additional violence. Thus, by frequent returns of the fits, the convulſive *aſthma* becomes habitual to the patient, and he has the misfortune to find himſelf labouring under a complication of two diſeaſes, the one aggravating the other, and both growing worſe. The convulſive *aſthma* ſometimes attacks perſons of a thin ſpare habit, whoſe conſtitutions have been greatly emaciated by a long expoſure to cauſes of general or chronic weakneſs. In ſome caſes it ſeizes patients who are robuſt and full of blood, particularly if they have ſmall veſſels and ſtrait cheſts. At other times it occurs in thoſe who are groſs, phlegmatic, corpulent, and in ſuch habits it is often very diſtreſſing. It is frequently connected likewiſe with hyſterical and hypochondriacal complaints, in irritable and relaxed conſtitutions. The convulſive *aſthma*, recurring for many years, is capable of reducing the ſtrongeſt conſtitutions, and of bringing on the ſymptoms of general debility; but if it attacks a conſtitution already weakened and exhauſted, it is obvious that it will neceſſarily weaken and exhauſt it more. The patient will loſe weight, ſink from his cloaths, and appear emaciated, eſpecially if the veſſels of the lungs are ſo relaxed that a conſiderable quantity of mucous matter is expectorated. The ſtomach and bowels are more particularly liable to be affected in the convulſive *aſthma*; they are often ſeized with colic pains, diſtended with wind, tormented with burning heats, and agitated with tremulous motions, which give a ſenſation to the patient of ſomething moving and fluttering within him. Floyer too has obſerved, that ſlight fits of the *aſthma* often affect the ſtomach and bowels, and not the lungs. The appetite is greatly impaired, ſleep is often prevented, or it is diſturbed and unrefreſhing. The menſes are ſometimes obſtructed, and ſometimes they are brought on before the uſual period, and when plethora prevails, that diſcharge is accompanied with relief. The patient is ſometimes coſtive, though ſometimes he will have looſe ſtools. The extremities, particularly the arms, ſhoulders, and upper parts of the body, are often affected with great uneaſineſs. Symptoms of fever are not eſſential to the diſeaſe, though they frequently occur, eſpecially when the humoral *aſthma* or a catarrh is complicated with the convulſive. A hectic fever, with a colliquative diarrhœa, faintings, palpitations, violent vomitings, coldneſs of the extremities, ſwelled legs, and other dropſical ſymptoms, ariſing from weakneſs, relaxation, and obſtruction to the circulation of the blood through the lungs, is common in the laſt ſtage of the diſeaſe. But a hectic fever, indeed, will ſometimes occur in very irritable and relaxed habits, when no immediate danger is threatened. This diſeaſe may attack at any age, but its general approach is after the prime of life.

From the preceding account of the ſymptoms of the convulſive *aſthma*, it will appear obvious that the *diſtinction* of it from every other diſeaſe cannot be difficult. The ſudden attack of the fits, the ſhort time of their duration, the violence of their ſymptoms, the ſtate of eaſe and good health between them and their returning at intervals, will ſufficiently characterize the complaint. The convulſive *aſthma* is ſometimes combined with the humoral *aſthma*, the pleuriſy, true peripneumony, falſe pleuriſy, falſe peripneumony, dropſy of the breaſt, catarrhal and conſumptive complaints; and if any one deſires the

fulleſt

fulleſt diſcuſſion in theſe different caſes, the beſt way is, an accurate ſtudy of the reſpective hiſtories of all the different complaints which bear any reſemblance to it. In many inſtances in the practice of medicine, words can never make thoſe minute diſtinctions which are very obvious to the eye and other ſenſes.

When this diſorder is recent, and produced by gouty matter, and ſuch like, there may be ſome hopes of a laſting recovery; otherwiſe it is rarely if ever cured. An eruption of the menſes, or of the hæmorrhoids, during a paroxyſm, alleviates it much; improper management cauſes an *aſthma* more readily to end in a dropſy; convulſive *aſthmas* greatly endanger the life at every return, yet ſeldom prove fatal. If frequent and long continued, if the patient eſcapes with his life, a dropſy is the reſult, which is the deſtruction of the patient. If a ſlow fever comes on, an unequal intermittent pulſe, a palſy of the arms, a continual palpitation of the heart, a preternatural ſmall diſcharge by urine, or a ſyncope, death is at hand. An *aſthma* coming on old people, uſually attends them to the grave.

The *proximate cauſe* of the convulſive or ſpaſmodic *aſthma*, is a ſudden contraction of the muſcular coats of the air-veſſels of the lungs, when the muſcular fibres of the air-veſſels are contracted, along with the midriff and the muſcles of the cheſt (the contraction of which laſt ſometimes occurs), the free admiſſion of air into the lungs is prevented, and the patient labours for breath. Expiration and inſpiration are ſlow, becauſe the parts performing the function of reſpiration are not able to act, but with the utmoſt difficulty. When this ſpaſm is removed, the patient, after the expectoration of a little phlegm, feels himſelf almoſt reſtored to perfect health; for the cauſe being obviated, and there being no fixed obſtruction in the lungs, the ſymptoms totally diſappear. The proximate cauſe of the convulſive *aſthma*, when complicated with the humoral, is a *ſpaſmodic contraction* of the air-veſſels of the lungs, preceded and followed by a *relaxation* of the mucous glands, with an *increaſed ſecretion* of mucus.

The REMOTE CAUSES, which comprehend both the *prediſpoſing* and the *occaſional*, are next to be conſidered. Theſe, operating together, produce the proximate cauſe, with which the diſeaſe neceſſarily exiſts.

The CHIEF PREDISPOSING CAUSES of the convulſive *aſthma*, are a *narrow contracted cheſt, morbid irritability of the lungs, and pulmonary obſtructions* in conſequence of tubercles, either ſcrophulous or formed by repeated catarrhs, winter coughs, pleuriſies, and peripneumonies.

The OCCASIONAL CAUSES of the convulſive *aſthma, are cold, moiſture, ſudden changes of weather, duſt, metallic fumes, ſmoke and other particular ſmells, mephitic vapours, evacuations, great fatigue, neglect of exerciſe, ſhouting, and all ſtrong exertions of the voice, certain diſorders in the conſtitution, anger, joy, ſurprize, fear, grief, and other depreſſing paſſions, exceſs in venery, and intemperance in diet.*

This obſtinacy of the diſeaſe is to be eſtimated from the violence and duration of the ſymptoms, the age of the patient, the condition of his conſtitution, the nature of the prediſpoſition, and the power of the exciting cauſes. If the ſymptoms of the ſpaſmodic affection in the lungs run high, if the diſorder be of long ſtanding, and, when once excited, continues for ſeveral days; if the returns of it be frequent; if the lungs be greatly obſtructed with phlegm at the termination of the convulſive fits, and an obſtinate cough remains during the intervals, with a laborious reſpiration, and a copious expectoration of mucous matter, the cure is difficult, tedious, and uncertain. Tubercles and obſtructions in the lungs, &c. are ſymptoms too unfavourable to admit of hope. If on the contrary, the diſorder be recent; if the patient's conſtitution be not greatly impaired; if there be no natural deformity in the cheſt; if reſpiration after the termination of the fit be free, and the cough with expectoration of phlegm not violent, nor obſtinate in its duration; if the occupation of the perſon be not injurious to the lungs, or, if ſo, can be eaſily relinquiſhed; and if the lungs be not obſtructed with tubercles, either in conſequence of a ſcrophulous habit, or repeated inflammatory affections, the caſe bears a favourable aſpect, and may in all human probability be frequently treated with ſucceſs.—When infants are ſeized with the *aſthma*, it often ends in ſuffocation, eſpecially if powerful means for the removal of it be not applied at its commencement.

THE INDICATION OF CURE will be to drive the humours to the exterior and inferior parts, to procure a due and equable circulation, and remove the ſeveral cauſes which ſupport the diſorder, by medicines adapted to their reſpective natures: the two firſt are to be anſwered during the paroxyſm, the latter in the intervals between them. In the convulſive *aſthma*, the care will be to alleviate the ſpaſmodic ſtrictures of the breaſt, and parts ſubſervient to reſpiration.

The diet ſhould be light: ſweet things, and ſuch as are flatulent, muſt be avoided: large and full meals are injurious, or any food that is ſlow of digeſtion; but many aſthmatics bear animal food of the lighter kinds, and in moderate quantity. In recent aſthma, and eſpecially in the young and plethoric, a ſpare, light, and cool diet, is neceſſary; but after the diſeaſe has continued for ſome years, they commonly bear, and often require, a tolerably full diet, though in all caſes a very full diet is hurtful. In drinking, water, or cool watery liquors, is the only ſafe and fit drink for aſthmatics; and all liquors ready to ferment, and become flatulent, are hurtful: any kind of ſtrong drink, they ſeldom can bear; and any exceſs in ſuch, is always miſchievous to them: warm and tepid drinks are improper, as they are noxious to them; ſo, on that account, and upon the account of the liquors weakening the nerves of the ſtomach, neither tea nor coffee is proper in this diſeaſe. Exerciſe ſhould be moderate, but regular, and daily riding on horſeback, going in a carriage; eſpecially ſailing is highly uſeful; the feet ſhould be kept warm, and perſpiration aſſiſted with a flannel ſhirt.

With reſpect to the air which theſe patients breathe, it is difficult to give any general rules, as different aſthmatics have different idioſyncraſies, with reſpect to externals; ſome are only eaſy in a dry ſerene air in the country, others muſt live in the midſt of a great city; though the former bear the air of a low ground, if tolerably free and dry, better than that of a mountain. Having placed the patient, if he is of a full habit, ſubject to much heat, proceed with bleeding, a thin, cooling, and diluting diet, give frequent ſmall doſes of nitre, and, at proper intervals, let purges with Glauber's ſalt be worked off with plenty of warm but very thin gruel; bathing in ſubtepid baths, and bliſters, will alſo be of uſe: but if of a contrary conſtitution, order a nutritive animal diet, with generous liquors; for common drink, let ferrugineous medicines, with the bark, bitters, gum benjamin, gum ammoniacum, the warm balſams, as thoſe of Tol, and Peru, be duly uſed.

In both the above caſes, the natural perſpiration ſhould be carefully ſupported; and as a check thereto is the moſt frequent cauſe of *aſthmas* in this country, a particular regard ſhould always be had unto it.

Periodical *aſthmas* give way to the bark, aſſiſted with ſuch other means as peculiar circumſtances may require.

The nervous *aſthma* admits of bleeding only where there is a ſanguine plethora; a pulſe ſtrong and ſlow does not indicate bleeding in the ſame degree as if it were ſtrong and frequent. A ſtrong, frequent, and hard pulſe, demands a frequent diſcharge by bleeding. But much diſcretion is required in this affair, from various difficulties that occur in judging. In other caſes, antiſpaſmodics, warm nervous medicines, opiates, and the bark, are the principal means of relief; caſtor, tinctura opii camphorata, ſal c. c. with aſſafœtida, and gum ammoniacum; and if they fail, try the bark and opium.

Except under ſome peculiar circumſtances, ſuch *as ulcers in the lungs, tubercles, inflammation of theſe organs, recent catarrh; catarrh of long ſtanding, attended with expectoration of much phlegm*, as in that diſeaſe, called humoral aſthma; *plethora, general*, or *partial; dropſy of the cheſt; difficulty of breathing*, from various cauſes, *malconformation of the cheſt*; cold bathing in an artificial ſalt bath, or in the ſea, has been greatly recommended by Dr. RYAN; the latter of which is infinitely moſt eligible, the former being conſidered only as a ſuccedaneum, as bathing in cold water, without its being ſtrongly impregnated with ſalt, has not been found uſeful. See Dr. Ryan's Obſervations on the Hiſtory and Cure of Aſthmas.

An anaſarca is ſometimes attended with a greater difficulty of breathing than a confirmed aſcites, ſo when a ſudden *aſthmatic* fit is obſerved, without any viſible cauſe, if there is the leaſt fulneſs of the face, which indeed is only to be ſeen in ſome inſtances after lying down, or any appearance of an œdema in the ancles or feet, the cauſe is undoubtedly the ſame in the lungs; and that this is the caſe, will be further confirmed by the pulſe being

being ſuppreſſed: as the ſpeedieſt relief, give immediately of calomel gr. x. by which, as ſoon as it operates, the pulſe and the breaſt will be relieved: this doſe may be repeated after a few days.

Vomits are uſually adminiſtered too ſoon in *aſthmas*: expectoration ſhould be rendered ſomewhat free, and then they may be given with more ſafety and greater advantage; the oxymel. ſcillæ and antimonium tartariſ. are eſteemed the beſt; but Dr. Akenſide prefers, and with ſome reaſon, the ipecacuanha, which, whether in the humoral or ſpaſmodic kinds, he always uſes as ſpeedily in the fit as attending circumſtances will admit, and experiences the ſpeedieſt relief by it: when he preſcribes the ipecac. in chronical caſes, he gives from three to five grains, or from five to fifteen grains, every other morning, according to the degree of the diſeaſe, and without regard to any particular paroxyſm, and thus continues it for three, four, or ſix weeks; he ſays it is as uſeful when it only excites a nauſea, as when it pukes; whence it ſeems, that in the relaxing quality, its virtue conſiſts, as uſed in theſe caſes. When the ſpaſmodic attends the humoral *aſthma*, he preſcribes the ipecacuanha, with all deſirable ſucceſs. See Lond. Med. Tranſact. vol. i. Dr. Cullen remarks, that as flatulency in the ſtomach, and other ſymptoms of indigeſtion, are frequent attendants of *aſthma*, and very troubleſome to *aſthmatics*, ſo, both for removing theſe ſymptoms and for taking off all determination to the lungs, the frequent uſe of gentle vomits is proper in this diſeaſe. In certain caſes where a fit was expected to come in the courſe of the night, a vomit given in the evening has frequently ſeemed to prevent it. See VOMITUS.

Diuretics are particularly uſeful in an *aſthma* attended with a cachexy, two parts of nitre, and one of ſal ammoniac, given every, or every other day, ſo as to paſs freely by urine, is very beneficial; but if theſe ſalts are obſerved to irritate the cough, the rad. ſcillæ, in ſmall doſes, may be preferred.

Expectorants, in the moiſt *aſthma*, are important aids. Garlic is celebrated, the ſquills and gum ammoniacum are moſt commonly uſed; but perhaps an extract of tobacco might be ſo managed as to exceed any of the medicines now in uſe for this end; for thoſe, who are not uſed to chew tobacco, are very ſpeedily relieved by holding it in their mouth until a ſickneſs comes on, and then going into bed to ſweat; a few repetitions of this hath totally freed the patient from a preſent paroxyſm.

One of the beſt general forms of expectorants is the following:

℞ Gum, aſſafœtid. gum ammoniac. ää. ʒ i. ſs. Aq. pur. ℥ ix. m. detur cochl. larg. freq.

To this mixture may be added as required, the tinct. opii camph. the oxym. ſcillæ or ſyr. allii. Sometimes the aſſafœtida diſagrees.

Dr. Millar recommends the miſtura camphorata in the fit of the *aſthma*; the doſe is one or two ſpoonfuls every three or four hours. Before he gives the miſtura camph. he uſually preſcribes a gentle emetic, and then a doſe of the tinct. rhei, or tinct. aloes.

Diaphoretics are always ſo far needful, that the natural perſpiration ſhould be ſupported; but when the *aſthma* is produced by acrid matter, &c. repelled from the ſkin, they are abſolutely neceſſary, being then principally to be depended on: powders, with nitre and pulv contrayerv. with two or three grains of camphor in each doſe, the ſps. febrif. Di. Clutton, are excellent for this purpoſe, and frequent draughts of warm elder-flower tea may accompany them.

Purges ſhould not be of the rougher kind, but manna with caſſia, joined to ſmall doſes of the antimonium tartariſatum; or if the genuine can be obtained, the ol. Ricini, given in a warm vehicle, is the beſt. In ſome caſes, glyſters only can be admitted.

Opiates, when admitted in the humoral aſthma, ſhould be accompanied with expectorants; the tinct. opii camphorata, and the pil. e. ſtyrace, are excellent; or if the tinct. opii is ventured on, it ſhould be mixed with the ox. ſcillæ. In the ſpaſmodic *aſthma*, the tinct. opii hath been found neceſſary even to a hundred drops, in a few hours; but in all ſpaſmodic complaints, opiates, mixed with purgatives, in ſuch quantities as to keep the bowels lax, is the beſt method of adminiſtering them.

Bleeding. The pulſe and heat of the body will generally beſt determine when to uſe or omit this operation. When a ſudden fit is produced by an eaſterly wind, if it is violent, bleeding, though on other accounts not adviſeable, may, notwithſtanding, be neceſſary; in ſuch inſtances, judgment and ſagacity will be put to the trial.

Iſſues ſhould be made in the inſide of the thigh, juſt under the gartering place; for there their diſcharge is uſually greater than in the back, and their trouble far leſs; their uſe is equal, be the kind of *aſthma* what it will.

Bliſters on the back are an excellent aid during the fit, in caſes of humoral *aſthma*; and to prevent returns, keep them open as long as poſſible. In the ſpaſmodic or true *aſthma*, iſſues and bliſters are of leſs efficacy, but not to be omitted.

In the pure convulſive *aſthma*, bathing the feet in warm water is of admirable efficacy in many inſtances.

Dr. Withers ſeems to be the firſt who has propoſed the flowers of zinc. He ſays, "that when plethora or fulneſs of blood is not preſent, I have found them to ſucceed where others have failed." This is, the Doctor obſerves, a powerful antiſpaſmodic, and at the ſame time beneficial in ſtrengthening the conſtitution. The doſe of theſe flowers is from two grains to fifteen, two or three times a day.

See the article VOMICA, for directions in caſes of tubercles.

Variety of forms are to be ſeen, which are well adapted to the diſorder in general, and the ſymptoms in particular, in Dr. Smith's Formulæ Medicamentorum, Dr. Brookes's, and the London Practice of Phyſic.

Dr. Percival obſerves, that in Derbyſhire, when the miners or ſmelters of lead find themſelves affected with the *aſthma*, they uſually leave their occupation for a few days, and work at the lime-kilns; experience having proved that the fixed air ariſing from the calcination of lime-ſtones, is an effectual and ſpeedy remedy in this diſorder.

The *aſthma*, in ſome inſtances, ends in a partial palſy; in others, in ſome ſpecies of dropſy; ſometimes, though not often, the patient is ſuddenly ſuffocated; this accident, when it happens, hath for its cauſe a polypus in the lungs; and inſtances have occurred of its ending in an inflammation of the lungs.

See ARETÆUS, Dr. DOVER. Sir JOHN FLOYER on the *Aſthma*. CULLEN's Firſt Lines, edit. 4. vol. iii. WITHERS on the *Aſthma*. HOFFMAN on Convulſive *Aſthma*. Dr. RYAN on the Hiſtory and Cure of *Aſthma*.

There are ſeveral diſeaſes called *aſthma*, which more properly belong to other genera; which ſee under Dyſpnæa, and Suffocatio Stridula; and alſo in CULLEN's Noſologia Methodica, vol. ii. under CYNANCHE TRACHEALIS, and DYSPNÆA.

ASTITES GLANDULOSI. See PARASTATÆ.

ASTRAGALO. } See OROBUS.
ASTRAGALOIDES. }

ASTRAGALUS. ANKLE-BONE. Alſo called the SLING-BONE, *balliſtæ os*. *Aſtrion*, the *talus*, called alſo *quatrio*; *tetroros*; *cavicula*; *cavilla*; *diabebos*; *peza*, or firſt bone of the foot, ſo named from its being uſed in ancient ſports, or ſomething of that ſhape, called COCKAL, in like manner with our dice, and going by the ſame name.

It is the upper *bone* of the foot, the tibia reſts upon it; its upper and under ſide are covered with cartilage, and on its under ſide it articulates with the os calcis; the fore part of this *bone* is cartilaginous, and there it articulates with the os ſcaphoides. Some apply the term to the vertebræ of the neck. HOMER, in his Odyſſey, uſes it in this ſenſe.

ASTRAGALUS. Alſo a name for the LIQUORICE VETCH. See OROBUS, and GLAUX VULGARIS LEGUMINOSA.

ASTRAGALUS ACULEATUS,
——— MASSILIENSIS,
——— TRAGACANTHA ALBUS. } See GUMMI TRAGACANTHA.

ASTRANTIA VULG. ET NIGER. See IMPERATORIA.

ASTRAPE. LIGHTNING. Galen reckons it among the procatarctic cauſes of an epilepſy; and it is doubtleſs a cauſe of diſeaſe in leſſer degrees of its influence, as well as of death in greater. In the Phil. Tranſ. art. xlii. ann. 1766, Dr. Laurence gives an inſtance of a ſingular effect of *lightning*.

ASTRICTA. When applied to the belly, it ſignifies COSTIVENESS.

ASTRINGENTIA. } ASTRINGENTS, from *aſtringo*, *to bind*. ADSTRINGENTIA, called alſo *anaſtaltica*; *conſtringentia*.

The ſolid parts of the human machine, from various morbid cauſes, are ſo præternaturally relaxed, that they become weak and flaccid, unfit to perform properly their natural functions. It ſeems neceſſary, therefore, that there ſhould be ſuch remedies as can correct ſuch debility and relaxation, and bring back our ſolids to their former healthful ſtandard. Remedies of this ſort among phyſicians are called ASTRINGENTS. That many materials have the power of condenſing, giving firmneſs, and ſtrengthning the ſolid parts of animal bodies, is proved from daily experience, eſpecially that common and well-known art of tanning and preparing leather by oak-bark, and other things ſimilar, until it acquires a remarkable hardneſs and firmneſs.

We are taught from reaſon, and experience hath clearly demonſtrated, that many things can excite a ſimilar power by ſome means or another upon the living machine. But the mode by which this is performed, ſeems not to be properly underſtood—whether, according to the opinion of ſome, by the interpoſition of the particles of new matter between thoſe of the old, which may connect them more ſtrongly, and therefore make the whole compages firmer;—or, as is more agreeable to others, little or no new matter being added by only conſtringing the bonds of adheſion of the former particles, which being thus brought into nearer contact, render the matter firmer. However, concerning a matter ſo obſcure and uncertain, it is ſurely better not to form any conjectures, than to perplex ourſelves with a variety of opinions which are neither accurate nor capable of properly explaining the buſineſs. Still, it is an indiſputable fact, that the ſolids of the machine are capable of being rendered firmer by the particles of which they conſiſt, being drawn only into cloſer contact with each other, without any, even the ſmalleſt change of their compoſition; and ſometimes alſo by the moiſter particles, by which they had been rendered ſoft, being diſſipated. But whether aſtringents produce this effect in a ſimilar manner, or by any mode altogether different, it is of little conſequence, ſo long as the effect itſelf is certain, and the nature and adminiſtration of them ſufficiently clear. Dr. CULLEN ſays, "That by the corrugation, and conſtriction of the whole mouth and faucus, from a ſmall portion of aſtringents being applied to a ſmall part of the tongue, that aſtringents act upon the ſentient nerves; and, that taken into the ſtomach, they ſhew their effects in other parts of the body ſo quickly, that they can hardly be ſuppoſed to have paſſed the ſtomach itſelf; and, therefore, their ſudden effects in diſtant parts, muſt be aſcribed to an aſtringent power communicated from the ſtomach to thoſe diſtant parts." From all which it is concluſive, that aſtringents act *topically*, and *ſympathetically*; the firſt by exerting their efficacy equally upon the dead, and living fleſh; the ſecond, by rouzing the living principle, or nervous energy, from their ſtimulus, or, mitigating too powerful action by their ſedative influence.

Hence, aſtringents, as they are medicines ſuited to encreaſe the cohesion, and produce ſome contraction in the the ſimple ſolids, and moving fibres of the human body, are applicable in caſes where the muſcular fibres have been ſtretched, as in bruiſes and ſtrains; in theſe caſes *aſtringents* are uſed at the beginning as ſedatives to abate inflammation, and alſo as *aſtringents* to reſtore the loſt tone of the parts; and after the removal of inflammation, they are continued only as tonics. *Aſtringents* are ſometimes uſeful for checking too great ſecretions, which effect they generally produce in conſequence of their acting more powerfully on the ſmall veſſels in conſtringing, than on the larger veſſels in increaſing the impetus of the circulation. In hæmorrhages, *aſtringents* have been employed with advantage, but the advantage is in paſſive hæmorrhages only; for when there is a ſtrong action of the veſſels, *aſtringents* would be very injurious. *Aſtringents* are often uſeful for leſſening morbid irritability and ſenſibility; for they act not only on the ſimple fibre, but alſo on the living power: morbid irritability is beſt removed by a moderate uſe of *aſtringents*. Thoſe *aſtringents* that have no ſtimulus, ſuch as the uva urſi, &c. eaſe pain from irritation, whence their uſefulneſs in fits of the ſtone. *Aſtringents* promote ſuppuration as well as the bark, and in the like inſtances that are benefited by the bark.

When ſudden changes are to be produced, give the ſoſſil *aſtringents*; when irritability or other habitual diſorders are to be removed, uſe vegetable and metallic *aſtringents*; they are the moſt powerful, and exceed alum in activity and efficacy; dilute ſolutions of metals, externally applied, are anti-inflammatory and ſedative, whilſt ſtronger ſolutions inflame, and are powerful cauſtics.

During inflammation, or an inflammatory diatheſis, avoid *aſtringents* that have a degree of ſtimulus; avoid all *aſtringents* when the blood tends too much to the head; avoid *aſtringents* during a ſanguine plethora, or obſtructions in the viſcera.

Aſtringents are beſt adminiſtered in ſmall doſes, with a large quantity of ſome proper liquid. They are generally diſtinguiſhed by a rough auſtere taſte, and changing ſolutions of iron, eſpecially thoſe made with the vitriolic acid, of a dark purple or black colour; but theſe criteria are not without reſtriction, when conſidered with reſpect to the application of thoſe medicines to the living fibre. They yield their virtue to water by infuſion, and alſo to a ſpirit in a leſs degree; by diſtillation they afford nothing, nor to oils do they impart any of their qualities. Extracts made from *aſtringent* vegetables do not keep long. Some vegetable *aſtringents* are antiſeptic, by their fixed air correcting the putreſcent tendency of the blood, and by the tonic power of theſe drugs on the ſolids, by which they oppoſe ſpaſm.

Dr. Percival, in his Eſſays Med. and Exp. obſerves, that *aſtringents*, acid and bitters, neutralize each other; that vegetable acids leſſen their aſtriction externally, but mineral acids increaſe it both internally and externally.

Vegetable *aſtringents* are the moſt powerful, as medicines; and of theſe, one of the ſtrongeſt is galls. See FORDYCE. GREGORY Conſpectus Med. WALLIS on Health and Diſeaſe. CULLEN's Materia Medica.

ASTRIOLISM. BLASTING, or PLANET-STRIKING.

ASTRION. See ASTRAGALUS.

ASTROBOLISMOS, } From ἀστρον, *a ſtar*, and βάλλω, *to ſtrike upon*; i. e. planet-
ASTROBLES. } ſtruck. The blaſting of trees, or mortification by a blaſt; but when applied to the human body, it ſignifies an apoplexy or a ſphacelus. The firſt term is brought into our Lexicons, but is uſed only by Theophraſtus of Plants.

ASTROCYNOLOGIA, from ἀστρον, *a ſtar*, κυων, *a dog*, and λογος, *a diſſertation*. The name of a treatiſe on the dog-days.

ASTRONOMIA, ASTRONOMY, from ἀστρον, *a ſtar*, and νομος, *law*. It is the ſcience which teaches the knowledge of the heavenly bodies, ſhewing their magnitudes, diſtances, order, and motion. Hippocrates ſays, that one ignorant of *aſtronomy* cannot be well qualified for a phyſician. Others, ſince his day, have greatly extolled the utility of this ſcience in the ſtudy and practice of medicine; ſome reckoning anatomy to be the right eye of phyſic, and *aſtronomy* its left; for they ſay, ſuch is the influence of the ſun, moon, and ſtars, eſpecially the planets, upon terreſtrial bodies, by the intervention of the æther and atmoſphere, that they induce very ſenſible changes in them; but admitting of ſome influence in the planets, it is in degrees too trifling to affect us in the practice of medicine. The planets may affect meteors, and, in ſome inſtances, the effects on our atmoſphere may influence our bodies for their good or harm. Meteorology, and thoſe other branches of ſcience by which we are taught the nature, properties, &c. of our atmoſphere, ſeem more directly proper to medical enquiries.

It is pleaded, that the aſpects of the ſtars influence the human body, becauſe that in the vernal equinox, or the ſummer ſolſtice, the force of intermitting fevers is deſtroyed, though obſtinate in all other ſeaſons; and becauſe that the equinoxes are peculiarly hurtful to ſome ſort of patients; but theſe circumſtances are better accounted for on principles leſs remote than thoſe derived from *aſtronomy*. The late Dr. Mead was a great advocate for this branch of ſcience being an eſſential qualification in a phyſician.

ASTRUM. A STAR. With the chemiſts this word ſignifies that virtue and power which accrues to things from their preparation; thus, the *aſtrum* of ſalt is its reſolution into a fluid ſtate, by which it can exert itſelf more. *Aſtrum* is a name given to many medicines.

ASUAR. See MYROBALANI INDIA.

ASUGAR. See ÆRUGO ÆRIS.

ASUOLI. See FULIGO.

ATAC. See NITRUM.

ATAXIA. ATAXY, from α, *priv.* and τασσω, *to order*. Some particular irregularity or diſorder.

ATAXMIR. An Arabic word expreſſing the method of treating an eye, when preternatural hairs grow under the natural ones.

ATEBRAS. A SUBLIMING VESSEL.

ATECHNIA, ατεχνια, from α, neg. and τεχνη, *an art, want of art.* See ANAPHRODISIA.

ATER SUCCUS. See ATRABILIS.

ATERAMNA. This words occurs in Hippocrates's Lib. de Aere, Locis, et Aquis, and is expounded by Galen as ſignifying difficulty of concoction, and hard. He obſerves that the ancients called bad waters thus, and that, as joined with other words, it hath other ſignifications.

ATHAMANTIA CRETENSIS. See DAUCUS CRETICUS.

ATHANASIA, α, neg. et θανατος, *death.* The IMMORTAL PLANT. A name given to TANSEY, becauſe when ſtuffed up the noſe of a dead corpſe, it is ſaid to prevent putrefaction: ſee TANACETUM. Alſo it means *immortality.* The name of an antidote of Galen, alſo of one ſaid to be Oribaſius's; it is the name too of a collyrium deſcribed by Aetius. Beſides theſe, it is the appellation of many other compoſitions.

ATHANOR, } Amongſt the chemiſts it is a ſort of
ATHONOR, } digeſting furnace, contrived to maintain its heat a long time, and is a furnace which communicates with its chimney by a lateral canal, ſuch as is in the furnace for a ſand-bath; this furnace is carried to a conſiderable height above the part where this canal enters it: it is filled with fuel up to the top, and cloſely covered, and as the lower part of the fuel conſumes, it is ſupplied by what is above, which falls down into its place; thus a conſtant and equal heat is maintained a a long time without any attendance. See FORNAX.

ATHARA. A ſort of PAP made with wheat-flour.

ATHENA. A plaſter in much repute among the ancients.

ATHENATORIUM. A thick glaſs cover which is, in the Theatrum Chymicum, vol. iii. p. 33, directed to be luted to a cucurbit, when the alembic is taken off in a particular proceſs there preſcribed.

ATHENIONIS CATAPOTIUM. The name of a pill in Celſus's writings.

ATHENIPPON. The name of a collyrium alſo called *diaſmyrnes.* It alſo a name of many collyria.

ATHENIPPUM. See ASCLEPIOS.

ATHERA. A ſort of food made with wheat-flour, like the pap-meat which is given to children. Pliny ſays it is an Ægyptian invention.

ATHEROMA, from αθηρα, *pulſe, pap,* or *a kind of poultice.* It is a kind of tumor, thus named from its poultice-like contents. See NÆVUS.

ATHLETICUS, ATHLETIC, from αθλεω, *to contend.* It implies the ſame as a robuſt conſtitution fit for wreſtling.

ATHONOR. See ATHANOR.

ATHRIX. See ALOPECIA.

ATHROON, } In medicinal authors it imports copi-
ATHROOS. } ous, accumulated, or ſudden, and is the reverſe of by degrees: ſimilar to *Confertus.*

ATHYMIA, from α, neg. and θυμος, *courage.* PUSILLANIMITY. In medicinal authors it uſually ſignifies that dejectedneſs, deſpondence, anxiety, and deſpair, which frequently occurs in the courſe of diſtempers. Some uſe this word as ſynonymous with *melancholia.*

ATINCAR, or ATINKAR. See BORAX.

ATITARA. See PALMA MINOR.

ATLAS, from ατλαω, *to ſuſtain,* or ατλημι, *to carry.* The name of the firſt vertebra of the neck; ſo called becauſe it ſuſtains the head, as Atlas was ſuppoſed to ſuſtain the earth. It is a bony ring, and in its back part it receives the proceſſus dentatus of the ſecond vertebra; it hath no ſpinal proceſs; its tranſverſe proceſſes are very thick; inſtead of the two ſuperior oblique proceſſes, which the other vertebra have, there are two oblong holes which receive the condyls of the os occipitis, and the inferior oblique proceſſes are horizontal to admit of rotation.

ATMOSPHÆRA. The ATMOSPHERE. See AER.

ATOCHIA. PRÆTERNATURAL LABOUR.

ATOCIUM. See ANTIRRHINUM.

ATOLLI. A ſort of *pap,* made of the meal of maize and water, which the Indians mix with their chocolate.

ATOMUS, from α, negative, and τεμνω, *to cut* or *divide.* AN ATOM. It is a particle of matter ſo ſmall as not to admit of any farther diviſion. Aſclepiades taught that *atoms* were the primordia of all things, and that they were not perceptible to our ſenſes, but only to our underſtandings; that they had no qualities, for the qualities of bodies which they compoſe depend on the order, figure, number, &c. of many *atoms* joined together; and this laſt circumſtance he proves by obſerving, that a lump of ſilver is white, but if filed down it is black; and horns of goats are black when whole, but white if filed down. Galen ſays, that Aſclepiades, adhering to the ſentiments of Democritus and Epicurus, with regard to the principles of bodies, had only changed the former names of things, calling *atoms* molecules, and a vacuum, pores.

Molecules were diviſible, but *atoms* not.

ATONIA, from α, negative, τεινω, *to ſtretch.* ATONY; defect of muſcular power. *Relaxation,* laxity, debility, or diſtemperature. This word was much in uſe among the methodic ſect, who aſcribed the cauſes of all diſtempers to relaxation, ſtricture, or a mixture of theſe. It is generally ſynonymous with palſy.

ATOYAXACOTL. } See MACAXO-
ATOYAXOCOTL. CHICHILTIC. } COTLIFERA.

ATRA BILIS. *Atri ſuccus; bilis atra; mercurialis;* BLACK BILE, or MELANCHOLY. According to the ancients it hath a twofold origin: 1ſt. From the groſſer parts of the blood, and this they called the melancholy humour. 2dly, From yellow bile being highly concocted. Dr. Percival, in his Eſſays Med. and Exp. ſuggeſts, that it is the gall rendered acrid by ſtagnation in the gall-bladder, and viſcid by the abſorption of its fluid parts. *Bile* in this ſtate diſcharged into the duodenum, occaſions univerſal diſturbance and diſorder, until it is evacuated; it occaſions violent vomiting, or purging, or both, and previous to this the pulſe is quick, the head aches, a delirium comes on, a hiccough, intenſe thirſt, inward heat, and a fetid breath. Some deſcribe this kind of *bile* as being acid, harſh, corroding, and, when poured on the ground, bubbling up, and raiſing the earth after the manner of a ferment. Dr. Percival ſays, that by the uſe of the infuſ. ſenæ limoniat. warmed with the tinct. columb. he had checked the vomitings occaſioned by this matter.

ATRACHELUS, from α, negative, and τραχηλος, *the neck.* SHORT-NECKED.

ATRACTYLIS, called *cnicus, carduus luteus, cardiocnicus,* DISTAFF THISTLE, from ατρακτος, *a ſpindle.* It is a plant which grows in Italy, Greece, and other warm countries. Its leave are of the ſame nature as thoſe of the carduus benedictus, but the ſtalk is the part that is chiefly uſed. The women keep them for diſtaffs.

ATRAGENE, called alſo *viorna, clematis, flammula,* and TRAVELLER'S JOY. It grows in hedges, flowers in July: the whole plant is of a cauſtic quality, and laid on the ſkin it preſently raiſes a bliſter there. Dale.

ATRAMENTUM SUTORIUM. A name of the GREEN VITRIOL, and *melanteria.* See VITRIOLUM VIRIDE.

ATRAPHAXIS, or ATRAPHRAXIS. See ATRIPLEX.

ATRESIA, from α, negative, and τιτρωω, or τριω, *to perforate.* IMPERFORATION. See ATRETI.

ATRETARUM ISCHURIA. A SUPPRESSION of URINE, from the menſes being retained in the vagina. See ISCHURIA VESICALIS.

ATRETI, IMPERFORATE, from α, priv. and τιτρωω, *perforate.* Thoſe of either ſex are thus called, when their anus, or any other natural aperture, is cloſed.

ATRICES. Small tubercles about the anus, which recede and return again, eſpecially at the firſt. Valeſius de Taranta reckoned them among condylomata & fici.

ATRICI. Small ſinuſes in the inteſtinum rectum, which do not reach ſo far as to perforate into its cavity.

ATRIPLEX. ORACH, or ORACHE: alſo called *atriplex* alba vel rubra hortenſis, *arrache, atra-phaxis, atraphraxis, chryſolachanon, olus aureum;* WHITE, RED, or GARDEN ORACH.

It is an annual plant riſing from ſeeds, and chiefly employed in the kitchen. That named —— FOETIDA: Called alſo *garoſmum, andraphex, vulvaria, chenopodium fœtidum, chenopodium vulvarium, atriplex olida, blitum fœtidum;* STINKING ORACH; is the CHENOPODIUM VULVARIUM foliis integerrimis rhomboideo-ovatis, floribus conglomeratis axillaribus. CL. PENTANDRIA. ORD. DIGYNIA. LINN. Gen. Plant. 309. It is a low procumbent plant, ſprinkled all over with a whitiſh clammy meal; the leaves are ſmall, of a roundiſh figure, with

with an obtuſe point. On the tops of the branches come forth cluſters of imperfect flowers, followed each by a flattiſh ſeed. It is annual, grows wild about dung-hills, and flowers in Auguſt.

It hath a ſtrong diſagreeable ſmell, ſomewhat like that of ſalt-fiſh. Such of it as is found growing amongſt old rubbiſh is weaker than that in moiſter ground. Water takes up all its virtue by infuſion; it loſes its ſtrength by keeping. It is a fetid anti-hyſteric, antiſpaſmodic, and acts without irritation. It can only be uſed in its recent ſtate, as in its dry ſtate it loſes all its ſenſible qualities. Therefore, the beſt form is a conſerve, of which two or three drams may be taken in a day. Dr. Cullen wiſhes it was often employed, Mat. Med.

ATRIPLEX. MARITIMA, and PORTULACA. See HALIMUS.——ODORA SUAVEOLENS. See BOTRYS.——OLIDA. See ATRIPLEX-FOETIDA.——SYLVESTRIS, WILD ORACH. See CHENOPODIUM.

ATROPA, BELLADONA. See SOLANUM LETHALE.——MANDRAGORA. See MANDRAGORA.

ATROPHIA, from *α*, and *τρεφω*, *to nouriſh*. Alſo *contabeſcentia*. *Inutritio*, *maraſmus*, *ariditas corporis*; an ATROPHY. It is a waſting, with loſs of ſtrength; but without a hectic fever. Dr. CULLEN on this remarks, that an atrophy perhaps is never without fever; at leaſt the pulſe is quicker than uſual; but the abſence of the *true hectic fever* diſtinguiſhes this diſeaſe from the tabes. Some ſay that in an *atrophy*, the fat only is waſted. The Latins call it *inutritio*, the want of nutrition. It is alſo called a nervous conſumption. Dr. Cullen ranks this genus of diſeaſe in the claſs CACHEXIÆ, and order MARCORES. He enumerates four ſpecies. 1. *Atrophia* inanitorum, from too great evacuations, alſo *tabes nutricum*;—*ſudatoria*;—*a ſanguiſluxu*. 2. *Atrophia* famelicorum, from deficient nouriſhment. 3. *Atrophia* cacochymica, from bad nouriſhment; alſo *tabes ſyphilitica*; —*ab hydrope*. 4. *Atrophia* debilium, when the function of nutrition is ſo depraved as to be productive of diſorder where too exceſſive evacuation or cachochymia has not preceded. The atrophy of children is called *paidatrophia*. Whether with the firſt or fourth ſpecies is to be claſſed the tabes dorſalis, ſeems doubtful; CULLEN thinks the laſt.

An *atrophy*, from whatever it may ariſe, has for its proximate cauſe, a defective exertion of the aſſimilating powers of the conſtitution, or an impediment to the application of their effects, by which even the functions of the machine ordained for the ſupport, becomes its deſtruction, from the mere want of proper nutrition. The diſorder, therefore, better be conſidered of one kind, brought on by different cauſes, tending to the ſame end.

The cauſes are, a weakneſs in the organs of digeſtion, whence an undue ſupply of chyle to the blood; a diet that affords inſufficient nouriſhment; a tenderneſs and irritability of the nervous ſyſtem; a defect of, or an excoriation of the mucus, which defends the inner ſurfaces of the heart and arteries; exceſſes of the paſſions, and in luxurious purſuits, too copious evacuations, &c.

The ſigns in the beginning are, a decreaſe of ſtrength, loſs of appetite without *much* fever, cough, or ſhort breath, though in the progreſs, when a conſumption of the fleſh hath gradually affected the whole habit, there is ſome degree of difficulty in the breathing; the urine is inconſtant in its colour, though generally high, and ſmall in quantity; ſometimes it is pale and profuſe; in time the blood grows hot and acrid for want of its due ſupplies, a febrile heat increaſes, as alſo a cough and difficulty of breathing. In children this diſeaſe frequently happens; and, beſides the above-mentioned cauſes, they are ſubject to it from a ſudden change from the breaſt to more ſolid food; in which caſe their legs become pendulous, the habit flaccid, their ſkin corrugated, and, in many inſtances, their appetite for food is almoſt inſatiable. As a weakneſs in their chylopœtic organs is the cauſe, ſoon diſſecting thoſe patients after death, their meſenteric glands are tumified, their livers much diſordered, their inteſtines filled with black fetid ſordes, and the muſcles of their bellies extenuated almoſt to a membrane.

This diſorder ſhould be diſtinguiſhed from leanneſs, the rickets, and that weakneſs and leanneſs in ſome children, who pine only for want of a due ſupply from the breaſt.

The cure will be regulated by the cauſe.

If this diſorder depends on any other, as on a diarrhœa, fluor albus, diabetes, gonorrhœa, &c. the cure will depend on the cure of the original diſeaſe.

If the cauſe is indigeſtion, with a viſcid obſtruction of the meſentery, which is the caſe in children and old people for the moſt part, give now and then gentle doſes of rhubarb with calomel; or ſal polychreſticus, and, in the intervals, let ſtomachics, with warm perſpiratives, be preſcribed. Carefully avoid irritating purges, for they aggravate the ſymptoms by inflaming the bowels. The kali acetatum tinct. guiac. and ferrugineous medicines, may be uſed, and thoſe with the helleb. nig. adding thereto the bark if required.

If there is an irritable habit from any of the cauſes above ſpecified, endeavour to abſtract from the ſtimulus, and appeaſe all ſpaſmodic affections by opiates, mucilages, gentle aſtringents that are glutinous, the bark, and ſuch other medicines as the preſent ſymptoms may indicate.

The ſcrophulous and cancerous caſes only admit of palliating, by keeping the circulation as low as the general health will admit. A thin light diet is the moſt proper, ſuch as jellies of both vegetable and animal ſubſtances, broths, &c. not forgetting the bark, and acidum vitrioli dilutum, as corroborants.

When exceſſive evacuations have been the cauſe, the decoction of ſarſaparilla, ſalop, chalybeate waters, bark, and gentle riding, are proper.

A venereal taint is often an unſuſpected cauſe; in which caſe mild mercurials, with ſarſaparilla, and a milk diet, are the cure. See SAUVAGES Noſologia Methodica. HOFFMAN. Syſt. Rat. Medicinæ. MORTON. WILLIS.

ATTA. Feſtus ſays it is one who, by reaſon of the tenderneſs or other defect in his feet, touches the ground rather than treads on it.

ATTAGEN, } The name of an
ATTAGENA PHRYGIA. } Aſiatic partridge, commonly known by the name of FRANCOLIN. The Greeks call it *lagopus*, *hare's foot*, becauſe its feet are downy. It is of a duſky red colour on its back, and ſeems to be the ſame as our *red cock*, which Aldrovandus calls *attagen*. Ray names it *francolino Italorum*. Pliny deſcribes it under the name of *lagopus altera*, and with us it is called the RED COCK, COR COCK, MOOR COCK, or RED GAME. They are beſt in autumn for food, are not remarkable in medicine, though the gizzard on its inſide is very fragrant juſt after the bird is killed.

ATTALICUS. The name of ſome compound medicines mentioned by Galen.

ATTENUANTIA, from *attenuo*, *to make thin*. ATTENUATING MEDICINES act either, it is ſuppoſed, by diminiſhing the conſiſtence of, or dividing coherent maſſes; or by diminiſhing the ſize of the larger particles; hence exert their power both on the ſolids and fluids. Such as operate on the fluids by immediate contact are few, and thoſe are water, or ſuch as abound with water, as on this they depend for their action only. Viſcid humours, alkaline, and other ſalts, are diſſolved by water. Moſt of, or all the other *attenuants*, act on the ſolids by quickening their motion, increaſing their tone, and ſo enabling them to attenuate the too thick fluids; hence properly come under ſome other claſſes. See HOFFMAN, vol. i. and ii. cap. iv. CULLEN's Mat. Med.

ATTICUM. The name of a plaſter uſed by Hippocrates. When joined with another word, it is an adjective, and ſignifies *attic*, *or the beſt*, as MEL ATTICUM, *the beſt honey*, CERA ATTICA, *the beſt wax*, &c.

ATTINCAR VENERIS. The whitening of copper to tranſmute it into ſilver.

ATTINGAT. See ÆRIS FLOS.

ATTOLLENS AURICULÆ SUPERIOR. A muſcle which riſes from the corrugator ſupercilii by a thin faſcia.——OCULI, i. e. Muſculus ſuperior, & rectus ſuperior oculi. See ELEVATOR OCULI.

ATTONITUS MORBUS. } Names of the APO-
——— STUPOR. } PLEXY. See APOPLEXIA. It is alſo given to that ſpecies of palſy which ſucceeds the *apoplexy*. See PARALYSIS.

ATTRACTIO. See REPULSIO and AFFINITAS.

ATTRACTIVUM, ATTRACTIVE. Paracelſus pretends to have had an *attractive* medicine, which would draw away the diſeaſes of the body; but the extravagancies of this whimſical genius, with reſpect to it, though not deſerving a place here, may be met with in his Archidox. lib. vii.

ATTRACTIVUS, ATTRACTORIUS, and ATTRAHENS, are applied to remedies that have a power of attracting.

ATTRITA, ATTRITIO. } ATTRITION See INTERTRIGO.

ATYPOS, from α, negative, and τυπος, *a form* or *tenor*. IRREGULAR. It is applied to diſeaſes which have no regularity in their periods. Alſo a deformity in the limbs.

AUANTE, AUAPSE. } The DRY DISEASE. Hippocrates deſcribes it thus. The patient cannot bear either abſtinence or eating. Faſting cauſes a rumbling in his belly, and gnawing pain in his ſtomach. He vomits up various matters, and after vomiting he is at eaſe. After eating, there are eructations, an inflammatory heat and redneſs; a conſtant feeling as if a painful ſtool was to be diſcharged, yet only wind is evacuated, a headach is complained of: a ſenſe of pricking, as with needles, in different parts of the body; the legs ſeem heavy, grow feeble and extenuated, and he becomes weak.

The method of cure which he preſcribed was, firſt to give a purge, and after it an emetic; then directs abſtinence from fat food, temperance, bathing, unctions, and moderate exerciſe.

AUCHMOS, from αυω, *to dry*. The Latins call it *ſqualor*. It is hot, dry, ſultry weather.

AUCUPALIS, or AUCUPARIA. See ORNUS, and SORBUS SYLVESTRIS.

AUDACIA. In a medical ſenſe is that ſort of boldneſs which we meet with in deliria or madneſs. It alſo ſignifies impudence.

AUDITORIA ARTERIA. The internal *auditory artery* goes off from each ſide of the *arteria baſilaris* to the organ of hearing, and accompanies the auditory nerve, having firſt furniſhed ſeveral ſmall twigs to the membrana arachnoides.

AUDITORIUS MEATUS. The paſſage that conveys the air to the auditory nerve. It leads from the lower anterior part of the concha to the tympanum, and is partly bony, partly cartilaginous; all within the temporal bone is the bony part, is the longeſt, and forms the bottom; the reſt is cartilaginous, and makes the external opening, or orifice of the canal; theſe two parts make a canal of about three-fourths of an inch long, a little tortuous, and wider in ſome parts than in others. On the membranous covering of the cartilaginous part, we obſerve the yellow bodies, ſuppoſed to be the *glandulæ ceruminis*. The bony part of the *meatus* is nearly horizontal, and ſtraight; the cartilaginous part is curved and winding, which ſhould be obſerved when a ſyringe is uſed to inject any thing with into the ear.——NERVUS. The AUDITORY NERVE. The ſeventh pair of nerves are called *auditory nerves*, ſo are the *ſympathetici minores*. This ſeventh pair of nerves runs into the os petroſum, and is there divided into the *portio mollis*, which is ſpent upon the labyrinth of the ear, and diſtributed to the meatus *auditorius* internus, and ſo paſſes to the veſtibulum cochlea, and *portio dura*, which goes out by the aquæduct, between the maſtoid and ſtiloid proceſſes, paſſes through the parotid, becomes a cutaneous nerve, and communicates with the upper maxillary. On theſe nerves, no covering from the dura mater can be traced.

AUDITUS. The ſenſe of HEARING, alſo called *acoe*. By this ſenſe we perceive the elaſtic tremors of the air; hence the organ of *hearing* is made up of hard bones, and of elaſtic cartilages and membranes. The elaſtic air only receives ſonorous tremors, and transfers them, as we ſee water transfers any impulſe given to it. The aforeſaid ſound is increaſed in air that is condenſed, and is loſt in a veſſel emptied of its air. The body which produces ſound ought to tremble or vibrate in all, even the leaſt of its particles. From ſuch a tremor, the contiguous air is beat into waves, whereby the parts of the air that lies outermoſt are compreſſed, and fly back again as ſoon as their elaſticity gets over the impulſe, whence the air flies again towards the ſonorous body, where it is now more looſe and rarefied, to be there again compreſſed by the impulſive power; and in the ſame manner the anterior and outer portion of air ſurrounding that which is impelled, is by the action of the latter compreſſed and removed farther from the trembling body, yet ſo as to return again in its proper time by the force of elaſticity, driving its contents to the tremulous body for the exciting of a new wave. Theſe impulſions of the air are required to ſucceed each other with a certain velocity; and in order to render them audible, they muſt not be fewer than thirty in a ſecond of time. As theſe ſonorous waves are more frequent in a given time, ſo much ſharper is the ſound heard, and the more ſtrongly does it affect us, till we come to the moſt acute of audible ſounds, which have 7520 tremors in a ſecond. Acute ſounds are in general yielded from bodies that are hard, brittle, and violently ſhook or ſtruck; but grave ſounds from the contrary. Sounds, whether acute or grave, are carried through the air with a celerity equal to about 1038 Paris feet in a ſecond; but a contrary wind retards their progreſſion about one-twelfth of their velocity. Sounds being elaſtic, are reflected from hard bodies in angles, equal to thoſe of their incidence; but the ſame ſound uſhered into the open air, and dilating through an immenſe ſphere, grows proportionably weaker; but if it be uſhered through a tube in a cylindrical ſhape, it becomes increaſed; therefore, the ſonorous waves of the elaſtic air being driven into the cartilaginous funnel of the ear, are repelled and collected together by alternate reflections from its elaſtic ſides into the cavity of the concha, from whence it proceeds through the auditory paſſage, with a force ſo much ſtronger as the ſurface of the outer ear is larger than the ſection of the ſaid auditory paſſage, through which the ſame force is continued entire forward, and increaſed by new reſonances, excited from the percuſſion of the elaſtic cartilages and hard bones, ſo as to mix imperceptibly with the primitive ſound. At the bottom of the auditory paſſage is the MEMBRANE OF THE DRUM OF THE EAR, called MEMBRANA TYMPANI; ſometimes by the barbarous terms *myringa*, *myrinx*, which is a thin tranſparent, flattiſh pellicle, the edge of which is round, and ſtrongly fixed in the circular groove which divides the bony meatus of the external ear from the tympanum or barrel: this membrane conſiſts of ſeveral plates, one of which is dry, rattling, ſplendid, and pellucid. It is very tenſe, eaſily put into a tremulous motion; and upon it the ſonorous waves or modulations of external air ſtrike, moves the malleus which is fixed to it, and ſo it proves a means of ſound being readily conveyed to the common ſenſorium. This membrane is ſtretched over a cavity in the os petroſum, called the TYMPANUM or DRUM, which conſiſts of ſeveral cavities. In the tympanum, which is of an irregular oblong figure, are the bones of *hearing*, lodged in its hollow part, between the pars petroſa and ſquamoſa of the temporal bones. The tympanum hath cavities, viz. the opening of the *cellulæ maſtoideæ*, *maſtoid cells*; *that of the euſtachian tube*, the *canalis ſemi-petroſus*, *bony half canal*, the *feneſtra ovalis*, and *rotunda*. Within the tympanum are ſuſpended the bones of hearing moveably; the firſt of which is the *malleus*, whoſe handle is fixed to the membrane of the drum; and at one end to the ſecond bone, called the *incus*, to which it returns the tremors impreſſed upon the membrane; the incus reſts on the *os orbiculare*, a ſmall round bone, and this upon the ſtapes; the *ſtapes* and the air of the tympanum preſs the auditory nerve, whence the ſenſe of ſound is conveyed to the common ſenſory. When, by the force of external ſounds, the membrane of the drum is forced too much inward, it is probably ſupported by air which paſſes from the mouth through the Euſtachian tube into the inner ear. The importance of the cochlea of the ear, in order to the conveyance of the ſound, is very conſiderable. For a more minute information, conſult Haller's Phyſiology, in the lecture on *Hearing*; and the ingenious obſervations of Dr. Shebbeare on this ſubject, in his Theory and Practice of Phyſic, and the article SONUS.

AUGMENTUM, AUXESIS. The increaſe of a diſeaſe, from its attack to its height.

AUGUSTUM. An epithet given to ſeveral compound medicines.

AULISCOS. See CATHETERUS, and FISTULA.

AURA, ſignifies an exhalation, or vapour, which ariſes from mephitic caves.

AURA, from αυρα, *gale*, ſignifies an airy exhalation, or vapour, and is applicable to ſuch alſo as riſe from mephitic caves. The *chemiſts* mean by it a certain fine and pure ſpirit, found in every animal and vegetable body; but ſo ſubtle as only to be perceptible by its ſmell and taſte, or other effects not known in that body.

AURA EPILEPTICA. A gradual ſenſation, like air aſcending upwards, occaſioning an epileptic attack; in the *Ephem. Nat. Cur.* Ann. 3. Obſ. 336; alſo, in a Treatiſe of GALEN on an Epileptic Boy, there is an evident example of an epilepſy, *per conſenſum ab aura adſcendente*.

AURA VITALIS. So Helmont calls the vital heat.

AURANGIA. See AURANTIA HYSPALENSIS.

AURANTIA. { ENASCENTIA, IMMATURA, } See AURANTIA CURASSAVENTIA.

——— DULCIS. See AURANTIA SINENSIS.

AURANTIA HISPALENSIS, called alſo *mala aurantia* fructu acido, major *arantia malus, arangia, aurangia, mala aurea, chryſomelea, nerantia, crangia, martianum pomum*; *poma anarantia*; SEVILLE ORANGE. It is the CITRUS AURANTIUM, or CITRUS PETIOLIS ALATIS, *foliis acuminatis*. CLASS POLYADELPHIA. ORD. ICOSANDRIA. Linn. Gen. Plant. 901.

The China and Seville orange are both only varieties of the ſame ſpecies: it is the latter which takes place in our pharmacopœias; and we find that the *flowers, leaves, yellow rind*, and *juice*, are made uſe of for different medical purpoſes.

THE FLOWERS of this tree are highly odoriferous, and are uſed as a perfume: they are bitter to the taſte; they give their taſte and ſmell both to water and to ſpirit, but moſt perfectly to rectified ſpirit of wine. The water which is diſtilled from theſe flowers is called *aq. naphæ*. In diſtillation they yield a ſmall quantity of eſſential oil, which is called *ol.* vel *eſſentia neroli*; they are brought from Italy and France.

THE LEAVES have a bitteriſh taſte, and yield by diſtillation an eſſential oil; indeed by rubbing them between the fingers and thumb, they manifeſt conſiderable fragrance. WESTÆRHOEF, DE HAEN, and ſeveral German phyſicians, have ſpoken highly in favour both of the flowers and leaves, but particularly of the latter, and held them in great eſtimation as a remedy for epilepſy, and other convulſive diſorders; but from the experience of Dr. CULLEN and HOME, they have ſunk greatly in their reputation for want of efficacy. The doſe of the leaves in powder, was from 3 ſs. to 3 i. two or three times a day, and in decoction, proportionably ſtrong.

THE YELLOW RIND of the fruit, freed from the white fungous part, is warmer than the peel of lemons, of a more durable flavour, and abounds more with a light fragrant eſſential oil, which exudes upon wounding it. Infuſed in boiling water it gives out nearly all its ſmell and taſte; cold water extracts the bitter, but very little of the flavour. In diſtillation all the oil riſes, but none of the bitter. The yellow rind gives an agreeable flavour to the other medicines, and has deſervedly gained the character of a pleaſant warm aromatic bitter.

The orange peel is commonly employed as a ſtomachic, promotes appetite, and gives ſtrength and vigour to the viſcera; and is particularly uſeful in reſtoring tone to the ſtomach when it has been much impaired; beſides, it has been much celebrated in cure of intermittents, and in thoſe of a moſt obſtinate kind, has been experienced a powerful remedy in menorrhagia, and immoderate uterine evacuations, as evidenced by the authority of Dr. WHYTT and HOME. The London College direct a ſyrup and tincture.

SYRUPUS CORTICUS AURANTII. The SYRUP of ORANGE-PEEL.

Take of the outer yellow rind of a freſh Seville orange-peel, eight ounces; of diſtilled water, five pints; ſteep the peel in the water for a night in a cloſe veſſel, and in the morning diſſolve in the liquor, ſtrained, of doubled-refined ſugar as much as is ſufficient to make a ſyrup.

TINCTURA CORTICIS AURANTII. TINCTURE of ORANGE-PEEL.

Take of the freſh exterior part of Seville oranges, three ounces; proof ſpirit of wine two pints; digeſt for three days, and ſtrain. Ph. Lond. 1788. The doſe, one or two tea-ſpoonfuls twice a day.

THE JUICE OF SEVILLE ORANGES is a grateful acid, which by allaying heat, quenching thirſt, promoting various excretions, and diminiſhing the action of the vaſcular ſanguiferous ſyſtem, proves extremely uſeful in both ardent and putrid fevers, though the China orange juice, as impregnated with a larger proportion of ſugar, becomes more agreeable, and may be taken in larger quantity. The acid matter of the Seville orange differs in ſome of its pharmaceutical properties, both from the fermented acid of vinegar, and from the native acid ſalts of the leaves of plants: from the former in its not being volatile, or not exhaling upon inſpiſſating the juice, nor riſing in diſtillation with the heat of boiling water; from the latter, in its being ſoluble in ſpirit of wine; the inſpiſſated juice liquifies in air, water, or ſpirit of wine; whence it is eaſily preſerved during many years, either in the form of an extract, or in a dilute ſtate, as in a ſpirituous ſolution.

AURANTIA CURASSAVENTIA. } CURASSOA or CURRASSAD, APPLES or ORANGES. They ſeem to be the
AURENTIUM CURRASSAVENSE. } immature oranges that by ſome accident have been checked in their growth; hence called alſo *aurantia exaſcentia*, and *aurantia immatura*. They are a grateful aromatic bitter, of a flavour very different from that of the peel from the ripe fruit, and without any acid, what little tartneſs they have when freſh is loſt in drying. Spirit of wine extracts perfectly all their virtue; water imperfectly; infuſed in wine or brandy they afford a good bitter for the ſtomach. They are uſed to promote the diſcharge in iſſues, whence their name of ISSUE PEAS.

AURANTIA SINENSIS, called alſo *aurantia dulcis, poma Sinenſis, mala aurantia Chinenſia, Chinenſe*, CHINA or SWEET ORANGES.

The rind hath a faint ſmell, and but little bitterneſs, ſo is never uſed in medicine: the juice hath a grateful ſubacid ſweetneſs, in general of the ſame qualities as our ſummer fruits.

AURANTIA. { ENASCENTIA. } See AURANTIA
{ IMMATURA. } CURASSAVENTIA.

AURANTIUM. The ORANGE-TREE. It is an evergreen with many prickly branches; ſmooth, firm, broad leaves, having each two heart-like appendages on the pedicle; the flowers are white, pentapetalous, ſet thick together among the leaves; the fruit is large, round, and yellow, divided internally into eight cells filled with a juicy pulp and white ſeeds: it is a native of the warmer climes, and ſcarcely bears the cold of this country. The beſt are brought from Portugal and Spain, the next from France and Italy. The tree bears flowers and fruit all the year. The fruit of theſe trees are the POET'S GOLDEN APPLE.

AURATUS GERMANORUM. It is an oleo-ſaccharum with the oil of cinnamon, called AURUM-HORIZONTALE.

AUREA ALEXANDRIA. An antidote invented by Alexander.

AURELIANA CANADENSIS IROQUÆIS. See GENSING.

AUREUS. A weight equal to a dram and a half; alſo a pompous appellation for many compound medicines. Blancard ſays, it was a weight amongſt the Arabians of a dram, a ſeventh part; the ſame with *denarius*.

——RAMUS. The art of making gold.

AURICHALCUM. See ÆS.

AURICOLLA. See TINCAL.——ETHELA. A red tincture, and the white flower of gold.

AURICULA. THE EXTERNAL PART OF THE EAR; which is divided into the upper part called *pinna*, and the lower ſoft part called the *lobus*, or *lobulus*. The pinna is divided into ſeveral eminences and cavities; the eminences are the *helix*, called alſo *capreolus*; *anti-helix*, *tragus*, called alſo *antilobium*, and *anti-tragus*.

The *helix* is the large border round the ear, or the exterior compaſs of the ear, ſo called becauſe of its tortuoſity.

The *anti-helix* is the large oblong eminence, ſurrounded by the helix.

The *tragus* is the little anterior protuberance, oppoſite to the lobe, below the fore part of the helix, which in the aged is often covered with hairs.

The anti-tragus is the poſterior protuberance below the inferior extremity of the anti-helix. The name of a muſcle which acts only upon the cartilage of the ear.

The cavities are the *ſcapha*, on the inſide of the helix; the *cavitas innominata* or *foſſa navicularis*, at the anterior upper part of the anti-helix; the *concha*, which is ſituated under the anti-helix: there is a ſort of *ſeptum conchæ*, which is a continuation of the helix; and the fourth cavity is the *meatus auditorius externus*.

The *auricula* is compoſed chiefly of cartilage, which gives and preſerves its ſhape. It hath the advantage of being variable, for there are certain ſmall muſcles called *helicalis major*, and *minor*, *tragicus*, and *anti-tragicus*, which are peculiar to the ear; they are ſuppoſed to act only upon the cartilage, and alter its ſituation, whence it is ſuppoſed that we have the power of receiving more or leſs ſound into the meatus auditorius.

The external ear is fixed to the cranium, not only by the cartilaginous portion of the meatus, but alſo by the ligaments, viz. the anterior, which is fixed by one extremity to the root of the apophyſis zygomatica of the os temporis, cloſe to the corner of the glenoid cavity, and by the other extremity to the anterior and ſuperior part of the cartilaginous meatus. And the poſterior ligament is fixed by one end to the root of the maſtoid apophyſis, and by the other to the poſterior part of the convexity of the

the concha, ſo that it is oppoſite to the anterior ligament. There is alſo a kind of ſuperior ligament which ſeems to be only a continuation of the aponeuroſis of the frontal and occipital muſcles.

The lobe ſeems to be a doubling of the tegument; it is only ſkin and cellular membrane. For a particular account of the veſſels, &c. ſee AURIS.

AURICULA INFIMA. The LOBE of the EAR.——LEPORIS. See BUPLEURUM.——MURIS. See ALSINE.

——URSI, called alſo *ſanicula Alpina lutea*, YELLOW BEAR'S EARS, *oricola*, and FRENCH COWSLIPS. They grow plentifully in Switzerland, Savoy, and many other places: it bears thick, large, green leaves, and on the tops of the ſtalks there are flowers of different colours. In Utrecht this flower is called *primula odorata*, on account of its agreeable ſmell. The juice removes ſpots on the face.

AURICULÆ CORDIS. See COR.——JUDÆ, called alſo *fungus ſambuci*, *fungus membranaceus*, *peziza auriculam referens*, *agaricus auriculæ forma*; JEWS EARS. *Peziza auricula*. Linn. They are a ſort of fungus which grows on elder-trees: their internal uſe is generally thought not ſafe, but a decoction of them in milk is a much eſteemed gargle in the quinſy.

AURICULARIA. See MENTHA PALUSTRIS FOLIO OBLONGO.

AURICULARIS. See EXTENSOR MINIMI DIGITI.——DIGITUS. The little finger is called the ear-finger, becauſe with it we are moſt apt to rub and pick the inner ear.——MEDICUS. A phyſician for the ear.

AURICULARIUS. Belonging to the ear, alſo an ear-doctor.

AURICULARUM SEPTUM. See COR.

AURICULATUM, vel AURITUM FOLIUM, an EARED LEAF, from *auricula*, a little ear—twiſted into the form of a little ear, or having an appendage like a little ear; or they are heart-ſhaped, but have the corners prominent, and rounded, with an additional ſmaller lobe near the baſe.

AURIGA. A ſort of bandage for the ſides, deſcribed by Galen. It was alſo a name given by the ancients to a fourth lobe of the liver. They divided the liver into four lobes; the *firſt* was called FOCUS, from a ridiculous belief, that there the food was concocted; *ſecond*, MENSA, becauſe they thought the ailments of the limbs were placed there; the *third*, CULTER; and *fourth*, AURIGA, as conducive to the diſtribution of the aliments.

AURIGO. See ICTERUS.

AURIPIGMENTUM, alſo called *arſenicum croceum*, *arſenicum flavum*, *adarnech*; *albimec althanaca*; *althanacha*; *ethel*; ORPIN, ORPIMENT and AURIPIGMENT. Galen called it *arſenicum*, and Serapion calls it *narueth*.

There are three kinds of *orpiment*, the gold-coloured, the deep red mixed with yellow, called *andarac*; *auripigmentum rubrum*, and the greeniſh and yellowiſh, which is the leaſt valuable. The beſt is a yellow ſhining ſulphureous mineral, conſiſting of little flakes or ſcales like talc. If powdered *orpiment* is ſet on fire, it will flame, and yield the odour of common brimſtone; if a plate of copper is held over theſe fumes at their firſt riſing, it becomes white and brittle; an iron plate is alſo turned white by them; it is ſoluble in oil. Mercury joined to an acid ſalt is a part in this mineral; but, as is the caſe with crude antimony, its ſulphureous combination is ſuch as to render it inert. It is kept long in a ſubliming veſſel over the fire; the whole maſs is raiſed, and concretes in the upper part of the veſſel into a red pellucid ſubſtance like a ruby, leaving only a very ſmall portion of metallic earth at the bottom.

Some uſe it for fumigating venereal ulcers; Drs. Boerhaave and Mead, and others, commend its fumes in aſthmas; mixed with quicklime it hath been uſed as a depilatory. The painters uſe it for a gold colour, without the opinion of its being poiſonous; but, if ſwallowed, its effects are ſimilar to thoſe of the hydrargyrus muriatus.

AURIPIGMENTUM RUBRUM. See REALGAR.

AURIS. The EAR. The *ear* is uſually divided into the external and the internal. By the external is meant all that lies without the external orifice of the meatus auditorious in the os temporis; ſee AURICULA. By the internal, all that lies within the cavity of this bone; the orifice of which is called *eyar*. For MEATUS AUDITORIUS, TYMPANUM and LABYRINTH. See LABYRINTHUS, &c.

The arteries of the external *ear* come anteriorly from the arteria temporalis, and poſteriorly from the occipitalis. The veins are branches of the external jugulars. The portio dura of the auditory nerve having paſſed out of the cranium through the foramen ſtylo-maſtoidæum, gives off a branch, which runs up behind the ear, whence it ſends off ſeveral filaments to the meatus and fore-ſide of the ear. The ſecond vertebral pair ſend alſo a branch to the *ear*, the ramifications of which communicate with thoſe of the other branch from the portio dura.

The bones of hearing, called *malleus*, *incus*, *orbiculare*, and *ſtapes*, are placed in the cavity of the tympanum, immediately on the inſide of the membrana tympani. The malleus is joined by its handle to the membrana tympani, and its round head reſts on the incus, the long leg of which reſts on the os orbiculare, which is fixed to the fore part of the ſtapes, the ſole of which reſts on the hole called feneſtra ovalis.

The uſe of the external *ear* is to collect ſounds, and to render their impreſſion on the other organs of hearing moſt perfect; this is evident from thoſe who have their *ears* cut off, being obliged to uſe a horn or ſome means to aſſiſt them in hearing: all animals, as deer, hares, &c. whoſe ears have much motion, always direct them ſo as to meet the ſound.

How hearing is effected, ſee AUDITUS and SONUS.

On the *ears*, ſee Caſſebhomius, Du Verney, Valſalva, Celſus, and Winſlow's Anatomy. They treat either of the anatomy or the diſorders of the *ear*.

AURIS MARINA, AURMAR. A ſhell-fiſh very common on the coaſt of Scotland, Guernſey, Normandy, &c. it is ſhaped like an ear, it adheres to rocks, and to render them eatable they are firſt boiled, then fried.

AURIUM SORDES. See CERUMEN AURIS.

AURORA CONSURGENS. A whimſical phraſe by which the alchemiſts expreſs the vegetation of their gold.

AURUM, GOLD, called alſo *ſol*, and *rex metallorum*, *deheb*, *dehebeh*, *cor*. The filings are named *catma*; the chemiſts called it ſol, becauſe they thought it to be under the influence of the ſun. Its character is a circle with a dot in the middle, thus ⊙, denoting a body perfectly inacrimonious, ſmooth, and equal.

It is found more or leſs in every country; but the greateſt part of what we have comes from America, particularly from the mines of Peru; but the Aſiatic is eſteemed the fineſt. Sometimes it is found pure and unmixed, in ſmall grains or in large lumps, and is then called VIRGIN GOLD; but for the moſt part it is found in ores of different kinds; to ſeparate it from which various methods are required: its chief matrix is flint. All ſand contains a greater or leſs quantity of it.

Gold is a yellow metal, nineteen times heavier ſpecifically than water.

It was the Arabians that introduced *gold* into medicine; Avicenna eſteemed it for its cordial quality, and a comforter of the nerves; but as no means are yet diſcovered to ſeparate its component parts, and it is inſoluble by any of the animal fluids, its medicinal power can only conſiſt in its being an external antidote or amulet againſt poverty. Though in convulſive diſeaſes, particularly the chorea ſancti viti, the *aurumfulminans*, has been recommended, and is inſerted in ſome of the foreign pharmacopœias. It is made in the following manner:

AURUM FULMINANS. *Cerauno-chryſos*, *chryſo-ceraunius*.

Put a dram of the filings of *gold* with half an ounce of new-made aqua regia, into a matraſs placed in ſand; when the menſtruum ceaſes to act, pour off the ſolution, and if any of the *gold* is left, add as much more aqua regia as will be neceſſary to diſſolve it; dilute the ſolution with ten times its quantity of warm water, then drop in the lixivium of tartar till the effervеſcence and precipitation ceaſe; let the whole ſettle, pour off the clear liquor, and waſh the precipitated matter with water till it becomes inſipid, and then dry it.

In drying it the utmoſt care is required, for in a ſmall heat it explodes with violence; even with ſtrong rubbing it flies off in the manner of gunpowder. The more it is waſhed the leſs violently it fulminates when heated. It is ten times ſtronger than the common gunpowder as to its explоſive power. This eaſily explоſive property is checked by adding a larger quantity of the lixivium tartari than is neceſſary in the preparation.

See a hiſtory of *gold*, and the various arts depending thereon, in Dr. Lewis's Philoſophical Commerce of Arts, vol. i.

AURUM ELEMPIUM. See SUCCINUM.

AURUM HORIZONTALE. See AURATUS GERMANORUM.

AURUM POTABILE. See LENTSICUS.

——— LEPROSUM. See ANTIMONIUM.

——— VEGETABILE. A name given to SAFFRON. See CROCUS.

AURUS BRASILIENSIS. See CALAMUS AROM. ASIATICUS.

AUSTER. The SOUTH WIND, which is hot, moiſt, and productive of putrid diſeaſes. It means alſo AUSTERE, and is formed by the union of acid with terreſtrial particles, ſuch as in unripe fruits, aſtringent juices, *auſtere* wines, &c.

AUSTROMANTIA. A pretending to tell events from a ſuperſtitious obſervation of the winds.

AUTALIS. See DENTALIUM.

AUTHEMERON, from αὐτὸ, *the ſame*, and ἡμέρα, *a day*. The VERY SAME DAY. A medicine is thus called that gives relief on the ſame day it is taken. Galen has two remedies of this kind.

AUTOPHOSPHORUS. See PHOSPHORUS.

AUTOPSIA, AUTOPSY, from αὐτὸς, *himſelf*, and ὄψις, *ſight*, or αὐτὸν, *himſelf*, and ἐπόμαι, *to ſee*. Ocular evidence.

AUTOPYROS. See PANIS.

AUTUMNUS. AUTUMN. The ſeaſon of the year between ſummer and winter, beginning aſtronomically at the equinox, and ending at the ſolſtice: popularly it compriſes Auguſt, September, and October. Celſus wiſely adviſes people to begin early in this ſeaſon with warmer cloaths, for the irregularity of the weather ſubjects them to a variety of diſeaſes.

AUXESIS. See AUGMENTUM.

AUXILIARII MUSC. See PYRAMIDALIS MUSC.

AUXYRIS. See ASYRIS.

AVACCARI. A little tree, the leaves, fruit, and flowers of which reſemble the myrtle, but it is more aſtringent; it grows on mountains in the provence of Malabar. It is uſed againſt dyſenteries.

AVARAMO-TEMO. The name of a ſiliquoſe tree which grows in Braſil. Its bark is externally of an aſh colour, and internally very red, both it and the leaves are aſtringent; a decoction of the bark hath been extolled to dry ulcers, and is ſaid to have cured cancers. Raii Hiſt.

AVELLANA, called alſo *corylus*; the HAZLE-NUT. Miller takes notice of ſix ſorts, viz. the hazle-nut, the ſmall manured ditto, the large cob-nut, the Spaniſh nut, the red filbert, and the white filbert.

The iuli, or katkins, which grow on the trees early in the ſpring, and the ſhells, are reſtringent or binding. An emulſion made of the kernels of nuts or filberts, and mead, is commended in coughs. Filberts nouriſh more than nuts, the roundeſt kernels are moſt eſteemed. They all afford a conſiderable quantity of an agreeable ſoft oil by expreſſion.

AVELLANA CATHARTICA. See CATAPUTIA MINOR.

——— MEXICANA. See CACAO.

——— PURGATRIX. See CATAPUTIA MINOR and BEN.

——— INDIANA VERSICOLOR. See ARECA.

AVELLANÆ INDICÆ GENUS OBLONGUM. An inferior ſpecies of NUTMEGS.

AVENA. OATS. There are two kinds, the black and the white; they have ſimilar virtues, but the black ones are chiefly ſown for horſes; they are leſs viſcous and leſs nouriſhing than rice or wheat, yet afford a ſufficient nouriſhment to as active and vigorous a people as the world produces, viz. the Highlanders in the north of this iſle. Gruels made with the flower, called OAT-MEAL, digeſt eaſily, have a ſoft mucilaginous quality, by which they obtund acrimony, and are uſed for common drink and food in inflammatory diſorders, coughs, hoarſeneſs, roughneſs, and exulceration of the fauces.

Water-gruel anſwers all the purpoſes of Hippocrates's ptiſan; externally, *emollient* poultices with vinegar and oil, for ſprains and bruiſes, and *ſtimulant* with the grounds of ſtrong beer for tumors, &c. of a gangrenous tendency; or in poor emaciated habits.——For that named GRÆCA, and STERILIS, ſee ÆGYLOPS.

AVENQUA. See ADIANTHUM CANADENSE.

AVENS. See CARYOPHYLLATA.

AVERSIO. AVERSION. The diverting of a flux of humours from one part to another, alſo a nauſea or inappetency, or the receſſion of the uterus from its proper place.

AVES, vel AVICULÆ CYPRIÆ. See CANDELA FUMALIS.

AVIB. An abbreviation of avibus.

AVICENNIA TOMENTOSA. See ANACARDIUM.

AVICULÆ HERMETICÆ. The univerſal ſalt which is ſaid to be found in dew.

AVIS MEDICA. The PEACOCK.

AVOIR DU POIS. This, in the French language, ſignifies *to have weight*, becauſe the pound ſo called contains ſixteen ounces, and hath more weight by ſome ounces than that which is called Troy weight, which contains twelve ounces.

AVORNUS. See ALNUS NIGRA.

AVRANCUM. See OVORUM TESTA.

AVRARIC. See ARGENT. VIVUM.

AVRUM. See SUCCINUM.

AXEA COMMISSURA. See TROCHOIDES.

AXEDO. The name of a ſpell in Marcellus Empiricus, to render a perſon impotent.

AXILLA. The ARM-PIT, called alſo *maſcale*, *titillicum*, *Male*; ſometimes an offenſive ſmell will be perceived from the arm-pit. DIOSCORIDES and ÆTIUS recommend the decoction of wild artichoke in wine, which by bringing off much fœtid urine, may produce a cure. See alſo ALA.

AXILLARIA ARTERIA. The SUBCLAVIAN ARTERY, having left the thorax immediately above the firſt rib, in the interſtice between the portions of the ſcalenus muſcle, there receives the name *axillary*, becauſe it paſſes under the axilla. This *axillary artery* detaches the external mammary arteries to the breaſt; the *axillary* lies behind, on the inſide of the coraco-branchiæus; when it has got to the under ſide of the ſubſcapularis, it gives off a branch to that muſcle, the ſerratus major anticus, &c. The *axillary artery* gives off the inferior ſcapular, which paſſes backwards, chiefly to the infra ſpinatus. Juſt below the head of the humerus the *axillary* throws off the humeral or articular artery, which paſſing round the joint, anaſtomoſes with its fellow. The *axillary artery* commonly runs down behind the tendon of the pectoralis major, then paſſes over the coraco-brachiæus, goes down on the inſide more and more forward, juſt covered by the inner edge of the biceps, paſſes under the aponeuroſis of that muſcle, and a little below the bend of the arm, between the pronator teres and ſupinator radii longus, divides into the radial and ulnar arteries.

AXILLARIS NERVUS. The AXILLARY NERVE; alſo called the ARTICULAR NERVE, ariſes from the laſt two cervical pair; it runs in the hollow of the axilla, behind the head of the os humeri, between the muſculus teres major and minor, and turns from within outwards and backwards round the neck of the bone, and runs to the deltoid muſcles.——VENA. The AXILLARY VEIN. It is the continuation of the ſubclavian vein, from its paſſage out of thorax to the oppoſite ſide of the axilla.

AXIOMA. An AXIOM, alſo *apoſthegm*. A ſelf-evident propoſition, ſo neither requires nor admits of demonſtration.

AXIRNACH. See ADEPS.

AXIS. That round which any thing revolves or is ſuppoſed to revolve.——In BOTANY, it is a taper column placed in the centre of ſome flowers or katkins, about which the other parts are diſpoſed.——WITH ANATOMISTS the name of the ſecond vertebra, and according to ſome the firſt vertebra, of the neck; it hath a tooth which goes into the firſt vertebra, and this tooth is by ſome called the *axis*, by others the axle. Blancard ſays it is the third vertebra from the ſkull.

AXIS ARTERIÆ COELIACÆ. See COELIACA ARTERIA.

AXUNGIA, from its uſe, *unguendi*, of ſmearing, *axem*, the axle of a chariot or ſuch like. HOG'S-LARD. See ADEPS.——For that name——CASTOREI.——See CASTOR.——DE MUMIA. See MEDULLA.——VITRI. SANDIVER, or SALT of GLASS; it ſeparates from glaſs whilſt it is making; it is acrid and biting. It hath been uſed to clean the teeth with.

AYBORZAT. See GALBANUM.

AYCAPHER. See ÆS USTUM.

AYCOPHOS. BURNT BRASS.

AZAA. RED MARL.

AZAC. See AMMONIACUM.

AZADAR ACHENI ARBOR. See AZEDARACH.

AZAGOR. See ÆRUGO.

AZAMAR. See CINNABARIS.

AZANE. See ADROP.

AZANITÆ ACOPON. The name of an acopon, or ointment, in P. Ægineta.

——— CERATUM. The name of a cerate in Oribasius.

AZAR. See ADROP.

AZARNET. See AURIPIGMENTUM.

AZEDARACH, } called alſo *pſeudoſycomorus, aza-*
AZEDRACHINI. } *dar tacheni arbor, arbor traxini folio flore cæruleo, zizipha candida, anabepon. Nimbo Aceſtæ, Zodoaria candida.* It is a tall tree, in the iſland of Zeylon, and other parts of the Eaſt Indies. It reſembles an aſh; the fruit is like an olive, and from it oil is expreſſed for ſtaining cotton with: the flowers are ſaid to be poiſonous, ſome ſay aperient and deobſtruent: the leaves are uſed to deſtroy worms. See Raii Hiſt.

AZEDEGRIN. See HÆMATITES.

AZEFF. SCISSILE ALUM. See ALUMEN. Sp. 2.

AZEG. See VITRIOLUM.

AZEMAFOR. RED LEAD. See PLUMBUM, N° 4.

AZEMASOR. See CINNABARIS.

AZENSALI. A ſort of moſs that grows on rocks.

AZIGOS. See AZYGOS.

AZIMAR. BURNT COPPER. See ÆS USTUM.

AZIUS LAPIS. See ASIUS LAPIS.

AZOB. See ALUMEN FEBRIFUGUM.

AZOCH. A name given by Paracelſus to the mercurius philoſophorum, that is, to quickſilver extracted from any metalline body. The ſame as *azoth.*

AZOM. BOILED BUTTER.

AZOTE, } from α, non. and ζωη, *vita.*
AZOTICUS GAS, } AZOTIC GAS. This is the noxious part of the atmoſpheric air, called *mephitic,* ſee AER. It has been called AZOTIC by modern chemiſts, becauſe the chemical properties of the noxious portion of atmoſpheric air being hitherto little known, they have thought it right to derive the name of its baſe, from the known quality of killing ſuch animals as breath in it. The weight of this gas, at the temperature of (54. 50), and under a preſſure, equal to 28 inches of the barometer, is one oz. two gros. and 48. gr. to the cubical foot, or 0.444 of a grain to a cubical inch. See LAVOISIER'S *Elements of Chemiſtry.*

AZOTH. The ſame as *azoch.* Paracelſus alſo ſignifies by it, the univerſal remedy prepared of the ſun, moon, and mercury.

Azoth is alſo taken for the liquor of quickſilver mixed with vitriol and ſalt, and ſo ſublimed, which is alſo called *aqua permanens, cryſtallus philoſophorum, & luna phyſica. Azoth* is a name for BRASS. It ſometimes ſignifies the quickſilver of any metallic body. See REBIS.

AZRAGAR. See ÆRUGO ÆRIS.

AZUB. See ALUMEN.

AZUR. See CORALLIUM RUBRUM.

AZURIUM. A chemical preparation deſcribed by Albertus Magnus. It conſiſts of quickſilver two parts, ſulphur one third, ſal ammoniac one fourth, mixed in a mortar, then ſet in a veſſel over the fire, till a bluiſh ſmoke ariſes, then take it from the fire, break the glaſs, and powder the contents.

AZUTUM. See ARMENUS LAPIS.

AZYGES. See SPHÆNOIDES OS.

AZYGOS MORGAGNII. See STAPHYLINI.

AZYGOS, vel AZIGOS, from α, neg. and ζυγος, *a pair, without a fellow.* The muſculus *azygos* of Morgagni riſes tendinous from the junction of the oſſa palati, and runs down the palatum molle to the middle of the uvula, ſerving to elevate it.

——— PROCESSUS. See SPHÆNOIDES OS.

——— VENA. *Vena ſine pari, & azygos.* A vein ſituated within the thorax on the right ſide, having no fellow on the left, whence its name. It ariſes poſteriorly from the vena cava ſuperior, a little above the pericardium; it is immediately bent backwards over the origin of the right lobe of the lungs, forming an arch which ſurrounds the great pulmonary veſſels on that ſide, as the arch of the aorta does thoſe on the left, with this difference, that the curve of the *azygos* is directly backwards, but the other is oblique, from thence it runs down by the right ſide of the vertebræ dorſi, and before the intercoſtal arteries, and getting behind or below the diaphragm, it terminates by an anaſtomoſis, ſometimes with the vena renalis, at others with the neighbouring lumbar vein, ſometimes immediately with the trunk of the vena cava inferior.

The vena *azygos* ſends out branches from its upper part to the aſpera arteria and bronchia, by the name of venæ bronchiales, afterwards it ſends out the *intercoſtales dextræ ſuperiores* lower down the *intercoſtales dextræ inferiores.*

Sometimes there is an *azygos,* on the left ſide, proceeding from the arch of the common *azygos;* it is afterwards diſtributed in the ſame manner as the other on the right ſide; but this diſpoſition is very variable.

The *azygos* having reached the laſt rib, ſends off a large branch, which bending outwards, perforates the muſcles of the belly, is ramified betwixt different planes, and communicates with the branches of the intercoſtal veins, which run there.

AZYMAR. See CINNABARIS.

AZYMOS, from α, neg. and ζυμη, *ferment.* UNFERMENTED BREAD, as SEA-BISCUIT, which, as Galen obſerves, is not very wholeſome, except where the digeſtive powers are too ſtrong.

BALANOS. See QUERCUS; SUPPOSITORIUM; PESSARIUM; PENIS GLANS; and ADIPSOS. THEOPHRASTUS uſes it ſometimes to expreſs any glandiferous tree. From the ſimilitude of form, this word is uſed to expreſs *ſuppoſitories* and *peſſaries*.

BALANUS MYREPSICA. See BEN.

BALAUSTIA, BALAUSTIUM, } called alſo *malus punica ſylveſtris*; *granatus ſylveſtris*, the double-flowered wild POMEGRANATE, or the BALAUSTINE TREE. The PUNICA GRANATUM, PLENA MAJOR. *Foliis lanceolatis, caule arboreo.* CLASS, ICOSANDRIA. ORD. MONOGYNIA. LINN. Gen. Plant. 618.

Balauſtium is properly the cup of the flower of this tree. The *balauſtines*, which are in the ſhops, are large roſe-like flowers of a deep red colour, ſet in long, bell-ſhaped, tough cups; they are produced on the *balauſtia* flore pleno majore, C. B. which is a low prickly tree or ſhrub, with long narrow leaves, with a browniſh acerb fruit, about the ſize of an orange. It is a native of the ſouthern parts of Europe, and is cultivated in our gardens for the beauty and duration of its flowers. The dry flowers are brought from abroad into England, but thoſe of our own growth do not ſeem to be inferior to the foreign.

Thoſe flowers are mildly aſtringent, but leſs powerful than the bark of the fruit, and have a rough bitteriſh taſte. They give out their virtue to water, and to rectified ſpirit of wine; the extracts made from theſe tinctures retain all their aſtringency, but the watery infuſion yields moſt, and the ſpirituous a ſomewhat ſtronger extract.

The doſe of theſe flowers may be from one ſcruple to two drams, to which quantity, moſt of the vegetable aſtringents may be given. The rind of this fruit is conſidered as ſtrongly aſtringent, and has been particularly uſeful in gargles, in diarrhœa, and in external applications. The doſe in ſubſtance is from 3 ſs. to 3 j; in infuſion, or decoction, to ℥ ſs. SYDENHAM, againſt prolapſed rectum, and uterus, preſcribed an ounce of the rind bruiſed with two pints of the decoction of oak bark and half a pint of red wine, as a fomentation; and Dr. MEAD orders a decoction compounded of this bark with cinnamon and red roſes of each a dram; in milk ſtrained one pint, and the ſame quantity of water to be

gradual-

gradually added, the whole reduced to one pint, and ſweetened with ſugar, to be taken daily in colliquative diarrhœas.

BALBUTIES. A defect of ſpeech, properly that ſort of ſtammering, where the patient ſometimes heſitates, and immediately after ſpeaks precipitately; the *pſelliſmus balbutiens* of Dr. Cullen.

BALCHUS. See BDELLIUM.

BALLA-MUCCA-PIRA. See MOMORDICA.

BALISTÆ, Os. from βαλλω, *to caſt*. See ASTRAGALUS.

BALLOTE, called alſo *marrubium nigrum fœtidum*, *marrubiaſtrum*, *melyſſophyllum*, and BLACK STINKING HOREHOUND.

It ſhoots up from one root, in numerous black, ſquare, hairy ſtalks; the leaves like common horehound, but larger and rounder, black, and hairy, and ſet at diſtances about the ſtalk, like thoſe of the *melyſſophyllum*, by which name it is called by ſome; the flowers are white, and grow about the ſtalks in whorles. It grows in paths, highways, and hedges, flowering in July.

A ſtrong decoction of it, freely taken, is of great efficacy againſt hyſteric affections.

BALNEA. BATHS.

EMBROCATIONS, FOMENTATIONS, and BATHS, differ from each other as follows: the FIRST are FLUIDS, deſigned to paſs through the ſkin, when rubbed on it, to diſlodge ſome obſtruction, eaſe pain, or to irritate the part into more warmth, and a greater ſenſe of feeling; the SECOND differ only in the manner of application, which is with *actual heat*, by means of flannel cloths or ſponges, and that they are made in an aqueous menſtruum, as their application is more extenſive: the THIRD differ from them both in being univerſal, the whole body being immerſed in a *bath*, and from the firſt in being always of a watery kind.

BATHS are either of ſimple cold water, and then are called *cold baths*; ſimple or medicated water made hot, or that is ſo by natural means; theſe are called *warm* or *hot baths*, according to the degrees of heat given.

The firſt inſtance of *cold bathing* as a medicine, is that of Melampus's bathing the daughters of the king of Argos; and the firſt of *warm bathing* is Medea's uſe of it, whence ſhe was ſaid to burn people alive, becauſe that Pelias, king of Theſſaly, died in a warm *bath* under her care.

Of the artificial warm *baths*, the ſulphureous are the moſt uſeful; they promote perſpiration, relax, and penetrate. The following are good general forms for them:

BALNEUM SULPHUREUM, *a* SULPHUR BATH.

℞ Raſſur. guaiac. ſulph. nativ. āā ℔ i. ſs. coq. in aq. font. cong. xiij. ad xij. & adde aq. font. frigid. q. ſ.

vel.

℞ Hepat. ſulphuris ℥ij. Aq. font. calidæ q. ſ.

Theſe *baths* ſhould be entered into every day; and in ſome obſtinate diſorders of the ſkin, twice a day is not too often.

Spring waters are uſually the coldeſt; but, if required, the coldneſs may be increaſed by adding ſal ammoniac, nitre, or rolls of brimſtone, juſt before the patient enters into them.

The ſea water is the heavieſt, and is ſo in proportion to the degree of ſalt it contains; but it is not ſo cold as the freſh water of ſprings.

Of the COLD BATH.

Cold bathing is the moſt uſeful where a ſtrong ſhock is required, the humours too much diſperſed, and a counteracting revulſion of the ſolids, to promote the circulation of the blood and humours impeded, and where the ſurface of the body requires bracing up to a more tenſe degree.

The cold *bath* contracts the ſolids, condenſes the fluids, and accelerates their circulation; and this by its ſtimulus, when the water is freſh, and by its gravity as well as ſtimulus, when it is ſalt. As to preſſure, the cold and the hot *bath* ſeem not to differ; if the benefit is expected from this principle, the ſea-water muſt be choſen.

In tender conſtitutions, and ſome diſeaſes in which a morbid viſcidity is the offending cauſe, a moderate warm *bath* ſhould be uſed before the cold one is attempted, and the approach to coldneſs ſhould be gradual.

When the fibres are rigid, and the viſcera unſound, cold bathing is injurious; fat people are very little benefited by it; and none ſhould engage in it before a gentle glow is excited in them by moderate exerciſe, and this when the ſtomach is the moſt empty.

Previous to cold bathing, evacuations, ſuch as the conſtitution of the patient requires, ſhould be made. When ſweating is to follow the immerſion in cold water, the patient ſhould return from the *bath* as ſpeedily as poſſible, be rubbed dry, and then put to bed. If cold bathing is uſed to encreaſe the ſtrength, to preſerve health, or to thin the humours, ſweating ſhould not ſucceed. In a morning is the beſt time for the cold *bath*, becauſe then the perſpiration is generally moſt finiſhed, and the body freeſt from what nature alone can throw off by the ſkin. If the cold bathing continues to make the patient cold and numb after he comes out of the water, notwithſtanding precautions againſt this effect, this kind of bathing muſt be omitted. While it continues to excite an univerſal glow after coming out, it is uſeful.

In climes that are changeable, and where there is much damp weather, cold bathing, by making the ſkin leſs ſuſceptible of ſuch changes, proves very ſalutary. In cold countries, bathing in cold water is generally the leaſt diſagreeable, and the moſt ſalutary. The Ruſſians uſed cold bathing both frequently, and in a manner that is almoſt peculiar to themſelves; they firſt make themſelves ſweat and then plunge into the cold *bath*; but it ſhould be obſerved, that the different effects of going into cold water when hot, are from the different modes of the heat being excited. The Ruſſians heat themſelves before cold bathing by expoſing their bodies to an external heat, and ſitting quietly in it; now in this caſe, though the pulſe is quickened, yet the lungs are not affected, nor is reſpiration hurried: but if the heat had been excited by exerciſe, the reſpiration would have been effected at the ſame time, and in the ſame degree as the pulſe; and from this circumſtance ariſes the danger of ſudden cold ſucceeding heat thus raiſed.

Though the proper uſe of a cold bath is very ſtrengthening to many, yet if the patient ſtays in much longer than is neceſſary for being wholly immerſed, he will be weakened by it, and that proportionably to his continuance.

Of the WARM *and* HOT BATH.

Warm bathing was regarded by the Greeks and Romans not only as an efficacious remedy, but alſo as one of the higheſt luxuries. The North American Indians are very ſucceſsful in their cures by vapour bathing, which they manage by ſhutting themſelves in a ſmall room, then throwing a very hot ſtone into a pail of water, and when thus ſweated for ſome time, they plunge into cold water, then return again to receive the hot vapours. The Greeks, at this day, have hot *baths* in their houſes, if capable of bearing the expence; if not, public ones are provided by the government for them, which alſo obliges them to bathe there at certain periods of time, though no diſorder is manifeſt; and certainly with much reaſon, eſpecially as age advances, for old people are ſtrengthened by it, perſpiration is alſo facilitated, which in dry ſkins is much retarded, and thus many diſeaſes are prevented.

It is on the principle of abſorption that benefit by the warm, and all medicated *baths*, is ſaid to be deſired; but certainly great good is to be expected from the promotion of inſenſible perſpiration, and ſoliciting the circulation of the fluids to the ſurface of the body.

Before entering on a courſe of hot bathing, let the plethora, if there is any, be reduced by proper evacuation; and make the bowels lax if they are not already in that ſtate.

When diſorders, or their cauſes, are confined to the inward parts, ſo as to interfere with their functions, then the warm *bath* is the propereſt method of relief.

The heat of the *bath* being regulated, for weakly people faint in very warm ones, let the patient's body be well rubbed, that its power of abſorption may be increaſed, and it ſhould be well dried at leaſt, on returning out of the water.

In the morning faſting, and four hours after dinner, are proper times for bathing, and an hour at a time is the longeſt ſtay in the *bath* that ſhould be permitted.

If after bathing a few times, the belly ſeems retracted, the patient will be benefited by continuing it; but if the hypochondres ſeem inflated, and uneaſineſs is complained of in the bowels, or if alternate heat and cold affect the patient, it muſt be omitted.

The

The corpulent, thoſe with tenſe fibres, and thoſe with cold temperaments, are much benefited by the warm *bath*.

The ſenſation of the patient will beſt determine the neceſſary degree of heat to be uſed, that which produces the moſt agreeable is the moſt eligible; but where much heat is moſt likely to be of uſe, it can be beſt ſupported by the patient, if a ſmall quantity of petroleum Barbadenſe is added to the water.

Cancers have been much relieved by *baths*, and more benefit may perhaps be obtained by this method of cure than by any other; for the glands are the moſt abſorbent parts, and by this method medicines come directly to the part, whereas by the ſtomach they undergo ſome change before they arrive at their proper ſeat of action. Probably ſcirrhous tumors, tophi, nodes, &c. would be beſt attacked in their beginning this way.

Warm bathing is generally forbid in thoſe diſorders that impair the underſtanding, or affect the head with giddineſs and pain, in which the lungs are weakened or affected, when inflammation is an attendant ſymptom, when a flying gout or rheumatiſm is alſo the matter of complaint, and when there are moveable tumors. But in almoſt every caſe, where bathing is adviſable, the warm is to be preferred; and if it neither ſinks the ſpirits, waſtes the ſtrength, nor leſſens the appetite, it will be proper to continue it.

If we conſider the immediate effect produced by the uſe of cold or warm bathing, we ſhall be readily led to perceive the utility in a variety of complaints. The cold bath invigorates the ſyſtem, encreaſes the tone of the ſolids and circulation of the fluids, and promotes inſenſible perſpiration; hence becomes a corroborant deobſtruent, and general evacuant; whilſt the warm and vapour baths relax the ſolids, ſolicit the fluids externally, and, by their means, greatly promote ſenſible perſpiration, and may be conſidered as relaxants, and evacuants; and if we allow that abſorption takes place, they may be conſidered as diluent, and capable of diffuſing through the habit, ſuch particular materials as they can be minutely impregnated withal; but we muſt obſerve, that the baths ſhould always be proportioned to the ſtrength of the conſtitution, if any benefit is expected to be derived from their application.

See among the ancients, Hippocrates, Celſus, Cœlius Aurelianus, Aretæus, and Trallian: and among the moderns, ſir John Floyer, Dr. Wainwright, on Bathing, and particularly HOFFMAN.

BALNEABILIS. An epithet for ſuch waters as are proper for bathing.

BALNEUM ARENÆ. BALNEUM SICCUM. The SAND BATH.

Over the mouth of a common wind furnace, place one end of an iron plate, with a ledge round it, and under this plate, the canal muſt run, by which the furnace communicates with its chimney; the plate muſt then be filled with ſand or other dry matter, for placing the medicines to be digeſted in; the fire then being kindled, the heat will be different in different parts of the plate, and thus, as the things to be digeſted require more or leſs warmth, they may, at the ſame time, be ſuited by one and the ſame fire, for the heat of the ſand gradually decreaſes as the plate on which it lays is extended from the mouth of the furnace.

The veſſel containing the matter to be heated, hath its bottom and ſides totally covered with the ſand, and there it is continued until the digeſtion is completed.

Aſhes may be uſed in this *bath* when a leſſer heat is wanted, ſand for a greater, and iron filing for the greateſt. See FORNAX. —— MARIÆ vel MARIS. The WATER or VAPOUR BATH; ſometimes it imports the heat of boiling *water*.

This is when the veſſel, containing the matter to be treated, is placed in another that is full of water, under which a fire is put, that by this means the water becoming hot, may, in its turn, heat the matter to be digeſted. When a greater heat than that of boiling water is not required, this method of digeſtion is preferable to that by the ſand *bath*, becauſe the heat cannot exceed at any time that which is required.——SICCUM. See BALNEUM ARENÆ.——VAPORIS. A VAPOUR BATH. This is properly when the veſſel containing the matter to be digeſted is expoſed only to the ſteam that ariſes from boiling water. *Vapour baths* are alſo applied to the human machine in many caſes, where warm *baths* have been thought adviſeable, but with more certain ſucceſs—and relax the habit in general leſs, where the fluids are wanted to be ſollicited externally.

BALSAMELÆON. See BALSAMUM.

BALSAMELLA. See MOMORDICA.

BALSAMI OLEUM. See BALSAMUM.

BALSAMICA. BALSAMICS. *Balſamica* is a Latin word which ſignifies *mitigating*. The term *balſamica* is very *vague*; it includes medicines of very different qualities, as emollients, detergents, reſtoratives, &c. but in medicines of all theſe kinds there ſeems to be this requiſite in them, viz. that they be ſoft, yielding, and adheſive; alſo that by their ſmallneſs they have a ready diſpoſition to motion. Medicines of this tribe are generally required for complaints whoſe ſeat is in the viſcera, and as they cannot be conveyed there but by the common road of the circulation, it follows that no great effects can be expected from them but by their long continuance. Hoffman calls thoſe medicines by the name of *balſamics* which are hot and acrid, alſo the natural balſams, gums, &c. by which the vital heat is increaſed. Dr. CULLEN conſiders almoſt all of the ſubſtances called BALSAMS, to have the form and conſiſtence of turpentine, and ſeem to conſiſt of this for the greater part of their ſubſtance; conſequently, that they poſſeſs ſimilar virtues; ſee TEREBINTHINA. Dr. FOTHERGILL ſeems to be of the ſame opinion with HOFFMAN; hence his caution againſt their uſe in ulcers of the lungs. See MED. OBSERV. vol. iv. p. 231—18. CULLEN's Materia Medica. LEWIS's Materia Medica.

BALSAMIFERA, and ARBOR INDICA. See PERUVIANUM BALSAMUM.——ARBOR BRASILIENSIS. See CAPIVI BALSAMUM.

BALSAMITA MINOR. See AGERATUM.

BALSAMUM. Alſo *Boleſon Belegin*, any ſpecies of balſam.

