LENTICULARIA MINOR. See LENTICULA PALUSTRIS.

LENTIGINES. FRECKLES. See EPHELIDES.

LENTISCUS. MASTICHE. The LENTISK or MASTICH-TREE. *Piſtachia lentiſcus*, or PISTACHIA *foliis abrupte pinnatis, foliolis lanceolatis*, CLASS DIŒCIA; ORD. PENTANDRIA. LINN. Gen. Plant. 1108. Boerhaave mentions three ſpecies of it. It is an evergreen, with ſoft branches hanging downwards, and ſmall ſtiff leaves pointed at both ends. Some trees produce reddiſh flowers, others produce blackiſh berries with white kernels. Theſe trees are native in the ſouthern parts of Europe, but bear the uſual winters in our clime. In Turkey, and ſome other places, plantations are made for the ſake of the reſinous gum which we have under the name of *maſtich*. The Indian maſtic is called *moll*. It is obtained from inciſions made in the trunks; it flows in drops in Auguſt. This reſin is brought to us chiefly from Aleppo and Smyrna. The wood is ſometimes brought from Marſeilles, in thick knotty pieces, covered with a browniſh bark; it is internally of a whitiſh or a pale yelloviſh colour.

The wood is mildly balſamic and reſtringent; the ſmall tough ſprigs are ſtronger than the larger pieces, and the bark is more than either, but none of them are of much value in medicine; yet a decoction of the wood hath obtained the name of *aurum potabile*. This wood has been by ſome highly extolled in dyſpeptic, gouty, hemorrhagic, and dyſenteric affections; and enters into the Materia Medica in ſome foreign Pharmacopœias. The reſin, uſually called *gum maſtich*, by means of gum arabic, is diſſolved and rendered miſcible with water; it poſſeſſes the ſame virtues with turpentine in general; but as a maſticatory it is to be preferred. See Lewis's Mat. Med. Newman's Chem. Works. For that named —FOLIIS SPINOSIS, FLORE SPICATO, &c. See BONDUCH INDORUM.

LENTOR, A VISCIDITY OF SIZYNESS. When this is the ſtate of the animal fluids, the body is variouſly diſordered.

LEO. The LION. It is a name for ſeveral preparations of the Spagiriſts, of the leproſy, &c.

LEONINA LEPRA, or LEONTIASIS, or LEONTION. A variety of the ELEPHANTIASIS.

LEONIS OS and ORA SÆVA. See ANTIRRHINUM.

LEONTICE VETERUM. See CACALIA.

LEONTODON. See DENS LEONIS.

LEONTOPETALO, and LEONTOPETALON. Names of the RED and of the BLACK TURNIP.

LEONTOPODIUM, alſo called *filago Alpina*, *leontopodium majus*, *gnaphalium Alpinum*, LION'S FOOT. It grows on hills, and flowers in July. The bruiſed roots are famed for removing the blackneſs of bruiſes in the ſkin.

LEONURUS. See CARDIACA.

LEPIDIUM, alſo called *piperitis*, *raphanus ſylveſtris*, *iberis*, *dionyſius*, POOR MAN'S PEPPER, PEPPER-WORT, DITTANDER. It is the LEPIDIUM LATIFOLIUM, Linn. It is a plant with undivided leaves, ſmall white flowers on the tops of the ſtalks, which are followed by heart-ſhaped pods. It is perennial, grows wild on the ſides of rivers and ſhady places; it flowers in June and July. The whole plant is hot like pepper.

—— ARABIS. See DRABA.

—— GRAMINEO FOLIO, alſo called *Iberis*, *cardamantica*, *agriocardamum*. SCIATICA CRESSES. It is the LEPIDIUM IBERIS, Linnæus This ſpecies hath long narrow leaves; the lower are on long pedicles and ſerrated; the upper are entire, and without pedicles. It is annual, and raiſed in our gardens for culinary uſe.

Theſe plants, when freſh gathered, have a quick, penetrating, pungent taſte, which is almoſt diſſipated in drying; it is retained in the expreſſed juice, extracted by water and by ſpirit, and riſes with both of them in diſtillation. In external applications they have been uſed againſt the ſciatica, whence their name *ſciatica creſſes*. Internally they have the ſame effects as the cochlearia and naſturtium.

—— MONSPELLIACUM. See PLUMBAGO.

LEPIDOCARPODENDRON, from λεπις, *ſcale*, καρπος, *fruit*, and δενδρον, *a tree*. Boerhaave takes notice of twelve ſpecies of this tree; but their medicinal powers are not remarkable.

LEPIDOIDES SUTURA, from λεπις, *a ſcale*, and ειδος, *likeneſs*. See SUTURÆ.

LEPIDOSARCOMA So M. A. Severinus calls a tumor of the mouth, which is ſarcomatous, and full of irregular ſcales, from λεπις, *a ſcale*, and σαρξ, *fleſh*.

LEPORINA-LABRA. See LABIA LEPORINA.

LEPORINUM ROSTRUM. The piece of fleſh which often is ſeen betwixt the diviſions of the hare-lip.

LEPRA, from λεπρος, *rough*, and that from λεπις, *a ſcale*. The LEPROSY. Among the various diſorders which ariſe from an impure ſerum, and manifeſt themſelves in the ſkin and ſubjacent integuments, are thoſe which come under the names of itch, herpes, and *leproſy*; of the latter there are different ſpecies on record, ſome of which are no where known to exiſt at this day; and the reſt are but obſcurely underſtood. See ALPHUS.

The *leproſy*, of whatever kind, is a chronical diſorder; in warm climes is very infectious, though not evidently ſo in cold countries. Dr. Cullen places this genus of diſeaſe in the CLASS CACHEXIA, and ORD. IMPETIGINES; and defines it, the ſkin made rough with white, furfuraceous, chapped eſchars, ſometimes moiſt underneath, and pruriginous. One ſpecies only is known. Sauvages notes ſix varieties, the chief of which obſerved with us are the *lepra* Græcorum, and the *lepra* ichthyoſis.

Fat people are obſerved to be more grievouſly afflicted with ſkin diſeaſes, when they are the ſubjects of them, than the lean; alſo more ſubject to relapſes after being cured.

The remote cauſes are, whatever diminiſhes the vital heat, and reduces the general ſtrength of the body. The immediate cauſe is, a faulty ſerum: this ſtagnates in the integuments and ſkin, producing inflammation, exulceration, eruptions, &c. there.

The *leproſy* of the Arabians (which ſeems to be the ſame with that of the Greeks) is well deſcribed by Aetius as follows: "it is almoſt unknown in Italy (i. e. the *lepra* "Arabum) but very frequent in ſome countries, is the "diſeaſe which the Greeks term ελεφαντιασις, and which is "reckoned amongſt the chronical diſorders. By it the "whole body is ſo diſordered that the bones are ſaid to "be vitiated. The ſurface of the body is covered pretty "thick with ſpots and tumors, the redneſs of which is by "degrees converted into a black colour. The external "ſkin becomes unequally thick, thin, hard, and ſoft: it "is in a manner rendered rough by certain ſcales, clefts, "and chaps; the body grows lean; the face, legs and "feet ſwell. When this diſorder is of long ſtanding, the "fingers and toes are concealed under a tumor, and a ſlight "fever ariſes, which eaſily deſtroys the patient, labouring "under ſo many diſorders." In the Weſt Indies this diſorder is known by the name of the *black ſcurvy*, or *India black ſcurvy*. Its approach is there obſerved to be gradual; at firſt there are many ſpots on the body, of a yellow brown caſt, which ſoon turn purple, and of a copper colour; theſe increaſe, grow thick, and rough, with hard ſcales; a numbneſs is felt on the fingers and toes; the breath is fœtid, the voice hoarſe, the hard and ſcaly parts crack, and ulcers appear in different parts; but at length a fever comes on which cloſes the ſcene.

In hot countries *leprous* diſorders are moſt frequent; and in different places there is ſome variety in the ſymptoms; but by the methods attempted for the cure, and the ſucceſs which attends them, the diſorder ſeems to have but one general nature, however it appears, or by whatever name it is called.

Beſides a thin laxative diet, warm baths, and a pure temperate air; antimonials, mixed with mercurials, are principally depended on; theſe are aſſiſted by warm perſpiratives, ſuch as guaicum, ſharp-pointed dock, ſaſſafras, &c. ſmall doſes of cantharides, ſo as to promote a moderately increaſed diſcharge by urine; nitre continued in ſmall doſes for a long time, and many other medicines, have

have been adminiſtered for the relief of theſe diſorders; but none of them ſeem to have equalled the ſucceſs which Dr. Lyſons met with from the following decoction:

℞ Cort. interior. ulmi rec. ℥ iv. coq. in aq. puræ ℔ iv. ad ℔ ij. colaturæ cap. ℔ ſs. bis die. It ſhould be continued ſeveral weeks. If after its uſe the efflorefcences increaſe, it is a favourable ſymptom. See Aretæus, lib. iv. cap. 13. Celſus lib. iii. Hieronimus Mercurialis de Morbus cutaneis. Lond. Med. Tranſ. vol. i. & ii. Lond. Med. Obſ. & Inq. vol. i. p. 201, &c. Lond. Med. Journal, vol. i. p. 94.

Lepra Arabum. Blancard ſays it is the *elephantiaſis* of the Greeks. Cullen makes it ſynonymous with the *elephantiaſis* in his Noſology. See alſo Lepra.

—— Græcorum, called alſo *alba nigra*. It is the *impetigo* of Celſus. Dr. Cullen reckons but one ſpecies of *leproſy*; the diſtinctions are but varieties.

—— Ichthyosis. Fiſhy Leprosy. Avicenna calls it *albara nigra*.

So far as my obſervations have aſſiſted me, this diſeaſe does not depend on a particular diet, as ſeveral of a family have lived together on ſimilar food, when only one has been afflicted; nor is it confined to any particular temperament. Though it uſually appears in both ſexes about the age of puberty, or, after that, towards the acme of life, in thoſe eſpecially of light-coloured hair, and ſmooth fine ſkin; yet it certainly is not contagious, as it ſubſiſts in individuals of a family, without affecting the reſt, where no reſerve or precaution had been uſed in their communication. People advanced in years have it in leſs degree than the former, but no time of life is totally exempt from its attack. Beſides the preternatural appearance of the ſkin, no function ſeems interrupted or impaired, nor any other complaint evident. It would, therefore, appear to be purely a topical cutaneous diſeaſe, which probably ariſes from ſome affection of the ſecretory organs or glands of the ſkin.

At firſt it appears in red ſpots in the ſkin, of a roundiſh figure, which riſes up into ſenſible eminences, and being ſcratched, a fluid oozes out. When the cuticle becomes thin, they ſeem evidently more or leſs ſeparated, and then reſemble ſo many tranſparent ſcales, which generally do not fall off till a new cuticle is formed below, which in a little time riſes again in the ſame manner in a dry ſcaly cruſty eruption; ſometimes confined to particular parts; at others occupying nearly the whole ſurface of the body, or removing from one part of it to another without any evident cauſe; and in ſummer, ſometimes entirely leaving the patient, and returning again in autumn and winter.

Purging by ſea-water, and bathing therein; the uſe of other alterative waters; antimony variouſly prepared; mercury variouſly adminiſtered; theſe aſſiſted with a decoction of ſarſaparilla and mezereon, have all been uſed with a tedious perſeverance, and without effect; though ſometimes the patient ſeems to be relieved thereby. Mercurials have been given with antimonials, but theſe, and even a ſalivation, have been uſeleſs. Many topical applications have been tried with very little advantage. Bliſters on the parts gave but a temporary relief, and that but ſhort. In my earlier practice, by the recommendation of a phyſician of unqueſtionably great abilities, I uſed the juniper ſhrub, as the ultimate remedy in obſtinate eruptions, and in the milder kinds of herpes and ſcorbutic eruptions; my ſucceſs was ſuch as to give one expectation of equal advantage from it in this ſort of *leproſy*, but experience ſhewed me my miſtake. The moſt uſeful external application that I uſed, was bees-wax and oil of olive in the form of a cerate. The only effectual internal medicine is the decoct. cort. interior. ulmi.

A boy about thirteen years of age took of the decoct. cort. inter. ulmi, ℥ iij. every day, which in about two weeks produced a conſiderable change, and at ſix weeks end, a cure was effected. In another caſe of this kind, in a young woman, aged twenty-one, I ordered two aloetic pills every night at bed-time, and a pint of the decoct. ulmi to be drank every day, which reſtored the ſkin to its former ſmoothneſs; but the itching ſtill continued, on which account ſhe took a nitrous mixture with the above medicines, and, in about two weeks more was cured. I have given nitre to ℥ j. a day; but alone it never anſwers. While the decoct. ulmi is uſing, the body ſhould be kept open, the patient ſhould live upon a larger proportion of vegetable diet, avoiding thoſe meats that are leaſt perſpirable. If the diſorder is obſtinate, continue the decoct. cort. ulmi for ſome months. Sometimes the diſorder ſeems entirely removed in the ſpring when the warmth of the weather increaſes with the year; and returns with the returning cold towards the concluſion of autumn. It would hence be adviſeable to repeat this decoction, with the other precautions, at thoſe periods when the diſorder may be moſt ſuſpected, till the patient has a probable ſecurity againſt any future attack. Lettſom's Medical Memoirs.

Lepтophonia. See Paraphonia.

Leptopityron. See Furfur.

Leros. See Delirium.

Leseoli morbus. See Icterus.

Leseolus, by Paracelſus is called an highly diaphanous ſalt, which cures the jaundice, but does not ſay how it is compounded.

Lethargus. Lethargy, from λήθη, *forgetfulneſs*, and ἀργός, *ſlothful*, alſo called *veternus*. See Caros.

Lethargus à frigore. Apoplexia venenata.

—— Literatorum. Apoplexia ſerosa. } See Apoplexia.

—— à Narcoticis. Apoplexia venenata.

Leucanthemum. It agrees in every thing with the chryſanthemum, except in the white colour of the ſemiflorets. Boerhaave mentions eleven ſpecies. It is alſo a name for the common and other ſpecies of camomile. See Chamæmelum.

Leucanthemum bellidis facie, ſee Bellis major.

—— Canarienſe, alſo called *chamæmelum Canarienſe*. If the flowers or the wood are chewed, they produce the ſame effects as the pellitory root.

Leucanthe veterum. See Calcitrapa officinalis.

Leucas montana. See Lamium luteum.

Leuce. See Alphus.

Leucoium. See Cheiri, and Bulbonach.

Leucolachanon. See Valeriana Sylveſtris.

Leucoma, from λευκός, *white*. See Albugo.

Leucoma nephelium. See Achlys.

Leuconymphæa. See Nymphæa.

Leucophlegmatia, from λευκός, *white*, and φλέγμα, *phlegm*. Aretæus obſerves, that the *leucophlegmatia* differs from an anaſarca, in that the fleſh is not yet waſted, as is always the caſe when an anaſarca is preſent; and that it is by far more eaſily cured than an anaſarca, becauſe the texture of the blood is not ſo greatly injured. Indeed the *leucophlegmatia* is only the beginning of that diſorder, the worſt ſtate of which is the anaſarca. Sometimes this word ſignifies an *emphyſema*.

Leucopiper. See Piper album.

Leucorrhœa, from λευκός, *white*, and ῥέω, *to flow*. Leuchorrhois by many writers is uſed in the ſame ſenſe. See Fluor albus.

Leucorrhois. Is alſo that ſpecies of diarrhœa called *diarrhœa mucoſa*. See Diarrhœa, and Hæmorrhoides.

Levator palati mollis. This muſcle riſes from the baſis of the ſkull, near the articulation of the lower jaw, runs down the fauces, paſſes inwards and forwards, ſpreads itſelf on the palatum molle, and goes to the uvula.

—— Palpebræ superioris. *Aperiens palpebrarum rectus*, thus named, from its ſtraight progreſs and uſe, by Fallopius, and Douglas, and *elevator*. It ariſes, on each ſide, from the bottom of the orbit by a ſmall tendon, and as the fleſhy fibres of this muſcle paſs over the globe of the eye, they gradually ſpread, and afterwards terminate by a broad tendinous expanſion in the ſuperior part of the tarſus belonging to the upper lid.

—— Scapulæ, *vel muſculus angularis, ſeu patientiæ Muſculus*. They riſe, ſplit into four little muſcles, from the tranſverſe proceſſes of the four ſuperior cervical vertebræ. Theſe branches join and make one fleſhy belly, which are inſerted into the baſes of their reſpective ſcapulæ above the ſpine.

Levatores ani, called alſo *elevatores*. They riſe with a broad baſe from the ſymphiſis of the os pubis, the internal part of the ileum, and the ſharp proceſs of the iſchium, directing their courſe towards, and blending part of their fibres with thoſe of the ſphincter; wherefore they partly ſerve to expel the fæces, but do not (as is generally ſuppoſed) compreſs the veſiculæ ſeminales in coition.

Levatores com. labiorum, called alſo *elevatores labiorum*.

labiorum. Theſe muſcles riſe from the cavity on each ſide under the os jugale, in the os maxillare, and are inſerted, with the zygomaticus major and others, into the angle of the lips.

LEVATORES COSTARUM, alſo called *ſupracoſtales*. Theſe muſcles riſe from the tranſverſe proceſſes of the vertebræ, and are inſerted into the ribs; they are divided into two claſſes, viz. the longiores and the breviores. The *breviores* are thoſe which riſe from the tranſverſe proceſſes, and are inſerted into the next rib; the *longiores* run over one rib, and are inſerted into the next.

—— LABII INFERIORIS, called alſo *par mentale*. They riſe from the ſockets of the inciſores, and are inſerted into the lower lip, named likewiſe *elevatores*.

—— LABII SUPERIORIS. They riſe from the os maxillare and deſcend obliquely under the ſkin of the upper lip, called alſo *elevatores*.

LEVISTICUM, alſo called *liguſticum*, *angelica montana perennis*. COMMON LOVAGE. The ſpecies uſed in medicine is *liguſticum leviſticum*; or LIGUSTICUM *foliis multiplicibus*, *foliolis ſuperne inciſis*, *floribus umbellatis luteis*, CL. PENTANDRIA; ORD. DIGYNIA. LINN. Gen. Plant. 346. It is a tall umbelliferous plant, with leaves divided like thoſe of ſmallage; the root is thick, fleſhy, and juicy, branched, and of a brown colour outwardly. It is a native of the ſouth of Europe, but thrives in our gardens. It is perennial, flowers in June, and its ſeeds are ripe in Auguſt. This plant hath a very ſtrong and peculiarly ungrateful ſmell: to the taſte it is warm and aromatic, reſembling angelica, but not ſo agreeable. It abounds with a yellowiſh gummy reſinous juice, much reſembling opoponax.

The ſeeds are warm and pungent, and more agreeably flavoured; the roots are ſweetiſh and more pleaſant than the leaves; a large quantity affords a little eſſential oil: an extract made with rectified ſpirit retains both the aroma and the ſweet. This plant in virtues is ſuppoſed to be ſimilar to angelica, and maſterwort, as carminative, ſudorific, and deobſtruent, and may be a good ſubſtitute for either. It has been chiefly employed in hyſterical diſorders, and uterine obſtructions. The leaves eaten as ſallad are accounted emmenagogue. See Raii Hiſt. Lewis's Mat. Med.

LEVITAS INTESTINORUM. See LIENTERIA.

LIBANOTIS, } Alſo called *cachrys*, *cachryſera*, FEN-
LIBANOTOS. } NEL HERB FRANKINCENSE. This plant grows on mountains in Italy and Sicily. It flowers in May. The ſeed is called *cacry*. It is alſo a name for ſeveral ſorts of *laſerpitium*, *ferula glauco folio*, *ferula minor*, *roſmarinus*, *oreoſelinum apii*, and ſeveral other plants.

LIBERANS AQUA. See CALCIS, AQUA MAJ. COM.

LIBIDO. See PRURITUS.

LIBRA. See PONDUS.

LICHANOS. See INDEX.

LICHEN. IN SURGERY. It is a kind of eruption variouſly named by different writers; ſome name it *ſerpigo*, or *zerna*, others call it *petigo*, *ſarpedo*, and *voliatica*. Blancard ſays the *ſcabies* of Celſus is the *lichenes* of the Greeks: the Greeks or Arabians reckon two ſorts, one milder than the other, and the *impetigo Arabum Plinii*. Blancard further obſerves, that the *lichenes* are certain aſperities of the ſkin, and as it were tumors which itch much, and ſend forth matter. Avicen obſerves, that the dry ſort is the worſt: he further adds that one kind ſpreads and is malignant, the other fixed and ſtanding. This diſorder affects any part of the body, but more particularly the face and chin. Sauvages and ſome others rank it as a ſpecies of tinea, with which, perhaps, it may be as conveniently ranked as with any other of the like cutaneous itching ulcers.

IN BOTANY. It is a floriferous and ſeminiferous kind of moſs, whoſe flowery little heads are furniſhed with many grains, and are variouſly ſhaped, producing as they ripen ſeveral little monopetalous flowers. The ſeeds, which are ſmall, flat, and orbicular, are contained in ſome peculiar open capſules, reſting upon the plane of the leaves, and are ſometimes found in the ſame plant that bears the little heads, ſometimes in other plants of the ſame ſpecies. Beſides theſe flowery little heads, there are obſerved in ſome ſpecies ſome umbellated heads of different figures, which produce neither flower nor ſeed, as other plants of the ſame ſpecies uſually do. The pedicles of both ſpecies are for the moſt part naked, and proceed from no vagina. The leaves are of an herbaceous conſiſtence, and of an indeterminate figure, widely ſpreading, and running out into various roots from their back part. Boerhaave enumerates thirty-eight ſpecies. Every plant under the name of *lichen* is warming and aſtringent. It is a name given to the *muſcus pyxidatus*, *hepatica vulgaris*, &c. beſides the ſucceeding; alſo to a ſpecies of leproſy, and certain warts which grow on horſes' legs.

LICHEN ARBOREUS PULLUS, called alſo *muſcus cruſtæ*. TREE LIVER-WORT. It grows to trees, and is uſed inſtead of the pulmonaria arborea.

—— CINEREUS. ASH-COLOURED GROUND LIVER-WORT. It is the *lichen* caninus, or *lichen* coriaceus repens lobatus obtuſus planus, ſubtus venoſus villoſus, pelta marginali aſcendente, Linn. It conſiſts of roundiſh thick leaves, divided about the edges into obtuſe ſegments, flat above, of a reticular texture underneath, faſtened to the earth by ſmall fibres; when in perfection, of an aſh-grey colour, by age turning darker-coloured or reddiſh. It grows on commons and open heaths, ſpreads quickly on the ground, and is to be met with at all times of the year, but is ſuppoſed to be in its greateſt vigour about the end of autumn, &c. to the winter. A powder uſed to be formed of two parts of this lichen in powder, and one of black pepper. Doſe 3 i. ſs. in half a pint of cow's milk for four mornings ſucceſſively was to be taken faſting: the powder was called PULVIS ANTILYSSUS, and held at one period in high eſtimation, on the authority of Dr. Mead, and ſome other, though leſs eminent, equally credulous practitioners. Now, and very properly, it has fallen into diſrepute. Indeed from the ſenſible qualities of this lichen it does not appear to be poſſeſſed of any uſeful degree of medicinal virtue.

LICHEN ISLANDICUS; called alſo *lichen terreſtris*; *lichenoides rigidum*;—— *Iſlandicum*. ERYNGO-LEAVED, EATABLE, ICELAND LICHEN. It is the LICHEN foliaceus aſcendens laciniatus, marginibus elevatis ciliatis. CLASS. CRYPTOGAMIA; ORD. ALGÆ. LINN. Gen. Plant. 1202. This is a native of Britain, and grows particularly on the mountains, both in the Lowlands, and Highlands of Scotland, and in Wales. It is foliaceous, erect, large: the leaves are crowded, connected, about two inches high, of a ſtiff ſubſtance when dry, but ſoft and pliant when moiſt: they are variouſly divided, without order, into broad diſtant ſegments, turned in at the edges, and fringed with ſhort ſtrong briſtles; the UPPER SURFACE is ſmooth, concave, ſhining, of a pale green or cheſnut colour, but red at the baſe: the under is ſmooth and whitiſh, a little pitted and ſprinkled with very minute black warts; the fructifications are large, of a reddiſh-brown colour, and placed on the lobes of the leaves. This plant is extremely mucilaginous, has a bitter and ſomewhat aſtringent taſte, and is conſidered as a laxative in its recent ſtate: but its bitterneſs and aperient quality are in a great meaſure deſtroyed by drying, or ſlightly infuſing in water. The Icelanders make a flour of it called *fialgras*, either by firſt waſhing the plant, and cutting it into ſmall pieces, or by drying it by the fire or in the ſun, then putting it into a bag, which is well beaten; and laſtly, by ſtamping, working it into flour. This is a tolerably agreeable, and grateful food. As a medicine, Scopoli and Haller recommended it in coughs and conſumptions; and it has alſo proved efficacious in dyſentery, and diarrhœas. Dr. Herz found it ſo ſucceſsful in dyſentery that after the repeated adminiſtration of emetics and cathartics, he never uſed any other medicine, to which (though) he occaſionally added opium. Dr. Crichton has an high opinion of it in two ſpecies only of conſumption, the *phthiſis hæmoptoica*; and *phthiſis pituitoſa vel mucoſa*; for by the uſe of this he has ſeen patients get ſo far the better as to be diſmiſſed from the hoſpitals cured. The form in which it is given, is in decoction, made by boiling one ounce and an half in a quart of milk, *over a ſlow fire, exactly one quarter of an hour*. DOSE, about three or four ounces frequently in the day. If milk diſagrees, water may be uſed. It ſeems highly probable that this medicine may be uſeful in the abovementioned caſes, for it certainly ſtrengthens the digeſtive powers, proves extremely nutritious, and is poſſeſſed of demulcent, and inſpiſſating properties.

LICHENOIDES. See LICHEN ISLANDICUS.

LIEN. See SPLEN.

LIEN SINARUM. See FABA ÆGYPTIA.

LIENTERIA, from λειος, *ſmooth*, and εντερον, *the gut*. A LIENTERY. The Latins call it LÆVITAS INTESTINORUM. Dr. Cullen makes it the fifth ſpecies of diarrhœa, and defines it, a diarrhœa in which the ali-

ments are quickly hurried through the body in a nearly indigeſted ſtate. FERNELIUS attributes this diſorder to a weakneſs of the firſt concoction; but DR. FREIND, with greater probability, ſuppoſes an obſtruction of the inteſtinal glands to be a principal cauſe; and FR. SYLVIUS ſays, that the orifices of the lacteals are in a great meaſure obſtructed. ACTUARIUS obſerves that an inveterate diarrhœa or dyſentery moſt commonly produces the diſtemper.

ETMULLER propoſes to ſtrengthen the ſtomach with rhubarb, quinces, and ſuch means as check vomiting: and DR. FREIND aſſures us that the moſt rational method is, gently to ſtimulate the inteſtinal tube, and to deterge the obſtructed glands by means of mild purges, and vomits of ipecacuanha at proper intervals. To theſe may be added moderate riding, ſtomachic and warm ſtrengthening medicines. See DIARRHŒA.

LIENTERIA SPONTANEA. See DIARRHŒA.

LIGAMENTUM, from *ligo, to tie*; called alſo *colligamen, copula, ſyndeſmos*. A LIGAMENT. The *ligaments*, ſo far as they relate to the bones, are tendinous, inelaſtic, gliſtening bodies. Every articulating bone is furniſhed with a capſular *ligament*, which *ligament* is compoſed of two layers; the external layer is the ſtronger, being made by the perioſteum, the inner is thin and uniform.

—— ANNULARE. The ANNULAR LIGAMENT. This name is given to a *ligament* on each ankle and each wriſt, and this more on account of their uſe than their figure; they bridle the tendons of the muſcles which paſs through them. Hence the term FRÆNUM.

—— ARTERIOSUM. See DUCTUS ARTERIOSUS.

—— COLI DEXTRUM. The meſentery having reached the end of the ileum joining the colon, the particular lamina which is turned to the right ſide forms a ſmall tranſverſe fold thus called.

—— COLI SINISTRUM. The meſentery, here called *meſocolon*, having paſſed below the left kidney, it contracts and forms a tranſverſe fold thus named.

—— COLLI vel NUCHÆ. See CUCULLARIS.

—— CUTANEUM OSSIS COCCYGIS. It goes out anteriorly from the extremity of the os coccygis. It is very ſlender, and divides into two portions at the orifice of the anus, which run in the membrana adipoſa, and are inſerted in the ſkin on each ſide of the anus by a kind of expanſion, and continuing to divaricate, they are loſt on the two ſides of the perinæum.

—— DENTICULATUM. Between the anterior and poſterior bundles of fibres which form the ſpinal nerves, a *ligament* is connected, by a number of threads, to each ſide of the pia-matral covering of the ſpinal marrow, through its whole length, for its ſupport. As this *ligament* is fixed by a number of teeth, to the inner ſide of the ſheath formed by the dura mater, it has been called *denticulatum*. The greater number of theſe teeth run tranſverſely; ſome aſcend, others deſcend; all ſplit into fibres, which are incorporated with the fibres of the inner layer of the dura mater. From the conical lower end of the ſpinal marrow a cord is produced, which reaches to the os coccygis, and there ſplits into threads, which may be conſidered as the termination of the laſt teeth of this *ligament*.

—— FALLOPII. See LIGAMENTUM POUPARTII.

—— HEPATIS SUSPENSORIUM. It was the umbilical vein in the fœtus.

—— INTERMAXILLARE. So Winſlow calls a *ligament* on each ſide of the face. It connects the two jaws, and gives inſertion to the poſterior fibres of the buccinator muſcle. It is ſtrong and broad, fixed to the outſide of the upper jaw, above the laſt dens molaris, and at the ſide of the apophyſis pterygoidæus internus. By the lower end it is fixed on the outſide of the lower jaw, below the laſt dens molaris.

—— LATUM, or *ſuſpenſorium hepatis*. It is made up of the double membrane of the peritonæum, which covers the liver on each ſide, and meets to be joined by the ſternum.

—— POUPARTII. } POUPART'S LIGAMENT. It is
—— FALLOPII. } only the lower border of the deſcending oblique muſcle of the belly ſtretched from the fore part of the os ilium to the pubes.

—— PUBIS INTEROSSEUM. It is a ſtrong triangular membrane, fixed by two of its edges in the inferior branches of thoſe bones, all the way up to their common ſymphyſis; the third edge, which is loweſt, is looſe: and this whole membrane, the middle of which is perforated by a particular hole, is ſtretched very tight between the two bones, and under their cartilaginous arch to which it adheres very cloſely.

LIGAMENTUM ROTUNDUM. The ROUND LIGAMENT. There are two of this kind, one on each ſide of the uterus. They are two long ſmall plexuſes of blood-veſſels upon the fore-part of the ligamenta lata, *whoſe uſe is not known*. They run in the duplicature of the broad ligaments, from the corners of the fundus uteri, paſs through the annual aperture of the obliquus externus, and are loſt in the middle and upper part of the fat in the groin.

LIGAMENTUM SUSPENSORIUM. See CORPORA CAVERNOSA PENIS.

LIGATIO, } A BANDAGE, or LIGATURE, (See
LIGATURA. } FASCIA), or ſtiffneſs of the joint, and alſo that impotence which is ſuppoſed to be induced by magic.

LIGATURA VENERIS. A name for camphor, from a ſuppoſition that it checks the venereal appetite. See CAMPHORA.

LIGNUM CAMPESCANUM. } See CAMPE-
—— CAMPECHIANUM. } CHENSE LIG-
—— TINCTILE CAMPECHIANUM. } NUM.

LIGUSTICUM. See LEVISTICUM.

LIGUSTRICUM. See SESELI VULGARE.

LIGUSTRUM INDICUM. Alſo called *alcanna, Cyprus Dioſc. & Plinii, elhanne Arabum*. EASTERN PRIVET. This is the KENNA of the Turks and Moors. It is reckoned emmenagogue, but is little uſed, except to ſtain the nails of women and the beards of men of a red colour.

Phillyrea or MOCK-PRIVET is ſaid to dry and aſtringe, but, like the reſt, is neglected in practice.

—— VULGARE, alſo called *liguſtrum* Germanicum, PRIMPRINT, or COMMON PRIVET. It is a ſhrub with rough pliant branches, whence it is in much uſe for hedges in gardens; the flowers grow in ſpikes, they are of a whitiſh colour, and followed by cluſters of black berries; the flowers appear in May and June, the berries are ripe in September.

There are other ſpecies; but, though reckoned ſomewhat aſtringent, and alſo uſeful in hyſteric diſorders, they do not obtain in practice.

LILIASTRUM ALPINUM MINUS. SPIDER-WORT. This plant is chiefly uſed as an ornament in gardens, though it is ſaid to be a reſiſter of poiſon, and uſeful in eaſing gripes, called alſo *Phalangium Alſobrogicum*.

LILIO-HYACINTHUS. The LILY-HYACINTH, called alſo *hyacinthus ſtellaris*. CLASS. HEXANDRIA; ORD. MONOGYNIA. LINN. Gen. Plant. 410. The leaves and roots reſemble thoſe of the *lily*, but the flower more reſembles that of the *hyacinth*. The roots, like thoſe of the lily, are digeſtive.

LILIUM. The LILY. This plant is ſo well known as not to need a deſcription. Boerhaave enumerates nineteen ſpecies, but there are very few of them that are uſeful in medicine. It is alſo a name given to many flowers, as LILIUM CONVALLIUM MINUS. See MONOPHYLLON.

—— ALBUM. The COMMON WHITE LILY. LILIUM CANDIDUM, or LILIUM PALÆSTINUM, foliis ſparſis, corollis campanulatis, intus glabris. It is perennial, a native of Syria and Paleſtine, common in our gardens, and flowers in June. The flower gives an agreeable flavour to expreſſed oils, and the roots are extremely mucilaginous; and, boiled with milk or water, are uſeful in emollient and ſuppurating cataplaſms: but the bread and other farinaceous poultices poſſeſs equal advantages. Dr. Alſton ſays that the roots are of the nature of ſquills. Godorus, ſerjeant-ſurgeon to queen Elizabeth, cured many dropſical people by giving them bread to eat in which theſe roots were baked.

—— CONVALLIUM, alſo called *convallaria, Maianthemum*, MAY LILY, and LILY of the VALLEY. It is the CONVALLARIA MAJALIS, Linn. The flowers of this kind of *lily* are ſmaller than thoſe of any other; they have a penetrating bitter taſte, and a fragrant ſmell: the bitter matter of theſe flowers remains both in the ſpirituous and watery extract, and is nearly as purgative as aloes. The dried flowers are a ſtrong ſternutatory. The roots alſo poſſeſs the bitter and purging qualities of the flowers.

—— RUBRUM, alſo called *hemerocallis, lilium purpurocroceum, lilium croceum*. RED or ORANGE LILY. The leaves are cooling, and the roots are aperitive and ſtimulating.

LIMATURÆ FERRI. See FERRUM.

LIMONIUM. SEA-LAVENDER. Boerhaave mentions

tions fourteen ſpecies. It is aſtringent, and ſaid to be given with ſucceſs againſt diarrhœas, dyſenteries, profluvia menſium, and all kinds of hæmorrhages. The roots and leaves are the parts moſt uſed. It is alſo a name for *behen rubrum*, and *beta ſylveſtris*.

LIMONUM. The LEMON-TREE. CITRUS LIMON. VULGARIS; vel CITRUS MEDICA *petiolis linearibus*. CLASS. POLYADELPHIA; ORD. ICOSANDRIA. Linn. Gen. Plant. 901. It is a native of Aſia, but cultivated in the warmer parts of Europe: there are many varieties with reſpect to the fruit. Linnæus reckons the ſeveral citrons, as well as lemons, to be only varieties of one ſpecies, which is diſtinguiſhed from the orange kind only by the pedicles of the leaves being naked, The lemon is called, *malus Medica*; *malus Perſica*.

The YELLOW RIND of *lemons* is a grateful aromatic, and very commonly uſed in ſtomachic tinctures and infuſions. Its flavour is the beſt adapted to accompany bitters. It affords an ESSENTIAL OIL, commonly called the eſſence of *lemon*, which is extremely volatile, of a pale ſtraw-colour, in ſmell as agreeable as the freſh peel, and is often employed as a perfume; but it is often adulterated with ſpirit of wine, or with oil of turpentine; to detect which, add a little of the ſuſpected oil of lemon to a little ſpirit of wine, and if it is adulterated with oil of turpentine, the mixture becomes milky; if the adulteration is with ſpirit, a mixture of it with the oil of turpentine becomes milky alſo.

The JUICE OF LEMON is more acid than that of oranges; ſix drams of good *lemon* juice ſaturate about half a dram of fixed alkaline ſalt; and this mixture, with the addition of a ſmall quantity of any aromatic water, is much in uſe, for abating naufeas, vomiting; and, from promoting the ſecretions eſpecially that to the ſurface, proves of conſiderable ſervice in abating the violence of fevers. This juice has been found to allay hyſterical palpitations of the heart, after various other medicines had proved ineffectual. In jaundice, four or ſix ounces taken a day, or the juice of oranges, have proved a remedy. With regard to other properties, they are the ſame as thoſe of the orange juice; but, as this is ſtronger than that of the orange, where a ſtrong vegetable acid is required, that of the lemon is preferred. As an antiſcorbutic, it is generally taken on board of ſhips; but, as it ſpoils by long keeping, a fourth or fifth part of any ardent ſpirit added to it, will prevent it. See Neumann's Chem. Works. Lewis's Mat. Med.

LINAGROSTIS. See PANICUM.

LINARIA, alſo called *oſiris*, *urinaria*, FLAX-WEED, or COMMON TOAD-FLAX. The ſpecies formerly uſed in medicine is the ANTIRRHINUM LINARIA, Linn. Boerhaave enumerates twenty-two ſpecies of *linaria*, but hardly any of them deſerve notice. The common ſort ſo reſembles the eſſula minor, that it is not diſtinguiſhable before the flowers appear, but by breaking the ſtalk; for the *toad-flax* is deſtitute of the milky juice which is obſerved in the eſſula. It is perennial, grows wild about the ſides of dry fields, and flowers in June and July. If the leaves are inwardly uſed, they are diuretic and purgative; externally they have been commended againſt the piles. A name alſo for a ſpecies of *elichryſum*.

—— HEDERACEO FOLIO. See CYMBALARIA.

LINCTUS, alſo called *lohoc*, *eclegma*, *elixis*, *elegma*, *electos*, *ecleitos*, *illinctus*. LOCH, and LAMBATIVE. This compoſition is thicker than ſyrup, but much ſofter than an electary; and was firſt made to be licked from a ſtick of liquorice, and then gradually ſwallowed. It is a form that ſoon palls. Linctuſes may be uſed in diſorders of the inward parts of the mouth, the fauces, and œſophagus, as in aphthæ, tickling coughs from defluxions of thin ſerum, &c.

LINEA ALBA, —— CENTRALIS. } It extends from the cartilago enſiformis to the os pubis. From the os pubis to the navel it is a mere line, but higher it is broader. Its whiteneſs is cauſed by the tendons. It is made up and interwoven out of all the tendons of the abdominal muſcles, which, being run together into one entire body, aſſiſt each other's motion in compreſſing the belly.

LINEÆ SEMILUNARES. They terminate the lower part of the external oblique muſcle of the abdomen, and are loſt at the upper part.

—— TRANSVERSÆ. They paſs between the linea alba and lineæ ſemilunares, and are formed by the intendinations of the recti muſcles. They are not directly tranſverſe as repreſented in figures, but are irregularly waved.

LINGODES. Fevers are ſo called that are much attended with an hiccough.

LINGUA, from *lingo, to lick*. The TONGUE, called alſo *gloſſa* and *glotta*, and by ſome authors, *plectrum*. As to its ſtructure, it is compoſed of two parts; the inferior is a maſs of muſcle; the upper ſurface is, towards the apex, full of papillæ, which, as you trace them backward, become more irregular and flat, whence authors treat of papillæ pyramidales, capitatæ, and lenticulares. Theſe papillæ are a maſs of veſſels running from the baſis towards the apex. Near the epiglottis, the ſurface of the *tongue* is merely glandular. Near the middle of the *tongue*, is a chap, called the *foramen cæcum*: Morgagni firſt deſcribed it, and Vaterus hath ſince found its ducts which diſcharge ſaliva. Under the papillæ, on the ſurface of the *tongue*, are fleſhy fibres running in all poſſible directions; it is owing to theſe that the *tongue* hath ſuch variety of motions; and on the under part of the tongue, is a membranous ſubſtance, called *frænum* and *filetum*; and that part of the tongue, which is next the root, and neareſt the fauces, is called *cephaline*; the tip, *progloſſis*. This is alſo a term given to many botanical ſubſtances.

—— AVIS. See FRAXINUS.

—— CERVINA, alſo called *calcifraga* by SCRIBONIUS, *phillitis*, *ſcolopendrium*. It is the ASPLENIUM SCOLOPENDRIUM, vel ASPLENIUM *frondibus ſimplicibus cordato-lingulatis integerrimis, ſtipitibus hirſutis*. CLASS. CRYPTOGAMIA; ORD. FILICES. LINN. Spec. Plant. p. 1079. HIND'S, or HART'S TONGUE. It is a plant with long, uncut, narrow leaves, of a bright green colour, ſtanding on long hairy pedicles. There is no ſtalk, nor any manifeſt flowers; the ſeeds are a fine duſt, lying in large, rough, brown, tranſverſe ſtreaks on the backs of the leaves. This plant is perennial, and is found green in all the ſeaſons of the year. It delights in moiſt, ſhady, ſtony places. The leaves are commended as aperient and corroborant, particularly in diſeaſes of the viſcera: but preſent practice does not employ them.

—— SERPENTIS, See OPHIOGLOSSUM.

LINGUALES. The ninth pair of nerves. See HYPOGLOSSI EXTERNI.

LINGUALES GLANDULÆ. They are thoſe of the foramen cæcum of the baſis of the tongue. See LINGUA.

LINGUALIS MUSCULUS. The MUSCLE of the TONGUE. It riſes from the baſis of the os hyoides, and runs to the tip of the tongue. It is in general the fleſhy fibres of the tongue, which run in many directions. It turns the tongue laterally, and downwards.

LINI INFUSUM. See DYSURIA.

LINIMENTUM. LINIMENT, called alſo *hypaleiptom*, *litus*, *perichriſis*. It is a thinner kind of ointment, and principally deſigned for an application where the tenderneſs of a part will not admit of a harder ointment.

—— ALBUM. See SPERMA CETI.

—— ARCÆI. See ELEMI.

—— BITUMINIS AMMONIATUM. ℞ Petrolei Barbadenſis ℥ i. ſs. aquæ ammoniæ puræ ℥ ſs. m. This is a ſtrong ſtimulant, applied in diſeaſes of the hip and other parts, under the idea of powerfully diſſolving thickened lymph.——CAMPHORÆ COMPOSITUM. ℞ Camphoræ ʒ ij. olei olivæ ℥ i. aq. ammon. puræ ℥ iij. m. in oleo prius ſolvatur camphora, deinde adjiciatur aqua ammoniæ puræ. This is of uſe in deep-ſeated inflammations, and quickening ſuppuration in torpid habits.—CAMPHORÆ AMMONIATUM. ℞ Spiritus camphorat. ℥ ij. aquæ ammoniæ puræ ʒ ij. m. In chronical enlargements of the joints, and other affections, which require the uſe of ſtimulants externally, this appears calculated to afford ſome relief. It has been ſaid to be of great uſe in cancerous ſores, externally applied; *even to promote their ſucceſsful termination*. But in the noli me tangere, it has certainly manifeſted conſiderable utility.

—— CERUSSÆ cum SAPONE. See PLUMBUM.

—— OLEOSUM. See AMBUSTA.

—— SAPONACEUM, now called *linimentum ſaponis*. SAPONACEOUS LINIMENT. It was formerly called *opodeldoc*, and ſaponaceous balſam. It is chiefly employed for external purpoſes againſt rheumatic pains, ſprains, bruiſes, and ſuch like complaints. The London College directs the following very liquid form, becauſe the ſoap acts moſt to advantage when ſo diluted.

Soap LINIMENT.

Take of the ſpirit of roſemary, lb. i. hard Spaniſh ſoap, three ounces; camphor, one ounce; digeſt the ſoap in ſpirit

ſpirit of roſemary, until it is diſſolved, and add to it the camphor. Ph. Lond. 1788. See OPODELDOC.

LINOSYRIS NUPEORUM. See ELICHRYSUM.

LINQUART. See DISCESSUS.

LINTEUM. See CARBASUS.

LINUM. LINE, or FLAX. LINUM USITATISSIMUM, or LINUM SYLVESTRE, *foliis lanceolatis alternis, calycibus capſuliſque mucronatis, petalis crenatis, floribus cæruleis, caule ſubſolitario.* CLASS. PENTANDRIA; ORD. PENTAGYNIA. LINN. Gen. Plant. 389. This plant is properly called *line* only while it is an herb ſtanding green in the field, and hath no inner bark: when the inner bark is perfected, and ever after, it is called FLAX. Boerhaave mentions eight ſpecies; but it is only the ſeed of the common ſort that is uſed in medicine.

Lineſeed is of a reddiſh-brown colour, gloſſy, flat, ſlippery, nearly oval, and pointed; it hath an unctuous, mucilaginous, ſweet taſte, but no ſmell; the mucilage is in the ſkin of the ſeed. On expreſſion much oil is obtained from it. This oil, if drawn without heat, is inſipid, but does not congeal with the winter's cold, nor does it form a ſolid ſoap when mixed with fixed alkaline ſalts, but acts more powerfully than any expreſſed oil as a menſtruum on ſulphureous bodies. When this oil is ſweet, it is emollient; when rancid, it is better as an expectorant. It is ſuppoſed to be of a more healing and balſamic nature than the other oils of this claſs; hence very generally employed in pulmonary complaints; alſo in colics, and conſtipations of the bowels. Applied to burns and ſcalds, it is uſeful; and when women's breaſts are inflamed from the milk ſtagnating in them, it affords conſiderable relief. If the ſeeds are boiled in water, they afford a large quantity of mucilage; but if deſigned for inward uſe, an infuſion is more agreeable. Theſe infuſions are emollient, incraſſant, and demulcent, of uſe in tickling coughs, ſtranguries, &c. A ſpoonful of the ſeeds unbruiſed is ſufficient for a quart of water.

Infuſion of LINESEED.

A large ſpoonful of the unbruiſed ſeed may be infuſed in a quart of boiling water, to which half an ounce of the root of liquorice may be added; and when it is cold, the ſtrained liquor may be uſed as common drink.

If an ounce of colt's foot leaves is added, it is called PECTORAL INFUSION.

The mucilage obtained by inſpiſſating the decoctions, is an excellent addition for reducing diſguſtful powders into the form of an electary: thus the compound paſſes into the ſtomach, before the diſguſtful taſte can be perceived.

The ſeeds may be uſed for maturating cataplaſms after the oil is expreſſed from them; but they are generally made by ſtirring a ſufficient quantity of the meal into boiling water to form it into a proper conſiſtence. A cataplaſm of this ſort is eſteemed a good emollient and relaxant, though it anſwers better if mixed with crumbs of bread; becauſe the lineſeed meal affords too great a quantity of ſliny mucilage to render it ſo relaxant as it ought to be. See Lewis's Mat. Med.

This is a name for the EARTH FLAX, and SALAMANDER'S WOOL; to which are joined the following epithets: *linum abeſtinum; carpaſium; caryſtium; Cypricum; Creticum; foſſile; Indicum; & vivum*; ſee AMIANTHUS.

LINUM CATHARTICUM, Linn. Called alſo *linum minimum, chamælinum*, MOUNTAIN-FLAX, MILL MOUNTAIN, and PURGING FLAX. It is a ſmall plant, with little, oblong, ſmooth leaves, having one vein or rib running along the middle. The ſtalk is ſlender, reddiſh, divided towards the upper part into fine branches, bearing on the tops white flowers, followed, as in the common flax, by roundiſh ribbed capſulæ, with ten flattiſh ſlippery ſeeds in each. It is annual, and grows wild on chalky hills, and dry paſture grounds. It is an effectual, ſafe purge; a handful of the freſh leaves infuſed in wine or whey, or a dram of the leaves in powder, is a doſe. See Raii Hiſt. Lewis's Mat. Med.

LIPIRIA. See ARDENS FEBRIS.

LIPODERMUS, from λειπω, *to leave*, and δερμα, *the ſkin*. See PRÆPUTIUM.

LIPOME. See NÆVUS.

LIPOPSYCHIA, from λειπω, *to leave*, and ψυχη, *life*. A FAINTING FIT.

LIPOTHYMIA, from λειπω, *to leave*, and θυμος, *the mind*. FAINTING. *Deliquium animi, & animæ; defectio animi; diſſolutio, exanimatio, ſyncope, aſphyxia; virium lapſus.* The greateſt degree is called *apopſychia, apſychia; echyſis.* Dr. Cullen places ſyncope as a genus of diſeaſe, in the CLASS, NEUROSES; ORDER, ADYNAMIÆ, which he defines, the motion of the heart diminiſhed, or at reſt for ſome time. He diſtinguiſhes two ſpecies: 1. SYNCOPE CARDIACA, when it often returns without any evident cauſe, with violent palpitations of the heart at intervals: *This from ſome fault of the heart, or contiguous veſſels.* 2. SYNCOPE OCCASIONALIS, when it ariſes from a manifeſt cauſe: *This from an affection of the whole ſyſtem.* Both theſe he conſiders as idiopathic; the ſymptomatic ſpecies, ſymptoms of diſeaſes either of the whole ſyſtem, or other parts except the heart—inſtanced in the SYNCOPE *febrilis, febricoſa*; and in the SYNCOPE *exanthematica; ſtomachica; hyſterica; arthritica; ſcorbutica.* The ancients named it *cardia*, when cauſed by anger: and what we term ſyncope, they called CARDIACA PASSIO, to which, for the account, refer.

In this diſeaſe, the pulſe and reſpiration become ſuddenly weaker than uſual, and that in ſuch a degree, that, to the perception of the attendants, they wholly ceaſe.

The ſlighteſt degree is that in which the patient conſtantly perceives, and underſtands, yet is without the power of ſpeaking: this is called *fainting*. It often happens to thoſe who are diſturbed with flatulencies, without any remarkable alteration in the pulſe.—If he loſes his feeling and underſtanding, with a conſiderable ſinking of the pulſe, it is called a *ſyncope*, or ſwooning.—If the ſyncope is ſo violent, that the pulſe ſeems totally extinguiſhed, without any diſcernible breathing, with a manifeſt coldneſs of the whole body, and a wanly-livid countenance, ſometimes followed by death, it is called *an aſphyxy*, which may ſignify a total reſolution. This laſt degree, in moſt inſtances, conſtitutes, according to Dr. Cullen's arrangement, varieties of apoplexy, and theſe chiefly are varieties of the ſpecies which he calls *apoplexia venenata.*

The cauſes are various, either too much or too little blood;—a load at, or other diſorder in the ſtomach;—nervous complaints;—paſſions of the mind;—a polypus in ſome of the principal blood-veſſels—and various other diſorders; as alſo opiates, and other volatile and active drugs, &c.

The different degrees of this diſorder ſhould be diſtinguiſhed from hyſteric fits, epilepſy, and the apoplexy.

People who are ſubject to frequent *faintings*, without any manifeſt cauſe, uſually die ſuddenly, and are found to have polypuſes in their principal blood-veſſels. When anger is the cauſe in weak perſons, it is dangerous; and when occaſioned by worms, it is equally ſo.

During the fit, all that can be done is to reſtore the motion of the heart, which may be attempted by placing the patient in a proper poſture. Cold water, or vinegar and water, may be ſprinkled on his face, and a little of the ſame poured down his throat. Strong vinegar may be held under his noſtrils; the extremities ſhould be well rubbed; and, as ſoon as he can ſwallow, give him a glaſs of wine, or of ſome cordial water.

After the fit, the cauſe muſt be removed. If this is pain, give ſmall doſes of any convenient opiate at proper intervals;—*if violent evacuations*, give gentle anodynes, a light, cordial, but nouriſhing diet, which muſt be allowed very frequently, as but ſmall quantities can be taken at a time.—*If the patient is robuſt*, and *a redundancy of blood overcomes him*, bleed; but wait his recovery from a preſent fit before performing this operation, except ſome very urgent circumſtance demands immediate bleeding.—*When indigeſtion is the cauſe*, or *other diſorder in the ſtomach*, a vomit may be given ſpeedily, and then the reſpective diſorder muſt be adverted to.—*When nervous affections* give riſe to this diſorder, a ſupine poſture, freſh air, and either ſweets or fœtids held to the noſe (as the patient finds relief from one to the other) give the ſpeedieſt help. *When unruly paſſions*, when anger, or grief, &c. produce this diſorder, the fits are often tedious, and, when removed, ſoon return; in this caſe keep the patient ſtill; in the fit, let the ſtrongeſt vinegar be held to his noſe; as ſoon as he begins to recover, give a ſmall doſe of tinct. opii in an agreeable cordial water; now and then give the ſp. ætheris vitr. in his drink: if he complains of ſickneſs, and a bitter taſte in his mouth, give a gentle emetic, and, after it, the ſp. ætheris nitr. or nitre itſelf, with a little rhubarb. See Cullen's Firſt Lines, vol. iii. edit. 4. Some of the aſphyxiæ are conſidered as belonging to this complaint. See ASPHYXIA.

LIPPITUDO. BLEAREYEDNESS. See EPIPHORA

and XEROPTHALMIA. Celſus means by it an opthalmia.

LIPYRIA. A ſpecies of fever, in which the internal parts are very hot, whilſt the external are very cold.

LIQUIDAMBAR, } called alſo *ſtyrax liquida, acer* LIQUIDAMBRA, } *virginianum odorat. ſtiraciflua*, Linn. LIQUID AMBAR. It is a reſinous juice, of a yellow colour, inclining to red; at firſt about the conſiſtence of turpentine, by age it hardens into a brittle reſin. It is the produce of a tree in various parts of America, called STYRACIFERA. It is rarely met with genuine; and, when it is, its uſe is chiefly as a perfume. See Lewis's Mat. Med.

LIQUIRITIA. See GLYCYRRHIZA.

LIQUOR AMNII. In MIDWIFRY, this is generally called the WATERS. It is the fluid in which the fœtus ſwims during geſtation. This liquor contains air, whence, it is ſuppoſed ſome children have been heard to cry in the womb.

—— MINERALIS ANODYNUS HOFFMANNI. Fred. Hoffman, the author of this medicine, extols it as an anodyne and antiſpaſmodic: but æther is a ſuperior medicine of the ſame kind. In the Paris Pharmacopœia, the following is given as the method of preparing this liquor, but it is not certainly known to be as Hoffman was uſed to make it.

HOFFMAN'S MINERAL ANODYNE LIQUOR.

In half a pound of concentrated oil of vitriol, placed in a large glaſs retort, pour by little and little through a long ſtemmed funnel, a pint and a half of highly rectified ſpirit of wine. Stop the mouth of the retort; digeſt for ſome days; and then diſtil with a gentle heat. At firſt a fragrant ſpirit of wine will ariſe, and after it a more fragrant volatile ſpirit, which is to be caught in a freſh receiver: the receiver being again changed, a ſuphureous volatile acid phlegm comes over; and, at length, a ſweet oil of vitriol, which ſhould be immediately ſeparated, leſt it be abſorbed by the phlegm. Mix the firſt and ſecond ſpirits together; and, in two ounces of this mixture, diſſolve twelve drops of the ſweet oil juſt named. If the liquor hath any ſulphureous ſmell, rediſtil it from a little ſalt of tartar. It is given as a ſedative, and antiſpaſmodic, in hyſteric, arthritic, and other painful complaints; to adults from thirty to an hundred drops, or more, along with ſome ſugar, or ſome appropriate mixture. See ÆTHER.

LIQUOR. This term is added to many ſubſtances, as *liquor fireniacus*, or *cyreniacus*. See BENZOINUM.—*Æthereus*. See ÆTHER.—*Cereris*. See ALLA.—*Metallicus*. See ARGENTUM VIVUM.—*Salis*. See CIRCULATUM.—*Veneris*. See ÆRUGO ÆRIS.

LITHAGOGUS, from λιθος, *a ſtone*, and αγω, *to bring away*. An epithet for a medicine that expels the ſtone.

LITHARGYRUM, from λιθος, *a ſtone*, and αργυρος, *ſilver*. LITHARGE: called alſo *almakanda* and *almakiſt*; *almarkab chryſitis*; *chryſitis ſpodos*; *cycima*; *hiſmat, marched*; *calciteoſa, argyritis*; *cathmia*. When ſilver is to be ſeparated from copper, or the other impure mixture in the ore, it is put into a teſt; and, with it, is melted a great quantity of lead. When by the heat to which theſe matters are expoſed, the lead, and the other impure metals, &c. which were in the ſilver ore, ſwim like oil on the ſurface of the ſilver, the lead is gradually blown to the ſides of the teſt; and then a notch being cut, the lead runs off, and when cool, appears in the form which we call *litharge*. This *litharge* is of a deep yellow, or of a whitiſh colour, according to the different bodies that are mixed with it, or according to the different degrees of heat to which it was expoſed; and, according to the darkneſs or lightneſs of its colour, is called *litharge* of gold, *alatan*, or of ſilver, *almarcarida*. There are a very great variety of medical compoſitions, of which litharge, or ſome of its preparations make the principal, and always a material ingredient, ſeveral of which here ſucceed, in different forms, viz. cataplaſms, cerates, collyria, liniments, lotions, plaiſters, ointments, &c.

LITHARGYRI ACETATI AQUA. See PLUMBUM. N° 6.

—— EMPLASTRUM. See EMPLASTRUM COMMUNE.

—— ACETATI CREMOR. See PLUMBUM. N° 6.

COLLYRIUM LITHARGYRI ACETATI. EYE-WATER OF ACETATED LITHARGE.

1. Let ten drops of the water of acetated litharge be added to four ounces of roſe water; 2. To the above let twenty drops of camphorated ſpirit be added; but mix the ſpirit with the acetated litharge before the water which muſt be put to them afterwards, to prevent the camphor ſeparating.

LINIMENTUM LITHARGYRI COMPOSITUM. COMPOUND LINIMENT OF LITHARGE.

℞ Unguenti lithargyri cum aceto ℥ ſs.—camph. gr. viij. ceruſſæ acetatæ gr. xvj. opii pulverizati gr. viij. —m. with this the inflamed edges of the eye-lids are to be ſmeared at bed time.

LOTIO LITHARGYRI ACETATI CAMPHORATI. See AMBUSTA.

EMPLASTRUM LITHARGYRI. See EMPLASTRUM COMMUNE.

LOTIO LITHARGYRI ACETATI. This is made by adding one ounce of rectified ſpirit of wine, to two pints of diſtilled water, mixed with two drams of the water of acetated litharge; two drams of proof ſpirit, added to the ſame quantities of the other ingredients, forms the AQ. LITHARGYRI ACETATI COMPOSITA of the London Pharmacopœia.

CATAPLASMA LITHARGYRI ACETATI. See PLUMBUM. N° 6.

CERATUM LITHARGYRI. CERATE OF LITHARGE.

℞ Emplaſtri Lithargyri; adipis ſuillæ ā ā ℥ 4. ceræ flavæ ℥ſs. colliquantur, & quando fere frigida fiat mixtura, adjiciantur aquæ lithargyri acetati ℥ ij. agitentur ſimul donec frigeſcant. For ſuperficial ſores, or ulcers whoſe edges are inflamed, this is much recommended.

UNGUENTUM LITHARGYRI ACETATI.

℞ Unguenti ceræ ℥ j. aq. lithargyri acetati ʒ ſs. m. This is applied to ſmall ulcers whoſe edges are in a ſtate of inflammation; and is preferred to the unguentum ceruſſæ acetatæ, becauſe it will keep longer, is more readily made, and does not grow ſo ſoon rancid. See NUTRITUM UNGUENTUM.

UNGUENTUM LITHARGYRI COMPOSITUM.

℞ Emplaſt. litharg. lb. ſs. adipis ſuillæ pp. ℥ iv. olei olivæ, unguenti ceræ, ā ā ℥ vj. aceti uncias quatuor; aquæ lithargyri acetati ℥ ij. After the unctuous ingredients are melted together and ſuffered to cool, the water of acetated litharge, and the vinegar, are to be gradually incorporated with them. This is applied with great effect in inflammations of the ſkin.

Ceratum Lithargyri acetati. Cerate of acetated LITHARGE.

Take water of acetated *litharge*, two ounces and an half by meaſure; yellow wax, four ounces; olive oil, nine ounces by meaſure; camphor, half a dram: rub the camphor with a little of the oil; melt the wax with the remaining oil; and, as ſoon as the mixture begins to thicken, pour in by degrees the water of the acetated *litharge*, and ſtir conſtantly till it is cold; then mix in the camphor before rubbed with oil. Ph. Lond. 1788.

LITHARGYRUM, alſo called lithargyrus aureus, *chryſitis*, or *chryſitis ſpodos*, REDDISH OR GOLD LITHARGE.
LITHARGYRUS ARGENTEUS, called alſo *argyritis*, WHITISH, or SILVER LITHARGE.
} See LITHARGYRUM.

LITHIASIS, from λιθος, *a ſtone*. The GRAVEL or STONE. See CALCULUS.—Alſo a tumor on the eye-lid, in which is a hard concretion between its coats.

LITHODENDRON. See CORALLIUM.

LITHOEIDES, from λιθος, *a ſtone*, and ειδος, *form*, ſo called from its hardneſs. See TEMPORUM OSSA.

LITHONTRIPTICUS, from λιθος, *a ſtone*, and θρυπτω, *to break*. An epithet for medicines that are ſaid to *break* the *ſtone* in the bladder, called alſo *calculifragus*. Though the different *ſtones* that are generated in the human bladder require different ſolvents when out of the body; and though art hath not yet afforded a medicine, which, when injected into the bladder, will, without injury thereto, diſſolve the *ſtone* therein lodged; it cannot thence be concluded, that there are no *lithontriptic* medicines. It may be here obſerved, that one ſolvent affects one ſubject, but hath no effect on another; ſo a ſolvent may yet be met with, that will deſtroy the *ſtone*, and not hurt the human body. The water in which the boiled white of egg diſ-

folves, will liquefy myrrh, but may be put into the human eye without caufing any uneafinefs.

Soap-ley, taken at firft in fmall dofes, in broth that is freed from all its fat, fucceeds in moft cafes which require an alkaline folvent. The patient may begin with twenty drops, and gradually increafe the dofe as he is able: and by repeating it three times a day for fix, eight, or twelve months, the wifhed-for effects often follow. See Blackrie on Diffolvents of the *Stone*. A folution of vegetable alkali impregnated with fixable air, has been faid to be fuccefsful in diffolving the calculus in the kidneys, of which feveral cafes have been publifhed by Dr. Falconer of Bath.

LITHOPHYTON. A LITHOPHYTE is a fpecies of plant of a horny fubftance, feeming to be of a middle nature betwixt wood and ftone. Boerhaave calls it *keratophyton*.

—— NIGRUM. See CORALLIUM NIGRUM.

LITHOSPERMUM, called alfo *milium folis*, *Ægonychon*, *ætonychum* GROMWELL, GRAY-MILL. The LITHOSPERMUM OFFICINALE, Linn. It is a rough plant, with ftiff branched ftalks, oblong acuminated leaves, fet alternately without pedicles, and whitifh monopetalous flowers, fcarcely longer than the cup, followed by roundifh, hard feeds. It is perennial, grows wild in fields, and flowers in May and June. The feeds are diuretic. They are rarely ufed. See Lewis's Mat. Med. It is alfo a name for the *lacryma Jobi*.

LITHOTOMIA, from λιθος, *a ſtone*, and τεμνω, *to cut*, alfo *cyſtotomia*. LITHOTOMY, or cutting for the *ſtone*.

This operation was performed in the time of Hippocrates; but being then thought mere madnefs, it was only performed by empirics.

When a *ſtone* is fufpected to be lodged in the bladder, befides the common fymptoms of this cafe, it is ufual for a furgeon to make a fuller examination, by introducing an inftrument, called A SOUND, into the bladder, by which, if poffible, to feel the *ſtone*. In order to this, Mr. Sharp directs the following method: "The patient being laid on an horizontal table, with his thighs elevated, and a little extended, pafs the found, with the concave part towards you, until it meets with fome refiftance in perinæo, a little above the anus: then turning it without much force, puſh it gently on into the bladder; and if it meets with an obſtruction at the neck, raife its extremity upwards, by inclining the handle of it towards you; or if it do not then flip in, withdraw it a quarter of an inch, and introducing your fore-finger into the rectum, lift it up and it will ſeldom fail to enter. There is fome art in turning the found; in the proper place of the urethra, which furgeons not well verſed in this operation cannot fo well execute; therefore they may pafs the inſtrument with the concave fide always towards the abdomen of the patient."

The common rule of knowing whether there is more *ſtones* than one in the bladder, is not infallible (fee Warner's Cafes in Surgery); though, if a *ſtone* is univerſally rough, there is rarely more than one: but if one part is poliſhed, and another rough, it is almoſt certain that there are more. Some ſpeak of an adheſion of the *ſtone* to the coats of the bladder. It indeed often happens that the bladder is wrinkled round the *ſtone*; and in extracting, the operator tearing a little of the inner coat of the bladder, imagines, or pretends, that there was an adheſion. If the *ſtone* is large, by introducing the found, the operator may hear it ſtrike againſt it, but cannot thus determine whether the *ſtone* is large or ſmall. Sometimes the operator examines, but cannot find a *ſtone*, though there is one; for inſtances occur in which it is lodged in a ſac. Before a patient is examined, he may uſe a little exerciſe, ſuch as riding, or jumping, by which the *ſtone* may fall down to the neck of the bladder; for thus it may more readily be diſcovered.

After the operation, children relapſe more frequently than adults; and adults run greater hazards in the operation than children.

From the variety in the apparatus, or in the modes of operation, different names have been given, as follow:

The leſſer Apparatus, called alſo the Celſian Method, cutting on the Gripe, and the Guidonian Method.

This way was directed and practiſed by Celſus. Since the time of Johannes de Romanis, it is called *cutting with the leſſer apparatus*, to diſtinguiſh it from his new method, which, on account of the many inſtruments in it, is called *cutting with the greater apparatus*. Heiſter ſays, this method is practicable in boys under fourteen years of age, becauſe that in them the *ſtone* may be brought to the perinæum. He ſays, he always performs it on children; and that it may be practiſed on adults, when the *ſtone* cauſes a ſuppreſſion of urine, by its adhering to the neck of the bladder; but otherwiſe it is dangerous to adults.

The greater Apparatus, called alſo Marianus's Method, and the Old Way.

This method was invented by Romanis, but publiſhed by Marianus, who was his pupil. Romanis conſidered the ſhortneſs and dilatability of the urethra in women, and imagined, that, by an opening made in the urethra in men, near the bladder, it might be dilated, and the *ſtone* extracted with eaſe.

The high Operation, alſo called Hypogaſtrica Sectio, and Franco's Method.

The great objections to this method are, as the bladder is apt to be thickened and inflamed, and cannot be diſtended, the inciſion may happen to be made into the peritonæum; and alſo, if not being in a depending part, the urine and pus will inſinuate themſelves into cavities, ſo occaſion inflammations, ſuppurations, and fiſtulas, which cannot often be healed.

The lateral Operation.

This method was invented by an eccleſiaſtic, who called himſelf Frere Jaques. Rau learned it of him, and Albinus publiſhed it. Various improvements have been made in this method, and it is yet continued in practice. Mr. Sharp directs it as follows, from Mr. Cheſelden: "The patient being laid on a table, with his hands and feet tied, and the ſtaff paſſed, as in the old way, let your aſſiſtant hold it a little ſlanting on one ſide, ſo that the direction of it may run exactly through the middle of the left erector penis and accelerator urinæ muſcles; then make your inciſion through the ſkin and fat, very large, beginning in one ſide of the ſeam in perinæo, a little above the place wounded in the old way, and finiſhing a little below the anus, between it and the tuberoſity of the iſchium. This wound muſt be carried on deeper between the muſcles, till the proſtratæ can be felt, when ſearching for the ſtaff, and fixing it properly if it had ſlipped, you muſt turn the edge of the knife upwards, and cut the whole length of that gland from within outwards, at the ſame time puſhing down the rectum with a finger or two of the left-hand, by which precautions the gut will always eſcape wounding; after this, introduce the forceps to take out the ſtone. After the operation is ended, if there is an hæmorrhage from the proſtate gland, a ſilver canula of three or four inches long, covered with fine rag, may be introduced into the bladder, and left there two or three days; for it rarely fails to check it:—the patient may alſo take an opiate. If the wound does not bleed, a little dry lint, or a pledgit of digeſtive, may be laid in it. If a pain is felt near the bladder ſoon after the dreſſings are finiſhed, a bladder of warm water may be applied over it; and if it increaſes, as there will be much danger therefrom, bleeding and clyſters will be neceſſary."

When a *ſtone* ſticks in the urethra of a man, proceed as directed in the article CALCULUS.

Women are rarely afflicted with a *ſtone* in the bladder; but when they are, it generally may be extracted through the urethra, which may be gradually dilated to an almoſt incredible ſize. *Stones* have been extracted through a dilated urethra, which weighed more than five ounces.

As the urethra is generally lacerated in ſome degree by the paſſage of the *ſtone*, many prefer the making of an inciſion; but either method ſucceeds ſo well, that it is difficult to ſay which is the beſt.

Mr. Bromfield gives the following inſtance of dilating the urethra, which is a far better method than thoſe by means of tents, &c. By the help of a ſtrait blunt director, he introduced into the bladder the cloſed end of the appendicula inteſtini cœci of a ſmall animal; and leaving out, at a proper length thereof, the open end, he filled it with warm water by means of a ſyringe, and prevented the water's eſcape by a ligature. He then made a twiſt or two of that part of the appendicula which was left out, that the contained water might, by being preſſed on, diſtend the cloſe end which was in the bladder: an aſſiſtant was directed to draw it forward from time to time, and occaſionally to give a freſh twiſt, ſo as to fill the end contained in the bladder more and more as the

cervix

cervix vesicæ opened; by which process, continued for some time, the neck of the bladder was so opened, that the forceps might have easily been admitted, if required; but the *stone* getting a passage by the help of the urine, this instrument was not needed. After the passage of the *stone*, the parts were fomented with warm milk, and then with camphorated spirit of wine; very little inflammation was observed, and no other disagreeable symptom. See his Observations and Cases, vol. ii.

Mr. Gooch gives an instance of extracting a *stone* of four ounces weight, through an incision which he made from the vagina into the bladder. This procedure was attended with very little trouble, either to himself or the patient; the ulcer soon healed, by the use of soft balsamic injections, and no inconvenience was observed after the healing of the parts. See his Cases and Remarks, vol. ii. p. 182, &c.

See Sharp's Operations of Surgery. Sharp's Critical Enquiry. Heister's Surgery. Bromfield's Cases and Obs. vol. ii ch. 8. Le Dran's Operations. Heister's Dissertation on the High Apparatus. Bell's Surgery, vol. ii. p. 41, &c.

LITRON. See ANATRON.

LITUS. See LINIMENTUM.

LIVIDUS MUSCULUS. See PECTINEUS.

LIX. See CLAVELLATI CINERES.

LIXIVIUM. A LEY. That is, water impregnated with the salts or burnt vegetables.

—— MARTIS, N° 7, under FERRUM.

—— TARTARI. See KALI AQUA.

—— SAPONARIUM. See KALI PURI AQUA.

LOBELIA. So father Plumier named a plant which he found in America, in honour of Lobel, a famed botanist. In North America there are five species. They are found in marshy grounds, and on the sides of rivers. With the root of the *lobelia*, the American Indians cure the most virulent pox. They take five or six of the plants (some take the roots either fresh or dry), and boil them in water. Early in the morning the patient drinks as much as he can of this decoction; and during the day it is his chief drink; by and by, it begins to purge him; and the strength of the decoction is increased or lessened, as the patient can bear the evacuation. If any part is sore, it is to be washed with this decoction, and thus in two or three weeks a cure is performed. The DECOCTUM LOBELIÆ, see Chan. Chir. 33. The species recommended by the College of Edinburgh is the LOBELIA SYPHILITICA, or LOBELIA *caule erecto, foliis ovato-lanceolatis subserratis, calycum sinubus reflexis*. CLASS SYNGENESIA. ORD. MONOGAMIA. Linn. Gen. Plant. 1006. This is a native of Virginia, and flowers from August to October. Every part of this plant abounds with a milky juice, and has a rank smell. The root, which is the part used in medicine, in taste resembles tobacco, and is apt to excite vomiting. It was called syphilitica from its efficacy in the cure of syphilis. With the North-American Indians, it was considered as a specific in that disease, and by them kept as a profound secret. It is now given in decoction. A handful of the dried root is boiled in 12 pints of distilled water, till they are reduced to eight. The patient is to begin with half a pint of this, morning and evening, then four times a day, so long as the purgative effect is not too violent; if otherwise, it must be omitted for three or four days, and then again be had recourse to, till the cure is completed. However great may have been its character in North America, the practitioners of this country do not repose more confidence in it than other ingredients of which similar accounts have been given, but which have proved equally inefficacious. The chief medical effects that have been attributed to this root, is that of being purgative.

LOBELLUS, } A SMALL LOBE. The small cells of
LOBULUS. } fat are called *lobuli* adiposi: and the extremities of the bronchia, which end in little knobs, are called *lobuli pulmonum*. Winslow calls the lobe of the ear *lobus*, or *lobulus*. See AURICULA.

LOBUS ECHINATUS. See BONDUCH INDORUM.

LOCALES. Diseases that affect, or have their seat, only in a particular part of the body, or of its limbs, synonymous with *morbi organici*, which see, and also PLAGÆ.

LOCALIS MEMBRANA. See PIA MATER.

LOCHIA, from λεχομαι, *to lie in child bed*, or λοχος, *a bed*. The PURGATIONS OF THE UTERUS AFTER CHILD-BIRTH, sometimes called *gynæcia*. It is the *third species* of Dr. Cullen's MENORRHAGIA, which he defines, a sanguinary menorrhagy in lying-in women. This discharge is necessary to unload the vessels, and proceeds from the appendices cæcæ, after the separation of the placenta: it continues for a quarter, half, or a whole hour after delivery, more or less, according to the state of the woman. The flux retains a sanguine colour for three or four days, then gradually grows more serous, until it totally ceases. Sometimes it continues several weeks; but at length the uterus and its vessels contracting, it ceases. Baglivi observes, that, when the breasts are full of pain, at the coming of the milk, the *lochia* stop, but flow again as soon as the pain vanishes. Its quantity is generally less after a miscarriage than when a woman goes her full time; and it sooner stops when a woman gives suck, than when she does not.

The *lochia* may produce much disorder by being deficient or redundant.

When the *lochia* are defective, the belly swells; a heavy pain is felt there and in the loins, and sometimes in the groins also; a heat and pulsation in the uterus, which produces restlessness and a fever; a full, hard pulse, pain in the head and back, a nausea, sometimes a vomiting, and a difficulty of breathing. The face looks red; the eyes are disordered; the rigors of acute fevers come on, fainting, cold sweats, a pulsation and heat of the womb, a palsy in the lower part, and sometimes an epilepsy. The *lochia* sometimes diminish gradually, and sometimes all at once, in the morbid suppression of them. Sometimes a delirium comes on, which increasing occasions convulsions and death; and if the patient escapes with life, she loses her senses and continues lunatic.

One of the principal causes of this disorder is, the woman's rising too soon after delivery; whence the weakly, and those who are subject to hysteric symptoms, should be very cautious in this respect. Among other causes are, a defect or impoverishment of blood; an inspissation of the blood in the uterus from cold; a convulsive stricture of the uterine vessels; a diarrhœa, or other flux; an inflammation of the uterus, &c.

The obstruction of this discharge (called *dylochia*), is the worst, if it happens while the evacuated blood is florid; but far less troublesome when it grows serous. In some constitutions, it is small in quantity; but when no pain, fever, or other manifest ill effects are the consequence, it is not to be attended to.

THE INDICATIONS OF CURE are, to calm the spirits, and to promote the return of the impeded discharge. Means, however, are not to be persisted in, if relief is not obtained in two or three days; proper means having thus far been used, wait and see what time will produce. If the patient outlives the twentieth day, there is rarely any danger to fear. If the obstructed *lochia* have produced any other disorder, it will be best removed when the woman's strength is somewhat restored.

If, on the suppression of the *lochia*, the pulse is full and hard, bleed, give warm camomile tea as oft as the patient can take it without puking; draughts may also be given, in which are the pulv. contrayerv. and sal succin. or with conf. aromatica or mithridate, with small doses of the tinct. opii; and, if the heat requires it, add the kali acetatum. These may be repeated every three or four hours.

If the pulse is observed to sink from the bleeding, it must not be repeated, but a blister should be applied as a stimulant.

As different causes may retard or suppress the *lochia*, the present or particular one should be attended to, in order to the administration of proper help.

When cold is the cause (as for the most part it is) gentle anodynes and perspiratives will generally afford relief.

The hurry and tumult both of body and mind, when labour is painful and tedious, produce *spasmodic affections*, and retard the *lochia*. In this case, if the pulse require it, bleed, give a laxative cooling clyster, anodynes, and mild diaphoretics.

Depressing passions, in irritable habits, have sometimes this ill effect; in which case, keep the patient still and in bed; support her with every encouragement; let all the drinks be warm; and, with cordials, let such nervous medicines be mixed as the peculiarity of her circumstances may require.

If inflammation is the cause, proceed as directed in inflammation of the part affected. The best fomentation are bladders of warm water laid over the part in which the pain is most oppressive.

If the lochia are only diminished, gentle stimulants with perspiratives

perſpiratives may be allowed: but if *they are ſuppreſſed*, there is for the moſt part a fever, in which caſe forcing medicines are improper.

If the lochia return not, but a ſhivering cold fit comes on, an abſceſs may be ſuſpected to be forming in ſome part of the body, which will generally carry off the complaint, provided the patient hath ſtrength to bear the diſcharge. Theſe abſceſſes often happen in the breaſt, but ſometimes they are ſeated in ſome other glandular part.

Purging ſhould be guarded againſt: but, though neutral medicines often purge in the beginning of their uſe, this effect generally ceaſes in a day, or early in the ſecond. If a purging comes on, and the ſtrength is not impaired by it, leave it to nature, as ſhe often ſets up one diſcharge to anſwer the end of another. But, if the ſtrength ſeems to be affected by it, give opiates both by the mouth and clyſterwiſe: this is the chief if not only reſource, for aſtringents do little or no ſervice.

If pain is conſiderable, and makes the patient reſtleſs, beſides anodynes, emollient clyſters ſhould be frequently injected, not only to empty the bowels, but to act as a fomentation to the parts.

If, in weakly women, from riſing too ſoon, a delirium is brought on, it generally proceeds to a fatal madneſs: ſometimes it ends in lunacy for life. In this caſe keep the patient in bed; avoid all evacuations except perſpiration, and guard againſt every thing that can diſturb. Sal ſuccin. ſpermaceti, pulv. rad. contray. emollient clyſters, by way of fomentation, and bladders of warm water on the part moſt complained of, may be tried.

THE LOCHIA ARE SOMETIMES EXCESSIVE, then called MENORRHAGIA LOCHIALIS. Here obſerve that the quantity diſcharged by different women is ſo various, that it is not to be regarded whether little or much is loſt in particular caſes, if no bad ſymptoms come on in conſequence of it.

An immoderate flux is attended with weakneſs, loathing, fainting, convulſions, a flow, weak, intermitting pulſe, a pale countenance, excretions of grumous blood, pains in the hypochondrium, a tenſion of the belly, vertigo, dimneſs of ſight, tingling in the ears, &c.

If any part of the placenta remains in the uterus, or clots of blood are lodged there, they may both irritate and prevent a due contraction of the uterus and its veſſels, and ſo cauſe this complaint. Theſe ſhould immediately be brought away.

If the pulſe is full and hard, and *the patient's ſtrength will admit*, bleed: but this is rarely required. Ligatures about the wriſt and ankles, and above the knees and elbows, are generally a more proper management. Aſtringents, as alum, &c. are preſcribed by many: but the ſame proceeding as is directed in the article ABORTUS, in caſe of a flooding, may be conſulted for what is farther needful in this caſe. See Wallis's Sydenham. La Motte's Obſervations.

LOCHIORRHŒA. An exceſs of the lochia after they become pale or whitiſh.

LOCULAMENTA. The cells in the fruit of plants, where the ſeeds are lodged, which are divided by ſmall partitions. See CAPSULA.

LOCUSTA. The GRASSHOPPER; alſo the outer covering of the flower and grain of corn, which incloſes the chaff; and it is a name for LACTUCA AGNINA.

LOHOC. See LINCTUS.

LOGAS. The white of the eye. See ADNATA.

LOLIUM, from λωειν ολεειν, *ſegetem perdere*; vel λωειν ολεο. *Seges nexia*, or lolium, quaſi δολιον, *doloſus*, as it was ſuppoſed to be generated of corrupted barley or wheat. The *d* is changed into *l*, from a cuſtom in ſome parts of Greece of changing the letters uſed in other parts. *Lolium* is alſo called *aira*, *infelix*, *æra ivray*, *gramen loliaceum*, *lolium album*, *lolium tremulentum*; DARNEL, IVRAY, COCKLE; and the French call it DRUNKEN WHEAT.

It is diſtinguiſhed from other grain by its ſlender flat ear, and by its grains, with their huſks on both ſides as far as the ſtalks, being ſituated in the ſame plane. It is not uſed in medicine. Its moſt noted qualities are, its producing ſpeedy drunkenneſs if taken inwardly, and preventing drunkenneſs if applied outwardly. It cauſes a vertigo and torpor; and by an imprudent uſe of it, much miſchief is produced. See Raii Hiſt.

Another ſpecies is called *phœnix*, alſo *anchynopes*, RAY-GRASS, or DARNEL-GRASS.

LOMENTUM FABÆ. BEAN MEAL, or bread made thereof. See FABA MAJOR.

LONCHITES, from λογχη, *a lance*, becauſe the leaves are ſharp-pointed, and reſemble the head of a lance. It is alſo called *filix aculeata*, and *filix mas*. The root is aperient and diuretic, but not much uſed in the preſent practice.

LONCHOTON. See VITRIOLUM.

LONGANON, LONGAON. } See RECTUM INTESTINUM.

LONGISSIMUS DIGITUS. See DIGITUS.

LONGISSIMUS DORSI. This muſcle is thus named from its length. It is the longeſt in the back. It hath the ſame origin with the ſacro-lumbaris; it is inſerted by ſeveral digitations into the ribs on the inſide of the upper part of this muſcle; betwixt it and the complexus, the tranſverſalis colli of Albinus is ſeated, which runs from the tranſvere proceſſes of the vertebræ of the back to thoſe of the neck, and is an erector of the body.

LONGISSIMUS OCULI. See OBLIQUUS MAJOR OCULI.

—— POLLICIS MANUS. See FLEXOR TERTII INTERNODII POLLICIS.

LONGUS COLLI. This muſcle riſes from the two upper vertebræ of the back, and runs to be inſerted into the three upper vertebræ of the neck. It is made up of two planes, which decuſſate each other; and it receives ſlips from ſome of the lower tranſverſe proceſſes of the neck. Its office is to bend the neck.

LONICERA PERICLYMENUM. See CAPRIFOLIUM.

LOPHADIA, LOPHIA. } See SPINA. *Lophia* alſo ſometimes ſignifies the upper part of the back of the neck.

LOPIMA. See CASTANA.

LORA. See DEUTERIA.

LORDOSIS, from λορδος, *bowed* or *bent inward*. It is an affection of the ſpine, in which it is bent inward, or toward the fore parts. It is the oppoſite to gibboſity. It is alſo a name for the *lumbago*, and the *tabes dorſalis*. When it is ſpoken of legs, it ſignifies bow-legged.

LORICA. A kind of lute, with which glaſs retorts, &c. are coated, before being put into the fire. Many kinds of coating made for chemical veſſels. See Dict. of Chem.

LORIND. MATRICIS. An epilepſy, or a convulſive diſorder proceeding from the uterus.

LOTIO. A LOTION. It is an external fluid application. *Embrocatio*, *lotio*, and *collyrium*, are ſimilar forms: but when uſed on the eyes, it receives the names of *collyrium*; on the face, a *lotion*; on any other part, an *embrocation*. *Lotio*, (from *lavare*, *to waſh*), ſometimes ſignifies a CLYSTER, alſo urine.

—— ALUMINIS. See INFLAMMATIO.

—— AMMONIÆ MURIATÆ, —— —— —— ACETATÆ. } See INFLAMMATIO *Mammæ*, N°7.

—— AMMONIÆ MURIATÆ CUM ACETO. See INFLAMMATIO

—— SPIRITUOSA. See AMBUSTA.

LOTUS. It is a ſpecies of plant, of which Boerhaave enumerates ſixteen. Thoſe that are uſed in medicine are noticed under other names which they bear. It is alſo a name for *melilotus*, and ſome other plants.

—— ARBOR called alſo *celtis*. The LOTE or NETTLE-TREE. Boerhaave mentions three ſpecies. They grow in the ſouthern parts of Europe; their fruit, which is a berry, is aſtringent.

—— URBANA, called alſo *trifolium odoratum*, *melilotus major odorata violacea*. SWEET TREFOIL. It is the *trifolium cæruleum*, Linn. Boerhaave ranks it as a ſpecies of melilot. The ſeeds, leaves, and flowers, are anodyne and diaphoretic.

LOXARTHRUS. An obliquity or perverſion of the head of bones, and the muſcles annexed; of the joint to a degree of deformity, without luxation or ſpaſm.

LUCE (EAU DE). It is a kind of liquid ſoap that is volatile, and of a ſtrong penetrating ſmell. See ALCALI.

LUCIDUM SAL. See GEMMÆ SAL.

LUCIDUS LAPIS. See BONONIENSIS LAPIS.

LUCINA. See ALILAT.

LUDUS HELMONTII. The WAXEN VEIN, called alſo *ludus Paracelſi*. It is a ſtony matter, and ſeems to be an indurated ſubſtance in the earth, ſimilar to the calculus of the human ſpecies, called *cevil*. It is found in pits, and is diſtinguiſhed by the yellow cracks which are frequent in it, and which are filled up with yellow ſpar. PARACELSUS preſcribed the cubic pyritæ, which are like dice, and called them *ludi*: HELMONT miſtook him, and ſuppoſed this ſtone, which is moſtly divided into ſquares by the cracks, to be the ſubſtance. The ſpar that

fills

fills up the cracks, is only to be uſed; for it is that alone which promotes urine, and is a ſpecies of calcareous earth, a remedy for the ſtone.

LUES. It is the PESTILENCE in men, and the MURRAIN in beaſts.

—— DEIFICA. One of the pompous names for the epilepſy.

—— NEURODES CONVULSIVA. It is a mild typhus.

—— VENEREA. The PLAGUE of VENUS, or VENEREAL DISEASE. Dr. Cullen names it SYPHILIS, and places it as a genus in the CLASS CACHEXIÆ, and ORDER IMPETIGINES, which he defines, a contagious diſeaſe, ariſing after impure coition, and a diſeaſe of the genitals, ulcers of the throat; corymboſe papulæ of the ſkin, particularly at the margin of the hairy ſcalp, running in ſcabs and ſcabby ulcers; pain in the bones, and exoſtoſes: of which he allows only one ſpecies. It is alſo called the VENEREAL PESTILENCE, or POX. *Aphrodiſius morbus, morbus Gallicus, grand-gor, Indicus morbus, Neapolitanus morbus, paturſa.* It is endemic in Peru. It was brought from the Spaniſh Weſt Indies into Spain in 1493; in 1494 it was carried from Spain to Italy; in 1495 it was ſpread both in Naples and France: from theſe all Europe was infected. That this diſorder was unknown to the Greeks and Romans, appears from their abſolute ſilence concerning it. All phyſicians who lived at the time when it appeared firſt in Europe, unanimouſly declared their ignorance of it, any further than that it was brought into Europe at the cloſe of the fifteenth century. See Aſtruc on the *Venereal Diſeaſe*, vol. i. b. i. c. 1. The firſt inſtances upon record, of *poxes*, that is, of the *venereal diſeaſe*, imported from America, are in the writings of one Boyle, a Benedictine monk, and in Peter Margarit, a noble Catalonian, in 1494. The origin of this diſeaſe is traced much higher, even from the year 1193. See SWEDIAUR, on the Venereal Diſeaſe.

Wherever this diſorder attacks, at the firſt, it is conveyed into the conſtitution by the lymphatics; *if the infection is received by the penis*, by means of the abſorbent or lymphatic veins, a bubo happens in the groin; for the lymphatics of the genitals paſs through the inguinal glands;—*if at the hand*, the axilla will be the ſeat of the bubo, for the ſame kind of reaſon;—if at the lips, the glands in the neck will tumefy and inflame. This diſorder never affects the viſcera, but it attacks the bones; hardly a bone in the body but what hath been injured by it, though moſt commonly it is ſeated in the ſhin bones, upper part of the ſkull, clavicles, the bones of the arm near the joints of the elbows, and ſometimes the knees, ribs, or even the ſpine; ſome external glands, the palate, noſe, ſkin, or ſome other part not out of the reach of ſurgery, are the uſual parts affected. It is probable that the lacunæ in the urethra are the firſt ſeat of infection; if ſo, the nearer the firſt ſeat of running is to the neck of the bladder, the more the urethra will be affected, the ſymptoms more ſevere, the diſcharge greater, and vice verſa. The inflammation and heat of urine is felt moſt near the glans, and the ſeat of inflammation and pain are moſt likely to be the ſeat of the diſcharge.

In patients of a thin habit, the ſymptoms and cure are worſe and more difficult to manage than in the fat and plethoric. And in children this diſorder is worſe than in adults.

It is always propagated by contagion. The *venereal* matter muſt be applied in a fluid ſtate, either to ſome part where the mucus is very ſoft, as it is in the part of generation, &c. or to a wound or ulcer; or it may be given to a child from its mother during her pregnancy, or to a nurſe from a diſeaſed child, during its ſucking. The *venereal* matter almoſt always occaſions a converſion of the mucus of the part, or of the fluids of the ulcer or wound, into a matter ſimilar to itſelf; and when a ſufficient quantity hath been thus produced, it brings on an inflammation in the mucous membrane, or glands, or in the wound, or ulcer, and it is afterwards ſometimes abſorbed into the general ſyſtem of the veſſels, but very ſeldom before; the firſt ſymptom therefore appears in the part where the infection was received.

If children receive the infection from their mothers, they are ſometimes born with ſymptoms of the diſeaſe, as inflammations of the ſkin, gonorrhœa, &c. but for the moſt part there is no appearance for ſeveral days, but in about a week eruptions with browniſh ſpots or ſcabs, degenerating into ulcers, ariſe about the angles of the mouth, or other parts of the head, or over the body.

Women are not ſubject to ſo great a variety of ſymptoms as men are; their chief complaints are, a difficulty of urine, and a running; however, they are liable to chancres and warts, both within and without the labia pudendi, as alſo buboes in the groin; and ſometimes a contraction of the ſphincter vaginæ.

The firſt ſymptom obſervable in a freſh gonorrhœa in men is uſually an agreeable ſenſation in the whole or the greateſt part of the urinary paſſage; at this time, ſcarce any or no diſcharge is obſervable on the linen: then an uneaſineſs about the parts of generation, together with an appearance of a little whitiſh, or rather water-coloured, matter about the orifice of the uthera, when in the moſt favourable degree; but oftener it is whitiſh, and differs in colour and conſiſtence daily, becoming yellow; then, if the virulence is great, it is greeniſh, and ſometimes ſtreaked with blood. When the running is viſible, there is alſo an inflammation and ſwelling about the orifice of the urethra; this ſymptom is ſometimes perceptible when no running appears; in this caſe there is a degree of pungency on the evacuation of urine; the heat of urine is ſcarce perceived in voiding it, but immediately after the patient feels an extreme heat throughout the whole duct of the urethra, but more eſpecially at its termination in the glans. Spots appear on the linen, the edges of which are darker coloured than the centre; *this dark margin is a principal mark to diſtinguiſh the venereal diſcharge from thoſe ariſing from other cauſes.* From a defect of mucus in the urethra the urine excites a ſmarting and pain there as it paſſes through. The matter diſcharged from the urethra increaſes in quantity. The inflammation at the end of the urethra increaſes too, as appears from the redneſs and hardneſs of the edge of its orifice. A tenſion and hardneſs is perceived through the whole length of the urethra, and a ſenſation of ſtricture in the penis, particularly during an erection. The matter diſcharged is thinner, loſes its adheſiveneſs, and is more ill coloured. The inflammation often occaſions a curvedneſs in the penis, and the ſtimulus, by which the inflammation is excited, occaſions an erection too when the patient is warm in bed, and ſometimes produces involuntary emiſſions; this ſymptom is called a cordee, or a priapiſmus. If the inflammatory ſymptoms are violent, a ſtrangury comes on. Sometimes an inflammation in the prepuce confines it from being drawn back, and thus forms a phymoſis; or being drawn behind the glans cannot be returned, and is then called paraphymoſis. When the ſtricture from theſe two laſt ſymptoms is not ſpeedily relieved, a mortification comes on the part, or the whole of the penis becomes œdematous, in which caſe, without great care, a gangrene follows. Thus the inflammation continues to increaſe generally for about a week or two. If the mucus that is diſcharged waſhes away the *venereal* matter faſter than it is formed, the ſymptoms may continue in the ſame ſtate for ſome time, and then gradually decreaſe, and at length a cure is effected. All theſe ſymptoms may occur without occaſioning the lues venerea ſtrictly ſpeaking. See GONORRHŒA.

But if the diſorder ends not thus happily, ulcers are formed, or the *venereal* poiſon being abſorbed, inſtead of a gonorrhœa, a *lues venerea*, or *pox*, is the conſequence. When the gonorrhœa is long continued, it ſometimes produces a ſtricture in the urethra, and occaſions a difficulty in the evacuation of the urine, which is often attended with pain, the water flowing out in a ſmall ſtream, or only by drops: ſometimes it alſo produces an inflammation, and a diſpoſition to contraction in the bladder, and the urethra contracting, the ſtoppage is alſo increaſed; this generally goes off with a ſecretion of mucus from theſe parts; but it may have the other progreſſes and terminations of an inflammation of the bladder, and often no ſuch affection takes place, or if it does, goes off, and the ſtoppage and pain continue for years. The teſticles, the inguinal glands, and other parts, are ſubject to phlegmonous inflammations. Ulcers are formed in different parts of the body, as in the throat, occaſioning hoarſeneſs, or perhaps a deafneſs, from their ſituation on the orifice of the Euſtachian tube; or if theſe ulcers are very virulent, they eat through to the bone, and ſoon after deſtroying it, a paſſage is formed from the mouth to the noſe. Ulcers are formed in the ſkin; they begin with a purpliſh ſpot or brown ſcab. When ulcers from this cauſe happen in the palms of the hands, the ſoles of the feet, behind the ears, about the anus, or the inſides of the lips, they have the appearance of fiſſures; they alſo ooze out a thin matter, and are attended with great ſoreneſs and pain; the ſcurf and ſcab with which theſe ulcers begin

ste of a yellowish colour, inclining to brown, like the honey-comb; it appears on several parts of the body, by which circumstance they may be distinguished from all others; sometimes they are broad, resembling the descriptions given of the leprosy by some writers; and the more this scurf spreads, the easier the patient becomes. All those *venereal* eruptions are small, and most frequently are formed on the temples or other part of the head, and when they scale off they leave a mark nearly of a chocolate colour behind them. The *venereal* matter fixing on the eyes, produces an ophthalmy, and sometimes a loss of sight: falling on the ears, a deafness, and a caries of the bones there follows. It very often happens that the periosteum is affected, and when the patient begins to grow warm in bed, violent pains are excited; these pains are seated in the head and in the middle part of the bones of the limbs; in the morning they abate, and during the day are rarely troublesome. Sometimes the periosteum swelling, becomes hard, and forms those tumors which are called nodes. Excrescences also arise on the glans penis, prepuce, anus, labia pudendi, &c. these are seldom painful. Various other symptoms appear when no means have been used to check the progress of the disorder, but as mercury is so universally applied to, it is rare that even many of the above named appear in the same patient.

Some constitutions bear up many years, but others sink under the disease, and are carried off.

The *venereal* gonorrhœa should be distinguished from that in which there is no infection, from the fluor albus, and from other increased secretions from the different parts subject to this distemper, from the involuntary emissions of semen, from ulcers in the urinary passages: *venereal* ulcers, pains, eruptions, &c. should be distinguished from those which arise from any other cause.

The more regular the discharge from the urethra is made, the more mild are all the symptoms; but if the running is small in quantity, or the matter of a yellow or greenish colour, it is virulent. If, upon pressing the penis, a drop of limpid liquor, resembling the white of an egg, is discharged, it indicates a safe cure.

As a preventive of this disorder, the following is recommended: ℞ aquæ kali puri, ʒ i. solv. in aq. font. ℔ i. & cola per chartam. Some of this solution is to be mixed with a tea-cupful of water (so much as the mouth can bear without pain), then fill a syringe with the liquor, and inject it into the urethra, or vagina, retaining it there for about a minute; then add to the remainder of the liquor, a tea-spoonful of the solution, and wash the glans, prepuce, labia pudendi, &c. Lastly, inject and wash with warm water.

When the disorder is contracted, the indications of cure are, to destroy or evacuate the *venereal* infection, and to remove the symptoms excited by it.

A gonorrhœa, if recent, is best managed, by first treating it as a topical inflammation: at the same time rendering the urine as soft as possible by the use of demulcent drinks; such as a decoction of marsh-mallow root, or a solution of gum arabic in water.

The seat of the gonorrhœa is always in the inner membrane of the urethra, but it may spread to the prostatæ and vesiculæ seminales, and by gently squeezing the penis it may generally be discovered in what particular part of the urethra this disorder hath its seat; for either a hardness will be felt in the part, or the patient will complain of pain on almost any degree of pressure thereon.

Purging with the natron vitriolat. or the ol. ricini, will be proper until the inflammatory symptoms abate: and then begin to rub the penis under the urethra which the ung. hydrargyri fort. every night at bed-time; or inject a solution of hydrargyrus in the mucilage of gum arabic, rendered sufficiently fluid with linseed-oil fresh drawn: repeat the injection three or four times a day, retaining it eight or ten minutes each time: or some other injection may be made use of according to the sagacity of the prescriber. See INJECTIO, under which article will be found a variety of formulæ.

When injections are used, the patient should always make water first, for thus much of the virulent matter is washed away. The time to leave off injecting is when the running no longer stains the linen with a dark edged spot. The running does not always cease at this time, but though it continues a week or two, it gradually lessens.

During this time avoid all excesses; let the exercise be gentle and moderate; the diet somewhat abstemious, or at least free from every degree of what increases the natural, or excites an extraordinary heat.

If this method cannot be conformed to, give a few cooling purges at proper intervals, and one of the following pills, or two, if the patient can bear them without affecting his mouth, or exciting any of the sensible excretions: ℞ Calom. gr. i. antimonii tartarizati, gr. ½, conf. cynosb. q. s. f. pil. h. s. sumend. Where the affection is merely a discharge from the urethra, though originating from a venereal taint, mercury, or any of its preparations are rarely necessary: the antiphlogistic regimen, according to the constitution of the patient, with sedative applications at first; during the inflammatory state, in form of injection, and afterwards stimulant and astringent ones, will almost universally complete the cure. See GONORRHŒA. But care should be taken that no ulcer is formed in the urethra, for it sometimes happens, that along with a gonorrhœa, or discharge of puriform mucus from the urethra, such a circumstance takes place; in that case then, it will be necessary to pursue a different mode.

When an ulcer appears, or any symptom of the *venereal* matter being absorbed, the use of mercury or some other specific is necessary. If the mercury is used, it should be so managed that the whole habit may be affected by it, and yet none of the sensible discharges produced. It should be given so as to produce hardness, fullness, and a moderate frequency in the pulse, but nothing further; for mercury is most effectual and speedily useful when the patient's strength is not lessened by it. As to a salivation, it is not necessary, in order to a safe and effectual cure. Though indeed an unruly patient is sometimes best managed this way. See SALIVATIO.

In the worst cases, the mercury is best conveyed into the habit through the skin; but in less extraordinary circumstances, its inward use may suffice. The solution of hydrargyrus muriatus is most convenient when the patient must be exposed to the air. ℞ Hydrargyri muriati, gr. xvj. sp. vini Gallici, ℔ j. cujus capiat æger. cochl. unum largum vel medium nocte maneq. cum decocti sarsaparillæ libra una. These have removed different degrees and symptoms of confirmed pox, when persisted in for some time; otherwise preparations of crude mercury are to be preferred, or the pill with calom. & antimonium tartarizatum, above prescribed. If, without affecting the mouth, mercurials run off by the intestines, give the following pill: ℞ Opii & antimon. tartarizat. ā ā gr. ½, conf. cynosb. q. s. f. pil. mane ac vesperi sumend.

Sometimes it happens that whilst the patient continues in the air of a large town, all means prove ineffectual; but, soon after his removal into the country, he is restored to health. It is also most safe to continue the use of mercurials for four or five weeks, although every symptom may have disappeared.

Dr. Smith recommends the following concise method of managing a confirmed *lues venerea*. Give mercury only by way of alterative, and administer it as follows: ℞ hydrargyri calcin. gr. i. ad iii. sulph. ant. præcip. g. ii. ad iv. extr. opii, gr. ss. ad gr. i. conf. rosar. r. q. f. f. bol. omn. noct. hor. decubitus sumend.

During the use of the mercurial bolus, the patient should take half a pint of the following decoction four times a day: ℞ Rad. sarsaparil. ʒ iij. laureolæ ʒ ij. coq. in aq. font lb. iij. ad lb. ij. & cola.

During the cure, he directs that the patient be kept warm, use a light diet, drink plenty of broth and other thin liquors, and go frequently into a warm bath.

Sometimes the internal use of mercury produces uneasiness in the stomach and bowels, or passeth off by stool too freely; in these cases, as well as on other accounts, the mercury may, with equal advantage, be applied by rubbing the ungt. hydrargyri fort. on the skin, as directed in the article SALIVATIO; which see.

To what is already said, it may be added, that the Peruvian bark is a necessary addition in all cases where the patient's strength is diminished, and where there are the œdematous swellings.

In case of a woman's being pregnant, the same gentle method above recommended may be used, with all the safety and advantage that follows it when this supposed impediment does not attend. In the Lond. Med. Obs. and Inq. vol. ii. is an instance of a pregnant woman being cured by the use of hydrargyrus muriatus in sp. vin. Gal. taken inwardly, and washing the sores on the external parts therewith.

Various are the medicines prescribed in this disease;

an

and ſome may, under particular circumſtances, be neceſſary to alleviate ſymptoms, or aſſiſt the operation of mercury; but it muſt be by the judicious management of mercury that radical cures muſt be effected, which may be done with great eaſe, and perfect ſafety to the conſtitution.

PURGES. Theſe can only be wanted on account of particular ſymptoms, or a particular habit of body; and then ſome prudence is required in their uſe; for briſk purges and mercurial medicines freely given, increaſe the irritability of the habit, and thereby render the cure more difficult. The gentler purges that irritate leaſt are to be preferred; and mercurials of the ſimpleſt kind ſhould always be uſed: ſuch as PILULÆ HYDRARGYRI. ℞ Hydrargyri pur. ʒ ij. theriacæ vulg. ℈ ij. magn. alb. q. ſ. teratur hydrargyrus cum theriacâ donec globuli omnino diſparuerint; deinde adjiciatur magneſia. The mixture, during trituration, is apt to grow too thick: in that caſe, occaſionally add a drop or two of water; and form of this maſs 24 pills.

DOSE, one or two every night and morning; or, ℞ Hydrargyri purif. ʒ ſ. amyli ʒ iij. mucilaginis gum. Arab. q. ſ. Theſe muſt be made in the ſame manner as the above, and formed into ſixty pills. Doſe, four or five every day. The continuance of either theſe, or purging, ſhould be no longer than until the reſpective ends are obtained. While the complaint is local, purges are obviouſly uſeleſs, except to remove ſome particular ſymptom.

NITRE. It is commonly uſed to abate inflammation in a gonorrhœa; but, as it produces weakneſs and uneaſineſs about the neck of the bladder, and hath no pretenſion to the end for which it was given, that is, either to ſheathe the acrimony of the fluids, or to defend the urethra from their ſtimuli, emollients and demulcents ſhould be given in its ſtead. Decoction of marſhmallow-roots, or ſolution of gum arabic, would be properly directed as common drink.

LOBELIA. The root of this plant is one of the ſpecifics uſed by the American Indians, by which the *venereal* diſeaſe is deſtroyed, and all its ſymptoms removed. See LOBELIA.

MEZEREON. The bark of its root is recommended as a radical cure, and as effectually removing nodes and nocturnal pains. See LAUREOLA FŒMINA. It ſhould be uſed for two or three months.

SARSAPARILLA. The root ſoon relieves night-pains, head-achs, waſting, dry blotches, moiſtures: and even a caries in the bone is put a ſtop to, if a mild mercurial courſe accompanies it. The decoction ſhould be made freſh, at the furtheſt, every day; and is beſt when not made with a mixture of guaiacum. Joined with mercury, it always effects a cure, and often cures after a long uſe of mercury hath failed. See SARSAPARILLA.

As to the ſymptoms which occaſionally attend and require a particular management, the following methods uſually ſucceed.

CHANCRES, ſee CHANCRE. BUBO, ſee BUBO. SWELLED TESTICLES, ſee HERNIA HUMORALIS.

CARUNCLES IN THE URETHRA. They rarely take place before the running is nearly ſtopped, *if ever they are formed at all*, for it is a cicatrix that is found on diſſection; the ulcers in the urethra healing, leave a cicatrix which checks the free paſſage of the urine. A bougie paſſed up the urethra, a little beyond the place where it meets with reſiſtance, and kept there an hour or more every day, is the proper method of cure. Small ones ſhould be firſt made uſe of, as the ſize ſhould be gradually increaſed, taking care never to have them ſo large as to occaſion too great irritation; for the urethra is exquiſitely ſenſible, and may have an inflammation brought on by injudicious management. Sometimes a ſtricture in the uretra is miſtaken for a caruncle, but the cure is the ſame.

GUMMA, TOPHUS, or NODUS. Theſe are tumors on the periоſteum; the firſt is the ſofteſt; the laſt the hardeſt; they are moſt frequently cauſed by the *venereal* diſorder; much pain attends them. The decoction of mezereon, as above named, is recommended as a radical cure; a ſalivation is not to be depended on; but ſurgery provides an effectual remedy, viz. by cutting down to the bone, taking out the tumor, or as much as can conveniently be managed, and by bringing on a ſuppuration.

ULCERS. Theſe are on the ſkin, or the mucous membrane; their edges are reddiſh, or ſometimes of an aſh-colour, but their ſurface is whitiſh, and their form irregular; they are ſore, or painful: if they are ill treated, they eaſily become cancerous, and hardly admit of a cure, though they are eaſily brought to look well, and to have the appearance of a healing ſtate. Rough medicines, and a too free uſe of mercury, produce the worſt effects. Mild mercurials are always proper; if there is any morbid acrimony in the blood, demulcents ſhould accompany the mercury; and the bark ſhould never be omitted when *venereal* ulcers attend; though, if there is an inflammatory habit, it ſhould be removed by bleeding, &c.

Venereal, as well as *other ulcers*, are diſpoſed to good granulation and ſuppuration by the uſe of the bark given with the mercury. The bark alone, by deſtroying the irritability of the ſyſtem, will make the ulcers put on a good appearance and heal; but after a time, the diſeaſe will be apt to make its appearance again, *ſo that we ſhould never truſt to any medicine but mercury.*

It deſerves notice, that mercury will ſometimes produce ulcers on the tonſils, uvula, and inſide of the cheek, which do not look much unlike a *venereal* ulcer, viz. deep, with a looſe ſlough, and unequal, hard, riſing, craggy edges, but appear ſuperficial, i. e. more like an inflamed eroſion. The bark, with cleanlineſs, will remove theſe ulcers in a few days, even when, to a perſon unuſed to obſerve theſe caſes, the velum palati would ſeem likely to drop off in two or three days.

Mr. Bell obſerves, in his Treatiſe on Ulcers, that thoſe which he calls ſymptomatic, or that are the reſult of a *venereal* taint that hath been of a long continuance, are ſingular in the appearance of their diſcharge, which is as follows: at firſt it is thin, but ſoon becomes tough and viſcid; having a very loathſome, though not the ordinary fœtid putrid ſmell, and a ſingular greeniſh yellow colour. In ſuch ulcers as have an old *pox* for their cauſe, we ſhould depend on the effects of mercury given internally, contenting ourſelves with ſuch external applications as will keep the ſore clean. In this manner, the different ulcers healing up merely by the uſe of internal remedies, proves almoſt to a certainty, that the diſeaſe is eradicated from the habit; and further, it is the only proof that little or no more mercury is required. *Venereal* ulcers are apt to be inflamed; and then, by the pain they occaſion, are very troubleſome; if this inflammation becomes conſiderable, bleed; but, for the moſt part, a proper application of the ſaturnine poultice will ſuffice. The inflammation removed, the ungt. cereum Ph. Edinb. will be the only needful dreſſing. The pil. merc. Ph. Edinb. is generally eſteemed to be one of the beſt mercurial medicines for inward uſe, but ſometimes it fails, and then the hydrargyrus muriatus is generally more ſucceſsful; it may be given in the form of pills, or ſolution. In ſome obſtinate *venereal* ulcers, it ſometimes happens that various mercurial preparations are to be tried before it is known on which to depend; but when a proper one is diſcovered, it ſhould be uſed for ſome time after every appearance that is *venereal* hath vaniſhed. Whatever preparation of mercury be employed, it ſhould always be continued till a ſoreneſs of the mouth be induced; and it ſhould never be carried further than is neceſſary to produce a moderate ſpitting. Be careful to avoid a ſalivation: to guard againſt this, the warm bath ſhould be uſed along with the mercury; or, inſtead of the warm bath, the uſe of a flannel ſhirt next the ſkin; care being taken never to expoſe the body to much cold.—*If the ulcer is ſeated near a bone*, and fungous fleſh appears in it, a caries may be ſuſpected; in which caſe, beſides the neceſſary treatment for carious bones, mercury muſt be adminiſtered. Theſe ulcers are not unfrequently obſtinate, and do not heal, although every *venereal* ſymptom hath vaniſhed: here we may ſuſpect the preſence of ſome other diſeaſe, and that both have had their ſhare in producing as well as continuing the ulcer. As ſoon as the diſeaſe is diſcovered, the proper remedies for its removal muſt be directed; and then a cure will ſoon be accompliſhed. It may be that the ſores will not heal, though no other diſeaſe is attendant, but from the free uſe of mercury, &c. the body is enfeebled; here the bark, or opium, or both, with a nouriſhing diet, a pure air, and moderate exerciſe, may be tried, and uſually ſucceſs will be the reſult.—If the ſloughs on theſe ulcers are tough, dreſſings that gently ſtimulate will be required; e. g. ℞ Ung. reſinæ flavæ ʒ i. hydrargyri nitrati rubri ʒ ij. m. When the ſloughs are caſt off, and a proper diſcharge is produced, dreſs with ſuch other means as the then ſtate of the ſore requires.—When a gland is the ſeat of a general ulcer, a kindly

†

kindly ſuppuration is then difficultly produced, and ſometimes a cure cannot be performed, without deſtroying at leaſt all the hardened part of it. This is beſt done by repeated applications of the argent. nitrat. which may be repeated every third or fourth day. See Bell on Ulcers, vol. vi. p. 381, &c.

Venereal ulcers, whether from buboes, chancres, or otherwiſe, when they appear cancerous, will gradually give way by the uſe of freſh air, a fuller diet, abſtinence from mercury, or by means of hemlock applied outwardly, or given inwardly, whether with or without opiates. Sometimes, a more ſpeedy effect has been obſerved from eating ſix or more lemons in a day. See ſome obſervations of this kind in the Lond. Med. Tranſ. vol. ii. p. 338, &c. *Venereal ulcers in the throat* may be conveniently relieved with the following: ℞ Hydrargyri muriati, gr. x. acidi muriatici, gut. v. tinct. lav. c. ℥ i. m. cap. gut. v.—xx. bis die, in aq. pura vel juſcul. avenac.

Warts and excreſcences. When the infection is ſecurely deſtroyed, theſe may be removed either by a cauſtic or the knife. If they are cut away, deſtroy their roots with the argent nitratum, if they are warts, or hardiſh; but, if ſoft, rub them only with a mixture of quickſilver and lard, in equal quantities, or with the aq. phagedæn. When the whole is deſtroyed, heal the ulcer, as a common one.

Mr. Deaſe, in the fourth volume of the Edinb. Medical Commentaries, obſerves, how difficult it is to eradicate *venereal* warts; and, at the ſame time, cautions againſt perſiſting very long in a courſe of mercury for their removal. He aſſerts, that they continue after the *venereal* virus is effectually removed from the habit, ſo then they are merely local, and require no other treatment than ſuch applications as will remove and prevent them from returning.

Pains in the bones. Theſe are moſt troubleſome in the night. The decoction of mezereon is here effectual; but an opiate ſhould be given at bed-time, until the diſeaſe is vaniſhed. In this caſe be attentive to the deſtruction of the *venereal* infection.

Phimoſis. In the *venereal diſeaſe* this is uſually of the œdematous kind; and, beſides the uſe of proper mercurials, the bark ſhould alſo be given, from an ounce to an ounce and a half in twenty-four hours. In every kind of phimoſis, let milk and water be injected between the prepuce and glans very often. If, by a due uſe of proper means, the phimoſis does not give way, it muſt be cut open with a knife: for beauty, the inciſion may be made on the upper-part; but, to avoid every inconvenience, it may be in one ſide. If the phimoſis hath continued long, ſo that the prepuce is hard and ſcirrhous, the whole of the prepuce ſhould be cut off. Externally the application of Goulard's ſaturnine water, or other ſuch like application, may be uſed to remove the phimoſis in the beginning, but emollient poultices muſt be forborne.

Paraphimoſis. The ſame general method is proper here that is directed for the phimoſis. Bell's Surgery, vol. i.

Cordee. See Chordee.

LUJULA. See Acetosa.

LUMBAGO, from *lumbus, a loin*. The rheumatic pain in the loins. See Rheumatismus. Pains from other cauſes, when in this part, alſo take this name. See Arthritis.

Lumbago psoadica. — apostematosa. — ab arthrocace. } See Arthropuosis.

LUMBALIS, MUSCULUS. See Psoas.

LUMBARES, NERVI. The lumbar nerves. They paſs out from the ſpinal marrow through the vertebræ of the loins, and become larger from the firſt to the laſt. *The firſt lumbar nerve* throws a large branch backward, and two filaments to the intercoſtal; the trunk of the nerve goes through the pſoas muſcle, then to the ſpine of the os ilium, at whoſe anterior ſuperior proceſs it throws off ſeveral branches to the muſcles, and one to the ſpermatic cord in the male, and to the round ligament of the female. The firſt, going to join the ſecond, gives off two filaments; one of which goes to the ſpermatic cord, the other paſſes under the ligamentum Poupartii to the groin: it is from this that ſome account for the pain that is felt in the thigh during a fit of the ſtone.

The ſecond lumbar nerve lies on the inſide of the pſoas muſcle, goes through the head of it, and runs along it; then goes through the annular aperture of the obliquus externus to the ſcrotum in males, and the labia in women. The ſecond *lumbar* nerve joins with the third; and that again communicating with the fourth, forms the crural nerve. See Cruralis.

The fourth and fifth lumbar nerves, and the three firſt ſacral, form the *ſciaticus nervus*, sciatic nerve, which paſſing out at the great ſciatic notch, runs down between the tuberculum iſchii and trochanter major, along the internal and poſterior part of the thigh between the biceps and ſeminervoſus, as far as the ham, rather nearer the inner condyle of the os femoris than the outer. See Cauda Equina.

Lumbares arteriæ. They go out poſteriorly from the inferior deſcending aorta, in five or ſix pairs, or more, much in the ſame manner as the intercoſtals. The upper ones ſend branches to the neighbouring parts of the diaphragm and intercoſtal muſcles, and ſupply the place of ſemi-intercoſtal arteries; they are alſo diſtributed to the pſoas, and other adjacent muſcles; and, by perforating the oblique muſcles, they become external hypogaſtric arteries. They alſo go to the vertebral muſcles, and enter the ſpinal canal.

—— venæ. Sometimes they proceed from the vena cava, near the biſurcation, and principally on the right ſide; ſometimes they proceed from the left iliac vein; this branch communicates with the azygos and intercoſtal veins.

LUMBARIS EXTERNUS. See Quadratus lumborum.

—— internus. See Psoas.

—— regio. The region of the loins. It is the poſterior external region of the belly. It extends from the loweſt ribs on each ſide, and the laſt vertebra of the back, to the os ſacrum, and the neighbouring parts of the os ilium. The ſides of this region are moſt properly called the loins, but the middle part hath no proper name in man. This region takes in alſo the muſculus quadratus lumborum on each ſide of the lower portions of the ſacro-*lumbares*, of the longiſſimi, and latiſſimi dorſi, the muſculus ſacer, &c.

LUMBRICALES MUSCULI. So called becauſe they are long and ſlender, like *lumbricus, a worm*; alſo *fidicinales*; *flexores primi internodii digitorum*. Theſe belong both to the hands and feet. They are the productions of the flexors of the fingers and the toes, and taking their origin from their reſpective tendons, they wheel about the baſis of the fingers and toes, and join with the extenſors. Their office is, when the extenſors have done their utmoſt, to finiſh the extenſion, and, when the flexors have done their utmoſt, to finiſh the flexion. Brown calls them *vermiculares*.

LUMBRICI. See Vermes.

Lumbrici lati. See Tæniæ.

LUMBRICORUM SEM. See Santonicum.

LUMBRICUS TERRESTRIS. The earth worm. Theſe *worms*, called *inteſtina terræ*, are ſuppoſed to have an antiſpaſmodic and diuretic virtue. If they are moiſtened with vinous ſpirits to prevent their putrefying, and ſet in a cellar, they are almoſt wholly reſolved in a few days into a ſlimy liquor, which *is ſaid*, when mixed with alkaline ſalts, to yield cryſtals of nitre. They are as good as ſnails for the ſame purpoſes that ſnails are uſed.

LUMBUS VENERIS. See Millefolium.

LUNA. See Argentum.

Luna philosophorum. See Antimonium, N° ii.

—— physica. See Azoth.

LUNARE OS. The ſecond bone of the firſt row in the wriſt. It is ſo called, becauſe one of its ſides is in the form of a creſcent. See Carpus.

LUNARIA, a name for a ſpecies of *oſmunda*, of *ionthlaſpi*, and *bulbonach*.

LUNARIS PILULA. See Causticum lunare, under Argentum.

LUNATICA, Ischuria. A ſuppreſſion of urine which returns monthly. It is noticed by Sauvages. See Ischuria.

LUNÆTRIA. In the chemical jargon, it is a ſpecies of hectic, which is curable in one period of the moon.

LUPARIA. Alſo called *aconitum Ponticum, folio Platani, Lycoctonum luteum.* YELLOW WOLF'S BANE. Like the other ſpecies, it is poiſonous.

LUPIA. A kind of tumor like a ganglion; it is hard, and may be ſeated on any part of the body. When it is in the inſide of the eye-lid, it is called *chalaza.* A round, ſmall, ſoft tumor about the joints is called *lupia.* Dr. Cullen uſes this term as the generic one for A WEN. See NÆVUS.

LUPULUS, alſo called *Humulus, convolvulus perennis.* The HOP. This plant hath hollow ſtalks, and broad ſerrated leaves, which are cut into three, or five ſharp-pointed ſections. On the tops grow looſe ſcaly heads, with ſmall flat ſeeds among them. It grows wild in hedges, and at the bottom of hills, in England and other parts of Europe; but thoſe that are in uſe are cultivated in plantations. It is perennial. In Auguſt and September, the ſcaly heads are dried in kilns by means of a gentle fire.