BALSAMUM, called alſo *balſamum genuinum antiquorum, balſamelæon, Ægyptiacum balſamum, balſ. Gileadenſe, Aſiaticum, Judaicum, e Mecca, & Alpini*; *oleum balſami, xylobalſamum, opobalſamum*, the BALM of GILEAD; which is a reſinous juice, obtained from an evergreen tree or ſhrub, ſaid to grow in Syria and Arabia. The firſt is called *carpobalſamum*, which is about the ſize of a ſmall pea with a ſhort pedicle, of a roundiſh or oval figure, pointed at the top, compoſed of a dark brown, or reddiſh black wrinkled bark, marked with four ribs from top to bottom, and a whitiſh or yellowiſh medullary ſubſtance. This fruit, when in perfection, is ſaid to have a pleaſant, warm, bitteriſh taſte, and a fragrant ſmell, reſembling that of the balſam itſelf. But ſuch as we now meet with in the ſhops, is almoſt without ſmell or taſte. It was only ordered in the Theriaca, Andromachi, and Mithridate, for which, by the College of Phyſicians, London, cubebs were ſubſtituted; though now both theſe compoſitions are properly rejected. Jamaica pepper is often ſold for it. The AMYRIS GILEADENSIS, or OPOBALSAMUM. The CLASS OCTANDRIA. ORD. MONOGYNIA. LINN. Gen. Plant. 473. AMYRIS *foliis ternatis integerrimis, pedunculis unifloris lateralibus*. The beſt ſort, which naturally exudes from the plant, is ſcarcely known in Europe. Proſper Alpinus ſays that it is at firſt turbid and whitiſh, of a ſtrong pungent ſmell, like that of turpentine, but much ſweeter and more fragrant, of a bitter acrid aſtringent taſte; on being kept it becomes thin, limpid, light, greeniſh, and then of a golden yellow; after which it is thick like turpentine, and loſes much of its fragrance; ſome compare its ſmell to that of citrons, others to a mixture of roſemary and ſage-flowers.

It does not ſeem to excel any other of the balſams except in its fragrance; all the balſams agree in their general qualities, differing only in the degrees of warmth, pungency, and gratefulneſs. The *balm of Gilead* is a warm, ſtimulating, expectorating, detergent, diuretic, cordial, and nervine medicine; its diuretic quality is greatly increaſed by the addition of a fixt alkaline ſalt.

The Canadian *balm of Gilead* fir affords a balſam that is often impoſed for the genuine ſort. If the true balſam is dropped in water, when thin, it ſpreads itſelf on the ſurface, imparting to the water much of its taſte and ſmell, and the groſſer part, remaining at the top, is thick enough to be taken up with a needle; this is reckoned a mark of its being genuine. If pure balſam is dropped on a woollen cloth, it may be waſhed off without leaving the

the leaſt ſtain or mark; but the adulterated ſticks to the place. The pure coagulates with milk, but the adulterated will not.

This balſam is made into draughts by mixing it as follows:

℞ *Balſam Gileadenſ.* ʒ i. Pulv. gum. arabic. ℈ i. gradatim adde aq. puræ ʒ i. ſs. Aq. cinnam. fort. ʒ ij. f. hauſt.——TRAUMATICUM. See BENZOINUM.——For that called GUIDO. See ANODYNUM BALSAMUM.——MEXICANUM. See PERUVIANUM BALSAMUM.——GENUINUM ANTIQUORUM. See BALSAMUM.——ARCÆI. See ELEMI.

BALZOINUM. See BENZOINUM.

BAMBALIO. A man that ſtammers or liſps.

BAMBAX. See BOMBAST.

BAMIA MOSCHATA. See ABELMOSCH.

BAMIA. See ALCEA INDICA.

BAMMA. See EMBAMMA.

BAN ARBOR. See COFFEA.

BANANA, BANANIERA } called alſo *ficoides* ſeu *ficus Indica*, *muſa*, *fructu cucumerino breviori*, *ſenoria*, *pacæira*, *bacoba*, and the BANANA TREE. It grows in America; its fruit is diuretic, heating, and nouriſhing.

BANDURA, called alſo *planta mirabilis diſtillatoria*, *utricaria*; *priapus vegetabilis*; *Nepenthis*. It is a plant which grows in the thick foreſts of the iſland of Ceylon, where its long fibres ſupply it with water, and where no ſun comes to exhale it. Its ſeeds and ſeed-veſſels are like thoſe of gentian; but it is moſt remarkable for a foliaceous ſheath about a foot long, and as thick as a man's arm; and for its appendages, at the ends of its leaves, which turn up, and contain a cooling limpid liquor, as does its ſheath, which is half full and potable. The root is aſtringent, the liquor in the ſheath is cooling, it grows not far from Columbo in moiſt ſhady woods. Raii Hiſt.

BANGUE, called alſo *bangue* canabi ſimile, *cannabis Indica trifoliata*, *bangue* Indorum; *canjava*, called by the Ægyptians *aſſis*; *aſſerac cannabis peregrina*, *altheæ foliis cannabinis*, *kalengi-canjava*, *tſyeru-canjava*.

It reſembles hemp in its ſtalk, the rind of the ſtalk, and the leaves; but its medicinal qualities differ very much. The ſeeds and leaves are heating, and ſtrangely affect the imagination. It grows in Indoſtan and other parts of the Eaſt Indies.

BANICA. See PASTINACA SILVESTRIS.

BANILIA, BANILAS. } See VANILLA.

BAOBAB, BAHOBAB, } It is the only ſpecies of the genus, called by LINNÆUS, *adanſonia*. The tree is the largeſt production of the whole vegetable kingdom. The trunk is not above twelve or fifteen feet high, but from ſixty-five to ſeventy-eight feet round. The loweſt branches extend almoſt horizontally, and as they are about ſixty feet in length, their own weight bends their extremities to the ground, and thus they form an hemiſpherical maſs of verdure about one hundred and twenty, or one hundred and thirty feet diameter.

The roots extend as far as the branches. That in the middle forms a privot, which penetrates a great way into the earth, the reſt ſpread near the ſurface thereof.

The flowers are in proportion to the ſize of the tree; and are followed by an oblong fruit pointed at both ends, about ten inches long, five or ſix broad, covered with a kind of greeniſh down, under which is a ligneous rind, hard, and almoſt black, marked with rays which divide it lengthways into ſides. This fruit hangs to the tree by a pedicle two feet long and an inch diameter. It contains a whitiſh ſpongy juicy ſubſtance, of an acid taſte, and ſeeds of a brown colour, and the ſhape of a kidney-bean, which are called *goui*. The pulp that ſurrounds theſe ſeeds is powdered when dry, and brought into Europe from the Levant, under the name of *terra ſigillata Lemnia*. It grows moſtly on the weſt coaſt of Africa, from the Niger to the kingdom of Belin.

The bark of this tree is called *lalo*; the negroes dry it in the ſhade, then powder and keep it in little cotton bags, and put two or three pinches into their food; it is mucilaginous, and powerfully promotes perſpiration.

The mucilage obtained from this bark is a powerful remedy againſt the epidemic fevers of the country that produces theſe trees; ſo is a decoction of the dried leaves. The freſh fruit is as uſeful as the leaves for the ſame purpoſes.

BAPTICA COCCA. See CHERMES.

BARACH, PANIS. Rulandus explains it by nitrum ſalis.

BARAMETZ, See AGNUS SCYTHICUS.

BARAS. See ALPHUS.

BARBA. So the four leſſer claws of the popylus are called.

BARBA. ARONIS. See ARUM.
—— HIRCI. See TRAGOPOGON.
—— JOVIS. See SEDUM.

BARBAREA, called alſo *Herba ſanctæ Barbaræ*, *naſturtium hybernum pſeudobunias*, *eruca lutea latifolia*, *ſiſymbrium*, *carperitaria*, WINTER CRESSES, GARDEN ROCKET, ROCKET GENTLE. This plant reſembles the muſtard plant, but is diſtinguiſhed by the ſmoothneſs of its leaves, and its diſagreeable ſmell. Its qualities are ſimilar to thoſe of creſſes. It is a native of Switzerland; but cultivated in our gardens.

The WILD ROCKET, called *eruca ſilveſtris reſeda*, hath leaves like thoſe of dandelion, the flowers are yellow. It grows on old walls, and amongſt rubbiſh. Its qualities are much the ſame as the garden ſpecies, but its taſte is ſomewhat more acrid and bitter.

Both the kinds of *rocket* are acrid to the taſte, but the wild is the moſt powerful.

The active matter of the leaves is extracted by expreſſion; by infuſion in boiling water; and by digeſtion in rectified ſpirit; by diſtillation in water, a pungent yellow oil is obtained; drying the herb, and making an extract, deſtroys its diſagreeable ſmell and pungency. That of the ſeeds is leſs volatile; they are of ſimilar qualities to thoſe of muſtard, but not ſo ſtrong.

BARBARIA, BARBARICUM. } See RHARARBARUM.

BARBAROSSA PIL. BARBAROSSA'S PILL. It was compoſed of quickſilver, rhubarb, diagridium, muſk, amber, &c. and was the firſt internal mercurial medicine which obtained any real credit.

BARBARUM. The name of a plaſter in Scribonius Largus.

BARBOTA. The BARBUT. A ſmall river fiſh, with a very large head. It is generally about ſix inches long, it lives on mud and ſlime; is found in the river which runs by Tamworth, in Warwickſhire. The roe, as well as that of the EEL-POUT, operates both upwards and downwards.

BARBULÆ. They are the half-florets of compound flowers.

BARDANA. BURDOCK. *Arcion*, *arcium*; *betonica Bretanica*. By MYREPSUS, it is called *ilaphis*. It grows on highway ſides, and is ſufficiently known by the burs which ſtick to the cloaths.

BARDANA MAJOR, called alſo *lappa major*, *arctium lappa*, *perſonata arcium Dioſcoridis*, *Britannica*, CLOTEUR, or GREAT BURDOCK. It is the ARCTIUM LAPPA, or the *arctium major*, *foliis cordatis inermibus petiolatis*. CLASS SYGENESIA. ORD. POLYGAMIA ÆQUALIS. LINN. Gen. Plant. 923. The roots have very little ſmell, but a ſweetiſh taſte, with a light bitteriſhneſs and roughneſs. Boiled in water they impart a browniſh colour, and a ſoft vapid kind of taſte. Extracts, however made, are as inſipid as the root. They are chiefly commended as diuretic, diaphoretic, and antiſcorbutic, and have been ſucceſsfully employed in a great variety of chronic diſeaſes, rheumatiſms, the lues venerea, ſcurvy, gout, and pulmonic complaints, and in all caſes in common in which china and ſarſaparilla roots are preſcribed, for they reſemble them in all their ſenſible qualities.

The leaves are bitter, and more ſaline than the roots, and have none of their ſweetneſs. The ſeeds are bitter, and ſlightly aromatic. A dram of them is a doſe as a diuretic; but the prickly matter on their ſurface muſt be well removed, before adminiſtering them. The beſt method of uſing this plant as a medicine is in the form of a decoction, in which the root only is boiled, e. g.

Decoctum Bardanæ *Rad.* *The* DECOCTION *of* BURDOCK ROOT.

℞ Rad. Bardan. ʒ ij. aq. puræ ℔ iij. coq. ad conſumpt. ℔ ii. & adde kali vitriolat. ʒ ij.

Of this a pint ſhould be taken every day in ſcorbutic and rheumatic complaints; and when intended as a diuretic, ſhould be taken in the courſe of two days; or, if

poſſible, in twenty-four hours.——MINOR, called alſo *lappa minor*, *xanthium*, *chæradolethron*, by ÆTIUS, the LESSER BURDOCK, or LOUSE-BUR. The ſtalk is juicy, the leaves oblong and ſharp-pointed, and of a yellowiſh green. The flowers are inconſiderable, but the fruit is a rough capſula, containing a ſingle ſeed. From this roughneſs of the fruit it is called a *burdock*, though not in the leaſt allied to that plant. It grows in rich fat ſoils, and is found on ſome commons. Its juice is commended againſt ſcrophulous diſorders.——ARCTICUM, called alſo *lappa major montana*, *bardana montana*, *perſonata altera*, *perſonata montana*, *arction*, and WOOLLY-HEADED BURDOCK. Its virtues are much the ſame with the other ſpecies of *burdocks*.

BARIGLIA, } See ANATRON.
BARILLA, }

BARNET WATER. It is of the purging kind, of a ſimilar quality to that of Epſom; and about half its ſtrength. See AQUÆ CATHARTICÆ AMARÆ.

BAROMETRUM, BAROMETER, of βαρος *heavy*, and μετρον, *meaſure*. An inſtrument to determine the weight of the air, or obſerve the changes; it is commonly called a WEATHER-GLASS, and frequently the Torricellian tube, from Torricelli its inventor. He conſidered that a column of water of about thirty-three feet, was equal in weight to a column of air of the ſame baſe: and concluded, that a column of mercury, of about twenty-nine inches and a half would likewiſe be equal to a column of air. He accordingly made the experiment, and the apparatus he then uſed is now the common *barometer*.

The bore of the common tubes that are hawked about for ſale is too ſmall. The glaſs tube ſhould be one-third, or at the leaſt one-fourth of an inch in diameter, hermetically ſealed at one end, and open at the other; the length ſhould be thirty-four inches: the mercury with which it is filled muſt be pure. Fill the tube quite full with this mercury; and having in readineſs a baſon with a flat bottom, and about two inches high, in which is alſo ſome mercury; invert the tube, and put it in the baſon, ſtill holding your finger underneath it, till it is in the mercury of the baſon, then place it in a frame. On taking away your finger, the mercury in the tube will immediately ſubſide to about twenty-nine or thirty inches, according to the ſtate of the air, it being very rarely lower than twenty-eight, or higher than thirty-one inches. In the *barometers* that are generally uſed, the higheſt which the mercury is known to ſtand in the tube, is uſually about twenty-nine inches, when the air is heavy; but not above twenty-ſix, when the air is very light. If a ſcale of four inches be divided into tenths, and placed againſt the upper end of the tube, the inſtrument is complete.

In fine dry weather the air is charged with a variety of vapours, which float in it unſeen, and render it extremely heavy, ſo that it preſſes up the quickſilver; or, in other words, the *barometer* riſes. In moiſt rainy weather the vapours are waſhed down, or there is not heat ſufficient for them to riſe, ſo that then the air is ſenſibly lighter, and preſſes up the quickſilver with leſs force; or, in other words, the *barometer* falls.

The *barometer* meaſures the weight of the air with exactneſs enough for the general purpoſes of life, yet it is often affected with a thouſand irregularities, that no exactneſs in the inſtrument can remedy, nor for which theory can account. When high winds blow, the mercury is generally low; it riſes higher in cold weather than in warm; and is uſually higher in the morning and evening than at mid-day: it generally deſcends lower after rain than it was before it. There are alſo frequent changes in the air without any ſenſible alteration in the *barometer*. In general men feel themſelves braced, ſtrong, and vigorous, with a large body of air preſſing upon them: they are languid, relaxed, and feeble, when the air is light, and ſo fails to give our fibres their proper tone.

On advancing up high mountains, the air is leſs and leſe denſe, and uſually the ſame inconveniences are felt that are complained of when the air is moiſt. But it is obſerved in the Journey to the Glaciers, in the duchy of Savoy, edit. 2. that Mr. de Luc and his companions, when at the ſummit of Buett, were above the level of the Mediterranean ſea 3315 Engliſh yards; yet, except by their inſtruments, did not perceive any difference in the denſity of the air. The air there they found to be near one-third leſs denſe than that of the plains below them; yet though the weight of the atmoſphere was ſo much diminiſhed, the equilibrium within their bodies was undiſturbed. In this place, Mr. de Luc obſerves, how much naturaliſts are deceived in attributing the alterations that many perſons experience upon the falling of the *barometer*, to a difference either in the weight or denſity of the air, aſſigning as a cauſe, the failure of an equilibrium between the external and internal air, or a difference of motion in the heart and lungs, occaſioned by the air's being more or leſs denſe. For, if theſe changes, he ſays, could ſo ſenſibly affect our organs, what would become of thoſe Chamois hunters, who paſs every day from the bottom of the vallies to the higheſt mountains? What would become of the women of the hamlets by Sixt, who go up to Fonds (a diſtance of above ſix hundred yards in perpendicular height) every night in the ſummer ſeaſon, to milk their cows, and leaving their cattle to the care of their children, go down again every morning to aſſiſt their huſbands in the cultivation of their lands? Theſe people perceive no inconvenience; even aſthmatic people find none, notwithſtanding the *barometer* varies in theſe ſeveral places, as is uſually obſerved in other ſimilar ones. It is added, that it is neceſſary to have recourſe to ſome other cauſe, which ordinarily accompanies the variations of the *barometer*, to account for the alterations in our health, and particularly in our ſtrength, from which few people, perhaps, upon ſuch occaſions, are entirely exempted.

The *barometer* may be applied to ſeveral uſes, as meaſuring the heights of mountains: for twelve thouſand and forty inches of air being equal to one inch of mercury near the ſurface of the earth, twelve hundred and four inches, or one hundred feet, muſt be equal to one-tenth of an inch of mercury. Conſequently, if a *barometer* be carried up any great eminence, the mercury will deſcend one-tenth of an inch for every one hundred feet that the *barometer* aſcends.

But the great uſe of the *barometer*, is to predict the future ſtate of the weather for ſeveral hours, and ſometimes days preceding, though not to a certainty, yet in many inſtances to a good degree of probability: in order to which, obſerve, 1ſt, The riſing of the mercury preſages fair weather, and its falling, wet. 2d, In very hot weather, the falling of the mercury fortels thunder. 3d, In winter, its riſing portends froſt; and in a continued froſt, fortels ſnow. 4th, When foul weather happens ſoon after the falling of the mercury, expect but little of it; and ſo on the contrary of weather. 5th, When the mercury continues to riſe for ſome time before the foul weather is over, expect a continuance of fair weather to follow. 6th, In fair weather, when the mercury continues to fall before rains come, then expect a great deal of it, and probably high winds. 7th, The unſettled motion of the mercury denotes changeable weather.

It is not ſo much the height of the mercury that indicates the weather, as its motion up and down; therefore to know whether the mercury is actually riſing or falling, obſerve the following: 1ſt, If the ſurface of the mercury be convex, it is then riſing. 2d, If the ſurface be concave, it is falling. 3d, If the ſurface is plain, or rather convex, it may be conſidered as ſtationary.

There are different forms of this inſtrument; they have each their advantages and diſadvantages: but the common ſort is as good, if not better, than any other.

BAROMETZ, } See AGNUS SCYTHICUS.
BARONETZ, }

BARONES. Small worms, called alſo *nepones*.

BAROS. GRAVITY. Hippocrates uſes this word to expreſs by it an uneaſy weight in any part.

BAROS. See CAMPHORA.

BARR. ICON. An abbreviation of Jacobus Barrelierus Icones Plantarum per Galliam, Hiſpaniam, & Italiam, Obſervatarum.

—— SPEC. INS. An abbreviation of Jacobus Barrelierus Specimen Inſectorum.

BARTHOLINIANÆ GLANDULÆ. See SUBLINGUALES GLANDULÆ.

BARYOCOCCALON. See STRAMONIUM.

BARYPHONIA, from βαρος, *dull*, and φωνη, *the voice*. A difficulty of ſpeaking.

BARYPICRON. See ABSINTHIUM VULGARE.

BARYTES, called alſo TERRA PONDEROSA, PONDEROUS EARTH.

This is not found very abundantly, or in large conti-

nued

nued maſſes, but chiefly in the vicinity of mines, or veins of metal. Its ſpecies are either aerated ponderous ſpar, or vitriolated ponderous earth, either in the form of a tranſparent ſpar, or an opaque earth, of a white grey, or fawn colour; frequently of no regular figure, but often in the peculiar form of a number of ſmall convex lenſes, ſet edgewiſe in a ground. We are indebted to the celebrated chemiſts GAHN, SCHEELE, and BERGMAN, for our knowledge of this earth.

As this has ſeldom been found pure, in order to obtain it in a ſuitable degree of purity, we are favoured with the following proceſs by M. I. A. CHAPTAL. The ſulphate of barytes, or the vitriolated ponderous earth which is the moſt uſual combination met with on the earth, is to be pulveriſed, and calcined in a crucible with an eighth part of powder of charcoal: the crucible muſt be kept ignited during an hour; after which, the calcined matter is to be thrown into water. It communicates a yellow colour to this fluid, at the ſame time that a ſtrong ſmell of hepatic gas is emitted; the water is then to be filtered; and muriatic acid poured in; a conſiderable precipitate falls down, which muſt be ſeparated from the fluid by filtration. The water which paſſes this, holds the muriatic of barytes, or marine ſalts of ponderous earth in ſolution. The carbonate of potaſh, or mild vegetable alkali, in ſolution, being then added, the ponderous earth then falls down, in combination with the carbonic acid; and this laſt principle may be driven off by calcination. The product forms the pure terra ponderoſa, which being ſaturated with the muriatic acid, and little portion more of the acid being afterwards added, ſupplies the *terra ponderoſa muriata*, ſeu *ſalita*, which is conſidered as an evacuant, deobſtruent, and tonic; as, upon exhibition, it has been found in ſmall doſes to encreaſe the flow of urine, promote perſpiration, open the bowels, and improve the appetite and general health. It has been conſidered as highly uſeful in ſcrophulous caſes, cutaneous foulneſſes, ulcerated legs. In ſome cancers, and conſumptive affections, when not too far advanced, it promiſes to be of advantage. Its doſe is from ſix drops to ten or twenty; but if ever it occaſions vertigo, naufea, ſevere purging, or pains in the bowels, it muſt be reduced, or omitted. A courſe of this ſhould be begun by ſmall doſes, twice a day, and gradually encreaſed ſo long as they create no inconveniences. For a further account ſee Med. Com. VOL. iv. and vi. DEC. 2; Medical Commun. London, vol. ii. CHAPTAL's and NICHOLSON's Chemiſtry.

BASAAL. The name of an Indian tree growing about Cochin. It flowers and bears fruit once every year, from the firſt year of its bearing, to the fifteenth. A decoction of its leaves with ginger in water is uſed as a gargariſm againſt diſorders of the fauces. The kernels of the fruit kill worms. Raii Hiſt.

BASILARE OS. See CUNEIFORME, SPHENOIDES, and SACRUM OS.

BASILARIS ARTERIA. It is a branch of the vertebral *artery*, upon the apophyſis *baſilaris* of the os occipitis. The two vertebral *arteries* ſoon unite, after they have got into the ſkull, and form this *artery* about the cuneiform proceſs of the os occipitis. It runs forward under the great tranſverſe protuberance of the medulla oblongata, to which it gives ramifications, as well as to the neighbouring parts of the medulla. Sometimes it divides into two branches from about the apophyſis *baſilaris*, which communicate with the poſterior branches of the two internal carotids, and are loſt in the poſterior lobe of the brain.

BASILEION. An epithet for a collyrium in Aetius.

BASILIARIS APOPHYSIS. The great apophyſis of the os occipitis.

BASILICA VENA. The ancients termed the *baſilic vein* of the right arm, the *vein* of the liver, HEPATICA BRACHII VENA; and that of the left arm, the *vein* of the ſpleen; SPLENICA VENA BRACHII. Sometimes the *baſilica* hath a double origin, by a branch of the communication with the trunk of the axillaris. It continues its courſe along the middle of the os humeri, between the muſcles and integuments; and having reached the inner condyle, and ſent off obliquely in the fold of the arm, the *mediana baſilica*, it runs along the ulna, between the integuments and muſcles, a little towards the outſide, by the name of *cubitalis externa*: and, a little below it, ſends off another branch, which runs along the inſide of the fore-arm near the ulna; this branch may be called *cubitalis interna*. See CEPHALICA VENA.

BASILICUM UNGUENTUM FLAVUM. *Now called* UNGUENTUM RESINÆ FLAVÆ. OINTMENT *of* YELLOW ROSIN.

Take of olive oil a pint; yellow wax, yellow roſin, of each a pound. Melt the wax and roſin over a gentle fire, then add thin oil, and ſtrain the mixture while hot.

It is commonly employed as a digeſtive on wounds and ulcers: it is as uſeful as the linim. Arcæi, now called unguent. e gummi elemi. If it is required to be a little warmer, a few drops of ol. tereb. com. added juſt when uſed, will make it ſo. It gives place to no medicine of its intention, and juſtly ſuperſedes the uſe of all others of its kind. Pharm. Lond. 1788.

BASILICUM. BASIL, called alſo *acinos*. It is a plant with ſquare ſtalks, oval leaves ſet in pairs, and long ſpikes of labiated flowers, whoſe upper-lip is divided into four parts, the lower entire; the cup hath alſo two lips, one cut into four ſections, the other into two. This is a term alſo for *ocymum vulgarius*, *herba regia*, *ocymum medium*, *citratum*. COMMON, or CITRON BASIL.

Ocymum caryophyllatum, *ocymum minimum*. SMALL, or BUSH BASIL, with uncut leaves.

Both theſe are natives of the eaſtern countries, and ſown annually in our gardens for culinary uſes. The ſeeds, which rarely come to perfection in England, are brought from the ſouth of France and Italy. They flower in June and July, and ſeed in Auguſt.

Infuſions of the leaves are drank in catarrhous complaints and uterine diſeaſes, and to promote expectoration. They are ſucculent, ſlightly aromatic, have a mucilaginous taſte and ſtrong ſmell, which laſt they loſe partly in drying. The firſt ſort reſembles the ſcent of lemons; the ſecond that of cloves. Diſtilled in water they yield much oil, of a penetrating fragrance, ſimilar, but ſuperior to the oil of marjoram.

Clinopodium majus, called alſo *clinopodium acinos*, and GREAT WILD BASIL.

Boerhaave enumerates nine ſpecies. It grows in hedges, is an aſtringent and emenagogue.

BASILICUS PULVIS. The ROYAL POWDER.

Various preſcriptions have been given for making this *powder*, moſt of which have ſcammony, cream of tartar, and other things, which increaſe the bulk of the medicine, without adding to its good qualities; but the following ſimple method is obſerved to be both more agreeable and more uſeful.

℞ Calomel, pp. ʒ ij. pulv. rhab. ʒ ſs. jalap. ʒ x. m. Or,

℞ Antimonii tartariſati, gr. iv. calom. ʒ i. gr. iv. jalap. ʒ ſs. gr. viij. m.

This is a convenient purge for gouty and rheumatic people, for whom it is beſt made into pills, and to be taken at bed-time. It is alſo one of the beſt purges for groſs-bodied children, who are ſubject to breed worms, and have large bellies; for though the ingredients are efficacious, its operation will be mild and ſafe enough. It clears the bowels of ſlime, and diſcharges thoſe humours that obſtruct the meſenteric glands, and in a great meaſure the lacteals themſelves, which is often the caſe in children, and is attended with a hard belly, a ſtinking breath, frequent fevers, and a decay of ſtrength in the lower parts. Thoſe ſlight intermittents which ſuch children are ſubject to, will much ſooner be cured by ſuch a purge than by the bark; for theſe purges reach, and carry off the cauſe, but the bark pens it up; and by curing one, while ſuch reſtriction continues, gives room for a return with much greater aggravation.

The doſe for children is from ten grains to fifteen; for adults from fifteen grains to two ſcruples.

BASILIDION. A cerate deſcribed by Galen, and uſed for the itch.

BASILIS. A collyrium mentioned by Galen.

BASILISCUS, in chemiſtry, is the philoſophical ſublimate mercury, and *adamus*, or the philoſopher's ſtone.

BASIOGLOSSUS, from βασις, *the foundation*, and γλωσσα, *the tongue*. See HYOGLOSSUS.

BASIO-PHARYNGÆI. See HYOPHARYNGÆUS.

BASIS, from βαινω, *fixus ſum*, *I am fixed*. The ſupport of any thing upon which it ſtands or goes.

The broad part of the heart is called its *baſis*, to diſtinguiſh it from the apex or point.

IN PHARMACY by *baſis* is meant that ingredient on which the moſt ſtreſs is laid for anſwering the intention of any compound medicine.

BASSI COLICA. The name of a medicine in Scribonius Largus, compounded of aromatics and honey.

BAT. An abbreviation of Batavia.

BATANEA ALUMINOSA AQUA. See ALUMEN.

BATATAS. See BATTATAS.

BATCIA. See PASTINACA SYLVESTRIS.

BATHMIS. A ſeat, baſis, or foundation, from βαινω, *fundatus ſum.*

Hippocrates and Galen uſe it to expreſs a ſinus or cavity of a bone, which receives the protuberance of another at the joints, particularly thoſe at the articulation of the humerus and ulna.

BATHONIÆ AQUÆ. Called alſo *ſolis aquæ*, *baduza aqua*. BATH WATERS.

Dr. Cheyne accounts for the heat of this water by the following experiment: firſt mixing filings of iron, and the powder of ſulphur, then working them into a paſte with water, and putting them into a cellar, under a cock which drops water gradually and ſlowly, the paſte will ferment ſo, that the water running from it ſhall be of the ſame heat and virtue with thoſe of *Bath*, though not ſo pleaſant, nor ſo well fitted for human bodies. Tournefort obſerves, "that the filings of iron will grow warm by ſteeping in common water, but much more ſo in ſea-water; and if powdered ſulphur is added thereto, the mixture will burn."

Dr. Cheyne farther obſerves, that the heat of *Bath water* is owing to a principle in itſelf, as is evident from its retaining its heat longer than any other water heated to the ſame degree: that the ſulphur in the *Bath water* is evident to the ſenſes, for it is collected from the ſurfaces of the bath; and iron is manifeſtly in it, as appears from the blue tincture which it ſtrikes when mixed with an infuſion of galls; and by analyſis ſea-ſalt is found in it.

Moſt hot waters ſeem chiefly to conſiſt of ſulphur and iron, and to differ only as the ſulphur or the iron predominates; where the ſulphur moſt abounds, they are hotter, more nauſeous, and purgative.

According to the Experiments of Dr. Bryan Higgins, a Wincheſter Gallon of *Bath water* contains,

	dwt.	gr.
Of calcarious earth, combined with vitriolic acid, in the form of ſelenite -		$319\frac{1}{10}$
Of calcarious earth combined with acidulous gas - -	0	$22\frac{8}{10}$
Of marine ſalt of magneſia -	0	$22\frac{9}{10}$
Of ſea ſalt - -	1	$14\frac{4}{10}$
Of iron combined with acidulous gas -	0	$0\frac{1}{10}$

Acidulous gas, beſides what is contained in the above earth and iron, twelve ounces meaſure; and atmoſpheric air two ounces.

The four principal *waters* in England that poſſeſs any remarkable heat, are thoſe of BATH, BUXTON, BRISTOL, and MATLOCK. The firſt of which raiſes Fahrenheit's thermometer from about one hundred to one hundred and twelve; the ſecond to about eighty; the third to ſeventy-ſix; and the laſt to ſixty-ſix or ſixty-eight.

Dr. Monro, in ſpeaking of theſe waters, ſays the higheſt degree of heat attributed to them by

Dr. Howard,	Dr. Charleton,	and Dr. Lucas,	are from the pump of	
the king's bath,	113	116	119	of Fareinheit's thermometer.
hot bath	114	116	119	
croſs bath	108	110	114	

And that on evaporation, a gallon of them has been found to contain, of iron $\frac{1}{7}$ or $\frac{1}{3\frac{1}{2}}$ parts of a grain; of calcarious earth $22\frac{1}{2}$ grains; ſelenites $31\frac{1}{2}$ grains; Glauber's ſalt $25\frac{3}{4}$ grains; ſea-ſalt $51\frac{1}{4}$ grains; which were mixed with an oily matter, but not more ſo than is common to all waters. From this and other accounts it appears that the *Bath waters* are chalybeates, in which iron and earth are kept ſuſpended by means of aerial acid; and that they are impregnated with a ſmall portion of ſelenites, ſea-ſalt, and either Glauber ſalt, or vitriolated magneſia. Indeed theſe waters were for a long time eſteemed to be ſulphureous, but certainly they have not a title to that name in the leaſt: they do not affect the colour of ſilver, or metallic ſolutions, or produce any other effect of water impregnated with ſulphur.

It is from the combination of ſulphureous gas, ſea-ſalt, &c. that the *Bath water* is ſo uſeful wherever the vital heat requires an increaſe; nothing but iron can make ſuch a ſpeedy improvement as this water does in decayed conſtitutions; and it is the ſoapineſs of it, from the union of its ſulphur and iron, that relaxes ſo as to give vent to gouty, and other matters, by perſpiration. *It is ſafe and beneficial only when the vigour of the conſtitution is reduced, and when the vis vitæ is to be reſtored.* Indeed in all internal diſorders, where iron and ſulphur are preſcribed, the internal uſe of this water is effectual. But ſuch is the tenuity of the ſulphur and iron in theſe *waters*, from their perfect ſolvend, the fixed air therein, that the niceſt ſealed cork cannot long retain the medical parts; they ſhould therefore be drank on the ſpot.

They operate powerfully by urine, and promote perſpiration; and if drank quickly, and in large draughts, they ſometimes purge: but if taken ſlowly and in ſmall quantities, they rather incline one to coſtiveneſs; cauſe a ſenſe of heat; and oftentimes a heavineſs of the head; with a propenſity to ſleep—particularly on firſt drinking them.—Theſe waters have been much recommended in diſorders of the ſtomach and bowels; in the gout, nephritic complaints, rheumatiſm, palſy, particulaly that ſpecies which attack plumbers, painters, manufacturers in lead, and variety of other complaints.—They are likewiſe much uſed for bathing in;—and for pumping on diſeaſed limbs. For from hence much relief is obtained from wandering or fixed pains, ſtiffneſs of the joints, contractions of the tendons, waſting of the limbs, palſies, rheumatiſms, &c. When taken internally, as they often heat on the firſt uſing them, it is right to cool the body by taking a doſe or two of ſome mild aperient medicine, and to live on a cooling regimen, before entering into a courſe of them, and for the plethoric, to loſe a few ounces of blood;—and during theſe courſes to live regular, and if inclined to be too coſtive, to take occaſionally a doſe of ſome cooling phyſic.

The ſeaſon for drinking the *Bath waters* is whenever they are wanted; for there is little or no ſenſible difference in them at any one time compared with another. Many who have drank them for ſome time, leave them off for a month in the hotteſt weather, but cold conſtitutions need not, for they find them rather better at that time. With ſome perſons cold weather ſuits the beſt with their drinking it, eſpecially when the ſeaſon is dry, and in clear froſt it is the beſt of all.

More than two pints in a day can never be required, which may be drank at three or four times, a few hours intervening betwixt each portion; and in ſuch chronical diſeaſes as require preparations of iron, the artificial ones may at the time be uſed.

See AQUÆ SULPHUREÆ; Dr. Cheyne's Account of, and Dr. Falconer's Eſſay on, the BATH-WATERS; Monro's Treatiſe on Medical and Pharmaceutical Chemiſtry.

BATHRON. The SEAT OF SUPPORT. It is alſo the *ſcamnum Hippocratis*, an inſtrument invented for the extenſion of fractured limbs. Oribaſius and Scultetus both deſcribe it.

BATHYPICRON. See ABSINTHIUM VULGARE.

BATHYS. A ſort of cheeſe formerly uſed in Rome.

BATIA. See CORNUMUSA.

BATRACHIUM. See GERANIUM.

BATRACHOS. From βατραχος, *a frog*. See RANULA.

BATTARISMUS. See PSELLISMUS.

BATTATAS, BATATAS, BATTATUS. Called alſo BATTATTA VIRGINIANA, *ſolanum tuberoſum eſculentum, papas* vel *pappus Americanus*, vel PERUVIANUS; *aies*. The common or Virginian POTATOES.

They were firſt brought into Europe by ſir Francis Drake in 1486. He then brought home the famous mathematician Mr. Thomas Heriot, who was ſent to Virginia by ſir Walter Raleigh, to explore the productions of the country, who brought theſe roots with him. He gave them to Gerard the botaniſt; who firſt planted them in London; and ſent them to Cluſius, in Holland, who alſo planted them in Burgundy; and he ſent them to Italy, as appears from the works of theſe, and ſeveral other authors. It was from this introduction into Europe that ſo many writers ſay they were natives of Virginia; but the truth is, they will not grow there without ſkilful culture. They are natives of Peru.

Potatoes are a ſpecies of ſolanum, viz. SOLANUM TUBEROSUM of Linnæus; and though with us they require a ſunny expoſure; yet in the hot countries where they are native, thoſe that grow on the ſurface of the ground,

or under too thin a covering of earth, are ſo ſtrong of the poiſonous quality of nightſhade, that the hogs will not taſte them.

The light mealy ones are the beſt, and, by proper management, a wholeſome nouriſhing bread is made of them, called by the Peruvians *chuno*. Their uſe, as at preſent, is both profitable and ſalutary. More brandy may be obtained from an acre of *potatoes*, than from an acre of barley. They alſo afford much ſtarch.—They contain *water* more than half their proportion of other matter, which renders them of eaſy ſolution, and digeſtion in the ſtomach, and are leſs liable to become aſceſcent, and give the heart-burn than the unfermented cerealia. A cataplaſm is made of potatoes, called CATAPLASMA SOLANI TUBEROSI. See AMBUSTA.

The varieties of *potatoes* are numerous, and may yet be increaſed from the ſeed contained in the apples. The *potatoe* itſelf is not properly the root of the plant, but rather an under ground fruit, produced upon a confined branch. The real roots do not produce *potatoes*, they only ſerve the purpoſe of drawing nouriſhment from the ſoil, as the leaves above extract it from the atmoſphere. The *potatoe* below, and the apple above, are in fact the ſame; but living in different elements, they aſſume different appearances. The one ſeems to be intended for the preſervation of the ſpecies, the other for the food of animals. Such is the increaſe of this vegetable, that from one large *potatoe*, which was cut into nine pieces, eight ſtone and eight pounds, of good ſizable ones, hath been produced.

Potatoes produced from ſets, after a number of years, are found to decreaſe in bearing; for which reaſon they ſhould be brought back every fourteen years to their original. It is after this period, that thoſe produced from the ſeeds themſelves decline.

In Sweden, the leaves of the *potatoe* plants are manufactured for ſmoaking inſtead of tobacco.

See on this article many remarks, both curious and profitable, in the Georgical Eſſays. Cullen's Mat. Medica.

BATTATAS HISPANICA, alſo called *amotes*, *camotes Indica*, batatas occident. Indiæ; *convolvulus Indicus Rad. tub. &c. orientales inhamæ*, *cara*, *ſiſarum Peruvianorum*, *jetica Braſilienſibus*, *kippa-kelengu*, SPANISH POTATOES.——CANADENSIS, alſo called *flos ſolis pyramidalis*, *heliotropium Indicum*, *adenes Canadenſis*, *corona ſolis parvo Flore*, *&c. helianthemum Indic. tuber. Helenium Indicum*, *chryſanthemum Indicum*, *Americanum tuberoſum*, *aſter Peruanus tuberoſus*, *Farneſianus Flos.* JERUSALEM ARTICHOKES.

Both theſe kinds of *potatoes* are of qualities ſimilar to the common ſort.——PEREGRINA, called alſo *cacamotic-ſanoquiloni*. The CATHARTIC POTATOE. They grow ſpontaneouſly in the warmer parts of America. Their taſte is very agreeable; and if about two ounces of them are eaten at bed-time, they gently move the belly the next morning.

BATTITURA, } The ſquamous ſcales of metals
BATITURA. } which fly off whilſt under the hammer.

BAUDA. A veſſel for diſtillation is thus named.

B. P. An abbrevia ion for Caſpari Bauhini Pinax Theatri botanici, five Index in Theophraſti, Dioſcoridis, Plinii, & Botanicorum, qui a ſeculo ſcripſerunt Opera.

B. THEAT. An abbreviation of C. Bauhini Theatrum Botanicum.

BAURACH. See BORAX, ANATRON, and NITRUM.

BAXANA. A tree in an iſland near Ormuz, the ſmalleſt quantity of whoſe fruit is ſaid to ſuffocate the perſon who taſtes it, and the ſame effect to be the conſequence of continuing under its ſhade; yet the root, leaves, and fruit of the ſame are antidotes to poiſon in other countries. It is alſo called *rabuzit*. Raii Hiſt.

BAZCHEP. A Perſian word for antidote. See BEZOAR.

BDELLA, } A HORSE-LEECH. See alſo
BDELLERUM. } VARIX.

BDELLIUM, called alſo *madelion*, *bolchon*, *balchus*, and by the Arabians *mokel*; is a gummy reſinous juice, produced by a tree in the Eaſt Indies, of which we have no ſatisfactory account. It is brought into Europe both from the Eaſt Indies and Arabia. It is in pieces of different ſizes and figures, externally of a dark reddiſh brown, ſomewhat like myrrh; internally it is clear, and not unlike glue; to the taſte it is ſlightly bitteriſh and pungent; its odour is very agreeable. If held in the mouth it ſoon becomes ſoft and tenacious, ſticking to the teeth. Laid on a red-hot iron it readily catches flame, and burns with a crackling noiſe, and, in proportion to its goodneſs, it is more or leſs fragrant.

Near half of its ſubſtance diſſolves either in water or in ſpirit of wine; but the tincture made with ſpirit is ſomewhat ſtronger, and by much more agreeable. Vinegar, or verjuice, diſſolves it wholly.

The ſimple gum is a better medicine than any preparation from it. It is one of the weakeſt of the deobſtruent gums, but it is uſed as a pectoral and an emenagogue.

BECABUNGA, called alſo *anagallis aquatica*, *berula*, *laver Germanicum*, *veronica aquatica*, and by ſome authors, *cepæa*; WATER PURPEY, WATER PIMPERNEL, and BROOK LIME. The VERONICA BEGABUNGA, Linn. Of the CLASS DIANDRIA. ORD. MONOGYNIA. Linn. Gen. Plant. 25. It is deſcribed VERONICA *Racemis lateralibus*, *foliis ovatis planis caule repente*.

It is a low creeping plant, with round, thick, ſmooth, reddiſh ſtalks, naked and procumbent at bottom, erect at the top, clothed with firm, round, juicy leaves, of a dark ſhining green colour, ſlightly indented about the edges, and ſet in pairs about the joints; from the boſoms of the leaves ariſe naked footſtalks, bearing ſpikes of blue flowers, deeply cut into four ſegments, and followed by flattiſh ſeed veſſels. It is found in rivulets and ditches, and flowers in June.

It is a good antiſcorbutic, and in a leſſer degree it poſſeſſes the virtues of the cochlearia and naſturtium. It hath not the volatility of the cochlearia, nor is it pungent to the taſte, but rather ſubſaline and bitteriſh than acrid. It acts without irritation or pungency, and ſhould be eaten plentifully as food, or a large quantity of the juice taken, if benefit is expected from it.

BECHICA, from βηξ, *a cough*. Any medicine deſigned to relieve a cough. It is of the ſame import as the word pectoral.

TROCHISCI BECHICI ALBI. WHITE PECTORAL TROCHES, *now called* TROCHISCI AMYLI. TROCHES of STARCH. Ph. Lond. 1788.

The London College directs them to be made thus: Take of double refined ſugar, a pound and a half; of ſtarch, an ounce and a half; of liquorice, ſix drams; of Florentine orrice, half an ounce. All the ingredients being reduced to powder, with the mucilage of gum tragacanth, form troches. They may be made, if choſen, without orrice. This compoſition is a pleaſant pectoral, and may be taken at pleaſure; it is ſerviceable in tickling coughs.

TROCHISCI BECHICI NIGRI. BLACK PECTORAL TROCHES, *now called* TROCHISCI GLYCYRRHIZÆ. TROCHES of LIQUORICE.

Take the extract of *liquorice*, double refined ſugar, of each ten ounces; tragacanth powdered, three ounces. By moiſtening with water make troches.

Thus the London College alſo directs theſe to be made, but Rhazes was their firſt author.

They are calculated, by letting them gradually diſſolve in the mouth, to ſoften acrid humours, and to abate tickling coughs.

BECHITA. See EXPECTORANTIA.

BECHION, } See TUSSILAGO.
BECHIUM. }

BECUIBA NUX. It is as large as a nutmeg, of a browniſh colour, with an oily kernel, in a woody brittle huſk. A balſam is drawn from it, which is held in eſtimation in rheumatiſms. It is brought from Braſil.

BEDEGUAR. See CARDUUS LACTEUS SYRIACUS—& CYNOSBATOS.

BEETLA. See BETLE.

BEGMA, from βηξ, *a cough*. Hippocrates by this word means both a *cough* and the ſpit brought up with it.

BEHEN ALBUM, called alſo *jacea orientalis patula*, *behmen abrad Arabum*, *raphonticoides lutea*, and the true white BEN, BEEN, or BEHEN of the ancients.——ALBUM *vulg.* called alſo *lychnis ſylveſtris*, *lanaria*, *papaver ſpumeum vulg. muſcipula pratenſis veſicaria*, SPATLING POPPY, BLADDER CAMPION, or WHITE BEN.——RUBRUM; LIMONIUM, or LIMONIUM MAJUS.——SEA-LAVENDER, or RED BEHEN.

Two roots, viz. the red and the white *ben*, are talked of by the ancients. The white is a long, ſlender, white root, of an aromatic ſmell, and ſharp taſte; it is hard, but does not keep well. It comes from the Eaſt, and is a ſpecies of jacea with yellow flowers. The red is a

thicker root, alſo brought from the Eaſt. It is cut in ſlices, and taſtes acrid; but the root of the white lychnis is uſed for one, and the root of the ſea-lavender for the other. This ſea-lavender grows in ſalt marſhes, on ſome of our ſea coaſts. It hath a thick root that runs deep in the earth, and is of an aſtringent quality.

BEHMEN ABRAD ARABUM. See BEHEN ALBUM.

BEJUIO, called alſo the *habilla de Carthagena*, BEAN of CARTHAGENA. It is a kind of *bean* in South America, and is famed for being an effectual antidote againſt the poiſon of all the kinds of ſerpents, if a ſmall quantity is eaten as ſoon as the bite is received. This *bean* is the peculiar product of the juriſdiction of Carthagena.

BELAE. Thus, a particular kind of bark is named at Madagaſcar. It was firſt preſented by M. Saillant, to the College of Phyſicians at Paris. This bark is thin, of a yellowiſh colour externally, reddiſh within, and to the taſte ſlightly bitter and aſtringent. It is ſaid to be of conſiderable efficacy in diarrhœas.

BELEMNOIDES, } from βέλεμνον, *a dart*, and εἶδος,
BELENOIDES. } *ſhape*. *Belemnoides*, and *Belonoides*, alſo a name for the *proceſſus ſtyloides*. It is alſo a name of the proceſs at the lower end of the ulna.

BELESON. See BALSAMUM.

BELI. See COVALAM.

BELILIA, called *frutex Indicus baccifer*. An Indian berry-bearing ſhrub; a decoction of which is cooling. Raii Hiſt.

BELLADONNA. See SOLANUM LETHALE.

BELLEGU, BELLEREGI, BELLILEG, BELLERICÆ. See MYROBALANI BELLERICI.

BELLIDIOIDES. See BELLIS MAJOR.

BELLIS. The DAISY.

Of this plant there are many ſpecies, and ſeveral other plants alſo are called by this name.

BELLIS MINOR, called alſo *conſolida minima*, *ſymphytum minimum*, bellis ſylveſtris minor, BRUISEWORT, and COMMON DAISY. BELLIS PERENNIS, Linn. It is too well known to need a deſcription. Its leaves and flowers looſen the belly, are commended in diſorders that ariſe from drinking cold liquor while the body was hot. The leaves are ſlightly acrid, the roots rather more ſo. They have a ſubtle penetrating pungency, that is not hot nor fiery, but like the contrayerva. The root preſerves this pungent matter when dried, and an extract made with water, or with ſpirit, retains the greateſt part of its virtues. It is an excellent antiſcorbutic.—That named —— MAJOR, alſo called *conſolida media Lobelii*, *bellidioides*, bellis ſylveſtris caule folioſo major, *leucanthemum bellidis facie*, *buphthalmum*, or *buthalmum majus*, *oculus bovis*, OX-EYE, MAUDLIN-WORT, or GREAT OX-EYE DAISY. It is the CHRYSANTHEMUM LEUCANTHEMUM, Linn. a plant with oblong, narrow, deeply indented leaves, joined cloſe to the ſtalks, which are pentagonal, hairy, branched, and bear on the tops pretty large ſolitary flowers, compoſed of white petals, ſet round a yellow diſk. It is perennial, grows wild in corn-fields, and in dry paſture grounds. It flowers in May and June.

The leaves have been in eſteem as diuretic and antiaſthmatic.——LUTEA FOLIIS PROFOUNDIS. See CHRYSANTHEMUM.——MONTANA FRUTESCENS ACRIS. See PYRETHRUM.

BELLOCULUS. A ſort of precious ſtone reſembling the eye; hence ſuppoſed to be good againſt diſorders thereof.

BELLON. See COLICA.

BELLONIO & BELLONIS. See CEDRUS FOLIO CYPRI.

BELLON. DE AQUAT. An abbreviation of PETRUS BELLONIUS DE AQUATILIBUS.

BELMOSCHUS. See ABELMOSCHUS.

BELOIDES, } See BELEMNOIDES.
BELONOIDES. }

BELOERE. An Indian evergreen plant. The ſeeds purge moderately, but the leaves roughly. Raii Hiſt.

BELULCUM, from βέλος, *an arrow*, or *dart*, and ἕλκω, *to draw*. An inſtrument for extracting darts or arrows.

BELLUTTA TSJAMPACAM. Called alſo *Amelpodi*. The name of a large tree in Malabar. The root powdered and taken with ginger, promotes ſweat. A decoction of the leaves is a good expectorant. Raii Hiſt.

BELUZAAR. See ANTIDOTUM.

BELZOE, } GUM BENJAMIN, and its tree.
BELZONIUM. } See BENZOINUM.

BELZUAR MINERALE. See BEZOAR FOSSILE.

BEM-TAMARA. The EGYPTIAN BEAN. See FABA ÆGYPTIA.

BEN, alſo called *balanus myrepſica*, *glans unguentaria*, *nux ben*, *nux unguentaria moris*, *Coatlis*. The OILY ACORN, OILY NUT, or BEN NUT.

It is a whitiſh nut, of the ſize of a ſmall filbert, roundiſh, triangular, with a kernel covered with a white ſkin, produced by a middle-ſized tree, reſembling the birch. It grows ſpontaneouſly in the Eaſt Indies and America; we have them alſo from Arabia.

Theſe kernels have a nauſeous bitter, oily taſte, are purgative, occaſion a nauſea and gripes: on expreſſion they yield one-fourth their weight of a yellow oil, called *oleum myrepſicum*; *balaninum ol.* almoſt inſipid and flavourleſs; the nauſeous bitter remains behind, and is not ſoluble in oily menſtrua. This oil does not grow rancid by long keeping, as is common with expreſſed oils, on account of which it is uſed as the baſis of odoriferous unguents and perfumes. It is impregnated with the odour of jeſſamine, and other flowers, by ſtratifying them with cotton dipped in the oil, and repeating the proceſs with freſh flowers, until the oil becomes ſufficiently odorous, after which it is ſqueezed out from the cotton in a preſs. It is alſo a name of the *behen*.

Dale ſays that the *lignum nephriticum* is the wood of the tree which bears theſe nuts.

There is another ſpecies of *ben*, much larger than the above. Monardus calls it *ben* magnum, *ſeu avellana purgatrix*, the GREAT BEN or PURGING FILBERT. It purges and vomits violently.

BENATH. The Arabic name for ſmall puſtules which riſe in the night after ſweating.

BENEDICTA, AQUA. Formerly the *aqua calcis ſimplex* was thus called. It was the name of a water diſtilled from ſerpyllum.

BENEDICTA, AQUA COMPOSITA. i. e. AQ. CALCIS. COM. See CALX.——HERBA. The HERB BENNET. See CARYOPHYLLATA.

BENEDICTUM LIGNUM. See GUAIACUM.—— OLEUM. See LATERITIUM OLEUM. —— VINUM. See ANTIMONIALE VINUM.

BENEDICTUS LAPIS. See ADAMUS.

BENEOLENTIA. SWEET SMELLING MEDICINES.

BENGALLE INDORUM. See CASSUMMUNIAR.

BENINGANIO. A fruit which grows in the bay of St. Auguſtine: it is of the ſize of a lemon, red without, and grateful to the ſtomach. Raii Hiſt.

BENIVI ARBOR,
BENIVIFERA,
BENJOINUM, & BENJOIVUM.
BENJUI.
BENZOE, BENZOIFERA, and BENZOIN. } The BENJAMIN-TREE, and the GUM. See BENZOINUM.

BENZOINUM, called alſo *aſa dulcis*, *aſſa odorata*, *belzoe*, *belzoinum*, *benivi arbor*, *benivifera*, *benjui*, *benzonifera*, *benzoin*, *benjoinum*, *liquor ſyrenaicus*, *vel cyreniacus*, *balzoinum*, *benjovinum*, GUM BENJAMIN. It is a concrete reſinous juice, obtained from a middle-ſized tree, with leaves like the bay-leaves, but not ribbed, and falling off in winter, bearing flattiſh nuts, the ſize of nutmegs, whoſe fleſhy covering is externally rough and hairy. It is a native of the Eaſt-Indies and of North America, particularly of Virginia and Carolina; alſo of *Sumatra*; but it is only brought from the Eaſt Indies: it grows in open ground with vigour in England. Mr. DRYANDER has fully aſcertained this tree to be a ſtyrax; hence is it called *ſtyrax benzoin*. The CLASS DECANDRIA; ORD. MONOGYNIA. LINNÆI Gen. Plant. 595. It is the STYRAX FOLIIS *oblongatis acuminatis ſubtus tomentoſis*, *Racemis compoſitis Longitudine foliorum*, DRYANDER. Though in the laſt edition of the Edinburgh Diſpenſatory, it is conſidered as the TERMINALIA BENZOIN, *foliis lanceolatis*, LINNÆI; and by CURTIS, the CROTON BENZOE. The leaves and the bark ſmell like the gum; and to rectified ſpirit of wine they give out a reſin, like the *Benjamin*; but no reſin naturaly flows from it: the reſin is obtained by in-

ciſions made in its trunk about the origin of the firſt branches: as it runs out, it is white, but ſoon becomes yelloviſh, reddiſh, or browniſh. It is brought into Europe in brittle maſſes, compoſed partly of white, and partly of yelloviſh or light brown pieces. The white pieces are called *benzoe amygdaloides*, and are reckoned the beſt; they are hard, ſolid, ſhining, tranſparent, and poſſeſs a very fragrant ſmell: this gum-reſin hath but little taſte, impreſſing the palate with a ſlight ſweetiſhneſs; its ſmell is very fragrant if rubbed or heated, and is leſs heating than moſt of the other balſams.

If pure, it totally diſſolves in rectified ſpirit of wine. By digeſtion it imparts to water much of its fragrance and pungency: the filtered liquor, gently exhaled, leaves a cryſtalline matter of a ſeemingly ſaline nature, amounting to an eighth part of the whole.

1. Flores Benzoini. Flowers *of* Benjamin.

They partake of the fragrance of the reſin; diſſolve in ſpirit of wine, and with the aſſiſtance of heat, in water alſo, from which they are prevented from ſeparating, if as much ſugar is added as will give the conſiſtence of ſyrup to the water.

The College of Phyſicians of London, in their Pharmacopœia, order the flowers of *Benjamin* under the title of Flores Benzoes. *Flowers of Benjamin*, to be thus raiſed.

Take of *Benjamin* in powder, one pound, put it into an earthen pot placed in ſand; and with a ſlow fire ſublime the flowers into a paper cone, fitted to the pot. If the flowers ſhould be of a yellow colour, mix them with white clay, and reſublime them, only a ſmall portion ſhould be put in at a time, and the heat be very gentle. Ph. Lond. 1788.

2. Tinctura Benzoes compoſita. *Compound Tincture* of *Benjamin*, formerly *Commendatorium Balſamum*, *Guttæ Vitæ*; *Perſicum Balſamum*; Balsamum traumaticum, in the following form.

Take of *Benjamin* three ounces; ſtorax ſtrained two ounces; balſam of Tolu one ounce; Socotorine aloes half an ounce; rectified ſpirit of wine two pints—digeſt with a gentle heat for three days, and ſtrain.

3. Oleum Benzoini. Oil of Benjamin.

If the powdered *Benjamin* is expoſed to a gentle heat in a retort, it melts and ſends up the flowers; after which a thin oil riſes, which is yelloviſh, ſlightly empyreumatic, and mixed with an acidulous liquor called the ſpirit of *Benjamin*; then follows a thick butyraceous matter. The thin oil re-diſtilled with water loſes its taint, and now ſmells agreeably to the *Benjamin*, and ſeems to be of the ſame nature as eſſential oils; and yet the *Benjamin* itſelf, when diſtilled in water, yields no eſſential oil.

4. Tinctura Benzoini. *The* Tincture *of* Benjamin.

Take of *gum Benjamin* four ounces, and rectified ſpirit of wine a pint. Digeſt three or four days in a ſand-heat, and ſtrain off the tincture.

5. Lac Virginalis. Virgin's Milk.

To twenty ounces of pure water, add one ounce of the tincture of *Benjamin*; and if more water is neceſſary to render the mixture milky, add it.

6. Magisterium Benzoini. *The* Magistery *of* Benjamin.

If the lac virginalis be permitted to ſtand ſome time, the *Benjamin* precipitates in the form of a white magiſtery. This magiſtery is the *Benjamin* in its whole ſubſtance, and is preferred by ſome to the flowers; but the flowers are only the ſaline part of the gum with ſome of its fragrance, and it is the reſinous part that is moſt diſpoſed to be precipitated from ſpirit by water.

Of gum Benjamin, the principal uſe is in perfumes, and as a coſmetic. It approaches in virtues and fragrance to the ſtorax and balſam Tolu. It is uſeful in aſthmas and other diſorders of the breaſt, for removing obſtructions and promoting expectoration, in which intentions the flowers are given from grs. iv. to xv. the flowers are alſo a powerful errhine. The tincture may be given in doſes from twenty to eighty drops, but is chiefly uſed to make the ſkin ſmooth, and to clear it; and to ſcent waſh-balls. The lac virgin. muſt be uſed when a roughneſs or blotches and venereal ſpots diſcolour the ſkin and render it unſightly: it may be rubbed on gently every day with a ſoft rag; it renders the face and arms agreeably ſmooth.

Draughts are made with the gum itſelf by rubbing it with gum Arabic, as follows:

℞ *Gum benzoes* ſubtil. pulv. ʒ i. gum. arab. ℈ i. ſpt. vin. ten. ʒ ij. aq. puræ ℥ ij. m.

The flowers of *Benjamin* are manifeſtly a ſaline ſubſtance of the acid kind, of conſiderable acrimony, and ſtimulant power. They have been recommended as a pectoral; but Dr. Cullen has employed them in ſome aſthmatic caſes without effect, half a dram appeared to be heating and hurtful. Mat. Medica.

BERBARIS, } Called alſo *oxyacantha* Galeni, *ſpina*
BERBERIS. } *acida*, *creſpinus*, *criſpinus*; piperidge or piperage bush, and barberry. The berberis vulgaris, Linn.

It is a large prickly buſh, with brittle branches, covered with an aſh-coloured bark, under which lies another of a deep yellow colour; the leaves are ſmall, ſmooth, rather oval, of a pale green colour, finely ſerrated about the edges; the flowers are yellow, monopetalous, ſtanding in cluſters on the top upon naked foot-ſtalks, followed by oblong red berries, containing in each generally two ſeeds: ſome of the individuals have no ſeeds in their berries; and ſometimes berries with and without ſeeds are found on one buſh. It grows wild on chalky hills, flowers in May, and its fruit ripens in September.

The fruit is a mild reſtringent acid, uſeful in hot bilious diſorders, and colliquative putrid diſpoſitions in the humours. The leaves have the ſame virtues as the berries, but in leſs degree. The inner yellow bark is auſtere and bitteriſh, gently purgative, and uſeful in the jaundice. The bark of the root is mildly aſtringent. Theſe barks do not keep long, and are beſt uſed in infuſions, one ounce of bark to a pint of water.

Sal Essent. Berberis. Essential Salt *of* Barberries.

Digeſt two ounces of lemon-juice with two pints of the juice of *barberries* in a ſand heat for two days, after which evaporate the liquor to one half, then ſet in a cold cellar a few days and the ſalt will concrete; when the ſalt ceaſes to ſhoot, evaporate again, and more ſalt will be obtained. Simon Paulli calls this tartar of *barberries*.

Gelatina Berberorum. *The* Jelly *of* Barberries.

To a pound of *barberries*, picked clean from their ſtalks, add a pound of white ſugar, boil them with a gentle heat, to a due conſiſtence, then preſs the jelly through a flannel cloth.

BERDIRAMON. See Bistorta.

BEREDRIAS. The name of an ointment mentioned in Actius.

BERENS SECUM. See Artemisia.

BERENICE. See Succinum.

BERGAMOTE, or Bergamot. It is a ſpecies of citron, produced at firſt caſually by an Italian's grafting a citron on the ſtock of a *bergamot* pear-tree, whence the fruit produced by this union, participated both of the citron-tree and the pear-tree. The fruit hath a fine taſte and ſmell, and its eſſential oil is in high eſteem as a perfume.

The eſſence of *bergamot* is alſo called *eſſentia de cedra*. It is extracted from the yellow rind of the fruit by firſt cutting it in ſmall pieces, then immediately ſqueezing the oil out of them into a glaſs veſſel. This liquor is an etherial oil.

A water is diſtilled from the peel as follows: take the outer rind of three *bergamots*, a gallon of pure proof ſpirit, and four pints of pure water, draw off a gallon in a balneum mariæ, then add as much of the beſt white ſugar as will be agreeable. Or,

Take of the eſſence of *bergamot* three drams and a half, of rectified ſpirit of wine three pints; of ammonia prepared, a dram; diſtil off three pints in a balneum mariæ.

BERIBERI, } In the Eaſt Indies, the terms mean
BERIBERIA. } ſheep in common; but in a medical ſenſe there, a ſpecies of palſy, wherein, according to Bontius, patients ſeem to imitate ſheep in lifting their legs when they walk. He ſays this *palſy* is a kind of trembling, in which there is a deprivation of the motion and ſenſation of the hands and feet, and ſometimes of the body. Sauvages defines it under the Order of Clo-

NIC SPASMS. "In walking, a retraction of the knee, with tremor; a ſenſe of crawling, or tingling, and hoarſeneſs, common in the Indies."——LINNÆUS, "A tremor of the parts, contracture of the knees, i. e. continual chronic agitation of the parts without a ſenſation of coldneſs, ſtupor, and hoarſeneſs."—SAGAR adds to the definition of SAUVAGES, "A painful ſtupor of the limbs," and ſays, "He once ſaw ſome ſheep, obſerving a wolf, ſeized with this ſpaſmodic affection; and that they, whether ſtanding ſtill or walking, momentaneouſly retracted their knees, which immediately returned to their naturally ſituation."—Dr. AITKIN makes it ſynonymous with the contracture, which ſee.—The cauſe is generally thought to be expoſure to the cold vapours of the night too ſoon after exerciſe.

In this caſe a pituitous matter inſinuates itſelf betwixt the joints and relaxes their ligaments. Generally its approach is gradual; but ſometimes it ſeizes ſuddenly.

The ſymptoms are, an univerſal laſſitude, a faulty motion of the hands and feet, and the ſame throbbing titillation is felt in them as is felt in the fingers and toes in a cold country in the winter ſeaſon, only the pain is not ſo great; ſometimes the voice is ſo obſtructed as to render articulation difficult. Other ſymptoms occaſionally attend, but theſe are the chief.

THE CURE is tedious. The diſeaſe is not mortal, except by ſeizing the muſcles of the breaſt, ſo as to obſtruct reſpiration and the voice.

In order to the cure, moderate exerciſe and frictions are uſeful; the Indians uſe a half-bath made of water, in which is boiled an aromatic kind of herb called *lagondi*, or, in want of it, camomile and melilot. The affected parts are rubbed well with a mixture of the oils of mace and roſes. Bleeding is not required; but, on the contrary, warm nervous ſtrengthening reſtoratives are to be uſed: now and then a gentle purge may be admitted. Decoctions of ſarſaparilla and guaiacum are alſo of ſervice. See Bontius de Medicina Indorum.

BERICOCCA. See ARMENIACA MALA.

BERMUDENSES, BACCÆ. See SAPONARIÆ NUCULÆ.

BERNAVI. An electary mentioned by Proſper Alpinus, in his work, De Medicina Ægyptiorum. It is prepared in India: its compoſition is unknown; but very extraordinary effects are attributed to it.

BERNHARDI TESTICULUS. See ASPHODELUS LUTEUS, that called —— EREMITA. See CANCELLUS.

—— GAZOPHYL. An abbreviation of Gazophylacium Rerum naturalium Michaelis Ruperti Beſleri.

—— HORT. EYS. An abbreviation of Beſleri Hortus Eyſtetenſis.

BESONNA. Rulandus explains it by *muſcarum fungus*. Probably he means a *ſponge*, which is the nidus of ſome ſort of flies.

BESSANEN. In Avicenna it is a redneſs of the external parts, reſembling that which precedes the leproſy; it occupies the face and extremities. Dr. James thinks it is what we call chilblains. See PERNIO.

BESTO. See SAXIFRAGA.

BETA. BEETS. It is a plant with large, ſmooth, broad ribbed, juicy leaves, and ſlender, ſtriated, branched ſtalks, bearing ſpikes of imperfect flowers, followed each by a roundiſh, rough, watery ſeed-veſſel. Different ſorts are cultivated for culinary uſes: Linnæus ſuppoſes them to be varieties of the wild *beet* which grows on ſome of the ſea-coſts of England, Holland, &c. They are all biennial. That named —— ALBA, called alſo *ſicula*; is the *cicla*, *beta* palleſcens. COMMON WHITE BEETS. —— RUBRA VULG. called alſo BETA NIGRA. TURNEP ROOTED RED-BEET, RED ROMAN-BEETS, or BEETRAVE.——SYLVESTRIS. WILD-BEETS. There is a wild ſort which Dioſcorides calls LIMONIUM.

Beets, uſed as food, are difficult of digeſtion, and afford but little nouriſhment. If freely eaten they are laxative and emollient. They give out their virtue to water by boiling. The red ones give out their colour to ſpirit of wine; and on expreſſion, their colour accompanies their juice.

The juice of both kinds has been conſidered as a powerful errhine, occaſioning a copious diſcharge, but no ſneezing; but Dr. Cullen ſays, in the trials he made, the juice ſnuffed up the noſe, gave no large or durable evacuation, Mat. Med. The dried red *beet* roots yield one twentieth part their weight of ſugar, and the dried white *beet* roots one tenth.

BETLE, called alſo BETRE, *betele*, *bethle*, *betelle*, BEETLA, BEETLE, *piper longum foliorum nervis decurrentibus tenuioribus & mollioribus*, and *bulatwaela*.

It is a ſcandent plant, growing in different parts of the Eaſt Indies: it bears a fruit which reſembles a lizard's tail: its taſte is agreeable, and in the Malacca iſles is called *ſirii boa*. The ancient botaniſts confound its leaf with the malabathrum.

Mixed with other things, as fancy directs, the Indians chew it almoſt continually. It is gratefully cordial, but ſeems to injure their teeth.

BETONICA, called alſo *vetonica cordi*, *ceſtrum dro-ſiobetanon*, COMMON or WOODY BETONY. The BETONICA OFFICINALIS, Linn.

It is a low plant, with dark green, oblong, wrinkled leaves, that are crenated, hairy, and ſet in pairs, on ſquare unbranched ſtalks; bearing thick ſpikes of labiated purpliſh flowers, each of which is followed by four oblong triangular ſeeds, incloſed in the flower-cup. It grows wild in woody and ſhady places; flowers in June and July, in winter it dies to the ground, the roots continuing.

The leaves and tops are agreeably ſcented, but it ſoon flies off from the dry herb: to the taſte they are warm, rough, and bitteriſh; if powdered they make a good errhine.

An infuſion of the leaves in boiling water contains all the virtue of the herb, and is the beſt preparation of it. From large quantities a ſmall portion of eſſential oil is obtained by diſtillation. The roots are ſaid to be naſeous, bitter, purgative, and emetic; and, as a medicine, very ſimilar to the hellebor. alb.

BETONICA AQUATICA. See SCROPHULARIA AQUATICA. —— PAULI. See VERONICA. —— CORONARIA. See CARYOPHILIUS RUBER.

BETRE. See BETLE.

BETTONICA. See BARDANA MAJOR.

BETULA. The BIRCH-TREE. The *betula* alba of Linn.

It delights in moiſt woods. It hath many flexible branches and ſomewhat oval, ſharp-pointed, ſerrated, deep-green leaves, hanging on long and weak pedicles, producing ſmall ſcaly cones, which contain little winged ſeeds. The bark is externally white and chapt, conſiſts of a thick brittle ſubſtance, of a dark browniſh red colour, covered with three or four whitiſh, very thin, ſmooth, flexible, tough, ſemi-traſparent, membranous coats.

If this tree is wounded in the ſpring, pretty deeply into its trunk, there gradually iſſues a large quantity of a limpid ſweetiſh juice. It is beſt when drawn from the upper part of the tree; ſoon after the leaves have begun to appear, the juice loſes its ſweetneſs. This juice hath been drank as an antiſcorbutic: it ſenſibly promotes urine, and freely taken it moves the belly. By fermentation it becomes a vinous liquor; and inſpiſſated to the conſiſtence of a ſyrup, it yields a browniſh concrete like manna, if ſet in a cool place.

The leaves and bark are antiſeptic; the bark is burnt to correct bad air; and for this purpoſe it is the next in goodneſs to juniper.

BEUTUA. See PAREIRA BRAVA.

BEX. See TUSSIS.

BEXUGO. The root of the *clematitis Peruviana* of C. B. one dram of which is enough for a purge.

BEXUGUILLO. The PERUVIAN IPECACUANHA. See IPECACUANHA.

BEYA. So the alchemiſts call the *aqua mercurialis*, which, in their language, is wife to the *gabrien* or ſulphur of the philoſophers.

BEZOAR. This is originally a Perſian word, viz. BADZCHER, or LAZCHER, or PHAHAZAR, which ſignifies an *antidote*. Avenzoar is the firſt who mentions it as a medicine, or who gives its hiſtory.

Bezoar ſtones are preternatural or morbid concretions formed in the bodies of ſeveral land animals; they are compoſed of ſeveral ſtrata, or layers, like an onion. In the Hiſt. de l'Acad. an. 1703, it is aſſerted that all *bezoar* ſtones are bilious concretions of the reſpective animals which afford them.

Bezoars may be ranked thus: 1. The true oriental and occidental. 2. Such ſtones as are got from animals, and reſemble *bezoar*; ſuch as thoſe from apes, and even the various ſpecies of pearls and crabs eyes. 3. The ſeveral ſpecies of foſſile *bezoars*. 4. Thoſe that have only the ſhape, without the virtues of *bezoar*, ſuch as the human calculi in the bladder, kidneys, and gall-bladder; or in the ſame parts of oxen. 5. The ægagropila, and *bezoar germanicum*, ſee CAPRA ALPINA.——PORCI. See BEZOAR HYSTRICIS.

—— ORIENTALIS, called alſo LAPIS BEZOAR, HIRCUS BEZOARTICUS, and the ORIENTAL BEZOAR STONE. It is ſuppoſed to be produced in the cavity at the bottom of the fourth ſtomach of a ſpecies of goat in Perſia called *parau*. It is only found in the old ones, and only in thoſe which feed on particular mountains.

This ſtone finely powdered, and levigated with ſpirit of wine, was formerly made into balls, which were called GASCOIGN-BALLS, from one Gaſcoign their inventor; which are at preſent ſold under that name by the trading chemiſts, or rather a ſophiſticated medicine without *bezoar*.

—— OCCIDENTALIS, called alſo LAPIS BEZOAR, PERUVIANUS, the American or occidental *bezoar*.

It is found in the ſtomach of an animal of the ſtag kind, called *animale bezoarticum occidentale*, which is a native of Peru, and other parts in the Spaniſh Weſt Indies.

—— HYSTRICIS, called alſo PILA HYSTRICIS, BEZOAR PORCI, LAPIS PORCINUS, PEDRO DEL PORCO, LAPIS MALACENSIS, the PORCUPINE BEZOAR, or GALL-STONE. It is found in the gall-bladder of an Indian porcupine, particularly in the province of Mallacca; it is of a roundiſh figure, and of a pale or purpliſh colour, ſometimes betwixt a green and white; it is ſoft, ſmooth, and ſlippery to the touch; to the taſte it is intenſely bitter, and the water in which it is ſteeped ſoon becomes bitter alſo. It does not appear to differ from the biliary concretions of an ox or any other animal. It is rather to be called an ægagropila than a ſtone, as it conſiſts of woolly fibres, and a bitter friable matter, having neither laminæ nor membranes.——SIMIÆ, or LAPIS SIMIÆ, the BEZOAR of the MONKEY. Stones of this kind are found in the ſtomach of certain monkeys in Brazil, and the Eaſt Indies, but which very rarely produce them. They are about the ſize of hazel nuts, harder than the oriental *bezoar*, of a dark green colour almoſt black. The ſcarcity renders them coſtly, and they are rarely to be met with.——FOSSILE. FOSSILE BEZOAR. It is a ſmall hollow body from Italy, found in ſand and clay pits, of a purple colour, with a rough ſurface, the ſize of a walnut, and light. When broke, it is found to be an irony cruſt, containing in its hollow a fine greeniſh white earth reſembling pale *bezoar*. The earth is uſed and not the ſhells. It ſeems to be of the nature of bole armoniac. This is alſo called BEZOAR MINERALE, TERRA SICULA, LAPIS BEZAHAN, SICULUS ALBUS, BELZUAR MINOR. SICILIANA, MINERAL BEZOAR, and SICILIAN EARTH. They ſeem chiefly to be a ſpecies of calcareous earth. See Edwards' Elements of Foſſilogy. Notwithſtanding all their boaſted virtues, it is certain that they are abſolutely indigeſtible in the ſtomachs of the animals in which they are found; and they are equally ſo in the human, except when accompanied with an acid; ſo that no more can be expected from theſe concretes than from any of the teſtacea that are ſoluble in acids; but they are inferior to them, being far leſs abſorbent than they, and more difficultly acted on by any acid of either the animal or vegetable kinds. ——MICROCOSMICUM, called alſo *calculus humanus*, the calculus of the human bladder.

It is various in its degrees of hardneſs, as well as in its ſize and figure. It has been uſed in the place of other more coſtly ſorts.——ANIMALE. ANIMAL BEZOAR. Take the whiteſt calcined hartſhorn, levigated to the greateſt ſubtility, pour on it drop by drop the ſpirit of vitriol, to form it into a paſte to be made into balls.

A powder of liver and heart of vipers, is called *animal bezoar*.——BOVINUS, called alſo ALCHERON LAPIS. The Portugueſe call it MESANG DE VACA. It is a ſtone found in the gall-bladder of a bull.——MINERAL. See BEZOAR FOSSILE.

BEZOARDICA RADIX. See CONTRAYERVA.

BEZOARDICUM JOVIALE. BEZOAR with TIN. Take the regulus of antimony three ounces, pure tin two ounces, muriated quickſilver five ounces; melt the regulus in a crucible, then put to it the tin, ſo as to make a new regulus, to which, after being levigated, add the muriated quickſilver, and diſtil the mixture in a retort. Let the butter which riſes, be fixed, by three repeated diſtillations, with thrice its weight of the ſpirit of nitre; then calcine the powder, and throw it, whilſt ignited, into a proper quantity of ſpirit of wine, and dry it for uſe.

This differs very little from the anti-hecticum Poterii, and it is a mere calx, and might as well be prepared by ſimple deflagration with nitre.

BEZOARDICUS PULVIS. See BEZOAR ORIENTALIS.

BEZOARTICUM, BEZOARTIC; ſuch was the opinion of the ancients reſpecting the virtues of bezoar, that phyſicians held it as a medicine highly efficacious in a vaſt variety of caſes, and placed very great dependence on its powers; therefore all medicines, ſuppoſed to poſſeſs ſimilar virtues, were termed bezoartica.

—— MINERALE. Drop the butter of antimony into three times its weight of the ſpirit of nitre, diſtil them in a retort; at firſt the marine acid ariſes with a little of the nitrous ſpirit, and is the *ſpiritus nitri bezoarticus*; the diſtillation being continued until a dry white maſs remains, which muſt be calcined in a crucible, in a naked fire, heated to an almoſt white heat, and ſo kept for half an hour.

The common calx of antimony generally ſupplies its place, for like that calx it is abſolutely inert.

BEZOARTICUS SP. NITRI. See BEZOARTICUM MINERALE.

BEZOAS. It is a name given to many chemical preparations.

BIANCA ALEXANDRINA. See ALBUM HISPANICUM.

BIBINELLA. See ANAGALLIS.

BIBITORIUS MUSCULUS. See ADDUCTOR OCULI.

BIBULUS LAPIS. See PUMEX.

BICAUDALIS MUSCULARIS, vel INTRICATUS MUSCULUS. See ABDUCTOR AURIS, N° 1.

BICEPS MUSCULUS, from *bis* and *caput*. A double-headed muſcle.

—— HUMERI, called alſo BICEPS INTERNUS HUMERI; Dr. Hunter calls it BICEPS FLEXOR. It riſes by two heads; one of them, which is a ſlender tendon, from the uppermoſt part of the glenoid cavity; it runs acroſs, within the cavity of the joint, under the ligament of the articulation, paſſes in the groove between the two tubercles, and going down, grows fleſhy. The ſecond head riſes from the extremity of the coracoid proceſs, runs down the axilla, and joins the firſt, forming a tendon, which ſinks between the interſtices of the muſcles, to be inſerted into the tubercle on the inſide of the radius. This muſcle, beſides being a flexor, acts as a rotator of the radius, when the hand is prone. This muſcle ſends off an aponeuroſis towards the inſide of the arm, which is commonly what is wounded when the tendon is ſaid to be pricked by bleeding. This aponeuroſis was firſt noticed by Cowper.

—— EXTENSOR. This muſcle riſes by two heads, the longer taking its origin from near the neck of the os humeri, runs between the teres major and minor, down the back part of the arm, and joins the ſhort head which riſes on the outſide of the deltoid, and is inſerted into the olecranum.

—— FEMORIS. This muſcle hath two heads, the longer riſes in one maſs with the ſemitendinoſus, but having advanced a little way, they part; they ariſe from the protuberance of the iſchium, on its back part; as the biceps advances it becomes fleſhy. Between the *biceps* and the ſemitendinoſus, the veſſels lie in the ham. The ſhort head riſes from the linea aſpera, between the inſertion of the *biceps* and the origin of the vaſtus exernus.

The two heads join, and are inſerted into the ſuperior epiphyſis, or outer part of the fibula. It bends the tibia, and partly rotates the leg by turning the foot outwards. Cowper.

BICHICHIÆ. An epithet of certain pectorals, or rather troches, deſcribed by Rhazes, which were made of liquorice, &c.

BICHOS. A Portugueſe name for the worms which get under the toes of the people in the Indies, and which are deſtroyed by the oil of the caſhew nut.

BICION. See VICIA.

BICORNE OS, from *bis*, *double*, and *cornu*, *horned*. See HYOIDIS OS.

BICORNIS. A muſcle is ſo called when it hath two terminations; alſo a name of the *flexor carpi radialis*, and of the *extenſor carpi radialis*.

BICUSPIDES. See MOLARES.

BIDENS, called alſo *verbaſina*, *verbeſina*, *cannabina aquatica*, *hepatorium aquatile*, *eupatorium arabum*, *ceratocephalus*, WATER HEMP AGRIMONY, WATER AGRIMONY, HEMP AGRIMONY, and WATER HEMP.

It hath oblong acuminated leaves, deeply indented, ſet three on one pedicle, and the pedicles in pairs; the flowers, which ſtand in the umbel-like cluſters, conſiſt of purpliſh floſculi ſet in ſcaly cups, followed by oblong ſeeds winged with down. It is perennial, grows wild by the ſides of rivers and ditches, and flowers in July.

The leaves have a light agreeable ſmell, and pungent bitter taſte, are aperient, corroborant, and of ſome efficacy in icteric complaints; powerful againſt the ſcurvy and œdamatous ſwellings of the feet. An infuſion in boiling water, drank freely, is the beſt method of uſing them.

The juice of the freſh herb may be taken in doſes from one to two ounces: larger doſes operate by vomit and ſtool.

The root purges ſtrongly.

—— ZEYLANICA, } See ACMELLA.
—— URTICA, }

BIENNIALIS. BIENNIAL. Herbs are ſaid to be *biennial* when their roots continue two years.

BIFIDUS. Bifid; cloven, or divided into two parts, called alſo *Dicræus*.

BIFOLIUM, alſo called *ophris*, *ophris major*, *orchis bifolia*, *didyme*, ordinary WOOD BIFOIL, and COMMON TWAY-BLADE.

The root is ſlender, but much branched; it ſends up one ſtalk with two leaves from its ſides, that are large, oval, and full of nerves; the flowers grow on ſpikes at the top; they are roundiſh, and of a dull green colour. It is found in woods and other ſhady places, and flowers in June; and ranked among the agglutinant aſtringents. Millers's Bot. Off.

BIGASTER. A name given to muſcles that have two bellies.

BILADEN. See FERRUM.

BILIARIA ARTERIA. The BILIARY ARTERY. When the hepatic artery hath advanced as far as the veſicula fellis, it gives out the *biliaria*, which accompanies the two cyſtic branches in the gall-bladder, and then is loſt in the great lobe of the liver. See HEPATICA ARTERIA.

BILIMBI. A tree of about eight or ten feet high, which Bontius calls BILLING-BING; and by the Europeans it is named *malus Indica*, fructu pentagono.

It is cultivated in the gardens in Malabar, bears flowers and fruit all the year. The juice of the root is cooling; expreſſed from the fruit cures the itch, and ſeveral other ſkin diſeaſes, if applied by laying on linen cloths that have been dipped in it. Inwardly taken, it abates the gripes and a diarrhœa. The ripe fruit is eaten as a delicacy, the unripe made into a pickle for the uſe of the table.

There is another ſpecies called *nebi-pouli*, or *bilimbi* altera minor. The male ſpecies of the *nebi-pouli* is called *alapouli*. Raii Hiſt.

BILIOSA FEBRIS. The BILIOUS FEVER; called alſo the MARSH, REMITTENT, AUTUMNAL REMITTING, and CAMP FEVER. *Febris flava*; *febris maligna Barbadenſis*, *Icterodes*.

When a *fever* is accompanied with *bilious* diſcharges by vomit or ſtool, whether it be continual, intermittent, or remittent, it is called *bilious*. It is the ſecond ſpecies of typhus, in Dr. Cullen's Noſology, named *icterodes*, defined a typhus with yellowneſs of the ſkin. In his Firſt Lines, vol. i. he obſerves that the typhus is a genus that comprehends ſeveral ſpecies; that theſe, however, are not well aſcertained by obſervation; many of the different caſes do not imply any ſpecific difference, and ſeem to be merely varieties, ariſing from a different degree of power in the cauſe, from different circumſtances of the climate or ſeaſon in which they happen, or from different circumſtances in the conſtitution of the perſons affected. One effect ariſing from theſe circumſtances in the conſtitution of the perſons affected, is an unuſual quantity of bile appearing in the courſe of the diſeaſe; which is almoſt a diſtinguiſhing character of intermittent fevers; but if it ſhould appear with a continued fever, it could only be conſidered in ſuch a caſe as a coincidence, owing to the ſtate of the ſeaſon, producing no different ſpecies, or fundamental diſtinction, but merely a variety of the diſeaſe.

In Britain, it generally prevails after hot weather, in hot countries it is moſt frequent in damp marſhy places, and after great rains, that are ſucceeded by great heats. In both ſituations, they who are expoſed to damps, and to the night air, are moſt ſubject to it.

Beſides the cauſes in general of fevers, it is occaſioned by a copious ſecretion of the *bilious* fluid, which is poured into the duodenum and ſtomach, where, by its acrimony, it ſtimulates and produces inflammation, whence the ſymptoms proper to this fever ariſe.

Beſides the uſual ſymptoms of fever, there is an extraordinary inquietude and anguiſh, a burning heat, cardialgia, naufea, vomiting or purging, or both, and thereby a diſcharge of bile. The thirſt, in this diſeaſe, is exceſſive, and the dejection of ſpirits equally ſo; the pulſe is ſmall but quick; ſometimes it remits very ſenſibly, at others the remiſſions are very obſcure; and at laſt an inflammation of the bowels comes on.

If the evacuations are cadaverous, death uſually is at hand, and an involuntary diſcharge of the excrements is uſually fatal.

If the pulſe is full and hard, bleeding may be admitted in the beginning, but rarely, if ever, requires a repetition. And if in hot countries, it is beſt to omit this evacuation totally. But in all caſes begin with giving a grain or two of antimonium tartariſatum by way of emetic.

If ſaline medicines are given, the neutral mixture is the moſt proper, but each doſe ſhould be adminiſtered in the act off effervescence.

And as ſoon as an intermiſſion is perceived, begin with the bark, for it is the chief dependence. But if the diſeaſe is very violent, or the patient in a hot clime, the bark muſt be given before the intermiſſion, for on its early uſe depends the cure; a dram may be given every hour in wine and water, or what elſe the patient uſes for his common drink. If the bark, in ſubſtance, is not agreeable, let a cold infuſion of it be ſubſtituted, which may be acidulated with the acidum vitrioli dilutum, and the patient may take it as freely and frequently as his ſtomach will bear. If it runs off by ſtool, or is ejected by vomit, a few drops of the tinct. opii will probably prevent it.

After the vomit ſome recommend the following powder: ℞ antim. tartariſ. gr. j. p. contray. c. gr. v. m. to be repeated every two hours, until it procures a vomiting, purging, and ſweating; but the uſe of the columbo-root ſeems far more eligible.

Dr. Percival, in his Eſſays Medical and Experimental, informs us, that in theſe fevers, the pulv. rad. columbo, gr. xv. ad xx. with the kali vitriolat. ℈ i. ad ℈ ij. given every four, five, or ſix hours, produces both ſpeedy and beneficial effects. The neutral ſalts, he obſerves, abate the febrile heat, allay thirſt, and bring on a gentle ſalutary diarrhœa; whilſt the columbo ſupports the patient's ſtrength, obviates the ſickneſs, and checks the ſeptic ferment in the primæ viæ. Dr. Haygarth, of Cheſter, farther remarks, that, after the primæ viæ are unloaded of their *bilious* contents, the columbo-root admirably allays the naufea ſo conſtantly attendant on this diſorder; and that in this fever, though the remiſſions are very evident, and the acceſſion marked with chills, and other ſymptoms of an intermittent, yet the bark is not always ſo ſucceſsful as to encourage its uſe; but he ſays the columbo anſwers our warmeſt wiſhes, by correcting the bile, reſtoring the proper tone of the ſtomach, and of the whole habit; it excellently prevents relapſes, to which, in this fever, the patient is peculiarly diſpoſed.

BILIOSA ARDENS FEBRIS. The burning bilious, called alſo the YELLOW FEVER; the Weſt Indian fever. It is a variety of the typhus icterodes of Cullen. It ſeems not to differ from the *biliosa febris* juſt noticed; except in its greater degree of violence, in hotter countries.

The Europeans who live irregularly, give way to exceſſes

ceſſes, and are not careful to guard againſt the heats and dews that are common in the Weſt Indies, are the chief ſubjects of this diſeaſe.

It attacks with a tranſient chilline's and ſhivering, which is ſoon ſucceeded by a burning heat all over the body, but more particularly about the præcordia; the pulſe is high and quick, but not hard: the eyes are heavy, a violent head-ach comes on, with beating in the temporal arteries, alſo a thick laborious reſpiration; a nauſea ſoon follows, and what is diſcharged upwards is *bilious*; anxiety is very great; pain is complained of in the back and loins, and an uneaſy laſſitude in the limbs. In about twelve hours after the firſt invaſion of this diſeaſe, the tongue is very dry, rough, and diſcoloured; thirſt is exceſſive, a ſoreneſs is felt all over the body, and a delirium comes on. In the laſt ſtage the patient labours under a coma, manifeſts a great oppreſſion about the præcordia, the reſpiration is very difficult, and at length the tendons tremble, cold ſweats and convulſions appear, which uſher in death. When the patient recovers, the criſis uſually happens in the fourth day after the attack; generally diſcovers itſelf by a ſuffuſion of the bile all over the body; the yellow tinge ſometimes appears in the eyes, twelve hours after the ſymptoms of this fever come on; the ſooner it appears the more favourable is the prognoſtic. If the ſkin continues dry and rough, the patient rarely recovers, however good his pulſe may be. Inceſſant vomiting, and the diſcharges growing darker coloured, are fatal ſigns; and if a dry ſkin accompany an inflamed redneſs of the eyes, death may be expected in a few hours.

In order to the cure, bleeding muſt immediately be propoſed, more or leſs freely, according to the ſtrength of the patient; though after the third day it is rarely adviſeable: the operator would do well to obſerve the ſtate of the pulſe during the diſcharge of the blood, and if he finds it flag he ſhould deſiſt; if it riſes he may proceed.

After bleeding, let an emetic be given with antimonium tartariſatum gr. j. vel. ij. this beſt evacuates the offending bile. After this, the belly muſt be rendered ſoluble by repeated doſes of ſaline purges.

The primæ viæ duly evacuated, the bark muſt be freely uſed, in doſes as large, and as frequently repeated, as the ſtomach can digeſt them. The propereſt time to begin with it is as ſoon as a remiſſion is obſerved, or a diaphoreſis is produced. If the bark in ſubſtance does not agree, let an infuſion of it in cold water be tried, and if that cannot be complied with, give the following:

℞ Rad. ſerpentariæ V. ʒ ij. croc. Anglic. ʒ ſs. infund. in aq. bullient ℥ x. per horam unam; colantur ℥ vi. adde aq. menth. vul. ʒ ii. vin. Madeirenſ. ʒ iv. acidi vitriol. diluti q. ſ. ad gratam ſaporem; & cap. cochl. ij. omni horâ vel ſæpius. Or,

Repeated doſes of the common ſaline mixture may be given in the act of fermentation.

The vomiting, which uſually eludes every means hitherto uſed, even the tinct. opii, gut. ij. vel. iij. in every draught of the patient's drink, and bliſters applied to the region of the ſtomach, may probably give way to the rad. columbo, as mentioned in the article BILIOSA FEBRIS.

In the beginning the drink may be a decoction of toaſted bread in water, or other ſmall liquors acidulated with tamarinds; and as the fever declines, a little wine may be allowed.

When the delirium threatens or approaches, bliſters keep off the coma, which uſually comes on when they are omitted. If a coma is attendant, bliſters muſt be applied to the head, arms, and legs; and ſinapiſms to the ſoles of the feet. Cordial medicines, with camphor, muſt be duly adminiſtered.

The diarrhœa, which ſucceeds this fever, muſt not be ſuddenly ſtopped, if the patients health is not too much impaired by it.

See Biſſet on the *Bilious Fever* of the Weſt Indies. London Med. Obſ. & Inq. vol. iv. p. 156. Blicke on the *Bilious Fever* of Jamaica. Sir John Pringle, Drs. Chalmers, Lind, Towne, Warren, Cleghorn, Rouppe, all deſerve attention on this ſubject.

BILIS, called alſo FEL, CHOLE, BILE, and GALL.

It is a bitter viſcid juice, ſecreted from the blood in the liver, and collected in the receptacle known by the name of gall-bladder. The blood collected from the adjacent abdominal viſcera, is thrown into the vena portæ in the liver, which ramifying through this viſcus, carries the blood, charged with biliary matter, fit to be ſecreted, to its ultimate branches, from which the *bile* is emptied into the beginnings of the biliary ducts, called *pori*, or more properly *tubæ biliariæ*, and by them is conveyed into the ductus hepaticus; this duct paſſes on a little way, then enters into the ductus communis choledochus, whence the *bile* is partly diſcharged into the duodenum, and partly regurgitated into the ductus cyſticus, then falling into the gall-bladder, it remains there until it is wanted; by lodging there ſome time it is alſo more perfected, for being at reſt, its thinner parts are exhaled, tranſudes, or are reabſorbed, and the reſt becomes thicker, more acrid, increaſes in bitterneſs, and the depth of its colour.

The hepatic *bile*, before it is mixed with the cyſtic, in every reſpect reſembles lymph, that is ſub-alcaline and rather oily; it continually paſſes into the duodenum, but the cyſtic only as required.

The *bile* is formed from the blood in the ſecretory veſſels of the liver. It is a compound of mucilage and water, of a yellow colour, varying to green; it has a bitter taſte, with ſomething like ſweetneſs; the mucilage is decompoſed, not coagulated by acids, and ſome of their compounds; the acids precipitating a part which is reſinous. It is ſoluble in alchohol, but incompletely. It has a peculiar ſmell of the ſpecies of animal in which it is produced, and is a pretty powerful anti-putreſcent. Dr. Saunders, from ſome experiments which he made, draws the following concluſions, reſpecting the elements forming the bile, and ſays it conſiſts; 1ſt. Of water impregnated with the odorous principle. 2dly. A mucilaginous ſubſtance, reſembling the albumen ovi. 3dly. A reſinous ſubſtance containing the colouring principle and bitter taſte. 4thly. A mild mineral alkali. With reſpect to their combination, it ſeems that the ſaponaceous matter conſiſts of the bitter reſin in union with the alkali; this admits of a ready union with a mucilage, and with this again the aqueous matter very eaſily combines, ſo that the whole forms an apparently homogeneous maſs.

It is the leaſt putreſcent of any juice in the body; its uſe is to mix the chyle, to ſupport the periſtaltic motion of the inteſtines, and to aſſiſt in completing the digeſtion. When the ſtomach is full, the cyſtic *bile* is more copiouſly diſcharged into the duodenum; when it is empty, the hepatic more freely into the gall-bladder.

This ſaponaceous juice reſiſts acidity, and corrects it in the bowels; it eaſily mixes with water; renders oily, mucous, and viſcid bodies, miſcible alſo with that fluid; and if rubbed with reſinous gums, attenuates them. In ſhort, there is ſcarce an animal or vegetable ſubſtance that it will not diſſolve. When driven through the warm veſſels with the blood, it neceſſarily produces its effects there; ſo that the blood, in a ſhort time, is quite diſſolved, and a dropſy the natural conſequence of a jaundice. The livers of infants are very large, and their *bile*, though ſecreted in a conſiderable quantity, yet is frequently almoſt inert; whence acidity prevails in their firſt paſſages, and other ill effects of indigeſtion attend. An exceſſive uſe of acids, by overcoming the qualities of the *bile*, induces indigeſtion. The *bile*, in common with all bitters, neutralizes acids by mixture, and is itſelf neutralized by them; and when the *bile* tends to putreſcency, the native vegetable acids are its beſt reſtorers.

The gall-ſtones formed in the gall-bladder, are not of a cretaceous nature, but are merely coagulated *bile*; this is plain from their unctuous inflammable nature.

It is obſerved, that the gall of ſmall animals is ſtronger and more ſubtile than that of the larger kinds, whether on land or in the water; and, of land animals, that of the hawk and ſerpent; of water, that of the pike and eel is the moſt active.

Beſides its uſe in the animal œconomy, and in various manufactories, it is an article of ſome value in the materia medica; and, from its manifeſt properties, ſeems to be entitled to more notice in the practice of medicine.

The gall of oxen inſpiſſated to an extract hath been commonly that which was uſed; it prevents milk from turning ſour in the ſtomach, and reſolves it when coagulated. An extract made by the evaporation of its humidity, in balneum mariæ, until it can be rolled into pills, may be given to children in doſes of one grain, three times a day, and to adults three or four grains at each doſe. When adminiſtered clyſterwiſe, half a dram may be uſed at a time. This extract is an excellent bitter of the ſtimulating and reſolvent kind, and in want of appetite, or other diſorders; from a deficiency of *bile* in the firſt paſſages, this animal bitter is likely to be more uſeful than the vegetable kinds. The beſt ſucceſs hath followed its uſe in obſtructions of the abdominal viſcera, promoting urine,

urine, and the menſes; and if this is not thought ſufficiently efficacious, the gall of eels and pikes may be ſubſtituted in its ſtead; with this, Boerhaave tells us that he hath frequently cured rickety children, whoſe bellies were hard and very much ſwelled. Theſe more acrid kinds alſo deſtroy warts if now and then applied thereto.

A ſenſe of weight in the ſtomach is owing to the want of the ſolvent there, which ſhould digeſt the food.

A defect of *bile* diſpoſes the body to various diſeaſes, as hypochondriac, cachectic, &c. Fernelius, in his Pathology, ſays, that many have died from this cauſe alone. When, from its defect, a coſtiveneſs is induced, the oleum ricini is of ſingular ſervice; it ſhould be followed with nitrous and ſaponaceous medicines, and the Bath water may finiſh a cure.

When the *bile* offends by its acrimony, producing too frequent and copious diſcharges by ſtool, the oleum ricini will be more ſafe and effectual in correcting it than any of the other uſual means; and here alſo a finiſh may be given to the cure by the uſe of Bath water. Here oranges and ripe fruits are uſeful if freely eaten.

When *bile* in the ſtomach offends, it cauſes anxiety, chillineſs, or ſhivering; here too, the oleum ricini purges without irritating, powerfully obtunds the acrimony of the *bile*, and by moderating the fever, which almoſt always attends this caſe, it proves a moſt ſpeedy remedy.

If acidity prevails, and the *bile* is four, abſorbents and rhubarb will be proper; alſo magneſia alba, eſpecially if coſtive. If the ſtomach is loaded, give a vomit. To prevent acidity, ſtrengthen with bark bitters and chalybeates.

In caſe of viſcid mucus offending the ſtomach, repeated vomits and bark, with occaſionally aromatics to ſtimulate that organ, are neceſſary. At intervals, R. tinct. aloes, coch. magn. hora ante prandium, vel pil. ex aloe cum myrrha, q. ſ. or the following, which is more efficacious. R extract. colocynthidis comp. ʒ i. ſs. calomelanos pp. ʒ ſs. olei carui gutt. xij. fyr. croci q. ſ. ut fiant pilulæ triginta, deglutiantur duo, tres, vel quatuor horâ decubitûs pro ratione effectûs.

If there is a putrid tendency from ſalted meats, &c. give acids, fixed air, wort, and all kinds of vegetables.

Be careful to avoid coſtiveneſs, with aloes, rhubarb, &c. Cream of tartar given in ſmall doſes at due diſtances, is an excellent medicine, adminiſtered ſo as gently to move the belly.

Fernelius ſays, that "it is owing to the putreſcency of the *bile* that fevers are augmented;" alſo, that "in fevers, the *bile* becoming putrid, acquires a malignant quality; in the beginning of the acceſs it ruſhes violently, and in large quantities, into the membranes of the duodenum, as is ſufficiently proved by the dry cough, the oſcitation, ſuffocation, anxiety, diſtenſion of the præcordia, pain, nauſea, vomiting, and white urine."—Pathol. de Febrif. And Hoffman obſerves, that "corrupted *bile* renders all fevers worſe; alſo that freſh portions generated, cauſe the returns of intermittents, whence it is obvious why evacuants, which operate without irritation, and ſuch medicines as oppoſe putrefaction, as the bark, &c. are the beſt for removing them." It is certain that in fevers the *bile* is not only plentifully generated, but is alſo peccant in its quality, whence, if not duly evacuated, muſt be productive of many diſagreeable ſymptoms; from which cauſe the importance of a ſoluble belly in febrile diſorders. From a faulty *bile* in the inteſtines, when a fever attends, is often owing the aphthæ, inflammation in the fauces, purple ſpots in the ſkin, eryſipelatous diſorders, hæmorrhages, diarrhœas, &c.

Such is the importance of the *bile* in our conſtitution, and the ill conſequences of an error in it, that every aid is deſirable, by which our knowledge of its nature, &c. can be promoted. See SICK-HEAD, below, in the article CEPHALALGIA.

HALLER's Phyſiology, in the chap. on the Liver. PERCIVAL's Eſ. Med. and Exp. FORDYCE's Elements of the Practice of Phyſic, part i. MACBRIDE's Exp. Eſſ. The Appendix to Sir John Pringle's Diſeaſes of the Army. Maclurg's Experiments on the Human *Bile*, DE CÔE on biliary Concretions. Dr. SAUNDERS on the Structure, Œconomy, &c. of the Liver, and FORDYCE on Digeſtion.

BILIS ATRA. See ATRABILIS.

BILLING-BING. See BILIMBI.

BINARIUS. Among the Romans, it is the number two. But the Spagiric philoſophers affix other ideas to it, of which the curious may be informed in the Theat. Chym. vol. i.

BINGALLE. See CASSUMUNAIR.

BINOCULUS. A bandage for retaining the dreſſings on both eyes. It is either a ſingle or a double-headed roller, it is twelve feet long, and two or three fingers in breadth. Its application will be eaſily underſtood by referring to MONOCULUS.

BINSICA. A Rabbinical term, ſignifying *mental ſickneſs*, or a *diſordered imagination*. By the addition of —MORS to this term, it is a BINSICAL DEATH. The death which follows the diſorders of the mind, ſuch as are produced by the bite of a mad dog, &c.

BINTAMBARU ZEYLANENSIBUS. *Convolvulus maritimus Zeylanicus; pes capræ Luſitaniæ.* A plant growing in Malabar and Ceylon; it abounds with an acrid milky juice. A dram of the reſin of the root purges. Raii Hiſt.

BIOLYCHNIUM, from βιος, *life*, and λυχνος, a *candle* or *lamp*. The LAMP of LIFE. It is of the ſame ſignification as vital heat, vital flame, or natural heat. See CALIDUM INNATUM. It is alſo the name of a ſecret prepared of human blood, by Beguinus.

BIOS. LIFE, and its courſe. But ſometimes it only means victuals.

BIOTE. LIFE. In an affected ſenſe it ſignifies the time of a continuance of aliment in the body; thus weak food hath a ſhort life annexed.

BIOTHANATI. A term applied to thoſe who die a violent death.

BIPEMULLA, } See PLANTAGO MINOR.
BIPINELLA. }

BIPULA. A ſort of worm mentioned by Ariſtotle.

BIRA. See ALLA.

BIRAO. See AMOMUM.

BIRRETHUS. See CUCUPHA.

BIRSEN. An Arabian or Perſian word, ſignifying an inflammation or impoſthume in the breaſt.

BISCOCTUS. TWICE DRESSED. This word is chiefly applied to bread twice baked, or that is much baked, i. e. BISCUIT.

BISEMATUM. See PLUMBUM.

BISLINGUA. See LAURUS ALEXANDRINA.

BISMALVA. See ALTHEA.

BISMUTHUM. BISMUTH; alſo called *wiſmuthum*, *marcaſita*, *Galæna inanis*, *plumbum cinereum Argriolæ*, *blende Germanis*, MARCASITE of SILVER, and TIN GLASS.

It ſeems not to have been known to the Arabians; their marcaſite was the lapis pyrites. Some reckon it a ſpecies of tin. It is a bright pale lead-coloured mineral; when broke it appears of a ſilver white; it may be powdered without difficulty; it is nearly ten times ſpecifically heavier than water, of a flaky contexture; its earthy part affords as good a blue as that from cobalt; it is mixed with ſulphur and arſenic; by fuſion the ſulphur and arſenic evaporate, and the metallic part runs off from the earthy. In Cornwall there is much of this mineral; ſometimes it is found mixed with the cobalt. *Biſmuth* is eaſily ſeparated from its ore by means of fuſion with the common black flux. It melts long before ignition, a little ſooner than lead, but later than tin. A ſtrong fire ſublimes it into white flowers: it is convertible into glaſs by heat alone. The nitrous acid diſſolves it, from which it precipitates in the form of a bright white powder, by dilution with water. The marine acid does not readily affect it, and the vitriolic ſcarce at all. It impregnates the vegetable acid with a nauſeous taſte. The chief of it that is brought into England is from Saxony. Dr. Alſton denies that the ores of *biſmuth* contain any arſenic; it is true that the *biſmuth*, when brought to us, is without ſuch particles.

It mixes eaſily with ſeveral metals, but deſtroys their ductility. It promotes the fuſion of other metallic bodies. Mixed with lead and tin, it forms a compound that melts with a very ſmall heat; the following proportion is ſo fuſible, that it hath been propoſed for injections, two parts of lead, three of tin, and five of *biſmuth*. If *biſmuth* is mixed with lead, a larger portion of the latter can be combined with quickſilver than can be without this method; and the quickſilver cannot be freed from this mixture by the common methods.

It is not now in any medicinal uſe.

1. FLORES BISMUTHI. *The* FLOWERS *of* BISMUTH.

Take four ounces of *biſmuth* very finely powdered, half a pound of nitre equally fine, put the mixture by little

little and little into an earthen body, that is perforated in the ſide, and fixed to a proper number of aludels; when the body is red hot, and the operation ended, take away the aludels, and wipe away the flowers with a feather.

2. MAGISTERIUM BISMUTHI. MAGISTERY *of* BISMUTH.

Diſſolve *biſmuth* in aqua fortis, without heat, adding the *biſmuth* by little and little at a time. Pour the ſolution into ſixteen times its quantity of water, and thus a bright white powder is precipitated. If a little rectified ſpirit of wine is added, the precipitation is haſtened. Waſh the precipitated powder in freſh particles of water, and dry it in a ſhady place.

This preparation hath been uſed as a coſmetic, but it gradually impairs the natural complexion, and thickens the ſkin.

The SPANISH WHITE is a magiſtery of *biſmuth*, made by diſſolving it in ſpirit of nitre, and precipitating it with ſalt and water.

BISTACIUM. See PISTACIA.

BISTORTA. BISTORT, *quaſi bis torta*; twice twiſted, or wreathed. Called alſo the GREATER BISTORT, or SNAKEWEED; *colubrina*, *headramon*. It is the POLIGONUM BISTORTA, or POLIGONUM *caule ſimpliciſſimo monoſtachyo, foliis ovatis in petiolum decurrentibus*. CL. OCTANDRIA. ORD. TRIGYNIA. LINN. G. Plant. 496.

It is a plant with oval, pointed, wrinkled leaves, of a dark green colour above, and bluiſh underneath, ſtanding on long pedicles, and continued a little way down the pedicles, forming a narrow margin on each ſide. Among theſe ariſe, round, ſlender, jointed, unbranched ſtalks, furniſhed with ſmaller and narrower leaves, which have no pedicles, bearing on the top ſpikes of imperfect five-leaved red flowers, which are followed by triangular leaves. It is perennial, a native of Britain, grows wild in moiſt meadows, about Batterſea, and by the ſide of Biſhop's Wood, near Hampſtead, and flowers in May and June.

The root is bent vermicularly, whence its name, and jointed at each bending. It is commonly about the thickneſs of a finger, ſurrounded with buſhy fibres, of a blackiſh brown colour on the outſide, and reddiſh within. It is diſtinguiſhed from the other *biſtort* roots by being leſs bent; that of the officinal ſpecies having only one or two bendings, and thoſe of the other three or more.

This root is powerfully aſtringent, antiſeptic, and diaphoretic. It is of a ſingular efficacy in hæmorrhage, obſtinate fluxes, againſt looſeneſs of the teeth, ſpongy gums, and ſoreneſs in the mouth. It is ſaid to cool, but this is by its being ant-acrid, whence all aſtringents are cooling. The doſe is from gr. x. to ʒ i. Water totally diſſolves its aſtringent matter. Extracts made with water, or with ſpirit, retain all the ſtyptic qualities. All the parts of this plant poſſeſs the ſame qualities as the root, but in a leſs degree. If the roots are boiled in vinegar, an excellent antiſeptic gargle is obtained. Dr. Cullen ſays it ſeems to be one of the ſtrongeſt of our vegetable aſtringents, and juſtly commended for every virtue that has been aſcribed to any other: he has frequently employed it in intermittents, and has given it both by itſelf, and along with gentian to the quantity of three drams in one day. Cullen's Mat. Medica.

The tormentil root is ſo ſimilar in its efficacy, that it may always be ſubſtituted for it.

BISUL. An abbreviation of BISULCIS.

BITHNIMALCA. A word coined by Dolæus, to ſignify a peculiar acting principle reſiding in the ſtomach, and preſiding over the functions of chylification, &c. called alſo *Gaſteranax*.

BITHYNICI TONSORIS EMPLASTRUM. The Bithnian barber's plaſter for ſplenetic people. See Aetius Tetrabib. iii. ſerm. ii. cap. xxii.

BITHINOS. The name of a plaſter deſcribed by Galen.

BITI. A tall evergreen tree in Malabar, and other parts of the Eaſt Indies. An oil is prepared from its root, to cure the alopecia.

BITUMEN. Called alſo *aſphaltos*, *piſaſphaltus*, *aſphaltum*, *aſphaltum bitumen*, *Judaicum*, *carabe funerum*, *gummi funerum*. *mumia*, CARABE of SODON, FOSSILE PITCH, and JEWS PITCH.

It is a mineral ſulphur. It is a ſolid light ſubſtance, of a duſky colour on the outſide, and a deep ſhining black within, having but little taſte or ſmell, except it is heated, in which caſe it emits a ſtrong pitchy odour. It is not ſoluble in oils, nor in vinous ſpirits; it melts but imperfectly in the fire. On burning it, a large quantity of aſhes are left behind. It is found in the earth in many parts of Egypt, and floating on the ſurface of the Dead Sea. At firſt it is ſoft, but grows hard by keeping.

The genuine ſort is generally ſupplied by different bituminous ſubſtances found in Germany, France, and other countries; but theſe ſubſtitutes have a ſtronger pitchy ſmell than the true ſort. They are farther diſtinguiſhed from the true, by their more perfectly diſſolving with heat, and by their not leaving ſo many aſhes behind when burnt. Neuman ſays, that when the genuine *bitumen* is diſtilled in a retort, it yields a light inſipid phlegm, about 1-11th its weight of an oil, that reſembles the native petrolea, but of a more diſagreeable and empyreumatic ſmell; and any of the above ſubſtitutes may well be admitted. *Foſſile pitch* is found in many parts of this iſland, in the ſeams of lime-ſtones. The virtues of all theſe ſubſtances depend on the quantity of petroleum which they contain. See PETROLEUM and SUCCINUM.

BITUMEN BARBADENSE. See PISSÆLEUM.—LIQUIDUM. See PETROLEUM.

BIVALVA. } BIVALVE. In botany is the pods
BIVALVALA. } and huſks of plants which open lengthways in two parts like the ſhell of a muſcle.

BIVENTER. Thus muſcles are named that have two bellies, from *bis* and *venter*, alſo *Digaſtricus*.

—— MUSCULUS. It ariſes from the proceſſus maſtoidæus. Its tendon frequently joins the ſtylohyoidæus, and the membranous ring fixed to the os hyoidæus, and is then attached to the inner part of the chin. It depreſſeth the jaw, ſo opens the mouth. It is fleſhy at both its extremities, and tendinous in the middle. The middle tendon paſſing through the aponeurotic ligament at the lateral part, and the root of the cornua of the os hyoides, is what renders it capable of performing its office. The ancients called it *graphoides*.

BIXA OVIEDI. See ACHIOTL.——ORELLANA. See ORLEANA.

BLACCIÆ. See MORBILLI.

BLACTARA. See PLUMBUM. N°. 1.

BLÆSITAS. See PSELLISMUS RINGENS.

BLÆSSUS, Βλαισος, a Greek primitive, the ſame as *valgus*, BANDY-LEGGED, or one whoſe legs are bent outward; called alſo *cyllos*; *devalgatus*; one whoſe back-bone is bent either forward or backward; alſo a paralytic perſon; and one who hath an impediment in his ſpeech. Blancard.

BLANCA. See PLUMBUM, N°. 1. Alſo the name of a purging medicine in the Antidotarium of Nicolaus.

BLANC TARBE. See COBALTUM.

BLANCNON. See FILIX.

BLASS. A term coined by Helmont, by which he means the force of motion, and applies it to the ſtars, the human body, &c.

BLASO. An Indian name of a tree, the fruit of which, when powdered, is given to deſtroy worms. Raii Hiſt.

BLASTEMA, from βλαστανω, *to germinate*. Alſo called *germen*. A BUD, OFF-SET, or SHOOT of a plant: but Hippocrates expreſſes by it a cutaneous eruption or pimple.

BLATTA, or BLATTA FOETIDA. The SLOW-LEGGED BEETLE. It is that ſpecies of the beetle which is ſo common in bake-houſes. If they are boiled in oil, or bruiſed therein, then dropped into the ear, they relieve pains in that part.

BLATTARIA LUTEA. YELLOW MOTH MULLEIN. Ray takes notice of ten ſpecies. It is ſaid to poſſeſs the ſame virtues as the verbaſcum, but is of very little note in medicine.

BLENDE. A German name for BISMUTH. See BISMUTHUM; ZINCUM.

BLENNA, or BLENA. A thick phlegm deſcending from the brain, through the noſtrils; which ſhews a beginning concoction.

BLENNORRHŒA, BLENNORRHAGIA. See GONORRHOEA.

BLEPHARA. See PALPEBRÆ.

BLEPHARIDES, from βλεφαρον, *an eye-lid*. The hairs on the edges of the eye-lids, alſo that part of the eye-lids themſelves, on which the hairs grow.

BLEPHAROPTOSIS, from βλεφαρον, *palpebra*, *eyelid*, and πτωσις, *caſus*, *deſcent*, called alſo *ptoſis* A DISLOCATION, or DISPLACING OF EITHER, OR BOTH EYE-LID, by elongation, retraction, turning inwards or outwards, with different ſymptoms in different ſpecies;—but the true blepharoptoſy, or præternatural deſcent of the *eye-lid*, ariſes from a wound of the frontal muſcles of the temple, or the ſuperior levator of the eye-lid—or from any

large tumor dragging down the *eye-lid*; from inflammatory, or cold defluxions elongating the palpebra; from mere relaxations of the *eye-lids* brought on by superfluous serum; or from a palsy of the palpebra, which is sometimes constant, sometimes periodical. See PTOSIS.

The varieties of this species are obvious—with respect to the first, it must be remarked, that the cheek of the same side, the lower jaw, the tongue, eyes, and other parts, are affected. The second and third varieties are cured by conquering the primary disease to which they owe their origin; to the fourth, corroborating spirituous fomentations are useful; the fifth must be attacked by anti-paralytic remedies administered externally and internally; which, if in two varieties, do not properly succeed, a cure must be fought for from a surgical operation, performed on the prolapsed palpebra, or on the skin of the forehead, which also treat as in curing the first variety from a wound.—Internal remedies are considerably useful, such as will draw off the superabundant serous fluids, which are chiefly purgative, and diuretic remedies, particularly jalap, and sal diureticus. Amongst the remedies for any paralytic affection, electricity should be had recourse to, as occasioning the nervous system to exert its power, and by that means recover the action of the muscular fibres of the *eye-lid*. As for that variety which is said to proceed from relaxation, the use of alum with an infusion of oak-bark is recommended for an external application, which not succeeding, the relaxed skin must be cut away, and the edges of the wounds confined together by sutures, and healed in that situation. See Dr. Wallis's Nosologia Oculorum. There are several other species of this disease. See ECTROPIUM, TRICHIA.

BLEPHAROTIS. Inflammation of the EYE-LIDS. See OPHTHALMIA.

BLEPHAROXYSIS. See OPHTHALMOXYSTRUM.

BLEPHAROXYSTON, or BLEPHAROXYSTUM. the RASP-LIKE PROBE. So Paulus Ægineta, in lib. iii. cap. xxii. calls the *specillum asperatum*, from βλεφαρον, *an eye-lid*, and οξυω, *to scrape off*.

BLESTRISMUS. A restless tossing of the body, as in a phrensy.

BLETA, WHITE. An epithet for milky urine, proceeding from diseased kidneys.

BLETI. STRUCK. So those were called who were suddenly seized with a suffocation, or difficulty of breathing, &c.

BLITUM. See MERCURIALIS.

——— That named FOETIDUM, see ATRIPLEX FOETIDA.

BOA, a large aquatic serpent which follows the herds of oxen, whence its name. It sucks the milk from the cows. It is met with in Calabria. Also a symptomatic kind of miliary fever, in which the eruptions are of the size of millet-seeds, watery, without redness or pain, called *sudamina*; it is caused by inordinate sweating, called also *hydroa*.

BOANTHEMON. See BUPHTHALMUM.

BOBERRI. See BORRIBORRI.

BOCC. PLANT. RARIOR. An abbreviation of Paulus Bocconus, Icones, & Descriptiones rarium Plantarum Siciliæ.

Bocc. Mus. An abbreviation of Musco di Piante rare di Paulo Boccone.

BOCHETUM. A secondary decoction of lignum vitæ, and of other such like woods.

BOCIA. See CUCURBITA.

BOCIUM. See BRONCHOCELE.

BOD. à STAPEL. An abbreviation of Johannes Bodæus à Stapel, in Theophrasti Historiam Plantarum.

BOETHEMA. See REMEDIUM.

BOETHEMATICA SEMEIA. Auxiliary signs in diseases, such as give notice of a cure observable in them.

BOGIA GUM. See ESSULA INDICA.

BOICININGA. } The RATTLE-SNAKE, and Do-
BOICININGA. } MINCUM SERPENTUM.

It is said, that this serpent cannot approach a piece of a root, which in Virginia is known by the name of SENEGA, RATTLE-SNAKE-ROOT; but the blood-root is the most frequent remedy against their bite. This root is bruised and applied to the wound, and a decoction of it is drank.

Troches are made with the gall of *rattle-snakes*, which are caught in spring. This gall is mixed with chalk, or meal, into a paste; these are called *trochisci Connecticotiani*, from the Connecticut colony. They are anodyne; three or four grains are taken after great fatigue, but may be given to fourteen grains or more.

When a person is bit by a *rattle-snake*, purple spots, and a difficulty of breathing, soon attend, with other symptoms that manifest a coagulation of the juices; in which case, lessening the quantity of blood in proper time will lessen the overload at the heart, and give both it and the lungs more liberty to dilate and contract their muscular membranous fibres; and with the assistance of proper alexipharmics, given at the same time, may attenuate and add fresh vigour to the curdled mass; and thus a stop is put to those ruptures, and extravasations, which appear at the extremity of the small vessels. Many medicines are used by the Americans as an antidote to the poison of this animal, see SENEGA. Those in most esteem have a quick, warm, pungent taste, though mild and volatile on the tongue; but the most noted remedy is the following, which was discovered by a Negro. Take of the roots of plantain and horehound, in summer the whole herb, a sufficient quantity; bruise them and squeeze out the juice, and give immediately a large spoonful. If the patient be swelled, pour it down his throat. If it does not relieve in one hour, give a second spoonful, which never fails. If the roots are dried, moisten them with a little water.

It is said that *rattle-snakes* have a power of charming birds, and other small animals, so as to make them their easy prey.

BOITIAPO. A serpent of Brasil, which the Portuguese call *cobus de cipo*. Its bite is venomous.

BOJOBI. A serpent in Brasil, which the Portuguese call *cobre verde*. Its bite is venomous. The cure is the root of the caa-apia, which the patient is to swallow in a little water.

BOLBIDION. A small polypus kind of fish, mentioned by Hippocrates.

BOLBITON. BOLBITOS BOLYNTHON. Cow's DUNG

BOLBONAC. See BULBONACH.

BOLBOS. See BULBUS.

BOLCHON. See BDELLIUM.

BOLESIS. See CORALIUM.

BOLESON. See BALSAMUM.

BOLETTO. FRIT. It is imperfect, or half made glass.

BOLETUS. SPUNK. A genus of the funguses. It is an horizontal fungus; and porous underneath. The BOLETUS IGNIARIUS, commonly called AGARIC of the OAK. For that called —— CERVI, see AMANITA. ——PINI LARICIS. See AGARICUS.

BOLISMUS. See BOULIMOS.

BOLUS. A BOLE or BOLUS. *Boluses* differ not from electaries, only they are made rather of firmer consistence, in single doses, and therefore more proper where great exactness is required in the administration, and where the speedily perishing drugs are to be used, for they are only made for immediate use. The light and ponderous powders may more conveniently be mixed with mucilage, for so they are the least bulky. The quantity of each is a morsel, or a mouthful, as much as can be conveniently swallowed at once, whence their name *buccella*.

BOLUS, BOLE. *Boles* are a genus of earths, which readily fall down into a loose mass in water; having a degree of ductility, when not pervaded with too much water; and smooth, and rather unctuous to the touch. Edwards's Elements of Fossilogy.

BOLUS GALLICUS, FRENCH BOLE. It is a friable earthy substance of the argillaceous kind, intimately blended with a slight portion of ferrugineous calx, or calcareous earth. It is of a pale red colour, variegated with irregular specks, and veins of a whitish yellow. It is said to imbibe sharp acrid humors, and hence has been recommended in alvine fluxes, and cardialgia, in doses of from ten to sixty grains. Pipe-clay, coloured with red chalk, is chiefly its substitute.

There are various other species; but it is unnecessary to describe them, as they are not allowed to possess any medical virtues. Therefore, very properly, the London College have exchanged two compositions under the titles of *pulvis e* Bolo *compositus, sine opio & cum opio*: for the following,

Pulvis e Cretâ *Compositus*. COMPOUND POWDER *of* CHALK.

Take of prepared *chalk* half a pound; cinnamon four ounces; tormentil root, and gum arabic, ää ℥ iij. let them be reduced into powder separately, and mixed together—the dose is from ten grains to forty, or more.

Pulvis

Pulvis e Cretâ *Compositus cum Opio.* COMPOUND POWDER *of* CHALK *with* OPIUM.

Take of compound powder of *chalk* eight ounces; purified opium hard, reduced to powder, a dram and an half, mix; forty-three grains of this contains one grain of opium; the dose from ten grains to two scruples, or more.

BOLYNTHON. See BOLBITON.

BOMBAST, } COTTON. Called also *xylon, gossipium,*
BOMBAX. } *cotonium, bambax, moulflavou.*

There are three sorts of *cotton* trees: one creeps on the earth like a vine, the second is thick like a bushy dwarf tree, the third is tall as an oak. All the three, after producing beautiful flowers, are loaded with a fruit as large as a walnut, whose outward coat is black. When this fruit is ripe, it opens and discovers the *cotton*; the seeds are separated by a mill from the *cotton*. This tree grows in many places in the Levant, East and West Indies, especially in the Antilles. The fruit is oval. The *cotton* of the first sort, which creeps on the ground, is the best; that brought from the *East Indies* is supposed to be the BYSSUS of the antients. That produced near Smyrna is greater than any where else. They sow the seeds, which are like little beans, in June, gather the *cotton* in October, and the soil there produces three crops in a year.

The skin of the seed is mucilaginous, the kernel is sweet like an almond, and of virtues similar to the althea. If *cotton* is applied to wounds it excites inflammation; and, when worn next the skin, it checks perspiration; that called MOULFLAVOU is also denominated *arbor lanigera spinosa*; *gossipium arboreum caule spinoso*, a tall cotton-bearing tree, of the bark of whose root an emetic is prepared.

BOMBUS. A RESOUNDING NOISE, or RINGING of the EARS, from flatus confined there. A bad sign in acute diseases.

BOMBYX. The SILK-WORM. They are of no medicinal use, but it is said, that if their bags are burnt, they yeild a larger quantity of volatile salt than any other animal substance. Hence it might be superior to burnt sponge.

BOMPOURNICKEL. See COLIPHIUM.

BON ARBOR. See COFFEA.

BONA. The KIDNEY BEAN. See PHASEOLUS.

BONAN. An abbreviation of Philippi Bonanni Recreatio Mentis & Oculi.

BONDUCH INDORUM. Called also *bonduch cinerea, bonduch* pianta Indiano, *arbor spinosa Indica muricatis siliquis, lobus echinotus, acacia gloriosa, lentiscus foliis spinosis flore spicato luteo siliqua magna muricata, caretti, inimbosa*, &c. *marsas*. MOLUCCA NUTS, and BEZOAR NUTS.

The plant runs up to five or six feet in height; it is a native of both the Indies. The round beans only are in use, which are of an ash-colour on the outside, and white within. It is warm, bitter, and carminative.

Ray mentions another species, which he calls *bonduch*, Indorum siliqua minime spinosa.

BON. SEP. An abbreviation of Bonetus Sepulchretum.

BONIFACIA. See LAURUS ALEXANDRIA and HIPPOGLOSSUM.

BONONIENSIS LAPIS. The BONONIAN STONE. Called also *phosphorus Bononiensis, spongia solis, lucidus lapis, illuminabilis lapis, phosphorus Kircheri*; the LIGHT-CARRIER, and BONONIAN PHOSPHORUS.

It is a small, grey, soft, glossy, fibrous, sulphureous stone, about the size of a walnut. When broken, a kind of crystal, or starry talc, is found therein. This *stone* is met with in the neighbourhood of Bologna, or Bononia, in Italy; and, when duly prepared, makes a species of phosphorus.

When this phosphorus is held to the light, it retains it for six or eight hours after. As a medicine, this *stone* is caustic and emetic.

BONT. An abbreviation for Jacobus Bontius, who is a writer of good credit.

BONUS HENRICUS. See MERCURIALIS.

BOONA. See PHASEOLUS.

BORACE, }
BORACTRION & BORAXO. } See BORAX.

BORAGO. See BORRAGO.

BORASSUS. The tender medullary substance which grows at the top of the great palm-tree.

BORAX. Called also *chrysocolla, capistrum auri, auncinar, boraxtrion, boraxo, annucar, atincar, borace, tincar, amphitanc, baurach, nitrum factitium, santerna*, and *nitrum nativum*.

BORAC, or BORAX, called also *Baurac*, signifies nitre. The barbarians corrupted it into *borax*, and applied it to the chrysocolla. It is a mineral crystalline salt; the ancients called it chrysocolla. It is not much unlike alum. There is a factitious sort called *aceftis*. If genuine, it hath a sweet taste at the first, but afterwards an unctuous one. Its pure crystals are octagonal prisms, finely cut; it dissolves difficultly in cold water; it easily dissolves in boiling water, but, on the water cooling, the *borax* concretes into a solid mass; to keep it dissolved in cold water, it requires near twenty times its weight. It swells and bubbles in the fire, and soon becomes a glass, which yet dissolves again in water; but if mixed with flint or sand, it becomes a hard and durable glass, even hard enough to cut common glass. It is an excellent flux for metals, and for their ores; it changes the colour of blue flowers to green; precipitates earthy and metallic bodies dissolved in acids: it renders vegetable and animal oils miscible with water; it does not sensibly ferment either with acid or alkaline liquors; it dissolves in acids more easily than in water; a solution of *borax* made in a menstruum of vegetable acid, when inspissated by evaporation, is a tenacious substance that will not crystalize, but will dissolve in the air. If *borax* is mixed with the crude sal ammoniac, an urinous smell is emitted like that which arises from a mixture of fixt alkaline salts with it: whence it may be concluded, that *borax* is rather alkalescent, though it is a salt of its own kind.

There is a natural sort called *brute*, or *crude borax*; it is brought into Europe in dirty lumps, and of a disagreeable smell. The artificial is but this natural sort rendered pure by art, see TINCAL. The manner of refining it is known but to few; but after coming from the refiners, it differs so from the general salt, that Cramer calls it an adulterated *borax*. An artificial sort is said to be made of nitre, urine, &c. See SCHRODER on this subject. The oily matter is separated from the natural *borax*, by heating it in an iron ladle until it ceases to bubble and flame; thus the oil is destroyed; then boil it in water, and the salt is extracted pure.

GEOFFROY says, that "*borax* is at first a fluid, which ooses from various mines, but chiefly from those of copper. These springs are met with in Persia, the East Indies, and other countries in Asia. This fluid is salt, muddy, and greenish; but by the summer heats it is so evaporated, that the salt is found concreted in the reservoirs made for its reception." BECHER also tells us, in his Alphabetum Minerale, that "the universal acid, in dissolving a stone or a fusible earth, forms *borax*, as it forms alum when it meets with an earth fit to make lime."

The *borax* of the shops is often adulterated with alum; but then it is not so light, nor clear, nor does it swell so much as the pure when it is put on live coals.

Its constituents seem to be the mineral fixt alkaline salt, and a peculiar kind of acid. By all the mineral acids, its alkaline basis may be disjoined from the subacid part. The mode of effecting this analysis. See SEDATIVUS SAL.

Borax itself is used for soldering gold, whence its name *chrysocolla*. It is a solder for other metals also; and a powerful flux for fusing minerals of all kinds. It is used to give a gloss to silks.

As a medicine, it seems to possess greater virtues than those that are yet manifested in it. It is a powerful deobstruent, diuretic, and emenagogue, in doses of half a dram, or two scruples. A mixture of it with honey, viz. *borax* one dram, honey one ounce, is efficacious in removing aphthous crusts from the mouth and fauces, but a solution in water is considered to possess superior power. Externally it is a far better cosmetic than bismuth. Dr. Alston of Edinburgh says, that it should be dissolved when taken inwardly, for the stomach will not melt it, and if given in a dissolved state, it enters the vasa minima, mixes with the blood, and dilutes it. If given in powder it is emetic, but mixed with aromatics, this quality is checked, and in the fluor albus it is said to be a specific.

A dose of *borax* is from gr. v. to ʒ i. ss.

BORBONENSIS, or BORBONICA. A patronymic epithet for the Bourbon waters. See AQUÆ SULPHUREÆ.

BORBORODES. Feculent, Muddy, Dirty, Earthy.

BORBORYGMUS. A rumbling noiſe, excited by wind mixed with ſome degree of humidity in the bowels. This ſort of noiſe is likewiſe what is produced by treading in the mire, βορβορος, whence its name.

BOREAS. The NORTH-EAST WIND. The northern winds are of a cold, but wholeſome temperament. They abound with acid particles, whence they reſiſt putrid diſeaſes, but beget thoſe that depend on the rigid fibre.

BORI. Great eaters.

BORIDIA. A ſort of ſalt meat, prepared of a kind of fiſh, which is eaten raw. Oribaſius takes notice of it.

BORITIS, from βορος, *vorax*. The philoſopher's ſtone, which melts the copper of wiſe men, and renders it fluid like water. See Adamus.

BOROMETZ, or Boronetz. See Agnus Scythicus.

BOROS. Voracious. A *voracious* water, or ſuch as begets a good appetite.

BOROZAIL. The ZAIL of the Ethiopians. It is a diſeaſe epidemic about the river Senegal. It principally infeſts the pudenda, but is different from the lues venerea, though it owes its riſe to immoderate venery. In the men it is called *aſab*, in the women *eſſa batus*.

BORRAGO, vel BORAGO. Borrage. Alſo called *bugloſſum verum*, *bugloſſum latifolium*, BORAGO HORTENSIS. *Corrage*.

It is a hairy rough plant, with wrinkled, blackiſh green leaves, approaching to an oval ſhape, with round hollow ſtalks, on which the leaves are ſet alternately. On the tops of the branches come forth blue, and ſometimes reddiſh or whitiſh monopetalous flowers; each of which are followed by four wrinkled blackiſh ſeeds. It is perennial, grows wild on waſte grounds, and on old walls.

The leaves are ſucculent; their medical qualities are not diſcernible until the juice is ſeparated from them by preſſure, and then they are hardly worth our notice. A decoction of them affords a ſmall quantity of the nitrous and muriatic ſalts. The leaves are ranked among coolers, and the flowers among cordials. See alſo Buglossum.

BORRI-BORRI. Boberri. See CURCUMA. It is alſo a name in the Eaſt Indies, of an ointment uſed there, in which are the roots of turmeric.

BOS. The BULL, COW, OX, HEIFER, or any other of the neat kind.

As a medicinal article, we may reckon BEEF-TEA, which is thus made. Cut a pound of the lean part of a buttock of beef into thin ſlices, add to it two pints of water, boil them over a quick fire during five minutes, then, ſeparating the ſcum, decant the clear liquor for uſe. It is often made by juſt boiling the beef, then immediately removing it from the fire, and letting it ſtand to cool in a veſſel well cloſed; or indeed only infuſed in boiling water, for from hence it is ſuppoſed to retain the fineſt and more ſubtile parts of the nutritious lymph, which boiling diſſipates, and ſeems more agreeable to ſtomachs greatly debilitated; though if it boils ten, fifteen, or twenty minutes, which laſt is the longeſt that it ſhould be allowed, it contains more of the ſtronger part of the beef.

BOSA. An Egyptian word for a maſs which is made of the meal of darnel, hemp-ſeed, and water. It is inebriating.

BOSCAS. A ſort of dry pitch, which is tenacious like bird-lime.

BOS INDIANA. See Bubalus.

BOTANUM. See Plumbum.

BOTANY, from the Greek word βοτανη, *herba*, *an herb*. The SCIENCE OF PLANTS; that part of natural hiſtory which belongs to vegetables; hence he who is verſed in this ſtudy is called a BOTANIST.

The moderns have regulated plants under claſſes, to diſtinguiſh them, and they deſcribe them well; as to their virtues, they have done very little more than copy from the ancients, of whom Dioſcorides is the chief.

This branch of knowledge is very ancient. Solomon is recorded as having known all the plants from the cedar of Lebanon to the hyſſop upon the wall. Hippocrates is the next, of whom we have any valuable account: he ſpeaks of the virtue of about two hundred and thirty plants, but does not deſcribe them. Crateuas, or Crateias, a contemporary of Hippocrates, deſcribes thoſe plants of whoſe virtues Hippocrates gives an account. Theophrastus, and ſome others, purſued this kind of knowledge, until at length Dioscorides roſe up, and ſurpaſſed them all. He deſcribes four hundred and ten plants, and mentions, by name, one hundred and ninety more, he alſo treats on their virtues;

William Turner gives Fuchſius's prints, with their names in Engliſh, German, French, Latin, and Greek. Fuchſius's prints are large. Tac. Theod. Tabernæmontanus gave figures, which are copied by ſeveral of his ſucceſſors. Rembertus Dodonæus of Leyden, hath given very elegant figures. Carolus Clusius alſo hath left us many excellent figures. John and Casper Bauhine neglected to eſtabliſh the genuſes of plants, yet their Pinax is a very uſeful *botanic* work. Crispinus Passeus publiſhed his Hortus Floridus, with very accurate figures. Tournefort improved *botany* more than all before him; he formed it into a ſcience, and giving it the air of accuracy, added figures alſo. Our countryman Ray is valuable in this purſuit. Boerhaave's peculiarity in his *botanic* ſyſtem, is to diſtinguiſh plants by the parts of fructification; for theſe never vary by ſoil, clime, culture, &c. but the appearances of plants alter very much in other reſpects. Beſides theſe, there are the improvements of Linnæus, Miller, and others, whom, but to name, is to praiſe. One of the lateſt works of this kind, is the Inſtitutes of *Botany*, by Colin Milne, LL. D. Dr. William Woodville has publiſhed a work, called Medical Botany, giving an account of the various plants comprehended in the Pharmacopœias of London and Edinburgh, with accurate drawings, carefully characteriſed them, and ſubjoined their medical properties; which to practitioners is a very uſeful performance; nor ſhould the labour of Bergius be forgot, whoſe work, as far as it goes, ſtands in no ſmall degree of eſtimation.

Dr. Grew's works on the Structure of Plants, and on Vegetation, or the Growth of Plants, are among the moſt valuable on the ſubject of *botany*.

BOTANICON. The name of a plaſter deſcribed by P. Ægineta.

BOTHOR. It hath three ſignifications among the Arabians. 1. *Tumors* in general: 2. A tumor with a ſolution of continuity: and 3. Small tumors, which laſt is the moſt proper. Some take it for an abſceſs of the noſtrils. Blancard ſays it ſignifies pimples in the face, which do not ſpread, but are eaſily ſuppurated and vaniſh. It is beſides a general appellation for pimples in the face, lungs, or other parts. And the Arabians call the *ſmall-pox* and *meaſles* by this name.

BOTHRION, vel BOTRION. A ſmall ditch, from βοθρος, *a ditch*. This word is alſo uſed to expreſs a ſmall ulcer of the cornea, hollow, ſtraight, clean, without purulent, thick, or ſcaly ſordes, equal to the head of a pin, called alſo *exloma*; if it ſhould be an internal lamina of the cornea, it creates that called *gerontoxon*. A ſtaphyloma ſucceeds. Sauvages Noſologia Methodica. Alſo the *alveoli*, or ſockets of the teeth.

BOTIN. See Terebinthina.

BOTIUM. See Bronchocele.

BOTOTHINUM. A term uſed by Paracelſus, by which he would expreſs the flower of a diſeaſe.

BOTOU, } See Pareira brava.
BOTOUA. }

BOTRITIS, } Botrites, from βοτρυς *a cluſter*,
BOTRYITES. } properly of grapes. See Cadmia.

BOTRYS. It is difficult to ſay what particular plant this is; the following are by ſome placed under this name.

—— The OAK of CAPPADOCIA, or of Jerusalem; alſo called *artemiſia*, *ambroſia*, *chenopodium*, and *atriplex odora*, *ſeu ſuaveolens*. It is the *chenopodium botrys*, Linn.

—— Mexicana. The Mexican tea. Called alſo *botrys ambroſioides Mexicana*, *eparsthe Mexicanaua*, *chenopodium*, *botrys Americana*, and *Artemiſian botrys*.

The above plants are natives of the ſouthern parts of Europe; they are ſown annually in our gardens. The leaves and flowery heads have a ſtrong, but not unpleaſant ſcent, are moderately aromatic and bitteriſh to the taſte. If they are much handled, an unctuous reſinous juice adheres in conſiderable quantities to the fingers.

The proper menſtruum for their active matter, is rectified ſpirit of wine; but boiling water alſo takes up the greateſt

†

greateſt part of their virtue. An infuſion of them drank as tea is uſeful in coughs, and humoral aſthmas. They are ranked among the anti-ſpaſmodics.

BOTUS, Botia, or Botus Barbatus. It is a chemical veſſel, called a *cucurbit*, ſee Cucurbita; alſo a veſſel placed upon a veſſel; a veſſel for fuſion, or a *deſcenſorium*, a chemical furnace in which diſtillation is performed by deſcent; a crucible made to pour out of.

BOUBALIOS. See Cucumis agreſtis and pudendum muliebre.

BOUBON. The Greek word from whence bubo is taken; ſee Bubo. It ſignifies the groin, ſometimes the glands in the groin, and a tumor of the ſame; alſo a tumor in the neck, or arm-pits, or behind the ears, or of any of the external glandular parts.

BOUCERAS. See Fenum Græcum.

BOUGIE. In the French language means a *wax candle*. The term is applied to a machine, which (as the wax candle formerly was) is introduced into the urethra for removing obſtructions there. It is likewiſe known by the term *catheter*; *candela cerea*; vel *medicata*.

In Dr. Swediaur's Pharmacopœia Syphilitica, there are the following preſcriptions for *bougies*, called catheteres, firſt made of ſilver, but they are better formed of elaſtic reſin, of various ſizes. The ſecond he calls Cerei, of elaſtic reſin, or of muſical chords, made from the inteſtines of ſheep. The third Cerei medicati.

℞ Ceræ flavæ liquefactæ ℔ j. ſpermatis ceti, ʒ iij. aquæ lythargyris acetati, Ph. Lond. nov. ʒ ij.—ʒ j. theſe being mixed together, and removed from the fire, ſlips of linen cloth are to be dipped in the compoſition, of which the *bougies* are to be formed. The fourth are the Cerei medicati, ſaid to be the invention of Le Dran.

℞ Herbæ conii maculati, foliorum Nicotianæ tabaci, ſummitatum floreatium hyperici perforati. radicis iridis florentinæ, ana manipulum unum, infunde in decocti nucum juglandis regiæ ℔ j. addè herbæ anchuſæ officinalis ℔ j. axungiæ porcinæ, ovillæ curatæ, ana. ℔ iij. miſce ſuper ignem, dein adde ceræ flavæ ℔ ij.—Plenck, in great conſtriction of the urethra, prefers thoſe made of the muſical chord, becauſe they ſwell and then diſtend the paſſage, and, beſides, from their flexility, remain longer in the urethra without occaſioning any irritation; but perhaps thoſe made of the elaſtic reſin, which are formed hollow, are moſt eligible, as they always afford a free paſſage for the urine without removing.

Monſ. Daran, a French ſurgeon, lately boaſted of his introducing *bougies* as an improvement in his art, and acquired conſiderable profit by making and ſelling them. Sculetus, about the middle of the ſeventeenth century, uſed them in diſeaſes of the urethra; and probably Monſ. Daran took the hint from him.

Different compoſitions have been uſed, and generally mercury was a part in them. Riverius made a plaſter as follows: ℞ Ol. oliv. ℔ iv. ceræ citrin. ℔ ij. minii & ceruſ. aa ℔ i. ſs. tereb. Vener. & rez. alb. aa ʒ iij. m.

Whether the *bougies* are made up of theſe or any other compoſitions, they muſt be of different ſizes, from the bigneſs of a knitting needle, to that of a gooſe quill. They are made of linen rags, ſpread with a proper matter, and then rolled up as follows. Having ſpread any quantity of linen rag with the compoſition that is choſen for the purpoſe, cut it into ſlips, from ſix to ten inches long, and from half an inch to an inch broad; then dexterouſly roll them on a glazed tile into the form of a wax candle. And as the end of the *bougie* that is to be entered firſt into the urethra, ſhould be ſomewhat ſmaller than the reſt, it would be as well to cut the ſlips a little tapering. It ſhould alſo be obſerved, that when the *bougies* are rolled up, that ſide muſt be outward on which the plaſter is ſpread.

Monſ. Daran, and ſome others, attributed the action of their *bougies* to the compoſition made uſe of in forming them. Mr. Sharpe apprehended, that as much of their efficacy was owing to the compreſſion they made on the affected part, as to any other principle. And Mr. Aikin juſtly ſays, as it is evident that *bougies* of very different compoſitions, ſucceed equally well in curing the ſame diſorders in the urethra, it is plain that they do not act by means of any peculiar qualities in their compoſition, but by means of ſome property common to them all. This muſt be their mechanical form and texture, therefore their mode of action muſt be ſimple compreſſion.

The efficacy of mere compreſſion in many caſes of conſtriction is well known, from the uſe of ſponge tents for widening parts that are ſtraightened by cicatrices; and admitting obſtructions in the urethra to be from a conſtriction formed by cicatrized ulcers, or a projection of the ſpongy ſubſtance of the urethra into the canal, we may eaſily conceive that a gradle continued elaſtic compreſſion will, in time, overcome the diſeaſe. We may alſo readily account for the inferior efficacy of metallic and whalebone *bougies*, from their not having the property of ſwelling with moiſture, and therefore not making the compreſſion ſo equal.

As to *bougies* procuring a diſcharge of matter, there is no doubt but the mechanical ſtimulus of a foreign body, in ſuch a tender part, though free from diſeaſe, muſt produce it in ſome degree; and that this will be varied according to the chemically ſtimulating quality of the compoſition, and the irritable ſtate of the urethra; but it ſeems an abſurdity to apply a topic made uniform throughout, to the whole length of a canal, with a view of producing extraordinary effects upon a particular part of it, by means of ſome powerful quality in the ingredients. As to that part of the *bougie* which was in contact with the diſeaſed part, being particularly covered with matter, this circumſtance is owing to the greater irritation of the urethra where the diſorder is, than in the other parts of it. To forming *bougies* of very active materials, there certainly exiſts a very proper objection; becauſe the healthy, as well as the diſeaſed parts are expoſed to their action; and may, themſelves, become diſeaſed by the application. Surgeons, therefore, have given up the uſe of them, and confine themſelves to the ſimple kinds, and ſuch as act by compreſſion chiefly.

See Sharp's Critical Enquiry, ch. iv. and Aikins's Obſervations on the external Uſe of Preparations of Lead. Bell's Surgery, vol. ii. 201, &c. and White's Surgery, 371.

BOUI. See Thæa.

BOULIMUS. A voracious appetite, from βοῦς, a particle which in compoſition augments the ſenſe, and λιμὸς, *hunger*. *Boulimus*, or *bulimus*, for which word Avicenna uſes *boliſmus*, ſignifies an ox's appetite, though this diſeaſe is more frequently called *fames canina*, *appetitus caninus*; vel *appeſentia canina*; a canine or dog's appetite; it is alſo called *phagedæna*, *addephagia*, or *adephagia*, *bulimiaſis*, *bulimia*, *bupeina*.

Dr. Cullen names this genus of diſeaſe bulimia. He places it in the claſs locales, and order dyſorexia; and diſtinguiſheth three ſpecies. 1. Bulimia helluonum, in which there is no other diſorder of the ſtomach than an exceſſive craving of food. 2. Bulimia ſyncopalis, in which there is a frequent deſire of food, and the ſenſe of hunger is preceded by ſwooning. 3. Bulimia emetica, alſo *cynorexia*, in which is an appetite for much food, which is preſently ejected by vomiting.

This diſorder conſiſts in an inſatiable deſire of food, and a quick return of the appetite after eating.

In ſome it may be a natural misfortune, for on diſſection it hath been found, in a few inſtances, that the right orifice of the ſtomach was too large, conſequently the aliment was to ſoon expelled through it. Galen ſays it is cauſed by an intenſe acid in the ſtomach, or other acrimony in the gaſtric juice. Others attribute it to a weakneſs in the lower orifice of the ſtomach, worms, &c.

Lommius obſerves, that in this caſe there is great hunger, much is eaten, which oppreſſing the ſtomach is again thrown up; the patient is thus relieved, but the appetite returns; the ſtomach eaſed by eating, is again oppreſſed, and is again relieved, as that of a dog by vomiting.

There is no danger if food is ſupplied, though the patient is pregnant, except large colliquations attend, or fainting is frequent. Fainting with a full ſtomach is a dangerous ſymptom, coldneſs in the extremities generally fatal, and the breath failing when a fainting comes on, death may be expected at hand.

From faintings, the patient is recovered by offering to his ſmell a roaſt dipped in wine, or roaſted meat. After recovery from the fit, give him ſome food; and let it be of ſuch a kind as cools and nouriſhes, but is not ſoon digeſted, ſuch as carrots, beets, parſnips, with ſoft fat, and farinaceous ſubſtances.

If an acid is the cauſe, after vomiting, give the teſtaceous powders, the lixivium of tartar, and iron filings.

If worms are ſuſpected, anthelmintics muſt be preſcribed.

When the cauſe is not very manifeſt, moderate doſes of opium may be given at proper intervals; but ſome circumſpection

cumſpection is required in adminiſtering it. Beſides vomiting, purges with aloes will be adviſeable, wormwood, and ſuch other medicaments as warm and ſtrengthen the ſtomach. Galen commends frequent ſmall doſes of brandy; and Riverius ſays, that ambergriſe is peculiarly uſeful, if five or ſix grains be repeated at due intervals.

This diſorder terminates variouſly, as in a lientery, dropſy, atrophy, cachexy. Some make a diſtinction between BOULIMUS and FAMES CANINA; and alſo between the former, and BULIMIA; but, according to the opinion of many, without ſufficient reaſon. For they ſay that the BOULIMUS is not attended with a vomiting, but with a fainting; and that, in the FAMES CANINA, the patient vomits up his greedy meals as dogs do; though, with ſome, they own, it runs off by ſtool. In the BULIMIA, it is ſaid the ſame inclination to eat exiſts as in the BOULIMUS, but without the power; and after the patient does eat, he faints. See Galen, Alexander Trallian, Paulus Ægineta, and Lommius.

BOUNIAS, ſee BUNIAS.

BOURSE, LA. See SUSPENSOR.

BOUTUA. See PAREIRA BRAVA.

BOVILLÆ. See MORBILLI.

BOVINA AFFECTIO. The DISTEMPER of BLACK CATTLE. A diſeaſe among black cattle, cauſed by a worm lodged between the ſkin and the fleſh, and perforating the ſame. The Arabians call it *ægritudo bovina*; it is but little known in Europe. It is not mentioned by the ancient Greeks.

Some confound this diſorder with the *dracunculi*, but they are very different. Something analogous to this diſorder is a cutaneous one, with which ſome ſcorbutic conſtitutions are frequently affected, and which ſeems to be owing to an obſtruction of the perſpirable matter which concretes in the pores of the ſkin, and forms a ſebaceous ſubſtance reſembling a worm, with a black head, which may be ſqueezed out, and which ſometimes cauſes a ſmall ſuppuration, and is diſcharged with the pus.

AVENZOAR gives the following account of the *bovina affectio*. "Sometimes a worm breeds between the ſkin and the fleſh; and if this worm is not ſoon killed, the conſequences may be pernicious. As ſoon as it is perceived, burn the adjacent part with a hot iron, ſo that the heat may penetrate to the worm, in a degree ſufficient to kill it. This done, dreſs as is uſual after burns, and purge with aloes."

Here Avenzoar ſpeaks of this diſorder as in human ſubjects. But ALBUCASIS, who hath two chapters, one on the *dracunculi*, another on the *bovina affectio*, ſays, "This worm, which is generated between the ſkin and fleſh of black cattle, takes its courſe over the whole body, and is plainly perceivable in its motion, from one part to another, until it breaks the ſkin, and wherever it makes a breach, there it finds egreſs." ALZARAVIUS ſays, "that in human ſubjects this worm paſſes betwixt the ſkin and the fleſh, as Albucaſis hath repreſented it in brutes; and that it is generated of the ſame matter, as that from which lice are produced.

Another *bovina affectio* is deſcribed in a Diſſertation de Boum Œſtro, by WALLSINERIUS. This ŒSTRUM, or VEXATIOUS FLY, pitches on the back of black cattle, and with a kind of ſting, growing to its hinder part, perforates them, and into each perforation introduces an egg, which ſome time after gives birth to a worm, and this to a fly, which in due ſeaſon is like its parent. When this fly pierces the ſkin, it cauſes ſevere pain in the oxen. The worm, however, which is depoſited, grows without any remarkable injury to the health of the animal; it never moves from its place, but in the following ſpring it occaſions a tumor, out of which it finds his way when ſummer approaches, and becomes a fly. See Le Clerc Hiſt. Lumbric.

Under this article may be placed the CHICOS, or CHICRES. They are ſmall worms, which in the warmer parts of America, frequently breed in the muſcular parts, and particularly in the feet. The Indians pick them out, and then apply to the ſore, by rubbing, the aſhes of wood.

HOFFMAN ſpeaks of a kind of worms to which the children in Miſnia are ſubject. He ſays that theſe children are frequently ſeized with a tabes, which reduces them to mere ſkeletons. The cauſe is a ſort of worms like black hairs lodged under the ſkin. Theſe animals are uſually called COMEDONES, or gluttons, becauſe they devour the nutritive juices in their diſtribution. When the ſkin is rubbed with honey in any warm place, they come out; but cold makes them keep concealed within. See CRINONES.

SENNERTUS ſpeaks of a ſort of worms called *ſeuren*, *ſirenes*, or *crinones*. He tells us, that a ſpecies of puſtules among the Germans, which riſe on the palms of their hands, and the ſoles of their feet, are called *ſeuren*, and contain little worms called *ſirones* and *chirones*: that theſe worms are known to be there by the greater itching of theſe parts than is perceived at other times.

BOVISTA See LYCOPERDON.

BOXUS. See VISCUS.

BRABYLA. The plums which are called HUNGARIAN. They are large, ſweet, and of a blue black colour.

BRACHERIUM: AMMA. A ſurgeon's bandage and truſs for a hernia. A word uſed by the barbarous Latin writers, probably from *brachiale, a bracelet*.

BRACHIA. The diviſion of the large branches of trees from the trunk.

BRACHIÆUS MUSCULUS. The name of two muſcles of the arm, from *brachius, an arm*. That called —— INTERNUS, begins where the deltoid muſcle ends, covers the interior and anterior ſurface of the os humeri, and is inſerted into the coronoid proceſs of the ulna, ſerving to bend it. And the —— EXTERNUS, ſeems to be the third beginning of the gemellus; its origination is continued from above the middle of the inſertion of the ſame, and from the back part of the os humeri, to its cavity, which receives the olecranum in the extenſion of the cubit, where joining with the tendinous outſide of the gemellus, it is inſerted into the ſuperior and external part of the ulna, called olecranum. See ANCONÆUS. Cowper.

DOUGLAS ſays, that the *brachiæus externus*, and the *gemellus*, make but one ſingle muſcle with three heads, to which he gives the name of triceps cubiti, or extenſor cubiti, or extenſor cubiti magnus triplici principio natus.

BRACHIALE. See CARPUS.

BRACHIALIS ARTERIA. The BRACHIAL ARTERY. It is the continuation of the axillary artery, which as ſoon as it hath paſſed behind the tendon of the pectoralis major, receives the name of *brachial*. It runs down on the inſide of the arm, over the muſculus *coracobrachialis* and *anconæus internus*, and along the inner edge of the biceps, behind the vena baſilica, giving out ſmall branches as it goes along.

Between the axilla and the middle of the arm, it is covered only by the ſkin and fat; but afterwards it is hid under the biceps, and runs obliquely forward as it deſcends, being at ſome diſtance from the internal condyle; but it does not reach the middle of the flexure of the arm. Below the fold of the arm it divides into the cubitalis and radialis.

From its upper and inner part it ſends off a particular branch, which runs obliquely downward and backward, over the anconæi, and then turns forward again near the external condyle, where it communicates with a branch of the radial *artery*. A little below the inſertion of the teres major it ſends off another branch, which deſcends, and is united with the radial *artery*, and alſo with the cubital.

The common trunk of the *brachial artery* having reached the flexure of the arm, it runs, together with a vein and a nerve, immediately under the aponeuroſis of the biceps, and paſſes under the vena mediana, detaching branches on each ſide to the neighbouring muſcles.

Sometimes, though very rarely, the *brachial artery* is divided from its origin into two large branches, which run down on the arm, and afterwards on the fore-arm, where they are called cubitalis and radialis. Winſlow.

BRACHIALIS EXTERNUS and INTERNUS; theſe are the BRACHIÆUS EXTERNUS and INTERNUS.

BRACHIO-CUBITALE LIGAMENTUM. The expanſion of the lateral *ligament*, ſee LATERALIA LIGAMENTA, which is fixed in the inner condyle of the os humeri, runs over the capſula, to which it cloſely adheres, and is inſerted like radii on the ſide of the great ſigmoid cavity of the ulna; it is covered on the inſide by ſeveral tendons, which adhere cloſely to it, and ſeem to ſtrengthen it. Winſlow. That called RADIALE LIGAMENTUM, is the expanſion of the lateral *ligament*, ſee LATERALIA LIGAMENTA, which runs over the external condyle of the os humeri, and is inſerted round the coronary *ligament*, and from thence all the way down to the neck of the radius, and alſo in the neighbouring parts of

of the ulna. Through all this paſſage it covers the capſular *ligament*, and is covered by ſeveral tendons adhering cloſely to both. Winſlow.

BRACHIUM. The ARM. In Hippocrates it ſignifies what is now called the *humerus*. From the ſhoulder to the elbow, is called *lacertus*; to the wriſt, *cubitus*, or the *fore-arm*. By the *arm* is generally meant the whole, from the ſhoulder to the wriſt.

BRACHUNA. See SATYRIASIS, & FUROR UTERINUS.

BRACHYCHRONIUS, from βραχυς, *ſhort*, and χρονος, *time*. An epithet of a diſeaſe, which continues but a ſhort time.

BRACHYPNŒA, from βραχυς, *ſhort*, and πνεω, *to breathe*. BREATH fetched at ſhort intervals.

BRACHYPOTÆ, from βραχυς, *ſmall* or *ſhort*, and πωτης, *drink*. LITTLE DRINKERS. To drink but little in ardent fevers is a bad ſign.

BRACHYS. See BREVIS.

BRACIUM. See ÆS.

BRACTE, or BRACTEA, one of the ſeven fulcres or props of plants; a leaf different from the other leaves in ſhape and colour, generally ſituated on the peduncle, and often ſo near the corolla, as eaſily to be miſtaken for the calyx; but the calyx wither, when the fruit is ripe, if not before; whereas the *bracte* is generally more permanent. *Bractes* are either green or coloured.

BRADYPEPSIA. WEAK DIGESTION., or concoction of food. Blancard ſays it is a ſlow digeſtion, proceeding from a depraved diſpoſition of the acid ferment in the ſtomach.

BRADYS. SLOW.

BRAGGAT. See HYDROMELI.

BRANCA. An Italian word ſignifying *foot*; hence the acanthus is called BRANCA URSINA, *bear's foot*, from the reſemblance of the leaves to the foot of a bear.——LEONIS, or PES LEONIS. See ALCHIMILLA.——URSINA. See ACANTHUS.——URSINA GERMANICA. See PASTINACA.

BRANCHÆ, } Names of the glandulous tumors of
BRANCHI. } the fauces, which reſemble two almonds, and are accompanied with a difficulty of ſpitting and troubleſome breathing.

BRANCHUS. A DEFLUXION of HUMOURS upon the FAUCES. It is a ſpecies of catarrh, which Cœlius Aurelianus calls RAUCITAS.

BRASILIA. See BRASILIUM LIGNUM.

BRASILIANA ARBOR AQUATICA. See ANINGA.

BRASILIENSIS ARBOR SILIQUOSA, &c. See COURBARIL.——RADIX. See IPECACUANHA RADIX.

BRASILIS LIGN. } LOGWOOD, alſo RED-WOOD.
BRASILETTO. } See CAMPECHEN. LIGNUM.

BRASILIUM LIGNUM. BRASIL WOOD, called alſo *pſeudoſantalum rubrum*, *Braſilia*, *hirapitanga Braſilienſibus*, *ibirapitanga*; *Abelicea*, *criſta pavonis coronillæ folio*; *Erythoxilum Braſilianum*, *Santalus Adulterinus*.

This wood is rarely met with in preſcriptions; it is ſometimes ſubſtituted for red ſanders, with which it agrees in moſt of its properties, with this difference, that the red ſanders does not give out its colour to water; but the Braſil wood gives out to this ſimple fluid all its colouring matter. This wood is of a deep red or purple colour. It cools and ſtrengthens; but is chiefly uſed by the dyers.

From the Braſil wood of Pernambuco is extracted, by means of acids, a CARMINE.

BRASIUM. BARLEY, or COMMON MALT. Called alſo *byne*; by TACITUS, *frumentum corruptum*. From this, all thoſe liquors, ſuch as BEER, ALE, PORTER, &c. are made, which go under the general term, MALT LIQUORS, ſee ALLA; but an infuſion of malt, called WORT, is conſidered as powerfully antiſeptic, and has been ſucceſsfully given in the ſea-ſcurvy. It is prepared in the following manner: "Take of dry ſound malt, freſh ground, one meaſure; infuſe it for four, five, or ſix hours, in three meaſures of boiling water, then pour off the clear liquor," and let the patient drink two, three, or four pints every day. This has has been adminiſtered as a preventive to the ſcurvy, with ſome apparent efficacy; and it has been conſidered as an alterative, and given in caſes of inveterate ulcers, with advantage; and alſo, in ſuch conſtitutions as are diſordered by cutaneous eruptions, which reſiſt the action of mercury. It bids fair to be of ſervice where a permanent change in the ſtate of the animal fluids is required; and from its being grateful, and in general agreeing ſo well with the ſtomach, it is preferable to the ſcorbutic juices given for this purpoſe. See MACBRIDE's *Experimental Eſſays*, *Appendix to his Introduction to the Theory and Practice of Phyſic*.

BRASMA. See PIPER LONGUM.

BRASMOS. See FERMENTATIO.

BRASSADELLA, or BRASSATELLA. See OPHIOGLOSSUM.

BRASSICA. CABBAGE. Called alſo *crambe*; of which there are thirty ſpecies; Linnæus ranks them all under the name *braſſica* radice cauleſcente tereti carnoſa. They are all biennial. All the ſpecies are ſuppoſed to be only varieties of the ſmaller kind, which grow ſpontaneouſly on our ſea-coaſts. The white and green cabbages are called *caulodes*.

Cabbages have a ſtronger tendency to putrefaction than moſt other vegetable ſubſtances; and during their putrifying ſtate, ſend forth an offenſive ſmell, which much reſembles that of putrifying animal bodies; it therefore ſeems reaſonable to believe that they are eaſily digeſted in our ſtomachs, and alſo very nutritious.—All of them, ſays Dr. Cullen, may be conſidered as a ſupplemental proviſion only, and are ſeldom choſen by the quantity of nouriſhment they afford; but by the tenderneſs of their texture, and the fulneſs and ſweetneſs of their juice.

Cabbages are far from being unſalutary; they neither induce nor promote a putrid diſpoſition in the human body, but, on the contrary, are a ſalubrious aliment in the true putrid ſcurvy. They looſen the belly when eaten freely, and produce much flatulency; but by well boiling, they loſe their laxative quality. The *Braſſicæ* have great powers as antiſcorbutic, and taken in largely as aliments, have proved a cure for the ſcurvy: this perhaps is owing to the fixed air which they afford.

The Germans make the following preparation of *cabbage*, to which they give the name

Sauer Kraut. The Engliſh imitating the ſound, SOUR KROUT.

Take of the *cabbages* in common uſe, cut them into thin ſlices, put them into a caſk that is previouſly cleaned, dried, and lined in its whole inſide with the four paſte called leaven; on each layer of the ſliced *cabbage*, ſprinkle a ſmall handful of ſalt, and preſs it down; when as much is put into the caſk as it will contain, when thus forcibly preſſed, and all the liquor is poured off, which is ſqueezed out of the *cabbages*; cover it with a clean cloth, then lay the looſe caſk head thereon, and over it any heavy weight that the preſſure may be continued; thus, let it ſtand in a warm room until it ceaſes to ferment, and then it is fit for uſe. When uſed, boil a proper quantity for the preſent meal in water, during two hours or more, then pouring off the liquor, add to it a little butter, and eat it as other vegetable ſubſtances.

If the caſk is cloſed up when the fermentation of the *cabbage* is finiſhed, this preparation will be preſerved in its perfection many years, and would be a convenient part of ſeamen's diet, as a preſervative from the ſcurvy.

The white ſort is the moſt putreſcible and fetid; the red is the ſweeteſt, moſt emollient and laxative: if the ſtalks of the red kinds are cut longitudinally in autumn, and placed in a cool ſhade, a laxative juice reſembling honey or manna exudes from the inciſions. That called —— SATIVA, is the COLEWORT or CABBAGE, named alſo *caulis*, *braſſica capitata alba vel rubra*, *braſſica ſabauda alba*, &c.——FLORIDA. CAULI-FLOWER, called alſo *braſſica multi flora*, *caulis florida*.——CONGYLODES. TURNEP CABBAGE, called alſo *braſſica caularapa*, *rapocaulis*, *braſſica caule rapum gerens*.

The ſeeds yield by expreſſion, an oil which is uſeful for lamps, and in the woollen manufactory. After the oil is obtained, the remains are excellent food for cattle.

——CAPITATA VIRESCENS ITALICA CRISPA. GREEN BROCOLI.——RUGOSA, LONGIORIBUS FOLIIS. BROWN BROCOLI.——*Napus*,—*Radice cauleſcente fuſiformi*. See BUNIAS.——*Eruca*. See ERUCA.——ITALICA TENERRIMA GLOMEROSA FLORE ALBO. TABAUDE. The SAVOY CABBAGE.——MARITIMA, called alſo *ſoldanella maritima minor*, *convolvulus maritima minor*, *maritimus noſtras*. Sea BINDWEED, SEA-COLEWORTS, and SCOTCH SCURVY-GRASS. The *convolvulus ſoldanella*. Linn.

This is a ſpecies of convolvulus; its leaves are roundiſh and ſet on long pedicles; the flowers are of a reddiſh purple colour, large, and ſtanding ſolitary in the boſoms

of

of the leaves. It grows wild on the ſea-coaſt in the North of England, and flowers in June.

The leaves are a rugged cathartic; this quality reſides in the milky juice which exudes upon wounding them. A decoction of the dried leaves, from 3 ſs. to 3 iij. is a doſe.

Miller takes notice of three ſpecies.

BRASSIDELICA ARS. A way of curing wounds, mentioned by Paracelſus, by applying the herb *braſſadella* to them. See OPHIOGLOSSUM.

BRATHU. The herb SAVINE. See SABINA.

BREGMA, from *βρέχω, to moiſten*. In infants theſe bones are not only tender, but very moiſt. They are alſo called *ſinciput*, *paritoria*, and *medium teſtæ*. They are two bones on the upper part of the head, of an irregular ſquare figure; nearly of the ſame thickneſs all over, and divided into an upper and lower part by a circular line; on the upper part they are covered only by the integuments, on the lower by the crotaphite muſcle; towards the poſterior and upper part there is a hole through which the veſſels of the dura mater communicate with thoſe of the ſcalp. Theſe bones have a large extent, but are the weakeſt in the human body. The trepan may be applied to any part of this bone, except on the lateral parts of the poſterior lower edge of it, the lateral ſinuſes lying under thoſe parts. It often happens that tumors are formed on theſe bones in infants, which contain a fluid, and give to the touch an appearance of deficiency of bone, which is not the caſe. The beſt method of treating theſe tumors is to leave them to themſelves; their contents will be taken up by the abſorbent ſyſtem.

BRELISIS. See CARANNA.

BRETANICA. GREAT WATER-DOCK. See BARDANA MAJOR.

BREVIA VASA. The vena ſplenica towards its termination is divided into ſeveral branches that go to the ſpleen, one of which produces the veins which receive this name.

BREVIS vel BRACHYS. A name of the TERES MINOR.

BREYN. CENT. An abbreviation of Jacobi Breynii, Exoticarum aliarumque minus cognitarum Plantarum Centuria prima. Gedani, 1678.

—— HIST. COCC. An abbreviation of J. P. Breynii Hiſtoria Naturalis Cocci Radicum Tinctorii. Gedani, 1731.

—— PROD. An abbreviation of Jacobi Breynii Prodromus Faſciculi Rariorum Plant.

—— SCHED. An abbreviation of ſchediaſma de echinis.

BRICUMUM. See ARTEMISIA.

BRINDONES. A red fruit in the Eaſt Indies. It is kept for making vinegar from, and is alſo a material uſed for colouring. Raii Hiſt

BRISTOLIENSIS AQUA. BRISTOL WATER. Of the four principal warm waters naturally produced in England, this is the leaſt ſo. See BATHONIENSIS AQUA.

As the Bath waters are proper where the ſecretions are defective, ſo the *Briſtol water* is of ſervice where they exceed the requirements of health. The Bath *water* warms; the *Briſtol* cools. Bath *water* helps the ſtomach, inteſtines, and nerves; the *Briſtol* favours the lungs, kidneys, and bladder.

Except a jaundice attends, the *Briſtol water* may be of uſe in dropſies, by its drying and diuretic qualities.

Dr. Wynter aſſerts that there is no iron in the *Briſtol water*, and that its mineral contents are *chalk*, *lapis calcarius*, and *calaminaris*. Five gallons of this *water* after evaporation, afforded only 3 iij. and gr. ij of a mineral-like ſubſtance.

By the experiments of Dr. Bryan Higgins, a Wincheſter gallon of this *water* contains,

	dwts.	gr.
Of calcareous earth, combined with vitriolic acid in the form of ſelenite	0	8½
Of calcareous earth, combined with acidulous gas	0	12¾
Of marine ſalt of magneſia	0	5¼
Of ſea ſalt	0	6½

Acidulous gas, beſides what is contained in the calcareous earth above mentioned, eight ounce meaſures. And,

Atmoſpheric air, two ounces.

The diſeaſes in which this *water* is uſeful are internal hæmorrhages, immoderate menſes, old diarrhœas, fluor albus, internal inflammations, ſpitting of blood, dyſentery, purulent ulcers of the viſcera, conſumption, dropſy, ſcurvy with heat, ſtone, gravel, ſtrangury, habitual gout, atrophy, a ſlow fever, ſcrophula, gleets, and a diabetes; in which laſt it is eſteemed by ſome a ſpecific, and may be drank as freely as the thirſt requires it.

The hotter months are the beſt for uſing it. In general it is drank in repeated draughts of four ounces or half a pint, from a pint to two quarts a day.

The *Briſtol* and Matlock *waters* are of exactly the ſame qualities.

See Dr. Maplet, Dr. Guidot, and Dr. Wynter on the *Briſtol Waters*. It was doctors Mead and Lane who eſtabliſhed the reputation of *Briſtol water* in diſeaſes of the kidneys and bladder.

BRITANNICA. See BARDANA and LAPATHUM AQUATICUM.

BRIZA. SPELT WHEAT.

BROCHOS. CASTELLUS ſays, it ought to be referred to ſome chirurgical inſtruments, inaſmuch as it is neceſſary to ſome operations, on the authority of GALEN and ORIBASIUS. It is conſidered alſo as expreſſive of ſome morbific cauſes, particularly, according to GALEN, of a deprivation of voice. Indeed, in Surgery, it is a nooſe, and belongs to either inſtruments or bandages. It is the Greek word for *laqueus*.

BROCHTHUS. The THROAT. See GUTTUR. Alſo a ſmall kind of drinking veſſel.

BROCHUS. One with a prominent upper lip, or one with a full mouth and prominent teeth.

BRODIUM. BROTH, ſee JUS. Or it is the liquor in which ſome ſolid medicine is preſerved, or with which ſomething elſe is diluted.

BROMA. FOOD. That is, ſuch as is to be eaten and not drank. See ALIMENTA.

BROMA THEON. The victuals of the gods, h. f. MUSHROOMS. See AMANITA.

BROM. CHLOR. GOTH. An abbreviation of Olai Bromelii Chloris Gothica, ſeu, Catalogus Stirpium circa Gothoburgum naſcentium.

BROMELIA. See ANANAS.

BROMION. A plaſter mentioned by P. Ægineta.

BROMUS STERILIS. DRANK or WILD OATS. See ÆGYLOPS.

BRONCHIA, *(artia)*. See ASPERA ARTERIA and BRONCHUS.

BRONCHIALES ARTERIÆ. They ſometimes go from the fore ſide of the ſuperior deſcending aorta, ſometimes from the firſt intercoſtal, and ſometimes from the arteriæ œſophagææ. Sometimes they ariſe ſeparately from each ſide to go to each lobe of the lungs, and ſometimes by a ſmall common trunk, which afterward ſeparates towards the right and left hand, at the bifurcation of the aſpera arteria, and accompany the ramifications of the *bronchia*.

The *bronchial* artery on the left ſide often comes from the aorta, while the other ariſes from the ſuperior intercoſtal on the ſame ſide; which variety is owing to the ſituation of the aorta. Sometimes there is another *bronchial* artery, which goes out from the aorta poſteriorly, near the ſuperior intercoſtal, above the *bronchialis* anterior.

Communications have been obſerved between the *bronchial* artery and the vena azygos, and with the coronary artery of the heart.

RUYSCH firſt diſcovered theſe veſſels, and he deſcribes both the *bronchial* arteries and veins in his fourth epiſtle.

—— GLANDULÆ. At the angle of the firſt ramification of the trachea arteria we find on both the fore and back ſides certain ſoft roundiſh glandular bodies, of a bluiſh or blackiſh colour, and of a texture partly like that of the thymus, and partly like that of the thyroid gland. There are many ſuch like glands at the origin of each ramification of the *bronchia*. Dr. Hunter ſuppoſes their office is to ſeparate a mucus to lubricate the lungs: they are different both in colour and ſtructure from the conglobate and lymphatic glands.

—— GLANDULA. See THYROIDÆA GLANDULA.

BRONCHOCELE, from *βρογχος, the wind-pipe*, and *κηλη, tumor*. Alſo called BOCIUM; BOTIUM. It hath various names in different writings; the Swiſs call it *goutier*; ſome have called it *hernia gutturis*, *guttur*, *tumidum*, *& trachelophyma*, *goſſum*, *exechebronchos*; *gongrona*, *hernia bronchialis*; Heiſter thought it ſhould be named *tracheocele*; Mr. Proſſer, in his late publication on this diſorder, from its frequency on the hilly parts of Derbyſhire, calls it, with others, the DERBYSHIRE-NECK; and not ſatisfied reſpecting the ſimilitude of this tumor with that obſerved on

on the neck of women on the Alps, he calls it, particularly that which he ſo well deſcribes, the Engliſh *bronchocele*; as various cauſes give riſe to this complaint, the more ſtrictly to diſtinguiſh that, in which he expects ſucceſs in his attempt to cure, he calls that ſpecies which is not produced by external accidents, ſuch as loud-ſpeaking, crying, blows, &c. the natural, the ſpontaneous, or the curable *bronchocele*.

The ſeat of this diſeaſe is the thyroid gland, which Dr. Hunter hath obſerved lies juſt below the larynx, round the trachea. The tumor appears in the fore-part of the neck, between the ſkin and the wind-pipe. Women are the moſt frequent ſubjects of this diſeaſe, in whom it uſually appears early. Dr. Hunter met with one caſe of this kind in a young ſurgeon; but it rarely happens in males, or being leſs in ſight is not often noticed.

Various cauſes of this diſeaſe are aſſigned by different writers. On the mountainous parts of Genoa and Piedmont, they attribute theſe tumors to their drinking water cooled with ice. Dr. Leake obſerves, in his *Medical Inſtructions*, ed. 6. it is very probable that ſuch glandular ſwellings as happen about the neck and face, ſhould be owing to the ſeverity of the cold, moiſt air, eſpecially ſince they generally appear in winter, and rarely in the warm dry climates of Italy and Portugal. And this, adds he, is probable, becauſe the intenſe degree of cold may conſtringe the glandular ducts, and lock up that fluid which ought to paſs freely through them. Some writers attribute it to a ſcrophulous cauſe. Mr. Proſſer inclines to think that it is a dropſy in the gland, and ſimilar to the dropſy in the ovaries. He relates, that Dr. Hunter diſſected one of theſe glands that had been conſiderably enlarged, and it was found to be enlarged by a number of cyſts filled with water. Yet moſt writers agree that its true cauſe and nature are alike unknown.

Mr. Proſſer very accurately deſcribes this diſeaſe as follows: the *bronchocele* is a tumor ariſing on the fore-part of the neck; it generally firſt appears ſome time betwixt the age of eight and twelve years, and continues gradually to increaſe for three, four, or five years; and ſometimes the laſt half year, we are told, it grows more than for a year or two before. It generally occupies the whole front of the neck, for the whole thyroid gland is here enlarged, but does not riſe near ſo high as the ears, as in the caſes mentioned by Wiſeman, and it is rather in a pendulous form, not unlike, as Albucasis ſays, the flap or dewlap of a turkey-cock's neck when he is angry, the bottom being the bigger part of the tumor, it growing gradually leſs upwards: but as to its figure, it varies conſiderably in different caſes. It is ſoft, or rather flabby to the touch, and ſomewhat moveable; but when it has continued ſome years after it has ceaſed to encreaſe, it becomes more firm or confined. By the ſituation and nature of the complaint, it generally occaſions a difficulty of breathing, and very much ſo upon the patient's taking cold, or attempting to run or walk faſt. In ſome the tumor is ſo large, and ſo much affects their breathing, as to occaſion a loud wheezing; but we meet with many exceptions to this general rule. Some ſhall have the diſeaſe in an aggravated degree, and ſuffer but little by it; in others, though the enlargement of the glands is not near ſo conſiderable, yet they ſuffer much more from it. In common, the opulent of thoſe who have the complaint in a conſiderable degree, will be rendered incapable of enjoying life; the poor, of getting their living. Dr. Hunter obſerved, that ſometimes this tumor contains water, but now and then ſuppurates.

The *bronchocele* ſhould be diſtinguiſhed from a ſcirrhus, alſo from an aneuriſm, and particularly thoſe ſwellings in the neck that riſe from ſtrains, ruptured veſſels, &c. It is the natural, not the accidental ſpecies, that is above deſcribed, and which ariſes ſpontaneouſly, as it were, that is curable, and not thoſe from external and other manifeſt cauſes.

This tumor is not apt to become cancerous. Mr. Gooch ſays, he never knew this diſeaſe to endanger life, however large it was: but he obſerves a conſiderable inconvenience from it in caſes of quinſey attending with it. Mr. Sharpe mentions, that the only caſes of quinſey requiring bronchotomy, were owing to the preſence of *bronchoceles*. Dr. Hunter has noticed, that this diſorder appears two or three years before or after menſtruating: and that it ſometimes ſpontaneouſly diſappears if the menſtruation approaches kindly; and Mr. Proſſer adds, that often this change in the conſtitution does not ſeem at all to affect the tumor, but it continues to grow as before.

Some have obſerved, that the drain of an iſſue, or of a perpetual bliſter, applied on ſome other occaſion, has prevented the growth of the *bronchocele*; but being dried up, the tumor would increaſe faſter; and upon the iſſue's being opened again, or the diſcharge of the bliſter, it would be ſomewhat ſunk, or however its growing bigger prevented. But on this method no dependence can be had. By reaſon of its ſituation, it cannot be extirpated; it is ſo entangled with the recurrent nerves, the firſt branch of the external carotid artery, &c. that thoſe who have attempted to diſſect it, were glad to deſiſt: and if by chance a ſuppuration is formed, an ill conditioned ulcer is the conſequence, which is very difficult of cure. If it can be diſcuſſed, *that mode of relief alone can be prudently attempted*; and thus Mr. Proſſer hath ſucceeded in many inſtances. On this plan the late famous Coventry practice was formed. Mr. Wilmer has inſerted it in an Appendix to his Caſes, &c. in Surgery. It begins with an emetic the day after the moon at full, and the day after that a purge; the night following, and ſeven nights ſucceſſively, the following bolus muſt be laid under the tongue at bed-time; and in the days a bitter ſtomachic powder ſhould be given at noon. The bolus to be laid under the tongue, is formed of *calcined ſponge*, *cork*, and *pumice-ſtone*, of each ten grains, *ſyrup* a ſufficient quantity. But to proceed to that method by which Mr. Proſſer aſſures us the ſpontaneous or curable caſes are relieved, he ſays, that ſeveral have ſucceeded by the uſe of his medicines, though they were nearly advanced to their twenty-fifth year, which was more than twelve years after the appearance of the tumor on their necks: after the twenty-fifth year of the patients's age, no inſtance of ſucceſs hath occurred. He orders one of the following powders to be taken early in the morning, an hour or two before breakfaſt, and at five or ſix o'clock in the evening, every day for a fortnight or three weeks. The powder may be taken in a little ſyrup, or ſugar and water, or any thing elſe, ſo that none may be loſt. If it does not ſit well on an empty ſtomach, it may be taken betwixt breakfaſt and dinner:

℞ Cinnab. ant. op. levigat. milleped. ppt. & pulv. ää gr. xv. Spong. calcinat. ℈j. m.

After theſe powders have been taken for two or three weeks, the patient ſhould omit them for about a week, or nine days; then begin with them again, and take as many more, after the ſame manner; and alſo at bed-time, every night, during the ſecond courſe of the powders, three of the following pills are to be taken:

℞ Hydrargyr. ʒ v. terebinthinæ Straſburgenſis ʒ ij. extracti colocynthidis comp. ℈ iv. pulv. rhabarbari ʒ j.

Firſt grind the quickſilver with the turpentine till it appears no longer, then beat them up with the reſt into a maſs. If the turpentine chance to be too thick, it is to be thinned with a little olive oil.

Theſe medicines do not require any confinement, except they are taken in ſevere weather, and then it may be only to the houſe; nor need the diet be much regarded. It may be ſufficient that the medicines are taken in a temperate ſeaſon, or rather warm weather, and the patient lives exactly in the uſual way, guarding againſt cold, during the ſecond courſe of the medicines. The patient, if a ſervant, ſhould avoid ſtanding, eſpecially at the waſhing-tub, or ſuch other work as is done with cold water. As to diet, when no alteration hath been made in it, the ſucceſs has been the ſame as when ſtated regulations were regarded. In this, diſcretion may occaſionally direct. If the pills continue to purge, after taking them a few days, it would be better to leave out the extr. coloc. comp. in the preparation of the pills, and ſubſtitute its weight of liquorice-powder, that the quickſilver may remain in the ſame proportion. In general it will be proper for the patient to be purged twice or thrice with manna and ſalts, or any gentle cathartic, before the powders are begun. The medicines are here proportioned for an adult of a good conſtitution; therefore, if the patient is younger, or of a weakly habit, the doſes muſt be managed accordingly. As to external applications, they may be hurtful, but do not appear likely to be uſeful.

To conclude, it may be proper to obſerve, that the patient muſt not expect to find benefit in a little time; perhaps it will be as long after the medicines are all taken,

as the time they are in taking, before much difference will be perceived in the tumor of the neck. It is neceſſary that the medicines be begun with at a proper time, eſpecially the ſecond courſe; a few days ſhould always be diſpenſed with on that account.

Amongſt the earlier writers, ALBUCASIS is the firſt who gives any uſeful account of this diſorder. See it tranſlated into Friend's Hiſt. of Phyſic, and into James's Med. Dict. art. *Bronchocele*. See alſo Turner's Surgery, vol. i. p. 164. Wilmer's Caſes and Remarks in Surgery, in the Appendix. But the beſt of the moderns on this ſubject is an Account of the Method of Cure of the *Bronchocele*, by THOMAS PROSSER, edit. 3. Gooch, in his Med. Obſ. gives an inſtance of an aqueous *bronchocele*. Bell's Surgery, vol. v. 514. White's Surgery, 289. Memoirs of the Medical Society of London, 217.

BRONCHOTOMIA. BRONCHOTOMY. From βρογχος, *the wind-pipe*, and τεμνω, *to cut*. See TRACHEOTOMIA.

BRONCHOS. A ſuppreſſion of the voice from a catarrh. Alſo a catarrh, when it principally affects the fauces. See CATARRHUS.

BRONCHUS. According to Galen it is the *aſpera arteria*, from the larynx to the lungs; but bronchia or bronchi, as now underſtood, are the ramifications.

BRONTE. THUNDER.

BRUMA. WINTER. But particularly when the days are ſhorteſt.

BRUMASAR. A ſpagirical term for ſilver, ſee ARGENTUM.

BRUNELLA. COMMON SELF-HEAL; called alſo *prunella*, *conſolida minor*, and *ſymphytum petræum*. It is the PRUNELLA VULGARIS Linn. It is a ſmall plant with ſquare ſtalks, cut leaves that are ſet in pairs; the flowers are purple-coloured, forming ſhort thick ſpikes. It is perennial, grows wild in paſture grounds, and flowers in June and July. Its taſte is ſlightly auſtere and bitter, and hath been much uſed in fluxes, hæmorrhages, and in gargariſms, to remove aphthous exudations in the mouth, &c. Miller's Bott. Off.

BRUNNIERI GLANDULÆ. BRUNNIER'S GLANDS. They are lodged under the villous coat of the inteſtines, cloſely adjoining to the nervous. They are more numerous in the ſmall inteſtines, and ſmaller than in the large ones. They are alſo called *Peyeri glandulæ*, PEYER'S GLANDS.

BRUNUS. See ERYSIPELAS.

BRUSCUS. See RUSCUS.

BRUTA. That virtue of the celeſtial influence which is manifeſted by the brutes, as in the ſtork, teaching the uſe of ſalt in clyſters.

BRUTIA. An epithet for the moſt reſinous kind of pitch, therefore uſed to make the *oleum piſſinum*, ſaid by Ray to be the ſame as the piſſelæon of the ancients; for that was called by them *oleum picinum*; and was, according to Galen, a medicine made of oil and pitch mixed. The pix *Brutia* was ſo called from *Brutia*, a country in the extreme parts of Italy, where it was produced. The Brutti were a people of Calabria, over againſt Sicily. The pix *Brutia* was made from the *tæda*, MOUNTAIN-PINE.

BRUTINO. See TEREBINTHINA.

BRUTOBON. The name of an ointment uſed by the Greeks.

BRUTUA See PAREIRA BRAVA.

BRUXANELI. A tall tree in Malabar: its bark is diuretic. Raii Hiſt.

BRYGMUS. A peculiar kind of noiſe, ſuch as is made by the grating of the teeth, or their gnaſhing.

BRYON, called *ſplachnon* by ſome, a kind of moſs found on cedars, oak, &c. It is aſtringent.

BRYON THALASSIUM. See ALGA.

BRYONIA. It is a name for the WHITE JALAP; alſo BRIONY. Botaniſts enumerate ſeven or eight ſpecies; but the moſt common are the two following: the

—— ALBA. WHITE BRIONY; called alſo *vitis alba*, vel *ſylveſtris*; *agroſtis*, *ampelos*, *archeoſtis*; *echetroſis*, by HIPPOCRATES; *bryonia aſpera*; *cedroſtis*; *chelidonium*; *labruſca*; *melothrum*, *ophroſtaphylon*; *pſilothrum*; WILD VINE. This ſpecies is moſt in uſe. It is the BYRONIA ALBA *foliis palmatis utrinque calloſo-ſcabris*, *baccis rubris*, of Linn. CLASS DIOECIA. ORD. SYNGENESIA. Gen. Pl. 1093.

It is a perennial rough plant, grows wild in hedges, and climbs up buſhes, with curled tendrils; the leaves are in ſhape ſomewhat like thoſe of the vine. The flowers are bell-ſhaped, of a greeniſh white colour, and monopetalous; the flowers are ſucceeded by red berries, containing an extremely viſcid pulp with ſmall ſeeds; the root is large, as thick as a man's arm or leg, of a browniſh or yellowiſh colour on the outſide, and white within.

Theſe roots are taken up in ſpring; they afford much thin milky juice, which hath a diſagreeable ſmell, and a naſeous, biting, bitter taſte; if it is applied to the ſkin, it bliſters. If the root is dried, or its milky juice is inſpiſſated, they loſe moſt of their acrimony and ill ſcent.

Externally this root is ſtrongly diſcutient. Dr. Alſton ſays, that in ſwellings, ſtrains, and ſtiffneſs of the joints, he has experienced ſurpriſing effects from it; in contuſions, a decoction of it, with the addition of wormwood, does great ſervice; according to BERGIUS, it is a *purgative*; *hydragogue*; *emenagogue*, and *diuretic*: the freſh root, emetic; it has chiefly been employed in *dropſies*. It has alſo had good effects in *aſthma*, *mania*, and *epilepſy*. In ſmall doſes it is ſaid to be diuretic, reſolvent, and deobſtruent. In powder, from ℈ j. to a dram, ſtrongly purgative. The juice, which iſſues ſpontaneouſly, in doſes of ℥ ſs. or more, has ſimilar, though more gentle effects; but the watery extract, acts more mildly than the powder, and with greater ſafety. The doſe ʒ ſs. to ʒ j. Of the expreſſed juice, a ſpoonful acts violently both upwards and downwards; though cream of tartar takes off its virulence. As a diſcutient, the CATAPLASMA BRYONIÆ COMPOSITUM is much recommended, and thus made. Take of bryony root three ounces; elder flowers one ounce; gum ammoniac half an ounce; muriated ammonia two drams; camphorated ſpirit one ounce. Let the bryony and elder be boiled till they become tender, then bruiſe, and add the gum ammoniac, previouſly diſſolved in vinegar; the muriated ammonia and camphorated ſpirit muſt be afterwards added, and the whole mixed together in form of a cataplaſm.

—— NIGRA. BLACK BRIONY; called alſo *tamnus*, *ſigillum beatæ Mariæ*, *chironia*, *apronia*, *gynecanthe*; BLACK VINE, and the CHIRONIAN VINE. This plant climbs without tendrils, the leaves are ſmooth, and like thoſe of the great bindweed; it beareth black berries; the roots and leaves are commended as expectorant. Raii Hiſt. According to GERRARD, it is called *agriampelos*.

—— MECOACHANA NIGRA. } See JALAPA and
—— PERUVIANA. } MECHOACANA ALBA.

BRYTHION. A malagma ſo called. It is deſcribed by P. Ægineta.

BRYTIA. The ſolid parts of grapes, which remain after the muſt is expreſſed.

BRYTON. Βρυτον. A kind of drink made of barley, which Ariſtotle calls *pinon*. It is ſaid that thoſe who are drunk with it never fall but on their backs; ſome ſay it is made of rice.

BUBALUS. The BUFFALO; called *buffelus*, *bos Indiana*, and *buffal*. It is a kind of ox. This name it hath from the country in Aſia, from whence it was brought into Europe.

BUBASTECORDIUM. See ARTEMISIA.

BUBO. A BUBO, from βουβων, *the groin*. VOGEL names it *bubon* when in the groin; it is alſo named *cambuca*; *cambuca membrata*; *cedonſcella*; by ſome it is called *fugile*; and *aden*. It is a tumid gland which is inflamed, or tends to ſuppuration: but it is generally underſtood only of thoſe glands which are in the arm-pits, or the groins. GALEN ſays, in his firſt book De Diff. Febr. "a *bubo* is a kind of inflammation."

Dr. Cullen ranks this genus of diſeaſe in the claſs locales, and order tumores. He defines it to be the ſuppurating tumor of a conglobate gland. See his Noſology, edit. 3.

Buboes are diſtinguiſhed into MILD and MALIGNANT; the *mild* is when no manifeſt previous diſeaſe is in the body; the *malignant*, when ſome peſtilential diſeaſe, or ſome infectious one, excites them, as in the plague, lues venerea, &c.

The chief danger when *buboes* ariſe, is from the bad habit of body, or ſome attendant diſeaſe; if neither of theſe accompany them, at the worſt they are but a little troubleſome.

The cure of the mild kind will eaſily be effected by gentle mercurials externally applied, and a purge now and then; though if a ſuppuration threatens, it is beſt to encourage it, and proceed as in a common abſceſs.

A PESTI-

A PESTILENTIAL BUBO is known by its appearing at the time of a peſtilence, and being attended with more or leſs of the ſymptoms thereof; though, indeed the *bubo* is the firſt ſymptom in ſome patients, at a time of peſtilence. The appearance of a *bubo*, when the plague either prevails or attacks a perſon, is generally a happy preſage, and in the management of it repellents muſt not be uſed, but by all means ſuppuration encouraged; and as ſoon as a tumor appears, which, in this caſe, though the armpit is the general ſeat, yet it may be in any other part, as in the groin, the parotid glands, &c. apply the ſpeedieſt ſuppuratives, and ſecond them by the uſe of cordial antiſeptics inwardly. See PESTIS.

A VENEREAL BUBO. Theſe very rarely happen any where but in the groin, and are called *anginæ*; *panochiæ*; though inſtances have occurred in which the armpits are the ſeat; they tend very ſlowly to a ſuppuration, but when nature directs it, let ſuppuration be encouraged; at the ſame time let anti-venereal alteratives be uſed internally.

In the beginning theſe tumors are ſore, if touched; hard, and gradually increaſing they become painful; and if they tend to ſuppurate, an inflammation appears.

The veneral virus thickens the lymph in thoſe glands which are the ſeat of this diſeaſe, whence ſecretion is rendered difficult in them; at length they ſwell, &c. Sometimes this ſort of *bubo* ariſes ſolely from the venereal contagion directly paſſing to the affected gland, and there fixing itſelf; the *bubo* is then the eſſential diſeaſe. Or a gonorrhœa being ſuddenly ſtopped, or being too ſmall in its diſcharge, a *bubo* ariſes, and is a ſymptomatical diſeaſe: if it ariſes without any late contagion, it then is the pathognomonic ſign of a latent pox.

This tumour ſhould be diſtinguiſhed from thoſe that are ſimply inflammatory, peſtilential, ſtrumous, or the critical diſcharge of ſome other diſorder; and when in the groin, it muſt be diſtinguiſhed from the epiplocele, and the enterocele. Alſo from the detention of a teſticle in the groin.

In order to the cure, when venereal, the chief conſideration is to deſtroy or eliminate the venereal poiſon with which the body is contaminated; this done, the *bubo* is no other than a ſimple tumor or abſceſs in the part; this being duly adverted to, if the *bubo* is but in its beginning, and the cauſe recent, it may generally be diſperſed by bleeding, if the habit is inflammatory, or a ſanguine plethora is manifeſt; and by rubbing as much of the ung. hydrargyri on the patient's groin, near the *bubo*, as he can bear without ſalivating; gentle purging, at proper intervals, and a cooling diet, aſſiſt this intention. But if the *bubo* ſhould be the effect of venereal virus long lurking in the habit, we muſt endeavour to increaſe the inflammation, and produce ſuppuration; the ſooner this ſtate is completed the more perfect and ſatisfactory will be the cure. The common bread poultice applied warm, or, if this cannot be complied with, a ſoft plaſter, on which is galbanum, may be applied; all evacuations muſt now be forborne, and the diet may be more generous. The prominent part of the ſuppurated tumour may be deſtroyed with a cauſtic, and the ulcer may be treated as is common in venereal caſes. See LUES VENEREA.

The *buboes* that are ſcirrhous or cancerous, are beſt left quiet, eſpecially while they are eaſy: when they are painful, treat them as occult cancers.

See Heiſter's Surgery, Aſtruc on the Venereal Diſeaſe, or Chapman's Abridgment of Aſtruc. Bell's Surgery, vol. 405. Wallis's Sydenham, vol. i. 143. Whites's Surgery, 20. Plenck on the Lues Venerea; Swediaur, and Bell on the venereal diſeaſe; alſo Foot, and Hunter.

BUBON. See BUBO.

BUBONOCELE, from βουβων, *the groin*, and κηλη, *a tumor*. It is alſo called *hernia inguinalis*, or RUPTURE of the GROIN; when the inteſtines force the integuments through the ring of the external oblique muſcle of the belly, or, as Dr. FRIEND remarks, through the cavity in the thigh, between the *muſculus pectineus* and *ſartorius*, though this latter is called *hernia femoralis*, or *cruralis*.

The cauſe may be great diſtenſion of the bowels from wind, violent exerciſe, as leaping, lifting burdens, &c.

The ſigns are, a tumour in the groin, or upper part of the ſcrotum, beginning at the ring of the abdominal muſcle, and extending more or leſs downward, towards or into the ſcrotum, in men, and the labia pudendi, in women. This tumour appears different to the touch, according to its contents. If a portion of the ileum forms the tumor, its ſurface is ſmooth and renitent, but much more ſo if the patient coughs and ſneezes.——If only a piece of the omentum hath ſlipped down, the tumor is more flabby when felt, its ſurface is more unequal, and it makes leſs reſiſtance to the finger.——If both the inteſtine and omentum are deſcended, the diagnoſtics will be leſs diſtinct, and requires generally ſome experience to aſſiſt in judging of what can hardly be learnt by deſcription.

This diſorder muſt not be confounded with the hydrocele, nor the tumor of the teſticle called *hernia humoralis*, nor a bubo, or other glandular ſwelling in the groin; nor with a teſticle detained in its paſſage through the groin, or with the hydrocele of the ſpermatic cord. But it may be obſerved *that the greateſt pain in the bubonocele, is at the pit of the ſtomach*, which ariſes from the omentum, that is connected with it.

To reduce the hernia, merely by the hand without cutting or eroding the part, is called TAXIS; and when it is thus reduced by the hand, if the rupture conſiſted of a portion of the inteſtine only, it generally ſlips up at once; the patient being laid on his back, with his heels brought near to his buttocks, aſſiſts the return of the protruded parts:—if a piece of the omentum is the contents, its return is not ſo ſpeedy;—if there is both omentum and inteſtine, the latter aſcends firſt, and the former feels flabby, but ſoon after follows alſo. Sometimes after the inteſtine is returned, a ſoft knotty ſubſtance remains unreduced, and reſiſts all the efforts to reduction, until the patient's veſſels are emptied by bleeding, repeated purges, and a low diet; the varicous feel which this ſubſtance hath, ſeems as if it was the meſentery with its veſſels diſtended.

In infants the reduction is generally eaſy, and as they get ſtrength they are leſs ſubject to a relapſe. In the vigour of life the return is generally more difficult, and the neglect or bad management more dangerous.

The greateſt miſchief to be feared is a ſtricture, which is made by the borders of the aperture in the tendon, through which the inteſtine paſſed; and of this accident there is greater danger in the robuſt than in infants and valetudinarians. If no appearance of this ſymptom attends a patient, the uſe of gentle means alone are to be admitted; but a ſtricture demands immediate aſſiſtance at all times, and in every circumſtance.

The cure is palliative or radical: the means are the ſame in both kinds; the event depends on what is not within the reach of art. The ſurgeon's part is to reduce the prolapſed bodies, and with a proper bandage to prevent their deſcent; if nature lends her aid, the aperture may be ſo contracted as to remove our fear of the parts returning. It is true, circumſtances may attend, in different caſes, which may require ſome difference in the management. See HERNIA.

When the caſe is ſuch as to require an operation, the cauſe of it is, an increaſed degree of the ſtricture, which renders reduction difficult, ſometimes impracticable. In this caſe the pain in the groin is great, as alſo in the belly; the fever, nauſea, and ſuppreſſion of the inteſtinal diſcharges, all increaſe, as does the tenſion of the belly, &c. But as great nicety attends the determining when to uſe the knife, every operator, on ſuch an occaſion, will take the advice and aſſiſtance of thoſe whoſe experience hath enabled them to act with moſt advantage.

To proceed in the operation, ſhave the pubis and groin, and in order to have as much empty ſpace as poſſible for the return of the protruded parts, the patient ſhould be adviſed to empty his bladder entirely, then having laid the patient on his back, on a table of a convenient height, with his legs hanging eaſy over the end of it, with a ſtraight diſſecting knife an inciſion muſt be made through the ſkin and membrana adipoſa, beginning juſt above the ring of the abdominal muſcle, and continuing quite down to the inferior part of the ſcrotum; upon the diviſion of the membrana adipoſa, ſome ſmall tendinous bands appear diſtinct from each other, lying cloſe upon the hernial ſac, which is next to be divided: here caution is neceſſary, as the ſac is thinner in ſome parts than in others: even this external inciſion of the teguments ought to be made with great caution; for although, in by much the greateſt proportion of hernial ſwellings, *the ſpermatic veſſels lie behind the protruded parts, yet on ſome occaſions they have been found on the anterior part of the tumor*; ſo that in order to avoid the riſk of wounding them, ſo ſoon as the ſkin is divided, the remainder of the operation ought to be done in the moſt cautious manner, care being taken to avoid every large blood-veſſel that makes its appearance.

The

The incision in the sac, is best made about an inch and a half, or two inches below the stricture, and need be no more than such an aperture as will just admit the extremity of the probe, into which opening introduce one, and if it will go up and down, then enlarge it with a probe-pointed bistory, sufficient to introduce your finger to divide the whole, remembering to divide it downwards first, which gives more room, and lessens the hazard of the intestines getting round your knife, and being wounded by it, which might easy happen in dividing it upwards first. The fore-finger introduced into it is the best of all directors, and upon that finger a narrow-bladed curved knife, with a bold probe point, will be the only instrument necessary to finish the operation. With this knife on the finger, the sac should be divided, first downward to the bottom of the scrotum, then upward to the ring. Upon the first division of the hernial sac, a fluid is discharged, differing in quantity, colour, &c. in different patients. In opening the sac great care is required to evade wounding its contents. The sac being fairly divided up to the ring, the intestine pushes out, and seems to be more in quantity than it did while in its confinement. At this juncture, if the quantity of the protruded intestine is not very great, try to reduce it by first pulling down a little more, for thus its bulk being lessened, it perhaps may pass without dividing the ring; if this does not succeed, the probe-pointed knife, conducted on the fore-finger, will immediately divide the upper part of it, and set all free. The sac and ring divided, the contained parts come into view, and according to their different states, will be variously managed. If sound, immediately reduce them, remembering that the parts last protruded should be first returned. Slight adhesions may be separated with the finger, or snipped with the scissars. If the parts are so adherent as not to be capable of being returned, remove the stricture by dividing the sac and ring, and leave the prolapsed parts in the scrotum as you find them; but this case cannot easily be supposed to happen. If the contained parts are quite mortified, death will be the issue; but if the mortification is not very extensive, return them; if the intestine is mortified, make a ligature and fix it to the wound, thus the fæces will pass out there, and the patient may live many years after.

In women this kind of rupture may be cured by a caustic, which cannot be so well admitted of in men, on account of the spermatic chord.

The portion of gut found in hernial swellings is very various, no part of the intestinal canal being entirely exempted from falling down. Hitherto the ileum has been commonly supposed to form the substance of the greatest proportion of such tumors; later and more accurate observation, however, renders it probable that the cœcum, appendix vermiformis, and part of the colon, are more frequently contained in the hernial sacs than any other portion of the gut.

See Pott on Ruptures, Le Dran's Operations in Surgery, Sharp's Operations of Surgery. Lond. Med. Obs. & Inq. vol. iv. Bell's Surgery, vol. i. White's Surgery, 318.

BUBON GALBANUM. See Galbanum.

—— Macedonicum. See Apium Macedonicum.

BUCCÆ. The cheeks. Hippocrates terms them *Cyclos*; the cheek is also called *Gamphale*; *Gena*; *Maxilla*; *Melon*. They are the sides of the face; they reach from the eyes and temples between the nose and ears. The upper prominent parts of the cheeks are called, mala, which see.

BUCCACRATON. A buccea or buccella, that is, morsels of bread sopped in wine, which served in old times for a breakfast.

Paracelsus calls by the name of buccella, the carneous excrescence of a polypus in the nose, because he supposes it to be a portion of flesh parting from the bucca, and insinuating itself into the nose.

BUCCALES GLANDULÆ. All the insides of the cheeks, near the mouth, are full of small glandulous bodies called by this name. They open by small holes or orifices, through the inner membrane of the mouth. Winslow.

BUCCEA. See Buccacraton.

BUCCELATON, Buccella Purgatoria, and buccellatus. A purging medicine made up in the form of a loaf, consisting of scammony, &c. put into fermented flour, and then baked in an oven.

BUCCELLA. See Bolus; Buccacraton, and Buccelaton.

BUCCENATOR MUSCULUS, *constrictor musculus*. The trumpeters muscle, from βυκανη, *a trumpet*. It is thus named because of its use in forcing the breath to sound the trumpet, by two distinct beginnings on each side, one tendinous and fleshy from the lower jaw, between the last dens molaris, and the root of the forepart of the processus coronæ; the other is fleshy from the upper jaw, between the last dens molaris and the processus pterigoides, from whose extremity also it arises tendinous, being continued between these two originations to the pterigo-pharyngæus on one side, and the mylo-pharyngæus on the other; from thence proceeding with straight fibres, and adhering to the membrane that covers the inside of the mouth, but without touching the gums of either jaw. It is inserted and lost in the angle of the lips. By its substance on each side it constitutes the cheeks, and through its middle *the ductus salivalis superior* passes. Its use is not only to move the cheeks with the lips, but also to contract the cavity of the mouth, by bringing them inwards, and so thrust the meat between the teeth, for its better comminution.

BUCCINUM. The whelk. Whelks calcined have the same effect as the purplish-fish, but are somewhat more caustic. Filled with salt, then burned in a crude earthen pot, they make a good dentifrice. It is a sea shell-fish, of which there are many sorts, but they all are alkalies and absorbents.

BUCCULA. A diminitive of bucca, the cheek. The fleshy part under the chin.

BUCELLATIO. A way of stopping the blood by applying lint upon the vein or artery.

BUCERAS, or Buceros. See Fænum Græcum.

BUCRANION, from βους, *an ox*, and κρανιον, *a head*; so called because it resembles an ox's head. See Antirrhinum.

BUCTON. See Hymen.

BUFFAL. See Bubalus.

BUFFELI. A ring made of the horn of a buffalo, which is worn on the ring-finger to cure the cramp.

BUFFELUS. See Bubalus.

BUFO. The toad; also called *rubeta*, *rana rubeta*. The *toad* is of the frog kind, and of the number of those animals which have only one ventricle in the heart. It is much like the frog, but its belly is more inflated, and skin more full of tubercles; it is of an ash-colour, with brown, blackish, and yellow spots. It does not croak like the frog, but makes an indistinct noise that is obscure, and like the word *geu*, or rather *bu*, from which some suppose it is called *bufo*. It is said to have its name rubeta from rubus, because it is often found under bramble bushes.

There is a very poisonous species in America called *cururu* by the Brasilians, and *capo* by the Portuguese.

The common *toad* was first introduced into medicine upon a cure being performed on an hydropic person, to whom powdered *toads* were given, in order to dispatch him, but he voided a large quantity of urine after taking it, and soon recovered of his disorder. Since this, *toads*, gently dried and powdered, have been used as a diuretic. But the present practice rejects them. They have also been applied alive to cancers, under the idea of extracting the virus.

BUGANTIA. Chilblain. See Pernio.

BUGLOSSUM. Buglos; called also *buglossum angustifolium majus*, *buglossum vulgare majus*, *buglossum sativum*, garden-bugloss.

The *garden-bugloss* is a rough plant, resembling borage, and differing from it chiefly in the leaves being narrow, less prickly, not wrinkled, and of a bluish green colour, and in the segments of the flowers being obtuse. It grows wild on waste grounds in the southern parts of Europe, is cultivated with us in gardens, flowers from June to the end of summer, and in winter it dies to the ground, but the roots continue. It is a name of the *borrage*, and as a medicine is nearly similar, but its roots are less mucilaginous. For that called—— Radice Rubra, see Anchusa.

BUGONES, from βους, *an ox*, γινομαι, *to be bred*, or *generated of*. An epithet for bees, because the ancients thought them to be bred from the putrefaction of an ox. See Apes.

BUGULA. Bugle. Called also *consolida Media*, *prunella Germanis*, *symphitum medium*, and middle consound. The sort used in medicine is the *ajuga reptans*, Linn.

It is a low plant, with two kinds of stalks, round creeping ones, and upright square ones. They bear loose spikes of blue flowers; the leaves are somewhat oval, soft, and set

ſet in pairs about the joints of the ſtalks. It is perennial, found wild in woods and moiſt meadows, and flowers in May.

It is mildly aſtringent; the root is the moſt ſo.