The ſcaly heads have a bitter, warm, aromatic taſte; they give out their virtue to ſpirit, both proof and rectified, by maceration without heat; and to water, by warm infuſion. The extracts obtained from the ſpirituous tincture is an elegant bitter; but the only preſent uſe of this article is for preſerving malt-liquor. The Spaniards boil a pound of HOP-roots in a gallon of water to ſix pints, and drink half a pint of the decoction, whilſt in bed, every morning; this they do to cure the lues venerea. See Lewis's Mat. Med.

LUPUS. See CANCER.

LUPUS PHILOSOPHORUM. See ANTIMONIUM.

LUSCIOSUS. One who only diſcerns objects that are very near the eye.

LUSITARICUM DECOCTUM. See SARSAPARILLA.

LUCITIOSI. See NYCTALOPS.

LUTEA, } Called alſo *ſtruthium,* DYER'S
LUTEOLA. } WEED. The root, boiled with ſalt, dyes wool of a fine yellow colour. Dioſcorides recommends it as uſeful in the jaundice, but the preſent practice does not notice it.

LUTUM. LUTE. CÆMENTUM. Many chemical veſſels require to be covered with ſomething to preſerve them from the violence of the fire, from being broken or melted, and alſo to cloſe exactly their joinings to each other. The matters prepared for thoſe ends are, in general, called *lutes*; when this *luting* is applied as a cover to veſſels, it is alſo called COATING. Glaſs veſſels may be covered with a mixture of equal parts of coarſe ſand, and refractory clay, mixed up with water and a little hair, ſo as to form a liquid paſte. This may be ſpread with a bruſh upon the glaſs; and, when the firſt coat is dry, lay on another, &c. until the covering is ſufficiently thick; or, when a glaſs is to be expoſed to the action of the fire, to prevent its breaking, a coating to be made of fat earth, and freſh horſe-dung is recommended; for which purpoſe, the fat earth is ſuffered to rot for ſome hours in water; and, when it is moiſtened, and properly ſoftened, it muſt be kneaded with the horſe-dung, and formed into ſoft paſte: this is to be applied, and ſpread with the hand upon every part of the retort intended to be expoſed to the action of the fire. The horſe-dung combines ſeveral advantages. 1. It contains a ſerous fluid, which hardens by heat, and ſtrongly connects all the parts together. 2. The filaments, or ſtalks of hay, which are ſo eaſily diſtinguiſhed in horſe-dung, unite all the parts of the *lute* together. The dung muſt be freſh; for, when it has been altered by fermentation, or age, it does not poſſeſs the ſame virtues. Retorts luted in this manner, reſiſt the action of the fire very well; and, the adheſion of the lute to the retort is ſuch, that, even ſhould the retort fly during the operation, the diſtillation may be ſtill carried on.

The *lutes* with which the joining of veſſels are cloſed are of different kinds, according to the nature of the operations to be made, and of the ſubſtances to be diſtilled in theſe veſſels.—When vapours of watery liquors, and ſuch as are not corroſive, are to be prevented from eſcaping, it is ſufficient to ſurround the joining of the receiver to the noſe of the alembic, or of the retort, with ſlips of paper, or of linen, covered with a mixture of wheat-flour and water, of the conſiſtency of ſoft paſte, or ſlips of bladder wetted, may ſuffice, if carefully applied ſo as to ſecure every chink.—When more penetrating and diſſolving vapours are to be ſecured, the *lute* may conſiſt of a ſoft paſte made of quick-lime that is quenched in air, and mixed with the white of egg.—When corroſive acid vapours are to be confined, the *lute,* known by the name of fat *lute,* is very proper; it is thus made: ſift fine clay, that is well dried and powdered, through a ſilken ſearce, moiſten it with water, and then beat it into a ſtiff paſte with linſeed oil that is boiled, and fit for the painter's uſe. This paſte is to be applied to the junctures; but as it does not dry, it muſt be ſecured by means of ſlips of linen wrapped round it, and theſe ſlips muſt be covered with the *lute* made of quenched lime and white of egg. Dict. Chem. and Chaptal's Elements of Chemiſtry.

LUXATIO, } alſo *diſlocatio,* or by ſome *aberra-*
LUXATURA, } *tio*; *eluxatio*; *emotio*; *elongatio*; *ecptoma*; *ecclyſis*; *lygiſmos. Exarthrema*; *oliſthema*; A LUXATION OR DISLOCATION. A ſlight diſlocation is termed *diacinema*; *parathrema*; an incomplete one, *contorſio*; accord ng to AVICENNA, *declinatio.* Dr. Cullen places *luxatio* in the CLASS LOCALES, and ORD. ECTOPIÆ, which he defines a bone removed from its ſeat in the joints. Cœlius Aurelianus calls it *delocatio.* P. Ægineta, in lib. vi. cap. 8. deſcribes a *luxation* as follows: "it is a removal of the bone received from its proper cavity to another, by means of which voluntary motion is hindered." Boerhaave ſays, that the removal of an articulated bone from its cavity, is either total or partial, and that the former is a *luxation,* and the latter a *diſtortion*; but a partial *luxation* is properly termed a *ſubluxation,* becauſe a diſtortion denotes a change in the ſituation of the muſcles. Another diviſion is into ſimple and compound *luxations:* the *firſt* has been deſcribed above; the *laſt* is when a wound, a fracture, a contuſion, or other marks of violence, attend.

Luxations may proceed from external, or from internal cauſes; and thoſe from internal cauſes are thus known. 1. The limb is ſo relaxed, that it may be eaſily moved in any direction. 2. There is a cavity about the joint, and a hollowneſs between the bones, which may be felt with the fingers. 3. The diſlocated bone may eaſily be replaced, but ſoon ſlips out again ſpontaneouſly, becauſe of the weakneſs of the ligament and muſcles. 4. The diſlocated limb is longer than the ſound one. 5. No pain, inflammation, or convulſion, attends a *luxation* of this kind. 6. This happens generally to the upper part of the femur, or humerus, and ſometimes in the articulation of the foot with the tibia. When a *luxation* happens from an external injury, the diagnoſtics are ſometimes uncertain, becauſe a violent contuſion, or diſtortion, may render the joint tumid, which, with the pain, will obſcure the evidences of a *luxation.* In ſuch dubious caſes we muſt ſuſpend our judgment; and, indeed, could we be poſitive that a *luxation* had happened, until the inflammation and tumor had, in a good degree, given way, attempts towards a reduction would be improper. However, the more readily to diſcover a *luxation,* it may be obſerved, that *when the head of a bone is removed out of its place, the other end will be diſtorted in an oppoſite direction; for when the ſuperior end is outwards, the inferior will be inwards,* and *vice verſa.* Further, generally a tumor is obſervable where the diſlocated part of the bone is ſeated, and an hollowneſs where it receded from; though where there is much fleſh, the tumor and cavity are not eaſily perceived.

Various ſymptoms occur in conſequence of a *luxation,* but theſe are ſomewhat different, or as the parts are different in which the accident hath happened; in general, they are an immobility, or at leaſt a defective motion of the diſlocated limb; a diſtraction of ſome of the adjacent muſcles, and a relaxation of others; a torpor of the ſubjacent parts; a compreſſion of the adjacent veſſels, whence an atrophy, or a gangrene, pain, an œdema, convulſion, &c.

Compound *luxations* are more dangerous than compound fractures. Boerhaave ſays, "The worſt *luxation* of all is that produced by a ſolution, or a ſeparation of the epiphyſis from the body of the bone. In general, a modeſt prognoſtic is moſt conſiſtent with ſkill, experience, and prudence; but difficulties and uncertainties are to be apprehended from the largeneſs of the *luxation,* that is, the diſtance of the diſlocated bone from its proper place; the figure of the luxated limb; the part in which the *luxation* is ſeated; the parts preſſed, or intercepted; pain, inflammation, and other violent ſymptoms.

The principal indications of cure are, to reduce the luxated part; which operation is called *embole*; and

fecondly, to retain it in its proper ſituation. But if inflammation or tumor are conſiderable theſe ſhould be removed before a reduction is attempted. In reducing *luxations*, the muſcles ſhould all be put into a ſtate of the greateſt relaxation. Mr. Pott obſerves, that the reſiſtance of the muſcles is the only cauſe of the difficulty of reducing *luxations*; that much force is never required, provided the muſcles are relaxed by a proper poſition of the limb; and that in recent caſes, at leaſt, the capſular ligament will rarely if ever impede. The extenſion ſhould be gradual and continued, until the diſlocated bone is on a level with the civity from whence it receded, at which time, if the head does not return of itſelf, it muſt be aſſiſted by preſſing upon it, and making a lever of the diſlocated bone. Dr. Hunter ſeems to think that the contraction of the muſcles is rarely an impediment to reduction, but the rupture in the capſular ligament; however, they both recommend a gentle extenſion, and to avoid every violent effort.

1. Calcis luxatio ossis. Luxation *of the* Heel-bone.

This is luxated both inward and outward. A cavity on one ſide, and a tumor on the other ſide, diſcovers it; ſevere pain attends. Proceed to the cure as is directed when the bones of the hand are luxated, No. 14.

2. Capitis luxatio *vel* cranii. Luxation *of the* Head.

A ſeparation of the bones of the cranium from the hydrocephalus is by ſome called a *luxation* of the head. Whatever elſe be the cauſe, compreſſion and bandage, if not by other circumſtances forbid, are all that can be applied, beſides the uſe of ſuch means as are adapted to the diſorder. Mr. Bell calls this a *luxation* of the cranium; and in caſes of *luxation* of the head, adviſes as follows:

In *luxations* of the head, the patient being ſeated upon the ground, and ſupported by an aſſiſtant, the ſurgeon ſtanding behind ſhould raiſe the head from the breaſt; and the aſſiſtant being deſired to preſs down the ſhoulders, the head ſhould be gradually pulled ſtraight up till the diſlocation is reduced; or, if this does not happen with moderate extenſion, it may, at the ſame, be gently moved from ſide to ſide. A ſudden crack or noiſe is heard on the reduction being completed. See Bell's Surgery, vol. vi. p. 183, 195.

3. Carpi luxatio. Luxation *of the* Wriſt.

One or two of the bones in the wriſt are ſometimes removed from their place, which is diſcovered by a tumor in one part, or a cavity on another, perceptible to the touch; violent pain alſo attends. If the *luxation* is recent, treat it as a *luxation* of the hand. Bell's Surgery, vol. vi. p. 89, 246. White's Surgery, p. 163.

4. Claviculæ luxatio. Luxation *of the* Clavicle.

When this accident happens, the ſooner the reduction is performed the better, for old *luxations* of this kind are rarely cured.

The clavicle may ſlip from the ſternum either outwardly or inward; in the firſt caſe a preternatural tumor is obſerved about the joining of the bones: in the latter caſe, a ſinus is obſerved in the part affected, the aſpera arteria, the carotids, the contiguous nerve, and the œſophagus, are ſqueezed. As to the reduction of the bone in theſe caſes, the ſame general methods will ſuffice which are laid down in a caſe of a fractured clavicle, when the accident hath happened near the breaſt bone; the ſame may be alſo obſerved with reſpect to a *luxation* happening next the acromion.

A *luxation* happening next the acromion is ſometimes not eaſily diſtinguiſhed from a luxated humerus. Paré obſerves, when this caſe happens, that the upper part of the clavicle protuberates upwards, and a hollow or cavity is obſerved in the part where the clavicle is ſeparated from the acromion; violent pains alſo attend, and the patient cannot move the arm upwards. If in this laſt caſe the reduction is not ſpeedily effected, the arm will moſt probably ſoon become paralytic.

The greateſt care is required in the uſe of bandages; a defect herein may leave a ſtiff or a luxated arm. If the bone is luxated near the ſternum, and is ſtarted outward, beſides bolſters to ſuppreſs the end of the bone, the capelline bandage ſhould be uſed; but, if inward, the ſtellate bandage is to be preferred, on account of its keeping the ſhoulder back. If the *luxation* is next the ſcapula, the ſpica with two heads may be uſed. If both clavicles are diſplaced, the double ſpica muſt be applied as directed in *luxations* of the humerus and ſcapula. See Bell's Surgery, vol. vi. p. 204. White's Surgery, p. 157.

5. Coccygis ossis luxatio. Luxation *of the* Os Coccygis.

It may be forced internally by a blow, and outwardly by a difficult birth. In this caſe violent pain is felt in the lower part of the ſpine, inflammations and ſuppuration in the rectum are produced; theſe ſymptoms, with the ſight and touch, diſcover this *luxation*.

If this *luxation* is outward, it may be replaced by preſſure with the thumb; if inward, dip the fore-finger in oil, introduce it as high as poſſible up the anus, and puſh it outward, whilſt the other fingers, applied externally, guide it to a proper place.

The T bandage is proper here. After the bone is reduced, keep the patient pretty much in bed, and when he does ariſe, let him ſit in a chair with a hole in it. See Bell's Surgery, vol. vi. p. 201. White's Surgery, p. 157.

6. Colli luxatio. Luxation *of the* Neck.

A *luxation* between the head and the upper vertebra of the neck is immediate death, becauſe of the preſſure on the medulla oblongata, or medulla ſpinalis. When a man is ſaid to have broken his neck there is a partial *luxation* of the firſt or ſecond vertebra only: in this caſe the chin is fixed to the breaſt, which prevents his ſpeaking, ſwallowing, or moving the parts below. If an aſſiſtant is at hand, he muſt immediately turn the patient on his back, and ſetting his feet againſt his ſhoulders (being himſelf ſeated on the ground) he muſt place his hand below the patient's ears, and pull, gradually increaſe the force with which he pulls, and in pulling move the head from ſide to ſide.

After reduction, to prevent abſceſſes, &c. bathe the part with ſp. vin. White's Surgery, p. 186.

7. Costarum luxatio. Luxation *of the* Ribs.

If a rib is forced inwards, the pleura is injured, from whence there proceeds excruciating pains, inflammations, difficulty of breathing, coughs, ulcers, immobility of the body, &c. theſe, with the external poſition of the ſide, evidently diſcover this misfortune; *the ſhortneſs of breathing is almoſt a pathognomonic ſign.* This *luxation* happens betwixt the rib and the ſpine.

Luxations internally are difficultly reduced, becauſe neither the hands nor any inſtrument can be applied to elevate them. However, the patient may be laid on his belly, over ſome cylindrical body, and the anterior part of the rib being moved gently towards the back, or ſhook a little, the head may probably recover its ſituation. If this fails, recourſe muſt be had to the method propoſed for fractures of the ribs, when they are forced inwards, and a ſplinter offends the pleura. But, if the ſymptoms are not violent, nor the heads of the ribs much removed, forbear both the inciſion of the fleſh, and the violent compulſion of the ribs, as luxated ribs have often remained ſo without danger.

The bandage ſhould be a napkin and ſcapulary, and compreſſes may be applied, after ſqueezing them out of camphorated ſpirit of wine. See Bell's Surgery, vol. vi. p. 208.

8. Digitorum manus luxatio. Luxation *of the* Fingers.

The joints of the fingers may be luxated in every direction; but an eaſy extenſion and gentle preſſure with a finger and thumb will eaſily reduce them. See Luxatio metacarpi 16. See Bell's Surgery, vol. vi. p. 249. White's Surgery, p. 163.

9. Digitorum pedis, et ossium pedis luxatio. Luxation *of the* Toes, *and* Bones *of the* Foot.

A diſlocation of theſe bones produces great pain, inflammations, and ſometimes convulſions, &c. if ſpeedy aſſiſtance is not obtained. They are reduced as directed in caſe of bones in the hand being the ſubjects of this accident. The toes are treated as directed for the fingers. See White's Surgery, p. 167.

10. FEMORIS OSSIS LUXATIO. LUXATION *of the* Thigh-bone.

A fracture of the neck of this bone is sometimes mistaken for a *luxation*. The head of the thigh-bone may be luxated downwards, forwards, inwards, outwards, and backwards. This *luxation*, like that of the humerus, is always perfect, and most frequently happens inward and downward, the head of the bone tending towards the large foramen of the os pubis.

When the luxation is outwards, the bone generally slips upwards at the same time; if *inwards and downwards*, the leg is longer, and more bowed than the other, and the knee and foot turn outwards: the head of the bone is thrust near the lower part of the inguen and the foramen of the os pubis; sometimes the compressure of a nerve, which communicates with the bladder, causes a suppression of urine, and the pressure on the crural nerve a numbness in the leg; a sinus is perceived in the buttock, because of the great trochanter, and the rest of the bone; and if the reduction is long neglected, the limb withers; if the patient should not require a crutch, he will at least halt; the knee of the luxated limb cannot be brought to the other; the chief pain is perceived in the groin, and no grating can be perceived, as happens when the bone is fractured, and the limb moved. *If the luxation is backwards*, the limb is drawn upwards, whence a cavity is perceived in the groin, and a tumor in that part of the buttock, where the head of the bone and the trochanter are lodged; the limb is shortened, the foot bends inward, the heel does not touch the ground, but the patient seems to stand on his toes, and the luxated limb is more easily inflected than extended; in this case, many stand and walk firmly without the bone being reduced, provided they have a high heel to their shoe.

A fractured neck of the thigh-bone is distinguished from a *luxation* of its head; *first*, when the thigh-bone is luxated by a flux of humours, without any external violence, but only by walking or rising up: *second'ly*, when it is unattended with pain, tumor, or inflammation: *third-ly*, when the whole limb may be bent, and turned about the acetabulum without any noise, which is usually heard in fractures: the contrary signs indicate a fracture.

In reducing the luxated head of the thigh-bone, a longitudinal extension will not suffice, but it must be according to the direction of the cervix. Mr. Kirkland says, "When a thigh is dislocated inward, or outward, follow Celsus's advice in laying the patient on one side, so that the part into which the bone hath slipped be always uppermost, and that from which it hath receded, lowermost; by which means the extension may be made in any direction you have a mind, and your own invention will point out to you twenty ways of securing the patient upon a bed (for a table is usually too high), so that a proper resistance be made to the extension. This done, the knee bent, and a towel fixed properly above it, you must place yourself on that side of the thigh to which the bone is dislocated, with your knee near the head of the bone, and both hands on the opposite side of the knee of the patient, an assistant being fixed at the ankle. The extension may then gradually be begun by three or four men, with the thigh rather in a state of flexion; and when there is reason to think that the head of the bone is brought to a level with the socket, the extension being steadily continued, the knee may be bent near to the abdomen, and, at the same time, whilst the knee pushes the bone towards its place, the ankle must be moved in the same, but the knee of a patient in a contrary direction. Thus the head will always go into the socket, provided a due extension is made before you attempt to return it."

Sometimes the head of the thigh-bone is pushed between the ischium and sacrum; in this case, except the patient is very lean, before attempting the reduction, it may, perhaps, be most eligible to reduce the patient's flesh by repeated brisk purges, given at short intervals; for thus the state of the case is better discovered, and the reduction more easily effected. London Med. Journal, vol. v. p. 412. Bell's Surgery, vol. vi. p. 252. White's Surgery, p. 163. Edinburgh Med. Commentaries, vol. ii. p. 40.

11. FIBULÆ LUXATIO. LUXATION *of the* Fibula.

This bone may be separated from the tibia, either at the lower or superior part. When it happens at the inferior part it generally proceeds from a *luxation* of the foot externally; this bone must therefore be reduced, bound up, and the rest of the treatment must be agreeable to the directions given for *luxations* of the knee and patella. See Bell's Surgery, vol. xi. p. 273.

MALLEOLI LUXATIO. See No. 21.

12. GENU LUXATIO. LUXATION *of the* Knee.

This is usually partial. If it is complete, it is easily reduced, but then it is to no purpose, because the cross ligaments are broken. A luxated knee-pan is a necessary attendant of a luxated knee, and indeed is often taken for it; but a proper *luxation* of the knee is when the tibia recedes from the femur, which happens backwards and to each side, but never forward, because of the patella, which hinders it.

As this part is very little covered with flesh, dislocations here are easily discovered.

If the *luxation* is partial, place the patient on a table, one assistant taking hold of his thigh, and another extending his leg; in the mean time the operator may reduce the bone with his hands or his knees. In children and young persons, if the extension is made with violence, it endangers a separation of the epiphyses, which is a still worse disease than the *luxation*. See Bell's Surgery, vol. vi. p. 269. White's Surgery, p. 165.

13. HUMERI LUXATIO. LUXATION *of the* Humerus.

The head of this bone may slip out before, behind (even under the scapula), or downward; but never upwards, except the acromion and coracoid process are fractured. When the humerus is luxated downwards there is a cavity in the upper part of it, perceptible to the eye in some instances, but to the finger in all, and a tumor in the arm-pit, because the head of the bone is lodged there; the luxated arm is longer than the other, and when it can be moved or extended, it gives exquisite pain in lifting it up to the mouth.

Fresh *luxations* are most easily reduced; those of long standing are restored with difficulty; but if the head of the humerus grows to the adjacent parts, a reduction cannot be effected by any means. See Medical Obs. and Inq. vol. ii. p. 340.

To perform the reduction, bend the fore-arm, and let an assistant support it; then elevate the arm so that the elbow may be advanced somewhat above the shoulder, bringing it a little inward; then an assistant properly makes the extension, whilst another, counteracting him, draws the inferior angle of the scapula backward toward the spine, and presseth the acromion a very little downwards; the operator, with his fingers in the axilla presses the head of the bone upward as soon as he perceives the extension to be sufficiently made, and at the same time, with his other hand, brings the elbow of the luxated arm to the patient's side. An extension made downwards, or even horizontally, more frequently fails than when it is made in some degree upward.

When the luxation is forward, that is, *when the head of the humerus is under the pectoral muscle*, there is a cavity under the acromion, but the head of the luxated bone projects towards the breast more than when just in the axilla; and if the arm is moved, a more acute pain is felt than in the preceding case: for the great artery and the nerves of the bones are much pressed. If this kind of *luxation* is not easily reduced by the method directed, when the head of the humerus is in the arm-pit, let a pulley from the top of a room be fastened to the arm, just above the elbow of the luxated arm, and the patient gradually raised from the ground by it: this at least brings the head of the humerus into the axilla, whence, as above directed, it may be restored into its proper place. In this process remember to let the fore-arm be brought toward the breast, that the muscles may be relaxed.

If the luxation is backward, the cubit approaches the præcordia, and the head of the bone is prominent on the outside of the shoulder; the arm cannot be moved from the breast, nor extended without great agony, and the lower angle of the scapula will be somewhat pushed out. In this case the general procedure may be the same as when the head of the humerus is under the pectoral muscle.

In want of a pulley, a tall strong man may take the patient's arm over his shoulder and gently raise him from the ground, and the operator may push the head of the dislocated bone into its place as the body becomes suspended. This method of suspending the patient is not so severe as

it

it may ſeem; for as no force is uſed about the ſhoulder to make a counter extenſion, the patient does not ſuffer from thoſe troubleſome excoriations and contuſions, which too commonly attend the other methods.

As to the uſe of machines for reducing a luxated humerus, it is agreed among ſurgeons of the greateſt eminence that they are never needful. Freke's commander is preferred to all the reſt of the inſtruments uſed for this purpoſe; in the uſe of it the limb may be moved in all directions during the extenſion, and the ſituation of the head of the bone can be examined; but great care is required to keep it perpendicular to the ſide of the patient.

As in other *luxations*, bleeding, &c. to prevent or check inflammation and ſwelling, muſt be uſed after the reduction, and the arm ſuſpended in a ſling. See Medical Obſ. and Inq. vol. ii. p. 373. Bell's Surgery, vol. vi. p. 211. White's Surgery, p. 158.

14. MANUS LUXATIO. LUXATION *of the* Hand.

The hand may be luxated backward, forward, and on each ſide, but *backward and forward moſt frequently*. The hand is ſaid to be luxated forward when it inclines to the flexor muſcles of the fingers; backwards, when it inclines towards the extenſor muſcles; outwards, when there is a tumor near the thumb and a cavity near the little finger; and inwards when the reverſe happens.

From the diſtortion of the ſtrong ligament there is exquiſite pain and a rigidity of the fingers, which can neither be bent nor extended, by reaſon of the compreſſion of their tendons; from hence will follow inflammation, tumor, abſceſs, gangrene, and a caries of the ſpongy bones of the carpus, which are ſeldom curable but by amputation. But in a recent inconſiderable *luxation*, a milder practice will complete the cure. This kind of *luxation* ſhould therefore be ſpeedily reduced. *Firſt*, by the hand and arm being extended in oppoſite directions; *ſecondly*, by placing the ſinus of the extended hand on a table or ſome other flat body, that the tumor may be depreſſed. This method muſt take place whatever part of the hand is luxated. See LUXATIO METACARPI, 16.

15. MAXILLÆ INFERIORIS LUXATIO. LUXATION *of the* Lower Jaw.

This bone is uſually luxated forwards, and that on one or both its ſides. *If one ſide only it luxated*, the chin inclines to the oppoſite ſide, and on the diſlocated ſide the mouth is wider open. *When both ſides are diſlocated*, the month gapes wide, the jaw ſtarts forwards, and the chin falls towards the breaſt, ſo that the patient cannot ſhut his mouth, ſpeak diſtinctly, nor ſwallow with eaſe. This accident may happen from a blow or from yawning.

When one ſide only is diſlocated, it is eaſily reduced; but, *when both ſides ſuffer*, an immediate reduction is neceſſary, or violent ſymptoms ſoon follow, which are ſometimes fatal.

In order to the reduction, place the patient in a low ſeat, with his head ſecure againſt the breaſt of an aſſiſtant; then wrap your thumbs round with rags, to ſave them from being bit; place them on the patient's teeth, as far back as you conveniently can, at the ſame time fixing your fingers on the outſide of the jaw; when you have ſecure hold of the jaw, preſs it downward; then backward, and then upward; if all this is done, as it were in the ſame inſtant, the reduction will be complete; or, as Mr. Bell ſays, when the fingers, &c. are applied as juſt now directed, the ſurgeon muſt pull the under jaw forward, till he finds it move ſomewhat from its ſituation; and this being done, but not till then, he ſhould preſs the jaw orcibly down with his thumbs, and moderately backward with the palms of his hands, when the ends of the bone will immediately ſlip into their ſituation.

If only one ſide is luxated, proceed in the ſame manner, only preſſing the affected ſide moſt forcibly downwards and backwards.

Bandages are uſeleſs in this caſe. See Bell's Surgery, vol. vi. p. 189, 190. White's Surgery, p. 155.

16. METACARPI LUXATIO. LUXATION *of the* Metacarpus.

In this caſe, what is ſaid on a *luxation* of the hand will be a ſufficient direction.

Mr. Bell, in the ſixth vol. of his Surgery, p. 251. ſays, In the reduction of theſe diſlocations, (viz. of the metacarpus and fingers) the bone ſhould not be pulled down till it be ſomewhat raiſed or elevated from the contiguous bone; for, as all the bones of the fingers and thumbs, as well as thoſe of the metacarpus, are conſiderably thicker at their extremities than in any other part, theſe projections are apt to be forced againſt each other when the extenſion is made in a ſtraight direction. See Bell's Surgery, vol. vi. p. 249. White's Surgery, p. 163.

17. NASI OSSIS LUXATIO. LUXATION *of the* Bone *of the* Noſe.

This accident is eaſily diſcovered by the eye and the touch. The reduction is effected by a quill put up the noſtrils, and then with the fingers replacing the bone or bones. After the reduction a ſticking plaſter may be applied. Bell's Surgery, vol. vi. p. 184.

18. OLECRANI LUXATIO. LUXATION *of the* Elbow.

A perfect *luxation* rarely happens here, except the olecranon is fractured, or the ligament greatly weakened. This *luxation* may be backward (which is moſt frequent), forward, outward, or inward. If the *luxation* is backward, the arm appears crooked and ſhorter, and cannot be extended; in the internal part of the flexure the *humerus* will be prominent; in the external, the *olecranon*, with a large cavity between both bones. When, by reaſon of the fracture of the olecranon, the cubit is puſhed forward, the os humeri will ſtick out behind, the ulna is prominent on the fore-part, and a ſinus appears in proportion to the *luxation*. If the *luxation* is external, the tumor is ſo too, and vice verſa

In a violent *luxation*, or one of long ſtanding, the bone cannot be replaced without great difficulty, by reaſon of the ſtrong ligaments and various proceſſes. Recent and ſlighter *luxations* are more eaſily reſtored.

If the ligaments and tendons are rigid, let emollient applications be uſed ſome time before attempting the reduction; the egg liquor is uſeful in this caſe. See ANCHYLOSIS.

Reduce this *luxation* by making an extenſion until the fore-arm can be put into a ſtate of flexion, and then the reſt is eaſily accompliſhed by bearing upon the lower end of the humerus with one hand, and by taking hold of the wriſt and bending the elbow with the other, and if it is on either ſide, the hand of the patient muſt be turned inward or outward, at the ſame inſtant, as the caſe requires. After reduction an arm ſhould be hung in a ſling for ſome time, that the parts may recover their tone. See Bell's Surgery, vol. vi. p. 239. White's Surgery, p. 162.

19. PATELLÆ LUXATIO. LUXATION *of the* Knee-pan.

This may happen externally and internally. In order to its reduction, let the patient's leg be pulled ſtraight, or, if he can, he may ſtand on it erect; then let the operator take firm hold of the patella with his fingers, and force it into its place. After this nothing is required but to allow a little reſt. Bell's Surgery, vol. vi. p. 267. White's Surgery, p. 165.

20. PEDIS OSSIUM LUXATIO. See 9.

21. TALI LUXATIO, ſeu MALLEOLI. LUXATION *of the* Ankle.

Dr. Hunter obſerves that when there is a *luxation* of the *malleolus internus*, there is generally a fracture of the fibula; but that if the perſon is of a lax habit, the ligaments may be relaxed without a fracture.

If the ankle is luxated inwardly, the bottom of the foot turns outward; if it is luxated outwardly, the bottom of the foot turns inward; if forward, the heel becomes ſhorter, and the foot longer than uſual; if backwards, the heel ſeems lengthened, and the foot ſhortened. This kind of luxation is uſually attended with violent pain, and often with other very violent ſymptoms; and the difficulty of reducing the ankle is proportioned to the violence of the cauſe. Place the patient on a table or bed, and the leg with the knee bent, ſhould be firmly ſecured by an aſſiſtant or two. The foot is now to be put into that ſituation which tends moſt effectually to relax all the muſcles which belong to it; and being given to an aſſiſtant, he muſt be deſired to extend it in that direction till the moſt prominent point of the aſtragalus has clearly paſſed the end of the tibia, when the bone will either ſlip into its place, or may be eaſily forced into it. The reduction finiſhed, the patient ſhould keep in bed until the ſymptoms leave him, and he is in ſome mea-

measure able to rest upon his ankle. See Bell's Surgery, vol. vi. p. 274. White's Surgery, p. 166.

22. VERTEBRARUM LUXATIO. LUXATION *of the* Vertebræ.

These are rarely perfectly luxated. Those of the neck being small, and very moveable, are more subject to this accident than those of the back. Those of the loins are also more easily luxated than those of the back, because they are more moveable and smooth, are destitute of those sinuses with which the vertebræ of the back are furnished, and have a thicker cartilage interposed betwixt each. *Luxations* of the vertebræ must be imperfect, unless attended with a fracture, and a laceration of the spinal marrow, which threatens instant death. The imperfect *luxations* are often speedily fatal; and they most frequently happen in the upper vertebræ of the neck. Diflocation of the vertebræ of the back sideways, or crookedness of them, is called *contorsio*.

Hippocrates observes that children, between the ages of four and ten, are apt to have *luxations* of the vertebræ of the neck near the head, from an internal cause. An instance of this kind I once met with: it was in a boy of about ten years of age; he voided two round worms, and, in several instances, complained, as is usual when worms are the only manifest cause of any disorder; he obstinately refused every assistance from medicine, but after a few weeks his neck spontaneously and suddenly returned to its original state, and every other symptom presently vanished.

The vertebræ of the back cannot move much without a fracture; their upper or lower apophyses, and sometimes only one of them, are misplaced; great violence is generally required in order to a partial *luxation*: when a vertebra is luxated without a fracture, the body leans to one side, or forward: *if the left side* is affected, the patient leans to the right, and vice versa.

The common signs of a *luxation* of the vertebræ in the back, are, the back is crooked and unequal; the patient can neither stand nor walk, and his whole body seems paralytic; all the parts below the *luxation* are insensible and immoveable; the excrements and the urine cannot be discharged, or else they are involuntarily emitted; the lower parts gradually die, and very soon the death of the person is the end of the complaint.

All the *luxations* in the spine are very dangerous, both because of the injury that may be done to the spinal marrow, and the difficulty of reducing them. The danger is also greater, the nearer the *luxation* is to the head, because here the spinal marrow is soonest hurt. When several vertebræ are luxated together, the ill symptoms are not so violent.

For reducing the vertebræ of the neck, see LUXATION *of the* neck. When both the apophyses of the vertebræ are diflocated, lay the patient on his belly over some round body, as a tub, or drum; then two assistants may depress both ends of the luxated spine on each side, which elevates, and gradually extends the vertebræ, the spina dorsi being thus bent in form of an arch; after this, the surgeon presses down the inferior diflocated and prominent vertebræ, and, at the same instant, expeditiously pushes the superior part of the body upwards. If the first attempt fails, repeat it two or three times. When the left apophysis only is displaced, after the patient is laid in the same posture, one assistant may depress the left coxa, and the other the right humerus; and the reverse, if the injury is on the other side. After the reduction, bleed, apply compresses wrung out of spirit of wine, and then the napkin and scapulary. See Lond. Med. Journ. vol. i. p. 326, 327. Bell's Surgery, vol. vi. p. 196. White's Surgery, p. 156. See Boerhaave's Aphorisms. Petit's Diseases of the Bones. Lond. Med. Obs. and Inq. vol. ii. p. 99, &c. Gooch's Cases and Remarks. Pott's General Remarks on Fractures and Dislocations. Kirkland's Obs. on Pott's Remarks. Med. Mus. vol. ii. p. 406. Heister's Surgery. Wiseman's Surgery. Bell's Surgery. White's Surgery, where *luxations* are more generally, and some more particularly treated of.

LYCANCHE. See ANGINA.

LYCANTHROPIA, from λυκος, *a wolf*, and ανθρωπος, *a man*. LYCANTHROPY. The Arabians call it *cutubuth*, from an animal which perpetually moves up and down on the surface of stagnant waters. Aetius, in his Tetrabib. calls it *cynanthropy*, as well as *lycanthropy*. It is very probably the disorder with which the demoniac, mentioned in scripture, who dwelt among the tombs, was affected. Oribasius informs us, that, "These patients leave their houses in the night time, and in every thing imitate wolves, wander about the tombs until break of day." Actuarius adds, that "they return home then, and come to their senses." You may know them by the following symptoms: their looks are pale, their eyes dull, hollow, fixed, dry, and without the moisture of a tear. Their tongues are dry, and they are ready to perish with thirst, their legs, from the bruises they received in the night, (and, according to Aetius, from the bites of dogs) are full of incurable ulcers." This is the species of madness called MELANCHOLIA ERRABUNDA, *erratic melancholy*, and is thus described by SAUVAGES. In this disease the patient is perpetually restless, and is compelled to wander about from place to place, not knowing whither he is going; he is more timid than all other melancholic people, flying from the haunts of men, wandering in the night amongst tombs, and in solitary places; neither does he know what he flies from, what he would seek, or require. The body is dry, the eyes hollow, without moisture; they are continually thirsty, their tongue parched, the colour of the body yellowish, and they often have incurable ulcers in their legs. Bleeding, bitter stomach purges, gentle treatment, and, if possible, the procuring of sleep, are the principal means of relief.

LYCHEN PYXIDATUS. See MUSCUS PYXIDATUS.

LYCHNIS. Botanists enumerate above eighty species; it is a name given to various plants—as *Lychnis segetum major*. See NIGELLASTRUM.—*Sylvestris*. See ANTIRRHINUM; OCIMASTRUM; BEHEN ALBUM VULGARE, and SAPONARIA.—*Viscosa rubra*. See MUSCIPULA,

LYCHNIS CORONARIA DIOSCORIDIS. ROSE CAMPION. It is cultivated in gardens, flowers in June, and its seeds are purging.

Most of the *lychnises* are ornaments only in gardens; and the name is given to several plants not included in the long list of Boerhaave's which are called species of the *lychnis*.

LYCHNOIDES SEGETUM. See NIGELLASTRUM.

LYCIA. See CERUS CYPRI FOLIO.

LYCIUM. A name of the *nandia agiahalid*; also called *arbor-spinosa*, INDIAN THORN.

It grows in the East Indies. It is very large, resembling the wild pear; its fruit is bitterish and styptic; the leaves are sour and astringent, which last property its inspissated juice preserves, and called *cate*, by some, mistaken for the terra Japonica.

LYCIUM BUXI FOLIIS, also called *pyracantha*, BOXTHORN. It grows in hot countries. The rob of the fruit is astringent, but is often mixed with *amurca*, or with the juice of wormwood; or the rob from the berries of *periclimenum*, or other such like, are substituted for it.

LYCOCTONUM. See ACONITUM.

LYCOPERDON, from λυκος, *a wolf*, and πεδω, *crepitus*. PUFF-BALL. The ancients gave it this name, because they thought it sprung from the dung of wolves. Boerhaave enumerates eleven species, the best of which is the

—— VULGARE, called also *crepitus lupi, bovista, orbicularis fungus rotundus maximus pulverulentus*; DUSTY MUSHROOMS, PUFF-BALLS. It is the LYCOPERDON BOVISTA Linn. They are round, or egg-shaped, whitish, with a short and scarcely any pedicle; they grow in pasture grounds. When they are young they are covered with tubercles on the outside, and are pulpy within. By age they become smooth without, and inwardly are changed into a fine light brownish dust.

Dr. Bisset says, that it is the most powerful vegetable styptic yet known, when externally applied. Gooch prefers it to the agaric of the oak, and even to all fungous substances. It is softer, and more absorbent than lint, and, if cut into slices, might answer as well as spunge, as recommended by Dr. Kirkland, after amputation.

LYCOPERSICON, from λυκος, *a wolf*, and περσικον, *a peach*. WOLF'S PEACH. Boerhaave mentions six species, but Ray thinks them all poisonous.

LYCOPODIUM, called also *muscus clavatus, muscus terrestris, muscus squamosus, plicaria, cingularia clumbos*, WOLF'S-CLAW, and CLUB MOSS.

It is a fertile kind of *moss*, destitute of pedicles and capitella. It differs from the selago because its capsules grow not scattered in the sinuses of the leaves, but are collected into a club; for each scale covers a kidney-shaped and bivalve capsule, which loses no part of itself when ripe. It grows on heaths and hilly places, and flowers in July and August. It is reckoned cooling and astringent.

LYCOPUS. See MARRUBIUM AQUATICUM.

LYDIUS LAPIS. See MAGNES.

LYGISMOS. See LUXATIO, from λυγιζω, *torqueo*.

LYGMOS. See SINGULTUS.

LYMPHA. LYMPH. It is a pellucid, infipid, pure liquor in the human machine, the more fubtil parts of which afford the matter of the fluid of the brain, fpinal marrow, nerves, and alfo the feminal fluid. The gelatinous parts of this fluid nourifh all the folids of every kind, and its finer aqueous parts are circulated through the lymphatic veffels, by means of the valves and conglobate glands, again conveyed to the heart, where being again united with the blood, it is with it conveyed to all the parts of the body. Boerhaave fays, that from eight ounces of blood feven ounces of *lymph* arifes, if diftilled with a gentle heat.

LYMPHÆ DUCTUS, or *Vafa lymphatica*. LYMPHATIC VESSELS; called by the French *depot laiteux*: *enflure des jambes, lait repandu, engorgement laiteux*. They are divided into thofe of Bartholine, and called alfo abforbent lymphatics, and thofe of the moderns; thefe latter lead into larger veins. The *lymphatics* arife from the furface of the cells of the membrana cellularis, the furfaces of the guts, of the urine and gall bladders, and of all other parts, and carry a pellucid liquor towards the receptaculum chyli and thoracic duct, in which they all terminate. The coats of thefe veffels are thin and tranfparent, they are much crowded with valves, but not fo much as is repreſented in many figures; they are alfo very irregularly placed. The *lymphatics* frequently anaſtomofe, and in their way pafs through the *lymphatic glands*; before they enter a gland they ramify, and coming out in branches they unite again. They are general abforbents, and carry the juices to the duct, the receptaculum, and to the left fubclavian vein.

Their fyftem confifts of the lacteals, the *lymphatic veffels*, the conglobate glands, and the thoracic duct. See LACTEA VAGA; DUCTUS THORACICUS.

The lacteals begin from the inteſtinal tube. The *lymphatic veffels* arife from moft parts of the body. The courfe of the lymph and of the chyle is from the extreme parts of the body towards the centre. The *lymphatics* commonly lie clofe to the large blood-veffels of the extremeties. All the lacteals, and moft of the *lymphatics*, open into the thoracic duct, which lies upon the fpine, and runs up towards the neck, where it commonly opens into the angle between the jugular and fubclavian veins of the left fide; and thus both the chyle and the lymph are mixed with the blood.

The lacteals, the *lymphatics*, and the thoracic duct, all agree in having their coats more thin, and more pellucid than thofe of the blood-veffels. But, although their coats are fo thin, they are very ſtrong. Mr. Sheldon fays, that both the lacteals and *lymphatics* have a denſe internal coat, which is fmooth and polifhed on the infide; it is connected by a reticular fubftance on its outfide, to the internal furface of the middle coat. This fine internal membrane prevents the tranſudations of the lymph and chyle, and produces certain duplicatures internally, which form the valves, found in every part of this fyftem, and it is exactly fimilar to the internal coat of the veins. The fecond coat Mr. Sheldon thinks conſiſts chiefly of muſcular fibres, running in every poſſible direction; the greater number take the circular direction, and furround the internal membrane. He adds, that an outward coat may alfo be feparated, which is made of a membrane fimilar to the pleura, or peritoneum.

The coats of the lacteal and *lymphatic veffels*, have, in common with all other parts of the body, arteries and veins for their nouriſhment. They have alfo nerves: from the blood-veffels running through them they are fubject to inflammation, and from their numerous nerves, they are as irritable as any fet of veffels in the human body. The lymphatic veffels abound more with valves than the veins do; thefe valves are generally two in number, and are of a femilunar fhape. In moft parts of the body the valves are fo numerous, that there are three or four pair in the fpace of one inch, but fometimes there is no more than one pair.

The *lymphatic*-fyſtem, in different parts of its courfe, has the glands called conglobate, or *lymphatic*. Thefe glands are fo placed, that the veffels come in on one fide, and pafs out on the other in their way to the thoracic duct.

The *lymphatic veffels* of the lower extremities are thofe that are ſuperficial, and thofe that are more deeply ſeated. The ſuperficial ones lie between the ſkin and the muſcles, and belong to the ſurface of the body or the ſkin, and to the cellular membrane which lies immediately under it; one branch of the ſuperficial ones runs upon the top of the foot, another is generally found juſt under the inner ankle. The branch on the foot runs up on the outſide of the tendon of the tibialis anticus, until it hath got above the ankle; and running over the thin bone, it divides and forms a plexus, ſtill aſcending in the cellular membrane to the inſide of the knee, from whence it ſtill advances up the inſide of the thigh under the ſkin, and arriving at the groin, enters the *lymphatic* glands ſituated there. Theſe glands are ſix, ſeven, or eight in number; of theſe, ſome lie in the very angle between the thigh and the abdomen, and others lie a few inches down on the forepart of the thigh. It is into theſe upper glands alone that the *lymphatic veſſels* of the genitals enter, ſo that the venereal bubo which arries in conſequence of an abſorption of matter from theſe organs, is always ſeated in thoſe upper glands; and the lower glands are never affected, except by the regurgitation of the matter, or from their vicinity to the glands firſt diſeaſed, which very rarely happens. And as the upper glands are affected from the genitals, ſo the lower are uſually firſt affected from the abſorption of the acrid matter of an ulcer, &c. in the parts below them. The *lymphatic veſſels* of the genitals having joined thoſe of the thigh, a net work is formed, which enters the abdomen under the edge of the tendon of the external oblique muſcle, called Poupart's ligament: ſome branches of this plexus embrace the iliac artery. Theſe ſuperficial *lymphatics*, probably, are the trunks of theſe veſſels which abſorb from the ſkin and the cellular membrane immediately under it; and as no conſiderable branches can be diſtinguiſhed on the outſide of the leg or thigh, it is probable, that all the *lymphatic veſſels* of thoſe parts bends towards the inſide. Upon theſe *veſſels*, from the foot to the groin, there is commonly not one *lymphatic* gland, but to this there are ſometimes exceptions. Beſides theſe ſuperficial *lymphatic veſſels* which lie above all the muſcles, or in the cellular membrane under the ſkin, there is a ſet deeper ſeated that lie amongſt the muſcles, and accompany the crural artery; of theſe, the principal trunk can be diſcovered by cutting down to the poſterior tibial artery, near the inner ankle. From this ankle, the veſſel paſſes up along with the poſterior tibial artery, being hid amongſt the muſcles on the back part of the tibia. About the middle of the leg it enters a ſmall gland which is met with in moſt ſubjects. Having paſſed through this gland, it runs up to the back part of the ham, ſtill lying cloſe to the artery, and in the ham it uſually paſſes through three glands. Hitherto this *lymphatic* has been a ſingle trunk; but after it has paſſed theſe glands, it commonly divides into two or three branches, which ſtill accompany the crural artery, and paſs with it through the perforation in the triceps muſcle. Having paſſed the muſcle, they go up with the artery and enter a gland which is deeper ſeated than thoſe which appear on the groin; from this gland they paſs into the ſuperficial glands. See Plate 17.

The *lymphatics* of the lower extremities having now reached the trunk of the body, and having paſſed under Poupart's ligament, appear upon the ſides of the oſſa pubis, near the pelvis. A part of them paſſes up along with the iliac artery upon the brim of the pelvis; and another part dips down into the cavity of the pelvis, and joins the internal iliac artery near the ſciatic notch. At this place they are joined by the *lymphatics* from the contents of the pelvis. Beſides thoſe *lymphatic veſſels* which dip down into the cavity of the pelvis, on the inſide of the external iliac artery, there are others which keep on the outſide of that artery upon the pſoas muſcle; of theſe, one part paſſes up to the loins, and goes under the aorta in different branches, getting from the left ſide to the right, and joining the thoracic duct. Another part paſſes under the iliac arteries, and appears upon the os ſacrum, making a beautiful net-work, joining the *lymphatics* of the right ſide, and paſſing under the iliac artery, to form the net-work upon the upper part of the right pſoas muſcle. The *lymphatic veſſels* of the right ſide, joined by ſome from the left, having reached the right lumber region, appear there in the form of a plexus of large veſſels, and paſs through ſeveral glands. At this part they receive likewiſe large branches under the aorta, from the plexus on the left ſide of the loins, and having at laſt got up as high as the ſecond lumber vertebra, they all join, and form a ſingle trunk called the thoracic duct: at this part they are likewiſe joined by the lacteals.

Into the thoracic duct likewiſe enters the lymph of the

other abdominal viſcera. This is brought by a number of veſſels; a plexus of which may be traced from each kidney, lying principally behind the emulgent artery, and opening into large *lymphatic veſſels* near the aorta: with theſe alſo go the *lymphatics* of the glandulæ renales, or renal capſulæ.

The *lymphatic veſſels* of the SPLEEN paſs from the concave ſide of that viſcus, along with the ſplenic artery in the ſinuoſity of the pancreas, by the *lymphatic veſſels* of which they probably are joined. See Plate 19.

To the STOMACH belong two ſets of *lymphatic veſſels*, the one running upon its leſſer, and the other upon its greater curvature. Of theſe, the former accompanies the coronary artery, and paſſes through ſome *lymphatic* glands that lie by its ſide. The other ſet paſſes from the great curvature of the ſtomach, through ſome *lymphatic* glands that lie cloſe to the arteria gaſtrica dextra. Deſcending by the pylorus, it meets the plexus that accompanied the coronary artery; and near the leſſer curvature of the duodenum, forms a conſiderable net-work. Into this, not only the *lymphatics* from the ſpleen enter, but likewiſe thoſe from the gall-bladder, together with thoſe of the liver, which are very numerous both in its convex and on its concave ſide. Several branches proceed from this net-work, ſome running under the duodenum, and others over it; which all open into the thoracic duct.

The *lymphatics* of the LARGER VISCERA, (ſuch as the liver, the ſpleen, and the kidneys) are generally in two ſets; one of which lies upon the ſurface of the organ, and the other accompanies the large blood-veſſels in its centre. In the liver, theſe two ſets have been found to communicate with each other: ſo that, by injecting mercury into the *lymphatic veſſels* which lie upon its convex ſurface, Mr. Hewſon hath filled thoſe which accompany the *porta hepatis* & *vena portæ* in its centre. Moſt of the *lymphatic veſſels*, which lie upon the convex ſurface of the liver, run towards its falciform ligament, and paſs down by the ſide of the *vena cava*. But ſome of them run towards the right ligament of the liver, where they paſs down upon the diaphragm to get to the thoracic duct. The *lymphatics* on the concave ſurface run towards the porta, where they join thoſe which come from the centre of the liver, along with its large-blood veſſels. The *lymphatic veſſels* of the ſtomach, enter with others into the thoracic duct.

The *lymphatics* of the LUNGS are in two ſets. One ſet paſſes on the poſterior part of each lobe by its root, into the thoracic duct, near the middle of the thorax; the other paſſes from the fore-part of each lobe up towards the jugular and ſubclavian veins. Some of the *lymphatics*, on the poſterior part of the left lobe, paſs under the aorta to get to the thoracic duct. Thoſe from the anterior part of the left lobe, paſs into the angle between the jugular and ſubclavian vein of the ſame ſide, joining the thoracic duct at its termination; while thoſe from the fore-part of the right lobe do not communicate with the thoracic duct, but paſs into the angle between the right jugular and the right ſubclavian vein.

The *lymphatics* of the HEAD and NECK are as follow. By the ſide of each internal jugular vein is a large *lymphatic veſſel*, which is the trunk of thoſe of one ſide of the head and neck. Smaller *lymphatics* are ſeen near the branches of the external carotid artery. From various circumſtances, it is highly probable, that there are *lymphatic veſſels* on the external parts of the head; and though none have been diſcovered on the brain, it is very probable that it is not deſtitute of them. The ſmall *lymphatics* which accompany the branches of the external carotid artery, unite upon the neck, and form a large trunk, which accompanies the internal jugular vein, paſſing through ſome *lymphatic* glands, near the termination of this trunk, in the angles between the jugular and ſubclavian veins. The glandula thyroidæa has many *lymphatic veſſels* which can ſometimes be inflated by blowing air into the cells of the gland; theſe veſſels paſs on each ſide of the trachea, one part going into the angle of the right ſubclavian and jugular, and the other joining the thoracic duct upon the left ſide.

Like the leg, EACH ARM hath two ſets of *lymphatic veſſels*; one ſet which lies immediately under the integuments, belongs to the ſkin, and the cellular membrane, connecting it to the muſcles; the other accompanies the large arteries, and belongs to the parts deeper ſeated. See Plate 16.

The *lymphatic veſſels* diſcovered and delineated, are in general only to be conſidered as the trunks of the *lymphatics*. Since it is probable, that every (even the ſmalleſt) part of this, as well as all other parts of the body, has one of theſe veſſels adapted to abſorption. That this is the caſe, ſeems to be proved by the experiments made with the variolous matter: for at what part ſoever that matter is inſerted, the *lymphatic veſſels* take it up and carry it into the body, as can be traced by its inflaming the conglobate glands through which theſe veſſels paſs.

It is by the action of the abſorbent ſyſtem that many noxious materials are introduced into the habit; as the matter of the ſmall-pox when inoculated, the lues venerea, &c. the miaſmata of fevers; and [illegible] is alſo by their means that mercury rubbed externally is received into the conſtitution, and produces ſimilar effects on the interior parts. See Fordyce's Elements; part 1ſt Dr. Hunter's Commentaries. Monro's Deſcription of the Human Lacteal Sac and Duct. Hewſon's Experimental Inquiries into the *Lymphatic* Syſtem. Sheldon's Hiſtory of the Abſorbent Syſtem.

Amongſt diſorders of the *lymphatics*, Mr. White ſeems very properly to place that called by Puzos, *depot laiteux ſur la cuiſſe*; by Sauvages, *iſchias a ſpargoſi*; and by others variouſly, according to their apprehenſion of its nature and cauſe. Moſt writers have attributed this complaint to a redundancy of milk; hence has it been called *œdema lacteum*; but this does not appear to be a proper appellation: it might more deſcriptively be denominated ECCHYMOMA LYMPHATICA; but Mr. White more accurately deſcribes this diſorder than any other writer, and is the firſt who treats ſatisfactorily of its nature, cure, &c. he conſiders it as an affection of the lymphatics belonging to the parts diſeaſed, and thus deſcribes it. In about twelve or fifteen days after delivery, the patient is ſeized with great pain in the groin of one ſide; accompanied with a conſiderable degree of fever, which is ſeldom preceded by a ſhivering fit and cold rigor. This part ſoon becomes affected with ſwelling and tenſion, which extend to the labia pudendi of the ſame ſide only, and down the inſide of the thigh, to the ham, the leg, the foot, and the whole limb; and the progreſs of the ſwelling is ſo quick, that in a day or two, the limb becomes twice the ſize of the other, and is moved with great difficulty; it is hot and exquiſitely tender, but not attended with external inflammation. The pain in the groin is generally preceded by a pain in the ſmall of the back, and ſometimes by a pain at the bottom of the belly, on the ſame ſide; the parts which ſuffer the moſt pain are the groin, the ham, and the back part of the leg about its middle. The pain indeed extends over the whole limb, owing to the ſudden diſtenſion, but in a day or two it becomes leſs conſiderable. The ſwelling is general and equal all over the whole limb, in every ſtage of the diſorder, it is much harder and firmer than anaſarca; not ſo cold in any ſtate of the diſeaſe, nor ſo much diminiſhed by an horizontal poſition; neither does it pit when preſſed upon by the finger, nor any water iſſue from it, on its being punctured with a lancet. It is very ſmooth, ſhining, and pale, even and equal to the touch in every part, except where the conglobate glands are ſituated, which in ſome caſes are knotty and hard, as in the groin, the ham, and about the middle of the leg, at its back part. This diſorder generally comes on about the ſecond or third week after delivery; but in one inſtance I knew it to occur ſo early as twenty-four hours after, and another ſo late as five weeks, but neither of theſe are uſual. The firſt parts that begin to mend, both as to pain and ſwelling, are the groin, and labium pudendi; the thigh next, and laſtly the leg. The fever in ſome patients ſubſides in two or three weeks, in others it continues ſix or eight weeks, attended with a quick pulſe and hectic ſymptoms. It ſometimes attacks both the extremities; but this rarely happens. After the diſorder has ſubſided a week or two, it is not uncommon for the ſound leg to ſwell towards evening, and becomes œdematous; but then the groin and thigh are not affected on that ſide, and the leg is much ſofter to the touch than the other, and pits when preſſed upon by the finger.

This diſorder attacks women who are in full ſtrength, and thoſe who are reduced by flooding, thoſe who have a moderate diſcharge of the lochia, and thoſe who have a ſmall or a large quantity; thoſe who give ſuck, and thoſe who do not; whether their breaſts be drawn, or not; and whether they have much or but little milk. It attacks women who were delivered on the knee, and others who were delivered on the ſide; but of thoſe who were delivered on the ſide, it appears that the greater number were affected on that ſide on which they lay at the time of delivery.

delivery. It attacks women of all ranks, and of different habits, both the rich, and the poor: the moſt healthful, as well as who thoſe have laboured under chronic diſeaſes; the ſtrong and the weak; the lean and the corpulent; the ſedentary, and the active; the young and the middle aged; after their firſt, or any other labour; and whether the labour be natural or preternatural; but I have not known it happen after a miſcarriage, nor to a woman more than once, though ſhe has afterwards had more children. It occurs at all ſeaſons of the year indiſcriminately; and in the country, as well as in large towns. It neither attacks either of the arms, or other parts of the body. I have never known it to ſuppurate, or prove fatal, or any material inconvenience to ariſe from it after a few months were elapſed, except a little ſwelling of the leg, after fatigue, particularly walking.

Mr. White proceeds to point out the diſorders to which it bears, in one point of view or another, a reſemblance; as for example the *ſciatica*, *rheumatiſm*, *anaſarca*, *phlegmon*, &c. and then obſerves *that the proximate cauſe is an obſtruction, detention, and accumulation of lymph in the limb.* The parts affected are the whole of the limb from where the *lymphatic veſſels* enter under Poupart's ligament into the pelvis. As this diſorder happens only to lying-in women, and affects the lower extremities only, he adds, that we may conclude that its obſtruction is occaſioned by ſome accident happening during the time of labour, or ſome ſtate peculiar to child-bed. As to the remote cauſe, conjectures may be various, and Mr. White thinks it probable from the child's head preſſing the *lymphatic veſſel* or *veſſels*, which ariſe from one of the lower extremities, againſt the brim of the pelvis, during a labour pain, ſo as to ſtop the progreſs of the lymph; whence it is they burſt, and their contents eſcape. The extravaſation in ſome habits is re-abſorbed readily, in others not ſo readily; when, by lying out of the courſe of its circulation, it will preſs againſt the uterus and bladder, and occaſion forcing pains, and even ſuppreſſions of urine. When the orifice made in the *lymphatic veſſel*, or *veſſels*, is healed, and the diameter of the tube is contracted or cloſed, the lymph is retained in the *lymphatic veſſels* and glands of the limb and labium pudendi, and diſtends them ſo as to cauſe great pain and ſwelling, which always begin in that part next to which the obſtruction is formed: and when the obſtruction is in part or wholly removed, or the lymph has found a freſh paſſage, the part next to it is conſequently firſt relieved.

In order to the cure, *in the firſt or inflammatory ſtage*, antiphlogiſtics will be neceſſary, more or leſs ſo as the patient's ſtrength will admit; the bowels ſhould be kept rather lax; and the pains alleviated by opiates internally, by anodyne fomentations, and by the warm and vapour bath; bliſters on the upper part of the thigh have been found uſeful; antimonials, the ſaline draughts given in the act of effervescence, cool acidulated liquors, and cool air, all contribute to abate the fever. If the lochia happen to be acrid or putrid, it will be abſorbed and aggravate the diſeaſe; but by frequent emollient, or antiſeptic injections thrown up the vagina, the feveriſh diſorder will be much aſſuaged. *In the ſecond ſtage*, that is, when the pain abates, the ſwelling and tention of the parts begin to leſſen, but the quickneſs of the pulſe, and ſome degree of fever remains, the patient may be allowed a little wine, and a fuller diet. A doſe or two of calomel, of two grains each, given at proper intervals, have often been uſeful in this ſtage: before the patient is fit to take the bark, ſhe may take myrrh two or three times a-day, to the quantity of fifteen grains, in a neutral draught in the act of effervescence: when this hath been continued a few days, it may be given in the following form, which is more a tonic. ℞ myrrhæ, gr. xii. aquæ menthæ ſativæ, & aquæ diſtillatæ ſingularum, ℥ ſs ſpr. cinnamomi 3 i. kali pp. gr. vj. ferri ammoniacalis, gr. ii. ſs. m. f. hauſtus, ſexta quaque horâ ſumendus. The limb may be chafed with warm oil, and bathing it in water heated to 82 degrees of Fahrenheit's thermometer is generally uſeful; after being accuſtomed a few days to this degree of heat, the water may only be heated to 76. *The third ſtage* is when the pain and fever have left the patient, and no complaint remains, except the ſwelling of the limb, and perhaps a general relaxation; at this period, the bark, with or without ſteel, will become neceſſary, and dipping the limb in cold water, and embrocating it with ſpirit of wine and camphor, or with diſtilled vinegar, will aſſiſt in bracing it. A circular calico bandage applied to the limb will alſo aſſiſt in the recovery: and if the ſwelling is confined to the ſmall of the leg, the bandage may be changed for a ſtrait or laced ſtocking, or for a half-boot. Exerciſe on horſeback, and gentle rubbing of the limb, and ſtroaking it upwards, to facilitate the return of the lymph, will be of advantage; but walking or doing any thing that can promote a greater ſecretion of lymph, never fails to do manifeſt injury in every ſtage of this diſeaſe, and even until the lymph hath obtained as free a paſſage as it uſually had, and the patient hath recovered her full ſtrength.

See Mauriceau's Treatiſe des Maladies des Femmes groſſes, &c. edit. 5. 4to. He there treats of it under the title of l'Enflure des Jambes et des Cuiſſes de la Femme accouchée. Puzos's Memoir ſur les Depots laiteux, appelles communement Lait repandu. M. Lævret's Art des Accouchements, ch. iii. ſect. 7. des Engorgement laiteux dans le baſſin, et aux Extremités inferieures. Van Swieten's Commentary on Boerhaave's Aphoriſm, 1329. M. Raulin's Treatiſe des Maladies des Femmes en Couchée, under the article *depots laiteux aux aines & aux cruiſſes*. See Mr. White's Enquiry into the Nature and Cauſe of that Swelling, in one or both of the lower extremities, which ſometimes happens to lying-in women.

LYCANCHE. See ANGINA.

LYRA. Thus the ancients called the inferior ſurface of that part of the brain which is called the *fornix*, becauſe it is full of medullary lines, reſembling the ſtrings of the lyre. See CEREBRUM.

LYRUS. See ARNICA MONTANA.

LYNGODES. The HICCOUGHING QUOTIDIAN FEVER.

LYSIMACHIA. YELLOW LOOSE-STRIFE, or WILLOW HERB, called alſo *ænsthera*. Boerhaave enumerates ſixteen ſpecies of *Lyſimachia*. The name of *Lyſimachia* is from Lyſimachus, the ſon of a king of Sicily, who firſt diſcovered it. It is a ſmall plant which is found about the ſides of rivers, ſaid to be aſtringent, but of no note in medicine. It is alſo a name for a ſpecies of the *nummularia*, *caſſida*, and ſeveral other plants.

LYTHARGYRUM and LITHARGYRUM. See PLUMBUM.

LYSSA. The madneſs of dogs and wolves, or of men who are bit by them, is called *cynolyſſa*.

LYTHRON. Duſt mixed with ſweat; but Hippocrates occaſionally expreſſes by it, the menſtrual blood.

M.

MAC

M. or m. In prescriptions it signifies *misce*, *mix*, or *manipulus*, a *handful*.

MACANDON, *cada palavæ*, a coniferous tree mentioned by Bontius. It grows in Malabar; its fruit resembles the pine-nut, but it is not so hard; it is rather insipid to the taste: the flowers resemble those of the honey-suckle. The fruit is roasted, and eaten as a cure for dysenteries, and relief in the cholera morbus, and other complaints. Raii Hist.

MACAPATLI. See SARSAPARILLA.

MACAXOCOTLIFERA. The name of a tree in the West Indies; it is about the size of a plum-tree: its fruit is called *macaxocotl*; it is red, of a long figure, of the size of a walnut, and yellow within; it is sweet and laxative. Another species is the *atoyaxocotl*, and another is called *coztic axocotl* by the Mexicans, though others call it a species of mirobalan. Another species is called *atoyaxocotl chichiltic*; and the last species is called *chichiaxocotl*, which signifies *running down with sweat*. A decoction of the bark of these trees cures the itch, and the powder thereof heals ulcers. Raii Hist.

MACEDONISIUM SEMEN. See HIPPOSELINUM.

MACER. GRECIAN MACER. It is brought from Barbary; its thick yellow bark is astringent, so is the dried root. Its fruit, called *macre*, destroys all sorts of worms. See SIMAROUBA.

MACERATIO. MACERATION. It is an infusion, or a soaking of ingredients in water, or other fluid, in order to extract their virtue. See DURATUS.

MACERONA. See HIPPOSELINUM.

MACHA-MONA. A sort of calabash in Africa and America; the pulp of it is agreeable, and serves instead of of rennet for curdling of milk.

MACHÆRIA. See PERSICARIA.

MACHLIS. See CERVUS RANGIFER.

MACIA. See ANAGALLIS.

MACIES. Diseases in which the body, or particular parts, waste or wither. See MARCORES.

MACIS. MACE. It is the middle bark of nutmegs. It is of a lively red colour when fresh, but grows paler with age. It envelops the shell which contains the nutmeg. It is dried in the sun upon hurdles, which are fixed one over another, and then it is sprinkled with sea-water to prevent its crumbling in carriage. It hath a pleasant aromatic smell, and a warm, pungent, bitterish taste. Its qualities are similar to that of nutmeg, both as the subject of medicine, and of pharmacy. The principal difference is, that *mace* is warmer, more bitter, less unctuous, and sits easier on weak stomachs; in its yielding, by expression, a more fluid oil; and, in distillation with water, a more subtle volatile one.

The essential oil of *mace* is moderately pungent, very subtile and volatile, of a strong aromatic smell, like the *mace* itself; it is thin, limpid, of a pale yellow colour, with a portion of thicker and darker coloured oil at the bottom. There are three oils of mace so called in the shops, though really expressed from the nutmeg. See NUX MOSCHATA. See Lewis's Mat. Med. Neumann's Chem. Dict.

MACRE. See MACIS.

MAG

MACROCEPHALOS, from μακρος, *long*, and κεφαλη, *the head*. One with a long head.

MACROPIPER. See PIPER LONGUM.

MACROPNUS, from μακρος, *long*, and πνεω, *to breathe*. It is one who fetches his breath at long intervals.

MACULA, a SPOT, a BLEMISH. A cutaneous efflorescence which changes the colour of the cuticle. *Macula lata*, a name for the SHINGLES, see ERYSIPELAS. *Maculæ*, a name for the *nævus maternus*, or *macula matricis*; or the spots, or marks, supposed to be impressed by the mother's imagination on the fœtus. See NÆVUS. *Maculæ albæ*, see ALBUGO OCULI. *Maculæ hepaticæ*, *hepatic spots*, or efflorescences proceeding from an ichor in the blood, attended with a sort of coagulation. *Maculæ oculorum*, see CATARACTA, or SUFFUSIO. *Maculæ pestilentes*, pestilential spots, or efflorescences. *Maculæ volaticæ*, volatic, or soon-vanishing spots, such as are often seen in children.

MADAROSIS, from μαδος, *without hair*. A falling off of the hairs from the eye-lids, from a defluxion of acrid humors there. See DEPLUMATIO.

MADELION. See BDELLIUM.

MADISIS. See ACOSMIA.

MADOR. Such a sweat as arises during faintness, called also *ephidrosis*.

MADREPORA VULGARIS. See CORALLIUM ALBUM RAMOSUM.

MADROTES. See ACOSMIA.

MÆMACYLON. See ARBUTUS.

MAGDALEONES, MAGDALIÆ, MAGDALIDES, } Masses of plaster, or of other compositions reduced to a cylindrical form; they are also called *cylindri*.

MAGELLANICA AROMATICA ARBOR. See WINTERANUS CORTEX.

MAGISTERIUM. A MAGISTERY. This term hath various significations. 1. It is ascribed to powders made by solution and precipitation, see BENZOINUN;—BISMUTHUM;—CALAMINARIS LAPIS. 2. It is bestowed on resins, or resinous extracts. 3. The true *magistery* is when some of the menstruum remains united with the extracted essence. 4. The ancients gave this name to several white precipitates; and by this term they would have us to understand a very subtile preparation. 5. This word is generally used for a white powder, prepared from some mineral, vegetable, or animal.

The first chemists invented this term for some particular precipitated substances, but not for all; at present we have no general idea, or established characteristic, to distinguish *magistery* from precipitate. Every *magistery* is now some kind of precipitate; but every precipitate is not a *magistery*. *Magisteries* are always very white, and lighter than other precipitates.

MAGISTRALIS. See MEDICAMENTA EXTEMPORANEA.

MAGISTRANTIA. See IMPERATORIA.

MAGMA, also ECPIESMA. In a more general sense, it is any thick ointment that will not run with the heat of the body, or a poultice that will not spread, on account of its containing much water. In a stricter sense, it is the fæces of any ointment after the thinner parts are

ſtrained off: Galen reſtrains the word to the fæces of myrobalans.

MAGNA ARTERIA. See AORTA.

MAGNATES, } The LOAD-STONE. Called alſo *ca-*
MAGNES. } *lamita, lapis Lydius antiphyſon.* It is called *lapis Heracleios*, or *Heraclius*, from Heraclea, a town in Lydia; and Magneſia, from a town in Lydia of the ſame name; and *ſideritis*, from its attracting iron. It is an iron ore of different colours and ſolidity; the beſt load-ſtones are ſolid, and not porous, nor very heavy. The ſmaller will lift up more in proportion than the larger. It is ſomewhat aſtringent, but is not uſed in medicine. It attracts iron, or another *magnet*, or repels them, and directs its poles always to thoſe of the world.

MAGNES ARSENICALIS. ARSENICAL MAGNET. Take crude antimony, yellow ſulphur, and cryſtalline white arſenic, of each two ounces; powder them ſeparately; then mix them well together; put the mixture in a glaſs body or crucible, and melt it in a gentle ſand-heat, until it hath acquired the conſiſtence of pitch; then the fire being removed, it concretes into a glaſſy maſs of a dark red colour.

Caution is required in handling this glaſſy maſs, as a wound received from it may be dangerous.

This medicine is only to be applied externally, being a mild and gentle cauſtic; it hath been thought to be endued with a power of attracting poiſonous and other morbific matter from the centre of the body to the ſurface, like a load ſtone, and hence its name.

Beſides other virtues attributed to it, Geoffry ſays, that it opens, cleanſes, and heals ſcrophulous ulcers, without the aſſiſtance of ointment of any kind. See CANCER.

—— EPILEPSIÆ. See CINNABARIS.

MAGNESIA. See ETHEL; alſo *chambar*. It is often the ſame as *marcaſita*. It is taken for the matter of the philoſopher's ſtone, and for ſulphur; it is a term of art; it ſignifies melted tin, into which mercury being caſt, is thoroughly mixed and incorporated with it, into a brittle ſubſtance, and white maſs; it is alſo a mixture of ſilver and mercury, and a very fuſile metal, called *magneſia* philoſophorum, and it is alſo applicable to many other ſubſtances. See CASTELLI. Lexicon Medicum.

MAGNESIA ALBA. The WHITE MAGNESIA, called alſo *albus romanus pulvis, comitiſſæ palmæ*, vel *palmeri pulvis*. *Alba* is added to diſtinguiſh it from the *magneſia*, or manganeſe, which is employed in making glaſs. It is alſo called *miraculum chemicum*, the chemical miracle; becauſe from two pellucid liquors a coagulum is formed, which contains *terra*, the earth called *magneſia alba*. It was introduced as a medicine in the beginning of the eighteenth century, by count di Palma, at Rome, and continued a very lucrative ſecret. It is a very white, ſubtil powder, or a peculiar earth; it is not calcareous, but poſſeſſed of ſome peculiar properties. Dr. Lewis ſays, he never met with this earth in the mineral kingdom, except in the mother ley of nitre, and in the ſal cathart. amar. but he found it in the earth into which vegetables are reduced by fire; and he aſſerts, that the incinerated earths of animals are of a different kind. It is the baſis of Epſom ſalt. See CATHARTICUS SAL.

Mr. Henry, apothecary in Mancheſter, gives the following proceſs for making the *magneſia*.

"Diſſolve any quantity of ſal cath. amar. in its own weight of water; filter, and add to it by degrees, a filtered ſolution of pearl aſhes, in an equal quantity of water, ſtirring them gently, until the mixed liquors have acquired the appearance of a complete coagulum; then ceaſe adding any more of the alkaline lixivium, and immediately throw the mixture into a large veſſel of boiling water; keep it boiling for a quarter of an hour, then take it out, and put it into glazed earthen veſſels; as ſoon as the powder hath ſubſided, and before the water is quite cold, pour it off, and add a freſh quantity of boiling water, till the liquor hath entirely loſt its ſaline taſte; then let it be ſo agitated as to ſuſpend the finer parts of the powder, in which ſtate decant it into other veſſels, and having ſeparated the water from the *magneſia*, by inclination, put it on large chalk-ſtones, until a conſiderable part of the humidity is abſorbed; then wrap it up in ſheets of white paper, and dry it before the fire. Pour hot water upon the remaining powder, ſtir and decant it in its turbid ſtate, and ſeparate the *magneſia* from the water as before; thus the whole, or the moſt of it, will be reduced to an equal degree of fineneſs.

"The larger the quantity of water into which the precipitated powder is caſt, the more ſpeedily and perfectly will the vitriolated tartar, which is formed by the alkali uniting with the acid of the ſal cath. be waſhed off. The neutral ſalt ſhould be waſhed off as quick as poſſible, otherwiſe, by allowing the mixture to ſtand for ſome time, the powder concretes into minute grains, which, when viewed with a microſcope, appear to be aſſemblages of needles diverging from a point. Theſe concretions cannot be rediſſolved by any waſhing, however long continued. Dr. Black orders four times the quantity of water to that of the ſolution to throw the coagulum into, but that is far too little. The water ſhould be pure; diſtilled is the beſt; but it ſhould be kept until its empyreuma is gone off. Hard, or impure water, makes *magneſia* coarſe and diſagreeable. The chalk-ſtones on which the *magneſia* is dried, ſhould be expoſed to a moderate heat, that the moiſture may evaporate quickly. Cleanlineſs ſhould be particularly attended to through the whole."

As *magneſia* contains about $\frac{1}{7}$th parts of fixed air, it ſhould be calcined after it is made, and before it is adminiſtered, in flatulent caſes at leaſt. It is calcined by putting it in a common crucible, and placing it in a glowing fire, and keeping it red-hot for the ſpace of two hours.

Hoffman obſerves, that *magneſia* often occaſions flatulencies, and gnawing pains in the belly, and generates corroſive juices in the ſtomach; but theſe inconveniences will not be complained of, if care, agreeable to the above proceſſes, is not wanting.

In common with abſorbents, it corrects acidities in the primæ viæ, relieves the heart-burn, and all ſymptoms that have an acid for their ſource; as ſickneſs, giddineſs, vomiting, pain in the ſtomach, &c. alſo the gripes, convulſions, &c. in children, from the ſame cauſe. It is preferred to all common abſorbents, on account of its laxative quality, which it manifeſts when it meets with an acid in the ſtomach and bowels. If it is mixed with rhubarb, it is ſaid to prevent the rhubarb from leaving a coſtiveneſs behind. If the *magneſia* is neither accompanied, nor met with by an acid, it is not purgative, but ſimply abſorbent. See Hoffman's Obſ. Phyſ. Chem. lib. iv. Obſ. ii. Dr. Black's Obſ. on the *Magneſia Alba*, in the Eſſays Philoſ. and Literary of Edinb. vol. ii. Lond. Med. Tranſ. vol. ii. Mr. Henry's Strictures on Glaſs's *Magneſia*, and Mr. Henry's Reply to Dr. Glaſs's Examination of the ſame.

MAGNESIA OPALINA, alſo called *magneſia rubic. antimon.* OPALIN, or RUBY-COLOURED MAGNESIA of ANTIMONY. In making the hepar antimonii, ſome add, to the antimony and nitre, decrepitated ſal ammoniac, and thus make the *opalin*. It is a much weaker emetic than the liver of antimony, and does not cauſe great ſickneſs when given in conſiderable doſes to horſes, but paſſes freely by ſweat. Lemery directs it to be made of equal parts of antimony, nitre, and decrepitated ſea-ſalt.

—— VITRIOLATA. See CATHARTICUS SAL.

MAGNUM DEI DONUM. So Dr. Mead calls the *cort. Peruvianus*.

MAGNUM OS. Thus the third bone of the ſecond row in the wriſt is named. It is the largeſt of all the bones there. See CARPUS.

MAGNUS MORBUS. The GREAT DISEASE. So Hippocrates calls the epilepſia.

MAGUDARIS. See SILPHIUM.

MAHMOODY. See SCAMONIUM.

MAIANTHEMUM. See LILIUM CONVALIUM.

MAIL-ANSCHI. A ſpecies of rhamnus, growing in Malabar. A decoction of its root is commended againſt the gout; and a decoction of its leaves againſt the jaundice.

MAIL-ELOU. It is a tall tree, fifty feet high, growing in Malabar; it is an evergreen. Of the bruiſed leaves and bark is prepared an apozem againſt the after-pains of women in child-bed, and for promoting the lochia.

MAIL-ELOU-KATOU. This is larger than the above ſpecies; it is evergreen, and aſtringent.

MAJORANA. MARJORAM. Botaniſts enumerate five ſpecies.

—— CRETICA, vel SYRIACA. See MARUM SYRIACUM.

—— MAJORI FOLIO, called alſo *amaracus ſampſuchus*. SWEET MARJORAM. By amaracus the ancients meant *ſweet marjoram*; but by *leſſer marjoram*, they meant the marum. The Egyptians and Syrians call the *ſweet-marjoram* by the name of *ſampſuchus*. It is the ORIGA-

NUM

NUM MAJORANA; or ORIGANUM *foliis ovatis obtusis, spicis subrotundis compactis pubescentibus*, CLASS DIDYNAMIA; ORD. GYMNOSPERMIA. LINN. Gen. Plant. 726. It is a low plant, with slender, square branched, woody stalks; and little, oval, somewhat downy leaves, set in pairs; on the tops grow scaly heads of small whitish labiated flowers, whose upper-lip is erect and cloven, the lower is divided into three segments. It is sown annually in gardens for culinary, as well as medicinal uses. The seeds rarely come to perfection with us. They are brought from the south of France, where the plant is said to be indigenous.

The leaves and tops have a pleasant smell, a warm aromatic bitterish taste. Infusions in water smell strong, but taste weak and unpleasant; a tincture made with rectified spirit of wine, hath less smell but more taste. In distillation this plant yields its virtue to water, and thus it affords an essential oil, Hoffman says in the proportion of ℥ i. from ℥ lxiv. of the leaves slightly dried. But according to Beaumè fifteen ounces from one hundred and fifty pounds of the recent plant. This oil is hot, but not so agreeable as the *marjoram* itself. When carefully drawn it is of a pale yellow colour; but, by long keeping it turns reddish, and if distilled with too great heat, it is red at the first. The dose is two drops.

The aromatic matter almost all rises in distillation, so that an extract possesses very little of the valuable parts of the plant, which is an useful medicine in some disorders of the head and nerves, similar to that of lavender, uterine obstructions, catarrhs, and humoral asthmas. The powdered leaves, the essential oil properly diluted, and the distilled water, are agreeable errhines. In its recent state we are told, that it has been successfully applied to scirrhous tumors of the breasts

—— OLERACEA } See ORIGANUM ANGLICUM.
—— SYLVESTRIS. }

MALA, from a resemblance to μαλα, *Doric*, or rather *malum apple*, according to Martinius, the prominent part of the cheek, see BUCCÆ. It is also the term given to different sorts of fruit.

—— ASSYRIA. See CITREUM.

MALABARICA HERBA. See CORU CANARICA.

MALABATHRI OLEUM. See CINNAMOMUM.

MALABATHRINUM. Ointment of malabathrum. It is compounded of myrrh, spikenard, malabathrum, and many other aromatic ingredients. See DIONYSOS.

MALABATHRUM, } Into this word the Greeks cor-
MALABATRUM. } rupted the Indian word *tamalapatrum*. See FOLIUM.

MALACA RADIX. See SAGITTARIA ALEXIPHARMACA.

MALACIA. See PICA.

MALACOIDES, from μαλαχη, *a mallow*, and ειδος, *a form* or *likeness*. It is a plant which resembles a mallow, and possesses similar qualities, called also *malva betonicæ folio*.

MALACOSTEON. See MOLLITIES OSSIUM.

MALACTICOS. See EMOLLIENTIA.

MALAGMA, from μαλασσω, *to soften*, also βαος. It is synonymous with *cataplasma*, from the frequency of making cataplasms to soften; but formerly *malagmas* were made of many other ingredients.

—— ARABIS. A malagma made by the Arabians against strumous swellings and tubercles.

MALAGUETTA, or MALAGUETA. See PARADISI GRANA.

MALANKUA. See ZEDOARIA.

MALARUM OSSA The CHEEK BONES, called also *zygomatica ossa*. Albinus calls them *ossa jugalia*. They are the irregular square bones, placed on the outside of the orbits. Their four corners are reckoned processes; the posterior and superior, which are the longest, are called the *superior orbiter processes*; the anterior and superior, which end in acute angles, are called *the inferior orbiter processes*; the anterior and inferor, which are the shortest, are denominated the *maxillary*; the posterior and inferior points are called *zygomatic*.

MALAVISCUS. See ALTHÆA.

MALAXATIO. The softening of any thing, from μαλασσω, *to soften*.

MALAZISSATUS. One whose testicles are concealed in his belly. He is also called *emasculatus* and *mulieratus*.

MALE. See AXILLA.

MALICORIUM. See GRANATA MALA.

MALIGNITAS. MALIGNITY. Very different are the definitions of *malignity*, or the different accounts of what constitutes it. The fevers termed *malignant*, upon examining their symptoms, seem to proceed from coagulation or from dissolution of the juices; volatile and attenuating medicines relieve in the first case, and mild acids, cooling emulsions, and agglutinants, are useful in the latter. And as these medicines act by manifest qualities, it may reasonably be inferred that malignant disorders arise from manifest causes; so that the notion of *malignity* from a secret something, falls to the ground. The fevers that are malignant proceed from some particular contagious qualities of the air, not cognizable perhaps by the senses; corrupt and putrified matters diffused in the air may both cause and continue them.

The signs of *malignity* are, a slight coldness and shivering, a great loss of strength immediately ensuing, a small, quick, and contracted pulse, fainting, if an erect posture is long continued, drowsiness without any (at least refreshing) sleep, and if sleep comes on it is followed by a greater decay of strength and a delirium; there is no great complaint from pain, thirst, or other troublesome symptoms, and yet the patient is uneasy; at length the extremities are cold, the pulse intermits, and death soon approaches.

Those disorders in general may be called *malignant* which suddenly destroy the strength of the patient, and in which the flame of life seems at first to be almost quenched.

MALIS. A pungent pain from an animalcula lodged in an ulcerous tumor; or pain from an insect lodged in any part without ulcer or tumor, called also *cocyta*.

MALLAM-TODDALI. The name of a tree in Malabar, whose root, bark, leaves, and fruit, are esteemed as specific in the epilepsy. Raii Hist.

MALLEAMOTHE, called also *pavette*, *pavate*, *erysipelas curans arbor*. It is a shrub which grows in Malabar. The leaves boiled in palm oil, cures the impetigo; the root powdered and mixed with ginger is diuretic. Raii Hist.

MALLEI MUSC. EXTERN. vel Superior. See TENSOR MEMBRANA TYMPANI.

MALLEI MUSC. INTERN. See LAXATOR MEMBRANÆ TYMPANI.

MALLEOLUS. The ANKLE. See ASTRAGALUS; also, A MALLET. IN BOTANY the cuttings of vines, which are taken with joints of the old wood to their bottom, so as to resemble a little *mallet*, are thus termed; these cuttings most certainly take root, and make the best plants.

MALLEOLUS EXTERNUS. By some taken for the talus or ankle-bone, where it means the inferior extremities of the tibia and fibula, or the protuberances there. See FIBULA.

MALLEUS. A *hammer* or *mallet*, also one of the bones in the ears; see AURIS: this bone hath a large round head, which contracts all the way from the neck, from whence the processus Ravianus juts out like a fish bone, and on the outside a short process projects outward, and points against the membrana tympani; from thence the *manubrium* is continued down, and its extremity is fixed to the membrana tympani, and pulls it inwards. When the *malleus* is in its proper situation, the neck and head of it are turned upwards, and inwards, and the manubrium downwards, the short process of the handle upwards and outwards near the upper part of the edge of the tympanum, and the processus Ravianus forwards, reaching to the articular fissure in the os temporis, whence we may distinguish the *malleus* of one ear from that of the other. The handle of the *malleus* is tied to the membrana tympani by a fine membranous duplicature. This bone hath three muscles, viz. the *laxator membranæ tympani*, the *tensor membranæ tympani*, and the *musculus externus, auris* Du Vernii.

MALPIGHIA. BARBADOES CHERRY-TREE. So named in honour of Malpighius. It is not noted for any medicinal powers. It is also called *Cerasus Americana*, and is a genus of the decandria trigynia class: there are eight

eight ſpecies, natives of the Weſt Indies, where the fruit is eaten by the natives.

MALTHEORUM. See GEMMÆ SAL.

MALUM. A DISEASE, ſee MORBUS. In a ſtrict ſenſe it is the diſeaſe called *procidentia oculi*: it is when the eyes exceed the bounds of the eye-lids. It is alſo the Latin term for apple, as is *pomum*. In inflammatory and other febrile complaints, they are allowed as food when roaſted. Sliced and infuſed in boiling water they make a pleaſant diluting drink. When thoroughly roaſted the ſoft pulp is applied to the eye in form of cataplaſm without any intervening ſubſtance, in caſes of ophthalmy, if the eye itſelf ſhould not be too irritable.

—— CITREUM. See CITREUM.

—— GRANATUM. See GRANATA MALA.

—— MORTUUM. A malignant ſpecies of lepra or ſcab, which renders the body livid, with cruſty ulcers, void of ſanies and of pain.

—— TERRÆ. See ARISTOLOCHIA ROT.

MALUS. The APPLE-TREE. The many ſorts of apples that are known in this and other countries are but varieties of one ſpecies, in the opinion of ſome. Though we have more than fourſcore ſorts, yet the crab is the only one proper to this iſle. It is a term applied to different ſorts of fruit.

—— SYLVESTRIS, *ſive Agreſtis*, *malus* acido fructu ſylveſtris. The CRAB TREE, the WILDING, or the WELDING. It is the *pyrus malus* of Linnæus, called alſo AGRIOMELA.

—— AURANTIA. See AURANTIA HISPAN.

—— CITREA. See CITREUM.

—— CYDONIA. See CYDONIA.

—— HORTENSIS, *Malus Sativa*. The APPLE-TREE. The *firſt of theſe* is too ſour to be eaten; their juice is called VERJUICE, that is, green juice, as the French call it, and is often uſed as vinegar, called alſo *agreſta*. In moſt inſtances its uſefulneſs, both with reſpect to food and phyſic, is the ſame as that of vinegar.

The *ſylveſtris* may be conſidered as including all the variety of *apples* which by culture are improved. They have the common qualities of cooling and abating thirſt; the more acid kinds are ſomewhat laxative; the auſtere have rather a contrary effect. The juice of ſome of them, after being preſſed out, is left a little time to ferment, and then is the liquor called CYDER.

—— INDICA. See BILIMBI.

—— MALABARICA. See CANIRAM.

—— MEDICA. The CITRON, LEMON, and PEACH.

—— PERSICA. The PEACH and LEMON.

—— PUNICA. The POMEGRANATE. See BELAUSTIUM, and GRANATA MALA.

MALVA, of μαλαχη, from μαλαϛω, *to mollify*. The MALLOW. Boerhaave enumerates fifteen ſpecies; but the *common mallow* being more frequently found, and poſſeſſed of the largeſt ſhare of uſeful qualities, is juſtly uſed for them all. It is the MALVA SYLVESTRIS, or MALVA *caule erecto herbaceo, foliis ſeptemlobatis acutis, pedunculis petioliſque pilaſis*, CLASS MONODELPHIA; ORD. POLYANDRIA. LINN. Gen. Plant. 841. It is ſufficiently known not to need deſcription. Its leaves and flowers are a little mucilaginous, have no remarkable ſmell, and are rather emollient and laxative. A conſerve is made with the flowers; the leaves are uſed in decoctions for clyſters, fomentations of the emollient kind, and in cataplaſms. The roots have been uſed more as a pectoral than they are at preſent; they have a ſoft ſweet taſte, ſomewhat like liquorice, but have no remarkable ſmell. An extract from them, made with ſpirit of wine, is very ſweet. The leaves poſſeſs ſimilar powers to the althæa; their uſe is ſuperſeded for internal purpoſes by thoſe of the latter. See Raii Hiſt. Lewis's Mat. Med. This term is applied to different plants, as,

MALVA ARBOREA MARITIMA, alſo called *althæa arborea maritima*. The MALLOW-TREE. It agrees in virtues with the *common mallows*.

—— BETONICÆ FOLIO. See MALACOIDES.

—— ROSEA FOLIO SUBROTUNDO, called alſo *malva arboreſcens*, *malva hortenſis*, *dendromalache*. TREE or GARDEN MALLOW, and the HOLLYHOCK. Of this kind Boerhaave enumerates thirteen ſpecies. They are chiefly noticed as ornamental in gardens. Their medical virtues are ſimilar to, but leſs in degree than thoſe of the *common mallow*. And,

—— VERBENACEA, called alſo *alcea*, *alcea vulgaris major*. VERVAIN MALLOW. It is diſtinguiſhed from the *common mallow* by its leaves being jagged or cut in about the edges. It grows in hedges, and flowers moſt of the ſummer. It agrees in virtues with the other *mallows*, but it is the leaſt mucilaginous of any. Miller enumerates eight ſpecies of the *vervain mallow*.

MALVA-VISCUS. See ALTHÆA.

MALVASIA } MALMSEY, alſo called *marviſium*.
MALVISIUM, } It is a generous kind of wine. It is ſuppoſed to be the *arviſium* of the iſland of Scio.

MAMÆRA FŒMINA. See PAPAYA FŒMINA.

MAMANGA FRUTEX. An arborefcent ſhrub in Braſil. The Portugueſe call it *lavapratas*. Its leaves are applied to wounds and ulcers. The pods yield an oil by expreſſion, which is uſed in maturating poultices. Raii Hiſt.

MAMEI. The *mammee*, *momin*, or TODDY-TREE. It is a fine tall tree, appearing always of a fine green colour, and ſomewhat reſembles the walnut-tree; the fruit is as large as a man's two fiſts, and is very agreeable. This tree is found in different parts of the Weſt Indies, but thoſe on the iſland of Hiſpaniola are the beſt. From inciſions made in the branches a copious diſcharge of pellucid liquor is obtained, which is called *momin* or *toddy-wine*; but it muſt be drank very ſparingly, becauſe of its very diuretic quality: it is eſteemed as an effectual preſervative from the ſtone, as alſo a ſolvent of it when generated. There are two ſpecies. See Raii Hiſt.

MAMIRA. It is ſaid by Paulus Ægineta to be the root of a plant which is of a detergent quality. Some think it is the root of the *doronicum*; but what it really is, cannot be aſcertained.

MAMIRAAN. It is a plant which grows in the water. It hath a leaf like the convolvulus; its taſte is hot and bitter: the ſeed reſembles that of ſeſamum. It is in uſe amongſt the Arabians.

MAMMA. See PAPILLA.

MAMMÆ. The BREASTS, from μαμμα, *mother*, *mamma*, plural *mammæ*. In the *breaſts* are, the *mammillæ* or nipples, the *areola*, the body of the *breaſt*, and the lactiferous veſſels. The ſubſtance of the *breaſt* is deſcribed as lying between two membranes, one before, the other behind; but this is not true. The *breaſts* are compoſed of a glandular ſubſtance and fat; the glandular part is hard, white, and irregularly mixed with fat; but the ſtructure of the *breaſts* are very little underſtood. The whole maſs of the glandular part ſeems made up of tubes called tubi lactiferi. See LACTIFERI DUCTUS. Ferdinand Leber ſays, as to the internal ſtructure of the *mammæ*, it is made up of very much ſoft fat, which extends round about, and chiefly conſtitutes the ſubſtance of the *mammæ*. It conſiſts alſo of a large eminent gland which is compoſed of many leſs glands, arteries, veins, lymphatics, nerves, and proper excretory ducts, containing milk, when wanted. Each of theſe parts is encloſed in a firm, white, cellular texture, and they are all united together.

The glands in the *breaſts* of old women are very prominent, and may be taken for ſcirrhuſes.

The arteries and veins are ramifications from the arteriæ and venæ ſubclaviæ, and from the axillares. The nerves are principally from the coſtales, which communicate with the nervi ſympathetici. The uſe of the breaſts in women is to ſecrete and contain milk for the nutrition of infants.

MAMMÆARA MAS & FŒMINA. See PAPAYA MAS FŒMINA.

MAMMARIA EXTERNA ARTERIA. See MAMMARIÆ ARTERIÆ.

—— VASA. The arteries and veins of the breaſt.

MAMMARIÆ ARTERIÆ. The ARTERIES of the BREAST. The external are branches from the axillary arteries, and are called the ſuperior thoracic arteries. The internal proceed from the anterior and lower ſide of the ſubclaviæ, near the middle of the claviculæ, and run down, for about one finger's breadth, behind the cartilages of the true ribs, an inch diſtant from the ſternum; in their paſſage they ſend branches to the breaſts and to ſeveral of the adjacent parts; they afterwards go out of the thorax on one ſide of the appendix enſiformis, and are loſt in the muſcul. abdom. recti.

—— VENÆ INTERN. *The right* ſprings from the vena cava, a little below the bifurcation, runs along the internal edge of the ſternum, &c. as does its correſponding artery. The *left* ſprings from the ſubclavian, or from the axillary vein.

MAMMIFORMES, or MAMILLARES PROCESSUS. The maſtoid proceſſes. In *(forma) the ſhape* of *(mamma) a teat.* See TEMPORUM OSSA.

MAMILLA. See PAPILLA.

MAMMOE. See MAMEI.

MANACA. The name of a bacciferous ſhrub in Braſil. The root is powerfully emetic and cathartic, and is uſed on ſome occaſions by the natives. See Raii Hiſt.

MANANAOG. See NUX VOMICA SERAPIONIS.

MANATEA LAPIS, } alſo called *manati Indorum,*
MANATI, } *manati phocæ genus, vacca marina.* The SEA-COW.

The part of this animal which hath been uſed in medicine is the os petroſum of the head; it is of various forms, hard, and white, reſembling ivory. Its being harder than bones are in general, hath obtained it the name of ſtone.

MANCANILLA. The MANCHINEAL-TREE. There are three ſpecies in the Weſt Indies; they are as large as the oak-tree, the juice from their bark, whilſt freſh, is cauſtic; the fruit and leaves have the ſame effect, yet are eaten by goats. The wood is ſawed into planks, and brought into England. See Raii Hiſt.

MANCORON, according to Oribaſius's account, is a kind of ſugar which is found in a ſort of cane.

MANCURANA. See ORIGANUM.

MANDARU. *Aſſitra.* The pod-bearing Malabarian tree with bifid leaves. Ray mentions the following ſpecies:

1. *Chovanna mandaru* prima, alſo called *arbor St. Thomæ*, &c. 2. *Chovanna mandaru* ſecunda, &c. 3. *Volutta mandaru*, &c. 4. *Canſchena pou*, &c.

The flowers purge. The roots, if chewed, relieve pains in the teeth.

MANDIBULA, from *mando, to chew,* A JAW. See MAXILLA.

MANDIIBA, MANDIIBABURA, MANDIIBPARATA, MADIIBUMANA, MANDIIPEBA, MANDIIPUCA, MANDIOCA, MANDIHOCA, MANDIOPIBA. See CASSADA.

MANDRAGORA, alſo called *canina malus*; *dudaim.* The MALE MANDRAKE. It is the ATROPA MANDRAGORA Linn. This plant hath monopetalous, multifid, bell-ſhaped flowers; its fruit is ſoft, globular, and contains ſeeds, which are generally kidney-ſhaped The plant is common in Spain, Italy, and other hot countries. It is anodyne, narcotic, and cathartic; but is only uſed internally as a diſcutient.

Boerhaave mentions three ſpecies. They receive the name of *anthropomorphes.* The roots of marſh-mallow, of the arundo, and of bryony, are made to reſemble the *male mandrake* roots; the latter is very commonly impoſed for them.

MANDRAGORITES. The MANDRAKE WINE. Half a pound of the bark of the mandrake is put to nine gallons of wine, and they ſtand together during three months; this forms the proceſs.

MANDUCATES. See MASTUCATIO.

MANDUCATORES MUSC. from *manduco, to chew.* See MASSETER MUSCULUS.

MANGA, alſo called *mangas, amba, ambo, ambe, ambalam, mav, mau, conchifolia.* The MANGO-TREE. It is a large tree, a native of the Eaſt Indies. The fruit is larger than a gooſe's egg, and ſhaped like a kidney, and of a gold-yellow colour. This fruit is pickled and ſent to moſt parts of the world. See Raii Hiſt.

MANGA. See ABALAM.

MANGARATIA. See ZINGIBER.

MANGLE. See GUAPARAIBA.

MANGOSTAN. A tree which has been tranſplanted from the Molucca iſlands to Java, and at Batavia is admired as an ornament in gardens. The bark is aſtringent.

MANGOSTANS. It is an Indian fruit, of the ſize of a ſmall orange. It is cardiac and ſtomachic; its rind or peel is aſtringent. See Lemery des Drogues.

MANIA, alſo DELIRIUM *maniacum, paraphroſyne*; PHRENITIS *apyreta, heracleios, heracleius.* MADNESS. See alſo MELANCHOLIA. This diſorder receives different apellations, according to its greater or leſs violence, and the varieties of its cauſes and attending circumſtances. Melancholy is the primary diſorder, and *madneſs* is the higher degree. Alexander Trallian ſays that *madneſs* is nothing but melancholy arrived to a higher degree, and that the connection between theſe two diſorders is ſo great, that a tranſition from one to the other eaſily happens. Aretæus alſo ſays, that melancholy is the beginning and origin of *madneſs*, which is brought on by the increaſe of melancholy, rather than by any other cauſe.

Theſe two diſorders agree in their being accompanied with conſtant delirium, without fever. And it is alſo certain that he who can leſſen or remove one of theſe complaints, is equally able to afford relief againſt the other.

Madneſs, in all its ſpecies, is a chronical diſorder, and of the tribe uſually denominated nervous: it is defined by ſome to be, "The perception of objects not exiſting, or at leaſt not correſponding to the ſenſes." Hence it will be deſcribed as being a preternatural ſtate of ſenſation. Dr. Cullen places it under the CLASS NEUROSES; and ORD. VESANIÆ, which he defines an univerſal infanity. He forms three ſpecies. 1. *Mania mentalis*, when wholly from the affections of the mind. 2. *Mania corporea*, called alſo *mania inanitorum*, when evidently from a fault in the body. 3. *Mania obſcura*, when not preceded by any evident mental affection or diſorder of the body.

The dull, ſtupid, or forgetful; the very ingenious and penetrating; thoſe of a melancholico-choleric temperament, of a lean habit, with tenſe fibres, and a quick pulſe; thoſe who are prone to anger, particularly thoſe who are eaſily provoked to anger at meal times, are, above all other, ſubject to *madneſs*.

From diſſection of thoſe who died mad or melancholic, it appears that a *congeſtion of blood in the veſſels of the brain is a principal cauſe of theſe diſorders.* According to the different nature and condition of the blood, and its motion through the veſſels of the brain, both the rational and ſenſitive powers are ſo altered, that the difference of inclinations and appetites is to be accounted for from them. And *the immediate cauſe of madneſs* or of *melancholy* is a preternatural congeſtion of fluids in the veſſels of the brain, or ſuch an impreſs on ſome part of this organ of ſenſe, as excites the preternatural ſenſations which more particularly work on the imagination. The *mediate cauſes* are, a certain weakneſs, or at leaſt a peculiar diſpoſition to irritations of a peculiar kind. The *remote cauſes* are, violent commotions of mind, ſuch as long-continued or exceſſive grief, dread, terror, fear, &c. intenſe thought, an exceſs of love, narcotic drugs, expoſing the feet and legs to too much cold; and among the cauſes, a callous pia mater is mentioned as one in the Edinb. Med. Eſſays, vol. iv. art. 26; and to theſe many others might be added.

The preceding ſigns of *madneſs* are, in general, a rednes of the eyes, a tremulous motion of the eyelids, a change of diſpoſition and behaviour, a pride which diſcovers itſelf in the countenance, voice, and geſtures, a grinding of the teeth, an uncommon hatred to particular perſons, little ſleep, a violent cephalalgia, a quickneſs of hearing, a ringing and a ſort of muſical noiſe in the ears, increaſed ſtrength, and capacity of bearing cold; and in women, an accumulation of blood in the breaſts as the diſorder increaſes. As to the ſigns in the beginning, progreſs, and declenſion of the diſorder, Aretæus excellently lays them down in the following manner: "Thoſe who are affected with melancholy, are ſad, dejected, and dull, without apparent cauſe. They tremble for fear, are deſtitute of courage, affected with watchings, and fond of ſolitude. They are prone to anger, changeable in their tempers, and aſk a reaſon for the moſt trifling and inconſiderable occurrences. They are at ſome ſeaſons ſo covetous that they will not part with any thing, but ſoon become ſilly and prodigal. They are generally coſtive, ſometimes diſcharge no fæces at all, at other times their excrements are dry, round, and covered with a black and bilious humour; they diſcharge a ſmall quantity of urine, which is acrid and bilious. A large quantity of flatulencies are diſcharged from their mouths; ſometimes they vomit a certain acrid humour with the bile. Their countenances become pale, their pulſe is ſlow. They are lazy and weak, but diſcover a preternatural voracity in eating their aliments.—*When the diſorder advances to madneſs*, the patient, when provoked to anger, becomes raging mad. Some wander far from home; ſome cry out in a hideous manner; ſome ſhun the ſight of men, betake themſelve to ſolitude, and only converſe with themſelves; others tear and mangle their bodies.—*In the higheſt degree of this diſorder*, they perceive red images before their eyes, ſo that they in a manner think themſelves ſtruck by lightning. They are immoderately inclined to venery, ſo that they careſs publicly, without either dread or ſhame. But when the diſeaſe is in its decline, they become ſtupid, calm, and mournful; and coming

ing to the knowledge of their misfortune, they are dejected, on account of their calamitous and miserable situation."

Hoffman observes that *madness* sometimes remits for a long time, but returns at certain periods, especially about the solstices, the times at which they first appeared. Dr. Tyson, physician of the Bethlehem hospital, observes that the raving fits of mad people, which keep the lunar periods, are generally accompanied with epileptic symptoms.

Madness should be distinguished from an acute delirium or phrenitis; also that resemblance of *madness* which is produced by narcotic drugs.

If this disorder is symptomatic a recovery may be more readily expected; but when idiopathic, or when violent or disappointed love, excess of venery, great agitation or uneasiness of mind, were the cause, a cure will be difficult, and not soon to be expected.—If the paroxysms are slight and short, the cure may be reasonably expected.—If after sleep the patient is delirious and insensible of cold, or of drastic emetics or purges;—if, in consequence of a want of sleep, and of long abstinence, a great loss of strength is brought on;—or if epilepsy, convulsions, or lethargy come on, death is not far off.

As in other nervous disorders, so in this, the same method of cure is not to be indiscriminately used in every case.

As the immediate cause *appears to be a preternatural state of sensation, so whatever produces an opposite one, may be conducive to a cure*; whence moderate exercise continued within compass of the patient's strength, and travelling in temperate climes, are found useful: keeping the patient's mind diverted with any amusement that turns his thoughts directly contrary to those which he possessed before; if this can be duly continued, the cure is both facilitated and expedited. But severity in beating, terrifying, &c. is very rarely necessary, and never in a great degree, for all mad people are great cowards, and after a few instances of smart rather than severe discipline, the most frantic are easily governed.

When the disorder is symptomatic, or the consequence of other diseases having long continued, or being ill managed, the cure will much depend on the removal of the original disorders. As when it happens in consequence of nervous or intermitting fevers long continued, moderate exercise in a dry warm air, with the bark, cordials, and ferrugineous preparations, is most proper.—When it happens to weakly women affected with the nervous fever, particularly in child-bed, bleeding and all cooling methods are to be avoided; the patient must be kept in bed, and free from every disturbance; gentle cordials and perspiratives must be given, and the extract of the bark with the ferrum ammoniacale should accompany the cordial perspiratives.

In the young, sanguine, and robust, bleeding is an essential step towards relief; as to the quantity to be discharged, and the frequency with which it is to be repeated, they are best determined by the pulse.

Anodynes. These, in general, such as camphor, camphor with nitre, musk, &c. are proper; for though evacuations are required, medicines to strengthen the brain and spirits are necessary too: and, after due evacuations, strong opiates may be used with advantage. If musk is given, the doses should consist of from ℈ i. to 3 ss.—Opium may be given to two grains.—Camphor hath been given with great advantage from ℈ i. to 3 i. ss. at a dose, and repeated every night, and sometimes morning and night. Dr. Kenneir used to begin with an antimonial vomit; the next day he gave a large dose of camphor, and repeated it at night, and thus continued a few days; then in the day he gave pills of æthiops, gum guaiacum, &c. and at night the camphor, until a cure was effected; in which he often soon succeeded. Dr. Monro gives borax to 3 ii. at a dose, for procuring sleep.

Emetics are often highly useful by their stimuli; of these the antimonial are generally used; but when they fail, the juice of the leaves of asarabacca or groundsel may be given, from one to two table-spoonfuls for a dose; though the flor. antimonii are celebrated as being specific, if a specific is known for maniacs: some have disputed the utility of emetics, as they determine the fluids too much to the brain, and by increasing its energy, may be considered rather as medicines of some doubtful effect.

Diuretics. Dr. Mead observes that, in the cure of *maniacs*, evacuations by the kidneys are of greater consequence than is generally supposed, especially if the *mania* is of the furious kind, and accompanied with febrile heat. Alkaline salts in large doses are here the most effectual diuretics. The acetum distillatum acts often in this way, or by sweats, and has been proved to be highly useful in maniacal cases, given after emetics and proper purgatives, and having recourse to them occasionally, during the administration of this medicine; one ounce and a half may be taken once or twice a day, which has completed cures in six weeks, and sometimes sooner.

Purges. Though the ancients used hellebore, they rendered it mild before they administered it for purging; and it was because they knew not of any of the milder sorts which now are in use, that they employed this. Alexander Trallian observes that, in these disorders, "gentle purging, a moistening diet, and the interposition of the bath, are necessary; for those who prescribe hot antidotes and purgatives, render their patients more furious." Such purges as gently evacuate, and that with the least irritation, are the best, of which number the kali tartarizatum is in the highest estimation.

Blisters are rarely useful, though not wholly to be condemned.

Bathing. Cold bathing is commended, but perhaps would always be both more safe and effectual after a due use of the warm. The ancients both used and highly extol the use of bathing in warm light water, in which sweet herbs are infused. Celsus advises to "wash the patient's head with cold water, and then to lay a folded cloth, gently squeezed out of the same, upon it, when going into the warm bath: for thus (he says) the vessels in the head are strengthened, and more forcibly drive their contained blood from them, and the warm bath enlarging the vessels of the body, fits them for receiving more, and so lessening the quantity in the head." Trallian and Aretæus both urge the use of hot baths, because, they say, "the flesh of those patients is dry and tense, and that softening it tends much to relieve." When baths are made for this purpose, their heat should be only such as excites a pleasing sensation. Hoffman is a great advocate for warm bathing; but he first directs due evacuations, a liquid diet, and nitrous medicines.

Some considering melancholy and *madness* only as the higher degrees of the hypochondriac disorders, proceed and advise as directed in the cure thereof.

Dr. Muzzel of Berlin, in his Treatise of Melancholy, highly extolls the *kali acetatum*; he directs a dram (the Germans reckon twenty-four grains in ℈ i. hence there are twelve grains more than in our 3 i.) to be given three times a day in a draught of warm water, which is to be sweetened with honey: this, with a thin moistening diet, the warm bath every night, and the flesh-brush every morning, hath great efficacy.

It should be observed that every kind of *madness* is attended with a diminished perspiration, and that the custom of confining these patients in close apartments increases this morbid symptom.

See Aretæus, Alex. Trallian, Celsus, Sennertus, Hoffman, Sydenham, and Boerhaave, Dr. Battie's Treatise on *Madness*, and Dr. Muzzel's Treatise on Melancholy. Arnold on *Madness*. Cullen's First Lines, vol. iv. p. 144.

MANIGUETTA. See PARAD. GRANA.

MANIHOT, } See CASSADA.
MANIBA. }

MANIODES. MANIACAL. See FERINA.

MANIPEY. See JACARANDA ALBA.

MANIPUERA. See CASSADA.

MANIPULUS. A HANDFUL. The same as *desme*, *dragma*; as much as can be contained at once in the hand, which also *fasciculus* means.

MANJAPUMERAM. It is a large tree, which is common in the West Indies: its flowers are distilled, and the water is used against inflammations of the eyes, &c. See Raii Hist.

MANJELLA KUA. See CURCUMA.

MANNA, also called *manna Calabrina*, *ros Calabrinus*, AEROMELI, *alusar*, *drosomeli*. That species which is of a rosy colour, is called *rubea*. It is called *manna*, and *mel aërium*, from the supposition that it descended in dew from heaven; but it is incontestably proved to be the juice of the trees on the leaves of which it is found.

Juices of a like nature, but inferior both in quality and quantity, are obtained from several shrubs and trees in the warm eastern countries; but the officinal *mannas* transude during the dog-days from the FRAXINUS ORNUS, vel FRAXINUS, *foliis ovato-oblongis serratis petiolatis*, *floribus corallatis*

corallatis. Hort. Kew. CLASS, POLYGAMIA. ORD. DIOECIA. Linn. Gen. Plant. 1160. It exudes from every part of the tree; but, for a more abundant ſupply, inciſions are made through the bark, whence it flows more freely, and is ſoon inſpiſſated by the ſun's heat. The quality of the *manna* will often vary much, though the produce of the ſame tree. *Manna* is alſo the product of a ſpecies of aſh tree, named *alepenſis.*

Manna is a juice of the ſame nature with honey and ſugar, being, like them, ſweet, inflammable, ſoluble in water and in ſpirit; fermentable ſo as to yield a vinous ſpirit, a vinegar, tartar, &c: It poſſeſſes, like them, a laxative quality, but in a greater degree. The *finer manna* is in oblong, roundiſh, ſingle pieces; or in ſtalks, moderately dry, friable, of a whitiſh or pale yellowiſh colour, light, and ſomewhat tranſparent; internally it is compoſed as it were of fine capillary cryſtals.—The *inferior kinds* are moiſt, unctuous, brown, mixed with ſmall pieces of wood and other impurities, and in irregular lumps.

Chuſe the whiteſt, drieſt, lighteſt, pureſt, and that which hath a cryſtalline appearance upon breaking, a ſweet taſte, and which is rather biting to the tongue. The flake *manna* is generally preferred; but the ſmaller pieces are as good, if white or of a pale yellow colour, very light, of a ſweet not unpleaſing taſte, and free from impurities Some chuſe the fat honey-like *manna*, but very injudiciouſly, for it hath either been expoſed to moiſt air, or is damaged by means of ſea-water, or ſome other fluid.

Manna is often adulterated by compoſitions of coarſe ſugar, ſtarch, and ſome purgative ingredients, ſuch as ſcammony; but they are diſcovered by their taſte, weight, compactneſs, untranſparency, their habitude to certain menſtrua. The adulterated ſorts generally render the fluid in which they are diſſolved more or leſs glutinous.

This concreted juice liquefies in a moiſt air, diſſolves readily in water, and, by the help of heat, in rectified ſpirit alſo; the impurities only being left by both menſtrua. From the ſaturated ſpirituous ſolution great part of it ſeparates as the liquor cools, concreting into a flaky maſs, of a ſnowy whiteneſs, and a very grateful ſweetneſs: the liquor remaining after the ſeparation of this pure ſweet part, on being inſpiſſated, is unctuous, dark-coloured, and diſagreeable.

Manna is one of the mildeſt purgatives, and may be given with great ſafety to children, and pregnant women, to the delicacy of whoſe frames and ſituation it is particularly adapted; it is eſteemed a good and pleaſant auxiliary to the purgative neutral ſalts.—It ſheathes acrimony, and is uſeful in coughs, diſorders of the breaſt, and ſuch as are attended with fever and inflammation, as in pleuriſies, &c.—It is particularly efficacious in bilious complaints; and helps the diſcharge of mineral waters when they are not of themſelves ſufficiently active.—It is apt to create flatulencies and gripes, both which are prevented by a ſmall addition of ſome warm carminative.—It purges in doſes of from ʒ i. to ʒ ii. but its purgative quality is much increaſed by a ſmall addition of caſſia—When it is adminiſtered in bilious diſorders, Geoffroy recommends quickening it with a few grains of antimonium tartarizatum: thus he ſays the bilious ſerum will be plentifully evacuated, without any nauſea or gripes.—Sydenham recommends the addition of lemon-juice to *manna*, as a remedy for the gravel, and ſays, that the acid renders the purgative quality of the *manna* quicker, and alſo cauſes the *manna* to ſit eaſy on the ſtomach.—In bilious caſes tamarinds are uſefully joined with *manna*.—In the gravel, the hooping cough, and when all poſſible irritation ſhould be avoided, give the *manna* in milk. See Raii Hiſt. Tournefort's Mat. Med. Neumann's Chem. Works, Lewis's Mat. Med.

MANNA THURIS. See OLIBANUM.

—— TERENIABIN, and TRANGEBIN. See ALHAGI.

MANNIFERA ARBOR. See FRAXINUS ORNAS.

MANSORIUS MUSCULUS. See *Maſſeter muſculus.*

MANTILE. The name of a bandage.

MANUS. The HAND. It is divided into the carpus, metacarpus, and fingers. All the poſterior part is convex for greater firmneſs, and the internal part concave, for the greater convenience of graſping. The concave ſide is called the palm of the *hand.*

MANUS CHRISTI SIMPLICES. } See SACCHARUM.
—— CHRISTI PERLATÆ. }

MANUS DEI. A name for a reſolvent plaſter which is deſcribed by Lemery. Alſo for *opium.*

MANYL-RARA. A tall tree, growing in the Eaſt Indies. Its fruit reſembles an olive, and is eaten to promote an appetite and digeſtion.

MAY See MANGA.

MAON A ſpecies of AFRICAN MARIGOLD.

MARANDA. A ſpecies of myrtle, growing in the iſland of Zeylon, a decoction of the leaves of which is ſaid to be excellent againſt the venereal diſeaſe.

MARANTA GALANGA. See GALANGA.

MARASMODES. A hectic fever in its worſt ſtage.

MARASMUS, from μαραινω, *to render lean,* or *tabid.* An atrophy. See ATROPHIA. That ſpecies of hectic fever which is common and fatal to old men, was by the Greeks called *maraſmus.*

MARATHRITES. See FŒNICULUM.

MARATHROPHYLLUM. See PEUCEDANUM.

MARATHRUM. See FŒNICULUM.

MARCASITA. See PYRITES and BISMUTHUM.

MARCHED. See LITHARGYRUM.

MARCHIONIS PULVIS. MARQUIS's POWDER, deſcribed in the Leyden Diſpenſatory. It is deſigned as an anti-epileptic, and conſiſts of peony roots, miſſeto, elk's-hoof, coral, ivory, &c.

MALCOR. A preternatural drowſineſs.

MARCORES. It is the firſt order of Dr. Cullen's Claſs Cachexiæ, which he defines, diſeaſes that are attended with waſting of the whole body. It is ſimilar to the macies, and enaciantes of other authors.

MARGARITÆ, alſo called *pirlæ, unionet.* PEARLS. They may be ranked as a ſpecies of bezoar-ſtones. They are ſmall morbid excreſcences, of a calculous kind, of a bright ſemi-tranſparent whiteneſs, formed on the inſide of the ſhell of the *concha margaritifera,* or mother of pearl fiſh; as alſo of certain oyſters, muſcles, and other ſhell fiſhes. The fineſt pearls are brought from the Eaſt Indies; the next from the Weſt. The oriental have a more ſhining ſilver-like hue than the occidental; the laſt are ſomewhat milky. Inferior ſorts are found in the ſhell on our own ſhores. Thoſe which are not fit for ornamental uſes, are called rag *pearls* and ſeed *pearls,* and are employed in medicine.

True *pearls* calcine in the fire, and become quicklime, and readily diſſolve in acids, the vitriolic excepted. Theſe properties ſhew, that they are an earth of the ſame kind with crabs'-claws, oyſter-ſhells, and other calcareous animal abſorbents. *Pearls* have no virtues but what are common to other ſubſtances of the ſame claſs, nor yet do they poſſeſs them in any greater degree. See Lewis's Mat. Med. Neumann's Chem. Works.

MARGARITA. See STAPHYLOMA and ALBUGO OCULORUM.

MARGINATUS. BORDERED. The ſeeds of plants which have a thin leafy border round them, are ſaid to be *marginated,* as thoſe of the ſtock-gilly-flower, &c.

MARINUM, vel MARINUS SAL. SEA-SALT. It is alſo called *eſebon; communis ſal; artificialis ſal; culinarius ſal; cibarius ſal;* COMMON SALT.

The *ſalt* is not only extracted from the ſea-water by evaporation, but is alſo found in immenſe quantities in the earth. That which is found in the earth is uſually diſtinguiſhed by the name of *ſal gemma.* See GEMMA SAL. This *ſalt* is perfectly neutral, but differs from all other neutral *ſalts,* in its occaſioning thirſt if ſwallowed. It is compoſed of a peculiar acid, denominated marine acid, and of the mineral alkali, called natron. It diſſolves in about thrice its weight of cold water; and, if the water is hot, it diſſolves very little more.

The ſolution of this *ſalt* in water, if gently evaporated, firſt affords certain cubical cryſtals; theſe are the common or alimentary *ſalt*; after this, by farther evaporation, a quantity of the *ſal cathartic. amar.* is produced; the remaining part of the ſolution can hardly be cryſtallized; it conſiſts of the marine acid, and a calcareous earth.

When the ſea-water is thrown upon rocks, &c. in warm climes, it is gradually evaporated by the ſun's heat, and the remaining *ſalt* receives the name of BAY or ROCK-SALT; this is formed into large cryſtals; it does not liquefy in a moiſt air, and, being ſtronger, it preſerves proviſions better.

The common alimentary *ſalt* loſes part of its acid in the proceſs for preparing it; for *ſea-ſalt,* contrary to other neutral ones, loſes part of its acid in boiling down a ſolution of it to dryneſs; and hence its diſpoſition to liquefy

in air; but this is prevented by adding a ſmall quantity of acid juſt when it begins to concrete,

Sea-ſalt is fixed and unchangeable in our bodies; it paſſes through us unaltered.—It checks fermentation, and prevents puttefaction in the primæ viæ.—It readily joins with volatile urinous *ſalts*, and changes them into a ſal ammoniac, and ſo fits the fluids for running off by urine.—It ſtimulates the ſolids, and increaſes their oſcillatory motion;—and on theſe foundations are built all the virtues aſcribed to *ſea-ſalt*, of drying, heating, deterging, digeſting, opening, and attenuating, increaſing the appetite, and reſiſting putrefaction.—It is uſeful when the appetite fails, digeſtion is weak, the bowels are coſtive, or the urine obſtructed.—It checks the operation of vomits, by turning them downwards.—In palſies and apoplexies, conſiderable advantage is often perceived from *ſalt* being ſprinkled on the tongue. A free uſe of ſalt hath been blamed, for producing the ſcurvy and itch; but if *ſalt* is juſtly blameable in theſe caſes, it is becauſe a ſufficient quantity of it was not uſed. See AQUA MARINA.

Common-ſalt hath many peculiar qualities, ſome of which are as follow:

1. The ſmalleſt cryſtals are cubic.

2. Fire applied to it makes it crackle; this crackling is called decrepitating, and ſeems to proceed from the air contained in it, which, being rarefied, burſts its way with a noiſe.

3. Muriatic acid is the only known ſolvent of gold, but not without being joined with the nitrous.

4. It is anti-putreſcent from its acid.

5. A larger quantity is ſoluble in a given quantity of water, than of any known ſalt; ſix ounces of *common ſalt* may be diſſolved in ſixteen ounces of water.

6. *Salt* diſſolved in water, of a heat nearly equal to that of the atmoſphere, renders the water colder by much.

7. Notwithſtanding the coldneſs, the water in which *ſalt* is, will not freeze ſo ſoon as the freſher water.

8. If *ſalt* is made very dry, it attracts the moiſture of the air conſiderably in the drieſt ſeaſons.

Salt is decrepitated by placing it over a charcoal fire in an earthen veſſel, and ſtirring it continually with a ſpatula; as ſoon as it is hot it crackles, and when the noiſe is over, it is decrepitated, dried, calcined, or burnt.

To depurate ſalt, diſſolve it in ſix times its quantity of rain-water, ſtrain the ſolution hot through a cloſe linen bag ſo often as to render it limpid, then exhale in a glaſs veſſel one ſixth part of the water, and ſet it in a cool place, covered from the duſt; if in three days a ſediment is obſerved, pour off the water by decantation: if there is no ſediment, the liquor is fit for proceeding with; and in this caſe evaporate to a pellicle, then ſet it in a cool place for twenty-four hours, in which time it will ſhoot into cubic cryſtals. Keep the firſt for chemical uſes; evaporate the remainder, and proceed as before.

SPIRITUS SALIS MARINI GLAUBERI. *Glauber's Spirit of* SEA-SALT, now called *Acidum Muriaticum*, MURIATIC ACID.

Take of dry *ſea-ſalt*, ten pounds; vitriolic acid, ſix pounds; water, five pounds; add by degrees the vitriolic acid, firſt mixed with the water, to the *ſalt*; then diſtil.

The ſpecific gravity of this, is to that of diſtilled water, 1.170, to 1000. Ph. Lond. 1788.

The acid of the *ſea-ſalt* is completely diſengaged from its alkaline baſis by the more powerful acid of vitriol, and may now be collected in a concentrated ſtate by diſtillation; but as in this concentrated ſtate its fumes very difficultly condenſe, a little water muſt be added to promote that effect. The marine acid riſes in white fumes. The muriatic is the weakeſt of the mineral acids, but ſtronger than any of the vegetable kind; it requires a greater fire to diſtil it than that of nitre, yet it is more readily diſſipated by the action of the air.

It is chiefly uſed as a menſtruum for other preparations; but, when given as a medicine, the doſe may be from ten to ſixty drops, in water, or any other convenient liquor.—It is an uſeful antiphlogiſtic, aperient, antiſeptic, and diuretic.—In putrid fevers, after having cleanſed the primæ viæ, it powerfully corrects the putrid ſtate of the blood; hence ſtrongly recommended in malt infuſion for the ſea ſcurvy: ſo great is its ſubtility, that when taken internally, it diffuſes its efficacy to remote parts, eſpecially the membranous.—To its ſubtility it is owing that it acts on the nervous coats of the ſtomach ſo as to be the beſt exciter of the appetite of all the mineral acids.—In bilious fevers this ſpirit corrects the faulty diſpoſition of the bile.—In dropſies, a few drops in each draught of the patient's drink agreeably allay thirſt, and promote the diſcharge of the urine. In ulcerated ſore throats of the putrid kind, it is uſed to acidulate gargles with, and given alſo internally. The following epithem frequently applied, very often ſtops the progreſs of the ulcerated parts. R tinct. benzoes comp. mel. angl. ää ʒ i. acidi muriatici gut. x. f. m. Linnæus ſays, that if it is properly diluted and applied to *chilblains, it radically cures them*. If half an ounce of good *bay-ſalt* is diſſolved in four ounces of water, and two drams of the muriatic acid well rectified be added, of this mixture a tea-ſpoonful given in a glaſs of water will improve the appetite, and frequently ſtop vomiting.

The muriatic acid combined with volatile alkalies, produces the officinal ſal ammoniac; with the mineral fixed alkali it regenerates common *ſea-ſalt*, called ſal marinus regeneratus; *febrifugus ſal*; with fixed vegetable alkali it produces the

SPIRITUS SALIS MARINI COAGULATUS.

Drop into the muriatic acid a ley of any fixed alkaline ſalt until all effervescence ceaſes; then evaporate the mixture to dryneſs.

This is ſomewhat ſharper than the *ſea-ſalt*; it alſo melts in water, and is fuſed in the fire with more difficulty. Some call it SAL MARIN. REGENERAT.—SAL DIGESTIVUM SYLVII, but very improperly, as its baſis is not the ſame.

The ACIDUM MURIATICUM combined with calcareous earths forms a very pungent ſaline compoſition, which difficultly aſſumes a cryſtalline form, deliquates in the air, diſſolves both in water and in rectified ſpirit of wine; this is called *ſal ammon. fixum*, and *ſal muriatic. calcareum*. This ſalt is contained in a conſiderable quantity in ſea-water, and remains fluid after the cryſtallization of its other ſaline matter; and is far more antiſeptic than the perfect *marine ſalt*. It is ſaid to be diuretic and lithontriptic. The medicine commonly ſold under the name of LIQUID SHELL, appears to be no other than a combination of this kind, conſiſting of calcined ſhells diſſolved in the marine acid. Theſe combinations are made by mixing the calcareous earth with ſal ammoniac, and urging the mixture with a gradual fire, until the volatile alkali of the ſal ammoniac is either diſſipated in the air, or collected by diſtillation, and only its acid left incorporated with the earth; ſo much of the earth as is ſaturated with the acid may be ſeparated from the reſt by elixation with water.

See Lewis's Mat. Med. Neumann's Chem. Works. Dict. of Chem.

MARIPENDAM. It is a plant in the iſland of St. Domingo; its tops are diſtilled, and thus a water is obtained, which is held in great eſteem there againſt pains in the ſtomach, &c. See Raii Hiſt.

MARISCA. An excreſcence about the anus. See CONDYLOMA and HÆMORRHOIDES.

MARISICUM. See MERCURIALIS FRUCTICOSA, &c.

MARITUS. See ADAMUS.

MARJORANA. See ORIGANUM.

MARMARYGÆ, from μαρμαιρω, *reſplendeo*. It is a variety of *pſeudoblepſis imaginaria*. Sparks or coruſcations which ſeem to flaſh before the eyes, in ſome diſorders of the head.

MARMOLARIA. See ACANTHUS.

MARMOR. MARBLE is a genus in the order of calcareous ſtones. The characters are, a calcareous ſtone, neither tranſparent, nor figured, but capable of a fine poliſh, and beautifully coloured. When calcined, it becomes quick-lime; to which we refer for its medical uſes.

MARMORATA AURIUM. See CERUMEN AURIS.

MARMOREUS TARTARUS. See CALCULUS.

MARMORACEA VENENA. Such poiſonous ſubſtances are thus named which are fatal in doſes not exceeding the quantity of a grain of wheat.

MAROCOSTINUM. An epithet for a cathartic extract originally made by Mindererus: *marum* and *coſtus* are two of the ingredients in it, and thoſe from which it is named. Lemery and Bates have named it *pilulæ marocoſtinæ*. It was deſigned particularly for purging off ſe-

rous humours, but is now neglected. See Pharmacop. Auguſt.

MAROTTI. A tall tree in Malabar, with leaves like thoſe of the bay-tree, and a fruit which contains an oily kernel. The oil expreſſed from the kernel is variouſly uſed by the natives, and often medicinally. See Raii Hiſt.

MARRULLIUM. See LACTUCA.

MARRUBIASTRUM. See BALLOTTE.

MARRUBIUM. HOREHOUND. Called alſo *maurosmarſon*: but this probably means the black ſort. Boerhaave mentions nine ſpecies; but they are not all in uſe as medicines. It is alſo a name for *cardiaca*, and ſome other plants.

MARRUBIUM ALBUM; alſo called *praſium album*. COMMON WHITE HOREHOUND. MARRUBIUM VULGARE, or MARRUBIUM *album, dentibus calycinis, ſetaceis uncinatis, floribus albis*. CLASS DIDYNAMIA. ORD. GYMNOSPERMIA. Linn. Gen. Pl. 721. It is a hoary plant, with ſquare ſtalks and roundiſh unwrinkled leaves, ſet in pairs on long pedicles, in the boſoms of which come forth thick cluſters of whitiſh labiated flowers, in ſtriated cups, whoſe diviſions terminate in ſharp points or prickles. It is perennial, grows wild in cultivated grounds, and flowers in June.

The leaves have a kind of aromatic ſmell, but not an agreeable one; however, the diſagreeable part is wholly diſſipated after a few months keeping; their taſte is bitter, penetrating, diffuſive, and durable in the mouth. Taken in large doſes, they prove laxative. This plant is deſerving of more attention than is given to it, for it is a very uſeful aperient and corroborant; in humoral aſthmas, pulmonary conſumptions, cachexies, menſtrual ſuppreſſions, ſcirrhous affections of the liver, jaundice, and ſeveral other chronical diſorders, where it is not alone a cure, it is important in its aſſiſtance. The ancients had an high opinion of its efficacy, particularly in pulmonic and viſceral obſtructions; and amongſt the common people, this horehound-tea in coughs and aſthmas is a common remedy. Dr. Cullen diſputes its virtues as a pectoral, and ſays, in ſeveral caſes it has been judged to prove hurtful. For its uſe in aſthma and phthiſis, and power in reſolving indurations of the liver, the authorities of FORRESTUS, ZACUTUS, LUSITANUS, and CHOMEL, he thinks very inſufficient. Mat. Medica. A dram of the dried leaves in powder, two or three ounces of the expreſſed juice, or an infuſion of half a handful of freſh leaves, are commonly directed as a doſe. See BOICINENGA.

The dry herb gives out its virtues both to water and to ſpirit. The expreſſed juice, gently inſpiſſated to an extract, is the beſt preparation; the doſe is from gr. x. to 3 ſs.

—— AQUATICUM, called alſo *lycopus*; *Heraclea*. WATER HOREHOUND. This is found on the ſides of brooks, but is inferior in virtue to the white ſort.

—— NIGRUM FŒTIDUM. See BALLOTTE.

—— VERTICILLATUM, called alſo *marrubium Hiſpanicum*. Galen's MAD-WORT. *Stachy's*. The BASE HOREHOUND.

Theſe are not in much eſteem. See Lewis's Mat. Med. Neumann's Chem. Works.

MARS. So the chemiſts call FERRUM, which ſee.

MARUM; called alſo *ſampſuchus, clinopodium maſtichina Gallorum, thymbra Hiſpanica. Jaca Indica*, MASTICH THYME, or COMMON MARUM. It is the *thymus maſtichina* Linn. It is a low ſhrubby plant, with ſmall oblong leaves, pointed at both ends, ſet in pairs without pedicles; at the tops of the branches ſtand woolly heads, containing ſmall white labiated flowers, whoſe upper lip is erect and cloven, the lower divided into three ſegments; each flower is followed by four ſeeds, incloſed in the cup; it grows ſpontaneouſly on dry gravelly grounds in Spain, and in ſuch like ſoils it bears the ordinary winters in England. Its virtues are ſimilar to thoſe of the Syrian *marum*, but leſs powerful.

MARUM SYRYACUM, vel CRETICUM, alſo called *Majorana Syriaca vel Cretica, marum* Coortuſ, *chamædrys incana maritima*, MARUM GERMANDER, or SYRIAN HERB MASTICH. It is the *teucrium marum, foliis integerrimis ovatis acutis petiolatis, ſubtus, tomentoſis, flor. racemoſis ſecundis*. CL. DIDYNAMIA; ORD. GYMNOSPERSIA. LINN. Gen. Plant. 706. It is a low ſhrubby plant, with ſmall oval leaves, pointed at each end, and ſet in pairs without pedicles, of a dilute green colour above, and hoary beneath; in their boſoms appear ſolitary, purple, labiated flowers, each of which are followed by four roundiſh ſeeds, incloſed in the cup. It is ſaid to be a native of Syria. In our climate it does not well bear the winters without ſhelter.

The leaves are bitter, pungent, and aromatic to the taſte; they yield a quick ſmell which excites ſneezing; and agree very much with the canella alba in their virtues.

This plant loſes but little in drying; it gives out its active matter partially to water, but completely to ſpirit; the watery infuſions ſmell ſtrong, but taſte weak of the *marum*; the ſpirituous taſtes ſtrong, but ſmells weak. Diſtilled with water, it yields an highly pungent, volatile, eſſential oil, ſimilar to that of ſcurvy-grass, but ſtronger, and of a leſs periſhable pungency; the remaining decoction is bitteriſh. Rectified ſpirit carries off only a part of the ſmell and pungency of the *marum*. This plant is ſuppoſed to poſſeſs very active powers; hence becoming an important remedy in many diſeaſes requiring the uſe of ſtimulants; for it is attenuating, aromatic, deobſtruent; by Bergius, ſaid to be nervine; tonic, reſolvent, an emenagogue, diuretic, and a ſternutatory; uſeful in cachexy, hyſteria, and nervous debility. The doſe is 3 ſs of the powdered leaves given in wine. In the preſent practice here, it is chiefly uſed as a ſternutatory, and is one of the ingredients of pulvis aſari compoſitus of the London Pharmacopœia. See Raii Hiſt. Lewis's, and Bergius's Mat Med.

MARVISUM. See MALVASIA.

MASCHALE. See AXILLA.

MASCHALISTER. See SPINA.

MASLACH. A medicine of the opiate kind, in uſe among the Turks.

MASPETA, MASPETUM. } See SILPHIUM.

MASSALIS, and MASSARIAM. See ARG. VIVUM.

MASSÆ AD FORNACEM. See CANDELA FUMALIS.

MASSETER MUSCULUS, from μασσομαι, *to chew*, or *eat*. The MASSETER MUSCLE. It riſes on each ſide, from the cheek bone, and the interior part of the zygomatic proceſs of the os temporis; and is inſerted into the whole length of the lower jaw, particularly the angle. Theſe muſcles are alſo called, *laterales muſculi, manducatores, manſorius muſculus*.

MASSOY. It is a ſpecies of bark mentioned by Ray. It belongs to a tree. It is gratefully fragrant and heating.

MASTICATIO. MASTICATION; alſo *manducatio*; *commanducatio*; the action of CHEWING. The more we chew our aliment, the more agreeable it is to our ſtomachs, and the more eaſily it is digeſted. Our food being ground betwixt the teeth, and intermixed with ſaliva and air, does by the action of the latter undergo a farther diſſolution; the warmth of the parts exciting the elaſticity of the air, to expand and burſt aſunder the confining particles of the food, betwixt which it is included. In the act of maſtication the oily, aqueous, and ſaline parts of the food are intermixed the one with the other; ſo that the ſmell and taſte of different ingredients are loſt in one, which, by the ſolution of the ſaline parts with ſaliva, renders the food ſavourable; but ſuch particles as are more volatile and penetrating, being directly abſorbed

by the bibulous veſſels of the tongue and cheeks, are ſaid to enter ſtraight into the blood-veſſels and nerves, ſo as to cauſe an immediate recruit.

MASTICATORIUM. A MASTICATORY. See APOPHLEGMATICA.

MASTICHE. MASTICH. See LENTISCUS.

MASTICHEN. ODORATUM FUNDENS. See NUX VIRGINIANA.

MASTICHINA GALLORUM. See MARUM.

MASTOIDÆUM FORAMEN. See STYLO-MASTOIDÆUM FORAMEN.

MASTOIDÆUS MUSCULUS. The *maſtoid muſcle*. Dr. Hunter calls it *ſterno-maſtoides*, *ſterno-maſtoidæus*, and ſays it riſes by two diſtinct portions from the ſternum and that part of the clavicle which is articulated to the ſternum, and is inſerted into the maſtoid proceſs. This laſt portion Albinus makes to be a diſtinct muſcle, and calls it *clino-maſtoidæus*, but is not diviſible from the other without art. Winſlow calls this muſcle *maſtoideus* anterior, or *ſterno maſtoidæus*; he calls the *ſplenius* by the name of *maſtoidæus ſuperior*.

MASTOIDÆUS LATERALIS. See COMPLEXUS MINOR.

—— PROCESSUS. See TEMPORUM OSSA.

MASTOIDYNIA, from μαστος, *a nipple*, or *breaſt*, and οδυνη, *pain*. SORE OR PAINED NIPPLES. But more commonly pain in the breaſt from inflammation. See INFLAMMATIO MAMMARUM MULIERUM, N° 7.

MATALISTA, } See JALAPA.
MATBALISTIC. }

MATER. See DURA MATER.

MATER PERLARUM, called alſo *concha margaritifera*, *concha mater unionum*, *concha valvis æqualibus*. MOTHER OF PEARL. This is not the ſhell in which pearls are found; but the pure pearl-like part, which poſſeſſes all the properties of pearls. See MARGARITÆ.

MATERIA MEDICA. By this is not only underſtood the materials afforded by nature, but alſo thoſe which are prepared by art; ſuch as minium, ſoap, potaſh, &c. with which a phyſician ought to be acquainted, as well as what relates to diet, medicines, and ſurgery, which are the three plentiful ſprings that furniſh all the practical remedies requiſite to the preſervation and reſtoration of health. Writers on the *materia medica* have endeavoured to arrange the various articles of which it is compoſed into different claſſes; but a ſlight inveſtigation will convince us of the inaccuracy of the plans that have been preſented us, particularly ſome of the beſt, Cartheuſer, Newmann, Lewis, Gleditſch, Linnæus, Alſton, and Vogel. Dr. Cullen has lately ſupplied us with a *materia medica*, the moſt judiciouſly arranged. On which ſubject he ſays, "That as the ſtudy of the *materia medica* is truly the ſtudy of the medicinal virtues; ſo the plan that arranges the ſeveral ſubſtances, according to their agreeing in ſome general virtues, will be the beſt adapted to acquiring the knowledge of theſe, and will moſt readily inform the practitioner what different means he can employ for his general purpoſe. It will alſo inform him how far the ſeveral ſimilar ſubſtances may differ in their degree of power, and how far from the particular qualities aſſigned to each he may be directed, or limited, in his choice. As it ſeems proper that every practitioner ought as far as poſſible to practiſe upon general indications; ſo it is evident that his ſtudy of the *materia medica* is eſpecially to know the ſeveral means that can anſwer there. Such a plan muſt be moſt proper for giving inſtruction; and, if while medicines are arranged, according as they anſwer general indications, the particulars be likewiſe thrown together, as far as poſſible, according to their ſenſible qualities and botanical affinities, this plan will have the advantage of any other that has been propoſed for preſenting together the ſubject, that ought to be conſidered at one and the ſame time, and give the beſt means of recollecting every thing that relates to them." *Mat. Med.* Hence the whole of the ſubſtances are arranged under different heads, making the *materia medica* conſiſt of ſuch things as ſupply nouriſhment, which are SOLID FOOD and LIQUIDS, and ſuch things as are taken along with them, viz. CONDIMENTS. MEDICINES which act upon upon the *ſimple ſolids*, viz. ASTRINGENTS, TONICS, EMOLLIENTS, and ERODENTS.—Upon the *living ſolids*, viz. STIMULANTS. SEDATIVES, NARCOTICS, REFRIGERANTS, and ANTISPASMODICS.—Thoſe which act upon the fluids, viz. *ſuch as alter their fluidity*.—ATTENUANTS and INSPISSANTS,—THEIR MIXTURE;—Correctors of acrimony in general, viz. DEMULCENTS; in particular, viz. ANTACIDS, ANT-ALKALINES, and ANTISEPTICS.—And laſtly, EVACUANTS, viz. ERRHINES, SIALAGOGUES, EXPECTORANTS, EMETICS, CATHARTICS, DIURETICS, DIAPHORETICS, and MENAGOGUES. See CULLEN's Mat. Med. vol. i. They are, however, differently divided by other authors. See BOERHAAVE de Viribus Medicamentorum. GREGORY's Conſpectus Medicinæ Theoreticæ. DUNCAN's Therapeutica, and WALLIS on Health and Diſeaſe.

MATERIA MERCURII SALIS. See CIRCULATUM.

MATERIATURA. Caſtellus explains morbi *materiaturæ* to be diſeaſes of intemperature.

MATHÆI PILULÆ. MATHEWS's PILL. Starkey was its author, but it was ſold by *Mathews* for him as an univerſal medicine. It conſiſted of the ſoap of tartar, black hellebore, opium, &c.

MATLOCK WATERS. Theſe are found at a place from whence they take their name in the county of Derby, where there are a number of warm ſprings; Dr. Short ſays they acquire their heat by paſſing through a bed of *lime-ſtone*, and another ſort of ſtone which he calls *croil-ſtone*. The water of the bath, and all the other tepid ſprings is exceedingly clear, and has no ſteam except in cold weather, neither does it throw up great bubbles of air like the Buxton water; and is about a dram in the pint lighter than common water.

On being mixed with ſome drops of infuſion of galls, it ſtruck a fine purple colour; ſpirit of vitriol dropt into it, cauſed an effervеſcence, and it became clearer; alkalies made it cloudy, and milky; a gallon of this water contains about 37 or 38 grains of ſolid matter, 12 or 13 grains of which are a ſaline matter compoſed of ſea-ſalt, and calcareous nitre (vitriolated magneſia), the reſt calcareous earth, which, after calcination, had ſome particles mixed with it which were attracted by the loadſtone. This water ſeems to be a light chalybeate of a tepid temperature, which contains but a ſmall portion of ſolid matter.

In moſt diſeaſes for which the Briſtol waters have been preſcribed, this water has been recommended; and its baths have been uſed for gout, rheumatiſm, and other complaints, where a tepid bath has been found ſerviceable. It is drank from one to five pints or ſix in the day. Monro's Med. and Pharm. Chemiſtry, vol. ii.

MATRACIUM. See CUCURBITA.

MATRES. See DURA MATER. In BOTANY, the herb *artemeſia*, is called *mater herbarum*. In CHEMISTRY, quickſilver is known by the names of *mater metallorum*.

MATRICALIA. Medicines appropriated to diſorders of the uterus.

MATRICARIA; alſo called *parthenium*, *febrifuga*. COMMON FEVERFEW, or FEBRIFUGE, and often, but very improperly, FEATHERFEW. It is called *matricaria*, from *matrix*, becauſe of its uſefulneſs to the womb. It is called *parthenium*, from, παρθενος, *a virgin*, for the ſame reaſon. It is the MATRICARIA PARTHENIUM Linn.

This plant hath firm branched ſtalks and roughiſh leaves, each of which is compoſed of two or three pairs of indented oval ſegments, ſet on a middle rib, with an odd one at the end, cut into three lobes; the flowers ſtand on the tops in the form of an umbel, conſiſting each of a number of ſhort white petala ſet round a yellow diſk, which is followed by ſmall ſtriated ſeeds. It is perennial, grows wild in hedges, uncultivated places, and flowers in June.

The leaves and flowers have a ſtrong, not agreeable ſmell, with a bitteriſh taſte, both which they communicate to water and to ſpirit. On diſtilling a large quantity of the herb, a yellowiſh ſtrong-ſcented eſſential oil is found on the ſurface of the water; rectified ſpirit carries off but little of the flavour of this plant in evaporation. The ſpirituous extract is ſtrong of the virtues of the plant.

The herb is warm, aperient, carminative, and bitter, and ſeems to deſerve to be more employed than it is at preſent. It is in ſome degree ſimilar to camomile; it favours a little of camphor and caſtor. It keeps its virtues for ſeveral years.

An oil is made from it which is called *ol. parthenia-cum*. See Raii Hiſt. Lewis's Mat. Med. Neumann's Chem. Works.

MATRISYLVA. See ASPERULA and CAPRIFOLIUM.

MATRIX,

MATRIX, from *mater, the mother.* See UTERUS and MEDITULLIUM.

MATURANTIA. See SUPPURANTIA.

MAU. See MANGA.

MAUROMARSON. See MARRUBIUM.

MAUZ. See MUSA.

MAXILLA, from *μασσω, to chew*; called alſo *mandibula.* The CHEEK or the JAW. See BUCCÆ.

MAXILLA INFERIOR. The LOWER JAW, called alſo *mola.* It is ſituated at the lower part of the face: it is divided into the chin, ſides, and proceſſes. The chin is the anterior middle part; the ſides are continued beyond that, till the bone bending upwards, forms the proceſſes. On the middle part of the chin externally there is a tranſverſe ridge, on each ſide of which the quadrati, or depreſſores labii inferiores, and the elevatores labii inferiores, make a depreſſion for their lodgment. On the internal part of the chin are three protuberances, to the uppermoſt of which the frænum is tied. From the middle protuberance, the genioglosſi have their origin, and from the loweſt, the genio-hyoidei; below the laſt likewiſe the digaſtric muſcles are attached to two ſinuoſities; at the lower and anterior external part of each ſide of the *maxilla inferior* there is a ſmall protuberance, whence the depreſſor labiorum communis has its riſe; and nearer the upper edge is a longitudinal ridge, where the buccinator is inſerted; inwardly, towards the ſuperior edge of each ſide, is a ridge, whence the mylo-hyoidei riſe. The lower edge of the chin and ſides are ſmooth, and are called the baſe of the *lower jaw*, the extremities of which are named the angles; the outer ſurface of theſe angles hath ſeveral inequalities where the maſſeter is inſerted, as the inner ſurface has where the pterygoideus internus is attached.

The proceſſes on each ſide are two, viz. the anterior ſharp proceſs, called CORONOIDES APOPHYSIS MAXILLÆ, round which the temporal muſcle is inſerted, and the poſterior proceſs, called *condyloid*, which is received into the glenoid cavity of the os temporis. The upper part, where the teeth are inſerted, is called the *alveolar* proceſs.

The foramina are two on each ſide, one near the root of the proceſſus internally, where a branch of the fifth pair of nerves with an artery and a vein enters; the other, external, at the edge of the chin, where the nerve and the veſſels come out.

—— SUPERIOR. The UPPER JAW, called alſo *mola.* It is compoſed of thirteen bones, viz. the oſſa naſi, oſſa unguis, oſſa malarum, oſſa maxillaria, oſſa palati, oſſa ſpongioſa inferiora, called alſo oſſa turbinata inferiora, and the vomer.

MAXILLARES SINUS. The MAXILLARY SINUSES are lined with a glandulous membrane, which ſeparates a mucilage very different from that of the joints.

—— GLANDULÆ. The MAXILLARY GLANDS. Each is placed between the angle of the lower jaw and the os hyoides, and fills up the ſpace between the belly of the digaſtric muſcle, and the pterygoideus internus at the angle of the jaw. The anterior edge lies over the muſcle called mylo-hyoidæus, from whence comes off its duct, running cloſe under the membrane of the mouth, and by the ſide of the ſublingual; and both open at an angle, cloſe by the frænum of the tongue, juſt behind the inciſor teeth. The duct runs from its upper anterior part, on the outſide of the genio-gloſſi, and the inſide of the ſublingual, and opens at the frænum linguæ.

MAXILIARIA SUPERIORA OSSA. Theſe form the greateſt part of the *upper jaws.* That long proceſs, which, riſing from its ſuperior and anterior part, grows ſmaller as it proceeds upwards, to make the ſide of the noſe, is called *naſalis proceſſus*, the naſal proceſs. The *alveolaris proceſſus* is that ſpongy part where the ſockets for the teeth are formed. The *palatinus proceſſus*, palatine proceſs, forms a great part of the baſis of the noſtrils, and the roof of the mouth. The *orbitarius proceſſus*, orbiter proceſs, is very irregular, from the ſuperior and anterior part of which, to near the extremity of the naſal proceſs, a ridge proceeds which forms about one-third of the outward circumference of the orbit. The bodies of the *oſſa maxillaria ſuperiora* are entirely hollow, and form in each a large ſinus, called ANTRUM HIGHMORIANUM, which ſee.

MAXILLARIÆ ARTERIÆ. The MAXILLARY ARTERIES.

The *external maxillary artery* is alſo called the *genialis*, genial, and *angularis*, the angular artery; it is a branch from the external carotid. It runs to the baſis of the lower jaw, juſt cloſe to the attachment of the maſſeter; it gives a branch to the maxillary gland; it paſſes over the lower jaw; it goes up upon the buccinator; it gives off a branch to the lower lip, which anaſtomoſes with that on the other ſide, and is continued to the upper lip, where it anaſtomoſes likewiſe; there they are called *labiales arteriæ*, labial arteries. The external *maxillary* then gives off branches to the noſe, goes to the inner canthus of the eye, is loſt upon the forehead, and communicates with the temporal artery.

The *internal maxillary artery* is a branch from the external carotid; it riſes juſt at the origin of the temporal, and is diſtributed to both the jaws; it is very much convoluted, and gives branches to an the deep-ſeated parts; one branch of it runs through the lower jaw, which is called the *inferior maxillary artery*, whilſt the main trunk of it runs up to the bottom of the orbit, to the foramen, or orbitale lacerum inferius, winds about the antrum, and ſinks into the noſe behind the upper *maxillary* bone, and before the pterygoid proceſs of the os ſphenoides, to be ſpent upon the inſide of the noſe.

MAXILLARIS INFERIOR NERV. The LOWER MAXILLARY NERVE; called alſo *ramus inferior.* It is the third branch of the *fifth pair of nerves* which paſs from the head. It paſſes through the foramen ovale of the os ſphenoides, where it gives off ſeveral branches to the muſcles of the lower jaw, then throws a remarkable branch through the lower jaw to ſupply the teeth, which comes out at the anterior part of the channel, and branches upon the lip; from this, a capital branch is detached to the tongue, called the lingual, which runs between the two pterygoid muſcles, and paſſes to the top of the tongue, going along with the duct of the *maxillary* gland. It is this which gives off the chorda tympani. See TRIGEMINI.

—— SUPERIOR NERV. The UPPER MAXILLARY NERVE. It is the ſecond branch of the fifth pair of nerves which paſs from the head. It paſſes through the foramen rotundum of the os ſphenoides, where it throws off a branch to the palate, but the trunk paſſes on in the ſulcus of the *upper maxillary* bone, and goes to the upper jaw, and to the antrum there, when, having given off theſe branches, it comes out below the orbit, and is diffuſed upon the face, particularly upon the noſe, the upper lip, and cheek. See TRIGEMINI.

MAYS. It is a kind of Indian wheat, of which Boerhaave mentions three ſpecies, but they are only varieties from the ſame ſeed, called *frumentum Indicum*;—*Turcicum.*

MEATUS. A DUCT, or PASSAGE. Any canal which conveys a fluid is a *meatus.* The auditory paſſage is called *meatus auditorius.* The Euſtachian tube is called *meatus a palato ad aurem.* The urethra is called *meatus urinarius.* The ducts which convey the bile from the gall-bladder to the duodenum is the *meatus cyſticus.*

MEATUS AUDITORIUS EXTERNUS. It is the external paſſage to the ear. It begins at the hollow of the outer ear, and ends at the membrane of the drum. It was formerly a name for the Euſtachian tube. See AURICULA.

—— CÆCUS. See TUBA EUSTACHIANA.

MECAPATLI. Hernandus mentions four ſorts of *ſarſaparilla*, of which this is one.

MECCHA, BALS. See BALSAMUM.

MECHOACANA ALBA. Called alſo *rhabarbarum album, convolvulus Americanus, jalapa alba, bryonia alba Peruviana*, MECHOACAN. CONNOLVULUS MECHOACANNA LINN. It is the root of an American ſpecies of convolvulus, chiefly brought from a province in Mexico, of the ſame name. It is cut into thin tranſverſe ſlices like jalap, but it is larger, whiter, and ſofter. This root was firſt brought into Europe in 1524, as a mild cathartic, which having but little taſte or ſmell, was thought not to offend the ſtomach, but the black jalap hath ſuperſeded its uſe. See Raii Hiſt. Tournefort's Mat. Med.

MECHOACANA NIGRA. A name of the jalap in common uſe. See JALAPA. The Braſilians call it *jetecucu.*

MECON. See PAPAVER.

MECON. MECONIS and MECONIUM. See PEPLION.

MECONIO, (SYR. e.) See PAPAVER ALBUM.

MECONIUM. Opium is the juice of the poppy head, emitted through inciſions made therein. *Meconium*

tium is the juice of the whole plant, which is firſt bruiſed (head, leaves, ſtalk, and all together), then preſſed out.—By this word is meant alſo, the excrement contained in the guts of an infant at its birth. If this matter is not ſoon purged off, it occaſions gripes, &c. A tea-ſpoonful of true caſtor oil is an excellent purge in this caſe; but the firſt milk from the mother's breaſt is uſually ſufficient, if it flows in due time. See INFANS.

MEDENA, in Paracelſus, is a ſpecies of ulcer.

MEDENA VENA. According to Caſtellus it is the ſame as *medinenſis vena*.

MEDIA SUBSTANTIA VINI BECCHERI. See VINUM.

MEDIANA VENA. A remarkable vein on the inſide of the flexure of the cubit, betwixt the cephalic and baſilic veins, called by the Arabians *funis brachii*. It is frequently opened in bleeding.

MEDIANA CEPHALICA. See CEPHALICA MEDIANA.

MEDIANUM. See MEDIASTINUM.

MEDIANUS. See CERVICALES.

MEDIASTINA. See INFLAMMATIO MEDIASTINI.

MEDIASTINÆ ARTERIÆ. The *arteries* of the *mediaſtinum*. They ariſe from the ſubclavian arteries, and are ſpread about the mediaſtinum.

—— VENÆ. The *veins* of the *mediaſtinum*. The right comes out from the trunk of the ſuperior vena cava anterior, a little above the azygos; the left from the ſubclavia.

MEDIASTINUM, called alſo *medianum*. It is the membrane called the pleura, which when it goes to the ſpine, it proceeds therefrom, covers the lungs, paſſes to the ſternum, and makes a complete bag on each ſide; this duplicature forms the *mediaſtinum*. It is commonly ſaid, that at the ſternum there is a cavity betwixt the laminæ of the *mediaſtinum*, and that any matter may be diſcharged, if lodged there, by a perforation through the middle of this bone; but this operation, if really required, would be very uncertain; for the *mediaſtinum* does not commonly terminate along the middle of the inſide of the ſternum, but from above, all the way down it, inclines to the left-ſide; ſo that if an inſtrument was thruſt through the middle of the ſternum, it would paſs near an inch on one ſide of this membrane.

The *mediaſtinum* contains in its duplicature, the heart, the pericardium, the vena cava, and the œſophagus.

MEDICAMENTARIA. PHARMACY. It is the art of making and preparing medicines. In an ill ſenſe of the word, it is the art of preparing poiſon. *Pharmacy* hath been diſtinguiſhed into CHEMICAL and GALENICAL. The FIRST conſiſted in many operations, in moſt of which fire was a principal medium, whereby extractions were made of the elementary parts of ſimples, which, in their ſeparate ſtate, had qualities different from thoſe of the entire body, of which they were a part, and combinations of different ſimples formed, with qualities not found in any of the conſtituents. The SECOND conſiſted in altering the form, or texture of ſimples, ſo as to render them fit to be taken, or applied, without attempting any change in their qualities; and in conjoining them in compoſitions of various forms, wherein, nevertheleſs, each ſimple was ſuppoſed to retain its original properties. But theſe diſtinctions have, for ſome time paſt, been laid aſide.

The operations in *pharmacy* may be reduced to theſe four kinds:

1. COMMENSURATION, or the adjuſtment of quantities. This is neceſſary, both for the due adminiſtration of ſimple and compound medicines, and alſo for the formation of thoſe very compounds.

2. CHANGE OF FORM, or TEXTURE, in the ſimple. In many caſes this is previouſly requiſite, both for the convenient adminiſtering of ſimples, and forming compounds. The inſtances in which this is practiſed, are for the reduction of ſolid cohering bodies to powder, and of theſe that partake both of ſolid and fluid, into pulp; for converting ſalts, and other ſoluble bodies, to fluidity; and, in other caſes, the reſtoring them when fluid to their ſolid ſtate. The ſeveral particular operations, by which theſe changes are produced, are *trituration*, *calcination*, *ſolution*, *exſiccation*, and *cryſtallization*.

3. EXTRACTION, or SEPARATION. This is here to be underſtood in a general ſenſe of the word, and not confined to the making extracts of the gums and reſins of vegetables. The different elements of many compound bodies having qualities and powers, when ſeparate and pure, which they are incapable of exerting when their force is ſuppreſſed by the quantity, or counteracted by the repugnant qualities of other ſpecies with which they are conjoined, are by this means obtained; ſuch are the acid ſpirits, teſtaceous earths, &c.

4. COMPOSITION. This is of two kinds; FIRST, ſimple commixture. SECONDLY, menſtrual combination. *The firſt* is where the different ſpecies are intended to act, each according to its proper nature, affording only an auxiliary, and independent power, to the execution of the final intention, without producing any mutual change of, or alteration in each other. But this is the leſs important kind of compoſition, as ſingle ſimples moſtly will anſwer the end of ſuch compoſition. *The ſecond* of theſe produces many efficacious remedies, which have no adequate ſubſtitutes, obtained by other means; ſuch as the preparations of quickſilver, antimony, ſaline ſubſtances, &c. Its conſtituent ſpecies which are commixed, acting on each other, ſo as to produce a new compound ſpecies, differing in its nature and efficacy from any of theſe of which it is compoſed.

To execute theſe ſeveral intentions, a variety of methods and their proper inſtruments are employed, and a number of leſſer ſubſervient intentions ariſe occaſionally, and are furniſhed with their correſpondent names, as *calcination*, *cryſtallization*, *corroſion*, *depuration*, *digeſtion*, *diſtillation*, *expreſſion*, *exſiccation*, *fermentation*, *fuſion*, *incorporation*, *precipitation*, *pulverization*, *ſolution*, *ſublimation*, &c.

The means of effecting *pharmaceutic* operations are of two kinds, viz. *chemical* and *mechanical*. By the *chemical* is meant the natural media by which bodies can act on, and produce a change on each other, not explicable from the known general properties of matter, or laws of motion; theſe are the menſtrual powers, and fire. By *mechanical* is meant artificial inſtruments. For brevity ſake, in ſpeaking of theſe two kinds, the firſt is called media, the latter inſtruments.

MEDICAMENTA EXTEMPORANEA, alſo *Magiſtralia*. Theſe are ſuch kind of medicinal compoſitions as are framed by the phyſician himſelf pro re nata, according to the circumſtances of the patient, and made up by the apothecary; though a variety of theſe are to be found in ſome Pharmacopœias under the title of Extemporaneous Medicines, and all practices of phyſic chiefly conſiſt of them.

MEDICAMENTOSUS LAPIS. The MEDICINAL STONE.

℞ Litharg. bol. Gallic. alum. ℥ ℥ ℔ ſs. colcoth. vitr. ℥ iij. acet. acerrim. ℔ ij. m. & evaporet donec durus eſt. This was formerly uſed in collyriums, &c. as an aſtringent.

MEDICINA. MEDICINE. It is the art of preſerving preſent, and reſtoring loſt health; more properly the laſt. It is uſually divided into the following heads:

——HYGIENE, from ὑγιης, *ſound* or *healthy*; which is the firſt part of methodical medicine, being that which preſcribes rules for the preſervation of health. PHYSIOLOGIA; from φυσις, *nature*, and λογω, *to treat of*. That branch of medicine which conſiders nature with reſpect to the cure of diſeaſes; particularly the human body, its parts; their ſtructure, connections, dependencies, functions, health, life, and œconomy; and depends much upon the knowledge of anatomy. See SAUVAGES, BOERHAAVE, or HALLER, on this ſubject.——PATHOLOGIA; from παθος, *a diſeaſe*, and λογος, *a diſcourſe*. This explains the nature of diſeaſes, their cauſes and ſymptoms. But in order to underſtand a diſeaſe, we ſhould conſider the morbific cauſes, parts affected, ſymptoms, criſis, diagnoſis, prognoſis. Hence is pathology divided into all theſe parts.

——SEMEIOTICA, from σημειον, *ſignum*, *ſign*. This treats of the ſigns of health and diſeaſe. See Dr. Winter's Tranſlation of Lommius's Obſervations.

——THERAPEUTICA; from θεραπευω, *to heal*, or *cure*. To this belongs the art of curing diſeaſes. See PHARMACEUTICÆ.

MEDICINA TRISTITIÆ. See CROCUS.

MEDICINALES DIES, are thoſe days in fevers which are neither critical nor indicatory, and on which it is proper to adminiſter powerful remedies, &c.

MEDINENSIS VENA, alſo *Medena vena*. See DRACUNCULUS.

MEDITULLIUM, from *medium*, *the middle*, ſee DIPLOE. Sometimes it ſignifies the pith of vegetables, and then called alſo *cardia*, *cor*; *cucardium*, *Medulla*; *Matrix*.

MEDIUM. See CERVICARIA.

MEDIUM TESTÆ. See BREGMA.

MEDIUS DIGITUS. See DIGITUS.

MEDULLA. MARROW; called also *axungia de mumia*. In ANATOMY it hath various significations. The white substance of the brain is called *medulla*, or the *medullary* part, to distinguish it from the cortical. The continuation of the brain, &c. in the spine, is called *medulla spinalis*; but properly *medulla* is the *marrow* in the bones.

If the *marrow* is viewed through a microscope, it seems a mass of small globules joined together like the roe of a herring. The distinction which some authors make betwixt a *medulla* and the *succus medullaris* is useless, the *marrow* in human bones being always fluid. The *membrana medullæ* not only lines the internal surface of the bones, but also divides the *marrow* into vesicles, or membranous bags, which are furnished with very fine minute vessels. The *marrow* is secerned into these little membranes by the arteries, and the superfluous part is occasionally carried into the mass of blood by bibulous absorbent veins. The use of the *marrow* is to keep the bones firm and flexible, and from becoming brittle, which would soon be the case without it, as is often seen in pocky and scorbutic habits, where it is separated in too small a quantity, and is, beside, bad in itself. The membrana *medullæ* hath a nerve which enters with the artery, and makes it sensible.

Mr. Sheldon observes, that the *marrow* is never sensible but in a diseased state. The dropsy hath the power of removing it. No *marrow* is found in the fœtus, but a kind of gelatinous fluid in its place. Animal oil never transudes in the living body from the bones, nor does *marrow* prevent their brittleness, as it is merely adventitious. The bones of birds contain no *marrow*, but air. Marrow of animals is prescribed in some compositions, but it has no superior efficacy to other common oleaginous substances; however, the best time for collecting it, is about autumn, for at other times it is bloody, and brittle.

MEDULLA CASSIÆ. The pulp of the *cassia fistularis*. See also MEDITULLIUM.

—— OBLONGATA. It is a continuation of the *medullary* substance of the cerebrum and cerebellum, which passes downwards, and a little backwards to the foramen magnum occipitale, where it assumes the name of *medulla spinalis*. It is rather of a depressed pyriform figure, though it is called oblong. It rises by two crura from the cerebrum, and two peduncles from the cerebellum; the enlargement formed by the union of these is called *pons varolii*, or *tuberculum annulare*, behind which is a stricture upon the *medulla oblongata*, and then an enlargement, which have the name of *corpora pyramidalia*. From the *medulla oblongata* springs the *medulla* spinalis, and all the nerves that pass from the head, except the first and second pairs. If the *medulla oblongata* is injured, death is the consequence immediately. See CEREBRUM.

—— SPINALIS, termed *cerebrum elongatum*; *Æon*. It is the continuation of the *medulla* oblongata, from the foramen magnum occipitale, through the vertebræ of the neck, back, and loins. It is of different sizes: in the neck it is flat and broad, in the back, small; in the loins, large; and at last it becomes a bundle of nerves, which have the name of *cauda equina*, because when taken out, and extended in water, they resemble a horse's tail. See CEREBRUM.

MEGALOSPLANCHNOS, from μεγας, *great*, and σπλαγχνον, *a bowel*. It is a person who hath some of the viscera enlarged, from a scirrhus or other cause.

MEGRIM. See CEPHALALGIA.

MEIBOMII GLANDULÆ. See CILIARES GLANDULÆ.

MEL, MELI. } HONEY, called also *aeromeli*, *acoitus*. The first who is said to have gathered *honey* was Aristæus, a pupil of Chiron's. It is a sweet vegetable juice, collected by the bee from the flowers of various plants, and deposited in the cells of the comb; from which it is extracted either by spontaneous percolation through a sieve in a warm place, the comb being separated, and laid thereon, or by expression. That which runs spontaneously is purer than that which is expressed, a quantity of the wax, and other matters, being forced out along with it by the pressure. The best sort of honey is of a thick consistence, a whitish colour inclined to yellow, an agreeable smell and pleasant taste; both the colour and flavour are said to differ in some degree, according to the plants from which it is collected by the bees. It is generally supposed that *honey* is merely the juice of the flower, perspiring and becoming inspissated thereon; and that the bee takes it up with its proboscis, and carries it to be deposited in their waxen cells, to feed their young at present, and themselves in winter; but it is certain that no other method of collecting this juice, besides that of the bees, affords us *honey*. The *honey* wrought by young bees, and that is permitted to run from the comb without heat or pressure, is white and pure, and called VIRGINS' HONEY. The *honey* of old bees, or that which is forced from the comb by heat or pressure from the wax, is yellow. *Honey* produced where the air is clear and hot, is better than that where the air is variable and cold. Where the bee-hives are fixed, there should be plenty of rosemary, thyme, lavender, violets, primroses, marjoram, baum, sage, myragolds, &c.

MEL AERIUM. See MANNA.

—— DESPUMATUM. CLARIFIED HONEY.

Liquefy the *honey* in a water-bath, and as the scum arises take it off. Thus the *honey* is purified from wax and all foreign matters. On continuing the heat, there arises a considerable quantity of aqueous fluid, impregnated with the finest smell of *honey*; the inspissated residuum dissolves in water and in spirit; and if treated with moist clay, as practised by sugar-bakers for purifying sugar from its treacly matter, the unctuous parts of the *honey* may be separated, and its pure sweet matter obtained in the form of a solid, saline, white concrete.

Honey is a natural soap, more aperient and detergent than the juice of the sugar-cane; it dissolves viscid phlegm, promotes expectoration; in which intention it is much assisted by acids: it gripes and purges some, but this effect is prevented by boiling it; it is detergent, antiacrid, antiseptic, and laxative. But when heat and inflammation are considerable, it is hurtful. It has been said to be beneficial in some asthmatic cases, taken in the quantity of some ounces in the day.

The more fixed parts of vegetables, dissolved in watery liquors, may be thence transferred into *honey*, by mixing the *honey* with the watery decoction, or juice of the plant, and then boiling them until the aqueous parts have exhaled, and the *honey* remains of its original consistence, and hence the several mels and oxymels.

Oxymel Simplex. Simple OXYMEL.

Take of *clarified honey*, two pounds; of distilled vinegar, a pint. Boil them in a glass vessel, with a gentle fire, to the consistence of a syrup. Pharm. Lond. 1788.

Honey yields by distillation an acid spirit, a brownish empyreumatic oil, and a caput mortuum. See Lewis's Mat. Med. Neumann's Chem. Works.

CERATUM MELLIS. CERATE OF HONEY. ℞ Olei olivæ; mellis despumati ā ā ℔ fs. Ceræ flavæ—Emplastri lithargyri ā ā ℥ iv. m. Melt the oil, wax, and plaister together, and afterwards add the honey; when strumous sores, or ulcers requires a slight degree of stimulus, for this purpose the cerate seems well calculated, and frequently employed.

MEL BORACIS. HONEY OF BORAX. ℞ Boracis pulv. ʒ i. mellis despumati, ℥ j. misce.—This is applied to the mouth in cures of aphthæ.

MEL HYDRARGYRI. HONEY OF QUICKSILVER.

℞ Hydrargyri purificati. Mellis despumati ♎ ℥ j. conterantur donec globuli omnino disparuerint, dosis gr. v. ad x. nocte maneq. In the administration of this composition, great care should be taken that the honey is perfectly agreeable to the constitution of the patient, otherwise the addition of the quicksilver might contribute greatly to encrease the painful sensations of the stomach and bowels, which honey is apt to create in some habits.

There are other compositions where *honey* forms the basis, as the *mel scillæ*, *oxymel scillæ*. See SCILLA. *Mel Rosæ*. See ROSA. *Oxymel Colchici*. See COLCHICUM.

MEL ÆGYPTIACUM. See ÆGYPTIACUM UNGUENTUM.

MELÆNA, MELAINA. } BLACK BILE, or the disease, the matter of which is *black bile*. Also,

—— NOSOS. See MORBUS NIGER.

MELAMPODIUM. See HELLEBORUS NIGER.

MELAMPYRUM. This name is compounded of μελας, *black*, and πυρος, *wheat*, because it most resembles wheat. It is also called *triticum vaccinum*, *cratægonum*, PURPLE COW-WHEAT. It is called *cow-wheat*, because

it is very grateful to black cattle. It is found among corn in many countries, particularly Friefland and Flanders. Thofe who eat it are affected as if they had eaten darnel; but by ufe it is eaten without any fuch ill effect. There is a wild fpecies, which is called faturcia lutea fylveftris. See Ray Hift.

MELANAGOGA. Medicines which purge off black bile.

MELANCHOLIA, from μελαινα, *black*, and χολη, *bile*. Melancholy; alfo *delirium melancholicum*, *erotomania*, *panophobia*, *athymia*. Dr. Cullen places it as a genus in the CLASS Neuroses, and ORDER Vesaniæ, and defines it a partial infanity, without a difficult digeftion. By infanity is meant, that particular ftate when the relations of things altogether falfe are conceived in the mind, fo that either the paffions or actions may be irrationally excited.

Melancholy and hypochondraifm appear to be fo nearly allied, that we cannot *always* make a proper diftinction between them—When we can, it is accomplifhed by no other fign but by dyfpepfy being always an attendant fymptom of the latter; often abfent in the former.

Of this he makes eight varieties, arifing from thefe things concerning which a man forms falfe conceptions. 1ft. From being fearful of the dangerous ftate of his conftitution from flight caufes, or the bad ftate of his affairs. 2. From being too much elevated with refpect to his worldly concerns. 3. From violent love without any luftful appetite from local difeafe. 4. From fuperftitious fear of future occurrences. 5. From a diflike of motion, and all the offices of life. 6. From inquietude and impatience with refpect to his fituation. 7. From being weary of life; though amongft the Engliih this perhaps does not always depend upon difeafe. 8. From a falfe conception of the nature of his own fpecies, fancying himfelf a dog, a horfe, or fome other animal.

Melancholy however is confidered in general to be the beginning of madnefs, or the leffer degree of it, and the higheft degree of the hypochondriac difeafe. See Mania.

MELANOPIPER. See Piper nigrum.

MELANTHIUM, } See Nigella Romana.
MELASPERMUM. }

MELANTORIA. See Atramentum Sutorum.

MELAS. Black. An epithet applied to the colour, and the fkin, and alfo to fome particular medicines. So is a fpecies of leprofy called when of a dark black colour. See Alphus.

MELASMA. See Sugillatio.

MELAZZO. See Saccharum.

MELCA. Galen fays it is a Roman word: and Conftantine, in lib. xviii. De Agricultura, fays, "It is nothing but milk repofited in an earthen pot, firft well feafoned with boiling-hot vinegar, by which means there was a feparation of the thicker fubftance of the milk from the whey."

MELEGETA, or Meleguetta. See Parad. Grana.

MELEIOS. See Alumen.

MELI. See Mel.

MELICA. See Milium Indicum.

MELICERIOLA. A fmall meliceris.

MELICERIS, from μελι, *honey*, and κηρος, *wax*. See Nævus. It is an encyfted tumor, whofe contents refemble *honey* and *wax*. Alfo called *melifavium*. It is a fpecies of wen.

MELICRATON. See Hydromeli.

MELIGEION. Blancard fays it is a fœtid oleous humor of the conftitence of honey, difcharged from ulcers complicated with a caries of the fubjacent bone.

MELILOTUS, from μελι, *honey*, and λωτος, *a kind of lotus*. It is alfo called *lotus fylveftris*, *fertula campana*, *trifolium caballinum*, *corona regia*. Common melilot. It is the tripolium melilotus Linn. It is a plant with fmooth, oval, ftriated leaves, ftanding three together on ilender pedicles, and round, ftriated, branched ftalks, terminated by long fpikes of papilionaceous flowers drooping downwards, which are followed by fhort, thick, wrinkled pods, containing each one or two roundifh feeds. It is annual, or biennial, and found in flower in hedges and corn-fields the greateft part of the fummer.

It is efteemed as refolvent, emollient, and anodyne, and participates of the virtue of camomile. Its tafte is unpleafant, fubacrid, fubfaline, but not bitter; when freih it hath not much fmell, but in drying it acquires a ftrong one, of the aromatic kind, but not agreeable. The diftilled water of *melilot*, though of little fmell itfelf, remarkably heightens that of other fubftances. It formerly gave name to a plafter, to which its juice gave a green colour; but it is now feldom ufed. Boerhaave mentions twelve fpecies, and Dale adds another, but none of them are now in much ufe.

Melilotus major. See Lotus Urbana.

MELYPHYLLON, } Baum or Balm, or it is called
MELISSA. } *melifla*, from μελι *honey*, becaufe bees gather much honey from it. It is called *opiaftrum*, from *apis*, *a bee*, becaufe bees love it; *Erotion*, *mellifolium*, *melifophyllum*, from μελι, *honey*, and φυλλον, *a leaf*; *citrago*, *citraria*, and *cedronella*, becaufe its colour refembles that of a citron. It is that of the melissa officinalis, or melissa Italica hortensis, *racemis axillaribus verticillatis*, *pedicellis fimplicibus*,—*floribus ex alis inferioribus fubfeffilibus*, CLASS Didynamia; Ord. Gymnospermia. Linn. Gen. Plant. 728. It is a well known plant in our gardens; the ftalks are fquare, the leaves are oblong, pointed, dark green, fomewhat hairy, and fet in pairs, in the bofoms of which come forth pale, reddifh, labiated flowers, ftanding feveral together in one pedicle, with the upper lip roundifh, erect, and cloven, and the lower divided into three fegments. It is perennial, a native of mountainous places in the northern parts of Europe, and flowers in June in our gardens.

It is one of the mildeft cordials and corroborants; hath a pleafant fmell, fomewhat of the lemon kind, and a weak aromatic tafte, of both which it lofes much in drying; a flight roughnefs, which the freih herb is accompanied with, becoming at the fame time more fenfible; the young fhoots are ftronger than the full grown ftems. Infufions of the leaves in water fmell agreeably of the herb, but have not much tafte, though on being infpiffated, they have a conliderable quantity of a bitterifh auftere extract. Infufions of *baum* do not, like other aromatics, offend the head, as is complained of from fage, &c. Cold infufions in water, or fpirit, are far better than the cohobated diftilled water, and are the beft preparations from the plant. It ufed to be confidered as an efficacious medicine in nervous affections, and given in hypochondriac, and melancholic difeafes; and it has been fpoken of as an emmenagogue. At prefent, however, no medicinal power is attributed to this plant; it is given infufed in water as a grateful diluent in fevers by itfelf, or acidulated with lemon juice.

On diftilling the freih herb with water, it impregnates the firft running pretty ftrongly with its grateful flavour. When large quantities are fubjected to the operation at once, there feparates and rifes to the furface of the aqueous fluid, a fmall portion of eflential oil, which fome call *ol. Syriæ*, and others *ol. Germanis*. It is of a yellowifh colour, and a fragrant fmell. It is a name alfo for feveral fpecies of plants. See Molucca.

Melissa nepetha. See Calamintha
—— calamintha. See Montana.
—— turcica, called alfo *melifla Americana trifolia odore gravi*, *Camphorafma*, and *Moldavica*. Turkey, or rather Canary baum, commonly called *balm of Gilead*. This fpecies of *baum* is a native in the Canary ifles, and fcarce bears the cold of our climes without fhelter. It is commended as a ftrengthener of the ftomach and the nervous fyftem, if infufions of it are frequently drank.

Boerhaave takes notice of feven fpecies, but thefe two are the moft ufeful.

MELISSOPHYLLON. See Melissa, and Ballote.

MELITISMOS. A linctus prepared with honey.

MELLAGO. Any medicine is thus called which hath the confiftence and fweetnefs of honey.

MELLEGUETTA. See Paradisi Grana.

MELLIFAVIUM. See Meliceris.

MELIFOLIUM. See Melissa.

MELO. The musk melon. It is called *melon* from μηλον, *an apple*, becaufe its pulp refembles *an apple*. Boerhaave mentions feven fpecies. They are only ufed in deferts. They come near to the qualities of the fermentable fruits called *acido-dulces*, and from the firmnefs of their texture, produce the effects of too great acefcency; they fhould, therefore, be ufed moderately, efpecially by thofe who have weak digeftive powers, and are beft eat with fugar and fome aromatics, as ginger.

Melo Indicus. See Jace Brasiliensibus.

MELOE VESICATORIUS. See CANTHARIDES.

MELON. It ſignifies an apple, the cheek, ſee MALA and BUCCÆ. It is alſo a diſorder of the eye, when it protuberates out of the ſocket. See EXOPHTHALMIA and MALUM. Alſo the name of the MUSK-MELON. See MELO.

MELONGENA, called alſo *mala inſana*, *ſolanum pomiferum*. MAD-APPLE. It is through miſtake that they have been thought to have been injurious, and ſo to have been thus named. The Spaniards and Italians eat them both in ſauce and in ſweet-meats: their taſte ſomewhat reſembles citron.

MELOPEPO. The SQUASH. It agrees in all things with the pompion, except that its fruit is roundiſh, ſtriated, angulous, cut into five parts, and full of flat ſeeds, which are affixed to a ſpungy placenta. It is called *melopepo*, becauſe its fruit is nearly of the ſize of a melon, and it partakes of the nature of a pompion. See PEPO. Boerhaave mentions five ſpecies.

MELOSIS, from μηλη, *a probe*. The ſearching of any part with a *probe*; hence the name *melotris*. See APYROMELE.

MELOTHRUM. See BRYONIA ALBA.

MELOTRIS. See APYROMELE.

MEMBRANA. A MEMBRANE. So called becauſe it covers *membrum*, *a limb*, called alſo *chiton*. Winſlow deſcribes it to be a pliable texture of fibres, diſpoſed or interwoven together in the ſame place. Membranes differ in thickneſs, according to the ſmallneſs of their fibres, and the number of their planes. Theſe planes are called *laminæ*.

The *cellular membrane*. See CELLULOSA MEMBRANA.

The *mucous membrane* is that covering of the ſurface of any part, whether within the body or more externally, which is expoſed to any extraneous matter, ſuch as the ſkin, internal *membrane* of the mouth, noſe, lungs, ſtomach, œſophagus, inteſtines, urinary paſſage, &c.

The common *membranes*, called the common teguments, are the ſcarf-ſkin, the true ſkin, and the cellular *membrane*: thoſe which cover particular parts are, the *dura mater*, *pia mater*, *pleura*, *peritonæum*, *pericardium*, *perioſteum*, *membrana propria muſculorum*, a vaſcular *membrane* which covers all the veſſels of the body, and thoſe which form the tubes, as the ſtomach, inteſtines, arteries, veins, gall-bladder, urinary bladder, &c.

MEMBRANACEI. Inflammation of membranous parts.

MEMBRANACEUS PINGUIS. See CÆLIFLOS.

MEMBRANÆ. The MEMBRANES. Thoſe ſo called in midwifery. See INVOLUCRA.

MEMBRANOLOGIA. MEMBRANOLOGY. It treats of the common integuments, and of particular membranes.

MEMBRANOSUS MUSCULUS. So called from its large membranous extruſion. See APONEUROSIS.

MENDOSA SUTURA. The ſquamous ſuture in the ſkull: or baſtard ſutures, from *mendax*, *counterfeit*.

MENDOSÆ COSTÆ. See COSTÆ.

MENINGÆ ARTERIÆ, h. s. Arteriæ duræ matris.

MENINGES. See DURA MATER.

MENINGÆÆ ARTERIÆ. See DURÆ MATRIS ARTERIÆ.

MENINGOPHYLAX, from μηνιγξ, *a membrane*, and φυλασσω, *to guard*. An inſtrument deſcribed by Celſus, lib. viii. cap. 3. contrived for guarding the membranes of the brain, whilſt the bone is raſped, or cut, after the operation of the trepan.

MENINX. See DURA MATER.

MENORRHAGIA. EXCESSIVE OR EXTRAORDINARY DISCHARGE of the MENSES, called alſo *metrorrhagia*, *hæmorrhagia uterina*. Dr. Cullen places this genus of diſeaſe in the CLASS PYREXIÆ, and ORDER HÆMORRHAGIÆ, which he defines pains of the back, loins, belly, ſimilar to thoſe of labour, attended with flux of the menſes, or of blood from the vagina, more copious than natural. He diſtinguiſhes ſix ſpecies. 1. *Menorrhagia* rubra. See MENORRHAGIA under MENSES. 2. *Menorrhagia* abortus. When floodings happen to pregnant women, or miſcarriage, called alſo *menorrhagia* gravidarum. See Floodings under ABORTUS. 3. *Menorrhagia* lochialis. See LOCHIA. 4. *Menorrhagia* vitiorum; when the appearances of the menſes are from ſome local defect, as from an ulcer, &c. 5. *Menorrhagia* alba. See FLUOR ALBUS. 6. *Menorrhagia* nabothi. When there is a ſerous diſcharge from the vagina in pregnant women.

MENORRHAGIA DIFFICILIS. *Difficult menſtruation*, as when attended with pain, &c. See MENSES DEFICIENTES.

MENSA. Thus the ſecond lobe of the liver was called by the ancients. See AURICA.

MENSA JOVIS. See VERBENA.

MENSES, from *menſis*, *a month*, called alſo *catamenia*, *menſtrua*, *emmenia*, *gynæcia*. They are the periodical diſcharges of blood from the uterus, vagina or both, from about the age of fourteen to about fifty. In warm climes they appear at about eight or nine years of age; but, with us, not until after twenty in many inſtances, although uſually at the age of from *thirteen* to *fourteen*.—The quantity is ſuppoſed to be from about four to ten ounces; however, in this there is not much certainty. In ſome women this diſcharge continues to flow two days, in others three or four, or perhaps a week. In warm climes the quantity of the diſcharge may be from two to twenty-four ounces. About their firſt eruption the quantity is ſmall; but in women arrived to maturity it is more. Thus the more lax the conſtitution, the larger the diſcharge is, other circumſtances favouring.—Lean women, and thoſe who abound with blood, evacuate more than ſuch as are fat, and of a colder temperament; and thoſe who are addicted to luxury and idleneſs, loſe a larger quantity than thoſe who uſe much exerciſe, and live on a poor or a ſpare diet.—Uſually, the ſooner they appear, they ſooner they diſappear. Commonly this evacuation continues in this country to return the till fortieth, the forty-eighth, or ſometimes the fiftieth year.

The *menſes* flow chiefly from the uterus, and ſometimes from the vagina. Some have the flux by other paſſages, manifeſted by periodical vomiting, coughing of blood from the lungs, bleeding from the hæmorrhoidal veins, noſe, &c. But when the menſtrual blood paſſes by theſe preternatural paſſages, it is generally productive of various diſorders.

Drs. FREIND and HALLER, both aſſert that this diſcharge is from a plethora, and ſupport their opinion by anatomical remarks. BOERHAAVE joins them in the ſame, as does many other phyſicians of eminence; though others conſider it only as a law of the animal œconomy, and do not pretend to account for it any further, as they think it inexplicable.

One of the laeſt opinions reſpecting the cauſe of the *menſes* is, that *they depend upon a topical congeſtion*. Dr. Cullen adopts this opinion, and in his lectures obſerves that, "the growth of the body depends upon the increaſe of the quantity of fluids giving occaſion to the diſtenſion of the veſſels, and thus producing the gradual evolution and full growth of the whole ſyſtem. This evolution does not happen equally in every part of the body at the ſame time, but ſucceſſively, according to the different ſize and denſity of the ſeveral veſſels determined by the original ſtamina. Thus the upper parts of the body firſt acquire their natural ſize, and then the lower extremities. By the ſame conſtitution it ſeems to be determined, that the uterus of the human ſpecies ſhould not be conſiderably evolved, till the reſt of the body is nearly arrived at its full bulk. But as the veſſels of every part, by their diſtenſion and growth, increaſe in denſity, and give thereby more reſiſtance to their further growth, at the ſame time, by the ſame reſiſtance they determine the blood in greater quantity in the parts not yet equally evolved. By this means the whole of the ſyſtem muſt be ſucceſſively evolved, till every part is brought to that degree of diſtenſion which is neceſſary to bring them to a balance with reſpect to denſity and reſiſtance with one another. Upon theſe principles, there will be a period in the growth of the body, whence the veſſels of the uterus will be diſtended till they are in balance with the reſt of the ſyſtem; and their conſtitution may be ſuch, that their diſtenſion may proceed ſo far as to open their extremities, terminating in the cavity of the uterus, ſo as to pour out blood there; or it may happen, that a certain degree of diſtenſion may be ſufficient to irritate and increaſe the action of the veſſels, and thereby to produce an hæmorrhagic effort, which may force the extremities of the veſſels with the ſame effect of pouring out blood. In either way, he accounts for the firſt appearance of a flow of blood from the uterus in women. In order to this, he does not ſuppoſe any more of a general plethora in the ſyſtem, than what is conſtantly neceſſary to the ſucceſſive evolution of the ſeveral parts of it; and he proceeds upon the ſuppoſition that the evolution of each particular part muſt eſpecially depend, upon the plethora, or increaſed

creaſed congeſtion, in its proper veſſels. Thus he ſuppoſes it to happen with reſpect to the uterus: but as its plethoric ſtate, he obſerves, produces an evacuation of blood from its veſſels, this evacuation muſt empty thoſe veſſels more eſpecially, and put them again into a relaxed ſtate with reſpect to the reſt of the ſyſtem. This emptied and relaxed ſtate of the veſſels of the uterus will give occaſion to a new congeſtion of blood in them, till they are again brought to that degree of diſtenſion, that may either force their extremities, or produce a new hæmorrhagic effort that may have the ſame effect. Thus, an evacuation of blood from the uterus being once begun by the cauſes before mentioned, it muſt, by the operation of the ſame cauſes, return after a certain period, and muſt continue to do ſo till particular circumſtances occaſion a conſiderable change in the conſtitution of the uterus. What determines the periods of theſe returns to be nearly in the ſpace of a month, he cannot exactly explain; but ſuppoſes it to depend upon a certain balance between the veſſels of the uterus and thoſe of the other parts of the body. This muſt determine the firſt periods; and when it does ſo, it can be underſtood, that a conſiderable increaſe or diminution of the quantity of the blood in the whole ſyſtem will have but little effect in increaſing or diminiſhing the quantity diſtributed to the uterus. It may alſo be further obſerved, that when the evacuation has been repeated for ſome time at regular periods, it may be ſuppoſed that the power of habit, which ſo readily takes place in the animal ſyſtem, may have a great ſhare in determining the periodical motions of the uterus to be with great regularity, though in the mean time conſiderable changes may have happened with reſpect to the whole ſyſtem." But whatever may be the cauſe, the ſymptoms which precede, and thoſe which follow this evacuation, are here conciſely enumerated.

Before the diſcharge, the breaſts ſwell, the head aches, the eyes have their veins full of blood, the back aches, and there are other ſymptoms of a febrile ſtate; the due quantity being excreted, nature is reduced a little below a ſtate of health, as is evident by the languor and diſpiritedneſs. The ſymptoms of defective *menſes* are the ſame as are conſequent in an inert ſtate of the fluids.

MENSES DEFICIENTES. MENSES DEFECTIVE, or SUPPRESSED.

This diſeaſe is the amenorrhæa of Dr. CULLEN, ranked by him in the CLASS LOCALES, and ORDER EPISCHESES, called alſo *dyſmenorrhœa*. Of which are formed the following ſpecies. 1. EMANSIO MENSIUM, when the menſes do not appear ſo early as uſually expected. 2. SUPPRESSIO MENSIUM, when after the appearance of the menſes, and continuance for ſome time at the accuſtomary periods, they ceaſe without pregnancy occurring. 3. AMENORRHŒA, ſeu MENORRHAGIA DIFFICILIS, when the menſes flow in too ſmall quantity, the flux alſo attended with great pain.

At the approach, as well as at the exit of the *menſes*, the body is ſingularly ſuſceptible of unnatural and uneaſy impreſſions, and ſuffers much from them. The *menſes* are retarded by cold, poor blood, ſorrow, ſudden frights, exceſſive evacuations of any ſort, aſtringents, violent ſhocks, as by a fall, &c. after which laſt they ſometimes never return. *In general*, the cauſe is, a defect of craſſamentum in the blood, or a ſtricture of the uterine veſſels. This diſcharge is interrupted naturally during pregnancy, but this is not always the caſe; for ſome have the menſes three, ſome ſix months, and ſome the whole time of geſtation, but in leſs quantity than at other times, except it be in the few inſtances of women who never have them but during their being pregnant. For the moſt part, the *menſes* are interrupted during the time of giving ſuck, though many women have a return about the third or fourth month after delivery, and almoſt all have them again by the ninth or tenth.

Beſides the decreaſed diſcharge, moſt of the ſymptoms of a chloroſis attend alſo, both when the *menſes* are obſtructed or ſuppreſſed. In many inſtances the blood hath diſcharged itſelf by other outlets. Sometimes an epilepſy is an attendant ſymptom, a loſs of memory, a dropſy of the womb, or a ſcirrhous tumor there, and innumerable other diſorders.

The inteſtines and the uterus receive their nerves from the ſame pair; it thence happens that if the one is diſeaſed the other ſuffers; hence the naufea, ſickneſs, vomiting, bad digeſtion, &c. when the uterus is diſordered.

It is a general received opinion, that many of the diſeaſes of women are owing to a ſuppreſſion of the *menſes*, but it may, perhaps, be doubted whether this will ſo often prove the cauſe, as the conſequence of other diſorders; as in general, for the removal of obſtructions, there is little more to do than to remedy the particular indiſpoſition of body under which the patient may labour. Hence different and oppoſite methods of cure will be required, according to the habit of body and nature of the ſymptoms.

The INDICATIONS OF CURE will then be regulated by the cauſe; 1. If a ſanguine plethora produces the diſorder, leſſen it. 2. If there is a defect of good blood, it muſt be improved. 3. If ſpaſms in the uterine veſſels are preſent, they muſt be remedied. 4. If there is a natural ill conformation of the veſſels, palliatives only can be propoſed; but in every other caſe, one indication may ſuffice, viz. reſtore the body to its healthy ſtate, and this evacuation will ſpontaneouſly flow; if a final ceſſation hath not arrived and which will manifeſt no morbid effects.

If a viſcidity, or *too great a coheſion in the blood*, be the cauſe, bleeding and attenuants will be neceſſary; the heat in this caſe may occaſion a ſtricture in the veſſels great enough to reſiſt the diſcharge, and here the kali acetatum is an admirable aſſiſtant; it may be given from 3 ſs. to 3ii. three times a day; if the larger doſe runs off by ſtool, it muſt be leſſened. Nitre, borax, and black hellebore, are alſo proper in theſe circumſtances.

The moſt frequent cauſe is a defect in the quantity of good blood, an attendant of which is generally a redundancy of vapid ſerum. Here antimonial vomits, repeated as frequently as this kind of evacuants is required; aloetic purges, joined with calomel, the tinct. aloes, or pilul. ex aloes cum myrrha, are excellent both as alteratives and evacuants; bitters, aromatics, and ferruginous preparations, finiſh the cure, if moderate and duly repeated exerciſe, and a cordial nouriſhing diet accompany them. In every inſtance of obſtructed *menſes*, if the woman is weakly, endeavour firſt to increaſe her ſtrength; when that is effected theſe natural diſcharges will uſually return; if they then do not, a prudent uſe of emmenagogues, that is, of ſtimulating forcers, may be admitted; but until the conſtitution is filled with good juices, it would be abſurd to force away what is already very deficient; or to expect that nature ſhould diſcharge that whereof ſhe needs a ſupply.

A ſluggiſh viſcid ſerum may be corrected by repeated doſes of tinct. aloes, or pilula ex aloe cum myrrha, given ſo as to keep the bowels free from coſtiveneſs, or by pills of ſoap and aloes. If theſe promote the piles inſtead of what is intended, their effect is ſalutary, as this is the beſt ſubſtitute for the uterine flux: but, quitting the aloes on this account, the beſt deobſtruent will be ſome preparation of iron; or if it heats too much, the black hellebore may be choſen. The breathing of ſome patients is affected by the uſe of iron, but the addition of a little gum ammoniacum ſeldom fails to relieve: the following form in general will ſucceed. ℞ Limat. mart. ʒ vi. gum. ammon. ſapon. Venet. ad ʒ ii. pulveris aromat. ʒ i. aloes ʒ ſs. ſyr. q. ſ. f. p. mediocres.

When the head-ach and ſickneſs in the ſtomach affects theſe patients, Dr. Alſton extols the uſe of borax; but adviſes it to be given in a fluid ſtate, for he thinks that the ſtomach cannot diſſolve it.

The rubia tinctorum in powder, from half a ſcruple to half a dram twice a day, has by ſome been eſteemed in theſe caſes very efficacious, but the ſavin is a much more powerful and certain medicine in the ſame doſes.

Bleeding is almoſt univerſally the firſt ſtep taken in theſe caſes; but except there is a manifeſt redundance of good blood, this evacuation is rarely to be admitted. If the operation is performed, the beſt time for it is juſt before the expected approach of the *menſes*.

Vomits are beſt adminiſtered juſt before the menſtrual return; and if a tenſeneſs of the uterine veſſels is ſuſpected to concur to this diſeaſe, the patient ſhould ſit ſo as to receive the vapours of warm water up the vagina, during the operation of vomiting medicines.

Pediluves are often of peculiar efficacy as aſſiſtants to other means, and may be uſed during bleeding whilſt a vomit is working off, or two or three times a-day during the ſymptoms of the *menſes* approach.

Volatile ſalts diluted with water, and received in the form of vapour up the vagina, powerfully promote the *menſes*, if prudently uſed.

Opiates are often very uſeful to take off thoſe ſpaſms which are excited by a painful approach of the *menſes*, and which too often retard or obſtruct their courſe; it is

true

true that little is to be expected when there is a natural ill-conformation of the veſſels; but when pain, or ſpaſmodic ſymptoms are attendant, ten grains of the pil. ſaponac. or five of the pilula opii, may be repeated, as the urgency of the caſe requires, until the difficulty is ſurmounted. When ſpaſms increaſe, convulſions ſometimes come on, and increaſe both difficulty and danger; here, beſides gentle opiates, the uſe of galbanum, camphor, balſam of Peru, and other antiſpaſmodics, are required. Cullen's Firſt Lines, vol. iii. p. 32, 48. See CHLOROSIS.

MENSES IMMODICÆ, vel MENORRHAGIA RUBRA. An IMMODERATE FLUX of the MENSES. It is the firſt ſpecies of Menorrhagia of Dr. CULLEN, which he defines, a ſanguinary menorrhagy or too copious flux of the menſes in women not pregnant or in child-bed. Indeed a too long continued, or a too frequent return of the *menſes*, or any ſuch diſcharge as reduces the patient's ſtrength during the intervals of their return, is called immoderate.

Women with ſoft lax habits, thoſe who have frequently miſcarried, and thoſe who live in eaſe and plenty, are the moſt frequent ſubjects of this complaint; not but more vigorous conſtitutions may ſuffer this way, and do, when ſubjected to violent exerciſe, &c.

Among the variety of cauſes, the chief is *a weakneſs of the veſſels, particularly of thoſe through which this diſcharge is made*; in ſome inſtances the morbid cauſe is, *an acrimony and thinneſs of the blood*: in others the occaſional cauſes are, *violent exerciſe, ſudden violent paſſion, abortion*, a *plethoric habit, particular medicines* or *diet*, &c.

An approaching hæmorrhage of this kind is uſually attended with a laſſitude of the whole body, a pain in the back and loins, tenſion of the hypochondria, paleneſs of the face, horripilation of the ſkin, conſtriction of the pores, &c. And the companions of this flux, are all thoſe ſymptoms which are the conſequents of impoveriſhed blood.

Whilſt the pulſe is good, *bleeding in the arm* may be adviſed, and the greateſt advantage attends this operation if performed on the firſt day of the *menſes* appearing. But if the ſtrength is greatly reduced, the ſame means muſt be uſed to check as were uſed to promote this evacuation, when its defect is owing to a defect of good blood; theſe are vitriolic acids, the bark, bitters, aromatics, and chalybeates, which muſt be given in the intervals of the diſcharges.

As to the means of relief during the preſent exceſſive flux, what is ſaid in the article ABORTUS may ſerve as a full direction here.

If the *menſes* are too copious in pregnant women, the true and only remedy is opium, which muſt be given until the end is obtained; if the pulſe require it, blood may be taken from the arm; or, if great pains attend in the belly, and it is evident that they are of the ſpaſmodic kind, clyſters, in each of which is a dram or more of the tinct. opii, will be the moſt proper means of relief.

MENSES CESSANTES. *The* MENSES DEPARTING.

It uſually happens that this periodical diſcharge ceaſes betwixt the age of forty and fifty; with ſome women it happens earlier. Sometimes it quits them all at once, but generally its departure is gradual, and this time is often critical with the ſex. Pains in the head and about the loins, nauſea, the fluor albus, and many other troubleſome and ſometimes dangerous ſymptoms, are attendant; but they generally yield to frequent bleeding in ſmall quantities, and aloetic purges with chalybeates. The diet ſhould now be rather ſparing, except the ſtrength of the perſon is remarkably diminiſhed, and the exerciſe ſhould be ſomewhat increaſed. Indeed under this circumſtance, the peculiar nature of the conſtitution is to be conſidered, with reſpect to its ſtrength, or delicacy, and the ſtate of the moving powers, whether they are too irritable, incitable, or torpid, and according as one or other is moſt prevalent, our remedies are to be adapted to alleviate thoſe uneaſy ſenſations, which may ariſe from theſe conſtitutional cauſes, made more diſtreſſing by this change wrought upon the habit by this law of nature, for it cannot be conſidered as a diſeaſe, conſequently the cauſe cannot be obviated; the effects therefore can only be palliated, or ſome of them perhaps removed. No general method can be laid down, as the mode of relief will vary according to the nature of the habit upon which they are to operate; hence upon the ſagacity of the Phyſician the whole muſt be totally dependent.

Hamilton's Midwifery, edit. 2. p. 134. Edinb. Med. Comm. vol. v. p. 119. Lond. Med. Jour. vol. v. p. 183. Leake's Med. Inſtructions.

MENSIS PHILOSOPHICUS. A PHILOSOPHICAL or CHEMICAL MONTH. This is not one determined ſpace of time, for, according to ſome, it is three days and nights, others ſay it is ten, and there are who reckon it thirty and even forty days.

MENSTRUA. The *menſes* in women, and the bleeding piles in men. In chemiſtry *diſſolventia*.

MENSTRUUM. This is a barbarous term, and denotes a body which, when artificially applied to another, divides its ſubtilty, ſo that the particles of the ſolvent remain thoroughly intermixed with thoſe of the ſolvend. This ſolvent was called a *menſtruum*, becauſe the chemiſts in its application to the ſolvend firſt uſed a moderate fire for a philoſophical month, or forty days; hence aroſe the name of a menſtrual ſolvent, and at length was called barely a *menſtruum*. It is ſynonymous with the word *ſolvent*.

Many bodies are called *menſtruums* that are hard, and cannot act in that ſtate as ſolvents; and hence *menſtruums* are divided into the ſolid and fluid kinds; and however theſe may be ſubdivided, all the known *menſtruums* may be divided into four kinds. 1. Thoſe which act by a mechanical power. 2. Thoſe which act by a mechanical, mixed with a repellent power. 3. Such as act by a mutual attraction between the parts of the ſolvent and ſolvend: of this kind there are many. 4. Thoſe which act by the joint concurrence of the ſeveral properties included in the three preceding: of this kind there are the largeſt number.

It is ſuppoſed by many, that the ſolution of bodies is principally affected by their pores, and that to the different form or ſize, or both, of theſe pores, it is owing that different *menſtruums* diſſolve, or are required for different bodies. But not to mention the various errors which attend this notion, the following appears to be the more probable, if not real cauſe of ſolution. The ſolvent putting the parts of the ſolvend in motion, hurries them along with itſelf; in the ſame motion of fluidity, unites itſelf with them, as water puts ſalt into a like motion of fluidity, and ſo unites itſelf. And as a ſolution is effected by a union of the ſolvent with the ſolvend, ſo, when this union is deſtroyed, and the ſolvent forſakes the ſolvend, the fluidity ceaſes, and the ſolvend is ſeparated from the *menſtruum* or ſolvent, and thus precipitation is effected. In ſhort, the whole of ſolution and precipitation ariſes from the greater or leſs diſpoſition in reſpective bodies, to unite with or recede from each other; thus gold is diſſolved in aqua regia, but not by ſpirit of nitre; becauſe it is more diſpoſed to unite with the one than the other: ſo when one ſolvend is rendered fluid by a ſolvent, if another ſolvend, to which the ſaid ſolvent is more powerfully diſpoſed to unite be added, the ſolvent quits its ſolvend, and unites itſelf to the added one, leaving the firſt to precipitate. This is performed by the laws of chemical attraction.

The principal *menſtrua* in pharmacy are water, acid ſpirits, vinous ſpirits, alkaline ſalts, and oils. See the Dict. of Chem. article SOLUTION. Boerhaave's Chemiſtry.

MENTAGRA, called alſo *impetigo*. An obſtinate tetter which appeared in Italy during the reign of Claudius Cæſar. It began upon the chin, and extended itſelf over the face, even to the eyes, and deſcended to the neck, breaſt, and hands. In order to the cure, a cautery was applied to ſome convenient part, and made to penetrate the bone.

MENTALES. Alienation of the judgment, in which the functions of the mind are diſturbed.

MENTASTRUM. See MENTHA PALUSTRIS.

MENTHA. MINT, called, on account of its ſweet ſmell, *hedyoſmos*. It is a perennial herb with ſquare ſtalks, ſerrated leaves ſet in pairs; and ſpikes of monopetalous flowers, each of which is cut into four ſections, and followed by four ſeeds incloſed in the cup. Boerhaave enumerates thirteen ſpecies; Dale adds four more to them: and of theſe we have ſixteen which grow natu-

rally in England. It is alſo a name given to many plants.

MENTHA AQUATICA, alſo called *ſiſymbrium mentha ſtrum, mentha rotundifolia paluſtris.* RED WATER-MINT. Its leaves are ſomewhat oval, and are ſet on pedicles; the ſtamina are long, ſtanding out from the flowers.

—— CATARIA, called alſo *nepeta cattaria, gattaria, mentha ſelina, herba felis, calamintha paluſtris, nepetella,* NEP, or CAT-MINT. It is the NEPETA CATARIA Linn. It is ſo called from its being deſtroyed by cats. It is an hoary plant with ſquare ſtalks; the leaves are heart-ſhaped, acuminated, ſerrated, and ſet in pairs on oblong pedicles; the flowers are whitiſh, labiated, ſtanding on ſpikes at the top of the branches. The upper lip is divided into two, and the lower into three ſections. It grows wild in hedges and on dry banks; and flowers in June; it is moderately aromatic, of a ſtrong ſmell, reſembles a mixture of *mint* and pennyroyal, and participates of their virtues. Water extracts all their active matter, but rectified ſpirits extracts it more completely. Diſtilled with water, they yield a yellow eſſential oil, not quite ſo agreeable as the herb, though ſmelling ſtrong of it; the remaining decoction is bitter, and ſubaſtringent. See Raii Hiſt. Plant. Cullen's Mat. Med. Tournefort's Mat. Med. Lewis's Mat. Med.

—— CORYMBIFERA MINOR. See AGERATUM.

—— PALUSTRIS FOLIO OBLONGO, called alſo *mentaſtrum hirſutum, auricularia.* HAIRY WATER-MINT or EARWORT. It has long hairy leaves, which have no pedicles, and broad ſpikes of flowers. Both theſe ſpecies, which are called *water-mints*, grow on mountainous grounds and marſhes, and on the banks of rivers, and flower towards the end of ſummer; their ſmell is leſs agreeable than that of ſpear-*mint*, their taſte more bitter and pungent; the ſecond ſort approaches a little towards pennyroyal; they yield much leſs eſſential oil than the ſpear-*mint*, and their virtues, though ſimilar to it, are much inferior in degree.

The *hairy water-mint* is ſuppoſed to be *auricularia, planta Zeylanica,* or EAR-WORT; celebrated by Marloe for the cure of deafneſs.

—— PIPERITIS. PEPPER-MIMT. MENTHA PIPERITA, or MENTHA *floribus capitatis, foliis ovatis petiolatis, ſtaminibus corolla brevioribus,* CLASS. DIDYNAMIA; ORD. GYMNOSPERMIA. LINN. Gen. Plant. 713. It hath acuminated leaves on very ſhort pedicles, and the flowers ſet in ſhort thick ſpikes or heads; it is a native of this kingdom only; it is plentifully raiſed in gardens on account of its uſefulneſs; its natural ſoil is a watery one, but it does not, like the other ſpecies, loſe much by being cultivated in any other.

It hath a more penetrating ſmell than the other *mints*, a ſtronger and a warmer taſte; it is pungent and glowing, like pepper, and ſinks, as it were, into the tongue; at firſt its taſte is hot, and afterwards it ſeems to be cold and ſomewhat nitrous. From its ſtomachic, antiſpaſmodic, and carminative qualities, it is of great uſe in flatulent complaints, hyſteric depreſſions, retchings, and other dyſpeptic ſymptoms, acting as a cordial, and often producing immediate relief; it exerts its activity as ſoon as it is in the ſtomach, diffuſes a glowing warmth through the whole ſyſtem, yet is not liable to heat the conſtitution near ſo much as might be expected from the great warmth and pungency of its taſte. Its qualities are with great probability aſcribed to the camphor, which the experiments of Gaubius have proved to be largely contained in it.

It readily and ſtrongly impregnates either water or ſpirit by infuſion; in diſtillation with water, it gives over a large quantity of eſſential oil, of a pale greeniſh yellow colour, growing darker-coloured by age, and poſſeſſes a great degree of the ſmell and pungency of the herb; as much of this oil as can be ſuſpended in rectified ſpirit of wine is ſold under the name of the eſſence of *pepper-mint*. The decoction which remains after diſtillation, like that of the other *mints*, is a bitteriſh ſubaſtringent. For the water, ſpirit, and oil, ſee MENTHA SPICATA.

MENTHA PULEGIUM. See PULEGIUM.

MENTHA SPICATA, called alſo *mentha ſativa, mentha vulgaris* HART-MINT, and COMMON SPEAR-MINT. *Mentha ſativa*, Pharm. Edinb. *Mentha ſpicata*, Weſton. MENTHA VIRIDIS, or MENTHA *ſpicis oblongis, foliis lanceolatis nudis ſerratis ſeſſilibus; ſtaminibus corolla longioribus*, CLASS DIDYNAMIA; ORD. GYMNOSPERMIA. LINN. Gen. Plant. 713. It hath oblong, narrow-pointed leaves, joined cloſe to the ſtalk, and ſmall purpliſh flowers, ſtanding on long ſpikes on the top. It is a native of warmer climes; it is common in our gardens, and flowers in June and July.

It hath a ſtrong, agreeable, aromatic ſmell, and a bitteriſh, roughiſh, moderately warm taſte; it is reſtringent, carminitive, and ſtomachic; in vomitings and weakneſs of the ſtomach few ſimples have an equal efficacy. If an infuſion of *mint* in water is drank with milk when acidity prevails in the ſtomach, the milk will not coagulate there. It is poſſeſſed of the ſame qualities of the *pepper-mint*, though more heating; but the different preparations of the former, though more pleaſant, are by ſome conſidered to be leſs efficacious.

Mint is ſaid to act very powerfully upon the part to which it is immediately applied, and therefore conſiderably to the ſtomach, invigorating all its functions. It acts particularly as an antiſpaſmodic, hence relieves pains, and colic depending upon ſpaſm. In caſes though depending on inflammatory irritation in the ſtomach itſelf, or in other parts of the body, it aggravates the diſeaſe, and though in ſome caſes it relieves vomiting, it here contributes to increaſe it. The beſt mode of giving it is in infuſion.

The juice expreſſed from the leaves retains the bitterneſs and reſtringent, but not the aroma of the *mint*, in which its chief virtues lie. This herb is very little hurt by keeping, drying, or being expoſed to any moderate degree of heat. In five or ſix hours cold water extracts a rich tincture from the *mint*; a longer maceration extracts the groſſer parts, and ſo is leſs agreeable. Hot water more readily extracts its virtues, but boiling diſſipates the aroma. Infuſions and tinctures contain the whole virtue of the *mint*; the oil and the diſtilled water only the aroma.

That water is the moſt agreeable that is diſtilled from newly dried *mint*; and it is further improved by the method below for making a tincture of *mint*. In diſtillation with water an eſſential oil ariſes, which is of a pale yellowiſh colour, changing by age to a reddiſh one: and in quantity about an ounce from ten pounds of *mint*, which for this purpoſe ſhould be gathered when the flower is put out: this oil is ſtrong of the *mint*, but not ſo agreeable.

Dry *mint* digeſted in ſpirit of wine, either with or without heat, gives out all its virtue, without its diſagreeable parts. Spirit takes up very little in diſtillation. An extract made with ſpirit poſſeſſes the concentrated virtues of a large portion of dried leaves. Fifteen grains of the reſinous extract obtained from either the common *mint* or pepper-*mint*, by means of ſpirit of wine, is equivalent to ſix drams of the dried herb. The ſpirituous tincture mingles with watery liquors without precipitation or turbidneſs; but ſpirituous liquors impregnated with its pure volatile parts by diſtilliation, turn milky on the admixture of water.

Tincture of MINT.

To a pint of *mint* water, add half an ounce of the dried leaves of *mint*; let them ſtand four hours in a warm place, and then ſtrain.

The diſtilled water contains as much of the volatile part of the herb as it can retain: however, by infuſion it takes up as much from the *mint* as pure water would. Thus any of the ſimple diſtilled waters may be much improved, and, when required, the waters diſtilled from one vegetable may be the menſtruum for a different one.

The College of Phyſicians order from the *mentha* ſativa, and *mentha* piperitis, a water and a ſpirit, which they make as follows. Take of ſpear-*mint* or pepper-*mint* dried one pound and a half, water ſufficient to prevent an empyreuma: this forms the aqua. To make the ſpirit, to the ſame quantity of the herb they order one gallon, water ſufficient to prevent an empyreuma. In each proceſs they draw off a gallon. The eſſential oils of theſe are acquired by diſtillation. See ESSENTIAL OILS under OLEUM.

MENTHASTRUM, See MENTHA AQUATICA.

MENTULA. See PENIS.

MENTULA ALATA. See PENNA.

MENTULAGRA. A diſorder of the penis, induced by a contraction of the erectores muſculi, and cauſing impotence.

MENTUM. The CHIN. It is the anterior protuberance which terminates the lower part of the face, from whence

whence it runs to the neck; the under part of the *chin* is termed its baſis, and it is diſtinguiſhed from the throat by a tranſverſe fold, which reaches from ear to ear; in the middle of the *chin* is a dimple.

MENTZ. An abbreviation of Index Nom. Plant. Multilinguis Opera Chriſt. Mentzelii.

MENYANTHES TRIFOLIATA;—PALUSTRIS. See TRIFOLIUM PALUDOSUM.

MEPHITIS, a Greek word, μεφίτις, applied to the fætor which aroſe from burning ſulphur. It is now expreſſive of A POISONOUS EXHALATION, or what the miners call a DAMP. Venomous ſteams or *damps* are what the Latins call by this name. The word *mephiticus mephitic*, ſignifies *ſtinking*, particularly ſuch an ill ſmell as ariſes from brimſtone and water, or a damp or ſtrong ſmell from corrupted water mixed with earth and brimſtone. And as the word *mephitic* is uſed to ſignify noxious, hurtful, injurious, &c. it is applied to fixed air. See AER.

MERCURIALIS. MERCURIAL. An epithet of all preparations of *mercury*. But the *atra bilis* is alſo called the *mercurial humour*; and the diſeaſes thence generated are named *mercurial diſeaſes*. IN BOTANY it is the name for *bonus Henricus, tota bona, lapathum unctuoſum folio triangulo, blitum, chenopodium*, ALL-GOOD ENGLISH MERCURY. It is a plant with triangular leaves, covered underneath with a whitiſh unctuous meal; it hath ſtriated hollow ſtalks, partly erect and partly procumbent, bearing on the tops ſpikes of ſmall imperfect flowers, each of which is followed by a ſmall black ſeed, incloſed in the cup; it is perennial, grows by the road ſides and in waſte grounds, and flowers in Auguſt. The leaves are mucilaginous and a little ſubſaline, are uſed as emollients in clyſters and fomentations. The young ſhoots are eaten in ſpring; they looſen the belly and promote urine. See Raii Hiſt.

—— AQUA. See BEYA.

—— FRUCTICOSA INCANA TESTICULATA, called *mariſicum*; *thelygonon*. CHILDREN'S MERCURY.

This is only met with in the gardens of the curious, and flowers in ſummer. In Barbary it is uſed againſt diſeaſes peculiar to women.

—— MAS, called alſo *mercurialis teſticulata, merc. ſpicata, merc. fœmina*. FRENCH MERCURY. It is the MERCURIALIS ANNUA Linn. This plant hath ſmooth gloſſy leaves, and branched ſtalks. The flowering plants called female, and thoſe which produce ſeeds, are both annual, and grow wild together in ſhady uncultivated grounds.

The leaves have no remarkable ſmell, and very little taſte; they poſſeſs a ſmall degree of mucilage, and a little ſaline matter, but are not much uſed.

—— MUCILAGO. See ARGENTUM VIVUM.

—— SYLVESTRIS, called alſo *cynocrambe, canina braſſica, perſicaria ſiliquoſa*; *merc. montana*, WILD MERCURY, DOG'S MERCURY. It is the MERCURIALIS PERENNIS of Linnæus. It is one of the poiſonous plants found in Great Britain.

The root is creeping, light-coloured, and fibrous. The ſtalk is a foot high, erect, green, juicy and unbranched. The leaves are oval, ſerrated, pointed, at the extremity, placed in parts oppoſite each other. The flowers grow at the tops of the ſtalks, and in thin ſlender ſpikes out of the alæ of the leaves, and are of a light green. The flowers are of two kinds, male and female. The furrows of the germen receive a barren filament, terminated with a gland, marked with two dark-coloured ſpots. It flowers early in the ſpring. It is found in woods, ſhady places, and ditch-banks. It is diſtinguiſhed from the French *mercury* by being perennial, larger, having rough leaves, and the ſtalks not at all branched.

This plant is ſaid by many writers to be injurious both to man and beaſt. Dr. Withering ſays, in his Botanical Arrangement, that it is dreſſed like ſpinach; it is very good eating early in the ſpring; that, probably, when the ſeaſon is more advanced, and the plant is become more acrimonious, its ill qualities take place.

The ſymptoms that are ſaid to be produced by it are a nauſea, vomiting, and afterwards comatoſe ſymptoms.

Its ill effects are removed as in caſes of poiſonous muſhrooms. See AMANITA and VENENUM.

Wilmot's Obſervations on poiſonous Vegetables.

MERCURIUS. QUICKSILVER. See ARGENTUM VIVUM.

MERCURIUS ALB. SUBLIMAT. See MERC. COR. ALB.

—— ALCALIZATUS. ALKALIZATED MERCURY, now called *hydrargyrus cum creta*. QUICKSILVER with CHALK; called alſo *Æthiops albus*. ℞ Hydrargyri pur. ℥ iij. cretæ pp. ℥ v. rub them together until the globules diſappear. Ph. Lond. 1788. It is obſerved that *mercurials* prepared without a ſaline ſtimulus, are moſt efficacious in intermittents, rheumatiſms, pleuriſies, and peripneumonies, after due bleeding and purging. In other caſes it operates more gently than when reduced to a calx by fire, or is prepared with acids; but is leſs certain in its effects. In general it is an excellent method of adminiſtering *mercury* as an alterative; its doſe may be from three grains to as much as the patient can bear, without promoting any ſenſible excretion. Dr. Fordyce and ſome others do not conſider this as capable of producing any effect on the ſyſtem. Still in diſeaſes of the proſtate gland, it is allowed ſome efficacy. If it runs off by ſtool, opium is better than aſtringents for reſtraining it.

—— CALCINATUS, *merc. præcip. per ſe*. CALCINED QUICKSILVER, now called *hydrargyrus calcinatus*.

This preparation is directed by the London College to be prepared by expoſing a pound of *quickſilver* in a flat-bottomed glaſs cucurbit, to a heat of about 600 degrees, in a ſand-bath, till it becomes a red powder. By agitation, or by triture, ſimilar effects are produced on the *mercury*, and in much leſs time. This red powder gripes more than the calomel, than which it does not appear to be a better medicine, though, in ſome few inſtances, it agrees better with the patient. The doſe is from gr. ſs. to gr. ii. mixed with opium.

—— CHEMICORUM. See ARGENT. VIV.

—— CINNABARINUS. See CINNAB. FACTITIA.

—— COR. SUB. See MERC. CORROS. ALB.

—— CORALLINUS, *arcanum corallinum*. This was a preparation in the Diſpenſatory of the London College, directed with a view to render the merc. nitratus ruber a more mild internal medicine; but no conſiderable advantage is obtained by the proceſs; it is therefore rejected.

—— CORROSIVUS ALBUS. The WHITE CORROSIVE MERCURY, called alſo *merc. cor. ſublim. ſilum arſenicale, gas ſiccum ſublimatum; albi; aquila alba; ſublimotum*; now HYDRARGYRUS MURIATUS, MURIATED QUICKSILVER. The modes of preparing this medicine are various; but the College of London direct *quickſilver* and vitriolated acid two pounds of each; dried ſea-ſalt, three pounds and an half; mix the *quickſilver* with the acid in a glaſs veſſel, and boil in a ſand heat, till the matter is dried; mix the matter, when cold, with the ſea-ſalt in a glaſs veſſel; then ſublime in a glaſs cucurbit, with a heat gradually raiſed; laſtly, let the ſublimed matter be ſeparated from the ſcoriæ. Pharm. Lond. 1788.

The greateſt part of this *mercurial* preparation that is uſed in England, is brought from Holland and Venice; and as many ſuſpect its being adulterated with arſenic, Dr. Lewis gives the following method of detecting the fraud: "Take any quantity of the ſuſpected *white corroſive mercury*, powder it in a glaſs mortar, and mix it well with twice its weight of *black flux* (for which ſee CALCINATIO,) and a little filings of iron; put the mixture into a crucible capable of holding four or five times as much; give a gradual fire until the ebullition ceaſes, then haſtily increaſe it to a white heat, if no fumes of a garlic ſmell be perceived during the proceſs, and if the particles of iron retain their form, without any of them being melted, we may be ſure that the mixture contains no arſenic." Neumann denies the poſſibility of this preparation being adulterated with arſenic, and obſerves, that inſtead of their ſubliming together, the arſenic will attract the marine acid to itſelf, and the *mercury* will be revived, inſtead of ſublimed, into the form which this preparation is found in.

The *white corroſive mercury* is a violent medicine; it corrupts and deſtroys all parts of the body that it touches, more ſpeedily than white arſenic does.

Aq. Phagedenica. ℞ Hydrargyri muriati ʒ ſs. aq. calcis f. lib. i. m. The lime renders it more mild.

Internally taken, it produces the moſt violent ſymptoms, ſuch as thirſt, ſickneſs, vomiting, pain, dejections of blood and mucus, ſwoonings, convulſions, gangrene, and death. When an imprudent doſe hath been given, a vomit of the zincum vitriolat. ſublimatum ſhould be inſtantly given, to promote the ſpeedieſt diſcharge; after puking two or three times, give a ſolution of fixed alkaline ſalt in pure water, and let it be copiouſly drank; then ſolutions of gum arabic may be plentifully given with proper doſes of opiates; for opium is the beſt corrector of the active preparations of *mercury*.

Notwith-

Notwithſtanding the ill effects of imprudent doſes of this medicine, its uſefulneſs is not equalled by any other known means for relief in many diſorders. *In the venereal diſeaſe* it is one of the moſt uſeful preparations of *mercury*,—*in carcinomatous* or *phagedenic ulcers*—*in cancers* and *cancerous indiſpoſitions*,—obſtinate cutaneous diſorders,—cachectic ulcers,—dimneſs of ſight, and glandular ſwellings, it hath ſucceeded in many inſtances when all other known methods of cure have failed; but, as its power is great, ſo it muſt be long continued in very ſmall doſes. The following ſolution of it may ſerve as general form, and the doſe may be proportioned to the nature of the caſe and the conſtitution of the patient.

℞ Hydrargyri muriati, gr. xvi. ſpt. vini rect. ℔ i. m. From half a table ſpoonful the doſe may be increaſed as diſcretion will admit, and may be repeated two or three times a day. The beſt vehicles are watery and mucilaginous liquors; the moſt common in venereal complaints is the decoct. ſarſaparil. but, in want of it, ſolutions of gum arabic will be very uſeful; theſe and ſuch like may be uſed in all other caſes, if the preſcriber directs no other as more particularly adapted to relieve. It promotes the cure of leprous and other eruptive complaints; and is ſometimes applied externally in the proportions of from three to eight grains in a pint of water, mixed with one or two ounces of hog's-lard. In ſcorbutic or relaxed habits, though moderate doſes of bark ſhould accompany its uſe, and the bowels be kept moderately open.

Externally, it is applied in form of gargle, by adding five drops of the liquor hydrargyri muriati, to one pint of the decoction of barley, ſweetened with two ounces of honey of roſes: and, in caſes of venereal ulcers in the throat, it has been highly beneficial. For a ſtronger preparation, ſee HYDRARGYRUS MURIATUS FORTIOR. See Dict. of Chem. Lewis's Mat. Med. Neumann's Chem. Works. Lond. Med. Obſ. and Inq. vol. i. p. 365, &c. vol. ii. p. 70, &c.

MERCURIUS DULCIS SUBLIMATUS. DULCIFIED MERCURY SUBLIMATE. Now called CALOMELAS, and when the *ſublimation* hath been repeated to ten or twelve times, it hath been called *panacea mercurii*.

It is the *merc. cor. alb.* dulcified by the addition of crude *mercury*. The London College directs the proportion of nine ounces of purified *quickſilver* to twelve ounces of the muriated *quickſilver*; rub them together, till the globules diſappear, and ſublime; in the ſame manner repeat the ſublimation four times, afterwards rub the matter into the fineſt powder, and waſh it by pouring on boiling diſtilled water. Ph. Lond. 1788. And in the Auguſtan Diſpenſatory one ſublimation only is required.

The dulcification intended in this proceſs is wholly effected by the combination of ſo much freſh *mercury* as may fully ſatiate the acid of the white corroſive *mercury*, and therefore, though triture and digeſtion promote the union of the two, they are not properly the cauſe of the dulcification; and, as to ſublimation, it rather tends to diſunite theſe ſubſtances, ſo need not be ſo often repeated as according to ſome directions is required.

By whatever method this medicine is prepared, if it proves too acrid, by boiling it in water, the acrid parts will be diſſolved and ſeparated; after the boiling, let the water be poured off, the powder dried, and then ſublimed again. To every ten ounces a quart of water may be allowed for boiling it in.

The marks of ſufficient dulcification are, its being perfectly inſipid to the taſte, and indiſſoluble by long boiling in water; and whether or not that the water hath taken up any part of the *mercury*, may be known by dropping into the liquor a ley of any fixt alkaline ſalt, or any volatile alkaline ſpirit; if the decoction hath any mercurial impregnation, it will grow turbid on this addition; if otherwiſe, it will continue limpid. To prevent deception here, let diſtilled water be always uſed. If this *calomel* is rubbed on gold, and it turns paſe only, and not white, the dulcification is ſufficient; or if the *dulcified mercury* turns black on being mixed with lime-water, it is duly prepared.

Calomel is very ſubject to conſiderable variation in its efficacy, &c. as a medicine, from the different management in its preparation. The diſadvantages which attend it are greatly removed by the following method of making it, which Dr. Swediar hath favoured us with, by tranſlating it from the Acta Stockholm, where it was inſerted by Mr. Scheele, to whoſe ingenuity the world is indebted both for it and other chemical materials.—Mr. Scheele's proceſs and obſervations on it are as follow:

"Half a pound of *quickſilver*, and the ſame quantity of nitrous acid are to be put into a ſmall veſſel with a long neck, the mouth of which is to be covered with paper. The veſſel is then to be placed in a warm ſand-bath; and, after a few hours, when the acid affords no ſigns of its acting any longer on the *quickſilver*, the fire is to be increaſed to ſuch a degree that the ſolution may nearly boil. This heat is to be continued for three or four hours, taking care to move the veſſel from time to time, and at laſt the ſolution is to be ſuffered to boil gently for about a quarter of an hour. In the mean while we are to diſſolve four ounces and a half of fine common ſalt in ſix or eight pints of water. This ſolution is to be poured boiling into a glaſs veſſel, in which the above mentioned ſolution of *quickſilver* is to be mixed with it, gradually, and in a boiling ſtate alſo, taking care to keep the mixture in conſtant motion. When the precipitate is ſettled, the clear liquor is to be drained from it, after which it is to be repeatedly waſhed with hot water till it ceaſes to impart any taſte to the water. The precipitate obtained by this method is to be filtered, and afterwards dried by a gentle heat. This is the *hydrargyrus muriatus mitis* of the London Pharmacopœia, only they order four ounces of ſea-ſalt, inſtead of four ounces and a half.

"It might be ſuppoſed, that when the nitrous acid ceaſes to effervesce with the *mercury*, it is ſaturated with it: but this is far from being the caſe; the acid, when the heat is increaſed, being ſtill able to diſſolve a quantity of it; with this difference, however, that the *quickſilver* at the beginning of the proceſs is calcined by the acid, but afterwards is diſſolved by it in a metallic form. In proof of this we may obſerve, that not only more elaſtic vapour ariſes, but alſo, that by adding either fixed or volatile cauſtic alkali, we obtain a black precipitate; whereas, when the ſolution contains only calcined *quickſilver*, the precipitate becomes yellow by ſuch an addition. If this black precipitate is gently diſtilled, it riſes in the form of *quickſilver*, leaving a yellow powder, which is in fact that part of the *mercury* that in the beginning of the operation was calcined by the nitrous acid.

"The boiling of the ſolution for about a quarter of an hour is neceſſary, in order to keep the hydrargyrum nitratum in a diſſolved ſtate, it being much diſpoſed to cryſtallize. In general, ſome of the *mercury* remains undiſſolved; but it is always better to take too much than too little of it, becauſe the more metallic ſubſtance the ſolution contains, the more hydrargyrus muriatis mitis will be obtained.

"It is neceſſary to pour the *mercurial* ſolution into the ſolution of ſalt by little at a time, and cautiouſly, ſo that no part of the undiſſolved *quickſilver* may paſs along with it. Two ounces of common ſalt are ſufficient to precipitate all the *mercury*; but then it may eaſily happen that ſome ſuperfluous *mercurius* corroſivus attaches itſelf to this precipitate, which the water alone is incapable of ſeparating completely. This is undoubtedly the reaſon why *mercurius precipitatis albus* is always corroſive. I have found that common ſalt poſſeſſes the ſame quality as ſal ammoniac, viz. that of diſſolving a great quantity of *mercurius corroſivus*. I therefore employ four ounces and a half of common ſalt, in order to get the *mercurius corroſivus* entirely ſeparated.

"If we conſider the manner in which hydrargyrus muriatus mitis is obtained in the dry way, by ſublimation, we ſhall not find it difficult to give the rationale of this new proceſs.

"*Mercurius corroſivus albus* is a middle ſalt, conſiſting, as is well known, of marine acid combined with calx of *mercury*. This ſalt is capable of diſſolving a good deal of *quickſilver* in a metallic form; but for this purpoſe the moſt minute particles of each muſt be reciprocally mixed. This happens, when by means of heat they are both converted into vapour. The ſame thing occurs in the above mentioned proceſs. The ſolution firſt ſpoken of contains the calx *mercurii* and *quickſilver* divided into the moſt minute particles. If, to this ſolution, we add marine acid, or (to ſave the expence) common ſalt, the marine acid will unite with the calx of mercury, and the reſult of this union will be a true *mercurius corroſivus albus*; and as the ſolution contains *quickſilver* in its metallic ſtate, this will immediately attract as much of the *mercurius corroſivus* as is neceſſary to ſaturate it, and by this means a real *mercurius dulcis* will be procured, which, from its being inſoluble, will be immediately precipitated.

"The following facts are proofs that this precipitate

is

is a good *mercurius dulcis*: 1ſt, It is entirely taſteleſs. 2dly, I have ſublimed it, and examined what aſcended in the beginning, and which ought to have been corroſive, if the precipitate had contained any thing of the nature, it being well known that *mercurius corroſivus* aſcends ſooner than *mercurius dulcis*; whereas, through the whole of the ſublimation, what aroſe was a pure *mercurius dulcis*, exactly like that which is obtained in the common manner. 3dly, I have mixed this precipitate with one-fourth part of *quickſilver*, and ſublimed it, upon a ſuppoſition that if it contained too much *mercurius corroſivus*, it would be able to unite with more *quickſilver*; but ſo far was this from being the caſe, that the *quickſilver* was not diminiſhed in weight by the experiment. 4thly, It is known that cauſtic alkali and lime-water give *mercurius dulcis* a black colour; the ſame thing happened with mine. The black colour is no other than *quickſilver*, divided into very fine particles.

"That the proceſs I have been deſcribing, is more advantageous than that which is uſually adopted, I cannot doubt; becauſe, 1ſt, This *mercurius dulcis* can be prepared with leſs difficulty, with leſs expence, and without employing corroſive ſublimates. 2dly, As there can be no danger of its being in any degree corroſive, provided it be ſufficiently edulcorated, it may always be given with ſafety. 3dly, The operator is not expoſed to that noxious duſt, which in the old method ariſes during the trituration of the corroſive ſublimate with *quickſilver*. 4thly, This is much finer than the common *mercurius dulcis*, it being impoſſible to make the latter equal to it in this reſpect, however long it may be triturated."

Of all the preparations of *mercury*, calomel is the moſt frequently uſed; it is attenuant, gently ſtimulates the ſolids; and all the virtues attributed to the ſimple *mercury*, this preparation of it eminently poſſeſſes. The doſe is from gr. i. to ℈ i. according to the intention; but five or eight grains are rarely exceeded. In ſimilar caſes to thoſe in which the *mercurius corroſivus* is uſed, ſo is calomel; in doſes of half a grain to two grains once or twice a day, as an alterative; from three grains to ten, joined with moderate doſes of rhubarb, it is uſeful in worm caſes, hepatic, and other viſceral obſtructions. In venereal and glandular complaints, the following pills have proved an excellent remedy: ℞ Calomelanos pp. gr. i. ſulph. antimon. præc. gr. ij. opii gr. ¼. From three to five grains of calomel, joined with the ſame quantity of camphor; and half a grain of opium, adminiſtered in the early ſtage of pleuriſy, have been attended with great ſucceſs, and prevented the neceſſity of repeated bleeding; and, in the confluent ſmall pox, great has been the efficacy of this medicine, joined with bark. Rubbed upon the inſide of the lips, it has produced ſimilar effects to thoſe which it occaſioned by taking it internally, particularly in the lues venerea; beſides, in caſes of chancres, uſed by itſelf, or in the following form, it has been conſidered as poſſeſſing no ſmall degree of utility.

CERATUM CALOMELANOS. *Cerate with Calomel.*

℞ Cerati lapid. calamin. ℥ ſs. calomelanos pp. ʒ j. m. To ulcers this is a good application; but to thoſe of the venereal kind, when previouſly cleanſed by cauſtics, or other irritating remedies, particularly ſerviceable.

MERCURIUS DUPLICATUS PHILOSOPHICUS, See REBIS.

—— EMETICUS FLAVUS. The YELLOW MERCURIAL EMETIC, now called *hydrargyrus vitriolatus*, VITRIOLATED QUICKSILVER; alſo called *turpethum minerale*; TURBITH MINERAL. This is another preparation of *mercury*, which is given in the London Diſpenſatory.

Take of purified *quickſilver*, vitriolic acid, of each a pound; mix in a glaſs veſſel, and heat them by degrees, until they unite into a white maſs, which is to be perfectly dried with a ſtrong fire. This matter, on the affuſion of a large quantity of hot diſtilled water, immediately becomes yellow, and falls to powder. Rub the powder carefully with this water in a glaſs mortar; after the powder has ſubſided, pour off the water; and adding more diſtilled water ſeveral times, waſh the matter till it becomes inſipid. Pharm. Lond. 1788.

But to the direction given there, it may be added, that the beſt method of edulcorating it is by impregnating the water intended to be uſed in its ablution, with a determined proportion of fixed alkaline ſalt; for, by this means the waſhed turbith will not only turn out greater in quantity, but will be more equal in ſtrength.

The *yellow emetic mercury* is a powerful vomit; it, like other mercurials, will excite a ſalivation: in robuſt habits it hath been uſed in leprous diſorders and glandular obſtructions. As an emetic, it hath been given to eight or ten grains; but it is beſt if given in ſmaller quantities, from one to four grains, and joined with ipecacuanha. Half a grain, or a grain, given every or every other night, hath been productive of the beſt effects in the worſt degrees of the venereal diſeaſe, in obſtinate rheumatiſms, and ulcers that were difficult of cure. It is a powerful medicine, but yet does not appear to exceed the other leſs violent mercurials, except in particular inſtances; ſuch as where, from a peculiarity in the patient's conſtitution, it is particularly favoured in its effects.

MERCURIUS MORTIS. See MERCURIUS VITÆ.

—— PRÆCIPITATUS, RUBER, alſo called corroſivus, and *corolatum*, though now named HYDRARGYRUS NITRATUS RUBER. RED NITRATED QUICKSILVER. Pharm. Lond. 1788. RED PRECIPITATE. The London College directs to take of purified *quickſilver* and nitrous acid each a pound; muriatic acid, one dram by weight; mix in a glaſs veſſel, and diſſolve the *quickſilver* in a ſand-bath; then raiſe the fire, till the matter is formed into red cryſtals. Pharm. Lond. 1788

It may be obſerved, that the marine acid diſpoſes the mercurial calx to aſſume the bright ſparkling red appearance which is admired in it, and which, though no advantage as a medicine, is eſteemed a mark of its goodneſs and ſtrength. As ſoon as it hath acquired this colour, it ſhould be immediately removed from the fire, or it will ſoon loſe it again.

This preparation is ſometimes mixed with minium and vermilion, but then the bright colour is deſtroyed. If only minium is added, it may be detected from the ſweetiſh taſte it gives to vinegar, or by laying a little of the ſuſpected *corroſive mercury* on a very hot iron; for thus the *mercury* will paſs off in fumes, and the lead will be left behind.

The *red nitrated quickſilver* is only uſed externally as an eſcharotic; it cannot be given internally on account of its extraordinary activity; it deſtroys fungous fleſh; and if finely powdered and mixed with the unguentum reſinæ flavæ, it is an excellent digeſtive for foul ill-conditioned ulcers; it brings on a laudable digeſtion when a thin ſanies is diſcharged from them: from one to two ſcruples may be mixed with an ounce of the ointment.

CERATUM HYDRARGYRUS NITRATI. *Cerate of nitrated quickſilver.* ℞ Unguenti hydrarg. nitrati; cerati ſpermat. cet. āā ℥ ij. m. This is deſigned as an application to ſcrophulous and phagedenic ulcers.

—— PRÆCIPITATUS ALBUS. WHITE PRECIPITATE MERCURY now called CALX HYDRARGYRI ALBA. WHITE CALX OF QUICKSILVER. The London College directs the following method of preparing it: take of muriated *quickſilver*, ſal ammoniac, water of kali, each half a pound; diſſolve firſt the ſal ammoniac, afterwards the muriated *quickſilver* in diſtilled water, and add the water of kali; waſh the precipitated powder until it becomes inſipid. Phar. Lond. 1788.

Great care is required leſt more of the fixed alkali be added than is neceſſary, for then the *precipitate*, inſtead of being white, will be yellow. This preparation is almoſt conſtantly confined to external uſes. Half a dram or two ſcruples of it, added to an ounce of pomatum, is uſed as an elegant cure for the itch; the ſame quantity may be diſſolved in two ounces of a thick decoction of linſeed, as a liniment for curing chancres when ſituated on the glans penis, or on the inſide of the prepuce; a rag being dipped in it may be applied to the glans, and then the prepuce may be drawn over it.

This *precipitate* is adulterated with ſtarch, and with white lead. The firſt is diſcovered by its being gluey on being diſſolved in a ſmall quantity of water; the ſecond may be detected by putting a little into a crucible with one third of its weight of alkaline ſalt; make them red-hot, and continue until no fumes ariſe; then take in the reſiduum, and if it does not melt in water, it is bad.

—— PRÆCIPITATUS DULCIS. Ph. Lond. 1721. See HYDRARGYRUS MURIAT. MITIS.

—— PRECIPITATUS PER SE. See MERC. CALCIN.

—— SACCHARATUS. SUGARED MERCURY.

Take of pure *quickſilver* and brown ſugar-candy, of each half an ounce; of the oil of juniper, ſixteen drops; grind them well in a mortar, until the *quickſilver* diſappears. The deſign of this ſeems to be for the convenience of giving *mercury* in a draught.

See several other preparations under the article HYDRARGYRUS, in this Work; MERCURIUS, in the Dict. of Chem. Lewis's Mat. Med. Neumann's Chem. Works.

MERCURIUS VITÆ, also called *angelicus pulvis*, *mercurius mortis*, *Algarothi pulvis*. The MERCURY OF LIFE.

Take any quantity of the butter of antimony, dilute it plentifully with pure water, and thus the reguline part of the antimony will be precipitated in the state of a white powder, thus named.

After the precipitation of this powder, and duly washing it in several waters, it possesseth no degree of the marine acid; but is a calx of antimony, that is constantly of the same strength, and therefore preferable to the glass of antimony for making the emetic tartar with.

MERGEN. See CORALLIUM.

MERLUCIUS. See ASELLUS MAJOR and MINOR.

MERYOPHYLLON. See MILLEFOLIUM.

MEROCELE. See HERNIA FEMORALIS.

MERON. See FEMUR.

MESANG DE VACCA. See BEZOAR BOVINUS.

MESARÆON, μεσαραιον, from μεσος, *medius*, and αρτηρια, *belly*. See MESENTERIUM. Hence its arteries and veins are called *mesaraicæ* vessels.

MESARAICA, vel MESARAICA MAJOR VENA. The MESARAIC or MESENTERIC VEIN. It is the continuation of the vena portæ ventralis. See PORTÆ VENA. It bends towards the superior mesenteric artery, sends off two veins, then runs up over that artery, and accompanies it in those portions of the mesentery and mesocolon which belong to the small intestines, the cœcum and right portion of the colon; as it runs down it forms an arch obliquely, like that of the artery, which is also ramified on the convex and concave sides. It very much accompanies the mesenteric artery, and is branched out in somewhat the same manner.

MESARAICA MINOR VENA. See HÆMORRHOIDALIS INTERNA VENA.

MESENTERICÆ ARTERIÆ. The MESARIAC or MESENTERIC ARTERIES.

The upper *mesenteric artery*, called *colica*, seu *mesenterica superior*, rises very little below the cœliac. The aorta, a little above its division, gives off the inferior, or *colica sinistra* seu *mesenterica inferior*, to the left side upon the mesocolon, the lowest branch of which goes to the extremity of the anus, and forms the *hæmorrhoidal artery*. The upper branches anastomose with the superior *mesenteric*. These two are azygous. The upper *mesenteric* branch forms a large arch in its course from the right side to the left of the *mesentery*; and from its convex side there goes out many branches to the intestines, where they communicate by reciprocal arches, &c. The branches which go out from the concave side are but few; they spread themselves in the mesocolon, colon, &c.

—— GLANDULÆ. The MESENTERIC GLANDS. The lymphatic glands in the mesentery are larger in young than in old subjects; and, if not the proper seat of the evil, they are always affected in that disease.

MESENTERIUM. The MESENTERY, from μεσος, *middle*, and εντερον, *an intestine*. It is thus named from its being, as it were, in the middle of the *intestines*, called also *epichordis*; *mesaræon*. It is a duplicature of the peritonæum, connected by a cellular membrane, expanding and receiving the guts as in a sling. It begins loosely upon the loins, extending to all the *intestines* except the duodenum; but that part of it which belongs to the great guts is called *mesocolon*. It prevents the *intestines* from twisting, and keeps them in their proper places. It sustains the arteries, veins, lymphæducts, and nerves, in their passage to and from the *intestines*.