BULAT-WELA. See BETLE.

BULBINA. A diminutive of bulbus.

BULBOCASTANUM; called alſo *agriocaſtanum*, *nucula terreſtris*, *balanocaſtaneum*, *pancaſcelus*; *bulbocaſtanum majus & minus*, EARTH-NUT, HAWK-NUT, KIPPER-NUT, and PIG-NUT.

This root is as large as a nutmeg, hard, tuberous, and whitiſh, ſending out fibres from the bottom and ſides; the lower leaves are winged, cut into ſeveral diviſions of leaves, finer and ſmaller than thoſe of ſaxifrage; the ſtalk is above a foot high, having one leaf about the middle, which is fine and ſlender as fennel, having the like leaves at every diviſion of the branches, on the tops of which grow thin umbels of ſmall white flowers. It grows in ſandy and gravelly places, and flowers in May.

The root only is uſed; it is eaten either raw or roaſted. It is ſweetiſh to the taſte, nouriſhing, and of uſe againſt the ſtrangury and bloody urine.

BULBOCODIUM. See NARCISSUS LUTÆUS SYLVESTRIS.

BULBONACH, called alſo *viola lunaris*, *lunaria major*, *leucoium lunatum*, *bolbonac*, SATTIN and HONESTY.

The ſtalk is two or three feet high, as thick as a man's little-finger, hairy, and of a dark red, or an azure colour; the leaves reſemble thoſe of a nettle, but are much larger, and hairy; the branches and ſummit of the ſtalk are laden with flowers of a purpliſh, or carnation colour; the root is knotted, whence the name *bulbonach*; the ſeeds are large, red, and acrid to the taſte. It grows ſpontaneouſly in Germany and Hungary, and is ſown in gardens in England.

This plant is a warming, diuretic medicine. Raii Hiſt.

BULBUS, vel BOLBOS. *Bulbous* roots are ſuch as conſiſt of either ſeveral coats involving one another, or of the ſeveral ſcales lying one over the other. The firſt is called a tunicated root, ſee Pl. 23. N°. 7. The ſecond is called ſquamous or ſcaly, ſee Pl. 23. N°. 8. The third, ſolid bulbous root, ſee Pl. 23. N°. 6. The fourth, double bulbous, or teſticulated, ſee Pl. 23. N°. 9. For that named —— ESCULENTUS, are ſuch *bulbous roots* as are commonly eaten. —— VOMITORIUS, called alſo *muſcari*, ASH-COLOURED GRAPE-FLOWER, *muſcari obſoletiore flore*, *hyacinthus racemoſus moſchatus*, *ſibcadi*, *dipcadi*, and MUSK GRAPE-FLOWER.

It hath a leaf as flexible as leather, the root is covered with a black rind, but in other reſpects like the *bulbus* eſculentus. The root is emetic and diuretic. It grows in gardens about Conſtantinople, and in Aſia. Raii Hiſt.

—— SYLVESTRIS. See NARCISSUS LUTÆUS SYLVEST.

BULIMIA, BULIMIASIS, & BULIMUS. See BOULIMUS.

BULITHOS, from βους, *an ox*, and λιθος, *a ſtone*. A ſtone found in the gall-bladder, kidnies, or urinary bladder of an ox.

BULITHUM. See CAPRA ALPINA.

BULLÆ. Puſtules ariſing in the eye, or from burning any part.

BULLION. Gold or ſilver in the ore, or imperfectly refined.

BULLOSSA FEBRIS. See PEMPHIGUS.

BUMELIA. See FRAXINUS.

BUNA. See COFFEIA.

BUNIAS, vel BOUNIAS, from β νις, *rugged*, becauſe it delights in rugged places, called alſo *Æthne*; *Napus*. NAVEW. It is a plant of the turnip-kind, with oblong roots, growing ſlender from the top to the extremity. Linnæus ſuppoſes two ſorts, viz. the wild and the ſweet *navew*, to be but varieties, and calls them by the name of BRASSICA RADICE CAULESCENTE FUSIFORMI. They are biennial. It is alſo the *napus ſativa*, *napus dulcis*, NAVEW GENTLE,—RAPE, FRENCH NAVEW, SWEET NAVEW, and FRENCH TURNIP. It is the BRASSICA NAPUS of Linn.

It is cultivated in gardens for the kitchen. Theſe are warmer, and more grateful, than the common turnip, and afford a good pectoral juice.

The ſeeds of both ſorts are warm and pungent, approaching to the virtues of muſtard, but much inferior in their efficacy. Water takes up all their virtues. They yield by expreſſion a large quantity of oil, which is ſold under the name of rape oil: the wild ſort is cultivated for this purpoſe. The cake remaining after the oil is expreſſed, retains the acrimony of the ſeed.

There is a ſpecies which Galen prefers to the above; it is called *pſeudo-bunium*, or *napus ſylveſtris Critica*, or CANDY WILD NAVEW. Dale.

BUNITES VINUM. WINE of BUNIUM. It was formerly made of *bunium*, two drams; and muſt, four pints.

BUNIUM. WILD PARSLEY, alſo called *daucus petroſelini*, vel *coriandri folio*;—*Saxifraga montana minor*. It grows in ſtony places; and is ſomewhat warming and diuretic.

BUPEINA. See BOULIMOS.

BUPHAGOS. The name of an antidote in Marcellus Empiricus.

BUPHTHALMUM. OX-EYE, or OX-EYED, named *boanthemon*.——In MYREPSUS, it is called *creſpulum*. That called —— COTULÆ FOLIO, alſo *cotula flore luteo radiato*, is the camomile-like *ox-eye*.—— GERMANICUM, called alſo *bupthalmum tanaceti minoris folio*, *chamæmelum chryſanthemum*, *buph. vulg.* COMMON OX-EYE.—— VERUM, called alſo *buph. peregrinum*, *buph. tenuifolium folio mille folii fere*, *chryſanthemum cotulæ folio*, *cotula flore luteo radicato*, *cachlan*, OX-EYE.

Theſe plants have tender ſtalks, with leaves like thoſe of fennel, and yellow flowers reſembling an eye. They grow in fields about towns. All the ſpecies are commended in the jaundice.

Miller ſays, that which is ſold for *ox-eye* in the ſhops is the bellis major; of which there are five ſpecies. See Miller's Bot. Off.—— CRETICUM. See PYRETHRUM. —— MAJUS. See BELLIS MAJOR.

BUPHTHALMUS. A DISTEMPERED EYE. From βους, *an ox*, οφθαλμος, *oculus*. From its vaſt largeneſs like an ox's eye. See EXOPHTHALMIA.

BUPLEURUM, } HARE'S EAR. Alſo called *auricula*
BUPLEURON. } *leporis*, *perfoliata*, & *hyſophyllon*.

It grows on hilly places in France, &c. flowers in July and Auguſt, is deterſive and diuretic. Dale. For that called —— ARBORESCENS SALICIS FOLIO, ſee LASERPITIUM VULGATIUS.

BUPLEUROIDES. A plant which much reſembles the bupleurum. Miller's Dict.

BUPRESTIS. The BURN COW. They are a kind of cantharides, and are poſſeſſed of a good degree of the ſame virtues. It is alſo a name of an herb, which was in much eſteem among the Greeks as an eſculent one.

BURAC. See SAL.

BURHALAGA. See EMPETRUM THYMELÆÆ FOLIIS.

BURINA. PITCH. See PIX.

BURIS. So Avicenna calls a ſchirrhous hernia.

BURNEA. PITCH. See PIX.

BURRHI SPIRITUS MATRICALIS. Burrhus's ſpirit for diſorders of the womb.

It is made with myrrh, olibanum, and amber, in ſpirit of wine.

BURSÆ MUCOSÆ, called alſo *burſæ tendinibus ſubjectæ*; & *facculi mucoſi*.

It is ſaid that Bellini firſt obſerved theſe bags, but Douglas firſt deſcribed them. Their office is to emit a lubricating mucus, to facilitate the motion of the tendons, where they play upon one another, or upon a bone.

Bell's Surgery, vol. v. 479. Monro's Deſcription of the *Burſæ Mucoſæ*, and their diſeaſes.

Mr. Gooch, in his obſervations, takes notice of a wound into one of theſe bags on the ſide of the knee, which from the diſcharge he concluded to have been in the burſal ligament, but it healed kindly, and gave him to ſuſpect that theſe bags may be the ſeat of diſorders not yet adverted to. He hath alſo given the following liſt of them.

1. DELTOIDES. A large one ſituated under this muſcle, upon the acromion ſcapulæ.

2. BICEPS BRACHII. A ſmall one inveſting the tubercle of the radius, both on the ſide where the tendon is fixed, and alſo on the other ſide, where there is no tendon. It adheres ſtrongly to the whole tubercle, and looſely to part of the ſupinator brevis, under which it lies, as well as under the tendon of the biceps.

3. ILIACUS INTERNUS & PSOAS. A large thin and pliable one is found upon the iſchium, beneath the tendons of the iliacus internus and pſoas, as they paſs down to their inſertions in the os femoris. It is attached to

theſe tendons, and to the anterior ſurface of the capſular ligament; and this ſacculus ſometimes communicates with the joint.

4. LATISSIMUS DORSI & TERES MAJOR. One is ſituated between the extremities of the tendons of theſe muſcles, adhering ſtrongly to them.

5. GLUTEUS MAXIMUS. A large thin one, firmly connected by a ſmall part of it to the back of the trochanter, immediately under the termination of the gluteus medius, and is looſely attached to the reſt of the trochanter, and the tendon of the gluteus maximus.

6. GLUTEUS MEDIUS. A ſmall one ſituated between the termination of its tendon and that of the pyriformis, adhering to both.

7. GLUTEUS MINIMUS. A ſmall thin one, attached to its tendon and the trochanter major.

8. GEMINI. A ſmall one between them and the termination of the obturator internus, connected to both, and to that part of the capſula of the joint which lies under the gemini.

9. BICEPS CRURIS. One is ſituated between the end of its tendon exteriorly, and the capſular ligament of the knee, adhering to both.

10. SEMIMEMBRANOSUS. A ſmall one, lies between its tendon, which runs between the inner condyle of the tibia, and the capſular ligament of the joint.

11. CRURALIS & VASTI. Behind the tendons of the cruralis and vaſti there is a thin, but large one, connected to thoſe tendons before they join, and, after their junction it is fixed to the patella. It alſo adheres to the capſula of the joint that expands itſelf over the bone.

12. GRACILIS, SARTORIUS, & SEMITENDINOSUS. Under the extremities of the tendons of theſe muſcles, is a large one, adhering to them on one ſide, and on the other to the capſular ligament of the knee, and on the ſide where theſe tendons play.

13. GEMELLUS. A large one lies under its inner head, firmly attached to its tendinous origin, alſo to the extremity of the ſemitendinoſus, and the capſula of the knee near the anterior condyle.

14. SOLEUS. The tendon of the ſoleus paſſes over the upper part of the os calcis, between which and the bone lies a large ſacculus, and, near that, is found a glandular body which furniſhes a mucous fluid for the more effectual lubrication of theſe parts, that are in ſuch conſtant motion in walking.

15. TIBIALIS ANTICUS. A ſmall one is fixed to the tendon a little before its termination, where it plays on the top of the foot.

16. PERONEUS LONGUS. One lies under the tendon of this muſcle, where it plays over the os cuneiforme, on the outſide of the foot.

BURSA TESTIUM. See SCROTUM.

BURSALIS MUSCULUS. So called from its reſemblance to *burſa, a purſe*. See OBTURATOR EXTERNUS & INTERNUS.

BUSELINUM. See DAUCUS SATIVUS.

BUSSII SPIRITUS BEZOARDICUS. The BEZOARDIC SPIRIT of BUSSIUS, who was an eminent phyſician at Dreſden.

Take the ſpirit of ivory, ſaturated with ſubtile oil and ſalt, two ounces; crude ſal ammoniac, four ounces; potaſh, diſſolved in water, eleven ounces; amber, half a pound; oil of juniper, half an ounce; diſtil them in a retort. A ſalt riſes firſt, and then the ſpirit, which diſſolves this ſalt.

BUTIGA. See GUTTA ROSACEA.

BUTINO. See TEREBINTHINA.

BUTHALMUM MAJUS. See BELLIS MAJOR.

BUTOMON. } See IRIS PALUSTRIS.
BUTOMUS. }

BUTUA. See PAREIRA BRAVA.

BUTYRUM. BUTTER. See ADEPS.

——— CERÆ. See OLEUM CERÆ.

——— COCTUM. See AZOM.

BUTYRUM ANTIMONII. See ANTIMONIUM, N°. 7.

BUXB. An abbreviation of J. C. Buxbaumi Enumeratio Plantarum, 1721, 8vo.

BUXTONIENSIS AQUA. BUXTON WATER. See AQUÆ SULPHUREÆ. *Buxton* is in the Peak of Derbyſhire. The *waters* there are the ſecond in degree of heat among thoſe of this iſle. The *water* of St. Ann's well contains calcareous earth, foſſil alkali, and ſea ſalt; but of theſe their quantity is ſo ſmall, that when a gallon of the *water* was evaporated, the ſediment was only betwixt twenty-three and twenty-four grains. This *water* ſtrikes a light green with the ſyrup of violets; it ſuffers no change from galls, from fixed vegetable alcalies, or from mineral acids; it becomes milky with the volatile alkali. The ſpecific gravity of this *water* is preciſely equal to that of rain-water, when their temperatures are the ſame; but when firſt taken from the ſpring it is four grains in each pint lighter.

The temperature of the bath is about eighty-two degrees by Fahren. therm. that of St. Anne's not quite ſo much.

Beſides the contents already mentioned, which the *water* of St. Anne's well poſſeſſes, it contains a conſiderable quantity of mephitic air, in which its ſtimulus and indeed its efficacy reſide, and which is quickly diſſipated by expoſure to the atmoſpheric air.

This *water* is alterative, and not evacuant. Begin the uſe of it by taking about a pint in the forenoon, and gradually increaſe the quantity. The cooler the weather, the hotter and more medicinal is the *water*. It increaſes the vital heat, is uſeful in the gout, rheumatiſm, dry aſthma, convulſive diſorders, indigeſtion, loſs of appetite from intemperance, contractions of the tendons, defective catamenia, &c. It is of ſervice in other diſorders where tepid baths are uſeful. It is uſed for baths, and drank to the quantity of five or ſix pints in a day.

See Short's Hiſtory of Mineral waters. Percival's Eſſays, Med. and Exp. vol. ii. Dr. Hunter's Eſſay.

Beſides the tepid mineral *waters* which are in ſo much repute, there is a ſpring here of a fine clear chalybeate *water*, which has a rough irony taſte. Dr. Short evaporated a gallon of it, and had remaining a ſcruple of ſolid matter, above half of which he ſays was ochre, and the reſt a ſaline matter compoſed of ſea-ſalt and nitrum calcarium (vitriolated magneſia). This water is drank for the ſame purpoſes as other chalybeates.

BUXUS. BUXUS SEMPERVIRENS. The BOX-TREE. The Hollanders call it palm-tree. It is an ever-green, and full of branches. Its leaves are gloſſy, and almoſt of an oval ſhape. The wood is yelloviſh, and more compact and ponderous than any other of the European woods. The flowers are imperfect; the fruit is a green berry, divided into three cells, containing ſix ſeeds. It is found wild in ſome parts of England.

An infuſion of the leaves in water hath a ſtrong, nauſeous taſte, is purgative, and deſtroys worms. The active matter of the wood is of the ſaline, and not of the reſinous kind, conſequently differs from the lignum guaiacum, with which ſome ſay it agrees.

The leaves of the common *dwarf-box* dried and powdered are ſaid to deſtroy worms in children. As much as will lay on a ſhilling may be given at bed-time, every night.

BUYO-BUYO. A ſort of pepper in the Philippine iſlands. Ray calls it *piper longum menardi*.

BYARIS. See CETE ADMIRABILE.

BYNE. See BRASIUM.

BYNG. A Chineſe name of GREEN TEA. See THÆA.

BYRETHRUM, } See CUCUPHA.
BYRETHRUS. }

BYRSA. See ALUTA.

BYRSODEPSICON, from *βυρσα, a ſkin*, and *δεψεω, to curry leather*. See RHUS.

BYSAUCHEN, from *βυω, to hide*, and *αυχην, the neck*. People are thus called who by elevating their ſhoulders hide their neck. Alſo one who hath a morbid ſtiffneſs of the neck.

BYSMA, from *βυω, to ſtop up, obſtruct, fill up, conſtipate*, or *ſtuff*. The covers, or ſtopples of any veſſels. Some take the *byſma* to be the ſame with the *amurca*. See BYZEN.

BYSSUS. Is a name for the *pudendum muliebre*; and a ſort of fine cloth worn by the ancients. See alſo BOMBAX.

BYSTINI ANTIDOTUS. An antidote often mentioned by Aetius, which ſeems to be much like Mithridate.

BYZEN. In a heap, croud, or a throng; called alſo *byſma*. It is derived from the word *βυζω, or βυω, to fill up by ſtuffing, to condenſe*; thus it expreſſes any thing that is ſufficiently denſe. Hippocrates uſes this word to expreſs the hurry in which the menſes flow away in an exceſſive diſcharge of them.

C.

C A A

C. See NITRUM.

CAA-APIA. It is a ſmall low plant, with a root about two fingers breadth long, as thick as a ſwan's quill, and ſometimes as large as a man's little finger. This root is knotty, and covered with filaments that are three or four fingers breadth long. Outwardly it is of a yellowiſh grey colour, but inwardly it is white. After being chewed a little it is acrid, and hath nearly the ſame virtues with *ipecacuanha*, whence it hath alſo received that name.

The Braſilians cure the wounds from poiſoned darts with the juice of this root, which they pour into the wound. Piſo ſays it hath the ſame efficacy againſt the bite of ſerpents. See BOJOBI.

CAA-ATAYA BRASILIENSIS, hence its name *Euphraſiæ affinis Braſilienſis ſiliquoſæ*. It is a plant which grows in Braſil, of no ſmell, but bitter to the taſte. A decoction of it operates powerfully both upward and downward. It reſembles the euphraſia. Raii Hiſt.

CAACHIRA. See INDICUM.

CAACICA BRASILIANIS. Called alſo *Colubrina Luſitanica*. An herb growing in Braſil, whoſe leaves reſemble thoſe of the male ſpeedwell, ſomewhat hairy, green above, and white underneath. It is full of a milky juice. When freſh it is bruiſed, and applied againſt venomous bites. Raii Hiſt.

CAACO. The SENSITIVE PLANT, alſo called *æſchynomene ſpinoſa Braſilienſibus ſecunda, herba viva, noli me tangere*.

It is a native of Braſil. If the leaves of this plant are touched by any thing, they immediately contract, but ſoon after return to their former ſtate. Dr. Shebbeare ſuppoſes, that this plant is diſtended by a portion of the general principle which animates all nature, and that the touch of any foreign body diſcharging a part of it, is the cauſe of its contraction, from which it recovers as the ſame is reſtored by its own power of attracting it. The tops of this plant are noxious, and the roots are their antidote. A decoction is made of a handful of that part of the root which is under ground, boiled in ſix pints of water for a few minutes, half a pint of which is to be drank every hour or two, until the patient is well. This root is an antidote to ſeveral poiſons which the Americans have amongſt them.

There is another ſpecies called *herba viva tertia ſpecies*; *æſchynomene ſpinoſa tertia*.

CAAETIMAY BRASILIENSIBUS, called alſo *ſenecio Braſilienſis*.

It is a tall plant which grows in Braſil; the leaves of which have a hot and acrid taſte. A decoction of them cures the itch, by waſhing the parts affected with it. Raii Hiſt.

CAAGHIYUYO BRASILIENSIBUS, *Frutex baccifer Braſilienſis*. A ſhrub growing in Braſil; its leaves are powdered, and then applied to ulcers as a deſiccative.

CAA-OPIA, called alſo *arbuſcula gummifera Braſilienſis*. It is a tree growing in Braſil, from the bark of which, if inciſions are made, a juice is emitted, which, when dry, reſembles the gutta gamba in all reſpects, only in being ſomewhat redder. Raii Hiſt.

CAAPEBA. See PAREIRA BRAVA.

CAAPONGA. The Braſilian name for *crithmum*, alſo called *trifolia ſpica, crithmum marinum non ſpinoſum*.

C A C

The leaves and young ſtalks are pickled for the uſe of the table, though they are gently diuretic.

There is another ſpecies; it is called *perexyl Luſitanis*; it reſembles purſlane, and is of the ſame nature as the above.

CAAROBA. A tree which grows in Braſil; the leaves are bitter, a decoction of them promotes perſpiration, and is uſeful in the veneral diſeaſe. Raii Hiſt.

CABALA, CABBALA, CABALIA, CABULA, CABALLA, KABALA, KABBALA, CABALISTICA ARS. The CABALISTIC ART. It is derived from the Hebrew word, ſignifying *to receive by tradition*. It is a ſcience which conſiſts in a myſterious explication of the Scriptures, however they were received: This is the Jewiſh *cabala*; but, from this original, the word is applied to any ſort of myſterious or magical explication of things. Paracelſus, though, uſes it in a medical ſenſe, ſaying *cabaliſtic* ſigns cannot deceive, *ſi Dis placet*; beſides, ſome enthuſiaſtic philoſophers and chemiſts have tranſplanted it into medicine, importing by it ſomething magical.

CABALATOR. See NITRUM.

CABASSONUS MASSILIENSIUM. A fiſh found in the Mediterranean ſea; alſo called *lavoronus*.

CABALLICA ARS, from καταβαλλω, *to throw down*. A term in gymnaſtics, importing among wreſtlers the art of foiling, or throwing an antagoniſt down.

CABEB, or CABEBI. SCALES of IRON.

CABELIANUS. A fiſh of the cod, or of the pike kind.

CABELIAU. COD-FISH. See ASELLUS MAJOR.

CABULA. See CABALA.

CABULATOR. See NITRUM.

CABUREIBA. } See PERUVIANUM BALSAMUM.
CABURIIBA. }

CACAGOGA. OINTMENTS, that by being rubbed on the fundament procures ſtools. See P. Ægineta, lib. vii. ix.

CACAI. See CACAO.

CACALIA, alſo called *leontice veterum*, and STRANGE COLT'S-FOOT.

It hath a floſculous flower, and downy ſeeds; the leaves are large and white; it grows in ſhady places. PAULUS of ÆGINA, and DIOSCORIDES, ſuppoſe this to be the Cacanum; for their virtues are ſimilar to the common ſort, for which ſee TUSSILAGO. Miller enumerates ſeven ſpecies.

CACALIANTHEMUM, ſo called by Dr. Dillenius; it is alſo called the CABBAGE-TREE, and the CARNATION-TREE. Originally it was brought from the Canary iſlands. There is a ſpecies which was firſt brought into Europe from the Cape of Good Hope. See Miller's Dict.

CACAMOTICFLANOQUILONI. See BATTATAS PERIGRINA.

CACANUM. See CACALIA.

CACAO, called alſo *cacoa, amygdalus ſimilis Guatimalenſis, cacava, cacari, quahoitl, caravata, cocolata, chocolata, cacai, avellana Mexicana, cacavera, cacavata cocao Americæ*, the PEAR-BEARING WHOLESOME ALMOND-TREE, CACOA, and CHOCOLATE. It is the THEOBROMA CACAO of Linn. The nut is the only part of this tree which is uſed; its ſhape is nearly like that of an almond, but of a much larger ſize. The ſhell is dark-coloured,

coloured, brittle, and thin; the kernel throughout is of a brown colour. It is produced by a ſmall American tree, which bears a large red fruit like a cucumber; in this fruit is contained from thirty to a hundred of theſe nuts. A good tree produces a crop in June and another in December. The principal diſtinctions among theſe nuts are the ſize and place from whence they are brought: the larger kind from the province of Nicaragua, in Mexico, are moſt eſteemed. The chief of what we have in England are brought from Virginia and Jamaica.

Theſe nuts have a light agreeable ſmell, and an unctuous bitteriſh taſte, but not ungrateful. Thoſe from Nicaragua and Caracco are the moſt agreeable; thoſe from the French Antilles, and our American iſlands, are the moſt unctuous.

The principal uſe of this kind of nut is for making the liquor which is known by the name of *chocolate*; which is a mild, unctuous, nutritious fluid, and greatly demulcent. In hectic, ſcorbutic, and catarrhous diſorders, an atrophy, malignant itch, and hooping cough, *chocolate* made in the uſual way is ſaid to relieve after all other uſual methods have failed. In all diſorders from an acrid ſalt, whether acid or bilious, this liquor is highly uſeful. When *chocolate* is mixed with demulcent and aromatic ingredients, it is uſeful for the hypochondriac and melancholic. It is ſaid to make the teeth black.

All theſe ſorts of *chocolate* nuts afford by preſſure on oil of the ſame kind as thoſe that are obtained the ſame way from other kernels and ſeeds.

OLEUM SEU BUTYRUM E NUCL. CACAO. *The* OIL *or* BUTTER *of the* CHOCOLATE NUT.

Roaſt the nuts ſlightly in an iron pan, then being cleared from the rind and germ, and levigated on a hot ſtone, dilute them with a proper quantity of hot water, and keep them in a water bath till the oil riſes to the top; which, when concreted, is of a brown colour, and by repeated liquefactions in hot weather becomes white.

This proceſs is from the Paris diſpenſatory. Theſe nuts, thus managed, afford ſometimes more than half their quantity of this vegetable ſevum or ſebaceous matter. It is not liable to turn rancid by long keeping; hence it is a proper baſis for odoriferous unguents: but its indigeſtible property renders it unfit for internal uſe.

To ſeparate the huſks from the *chocolate* nuts, put two or three pounds of them into a pan over a gentle clear fire, ſtir them about until they are a little heated, and as ſoon as you find that the huſks will peel off, carefully free the kernels from them, for they are totally indigeſtible. The mucilaginous pulp contained in theſe huſks, if preſſed, yield a cream that is cordial and grateful to the taſte; as an emollient for external application, it is of admirable efficacy.

To prepare the kernels of the *chocolate* nuts for uſe, bruiſe them, after having ſeparated their huſks; then place them before a clear fire or in an oven that is warm, but not very hot; and thus they are ſo diſſolved as to be fit for making into cakes or rolls for uſe.

This ſubſtance is not always eaſily digeſted, and has ſometimes given many inconveniencies, which are apt to occur from this cauſe, but theſe may be obviated in a great meaſure by a very diligent triture, uniting very intimately the farinaceous and oily part of which it conſiſts.

The Mexicans mix with theſe nuts a portion of Indian corn, a few ſeeds of rocou, and a little vermilion. The Spaniards mix cloves and cinnamon with them. The French mix with their's a little cinnamon, vanilla ſeeds, and fine ſugar: in Paris they make up their *chocolate* for ſale as follows. Take of *chocolate* nuts, freed from their huſks, and fine ſugar, of each a pound; of cinnamon, finely powdered, two drams; and of vanilloes half a dram; beat them well together, and form them into cakes or rolls.

After drinking of *chocolate*, if it is uneaſy in the ſtomach, relief will be found from drinking a tea-cupful of cold water.

AN ARTIFICIAL CHOCOLATE is made of almonds, thus: take of ſweet and bitter almonds of each an ounce, roaſt them in an iron pan until they are brown, then wipe them clean, and bruiſe them in a mortar, gradually mixing with them four meaſures of warm milk, two eggs that have been well mixed with a little cold milk, and as much cloves, cinnamon and ſugar, as may be agreeable to the palate.

CACAPHONIA. See PARAPHONIA.

CACATORIA FEBRIS. A name given by Sylva to a kind of intermittent fever attended with copious ſtools.

CACARI, CACAVIFERA, CACAVA, QUAHOITL, CACAVATA. } See CACAO.

CACAVI. See CASSADA.

CACCIONDE. A pill commended by Baglivi againſt the dyſentery: its baſis is the terra Japonica.

CACEDONIUM TARTARUM. The peccant matter in the human body, generated from ſeparations by the ſecretive faculty, which are not immediately ſucceeded by the operation of the expulſive.

CACHALOT. See CETE ADMIRABILE.

CACHEXIA, from κακος, *ill* or *bad*, and εξις, *a habit*. A BAD HABIT OF BODY, called alſo *deformes*.

A *cachexy* is an univerſal bad habit of body, in which there is a defect of vital heat. Or, it is that diſpoſition in the body which depraves the nouriſhment thereof, and makes the ſkin of a diſagreeable colour. If difficult menſtruation is the cauſe, it is called a *chloroſis*. In Dr. Cullen's Noſology, it is the third claſs of diſeaſes. He defines it to be "a depravity of the conſtitution of the whole, or of a great part of the body, without any febrile or nervous diſeaſe as the primary one."

They are the moſt diſpoſed hereto who are naturally of a lax and ſpongy habit, which conſiſts in the ſoftneſs of the moving fibres, the ſmallneſs and number of the veſſels, and the ſlenderneſs of the tendons. Women are more ſubject to it than men; men of a ſanguine, and phlegmatic habit, than thoſe of different ones; for ſuch perſons are apt to be phlethoric, which occaſions the liver ſometimes to be obſtructed, whence the train of conſequences which form this diſorder.

The CAUSES are various: as, whatever can leſſen the natural heat of the conſtitution;—whatever produces repletion or depletion;—a bad quality introduced into the circulating fluids;—the nerves in the uterus and inteſtines having the ſame origin, the diſorders in the firſt diſturb the latter, when the chyle being crude and unfit for nature's wants, a *cachexy* is the conſequence;—free eating and an inactive life, particularly when the ſtomach and digeſting powers are impaired, beget a crude chyle, irregular, and otherwiſe defective ſecretions, whence a general indiſpoſition of the juices and defect in the ſolids, and this Dr. James obſerves may produce any of the ſymptoms that the different writers ſay are proper to this ſtate of the body. In pubertine girls it is cauſed by difficult menſtruation: many aged people have this diſorder from a ceſſation or obſtruction of periodical diſcharges.

Its PRESENCE is manifeſted by a pale white countenance, but oftener by a yelloviſh or greeniſh colour in the ſkin, a tumidneſs, coldneſs, and a ſoft flabbineſs of the body, with a general feebleneſs; a wearineſs is alſo complained of, a difficulty of breathing on the leaſt exerciſe, the feet are puffed, the mind is inactive, during ſleep an oppreſſion is perceived, the urine is white and turbid, the pulſe ſlow and ſoft, the eye-lids have an œdematous kind of ſwelling. When a difficult menſtruation in girls is the cauſe, beſides theſe ſymptoms, there is a pain in the head, a frequent palpitation of the heart, and a preternatural longing for things noxious and unfit for food; pain in the back and loins, a plethora either of the ſanguineous or phlegmatic kind, and a ſenſe of weight acroſs the eyes. See CHLOROSIS.

There are ſeveral chronical diſorders which may properly be called *cachexies*, but are diſtinguiſhed by differing in their cauſe, ſeat, or other circumſtance; the cacochymia, chloroſis, fluor albus, &c. are inſtances of this kind. But what is generally underſtood by *cachexy*, (which is a general bad habit of body, without any one remarkable ſymptom by which any particular diſorder is characteriſed), ſhould be diſtinguiſhed from a jaundice, leucophlegmacy, an atrophy, a ſcurvy, &c.

Old perſons are the moſt ſeverely afflicted with a *cachexy*, for old age itſelf is a ſpecies of this diſorder. That ſpecies which is ſuddenly produced by intemperance and a depraved digeſtion after chronical diſeaſes, is more eaſily removed than that which is from a fault in the viſcera. An ill colour in the ſkin, as it indicates very often a diſorder in the liver, is conſidered as a ſymptom of a complaint very difficult to overcome.—If fainting fits are frequent, the danger is great.—If its cauſe is from an hæmorrhoidal diſcharge, the cure is generally effected with difficulty.—If women are cachectic from defective menſtruation, they either become barren or bring forth weakly children: and of all diſorders, none more eaſily degenerate

degenerate into an anaſarca, aſcites, atrophy, or a hectic fever, than does a *cachexy*.

The indications of cure are, to correct the bad quality of the juices, to ſtrengthen the ſtomach, and to invigorate the ſyſtem.

Hence the diet ſhould be nutritious, cordial, and ſuch as nouriſhes in the leaſt quantities, and repeated often, to afford a plenteous nouriſhment, and of ſuch a nature as to oppoſe the cauſe and circumſtances of the diſorder. Exerciſe ſhould be conſtant and regular, but within the compaſs of the ſtrength. The primæ viæ being evacuated, adminiſter ſuch medicines as increaſe the vital heat, ſuch as warm bitters, aromatics, and chalybeates, antimonials have been alſo adviſed, but they are apt to relax the ſtomach, and therefore ſhould be given ſparingly. Stomach medicines ſhould be given juſt before and after meals. If the cauſe is a ſuppreſſion of any uſual evacuation, endeavour to promote the return of it. If laxity of the fibres, or defect of vital heat, aromatics and iron ſhould begin, and exerciſe complete the cure. That called —— ICTERICA. See ICTERUS.

See Dr. James's Dictionary, the Article CACHEXIA. Boerhaave on the *Cachexy*. Shebbeare's Theory and Practice of Phyſic. Lewis's Tranſlation of Hoffman's Practice of Medicine, vol. ii.

—— UTERINA. See FLUOR ALBUS.

CACHLAN. See BUPHTHALMUM VERUM.

CACHLEX. A little STONE or PEBBLE. Suidas makes it the name of an animal. Galen ſays that the *cachleces* heated in the fire and quenched in whey, endues them with an aſtringent virtue againſt a dyſentery.

CACHOS, or *Solanum pomiferum folio rotundo tenui*. It grows only on the mountains of Peru. It is a ſhrub of an extraordinary greenneſs: the leaves are thin and round: the fruit reſembles the mad-apple, of an aſh-colour and a grateful taſte. The Indians uſe it as a diuretic, and to expel concretions from the kidnies. Raii Hiſt.

CACHOU. See TERRA JAPONICA.

CACHRYFERA, } LIBANOTIS. Galen ſays it ſome-
CACHRYS, } times means parched barley; called alſo *canchry*, or *canchrys*.

CACHUNDE. A compound medicine much eſteemed by the Chineſe and Indians. Zacutus Luſitanus ſays it is made with amber, muſk, aloes wood, pearls, emeralds, granates, jacinths, galangals, cinnamon, aloes, &c.

CACHYMIA. A term in Paracelſus, by which he intends an imperfect metallic body, or an immature metalline ore, which is neither a ſaline ſubſtance nor a metal, but yet almoſt metal. *Cachymiæ* may be divided, 1ſt, into the ſulphureous, as marcaſites, biſmuths, and cobalts; or, 2dly, into mercurials, arſenical or orpimental, and ſuch like; or, 3dly, into ſaline, ſuch are all tales.

CACOA. See CACAO.

CACOALEXITERIA, from κακος, *evil*, and αλεξιτηριον, *a remedy* or *medicine*. See ALEXIPHARMACA.

CACOCHOLIA, An indiſpoſition of the bile.

CACOCHROI, from κακος, *ill*, χροια, *colour*. Such as have an ill colour in the face.

CACOCHYLIA. Indigeſtion or depraved chylification.

CACOCHYMIA, from κακος, *ill*, and χυμος, *humour*, for this the barbarous term, *Kachimia*, is ſometimes uſed. A depraved ſtate of the humours.

CACOETHES, from κακος, *ill*, and ηθος, *mos*, *a cuſtom*, which, when applied to diſeaſes, ſignifies a bad quality or diſpoſition. HIPPOCRATES applies this word to malignant and difficult diſtempers. LE DRAN explains it to be an evil ulcer, boil, or ſore. GALEN and ſome others expreſs by it, an incurable ulcer, that is rendered ſo through the acrimony of the humours flowing to it. LINNÆUS and VOGEL uſe this term much in the ſame ſenſe with Galen, and deſcribe the ulcer as ſuperficial, ſpreading, weeping, and with callous edges.

CACONIAI. See CANONIAI.

CACOPATHIA. An ill affection.

CACOPHONIA. See PARAPHONIA.

CACOPRAGIA, from κακος, *ill*, and πραττω, *to do* or *act*. A depravation in thoſe viſcera by which nutrition is performed.

CACHORE. See TERRA JAPONICA.

CACORRYTHMUS, from κακος, *ill*, and ρυθμος, *order*. An epithet of a diſorderly pulſe.

CACOS. EVIL, BAD. Alſo the name of an Indian herb, of a red colour: it is diuretic, and uſeful againſt calculous diſorders.

CACOSITIA, κακος, *ill*, and σιτος, *food*. See NAUSEA.

CACOSPHYXIA, from κακος, *ill*, and σφυξις, from σφυζω, *to leap* or *beat like an artery*. A diſorder of the pulſe in general.

CACOSTOMACHUS. Literally, an ill or bad ſtomach; but is ſpoken of food that is bad for the ſtomach.

CACOTHYMIA, from κακος, *ill*, and θυμος, *the mind*. Any vicious diſpoſition of the mind.

CACOTROPHIA, from κακος, *ill*, and τροφη, *nutriment*. Any ſort of vicious nutrition in general.

CACRY. See LIBANOTIS.

CACTOS. See CINARA.

CADAGUS PALI. See CONESSI.

CADAPALAVA. See MACANDON.

CADDIS. See CARBASUS.

CADJUCT. See PHASEOLUS ZARRATENSIS.

CADMIA, alſo *Chlimia*, *Climias*, *Catimia*. This name has been applied to ſeveral different things. DIOSCORIDES meant by it the recrement, which ariſes from braſs whilſt melting. GALEN applied it to the recrement of braſs; and a ſtone found in ſome mines, called Cadmia LAPIDOSA, ſuppoſed to be the *æruginoſus lapis*. The calamine ſtone is now called cadmia, and the GERMANS have given this name to Cobalt; whence AGRICOLA ſays, that there are three ſorts; one *metallic*; one *foſſil*; one of the *furnaces*. Inſtanced in the ſucceeding.

CADMIA METALLICA. See COBALTUM.

—— { FOSSILIS, / LAPIDOSA, } See CALAMINARIS LAPIS.

—— { FACTITIA, / FORNACUM, } See TUTIA.

The burnt cadmia, receives different names, according to the part of the furnace from whence it is collected; if in the upper part of the furnace, reſembling a cluſter of grapes, *botrytes*, or *botritis*; if in the lower part, *placitis*. But SCHRODER ſays, that the *botritis* is collected in the middle, the *placitis* in the upper, and the *oſtracitis*, which is thin, and generally earthy and black, in the lower part of the furnace. See alſo CALAMITIS; and POMPHOLIX, which are truly CADMIA.

CADUCA. See VERTIGO, the third ſpecies; and DECIDUA.

CADUCUS MORBUS. See EPILEPSIA.

CÆCALIS VENA. See CÆCUM INTESTINUM.

CÆCILIA. The BLIND-WORM or SLOW WORM, alſo called cæciliaty phlops, and cæciliaty phlinus, Græcis. It is a ſpecies of ſerpent, whoſe bite is of much the ſame effect as that of the viper.

CÆCITAS MINOR. See AMAUROSIS.

CÆCUM INTESTINUM. The BLIND GUT; ſo called from its being perforated at one end only; called alſo *monomachon*. What we now call the *appendicula cæci*, Rufus Epheſius called the *cæcum*. But modern anatomiſts divide the large inteſtines, which form one continued canal, into three portions. This canal begins by a kind of SACCULUS, or bag, which is the firſt of the three portions, and is called *cæcum*. Dr. Hunter ſays that it lies on the inſide of the os ilium upon the iliacus internus, and is only a round ſhort broad bag, whoſe bottom is turned downwards, and its mouth upwards. This inteſtine, which is about three fingers breadth long, is hid by the laſt convolution of the ilium. It hath the ſame bands as the colon, which bands take their origin from the appendicula vermiformis. Winſlow obſerves that this bag lies under the right kidney, and that its diameter is more than double that of the ſmall inteſtines. Its arteries are from the meſenterica ſuperior. The veins are from the greater meſenteric, and one of the branches Riolan calls the *vena cæcalis*. The nerves from the poſterior and inferior, meſenteric.

CÆMENTUM. See COEMENTUM.

—— CUPRÆUM. CEMENT COPPER, called alſo *ziment copper*. It is copper precipitated from vitriolic waters, by means of iron. The name is derived, as is ſaid, from a vitriolic water in Hungary called ziment.

CÆS. & CÆS. ALP. An abbreviation of Andræus Cæſalpinus de Plantis.

CÆSAREA SECTIO. The CÆSAREAN SECTION or operation, alſo called *hyſterotomia*, and *hyſterotomatocia*. It is the operation whereby the fœtus is extracted from the uterus through the teguments of the belly. It is called the *Cæſarian* operation from Julius Cæſar, who was brought into the world this way. Some ſay it was one Cæſo, who was the firſt thus taken from his mother's womb, and from whom the operation is named.

There are three cauſes wherein this operation may be neceſſary. 1. When the mother dies, and the fœtus is perceived

ceived to be alive, and this happening in labour, or in the laſt two months. 2. When the fœtus is dead, but ſo preternaturally ſituated as to be impoſſible to deliver it in the uſual way. 3. When both the mother and the child are living, but the ſame difficulty attends as in the ſecond caſe.

Many inſtances have occurred in which both the mother and the child have lived after this operation. Heiſter gives a very diſtinct account of this operation, in his Surgery; and of its ſucceſs in his Inſtitutes of Surgery, p. ii. § 5. cap. 113. See alſo Mem. de l'Acad. Roy. de Chirur. vol. i. p. 623. ii. p. 308. Edinb. Med. Eſſays, vol. v. art. 37 and 38.

It ſhould not be recommended if the woman is living before ſhe falls into labour, and yet it muſt be attempted before ſhe hath ſuffered much by her ineffectual throes; for when ſhe is thereby reduced, the operation is almoſt ſure to be fatal.

To perform this operation, lay the woman on her back, place a pillow under her right ſide, to turn the uterus as much as poſſible on the left; then the operator muſt make a longitudinal inciſion, beginning as high up as the navel, on the outſide of the linea alba, and carrying it down in an oblique direction towards the ilium, he muſt cut carefully through the muſcles of the belly, and alſo the peritoneum, and introduce a finger into the abdomen, which muſt be carried along before the point of the knife, in order to prevent the vagina from being wounded. The inciſion is uſually directed to be on the left ſide, for fear of wounding the liver, becauſe the large lobe lies on the right ſide; though there ſeems to be more danger of the omentum, or a flexure of the inteſtines; becauſe as the uterus riſes up, it carries the viſcera above it, and to each ſide; but the omentum is frequently found lying between it and the parietes of the belly. The inciſion into the uterus muſt be longitudinal, and as long as the external wound will permit, taking care not to wound the Fallopian tubes; the child muſt be taken out at the inciſion, and after it the placenta and membranes; the water and blood muſt be abſorbed with ſponges: the wound in the uterus muſt be left to nature, for by its contraction it will be brought into about an inch and a half in length. The external wound is to be ſutured with the interrupted ſtitch, and then to be dreſſed up, as in general. If any conſiderable veſſels are cut through, they ſhould be taken up.

In the Lond. Med. Obſ. and Inq. vol. iv. p. 261, &c. is an inſtance of this operation being performed, which, though unſucceſsful, yet merits attention. In this caſe the inciſion was made on the right ſide; and it was obſerved that the woman complained but little during the operation, except when the needles paſſed through the peritoneum in making ſutures; and that the uterus ſeemed very little ſenſible of any injury done to it. It is noticed in the remarks made on writers who have deſcribed this operation, that there is very little ſatisfaction to be obtained from them, that all they relate is very vague; and that it is indifferent on which ſide the inciſion is made, farther than as ſome preſent circumſtance may determine; that the hæmorrhage ſpoken of by Heiſter is not ſo much to be dreaded as he intimates; that the courſe of the linea ſemilunaris, as nigh to the outer edge of the rectus muſcle as poſſible, ſeems to be the moſt eligible place for the operation.

Paré, Guillimeau, Rolfincius, Hoorne, Mauriceau, Solingen, and ſome others, are ſaid to be violent oppoſers of this operation; but they only object to it in certain caſes, where they thought the practitioners too raſh in the attempt. As a ſubſtitute for this operation, the ſection of the ſymphyſis of the pubes is propoſed. See Pubis Ossa. See alſo an Account of the *Cæſarean Section* by Dr. Vaughan of Leiceſter. Bell's Surgery, vi. 446. White's Surgery, 451.

CÆSARES, CÆSONES, } Children who are brought into the world by the Cæſarian operation.

CÆTCHU. See Terra Japonica.

CAF, CAFA, CAFAR. See Camphora.

CÆFE. See Coffea.

CAGASTRUM. Paracelſus uſes this word to expreſs the morbific matter which generates diſeaſes, and that is not innate, but adventitious. Diſeaſes ariſing from the *cagraſtum* are pleuriſy, peſtilence, fever, &c.

CAHVEH, CAHOUA, } See Coffea.

CAIRA, CAITCHU, } See Terra Japonica.

CAJAHABA. An Indian plant which adheres to trees like ivy; the natives bruiſe it, and bind it upon fractures. Raii Hiſt.

CAJAN, or Cayan. *Phaſeolus, arbor incana ſiliquis toroſis; cavan, dicta, thora paron; piſum arborescens.* A ſhrubby plant with pods containing four reddiſh peas. A decoction of the leaves reſtrains the hæmorrhoids when exceſſive. Raii Hiſt.

CAJEPUTI OLEUM. See Paradisi Grana.

CAJOU, CAJOUS, CAJUM, } See Acajaiba

CALABA. Indian mastich tree. It hath roſaceous flowers, which are followed by a fleſhy fruit that includes a nut. This tree is a native of the warm parts in America. From the trunk and branches a gum, like the gum maſtich, iſſues.

CALAMARY. See Sepium os.

CALAMBAC, CALAMBOUR, } See Agallochum.

CALAMBEDON, from καλαμος, *a reed.* A ſpecies of fracture which runs along the bone in a right line, but is lunated in the extremity.

CALAMINA, CALAMINARIS LAPIS, } Calamine stone, cadmia, or Cathmia, alſo called *cadmia lapidoſa ſcrobs; cadmia foſſilis*, calamite, calamy, and calaminar stone.

It is a metallic mineral, of a grey, brown, yellow, or pale red colour, and ſometimes of all theſe colours variouſly mixed; it is heavy and hard, but not ſo as to ſtrike fire with ſteel. It is of a middle nature betwixt ſtone and earth, found in copper mines, and thoſe of lead and iron; it is found in England, Germany, and other countries, either in diſtinct mines, or intermixed with the ores of lead or other metals. It is the ore of a metal known by the name of zinc, and contains a ſmall portion of iron. It is generally calcined before it is brought into the ſhops, in order to ſeparate ſome ſulphureous and arſenical particles, of which it is ſuppoſed to be poſſeſſed, and alſo to render it more eaſily reducible into powder.

Calamine is ranked by Mr. Edwards, in his Elements of Foſſilogy, as a cryptometalline ſtone, and its varieties as ſo many ſpecies of the zinc-ſtone genus: ſome are varieties of the zinc floſſes; they are tranſparent or gloſſy.

The quantity of zinc is variable in different parcels of this ore. In the Berlin Memoirs Marggraf ſays, that from 2-16ths to 7-16ths of the weight of the ore is pure metal. The common ſort in our ſhops in England frequently affords 9-16ths.

If this ore is not already calcined, it muſt be heated to a ſtrong red heat, then quenched in water; and this proceſs muſt be repeated three times. Before calcination it is of a grey or red colour; but when calcined it is yellow.

It is an error of ſome writers who ſay that the *calamy* is a recrement of melted copper, and that tutty is a recrement of melted braſs; though it is true that the beſt *calamy* is what ſticks to the iron rods uſed in ſtirring the matter in the furnaces while braſs is making.

Though the *calamine* ſtone is an ore of zinc, it is not the only one; for zinc is found in the ore of lead, and of other metals. The principal uſe of this mineral is for changing copper into braſs, which it does by its metallic part mixing with the copper while it is in a ſtate of fuſion. See *Æs*.

For medicinal uſes the *calamine*, after being calcined, ſhould be levigated to an impalpable powder; it is then called lap. *calam.* ppt. for the mode. See Comminutio. When thus prepared it is uſeful in collyria as an aſtringent and corroborant, and againſt defluxions of thin acrid humours upon the eyes, and in ointments for cutaneous exulcerations, &c. If it is exquiſitely fine, it acts as an abſorbent or deſiccative, but if not, it is eſcharotic.

The London College directs the following cerate, in which this mineral is the principal ingredient:

Ceratum Epuloticum. Cicatrizing Cerate; now called Ceratum Lapidis Calaminaris. Calamine Cerate.

Take of olive oil, a pint; yellow wax, calamine prepared, of each half a pound; melt the wax with the oil, and as ſoon as the mixture begins to thicken, ſprinkle in the *calamine*, and ſtir all well till the cerate is quite cold. Ph. Lond. 1788. This is calculated to promote the cicatrization of ulcers.

This hath been called *Ceratum Turneri*. Dr. James ſays that he remembers to have met with a like cerate in a publication by an old Engliſh ſurgeon who preceded Dr.

Dr. Turner. The Edinburgh College calls it *ung. lap. calamin.*

MAGISTERIUM LAPIDIS CALAMINARIS. *The* MAGISTERY *of* CALAMINE.

Take of *calamine* ſubtily powdered, four ounces; put it into a matraſs, and pour upon it a pound of the muriatic acid; let them digeſt upon warm ſand forty-eight hours; filtre the ſolution and precipitate the magiſtery with the ſpirit of urine; free it from the ſalts by ſeveral ablutions, and dry it for uſe. In doſes from three to ſeven grains it is emetic and cathartic. See Neumann's Chemical works. Lewis's Materia Medica, and the Dictionary of Chemiſtry, 4to.

CALAMINTHA, from καλα μινθη, *good mint.* CALAMINT.

It is a plant with ſquare ſtalks, the leaves ſet in pairs; the flowers on branched pedicles, whereof two iſſue from one joint in the boſoms of the leaves; the upper lip of the flower is divided into two ſegments, the lower into three. It is perennial, and flowers in July and Auguſt. ——ANGLICA. FIELD CALAMINT, called alſo *calam. pulegii odore nepeta agreſtis, calam. fol. ovatis,* &c. and SPOTTED CALAMINT. *Meliſſa nepeta* Linn. Its ſtalks are reclining; the leaves are ſmall, irregularly oval, ſlightly indented, without pedicles, the flower-ſtalks larger than the leaves; it grows wild in dry grounds and by the ſides of fields, in hedges, highways, and ſandy ſoils. The leaves have much of the ſmell of penny-royal and ſpearmint, but hotter, and their virtues are ſimilar to a mixture of them; water by infuſion extracts all their virtue, and by evaporation it carries off all their flavour. By diſtillation with water, they give out a large portion of eſſential oil, that is pungent to the taſte and ſtrong of the herb: the decoction in the ſtill, after the oil is carried off, is rough, bitter, and aromatic. Rectified ſpirit of wine extracts the virtues of this herb the moſt completely.——HUMILIOR. GROUND-IVY. See HEDERA TERRESTRIS.——MAGNO FLORE. MOUNTAIN CALAMINT with a large flower; alſo called *calamintha montana magno flore,* MOUNTAIN-MINT, the GREATEST CALAMINT, and the MORE EXCELLENT CALAMINT. It hath large leaves and flowers, the leaves are deeply ſerrated, pointed, and ſet on pedicles. It is a native of the ſouthern parts of Europe, and raiſed in our gardens.

It hath a moderately pungent taſte, and a more agreeable one than any of the other *calamints,* and is a bitter ſtomachic. That called——MONTANA is the common *calamint,* named alſo *cal. vulg.* vel *officinarum Germaniæ,* and *calam. flore magno vulg.* It is the *meliſſa calamintha,* Linn.

The ſtalks are large and upright, the leaves are pointed and ſerrated. It is found on the ſides of the highways, but it is not ſo common as the field ſpecies, nor are its leaves ſo powerful in their medicinal qualities, not having the penny-royal ſmell.

CALAMINTHA PALUSTRIS. See MENTHA CATARIA.

CALAMITA. See STYRAX & MAGNES.

CALAMITIS. A name of that factitious cadmia which, by fixing to iron rods, acquires the figure of a reed; hence the name calamitis. See alſo POMPHOLIX.

CALAMUS. The ſtalk of any plant. See CAUDEX.

CALAMUS AROMATICUS. SWEET-SCENTED FLAG; alſo called *clava rugoſa, diringa, jacerantatinga, acorus verus, typha aromatica.* It is the ACORUS CALAMUS VERUS. ACORUS *ſcapi mucrone longiſſimo foliaceo,* KEW HORT. CLASS. HEXANDRIA. ORD. MONOGYNIA. Linn. Gent. Plant 414.

The name of *calamus aromaticus* is given to the acorus, but they are very different things; the firſt is a ſtalk of an Eaſtern reed, which is ſlender, hollow, white, and of a fragrant ſmell; it is alſo called *calamus odoratus,* and *arundo Syriaca.*

The ſweet flag is a plant with long narrow-pointed leaves, like thoſe of the common iris, and of a bright green colour; they are divided by the longitudinal rib into two unequal proportions, one of which is ſmooth, the other tranſverſely wrinkled; the flowers are imperfect and ſtand thick together, forming an elegant ſpike; the root, which ſpreads obliquely under the ſurface of the earth, is long, crooked, full of joints, about an inch thick, ſomewhat flatted, externally of a greeniſh white colour, which changes in drying into a browniſh yellow, internally white, and of a looſe fungous texture. It is found in rivulets and marſhy places in many parts of England, and in Holland. The ſtalk dies in winter, but the root is perennial.

The dried roots are brought from the Levant, but thoſe of our own growth are preferable. Dr. Alſton ſays, that this root is aromatic, ſtomachic, and carminative. As an *aromatic,* though not heating like the ſpices, it promotes the fluid ſecretions, is of uſe in gangrenes both internally and externally, agreeably ſtimulates, and produces a pleaſant ſenſation in the mind. It has been deemed uſeful as a warm ſtomachic, and renders other bitters more grateful and carminative. It is recommended in vertigo proceeding from a vitiated ſtomach, and has been ſaid to have cured intermittent fevers, after bark had failed: in conjunction with the bark, it ſeems to add to its efficacy, particularly where that organ is in a torpid ſtate. The aroma is fixed, and will keep many years. When freſh gathered the ſcent is not agreeable, but ſomewhat like that of leeks; by drying, this kind of flavour goes off.

Chooſe that which is ſound, tough, and whitiſh within when broke.

Water beſt takes off the bitter part of this root, and ſpirit the *aromatic* part. In diſtillation with water, it ſends up a very ſmall portion of eſſential oil, leaving a nauſeous bitter in the decoction.

More agreeable bitters ſupercede its uſe, but it is a tolerable ſubſtitute for gentian, and other gently warm bitters. That named——AROMATICUS ASIATICUS, is the ASIATIC SWEET-FLAG; called alſo *acorus Aſiaticus, aurus Braſilienſis,* and *capicatinga.* It grows in both the Indies. Its root agrees in virtues with that of our own growth.——ROTANG. See SANGUIS DRACONIS.——ODORATUS. See CALAMUS AROMATICUS.——SCRIPTORIUS. A dilatation of the brain, near, or in the fourth ventricle, is thus named, becauſe it reſembles a quill. HERODOTUS calls it ANAGLYPHE.

CALBIANUM. The name of a plaſter in Myrepſus.

CALCADINUM. See VITRIOLUM.

CALCADIS. See VITRIOLUM ALBUM, & ALCALI.

CALCANEUM, CALCAR, CALCIS OS, PTERNA. The HEEL-BONE. It is the largeſt bone in the foot, of which it is the poſterior part, and in ſome meaſure the baſis. The large tendon, called tendo Achillis, is inſerted into this bone.

If it is injured in its fore-part, it may ſafely be amputated.

CALCANTHOS, CALCANTHUM. See VITRIOLUM.

CALCAR. See CALCANEUM.

CALCARIUS LAPIS. See CALX.

CALCATAR. See VITRIOLUM.

CALCATON. See ARENICUM ALBUM.

CALCATREPOLA. See CALCITRAPA.

CALCEDONIUS. See CHALCEDONIUS.

CALCENA, CALCENON, CALCENONIA, CALCINONIA, CALCENONIUS, CALCENOS, CALCETUS. Paracelſus uſes theſe words to expreſs the tartarous matter in the blood; or that the blood is impregnated with tartarous principles.

CALC. MUS. An abbreviation of Muſeum Calceolaralium Veronenſe.

CALCETUS. See CALCENA.

CALCEUM EQUINUM. See TUSSILAGO.

CALCHITHIOS. See ÆRUGO ÆRIS.

CALCHOIDEA OSSICULA. See CUNEIFORME OS EXTERNUM.

CALCIDICUM. The name of a medicine in which is arſenic.

CALCIFRAGA. BREAK-STONE. An epithet given to the herb *ſcolopendium* or *ſpleen-wort,* in Scribonius Largus. See LINGUA CERVINA.

CACIGRADUS. Hippocrates means by it, one who in walking lays much ſtreſs upon the heels.

CALCINATIO. Alſo, CONCREMATIO. DEFLAGRATIO. COMBUSTIO, COMBUSTURA, AMBUSTIO. The *calcination* of a body is, properly ſpeaking, to expoſe it to the action of the fire to produce ſome change in it; or it is the ſeparating, by means of fire, the more volatile from the more fixed parts of any compound body; or the deſtruction of the inflammable principle thereby, or both.

Bodies are deprived of their volatile parts by *calcination,* in the inſtances of burning ſtones, &c. to convert them into quick-lime, which is effected by the evaporation of the air and watery principle; in the expoſing gypſum, alum, borax, and ſeveral other ſalts to the fire, which deprives them of the water that is neceſſary for their cryſtallization; and in the roaſting of minerals, which car-

ries

ries off their ſulphur, arſenic, and other volatile contents.

The inflammable principle is ſeparated from imperfect metals by expoſing them to the fire; in an intenſe heat they are deprived of their form and metallic properties, and are changed into earthy matters, called metallic calces. Here it may be obſerved, that what are called calces of gold and of ſilver, are improperly ſo termed, being only theſe metals reduced into fine powders; no method is known by which theſe metals can be deprived of their phlogiſton, or inflammable principle. The changes made by this ſecond kind of calcination, are different from the former; in this caſe the alteration is effected not by evaporation, but by decompoſition and deſtruction of the phlogiſton; it is therefore a combuſtion, and not a volatilization of their inflammable principle.

There is an evaporation of volatile parts, and a deprivation of the inflammable principle, without any ſenſible combuſtion, in expoſing imperfect metals, combined with vitriolic and nitrous acids, to a due degree of heat; in this proceſs the acid riſes, and at the ſame time carries with it the inflammable principle; for inſtance, in calcining the vitriol of iron.

Acids, particularly the nitrous, extract the inflammable principle from imperfect metals, and reduces them by ſolution, without fire, to a ſtate ſimilar to that by calcination; whence ſuch acids are conſidered as capable of calcining them; and metallic ſubſtances, dephlogiſticated by their means, are called calces.

Calcination is ſaid to be actual, when effected immediately, and only by the action of fire; and potential, when aqua fortis, or ſome different ſolvent, is uſed to corrode iron, or any other metal.

The *calcination*, which by means of fire reduces ſolid bodies into a powdered ſtate, alſo alters the qualities thereof; hence it differs from comminution.

To this head belongs the burnings of vegetable and animal matters; otherwiſe called USTIO, INCINERATIO, or CONCREMATIO.

There are ſeveral ſpecies of *calcination*, by which different degrees of the ſame effect are produced, and thus *calcination* is perfect or imperfect: the firſt is where the utmoſt change, except vitrifaction, is brought about; the ſecond is where the circumſtances of the proceſs are limited in proportion to the change intended.

The *calcination* of metallic bodies, gold and ſilver excepted, are promoted by nitre. This ſalt expoſed to the fire in conjunction with any inflammable ſubſtance, extricates their inflammable matter, but burſts with it into flame, accompanied with a hiſſing noiſe; this proceſs is called DEFLAGRATIO, or DETONATIO. To underſtand the principle of this operation, it muſt be obſerved, that the afflux of air, or a ſubſtitute for it, is neceſſary to the ſupport of fire; and that nitre, or any thing containing the acid thereof, is ſuch a ſubſtitute; that if nitre be added to any matter containing an inflammable principle, and a heat be imparted to the mixture, ſufficient to bring the nitre to fuſion, fire will be produced, and a *calcination* effected, even though all the air be excluded.

The manner of operation varies, according to the nature of the matter to be *calcined*, and may, according to the principle on which it is performed, be diſtinguiſhed into three kinds, COMBUSTION, CALEFACTION, and DETONATION.

CALCINATION by COMBUSTION is where the body kindled ſupports, with the aſſiſtance of the air, the fire which *calcines* it, as in the inſtance of coals in the culinary fire. Vegetables are thus *calcined*, and when they are thus treated, ſome call the operation INCINERATION.

CALCINATION by *calefaction* is, where the *calcining* heat is not generated in the body itſelf, but imparted to it from ſome external fire. The methods here are various, almoſt as the different kinds of matter thus treated; and in the management regard muſt be had to the ſubſtance of the containing veſſel, for ſome ſhould be made of iron, others of glaſs or clay, &c. the heat muſt be differently regulated, or elſe vitrifaction, inſtead of *calcination*, may enſue. *Calcinations* of this kind are expedited by the increaſe of ſurface, which is given to the calcined matter, and the copious admiſſion of air through that part of the furnace where the matter is placed, by ſtirring it with a ſpatula, by previous pulverization, and by raking off the calx from the ſurface of the metal, as faſt as it appears thereon. It ſhould be farther obſerved, that if any coal, or other inflammable matter, that does not contain a mineral acid, be ſuffered to fall on the calcining matter, *calcination* will thereby be prevented, and part of what is *calcined* will be revived or reduced, that is, it will return into its metallic form again.

CALCINATION by *detonation* differs from combuſtion only in this; in the latter the aſſiſtance of air is neceſſary, in the former this want is ſupplied by the nitre that is added to the matter, which producing a quicker and more intenſe fire, both ſhortens the operation, and, in ſome inſtances, perfects it more fully. Detonation is thus performed: a proper quantity of nitre is mixed with the matter to be calcined, a crucible is heated red-hot, then the matter thus mixed is gradually thrown in, an explofive effervescence ſoon follows the injection of each quantity, the ceſſation of which effervescence each time, is the proper limit of the intervals of throwing in, till all is in, at which time it is finiſhed. The crocus antimonii, and ſome other medicines, are thus prepared. A portion of the alkaline baſis of this ſalt, ſometimes joins with the calcined matter; but the reſt is to be ſeparated by water, which is to be added warm, and after being well mixed, it is to be poured off, and the ſame to be repeated till the ſalt is extracted; this is called EDULCORATION.

The metals which melt before ignition, are calcined by keeping them in fuſion for ſome time. Thoſe metals which require a ſtrong fire to melt in, calcine with a much leſs heat than is ſufficient to make them flow; hence the ſcorification, or burning of ſuch iron or copper veſſels, as are long expoſed to a conſiderable fire without defence from the air.

In *calcination* the metals viſibly emit fumes; yet the weight of the calx proves greater than that of the metal employed. And all the metallic calces and ſcoriæ are revived into their metallic ſtate, by fuſion with any animal or vegetable inflammable matter.

Except the calces of lead and biſmuth, all the metallic calces require an addition to make them melt in the ſtrongeſt fire that can be made in common furnaces; and the additions, called fluxes, chiefly conſiſt of a mixture of fixed alkaline ſalt, with ſome inflammable matter. As theſe fluxes not only fuſe the calx, but alſo revive it into metal, they are ſometimes called reducing fluxes; of which the following is one of the chief, and is called the BLACK FLUX.

Take of nitre one part, and ſalt of tartar two parts, grind them well together, then ſet the mixture on fire, by throwing in a bit of red-hot coal; cover the veſſel and ſuffer them to burn until the whole is changed into a black alkaline coaly maſs.

Metallic calces of ſcoriæ mingled with twice their weight of this black flux, and expoſed to a proper fire in a cloſe-covered crucible, melt and reſume their metallic form. But though the calx was heavier than the metal of which it was formed, on reviving to its original metallic ſtate, its weight is leſs than at the firſt.

See Newman's Chem. Works, Lewis's Materia Medica, the Dictionary of Chemiſtry.

CALCINATUM, alſo *cenificatum*. Terms applicable to calcined ſubſtances.

CALCIS VITRIOLATÆ CATAPLASMA. CATAPLASM OF PLASTER OF PARIS. Mix plaſter of Paris with water to a proper conſiſtence, and whilſt ſoft, apply it to the ulcer, where it will harden, and muſt be ſuffered to remain for two or three days before it is removed; where want of vigor is apparent in an ulcerated part, it is there conſidered as applicable. The principle upon which it is applied, has never been well explained, nor has experience yet confirmed its utility.

CALCINATUM MAJUS. It is whatſoever is dulcified by the chemical art, which was not ſo by nature; ſuch as dulcified mercury, lead, and the like ſubſtances, which are very ſpeedily conſolidated.——MAJUS POTERII. It is mercury diſſolved in nitrous acid, and precipitated with ſalt water. Poterius uſed it in the cure of ulcers.——MINUS. Any thing which is ſweet by nature, and ſpeedily cures, as ſugar, manna, tamarinds, &c.

CALCINONIA. See CALCENA.

CALCIS AQUA. See CALX.

CALCIS VIV. FLORES. See *Aqua calcis*, under CALX.

CALCIS OS. See CALCANEUM.

CALCITARI. See ALCALI.

CALCITEA. See VITRIOLUM.

CALCITEOSA. See LITHARGYRUM.

CALCITHOS. See ÆRUGO ÆRIS.

CAL-

CALCITRAPA. COMMON STAR-THISTLE; alſo called *carduus ſtellatus*, *jacea ramoſiſſima*, *jacea ſtellata*, *jacea rupina*, *crupina*, and *calcatrepola*.

The ſtalk of this plant is divided into numerous branches, ſpreading about, and riſing near two feet high, with a few leaves on them placed at the diviſions of the ſtalks; the flowers are of a reddiſh colour, grow thick upon the branches, and come out of heads, which are compoſed of ſeveral ſcales, each ending in a long, ſtraight, hard, and ſharp horn; theſe flowers paſs away in down, containing white flattiſh oblong ſeeds; the root is ſingle, about a finger's breadth long, runs deep into the ground, of a whitiſh colour, and has a thick bark on it. It grows near highways, on commons, and flowers in June.

The leaves are bitter; a dram of the ſeed, in a glaſs of wine, powerfully expels viſcid matter which obſtructs the urinary paſſages; the root is uſed againſt the gravel, and the ſtone in the bladder; and the bark of the root is extolled in the nephritic colic. It ſhould be gathered about the end of September, and when dried a dram is a doſe. Dale.

CALCITRAPA OFFIC. ST. BARNABY'S THISTLE; called alſo *carduus ſtellatus lutea*, *carduus ſolſtitialis*, *ſpina ſolſtitialis*, *jacea ſtellata*, *jacea lutea capite ſpinoſa minori*, and *leucanthe veterum*.

It is commended as an antiſcheric, anti-cachectic, and lithontriptic. Dale.

CALCOIDEA OSSICULA. See CUNEIFORME OS.

CALCOTAR. See VITRIOLUM.

CALCULIFRAGUS. See LITHONTRIPTICUS.

CALCULOSUS. Afflicted with the ſtone.

CALCULUS. The GRAVEL and STONE. The Greeks call this diſorder *lithiaſis* and *adamitum*; the Latins name it *calculus*, and the Engliſh we underſtand by *gravel*, ſmall *ſtones* that paſs from the kidnies through the ureter, &c. in a few days; and by the *ſtone*, a calculous concretion in the kidneys, or in the urinary bladder, when here called by ſome *adamita*, *cyſteolithos*, which is too large to paſs, or at leaſt without great difficulty. Some call it *nephritis*; though now, in modern practice, this is confined to an inflammation of the kidnies. See NEPHRITIS.

This *ſtone* in the bladder is called *Bezoar miſrocoſmicum*.

What is called a fit of the *gravel* or *ſtone* is, when from the ſtony concretions in the kidnies, &c. there is pain, with other ſymptoms which uſually attend, when nature endeavours to diſcharge them.

The concretions that form this diſeaſe, are very various in their properties; and when out of the body require very different ſolvents to deſtroy their cohefion. See Lond. Med. Tranſ. vol. ii. p. 105, &c.

The human *calculi*, the hardeſt ſpecies of which is called *marmoreus tartarus*, contain about half their weight of fixed air, much volatile alkaline ſalt, ſome oil, a little earth and phlegm; and the different hardneſs obſerved in different ones, is owing to the variety in the proportion of the conſtituent parts. From the ſuppoſition that the *ſtones* in the kidnies, and the bladder, conſiſt of calcareous earth, they have been called *calculi*; but ſir Torbern Bergman aſſerts that the moſt exact analyſis cannot diſcover in them, upon an average, above one part in a hundred of this earth.

Stones are generated in any part of the body; but when the *ſtone* is ſpoken of as a diſeaſe, it is underſtood to be ſeated in the kidneys, ureters, or the bladder. As to what is called a *ſtone* in the gall-bladder, it is only a coagulation, or at moſt a concretion of the bile, and not properly of the calculous kind, though it is poſſible ſuch a circumſtance may occur there.

Perſons of vigorous conſtitutions are more ſubject to this diſeaſe than thoſe of a more lax and cold habit.

If any ſmall indiſſoluble ſubſtance is fixed in any part of the body, a ſtony cruſt ſoon forms itſelf upon it, either more or leſs. Thus it may be formed in a kidney, and increaſing, may obſtruct it, and even prove its deſtruction by its occaſioning corruption; in this caſe a bloody, fœtid, and purulent urine is diſcharged: or if this concretion is removed from the kidney, obſtructing the ureter, it occaſions at firſt a ſpaſmodic, but ſometimes it produces an acute inflammatory pain there; or, deſcending into the bladder, it is either expelled with the urine, and diſcharged through the urethra, or detained there, where it increaſes in bulk by the attraction and adhefion of the earthy parts of the urine, forming ſtrata of different colours; the nucleus which fell from the kidney always remaining red. As to the production of *ſtones* in the human body, a ſmall attention to the cauſes of the gouty matter and to the affinity betwixt the gout and the *ſtone*—alſo on recollecting that a fit of one is often tranſmuted into a fit of the other, we ſhall be readily led to conclude, that the cauſes of both are, a defective ſolution of the earthy particles of our aliment by the powers of digeſtion; other peculiarities in the conſtitution conducing to the formation of one or the other diſorder, from the ſaid leading cauſe. Wine is ranked among the occaſional cauſes, ſo is hard and *ſtony* water. Though Dr. LEAK ſeems greatly to doubt this fact, and ſays, experience ſhews, that hard ſpring water, in which calcareous earth moſt abounds, is not more apt to generate gravel in the kidneys than that which is more ſoft and pure, but on the contrary has been found beneficial, and adduces many circumſtances in proof of this opinion. See *Diſeaſes of the Viſcera*, p. 324, &c. But the tartar of wine agrees not with the human *calculus* in its conſtituents, except in poſſeſſing ſome fixed air and earth, and theſe in proportions very different too: and as to *ſtony* waters, they, at moſt, can only prove a negative cauſe; water is the only diluter, and in the performance of its office of diſſolving not only our food, but alſo the recrementitious parts of our juices, it promotes health, and counteracts diſeaſes and their cauſes: when pure water only is drank, the veſſels are permeable, the excretions duly performed, and every thing that is faulty carried out of the body; but water impregnated with indigeſtible particles, is already ſaturated with its own contents, therefore leſs capable of diſſolving and carrying off with it ſuch other particles as require its aſſiſtance in order to their diſcharge.

HOFFMAN obſerves, that the pain which is excited by *calculus* in the bladder, attended with a conſtant ſtrangury, is to be referred to ſpaſm as its cauſe. For on account of the ſpaſmodical ſtricture, which not only affects the muſcular coat of the bladder, but alſo its ſphincter and the urethra, all the diſtreſſing ſymptoms in the diſcharge of urine are induced. But while ſuch ſpaſmodic affections are ſometimes brought on by *calculus*, it is alſo certain that they may ariſe from obſtruction and ſtagnation of blood in the veſſels of the bladder, as in caſes of ſuppreſſion either of the hæmorrhoidal or of the menſtrual flux; or from ſome acrid application to the bladder; and from various other cauſes.

In ſome inſtances, the difficulty of diſcovering whether or no there is a *ſtone* in the bladder is ſuch, as to elude the beſt ſkill in the ſymptoms thereof; the greateſt dexterity in uſing the catheter, and the beſt helps that experience hath given, in the uſe of any other means. However, in general, if the patient handles his penis frequently, if he hath a motion to ſtool when he begins to diſcharge his urine, if he walks in the ſtreets with his legs ſtraggling, it is not doubted but that there is a *ſtone* in the bladder. LE DRAN ſays, that when a ſmall *ſtone* is lodged in the neck of the bladder, the patient is only pained whilſt the firſt drops of urine paſs, each time that he attempts to diſcharge it; if the *ſtone* is large, the greateſt pain is whilſt the laſt drops are diſcharging; but *if there is a difficulty in paſſing the urine all the time of its going off*, the caſe is not a *ſtone*.

THE SIGNS OF A STONE IN THE KIDNIES ARE, *an obtuſe pain in their region; a nauſea, ſickneſs, and frequently a vomiting; a titillation at the point of the penis; coſtiveneſs, and flatulency; the pain ſometimes extending to the groin, hip, or to the neighbouring teſticle; there is a chillneſs, ſhivering, and difficulty of breathing; the leg, on the ſame ſide with the affected kidney, is ſometimes contracted, and at others benumbed; the urine is diſcharged frequently, but with difficulty and in ſmall quantities*; or *it is totally ſuppreſſed*: but as a diſtinguiſhing ſign, *the ſediment of the urine may be attended to, for it ſubſides directly*; if then this, with the other named ſymptoms attend, the patient's caſe is manifeſtly this diſorder.

As to a *ſtone* in the urethra, it may be detained in various parts, but its ſituation may be eaſily known by the pain or by a catheter.

Pain in the loins from the *gravel* or *ſtone* in the kidnies, ſhould be diſtinguiſhed from that which is cauſed by ſpaſms, ſuch as frequently happen in nervous diſeaſes, and to hyſteric and hypocondriacal people; from the colic, which it much reſembles in the beginning of the fit; from the lumbago, and from pain in the ploas muſcle; alſo from the gout in the parts, or a latent intermittent there. The *ſtone* in the bladder ſhould be diſtinguiſhed from both theſe laſt alſo; from ſpaſmodic ſymptoms; from

the pain excited by ſharp urine, or other actid matter deſcending from the kidnies, or otherwiſe introduced into it; an abſceſs in a part adjacent preſſing forcibly againſt it; an ulcer, or other diſorder in the uterus; and any complaint in the inteſtinum rectum.

A *ſtone* in the kidnies often brings on a tabes renalis. When the violent pain hath continued for ſeveral days and nights without intermiſſion, and hath exceedingly reduced the patient, if the extremities become cold, or if the urine continues to be totally ſuppreſſed, death is to be expected. If a *ſtone* continues long in the ureter, or in the urethra, the appetite begins to fail, a naufea comes on, and a hectic heat approaches, the danger is great. An inflammation of any of the viſcera approaching is alſo fatal.

In adminiſtering remedies for the relief of theſe diſorders, it ſhould be remembered, that during the fit, the treatment muſt be very different from what it is in the abſence thereof. During the paroxyſm the inflammation is removed by bleeding, emollients, and terebinthinate clyſters, in which is the oleum ricini; this oil ſhould alſo be given by the mouth as a purge, warm baths be made uſe of, and when the inflammation is abated, opiates, with oily emollient decoctions, may be adminiſtered. In general, plethoric habits are relieved by proper bleeding. While the violence of the pain continues, with difficulty in the diſcharge of urine, nothing affords greater relief than emollient oily clyſters, warm bathing, and the pediluvium. Fomentations made with the flor. chamæmel. &c. and applied to the part moſt pained, conſiderably allay the pains and ſpaſms.

After the fit is over, begin with a cautious uſe of diuretics and lithontriptics; and when there is no inflammation nor pain, the aqua kali may by given in ſmall quantities.

The following is the beſt mode of preparing and adminiſtering it:

Take of kali prepared, eight ounces; of freſh quicklime, four ounces; of diſtilled water, a quart; mix them well together in a large bottle, and let them ſtand for twenty-four hours; then pour off the ley, filter it through paper, and keep it in well ſtopped vials for uſe. Of this the doſe is from thirty drops to three or four drams, which is to be repeated two or three times in a day. Mix the quantity to be uſed in the day with three pints of plain broth, which has been made with the lean part of veal, all the fat or oily parts being ſeparated from it, by putting it, when made, into a large bowl, and ſkimming them off with a ſpoon when cold, and let the patient drink within an hour a pint of this broth three times a day, early in the morning, at noon, and in the evening: continue the uſe for three, four, or more months, living during this courſe on ſuch things as leaſt counteract the courſe of this medicine.

Inſtead of this the following ſolution of the vegetable alkali fully ſaturated with fixed air, aerial acid, has been lately recommended, as a powerful diſſolvent of the *ſtone*.

Take kali prepared half an ounce; diſtilled water ℔. i. ſs. let the kali be diſſolved, and then ſaturate the ſolution with fixed air fully: three ounces may be taken twice a day, and the doſe be encreaſed if the ſtomach will bear it.

The diet ſhould be light, and of a laxative kind, exerciſe moderate, but as conſtantly as the ſtrength, &c. will admit. The water that is drank, and all the liquors that are of a watery kind, muſt be, from ſuch ſupplies as are abſolutely free from all mineral impregnations.

Lithontriptics are to be uſed during the intervals of the fits; but as ſome *ſtones* are only ſoluble in alkaline, others in acid, and others again in no known menſtruum, before any of theſe kinds of medicines are uſed, the nature of the offending *calculi* ſhould be known: this diſcovery is eaſily made by an attention to experiments on the fragments, &c. that are caſt off, or to the contents of the urine.

Bleeding. During a fit, if the habit is plethoric and ſanguine, this evacuation both guards againſt and removes inflammation, and alſo tends to relax the rigid fibres. As to thoſe perſons who are ſubject to regular returns of the *gravel*, they ſhould loſe blood a little before the return is expected.

Diuretics. Theſe ſhould never be of the forcing kind; the emollient and oily are the moſt proper, and after them diluting ones, both by the mouth and by clyſters frequently repeated. In general, the more painful the fit, the gentler ſhould the diuretics be, and the leſs copiouſly given. The aged and weak ſhould be allowed the uſe of cordials with their diuretic medicines. A very free uſe of diuretics injure the kidnies; however, when the pain and ſpaſm are very violent, and yet there is hope that the *ſtone* will paſs the urinary ducts, gentle diuretics, mixed with mild anodynes, do moſt ſervice; for the latter relax the parts and eaſe the pain; and the former then more eaſily and ſafely propel the *ſtone*. When gravelly matter hath been ſeen to be diſcharged with the urine, and to ſubſide preſently after it is made, light freel waters, either of the purging or of the diuretic kind, very ſafely and effectually expel it, and ſtrengthen the kidnies; the water ſhould be continued ſome weeks and repeated at proper intervals. But if a ſtone in the kidnies is ſo large that there is no hopes of its paſſing through the ureters, the freel-waters ſhould not be uſed.

Purges. Of all the purging medicines, the oleum ricini is to be preferred in *calculous* diſorders; whether a *ſtone*, or other cauſe of inflammation, produce gravelly ſymptoms, after bleeding, emollient and lubricating medicines will be neceſſary. To theſe ends, and to relax the paſſage for the calculus to paſs from the kidnies to the bladder, this oil conduces in a particular manner, even beyond any other known medicine: it ſhould be given both by the mouth and clyſter-wiſe. In want of this, oil, manna with nitre, or ſal. cath. amar. mixed with the oil of almonds, muſt be uſed; for they both empty the inteſtines, and take off all preſſure upon the ureters; they alſo moderate the heat of the body, and leſſen the inflammation; thus they relax the ſpaſm too, which the pain occaſions. If the ol. ricini is taken in the fit, ſo as to keep the belly lax, and the aqua kali puri is taken at proper intervals, mixed in any ſuitable vehicle, *their efficacy in calculous diſorders will equal that of the moſt boaſted noſtrums uſed in theſe caſes*. In lighter caſes, where gravel is to be carried off, give a mixture of ſoap, four parts, and rhubarb one part, twice a day, in doſes ſufficient for keeping the bowels eaſy.

Clysters. Their uſe is ſingularly beneficial. The colon forms a kind of arch over both the kidnies, is ſometimes joined to the left, and conſequently, if a warm emollient decoction be thrown up into it, it may, by its heat and moiſt vapour, relax and ſoften the kidney like a fomentation. Hence we ſee why wind in the firſt paſſages, and much hard dry excrement, uſually occaſion ſuch grievous diſorders, as to bring on a freſh fit; alſo why the left kidney is more ſubject to complaints than the right. The ol. ricini is peculiarly uſeful in emollient clyſters; and turpentine diſſolved with the yolk of an egg ſhould be a part of their compoſition: or, ℞ Decoct. com. pro clyſt. ℔ ſs. balſ. cap. vitel. ovi admixti, ʒ ii. ol. ricini ℥ ii. m. f. enema. To this clyſter thirty drops of the tinctura opii may be added, when the pain is great.

Opiates. When the vomiting abates, the ſtomach and bowels are freed from their foul contents, and the belly is rendered ſoluble; then, and not before, it is proper to give opiates, which, by eaſing the pain, and relaxing the ſpaſmodic tenſion of the fibres, moſt effectually open a paſſage. As to their repetition, it can only be determined by the attending phyſician. When the pain is of very long continuance, and accompanied with great proſtration of ſtrength, eſpecially if theſe occur in advanced age, and with a weak ſtate of the pulſe, Hoffman forbids the uſe of opiates, as of a poiſon; and ſays that in ſuch caſes, gentle cordial waters, as thoſe of mint, balm, and cinnamon, with the addition of a few grains of ſaffron, and the moderate uſe of wine, are the beſt means for ſupporting nature. Yet, if the loſs of ſtrength is cauſed by the violence of the pain alone, opiates will be neceſſary.

Lime-water. It ſeems to be uſeful by depriving the calculus of its oily particles, and volatilizing the ſalts, and ſo deſtroying the cements of its parts.

The semicupium is a neceſſary aſſiſtant when the pain is violent, for it powerfully relieves the ſtricture of the part. After ſitting a ſufficient time in it, let the patient take from gr. ten or twenty of the ſoap pill, and go to bed.

Vomiting is ſometimes a troubleſome ſymptom, but if not very ſevere, it is rather uſeful, ſo not to be ſuddenly checked. Whilſt moderate, it rather prevents the cohe-ſion of the gravel, and promotes its expulſion. When it is neceſſary to remedy this complaint, let the patient drink freely of ſome warm aqueous liquor to free the ſtomach from its contents: and if need be, give the ſaline draught in the act of fermentation, and in a few minutes after it give the following: ℞ Tinct. benzoes compoſt. gutt. xxx. tinct. opii, gtt. xx. aq. menth. ℥ i. m.

If a ſtone ſticks in the kidney, or the ureter, medicines

are unſafe that act by ſtimulating, and a plentiful uſe of diluents are thrown up without producing any advantage to the patient; but when the anodynes, oily medicines, &c. have conſiderably abated the ſpaſms, when the pulſe is grown calm and ſoft, and the whole body is of a moiſt and equal heat, then the expulſion of the ſtone or gravel may be attempted, by giving very gentle expellents now and then.

BLOODY URINE is ſometimes a ſymptom attending the gravel, in which caſe a doſe of manna may be taken as a purge, in a quart of milk-whey at ſeveral draughts. See WALLIS's Sydenham. To quicken its operation, and render it eaſier in the ſtomach, a ſlice of lemon may now and then be ſucked. This may be repeated twice in a week, for it both eaſes the pain, and moderates the diſcharge of blood. After its operation let a doſe of opium be taken at bed-time. If the bloody urine is from the bladder, and attended with ſpaſms there, or an ulcer, warm external applications are uſeful, ſuch as bladders of warm water laid juſt above the pubes.

SPASMS IN THE BLADDER are often very troubleſome. Whilſt they are actually preſent, and are attended with pain and difficulty of urine, emollient oily glyſters, baths, and half-baths ſhould be uſed, and internally give almond emulſions, with nitre, caſtor, ſaffron, and ſp. ætheris vitriolici compoſitus. If a tranſlation of rheumatic matter cauſed the ſpaſms, iſſues may be uſed, and perſpirative anti-rheumatics.

When CALCULOUS COMPLAINTS ATTEND DURING PREGNANCY, if the pain is violent, bleed moderately, give only medicines by the mouth; and clyſters, ſuch as are directed above, may be repeated as oft as the ſtate of the caſe may ſeem to require; and if theſe fail, give opiates ſo as to procure reſt. If a ſtone is perceived in the bladder, it ſhould be extracted before pregnancy; but if the woman is already pregnant, wait until her delivery, for fear of inflammation. During the time of labour, the ſtone ſhould be puſhed and kept up above the child's head, if poſſible; if this cannot be done, the aſſiſtant muſt paſs up his hand as ſoon as the os internum is ſufficiently dilated, and, breaking the membranes, turn the child, and bring it away footling, then there will be room for the ſtone to be raiſed by the catheter, to prevent the child's head from preſſing it againſt the urethra, which would give the woman great pain, and perhaps lacerate the parts.

As a preventive of the *gravel*, &c, Dr. Hales propoſes for the patients, at all times, to lie with the head and upper parts of the body conſiderably higher than the lower: for thus the urine is not detained ſo long in the kidnies as to allow its tartarous parts to unite with each other.

The UVA URSI in powder, given from ℈ i. to ʒ ſs. or ʒ i. twice a day with the common emulſion, in which ſhould be double the quantity of gum arabic, is often productive of every deſirable advantage. An infuſion of the ſeeds of WILD CARROT is deemed alſo a ſpecific. Acids are as powerful ſolvents of ſome calculous concretions, as the cauſtic lixivium is of others, and of this kind the acidum muriaticum may be preferred.

See BOERHAAVE, who ſpeaks well, and Aretæus admirably on this ſubject; Alexander Trallian and Lommius deſerve to be conſulted; Hoffman hath many excellent remarks on this diſeaſe in his Med. Rat. Syſt. WALLIS's Sydenham. Lobb on the *ſtone* and gout. Medical Muſeum, vol. i. and iii. Bell's Surgery, vol. ii. 9, &c. White's Surgery, 348. Memoirs of the Medical Society. vol. i. 225.

A *Stone* is ſometimes forced from the bladder into the urethra, and ſometimes it is generated in this paſſage. Dr. Boerhaave obſerves, that if recent urine be placed in a heat no greater than that of a healthy man, it ſoon throws off a ſtony matter to the ſides of the veſſels; whence we learn, that calculous matter, by too long a detention of this fluid in the bladder, may both ſoon and eaſily be formed; and a little of it may on its paſſage with the urine be ſo entangled in the urethra as not eaſily to be extricated, and ſo become the baſis of a larger ſtone, which time produces. Mr. Warner obſerves, that the urethra, in caſes of this kind, becomes a cyſt, which cyſt acquires a great degree of hardneſs, remaining compact and whole till an inflammation is produced by its incapacity of admitting any further diſtenſion: this inflammation is ſoon after communicated to the teguments, by which means they become painfully tender, and are eaſily lacerated.

If a ſtone is obſtructed in its paſſage through the urethra, and the urine requires to be drawn off, though this is difficultly effected, yet if poſſible it muſt be done; after which, a little warm oil ſhould be injected up the urethra, and repeated every hour; then bleed the patient, give him an emollient clyſter; after this operation an anodyne draught will be proper, plenty of the common emulſion ſhould be drank, and the patient being placed in a warm bath preſently after the clyſter is adminiſtered, and the oil, injected, often facilitates the exit of the ſtone.

If the ſtone ſticks in the neck of the bladder, and requires an operation for its extraction, introduce two fingers into the anus, to detain the ſtone until the inciſion is made through the perinæum upon it. After the operation, as well as for ſome days before, Heiſter adviſes the patient to drink as ſparingly as poſſible, that the wound may not be hurt by the urine; to guard againſt which, a canula may be introduced beyond the wound, and kept in the urethra until it is healed. In whatever part the ſtone is lodged, make the inciſion in the courſe of the urethra, and cut ſo upon the ſtone as that the wound in the ſkin may be parallel to that in the urethra. When the ſtone is extracted, cloſe the wound, and keep its lips together, by firſt laying on it a pledget of lint ſpread with ſome digeſtive ointment, then ſecured with ſlips of plaſter, as directed for the dry future. See Heiſter's Surgery, Warner's Caſes in Surgery, Gooch's Treatiſe on Wounds, and the Med. Muſ. vol. i. &c. ii. Bell's Surgery, vol. ii. 9, &c.

CALCULUS BILIARIS. GALL-STONE.

The *ſtone* in the gall-bladder is not of the nature of calculi above noticed, being only the bile concreted into hardiſh lumps. Theſe ſtones are found for the moſt part in the gall-bladder, though they are often met with alſo in the duct. com. choledochus.

The *gall-ſtones* often lie quiet in the gall-bladder, and until diſſection after death, were never known to exiſt; but when they are prevented from paſſing through the gall-ducts, they generally obſtruct the paſſage of the gall into the inteſtines, and produce alſo many other afflictive ſymptoms.

The diagnoſtics of this diſorder are ſometimes very obſcure, and in ſhort very uncertain; for other cauſes produce the ſame kind of ſymptoms, as thoſe which attend in this diſeaſe. Of this ſee an inſtance in Mr. White's Treatiſe on the Diſorders of the Bile: however, the uſual ſymptoms are *a loſs of appetite, a ſenſe of fulneſs in the ſtomach, ſickneſs, vomiting, languor, inactivity, ſleepleſſneſs*, and, if the obſtruction continues a few days, *a waſting of the fleſh; a yellowneſs of the eyes, ſkin, and urine; whitiſh ſtools; a pain in the pit of the ſtomach, and the pulſe in its natural ſtate*. The pain excited by obſtructions of the gall-ducts, from the *gall-ſtones* paſſing through them not affecting the pulſe, is conſidered the pathognomonic ſymptom of this affection. This pain, which in ſome is extremely acute, in others, a ſlight uneaſineſs is felt about the region of the liver, and its particular ſeat is in the gall-duct, juſt where it enters the duodenum. In ſome patients the yellowneſs does not appear, in others it is attendant for ſeveral months. There is no diſeaſe more painful than this in ſome inſtances; it is as frequent as any diſorder of the liver; it receives much relief from art, and is not immediately dangerous.

In the cure, pain is the firſt object of attention, and when it is conſiderable, opium is the only reſource; a doſe may be taken as ſoon as the patient perceives its approach, and repeated every hour or two until a remiſſion is procured. The vomiting, which generally attends, is nature's effort to diſlodge the *gall-ſtones*; and, whether it is preſent or abſent, as ſoon as the pain begins to abate, let an emetic be adminiſtered, and repeated if required; and after its operation let an opiate be given. Purging medicines may alſo contribute to the ſame ends as vomits; and of theſe, ſuch as act with the moſt eaſe, and may be continued with the greateſt ſafety, as ſea-water, the waters of purging ſprings, neutral ſalts, &c. Theſe may be repeated every other day for ſeveral months without palling the appetite, or leſſening the ſtrength. A little rhubarb may alſo be taken now and then. See London Med. Tranſactions, ii. 123. Memoirs of the Med. Society of London, i. 373.

The juice of graſs in the ſpring is a powerful ſolvent. Mr. White ſays, that he hath given alcohol ſaturated with the ol. tereb. æther. and advantageous effects have been ſoon manifeſted.

See Dr. Coe on Bilious Diſeaſes. Gooch's Caſes and Remarks, p. 163—169. Lond. Med. Tranſ. vol. ii. p. 105.

CALCULUS HUMANUS. See BEZOAR MICROCOSMICUM.

CALDAR. See STANNUM.

CALDARIUM. A veſſel in the baths of the ancients to hold hot water. It alſo means the ſame as *laconicum*, or *æſtuarium*; *a ſtove*; *a bagnio*; or *a ſweating room*; *hypocauſtum*, and *calidarium*, though they are applied to an apartment for bathing and ſweating in, which is heated by a fire under the floor; ſtill they are uſed ſynonymouſly with *laconicum*.

CALDARIÆ ITALICÆ. Hot baths near Ferrara, in Italy, uſeful in difficulty of urine.

CALDUS, for CALIDUS, is frequently uſed by Scribonius Largus.

CALEFACIENTIA. Such Medicine as warm the habit. They belong to the claſs of ſtimulants, and from the effects they produce are called calefacients. See STIMULANTIA.

CALEFACTIO. See CALCINATIO by *calefaction*.

CALENDULA. GARDEN-MARIGOLD, called alſo *caltha calendula ſativa, chryſanthemum, ſponſa ſolis, ſolſequia*, SINGLE MARIGOLD.

Of the many ſorts of *marigold*, this is the only one that is generally received in medicine. It is ſo common in our gardens, that a particular deſcription is needleſs. It is annual, propagates itſelf by ſeeds, and flowers from May to the end of Autumn.

The leaves have more virtue than the flowers, their expreſſed juice contains moſt of their pungent matter; it is aperient, and promotes the ſecretions in general. The flowers are a ſlight cordial.——ALPINA. See ARNICA MONTANA.——ARVENSIS, is that named the WILD MARIGOLD; alſo called *caltha arvenſis*, calendula minima, and *caltha minima*. The leaves are ſtinking and bitter, and if burnt in the candle they crackle like nitre.

Some prefer it to the garden ſort. Its juice is given from one to four ounces in the jaundice and cachexia; and the leaves are commended as a ſalad for children that have ſcrophulous tumors.——PALUSTRIS. COMMON SINGLE MARSH-MARIGOLD. Alſo called *populago, caltha paluſtris, pſeudo helleborus, ranunculoides pratenſis*, &c.

It grows in marſhes, and is very acrid. It is ſo cauſtic that cattle avoid it, if graſs is ever ſo ſcarce; for it excites an inflammation if they chance to ſwallow it.

CALENTURA. It is a violent ardent fever, in which a delirium comes on both early and ſuddenly. It happens to ſeamen when ſailing into very hot countries. Dr. Oliver gives the hiſtory of a caſe, in the Philoſ. Tranſ. Abr. vol. iv. in which he obſerves, that when the delirium came on, the patient imagined that he was in green fields; that after a free bleeding he ſlept, and waked without any other complaint than weakneſs from the loſs of blood, and ſoreneſs from ſtruggling during his delirium. He farther adds, that this fever attacks in the night, whence the patient, under the notion of green fields, runs into the ſea before any one is aware, ſo that few of theſe caſes occur to their obſervation. Dr. SHAW adviſes, that the patient ſhould indulge in reſt, be bled freely, take a few hours afterwards an emetic; dilute plentifully with barley water, and then bliſter.

CALESIAM. A tall tree, which bears cluſters of berries like grapes or currants. Theſe berries contain a flat ſtone with a kernel in it. It grows in Malabar. Of the wood is made ſheaths for knives and ſwords. The bark, made into an ointment with butter, cures convulſions from wounds, and heals ulcers. The juice of the bark cures the aphthæ; and taken inwardly, the dyſentery. Raii Hiſt.

CALI. See CLAVELLATI CINERES.

CALICHAPA. See SPINA ALBA.

CALIDARIUM. See CALDARIUM.

CALIDRIS BELIONII. The French call it *chevalier*. It is water-fowl, of the bigneſs of a pigeon; its legs are long, and becauſe its body is high mounted, and its motion is ſwift, it is called chevalier. It is met with in meadows where there are pools and rivulets. There are ſeveral ſpecies, and their fleſh is a nouriſhing food.

CALIDUM INNATUM. The ANIMAL HEAT, or VITAL HEAT, called alſo *hyſtychnium*. There can be little doubt at this time, but that the *vis vitæ*, and *vis medicatrix naturæ*, the animating, preſerving, and curative power of nature is the *calidum innatum*, which ſome ſubſtances attract and retain in a larger proportion than other natural bodies. BOERHAAVE uſes the term *vis vitæ*, to ſignify the joint action of all the parts of the human body, whereby the machine is continually recruited and put in order. But when any thing proves too difficult to be conquered by this vis, a diſeaſe enſues. Dr. AITKIN defines it to be the ſtate or condition of animal or vegetable organization, indiſpenſably requiſite to the capability of function. HIPPOCRATES and many others conſider it as heat or fire. Indeed the experiments of the moderns may be adduced to prove the truth of this laſt opinion. And with reſpect to the human body it is an allowed fact, that the CRASSAMENTUM, or *red globules* in the blood, attract and retain *heat* in the largeſt proportion of any other part, evident from the *heat* and diſorders that attend the rigid fibre, which is always proportioned to the quantity of red blood. Experiments made with the different parts of the blood, after its being taken from the body, contribute much to the proof of this aſſertion.

The immediate cauſe then of *animal heat*, is the craſſamentum of the blood attracting and retaining the fire which is diſperſed through the earth.

The nerves are the conductors of the fire attracted from the earth, through the whole human frame, as the various operations in the animal œconomy, and actions that depend on our wills, require.

Every fibre in the human body is elaſtic, and covered with the cellular membrane, which is formed of the continuation of the nerves of their coats. Thus,

From the red blood attracting and retaining, and the nerves conveying, *animal heat* is excited and preſerved.

All our fluids are vehicles and conductors of fire.

Concomitant with the exceſs or defect of red blood, is the exceſs or defect of *animal heat*. The exceſs of red blood is attended with the rigid fibre, and its conſequents. The defect, with the lax fibre, and its conſequents. Life, health, diſeaſe, and death, depend on the fire received by our blood from the earth, and our firſt regard in our curative conſiderations ſhould be thereto.

The common *heat* of the human body, in health, is about ninety-eight degrees of Fahren. therm. but ſome conſtitutions are healthy at eighty-three; and this *heat* continues the ſame, whether the atmoſphere, or other ſurrounding bodies, exceed, or ſink, below ninety-eight, unleſs when a diſeaſe is produced thereby; the conſequence of which is, an increaſe or diminution of the *heat* of the body. The body reſiſts different degrees of external *heat* or cold, according to the habit it hath acquired. There are inſtances of its bearing twenty degrees below 0 or Fahren. therm. with moderate clothing; and 144 above, without alteration.

The *heat* of the body rarely decreaſes lower than 94, nor riſes to more than 110 of Fahren. therm.

See Dr. Magenife's Doctrine of Inflammations, p. 31—52. Dr. Berdoe's Enquiry, and his Remarks on Voltaire's Diſcoveries in Natural Hiſtory. Dr. Shebbeare's Theory and Practice of Phyſic. Dr. Haller's Phyſiology, the Lecture on Muſcular Motion. Dr. Kirkland's Diſſertation on the Brain and Nerves. Drs. Crawford and Elliot on *Animal Heat*.

CALIETA, or CALIETTE. See JUNIPERINUM LIGNUM.

CALIGO. A growing darkneſs of the eye or dimneſs of ſight from a manifeſt cauſe: as in caſes of the cataract, &c. Dr. Cullen places this genus of diſeaſe in the claſs locales, and order dyſæſthеſia. He defines it to be ſight diminiſhed, or wholly aboliſhed; from a dark barrier between the object and the retina, in the eye itſelf, or in the eye-lid. He alſo enumerates five ſpecies, viz. 1. *Caligo* lentis; the *Glaucoma, Woolhouſii, Maitre Jean St. Yves*; this he denominates the cataract, and Sauvages calls it the true cataract; it is cauſed by an opake ſpot behind the pupil. See CATARACTA. 2. *Caligo* corneæ, from an opacity of the cornea. See ALBUGO. 3. *Caligo* pupillæ, from obſtruction in the pupil. See *Synizeſis*, called alſo *Amauroſis & Synchyſi a Myoſi*. 4. *Caligo humorum, Glaucoma Vogelii*, from a fault in the humours of the eye. 5. *Caligo palpebrarum*, from a diſorder in the eyelids. See Cullen's NOSOLOGY, edit. 3.

CALIHACHA. See CASSIA LIGNEA.

CALIX, See CALYX.

CALLÆON. The gills of a cock, which Galen ſays is a food neither to be praiſed nor condemned.

CALLECAMENON. See ÆS USTUM.

CALLENA. A kind of SALT PETRE. See NITRUM.

CALLI, πῶροι, Galen uſes this word to expreſs the nodes in the gout.

CALLIBLE-

CALLIBLEPHARON, from καλλος, *beauty*, and βλεφαρον, an *eyelid*. Medicines appropriated to the eyelids.

CALLICREAS. See PANCREAS.

CALLIGONUM, from καλλος, *beauty* and γονυ, *a joint*, or *knot*. See POLYGONUM.

CALLIOMARCUS. See TUSSILAGO.

CALLIONYMUS, from καλλος, *beauty*, and ονομα, *a name*. See URANOSCOPUS.

CALLIPHYLLUM, } from καλλος, *beauty*, and φυλλον,
CALLITRICHUM. } *a leaf*; from καλλος, *beauty*, and θριξ, *a hair*. See ADIANTHUM NIGRUM.

CALLOSITAS, CALLOSITY, from *callus*. See CALLUS.

CALLUS, is a cutaneous, carneous, or osseous hardness, either natural or preternatural. But generally it means the *callus* generated about the edges of a fracture. Sometimes it means a corn on the toes, or the hardness in the hands produced by labour; also the hard edges of ulcers. See Bell's Surgery, ii. 326. Kirkland's Med. Surgery, ii. 246.

This term and callositas, are in a special sense spoken of the eye-lids, both by Galen and Scribonius Largus. For the *callus* in the hands and on the soles of the feet, see CLAVUS. But the word,

Callus, has a particular signification, in which it means the *corpus callosum* of the brain. Paracelsus gives the name of *callus* to an abscess, or ulcer, caused by an acrid and arsenical nutritious juice, which excites a vehement itching,

The contraction of the part divided is a common symptom in wounds; and the stronger the contractile force, the greater the retraction of the sides of the wound from each other. The skin of the head is thick and strong, and equally tense on all parts of the skull, and under it lays a cellular membrane. For these reasons, when the skin of the cranium is divided, the lips of the wounds are speedily far retracted from each other, and are called *callus*, for which reason wounds of the forehead generally leave large scars behind them.

As the growing vessels in wounds of the soft parts are highly tender and pulpous, in consequence of their not being covered with the skin, they may easily be too much distended, and degenerate into fungous flesh. The same holds true in the *callus* of the bones, which may become luxuriant when the vessels which constitute the substance of the growing bone are distended, either by a redundance, or too strong impetus of the fluids.

Dr. Nisbet and Dr. Hunter imagine a *callus* of the bone is not formed by the inspissation of any fluid, but from a regeneration, or, as it were, granulation from the fibres of the bone.

CALMET. See ANTIMONIUM.