Many disorders are spoken of by different writers, as taking their rise from the *mesentery*; but Dr. Hunter says, that it is rarely diseased, and then its glands, which are sometimes disordered in children, are not affected so frequently as is suspected. Riverius, in his Prax. Med. lib. xiii. hath a chapter on obstructions in the glands of this membrane, in which he observes that the causes and cure are the same as when this disorder happens in the liver.

MESENTERITIS. Dr. Cullen makes it a species of PERITONITIS, which see; and calls it PERITONITIS MESENTERICA. See INFLAMMATIO MESENTERII.

MESERION. See LAUREOLA FŒMINA.

MESIRE. A disorder of the liver, mentioned by Avicenna, accompanied with a sense of heaviness, tumor, inflammation, pungent pain and blackness of the tongue.

MESOCOLON, from μεσος, *the middle*, and κωλον, *the colon*. See MESENTERIUM.

MESOGASTRION. It is the substance on the concave part of the stomach, between the orifices, which attaches it to the adjacent parts. See OMENTUM.

MESOGLOSSI. See GENIOGLOSSI.

MESOMERIA. So Ruffus Ephesius calls all that part of the body which lies betwixt the thighs.

MESOMPALION, from μεσος, *middle*, and ομφαλος, *navel*. The middle of the navel.

MESOPHYRON. So Ruffus Ephesius calls that part of the face which lies betwixt the eye-brows.

MESOPLEURIOI. See INTERCOSTALES.

MESO-RECTUM. It is a production of the peritonæum, which invests the intestinum rectum. About the middle of the fore-side of this intestine it forms a semicircular fold, which appears when the intestine is empty, but is lost when it is full.

MESOTHENAR. It is a flat and near a triangular muscle, lying between the first phalanx of the thumb and the bottom of the palm of the hand; it is inserted into the ligament which connects the os magnum of the carpus to that which supports the thumb, and it is inserted too into that bone of the metacarpus which supports the middle finger, as well as to that which answers to the index; from thence, the fibres contracting to an angle, form a tendon, which is inserted into the head of the first phalanx of the thumb. See Winslow's Anatomy.

MESPILUS. The MEDLAR. The common *medlar* is a tree about the size of an apple-tree; the leaves are strong and sharp-pointed; its flowers appear in May, and the fruit ripen in September. In Germany these trees are found in the woods, but with us they are only in gardens. The fruit hath an austere astringent taste, and cannot be eaten before long keeping; the fruit is cooling and astringent, especially before they are ripe, and are useful in all kinds of fluxes; though eaten too freely they are apt to create the colic.

—— MESPILUS Apii folio, &c. See SPINA ALBA.

METACARPIUS. A small fleshy muscle, situated obliquely between the large internal angular or transverse ligament of the carpus, and the whole inside of the fourth metacarpal bone. It is fixed by a tendon to the os orbiculare, and to the neighbouring part of the large ligament of the carpus, and at its other end in the outer edge of the fourth metacarpal bone.

METACARPION, } from μετα, *after*, and καρπος,
METACARPUS, } *the wrist*. It is that part of the hand which is situated between the wrist and the fingers. The ancients called the carpus by the name of *brachiale*, and the *metacarpus* they called *post-brachiale*. The *metacarpus* on its inside forms the palm of the hand, and on its outside the back of the hand. The first phalanx of the thumb is not, as formerly, thought a part of the *metacarpus*. The first metacarpal bone supports the fore-finger, the fourth or last, the little finger.

METACINEMA. A removal of the pupil of the eye from its proper situation.

METACONDYLI, from μετα, *after*, and κονδυλος, *a knuckle*, the last joints of the fingers next the nails.

METALLA. METALS, or METALLIC SUBSTANCES. The very great weight, and that opake shining appearance, called metallic splendour or brilliancy, distinguish these from all other bodies in nature. Very few substances have half the specific gravity of the lightest among the metals. They are all fusible, though with different degrees of heat, and if the fusion be made in close vessels, they fix again by cold, without having suffered any change except that of external appearance, assuming the form of the containing vessel. Some of them are malleable, and capable of being considerably extended by the hammer. Those which possess this property are called ENTIRE METALS, or METALS, in contradistinction to such as are more BRITTLE, and are called SEMIMETALS.

Metallic substances are also called PERFECT, or IMPERFECT. The FIRST are such as undergo no lasting change by any heat which can be applied to them, at least in common furnaces. The SECOND, when exposed to a strong heat, with the access of vital air, are changed by a process similar to burning, and in some of them with an actual flame into a brittle dull substance called calx, the whole of which is heavier than the metal from whence it came, though its specific gravity is not so great; some are even converted into acids. If the calx of a metal be exposed to a strong heat in a closed vessel, with

with ſome inflammable matter, it recovers its metallic ſtate. This is called REDUCTION, or reviving of the metal.

All metals are imperfect, except *gold*, *ſilver*, and *platina*. The IMPERFECT metals are, *mercury*, *lead*, *copper*, *iron*, *tin*; and the SEMIMETALS, *biſmuth*, *nickel*, *arſenic*, *cobalt*, *zinc*, *antimony*, *maganeſe*, *wolfram*, *molybdæna*, and *uranite*.—the names *arſenic*, *antimony*, *maganeſe*, *wolfram*, and *molybdæna*, being uſed to denote the mineral ſubſtance from which the ſemimetals are obtained: the ſemimetals themſelves are diſtinguiſhed by the names of REGULUS, as *regulus of arſenic*, &c. though moderns often uſe the ſimple term to denote the ſemimetal itſelf alone. In due degrees of cold, quickſilver becoming malleable, ranks it among the metals. In point of gravity, the firſt is gold, then platina, mercury, lead, ſilver, copper, iron, and tin.

Sulphur is the bond of union in all *metals*. *Metals* are bituminous ſubſtances which have undergone a long digeſtion; for by depriving them of their ſulphur they are reduced to aſhes, and then to glaſs; and by reſtoring the ſulphur, this glaſs is converted into *metal* again. Ores are the compoſitions in which *metals* are found, or the beds in which they are produced: *metals* and minerals moſtly abound with ſulphur and arſenic, which are ſeparated in the ſmelting furnace, and the body does not become truly metallic until they are ſeparated; and ſulphur and arſenic added to *metals* bring them to ores again.

All the *metals* diſſolve in acids, ſome in one and ſome in another; and in moſt of theſe ſolutions the inflammable principle of the *metals* is abſorbed or expelled. Gold, ſilver, and mercury, ſuffer no reſolution or diſſipation of their parts from any known power; if changed into the appearance of calx, they are recoverable without any loſs.

Such are antimony, calamine ſtone, blood-ſtone, &c. See Dict. of Chem. Neumann's Chem. Works. Boyle on the Growth of Metals. Nicholſon's, Lavoiſiers, Chaptal's, and Fourcroy's Principles and Elements of Chemiſtry.

METALLORUM MERCURIUS. See PHILOSOPHORUM MERCURIUS.

METALLUM FLUIDUM. See ARGENT VIV.

METALLURGIA. METALLURGY. It is that part of chemiſtry which is concerned in the ſeparation, depuration, and preparation of metals. Sometimes it implies the digging them out of the mines.

METAPEDIUM. See METATARSUS.

METAPHRENON. See DORSUM.

METASTASIS, from μεταϊστημι, *to tranſfer*. It ſignifies a tranſlation and ſettlement of ſome humour or diſeaſe from one part to another. It makes its way through the cellular membrane. It is alſo called *diadexis*, and *diadoche*.

METASYNCRISIS, from μετα, importing *change*, and συγγνω, *to collect*, or *mix together*. The word is applied differently by different authors; but they all mean a change in the part to which the word is applied. Aſclepiades thought every thing was formed by a concourſe of atoms, for which reaſon he called all bodies *ſyncrimata* or *ſyncriſeis*, mixtures; and alterations in the congeries of atoms he calls metaſyncrineſthai.

METATARSIUS. A fleſhy maſs lying under the ſole of the foot; it is fixed by one end in the fore part of the great tuberoſity of the os calcis, and running forward from thence it terminates in a kind of ſhort tendon, which is fixed in the tuberoſity and poſterior part of the lower ſide of the fifth bone of the metatarſus. It moves the laſt bone of the metatarſus, and draws the fourth bone along with it, and contracts the ſole of the foot, increaſing the convexity of the upper ſide.

METATARSUS, from μετα, *after*, and ταρσος, *the tarſus*. It is compoſed of five bones, but theſe bones and the bones of the toes being ſo ſimilar to the metacarpus and fingers, need no farther deſcription. The *metatarſus* is alſo called *planta*, *planum*, *veſtigium*, *ſolium*, *metapedium*, *pectus*, *præcordium*, and *pectuſculum*.

METEORISMUS. See TYMPANITES.

METEOROS, from μετα, and αειρω, *to elevate*. Elevated, ſuſpended, erect, ſublime, tumid. Galen expounds pains of this ſort as being thoſe that affect the peritonæum, or other more ſuperficial parts of the body; theſe are oppoſed to more deep-ſeated ones.

METHEMERINOS. See QUOTIDIANA FEBRIS.

METOPION, } An oil, or an ointment deſcribed by
METOPIUM. } Dioſcorides; it is thus named, becauſe it hath galbanum in it; galbanum was the produce of a plant called *metopium*. *Metopium* is alſo a name of the oil of bitter almonds. See AMYGDALÆ.

METOPON or METOPUM, from μετα, *poſt*, and ωψ, *oculus*. See FRONTIS OS.

METOSIS. A kind of amauroſis, from an exceſs of ſhort-ſightedneſs.

METRA. See UTERUS.

METRENCHYTA, from μητρα, *the uterus*, and εγχεω, *to infuſe* or *pour into*. INJECTIONS for the UTERUS.

METRENCHYTES. A WOMB SYRINGE.

METRITIS. See INFLAMMATIO UTERI.

METROCELIDES, from μητρα, *a mother*, and κηλις, *a ſpot* or *mole*. See NÆVUS.

METROPROPTOSIS, from μητρα, *the womb*, and πρωτιπτω, *to fall down*. See PROCIDENTIA UTERI.

METRORRHAGIA. See MENORRHAGIA.

MEU, } from μειων, *leſs*, becauſe of the extreme
MEUM, } tenderneſs of the leaves. SPIGNEL, BAUDMONEY, or BAULD-MONEY. ÆTHUSA MEUM, Linn. Alſo called *fœniculum aſpinum*. It is a perennial plant, whoſe leaves are capillaceous and much ſmaller than thoſe of fennel, but its ſeeds are bigger and broader than the ſeeds of fennel. The root is of the ſame nature as that of fennel or lovage, but ſmells more agreeably, and taſtes warmer and ſweeter. The plant hath an aromatic pungency, borders on the fetid, and abounds with volatile ſalt. It is more pungent than fennel, and milder than lovage.

MEUM ALPHINUM GERMANICUM. GERMAN or MOUNTAIN SPIGNEL. It is alſo called *mutellina* and *phellandryum*. It poſſeſſes virtues ſimilar to thoſe of the common ſort.

—— LATIFOLIUM ADULTERINUM, called alſo *ſeſeli perenne folio glauco brevieri*, *fœniculum ſylveſtre*, *ferula folio breviori*, *ſaxifraga montana minor*, &c. BASTARD SPIGNEL. Boerhaave makes this a ſpecies of ſeſeli. It grows on dry hills, and flowers in June. The root is of a drying burning quality.

MEXICANUM BALS. See PERUV. BALS.

MEXICANAVA. See BOTRYS MEXICANA.

MEZEREUM, } See LAUREOLA FŒMINA.
MEZERION. }

MIASMA. MIASMATA, as they relate to diſeaſes, are productive of ſome of the febrile kinds, and of them only, which are alſo produced by contagion. They are generally floating in the atmoſphere when they are injurious to mankind; but they are not obſerved to act but when they are near the ſources from whence they ariſe; that is, near to the bodies of men from which they immediately iſſue, or near to ſome ſubſtances, which, as having been near to the bodies of men, are imbued with their effluvia, and in which ſubſtances theſe effluvia are ſometimes retained in an active ſtate for a very long time. But the notion of contagion properly implies a matter ariſing from the body of man under diſeaſe; and that of *miaſma*, a matter ariſing from other ſubſtances.

Dr. Cullen remarks, that the ſubſtances imbued with the effluvia from the bodies of diſeaſed men, may be called fomites; and that it is probable that contagions, as they ariſe from fomites, are more powerful than as they ariſe immediately from the human body. Further, that though the fomites are poſſeſſed of matter from the human body, yet this matter paſſing from the fomites is called *miaſma*; which requires further to be diſtinguiſhed from the *miaſmata* ariſing from marſhes, &c. by the epithets human and marſh *miaſmata*.

On this ſubject of contagion and *miaſma*, Dr. Cullen obſerves as follows. As fevers are ſo generally epidemic, it is probable that ſome matter floating in the atmoſphere, and applied to the bodies of men, ought to be conſidered as the remote cauſe of fevers. Contagions have been ſuppoſed to be of great variety; and it is poſſible that they may be ſo; but that they truly are, does not appear clearly from any thing that we know at preſent. The number of genera and ſpecies of contagious diſeaſes, of the claſs pyrexiæ, at preſent known, is not very great. They belong to the order of fevers, of exanthemata, or of profluvia. Whether there be any belonging to the order of phlegmaſiæ, is doubtful; and, though it ſhould be ſuppoſed, it will not much increaſe the number of contagious pyrexiæ. Of the contagious exanthemata and profluvia, the number of ſpecies is nearly aſcertained; and each of them is ſo far of a determined nature, that

though

though they have now been obſerved and diſtinguiſhed for many ages, and in many different parts of the earth, they have been always found to retain the ſame general character, and to differ only in circumſtances, which may be imputed to ſeaſon, climate, and other external cauſes, or to the peculiar conſtitution of the ſeveral perſons affected. It is, therefore, probable, that, in each of theſe ſpecies, the contagion is of one ſpecific nature, and that the number of the contagious exanthemata, or profluvia, is hardly greater than the number of ſpecies taken notice of in our ſyſtem of noſology. While the contagious exanthemata and profluvia are thus limited, it is probable that the contagions which produce the continued fevers are not many; nay, it is not evident, that there are more than one common ſource of them. It is well known that the effluvia conſtantly ariſing from the living human body, if long retained in the ſame place, without being diffuſed in the atmoſphere, acquire a ſingular virulence, and, in that ſtate, applied to the bodies of men, become the cauſe of a fever which is very contagious. The late obſervations on jail and hoſpital fevers have fully proved the exiſtence of ſuch a cauſe; and it is ſufficiently obvious, that the ſame virulent matter may be produced in many other places. At the ſame time, the nature of the fevers ariſing, render it probable that the virulent ſtate of human effluvia is the common cauſe of ſuch fevers, as they differ only in a ſtate of their ſymptoms, which may be imputed to the circumſtances of ſeaſon, climate, &c. concurring with the contagion, and modifying its force.

Miaſmata ariſe from various ſources, and are of different kinds; but we know little of their variety or of their ſeveral effects. We know with certainty only one ſpecies of *miaſma*, which can be conſidered as the cauſe of fever; and from the univerſality of this, it may be doubted if there be any other. The *miaſma*, ſo univerſally the cauſe of fever, is that which ariſes from marſhes or moiſt ground, acted upon by heat. So many obſervations have now been made with reſpect to this, in ſo many different regions of the earth, that there is neither any doubt of its being in general cauſe of fevers, nor of its being very univerſally the cauſe of intermittent fevers in all their different forms. The ſimilarity of the climate, ſeaſon, and ſoil, in which intermittents ariſe, and the ſimilarity of the diſeaſes, ariſing in different regions, concur in proving that there is one common cauſe of theſe diſeaſes, and that this is the marſh *miaſma*. What is the particular nature of this *miaſma*, we know not; nor do we certainly know whether or not it differs in kind: but it is probable that it does not, and that it differs only in the degree of its power, or perhaps in its quality, in a given ſpace.

It remains moſt probable, that the remote cauſes of fevers are chiefly contagions or *miaſmata*, and neither of them of great variety. *Miaſmata* are ſuppoſed to cauſe intermittents, and contagions to cauſe continued fevers, ſtrictly ſo named. It may further be added, that both contagion and *miaſmata* are of a debilitating or ſedative quality. They ariſe from a putreſcent matter. Their production is favoured, and their power increaſed, by circumſtances which favour putrefaction; and they often prove putrefactive ferments with reſpect to the animal fluid. Though fevers generally ariſe from marſh or human effluvia, other remote cauſes of fevers, which have been commonly ſuppoſed, cannot with any certainty be excluded. See Cullen's Firſt Lines, vol. i.—and CONTAGIO.

MICA THURIS. See OLIBANUM.

—— PANIS. The ſoft part or crumbs of bread, of which the mildeſt kind of cataplaſms uſed to be made, by boiling in milk to a proper conſiſtence. But now practioners merely ſoak ſlices of new bread in water until they ſwell, and become perfectly ſoft; then preſs out the ſuperfluous water, and beat the bread up with a ſpoon, and ſtir into it a ſmall quantity of linſeed-meal. By this means it becomes a neater and much cleaner application, and retains its moiſture much longer.

MICRO-LEUCO-NYMPHÆA, alſo called *nymphæa, morſus ranæ, ſtratiotes* FROG-BIT. It grows in muddy waters, and flowers in July. It is not much uſed, but is ſaid to agree in virtues with the leuco-nymphæa,

MICRO-NYMPHÆA. It is leſs than the nymphæa; it grows in ditches, and is ſaid to poſſeſs the ſame virtues with the nymphæa.

MICROS. See DIGITUS.

MIGRANA. See CEPHALALGIA.

MILIARES GLANDULÆ. See SEBACEÆ GLANDULÆ.

MILIARIA, vel MILIARIS FEBRIS. The MILIARY FEVER, called by the Germans *Frieſel*. Dr. Cullen places this genus of diſeaſe in the CLASS PYREXIÆ, and ORDER EXANTHEMATA, which he defines "a ſynochus attended with reſtleſſneſs, frequent ſighing, a fetid ſweat, and prickling of the ſkin; red, ſmall, diſtinct ſpots, on ſome day or other of the diſeaſe, break out copiouſly over the whole ſkin, except the face, whoſe tops diſcover, after a day or two, very ſmall white puſtules, continuing but a ſhort time." This fever, though Dr. Cullen, as well as ſome others, do not think idiopathic, but ſymptomatic; becauſe to him it never appeared to be contagious or epidemic, though more riſe at ſome times than others; he acknowledges, though it ſometime, attends febrile affections, as well as thoſe of an inflammatory as a putrid nature; yet it does not occur in any unleſs a hot regimen and ſweat had preceded. See Synopſis Noſolog. Method. vol. ii. p. 144.

It is called *miliary* from the ſmall puſtules or veſicles which appear in the ſkin, principally on the upper parts of the body, and in ſome meaſure reſemble a *millet-ſeed*. At firſt theſe puſtules are ſmall veſicles, full of a limpid and afterwards of a whitiſh and almoſt pearl-coloured ſerum; ſometimes they are reddiſh, or red and white ones mixed. Many writers term the diſeaſe, when the puſtules are white, *purpura alba*, and when they are red, *purpura rubra*.

It is generally ſuppoſed to be a child-bed diſeaſe; but except the woman is kept too hot and in a ſweating ſtate too long, it rarely happens at this time; and when it does, it is produced by cauſes which would have been followed by the ſame effect, had the patient not been a child-bed woman.

This diſorder is denominated ſimple when none but *miliary* puſtules are accompanied with red ones, which, when appearing alone, are called a RASH.

The CAUSES are generally ſaid to be *an exceſſive ſeroſity and an acid acrimony in the blood, with a preternatural commotion of the ſpirits. Theſe cauſes ſeem evident from the large quantities of pale-coloured urine uſually diſcharged in theſe fevers, the plentiful flux of ſaliva, the almoſt total abſence of thirſt, the uſefulneſs of abſorbents, the injury received from acids in many inſtances of the diſorder, the moderate degree of heat, &c.*

Sometimes a degree of bilious acrimony attends this diſorder. Great diſturbance in the mind, eſpecially from the depreſſing paſſions, brings on this diſorder, where there is the leaſt tendency to it already in the conſtitution.

It is preceded by a weakly habit of body, a ſerous ſtate of the blood, a weakneſs in the mind, which diſpoſes it to be ruffled by external impreſſions, cloſe thinking, ſome tedious and painful diſorder, a ſour ſmell in the ſweat, an internal heat, with a dull ſenſe of thirſt; and if the patient is a woman at or near the time of bringing forth a child, ſhe complains of a great oppreſſion in her breaſts, and is often ſighing. The fever approaches with pains reſembling the colic, or the gravel, or the rheumatiſm, and ſometimes like thoſe of labour; after a few days the pains abate, an alternate cold and heat is felt all over the body, the palms of the hand are very hot, but the heat elſewhere is far leſs in proportion; the pulſe is frequent but weak, the ſpirits are uſually much ſunk, the breaſt ſeems as if oppreſſed with a great weight, frequent and deep ſighs occur, and, as an *inſeparable companion, the patient's ſleep is ſuddenly interrupted at the firſt onſet of the complaint*, and *ſhe continues without ſleep during whole days and nights*, and *at the ſame time is neither ſeized with pain in the head, nor a delirium*; a whitiſh cruſt ſometimes appears on the tongue, at others its appearance is like that of a perſon in health; the urine is thin and pale, though ſometimes it is nearly as in health; ſometimes a pain is complained of in the ſtomach after ſleep; a tremor often accompanies this fever; and in the worſt degrees, and laſt ſtages of the diſorder, delirium, convulſions, difficultly of breathing, &c. come on. *The exacerbations in theſe fevers recur like the paroxyſms of an intermittent. The oppreſſion in the breaſt, which is productive of ſighs, the uncommon ſinking of the ſpirits without any evident cauſe, watchings, and the tumultuous agitation of ſpirits, commonly called a hurry of the head, when the patient endeavours to compoſe himſelf to reſt, as alſo the frequent and weak pulſe, may be conſidered as pathognomonic ſigns of the*

miliary

miliary puſtules being about to appear, and they continue until the puſtules become prominent, after which they moſtly diſappear. For the moſt part the puſtules are only on the neck, breaſt, and interſtices of the fingers, though ſometimes they are alſo found all over the body, and after increaſing to their full ſize they gradually diſappear, the cuticle remaining rough on thoſe parts where they were ſeated. In the compound ſort theſe puſtules itch more orleſs.

It ſometimes happens that this fever begins with ſymptoms ſo mild that it is neglected, and thus becomes very dangerous before help is demanded; the time of the puſtules appearing is not eaſily to be determined; they ſometimes are obſerved on the third day, and ſo on to the fourteenth.

In the decline of the diſorder, the upper parts of the hands are often moiſt with a cold ſweat; and after the eruptions are abated, a ſwelling of the feet, legs, and thighs comes on, a tumor or abſceſs in the breaſt, a defect in the memory, an immoderate diſcharge of urine, and if the patient is a child-bed woman, the lochia become exceſſive, hyſteric ſymptoms, an internal heat, languor, and loſs of appetite follow; and when theſe happen, a fatal hectic is not rare.

The puſtules are moſt numerous where the ſweat is moſt copious; they are about the ſize of millet or poppy ſeeds, at firſt are filled with a pellucid ſerum, and ſometimes they have a diſagreeable ſmell; but, happen when they will, they do not appear to be critical; from a pellucid fluid the contents of the puſtules change to a pearl, or a pale yellow colour.

When reddiſh puſtules appear without a fever, they are chronical, and appear at ſtated ſeaſons; but the white ones rarely appear without a fever. The red ſort itch the moſt.

The different ſtates and kinds of the *miliary* fever ſhould be diſtinguiſhed from the ſynochus, the nervous fever, and the catarrhal fever.

In the beginning, though the ſymptoms were mild, if heating medicines, or an heating regimen were uſed, and a diaphoreſis not brought on, the diſorder will be dangerous. If from the beginning of the fever any particular part is affected with pain;—if the patient is hot without any ſenſe of pain;—if he labours under a ſickneſs of the ſtomach;—and if theſe ſymptoms are ſucceeded by alternate heats and colds recurring at unequal intervals, a defect of the ſpirits, an oppreſſion of the breaſt, accompanied with ſighs, and uneaſy reſpiration, and, at laſt, if the puſtules make their eruption with a gentle and continual diaphoreſis, the patient is, for the moſt part, in a hopeful condition.—If a delirium, convulſions, &c. appear in the beginning, they may more eaſily be removed by proper care and medicines; but in the progreſs or decline of the diſorder their preſence is much to be dreaded.—If a diarrhœa comes on, and is ſuddenly checked, whether this happens ſpontaneouſly, or by art, it endangers an apoplexy. The urine changing ſuddenly from a yellow to a pale colour is a threatening ſymptom. In child-bed women a diarrhœa is a very dangerous ſymptom. Much ſleepineſs is a favourable ſymptom: red puſtules are leſs dangerous than white ones. When puſtules appear and vaniſh by turns, much danger is threatened.

THE PRINCIPAL INTENTIONS OF CURE ARE, 1. *To correct the peculiar acrimony.* 2. *To relax the ſtrictures occaſioned by the acrimony.* 3. *To evacuate the offending matter by the ſkin*; and, 4. *To prevent the return of that which is already excreted through it.*

According to the patient's ſtrength let him continue in bed, or be raiſed a few hours in the day. The linen and bed cloaths may be changed as oft as the nauſeous ſweating may require.

Freſh air may be admitted into the room as much as is agreeable to the ſenſations of the patient. The bed-cloaths ſhould not be more numerous than when in health.

The patient's conſtant drink may be Seltzer water, a decoction of ſarſaparilla, or other ſuch like liquors, which ſhould be always given warm.

Medicines of the cordial and perſpirative kind are proper, but avoid all heating ones.

In the red kind, a little nitre may be added to the medicines, if the heat is conſiderable, or rather the ſp. ætheris nitroſi; ſpt. feb. D. Clutton.

The bowels ſhould be kept eaſy, and as near to a natural ſtate as may be.

Very frequently this fever tends much to that of the nervous kind, in which caſe a ſimilar treatment with what is there recommended will be proper; (ſee NERVOSA FEBRIS) but if a putrid diſpoſition manifeſts itſelf, the dulcified mineral acids, with cordials and the bark, will be required.

When the eruptions appear and retire, camphor will be an important addition to whatever other medicines the ſtate of the caſe may require.

Sometimes in the beginning of the diſorder, the nature of the caſe is miſtaken; and from miſtaken management, the morbid matter, inſtead of paſſing through the ſkin, is determined to ſome other part, and there produces ſymptoms which are various as are the parts affected; in the ſtomach a vomiting, in the bowels a purging is excited, &c. but when under theſe circumſtances, the complaint is diſcovered to be a *miliary* fever, gentle continued diaphoretics alone will be the propereſt remedies, and opiates, as well as aſtringents, ſhould be admitted.

Bleeding can very rarely, if ever, be admitted in this diſeaſe; for thoſe inflammatory ſymptoms, which require this operation, rarely if ever attend.

Bliſters ſhould hardly ever be omitted; they are beſt applied one after another, that is, a freſh one ſhould be applied as ſoon as the former one begins to ceaſe from diſcharging; and, except ſome violent ſymptoms require, more than one at once is not convenient. It may be obſerved, that when a bliſter begins to dry, the ſymptoms become worſe, but are relieved by the operation of the next; hence the propriety of ſucceeding one by one. Apply the bliſters on the moſt ſenſible parts, as on the inſide of the legs and thighs; though if inflammation, or any other ſymptom in any particular part, ſhould require it, a bliſter may be uſefully applied there.

As to diaphoretics, the cool ones, joined with ſuch cordials as in the judgment of the preſcriber may be indicated, will be the beſt.

All the variety of ſymptoms attendant on *miliary fevers*, taken collectively, are to be removed by the ſame medicines which would be proper if they each appeared ſeparately; and a gentle diaphoreſis is the proper remedy.

If convulſions come on from a tranſlation of the morbific matter, let a clyſter be given, and afterwards the patient ſhould ſwallow repeated doſes of volatile ſpirits in what he drinks. By the ſame means, aſthmatic ſymptoms are removed if they appear.

A vomiting and diarrhœa are mitigated by the ſaline draughts, with ſaffron and crabs' eyes.

See Hoffman, Mead, and ſir David Hamilton's Treatiſe on the *Miliary* Fever. Cullen's Firſt Lines, edit. 4. vol. ii.

MILIARIS NAUTICA. A kind of typhus, called by Huxham *febris nautica peſtilentialis.*

—— PURPURATA. It is a kind of typhus.

MILIARIUM. See ALEMBICUS.

MILIOLUM. A ſmall tumor in the eye-lids, of the ſize of a millet ſeed.

MILITARIS AIZOIDES. See ALOIDES,

—— HERBA. See MILLEFOLIUM.

MILIUM, from *mille*, a *thouſand*, becauſe of its numerous ſeeds. MILLET, called alſo *cenchros*. It hath large, broad, graſs-like, ſomewhat hairy leaves; they encompaſs the ſtalk, which grows to be three or four feet high, bearing on the top a large panicle, hanging down the head, compoſed of many ſlender ſtalks, with many ſmall glumes growing on them, including ſmall, white, hard, ſhining grain. It grows plentifully in Poland, &c. It is ſown in April, and reaped in Auguſt or September, and is uſed as food. It is nutritious and very eaſily digeſted. See Raii Hiſt.

MILIUM INDICUM. Called alſo *ſorgo, ſorghum, melica, Holcus.* INDIAN MILLET. It is ſown in Spain, Italy, and other warm countries. This ſpecies binds the belly very much. In Turkey they feed their hogs and poultry with it.

—— ARUNDINACEUM. The *lachryma Jobi*; and—*Solis*, the *litho ſpermum.*

MILLEFOLIUM, alſo called *ſtratiotes*; *lentibularia*; *Achillea, ſupercilium veneris, lumbus veneris, myriophyllon, chiliophillon, militaris herba.* COMMON YARROW MILLFOIL. It is called *millefolium*, from its numerous leaves; and Achillea, becauſe Achilles firſt diſcovered its efficacy in curing wounds; and ſtratiotes, from στρατος, *an army*, on account of its uſefulneſs in healing wounds. It is the ACHILLEA MILLEFOLIUM, vel ACHILLEA *foliis bipennatis nudis: laciniis linearibus dentatis, caulibus ſulcatis*; CLASS, SYNGENESIA; ORD. POLYGAMIA SUPERFLUA; LINN. Gen. Plant. 971.

It is a plant with rough ſtiff leaves, divided into ſmall ſegments, ſet in pairs, along a middle rib, like feathers; the little flowers ſtand thick together in the form of an umbel on the top of the ſtiff ſtalk, and conſiſt each of ſeveral whitiſh, or pale purpliſh petala, ſet round a kind of looſe diſk of the ſame colour, followed by ſmall crooked ſeeds. It is perennial, grows plentifully on the ſides of fields, and on ſandy commons, and it flowers almoſt all the ſummer.

The leaves and flowers are mild corroborants, and antiſpaſmodics; their ſenſible qualities promiſe conſiderable activity; they have a weak but agreeable aromatic ſmell, a bitteriſh, roughiſh, pungent taſte; the leaves are moſt bitter, the flowers have moſt ſmell, and the young roots a glowing warm taſte like that of contrayerva, but they loſe much of their ſmell in drying. By the Greek phyſicians this plant was eſteemed an excellent vulnerary and ſtyptic, and was generally employed internally as an aſtringent in all hæmorrhages. Stahl and Hoffman uſed it in ſpittings of blood, bleeding of the noſe, too copious flux of the menſes, and bleeding piles: and recommended it alſo in various other complaints, the firſt of whom conſidered it not only as an aſtringent, but a powerful tonic, antiſpaſmodic, and ſedative. However, this plant we believe now almoſt wholly neglected in practice: but when uſed, the leaves and flowers are only appropriated to medicinal purpoſes.

Both water and ſpirit take up the virtue of the leaves and flowers; but water extracts the aſtringency, and ſpirit the aromatic, in the greateſt degree. If the flowers are diſtilled with water, they yield an eſſential oil; and if the plant was gathered from a rich ſoil, the oil will appear of a blue colour; if from poor ground, it will be green.

A ſtrong decoction of the root and leaves hath cured a dyſentery. See Raii Hiſt. Lewis's Mat. Med.

MILLE-FOLIUM AQUATICUM. See MYROPHYLLON.

MILLEGRANA MAJOR. See HERNIARIA.

MILLEMORBIA. See SCORPHULARIA MAJOR.

MILLEPEDES. See ASELLI.

MILPHOSIS. A Greek primitive. A BALDNESS of the EYE-BROWS: alſo an increaſe of the fleſh in the corners of the eyes.

MILZADELLA. See LAMIUM MACULATUM.

MIMOSA NILOTICA, ſeu, ÆGYPTIACA. See ACACIA.

—— JAPONICA CATECHU. See TERRA JAPONICA.

MINÆA. See ANIME.

MINERALES ARTIFICIALES AQUÆ. ARTIFICIAL MINERAL WATERS.

Waters which are made to imitate thoſe of natural ſprings impregnated with different mineral ſubſtances. Several chemiſts have ſucceeded in their attempts, by firſt being well acquainted with the nature, and proportion of the different materials of which any mineral water conſiſts, and adding ſimilar ingredients to pure water.

MINERALIA. MINERALS. In the *mineral* kingdom are found, 1. An oil called petroleum; this differs in conſiſtence, &c. and thence receives different names. 2. Earths: theſe are of different kinds, and include all the ſtones, they being only indurated earths. 3. Metals. And, 4. The acids known by the name of *mineral* acids.

MINIMUS DIGITUS. See DIGITUS.

MINIUM. See PLUMBUM.

MINIUM GRÆCORUM and PURUM. See CINNABARIS.

MINUTA. An epithet for a violent fever, accompanied with a ſyncope, which is ſaid to reduce the patient ſo, that he cannot ſupport it more than four days.

MIRABILIS AQUA. See PIPER JAMAICENSE.

—— PERUVIANA. See JALAPA.

MIRACULUM CHEMICUM. See MAGNESIA ALBA.

MIRI. See CEBIPIRA BRASILIENSIBUS.

MISERERE MEI. See ILIACA PASSIO.

MISTURA. A MIXTURE. It differs from juleps in not being tranſparent, having ſome powder, or other ſubſtance, diſſolved or mixed with it, as a part of the whole. See JULAPIUM.

MITELLA. A ſcarf for ſuſpending the arm. IN BOTANY it is the name of ſome plants, of which Boerhaave enumerates four ſpecies.

MITHRIDATUM. See CONFECTIO DAMOCRATIS.

MITRALIS VALVULA. See COR.

MIVA CYDONIORUM. MARMELADE of QUINCES. See CYDONIA.

MIXTIO. MIXTION. Stahl uſed this expreſſion to ſignify the union of the firſt principles in the moſt ſimple compounds. In the Engliſh language, thoſe principles of bodies are emphatically called *a mixt*, which are ſo intimately united to each other, as hardly to manifeſt themſelves on the ſevereſt trials (as in caſe of alkaline ſalt in glaſs, acid in flint, ſulphur or mercury in metals, &c.) to diſtinguiſh them from *aggregates* or *compounds*, where the texture is looſe, and the parts more eaſily ſeparated.

MOCHLIA, from μοχλος, *a lever*. A reduction of the bones from an unnatural to a natural ſituation.

MOCHLICA. Violent purges.

MODERNI. MODERNS. The revival of learning in Europe was cauſed by the deſtruction of the Greek empire at the taking of Conſtantinople, by Mahomet the Great; for on that occaſion, many learned Greeks retired from that city, and brought with them the ſciences into Italy. The day, therefore, on which Conſtantinople was taken, may be called the birth-day of learning, with reſpect to the weſtern parts of Europe, and this was on the 27th of May, 1453. All before this are ancients, all ſince are *moderns*.

MODIOLUS, from *modus*, *a meaſure*, being contrived to enter only to a certain depth. The crown or ſaw of the trepan; or a circular trepan reſembling in ſhape the nave of a wheel, which is its true ſignification. See TREPHINE.

MODIRA. See COLUBRINUM.

MOGILALIA, from μογις, *difficulty*, and λαλεω, *to ſpeak*, a difficulty of ſpeech. It is the pſelliſmus acheilos of Dr. Cullen. See ANCYLOGLOSSUM.

MOKEL. See BDELLIUM.

MOLA. A name for the *patella*, KNEE-PAN, for the *molares dentes*, and for the *maxillæ*. It alſo ſignifies a grinder and a FALSE CONCEPTION, a ſhapeleſs maſs in the uterus, without a placenta, called alſo *epicyema*, *myle*; AVICENNA calls it *naducem*. Should part of the placenta remain in the uterus after the birth of the child, this may form a mole; or put on an appearance ſomewhat like it. This is called *pſeudo-mola*, a FALSE MOLE. If the ſymptoms of a miſcarriage happen in the firſt, or beginning of the ſecond month, the fœtus being then very tender, and lying in the os internum two or three days, will diſſolve into a kind of jelly, which coming away, is called a *falſe conception*; and if, during the time of childbearing, a flooding comes on, after its being reſtrained, a large coagulum of blood is formed, which after more or leſs time is diſcharged; it hath a fibrous appearance from the compreſſion of the womb, and is called a mole. *This coagulum is only fibrous on the outſide, whereas the placenta is equally ſo both within and without*, and *thus they are perfectly diſtinguiſhed.*

The ſigns of a *mole* are, in general, the ſame as pregnancy, except that *in pregnancy the belly often becomes flat, and leſs, until the end of the ſecond month*; on the contrary, when there is a *mole*, *the belly increaſes from the firſt, and ſo continues to the ſecond or third month, at which time it generally comes away.* If it continues longer, it often proves troubleſome by the flooding it occaſions; and if the woman is weakly, its conſequence may be death.

During the firſt four months, a *mole* is not eaſily diſtinguiſhed from pregnancy; but after this period it may be obſerved, that the *mole* excites no motions in the womb like thoſe of a living child; beſides, a *mole* diſtends the belly equally, but a child makes it moſt prominent towards the navel, or on one ſide; a *mole* changes its ſituation in the belly according to the poſture of the mother, but this never is known to happen whilſt the fœtus is alive; and in caſe of a *mole*, the general health is commonly worſe, but in pregnancy it uſually improves after the fourth month.

When a *mole* occaſions no ill ſymptoms in the mother, no violence ſhould be uſed to bring it away, but it may continue many years without creating any remarkable inconvenience. If it comes away by the end of the third month, it rarely happens that any aſſiſtance is neceſſary, though it uſually occaſions more or leſs of a flooding.

When aſſiſtance is neceſſary, let the finger be gradually introduced into the uterus, and, if that ſuffice not, introduce another, and thus the *mole* will generally be excluded by the pains which attend on theſe occaſions. As there is no placenta, ſo if after the diſcharge of the *mole* the flooding ceaſes, the whole is at an end; but if it continues, another *mole* may be ſuſpected, and, with a little

patience

patience and care, it being alſo brought away, ſhe woman will ſoon recover. See La Motte, Mauriceau, Smellie, and other practical authors on midwifery.

MOLAGO CODI. See PIPER NIGRUM.

MOLARES DENTES. GRINDERS. So the large teeth on each ſide the dentes canini are called, by Cicero, *genuini*, by ſome *gomphioi*, *molæ*, *momiſci*.

Dr. Hunter obſerves that the two firſt are ſmaller than the reſt; at the baſis of their body they terminate in two points, and therefore Mr. John Hunter thinks the name *bicuſpides* is more proper for theſe than *molares*. Theſe, i. e. the two firſt on each ſide, have ſhort fangs, but are double at their extremities: he (Mr. J. Hunter) thinks the name *molares* is very proper for the other three on each ſide; theſe have four points at the baſis of their bodies, two anteriorly, and two poſteriorly; theſe have generally two fangs in the lower jaw, and three fangs in the upper. Mr. John Hunter obſerves, that the firſt and ſecond of the *grinders* (commonly ſo called) are nearly alike; theſe two ſtand next behind the canini or eye-teeth; they are, as above noticed, called *bicuſpides*; the firſt of theſe two is frequently the ſmalleſt, and hath rather the longeſt fang; this, as well as the eye-teeth, hath in many inſtances its point bent. In the upper jaw, the bicuſpides are rather thicker than in the lower. The *bicuſpides*, and eſpecially the ſecond of them, in both jaws, are oftener naturally wanting than any of the teeth, except the dentes ſapientiæ. The *bicuſpides* and the *molares* or *grinders* alter very little in ſhape on their grinding ſurfaces, by uſe; their points only wear and become obtuſe. The two firſt *grinders* differ from the bicuſpides in being much longer, and in having more points upon their body, and more fangs. The body forms almoſt a ſquare, with rounded angles. The grinding ſurface has commonly four points or protuberances, two of which are on the inner, and three on the outer edge or part of the tooth, and generally ſome ſmaller points at the roots of theſe longer protuberances. The body towards its necks divides into two flat fangs, one forward, the other backward; theſe fangs are often bifurcated. The firſt *grinder* is ſomewhat larger and ſtronger than the ſecond; both the firſt and ſecond *grinders* have ſhorter fangs than the bicuſpides have. In the upper jaw they have three fangs. The firſt and ſecond in the upper jaw are placed directly under the maxillary ſinus. The third *grinder* is the *dens ſapientiæ*. See DENS, and alſo Mr. John Hunter's Natural Hiſtory of the Human Teeth.

MOLARES GLANDULÆ. Theſe are two glands, nearly of the ſame kind with the ſublingual glands, each of them being ſituated between the maſſeter and buccinator muſcle, and in ſome ſubjects they may be eaſily miſtaken for two ſmall lumps of fat. They ſend out ſmall ducts, which perforate the buccinator, and open into the cavity of the mouth, almoſt oppoſite to the laſt dentes *molares*, and from thence Heiſter, who firſt deſcribed them, called them thus.

MOLDAVICA. MELISSA. TURKEY BAUM or BALM. See MELISSA TURCICA.

MOLE. See TALPA.

MOLL. See LENTISCUS.

MOLLITIES OSSIUM. A SOFTNESS of the BONES, called alſo *malacoſteon*. In children this is called the *rickets*. Mr. Sharp thinks it is cauſed by a redundance of oil, or from a bad quality in the juices. Dr. Hunter is of opinion, that an exceſs of oil or marrow hath no ſhare in the cauſe, but that a defect of boney matter is the immediate cauſe; and this defect is occaſioned by a ſcorbutic, venereal, or other taint in the juices. However, they both agree with moſt practical writers, that in order to a cure, cleanlineſs, a change of air, frictions, a good diet, cold bathing, exerciſe, and chalybeate medicines, are proper. See DISTORTIO SPINÆ. GUMMA.

MOLLIFICATIO. A barbarous term for a palſy of the muſcles, in any particular part.

MOLLUGO. See RUBIA SYLVATICA LÆVIS. Boerhaave mentions three ſpecies, and Dale adds a fourth. See ALYSSUM.

MOLUCCA MELISSA. MOLUCCA BAUM or BALM. Boerhaave names two ſpecies. Their qualities agree with thoſe of meliſſa.

MOLVA. See ASELLUS MAJOR.

MOLY, called alſo *allium latifolium liliflorum*. MOLY of THEOPHRASTUS, or HOMER'S MOLY. Boerhaave mentions ſeven ſpecies, and gives the following as the character of it. It reſembles garlic in every reſpect, except that it hath a ſweet taſte, or at leaſt not a diſagreeable one. Some take it to be a ſpecies of rue; but as ſome uncertainty attends the deſcription of what it is, the curious are referred for further information to Ray's Hiſtory of Plants, and James's Med. Dict. &c.

MOLY ALPINUM. See OPHIOSCHORDON.

MOLYBDÆNA, named alſo *elerſna*; *galena*. See PLUMBAGO, and PLUMBUM NIGRUM.

MOLYBDOS. See PLUMBUM.

MOLYZA. See ALLIUM.

MOMIN. See MAMEI.

MOMISCUS. The part of any of the dentes molares next the gum. The dentes molares themſelves are alſo called *momiſci*.

MOMORDICA, called alſo *balſamina mas*, *pomum Hieroſolymitanum*, *cucumerina Indica*, *pomum mirabile*, *balla*, *muccapira*; *balſamella*, *charantia*, *cucumeraria*, *cucumis*, *Punica cordi*, *impatiens herba*. The MALE BALSAM-APPLE. It is cultivated in the gardens of the curious, but is not uſed in medicine. The fruit is ſomewhat cooling. Boerhaave takes notice of five ſpecies.

MOMORDICA ELATERIUM. See CUCUMIS AGRESTIS.

MONADELPHIA (μονος, *unicus*, αδελφος, *frater*.) The ſixteenth claſs of the Linnæan ſyſtem—it is a natural claſs, and comprehends thoſe plants which produce hermaphrodite flowers with one collection of united ſtamina.

MONANDRIA (μονος, *unicus*, and ανηρ, *maritus*.) The firſt of Linnæus's 24 claſſes; it comprehends thoſe plants which produce hermaphrodite flowers having but one ſtamen.

MONERES. It is properly a boat with a ſingle oar; but is figuratively applied to a melancholy perſon, becauſe of his love of ſolitude.

MONOCEROS. See UNICORNU.

MONOCOLON. See RECTUM INTESTINUM.

MONOCULUS, } It is a roller of ten or twelve
MONOPHTHALMUS. } feet in length and two or three fingers breadth. It retains the dreſſings on the eye-lids or eyes. To apply it, fix it on the occiput, letting about a foot hang down, and from thence carry it obliquely round the head, acroſs the wound, &c. to where it began; having carried it thrice round, the remainder goes circularly about the temples, occiput, and forehead; the end hanging behind, is then to be brought over the vertex to the forehead, and the whole ſecured. A napkin, or an handkerchief, does as well, It alſo ſignifies a perſon with only one eye, or with one eye leſs than the other. See MONOPIA.

MONOECIA, (μονος, *ſolus*, οικος, *domus*), the name of the twenty-firſt claſs in the Linnæan ſyſtem, comprehending the androgynous plants, or ſuch as produce male and female flowers on the ſame individual, without any mixture of hermaphrodites.

MONOGYNIA, (μονος, *ſolus*, and γυνη, *mulier*.) The name of the firſt order in each of the thirteen claſſes in the Linnæan ſyſtem, comprehending ſuch plants as have one piſtil in a flower, which is conſidered as the female organ of generation, where the ſtyle is wanting, it regards the ſtigma.

MONOMACHON. See CÆCUM INTESTINUM.

MONOPAGIA, } A pain in the head which affects
MONOPEGIA. } only one point.

MONOPHYLLON, called alſo *ſmilax unifolia humillima*, *unifolium*, *ophrys unifolia*, *lilium convallium minus*. ONE BLADE. It grows in woods and thickets, and flowers in May and June. The flowers are ſaid to be alexipharmic and vulnerary. See Raii Hiſt.

MONOPIA, from μονος, *ſolus*, *alone*, or *one*, ωψ, *oculus*, *an eye*. Thus the Greeks called thoſe who were ſaid to have only *one eye*: the Latins called them *monoculi*, and in the Scythian language they were called *arimaſpes*; *ari*, in that tongue, ſignifying *alone*, and *maſpe*, *the eye*. According to fabulous hiſtory, the ancient Scythians had but *one eye*, which was placed in the middle of the forehead. This fiction took its riſe as follows: the Scythians were great archers, and as *one eye*, in ſhooting, is ſhut while the other is open, they were ſo accuſtomed to look with *one eye*, that the other was rarely ſeen. But theſe words alſo are applied to thoſe who have *one eye* leſs than the other. When this deformity of a larger and a leſſer *eye* is obſerved in infancy, it is recommended to keep ſuch children from ſuch exerciſes as require the uſe of only *one eye*, as looking through microſcopes, perſpective glaſſes, teleſcopes, &c. See Orthopædia, tranſlated from the French of M. Andrée.

MONOPOS. So the perſon is called who hath but one eye, or who hath *one eye* leſs than the other.

MONOR-

MONORCHIS, from μόνος, and ὄρχις, *a teſticle*. A perſon is thus named who hath but one teſticle.

MONS VENERIS. The HILL or MOUNT of VENUS. It lies before and on the upper part of the ſymphyſis of the oſſa pubis; it is an eminence formed by fat in the ſubjacent cellular membrane, and in adults is generally covered with hair.

MONSTROSITAS, } MONSTER. It is generally ap-
MONSTRUM. } plied to preternatural productions amongſt animals, with inſtances of which Schenkius, Parey, and ſome other writers, abound. See ACEPHALOS, and PRÆTENTATIO.

MONTA PANNA. See PALMA JAPONICA.

MORBI ORGANICI. Diſeaſes of particular organs of the body. It is ſynonymous with Dr. Cullen's locales. See LOCALES.

MORBILLI. The MEASLES. Avicenna calls them *variola cholerica*. RHAZES *blacciæ*; the Arabians *bothor*; *bovilla*; *ferſæ*. Dr. Cullen places this genus of diſeaſe under the name *rubeola*, in the CL. PYREXIÆ, and ORD. EXANTHEMATÆ, which he defines—a contagious fever of the inflammatory kind, attended with ſneezing, watery eye, and a dry, hoarſe cough; on the fourth day, or a little later, ſmall ſpots, crowded together, ſcarce prominent, break out, converted after three days into ſmall furfuraceous ſcales. He diſtinguiſhes two ſpecies. 1. Rubeola vulgaris. When the eruptions are very ſmall, confluent, and corymboſe, hardly riſing above the ſkin. Of this he forms two varieties, *in one* of which the ſymptoms are more ſevere, and the courſe of the diſeaſe not ſo regular, theſe are the anomalous meaſles of Sydenham; in the other, they are accompanied with a ſore throat. 2. Rubeola variolares. When the eruptions are diſtinct and elevated. In this the doctor has followed SAUVAGES, though he doubts much, whether it ought to be referred to the meaſles as a ſpecies, not only from the appearance of the eruptions which are widely different—but what appears of more conſequence, it is for the moſt part free from the catarrhal ſymptoms which are peculiar to the meaſles. In Scotland it is called NIRLES. This diſorder appeared in Europe about the time that the ſmall-pox appeared, and hath great affinity to it. They both come from the eaſt, are both infectious, and only attack the ſame perſon once, though ſome ſay this is not certain.

The *meaſles* is an acute diſorder; Dr. Mead ſays it is of the peripneumonic kind; ſome call it an eruptive fever of a ſimple, inflammatory nature; others rank it as an eruptive catarrhal fever; Dr. Morton ſays, that the ſcarlet fever is the confluent *meaſles*; and Dr. Watſon obſerves, that in the ſmall-pox the eruption is critical, but not ſo in the *meaſles*; there the eruption is merely ſymptomatic, as it is well known that the cough, the peripneumony, &c. are not relieved by the eruption, but moſt generally continue after it is over; and further he obſerves, that it is a common notion that the *meaſles* are a good preparative for the ſmall-pox, but that the opinion is falſe, and that from experience, he obſerves, it is moſt prudent not to inoculate for the ſmall-pox, until at leaſt ſix months after a bad kind of the *meaſles*.

All ages are ſubject to this diſeaſe, but it for the moſt part attacks children. In great towns it is more fatal than in villages.

In ſome conſtitutions the *meaſles* give notice of their approach many days before an evident invaſion, by a ſmall, frequent, and dry cough, without any other ſenſible complaint, though more frequently by a general uneaſineſs, by ſucceſſions of ſhivering and heat, and by a ſevere head-ach in grown perſons, a heavineſs in children, and often hoarſeneſs, and by *what more particularly characteriſes this diſtemper, an inflammation, and a conſiderable heat in the eyes, attended with a ſwelling in the eyelids, a defluxion of ſharp tears, and ſo acute a ſenſation in the eyes that they cannot bear the light, by very frequent ſneezing, and a dripping from the noſe.* Sooner or later a feveriſhneſs is manifeſt, and then it ſoon increaſes, a cough comes on, a ſtuffing with a degree of anguiſh, and continual retching to vomit; violent pain ſeizes the loins, and ſometimes a looſeneſs, in which caſe the vomiting is leſs troubleſome. In ſome a conſiderable ſweating chiefly prevails. The ſymptoms are generally more violent than in the milder kind of ſmall-pox; they uſually increaſe to the fourth day, at which time little red ſpots, like flea-bites, begin to appear in the forehead, and other parts of the face, which being increaſed in number and bigneſs, run together, and form large red ſpots of different figures; on the third day theſe ſpots appear in ſome, but in others not until the fifth; theſe ſpots are compoſed of ſmall red pimples, ſeated near each other, and riſing a little higher than the ſurface of the ſkin, ſo that they may be felt upon preſſing them ſlightly with the finger, though they can ſcarce be ſeen; many of theſe ſpots ſoon joining, form red ſtreaks or ſuffuſions, larger or ſmaller, which inflame the ſkin, and produce a ſwelling of the face, whence the eyes are ſometimes cloſed; each ſpot or ſuffuſion is elevated a little above the face; in the other parts of the body this elevation is not perceptible by any circumſtance but the roughneſs of the ſkin; theſe eruptions firſt appearing in the face, are afterwards extended to the breaſt, back, arms, thighs, and legs, and they generally ſpread plentifully over the breaſt and back, and ſometimes red effuſions are ſeen on the breaſt, before any thing appears on the face. The eruption is not followed by ſo ſenſible an abatement of the ſymptoms in the *meaſles*, as in the ſmall-pox; the retching and vomiting, it is true, totally abate, but the cough, fever, head-ach, &c. grow more violent; the difficulty of breathing, the weakneſs of, and defluxion upon the eyes, the conſtant drowſineſs and loſs of appetite, perſiſt in their former ſtate. Sometimes a bilious vomiting is obſerved a day or two after the eruption, which is conſiderably uſeful. Sometimes the patient is relieved by a copious diſcharge of blood from the noſe, which greatly abates the complaints in the head, eyes, and throat. On the third or fourth day after the eruptions firſt appear, the redneſs diminiſhes, the ſpots dry up and fall off in branny ſcales, the forehead and face grow rough, but, in the other parts of the body, the ſpots appear very large and red; in about another day, ſooner or later, according to the malignity of the ſymptoms attending, all ſpots are vaniſhed in the face, and but few remain elſewhere; the face and limbs, and ſometimes the whole body, is, as it were, covered with bran ſprinkled over them; but in ſome ſeaſons, this branny appearance is not attendant. On the ninth day from the beginning, when the progreſs hath been ſpeedy, and on the eleventh when it hath been ſlow, no trace of redneſs is to be found, and the ſurface of the ſkin ſoon reſumes its uſual appearance. At the going off of the ſpots, the defluxion on the eyes increaſes, the fever and difficulty of breathing increaſe, the cough becomes more troubleſome from the defluxion on the lungs, ſo that the patient can get no reſt in the day, and very little in the night; this bad ſymptom is worſt after too heating a regimen, and too warming medicines, which are often uſed to promote the eruptions; from theſe circumſtances ariſes a peripneumonia, which deſtroys a great number of patients. The bad ſymptoms are often followed by a looſeneſs, which immediately ſucceeds the diſeaſe, and continues ſeveral weeks after all other ſymptoms are quite removed. This looſeneſs is often fatal. Sometimes it happens that after an hot regimen, the eruptions turn livid, and then black; but this occurs only in grown perſons, and is fatal except prevented by due bleeding, and cooling antiſeptics. If during the courſe of the diſeaſe, or immediately after it, ſome conſiderable evacution, ſuch as the vomiting of a bilious matter, a bilious looſeneſs, a conſiderable diſcharge by urine, or plentiful ſweating comes on, the patient recovers ſoon after the ſpots diſappear from the ſkin; but ſometimes for want of theſe evacuations, the venom of the diſeaſe is not duly expelled, but is tranſlated to the lungs, occaſioning inflammation there, with a fever, anguiſh, cough, or other ſymptoms, and along with them no ſmall danger of life. This outrage is uſually leſs vehement than what attends the *meaſles*, but it proves tedious and chronical, and the cough reſembles the hooping-cough; but when a cool regimen hath been uſed, theſe conſequences are rare.

The *meaſles* in their dangerous ſtate may be conſidered as a peripneumonia. *The favourable ſymptoms* are, a moderate looſeneſs, a moiſt ſkin, and a plentiful diſcharge of urine. *The dangerous ſymptoms are*, a ſudden diſappearance of the ſpots, a delirium, great loſs of ſtrength, coldneſs of the extremities, reſtleſsneſs, violent vomiting, a continual cough, profuſe ſweats, convulſions, a difficulty of ſwallowing, the ſpots turning pale, or livid. If the pain in the head, which attends in the beginning, continues through the various ſtages, it generally leaves ſome bad complaint, and, not ſeldom, a gutta ſerena.—When the *meaſles* are over, if a cough and hoarſeneſs remain, a conſumption is likely to follow.

The regimen ſhould be the ſame as in the ſmall-pox;

but when the ſpots are gone, do not expoſe the patien too ſuddenly to a cold, or a damp air, for thus an aſthma may be brought on.

Bleeding very rarely fails to be a firſt ſtep towards relief in this diſorder. If the ſymptoms are very mild, this operation is not neceſſary; but if the heat is conſiderable, the breathing much affected, or the breaſt ſeems oppreſſed, blood muſt immediately be taken away, and bleeding may be repeated at any time of the diſeaſe, if the pulſe is hard, and other ſymptoms ſeem to require it.—When *ſymptoms are violent*, there is danger of an inflammation of the lungs; therefore, whether the eruptions have not appeared, are already out, or on the decline, *the lancet muſt not be ſpared.*

The regimen, and *other means*, being of the cooling kind, *the cough* will demand attention; it, with the hoarſeneſs, is beſt relieved by vapours of warm water received into the throat. After the appearance of the eruption, an anodyne ſhould be given every night; and if there is any tendency to coſtiveneſs, a clyſter may be given every day from the very beginning.

If purple or livid ſpots appear, the bark, with vitriolic, or any of the dulcified mineral acids, will be abſolutely neceſſary. Dr. Cameron of Worceſter obſerves, that the coming on of bad ſymptoms, after the diſappearing of the *meaſles*, is owing to the retroceſſion of the morbid acrimony; and that they may be prevented by giving ſmall doſes of the bark in ſubſtance, with a little watery extract of myrrh in ſmall cinnamon water; thus, he ſays, the fever and the cough will ceaſe on the ſeventh day, but the efflorescence ſtays on the face until the twelfth, becauſe the bark prevents the retroceſſion of the morbid matter.

If hæmorrhages happen, avoid aſtringents, and ſtrong opiates; but gentle opiates may be uſed, with vitriolic acids and the bark.

A looſeneſs coming on in the beginning, or *any other period of this diſeaſe*, is uſeful if it is moderate, but if it ſeems to affect the ſtrength of the patient, it muſt not totally be negiected, nor yet checked very ſuddenly; *bleeding* is generally neceſſary in this caſe, and ſmall doſes of rhubarb may be given with the teſtaceous powders.—If the looſeneſs attends after the *meaſles* are paſt, a few grains of the cort. eleuther. may be added to each doſe of other medicines; rhubarb may be given every morning, and a gentle opiate at night.

If ſymptoms of a peripneumony come on, treat the caſe as a peripneumony in its firſt ſtage: bleed, apply a bliſter between the ſhoulders and give the antimonial powder as is uſual in that fever.

If convulſions proceed from the *meaſles*, immediately apply a bliſter.

If the puſtules ſink ſuddenly, proceed as in the ſmall-pox under the ſame kind of circumſtance.

When the *meaſles* go off, gentle purging ſhould be repeated, or perſpiration kept up for ſome days.

Thoſe who die of the meaſles, are uſually taken off on the ninth or tenth day by a ſuffocation, or by an inflammation in the lungs.—Some, when the diſeaſe is ended, have a looſeneſs, which continues ſeveral weeks, and brings on a mortal tabes;—others have a ſlow fever, with an atrophy, and a ſwelling of the belly, which are fatal.

The *meaſles* may be inoculated by means of the hot ſharp rheum, which diſtils from the eyes, or from the blood, or by means of flannels placed under the arm-pits, where the effluvia may be imbibed, and this applied where a ſmall puncture is made. Tiſſot aſſures us, that he practiſed the inoculation of the *meaſles* for twelve years, and the more he inoculated, the more he ſaw reaſon for encouraging others to do the ſame. Dr. Home of Edinburgh propoſed, by inoculating the *meaſles*, to prevent its mortality, to prevent the cough, and to prevent the diſorders which in the natural way are conſequents of this diſeaſe: and his experience manifeſts the advantage of inoculating the *meaſles*, to exceed even thoſe which are obſerved from inoculating the ſmall pox.

See Hoffman, Mead, Wallis's Sydenham, and Huxham on the *Meaſles*. Dr. Home's Medical Facts and Experiments. Tiſſot's Advice to the People. Lond. Med. Obſ. and Inq. vol. iv. p. 132—135. and p. 247—260. Brooke's and the London Practice of Phyſic. Med. Muſ. vol. ii. p. 46—48. Cullen's Firſt Lines, edit. 4. vol. ii. p. 173. See alſo Edinburgh Med. Eſſays, vol. v. pt. 2. Lond. Med. Obſ. vol. iv. art. 11. Sauvages' Noſologia Methodica, vol. i. p. 435, where particular accounts of the anomalous, anginous, and variolous *meaſles*, and this diſeaſe, attended with a putrid diatheſis, are more particularly deſcribed, with the modes of cure.

MORBILLOSA. Belonging to the *Meaſles*.

MORBUS. A DISEASE, called alſo *malum, noſos*. Galen defines it to be "ſuch a preternatural diſpoſition or affection of the parts of the body, as primarily, and of itſelf, hinders their natural and proper action." Hippocrates ſays, "a diſeaſe is that which afflicts a man." Dr. Geo. Fordyce, in his Elem. of the Pr. of Phyſ. ſays, "A *diſeaſe* is ſuch an alteration of the chemical properties of the fluids or ſolids, or of their organization, or of the action of the moving power, as produces an inability or difficulty of performing the functions of the whole, or any part of the ſyſtem, or pain, or preternatural evacuation. Some define *diſeaſes* one way, and ſome another; ſome deſcribe *diſeaſes* by their cauſe, and others by their effect, ſo that much perplexity and uncertainty is met with on this ſubject.

Dr. Wallis, in his comments on the works of Sydenham, attempting to obviate theſe difficulties, has given a definition of *diſeaſe*, which ſeems to comprehend the whole. He ſays, "*Diſeaſe* is a preter or ſuper-natural affection of ſome part or parts, or the whole of the machine, by which the ſyſtem is injured and diſturbed; or the action of a part impeded, perverted or deſtroyed, attended with peculiar ſymptoms, adapted to the nature of the affection, and parts affected; or appearances deviating from health, from ſome general or partial affection, by which the ſyſtem in general, or in part, is oppreſſed, or diſfigured."

As to particular *diſeaſes*, that immediate and conſtant effect of the immediate cauſe which in all caſes occurs, conſtitutes the *diſeaſe*, and the relation of this with reſpect to any particular *diſeaſe*, is its definition; ex. gr. an inflammation is a too rapid afflux of humour through the part. If it is ſaid that this is not different from a congeſtion of blood, it is anſwered, that a congeſtion of blood is too great an afflux of fluid to the part: the one is too rapid, the other too great; in the one the humour flows through, in the other it flows to the part: and further to diſtinguiſh them, it may be obſerved, that inflammation is too rapid an influx from an erethiſm as the immediate cauſe; and a congeſtion is too copious an influx, from a relaxation of the part, as its immediate cauſe.

Diſeaſes are divided into acute and chronical; but, perhaps, the diviſion would be better, if the diſtinction was into febrile and not febrile.

Several profeſſors of medicine have arranged *diſeaſes* under their reſpective claſſes, orders, genera, &c. The following is according to the method purſued by that celebrated teacher of the healing art, Dr. Cullen. See his Synopſis Noſologiæ Methodicæ, edit. 5.

Claſſis I. Pyrexiæ,	Ordo I. Febres. II. Phlegmaſiæ. III. Exanthemata. IV. Hæmorrhagiæ. V. Profluvia.
Cl. II. Neuroſes,	Ordo I. Comata. II. Adynamiæ. III. Spaſmi. IV. Veſaniæ.
Cl. III. Cachexiæ,	Ordo I. Marcores. II. Intumeſcentiæ. III. Impetigines.
Cl. IV. Locales,	Ordo I. Dyſæſtheſiæ. II. Dyſorexiæ. III. Dyſcineſiæ. IV. Apocenoſes. V. Epiſcheſes. VI. Tumores. VII. Ectopiæ. VIII. Dialyſes.

Theſe orders are again ſubdivided into near 150 genera.

SAUVAGES, beſides his arrangement from the appearances which different diſorders aſſume, has given two others—ÆTIOLOGICALLY, *from the cauſes*; and ANATOMICALLY, *from the parts affected.*

CLASSES OF DISEASES FROM THE CAUSES, are:

CLASSIS.—1. MORBI *venenati*;—2. *virulenti*;—3. *exanthematici*;—4 *metaſtatici*;—5. *febricoſi*;—6. *miaſmatici*;—7. *phlogiſtici*;—8. *ſanguinei*;—9. *biliofi*;—10. *ſaburrales*;—11. *pituitoſi*;—12. *catarrhales*;—13. *lactei*;

tei;—14. *ſeroſi*;—15. *flatuloſi*;—16. *purulenti*;—17. *acrimonioſi*;—18. *organici*;—19. *vulnerarii*,—20. *emphractici*;—21. *verminoſi*;—22. *calculoſi*;—23. *ſpaſmodici*;—24. *atoni*;—25. *morales*.

CLASSES OF DISEASES FROM THE PARTS AFFECTED, are:

CLASS.—1. MORBI *cutanei univerſales*;—2. *cutanei partiales*;—3. *artuum*;—4. *ſexuum*;—5. *ſenſuum*;—6. *capitis*;—7. *pectoris*;—8. *abdominis*;—9. *ætatum*. For the arrangement of different Nofologiſts, ſee *Nofologiæ Methodicæ Synopſis* CULLENI, where will be found thoſe of SAUVAGES,—LINNÆUS,—VOGEL,—SAGAR, and MACBRIDE; ſee alſo the Seats and Cauſes of *Diſeaſes* inveſtigated by Anatomy, by J. B. Morgagni, M. D. *tranſlated into Engliſh* by B. Alexander, M. D.—Ramazini's Treatiſe on the Diſorders of Artificers, *tranſlated into Engliſh* by Dr. James.—Eſſay on the Diſorders of People of Faſhion, by M. Tiſſot, M. D.

MORBUS is a term belonging to a variety of *diſeaſes*, which are ſpecifically diſtinguiſhed by the terms with which they are conjoined, viz. MORBUS ARQUATUS, REGIUS. See ICTERUS.

ATTONITUS,—CADUCUS,—COMITIALIS,—HERCULEUS,—INFANTILIS,—PUERILIS,—INTERLUNIUS MAGNUS,—SACER. The EPILEPSY, ſee EPILEPSIA. COXARIUS, ſee ARTHROPUOSIS;—GALLICUS—INDICUS, ſee LUES VENEREA.—HUNGARICUS, ſee AMPHEMERINA HUNGARICA,—STRANGULATORIUS;—TRUCULENTUS INFANTUM, ſee SUFFOCATIO STRIDULA.

MORBUS NIGER, the BLACK DISEASE. SAUVAGES calls it *melæna*, and defines it a diſcharge of matter of a black, or reddiſh black colour, frequently by ſtool or vomiting; of which he enumerates ſeven ſpecies. It is named by HIPPOCRATES *melaina noſos*, of which he deſcribes two ſpecies. IN THE FIRST the patient vomits black bile, which is ſometimes bloody and ſour; ſometimes he throws up a thin ſaliva, and at others a green bile; ſometimes the mouth is inflamed with the matter that is thrown up, the teeth are ſet on edge, and then what is vomited ferments on the ground. After vomiting, the patient is eaſier, but he can neither faſt, nor eat freely; for in the firſt caſe he is troubled with rumbling in the belly, and ſourneſs of the ſaliva, and after eating, he feels a weight and oppreſſion of the viſcera, with a pungent pain of the breaſt and back, as if inflicted by pins thruſt therein: there is a pain in the ſide, a ſlow fever, head-ach, dim ſight, heavineſs in the legs, and blackneſs in the ſkin. The cure is performed by frequent cathartics, and afterwards drinking whey, and milk, and living on ſimilar viands. THE SECOND is a concrete blood of a blackiſh red colour, and mixed with a large quantity of inſipid, acid, or viſcid phlegm, which is thrown up by vomit. This evacuation is generally preceded by a pungent, tenſive pain, in both the hypochondria, and the appearance of the *diſeaſe* is attended with anxiety, a compreſſive pain in the præcordia, and fainting, which laſt is more frequent, and more violent, when the blood, which is evacuated, is fetid and corrupt. *The ſtomach and the ſpleen are the principal, if not the proper ſeat of this diſorder.*

This diſorder ſeems to differ not from a vomiting of blood, any other than as one inſtance of the ſame differs from another in proceeding from a different cauſe.

The pains attending this diſorder are ſpaſmodic, and muſt be diſtinguiſhed from an inflammation in the ſtomach.

The ſpleen is often enlarged, or the liver much diſordered in this *diſeaſe*: when ſymptoms indicating theſe attend, a cure is hardly to be expected, but the danger is great, when fainting is frequent and conſiderable; but the *worſt prognoſtic ariſes from a diſcharge of black, pitch-like fetid matter by ſtool.* The patients ſubject to this terrible diſcharge of black matter by ſtool, are either hypochondriac or diſpoſed to hæmorrhoidal diſcharges; hence the ſpaſmodic pains which are felt in this diſorder; for the blood paſſes with difficulty through the meſaraic veſſels: and when in the piles a black blood is diſcharged, it will be eaſy to diſtinguiſh the piles from the *black diſeaſe*, by the abſence of thoſe pains in the former which conſtantly attend in the latter.

The fainting, which is ſo conſiderable in this diſorder, is ſuppoſed to be owing to the putreſcence of the blood, which is thrown out into the bowels, and mixes with the fæces there.

During the fit, if the body is plethoric, bleed;—if the pulſe is quick and ſtrong, a draught of water ſhould be gradually ſwallowed, in which is a dram of nitre, and half an ounce of the ſyrup of poppy heads; this may be repeated as required.—When there is great thirſt, pungent and vellicating pains, with ſpaſmodic ſtrictures in the ſide, almond emulſions, with a little nitre and ſyrup of poppy heads, ſhould be frequently drank; emollient clyſters with nitre ſhould alſo be injected frequently.

To check the ſpaſms, the following liniment is recommended:

℞ Camphor. ʒ i. ol. amygd. ℥ i. ol. rhodii, gut. xx. m. After rubbing the region of the ſtomach, and the left hypochondrium with this, a bladder of warm water may be applied thereto.

After the fit, to prevent a return, give half a dram of rhubarb, in a glaſs of water, at bed-time, twice a week. If any other diſorder is attendant, endeavour to remove it, and let a mucilaginous nutritive kind of diet be uſed, but avoid oily kinds of aliment.

See Hippocrates, lib. ii. De *Morbis*, ſect. v.—Hoffman Rat. Med. Syſt.—Edinb. Med. Comm. vol. iv.—London Med. Journal, vol. i. p. 10.

MORDEHI. Thus the Eaſt Indians call a *diſeaſe* to which they are ſubject. In it the ſtomach is diſordered, whence ariſes a perpetual heat, copious ſweats, and ſupervening cold, which weaken it ſtill more. See F. Hoffman. De Morb. Epid.

MORDEXYN. At Goa, in the Eaſt Indies, a diſorder is very common which ſeizes the patient ſuddenly and unexpectedly; it is attended with a continual nauſea and vomiting. It often proves fatal. F. Hoffman, De Morb. Epid.

MORHUA. See ASELLUS MAJOR.

MORILLE. See AMANITA.

MORINA. A plant to which Tournefort gives this name, in honour of Dr. Morin of Paris. It is cordial and perſpirative.

MORINGA. A large tree in Malabar, and other parts of the Eaſt Indies, whoſe fruit is a foot long, as thick as a carrot, with eight corners and delicious to the taſte. The leaves, roots, bark, and fruit, are antiſpaſmodic and ſudorific. See Raii Hiſt.

MORO. An abſceſs in the fleſh, reſembling a mulberry.

MOROSIS, from μωρεω, *fatuum reddo*, μωρος, *ſtultus*, *fooliſh*; it is called alſo *fatuitas*. STUPIDITY, IDIOTISM, DEFECT OF IMAGINATION. The immediate cauſes are, a deficiency of vital heat, or a defect in the brain. *Stupid* children ſometimes become ſprightly youths; but if *ſtupidity* continues to the age of puberty, it is hardly ever removed. If *ſtupidity* follows upon a violent paſſion, an injury done to the head, or other evident cauſe, if it continues long, it becomes incurable. But the *ſtupidity* which conſiſts in a loſs of memory, and ſucceeds a lethargy, ſpontaneouſly ceaſes when the lethargy is cured. Dr. CULLEN conſiders this as ſynonymous with AMENTIA. SAUVAGES makes it a ſpecies of AMENTIA, and defines it, a flowneſs of, or inability in the faculty of imagining, or conceiving; conſequently a debility in judgment without delirium. There is a great difference between fooliſhneſs, and ſtupidity; for fooliſh people readily imagine, or conceive, and do not want memory; but judge improperly; and, by acting ridiculouſly, divert their aſſociates; but the ſtupid want both conception, and memory; nor do they properly, or readily, conceive what is ſaid to them; they are not trifling, or whimſical in their behaviour; but are dull, ſulky, and refractory. See AMENTIA.

MOROSITATES, are diſeaſes wherein the deſires, and averſions, are unnatural, and depraved; and, in which, it is difficult to pleaſe, gratify, or ſatisfy. A moroſe man, ſpeaking of him in a ſtate of diſeaſe, conſtantly is requiring what is not really good for him, or is averſe to that which only appears bad, though in reality it would certainly be uſeful and beneficial to him. Dr. Cullen makes them ſynonymous with *dyſorexiæ*, appetites erroneous and defective. To which he adds, that to the claſs of Veſania he had joined the Moroſitates of Sauvages, but now he had brought it under the Claſs LOCALES; and he thinks, properly, becauſe almoſt all the ſpecies of DYSOREXY are affections of a particular part, rather than of the whole body. The noſtalgia alone, if it can be called a diſeaſe, cannot be eſteemed a local diſeaſe, but he could not well ſeparate an uncertain diſeaſe from the reſt of dyſorexies. See Nofolog. Meth. Synopſis vol. i.

MORPHÆA.

MORPHÆA. MORPHEW, SCURF. It is ranked as a ſpecies of leproſy, though differing from it in this, that the ſeat of the leproſy is in the fleſh, but that of the *morphew* in the ſkin. The alphus is ſometimes thus named. The brown itching *morphew* is named *hepatizon*.

MORPIONES. CRAB-LICE. They are ſo called from their reſembling crab-fiſh. They are in the armpits, eye-lids, eye brows, and pudenda of grown perſons. They are flattiſh, and ſtick ſo cloſe to the ſkin as with difficulty to be diſlodged. They are alſo called *plactulæ*, *petolæ*, *peſſolatæ*, and, from their often infeſting the pubes, they are called *pediculi inguinales*. They are deſtroyed either with black ſoap, or mercurial ointments, or a ſolution of ſublimate in roſe-water, of which laſt the proportion may be 3 ſs. of ſublimate to ℔ i. of the water.

MORSELLUS, or MORSULUS. See TROCHISCI.

MORSURA. A BITE, generally underſtood to be venomous, as of a mad dog, a viper, &c.

MORSUS. A BITE. Figuratively it is uſed to expreſs a ſort of pain reſembling that which is excited by a *bite*, or by gnawing.

MORSUS DIABOLI. DEVIL'S BITE. See TUBÆ FALLOPIANÆ, or DEVIL'S BIT. See SUCCISA.

—— GALLINÆ. See ALSINE.

—— RANÆ. See MICROLEUCONYMPHÆA.

MORTA. The ſame as *pemphigus*.

MORTARIOLUM. In CHEMISTRY, it is a ſort of mould for making cupels with. In ANATOMY, it is the ſockets of the teeth. See ALVEOLI.

MORTIFICATIO. A MORTIFICATION. From *mors*, *death*, and *facio to make*. The Greek word SPHACELUS, called alſo *ignis frigidus*, is very ambiguous in its uſe among the ancients. Hippocrates uſes this term in different ſenſes; ſometimes he confines it to a corruption of the bone, and in this ſenſe Celſus uſes the verb *vitiari*; but theſe words were afterwards, and now are uſed in general to expreſs the corruption of the fleſh as well as bones, as Galen in many places expreſſes, and the preſent uſe of the word in practice teſtifies. For a *mortification* of the ſoft parts only, Hippocrates often uſes the word *ſapron*, *mydoſen*, and *ſepomenon*. The word *ſphacelus* was uſed by the ancients to expreſs violent pains, violent inflammations which tended to mortify the part where they were ſeated, a *mortification* in part, or in general, and alſo the withering of any part. Galen ſays, in Com. iv. Lib. de Art. & Com. vii. Aph. I. that ſphacelus is taken for an incipient gangrene. However, the terms are generally conſidered in the following manner:

Boerhaave ſays, that a gangreme, for which Paracelſus uſes the term *cancrena*; is a beginning *mortification*. Mr. Pott obſerves, that a gangrene is in the cellular membrane and the ſkin; but that a *ſphacelus* is deeper, attacking the muſcles. When a *mortification* is in the bone, it is called a *caries*. Dr. Cullen conſiders the *mortification* not as a genus of diſeaſe, but as a mode of inflammation terminating; which he divides into GANGRÆNA, and SPHACELUS; The FIRST, he defines: after an inflammation, the part becomes livid, ſoft, has little ſenſibility, and is often attended with ichorous veſicles. The SECOND, after a gangrene, the part becomes black, flaccid, eaſily lacerating, without ſenſation or heat, and attended with the fœtor of putrid fleſh; the malady quickly ſpreading; ſo that the latter is but an higher degree of the former.

A *mortification* is, when all vital action ceaſes in a part, or is the putrefaction thereof, whilſt a principle of life remains in the reſt of the body. Celſus deſcribes the progreſs of a gangrene and ſphacelus thus: "In this ſpecies of ulcer, the fleſh is black or livid, alſo dry or parched, and the external ſkin is generally full of blackiſh puſtules; then that which is next to it is pale or livid, and almoſt æruginous, and without ſenſation. It is ſtill worſe in an inflammation, ſince all the ſymptoms ſpread at once, the ulcer into the puſtulous place, the puſtules into that which is pale and livid, the pale or livid into that which is inflamed, and that which is inflamed into that which is found".

Dr. Kirkland well obſerves, that it is very proper to diſtinguiſh betwixt local gangrenes inclining to ſpread, and gangrenes from a bad habit; on which he obſerves as follows:

"When the *mortification* ariſes ſimply from injury done to the limb, it is not preceded by a gangrene, but comes on in conſequence of an abſolute ſtagnation of the blood and juices alone, and accordingly the ſkin, and all the injured parts, become dead and putrid at the ſame time, without any previous emphyſema. A *mortification* ariſing indeed from a weakneſs, and deficiency of native heat, comes on in the ſame manner, only more gradual, with the ſame appearances; but the ſtate of the patient will eaſily lead to the nature of the diſeaſe. When external injury is the cauſe, if an inciſion is early made, the part is inſenſible, and no other than extravaſated blood is diſcharged. In this kind of *mortification*, the countenance is ſerene, nor does any other fever ſupervene, but ſuch as is common to contuſed wounds; and, unleſs the affected part is very near the body, the diſeaſe ſlowly extends itſelf by the acrid fluids corroding the neighbouring parts in the manner of a cauſtic, till matter enough is abſorbed to contaminate (unleſs prevented) the whole maſs of blood. *But a ſtop may be always put to local ſphacelus*; for a *mortification rarely ariſes merely from the injury done to the part, which would not give way to proper management.*

"When a *mortification* ariſes from an internal cauſe, that is, from a gangrenous diſpoſition of the juices; ſoon after the injury is received, whether a large wound is made by external violence, or a ſmall wound by protruſion of a broken bone, the lymph which ſtagnates about the wound immediately inflames and corrodes the veſſels which contain it; when air-bubbles in the adipoſe and other membranes are inſtantly ſet at liberty; which air-bubbles, by increaſing the inflammation, are increaſed, and extended immediately upon the ſmalleſt degree of obſtruction taking place, all over the limb, &c. an emphyſema often firſt diſcovering the tragedy that is acting under the ſkin, not yet apparently diſeaſed. A fever at this time frequently comes on, accompanied with a delirium, great dejection of ſpirits, and often a particular wildneſs in the looks; the pulſe is either quick, low, weak, and fluttering, or quick, unequal, and hard, and the ſcene is frequently cloſed with a rapidity that will not admit of aſſiſtance. If an inciſion is made into the affected part, when the air-bubbles are firſt formed, it is ſenſible, and blood is diſcharged from the arteries, in a florid ſtate, as free as uſual; the adipoſe membrane is of a darkiſh yellow colour, and the muſcles only appear browner than common. Afterwards the ſkin becomes inflated, and the muſcles, not yet having loſt their ſhape, frequently force themſelves out immediately upon making an inciſion, with a large diſcharge of wind, and a quantity of frothy matter: the blood in the veſſels is now turned to a black coagulated maſs, the adipoſe membrane, and the membranes in the interſtices of the muſcles and fibres, and the muſcles themſelves, putrefy; and, laſtly, the ſkin alſo becomes livid and putrid; from all which it is evident that a gangrene brings on a ſphacelus, while the blood is yet circulating in the veſſels."

The uſual ſigns of a preſent gangrene are, *the ſudden removal of inflammation* (when inflammation attends); *the leſſened ſenſation of the part, for the ſkin does not ſo ſpeedily mortify as the cellular membrane*; hence, *till the ſkin is deſtroyed, there is a little feeling. A pale, cineritious, dark, livid, or black colour, which is always worſe as it recedes from the pale to the black. Softneſs and flaccidity of the parts*, ſo as to retain the impreſſion made by the finger; *puſtules or bliſters*, FULL OF LYMPHATIC, YELLOWISH, OR REDDISH ICHOR; *this is generally accounted the pathognomonic ſign of a gangrene on the external part of the body.*—When a gangrene is induced by cold, an itching and a violent ſenſe of puncture, together with intenſe redneſs, ſoon ſucceeded by blackneſs, indicate *mortification*: the cold produces firſt a paleneſs, which is ſucceeded by redneſs accompanied by a troubleſome pungent pain, or an uneaſy itching. Then the redneſs is increaſed to a purple colour, and afterwards the part becomes black.

The immediate cauſe is, the reduction of the vital heat in the part to a certain degree below that which health requires.

The immediate cauſes are, violent inflammation, which, by the heat attending, ſo diſtends the cellular membrane as to compreſs the veſſels, ſtop the circulation in the adjacent parts, and deſtroy the vital action there.—The acrimony of the juices, by rupturing the veſſels in an inflamed part, occaſions an extravaſation of blood, which putrefying, produces a *mortification*.—A contuſion or wound of the ſpinal marrow, by preventing any further influx of the vital heat to the parts below where the in-

ju y

jury is received, cauſes a *mortification* there.—External compreſſion, intenſe cold, compreſſion from tumors internally, poiſons, &c.

The prognoſtics are to be taken from the patient's age, the attending diſorder (if there is any), the circumſtances of the *mortification*, the ſtrength of the patient, a knowledge of the cauſe, the ſeaſon of the year, &c.

THE INDICATIONS OF CURE ARE, to confirm the ſtrength, or to raiſe and maintain the vital heat a little above the natural healthy degree,—to prevent the ingreſs of the putrid matter into the veins—to check and remove the putrefaction formed.

The bark is the only known ſpecific, but yet its uſe is not to be indiſcriminately admitted of in every caſe; in habits that are lax and feeble, no objections can occur to prohibit it; but in inflammatory habits, nitre, or mineral acids, ſhould accompany it if given, and great caution is neceſſary before it is directed. *If the inflammation is conſiderable*, the mineral acids are more proper than the bark.

If the pulſe is ſtrong, large, and hard, and the extremities of the body are warm, the urine red and high coloured, the circulation is ſufficiently ſtrong, ſo need not be increaſed; but, *if the pulſe is weak, and the ſymptoms indicate a defective vital heat*, cordials will be neceſſary.

The following preparation of the bark will be adviſeable: ℞ aq. fontan. & aq. cinnam. fort. ää ℥ 4. pulv. cort. Peruv. ℥ ſs. m. cochl. ij. omni ſemihora ſumend. agitata phiala.

Mr. Pott obſerves, that a *mortification* proceeds from a *circulation that is too rapid*, or *too languid*; that, in the *firſt caſe*, bleeding and diluters; and in *the ſecond*, cordials and invigorating medicines, muſt be preſcribed. When a *mortification* is from an internal cauſe, there is uſually great pain, and opium is directed to be freely uſed. This ſhould be done whether the cauſe is internal or external; in theſe caſes opium is the greateſt cordial known.

If a putrid ſcurvy affects the patient, adminiſter ſuch medicines as will oppoſe it; or, if any other diſorder attends, the proper means muſt be made uſe of, by which it may moſt ſpeedily be removed.

The external applications ſhould be removed as often as they ſeem to have acquired a putrid ſmell, which will be in three or four hours, while the diſorder is in its progreſs; but when it abates, the dreſſings may continue proportionably longer.

As an external application, Heiſter recommends the following: ℞ Aq. calcis ſ. ℔ i. ſp. vini camph. ℥ iii. aquæ ammon. ℥ ſs. m. Apply it frequently and warm; it is powerfully antiputreſcent, it ſtimulates and digeſts. As a cataplaſm, the catapl. cumini is moſt commonly directed, and rarely need be ſet aſide for any other.—When a mortified part is ſcarified, immediately foment it with a proper antiſeptic fomentation made warm; and, after fomenting it for ſome time, apply a warm antiſeptic cataplaſm.—If emollients are mixed with *antiſeptics*, they aſſiſt in ſeparating the putrid parts, and ſtopping the farther progreſs of the *mortification*.

When the eſchar or the mortified parts begin to ſeparate, remove no more at each dreſſing than comes away without pain or loſs of blood. Bladders of warm water may be laid over the dreſſings; they continue the heat much longer and more equally.

For that ſpecies of *mortification* which ariſes from cold, ſee the article CONGELATUS.

Some inſtances of *mortification* require that the limb be amputated. When this misfortune happens to the extremities, and penetrates to the bones, deſtroying the whole ſurrounding ſoft parts, amputation is often neceſſary. However, in general, amputation ſhould not take place until a ſeparation of the mortified part from the ſound is perceptible. But as ſoon as this ſeparation hath occurred, no time ſhould be unneceſſarily loſt in having recourſe to the operation; for ſo long as any of the corrupted parts remain in contact with the ſound, the ſyſtem muſt ſtill be ſuffering by the conſtant abſorption of putreſcent particles. For inſtances of deviation from this general rule, ſee the articles FRACTURA, ARTERIA, &c. It ſometimes happens that the arteries of the lower extremities oſſify, which, by deſtroying the elaſticity, produces *mortification*, which appears firſt at the toes, and afterwards in the limb, nearly as high as the oſſification terminates: ſo that in *mortifications* from this cauſe, we ſee why the amputation, during their increaſe, is of ſo little ſervice, unleſs performed above the oſſification; but we have no way to judge where the oſſification ends, except by the inference we make from the gangrene ſtopping.

It may be further added, that, at the point of alteration from a *mortification*, the adjacent part is yet in a bad ſtate, and ſhould be ſtill left quietly, until, with the aſſiſtance of cordial, &c. medicines, granulations of good fleſh appear on the ſound part, and diſcover the healthy ſtate of the blood. Until this appearance, amputation is but rarely to be admitted.

Bell on Ulcers, edit. 3. p. 93—122. Kirkland's Med. Surgery, vol. ii. p. 291—433. London Med. Tranſactions, vol. iii. p. 47. Pearſon's Principles of Surgery, vol. i. p. 105. White's Surgery, p. 8.

MORTUA TERRA. See CAPUT MORTUUM.

MORUM. An excreſcence on the ſurface of the ſkin in many parts of the body, reſembling a mulberry. When this happens on the eye-lids, the Arabians call it *alchate*.

MORUS. The MULBERRY-TREE. The MORUS NIGRA, *foliis cordatis ſcabris*. CLASS. MONOECIA. ORD. TETRANDRIA. LINN. Gen. Plant. 1055. Its fruit hath the common quality of all other ſweet fruits, quenching thirſt, partly by cooling, and partly by exciting an excretion of mucus from the glands of the mouth and fauces; a ſimilar effect is alſo produced in the ſtomach, where, by correcting putreſcency, a powerful cauſe of thirſt is removed. A ſyrup is made of the juice of this fruit; but, otherwiſe, it is of very little uſe in medicine. See Raii Hiſt. The bark of the root of the mulberry-tree has an acrid bitter taſte, and poſſeſſes a cathartic power. This has been uſed with ſucceſs as a vermifuge, particularly in caſes of the tape-worm. DOSE, of the powder, half a dram.

MORXI. A peſtilential diſtemper, very common in Malabar and other parts of the Eaſt Indies.

MOSA. A ſort of liniment uſed in ſome parts of Germany; it is made of wheat-flour and milk, and is of no greater conſiſtence than what requires a ſpoon for eating it with.

MOSCH. Caſtellus ſays they are a ſort of roriferous veſſels, which Bilſius diſcovered in the kidneys.

MOSCHATELLINA, called alſo *ranunculus nemoroſus, ariſtolochia rotunda, concava, &c. denticulata*. It is called *moſchatellina*, as diminutive from moſchus, that is to ſay, it is a ſmall plant which ſmells like muſk. Its root is reſolvent and detergent. See Raii Hiſt.

MOSCHUS. MUSK. Alſo called *amiſa*. It is an odoriferous grumous ſubſtance. The animal which affords this odoriferous drug, is the *capreolus moſchi* of Geſner, *animal moſchiferum* of Ray, &c. the MUSK ANIMAL of Le Brun, &c. the *capra moſchi, cervus odoratus*, the *moſchus moſchiferus* of Linnæus, and the TIBET MUSK of Pennant. This animal is a quadruped, with cloven hoofs, ſomewhat of the form of a roebuck, according to Mr. Pennant's deſcription of it, who further informs us, that the noted drug which bears the ſame name with this animal, is found in a bag or tumor of the ſize of a hen's egg, on the belly of the male *only*; this bag is kidney-ſhaped, and pendulous, furniſhed with two ſmall orifices; the largeſt is oblong; the other is round; the one is naked, the other is covered with long hairs. The *muſk* is contained in this. The hunters cut off the bag, and tie it up for ſale. The Tibet *muſk* is the beſt, and is the ſtrongeſt in rutting time. See Pennant's Hiſt. of Quadrupeds.

Pomet gives a good figure of this animal in his Hiſtory of Drugs. The beſt *muſk* is brought from Tonquin in China; it is in thin bags that have browniſh hairs; an inferior ſort comes from the Eaſt Indies in bags that have white hairs in them. Neumann ſays, the quality of one is not inferior to that of the other.

Fine *muſk* is brought to us in round thin bladders, about the ſize of pigeons' eggs, covered with ſhort browniſh hairs, well filled, and without any aperture or appearance of having been opened. The *muſk* itſelf is dry, with a kind of unctuoſity, of a dark reddiſh brown or ruſty blackiſh colour, in ſmall round grains, with very few hard black clots, perfectly free from any ſandy or other viſible foreign matter. Chewed and rubbed with a knife on paper, it is bright, yellowiſh, ſmooth, and free from grittineſs. Laid on a red-hot iron it catches flame, and burns almoſt entirely away, leaving only an exceed-

ing

ing ſmall quantity of light greyiſh aſhes. It hath a biterish ſubacrid taſte, and a fragrant ſmell, agreeable at a diſtance, but diſagreeable if nearly ſmelt to, unleſs weakened by a large admixture of other ſubſtances.

A ſmall quantity macerated in rectified ſpirit of wine imparts a deep tincture and a ſtrong impregnation to it; the ſpirit ſo covers the flavour of the *muſk*, that this tincture diſcovers but little ſmell; but, on dilution, the full fragrance of the *muſk* is manifeſted: a drop or two communicates to a quart of wine, or to watery liquors, a rich muſky ſcent. The quantity of liquor which may thus be flavoured by a certain known proportion of *muſk*, is the beſt criterion of the genuineneſs and goodneſs of it.

Rectified ſpirit of wine takes up completely the active matter of the *muſk*; watery liquors take it only in part, though, by the intervention of a mucilage, the whole quantity of the *muſk* mixes with the water, as in the following mixture:

Miſtura Moſchata. MUSK MIXTURE, *formerly Julepum e Moſcho.* MUSK JULEP.

Take of roſe-water, ſix ounces; of *muſk*, two ſcruples; of the mucilage of gum arabic, and of double refined ſugar, of each one dram; grind the *muſk* with ſugar, then with the gum, and add the roſe-water by degrees. Volatile ſpirits are, in many caſes, a uſeful addition to *muſk*, and enables the water to keep more of it diſſolved; two drams of the volatile ſpirit may be added to the above mixture. Doſe, two or three table-ſpoonfuls.

By diſtillation, water becomes ſtrongly impregnated with the ſcent of *muſk*, and ſeems to elevate all its odoriferous matter, while the rectified ſpirit, on the contrary, brings over little or nothing of it.

The principal uſe of muſk is in nervous diſorders. Its impreſſions on the organs of ſmell, ſometimes diſorders perſons who are hyſterically diſpoſed, or whoſe conſtitutions are poſſeſſed of great ſenſibility; yet, when taken inwardly, it abates ſymptoms of that kind which its ſmell produces. It is one of the principal of the antiſpaſmodic claſs of medicines. But much of the advantage of this medicine is loſt by giving it in too ſmall doſes. Dr. Wall, of Worceſter, relates, that two perſons, who were labouring under a ſubſultus tendinum, extreme anxiety, and want of ſleep, occaſioned by the bite of a mad dog, were perfectly relieved by two doſes of *muſk* of ſixteen grains each;—he further obſerves, that convulſive hiccoughs, attended with the worſt ſymptoms, were removed by a doſe or two of ten grains;—that where, on account of convulſions, no medicine could be given at the mouth, *muſk* anſwered the end, when adminiſtered by way of clyſter;—that thoſe who are averſe to perfumes, take it very well by way of bolus;—that under ſix grains, he never ſaw any benefit by its uſe, but that ten grains and upward promotes a diaphoreſis without heating or giving any uneaſineſs; but on the contrary, abates pain, raiſes the ſpirits, and, after the ſweat begins, it promotes ſleep; and that, in maniac caſes, it hath afforded a temporary relief. Dr. Owen, of Shrewſbury, relates a ſingular inſtance of ſucceſs from yet larger doſes, in a convulſive diſorder; after all other uſual methods failing, he gave doſes of half a dram every four hours. See Lond. Med. Obſ. and Inq. vol. iii.

Muſk is beſt given in ſubſtance, in large doſes, from half a ſcruple to half a dram, and theſe muſt be quickly repeated till the diſeaſe is conquered. We are to form our judgment of its goodneſs by the ſtrength of its odour, and always be careful of having it genuine; much of its efficacy depends upon that. It is a powerful remedy in many convulſive and ſpaſmodic affections, and has been extremely beneficial in the hydrophobia, in the gout in the ſtomach, *in large doſes*; head-ach, and delirium, ſpaſm of the pharynx. See Cullen's Mat. Medica, where, in large doſes, it is ſaid to procure ſleep, and as certainly occaſioning a profuſe ſweat; hence properly conſidered as a ſudorific.

Some practitioners conſider *muſk* as a medicine of little or no conſequence; but for what reaſons it is difficult to determine, ſince the experience of every day proves it certainly a diaphoretic and antiſpaſmodic, given in doſes, ſuch as are properly adapted to the conſtitution of the patient, and nature of the complaint; for ſome require much larger doſes than others.

When *muſk* occaſions hyſteric ſymptoms by its ſmell, fetids applied to the noſe ſoon afford relief.

See Lewis's Mat. Med. Neumann's Chem. Works Schrockii Hiſtoria Moſchi.

MOSCH. ARABUM. See ABELMOSCHUS.

MOSE HAZUANIA. See ENDICA.

MOSQUITÆ. It is a cutaneous diſorder in the Eaſt Indies, which *ſometimes is produced by ſweating*, and *ſometimes by the bite of an inſect*, which the Portugueſe call *moſqueta*; whence the name of the diſeaſe. When the pimples riſe on the ſkin, an itching immediately follows, which, if ſcratched, is ſoon ſucceeded by an ulcer. When ſweating is the cauſe, perſpirative medicines are taken inwardly, and the itching is allayed by waſhing the ſkin with vinegar in which nitre is diſſolved. See Bontius de Med. Ind.

MOSYLLON. See CINNAMOMUM.

MOTA. See CASTANA.

MOTORES OCULORUM. Theſe nerves are alſo called *motorii oculorum communes*, *oculares communes*, and *oculo-muſculares*. Theſe are the third pair of nerves from the head; they pierce the dura mater by the ſides of the ſella turcica, run through the foramen lacerum orbitale ſuperius, and go to all the muſcles of the eyes, except the obliquus ſuperior and abductor of each. They go likewiſe to the levator palpebræ ſuperioris, and ſend twigs to form the ciliary nerves; ſome twigs are alſo ſent to the choroides and iris.

—— OCULORUM EXTERNI. Theſe nerves are alſo called *oculares externi*, *ophthalmici externi*, *orbitarii*, and *oculo-muſculares-externi*. They are the ſixth pair of nerves that go out from the head. They lie between the fifth, go the abductores *oculorum*, run forward on the ſide of the ſella turcica, and get into the orbit by the foramen lacerum orbitale ſuperius; by the ſide of the ſella turcica they give off what is called the beginning of the intercoſtal nerves, but are more properly branches of the intercoſtal, which join theſe nerves.

MOTORII. See SPASMUS CLONICUS. Alſo the MOTORES OCULORUM.

MOTOS, LINT. See CARBASUS.

MOUL-ELAVOU. See BOMBAX.

MOUL-ILA, ſeu MOUL-ELAVOU. The INDIAN LEMON-TREE, the fruit of which is both acid and aromatic like the pepper. See Raii Hiſt.

MOUNT-SION WATER. This is a chalybeate, and no known water of the kind is obſerved to keep ſo well, and to retain its natural contents ſo long. See an Eſſay on the Liverpool Spa Water, by T. Houlſton, M. D.

MOXA, alſo called *artemiſia Chinenſis*, *muſia-pattræ*, MOXA, or MUGWORT of CHINA. It is a ſoft lanuginous ſubſtance, prepared in Japan from the young leaves of a ſpecies of *mugwort*, by beating them when thoroughly dried, and rubbing them together betwixt the hands, till only the fine lanuginous fibres are left; which are then combed, and formed into ſmall cones.

The down on the leaves of mullein, cotton, hemp, &c. do as well as *moxa*.

In the eaſtern countries it is uſed by burning it on the ſkin: a little cone of the *moxa* is laid upon the part, previouſly moiſtened, and ſet on fire at the top; it burns down with a temperate glowing heat, and produces a dark-coloured ſpot, the exulceration of which is promoted by applying a little garlic; the ulcer is kept open, or healed, according to the intention in uſing the *moxa*. In the eaſtern countries, thoſe uſed as cauteries are employed in preventing and curing many complaints; but chronic rheumatiſms, gouty, and ſome other painful affections of the joints, ſeem to be the chief complaints for which they can be rationally employed. See Kæmpfer Amænit. Exot. p. 502, &c. Abbé Groſier's Hiſtory of China.

MUCAGO. See MUCILAGO.

MUCHARUM. A barbarous word, ſignifying an infuſion of roſes, made with warm water, and with ſugar reduced to a ſyrup.

MUCIFLUXUS ACTIVUS, and PASSIVUS. See GONORRHŒA.

MUCILAGO. A MUCILAGE, alſo *mucago*. It is any viſcid glutinous liquor made with warm water, as the *mucilage* of gum arabic, or of quince-ſeeds, which are made by diſſolving the gum, or the ſoluble part on the huſk of the ſeed in water.

Mucilage is alſo that humour which is ſeparated from glands about the joints, in order to the eaſy motion thereof. See SYNOVIA. FORDYCE, in his Treatiſe on the

Digeſtion of Food, ſays, *mucilage*, taken as the name of a claſs, includes animal and vegetable ſubſtances, ſolid, brittle, inflammable, decompoſable by heat, capable of being combined with water in their natural ſtate; capable of being combined with water by decoction, or Papin's digeſtion, ſo as to form a fluid. See DIGESTIO.

MUCILAGINOSA LIGAMENTA. See CAPSULARIA LIGAMENTA.

MUCOCARNEUS. In M. A. Severinus, it is an epithet for a tumor, or abſceſs, which is partly fleſhy, and partly mucous, called alſo *myxo-ſarcoma*.

MUCOSÆ GLANDULÆ. See COWPERI GLANDULÆ.

MUCOSUM LIGAMENTUM. It is betwixt the nature of a ligament and a cartilage, and full of glairy matter. It is ſituated betwixt each of the vertebræ, and admits them to recede from, or approach nearer to each other. To this it is owing, that at night a man is half an inch ſhorter than in a morning.

MUCRO. A SHARP POINT. Thoſe leaves or fruits of plants which are terminated in a ſharp point, are termed mucronated. *Mucro* is alſo the *ſharp-point* of the heart.

MUCRONATUM, Os, from *mucro*, *a point of a ſword*. See ENSIFORMIS CARTILAGO.

MUCUNA GUACU. The largeſt and moſt beautiful kind of *phaſeolus* in Braſil. It grows on a tree of the ſame name. The beans are poiſonous, but eaſily rendered fit for food. See Raii Hiſt.

MUCUS; called alſo *myxa*; *myxara*; *myxas*. By it is uſually underſtood that viſcid fluid which is ſecreted in the membrana pituitaria, and diſcharged from the noſe upon blowing. But *mucus* is the covering for the ſurfaces of all the membranes in the body that are expoſed to any extraneous matter; ſuch as the ſkin, internal membrane of the mouth, noſe, lungs, œſophagus, ſtomach, inteſtines, urinary paſſages, &c. It is a compound of coagulable matter and water. It defends the membranes from being too much ſtimulated by what is applied to them. It is colourleſs, inſipid, inodorous, and incapable of ſtimulating; but if its ſecretion is ſuddenly increaſed, inſtead of a ſimple *mucus*, it becomes a watery kind of fluid, containing the ſalts of the blood, and, in conſequence of them is capable of ſtimulating, loſes its quality of defending the membranes from acrimony, and further, its colour often is changed to a whitiſh, or a greeniſh yellow, and now and then it acquires a ſmell, and puts on, in ſome reſpects, the appearance of pus; but to diſtinguiſh one from the other, ſee PUS. See Fordyce's Elements, part i. p. 21, &c.

MUGILIS. MULLET. This, in the proper ſenſe, is the *mugil*, or *cephalus* of the generality of authors, called alſo *cephalos*, the cephalus of Ariſtotle and the Greeks, and the *ceſtreus* of Oppian, and others. It is alſo called *Bacchus*. It ſeems to be of a ſpecies between the carp and haddock; leſs dry than the one, and more ſucculent than the other. It is ſufficiently ſoluble, and nutritious. The Romans valued a fiſh of this name highly for its exquiſite reliſh; but whether this be the ſame is uncertain.

MULÆ. Puſtules contracted either by heat or cold.

MULIERATUS. See MALAZISSATUS.

MULSUM *Hydromeli*, HONEY and WATER, called alſo *aeratomeli*, from ἀκρατος, *vinum*, and μελι, *mel*; but then ſignifies wine ſweetened with *honey*. See CONDITUM.

MULTICAPSULARES PLANTÆ. They are ſuch as have ſeveral pods of ſeeds ſucceeding each flower, as the celandine, &c.

MULTIFIDUS SPINÆ MUSCULUS. This muſcle lies under the ſpinalis. It riſes from the roots of the tranſverſe proceſſes, and runs to the roots of the ſpinal proceſſes; it is commonly called *tranſverſalis*, and is diſtinguiſhed into the *tranſverſalis colli*, *dorſi*, and *lumborum*. The tranſverſalis lumborum is alſo called *ſacer*; which ſee.

MULTIFORME Os. See CUBOIDES OS.

MULTIPEDÆ. The ſame as MILLEPEDES. See ASELLI.

MULTIPES. POLYPUS.

MULTISILIQUÆ PLANTÆ. They are ſuch as have after each flower many diſtinct, long, ſlender, and many times crooked caſes, or ſiliquæ, in which their ſeed is contained; and which, when they ripen, open of themſelves, and let the ſeeds drop. Of this kind are columbines, houſleek, &c. It is the name of the twenty-third order in the fragments of a natural method in *Philoſophia Botanica*; and of the twenty-ſixth in the Ordines Naturales, at the end of Linnæus Genera Plantarum.

MUMIA. MUMMY. This name is variouſly applied. It ſignifies *piſſaſphaltum*, or *bitumen*, or a certain liquamen found in ſepulchres, in which the bodies of men which have been embalmed with ſpices, have been preſerved many years,—alſo a carcaſe that is dried by the ſun and ſands. Theſe bodies, by drying, are of the conſiſtence of horn, and light, and are called white *mummies*. Other carcaſes are embalmed, and then are called *mummies*; of this kind are thoſe which are called Egyptian.—*Mumia medullæ* is the marrow of the bones. —*Mumia elementorum*; ſo Paracelſus and Helmont name a balſam, which is defined to be the balſam of the external elements.—*Mumia tranſmarina*; thus, ſome have called manna.—*Mumia*; thus water is called which is collected in a phial from the breath of a man received therein, after waſhing his mouth with water.—*Mumia*; it is a ſubtil, ſpirituous, ætherial ſubſtance, innate in every body, and remaining therein in ſome meaſure after death.—*Mumia*, that which is taken from a human body is a reſinous matter, hath an hardened, black, ſhining ſurface, is acrid and bitter to the taſte, and of a fragrant ſmell. *Mumia*, that which is particularly called *mummy* of the Arabians, is a concreted liquor, obtained in ſepulchres by exudation from carcaſſes embalmed with aloes, myrrh, and balſam.

MUNDI ANIMA. PLATO treats at large of his ψυχη του κοσμου, in his Timæus; which his ſcholars thus explain: *Anima mundi* is a certain univerſal, æthereal ſpirit, which exiſts perfectly pure in the heavens, as retaining its proper nature; but on the earth pervading elementary bodies, and intimately mixing with all the minute atoms thereof, it aſſumes ſomewhat of their nature, and becomes of a peculiar kind. The idea is elegantly expreſſed, and fully comprehended in the following lines:

" Spiritus intus alit, totoſque infuſa per artus,
" Mens agitat molem, & magno ſe corpore miſcet."

See ARCHÆUS, ANIMA MUNDI.

MUNDICATIVA, } Cleaning, deterging, puri-
MUNDIFICATIVA. } fying.

MUNDIFICATIVUM PARACELSI. ℞ Mel Brit. tereb. Venet. āā ℔ ß. vitel. quatuor ov. coq. ad conſiſt. ung. & ad fing. ʒ i. adde hydrar. nitrat. rub. ʒ i.

MUNDY-GUACU. See CATAPUTIA MINOR.

MUOIDES. See PLATYSMA MYOIDES.

MURALIS. See PARIETARIA.

MURECI. A berry-bearing tree in Braſil; the berries are purging. See Raii Hiſt.

MURIA. BRINE. It is made of common ſalt, and ſo of the ſame nature and uſe. An acrimony in the juices reſembling that of *brine*, is called a *muriatic acrimony*.

MUSA, alſo called *muza*, *mauz*, *palma humilis*, *ficus Indica*, *bala*, *platanus*. The PLANTAIN-TREE.

Muſa is the Arabic name; *bala* is the Malabarian name. Though called a tree, it hardly deſerves the name of a ſhrub, ſince it hath an annual ſtalk, which is like a reed. The leaves are an ell long, and three ſpans broad; of theſe leaves it is ſuppoſed *that Adam and Eve made aprons*. The fruit is a delicous food, and reſembles meal and butter. It is found in all the eaſtern countries, and in Africa. See Raii Hiſt.

MUSA *fructu cucumerino breviori*. See BANANA.

MUSADI. See AMMONIACUS SAL.

MUSAM. See CASSADA.

MUSCÆ HYSPANICÆ. See CANTHARIDES.

MUSCARI. See BULBOS VOMITORIUS.

MUSCARUM FUNGUS. See BESONA.

MUSCIPULA, alſo called *lychnis viſcoſa rubra*, *viſcaria*. CATCH-FLY. It grows among corn, and is cultivated in gardens, but not uſed in medicine, though ſome ſay its ſeeds are warm and diuretic. See Raii Hiſt.

—— PRATENSIS. See BEHEN ALB. VULG.

MUSCOSÆ GLANDULÆ. Some of the conglobate glands are thus called, to diſtinguiſh them from the *conglomerate*, which are called *glandulæ vaſculoſæ*.

MUSCULARIS ARTERIA. See SCAPULARIÆ ARTERIÆ.

—— VENA. A branch of the poſterior or upper branch of the external jugular; it ſpreads in the muſcles, which cover the ſcapula and joint of the humerus. Winſlow ſpeaks of its riſing alſo from the axillaris.

MUSCULI OBLIQUI SUPERIORES NERVI, See PATHETICUS.

MUSCULO-

MUSCULO CUTANEUS NERVUS. See CERVICALES.

MUSCULORUM COMMUNIS MEMBRANA. } MUSCULOSA. }

Winſlow denies its exiſtence, but others deſcribe it as conſiſting of ſome ſmall fibres glued together, a proper quantity of which is connected by the cellular membrane, which fills up the interſtices of muſcles. Winſlow ſays, that the elongations of the lamina of the cellular membrane may have given riſe to the notion of a muſc. com. memb. for in ſome places this membrane is cloſely united to the proper membrane of the muſcles.

MUSCULOSI. External or muſcular inflammations.

MUSCULUS. See MYTILUS, and CETUS. A MUSCLE generally is ſaid to be derived from *mus, a mouſe*; but the true derivation is from μυειν, *to draw* or *contract*. Muſcles conſiſt of thoſe bundles of fleſhy fibres by which the motions of all animal bodies are performed; or, as ſome deſcribe it, "it is a bundle of thin and parallel plates of fleſhy threads or fibres incloſed by one membrane; an original part of an animal body, framed of its proper membrane, fibrous fleſh, a tendon, vein, artery, and nerve: it hath the power of contracting and lengthening, and is the chief inſtrument of voluntary motion," See LACERTULI.

A *muſcle* is divided into the head, belly, and tail. The head is the tendinous part which is fixed on the immovable joint, and is called its ORIGIN. The BELLY is the middle, fleſhy part, whoſe fibres are the true muſcular fibres, and have the power of motion. The TAIL is the tendinous part, which is inſerted into the part to be moved by it, and is called the inſertion.

A *muſcle* is compoſed of the ſame number of fibres in all its parts, only thoſe of the tendon are more compact than thoſe of the belly.

The arteries, veins, and nerves, generally enter the middle of *muſcles*, but this is not certain or conſtant; they ramify alike throughout their whole ſubſtance.—*The large arteries* and veins run according to the direction of the muſcular fibres; *the leſs* anaſtomoſe and run tranſverſe.—*The uſe of the nerve* in a *muſcle*, is to bring the immediate cauſe of motion thereto; that of the *arteries* is to diſtribute the blood throughout the part: but a *muſcle* hath more blood conveyed to it than is required for its nouriſhment, and, therefore, the free influx of blood ſeems neceſſary to the contraction of the *muſcle*. Albinus ſays, that the arteries in the *muſcles* terminate in the cellular membrane and the muſcular fibres; but this latter termination is not to be proved.

Thoſe *muſcles* which are deſtined for the moſt action, have the larger quantity of nerves imparted to them, and vice verſa.

The *muſcles* are commonly attached to the bones, and the tendons are inſerted into the ſubſtance of the bone. When a *muſcle* is fleſhy at its inſertion, it is only fixed to the perioſteum.—Some *muſcles* are fixed to cartilages, but do not ſink into them, being only attached to the perichondrium.—Some are fixed to ligaments; as thoſe in the fore-arm; others into membranes, as thoſe of the eye; and others again into fleſhy parts, as thoſe of the tongue.

There are many diviſions of *muſcles*, ſuch as the *oblong*, *hollow*, and *mixt*; the oblong are ſubdivided into the rectilinear, half penniform, the penniform, the complex penniform, the radiated, &c.

The uſe of the tendon is, 1ſt. To avoid a large quantity of fleſh, near the joint, which would have obſtructed the motion of the limb. 2dly. To prevent clumſineſs in particular places, for fleſh in the hand would have been inconvenient. 3dly. That the fleſhy part of the muſcle might be nearer the center of motion. 4thly. For the better admitting of that friction, which in leſs compact parts would have been injurious.

The appendicles of *muſcles*, are, 1ſt. The faſcia, or aponeuroſis. 2d. The frænum, or annular ligament, by which the tendons of ſome *muſcles* are confined. 3d. The oculi mucoſi.

Amongſt the many phænomena relating to *muſcles*, the following are a few which deſerve ſome attention. 1. A *muſcle* in action grows tenſe and ſhorter; it can contract itſelf ſo as to be ſhortened one third. 2. The diameter of a *muſcle* in action is not greatly increaſed. 3. If the brain is injured to a certain degree, all the *muſcles* ſubſervient to the will become paralytic. 4. If the cerebellum is injured, all the involuntary motions ceaſe. 5. If a nerve, or an artery, going to a *muſcle*, is tied, or deſtroyed, the *muſcle* becomes paralytic. 6. Irritation upon the *muſcle* produces motion. 7. Some *muſcles* continue to act, after all communication with the nerves and blood veſſels is taken away. 8. The action of *muſcles* is inſtantaneous, and, in moſt parts of the body, ſubſervient to the will. This laſt phænomenon alone, Dr. Hunter obſerves, is ſufficient to confute the various hypotheſes of Crowne, Mayow, Borelli, Keil, Boerhaave, Baglivi, Cowper, Nichols, Vernoulli, &c. as the numerous apparatus which they ſuppoſe neceſſary, can never account for that inſtantaneous exertion which is obſervable in muſcular motion. See Brown on the *Muſcles*. Winſlow's Anatomy. Cooper's and Albinus's Tables of the *Muſcles*. Innes and Douglas on the *Muſcles*.

MUSCULUS ANTERIOR MALLEI, —— EXTERNUS AURIS DU VERNII. } Called alſo *anterior malleolus*: it is placed in a fiſſure on the temporal bone, above the glenoid cavity, where the lower jaw plays, runs inward, and is inſerted into the Ravian proceſs of the malleus irregularly forwards from the incus, and by taking off from the vibratory motion of the bones, it is ſuppoſed to fit the ear for receiving weaker ſounds.

—— EXTERIOR. See ABDUCTOR OCULI, N° 5.

—— INFERIOR. See DEPRESSOR OCULI.

—— TUBÆ NOVUS VALSALVÆ. See CIRCUMFLEXUS PALATI.

MUSCUS. Moss. Numberleſs almoſt are their varieties; but as they ſhare little or nothing in medical worth, the curious are referred to Ray, Dale, Miller, and other botanic writers. It is alſo a name for theſe and many other vegetable productions. See CORALLINA, LICHEN ARBOREUS PULLUS, COELIFOLIUM; and the term will be found in ſome authors joined to ſome ſpecies of coralloides, lycoperdon, filix, and ſome others in the vegetable kingdom.

MUSCUS CLAVATUS. See LYCOPODIUM.

—— PULMONARIUS, called alſo *pulmonaria arborea*, OAK-LUNGS, and LUNG-WORT. It is made up of flat, wrinkled, rough leaves, greeniſh above and aſh-coloured underneath, having ſeveral round, reddiſh-brown ſpots on the ſuperficies, in which the ſeed is ſuppoſed to lie. It hath a bitteriſh and reſtringent taſte; and grows ſpontaneouſly on the oak-tree. See Miller's Bot. Off.

—— PYXIDATUS, called alſo *muſcus pyxoides terreſtris, lichen pyxidatus major*. CUP-MOSS. It is a ſpecies of *lichen*, hath many hoary, whitiſh green, ſmall leaves, ſpread on the ſurface of the earth, among which ariſe little, whitiſh, duſky, hollow cups, a quarter of an inch high, ſhewing neither flower nor ſeed; it grows upon dry barren ground. A decoction of this is reckoned a ſpecific againſt the hooping cough.

—— SQUAMOSUS—TERRESTRIS. See LYCOPODIUM.

MUSCÆ HISPANICÆ. See CANTHARIDES.

MUSIA-PATTRÆ. See MOXA.

MUSTELANEI. See ANCI.

MUSTUM. MUST, called alſo *gleucos*. By *muſt* is meant the ſaccharine juice of ſeveral fruits, ſuſceptible of the ſpirituous fermentation, and particularly of grapes, before the commencement of this fermentation; accordingly *muſt* is, properly ſpeaking, what is called ſweet wine. When this is boiled till one third is conſumed, it is then called CARÆNUM; boiled into the conſumption of one half, before it is permitted to ferment into wine, DEFRUTUM; HEPSEMA; and when its fermentation hath been prevented, or prematurely ſuppreſſed by fumigation with ſulphur, STUM. See VINUM.

MUSTUS. The WHITE CALX of URINE.

MUTELLINA. See MEUM ALP. GERM.

MUTITAS. DUMBNESS. The want of power to articulate words. Dr. Cullen places this genus of diſeaſe in the CLASS LOCALES, and ORDER DYSCINESIÆ, which he defines, an inability of articulating words. He diſtinguiſhes three ſpecies. 1. *Mutitas organica*; when the tongue is taken away, or injured: 2. *Mutitas atonica*; when the nerves of the tongue are injured; 3. *Mutitas ſurdorum*; ariſing from children being born deaf, or becoming ſo in their infantile years.

MUZA. See MUSA.

MYACANTHA. See RUSCUS.

MYAGRO. See RAPISTRUM.

MYAGRUM. This plant hath a turbinated fruit, like an inverted pear, unicapſular, preſſing in the ſtalk, containing one ſeed with two empty cells. Boerhaave mentions two ſpecies. Their virtues are the ſame as thoſe of rapiſtrum. It is alſo a name for *raphaniſtrum*.

MYCE, from μυω, *to wink, ſhut up*, or *obſtruct*. A WINK-

WINKING, CLOSING, or OBSTRUCTION. It is applied to the eyes, to ulcers, and to the viſcera, eſpecially the ſpleen, where it imports obſtruction. In BOTANY it imports a fungus. In SURGERY it is a fungus, ſuch as riſes in ulcers or wounds. Some writers ſpeak of a yellow vitriol which is called *myce*.

MYCHTHISMOS, from μυζω, *to mutter* or *groan*. In Hippocrates it is a ſort of ſighing or groaning during reſpiration, whilſt the air is forced out of the lungs.

MYCONOIDES. An epithet for an ulcer which is full of mucus.

MYCTER. See NASUS.

MYCTERES, μυκτηρ. A Greek primitive. See NARES.

MYDESIS, from μυδαω, *to abound with moiſture*. It imports in general, a corruption of any part from a redundant moiſture. But Galen applies it particularly to the eye-lids.

MYDON. Fungous fleſh in a fiſtulous ulcer.

MYDOSAN. See MORTIFICATIO.

MYDRIASIS. See AMAUROSIS.

MYLACRIS. See PATELLA.

MYLE. See PATELLA and MOLA.

MYLO-GLOSSI, from μυλη, *dens molaris*, and γλωσσα, *lingua*. Theſe muſcles are often wanting. They are ſmall fleſhy planes, ſituated tranſverſely on each ſide, between the ramus of the lower jaw and the baſis of the tongue; they riſe from near the inner ſide of the dentes molares, and thence run to the baſis of the tongue.

—— HYOIDES. Theſe muſcles riſe with a large baſis from the inferior part of the lower jaw, and are inſerted at the baſis of the os hyoides.

—— PHARYNGÆI. See GENIOPHARYNGÆI. So alſo the *cephalo-pharyngæi* are called. See PHARYNX.