CALMUS. The stalk of any plant. See CAUDEX.

CALOCATANOS. See PAPAVER RUBRUM.

CALOMELANOS CERATUM. See MERCURIUS DULC. SUBL.

CALOMELANOS TURQUETI. So Riverius calls a certain purgative medicine which he often used. It is thus prepared:

℞ Merc. dulc. ℈j. gum. scammon. cum sulph. impregn. vel rez. jalap. ℈fs. mucilag. e gum. trag. q. s. f. pil. mediocr.

CALOMELAS, from καλος, *good* and μελας, *black*. It is what used to be called Ethiops mineral. But *calomelas*, or *calomelanos*, is, in common acceptation, the *merc. dulc. 6ties* sublim. which, if ground with the volatile spirits, becomes black, and perhaps is the true *calomel*; it is called *aquila alba*. See MERCUR. DULC. SUBL.

CALOMOCHANUS, or CALOMOCHNUS, see ADARCES.

CALONIA, CALONIAN MYRRH. Hippocrates often prescribes it.

CALORIC. LAVOISIER, in giving his reasons for the adoption of this term, says, "All bodies are either *solid*, *liquid*, or *in a state of aeriform vapor*, according to the proportion which takes place between the attractive force inherent in their particles, and the repulsive power of the heat acting upon these; or in proportion to the degree of heat to which they are exposed. It is difficult to comprehend their phenomena, without admitting them as the effects of a great and material substance, or very subtile fluid, which insinuating itself between the particles of bodies, separates them from each other. This substance, whatever it is, being the *cause of heat*, or in other words, the sensation, which we call *warmth*, being caused by the accumulation of this substance; we cannot in strict language distinguish it by the term *heat*, because the same name would very improperly express both cause and effect." He therefore gave it the names of *igneous fluid*, and *matter of heat*. But these being considered as periphrastic expressions, which both lengthen physical language, render it more tedious and less distinct, and frequently not conveying sufficiently just ideas of the subject intended. The cause of heat, or that exquisitely elastic fluid which it produces, therefore, has been distinguished by the term CALORIC, *considered as the respective cause, whatever that may be, which separates the particles of matter from each other*. See Elements of Chemistry, p. 5.

CALTHA, or CALTHULA. MARYGOLD. See CALENDULA.

—— ARVENSIS } See CALENDULA ARVENSIS.
—— MINIMA. }

—— PALUSTRIS. See CALENDULA PALUSTRIS.

CALTROPS. This is a genus of the decandria monogynia class, in the Linnean system, of which there are three species, natives of warm countries. It derives its name from the form of its fruit, which resembles those instruments of war which were cast in the enemy's way to annoy their horses. This plant is also called *Tribulus*, and taken inwardly is a vulnerary, and said to be of service in a diarrhœa, and the stone.

CALVA, }
CALVARIA. } See CRANIUM.

CALVATA. See PHALACRA.

CALVITIES, }
CALVITIUM, } See ALOPECIA.

CALX. This word is applied to whatever is subjected to calcination, or chemical corrosion. See CALCINATIO. It also comprehends many different stones, in this one character, that they burn to lime;

LIME-STONE, hence *calcarius-lapis*; also called *saxum calcarium*, *abesum*, *algeriæ*; *algerie*; *ancora*; *carium terra*. *Lime-stone* is a general name for all those stones from which quicklime is commonly prepared. They contain a portion of sulphureous matter, and the marine acid; but though the limes prepared from different stones answer many general purposes equally well, they differ greatly in their efficacy in many chemical and other kind of experiments.

All stones have for their basis either crystal or spar; those that have crystal run into glass by burning; but those that have spar, run into lime. All sea-shells, and any stone or earth that effervesces with an acid, will burn to lime. The harder the stone the stronger is the lime it produces. It may here be observed, that both earths and stones are termed earths by the chemist, but they are divided into two classes by the fossilist; calcareous earths and stones are thus characterised, considered as the objects of fossilogy. Calcareous earth is an earth which effervesces with acids. Calcareous stone is a stone effervescing with acids, burning into quicklime, and not striking fire with steel. See Edward's Elements of Fossilogy. But we must observe, that amongst earths, the calcareous is a genus; amongst stones, the calcareous is an order.

When stones of the sparry kind have been calcined by the fire, they are converted into quicklime called CALX VIVA; *albeston*, *almiza*, *annora*, *ansra*, *asbestos*, *asbestus*, *gir*; *nix fumans*; *almyzinthra*, is supposed to have the same meaning; and while they continue unpossessed of aqueous moisture, they retain this character. When calcareous stone is either figured or transparent, it takes the name of spar.

Quicklime dissolves in nitrous, marine, and vegetable acid, unites with the vitriolic into an indissoluble and insipid concrete, produces heat on mixing it with water, and gives thereto a medicinal quality. If quicklime is exposed to the atmosphere, it falls into a powder, and loses all the distinguishing properties of quicklime, except that it retains its acrimony longer in a moist than in a dry state.

The stones from which quicklime is produced, contain a large quantity of air, which in calcination is expelled: hence strong quicklime raises to effervescence, or emits no air-bubbles during its dissolution in either acids or alkalies.

CALX VIVA, or EXTINCTA, or LOTA; into these three is lime divided. The FIRST is lime in its fiery state; as brought from the kiln; the SECOND that which, having been long exposed to the air, is fallen to powder; the LAST, that which hath been deprived of its salts by repeated affusions of water.

Sir Torbern Bergman obſerves, that calcareous earth is commonly found ſaturated with aerial acid, which exhibits the appearance of effervescence, upon being driven from its baſis by a ſtronger acid. Calcareous earth, he ſays, is found diſſolved in moſt waters, by means of a redundant portion of the aerial acid. That by burning it loſes that acid, together with a proportion of water with which it was combined, and enters into a chemical combination with a certain quantity of the matter of heat, in which ſtate it is called QUICKLIME. Farther, that its attraction for water being greater than for the matter of heat, is the reaſon, that when the quicklime meets with the former, its lets go the latter; by which means a great quantity of ſenſible heat is produced, converting a part of the water which it hath abſorbed into vapours; which, if the calcareous earth were in the form of a ſtone, would break it down into a fine powder.

Quicklime is employed for increaſing the activity of alcaline ſalts, for making the milder kind of cauſtics, and for deſtroying the hair on places where it is thought to be unſeemly; it diſſolves ſulphurs and vegetable reſins, and produces many effects ſimilar to thoſe of the fixed alcaline ſalts.

CATAPLASMA CALCIS, LIME CATAPLASM.

Take of lime recently flaked, and wheat flour, of each two ounces; hogs lard prepared, four ounces; to the lime when flaked add the other ingredients. At the Bath hoſpital this is uſed as a remedy in knee caſes.

AQUA CALCIS, LIME-WATER, called alſo *Aqua Benedicta*.

Take of quicklime, half a pound; boiling diſtilled water, twelve pints; mix, and ſet it aſide in a covered veſſel for one hour; then pour off the liquor, which keep in a cloſe veſſel. Ph. L. 1788. The quantity of lime diſſoluble in water is much greater than is generally ſuſpected. Dr. Alſton obſerves, that one third of the quicklime is ſoluble in water; ſee his Diſſertation on Quicklime. The above method of making lime-water limits the quantity of water too much, for the lime requires ſeveral hundred times its weight of water to diſſolve it.

The College of Edinburgh direct particularly to ſprinkle upon this quantity, in an earthen veſſel, four ounces of water gradually, keeping the veſſel ſhut during the effervescence, and its falling to powder; then to mix the reſt of the water with it by ſtirring; to renew the ſtirring after it has ſubſided, and this for ten times, always keeping the veſſel ſhut during the ebullition, to prevent the acceſs of air, and to filter it through paper, placed in a funnel, cloſe ſhut at its top.—The London College, by avoiding the frequencies of ſtirring, expoſe it leſs to the air.

The Lime-water is a ſolution of the quicklime in water, and receives no improvement from the ingredients added in the compound ſorts which uſed to be ordered, for they precipitate much of the lime which the water ſuſpended. When the lime-water loſes its taſte, ſo does it its virtues. It hath a ſtrong ſtyptic taſte, which is followed by a ſweetiſh one; it changes the juices of blue flowers to a green; it precipitates metallic bodies that are diſſolved in acids; it tinges ſilver of a coppery hue; it turns red wine to a dark colour; and by thoſe properties its ſtrength may be eſtimated.

The ſpecific gravity of water is increaſed by the lime more than the weight of the calcareous matter taken up, on account, perhaps, of the water being deprived of its air.

If lime-water is cloſe kept, it may be preſerved many months; but in open veſſels, the calcareous matter ſoon ſeparates from the water, and concretes on its ſurface. The pinguious matter which floats upon the ſurface of lime-water which is freſh made, is called *calcis vivi flores*.

Lime-water diſſolves thick phlegm, or mucous matter, and the curd of milk. The ſtone-lime is beſt for building with, but that which is made of the ſhells of cockles or oyſters is to be preferred, when it is uſed in medicine as a ſolvent of calculous matter, &c. When the ſhell lime-water has been drank to the quantity of three pints in a day for ſome weeks, it hath been uſeful in ſcrophulas, fluxes, and other complaints, from an acrimonious ſalt. It promotes expectoration in thoſe who abound with phlegm. It generally induces a coſtiveneſs, but this is prevented by mixing a little milk in each draught. In cold phlegmatic conſtitutions it is peculiarly uſeful, but in hot bilious habits, and during either critical or periodical evacuations, it ſhould be foreborn. It ſtrengthens the appetite, and aſſiſts digeſtion; it is a good antiſeptic, and greatly helps the concoction of matter in abſceſſes, that do not ſuppurate kindly. It corrects acidity in the primæ viæ. In the diabetes and hectic fever, it is of ſingular efficacy, if drank when freſh made, and before the heat excited by mixing the lime with the water is vaniſhed. Four ounces or more of lime-water are given to adults, and repeated twice a day, or oftener, in ſome alvine fluxes, and leucorrhœa; and though it may not be lithontriptic in any great degree, it alleviates ſome calculous ſymptoms. In ſome kinds of ulcers, it is applied as a waſh: and in ſome caſes as an injection.

The ſofter the water is, uſed for making lime-water, the more effectual it is as a medicine, and the leſs diſagreeable to the palate. Diſtilled water is the beſt; and boiling water diſſolves the lime more freely than cold. It is better to pour the water gradually on the lime, for otherwiſe much of the calcareous matter is unaffected by it.

The aq. cal. mag. comp. hath been uſed under the name of *liberans aqua*. Bates calls it *aqua Benedicta* comp.

The properties, uſes, and medicinal virtues of lime, and its preparations, deſerve to be more extenſively known than our limits for information will admit; but much ſatisfaction will be obtained by conſulting the Dictionary of Chemiſtry; Newman's works; Experiments, &c. on Quick-lime, by Mr. Henry; Macbride's Eſſay on the diſſolving Power of Quick-lime; Percival's Eſſays, Med. and Exp. edit. 2. p. 328. Lewis's Mat. Med. and the Edingb. Eſſ. Phyſ. and Lit. vol. i. art. 13. and vol. ii. art. 8. Dr. Whytt on Oyſter Shell Lime-water.

CALX ANTIMONII. See ANTIMONIUM, N°. I.

—— CUM KALI PURO. See CAUSTICUM COMMUNE FORTIUS.

—— HYDRARGYRI ALBA. See MERCURIUS PRÆCIPITATUS ALBUS.

—— PREPARATA, CALCARIUS LOTUS. See CALX EXTINCTA & LOTA.

CALYCULUS, CALYCLE, from CALYX. A row of ſmall leaflets placed at the baſe of the calyx, on the outſide. Calycle of the ſeed is the outer proper covering or crown of the ſeed, adhering to it, in order to facilitate its diſperſion.

CALYPTER, from καλυπτω, *to hide*. A carnous exceſcence covering the hæmorrhoidal vein.

CALYPTRA, from καλυπτω, *to hide*, A VEIL. It is the thin involucrum or cover of ſome ſeeds, uſed by former botaniſts to expreſs that which LINNÆUS means by *arillus*: alſo a thin cup which covers the *antheræ* of ſome of the moſſes.

CALYX, *Calix*, or *Empalement*, from καλυπτω *tego*, *to cover*. The firſt of the ſeven parts of fructification, by LINNÆUS defined to be the outer bark of the plant preſent in fructification. In general it is that green cup which ſupports the bottom of the corolla, and is otherwiſe called *perianthium*, *amentum*, *ſpatha*, *glume*, *calyptra*, or *vulva*, as it happens to be differently circumſtanced. It is generally ſingle; in ſome plants double; and in others entirely wanting. It is commonly divided into the ſame number of ſegments with the corolla. The calyx commonly withers when the fruit is ripe, not before; which circumſtance infallibly diſtinguiſhes it from *bractiæ* in dubious caſes. It is generally leſs in point of height, but more ſubſtantial than the corolla.

CAM. An abbreviation of Joach. Camerarius de Plantis Epitome.

CAMARA, or CAMARIUM, the fornix of the brain. Likewiſe the vaulted part of the auricle, leading to the external foramen.

CAMARA. See VIBURNUM.

CAMARIUM. See CAMARA.

CAMAROMA CAMAROSIS, from καμαρα, *a tortoiſe*. Alſo an arched roof. A fracture of the ſkull, which appears like an arch of a vault. Called likewiſe *Cameratio*.

CAMARUM, *Cammarum*, vel *Cammorum*. A ſpecies of ſhrimp, of the crab kind; alſo the *aconites*, and, according to ſome *cicuta*.

CAMBODIA, CAMBOGIA, CAMBOGIUM. } The Indian yellow orange of Malabar, from whence the gamboge, *Coddam Pulli*. See GAMBOGIA.

CAMBRO BRITANNICA. See CHAMÆMORUS.

CAMBUCA.

CAMBUCA, or CAMBUCA MEMBRATA. *Bubo, ulcus*, or abſceſs on the pudenda; alſo a boil in the groin.

CAMBUI. The wild AMERICAN MYRTLE of Piſo and Maregraave. There are two ſpecies. Their fruit, flowers, and leaves, are fragrant and aſtringent. One ſpecies is low and buſhy, the other very tall. Ray ſays there is a third ſpecies which is white, but is very rare.

CAMEL. SYLLAB. An abbreviation of G. J. Camellus Stirpium inſulæ Luzonis, &c. Syllabus.

CAMELINA See ERYSIMUM.

CAMERATIO. See CAMAROSIS.

CAMES. or CAMET. See ARGENTUM.

CAMINGA. See CANELLA ALBA.

CAMINUS. It ſignifieth the furnace and its chimney. In Rulandus it ſignifies a bell.

CAMISIA FŒTUS. See CHORION.

CAMMARUM. See CAMARUM.

CAMMARUS. See CANCER FLUVIATILIS.

CAMMORUM. See CAMARUM.

CAMOTES INDICA. See BATTATAS HYSPANICA.

CAMOMILLA. See CHAMÆMELUM.

CAMPANA. A BELL. In chemiſtry it is a receptacle for the gas of ſulphur, where it is concentrated and collected together into a thin aqueous matter, in order for the preparation of the acid ſpirits of ſulphur; hence *oleum ſulphuris per campanam*.

CAMPANULÆ. See CERVICARIA.

CAMPE, from καμπτω, *to bend*. A flexure or bending. It is alſo uſed for the ham, becauſe it is the part uſually bended: alſo *a joint, or an articulation*.

CAMPECHENSE LIGNUM. LOGWOOD; alſo called *Acacia Zeylanica, lignum Campeſcanum, ſappan lignum, tſham pangam, lignum Campechianum, Indicum montanum lignum, lignum tinctile Campech*. CAMPEACHY WOOD, *Braſiletto*, and BRASILIS LIGNUM, or JAMAICA WOOD.

It is the *wood* of a prickly pod-bearing tree, a native of Campeachy iſland. It is brought into Europe in large compact logs of a red colour. Its fruit reſembles cloves in their quality. It is the HÆMATOXYLON CAMPECHIANUM of the CLASS Decandria, ORD. MONOGYNIA, Gen. Plan. LINN. 525.

HÆMATOXYLON, *Calyce*; quinque partito; *Petalis* quinq. *Capſula* lanceolata; uniloculari; bivalvis *valvis* navicularibus.

This *wood* is chiefly brought for the dyers, but uſed medicinally as an aſtringent and corroborant. It is peculiarly efficacious in diarrhœas, and in the laſt ſtages of dyſentery; when the obſtructing cauſes are removed, it powerfully reſtrains this kind of flux, yet it does not contract the fibres, as is the caſe with aſtringents; it obtunds acrimony, and hath more of a balſamic taſte than of an aſtringent one. It ſtrengthens the bowels, and indeed the general habit. It is an agreeable medicine, being free from any thing diſguſtful to the taſte, and almoſt void of ſmell.

The London College directs an extract from this *wood*, as follows;

Extractum Ligni Campechenſis. *The* EXTRACT *of* LOGWOOD. Ph. Lond. 1788.

Take the ſhavings of *logwood*, one pound; boil it four times, or oftener, in a gallon of diſtilled water, to one half; then boil all the liquors, mixed together and ſtrained, to a proper conſiſtence. The ſhavings are here ordered to prevent it from being mixed with Jamaica, or other cheaper woods; which might be the caſe if bought in powder. The doſe from ℈i to 3 ſs. repeated according to the urgency of the ſymptoms.

Rectified ſpirit of wine takes up more from this *wood* than water does; therefore it is better to digeſt its powder in as much ſpirit as will cover it three or four fingers breadth above its ſurface, then boil the reſiduum in water as directed above; after which, the watery menſtrua are firſt evaporated to the conſiſtence of honey, then the ſpirituous one is mixed therewith, and the whole reduced to a proper conſiſtence.

DECOCTUM CAMPECHENSE. DECOCTION *of* LOGWOOD.

Boil three ounces of powdered *logwood* in four pints of water to two, at the end of which add two drams of cinnamon, boil them together a few minutes, and when cool ſtrain off the liquor for uſe.

This extract and decoction are either of them agreeable, mild, and ſafe, when ſtronger aſtringents are not ſo; and this advantage attends the *logwood*, which cannot be ſaid of aſtringents, it may be uſed with equal ſafety, whether a fever attends or not. Theſe preparations make the ſtools and urine appear like blood. The extract may be taken in doſes from gr. x. to 3 ſs. the decoction to three or four ounces, three or four times a day.

The preparations of this wood are chiefly held in eſteem for their aſtringency, and may be given ſafely in fluxes, and at the cloſe of dyſentery; but in the beginning they are miſchievous: ſo Dr. Cullen has found them.

When flatulencies attend in diarrhœas and dyſenteries, a few grains of the cortex elutheriæ is a proper addition to each doſe of the above extract or decoction. See Lewis's Mat. Med. and Newmann's Chemical Works. Cullen's Mat. Med.

CAMPHORA. CAMPHOR; called alſo *caf, caſa, cafar, ligatura veneris, caphura, caphora; capur, alkoſor, altefor*; CAMPHOR. It is a ſolid concrete, chiefly obtained from the woody part of ſome trees, which are met with in the iſland of Borneo, in the Eaſt Indies, and in Japan; it is only from the latter that it is brought into Europe. The Indians have a ſpecies, which they diſtil from the roots of the true cinnamon trees, that they call *baros*, See CINNAMOMUM. And alſo a ſpecies which ſeparates from the *caphuræ oleum*, on re-diſtilling it. It ſometimes oozes from the bark of the root of the cinnamon tree in the form of oleous drops, which inſenſibly concrete into white grains. Theſe are called *caphura baros Indorum*. In the ſtate camphor is extracted from the roots of the camphor tree, it is named *camphora rudis*. But it is obtained chiefly from the LAURUS CAMPHORA, or the laurus fol. triplinervis lanceolata-ovatis nitidis, petiolis laxis, floribus parvis albis of LINN. The CAMPHOR-TREE. CLASS *enneandria*, ORD. *monogynia*. Gen. Plant. 503. In ſmaller quantities it is obtained from ſome cinnamon trees, and in very ſmall quantities from ſeveral other vegetables. That in Japan is extracted from a large tree of the bay kind, called *lauro camphorifera*, and by LINNÆUS, laurus foliis trinervis langeolata-ovatis; nervis ſupra baſin unitis.

As firſt ſublimed or diſtilled from the wood, it is of a browniſh colour, and compoſed of ſemi-pellucid grains, mixed with ſome impure matter; in this ſtate it is imported by the Dutch, then called *camphorata elaborata*, unpurified camphor. It is purified by a ſecond ſublimation, &c. but after a manner only known to themſelves, except the Venetians, who formerly were the only refiners of it: the laſt proceſs in the management is ſo contrived, that the head of the ſubliming glaſs is kept warm enough to make the *camphor* run together into a maſs of its own figure, in whi.h form it is brought into the ſhops. Dr. Lewis ſays, that it may be purified in ſp. vin. rect. by ſolution, and recovered from the ſpirit by diſtillation, the ſpirit all riſing before the *camphor*; and after this it may be formed into loaves by fuſion, with a gentle heat, in a cloſe veſſel.

The ancient Greeks do not mention *camphor*: it was firſt uſed in medicine by the Arabians.

Camphor is a vegetable concrete, unctuous to the touch, with a fragrant ſmell, ſomewhat like that of roſemary, and a bitter aromatic pungent taſte, accompanied with a ſenſe of coolneſs on the tongue; it is volatile like eſſential oils, but without their acrimony: it alſo differs both from them and from the ſebaceous oils, in ſuffering no ſenſible alteration from long keeping, in being totally exhalable in a warm air, without any change or ſeparation of its parts, and ſubliming unaltered in the heat of boiling water, &c. It burns in water, it receives no empyreumatic impreſſions, nor does it ſuffer any reſolution from any degree of fire, to which it can be expoſed in cloſe veſſels, though readily combuſtible in the open air. It diſſolves in concentrated mineral acids, rectified ſpirit of wine, oils, &c. but not in water, in vegatable acids, nor alcaline liquors. It melts into an oily appearance, with a leſs degree of heat than that of boiling water; laid on a red-hot iron it totally evaporates in a bright white flame and copious fumes, which, condenſing, form a ſoot.

Camphor is known to be good, if when it is put upon hot bread, it turns moiſt: if it becomes dry it is bad: it ſhould be kept cloſe in a bottle or a bladder, not to prevent it from loſing its quality, but to preſerve the whole of it from exhaling away.

As *camphor* is ſo extremely uſeful a medicine in a variety of caſes, it is neceſſary to give its effects on the human machine in the cleareſt point of view which we are able And firſt, the queſtion is, whether its power is of a ſtimulant or ſedative nature? Dr. Cullen ſeems clearly to have proved the laſt, when taken into the ſtomach—

externally

externally it is certainly ſtimulant, for when taken into the mouth it has an acrid taſte, and, though by its evaporation it excites a ſenſe of cold air, what remains is a ſenſe of heat in the mouth and fauces. When taken down upon the ſtomach it often gives pain and uneaſineſs, which he imputes to the operation of the acrimony upon the upper orifice. When applied to any ulcerated part, it perceptibly irritates and inflames; theſe are marks of its ſtimulant power. When thrown into the ſtomach of brute animals, it operates there by a ſmall portion of its effluvia, for when a maſs of any bulk has been thrown in, though it has produced conſiderable effects on the body, neither the bulk nor weight are found ſenſibly diminiſhed; hence he concludes the operation has been upon the nerves of the ſtomach, and by theſe on the reſt of the ſyſtem, and the operation to be entirely that of a ſedative power. However, the ſudden death of many animals occaſioned by it, as experimentally proved, ſhew ſtill more evidently its ſedative effects in the ſenſorium, which deſtroy the mobility of the nervous power, and thereby extinguiſhes the vital principle. It can no other way be accounted for; for *camphor* firſt operates by inducing ſtupor and ſleep, and the other ſymptoms of delirium. Furor and convulſions can all be explained by the ſtruggle which occurs between the force of the ſedative power, and reaction of the ſyſtem, as in caſes of other poiſons. It evidently ſhews no ſtimulant power on the ſanguiferous ſyſtem, for the pulſe, where it has been obſerved, has been ſlower than before its effects took place, by ten ſtrokes in a minute.

With regard to the diſeaſes in which it has been employed, we find it has often been given with advantage in fevers of all kinds, particularly nervous fevers, attended with much watchfulneſs, and delirium. WHERLHOFF adminiſtered it in many inflammatory diſeaſes with great benefit, and conſiders it as a refrigerant. It has been remarkable in putrid fevers, from its antiſeptic powers; and Collin has found it efficacious in curing and reſiſting gangrene. From its uſe in low, and what are called malignant, fevers, and from its antiſeptic powers, it is highly probable that it has been of great ſervice in the confluent ſmall pox, and alſo in favouring the eruption of exanthemata, and bringing them back to the ſkin, when from any cauſe they have ſuddenly receded; but this he ſays, not from experience.

In chronic caſes, whenever diſeaſes depend upon a mobility of the nervous power, and an irregularity of its motions; it may be expected ſuch a powerful ſedative ſhould be of ſervice: hence its uſe in hyſteric and hypochondriac caſes, which the doctor has frequently obſerved, as well as many other practitioners. In convulſive and ſpaſmodic affections it hath been of ſervice, and even in epilepſy uſeful; which laſt has been entirely cured by this medicine alone, but it has been ſingularly beneficial when united with cuprum ammoniacum, white vitriol, or calx of zinc. It has often been employed, and ſometimes ſucceſsfully, in caſes of maniacal and melancholic caſes. It has often been given ſucceſsfully in acute rheumatiſm, and the doctor ſays that he has no doubt of *camphor* having a peculiar power in taking off the inflammatory ſtate in caſes both of rheumatiſm and gout; but as *camphor* is ready to occaſion a tranſlation from external application, as proved in a caſe recited by him, it will in gouty caſes be always employed with great danger. It is often found uſeful in relieving tooth-ach, and may be in ophthalmia, from its power of taking off local inflammation.

When united with other ſubſtances, it has been found peculiarly uſeful; with draſtic purges it is ſaid to moderate their acrimony, and thereby their violent operation. It has the power of correcting the acrimony of cantharides, according to general opinion, but in this point ſome are very doubtful. It moderates the action of mercury, at the ſame time does not deprive the ſaline mercurials of much of their deobſtruent virtue. United with opium it prevents ſome inconveniences and diſorders which happen to taking opium alone; and joined with the Peruvian bark, gives it more energy and force, whether in curing fever or gangrene. It ſhould either be given in large doſes, not under twenty grains; or if in ſmaller, they muſt be repeated at ſhort intervals, if any ſenſible effects are to be obtained from it. It may be divided and rubbed with nitre or ſugar, and a few drops of ſpirit of wine, or diſſolved in mucilage of gum arabic, the *camphor* previouſly diſſolved in a little ſpirit of wine, or expreſſed oil. But for a fuller diſcuſſion on theſe points ſee CULLEN's Materia Medica. CAMPHOR, mixed with equal quantity of myrrh, makes an uniform ſolution in aqueous fluids, and is the beſt mode of giving camphor in a liquid form, where myrrh may not be thought an improper combination with reſpect to the intent which is withed to be produced.

An imprudent doſe of *camphor* produces coldneſs of the extremities, vertigo, a ſmall weak pulſe, drowſineſs, uneaſineſs about the precordia, &c. but theſe effects are relieved by an emetic, followed with ſmall doſes of vinegar, or other vegetable acids.

1. *Emulſio* Camphorata. CAMPHORATED EMULSION.

Add a dram of *camphor* to a pint of the almond emulſion, now called *lac amygdalæ*—ALMOND MILK; to mix the *camphor*, it will be neceſſary to uſe an additional quantity of the mucilage of gum arabic. A large ſpoonful, or more, may be given every two hours. Nitre, or acids, may be added, as the occaſion may require.

The London College directs the following preparation, called,

2. *Miſtura è* Camphora. *The* CAMPHORATED MIXTURE. *Formerly* Julepum à Camphora. CAMPHORATED JULEP.

Take of *camphor*, one dram; rectified ſpirit of wine, ten drops; of double refined ſugar, half an ounce; of boiling diſtilled water, a pint. Rub the *camphor* firſt with the rectified ſpirit, then with the ſugar; laſtly, add the water by degrees, and ſtrain the mixture. This is better made by mixing the *camphor* with double its quantity of gum arabic; for thus it is leſs apt to vellicate the ſtomach, and cauſe anxiety; a large ſpoonful contains about two grains of *camphor*: by this method vinegar may be added inſtead of water; vinegar renders the *camphor* more eaſy on the ſtomach, and improves its antiſeptic power. So has it been ſaid of nitre; but experience does not prove the validity of this opinion.

The emulſion or the mixture of *camphor*, are excellent in low and putrid diſorders; being, in theſe caſes, the lighteſt and beſt cordials, eſpecially for women or feeble men, with ſpaſmodic ſymptoms.

A very ſmall proportion of *camphor* is diſſolved in this menſtruum by the mode here preſcribed: but if *camphor* and myrrh be united in equal proportions, well triturated together, they will form an uniform mixture, with an aqueous ſolvent gradually added, as proved by ſome experiments recited in the Memoirs of the Medical Society of London, 1789.

The London College alſo orders the following for external uſes:

3. *Spiritus* Camphoratus. CAMPHORATED SPIRIT. *Formerly Spiritus vinoſus* Camphoratus. CAMPHORATED SPIRIT OF WINE.

Take of *camphor*, four ounces; of rectified ſpirit of wine, a quart; mix them ſo that the *camphor* may be diſſolved. This is often ſucceſsful in removing pains, inflammations, numbneſs, palſey, &c. by rubbing the part affected with it. An ounce of *camphor* will diſſolve in leſs than an ounce and a half of ſpirit, and in theſe ſolutions it does not exhale, for the ſpirit muſt all be evaporated before the *camphor* will depart.

4. *The* SPIRITUS CAMPHORÆ TARTARIZATUS *is thus made.*

Mix equal parts of *camphor* and ſalt of tartar, in a proper quantity of proof-ſpirit, and draw off one half. But this preparation does not poſſeſs any advantages above the ſp. *camphoratus*.

The College of London uſed to add ʒ i. of *camphor* to ℔ j. of the white ointment, and called it ung. alb. *camphorat.* but have now rejected it; though it is eſteemed by ſome cooling, emollient, and diſcutient, and uſeful againſt cutaneous heats, tetterous or ſerpiginous eruptions.

Different preparations are called oils of *camphor*, ſeveral of which may be ſeen in Newman's Chemical Works, and other writers, but they do not appear to poſſeſs any peculiar advantages above the crude *camphor*.

CAMPHORATUM OLEUM. A mixture of olive oil two parts, with one of *camphor*, is called oleum *camphoratum*; and is of uſe in inflammatory ſwellings of the throat, if mixed with a proper cataplaſm and applied thereto, and alſo in aſcites when the abdomen is much diſtended, if rubbed freely on, every night and morning.

CAMPHORA RUDIS. See CAMPHORA.

CAMPHORÆ ELIX. HARTMANNI, i. e. Spt. *Camph.* cum pauculo croci Anglicani.

—— FLORES. The ſubtile ſubſtance is thus called which firſt aſcends in the ſubliming of *camphor*.

—— FLORES COMP. The compound flowers of *camphor*.

Sublime eight parts of *camphor* with one of the flowers of benjamin.

—— OLEUM. See CINNAMOMUM.

CAMPHORATA. STINKING GROUND-PINE, called alſo CHAMÆPEUCE, and *camphorata hirſuta*. It is a low plant, a native of the warmer parts of Europe; it ſmells like camphor, but hath ſomething diſagreeable beſide. It is much eſteemed in fomentations againſt pain. It is warming, and commended in gouty complaints. Miller's Bot. Off.

—— ELABORATA. See CAMPHORA.

CAMPHORASMA. See MELISSA TURCICA.

CAMPSIN. The Egyptian name for the ſouth wind. See ÆTESIÆ.

CAMPULUM, from *καμπτω, to twiſt about*. A diſtortion of the eye-lids, or other parts.

CANABIL. See ERETRIA.

CANABINA AQUATICA. See BIDENS.

CANABIS INDICA, } See BANGUE.
—— PEREGRINA. }

CANADELLA. See CHANNA.

CANADENSE BALSAMUM. See CAPIVI BALSAMUM & ABIES. No. 4.

CANALICULUS, vel CANALIS ARTERIOSUS. See ARTERIOSUS DUCTUS.

CANALIS. A CANAL. It is alſo a round hollow inſtrument for embracing and holding a broken limb. Hippocrates ſpeaks of its uſe, and Sculletus repreſents different ſorts of them in his Armamentarium, part i. tab. 23.

According to Gorræus, *canalis* ſignifies the hollow in the ſpine, where the medulla oblongata deſcends.

CANALES SEMICIRCULARES The *ſemicircular canals* of the ear.

They are three in number, one ſuperior and perpendicular, one poſterior and perpendicular, and one horizontal; their ſize is nearly the ſame, but generally the ſuperior perpendicular is the greateſt. They begin in the veſtibulum, wind round the bone, and terminate in the veſtibulum again; each at their origin have a ſeparate orifice, but the two perpendicular meet and return into the veſtibulum by one common orifice. That theſe ducts contribute to hearing, appear from their being found in birds and fiſhes, though the cochlea is not found in either.

CANALIS SEMIS. PETROS. The BONY HALF CANAL. See AUDITUS.

—— VENOSUS. The vein of the funis umbilicalis proceeds from the placenta to the navel of the child, and thence to the vena porta, with which it communicates by its main trunk, where there is a canal, which goes to the vena cava hepatica, thus called, and alſo ductus venoſus; it runs between the lobulus Spigelii and the left or ſmall lobe of the liver. This ductus venoſus enters the vena cava hepatica of the left ſide, juſt where that is piercing the great trunk of the vena cava inferior.

CANANGÆ OLEUM. Hoffman mentions this oil as being ſcarce, and brought from India, alſo that it is diſtilled from the flowers of the lime-tree See Hoffman's Obſ. Phyſico-Chym. and in his Med. Rat. Syſt. vol. i. § ii. cap. 6.

CANCAMUM GRÆCORUM. See COURBARIL.

CANCELLUS. The WRONG HEIR, alſo called *Bernhardus eremita, cancer in teſtis degens.*

It is a ſmall ſpecies of cray-fiſh, which the French call BERNARD THE HERMIT, becauſe it ſhuns others, and retires into the firſt ſhell it meets with. It is found in the ſlime near the rocks, but commonly in a ſhell of a conic figure, and as large as a nut. There is a larger ſpecies in the American iſlands; it is three or four inches long: they call it the SOLDIER, becauſe it fortifies itſelf in a ſhell which is not its own. Father Du Tertres ſays, half its body is like a graſs-hopper.

Hang them in the ſun, and they diſſolve into a kind of oil, which is very ſpeedy in curing the rheumatiſm, if rubbed on the part.

CANCER. The CRAB. *Cancer* in Latin correſponds with the *καρκινος*, the *καραβος*, or the *καμμαρος* of the Greeks, and to the *crab* in the Engliſh.

CANCER IN TESTIS DEGENS. See CANCELLUS.

—— MARINUS, is that called the SEA-CRAB; named alſo *pagurus*, and *cancer mœnas*.

—— FLUVIATILIS. The RIVER-CRAB, or CRAY-FISH; it is alſo called *cammarus* and *gammarus*. See ASTACUS MARINUS.

The black tips of the claw of *ſea-crabs* are levigated and uſed as an abſorbent under the name of pulv. e. chel. c. ppt. The London college directs a compound powder, made with *crabs* claws, red coral, and chalk; but any one of them is as good as them all together or ſingly: they all conſiſt of the ſame calcareous animal earth.

Pulvis e Chelis Cancrorum *compoſitus.* COMPOUND POWDER *of* CRAB CLAWS

Take of the tips of *crabs* claws prepared, one pound; chalk, red coral, each prepared, of each three ounces; mix them all together.

The compoſition has been conſidered inelegant, for the *chæle cancrorum* conſiſts of a calcareous earth, part of which is combined with the phoſphoric acid and glutinous matter; the corallium rubrum contains the ſame, and theſe are mixed with chalk, a ſomewhat more pure calcareous earth; hence are theſe calcareous earths joined with nauſeous impurities, inſtead of pure abſorbents. The creta and teſta oſtreorum will better ſupply the place, and if calcareous earth is deſired to be combined with phoſphoric acid, it may be found in a pure ſtate in the cornu cervi uſtum. Obſervations on the Sp. Alterum Pharmacop. Londinenſis, 1788.

The college of Edinburgh directs the following preparation, called

Pulvis Teſtaceus Compoſitus. The COMPOUND TESTACEOUS POWDER.

Take of oyſter ſhells prepared, one pound; and of white chalk prepared, half a pound. Mix them together.

The uſe of all the abſorbent earths, and preparations of ſhells, is to abſorb acidities in the primæ viæ; and this preſcription from the Edinburgh Diſpenſatory is equally valuable as a medicine with any other preparation of the kind, however attended with pompous epithets. If they meet with no acid to diſſolve them, they ſhould be accompanied with gentle purges. They ſtrongly promote putrefaction, whence their uſe ſeems to be forbid in putrid diſeaſes, and alſo from their abſorbing acids ſo powerfully in the primæ viæ, their prohibition is neceſſary. In ardent fevers their uſe is ſomewhat important: oyſter ſhells are diſſolved with a very weak acid into a mucilage, like that which lines the inner ſurface of the ſtomach, bladder, blood-veſſels, &c. which is abraded when there is inflammation in them; and this jelly, formed of teſtaceous powders, ſeems to ſupply, in ſome meaſure, the want of the natural.

See Haller's Noſology, Lewis's Materia Medica, and Neumann's Chemical Works.

CANCER. *καρκινος, a crab.* By the term *cancer*, the Roman writers underſtood what the Greeks called gangrene and ſphacelus; but the diſeaſe which is now called *cancer*, is what the Greeks and Romans meant by *carcinoma*, and *carcinos*. It is called alſo *lupus*, becauſe it eats away the fleſh like a wolf. See Celſus, lib. v. cap. xxviii.

Galen ſays, that as the *crab* is furniſhed with claws on both ſides of its body, ſo in the carcinoma, or carcinos, the veins, which are extended from the tumor, repreſent with it a figure much like a *crab*. And Boerhaave ſays, that if the ſtagnating matter of a ſcirrhus is put in motion, ſo as to inflame the veſſels ſituated in its margin, it becomes malignant, and then is called a *cancer*.

With Hippocrates we may, perhaps, moſt properly conſider all the ſpecies as compriſed in the occult and open *cancer*. A *cancer* then is, as P. Ægineta deſcribes it, an unequal tumor, with or without an ulcer. Hippocrates calls that an occult *cancer*, that is yet unburſt, or without an ulcer; and that an open, or an ulcerated one, that is burſt or ulcerated.

Mr. PEARSON ſays, when a malignant ſchirrus, or a warty excreſcence hath proceeded to a period of ulceration, attended with a conſtant ſenſe of ardent pain, is irregular in its figure, and preſents an unequal ſurface; if it diſcharges ſordid, ſanious, or fœtid matter; the edges of

the fore ſhould be thick, indurated, and often exquiſitely painful, ſometimes inverted, at other times retorted, and exhibit a ſerrated appearance. And ſhould the ulcer in its progreſs be frequently attended with hæmorrhages in conſequence of the eroſion of blood veſſels, there will be little hazard of miſtake in calling it a cancerous ulcer.

Dr. Cullen places this genus of diſeaſe in the CLASS LOCALES, and ORD. TUMORES. He defines it, a painful ſcirrhous tumor, terminating in a fatal ulcer.

Any part of the body may be the ſeat of this diſorder, though a gland is generally its immediate ſituation. The obſtruction is in the minute lymphatic veſſels, and the adjacent parts are affected as a conſequence.

Mr. PEARSON ſays, "It is probable that any gland in the living body may be the ſeat of a cancerous diſeaſe; but it appears more frequently as an idiopathic affection in thoſe glands that form the ſeveral ſecretions, than in the abſorbent glands; and of the ſecreting organs, thoſe that ſeparate the fluids, which are to be employed in the animal œconomy, ſuffer much oftner than the glands which ſecern the excrementitious part of the blood. Indeed it may be doubted whether an abſorbent gland ever be the primary ſeat of a true ſchirrus. Daily experience evinces, that theſe glands may ſuffer contamination from their connection with a cancerous part; but under ſuch circumſtances, this morbid alteration being the effect of a diſeaſe in that neighbourhood, it ought to be regarded as a ſecondary, and conſequent affection. I never yet met with an unequivocal proof of a primary ſcirrhus in an ABSORBENT GLAND; and if a larger experience ſhall confirm this obſervation, and eſtabliſh it as a general rule, it will afford a material aſſiſtance in forming the diagnoſis of this diſeaſe. The general term ſcirrhus has been applied with too little diſcrimination, to indurated tumors of the lymphatic glands. When theſe appendages of the abſorbent ſyſtem enlarge in the early part of life, the diſeaſe is commonly treated as ſtrumous; but as a ſimilar alteration of theſe parts may and often does occur at a more advanced period, there ought to be ſome very good reaſons for aſcribing malignity to one rather than the other. In old people, the tumor is indeed often larger, more indurated, and leſs tractable than in children; but when the alteration originated in the lymphatic glands, it will very rarely be found to poſſeſs any thing cancerous in its nature." However, in men a *cancer* moſt frequently ſeizes the tongue, mouth, or penis; in women, the breaſts and the uterus, particularly about the ceſſation of their periodical diſcharges; and in children, the eyes. Sometimes at the breaſt there is a hard and unequal tumor, attended with pain, which is not quite continual, and a burning heat much like what happens in *cancer* whence it is called ZARUTHAN, *a ſpurious cancer*.

Celibacy, as well as the ceſſation of the menſes, conduces to the production of *cancers* in women, whence antiquated maids are the moſt ſubject to them: next to theſe are thoſe mothers who have not ſuckled their children; then thoſe women who are paſt child-bearing; and the leaſt ſo are men, and thoſe women who have born children, and nurſed them with their own milk. Hollerius obſerves, that girls are ſubject to glandulous tumors whoſe menſtrual diſcharges are ſcanty.

The matter of *cancers* is inſpiſſated lymph, obſtructing the glands, whence pus is never well formed in them. Lymph ſtagnating in the ſcirrhous body is capable of being rarefied by heat; when heated it expands, and the tumor is enlarged; on the increaſe of the ſwelling, a part of the ſcirrhous forms an apex; then the ſkin burſts, the morbid matter obtains liberty, and ſpreading more and more, it turns out the lips of the ulcer all round. Hence the preternatural heat excited in a ſcirrhous tumor is a proximate cauſe of its becoming a *cancer*; and whatever can excite heat in a ſcirrhus, may be a remote, or procatarctic cauſe of this diſeaſe. The cauſes of a ſcirrhus are the remote cauſes of moſt *cancers*, and are whatever can coagulate, or dry the juices, prepared in, or received by the glands. The matter thus obſtructed, deſtitute of the means of being reſolved, or changed into pus, may lodge many years without giving much trouble; but when by any cauſe the motion of the humours is increaſed through the adjacent pervious veſſels, an inflammation is produced, pain and heat comes on: thus the ſcirrhus, which hitherto was inert, now acquires an acrimony, by which the containing parts are irritated and corroded. Sorrow, and other diſturbance of the mind, eaſily converts a ſcirrhus into a *cancer*. The veſſels of diſtended glands become preternaturally ſenſible, whence it is more eaſy for any cauſe of local inflammation to cauſe a *cancer*. When a ſcirrhus ſo enlarges as to be affected by the heat, or preſſure of the adjacent parts, it ſoon becomes cancerous. Gooch and Turner give inſtances of cancerous ulcers being produced by touching cancerous matter with the tongue.

A hard unequal tumor that is indolent, and without any diſcolouration in the ſkin, is called a SCIRRHUS; but when an itching is perceived in it, which is followed by a pricking, ſhooting, or lancinating pain, and a change of colour in the ſkin, it is known to be a *cancer*. It generally is ſmall in the beginning, and increaſes gradually; but though a change of colour in the ſkin is made to a red or livid appearance, as well as from an indolent ſtate, a painful one is induced: it is ſometimes very difficult to ſay, when the tranſition out of the ſcirrhous into the cancerous ſtate happened; the progreſs being quick or ſlow according to concurring cauſes. GOOCH very well obſerves, that when the tumor is attended with a peculiar kind of burning, ſhooting pains, and the ſkin hath acquired the duſky purple, or livid hue, it may then be deemed the malignant ſcirrhus, or confirmed *cancer*. He farther adds, when thus far advanced in women's breaſts, the tumor ſometimes increaſes ſpeedily to a great ſize, having a knotty unequal ſurface, more glands becoming obſtructed; the nipple ſinks in, turgid veins are conſpicuous, ramifying far about, and reſembling a crab's claws. Theſe are the characteriſtics of an occult *cancer* on the external parts, and we may ſuſpect the exiſtence of one internally, when ſuch pain and heat as hath been deſcribed, ſucceed in parts where the patient hath before been ſenſible of a weight and preſſure, attended with obtuſe pain. A cancerous tumor never melts down in ſuppuration like an inflammatory one, becauſe the obſtruction is in the minute lymphatic veſſels; but when it is ready to break open, eſpecially in the breaſt, it generally becomes prominent in ſome point, attended with an increaſe of the peculiar kind of burning, ſhooting pain, commonly felt before, at intervals, in a leſs degree, and deeper in the body of the gland, or glands. In the prominent part of the tumor, in this ſtate, a corroding ichor ſometimes tranſudes through the ſkin, ſoon forming an ulcer; at other times a conſiderable quantity of a thin lymphatic fluid, tinged with blood from eroded veſſels, is found on it. Ulcers of the cancerous nature diſcharge a thin, fœtid, acrid ſanies, which corrodes the parts, having thick dark-coloured retorted lips; and fungous excreſcences frequently vegetate from theſe ulcers, notwithſtanding the corroſiveneſs of the humour. In this ſtate they are often attended with excruciating, pungent, lancinating, burning pains, and ſometimes with bleeding.

Though a ſcirrhus may truly be deemed a *cancer* as ſoon as pain is perceived in it, yet every painful tumor is not a *cancer*; nor is it always eaſy to ſay whether a *cancer* is the diſorder or not; irregular hard lumps may be perceived in the breaſt, but on examining the other breaſt where no uneaſineſs is perceived, the ſame kind of tumors are ſometimes found, which renders the diagnoſtics uncertain.

The itching, increaſing tumor, and pain, are owing to heat rarifying the obſtructed humour, diſtending the veſſels, and producing a preternatural ſenſibility in them. As any part of the tumor is more enlarged than another, there an apex will be formed, the top of which will be covered with a tenſe, ſmooth, ſhining, thin ſkin, of a darkiſh red colour, becauſe the blood meets with difficulty in paſſing through its veſſels, which are too much diſtended. The ſkin, rendered thin by violent ſtraining, is at laſt burſt by the contained matter; hence the ulcer, which by the continuance of the ſame cauſes that produced it, increaſes. While the blood-veſſels remain unhurt, a ſerous ichor only appears in the ulcer; but when they are corroded, blood alſo iſſues forth, and as the fungous fleſh diſſolves, ſome pus is generated. The ſtinking ſanies is, from the heat of the part, and the acceſs of the air putrifying it.

A cure is rarely made but with the knife or cautery; when theſe methods of relief are not uſed, the treatment is only palliative. If the tumor firmly adheres to the ſubjacent part, it can neither be extirpated nor waſted away by a cauſtic: if it is moveable, it may generally be taken away, if at a due diſtance from ſuch blood-veſſels as would endanger life by being wounded. In general, the larger are more dangerous than the leſſer, the painful than the indolent, and the ulcerated than the occult.

When

When a breaſt is once ſcirrhous, it ſeldom continues long in a ſtate that threatens a *cancer*, without affecting the axillary glands, the other breaſt, or the uterus. Any kind of acrimony in the habit diſpoſes a ſcirrhus to a ſpeedy change into a *cancer*. When a cancer in any part is attended with a hardneſs of the adjacent glands, ſucceſs hath rarely followed an attempt to cure. In habits not otherwiſe diſordered, an occult *cancer* ſhould not be exaſperated by emollients, ſtimulating application, or intemperance, for then it may remain a long time without inconvenience; though at the ceſſation of the menſes in women they will be exaſperated, whence, if it can conveniently be done, it may be moſt proper to extirpate early.

Mr. Henry Fearon ſays, I am inclined to think, that were we to treat cancerous complaints at an early period, as proceeding from inflammation, we ſhould be much more ſucceſsful in practice.—His mode of cure conſiſts in bleeding, either topical or general, according to the ſeat of the complaint, or part affected, which muſt be perſevered in for a ſufficient length of time, to which muſt be joined a milk and vegetable diet, an open belly, and ſaturnine applications, avoiding wine, ſpirits, and fermented liquors. Memoirs of the Medical Society, London, 1789.

The indications of cure are, 1ſt, to extirpate the tumor, and prevent a return of the diſeaſe: or, 2dly, to palliate when extirpation cannot be admitted.

The diet ſhould be cool, moiſt, and light; the mind ſhould be tranquil; and the body as free from violent action as poſſible.

If the cure is to be effected by extirpating the tumor, (ſee AMPUTATIO) and if this method of relief is attempted, care muſt be had to remove all other *cancerous* tumours, the whole of each muſt be cleared away, and the habit of body muſt be corrected as much as poſſible; and when the wound is nearly healed, it may be kept open in the manner of an iſſue.

Cathæretics are propoſed for deſtroying the tumor, when the knife cannot be ſubmitted to from the patient's dread. The moſt famed of theſe have arſenic in their compoſition. Mr. Plunket's application is, on good authority, ſaid to be as follows:

"Take of crow's-foot, ſuch as grows in low moiſt grounds, dog-fennel, each an ounce; pound them well: add to them of crude brimſtone, ſome prefer the *magnes arſenicalis*, five ſcruples; and of white arſenic finely levigated, one dram. Make theſe into ſmall balls, and dry them in the ſun. Theſe balls muſt be powdered and mixed with the yolk of an egg, then laid over the ſore or *cancer* upon a piece of pig's bladder, which muſt be cut to the ſize of the ſore, and ſmeared with the yolk of an egg. This muſt not be applied on a piece of bladder larger than a half crown, if the *cancer* to be extirpated is on the face; the ſame caution is required if it is near the heart; but elſewhere it may ſpread the ſize of the ſore. The plaſter muſt not be ſtirred until it drops off of itſelf, which will be in about a week. Clean bandages are often to be put on." This is called CAUSTICUM ANTI CANCROSUM, in applying which, great circumſpection is neceſſary, particularly to cancers on the noſe or lips; on account of the danger of ſwallowing a portion of the arſenic.

This arſenical preparation will anſwer beſt in recent caſes, but it ſhould never be uſed except the whole tumor can be removed. The crow-foot is added to deſtroy the ſkin; but this end will, perhaps, be better anſwered, by rubbing the part immediately over the tumor with antimonium nitratum, the day before the arſenical medicine is appplied: this makes way for the action of the arſenic. Inſtead of the ſimple mixture of brimſtone and arſenic as above, the preparation of arſenic, called magnes arſenicalis, ſhould be uſed. This cauſtic does not deſtroy the gland, but only the ſubſtances all around it, ſo the tumor comes out as if it had been dexterouſly diſſected out; and it muſt be obſerved, that a patient ſhould never go into a warm bath whilſt arſenic is applied.

Several eminent practitioners have formerly encouraged this method, as Fallopius, Zaber, Sennertus, &c. but though on ſmall cutaneous glands it may do, in the larger and deep-ſeated it is unſafe; for by the irritation of theſe medicines an inflammation, and, perhaps, fever, are brought on, which are dangerous ſymptoms; and by the ſubtil penetrating quality of arſenic, the life of the patient is alſo greatly hazarded, whatever be its mode of application and correction

Mr. Pott obſerves, that if a cauſtic is uſed, it ſhould be ſuch a one as will penetrate quite through the tumor, and effectually eradicate it at the moſt in two or three applications: this the common ones will not do, for they only reach as far as into the cellular membrane; hence their frequent repetition will be neceſſary. On every repetition of the cauſtic, the tumor reinflames, hardens, and enlarges; conſequently, it becomes, by ſuch treatment, more and more untractable. Cauſtics harden the ſurrounding parts, and produce other ill effects, and this gave origin to that ridiculous idea of the ſcirrhus or *cancer* having claws or roots, &c. If cauſtics are uſed, the moſt active ones are to be preferred.

If the *cancer* is ulcerated, frequent dreſſing with dry lint, or ſuch other things as experience manifeſts to be the leaſt uneaſy, are the moſt eligible.

In general the palliative method will be,

To avoid all external means while the diſorder is in its occult ſtate; to prevent its being handled, or preſſed by the cloaths, that it may be kept eaſy and cool.

To correct the habit of body, if any way diſordered; and with the alteratives may be given ſmall doſes of hydrargyrus muriatus, but with great caution.

To moderate pain.

To keep the belly ſoluble with cooling medicines, ſuch as manna, natron vitriolat. &c.

To bleed as often as the ſtrength will admit.

To avoid cordials, exerciſe, or whatever can excite a greater heat than is proper to health in a ſtate of reſt.

A ſlight inflammation in the neighbourhood of the tumor, which yet is in its ſcirrhous ſtate, may be relieved by means of Goulard's ſaturnine water, and thus is hindered from degenerating into a *cancer*; but if the inflammation is conſiderable, a *cancer* cannot be prevented.

Bleeding is neceſſary, at leaſt as often as pain and feveriſhneſs require it.

Purging ſhould not only be uſed to prevent a coſtive habit, but alſo immediately after every bleeding, to increaſe its cooling effect.

Pain, when urgent, requires bleeding, cooling purges, a ſpare diet that is thin and cooling, and anodynes inwardly. This ſymptom is alſo much relieved by deſtroying the ſenſibility of the parts by preparations of lead.

Fever. This requires the ſame means for its relief as are recommended againſt pain; to which may be added any other febrifuge that the ſtate of the conſtitution may ſeem to admit of. Milk and water, or a decoction of ſarſaparilla, are convenient for common drink.

The beſt external medicine in the occult ſtate is a well dreſſed hare's or rabbit's ſkin; for now all emollients, ſtimulants, and unctuous preparations are to be avoided.

When the *cancerous* tumor becomes ulcerated, the edges of the ulcer are hard, ragged, and unequal, very painful, and reverſed in different ways, being ſometimes turned upwards and backwards, and on other occaſions inwards. The whole ſurface of the ſore is commonly very unequal; in ſome parts there being conſiderable riſings, and in others deep excavations. The diſcharge, for the moſt part, is a thin, dark-coloured, fetid ichor, and is often poſſeſſed of ſuch a degree of acrimony as to excoriate, and even deſtroy the neighbouring parts. In the more advanced ſtages of the diſeaſe too, by the eroſion of blood-veſſels which occurs, conſiderable quantities of pure blood are ſometimes diſcharged. There is generally a burning heat complained of, all over the ſurface of the ulcer, and an increaſe of the ſhooting lancinating pains, which were much complained of before the ulcer was formed. The appearances of theſe ulcers are ſo various, that it is, perhaps, impoſſible for any deſcription to take them all in. Some have fungous excreſcences about their edges reſembling cauliflowers, or ſtrawberries; others have none. When the *cancer* is ulcerated, the following have been extolled:

℞ Ung. ſaturn. cum duplici quantitate ceræ albæ paratum & fiat ceratum.

℞ Pulv. e ceruſſ. C. mucilag. gum. arab. ℥ß ʒ ij. ceruſſæ acetatæ ℈i. probe contritis in mortario marmoreo adde ſenſim aq. calcis & roſar. ℥ß ʒ vi. f. lotio.

After gently cleanſing the ulcer, waſh it with the lotion juſt warmed, then covering it with dry lint, or lint moiſtened in the lotion; lay over the whole a plaſter ſpread with the cerate, which may extend ſomewhat over the edges of the ſore.

In general, that which is the eaſieſt is the beſt, and often a cerate of oil and wax is preferred.

A mixture of vinegar, with twenty times its quantity of water, is ſometimes of excellent uſe.

Goulard

Goulard commends his faturine preparations.

Tar-water, both inwardly and outwardly, hath been attended with conſiderable advantage, and particularly when the diſorder appeared at or about the ceſſation of the menſtrual diſcharge.

Narcotic herbs, ſuch as the ſolanum and cicuta, have been uſed with ſucceſs. See the articles reſpectively.

Carrot poultices renewed twice a day remove the nauſeous ſmell which attends *cancerous* ulcers. See DAUCUS. Fixed air applied to the ulcer hath the ſame effect, if it ſhould be uſed every ſix, eight, or twelve hours, and after it, rags may be laid on the ſore, after dipping them in lavender, or other odoriferous water mixed with vinegar.

The hydrarg. muriatus, gr. ſs. given night and morning, as in venereal diſorders, with the decoct. ſarſaparil. keeping the body lax, but not to purge, hath been manifeſtly uſeful, though it is owned that its efficacy is leſs in caſes where the ulcer is very conſiderable. It hath often ſucceeded in *cancers* of the face and noſe. The bark may accompany it when the habit is lax.

The bark and hemlock may very advantageouſly accompany the uſe of this mercurial medicine, and may, in general, be thus adminiſtered:

℞ Extract. cicut. gr. v. vel plus bis in die; or rather the powder.

℞ Infuſ. cort. Peruv. ℥ iij. bis terve in die.

℞ Hydrargyri muriati, gr. 1-16th, ad ſs. bis in die.

If the muriated quickſilver is not eaſy in the ſtomach, a few drops of the tinct. opii may accompany each doſe.

In recent caſes the hemlock is ſometimes uſeful; its external uſe is more effectual than its internal; and its efficacy exceeds that of carrot poultice, though they all, and in every mode, are uſeful. Mr. Juſtamond intimates in his Lectures on the Operations of Surgery, that the beſt way of uſing hemlock is to make a bath with it; when this bath is uſed, it muſt be tepid, and the patient may ſtay in it during fifteen or twenty minutes, and repeat it two or three times a week. He further recommends as a powerful efficacious medicine, the ferrum ammoniacale internally; it may be given three times a day, beginning with ten grains made into two pills, and increaſe the doſe as far as the ſtomach will bear it.

In the fourth volume of the Edinburgh Medical Commentaries, is an extract from a publication by Dr. Le Febure, a French phyſician, by which it appears, that the internal uſe of arſenic is frequently effectual in curing *cancers*. He ſays, that in ſome inſtances the cancerous virus is alkaleſcent, and in others it is aceſcent. His general method of adminiſtering this medicine is as follows:

℞ Arſen. alb. gr. iv. f. ſolutio in aq. font. diſtil. ℔. i. hujus ſolutio detur cochl. magn. cum lact. vaccin. cochl. magn. & ſyr. e mecon. ℥ ſs. mane jejuno.

The arſenic is directed to be of a clear, white, ſhining appearance, and in ſmall cryſtals; and every morning that the doſe is taken, the patient muſt not take any thing after it during one hour. This courſe muſt be continued eight days, after which a doſe is to be taken in the ſame manner, twice every day; the firſt in the morning, the laſt about eight at night. At the end of a fortnight, three doſes are to be given in a day; the third being taken about mid-day. Thus, women of weakly conſtitutions may continue until a cure is completed. But with an adult of a good conſtitution, the doſe may be augmented by degrees, every eight days, till he takes ſix table ſpoonfuls of the ſolution every day; two table ſpoonfuls being taken for each doſe, with as much milk, and half an ounce of the ſyrup of poppies. For children, tea-ſpoons muſt be uſed, and the doſe ſhould, on no account, exceed three of theſe, with a proportionable quantity of the ſyrup. But, beſides that, the ſolution of the arſenic is thus to be increaſed to a certain height, in point of quantity; the ſtrength is alſo to be augmented. Six grains of arſenic may be diſſolved in the ſecond bottle of the ſolution, and eight in the third. But, beyond this, Dr. Le Febure thinks it unadviſeable to proceed. In general, he ſays, ſix bottles of the ſolution is ſufficient for the cure of an open *cancer*; in one caſe, however, eight were neceſſary. He aſſerts, that this method is never attended with any ill accidents; and adds, that the arſenic does not act in any certain manner upon the ſecretions. A purgative compounded of manna, rhubarb, and ſal ſeignette, is to be given every eight or twelve days. Whey, with twelve grains of nitre to the bottle, or a weak decoction of the roots of marſhmallows, with the ſame quantity of nitre, may be given for common drink. The belly is to be kept open by injections of whey, bran-water, or pure water, with the addition of emollient herbs, if neceſſary, or a little honey. With reſpect to regimen, it is directed to abſtain from wine and fermented liquors. Broths, made with a little beef, veal, or chicken, are proper. Broiled, roaſted, or boiled meat, ought to be taken in ſmall quantity. Spinnage, lettuce, ſuccory, or ſorrel, may be given with advantage. Ripe fruit is not to be forbid. Rice cream, and milk in different forms, are a very proper part of diet. The doctor has ſometimes been obliged to give the bark, and to open an iſſue, when the humours were either very alkaleſcent, or in very great quantity. He conſiders an iſſue as uſeful in every caſe. When the ulcer is cicatrized, he recommends cold or warm mineral waters, according to the circumſtances of the patient, with a view of completing the cure, or where theſe cannot be had, he gives artificial ones. Beſides this treatment by internal medicines, the method of dreſſing the ulcer becomes alſo an object of attention. If the tumor be not ulcerated, he directs it to be waſhed with a ſolution of arſenic, having eight grains in a pint of water. After waſhing with this ſolution, apply the following cataplaſm; take of carrot-juice, one pound; of acetated cerufs, half an ounce; of arſenic diſſolved in diſtilled vinegar, half an ounce; of liquid laudanum, a dram and a half; form the whole into a maſs of a proper conſiſtence with as much powdered hemlock as is neceſſary. With part of this cataplaſm the tumor is to be covered to a tolerable thickneſs, and the whole kept up with the common plaſter. If the *cancer* be ulcerated, it is adviſed that the ichorus ſeroſity be taken away at each dreſſing, by means of dry lint. The ulcer is then to be fomented with the arſenical ſolution, having the chill taken off it, and above one third of red wine added to it. If the ſore be of a very bad kind, it is adviſed that the arſenic be diſſolved in a decoction of bark, for fomenting the ulcer. Afterwards the cataplaſm mentioned above, and the plaſter, are to be applied. This treatment muſt be renewed every twelve hours. In Decad II. vol. i. of the Medical Commentaries of Edinburgh, a ſolution of arſenic is given in drops, in intermittent complaints; which may alſo be adminiſtered in this, in the ſame manner, gradually increaſing the doſe, as much as the habit will bear, with equal efficacy and more elegance.

Mr. Bell, in his Treatiſe on Ulcers, edit. 3. p. 299, &c. obſerves, that *cancers* are moſt frequently in the lips in men, and the breaſts in women. The ſooner cancerous caſes are operated upon, the greater is the chance of the extirpation proving effectual, and vice verſa. This, though, is contradicted poſitively by Mr. PEARSON; "If ſays he, the removal of the morbid part were equally complete in two patients, one of whom had been afflicted ſeven months, and the other ſeven years, with a cancer, I ſhould eſteem the latter in leſs danger of a relapſe than the former. For example, when the breaſt is affected by a cancer, diſtant parts of that gland may become the ſeat of the morbid alteration about the ſame period. Theſe ſeveral diſeaſed portions may not advance with equal celerity; but while one part acquires a conſiderable bulk, the other altered parts may be ſcarcely objects of attention. Under ſuch circumſtances, the more obviouſly morbid parts may be removed; but the diſeaſe being only in progreſſion, no man can be certain without removing the whole breaſt, that he has not left ſome diſeaſed fibres. If however the diſeaſe ſhall continue without increaſing during ſeveral years, one may in general conclude that its boundaries are more accurately defined." Conſcious that ſuch accidents may occur, BELL therefore adviſes: when the complaint is on the breaſt, although part of it only may be affected, the whole ſhould be always taken off. But, although it be proper to extirpate every part that is really diſeaſed, none of the external teguments ſhould be ever unneceſſarily deſtroyed, nor ſhould more of them be taken away than is requiſite. A little before the ſore heals up, an iſſue ſhould be introduced, ſo as to diſcharge freely before the cicatrix is formed. If ſcirrhus or cancerous diſorders appear in ſeveral different parts, the removal of any or all of them would not probably be effectual. If *cancers* adhere to another adjacent part, they rarely can be extirpated with ſafety; a cancerous tumor may be attached to a circumjacent muſcle or tendon, and may admit of an operation: however, much prudence is requiſite in attempting a deſperate caſe. See alſo his Surgery, vol. ii. 434, where he directs how to amputate cancerous breaſts.

CANCER ON THE FACE. Theſe are generally ſeated

on the lips, nose, or eye-lid. When they ulcerate, they are always attended with a hardness, which extends in proportion as that which formed the first tumor is destroyed by erosion, and is always preceded by a change in the colour of the skin, which, before it indurates, turns red; and in extirpating, all that is thus florid must be cut away, as well as the part that is manifestly cancerous. See Le Dran's Obs. When a *cancer* on the lip becomes ulcerous, it appears at first like a crack, and then gradually widens. In extirpating cancerous lips, the operation is best performed as for the cure of the hare-lip. Mr. Sheldon observes that *cancer* in the cheek, which no operation can cure, proceeds from a polypus.

Cancer, in the Intestines. In this case the patient is continually afflicted with an highly acrid and obstinate dysentery, which corrodes all the parts it touches, and is attended with frequent convulsions, and fixed pains.

Cancer in the testicle. The most powerful means may be tried; great advantage hath followed the internal and external use of hemlock, but castration is generally the *last*, but safest resource.

Cancer in the Womb. This disease happens generally about the time of the menses disappearing, but may approach at any other period of life. Women, who have been accustomed to a large discharge by their menses, are more liable to *cancers* in this part than in any other, and the disease commonly begins when that discharge goes off, or when it disappears. It is known by pains in the pelvis and womb, of the stretching, tearing kind, mixed with shooting pricking ones; indurations in the part, sensible to the touch, a preceding immoderate discharge of the whites, reds, or both. Aetius describes this case very well, and says that "there is a violent pain in the groins, upper part of the belly and loins, whilst the parts originally affected can hardly bear to be touched: but if the *cancer* is ulcerated, besides the pain, hardness about the neck of the womb, there are ulcers with tumid, sordid, and whitish lips, and from them a fœtid sanies flows, &c." The discharge from these ulcers are very various, being sometimes bloody, sanious, or accompanied with sloughs, &c. If the indurations are not ulcerated the discharge is sanious and acrid. In time the labia swell, and are œdematous, and if, as sometimes happens, the inguinal gland is obstructed, the œdema extends along the thigh.

In this unhappy case, besides the general methods, a close adherence to the extract. cicut. must be insisted on; beginning with a small dose and increasing it gradually, gr. x. ter die vel sæpius. This moderates the pains better than opium.

Mr. Justamond is very sanguine in his expectations of a cure from the use of the hemlock bath, and the ferrum ammoniacale, as above directed. See Cancer.

Mr. Le Febure recommends, in case of *cancerous* ulcers in the womb, that injections should be frequently thrown up, of a decoction of carrots and hemlock, having four grains of opium, and as much arsenic, dissolved in every pint of it: see his general method of cure with arsenic above, in the article Cancer. When in the bone or bones of a limb a *cancer* takes place, the amputation of that limb will be necessary.

The peculiar advantages of Mr. Fearon's mode of excision of the breast, and his after-treatment, merit attention; and are conducted as follows.

The patient being seated conveniently with her head supported upon a pillow, by an assistant behind, and her arms held by one on each side, the surgeon makes a horizontal incision, in the direction of the ribs, a little below the nipple; the assistants then draw the teguments as far asunder as possibles and press their fingers on the bleeding arteries, whilst the surgeon is dissecting the diseased mass from the skin above, and the pectoral muscle or parts below: after which, the wound being carefully examined, every small indurated or thickened part is to be removed.

The hæmorrhage by this time generally ceases; but if an artery still bleeds freely, it must be secured by means of the tenaculum and ligature, the ends of which are left a proper length out of the wound. The whole is then spunged clean, and the parts and edges of the wound are laid in even and perfect contact, and retained so by two, three, or more sutures of the interrupted kind, according to the extent of the wound, and by the applications of slips of adhesive plaster, in the intermediate spaces, across the line of incision.

About the third or fourth day the serous discharge appears through the bandages, and the slips of plaster grow loose and require to be removed: the stitches in the teguments are then to be divided with a pair of scissars. The incision is afterwards dressed daily with small slips of lint, spread thin with a mild cerate, made of the purest oil and wax. The ligatures by which the arteries are secured, are gently tugged every day after the first inflammation is abated, and drawn away in due time for the secondary union, or what is termed adhesive inflammation, to take place. The cure is greatly accelerated by repeatedly supporting the edges with a few slips of adhesive plaster.

When the skin is ulcerated or diseased, a second incision is made in as straight a line as the inclusion of the diseased part will admit, down to the extremity of the first; and the edges, &c. are brought together in the same manner as in the first incision. The incision is to be made below the nipple, because the natural position of the part more readily assists the union, and the breast is less subject to deformity.

Thus the cure is generally completed in a fortnight or three weeks; nay sometimes in as many days as weeks, where the suppurative process has been allowed to take place.

A large thick soft compress made of linen, which has been in use, is to be applied after each mode of dressing, and a linen, or rather a flannel roller, about five inches broad, and six or eight yards long, bound gently tight over all. The arm on the affected side is to be supported in the flexed position, by a handkerchief tied round the neck. See Fearon on *Cancers*.

Pity it is, that in this disease, the opportunity of procuring relief is so little minded, and often lost! The following hints, if duly attended to, may serve to shorten the progress of an evil, which, if neglected, must be productive of the worst consequences.

1. In its infant state, when the tumor is round, smooth, and not hard to the touch, the disease *often* yields to an alterative course.

2. When the tumour is become large, round, smooth, and in some degree indurated, it *seldom* gives way to such mode of treatment.

3. When the tumour is hard and unequal, and attended with pricking pain, it *scarcely ever* admits of relief from such means; and I believe *never*, when it has attained what may be considered as a fourth stage; that is, when the tumor is of a stony hardness, and very unequal, attended with acute shooting pains. In this latter stage of the disorder, when the breast begins to lose its natural colour, and the nipple is drawn in, the knife should be submitted to without hesitation; and indeed, from duly considering the progress of the disease, as specified in the above hints, I am convinced that the easiest, safest, and most proper periods for extirpation, are in the second and third stages. See London Medical Journal, vol. v. p. 73.

CANCRORUM MUNDITORUM. *Chimney sweeper's Cancer.* See Scrotum.

Cancer Ossis. See Spina Ventosa.

CANCHRY, or Canchrys. See Cachrys.

CANCINPERICON. Hot Horse dung. See Anhelatio, &c.

CANCRENA. See Gangræna.

CANCRUM ORIS. Canker of the Mouth, called also, *Aphthæ serpentes*, *Labrisulcium*, *Gangrenæ oris*. *Gangrene scorbutique des Genevies*, by Le Dran Cheilocace. It is a deep, foul, irregular, fetid ulcer, with jagged edges, which appears upon the inside of the lips and cheeks; and is attended with a copious flow of offensive saliva.

This disease is seldom seen in adults, but it most commonly attacks children. When the ulceration begins at the inner part of the lip, it exhibits a deep narrow sulcated appearance, and quickly spreads, along the inside of the cheek, which becomes hard, and tumefied externally. The gums are very frequently affected, the teeth are generally loose and diseased; matter is often found in the sockets, and abscesses sometimes burst externally through the cheek, the lip, or a little below the maxilla inferior: and it is not uncommon to see an exfoliation of the alveolar processes, or even of the greater part of the lower jaw. Among the children of poor people, where this disease is often neglected or mismanaged at the beginning, a gangrene will sometimes supervene.

In order to the cure, it will be proper to remove any diſeaſed teeth, bones, &c. if poſſible; to preſcribe a milk and vegetable diet, and to allow a prudent uſe of fermented liquors; to give the Peruvian bark, ſarſaparilla, elm bark, and mineral acids.

External applications may be preparations of copper: a diluted mineral acid: burnt alum: decoction of bark, with vitriol, or borax: tincture of myrrh, &c. See Aphthæ: alſo Pearſon's Principles of Surgery, vol. i. p. 262.

CANCRORUM LAPIDES. See OCULI CANCRORUM.

CANDELA. A CANDLE.

Exhalations from candles are ſalutary or hurtful, according to the materials of which they are formed. Old tallow often ſends off bad fumes; wax, though white, creates the head-ach, and often hurts weak lungs; hogs fat is very offenſive; beef tallow alone is not good; that of ſheep afford the beſt.

CANDELA FUMALIS, or candela pro ſuffitu odorata, called alſo *tæda*; *aves*, and *avicula Cypria*. Theſe are made of odoriferous powders, mixed with one third or more of the charcoal of willows or lime-tree, and reduced to a conſiſtence with turpentine, laudanum, &c. Reſinous ſubſtances alone, mixed up with balſamics, will do; they give out a grateful odour, purify the air, and excite the ſpirits; and are burnt in times of peſtilence. They are alſo, from their form called *bacilli*, and *maſſæ ad fornacem*, becauſe they are uſually applied to a hot grate or chimney, to diffuſe their ſmell without lighting them. See Chomel's Dict. Œconomique, for that called CEREA, *medicata*. See BOUGIE.

——REGIA, ——CANDELARIA. } See VERBASCUM.

CANDUM. SUGAR-CANDY. See SACCHARUM.

CANELA. A word uſed by the ancients for CINNAMON, or rather CASSIA.

CANELLA. See CINNAMOMUM.

CANELLA ALBA, called alſo CANELLA CUBANA;—*malabarica*;—*winterana*;—*jamaicenſis*;—*tubis minoribus alba*; five: CINNAMOMUM *album*;—*malabaricum*;—*aromaticum lignum*; *aromaticus cortex*; *caminga*; *caryophilli ſuavis odoris*; *winterania canella*; *cortex winteranus ſpurius*; *caſſia lignea jamaicenſis*; *cortus corticoſus*; *gingiberis amaritudo*; *arbor jucadice*; WILD CINNAMON TREE.

Dr. Brown, in his Natural Hiſtory of Jamaica, calls the tree *laurus fol. enerviis, Racemis terminalibus*; Weſton, in his Univerſal Botaniſt, carries it from another edition of Linnæus, and ſays *Winterana canella*, or *Winterana Jamaicenſis*, foliis enerviis obovatis obtuſis nitidis, racemis terminalibus; cortice piperis modo acri, fructu viridi calyſculato racemoſo: CLASS DODECANDRIA. ORD. MONOGYNIA. LINN. Gen. Plant. 598.

The bark of this tree is commonly, but falſely, called *cortex Winteranus*. It is a large tree, whoſe bark conſiſts of two parts, an outward and an inward; the outer is as thin as a milled ſhilling, of an aſh grey colour, with whiter ſpots here and there, and ſeveral ſhallow furrows of a darker colour, running variouſly through it; the taſte is aromatic. The inner bark is thicker than that of cinnamon, being as thick as a milled crown piece, ſmooth, of a whiter colour than the outward, and of a more biting and aromatic taſte, reſembling that of cloves, and not glutinous when chewed, but dry, and crumbling between the teeth. Some call it the Weſt Indian cinnamon-tree.

It grows in Jamaica, Antigua, and other of the Caribbee Iſlands. The bark is the chief part in uſe, the poor natives uſe it in the place of all other ſpices; its virtues though ſimilar are very weak. It is ſold in England for the cort. Winter, for its virtues are the ſame. It yields a heavy oil, which when mixed with a little oil of cloves, is ſold for it; and Dr. Brown adds, the adulteration is no prejudice to the oil of cloves. See Miller's Bot. Off. and Dr. Brown's Natural Hiſtory of Jamaica. WOODVILLE's Med. Botan. For that called CANELLA *Cubana*, See CANELLA ALBA, and CASSIA LIGNEA.—*Javenſis*—*Malabarica*. See FOLIUM, and CASSIA LIGNEA. *Syluſtris Malabarica*. See FOLIUM.—*Cuarde*;—*Zeylanica*. See CINNAMOMUM.

CANELLIFERA MALABARICA. See CASSIA LIGNEA.

CANICÆ. Coarſe meal was anciently thus called, from *canis*, *a dog*, becauſe it was food for dogs. Hence *panis canicaceus*, very coarſe bread.

*CANICIDA. See ACONITUM.

CANICIDIUM. A diſſection of living dogs.

CANICULARIS. DOG-DAYS. This is the time when the canicula, or dog-ſtar, riſes and ſets with the ſun; they begin about the middle of July, or ſomewhat later, and end about the latter end of Auguſt, or beginning of September. In ſome countries they ſtill maintain the opinion, that bleeding, purging, and other means of relief, are not efficacious in this ſeaſon, becauſe of the great heat and unuſual languor of the patient; but if they conſidered that the heat rarifies the blood, and occaſions a ſort of plethora which oppreſſes, and that taking away blood leſſens this plethora, and takes off this languor, which was cauſed by oppreſſion or diſtenſion, ſurely their notions would be diſcarded.

CANINA APPETENTIA;—*Fames*. See BOULIMUS.——*Braſſica*. See MERCURIALIS SYLVESTRIS.——*Lingua*. See CYNOGLOSSUM.——*Malus*. See MANDRAGORA.——*Rabies*. See HYDROPHOBIA.

CANINI DENTES, called alſo *columellares dentes cynodontes*. The teeth betwixt the inciſores and the grinders, of which there are one in each ſide, both in the upper and lower jaw. See DENS.

Mr. John Hunter, in his Natural Hiſtory of the Human Teeth, names theſe *cuſpidati*, becauſe though made ſomewhat like the inciſores, they have the two ſides of the edge ſloped off to a point, and this point is very ſharp. Their fangs are longer than thoſe of the inciſores, and therefore, from their fangs being ſuppoſed to extend the greateſt part of the way to the eye, they have been called the EYE-TEETH. The cuſpidatus on each ſide of each jaw, ſtands next to the inciſores. Their uſe ſeems to be to hold what is caught or taken. In Varro, and Pliny, they are called *columellares*,

CANINI MINORES. The inciſorii laterales muſc. ſometimes ſend a few fibres to the muſculi canini, to which Winſlow gives the above name.——Muſc. Winſlow ſays that each of the two muſc. *canini* are fixed above the ſocket of the dens *canini*, and terminate in the arch of the orbicularis labiorum.

CANINUS SENTIS. See CYNOSBATOS.

CANIRAM, called alſo *malus Malabarica*. It is a large tree, bearing a ſmooth gold-coloured apple, whoſe pulp is white and mucilaginous: this fruit is remarkably bitter, and ſo is its ſeeds, and indeed the whole tree. The root is cathartic, the bark reſtringent. Raii Hiſt. See alſo NUX VOMICA.

CANIRUBUS. See CYNOSBATOS.

CANIS, alſo *cyon*. A DOG. The Latins call the whelp *catulus* and *catellus*. Gloves made of *dogs* ſkins are worn in ſummer to keep the ſkin ſmooth and cool. The external ſurface of theſe ſkins is ſmooth, and, as is common with poliſhed bodies, reflect the heat back again. The white dung of this animal was formerly in eſteem. See *album Græcum*, but is not now uſed.

CANIS. See PENIS.

CANIS INTERFECTOR. See CEVADILLA.——PONTICUS. See CASTOR.

CANITIES. Greyneſs of the hairs, or grey-headed.

CANNA DOMESTICA MAJOR CRURIS, and *canna major*. See TIBIA.——For that called—*Fiſtula*, ſee CASSIA FISTULARIS.——*Indica*. See SAGITTARIA ALEXIPHARMACA.——*Minor cruris*. See FIBULA.

CANNABINA. See ACMELLA.

CANNABINA AQUATICA. See BIDENS.

CANNABINUM. See EUPATORIUM.

CANNABIS. HEMP, or SEED-BEARING HEMP. It is the CANNABIS SATIVA, Linn. It is a tall annual herb with digitated leaves, cultivated in the fields, on account of the mechanic uſes of its tough rind. Some of the plants called male, produce flowers compoſed of a yellowiſh ſtamina ſet in five-leaved cups; others, called female, produce ſeeds, moderately large, covered with a ſhining dark grey-coloured ſhell, under which is lodged a white kernel.

This plant hath a rank ſmell of the narcotic kind, which is ſuppoſed to injure the health; the effluvia of the freſh herb is ſaid to weaken the eyes and affect the head, and the water in which the herb hath been ſteeped for facilitating the ſeparation of the tough rind, is thought to be a violent and ſudden poiſon; but perhaps the deleterious quality of this water may be chiefly from the putrefaction of ſome part of the *hemp* which remains in it.

The leaves of an Oriental *hemp*, called *bang* or *bangue*, and by the Egyptians *aſſis*, are ſaid to be uſed in the eaſtern countries as a narcotic and aphrodiſiac.

The faint ſmell of the ſeeds goes off in keeping; their taſte is unctuous and ſweetiſh, accompanied with a ſlight warmth.

warmth. On expreſſion they yield much inſipid oil, which unites with water by trituration, into an emulſion. Decoctions of them in milk are commended in coughs, heat of urine, &c. in which caſes their uſe depends on their emollient and demulcent qualities. Miller's Bot. Off.

CANNABIS INDICA PEREGRINA. See BANGUE.

CANACORUS RADICE CROCEA. See CURCUMA.

CANNULA. A name for ſeveral inſtruments in ſurgery: they are tubes of different ſhapes and ſizes; introduced into openings for the conveyance of a fluid from the part.

CANONIAI. Hippocrates in his book de Aëre, &c. calls thoſe perſons thus, who have ſtraight and not prominent bellies. He would intimate that they are diſpoſed as it were by a ſtraight rule. For this word, *caconiai* is corruptly uſed.

CANOPITE. The name of a collyrium mentioned by Celſus.

CANOPUM. In P. Ægineta it is both the flower and the bark of the elder-tree.

CANSCHENA-POU. See MANDARU.

CANSJAVA. See BANGUE.

CANT. An abbreviation of Cantabrigia.

CANTABRICA, alſo called *convolvulus minimus ſpicæ foliis*; *convolv. linariæ folio*; *volvulus terreſtris*. Pliny ſays it is an herb that was diſcovered in the time of Auguſtus, in the country of the Cantabri, in Spain, whence its name. It grows wild in the field, flowers in June, and is commended againſt the worms. See CONVOLVULUS CANTAB.

CANTABRUM. See FURFUR.

CANTACON. GARDEN-SAFFRON.

CANTARA. See NUX VOMICA SERAPIONIS.

CANTHARI FIGULINI. See CUCURBITA.

CANTHARIDES, FRENCH FLIES, *Muſcæ Hiſpanicæ*, SPANISH FLIES, *cantharis major. Meloeveſicatorius, alatus viridiſſimus nitens, antennis nigris.* Linn. There are a kind of them called BUPRESTIS: but what are in general uſe, were formerly brought only from Spain, whence they were called *Spaniſh flies*; but they are met with in France, Italy, ſome parts of Germany, and other countries. Newmann ſays that they are found chiefly in the ſpring ſeaſon, and on poplar and aſh-trees.

They are an inſect of the beetle kind, known by their ſhining golden green colour, which is alſo of a bluiſh caſt. They have a ſtrong and ſickly ſmell; when taſted they make no impreſſion on the tongue at firſt, but preſently an acrimony and pitchy flavour is perceived.

The largeſt and beſt are brought from Italy; they ſhould be choſen freſh-coloured, entire, and free from duſt. Newmann ſays, that after long keeping they fall into a grey brown powder, and in this ſtate are unfit for uſe, their intrinſic qualities periſhing with their external form.

It has been thought that they peculiarly affect the kidneys and urinary paſſages, proving diuretic; though whether they affect the former it is much doubted, if we can believe the evidence of Dr. C. Smith, and Dr. Cullen, notwithſtanding WERLHOF gives a remarkable inſtance of the diuretic powers of *cantharides*; and tells us, he had frequently experienced the ſame in dropſy and other diſeaſes. He gave a grain of the powder in a doſe, and repeated this every four hours, and it was only after the third doſe, after a ſuppreſſion of urine of many days ſtanding, that it began to yield: ſtill Werlhof diſcontinued the uſe of *cantharides* in dropſy, and other diſeaſes. Externally they are cauſtic, and are uſed to raiſe bliſters, for which end Aretæus firſt rubbed them on the head. When they are applied to the ſkin, the heat and motion of what perſpires, ſet them in action, whereby they penetrate it, and ſo ſtimulate the fibres as to bring on a flux of fluid that raiſes up the cuticula, through which it cannot paſs, into a bliſter. They produce a more plentiful diſcharge of ſerum than any of the vegetable acrids. They alſo deſtroy fungous fleſh. Internally their efficacy is truly valuable, when ſkilfully managed. The caſe where their internal uſe is moſt neceſſary, and moſt ſafe, is, when they are wanted to ſcour the urinary paſſages, and this is when they are obſtructed with ſloughs, and ſuch viſcidities as are apt to be waſhed off from the ulcerated parts; this happens moſt in women. In venereal caſes, where much filth hath fallen on the genitals, the tincture is very uſeful. They are commended in gravel, leproſies, the fluor albus, ulcers in the bladder, uterus, and kidnies. The phlegmatic may take them without much caution, but the hot and bilious require them mixt with proper correctors. Their uſe in cutaneous diſorders has ſometimes been ſucceſsful. Cullen's Mat. Medica, &c.

In caſes of ſtone in the kidnies, fits of gravel, ſtone in the bladder, ſome œdematous caſes, and ſometimes in pregnant women, their uſe is not to be admitted.

However uſed, they are apt to produce a ſtrangury, and inflammation of the urinary paſſages; to prevent which, when bliſters are applied, requires the aſſiſtance of nitre, oily drinks, ſoap pills, &c. Waſhing the bliſtered part when dreſſed, with warm milk, greatly relieves theſe ſymptoms. When imprudently taken into the ſtomach, they cauſe great heat, inflammation, bloody urine, a dribbling heat, and withal, a priapiſm, thirſt, and a cadaverous breath, &c. in which caſes give nitre, camphor, mucilage of gum arabic, and acids; ſimple oxymel is of excellent uſe as an antidote. Sometimes bliſters laid to the thighs, or calves of the legs, have produced a gangrene, becauſe a flux of humours is very eaſily invited to theſe parts; therefore ſhould not be applied to them when they are œdematous, but rather to the inſide of the arms, wriſts, nape of the neck, or head.

A doſe of the powder may be from half a grain to ſix grains; and of the tincture from five to fifty drops, twice a day. By beginning with a ſmall doſe, and gradually increaſing it, a much larger quantity may be taken.

The powdered *flies*, the ſpirituous extract, or the watery one, applied to the ſkin, all bliſter it equally; but the beſt preparation for internal uſe is the tincture. Newmann ſays, that milk and oil are the beſt correctors.

Their active part is a reſinous matter, ſimilar to vegetable reſin. Some ſay that their efficacy is from an acrid ſalt; but as Newmann well obſerves, their practice contradicts their theory, for they uſe ſpirit for making the tincture, and water is the proper menſtruum for ſalts.

Water, proof ſpirit, and rectified ſpirit, all take up the active part of *cantharides* equally; but it does not riſe with any of them in diſtillation. The reſiduum, after digeſting the *flies* in water or ſpirit, does not in the leaſt bliſter or inflame the ſkin.

The London College directs the following preparations:

1. TINCTURA CANTHARIDIS. *Tincture of* SPANISH FLIES.

Take of *cantharides* bruiſed, two drams; of cochineal, half a dram; of proof ſpirit of wine, a pint and a half; digeſt and ſtrain for eight days.

This tincture may ſtand a week to digeſt, without heat, and then be uſed: it contains all the virtue of the *flies*. The doſe may be from x. to l. drops twice a day. Two or three drops may be added to each doſe, according as the patient can bear them. Some add balſams, &c. in making this tincture, and then commend it as more uſeful when the kidneys, womb, or bladder are ulcerated, or the urethra is corroded; but whatever additions may be thought of, they are beſt joined extemporaneouſly, or interpoſed by themſelves at proper intervals. The diuretic power of the *flies* is much improved by the addition of ſps. ætheris nitroſi, and they may be thus adminiſtered.

℞ Tinct. *cantharidis* ʒ ii. ſpt. æther. nitroſi, ʒ iii. tinct. opii, ʒ i. m. cap. 40 bis die.

2. UNGUENTUM CANTHARIDIS. *Ointment of* SPANISH FLIES, *formerly Unguentum ad veſicatoria.*

Take of Spaniſh flies, two ounces; diſtilled water eight ounces; ointment of yellow reſin, eight ounces: boil the water with the Spaniſh flies to one half, and ſtrain. To the ſtrained liquor add the ointment of yellow reſin: Evaporate this mixture, in a water bath, ſaturated with ſea ſalt, to the thickneſs of an ointment. The uſe of this ointment is to dreſs bliſters with, that muſt be kept conſtantly open, for thus they are prevented from healing.

3. EMPLASTRUM VESICATORIUM. *Bliſtering Plaſter. Now Emplaſtrum* Cantharidis. *Plaſter of* SPANISH FLIES.

Take of Spaniſh flies, one pound in powder; plaſter of wax, two pounds; prepared hog's lard, half a pound; having melted the plaſter and lard, a little before they coagulate ſprinkle in the flies. Moſt ſkins are ſoftened by bathing them with warm vinegar, and if a bliſtering plaſter is applied immediately after, in ſome inſtances it produces a ſpeedier effect. Complants have been often made of the failure of bliſters, which have ariſen from

neglect or ignorance; the apothecary, therefore, ſhould be careful to have the flies good, freſh powdered, that powder very fine, and that the plaſter be neither made in too great quantity at once, nor ſpread with too hot a ſpatula.

4. CERATUM CANTHARIDIS. *Cerate of* SPANISH FLY.

Take of the cerate of ſpermaceti, ſoftened by heat, ſix drams; Spaniſh flies, reduced to a fine powder, one dram, mix. Ph. Lond. 1788.

In caſes where the common bliſtering plaſters are thought to be too active, Dr. Percival commends the following compoſition and manner of application. It is chiefly made uſe of to keep up the diſcharge from bliſters.

EMPL. VESICATOR. MITIUS.

℞ Empl. veſicat. Ph. Lond. p. i. vel. ij. empl. ſtomach. p. i. vel. ij. camphor in ſpt. vin. ſolut. ʒ i. vel ij. m.

If a plaſter of this compoſition be moderately warmed before the fire, then covered with a fine ſoft piece of muſlin, it will occaſion much leſs irritation than the uſual one, produce no ſtrangury, or but in a ſlight degree, and when to be removed will ſeparate from the ſkin with great facility. Nor will this covering prevent its veſicating effects. Hence bliſters may thus be applied when the ſkin is diſpoſed to eryſipelatous inflammation from its great ſenſibility, or when the evacuating power is wanted without the ſtimulus.

Cantharides are principally uſed for bliſtering: this article will then be moſt properly concluded by a few obſervations on the effects and uſes of bliſters.

Whether *cantharides* are applied externally or adminiſtered internally, ſimilar effects are produced; but yet it is not agreed, with reſpect to bliſters, whether their action and mode of operation is directly on the ſkin, or by the abſorption of their ſtimulating particles. However, experience hath eſtabliſhed the uſe of bliſters in the following caſes, viz.

IN LOW NERVOUS FEVERS, when the pulſe is languid, and ſpirits ſunk, the præcordia oppreſſed, the breathing difficult, or a delirium comes on.

ARDENT AND INFLAMMATORY FEVERS, when, in their advanced ſtate, the patient becomes languid, and poſſeſſed of ſymptoms that indicate the approach of an oppoſite diſorder, viz. the low or nervous kind; the vis vitæ muſt be ſupported, and the ſinking powers roufed by bliſters. In ſhort, in any fever, when a langour, a coma, or a violent ſpaſmodic pain in the head approaches, they muſt be immediately uſed.

SMALL-POX. When the patient's habit is lax, the pulſe depreſſed, and the heat not ſufficient, either during the expulſion or the ſuppuration of the puſtules: when they are of a bloody kind, and a delirium threatens or attends; alſo when the ſwelling of the face is not likely to be duly ſucceeded by that in the hands and feet.

APOPLEXY. Bliſters may be applied to the head, &c. particularly in thoſe perſons in whom the vis vitæ is below what health requires.

CARUS and LETHARGY. Here bliſters are peculiarly indicated.

PALSY, whether general or particular, though in the latter their application is moſt efficacious.

INCONTINENCE OF URINE, if applied on the region of the os ſacrum.

GUTTA SERENA, if laid on the forehead.

TYMPANITES, in which caſe, if the bowels are not already inflamed, bliſters may be applied on the belly.

SCIRRHOUS TUMORS of the conglomate glands of the neck, are relieved by the bliſters applied to the head.

Scirrhous tumors of the glands in the groin are diſperſed by bliſters on the thighs.

WHITE SWELLINGS. Thoſe tumors ſo called, that ſo frequently deſtroy the joints, and in the end the patient, are in ſome inſtances, cured by an early application of bliſters upon them.

CONVULSIONS and SPASMS. Bliſters aſſiſt in relieving them almoſt univerſally by their ſtimulus, when applied on a part free from the diſorder.

EPILEPSIES, both idiopathic and ſympathetic, are often much relieved by bliſters.

ASTHMA, both the humoral and nervous kinds are moderated by bliſters, and particularly by perpetual ones.

SPASMODIC pains in the bowels are relieved by applying bliſters on the part affected.

PAINS FROM INFLAMMATION, when the inflammatory diatheſis prevails ſtrongly and uniformly through the ſyſtem, and no one part is more affected than another, bliſters are hurtful; but when the head, lungs, or any particular part is affected more than the reſt of the body, they are remarkably uſeful.

DELIRIUMS, attended with a pulſe that does not admit of bleeding, are removed by bliſters.

OPHTHALMIA. This diſorder is as much benefited as moſt, by bliſters behind the ears, or on the fore-part of the head; Hoffman adviſes to lay them on the ſoals of the feet.

QUINSEY. After bleeding and purging, a bliſter between the ſhoulders is a neceſſary application, and another acroſs the throat is often of eminent ſervice.

MALIGNANT QUINSEY. In the firſt ſtage of this diſorder a bliſter to the nape of the neck, and on each ſide of the throat, produces ſalutary effects; in this caſe, the milder bliſtering plaſter above noticed is to be preferred.

PLEURISY. The pain felt in the ſide, is beſt relieved by a bliſter laid over where it is ſeated; though in pulmonic diſorders Huxham adviſes that the legs be bliſtered.

COUGHS, both the hooping and other kinds, have their violence abated, and cure promoted by a proper uſe of bliſters.

INFLAMMATION OF THE LIVER. One of its principal remedies is a bliſter laid over the part affected. The ſame advantage follows this practice when inflammatory pains are fixed in the ſtomach, inteſtines, &c. or when pain in theſe parts have flatulency for their cauſe.

DIARRHŒA. When this diſorder attends the meaſles, no remedy is equal to the application of a bliſter.

DYSENTERY. When the pain attendant on this diſorder yields not to fomentations, a bliſter over the pained part is the only reſource.

SCIATICA, GOUT, and RHEUMATISM. The moſt eminent practitioners extol the uſe of bliſters, if applied to the parts affected at a proper time.

Pregnant women require ſome caution, when bliſters are propoſed; but the milder plaſter above noticed, if applied as there directed, may be ſafely uſed when circumſtances require it.

ANASARCOUS DROPSIES. The ſcarifying the legs may be preferable; yet, when the patient will not comply therewith, the mild bliſter plaſter juſt mentioned may be ſafely uſed, and with conſiderable advantage.

See Lewis's Mat. Med. Baglivi's Diſſert. on the Uſe and Abuſe of Bliſters. Percival's Eſſays Med. and Exp. edit. 2. p. 183, 248.

CANTHARIS, Major. See CANTHARIDES.

CANTHI, CANTHUS. Κανθοι, a primitive in the Greek. AN ANGLE OF THE EYE. *Anguli oculi*, alſo *epicanthides*. The cavities at the extremities of the eyelids, called the corners of the eyes; the greater *canthus* is next to the noſe; the leſſer *canthus* lies towards the temples.

CANTHUM. SUGAR-CANDY. See SACCHARUM.

CANTIANUS PULVIS. The Counteſs of Kent's powder. It is made with the rad. contrayerv. coral. alb. cryſtal. ter. Lemn. ceruſ. ant. moſch. ambergriſ. & croc. Anglic.

If cochineal be added, it is called *pulv. cant.* rub.

If calcined toads be added, it is called *pulv. cant.* nigr.

CANTION. A term for Saccharum, ſugar; but in conjunction with it, then for ſugar-candy. See SACCHARUM.

CANTIUM, or CANTUM. A word uſed by the Greeks, to ſignify angulous, and is applied to cryſtallized SUGARS.

CANTUARIENSES AQUA. CANTERBURY WATERS. At Canterbury, there are five wells, not far from each other; they are ſtrongly impregnated with iron, ſulphur, and fixed air. Their taſte is ſomewhat hard and auſtere; their ſmell is ferruginous and ſtrong of the ſulphur. They are inferior to no mineral *waters* in England, in moſt diſorders in the ſtomach, in aſthmas, catarrhs, rheumatiſms, gouty complaints, the ſcurvy, jaundice, diſeaſes of the ſkin, chloroſis, agues, &c.

CAOVA. See COFFEA.

CAPELINA; or *Capitalis reflexa*, CAPELINE DE LA TETE, DELIGATIO, Species 8.

A REFLEX BANDAGE. It is a double-headed roller, about twenty-four feet long, and the breadth of four inches, ſometimes narrower; the middle is fixed to the occiput, and after two or three circular rounds, the rollers interſect each other upon the forehead and occiput; then one

one roller being reflected over the vertex or fagittal future to the forehead, the other is continued in a circular tract; they croſs each other upon the forehead, after which croſſing, the firſt head is carried back obliquely towards the occiput, and reflected by the ſide of the other; the laſt is continued in a circular direction, but the firſt is brought again over the fagital future backward and forward, and ſo continued till the whole head is covered. It muſt be applied ſmooth and even upon the part which it ſurrounds, or on which it reflects. It is uſed in the hydrocephalus, but is not of any advantage.

CAPELLA. A CUPEL or TEST. See CUPELLA and ALEMBICUS.

CAPER. The GOAT. Or, *Capra Domeſtica.*

Dr. CULLEN, in his Claſs of NUTRIENTIA, reckons the milk of animals, amongſt which he enumerates that of *goats*, and ſets them down in proportion to their ſolid contents: thus, women's, aſs's, mare's, cow's, ſheep's, and goat's; and ſays, that the three firſt agree very much in their qualities, having little ſolid contents; and when evaporated to dryneſs, having thoſe very ſoluble, containing much ſaccharine matter, of very ready acefcency, and when coagulated, their coagulum being tender, is eaſily broken down. The three laſt agree in oppoſite qualities to the three mentioned, but here there is ſomewhat more gradation. Cow's milk comes neareſt to the former milks: goats milk is leſs fluid, leſs ſweet, leſs flatulent; has the largeſt proportion of inſoluble parts after coagulation, and indeed the largeſt proportion of the coagulable part. Its oily and coagulable part are not ſpontaneouſly ſeparable, never throwing out a cream, or allowing butter to be readily extracted from it. Hence the virtue of theſe milks are obvious, being more nouriſhing, though at the ſame time leſs eaſily ſoluble in weak ſtomachs than the three firſt, leſs aſcefcent than theſe, and ſo more rarely laxative, and peculiarly fitted for the diet of convaleſcents without fever. The three firſt again, are leſs nouriſhing, more ſoluble, more laxative, are more acefcent, and adapted to convaleſcents with fever. Mat. Med. p. 112. Lond. 1772. See alſo LAC.

Goat's whey is aperient, abſtergent, attenuating, and laxative; it is generally preferred before all other wheys.

CAPHORA, CAPHURA, CAPHURA BAROS INDORUM. } See CAMPHORA.

CAPHURÆ OL. An aromatic eſſential oil diſtilled from the root of the cinnamon-tree.

CAPICATINGA. Species of acorns which grow in the Weſt Indies, larger and more uſeful than ours in Europe, of the ſame qualities, but poſſeſs them in a greater degree. CAPICATINGA. See CALAM. AROM. ASIATICUS.

CAPILACTEUM. See APHROGALA.

CAPILLAMENTA, from *capillus, a hair. Capillaments* in flowers are generally underſtood to mean the chives which ſupport the apices.

They are thoſe ſlender filaments that ſpring up within the leaves of a flower, and are more uſually called the ſtamina; whence a capillaceous flower is alſo a ſtamineous one. Again, by *capillaments* are meant thoſe ſlender parts which reſemble hairs, and are produced from vegetables; as, for inſtance, from ſeeds, roots, &c. RAY calls the ſtamens by this name.

CAPILLAMENTUM. The hairy or villous integuments belonging to animals. Called alſo *Capillitium.*

CAPILLARIA VASA, from *capillus, a hair.* CAPILLARY VESSELS. The ſmalleſt veſſels in our bodies are ſo called, becauſe they appear as ſmall as hairs.

CAPILLARES VERMICULI. See CRINONES, and DRACUNCULI.

CAPILLARIS. Any thing that reſembles hairs, applied to LEAVES, that are longer than the ſetaceous, or briſtle-ſhaped leaf—to GLANDS reſembling hairs;—to FILAMENTS;—to the STYLE, and to the PAPPUS or DOWN affixed to ſome ſeed.—This is by ſome called *pilo-ſus*, oppoſed to *plumoſus* or feathered. Ray calls thoſe vegetables *capillares* which have no main ſtalks, but whoſe ſeed is on the back of their leaves, for they grow cloſe to the ground, as the hairs grow to the head

CAPILLATIO. A capillary fracture of the cranium. See TRICHISMOS.

CAPILLITIUM. See CAPILLAMENTUM; and TRICHIASIS.

CAPILLORUM, DEFLUVIUM. See ALOPECIA.

CAPILLUS, alſo CRINIS. The HAIR. *Capillus* is properly the *hair* of the head, but is uſed alſo for hair in general. The word PILUS means a *hair*. The *hairs* are hollow, and furniſhed with veſſels; are knotted at certain diſtances, like ſome ſorts of graſs, and ſend out branches at their joints. The diſorder called *plica polonica* proves them to be hollow. As to the branching of the *hair*, it is viſible enough at the extremities with a microſcope, and it is apt to ſplit if worn long and kept dry. Each of theſe *hairs* have a bulbous root, of an oval ſhape, which is lodged in the ſkin. As long as any moiſture remains about the roots of the *hair* it continues to grow, though the body be dead and mouldering to duſt. Drake's Anat.

Dr. Cheyne, in his Engliſh Malady, obſerves that as the *hair* is for ſtrength, ſo is the general habit.

The principal diſorders in the *hair*, ſee ALOPECIA.

CAPILLUS VENERIS CANADENSIS. See ADIANTHUM CANADENSE.

——VENERIS. See ADIANTHUM VERUM.

CAPIPLENIUM. See CATARRHUS. It is a barbarous word, but Baglivi uſes it to ſignify that continual heavineſs or diſorder in the head, which the Greeks call *carebaria.*

CAPISTRATIO. See PHIMOSIS.