MYLON. See STAPHYLOMA.

MYOCEPHALON, from μυια, *a fly*, and κεφαλη, *the head*. A tumor in the uvea tunica of the eye, which reſembles the head of a fly. See STAPHYLOMA.

MYOCOILITIS, from μυων, *muſculus*, and κοιλια, *venter*. So Vogel names inflammation of the muſcles of he belly. See INFLAMMATIO MUSC. ABDOMINIS.

MYOLOGIA, from μυς, *a muſcle*, and λογος, *ſermo*, a diſcourſe on the muſcles.

MYOPIA, } from μυω, *to ſhut*, and ωψ, *the eye*.
MYOPIASIS. } SHORT SIGHT, called alſo *nucioſitas*. Becauſe people ſo affected generally half ſhut their eyes when they look attentively at an object. The ſight of *myopes* is ſo ſhort that they can neither read nor diſtinguiſh objects without concave glaſſes; this is owing to the too great convexity of the cryſtalline humor of the eye, whereby the rays, unleſs the object is placed cloſe to the eye, are united before they reach the retina; conſequently viſion muſt be indiſtinct in ſuch. The concavity of the ſpectacles muſt be proportioned to the ſight, and *myopes* ſhould begin with the leaſt concave glaſſes, and when they read they ſhould uſe them as little as they conveniently can. It is the *dyſopia diſſitorum* Culleni. See AMBLYOPIA.

MYOPS. A perſon who is ſhort ſighted.

MYORESHALON. A growing of the tunica uvea over the ſight.

MYOSITIS. In Sagar's Syſtem of Noſology this word is uſed to ſignify the rheumatiſm, particularly when it affects the muſcles of the limbs proceeding from the joints. See RHEUMATISMUS.

MYOSUROS, called alſo *cauda muris*, *holoſteum*, *holoeſtes*, *ranunculus*. MOUSE-TAIL. The leaves are gramineous; it flowers in May; it grows on the wayſides; its virtues are like thoſe of plantain.

MYOTOMIA, from μυς, *a muſcle*, and τεμνω, *to cut*. A diſſection of the *muſcles*.

MYPOUN. See TINCAL.

MYREPSICUM OLEUM. See BEN.

MYRICA. See TAMARISCUS.

MYRINGA, } See AUDITUS.
MYRINX. }

MYRISTICA MOSCHATA, } See NUX MOSCHATA.
MYRISTICA NUX. }

MYRMECIA. A ſort of wart about the ſize of a lupine, with a broad baſe, deeply rooted, and very painful. It grows on the palms of the hands, or on the ſoles of the feet It is a ſoft and often moiſt ſort of wart.

MYROBALANI. MYROBALANS. They are a dried fruit of the plum kind, and are brought from the Eaſt Indies. See ADIPSOS There are four kinds, brought from Bengal, called *faba Bengalenſis*, *Cambaia*, and *Malabar*. They have been recommended as ſomewhat aſtringent, and ſtrengtheners of the ſtomach, but are not now in uſe. *Myrobalanes* is in the Greek the ſame as *nux* or *glans unguentaria* in the Latin, which, in Engliſh, is a NUT or ACORN fit for making precious ointments. Out of the *myrobalans* deſcribed by Dioſcorides, Pliny, and Galen, they uſed to expreſs a fragrant oil, which was uſed in ointments. Of the *mylobalans* there are different kinds, viz.

MYROBALANI BELLIRICI, called alſo by the Arabians *Belleregi*, *Bellileg*, *Bellegu*, *Bellericæ*. BELLIRICK MYROBALANS. They are of a yellowiſh grey colour, and an irregularly roundiſh or oblong figure, about an inch long, and three quarters of an inch thick.

—— CHEBULÆ; CHEBUL MYROBALANS. Theſe reſemble the yellow ſort in figure and their ridges, but are larger and darker coloured, inclining to brown or blackiſh, and with a thicker pulp.

—— CITRINI, vel YLAVI. CITRON, or YELLOW MYROBALANS. They are ſomewhat longer than the Belliric ſort, have generally five large longitudinal ridges, and as many ſmaller between them, ſomewhat pointed at both ends.

—— EMBLICI, called alſo by the Arabians, *embleg*, or *ambegu*. EMBLIC MYROBALANS. They are of a dark blackiſh grey colour, roundiſh, about half an inch thick, with ſix hexagonal faces opening from one another.

—— INDICI, vel NIGRI, alſo called by the Arabians *aſuar*. INDIAN or BLACK MYROBALANS. They are of a deep black colour, oblong, octangular, differing from all the others in having no ſtone, or only the rudiments of one, from whence they are ſuppoſed to have been gathered before maturity.

All the ſorts have an unpleaſant, bitteriſh, auſtere taſte, and ſtrike a black colour with a ſolution of vitriol. They are gently purgative and aſtringent. The doſe in ſubſtance is from ʒ i. to ʒ ſs.—in infuſion or decoction from ʒ ſs. to ʒ i. ſs. Water extracts their ſtyptic virtue, and the extract is aſtringent. The Indians tan leather with them.—The *faba Bengalenſis*, or the BENGAL BEAN, is a vitiated fruit of the *myrobalans* kind; it is round, flattiſh, wrinkled, and of the ſize of a ſmall fig, hollow in the middle, of an irregular ſhape, hard, tough, brown outwardly, and blackiſh within, of but little ſmell, but an auſtere and aſtringent taſte. It is vitiated by the puncture of an inſect, by which it is often hollowed like a gall. It is a powerful aſtringent; it alſo incraſſates and allays acrimony. See Raii Hiſt. Tournefort's Mat. Med.

MYROBALANUS ZEYLANICUS. See ELEMI.

MYRON. An ointment, medicated oil, or unguent.

MYROPHYLLON, called alſo *millefolium aquaticum*. WATER FENNEL. It grows in marſhy ſoil; flowers in April, and is ſaid to be vulnerary. See Raii Hiſt.

MYROXYLON. See PERUVIANUM BALSAMUM.

MYRRHA. MYRRH. The ancient character for myrrh was Z z. It is alſo called *ſtacte*, and the worſt ſort *ergaſma*. DIOSCORIDES mentions a pinguious ſpecies called GABIREA. It is a gummy reſinous concrete, brought immediately from Alexandria, Smyrna, and Aleppo; but from what plant it is obtained is uncertain. It is ſaid to be a produce of the SCANDIX ODORATA, or SCANDIX *feminibus ſulcatis angulatis, floribus albis*, CLASS PENTANDRIA, ORD. DYGYNIA, LINN. Gen. Plant. 357. SWEET-FERN, or MYRRH. It is brought to us in globes or drops of various colours and ſizes. That of a reddiſh brown colour, not verging too much to yellowiſh or blackiſh, which is uniform on the outſide, internally ſpeckled or ſtreaked with white, clear and bright, ſomewhat unctuous to the touch, but not tenacious ſo as to ſtick to the fingers, is the beſt.

This drug is ſubject to a variety of frauds; it is mixed with hard, ſhining, yellow pieces of a gum which reſembles gum arabic, and is void of ſmell or taſte. Pieces of bdellium are mixed with it, and are known by their darker colour, and their being ſoft within, which *myrrh* never is; alſo by their different ſmell and taſte. Sometimes an unctuous gummy reſin, of a moderately ſtrong, ſomewhat ungrateful ſmell, and a bitteriſh, very durable taſte, obviouſly different both from thoſe of bdellium and *myrrh*. Alſo pieces of a hard, compact, dark-coloured kind of tears, leſs unctuous than *myrrh*, of an offenſive ſmell, a moſt ungrateful bitterneſs, and of a very reſinous nature. The *myrrh* itſelf is either, 1. *Blackiſh*, which is gathered from old trees, and being more reſinous, is fitter for tinctures. 2. *Yellow*, which is from young trees; this

this sort contains much gum; *it easily dissolves in the mouth, hath a much more agreeable aromatic smell, and is what should be used for pills, powders, and watery solutions.*

Myrrh is esteemed as being balsamic, vulnerary, antiseptic, attenuant, deobstruent, powerfully promoting the fluid secretions, &c. Its dose may be from gr. v. to ʒ ss. or more.

It manifestly stimulates the stomach, and promotes, in small doses, appetite and digestion; but in doses of ʒ ss. or ʒ ij. it heats the stomach, creates a frequency of the pulse and a heat over the whole body. It strengthens also the viscera, attenuates viscid lymphs, promotes secretions, resists putrefaction, and removes uterine obstructions. In obstinate intermittents, hectic and cachectic habits, and in putrid, pestilential fevers, it has been recommended. Though it may be an useful medicine in that flaccidity of the system, which is often connected with a retention of the menses, from its stimulating power in phthisical cases, in which it has been much recommended, it seems not so proper, for harm has been found to arise from it in complaints of this sort.

It dissolves almost totally in boiling water, but as the liquor cools, the resinous part subsides; and if the solution is evaporated to an extract, the bitter of this drug only remains. By distillation with a boiling heat in water, the whole of its flavour arises, partly impregnating the distilled water, and partly collected and concentrated in the form of an essential oil, which is in smell extremely fragrant, and rather more agreeable than the *myrrh* in substance; in taste remarkably mild, and so ponderous as to sink in water. Two drams of this oil are obtained from ʒ xvi. of the gum; if the gum is very good, ʒ iij. Rectified spirit dissolves less *myrrh* than water does; but it extracts more perfectly that in which its bitterness, flavour, and virtue consist. The spirituous solution contains all the active matter; in distillation nothing is carried away by the spirit, so that the extract obtained from a spirituous solution is a very fragrant, bitter, tenacious resin, and possesses all the virtue of the *myrrh*.

The London College directs the tincture of *myrrh* to be prepared in the following manner: Take *myrrh*, bruised, three ounces by weight; proof spirit of wine, one pint and a half; rectified spirit of wine, half a pint; digest with a gentle heat for eight days, and strain. Pharm. Lond. 1788. This tincture is frequently employed in detergent gargles (see APHTHÆ); but if one ounce of hepatic aloes is added it becomes the tinctura myrrhæ cum aloe, and is used externally to ulcers as a vulnerary, and is of service in such as are foul and fœtid, and require stimulating applications.

ELIXIR MYRRHÆ COMPOSITUM. *The Compound Elixir of* MYRRH. *Now called Tinctura Sabinæ Composita. Compound Tincture of* SAVIN.

Take of the extract of savin, one ounce; of the tincture of castor, one pint; of the tincture of *myrrh*, half a pint. Digest until the extract is dissolved, and strain. Pharm. Lond. 1788. This was formerly called *elixir uterinum*. Dose 20 to 40 drops or more in a cup of pennyroyal tea twice a day. It is esteemed a good emenagogue, and possesses similar virtues to the powder and extract of sabine.

Pulv. e MYRRHÆ *Comp. Compound Powder of* MYRRH.

Take of the leaves of dried rue, savin, *myrrh*, and Russia castor, of each an ounce; mix and beat them into a powder. Pharm. Lond. 1788. Dose 15 to 30 grains two or three times a day. In uterine obstructions and hysteric cases it is an efficacious medicine.

PULVIS MYRRHÆ cum LAPIDE CALAMINARI. ℞ Myrrhæ, lapid. calaminaris pp. ȝ ss ʒ ij. m. This is merely sprinkled upon an ulcer, which is afterwards dressed superficially to promote its cicatrization.

Oleum MYRRHÆ *per Deliquium.*

Boil an egg very hard, take out the yolk, and fill the cavity with *myrrh*, bind the divided sides together, set it in a cool moist cellar, and it will all run into a liquid.

It is used for removing freckles in the face. It possesses all the smell and taste of the *myrrh*; it may be precipitated and coagulated by spirit of wine; and this coagulum is again dissolved by water. See Raii Hist. Miller's Bot. Offic. Tournefort's Mat. Med. Lewis's Mat. Med. Neumann's Chem. Works. Cullen's Mat. Med.

MYRRHA. See ANIME.

MYRRHINE. See MYRTUS.

MYRRHIS, called also *cerefolium Hispanicum, conile*, so called from its resemblance to *conium, hemlock, cicutaria odorata*, SWEET CICELY, GREAT CHERVIL. It is the SCANDIX ODORATA Linn. Boerhaave enumerates fifteen species, and gives the following as characters; the petals are unequal, the seed striated, resembling the beak of a bird. This plant is cultivated in gardens, and agrees in virtues with chærefolium. It also hath something of the taste of cloves, and, like them, is useful in the scurvy. The branches resemble those of fern, have a pleasant aromatic smell, the stalks are hairy, the flowers are white, and appear in May or June. It is more an eculent than a medicinal plant, though it is somewhat diuretic. See Raii Hist.

MYRRHIS ANNUA. See DAUCUS CRETICUS.

—— SYLVESTRIS. A name of the *chærophillum sylvestre*, &c.

MYRTACANTHA. See RUSCUS.

MYRTIDANON. By this Hippocrates means the fruit of the Indicum, thus called from resembling myrtle berries, which he says the Indians call pepper. But Dioscorides means by it an excrescence which grows on the trunk of the myrtle, and which is more astringent than the myrtle itself.

MYRTILLI. See MYRTUS COM. ITALICA.

MYRTOCHEILIDES. See NYMPHÆ.

MYRTON. See CLITORIS.

MYRTUS. The MYRTLE, called also *myrrhine*. Some derive the name from *myrrha*, because it smells like myrrh; others from *Myrtha, a virgin*, said to be turned into this tree after her death; she was beloved by Pallas.

MYRTUS BRABANTICA, and ANGLICA, called also *Thus myrtifolia belgica, gale, gagel; rhus sylvestris; acaron; frutex odoratus septentrionalium, elæagnus, elæagnus cordi, chamælæagnus* Dodonæo. GAULE, SWEET-WILLOW, DUTCH MYRTLE.

It is a small shrub, much branched, with oblong, smooth, whitish green leaves, somewhat pointed or converging at each end; among which arise pedicles bearing scaly cones, which include the seeds, one little seed being lodged in each scale. It grows wild in heaths, uncultivated places, and waste watery places, in many parts of England. It flowers in May or June, ripens its seeds in August, and loses its leaves in winter. The leaves, flowers, and seeds, have a strong fragrant flavour, and a bitter taste; they are used to destroy moths and cutaneous insects, of which they are reckoned destructive of all kinds. An infusion of them, taken inwardly, destroys worms, and strengthens the stomach. They are a good substitute for hops, and are used by some to preserve malt liquor, which they do very well, but renders it very inebriating. In some countries this plant is held in high esteem, but hath not obtained with us. BOERHAAVE hath enumerated three species. See Raii Hist. Plant. Lewis's Mat. Med.

—— COMMUNIS ITALICA. COMMON MYRTLE. The MYRTUS COMMUNIS Linn. It is an evergreen shrub, with oblong leaves, pointed at both ends, in the bosoms of which spring solitary white pentapetalous flowers, followed by black oblong umbilicated berries, full of white crooked seeds. It is a native of the southern parts of Europe; the berries, which are called *myrtilli*, rarely come to perfection with us.

The berries are recommended in alvine and uterine fluxes, and disorders from laxity and debility; they have a roughish not unpleasant taste, and are accompanied with a sweetish aromatic flavour. The leaves are astringent, and if rubbed they yield an aromatic flavour. See Raii Hist. Lewis's Mat. Med.

MYRTUS PIMENTA vel JAMAICENSIS. See PIPER JAMAICENSIS.

MYSTICETUS. See CETUS.

MYTILUS. The MUSSEL, called also *musculus*. As from mushrooms, so from this shell fish very alarming symptoms are often produced. Some attribute these effects to a quality in the *mussels*, either proper to this fish, in general, or accidentally acquired from the situation in which they derive their nourishment: others charge the pea-crab, which is often found in them, as the injurious cause; but as similar effects are observed to arise from various other causes besides mushrooms and *mussels*, the peculiarity of the person's constitution seems to be that to which the whole is owing. On undoubted evidence it appears, that similar complaints have often been produced by eating salmon, by taking the Peruvian bark, by wash-

ing the hands in water after fiſh hath been boiled in it, bathing in the ſea, cantharides applied to the ſkin, the internal uſe of wild valerian root, &c. When an itching, &c. affects the ſkin from external applications, it may be ſaid that ſuch effects ariſe from a mechanical cauſe. When the ſame ſymptoms ariſe in the ſame parts from various kinds of aliment and medicine received into the ſtomach, is it not from the influence of ſympathy that they are produced? This idea ſeems to be ſtrongly confirmed by the relief that ſoon follows from diſcharging thoſe aliments or medicines by an active emetic.

The ſymptoms conſequent on eating *muſſels*, are accurately deſcribed in the ſecond volume of the Memoirs of the Academy at Bruſſels, and tranſlated in the following manner: "The ſigns which announce the noxious effects of boiled *muſſels*, are an univerſal uneaſineſs or numbneſs, that commonly takes place three or four hours after they have been eaten. Theſe ſymptoms are ſucceeded by a tightneſs of the throat, a ſenſe of heat about the head and eyes, immoderate thirſt, nauſea, and ſometimes vomiting. If the patient hath the good fortune to vomit up the whole of the offenſive matter, this evacuation is generally ſufficient to ſtop the progreſs of the complaint; but if he does not bring up any, or only a part of the noxious ſubſtance, the diſorder becomes more or leſs alarming, according to the quantity of deleterious matter in the firſt paſſages, and the particular conſtitution of the patient. The want of a ſufficient evacuation by vomit increaſes the tightneſs of the throat, and the ſwelling of the face, eyes, and tongue; all the parts within the mouth appear inflamed, and as it were excoriated, and the redneſs ſoon ſpreads to the outer ſurface, appearing firſt in the face, and extending from thence to the neck, breaſt, and abdomen, and by degrees over the whole body. *This particular eruption is the ſymptom the moſt diſtinguiſhing and characteriſtic of the malignancy of muſſels*; it is conſtantly accompanied with a kind of delirium, with a ſingular uneaſineſs, and an inſupporſable itching; it has no affinity with the eruption produced by the eryſipetalous fever, with the ſcarlatina, meaſles, purpura urticata, or any other known ſpecies of red eruption: it has theſe particularities, viz. that it never appears unleſs *muſſels* have been eaten; that it is not preceded by fever; that it is accompanied by ſymptoms which appear united in no other diſeaſe; and laſtly, that the whole ſurface of the body, though redder than in any other eruptive diſeaſe, appears as it were ſpotted with an infinite number of red ſpots of a deeper red than the reſt of the ſkin. Theſe points are infinitely ſmaller than a millet ſeed; if we examine them through a lens, we ſee diſtinctly that they are the opening or pores of the cuticle, which leave minute ſpots of the cutis expoſed to our view, while the redneſs which is ſeen only through the epidermis, appears of a paler hue." See Lond. Med. Journal, vol. iii.

In general, when people are thus affected by eating *muſſels*, the ſame treatment will be proper as that directed when muſhrooms are the offending cauſe. See AMANITA. The itching is conſiderably allayed by waſhing the whole ſurface of the body with vinegar and water for about half an hour.

The author of the above account of the ſymptoms that are the effect of eating *muſſels*, adviſes, as a preventive of their injuries, to waſh them with water, and afterwards with vinegar, and then to boil them for uſe in an earthen pot with vinegar and water, and a few grains of Jamaica pepper.

MYTTOTUM. A kind of food made of garlic, onions, and cheeſe, bruiſed together.

MYURUS. An epithet for a ſort of ſinking pulſe, when the ſecond ſtroke is leſs than the firſt, the third than ſecond, &c. Of this there are two kinds; the firſt is when the pulſe ſo ſinks as not to riſe again; the other, when it returns again and riſes in ſome degree. Both are eſteemed bad preſages.

MYXAS, MEXAS, vel MYXARA. Mucus. But IN BOTANY it is a plant which is alſo called *ſebeſten, ſebeſtina domeſtica*. See SEBESTEN.

MYXOSARCOMA. See MUCOCARNEUS.

N.

NAC NAL

N, In preſcription, ſignifies number.
NABEA. See ŒNOPLIA.
NABIT. See SACCHARUM.
NACTA. See ABSCESSUS PECTORIS, and MAMMÆ.
NADUCEM. See MOLA.
NÆVUS. A MOLE ON THE SKIN, generally called *nævus maternus, a mother's mark, macula matricis, ſtigma*; ſee MACULA. Alſo the tumor known by the name of a WEN, called alſo *encyſtis*. Dr. Cullen gives the *wen*, the general name LUPIA; and, conſidering it as a genus, he places it in the CLASS LOCALES, and ORD. TUMORES, which he defines, an extuberance under the ſkin, moveable, ſoft, and without pain.

All preternatural tumors on the ſkin, in the form of a wart or tubercle, are called excreſcences; by the Greeks they are called *acrothymia*; and when they are born with a perſon, they are called *nævi materni, metrocelides*, or MARKS FROM THE MOTHER. A large tumor depending from the ſkin is denominated *ſarcoma*. Theſe appear on any part of the body; ſome of them differ in their colour from the reſt of the ſkin, whilſt others are red, black, &c. Their ſhapes are various, ſome reſembling ſtrawberries, others grapes, &c. Heiſter adviſes their removal by means of a ligature, a cautery, or a knife, as circumſtances beſt ſuit.

As to the tumor called a *wen*, its different ſpecies are diſtinguiſhed by their contents. Dr. Aitken, in his Elements of Surgery, divides the *wen* into the following ſpecies. 1. *Atheroma*. 2. *Meliceris*. 3. *Steatoma*. They are encyſted tumors; the matter contained in the firſt three following, is inſpiſſated lymph; and that in the fourth is only fat. Monſ. Litre is the firſt who hath particularly deſcribed the fourth kind; and to the following purpoſe he ſpeaks of them all. A *wen* is ſaid to be of three ſorts, according to the kind of matter it contains. The ATHEROMA is colourleſs, void of pain; containing in a cyſt, a matter like pap, boiled rice, or curds, intermixed ſometimes with hard corpuſcules, and ſometimes with a hardiſh matter, like the chewed bones of chickens. It is of an irregular ſhape, not eaſily impreſſed with the finger, nor after impreſſion does it eaſily riſe again, in which it differs from the meliceris.—If it reſembles honey, it is named *meliceris*;—and, if it is like ſuet, it is denominated STEATOMA, which ſee:—but there is a fourth ſort, which may be called LIPOME, becauſe of its fat contents reſembling greaſe. He ſays, that he hath ſeen one on the ſhoulders of a man, which was a thin bag, of tender texture, full of a ſoft fat; that it had all the qualities of common greaſe; and, though the fat in the *lipome* reſembles that in the *ſteatoma*, yet they cannot be the ſame, for the matter of the *ſteatoma* is not inflammable, nor does it melt; or, if it does, it is with great difficulty, and imperfectly; whereas it is the contrary with the *lipome*. When the man who had the above-named *lipome* was fatigued, or had drank freely of ſtrong liquors, his *lipome* was inflamed for ſome days after, and its contents rarifying increaſed the ſize of the tumor. See Mem. de l'Acad. Roy des Sciences, l'Ann. 1709.

The *lipome* ſeems to be no other than an enlargement of one or more of the cells of the adipoſe membrane, which is filled only with its natural contents. Its ſoftneſs and largeneſs diſtinguiſh it in general from the other ſpecies, though ſometimes the fatty contents will be ſo hard as to deceive. As this kind of *wen* does not run between the muſcles, nor is poſſeſſed of any conſiderable blood-veſſels, it may always be cut off with eaſe and ſafety.

As to the other kind of *wens*, their extirpation may or may not be attempted, according as their ſituation is with reſpect to adjacent veſſels, the wounding of which would endanger the patient's life.

Mr. Bell ſpeaks of theſe tumors in his Surgery; he obſerves that they each have various degrees of conſiſtence. In judging of the nature of theſe tumors, ſome advantage may be derived from attending to their ſituation. Thus, in ſome parts, fat is more apt to be ſecreted and depoſited in the cellular ſubſtance than in others. In others, indeed, fat is ſcarcely ever found, as over a great part of the head; while, particularly over the prominent part of the belly, we commonly meet with it even in the leaneſt ſubjects. And, I believe, that the *ſteatomatous* tumors are ſeldom, if ever met with, in thoſe parts of the body which are not uſually in a ſtate of health ſupplied with fat. The head, indeed, is more liable than any part of the body to encyſted tumors, but they are very univerſally the *atheromatous* or *melicerous* kinds. I have never met with the *ſteatomatous* tumors but where fat is uſually depoſited in the contiguous cellular ſubſtance.

As to the cure, if they appear to be of the thin *melicerous* kind, which for the moſt part will be the caſe, if a diſtinct fluctuation be diſcovered through the whole body of the tumor, treat it as a common abſceſs, or as directed in the article HYDROCELE, for the hydrocele of the tunica vaginalis.

When a cyſt containing matter adheres ſo firmly to the contiguous parts, as to require much time to remove it by diſſection, it ſhould never be attempted. It will be ſufficient to lay it freely open through its whole extent by an inciſion, and to remove any looſe portion of it. The contents of the tumor will in this manner be completely removed, and the cure may either be effected in the uſual way, by preſerving the wound open till it fills up with granulations from the bottom;—or it may be attempted by drawing the divided edges of the ſkin together, and truſting to moderate preſſure and the ordinary effects of inflammation, for producing a complete cure.

See alſo the article STEATOMA, for the method of diſſecting the whole tumor out; which, when the tumor is not very large, may be ſubmitted to.

See Wiſeman's Surgery. Turner's Surgery. Heiſter's Surgery. Warner's Caſes in Surgery. Gooch's Caſes and Remarks, p. 281, &c. White's Surgery, p. 76. Bell's Surgery, chap v. p. 457.

NAI CORONA. See PHASEOLUS, ZURATENSIS.

NAKIR. According to Schenkius it is a violent flatulence which paſſes from one limb to another, and is attended with pain.

NALUGN. A bacciferous ſhrub which grows in Malabar, and flowers twice a year. Its different parts are uſed by the natives in flatulent and ſome ſpaſmodic diſorders, &c. See Raii Hiſt.

NANA, } See ANANAS.
NANAS. }

NANDI-ERVATAM. A ſmall Eaſt Indian ſhrub, the whole of which is lactefcent; the juice deſtroys worms, and is uſed with many other intentions. See Raii Hiſt.

NANDIA. See LYCIUM.

NAP, or NAPECA. See ŒNOPLIA.

NAPELLUS. See ACONITUM.

NAPHÆ AQ. See AURANT. HISP.

NAPHTHA, vel NAPTA. This is the ſame that the Arabians call *amber*. See AMBRA; named alſo *naſa, terræ oleum*. It is the thinneſt of the liquid bitumens; it is a perfectly fluid thin bitumen, or mineral oil, clear and colourleſs as cryſtal, of a ſtrong ſmell, extremely ſubtil, ſo light as to ſwim on all known liquors, ſpreading to a vaſt ſurface on water, exhibiting rainbow-colours, and is highly inflammable. This name is given to this kind of thin oil, whether it is ſeparated by nature or art from petroleum, or other bituminous matter. Petroleum is a groſſer oil of this kind. The true *naphtha* is uſeful as an external application for removing old pains, nervous diſorders, ſuch as cramps, contractions of the limbs, paralytic affections, &c. See PETROLEUM.

NAPIUM. See LAMPSANA.

NAPTA. See NAPHTHA. It is a name alſo for the tumor called *nata* or *natta*.

NAPUS. See BUNIAS.

NAPY. See SINAPI.

NARCE, from ναρκη, *the torpedo fiſh*, which is ſaid to ſtupefy in its touching, whence *narcotica*. A torpor, ſtupor, or dulneſs of ſenſation. It alſo ſignifies a ſtupefaction of the ſenſes by medicines, in order to render a perſon leſs ſenſible of pain.

NARCISSUS LUTÆUS SYLVESTRIS, alſo called *bulbocodium, codianum, codianimum* flore codii, *bulbis ſylveſtris, pſeudo-narciſſus Anglicus*. WILD DAFFODIL.

The roots of theſe are ſomewhat purgative and emetic; the doſe is two drams in infuſion.

NARCOSIS, from ναρκη, *torpor, ſtupor, numbneſs*. A STUPEFACTION.

NARCOTICA. See ANODYNA.

NARDUS CELTICA, alſo called *ſpica Celtica ſaliunca*, CELTIC SPIKENARD. It is the VALERIANA CELTICA Linn. It is a ſmall ſpecies of valerian, with uncut, oblong, obtuſe, oval leaves; it is a native of the Alps, from whence we have the dry roots, conſiſting of a number of blackiſh fibres, with the lower parts of the ſtalks adhering, which laſt are covered with thin yellow ſcales, the remains of the withered leaves. Its virtues reſemble thoſe of valerian.

There is a mountain *nard*, but it is only the root of the large valerian. None of theſe are in much eſteem in practice. See Raii Hiſt.

NARDUS INDICA, } Called alſo *ſpica, ſpica Indica,*
—— SYRIACA. } *ſpica nardi*, INDIAN SPIKENARD, NARD, of SYRIAN NARD. It is the ANDROPOGON NARDUS Linn.

Dioſcorides makes the Indian and the Syrian *nard* to be different, but they are the ſame. They are the buſhy top of the root, or the remains of the withered ſtalks and ribs of the leaves of an Indian graſſy-leaved plant, of which we have no particular account. The *nard*, as brought to us, is a congeries of ſmall, tough, reddiſh, brown fibres, cohering cloſe together, but not interwoven, ſo as to form a bunch or ſpike about the ſize of a finger: ſometimes two or three bunches iſſue from one head, and ſometimes bits of leaves and ſtalks in ſubſtance are found among them. The *ſpikenard* of India and Syria alike reſemble valerian in their virtues; but the Indian is warmer and more ſpicy than the Syrian; it is alſo ſomewhat pungent and bitteriſh. It alſo agrees very nearly in its virtues with cyprus.

NARDUS ITALICA. See LAVENDULA LATIFOLIA.

—— RUSTICA & MONTANA. See ASARUM.

NARES. The NOSTRILS; called alſo *myctheres*. The internal *nares*, or cavity of the noſe, called *pater narium*, comprehend the whole ſpace between the external *nares* and the poſterior openings immediately above the arch of the palate, by which a probe may be paſſed from the noſe to the fauces, from whence thoſe cavities reach upward as far as the lamina criboſa of the os ethmoides, where they communicate forward with the ſinus frontales, and backward with the ſinus ſphenoidales. Into the noſtrils, the two frontal ſinuſes, the two antra highmoriana, the cellulæ of the os cuneiforme under the upper ſpongeous bone of the noſe, open into the noſtrils, and excrete the mucus thereinto. The ſpongeous bones, which are two in each noſtril, are covered with the mucous membrane alſo; whence mucus is collected and diſcharged, and thus the ſurface of the mucous membrane of the noſtrils is enlarged. The olfactory nerves, without their dura-matral covering, pierce through the holes in the os ethmoides, and ſpread themſelves on the mucous membrane of the noſtrils; a branch from the fifth pair is alſo ſent here. The membrana pituitaria, which lines the *noſe*, is very vaſcular and papillous at thoſe parts where it is moſt expoſed to the ſtream of the air. The whole membrane is full of ſmall glands which ſeparate mucus; and this membrane gives riſe to polypous exceſcences.

The noſtrils of infants are ſometimes obſtructed, and it is common to greaſe the *noſe* in order to relief in this caſe; but three or four grains of white vitriol diſſolved in half an ounce of water, anſwers much better for ſoliciting a diſcharge of the too viſcid mucus.

In Heiſter's Surgery is an inſtance of cure, when the noſtrils, after the ſmall-pox, were cloſed up. An opening was made into them with a ſmall knife, and kept diſtended until the wound was healed.

NARIFUSORIA. Medicines which are inſtilled into the noſtrils.

NARUETH. See AURIPIGMENTUM.

NASALE. See ERRHINÆ.

NASALIS ARTERIA. See MAXILLARIÆ ARTERIÆ.

NASALIS, alſo called *compreſſor naris*, and *vinæus*. It riſes fleſhy from the extremity of the os naſi, and adjacent parts of the os maxillare, and is inſerted into all the cartilages of the ala. It dilates the noſtrils.

—— PROCESSUS. See MAXILLARIA SUPERIORA OSSA, and FRONTIS OS.

NASCALE. A ſort of peſſary made of wood or cotton.

NASCAPHTHON. See CASCARILLA.

NASIDA. See NAPHTHA.

NASI OSSA. The BONES of the NOSE. Theſe are the two ſmall bones which compoſe the upper part of the noſe, and are ſupported by the ſeptum naſi.

—— ALÆ. See PINNÆ.

NASITAS. A ſpeaking through the noſe.

NASO PALATINI DUCTUS. See INCISORII DUCTUS.

NASTURTIUM. Quaſi naſi tormentum, to torment the noſe, becauſe the acrimony of the ſeed, whilſt it is bruiſing, excites ſneezing. In all reſpects it reſembles the mithridate muſtard, with a leſs foliaceous margin, and multifid leaves to diſtinguiſh it. Boerhaave enumerates eleven ſpecies. It is a name for BARBAREA, SOPHIA, and ſeveral other plants.

NASTURTIUM AQUATICUM, called alſo *lauer odoratum, ſiſymbrium, cratevæ ſium, creſſio, cardamines*. WATER-CRESSES. SISYMBRIUM NARSTURTIUM. Or SISYMBRIUM AQUATICUM, *foliis pinnatis, foliis ſubcordatis, floribus albis tetrapetalis, ſiliquis declinatis*. CL. TETRADYNAMIA; ORD. SILIQUOSA. LINN. Gen. Plant. 813. A juicy plant with brownith, oblong, obtuſe leaves, ſet nearly in pairs, without pedicles, on a middle rib, which is terminated by an odd one, larger and longer pointed than the reſt. The ſtalks are hollow, pretty thick, channelled, and crooked; on the tops grow tufts of ſmall tetrapetalous white flowers followed by oblong pods, which burſting, throw out a number of roundiſh ſeeds. It grows in rivulets, and the cleareſt ſtanding waters, and flowers in June. The leaves remain green all the winter, but are in the greateſt perfection in ſpring.

The leaves are, to the taſte, moderately pungent; when rubbed betwixt the fingers, they emit a quick penetrating ſmell like that of muſtard, but weaker. This herb is a mild, aperient antiſcorbutic, of the ſame general virtues with the garden ſcurvy-graſs, but much leſs pungent, and, in a great meaſure free from the peculiar flavour thereof. It is ſuppoſed to purify the blood and humours, and to open viſceral obſtructions. The expreſſed juice carries with it all the virtue of the plant; but whether the leaves are eaten as a ſallad, or the juice taken alone, their uſe ſhould be continued ſome time, and the quantity of either not ſparing, if much benefit is expected. This has chiefly been employed as an antiſcorbutic, and forms one of the ingredients for the ſuccus cochleariæ compoſitus.

NASTURTIUM

NARSTURTIUM HORTENSE. COMMON GARDEN CRESSES. A low plant, with variouſly-cut winged leaves, bearing on the top of the round ſtalk and branches, tufts of tetrapetalous white flowers, which are followed by roundiſh capſules, flatted on one ſide, and full of reddiſh round ſeeds. It is annual, and raiſed in gardens. It is an uſeful dietetic herb in ſcorbutic caſes, when viſcid juices are the fault in the conſtitution, and when the chylopoietic organs are weak. It is nearly of the ſame qualities as water-creſſes, but ſomewhat milder. The ſeeds are more pungent than the leaves, and agree in their general qualities with thoſe of muſtard.

—— INDICUM, alſo called *acriviola*, *flos ſanguineus Monardi*, *naſturtium* Peruvianum, *cardamindum minus*. INDIAN CRESS, or YELLOW LARK-SPUR. The leaves are round and umbilicated, and placed alternately; the ſtalks are trailing, the flowers conſiſt of fine leaves, formed like violets; the ſeeds are round and rough, three of them ſucceed in each flower. It is a native of Peru. Miller enumerates five ſpecies. Their young ſhoots are uſed as pickles. Their medical virtues are ſimilar to thoſe of the common ſort with us. See Raii Hiſt. Lewis's Mat. Med.

NASUS. The NOSE; called alſo *myſter*. The external parts of the *noſe* are the root, the arch, the back or ſpine, the ſides, the tip, called *acre*; the wings, named *alæ*, or *pinnæ*, the external nares, and the part under the ſeptum. The internal parts are, the internal nares, ſeptum narium, the circumvolutions, the conchæ ſuperiores, the conchæ inferiores, the poſterior openings of the internal nares, the ſinus frontales, ſinus maxillares, ſinus ſphenoidales, ductus lachrymalis, and ductus palatini. The nerves are the olfactory, and a branch from the fifth pair. The cartilaginous part of the *noſe* keeps always open to admit of reſpiration. It grows narrower a little above like a funnel. See NARES.

NATA or NATTA. A ſort of tumor of the wen kind, called *naphtha*, or *napta*; it hath a narrow baſis, but a much larger body. Linnæus ſpeaks of it as rooted in a muſcle.

NATATIO. SWIMMING. It is pleaſant in ſummer, and tends to promote perſpiration, and attenuate the fluids if uſed in moderation; but, from forcing the blood internally, in ſome conſtitutions, where there is much debility in the interior parts of the ſyſtem, it is often of diſſervice, creating viſceral and other obſtructions; and it is particularly injurious to the head, more eſpecially if perſevered in too long. Oribaſius gives ſome directions on the ſubject, lib. vi. cap. 27.

NATES. The BUTTOCKS. Alſo a name of two prominences on the brain. See CEREBELLUM.

NATRIX TORQUATA. See ANGUIS.

NATRON, } See ANATRON.
NATARON. }

NATRON PREPARATUM, i. e. SAL SODÆ. See ALCALI.

—— TARTARISATUM. See RUPELLENSIS SAL.

—— VITRIOLATUM. See GLAUBERI SAL.

NATSIATUM. See COCCULUS INDUS.

NATURA. NATURE. There have been few definitions amongſt the variety which have been given, that ſeem perfectly ſatisfactory on this ſubject. This defect is attempted to be ſupplied by the laſt commentator on Sydenham's Works, who, after reciting what HIPPOCRATES, VAN SWIETEN, HOFFMAN, VAN HELMONT, and MEAD, ſay on this ſubject, and proving the inſufficiency of what they advance, aſſerts, "That the human body is neither more nor leſs than an inſtrument upon which *nature* performs her various operations, for the purpoſes for which the machine was created, and that diſeaſe is nothing but a defect or imperfection in that inſtrument, occaſioned by ſome material or mental cauſe, inherent or accidental, and not to a deficiency of *nature*, which, univerſally conſidered, we take to be an agent of Divine Providence, endowed with limited powers, which ſhe exerciſes for the formation of bodies, and other particular purpoſes, in order to promote the ends for which they were ordained;—that ſhe cannot tranſgreſs thoſe bounds, and that in herſelf ſhe is ever perfect; and when any imperfections happen in bodies in the animal, vegetable, or mineral kingdoms, they are owing to ſome circumſtances in which thoſe bodies are placed, or with which they are connected, and not to any defect in *nature*. This is *nature* conſidered in its moſt general ſenſe; but when we apply the term to particular bodies, ſomething elſe ſeems neceſſarily included in the definitions reſpecting, and peculiar to thoſe bodies. Thus then, applied to the human machine, we would ſay, that by *nature* are meant the powers inherent in the ſyſtem, put into, and continued in action by the force of the living or vital principle; and when diſeaſe occurs, it is owing to ſome circumſtances happening to the ſolids or fluids of the human machine, or to ſome ſituation into which they are thrown, from whence they cannot perfectly exerciſe thoſe powers, or feel the impulſes of the vital principle, and not to any defects in thoſe powers or principle. We ſhall offer one inſtance in proof: a man walking in apparent health, ſhall, from the burſting of ſome large blood veſſel, drop dead inſtantaneouſly; here appears no previous defect of the conſtitutional powers or the vital principle, the action only ceaſes in conſequence of the vaſcular rupture, becauſe the circulation of the blood, for want of vaſcular continuation, is deſtroyed by this accident; the defect lies then in the inſtrument in which theſe inherent powers reſide, and on which this principle aſſerts its action, and not in the powers or principles themſelves; and this will apply to every other ſpecies of diſeaſe. See Dr. Wallis's Sydenham, vol. i. p. 147, 148.

NATURALIA. See PUDENDA.

NAUSEA, from ναυς, *a ſhip*. This is properly the ſickneſs perceived on ſailing; but it is uſed to expreſs all ſorts of ſickneſs, and propenſities to vomit, whether called ſickneſs, *nauſea*, qualm, loathing, or whatever elſe.

Cacoſtitia alſo means a loathing; or, according to Linnæus, a fixed averſion to food.

Nauſea may be defined to be an approach to ſickneſs. It is ſuch a ſubverſion of the ſtomach, as that it reſts not in its natural, eaſy ſtate.—*Sickneſs* is that affection of the ſtomach, whence there is an inclination of the actual ejection of its contents.

Sea-ſickneſs depends on nervous irritability and ſpaſm; it is a diſeaſe of the brain from the unuſual motion which the ſhip gives it, and from thence, by conſent of parts, it is carried to the ſtomach, where it occaſions vomiting. Long voyages uſually overcome this diſorder, but ſhort ones ſeldom do. Keeping the bowels ſolutive is always found to relieve; and drinking ſea-water with wine is a preventitive from ſea-ſickneſs in many.

A *nauſea* is deſcribed by ſome as a gentle convulſion of the œſophagus, accompanied with an inverſion of its periſtaltic motion, and producing an inclination to vomit. Others again ſay, it is the idea of ſome ungrateful ſubſtance accompanied with ſpaſms of the œſophagus and ſtomach. Generally it is an attendant on dyſpepſia.

The lips are covered with the continuation of the inner coat of the ſtomach, whence whatever vellicates this coat, either in the ſtomach, or œſophagus, and often in the mouth, occaſions a *nauſea*, or a ſickneſs.

A *nauſea* always precedes a vomiting, and then it is attended with a tremulous motion of the lips. It attends all inclinations to vomit, and cardialgias. It is often attended with a diſcharge of a limpid mucus from the ſtomach, or œſophagus, or both, when no inclination to vomiting is preſent; and this happens from the ſpaſms affecting the glands there. It often indicates worms in the primæ viæ. It generally ſucceeds crudities in the ſtomach, which, as they are acrid, when the ſtomach is empty, they then particularly excite a *nauſea*, which, however, is alleviated by taking any kind of aliment. It precedes violent diſorders in the head, eſpecially ſuch as derive their origin from the upper orifice of the ſtomach. It attends hypochondriac diſorders, and others, the ſomes of which lodge in the primæ viæ; and in the beginning of malignant fevers it is generally attendant.

According to the variety of cauſes, ſo will be the remedies; when acrid ſordes in the primæ viæ produce a *nauſea*, preſent relief is obtained from a freſh ſupply of food, and a gentle emetic, or a few aloetic purges will often remove the diſorder. Indeed, in common, after theſe general evacuants, warm, ſtrengthening, ſtomach medicines, ſeldom fail to cure.

If an exceſſive uſe of ſpirituous liquors is the cauſe, the warmth of the bed, riding, and the elixir of vitriol, ſucceed the beſt.

In the beginning of fevers, when bile regurgitates into the ſtomach, and in many other inſtances of *nauſea*, and even of vomiting, the columbo root is almoſt a ſpecific.

A *nauſea* may be relieved, in general, by the ſame means as a vomiting. See VOMITUS.

NAUTICUS. See TIBIALIS POSTICUS.

NAVICULARE OS, } from *navicula, a little veſſel.*
NAVIFORME, } See SCAPHOIDES.

NAVIGATIO. SAILING. It is beneficial to weak perſons. In a calm, when the ſhip's motion is gentle, an uncommon alacrity, an increaſed perſpiration, a keener appetite, and a quicker digeſtion are excited; but when a patient is very weak, the violent agitation of a ſhip in a rough ſea is not very ſafe. Sea voyages have been recommended in a variety of complaints; ſuch as hypochondriac affections, viſceral obſtructions, ſcrophula, and particularly in conſumptions, in which laſt complaint, if properly conducted, ſome authors have aſſerted they always are beneficial, and often radically cure, admit patients begin in the early ſtage, and perſiſt for a ſufficient length of time. Indeed, if we conſider the benefit which will be derived from agreeable effects produced on the nervous ſyſtem, and the digeſtive powers of the machine, we may fairly conclude that they ſeem calculated to be highly uſeful in all chronic complaints.

NEAPOLITANUM UNGUENTUM. NEAPOLITAN OINTMENT.

This is now never made, the ung. hydrargyri mit. being ſubſtituted for it.

NEAPOLITANUS MORBUS. See LUES VENEREA.

NEBI POULI. See BILIMBI.

NEBULA. See ALBUGO.

NECESSARIÆ RES. See NON-NATURALIA.

NECROSIS, from νεκρος, *dead.* DRY GANGRENE. This is a ſlow mortification of a part, without any previous tumor, ſoftneſs, and fœtid diſſolution, attended with violent pain and ſtupor, which a dryneſs, induration, blackneſs, and mummy-like appearance of the part ſucceed; it differs from a gangrene, becauſe it is ſlower in its progreſs, and becomes offenſive, and quickly finiſhes its courſe. SAUVAGES enumerates ſix ſpecies.—1. NECROSIS *uſtilaginea*, when it ariſes from eating corrupted grain;—2. *a viru*, from virus, generated in the habit, or poiſon thrown into it;—3. *febrilis*, when it ſucceeds the attack of a fever;—4. *ſcorbutica*, when from the ſcurvy;—5. *epidemica*, when epidemical;—6. *infantilis*, when it attacks infants, which it does when they are about five years old. See Noſologia Methodica, vol. ii. p. 623. But this complaint, BELL ſays, never ariſes from inflammation, but generally from ſome cauſes obſtructing the principal arteries which uſed to ſupply thoſe parts with blood; conſequently, from a defect of fluids, and a conſiderable evaporation going on, ſuch a degree of humidity cannot occur as in other caſes of gangrene. See Bell on Ulcers, edit. 3. p. 94. Edinb. Med. Com. vol. ix. p. 78. London Med. Journal, vol. iii. p. 369; vol. vii. p. 263.

NECROSIS USTILAGINEA. See RAPHANIA.

NECTARIUM, (from *nectar, honey,*) the melliferous part of the vegetable, peculiar to the flower. It commonly makes a part of the *corolla*, but is ſometimes entirely diſtinct from it, and is then called a proper nectary. It is frequently in form of a horn, or ſpur; ſometimes it takes the ſhape of a cup; whence this part is named in Engliſh by ſome, the HONEY CUP.

NEDUM SCHETTI. The name of a bacciferous ſhrub which grows in the Eaſt Indies, of which an ointment is made by boiling in oil, and is then uſed againſt pruriginous diſorders.

NEDYIA. See ABDOMEN.

NEDYS. See STOMACHUS and ABDOMEN.

NEDYUSA. See SITIS.

NEFRENDES. Properly SUCKING PIGS; but it is applied to young children, or old people, who have no teeth.

NEPENTHES, from νη, importing *negation*, and πενθος, *mourning.*

The *nepenthes* of the Egyptians was, according to Olaus Borrichius, a preparation of opium and dutray, both the produce of Egypt. Romantic accounts are given of it. See Schulz's Hiſt. Med. See alſo BANDURA.

NEPETA. } See MENTHA CATARIA.
NEPETELLA. }

NEPHRALGIA. Pain in the kidneys or ureters.

NEPHRALGIA CALCULOSA. *Nephralgy*, PAIN from a STONE in the KIDNEYS. This differs from a nephritis, from the ſame cauſe, and is conſidered as a diſeaſe whoſe principal ſymptom conſiſts in a fixed pain in the region of the kidneys and ureters, *without any acute febrile affection*, and is thought to depend on a rather large *ſtone* fixed in the kidneys, or ureters, which is diſcoverable by pain and very ſevere uneaſineſs in either lumbar region, ſeldom happening in both, and that fixed and permanent; which pain extends itſelf along the duct of the ureter in the abdomen towards the bladder, attended in men with a painful drawing up of the teſticle of the ſame ſide; in women, with a ſtupor, or numbneſs of the thigh, and pain, if the fit ſhould be intenſe. In the violence of the pain a naufea and frequent vomiting are occaſioned; by laying on the pained ſide the uneaſineſs is mitigated, but on that which is oppoſite, increaſed; and laſtly, the urine has different appearances; in the beginning, it is watery, and ſmall in quantity; afterwards turbid and copious, often extremely hot and bloody. The chief relief in theſe caſes is to be expected from bleeding, reſt, diluting mucilaginous liquids, decoctions of infuſions of lineſeed, marſh-mallows, barley, gum-arabic, &c. anodynes, oily medicines, warm bath, and a thin cooling diet, &c. See CALCULUS and NEPHROTOMIA.

NEPHRELMINTICA ISCHURIA. A ſuppreſſion of urine from worms.
NEPHRITICA. A ſuppreſſion of urine from inflammation in the kidneys. } See ISCHURIA.

NEPHRITICA AQUA. See NUX MOSCHATA.

NEPHRITICUM LIGNUM, alſo called *perigrinum lign.* NEPHRITIC WOOD. Dale thinks it to be the wood of the tree which bears the *nux ben*, ben-nut. It is the GUILANDINA MORINGA Linn. It is brought from America in large compact pieces; the out-part is of a whitiſh or pale yellow colour; the medullary ſubſtance is of a dark brownith, or reddiſh colour. If it is bruiſed, and macerated in water for half an hour, or an hour, it imparts a deep tincture, appearing, when placed betwixt the eye and the light, of a golden colour; but in other ſituations, of a fine blue colour; a property in which it differs from all other known woods. Pieces of other woods are often mixed with it, which only give a yellow tincture. If this wood is ſteeped in rectified ſpirit of wine, the ſame blue tincture is obſerved as when water is the menſtruum: if an acid is joined to the tincture, it becomes yellow, but the blue is again reſtored by an alcali. It is the only vegetable blue that is deſtroyed by acids.

To the taſte it is ſlightly bitter, and the raſpings have a faint aromatic ſmell. A ſtrong infuſion of it in water is gently aſtringent, and is recommended in dyſury, nephritic complaints, and all diſorders of the kidneys and urinary paſſages. It does not, like the warmer diuretics, heat or otherwiſe offend the parts; but its efficacy hath not obtained it a place in general practice. See Raii Hiſt. Lewis's Mat. Med.

NEPHRITICUS, from νεφρος, *a kidney.* Belonging to the kidneys. It is uſed with reſpect to diſorders of theſe parts, or to medicines adapted to their cure.

NEPHRITIS, from νεφρος, *a kidney*, INFLAMMATIO RENUM. AN INFLAMMATION in the KIDNEYS. This diſorder is not very frequent, for a determination of the fluids to the kidneys occaſions an increaſed ſecretion of urine, ſometimes mixed with blood, which prevents inflammation. Dr. Cullen places this genus of diſeaſe in the CL. PYREXIÆ; and ORD. PHLEGMASIÆ; which he defines a febrile affection, attended with pain in the region of the kidney, often following the courſe of the ureter; frequent micturition, voiding water either thin and tranſparent, or very red; vomiting, numbneſs of the thigh, and retraction or pain of the teſticle on the ſame ſide as the kidney affected. The true ſpecies, he calls NEPHRITIS VERA; the ſymptomatic conſiſts of five.—1. NEPHRITIS *calculoſa*;—2. NEPHRALGIA *calculoſa*;—3. *arenoſa*;—4. *purulenta*;—5. *arthritica*, according to the cauſe from whence the inflammation ariſes, whether from *a ſtone in the kidney, gravel, pus*, or *the gout.*

The

The GENERAL CAUSES are, whatever hinders the extremities of the arteries from tranſmitting their fluid; as a wound, contuſion, abſceſs, tumor, long continued defluxion, or a ſmall ſtone, &c.—whatever hinders the conveyance of the urine into the pelvis, ureters, and bladder;—ſuch as forcibly convey the thicker parts of the blood into the urinary ducts, as running, violent riding, exceſſive heat, an effort of the body, a plethora, acrid diuretics, poiſons, &c.—a long continued ſpaſmodic contraction of theſe veſſels. When theſe veſſels are ſeized with a violent inflammation, they are often ſo conſtricted, that no urine can be diſcharged; or if a ſmall quantity, it is pellucid, thin, and aqueous, which is an unpromiſing ſign; the nerves cohering to theſe veſſels, and lying contiguous to them, being often irritated, pains and convulſions are produced in the ſtomach, meſentery, inteſtines, and uterus; hence ariſe eructations, nauſeas, vomiting, fluxes, iliac paſſions, retentions of urine, ſtupor, immobility of the legs, &c. preternatural heat in the loins.

A ſtone in the kidney uſually excites inflammation in the internal membrane thereof, and in the tubuli uriniferi.

The *inflammation* begins with a pungent burning pain in the region of the kidney, that is, in the back, near the articulation of the ſhort ribs, higher up on the left ſide than on the right, often ſhooting down by the ureters to the bladder, and by the ſpermatic cord to the teſticle;—a fever;—the urine is ſometimes red at the firſt, but ſoon becomes pale, and is frequently diſcharged in ſmall quantities, and that with difficulty, pain, and heat.—Sometimes a redneſs appears externally;—the thigh and leg of the affected ſide is ſeized with a ſtupor;—the pain is increaſed upon ſtanding, walking, couching, lying on the oppoſite ſide, or in any other caſe where the kidney is moved, or the ſurrounding part extended;—there is pain in the groin, and in the teſticle next adjacent;—the pulſe is hard and frequent, and, as the pain increaſes, it often becomes ſmall, quick, and ſometimes intermittent, with coldneſs of the extremities, cold ſweats, ſickneſs, bilious vomitings, fainting, delirium, convulſions, &c. The patient lies with the moſt eaſe on the affected ſide.

A *true inflammation in the kidneys*, ſhould be diſtinguiſhed from the gravel, a ſtone obſtructing the ureter, an inflammation of the pſoas muſcle, or other adjacent parts, from the colic, and other inflammatory and ſpaſmodic pains in the inteſtines.

If the diſeaſe is protracted beyond the ſeventh or eighth day, and there is a ſtupor or heavineſs of the part, with frequent returns of chillneſs and ſhivering, &c. there is reaſon to ſuſpect that matter is forming in the kidney, and that an abſceſs will enſue.

If the urine becomes higher coloured, is ſecreted in a larger quantity, and at laſt is copious, thick, and mixed with mucus, a gradual relief follows, and thus the cure is effected. It may go off by a metaſtaſis, or terminate in an abſceſs, mortification, or a ſcirrhus. Inflammations in this part often ſuppurate on the fourth day, if not prevented by either a natural, or an artificial attempt towards a cure: but yet theſe failing, an abſceſs may be begun ſo late as the fourteenth day. This abſceſs may be diſcharged into the pelvis of the kidney, the abdomen, or externally through the integuments and the ſkin; in the firſt caſe, if the matter is kindly, a cure may follow, but otherwiſe an hectic deſtroys the patient;—in the ſecond caſe it is fatal;—in the third, an ulcer of very uncertain cure is formed.

When the preſence of this diſorder is once manifeſted, *immediately bleed*, and in general proceed as in other internal inflammations.

Decoctions of parſley-roots, infuſions of line-ſeed, or *the Arabic emulſion*, with a double quantity of the gum, are convenient as common drink; and to prevent their palling the appetite, a little lemon juice and ſugar may be added to render them grateful.

A moderately warm ſemicupium, and *laxative clyſters* frequently injected, contribute much to promote the ſecretion of urine.

If *inflammation appears externally*, apply fomentations and poultices to the part ſo affected.

In caſe of a ſuppuration, the treatment is nearly the ſame as in a ſuppuration of the liver. After the abſceſs is burſt, the patient ſhould drink freely of a decoction of marſhmallow-roots, or ſuch like liquors, and take the bark freely. In this caſe the bark is preferable to the uſual method of adminiſtering balſamics.

If pains are exceſſive, give opiates to moderate them; and *if vomiting is troubleſome*, give tepid water, ſweetened with honey, and let the patient drink ſmall quantities frequently.

If a gangrene takes place, it is known by the violence of the cauſe, of the ſymptoms, the want of relief by remedies, and the *ſudden remiſſion of the pain without apparent cauſe, cold ſweats, a weak intermittent pulſe, hiccoughs, either no diſcharge of urine, or ſuch as is livid black, full of hairs, fetid, and foul, with a ſudden and conſiderable loſs of ſtrength*. In thoſe caſes, no cure can be expected.

See Boerhaave's Aphoriſms, and Van Swieten's Comments thereon. Fordyce's Elements, part the ſecond. Brooke's and the London Practice of Phyſic. Cullen's Firſt Lines, edit. 4. vol. i. p. 387.

NEPHROLITICA ISCHURIA. A ſuppreſſion of urine from the ſtone in the kidneys. See ISCHURIA.

NEPHROMETRÆ. See PSOÆ.

NEPHROPLETHORICA ISCHURIA. A ſuppreſſion of urine from a plethora.

NEPHROSPASTICA. A ſuppreſſion of urine from a ſpaſm in the kidneys.

NEPHROTHROMBOIDES. A ſuppreſſion of urine from grumous blood in the kidneys.

NEPHROPYICA. A ſuppreſſion of urine from purulent matter in the kidneys.

NEPHROPHLEGMATICA. A ſuppreſſion of urine from pituitous or mucous matter in the kidneys.

NEPHROPLEGICA. A ſuppreſſion of urine from a paralytic ſtate of the kidneys.

} See ISCHURIA.

NEPHROS. See REN.

NEPHROTOMIA. NEPHROTOMY. It is the extracting of a ſtone from the kidneys by a wound made for that end. Rouſet was the firſt who adviſed this operation. In Mezeray's Hiſtory of France is the following narrative: "The doctors of the faculty of phyſic at Paris, knowing that an archer of Bagnolet, who had been very much afflicted with the ſtone, lay under ſentence of death, begged of the king that he might be put into their hands, to make an experiment whether they could open the kidney, and take out the ſtone. They obtained their requeſt, and the operation ſucceeded ſo well, that the man lived many years after in good health: ſo ſays the hiſtorian. And many writers ſpeak in favour of this operation, and aſſert that it is practicable with ſafety; but from the courſe of the renal artery it does not appear to be poſſible, without deſtroying the patient. See RENES. Beſides the objection from the renal artery, there are others apparently inſurmountable. See Avicenna, Serapion, Wedelius, Meckren, Heiſter, Med. Muſ. vol. ii. p. 370. Bell's Surgery, vol. ii. p. 144. White's Surgery, p. 368.

NEPONES. See BARONES.

NERANTIA. See AURANTIA HYSPALENSIS.

NERION, NERIUM, called alſo *rhododaphne*, *rhododendron*, *oleander*, *laurus roſea*. The DWARF ROSE BAY. It is called nerion, from *νηρὸς*, *humid*, becauſe it grows in moiſt places. *Rhododaphne*, from its flowers reſembling a roſe, and its leaves a bay-tree. *Rhododendron*, becauſe it ſometimes grows to the ſize of a little tree, and hath a flower like a roſe. The branches are divided and ſubdivided by threes, and the leaves grow three together. It grows in maritime places. The leaves and flowers are poiſonous; if any of them are ſwallowed, deglutition is immediately ſtopped, but vomiting and purging ſoon come on. Vinegar is an antidote in this poiſon. See Raii Hiſt.

NEROLI OLEUM. See AURANTIA HISPALENSIS.

NERONIANA. See PHLEBOTOMIA.

NERVALIA OSSA. See ARCUALIA OSSA.

NERVEA SPONGIOSA. See CORPORA CAVERNOSA PENIS.

NERVI, named alſo *neuri*. The NERVES, are thoſe productions of the brain, which are the means of ſenſe and motion in every part. They are continuations of the medullary ſubſtance of the brain; and, like the brain, they have an infinite number of blood-veſſels diſperſed about them. They receive their ſtrength from the membranes that ſurround them. They have two coats, at leaſt as far as the eye can trace them, one from the pia mater, the other from the dura mater. *The nerves are ſuppoſed to depoſit their coats when they arrive at the place of office.* In their riſe and progreſs from the brain they are ſuppoſed to decuſſate each other, that is, thoſe which

riſe

rife on the right fide of the brain pafs out on the left, and thofe which rife on the left pafs out on the right; their origin, however accurately traced, cannot be found out: that they decuffate each other, is fuggefted at leaft from a concuffion of the brain, in which cafe a blow is received on one fide, and the injury done is on the other; but again, there are many exceptions to this. Frequently the *nerves* form plexufes in their courfe, in which they become one. In their courfe through the body they commonly branch with the blood-veffels, but ramify more regularly. That junction, which in the arterial and venal fyftem is called *anaftomofis*, in the *nerves* is denominated *communication*. From this communication of *nerves* fome inftances of fympathy are accounted for; but how far this is the truth is not eafy to aflert, as there is hardly a *nerve* but in its paffage communicates with fome branch of almoft every *nerve* in the body. In the ganglions of the *nerves* there is always a particular rednefs, on which conjectures are formed by different anatomifts, but their opinions are not well fupported: Lancifi fays that thefe ganglions are only on thofe *nerves* which are governed by the will.

All the *nerves* in the body originally proceed from the cerebrum or cerebellum, by means of the medulla oblongata, or medulla fpinalis. They go out in pairs, and are afterwards divided into branches to be diftributed on all parts of the body.

From the head there goes out ten pair of *nerves*; the FIRST and SECOND PAIR proceed from the cerebrum, and are called the *olfactory* or firft pair; and the *optic nerves*, or fecond pair. The reft proceed from the cerebellum, and are called *motores oculorum*, or THIRD PAIR; *pathetici*, or FOURTH PAIR; *trigemini*, or FIFTH PAIR; *motores oculorum externi*, or SIXTH PAIR; *auditorius*, or SEVENTH PAIR; *par vagum*, or EIGHTH PAIR; *hypogloffi externi*, or NINTH PAIR; *fuboccipitales*, or TENTH PAIR.

From the fpinal marrow there goes out about TWENTY-FOUR PAIR, which have the general name of vertebrales; *feven* of which paffing through the vertebræ of the neck, are called cervicales; *twelve* pafs through thofe of the back, and are called dorfales; *five* pafs through thofe of the loins, and are called lumbares: and there are *five* or *fix pair* which, paffing through the os facrum, are called facri *nervi*.

The *nerves* that ferve the vital functions arife from the cerebellum; thofe that are fubfervient to the fenfes proceed chiefly from the bafis of the brain; and thofe that are deftined to the voluntary motions of the touch, are principally from the fpinal marrow.

In many inftances, if the *nerve* is cut, compreffed, or deftroyed, all motion, fenfation, and nutrition in that part to which the *nerve* is diftributed, is loft; yet this does not always happen, for if all, or at leaft the principal *nerves* in the part are not deftroyed, it recovers its health and vigour. This is evident in performing the operation for the aneurifm, in which cafe, if the *nerve* is tied with the brachial artery, a temporal numbnefs only is felt, and fenfation in any degree below the ligature is not loft. If a ligature is made on the *nerve* on the fide of the windpipe, the animal will be dumb. If a pointed inftrument is puthed between the occiput and atlas of a dog, he dies inftantly. The fame fymptoms happen in wounds of the cerebrum, cerebellum, and medulla fpinalis.—All *nerves* which have their origin below an injury of the medulla fpinalis, lofe their fenfe and motion.—A member may be deprived of its motion, and yet not lofe its fenfation; or it may lofe its fenfation, and retain its motion.—Senfation remains fome time after the limb is amputated.—Preffure makes a part paralytic.—As the *nerves* are continuations of the medullary part of the brain and fpinal marrow, it is probable that they are partly nourifhed by thofe veffels which are fpread on that production of pia mater which furrounds them, in like manner as the brain derives its nourifhment from the arteries of pia mater; if this be the cafe, we may readily fee why the *nerves* lofe their powers when they are wholly deprived of the arterial blood, and alfo retain them, in fome meafure, after the brain is offified and petrified.

The *nervous* fluid is often fpoken of as fynonymous with the animal fpirits, &c. But Dr. Kirkland obferves, in his Inquiry, vol. i. p. 433. that, by *nervous* fluid, we mean what we difcover upon diffecting the brain or *nerves*; and which a rupture in the tumor, accompanying the bifid fpine, difcovers to be effentially neceffary to life: for we may eafily fuppofe a fluid refiding in the *nerves*, of fuch high importance to life as it evidently appears to be, to bring on (when both the *nerves* and itfelf are diftafed) the *nervous* fymptoms we difcover before the gouty matter is thrown off into the extremities, &c. in other inftances of diftafe.

There are many claffes of *nerves* differing in finallnefs, and it is fuppofed that one clafs may remain entire, while another is fomewhat hurt, and perhaps this is the caufe of a gradual decline of the fenfes.

It is alfo to be obferved that fome *nerves* are fufceptible of one impreffion only, or with fuch at leaft as many others are not affected by; e. g. the femen ftimulates the *nerves* of the teftieles and veficulæ feminales, but of no other part;—fome affift in vifion,—others fmell, &c. The ancients not only gave the name of *nerve* to thefe productions of the brain, but alfo to the tendons and ligaments.

By what means the *nerves* perform their different functions, we are at a lofs precifely to point out; but, it is generally believed, they act by a fluid, derived from the medullary part of the brain, and fpinal marrow. Dr. MONRO fays, "that the matter upon which the nervous energy depends, is a fecreted fluid, we are, indeed, far from "being able to prove; but, to fay, that the offices of "the nerves are not performed by a fecreted fluid, merely becaufe we cannot comprehend how any part of "the blood, or any humour prepared from it, could "render the mind fenfible of an injury, or throw a mufcle into action, is, in my opinion, faying a great deal "too much; for, in the generation of animals, effects "more incomprehenfible, and aftonifhing, feem to depend on the fecretion and mixture of the fluids of the "teftes and ovaria; the brain, the nerves, the nervous energy, and complex fabric of other organs being thereby "produced."

On the *nerves*, their ufe, &c. fee Winflow's Anatomy, where the *nerves* are very accurately deferibed; Monro's Diff. on the Nerves; it is annexed at the end of his Ofteology; befides thefe, the curious may conful Steno, Vieuffens, Willis, Ridley, Leuwenhoeck, and Ruyfch. See alfo Hales's Stat. Eflays, vol. ii. p. 59, 60. Whytt on the Sympathy of the *Nerves*, and *Nervous* Diforders. Kirkland's Diff. on the Brain and *Nerves*, and on the Sympathy of the *Nerves*. NERVOSA FEBRIS. The NERVOUS FEVER, called by the ancients *cardiacus*; and alfo *pituitofus morbus*. Under this name we may conflder *nervous* diftafes in general; they are numerous; fome authors have divided them into *habitual* or *chronical*, and *acute*, nervous fevers; for, in fome, the fever is latent, in others it is lefs obfcure.—Indeed from difference in degrees, or other circumftances, the different denominations arife, and, from a fimple yawning, to the greateft extreme of madnefs, is the extent in which thefe varieties are manifefted. SYDENHAM fays, that fevers make two thirds of the diforders to which men are fubject, and the hyfteric or *nervous* diforders one half of the reft.

When thefe diforders of the nervous clafs are *chronical*, though the ftomach, or inteftines, or other particular part, may moft be complained of, the cellular membrane is probably their immediate feat. When *acute*, a contaminated lymph is the fource of every morbid fymptom.

The CHRONICAL kinds are called *vapours*, *hyfteries*, *hypochondriac diforder*, &c. The ACUTE is ufually denominated the *nervous fever*, LITTLE FEVER, SLOW FEVER, a FEVER on the SPIRITS, &c.

Thofe who have difordered vifcera, lead fedentary lives, are ftudious, oppreffed with long anxiety, who are eafily affected by external occurrences, &c. are the moft fubject to nervous complaints.

The fymptoms attendant on nervous complaints refemble almoft every diforder to which the human body is fubject: according to the part more immediately affected, and the peculiarities of the patient's conftitution, the different diftafes proper to that part will feem to prefent themfelves. As the occafional caufe then is, and the part in which its influence is exerted, the fymptoms will be, wind in the ftomach and bowels, heart-burning, four belching, fqueamifhnefs, and ejection of a watery fluid or other kind of matter from the ftomach, a want of appetite,

petite, and indigeſtion, or an uncommon craving for food, and quick digeſtion, debility, faintneſs, a ſenſe of emptineſs about the ſtomach when hungry, a ſtrong deſire for uncommon food, inflations of the ſtomach, pain and cramp in the ſtomach, oppreſſion about the præcordia, uneaſy, though not painful, ſenſations about the ſtomach, low-ſpiritedneſs, anxiety, timidity, ſtrong pulſations within the belly, ſpaſms in the bowels, diſtentions of portions of the bowels, colic pains, a grumbling noiſe in the bowels from wind, the belly often lax, but more frequently coſtive, pains in the back and belly reſembling the gravel, a ſenſe of irritation and heat in the neck of the urethra, with a frequent deſire of making water, a copious diſcharge of limpid urine, frequent ſpitting, ſudden flufhes of heat all over the body, thiverings, a ſenſe of cold in certain parts as if water was poured on them; and at other times an univerſal glow, flying pains in the limbs, pain in the back and between the ſhoulders, pains attended with a hot ſenſation, ſhifting often from the ſides or back to the interior parts of the abdomen, cramps or convulſive motions of the muſcles, or of a few of their fibres, ſudden ſtartings of the legs or arms, frequent involuntary motion of the muſcles of the neck, or head, or arms, or legs; a general convulſion affecting at once the ſtomach, bowels, throat, legs, arms, and almoſt the whole body, in which the patient ſtruggles as in an epileptic fit; long faintings, which, in ſome inſtances, follow one another after ſhort intervals, palpitation of the heart, pulſe variable, a dry cough, with difficult breathing or a conſtriction of the lungs, which in ſome perſons return periodically; yawning, hiccough, ſighing, a ſenſe of ſuffocation as if from a ball or a lump in the throat, crying, laughing; in the day the patient is moſtly cool, with a ſlow or natural pulſe, but in the time of ſleep hot flufhes often ſpread over the whole body; the pulſe is quicker and ſtronger, and faintneſs or ſickneſs is felt; a giddineſs, eſpecially after riſing up haſtily; pains in the head, which in many return periodically; pain in a ſmall part of the head, which generally fixes on the crown, as if a nail was drove in; finging in the ears, dimneſs of ſight, miſt before the eyes, objects ſeen double, unuſual ſmells perceived, obſtinate watchings, ſometimes attended with uneaſineſs which is not to be deſcribed, but which is leſſened by getting out of bed; diſturbed ſleep, frightful dreams, night-mare, drowſineſs, fear, peeviſhneſs, ſadneſs, deſpair; at intervals the ſpirits are too active and gay, wandering thoughts, impaired memory, ridiculous fancies, ſtrange perſuaſions of their labouring under diſeaſes from which they are free, and imagining their complaints as dangerous as they find them troubleſome.

After being long afflicted with ſome of theſe (for they never are all attendant in the ſame perſon), the patient ſometimes becomes melancholy or mad, or goes into the black jaundice, a dropſy, the phthiſis pulmonalis, palſy, apoplexy, or ſome other fatal diſtemper.

Thoſe who are liable to the above ſymptoms are diſtinguiſhed into the following claſſes:

1. Such as, though uſually in good health, are yet, on account of a preternatural irritability of the nerves, apt to be affected frequently with violent tremors, palpitations, faintings, and convulſions, from fear and grief, ſurprize, or other paſſions, and from whatever diſagreeably affects the more ſenſible parts of the body. Theſe may be called ſimply *nervous*.

2. Such as, beſides being liable to the ſymptoms mentioned in the firſt claſs, from the ſame cauſes, are always troubled with indigeſtion, flatulence, &c. may be ſaid to be *hyſteric*, or *hypochondriacal*.

3. Thoſe who from a leſs delicate feeling are ſcarce ever affected with palpitation of the heart, fainting, &c. from diſturbed paſſions; but, on account of the diſordered ſtate of their ſtomach and bowels, are ſeldom free from indigeſtion, flatulence, want of appetite, or too great craving, and ſuch ſymptoms as therefrom ariſe; ſuch as belching, coſtiveneſs, oppreſſion about the præcordia, low ſpirits, diſagreeable thoughts, diſturbed ſleep, &c. and may be ranked as *hypochondriacal*.

4. When a fever is manifeſt in a patient attended with nervous ſymptoms, above recited, or when a fever coming on from a cauſe which induces nervous ſymptoms, the diſorder is called a NERVOUS FEVER, which Dr. Cullen names TYPHUS, and defines a contagious diſeaſe, wherein the heat of the body is not much encreaſed, the pulſe ſmall, weak, and for the moſt part frequent; the urine but little changed, the functions of the ſenſorium much diſturbed, and the ſtrength greatly diminiſhed; of which he forms two ſpecies.—1. TYPHUS *petechialis*, when it is attended, as it is frequently, with petechial eruptions; which ſpecies varies in degree, thence named mitior, or gravior, according to the mildneſs or violence of the ſymptoms.—2. TYPHUS *icterodes*, when attended with a yellowneſs of the ſkin.

Of the different kinds which have been treated on by different authors, all of which belong to ſome of the diviſions, there are not leſs than ſixty enumerated, with their proper references. See Synopſis Noſologiæ Methodicæ, vol. ii. p. 71—78. The ſymptoms, however, are conciſely and well deſcribed by Hippocrates: "There are frequent tranſient chilline ſſes in the day; a giddineſs or miſt before the eyes; a liſtleſſneſs, with great laſſitude and wearineſs all over the body; frequent yawnings, with little flying pains; dozing, inappetency; dryneſs of the lips and tongue; ſighings, with great and unaccountable anxiety; delirioufneſs and forgetfulneſs by fits; oppreſſion and pain about the region of the heart and ſtomach; difficulty of breathing by intervals; the tongue generally white, but ſometimes redder than ordinary, together with a heat in it; a low, quick, unequal pulſe; heat and thirſt, but moderate; pale urine, often and ſuddenly made; frequent naufeas and flufhings; faintings on every the leaſt motion and ſurprize; cold clammy ſweats by turns: theſe, more or leſs, uſually accompany the *nervous fever*, and will continue thirty or forty days, unleſs ſtupors, ſyncopes, and death, end the ſcene before." Huxham deſcribes the *nervous fever* admirably; and ſir Richard Manningham, in his Febricula, is very particular in his deſcription of it, and to the above ſymptoms he adds, that the pathognomonic ſigns are:

1. *A low, quick, and unequal pulſe; that is, it is ſwift, frequent, and large, then preſently it becomes low and quick*, &c. *alternately; this*, he obſerves, *is its greateſt inequality*, and *is a characteriſtic of this fever.*

2. *A heat in the tongue, without much thirſt.*

In all diſeaſes the nerves ſuffer more or leſs; but nervous diſeaſes are ſuch as ariſe, FIRST, from a peculiar or preternatural irritability of the nerves in general, or of thoſe in any part in particular, whence, what is applied to them, whether of a morbid quality or not, may alike be productive of that variety of ſymptoms which form the deſcription above given; or, SECONDLY, from the peculiar quality of ſuch morbid humours, &c. whoſe moſt manifeſt effects are from the diſorders which they excite in the nervous ſyſtem. But, perhaps, the firſt may more ſtrictly be called nervous, though the ſecond enlarge the liſts of diſorders ſo called, conſiderably.

The remote cauſes are numerous; they are violent paſſions; long continued ones in leſs degrees, ſuch as grief, fear, &c.—indolence;—exerciſe beyond the ſupplies received for a due ſupport;—eager purſuits, whether of pleaſure or buſineſs;—irregularity in diet, or in the general manner of living;—a cold damp, or a hot and moiſt air—ſudden and great changes in the climate—defective perſpiration,—exceſſive evacuations, and indeed whatever much leſſens the vis vitæ.

The immediate cauſes are, a defect of vital heat,—an acrimony from contagion, or from ſome other cauſe;—and ſometimes the peculiar or preternatural ſenſibility of the nerves is the immediate cauſe, as when nervous affections are excited by what in a natural or healthy ſtate of the nerves would be unperceived.

Many circumſtances occur to, or are attendant on perſons ſubject to nervous diſorders, which prove occaſional cauſes: ſuch are flatulence in the ſtomach and bowels, worms, &c. ſcirrhous obſtructions in any of the abdominal viſcera, &c.

And as to the acute ſpecies, or *nervous fever*, if whatever can excite fever, is attendant on any of the immediate cauſes of nervous diſorders in general, there will no more be required to produce it.

NERVOUS DISEASES, it is already obſerved, reſemble almoſt every other diſeaſe which affect the human frame; and oftentimes it is very difficult to diſtinguiſh whether it is the real diſeaſe, or only nervous affections aſſuming the type; for, as ſcarce any part of the body is without nerves, and very few altogether without feeling, the nerves muſt not only ſuffer, when they themſelves, or the brain, or the ſpinal marrow, are primarily affected, but alſo when the other parts are diſeaſed; and hence the difficulty of fixing a certain criterion by which nervous diſorders may at once be diſtinguiſhed from all thoſe not ſo called; though, in ſome inſtances, a ſmall degree of attention will enable us to clear away the uncertainty.

The prognoſtics in nervous diſorders, of the chronical as well as of the acute, are both difficultly formed and uncertain; IN THE FIRST, if the diſeaſe is recent and left to itſelf, it is rather troubleſome than dangerous; but a faulty treatment may be productive of other complaints, that are both difficult of cure and dangerous. IN THE SECOND, *the favourable ſigns are*, the ſymptoms being ſlight; the pulſe becoming fuller on the uſe of cardiacs; if toward the end of the diſeaſe a gentle ſweat or diarrhœa, but particularly if a ſalivation without aphthæ break out; or if miliary eruptions appear, without any preceding profuſe ſweat: the leſs favourable ones are, a coldneſs of the extremities, whilſt the reſt of the body is warm and perſpires; the fauces becoming livid, and reddiſh or purple ſpots appearing on the ſkin; *but the following are fatal*, a trembling of the tongue, the nails becoming livid, the ſight failing or being nearly loſt, the delirium changing to a coma, the excrements diſcharged involuntarily, and the tendons twitching.

However troubleſome *nervous* diſorders are, they have this advantage, viz. that their ſubjects are not very liable to thoſe of the inflammatory kind, and rarely, if ever, ſuffer much from them. But before a cure is attempted, the patient ſhould be informed, in *the firſt place*, that his diſorder admits of relief, but hardly of a radical cure; for the remaining diſpoſition to be ſtrongly affected by ſlight cauſes, not being changed, relapſes are ſo eaſily occaſioned, that a continuance of health, when all manifeſt ſymptoms are removed, cannot be promiſed. Secondly, that without perſeverance in the uſe of means, no advantage can be expected.

THE GENERAL INDICATIONS OF CURE WILL BE,

1. To palliate the ſymptoms.

2. To leſſen or remove the morbid irritability of the *nerves*.

3. To correct the occaſional cauſes, eſpecially the morbid ones.

1. TO PALLIATE the SYMPTOMS, the moſt remarkable of which, with the method of relief, are as follow:

Convulſive motions, or *fixed ſpaſms*. In theſe caſes, if ſlight, a gentle opiate given an hour before the approach of the fit, when its return can be gueſſed at, will often prevent it; but, in the more violent inſtances, bleeding ſhould ſometimes precede, and then opiates muſt be given freely, both as to the largeneſs of the doſe and the frequency of the repetition. Beſides this, *which of all others is the moſt powerful*, the following in different degrees, and on different occaſions, afford the wiſhed-for relief; they are *camphor, caſtor, muſk, fetid gums, æther, volatile alkaline ſpirits*, &c. To theſe may be added, the *warm bath, ſemicupiums, pediluves, emollient clyſters*, and *warm fomentations*.---Sometimes the ſpaſms in one part are relieved by painful applications on another, ſuch as *bliſters, acrid cataplaſms*, and *frictions*;---*fear* or *ſurpriſe*, when they can be prudently excited, may produce the moſt deſirable effect.---Bandages tightly applied to the part affected, and continued for a ſhort time, will often procure relief. The particular cauſe being diſcovered, and the particular diſpoſition of the patient being attended to, will aſſiſt in determining which of theſe methods may moſt likely be ſucceſsful.

Fainting with convulſions. If the pulſe admits of it, bleeding ſhould be the firſt means uſed;---the ſtrongeſt acid ſpirits ſhould be held to the noſe, or, in want of them, take the fetid and volatile alkaline ſpirits;---hot bricks may be applied to the feet, and the legs, arms, and belly may be ſtrongly rubbed; or, if convenient, the legs may be put into water that is blood warm, or rather more ſo; and as ſoon as the patient can ſwallow, if the conſtitution is ſanguine and plethoric, give a draught of water, with a large ſpoonful or more of ſharp vinegar in it; *but if the habit is lax and feeble*, a gentle cordial is to be preferred.

Pain with cramps in the ſtomach. If there is a tendency to vomit, waſh the ſtomach with a few draughts of camomile-tea, after which give from fifty to eighty drops of the tinct. opii, in ſix ounces of warm water, by way of clyſter.---If the cramps return, the clyſter ſhould be repeated;---muſk ſhould be given in large doſes with ſome cordial liquid,---the anodyne balſam may be rubbed on the region of the ſtomach, or the patient may be put into a warm half-bath. *Except great weakneſs forbids*, bleeding ſhould be uſed, if the pain is violent.

Indigeſtion and vomiting, with pains in the ſtomach. When he happen from faulty humours in the ſtomach, vomits,- ye..t bitter purges--- the teſtacea---elixir of vitriol, &c. are proper.---If too great ſenſibility in the ſtomach is the cauſe, beſides ſtrengthning the ſtomach with the bark, bitters, &c. from five to thirty drops of laudanum may be taken an hour before dinner and ſupper. In ſome inſtances, a draught of warm water with a little brandy, after the principal means, prevents thoſe ſymptoms.

An hyſteric or *flatulent colic. If there is coſtiveneſs*, give a laxative clyſter with a dram or two of aſa fœtida diſſolved in it;---and if there are troubleſome vomitings, after ſeveral draughts of water in which toaſted bread hath been boiled, give the ſame draughts, with peppermint water, and a few drops of tincture of opium in each:---or, if the tincture was given clyſter-wiſe in warm water, and the ſaline mixture ſwallowed whilſt in the act of effervescence, the effects will be more certain and ſpeedy; beſides, if a thorough paſſage can be procured by means of a few pills with calomel and aloes, this operation will be much favoured by the opiate clyſters, and thus the ſymptom is, for the moſt part, effectually removed.

Flatulence in the ſtomach and bowels. Beſides keeping the body ſolutive, draughts of warm water may be taken, in which is a ſmall quantity of pepper-mint water, brandy, ſpirit of nitre, or ſpirit of hartſhorn, according as one or other are obſerved to be moſt generally uſeful; with ſome a little acidum vitrioli dilutum anſwers this purpoſe, and others require a few drops of tincture of opium.

The nervous or ſpaſmodic aſthma. Bleeding according to the ſtate of the pulſe, and repeated doſes of the tinct. opii camphorata uſually ſucceed.---Or if the wind in the ſtomach cauſes or increaſes this ſymptom, a ſolution of aſſafœtida with a little ſpirit of hartſhorn will be a uſeful help. But if the aſthma is attended with fixed obſtructions of the lungs, or a conſiderable accumulation of phlegm, opiates muſt be omitted, and bleeding, with bliſters, uſed in their ſtead; the lac ammon. with aſſafœtida will alſo be proper.---To prevent returns, be careful to ſupply the patient with every proper means for recovering and eſtabliſhing the ſtrength of the conſtitution in general.

A palpitation of the heart. If this ſymptom ariſes from ſympathy when the ſtomach is weak and diſordered, for preſent relief give an opiate; and then go on to recover the healthy ſtate of the ſtomach.---If the matter of the gout, &c. be repelled, and occaſions this diſorder, the proper means of relief will be *warm ſtomachics, laxatives, camphor, volatile ſalts, warm pediluves, bliſters on the legs, ſinapiſm on the feet*, and, IF PLETHORIC, *bleeding*.---If ſuppreſſed evacuations are the cauſe, they ſhould be reſtored;---or if polypi, &c. produce it, the beſt palliatives are, frequent *ſmall bleedings, gentle purges, cooling attenuants, a light diet*, and the avoiding of all that hurries either body or mind.

An immoderate diſcharge of pale urine. An opiate, mixt with any convenient vehicle, gives the ſpeedieſt relief.

Periodical head-achs. After thoſe general methods which uſually remove diſorders in the ſtomach, ſuch as crudities and indigeſtion, give the bark in an infuſion of valerian root; but if the caſe is ſymptomatic, regard muſt be had to the original diſeaſe.

Low-ſpiritedneſs. The cold-bath is, in general, the beſt help in this caſe; but, beſides this, the particular cauſe of the *nervous* diſorders in general which affect the patient, ſhould be adverted to, and alſo of this ſymptom in particular; ſuch as a diſordered ſtomach, grief, obſtructed uſual evacuations, &c. each of which muſt be remedied before ſucceſs can be expected.

2. TO LESSEN OR REMOVE the MORBID IRRITABILITY of the NERVES.

The medicines adapted to this end are, ſuch as not only ſtrengthen the ſtomach in particular, but alſo the whole conſtitution; and alſo thoſe which, by their peculiar action on the *nerves* to which they are applied, leſſen for a time the too great ſenſibility of the general ſyſtem; and of this kind are,

Bitters. Of which the propereſt are *gentian root, the tops of the leſſer centaury*, and *the yellow rinds of Seville oranges*; theſe may be infuſed in ſtrong white wine; but if the ſtomach is diſturbed with acidities, in which caſe a peculiar coldneſs is alſo felt there, an infuſion in boiling water will be the beſt, and to this a proper quantity of brandy may be added: if theſe heat too much, add a little of the *acidum vitrioli dilutum* to each doſe. The *lignum quaſſiæ* is here an admirable medicine. Sometimes

times it happens that bitters lie heavy on the ſtomach, and leſſen the appetite; in this caſe vomit, and proceed with other means.

Bark. This ſtrengthens more and heats leſs than any of the bitter kind of medicines. It may be given in ſuch forms and in conjunction with any other means as preſent circumſtances render neceſſary. Joined with bitters, and given in a ſpirituous vehicle, it generally anſwers the intention of preſcribing it.

Diluted vitriolic acid. When this kind of preparation agrees with the ſtomach, twenty or thirty drops may be taken twice a day in a glaſs of water, or brandy and water. It ſtrengthens the ſtomach, reſtores a decayed appetite, and both allays flatulence, and helps digeſtion. When the tongue is white, and ſome degree of thirſt attends, from a heat in the ſtomach, it moderates the ſame, and relieves all its conſequent ſymptoms.

Iron. Few, if any, medicines ſo remarkably ſtrengthen the ſtomach and bowels, and indeed the whole habit, as preparations of this kind. The beſt preparation has been ſaid to be the *ſimple filings*, juſt as they fall from under the file, if they can be complied with, notwithſtanding the ſymptoms which they ſometimes excite. From five to twenty grains or more may be taken three times a day; but if the filings offend, the tincture, or other preparations, may be tried. The *ruſt prepared*, or *the tartariſed iron*, particularly the latter, is now held in high eſtimation, where acidities are prevalent in the ſtomach; where not, ſome other of the more compound preparations. If there is a ſtrong acidity upon the ſtomach, the iron is by much the beſt remedy given in ſubſtance, for it aſſiſts in immediately correcting the acid, and forms a very active chalybeate ſalt. Preparations of iron ſometimes ſucceed beſt in conjunction with the bark and bitters. *The Bath waters* excel in diſorders of the nervous kind.

As theſe medicines require a long continued uſe before any good can be expected from them, the bark and bitters may be taken during the winter and ſpring, now and then intermitting their uſe for a week or two; and in ſummer uſe ſuch preparations of iron as are found moſt convenient; this direction is principally to be regarded when the waters are drank from ferrugineous ſprings.

Cold bathing. This ſhould be regularly continued during the ſpring, ſummer, and autumn quarters. Thoſe with ſpare habits may go into the bath twice or thrice a week; but the more corpulent or fleſhy may go in daily.

It ſhould be noted that, though all theſe are recommended, they are not all to be uſed at once, but ſingly or in conjunction, at the diſcretion of the preſcriber; and further, *when the patient hath a quick pulſe and a preternatural heat, inſtead of bitters and iron, the bark with the diluted vitriolic acid will be moſt proper.*

Air. If the air is hot, whether from the ſun or a fire, it injures *nervous* patients; and, whether hot or cold, if it is moiſt, the worſt nervous ſymptoms will thereby be produced; ſo that a dry air is always to be choſen, and a cool or warm one, as the ſenſations of the patient may direct.

Food. The ſolid part of diet ſhould be ſuch as affords a due degree of nouriſhment with the leaſt trouble to the ſtomach. All exceſſes are hurtful, ſo are fat meats, and rich ſauces.

Wine. Much wine, and indeed of any liquid after eating, retards digeſtion in weak ſtomachs. The beſt time to take wine or other cordials is when the ſtomach is nearly empty. If thoſe whoſe ſtomachs are weak, and upon motion, have hot qualms, are languid and apt to ſweat, were, on ſuch occaſions, to eat a morſel of bread and drink a glaſs or two of wine, their ſtrength would be ſpeedily recruited, and every diſagreeable affection would vaniſh.

Exerciſe. Without this the beſt remedies may fail. Riding ſhakes the body equally, and more than walking, and fatigues it leſs: and, whatever mode of exerciſe is engaged in, the laſt meal ſhould be nearly digeſted before attempting it.

Amuſement. As nothing injures the ſtomach more than uneaſy and painful affections of the mind, it ought to be amuſed by ſome means or other, ſo that the ſpirits might be kept in a ſtate of chearfulneſs, and content; and here it will be proper to obſerve, that people are apt to give way to lowneſs of ſpirits, and rather indulge in, than attempt to conquer that unhappy frame of mind. Under ſuch circumſtances, medicine can do little; it therefore is a point eſſentially neceſſary to be inſiſted upon, to diſſipate all gloomy ideas by change of ſcene, amuſements which will engage the attention, and exhilarate the ſpirits, particularly chearful company.

3. To CORRECT the OCCASIONAL CAUSES, ESPECIALLY the MORBID ONES; ſuch as,

Morbid matter in the blood. In many inſtances we cannot diſcover this: but when it is manifeſt, as when a wandering gout attends, ſuch means as leſſen its increaſe, or determine it to the extreme parts, are immediately to be preſcribed, and ſteadily perſiſted in. If there is a ſcorbutic, or other kind of acrimony, means adapted to each reſpectively will be the proper method for removing thoſe *nervous* ſymptoms depending on it.

A diminution or ſuppreſſion of natural evacuations. When theſe are obſerved to give riſe to *nervous* diſorders, they muſt be recalled; and in the mean time the *nervous* ſymptoms muſt be palliated.

The drying up of old ulcers, and the ſudden retiring of pimples on the face. In theſe caſes, gentle purging, perpetual bliſters, and iſſues, are the only means, except the ulcers can be made to diſcharge afreſh, and the pimples to return.

A defect of craſſamentum in the blood. In this caſe, whilſt troubleſome *nervous* ſymptoms are palliated by means of cordial and anodyne medicines, whatever attending diſorder can conduce towards diminiſhing the craſſamentum, muſt be removed: and by means of ſuch medicines and aliments as are beſt adapted to this end, the blood muſt be repleniſhed. Beſides *a light cordial and nouriſhing diet, moderate exerciſe, a dry air, the bark, aromatics*, and *preparations of iron*, will be the beſt.

Tough phlegm in the ſtomach and bowels. Gentle but repeated emetics, after which, to ſtrengthen the ſtomach, *bitters, chalybeates* and *exerciſe*, will be neceſſary; and to reſtore the ſecretory veſſels to an healthy ſtate, give the *tinct. aloes frequently in ſmall doſes.* According as the phlegm abounds, more or leſs, repeat the emetic every ſecond or third week, and work it off with warm water, in which is a little flour of muſtard. Beſides theſe, *as lime-water diſſolves phlegm in the ſtomach, a quart at leaſt ſhould be drank, at three times, every day*; the firſt draught may be taken an hour before breakfaſt, the ſecond as long before dinner, and the third the ſame diſtance of time before ſupper.

Aliments noxious from their quality or quantity. Whether a habit is formed of eating too freely or too ſparingly, let the error be gradually avoided. Valetudinarians ſhould never eat ſo much at a time as to incommode them either for buſineſs or ſtudy. As to the quality of what is eaten, ſuch things ſhould be avoided as reſt uneaſily on the ſtomach, create flatulence, or are very fat.

Violent affections of the mind. Beſides other general methods recommended in *nervous* diſorders, diverting the mind by pleaſing objects in the day, and an opiate at night, are the moſt proper, except it be the fruition of the object in caſes of diſappointment.

When a fever attends, or in the *nervous fever*, *bliſters* ſhould be applied early; by their ſtimulus, the advantage overbalances the inconveniences; *the patient ſhould be kept in bed: light cordials, with diaphoretics, volatiles, and as early a uſe of the bark as poſſible*, are the principal remedies. To moderate the feveriſh heat, *Clutton's febrifuge ſpirit*, joined with any proper cordial, and taken in all the patient's drink, is a moſt agreeable medicine. *The ſp. ætheris nitroſi* very effectually abates the ſickneſs which often attends.

In this kind of fever there is rarely any extraordinary degree of plethora, ſo there is as rarely any remarkable critical diſcharge obſerved. In giving the cordial, diaphoretic medicines with volatiles, as above directed, their too free uſe will produce a ſweating, which keeps up the fever; therefore, to ſecure the proper medium, obſerve the urine; if from being pale, it aſſumes an amber colour, the doſes are duly proportioned, and that more eſpecially if when in bed a kindly moiſture comes on without reſtleſſneſs. As ſoon as a turbidneſs appears in the urine, give the bark with cordials. For procuring ſleep in *nervous* fevers, *a few grains of ferrum ammoniacale* are by many preferred to every other means. A ſymptom of all others the moſt to be dreaded in this diſorder, is madneſs, which ſometimes comes on when women are much reduced in child-bed; in this caſe carefully avoid bleeding, and all elſe that can leſſen the vis vitæ, and ſteadily adhere to the cordial diaphoretic method in general uſed

to remove the *nervous fever*, and to theſe add the extract of bark with the ferrum ammoniacale.

On *nervous* diſorders, amongſt the ancients, ſee Hippocrates, Aretæus, Fernelius, Duretus, Hellerius, Mercurialis, &c. Among thoſe of later date, ſee Wallis's Sydenham, Hoffman, Shebbear's Practice of Phyſic, Smith's Diſſertation on the Nerves and *Nervous* Diſeaſes, Whytt on *Nervous* Diſeaſes, Huxham, Hume, and ſir Richard Manningham on the *Nervous* Fever.

NERVORUM RESOLUTIONES. See COMATA.

NESTIS. See JEJUNUM.

NEURI. See NERVI.

NEUROCHONDRODES, from νευρον, *a nerve*, and χονδρος, *a cartilage*. A hard kind of cartilaginous ligament, partly broad, partly round; a certain middle ſubſtance between cartilage and ligament; harder than the latter, but ſofter than the former. CASTELLI.

NEUROLOGIA. NEUROLOGY. A deſcription of the nerves.

NEUROMETERES. See PSOÆ.

NEUROSES, from νευρον, *a nerve*. NERVOUS DISEASES. Theſe form the ſecond claſs in Dr. Cullen's Noſology; and under this title he comprehends thoſe preternatural affections of ſenſe or motion, which are without fever, as a part of the primary diſeaſe; and all thoſe which do not depend upon a topical affection of the organs, but upon a more general affection of the *nervous* ſyſtem, and of thoſe powers on which ſenſe and motion more eſpecially depend. He conciſely defines them, ſenſation and motion injured, without any idiopathic fever, or local diſeaſe.

NEUROTICA, vel NERVINA. NERVOUS MEDICINES. By theſe are meant ſuch as are ſuited to relieve the diſeaſes, or correct diſorders of the nervous ſyſtem, on which Dr. Cullen makes this remark. The obſcurity which ſtill attends the mode of the operation of medicines upon the nervous ſyſtem, might excuſe this term; but it ſeems to be more general than neceſſary, and we ſhall never get the better of the obſcurity mentioned, until more preciſion is attempted upon the ſubject.

NEUROTOMIA, from νευρον, *a nerve*. An anatomical diſſection of the nerve.

NEUROTROTOS, from νευρον, *a nerve*, and τιτρωσκω, *to wound*. A perſon who labours under a *wound* of a *nerve*.

NEUTER. NEUTRAL. In CHEMISTRY this word is applied to ſalts, formed of ſuch proportions of acid and alkalies that neither of them predominate in the compound, called alſo *enixi*. There are many ſalts of this kind, which yet have different qualities from each other; ſome of them are natural, and others are artificial. They have a more extenſive uſe in medicine than any other kind. In general they are EVACUANTS, i. e. *cathartics*, *diaphoretics*, and *diuretics*; and are eſteemed under ſome circumſtances antiſpaſmodics: and when mixed with human blood, in that they produce not any change.

NEUTHA. Thus that part of the membrane is called which is torn away, and covers a part of the whole face of a child at its birth.

NHAMBI BRASILIENSIBUS. A plant in Braſil, whoſe leaves, when chewed, taſte like muſtard or naſturtium, and, if rubbed on a bubo, preſently remove it. See Raii Hiſt.

NHAMBU GUACU. See CATAPUTIA.

NHANDU, alſo called *piper caudatum*. It is a ſmall ſhrub which grows in the woods in Braſil, and bears a ſpecies of katkins, full of round blackiſh ſeeds, as large as thoſe of the poppy, and with a taſte much reſembling that of pepper. See Raii Hiſt.

NICON. See HELLEBORUS.

NICOTIANA, called alſo *petum*. The Indians name it *petun*; *tabacum*, *hyoſcyamus Peruvianus*, *picelt*. TOBACCO. It is the NICOTIANA TABACUM, *foliis lanceolato ovatis ſeſſilibus, decurrentibus, floribus acutis*. CLASS PENTANDRIA, ORDO MONOGYNIA, LINN. Gen. Plant. 248. It is a plant with alternate leaves and monopetalous tubulous flowers, divided into five ſections; the flowers are followed by an oval capſule, which opening longitudinally, ſheds numerous ſmall ſeeds. Its root is annual. It is ſown in ſpring and flowers in July. Boerhaave mentions four ſpecies, but there are ſeveral more.

—— AMERICANA. AMERICAN, or VIRGINIAN TOBACCO. It hath large ſharp-pointed, pale, green, ſhort leaves, about two feet in length, joined immediately to the ſtalk without pedicles. It was brought into Europe by M. Nicott, a Frenchman, from whom it is called *Nicotiana*; he brought it from the iſland of Tobago in America, about the year 1560; but it is now cultivated in many parts of Europe. Sir Francis Drake firſt brought it into England, and ſir Walter Raleigh firſt made its uſe a ſort of faſhion amongſt us.

The leaves have a ſtrong diſagreeable ſmell, and a burning acrid taſte; they give out their active parts both to water and to ſpirit, but moſt perfectly to the latter, but yield nothing conſiderable by diſtillation with either; nevertheleſs their acrimony is much abated in inſpiſſation of the tincture, the watery extract being leſs pungent than the leaves themſelves, and the ſpirituous not much more ſo. The *American tobacco* is ſtronger than that which is raiſed in England, and affords a more fiery extract, though in leſs quantity. This plant is conſidered as a narcotic, which it diſcovers in all perſons, even in ſmall quantity, when firſt applied to them. Small quantities ſnuffed up the noſe have been known to produce giddineſs, ſtupor, and vomiting: and when applied in different ways, in larger quantity, there are many inſtances of its more violent effects, even of its proving a mortal poiſon. In all theſe inſtances, it operates in the manner of other narcotics. But along with its narcotic qualities, it poſſeſſes alſo a ſtrongly ſtimulant power, perhaps with reſpect to the whole ſyſtem; but eſpecially with reſpect to the ſtomach and inteſtines, ſo as readily, in no great doſes, to prove emetic and purgative, by this account, conciſe as it is, may be explained the whole medicinal effect of *tobacco*.

If *tobacco* is taken inwardly in too large a doſe, or if a ſtrong decoction of it is uſed as a clyſter, it proves violently cathartic and emetic, occaſioning extreme anxiety, vertigoes, ſtupors, and diſorders of the ſenſes; however, in proper quantities, it has been employed as a purgative in clyſters, and is generally very effectual. ENEMA NICOTIANÆ. TOBACCO GLYSTER. See HERNIA INCARCERATA. It is employed in all caſes of more *obſtinate coſtiveneſs*; and *in this*, the *ileus*, and *incarcerated hernia*, the ſmoke of burning *tobacco* has been thrown into the anus with great advantage.—It has been lately recommended as a powerful diuretic; but from the ſickneſs and vomiting it occaſioned before it became efficacious, from the increaſe of the doſes, it has been in ſome degree laid aſide.—By long boiling in water its deleterious power is abated, and at length deſtroyed. —The ſmoke of *tobacco* received by the anus is of ſingular efficacy in obſtinate *conſtipations of the belly*, for *deſtroying aſcarides*, and for *recovering men that ſeem to be drowned*.

Tobacco is ſometimes uſed in lotions and unguents *for cleanſing foul ulcers*, and *deſtroying cutaneous inſects*;—it is deſtructive to all inſects, whether in the vegetable or animal world.—Beat into a poultice with vinegar, and *applied to the hypochondres, it hath diſcuſſed tumors there*. Bergius recommends a fomentation of it in *paraphymoſis*.

A conſtant chewing of *tobacco* deſtroys the appetite, by depriving the conſtitution of too much ſaliva; however, though it is improper for lean, dry, and hectic habits, it is uſeful to the more groſs, to thoſe of very moiſt temperaments, and thoſe who are ſubject to diſeaſes of the colder kind.—When the gums are ſurcharged with rheum, or when the lungs are œdematous, *tobacco* may be uſeful as an errhine.—Snuff never hurts, if not ſwallowed, but is better omitted by thoſe who are inclined to an apoplexy. The oil of the *tobacco* which aſcends in the ſmoak, blackens the teeth, and decays them. Cullen's Mat. Med.

NICOTIANA MINOR, called alſo *hyoſcyamus luteus*; *priapeia*. YELLOW HENBANE. ENGLISH TOBACCO. Its leaves are ſhort, and ſomewhat oval, and ſet on pedicles; by theſe three characters it is diſtinguiſhed from the American ſorts, with which it agrees in their qualities, but is weaker. See Raii Hiſt. Lewis's Mat. Med. Neumann's Chem. Works. Edinb. Med. Eſſays, vol. ii. art. 5.

NIDI CYNIPIDIS. See GALLÆ.

NIDOR. The ſmell of burnt animal ſubſtances; hence eructations, which have a ſavour like putrefied fleſh, are called nidorous.

NIGELLA. It is a plant whoſe root is annual, leaves capillaceous, and flower roſaceous. Boerhaave enumerates ten ſpecies. The ſort formerly uſed as a medicine, was the NIGELLA SATIVA Lin.

—— ARVENSIS, alſo called *melanthium*. WILD FENNEL-FLOWER.

—— ROMANA, alſo called *gith*, *git*, *melaſpermum*. FENNEL-FLOWER.

It is called *nigella*, as it were nigrella, from the black colour of the ſeeds; alſo *melanthium*, i. e. BLACK FLOWER, though the flowers are not black; and melaſpermum, BLACK SEED.

None of the ſpecies of this plant are uſe in with us; they are ſaid to be aperitive, reſolvent, diuretic, and carminative. The ſeeds poſſeſs ſimilar virtues, but are alſo expectorant. See Raii Hiſt.

NIGELLASTRUM, called alſo *pſeudomelanthium*, *lychnis ſegetum major*, *gethago*. *nigella officin. lychnoides ſegetum*, COCKLE, or CORN-CAMPION. It is Boerhaave's ſixth ſpecies of lychnis; the ſeeds are uſeful in flatulent diſorders, but are rarely given. The plant grows amongſt corn, and flowers in June and July. See Raii Hiſt.

NIGRITIES Os. See CARIES.

NIGRUM PIGMENTUM. See CHOROIDES.

NIGUS. So the Spaniards call the worms which get under the toes of the Indians, and which are deſtroyed by the oil from the ſhells of caſhew-nuts.

NIHIL ALBUM, } See ALBUM GRÆCUM, and
—— GRISEUM, } POMPHOLYX.

NIIR-NOTSJIL. A kind of tree or ſhrub, in Malabar; the leaves of which, when eaten with rue, are ſaid to cure the lues venerea. See Raii Hiſt.

—— PONGELION. A tree which reſembles the pear-tree, and grows in Malabar. The fruit is eaten by parrots; the ſeeds are uſed, with other ingredients, for making an antiſpaſmodic liniment. See Raii Hiſt.

NIL. See INDICUM, and COLINIL.

NILENTSIUNDA. See SOLANUM.

NIMBÆ ACOSTÆ. See AZEDARACH.

NINDSIN, } See GENSING.
NINZIN. }

NIQUI. See GUAPARAIBA.

NIRLES. See MORBILLI.

NIRUALA. A large tree in Malabar, whoſe leaves provoke urine, though only externally applied. See Raii Hiſt.

NISI. See GENSING.

NITRIALES. All things capable of reducing to a calx, as nitre, ſulphur, &c.

NITRI PULVIS COMPOSITUS. See DYSURIA.

NITRO DE PILULÆ. See DIACOLOCYNTHIDOS PILULÆ.

NITRUM. NITRE. Called alſo *ſal petræ*, *alaurat*, *algali atac*, *baurach*, *acuſto*, *halinitrum*, and SALT-PETRE. *C.* in the chemical alphabet, ſignifies *ſalt-petre*, cabulator, cabalator. There is a kind called callena. It is a neutral ſalt, formed by the coalition of the common vegetable fixed alkaline ſalt, with a peculiar acid; it hath a ſharp penetrating taſte; it is compoſed of near equal quantities of volatile and fixed nitrous aerial ſalts; it is ſoluble in eight times its weight of very cold water; and in leſs than three times its weight of water which is temperately warm; and in one third its weight of boiling water. Dr. Alſton obſerves, that when the atmoſphere is temperate, two ounces of water diſſolves half a dram of *nitre*. A ſaturate ſolution of *nitre*, ſet to cryſtallize, ſhoots into cryſtals like ſprig cryſtals; but on evaporating part of the fluid firſt, it concretes into tranſparent colourleſs cryſtals, of an hexagonal priſmatic ſhape, terminating in pyramids of the ſame number of ſides. In a moderate heat it melts as thin as water, and when heated to ignition, it deflagrates on the contact of any inflammable ſubſtance, with a bright flame, and a conſiderable hiſſing noiſe; and leaving, after detonation, its fixt alkaline ſalt, the acid being deſtroyed by the act of accenſion; and thus is produced the

NITRUM FIXUM, N° 1.

Take of powdered *nitre*, four ounces; of powdered charcoal, five drams; mix them well by rubbing in a mortar; then inject the mixture by a little at a time, in a red-hot crucible. A deflagration, with a hiſſing noiſe, happens on each injection: the whole quantity being thus deflagrated, continue the fire ſtrong for half an hour. Thus the acid of the *nitre* is either deſtroyed or changed to another nature, and the remaining ſalt differs not from the ſalt of tartar, except that a very minute portion of the *nitre* generally remains unchanged. This *nitrum fixum* is purified by ſolution in water, filtration, and evaporation. It muſt be kept cloſe from the air. Dr. Alſton ſays, it is a *ſtyptic*, and *of the nature of alum*; but it is rarely uſed, except for the making of the tinct. nitri, which does not appear to differ from the tinct. ſal. tart.

The origin of the acid of *nitre* is unknown. It is true, that common waters, both atmoſpherical and ſubterraneous, often contain a little of this acid in combination with earthy and other bodies, ſo as to yield by cryſtallization, on ſupplying the vegetable fixed alkali, a perfect *nitre*; and that when animal and vegetable ſubſtances, mixed with porous and abſorbent earths, have been expoſed to the air till they are thoroughly rotted, they are found in like manner to contain a ſmall portion of *nitre*, or of nitrous acid, ſo as to give out a little *nitre* to water, either without addition, or on being ſupplied with the proper alkaline baſis. On this foundation *nitre* is prepared in ſeveral parts of Europe; where they expoſe earth, wet with urine, or animal dung, to abſorb the aerial acid; on ſea-coaſts, ſheds are made over heaps of vegetable ſubſtances, both the marine and others; of animal ſubſtances, as the entrails, &c. of beaſts and fiſhes, the rubbiſh of old buildings, &c. promiſcuouſly jumbled together, and open to the air, but covered from rain; on the ſurface of theſe heaps, a nitrous cruſt is found. The greateſt quantities are brought to us from Perſia and the Eaſt Indies; but whether it is there a natural or artificial production, is not known. It is brought to us crude, and of different complexions, as grey, blackiſh, &c. but that which is of a blackiſh caſt is the beſt, as it requires only a bare ſolution, colation, and cryſtallization for purifying it. Very often it is mixed with ſea-ſalt, from which it is purified as follows:

2. NITRUM PURIFICATUM.

Boil *nitre* in water until it is diſſolved; filtre the ſolution through paper, evaporate, and ſet it to cryſtallize in a cool place. The liquor which remains after cryſtallization may be further evaporated, and ſet to ſhoot as before; but this proceſs muſt not be too long protracted. The uſual method of evaporating for cryſtallization, is till a pellicle appears; but this direction fails in *nitre*, for it does not contract a pellicle: here, when the liquor is become ready for ſhooting, a little ſhould be taken up in a ſpoon; as it cools, the ſalt will begin to ſhew itſelf in threads. In this proceſs, the ſea-ſalt is all ſeparated, for it remains diſſolved, after the greateſt part of the *nitre* hath cryſtallized. The cryſtals which ſhoot after the ſecond evaporation, are not totally free from the ſea-ſalt; but the refiners purify it ſo well, that ſuch as is found in the ſhops is perfectly fit for uſe. It is given in doſes, from five to thirty grains, with equal quantities of gum arabic and ſugar, and diſſolved in a cup full of barley-water, thin gruel, or the like. In acute fevers and other inflammatory diſorders, it is adminiſtered as cooling and attenuating; mix it with ſome of the abſorbent powders, it is ſuppoſed not ſo readily to run off by the urinary paſſages, as it is apt to do without this combination. In large doſes, it ſeldom ſits eaſy on the ſtomach, and is apt to debilitate and depreſs hypochondriac and nervous habits; on which account, when neceſſary to be given to them, it is ſometimes joined with a few grains of camphor.

Geoffroy ſays, that *nitre* loſes, in melting, half its weight of watery moiſture, and recovers this again on being diſſolved and cryſtallized; whence, it ſeems, that one part of melted *nitre* is equal to two parts of the cryſtals; but on making the experiment, his obſervation is not found true.

To improve the virtue of *nitre*, it is deflagrated with ſulphur; by which a portion of the nitrous acid paſſes off with the ſulphur; and, as Dr. Alſton obſerves, the *nitre* is thus rendered a little leſs cooling. The proceſs is as follows; and when finiſhed, the preparation is called,

3. SAL PRUNELLÆ. Called alſo *Anodynum Minerale*, *Cryſtallum Minerale*.

Take two pounds of pure *nitre*; melt it in a crucible, or in an iron pot; then ſprinkle into it, by little and little, the flowers of ſulphur, waiting each time until the deflagration is over, and then add more, until an ounce hath been thus conſumed; then with an iron ladle take it out, and caſt it into moulds of what ſhape you pleaſe. If the ſulphur is in a larger proportion, its effects will be to change the *nitre* into a different medicine; as is inſtanced in the

4. SAL POLYCHRESTUM. *Salt of many Virtues.*

Take of pure *nitre*, melt it in an iron pan, and then add, by little and little, an equal weight of the flowers of ſulphur, waiting until the deflagration of one portion is

over before another is added; when all the ſulphur is expended, continue the *nitre* over the fire for an hour. Thus the acid of the *nitre*, and the inflammable principle of the ſulphur, detonate together, and are diſſipated; whilſt the acid of the ſulphur or vitriolic acid remains combined with the alkaline baſis of the *nitre*. For this ſal polychreſtum, the *nitrum* vitriolatum is ſubſtituted. Dr. Alſton ſays, that this ſalt much reſembles the tart. vitr. but is rather more acrid, and that a doſe of half a dram is *diaphoretic*; a dram, is *diuretic*; and two drams, *cathartic*. The ſalt may be obtained by pouring gradually on *nitre*, the pure acid of vitriol, or ſulphur; this acid decompoſes the nitrous acid, which flies off immediately in yellow or red fumes, and may be collected in a retort, with a moderate heat, and is the

5. Spiritus Nitri, or Spiritus Nitri Glauberi, *now called* Acidum nitrosum. Nitrous Acid.

Take of *nitre*, ſixty ounces; vitriolic acid, twenty-nine ounces; mix, and diſtil. Ph. Lond. 1788. If two parts of *nitre* are taken to one of oil of vitriol, the remaining alkaline baſis of the *nitre* is completely ſaturated with the vitriolic acid; and the reſult is a neutral ſalt, the ſame as the vitriolated tartar: if no more *nitre* is uſed, a part of the *nitre*, in ſubſtance, will remain behind, blended with this vitriolated ſalt; if leſs *nitre*, it cannot afford alcali enough to ſaturate the vitriolic acid, and the reſiduum will not be neutral, but very acid. In this laſt caſe, one advantage attends; the acid ſalt is readily diſſolved in water, ſo as to be got out without breaking the retort, which the other cannot. The ſpecific gravity of the nitrous acid is to that of diſtilled water as 1,550 to 1,000. Pharm. Lond. 1788.

The acid of *nitre* is next in ſtrength to the vitriolic, and diſlodges all but that from the alkaline ſalts and earths. It differs from all the other acids, in deflagrating with inflammable matters; if it is dropped on ol. carui, it will flaſh, and make an ebullition as ſtrong as though on the fire, and will yield ſuch fumes as, by mixing with air, will be ſenſible for three or four hours. If a ſolution of any inflammable ſubſtance, as hartſhorn, &c. in this acid, be ſet to evaporate, as ſoon as the matter approaches to dryneſs, a violent detonation enſues. This acid is chiefly uſed as a menſtruum, and as the baſis of ſome other preparations. *Diluted in water, it hath been given as a diuretic from ten to fifty drops.*

If three parts of *nitre* be uſed to one of the vitriolic acid, a part of the *nitre* remains unchanged, after the ſpirit is diſtilled from it. On diſſolving the whole reſiduum in hot water, and ſetting the filtered ſolution to cryſtallize, the vitriolated ſalt ſhoots firſt, the greateſt part of the *nitre* continuing diſſolved; and this is the

6. Nitrum vitriolatum. *Vitriolated Nitre*, called alſo *ducis Holſtatiæ ſal*, *duobus de ſal*; *panacea duplicata*; *arcanum duplex*; now *kali vitriolatum*, vitriolated kali.

Take the ſalt which remains after the diſtillation of the nitrous acid, two pounds; diſtilled water two gallons; burn out the ſuperfluous acid, with a ſtrong fire, in an open veſſel; then boil it a little while in the water; ſtrain and ſet the liquor aſide to cryſtallize; this, as already obſerved, differs not from the tart. vitr. except in being a little more acrid; nor is its difference from the ſal polychreſtum conſiderable. Vitriolated tartar in ſmall doſes, as, ℈ i. ſs. or ʒ ſs. is *an uſeful aperient*; in larger ones, as four or five drams, *a mild cathartic*, which does not paſs off ſo haſtily as the ſal amarus, or natron vitriolatum.

7. Aqua Fortis Simplex.

Take of *nitre*, and of green vitriol, not calcined, of each three pounds; of calcined green vitriol, a pound and a half; mix them well, and diſtil them with a ſtrong fire, as long as any red vapours ariſe. The ingredients ſhould be perfectly well mixed together before they are put to be diſtilled, or elſe but a ſmall quantity of the aqua fortis will be obtained. Mixing the vitriol requires ſomewhat more heat than when the oil of vitriol is uſed, for its acrid ſpirit muſt be ſeparated before it can act on the *nitre*; but then, too much heat may force over ſome of the metallic part of the vitriol. The produce of the proceſs is, a ſpirit of *nitre*, containing ſo much more phlegm or watery moiſture than Glauber's ſpirit, as the vitriol employed does more than an equivalent quantity of the oil of vitriol, and is liable to an admixture with the vitriolic acid, more or leſs of which is generally forced over. For this the College order nitrous acid and diſtilled water, a pound of each, to be mixed together, and call it acidum nitroſum dilutum. Ph. Lond. 1788.

8. Aqua Fortis Duplex.

Take equal parts of *nitre*, green vitrial calcined to redneſs, and of dried clay. Diſtil them in an earthen retort. The making of this is a diſtinct trade, on account of the large demand for it amongſt the dyers, and other artiſts. But when this is intended for medicinal uſes, or for the nicer chemical experiments, it requires to be purified; for the rough *nitre* is uſed, and a great heat, whence both the ſpirit of ſalt and a ſolution of iron are contained in it.

9. Aqua Fortis Purificata.

Drop into the impure aqua fortis a ſmall quantity of the tincture of ſilver, and when the cloudineſs of milkineſs which it occaſions, ſubſides, drop in more, and thus continue until a freſh addition occaſions no farther change; then pour the liquor into a glaſs retort, and diſtil it in a ſand-heat to dryneſs. The ſilver abſorbs both the marine and the vitriolic acids, and forming a concrete with them, they all fall together.

Good aqua fortis diſſolves about half its weight of ſilver.

10. Aqua Fortis Composita.

Take of aqua fortis ſixteen ounces in weight, of ſea-ſalt, one dram, diſtil to dryneſs. This is deſigned as a menſtruum for quickſilver, for the preparation of hydrargyrus nitratus rub. which the marine acid in this compoſition renders of a more ſparkling appearance, and more beautiful to the eye, than when made with the nitrous acid alone.

11. Aqua Regia.—Regalis Regis. *Aqua Stygia*, called by Helmont and others *Chryſulca*.

Put an ounce of crude ſal ammoniac powder into a large cucurbit, and add to it, by little and little, four ounces of the ſpirit of *nitre*, or of duuble aqua fortis; let them ſtand in a ſand heat until the ſalt is entirely diſſolved. Or, the ſalt may be powdered fine, and gradually added to the acrid ſpirit, which ſhould be of a middle ſtrength, between ſingle aqua fortis and ſtrong ſpirit of *nitre*.

The nitrous ſpirit obtained from rough *nitre* contains ſome of the marine acid, as well as the vitriolic; the firſt is diſcovered and ſeparated by dropping in a little ſolution of ſilver; the latter by a ſolution of chalk, or any other calcareous earth, made in the pure nitrous acid; the ſilver abſorbing the marine acid, and the chalk the vitriolic, and forming, with thoſe acids, indiſſoluble concretes, which immediately render the liquor milky, and then fall to the bottom. The ſolutions may be ſlowly dropped in, until no more milkineſs appears; and in caſe of an exceſs of their quantity, and the ſpirit is required pure, it muſt be re-diſtilled.

The nitrous ſpirit, combined with vegetable fixed alcalies, reproduces common *nitre*; with the mineral fixed alcali it produces,

12. Nitrum Cubicum.

Diſſolve chalk or lime in purified aqua fortis, and add the ſolution, by degrees, to a ſolution of natron vitriolatum in water, ſo long as a freſh addition produces any milkineſs, a white powder will percipitate; after which, the liquor is to be filtered, and after due evaporation, ſet to cryſtallize. Thus a ſpecies of *nitre* is formed, not much different from the common ſort; it cryſtallizes into cubical, inſtead of priſmatic figures; but as a medicine, this, and the common ſort, may be indifferently uſed.

13. Nitrum Flammans,

Is a combination of the nitrous acid and volatile alcaline ſalt. It is alſo called *nitrum volatile*, and *nitrum ammoniacale*; it is very ſubtil, pungent, and diſſolves in rectified ſpirit of wine.