CAPISTRUM. A bridle, or rather a horſe's headſtall. Alſo the name of ſome chirurgical bandages about the head. See alſo TRISMUS.

CAPISTRUM AURI. The bridle of gold, or rather the ſoldering of gold: it is a name given to borax, becauſe of its uſe in ſoldering this metal. See BORAX.

CAPISTRY. See FASCIA, No. 6.

CAPITA. Heads in plants are either thoſe receptacles of the ſeeds, which by their globous figure repreſent a head, as the heads of poppies, &c. or they are the ſame as bulbs.

CAPITALIA. See CEPHALICA.

CAPITALIS REFLEXA. See CAPELINA.

CAPITATÆ PLANTÆ, are plants whoſe ſeeds with their down, being included within a ſquamous calyx, are conglobated into a roundiſh figure reſembling a head. Hence are called *cephaloides*, or *cephalotæ.*

CAPITELLUM. The head or ſeed-veſſels, frequently applied to moſſes, &c. as in capitulum. Some ſay it ſignifies ſoapy water, others ſay it is a lixivium.

CAPITILUVIUM. A bath or lotion for the head.

CAPITIS OBLIQUUS INFERIOR & *major.* See OBLIQUUS INFERIOR.——OBLIQUUS SUPERIOR. See OBLIQUUS SUPERIOR.——PAR TERTIUM FALLOPII. See COMPLEXUS MINOR.——POSTICUS. See RECTUS MAJOR.——RECTUS. See RECTUS MINOR.——VENA. See CEPHALICA VENA.

CAPITO ANDROMACHUS. Thus Geſner calls a fiſh, which is alſo named *zerta*, becauſe it paſſes out of the ſea into the river Elb. It lives both in the ſea and in rivers, and is reckoned to be of a good kind for food.

——LACUSTRIS. This name is given by Geſner, to the fiſh called by the ancients *albus*, the fleſh of which was ſo hard, and ſo difficult of digeſtion, that it was conſidered as the pooreſt and worſt of all fiſh for culinary purpoſes.

CAPITULUM. In botany, a ſpecies of infloreſcence, or a manner of flowering, in which ſeveral flowers form a kind of ball. As in gomphrena, this is globular, roundiſh, or halved, leafy or naked. Flowers in this caſe are ſaid to grow in a head, *capitati flores*; a ſtigma round like a ball, *capitatum ſtigma.* In chemiſtry it is an alembic. See ALEMBICUS. In anatomy it is a ſmaller proceſs or protuberance of a bone received by another bone.

CAPIVARD. A Portugueſe name for a WATER-DOG. Lemery deſcribes an animal under this name, that is met with in Braſil, which ſtays in the water all day, and at night goes on the land to ravage the gardens and tear up trees. Its body is like a hog's, and its head reſembles a hare's. Its fleſh is good for food.

CAPIVI BALSAMUM. BALSAM CAPIVI, called alſo *copaiba, copaiva, capivus, album balſamum.* The tree which affords it is called *arbor balſamifera Braſilienſis, copaiba Braſilienſibus*, and *baccifera arbor Braſil. fructu monopyreno folio ſeſquepedali.* It is is the *copaifera officinalis*, or *copaifera fol.* pennatis ſubrotundis, flore rubro. The *balſam capivi* tree of Linn CLASS, DECANDRIA; ORD. MONOGYNIA. Gen. Plant. 442. The tree grows ſpontaneouſly in the woods of Braſil, St. Vincent, and other of the Britiſh American iſlands. Deep inciſions are made into the trunks of this tree, during the hotter ſummer months; one tree ſometimes is met with that affords five or ſix gallons of *balſam*, but the ſame tree never yields it twice.

This *balſam* is at firſt limpid and colourleſs, and ſmells like calambour wood; as brought into Europe it is generally yelloviſh, and ſomewhat thicker than olive oil; by long keeping it becomes ſtill thicker, but does not dry. In all ſtates of its conſiſtency, it continues clear and tranſparent. To the ſmell it is grateful, to the taſte bitteriſh and biting; not intenſely ſo, but durable.

To prove its genuineneſs, drop it on paper; if it ſpreads not, as oil, nor runs through, it is good; on the contrary, if it ſpreads or ſinks through, it is adulterated. It is alſo eſteemed genuine when a drop, falling from the point of a needle into cold water, ſinks to the bottom, or is ſuſpended in the middle; but if it is ſuſpended at the top, or ſpreads, it is ſpurious. If genuine it is ſaid that it does not give the violent ſmell to the urine of thoſe who take it.

We rarely have it genuine; the BALSAMUM CANADENSE is generally ſold for it. The Canada *balſam* is the product of the pinus abies Canadenſis. The turpentines and their productions, frankincenſe, and the Canada *balſam*, all poſſeſs nearly the ſame qualities as the *balſam capivi* does.

Diſtilled with water it yields half its weight, or nearly ſo, of eſſential oil; the remaining reſin is tenaceous and inodorous. If it is diſtilled in a retort, without any addition, by a fire gradually raiſed, it ſends over firſt a light yellow oil, which ſmells ſtrongly of the juice; then a dark coloured oil, and after it a fine blue oil, both which are pungent to the taſte, having alſo an empyreumatic flavour, but not an ungrateful one.

The *balſam capivi* is uſed in gleets, the fluor albus, coughs, ulceration in the lungs and urinary paſſages; is purgative in doſes of two or three drams; it is detergent, heating, and irritating; therefore few caſes occur where it can be ſafely given in large doſes; its uſe is chiefly confined to gleets and fluor albus. If it can be given in pulmonary affections, it muſt be in the abſence of fever, or inflammatory congeſtion. Rieger ſays that it ſhould not be given in fevers, nor where there is an acrimony in the juices. When joined with the aqua kali it powerfully provokes urine in dropſies. It gives relief in hæmorrhoidal affections, in doſes of twenty to forty drops, once or twice a-day.

The uſual doſes are from x. to xl. drops; the leaſt offenſive method is to take it in a glaſs of cold water, or in milk. It is ſometimes formed into an injection. Two drams of the balſam added to half an ounce of gum arabic; and four ounces of lime water, as an aſtringent in gleets; in the latter ſtages of gonorrhœa; and is alſo of uſe ſometimes in the fluor albus,

Divided by the white of an egg, ſugar, honey, or the powder of gum arabic, it mixes with water into an uniform milky fluid. The beſt of theſe mediums is the gum, which ſhould be uſed in the proportion of one part to three parts of the *balſam*. It eaſily mixes with diſtilled oils; but difficulty with expreſſed ones. If a ſmall quantity of alkaline ſalt is added to rectified ſpirit of wine, it perfectly diſſolves this *balſam* into a fragrant liquor, more agreeable than the *balſam* alone. See Neumann's Chemical Works, Lewis's Mat. Med. Cullen's Mat. Med.

CAPIVUS ALBUS. See CAPIVI BALSAMUM.

CAPNELAION, } In Galen's works, it is ſaid to
CAPNELÆUM. } be a reſin that flows ſpontaneouſly from ſome tree in Lacedæmon. In Cilicia it is called *capnelaion*, from καπνος, *ſmoak*, and ελαιον, *oil*, *ſmoaky oil*; but in Lacedæmon and in ſome other places it is called πρωτόφυτος, *the firſt product*. Fœſius ſays it ſeems to be called *capnelaion* becauſe of the ſmoak it gives when placed near the fire.

CAPNISTON. A name of a ſort of oil prepared of ſeveral kinds of ſpices and oil, by kindling the ſpices, and ſuffumigating the oil.

CAPNITIS. See TUTIA.

CAPNOS. See FUMARIA.

CAPO, } A name of the American TOAD. See
CAPUS. } BUFO. Alſo a CAPON. The deſign of caſtrating a cock is to render him a fit leader for the other poultry, and alſo more fleſhy.

CAPO MOLAGO. See PIPER INDICUM.

CAPOLIN MEXICANORUM HERNANDEZ. SWEET INDIAN CHERRIES, called alſo *ceraſus dulcis Indica*. The bark is reſtringent. There are three ſpecies, the *xitoma capolin*, the *helocapolin*, and the *telacapolin*. Raii Hiſt.

CAPOTES. See COVALAM.

CAPPARIS. The CAPER BUSH. It is a low prickly buſh, grows wild in Italy, Spain, and the ſouthern parts of France. The bark of the root is bitteriſh and acrid to the taſte, and is ranked among aperients and diuretics. The green buds of the flowers are pickled in vinegar and ſalt, and are uſed at the table to help the appetite. In Holland and Germany they ſubſtitute the buds of the flowers of the *cytiſogeniſta ſcoparia vulgaris flore luteo* for the *capers*, and pickle them in the ſame manner.

CAPPARIS FABAGO, } See FABAGO.
—— PORTULACA, C. B. }

CAPRA ALPINA. The CHAMOIS or GEMS, called alſo *rubicapra*, *rupicapra*, and *dorcas*, the ROCK GOAT. It is met with on the Alps belonging to Switzerland: alſo in Germany; it is a ſpecies of wild goat, in ſhape and ſize reſembling the tame one, with ſhort horns, the ends of which are hooked. The balls found in their ſtomachs are called *ægagropila* and *bezoar Germanicum*, formed of hairs which they lick. Such are found alſo in the ſtomachs of cows, hogs, ſtags, &c. with us; when taken from ruminating animals, they are called *bulithum*, or *cows bezoar*; from ſtags, *elaphopila*.

—— DOMESTICA. See CAPER.

—— MOSCHI. See MOSCHUS.

—— STREPSICEROS. See ANTILOPUS.

CAPREA PLINII. See CAPRÆOLUS.

CAPREOLARIS, } See SPERMATICA CORDA,
CAPREOLARIA. } from *capreolus*, a tendril of a vine.

CAPREOLUS. In BOTANY. See CIRRHUS. In ANATOMY, it is the *helix* of the ear. See AURICULA; and in zoology the ROE-BUCK, which is alſo called *capræa Plinii*, and *dorcas*. It is found in Scotland and other parts.

—— MOSCHI. See MOSCHUS.

CAPRICERVA OCCIDENTALIS. The deer which affords the Weſt Indian BEZOAR.——ORIENTALIS. The deer which affords the Eaſt Indian BEZOAR.

CAPRICORNUS. See PLUMBUM.

CAPRIFICUS. See FICUS SATIVA.

CAPRIFOLIUM. HONEY-SUCKLE or WOOD-BIND. alſo called *matriſylva*, *periclimenum*, *chamæceraſus*. It is the *lonicera periclymenum*, Linn. It is a climbing ſhrub, common in ſhady places; for the beauty and ſweetneſs of its flowers it is cultivated in gardens: its medical properties do not recommend it in practice, though ſome attribute extraordinary efficacy to it.

CAPRIMULGA. A large kind of viper, which is not poiſonous.

CAPSICUM. } See PIPER INDICUM.
CAPSICUM ANNUUM. }

CAPSULA. A diminutive, from *capſa*, a little bag or caſe, or cheſt. In SURGERY it is a bag made of the broken or diſtended membrana cellularis, or other membrane, formed by nature to encloſe or lodge ſome extravaſated juice, or other matter contained in thoſe tumors called encyſted. Thus it is the ſame with *cyſtis*. But in BOTANY, it is the ſhort pod, or huſk of a plant, containing the ſeed. According to the number of cells for ſeed, the pod is called uni-capſular, bi-capſular, &c. It has ſeveral members of which it is compoſed. 1ſt. The outer coverings called *valvulæ*. 2nd. The partitions, *diſſepimenta*. 3d. Central pillar, *columella*. 4th. Cells, *loculamenta*.

CAPSULA COMMUNIS GLISSONII. } It is a production
—— VENÆ PORTÆ. } of the peritoneum, including the vena porta and biliary duct in the liver. It is alſo called *Vagina portæ*. Gliſſon firſt deſcribed it particularly.——CORDIS. See PERICARDIUM. *Staminis*. See ANTHERÆ.

CAPSULÆ ATRABILARIÆ, } alſo called *glandulæ*
—— RENALES. } *ſupra-renales*; *renes ſuccenturiati*, and *glandulæ renales*.

They are glandulous bodies, lying on the upper part of the kidnies; or they are two little, oblong, flat, triangular bodies, lying at the upper end and inſide or the extremity of each kidney; the right behind the vena cava, and the left behind the ſpleen and pancreas, being attached by veſſels to thoſe of the kidnies. When they are cut into, there ſeems to be a ſmall cavity, containing a deep green juice; and if viewed when freſh, a white ſubſtance where the veſſels ramify; the inner part is a tender ſubſtance like the liver, ſo that it readily breaks down. Both the external and internal parts are vaſcular, and two or three large veſſels may be obſerved in the middle, which give it the appearance of a juice, as above mentioned

ed. Euſtachius was the firſt who deſcribed theſe glands. They are larger in the fœtus than in the adult. Their uſe is not certainly known.

CAPSULARES ARTERIÆ. The arteries of the renal glands are thus called, and ariſe from the aorta, above the arteria renalis, and give out the arteriæ adipoſæ, which go to the fat of the kidnies. Sometimes they come from the trunk of cœliaca. The right *capſular artery* comes, moſt commonly, from the arteria renalis, of the ſame ſide, near its origin; the left from the aorta above the renalis.——VENÆ. Theſe are branches from the emulgents, and go into the renal glands.——SEMINALES. The extreme parts of the vaſa deferentia, which have their cavities dilated in the manner of *capſules*. Their uſe is to tranſmit the ſemen from the teſtes to the veſiculæ ſeminales.

CAPSULARIÆ LIGAMENTA. CAPSULAR LIGAMENTS, alſo called *mucilaginoſa Ligamenta*, mucilaginous *ligaments* as they contain many glands to ſeparate the ſynovia. Every articulating bone is furniſhed with a *capſular ligament*, which *ligament* is compoſed of two layers; the external layer is the ſtronger, being made by the perioſteum; the inner is thin and uniform.

The uſe of the capſular *ligament* is, 1ſt, to connect the bones, which is performed by the outer lamella; 2dly, to confine the ſynovia, which is the office of the inner layer.

They are long and large in thoſe bones that are deſigned for rotation, to give room for motion; and tendons are frequently inſerted into them, that by their action they may draw them outward, and prevent their being pinched.

They are generally of an equal thickneſs all round, in the enarthroſis and arthrodia; but in the ginglymus they are thick on the ſides, and thin on the fore and hind parts, as in thoſe places their thickneſs would have been inconvenient, by hindering the due flexion and extenſion of the joint; but the tendons ſtrengthen the joint in that part, and partly compenſate for the weakneſs of the *ligament*.

In complete luxations, the *capſular ligament* is generally, if not always, ruptured.

That of the os femoris, is extended, from below the neck of the bone, to admit of a more extenſive rotation.

The *capſular ligament* of the head of the humerus proceeds from the edge of the glenoid cavity in the ſcapula, and is continued over the hemiſphere of the head of the os humeri, and is fixed near its edge towards the muſcular ſurfaces of the great and ſmall tuberoſities, and runs down on the neck of the bone, below the loweſt part of the cartilaginous hemiſphere. In all this courſe, the capſula is cloſely fixed in the bone, except a ſmall portion where it paſſes over the inner articular tendon of the biceps muſcle.

The *capſular ligament* always includes the whole joint. Of collections within the *capſular ligaments* of the joints, ſee Bell's Surgery, vol. v. 485. Alſo, of concretions and preternatural excreſcences within the *capſular ligaments* of the joints, ſee Bell's Surgery, vol. v. 491.

CAPUR. See CAMPHORA.

CAPUS. See CAPO.

CAPUT. The HEAD. The parts in the lower cavities are the ſeat of the vital faculty, and the *head* is the ſeat of the animal faculty; it being the ſeat from whence all ſenſation is derived.

Beſides the external integuments of the *head*, there is an aponeurotic expanſion which covers it like a cap. It is alſo ſpread round the neck, and on the ſhoulders, like a riding-hood, for which reaſon Winſlow calls it COIF, and the ſuperior portion of it, the APONEUROTIC CAP. It is very ſtrong, and appears to be made of two ſtrata of fibres croſſing each other; as it ſpreads to the neck, it becomes thinner, and is loſt inſenſibly on the clavicles. It ſends out a production on each ſide from above downward, and from without inward, which having paſſed over the ſuperior extremity of the muſculus maſtoideus, it runs behind that muſcle toward the tranſverſe apophyſis of the vertebræ of the neck, where it communicates with the intertranſverſalia ligamenta. See PERICRANIUM.

The *head* comprehends the cranium and the face; the cranium is diſtinguiſhed into the upper and lower parts. The baſe of the ſkull externally is very uneven; internally it is divided into three pair of cavities, and one azygous cavity. The firſt pair are above the orbit, in which the anterior lobes of the cerebrum are placed; and the next pair contains the middle lobes; the poſterior pair are placed behind the foramen magnum occipitale, where the poſterior lobes of the cerebellum are lodged. The azygous cavity is ſituated upon that part of the ſphenoide bone called the ephippium, or ſella turcica, where the glandula pituitaria lies.

The bones of the upper part of the cranium are nearly of the ſame thickneſs. Where the bone is thick there is a larger ſpace occupied by the meditullium; where they are very thin, there is no meditullium, whence in the latter caſe the cranium is diaphanous, in the former opaque. The cranium is laterally depreſſed, which ſerves to enlarge the ſphere of viſion, and to increaſe the ſtrength of the ſkull on its fore and hind parts, by making them more convex, which is a neceſſary contrivance to prevent injuries by falls, we generally pitching on theſe parts, ſeldom on the ſides. See FACIES and CRANIUM.

The beſt way of forming a perfect idea of the bones of the *head*, is to have a ſkull, the bones of which are ſeparated by art, and another, in which they are connected, in their proper articulations.

The nerves from the fifth pair, and the hard portion of the ſeventh, are diſtributed through the external parts of the head.

Through the ſmall *foramina* of the os ethmoides, the filaments of the firſt pair of nerves paſs to the noſe, and are called olfactory nerves.

In the os ſphenoides is the *foramen* opticum, through which the ſecond pair of nerves, called the optic, paſs. This hole, which is ſeated below the anterior clinoid proceſs, likewiſe admits the branch of the carotid artery that goes to the eye.

The *foramen lacerum ſuperius* lies between the tranſverſe ſpinous, and orbiter proceſſes of the os ſphenoides: through this hole the three pair of nerves, called motores oculi; the fourth pair, or pathetic; the firſt branch of the fifth pair; the whole ſixth pair, except one reflected branch; and an artery from the internal carotids, paſs to the orbit.

Behind the laſt mentioned hole, in the ſame bone, is the foramen rotundum, through which the ſecond branch of the fifth pair of nerves, called the ſuperior maxillary nerves, paſs to the bottom of the orbit.

Between the pars petroſa of the os temporis, and the proceſs of the os ſphenoides, is an oblong ſlit, through which the carotid artery paſſes, running inwards and upwards to the ſella turcica, and ſo to the clinoid proceſſes, where it paſſes through the dura mater.

The portio mollis of the ſeventh pair of nerves, called the auditory nerve, is diſtributed to the meatus auditorius internus; the portia dura comes out by the aqueduct.

The eighth pair of nerves, called the par vagum, paſs out by that common hole, between the temporal and occipital bones; where likewiſe the internal jugular vein, which is a continuation of the tranſverſe ſinus, goes out of the cranium.

The ninth pair of nerves paſs through the holes of the occiput, above the condyles.

The tenth pair of nerves paſs through the foramen magnum, where likewiſe the vertebral arteries enter.

The external eminencies are, the two maſtoid proceſſes, the two ſtyloid proceſſes, the two condyloide proceſſes, the two pterygoid, the two arches called zygomata, the external ſpine of the occiput, the condyloide and coronoide apophyſes of the lower jaw.

The principal uſes of the bones of the *head* are, to contain the brain, to be the ſeat of the organs of ſenſation, to ſerve for maſtication, reſpiration, and the formation of the voice. There is ſometimes a diſorder of the head, which draws it to one ſide; this is called *contorſio*.

Lancili's tables of the bones of the *head* are good ones. See Winſlow's Anatomy, or Monro's Oſteology.

CAPUT, is the *head* of a plant. See CAPITA, alſo a proceſs. See PROCESSUS.

—— CONCUTIENS. See INTERTRANSVERSALES COLLI.

—— GALTINACEUM. See ONOBRYCHIS.

—— MONACHI. See DENS LEONIS.

—— MORTUUM. A DEAD HEAD. In chemiſtry it imports the dry faeces left in a veſſel after the moiſture hath been diſtilled from it. It is alſo called *terra damnata*, and *mortua terra*. The earthy part of moiſt bodies ſerves as a baſis to the other principles; it is that which brings them together, which unites them, and which gives to them their ſolidity. When the active principles are extracted, it is called *caput mortuum*. It hath the name of *caput*, before the ſeparation, becauſe it contains the ſpirituous and eſſential parts of the mixed, even as the head of an animal contains its ſubtle

ſubtle parts; and afterwards it receives the epithets of *mortuum* and the term *damnata terra*, to ſhew that being deprived of theſe active principles, it is not capable of producing any effect. Lemery Chem.

—— OBSTIPIUM. See CERVIX.——PURGIA. See ERRHINÆ.——VITULI. See ANTIRRHINUM.

CARA BRASILIENSIBUS, called alſo *igname*, *inhame*; *battatas Hyſpanica*. Ray mentions three kinds of it. Beſides, it is a name given by the old Roman authors to a plant with large and eſculent roots. The ſoldiers of Cæſar are ſaid, in ſome of their marches, when diſtreſſed for proviſion, to have made a ſort of bread of this root; and P. ÆGINETA and DIOSCORIDES inform us that this plant was of the *paſtinacka*, or parſnip kind. It was probably the *elophoboſcum*, or wild parſnip, which has roots long and thick, and of as good a taſte as thoſe cultivated in gardens, only they were not quite ſo tender. It is ſuppoſed that our word carrot is derived from this CARA. Chambers's Encyc. by Rees.

CARAB. See SILIQUA.

CARABACCIUM LIGNUM. The wood taſtes like cloves, but very mild, and quite grateful, of a cinnamon colour. It is brought from India, but not much known in practice. Baglivi ſays, it corrects acrimony, and a ſcorbutic diſſolution of the lymph. See CASSIA CARYOPHILLATA.

CARABE. See SUCCINUM.

CARABE FUNERUM. See BITUMEN.

CARABUS. This word is variouſly underſtood; with ſome it ſignifies an inſect of the beetle kind; or thoſe which are bred in dried woods, and belong to the ſcarabæi; with others, the cray-fiſh; and ſometimes it is uſed for the locuſta marina.

CARACOSMOS. A name of the four mare's milk which the Tartars ſo much admire.

CARAGNA. See CARANNA.

CARAGUATA ALOE BRASILIENSIS. The COMMON ALOE OF BRASIL. Some ſpecies of it grows among the rocks; one ſpecies of it affords better cloth than flax does. If the root or freſh leaves are bruiſed, and thrown on the ſurface of the water, fiſhes are ſo infatuated by it, as to be eaſily taken by the hand. There are ſeveral ſpecies, as the *carag.* guacu, *carag.* acanga, &c. Raii Hiſt.

CARAMBOLAS This tree bears fruit three times in a year, It grows in the Eaſt Indies. To its different parts are attributed as many medical virtues. Raii Hiſt.

CARAMENO. See HYBOUCOUHU AMERICANUS.

CARANNA, alſo called *Caragna*; *Breliſis*. It is a concrete reſinous juice brought from New Spain, and other parts of America, in little maſſes, rolled up in the leaves of flags, outwardly of a dark brown colour, inwardly brown, with a caſt of red, variegated with irregular white ſtreaks, ſomewhat ſoft and tenacious as it firſt comes over, but in length of time growing dry and friable. The whiter the gum, the better it is, eſpecially if of the conſiſtence of a plaſter. Its virtues are the ſame as thoſe of *tacamahaca*, but more efficacious. It hath an agreeable ſmell, with a bitter and ſlightly pungent taſte. Rectified ſpirit diſſolves three-fourths of it, and water diſſolves all the reſt, except the impurities. By diſtillation it affords much eſſential oil, of an orange-colour. It is fragrant, and to the taſte, moderately pungent If the ſpirituous tincture is inſpiſſated, it yields a tenacious reſin, and an oily matter, which ſeparates and floats on the ſurface: it is conſiderably aromatic, and moderately bitter. Etmuller ſays, that this gum is uſeful againſt pains in the ſtomach, and in the joints, if ſpread plaſter-wiſe, and applied thereto. See Lewis's Mat. Med.

CARANTIA. See SILIQUA DULCIS.

CARA-SCHULLI. *Frutex Indicus ſpinoſus*. An Indian ſhrub like the caper-buſh. A decoction of the root provokes urine. Raii Hiſt.

CARAVATA. See CACAO.

CARBASUS. Scribonius Largus uſes this word to ſignify the thin linen, or ſoft threads, on which the ſurgeons ſpread their ointments, &c. i. e. LINT, called alſo *achne*; *carpia*. Soft lint is named *caddes*. It is called likewiſe *linteum*, which alſo means *linen*, *tents*, *rollers*, *compreſſes*; MOTOS is an appellation for *lint*, whence *diamotoſis*, the introduction of lint into a wound or ulcer. Where lint is applied to abſorb the matter from a wound, pledgits of fine ſponge are more effectual, and ſhould be preferred, where any inconvenience is apprehended from the ſharpneſs of the matter.

CARBO. A COAL. Charcoal is generally underſtood by this word, when *foſſilis* is not joined with it. It is alſo a name of the *carbunculus*.

CARBO FOSSILIS. PIT-COAL, or SCOTCH-COAL. Hoffman ſays, that when it is analyſed by diſtilling in a retort, over an open fire, it firſt yields a phlegm, then an acrid ſulphureous ſpirit, then a fubtil oil, then a groſſer oil, which falls to the bottom of the receiver; then by a briſker fire, an acidulated ſalt like that of amber; in the retort there is left a black earth that is light, and which, on the application of fire, emits neither flame nor ſmoke. The groſs empyreumatic oil contains a quantity of mineral ſulphur: thus coal, as all bitumens are, is an oleous ſulphureous acid, with fine alcaline parts.

Theſe *coals* are only uſed for the advantage of their heat, by burning them in ſtoves; but for ſome purpoſes they undergo a proceſs previous to their being uſed, that is, they are charred, or reduced to COAKS: this is effected by a method ſimilar to that of making charcoal of wood: by this operation they are deprived of their phlegm, their acid liquor, and much of their fluid oil.

CHARCOAL, or VEGETABLE COAL; that is, the *coal* into which wood is converted by the following proceſs:

Pieces of wood are ſo diſpoſed as to form a pile, generally conical; this pile is covered with turf, to prevent the two free draught of air, by which the wood would be reduced to aſhes, and not to *coal*. The pile is then kindled, and the fire continued till the watery and the more volatile parts of the wood are diſſipated, that is, till no more ſmoke ariſes, at which time the wood is thoroughly red hot. The external air is then to be totally excluded by covering the pile with earth, and thus the fire is extinguiſhed.

In CHEMISTRY, by the word *coal* is underſtood any ſubſtance containing oil, which hath been expoſed to fire in a cloſe veſſel, ſo that all its volatile principles are expelled, and that it can ſuſtain a red heat without farther decompoſition. This *coal* is an unalterable compound, in every inſtance except of burning in open air, and of communicating its phlogiſton to other bodies. There is ſome difference in the different *coals* obtained from various ſubſtances, but they all conſiſt of an earth, which is not perfectly refractory, of a ſaline matter, which is fuſible, and aſſiſts the fuſion of other ſubſtances, and of phlogiſton.

The vapours that ariſe from both foſſil and vegetable *coals*, are extremely pernicious, producing a ſpecies of apoplexy in thoſe perſons who are expoſed to them. The produce at firſt a ſenſe of uneaſineſs, then a chillneſs, ſickiſhneſs, and kind of head-ach, which uſher in a loſs of ſenſe, a fixedneſs of the eyes, a rigidity of the whole body, a ghaſtly countenance, a ſmall frequent and irregular pulſe, feveriſhneſs, &c.

In this caſe the noxious vapours act on the brain and nerves, and not, as has been generally ſaid, on the lungs; theſe vapours, and thoſe from fermenting vegetables, putrifying animal ſubſtances, or from caverns, operate in the ſame manner; and as accumulated and confined, their effect is more or leſs inſtantaneous. They attack the vital principle, and extinguiſh it if they are copious; and a leſſer quantity produces the ſymptoms of a debility in the nervous ſyſtem. To prevent ſuffering from this cauſe, avoid cloſe rooms where theſe ſubſtances are burning, and never enter their repoſitories but when a candle will continue to burn there.

In order to the cure, expoſe the patient to the open air; if the patient can ſwallow, give him acidulated liquors; if he is inſenſible, throw cold water on his face; ſtrong vinegar may be rubbed about his noſtrils, and held under them; blood may be taken from the arm; as ſoon as poſſible make him ſwallow cold water, with vinegar in it; ſtimulating clyſters are uſeful: to remove the ſpaſms, the ſps. æthereis vitriolicus compoſitus, with ſmall doſes of opium, will be proper. If theſe fail, let a ſtrong healthy perſon breathe forcibly into the mouth of the patient, ſo as to diſtend his lungs.

See the Chemical Dictionary, Newmann's Chemical Works, Shebbeare's Theory and Practice of Phyſic, and Percival's Eſſays, Med. and Exp. vol. ii.

CARBOS. CANAL COAL. See AMPELITIS.

CARBUNCULUS. A CARBUNCLE, from *carbo*, *a burning coal*. It is called *carbo*, *rubinus verus*; *codefella*. *erythema gangræneſum*, *granatriſtum*, *anthrax*, *anthrax*, *pruna*,

pruna; and AVICENNA names it, *Perſicus ignis*, particularly that ſpecies which is attended with puſtules, and veſications. Paulus Ægineta ſays it is a cruſty ulcer, beginning for the moſt part with a puſtule like a burn, and ſometimes without it; at firſt the patient ſcratches the part, whence ariſes one or more puſtules, ſmall as a grain of millet, which breaking becomes a cruſty ulcer, as if it was produced by an actual cautery; the cruſt is rather of an aſh colour or blackiſh; it adheres, and is fixed on its baſe to the part, and ſpreads by its phagædenic property; the fleſh all around is inflamed and black, and ſhines like bitumen. Heiſter ſays, a *carbuncle* is an inflammation, which, in peſtilential times, riſes with ſuch veſicles as are the uſual effects of a burn; this inflammation, for the moſt part, ſuddenly degenerates into a ſphacelus, and corrupts the ſubjacent parts to the very bones, rendering them as black as a coal; and this ſeems to be the reaſon why the Latins call them *carbunculi*, and the Greeks *anthraces*.

In the Edinb. Med. Commentaries, vol. vi. p. 165. it is obſerved that *carbuncles* are a gangrenous ſpot upon the ſkin, having the appearance of a burn, with red, livid, or black veſicles, bounded by an inflammatory ring, which ſoon terminates in a hard black eſchar. The anthrax, an affection of ſomewhat the ſame nature with the *carbuncle*, only the former is more prominent, penetrates deeper into the adipoſe membrane, and occaſions a higher degree of pain and inflammation.

Dr. Cullen places it as a variety of phlogoſis erythema, on account of its violence, making it ſynonymous with Anthrax, and the erythema gangrænoſum of SAUVAGES. *Carbuncles* generally break out ſuddenly and unexpectedly, in an hour or two at the moſt, and are attended with pain and heat. The inflammation proceeds ſo quickly to mortification, that there is ſeldom any evident tumor raiſed, the parts turning black, and ending in real gangrene, often in the courſe of 24 hours, from the firſt attack. But when a tumor does ariſe as ſoon as it is opened, it diſcharges a livid ſanies, or ſometimes limpid water. It is black within, which ſhews that a ſphacelus has ſeized the ſubjacent fleſh, and is making rapid progreſs. In thoſe that recover, a ſeparation is made betwixt the ſound and the diſordered fleſh, by means of a ſuppuration. There is no part of the body but what may be the ſeat; and they are generally attended with buboes. The proximate cauſe is the inflammation from peſtilential contagion, with a putreſcent ſtate of the ſyſtem. Danger is great when the colour is livid; the milder ſort are firſt red and then yellow. When they are ſeated on the face, neck, breaſt, and arm-pits, they are generally fatal. When they occur, as they ſometimes do internally upon any of the viſcera, they muſt in every inſtance probably prove fatal, as we are not acquainted with any remedies, which can ever prevent their progreſs to mortification. Externally indeed, when they are not very extenſive, nor ſeated on any of the large blood veſſels and nerves, they are frequently got the better of, that is, by loſs of the part affected.

Heiſter alſo obſerves, that the cure by internal medicines will be beſt effected by ſuch as free the habit from the peſtilential diſeaſe which cauſes theſe ulcers. Heiſter's Surgery, Bell on Ulcers, edit. 3. p. 97—99. Kirkland's Med. Surgery, vol. i. 320, vol ii. 280, 389. Pearſon's Principles of Surgery, vol. i. 136. White's Surgery, 15.

As to the external means, one object ſhould engage the attention, viz. to appeaſe pain as much as poſſible; none therefore but the ſofteſt, moſt lenient, and anodyne or relaxing, can be proper.

Van Sweiten deſcribes another ſort of *carbuncle* in his Comments on Boerhaave's Aph. and ſays, it is an ulcer, which, when after a violent and commonly very painful inflammation, there happens a rupture of the ſkin in ſeveral places, and fragments of the corrupted paniculus adipoſus are diſcharged at its orifices.

CARCAPULI FRUCTU MALO AUREO ÆMULO; CODDAMPULLI. The INDIAN YELLOW ORANGE-TREE of MALABAR, called alſo *ghoraka*.

It is a tall large tree, with yellow flowers, and large round fruit, that is ribbed and whitiſh when ripe, of an agreeable acid and ſweetiſh taſte, and with ſeeds of an azure blue colour. This fruit recovers loſt appetite, and is reſtringent.

—— LINCOTANI. This differs from the above in its flower and fruit. The fruit of this ſpecies is ſweet, round, and of the ſize of a cherry. It is alſo called *kanna ghoraka*. They both afford the gamboge, but this latter the beſt; though this is not the common gamboge, which is from a plant of the eſſula Indica kind. See GAMBOGIA.

CARCAROS. See PHRICODES.

CARCAS. See CATAPUTIA, under RICINOIDES.

CARCAX. A ſpecies of poppy, with a very large head.

CARCER. Paracelſus means by it a remedy proper for reſtraining the diſorder by motions of body and mind, as in curing the chorea ſancti Viti.

CARCHESIUS. The name of ſome bandages noticed by Galen, and deſcribed by Oribaſius. Properly it is a top of a ſhip's maſt.

CARCINETHRON. A name in Oribaſius for the *Polygonum*, or common knot-graſs.

CARCINODES. A tumor reſembling a cancer.

—— CHOIRADES. Strumous ſwellings, of a malignant quality, painful to the touch, and exaſperated by medicines.

CARCINOMA, and CARCINOS. See CANCER. It *ſometimes* ſignifies the cancer *only* in its ulcerated ſtate; or cancerous ulcer, however produced.

CARDAMANTICA. See CARDAMINES.

CARDAMELEUM. The name of a medicine mentioned by Galen.

CARDAMINDUM MINUS. See NASTURTIUM INDICUM.

CARDAMINES, alſo called *cardamantica*, *naſturtium aquaticum*, *culi flos*, *iberis*, *herba veteribus ignota*, *ſophia*; MEADOW-CRESSES, LADIES-SMOCK, and CUCKOW-FLOWER. The CARDAMINES PRATENSIS, or CARDAMINES foliis pinnatis foliolis radicalibus ſubrotundis: caulinis lanceolatis. CLASS, TETRADYNAMIA; ORD. *Siliquoſa*; Gen. Plant. LINN. 812.

This plant grows about a foot high; its lower leaves are pinnated; each leaf conſiſts of four or five pair of ſmall, roundiſh pinnæ, not always ſet directly oppoſite, having one ſingle; that at the end larger than the reſt; the ſtalk is ſmooth and round, bearing leaves which are leſs, and have narrower pinnæ. The flowers grow ſeveral together at the top, each conſiſting of four roundiſh leaves, of a white colour, or, in ſome plants, having a daſh of purple, with darker veins running through them. The ſeeds are ſmall and reddiſh, growing in long ſlender pods. The root is ſmall and fibrous. It grows in meadows, and flowers in April.

Sir Geo. Baker confirms its ancient character of being antiſpaſmodic and anti-epileptic, ſee Lond. Med. Tranſ. vol. i. p. 442, &c. where he relates the caſe of a ſpaſmodic aſthma, that reſiſted all other means, being cured by taking the flowers of this plant, at firſt ℈j. twice a-day, by which relief was had; and afterwards ʒ ſs. twice a-day, by which the cure was perfected. The chorea ſancti Viti was cured by ʒ ſs. twice a-day. The caſe was obſtinate while other means were uſed, but ſoon gave way to theſe flowers. To theſe he adds a caſe in which the palſy, a difficulty of ſwallowing, and convulſions were complicated; and though theſe diſorders had been of long ſtanding, relief was obtained by ʒ ſs. of theſe flowers taken twice a-day. He farther obſerves, that theſe flowers improve the appetite, that ʒj. hath ſucceeded as an antiſpaſmodic, where opium, camphor, and valerian failed; and that they have been given to ʒi. ſs. three times a-day.

GREEDING, though he tried this medicine in large doſes in a great number of caſes, experienced its good effect only in one.

Linnæus obſerves, that theſe flowers are pungent to the taſte. Dioſcorides ſays, they are warm and diuretic; Galen, that they reſemble water-creſſes in taſte and virtues; Dale, that they are antiſpaſmodic; and Dr. T. Robinſon, that they are powerfully anti-epileptic.

Dr. Cullen mentions this plant, and particularly its flowers, to be far inferior to ſeveral other of the ſiliquoſæ in the ſenſible qualities; ſo much ſo, that he ſhould not have thought of taking notice of them, as ſubjects of the materia medica, but on the authority of Sir Geo. Baker, referring to his paper on this ſubject above quoted.

CARDAMOMUM. The COMMON or LESSER CARDAMOMS, called alſo *elettari*, *cardam.* minus. The leſſer *cardamon* ſeeds are the produce of the AMOMUM CARDAMOMUM, or AMOMUM REPENS ſcapo ſimpliciſſimo breviſſimo, bracteis alternis laxis. CLASS, MONANDRIA; ORD. MONOGYNIA; Gen. Plant. LINN. 2.

Cardamoms are a dried pod, with ſeeds, brought from Malabar in the Eaſt Indies; the beſt comes from Comagene, Armenia, and the Boſphorus. They grow alſo in Arabia. Theſe pods are divided internally into three cells, in each of which are two rows of triangular ſeeds, of a brownith colour on the outſide, and white within. The plant grows in the form of our reeds.

Sem. *cardam.* min. The leſſer *cardamoms* have ſhort triangular huſks, ſcarce half an inch long. The ſeeds, freed from their huſks, are a grateful aromatic, warm, but not fiery, and not ſubject, like the peppers, to create immoderate heat. The huſks ſhould only be ſeparated at the time of uſe; for the ſeeds loſe much of their flavour, if taken out. They give out all their virtue to ſpirit, and nearly ſo to water. In diſtillation with water, a large quantity of eſſential oil riſes; it is pungent to the taſte, and ſmells ſtronger of the ſeeds; the remaining decoction is bitter and mucilaginous, but void of the flavour and warmth of the ſeeds. A ſpirituous tincture, when evaporated, leaves the virtues of the ſeeds almoſt all in the extract, which is more grateful than the ſeeds themſelves. They are conſidered as gentle ſtimulant of the ſtomach, cordial, carminative, and antiſpaſmodic; but without that irritation and heat, which many other of the aromatic ſpices are apt to produce. However, they are conſidered, by phyſicians, merely as an aromatic. All the ſpirituous preparations are more agreeable than the watery.

1. *Tinctura* Cardamomi. TINCTURE *of* CARDAMOMS.

Take of the ſmaller *cardamom* ſeeds, freed from their huſks, and bruiſed, three ounces; of proof ſpirit of wine, a quart, digeſt for eight days, and ſtrain. This tincture poſſeſſeth all the virtues of the ſeeds; and among all the aromatics, there are none that anſwer ſo well, in general, as this tincture, for rendering mineral waters, and other ſaline liquors, eaſy and agreeable in the ſtomach. Doſe, one dram to three.

2. *Tinctura* Cardamomi *compoſita.* COMPOUND TINCTURE *of* CARDAMOMS. *Formerly Tinctura Stomachica.*

Take of ſmaller *cardamom* ſeeds, huſked, carraway ſeeds, cochineal, of each, powdered, two drams; cinnamon, bruiſed, half an ounce; raiſins, ſtoned, four ounces; proof ſpirit, two pints; digeſt for fourteen days, and ſtrain. This is often ordered by itſelf, or in ſtomach draughts, up to half an ounce, or more, joined with æther, and tinct. opii, againſt gouty and other ſpaſmodic affections of the ſtomach, and præcordia.

CARDAM. MAJUS. The GREATER CARDAMOMS. The AMOMUM GRANI PARADISI, Linn. Their pods are about an inch long, triangular, and with two rows of ſeeds in each. The huſks are tough, and thicker than thoſe of the leſſer kind. They grow in Java and the Eaſt Indies. That called —— MEDIUM, grows in pods of a round figure. Theſe two, though of the ſame nature, are weaker than the minus; therefore thrown out of uſe. Indeed, the different ſpecies from whence they are ſaid to have been produced, are ſo imperfectly deſcribed, and their botanical hiſtories ſo confuſed, that no ſatisfactory account can be given of them. See CULLEN's Mater. Medic. WOODVILLE's Medic. Botany.

—— PIPERATUM. See PARADISI GRANA.

—— SIBERIENSE. See ANISUM INDICUM.

CARDEGI INDI. See FOLIUM.

CARDIA. See COR, CARDIALGIA, MEDITULLIUM, and LIPOTHYMIA.

CARDIACA HERBA. MOTHERWORT. It is alſo called *agripalma gallis, marrubium,* and *cardiaca lycopus,* Ruellii. It is the *leonurus cardiaca,* Linn.

It is called *cardiaca,* becauſe it relieves in faintings and diſorders of the ſtomach, particularly in children, and in hypochondriacs. It is a large plant, with ſquare branched ſtalks, the leaves ſet in pairs on long pedicles at the joints, and the flowers in cluſters round the upper joints. The leaf is dark-coloured, cut deep into three ſharp-pointed, indented ſegments, of which the middle one is the longeſt, and the two lateral ones commonly again deeply cut. The flower is purpliſh, labiated, with the upper lip long and arched, the lower ſhort, and cut into three ſections. It is biennial, grows waſte in wild grounds, and flowers in July.

It hath been famed in diſorders of the ſtomach, proceeding from thick phlegm. It looſens the belly, promotes perſpiration and urine, alſo the uterine purgations. Its ſenſible qualities are ſuch as give us to expect theſe effects from it. The leaves and tops have a ſtrong, rather a diſagreeable ſmell, and a bitter taſte. By keeping, or by boiling, the diſagreeable ſmell is diſſipated. An extract of a pungent bitter, ſubſaline quality, is obtained by evaporating the watery decoction. But an infuſion of the tops before it flowers, is the beſt preparation. See Dale, Miller's Bot. Off. Lewis's Mat. Med.

CARDIACA. In pharmacy it ſignifies CORDIAL, and is alſo named *cordialia, analeptica, confortantia, confortativa, refectiva, reſumptiva,* and, by PARACELSUS, *defenſiva.*

The word *cordial* is of a large extent. Things of very oppoſite natures may prove cordials, by relieving the ſame ſymptoms, when oppoſite cauſes produce them. To underſtand their operation on the body, it is neceſſary to conſider, that a languor or faintneſs muſt be the conſequence either of what oppreſſes, or elſe of what exhauſts the vital powers; that which retards the progreſs of the vital principle in our frame, or is an impediment to its influence, produces the ſame ſenſation as a diminution of it does. In both theſe caſes, medicines of oppoſite natures produce the ſame effect, that is, they add force to the fibres; thus, under an oppreſſion of ſpirits from heat, when no extraordinary action, or indiſpoſition of body, hath exhauſted them, a glaſs of cold water is a *cordial,* for it ſtimulates the fibres, and rouſes them to their wonted action; and when from violent exerciſe, or a tedious diſeaſe, a perſon faints, warm medicines, or aromatic and ſpirituous liquors, are alſo *cordial,* by producing to us the ſame effect. But in general, by *cordials,* is underſtood, thoſe preparations, whoſe warm and active parts immediately, on being received into the ſtomach, produce a cheerfulneſs in us, and are ſuited to encreaſe the ſtrength and vigour of the heart. Valcarengus ſays, that a *cordial* is whatever deſtroys, or at leaſt blunts, the force of the morbific cauſe, reſtores the loſt tone of the ſolids, and gives due motion to the fluids, and by that means procures a juſt equilibrum, which is the only and laſting principle of all the motions in our body. It ſhould be obſerved, that weakneſs ariſes from a redundance, as well as a deficience, in the conſtituents of health: whence, from this definition of *cordials,* oppoſite means aſſume the ſame character, for thus they both are *cordials,* by oppoſing the cauſe of langour.

CARDIACÆ ARTERIÆ, & VENÆ. See CORONARIÆ ARTERIÆ, & VENÆ.

CARDIACUS MORBUS. See NERVOSA FEBRIS.

CARDIACA PASSIO. The CARDIAC PASSION. It is a diſorder that is frequently mentioned by the ancients; but by the moderns, it is moſtly treated of under the name of SYNCOPE; and, indeed, from the deſcription which the ancients give of a *cardiac paſſion,* it may well be referred to that article. The name *cardiaca paſſio* is from the part ſuppoſed to be affected. Cœlius Aurelianus ſays, "that this diſorder, according to ſome, derived its name from the part affected; for they imagine, that the heart is the principal ſeat of it." Soranus declines the giving a definition, and ſays, "that there is no perceptible ſign of any tumor about the heart," which ſome ſuppoſe; and he aſſerts, "that it is a quick and inſtantaneous ſolution, or relaxation." Hippocrates mentions this diſorder in his firſt and ſecond book of Epidemics. Eraſiſtratus alſo ſpeaks of it in his books concerning the belly. Artimedorus Sidenſis ſays, it is a tumor about the heart: but by the account which Cœlius Aurelianus gives of it in his Acut. Morb. lib. ii. he ſeems to deſcribe the ſyncope very clearly and accurately. See LYPOTHYMIA.

CARDIALGIA. The HEART-BURN, from καρδια, *the left orifice of the ſtomach,* and αλγεω, *to be pained.* Called alſo *Ardor Ventriculi,* and properly ſo, when attended with heat, as it ſometimes is, and that conſiderable; likewiſe *Cordolium*; pain or uneaſineſs about the upper orifice of that organ. It is ſometimes the ſame as *cardiogmus.*

Dr. Cullen ranks it as ſynonymous with *Dyſpepſia*; and conſiders it as ariſing either idiopathically, or ſymptomatically, in two ways: firſt, from a diſeaſe of the ſtomach itſelf: ſecond, from an affection of ſome other part, or of the whole habit. SYNOP. NOSOLOG. METHOD. Gen. 45.

This diſorder is called SODA, *heart-burn,* or *ſpurious cardialgia*; *pain in the ſtomach,* or *the true cardialgia,* alſo *cardimona.* In the SPURIOUS kind, the pain is not

to

ſo great, nor does the ſtrength fail; nor is there any toſſing, or remarkable inquietude. In the TRUE, there is pain in the ſtomach, or about its orifices, but generally felt about the part called the pit of the ſtomach: it is attended with great anxiety, difficulty of breathing, want of ſtrength, inquietude, retching to vomit, coldneſs, and trembling of the extremities. Sometimes the uneaſy ſenſation extends the whole length of the œſophagus, with a preſſure or conſtriction, and uſually attacks by fits.

Some ſay, that the upper orifice is the ſeat of this diſorder; others, that it is in the lower; and this latter is very probable, for the uneaſineſs is generally perceived in the ſcrobiculum cordis, where the lower orifice of the ſtomach is placed; the reſt of the ſtomach may be affected from the pain in its orifice. In thoſe who have died of this diſorder, on diſſection the right orifice only hath appeared to be in an unnatural ſtate.

Thoſe whoſe ſtomachs abound with acid, or with bilious humours, are the moſt ſubject to theſe complaints.

The CAUSES are various, as *flatus*, *acid*, and *other acrimonious humours in the ſtomach*, *a loſs of its mucus*, *ſpicy* and *pungent aliment*, *worms*, a *tranſition of rheumatic*, *gouty*, &c. *humours to the ſtomach*, or *an ulcer in any part of it*; *fat aliment*, eſpecially if cold ſmall liquors are drank too ſoon after eating it; *bilious matter*, which is known by bitter and nauſeous eructations, as well as by a yellow or greeniſh diſcharge by vomiting; *congeſtions of blood about the region of the ſtomach*, from a plethora, or from ſpaſms. Dr. Hunter thinks this diſorder is generally cauſed by *fumes ariſing from acrid humours rather than from the humours themſelves*: his reaſon is, becauſe if the patient puts himſelf into a poſture to prevent the fumes riſing to the part affected, immediate relief is generally found. A *ſpaſm in the orifices of the ſtomach*, by which the vapours are impeded in their paſſage from this viſcus, and by the heat of the part rarefying the air, produces a diſtenſion, anxiety, &c. *anger*, particularly after meals; *corroſive poiſons*; *ſtones in the gall-ducts*, or *in the ureters*, by ſympathy produce this diſeaſe in the ſtomach.

Thoſe who labour under this complaint, have an uneaſy ſenſation in the ſtomach, anxiety, heat which extends ſometimes up the œſophagus, oppreſſion, faintneſs, inclination to vomit, a diſcharge of clear lymph from the ſtomach, the mind ſeems diſturbed; there is a difficulty of breathing, loſs of ſtrength, coldneſs of the extremities, frequent eructations, which, while diſcharging, alleviate the pain; head-ach, vertigo, trembling, a weak pulſe that is intermitting and unequal; the face is pale, yellow, or livid, &c. A greater or ſmaller number of theſe ſymptoms are the attendants of the *cardialgia*, which approaches generally with yawning and liſtleſſneſs, and at its height the extremities are cold. It does not quit the patient till heat returns into the feet, and it often totally vaniſhes with a copious perſpiration.

The *cardialgia* muſt be diſtinguiſhed from that oppreſſion and uneaſineſs in the ſtomach, which is only the effect of overcharging it with food, the colic, and a ſwooning.

If this diſorder ſucceeds a fever, with petechial or purple ſpots, it is generally a fatal ſign; following a ceſſation of pain in gouty limbs, manifeſts the turn of the diſorder inwards; or if it ſucceeds foul exulceration in the ſkin, there is much danger. Coming on upon a ſudden check of a dyſentery, it is a bad ſign; but, except it is attended with inflammation, or is the conſequent of ſome other diſeaſe, it is rarely dangerous.

IN ORDER TO THE CURE, it ſhould be conſidered, whether or not the diſorder is ſymptomatical; if it is, regard muſt chiefly be had to the primary diſorder; if it is an original complaint, its various cauſes muſt be adverted to, that the remedies may be adapted to the particular one in the preſent caſe.

The diet ſhould be light, generally of the animal kind: what is drank ſhould not be apt to ferment; brandy and water, or water in which toaſted bread is ſteeped, will generally agree; or camomile tea, which ſoothes the ſpaſmodic motions of the ſtomach. Lime-water, the mineral alkaline waters, and diſtilled water, are proper for common drink.

If acid juices in the primæ viæ are the cauſe, abſorbents and mild alkalines will be the remedies; and of theſe the mixtura cretacea, magneſia alb. with ſmall doſes of the natron pur. are elegant and efficacious.

If with acidity the digeſtion is weak, beſides the magneſia at proper intervals, bitter infuſions mixed with mild aromatics will be proper, and chalybeates, particularly the rubigo ferri.

Acrimony of any kind is relieved for the preſent by cold water, in which gum arabic is diſſolved. If the acrimony is of the acid kind, it produces a gnawing, darting pain; if of the alkaline, a burning pain.

When an alkaline acrimony, or an acrid hot bile, thrown into commotions by an exceſs of anger, is the cauſe, the faulty matter ſhould firſt be evacuated by ſtool: nitre in ſmall doſes, frequently repeated, will be neceſſary; a draught of cold water may now and then be given; and ſtupes, wrung out of a warm fomentation, may be applied to the ſtomach, until a general perſpiration comes on; this will be uſeful when a *cardialgia* accompanies a cholera morbus; when this diſorder, from this cauſe, follows a tertian fever, the cure ſhould commence with an emetic; when a vomiting attends a bilious *cardialgia*, avoid hot carminatives, but ſupply the patient with ſps. ætheris vitriolicus compoſitus, in due doſes, and as frequently as the urgency of the ſymptoms require.

In general, in any of the caſes of alkaline acrimony, after an emetic, a gentle cathartic, or both; acids, ſuch as the ſpt. æth. nitroſi, acid. vitriol. dilutum. ſpt. febrifug. Di. Clutton. ſps. ætheris vitriolici compoſiti, diluted with water, or other ſmall liquors are indicated.

If from ſalt aliments, warm water ſhould be drank, and after it a little of any ſpirituous liquor.

If aromatics or high-ſeaſoned food is the cauſe, frequent draughts of warm water give the ſpeedieſt and moſt effectual relief.

When an undue uſe of ſpirituous liquors creates this diſorder, the bark and vitriolic acids before and after meals, moderate exerciſe, and the mineral alkaline waters, are the beſt means of recovery.

When flatulence with a weak ſtomach are the chief cauſes, carminatives, ſuch as flor. cham. vel cort. aurant. ʒ ſs. ad ʒ j. gives much relief, but mild opiates are often to be preferred.

The ſedentary and ſtudious are ſubject to this diſeaſe, *from a laxity in the ſtomach*, when the habit in general is robuſt; in this inſtance the cort. Peruv. pulv. ʒ ſs. vel ſem. ſinap. non contuſ. cochl. mediocr. bis terve in die; vel ʒ j. bis terve in die; or if theſe fail, warm bitters, and the fetid gums joined with light chalybeates generally ſucceed.

When worms produce it, avoid all the acrid anthelmintics; give warm milk, mint, penny-royal, or any other ſimple diſtilled water.

In hyſteric or hypochondriac cardialgias, light infuſions of the bark, with rhubarb, and ſmall doſes of fixt alkaline ſalt; the chalybeate waters, and exerciſe on horſeback, ſhould alſo, if poſſible, be uſed. In hypochondriac caſes, nitre is often uſeful.

When a congeſtion of blood, from impeded or ſuppreſſed periodical evacuations, give riſe to this complaint, bleed, give antiſpaſmodics, and endeavour to promote their due diſcharge.

Surfeits are ſometimes the cauſe; in which caſe, after a vomit, give camomile or carduus tea; and if the diet was putrid, let vinegar and other vegetable acids be taken.

Violent vomits, *draſtic purges*, and *cauſtic poiſons*, produce this diſorder; and when theſe are its cauſe, give plenty of warm water to promote two or three diſcharges upwards, then milk and water and oily mixtures, with ſmall doſes of ſome warm opiate.

Clyſters are uſeful auxiliaries in all the caſes of this kind.

Gouty, &c. *matter in the ſtomach*, cauſing this complaint, is to be removed by warm cordials, taken in moderate quantities, until the ſtomach itſelf becomes warm: how much will do, this the feelings of the patient alone can determine. See CARDAMOMUM, No. 2.

External applications for abating pain in the ſtomach, if this diſorder ſeems to be in the upper orifice, are beſt applied to the left ſide of the eighth or ninth vertebra; and in other diſorders in this part, as nauſea, vomiting, &c. they are moſt effectual when laid on the left ſide, towards the back, and on the ſpurious ribs.

CARDIALGIA INFLAMMATORIA. See INFLAMMATIO VENTRICULI. —— SPUTATORIA. See PYROSIS.

CARDIMELECH. A fictitious term in Dolæus's Encyclopedia, by which he would expreſs a particular active principle reſiding in the heart, appointed to what we call the vital functions.

CARDIMONA. See CARDIALGIA.

CARDINAMENTUM, from *cardo, a hinge.* An hinge-like articulation. See DIARTHROSIS.

CARDIOGMUS, } from *καρδιωσσω, to have a gnaw-*
CARDIONCHUS, } *ing pain at the mouth of the ſtomach.* The former is ſynonymous with *Cardialgia.* See alſo ANEURISMA PRÆCORDIORUM.

CARDIOTROTUS. One who hath a wound in his heart.

CARDITIS. See INFLAMMATIO CORDIS.

CARDO. See GINGLYMUS.

CARDONET. See CINARA SYLVESTRIS.

CARDONIUM. In the phraſe of Paracelſus, is wine medicated with herbs.

CARDOPATIUM. See CARLINA.

CARDUO-CNICUS. See ATRACTYLIS.

CARDUUS. The THISTLE. The general characters of which are as follow: the leaves are ſet alternately on the branches, and are prickly; the heads are moſtly ſquamous and prickly; prickles are on moſt or all parts of the plant, and they are moſtly lacteſcent.

But the modern botaniſts ſo vary in their arrangement, that each reject ſome which others rank in this claſs. Boerhaave hath thirty ſpecies in his catalogue.

CARDUUS BENEDICTUS. The BLESSED or HOLY THISTLE; alſo called *cnicus ſylveſtris, cardui lutei procumbentis ſudorifici & amari.* It is the CENTAUREA BENEDICTA, or the CENTAUREA calycibus duplicato ſpinoſis lanatis involucratis, foliis ſemidecurrentibus denticulato-ſpinoſis. CLASS, SYNGINESIA; ORD. POLYGAMIA FRUSTANEA; Gen. Plan. Linn. 984. It is a plant with rough, narrow, jagged leaves, ſituated alternately, terminating in ſoft prickles, and large hairy branched ſtalks, leaning to the ground; on the tops of which grow large, ſcaly, prickly heads, including a number of yellow floſculi, which are followed by oblong ſtriated ſeeds incloſed in down. It is a native of Spain and ſome of the Archipelago iſlands, and is annually ſown with us in gardens.

The leaves have a penetrating bitter taſte, not very ſtrong or durable in the mouth; when freſh they are more ungrateful than when dry. The plant ſhould be hung up looſely in an airy place, after it is well dried; for if preſſed cloſe, it rots. The beſt time for gathering it is when in flower.

This plant obtained the name Benedictus, from its being ſuppoſed to poſſeſs extraordinary medical virtues; but it is not found to excel ſeveral other of the ſimple bitters; though BERGIUS conſiders it as antacid, corroborant, ſtomachic, ſudorific, diuretic, and eccoprotic.

Camomile flowers is now generally ſubſtituted for the Carduus benedictus, and is thought to be a ſuperior medicine.

However, when this herb is uſed to excite vomiting, a decoction of it in water is the beſt, for thus its more naſeous parts are extracted: cold water in an hour or two extracts the light grateful bitter; but if the infuſion is continued much longer, the naſeous part is alſo extracted; rectified ſpirit extracts only the agreeable bitter, but, though heated, it does not eaſily take up the offenſive parts.

A light, cold, watery infuſion, with freſh lemon or orange-peel, helps the appetite, and is uſeful when the digeſtive powers are weak; it ſits eaſy on the ſtomach, and no bitter is leſs heating. Dr. Cullen thinks this plant a ſimple and pure bitter, though not a very ſtrong one; and therefore has none of the extraordinary virtues aſcribed to it. An ounce of the dried leaves may be infuſed two hours in a pint of ſoft water; it may be flavoured at pleaſure with any aromatic. It may be made ſtronger by returning the liquor on freſh parcels of the leaves or tops. It affords nothing valuable by diſtillation. See Lewis's Mat. Med. Miller's Bot. Off. Dale.

—— HÆMORRHOIDALIS, alſo called *carduus* vinearum repens, *carduus* vulgariſſimus viarum, *ciriſium arvenſe, eunithos.* The COMMON CREEPING WAY-THISTLE.

Its roots are whitiſh, but now and then incline to black, and have a ſtrongiſh ſmell: it ſends forth fibres that creep on the ground, and propagates itſelf to a great diſtance: it is common in tillage ground and highways: it flowers in July and Auguſt. It is called *hæmorrhoidalis,* becauſe it relieves the pain of the hæmorrhoids, if beat into a poultice, and applied.——LACTEUS, alſo called *carduus* Mariæ, *carduus* leucographus, *carduus* Marianus, *carduus* albis maculis notatus vulgaris. COMMON MILK THISTLE, or LADY'S THISTLE. It is diſtinguiſhed from all other thiſtles in England, by having its leaves cut in ſeveral laciniæ full of hard ſharp prickles, having all the upper part ſpotted with long and broad white ſpots. It grows on banks, and flowers in June. The leaves and ſeeds have ſimilar virtues to thoſe of the *carduus* benedictus, but in an inferior degree. It is ſaid to be efficacious againſt pungent pains. Miller's Bot. Off.—— LACTEUS SYRIACUS, alſo called *carduus* albis maculis notatus exoticus. *Bedeguar Arabum Rauwolfii, cnicus albis maculis notatus.* The SPANISH MILK-THISTLE.

The characters of this and the next ſpecies are, they are perennial, have long, narrow, deeply jagged leaves, that are prickly and laying on the ground; in the middle of which grows a large roundiſh head, without any ſtalk, encompaſſed with ſmaller leaves, which may be eat as artichokes are; the flowers iſſue from the middle of the head. Boerhaave enumerates ſeven ſpecies;——PINEA, alſo *chamæleon verum, &c.* called likewiſe *carduus humilis gummifera, carlina cnicus, cinara acaulis gummifera, ixine, acanthina maſtiche, chamæleo albus Dioſcoridis, columnæ,* and PINE-THISTLE. Its flowers are compoſed of purpliſh floſculi, like thoſe of the common thiſtle. It is a native of Italy and of Candy. Its roots are larger than thoſe of the carline thiſtle, and ſmell ſtronger; if wounded when freſh, they yield a viſcous milky juice, which concretes into tenacious maſſes, at firſt whitiſh, and reſembling wax, when much handled growing black, ſuppoſed to be the *ixion, ixia,* and *acanthina maſtiche* of the ancients; the people of APULIA gather this gum, and name it *cera di cardo.* It was formerly chewed for the ſame purpoſes as the maſtich gum: the root hath the ſame virtues as the carline thiſtle roots.——SPINOSISSIMUS *ſphærocephalus rigidis acaleis armata*; C. B. *cardui Arabici,* PARK. THEAT. *ſpina Arabica offic.* ARABIAN THISTLE. It ſeems to have like qualities with the ſpina alba.—ACANTHUS. See ACANTHUS.——BRASILIANUS FOLIIS ALOES. See ANANAS.——*Altilis*;——*domeſticus*;——*ſativus, non ſpinoſus*;——*ſativus.* See CINARA.——*Humilis Gummifera.* See CARDUUS PINEA.——*Lutæus.* See ATRACTYLIS.——*Solſtitialis.* See CALCITRAPA OFFICIN.——*Sativus.* See CARTHAMUS.——*Stellatus.* See CALCITRAPA.——*Stellatus lutæus.* See CALCITRAPA OFFICIN.——*Eſculentus*; *ſpinoſiſſimus elatior.* See CINARA SPINOSA.

CEREALIA. See PANIS.

CAREBERIA, from *καρη,* the *head,* and *βαρος, heavineſs.* See CAPIPLENIUM.

CARENA. The twenty-fourth part of a DROP.

CARETTI. See BONDUCH INDORUM.

CAREUM. } See CARUM.
CARI. }

CARICA. A DRY FIG. See FICUS SATIVA.

CARICUM, vel CARYCUM. The name of a medicine for deterging ulcers.

It is prepared of the black hellebore, cantharides, and ſeveral other things mixed together.

It is alſo the name of an oil mentioned in Athenæus, lib. ii.

CARIES. Mr. Sharp ſays it is a partial mortification of the bone, which ſeparates from the ſound part ſooner or later. Dr. Cullen places this genus of diſeaſe in the claſs locales and order dialyſes, and names it *exulceratio oſſis.* But as Mr. Bell obſerves, in p. 124. of the 3d. edit. of his book on Ulcers, every ſpecies of *caries* attended with loſs of ſubſtance may be termed an ulcer; but to prevent confuſion, he conſiders *caries* as an accidental ſymptom of ulcers, and ſpeaks of it under the general name of CARIOUS ULCER.

This corrupted ſtate of the bone is called *caries, ſphacelus, teredo,* or tredon.

This diſorder happens when the bone is deprived of its periоſteum, and having loſt its natural colour becomes pinguinous, yellow, brown, and at laſt black. This ſtate, which is the firſt degree of this diſorder, was called by the ancients OS VITIATUM, OS NIGRITIES; but the greateſt degree is when the bone is corroded, diſcharging a ſanies which conſumes the adjacent fleſh. Of the many names given to the *caries,* which are collected under *ſpina ventoſa,* there ſeems to be only the following needful: firſt, when the cauſe is internal it is the SPINA VENTOSA; or, with Severinus, when it happens to children, it may be called PÆDARTHROCACES; and ſecondly, when the cauſe is external, it may be called *caries.*

That an inflammation of the periоſteum is tending to a gangrene,

gangrene, and so a *caries* of the bone is known, first, *from the signs of inflammation preceding; secondly, a freedom from pain in the affected part, without a manifest cause, and from a dense, slow, increasing, and not very painful tumor of the incumbent parts.* But among the signs of a beginning gangrene, the sudden removal of pain is fallacious, for this happens in inflammation of the periosteum, when the periosteum is corroded so as to admit the matter to escape betwixt the muscles, though in general, when pain is relieved by a resolution of inflammation, it goes off gradually only; but a good resolution hardly if ever happens after a violent inflammation. Again, when a gangrene is threatened, the taint is propagated through the cellular membrane, which, by slight causes, is often raised into a large tumor; but, as all the symptoms of an inflammation cease when a gangrene is present, the tumor will not have the hardness and resistance, observable in a phlegmon, but will be flaccid, and hardly sensible of pain. *If the incumbent part changes to a livid colour*, the bone is then without doubt in a mortifying state.

Celsus, who treats on this disorder the best of all the ancients, at least as to its cure, says, lib. viii. cap. 3. "We may soon, by means of a probe, discover a *caries* of the bone, since the probe will penetrate less or more, according as the *caries* is superficial or deep." When the probe comes to the sound part of the bone, it is resisted. Wiseman, vol. i. p. 296. edit. 5. says, "If the bone be bare, its corruption is easily discerned, though sometimes it be covered with a grumous or viscous matter, which rubbed off, the bone appeareth white, brown, or black. If the white be porous, the *caries* may be deeper and more dangerous than if it were black and hard. If the bone lies so hid as that you cannot feel it with your probe, yet you may judge it carious from the quantity or quality of the matter. If the bone lies near, and the flesh is lax and white, it is strongly suspicious that the bone is carious: but if *the matter stinks or be oily, it is a more certain sign of rottenness.* Ulcers of long continuance near a bone do also foreshew a *caries*, according to Hippocrates. Also the difficulty in cicatrizing them, and the frequent and sudden eruption of them after they are cured, give a suspicion of a foul bone. But if the bone is much corrupted, the matter is fetid, and the probe will penetrate into it."

In living persons the bones are of a reddish or bluish colour: *the first sign of a vitiated bone is a change from this colour to a white, yellow, dark, and at last a black one:* a white denotes a beginning mortification; hence, when small perforations are made in a cranium thus effected, the first sign that a cure succeeds is, when the white surface of the bone begins to assume a reddish colour.

The friability of carious bones is much augmented by the acrimony of their humours, and chiefly of their corrupted medullary oil; for the cohesion of the bones depend much on the interposition of it between the terrestrial parts.

The peculiarly disagreeable fetid smell which arises from carious bones is from the corrupted medullary oil.

When A CARIES IS UNDER AN ULCER, *the flesh over the caries is soft, flaccid, fungous, inflated, and tumid; the lips of the ulcer inverted, the sanies clear, subtil, fetid, and full of small black scales, nor can the ulcer be healed, at least only superficially, and it soon breaks out again.* See ULCER with a *caries*, under ULCUS.

In the Edinb. Med. Essays, Dr. Monro gives a particular account of several species of this disorder, viz.—1. The DRY or GANGRENOUS CARIES, which is, where the bone is smooth and firm, and throws out little matter; its surface at first is not of a very dark colour, but before exfoliation it turns very brown or black. This kind exfoliates with less difficulty than any other.—2. THE WORM-EATEN CARIES or ULCER of the BONES; this species hath not such a dark colour as the former, it discharges more matter; the cavernous, or spongy texture of the bone is evident.—3. THE CARNEOUS CARIES, or ulcer of the bones with hypersarcosis; this sort differs from the worm-eaten *caries* only in the addition of spongy flesh growing in the cells of the bone; this spongy flesh often bleeds if touched with the greatest care.—4. THE PHAGEDENIC CARIES with hypersarcosis; in this case the periosteum is thickened, the bone softened, and its surface is eroded, a yellow red spongy substance sprouts out; the difference betwixt this and the carneous *caries* is, that in the latter the spongy flesh grows out of the caverns while the grey or brown coloured spongy bony sides of them still remain; but in the former, the bony fibres disappear wherever the spongy flesh comes, so that one can scarce determine by the probe whether or no the bone is carious: upon scraping away this bone-consuming flesh, the surface of the bone appears rough indeed, but not much eroded, nor greatly altered in its colour.—5. THE SCROPHULOUS CARIES: this is sometimes observed when an abscess is opened; the bone at the bottom of it appears white and smooth, without its periosteum or connection to any of the neighbouring parts, except by its ligaments at the extremities; and this way of bones mortifying most commonly happens in scrophulous habits.—6. THE SCIRRHO-CANCROUS CARIES: in one species of exostosis the tumefied bone is softer in one part than in the other, and is not composed of regular fibres, nor cavernous, but as if the ossifying juice had been thrown out irregularly; over which a cartilaginous or tendinous substance is spread, and from this a firm shining smooth flesh grows out, which, after the teguments are moved, sends forth a thin stinking acrid sanies; the patient complains often of throbbing pains in it, and sometimes considerable hæmorrhages are made from imperceptible vessels in its surface.—7. THE SPREADING CANCEROUS CARIES: in the spreading eating cancers, the bones are wasted, as well as the soft parts, and the appearances are the same in both, unless that the bones do not consume quite so fast.

In considering a *caries* of the bones, we should remember, that the bones have their vessels and circulating fluids, and the same general texture which the soft parts have: so that solidity, and a stronger cohesion of parts, are the only evident distinguishing characters of the composition of bones.

Heister observes, that the cure of a *caries* depends on removing easily and speedily all the corrupted parts of the bone, and that in the gentlest cases this is done by *rectified spirit of wine* being applied by means of lint dipped in it; or *alcohol caryophillatum*, thus made: alcohol, 3 iij. ol. caryoph. 3 i. m. this applied upon lint to carious bones, quickens the exfoliation. Vinegar used in the same manner, has been thought to answer the purpose equally well. In more violent cases *a solution of mercury in aqua fortis* is required, and in the most malignant *the actual cautery* will be necessary; but these hinder suppuration, and retard the operation intended. See EXFOLIATIO.

An exfoliation of the carious laminæ of the bone, sometimes takes place in two or three weeks, and in other instances the laminæ are not removed in a year.

It is necessary to examine strictly all circumstances, and to discover, if possible, what cause, either general or topical, may have made the corruption of the bone, that endeavours may be used to remove it, if it still subsists: the *lues venerea, scrophula, scurvy, gangrene, abscess, wounds, contusions*, and many other diseases, may be the cause.

When the bone is perceived to separate, if the pus which flows from under it, is mild and in a due quantity, it will be the best suppurant and incarner, and nothing is to be done but to remove the pieces of bone as often as they are perceived to be loose. If the quantity of pus is too small, dress it with ung. resinæ flavæ, or other such digestive. If the opening in the integuments is so small that the matter detained is either absorbed into the circulation, or forms sinuous ulcers, the aperture must be enlarged by means of sponge tents, and kept so by dossils of lint. Indeed, if the exfoliation is likely to be tedious, in some cases it may be hastened by the use of a caustic or actual cautery, though in general the suppuration, which contributes to throw off the diseased part, is thereby retarded; or the rasp may be used; if instead of the actual cautery a potential one is preferred, the common caustic is the best.

In the WORM-EATEN CARIES it is necessary to destroy all the affected part of the bone as soon as conveniently can be done, by rasping, chisseling, trepanning, &c. according as each of them can be applied; after which the method as above described, is to be pursued. When the ulcer is deep, let honey dissolved in vinegar and water be injected into it every day.

In the CARNEOUS CARIES the fungous and corrupted parts are best destroyed by a caustic; though Gooch, in his Cases and Remarks, vol. ii. p. 359. gives an instance of the inefficacy of caustics in this case, and of the necessity of using the actual cautery, which he in general prefers.

The PHAGEDENIC CARIES: one or two applications of the potential cautery are sufficient to reduce it to the most simple kind of *caries*; but sometimes great difficulties attend it.

In the SCROPHULOUS CARIES; deſtroy fully the teguments which cover the abſceſs formed on the bone, with a cauſtic, cut eſchar through the middle to evacuate the matter; and to ſave the eſchar as long as poſſible, let mild applications only be laid on the ſore; then to aſſiſt the diſcharge of the matter, waſh it with water; but if it is fetid, mix vinegar with the water.

In genenal a mild treatment is to be preferred. In the ſlighter caſes endeavour to excite and continue a degree of inflammation in the adjoining ſound part of the diſeaſed bone, ſo as that it may be the means of ſeparating the mortified part. This is done by making a number of ſmall perforations all over the ſurface of the *carious* bone, to ſuch a depth as to give the patient a very little pain, and no farther; this operation may be renewed in different parts every third day, or thereabout; thus ſuppuration will take place, and a conſequent ſeparation of the *carious* part. But when the diſeaſe is extenſive, and goes deeper than the ſecond lamella of the bone, inſtead of little perforations made by the pin which fixes the trepan, it will be adviſeable to uſe a ſmall head of a trepan; this inſtrument, applied at proper diſtances over the ſurface of the *caries*, and carried juſt ſo deep as to produce a little uneaſineſs, will occaſion the needful inflammation and ſuppuration. As ſoon as any of the parts looſen at the edges, their final ſeparation may be always greatly haſtened by daily inſinuating below them the end of a common ſpatula, ſo as to preſs their edges a very little upwards. After the uſe of thoſe inſtruments, apply to the ulcer the ſame dreſſings as in caſes of a ſimple ulcer; and, to moderate the fœtor of the *caries*, the dreſſings may be covered with lint, moiſtened with a ſtrong decoction of the cort. Peruv. & fol. jugland. The *caries* ſeparated, dreſs as in caſes of ſimple ulcers in fleſhy parts. If the *caries* penetrates very deep into the ſubſtance of a bone, ſo that a conſiderable portion is affected, or, as frequently happens, the diſeaſe extends even round the bone, the ſhorteſt method then is to take out at once, all the diſeaſed parts, either with the head of a trepan frequently applied, or by means of a ſmall ſpring-ſaw. This may be performed on the ſkull, hands, feet, legs, or arms. See the article TIBIA for the proceſs.

In the SCIRRHO-CANCEROUS CARIES; in this caſe, as in cancers of the glands, extirpation is the only remedy; but here alſo the diſorder is apt to return in another part.

The SPREADING CANCEROUS CARIES ſeldom heals: it may be dreſſed with lint, or a cautery may be applied; but it generally breaks out again after a ſeeming cure.

Some aſſert that ſea-water is more efficacious in *caries* of the bones than in glandular ſwellings.

A *caries* of the whole bone or bones, forming a limb, is ſometimes productive of the neceſſity of amputation: particularly when the internal ſurface of ſuch bones are affected as well as the external, and that through the whole extent, or near it. In ſuch inſtances, if the whole bone is not removed by amputation, the patient will periſh. It too often happens that in young ſubjects, with the beſt health, the whole habit will be ſo injured by the *carious* bone, that a hectic fever of the putrid kind, with all its horrid train of ſymptoms, will quickly deſtroy the patient.

See Almeloveen's edition of Celſus de Morbis Offium, p. 539. Petit's Diſeaſes of the Bones. Heiſter's Surgery. Le Dran's Obſervations. Wiſeman's Surgery. Monro's Account of the *Caries*, in the 5th vol. of the Ed. Med. Eſſays. Bell's Treatiſe on Ulcers, edit. 3. and his Syſtem of Surgery. Pott's Works. London Med. Tranſactions, vol. iii. p. 25.

CARIMA. See CASSADA.

CARIM-CURINI. An Indian ſhrub, the bark of which is uſed in a decoction againſt the gout; and a decoction of the leaves againſt a diſury. Raii Hiſt.

CARINA. The keel of a boat or ſhip. In BOTANY, it is the inferior petal of a papilionaceous corolla; incloſing the ſtamens and piſtil, uſually ſhaped like a boat, hence the name.

IN ZOOLOGY, it is applied to the firſt rudiments of the ſpine of a chicken during incubation.

CARIOSSE. See ADY.

CARIUM TERRA. LIME. See CALX.

CARIVILLANDI. See SARSAPARILLA.

CARLINA. CARLINE THISTLE. The ſpecies uſed in medicine is the CARLINA ACAULOSI, Linn. It is alſo called *cardopatium*, *chryſiſceptum*, *crocodilion*, *heracantha*, *ixia*, *chamæleon album*, *acaulos magno flore*, *carlina humilis*, the LOW CARLINE THISTLE.

That ſpecies with the flower, compoſed of a number of white petals ſet round a middle diſk, is a native of the mountainous parts of Italy and Germany. The roots have a ſtrong diſagreeable ſmell, and weak bitteriſh, ſubacrid aromatic taſte. They are diaphoretic, hyſteric, and anthelmintic. The doſe from 9 j. to 3 j

—— ACAULIS GUMMIFERA. See CARDUUS PINEA.

CARLO SANCTO, RADIX. ST. CHARLES'S ROOT. It is found in Mechoacan, a province of America: its bark is eaſily ſeparated from it, and hath an aromatic flavour, with a bitter acrid taſte. The root itſelf conſiſts of ſlender fibrils. The bark is ſudorific, and ſtrenghens the gums and ſtomach: the Spaniards call it *St. Charles*, on account of its great virtues.

CARMES, EAU DE. CARMELITE WATER, called alſo MAGISTERIAL WATER of BAUME. It hath its name from being invented by the Carmelites at Paris.

Take of freſh baum, ſix ounces: freſh lemon peel, the yellow part, two ounces; nutmegs and coriander ſeeds, of each half an ounce; bruiſe them and put them into rectified ſpirit of wine and pure water, of each a pint and a half; let them ſtand in a moderate heat for three days, then draw off two pints and a half in a vapour bath. Rectify the diſtilled liquor by a ſecond diſtillation in a water bath, drawing off only two pints.

Mr. Beaumé obſerves, that all aromatic ſpirits ought to be prepared in the ſame manner; that in this rectification only the more volatile, ſubtil, aromatic parts ariſe, there remaining behind a white liquor, acrid, bitter, and loaded with only the groſſer oil, deprived of all the ſpecific flavour of the ingredients. He farther obſerves, that aromatic ſpirituous *waters* have leſs ſcent when newly diſtilled than after they have been kept about ſix months; and he found that the good effects of age was produced in a ſhort time by means of cold, and that by plunging quart bottles of the liquor into a mixture of pounded ice and ſea-ſalt, the ſpirit, after having ſuffered for ſix or eight hours the cold hence reſulting, proves as grateful as that which hath been kept many years. Simple waters alſo, after having been frozen, prove far more agreeable than they were before. Geoffroy takes notice of this melioration by froſt. See Hiſt. Acad. 1713.

CARMINA, VERSES: alſo INCHANTMENTS. See AMULETA.

CARMINANTIA, or CARMINATIVA. CARMINATIVES; called alſo *antiphyſica*. In general by theſe words are meant ſuch medicines as are uſed in colics, and other flatulent diſorders to expel wind. The ancients had much of myſtery in their practice, and celebrated theſe medicines by ſinging of verſes when they adminiſtered them, as they by their frequent ſpeedy relief ſeemed to act as by a charm; ſo from *carmen*, the Latin word for a *verſe*, the word *carminative* is derived. Some derive it from *carmino*, *to card wool*, or *cleanſe it from foulneſs*; and ſay that the phyſicians, by a metaphor, uſed to ſignify the expulſion of, or cleanſing from the wind. Others from *carmina*, *charms*, which were formerly ſuperſtitiouſly uſed for ſeveral cures. Others, becauſe they produce *carmen*, *muſic*. They were ſuppoſed to attenuate and diſcuſs wind or vapours, and promote their diſcharge by perſpiration. At preſent they are confined, and properly to ſuch medicines as by their ſtimulating, and antiſpaſmodic power, encreaſe the action of the primæ viæ, and take off ſpaſmodic affections, and thus promote the expulſion of flatulencies.

Boerhaave places the following draught amongſt the firſt of this tribe of medicines: ℞ Spt. nitri d. 3 j. aq. menth. & cinnam. ää 3vj. m.

CARNEÆ COLUMNÆ. See COR.

CARNICULA. Fallopius uſes this word inſtead of *caruncula*, to ſignify in particular the fleſh which ſurrounds the gums.

CARNIFORMIS ABSCESSUS. An ABSCESS with a hardened orifice, and of a firm ſubſtance, or hard conſiſtence like a ſhell, not much elevated into a tumor, but broad and expanded, with membranes, fibres, and capillaries, uſually interſperſed. It generally riſes where the muſcles inſert themſelves into the joints. Severinus.

CARNIVORUS. FLESH-DEVOURING. A term of the *aſſius lapis*. Animals are alſo thus called whoſe food is fleſh.

CARNOSA CUTIS. See PANICULUS CARNOSUS.

—— MUSCULOSA MEMBRANA. See FRONTALIS MUSCULUS.

CAR. STEPH. PRÆD. RUST. An abbreviation of Caroli Stephani Prædium Ruſt. Paris, 1629.

CARO. FLESH. In ANATOMY it is only the red part or belly of a muſcle. In BOTANY it is the pulp of a fruit.

——— ADNATA. Ad Teſtem. } See SARCOCELE.
——— ——— Ad Vaſa. }

——— MUSCULOSA QUADRATA. See PALMARIS BREVIS.

CAROBA. See SILIQUA DULCIS.

CARŒNUM. See MUSTUM.

CAROLI. See CHANCRE.

CAROPI. See AMOMUM VERUM.

CARORA; alſo CYNNIA, and CYMIA. The name of a veſſel that reſembles an urinal.

CAROS. See CARUM.

CAROS, } Καρῶ, or *carus*, ſynonymous with *ſopor*. It
CARUS, } riſes on a coma, and is a ſlight degree of apoplexy, in which you get ſome broken incoherent anſwers from the patient; when called, he ſcarce opens his eyes: yet, if he be prickad, he hath feeling enough to manifeſt his ſenſe of it. This diſeaſe is ſuppoſed to take its name from *caryon*, the walnut-tree; or elſe the tree is named from this diſeaſe. See CARYON.

The *coma lethargus*, *coma vigil*, *coma ſomnolentum*, *cataphora*, are diſeaſes that reſpect ſleeping chiefly, and they riſe on each other; the coma is the loweſt degree, the lethargy the higheſt, and is itſelf a ſpecies of apoplexy, which is the higheſt degree of theſe diſeaſes. Galen ſays, that if the *carus* oppreſſes reſpiration, as in thoſe who ſnore in their ſleep, it is an apoplexy. See COMA. Boerhaave ſays, that a *carus* is a ſlight apoplexy from a hot cauſe, and is attended with a fever; and a lethargy is a ſlight apoplexy from a cold cauſe.

Hippocrates ſometimes calls this diſorder *aphonia*. Galen, in his Method. Med. lib. xiii. calls it *catoche*. Cœlius Aurelianus calls it *gravatio*; and Pliny, *gravedo*. Dr. CULLEN arranges CARUS, as ſynonymous with APOPLEXIA. In a *carus* there is inſenſibility and ſleepineſs, with quiet reſpiration. It ſometimes ſignifies a loſs of ſenſe and voluntary motion, reſpiration remaining uninjured.

The immediate cauſe of ſleepy affections ſeems to be a defect of, or an impediment to, the paſſage of the vital principle. The remote cauſes are, whatever diminiſhes the vis vitæ, or that can obſtruct its influence, as tumors preſſing on the brain, a turgeſcency of the veſſels from obſtructed menſes and hæmorrhoids, &c. a too free uſe of ſpirituous liquors, expoſure to offenſive vapours, blows on the head, and ſuch like circumſtances.

COMA VIGIL is known by a burning and extenſive pain in the head, attended with a ſenſe of ebullition therein. There is a ſtrong inclination to ſleep, and the patient either does not ſleep at all, or if he does, he awakes immediately with little or no relief, but there is no delirium. This diſorder is always ſymptomatic, and often attends acute fevers, and uſhers in a phrenzy. It ſometimes attends an hemiplegia.

COMA SOMNOLENTUM. In this diſorder the patient is languid, and his chief complaint is a conſtant drowſineſs. He often falls aſleep at meals, in converſation, and in the midſt of buſineſs; and, when awaked, he ſoon falls aſleep again. Luxurious old men are moſt ſubject to it. It is a primary diſorder, and unattended with fever.

CARUS. This is a profound ſleep, out of which great difficulty attends the rouſing a patient; though he ſeems ſenſible of pinching, or pricking him with pins, he either does not ſpeak, or he immediately relapſes into the ſame degree of ſleep. This diſorder is either idiopathic, or ſymptomatic, and often attended with a fever. When it is ſymptomatic, it is ſaid to be of three kinds, but is only the ſame diſeaſe in the different periods of that complaint, of which it is a ſymptom. The firſt happens in acute fevers in their beginning or increaſe; and if convulſions and hiccoughing comes on, it is ſoon fatal. The ſecond comes after acute fevers, and when the patient is exceeding weak, the ſleep will continue for ſeveral days: if it happens in acute fevers on critical days, with a ſweat, it is a good omen. The third happens a day or two before death, when the patient's ſtrength being exhauſted, he lies deprived of ſenſe and motion, as it were in a profound ſleep, and under it expires.

LETHARGUS, alſo called *veternus*, a LETHARGY, is a heavy perpetual ſleep, with ſcarce any intervals of waking; being awakened, the patient anſwers; but, ignorant or forgetful of what he ſaid, he immediately ſinks into the ſame ſtate of ſleep; indeed it is attended with ſuch a ſtupidity and forgetfulneſs, that when the patient yawns, he forgets to ſhut his mouth; or whatever he begins to do, he forgets to proceed in it, and falls aſleep. It is attended with a fever, which is a ſymptom thereof, and is chiefly diſcovered by the frequency of the pulſe; and does not invade ſo ſuddenly as an apoplexy, nor does it kill ſo ſoon. By ſome, though, it is conſidered as ſymptomat c generally, and often the attendant of fevers. In this diſeaſe there ſeems to be an utter loſs of all the rational powers, and inaptitude to motion, whence ſome have named it *deſidia obliviosa*. Dr. CULLEN thinks it a ſymptomatic apoplexy.

Bonetus, in his Sepulchretum Anatomicum, obſerves, that thoſe who died of ſleepy diſorders, on being opened, in their brain was found a copious ſerum diffuſed through its ſubſtance, yet ſo, that the cortical part thereof, with its meninges, were principally overflowed with water; in ſome he found the ventricles replete with ſerum, and the cortical part unaffected by it, and theſe, he ſays, were never troubled with ſleepy diſeaſes. But he obſerves, that the more this watery fluid penetrated into the medullary part of the brain, the more obſtinate was the ſleepineſs during the life of the patient. In ſome who died of drowſineſs, he found abſceſſes, tumors, and ſcirrhoſities of the brain; but theſe were only on the anterior and cortical region of it. In ſome he found the veſſels of the pia mater very much diſtended with blood.

The COMA VIGIL ſhould be diſtinguiſhed from the pervigilium: and each of theſe diſorders from one another; alſo all of them from an apoplexy, an hyſteric fit, and a ſyncope.

A coma vigil often preſages a phrenſy, and convulſions; and in malignant fevers is often fatal. When pains attend a *carus*, they portend convulſions; and, in proportion to the violence of the fever, a *carus* is more or leſs dangerous. A lethargy is always dangerous, but the moſt ſo when the limbs are affected with a tremor, and a cold ſweat is perceived on the face.

In order to the cure, it ſhould be conſidered, that an exceſs, as well as a deficiency of the vis vitæ, may be the cauſe: and that in the beginning of fevers, an exceſs is the cauſe for the moſt part.

When the cauſe is an exceſs of the vis vitæ, and a fever attends, an inflammation of the membranes of the brain may be expected, therefore a free bleeding will be the firſt ſtep towards relief. But, as moſtly happens, the vital powers are below the requirement of health; in which caſe, if there is any plethora, it is of the ſerous kind, which does not admit of bleeding, but muſt be relieved by purges, and ſuch other evacuations as promote only the thinner excretions.

The general indications are, 1ſt. To rouſe from ſleep. 2d. To remove the difficulty of the circulation, the ſtagnation, or extravaſation of the blood or ſerum in the head. 3d. To reſtore the loſs of ſtrength.

To ſhake off the drowſineſs. After due attention to the degree of heat and ſtrength, by which bleeding will be required or forbid, uſe ſuch medicines as, while they raiſe or depreſs the vital force, may alſo produce a tremulous motion in the whole nervous ſyſtem. When the ſleepineſs is from a great defect in the animal powers, volatile ſalts may be held to the noſe, but, in general, the pungent acid ſpirits are greatly to be preferred; vinegar may be blown up the noſtrils, or if it can be had, the ſpirit of verdigriſe will be the beſt.

Due evacuations being made, cold water may be poured on the head; for this purpoſe the head ſhould be ſhaved juſt before. This both tends to remove the ſleepineſs, and to ſtrengthen the membranes of the brain.

Cataplaſms of ſtrong vinegar, muſtard ſeed, camphor, and caſtor, with any other ſuch like ſtimulants, may be applied to the temples and the head, after ſhaving it.

Bliſters may be applied to the neck and feet.

If there is no conſiderable plethora, ſternutatories may aſſiſt in driving the redundant moiſture from the head. Some caution is neceſſary in admitting them, leſt an apoplexy ſhould be the conſequence, by forcing a glut of humours upwards: but if admitted, one of the beſt is vitriolized zinc, purified, diſſolved in water; gr. x. to 3ſs. will be a good proportion.

Strong frictions may be uſed on the lower parts.

Strong clyſters, in which is the ſal gemmæ.

To remove the difficulty of the circulation, &c. If an extravaſation of blood, or ſerum, is the effect of external violence, bleeding may be freely uſed, and ſuch other methods as are propoſed to relieve when contuſion happens

in

in this part, but generally trepanning is found neceſſary. *A red face, eyes turgid with blood, tumid veins, a ſtrong pulſation of the arteries*, indicate bleeding in any ſleepy affection; though it may be proper to conſider whether the turgeſcence in the veſſels is from a plethora, or from rarefaction, before taking away the blood; and alſo whether the plethora is of the ſanguine, or the ſerous kind.

The belly ſhould be kept ſoluble, and nervous diapheretics, ſuch as the vin. ant. ſal ſuccin. &c, may be given to remove ſpaſms in the inteſtines, if they ſeem affected therewith.

When the patient recovers, a relapſe may be guarded againſt, by diminiſhing or removing the cauſe; by a well regulated diet, and due attention to all the non-naturals; by moderate exerciſe, and chearful company.

See Galen, Cœlius Aurelianus, Moor's Pathologia Cerebri, Hoffman, and Boerhaave.

CAROTA. See DAUCUS.

CAROTIDÆ ARTERIÆ. The CAROTID ARTERIES. In making experiments, by tying the nerves, to prove the compreſſion on them, ſo as to intercept their communication with the brain, the parts to which they belonged were deprived of ſenſe and motion. The firſt who tried theſe experiments, thought the animals turned comatous; and aſcribing this effect to the intercepting any paſſage of vital blood from the heart to the brain by the way of *arteries*, they gave theſe blood-veſſels the name of *carotides*, or *ſoporaria*, from κάρη, *the head*, or κάρος, *found ſleep*.

From the fore part of the curvature, juſt before the trachea, the right ſubclavian and the *carotid*, moſtly ariſe in one common trunk, which runs upwards a little way, and then divide. The left *carotid* riſes ſingle, and runs upwards on the ſide of the trachea. Both theſe *carotids* run up as high as the ſide of the larynx, even to the upper part of the thyroid cartilage before they give off one branch, and there they divide into the external and internal; the latter goes to the inſide of the cranium, the pia mater, &c. the former, which is the largeſt, gives branches to all the external parts of the head.

The external *carotid* is anterior, the internal is poſterior, the external ſituated more inward and nearer the larynx. It is the ſmalleſt, runs inſenſibly outward between the external angle of the lower jaw, and the parotid gland, which it ſupplies as it paſſes; afterwards it aſcends on the fore-ſide of the ear, and ends in the temples. It ſends off the gutturalis ſuperior, ſublinguales maxillaria inferior, maxillaria externa, &c. The internal *carotid* leaving the general trunk, is, at firſt, a little incurvated. It is ſituated a little more backward than the external, and generally runs up, without any ramification, as high as the lower orifice of the great canal of the apophyſis petroſa of the os temporis; it enters this orifice, and the cranium through a notch in the ſphenoidal bone; and, except one branch, which goes to the eye, it is wholly ſpent upon the brain. See Winſlow's Anatomy.

CAROTIDES. See CAROTIDÆ ARTERIÆ.

CAROUM. See CARUM.

CARPA. See CARPIO.

CARPASUS. An herb, the juice of which was formerly called *opocarpaſon*, *opocarpathon*, or *opscalpaſon*; it reſembles myrrh, but is eſteemed poiſonous; it is not certainly known what it is.

CARPATA. See CATAPUTIA MINOR.

CARPATHICUM. From the freſh cones of the trees which yield the common turpentine, is diſtilled a fine eſſential oil, ſaid to be *carpathicum*, or *Germanis oleum*.

CARPERITARIA. See BARBAREA.

CARPESIUM. This is an aromatic vegetable; it is often mentioned by the ancients, but it is not known what it is.

CARPHOS. See FŒNUM GRÆCUM.

CARPHUS. In Hippocrates it ſignifies a ſtraw, or mote, or any ſmall ſubſtance. It alſo ſignifies a ſmall puſtule, for the cure of which Aetius, Tetrab. 1. recommends rubbing them with the dried ſeeds of mercury.

CARPIA. See CARBASUS.

CARPIO, called alſo *Carpa*; *Cyprinus*. The CARP. Fiſh of this kind that are fed in rivers, are far better than thoſe that are fed in ponds; and of theſe the largeſt and fulleſt fed are the beſt. They feed on herbs, mud, ſlime, and the ſmaller fiſhes. They are nutritive and eaſily digeſted. The head is the fineſt part of the fiſh; and of the head, the tongue is the moſt delicate.

CARPOBALSAMUM, from καρπὸς, *fruit*, and βάλσαμον, *balſam*. It is the fruit of the tree that yields the BALM of GILEAD. See BALSAMUM.

CARPOLOGIA. A DELIRIOUS FUMBLING; as when a patient ſeems to be gathering ſomething from off the bed-cloaths, which yet is difficultly performed, becauſe of the trembling which affects his hands. It is uſually a fatal ſymptom in fevers.

CARPOS. See FRUCTUS and SEMEN.

CARPUS. Καρπὸς, a Greek primitive, A WRIST, called by the ancients *brachiale*. It conſiſts of eight bones, viz. the *os ſcaphoides*, *lunare*, *cuneiforme*, *piſiforme*, *trapezium*, *trapezoides magnum*, and *unciforme*. The three firſt make an oblong head, by which they are articulated, to the lower extremity of the bones of the fore-arm by arthrodia. The articulation of theſe three bones, with the bones of the inferior row, is ſuch as allows of motion, eſpecially backward and forward, to which the arthrodia of the os magnum with the ſcaphoides and lunare greatly contribute. The trapezium on the one ſide, the piſiforme, and cuneiforme on the other, being raiſed above the reſt of the bones of the *carpus*, make a ſort of arch for the ſecure paſſage of the flexors of the fingers, and the tranſverſe ligament being extended from one ſide of the arch to the other, binds them down in their proper place. Lyſerus gave the eight bones of the *wriſt* their reſpective names. The four bones of the ſecond row are all in a line, the firſt being articulated with the thumb and the reſt with the metacarpus. Theſe bones are very ſpongy. See Winſlow's Anatomy.

CARTHAMUS. BASTARD SAFFRON. Called alſo *cnicus*, *cnecus*, CARTHAMUS TINCTORIUS, Linn. *crocus ſaracenicus*; *carthamum* officinarum; cnecus, *carduus ſativus*, SAFFLOWER. It agrees with the thiſtle in moſt of its characters, but its ſeeds are deſtitute of down. The leaves are oval and pointed; on the tops grow ſcaly heads, with *ſaffron*-coloured fiſtular flowers; theſe are followed by ſmooth, white ſeeds, of an oblong roundiſh ſhape, yet with four ſenſible corners, remarkably heavy, ſo as to ſink in water. This plant is annual, a native of Egypt, and cultivated in other parts on account of its flowers, which are uſed in dying. It does not come to much perfection in England.

The ſeeds have an unctuous ſweetiſh taſte, which on chewing are acrid and diſagreeable. With water they form an emulſion by trituration; and to ſpirit they give out a little nauſeous acrid matter. They are cathartic in doſes of 3 j. or ij. The flowers are difficultly diſtinguiſhed by the eye from true *ſaffron*, when they are well cured, but they have neither its ſmell nor taſte. They give to ſpirit of wine a deep *ſaffron* tincture, and to water a paler yellow. After the yellow matter is extracted by water, the flowers appear of a red colour, and communicate to ſpirit of wine a deep red.

Some have the art of preparing the ſeeds of melons and of cucumbers, ſo as to reſemble the excoriated ſeeds of *baſtard ſaffron*, for which they ſell them; but the genuine ſeeds are not ſo white as the artificial.

Botaniſts enumerate three ſpecies. Miller's Dict.

CARTHUSIANUS PULVIS. See ANTIMONIUM, No. 15.

CARTILAGINOSUM. See PATELLA.

CARTILAGO. A CARTILAGE or GRISTLE, called alſo *chondros*. Dr. Hunter defines it to be a ſmooth, ſolid, diaphanous, elaſtic, inſenſible, inorganic ſubſtance. He obſerves, that in the freſh ſubject it appears uniform, and without any viſible fibres; when cut in any direction, its ſurface appears ſmooth like wax or glue. On a *cartilage* there is no perioſteum, but its place is ſupplied by the perichondrium. *Cartilage* is the leaſt affected by preſſure, of all animal ſubſtances, while the body is living; their ſubſtance is firm and denſe, and their texture ſo fine, that when cut, they appear only like a very ſtiff jelly.

Cartilages are diſtinguiſhed into three kinds:

Firſt, ſuch as ſupply the place of a bone in an adult, as the *trachea*; ſecondly, ſuch as ſupply the place of bones in young ſubjects, as *epiphyſes*; and, thirdly, ſuch as are *common to the fœtus and adult*, and are expanded on the extremities of articulating joints.

The articulating *cartilages* cannot be injected to their middle ſolid part, though the external veſſels are eaſily filled. The *cartilages* are ſuppoſed to be ſupplied with nerves, but they are too minute to be viſibly demonſtrated.

The uſes of the articulating *cartilages* are, *firſt*, to prevent abraſion, as without them the continual attrition of the bones againſt each other's ſurface, muſt have produced a true anchyloſis; *ſecondly*, by their elaſticity, they break the force of colliſion; *thirdly*, they ſerve as indolent bodies, to admit of motion and friction without pain.

A dif-

A diſeaſe never affects the *cartilages* primarily. They are incapable of exfoliation, but when diſeaſed from ſome preceding diſorder of the bone, the whole is generally affected, and the coheſion between the *cartilage* and the bone in the joint being leſs than between the parts of the *cartilage* itſelf, cauſes it to ſeparate from the bone. If a part of the *cartilage* is deſtroyed, it is never reſtored.

CARUI. See CARUM.

CARUM, CARAWAY; alſo called *carvi, cuminum pratenſe, cares, careum, carui, cari*; CARAWAIES. It is the CARUM CARVIOR, CARUM PRATENSE, *foliis pinnatifidis planis, floribus albis, umbellatis inæqualibus confertis.* CL. PENTANDRIA, ORD. DIGYNIA. LINN. Gen. Plant. 365.

Botaniſts enumerate three ſpecies. It is an umbelliferous plant, with ſtriated branched ſtalks two or three feet high, and finally divided; the leaves are ſet in pairs along a chanelled rib, every two of which ribs croſs one another at their origin on the ſtalk: the ſeeds are ſmall, of a browniſh or blackiſh colour, ſomewhat bent, ſtriated, flat on one ſide, and convex on the other. It is a native of the northern climes; cultivated in gardens with us, but by chance found wild, and is a biennial plant.

The ſeeds are warm and carminative; have an aromatic ſmell, and a warm penetrating taſte; and are given in powder from ℈ j. to ʒ j. They diſpel wind, are cordial, ſtomachic, and help the digeſtive powers. Hence recommended in dyſpepſia, flatulencies, and ſome hyſterical, and hypochondriacal, affections. They alſo differ only from aniſeeds in the peculiarity of their odour.

An extract made from a tincture, with rectified ſpirit, retains all the virtue of the ſeeds. After infuſion in water, ſpirits extract a ſtrong tincture; watery infuſions are ſtrongeſt to the ſmell, and ſpirituous ones ſtrongeſt to the taſte.

Diſtilled in water, all their aroma riſes. They afford an eſſential oil which is a warm carminative, and given in doſes from one to five drops. And there is alſo a ſpirit drawn from the ſeeds. SPIRITUS CARUI.

℞ Seminis carui contuſi ℔ ſs. ſp. vinoſi tenuioris cong. unum. aquæ q. ſ. ad evitand. empyreuma, diſtilla cong. un. This is an excellent ſtomachic.

CARUNCULA. A CARUNCLE. This word is a diminutive from *caro, fleſh*. A *caruncle* is a ſmall piece of fleſh, or an excreſcence that hath the appearance of fleſh. Thus there are the *caruncuiæ lacrymales* in the corners of the eyes; the *caruncuiæ myrtiformes*, which are at the entrance into the vagina, and ſaid to be formed by the rupture of the hymen, ſee HYMEN: the *papillares caruncuiæ* of the kidnies; and a *caruncle* of the urethra at the orifice, which opens from the veſiculæ ſeminales, beſides many others, all which are the products of nature.

The uvula is ſometimes called *caruncula*.

Morbid excreſcences of fleſh are called *caruncles*, and ſmall portions of a fleſhy ſubſtance, which are ſometimes diſcharged in a dyſentery by ſtool, or in diſeaſes of the urinary paſſages by urine.

Excreſcences in the urethra ariſe from its ulcerated or excoriated ſides, by ſharp corroding matter paſſing through and lodging there: theſe are ſaid to happen after the cure is completed, which makes them miſtaken for the ſtone, or nephritic ſymptoms. A ſtricture in the urethra is generally, if not always, the caſe; when theſe morbid *caruncles* are ſuſpected, and a bougie paſſed a little above the obſtruction, and kept in three or four hours, more or leſs, every day, cures it; the ſigns are, when the urine is diſcharged it paſſes from the urethra, divided into two or more ſtreams, ſometimes only with pain, and in drops; *but the only certain ſign is*, to paſs a probe or bougie up the urethra, until the obſtruction is met with; and if any is found on this ſide the valve, at the entrance of the bladder, there is reaſon to ſuſpect this diſorder. Bell's Surgery, vol. ii. p. 188.

CARUNCULA LACHRYMALIS. Is ſituated between the internal angle of the eye-lids and the ball of the eye; it is a ſmall reddiſh oblong ſubſtance, and hath the appearance of being fleſhy, though it is thought to be glandular. The ancients call it *glandula lachrymalis*, alſo *glandula innominata*. It ſerves to prevent the internal edges of the lids at that part, from ever coming into contact with one another; and thereby the orifices of the *lachrymal* points being to a certain degree kept open, the tears paſs freely through theſe points into the ſac.

CARUNCULÆ MYRTIFORMES. They are ſeveral ſmall knots or protuberances, at the entrance of the vagina; they are the remains of the ruptured hymen, and when large, have been taken for cancers.

CARUNCULOSA ISCHURIA. A ſuppreſſion of urine, from caruncles in the urethra. See ISCHURIA. 4th ſpecies.

CARUS A FRIGORE,
—— SPONTANEUS,
—— A HYDROCEPHALO,
—— AB INSOLATIONE,
—— A PATHEMATE.
} See APOPLEXIA.

CARUS. See CAROS.

CARVA. See CASSIA LIGNEA.

CARVI. See CARUM.

CARYA. See JUGLANS.

CARYCE, or CARYCIA. Galen ſays it is a coſtly ſort of food prepared by the Lydians. Varinus ſuppoſes it to be thus called, becauſe it was black like the boiled walnuts.

CARYCUM. See CARICUM.

CARYEDON See ALPHITEDON.

CARYL. See CORALLODENDRON.

CARYOCES. A Portugueſe name for the fruit of the Guinea palm-tree, See alſo ADY.

CARYOCOSTINUM ELECT. See SCAMMONIUM.

CARYON. A NUT. This word is applied to all ſuch fruit as incloſe ſomewhat eatable within an hard ſhell. Plutarch ſays that the ancients called the walnut *caryon*, becauſe it induces a heavineſs and ſtupidity of ſpirits. See CAROS.

CARYON BASILICON. See JUGLANS.——HERACLEOTICON. A ſmall nut, as a hazle nut, or filbert, ſo called, becauſe it was brought from Heraclea, in Pontus, into Greece. ——LEPTON. A ſmall nut, as filberts, or hazle nuts, from λεπτος, *ſmall*.

CARYOPHYLLATA; alſo called *herba Benedicta, caryoph. vulgaris, garyophilla, jamamunda, avens*, HERB BENNET. It is called *caryophyllata* becauſe its ſmell reſembles that of clove July flowers. It is the GEUM URBANUM. Linn.

Boerhaave enumerates eight ſpecies.

It is a rough plant with dark coloured winged leaves, and pentapetalous yellow flowers, ſtanding in ten-leaved cups, on the tops of the branches; the ſeeds are hairy, the roots are ſlender, full of fibres, of a dark browniſh colour on the outſide, and reddiſh within. It is perennial, grows wild in woods and hedges, and is found in flower the greateſt part of the ſummer.

The root is gently ſtyptic, corroborant, and ſtomachic; hath a middle auſtere aromatic taſte, a pleaſant ſmell, eſpecially in the ſpring, and when produced on dry warm ſoils. It has been ſaid to cure intermittents where bark has failed. Indeed it is ſtrongly aſtringent with ſome aroma, when recently raiſed in the ſpring ſeaſon, and from a dry ſoil; however, with regard to its efficacy in intermittents, there is great reaſon to doubt, as the experiments of the Sweediſh phyſicians contradict thoſe of the Danes, and the Germans, who are the great advocates for this medicine. It gives its aroma moſt to ſpirits, and its aſtringent matter to water or to ſpirit. In diſtillation with water it affords a ſmall quantity of an agreeable concrete oily matter, and the remaining decoction, if inſpiſſated, by evaporation, is moderately aſtringent. Lewis's Mat. Med. Cullen's Mat. Med.

CARYOPHYLLATUM ALCOHOL. See CARIES.

CARYOPHYLLI AROMATICI. The AROMATIC CLOVES.; called alſo *garyophyllus, hinka*, and *clous*.

The unripe fruit, or perhaps the cups of the unopened flowers of a bay-like tree, which grows in the Moluccа Iſlands. In ſhape it reſembles a ſhort thick ſquare nail; of a ruſty colour inclining to black; in the middle of each clove are found a ſtylus or ſtamina, with their apices; at the larger end ſhoot out from the four angles four little points, like a ſtar, in the middle of which is a round-ball of a lighter colour than the reſt, compoſed of four ſmall ſcales or leaves, which ſeem to be the unexpanded petala of the flower. The tree is the CARYOPHYLLUS AROMATICUS, or CARYOPHYLLUS ORIENTALIS AROMATICUS, *fructu elevato monopyreno, fol. ovato-lanceolatis oppoſitis flor. terminalibus, ſtaminibus corolla longioribus.* CLASS, POLYANDRIA. ORD. MONOGYNIA. LINN. Gen. Plant. 669. It is however ſaid evidently to belong to the CLASS, ICOSANDRIA; and modern botaniſts refer it to the GENUS EUGENIA. Woodville. The *clove-tree* is one of thoſe whoſe flower is produced above the rudiments of the fruit: the ripe fruit ſometimes

brought to England under the name of *anthephyllus*, *antophyllon*, *antophyllus*, is marked on the top with the remains of the flower, is about the fize and fhape of an olive, and contains under a thin blackifh fhell, a hard kernel of the fame colour, which hath a deep longitudinal feam on the fide. The *cloves* are faid to be cured by expofing them to fmoke, and afterwards drying them in the fun.

The largeft and darkeft coloured are the beft, and thofe which feel oily when preffed. Another mark of their goodnefs is, when, on piercing them with a needle, a little liquid matter like oil oozes out. Thofe that are of a light brown colour have had their oil extracted from them.

Cloves have a ftrong but agreeable fmell, a bitterifh hot pungent tafte; are one of the hotteft, and moft pungent and acrid of the aromatic clafs, and have all the virtues afcribed to aromatics in general. They are remarkably difpofed to imbibe humidity; and when robbed of their active parts, and afterwards mixed with freth cloves, they regain from them a conliderable fhare both of tafte and fmell. The Dutch extract the oil from them, and then mix them with others, from which it hath not been feparated; but their dryneis, lefs pungent odour, and pale colour, difcover the fraud.

Rectified fpirit of wine takes up all the virtue of *cloves*: an extract from this fpirituous tincture amounts to nearly one-third of the *cloves* ufed in preparing it, and retains nearly their whole virtue. Infufed in water, they give out to it more of their fmell than to fpirit, but not fo much of their tafte.

Diftilled with water, they give over very flowly about one-fixth of their weight of eflential oil, at firft yellow, and afterwards a reddifh-brown; but if the fire is very moderate, its colour is pale: it finks in water, is mild, and not very pungent; but the only way to have it genuine, is to diftil it ourfelves. What we have from the Dutch is very acrid, and contains near half its weight of an infipid expreffed oil. It is probable, that, from an admixture of the refinous part of *cloves*, this fophifticated oil receives both its acrimony and high colour; or, as freth cloves are faid to yield a high-coloured fragrant thick oil upon expreffion, it may be, that the common oil of *cloves*, brought from the fpice iflands, is no other than this oil diluted with infipid ones.

If the oil of *cloves* is adulterated with an infipid expreffed oil, it is difcovered by dropping a little into alcohol; and on fhaking them the genuine oil mixes with the fpirit, and the infipid oil feparating is difcovered.

Clove is confidered to act as a powerful ftimulant to the mufcular fibres: hence may in fome cafes of atonic gout, paralyfis, &c. fuperfede moft others of the aromatic clafs. Both the fpice and oil are ufed as correctors chiefly of fome of our officinal compofitions. The Dutch join it with bark and cream of tartar, in obftinate agues. Twenty cloves added in powder to half an ounce of each of the other, and 3 iis. given every third or fourth hour.

In dyfpepfy, alfo againft flatulence, and as a vehicle to other medicines, 3 ij. of cloves are infufed in half a pint of boiling water. The dofe, one ounce and an half, or two ounces.

But the oil of *cloves* is made into an agreeable draught by mixing it with a proper quantity of gum arabic, and then with water. See Newmann's Chem. Works. Lewis's Mat. Med. Cullen's Mat. Med.

CARYOPHYLLI SUAVIS ODORIS, &c. See CANELLA ALBA.

CARYOPHYLLOIDES CORT. } See CASSIA
CARYOPHILLON PLINII. } CARYOPHYLLATA.

CARYOPHYLLUS AROMATICUS AMERICANUS. See PIPER JAMAICENSIS.——AROMAT. CUM FRUCTU ROTUND. See CASSIA CARYOPHYLLATA.——HORTENSIS. See CARYOPHILLUS RUBER.——INDICUS. See ANTHELMIA.——VULGARIS. See CARYOPHILLATA.

CARYOPHILLUS RUBER. GILLYFLOWER; alfo called *tunica*, *vetonica*, *betonica coronaria*, *caryoph. hortenfis*, CLOVE JULY FLOWER. It is the DIANTHUS CARYOPHYLLUS, or DIANTHUS *floribus folitariis, fquamis calycinis fubovatis breviffimis, corollis crenatis*. CLASS, DECANDRIA; ORD. DIGYNIA; LINN. Gen. Plant. 565.

It is well known in our gardens, is perennial, and faid to be a native of Italy. There are many varieties, but thofe employed for medicinal ufe are of a deep crimfon colour, and an agreeable aromatic fmell, fomewhat akin to that of the clove fpice; and this odour is not very foon diffipated.

Thefe flowers are efteemed moderately cardiac, diuretic, and perfpirative; but they are chiefly ufed in the form of a fyrup, for the beauty of their colour and flavour.

The London College directs the following fyrup:—*Syrupus* Caryophylli rubri. *Syrup of* CLOVE JULY FLOWER.

Take of freth *clove July flowers*, with their heels cut off, two pounds; of boiling diftilled water, fix pints: macerate the flowers in the water for twelve hours in a veffel of glafs; and in the liquor ftrained, diffolve as much double refined fugar as is required to make a fyrup.

It fhould be obferved, that the beauty of the colour is a principal quality of this *fyrup*; no preffure of the flowers is to be admitted.

In St. Thomas's hofpital, a fubftitute for this *fyrup* is made by ufing the aromatic clove, and for the colour a little cochineal is added. See Lewis's Mat. Med.

CARYOTI. See DACTYLUS PALMULA.

CAS GANGYTHREB. See VERBENA.

CASAMUM. See ARTHANITA.

CASCARILLA. CASCARILLA. The Spaniards apply this word to the Peruvian bark, as we apply the word *bark* to diftinguith the fame material. It is a diminutive of *Cafcara*, the Spanifh word for bark or fhell; but is applied by us to a peculiar bark. See THURIS CORTEX, and CORTEX PERUVIANUS.

CASCHU. See TERRA JAPONICA.

CASEUS. CHEESE. When old, it is called *Palætyrus*. Ariftæus, a pupil of Chiron, is faid to have firft difcovered the art of making it. It is a common opinion, that old *cheefe* digefts every thing, yet is left undigefted itfelf; but this is without proper foundation. New *cheefe* digefts difficultly, and, when old, is acrid and hot. *Cheefe* made from the milk of fheep digefts fooner than that from cows, but it is lefs nourifhing; and that from the milk of goats digefts fooner than either, but is alfo the leaft nourifhing. The acrimony in *cheefe* is from the rennet, which is increafed by age. As to the goodnefs of this article, that is beft tafted which difcovers no particular quality to excefs, and which is the fooneft digefted. In general, it is a kind of food fit only for the laborious, or thofe whofe organs of digeftion are ftrong. See Galen de Alim. Facult.

When fpeaking of this article, of which Dr. Cullen, in his Materia Medica, vol. i. gives a very minute account, well worth perufing, he tells us "the cafeous, or coagulable part of milk, is certainly a great, if not the greateft part of the nourifhment which milk affords, and is in itfelf the more nourifhing the more it is united with the oily parts. When the coagulum has the whey taken from it, it becomes a more nutritious fubftance than the milk it was taken from, but will probably be of more difficult digeftion. *Cheefe* in its dried ftate, when made from milk previoufly deprived of its cream, may be ftill a very nutritious matter, but of very difficult digeftion; but made of entire milk, muft be a more nourifhing fubftance, and of much eafier digeftion; and made of entire milk, with a portion of cream taken from other milk added to it, will be ftill more nourifhing, and hardly of lefs eafy digeftion, as the oily parts every-where interpofed between the parts of the gluten muft render the adhefion of this lefs firm; and as *cheefe* is made of cream alone, that will be certainly the moft nutritious, and of the eafieft digeftion.

But *cheefe* is not only made of cow's milk alone, but alfo of the milk of ewes and goats, and often of a portion of the two latter added to cow's milk. In all thefe cafes, as the milk of ewes and cows contains a larger portion of the oily and cafeous parts, fo in proportion as thefe are employed, the *cheefe* becomes more nutritious, but at the fame time of more difficult digeftion.

As *cheefe* is employed not only when recent and freth, but alfo under various degrees of corruption it is liable to; fo it acquires new qualities; and according to the degree of corruption, it becomes more acrid and ftimulant, partly by the acrimony it has acquired from corruption, and partly by the great number of infects that are very conftantly generated in it in that ftate. In this corrupted condition, it can hardly be taken in fuch a quantity, as to be confidered as alimentary; and as a con-

condiment influencing the digeſtion of other food, it is a point difficult to explain, though it is commonly admitted. When toaſted, it is certainly not eaſily digeſted by weak ſtomachs, as a portion of the oil is ſeparated, and the other parts more firmly united by that proceſs: hence for thoſe hurt by indigeſtion, and heated by a heavy ſupper, it is a very improper diet.

CASSA. See THORAX.

CASSADA, called alſo *cacavi*, *cazabi*, *caſſave*, *caſſavi*, *pain de Madagaſcar*, *ricinus minor*, *maniot*, *yucca*, *manitiba*, *aipi*, *aipima coxera*, *aipipoca*, *janipha*, *jatrophra*, & *manihot*. This plant grows in the warmer parts of the weſtern world. Its root is the part in uſe, called *yuca*: the Mexicans call it *quanticamotli*; and when it is prepared into a flour, they call it *caſſavi*. Names for the preparations of the root, in order to make it into bread, are various. See MANDIBA.

There are many ſpecies of this plant, which may be ſeen in Margrave, but the ſtalks and roots of them all paſs under the common name of *mandihoca*.

The liquor that is preſſed from this plant is called *manipuera*; the root macerated in water until it is ſoft, is called *mandiopiba*; of the ſediment of this is made a finer flour, called *vipeba* by the Braſilians, and by the Portugueſe *farinha freſca*, the undried dreſſed meal *farinha relada*.

The ſoft mandihoca is called *puba*; when dried over the fire, or in the ſun, it is called *carima*, and of this good bread is made, which is called *muſam*, or *angu*, or *enfonde*.

It is the fourth and fifth ſpecies, called *janipha*, and *manihot*, natives of Africa and the Weſt-Indies, which are cultivated as articles of food. The root of the bitter caſſada is poiſonous when raw: however, it may be deprived of its noxious qualities, which reſide in the juice, by heat. Caſſada bread is made therefore both of the bitter and ſweet, by waſhing and ſcraping the root clean, grating them into a tub or trough, and ſqueezing out the juice by ſtrong preſſure through a hair bag; the thinner part of which is evaporated, and the remainder dried over the fire in a hot ſtone baſon, and afterwards made into cakes. It alſo makes puddings equal to millet.

Caſſada root yields a great quantity of ſtarch, called *tapioca*, exported in little lumps by the Braſilians.

The ſmall bits which have eſcaped the grater, and the clods not paſſing through the ſieve, are dried in the ſtove after the flour is roaſted; then pounded in a mortar to a fine powder, of which is made ſoup. It is likewiſe uſed for making a kind of coarſe caſſada, which is roaſted till almoſt burnt; which, fermented with melaſſes and Weſt-India potatoes, forms an intoxicating liquor, a favourite drink of the natives, called *ouycou*. With this the poorer inhabitants and workmen get intoxicated. This liquor is of a red colour, ſtrong, nouriſhing, and refreſhing; to which the inhabitants are as ſoon and eaſily accuſtomed as beer.

Of the carima and the tapioca are made emulſions, ptiſans, &c. which are uſed in conſumptions, dyſenteries, fevers, faintings, againſt poiſons, and hæmorrhages, both internal and external.

The ſcrapings of freſh bitter caſſada are ſucceſsfully applied to ill-diſpoſed ulcers.

The juice of roucou is an antidote to the poiſon of this plant. Raii Hiſt. Encyclop. Britannica.

CASSAVE, CASSAVI. See CASSADA.

CASSALE VULNUS. A term ſignifying a wound in the breaſt: from the Arabian word *cas*, *a breaſt*.

CASSAMUM. The fruit of the balſam tree.

CASSATUM. Weak ſpiritleſs blood, that is grumous, and hinders the paſſage of the circulating blood. It is a word of Paracelſus.

CASSE, EAU DE, or EAU DE CASSE-LUNETTE. It is ſnow-water diſtilled from the flowers of the cyanus.

CASSIA. See SENNA ALEXANDRINA.

CASSIA CANELLA. See CASSIA LIGNEA.

—— CARYOPHYLLATA, called alſo *piper tavaſci*, *caryophillus aromaticus fructu rotundo*, *caryophyllon*; *caryophillon Plinii*, *amomum*, CLOVE BERRY-TREE, SWEET-SCENTED JAMAICA PEPPER TREE. The bark is called *cortex caryophylloides*, CLOVE BARK, and *caſſiæ cortex*, CASSIA BARK. Miller mentions nine ſpecies of caſſia.

The *bark* is in uſe: it is brought from Jamaica, Cuba, and other of the Weſt-India iſlands. It is rolled like cinnamon, but is rather thinner, rougher on the outſide, and of a dark-brown colour. It is warm and aromatic, reſembles the ſmell of cloves, but is weaker, and mixt with a cinnamon flavour. It agrees with cloves in the ſolubility and volatility of its active principles. Spirit of wine takes up all its aroma, but carries very little of it in diſtilling. Water takes up its ſmell, but not much of its taſte; and diſtilled with water, a ſmall portion of an eſſential oil ariſes, which reſembles that of cloves, but is more pungent.

A ſimilar bark is brought from the Eaſt-Indies, under the name of *culiltawan* or *culilawan*, a compound Malabarian word, which is tranſlated into the Latin by cortex caryophylloides, or *clove bark*. That diſtinguiſhed in Europe by the name of culilawan is thicker than the other, and is more of a cinnamon colour, but ſcarcely differs from it in ſmell or taſte. The ſame with this ſeems to be the *carabacium* of Baglivi. Rumphius obſerves, that the outer and inner barks of different parts of the tree differ in colour and taſte from one another; whence probably ſuch differences as may have been obſerved in thoſe brought under different names into Europe.

The unripe fruit is the JAMAICA PEPPER. See PIPER JAMAICEN. ——*Cinnamomea*. See CINNAMOMUM. ——*Cribatra*. See CASSIA FISTULARIS. ——*Fiſtula*. See CINNAMOMUM. ——FISTULARIS, called alſo *caſſia nigra*, *caſſia ſolutiva*, *caſſia purgatrix*, *chaiarxambar*, *canna*, *fiſtula*, PURGING CASSIA. It is the CASSIA FISTULA, or CASSIA *fol. quinque jugis ovatis acuminatis glabris, petiolis eglandulatis*. CLASS, DECANDRIA; ORD. MONOGYNIA; LINN. Gen. Plant. 514. The ALEXANDRIAN PURGING CASSIA.

The *caſſia fiſtula* is the hard woody cylindrical pod of a tree called PUDDING-PIPE TREE, which reſembles the walnut: it grows ſpontaneouſly in Egypt, and the warmer part of the Eaſt-Indies, and hath been thence introduced into the Weſt, and is brought to us from the Braſils. The pods are about an inch in diameter, and a foot or more in length; externally of a dark-brown colour, ſomewhat wrinkled, with a large ſeam running the whole length upon one ſide, and another leſs viſible on the oppoſite ſide, internally of a pale yelloviſh colour, divided by thin tranſverſe woody plates, in a number of little cells, containing each a flattiſh oval ſeed, with a ſoft black pulp.

The pulp is called by ſome *medulla*, *caſſia cribratra*, *caſſiæ atramentum*,—*extractum*,—*flos*; by others, WILD HONEY, becauſe of its ſweet taſte, which is followed by ungrateful kind of acrimony: that from the Eaſt-Indies hath a more agreeable ſweetneſs and leſs acrimony than the Weſt-Indian kind. The beſt pulp is of a ſhining black colour; ſweet taſte, with a ſlight degree of acidity.

The oriental pods are ſmaller, ſmoother, and thinner rinded than the occidental, and its pulp is of a deeper ſhining black colour. Thoſe pods that are dry, and in which the ſeed rattles, are generally rejected; but Neumann thinks that they are very little, if any, worſe than the other, as it is only their humidity that is waſted, and by this loſs it is ſecured from being mouldy or ſour. The beſt ſort, if gathered before it is full ripe, grows mouldy, and becomes ſour or harſh.

The pulp of *caſſia* diſſolves very readily in water, whether it is moiſt or dry, but not ſo readily in ſpirit of wine. It is uſually extracted by boiling the bruiſed pods in water, and evaporating the ſtrained ſolution to a proper conſiſtence: the exhaling vapour carries nothing off. The pulp ſoon turns ſour, ſo ſhould be extracted only in ſmall quantities.

Caſſia was unknown to the ancient Greeks, and was firſt uſed by the Arabians. Where irritating purges would do harm, this may be ſafely uſed: in doſes of a few drams, it is generally laxative, is particularly uſeful in coſtive habits and inflammatory caſes; and, according to Geoffroy, is peculiarly beneficial in thoſe tenſions of

the

the belly which attend an imprudent uſe of antimonials: as a cathartic, two ounces is required, and ſo is ſeldom uſed for this end. However, at preſent, it is rarely given by itſelf, except to children, or pregnant, delicate women, ſeldom occaſioning griping or uneaſineſs of the bowels: it is indeed conſidered of little uſe; the pulp of prunes being recommended to ſupply its place.

It is ſometimes quickened by ſtronger purgatives, or with the antimonial emetics; of which laſt it diminiſhes the activity ſo far, that *four grains or more of emetic tartar may be taken in a decoction of caſſia by thoſe who without it can bear but one grain or a little more*; it is joined with manna, and is ſuppoſed to enhance its purgative virtue; a mixture of half an ounce of *caſſia* with two drams of manna, is ſaid to purge more than three times the quantity of *caſſia* by itſelf, or than a yet greater quantity of manna when alone.

Caſſia, if repeatedly taken, tinges the urine of a yellow, green, or brown colour, according to the quantity given; though BERGIUS gives an inſtance to the contrary, where one ounce was taken for three ſucceſſive mornings, without ſuch effect.

The London College directs the following preparation:

Electarium e Caſſia. *Electary of* CASSIA.

Take of ſyrup of roſes, the pulp of *caſſia*, freſh extracted, of each half a pound; of manna, two ounces; or the pulp of tamarinds, one ounce. Beat the manna, and with a ſlow fire diſſolve it in the ſyrup, then add the pulps, and the heat being continued, reduce the whole to a proper conſiſtence.

This electary was formerly called *diacaſſia*: the tamarinds render the taſte of it very agreeable, and do not ſubject it to turn ſour. Two or three drams is a doſe, as a ſolutive. See Lewis's Mat. Med. Newmann's Chem. Works, Cullen's Mat. Med.

CASSIA LIGNEA, called alſo *caſſia lignea Malabarica, xylo-caſſia, canella Malabarica & Javenſis, karva, canella Cubana, arbor jucadice, caſſia canella, canellifera Malabarica, cortex craſſior, cinamomum Malabaricum, carva, calikacha*, and by the ancients *cancla*, WILD CINNAMON TREE, MALABAR CINNAMON TREE, or *caſſia lignea* tree.

The leaves of this tree are, by way of eminence, called FOLIUM, which ſee. The bark is called *caſſia lignea*, and is brought from the Eaſt-Indies. This tree is of the *cinnamon* kind. It is the LAURUS CASSIA, or LAURUS MALABARICA *perpetuo florens, fol. triplinerviis lanceolatis*, Linn. The *caſſia*, or *wild cinnamon tree*. Curtis, in his catalogue of Medicinal, &c. Plants, in the London Botanic Garden, calls it *laurus Malabathrum*. This bark (the beſt pieces of which are called *daphnitis*) reſembles *cinnamon* in appearance, but is diſtinguiſhable by its breaking ſhort or ſmooth, whilſt *cinnamon* breaks fibrous and ſhivery; alſo by chewing, after which the *caſſia* becomes mucilaginous, but the *cinnamon* auſtere and dry. It reſembles *cinnamon* in flavour, but is weaker: it contains a mucilage, of which *cinnamon* does not ſenſibly partake. if powdered, and boiled in water, the water becomes glutinous, ſo as to concrete on cooling into a jelly. Of the bark, chuſe that which is ſmall, purpliſh, eaſily broken, fragrant, pungent, ſweetiſh, and mucilaginous when chewed a little.

Spirit of wine extracts the aroma, and water extracts the mucilage. By diſtillation in water, it yields a ſmall portion of oil, which differs not from that of *cinnamon*; and if care is taken in diſtilling it with water, no difference can be diſcovered from what it produces, and that which is drawn from true *cinnamon*; but if too much heat is continued at the end of the operations, it produces an empyreumatic flavour, becauſe of the mucilage, which is very apt to be changed by the fire. As a cordial, it is equally good as *cinnamon*, if twice the quantity is allowed for a doſe; but as to aſtringent powers, it has no pretenſions. See Newmann's Chem. Works, Lewis's Mat. Med. Cullen's Mat. Med.

—— POETICA LOBELII, *caſſia Latinorum, caſſia lignea Monſpelienſium*, and *caſſia Monſpelienſium*, See OSYRIS.

—— EXTRACTUM, —— FLOS. } See CASSIA FISTULARIS.

CASSIANA. See CASSINE.

CASSIBOR. See CORIANDRUM.

CASSIDA, alſo called *ſcutellaria, tertianaria, Lyſimachia galericulata*. HOODED LOOSE-STRIFE.

LYSIMACHIA CŒRULEO GALERICULATA, or *gratiola cærulea*; HOODED WILLOW HERB.

Dr. Turner ſays it was called *tertianaria*, from its uſe in intermitting fevers: it is bitter, ſtinks like garlic; but is of very little uſe in medicine.

CASSIDBOTT. See CORIANDRUM.

CASSINA, CASSINE. } CASSINY, alſo called *alaternoides Africana lauri ferratæ folia, Apalachine gallis*, herba *caſſiana, alaternus*. It grows in Carolina; the leaves are about the ſhape and ſize of ſena leaves, blackiſh when dried, ſhining in the upper part, green underneath, and have no taſte, but an aromatic ſmell. Dale calls it a ſpecies of *alaternus*. There are two ſorts, and they are the third and fourth ſpecies of alaternus. Miller calls the *caſſine* vera Floridanorum, the SOUTH SEA TEA-TREE; and the *perigua*, the CASSIO BERRY BUSH. Some call the *Paragua* or South Sea tea, by the name of BARTHOLOMEW'S HERB. It grows near the ſea, and is not known to grow far inland. The trade for this tea is chiefly at Santa Fé, whither it is brought by the river of Plate: there are two ſorts, the *yerba de palos*, and a finer and a better ſort called *yerba de camini*. It is moſt probable that the yerba de camini is the Paraguay or South Sea tea, and the *yerba de palos* is our caſſio-berry buſh. Miller's Dict.

CASSOB. See ALCALI.

CASSOLETA. A kind of humid ſuffumigation deſcribed by Marcellus.

CASSONADA. See SACCHARUM.

CASSU. See ACAJAIBA.

CASSUMMUNIAR, called alſo *bingalle, riſagon, bengalle Indorum, caſmunar, caſumunar, ryſagon*, and *caſminaris caſminar*. The root brought from the Eaſt Indies is tuberous, an inch or more thick, marked on the ſurface with circles or joints like the galangal, a ſpecies of which it is reckoned by ſome: it is brown on the outſide, and of a duſky yellow within. We have no certain account of the plant from which this root is taken; it is brought over in irregular ſlices.

This root was introduced by Marloe as a medicine of uncommon efficacy in nervous diſeaſes; at preſent it is uſed as a ſtomachic, but its uſe is not ſo general as it ſeems to deſerve. It is warm and aromatic, ſlightly bitter, in ſmell reſembling ginger, or zedoary, from which it differs in being milder. Spirit of wine extracts all its virtue completely, and if the tincture is evaporated it all remains in the extract. Lewis's Mat. Med.

CASSUTA. CASSUTHA. } See CUSCUTA.

CASTALTICUM. A barbarous term for *cataſtaltic-um*.

CASTANA. CHESNUTS, called alſo *lopima, mata, glans Jovis Theophraſti*, JUPITER'S ACORN, and SARDINIAN ACORN. The coat between the kernel and ſhell is aſtringent; the kernel is windy and ſomewhat binding, but if roaſted and mixed with honey, it is commended for coughs and ſpitting of blood.

CASTANEA. FLORE ALBO, &c. See COFFEA.—— EQUINA. HORSE-CHESNUT. See HIPPOCASTANUM.

CASTJOT. See TERRA JAPONICA.

CASTLE-LEOD WATERS. This mineral water is found at a town from whence it takes its name in Roſsſhire, in Scotland: and here there is a ſpring of ſtrong ſulphureous water, which has been in great repute for many years. Dr. Monro, from an analyſis he made of theſe waters, ſays, that a gallon contains about 59 grains of ſolid matter, viz. of abſorbent earth, 17 grains; of ſelenites 26½ grains; of ſaline matter, 30½ grains: the greateſt part of which is true Glauber's ſalt, mixed with a pittance of ſulphur, and probably with a very ſmall portion of marine bittern. This water is ſaid very ſenſibly to increaſe the urine, and ſometimes remarkably open the pores. It whets the appetite, and ſits light on the ſtomach; ſome have the head-ach after drinking their morning bottle, but it is of no long duration, nor to any great degree. Dr. Mackenzie has directed people with various complaints to drink them, and obſerves that ſome very foul faces have been cleared by their uſe; the herpes removed, the eryſipelas received benefit, foul ulcers cured, &c. Dr. Monro aſſerts, that many of thoſe cutaneous diſorders called ſcorbutic have been removed

by their means, and that they cure the itch. As this water contains but a ſmall portion of purging ſalt, and does not operate by ſtool, ſome purging ſalt may be occaſionally added to the firſt glaſs, that is taken in the morning, and if equal parts of this and ſea-water be mixed, they will form a purging ſulphureous water, ſimilar to that of Harrowgate. See Monro, vol. ii. Medical and Pharmaceutical Chemiſtry, &c.

CASTOR. The BEAVER. It is alſo called *fiber*, and *canis ponticus*, CASTOREUM RUSSICUM, *materia, in folliculo prope anum ſita, collecta*. PHARMACOP. LOND. RUSSIAN CASTOR. The CASTOR FIBER, or CASTOR *cauda ovata plana, calva*, Linn. ſyſtema naturæ. It is an amphibious quadruped, inhabiting ſome parts of Pruſſia, Poland, Ruſſia, and Germany; but the greateſt quantities are met with in Canada. In the inguinal region of this animal are found four bags, of an oval ſhape, a large and a ſmall one on each ſide; in the two large ones is contained a ſoftiſh, greyiſh yellow, or light brown ſubſtance, which in a warm dry air grows by degrees hard and brittle, and of a darker and browner colour: this is alſo called *caſtor*, and is what is uſed in medicine. The two ſmaller bags have a ſmell much like that of the larger, but contain a ſofter and more unctuous kind of matter, which is not of much value.

On cutting theſe bags, when dry, and as brought into the ſhops, they are found full of a brittle friable ſubſtance, of a browniſh red colour, interſperſed with fine membranes and fibres, exquiſitely interwoven. Neumann ſays, that the beſt comes from Pruſſia; but moſt, if not all other writers, ſay from Ruſſia. The Ruſſian is in hard round bags: an inferior ſort comes from Dantzig; it is ſmaller and moiſter. The worſt is from New England; it is in thin long bags.

The Ruſſian *caſtor* hath a ſtrong, but not agreeable, ſmell; the other ſorts are weaker and more ungrateful.

Caſtor is ranked among antiſpaſmodics, and certainly, on many occaſions, a powerful one, and has been uſeful, almoſt in every caſe requiring ſuch remedies, when given in doſes of from 10 to 30 grains. In ſlow nervous fevers it takes off the oppreſſion of the præcordia, which is often a very troubleſome ſymptom. If is of a ſaponaceous nature, ſo does not act by its ſtimulus alone, but is reſolvent and detergent: in ſome caſes it is anodyne.

Rondeletius ſeems to have been the firſt who made the diſtinction between theſe bags or glands of the *beaver* and his teſticles, which latter they were generally ſaid to be. Alb. Seba ſays, that the Siberian *caſtor* is the beſt, and in ſucceſſion, the Norwegian, the Swediſh, the Poliſh, and the worſt is from Canada. But from whatever country it comes, chuſe that which is from a full grown beaver, hath a fetid and diſagreeable ſmell, an acrid biting taſte, a browniſh colour, and a friable texture.

It is adulterated with dried blood, gum ammoniacum, galbanum, &c. mixed with a little of the powder of *caſtor* and ſome quantity of the *axungia caſtorei*, the adeps or fat of the beaver. But to detect the fraud, obſerve that the genuine follicules ariſe both from one common ſource; that the matter contained in them is of a firm conſiſtence, and too bulky to be forced therein in their natural ſtate; the ſmell is not ſo ſtrong as the genuine; it is true that ſometimes the difficulty to diſtinguiſh the falſe from the genuine is very great, but the ſophiſtication is undoubted, when the membranes, pellicles, and fibres, appear intermixed with the *caſtor*.

This drug does not keep well in powder. Rectified ſpirit, proof ſpirit, and water, by the help of a little heat, extracts the whole virtue of the *caſtor*. Rectified ſpirit takes up the leſs ungrateful parts, and water the more nauſeous. Proof ſpirit acts equally, though with ſome difficulty, on both; the ſp. ammon. compoſitus is an excellent menſtruum for it, and in many caſes improves its virtues.

The London College directs a tincture from this drug.

Tinctura Caſtorei. *Tincture of* CASTOR.

Take of Ruſſia *caſtor*, two ounces; of proof ſpirit of wine, a quart; digeſt for ten days without heat, and then ſtrain. Doſe ℥ i. to ʒ i. Heat only extracts the groſſer part more plentifully than a cold maceration does, and proof ſpirit does this more than a rectified one. If it ſhould be wanted to be ſuddenly diffuſible, the tincture of the Edinb. New Diſpenſatory 1789, is preferable. R caſtorei Ruſſici ʒ i; aſafœtidæ ʒ ſs; ſp. ſal. ammoniaci vinoſ. ℔ i. digere per ſex dies. Edinb. New Diſpenſ. 1789.

CASTOR. See CATAPUTIA MAJOR.

CAST. DUR. An abbreviation of caſtore durante.

CASTRATIO, CASTRATION. This operation called alſo *celotomia*, *orchotomia*, is performed when the teſticle is ſcirrhous or cancerous. When the teſticle ſuppurates, it is only treated as a common abſceſs. Mr. Barnard ſays, that out of a hundred patients that he caſtrated, only three were living three years after: and that when, after the operation, the wound heals nearly, and not completely, it commonly proves mortal. Some of the moſt eminent this day in practice obſerve, that when a ſcirrhus is extirpated, it is apt to return as a cancer is in the breaſt; if it is of the virulent kind, certainly; and the patient will probably live as well and as long if the operation is not performed, as when it is; therefore, in general, there is no inducement to proceed to it.

But if the teſticle muſt be extracted, firſt examine whether or not the ſpermatic cord is free, which muſt be laid bare, tied, and cut; after which proceed to diſſecting all the diſeaſed part of the ſcrotum, though perhaps it may be beſt to diſſect the tumor out firſt, as it leads you up to the cord before you tie it. If the tumor is large, or if it adheres to the ſkin, make an oval inciſion to take it out; the inciſion is begun a little above the tumor, for the better convenience of tying the veſſel.

Mr. Gooch (ſee his 2d vol. of Caſes) firſt ſlits the ſheath of the cord with the point of a knife, then opens it farther with a ſmall pair of crooked ſciſſars, by which method the veſſel is fairly diſcovered, and eaſily taken up with a crooked needle and ligature. And he farther obſerves that if the whole ſpermatic cord is tied, the conſequences are diſagreeable, or perhaps fatal: he therefore, after diſſecting the ſheath, ſecures only the artery, and thus an hæmorrhage is prevented, and the uſual conſequences of tying the whole cord avoided. Dr. Hunter long ſince adviſed to ſecure the artery, and leave the reſt to the cord; nay, he ſuggeſts a ſufficient ſecurity though the artery ſhould be left untied; though if it is to be cut cloſe to the ring he adviſes to tie it before cutting, that it may not retract too ſuddenly, and ſo prove troubleſome by its diſcharge. See Sharpe's Operations, Le Dran's Operations, and his 74th Obſ. Heiſter's Surgery. Bell's Surgery, vol. i. p. 520.

CASTRENSIS. See DYSENTERIA.

CASUMUNAR. See CASSUMMUNIAR.

CASUS. This word ſignifies the ſame as *ſymptoma*; ſometimes it is uſed for any thing fortuitous or ſpontaneous, or a fall from an eminence. In Paracelſus it ſignifies a preſent diſtemper, and alſo an entire hiſtory of a diſeaſe.

CATABALAM. See AMBALAM.

CATABLEMA. According to Galen, Hippocrates means by it the outermoſt fillet which ſecures the reſt of the bandage. Called alſo *Fimbria*.

CATACHLOOS, from χλοη, *graſs* or *green herb*; Galen expounds it "a very green colour." It is applied to ſtools, and then may read for this word, CATACHOLA, very bilious.

CATACHRISTON. A medicine applied by way of unction.

CATACHYSIS. To pour upon; an affuſion.

CATACLASIS, from κατακλαω, *to break*, or *diſtort*. Galen explains it to be an affection of the eye, as when the eyelids are diſtorted. Vogel defines it to be a ſpaſtic occluſion of the eye.

CATACLEIS, SUBCLAVICLE. According to Galen, it is the firſt ſmall rib of the thorax. from κατα, *below*, κλειϛ, *clavis*, *the clavicle*.

CATACLINES, from κατακλινω, *to lie down*. See CLINICUS.

CATACLYSMA, from κατακλυζω, *to waſh*. See ENEMA.

CATACLYSMUS, EMBROCATION. Cœlius Aurelianus alſo expounds this by *illiſiones aquarum*, daſhings of water.

CATACORES. Full, abundant, and when applied to ſtools, it means that they are purely or intenſely bilious. Hippocrates uſes it in both theſe ſenſes.

CATACONESIS, from κατασσω *to irrigate*. Irrigation by a plentiful affuſion of liquor on ſome part of the body.

CATAGEMU. See GAMBOGIA.

CATAGLYPHE, from γλυφω, *to cut in wood* or *metal*.

An excavation, hole, or pit. Hippocrates uſes this word in his De Art. & de Morb.

CATAGMA, a FRACTURE. See FRACTURA. Galen ſays, "a ſolution of the bone is called *catagma*, and *eleos* is a ſolution of the continuity of the fleſh; that when it happens to a cartilage it hath no name, though Hippocrates calls it *catagma*." See ALPHITEDON.

CATAGMATICA, from καταγω, *deduco*. Remedies proper for cementing broken bones, or to promote a callus, from καταγνυμι, κατα, *contra*, αγνυμι, *frango*.

CATAGOGE. In Hippocrates's Epid. lib. vii. it means a region, and its circumjacent part.

CATALENTIA. See EPILEPSIA.

CATALEPSIS, CATALEPSY, from καταλαμβανειν, *to occupy, detain, ſeize*, or *interrupt*. It is alſo called *catoche, catochus, congelatio*; and by Hippocrates, *aphonia*; by Antigenes *anandia*; by Cœlius Aurelianus, *apprehenſio, oppreſſio*; and alſo by ſome *apoplexia cataleptica, detentio*; *encatalepſis: prehenſio, comprehenſio*; *deprehenſio*.

The word *catalepſis* hath many ſignifications, as perception, or the knowledge of a thing; the retention of the breath, as when a perſon ſtrains at ſtool; a retention of any humour which ought to be evacuated; an interception of the blood in the veſſels by a bandage, as in bleeding; and the diſeaſe which is the ſubject of this article.

Some ſuppoſe the catoche to be the coma vigil; but moſt writers mean by it the *catalepſy*.

This diſorder is reckoned by ſome under the liſt of acute ones; and indeed with the carus, it may be ranked among the ſpecies of apoplexy. Dr. Cullen ranks it as a ſpecies of apoplexy, to which he affixes the following remark: "I never ſaw any catalepſy, but what was counterfeited; and the ſame has been ſeen by others. Therefore from the diſeaſe being ſeldom ſeen, differently deſcribed, and often altogether feigned, I know not in what place to fix it with certainty; but as I am perſuaded, in general it does not differ from apoplexy, I have therefore placed it under that head," viz. *apoplexia cataleptica*, when the muſcles are contracted upon being moved by external force. However from the accounts of other authors, its ſeat ſeems to be in the back part of the brain, from the ſymptoms of the diſeaſe, and the obſervations made on diſſecting thoſe who die of it.

Women, thoſe with a melancholic habit, and a very active imagination, are moſt ſubject to it, eſpecially if they uſe a cold regimen, are expoſed to bad weather, and cold climes.

The immediate cauſe ſeems to be an impediment to the influx of the vital fire into the nerves ſubſervient to ſenſation, and involuntary motion, whilſt it is carried on in its natural, and in ſome meaſure a more impetuous manner in the nerves ſubſervient to the vital actions. This retarded influx of vital principle, is from a ſpaſmodic conſtriction of the parts where the ſeat of the diſeaſe is; and hence ariſe all the ſymptoms of this diſorder.

The remote cauſes are the ſame as thoſe that produce melancholy, and other nervous affections; the ſecondary cauſes are alſo the ſame that produce other diſorders in the nervous ſyſtem, ſuch as poor diet, cold and moiſt countries, fear, anger, anxiety, intenſe thought, exceſſes of any kind, worms, &c.

This diſorder rarely occurs: when it does, the fits ſeize the patient at intervals, and laſt generally a few minutes, though now and then they continue for ſome hours or days. It is rarely preceded by any ſigns that indicate its approach; in a few inſtances a ſtiffneſs in the neck, a dull pain in the head, &c. have uſhered in the fit. In the diſorder the patient is ſenſeleſs and motionleſs, continuing in the poſture in which the fit attacked him, until a recovery from it: the limbs are moveable by another perſon, but, however they are diſpoſed, the patient never alters their poſition, until the paroxyſm is at an end. He neither ſees, hears, nor feels, whatever methods may be uſed to excite the ſenſations. He ſwallows greedily all that is given him; the countenance becomes florid; the eyes are open, ſeem fixed upon ſome object; at the cloſe of the fit he fetches a deep ſigh, and then recovers. Other ſymptoms alſo attend different patients, or the ſame at different times, ſuch as tears dropping from the eyes, grinding of the teeth, &c. but the above are the moſt generally attendant.

Care muſt be taken not to confound a *catalepſy* with a tetanus.

If this diſeaſe proceeds from paſſions, the danger is not ſo great as when a thick blood, or ſuppreſſed accuſtomed evacuations, are the cauſe; in the latter it is moſtly fatal.

In general the cure will be ſimilar to that of the apoplexy. The indication, in the fit, is to relax the ſpaſmodic ſtricture; and, out of the fit, to remove the material, or ſecondary cauſes, which contribute to the production of the conſtriction.

In the fit apply pungent acid ſpirits, ſuch as the ſpirit of verdegriſe, to the noſe, or the ſtrongeſt wine vinegar. Foreſtus ſtrongly recommends anti-ſpaſmodic oils to be rubbed on the nape of the neck, and on the back part of the head, after ſhaving it.

Strong ſtimulating clyſters may be injected, if the anus is not too much conſtricted to admit them.

Bleeding is commended, if the face is very red and turgid; but the heat and ſtrength of the patient will beſt determine the propriety of this operation.

Bliſters, though recommended, ſeem not ſo eligible an application as ſinapiſms to the feet.

Two or three ſpoonfuls of the following mixture may be given, at proper intervals, either during the fit, or in its abſence.

℞ Gum. aſſ. fœtid. ʒ ij. aq. puleg. ℥ iv. ſp. ammoniæ fœtid. and tinct. valer. vol. ää ℥ ſs. m.

In the abſence of the fit, endeavour to remove the mediate cauſes. According as theſe are, the remedies will be formed; remembering that if fears, apprehenſions, and paſſions of the mind are the cauſes, medicines cannot be expected to be uſeful, at leaſt not effectual; but in ſuch like caſes, a change of air, travelling, diverting company, &c. are to be inſiſted on.

The *catalepſy* ſometimes ends in a melancholy, epilepſy, or fatal apoplexy.

See Cœlius Aurelianus, Acut. lib. ii. cap. x. and Hoffman, Brookes's, and the London Practice of Phyſic.

CATALONGAY. The plant that bears the *Faba Sancti Ignatii*.

CATALOTICA. This word is by miſtake put for *catulotica*.

CATALYSIS, from καταλυω, *to diſſolve*, or *deſtroy*. It ſignifies a *paralyſis*, or ſuch a reſolution as happens before the death of the patient; alſo that diſſolution which conſtitutes death.

CATAMENIA, from κατα, *infra*, or rather *ſecundum, according to*, and μην, *menſis, the month*. See MENSES.

CATANANCE. See CICHORIUM.

CATANTLEMA, from αντλαω, *to draw*, or *pour water*, a kind of lotion by infuſion of water. Moſchion de Morbis Mulierum.

CATANTLESIS. A lotion with hot water, expreſſed out of ſponges, recommended by Marcellus Empiricus againſt hot running ulcers of the head.

CATAPASMA. } from πασσω, *to ſprinkle*. The
CATAPASTUM, } ancient Greek phyſicians meant by this, any dry medicine reduced to powder, to be ſprinkled on the body. Called alſo *conſperſio, epipaſtos, paſma, ſympaſmata, aſperſio, aſpergines*; their various uſes may be ſeen in Paulus, lib. vii. cap. xiii. *Catapaſms* are of various kinds, according to the intention of the phyſician. Powders put in the drink were called *diapaſma*: though Pliny ſays, that ſuch powders as were valued for their grateful ſmell were called diapaſms. Oribaſius ſhews from Antyllus, that *empaſmata* were uſed in order to reſtrain ſweat, or any other evacuation by the pores; or for exciting an itching. *Catapaſms* were ſprinkled on ulcers, but diapaſms were prepared for the ſake of their ſcent, and were applied to the armpits, and the inſide of the thighs, to remove their ſcent. Cœl. Aurel. in Morb. Acut. lib. ii. cap. xxxviii. ſays, that ſympaſmata were ſuch powders, as being endowed with an acrid quality, were ſprinkled on the body to procure heat.

CATAPASMUS. A term uſed by Cœl. Aurelianus, probably by miſtake, for ſome other word. It implies, according to him, a rubbing of the poſterior part of the ſhoulders and neck downwards.

CATAPASTUM. See CATAPASMA.

CATAPHORA, from καταφερω, which, among other ſignifications, implies *to render ſleepy*. A preternatural propenſity to ſleep. See CAROS. Galen calls a coma by this name.

CATAPHORA COMA. i. e. APOPLEXIA SANGUINEA.

CATAPHORA HYDROCEPHALICA, i. e. APOPLEXIA SEROSA. See HYDROCEPHALUS.

CATAPHRACTA. from καταφρασσω, *to fortify*. See QUADRIGA.

CATAPHISMA. A kind of thick poultice of meal, and herbs.

CATAPLASMA, a POULTICE, from καταπλασσω, *illino*,

illino, to ſpread like a plaſter, alſo *malagma, epipaſma, epiplaſma*. *Cataplaſms* take their name ſometimes from the part to which they are applied, or effects they produce, ſo are called *anacollema*, and *frontale*; when any topical application of this ſort was laid upon the forehead; the *former* tho' were always made of agglutinants. *Epicarpium*, and *pericarpium*, when they were applied to the wriſts;—*epiſpaſticum*, when the external remedies only rubified the ſkin; *veſicatorium*, when it occaſioned bliſtering;—and *ſinapiſmata*, when muſtard entered the compoſition, becauſe it produced irritation, and occaſioned redneſs, heat, itching, and tumor, in the part to which it was applied. See EPISPASTICA.

Theſe kind of applications are ſofter, and more eaſy, than plaſters or ointments. They are formed of ſome vegetable ſubſtances, and applied of ſuch a conſiſtence as neither to adhere nor run: they are alſo more uſeful when the intention is effected by the perpetuity of the heat or cold, which they contain, for they retain them longer than any other kind of compoſition.

When deſigned to relax, or to promote ſuppuration, they ſhould be applied warm. Their warmth, moiſture, and the obſtruction they give to perſpiration, is the method of their anſwering that end. The proper heat, when applied warm, is no more than to promote a kindly pleaſant ſenſation; for great heat prevents the deſign for which they are uſed. They ſhould be renewed as often as they cool. For relaxing and ſuppurating, none excel the white-bread *poultice*, made with the crumb of an old loaf, a ſufficient quantity of milk to boil the bread in until it is ſoft, and a little oil; which laſt ingredient, beſides preventing the *poultice* from drying and ſticking to the ſkin, alſo retains the heat longer than the bread and milk alone would do. To preſerve the heat longer, the *poultice*, when applied, may be covered with a ſtrong ox's bladder.

When deſigned to repel, they ſhould be applied cold, and ought to be renewed as oft as they become warm: a proper compoſition for this end, is a mixture of oatmeal and vinegar.

Epithems are alſo a kind of *cataplaſms*.

Cataplaſma *Emolliens*. *An Emollient* POULTICE.

Boil half a pound of the crumb of bread, and one ounce of white ſoap, in a ſufficient quantity of cow's milk, to reduce the whole to a proper conſiſtence. Amongſt the poor, the bran from wheat may be uſed inſtead of bread, adding a ſmall quantity of oil or lard to it.

Cataplaſma *Diſcutiens*. *A Diſcutient* POULTICE.

Take of barley meal, ſix ounces; the leaves of hemlock freſh gathered and bruiſed, two ounces; crude ſal ammoniac, half an ounce; vinegar enough to give the whole a proper conſiſtence. Mix them without uſing heat, and apply it cold.

CATAPLASMA EFFERVESCENS. Stir into a ſtrong infuſion of malt, as much oatmeal as will make it of a proper conſiſtence, then add a ſpoonful of yeaſt, and mix them well together. By this mode, fixed air is applied to ulcers, cancers, and other local affections requiring powerful antiſeptic remedies. In the application, room muſt be left by the bandages, ſufficient to permit its expanſion, which from the fermentation will be conſiderable.

CATAPLASMA ALUMINIS. See COAGULUM ALUMINIS.——ACETI. See STREMMA. There are a variety of other cataplaſms; all which will be found under the reſpective ingredients, from whence they are denominated; as CATAPLASMA ROSÆ. See ROSA. CATAPLASMA CUMINI. See CUMINUM, &c. &c.

CATAPLEXIS, from πλησσω, *to ſtrike*. Any ſudden ſtupefaction, or deprivation of ſenſation in any of the members or organs.

CATAPOSIS, from καταπινω, *to ſwallow down*. According to Aretæus, it ſignifies the inſtruments of deglutition. Hence alſo

CATAPOTIUM. A PILL. See PILULA.

CATAPSYXIS, from ψυχω, *to refrigerate*. A refrigeration without ſhivering, either univerſal, or of ſome particular part. A CHILLNESS, or as Vogel defines it, an uneaſy ſenſe of cold in a muſcular, or cutaneous part.

CATAPTOSIS, from καταπιπτω, *to fall down*. It implies ſuch a falling down as happens in apoplexies; or the ſpontaneous falling down of a paralytic limb, expreſſed often by *decidentia*.

CATAPULTARUM AQUA. See ARQUEBUSADE.

CATAPUTIA. SPURGE. Under this name are ranked the CATAPUTIA MAJOR; called alſo *palma Chriſti, alkerva, ficus infernalis, pentadactylon, granadilla Peruviana, ricinus vulgaris, agnus caſtus*; *eraway, kik, kiki, ricinus Americanus, nhambu guacu* of Piſo, *cherva major*, COMMON PALMA CHRISTI, GREAT SPURGE, MEXICO SEED, *caſtor*, and by the Italians it is called cataputia maggiore. It is the RICINUS AMERICANUS, Linn. the AMERICAN PALMA CHRISTI; or RICINUS COMMUNIS foliis peltatis ſubpalmatis ſerratis. CLASS MONŒCIA, ORD. MONADELPHIA, LINN. GEN. PLANT. 1085.

This plant is as tall as a little tree, and is ſpread into many branches; the leaves expand like one's hand, with the fingers a little ſeparated: the flowers are ſmall and in bunches. On the body of the plant there are cluſters of rough triangular huſks, each containing three ſpeckled ſeeds, about the ſize of ſmall kidney-beans, which have in their ſhells white kernels, of a ſweet, oily, and ſometimes of a nauſeous taſte.

Theſe ſeeds are called *grana ragium*, and were uſed by Hippocrates, and perhaps before him. If they are uſed in ſubſtance they are acrid, and purge roughly; but the oil expreſſed from them acts more gently, though very efficaciouſly.

The leaves when beat and boiled in milk to the conſiſtence of a poultice, are powerful ſuppurants, uſed for dreſſing bliſters and children's heads that are ſcabbed, &c.

The ſeeds are externally variegated with black and whitiſh ſtreaks, reſembling both in ſhape and colour the inſect called ricinus, the tick, whence the name ricinus is given to the plant. The oil which theſe ſeeds called *croton* afford, is what the plant is moſt valued for. This oil is obtained both by expreſſion and decoction; the latter is preferred by ſome as more mild in its operation.

This oil is known by the names of OL. RICINI, *alkerva, ol. palmæ Chriſti, oleum cicinum, kerva*, OIL of KIK, OIL of AGNUS CASTUS, and CASTOR OIL. The Greeks called it Αιγυπτιον ελαιον, Oleum Ægyptium.

This oil operates ſooner after exhibition than any other known purgative, as it produces this effect in two or three hours: it ſeldom gripes, or gives more than two or three ſtools. It is particularly ſuited to cures of coſtiveneſs and of ſpaſmodic colic. It is not heating or irritating to the rectum, and therefore well ſuited to caſes of hæmorrhoids; beſides its eaſily operating as a purge, it is of peculiar uſe in hot, bilious conſtitutions, in febrile diſorders of the ardent kind; and, by joining it with proper cordials, may be uſed in the low and putrid fevers. Its efficacy exceeds all other kind of purging medicines in the colic, in calculous diſorders, and all ſuch caſes as require the bowels to be moved, and yet forbid the uſe of powerful ſtimulants.

To children it may be given in the manner of an oleoſaccharum. Gooch, in his Medical Obſervations, commends the following method of adminiſtering it to adults, and aſſures us, that two or three ſpoonfuls taken occaſionally at bed-time, keeps the bowels ſoluble, even when the bleeding piles attend. A larger doſe, or the above, more frequently repeated, ſuffices for a purge on any occaſion.

℞ Ol. ricini ℥ j. ſs vitel. ovi parum, probe contritis in mort. marm. adde ſenſim aq. menth. pip. & aq. cinnam. aā ℥ ij. ſyr. roſæ, ℥ ſs. m.

He obſerves that it acts by lubricating rather than by ſtimulating.

In the colic, a table ſpoonful of this oil may be mixed with a little pepper-mint water, and repeated every half hour, or every hour, until it promotes the deſired evacuation. If the ſtomach rejects it, a gentle puke may be excited by a few grains of ipecacuanha, and then the oil will be more eaſily retained.

In fevers it both opens and cools; but in the lower kind of fevers it cools too much, if not guarded by ſome proper aromatic. In the yellow fever of the Weſt Indies it is almoſt a ſpecific. When the belly is already too lax from acrid bile, this oil obtunds the acrimony, and thus reſtrains the exceſſive diſcharge; in dyſenteries it relieves by its obtunding acrimony. The intentions of cure in nephritic complaints, and the properties of this oil, being conſidered, will readily point out its uſe in thoſe afflictive complaints, for it purges briſkly, in ſmall quantities, without irritation; it is cooling,

ing, and ſo allays all febrile heats; it corrects acrimony, and prevents the coheſion of calculous concretions, if it does not diſſolve them. In gonorrhœas, the fluor albus, the conſtipation peculiar to ſtudious and ſedentary perſons, &c. this oil is of ſingular efficacy. It is particularly to be obſerved of this oil, that if it be frequently repeated the doſe may generally be more and more diminiſhed; for perſons of coſtive habits, who at firſt required half an ounce or more for a doſe, after being frequently repeated, had the body kept lax and regular, by two drams. The beſt mode of its being given to prevent ſickneſs, or nauſea which it ſometimes occaſions, is to mix one of tincture of ſena to three parts of the oil; ſhake them well together, and take them in this form; the oil is leſs nauſeous to the taſte, and ſits more eaſy on the ſtomach. The doſe is a table ſpoonful, or ℥ ſs; but ſome require double the quantity. Where the oil is rejected, the ſeeds may be carefully ſeparated from their ſhells, and the inner white membrane, and formed into an emulſion, as an agreeable ſubſtitute for the oil.

Chuſe it of a pale colour, limpid, and rather inclining to a greeniſh caſt, almoſt inſipid to the taſte, with but little ſmell, and of a thickiſh conſiſtence. See Lewis's Mat. Med. Lond. Med. Obſ. and Inq. vol. ii. Canvane's Diſſ. on the Ol. Palmæ Chriſti. Med. Muſ. vol. iii. Cullen's Mat. Medica.

CATAPUTIA MINOR. GARDEN SPURGE. Alſo called *lathyris major*, and *tithymalus latifolius*.

All the *ſpurges* are acrid: the milky juice, in which their virtue lies, is cauſtic and cathartic; the root, or bark, prepared by infuſion in vinegar, hath been given to a dram; three or four of the leaves purge ſtrongly: the milky juice is ſaid to deſtroy warts: but none of this tribe are now uſed, becauſe of their exceſſive acrimony.

Under this article may be ranked the three following, viz

RICINOIDES. The BARBADOES NUT; alſo called *pinus purgans, pinhones Indici, carcas, nux Barbadenſis, faba purgatrix, jatropha, curcas, carpata, chiviquilenga, ricinus Americanus major femine nigro, munday-guaca, nux cathartica*, and *avellana cathartica*. The fruit is oval-ſhaped like a wall-nut, and contains oblong black ſeeds. The tree is a native of America, and alſo of the Eaſt Indies; it grows to a conſiderable ſize. The ſeeds are extremely acrid, and afford an oil that purges, but is rarely uſed on account of its activity.

AVELLANA CATHARTICA, *ſeu purgatrix*. The PURGING NUT. Alſo called *nuces purgantes, jatropha*, and *vicinoides*. The tree is a native of America, and the Weſt Indies; grows to a conſiderable ſize. Its fruit is oval-ſhaped, containing roundiſh, and ſomewhat triangular, browniſh ſeeds, which have but little acrimony, and taſte like almonds, but yet operate briſkly by vomit and ſtool.

GRANA TIGLIA. The MOLUCCA-GRAINS, ſo called becauſe they were firſt brought from the Molucca iſlands. They are alſo called *croton*, and *pinus Indica nucles purgante*. The tree is a native of America and the Eaſt Indies; the fruit is roundiſh, containing dark greyiſh ſeeds; ſhaped nearly like thoſe of the palma Chriſti. They are intenſely hot and acrid, operate with a degree of virulence both upward and downward; and of the four ſorts above mentioned, this is the moſt active. One dram of the oil is a ſtrong doſe.

The wood and leaves of the above five trees and plants are ſtrong cathartics. Hermann ſays, that the wood of the tiglia, called *panava*, or *pavana*, operates violently when freſh, but when long kept is ſudorific.

CATARACTA. A CATARACT, from καταρασσω, *to mingle together*, or *put out of order*. Dr. Cullen places it as a ſpecies of caligo, and names it CALIGO (*lentis*) ob maculam opacam pone pupillam; and obſerves, that he cannot agree with SAUVAGES, that a cataract ſhould be of a different genus from caligo; and leaves it to the judgment of others to determine, whether he has been right in changing the character of caligo, and placing cataract as its ſpecies.

A *cataract* is an opacity of the cryſtalline humour of the eye, which prevents the rays of light paſſing to the retina, and ſo preventing viſion. Dr. Hunter ſays, it is when an inflammation in the coat of the cryſtalline humour hath rendered it opake; but Mr. St. Yves ſeems to intimate, that the cryſtalline humour ſwells.

Hippocrates called it, *Glaucoſis*. Galen *Hypochyſis*, and *Hypochyma*, the Arabians *Gutta opaca*. But many cataracts are termed *maculæ oculorum*. The ancient Greeks ὑπεχυμα, or ὑπεχυσις, which Celſus renders by the word SUFFUSIO: it ſometimes has the term *affuſio* applied to it; and γλαυκωσις, or γλαυκωμα, which Galen, and moſt of the ancients, ſay, is a dryneſs, or concretion of the cryſtalline humour. Aetius ſays, it is a change of the cryſtalline humour to a ſky colour, with a dryneſs and concretion. And ſome in our day obſerve, that the principal difference betwixt a *cataract* and a *glaucoma* is, that, in the latter, the cryſtalline humour becomes hard, and of a ſky colour (glauci coloris); and in the former it is ſoft.—But the idea of *cataract* is now totally cleared from all that confuſion, in which it was uſually involved; *it is univerſally allowed to be an opacity of the cryſtalline lens, and its capſule*.

Mr. de St. Yves divides the *cataract* into the true, doubtful, and falſe.

THE TRUE, is when the cryſtalline humour hath loſt its tranſparency: and this he ſubdivides into three ſorts; 1ſt, When the cryſtalline humour is ſoft: 2dly, When it is hard: and, 3dly, When it is purulent.

THE DOUBTFUL, are thoſe in which the ſucceſs of the operation is as uncertain as the uſe of topical remedies. Theſe are of four ſorts, 1ſt, A membranous *cataract*: 2dly, A filamentous *cataract*: 3dly, *Cataracts* from blows or other external injuries: and, 4thly, From a defect of the membrane, which covers the bottom of the ſocket in the vitreous humour. The firſt and third of theſe he ſubdivides again, each into three kinds, as he endeavours to be minute, as well as full, in his deſcription of this diſorder.

THE FALSE, are thoſe in which the remedies afford no relief farther than to palliate pains, or to remove deformity; and theſe he divides into the *glaucoma*, and the ſhaking *cataract*.

All this diviſion, and ſubdiviſion, ſeems little regarded in preſent practice; but yet ſome uſeful hints will be derived by a peruſal of this author.

When a *cataract* begins, the patient at firſt complains of a diminution of his ſight; and on a careful examination of the eye, a whiteneſs is perceived very deep in it: on examining the eye at diſtant periods of time, its opacity becomes more and more manifeſt to the obſerver, and the patient very ſenſibly loſes the advantages of ſight. The progreſs of a *cataract* is uſually very ſlow.

No medicines are known, that are capable of removing this diſorder of the eye; but methods of operating on the cryſtalline humour are uſed to recover the ſight thus obſtructed. The firſt is by depreſſing, the ſecond by extracting this humour. In a recent caſe it may not be amiſs to try ſuch medicines as relieve the gutta ſerena. Sometimes ſucceſs ſeemed to follow repeated doſes of calomel, and poultices of freſh hemlock on the eye, conſtantly keeping a bliſter on the back. Small doſes of Hydrargyrus muriatus daily repeated for a length of time, have been uſeful.

Sauvages enumerates no leſs than five ſpecies, and of the *cataracta vera* ſix varieties, and tells us that two patients he knew cured by the internal uſe of the hyoſcyamum, one of the ſpecies which he inſerts under the title of membranacea, is very doubtful. He ſays, that it was diſcovered by Lower in horſes, and ariſes from a mucus exuding from the margin of the pupil, or uvea, which concretes ſometimes into a membrane, that obſtructs the pupil; but whether this membranous *cataract* exiſts in the human ſpecies, he thinks uncertain, notwithſtanding there have been experienced oculiſts, who have thought that they have ſometimes found this and depreſſed it with the needle. See Sauvageſii Noſologia Methodica, vol. ii. p. 723.

Mr. Sharpe gives it as a general rule for proceeding to the operation, when the *cataract* is entirely opake; he obſerves, that ſometimes they are of a proper conſiſtence for the operation before they become ſo, but forbids proceeding thereto while the patients can perceive any thing through them. *Cataracts* are of different colours; the pearl coloured, and thoſe that appear like burniſhed iron, are thought proper to endure the needle; the white are ſuppoſed milky; the green and yellow are horny: and incurable; the black *cataract* Mr. Sharpe takes to be the gutta ſerena.

The yellow *cataract* often adheres to the iris, ſo as to be incurable. When a gutta ſerena attends, the operation will not relieve.

There is little to be expected from the operation, when the diſeaſed eye is either diminiſhed, or increaſed, from its natural ſize.

Before and after the operation, a due regard muſt be had to the ſtate of the patient's conſtitution; and ſuch means are generally adviſed, as will keep it ſomewhat below its natural vigour.

When no objection to the operation attends, Mr. Sharp commends the following method for depreſſing the *cataract*, "Place the patient in a convenient light, and a ſuitable height: put a pillow behind his back, that his body may bend forward, and the head approach near to the operator; then inclining the head a little backwards upon the breaſt of the aſſiſtant, and covering the other eye, ſo as to prevent its rolling, let the aſſiſtant liſt up the ſuperior eye-lid, and the operator depreſs a little the inferior one: this done, ſtrike the needle through the tunica conjunctiva, ſomething leſs than one-tenth of an inch from the cornea, even with the middle of the pupil, into the poſterior chamber, and gently endeavour to depreſs the *cataract* with the flat ſurface of it. If, after it is diſlodged, it riſes again, though not with much elaſticity, it muſt again and again be puſhed down. If it is membranous, after the diſcharge of the fluid, the pellicle muſt be more broken and depreſſed. If it is uniformly fluid, or exceedingly elaſtic, we muſt not continue to endanger a terrible inflammation, by a vain attempt to ſucceed.

After the operation, treat it as an ophthalmy; and a collyrium, of one part rectified ſpirit of wine, and ten parts of lukewarm water, will be as proper an application as any."

Mr. Daviel has the honour of having diſcovered the method of extracting the cryſtalline humour; but Mr. St. Yves practiſed it about ſixty years before him. When the cryſtalline lens had paſſed through the pupil into the anterior chamber of the eye, both Mery and Petit extracted it; for then the depreſſion is impracticable. When this method of relief is put into practice, proceed as follows.

Paſs your knife through the cornea into the anterior chamber of the eye, about a line before the iris; for if it is not put there, the iris will, perhaps, be wounded: if you go too far on the cornea, you may get between its lamina, and ſo not perforate into the chamber: after puncturing into the chamber, guide your knife with the flat ſide perpendicular to the eye, through the aqueous humour horizontally (being careful not to wound the iris) and then thruſt it out at the oppoſite ſide and ſituation of the cornea in which you inſert it; then turning its edge obliquely and perpendicular outwards, make an inciſion rather through the inferior half of the cornea, then lifting up the ſuperior part of it, the cryſtalline humour will burſt its aranea, and drop out; but if it ſhould ſtick at its exit through the wound, it ſhows that the capſula of the cryſtalline is not broke, on which you muſt puncture it with the knife, and then it will drop: but if the diſeaſe is in the aranea, or the capſula of the cryſtalline, you muſt extract it alſo with the forceps.

With reſpect to the nature of this diſorder, or the ſtate of the cryſtalline lens, whatever improvements have been made within the preſent century, reſpecting its diſordered ſtate, many difficulties are ſtill attendant. Mr. Pott obſerves, that until the year 1720, or thereabout, neither the ſtate, nature, nor ſeat of this diſeaſe were truly known, at leaſt not to thoſe who practiſed ſurgery. Accident, he adds, firſt proved it to be a diſtemper of the corpus cryſtallinum, and to be in general abſolutely confined to it. Heiſter is the firſt writer on this ſubject, who leads to any juſt idea of it. Mr. Pott ſeems to be the firſt who dwells on the true ſtate of the cryſtalline humour when a *cataract* is formed. He ſays, that the idea of a beginning or imperfect *cataract* being ſoft, and that of a mature or perfect *cataract* being hard, is erroneous; at leaſt, for the moſt part: that the natural ſound tranſparent cryſtalline is very far from being uniform in its conſiſtence through its whole ſubſtance; its external part is much ſofter, and more gelatinous, than its internal; which therefore, although equally tranſparent, may be ſaid to form a kind of nucleus, and is always of a much firmer texture. He adds, if this known difference of conſiſtence, between the external and internal parts of the cryſtalline, was duly attended to, it would ſolve many of the appearances in *cataracts*; which for want of ſuch attention, are either not accounted for, or very abſurdly. Among other phænomena, it would account for the very different colour which the different parts of the ſame *cataract* frequently bear; and which hath furniſhed the wildeſt conjectures. From this ſound and natural ſtate, it is capable of ſeveral morbid alterations, it is capable of being diſſolved or of becoming a fluid, without loſing any thing of its tranſparency: it hath been ſuppoſed by very able anatomiſts, that the human cryſtalline has ſometimes between its ſurface and its capſula, a ſmall quantity of fine pellucid lymph; and conſequently that there is no immediate connection between the body and its inveſting membrane. In many beaſts, as well as fiſhes, this is known to be the caſe; but whether it be ſo in the human eye, is not very eaſy to be known during life; but that this is the caſe ſometimes from diſtemper, there is no doubt: that is, the whole cryſtalline is diſſolved into a fluid, which ſtill preſerves its tranſparency; and this ſeems to form what is called the black *cataract*, which is a ſpecies of the gutta ſerena. Mr. Pott goes on to obſerve, that the cryſtalline humour is capable of being diſſolved into an apparently uniform fluid of a gelatinous conſiſtence, which will be more or leſs opake through the whole of it: it ſometimes becomes opake, while it undergoes a partial kind of diſſolution, which leaves, or renders the different parts of it of very different degrees of conſiſtence; and it now and then, though very rarely, becomes opake through its whole ſubſtance, and yet preſerves its natural degree of firmneſs. From this variety of alteration, which the cryſtalline humour is capable of undergoing, proceeds that variety of appearance which our anceſtors have called ſo many different kinds of *cataracts*. The idea of beginning *cataracts* being ſoft, and hardening as they become more perfect, hath an ill influence in practice. When the cryſtalline humour becomes ſofter than it ſhould be, it is certainly diſtempered, and unfit for perfect viſion, whether it be opake or not; but that this ſoftened lens will ever be harder, we have no reaſons to depend on, any more than we have evidences that an opacity is a proof of its induration. The moſt fluid *cataracts* are as opake as the moſt firm ones. Farther inconveniences attending the idea of ripe and unripe, ſoft or hard, *cataracts*, are as follow: the early or unripe ſtate is ſuppoſed an improper one for the operation, and that the patient muſt wait for a later or ripe one; it then becomes a matter of conſideration, whether the patient ſhall or ſhall not continue blind for a very uncertain ſpace of time. Again, the ſoft ſtate being ſuppoſed not the proper one, a more opake and hardened ſtate is expected as a neceſſary conſequence of time, which not being true, the patient is either never relieved, or at beſt is deprived of that advantage without any juſt reaſon. Beſides the body of the cryſtalline lens, its capſula or inveſting membrane may be the ſeat of the diſeaſe; it may become opake while its contents are clear and duly tranſparent. This may happen after the operation for depreſſing a harder *cataract*, or for letting out a ſofter one. When the capſula is the ſeat of the diſeaſe, and happens to take place after depreſſing or extracting the cryſtalline lens, it ſometimes vaniſhes in a few weeks, and ſometimes requires an operation.

Reſpecting the operation of couching, Mr. Pott obſerves, that as in ſome inſtances the *cataract* remains always fluid, ſo in others they become inſtantly indurated: whence it follows, that there is no point of time for which we ſhould wait, but at any time when on other accounts the object is a proper one, the ſurgeon may proceed. Previous to the operation, it is right to know the circumſtances which render it likely or unlikely to ſucceed. To have it ſucceed, the cryſtalline humour ſhould be opake, and all the other parts of the eye capable of performing their functions; the eye ſhould be of its natural ſize; when with a *cataract* the globe of the eye is manifeſtly enlarged, the patient is incapable of perceiving light, or diſtinguiſhing betwixt light and darkneſs, in ſuch a caſe the operation muſt be omitted. The pupil ought to be capable of contracting and dilating: it hath been taught by many, that, when the pupil is immoveable, it is to no purpoſe to perform the operation, which in a general ſenſe is true, though not in a particular one; the operation certainly ſhould not be performed, if the pupil is immoveable from a paralyſis of the part, nor if it adheres to the cryſtalline, as in theſe caſes we could not operate with any ſucceſs; but if it is immoveable, or almoſt ſo, from a diſtenſion of the cryſtalline humour (which Mr. Pott thinks ſometimes happens), you may operate: however, in theſe caſes, on a very nice examination, the pupil will be found to have a very ſmall degree of motion. The patient ought always to be able to diſtinguiſh light from darkneſs, and a

white from a black body; if he is not, though you remove the *cataract* from over the pupil, yet the retina is incapable of performing its office. In the following inſtances, ſucceſs is hardly to be expected by either couching or extracting the cryſtalline body; when the diſeaſed cryſtalline is ſomewhat of the colour of braſs, or of a bright yellow, or of a copper colour, the operation does not ſucceed, the pupil being generally found immoveable, and the whole eye enlarged. When all the parts of the eye are enlarged, or when the cryſtalline protrudes through the pupil, the caſe is not a proper one for the operation.

As to the extraction or depreſſion of the *cataract*, thoſe who undertake to perform thoſe operations will doubtleſs have availed themſelves of all the information given by the beſt writers on theſe ſubjects; and to thoſe who wiſh for fuller directions, &c. the ſubjoined writers are thoſe from whom the whole of what art hath taught will be received.

CATARACTA NIGRA. See AMAUROSIS.

CATARIA. See MENTHA CATARIA.

CATARRHALIS FEBRIS AMPHEMERINA. The CATARRHAL FEVER, or CONTINUAL QUOTIDIAN of the ancients. It begins in the evening, with a ſhivering and a coldneſs of the ſkin and extreme parts, a coſtiveneſs, a frequent deſire of making water, but the urine is ſmall in quantity; a weakneſs of the head, an univerſal languor, a falſe appetite, thirſt, difficulty of ſwallowing, a ſtimulus in the larynx, a heat in the noſtrils and fauces, attended with ſneezing, and a weight in the breaſt. Towards night, heat, and a quicker, fuller pulſe, a cough, with a defluxion of rheum, a heat in the fauces, unquiet ſleep, ſweating in the morning, and at length a total loſs of appetite ſucceeds.

The immediate cauſe is a ſharp, acrid ſerum, or lymph, which irritates the glandulous tunics, of the noſtrils, palate and fauces, the aſpera arteria, and branches of the bronchia, and ſometimes the œſophagus, ſtomach, and inteſtines are affected; whence a cough, hoarſeneſs, ſpitting of a viſcid matter, ſneezing, a defluxion on the lungs, nauſea, gripes, &c. followed by a ſalutary flux.

Women, children, and weakly men, are its chief ſubjects.

It is moſt frequent in ſpring and autumn, or in very variable ſeaſons.

In ſeven, or betwixt that and fourteen days, a *catarrh* comes on; and as ſoon as its diſcharge appears at the noſe, the ſymptoms of this fever go off: ſometimes indeed a copious perſpiration relieves, and at others a large diſcharge thrown up from the lungs, gives a turn to the complaint, or, perhaps, a diarrhœa proves the natural means of cure.

The intentions of which are, 1ſt, to ſheath the acrimony of the lymph; 2dly, to increaſe perſpiration; 3dly, to promote the expectoration of the viſcid mucus.

The firſt intention is anſwered by abſorbents and demulcent drinks; the ſecond, by adding ſaffron and ſnake-root to the abſorbents, and by waſhing them down with tepid liquors; the third, decoctions of figs, mixture with gum ammoniacum, &c.

If the heat is conſiderable, nitre may be joined with the other medicines; and if the cough is violent, the camphorated tincture of opium, or ſtorax pill, may be given at bed-time.

After the fever is abated, if a copious ſpitting continues, to the perſpirative powders a few grains of cort. eluther. may be added. See Hoffman's Med. Rat. alſo CATARRHUS.

CATARRHALIS FEBRIS EPIDEMICA. See INFLUENZA.

CATARRHEUMA. See CATARRHUS.

CATARRHEXIS. A violent and copious eruption or effuſion; joined with κοιλιης, it is a copious evacuation from the belly, and ſometimes alone it is of the ſame ſignification. In Vogel's Noſology, it is defined a diſcharge of pure blood from the belly.

CATARRHŒCUS. A word applied to diſeaſes proceeding from diſtillations of rheum.

CATARRHOPA PHYMATA. Tubercles tending downwards; or, as Galen ſays, thoſe that have their apex on a depending part.

CATARRHOPOS NOUSOS. A remiſſion of the diſeaſe, or its decline, and oppoſed to the paroxyſm.

CATARRHUS, a DEFLUXION, from κατα and ῥεω, *to flow down*; called alſo *bronchos*, *catarrheuma*, *fluxio*, *rheuma*, *capiplenium*. It is an inflammation of, or an increaſed and morbid ſecretion from the mucous membrane of the noſe, eyes, throat, mouth, or lungs, which in the leſſer degrees of it, is called a cold. Dr. Cullen ranks this genus of diſeaſe in the CLASS pyrexiæ, and ORD. profluvia. He alſo enumerates two ſpecies: the *firſt* from cold, called alſo *amphemerina tuſſiculoſa*, *tuſſis catarrhalis*, *rheuma catarrhale*, *cephalalgia catarrhalis*, *coryza catarrhalis*,—*phlegmatorrhagia*,—*febricoſa*; the *ſecond* from contagion, called *rheuma epidemicum*. Hippocrates hath ſeven ſpecies of defluxions under the appellation of *catarrh*. He and CŒLIUS AURELIANUS under this term comprehend *coryza*; and Dr. Cullen uſes it as a ſynonyme to catarrhus.

When inflammatory ſymptoms precede the increaſed ſecretion, it is called a hot *catarrh*: if a fever precedes it, a *catarrhal* fever. See CATARRHALIS FEBRIS. When the ſecretion of the mucus is increaſed at the beginning of the diſorder, and inflammation appears afterwards, but in no very conſiderable degree, it is then called a *cold catarrh*: when there is a violent cough excited, either by an exceſſive *catarrh*: by the rupture of a vomica in the lungs, by a polypus driven into the pulmonary artery from the heart, or by a ſpaſmodic conſtriction of the nerves, it is called a *ſuffocative catarrh*. Many include under the word *catarrh*, almoſt all kinds of defluxions; but the moſt received diſtinctions have been included in theſe verſes:

Si fluit ad pectus dicitur Rheuma CATARRHUS.
Ad fauces BRONCHUS *ad nares eſto* CORYZA.

The ſeat of the *catarrh* is in the membrane of the noſe, the frontal ſinuſes, the antra Highmoriana, all the cells of the os ſphenoides, the mouth, fauces, eyes, the aſpera arteria, and its branches in the lungs.

This diſorder is moſt frequent in cold climes, in ſpring and autumn, or in variable ſeaſons: and happens chiefly to thoſe who have narrow cheſts, long necks, or ſuch as are diſpoſed to coughs, and thoſe who are phlegmatic and weakly.

In general, it is produced by whatever gives a check to perſpiration: ſtimulating diet, paſſions of the mind, &c. may conduce to this diſeaſe. The ſuffocating kind is produced by a palſy in the nerves ſubſervient to reſpiration, and polypous concretions in the pulmonary veſſels.

IN A HOT CATARRH, the ſymptoms, according as the different parts are affected, are a redneſs, heat, ſoreneſs, and ſenſe of diſtenſion in the eyes and eye-lids; at the ſame time there is an unuſual ſecretion of tears, and watery mucus, which running down the cheeks inflame them. *When the noſe is affected*, there is a ſenſe of ſtuffing and ſwelling in the noſtrils, an alteration in the voice, a loſs of ſmell; and if the inflammation runs high, a thin mucus is ſecreted, which produces heat and ſoreneſs of the noſtrils, ſneezing, and ſometimes inflammation, with excoriation of the upper lip. *If the throat, trachea*, or *lungs, are the ſeat of the diſeaſe*, the rheum ſeparated in theſe parts inflames them: ſometimes a ſwelling of the noſe attends, or perhaps the whole face is puffed up; a languor, ſtupor, deafneſs, and ſoreneſs of the ears, are alſo complained of, and a running from them. *When the throat is affected*, the tonſils, and parts thereto adjacent, are red, ſore, and hot, accompanied with a ſecretion of watery mucus, which ſtimulates, and occaſions a conſtant, troubleſome, tickling cough; ſometimes the whole mouth is ſore, there are little excoriations of the tongue, and a conſtant flow of ſaliva, with ſoreneſs of the ſalivary glands, and the lips are inflamed and excoriated. *When the larynx or trachea are affected*, a ſoreneſs is felt in them, attended with a hoarſeneſs, and generally with a troubleſome tickling cough. *In the lungs*, this diſeaſe produces a ſoreneſs, tightneſs, and ſenſe of ſtuffing in the breaſt, with difficulty of breathing, and a violent cough, with which either nothing, or only a watery mucus is at firſt ſpit up, and which produces ſoreneſs under the ſternum, and in the ſides, and ſometimes head-ach, ſickneſs, and retching. Sometimes *all theſe parts are affected at once*; but more generally it happens, that one only is diſeaſed at the firſt, and it ſpreads more or leſs, as circumſtances concur to favour its progreſs. There is more or

leſs

leſs of inflammation too, according to the ſtrength of the patient, or the violence of the diſeaſe. In the evening, the ſymptoms are more troubleſome; but, in the morning, a gentle moiſture in the ſkin appears, and the patient is eaſier. In weakly habits, the pulſe is frequent, but not very hard; the appetite is loſt, and the increaſe of the evening paroxyſm is conſiderable.

In the cold catarrh, the ſecretion of the mucus comes on firſt: there is, therefore, a running from the noſe; the matter is not watery, but viſcid, though thin, and not very ſtimulating. This mucus, when it is ſecreted into the throat, produces a cough, by which it is thrown off, and ſometimes a naufea; or affecting the lungs, there is a ſpitting with the cough. This expectoration of phlegm is moſt conſiderable after ſleeping; but there is no great ſenſe of foreneſs or of ſtuffing. After ſome days, inflammatory ſymptoms come on, though not in a great degree, nor is the whole ſyſtem often much affected. Theſe ſymptoms are followed by an increaſed ſecretion of mucus, which becoming viſcid, if it was not ſo at the beginning, loſes its ſtimulus. If the inflammation is great, the mucus diſcharged is yellowiſh, and ſometimes tinged with blood; as this goes on, the other ſymptoms abate, and at length the diſcharge by ſpitting grows whiter, then leſs in quantity, and thus the diſorder ends. If the patient is in a cold atmoſphere, the cough is the more troubleſome, the other ſymptoms are aggravated, and the diſeaſe is prolonged. If through an imprudent expoſure to the air, a relapſe happens, the ſame courſe is run through that had juſt before been paſſed. If the inflammation is very conſiderable, an angina, or a quinſy, may be produced; or if there is alſo the inflammatory diatheſis in general, a pleuriſy, or other diſorders which tend to a conſumption, may occur.

As different ſymptoms appear, according to the violence of the attack, &c. different diſeaſes are imitated by this; and care ſhould be taken to diſtinguiſh the *catarrh* from an angina, peripneumony, ulcerated ſore throat, venereal and other ulcerations in the throat, &c. and the ſuffocative *catarrh* muſt not be confounded with the hooping cough, aſthma, and other difficulties of breathing.

The mode of cure. According to the heat of the body, and the ſtrength of the patient, the cure may be begun by bleeding, or with purging, ſucceeded by gentle laxatives, diuretics, or perſpiratives, as one or the other may ſeem moſt likely to relieve, and let them be repeated as circumſtances may require. After purgatives, let a gentle opiate be given at nights, joined with a ſmall doſe of the antimonium tartarizatum. If pain in the breaſt is conſiderable, let a bliſter be applied as near the part affected as is convenient. If the throat is ſore, the volatile liniment may be applied to the fore part of it. Perſpiration may be promoted with the uſual antimonial preparations, joined with ſuch other perſpiratives of the cooling or warmer kinds, as the nature of the caſe may require, and by bathing the feet in warm water at night. This laſt method abates the cough and head-ach conſiderably; and if inflammation does not forbid, the following anodyne preparation will be a good auxiliary. ℞ opii puri. gr. ij. amygd. decort. gr. x. antim. tartariſat. gr. ij. f. pil. no. vi. cujus capt. j. ter in die.

In chronical *catarrhs*, very great advantage is obtained by a frequent uſe of purgatives, mixed with opiates, in ſuch quantities as not to prevent their efficacy as laxatives, e. g.

℞ Pil. ex aloe cum myrrha, gr. xv. pil. ſapon. gr. viij. m. f. pilul. no. iij. h. ſ. ſumend.

To moderate the cough, eaſe the foreneſs complained of inwardly, and aſſiſt the diſcharge by ſpitting, mucilaginous medicines may be adminiſtered, ſuch as the infuſion of linſeed, mixtures with ſpermaceti, &c.

See Hoffman's Med. Rat. Syſt. Opuſcula Med. Doctoris Baker, Dr. Fordyce's Elements, part ii. Brooks's Practice of Phyſic. Schneider hath writ largely on this diſeaſe. Cullen's Firſt Lines, vol. ii. 83. edit. 4. Wallis's Sydenham.

Catarrhus Bellinsulanus. See Cynanche Parotidæa.

—— Suffocativus. See Suffocatio Stridula.

—— Vesicæ. See Dysuria.

CATARTISMUS. According to Galen, it is a tranſlation of a bone from a preternatural to its natural ſituation.

CATASARCA. See Anasarca.

CATASCHASMOS, from σχαζω, *ſcarifico*. Scarification; and according to Dioſcorides, a deeper ſcarification than common, which is neceſſary in gangrene and ſphacelus.

CATASTAGMOS, } from σταζω, *to diſtil*. Theſe
CATASTALAGMOS, } are names which the Greeks, in the time of Celſus, had for distillatio.

CATASTALTICUM, from καταστελλω, *to reſtrain*, or στελλω, *to contract*. It ſignifies ſtyptic, aſtringent, repreſſing, ſometimes termed *caſtalticum*.

CATATASIS, from κατατεινω, *to extend*. In Hippocrates, it means the extenſion of a fractured limb, or a diſlocated one, in order to replace it; alſo the actual replacing it in a proper ſituation.

CATAXA. Both Aetius and Actuarius expreſs by this word raw ſilk, or ſilk before it is dyed.

CATE. See Lycium, and Terra Japonica.

CATEE. See Acajaiba.

CATECHU. See Terra Japonica.

CATEIADION. A long inſtrument which was introduced into the noſtrils, in order to provoke an hæmorrhage in the cure of the head-ach. It is mentioned by Aretæus.

CATELLORUM, Oleum. It is olive oil in which young whelps have been boiled until their fleſh ſeparates from the bones; after which is added thyme, marjoram, &c. which ſtand together in the ſun, and then the oil is ſtrained for uſe. See Ph. Paris.

CATELLUS. See Canis.

—— Cinereus. A cupel or test. See Cupella.

CATEVALA. Common aloe. See Aloe hepatica.

CATH. An abbreviation of *catholicon*.

CATHÆRESIS, from κατα and αιρω, *to take away*. Any ſort of ſubtraction of a part of the body by any kind of evacuation, called alſo *detractio*.

CATHÆRETICA, from αιρω, *to take away*. Remedies which conſume ſuperfluous fleſh. See Corrodentia.

CATHARMA, from καθαιρω, *to purge*. The excrements purged off from any part of the body.

CATHARMOS, from καθαιρω, *to purge*. Purgation by medicines, and the cure of a diſorder by ſuperſtitious remedies.

CATHARSIS. Purgation. Whether by the menſes, lochia, urine, ſtool, in a way natural or artificial.

CATHARTICA, from καθαιρω, *to purge*. This word is generally uſed as expreſſive of purging medicines. See Purgantia. But it alſo implies emetics.

Catharticum Extractum —— Cocciæ Minores Pilulæ;—Colocynthidis Pil. cum Aloe. *Now called* Extract. Colocynth. Compositum. Compound Extract *of* Colocynthis.

The London College directs the following:

Take of Succotorine aloes, an ounce and a half; of the pith of coloquintida, cut ſmall, ſix drams; ſcammony, powdered, half an ounce; ſmaller cardamom ſeeds, huſked, and powdered, one dram; of proof ſpirit, a pint. The ſpirit being poured upon the coloquintida, digeſt, with a gentle heat, four days; then to the tincture preſſed out, add the aloes and ſcammony, firſt ſeparately reduced to powder; and theſe being diſſolved, draw off the ſpirit, and reduce the maſs to the conſiſtence of a pill, adding the ſeeds toward the end of the proceſs.

This is a very effectual purge. The doſe is from gr. x. to 3 ſs.

CATHARTICUS, Sal, called alſo *amarus ſal, magneſia vitriolata, Ebſhamenſis* and *Epſomenſis ſal.* Purging salt, Epsom salt, and English salt. This *ſalt* was firſt obtained from the mineral water at Epſom: it was afterwards ſeparated from the brine which remains after the cryſtallization of common ſalt, and this latter is the ſort which is now in general uſe. It is compoſed of the vitriolic acid and magneſia: differing from the natron vitriolatum, in that the latter hath a mineral alkaline ſalt for its baſis. The firſt is often ſold for the latter; but they are thus diſtinguiſhed: to a ſolution of the firſt, add any alkaline ſalt in a ſtate of ſolution, and the earth will ſoon be precipitated; the like addition being made to a ſolution of the ſecond, no alteration is perceived.

It

It is with this *ſal amarus* that the purging mineral waters are impregnated, and to which they owe their virtue. It hath a bitter taſte, is ſoluble in leſs than twice its weight of water, ſhoots into long priſmatic cryſtals, liquifies and bubbles in a moderate heat, emitting a quantity of aqueous vapours, it changes to a white ſpongy maſs; this ſpongy maſs is more bitter than the ſalt was before this change was made in it by the heat.

That the acid contained in this *ſalt* is of the vitriolic kind, appears from its precipitating chalk that is diſſolved in aqua fortis, or other acids.

If this *ſalt* is diſſolved in water, and cryſtallized afreſh, it concretes into a larger kind of cryſtals, which reſemble the purging ſalt uſually called Glauber's.

This *ſalt* has a naufeous, bitter taſte; is a gentle purgative, operating in general with eaſe and ſafety, yet with a ſufficient efficacy, and quickly finiſhing its operation. Two or three drams, diſſolved in a pint of water, or a larger quantity, operates more powerfully and eaſily, than twice the quantity in three or four ounces. Its paſſing off haſtily, and not extending its action ſo far as moſt other purgatives, ſeem to be its principal imperfections; though if given in ſmall doſes, it paſſes farther into the conſtitution, promotes the ſecretions in general, and proves an excellent aperient in many chronical diſorders. It ſeldom occaſions gripes or ſickneſs, &c. which is common with reſinous purges. If the patient keeps warm, ſmall doſes will ſweat him; if cool, they paſs off by urine. As a purge, from an ounce to an ounce and a half is a full doſe, which, when diſſolved in a quart of water that hath a dram of mace or of cardamom ſeeds previouſly infuſed in it, ſits very eaſy on the ſtomach. See Lewis's Mat. Med. Neumann's Chem. Works.

—— HISPANICUS SAL. It is produced near Madrid, from ſome ſprings there: it is neutral, and agrees with the natron vitriolatum, or Glauber's ſalt. Its operation is very gentle.

—— GLAUBERI [illegible]. See GLAUBERI SAL.

CATHEDRA. See ANUS.

CATHÆRETICA, from καθαιρω, *to throw down.* See CORRODENTIA.

CATHESTECOS. See DIÆTA.

CATHETERUS, CATHETER, from καθιημι, *to thruſt into*; alſo called *auliſcos*, *fiſtula*. It is a long crooked tube for paſſing along the urethra into the bladder, either for the diſcovery of a ſtone there, or to occaſion a flow of urine if ſuppreſſed. The Latins call it fiſtula: and it had the epithet ænea beſtowed on it from the matter of which it was formed, being of braſs or copper. It is the name alſo for *bougie*.

CATHETERISMUS. The introduction of the catheter into the bladder. This appellation was given by P. Ægineta to this operation; and it is required in the following caſes.

1. When a ſtone lies internally on the neck of the bladder, and ſtops the diſcharge of the urine.

2. When a preternatural weakneſs of the bladder hinders the urine from being diſcharged in the uſual manner; and when other remedies fail, as often happens in women weakened with labour, &c.

3. When by too long retention of urine, the bladder is ſo diſtended and weakened, as not to be able to diſcharge its contents.

4. When mucus, blood, pus, or other matter, ſticks in the neck of the bladder, in caſes of ulcers, or wounds of the kidneys, or after diſcharges of bloody urine.

5. When the urethra is contracted or obſtructed, or the neck of the bladder; but in this caſe bougies are preferred, or when the proſtatæ are ſcirrhous or tumid, and prevent the paſſage of the urine.

6. In the laſt months of pregnancy, it is ſometimes uſeful to introduce the *catheter*, to draw off the urine.

7. When a prolapſus uteri produces an iſchury.

8. When a liquor is to be injected into the bladder; in which caſe a bladder may be filled with the liquor to be injected, then faſtened to the *catheter*, and ſo by gentle preſſure conveyed through it.

It is eaſy to introduce the *catheter* into the bladder of a woman, but in men's ſome difficulty attends. Heiſter ſays, that the eaſieſt method of introducing the *catheter* is for the man to lie on his back, and the operator to take the penis in his left hand, as he ſtands on the patient's left ſide, reclining the penis towards the navel; then he is to introduce the *catheter*, with its concave part to the belly, into the urethra, ſo far as the os pubis, and ſo thruſting it under the ſymphyſis of thoſe bones, and moving the handle, ſomewhat in a circular poſition, he gently forces it into the bladder.

If the *catheter* is too ſmall, it is the more apt to ſtop in the corrugations and foldings of the urethra, which often occur in old men. Dr. Hunter obſerves, that ſome impediments are often met with at the caput gallinaginis, in which caſe he adviſes to draw the *catheter* a little back, and preſs the end of the *catheter* a little higher, and then it will ſlip in; but he cautions againſt uſing any force. If a difficulty is ſtill found, he adviſes to put a finger into the anus, at the ſame time draw the perinæum forward, and therewith endeavour to aſſiſt the *catheter* in its introduction.

Mr. Ware, in a paper expreſsly written on this ſubject, ſays, "the mode in which I paſs the inſtrument is as follows: Being firſt thoroughly oiled, I introduce it into the urethra, with its convex part uppermoſt, and carry it as far as it will paſs without uſing force; then I turn it *ſlowly* round, ſo as to bring its concave ſide uppermoſt; and in doing this, I make a large ſweep with the handle of the inſtrument, and at the ſame time keep my attention fixed ſteadily on its apex, or inner termination, which I take particular care neither to retract, nor to move from its firſt line of direction. When the catheter is turned, it muſt ſtill be preſſed onward, and its handle at the ſame time gently depreſſed: by this method it will be made to enter the bladder."

The *catheter* made uſe of by Mr. Ware, is twelve inches long, which is more than an inch above the ordinary length; and the curvature larger than common, as repreſented in the plate he has annexed; and with which he has ſucceeded often, where others of a different ſize and curvature had failed.

Thoſe *catheters* are the beſt that are made with ſmall holes at their ends inſtead of long eyes.

Though this inſtrument may be required on ſome accounts, yet in the following caſes it cannot be uſed.

1. When the neck of the bladder is greatly inflamed, for then the urethra is much contracted, and to force in this caſe would endanger a ſphacelus.

2. When a caruncle, cicatrix, or hard tubercle, obſtructs the paſſage.

3. In old men, ſometimes from the ſtricture ſhrinking, or from wrinkles in the urethra.

4. From the diſtenſion of the ſpongy ſubſtance of the urethra with the blood.

5. From a ſcirrhoſity or preternatural humour of the proſtate gland.

6. From a ſtone lodged in the neck of the bladder.

7. When the uterus is remarkably prominent and pendulous over the oſſa pubis, the neck of the bladder, then forming an angle with the body of the bladder, hinders the paſſage of the *catheter*.

CATHIDRUSIS, from καθιδρυω, *to place together.* See FRACTURA.

CATHIMIA. In the Spagyric language ſignifies, 1. A ſubterraneous mineral vein, where gold and ſilver is dug; 2. Concretions in the furnace of gold and ſilver; 3. Gold; 4. *Spuma argenti, auri, æris*, ac etiam *ferri*; and 5. Soot that adheres to the walls in burning braſs. See LITHARGYRUM.

CATHOLCEUS. An oblong fillet which came over the whole bandage of the head, called periſcepaſtrum, or the ſling with ſix heads. See FASCIA, No. 3.

CATHOLICON. A general or univerſal medicine. Formerly it was ſuppoſed to purge off all kinds of bad humours. From κατα, *through*, and ὁλος, *the whole*, ſometimes alſo termed *diacatholicon*, or univerſal purge. It was an electary which formerly NICOLAUS preſcribed, as a purge ſuited to carry off all kinds of humours.

CATHYPNIA, from ὑπνος, *ſleep.* A profound ſleep.

CATIAS, CATIUS, from καθιημι, *dimitto.* An inciſion knife, formerly uſed to extract a dead fœtus, and for opening an abſceſs in the uterus.

CATILLIA. The weight of nine ounces.

CATIMIA. See CADMIA.

CATINUM ALUMEN. See CLAVELLATI CINERES.

CATINUS FUSORIUS. See CRUCIBULUM.

CATISCHON. One who is coſtive, or not eaſily purged.

CAT-

CATIXIS. On the ſame ſide. In inflammation of the liver a criſis of blood diſcharged from the noſe is by the right noſtril; and inflammation of the ſpleen by the left; and it hath long been obſerved, that nature endeavours with more vigour, and more certain ſucceſs, to free herſelf on the paſſages on the ſame ſide of the diſeaſe.

CATMA. See AURUM.

CATOCATHARTICA. See PURGANTIA.

CATOCHE. See CATALEPSIS and CAROS.

CATOCHITES, from κατεχω, *to retain*. A ſtone found in Corſica, which Pliny ſays attracts and retains the hand when laid upon it.

CATOCHUS. See CATALEPSIS; and TETANUS.

CATODON, from κατω, *below*, and ὀδους, *a tooth*. See CETE ADMIRABILE.

CATOMISMOS, from κατω, *under*, and ωμος, *the ſhoulder*. By this word P. Ægineta expreſſeth that mode of reducing a luxated humerus, which is performed by a ſtrong man taking the patient's luxated arm, and laying it over his ſhoulder, ſo that he can raiſe him from the ground, thus by the weight of the body the luxation is reduced.

CATOPTER. From κατα, *through*, οπτομαι, *to ſee*. See SPECULUM.

CATORCHITES. A ſort of wine which Dioſcorides takes notice of.

CATORETICA, } from κατω, *downwards*, and ῥεω, *to*
CATOTERICA, } *flow*. See PURGANTIA.

CATOU-KARUA. See FOLIUM.

CATTARIA. See MENTHA CATARIA.

CATTEE. See ACAJAIBA.

CATTU-SCHIRAGAM. The Malabar name for the *ſcabioſa Indica arborea*: the ſeeds of which kill worms. Raii Hiſt.

CATULOTICA, καλλωσις, improperly *catalotica*. Medicines that cicatriſe wounds.

CATULUS. In zoology it is a PUPPY. See CANIS. In botany it is a catkin. See AMENTACEI FLORES.

CATU-TRIPALI. See PIPER LONGUM.

CAUCALIS. BASTARD PARSLEY, called alſo *echinophora tertia*, *lappula Canaria*, *pſeudoſelinum*, *anthriſcus*, *daucus annuus minor*, HEDGE-PARSLEY; they have generally red flowers, and poſſeſs the common qualities of the garden parſley. See APIUM HORTENSE. Boerhave takes notice of twelve ſorts.

CAUCALOIDES. A name of the *patella*, in Moſchion de Morb. Mulieb. ſo called from its likeneſs to the flower of the caucalis.

CAUDA. In botany, the tail of a leaf; is a production of the middle rib, and connects the leaf with the ſtalk, after the manner of a pedicle; when the middle rib hath an appendix of the leaf running along it, it is often called a winged leaf. MARTIN ſays it is a proceſs, or thread, terminating a ſeed, and facilitating its propagation; this term was uſed formerly for the narrow baſe of a petal, in a polypetalous corolla, which LINNÆUS calls *unguis*, the claw.

CAUDA. Aetius in his Tetrab. 4. ſerm. 4. ch. 103. ſays that in ſome women a fleſhy ſubſtance ariſes from the os uteri, and fills the vagina. Sometimes it protuberates without the lips of the pudenda, like the tail of ſome animal, *whence its name*. In order to extirpate it, he adviſes to extend it with a forceps, and then cut it off, after which it muſt be dreſſed with lint dipped in rough wine. P. Ægineta ſpeaks to the ſame purpoſe. It is alſo a name of the *coccygis os*.

CAUDA EQUINA. In ANATOMY, the medulla ſpinalis ends about the firſt or ſecond lumbar vertebra, and there forms itſelf into many branches which receive all together the name *cauda equina*, from being like a horſe's tail. From the loins downwards the holes in the vertebræ are ſomewhat lower than the origin of the nerves that paſs through them; hence it is of importance when any diſorder ariſes from an injury of any of the nerves below the firſt and ſecond lumbar vertebra to advert to this circumſtance; and as at the firſt or ſecond vertebra of the loins the *cauda equina* begins, ſo in tracing the ſource of all the nerves below theſe parts, their origin is together there. See LUMBARES.