The nitrous acid in its moſt concentrated ſtate, ſaturates about five-ſixths its weight of vegetable fixt alkali. Solutions of calcareous earths in this acid are bitteriſh and pungent, difficultly aſſume a cryſtalline appearance and when evaporated, and exſiccated by heat, it ſoon deliquates again in the air. The nitrous acid diſſolves zinc, iron, copper, lead, biſmuth, mercury, and ſilver, the moſt readily of all the acids; it diſſolves tin imperfectly, and

and it only corrodes the regulus of antimony. Aqua fortis diſſolves ſilver, mercury, iron (and that beſt when mixed with equal parts of common water), copper, lead, regulus of antimony, biſmuth, zinc, tin imperfectly, gold not at all: but by the addition of ſal ammon. crud. it loſes this name, and becomes aqua regia, ſo called becauſe it diſſolves gold, which chemiſts call the king of metals; it alſo diſſolves iron, copper, tin, mercury, regulus of antimony, biſmuth, zinc, and lead more than the ſpirit of ſea-ſalt does; but does not diſſolve ſilver.

The concentrated acid combined with ſpirit of wine loſes its acidity, the coalition of the two producing a new compound called,

14. Spiritus Nitri Dulcis, *now* Spiritus Ætheris Nitrosi.

Take of rectified ſpirit of wine one quart, of nitrous acid half a pound. Mix them by pouring the nitrous acid on the other, and diſtil one pound ten ounces. Ph. Lond. 1788.

This dulcified ſpirit is held in juſt eſteem for quenching thirſt, promoting the natural ſecretions, expelling flatulencies, and moderately ſtrengthening the ſtomach, but more particularly as a diuretic and cooling febrifuge; it is ſtrongly antiſeptic. Mixed with a ſmall quantity of liquor c. c. or ſp. ammoniæ comp. or any volatile alkaline ſpirit, it proves mild, yet efficacious, diaphoretic, and diuretic, eſpecially in fevers. The ſp. ætheris nitroſi allays vomiting when ſaline mixtures fail. It is often adulterated with water, which diminiſhes its grateful ſcent. A ſmall proportion of ſp. ætheris nitroſi gives a French brandy flavour to malt ſpirits. Doſe from 20 to 60 drops.

Nitre makes no impreſſion on blue paper, nor tincture of turnſol, nor ſyrup of violets; a violent fire is neceſſary to draw the ſpirit from this ſalt; it flames upon the fire, and kindles readily, though its ſpirit extinguiſhes fire; it does not curdle milk; *nitre* and oil of tartar make an almoſt inſenſible ebullition.—It is one of the principal of the antiphlogiſtics, of general uſe where inflammations attend from the ardency of the blood;—it is an antiſpaſmodic, when irritation or inflammation is excited by ſtimulating drugs; for if mixed with regulus of antimony, gamboge, ſcammony, &c. their uſual ill effects are prevented.—When uſed in gargariſms for inflammations of the fauces, in acute fevers, it thickens the ſalival fluids into a mucus, which keeps the part moiſt for ſome time, whereas if *nitre* is not added, a dryneſs of the mouth preſently enſues.—It promotes urine, tends to looſen the belly in hot diſpoſitions, and checks diarrhœas from the acrimony of the bile;—it is of ſingular ſervice in the cholera morbus when accompanied with anxiety, and in the cardialgia of hypochondriacs; —its virtues are ſimilar to thoſe of neutral ſalts in general, but exceed them in degree in many inſtances;—in the ſmall-pox, if the fever runs too high, *nitre* ſoon reduces it; ſometimes it is aſſiſted in its efficacy by a conjunction with volatile ſalts or camphor, at the ſame time that it is often by this means rendered more grateful to the ſtomach; thus managed it is uſeful in removing pains in the limbs;—it checks bloody urine from an inflammatory cauſe; hæmorrhages from rarefaction, and inflammations are reſtrained by its internal uſe; in hæmoptoes and other diſorders of the lungs, *nitre* is generally uſeful;—as an alterative, it hath been uſeful, by a long continuance of it, in the leproſy, and particularly ſo in the cure of old ulcers in the legs;—joined with warm carminatives, it carries their efficacy through the inteſtines, which otherwiſe would be confined to the ſtomach.

Nitre, however, ſhould not be given without caution; though uſeful in moſt diſorders of the lungs: if the vis vitæ is defective it is better omitted; the ſame may be obſerved in almoſt all other caſes.—It often occaſions a nauſea, or a pain in the ſtomach if taken in a ſolid form; in this caſe, plentiful dilution, or warm medicines accompanying its uſe; theſe are prevented, or removed, if they happen to come on.

The doſe of nitre may be from three grains to two ſcruples, or more, every hour or two. And if each doſe is given as ſoon as it is diſſolved, its efficacy will be greater, and thus it alſo reſts more eaſy on the ſtomach.

15. Decoctum Nitrosum.

Take half an ounce of *nitre*, one ſcruple of cochineal, boil them in a quart of water until the *nitre* is diſſolved, then add two ounces of ſugar; and when cold, ſtrain off the clear liquor. This is palatable, and agreeable to the eye. Three or four table ſpoonfuls may be taken for a doſe, and repeated according to the intention of giving it. In ſome inſtances *nitre* produces pain, nauſea, and even ſickneſs. It is ſaid that, when it is boiled before it is adminiſtered, no ſuch effects are obſerved; and farther, that when *nitre* has excited a nauſea, &c. it may afterwards be given as above preſcribed, and it will remove the ſickneſs previouſly excited.

See Hoffman de Salium Medicorum, & de præſtantiſſima *Nitri* Virtute. Stahl de Uſu *Nitri* Medico. Neumann's Chem. Works. Lewis's Mat. Med. Dict. of Chem.

Nitrum Antiquorum. See Anatron.

—— Artificiale Hoffmanni. It is made of the ſpirit of ſal ammoniac and ſpirit of *nitre*. It perfectly diſſolves in rectified ſpirit of wine.

—— Calcareum Verum. It is a ſolution of calcareous earth, in the nitrous acid.

—— Causticum. See Antimonium, N° 11.

—— Factitium, } See Borax.
—— Nativum, }

—— Stibiatum, called alſo *anodynum minerale*. After making the calx of antimony, it is directed to be waſhed in ſeveral waters, until they become inſipid; theſe waters being mixed, then evaporated over a gentle fire till a cuticle forms on the ſurface, yield in the cold, cryſtals which are thus called. They poſſeſs but little of the antimony.

NIX FUMANS. See Calx.

—— Antimonialis. See Antimonii Flores under Antimonium.

NOCHETZLI NOPALLI, } See Coccinella.
NOCHEZNOPATLI. }

NOCTAMBULATIO, } See Somnambulo.
NOCTAMBULO. }

NOCTUINI OCULI. Grey eyes.

NOCTILUCA TERRESTRIS. See Cicindela.

NODOSA. Knotted. In Surgery, it is an epithet for a ſort of future; and for various bandages. Alſo for a ſpecies of the gout. See Arthritis.

NODULAS. In pharmacy, it is a knot tied on a rag, including ſome medicinal ingredient, with which the liquor this *nodulus* is ſuſpended in, is intended to be impregnated.—It is alſo a bag, in which ingredients are included, in order to be ſuſpended in a diet-drink, or medicated wine.

NODUS. See Gumma. In Botany. It is a protuberant joint in the ſtem of ſome plants, particularly in corn and grapes, in order to ſtrengthen their otherwiſe weak hollow culms.

NOELA TALI. The Indian barberry-tree, with an orange leaf. It grows in Malabar, it is evergreen, its fruit reſembles barberries; they are cooling and antiſeptic. See Ray's Hiſt.

NOLI ME TANGERE, called alſo *formix*. Touch me not. In botany, it is the *perſicaria ſiliquoſa*, and a name for the *cacao*, or sensitive plant. In surgery, it is a ſpecies of ulcer, and a kind of wart on the eye-lid which appears blackiſh, in which caſe it preſently mortifies; or a cancerous ſore, which, becauſe it is uſually provoked by medicines, is called *touch me not*. It is alſo a name of a ſpecies of *ſcirrhus*, and *herpes*. See Herpes. Sp. 5. Polypus Narium.

NOMA, } A phagedenic ulcer, from νεμω, *to eat away*.
NOME. } Alſo a ſpecies of herpes. See Herpes. Sp. 5.

NONANA. An erratic intermitting fever returning every ninth day.

NON-NATURALIA. The non-naturals, ſo called becauſe they affect man without entering into his compoſition, or conſtituting his nature; but yet are ſo neceſſary that he cannot live without them. They ſeem more properly to merit the appellation necessariæ res, as they are things *natural* in themſelves, and to man's exiſtence *neceſſary* and unavoidable. They have uſually been divided into ſix:

1. Air.
2. Aliment.
3. Exercise and Rest.
4. Paſſions and Affections of the Mind.
5. Wakefulness and sleep.
6. Repletion and Evacuation.

But theſe ſix might with great propriety be confined to the firſt four—for *exerciſe* and reſt produce pretty nearly ſimilar effects to *wakefulneſs* and *ſleep*—hence might theſe not improperly be reduced to one head; allowing ſome-

thing

thing more to *exercise*, than *wakefulness*, because of the muscular motion employed in the former.

And as for *repletion* and *evacuation*, they may be considered in the light of morbid affections, because when profuse on the one hand, or too sparing on the other, they certainly constitute disease, viz. *if perspirable matter passes not off as it ought, but is obstructed—plethora—fevers—head-ach*, &c. will ensue. *If what we eat lies too long on the stomach*---indigestion---heart-burn---flatulence, &c. *If too great a flux happens from the salivary glands*, it constitutes a ptyalism. *If from the liver—or pancreas---or intestines* --cholera morbus—bilious cholic---looseness, &c. and a variety of others might be adduced to prove the same point. See WALLIS on Health and Disease, edit. 2.

The luxury of most climes consists very much in the excess of what is needful in its kind, and in the requisites to correct that excess. In hot climes they surfeit themselves with fruits, and other vegetables;---they cool their fruits, creams, wines, &c. to an unsalutary degree, with ice, &c. Then, to correct the inconveniences of these excesses, they use brandy, hot tea, high sauces, &c.---In cold climes they surfeit with animal diet, fermented liquors, exercise, cloathing, &c. for which they use opposites to moderate their excesses, or rather the inconveniences thereof.

There are very few disorders happen to our frame, in which an error in one or more of the *non-naturals* have not an influence as a cause thereof.

Besides what is said on each article of the *non-naturals* in these sheets, see Dr. Fr. Clifton's translation of Hippocrates on Air, Water, and Situation; Wainwright on the *Non-naturals*; Sanctorius's Med. Static. Keil's Animal Œconomy. Mackenzie on Health.

NONUS HUMERI MUSCULUS PLACENTINI. See CORACO-BRACHÆUS.

NORTHAW, or NORT-HALL WATER. It is of the purging kind, and similar to that of Epsom, but not half so strong, and, though a little brackish and bitterish in the throat, not so nauseous. This water will not ferment with the vitriolic or muriatic acid, though it contains a little lime-stone, some calcareous nitre, with a small mixture of sea-salt. It is slightly purgative.

NOSOCOMIUM, } from νοσος, *a disease*, and κομεω,
NOSODOCHIUM, } *to take care of*. An HOSPITAL.

NOSOLOGIA, from νοσος, *a disease*, and λογια, *a discourse*. NOSOLOGY. It is an explication of diseases, or a discourse concerning the nature and properties of them, dividing them into CLASSES, ORDERS, *genera*, *species* and *varieties*; by which means accurate distinctions are formed, and much confusion avoided. See Sauvages's *Nosologia* Methodica. Cullen's Synopsis *Nosologiæ* Methodicæ. Vogel, Linnæus, Sagar, and Macbride, on the same subject.

NOSOS. See MORBUS.

NOSTALGIA, from νοστος, *redire*, and αλγια, *mœror*. BROKEN HEART, *longing for home*; or NATIONAL INSANITY. SAUVAGES makes a genus of MOROSITATES, in which strangers in any place have such an unconquerable desire to return to their parents and their own country, that being denied they become extremely sorrowful, and are afflicted with restlessness, loss of appetite, and other violent symptoms. Dr. CULLEN places this in his CLASS LOCALES, and ORDER DYSOREXIÆ, which he concisely defines, in those who are absent from their own country, a vehement desire of returning to it. He observes two species. 1. *Nostalgia* simplex, when no other disease attends. 2. *Nostalgia* complicata, when it is attended with some other disease. The reason for this arrangement, see MOROSITATES.

NOSTOCH. See CŒLI FLOS.

NOTHÆ COSTÆ, from νοθος, *spurious*. See COSTÆ.

NOTIÆUS, from νωτος, *the back*. See MEDULLA SPINALIS.

NUBA. See MANNA and ÆSCAVUM.

NUBECULA, } See URINA, ENCAUMA, and ALNUBES. } BUGO.

NUBECULA SUSPENSA. See ENÆOREMA.

NUCAMENTA. See AMENTACEI FLORES.

NUCES GALLÆ. See GALLÆ.

—— OLEOSÆ. See FARINACEA.

—— PURGANTES. See CATAPUTIA MINOR.

NUCHA. The BACK of the NECK. Properly the region upon the first vertebra of the back. It is an Arabic term.

NUCI PRUNIFERA & NUCIFERA. See NUX VIRGINIANA.

NUCIOSITAS. See MYOPIA.

NUCIPERSICA. The NECTARINE.

NUCISTA. See NUX MOSCHATA.

NUCLEUS. A KERNEL. IN BOTANY the seed of a nut, and stone fruits, that part of the fruit which is inclosed in a hard shell, as the kernels of almonds and apricots.

NUCULA TERRESTRIS. See BULBOCASTANUM.

NUMMULARIA. This plant is so called from *nummus*, *money*; because its leaves are round. It is also called *centimorbia*, because it is said to be useful in an hundred diseases. In English it is named HERB TWOPENCE, and MONEY-WORT.

It is a low creeping plant with square stalks, and smooth, little, roundish, or heart-shaped leaves, set in pairs at the joints, upon short pedicles; in their bosoms appear yellow solitary monopetalous flowers, each divided into five oval segments, and followed by a small round capsule, full of minute seeds. It is perennial, grows wild in moist pasture grounds, and flowers from May to the end of summer. It is restringent, antiscorbutic, and vulnerary. Boerhaave thinks it similar to a mixture of scurvy-grass and sorrel; but it is weaker than either of them.

NUMMULARIA RUBRA; called also *Lysimachia*. The species formerly used in medicine was the LYSIMACHIA NUMMULARIA Linn. The juice of this species of *moneywort*, is like that of becabunga; it hath a saponaceous, aromatic, and balsamic taste; its virtues are the same as a mixture of cochlearia with acetosa. See Raii Hist. Lewis's Mat. Med.

NUSCITIOSUS. See NYCTALOPS.

NUTRICATIO, *Accretio alitura*. NUTRITION, ACCRETION, or GROWTH. It hath generally been thought that *nutrition* is chiefly performed by means of the nervous fluid, because those parts whose nerves are destroyed, or wholly deprived of their usual power, are observed to become smaller; but this is without foundation, for, from certain experiments, it is known, that the motions of the fluids, in the very small vessels, depend in a great measure upon the influence of their nerves; and that when this is wanting, the fluids either do not circulate at all through the vessels, or at least in a very languid manner; whence the parts to which they belong collapse, and are not properly nourished. See WHYTT's Physiological Essays, edit. 2. p. 22, &c. p. 49, and 50. Monro's Observations on the nervous System, edit. fol. chap. 25. p. 78. The standard of *nutrition* varies in persons of different ages; for, during infancy, more is added to the body than is thrown off from it; but to old age, the consumption is greater than the addition. The first of these is the growth, the latter the decrease, and so decay of the body. In infancy and youth the fibres are extensible; and the force of the circulation proportionably greater than in later life: on the arrival of maturity, the last lessens, and the first is totally at an end. See Haller's Physiol.

NUTRITUM UNGUENTUM. It was formerly made by mixing certain proportions of vinegar, oil, and litharge; but the London College substituted, as a neater application, the *ungt. saturninum*, which they now call *unguentum cerussæ acetatæ*, OINTMENT of ACETATED CERUSSE, and make in the following mode: take of acetated cerusse, two drams by weight; white wax, two ounces by weight; olive oil, half a pint; rub the acetated cerusse, previously powdered, with some part of the olive oil; then add it to the wax, melted with the remaining oil. Stir the mixture until it is cold. Ph. Lond 1788. See UNGUENTUM LITHARGYRI acetati, under LITHARGYRUS.

NUX MOSCHATA; also called *myristica nux*, *nucista*, *pala*, *chrysobalanus Galeni*, *unguentaria*, *assala*, *nux aromatica*, the NUTMEG. Weston, in his Universal Botanist, names the tree *myristica moschata*, and describes it myristica arbor, *nuces moschatas & macem gerens*. The NUTMEG and MACE-TREE. Linnæus in his Suppl. 265, names the tree MYRISTICA OFFICINALIS. There is a spurious sort of this tree called *panempalka*. The TRUE NUTMEG tree, however, is the MYRISTICA MOSCHATA, *foliis lanceolatis*, *fructu glabro*. CLASS DIŒCIA, ORD. SYNGENESIA, LINN. Genera Plantarum Nova, per SHREBER 1562.

It is the aromatic kernel of a large nut, produced by a tree said to resemble the pear-tree; it grows in the East Indies, principally on the Isle of Banda, and on the Mo-

luccas

lucca Iſles. The outer part of the fruit, which is the ſize of a peach, is a ſoft fleſhy ſubſtance like that of the walnut, which ſpontaneouſly opens when ripe; under this lies a red membrane, called *macis*, *mace*, forming a kind of reticular covering, through the fiſſures of which is ſeen the hard woody ſhell that includes the *nutmeg*. C. Bauhine ſpeaks of three ſorts; but there are two which are frequently enough met with; one of them is of an oblong figure, called *male*; the other roundiſh, called *female*; this laſt is the officinal ſpecies, being preferred to the other, on account of its ſtronger and more agreeable flavour, and its being, as is ſaid, leſs ſubject to become carious. The Dutch monopolize this part of trade, as well as the reſt of the ſpices in general, whence we ſeldom have them genuine.

The *nutmeg* is moderately warm, grateful to the taſte, and unctuous. It is conſidered as antiſeptic, ſtomachic, cordial, carminative, and reſtringent, in doſes of from ſix grains to half a dram; but to encreaſe its laſt power the nutmeg in ſubſtance ſhould be roaſted; and from this effect it has been much uſed in diarrhœas and dyſenteries. People ſhould be cautious of uſing it in large quantities, as it is apt to affect the head, and manifeſt ſuch a ſtrong hypnotic power as to prove extremely dangerous. Bontius ſays, this is a frequent occurence in India, and Dr. Cullen ſaw a remarkable inſtance of its hypnotic power in a perſon, from taking two drams, or a little more of nutmeg in powder. See Cullen's Mat. Med. vol. ii. p. 204. An ordinary kind of nutmegs is called *arecæ*, *avellanæ Indicæ*, &c.

The London College directs a gallon of proof ſpirit to be drawn by diſtillation from two ounces of *nutmegs*, and this is called *ſpiritus nucis moſchatæ*; but when a few hawthorn flowers are added, it is called *nephritica aq.* Tincture made from the *nutmeg* in proof ſpirit, is a more excellent medicine.

By diſtillation with water, *nutmegs* yield nearly one tenth their weight of a limpid eſſential oil, which is very grateful, and poſſeſſes the flavour of the ſpice in perfection; it is recommended as antiſpaſmodic and hypnotic. It is ſimilar in quality to the oil of mace, but not quite ſo grateful.

On the ſurface of the remaining liquor in the ſtill, after the aſcent of the eſſential oil, called *oleum nucis moſchatæ eſſentiale*, is found floating an unctuous concrete, like tallow, of a white colour, nearly inſipid, not eaſily corruptible, and hence commended as a baſis for odoriferous balſams; the decoction, freed from this ſebaceous matter, and inſpiſſated, leaves a weakly bitter ſub-aſtringent extract.

Rectified ſpirit takes up the whole ſmell and taſte of the *nutmegs*, and receives from them a deep bright yellow colour; the ſpirit drawn off from the filtered tincture is very ſlightly impregnated with their flavour; the greateſt part of the ſpecific ſmell, as well as the aromatic warmth, bitterneſs, and ſubaſtringency of the ſpice, remaining concentrated in the extract.

Both the oil, the ſpirituous tincture, and extracts, agree better with weak ſtomachs than the *nutmeg* itſelf.

Ol. N. M. per Expr. *commonly called* Ol. Macis per Expr.

When *nutmegs* are heated, and ſtrongly preſſed, they give out a fluid yellow oil, which concretes on growing cold, into a ſebaceous conſiſtence. We are informed, that in the Spice Iſlands, the imperfect and damaged nuts are ſeparated for obtaining this expreſſed oil. In the ſhops we find three ſorts, under the name of *oil of mace*. The BEST is brought from the Eaſt Indies in ſtone jars; *it is ſoftiſh, of a yellowiſh colour, an agreeable fragrant ſmell, greatly reſembling that of the nutmeg itſelf; it is of the colour of mace.*—The NEXT comes from Holland in ſolid maſſes, generally flat, and of a ſquare figure; *it is paler coloured, weaker in its ſmell, and inferior in its quality to that of India.*—The LAST is the worſt; it ſeems to be a *compoſition of ſuet, palm-oil, and ſuch like expreſſed ones, flavoured with a little of the genuine oil of nutmeg.*—The beſt is the ſebaceous matter of the *nutmeg* and its eſſential oil; by diſtillation in water, and maceration in rectified ſpirit of wine, the eſſential oil is ſeparated, and the ſebaceons matter is left quite inſipid. The chief uſe of theſe is for liniments, &c. to be applied to the ſtomach, or as a part in anodyne and nervous ointments. See Tournefort's Mat. Med. Lewis's Mat. Med. Neumann's Chem. Works. Cullen's Mat. Med.

NUX vel GLANS UNGUENTUARIA. See MYROBALANI.

—— METELLA. See NUX VOMICA.

—— VIRGINIANA, called alſo *prunus prunifera*, *nucifera*, *nucipruniferа*, *maſtichen odoratum fundens*, MASTICH of LIGON, and VIRGINIA NUT. Its leaves ſhine like thoſe of the bay-tree, and it differs from other pruniferous trees in its fruit, which is ſmall, turbinated, and contains but a little pulp.

The fruit is of the ſhape and ſize of a filbert, ſmooth, of a brown colour, with an eye near one end, containing a hard ſtone, with a white globular kernel, of a bitteriſh taſte and an aromatic ſmell. It is antiſcorbutic, deobſtruent, and warming. See Raii Dendr.

—— VOMICA, called alſo *nux metella*, *caniram*; *faba febrifuga*, *godhakadura*, *igaſur*, VOMIC NUT. It is a flat roundiſh ſeed, or kernel, about an inch broad, and a quarter of an inch thick, with a prominence in the middle, on both ſides of a grey colour, covered with a kind of woolly matter, internally hard and tough like horn. It is the produce of a large tree growing in the Eaſt Indies, which Plukenet calls CUCURBITIFERA MALABARIENSIS *ænopliæ foliis rotundis fructu orbiculari rubro, cujus grana ſunt nuces vomicæ officinarum.* The *nux vomica* is the fruit of the STRYCHNOS NUX VOMICA, vel *Indica, foliis vatis quinque nervis, cauli interni*, CLASS PENTANDRIA; ORD. MONOGYNIA. LINN. Gen. Plant. 253.

They have no place in the preſent practice; to the taſte they are bitter, but have no ſmell. Fallopius ſays, in doſes to 3 ſs. they procure ſweat; but Hoffman informs us, that two doſes of ſeven or eight grains each, were fatal to a girl of ten years old. They poiſon dogs, crows, &c. When imprudently ſwallowed by men, they produce great anxiety, convulſions, paralytic ſymptoms, retching, an increaſed motion of the heart and of the lungs. The poiſonous matter is probably the ſame as that of bitter almonds, which act chiefly on the nervous ſyſtem. See Raii Hiſt. Lewis's Mat. Med. Neumann's Chemical Works.

Dr. Hagſtrom, a Swediſh phyſician, commends the uſefulneſs of the *nux vomica* in the dyſentery. See the Lond. Med. Journal, vol. iii. p. 189, &c.

However, they appear to be too dangerous to be admitted into practice, eſpecially where other medicines, leſs deleterious, are equally efficacious.

—— VOMICA SERAPIONIS, called alſo *faba ſancti Ignatii*, *pepita nux*, *faba Indica*, *catalongay*. ST. IGNATIUS's BEAN. It is the produce of a tree called MANANAOG, alſo *cantara*. It is met with in the Eaſt Indies and the Philippine iſlands. The fruit reſembles a gourd, in each of which is from twenty to thirty ſeeds, improperly called *beans*. They are of a roundiſh figure, irregular and uneven, the ſize of a middling nutmeg, ſemitranſparent, of a horny texture, and of a colour betwixt white and a ſky-blue. Theſe ſeeds have a bitter taſte, but no ſmell, except a degree of a muſty ſcent whilſt freſh. The inhabitants of the Philippine iſlands uſe them as a medicine, but they affect the Europeans violently, producing the ſame effect as occurs from vomic nuts. See Act. Phil. Lond. No. 249, p. 44. Med. Muſ. vol. iii.

NUX is a term added to many vegetable productions, viz. *Nux baſilica*, *Euboica*, *Perſica*, *& regia*. See JUGLANS.—*Ben*, *& unguentaria*. See BEN.—*Barbadenſis & cathartica*. See CATAPUTIA MINOR.—INDICA. See PALMA COCCIFERA.—*Malabarica*. See CUMBULU.—*Vomica minor moliceana*;—*altera*. See COLUBRINUM.

NYCTALOPIA. See AMBLYOPIA.

NYCTALOPS, from νυξ, *night*, and ωψ, *an eye*, NIGHT-BLINDNESS. Celſus calls the diſeaſe *imbecillitas oculorum*. Sometimes theſe patients are called *luſcitioſi*, or *nuſcitioſi*, but improperly; for *luſcitioſus* is one who ſees but little, through ſome defect of the eye, and ſees better in the evening than at noon. But amongſt both the Greek and Latin writers, there is a direct oppoſition in the uſe of the word *nyctalops*; ſome ſaying it ſignifies thoſe who ſee by night;—and others expreſs by it thoſe who cannot ſee during the night. However, at preſent, it is underſtood to ſignify that diſorder, in which, as the night approaches, the patient loſes his ſight, he remains blind until the morning, at which time the ſight returning, it continues all the day, and ſo continues to return with the day, and to depart at night.

The words *hemeralopia*, in Vogel's Genera of Diſeaſes,

ſtands for blindneſs in the night, and ſight in the day; and *nyctalopia*, in Linnæus's and Vogel's Genera, ſtands for blindneſs in the day, and ſight in the night.

The difference in the account of this diſorder, as to its appearing in the night, or in the day, is reconciled by conſidering it as of the intermitting kind; the difference then will conſiſt in the different times of its approach, ſo may be called *periodical blindneſs*. Intermittents appear in a variety of modes, and the ſucceſs of the bark, in ſome inſtances of this ſort of blindneſs, both favour the opinion of its being an intermittent diſeaſe of the eyes. See Lond. Med. Tranſ. vol. i. and Lond. Med. Obſ. and Inq. vol. i. p. 111, &c. Wallis's Sauvages's Noſology of the Eyes, p. 265.

NYMPHÆ, called alſo *alæ internæ minores clitoridis, colliculum, collicula, myrtocheilides*. They run down on each ſide of the clitoris, and with the frænum of the perinæum they form what ſome call the foſſa magna, or entrance into the vagina. In MIDWIFERY this is called *os externum*. Sometimes the *nymphæ* are large, and appear cancerous; when this happens, the part may be cut off with ſciſſars, and it will then heal as a common wound. Galen and other ancient writers, ſometimes call the *clitoris*, and ſometimes the *hymen*, by the name of *nymphæ*; but what the moderns call *nymphæ*, or *criſtæ clitoridis*, or *alæ minores ſive internæ*, are two prominent folds of the inner ſkin of the greater or external alæ, reaching from the præputium of the clitoris, to the two ſides of the great orifice of the uterus: they begin narrow, grow broader, then at their lower end they grow narrow again, and are loſt about the orifice of the vagina, in the labia externa.

NYMPHÆA, called alſo *nenuphar, leuconymphæa, microleuco-nymphæa*. The GREAT WHITE WATER-LILY. NYMPHÆA ALBA Linn. It is called *nymphæa*, becauſe it lives in waters where the nymphs are feigned by the poets to inhabit. There are ſeveral ſpecies, diſtinguiſhed by their white and yellow flowers, &c. but their virtues, which are ſaid to be anodyne and demulcent, are too inſignificant to demand any notice in medical practice. See Raii Hiſt. It is alſo the name of a preternatural excreſcence on the *nymphæ*.

— GLANDIFERA.
— INDICA.
— MADRASPASTANA.
} See FABA ÆGYPTIA.

NYMPHOIDES, from its reſemblance to the nymphæa, both in its form and virtues, thus named. It is alſo called nymphæa lutea and alba minor.

NYMPHOMANIA, from νυμφη, *nymphæ*, and μανια, *furor*. See FUROR UTERINUS.

NYMPHOMANIA PRURIGINOSA. A variety of the *nymphomania*.

NYMPHOTOMIA. A ſection of the clitoris when too large; for the ancients called the clitoris by the name of nympha.

NYSTAGMOS. A WINKING OR TWINKLING with the eyes, ſuch as happens when a perſon is very ſleepy. When a diſeaſe, it is an inſtance of the clonic kind of convulſion.

O.

OBL

OB. Selden ſays that *Ob* was uſually tranſlated Python, or magician. This *Ob* is as a ſpirit, or demon, that gave anſwers which ſeemed to come from the pudenda, the head, or the arm-pits, but with a voice ſo low, as not to be diſtinctly heard.

OBELÆA, from ὀβελός, *a dart* or *a ſpit*. See SAGITTALIS SUTURA.

OBELCHERA. See CUCURBITA.

OBESITAS. *Corpulentia.* CORPULENCE, or FATNESS. It is obſerved that for one fat perſon in France or Spain, there are an hundred in England and Holland. This is ſuppoſed to be from the uſe of new malt liquors, more than from the difference of climes, or degrees of perſpiration. Indolence may cauſe *fatneſs* in ſome conſtitutions; but in general, thoſe who are diſpoſed to this habit will be fat in ſpite of every endeavour to the contrary, except that of deſtroying health. Vinegar never prevents *fatneſs*, but by inducing a worſe diſorder. One of the beſt methods of emptying the cellular membrane of its oil, ſeems to be a gentle mercurial ſalivation, and decoctions of guaiacum wood at proper intervals. See a remarkable inſtance of *fatneſs* in the Lond. Med. Obſ. and Inq. p. 69—84. Though people may be extremely corpulent, and enjoy a good ſtate of health, yet ſtill it frequently lays the foundation for diſeaſe; ſee POLYSARCIA.

OBLATES PURGANTES. They are figured purging cakes, made of flour, ſugar, and purging ingredients.

OBLIQUUS. A name for ſeveral pairs of muſcles; alſo a name of the *pronator teres*.

OBLIQUUS ASCENDENS, } called alſo ACCLIVIS.
—— INTERNUS, } These muſcles of the belly receive their name from the oblique aſcent of their fibres. They lie under the *obliquus* deſcendens. The ſame error which many anatomiſts have taught with reſpect to the *obliquus* deſcendens, they have committed with reſpect to theſe muſcles; they have no communication with the lumbal vertebræ, they ariſe fleſhy from the ſpine of the os ilium and ligamentum pubis, and the upper edge of the os ſacrum, according to Dr. Hunter; but ſome others ſay, that there is no part of them that comes from the os ſacrum, but paſſing forward and upward from the oſſa pubis and ilii, they form a broad membranous thin tendon, implanted into the whole length of the linea alba, and the cartilages of the eighth, ninth, tenth, eleventh, and twelfth ribs. Their tendons divide into two lamellæ, one of which joins the *rectus* on each ſide, and the other the *tranſverſalis*. Theſe muſcles are not perforated by the ſpermatic cord. Beſides their uſe in compreſſing of the belly, that part which ariſes fleſhy towards the back part of the edge of the os ilium, and goes to the cartilaginous endings of the ribs, not only depreſſes them, and ſtraitens the thorax in expiration, but alſo the order of the fibres of theſe muſcles interſect thoſe of the oblique deſcending muſcles, and counteract them in the turning the trunk of the body, on the axis of the vertebræ; as on its contrary ſide, its ſeries of fleſhy fibres being parallel to thoſe of the ſaid oblique muſcle deſcending on the oppoſite ſide, may act in concurrence with them in diſcharging of their office.

—— DESCENDENS, } This pair of muſcles is alſo
—— EXTERNUS. } called *declivis*. They are the external muſcles of the belly, and derive their name from the progreſs of their fibres, which run obliquely downwards. They ariſe by productions partly fleſhy, and partly tendinous, from the lower edge of the fifth, ſixth, ſeventh, and moſt of the inferior ribs, which indent themſelves into the the fleſhy dentiform proceſſes of the *ſerratus anticus major*. Their fibres run forward and downward, terminating in the ſpine of the ilium, os pubis, and linea alba. Part of theſe fibres, which run toward the ilium, are loſt in the faſcia of the thigh, and thoſe which run toward the os pubis, are doubled under themſelves. This duplication (being ſuppoſed to be a ligament) goes by the name of *ligamentum Poupartii*, and through it the ſpermatic veſſels of men, and the round ligaments of the womb in women, perforate. The ring through which theſe paſs, is formed by the tendinous fibres parting. From their origins, which are moſtly fleſhy, their oblique deſcending fleſhy parts expand themſelves into a broad membranous tendon, before they go over the rectus to their inſertion in the linea alba and os pubis, from whence ſtill deſcending, they end partly tendinous in the ligamentum pubis, but chiefly fleſhy on the ſuperior and forepart of the circular edge of the os ilium. They do not adhere to the tranſverſe proceſſes of the vertebræ lumbares, but their largeſt, laſt, and moſt fleſhy digitation, leaving the loweſt baſtard rib at its extreme point, in their oblique deſcent going forwards, ſtill recedes gradually from the vertebræ, forming a triangular interſtice, which is taken up by the *ſacrolumbus os ilium*, and its lower ſide; in this area the fibres of the ſubjacent muſcles plainly appear. Theſe muſcles give ſtrength to the parietes of the belly, ſuſtain and compreſs the viſcera, propel the fæces, urine, and the fœtus: that part of them which is interjacent, between the linea alba, os pubis, and the ſpine of the os ilium, bearing an analogy in its poſition to the maſtoideus of the head, ſerves for the circumrotation of the trunk, upon the axis of the vertebræ, when we turn the body to the contrary ſide, and the feet remain unmoved.

OBLIQUUS INFERIOR, } alſo called *capitis obliquus*
—— MAJOR, } *inferior*.

One of theſe muſcles riſes on each ſide, from the ſide part of the ſpinal proceſs of the vertebra dentata, then goes upward and outward, and is inſerted into the tranſverſe proceſs of the atlas. They are the principal rotators of the head, and run in a contrary direction to the *obliquus* ſuperior.

—— MAJOR OCULI, alſo called *ſuperior*; *trochlearis*, *amatorius*; *longiſſimus oculi*. It is called *trochlearis* from its tendon paſſing through a cartilaginous pulley, that is ſituated in the orbit of the eye to the inſide of the internal angular proceſs of the os frontis near the inner angle. This muſcle riſes tendinous from the bottom of the ſocket near the entrance of the optic nerve, and paſſing towards the upper part of the ſocket near the great angle of the eye, its round tendon runs through a cartilaginous pulley, which is there fixed to a depreſſure in the os frontis; from thence it is reflected, and runs obliquely backward, incloſed in a ligamentous ſheath, and is inſerted tendinous into the ſclerotica, upon the upper part of the globe of the eye, a little more backward than the inſertion of the rectus ſuperior. When it acts ſingly, it rolls the eye about its axis, drawing the globe forward and the pupil downward; when it acts in conjunction with the *obliquus* minor, the eye is drawn outward or forward.

OBLIQUUS

OBLIQUUS MINOR. See RECTUS MINOR.

—— MINOR vel INFERIOR OCULI. It riſes chiefly, fleſhy, juſt within the edge of the lower and anterior part of the ſocket, near the caruncula lachrymalis, and paſſing obliquely backwards under the globe, it is inſerted into the ſclerotica on the external ſide of the eye, near the optic nerve. It is alſo called *amatorius*.

—— NASI, called alſo *laterales muſc.* Theſe are thin muſcles running along the ſides of the pyramidales naſi; they are fixed to the apophyſis naſalis of the oſſa maxillaria, and are inſerted into the alæ narium.

—— PALPEBRARUM. The muſcles of the eye-lids thus named, are all that extent of fleſhy fibres, which by a thin ſtratum ſurrounds the edge of each orbit, and from thence, without any interruption, covers the two *eye-lids* all the way to the cilia. Theſe fibres are moſtly tranſverſely oval. They adhere to the ſkin of the *eye-lids* and wrinkle them.

—— SUPERIOR. Theſe muſcles are on each ſide covered by the head of the trachelo-maſtoideus; they each riſe from the tranſverſe proceſs of the atlas, and have their inſertion into the os petroſum and os occipitale, near the proceſſus maſtoideus; they ſerve to bend the head backward; called alſo *capitis obliquus ſuperior*.

—— SUPERIOR OCULI. See OBLIQUUS MAJOR OCULI.

OBLIVIO. See AMENTIA.

OBOLUS. A weight of about nine grains.

OBSIDIANUM. See ANTIMONIUM VITRIFICATUM.

OBSIDIANUS LAPIS. See AMPELITIS.

OBSONIORUM RHUS. See RHUS.

OBSTETRICATIO. MIDWIFERY. The firſt mention that is made of this is in Gen. xxxv. 16, 17. And then it appears to have been in the hands of women. Amongſt medical writers, Hippocrates was the firſt who gave any account of it, either as a branch of ſcience, or of art; after Hippocrates, Celſus, Moſchion, Rufus Epheſius, Galen, Oribaſius, Aetius, Paulus Ægineta, Avicenna, Alberſis, and others, have enlarged on this ſubject; but the laſt improvers are Mauriceau, Dionis, Memis, the Chamberlains, Chapman, Daventer, La Motte, Giffard, Heiſter, Smellie, Hamilton, Leake, Denman, Clark, &c.

It may here be obſerved, that the Engliſh and the French are not peculiar nor unprecedented in calling in the aſſiſtance of men. When women fell in labour, it appears in hiſtory, that the Athenians had a law to forbid ſlaves and women to practiſe *midwifery*; afterwards, indeed, a law was made, by which free-women were allowed to practiſe it.

Midwifery, at preſent, is taught and practiſed as a diſtinct branch of art; and in order to a proficiency therein, the practitioner is ſuppoſed to poſſeſs a competent knowledge of the following particulars, moſt of which are, more or leſs, noticed in the reſpective parts of this work. They are as follow:

The parts of the pelvis, its dimenſions, the depth of its cavity, its various diſtortions, &c.—The parts of women, ſubſervient to generation.—The ſtate of the womb and its neck, in the different periods of geſtation.—Twins.—Monſters.—Superfœtations.—Extra-uterine fœtuſes.—Moles. The progreſs of a child's head through the different parts of the pelvis in a natural labour.—The ſecundines.—The various complaints which uſually attend pregnancy.—The manner and uſe of touching.—The difference betwixt falſe and true labour pains.—The different kinds of labour.—The various modes of the child's preſenting, with the methods of delivery.—The diſorders of childbed women.—The management of the child and its mother during the time of lying-in, &c. on which ſee the articles PELVIS, PARTURITIO, GESTATIO, INVOLUCRA, PRÆSENTATIO, &c

OBSTIPATIO. COSTIVENESS. Thus Dr. Cullen names this genus of diſeaſe. He places it in the CLASS LOCALES, and ORD. EPISCHESES, which he defines, no dejection of fæces, or leſs frequent than uſual. Its ſpecies are, 1. *Obſtipatio debilium*; it happens in lax and weakly men who have generally but a weak digeſtion. 2. *Obſtipatio rigidorum*; it happens to men who have rigid fibres, and often are hypochondriac. 3. *Obſtipatio obſtructorum*; when there are ſymptoms of the ſpaſmodic colic,—the colic of Poictiers,—the accidental colic,—or the colic from ſtony concretions in the bowels. See CONSTIPATIO, where the modes of cure are ſpecified.

OBSTIPITAS. See CONTRACTURA.

OBSTRUCTIO. OBSTRUCTION. It is when the fluids can no longer paſs through the veſſels of a particular part; and may happen from the increaſed viſcidity of the fluid;—a diminution of the capacity of the veſſels;—or a concurrence of both theſe cauſes. Theſe are more or leſs difficultly removed, according to the age, conſtitution, &c. of the patient. The word *oppilatio*, is uſed in the ſame ſenſe, but means a cloſe kind of obſtruction; for RHODIUS ſays, it not only ſignifies to ſhut out, but alſo to fill.

OBTUNDENTIA. Medicines ſuited to cover, or blunt the acrimony of the fluids. See DEMULCENTIA.

OBTURATOR EXTERNUS. Some call it *marſupialis*, and *burſalis muſculus*. This muſcle covers the foramen magnum iſchii, and riſing from the bone before the foramen, runs backwards under the head of the os femoris, covered by the quadratus femoris, and is inſerted into the trochanter major, contiguous to the internus, and is, like it, a rotator.

OBTURATOR INTERNUS, or MARSUPIALIS, alſo *burſalis muſculus*. This muſcle takes its origin from the inner circumference of the foramen magnum iſchii, and goes out playing round the iſchium as on a pulley, and is inſerted into the trochanter major, contiguous to the pyriformis, and is a rotator of the thigh. The tendon of this muſcle plainly rooves the bone in its paſſage.

—— NERVUS. This nerve is a branch of the crural; it paſſes through the foramen ovale, and is loſt in the inner muſcles of the thigh.

OBTURATRIX ARTERIA. It is a branch of the hypogaſtric. It perforates the obturator muſcle, whence its name; and goes out of the pelvis, at the upper part of the ligament of the foramen ovale, having firſt ſent a branch over the ſymphyſis of the os ilium, and os pubis, to the inguinal glands and integuments. It ſends out a branch which communicates with a branch of the ſciatica arteria; and gives out branches to the adjacent muſcles, and ſends many ſmall ones by the neck of the thigh-bone.

—— VENA. It is a branch from the hypogaſtric vein, and receives this name, where it enters into the internal obturator muſcle.

OCCA. See CETE ADMIRABILE.

OCCIPITALIS ARTERIA. It is the firſt external, or poſterior branch of the external carotid. It paſſes obliquely before the internal jugular vein; and having ſent out twigs to the adjacent muſcles, it runs between the ſtyloid and maſtoid apophyſes, along the maſtoid groove, and goes to the muſcles and integuments, which cover the occipital bone. It communicates with the temporal, vertebral, and cervical arteries.

OCCIPITALIS MUSCULUS. It is one of the *quadrati*. This is mentioned by Columbus, and accurately deſcribed by Fallopius. There are two of them; they are ſhort, broad, thin, and fleſhy; they are ſituated on the occiput, where the maſtoideus and ſplenius muſcles are inſerted; they ſoon become tendinous, join with the pericranium, which firmly adheres to the hairy ſcalp on the ſinciput. When they act they pull the hairy ſcalp backwards.

—— NERVUS. A branch from the tenth pair of nerves which proceed from within the ſkull; it ſpreads and runs on the upper and lateral parts of the head.

—— POSTERIOR ARTERIA. It is a branch from the vertebral. It ſpreads on the occiput.

—— VENA. A branch from the poſterior, or upper external jugular; but it ſometimes proceeds from the vertebralis, or axillaris. It ſpreads on the occiput.

OCCIPITIS OS. This bone is of a rhomboidal figure, a tranſverſe ridge running from the maſtoid proceſs of one ſide to that of the other, divides it into two parts. Its external ſurface is convex, except at the cuneiform proceſs, at the baſe of which, on each ſide of the foramen magnum, are the condyles which connect the head to the ſpine; on the outſide of theſe condyles the bone makes a projection, and there is a notch where the internal jugular vein paſſes. The bone is divided into four cavities in its inſide, by a crucial ſpine, which hath four canals in it; the ſuperior, for the longitudinal ſinus; the inferior frequently hath the occipital ſinus; theſe on each ſide, for the lateral ſinuſes, which are continuations of the longitudinal. There are five foramina proper to this bone; the firſt is the foramen magnum: juſt above the condyle there is a hole on each ſide for the ninth pair of nerves, and generally there are two holes which pierce from behind the condyles to the foſſæ of the lateral ſinuſes. Beſides theſe, there are two common foramina which

which are one on each side, between the processus cuneiformis and os petrosum.

OCCIPITO-FRONTALIS. Albinus calls it *epicranium*. It rises from the posterior part of the occiput, goes over the upper part of the os parietale and os frontis, and is lost in the eye-brows. It is a very thin muscle; its office is, to raise the eye-brows, and wrinkle the forehead. It is antagonist to the corrugator coiterii.

OCCIPUT, called also *prora*; the hind part of the head, called *inion* by some. BLANCHARD says inion is the beginning of the spinal marrow; others that it is the back part of the neck.

OCHEUS. See SCROTUM.

OCHLAGOGI, ὀχλος, *populus*, and ἀγωγος, *ductor*. See AGYRTÆ.

OCHRA, called also *vitriolum abortivum*. YELLOW OCHRE. Some is found of a brown colour; and some is red. The darkest red sort is called RED OKER, *rubrica fabrilis*; *Creta rubra*, *arcanne*, MARKING STONE, RUDD, and RUDDLE. They are an argillaceous earth, less tenacious when moistened than the clays and the boles; impregnated with a small portion of iron, and thence their colour. By burning, their argillaceous nature is discovered; and by digesting in aqua regia, their iron is extracted, and then the *ochre* remains white. Their chief difference from bole is in their being less viscid. See Lewis's Mat. Med. Neumann's Chem. Works.

—— NIGRA. See PLUMBUM NIGRUM.

OCHREA. See TIBIA.

OCHRUS, also called *lathyris*, and *ervilia*. Boerhaave mentions this plant. It bears cylindrical pods with round seeds as large as peas, which are eatable, but not very easily digested.

OCHTHODES, from ὀχθος, importing the callous tumid lips of ulcers; or from ὀχθη, *a bank*. See ULCERS.

OCIMASTRUM, } *Lychnis sylvestris, alba simplex.* WILD WHITE CAMPION.
OCYMASTRUM, }
OCYMOIDES. }

It is Boerhaave's fourteenth species of lychnis. It is found in hedges and borders of fields; it flowers in May. The flower is said to check the fluor albus, and inward bleedings; the herb boiled in posset, is said to cure convulsions in children; but its virtues hath not obtained it a place in practice. See Raii Hist. It is a name for the *circæa lutetiana*, and several species of *lychnis*.

OCTANA. An erratic intermitting fever, which returns every eighth day.

OCTAVUS HUMERI MUSC. } See TERES
—— HUMERI PLACENTINI MUSC. } MINOR.

OCULARES COMMUNES. See MOTORES OCULORUM.

—— EXTERNI. MOTORES OCULORUM EXTERNI.

OCULARIA. See EUPHRAGIA.

OCULI CANCRORUM. CRABS EYES. Called *cancrorum lapides*, *lapilli*. They are stony concretions, of what, at first, was but a milky juice, found in the head of the *astacus fluviatilis*, or river craw-fish; they are lodged in a bag on each side of the stomach, which also is in the head of this fish; two of them are lodged in the head of each. These stones are roundish, flatted on one side, in colour white, having sometimes a reddish, and at others a bluish cast; the blue are the best, the white are taken out after the fish hath been boiled; they are internally of a leafy texture. The largest quantities are the produce of Muscovy, particularly of the river Don; great quantities are also found in other parts of the Russian empire.

They are used as an absorbent of acid humours in the primæ viæ, and are supposed, when combined with the acid, to be more aperient and resolvent than most of the other absorbent earths; however this may be, it is certain that the earth of *crabs-eyes* differs much from the earth of crabs-claws, for the first is not convertible into quicklime. The medical difference of their earths, dissolved in any acid of the vegetable or animal kingdom, does not appear to be great; the solutions of the two are alike in taste. The earth of *crabs-eyes*, as to its chemical characters, is the same as the earth of hartshorn.

These stones are counterfeited with pipe clay, or with chalk, mixed with glutinous materials, or with the shells of fishes; but these compositions are easily distinguished from true *crabs-eyes*, by their texture being uniform, and not leafy;—by their sticking to the tongue, which *crabs-eyes* will not do;—by their softening with water, which *crabs-eyes* will not do;—by their dissolving in acids, while *crabs-eyes* steeped in vinegar retain their form; but when the artificial sort are made with shells, the want of the lamellated coats is the best method of distinguishing them. See Tournefort's Mat. Med. Lewis's Mat. Med.

OCULO MUSCULARES. See MOTORES OCULORUM.

OCULO MUSCULARES EXTERNI. See MOTORES OCULORUM EXTERNI.

OCULUS. The EYE; called also *illos*. The EXTERNAL PARTS are, the *eye-brows*, the *eye-lids*; the extremities of which, where the eye-lashes grow, are called *orchos*; the cilia, the forepart of the globe, the membrana conjunctiva, the cornea lucida, the iris, the pupilla, the caruncule lachrymales, and angles of the *eye-lids*, &c. The external of which are named *paropiæ*; the internal, *pegæ*. The INTERNAL PARTS are the globe of the *eye*, the adnata or albuginea; the extremity of which is called *premnon*; the sclerotica, the choroides, the retina, the aqueous humour, called *hydatodes*, *hydatoides*; *oeides*; *ovatus* vel *oviformis humor*; *albuginosa humor*; the vitreous humour, called *hyaloides*; crystalline humor, called *phacoides*; the muscles that move the *eye*, and the optic nerve, &c. For an account of these, see the respective parts described under each head specifically.

A new-born child shall be observed, perhaps, never to keep its *eyes* fixed on any one object, but continually changing from one to another; and if you put your hand before them, the children will not wink; hence some have thought, that new-born infants have no sight; but this is a mistake, and the true reason why their *eyes* are in perpetual motion is, that they have not yet acquired the habit of examining one thing at once with their *eyes*; their not winking at the approach of the hand arises from their want of experience how easily their *eyes* may be hurt; but, in a few days, they get the habit of winking, so that afterwards their *eyes* do it spontaneously at the approach of danger.

See a Description of the *Eye*, and its adjacent parts, by J. Warner, Surgeon. Remarks on the Ophthalmy, &c. by J. Ware, Surgeon. Winslow's Anatomy. Cheselden's Anatomy, &c.

ARTIFICIAL EYES are made of concave plates of gold, silver, or glass, and are stained so as to resemble the natural *eye*. They must, when fixed in the orbit, be taken out and cleaned every night, and replaced in the morning. If no more of a diseased *eye* is removed, than what is preternaturally projected, or if enough is left, to leave the muscles unhurt, the artificial eye will have a little motion from the muscles that remain. If the *eye* does not fit well, it irritates and inflames the other *eye*; in which case, lay it aside, until one can be had that fits better.

On disorders of the *Eyes*, see St. Yves; Benedict Duddell; and J. Warner, Surgeon. Ware's Remarks on the Ophthalmy, &c. Bell's Surgery, vol. iii. p. 232—519. Wallis's Nosologia Oculorum.

—— ELEPHANTINUS. See PROPTOSIS.
—— GENU. See PATELLA.
—— LACHRYMANS. See EPIPHORA.

OCYMASTRUM. See OCIMASTRUM.

OCYMASTRUM VERRUCCARIUM. See CIRCEA.

OCYMOIDES, also called *lychnis sylvestris sive aquatica purpurea simplex*. RED WILD CAMPION.

It is Boerhaave's twentieth species of lychnis. It grows in hedges, and flowers in summer. The seeds are purging, but it is not known in present practice. See Raii Hist.

—— It is a name for several species of *lychnis* and *ocimastrum*.

OCYMUM, ωκυμος, *swiftly*. It is thus called from its sudden growth. It is also called *basilicum*, because of its excellent smell. It is the OCYMUM BASILICUM Linn. Boerhaave enumerates twenty-four species. The chief use of *ocymum* is for improving the flavour of sp. vol. arom.

OCYMUM *Caryophillatum*, — *minimum*,—*vulgarius*,—*medium*,—*citratum*;—see BASILICUM.

ODAXISMOS, from ὀδους, *a tooth*. A biting sensation, pain or itching in the gums. See DENTITIO.

ODONTAGOGOS, } from αγω, *to draw*, and ὀδους,
ODONTAGRA, } *a tooth*. See DENTAGRA.

ODONTALGIA, from *ὀδους, a tooth*, and *ἀλγος, pain.* The TOOTH-ACH. Dr. Cullen places this genus of diſeaſe in the CLASS PYREXIÆ, and ORD. PHLEGMASIÆ, which he defines a rheumatiſm or pain of the jaws from carious teeth. The Doctor uſed to conſider this as a ſpecies of rheumatiſm; but obſerving that its cauſe was totally different from every other rheumatiſm, viz. an acrid humour irritating the ſenſible membranes, he has now arranged it as a diſtinct genus. This diſeaſe happens either from EXTERNAL or from INTERNAL CAUSES. The *external* are ſuch as rot the teeth, by deſtroying their enamel, and thus procuring an acceſs of air to their bony parts: hot liquors, frequent picking of the teeth with hard inſtruments, as pins, &c. ſoon deſtroy this enamel; various are the modes of cure adviſed in this caſe. A pill of opium, and red precipitate applied in the hollow of the tooth, or camphor and opium in the ſame way; muriatic acid dropped into the part, and neutralized with alcaline ſalt; the actual cautery applied to a particular part of the ear, and dividing the branch of the fifth pair of nerves which ſerves the teeth; and ſeveral other methods, have been recommended; but when once the tooth is carious, the only cure is to extract it. The INTERNAL CAUSES, are acrid particles excreted from the blood, in which caſe an emollient gargariſm ſhould be frequently held in the mouth as warm as is convenient; bliſters behind the ears are alſo uſeful; and if the gums ſwell, leeches may be applied, or ſmall ſcarifications made in them with a lancet. See Bell's Surgery, vol. iv. p. 248. Dr. Cullen's Firſt Lines, edit. 4. vol. ii. p. 38. alſo DENS.

ODONTIASIS, from *ὀδους, a tooth.* See DENTITIO.

ODONTICA. Remedies for pains in the teeth.

ODONTIRRHŒA. Bleeding from the ſocket of the jaw after tooth-drawing.

ODONTIS, } Names for ſeveral ſpecies of lych-
ODONTITIS. } nis.

ODONTOGLYPHON, from *ὀδους, a tooth*, and *γλυφω, to ſcrape.* See DENTISCALPIUM.

ODONTOIDES, from *ὀδους, a tooth*, and *ειδος, form.* The tooth-like proceſs of the ſecond vertebra of the neck.

ODONTOPHYIA, from *ὀδους, a tooth*, and *φυω, to grow.* See DENTITIO.

ODONTOTRIMMA, from *ὀδους, a tooth*, and *τριβω, to wear away.* See DENTIFRICIUM.

ODORATUS. See OLFACTUS.

ODORIFERÆ GLANDULÆ. Theſe are about the pudenda, arm-pits, &c. They are of the ſame kind as the ſebaceous glands. Dr. Hunter ſays he never could diſcover the orifices of theſe in the axilla, therefore he ſuppoſes the diſcharge to be from innumerable ſmall pores that are imperceptible.

OE. See SORBUS.

ŒCONOMIA, from *οικος, an houſe*, and *νομος, a law*, or *rule.* Hippocrates uſes this word to expreſs the management of a ſick perſon. The ANIMAL ŒCONOMY is the conduct of nature in preſerving animal bodies.

ŒDEMA, from *οιδαω, tumeo.* See TUMOR. It ſignifies properly any tumor, but is now generally confined to ſerous *tumors* that are ſeated in the cellular membrane, and form partial anaſarcous ſwellings. See ANASARCA.

When the glands are diſeaſed, the lymph cannot paſs towards the heart, but goes to the lower extremities, merely from gravitation; and for want of a due abſorption, the limbs ſwell.

When the veſſels are not too much debilitated, rollers, or laced ſtockings, are ſometimes uſeful. See Bell's Surgery, vol. v. p. 499.

ŒDEMA ERYSIPELATOIDES. It is that œdematous tumor which is white, pellucid, and accompanied with heat, called alſo *eryſipelas bullatum—inflammatorium.*

Dr. Kirkland, in the firſt volume of his Inquiry, ſpeaks of an inflammatory *œdema* which comes on ſuddenly, and is ſometimes accompanied with an eryſipelas, or more commonly a ſimple inflammation of the ſkin. He deſcribes it as a cold, indolent, doughy humour; and, in order to its cure, requiring diſcuſſion. He obſerves, that an *œdema* is always local; it is always confined to one place, or member.

It is ſometimes cauſed by a metaſtaſis of inactive matter from the blood and other juices; ſometimes from nervous affection.

Diſtinguiſh this diſeaſe from the anaſarca.

In an *œdema*, which comes on ſuddenly, and is of ſhort duration, the fluids have not had time to become viſcid in the cellular membrane; they are therefore eaſily ſet at liberty, and the inflammation diſappears as the ſwelling ſubſides.

As an external application, a cerate may be made of the empl. e min. fuſc. cera flav. & ol. oliv. As ſoon as the ſwelling begins to ſubſide, apply a bandage, and gradually increaſe its tightneſs as circumſtances will permit. Over night give ſmall doſes of calomel, and next morning a purging draught, in which is diſſolved a proper quantity of the ſoluble tartar. Sudoriſics, or diuretics, may be given to haſten the cure; which, when tolerably advanced, will require the bark; this at firſt ſhould be accompanied with the ſal diuret. but when evacuation is no longer required, the bark may be given alone.

See Kirkland's Med. Surgery, vol. i. p. 468.

——ŒDEMATODES. It is that ſerous tumor which is ſimply called *œdema*; or, according to ſome, the cold *œdema.*

—— LACTEUM. See LYMPHÆDUCTUS.

ŒDEMOSARCA. A ſpecies of tumor mentioned by M. A. Severinus, of a middle nature, betwixt an *œdema* and ſarcoma, called *uteriformis abſceſſus.*

ŒLNIZIUM, } Called alſo *Thyſſelinum Pli-*
ŒLSNICHIUM, } *nii, apium ſylveſtre, elſenichium.*
ŒLSNITIUM. } MILKY-PARSLEY. The root of this plant is perennial, large, and full of milky juice, as is the whole plant. The leaves reſemble thoſe of the ferula; the ſeed is oval, flat, large, ſtriated, marginated, and ſometimes calls its huſks. There is another ſpecies called *thyſſelinum paluſtre*, and *ſeſeli paluſtre.* They are both hot and acrid; the roots are aperient and detergent, their milky juice is of the nature of ſcammony. See Raii Hiſt.

ŒNANTHARIA. SWEET-SCENTED OINTMENTS. Paulus Ægineta ſays they are not thus named becauſe they have *œnanthe* in their compoſition, but becauſe they are ſweet-ſcented and fragrant, or on account of the wine and lilies, which are ingredients in them.

ŒNANTHE CHÆROPHYLLI FOLIIS, from *οινη, vitis*, and *ανθος, flos, œnanthe, petroſelidi folio, veneno ſa, œnanthe cicutæ facie lobelii, filipendula cicutæ facie.* G. HEMLOCK DROP-WORT. DEAD-TONGUE. It is the ŒNANTHE CROCATA of Linn. Near Clonmell, in Ireland, it is called TAHOW.

The root is long, thick, tuberous, extremely ſucculent; and on expoſure to the external air, the juice becomes of a yellow complexion. The ſtalk is ſtriated, round, branched, of a yellowiſh red colour, about three feet high. The leaves are of a pale green, ſome are winged, but more are doubly winged; the little leaves are wedge-ſhaped, ſmooth ſtreaked, and jagged at the edges. The flowers are very ſmall and white; diſpoſed in umbels, placed among the principal ſtalks, with ſhort ones at the ſubdiviſions: each flower is compoſed of five petals; ſome of them are bent inwards and heart-faſhioned; tips, purple or brown; fruit-ſtalks angular, ſcored; the general fence not always preſent. The ſeeds are ſtriated on one ſide, and dented on the other.

It is found on the banks of rivers; is perennial; flowers in June or July.

The whole of this plant is poiſonous. It is ſaid that the root is the moſt virulent of all the vegetable poiſons that Great Britain produces. It is one of the claſs of poiſons which produces epileptic ſymptoms, &c. See VENENUM. The general effects of this poiſon are convulſions, locked-jaws, giddineſs, ſome inſtances of furious madneſs have occurred, loſs of hair and nails, violent heat in the throat and ſtomach, vertigo, ſickneſs, purging: one or more of theſe ſymptoms ſoon attack after ſwallowing any part of this plant, and the conſequence is often fatal in a few hours.

This herb hath been miſtaken for wild celery, water-parſnep, ſmallage, and for Macedonian parſley. The root hath no ill taſte; hence the more apt to be unſuſpected.

In Pembrokeſhire the root is called FIVE-FINGERED-ROOT; and is much uſed in cataplaſms for whitlows, &c. In Cumberland it is called *dead-tongue*, and applied in cataplaſms to ſome diſeaſes of horſes. An infuſion of the leaves, or three tea-ſpoonfuls of the juice of the root taken every morning, hath been effectual in curing ſome obſtinate cutaneous diſeaſes, but not without greatly diſturbing the conſtitution.

On ſuſpicion of this poiſonous plant being ſwallowed, give an active emetic as ſpeedily as poſſible, and aid its operation with warm water and oil. If the ſpaſms prevent the patient's ſwallowing, there is no hope.

Withering's

Withering's Bot. Arrang. Wilmer's Obſ. on poiſonous Vegetables; a caſe of a boy poiſoned by the root of *hemlock-dropwort*, related by Dr. Houlſton, in the Lond. Med. Journal, vol. ii. p. 40, &c. This is the name alſo for WATER-HEMLOCK, and a ſpecies of *thalictrum*.

ŒNAREA. The aſhes prepared of the twigs, &c. of vines.

ŒNELÆUM. A mixture of oil and wine.

ŒNOGALA, from οινος, *wine*, and γαλα, *milk*. A ſort of potion made of wine and milk; but according to ſome, it is wine as warm as new milk.

ŒNOPLIA, alſo called *nabea*, *paliurus*, *nap*, *napeca*, GREAT JUJUBE. This is produced in Egypt and Crete; it is aſtringent before it is ripe. When ripe it is agreeable to the palate, and like cherries is ſubject to corrupt in the ſtomach. This fruit is eaten as a delicacy in Egypt and Turky.

ŒNUS. WINE. From the Greek word οινος, *vinum*, a term alſo by which different *wines* are diſtinguiſhed by the addition of ſome epithet, viz.

ŒNUS ANDRIUS. *Genefous wine*, or elſe *wine* of the iſland of Andros.

—— ANTHINOS. *Flowery wine*. Galen ſays it is either *œnus anthoſmias*, or *wine* impregnated with flowers, in which ſenſe it is an epithet for the *cyceon*.

—— ANTHOSMIAS, from ανθος, *a flower*, and οσμη, *a ſmell*. *Sweet-ſcented wines*.

—— APODÆDUS. *Wine* in which the dias or tæda hath been boiled.

—— APEZESMENUS. A *wine* heated to a great degree, and preſcribed among other things, as garlic, ſalt, milk, and vinegar.

—— DEUTERUS. *Wines* of the ſecond preſſing.

—— DIACHEOMENUS *Wine* diffuſed in larger veſſels, cooled, and ſtrained from the lees, to render it thinner and weaker *Wines* thus drawn off are called *faccus*, and *faccata*, from the bag through which they are ſtrained.

—— GALACTODES. *Wine with milk*, or *wine* made as warm as new milk.

—— MALACUS, five MALTHACUS. *Soft wine*. Sometimes it means *weak* and *thin*, oppoſed to *ſtrong wine*; or *mild*, in oppoſition to auſtere.

—— MELICHROOS. *Wine* in which is honey.

—— ŒNODES. *Strong wine*.

—— SIRÆOS. See SAPA.

—— STRAPHIDIOS LEUCOS. *White wine* made from raiſins.

—— TETHALASMENOS. *Wine* mixed with ſea water.

ŒNOSTAGMA. See VINUM ADUSTUM.

ŒNOTHERA. See LYSIMACHIA.

ŒPATA. See ANACARDIUM.

ŒSOPHAGÆÆ ARTERIÆ. Theſe are generally two or three, and ſometimes but one. They riſe anteriorly from the aorta deſcendens, and are diſtributed to the œſophagus. Sometimes the uppermoſt œſophagææ produce a bronchial artery.

ŒSOPHAGÆUS. See ŒSOPHAGUS.

ŒSOPHAGISMUS. IMPEDED DEGLUTITION, or ſpaſm of the œſophagus.

ŒSOPHAGUS, from ωσω, the future tenſe of φερω, *to carry*, and φαγω, *to eat*, becauſe it carries the meat into the ſtomach, called alſo *Gula*, and *Læmos*, (a Greek primitive) *Lucania*; the GULLET. It is the contracted continuation of the *pharynx*. The *œſophagus* beginning at the laſt part of the fauces, has, at its beginning, a large cavity, called by the Greeks *pharynx*, and by the Latins *infundibulum*. Its anterior part is connected with the root of the tongue, the os hyoides, and the larynx; and its poſterior part cloſely adheres to the vertebra of the neck. It is moved by various muſcles, which elevate and dilate the pharynx, and by their conſtrictory muſcles, which ſhut it. There is one pair of theſe muſcles, which ariſing by three origins from the os hyoides, the cartilago cricoides, and the cartilago thyroides, totally ſurrounds the pharynx, and is called *œſophagæus*, the *ſphincter of the œſophagus*. There are principally three pair of theſe muſcles, viz. the *cephalo-pharyngæus*, *ſpheno-pharyngæus*, and *ſtylo-pharyngæus*. At the end of the pharynx the *œſophagus* begins, which firſt of all runs ſtrait between the aſpera arteria and the vertebræ of the neck and back, but turns to the right about the fifth vertebra of the back, and to the left about the ninth; then proceeding through the middle of the thorax and the muſcular part of the diaphragm, behind the little lobe of the liver, it is united with the ſuperior orifice of the ſtomach.—The *œſophagus* itſelf conſiſts of FOUR COATS, *the outermoſt coat* of which being membranaceous, thin, vaſcular, and cellular, derives its origin from the pleura, and joins the *gullet* to the adjacent parts. Some reckon the cellular membrane in the number of its coats, but this is not peculiar to it. *The coat next to the outer* is muſcular, furniſhed with annular or orbicular fibres, and above theſe with longitudinal. ones. *The third coat* is nervous, common to the mouth and fauces, and reaching three fingers breadth within the ſtomach, it is thick ſet with glands, to which, on the oppoſite ſide, are diſtributed ſome veſſels, from which they receive a certain liquor, more pinguious than the ſaliva and which drops into the cavity of the *gullet*. *The fourth coat* or *innermoſt*, is covered with a ſlippery mucus, villous, and every where perforated like a ſieve, with many emunctories. The cuticle lines the *œſophagus*, but is too thin to be demonſtrated.—The *œſophagus* is furniſhed *with numberleſs glands*, partly thoſe which being ſmaller than the eggs of ſilkworms, are lodged in the nervous coat, and are eaſily perceived, if upon taking off the nervous coat the fleſhy coat is expoſed to the ſight, or the *gullet* is macerated in water; and partly with other glands placed without the *œſophagus*, amongſt which the moſt conſiderable are the dorſal glands about the fifth vertebra of the back, adhering to the *gullet*, and the thyroid gland ſituated between the thyro-cricoide cartilage and the *œſophagus*. Its upper part receives arteries from the internal carotids, its middle part from the aorta and intercoſtal, and its inferior part from the gaſtric arteries. The ſuperior part receives veins from the jugulars, its middle from the vena ſine pari, and its inferior from the coronary veins of the ſtomach. The nerves proceed from the par vagum. The function of the *œſophagus* is, ſwallowing; obſtructions to which may happen from various cauſes. See *Incapability of Swallowing* under DEGLUTITIO. It is alſo ſubject to inflammation. See INFLAMMATIO ŒSOPHAGI.

Spaſms in the *œſophagus* ſometimes prevent deglutition. Hoffman obſerves, that ſpaſms of the *œſophagus* are accompanied with the general ſymptoms of other diſtenſions of the upper parts;—a coldneſs of the extremities, particularly the feet;—tremor of the limbs,—ſuppreſſion of the alvine evacuations,—regurgitation of flatulencies upwards,—ſtrictures, pains, and rumbling of the belly,—ſtraitneſs of the præcordia,—retchings to vomit,—cardialgia,—thin watery urine—and a hard and large pulſe.—The SYMPTOMS PECULIAR TO SPASMS OF THE PHARYNX, are, *a difficulty, or a total inability of deglutition*; *a rigid conſtriction and pain of the parts cohering with the pharynx*, as the tongue, the larynx, and the whole neck; *a ſuffocative uneaſineſs*; *a ſenſation, as of a ſtake thruſt into the fauces*, or *of ſomething endeavouring to get out*; *and a loſs of voice*. Theſe complaints return at intervals, and ſometimes terminate in convulſions of the whole nervous ſyſtem.—In ſpaſms of the *œſophagus* itſelf, the aliment is ſwallowed freely, but a kind of reſiſtance is perceived to its deſcent, about the upper orifice of the ſtomach: cold liquors are particularly reſiſted, and increaſe the conſtriction, whilſt warm ones often paſs freely into the ſtomach. A pain is felt on the ſpine, between the ſcapulæ; often anxious retchings or vomiting are joined with nauſea, and a diſcharge of limpid mucus from the mouth, diſtinct from the vomitings. A combination of theſe ſymptoms with thoſe above enumerated, denote the whole canal to be affected. Spaſms of the pharynx are diſtinguiſhed from a paralyſis or relaxation of the part, by the difficulty of ſwallowing, being in the latter continual, in the former intermitting:—*in the paralyſis*, ſolids are more eaſily ſwallowed than liquids;—*in ſpaſms* the difficulty of ſwallowing ſolids and liquids is equal;—ſpaſms, of the pharynx are diſtinguiſhed from inflammations, by the latter being accompanied with ſwelling, redneſs, heat in the fauces, thirſt, and fever.—Spaſms of the gullet have alſo one ſymptom, *the reſiſtance to the deſcent of food*, in common with ſome other diſorders, as an obſtruction of the *œſophagus* from ſome ſolid bodies ſticking in it, tumors, excreſcences, ſwellings of the glands joined to the *œſophagus*, about the fifth vertebra of the back. But in theſe caſes, though ſolid foods ſtop, and are thrown up again, liquids, both cold and hot, paſs down with a greater or leſs degree of freedom; whilſt, in ſpaſmodic ſtrictures, cold liquors paſs with remarkably greater difficulty than ſuch as are warm: ſpaſms in the *œſophagus* are alſo accompanied with pains in the ſcapulæ.

Idiopathic

Idiopathic ſpaſms of the pharynx are apt, from improper treatment, to become obſtinate and habitual. Thoſe which ariſe from acrid ſubſtances threaten an inflammation: from hyſteric paſſions, an apoplexy. Etmuller obſerves, that a difficulty of ſwallowing from a convulſion, in wounds, is dangerous; and Hippocrates, that a ſudden contortion of the neck, obſtructing deglutition, without any ſwelling in fevers, is mortal. Spaſms of the *gullet* from paſſion at meals are apt to lay the foundation of cholera, and bilious fevers. THE GENERAL INDICATIONS OF CURE ARE, *to alleviate the ſpaſms and remove their cauſes.* The firſt is anſwered by antiſpaſmodics and anodynes, mixed with diſcutients, both given internally, and applied externally.—The more violent the conſtriction, the more neceſſary it is to begin with externals. Emollient glyſters, with the addition of corroborants, are to be two or three times repeated; and the feet bathed in pretty warm water, to invite the humours downwards; when pediluvia are called in aid, be careful that the feet be not too cold; if they are, they muſt firſt be warmed by frictions and bottles of hot water. To the part affected apply paregoric nervine liniments, compoſed of vinous ſpirit, aq. ammoniæ; eſſent. croci; eſſ. nucis Moſchat. camphor. liquor. minor. anod. &c. The balſ. vitæ, and the ſpt. ætheris vitriol. comp. may be dropped on ſugar, and kept in the mouth, to be ſlowly ſwallowed. A bladder of warm water may be applied to the throat.—If the face is red, the veſſels inflated, with ſtrong pulſation in the arteries of the head, and at the ſame time there are conſtrictions of the fauces, a vein may be opened to prevent an apoplexy.—The ſpaſms allayed by means of antiſpaſmodics externally and internally uſed, proceed to ſubdue the cauſe.—*If acrid ſubſtances, draſtic purgatives,* or *emetics*, have given riſe to the diſeaſe, their acrimony muſt be immediately obtunded by mucilages, oils, milk, fat broth, warm water drank plentifully, ſo as to promote a gentle vomiting.—In ſpaſms of the *æſophagus, from a violent fit of anger during a meal*, there is generally an effuſion of bile into the ſtomach; in this caſe give abſorbents, and mucilaginous ſubſtances, as water-gruel, or barley-water; and afterwards evacuate by means of manna, or rhubarb, or other gentle laxatives; or emetics, as antimonium tartariſatum gr. i. vel ij. with one of theſe laxatives. But never give either emetic or purgative immediately after paſſion:—in caſe of flatulencies offending, oily and carminative clyſters are to be preferred.—*In chronical ſpaſms of the gullet, from a general bad habit, or from crudities in the ſtomach and bowels*; the firſt muſt be obviated by ſuitable alteratives and abſorbents, the latter by manna, rhubarb, &c.—*In very obſtinate caſes* mineral waters are extolled.—*In hypochondriacal caſes*, where uterine or hæmorrhoidal hæmorrhages are obſtructed; the ſulphureous mineral waters, with bleeding and proper exerciſe, are the principal remedies.—*Chronical ſpaſms of the æſophagus, from a debility of the nervous ſyſtem*, are chiefly to be cured by dietetics, and light ſlender food; balſamic elixirs to ſtrengthen the ſtomach; moderate, but frequent exerciſe; occaſional bleedings; the hot ſulphureous waters both for drinking and bathing in.—*In ſpaſms of the lower gullet*, externals are beſt applied to the ſpine, with which the *æſophagus* is immediately connected. If the ſpaſms are ſo violent that the patient cannot ſwallow, he muſt be ſupported by nouriſhing clyſters.

See Hoffman's Practice of Phyſic, tranſlated by Lewis, vol. ii. p. 147, &c. Percival's Eſſays, Medical and Experimental, vol ii. p. 141, &c. Lond. Med. Tranſ. vol. i. p. 165. vol. ii. p. 90.

ŒSTRUM. See BOVINA AFFECTIO.

ŒSTRUM VENERIS. See CLITORIS.

ŒSTROMANIA. See FUROR UTERINUS.

ŒSYPE, ŒSYPOS, or ŒSYPUM. The greaſy ſordes of wool.

OFFA ALBA HELMONTII. If rectified ſpirit of wine be poured gently into a fully ſaturated volatile alkaline ſpirit, the ſpirit of wine running on the ſide of the glaſs, which muſt ſtand in a cold place, immediately an opake denſe coagulum is formed, which on gently ſhaking, falls into a conſiſtent maſs; this maſs ſoon reſolves, by warmth, into a ſolid and fluid part; the ſolid part is called *offa alba*. It is ſuppoſed to be a volatile ſoap, compoſed of the volatile ſalt of one ſpirit, and the oil of the other; but it is no more than the alkaline ſalt diſlodged by the vinous ſpirit.

OFFICINALIA. OFFICINALS. IN PHARMACY it is an appellation given to ſuch medicines, whether ſimple or compound, as are required to be conſtantly kept in the apothecary's ſhop; or to ſuch vegetable ſubſtances as are ſelected for medicinal purpoſes, by which the ſpecies in uſe is particularized.

OFFUSCATIO. See AMAUROSIS.

OLAMPI. The name of a gum which reſembles copal, and is brought from America. Lemery ſays it is ſweet to the taſte, and ſomewhat aſtringent. It is not in uſe with us.

OLCACATZAN. See CHINA OCCIDENTALIS.

OLEA, ſeu OLIVA. The OLIVE TREE. It uſed to be called by the ancients *cotinus*. It is the OLEA EUROPEA, *foliis lanceolatis integerrimis racemis axillaribus coarctatis*. CLASS DIANDRIA, ORD. MONOGYNIA. LINN. Gener. Plant. 20. It is an evergreen, with oblong, narrow, willow-like leaves, and monopetalous whitiſh flowers, cut into four ſections, followed by cluſters of oval black fruit, containing, under a fleſhy pulp, a hard rough ſtone. It is a native of the ſouthern parts of Europe, and bears the ordinary winters of our clime. There are five varieties; four of which take their names from the ſhape of the leaves, and one from its colour; as *long-leaved,—broad-leaved,—twiſted-leaved,—box-leaved,—iron-leaved*. The olives, when they are ripe and fall from the trees ſpontaneouſly, are called *drupas*, ſeu *drypa*.

The fruit hath a bitter, auſtere, diſagreeable taſte: pickled it proves leſs ungrateful, and is ſuppoſed to promote an appetite, help digeſtion, and attenuate viſcid phlegm in the firſt paſſages. The Lucca olives are the ſmalleſt and weakeſt, and the Spaniſh are the largeſt and ſtrongeſt taſted. The middling ſize, which are brought from Provence, are generally moſt eſteemed: but the principal conſumption of this fruit is, for the obtaining their oil. When taken from the unripe fruit, it is called *omotribes — omphacinum*. The oil for uſe is procured when the fruit is ripe. It is ground and preſſed; the purer and finer oil iſſues out firſt, by gentle preſſure; and inferior ſorts, on heating the reſiduum, and preſſing it more ſtrongly. The beſt olive oil is of a bright pale amber colour, bland to the taſte, and without any ſmell; it becomes rancid by age, and the ſooner, if kept in a warm ſituation; by cold, at the 38th degree of Fahrenheit's thermometer, it congeals, and does not become rancid if preſerved in a degree of cold equal to the freezing point of water. All the mild expreſſed vegetable oils are nearly of the ſame nature; however, a preference ſhould be given to the moſt fluid; hence the oil of olives, and that of almonds, are moſt commonly directed for internal uſe. See AMYGDALÆ; and GROSS and EXPRESSED OILS, under OLEUM; and alſo HYDROPHOBIA.

OLEAMEN. A thin liniment compoſed of oils.

OLEANDER. See NERION.

OLEASTER. The WILD OLIVE, called alſo *elæagnus, agrielæa*. It differs from the olea, or garden olive, only in culture.

OLECRANON, from ωλενη, *cubitus*, and κρανον, *the head*. The ELBOW, alſo called *ancon, pechys*. It is the largeſt of the two apophyſes at the upper end of the ulna; it ends in a rough tuberoſity and an obtuſe point. The tuberoſity makes the corner of the elbow, called *acrolenion*; the point is lodged in the poſterior cavity of the lower extremity of the os humeri, when the fore-arm is extended. Alſo the head of the *humerus*.

OLENE. See CUBITUS.

OLEOSACCHARUM. Eſſential oils, ground with eight or ten times their weight of ſugar, become ſoluble in water, and may be diluted to any aſſigned degree; and thus *oleoſacchara* are formed, and kept in well ſtopped bottles for making extemporaneous diſtilled waters, either ſimple or compound.—Mucilages render them miſcible with water into a milky liquor; they diſſolve alſo in a little more than their weight of rectified ſpirit of wine. The extemporaneous waters which are made by means of the *oleoſacchara* are not ſo grateful as thoſe that are diſtilled, for want of the volatile ſaline parts which remain in diſtillation.

OLEUM. OIL. *Oils* are *animal, vegetable*, and *mineral*.—*Animal oils* are the fat of animals. All animal ſubſtances yield this *oil* by diſtillation.—*Vegetable oils* are principally procured by expreſſion, diſtillation, and by boiling. *The mineral ones* are obtained ſpontaneouſly, and by diſtillation.

Among the ſubſtances naturally contained in vegetables, and ſeparable by art, without alteration of their native qualities, are the following:

1. GROSS

1. GROSS, or EXPRESSED OILS. Theſe are produced by ſome fruits; but abound chiefly in the kernels of fruits, and in certain ſeeds, are commonly extracted by expreſſion, and hence are diſtinguiſhed by the name of expreſſed *oil*. This *oil* is contained in all parts of a vegetable, and may be forced out by the action of fire, but thus their qualities are altered.—*Expreſſed oils* are not diſſoluble in water, nor in ſpirit of wine, without firſt being mixed with ſome ſuitable medium.—If expoſed to the cold they loſe much of their fluidity, ſome of them congealing into a conſiſtent maſs with a ſmall degree of cold.—If they are kept ſome time in a warm air, they become thin and rancid, their ſoftening quality is changed into an acrid one; and in this ſtate, inſtead of allaying irritation, they occaſion it: this rancidity is extracted even in the kernels, &c. in which this *oil* reſides before its being expreſſed; yet on triturating thoſe ſeeds, &c. with water into an emulſion, this emulſion, inſtead of growing rancid, turns ſour.—In ſuch a degree of heat as will occaſion a ſmall evaporation from theſe *oils*, a pungent vapour ariſes, ſeemingly of the acid kind; and when ſuffered to grow cold again, they are found to have acquired a greater degree of conſiſtence than they had before, together with an acrid taſte.—In a heat approaching to ignition, in cloſe veſſels, greateſt part of the *oil* ariſes in an empyreumatic ſtate, a black coal remaining behind.

In order to obtain theſe *oils*, the ſeeds, &c. which contain them, muſt be ground or powdered ſmall, then included in proper bags, and wrapped in hair-cloths, then committed to the preſs, by which the *oil* is forced out. To facilitate the expreſſion, it is uſual to warm either the preſs, or the plates, betwixt which the ſeeds, &c. are ſqueezed, or to heat the ſubject which is to be preſſed. But heat occaſions rancidity, ſo ſhould only be admitted when this circumſtance interferes not with the uſe for which the *oil* is deſigned.—Many are the different ſeeds, &c. which afford *oil* by this treatment, but the preſent practice attends but to few, viz. *olive*, *almond*, *linſeed*, *rape*, and *muſtard-ſeed*. Indeed, there is not much difference betwixt the expreſſed *oil* of one and another, the diſcriminating quality of the ſubjects not reſiding in the *oil* which is thus obtained; the *oil* of muſtard is as ſoft, inſipid, and void of pungency as that of ſweet almonds, the pungency of the muſtard remaining in the cake left behind after expreſſion; it is true, that there are certain ſpecific differences betwixt them, but as medicines, they are ſo nearly alike, that they may generally be indiſcriminately uſed; they are emollient, they ſoften and relax the ſolids, and are ſuppoſed to obtund acrimony in the humours, and thus may be uſed internally to obviate the effect of various ſtimuli which produce irritation, and conſequent inflammation. Hence OIL has commonly been preſcribed in ſome coughs—catarrhal affections—and eroſions; alſo ſucceſsfully uſed in worm caſes—in nephritic pains—ſpaſms—colics—conſtipation of the bowels, &c.—and been recommended in caſes of canine madneſs. See HYDROPHOBIA. *Externally*, it has been found of uſe in bites and ſtings of various poiſonous animals, burns, tumors, and other affections, by itſelf, or mixed in liniments, injections, clyſters, and poultices. Rubbed over the body it has been ſingularly beneficial in dropſies, particularly in aſcites. The following are ſome of the forms in which *oil* is exhibited:

ENEMA OLEOSUM. *Oily Clyſter.*

℞ Decocti avenæ ℔ j. Olei olivarum ʒ ij. m. Where the principal intention is to foment the abdominal viſcera, this clyſter muſt be thrown up in a very gradual manner, that as ſlight a ſtimulus as poſſible may be given to the inteſtines, and their immediate reaction prevented. An ounce of Glauber's ſalt added to this, and exhibited in a different mode, affords an eligible purging clyſter.

ENEMA OLEI CUM OPIO. *Oil Clyſters with Opium.*

℞ Olei olivæ ʒ iv. Tincturæ opii gtt. xl. m. This is adminiſtered in ſpaſmodic affections of the neck of the bladder, and in that ſenſe of weight and uneaſineſs in affections of the proſtate gland in gonorrhœa, and ſome other ſurgical caſes to allay pain.

ENEMA OPIATUM. *Opiated Clyſter.*

℞ Mucilaginis amyli. ℔ j. Tinct. opii ʒ j. m. This is uſed for the ſame purpoſes as the above enema.

INJECTIO OLEOSA. See INJECTIO.

LINIMENTUM OLEOSUM. See AMBUSTA.

LINIMENTUM OLEOSUM COMPOSITUM. *Compound oily Liniment.*

℞ Olei olivæ ʒ ij. ſs. Olei terebinth. ʒ j. Acidi vitrioli gutt. xlv. Add the vitriolic acid to the other ingredients *gradually* in an open veſſel. In chronic affections of the joints, and in debility and ſome other effects of long ſtanding from ſprains and bruiſes, this is ſaid to be an efficacious remedy, though by no means an elegant one.

Though expreſſed *oils* may be combined with water, by the intervention of gum or mucilage, yet they do not act upon, or unite with the gummy or mucilaginous parts of vegetables; hence the ol. e mucilaginibus, does not contain any of the mucilage with which its ingredients ſo much abound.—Expreſſed *oils* may be tinged by vegetable matters of almoſt all colours; in making the officinal *oils* by decoction, in order to have the colour clear and ſtrong, the beſt method is to ſtrain off the *oil* as ſoon as it hath acquired a ſufficient depth of colour, and then again to boil it until no aqueous vapours exhale. If the water is not all exhaled, the *oil* will have a dingy colour, and ſoon be mouldy; and if the leaves that are boiled in the *oil*, continue after they are criſp, they occaſion a diſagreeable blackneſs.

2. A GROSS SEBACEOUS MATTER. From the kernels of ſome fruits, as that of the chocolate-nut, inſtead of a fluid oil, a ſubſtance is obtained which is of a butyraceous conſiſtence. Theſe are moſt commodiouſly extracted by boiling the ſubject in water; this ſebaceous matter, liquefied by heat, ſeparates and ariſes to the ſurface, and reſumes its proper conſiſtence as the liquor cools.—The ſubſtance of this claſs have the ſame general properties with expreſſed *oils*, but are leſs diſpoſed to become rancid than moſt of the common fluid *oils*.—It is ſuppoſed that their thicker conſiſtence is owing to a larger admixture of an acid principle; for in their reſolution by fire, they yield a vapour more ſenſibly acid than the *fluid oils*; and *fluid oils*, by the admixture of concentrated acids, are reduced to a thick and a ſolid maſs.

3. ESSENTIAL OILS. They are obtained only from thoſe vegetables, or parts of vegetables, that are conſiderably odorous. They are the direct principle in which the odour, and oftentimes the warmth and pungency, and other active powers of the ſubject reſide, whence their names of *eſſences*, and *eſſential oils*.—ESSENTIAL *oils* unite with *rectified ſpirit of wine*, though ſome of them require for this purpoſe a much larger proportion of the ſpirit than others;—*water* alſo, though it does not diſſolve their whole ſubſtance, may be made to imbibe ſome portion of their more ſubtile matter, ſo as to become conſiderably impregnated with their flavour, as happens in diſtillation;—*by the admixture of ſugar, gum*, &c. they are totally diſſolved with water.—Digeſted with volatile alkalies, they undergo various changes of colour, and ſome of the leſs odorous acquire conſiderable degrees of fragrancy, whilſt fixed alkalies univerſally impair their odour.—In the heat of boiling water theſe *oils* totally exhale, and on this principle they are commonly extracted from ſubjects that contain them; for no other fluid that naturally exiſts in vegetables is exhalable by that degree of heat except the aqueous moiſture, from which greateſt part of the oil is eaſily ſeparated. Some of theſe *oils* riſe with much leſs heat than others. In their reſolution by a burning heat, they differ little from expreſſed *oils*. When expoſed for ſome time to a warm air, they ſuffer an alteration very different from that which the expreſſed undergo; inſtead of growing thin, rancid, and acrimonious, they gradually become thick, and at length harden into a ſolid, brittle concrete, with a remarkable diminution of their volatility, fragrancy, pungency, and warm ſtimulating quality. In this ſtate they are found to conſiſt of two kinds of matter, a fluid *oil*, volatile in the heat of boiling water, and nearly of the ſame quality as the original *oil*, and of a groſſer ſubſtance, which remains behind, not exhalable without a burning heat, or ſuch a one as changes its nature, and reſolves it into an *acid*, an *empyreumatic oil*, and a *black coal*. The admixture of a concentrated acid inſtantly produces in *eſſential oils* a change nearly ſimilar to that which time effects.

The *oils* expreſſed from aromatic ſubſtances differ from thoſe which are thus obtained from olives, almonds, &c. Theſe retain for the moſt part an admixture of the aromatic matter of the ſubject; thus aniſeed, mace, and nutmegs, yield, upon expreſſion, an *oil* impregnated with the flavour of the ſpices, and an *oil* expreſſed from aniſeed hath a great ſhare of the peculiar ſmell of the ſeeds.

A purgative *oil* is expreſſed from the ſeeds of the ricinus. The rinds of oranges, lemons, and citrons, yield, by a kind of expreſſion, their *eſſential oils*, almoſt as pure, and nearly ſimilar to thoſe which are obtained from them by diſtillation. The *eſſential oils*, in which the fragrance, and aromatic warmth of theſe fruits reſide, are contained in numerous cells, or veſicles, which may be diſtinguiſhed by the naked eye, and are ſpread all over the ſurface of the peel; it is moſt conveniently obtained by rubbing a piece of lump-ſugar on the ſurface of the freſh peel; the veſicles are thus burſt, and the ſugar imbibes the *oil*; when the ſurface of the ſugar is ſufficiently moiſtened therewith, ſcrape it into a phial, and keep it cloſe until it is uſed.

Moiſt eſſential oils are drawn by diſtillation. A quantity of water is added to the ſubject, ſufficient to prevent its burning, and in this water it is macerated a little before the diſtillation; the *oil* comes over with the water, and either floats on its ſurface, or falls to the bottom. The water employed in diſtilling *eſſential oils* imbibes ſome portion of them; it cannot, however, retain above a certain quantity, and therefore ſuch as have been already uſed, and almoſt ſaturated itſelf, may be advantageouſly employed inſtead of common water in future diſtillations of the ſame ſubject.

Eſſential oils are very often adulterated. If the mixture is with an expreſſed *oil*, the *fraud is diſcovered by adding a little rectified ſpirit of wine to a few drops of the ſuſpected eſſential oil, and, ſhaking them together; the ſpirit diſſolves all the eſſential oil, and leaves the expreſſed untouched*;—or *if it is the heavier eſſential oils*, the ſuſpected one may be dropped into water, and the *eſſential oil*, after a briſk agitation, falls to the bottom, and the expreſſed *oil* ſwims at the top;—or evaporate a little in a ſilver ſpoon, by which the *eſſential oil* will leave the expreſſed behind.—*If the adulteration is with rectified ſpirit of wine*, drop a little of the ſuſpected *oil* into water, or into ſpirit of turpentine; and if a milkineſs appears on the mixture being ſhaken, there is ſpirit of wine in the *oil*.—*If the eſſential oil is mixed with other cheaper eſſential oils*, dip a rag into the ſuſpected *oil*, and then hold it before the fire: thus the flavour of the genuine *oil* paſſes off, and leaves that of the added one ſufficiently diſtinct behind. The cheap *eſſential oils* that are added are uſually thoſe of the turpentine kind, which are alſo diſcovered by dropping the ſuſpected *oil* into ſpirit of wine, for then a milkineſs is produced, but not if the *oil* is genuine.

Eſſential oils, medically conſidered, agree in the general qualities of pungency and heat, though in theſe they differ in their degrees; in particular virtues they differ, as the ſubjects do from which they are obtained. Some of theſe *oils* are uſed to correct reſinous purges; they make them eaſy in the ſtomach at the firſt, but ſo far from abating their irritating quality, they add a freſh ſtimulus. Theſe *oils* are beſt adminiſtered with powders, pills, boluſſes, or electaries.

4. CONCRETE ESSENTIAL OIL. Some vegetables, ſuch as roſes and the roots of elecampane, inſtead of a fluid *eſſential oil*, yield a ſubſtance poſſeſſing the ſame general properties, but of a thicker and ſebaceous conſiſtence. This ſubſtance appears of as great volatilty and ſubtility as the fluid *oils*; it equally exhales in the heat of boiling water, and concretes upon the ſurface of the collected vapour. The total exhalation of this matter, and its concreting again in its original conſiſtent ſtate, without any ſeparation of it into a fluid and a ſolid part, diſtinguiſhes it from *eſſential oils* that have been thickened or indurated by age or by acids. See Hoffman's Obſ. Phyſ. Chem. lib. i. Neumann's Chem. Works. Dict. of Chem.

OLEUM AMYGDALARUM. See AMYGDALÆ.

—— OLIVARUM. See OLEA ſeu OLIVA.

OLEUM is a term for the product of ſeveral ſubſtances, viz. *Oleum* balſami, ſee BALSAMUM. *Salis*, ſee CIRCULATUM.——Myrrhæ per deliq. ſee MYRRHA.——Antimonii. See ANTIMONIUM, N° 7.

OLFACTORII NERVI. The OLFACTORY NERVES. They were formerly called *proceſſus mammillares*. They are the firſt pair of *nerves* from the brain. They ſeem to approach nearer each other as they paſs towards the criſta galli. They divide into many ſmall filaments, which paſs through the foramina of the os ethmoides. On theſe *nerves* no covering from the dura mater can be traced. See OLFACTUS.

OLFACTUS. The SENSE of SMELLING, called alſo *odoratus*. The mucous membrane which lines the noſtrils, hath its ſurface greatly enlarged by its ſpreading into the two frontal ſinuſes, the antra of Highmore, the cells in the ſphenoid bone, and on the ſpongy bones of the noſtrils. The olfactory nerves, without their dura matral coat, pierce the holes in the ethmoid bone, and ſpread themſelves in the mucous membrane of the noſtril. Theſe nerves are widely expanded, and no where are the nerves ſo ſoft, naked, and conſequently ſo eaſily affected and injured as in this; yet an inſipid mucus is conſtantly ſeparated in the membrane of the noſe to defend the nerves. A branch from the fifth pair is alſo ſent to this membrane, by the irritation of which ſneezing is excited when the mucus is not duly diſcharged. The objects of *ſmell* are thoſe parts of ſubſtances which are lodged in their ſpirit, oil, ſalt, or ſoap, if they are ſo divided as to become capable of floating in the atmoſphere: but from experiments it is plain, that the ſpirit lodged in the *oil*, is that which excites the *ſenſe* of *ſmelling*; for when this ſpirit is ſeparated, the ſubject is inodorous, and to whatever ſubject this ſpirit is communicated, there the odour is alſo. The *ſenſe* of *ſmell* is only excited when the odorous effluvia contained in the air, and attracted through the noſtrils, are impreſſed on the olfactory nerves. The longer the noſtrils, the more the ſurface thereof, and if the ſpongy bones there are enlarged, the more acute is the *ſenſe* of *ſmelling*.

OLIBANUM, called *Conder*, *Thus maſculinum*, & *corticoſum*. LYCIAN JUNIPER or CEDAR. The Greeks called *Thus*, olibanum. See THUS. The olibanum is a gummy reſin brought from Turkey and the Eaſt Indies. Dale ſays he found a ſpecies of cedar in Carolina, which afforded a gum ſo like this, that he could not perceive any difference in it. The tree is the JUNIPERUS LYCIA, or JUNIPERUS *foliis ternis undique imbricatis ovatis obtuſis*, CLASS DIOECIA; ORDO MONADELPHIA, LINN. Gener. Plant. 1134. It is uſually in drops or tears, like thoſe of maſtich, but larger, of a pale yellowiſh colour, which by age becomes reddiſh. It hath ſeveral names, according to its different appearances; the ſingle tears are called ſimply *olibanum*, or *Thus*; when two are joined together, they have been called *Thus maſculinum*; and when two were very large, *Thus fœmininum*; ſometimes four or five have adhered together, about as big as filberts, and, perhaps, found on the bark of the tree; theſe have been named *Thus corticoſum*; the finer powder which rubs off from tears in carriage is called *Mica Thuris*; the coarſer, *Manna Thuris*. This drug, however, is not in any of its ſtates what is now called Thus, or *frankincenſe*, in the ſhops.

This gummy reſin hath a moderately ſtrong, not very agreeable ſmell, and a bitteriſh pungent taſte. In chewing it ſticks to the teeth, becomes white, and renders the ſaliva milky. Laid on a red-hot iron it readily catches flame, and burns with a ſtrong diffuſive ſmell, which is not unpleaſant. *It is ſuppoſed to have been the incenſe uſed by the ancients in their religious ceremonies.* On trituration with water, the greateſt part of it diſſolves into a milky liquor, which on ſtanding depoſits a portion of reſinous matter, and being now gently inſpiſſated, leaves a yellow extract, which retains greateſt part of the ſmell as well as taſte, of the *olibanum*, the odorous matter appearing to be of a leſs volatile kind than that of moſt other gummy reſins. Rectified ſpirit of wine diſſolves leſs than water, but it takes up nearly all the active matter. It is recommended in diſorders of the head and breaſt, in hæmoptoes, and in alvine and uterine fluxes by ſome authors: its doſe from ℈ i. to ʒ i. though Dr. Cullen thinks it has no medicinal virtues, therefore takes no notice of it. Notwithſtanding which, ſome practitioners have a favourable opinion of it, and preſcribe it in gleets, leucorrhœa, and ſome other ſupernatural diſcharges, where ſtimulants in the urinary paſſages or parts contiguous are neceſſary, in form of draughts, or electary. The following is an hoſpital compoſition:

ELECTARIUM OLIBANI. *Olibanum Electary.*

℞ Gummi olibani pulv. balſami copaibæ ää ʒ ſs. conſerv. cynobatæ ʒ j. fyr. ſimplicis q. ſ. ut fiat electarium; bis vel ter de die drachmæ duæ vel tres exhibeantur ſingulis vicibus. See Lewis's Mat. Med. Neumann's Chem. Works.

OLISTHEMA, from ὀλισθαινω, *to fall out*. See LUXATIO.

OLIVARIA CORPORA. Two eminences on the lower part of the medulla oblongata, near where it commences medulla ſpinalis. Many tables place theſe higher, but unjuſtly.

OLOPHLYCTIDES. See PHLYCTÆNÆ.

OLSENICHIUM. See ŒLSNITIUM.

OLUS ATRUM. See HIPPOSELINUM.

OMAGRA. See ARTHRITIS.
OMASUM, or OMASUS. See ABOMASUM.
OMELYSIS, from ωμος, *crude*. Some say it is the meal of barley not parched; others, that it is any sort of meal.
OMENTA. See DURA MATER.
OMENTALIS PERITONITIS, } See PERITONI-
OMENTITIS. } TIS.
OMENTUM, called EPIPLOON by the Greeks, and by us the CAWL. It is also called *reticulum*, and *gangamon*, from its structure resembling that of a net. Fallius calls it *dextron*. Below the liver, floating over the intestines, is the *omentum*, whose superior portion is, as it were, divided into two borders, one of which is fixed along the great arch of the colon, and the other along the great curvature of the stomach. The union of these two borders on the right side is fixed to the ligament, or adhesion of the duodenum and colon; that on the left side to the longitudinal fissure of the spleen, to the extremity of the pancreas, and to the convex side of the great extremity of the stomach. The *omentum* is generally larger on the left side than on the right. Its use is, by its fat, to lubricate the parts adjacent, to prevent adhesions of the intestines, and as a preparatory organ for the bile.
The little *omentum*, called also *meso-gaster*. See MESOGASTRION.
OMOCOTYLE. See SCAPULA.
OMOHYOIDÆUS MUSCULUS. See CORACO-HYOIDÆUS MUSC.
OMOLINON, from ωμος, *crude*, and λινον, *linum*. RAW FLAX; which Hippocrates uses for burning or cauterizing, when necessary, or in the cure of the fistula in ano, which mode ÆGINETA calls *apolinoses*, or in a tubercle of the side after cutting, and cauterising, or in dropsy.
OMOPLATA, from ωμος, *the shoulder*, and πλατυς, *broad*. See SCAPULA.
OMOPLATO-HYOIDÆUS. See CORACO-HYOIDÆUS MUSC.
OMOS See HUMERUS and UTERUS.
OMOTRIBES, } See OLEA.

OMPHALOCELE, from ομφαλος, *the navel*, and κηλη, *a rupture*. See HERNIA UMBILICALIS.
OMPHALOS. See UMBILICUS, and HERNIA UMBILICALIS.
OMPHAX. See AGRESTA.
ONAGRA. See ARTHRITIS.
ONEIRODYNIA, from ονειρον, *somnium*, and οδυνη, *cruciatus*. DISTURBED or TROUBLED SLEEP. Dr. Cullen places this genus of disease in the CLASS NEUROSES, and ORDER VESANIÆ. He defines it, violent or disturbed action of the imagination during sleep; and observes two species. 1. *Oneirodynia activa*, when people are in their sleep excited to walk about, or perform various other motions, called *somnambalo*, which see, &c. 2. *Oneirodynia gravans*; when a sense of pressure is perceived, particularly on the breast. See INCUBO.
ONEIROGMOS, from ονειρωσσω, *semen in somno profundere* VENEREAL DREAMS. Thus Cœlius Aurelianus calls this disorder, and he describes it as disturbing the patient with wild delusive dreams, and frequently emitting their *semen* whilst asleep. He says it is the result of impressions on the fancy, which affect the patient during sleep, and arising from extraordinary desire of, or great abstinence from venery. See Cœl. Aurel. Morb. Chron. lib. v. c. 7, also GONORRHŒA DORMIENTIUM, under CONORRHŒA.
ONEIROGONOS. So the Greeks call an occasional emission of the semen in sleep, when it only happens rarely.
ONISCI. See ASELLI.
ONISCUS. See ASELLI.
ONITIS. See ORIGANUM, CRETICUM, and ANGLICUM.
ONOBRYCHIS, called also *polygalon Gesneri*, *caput gallinaceum*, HOLY-HAY, COCK'S HEAD VETCH, SAINTFOIN.
It grows on hills, in highways, and corn-fields, but always in a dry chalky soil exposed to the sun. It is cultivated for feeding of cattle. It is said to generate much milk in cows.
ONOCHELIS, }
ONOCHILES, } See ANCHUSA.
ONOCLEA. }

OPERCULUM COCHLEÆ CŒLATÆ. See UMBILICUS MARINUS.
OPHIASIS. See ALOPECIA.
OPHIOGLOSSUM, from οφις, *a serpent*, and γλωσσα, *a tongue*, because the fruit of the plant resembles a tongue. See Cyclopædia, *Adder's tongue*; also *brassadallica ars*. ADDER'S TONGUE, called also *brassadella*, or *brassatella*; *lingua serpentis*. It is the OPHIOGLOSSUM VULGATUM Linn. This plant hath only one leaf, with a slender stalk arising from the bottom of it, dented about the edges, and supposed to resemble the tongue of a serpent. It grows in meadows; the leaf is thick, of a fresh green colour, and juicy; the seed is in a green spike.
OPHIOSCORDON, or OPHIOSCORODON: also called *victorialis*; *allium agninum*, *allium montanum latifolium maculatum*; *allium alpinum*; *idæa*, *moly alpinum*; SPOTTED RAMSONS; BROAD-LEAVED MOUNTAIN GARLIC. It is a species of garlick, kept in the gardens of the curious, but grows wild in most countries. Its virtues are similar to the common *garlic*. See Raii Hist.
OPHIOSTAPHYLON. See BRYONIA ALBA.
OPHRIS, and OPHRIS MAJOR. See BIFOLIUM.
OPHRYS. See FRONTIS OS.
OPHRYS UNIFOLIA. See MONOPHYLLON.
OPHTHALMIA, from οφθαλμος, *an eye*. INFLAMMATIO OCULI, also *ophthalmitis*, *blepharotis chemosis*. AN INFLAMMATION OF THE MEMBRANES WHICH INVEST THE EYES; particularly the ADNATA.
Monf. de St. Yves distinguishes this disorder into fourteen or fifteen different kinds, according to their different causes, or other circumstances.
Dr. Cullen places this genus of disease in the CLASS PYREXIÆ, and ORDER PHLEGMASIÆ, which he defines redness, and pain of the eye, with incapability of bearing the light, and most commonly with weeping. He distinguishes two species. 1. The *ophthalmia membranarum*; that is, when the tunica adnata, and membranes lying under it, or the coats of the eyes, are the seat of the inflammation. 2. *Ophthalmia tarsi*, when the inflammation is attended with tumor, erosion, and glutinous exudation of the tarsus, or edges of the eye-lids. The FIRST he considers as varying according to the degree of inflammation, and according to which of the tunics are principally affected. The SECOND includes but two varieties. He further distinguishes betwixt the idiopatic and the symptomatic: *in the first* are included the above named species; *in the last*, he forms the varieties from the disease that causes the inflammation, being in the eye itself, or in the general habit, or some other part of the body separate from the eye. Here, the different distinctions in the *ophthalmia* are seen at one view: and as much perplexity attends the inquirer in this particular, if unpossessed of this valuable work, his arrangement is here inserted as follows.

OF THE FIRST SPECIES, and which varies according to the degree of external inflammation, are the

Ophthalmia Taraxis — *Ophthalmia* Erysipelatosa.
Humida — Pustulosa
Chemosis — Phlyctænodes.

Of the same species, but which vary according to which coat of the eye is affected, are the

Ophthalmia Choroeidea
Tenebricosa.

OF THE SECOND SPECIES, which are seated in the tarsus, also affecting the eye-lids, are the

Ophthalmia Trachoma
Sicca.

Or

OF THE VARIETIES THAT ARE SYMPTOMATIC; thoſe that take their riſe from other diſeaſe of the eye or the eye-lid, are the

Ophthalmia Angularis	*Ophthalmia* a Lagophthalmo
Tuberculoſa	ab Elcomate
Trichiaſis	ab Ungue
Cancroſa	a Corneæ fiſtula
a Synechia	Uveæ.

THOSE VARIETIES THAT ARE SYMPTOMATIC, and take their riſe from diſeaſes in another part of the body, or of the whole habit, are the

Ophthalmia Metaſtatica	*Ophthalmia* Syphilitica
Scrophuloſa	Febricoſa.

For the moſt part this diſorder is in the adnata; but ſometimes the interior coats are affected: indeed the inner ones are ſometimes the ſeat of the inflammation.

Any of the cauſes of external inflammation may produce the ſame in the external coat of the eye; and the ſame cauſes which produce this diſorder in other internal parts may alſo produce it in the inner membranes of this organ. Accidents from without, as cold air, duſt, too much expoſure to vivid colours, blows, wounds, &c. and as internal cauſes, the meaſles, and ſmall-pox, ſcrophula, &c. are all occaſionally the cauſes of this complaint. The red veſſels in the eye are increaſed in their ſize, and there appear many more than did in their natural ſtate. There is pain which is increaſed on the leaſt motion, which produces tears from the lachrymal glands. When the affection of the adnata is conſiderable, it is communicated to the ſubjacent membranes, even to the retina, which thereby increaſes in ſenſibility, and the leaſt degree of light is painful.

Dr. Cullen conſiders all the caſes of *ophthalmia* membranarum as the ſame diſeaſe, differing only in ſituation or degree, and as being to be cured by the ſame means, more or leſs employed.

The *ophthalmia ſubſequent to blows on the head, by which the meninges are hurt, is a ſign of death.* When in the beginning of the ſmall-pox this diſorder is attendant, the conſequence is generally fatal.—When attended with long and violent head-achs, blindneſs is to be feared.—When *ophthalmia* is an original diſeaſe, when the temples ach, the forehead itches, and the body ſweats at nights, there is danger even of life.--The humid ſpecies, the eryſipelatous and venereal kinds, that of the choroides, and the chemoſis, all greatly tend to deſtroy the ſight.

IN THE CURE of the above ſpecies of inflammation in the eye, the diſtinctions may very well be loſt in moſt of them. When a flux of humours attends, it uſually abates by whatever relieves the inflammation; and in general to conſider and treat theſe diſorders under the ſimple idea of inflammations will be the moſt proper and eaſy: as to particular circumſtances, they may be attended to, and treated according to their reſpective natures, as directed here and in other articles, or as the preſcriber's particular experience may direct. It is happily obſerved by Dr. Kirkland, in the firſt volume of his Inquiry, p. 480. that "like all other inflammations, *it gives way to thoſe remedies which remove the irritating cauſe, and leſſen the ſenſibility of the parts.*"

All heating, ſpirituous, and aromatic food muſt be avoided; a cooling liquid diet will be neceſſary; a freedom from all forcible exerciſe muſt be enjoined; and the eye may be ſhaded from the light, and all glaring objects, by means of a ſtiff paper, lined with black ſilk.

Bleeding according to the ſtrength and quickneſs of the pulſe: beſides taking blood from the arms, *leeches* may be applied to the external angles of the eyes. *Opening the temporal artery* is very generally adviſed;—Mr. WARE obſerves, that the two following difficulties attend it. 1ſt. It frequently will not yield a quantity of blood ſufficient to anſwer the intended purpoſe. 2d. The troubleſome and dangerous hæmorrhages which have ſometimes burſt from the orifice, at the diſtance of many hours from the operation. He farther obſerves, that conſiderable advantage hath followed a complete tranſvere diviſion of this artery; whereby the patient not only received benefit from the ſudden derivation of a large quantity of blood, but one principal ſource from which the blood circulated to the inflamed part, was cut off. *The external jugular vein* has alſo ſometimes been opened in this complaint; but as it does not come from the eye itſelf, it does not yield a very direct derivation. *As to leeches*, when they are applied to or near the eye-lids, they have ſometimes occaſioned them to ſwell to a large ſize, and have increaſed for a time the irritation of the eye; to prevent which, when they are applied near the eye, *confine them as near as poſſible, in the hollow of the temple, about an inch and a half from the outer orbit.*—Dr. KIRKLAND thinks that any other bleedings than that from the arm, are not attended with ſuperior advantage; as to leeches, he ſays they leave an inflammation behind, and occaſion a greater irritability in the neighbouring parts.—Dr. CULLEN ſays, that in many caſes a very effectual remedy is, that of ſcarifying the internal ſurface of the inferior eye-lid; and more ſo ſtill, is cutting the turgid veſſels upon the adnata itſelf.---As ſoon as blood is taken away, *let a cooling purge* be given; and *ſmall doſes of the natron vitriolatum* may be repeated every day after, ſo as to procure a few ſtools, until the violence of the ſymptoms give way. Particularly be careful to avoid ſtrong purges.---*A bliſter* applied to relieve inflammation in the eyes, is moſt effectual when laid upon the fore part of the head, and kept open a few days; apply the plaſter from the crown to the forehead, having firſt ſhaved the part. Dr. KIRKLAND is of opinion that bliſters, like leeches, are prejudicial by increaſing irritability where they are applied, and to ſome extent around them.---*The feet and legs may be placed in moderately warm water every night.*---*A ſeton*, if neceſſary, is beſt *fixed under the lower jaw*, in the ſide where the affected eye is, or if both eyes are bad, it may be placed under the chin; when it is fixed in the ſide of the jaw, let it be betwixt the external jugular vein and the larynx.

AS AN EXTERNAL REMEDY, *the vegeto mineral water* of Goulard is almoſt the only one needful; begin with it very mild, and increaſe its ſtrength ſo as to avoid irritation. Whether inflammations are phlegmonous, ſcrofulous, cancerous, or eryſipelatous, from bruiſes, &c. this water is of ſingular efficacy. *Ammonia acetata*, and *roſe water*, equal parts, or to theſe may be added an equal quantity of the comphorated mixture. And alſo one dram of ceruſſiæ compoſitus pulvis may be mixed with acetated ammonia and roſe-water, two ounces of each, or forty drops of tincture of opium; all of which form agreeable and efficacious collyria. *Vitriolated zinc* is the uſual remedy in theſe caſes; it cools, dries, and reſtringes; it is very uſeful when there is a defluxion, or an inflammation in the eyes, but the diſorder ſhould be giving way before its uſe is begun with: ſome prefer *alum*; bleeding, purging, and every proper evacuation, ſhould alſo have preceded; from two grains to five *of vitriolated zinc may be diſſolved in two ounces of water*, beginning with the weaker and gradually proceeding to the ſtronger; if it is too weak, the redundant tears will waſh it away before it produces any effect; or, ℞ zinci vitriolat. ʒ ſs. camphoræ gr. x. bene triturentur, et affunde aquæ ferventis ℥ vj. deinde per chartam colantur. Blue vitriol is uſeful when the humours are thick, and formed into ſordes; and when they begin to form ſmall membranes in the tunica albuginea, which frequently happens after the ſmall-pox and the meaſles; in ſuch caſes, *a grain or more may be added to an ounce of water; but it ſhould be omitted in all inſtances of inflammation attended with ſaline, hot, acrid defluxions, with redneſs and itching, becauſe it increaſes theſe ſymptoms.*---WHEN THE INFLAMMATION IS DEEP, *violent*, and *dangerous*, the eye being almoſt deprived of the ſight and ſenſibility, happy effects have been found from the uſe of *tepid camphorated ſpirit of wine mixed with the Peruvian balſam. Weak ſolutions of camphor* abate theſe inflammations, but a free uſe of it increaſes them. Dr. Kirkland recommends a ſmall quantity of *natron vitriolatum*, in fine powder, to be blown into the inflamed eye; he obſerves, that at firſt the inflammation ſeems to be increaſed by it, but ſoon a diſcharge of lymph follows, and the next day the inflammation is much abated or gone. *Opium* is ſaid by ſome not to eaſe pain in the eye; but that this ſymptom is relieved by the external uſe of aloes; however, it is clear from experience, that ſmall quantities of opium, mixed with any cooling liniment, ſpeedily abates inflammation in this organ. Mr. Ware ſtrongly recommends a few drops of the tinct. Theb. Ph. Lond. to be dropped into the eye, once every day; and ſupports his aſſertions in its favour, with narratives of facts which admit of no doubt. *Dr. Kirkland* obſerves, with reſpect to it, that "with due perſeverance, it ſufficiently anſwers our intention, where it can poſſibly do ſervice, without occaſioning pain. It may be uſed with advantage where the

ſenſibility

ſenſibility in the beginning is often exquiſite, and where few other remedies can be applied without giving offence." WHEN A CORRODING ACRIMONY IS OBSERVED IN THE HUMOUR THAT IS DISCHARGED, the eye may now and then be waſhed with a thin ſolution of gum arabic, or the mucilage of quince-ſeed.—IF THE EYE REMAINS VERY WEAK, after the inflammation abates, the beſt applications are, the *alum curd* which may be ſpread thin on a rag, and applied over the eyes every night; and a *ſolution of alum* in the proportion of a dram to half a pint of water; to which may be added the white of one egg; and to finiſh the cure, the patient may bathe in the ſea, or cold water may be poured upon his head every morning for ſome time.

WHEN FILMS ATTEND, OR ARE FOLLOWED BY DEFLUXIONS ON THE EYES, OR WHEN THE TRANSPARENCY OF THE CORNEA IS DIMINISHED, *borax* proves an admirable means of relief, and may be uſed as follows. ℞ Boracis opt. ʒ ſs. ſacch. alb. ʒ i aq. roſar. ℥ ii. m. f. collyr. Let a little of this be frequently dropped into the affected eye: Or, ℞ æruginis pp. gr. iv. ammoniæ muriatæ ʒ ſs. aq. calcis recentis ℥ viij. m. Vel, liquoris hydrargyri muriati, gutt. i. aq. diſtillat. ℥ iv. Vel, ℞ hydrargyri nitrati rubri, lapidis, calamin. pp. ää ʒ iſs. lythargyri levigati ʒ i. tutiæ pp. ʒ ſs. hydrargyri ſulphurati ℈ i. bene commiſceantur, deinde adjiciantur adipis ſuillæ ℥ ij. balſam Peruviani gutt. xv. m. This laſt is called PELLIER'S Ointment. WHEN PIMPLES ON THE EYE ATTEND AN INFLAMMATION, the ſolution of vitriolated zinc uſually ſucceeds; WHEN MATTER IS FORMED IN THESE PIMPLES, pierce them with the point of a lancet, and then waſh them with the juſt named ſolution; or, ℞ ungt. ſperm. ceti, ʒ v. ceruſſæ acetatæ, ʒ i. quibus ſuper porphyrite ſimul tritis inſtillentur tinct. benzoin comp. ʒ ii. hujus paululum, linteo exceptum, oculo dolenti omni nocte imponatur.—WHEN A BLOW IS THE CAUSE, and a SLACKNESS remains about the eyelids, ℞ conſ. roſar. rub. ℥ iii. tinct. opii. ʒ ii. m. vel, ℞ acet. diſtil. ℥ ii. aquæ ammon. ʒ i ſs. m. In Gooch's Caſes and Remarks, page 44, &c. is an inſtance of relief, when the tunica albuginea was inflamed ſo as to reſemble, if not conſtitute the chemoſis.—A GOUTY OPHTHALMIA requires that the gout, if poſſible, ſhould be brought into the extremities, and then the diſorder in the eye immediately vaniſhes; *if the inflammation is violent*, bleed, purge with aloetics, and waſh the eye with a mixture of tepid water two parts, and brandy one part. WHEN A TRANSLATION OF RHEUMATIC MATTER, FROM THE HIP, OR ELSEWHERE, is the cauſe, bliſters may be applied to, or near the part whence the rheumatiſm receded; a ſeton may be fixed under the lower jaw, and the bark with guaiacum may be given. IN THE SCROFULOUS INFLAMMATION of this organ, the bark is the ſovereign remedy: if in this caſe, the glands under the ears are affected, apply a cauſtic on one of them, and then another, if there are more than one, and the conſequent diſcharge will ſoon remove the inflammation; proper alteratives, as required, may accompany the bark; and the head ſhould be waſhed every morning with cold water. *Nitre*, given to a ſcruple three times a day, hath been found to be remarkably efficacious in this as well as with the common *ophthalmias*.—THE VENEREAL OPHTHALMIA admits not of vitriolic collyriums; it calls for the ſpeedieſt aid, which ſhould conſiſt of bleeding in the foot; an inward uſe of mercurials; the warm bath night and morning; purges repeated every day from the firſt day of bathing, until the inflammation abates, if other circumſtances do not forbid; compreſſes ſqueezed out of brandy and water may be conſtantly kept on the eye.

The OPHTHALMIA TARSI, ſo far as it is produced by the *ophthalmia membranarum*, the ſame remedies may be neceſſary. *Some ulcerations* are often formed on the tarſus; theſe require the application of *mercury* or *copper*, either of which often entirely cure the diſorder. It often depends *on an acrimony depoſited in the ſebaceous glands of the part*, and will require various remedies, according to the nature of the acrimony in fault, as ſcrofulous, or other diſeaſes with which this *ophthalmia* may be connected. When the nature of the acrimony is not aſcertained, mercury may be tried.

See Heiſter's Surgery. Gooch's Caſes and Remarks, page 44, &c. Boulton's Surgery, chap. vii. in the Appendix. Lewis's Tranſlation of Hoffman's Practice of Medicine, vol. i. page 308. Ware's Remarks on the *Ophthalmy*, &c. White's Surgery, p. 223. Bell's Surgery, voll. iii. p. 232. Kirkland's Inquiry, vol. i. p. 473. Warner on the Eye, and its Diſeaſes. Cullen's Firſt Lines, edit. 4. vol. i. p. 260. Wallis's Sauvages's Noſology of the Eyes, p. 96, &c.

OPHTHALMIA MUCOSA. The MUCOUS OPHTHALMY. It is a variety of *ophthalmy* of the membranes of the eye, though not in Dr. Cullen's Noſological Arrangement. Mr. Ware calls it the purulent eye, but owns that the term is not to be ſtrictly underſtood; he ſays, "the diſcharge from the eye is not real pus, but only *mucus* increaſed in quantity, and altered in colour." See his Remarks on the *Ophthalmy*, &c. p. 114.

Dr. Wallis, in the notes to his tranſlation of Sauvages's Noſology of the Eyes, places it amongſt the diſeaſes of the eye-lids, in the inner membrane of which the inflammation begins, and when it extends, the eye becomes more or leſs affected, and calls it *ophthalmia mucoſa puriformis*, becauſe there is a diſcharge of mucus, diſcoloured like pus, though not poſſeſſing the properties of pus.