CAUDA MURIS. A ſpecies of RANUNCULUS. See alſo MYOSURUS.

—— PORCINA. See PEUCEDANUM.

—— VULPIS RUBICUNDI. See MINIUM, under PLUMBUM, No. 4.

CAUDATIO. So an elongation of the clitoris is called.

CAUDEX, (from *cædo*, *to cut down*). The TRUNK of a TREE. The trunk, ſtock, or ſtem, is that part of any plant which lies betwixt the root and the branches. In herbs and underſhrubs this part is called *caulis*, *thyrſus*, *ſcapus*, *calmus*, or *calamus*; according to LINNÆUS, when a ſeed germinates, the *caudex deſcendens* terminates in roots, the *aſcendens* in branches and leaves.

CAULEDON, becauſe it breaks like καυλος, *a branch*. A ſpecies of fracture, when the bone is broken tranſverſely ſo as not to cohere.

CAULIAS. An epithet for that juice of the ſilphium which flows from the ſtalk, by way of diſtinction from that which flows from the root, and is called ῥιζιας, *rizias*.

CAULIFEROUS. Such plants are ſo called as have a true ſtalk.

CAULIS. The STALK. See CAUDEX. It is a name alſo for both the *penis* and vagina; and in corn and graſs it is called the BLADE; and is alſo a name for a cabbage or colewort. See BRASSICA SATIVA.

—— FLORIDA. CAULIFLOWER. See BRASSICA FLORIDA.

—— PROCUMBENS. A procumbent or trailing ſtalk is that which lies on the ground, without emitting roots.

—— REPENS. Runs along the ground and ſtrikes root at certain diſtances, as in the ivy.

—— SCANDENS. A climbing ſtalk is that which climbs by the help of tendrils, as the vines and briony.

—— VOLUBILIS. A twining ſtalk is that which twiſts about any prop, without the help of tendrils, as the hop and kidney-bean.

CAULODES. See BRASSICA.

CAULOS. This is the Greek word for CAULIS, and is more expreſſive as it includes the trunk of the tree, whereas *caulis* is confined to the ſtalk of herbs only. See CAUDEX. It is alſo ſaid to be uſed by way of eminence, to expreſs the ſtalk of *ſilphium*, or *laſer*, the aſa-fœtida plant.

CAUMA, from καιω, *to burn*. The heat of the atmoſphere; or of the body in a fever.

CAUNGA. See ARECA.

CAUSA. A CAUSE. It is more difficult very often to diſcover the *cauſes* of diſorders than to preſcribe for the cure, when the *cauſe* is known; and it is by this ſkill and ſagacity in making ſuch diſcoveries that a phyſician ſhews how much he is above the mountebank and pretender. Great confuſion is met with in moſt writers on this ſubject; and indeed it is hard to ſay from whoſe theory we ſhall proceed to an uſeful practice. One ſays that the *cauſes* of diſeaſes are in the fluids; another fixes them in the ſolids; ſome proceed from chemical, and others from mechanical principles, &c. But when reaſoning a priori is laid aſide, when nature is ſtudied, and theory is confirmed only by clinical obſervation, this ſubject, ſo perplexed, may gradually unfold, and a theory be formed which, ſo far as it extends, will happily convert this uncertain ſcience into an art.

It is ſome ſatisfaction to be able to account for morbid ſymptoms, though the diſeaſes which give riſe to them may be in their own nature incurable; for, where we cannot relieve, we ſhall at leaſt be prevented from doing harm; and alſo enabled to make judicious prognoſtics.

Diſeaſes ſhould be diſtinguiſhed by their *cauſes*, and not their effects; for this method, in many inſtances, Boerhaave and Van Swieten are truly admirable. It is owned that men of experience may be led from the effects of a diſeaſe to the knowledge of its *cauſe* in ſome caſes; but then the curative indications can only be properly taken from the knowledge of the true *cauſe*.

The *cauſes* of diſeaſes are what impair the functions, and thus produce diſorders in the ſolids, fluids, or both.

Moſt diſeaſes have four cauſes, viz. the PREDISPOSING, PRIMARY, ANTECEDENT, and CONJUNCT. The three laſt are called morbific *cauſes*.

THE PREDISPOSING *cauſe*, alſo called *cauſa prægumena*, is that which renders the body more fit to receive a morbid impreſſion, when a primary *cauſe* is applied; or diſpoſes the body to ſuffer in one or other mode more readily than in any different ones. This kind of *cauſe* is a fault in the original conſtitution; or elſe it is induced in time by ſome accident. Of itſelf it neither conſtitutes nor produces a diſorder; but when certain morbid *cauſes* occur, it favours their effects; e. g. *a long neck and flat breaſt diſpoſes to a conſumption; a ſhort neck to an apoplexy; ſlenderneſs to a pain in the ſide; rigid fibres to inflammation and fever; lax fibres to a cachexy and dropſy*, &c. Some diſeaſes pave the way for others, as an *aſthma for a dropſy*; *colic for the palſy*; *ſmall-pox and meaſles for an inflammation in the eyes* and *a conſumption*,

tion, &c. And a part, once injured, is more ſubject to be affected in the ſame way again.

THE PRIMARY CAUSE, called alſo the *privative, external, evident, apparent, remote, active, efficient, præincipient, procatarctic*, or *occaſional*, excites the pre-diſpoſing *cauſe* to action, or theſe *cauſes* applied to the body that is pre-diſpoſed thereto, excite diſeaſes; and are generally an error in one or more of the non-naturals, or wounds, contuſions, compreſſions, morbid effluvia, &c.

THE ANTECEDENT CAUSE, called alſo the *mediate*, is uſually in the excreta and retenta. In moſt complaints, the non-naturals firſt diſorder ſome of the evacuations, this is the primary *cauſe* of the diſeaſe; then theſe evacuations affect the blood and juices, which is the ſecond *cauſe*; the blood and juices thus affected, will not fail to diſturb the action of the parts, which is the laſt and immediate *cauſe* of diſeaſe, and in which conſiſts the nature of all diſeaſes.

THE IMMEDIATE, called alſo the *conjunct, proximate, continent, formal, hidden*, and *internal*, are thoſe which, taken altogether, immediately conſtitute and continue the preſent diſeaſe; the removal of which *cauſes* is the cure: as the air in an emphyſema, and the blood in an aneuriſm.

A knowledge of the proximate *cauſe* enables us to judge of the nature of the complaint and its remedies, which may be learnt from, *firſt*, a fore-knowledge of the nature and powers of the remote *cauſes*; *ſecondly*, from collating the different ſymptoms of the diſeaſe together, and by ſtrict reaſoning to reduce them to one ſimple *cauſe*; *thirdly*, from the pernicious or ſalutary effects of the remedies applied during the diſeaſe; *fourthly*, by a careful inſpection of dead bodies. In this laſt, though, much ſkill in the appearances met with in dead bodies is required, leſt the effects of the *cauſes* ſhould be miſtaken for the *cauſes* themſelves.

The proximate *cauſe* is often difficult to be diſcovered, ſometimes impoſſible; and general *cauſes* are very numerous, hence the difficulty to fix on the particular one. However, the *immediate cauſe*, wherever it can, ought to be diſcovered, becauſe upon that depends the mode of cure which ſhould be adopted, and from whence we have every right to expect ſucceſs in all curable caſes. Upon the whole, if we can find out the nature of the prediſpoſing, the primary, and the proximate cauſe, we ſhall be furniſhed with every material on which to found a rational practice, whether our endeavours are directed to prevent, palliate, or cure diſeaſe. See WALLIS, on Health and Diſeaſe.

CAUSIS. See AMBUSTA.

CAUSODES FEBRIS. See FEBRIS ARDENS.

CAUSOMA. In Hippocrates ſignifies a burning heat and inflammation.

CAUSTICA. CAUSTICS, from καιω, *to burn*. See EPISPASTICA ESCHAROTICA.

CAUSTICUM AMERICANUM. See CEVADILLA.

—— ANTIMONIALE. See ANTIMONIUM, No. 7.

CAUSTICUM ANTICANCROSUM. See CANCER.

—— COMMUNE FORTIUS. Ph. Lond.

The Common ſtronger Cauſtic *of the London College.—Called now*, CALX CUM KALI. PURE LIME WITH PURE KALI.

Take of *quicklime*, five pounds four ounces; water of pure *kali*, ſixteen pounds; boil away the water of pure *kali* to a fourth part; then ſprinkle in the lime, reduced to a powder by the affuſion of water. Keep it in a veſſel cloſe ſtopped. For the mode of application, ſee CAUTERIA, under ESCHAROTICA.

—— LUNARE. See ARGENTUM.

CAUSTICUM OPIATUM. OPIATED CAUSTIC.

℞ Calcis cum kali puro ʒ ij. opii pulveriſati ʒ ſs. ſaponis mollis q. ſ. commiſceantur calx cum kali puro, et opium, et in paſtam cum ſapone molli formentur; This is uſed in the radical cure of an hydrocele, by forming of adheſive plaſter ſpread on leather of ſeveral thickneſſes a circular aperture at the lower and anterior part of the tumor, in which is introduced the paſte. This is to continue for about eight hours, about which time, it will without much pain, penetrate down to the tunica vaginalis. Afterwards apply poultices till the eſchar ſloughs, the water is evacuated, and the cure completed. This is Mr. Elſe's mode, at St. Thomas's Hoſpital.

CAUSUS. See ARDENS FEBRIS and DIPSAS.

CAUTERIUM, from καιω, *to burn*. A CAUTERY, either actual or potential. See ESCHAROTICA.

Cauterium *Potentiale Ph. Edinb.* *The* POTENTIAL CAUTERY of the Edinburgh Diſp.

Take of Ruſſian pot-aſh and quicklime, of each equal parts; of ſpring-water three times the quantity of the whole; macerate them for two days, occaſionally ſtirring them; then filter the ley, and evaporate it to dryneſs; put the dry maſs into a crucible, and urge it with a ſtrong fire till it flows like oil; then pour it out upon a flat plate made hot, and while the matter continues ſoft, cut it into pieces of a proper ſize and figure, and keep it in glaſſes cloſely ſtopped.

This is alſo called *lapis ſepticus*. It is a ſtrong and ſudden cauſtic, but it deliquates too ſoon in the air, and runs beyond the bounds it ought; indeed the ſuddenneſs of its action depends on its diſpoſition to liquify. But this inconvenience is avoided in the calx cum kali puro. Ph. Lond. 1788.

CAVA VENA. The large vein which receives the refluent blood, and conveys it to the heart, is thus named.

The *vena cava* is generally deſcribed as being two, viz. the aſcending and the deſcending; the right auricle receives them both, one at its upper, the other at its lower part.

The ſuperior *vena cava* is diſtributed principally to the thorax, head, and upper extremities, and but very little to the parts below the diaphragm.

The inferior *vena cava* is diſtributed principally to the abdomen and lower extremities, and very little to the parts above the diaphragm.

The ancients called the *vena cava* ſuperior, the *vena cavâ aſcendens*; and the *vena cava* inferior, *vena cava deſcendens*.

According to Winſlow, who is extremely accurate in his deſcription of the blood-veſſels, the ſuperior or aſcending *vena cava* runs up from the right auricle of the heart, almoſt in a direct courſe for about two fingers breadth within the pericardium, on the right ſide of the aorta, but a little more anteriorly. When it paſſes out of the pericardium, it runs up to near the cartilage of the firſt true rib, and a little higher than the curvature of the aorta; here it divides into branches, viz. the right and left ſubclavian veins. The trunk of this upper *vena cava* from where it leaves the pericardium, to the juſt named bifurcation, ſends out anteriorly the vena mediaſtina, pericardia, diaphragmatica ſuperior, thymica, mammaria interna, and trachealis. All theſe are called dextræ. Their fellows on the other ſide are called ſiniſtræ; they do not ſpring from the trunk of the *vena cava*, but from the left ſubclavian vein. Poſteriorly, a little above the pericardium, the trunk of the *vena cava* ſends out a capital branch, called vena azygos. It runs down by the vertebræ dorſi, almoſt to the diaphragm, giving off the greateſt part of the venæ intercoſtales and lumbares ſuperiores.

Hardly a quarter of an inch of one ſide of the *vena cava* inferior is contained in the pericardium; from thence it immediately perforates the diaphragm, to which it gives the venæ diaphragmaticæ inferior, or phrenicæ: it paſſes behind the liver, through the great ſinus of that viſcus, to which it furniſhes thoſe branches called venæ hepaticæ. In this courſe it inclines towards the ſpina dorſi and aorta inferior, the trunk and ramifications of which it accompanies all the way to the os ſacrum, the arteria cœliaca and the two meſentericæ excepted. Arrived at the os ſacrum, it terminates by a biſurcation, and forms the two iliacæ, which give off the hypogaſtricæ, and ſome other branches diſtributed into the pelvis; then they paſs under the ligamentum Fallopii, and there take the name of crurales, each of which are diſtributed throughout the lower extremities.

CAVAN *dicta* THORA PAROU. See CAJAN.

CAVERNA. A CAVERN. See alſo PUDENDUM MULIEBRE.

CAVIARIUM. It is the pickled roe of the ſturgeon.

CAVICULA, } See ASTRAGALUS, and alſo CUNEI-
CAVILLA. } FORME OS.

CAVITAS INNOMINATA. See AURICULA.

CAYAN. See CAJAN.

CAYENNE, } See PIPER INDICUM.
CAYAN. }

CAYUTANA LUZONIS. See FAGARA MAJOR.

CAZABI. See CASSADA.

CEANO-

CEANOTHOS. See CARDUUS HÆMORRHOIDALIS.

CEANOTHUS. See CELASTUS INERMIS.

CEASMA, from κεάζω, *to split*, or *divide*. A fiſſure or fragment.

CEBAR. See AGALLOCHUM.

CEBIPIRA *Braſilienſibus*. *Guacu*, or *Miri*. A tree which grows in Braſil. Its bark is bitter and aſtringent, and of which baths and fomentations are made for the relief of pains in the limbs, diſeaſes from cold, tumors of the feet and belly, itch, and other cutaneous diſeaſes.

CECIS. A GALL of the OAK. See GALLÆ.

CECRYPHALOS. Hippocrates by this word means the net in which women confined their hair. See alſo ABOMASUM.

CEDMA. See PUDENDAGRA.

CEDRA, ESSENTIA DE. See BERGAMOTTE.

CEDRELÆUM. OIL of CEDAR. See CEDRIA.

CEDRELATE. According to Bellonius, this word is derived from κέδρος, *the fir-tree*, and ἄνδρος, *the cedar*. Among botaniſts, it ſignifies that ſpecies of *cedar* which is ſaid to exceed all other trees in ſize.

CEDRIA. It is called the PITCH and the RESIN of the great cedar-tree, ſo that it is the crude tears of the cedar. Some ſay it is different from the *cedrium*, or oil of cedar, which is more oily and liquid; but by writers in general, it is called *cedria*, *cedrium*, and *cedrelæum*, &c. Gorræus and Pliny ſay, that the great cedar yields a pitch called *cedria*, to which Galen gives ſeveral names, and among the reſt he calls it *cedria*. Salmaſius ſays, that the Arabians call the oil of cedar *ketran*, or *alketran*; and we, by a corruption of that word, give the name of *cedrinum* to the pitch which is uſed for ſhips. Though the Greeks confound cedrelæum with *cedria*, they are not the ſame; for the *cedria* is the pitch, or reſin, that diſtils from the cedar-tree; and the cedrelæum is an oil obtained from pitch or reſin, and which ſwims above it in boiling, and is collected with wool. Dioſcorides ſays, that the beſt *cedria* is thick, pellucid, of a nauſeous ſmell, when poured out it does not ſpread, but runs into drops, and has a power of preſerving dead bodies from corrupting: but notwithſtanding all the diſputes, it does not appear to be really known what the cedrium is.

CEDRINUM LIGNUM. See JUNIPERINUM.

—— VINUM. CEDAR WINE. Take thin pieces of wood, juſt cut from the tree, while the fruit is on it, and expoſe them to the ſun, or a fire, to obtain their juice by exudation. A pint of this juice is mixed with ſix pints of wine; then they ſtand for two months, after which they are decanted into another veſſel, and expoſed for ſome time to the ſun, and thus this wine is made fit for uſe.

In the ſame manner are prepared wines from juniper, pine, *cypreſs*, bay, and the wood of ſome other trees. All theſe wines are remarkably heating, diuretic, and aſtringent, and the bay wine is particularly ſo.

Cedar wine is alſo prepared by mixing half a pound of the bruiſed berries with ſix pints of muſt, which are placed in the ſun for forty days, and then taken for uſe.

CEDRINUM is a name for that compoſition of wax and reſin uſed for ſhips. See CEDRIA.

CEDRIS. See CEDRUS.

CEDRITES. Is wine, in which the reſin which diſtils from cedar-trees hath been ſteeped.

CEDRIUM. See CEDRIA, and PIX LIQUIDA.

CEDRO. } See CITREUM.
CEDROMELA. }

CEDRONELLA. See MELISSA.

CEDROSTIS. See BRYONIA ALBA.

CEDRUS, called alſo *cedrus conifera foliis laricis*, *cedrus Libani*, *cedrus magna*, *larix orientalis*. The great cedar of Libanus.

No modern botaniſts find any of the *cedar*-trees that agree with the Scripture account of their loftineſs, but rather with that account of them which the Pſalmiſt gives, when he ſays, the flouriſhing ſtate of a people is, that they ſpread their branches like the *cedar*-tree. Maundrel, in his Travels ſays, he meaſured the trunks of ſome old *cedar*-trees, and found one to be twelve yards in circumference, and thirty-ſeven yards in the ſpread of its boughs.

The *cedar of Lebanon* is an ever-green coniferous tree, with very narrow, ſtiff, ſharp-pointed leaves, ſtanding ſeveral together in tufts. Its fruit is called *cedris*. It is a native of the bleak ſnowy mountains of Syria, and is not as yet become common in England. As a medicine, it differs very little from the virtues of the fir-tree. Its ſmell is conſiderably more agreeable, and the reſinous juice extracted from the trunk of the *cedar*-tree, by inciſions, is more diſpoſed to concrete into a ſolid brittle maſs than that from the fir-tree; nor does the matter which diſtils from the *cedar*-tree loſe much of its finer parts in drying; even boiling water does not eaſily carry off the flavour of *cedar*-wood.

By diſtilling the wood with water, a ſmall quantity of eſſential oil is obtained, which congeals in a moderate degree of cold. The decoction in the ſtill affords an extract by evaporation, which ſmells conſiderably of the wood, and is in taſte bitteriſh and ſaline. In the ſaline nature of this extract, this wood differs from all the reſinous ones that have been examined. Margraff ſays, that the ſaline part which ſhot from the extract juſt named, was common ſalt. That —— CUM FOLIO CYPRI, called alſo *lycia*, *bellonio*, *bellonis*, *oxycedrus*, *juniperus*, *thuyæ genus quartum*, and *ſabina baccifera*.

It is a ſhrub with yellow flowers, and fleſhy leaves, placed four together like thoſe of cypreſs. The flowers are followed by a round fruit like a mulberry in taſte and ſmell, and of a purple colour when ripe. In this fruit are three or four ſeeds which ſmell like roſin. Until this tree is three or four years old, its only diſtinction from the juniper buſh is, that its leaves are ſofter and ſhorter. It grows in many of the ſouthern parts of Europe. Its medicinal qualities are like thoſe of juniper. Dale informs us of another ſpecies which he found in Carolina, and which affords a gum ſo like the true olibanum, that when mixed they cannot be ſeparated. Hence he concludes, that this is the tree that affords the olibanum.

—— AMERICANUS. See THUYA.

—— BACCIFERA, SABINA. See CEDRUS FOLIO CYPRI.

—— CEES. See CRINONES.

——PHOENICIA, called alſo *thuya Maſſilienſium*, *juniperus e Goa*, *cedrus e Goa*, *ſabina Goenſis*, and *juniperus Caroliniana*. Its virtues are ſimilar to thoſe of juniper.

CELASTUS, INERMIS, *foliis ovatis*, *ſerratis*, *trinervis* LINNÆI. Called alſo CEANOTHUS Linnæi. It is a ſpecies of carduus.

Some noted Indians depend more on this than on the lobelia for the cure of the pox, and uſe it in the ſame manner as the LOBELIA, which ſee. If the diſorder is exceedingly virulent, they mix ſome of the roots of the RUBUS *caule aculeato foliis ternatis* Linn. with it.

CELE. Κήλη, a TUMOR, cauſed by the protruſion of a ſoft part, alſo a *rupture*.

CELERI ITALORUM. See APIUM.

CELLULÆ MASTOIDÆÆ. Theſe are very irregular cavities in the ſubſtance of the maſtoid apophyſis, which communicate with each other, and have a common opening towards the inſide, and a little above the poſterior edge of the orbicular groove. Theſe cells are lined by a fine membrane, which is partly a continuation of the perioſteum of the tympanum, and partly ſeems to be a glandular ſtructure like a kind of membrana pituitaria. The *maſtoide* opening is oppoſite to the ſmall opening of the Euſtachian tube, but a little higher. See AUDITUS.

CELLULOSA MEMBRANA. The CELLULAR MEMBRANE. It is called the MUCUAL WEB, *tela celluloſa*, *panniculus adipoſus*; *adipoſa*, *pinguedinoſa*, and *reticularis membrana*; the French call it *tiſſue cellulaire*, *tiſſue muqueux*, and *l'organe cellulaire*. This membrane is of the greateſt extent, and of the utmoſt conſequence in the human ſtructure; for it not only enfolds, but it enchains and penetrates into every part; indeed it ſeems to be the very conſtituent of moſt, if not all the parts that are called the ſolids in our bodies. Experiments prove that all *membranes*, without exception, and the veſſels, which are hollow *membranes*, the parenchymatous ſubſtance of the viſcera, ligaments, and a great part of the bones, either are, or have been *cellular membrane*. The *cellular membrane* by being compacted in different degrees of firmneſs, forms theſe ſolids. Air introduced under the ſkin diffuſes itſelf through all the ſurface of the body, penetrates into the interſtices of the muſcles; and Haller aſſerts, that even the vitreous humour of the eye hath received the flatus of an emphyſema.

Some deſcribe the *cellular membrane* not as one, but as a congeries of many membranous laminæ joined irregularly to each other at different diſtances, ſo as to form

numerous interſtices of different capacities, and which communicate with each other. Theſe interſtices they call cellulæ, and the ſubſtance made up of them cellulous ſubſtance.

But generally, and that moſt properly, it is conſidered as being of two kinds, viz. reticular and adipoſe; and is deſcribed as a compoſition of ductile *membranes* for the lodgment of oil, connected by a ſort of net-work. In ſome parts its ſubſtance is merely a net-work of ſlender fibres, and ſmall membranes which give it ductility and looſeneſs; for inſtance, under the ſkin of the penis and ſcrotum. In other parts, it is more or leſs loaded with oil, and is leſs porous or ſpongy in its ſubſtance, as under the ſkin of the buttocks, and in the ſoles of the feet. Dr. Hunter uſes the term *cellular* as the generical name, and the terms reticular and adipoſe, for expreſſing the two ſpecies. He alſo obſerves, that the reticular part is evidently diſperſed through the whole body, except, perhaps, in the ſubſtance of the bones, of the brain, and in the humours of the eye. That is found in a much greater degree in the belly of muſcles than in the tendons, in which it is ſcarcely diſcerned. And he is of opinion, that the adipoſe *membrane* is compoſed of two kinds of cells, viz. the reticular, which communicate with each other; and adipoſe, which are diſtinct, and are the reſervoirs of the animal oil, or a white granulated matter, capable only of being fuſed by heat; the cells of which, containing it, are called *faſciculi adipoſi*. He urges, as a proof of his opinion, that the water in an anaſarca goes downward, whilſt we are in an erect poſture, but the oil does not. The oil is ſuppoſed to be ſecreted by the ſmall arteries, and occaſionally abſorbed into the circulation. Though Dr. Hunter thinks, that wherever there is fat in the human body, there is a particular glandular apparatus ſuperadded to the reticular *membrane*, conſiſting of veſicles, or bags, for lodging the animal oil, as well as veſſels fitted for its ſecretion.

Whether or no the *cellular membrane* be the baſis of all the organized and vaſcular parts of our frame, Dr. Hunter hath proved, that the moſt ſimple parts of it are vaſcular; that the callus which unites broken bones, is itſelf bone, and alſo vaſcular; that the morbid adheſion between the lungs, &c. and their adjacent parts are vaſcular, and that a cicatrix in the ſkin is vaſcular. Whence he infers, that all our ſolids are organized, and that whether lengthened, or renewed, they ſhoot in a vaſcular form. But here the doctor ſpeaks of the viſible parts.

The *cellular membrane* receives the terminations of the nerves, both of the brain, and of the medulla ſpinalis. Perhaps it is formed of the continuation of their coats, and is the termination of them.

The ducts which carry off the fluid ſecerned in this membrane, paſs out between two membranes like the ureters in the bladder.

The uſes of this membrane are many, ſome of which are of the utmoſt importance, conſidered in a medical view, and others but little underſtood. Among the variety, the following are ſufficiently obvious:

1. It fills up interſtices, and gives an agreeable contour to the body.

2. It is a cuſhion to defend againſt preſſure, hence it is of a thicker compoſition in infants.

3. It connects the parts of the body, but ſo as to admit of a ſliding motion on the circumjacent parts.

4. In ſome parts of the body it ſerves as a bed for tender parts to be lodged on, as in the orbit, ſcrotum, &c.

5. It ſerves as a reſervoir for animal oil.

6. And from obſerving, that the deſtruction of it in a muſcle is always attended with a loſs of motion there; it is juſtly concluded to be of uſe in conveying the principle of life, and duly diſtributing it throughout the body.

This membrane is the ſeat of abſceſſes, the leucophlegmatia, emphyſema, anaſarca. In a conſumption it is ſhrunk up ſo as to be hardly viſible; in an anaſarca its greaſy contents are all deſtroyed; and in an emphyſema, almoſt its minuteſt parts are rendered viſible. Bullets, and other large ſubſtances that cannot paſs the circulation, paſs by the *cellular membrane*.

On this article, ſee what Dr. Hunter ſays in the Lond. Med. Obſ. and Inq. vol. ii p. 26, &c. Haller's Phyſiology; Malpighius on the *Cellular Membrane*; Dr. Shebbear in his Theory and Practice of Phyſic; alſo Recherches ſur le Tiſſu Muqueux, ou *l'Organe cellulaire* par Monſ. Theoph. de Bordeu.

CELLULOSA TUNICA RUYSCHII. See INTESTINA.

CELOTOMIA, from κηλη, *hernia*, and τεμνω, *to cut*. See CASTRATIO, and HERNIA.

CELSA. Paracelſus means the ſame by this word, as is generally meant by what is called the beating of the life, or of the life's blood: it is a barbarous term of Paracelſus.

CELTIS. See LOTUS ARBOR.

CEMENTATIO. See COEMENTUM, and CORROSIO.

CEMENTERIUM. See ALUDEL.

CEMENTUM. See COEMENTUM.

CENCHRAMIS. See FICUS SATIVA.

CENCHRIUS. A ſpecies of HERPES that reſembles κεγχρος, *millet*. See HERPES, Bell's Spec. 3d.

CENCHROS. MILLET. See MILLIUM. Theſe ſeeds are alſo called cenchreides, whence in Hippocrates we find the words κεγχρωδεες ιδρωτες, *miliary ſweats*.

CENEANGIA, from κενος, *vacuus, inanis*, and αγγος, *vas*. It is an emptineſs of veſſels, particularly thoſe of the body; on account of abſtinence, or refraining from food. By ſome it is thought to mean primarily, a ſpontaneous evacuation of blood from the veſſels, and conſequently that which is artificial, may be meant in ſome authors by this term.

CENEONES, the FLANKS, from κενος, *empty*.

CENIFICATUM. See CALCINATUM.

CENIGDAM, } CENIPLAM, or CENIPOLAM.
CENIGOTAM. } The name of an inſtrument anciently uſed for opening the head in epilepſies.

CENIOTEMIUM. A purging remedy, formerly of uſe in the venereal diſeaſe, ſuppoſed to be mercurial.

CENOSIS, from κενος *empty*. EVACUATION. It muſt be diſtinguiſhed from catharſis. *Cenoſis* imports a general evacuation. Catharſis means the evacuation of a particular humour which offends with reſpect to quality.

CENIPLAM. } See CENIGDAM.
CENIPOLAM. }

CENT. An abbreviation of *centaurium*.

CENTAUREA BENEDICTA. See CARDUUS BENEDICTUS.

CENTAUREA CENTAUREUM. See RHAPONTICUM VULGARE.

CENTAUREUM MINERALE. See ANTIMONIUM, N°. 15.

CENTAURIOIDES. See GRATIOLA.

CENTAURIUM. CENTAURY.

Boerhaave mentions thirteen ſorts.

—— MAGNUM, MAJUS. See RHAPONTICUM VULG.

—— MINUS. Centaurium minus, or *leſſer centaury*. It is the GENTIANA CENTAURIUM, or, GENTIANA *corollis quinquefidis infundibuliformibus, caule dichotomo, flore purpureo*. CLASS, PENTANDRIA; ORD. MONOGYNIA; LINN. Gen. Plant. 255. the PURPLE LESSER CENTAURY.

It is a ſmall plant, with three-ribbed, ſomewhat oval leaves, ſet in pairs on the ſtalks which divide towards the top into ſeveral branches, bearing umbel-like cluſters of bright red, funnel-ſhaped flowers, cut into five acute ſegments, followed by little oblong capſules, full of very ſmall ſeeds. It is annual, grows wild in dry paſtures, and among corn. It flowers in July, ſome call it the *febrifuge*.

The leaves and tops are ſtrong bitters, having ſcarcely any ſmell or flavour, and agree with the gentian root.

The ſeeds are bitter, but the petala of the flowers and roots are almoſt inſipid. The flowery tops are chiefly the part that is uſeful.

All its active parts are readily given out to water, or to rectified ſpirit of wine. Water takes up with the bitter an inſipid mucilage; but ſpirit only takes up the bitter part. Hence the watery extract is more in quantity, and leſs bitter; and the ſpirituous one leſs, but more bitter. Cartheuſer ſays, that one ounce of the herb yields about half an ounce of the watery extract, and ſcarcely two ſcruples of the ſpirituous. The Centaury is juſtly eſteemed to be the moſt efficacious bitter of the medicinal plants, indigenous in England, and has been recommended as a ſubſtitute for gentian; and by ſeveral thought to be a more uſeful medicine. Dr. CULLEN ſays, though the extract of this plant is ſaid to be leſs agreeable than that of gentian, he can find no difference between them, and thinks that it ſhould be conſtantly uſed for that of gentian, as it may be more cheaply prepared. It is conſidered as ſtrengthening and ſtomachic, and as out of

of the body, centaury, manifeſt an equal degree of antiſeptic power with that of gentian, ſimilar medicinal effects are aſcribed to it. It is given in atony, dilepſy, and Jaundice. The flowery tops are infuſed after the manner of tea, and a tea-cup full adminiſtered 3 or 4 times a day; but they may be alſo taken in powders, and prepared into an extract, in the ſame manner as wormwood. See Newman's Chem. Works. Lewis's and Cullen's Mat. Med.

CENTIMORBIA. See NUMMULARIA.

CENTINERVIA. See PLANTAGO.

CENTINODIA, or CENTINODIUM. See POLYGONUM.

CENTIPEDES. See ASELLI.

CENTRATIO. Paracelſus expreſſes by it the degenerating of a ſaline principle, and contracting a corroſive and exulcerating quality. Hence centrum falis is ſaid to be the principle and cauſe of ulcers.

CENTRE PHRENIQUE. See DIAPHRAGMA.

CENTRION, from κεντεω, *to prick*. An epithet for a plaſter mentioned by Galen, and which is calculated againſt ſtitches in the ſide.

CENTRUM, in Chemiſtry, is the principal reſidence, foundation, or ſource of any thing. Alſo that part of medicine in which its virtue reſides.

CENTRUM NERVEUM. The tendinous part of the diaphragm, which hath a triangular appearance, is thus named by ſome, called alſo *centrum tendinoſum*.

—— OVALE. Vieuſſens firſt called a part of the *corpus calloſum* thus. It is convex, and of the form of the cerebrum. See CEREBRUM.

—— SALIS. See CENTRATIO.

—— TENDINOSUM. See CENTRUM NERVEUM.

CENTUNCULUS. See ALSINE, and GNAPHALIUM

CEPA. The ONION. *Allium cepa*, Linn. *crommyon*; *cromyon*. Botaniſts enumerate ten kinds; they are called *agrumina*.

The common *onion* is a plant too well known to need any thing being ſaid with reſpect to its botanical character. It is chiefly cultivated for culinary uſes: its root affords a large proportion of alimentary matter, particularly in its boiled ſtate, as it ſhews with ſome ſweetneſs, a large proportion of mucilaginous matter, with its acrimony exhaled.—In its freſh ſtate, it is very acrid and ſtimulating. In bilious hot diſpoſitions it produces flatulence, thirſt, and head-ach; it is uſeful in cold ſluggiſh and phlegmatic temperaments; is warming, attenuant, and promotes both expectoration and urine. It is powerfully antiſeptic; and if applied to tumors is ſuppurating.

The root is the moſt active part; it loſes moſt of its virtue by drying. Diſtilled with water, all its flavour and acrimony ariſes. The active matter is much more volatile than garlic. but in other reſpects they agree.

Onions have the moſt effect of any of the alkaleſcent plants in diſſolving gravelly concretions. The expreſſed juice has been ſervicable in deafneſs, ſee ALLIUM. Neumann ſays, that the characteriſtic principle of this root is its eſſential oil, notwithſtanding it cannot be collected to a ſeparate ſtate. See Lewis's Mat. Med. or Neumann's Chem. Works. Cullen's Mat. Med.

—— SECTILIS. CIVES, or CHIVES.

CEPÆA. A ſmall ſpecies of onion, is ſo called, which uſed to be in great requeſt for ſallads in ſpring, but is not now much regarded. See alſo BECABUNGA.

CEPHALÆA. A long continued pain in the head. See CEPHALALGIA.

CEPHALAGIA, CEPHALALGIA, from κεφαλη, *the head*, and αλγος, *pain*. The HEAD-ACH. It is alſo named *cephalæa*, *cephaloponia*, and *hemonopagia*. By ſome it is uſed to ſignify a dull pain of the head, which is of a ſhort duration. But moſt frequently it is uſed as expreſſive of pain in the head in general, without regard to circumſtances.

It is ſometimes acute and ſometimes chronical.

In ſome the pain is in the back of the head, from a contraction of the occipital muſcles. When mild it is called *cephalalgia*, when inveterate it is called *cephalæa*. When one ſide of the head only is affected, it takes the name of *hemicrania*, alſo called *migrana*, *hemipagia*, and *megrim*; in one of the temples only it is intitled *crotaphos*; and that which is fixed to a point, and that generally in the crown of the head, is diſtinguiſhed by the name of *clavus hyſtericus*, which laſt ſee.

The nervous membranes of the head are the general ſeat of pains there, as the pericranium, the ſkin, dura mater, the membrane which covers the ſinus in the os frontis, &c. This complaint is not taken notice of in the noſology of Dr. CULLEN, though treated as an idiopathic affection by other noſological writers. See VOGEL, SAGAR, LINNÆUS, MACBRIDE. SAUVAGES places it under his ſeventh CLASS, DOLORES, and ſecond ORD. DOLORES CAPITIS, of which the CEPHALALGIA, and CEPHALÆA, form two diſtinct genera. See *Noſologia Methodica*, VOL. II p. 49.

Women, on account of their care about their hair; and children, becauſe of the irregular indulgences in improper foods, are the moſt ſubject to this diſorder.

The cauſes are very numerous. Hippocrates, in the 13th ſection of his book De Flatibus, ſays, "As the motion of the blood in the head is performed through very narrow channels, the redundance and confinement of this fluid excites pain; for as the blood is naturally hot, when it is impelled by any force, it cannot quickly paſs through the narrow channels, ſince it meets with many hindrances and obſtructions, for which reaſon there is a pulſation about the temples." Among the variety of cauſes are ſuppreſſed or diminiſhed cuſtomary evacuations; the acrid matter of ſome diſeaſes, as rheumatiſm, gout, &c. by fixing particularly on any part of the head; a caries in the bones of the head; polypuſes, &c. obſtructing the blood's paſſage through the jugular veins and ſinuſes of the brain; ſtoney concretions in the brain; acrid humours repelled from the external parts of the head; abſceſs in the brain; a want of ſleep; expoſure of the head either to heat or coldneſs; a ſpaſmodic conſtriction of the nervous membranes in the head; uneaſineſs in the ſtomach, and the faulty quality of its contents, cold feet; inanition; repletion; hardneſs, and adheſion of the meninges. The hemicrania is uſually from diſorders in the ſtomach; and periodical pains have their cauſe in the ſtomach or other viſcera, &c.

When the pain is in the back part of the head, it is uſually from a ſpaſm of the occipital muſcles. Some *headachs* are attended with fever, and others not.—When *a ſuppreſſed uſual evacuation of blood from the noſe is the cauſe*, there is generally a pain in the whole head, which becomes hot, red, and tumid; the veſſels ſwell, the pulſation of the arteries become ſtrong, eſpecially about the neck and temples, the noſtrils are parched and dry, a heat ſeizes the fauces, and thirſt is troubleſome.—*When a catarrh*, a pain affects the fore part of the head; it is of a dull kind, with a ſenſe of preſſure and heavineſs. *When a lues venerea*, it often renders the cranium carious.—*When the cauſe is from a hot bilious habit*, the pain is acute and throbbing.—*When from a cold phlegmatic habit*, there is a dullneſs and heavy oppreſſion in the head, and a ſenſe of coldneſs in the part.—*When hyſteric affections are the cauſe*, the pain is fixed generally to a point in the crown of the head, ſcarce exceeding the breadth of half a guinea; *in ſome* it ſeems as if a nail was driven into the head; *ſometimes* it ſeizes the forehead and affects the eye-brows; *ſometimes* it is in the ſinciput, at others in the occiput; *ſometimes* it is near the vertical future, at others about the temples; and a ſenſation of cold is always attendant on this kind of pain in the part affected; it is called *clavus hyſtericus*.

When the cauſe is within the cranium, and the pain is attended with a conſiderable degree of fever, there is danger of a phrenitis. If, when no fever attends, *a ſudden pain attacks hypochondriac patients*, or ſuch as are diſpoſed to melancholy, depriving the patient of ſleep and appetite, and is accompanied with a dullneſs of hearing, and an internal pulſation of the veſſels, there is danger of madneſs. *When a ſudden pain of the head* is followed by a ringing of the ears, a weakneſs in the knees, and interruption in the ſpeech, an apoplexy may be expected. Frequent *head-achs* in young people prognoſticate future arthritic diſorders. Violent *head-achs* with pale urine in fever indicate an approaching delirium. Violent and long continued *head-achs* often end in deafneſs, blindneſs, vertigo, apoplexy, and epilepſy or palſy, &c.

The cauſes diſtinguiſhed, and the particular cauſe determined, will eaſily lead to the cure; but, in general, if the fluids are impetuouſly conveyed to the head, they muſt be derived to the leſs noble parts. The ſpaſmodic ſtrictures relaxed, the cauſe muſt be removed; and to prevent a relapſe, the whole nervous ſyſtem muſt be ſtrengthened.

Patients ſubject to pains in the head ſhould eat ſparingly at night, lay high with their heads, keep their bowels ſoluble, and feet warm.

Vomits. They are proper to begin the cure with, in

all cafes where the ſtomach is in fault, which it is in all hemicranias, and moſt periodical *head-achs*; firſt taking care to have the bowels ſoluble, and the head free from ſanguinary plenitude.

Bleeding. This operation is only neceſſary where there is a ſanguine plethora or an inflammation attendant. Opening the temporal artery is uſually extolled in violent *head-achs*; but, if the external jugular vein was opened, greater benefit, and that more ſpeedily, would be produced.

Baths for the feet. In all caſes where bleeding cannot be conveniently admitted, a bath of tepid water, in which the feet and part of the legs may be now and then placed, will be of ſingular uſe.

Purges. Lenitives are more proper in all kinds of *head-achs* than the more active purges. The ol. ricini, elect. e caſſia, or vinum aloes, are to be preferred.

Æther. If this is dropped on a rag, laid upon the palm of the hand, then immediately applied to the part affected, inſtant relief is ſometimes obtained. Thus the late Dr. Ward cured pains that were ſituated ſuperficially.

A branch from the fifth pair of nerves is ſpread on the membrane that lines the noſtrils, and another branch from the fauces paſſes through the foramen ſupercilia, and ſpreads on the teguments of the forehead; hence, when pain is in the eye-ball and forehead, a heat is perceived in the noſtrils, and benefit may be expected from external means, if applied to the membrana narium and to the forehead; alſo from alternate preſſure near the ſuperciliary holes of the frontal bones.

If ſpaſms of the lower parts propel the blood upwards, and ſo produce this diſorder, bleed; then rub the ſpaſmodic extremities with æther to relax them, and place the feet in tepid water.

Symptomatic head-achs are only removed by relieving the original diſorder: e. g. if the venereal diſorder gave riſe to it, mercurials will be the proper medicines; if any other diſorder, in which an acrimony is induced into the juices, let the means of relief reſpectively be accompanied with a free uſe of a decoction of ſarſaparilla.

Periodical head-achs are the moſt difficult to remove. In theſe caſes the bark is the general remedy, and when it fails, large doſes of valerian, duly repeated, will ſucceed.

If the pain is ſo great that the ſtrength is leſſened by it, the firſt endeavours muſt be to abate the pain by gentle laxatives and anodynes, and then to remove the cauſe.

If a beginning caries is obſerved to be the cauſe, cut directly upon it, for thus relief is ſoon obtained; but if the caries hath reached the diploe, the only cure is the trepan.

In the hemicrania, vomits, repeated bitter purges, and warm ſtrengthening ſtomachics, are the proper means.

Habitual head-achs have been much relieved by cold bathing, and by the uſe of antimonial wine taken in doſes as large as the ſtomach will bear, with a ſtrong infuſion of the wild valerian root.

When an acid in the primæ viæ gives riſe to this diſorder, a glaſs of warm water may be taken now and then with thirty drops of liquor c. c. and a doſe of rhubarb with magneſia, every third or fourth day.

In that ſpecies called *clavus* a bliſter may be applied to the part, fetid pills and valerian muſt be given freely, or inſtead of a bliſter, æther may be applied to the pained part, and warm pedilaves may be uſed.

If a tranſition of gouty matter to the head produces pain there, give now and then the *vinum aloes* as a ſolutive, bliſter the legs, and give draughts with ſal. c. c. vol. rad. ſerp. conſ. aromat. &c.

CEPHALALGIA CATARRHALIS. See CATARRHUS.

—— INFLAMMATORIA. See PHRENITIS.

—— HERBA. See VERBENA.

—— SPASMODICA. THE SICK HEAD-ACH. For aſſiſtance in this afflictive malady, we are firſt, I believe, indebted to Dr. Fothergill; who obſerves that it is not the complaint of any particular age, ſex, conſtitution, or ſeaſon, but it is incident to all. The ſedentary, inactive, relaxed, and incautious reſpecting diet, are the moſt expoſed to it.

The patients, he obſerves, generally awake early in the morning with a *head-ach*, which ſeldom affects the whole head, but one particular part of it, moſt commonly the forehead; over one frequently, ſometimes both eyes. It is ſometimes fixed about the upper part of the parietal bone, of one ſide only; ſometimes the occiput is the part affected: ſometimes it darts from one to another of theſe places. From the time it commences, until it wholly ceaſes, it is ſometimes more, ſometimes leſs tolerable. With this is joined more or leſs of ſickneſs, which in ſome is juſt barely, in many is not ſufficient, without aſſiſtance, to provoke vomiting. If this pain does happen, as it moſt commonly comes on early in the morning, and before any meal is taken, ſeldom any thing is thrown up but thin phelgm, unleſs the ſtraining is ſevere, when ſome bitter or acid bile is brought up. In this caſe the diſeaſe ſoon begins to abate, leaving a foreneſs about the head, a ſqeamiſhneſs at the ſtomach, and a general uneaſineſs, which induces the ſick to wiſh for repoſe. Perhaps, after a ſhort ſleep, they recover perfectly well, only a little debilitated by their ſufferings. The duration of this conflict is very different in different perſons; in ſome, it goes off in two or three hours; in others, it will laſt twenty-four hours or longer, and with a violence ſcarcely to be endured, when the leaſt light or noiſe ſeems to throw them on the rack. In young perſons, it moſt commonly goes off ſoon; if it continues to harraſs them many years, as it ſometimes does, the fit is of longer duration, and leaves the whole frame in ſo weak a condition, as to require ſome length of time to recover. Its returns are very irregular; ſome have it every two or three days, ſome once in two or three weeks, others in as many months, and ſome yet ſeldomer. Thoſe who uſe but a little exerciſe, and are inattentive to their diet, are the greateſt ſufferers: coſtive habits are moſt expoſed to it; an habitual laxity of the bowels coming on has removed this complaint.

The diſeaſe is ſpaſmodic; it attacks after digeſtion is performed, when the bile has acquired its full activity, undiluted by freſh ſupplies of liquid, and the nerves expoſed to irritation: from numerous circumſtances it appears to proceed from the ſtomach. For the moſt part it proceeds from inattention to diet, either in reſpect to kind or quantity, or both; and *without exact conformity to rule in this reſpect, medicine proves ineffectual.* Occaſional and too general miſchief ariſes from eating butter and other fat ſubſtances, pepper, or other ſpices, meat pies, rich baked puddings, drinking ſtrong liquors, alſo a very free uſe of malt liquor. Bitter medicines too are not generally agreeble. Quantity as well as quality of diet is to be conſidered. Bile, if very acid or bitter, is a frequent cauſe. There are habits in which the bile, whether acid or bitter, will purge, and theſe this diſorder rarely affects.

In order to relief, an emetic, or mild cathartic, and ſome time after it an anyodyne, will carry off the complaint. But perhaps in a few days it may return, though in ſome a month or more, even to a year, will paſs before another fit is repeated. If diſpoſed to coſtiveneſs, an agreeable laxative ſhould be ſo uſed as to keep the belly open: where acid bile abounds, bitter and abſorbent laxatives; where the bitter is abundant, ſalines are generally uſeful. *In the former caſe* give ſmall doſes of ſtomach-bitters, with a little alkaline ſalt, or a chalybeate, once or twice a day: *In the latter*, mineral or vegetable acids, and a diet of the ſame nature, ſoap, and pil. aloes cum myrrha, or magneſia and rhubarb in ſmall doſes, daily continued, will often prove, in caſes of acid bile, very uſeful; or the following: ℞ aloes ſuccotorin. ʒ i. rad. rhab. & rad. glycyrrhiz. inciſ. ää ʒ ſs. infunde in aq. calcis ℥ viij. colaturæ adde tinct. lavend. ℥ ſs. m. cap. cochl. i. ij. vel iij. pro re nata.

This diſeaſe is not the effect of any ſudden and accidental cauſe, but the effect of reiterated errors in diet, or in conduct, which by weakening the organs of digeſtion, and otherwiſe diſordering the animal functions, have affected the ſecretion of their juices, and perhaps the organs themſelves, ſo as to require a ſteady perſeverance in the uſe of medicines. This change cannot be effected ſpeedily; it requires a patient obſervance of proper regimen, in reſpect both to medicine and diet. The former ought therefore to be ſo contrived, as to be taken without diſguſt for ſeveral weeks together, and to be repeated at proper diſtances, till the end is obtained, digeſtion rightly performed, and the bile ſecreted and diſcharged as health requires; by which means, all that train of evils, which are the conſequences of its detention and diſtempered ſtate, will be gradually removed. Unleſs the whole plan of diet, both in kind and quantity, are made to conſpire with medical preſcription; the benefits ariſing from this are hourly annihilated by neglect or indulgence. It demands attention to obſerve the juſt medium, and no leſs reſolution to keep to it, which the ſtomach invariably points out in reſpect to quantity: *how much muſt be determined by every individual, and thoſe who are happy enough to abſtain at the firſt ſenſation of ſatiety, have made great progreſs in the*

art of maintaining ſuch a command of appetite, as, under moſt chronic indiſpoſitions, is one of the greateſt aids of recovery; and in health, one of the ſureſt preſervatives againſt them. Theſe patients are often ſubject to falſe appetite, a craving that does not ariſe from the demands of health, but from the morbid piquances of the juices in the ſtomach, which prompts them to eat more, and more frequently than nature requires, whence many take more than can be digeſted, &c. by which their ſufferings are increaſed, and the diſeaſe gains ground. See BILIS.

Alſo Dr. Fothergill's Works by Dr. Lettſom, 4to edit. p. 597, &c. Medical Obſervations and Inquiries, vol. vi. p. 103, &c.

CEPHALARTICA. Medicines that purge the head.

CEPHALEA JUVENUM. The HEAD-ACH that often attends youth at the approach of puberty.

CEPHALICA, CEPHALICS. From κεφαλη, *the head*, alſo *capitalia*. Thus remedies againſt diſorders of the head are ſtyled. Dr. CULLEN ſays, "however frequently employed, ſuch a general meaning is ſufficient to ſhew the abſolute impropriety of the term. It has been propoſed to limit it to ſuch medicines as have the power of encreaſing the energy of the brain, and the activity of the nervous ſyſtem. But in this manner it has been applied without any proper diſtinction and preciſion, and till this can be done the term would be better laid aſide."

However, cordials have been comprehended herein, as alſo whatever promotes a free circulation of the blood through the brain.

Except when the diſorder ariſes from exceſs of heat or an inflammatory diſpoſition in the head, moiſt topics ſhould never be uſed, becauſe, by diſtending, relaxing the veſſels, they produce congeſtion of the humors, and conſequently hurt the brain; dry ones are therefore preferable.

To rub the head after it is ſhaved proves ſometimes an inſtantaneous cure for a cephalalgia, a ſtuffing of the head, and a weakneſs of the eyes, ariſing from a weak and relaxed ſtate of the fibres.

And as by every freſh evacuation of the humours their quantity is not only leſſened, but alſo their recrimentitious parts derived thither, the more frequently the head is ſhaved, the larger quantity of humour is diſcharged; ſo that the frequent ſhaving of the head, is like a perpetual bliſter: and inaſmuch as it is uſeful, it is a *cephalic*.

—— POLICIS. A branch from the *cephalica* vena, ſent off from about the lower extremity of the radius, and runs ſuperficially between the thumb and the metacarpus.

CEPHALICA TINCTURA, Ph. Edinb. Take four ounces of wild valerian root, finely powdered; one ounce of Virginian ſnake-root, powdered; half an ounce of the tops of roſemary, and ſix pints of white French wine; digeſt for three days, and then ſtrain off the clear liquor for uſe: if to the *cephalic tincture* be added two ounces of ſena, one ounce of black hellebore, and two pints of French white wine, the *cephalica tinctura purgans* is formed.

Purgatives are uſeful additions to *cephalic* medicines.

—— VENA. The CEPHALIC VEIN, called alſo *capitis vena*. It was ſo called becauſe the head was ſuppoſed to be relieved by taking blood from it. It does not attend any particular artery; it comes over the ſhoulder between the pectoral and deltoide muſcles, and runs down the back part of the arm; when it gets to, or a little below the bending of the fore-arm, it divides into two, below the outer, as the baſilic does below the inner condyle of the os humeri. The inner of the two branches of the *cephalic vein* is called *mediana cephalica*, and is the ſafeſt to bleed in. It is a branch from the axillary vein.

CEPHALICUS. PULVIS. See ASARUM.

CEPHALINE. See LINGUA.

CEPHALITIS. See PHRENITIS.

CEPHALOIDES. Shaped like a head, or having a head. It is applied to plants which are called *capitatæ*, which ſee.

CEPHALONOSOS, from κεφαλη, *a head*, and νοσος, *a diſeaſe*. This term is applied to a fever that is frequent in Hungary. See AMPHEMERINA HUNGARICA.

CEPHALO-PHARYNGÆUS, from κεφαλη, *the head*, and φαρυγξ, the *throat*, called alſo *gloſſo-pharyngæus*, *mylopharyngæus*. A muſcle of the pharynx is thus named. It ariſes above, from the cuneiform proceſs of the os occipitis, before the foramen magnum, near the holes where the ninth pair of nerves paſs out; lower down, from the pterygoid proceſs of the ſphenoid bone, from the upper and under jaw, near the roots of the laſt dentes molares, and between the jaws; it is continued with the buccinator muſcle, and with ſome fibres from the root of the tongue, and from the palate. It is inſerted into a white line, in the middle of the pharynx, where it joins with its fellow, and is covered by the conſtrictor medius, i. e. hyopharyngæus of Douglas. Its uſe is to compreſs the upper part of the pharynx, and to draw it forwards and upwards. Innes. See PHARYNX, and PTERYGO-PHARYNGÆI.

CEPHALOPONIA. See CEPHALALGIA.

CEPHALOS, } See MUGILIS.
CEPHALUS. }

CEPHALOTOS. See CAPITATÆ PLANTÆ.

CEPINI. See ACETUM.

CERA. WAX. It is a concrete collected from vegetables by bees; and extracted from their combs after the honey is ſeparated from them. It poſſeſſes the attractive power of amber; it is lighter than water, but heavier than proof ſpirit: with the aſſiſtance of heat it is ſoluble in rectified ſpirit of wine. Dr. Alſton ſays it is more ſoluble in this ſpirit than in oil. It is not at all ſoluble in aqueous liquors. With a ſmall degree of heat it is diſſolved into the appearance of an oil; and in this ſtate it is eaſily miſcible with oils, and any kind of fat. It readily takes fire, and burns all away. It almoſt totally riſes in diſtillation, partly in form of a thick empyreumatic oil, and partly in that of a conſiſtent butyraceous matter, which by repeated diſtillations becomes fluid and thin. Hence it appears that all the *wax*, like camphor, is volatile in a certain heat. Inflammable vegetable oils may exiſt under the various forms of oil, balſam, roſin, pitch, dry tears, wax, or butter.

CERA FLAVA, YELLOW WAX, in the ſtate it is taken from the combs, is, while freſh, of a lively yellow colour, tough, yet eaſy to break; hath an agreeable flavour, ſomewhat reſembling honey: by long keeping it loſes its colour, its agreeable ſmell, and becomes harder and more brittle.

Diſtilled with water it impregnates the liquor with the ſcent, but gives no appearance of oil. If chewed, it proves tenaceous, and neither mingles with the ſaliva, nor diſcovers any peculiar taſte. By a mixture of gum arabic in fine powder it is rendered ſoluble in water; the *wax* requires its weight of the powdered gum for this end; and thus prepared it is ſtill inſipid, and void of all acrimony.

Dioſcorides ſays that *wax* is healing and ſoftening. When *wax* is made into an emulſion, or mixed with ſpermaceti and made into an electary, or divided by rubbing it with the teſtaceous powders while it is in a melted ſtate, it is ſucceſsfully uſed to blunt the acrimony in diarrhœas, and dyſenteries; it ſupplies the loſs of mucus in the bowels, and heals their excoriations.

The College of Edinburgh gives the following preparation:

Pulvis Teſtaceus CERATUS.

Melt yellow *wax* over a gentle fire, and carefully ſtir into it, by little and little, as much of the compound powder of crabs claws as the *wax* will take up. The doſe is a dram twice a day.

The chief uſes of *wax* are at preſent in plaſters, ointments, and cerates, partly to give conſiſtence, and partly on account of its emollient and ſuppurating quality.

The college of phyſicians of London order an EMPLASTRUM CERÆ, PLASTER OF WAX; formerly called *emplaſtrum attrahens*, to be made of yellow *wax* and ſheep's ſuet prepared, of each three pounds; yellow reſin, one pound: melted together, and the mixture to be ſtrained whilſt it remains in its fluid ſtate. Ph. Lond. 1788. Though bliſters uſed to be dreſſed with this plaiſter; it is not an agreeable form: cerates, by being ſofter, and leſs adheſive, are to be preferred: the ceratum ſpermatis Ceti, or the ceratum reſinæ flavæ, are good ſubſtitutes for this plaiſter; which ſee, under CERATUM ALBUM & CITRINUM.

Oleum Ceræ. OIL of WAX, called alſo *Cerelæum*—which Galen ſays is thinner than cerate.

Cut yellow *wax* in ſmall pieces, and put as much into a retort as will fill near one half, then add as much clean white ſand as will nearly fill the retort; after which place it in a ſand furnace. At firſt an acid liquor ariſes, afterwards a thick oil, which ſticks in the neck of the retort, unleſs it be heated by applying a live coal. "The thick oil

is

is alſo called the BUTTER OF WAX, and may be rectified into a thin oil by diſtilling it ſeveral times, without addition, in a ſand heat; if it is thus rectified, it never turns hard again.

Boerhaave highly extols this oil as an emollient, and for healing chaps and roughneſs of the ſkin, for diſcuſſing chilblains, and, with the aſſiſtance of exerciſe, for relaxing contracted tendons. It is rarely uſed on account of its empyreumatic ſmell, but it is wholly free from all acrimony.

CERA ALBA, WHITE WAX, is the yellow *wax* artificially deprived of its colour, by reducing it into thin flakes, expoſing them to the ſun and air, and occaſionally ſprinkling them with water. When ſufficiently whitened, it is melted and caſt into thin cakes. Some whiten it firſt by diſſolving it in hot water, then forcing it through linen ſtrainers into ſhallow metalline moulds, and then expoſe it to the air. When *wax* is thus robbed of its colour, it is alſo deprived of its reſolvent quality; but it is rendered more fit for cooling.

The college of Phyſicians of London give the following form for making the UNGUENTUM CERÆ, *Ointment of Wax*; formerly called *Unguentum Album*. Take of *white wax*, four ounces; ſperma ceti, three ounces; olive oil, a pint: let theſe be melted over a gentle fire, conſtantly and quickly ſtirring the compound, until it grows cold. Ph. Lond. 1788.

CERÆ UNGUENTUM CUM HYDRARGYRO. OINTMENT OF WAX WITH QUICKSILVER.

℞ Ceræ flavæ ℥ viij. adip. ſuillæ pp. ℥ ij. ung. hydrargyri ℥ vj. liquantur, cera, adeps, & oleum, donec ferè frigerant, deinde adjiciatur ung. hydrargyri, bene commiſceantur. This is highly recommended in languid ulcers, and as it acts favourably on the callous edges, it ſhould be extended ſome diſtance round the ſore.

A few drops of rectified ſpirit of wine renders *wax* more eaſy pulverizable. See Lewis's Mat. Med. Neuman's Chem. Works.

CERA DI CARDO. See CARDUUS PINEA.—— CERA CINNAMOMI. See CINNAMOMUM.

CERÆÆ, from κερας, *a horn*, called alſo *Cirri*. So Rufus Epheſius calls the cornua of the uterus.

CERAGO. The aliment of BEES.

CERAMIUM. A Greek meaſure of nine gallons.

CERANITES. See TROCHISCI.

CERANTHEMUS. See PROPOLIS.

CERARE. To incorporate or mix.

CERASIATUM. A purging medicine in Libavius, ſo called becauſe the juice of cherries is a part of it.

CERASIOS. The name of two ointments in Meſue.

CERASMA. A mixture of cold and warm water, when the warm is poured into the cold.

CERASORUM NIGRORUM AQUA. See AMYGDALÆ AMARÆ.

CERASUS. The CHERRY-TREE. It receives its name from *Ceraſus*, a city of Pontus, from whence it was imported to Rome by Lucullus, and thence propagated into Britain, according to Pliny's account. Boerhaave ſays that through culture the ſpecies are already forty-four in number.

Cherries have the ſame general properties as other ſummer fruits: they are agreeable, cooling, and quench thirſt, and becauſe they keep the body open, they are termed EUCOILIA.

CERASUS, *avium nigra*;——*Racemoſa fructu non eduli*;——*Folio laurino*;——*Trapezuntina*. See LAURO CERASUS & PADUS;——*Americana*. See MALPHIGIA;——*Dulcis Indica*. See CAPOLIN;——*Acida nigricantia*, the morello cherry;——*rubra*, alſo *ſativa*, and *Anglica*; common red cherry;——nigra, alſo ceraſus major, black cherry.

CERATIA. See SILIQUA DULCIS.

CERATIA DIPHYLLUS. See COURBARIL.

CERATITIS. See UNICORNU.

CERATIUM. See SILIQUA DULCIS.

CERATO-CEPHALUS. See ACMELLA and BIDENS.

CERATO-GLOSSUS, from κερας, *a horn*, and γλωσσα, *a tongue*. See HYO-GLOSSUS.

—— HYOIDÆUS. See STYO-HYOIDES.

CERATOIDES, from κερας, the genitive caſe of κερας, *a horn*. See CORNEA.

CERATOMALAGMA. See CERATUM.

CERATONIA. See SILIQUA DULCIS.

CERATO-PHARYNGEUS MAJOR & MINOR. See HYOPHARYNGEUS.

CERATOPHYLLUM. This is the name given to a genus of plants by LINNÆUS. VAILLANT and many others name it *hydro ceratophyllum*, and DILLENIUS, *dichotophyllum*. It is a genus of the polyandria order, belonging to the monoecia claſs of plants; ranking under the fifteenth order in the natural method *inundata*. The male calyx is multipartite; no coralla; ſtamina from ſixteen to twenty; the female calyx is multipartite; no corolla; no piſtil; no ſtyle; one naked ſeed.

CERATUM, from *cera*, *wax*, CERATE, called alſo *cerelæum*, which ſee, *ceroma*, *ceronium*, *cerotum*, *ceratomalagma*. *Cerates* chiefly differ from plaſters in conſiſtence, being a ſofter kind of plaſter, or harder kind of ointment. Their conſiſtence is very convenient: when mercury is made up in plaſters, a ſufficient quantity is not abſorbed from them to produce any valuable effect; but in a *cerate* it powerfully reſolves and diſcuſſes, and when thus applied to venereal tophs and nodes they often yield to it. The general rule for *cerate* is, eight parts of oil, fat, or juices, four of wax, and one or two of powders: or three ounces of oil, half an ounce of wax, and two or three drams of powder. The London College directs the following *cerates*.

Ceratum *Album*, WHITE CERATE, *now called* Ceratum Spermatis Ceti. SPERMA CETI CERATE.

Take of olive oil, four ounces in meaſure; of white wax, two ounces in weight; of ſpermaceti, half an ounce in weight: melt all together, and ſtir them well, till the *cerate* is quite cold. Ph. Lond. 1788.

CERATUM ANTIMONII VITRUM. See ANTIMONIUM VITRIFICATUM.

—— LYTHARGYRI. See LITHARGYRUM.

—— HYDRARGYRI NITRATI. See MERCUR. PRÆCIPIT. RUB.

—— MELLIS. See MEL.

Ceratum *Citrinum*. YELLOW CERATE, *now called* Ceratum reſinæ flavæ. CERATE of YELLOW RESIN.

Take of the ointment of yellow reſin, half a pound; of yellow wax, one ounce: melt them together. Ph. Lond. 1788.

CERATUM RUBRUM. RED CERATE. Take yellow wax, ſheep's ſuet, of each two pounds, red ſulphurated quickſilver, fifteen grains. Yellow roſin two ounces. Melt the roſin, wax, and ſuet together, and afterwards add the ſulphurated quickſilver; this is a cheap *cerate* for external dreſſings.

CERATUM EPULOTICUM. See CALAMINARIS LAPIS.

CERATUM LITHARGYRI ACETATI. See LYTHARGYRUM.

CERATUM SAPONIS. CERATE of SOAP. See SAPO.

CERATUM CANTHARIDIS. Cerate of SPANISH FLY. See CANTHARIDES. No. 5.

CERAUNO-CHRYSOS. See AURUM FULMINANS, under AURUM.

CERBERUS TRICEPS. See SCAMMONIUM.

CERCHNOS, CERCHNON. } Κερχνος, *wheezing*. See RHENCHOS.

CHERCHODES. See DASYS.

CERCIS, κερκις, *a peſtel for a mortar*, or *ſpoke for a wheel*. See SILIQUASTRUM & RADIUS.

CERCOSIS, κερκωσις, a diſeaſe of the clitoris, from κερκος, *a tail*. See CLITORIS.

CEREA. See CERUMEN AURIS.

CEREALIA. All ſorts of corn of which bread is made. The Greeks uſe the word *demetrias* in the ſame ſenſe. See FARINACEA.

CEREBELLUM, as it were, the LITTLE BRAIN, called alſo *epencranis*, *parencephalis*, *encranion*.

The cerebrum and *cerebellum* together, are often called *cerebellum*, when the brain is ſpoken of in ſmall animals, as birds, pigs, &c.

The *cerebellum* is flattened, and convex on its upper and lower part; its greateſt extent is from ſide to ſide. It is ſituated under the poſterior lobes of the cerebrum, and divided into two lobes by a ſmall proceſs of the dura mater, which is a continuation of the falx running in its direction. It is covered by the pia mater like the cerebrum, but the lobuli of the *cerebellum* differ from thoſe of the cerebrum, moſtly lying horizontal. It hath no convolutions like the cerebrum, but it hath curved parallel lines deſcribed on its ſurface by the pia mater, and is of a darker colour than the cerebrum. It is compoſed of a cortical ſubſtance, and a medullary part like the cerebrum

brum, but disposed in a more regular manner, and a perpendicular section of it hath a beautiful appearance, called *vitæ arbor*, the trunks of which form the *pedunculi of the cerebellum*. On the back part of the isthmus which joins the cerebrum and *cerebellum*, we see four eminences, the two upper are called *nates* or *glutia*, and the two lower *testes*, or *didymus*. Before these the aquæduct runs down into the fourth ventricle, the medullary covering of which is called *valvula magna Sylvii*. The fourth ventricle is placed between the *cerebellum* and the medulla oblongata.

CEREBRI AFFECTIO SPASMODICO-ECSTATICA. See APOPLEXIA.

CEREBRI COMPRESSIO, } *Compression of the*
——— COMPRESSUS. } *brain*, from *con*, & *premo*, to press together.

This often happens from external injuries, and then is generally attended with the following symptoms; giddiness, dimness of sight, stupefaction, loss of voluntary motion, vomiting, an apoplectic stertor in breathing, convulsive tremors in different muscles, a dilated state of the pupil of the eye, even when exposed to a clear light; paralysis of different parts, especially of the side of the body, opposite to that part of the head which has been injured; involuntary evacuation of the urine and fæces; an oppressed, and in many cases an irregular, pulse; and when the violence done to the head has been considerable, it is commonly attended with a discharge of blood from the nose, eyes, and ears. Some of the milder of these symptoms, such as vertigo, stupefaction, and a temporary loss of sensibility, are frequently induced by slight blows on the head; and as they often appear to be more the consequence of a shock, or concussion given to the substance of the brain than of compression induced upon it, so they soon commonly disappear, either by the effects of rest alone, or some other gentle means. See CONCUSSIO. But when any of the other symptoms take place, such as convulsive tremors, dilatation of the pupils, involuntary passage of the urine and fæces, and especially when much blood is discharged from the mouth, nose, eyes, and ears, it is almost certain that much violence has been done to the brain and that *compression* in one part or another is induced. In fine, a *compression of the brain* may be brought on by whatever contributes to diminish the cavity of the cranium, or increase its contents in any considerable degree: hence fractures attended with depression of any part of the bones of which it is composed, forcible introduction of any extraneous body through both tables of the skull, the effusion of blood, serum, pus, or any other matter; the thickening of the bones of the head produced by lues venerea; collection of water in the ventricles, or other parts of the brain, may occasion this disease. For the cure of which, see CONCUSSIO; FRACTURA CRANII, No. 6; DEPRESSIO, EXTRAVASATIO, HYDROCEPHALUS: also Bell's Surgery, vol. iii. p. 132. &c.

—— BASIS. See PALATUM.

—— GALEA. See CRANIUM.

CEREBRUM. The BRAIN, called *encephalus*; see also *epispharia*. Metaphorically called emporium (a Latin term for a market town), because it is the seat of all rational and sensitive transactions. Its structure and use are not so fully known as some other parts of the body, and different authors consider it in various manners. However, according to the observations of those most famed for their accuracy in anatomical enquiries, its general structure is thus described.

The whole mass of *brain* is divided into CEREBRUM and CEREBELLUM. It consists of two substances, viz. cortical or cineritious; the other medullary. The *first* is of an ash-colour, the *second* is white, and of a firmer texture: they both are vascular, but the cortical is more so than the medullary, from whence the nerves proceed. When the two hemispheres of the *cerebrum*, each side of the falx being called an hemisphere, are removed, a white part, called CORPUS CALLOSUM, running from one hemisphere to the other, appears. The CENTRUM OVALE is the appearance of a particular section of it. The anterior ventricles are two oblong bodies, placed one on each side the corpus callosum, with a partition between them, called the SEPTUM LUCIDUM, which is a continuation of the medullary substance of the corpus callosum. There is commonly much water in these ventricles, in those who die of disorders in their heads, as in the epilepsy, hydrocephalus, &c. but naturally they only contain about two drams. In watery heads the fluid is always found in the *cerebrum* only; the cerebellum never hath any share in it. Each ventricle at the posterior part throws back an appendage, which makes a cavity in the posterior lobe of the *cerebrum*. Below the septum lucidum appears the FORNIX, or LYRA, with the *corpora fimbriata*, narrow at the anterior extremity, where it rises by a double basis called its CRURA, which follow the track of the ventricle; in each ventricle are eminences of a cineritious colour, called CORPORA STRIATA. The PLEXUS CHOROIDES, called also *reticularis*, or *retiformis*, is a plexus of vessels which follow the sweep of the ventricle: it is formed by the vessels of the pia mater; it is partly collected in two loose fasciculi, which lie one in each lateral ventricle, and partly expanded over the neighbouring parts, and covering in a particular manner the thalami nervorum opticorum, GLANDULA PINEALIS, and other adjacent parts, both of the *cerebrum* and cerebellum, to all which it adheres. The parts of this plexus which are in the ventricles, contain some very small glands, which are considerably increased in some diseases. After the fornix is removed, we see a large plexus of vessels, particularly Galen's great vein, which go to form the TORCULAR HEROPHILLI, or fourth sinus, called also *lechenon*, and by Herophillus *lenos*. It is a sinus formed by the meeting of the sinusses of the dura mater. Under the plexus, before the united thalami nervorum opticorum, is a hole on each side called the ANUS and the VULVA; the latter goes to the infundibulum, the former to the aqueduct and third ventricle. The THALAMI NERVORUM OPTICORUM are white externally, and grey within, and are little eminences from whence the optic nerves arise. The third ventricle is very small; it runs back under the two thalami, between them and the medulla oblongata. The PINEALIS GLANDULA, pineal gland, called also *conarium*, *conoides & conoides corpus*, from its conelike form; and *turbinata*, covered by the plexus choroides, and situated on the Sella Turcica of the os sphenoides, is a little greyish body, the size of a pea: it lies just a little before where the transverse and longitudinal processes meet, where the vessels go to form the torcular. It is covered by the pia mater, and is connected by a little bone to each thalam. nerv. opt.

Numberless experiments prove, that the nerves are necessary to life; and that when the *brain*, or *medulla spinalis*, is much injured, life is at an end, or at least health: yet no part of the *brain* being injured, immediate death may ensue from different causes, though an injury of the *medulla oblongata* is so instantly fatal.

Behind the infundibulum called *pelvis* is seen, the CORPORA ALBICANTIA, or GLANDULÆ WILLISII.

Two glands are said to be in the *brain*, viz. the superior or *glandula pinealis*; and the inferior, or *glandula pituitaria*, which see. They have the external appearance of glands, but as to their being such is not certainly known.

The *cerebrum* fills all the upper portion of the cavity of the cranium, or the portion which lies above the transverse septum; each lateral half is divided into three eminences called lobes; one anterior, one middle, and one posterior.

The blood-vessels which supply the *cerebrum*, cerebellum, and *medulla oblongata*, come partly from the carotid, and partly from the vertebral arteries. The veins of the *cerebrum* and cerebellum may, in general, be looked on as branches not only of the longitudinal sinus of the dura mater, and of the two great lateral sinusses, but also of all the inferior sinusses of this membrane, in all which the veins terminate by different trunks.

Malpighius says that the *brain* is a gland; but other anatomists who have attended to the use as well as the structure, &c. of it, say it is not.

Dr. Kirkland, in his Dissertation on the *Brain* and Nerves, denies that the *brain* is fibrous, and asserts, that the nerves are only the continuations of the mucus, which constitutes the *brain*. He intimates, that this mucus is sensible. He observes that, "if we view the *brain* within the skull, just before it enters those membranes, which form the covering of the nerves, it will appear that the inside of a nerve is not a mass of fibres arising from the white part of the *brain*, but that it is a small portion of the white part of the *brain* itself, which is not fibrous. This being conducted by the dura and pia mater to the different parts of the body, it deposits one, or both of these coats, and is diffused round every fibre, not only upon the part it is carried to, but a considerable way round; so that each portion of the *brain* conveyed by its own nervous case, meeting, form one continued, or connected substance, in every part included within the cuticle, and gives that glossy, or gelatinous appearance, which

is fo readily diſtinguiſhed in the muſcular fibres. From whence it appears, that the *brain* is not confined to the ſkull, but is expanded in every part of the body, in the ſame manner, but much thinner, as the retina is expanded at the bottom of the eye." This ſimple method of conſidering the *brain* as a ſenſible mucus or jelly, both frees us from much perplexity, which attends all other views of it, and alſo has a happy influence in the doctrines which depend on this part of our frame.

Thoſe who are diſordered in their *brain*, are firſt affected with a ſtupor, often make water, and have other ſymptoms in common with thoſe who have the ſtrangury. Theſe ſymptoms continue eight or nine days, and then, if there is a watery or mucous diſcharge from the noſe or ears, there is a ſolution of the diſeaſe, and the ſtrangury ceaſes. Plenty of white urine comes off from the patient without pain, until the twentieth day; at which time the pain in the head leaves him, but a dimneſs of ſight remains if he looks long at any object.

Dr. Hunter obſerves, that the principal parts of the medullary ſubſtance of the *brain* in idiots and madmen, ſuch as the thalami nervorum opticorum, and medulla oblongata, are found entirely changed from a medullary to a hard, tough, dark-coloured ſubſtance, ſometimes reſembling white leather.

See Winſlow's Anatomy; Haller's Phyſiology; Kirkland's Diſſertation on the *Brain* and Nerves; alſo his Diſſertation on the Sympathy of the Nerves; and Monro on the Nervous Syſtem.

Cerebrum elongatum. See Medulla spinalis.

CEREFOLIUM. See Coelifolium, and Chærefolium.

——— Hiſpanicum. See Myrrhis.

——— Sylveſtre. See Chærophyllum Sylveſtre.

CEREI MEDICATI. See Bougie.

CERELÆUM. See Ceratum & oleum Ceræ, under Cera.

CEREVISIA AMARA. } See Alla.
——— ANTISCORBUTICA. }

Cerevisiæ Cataplasma.

Into the grounds of ſtrong beer ſtir as much oatmeal, as will make it of a ſuitable conſiſtence. This is ſometimes employed as a ſtimulant, though moſt commonly as an antiſeptic to mortified parts.

CERIA, or Ceriæ. See Tæniæ.

CERION, κήριον, *a honey-comb*. See Achor.

CERITUS, or Cerritus. Drunk with malt liquor. The goddeſs Ceres was ſuppoſed to affect people with that diſorder which is produced by an exceſs of ſtrong drink, whence this name.

CEROMA & CERONIUM. See Ceratum.

CEROPISSUS, alſo called *dropax*, *dropaciſmus*. A plaſter of pitch and wax. It was uſual to ſpread it on cloth or leather, and to apply it to ſome part of the body, then to pull it off again, and apply it afreſh, frequently renewing the application and removal of the ſame, to induce a redneſs on the part, with an intent to attract the humors which ſerve to nouriſh it. To render this *plaſter* the more efficacious, acrimonious powders were added to it. This dropax was alſo uſed to make hair fall off, or to pull it off from any part. But the ingredients for the *dropaces* were pitch, oil, bitumen, galbanum, and other ſtimulants.

CEROTUM. See Ceratum.

CERRITUS. See Ceritus.

CERRO. See Phellodrys.

CERUMEN AURIS. The wax in the ears. The Latins call it *cerca*, *aurium ſordes*, & *marmorata aurium*, *cypſele*, *cypſelis*, *fugile*. It inviſcates and retains inſects, and prevents their hurting the membrana tympani. It is bitter and viſcid, conſequently impregnated with acrid lixivial ſalts, mixed with pinguious and oily particles. Theſe principles render its qualities very ſimilar to thoſe aſcribed to the bile, with which it agrees in many particulars. It is ſeparated from the glands in the part of the ear in which it is found. It is fluid when firſt diſcharged, but ſoon thickens by lying. Wax, under ſome circumſtances, occaſions deafneſs. See Surditas.

CERUSSA. See Plumbum, No. 1.

Cerussa Acetata. See Plumbum, No. 5.

——— Antimonii. See Antimonium, No. 3.

CERVARIA. } See Laserpitium vulgaCervaria nigra. } tius, & oreoselinum.

Cervi spina. See Rhamnus.

CERVICALES. The *nerves* which paſs through the vertebræ of the neck are thus called.

The firſt cervical nerve throws out a conſiderable branch to the occiput; it joins the ninth pair from the brain, to form the firſt *cervical* ganglion of the intercoſtal.

The ſecond cervical nerve hath a very remarkable plexus; it ſends out a very conſiderable nerve to the occiput, as well as the firſt. It ſends off three branches behind the ſterno-maſtoideus, where they are entangled with the acceſſorius Williſii. The firſt branch going upward and backward becomes cutaneous on the poſterior parts of the temporal and parietal bones. The ſecond goes upward and a little forward under the ſterno-maſtoideus, and throws branches to the parotid gland, to the lobe, and to the poſterior ſide of the ear. The third goes horizontally forward to the neck, and there becomes a cutaneous nerve, which is ſometimes pricked in opening the external jugular vein.

The third cervical nerve goes downwards by a number of filaments towards the ſhoulders, and produces the phrenic nerve, which runs towards the thorax, before the anterior portion of the ſcalenus, between the ſubclavian artery and vein, contiguous to the trunk of the par vagum; runs down before the root of the lungs, follows the pericardium, and branches out in the diaphragm. That on the right is ſhorter than that on the left, as the latter goes round the apex of the heart.

The four inferior pairs, the above to be underſtood as pairs, are larger than thoſe already named. Their main trunk, with the firſt nerve of the back, paſſes between the portions of the ſcalenus over the firſt rib, into the axilla, where they produce ſix trunks, which go to the upper extremities. In their way thither, they detach branches to all the arteries.

The firſt of theſe ſix branches is the humeralis, which follows the courſe of the artery of that name, round the head of the os humeri.

The ſecond is the cutaneus, *cutaneus nerve*, which runs down the inſide of the arm, and goes into the fore-arm, juſt where we prick in opening the baſilic vein, and is often wounded.

The third is called the musculo-cutaneus, and is larger. It riſes pretty high, and throws branches into the coraco-brachiæus, through which the trunk paſſes obliquely; it is then covered by the biceps, and paſſing through between the brachiæus and biceps, it ſends off ſeveral branches, and lies on the outſide of the tendon of the laſt-mentioned muſcle, where we commonly bleed in the median cephalic vein.

The fourth is called cubitalis, vel ulnaris, the *ulnar nerve*; it follows the courſe of the artery, but paſſes gradually backwards, and gets behind the inner condyle of the os humeri, betwixt which and the olecranon it paſſes to the fore-arm. A little above the carpus, it divides into an anterior and poſterior branch, which goes to the palm, the back of the hand, and fingers. See under Cubitalis, Cheselden's account.

The fifth branch, called medianus, the *median nerve*, paſſes down contiguous to the brachial artery, and accompanying the veſſel, goes to the fore-arm, and to the palm of the hand, thence to the thumb and fingers.

The ſixth branch, called the radialis, *radial nerve*, paſſes down the inſide of the arm, and then backwards between the brachiæus externus, and the ſhort heads of the biceps externus attended by the artery. When it hath got round, it runs down; and at the head of the radius it gives off a cutaneous branch, which goes to the thumb and fingers on the back of the hand, whilſt the main trunk paſſes round the head of the radius through the ſupinator radii brevis, and goes betwixt the radius and ulna, to be loſt in the extenſor digitorum communis, and the muſcles of the carpus and thumb.

Cervicales Arteriæ. The arteries of the neck.

The *cervical artery* riſes from the ſubclavian on its upper ſide, and is preſently afterwards divided into two, which ſometimes come out ſeparately, and at others by a ſmall common trunk; the anterior one goes to the anterior muſcles which move the neck and head, the poſterior to the ſcalenus, trapezius, &c.

The anterior cervicalis, running behind the carotid of the ſame ſide, is diſtributed to the muſculus coracohyoidæus, maſtoidæus, cutaneus, ſterno-hyoidæus, and ſterno-thyroidæus, to the jugular gland, and aſpera arteria; the muſcles of the pharynx, bronchia, œſophagus, and to the anterior muſcles which move the neck and head. This *artery* has been obſerved to ſend out the intercoſtalis ſuperior.

The posterior cervicalis arises sometimes a little after the vertebralis, and sometimes from that *artery*. It passes under the transverse apophysis of the last vertebra of the neck, and from thence runs up backward, in a winding course, on the vertebral muscles of the neck, and then returns in the same manner. It communicates with a descending branch of the occipital artery, and with another of the vertebral, about the second vertebra: It is distributed to the musculi scaleni, angularis scapulæ, and trapezius, and to the jugular glands and integuments.

——— VENÆ. The CERVICAL VEINS. They are branches from the upper external jugular veins, or from the vertebral veins: they spread in the vertebral muscles of the neck, and communicate with the humeralis and occipitalis.

CERVICALIS. Belonging to the neck. The arteries and veins of the neck have this epithet.

——— DESCENDENS. } See SACRO LUMBARIS ACCESSORIUS.
——— DORSI. }

CERVICARIA. BELL-FLOWER, or CAMPANULA. The flower consists of one leaf, shaped like a bell: before it is blown, it is of a pentagonal figure, and, when fully opened, it is cut into five segments at the top. The summit of the pedicle is expanded into an ovary, whose apex is crowned with a monophyllous quinquifid calyx, divided into five long segments. The seed-vessel is for the most part divided into three cells, each having a hole at the bottom, by which the seed is emitted.

Boerhaave enumerates thirty-four species, but they possess no considerable medical virtue. The most common of them are the

Campanula esculenta, rapunculus, campanula flore cæruleo, rapuntium parvum. SMALL or GARDEN-RAMPION.

The roots are used in sallads.

Medium, campanula foliis profunde incisis fructu duro, viola Mariana peregrina. Syrian BELL-FLOWER.

Trachelium, called also *campanula vulgarior major.* GREAT THROAT-WORT, and CANTERBURY-BELLS.

The root is very moderately astringent.

CERVICARIA ALBA. See LASERPITIUM VULGARIUS.

CERVICULÆ SPIRITUS. Rulandus says, it is the Spirit of the bone of a stag's heart.

CERVIX, also *Collum*. The NECK. This is applied figuratively to parts: thus, there is the *cervix vesicæ, uteri, ossis.* See VESICA, UTERUS, and PROCESSUS.

But in its general acceptation, it means that part of the body situated betwixt the head and breast.

The *neck* is divided into the anterior part or *throat*, and the posterior or *nape*.

It contains the *larynx*, a part of the *trachea arteria*, the *pharynx*, *part of the œsophagus*, the *musculi cutanei*, *sterno-mastoidæi*, *sterno-hyoidæi*, *hyothyroides*, *cerato-hyoidæi*, *splenius*, *complexus*, the musculi vertebrales, which lie upon the first seven vertebræ, and a portion of the medulla spinalis.

The ARTERIES which go to the *neck*, are the *arteriæ carotides externæ*, & *internæ*, *vertebrales*, & *cervicales*. The VEINS are, the *venæ jugulares externæ* & *internæ*, *cervicales* & *vertebrales*. The NERVES are, the *portio dura* of the auditory nerves, the *eighth*, *ninth*, and *tenth pair*, the *seven cervical pairs*, and the *nervi sympathetici maximi*.

Among other disorders to which the *neck* is subject, a contraction of it to one side is of the number. Tulpius calls this contraction CAPUT OBSTIPUM; it is a kind of *contractura*: he hath removed this disorder in those who were twenty years of age, or more, and were born with it. Meekren and Roonhuysen have had the same success.

This disorder is usually described under the title of the WRY-NECK. It proceeds from various causes, as burns, a stricture in the skin, a relaxation of some of the muscles in the *neck*, or a contraction of them; but for the most part the cause is a contraction of the mastoid or sterno-mastoid muscle only.

When a paralysis is the cause, it is incurable; if it is produced by a defluxion of humours, sweating the part is often of use; if the skin is contracted by a burn, rub it with emollients, and apply warm fomentations, and if these fail, make two or three incisions transversely through the skin where it is contracted. If the cause is from several muscles being contracted, no method of relief is yet known; but if there is a contraction of the mastoid muscle only, or as called by some the sterno-mastoid muscle, the cure is effected by dividing it.

In order to form this operation, Mr. Sharpe directs in his Treatise of Operations, "to make a transverse incision through the skin and fat, something broader than the muscle, and not above half an inch from the clavicle; then passing the probed razor with care underneath the muscle, draw it out, and cut the muscle. After the incision is made, the wound is to be filled with dry lint, and always dressed so as to prevent the extremities of the muscle from re-uniting; to which end they are to be separated from each other as much as possible, by the assistance of a supporting bandage for the head during the whole time of the cure, which will generally be about a month."

Mr. Potts directs to cut through as near the middle as may be, taking care not to wound the carotid artery, nor the jugular vein. Dr. Hunter prefers making the incision near the sternum: he says, that at the lower part of the muscle it is best to perform this operation, because there the cellular membrane is not in any great proportion. Mr. Sheldon advises, when the sterno-mastoid muscle is to be cut, not to use the razor above named, for thereby danger attends, from cutting the carotid artery, the jugular vein, and the eighth pair of nerves. He advises to use an incision knife, to cut gently in a transverse direction; then the fibres will fly from the edge of the knife, and with a moderate attention, the dangers just mentioned will be avoided. See Bell's Surgery, vol. iv. p. 366. White's Surgery, p. 387.

Wounds in the *neck*. See VULNUS.

CERVUS. The STAG, HART, or male of the red deer.

Their flesh, until they are three years old, is excellent. The bone of the *stag's* heart, called *crux cervi*, is but the tendons of the muscles of its heart hardened. This bone, as it is called, should be very white.

Balls are formed in their stomachs from the hairs which they swallow when licking themselves. These balls are called *elaphopila*. See CAPRA ALPINA.

The tears of a *stag* are the sordes collected in the inner angles of the eyes, resembling wax. This matter hath many virtues attributed to it. Three or four grains are a dose.

CERVUS DAMA. See DAMA.

CERVUS MINOR AMERICANUS BEZOARTICUS. The deer which affords the West Indian *bezoar*.

——— ODORATUS. See MOSCHUS. ——— PLATYCEROS. The FALLOW-DEER. See DAMA. ——— RANGIFER. The REIN-DEER, called by some authors *tarandus*, and *machlis*. It is an animal very common in all the northern nations, of the shape of a *stag*, but its body is thicker, and its whole make much more robust and strong. It is of prodigious use as a beast of carriage, to the Laplanders, and almost all the other nations far north. SCHEFFER alledges from TORNÆUS, that though a cloven-footed animal, and plainly of the deer kind, it does not chew its cud: this, however, is wholly disbelieved by the more accurate naturalists. Its horns and hoofs have been said to be of use in spasmodic affections.

CESTREUS. See MUGILIS.

CESTRITES VINUM. Wine impregnated with betony.

CESTRUM. See BETONICA.

CETACEUS. CETACEOUS. Those fishes are thus called which are very large, bring forth a perfect animal instead of spawn; or which, like viviparous animals, respire by means of lungs, generate, conceive, bring forth young, and nourish them with milk.

CETE. See CETE ADMIRABILE.

CETERACH. See ASPLENIUM.

CETUS. The WHALE. There are many kinds of this fish; but the two principal are the Greenland *whale*, and the spermaceti *whale*: also called *balæna vulgaris*, *balæna major*, *musculus*, according to PLINY, *mysticetus*. The GREENLAND, or BLACK WHALE.

It is from the upper jaw that *whale*-bone is taken, and from no other part of this fish. Besides this bone, its only produce is its oil, called TRAIN-OIL, used for burning in lamps, but of no consequence in medicine. In Paris, they have two sorts of *whale* oil: the best is called *huile de grande baye*: it is made from the blubber immediately after it is taken out of the *whale*: whence the French oils are not of so offensive a smell as those from Hol-

Holland, which are melted down, &c. after their arrival there.

CETE ADMIRABILE, alſo called *cachalot*, *balæna macrocephala*, &c. *trompa*, *byaris*, *cete*, *ocea*; THE SPERMACETI WHALE. It is alſo called *catodon*, becauſe it hath teeth only in its lower jaw. This ſpecies does not afford any *whale*-bone; but inſtead of that, it hath teeth, which are ivory. From its body, it yields a finer oil than that from the Greenland ſpecies; and it alſo affords SPERMACETI, which ſee.

CEVADILLA, called alſo *febadilla*, *ſabadilla*, *cauſticum Americanum*, *hordeum cauſticum*, *canis interfector*. INDIAN CAUSTIC-BARLEY. It is the ſeed-veſſel of a Mexican plant; its form and ſtructure a *barley*-ear, but with ſmaller ſeeds, not above the ſize of linſeed. They are reckoned the ſtrongeſt of the vegetable *cauſtics*. Monardes ſays, that for deſtroying vermin, and as a corroſive for ſome kinds of ulcers, they are as effectual as the actual cautery, if a little of the ſeed is powdered and ſprinkled on the part. Dale ſays, it is the capſula of the ſeed that is uſed.

CEVIL. See LUDUS HELMONTII.

CHAA. See THEA.

CHAB. An abbreviation of Dominicus Chabræus, M. D. Stirpium Icones & Sciagraphia, 1677.

CHACARILLA. See THURIS CORTEX.

CHACRIL. A name which the French give to the *thuris cortex*.

CHÆREFOLIUM, CHÆROPHYLLUM, called alſo *cerefolium*, *gingidium*, *chærophyllon*, *cherefolium*; COMMON CHERVIL. It is the *ſcandix cerefolium*, Linn. It is an umbelliferous plant, with winged leaves, like thoſe of parſley, producing ſmooth longiſh ſeeds, ſhaped like a bird's beak; a native of the ſouthern parts of Europe, ſown annually in our gardens, and ſlightly aromatic, aperient, and diuretic, differing not from parſley in its medical virtues. Diſtilled with water, it affords a ſmall quantity of eſſential oil.

—— SYLVESTRE PERENNE CICUTÆ FOLIO, *Cicutaria*, *cicutaria alba*, *cerefolium ſylveſtre*, *myrrhis ſylveſtris*; WILD CICELY; COW-WEED. The roots are poiſonous, cauſing difficulty of breathing, torpors, and madneſs. The root reſembles parſnips, and are called by the country people MADNIPS. The plant above ground reſembles hemlock.

Botaniſts enumerate four ſpecies. Raii Hiſt.

CHAIARXAMBAR. See CASSIA FISTULARIS.

CHAITA. Properly the mane of quadrupeds; but Rufus Epheſius expreſſes by it the hair of the hind-head.

CHALAPA. See JALAPA.

CHALASIS, from χαλαω, *to relax*. See RELAXATIO.

CHALASTICA MEDICAMENTA. RELAXING MEDICINES.

CHALAZA, CHALAZION, CHALAZIUM, from χαλαζα, *a hailſtone*; called alſo *lupa*. A HAILSTONE. Some call them *grandines*. This name is given to a white knotty kind of ſtring at each end of an egg, formed of a plexus of the fibres of the membranes, whereby the yoke and the white are connected together, called *aquatum*.

It is a ſpecies of the hordeolum. STYE, STIAN, or STITHE, is a moveable ſcirrhous tumor on the margin of the eye-lid, reſembling a hailſtone, whence its name. It is white, hard, and encyſted; and differs from the *crithe*, another ſpecies, only in being moveable. It continues long, and proceeds ſlowly. Sometimes it may be diſperſed with the ung. ceerul. fort. and with a few doſes of calomel, of one grain each. In weakly habits, theſe may be accompanied with bark and ſteel. If they fail to relieve, make an inciſion through the ſkin which covers them, and diſſect the tumor clearly out, or touch the ſkin over them with cauſtic; then either preſs the tumor out, or touch it until the whole is waſted. See St. Yves on the Diſorders of the Eye. Bell's Surgery, vol. iii. p. 264. Noſ. Meth. Oculi of Dr. Wallis, p. 4.

CHALBANE. See GALBANUM.

CHALCANTHUM. See VITRIOLUM.

CHALCEDONIUS, CALCEDONIUS, is the name of a medicine, which Galen directs to be uſed in diſorders of the ears.

CHALCITIS, from χαλκος, *braſs*.

The native kind is ſaid to be a vitriolic mineral, containing copper and iron, of a copperiſh colour. Dr. Alſton aſſerts it to be one of the deſiderata, and that its ſuccedaneum is the

CHALCITI officinarum. See VITRIOLI COLCOTHAR, and VITRIOLUM VIRIDE.

CHALCOIDEUM, Os. The os cuneiforme of the *tarſus*. See CUNEIFORME OS.

CHALCOS. See Æs.

CHALCUTE. BURNT BRASS. See Æs uſtum.

CHALICRATON. WINE and WATER. From χαλις, an old word that imports *pure wine*, and κεραννυμι, *to mix*.

CHALINOS. This word is ſometimes uſed to expreſs that part of the cheeks, which, on each ſide, is contiguous to the angles of the mouth.

CHALYBS. STEEL; called alſo *acies*. As a medicine, it differs not from iron. See FERRUM. *Steel* is ſofter or harder than iron, according to the management of the artiſt; and, when ſofter, may be more eaſily prepared for ſome medical purpoſes, but otherwiſe contains no advantages above common iron. See Neumann's Chemical Works, the Dictionary of Chemiſtry.

CHALYBS TARTARIZATUS. See FERRUM, No. 9.

CHALYBEATÆ AQUÆ. See AQUA.

CHALYBIS RUBIGO. See FERRUM, No. 2.

CHALYBIS SAL. See FERRUM, No. 10.

CHAMA. BASTARD COCKLE; called alſo *glycimerides magna*, and *chama glycimeris*. They are found in the Mediterranean ſea, and are of the ſame nature and uſe as our common *cockle*, and other ſhell-fiſh.

CHAMÆACTE, from χαμαι, *upon the ground*, ακτη, *the elder*. See EBULUS.

CHAMÆBALANO. See OROBUS.

CHAMÆBATOS. See RUBUS VULGARIS.

CHAMÆCEDRYS. See ABROTANUM FOEMINEUM.

CHAMÆCERASUS. See CAPRIFOLIUM.

CHAMÆCISSUS. See HEDERA TERR.

CHAMÆCISTUS; called alſo *helianthemum*, *panax chironium*, *conſolida aurea cordi*, *conſolida aurea*, chamæciſtus vulgaris flore luteo; or *helianth. flore luteo*: LITTLE or DWARF CISTUS, or SUN-FLOWER. Miller enumerates fifty ſpecies or more.

It is vulnerary, and makes a good gargariſm in diſeaſes of the throat.

CHAMÆCLEMA. See HEDER. TERR.

CHAMÆCYPARISSUS. See ABROTANUM FOEMINEUM.

CHAMÆDAPHNE. See LAUREOLA MAS.

CHAMÆDROPS. In Paulus Ægineta and Oribaſius, it is the ſame as

CHAMÆDRYS. GERMANDER. *Chamædrys minor repens*; *vulgaris*. Alſo called *quercula columandrina*, *triſſago*, chamæd. minor repens; cham. vulg. SMALL GERMANDER, and ENGLISH TREACLE. It is the TEUCRIUM CHAMÆDRYS, or TEUCRIUM *foliis ovatis inciſo crenatis petiolatis*, *floribus ſubverticillatis ternis*, *caulibus procumbentibus*, Linn. CREEPING GERMANDER. Boerhaave mentions ſeven ſpecies of *chamædrys*.

The ſmall *germander* is a ſmall, creeping, ſhrubby plant, with ſquare ſtalks, ſmall, ſtiff, oval leaves, notched from the middle to the extremity, like thoſe of the oak-tree, ſet in pairs at the joints, and purpliſh labiated flowers, ſet thick together, wanting the upper-lip. It grows wild in France, Germany, and Switzerland. It is ſometimes found wild in England, but is generally raiſed by culture in gardens. It flowers in June and July.

The leaves and tops are bitter and aromatic, but by no means conſiderable. They loſe a little by drying: they are mildly aperient and corroborant. They have been by ſome held in eſteem, in uterine rheumatic complaints; by others, in intermittent fevers, ſcrophulous affections, and other chronic complaints. At preſent, however, they are very little in uſe.

The beſt time for gathering this herb is when the ſeeds are formed, and then the tops are preferable to the leaves.

When dry, the doſe is from ʒ ſs. to ʒ j.

Either water or ſpirit will extract their virtue, but water takes up more of the bitter matter.

This plant is an ingredient of the noted powder, which goes by the name of the duke of Portland's.

Pulvis ad Rheumatiſmum vel de Morbis Arthriticis Ducis Portlandii. The DUKE of PORTLAND'S POWDER for the Gout or the Rheumatiſm.

Take of the roots of round birthwort and gentian, the tops and leaves of ſmall *germander*, leſſer centaury, and ground-pine, of each equal parts; powder them all together. Of this powder a dram muſt be taken, in any convenient liquor, every morning faſting, for three

months; then two ſcruples for three months; and, after that, half a dram for ſix months; and to conclude the proceſs, half a dram every other day for a year. Aetius calls a powder ſimilar to this, *antidotos ex duobus centaureæ generibus*; Cœlius Aurelianus, *diacentaurion*.

Experience in general hath tended to leſſen the credit of this compoſition, which hath little more than its antiquity to ſupport the character with which it was lately puffed off. It differs but little from the diacentaureon of Cœlius Aurelianus, the pulvis principis Mirandolæ, and others, of which an account is given in the Lond. Med. Obſ. and Inq. vol. vi. p. 126, &c. where alſo the origin of the duke of Portland's powder is traced, and ſhewn to be but a variety of the many powders which the ancients uſed under the following names, viz. *antidotos ex duobus centaureæ* of Aetius; *climax* vel *ſcala ſacra*, &c. For that called

——— Incana maritima, &c. See Marum Syriacum.

Chamælinum vulgare. See Knawel.

CHAMÆLUIE. See Tussilago.

CHAMÆMELUM. Camomile. Galen calls it *Euanthemon*. It is corruptedly named *camomilla*.

The root is fibrous, the calyx ſquamous, and expanded with a manifold ſeries of leaves. The flower is generally radiated, ſeldom naked, with radiated petals, for the moſt part white, with a yellow diſk; the leaves are finely indented; in other things it reſembles the bellis.

Boerhaave enumerates eighteen ſpecies; of which the following are the moſt common.

Chamæmelum nobile, from χαμαιμηλον, quoniam odorem mali habeat. Plin. lib. 22. c. 21. Called alſo cham. Romanum, *chamomilla*, *leucanthemum odoratius*, vel *odoratiſſimum repens*, by Dioſcorides *chryſocallis*, common, or creeping, or Roman, or trailing perennial camomile. It is the anthemis nobilis, *foliis pinnato-compoſitis linearibus acutis ſubvilloſis*. Class, Syngenesia; Ord. Polygamia ſuperflua. Linn. Gen. Plant. 940.

It is found wild in moiſt paſture ground in many parts of England, but is commonly cultivated in gardens. It flowers in July and Auguſt, and ſo on through the ſummer; and the ſeeds come to perfection at the time of flowering. The leaves and flowers have a ſtrong, though not ungrateful ſmell, and bitter taſte. The flowers are more aromatic and bitter than the leaves and the ſtalks; the yellow diſk is by far the ſtrongeſt part. The ſmell and taſte are both improved by careful drying. Theſe flowers loſe very little by long keeping.

The flowers only are uſed internally: they are bitter, emenagogue, carminative, anodyne, antiſpaſmodic; of particular uſe in colics of the cold and flatulent kind; in nephritic, hyſteric, hypochondriac, and other ſpaſmodic diſorders; the pains of child-bed women are much relieved by frequent draughts of a warm infuſion of them; they promote the uterine diſcharges. They are almoſt a ſpecific in agues, by giving from half a dram to 3 i. of the powder during the intermiſſion; but as this quantity is apt to run off by the bowels, it is beſt given, therefore, joined to an opiate or aſtringent; which renders it more effectual. The *camomile*, by moving the bowels, makes it uſeful in flatulent and ſpaſmodic colics, and alſo in the dyſentery; but in diarrhœa, it has been found hurtful. In intermitting fevers, as well as thoſe of the low and irregular kind, attended with viſceral obſtructions, eſpecially when they border too much on continual fevers to admit of the bark, in this caſe the *camomile* is aſſiſted by a mixture of fixed alkaline ſalts, and other corroborating medicines. A warm infuſion, from four to ſix ounces, taken twice a day, has been efficacious in relieving pains of the ſtomach. Taken in much larger quantity, it excites vomiting, and promotes the operation of emetics; for which purpoſes it is frequently given.—Externally, the flowers are uſed in the decoction for fomentation, and are alſo an ingredient in the decoction for glyſters.

The doſe may be from gr. x. to 3 i. of the dry powder. Of the freſh juice from the whole herb, the doſe may be from one to ſix ounces, which, if taken juſt before the paroxyſm of agues, is effectual in a few doſes. This juice is peculiarly uſeful againſt a ſtrangury, in aſthmas, jaundice, and dropſies.

Camomile flowers give out their virtue to water and to ſpirit: the dry flowers make a more agreeable infuſion than the freſh ones, or newly dried; and the moſt grateful is when cold water only is uſed. Diſtilled with water, they impregnate it ſtrongly; and, from a large quantity of flowers, a ſmall quantity of eſſential oil may be thus obtained. This oil is of a yelloviſh colour, and poſſeſſeth all the virtues of the flowers in an eminent degree.

Externally, this herb is diſcutient and antiſeptic; but the flowers poſſeſs the greateſt degree of theſe qualities. Dr. Pringle ſays, that their antiſeptic power is 120 times greater than that of ſea-ſalt.

A green oil is prepared from the herb, whilſt it is freſh, in April and May at fartheſt, by boiling it with olive oil until the leaves are almoſt criſp: but as boiling diſſipates all the beſt part of the herb, the propereſt method is to ſteep the flowers cold in the oil, and to ſtrain it off as it is wanted.

Extractum Chamæmeli. Extract *of* Camomile.