This diſorder rarely happens, except to new-born children; in whom Mr. Ware obſerves, that it firſt diſcovers itſelf by a redneſs in the eye-lids, which quickly ſwell to a ſize ſo large as to prevent their being ſeparated, without the utmoſt difficulty; after which a conſtant diſcharge of thick yellow matter ſoon ſucceeds; which, if the lids can be ſeparated, will appear to ſpread over the eye, ſo as entirely to cover it. In common, both eyes are affected nearly in the ſame manner; and in bad caſes, whenever the child cries, the inſide of the lid is turned outwards; which is alſo the caſe, whenever an attempt is made to ſeparate them with the fingers; this is ſometimes the conſtant ſtate of the lids, and though they are reſtored by the fingers to their proper ſituation, yet on being left to themſelves, they immediately return to their former everted ſtate.

Occaſionally this complaint is accompanied with eruptions on the head and other parts of the body; and ſometimes is attended with ſymptoms of a ſcrofulous habit.

The ſwelling of the eye-lids neceſſarily occaſions a tightneſs, or conſtriction of their ciliary edges, by means of which the matter, which is formed on the inſide of them, is prevented from wholly running off; and its continuing between the lids and the globe ſerves ſtill farther to increaſe the inflammations, and is alſo the frequent cauſe of ulcers and ſpecks, which very often partially, and ſometimes totally, cover the pupil. Theſe effects may, in a great meaſure, be produced by the acrimony of the matter; but even allowing that the retained fluid is perfectly bland and mild, its continual lodgement on the eye is ſufficient, by maceration only, to deſtroy the tranſparency of the cornea; and when it has been joined with the preſſure of the ſwollen eye-lids, it has been known to cauſe the cornea to burſt, the humours to be partially or wholly diſcharged, and the eye, of courſe, to ſink in the orbit. To this accurate deſcription of Mr. Ware's, it may be added, that uſually, if left to nature, the quantity of *mucus* gradually increaſes until about a tea-ſpoonful of it may be ſqueezed from each eye every day; ſoon after this, if no extraordinary ſymptoms attend, the *mucus* decreaſes, and without art, a cure is effected.

This kind of inflammation may ariſe from any of the cauſes that produce external phlegmonous inflammations. Mr. Ware obſerves, that the tunica conjunctiva is defended from the acrimony of the tears by a ſoft, thin, *mucous* fluid, which is ſuppoſed to exhale from innumerable ſmall perforations diſperſed all over its ſurface. This fluid, as it naturally exiſts, is very ſmall in quantity; on which account, as it is pellucid, it is undiſcernible by the naked eye; nevertheleſs it is liable, by an irritation or inflammation of the parts which furniſh it, not only to be increaſed greatly in quantity, but to be ſo altered and changed in quality, as very much to reſemble pus itſelf, both in conſiſtence and colour. This inflammation is not often connected with any other diſorders, and is moſt frequently ſuppoſed *to ariſe from the child's being imprudently expoſed to the cold air*.

When early aſſiſtance hath been given, it was generally ſucceſsful; but when neglected, a partial blindneſs at leaſt, and too often a total one, hath been the conſequence. Like all inflammations of the eye, it is apt to terminate in an opacity of the cornea.

IN ORDER TO THE CURE, it is recommended by ſome to waſh the *mucus* out of the eye, whilſt in a tender inflamed ſtate, with a collyrium of equal parts of the common emulſion and julep of camphor.—Others with a ſyringe waſh out the *mucus*, but prefer mild fluids, ſuch as

warm barley-water; and until the ſwelling of the eye-lids ſubſide, they apply to them cooling ointments and emollient cataplaſms; at the ſame time, they repeat gentle purgatives as often as the patient's ſtrength, &c. ſeems to require.—Leeches are applied to the temples, and a bliſter between the ſhoulders, which is kept open as long as a tendency to a diſcharge of *mucus* in the eye appears.—When the turgidneſs of the eye-lids abates, and the inflammation of the conjunctiva diſappears, the decoct. cort. Peruv. is given inwardly, and collyriums directed that are of an aſtringent kind, and uſed three or four times a-day. Though bliſters are generally applied, ſome have, from an extenſive practice, concluded that their omiſſion would be no diſadvantage to the patient. Mr. Ware propoſes on the firſt attack to begin with reſiſting the diſcharge of *mucus*, by ſtrengthening the external coat of the eye. To this end he directs the eye to be cleared of the morbid *mucus*, by injecting into it by a ſyringe, a gentle aſtringent collyrium; in particular he prefers the aq. cupri vitriolati camphorata, diluted with common water, in the proportion of a dram, leſs or more, to two ounces. This practice he uſes in all the ſtages of the diſeaſe. As the matter increaſes, the collyrium may be uſed more frequently, and gradually increaſed in its ſtrength: in a ſlight caſe it may be uſed two or three times a day, but in the more malignant ones it may be repeated every hour, and the ſtypticity of the collyrium may be increaſed in proportion; as the diſorder gives way, the ſtrength of the medicine, and the frequency of uſing it, may both be decreaſed. To abate the ſwelling of the eye-lids, Mr. Ware prefers a cataplaſm of the coagulum aluminoſ. & tingt. flor. ſamb. an. p. æq. this ſhould be applied cold. When the eye-lids adhere ſtrongly, they will be beſt ſeparated by waſhing their edges with freſh butter diſſolved in warm milk. If the inſide of the eye lids turn outward, only when the child cries, and returns as ſoon as it ceaſes ſo to do, nothing more need be done than what is already recommended, but if this ſymptom is conſtant, it will require a more frequent repetition of the injection, and to employ a perſon immediately after the uſe of it, to return the lids, and to keep a compreſs dipped in the diluted aq. camph. conſtantly upon them with his finger, in order that the habit may be removed, and the eye-lids may recover their proper tone and ſtrength. When the inſide of the eyelid is much inflamed, the tinct. opii may be dropped on them with advantage every day; and when the quantity of *mucus* is ſo diminiſhed as that the tincture may come in contact with the eye, it may be applied there alſo once a day. If there is reaſon to ſuſpect any particular humour in the habit, give ſuch alteratives as their nature may appear to require.

Mr. Ware gives an inſtance of a caſe in which blood inſtead of *mucus* was diſcharged, and which gave way to the ſame treatment as is here recommended; on account of which, with many other important particulars, his publication deſerves the attention of every practitioner.

See Ware's Remarks on the *Ophthalmy*, &c. A Treatiſe on the Eye and its Diſorders, by Joſeph Warner, edit. 2. Dr. Wallis's Noſologia Oculorum.

OPHTHALMIA SICCA, & TARSI. See XEROPHTHALMIA.

OPHTHALMICI EXTERNI. See MOTORES OCULORUM EXTERNI.

OPHTHALMICUS WILLISII. The *ophthalmic* branch of the fifth pair of nerves. This is the firſt branch of the fifth pair of nerves, which runs through the foramen lacerum to the orbit, having from its paſſage thither a connexion with the ſixth pair. It is afterwards diſtributed to the ball of the eye, with the third; to the noſe along with the olfactory, which the branch of the fifth that paſſes through the foramen orbitarium internum joins. This *ophthalmic* branch likewiſe ſupplies the parts at the internal canthus of the orbit; the glandula lachrymalis, fat, membranes, muſcles, and teguments of the eye-lids; its fartheſt extended branch paſſing through the foramen ſuperciliare of the os frontis, to be diſtributed to the forehead. See TRIGEMINI.

OPHTHALMITIS. See OPHTHALMIA.

OPHTHALMOPONIA. An intenſe pain in the eye, whence the light is intolerable.

OPHTHALMOXYSIS. A bruſhing of the eye.

OPHTHALMORRHAGIA. Bleeding from the eye or the eye-lid.

OPHTHALMOXYSTRUM. A BRUSH FOR THE EYE; it was formerly made of the beards from barley or rye. It was ſo drawn acroſs the inſide of the eye-lids, to make them bleed. It is alſo called *blepharoxyſis*.

OPIATA. Properly medicines in which are opium; ſee alſo ELECTARIUM.

OPII. TINCTURA CAMPHORATA. See PAREGORICUM ELIXIR.

OPISTHOTONOS, from ὀπισθω, *backward*, and τονος, from τεινω, *to ſtretch*. See TETANUS.

OPIUM, } Probably from ὀπος, *juice*, called by the
OPION. } Arabians AFFION, AFIUN; *anfian*, alſo named *manus Dei*. This name ſeems to be by way of eminence, as by cort. is underſtood the cortex Peruv. Galen is the firſt among the Greeks who uſed the word to expreſs this drug. *Opium* is the milky juice which exudes from the heads of poppies when inciſions are made in them; this juice is gradually dried in the ſun, to a proper conſiſtence. The ſpecies of poppy, is the PAPAVER SOMNIFERUM, or PAPAVER *calycibus capſuliſque glabris foliis amplexicaulibus inciſis*, CLASS POLYANDRIA; ORD. MONOGYNIA. LINN. Gen. Plant. 648. It is brought from Turkey, Egypt, the Eaſt Indies, and other parts of Aſia. Neumann ſays, that the *opium* we receive from all the juſt named places, is obtained by the preſſing the juice from the heads of the poppies.

Opium is brought into Europe in flat cakes, or irregular maſſes, from four to ſixteen ounces in weight; covered with leaves to prevent their ſticking together. It is a gummy reſinous ſubſtance, ſoftiſh, and tenacious, eſpecially when warm or much handled; of a dark reddiſh brown colour in the maſs, and yellow when reduced to powder. It hath a faint diſagreeable ſmell, and a bitter taſte. If chewed a little it affects the tongue with a ſenſe of heat, which ſpreads to the palate, and then in a leſs degree to the lips, and provokes a diſcharge of ſaliva. It heats the noſe, and ſo irritates it as to excite a ſneezing.

Chooſe that in which, when ſliced, no viſible impurities are lodged; when broken, appears brightiſh, of a dark red, blackiſh colour; that is dry, not unctuous, but moderately ponderous and compact; that is inflammable, of an acrid bitter taſte, a faint ſmell reſembling that of unripe poppy heads, and without any empyreumatic flavour; and that communicates to water, not yellow, but a reddiſh tincture.

Hippocrates ſeems not to have been a ſtranger to its narcotic quality. The ancients rarely uſed it. Sylvius de la Boe firſt brought it into vogue. Sydenham firſt uſed it in the ſmall-pox; but now it obtains very extenſively in practice.

Bellonius obſerves, that it is ſo adulterated, that ſometimes a pound does but contain about four ounces that is pure genuine *opium*; but ſuch faulty ſorts are not brought amongſt us. Sand is added to increaſe its weight, and many foreign bodies are found mixed with it; but that the juices of other plants are added, does not appear clear. However it is ordered to be purified in the following manner—OPIUM PURIFICATUM, PURIFIED OPIUM. Take of *opium*, cut into ſmall pieces, one pound; proof ſpirit of wine, twelve pints; digeſt the *opium* with a gentle heat, ſtirring now and then till it is diſſolved, and filter through paper. Diſtil the tincture ſo prepared to a proper thickneſs. Purified opium ſhould be kept under two forms; one ſoft, proper for forming into pills, the other hard, which may be reduced into powder. Pharm. Lond. 1718.

The particular matter in which its virtues depend hath not yet been produced in a ſeparate ſtate, nor is it known: but whatever it is, it may by art be acuated, concentrated, obtunded, and deſtroyed. The principles ſeparable from *opium*, are, a reſin, which Neumann ſays is of two kinds, viz. a hard and a ſoft one. Mr. Awſiter ſeems to call this ſoft reſin, its thick eſſential oil; they both agree that this ſoft reſin, or thick oil, chiefly contains the active matter of *opium*, that is, its narcotic quality, though the other parts are ſtill mildly anodyne after the ſeparation of the ſoft reſin. Beſides this reſin, there is a gummy part, a ſaline one, which Dr. Alſton ſays is of the nature of ſal ammoniac, and an earth. In diſtillation with rectified ſpirit, little or nothing riſes from the *opium*, but with water its particular ſmell is brought over. The moſt active parts of *opium* are ſo fixed, that it keeps many years without any ſenſible loſs; a dram of *opium* was kept in the heat of boiling water during five hours, and it ſcarce loſt a grain and a half thereby. It diſſolved but partially in rectified ſpirit of wine, or in water; but

in

in proof ſpirit, wine, or vinegar, diſſolves all that is good, the impurities only being left. Dr. Alſton ſays, that twelve parts of *opium* contain five parts of gum, four of reſin, and three of earthy, with other indiſſoluble impurities. The gum is a mild anodyne, but free from the narcotic and other diſagreeable qualities of the crude *opium*. The reſin is almoſt taſteleſs, but hath a very muſty ſmell.

Opium enters into ſeveral of the compoſitions of the ſhop; as in confectio opiata;—pulv. e creta comp. c. opio;—pulvis ipecac. compoſitus; and alſo forms the principal ingredient in many others, viz.

PILULÆ EX OPIO. *Opium Pills*, made in the following manner:

Take of hard purified *opium*, by weight, two drams; extract of liquorice, by weight, one ounce. Beat them until they are perfectly united.

PILULÆ OPII CAMPHORATÆ.

℞ Opii purificat. ʒ j. camphoræ ʒ ij. ſyrup. ſimp. q. ſ. fiant pil. 60. Doſis, una vel duæ.

PILULÆ OPII COMPOSITÆ.

℞ Opii purificati, camphoræ ää ʒ j. antimonii tartariſati gr. xv. ſyrupi ſimplicis q. ſ. ut fiant pilulæ 60. Doſis, una vel ſubinde duæ.

VINUM OPII. *Olim Laudanum liquidum. Tinctura Thebaica.*

℞ Opii purificati ℥ ij. cinnamomi, caryophillorum ää ʒ j. vini alb. ℔ j. digere per hebdomadam ſine calore.

VINUM ANTIMONII OPIATUM.

℞ Vini antimonii ʒ vj. tinct. opii ʒ ij. miſce. Doſis, guttæ decem, quartis vel ſextis horis ſumend.

PULVIS OPIATUS. *Opiate Powder.*

Take of hard purified *opium*, one dram; burnt or prepared hartſhorn, nine drams. Mix them. Pharm. Lond. 1788.

TINCTURA OPII. *Tincture of Opium*

Take hard purified *opium*, ten drams; proof ſpirit of wine, one pint. Digeſt for ten days, and ſtrain. Pharm. Lond. 1788.

EMPLASTRUM OPIATUM.

℞ Emplaſtri lithargyri ℔ iij. ſ. picis aridæ ℥ ij. ſ. ceræ flavæ ℔ ſ. opii ℥ iv. m. ſec. artem.

ENEMA OLEI CUM OPIO. ENEMA OPIATUM. See ENEMA.

OPIATUM CAUSTICUM. See CAUSTICUM OPIATUM.

OPIATA INJECTIO. See INJECTIO.

The medical properties of *opium* are both numerous and valuable; even ſo that ſome have denominated it *manus Dei*. Its operation is generally accompanied with a ſlow but ſtrong and full pulſe, a ſlight redneſs, heat, and itching in the ſkin; it is followed by a weak and languid pulſe, low ſpirits, ſome difficulty in breathing, or a ſenſe of tightneſs about the breaſt, a ſlight giddineſs of the head, dryneſs of the mouth and fauces, ſome degree of naufea, heat, and pain in the ſtomach; but theſe ſymptoms are to be underſtood of a full doſe when no particular diſeaſe requires it; for very large doſes are taken in violent diſorders, and no diſagreeable effects are obſerved to follow. In moſt continued fevers of this climate, there is more or leſs of inflammatory diatheſis; and, ſo long as this continues, the ſymptoms would be encreaſed, and, conſequently the danger by the adminiſtration of opium; and, indeed, *in the more advanced ſtage*, whenever topical inflammation of the brain exiſts, and produces delirium, as is ſometimes the caſe, though other nervous or putrid ſymptoms may be prevalent, opium ſhould never be had recourſe to; but when irritation of the brain is not of the inflammatory kind, and debility has made much progreſs, or where delirium is accompanied with ſpaſmodic affections, it then becomes an efficacious remedy, and may be employed in large doſes every eight hours, unleſs a remiſſion of the ſymptoms and ſleep takes place.

In order to ſtop the recurrence of *febrile paroxyſms of intermittent fevers*, opium has been recommended to be given before the fit; and alſo, in the cold ſtage, in the hot ſtage, and during the interval, with the happieſt ſucceſs, without leaving thoſe viſceral obſtructions attributed to bark; but the union of the two medicines is conſidered as the beſt practice. *In ſome caſes of jaundice* it has been uſeful; alſo, *in acute rheumatiſm*, joined with diaphoretics,—*ſmall-pox* after the completion of the eruption,—or indeed before where the pulſe is languid, the countenance pale, attended with reſtleſſneſs, and other ſymptoms of irritability, joined with camphor and vinum antimonii, taking care to keep the body in a ſoluble ſtate. In hæmorrhages, dyſenteries, diarrhœas, colic, heartburn, and a variety of other complaints, where ſpaſmodic affections have been the attendant ſymptoms, unattended with *active* inflammation, and proper evacuations having preceded. Indeed, if we conſider the reſult of the action of opium, conſidered only as a *narcotic* or *ſedative*, we ſhall not be at a loſs to diſcriminate all thoſe caſes where it may be given with ſafety and efficacy, and where it ought to be prohibited.

Perhaps all the effects produced by *opium* depends on its power in diminiſhing the mobility, and in a certain manner ſuſpending the motion of the nervous fluids. In proper doſes, and repeated at due intervals, it is narcotic, anodyne, antiſpaſmodic;—it diſcuſſes ſtagnating fluids, whether externally applied, or internally adminiſtered;—it removes obſtructions ariſing from ſpaſms;—abates preternatural irritability, and removes convulſions which ariſe therefrom;—it promotes the diſcharges through the ſkin, but retards all other evacuations;—abates all kinds of pains, and totally removes ſome;—as a carminative it exceeds all of the aromatic tribe, for its efficacy extends through the whole inteſtinal canal.

One grain of pure *opium* is generally a full doſe; three grains can hardly ever be taken by an healthy man who is not accuſtomed to it; but, by habit, an ounce in a day may be taken. Garcias ſays he knew a perſon who took ten drams a day. In Turkey, at this day, ſober people take a dram, and drunken ones take five or ſix, when violent pains, or other ſymptoms require it. Sydenham obſerves, the doſe and its repetition may be proportioned to the urgency of the ſymptoms. Frequent experience manifeſts the propriety of large doſes; in ſpaſmodic complaints twenty-two grains of pure *opium*, beſides three hundred drops of laudanum, have been given in the ſpace of thirty-ſix hours; and afterwards no remarkable inconveniences were obſerved. However, different conſtitutions require different doſes to produce the deſired effect; therefore, practitioners ſhould be careful in diſcovering the preciſe doſe, agreeable to the conſtitution of the patient, by beginning with ſmall portions, and gradually encreaſing them till the end is obtained.

When imprudent doſes have been taken through miſtake, or with an ill deſign, there follows immoderate mirth, or elſe ſtupidity, giddineſs, a redneſs of the face, ſwelling of the lips, troubleſome dreams, ſtarting, convulſions, cold ſweats, a conſiderable dilatation of the pupil, imperfect ſpeech, ſlow full pulſe, quick breathing, naufea, itching in the ſkin, vomiting, madneſs, hiccough, fainting, &c. Immediately on the happening of ſuch an accident, give a vomit of vitriolated zinc, purified, and repeat it four, five, or ſix times; if the conſtitution is vigorous, bleed; and after this give frequently a ſpoonful of ſharp vinegar; beſides theſe, ſinapiſms may be applied to the feet, bliſters to the arms, clyſters of tobacco ſmoak may be given, frictions may be uſed, as the caſe ſeems to require. Vinegar is the antidote, yet cordials ſhould ſometimes accompany it.—When *opium* is given in a ſolid form, the pure *opium*, or the pills above mentioned, will be the beſt; when a liquid form is required, ſolutions in wine, or proof ſpirit, are to be preferred.

Alkaline ſalts diminiſh the ſoporific effect of *opium*;—the fixed alkaline ſalts render it diuretic;—the volatile carries it through the ſkin; and acids almoſt entirely deſtroy its powers. See Kæmpfer's Amænitates Exoticæ. Wedelius's Opiologia. Lewis's Mat. Med. Mead on Poiſons. Newmann's Chem. Works. Dr. Alſton's Diſſ. on *Opium* in the Edinb. Med. Eſſays, vol. v. Med. Muſ. vol, i. p. 473, &c. Jones's Myſtery of *Opium*. Cullen's Mat. Medica.

OPOBALSAMUM. BALSAM of GILEAD. See BALSAMUM.

OPOCALPASON, *Opocarpaſon, or Opocarphaſon*. See CARPASUS.

OPODELDOC. The name of a plaſter ſaid to be invented by Mindererus; it is often mentioned by Paracelſus.

celſus. Its preſent compoſition, ſee under LINIMENTUM SAPONACEUM. There is a compoſition ſold under the name of STEER's OPODELDOC, and is conſidered a powerful remedy for ſtrains, bruiſes, and ſuch other complaints wherein the linimentum ſaponaceum is allowed to be ſerviceable, and made in the following manner: ℞ Solution. ſaponis cum camph. aq. ammon. acet. āā ℥ j. aq. ammon. puræ ʒ ſs. m.

OPODEOCELE. A rupture through the foramen iſchii, and into the labia pudenda.

OPOPONAX. The plant from whence the gum THUS is produced, is known by the names of opoponacum, *panax heracleum*, *panax coſtinum*, *panax paſtinaceo. kyna*. HERCULES's ALL-HEAL, and OPOPONAX-WORT. It is the PASTINACA OPOPONAX, *foliis pinnatis; foliolis baſi antica exciſis*. CLASS PENTANDRIA, ORD. DIGYNIA. LINN. Gen. Plant. 362. See PASTINACA OLUSATRA.

The medicine kept under the name of *opoponax*, is a gummy reſinous juice, obtained from the roots of the *opoponax-wort*, which grows wild in warm countries, and bears the cold of our own. This gum is brought from Turkey and the Eaſt Indies, ſometimes in little round drops, but generally in irregular lumps, of a reddiſh yellow colour on the outſide, with ſpecks of white, internally of a paler colour, and often variegated with large white pieces; they have a diſagreeable ſmell, and a bitter acrid naueſous taſte; they diſſolve in water, and in ſpirit. As a medicine, this gummy reſin is ſometimes uſed as an attenuant and deobſtruent; in large doſes it is laxative: doſes from ℈ ii to ʒ i. are given with the ſame intentions as the galbanum and ammoniacum are uſed. This is the leaſt diſagreeable of the fetid gums, and therefore of the leaſt virtue, and retained in practice merely to afford a neceſſary variety. See Raii Hiſt. Lewis's Mat. Med. Neuman's Chem. Works. Cullen's Mat. Med.

OPPILATIO, from *oppilo*, of *pilo, to condenſe*. See OBSTRUCTIO.

OPPRESSIO. See CATALEPSIS.

OPTICUS NERVUS, from ὀπτομαι, *to ſee*. The OPTIC NERVE. This nerve, with its fellow, are the ſecond pair which proceed from the brain, where they are united, but ſoon become two diſtinct cords, each paſſing through the foramen opticum of the ſphenoid bone, to their reſpective orbits. They unite on the anterior part of the glandula pituitaria, but ſoon ſeparate again, and paſs to the poſterior of the eye, into which they are inſerted obliquely towards the noſe. The *optic nerves* are each ſurrounded by the four recti muſcles of each eye.

OPUNTIA. It is a ſhrub or tree, whoſe flowers expand like a caſe, having each a great number of ſtamina in the centre, growing upon the tops of the ovary. The ovary afterwards becomes a fleſhy umbilicated fruit, with a ſoft pulp, incloſing many ſeeds of an angular ſhape. Boerhaave mentions eleven ſpecies. They are chiefly noted for the cochineal which is gathered from them. See COCCINILLA.

OPUNTIOIDES. It is a marine plant, ſhaped like the opuntia. It is brittle and hard. Boerhaave takes notice of two ſpecies, and reckons them among vermifuge medicines.

ORANGIA. See AURANT HISP.

ORBICULANS LABIORIS. See LABIA.

ORBICULARE OS; called alſo *lenticulare*. See AURIS.

ORBICULARES PALPEBRARUM Muſc. *Conſtrictor palpebrarum*. The orbilar muſcles of the eye-lids. They lie under the ſkin about the eye-lids; they riſe from the ſide of the noſe; thoſe fibres which run on the eye-lids are elliptical, and terminate at each canthus. Theſe *muſcles* ſhut the eye-lids.

ORBICULARIS. See SPHINCTER ANI and LYCOPERDON VULG.

ORBICULARIS CLAUSOR. The orbicular muſcle of the eye-lid.

—— LABIORUM. See SPHINCTER LABIORUM.

ORBITA. The ORBIT of the EYE, or circular cavity in which the eye is placed; called by Hippocr tes *cyclos*.

ORBITALES ARTERIÆ. The arteries of the orbits of the eyes. They are branches of the inferior maxillary arteries. See MAXILLARIS ARTERIA.

ORBITARE EXTERNUM FORAMEN. It is in the os maxillare, below the orbit. Through it the nerves and veſſels which come from the teeth paſs to the cheek.

ORBITARE INTERNUM FORAMEN. It is a little above the os planum; through it goes a branch of the fifth pair of nerves to the noſe.

ORBITARII NERVI. See MOTORES OCULORUM EXTERNI.

ORBITARIUS PROCESSUS. See MAXILLARIA SUPERIORA OSSA, FRONTIS OS, and SPHENOIDES OS.

ORCHEA. See SCROTUM.

ORCHIS. A TESTICLE; alſo the name of a plant with a teſticulated root; of which Boerhaave enumerates fourteen ſpecies; and Dale adds five more.

The chief of theſe are the following ſpecies; *orchis*, alſo called *ſatyrion*; *cynoſorchis*; *teſticulus caninus*; *serapias* It is the ORCHIS MASCULA, or ORCHIS *foliis ſeſſilibus maculatis, bulbis indiviſis nectarii labio quadrilobo crenulato, cornu obtuſo, petalis dorſalibus reflexis, flore purpureo*. CLASS GYNANDRIA, ORD. DIANDRIA. LINN. Gen. Plant. 1009. MALE ORCHIES;—SATYRION;—DOGS' STONES;—FOOLS' STONES.

This plant hath ſix or ſeven long, narrow, ſmooth leaves, variegated with dark-coloured ſpots or ſtreaks, iſſuing from the root, and one or two embracing the ſtalk, which is ſingle, roundiſh, and ſtriated. On its top appears a long looſe ſpike of irregular, naked, purpliſh-red flowers, conſiſting each of ſix petala, one of which is large, cut into three ſections, hanging downward; the other ſmaller, forming a kind of hood above it, with a tail behind. The root conſiſts of two roundiſh, whitiſh tubercles, about the ſize of nutmegs; one plump and juicy, the other fungous and ſomewhat ſhrivelled, with a few large fibres at the top. It is perennial, grows wild in ſhady grounds and moiſt meadows, and flowers in May or ſooner.

The plump roots or bulbs are the only parts uſed in medicine; they have a faint ſmell, and ſweetiſh viſcid taſte. The propereſt time for gathering them is when the ſeed is formed, and the ſtalk ready to fall; becauſe the new bulb, of which the ſalep is made, is then arrived to its full maturity, and may be diſtinguiſhed from the old one by a white bud riſing from the top of it, which is the germ of the orchis of the ſucceeding year. Their properties are ſimilar in general to thoſe of the rad. althææ. The dried roots are brought from Turkey, under the name of *ſalep*, and *ſaleb*, formed from the root of the *orchis morio/bul*. Mr. Mault, in the Philoſophical Tranſactions, ſays it may be formed from ſeveral other ſpecies of the ſame genus, but thoſe of our own growth are as good. Thoſe that are brought from Turkey are in oval pieces, of a yellowiſh white colour, clear and pellucid, very hard and horny, of little or no ſmell, taſting like gum tragacanth. Our *orchis* roots, when robbed of their ſkin by boiling in water, and then dried in the air, gain exactly the ſame appearance. Reduced to powder, and diſſolved by boiling in water, a mucilage is formed, which is of a very nouriſhing quality; more ſo than any other known vegetable, though Dr. Cullen thinks, as a nutritious root, it has been greatly over-rated. Sometimes it occaſions coſtiveneſs, but this is remedied by a little of any vegetable acid mixed with it, or a little ſea-ſalt. *Half an ounce of the powder is ſufficient for a gallon of thick mucilage*. The powder ſhould be ſprinkled with a little boiling water, then ſtirred well into it, and afterwards mixed with the water in which it is to be boiled. If this powder is kept dry, it never ſpoils, ſo would be an excellent part of ſeamen's diet, particularly when they are in warm countries. A dram and a half of ſalt in a pint of portable ſalep, is not diſagreeable, whence, when freſh water fails at ſea, this powder would be an excellent expedient for leſſening that inconvenience. *As a diet*, it far exceeds rice in every point of view; and for children particularly it is peculiarly proper. This powder, and the dried gelatinous part of fleſh, or portable ſoup, diſſolved in boiling water, form a rich thick jelly capable of ſupporting life for a conſiderable time. One ounce of each of theſe articles, with two quarts of boiling water, will be ſufficient ſubſiſtence for one man a day.—AS A MEDICINE, the ſalep is mucilaginous, demulcent, obtunds the *acrimony of the ſea-ſcurvy*;—in *diarrhœas* and *dyſenteries* it is of ſingular efficacy by lubricating the bowels, and correcting putrefaction.—*In ſymptomatic fevers*, from the abſorption of pus, a plentiful uſe of ſalep is very demulcent.—In the *ſtrangury* and *dyſury* it is of ſervice by its mucilage. See Lewis's Mat. Med. Percival's Eſſays, Med. and Exper. Georgical Eſſays, vol. iv. Cullen's Mat. Medica.

ORCHIS

ORCHIS BIFOLIA. See BIFOLIUM. Dr. Cullen says he has seen the salep made from this as pure and as perfect as any that comes from Turkey. Mat. Medica.

ORCHOS. See OCULUS.

ORCHOTOMIA, from ὄρχις, *testicle*, and τέμνω, *to cut*. See CASTRATIO.

ORDO. ORDER. In medicine it is the second division under which nosologists arrange particular diseases. Which orders depend upon certain classes, viz. CLASSIS, Class, PYREXIÆ, febrile disorders. ORDO, Order. 1. FEBRES, idiopathic fevers. 2. PHLEGMASIÆ, inflammatory complaints. 3. EXANTHEMATA, eruptive fevers. 4. HÆMORRHAGIÆ, hemorrhages. 5. PROFLUVIA, evacuations, or defluxions. Now all these orders, though different in their appearances, participate of febrile affections, consequently come properly under the class specified. See CULLEN's Synopsis Nosologiæ Methodicæ.

OREILLONS. See CYNANCHE PAROTIDÆA.

ORELLANA. See ORLEANA.

OREOSELINUM. The GALBANUM PLANT. Boerhaave mentions three species, but the two following are those which afford the gum galbanum.

OREOSELINUM *Africanum galbaniferum fruteſcens, anisi folio.*

OREOSELINUM *aniſoides arboreſcens ligustici foliis & facie, flore luteo, Capitis Bonæ Spei.* It is also a name for *petroselinum montanum*; *apium montanum nigrum*; *oreoselinum apii folio minus*. MOUNTAIN-PARSLEY.

Of this and the two following species, the roots are slenderer than those of the daucus, and not lactescent; the leaves are like those of the apium or cicuta; the seeds are oval, flat, large, striated, marginated, and sometimes cast off their husks.

The *mountain-parsley* grows on the mountainous parts of Germany and other countries. It heats and is diuretic.

—— PRATENSE CICUTÆ FOLIO, also called *daucus Alsaticus*; *angelica pratensis apii folio.*

—— APII FOLIO MAJUS, also called *libanotis nigra*; *gentiana nigra*; *daucus montanus*; *cervaria nigra*; *daucus selinoides major*; *laserpitium minus paludapii folio semine crispato*; MOUNTAIN-DAUKE; or BLACK HERO-FRANKINCENSE.

It grows on mountains in Italy, and flowers in July. The seeds are opening, inciding, diuretic, and emmenagogue.

ORESTION. In Dioscorides it is the helenium. See Raii Hist.

ORGANE CELLULAIRE. See CELLUL. MEMB.

ORGASMUS, from ὀργάω, *turgeo*, I swell. SUDDEN VEHEMENCE. Its proper signification is a strong desire or impulse for coition, when the turgid semen solicits as it were its own excretion. When some female animals *are*, what is styled, *in heat*, gives us the original idea of the term. But HIPPOCRATES and some of his followers transferred this to the excrementitious, superfluous, and preternatural humors, which from thence being agitated, on fermenting in the body, solicit their own discharge. Hence a depraved motion of the humors, or an impulse from excretory stimulus, is called ORGASM. LINNÆUS calls it a subsultus of the arteries. QUINCY considers it as an impetuous and too quick motion of the blood or spirits; whereby the muscles are distended with an uncommon force.

ORICIA. A sort of turpentine-tree, so called from Oricus, a city of Epirus, near which it grows.

ORICOLA. See AURICULA URSI.

ORIENTALIA FOLIA. See SENNA ALEX.

ORIENTALE GUMMI. See GUM. SENEGAL.

ORIGANUM. WILD MARJORAM; called *Marjorana mancarana*; *Origanum* vulgare, Linn. It has been called *Heracleoticum* from Heraclea, where the best was said to be produced, also *Zazarhendi herba*. Boerhaave enumerates eleven species, but the two following are the chief that are in use.

ORIGANUM ANGLICUM, ὀρίγανον, *montis gaudium, quod locis montanis delectatur*, called also *orig. vulgare spontaneum*; *majorana sylvestris*; *acapnon*; *sampsuchum*; *agriorganum*; *onitis major*; *majorana oleracea*;—COMMON WILD MARJORAM. ORIGANUM VULGARE, spicis subrotundis paniculatis conglomeratis, bracteis calyce longioribus ovatis. CLASS. DIDYNAMIA, ORDO GYMNOSPERMIA. LINN. Gen. Plant. 726.

It is a plant with firm round stalks, and oval acuminated leaves, that are uncut, and somewhat hairy. It is set in pairs on short pedicles; on the tops grow scaly heads of pale-red labiated flowers, whose upper lips are entire, and the lower cut into three segments, set in form of a convex umbel, intermixed with roundish purplish leaves; each flower is followed by four minute seeds inclosed in the cup. It is perennial, grows wild on dry chalky hills and gravelly grounds in several parts of England, and flowers in June.

The leaves and flowery tops have an agreeable aromatic smell, and a pungent taste, warmer than that of the garden-*marjoram*, and much resembling thyme, with which they agree in medicinal virtue, as also with *marjoram*: infusions of them are drank as tea in weakness of the stomach, disorders of the breast, to promote perspiration and the fluid secretions in general; they are used in nervine and anti-rheumatic baths; the dry leaves powdered are a good errhine. For internal use, an infusion of half an ounce of the leaves in a pint of water is the best preparation. In distillation with water they yield a moderate quantity of a very acrid penetrating essential oil, smelling strongly of the *origanum*, but less agreeable than the herb; this oil is called OIL OF THYME, and is often put into hollow teeth to allay the pain of them. See Lewis's Mat. Med. Neumann's Chem. Works.

—— CRETICUM. See DICTAMNUS CRETICUS.

ORIGANUM MAJORANA, seu FOLIIS OVATIS. See MAJORANA MAJORI FOLIO.

ORIS ULCERA SERPENTIA. See APHTHÆ.

ORLEANA, called also *arbor Mexicana*; *orellana*; the ARNOTTO-TREE.

The *arnotto-tree* is the BIXA ORELLANA of Linnæus. Dr. Brown, in his History of Jamaica, gives the following account of it.

BIXA *foliis cordatis cum acumine, floribus racemosis terminalibus.* The ROUCOU or *arnotto-tree*. This curious shrub is frequently met with in the cooler vales in Jamaica; it rises commonly to the height of eight or nine feet or more; it thrives best in a cool rich soil, and shoots most luxuriantly near springs and rivulets. All the seeds of this plant are covered with a kind of wax, which is carefully gathered in many parts of America, and is what generally goes by the name of *terra orellana*, *roucou*, and *arnotto*. This commodity is manufactured in the following manner, viz. when the seed-vessels are full grown, and in a perfect state of maturity, they are picked off and opened, and the seeds gathered and put into convenient jars. When they have a quantity of these, proportioned to their vessels and design, they throw in as much hot water as may be sufficient to dilute and suspend the wax or pulp, with ease, which is gradually washed away from the seeds, both with the hand and the spatula. When all the wax is washed of, and the seeds appear quite naked, they are taken out, and the wash left to settle: but when the wax is thoroughly subsided, the clear incumbent waters are decanted off, and the sediment put into shallow vessels to be dried gradually in the shade. When this mass acquires a due consistence, it is made into balls or cakes, and left to dry in some open airy place, until it grows firm and hard, and then it is fit for use, or the market.—The wax is a cool agreeable rich cordial, and hath been long in use amongst the Indians and Spaniards in America, who still mix it with their chocolate, both to heighten the flavour, and raise the colour. It is said to be a successful remedy against the bloody-flux. It is used as a pigment. It is often mixed with other ingredients both by painters and dyers. The roots have much the same properties as the wax, but the roots are somewhat more diuretic.

This American shrub is retained in hot-houses in Great Britain. It is propagated by seeds from America; sown in pots in spring, and plunged in a bark bed; the plants are to be transplanted into separate pots, and always retained in the stoves.

Father Labat says, that the Indians prepare an *arnotto* of a bright shining red colour, almost equal to carmine.

The *arnotto* is difficultly dissolved in water, which it tinges of a pale brownish yellow colour. It readily dissolves in spirit of wine rectified, to which it gives an orange-red colour, and is used in varnishes, to give an orange hue to the simple yellows. Alkaline salt renders it soluble in boiling water, without altering its colour. There is a sort of Orleana, called ACHOTL, which see.

ORNITHOGALLUM. Boerhaave enumerates eleven species; the following is that which is generally used. ORNITHOGALUM *umbellatum medium angustifolium*; called also *ornithogalare*. The STAR OF BETHLEHEM. It is cultivated in gardens; it flowers in May; the root is bulbous or tuberous, and is sometimes used as a

wholesome nutrient: indeed the roots of all the species possess the same properties, See Raii Hist. It is also a name for *squills*. See Scilla.

ORNITHOGLOSSUM. Bird's-tongue. So the seeds of the common ash-tree are called from their shape.

ORNITHOPODIUM. Bird's-foot. There is another species called *telephium chironium*; *scorpioides*; scorpion-wort. They grow on sandy and gravelly places; and flower in summer. Their seeds are said to destroy the stone in the kidneys; but are very rarely used. Boerhaave mentions four more species, but they are not noted as medicinal. See Raii Hist.

ORNUS. See Fraxinus ornus. It is also a name for the *sorbus aucuparia*. See Sorbus Sylvestris.

OROBANCHE. See Hypocistis.

OROBUS, also called *astragalus*; *astragaloides*: *astragalo*; *chamæbalano*; wood-pease; heath-pease. It grows in woody places; flowers in April; ripens its seeds in May; the tubera of the root taste like liquorice, and in Scotland are used as liquorice is with us. They call the plant *karemyle*. See Raii Hist.

OROBUS, OROBRYCHIS PEREGRINA. } See Ervum.

ORPIMENT, ORPIN. } See Auripigmentum.

ORRIS. See Iris vulgaris.

ORTHOCOLON, from ὀρθος, *strait*, and κωλον, *a limb*. See Anchylosis.

ORTHOPNŒA. This disease, when neither a species of asthma nor of dyspnœa, is only a symptom of some other disease. It is a sighing suffocating respiration, and the patient must be erect to breathe; of this there are many species, viz.

Orthopnœa Spasmodica, — Hysteria. } These are varieties of the Asthma spontaneum. See Asthma.

— a lipomate, i. e. Dyspnœa sicca.
— ab hydropneumonia. i e. Dyspnœa aquosa.
— pinguedinosa, i. e. Dyspnœa pinguedinosa.
— traumatica, i. e. Dyspnœa thoracica.
} See Dyspnœa.

— a vaporibus.
— a deglutitis.
— a fungis.
— ab antipathia.
— a bronchocele.
} h. s. Dyspnœa extrinseca.

ORVALA. See Horminum.

ORVIETANUM. Orvietan. A celebrated antidote, so called from Orvieto, a city of Italy, where it was first used; though some say its inventor was one H. F. Orvietanus, and that it is named after him. It is an electary, made up of many ingredients mixed with honey.

ORYZA. Rice. Also called arac. It hath its grains disposed into a panicle, which are almost of an oval figure, and covered with a thick husk, like barley. Among the common kinds of grain, *rice* is the mildest. It is less viscous than wheat, but it is also less nourishing. It is used as a diet in diarrhœas, but the salep is to be preferred. The idea of its being hurtful to the eyes is without foundation. *Rice* delights in a moist soil, and grows even in water. In China they ferment the *rice*, and distil from it the liquor called *arrack*.

Oryza Germanica. A species of barley.

OS. A bone. *Bones* consist of a mucilage and an earthy matter. Acids dissolve this earthy matter, leaving the *bone* of its original shape, but soft. The earthy matter forming *bone*, is deposited by the exhaling arteries. The number of *bones* is 304.

The *bones* are composed of fibres, disposed in laminæ, which laminæ, laid over each other, compose the substance of the *bone*. In the fœtus the *bones* seem a net-work of threads, but when ossification is farther advanced, these threads are not so apparent, the interstices being filled up with others.—The bones are composed of a hard, solid, of a cellular, and of a reticular part. The cellular part is formed by the inner laminæ of the solid part, departing towards the axis of the *bone*. The reticular part lies in the cavity of the *bone*, and by degrees, as it approaches the extremities, unites, seeming partly to form the cellular part. There are no nails to join the laminæ, as some have described; they are rather connected by transverse fibres. The cavity of the *bones* serves not only to contain the marrow, but by the increase of the diameter, the strength of the *bone* is augmented.—The *bones* have numerous blood-vessels, but especially in the spongy and reticular parts, though the solid part is not without them; these vessels run according to the direction of the fibres of the *bone*; thus, in the long *bones* they run longitudinally. In the round *bones*, as in the *os* bregmatis, they run radiated, becoming less and less visible as they approach to the centre of the *bone*, because there the laminæ are the thickest.—The *bones* are full of pores for the admission of vessels; in the middle *these pores* are more large and conspicuous; in the extremities *they* are smaller. In every cylindrical *bone* there is a hole about its middle for the admission of an artery and its vein, which pass slanting through the substance of the *bone*, and branch through the internal periosteum, or membrana medullæ, which lies betwixt the medulla and the internal surface of the *bones*, and even branch externally again through the *bone*. These branches frequently anastomose, whence the *bone* may be nourished from within outwards, as well as from without inwards. *This internal periosteum* is liable to the disorders of other vascular substances, as inflammation, obstruction, suppuration, &c. with their consequences: but where these happen, the structure of the *bone* is frequently quite destroyed, as in the spina ventosa.—It is supposed that *bones* are furnished with nerves, and yet they mostly seem insensible; though the granulations from them are extremly sensible. It is probable that there are vessels sui generis, whose office is to carry *bony* matter, and occasionally to absorb it; as a proof of this, the mollities ossium, from a scorbutic, or a venereal cause, seems rather a defect of this *bony* matter, than of marrow.—The *membrana medullæ* not only lines the surface of the *bone* internally, but also divides the marrow into vesicles or membranous bags, which are furnished with very fine minute vessels.—The middle part of the larger bones is much less in diameter than the extremity, to give a greater firmness to the joint, and to allow a greater space for the fleshy belly of the muscles. The middle part of the bones is not smaller than the extremities merely by pressure, as we may observe in the fœtus; it is their original conformation, though pressure seems to have some effect in this case, as we may observe in a weakly constitution, and in women of a sedentary life.—The *bones* are entirely smooth, though in a robust habit there are cavities and furrows on their surface formed by the action of the muscles. The *bones* are, cæteris paribus, weaker in their middle part, from their diameter being less; whence in this part they are more exposed to fractures; but to compensate this, there are more lamellæ in the middle than in the extremities, and they are more compactly joined; there is a cavity also there which contains the marrow, and thus the strength in this part is greater than otherwise it would be.—Many *bones* have protuberances rising out of them, which are called *processes*; and in many there are cavities; if these are deep, with large brims, they are called cotylæ; if superficial, glenæ or glenoid; which general classes are divided into several species, of which, *pits* are small roundish channels, sunk perpendicularly in the *bone*;—*furrows* are long narrow canals, formed in the surface;—*niches* are small breaches in the *bone*;—*sinuosities* are broad but superficial depressions without brims;—*fossæ* are large deep cavities, which are not equally surrounded by high brims;—*sinuses* are large cavities within the *bones* with small openings;—*foramina*, or holes, are canals that pierce through the substance of the *bones*. The use of these cavities is to allow room for heads of *bones* to play in; to defend and lodge softer parts; and to afford a passage for vessels, muscles, &c.—The *bones* are destroyed in the living subjects, by the excess of air, or by blood lodging upon them.—The classes into which the *bones* are divided are usually as follow. 1st, The cylindrical: these are compact in the middle, and spongy in their extremities.—2dly, Spherical; these are entirely spongy, except a thin plate on the external surface.—3dly, The flat; they are compact on the outside and inside, but between the plates are spongy.—4thly, The irregular, which when thick, are like the round, and when thin, are like the flat ones.

Mr. Sheldon observes, that *bones* are composed of fibres connected by cellular substance; there are two portions in *bone*; one the living vascular or organized part; the other dead calcareous earth, which, though a dead matter treasured up in a living substance, yet does not stimulate or irritate. If bone is soaked in spirit of salt and water, it will leave nothing but vessels and membranes; it appears to be an inorganic concrete, but it is very much organized.

The

The fource of blood to the *bone*, is from the internal and external periofteum, whofe veffels copioufly anaftomofe with each other in the fubftance of the *bone*. In the flat *bones* the veffels anaftomofe in the diploe or meditullium. The arteries, veins, nerves, and abforbents, are all in like manner.—All the fpongy bones, as the fternum, vertebræ, facrum, &c. are covered with a ftrong ligamentous fubftance.—The earth of *bones* is confidered by the chemifts as the pureft; they call it VIRGIN EARTH. The whole fenfibility of the *bone* does not refide in the periofteum: *bone* becomes moft exquifitely fenfible, in the diſeaſed inflamed ſtate, owing to the veffels fwelling, and the fubftance round them being inelaftic.

See Havers on the *Bones*; Monro's Offeology; Thompfon on the *Bones*; Chefelden and Albinus's Offeography; Nefbit's and Kerckringius's Offeology; Monfieur Courtial's Obf. Anat. fur les *Os*. On the diſeaſes of the *Bones*, fee Petit.

OS. The MOUTH. Its external parts are the lips, the angles of the mouth, the border or edge of each lip; the foffula which runs from the feptum narium to the edge of the upper lip, and the tranfverfe fold which feparates the under lip from the chin. *The internal parts* are the palate, the feptum palati, the uvula, the amygdalæ, the gums, the fræna of the lips, and the tongue with its apex, root, fides, and frænum.

Os EXTERNUM. IN MIDWIFERY, the entrance into the vagina is thus called, in oppofition to the mouth of the womb, which is called the os internum.

—— INTERNUM. Called alfo *os tincæ*, and *amphideon* or *amphidæum*; Galen calls it *ofcheon*. IN MIDWIFERY, the orifice into, or mouth of the womb, is thus called, in oppofition to the entrance into the vagina, which is called the os externum. If the *os internum* is long and hard, when pains like labour come on, a clyfter and an anodyne may be given, for the pains are not labour-pains.—The os tincæ is fometimes open, a month or two before the time for labour; but it fhould be remembered that its thicknefs and foftnefs undergoes not fuch alterations, but remains the fame whether open or fhut, until labour comes on. Nor does it always point in one direction during pregnancy, nor in the beginning of labour.—If the *os internum* is rigid, fcooping is bad.—When opened by the membranes, it is foft, and then if contracted again from the difcharge of the waters, it is eafily dilated.—It fometimes is hardened and thickened by age, or by frequent labours, and then the birth, though natural, is fomewhat retarded.—The dilating the *os* externum and *internum* is performed in the following manner: having the hand well greafed, begin to dilate the external parts gradually, introducing the fingers one after the other, and moving them in a rotatory manner; when the hand is in the vagina, begin gradually to dilate the *os internum*, refting at intervals, both for your own eafe and that of the woman, who fuffers much from this practice; proceed with the more care and patience, in proportion to the rigidity of the parts. When the hand can be introduced into the uterus, let it enter with its back to the uterus, and the palm towards the membranes.

Os LEONIS. See ANTIRRHINUM.

—— TINCÆ. See Os INTERNUM.

OSCEDO. See OSCITATIO.

OSCHEOCELE, } See HYDROCELE.
OSCHEOPHYMA. }

OSCHEON. See SCROTUM and os INTERNUM.

OSCILLATORIUS MOTUS, } (from os, a mouth,
OSCILLATORY MOTION, } and cilleo, moveo.)
VIBRATION. According to Borellus, it is that power which directs and regulates the motion of the wheels of a clock, by moving backwards and forwards at equal periods—the inftrument is called *pendulum*. He alfo thinks that fuch a motion takes place in the blood by means of the inſpired air mixed with it in equal proportions, regulating and governing the motion of the ſpirits by its elaſticity.

OSCITANS. The YAWNING FEVER.

OSCITATIO, alfo *chafme*, *ofcedo*. YAWNING. Boerhaave fays, "the effect of *yawning* in the healthy is to move, accelerate, and equally diſtribute all the humours through all the veffels of the body, confequently to qualify the muſcles and organs of fenſation for their various functions." Juſt after ſleep, a perſon is moſt inclined to *yawn*, and ſtretch his limbs, becauſe a greater quantity of perſpirable matter going off by the pores at this time than at any other, whenever a perſon awakes, the increaſed contraction that then happens, cloſes much of that matter in the cutaneous paſſages, which will continually give ſuch irritations as excite *yawning* and ſtretching; and ſuch motions, by ſhaking the membranes of the whole body, and ſhifting the contacts of their fibres, upon the incloſed matter, by degrees throw it off. Hence we ſee the reaſon why healthful ſtrong people are moſt inclined to ſuch motions; they perſpire moſt in time of ſleep, and, therefore have more of the perſpirable matter to lodge in the pores, and hence great irritations to promote that purpoſe. The advantages of ſome little exerciſe juſt after waking in a morning are conſiderable, as it throws off all the perſpirable matter that is ready for its exit out of the body.

When *yawning is troubleſome, Hippocrates ſays, that long deep reſpiration, or drawing in the air at long intervals, cures it*.

OSCULATORIUS MUSCULUS. See SPHINCTER LABIORUM.

OSMUNDA VULGARIS —— PALUSTRIS, —— and REGALIS. See FILIX FLORIDA.

—— OSSA BATUS. See BOROZAIL.

OSSA E CORDE CERVI. The BONE of a STAG'S HEART. It is flat, oblong, and without ſmell or taſte. It is formed by the oſſification of the arteries.

OSSERVAZIONI. See CYNANCHE PAROTIDÆA.

OSSICULUM. IN BOTANY, it is the ſhell, or hard covering of ſeeds, like bony lamella.

OSSIFICATIO. OSSIFICATION. Dr. Neſbit ſays, that in the blood, or a fluid ſecreted from it, there is an *oſſifying* juice, conſiſting of particles that are not apparent; that whenever nature deſigns an *oſſification* between membranes, or within a cartilage, ſhe occaſions a more than uſual afflux of this fluid, which ſo diſtends the veſſels that were before inviſible, as to make them capable of receiving the red globules of blood, which are always to be ſeen near the place where *oſſification* is begun. In this blood, gritty bony particles are to be felt by the point of a knife, which have been formed by the attraction and coheſion of the particles of the *oſſifying* juice obſtructed, along with the other groſſer fluids in the beginning of the veſſels prepared to receive the refluent juices. The blood being capable of forming fine membranes, the membranous parts of a bone, which act as a gluten to keep theſe particles and fibres together, if there be any ſuch that do not ariſe from the coats of its veſſels, are produced by a coheſion round the cretaceous particles of a part of the fluid, in which they were generated and contained. Thus the membranes of cartilages ſerve as a bed, between or within which the bony particles are depoſited, or ſhoot; but without any intermixture of the particles of the bone and cartilage, or continuation of the fibres of the one ſubſtance to thoſe of the other, as is evident in cartilages containing bones, kept long enough in water, and then ſlit; for the bone will, as ſoon as the large veſſels that enter its ſubſtance are divided, ſlip as eaſily from it as an acorn does out of its cup; and there is a ſmoothneſs and a poliſh of the parts of both cartilage and bone, which ſhew there is no conjunction of the fibres of the two ſubſtances. While the bones are increaſing within cartilages, the cartilages are extended and ſpread out, by which, with the preſſure which they ſuffer, and the great influx of various fluids, and the nutritious matter being hindered from flowing freely into them, they decreaſe continually, and, at laſt, may truly be ſaid to be entirely deſtroyed.

Dr. Hunter, in his Lectures, ſupports Dr. Neſbit's opinion, by curious anatomical preparations, which oppoſe Kerkringius and others, who ſay that bones are cartilages in their original ſtate.

Mr. Cruikſhank obſerves, reſpecting *oſſification*, that Dr. Hunter uſed to ſend round, at lectures, a preparation of the patella, in which he demonſtrated, that the *oſſification* of that bone began by the arteries *oſſifying* in the centre of the cartilage, which, in young ſubjects, ſupplies the place of bony patella. Mr. Cruikſhank adds, that he hath proſecuted that ſubject, from the firſt appearance of an *oſſifying* artery, to the perfect formation of the patella. He ſuppoſed that the ſame thing took place in all other bones, and accordingly made preparations to demonſtrate it in every bone of the body; and can ſhow that *oſſification* is not only begun, but carried on by the *oſſifying* of the arteries.

Oſſifications frequently happen in the aorta, lungs, pericardium, and other parts, and advances in infants in proportion to the vis vitæ: thus women judge of a child's ſtrength by the dimenſions of its fontanel.

In flat bones, it begins in the centre, and ſhoots towards the circumference. *In long bones* it begins in the middle, ſhooting towards the extremities.

See Kerkringius, Coiterus, Eyſſanius, Ruyſch, Neſbit, Albinus, and Monro.

OSSIFRAGA. See OSTEOCOLLA.

OSTAGRA, from ὀστέον, *a bone*, and ἄγρα, *a laying hold of*. A forceps to take out bones with.

OSTEITES, } called alſo *oſſifraga*, *oſteolithos*,
OSTEOCOLLA, } *holoſteus*, *amoſteus*, *oſtracites*, *ſtelechites*, GLUE-BONE; STONE, or BONE-BINDER. It is the petrified root of a tree, as of the poplar, pine, &c. It is found in ſandy places in ſeveral parts of Germany; the ſand in which it is met with hath a large mixture of fine, white, calcareous earth, which ſticks to the fingers, looks like meal, and when waſhed by the rains into any cavity, hath the appearance of an emulſion. Of this ſand and calcareous earth, ſo inſinuated into the roots of the trees as to make them have a ſtony appearance, is the *oſteocolla* formed. IN FOSSILOGY it is placed amongſt the calcareous ſtones. It hath been famed for its virtues of promoting a coalition of fractured bones. See Lewis's Mat. Med. Neumann's Chem. Works Philoſ. Tranſ.

OSTEOCOPI, from ὀστέον, *a bone*, κοπος, *uneaſineſs*. A conſtant and remarkable pain of the bones from an affection of the internal periоſteum, not being encreaſed by preſſure, ariſing chiefly from acrimony of the humors in the ſpina ventoſa; theſe pains reſemble that of great wearineſs. SAUVAGES arranges it as a genus of diſeaſe under his CLASS DOLORES.

OSTEOGENEIA, from ὀστέον, *a bone*, and γενεσις, *generation*. OSTEOGENY. It treats of the geneſis or production of a bone under its ſeveral original ſtates. See OSSIFICATIO.

OSTEOGENICA. Medicines which promote the generation of a callus.

OSTEOGRAPHIA. OSTEOGRAPHY, from ὀστέον, *a bone*, and γραφω, *to deſcribe*. It deſcribes a ſkeleton, and all the bones which compoſe the ſeveral parts thereof; or it is the doctrine which deſcribes the bones.

OSTEOLITHOS. See OSTEOCOLLA.

OSTEOSARCOSIS, is when the bones become ſoft, and flexible, as ſometimes happens in the ſcurvy, and is ſaid to be relieved by the catapl. antiparalyt.

OSTIARUS. See PYLORUS.

OSTIOLA. SMALL DOORS. So Mundinus calls the valves in the veſſels of the heart.

OSTIOLOGIA, from ὀστέον, *a bone*, and λογος, *a diſcourſe*, *on oſteology*. A DESCRIPTION of the BONES. The doctrine relative to the bones. It includes *oſteogeny*, *oſteography*, and *ſyndeſmography*. See Monro's *Oſteology*.

OSTRACITES, } HORGOBLIN'S-
OSTREA LABRIS NON CRENATIS. } CLAW. It is a ſtony ſubſtance, of the ſhape of an oyſter-ſhell petrified by ſparry matter. It is uſed inſtead of the pumice ſtone to take off hairs. A name of the *oſteocolla*; ſee alſo CADMIA.

OSTREA. The OYSTER. It is an excellent diet if eaten raw, for thoſe who digeſt ſlowly, and whoſe ſtomachs abound with acidities. It ſeems to be conſiderably nutritious, and more ſo, becauſe it is not readily perſpired; beſides, it prevents the perſpiration of other aliments. The ſhells are excellent abſorbents, and are generally uſed to correct acidity in the primæ viæ. Before they are taken into the ſtomach they ſhould be calcined in the ſun; or if burnt in the fire, they become a better kind of lime than the ſtone-lime for calculous complaints; and after being ſeveral times uſed for making the lime-water with, they may be uſed as abſorbents. The hollow ſhells contain moſt of the fine white earth. The rough matter of the ſhell contains much ſea-ſalt. See Neumann's Chem. Works. Lewis's Mat. Med.

OSTRUTHIUM. See IMPERATORIA.

OSYRIS, called alſo *caſſia poetica lobelii*, *caſſia Latinorum*, *caſſia lignea Monſpelienſium*, *and caſſia moneſpelienſium*. POETS ROSEMARY. The whole ſhrub is aſtringent. It grows in the ſouthern parts of Europe. It is ſometimes corruptly called AUXYRIS.

OSYRIS. See LINARIA.

OTALGIA, from ους, *an ear*, and αλγος, *pain*. A PAIN in the EAR. This diſorder affects the concha, and the whole meatus auditorius. It is attended with inflammation, tumors, punction, eroſion, tenſion, pulſation, and a ſenſe of weight. Dr. Cullen places it as a variety of phlogoſis phlegmone, on account of its ſituation.

Extraneous bodies falling into the meatus auditorius, or whatever excites pain in other parts, may cauſe it here.

The quality of the wax may be faulty, and be a cauſe; but the moſt frequent cauſes are heat and cold; ſometimes an acrid ſerum is ſecreted in the glands of the ear.

When the wax or other humours are ſaline, they excite a pricking pain;—when the ſalts in theſe humours are corroſive, they excite a gnawing pain;—when the wax ferments, whilſt it is yet in the glands, it cauſes a tenſive pain—when the glands are very turgid, there is a ſenſe of weight;—and when there is a tumor, a pulſation is perceived, eſpecially if it tends to ſuppurate.

If the pain is violent, it ſeldom fails to bring on a fever, then called otitis, which is early attended with great reſtleſſneſs; and a delirium, fainting, and often convulſions, are the conſequence; for the membrane that lines the ear is exquiſitely ſenſible, and fully ſtored with nerves; beſides, membranes which adhere to bones have a more than ordinary ſenſibility.

In the beginning, whilſt the pain is not very conſiderable, a little warm olive-oil dropped into the ear will often relieve.—If cold is the cauſe, keep the head warm.—If there is inflammation and tumor, which will be known by the throbbing pain, a ſuppuration may be encouraged by cataplaſms applied warm on the outer ear; but if the ſtate of ſuppuration is not manifeſtly near, endeavour by bleeding, purging, and diſcutients applied to the ear, to remove the inflammation and pain; if external heat was the cauſe, bleed, and give daily a moderate doſe of Glauber's ſalt as a purge, until the pain abates, or until there is reaſon to ſuſpect a ſuppuration; an opiate may be given at night when the pain is violent.—When acrid defluxions are the cauſe, inject a warm infuſion of poppy-heads in water.—When living inſects have crept into the ear, blow the ſmoak of tobacco therein, and then pour in warm oil. Bliſters behind the ears, bladders of warm water laid on the affected ear, and the pediluvium, are occaſionally uſeful. Some of theſe modes, according to the cauſes, will be proper to abate the ſtimulus, and prevent ſuppuration from taking place. But ſhould this occur, digeſtive and oleous liniments are to be avoided, and in their ſtead warm balſamics ſhould be introduced as deep into the ear as is convenient; viz. pellets of cotton, or of wool, dipped in eſſence of amber, the tincture of myrrh, or the balm of gilead may be uſed; and if purulent matter diſcharges itſelf, tepid water mixed with a little ſoap, or honey of roſes may be injected into the ear.

See James's Med. Dict. Lobb on painful Diſtempers. Brooke's, and the London Practice of Phyſic.

OTENCHYTES, from ους, the genitive of ους, *an ear*, and εγχεω, *to pour in*. A SYRINGE for the EARS.

OTHONNA. See CHELIDONIUM MINUS.

OTITIS. Inflammation in the internal ear. See OTALGIA.

OTOPLATOS. A ſtinking diſcharge behind the ears.

OTOPUOSIS. A purulent diſcharge from the ear.

OTORRHŒA. A diſcharge of blood, or of bloody matter from the ear.

OUMERY. See COPOVIC OECASSOU.

OUYCOU. See CASSADA.

OURLES. See CYNANCHE PAROTIDÆA.

OVA ZEPHYRIA. Eggs which are not impregnated by the tread of the cock.

OVALE FORAMEN. See COR.

OVARIA. The OVARIES. They were formerly called the *female teſticles*; but ſince anatomiſts have thought that they perceived cluſters of eggs in them, they have named them *ovaria*. Dr. Hunter thinks they are properly teſticles ſecreting female ſeed, which is taken up and conveyed by the Fallopian tube to the uterus. The *ovaries* are two ſmall bodies ſituated behind each Fallopian tube; they are of a different ſize and figure ſometimes in the ſame body. At the age of puberty they are of a proper ſize, and continue plump and full until the menſes are about to depart. They receive veſſels from the ſpermatics, which run on to the uterus, and anaſtomoſe with the hypogaſtrics. The nerves are from the intercoſtals, lumbal, and ſacral. Beſides the liquor which reſembles the white of egg, they contain two or three vaſcular bodies called *corpora lutea*, and which by ſome are called the *eggs*.

The *ovaries* are ſubject to great diſtenſion from water, which conſtitutes what is called a dropſy therein. See Hydrops Ovarii, and alſo a ſingular Caſe in Gooch's Obſ. and Remarks.

OVATUS, or OVIFORMIS HUMOR. See OCULUS.

OVI CANDIDUM, } See ALBUMEN OVI.
—— ALBUS LIQUOR. }

OVORUM TESTÆ, called alſo *Anatum*, EGG-SHELLS. They are prepared by boiling them in water, ſeparating the membrane, which lines the inner ſurface, and then powdering them by levigation. They act ſimilarly with the reſt of the teſtaceous abſorbents, but are ſaid to be the leaſt aſtringent with reſpect to the primæ viæ. When calcined, they are called *annora*, *anora*.

OVUM. An EGG. *Eggs* are nutritious, but if hard boiled are difficultly digeſted. They ſeem to be a leſs alcaleſcent food than almoſt any other animal ſubſtance, and during digeſtion to be leſs ſtimulant; but they ſhould be eat as ſoon as poſſible after their being laid, as the nearer they approach to a putreſcent ſtate, the more offenſive they become to the ſtomach; nor is it material from what birds they are acquired, as they are very nearly, if not altogether, ſimilar in their nature. The yolk is uſed as a medium for uniting balſams with water, but the white is preferable, as it is leſs diſguſtful to many ſtomachs. Weak ſtomachs digeſt the white more eaſily than the yolk. Betwixt the ſerum of the blood and the white of *egg* there is great analogy. See Neumann's Chem. Works. Cullen's Mat. Med.

OVUM PHILOSOPHORUM, A glaſs whoſe belly is of an oval figure, by which a liquor may be diſtilled by circulation.

—— SUBLIMATORIUM. See CUCURBITA.

OXALIS. See ACETOSA, N° 3.

OXALME. A mixture of vinegar and ſalt.

OXELÆUM. A mixture of vinegar and oil.

OXYA, } See FAGUS.
OXYAS, }

OXYACANTHA. The BARBERRY. See BERBERIS & SPINA ALBA.

OXYCEDRUS. See CEDRUS FOLIO CYPRI.

OXYCOCCUS, called alſo *vaccinia paluſtris*, *vitis Idæa paluſtris*. MOOR or CRANE-BERRIES. This plant grows in marſhy and putrid ſoils, and flowers in June. The fruit is cooling and aſtringent. See Dale, and Raii Hiſt.

OXYCRATUM. OXYCRATE. It is vinegar mixed with ſuch a portion of water as is required, and rendered ſtill milder by the addition of a little honey.

OXYCROCEUM EMPLASTRUM, from ὀξος, *vinegar*, and κροκος, *ſaffron*. It is a plaſter, in the compoſition of which there is ſaffron and vinegar.

OXYDE, } ὀξυς, *acidum*.

OXYGEN. } ὀξυς, *acidum*, and γινομαι, *gignor*. The atmoſpheric air is compoſed of two gaſſes, or aeriform fluids, ſee AER; *one* of which is capable, by reſpiration, of contributing to animal life, and in which metals are calcinable, and combuſtible bodies may burn;—*the other*, on the contrary, is endowed with directly oppoſite qualities; it cannot be breathed by animals, neither will it admit of the combuſtion of inflammable bodies, nor of the calcination of metals. The baſe of the former, or reſpirable air, is termed OXYGEN, becauſe, in reality, one of the moſt general properties of this baſe is to form acids by combining with many different ſubſtances: and this proceſs is termed OXYGENATION. The union then of oxygen with caloric is called Oxygen Gas, which is the ſame as was formerly cal'ed vital, or pure air. And when oxygen is united with a combuſtible ſubſtance, it is ſaid the converſion of that ſubſtance into an acid, is to *oxygenate* it.

OXYDORCIA. See DACNERON.

OXYGALA. SOUR MILK.

OXYGARUM. See GARON or GARUM.

OXYGENATION, } See OXYDE.
OXYGENATE. }

OXYCLICI, } See APOMELI.
OXYGLICUM. }

OXYLAPATHUM. See ACETOSA, N° 1. and LAPATHUM ACUTUM.

OXYMEL, from ὀξος, *vinegar*, and μελι, *honey*. Honey and vinegar, boiled together ſo as to form a ſyrup, is called *ſimple oxymel*, alſo *apomeli*. To this HIPPOCRATES applies the term ADIPSON, a preventer or allayer of thirſt. See MEL. *Oxymels* of different denominations are made by macerating ſome medicinal ingredients in vinegar, and then boiling them up with honey.

—— ÆRUGINIS. See ÆGYPTIACUM UNGUENTUM.

—— COLCHICI. See COLCHICUM.

—— SCILLÆ. See SCILLA.

OXYMYRRHINE, or OXYMYRSINE. See RUSCUS.

OXYPHLEGMASIA. See INFLAMMATIO.

OXYPHŒNICIA, or OXYPHŒNICON. See TAMARINDUS.

OXYPHYLLON. According to Oribaſius it is the *cnicus*; but he ſeems to intend by it a different plant from that which we call by that name.

OXYPHONIA. See PARAPHONIA.

OXYREGMIA, from ὀξυς, *acid*, and ῥηγνυω, *to break wind*. An ACID ERUCTATION.

OXYRRHODINON. A compoſition of vinegar and oil of roſes.

OXYS. See ACETOSELLA.

OXYSACCHARUM. A compoſition of vinegar and ſugar.

OXYSAL DIAPHORETICUM. It is a preparation of Angelus Sala. It is a fixt ſalt loaded with more acid than is neceſſary to ſaturate it. The ſalt of juniper is of this kind.

OXYTOCA, from ὀξυς, *quick*, and τικτω, *to bring forth*. Medicines which promote delivery.

OXYTRIPHYLLUM. See ACETOSELLA.

OZÆNA, from ὀζω, *a ſtench*. See ABSCESSUS NARIUM.

P.

PÆN

P. In prefcription it fometimes fignifies a *pugil*, and fometimes *pars*.

PACAL. A tree in Peru, the afhes of which are mixed with foap for the cure of leprous diforders; the mixture is ufed as an ointment. See Raii Hift.

PACHYS. THICK. The name of a diforder which is not only unknown to us, but which has never been defcribed by any phyfician fince Hippocrates. It is fuppofed that the Cnidian phyficians are the authors of the defcription; Hippocrates condemns them for multiplying the fpecies of difeafes without neceffity; in this they make four fpecies, and the fymptoms are very incompatible too. The curious may fee the defcription in James's Med. Dict. or in Le Clerc's Hift. Med. lib. iii. c. 11.

PACO-CAATINGA. A coniferous fpecies of BRASILIAN CANNA. The ftalk of this plant, if chewed, occafions a fpitting; if the faliva is fwallowed when this ftalk is chewed, it cures a gonorrhœa in a few days; it is alfo a fort of lithontriptic. Ray takes notice of three fpecies. See his Hift. Plant.

PACOEIRA. See BANANA.

PADRI. A filiquous tree in Malabar. The juice of the leaves is a cure for the mania; the juice of the bark, mixed with the fruit of the pera, reftrains the menfes. See Raii Hift.

PADUS, called alfo *cerafus avium nigra*, *cerafus racemofa*. The WILD CLUSTER-CHERRY, the BIRD'S CHERRY.

It grows on rocky mountainous places, and the fruit is ufed to hang about the necks of children, as a cure for the epilepfy. See Dale, and Raii Hift. Alfo a name for the *lauro-cerafus*, which fee.

PÆDANCHONE, from παις, *a child*, and αγχω, *to ftrangulate*. See ANGINA.

PÆDARTHROCACE, from παις, *a boy*, αρθρον, *a joint*, and κακος, *an evil*. The JOINT-EVIL; intimating that this diforder frequently appears about the *joints* of children, and oftener in them than in adults, becaufe the bones of children are more foft and fpongy, and fo more eafily corroded by peccant humours, and diftended into tumors, fometimes of a very furprifing deformity. Severinus calls the *fpina ventofa* by this name; he alfo makes another diftinction between the fpina ventofa and the *pædarthrocace*, for the tumors of the firft kind are frequently attended with pain, rednefs, and all the appearance of inflammation; but the *pædarthrocace* has little or no pain in the beginning, as is obferved in ricketty children; but thefe names are ufed very promifcuoufly; by fome it is ufed to expreſs a fort of anafarca. Dr. Cullen places it as a variety of the firft fpecies of phlogofis, under phlogofis phlegmone. See M. A. Severinus's Treatife De Recondita Abfceffuum Natura, alfo SPINA VENTOSA; CARIES.

PÆDOPHLEBOTOMIA. The bleeding of children.

PÆNOE. A large tree in Malabar. The root, bark, fruit, and all the parts yield a refin, which is burnt inftead of incenfe in their facrifices. The kernels of the fruit, made into an emulfion with warm water, ftrengthen the ftomach, relieve from naufeas, allay pain in the belly, and cure the cholera. See Raii Hift.

PAL

PÆONIA. PIONY. From *Pæon*, the phyfician who with this plant cured Pluto when he was wounded by Hercules; called alfo *ephialtia*, *idæus dactylus*, *pentorobus*. Boerhave enumerates twelve fpecies, of which the following are fometimes, though very rarely, ufed.

PÆONIA MAS. MALE PIONY. The *pæonia* officinalis, Linn.

—— FOEMINA. FEMALE PIONY. The *pæonia* officinalis, Linn.

Thefe plants are fo common in gardens as to need no defcription. The male fort hath dark-green leaves, pale-red fingle flowers, long thick roots, with red ftreaks in the ftalks and pedicles; the female hath longer, pale, and narrower leaves, deep-red, double flowers, and irregular roots, compofed of feveral tuberous pieces, hanging by rough filaments from one head. They are perennial, and flower in May. The male is preferred; but fo little is the difference, that the female is moft frequently ufed. The roots, flowers, and feeds, are anodyne, but their efficacy is very inconfiderable. The flowers impart their colour to water and to fpirit. See Lewis's Mat. Med.

PAGANICA. A ball ufed by the Latins to exercife with. It was fo called becaufe ufed only in villages.

PAGARUS. See CANCER MARINUS.

PAHAZAR. See BEZOAR.

PAHUATLANICA. See CHINA OCCIDENTALIS.

PAIANELI, called alfo *couradi*. A tall pod-bearing tree in Malabar. There are two fpecies, the different parts of which are ufed by the natives againft feveral diforders. See Rai Hift.

PAIDATROPHIA. See ATROPHIA.

PAIDION. So Hippocrates calls the child in the womb when perfected there. See CONCEPTIO.

PAIDOPOIETIC. An epithet applicable to thofe who have children, from παις, *puer*, and ποιεω, *facio*.

PAIN DE MADAGASCAR. See CASSADA.

PAI-PAROCA. A bacciferous fhrub in Malabar. An apozem prepared of the leaves, fruit, and roots in water, is ufeful againft the gout. See Raii Hift.

PALA. See NUX MOSCHATA. Alfo a tall pod-bearing tree in Malabar. The natives ufe it in various diforders. See Raii Hift.

PALÆTYRUS. See CASEUS.

PALATI OSSA. BONES of the PALATE. They are two irregular fquare bones, fituated in the roof of the mouth, which join each other backwards, and the maxillary bones forward; backward there is a lunated edge, whence the velum pendulum palati hangs. The pterygoid procefs of this bone paſſes between the os maxillare fuperius, and the pterygoid procefs of the os fphenoides: it is of a triangular fhape, broad at its bafis, and fmall above. The nafal procefs is very thin, it rifes upwards, and covers a large part of the aperture of the maxillary finus. At the fuperior part of the nafal procefs, the *os palati* divides into two procefſes called the orbitar. The anterior is the larger, and its fore part is contiguous to the back part of the maxillary finus; its poſterior furface is cellular, and is contiguous to the ethmoid cells. It is placed likewife on the opening of the fphenoidal finus, fo as to leave a fmall hole above.

PALATINÆ GLANDULÆ. They are conglo-

merated

merated glands, ſituated in the ſeptum and arch of the palate, near the tonſils.

PALATINUS. It is a branch of the upper maxillary branch of the fifth pair of nerves; it runs before the pterygoid apophyſes of the os ſphenoides in the canal formed by the os maxillare and os palati, and through the foramen palatinum poſterius, it ſpreads in the glandular coat of the palate, and parts adjacent.

PALATINUS PROCESSUS. See MAXILLARIA SUPERIORA OSSA.

PALATO-PHARYNGÆUS. See CONSTRICTOR ISTHMI FAUCIUM; PERISTAPHILO PHARYNGÆI; and PHARYNX.

PALATO-SALPINGÆUS. See CIRCUMFLEXUS PALATI.

PALATUM. The PALATE, ſometimes called *cerebri baſis, hyperoa*. It is that arch of the mouth which is ſurrounded before by the teeth and gums, and extending backward the whole breadth of the upper part of the mouth, as far as the great opening of the pharynx. This arch is partly hard and immoveable, and partly ſoft and moveable. The ſolid part is formed by the two oſſa maxillaria, and the two oſſa palati. The ſoft part lies behind the other. The membrane that lines the *palate* is full of ſmall glands. It ſometimes happens when a child is born with the hare-lip, the fleſhy and the long parts of the *palate* are defective, from a fiſſure, or a diviſion through into the noſtrils; the uvula alſo is ſometimes divided as into two. In this caſe, the child cannot ſuck, but muſt be fed by the ſpoon.

PALATUM MOLLE, called alſo *ſeptum*, and *valvula palati*. Behind the bony palate lies the *ſoft palate*, from the middle of which the uvula hangs down: the two arches on each ſide of this uvula, are called *columnæ ſepti palati*.

PALEA DE MECHA. See JUNCUS ODORATUS.

PALIMPISSA, from παλιν, ſignifying *repetition*, and πισσα, *pitch*. See PIX NIGRA.

PALIURUS. CHRIST'S-THORN, or WILD-JUJUBE; alſo called *æneplia*; *rhamnus*. It is a ſpecies of thorn met with in the ſouthern parts of Europe. The leaves and roots are moderately aſtringent; but on account of the length of its ſpines, it is the beſt of all other buſhes for making hedges.

PALLIUM PURPUREUM. A PURPLE CLOAK. So Baſil Valentine calls a certain powder, prepared of an amalgama of gold and mercury put into a retort, where the mercury being ſeparated, what remains is calcined with ſulphur, and turned a purple colour.

PALMA. The PALM of the HAND. Alſo *thenar*, and *ages*; *agoſtus*.

PALMA. The PALM-TREE. Boerhaave's characters of this tree are, that its fruit, under an edible pulp, hath an hard ſtrong nucleus, like the ſtone of a plum. But to this may be added, that the *palm-tree* riſes up with one ſingle and individual trunk. The ſpecies are numerous; Boerhaave mentions nine; Dale adds ſix, and Ray increaſes the number by twenty more. Some of the moſt noted are, the

PALMA ADY. See ADY.

—— CHRISTI, and OLEUM. See CATAPUTIA.

—— COCCIFERA, alſo called *cocos, palma Indica coccigera anguloſa, coccus de Maldivia, coccos, cocceira Indica, coccys, palma Indica nucifera, palma nucifera arbor, nux Indica, inaja-guacuiba, tenga, polgaha*. The *coco*, or COCKER-NUT TREE.

From this tree, the Indians extract a liquor called *ſuri*, and diſtil the liquor called *arrac* from it; alſo a ſpecies of ſugar called *jagra*. The milk in the ſhell of the nut is grateful and cooling. The exterior covering of the nuts are at firſt edible, and are gratefully acid, and gently reſtringent. By boiling, an oil like that from almonds is obtained from the kernel of the nut.

—— DACTYLIFERA. See DACTYLUS PALMULA.

—— FOLIORUM PEDICULIS SPINOSIS, &c. See PALMÆ OLEUM.

—— HUMILIS. See MUSA.

—— JAPONICA, alſo called *ſagou, palma Indica, arbor farinifera, zagu, todda panna, monta panna*. The LIBBY-TREE, INDIAN BREAD, or SAGO-TREE. It is the CYCAS CIRCINALIS, or CYCAS INDICA, *frondibus pinnatis circinalibus, foliolis lineariibus planis*, Linn. The pith of theſe trees being well beat in a mortar with water, forms an emulſion, the fæcula of which, when dried, is ſago.

†

The fruit of this tree is ſomewhat aſtringent, though not ſo when eaten with ſugar.

The *ſago* is very nouriſhing, and is uſed by the Indians when rice is ſcarce; when boiled in water, it is reſolved into an inſipid almoſt tranſparent jelly. It is readily ſoluble, and properly given in this country as an aliment to weakly perſons. It is demulcent, and never ferments in the ſtomach, whence it is properly preferred by many to wheat-flour for the food of infants; its being eaſily digeſted, and its demulcent quality, renders it uſeful for the diet of hectic patients.

PALMA MAJOR. See DACTYLUS, and DACTYLUS PALMULA.

—— MINOR, alſo called *palma humilis dactyliſera*, &c. *palma humilis Hiſpanica ſpinoſa, & non ſpinoſa, attitana, palmites, chamærhiphes*. The DWARF PALM. Its fruit is aſtringent.

—— NOBILIS, alſo called *regulis Jamaicenſis & Barbadenſis, palmiſte, palmeto royal*. The CABBAGE-TREE; the cabbages of which are called *chou de palmiſte*. It is a tall ſtrait tree, between two hundred and fifty and three hundred feet high. On the top is a white tender, ſavoury, medullary ſubſtance, which, if eaten raw, is to the taſte like a walnut, but boiled and pickled with the white leaves which ſurround it, it is one of the greateſt delicacies in the Leeward iſlands. This fruit is called the *cabbage of the palm-tree*. On the top of the trunk grows the involucrum of the flower and fruits called *ſpatha*: the fruits are round, and the ſize of an egg. See Rai Hiſt.

In Jamaica, the *wild cabbage-tree bark* (which is alſo called WORM-BARK of JAMAICA,) taken from a tree named *geoffræa inermis*, is much uſed for the deſtruction of worms in human ſubjects. The following is the account which is given by Mr. Anderſon, a medical practitioner there for ſome years. He mentions two ſorts of this bark, the one much paler than the other. The paler ſort he obſerves is more rugged in its operation, occaſioning nauſea, and great uneaſineſs in the belly. The darker coloured bark, he ſays, reſembles much the caſſia lignea in colour, though it is of a much coarſer texture. But this laſt is the kind commonly uſed in the Weſt Indies: it may be uſed with ſafety in any caſe where an anthelmintic is neceſſary. The hazardous ſymptoms aſcribed to it, have moſt probably followed either an over doſe, or the uſe of the paler ſort inſtead of the darker. To ſecure againſt an over doſe, it is beſt to begin with a tea-ſpoonful of the decoction, and gradually increaſe it as often as it is repeated. The decoction is thus prepared, and adminiſtered: Take of the bruiſed bark, two ounces and a half; of water, two quarts; let it be boiled over a gentle fire to a pint and a half. Strain off the decoction, and keep it for uſe, in a bottle well corked. Of this decoction a table-ſpoonful is uſually given the firſt morning for a doſe to a grown perſon; one and a half the ſecond, continuing to increaſe it gradually to four or five table-ſpoonfuls, and giving it for eight or nine mornings ſucceſſively. After this, I commonly give a doſe of jalap, with a few grains of calomel, which ſeldom fails to bring away the worms, ſome dead, ſome alive. If at any time I have found the decoction produce more than one or two looſe ſtools, I have added to each doſe a few drops of tinct. opii. And in general I have given, with each doſe, fifteen or twenty drops of the ſpirit of lavender on a lump of ſugar. Edinb. Med. Commentaries, vol. iv. p. 85, &c. See alſo GEOFFRÆA INERMIS.

—— OLEOSA. See PALMÆ OLEUM.

—— SANCTA. } See GUAIACUM.
—— SPINOSA. }

PALMÆ OLEUM. It is the produce of the PALMA *foliorum pediculis ſpinoſis, fructu pruniformi luteo oleoſo*. Sloane, Jam.—Dr. Brown in his Nat. Hiſt. of Jamaica takes notice of the PALMA SPINOSA *minor fructu pruniformi*, &c. Slo. Cat. 178. called in Jamaica the MACKAW-TREE. He obſerves that the rind of the fruit is thick, and yields a fattiſh ſubſtance, not unlike or inferior to the real palm-oil. He alſo mentions the PALMA tota ſpinoſa major, &c. Slo. Cat. 177. and H. ii. 119. called the GREAT MACKAW-TREE, the fruit of which differs but little from that of the little mackaw-tree, the huſks of the fruit are alſo full of oil. He adds in his account of the great mackaw-tree, that the negroes ſay it is the tree which yields the true PALM-OIL. In the Pharmacopœia of the Edinb. Coll. this ſpecies of tree is deſcribed as being the PALMA *foliorum pediculis ſpinoſis*,

ſpinoſis, fructu pruniformi luteo oleoſo. Sloane's Jamaic. and Adanſon Seneg. Mr. Curtis, in his Catalogue of Medicinal, &c. Plants in the London Botanical Garden, calls the tree PALMA OLEOSA Linn. The tree is tall and unbranched, with long reed-like leaves elegantly diſpoſed on the top. Several ſpecies of it are met with in the warmer countries. The fruit is preſſed, or firſt bruiſed, and then boiled in water; by either of theſe methods the oil is obtained, which is of the conſiſtence of butter, and is eaten as ſuch by the inhabitants in Guinea, and in the Cape Verd iſlands. It is of a ſtrong, but not diſagreeable ſmell, and hath but very little taſte. The colour, whilſt good, is of a deep yellow inclined to red, but by long keeping it becomes pale, and is then to be rejected. This oil is uſed when mixed with ſome warm penetrating ingredients, to rub on parts affected with old pains, and in ſome nervous diſorders.

PALMARIS BREVIS, } Joannes Baptiſta Cannanus
—— CUTANEUS. } communicated this muſcle to Fallopius, and it was firſt publiſhed by Valverda, in his Anatomy written in Spaniſh. It riſes from the faſcia of the annular ligament, it runs acroſs the ball of the little finger, and is loſt in the ſkin to pull it inwards. Brown calls it *caro muſculoſa quadrata.*

—— LONGUS. This muſcle lies on the inſide of the extenſor carpi radialis, and riſing tendinous from the inner condyle of the os humeri, it runs under the annular ligament, makes a radiated expanſion on the palm, and is attached to the heads of the metacarpal bones, and the firſt joint of the fingers. It is alſo called *ulnaris gracilis.*

PALMETO ROYAL. See PALMA NOBILIS.

PALMISTE. See PALMA NOBILIS.

PALMITES. See PALMA MINOR.

PALMOS. A PALPITATION of the HEART, from παλλω, *to beat.* See PALPITATIO.

PALMULA. A DATE. Alſo a name for the broad and flat end of a rib.

PALPEBRÆ. The EYE-LIDS, called alſo *blepharo.* They are connected to the circumference of the ſocket by the tunica conjunctiva, ſee ADNATA. They are compoſed of the common teguments, a cartilage called tarſus, and an external membrane. They have two angles or corners, one the ſmall or external, the other the large or internal; theſe angles are called canthuſes. The form of each *eye-lid* is that of a ſegment of a circle, and in regard to the eye, is ſuch, that when both *eye-lids* are ſhut, they make an uniform arch, adapted to the convexity of the eye, and in contact with it; but in regard to one another when ſhut, their edges are ſo contrived, that they leave a ſort of groove, or channel between them, which is narrow toward the outer angle, and wider toward the inner, and ſerves to conduct the tears as they come from the upper part of the eye to what are called the lachrymal points. The margin, or baſis of each *eye-lid*, being a cartilage of a conſiderable thickneſs, is divided into the outer and inner edges; it is the outer edge only of each lid that is ſuppoſed to join when the *eye-lids* are ſhut, the inner edge being formed oblique or ſlanting, makes the groove, or channel, above mentioned, for the paſſage of the tears to the lachrymal points. This margin is the tarſus, and that in the upper *eye-lids* is the broadeſt. The cutis is very thin on the *eye-lids*. The outer edge of each *eye-lid* is furniſhed with a row of hairs called cilia. On the internal edge of each lid in the tarſus, is a row of ſmall holes, which are the excretory ducts of the ciliary glands. From the upper edge of the upper tarſus, and the inferior of the lower, is contained a membranous expanſion to the neighbouring edges of the orbit: each of thoſe membranes, together with its reſpective tarſus, has the form of the *eye-lid* to which it belongs, and is called ligamentum tarſi. The ligaments of the *eye-lids* are reckoned to be three; from the inner angle, to the naſal proceſs of the os maxillare ſuperius, we ſee one which is the tendon of the orbicularis; at the external angle we ſee another ligament, more diffuſed on the bony brim, blended with the cellular membrane; a third goes all round, proceeding out of the brim of the orbit from the periоſteum. The inſide of the *eye-lids* are lined by the ADNATA, which ſee. The muſcles which ſubſerve the motions of the *eye-lids*, are the orbicularis, and levator *palpebræ* ſuperioris. The *eye-lids* and their muſcles are furniſhed with branches from the angular, temporal, and frontal arteries, and theſe communicate with thoſe ſent to the internal membrane of the *eye-lids*. The levator *palpebræ* receives a branch from the internal maxillary artery. The veins correſpond very nearly with the arteries, and carry their blood into external jugulars, by means of the veins in the temples and face. The nerves proceed from the ophthalmic branch of the fifth pair, from the ſuperior maxillary branch of the fifth pair, and from the portio dura of the ſeventh pair; the levator *palpebræ* ſuperioris receives a branch from the third pair. The *eye-lids* defend the eyes from the light during ſleep; they preſerve the eye from becoming dry by their frequent motion, which ſpreads the tears over the external ſurface of the globe. See LACHRYMALES GLANDULÆ, LACHRYMALIA PUNCTA.

PALPERIA. See APOPLEXIA.

PALPITATIO. So the Latins call the *palpitation* of the heart. The Greeks called it *palmos*, a vibration or trembling of the heart. Some confound the *palpitatio* cordis with the cardialgia and cardiaca paſſio. Dr. Cullen places this genus of diſeaſe in the CLASS. NEUROSES, and ORD. SPASMI, and defines it, a violent, irregular motion of the heart. The only one ſpecies he calls *palpitatio cardiaca*; a palpitation almoſt conſtant, at leaſt, often returning without any other evident diſeaſe. Of this (though) there are ſeveral ſymptomatic ſpecies, a palpitation from the pancreas, alſo, the *arthritic*, *chlorotic*, *hyſteric*, *melancholic*, and febricoſe palpitation.

There is a morbid painful *palpitation* of the heart, which is chronical, and when violent, called *diegmus*. There is a kind of this diſorder which happens to perſons otherwiſe healthy, and is occaſioned by ſtrong paſſions, ſurprize, ſtrong exerciſe, &c. Actuarius ſays there are two ſorts, one from plenitude or heat in the blood, and that this is the moſt frequent; the other is from vapours. In the firſt he ſays, there is an unequal pulſe; in the latter, the pulſe is unaffected.

Thoſe are the moſt ſubject to this diſorder who are of a firm habit, of a ſanguine, melancholy temperament, of delicate minds, and ſubject to frights; alſo the young, who abound in blood and juices, and thoſe whoſe evacuations of blood, whether natural or artificial, are neglected or ſuppreſſed.

A *palpitation* of the heart may ariſe, either from a quick influx of the nervous fluid into the external ſurface of the heart about its baſis, or from a defect thereof into ſome of the nerves in this viſcus. The formal cauſe is always ſo violent a contraction and convulſion of the heart, that it is moved out of its natural ſtate: but the material or proximate cauſe is a certain ſtagnation of the blood, eſpecially in the right ventricle of the heart, and a too great congeſtion of it to the ſame part; on account of which there happens, an impetuous influx of the nervous kind into the cardiac nerves and fibres of the heart, and a preternatural contraction of them. The mediate cauſes are either in the heart, about it, or in parts remote from it. Among the firſt, the moſt frequent and conſiderable are polypous concretions, which are always fibrous and membranous, generated principally in the ventricles and auricles of the heart, then reaching into the veins, and thence frequently forced into the arteries;—ſome fault in the fluids;—a defect in the uſual evacuations of blood;—tight ſtays are not an unfrequent cauſe of this diſorder in young women;—coſtiveneſs;—a difficult paſſage of the blood through the abdominal viſcera;—a ſubtle acrid matter in the blood;—as when the itch, &c. is repelled;—a defect of blood;—great diſturbance in the mind;—intenſe thought produces it in many hypochondriac patients, and particular odours have the ſame effect in hyſteric women;—flatulent aliment;—Hippocrates aſſerts, that all *palpitations* of the heart are accompanied with flatulencies, ſtrictures of the belly, thighs, and legs; hectic heats; aneuriſms, &c.

During this diſorder it often happens, that the arteries are every where affected with a violent pulſation, eſpecially thoſe above the clavicles; the diſeaſe frequently intermits, eſpecially during the body's being at reſt; but after the occurrence of any of the cauſes it returns; the pulſations are ſo great that ſometimes its motions may be perceived on the outſide of the cloaths: it is ſometimes more violent, and ſometimes leſs ſo; ſometimes continues a longer, and at others a leſs time; ſometimes it attacks during ſleep, and awakes ſuddenly; ſometimes it only happens in the day, and is worſt after eating; ſometimes anxiety, or uneaſineſs in the præcordia, precedes; in the paroxyſm of *palpitation*, the breathing is difficult; though the pulſe is intermitting, it does not correſpond with the motion of the heart, but is languid and diminiſhed; in a violent paroxyſm, a great uneaſineſs is perceived in the region of the præcordia, and a conſiderable languor of the body,

body, with a tremor of the joints, remain after the *palpitation* is over. When polypous concretions in the heart are the cauſe, the following ſigns uſually attend: the *palpitation* is immediately increaſed after violent exerciſe, going up ſtairs, or the lighteſt commotions of the blood; great anxiety about the præcordia, with a weak, unequal, and ſometimes intermitting pulſe; the patient breathes with ſo much difficulty that ſometimes there is danger of ſuffocation; fainting frequently comes on, and ſometimes is fatal; the pulſe is ſometimes ſtrong, at others more feeble. When the polypus continues fixed, no *palpitation* happens; but when it is removed, it fluctuates in the ventricles of the heart, and partially or fully ſtopping the paſſages of the blood through ſome or other of the veſſels, a *palpitation*, or ſpeedy death is the conſequence. When a redundance of blood cauſes a *palpitation*, the ſigns are, the countenance is florid, the veſſels turgid with blood, and the pulſe is large: in a fit of very ſtrong *palpitation*, the diſtance between the pulſations is greater, and the longer the intervals, the more violent they are.

A *palpitation* of the heart ſhould be diſtinguiſhed from that which is perceived in women, about the laſt months of pregnancy, in the epigaſtric region, and which is only a pulſation of the cœliac arteries, in conſequence of too much blood being hurried through them.

One remarkable ſymptom attending a violent *palpitation* of the heart, is a pain which is acute and pungent, and ſeated immediately above the right orifice of the ſtomach. The third pair of cervical nerves paſs out between the third and fourth vertebræ, ſoon communicates with the ſecond, and ſending down a large branch, which being joined by another from the fourth, forms the phrenic nerve that runs along the pericardium to be loſt in the diaphragm; in this courſe the right phrenic is obliged to make a ſmall turn round that part of the pericardium which covers the apex of the heart; hence it is, that ſuch as have ſtrong *palpitations* have this kind of pain.

A *palpitation* of the heart, when it frequently returns, continues long, or is violent, is always to be feared, as it often ends in a fatal ſwooning, or a ſuffocation. An unequal pulſe, or difficulty of breathing attending, are dangerous circumſtances. When the diſorder is idiopathic, there is very little dependence on any means made uſe of for relief; but when it is ſymptomatic, its cure is effected by the removal of the original diſorder. When it proceeds from terror, and returns often, it produces polypuſes, which again may prove a cauſe of the worſt kind. *Palpitations* attend various diſeaſes, and increaſe the number of diſagreeable prognoſtics.

The indications of cure are, to allay the preternatural commotions of the nervous parts and fibres of the heart and veſſels; to hinder the ſtagnation of the blood about the heart and lungs, by deriving its afflux to parts elſewhere, and rendering the circulation more free. And, thirdly, out of the paroxyſm, to remove the cauſes which excite the diſorder.

To prevent the returns of the diſorder, avoid every known occaſional cauſe, and carefully adhere to regularity reſpecting the non-naturals. If there are any ſymptoms of a polypus, all violent motions are to be avoided, leſt the polypus ſhould be looſened. All tight ligatures ſhould be made eaſy, and the cloaths ſhould be equally ſo; the patient ſhould never continue long in the cold; and when the fit approaches, a clyſter ſhould be inſtantly adminiſtered, and the extremities rubbed; as to the paſſions of the mind, endeavour to keep them free from every degree of exceſs.

During the paroxyſm, enquire for the cauſe. Bleeding is the principal remedy, except the cauſe be weak nerves, or lax habit, in which laſt caſe give the bark, with nervous and ferrugineous medicines. If the cauſe be an ebullition, or ferment in the fluids, nitre, antimonium tartariſatum, as a perſpirative. Hoffmann's mineral anodyne liquor, &c. in a glaſs of water. If flatulence produces the fit, or when the patient is coſtive, ſkin dry; the feet cold, beſides the above medicines, give oily and carminative clyſters, rub the feet with warm cloths, and then put them into warm water. If hæmorrhages have preceded, to the above add analeptics and cordials; the eſſence of amber is particularly proper; bladders of warm water may be applied to the ſtomach. If an aſthma attends, bliſter, and give the volatile tincture of valerian at proper intervals. If gouty ſpaſms are the cauſe, bleed, bliſter, give volatiles, and put the feet into warm water.

Out of the fit, the whole intention of cure conſiſts in removing, or at leaſt diminiſhing the cauſe; thus, if there is a plethora, reduce it by proper evacuations; if a deficiency of good blood, endeavour to improve and increaſe it; if the *palpitation* is ſymptomatic, remove the original diſorder; if a bilious acrimony gives riſe to it, lemon juice, or other agreeable vegetable acids, will be proper; if the pulſe begins to be affected, bleed; opiates are often very uſeful; pedilaves ſhould not be uſed until the feet begin to grow warm by rubbing them, nor until the fit is going off.

See Actuarius, Hollerius, Sennertus, Lommius, and Hoffmann. Cullen's Firſt Lines, vol. iii. p. 372. edit. 4. Memoirs of the Med. Society of London, vol. i. p. 77.

PALUDAPIUM. See APIUM.

PALUS SANCTUS. See GUAIACUM.

PAMPINIFORMES. See DUCTUS THORACICUS.

PANACEA, from πᾶν, the neuter of πᾶς, *all*, and ἄκος, *a remedy*, whence is derived, πανακεία, remedium univerſale, *an univerſal medicine*, or, it comes from πᾶν, *all*, and from the verb, ἀκέομαι, *to heal*, quaſi omnia ſanans: alſo called *Hygieia*.

PANACEA DUPLICATA. See NITRUM, N°. 6.

There are many *panaceas* in moſt of the former diſpenſatories.

—— LAPSORUM. See ARNICA MONTANA.

—— MERCURII See MERCUR. DULCIS SUBLIMATUS.

—— VEGETABILIS. See CROCUS.

—— MOSCHATUM. See HERBATUM CANADENSIUM.

PANARIS. See PARONYCHIA.

PANARITIA. A WHITLOE with FEVER.

PANARITIUM. See PARONYCHIA.

PANATA, or PANATELLA. PANADA. Bread boiled in water, to a proper conſiſtence, for feeding children, very weak or infirm people with; and alſo a viand allowed in febrile and other acute complaints.

PANAVA. See CATAPUTIA MINOR, under GRANA TIGLIA.

PANAX. See PASTINACA OLUSATRA.

PANAX ASCLEPIUM. See FERULA GLAUCO FOLIO and MINOR.

—— CHIRONEUM. See CHAMÆCISTUS.

—— COLONI, called alſo *ſtachys paluſtris, fœtida galeopſis anguſtifolia fœtida, ſideritis Anglica ſtrumoſa radice, galeopſis paluſtris betonicæ folio flore variegato, marrubium aquaticum acutum.* CLOWN'S WOUND-WORT, or ALL-HEAL. Boerhaave ranks it as a ſpecies of *galeopſis*. Cæſalpinus calls it *tertiola*, and commends it againſt the tertian ague.

—— COSTINUM.
—— HERACLEUM.
—— HERCULEUM.
—— PASTINACEA.
} See OPOPONAX, & PASTINACA OLUSATRA.

—— QUINQUEFOLIUM. See GENSING.

PANCASCOLUS. See BULBOCASTANUM.

PANCHYMAGOGUM, from πᾶν, *all*, χυμὸς, *humour*, and ἄγω, *to bring away*. The name of ſome cathartic extracts, which are ſaid to purge away all kinds of humours.

PANCRATIUM. It was the name of an exerciſe which was uſed by the ancients, and conſiſted of a mixture of wreſtling and boxing.

PANCREAS, from πᾶν, *all*, and κρέας *fleſh*; called alſo *callicreas*; *pancrene*. The SWEET-BREAD. It is ſituated tranſverſely under the ſtomach, in the duplicature of the poſterior portion of the meſocolon, and reaches from the duodenum to the ſpleen. Its ſhape reſembles a dog's-tongue. It hath two edges, one anterior, the other poſterior; and two ſides, one ſuperior, and the other inferior. Its head lies in the firſt curvature of the duodenum, thence it runs acroſs the ſpine to the ſpleen behind and below the ſtomach. There is a natural cavity into the epiploon, between the lower ſides of the ſtomach, and the upper ſide of the meſocolon. It is here that the arteries, veins, and nerves enter, and the cyſtic and hepatic ducts come out to form the ductus communis cholidochus, which goes into the duodenum near the pancreatic duct. The veſſels of the *pancreas* come from thoſe of the ſpleen, which run along it. That head next the duodenum hath veſſels from the meſenterica and gaſtrica dextra. The ſubſtance of this viſcus is that of a conglomerate gland; in the whole length of it is a duct called ductus Wirſungii, from its diſcoverer, but generally it is ſpoken of by the name of ductus pancreaticus: its beginning is towards the ſpleen; as it goes on it receives branches, grows larger, and proceeds into the duodenum, in the ſame canal as the

biliary duct; the *pancreatic* duct is very thin, and without valves; it does not always go out jointly with the biliary duct, but it is seldom that we meet with it otherwise. Malpighi makes the *pancreas* a cluster of vesiculæ; Ruysch brings it out to be vascular, as injections prove it to be. The nerves come from the plexus hepaticus, plexus splenicus, plexus mesentericus, &c. The *pancreatic* juice resembles the saliva, but is less viscid, and contains a larger proportion of the salts of the blood; it is probably a menstruum for the solution of our aliment; but that it acts as a ferment, as some have asserted, is doubtful. All the *pancreatic* juice is sent into the duodenum, and is secreted most when the stomach is fullest. This viscus is subject, like the spleen, to inflammation, called PANCREATICA; and must in the same manner be treated.

PANCREAS MINUS. Where the great extremity of the *pancreas* is connected to the duodenum, it sends out an elongation, with a distinct duct in it, which opens into the duodenum.

PANCREATICÆ ARTERIÆ. The splenic artery runs from the cœliac artery, under the stomach and pancreas, to the spleen; it adheres to the lower posterior part of the pancreas, to which it gives several branches called *pancreaticæ arteriæ*.

PANCREATICÆ VENÆ. They are several branches from the splenica, which run to the pancreas along its lower side. There are other small pancreatic veins which do not arise from the splenica.

PANCRENE. See PANCREAS.

PANDALITIUM. See PARONYCHIA.

PANDEMIUS. See EPIDEMICUS.

PANDICULATIO. PANDICULATION, or STRETCHING, called also *distentio*. It is that restless *stretching* and uneasiness that accompany the cold fit of an intermitting fever.

PANEM-PALKA. See NUX MOSCHATA.

PANICULA. A PANICLE. A stalk diffused into several pedicles, sustaining the flowers or fruits. Of this kind are the oat, millet, &c. *Panicula* is also a diminutive of panus, a species of tubercle. It is a name for a sort of crude bile.

PANICUM, *linagrostis*; *elymagrostis*; *elymos*. A plant so called from its panicle. COMMON PANIC. The spike consists of innumerable thick seeds disposed in lesser spikes, so as to appear like a cluster. It is cultivated in Germany. The seeds have been used as food, but are not regarded in medicine. There are several species. See Raii Hist.

PANIS. BREAD. From πᾶν, *all in all*; also called *artos*; *cerealia*; *farinacea panis*. Good *bread* should be composed of flour well kneaded with the lightest water, seasoned with a little salt, fermented with the finest yeast, and sufficiently baked. Unfermented *bread*, called *dorates*, is viscid and glutinous; fermentation destroys this viscidity, and renders it more easily digestible, but at the same time inclines the substances fermented to acidity, whence unfermented *bread* only can be proper where acidity abounds in the stomach. That *bread* which is the lightest, and most easily dissolved in water, is the most wholesome, digested with the greatest facility, and soonest converted to laudable nutrition: the additions of lime, chalk, and alum, oppose dissolution. The best *bread* for general use is made with good wheat, all ground down together. For bran, consisting chiefly of the husks of the grain, is supposed to have a laxative and detergent quality. See TRITICUM. *Bread* made with the whole of the grain, viz. the bran and flour, was called by the ancients, *autopyros*.

PANIS CANINACEUS. See CANICÆ.
—— FURFURACEUS.
—— IMPURUS.
—— ATER.
—— CIBARIUS.
—— GREGARIUS.
} See COLIPHIUM.

—— CUCULI. See ACETOSELLA, N°. 3 under ACETOSA.

—— PORCINUS. See ARTHANITA.

PANNICULUS. A piece of cloth.

PANNICULUS ADIPOSUS. See CELLULOSA MEMBRANA.

—— CARNOSUS. Drake describes this in the human subject; but Winslow, Hunter, &c. deny its existence, and say it is only in brutes. Some say it is only in the face. It is also called *carnosa cutis*.

PANNONIUM. See ARTHOICUM.

PANNONICA. See HIERACIUM ALPINUM.

PANNUS. WOOLLEN CLOTH. The name of a disorder in the eye, called also *albugo*; and of a disorder in the skin, as a spot or mark, from a venereal or other cause.

PANOCHLÆ. See BUBO.

PANOPHOBIA. A kind of melancholy attended with groundless fear. See MELANCHOLIA.

PANTHEÆ. PENSILE BEDS.

PANTICES. See INTESTINA.

PANULA, or PANUS. A sort of crude bile.

PANUS. See PHYGETHLON.

PAO-AGULA. See AGALLOCHUM.

PAPAGA & PAPAGALLI. Names for the seeds of bastard-saffron. They are so called from the magpies eating them.

PAPAS. See BATTATAS.

PAPAVER, from *pappa*, that is, PAP; because formerly nurses mixed this plant with the children's pap-meat, as a remedy against the pains of the colic. The Greek name is *mecon*.

PAPAVER ALBUM, called also *papaver* hortense semine albo, *ches beul*; WHITE GARDEN POPPY, PAPAVER SOMNIFERUM ALBUM, or PAPAVER *calycibus, capsulisque glabris foliis amplexi-caulibus incisis*, CLASS. POLYANDRIA: ORD. MONOGYNIA. LINN. Gen. Plant. 648. This species is called white, because its flower-seeds are white. The heads are called *codia*.

As this species affords the largest quantity of active powers, it is always cultivated when the intention is for medicinal uses. A decoction of the heads in water strongly pressed out, depurated by settling, then clarified with the white of an egg, and inspissated, yields an extract amounting to 1-5th or 1-6th the weight of the heads. This extract is said not to produce a nausea or giddiness, which generally follows the use of foreign opium. Its dose is about double that of the opium from abroad: it checks a diarrhœa as well as any other opium, but does not so powerfully check expectoration. The seeds without a portion of farinaceous, contain a great quantity of oily matter, which is produced copiously by expression. It has the same properties of other expressed oils, and has been employed both in diet, and medicine. In the former also the seeds have been used in considerable quantity, nor have they discovered the least of a narcotic quality, but have been similar to the tribe of the nuces oleosæ. A cataplasm is formed of the heads, an dapplied to parts in an irritable state, and in all external cases where it becomes necessary to alleviate pain.

CATAPLASMA PAPAVERIS ALBI. *Cataplasm of white poppy.*

Take of a strong decoction of white poppy heads one pint, and form it into a poultice with crumbs of bread; this may be made more sedative, if necessary, by adding to it a solution of opium.

FOTUS PAPAVERIS ALBI. *Fomentation of white poppy.*

Take of white poppy heads, dried, four ounces, water six pints. Let the poppy heads be bruised, and boiled in the water till it is reduced to one quart, then strained. This anodyne fomentation is highly useful in mitigating extreme pain in inflamed and ulcerated parts.

A syrup is made from the *white poppy* heads. Themison first takes notice of it; he made it with the juice and decoction of these heads, and used honey for giving it the syrup-consistence. The London College directs the following:

Syrupus e Meconio sive Diacodion, now called *Syrupus Papaveris Albi*. *Syrup of* WHITE POPPY.

Take of the heads of dried *white poppies*, without their seeds, three pounds and a half; of water, eight gallons. Slice and bruise the heads, and boil them in the water, to three gallons; in a water bath saturated with sea-salt; reduce by boiling to about four pints, and strain whilst hot, first through a sieve, and then through a thin flannel: set it by for a night, that the fæces may subside; boil the liquor poured from the fæces to three pints, and dissolve six pounds of double refined sugar in it, that it may make a syrup. Pharm. Lond. 1788.

This syrup is given to children in doses of from ʒ ss. to one dram or more; to adults an ounce and a half. In general an ounce of this syrup is equal to one grain of opium; but it is subject to great variation in point of strength, from the different degrees of maturity, and the

foil

foil and ſeaſons in which the *poppy* heads are produced, varying according to theſe in the quantity they contain of the narcotic property. See OPIUM.

—— CORNICULATUM LUTEUM. See CHELIDONIUM MAJOR.

—— NIGRUM, called alſo *papaver* hortenſis nigro ſemine. BLACK GARDEN-POPPY.

This ſpecies is thus named becauſe its ſeeds are black.

Theſe plants are found wild in ſome parts of Europe, and ſeveral varieties, as to their flowers, are produced by culture in our gardens. The head, ſtalks, and leaves have an unpleaſant ſmell, and a bitteriſh biting taſte, of the ſame kind with thoſe of opium. The ſmell and taſte are lodged in a milky juice, which abounds chiefly in the cortical part of the heads, which may be collected in conſiderable quantites by ſlightly wounding them when almoſt ripe, and when the juice is run out, preſſing out what did not run, and which, on being expoſed for a little time to a warm air, thickens into a tenacious dark-coloured maſs, ſimilar to the opium brought from Turkey, &c. it is weaker as a medicine; one grain of foreign opium is often equal to two of ours, yet is ſtronger in ſmell and taſte. The juices obtained from the white or the *black poppy* differ no other than in quantity afforded by each; the white affording the largeſt qaantity. The ſeeds contain an inſipid oil, uſed for the ſame purpoſes as the olive oil; it is obtained by expreſſion, and is void of the narcotic quality of the poppy head.

—— RUBRUM, called alſo *papaver* rhœas, *papaver* erraticum, *calocatanos*. CORN-ROSE, WILD POPPY. It is the PAPAVER RHŒAS, *capſulis glabris globoſis, caule pilero multiflore, foliis pinnatifidis inciſis*, CLASS POLYANDRIA, ORD. MONOGYNIA. LINN. Gen. Plant. 468. This plant hath deep red flowers, dark-coloured ſeeds, hairy leaves and ſtalks. It is common in corn-fields, and is ſometimes, like the others, made to vary its flowers by culture. The heads contain the ſame kind of narcotic juice with thoſe of the preceding, but in ſo ſmall a quantity that they are wholly neglected. The leaves of the flowers, on expreſſion, yield a deep red juice, and impart the ſame to watery liquors, and a bright though pale red to rectified ſpirit. The London College of Phyſicians order a ſyrup to be made in the following manner:

Take of the freſh flowers of the wild or red *poppy*, four pounds; boiling diſtilled water, four pints and an half: put the flowers by degrees into the boiling water, in a water-bath, conſtantly ſtirring them. Afterwards, the veſſel being taken out of the bath, macerate them for twelve hours; then preſs out the liquor, and ſet it aſide that the fæces may ſubſide. Laſtly, make it into a ſyrup with double refined ſugar. Pharm. Lond. 1788. This ſyrup has been thought uſeful as an anodyne and pectoral, and is therefore preſcribed with thoſe views: but it ſeems rather valued for the beauty of its colour, than for any medicinal efficacy.

PAPAVER SPINOSUM, called alſo *argemone Mexicana*. PURGING THISTLE. Its juice is called *glaucium*, and is uſed as a cooling external medicine.

—— SPUMEUM. See LYCHNIS SYLVESTRIS, BEHEN ALBUM PEPLION, or PEPLOS.

Boerhaave enumerates thirty-four ſpecies. See Lewis's Mat. Med. Neumann's Chem. Works.

PAPAYA MAS, called alſo *mamæra mas*. The MALE PAPA-TREE.

—— FOEMINA, called alſo *papaya Peruvianis, papayamarum, platanus, mamæra fœmina*. FEMALE PAPA-TREE.

The fruit reſembles a melon; it is eaten raw or prepared with ſugar, and is ſaid to ſtrengthen the ſtomach.

PAPILIONACEA. PAPILIONACEOUS. Flowers are thus called from their reſemblance to the wings of a butterfly when expanded; irregular and uſually fourpetalled. The lower petal is ſhaped like a boat, and is called *carina*, or keel; the upper petal which ſpreads and riſes upwards, is called *vexillum*, ſtandard, or banner: the two ſide ones ſtand ſingly, being ſeparated by the keel, and are called *alæ*, the wings; the keel is ſometimes ſplit, and then this corolla is properly five-petalled. Theſe flowers form a natural claſs, named PAPILIONACEA, and are to be found in the 55th Order of LINNÆUS's FRAGMENTS, and in the 32d of his Natural Orders. They are chiefly comprehended within the order *Decandria*, of the Claſs *Diadelphia*, in the artificial ſyſtem. This is one of TOURNEFORT's claſſes, and is the ſame with the *leguminoſa* of RAY, and other authors. Of this tribe are peas, beans, kidney-beans, vetches, and other leguminous plants; hence are they called pea-bloſſomed flowers. See Miller's Dict. Martyn's Language of Botany.

PAPILLA. The NIPPLE, alſo called *mamma* and *mamilla*. Thus the little eminences on the breaſt are called. In children of both ſexes, and in males of all ages, they are commonly no more than cutaneous tubercles. In females arrived at the age of puberty, the *nipple* begins to increaſe; in pregnant women, and thoſe who give ſuck, it is large; in old age it decreaſes and becomes flabby. The body of the *nipple* contains the terminations of the tubuli lactiferi, where they are tortuous, and act as valves; but as they are diſtenſible, as the *nipple* is handled they become ſtraight, and thus the milk hath a free paſſage.—By this term Peyer calls the inteſtinal glands.

PAPILLÆ CAPITATÆ, LENTICULARES PYRAMIDALES. See LINGUA.

—— MEDULLARES. Small eminences on the medulla oblongata, called by Winſlow *tubercula mamillaria*.

—— PYRAMIDALES. On the ſurface of the ſkin theſe are obſerved. They are longer in ſome parts, as in the fingers, where they are called villi, and appear in rows, each having two ranks contiguous. They are the organs of touch, being the terminations of the cutaneous nerves, each of which are incloſed in two or three covers. See CUTIS.

PAPILLARE OS. See SPHENOIDES OS.

PAPILLARES CARUNCULÆ. See CARUNCULA.

—— PROCESSUS. The extremities of olfactory nerves inſerted into the mucous membrane of the noſe are thus named.

PAPILLARIS HERBA. See LAMPSANA.

PAPPOS. The downy hairs upon the chin.

PAPPUS. } POTATOES. See BATTATAS. Alſo the
PAPPAS. } down of the ſeeds of plants: hence plants, whoſe ſeeds, when ripe, are furniſhed with down, are called pappoſe or pappeſcent.

PAPULA. A PIMPLE or ULCEROUS TUBERCLE. Dr. Cullen places it as a variety of phlogoſis phlegmone. It ſuppurates with difficulty.

PAPYRUS. The PAPER-TREE; called alſo *papyrus* Nilotica Alpina, *Ægyptiaca, Cyperus Niloticus vel Syriacus*. This tree afforded to the Egyptians food, furniture for beds, and other utenſils in houſes, ſails for ſhips, ſhoes for prieſts, and paper.

PAR. When applied to days it ſignifies *even*; when uſed in preſcriptions it ſignifies *a pair*, or two. Some medicines and veſſels are called ſine pari, without an equal.

PAR CUCULLARE. See POSTICI.

—— LINGUALE. The ninth pair of nerves from the head.

—— MENTALE. See LEVATORES LABII INFERIORIS.

—— VAGUM. The eighth pair of nerves from the head, which are alſo called *nervi vagi, nervi ſympathetici medii*. This pair is made up of ſeveral ſmall chords which come from almoſt the whole length of the medulla oblongata, and being joined with the acceſſorius Willifii, which is a ſmall rope running up laterally from the medulla ſpinalis, paſſes through the foramen to join this eighth pair, which goes out by that common hole between the temporal and occipital bones, where likewiſe the internal jugular vein goes out of the cranium. The *par vagum* goes down the neck, by the ſide of the carotid arteries, and behind the internal jugular, and is accompanied by the intercoſtal nerve to the laſt cervical vertebræ, thence paſſes down into the thorax, gives branches to the pharynx, larynx, &c. and joins many nerves. As they enter the thorax they go acroſs the ſubclavian arteries, and as the right trunk paſſes before the ſubclavian, it ſends off a twig, which bends backwards under the artery, and runs up the ſide of the aſpera arteria; this is called the *recurrent nerve*. Afterwards the *par vagum* runs down behind the lungs, to which they give a plexus, and then form two ropes, one anterior the other poſterior, which are called *nervi ſtomachici*, which paſs along with the œſophagus through the aperture in the diaphragm, and are diſperſed on the ſtomach, &c.

PARA. A Greek prepoſition, which, when prefixed to the name of a diſorder, denotes its ſlightneſs; as paraplexia, a ſlight apoplexy, &c.

PARACENTESIS, from *παρακεντέω, to make a perforation*, called alſo *compunctio*. This operation is commonly

monly called TAPPING, and is uſed for diſcharging water through the integuments of the belly from the cavity thereof. The place appointed for the perforation is about four fingers breadth from the navel, or rather in the middle betwixt the navel and the upper part of the os ilium. The left ſide is uſually preferred, on account of not running any riſque of injuring the liver. Mr. Sharp obſerves that, if the navel protuberates, independent of the inteſtines or omentum, but from water only lodged there, a ſmall puncture made in that with a lancet will diſcharge the water, without endangering a rupture of the part.

In the young and robuſt, or if the conſtitution is not too much enfeebled, this operation may be performed; but when there is a fever, a ſcirrhus in any of the viſcera, an internal abſceſs, a conſumption, &c. this operation ſhould be omitted.

If the extravaſated fluid remains in the ſame proportion for ſeveral years, particularly if the health in other reſpects is good, the evacuation is a radical cure, provided that the health is otherwiſe unaffected; but whilſt the bulk of the water increaſes, there is not that confidence of a radical cure.

Upon a ſudden evacuation of the waters in a hydrops pectoris, or in an aſcites, a violent deliquium may, and often does enſue, becauſe the preſſure of the water is taken off from the arteries, whence they dilate, and the blood ruſhes into them from the upper parts of the body too ſuddenly, and leaves the brain not ſufficiently ſupplied with that fluid.

In order, therefore, to the eaſy and ſafe performance of this operation, it is proper to have in readineſs, 1. A roller of flannel, or a flannel laced about the belly, after the evacuation of the water; whether a roller or the laced flannel are uſed, begin with faſtening them tight about the lower part of the belly, and continuing the ſame upwards, that the bowels may be duly preſſed againſt the diaphragm. 2. A piece of flannel, which, when doubled four-fold, will be about a foot ſquare. 3. A quart or thereabouts of proof ſpirit, to dip the roller and flannel cloth in, before applying them to the belly. 4. A piece of ſticking-plaſter about two inches ſquare, in the middle of which ſhould be laid three pledgets of lint, one larger than the other, the leaſt being about the ſize of a ſixpence. 5. The trochar with its canula, the point dipped in oil; and a probe to thruſt back the inteſtines if they obſtruct the mouth of the canula when the water is nearly evacuated. 6. Two or three large baſons, to receive the water, and a pail to empty them into. 7. Four perſons beſides the operator, one of whom ſhould ſtand on each ſide, to keep a proper preſſure on the patient's ſides, obſerving to preſs from behind rather forward, and continuing this preſſure during the time that the water is paſſing off, and alſo until the roller or the laced flannel are ſecurely applied. One aſſiſtant will be employed in taking the baſons away when full, and providing the operator with empty ones; and the fourth aſſiſtant will be ready to ſupply the patient with a little wine or other cordial, if he faints.

When the water is drawn off, lay the pledgets upon the wound, and ſecure them with the plaſter; over them lay the flannel cloth, and then begin with the bandage or laced flannel, as already mentioned. See Heiſter's Surgery. Le Dran's Operations. Sharp's Operations. Bell's Surgery, vol. ii. p. 337, 354. White's Surgery, p. 298, 306.

PARACMASTICI. See ACMASTICOS.

PARACOE, from παρακουω, *difficult hearing*. DULLNESS of HEARING.

PARACOPE. In Hippocrates it is a ſlight delirium.

PARACYNANCHE, } from παρα, *de*, and κυων, *a dog*,
PARAKYNANCHE, } and αγχω, *to ſtrangle*. A ſpecies of quinſy; it being a diſtemper to which dogs are ſubject, called alſo *juxtangina*.

PARACUSIS. DEPRAVED or FAULTY HEARING. Dr. Cullen places this genus of diſeaſe in the claſs locales, and order dyſæſtheſiæ. He diſtinguiſhes two ſpecies. 1. *Paracuſis* imperfecta; in which ſounds are difficultly diſtinguiſhed. See SURDITAS. 2. *Paracuſis* imaginaria; as when the ſound perceived is not from without, but is excited within the ear; called alſo *ſuſurrus*; *ſyrigmus*, *ſyringmos*. See TINNITUS AURIUM.

PARADISAICA ARBOR. See THUYA.

PARADISI GRANA. GRAINS of PARADISE. They have erroneouſly been ſuppoſed to be the ſeeds of the larger cardamoms, whence they are called by ſome cardamum maximum; by others, *malagueta*, *malaguetta*, *melegeta*, *melleguetta*, *maniguetta*, and *cardamomum piperatum*. They are brought from Guinea and the Eaſt Indies. They are angular, of a reddiſh brown colour without, and white within; ſmaller than pepper; in appearance ſomewhat reſembling cardamom ſeeds. They grow in pods, ſhaped like unripe figs, and about the ſize of one. This pod is divided internally into three cells, in each of which is contained two rows of ſeeds. They have the flavour of cardamoms, and the pungency of pepper: their pungency does not reſide like that of cardamoms in their eſſential oil, but in their reſin. The diſtilled oil poſſeſſes their ſmell, but is mild; the remaining decoction inſpiſſated to an extract retains all the pungency. In ſome parts, theſe grains are uſed inſtead of pepper. Dr. Trew thinks, that the *cajeputi oleum* is extracted from them, which is commended as a nervous medicine, and being uſeful in ſome cardialgias; the doſe four or five drops in any convenient liquor. As to their medicinal virtue, they are preciſely of the ſame nature with the ſemina cardamomi, though rather more pungent. See Lewis's Mat. Med. Neumann's Chem. Works. Cullen's Mat. Med.

PARAGLOSSA. A PROLAPSUS of the TONGUE. A SWELLED TONGUE.

PARAGUA. See CASSINE.

PARALAMPSIS. See ALBUGO OCULORUM.

PARALLELA. A ſort of ſcurf or leproſy, affecting only the palms of the hands; it happens ſometimes in the venereal diſeaſe.

PARALOPHIA, from παρα, *near*, and λοφια, *the eminence of the back*. Keil ſays it is the lower and lateral part of the neck.

PARALYSIS, from παραλυω, *to diſſolve* or *weaken*. A PALSY; often it ſignifies a *palſy* of a particular part. It is alſo called *catalyſis*. Celſus and Cœlius Aurelianus ſay that the moſt ancient writers give the name of *attonitus morbus* and *ſtupor* to that ſpecies which follows an apoplexy. Dr. Cullen places this GENUS of diſeaſe in the CLASS NEUROSES, and ORD. COMATA, which he defines a loſs or diminution of the power of voluntary motion, but only affecting certain muſcles or parts of the body, often accompanied with drowſineſs. He diſtinguiſhes four ſpecies. 1. *Paralyſis partialis*; when ſome particular muſcles are affected. 2. *Paralyſis hemiplegica*; when one ſide of the body is affected longitudinally. 3. *Paralyſis paraplegica*; when one half of the body is affected, tranſverſely, as both legs and thighs. 4. *Paralyſis venenata*; when too powerful ſedatives are applied externally, or taken internally.

The apoplexy, hemiplegy, and *palſy*, are ſo nearly connected, that they may be conſidered in one view. In the beginning, the *palſy*, which is cauſed by an exceſs of good blood, is acute; but it ſoon becomes chronical; the other *palſies* are all, and at all times, chronical.

A *palſy* is when there is an abolition of voluntary motion, or of feeling, or both. Beſides the particular ſpecies mentioned above, when both ſides are ſeized, and reaſon is loſt, it is then an apoplexy.

When the muſcles of the face are paralytic, the ſource of the diſorder is in the brain; but if theſe be free, the nerves only of the ſpine, or medulla oblongata, are affected.

Dr. Shebbeare conſiders this diſorder as the effect either of too much vital heat or too little, and that as the ſame effect follows from oppoſite cauſes, ſo the ſame diſorder will require different remedies, according to the varieties of its origin. Occaſionally the *palſy* may proceed from an apoplexy, an epilepſy, violent pains, ſuppreſſion of uſual evacuations, a tranſlation of the morbific matter of acute diſeaſes, whatever diſtends, diſturbs, compreſſes, or contracts the nerves, ſtrong ligatures, luxations, fractures, wounds, gangrenes, inflammatory or other tumors in the coats of the nerves, extreme heat, violent cold, mineral effluvia, a too frequent uſe of hot water, &c. Dr. Cullen obſerves, that the power of voluntary motion may be owing either to a morbid affection of the muſcles, or organs of motion, by which they are rendered unfit for motion, or to an interruption of the influx of the nervous power into them, which is always neceſſary to the motion of thoſe that are under the power of the will. The diſeaſe, from the firſt of theſe cauſes, as conſiſting in an organic and local affection, is to be referred entirely to the claſs of local diſeaſes. As the *palſy*, that diſeaſe only is to be conſidered, which depends upon the interrupted influx of the nervous power; and

and to this alone the appellation of *palſy* ſhould be given.

From anatomy, we ſee that the nerves deſtined for the vital functions ariſe from the cerebellum; thoſe ſubſervient to the ſenſes, from the baſe of the brain; and thoſe ſubſervient to the voluntary motions and the touch, principally from the ſpinal marrow; we may then readily infer, *that in all apoplexies the cauſe compreſſing the nerves is within the brain*; in a PALSY, *within the ſpinal marrow*. The *palſy*, or loſs of motion, thus named, Dr. Cullen obſerves, may be diſtinguiſhed into two kinds; one, depending upon an affection of the origin of the nerves in the brain, and the other depending upon an affection of the nerves in ſome part of their courſe between the brain and the organ of motion. He further adds, that whatever is neceſſary to be obſerved of the firſt, will readily apply to the latter, both in pathology and practice.

A *palſy* ſometimes attacks ſuddenly without any previous ſymptoms by which it might be expected; but ſometimes an hemiplegy ſucceeds an apoplectic fit, and begins with a refrigeration of the ſide to be affected, and a preceding vertigo, and gradually terminates in an abolition of ſenſation and motion; the ſound ſide is often racked with ſpaſmodic and convulſive motions; the mouth is frequently diſtorted like that of a dog, and, as the diſorder proceeds, the functions of the mind, and eſpecially the memory, begin to be weakened.—A *particular palſy* is ſometimes preceded by a ſenſation of weight in the part about to ſuffer, a ſlow motion, accompanied with ſtupor, paleneſs, and torpor; the part affected is lax, flaccid, ſoft to the touch, and cold, like as it is affected in an atrophy or an œdematous tumor.—When the pharynx is affected with a *palſy*, the patient cannot ſwallow.—A *palſy* in the eye-lids is attended with a diſcharge of tears.—A *palſy* of the ſphincter ani is diſcovered by the deſcent of the rectum, and the involuntary diſcharge of the fæces.—A *palſy* in the bladder is known by the involuntary emiſſion of urine. In moſt other caſes the eye diſcovers the nature of the diſorder; or, when it conſiſts of a loſs of ſenſe, the patient's complaint determines it. The parts affected ſometimes appear puffy, at others they are ſhrunk and ſhrivelled; in theſe reſpects, as well as in thoſe of ſenſe being loſt in ſome inſtances, and motion in others, Dr. Shebbeare ingeniouſly accounts for them as follows. He ſuppoſes theſe diſorders to have an exceſs of vital heat for their cauſe; in this caſe, as the body receives its heat from the earth in greater or leſs abundance, according to the quantity of red globules in the blood; and as this heat is conveyed by means of the nerves, as required for the reſpective motions, whether voluntary or involuntary; various circumſtances may occaſion a too ſudden and abundant heat to be conveyed to any part, or through the whole frame, in any inſtant of time; whence, by the return of the ſame from the brain, to and through the reſpective parts, the cellular membrane is ſo dilated as that many cells are ruptured into one; and in proportion as this accident is extenſive, ſo will be the defect of motion; or the exceſſive motion, as well as quantity of fire, may lacerate the parts of the brain, in which thoſe nerves take their riſe, and then paſſing down by thoſe nerves that are deſtined to motion, the action of the part or parts is at an end; or paſſing by thoſe deſtined for ſenſation, ſenſibility is leſſened or deſtroyed; and, in this latter caſe, by the laceration of the cellular membrane, the nerves are ſeparated from contact with the ſkin, ſo that it is not as uſual confined, but riſes ſo far as to produce the appearance of unuſual fullneſs. Dr. Cullen obſerves, that in the *palſy*, the loſs of motion is often accompanied with a loſs of ſenſe; but as this is not conſtantly the caſe, and as, therefore, the loſs of ſenſe is not an eſſential ſymptom of *palſy*, he does not take it into his definition. He further obſerves that, ſo far as it is in any caſe a part of the *paralytic* affection, it muſt depend upon the ſame cauſes, and will be cured by the ſame remedies.

The prognoſtics are generally to be cautiouſly pronounced, at leaſt when delivered with reſpect to a recovery. A ſpaſmodic apoplexy and ſanguineous hemiplegy, are often removed, but they are apt to return and end in a fatal hæmorrhage in the brain:—the other ſpecies of *palſies*, and a ſerous hemiplegy, do not ſuddenly prove mortal; but the cure is more difficult and intricate, the more the ſenſes are injured, and theſe diſorders frequently continue during life.—When infants become *paralytic*, they are ſometimes relieved at or about the years of puberty, but ſuch favourable changes rarely are obſerved in adults.—A *palſy* in the belly and lower limbs is generally mortal, and often accompanied with a gangrene of the affected parts.—If convulſions and great heat are perceived in the parts oppoſite to thoſe that are paralytic, the danger is great.—When a *palſy* follows an apoplexy, or comes on in old age, it is rarely cured.—If the ſeat is in the membranes of the medulla ſpinalis, the the theca vertebrarum, &c. the caſe is out of the reach of art, death is unavoidable, but will only gradually approach.—If the part affected is painful, yet capable of ſenſation, not too cold, nor extenuated, there are ſome hopes of a recovery, which is ſtill more to be expected, if there is a ſenſation of formication and puncture in it.

The indications are the ſame as in the apoplexy; and are,

1. To remove the proximate and remote cauſes, which contribute to interrupt the influx of the nervous fluid into the nerves.

2. To ſtrengthen the parts affected, and the whole nervous ſyſtem.

When a ſanguine plethora is attendant, the principal cauſe is the exceſs of vital heat: bleed to reduce the heat, which muſt be brought and preſerved as near as may be to the ſtandard of health. And as, in this caſe, a laceration of the cellular membrane is the cauſe of motion being defective, as well as of the ſenſe of feeling being diminiſhed, a tight ſtocking, &c. according to the part affected, ſhould be applied, if poſſible, to aſſiſt the reunion of the parts that are torn aſunder. In this ſpecies of *palſy*, the Bath waters, and all heating medicines, are quite contrary to the curative indication: inſtead of them, cooling medicines, ſubtepid baths, and lenient purges, ſhould be uſed. But though this method may be proper in a recent caſe; yet, if it is of long ſtanding, and the blood is impoveriſhed, though the cauſe was too much vital heat, the cure will now be the ſame as when a defect of heat gave riſe to the diſorder.

When there is too little heat in the conſtitution, bleeding, and a cooling method, is evidently injurious; here the Bath water is uſeful both for bathing and inward uſe. The ſhrunk muſcle is reſtored and motion recovered, in curable caſes, by means of electricity. In this ſpecies of *palſy*, the cellular membrane not receiving its due degree of heat for keeping its cells diſtended, they gradually cling together, and thus deſtroy the power of action: warm bathing conduces much to the recovery of theſe patients. In the fit, apply bottles or bladders filled with hot water to the feet; let the body be well rubbed with rectified ſpirit of wine; if the lungs have ceaſed to play, breathe warm breath forcibly into them; and, as ſoon as the patient can ſwallow, give him cordial medicines. After recovery from the fit, attend to what affections may have agitated the patient, and then proceed with warm, nervous, corroborant medicines, not neglecting bliſters, and ſuch other evacuants as the kind of plethora may require.

In both the above ſpecies of *palſy*, a ſtimulating clyſter may be given with all convenient ſpeed; for thus the head will be in ſome meaſure relieved; the beſt ſtimulant is the ſal gem; or, in want of it, common ſalt.

Bliſters are not ſo well applied on the nape of the neck as on remoter parts; for, in ſome inſtances, they have produced convulſive twitchings when placed on the neck or back. In general *palſies*, bliſters are uſeful by their ſtimulus; but they are moſt ſo when only particular parts are affected, and then the propereſt place of application is where the nerves of the reſpective part have their origin; for example, when a *palſy* ſeizes the upper extremities, bliſters ſhould be applied to the vertebræ of the neck, and obliquely towards the ſhoulders: if the lower extremities are affected, the region of the ſacrum is the propereſt part. When, in a *palſy*, there is a plethoric ſtate of the ſyſtem, bliſters do not ſeem to be a ſafe means to be applied; but in all inſtances connected with, or that ſeem to depend upon a relaxed ſet of fibres, a moiſt atmoſphere, or the preſence of too much ſerum in the ſyſtem, bliſters are then the principal remedies to be depended on. They are alſo of ſervice in ſuch ſpecies of *palſy* as are produced by poiſons of different kinds, eſpecially thoſe of a metallic nature; but in theſe caſes, the uſe of ſtrong emetics and purgatives muſt always be premiſed.

After bleeding in the ſanguine ſpecies, ſpaſms of the internal parts, and a febrile ebullition, often remain; in which caſes it will not be proper to take off the fever ſolely, but only to keep it within moderate bounds by the

judicious uſe of nitre, Clutton's febrifuge ſpirit, and ſuch like medicines.

Diuretics of the warm and ſtimulating kind are proper in the ſerous kind of *palſy*; muſtard, horſe-raddiſh, and ſuch like, prove highly beneficial.

If other diſorders attend, a due regard muſt be had to their removal.

Baths of rain water, or *any other that is light*, and in which aromatic ingredients are boiled or infuſed, may be uſed when circumſtances do not admit of the patient's going to Bath.

As to *liniments*, the lnim. ſaponis perhaps equals any other in its efficacy and uſefulneſs.

When mineral exhalations have been the cauſe, the cure is difficult: lead particularly deſtroys ſenſation, whence often in *palſies*, *purging medicines* are required in very increaſed doſes.

A *palſy* from the colic, requires *perſpiratives* inwardly, and *warm applications* outwardly. In this caſe, the *Bath water* is a ſpecific.

When a *palſy* follows an epilepſy, after proper evacuations, *apply bliſters*, and give *aſſafœtida with ſalt of amber*.

A *palſy* in the belly is, in ſome meaſure, relieved by a *fomentation of hot wine*, in which *aromatics* have been boiled, and by drinking a little of the ſame when the pulſe will admit of it. When the tongue is affected, rub it with *muſtard*, or *muſtard and brandy*.

Dr. Cullen obſerves, that in the apoplexy, and in the *palſy*, the cauſes are, a compreſſion, preventing the flow of the nervous power from the brain into the organs of motion; or, the application of narcotic powers, which render the nervous power unfit to flow in the uſual and proper manner. Compreſſion may be from tumor, overdiſtenſion, or effuſion. The ſame means that are uſeful in preventing apoplexy, are uſeful for the ſame end in caſes of *palſy*. The ſame may be ſaid reſpecting the cure; in the beginning, *palſy* proceeds as in the apoplexy. What is ſaid when the cauſe is from compreſſion, may be repeated reſpecting the application of narcotic powers being the cauſe. When the *palſy* hath continued for ſome time, be the cauſe what it may, ſome little deviations from the treatment of apoplexy may be proper. As to the uſe of ſtimulants, both in the apoplexy and *palſy* ariſing from compreſſion, it is true, that they may, and often do, ſo excite the energy of the brain, as to overcome the compreſſion on the nerves; but then they ſo act on the ſanguiferous ſyſtem; and, if this happens in a conſiderable degree, they may be productive of the cauſe which they were given to oppoſe: a circumſtance that calls for careful attention. As to externals, they have occaſionally been uſeful in ſlight caſes, but much cannot be expected from them. Heat, cold, and electricity, are the moſt powerful external applications for relieving general affections. Heat is employed in warm bathing, and thus is a powerful ſtimulant; but as it both ſtimulates the ſolids, and rarefies the fluids, it will be unſafe, when compreſſion may be produced by the congeſtion in the brain, which may follow the uſe of warm bathing. Warm bathing is moſt proper when the cauſe was the application of narcotic powers. Cold is a uſeful ſtimulant, if the power of reaction in the body is equal to the action of the cold upon it: if otherwiſe, cold is extremely hurtful to the paralytic. Electricity acts very powerfully on the nervous ſyſtem; but as it ſtimulates the ſanguiferous, as well as the nervous ſyſtem, it requires caution; for its uſe hath ſometimes been more injurious than beneficial. The efficacy of electricity is more from its repetition than from its force: it is alſo better adapted to relieve when the cauſe was from narcotic applications to the nerves. Exerciſe, ſuch as circumſtances will admit, is beneficial. Internally, the volatile alkaline ſalts and ſpirits, if given in repeated and ſmall doſes, inſtead of large ones, are uſeful and ſafe. In many inſtances of ſerous *palſies*, thoſe vegetables of the claſs of etradynamia, are ſeveral of them very uſeful. Some reſinous ſubſtances, as guaiacum, &c. alſo ſome of the fœtid antiſpaſmodic medicines, have been employed, but without that advantage that is often attributed to them.

See Archigenes, Aetius, Celſus, Cœlius Aurelianus, Aretæus, Bellonius, Trallian, Hoffmann, and Boerhaave. Shebbeare's Theory and Practice of Phyſic. Lond. Med. Obſ. and Inq. vol. iii. p. 160, &c. p. 257, &c. For many uſeful elegant forms of medicine, ſee Brooke's and the London Practice of Phyſic. See Cullen's Firſt Lines, vol. iii. edit. 4. Edinb. Med. Comment. vol. iii. p. 9.

PARALYSIS, in BOTANY, the term for a flower, called *primula veris*, Linn. VERBASCULUM PRATENSE ODORATUM, *primula veris odorata, flore luteo ſimplici*; *primula veris* major, PAIGLES, COMMON COWSLIPS. This plant is ſufficiently known not to need any deſcription. It is valued for its flowers, which have an agreeable ſmell, and uſed to give flavour to a fermented liquor, known by the name of cowſlip wine. The flowers are gently anodyne and antiſpaſmodic.

Boerhaave enumerates twenty ſpecies of the primula veris, and of theſe there are the two following:

Primula veris minor. The PRIMROSE. PRIMULA VULGARIS, LINN. It grows in hedges, and woods; its flowers are weaker than thoſe of the cowſlip: the leaves and roots partake in ſome degree of the nature of aſarum, and are powerful errhines and emetics.

Primula veris, called alſo *herba petri*, *primula inodora lutea*; *verbaſculum pratenſe*. ORSLIPS, or GREAT COWSLIPS. The flowers are diuretic.

None of theſe are now uſed in medicine.

PARAMESOS. See DIGITUS.

PARANOIÆ. See DELIRIUM.

PARAPHIMOSIS, from παρα, *de*, and φιμοω, *to tie with a bridle*. Φιμος ſignifies properly *a ſtricture*, ſuch as the neck of a purſe; called alſo *periphimoſis*. It is when the prepuce is drawn back behind the glans penis, and cannot be drawn over it. See LUES VENEREA. Dr. Cullen places it as a variety of the phlogoſis phlegmone. See Bell's Surgery, vol. i. p. 534. Whites Surgery, p. 345.

PARAPHONIA. *Cacophonia*, *cacaphonia*. DEPRAVED VOICE, of which by ſome there are conſidered, dumbneſs and difficulty of ſpeech. Dr. Cullen places this genus of diſeaſe in the claſs locales, and order dyſcineſiæ. He defines it to be a depravity of the ſound of the voice, and diſtinguiſhes ſix ſpecies. 1. *Paraphonia puberum*; it is that change of voice ſo remarkable in boys about fourteen years of age, which from acute and agreeable, becomes grave and very diſagreeable. 2. *Paraphonia rauca*; when the voice becomes hoarſe and rough, from the dryneſs or flaccid tumor of the fauces. See RAUCEDO. 3. *Paraphonia reſonans*, called alſo *Rhenophonia*; when from obſtruction in the noſtrils, the voice is rough, and the ſound ſeems to come whiſtling through them. 4. *Paraphonia palatina*; when from a defect of the lip, the palate, or uvula, the voice is rough, obſcure, and confuſed. See ASAPHIA, or ASAPHODES. 5. *Paraphonia clangens*, called by ſome *Leptophonia*; when the ſound is ſhrill or ſqualling, or like that of geeſe. VOGEL calls this ſpecies the *cacophonia*; it is alſo called *oxyphonia*. See CLANGOR. 6. *Paraphonia comatoſa*; when from the velum palati, and glottis being relaxed, the voice is ſent out during inſpiration, and ſomewhat reſembles the ſnorting of people aſleep.

PARAPHRENESIS. See DELIRIUM; alſo the *Paraphrenitis*. An INFLAMMATION of the DIAPHRAGM. Its cauſes are the ſame as thoſe of the pleuriſy.

The pain is very violent and deep ſeated in the lower part of the breaſt, or under the ſhort ribs, or ſtriking between them and the back; the fever is very acute, and the delirium conſtant; the belly is drawn up, and kept as much at reſt as poſſible; the reſpiration is exceſſively quick, erect, ſmall, ſuffocating, and difficult, and performed principally by the muſcles of the breaſt; the patient is frequently affected with ſickneſs and hiccough, and often with involuntary laughter, convulſions, and madneſs; the pulſe is uſually very frequent and ſmall, often irregular; there is great anxiety; and ſymptoms of irritation come on, and death frequently enſues: if this does not happen, the progreſs, termination, and manner of treatment, are much the ſame as in the pleuriſy. The pain is greatly augmented during inſpiration, coughing, ſneezing, repletion of the ſtomach, naufea, vomiting, and a compreſſion of the belly in diſcharging the fæces and urine. The riſus ſardonicus, convulſions, madneſs, abſceſs, and gangrene, often terminate the diſeaſe. Sometimes a purulent aſcites is a conſequence. In CULLEN's Noſology, it is ſynonymous with pleuritis. SAGAR, from what he has experienced in his own patients, gives the following account.

It is an inflammation, attended with an obſcure pain at the ſpurious ribs, oppreſſion of the breaſt, often bloody ſpits, difficulty of breathing, and anxiety; the afflicted complained of tightneſs, like being bound with a cord, at

the præcordia; often drawing back the angles of the mouth, almoſt involuntarily, they become delirious; ſometimes they are ſeized with a lethargy, or preternatural propenſity to ſleep; the pulſe is unequal, intermittent, irregular, and hard; the hypochondria drawn inwards, reſpiration without the motion of the diaphragm; the urine is ſometimes pale, at others high-coloured, with an internal burning heat at the precordia.

THE CURE is generally the ſame as in the pleuriſy. See PLEURITIS. Emollient clyſters are peculiarly uſeful. See Boerhaave's Aphoriſms. Fordyce's Elem. part ii.

PARAPHROSYNE. It is a tranſitory inſanity without a fever. A DELIRIUM. A ſymptomatic madneſs. See MANIA.

PARAPLEGIA, } from *παρα*, ſignifying ſomething
PARAPLYXIA, } *injurious*, and *πλησσω*, *to ſtrike*. A *paraplegy*, or a *palſy* of all the parts below the neck: thus it is now underſtood; but in Hippocrates it ſeems to ſignify a *palſy* in any particular part, in conſequence of an apoplexy or epilepſy. Dr. Cullen makes it that ſpecies of *palſy* which divides the body horizontally, or tranſverſely, all below ſuch a part being paralytic; the palſied part beginning below the neck. See PARALYSIS.

PARAPOPLEXIA. See APOPLEXIA.

PARARYTHMUS. See ARYTHMUS.

PARATHREMA. See LUXATIO. It is alſo a tumor from protruſion; as an hernia.

PARASITICALES PLANTÆ. PARASITICAL PLANTS. They are ſuch as are produced out of the trunk or branches of other plants, from whence they receive their nouriſhment, and will not grow upon the ground, as the miſleto, &c.

PARASPHAGIS. The part of the neck contiguous to the clavicles.

PARASTATA. It ſignifies any thing ſituated near another.

PARASTATÆ, from *παριστημι*, *ſtand near*. *Aſſiſtentes*, *aſtites glanduloſi*. Herophilus and Galen called theſe the varicoſe *paraſtatæ*, to diſtinguiſh them from the glanduloſe *paraſtatæ*, now called proſtatæ. See alſo EPIDIDYMIS; and TUBÆ FALLOPIANÆ.

PARASTREMMA, from *παραστρεφω*, *to diſtort* or *pervert*. A perverſion, or a convulſive diſtortion of the mouth or any part of the face.

PARASYNANCHE. A ſpecies of QUINSY.

PARATHENAR MAJOR. This muſcle in each foot is fixed backward by a fleſhy body, to the outer part of the lower ſide of the os calcis, from the ſmall poſterior external tuberoſity, all the way to the anterior tuberoſity; there it joins the metatarſus, and at the baſis of the fifth metatarſal bone, ſeparates from it again, and forms a tendon, which is inſerted in the outſide of the firſt phalanx of the little toe, near its baſis, and near the inſertion of the parathenar minor. It ſeparates the little toe from the reſt.

—— MINOR. This muſcle in each foot is fixed along the poſterior half of the outer and lower ſide of the fifth bone of the metatarſus. It terminates under the head of the bone in a tendon, which is inſerted in the lower part of the baſis of the firſt phalanx of the little toe. Some call theſe muſcles *tranſverſales pedis*.

PARAU. See BEZOAR ORIENTALES.

PAREGORICA, from *παρηγορεω*, *to conſole* or *mitigate*. An epithet for medicines which relieve pain. See ANODYNA.

PAREGORICUM ELIXIR; now called OPII TINCTURA CAMPHORATA. CAMPHORATED TINCTURE of OPIUM. Take of hard purified opium, flowers of benjamin, of each one dram; camphor, two ſcruples; eſſential oil of aniſeeds, one dram, by weight; proof ſpirit of wine, two pints: digeſt for three days. Pharm. Lond. 1788. This is uſeful in tickling coughs, as it allays that uneaſy ſenſation, and is ſuppoſed to open the breaſt, and give greater liberty of breathing. It is given to children againſt the chincough, from 5 drops to 20; to adults from 20 to 100.

PAREIRA BRAVA, vel PAREYRA; alſo called *ambutua*, *caapeba*, *convolvulus colubrinus*, *botou*, *boutua*, *beutua*, *brutua caapeba*. WILD VINE. It is the CISSAMPELOS PAREIRA, *foliis peltatis cordatis emarginatis*, CLASS, DIOECIA; ORDO MONADELPHIA. LINN. Gen. Plant. 1138.

It is the root of an American climbing plant. It is brought from Braſil, generally in crooked pieces of different ſizes, from that of a man's finger up to that of a child's-arm; the outſide is browniſh, and variouſly wrinkled; the internal ſubſtance is of a pale, dull, yellowiſh hue, and interwoven, as it were, with woody fibres, ſo that on a tranſverſe ſection there appears a number of concentric circles, croſſed with ſtriæ, running from the centre to the circumference. There is a white ſpecies; the bark of the root of it is white, and the ſubſtance within appears like the root of liquorice.

This root has been in high eſteem as an attenuant and diuretic, in ſuppreſſions of urine, in nephritic and calculous complaints, in ulcers of the kidnies and bladders where the urine is mucous and purulent, and can ſcarce be voided without pain; in aſthmatic caſes, when thick phlegm hath been very troubleſome, an infuſion of this root hath brought on expectoration; in fluor albus, rheumatiſm, and jaundice;—by ſome foreign, and French phyſicians: but from the experiments made by the Engliſh it has fallen into diſrepute. The doſe of the powdered root is from ℈ j. to ℈ ij. in decoction ʒ iij. to a pint, divided into three doſes. It gives out its virtue to water or to ſpirit. See Lewis's Mat. Med. Neumann's Chem. Works.

PARENCEPHALIS, from *παρα*, *near*, and *εγκεφαλος*; *the brain*. See CEREBELLUM.

PARENCHYMA, from *παρεγχυω*, *to pour into*. Eraſiſtratus is ſaid to have introduced this term to ſignify all that ſubſtance which is contained in the interſtices betwixt the blood-veſſels of the viſcera, which he imagined to be extravaſated and concreted blood. According to ſome, any of the viſcera through which the blood is ſtrained.

PARENCHYMATICI. VISCERAL INFLAMMATIONS.

PARESIS. Aretæus ſays it is a palſy of the bladder, when the urine is either ſuppreſſed or diſcharged involuntarily. It is now generally underſtood to be an imperfect paralyſis; and may be conſidered as ſynonymous with ANAISTHESIS, which ſee.

PARETUVIER, See GUAPARAIBA.

PARIETARIA, COMMON PELLITORY of the WALL. It is the PARIETARIA OFFICINALIS, *foliis lanceolato-ovatis, pedunculis dichotomis, calycibus diphyllis*, CLASS POLYGAMIA, ORDO MONOECIA. LINN. Gen. Plant. 1152. This plant is called *parietaria*, from *paries*, *walls*; *muralis*, from *murus*, *a wall*; *helxine*, from *ελκω*, *to draw* or *attract*, becauſe its rough leaves ſtick cloſe to what touches them; *perdicium*, from *perdix*, *a partridge*, becauſe partridges love to feed on it; *vitriaria*, and *urceolaris*, *urceola*, *urceoli vitrei*; becauſe by its mucouſneſs it is of ſervice for ſcouring pots and glaſſes. This plant hath tender reddiſh ſtalks, rough, uncut, oblong leaves, pointed at both ends, and imperfect rough flowers growing in cluſters along the ſtalks, followed each by a ſmall ſhining ſeed. It is perennial, common on old walls, and amongſt rubbiſh. It flowers in May.

The leaves have been uſed externally for cooling; and internally as diuretic and emollient, though now very ſeldom uſed:—notwithſtanding it ſtands in both the London and Edinburgh Pharmacopœias. See Raii Hiſt.

PARIETARIA OSSA, from *paries*, *walla*; they defend the brain like walls. So the bones of the *ſinciput* are called. See BREGMA.

PARIGUA. See CASSINE,

PARIN CHAKKA. See CHINA SUPPOSITA.

PARIS QUADRIFOLIA. See HERBA PARIS.

PARISTHMIA, from *παρα*, *near*, and *ισθμος*, a part of the throat ſo called. See TONSILÆ.

PARISTHMIOTOMUS. An inſtrument with which the tonſils were formerly ſcarified.

PARMENTALE. See LEVATORES LABII INFERIORIS.

PARNASSIA, called alſo *hepatica alba*, *gramen Parnaſſi*, *ciſtus humilis*; *pyrola rotundi-folia*. GRASS of PARNASSUS, or WHITE LIVER-WORT. The leaves are roundiſh, and diſpoſed in a circle; it grows in flowery marſhy places, and flowers in Auguſt. The whole plant is ſaid to be cooling and diuretic; but it is not in uſe at preſent. See Raii Hiſt.

PARONYCHIA. A WHITLOE, or WHITEFLAW, from *παρα*, *near*, and *ονυξ*, *a nail*. It is alſo called a FELON. Le Dran calls it *panaris*: amongſt the Arabians, it is called *dogga*; alſo named *pandalitium*, *panaritium*; by Paracelſus, *paſſa digitum*; when at the ſide of the finger nail, *onychia*. It is an abſceſs at the end of the fingers, *abſceſſus digitorum*, &c. and is generally ſtrumous. It differs not from any abſceſs in any other part. According

as it is ſituated more or leſs deep, it is differently denominated, or divided into ſpecies by ſome writers. Dr. Cullen places it as a variety of the phlogoſis phlegmone.

It begins with a flow, heavy pain, attended with a ſlight pulſation without ſwelling, redneſs, or heat; but ſoon the pain, heat, and throbbing are intolerable; the part grows large and red, the adjoining fingers and the whole hand ſwells up; in ſome caſes, a kind of red and inflated ſuſe or ſtreak may be obſerved, which beginning at the affected part, is continued almoſt to the elbow; nor is it unuſual for the patient to complain of a very ſharp pain under the ſhoulder; and ſometimes the whole arm is exceſſively inflamed and ſwelled; the patient cannot ſleep, the fever, &c. increaſing, and ſometimes delirium or convulſions follow.

When it is ſeated in the ſkin or fat, in the back or the fore part of the finger, or under or near the nail, the pain is ſevere, but ends well.—*When the perioſteum is inflamed or corroded*, the pain is tormenting.—*When the nervous coats of the flexor tendons of the fingers or nerves* near them are ſeized, the worſt ſymptoms attend. *The ſecond ſpecies* proves very troubleſome, and ſometimes ends in a caries of the ſubjacent bone. *The third ſpecies* is very tedious in the cure, and uſually the phalanx on which it is, is deſtroyed.

If the firſt kind ſuppurates, it muſt be opened and treated as abſceſſes in general; but the beſt method of treating the other two ſpecies, is, on the firſt, or at fartheſt the ſecond day, to cut the part, where the pain is ſeated, quite to the bone; if this operation is longer deferred, a ſuppuration will come on; in which caſe, ſuppuration ſhould be ſpeedily promoted, and as early a diſcharge given to the matter as poſſible. As the pain is ſo conſiderable as to occaſion a fever, and ſometimes convulſions, the tinct. opii may be added to the ſuppurating applications, and alſo given in a draught at bed-time.

See Le Dran's Operations. Heiſter's Surgery. Kirkland's Med. Surgery, vol. ii. p. 269. Bell's Surgery, vol. v. p. 431. Pearſon's Principles of Surgery, vol. i. p. 82, &c. White's Surgery, p. 18.

PARONYCHIA, called alſo *ſedum*, *ſaxifraga*, *alſine*, WHITLOW-GRASS. It is ſaid to be emollient; but it is of too little efficacy to maintain a place in practice.

PAROPIÆ. See OCULUS.

PAROPTESIS. from παλαω, *to roaſt*. A provocation of ſweat, by making a patient approach a fire, or by placing him in a bagnio.

PARORASIS. An IMBECILITY of SIGHT. See DYSOPIA.

PARORCHIDIUM. A DETENTION of the TESTICLES, as when they have not yet deſcended upon the ſcrotum. The teſticles are ſometimes detained in the body; this caſe is called *cripſorchis*; *chrypſorches*; or concealed *teſticles*. Sometimes the *teſticles* (one or both) are detained in the groin: uſually about the time of the child's birth they deſcend into the ſcrotum; in ſome inſtances a little before birth, in others ſoon after. But this is very uncertain with reſpect to different perſons; alſo in the ſame perſon the two teſticles will conſiderably vary as to the time of their deſcent. Sometimes one, at others both, are detained in the belly, or ſtick in paſſing through the groin. Theſe accidents happen and continue a longer or leſſer time after the birth; and in ſome inſtances never paſs down into the ſcrotum. Mr. Pott takes notice of this caſe, and gives ſeveral inſtances of it in the quarto edition of his works; where he ſays, that he knows not of any particular inconvenience ariſing from the detention of a *teſticle* within the cavity of the belly; but the lodgment of it in the groin renders it liable to be hurt by accidental preſſure, &c. When it is ſo hurt, it may be miſtaken for a different diſeaſe, and thereby occaſion its being very improperly treated. To which conſiderations he adds, that there is no kind of diſeaſe to which the *teſticle* is liable in its natural ſituation, but what may alſo affect it in any or all its unnatural ones. In the firſt caſe related by Mr. Pott, a *teſticle* being detained in the groin of a young healthy ſeaman, who hurt the part by hitting it againſt a piece of timber; the tumor there became extremely painful, and was miſtaken as a bubonocele, from which it might have been more readily diſtinguiſhed by the following circumſtances, had not the extreme tenderneſs of the injured *teſticle* abſolutely prevented any examination there by the touch; and the very hard ſwelling of the ſcrotum, which prevented any certainty of a *teſticle* being there or not. But Mr. Pott here ſays, that the tumor in the groin did not, like the bubonocele, point obliquely from the ilium towards the pubes, but lay as it were acroſs the groin: alſo, as neceſſarily muſt happen, that when the ſcrotum became ſoft, no *teſticle* could be felt in it. Two ſtriking circumſtances by which to diſtinguiſh the detained *teſticle* from the bubonocele, and alſo to determine the nature of the caſe. In the earlier part of this young man's life, this detained *teſticle* had been miſtaken for a rupture, and a truſs had been applied to it. The ſecond caſe, the *teſticle* was detained in the groin; this patient had alſo been adviſed to wear a truſs on the ſuppoſition that the caſe was a rupture; but he could not wear it, becauſe of the pain it occaſioned. At length getting a clap, this detained *teſticle* inflamed, forming an hernia humoralis, which was miſtaken for a bubo. In this caſe, the tumour was moveable, and the ſcrotum on that ſide had no *teſticle* in it: two circumſtances ſufficient for diſtinction and determination. Both the above caſes were cured as inflammations of the *teſticles* are, when their ſituation is in the ſcrotum.

PAROTIDÆA. See CYNANCHE PAROTIDÆA.

PAROTIS, from παρα, *near*, and, ους, *the ear*, or from παρα, and ωτος, genitive of ους, *the ear*. The PAROTID GLAND, to which the terms *eparma* and *eparſis* are often applied. It is ſeated on each ſide, in a cavity below and before the ear, between the maxillary proceſs, the zygomatic proceſs, and the angle of the lower jaw; and the duct paſſes over the buccinator to pierce the membrane of the mouth, near the third dens molaris of the upper jaw. It is a conglomerate gland, and hath veſſels from the temporal artery. It hath an appendicle at the tendinous beginning of the maſſeter muſcle. It is one of the ſalival glands. The *parotides* are called *dioſcuri*, from that being the name of CASTOR and POLLUX. It is alſo an inflammation, or an abſceſs of the parotid gland. Dr. Cullen makes it ſynonymous with bubo. A bubo here is called *parotis*, and by ſome *ſigile*. See ABSCESSUS PAROTIDIS.

PAROXYSMUS, from παροξυνω, *to irritate* or *render ſharp*. A PAROXYSM; fit of a diſeaſe; ſtyled alſo *exacerbatio*. In which laſt ſenſe is to be underſtood, that period of the diſeaſe, in which the morbid cauſe exerts its powers moſt ſtrongly, perceptible by the encreaſe of violence, and number of ſymptoms, and indeed either periodically, as in fevers as well intermittents, as continual fevers verging towards the type of intermittents; or even without period; where the paroxyſm appears to coincide with the height, or vigour of the diſeaſe. Sometimes alſo paroxyſm is taken for criſis, becauſe commonly it is apt to occur in the paroxyſm or ſtate of the diſeaſe, accord ng to Fœſius.

PARTHENIASTRUM. BASTARD FEVERFEW. Miller takes notice of two ſpecies, one of which grows in Jamaica, where it is called WILD WORMWOOD, and is uſed as a vulnerary. The other is found in the Spaniſh Weſt Indies.

PARTHENIUM. A name for the *tanacetum*, *matricaria*, and *artemiſia*.

PARTURITIO, from *partus*, *a birth*. LABOUR, or the bringing forth of a child.

Women are generally delivered of their burden about the end of the ninth month, or very early in the tenth: inſtances though have occurred of nature's deviating, and of healthy children, which became vigorous men, being brought forth at different periods, from ſeven to eleven months, after conception.

The cauſe and mechaniſm of *labour* is as follows, ſome days before the *labour* commences, the belly ſeems leſs; by its contents ſinking lower down; ſoon after this certain efforts are made by nature, which from their exciting pain, are uſually called *pains*; in the beginning, theſe pains are ſlight, and the intervals conſiderable; after ſome of theſe efforts, the uterus begins to contract, and a glary mucus diſcharges from the vagina: after this, the pains become more ſevere, return more quick, and continue longer; the pulſe is now affected, the ſkin is hotter, the face reddens, and a general agitation follows; the mucus is tinged with blood; the os tincæ opens, its edges grow thin, the membranes protrude with the waters, dilate and widen the orifice; the child, at the inſtant of pain, is raiſed by the compreſſed waters from the os internum, towards the fundus, whilſt the uterus itſelf advances and deſcends by degrees into the inferior baſon. When the pain ceaſes each time, the womb riſes, but not ſo high as before; the tumor formed by the membranes diſappears; the os tincæ is relaxed, and the diameter diminiſhed; the child falls, by its gravity, upon the lower part of the womb; and may be eaſily diſtinguiſhed through the relaxed membranes, as alſo what part of its body preſents

fents to the paſſage. Towards the end of *labour*, the ſucceſſion of pains are rapid, and the efforts violent: at firſt the pains uſually begin in the ſmall of the back, and terminate about the pudenda; but now they are perceived in the regio umbilicalis, and die away towards the fundament, where, in moſt inſtances, they leave a ſenſibility of weight. The tumor formed by the waters diſtending the membranes below the mouth of the womb, dilates the parts, until at length it burſts and diſcharges the waters. If the child's head preſents fairly, it ſtops the diſcharge of the remaining waters. Sometimes the ſame effort which burſts the membranes, expels the infant, and terminates *labour*; at others the interval is long before the delivery of the child. The head of the child having paſſed the os internum, enters the vagina, which widens in proportion as it ſhortens; the perinæum is vaſtly ſtretched, and the frenulum ſometimes torn in the paſſage; the nymphæ are obliterated, and the labia pudendi are turned inward, and confounded in the general diſtenſion. At length the head forces the os externum, and the body readily follows, with the reſt of the waters, mixed with blood. At this laſt period, the woman trembles and is convulſed, but is ſoon relieved by the expulſion of the child; after which there is a calm, until returning efforts are exerted for the excluſion of the *placenta*, &c. called *ſecundines*. Hence it appears, that *parturition* demands the concurrence of ſeveral agents. The cauſe and determination of *labour* is the firſt, and this is in the womb itſelf; the womb contracts, and compreſſes whatever it contains, in ſuch a manner as forces it to eſcape by the part which makes the leaſt reſiſtance, which is conſtantly by the vagina. The womb is muſcular, and reticulated; ſome of its fibres run uniformly parallel upon the inner ſurface of the womb, from the fundus to the neck; others diagonally croſſing upon theſe, and others again horizontally interlaced, and ſo cloſely wove towards the fundus, as to have been miſtaken for a muſcle deſtined for the ſeparation of the placenta. The uterus, in ſhort, is capable of dilatation and contraction, analogous to the bladder, and acts in the ſame manner; the diaphragm and the abdominal muſcles co-operating to exclude the urine. The irritation which the womb ſuffers at the end of pregnancy, is what determines its action, and is the true cauſe of *labours*, as will thus appear. Before conception, the cavity of the womb is triangular and flattiſh; the ſides of the triangle are curved, with their convexity inward; this renders the angles very pointed, and leaves the uterus more thick in the middle, and at the fundus, where eminences are formed; the neck of the womb alſo is thick, and equals one third of its length, which together with the above eminences, may be juſtly conſidered as the magazine or ſtore, in which nature hath ſhut up, and cloſely ſtowed the folded fibres, coiled and doubled, as it were, in reſerve, to expand with the gradual developement of this organ; as in the buds of trees are lodged the leaves and flowers, which to expand and blow, need only the juices of the circulating ſap. In the firſt months the retained menſes moiſten, and penetrate the tiſſue of the uterus, ſwell and diſtend the fibres, to the end of the fifth month, when, and rarely ſooner, the cervix begins to ſhorten, and diminiſhes daily. The expanſion once begun, continues with the growth of the fœtus, until the whole ſtock of fibres are unbent and exhauſted. At this period, the volume of the fœtus ſtill augmenting, the womb ſtretches beyond its limited dimenſions, becomes irritated, ſuſceptible of pain, and hence *labour* proceeds. The prelude to *labour* conſiſts of gentle efforts of ſhort duration; the womb eſſays its force, as it were, exactly filled, and meets with equal reſiſtance on every ſide, except towards the orifice, where the ſenſation of the firſt pain begins. The contraction of the womb acting on the orifice, diſtends its fibres, and cauſes pain; when the orifice is ſufficiently dilated to let the head paſs, the pain ceaſes, but it is renewed when the head enters the vagina, and ſtretches the fibres of theſe parts. Hence the degrees of pain may be accounted for, by the more or leſs extenſion of the orifice, &c. As the neck of the womb hath neither an equal length, nor equal thickneſs in different women, and as the developement of its fibre may be retarded, or accelerated, by various circumſtances; in ſhort, as the operation goes on in proportion with the increaſe of the child, which may be faſter or ſlower, as well in the womb, as after its *birth*, it is obvious that ſome children may be protruded before the ordinary time of nine months, or their *birth* be protracted until after this term. However ſmall the dilatation of the os internum may be, it will occaſion a ſeparation of the chorion from the uterus, and break the communicating veſſels, ſo that the fluid, &c. that circulated between them, will tranſude, and become the ſource of that mucous diſcharge by the vagina in the beginning of *labour*: and this ſeparation, affected by gradation, will explain why the placenta retains its adherence until the laſt. If the membranes are ſtrong, their progreſſive ſeparation continues until it arrives at the borders of the placenta, where the ſubſtance, adheſion, and reſiſtance being greater, the bag generally burſts.

In a natural *labour*, the progreſs of the child's head, through different parts, is as follows: The head of the child, if it hath not ſuffered much by preſſure, is near an inch narrower from ear to ear, than it is from the forehead to the vertex. The vertex is the part which preſents in a natural *birth*. The bones that are preſſed together at the preſentation, are the two parietal and the occipital; ſometimes the frontal bones will be the ſuffering parts. When the vertex firſt preſents, one ear is to the pubis, the other to the ſacrum, ſo that the forehead muſt be to one ſide of the pelvis, and the hind head to the other; thus the broadeſt part of the head is here in the wideſt part of the pelvis; ſo that being ſqueezed by *labour*-pains, the vertex deſcends into the lower part of the iſchia, where the pelvis becomes narrower at the ſides, and here is the advantage of the ſacrum being concave; for the forehead now turns round into it, and the vertex towards the pubis, which ſtill takes the advantage of the width of the pelvis; it is then puſhed forwards, turning as on a fulcrum, until the forehead riſes gradually from under the perinæum.

With reſpect to preternatural preſentations, ſee PRÆSENTATIO.

Labours are uſually divided into natural, laborious, and preternatural.

Natural *labours* are, when the head preſents and is delivered by common pains, requiring no other aſſiſtance than what is needful in ſaving the perinæum from being lacerated. Laborious *labours*, called alſo *lingering*, *non-natural*, and *difficult*. They are when the head preſents, but *labour*-pains being inſufficient, ſome ſafe contrivance becomes neceſſary to bring the head forward; and theſe are of two kinds; firſt, when delivery is effected without deſtroying the child; and ſecondly, when, in order to delivery, the head of the child muſt be opened, that its ſize may be leſſened, and the mother's life ſaved. Preternatural *labours* are when the legs or breech are delivered firſt, the body and head laſt, or when different parts of the body preſent, except the head, or when the head preſents in ſuch a ſituation that the child is forced to be turned and delivered by the feet.

Some pains which come on about the time of *labour*, and ſuch as reſemble *labour*-pains, are not always real *labour*-pains, and therefore ſhould be diſtinguiſhed. *Falſe pains*, as they are uſually called, which are not the effect of *labour*, are cauſed by coſtiveneſs, a purging or a plethora. If the os tincæ is ſhut during the pains, they are falſe, and if the woman is coſtive, give her a clyſter; if a purging attends, gentle opiates will relieve; and if ſhe is plethoric, bleed. True *labour*-pains are promoted by opium much more than by ſtimulating cordials. Giffard ſays, that clyſters to provoke too languid throws, an opiate to put away falſe pains, and a cordial after delivery (if the woman was low), were all the medicines he uſed. Falſe and true pains ſometimes attend at the ſame time; in this caſe an opiate ſhould be given.

Until the woman is likely to be ſoon delivered, ſhe may be up or in bed; but in order to delivery, the moſt convenient poſture for herſelf and her aſſiſtant is when laid on her left ſide upon a bed, with the knees drawn up towards the belly. Short-breathed people may be laid high with their heads, or delivered in a ſitting poſture, with their knees raiſed towards their bellies.

The aſſiſting powers in a natural *labour* are, particularly the diaphragm, abdominal muſcles, feet reſiſting againſt ſomething to keep the abdominal muſcles tenſe, holding ſomething to pull with the hands, that the muſcles of reſpiration may be tightened; a ſtrong inſpiration at the beginning of each pain, and a retention of the breath during its violence, and as the pain abates, a leiſurely paſſing out of the breath. The practice of crying out and of drawing up the breath as the pain goes off, retracts the fœtus, and leſſens its force in diſtending the parts.

When the child's head preſſes againſt the perinæum, it ſhould be ſupported by gently preſſing with the hollow of the hand during the pain, to prevent its tearing.

Laborious *labours* may be cauſed by previous weakneſs, unſkilful management, convulſions, paſſions of the mind, rigidity of the os internum, eſpecially when an inflammation is brought on, by dilating it with the fingers, and the head being got through, it contracts about the neck; narrowneſs of the pelvis, largeneſs of the head, a diſtorted pelvis, &c. Lingering *labours* will ſometimes exhauſt the woman's ſtrength, when the head is in a right poſition, notwithſtanding all our care. The head being long confined in the pelvis, is equally dangerous to the mother and the child; for by its preſſure againſt the ſoft parts it may ſtop the circulation, and bring on inflammation and gangrene, which would prove certain death to the mother, and to the child by its affecting the brain; when danger of theſe kinds attend, the forceps are to be uſed.

Preternatural *labours* are more or leſs difficult, according to the poſition of the child and the contraction of the uterus; therefore are divided into three claſſes. 1. When the lower parts of the child, as the feet, knees, or breech, preſent. 2. When it is known that the preſentation is wrong, and we have the advantage of turning the child immediately on breaking the membranes, by means of the waters. 3. When the child preſents wrong, and the uterus is cloſely contracted, the advantage of the waters being loſt.

When it is known that the breaſt, belly, ſhoulders, or any part but the head, feet, knees, or buttocks preſent, when the membranes have ſomewhat protruded, break them, and immediately introducing the hand, bring the feet into the paſſage, and ſo deliver, as when the feet preſent. See PRÆSENTATIO.

PARTUS. See BIRTH.

PARULIS, from παρα, *near*, and ουλον, *a gum*. An INFLAMMATION, *boil*, or *abſceſs* in the GUMS. See ABSCESSUS GINGIVARUM.

PASMA. See CATAPASMA.

PASPIER. See CRITHMUM.

PASSA. See PARONYCHIA.

PASSIO. A PASSION, AFFECTION, or DISEASE. See AFFECTIO, and HYPOCHONDRAICUS MORBUS.

PASSULÆ. See UVÆ PASSÆ.

PASSUM. See VITIS.

PASTA REGIA, PASTILLUS. } See COLLIX, and TROCHISCI.

PASTINACA. PARSNEP. The root is thick, fleſhy, and juicy; the leaves are large and broad, and ſtrengthened by a thick rib; the ſeed is oval, large, thin, marginated, and caſts its huſk. Boerhaave enumerates eight ſpecies. It grows in meadows, and on the borders of fields, flowers in July, and is chiefly noted as a food moſt agreeable to rabbits. The name is given to ſeveral vegetable products, viz. *Branca urſina Germanica*, *ſpondylium*, *Cow-Parſnep*. It is likewiſe a name for a ſpecies of *ſium*, *dacus*, *tordilium*, and *cuminoides*.

—— HORTENSIS. See PASTINACA SATIVA.

—— OLUSATRA, called alſo *opoponax*, *pſeudoceſtus*, *panax heracleum majus*, *panax paſtinacea*, *ſpondilium vel paſtinacæ Germanicæ affinis panax*, *panax Herculeum*. HERCULES'S ALL-HEAL, or WOUND-WORT. It hath uncut leaves, and heart-ſhaped, but with one of the ſides lower than the other; the middle ribs bearing the ſeveral ſets of leaves, which ſtand in pairs along a larger rib. It is a native of the warm climes, and bears the cold of our's. The gum opoponax of the ſhops is the concreted juice of this plant. The ſeeds are much warmer than the wild or the garden *parſnep*. The roots and the ſtalks ſmell like opoponax. Boerhaave ſays, that on wounding the ſtalk of one of theſe plants, he obtained a juice, which, being inſpiſſated, agree in all reſpects with the gum called *opoponax*, which ſee.

PASTINACA SATIVA, called alſo PASTINACA HORTENSIS. GARDEN PARSNIP. The leaves are paler coloured than the wild ſort; they are ſmooth and indented. The roots have a conſiderable ſweetneſs in their taſte, contain a great deal of mucilage, and are very nutritious; they yield with rectified ſpirit of wine a ſweetiſh extract, and in diſtillation with water a ſmall portion of eſſential oil with the flavour of the root; the ſeeds are aromatic, but thoſe of the wild ſpecies are more ſo. Theſe roots are chiefly uſed as a part of diet.

—— SYLVESTRIS, alſo called *elaphoboſcum*, *elaphiſon*, *batcia*, *banica*, and WILD PARSNEP. It hath dark green, indented leaves, and ſlender woody roots; it is common about the ſides of fields, flowers in June and July, and ripens its ſeeds in September. On eating the roots a heat is complained of in the mouth, which is ſoon followed by thirſt; then the pupil gradually dilates, and the ſight is loſt; a delirium comes on, but on a diſcharge by vomit, theſe ſymptoms ſoon abate; the dilatation of the pupil is the laſt that diſappears. Among the garden ſort a faulty one is ſometimes met with, but *wild parſneps* are harder when boiled than the garden ſort, at leaſt than the good ones, and thus the bad may eaſily be known.

PATELLA. A diminutive of *patina*. The KNEE-PAN, called alſo *rotula*, *mola*, *genu*, *ſcutiforme os*, *cartilagineſum*, *diſciforme*, *oculus genu*, *caucaloides*, *epigonatis*, *epimulis*, *mylacris*, *myle*, and CAP of the KNEE. It is a flattened bone, ſituated at the anterior part of the joint of the *knee*, with its broad part upwards, and the pointed part downwards. Its anterior ſurface is ſmooth; its poſterior ſurface is alſo ſmooth, and covered with a cartilage: it is divided internally by a longitudinal ridge, and tranſverſely likewiſe, ſo that there are four cavities, the two lower of which move upon the femur in the extenſion, the two upper in the flexion of the leg. The tendons of the extenſors are inſerted into the upper part of the *patella*, and a ligament runs from the lower part, to be connected to the tibia. The *patella* ſuffers the leg to have ſome degree of rotation, which if it had been a fixed proceſs like the olecranum, it would not: it likewiſe is leſs incident to fractures than if it had been one ſolid bone with the tibia. At the time of birth it is cartilaginous.

—— DOCUMASTICA. See CUPELLA.

PATETÆ UVÆ, or PATETHEISÆ. See UVA PASSA.

PATHECA. See JACE BRASILIENSIBUS.

PATHEMA. See AFFECTIO.

PATHETICI. See DYSOREXIÆ.

PATHETICUS, from παθος, *paſſion*. An epithet of the fourth pair of nerves, becauſe they direct the eyes to intimate the paſſions of the mind. They are alſo called *trochlearis*, and *muſculi obliqui ſuperiores*. They are the ſmalleſt pair in the body, and appear below the edge of the tranſverſe proceſſes; they paſs by the ſide of the ſella turcica, and go through the foramen lacerum orbitale ſuperius, to the ſuperior oblique muſcle.

PATHOGNOMONICUS, from παθος, *a diſeaſe*, and γινωσκω, *to know*. An epithet for a ſymptom or a courſe of ſymptoms that are inſeparable from a diſtemper, and are found in that only, and in no other. Quod convenit omni, ſoli, & ſemper. Pathognomic ſymptoms are therefore thoſe by which a diſeaſe may with certainty be diſcovered, the enumeration of which forms the moſt conciſe definitions.

PATHOLOGIA. See MEDICINA.

PATIENTIA. See LAPATHUM HORTENSE.

PATIENTIÆ MUSCULUS. See LEVATOR SCAPULÆ.

PATOR NARIUM. See NARES.

PATRAPIUM. See APIUM.

PATRIMONIUM. See PUDENDA.

PATRUM CORTEX, vel PULVIS. See CORTEX PERUVIANUS.

PATURSA. See LUES VENEREA.

PAU DE SANGUE. See GUM. RUB. ASTRING.

PAULINA. CONFECTIO. The CONFECTION called PAULINA. This is a warm opiate. It is the *paulina* of Ariſtarchus, which is the ſame with the confectio Archigenis. The London College have rejected it from their Pharmacopœia of the year 1788, and not improperly.

PAVANA, i. e. MOLLUCCENSE LIGNUM. See CATAPUTIA MINOR, under GRANA TIGLIA.

PAVATE, PAVETTE. See MALLEAMOTHE.

PAVINA. See HIPPOCASTANUM.

PAVOR. FEAR. See PRURITUS.

PECHEDION. See PERINÆUM.

PECHYAGRA. See ARTHRITIS.

PECHYS. See OLECLANON.

PECHYTYRBE. See SCORBUTUS.

PECTEN. See PUBIS OSSA.

PECTEN VENTRIS. See SCANDIX.

PECTINATIO. COMBING. It is a ſpecies of friction.

PECTINÆUS vel PECTINALIS Muſc. From *pecten*, the os pubis. It riſes from the upper part of the os pubis, on the outſide of Poupart's ligament, runs downwards, backwards, and outwards, and is inſerted into the linea aſpera below the little trochanter. Brown ſays the

it is called *pectinæus*, becauſe it riſes from the os pectinis (pubis); it is alſo called *lividus*, from its colour.

PECTORALE DECOCTUM. See HORDEI DECOCTUM COMPOSITUM.

PECTORALIS. PECTORAL. An epithet for medicines which are appropriated to diſorders of the breaſt. Employed in that general ſenſe, Dr. CULLEN thinks it abſolutely improper, and that it has certainly led to abuſe. Though, as it is at preſent, commonly employed in the ſame ſenſe as expectorantia, it perhaps might be allowed; but certainly the latter term, as more preciſe, ought to be the one commonly made uſe of. If the pectoralia may, with Mr. LIEUTAUD, be of three kinds, demulcents, aſtringents, and reſolvents, it will be very obvious that the general term will be liable to much abuſe.

—— MAJOR vel ADDUCENS HUMERI. This muſcle riſes in a radiated manner from the anterior and inferior part of the clavicle, then from the ſternum, and at the lower part from the third, fourth, and fifth ribs, from the cartilage, and partly from the bony portion of the ſixth rib; then paſſes towards the arm, with its upper edge contiguous to the deltoid, betwixt which two the cephalic vein has its courſe; near its inſertion the pectoralis doubles in, on its lower edge, and forms a poſterior and anterior lamella; then it runs to be inſerted into the anterior part of the biceps groove. This muſcle is partly a rotator of the arm, but its great uſe is to bring the arm forward, cloſe to the body.

—— MINOR. Some call it *ſerratus anticus minor*: it lies beneath the pectoralis major. It riſes by three digitations from the third, fourth, and fifth ribs, then paſſes obliquely upwards and outwards, and joins with the ſhort head of the biceps, to be inſerted into the caretid proceſs of the ſcapula. Some make this a muſcle of the ſcapula, others of reſpiration, according as they make one or the other termination the fixed point.

—— INTERNUS. See TRIANGULARIS STERNI.

PECTORARIA HERBA. See ANGELICA SATIVA.

PECTORIS OS. See STERNUM.

PECTUS. The BREAST, called alſo *chelys*, becauſe it reſembles in its figure the back of a tortoiſe, from χελωνη, *a tortoiſe*; alſo the *metatarſus*.

PECTUSCULUM. See METATARSUS.

PEDECELLI. See PHTHIRIASIS.

PEDICULOSUS MORBUS. See PHTHIRIASIS.

PEDIBUS BOVIUM, OLEUM. NEAT'S FOOT OIL. It is prepared by boiling the joints of horned cattle in large veſſels. See ANCHYLOSIS.

PEDICULI INGUINALES. See MORPIONES.

PEDICULARIA. } See STAPHISAGRIA.
PEDICULARIS. }

PEDICULATIO. See PHTHIRIASIS.

PEDICULUS. A LOUSE. In BOTANY it is ſynonymous with PEDUNCULUS, from *pedo*, *pedure*, the ſame as *fulcire*, *to prop*, or *ſupport*, a PEDUNCLE. By older writers, it was called the *foot ſtalk*; by ſeveral moderns, the *fruit ſtalk*. To the firſt of which MARTYN objects, becauſe there is the ſame term for the ſupport of the fructification and leaf; to the ſecond, becauſe the peduncle being the ſupport of the flowers, as well as of the fruit, we are reduced to the abſurdity of ſaying, a many-flowered fruit ſtalk; and, to both, becauſe peduncle is generally received, and intelligible in every nation where botany is ſtudied; *for the peduncle is the fulcre of the fructification, or a partial ſtem ſupporting that only.* Ray, and other writers, uſed the claſſical word *pediculus*. LINNÆUS probably changed it for *pedunculus*, becauſe the former ſignified a ſort of inſect, as well as a little ſtalk that ſupports a fruit. See MARTYN's Lang. of Botany.

PEDICUS. See EXTENSOR DIGITORUM BREVIS.

PEDILUVIUM, *lavapedium*. A BATH for the FEET. The *feet* are very ſenſible, and a *bath* of warm water removes their ſpaſm, and, by conſent, ſpaſms and pains in the belly. If the *feet* are cold, the belly is coſtive; pain, ſuch as the colic, affects it; the ſkin is rough, perſpiration defective, and the ſalutary evacuations from the uterus and hæmorrhoides checked; hence the *pedilave* is extenſively uſeful. Baths for the feet ſhould be uſed at bed-time, and thus a general perſpiration is produced. If uſed a few days before the menſtrual diſcharge, they are ſaid to promote them. They are alſo particularly uſeful in ſome affections of the head, and at the onſet of febrile complaints.

PEDION, and PELMA. See PES.

PEDORA. The SORDES of the eyes, ears, and feet.

PEDRO DEL COBRA. See COBRA DE CAPELLO.

PEDRO DEL PORCO. See BEZOAR HYSTRICIS.

PEDUNCULÆ CEREBELLI. See CEREBELLUM.

PEDUNCULUS. See PEDICULUS.

PEGANON. See RUTA.

PEGE. A FOUNTAIN. See OCULUS.

PELADA. A ſhedding of the hair from a venereal cauſe.

PELECANUS. A PELECAN. The name of an inſtrument for drawing the teeth; alſo a glaſs veſſel formerly uſed in chemiſtry for the digeſtion and circulation of liquors poured in at their narrow necks, which were afterwards hermatically ſealed: at preſent two matraſſes are uſed inſtead of a *pelecan*, the neck of one being entered into the neck of the other.

PELIOMA. See SUGILLATIO.

PELLICULA MEMBRANACEA. It is in general any thin membrane. A name alſo of the AMNIOS.

PELMA. See PES.

PELTATA CARTILAGO, from *pelta*, *a buckler*. See ASPERA ARTERIA.

PELVIS. A name for the inferior part of the cavity of the belly. It is bounded forward by the os pubis, backward by the os ſacrum above, and coccygis below, laterally by the ilia above, and iſchia below.

In midwifery, the knowledge of the ſtructure, and peculiarities of the *pelvis*, is an important circumſtance. The brim of a well-ſhaped *pelvis* repreſents an irregular oval, or ſomething that approaches to a triangle; if it is conſidered as an oval, its greateſt axis is from ſide to ſide; if we conſider it as a triangle, the poſterior part is far longer, and the oſſa pubis conſtitute the other two ſides of the triangle, the lower circumference is formed behind by the ſacrum and os coccygis, on each ſide by the iſchium and ſacro ſciatic ligaments, and before by the lower part of the pubis; when the body is reclined, or half-ſitting, as it were, the brim of the *pelvis* is horizontal, and a line would paſs from the navel, through the middle of the cavity; but when a women is in labour, or near her time, this imaginary line muſt take place higher, and accordingly we find, that the firſt of the external parts, which the head of the child preſſes againſt, is behind the anus, and from thence it gradually advances up the perineum, until it comes to the lower part of the ſymphyſis of the oſſa pubis. The chief uſes we are to make of this ſuppoſed line, are, firſt, by it we place the woman in a good poſition during labour; for then ſhe can act more ſtrongly with her abdominal muſcles, and the child's head will fall directly into the middle of the *pelvis*; ſecondly, it will be a direction for us to introduce the forceps upon the child's head, and the hand into the uterus, when neceſſary.

In conſidering the *pelvis*, we ſhould obſerve its width, the depth and form of its cavity, and the extent of its brim from the fore to the back part, which, in a well-formed *pelvis*, is an inch leſs than it is from ſide to ſide, four inches and a half from the fore to the back part, and five inches and a half from ſide to ſide.

The lower circumference of the *pelvis* is nearly equal, but when we allow for the os coccygis being moveable, it makes a quarter of an inch more in its longer direction from the os coccygis to the os pubis, than from iſchium to iſchium. The depth of the *pelvis*, from the upper edge of the ſacrum, where it articulates with the vertebræ lumborum, to the lower part of the coccygis, is about five inches in a ſtrait line. When the os coccygis is preſſed back, it is then ſix inches; from the brim of the *pelvis*, to the lower part of the ſymphyſis of the os pubis, is only two inches: whereas, from the under part of the iſchium, it is four inches. The brim is concave internally all round.

A ſtrait *pelvis* will cauſe a difficult labour; its ſtraitneſs is known as follows: introduce your finger up the vagina, and if you can feel the os ſacrum, the *pelvis* is ſtrait; or touch the oſſa pubis with your fore-finger, and ſtrive to touch the vertebræ of the loins with your middle finger; if you can reach them, it is conſidered as narrow, and vice verſa. It is alſo the name for a cavity in the kidneys; for the cochlea of the ear; and hence *pelvis* renum, aurium, & cerebri.

PELVIS. See alſo CEREBRUM, and RENES.

PEMPHIGODES, or PEMPHINGODES. Fevers diſtinguiſhed by flatulencies, and inflations, in which we feel a ſort of ærial effluvia paſſing through the ſkin of the patient in the manner of an exhalation, and ſtriking upon the touch. Galen's Com. on 6 Epid. ſect. i. aph. xvii.

Others say it is a fever, by the intenseness of whose heat pustules are excited in the mouth, called *aphonæ*, or thrush. Fœsius says, that some will have it to be a synochus, in which, by the heat, the blood-vessels are inflated, whence some call it an inflative fever.

PEMPHIGUS, from πεμφιξ, *bulla, a vesicle*. The vesicular fever, called also *bullosa febris, exanthemata ferosa; morta*. Dr. Cullen places this genus of disease in the CLASS PYREXIÆ; and ORD. EXANTHEMATÆ. He defines it to be a contagious typhus. It is a rare disease in this country. On the first, second, or third day of the disease, little vesicles, the size of a nut, appear on different parts of the body; they continue a few days, and at last exude in the form of a thin ichor. To this, he annexes the following observations: "from the opinion of others, rather than my own, this character is taken; because I have seldom seen this disease, and never have observed it epidemical, or pursuing a regular course, as is here described."—And, with regard to the species, he says, "Since I never have seen a pemphigus, which I could consider as an exanthematous fever; and have found only very few observations in the writings of physicians concerning a disease of this kind, almost every thing inserted in our Nosology must necessarily be taken from SAUVAGES; therefore, I have followed him, though I would willingly have omitted this malady, since almost all that has been said about it, appears to me doubtful, obscure, and ambiguous. Francis Home, an eminent colleague of mine, shewed me a man slightly feverish, in whom vesicles, the size of a hazel nut, arose first on his arms, and afterwards, successively, on his whole body, which in two or three days after, exuding a little serous humour, collapsed. But this fever discovered no peculiar disposition or type, and, being by no means contagious, soon disappeared." Synopsis Nosol. Method. p. 148, 149. WALLIS on Health and Disease.

Dr. Withers, in his Treatise on the Asthma, p. 154, 155, says, "In the case of E. P. the vesicular eruption, which was very sore and painful, was preceded and accompanied with some feverish symptoms evidently of the low kind. It continued only for a few days, and then gradually went off. As it was so mild, it did not require any particular treatment; but had it been violent, and attended with a malignant, nervous, or putrid fever, the bark, elixir of vitriol, red wine, and stimulants, would have been highly necessary. By that method of treatment, not entered upon too hastily, nor delayed too long, I cured two patients a few years ago of the *pemphigus*, in which the fever was extremely putrid, and a great many gangrenous sloughs, of a fetid smell and most dreadful appearance, followed the eruption of the blisters, attended with a low delirium for many nights, and the greatest dejection of countenance and prostration of strength." See Acta Helvetica, vol. ii. p. 260. Cullen's First Lines, ed. 4. vol. ii. p. 254. Edinb. Med. Commentaries, vol. vi. p. 79.

PEMPTÆUS. See INTERMITTENS FEBRIS.

PENÆA SARCOCOLLA. See SARCOCOLLA.

PENICILLUS. A TENT or PLEDGIT.

PENGUIN. See KARATAS.

PENIS, from *pendo* vel *pendendo, to hang*, because it hangs without the belly. It is also called *caulis, coles, colis, mentula, priapus*; and is composed of three parts, viz. the two corpora cavernosa, and the corpus spongiosum urethræ. Its skin, which is thin, and without fat, hath a reduplication, which makes a hood, præputium, which covers the glans penis, or *balanus*; the small ligament, by which it is tied to the under-side of the glans, is called *frænum*, also *canis*, and *filellum*; the use of the prepuce is to keep the glans soft and moist, and to preserve its sensibility. The *penis* hath a small ligament, which arises from its back, a little from its root, and which ties it to the upper part of the os pubis. It receives two branches of veins from the hypogastric vessels, and its arteries from the hypogastric and pudicæ: the two veins unite towards its root, and make one trunk, which runs on the back of the *penis*. It hath two nerves from the sacrum, and several lymphatics, which empty themselves into the inguinal glands. It hath three pair of muscles, viz. the erectores, acceleratores, and transversales. Cowper observes, that the cuticula on the glans *penis* is villous or downy, and that the cutis is thinner here, and on the scrotum, than any where else. Regnerus de Graaf accurately describes the *penis*. Ruysch describes the *glans penis*, called also *cuspis*, better than de Graaf. See also Cowper's Observations on the *Penis*.

PENNA, called also *mentula alata*. A FEATHER. If a *feather* is swallowed, it should, if possible, be extracted. In the third vol. of the Lond. Med. Obs. and Inq. p. 7, &c. is an account of a successful attempt to recover a quill from the stomach, by means of a whalebone with a sponge at each end, to each of which was a thread loosely connected, and by which the quill was entangled, and so brought up.

PENO-ABSOU. A tree in America, whose bark is very fragrant, and whose fruit, which is the size of an orange, contains from six to ten nuts, from which an oil is expressed. The fruit is poisonous, but the oil is used to cure the wounds received by poisoned arrows.

PENTADACTYLON. See CATAPUTIA.

PENTAGYNIA, (πεντε, *quinque, five* and γυνη, *mulier, a woman.*) The name of one of the orders in the 5th, 10th, 11th, 12th, and 13th, classes in the Linnæan System, containing those plants which have five pistils in an hermaphrodite flower; which pistils in the sexual system are considered as the female organs of generation.

PENTANDRIA, (πεντε, *quinque, five*, and ανηρ, *maritus, husband*). The name of the fifth class in the Linnæan System, comprehending those plants which have hermaphrodite flowers, with five stamens.

PENTANEURON. See PLANTAGO MINOR.

PENTAPHARMACUM. A medicine consisting of five ingredients.

PENTAPHYLLUM. CINQUEFOIL. See QUINQUEFOLIUM.

PENTAPLEURUM. See PLANTAGO MINOR.

PENTOROBUS. See PŒONIA.

PEPASTICA, also PEPTICOS. DIGESTIVE MEDICINES. These are supposed to promote the production of a proper or laudable pus in wounds and ulcers. It however seems doubtful whether this general term be proper or necessary, because though there are medicines which certainly seem to answer this purpose, yet whether they directly contribute to this by their immediate action, or only correct those circumstances which impede the operation of nature, is a little uncertain.

PEPITA NUX. See NUX VOMICA SERAPIONIS.

PEPLION, or PEPLOS. They were purging medicines for evacuating bile and phlegm. Sometimes it is spoken of under the names of *mecon, meconis*, and *meconium*; also *chamæsyce, papaver spumeum, symphytum*, and *tithymalus*.

PEPLIOS LUTETIANORUM. See FABAGO.

PEPO. COMMON POMPION. Boerhaave enumerates fifteen species. They are not easily digested. By pressure an oil is obtained from the pulp, which softens the skin. See Raii Hist.

PEPTICOS. See PEPASTICA.

PEQUETI RECEPTACULUM. See RECEPTACULUM CHYLI.

PERAGU. A shrub in Malabar, whose juice kills worms, and its roots cure the lientery, colic, &c. See Raii Hist.

PERCOLATIO. See DEPURATIO.

PERDETUM. See SISARUM.

PERDICIUM. See PARIETARIA.

PEREGRINUM LIGNUM. See NEPHRITICUM LIGNUM.

PERETERION, from περαω, *transfodio, to dig through*. See TREPANUM.

PEREXYL LUSITANIS. See CAAPONGA.

PERFECTI MAGISTERII OLEUM. See LATER.

PERFOLIATA. See BUPLEURUM.

PERFORANS MANUS. See FLEXOR TERTII INTERNODII DIGITORUM MANUS.

—— PEDIS. See FLEXOR LONGUS PEDIS.

PERFORATA. See HYPERICUM.

PERFORATIO. See SETACEUM.

PERFORATUS MANUS. See FLEXOR INTERNODII SECUNDI DIGITORUM MANUS.

—— PEDIS. See FLEXOR SUBLIMIS PEDIS.

—— CASSERII. See CORACO-BRACHIÆUS MUSCULUS.

PERFRICATIO. See HORROR.

PERIAMMATA. See AMULETA.

PERIADYSMIA. See GASTRODYNIA.

PERIANTHIUM, (from περι, *circum*, and ανθος, *flos, a flower*). The calyx, so called, when contiguous to the fructification. When it includes the stamina, and germen, it is the perianthium of the fructification; when the stamina, without the germen, are included, the perianthium,

anthium of the flower; the perianthium of the fruit, when it contains the germen, and not the ſtamina. See CALYX.

PERIANTHIUM ABBREVIATUM. Shorter than the tube of the corolla.

PERIAPTA. See AMULETA.

PERIAPTON, *ſalutis magneticum*. See DRIFF.

PERIBLEPSIS, from περιβλεπω, *to ſtare about*. That kind of ſtaring look which is obſerved in delirious perſons.

PERIBOLE, from περιβαλλω, *to ſurround*. Sometimes it ſignifies the dreſs of a perſon; at others, a tranſlation of the morbific humours to the ſurface of the body.

PERICARDII ARTERIA. The ARTERY of the PERICARDIUM. This ariſes from the anterior middle part of the common trunk of the ſubclavian, or the carotid; it runs down upon the pericardium all the way to the diaphragm, to which it ſends ſome branches.

—— VENA. The VEIN of the PERICARDIUM. It ſometimes ſprings from the trunk of the ſuperior cava, at others from the origin of the right ſubclavian. The left vena pericardii comes ſometimes from the left ſubclavian before the mammaria, ſometimes from the mammaria or diaphragmatica ſuperior on the ſame ſide.

PERICARDITIS. See INFLAMMATIO PERICARDII.

PERICARDIUM, from περι, *about*, and καρδια, *the heart*, called alſo *capſula*, *involucrum*, and *faculus cordis*. The firſt membrane of the *pericardium* is formed by the pleura, which is connected to the *pericardium* by a cellular membrane; but this is only an occaſional covering, leaving the *pericardium*, where it adheres to the diaphragm. The ſubſtance of the *pericardium* is a ſtrong tough membrane, compoſed of two lamellæ, the external of which is by much the ſtronger; the internal is a complete bag, without perforation, being reflected over the *heart* itſelf. This internal coat contains the fluid called liquor pericardii, which was ſuppoſed to be ſecreted by glands lodged there, but is certainly ſecerned by the ſmall continuations of the arteries. In ſound habits this liquor is found in a ſmall quantity; in unſound habits we find a larger quantity: its appearance is like ſerum, a little tinged with blood. The redneſs is owing to the tranſudation of the blood in the muſcular cavities of the *heart*; and the longer the body is kept, the redder the liquor grows. The uſe of the *pericardium* is to afford the liquor, and to confine the *heart*; and as it is connected by a great ſurface of the diaphragm, perhaps it keeps the *heart* unmoved by the motions of the diaphragm in inſpiration: but there is very little in this, as the middle of the diaphragm hath not much motion in inſpiration and expiration. The *pericardium* is much larger than the *heart*; it is not fixed to the baſis of the *heart*, but round the large veins above the auricles, before they ſend off the ramifications, and round the large arteries before their diviſions. This membrane is ſubject to different affections, particularly dropſy, inflammation, and ſuppuration, which ſee under HYDROPS, INFLAMMATIO, and ABSCESSUS PERICARDII.

PERICARDIO-DIAPHRAGMATICÆ VENÆ. See DIAPHRAGMATICÆ ſuperiores.

PERICARPIUM, from περι, *about*, and καρπος, *fruit*, or *ſeed*. The germen, ſo called in its ſtate of maturity; it is a viſcus, big with ſeeds, or a veſſel producing ſeeds, which it lets drop when they are ripe; or, it may be conſidered as the ovary or germ fecundated, or arrived to a ſtate of maturity, after the flower is paſt, containing ripe ſeeds analagous to fruitful eggs. It is diſtinguiſhed by ſeveral appellations, as *capſula*, *ſiliqua*, *legumen*, *conceptaculum*, *drupa*, *pomum*, *bucca*, *ſtrobilus*, *folliculus*. Our Engliſh botaniſts call the pericarpium of LINNÆUS, *ſeed-veſſel*. See alſo CATAPLASMA.

PERICHONDRIUM. The *perichondrium* is ſaid to be only a continuation of the perioſteum. This Dr. Hunter ſays may be true of that ſort of cartilage which ſupplies the place of bone in an adult, as the trachea; or in ſuch as ſupplies the place of bone in infants, as epiphyſes; but on the cartilages that are expanded over the extremities of articulating joints, the *perichondrium* is the inner layer of the capſular ligament, reflected over the cartilage extremely fine. This is not diſcoverable in adults, but in young ſubjects, where the parts are ſeparable, it is eaſily diſcernible.

PERICHRISIS. See LINIMENTUM.

PERICHRISTA. Any medicine with which the eye-lids are anointed in an ophthalmia.

PERICLASIS, from περι, *about*, and κλαω, *to break*. A fracture with a great wound, wherein the bone is laid bare.

PERICLYMENUM. See CAPRIFOLIUM.

PERICLYMENUM PARVUM. See IPECACUANHA.

PERICRANIUM, from περι, *about*, and κρανιον, *the head*. The membrane which immediately inveſts the bones of the ſkull, or under the hairy ſcalp. It is made up of two lamina, cloſely united; the external lamina parts from the internal at the ſemicircular plane ſurrounding the temples, and becomes a very ſtrong aponeurotic, or ligamentary expanſion, which covers the temporal muſcle, and is afterwards fixed in the external angular apophyſis of the os frontis, in the poſterior edge of the ſuperior apophyſis of the os malæ, and in the ſuperior edge of the zygomatic arch, as far as the root of the maſtoid apophyſis. At this place the aponeurotic coif ſeems to form the external lamina of the *pericranium*, and they both communicate with particular aponeurotic expanſions of the maſtoid, maſſeter, zygomatic, and other neighbouring muſcles.

PERIDESMICA, ISCHURIA. A ſuppreſſion of urine from ſtricture in the urethra. See ISCHURIA.

PERIDROMOS. The extreme circumference of the hairs of the head.

PERIESTECOS, from περιιστημι, *to ſurround*, or *guard*. An epithet for diſeaſes, ſigns, or ſymptoms, importing their being ſalutary, and that they prognoſticate the recovery of the patient.

PERIGRAPHE, } An inaccurate deſcription or de-
PERIGRAPHÆ. } lineation. See alſo RECTUS ABDOMINIS.

PERIGUA. See CASSINE.

PERIN. See TESTES—PERINÆUM, and ANUS.

PERINÆOCELE. A rupture in the perinæum.

PERINÆUM, from περινεω, *to flow round*. Becauſe that part is generally moiſt, called alſo *interfœmineum*; *greſſura*; *pechedion*; ſome name it *perin*. It is the ſpace between the anus and the parts of generation; it is divided into two equal lateral portions by a diſtinct line, which is longer in males than in females.

In midwifery it is obſerved, that when the os externum is ſo much dilated by the head of the fœtus as to allow the delivery of the ſame, it is generally ſtretched to the length of three, and ſometimes of four inches; whence at this time delivery ſhould not be precipitated, leſt a laceration in this part ſhould be the conſequence. Inſtead of ſtretching back the *perinæum* with the finger, as is the practice of ſome, it ſhould be ſupported with the palm of the hand, and the head of the child, at the ſame time moderately oppoſed in its force againſt it, that its diſtenſion may be made gradually, until ſufficiently dilated for delivery. Inflammations and lacerations of the *perinæum*, if they occaſion vomiting, are fatal in a few days. If a laceration happens, keep the woman long in bed, and adviſe her to keep her knees cloſe, as conſtantly as poſſible; her bowels ſhould be kept ſoluble.

The puncture of the *perinæum* is an operation which was uſed to be performed when the bladder was under ſuch a ſuppreſſion of urine as could not be relieved by any gentler method. The operation was performed by puſhing a trochar from the place where the external wound in the old way of cutting for the ſtone was made, into the cavity of the bladder, and ſo procuring the iſſue of the water through the canula. At preſent, inſtead of this method, the water is evacuated by puſhing the trochar into the bladder, from a little above the os pubis. This method of diſcharging the urine hath ſucceeded, but when the ſuppreſſion is of any conſiderable ſtanding, the operation is dangerous. See Le Dran's Operations. Sharp's Operations. Sharp's Critical Enquiry. White's Surgery, p. 466. There are alſo abſceſſes formed in this part. See ABSCESSUS PERINÆI.

PERINÆALIS ISCHURIA. See ISCHURIA.

PERINEUCOS. See EPINEUCOS.

PERIN-PANEL. A bacciferous Indian ſhrub, the leaves of which are uſed in ſuffumigations againſt hyſteric ſymptoms. See Raii Hiſt.

PERINYCTIDES. PUSTULES, or PIMPLES, which break out in the night.

PERIOSTEUM, from περι, *about*, and οστεον, *the bone*; called by LE DRAN, *circumoſſalis*. It is that membrane which covers the bone. It is divided by authors into

two layers; the internal layer (or *periosteum* itself) lies close to the bone, and appears furrowed, as the bone is: this is one of the finest, thinnest membranes imaginable; and appears, upon a successful injection, to be extremely vascular; the reason of which is, that the vessels which run to the bone, play a while upon the surface of this membrane, before they enter into the substance of the bone. The external layer is of a white glistening appearance. It is merely adventitious, being composed of the fibrous expansions of membranes, ligaments, and tendons; wherefore it runs in various directions, according as these tendons, &c. are variously inserted. The *periosteum* is not elastic; Dr. Hunter thinks it is not very sensible; and advises, in amputations, not to scrape it, but only to pass the knife about it, a little above the place where you intend to saw. The *periosteum* is wanting on those parts of a bone where strong tendons enter, as in the trochanter. The uses of the *periosteum* are, to prevent the bad effect of friction on the bones, to protect the vessels running into the bones; to connect epiphyses; and to give origin to muscles. See Abscessus Periostei and Inflammatio.

PERIPHIMOSIS. See Paraphimosis.

PERIPLOCA. Italian and French SCAMMONY; called also *scammonia Monspeliaca rotundioribus foliis, apocynum latifolium*. Its concreted juice purges in somewhat larger doses than the *scammony* of the shops. Boerhaave takes notice of four other species, but they are not purging.

PERIPNEUMONIA. } A PERIPNEUMONY, from
PERIPLEUMONIA. } περι, *about*, and πνευμων, *the lungs*, also *pulmonia*. Dr. Cullen places it as a species of PNEUMONIA, and defines it a *peripneumonic pneumony*, attended with a pulse not always hard; sometimes soft; an obtuse pain in the thorax; a constant difficulty of breathing, often not perceived unless when the body is in an erect posture; the face swelled, and of a purple colour; most commonly with a moist cough, and often bloody spits. Of this he makes three divisions.—1. *Simple idiopathic peripneumonies.*—2. *Idiopathic peripneumonies, complicated with fever*;—examples of which are, *the putrid,—ardent,—and malignant peripneumony.*—3. *Symptomatic peripneumonies*, viz. *the arthritic—exanthematic—phthisical—hydrophobic,—and rachialgic.* By other authors, three kinds of *peripneumonies* are distinguished, as follow: the TRUE, or *inflammation in the lungs*; the SPURIOUS, or *when a pituitous matter obstructs the vessels of the lungs*; the CATARRHOUS, or *when a thin acrid defluxion on the lungs is the cause.*

The true *peripneumony* is produced by cold applied to the skin, or mouth, or stomach, where there is inflammatory diathesis; an over distension of the lungs; or by any of the general causes of inflammation. Such causes as particularly affect the *lungs*, are a faulty air, caustic matter in the atmosphere, or other faulty exhalations, violent exercise of the *lungs* by running, wrestling, &c. violent disturbances of the mind, a quinsy, accompanied with an orthopnœa, a violent pleurisy, or an excessive paraphrenitis. The disorder excited, various effects will be produced, according to the diversity of the part affected; for a bronchial inflammation by compression and contagion inflames the contiguous extremities of the pulmonary artery. When the extremities of the pulmonary artery are inflamed, the blood becomes stagnant, the vessel is extended, the thinnest part of the fluids is expressed, as it were, by transudation, and the thicker parts are accumulated: and all the blood, as yet capable of circulation, is collected between the right ventricle of the heart, and the extremities of the pulmonary arteries: hence the *lungs* become oppressed, incapable of expanding, and are livid, the left ventricle of the heart is deprived of blood, a great weakness is brought on, with a variety of other symptoms, as follow:

Inflammation of the chest, or of its contents, is always known by the following symptoms, fever, difficult breathing, cough, and pain in one part of the breast or another.

This fever is of the inflammatory kind, and begins with an obtuse pain in the breast, which is rather tensive and oppressive than acute; sometimes this pain is felt in one, and sometimes in both sides; sometimes it extends along the reins, at others it shoots to the back and to the scapulæ; the breathing is difficult, and affected with a kind of snoring; a cough usually attends; it is sometimes dry, at others the matter discharged is bloody, or chiefly blood; this cough is more acute than that which attends in the pleurisy, the air from the *lungs* being particularly hot: the mouth, tongue, and skin are very dry; there is a sense of fulness in the thorax, anxiety about the præcordia, with restlessness and tossing in bed continually; this restlessness never fails to attend, and that even in the beginning; sleep becomes a stranger; the pulse is commonly hard, always quick, but seldom strong or regularly full; it is sometimes soft, slender, and intermitting; before bleeding it is hardly to be perceived in some cases, but after bleeding it is stronger; the urine is often turbid; the difficulty of breathing, and the sense of fulness increase; and a quantity of thick mucus being secreted, occasions a sound as the air passes through the branches of the trachea: if the symptoms are violent at the first, the patient is not able to lie down; when he does, it is only on his back; for he can hardly breathe if not erect, and the passage of the blood through the *lungs* is obstructed, so that he fears suffocation; the veins of the neck swell, the pulse becomes every way irregular; one arm is often affected as with a palsy; the face swells, is of a dark colour, especially about the cheeks and the eyelids; and if the weather is sultry, livid spots appear on the neck and breast, the tongue swells, and is of a dark-red colour; the eyes are dull; a stupor, and a low delirium succeed, in which the patient raves, and seems neither asleep nor awake; sometimes there is a degree of paleness, and an air of astonishment at the beginning of the disease, the eyes staring wildly, and this portends much danger. The best expectoration resembles what is spit up with a cold, but rather more yellow and streaked with blood; but becoming less so, inexpressible anguish is felt, and at last the patient is suffocated. If the symptoms do not arise to so great a height, and at the same time no means of resolution have been applied before the fourth day, or if these means are not sufficiently powerful, or if they are not continued until the disease is totally carried off, a suppuration takes place, and is indicated by slight and frequent shiverings; the pain at the same time going off gradually, the sense of fulness, and the cough, with the other symptoms diminishing, and the patient being only able to lie on that side which was most affected.

This disorder should be distinguished from a pleurisy; from a difficulty of breathing in fevers; from the spurious peripneumony; inflammation in the mediastinum, or in the intercostal muscles; from the catarrh, the asthma, and other difficulties of breathing which happen in chronical diseases.

A white sediment in the urine, or a red sediment changing to a white, promise a safe and speedy recovery.—If the *peripneumony* takes place after a cold fit of a fever, and the fever continues along with the inflammation, which hath been relieved either naturally or artificially, *a crisis in the second week sometimes carries off both diseases.*—If in the young and robust, a bloody spit appears on the fourth day, *it is a good sign*; and if, on the seventh day, the same patient sweats spontaneously, *the disease is ended.* If in phlegmatic and languid constitutions, when the disorder hath a deep seat in the *lungs*, there is a termination of the disease on the eleventh or fourteenth day, partly by expectoration, and partly by sweat, the pulse becoming softer, the sleep calmer, and the strength being increased, *the disease ends well.*—If the disorder continues to the twenty-first day, *an abscess will be the consequence.*—It is most dangerous in flat-breasted and in asthmatic persons.—Frequent stools, and urine without any sediment, *are bad signs.*—If the pulse is small, soft, and irregular, *the danger is great.*—If the disease rushes on at once with a violent attack; if the horror, coldness, and shivering, lasts many hours, and are followed with nearly a scorching heat; if the brain is affected at the first onset; if there is a small purging with a tenesmus; if the patient abhors the bed; if either excessive sweating, or excessive dryness of the skin attend; if the natural countenance is greatly changed, *there is reason to apprehend the most fatal consequences.* Suppuration generally *proves fatal.*

Avoid the extremes of heat and of cold where the patient lies. All the drink and medicines should be lukewarm.

Dr. Fordyce, in the second part of his Elements, speaks of a natural cure. He says, that this may happen by a secretion of mucus from the *lungs*, which at first is spit up thin, and with uneasiness, becoming gradually thicker, and of a yellowish or greenish cast; it is often mixed with blood, relieving, and gradually diminishing the symptoms,

ſymptoms, ſo as to carry off the diſeaſe before the fourteenth day. Or, this diſorder may depart by an hæmorhage, or by an inflammation ariſing in ſome other part of the body, as the noſe, &c.

The artificial cure, the ſame author obſerves, is effected by ſimple reſolution, or by evacuation from the mucous glands. The firſt method is to be purſued in the robuſt, the ſecond in the more infirm. Thus, *in all caſes, on due bleeding*, or *expectoration, the cure chiefly depends*.

When the cure is attempted by reſolution, the firſt ſtep will be to bleed freely. This operation muſt be uſed in point of frequency, according to the ſtrength of the pulſe, or its fulneſs and hardneſs. A large orifice ſhould be made to diſcharge the blood. The ſooner blood is taken away, the more beneficial the evacuation proves. When from the violence of the inflammation, the pulſe is ſmall, very frequent, and irregular, it often riſes, and becomes regular after the operation; and from the diſeaſe increaſing, or recurring, it is frequently neceſſary to repeat this evacuation two or three times. As ſoon as the preceding cold fit is over, take by a large orifice from ℥ xii. to ℥ xvi. of blood; this large bleeding gives more relief than twice the quantity taken at three times; and except ſymptoms promiſe well after the firſt bleeding, take from ℥ vii. to ℥ xii. more in four hours after; and, as required, repeat it in ſomewhat leſs quantities in ſix or eight hours. *If florid frothy blood is ſpit up*, bleed as far as the patient's ſtrength will admit; but if the blood which is taken from a vein appears pale, and jelly-like, without the true buff; or if a ſpitting is already come on, bleeding will be injurious. The air in the room ſhould be kept moderately warm. The vin. antim. and kali acetatum ſhould be given in the uſual doſes as in inflammatory fevers; and if *they are repeated every hour*, or *at leaſt every two hours, their efficacy will be more ſuited to the intention*. Emollient clyſters, in which nitre is diſſolved, ſhould be frequently injected. Nitre may be mixed in every draught of the patient's drink, or it may be rendered agreeably acid by the addition of Clutton's febrifuge ſpirit. Bliſter the back and ſides, eſpecially after bleeding: if in the courſe of the diſorder expectoration ſtops too ſuddenly, and is not immediately followed by ſome other evacuation, bliſter both the legs. *A decoction of the rad. ſerpent. ſeneka*, given in proper doſes, and at due intervals, is of ſingular advantage.

If expectoration is attempted as the means of relief, bleeding is rarely admitted. If the expectorated matter be yellowiſh, or ſtreaked with blood, by keeping it up, the moſt deſirable ends will be anſwered. The gum ammoniacum is uſually preſcribed in this caſe, but the antimonium tartariſatum, or the vin. antim. given in ſuch doſes as will keep up a nauſea, are of more extenſive efficacy. But expectorating medicines, as ſuch, muſt not be given before the matter to be diſcharged becomes fit for excretion, for otherwiſe a greater flow of humours will be invited to the *lungs*. Vapours from warm water may be frequently received into the *lungs* with the breath. From the beginning give the decoct. rad. ſenekæ, beſides which few other medicines will be required. If the diſeaſe ſeems to be of a mixed kind, or if the lungs are not ſo much inflamed, as they are loaded with a viſcid or pituitous matter, apply bliſters between the ſhoulders, and on the ſides. When the mucus that is ſpit up is very thin, opiates may be uſed in ſmall doſes, to moderate the pain; and, to eaſe the cough, let mucilages be frequently ſwallowed. A ſharp ſudden cold air, too hot an air, exceſſive ſweating, imprudent purging, and diſturbed paſſions of the mind, may any of them check expectoration, in which caſe proceed as already directed. This diſorder, though generally carried off by expectoration, is ſometimes removed by urine, which on the ſeventh, ninth, or eleventh day, or, ſometimes, in the intermediate days, begins to let fall a plentiful ſediment of a pale red colour, and ſometimes real pus; theſe diſcharges are ſucceeded by ſalutary ſweats, but are preceded by anguiſh, palpitations, an irregular pulſe, &c. If the pulſe flags, give a few grains of the ſal c. c. with the conf. aromatica. If when blood is taken away from a vein, it appears of a looſe or broken texture, immediately deſiſt from any diſcharge of it, and begin with the uſe of cooling antiputreſcents, as the acet. camphorat. the juice of oranges or lemons in the patient's drink, or let his drink be acidulated with Clutton's febrifuge ſpirit, joined with ſome proper cordial, &c.

A *peripneumony* is very apt to return on a little irregularity of diet. It terminates variouſly, as by a reſolution, a ſuppuration, a ſcirrhus, a copious ſpitting, a bilious flux, or by a copious thick urine, in which is either a ſediment of a pale red colour, or of a purulent quality. When the patient dies, he is carried off by a ſuffocation, from the difficulty of coughing up the matter which is lodged in the *lungs*. See Cullen's Firſt Lines, edit. 4. vol. i. p. 306.

PERIPNEUMONIA NOTHA. The SPURIOUS, or BASTARD-PERIPNEUMONY. This diſorder may appear at any time in the year, but for the moſt part it approaches early in the ſpring, particularly after a very ſharp winter. This kind of *peripneumony* is chiefly diſtinguiſhed from a dry aſthma, by the degree of fever, and ſigns of inflammation which are manifeſt in it; in moſt ſymptoms, the *ſpurious peripneumony* alſo reſembles the true, but the heat, pain, and thirſt, are not ſo conſiderable in the firſt as in the laſt.

Thoſe advanced in years, and thoſe of any age who have a groſs habit of body, and are addicted to ſpirituous liquors, alſo thoſe who are ſubject to catarrhs, are moſt ſubject to this kind of diſorder.

It is often cauſed by cold north and north-eaſt winds. Bodies that are loaded in the winter with groſs and ſluggiſh humours, which at the approach of ſpring are rarefied, the *lungs* becoming turgid therewith, a bad cough is produced, and then the *peripneumony* is ſoon introduced. A redundant viſcid ſerum, or even a putrid tendency in the juices, may induce this diſeaſe. The drying up of an old ulcer or an iſſue may, in ſome circumſtances, be a cauſe. A weakened ſtate of the *lungs*, as when an œdema forms itſelf there, may alſo occaſionally be productive of this diſeaſe.

Boerhaave obſerves, that the baſtard *peripneumony* ſteals upon the patient unawares with a ſlight wearineſs, weakneſs, a general proſtration of the faculties of the mind, thick and ſhort breathing, and an oppreſſion of the breaſt. The commotions it excites are ſo ſmall, that the heat and fever are ſcarce ſufficient to make the patient ſenſible of his diſorder: afterwards ſlight ſhiverings, which come on by fits, and the attacks of a gentle fever appear, whence difficulty of breathing, and weakneſs ſuddenly increaſing, bring on death, of which there was ſcarce any ſign by the pulſe or urine. Sydenham was one of the firſt who diſtinguiſhed this diſorder from the catarrh, and he gives the following account of its manner of invaſion, and its progreſs. The patient is hot and cold alternately, giddy, complains of an acute pain in the head, when the cough is moſt troubleſome; he vomits up all liquids, ſometimes with, and at others without coughing: the urine is turbid and intenſely red; the blood taken away reſembles pleuritic blood; the patient breathes quick and with difficulty; if he is adviſed to cough, his head akes as if it would burſt; a pain is felt in the whole breaſt; a wheezing is obſerved by the attendants whenever the patient coughs. To what Sydenham hath ſaid, it may be added, that the patient's cheeks and eyes often appear red and inflamed, the pulſe is ſmall, a low fever attends, and the urine is generally pale-coloured.

If the ſtrength does not return after the diſeaſe is removed; if the pulſe is ſtill quick, though ſoft; if the breathing is difficult and oppreſſed; if there is at times a cold ſhivering, with fluſhing in the cheeks, the lips are dry, and the appetite defective, a phthiſis may be expected ſoon.

The indications of cure will be to expel the pituitous colluvies. 2dly, To ſtrengthen the habit in general, and the lungs in particular.

Attenuating ſtimulating expectorants, ſtomach purges, emetics, bliſters, both by their ſtimulus and diſcharge, and iſſues in the inſide and bottom of the knee, are all thought uſeful. For common drink, muſtard-whey, or a decoction of madder-root, will be very convenient: bleeding, except in a ſmall quantity, when comatous ſymptoms appear, is not to be practiſed, but bliſters applied to the back, ſides, and arms, with gentle puking at proper intervals, and ſuitable expectorants, may be much depended on. The decoct. rad. ſenek. is alſo uſeful in this diſorder.

If the cough is violent, opiates will be very uſeful, and may be given as ſoon as expectoration is become tolerably free; a mixture of the pil. c. ſtyrace and pil. ex aloe cum myrrha may be ſafely given in doſes as circumſtances may require. To keep the bowels lax is a neceſſary point in order to relief, and the opiate may be given to any quantity, not to interfere wholly with the uſual efficacy of the purgative which it accompanies.

As expectoration is a principal means of relief, to the

faline draughts, made with the aq. ammoniæ acetatæ, add as much of vin. antim. as will excite and keep up a nauſea: thus every uſeful ſecretion and excretion will be promoted.

When the breathing is eaſy, and expectoration free, begin to ſtrengthen the habit by means of the bark to each ounce of which a dram, or more, of the balſam of Tolu, may be added; mild chalybeates may alſo be uſed.

This diſorder terminates by a ſpitting, a bilious flux of the belly, or by plenty of thick urine, with a thick ſediment.

Dr. Macbride arranges this diſeaſe amongſt aſthmatic complaints, which he ſays commonly ſeizes the old and phlegmatic, the weak and lax, the fat and unwieldy, and is moſt rife in wet and flabby ſituations; in foggy weather, and winter ſeaſons. All which circumſtances point out, as the cauſe, an accumulation of ſerum in the cellular cavities of the *lungs*, whence great oppreſſion on the air-veſſels, and ſome degree of obſtruction in the pulmonic and bronchial arteries, thereby hindering the free and regular circulation of the blood. This diſeaſe is *always extremely dangerous*; and requires the utmoſt circumſpection in our prognoſtics, as the mildneſs of the ſymptoms, at the beginning, is too apt to miſlead both the patient and attendant. For, as it ariſes from a viſcid accumulation among the inert ſolids of the *lungs*, the ſymptoms do not appear very diſtreſſing, till it is generally too late for relief, and there can be no hope of a reſolution of the offending matter, ſince there is no way for it to be carried from the cells wherein it ſtagnates, but by the abſorbent ſyſtem, and it is generally too viſcid to be taken up by ſuch ſlender veſſels. Writers, from not making the neceſſary diſtinction between the cellular and tubular part of the *lungs*, and, by ſuppoſing the offending matter in the *peripneumonia notha*, chokes up the extremities of the pulmonary artery, have confounded the theory of this diſeaſe, ſince the ſymptoms cannot be ſatisfactorily accounted for, on the ſuppoſition that the morbific matter is lodged in any other place than the cellular interſtices, whereby it preſſes both upon the air-veſſels and blood-veſſels, hindering the firſt from being fully diſtened with air, and the laſt from tranſmitting blood. In this diſeaſe, therefore, bleeding is of no ſervice, but does harm, and our only hope is founded on repeated emetics and bliſters; the moſt proper emetics are thoſe of the antimonial claſs, nor ſhould the patient drink much after a vomit is given, in order that the agitation from puking may be ſtronger, and the bliſters are to be laid on the back, ſides, and arms, which are alſo to be bathed, and the body kept open by clyſters. But all this will very rarely anſwers, and we may foreſee the death of the patient, from the perpetual laborious wheezing, great anxiety, and intolerable oppreſſion of the præcordia, together with a conſtant doſing, coldneſs of the extremities, and a livid colour in the hands and face. People advanced in years, who are of a groſs habit and flabby texture, may perhaps be prevented from falling into this diſeaſe, by ſuffering iſſues to be made between the ſhoulders, as theſe will prevent the accumulation of lymph in the cellular part of the *lungs*, and probably prolong life.

On inflammations of the lungs, ſee Trallian, Cœlius Aurelianus, and Aretæus; and on both the kinds of *peripneumony*, ſee Hoffmann, Boerhaave, Wallis's Sydenham, Shebbeare's Theory and Practice of Phyſic, Fordyce's Elements, part ii. Cullen's Firſt Lines, vol. i. p. 349—355. Dr. Macbride's Introduction to the Theory and Practice of Phyſic.

PERIPYEMA. A collection of matter ſurrounding any part.

PERIRRHOEA, from περιῤῥέω, *to flow from every part*. A copious flux of the humours, or morbific matter from all part of the body, to the proper emunctories, in order to their diſcharge, or rather the diſcharge itſelf.

PERIRRHEXIS. See HÆMOPTYSIS.

PERISCEPASTRUM. See FASCIA.

PERISCYPHISMUS. It is an inciſion made acroſs the forehead, or from one temple to another, over the upper part of the os frontis, over the coronary ſuture. It was formerly uſed when a conſiderable inflammation, or defluxion in the eyes attended. The lips of this wound are to be kept aſunder with lint, or when the diſorder abates, raſp the denudated bone, and proceed to healing. See P. Ægineta, lib. vi. c. 7.

PERISTALTICUS, from περιστέλλω, *to compreſs*, or *contract*. The motion by which the inteſtines protrude, the fæces, is called the periſtaltic motion. It is a worm-like motion.

PERISTOMA. See INTESTINA.

PERISTAPHYLO-PHARYNGÆI. Two ſmall muſcles inſerted between the uvula and lower extremity of the internal ala of the apophyſis pterigoidæus; they run obliquely backward on the ſides of the pharynx. They are difficult to find in very lean ſubjects, and ſeem to be what M. Santorini calls *hypero-pharyngæi*, or *palato-pharyngæi*.

PERISTAPHYLINUS EXTERNUS. See CIRCUMFLEXUS PALATI.

PERISTAPHYLINI INTERNI. See PETRO-SALPINGO-STAPHYLINI.

PERISYSTOLE. The interval of reſt betwixt the ſyſtole and diaſtole of the heart.

PERITERION. See TREPANUM.

PERITTOMATICOS. See APERITTOS.

PERITONÆOREXIS. A burſting of the peritonæum, and conſequent hernia.

PERITONÆUM, from περιτείνω, *to extend round*. Dr. Douglas is the firſt who hath given us any true idea of this membrane, which lines the belly, and inveſts all the viſcera contained therein. It is of a cloſe texture, and yet very pliable; it is capable of great extenſion, after which it can recover itſelf, and be contracted to its ordinary ſize, as appears in pregnancy, &c. It is connected to all the circumambient parts by a cellular membrane; it is this cellular membrane (which is generally called the external lamella of the *peritonæum*) which forms what we call the proceſſes of the *peritonæum*. The *peritonæum*, nevertheleſs, hath productions of its own; but they are different from thoſe of the cellular membrane, for they run from without inwards, and give an external covering to the contained parts.

PERITONITIS. INFLAMMATION of the PERITONÆUM, including the meſentery and omentum, hence *inflammatio meſenterii*. Dr. Cullen defines it to be a fever, with pain in the belly, which is increaſed when the body is erect; but without other proper ſigns of abdominal inflammations, &c. places this genus of diſeaſe in the CLASS PYREXIÆ, and ORDER PHLEGMASIÆ; and diſtinguiſhes three ſpecies. 1. *Peritonitis* propria; that is, when the peritonæum, ſtrictly ſo called, is inflamed. 2. *Peritonitis omentalis, omentitis*, or *epiploitis*. See PUERPERILIS FEBRIS. 3. *Peritonitis* meſenterica. See INFLAMMATIO MESENTERII.

PERIU TODDALI. See LACCA.

PERLE. See ALBUGO OCULORUM.

PERLÆ. See MARGARITÆ.

PERMANENS AQUA. See AZOTH.

PERNIO, from πέρνη, *heel, chimethlon, erithema a frigore, beſſanen, bugantia, cheimetlon*. A KIBE or CHILBLAIN. This diſorder attacks the hands, feet, heels, ears, noſe, and lips; all ages are ſubject to it, but children of a ſanguine habit, and a delicate complexion are the moſt ſo. Dr. Cullen places this diſorder as a variety of phlogoſis erythema.

When the parts ſubject to this complaint are ſuddenly expoſed to cold, or from being cold are too ſpeedily heated, they are ſomewhat inflated, afterwards come on heat, redneſs, pain, and itching. Theſe ſymptoms increaſing, ſmall bliſters are formed, which ſoon burſt, leaving a ſlight excoriation, which ſpeedily ulcerates; this ulcer ſoon becomes deep and obſtinate, diſcharging a ſharp ill-conditioned matter; in the laſt, and worſt degree, a gangrene is formed.

Beſides a fulneſs of the humours, and a tenderneſs in the ſkin, which are the moſt frequent cauſes diſpoſing to *chilblains*, the wearing of woollen gloves or thoſe of fur and muffs, are too oft the productive cauſes; like the warm bath, they render the ſkin more ſenſible, and increaſe the afflux of blood thereto.

The principal methods of prevention and relief are as follow: the ſkin is rendered leſs tender, and more firm; changes of weather are guarded againſt; the vicious quality of the temperament is corrected; and, according to the different degrees of the complaint when preſent, the ſubſequent applications are made uſe of.

When winter approaches, let the parts uſually affected be frequently put into cold water, avoiding every occaſion of ſubjecting them to warm. Iſſues, or frequent gentle purges, will drain off a redundancy of humours. As to a faulty quality in the blood, of whatever kind it may be, proper alteratives are not to be neglected; but when the diſorder is preſent, whilſt in its loweſt degree,

dip the part into water that is cold, and as near to freezing as may be, and there continue it during a minute or two; or if the cold chills or benumbs the part very much, dip it in and take it out two or three times, at ſhort intervals; after this it may be gently dried; the ſame proceſs being repeated, at leaſt every morning and evening, until all uneaſineſs is removed. The moſt troubleſome itching is removed by dipping the part in cold water, or by applying ſnow to it, though in ſome few inſtances the ſnow rather increaſes than diminiſhes the diſorder. When the patient cannot bear the cold, when a cough attends, or other circumſtances which forbid the application of cold to the extremities, the beſt ſubſtitute is, to wear dog-ſkin ſocks, or gloves, day and night, until the inflammation is removed. Linnæus recommends the diluted marine acid for bathing the part affected with. The following embrocation is an efficacious remedy, applied by dipping in it linen rags, and keeping them applied to the parts. ℞ aceti, ſp. vini tenuioris ää lb. ſs. aluminis ʒ ij. m. In greater degrees, as when the part may be ſaid to be froſt-bitten, the treatment will be as directed in the article CONGELATUS; in this caſe dog-ſkin gloves or ſocks ſhould be worn. Vapours ſometimes agree better than baths, in which caſe the vapours from vinegar are the beſt; but as their vapour ſoftens the ſkin, it ſhould afterwards be often waſhed with a mixture; water two parts, and camphorated ſpirit of wine one part. If the parts are ulcerated, gentle purges may be uſed, the ſwelled parts expoſed to the ſteams of vinegar, and digeſtive ointments applied to the ſore. When a gangrene comes on, treat it as when the ſame happens from any other cauſe, attendance being given to the circumſtances of the conſtitution.

See Heiſter's Surgery. M. A. Severinus's Diſſ. de *Pernionibus*, in lib. de Abſceſſibus. Tiſſot's Advice to the People. Bell's Surgery, vol. v. p. 440. Pearſon's Principles of Surgery, vol. i. p. 142. White's Surgery, p. 22.

PERONÆA ARTERIA. The PERONEAL ARTERY. It is the ſmaller diviſion of the poſterior tibialis; it paſſes down behind the fibula, between the ſoleus and the flexor pollicis, paſſes over the interoſſeous ligament, and about the upper and back part of the os calcis it forms an arch with the tibialis poſterior.

PERONÆUS MUSCULUS, from *perone*, the fibula. It riſes from the outer part of the fibula, it lies in a groove in the malleolus externus, and is inſerted in the baſis of the laſt metatarſal bone of the little toe.

—— LONGUS, called *fibulæus*. It riſes from the head of the fibula, its tendon is turned back under the tarſus, paſſing over the os cuboides, at which place it hath a ſeſamoid bone, and runs acroſs the ſole of the foot to be inſerted into the baſis of the firſt metatarſal bone, being an abductor.

—— SECUNDUS, vel *ſemifibulæus*. It riſes about the middle of the outward part of the fibula, and as it runs under the malleolus externus, it becomes tendinous, and is inſerted with the tendon of the peronæus brevis into the metatarſal bone of the little toe.

—— VENA. It is one of the diviſions of the poplitea; it runs nearly the ſame courſe with the artery of the ſame name.

PERONE. See FIBULA.

PERONEUS BREVIS. See EXTENSOR DIGITORUM LONGUS.

PERSEA. PERSEA PRÆCOX. See MALA ARMENIACA.

PERSICA. The PEACH-TREE. *Perſica* from *Perſia*, whence they were firſt tranſplanted. It hath been called *Rhodacinea*, or *Rhodacina*, becauſe it was planted in *Rhodes*. The kernel of the peach is called MACHÆRIA; the fruit, *malus Perſica*.

PERSICARIA, URENS, called alſo *hydropiper*, CULRAGE, LAKE-WEED, WATER-PEPPER, and biting ARSMART. It is the POLYGONUM HYDROPIPER Linn. It is an annual plant, with oblong uncut leaves, pointed at both ends, and with imperfect flowers ſet in ſpikes on the tops of the ſtalks; the cup is thick and fleſhy, divided into five oval ſegments, which cloſing form a cover to an angular gloſſy ſeed. The leaves have a burning taſte, and ſeem nearly allied to the arum; their acrimony is diſſipated by diſtillation, and is deſtroyed in the proceſs; they are *antiſeptic*, *diuretic*, and *aperient*. It is called *perſicaria*, becauſe the leaves reſemble peach leaves, and *hydropiper* becauſe it grows in water, and taſtes like pepper. It is not uſed in the preſent practice. See Raii Hiſt.

PERSICARIA MACULATA, DEAD or SPOTTOD ARSMART. *Perſicaria mitis*. It is the POLYGONUM PERSICARIA Linn. It is ſo called from moſt of the leaves having a blackiſh ſpot in the middle: it grows alſo in wet grounds. It is ſaid to be *antiſeptic*, but is not in uſe as a medicine. See Rai Hiſt.

—— SILIQUOSA, alſo called *balſamina lutea*, *noli me tangere*, *impatiens herba*, *mercurialis ſylveſtris*, QUICK IN HAND, TOUCH ME NOT. This ſpecies is a *forcible diuretic*, but is rarely uſed. See Raii Hiſt.

PERSICON. See JUGLANS.

PERSICUM BALS. See BENZOINUM.

PERSICUS IGNIS. See CARBUNCULUS.

PERSISTENS FEBRIS. A REGULAR INTERMITTING FEVER, the paroxyſms of which return at conſtant and ſtated hours.

PERSONATA. See BARDANA MAJOR, and BARDANA ARCTICUM.

PERSPIRATIO. PERSPIRATION, alſo *tranſpiratio*, *dilatio*, *anapneuſis*; *diaphone*; *diſcuſſio*; *diaphoreſis*; *diapnoe*; *diffflatio*. Without a free *perſpiration* no animal nor plant can continue in a healthy ſtate. The matter of *perſpiration* is ſeparated through the ſkin, and alſo from the lungs; it is ſimply ſerum. This diſcharge is uſually leſs in women than in men; if in either women or men, the perſpiratory veſſels are obſtructed, the circulation of the blood meets with great reſiſtance.

Perſpiration is of two kinds, viz. that which is continually tranſuding, and is called *inſenſible*; the other is the ſenſible, called *ſweat*. It hath been ſuppoſed that different veſſels throw off theſe diſcharges, but that is not the truth; the ſame veſſels which throw out the inſenſible, being more ſtrongly acted upon, throw out the ſenſible *perſpiration*.

All animals have an abſorbing power, ſimilar to that of a ſponge, which is evident from the ſpeedy penetration of ſea-ſalt and ſalt-petre into the moſt interior parts of the largeſt pieces of butchers' meat; it is moſt probable that the pores, &c. through which the ſalt paſſes, are thoſe through which the *perſpiration* is carried on in living animals. The pores are ſometimes ſo enlarged as to tranſmit particles of red blood, as happens in the muriatic ſcurvy; and ſometimes are ſo contracted that the neceſſary evacuation can no longer be continued, whence a variety of diſorders proceeds. The fat under the ſkin is ſuppoſed to prevent a too free exhalation of the ſerum from the body; and want of fat in the lungs, to be a reaſon why ſo free a diſcharge is made therefrom. The coats of all the veſſels are perforated by the pores through which the matter of *perſpiration* paſſes; hence, when morbid humours are attenuated, they paſs through the ſkin, and are exhaled with the matter of *perſpiration*, or they may, and often are, abſorbed into the blood, and then excreted with the urine, &c.

PERTURBATIO ALVI. See DIARRHOEA.

PERTUSSIS, alſo called *tuſſis ferina*, *convulſiva*, *rheumatica*, a KINK-COUGH, HOOPING, or CONVULSIVE COUGH. Dr. Butter ſays it is an epidemic, contagious, ſpaſmodic diſeaſe. It ſeems to be analogous to an intermittent fever in the periodic return of the fits; they both prevail in the ſame ſeaſons, ariſe from the ſame cauſe, and are cured by the ſame remedies. See Huxham de Aëre, &c. Morb. Epid. p. 76, 77. Farther, the autumnal *hooping-cough* and intermittents are analogous, in that they renew their attacks in the returning ſpring, though ſeemingly cured, long before. The *hooping-cough* reſembles the ſmall-pox, in not uſually returning, in being infectious to the prediſpoſed, and in that it muſt have its courſe.

It is originally ſymptomatic; is often a ſymptom in the aſthma. SYDENHAM ſays that the cough is excited by vapours which are thrown into the lungs from the blood.—Dr. BUTTER, that its ſeat is in the inteſtines; that neither the ſtomach nor the lungs are concerned in it; that the primary affection is a morbid irritability of the mucous glands; and that an infectious miaſma is the occaſional cauſe.—Again, whilſt ſome aſſert that the diſorder is a convulſive one, occaſioned by irritating matter lodged about the bronchia, trachea, and fauces; others ſay, and indeed with greater ſeeming probability, that it is a convulſion in the diaphragm, excited by ſharp humours in the primæ viæ, and which cauſe a ſpaſmodic ſtricture in the glottis.—WALSCHMEID ſays, it proceeds

from a diſorder of the ſtomach.—Dolæus ſays, it is cauſed by tough viſcid matter lodged in the coats of the ſtomach. —Hoffman attributes it to thin and acrid juices in the ducts deſtined to reſpiration, as the aſpira arteria, &c.

Dr. Cullen places this genus of diſeaſe in the CLASS NEUROSES, and ORDER SPASMI, which he defines a contagious diſeaſe, attended with a convulſive ſtrangulating cough, and ſonorous reiterated inſpiration, often with vomiting.

This diſorder begins with a hoarſeneſs, but uſually with a dry cough, which continues about two weeks, and then becomes convulſive, and ſome phlegm is diſcharged; its increaſe and ſtate takes up about four weeks more, and in ſix weeks after it generally goes off, though ſometimes it continues eighteen or twenty weeks: ſometimes the phlegm is ropy, at others it is mixed with ſharp ſerum, but always is thrown up with difficulty: at the height, the phlegm is more concocted, and as the cough declines the expectorated matter is whitiſh. After recovery a relapſe may eaſily happen from taking cold; but theſe relapſes are ſlight and ſhort. Some have only the antecedent ſhort dry cough: theſe get well in two or three weeks, but if phlegm begins to appear, the patient is not ſo ſoon quit of this diſorder. When the cough is in any degree violent, the blood is ſo obſtructed in the face as to occaſion blackneſs there, and, according as the veſſels of the noſe are more or leſs able to reſiſt, ſo an hæmorrhage from thence is more or leſs copious and frequent.

The *kooping-cough* is moſt fatal to children under two years of age. Older children uſually ſwallow the phlegm and then puke it. After three years of age it ſeldom proves fatal; though, in ſome inſtances, wherein great weakneſs attends, and the bark hath been neglected, a conſumption follows, and the patient is carried off.

As opinions vary with reſpect to the ſeat, &c. of this complaint, ſo the methods of relief that are propoſed are alſo various; but in general, gentle antimonial emetics adminiſtered about half an hour before the return of each fit, when the periods can be gueſſed, are the principal aſſiſtants that hitherto have been obſerved. Particular ſymptoms are relieved by bleeding, bliſters, gentle laxatives, &c.—In the beginning, if the face is very black during the fit, or if the blood is diſcharged with the cough, bleed.—If the breathing is difficult, the lac ammon. will be proper. To moderate the violence of the cough, give now and then the ſyr. papaveris albi in ſmall doſes, or rather mix opiates with purgatives, and give them in ſuch doſes as whilſt the violence of the cough is moderated, the bowels may alſo be kept ſolutive.—Dr. Butter extols the *uſe of hemlock* as a cure. He directs to begin with a ſmall doſe, and gradually to increaſe until the ſymptoms of relief appear, and then continue that doſe as long as it produces good effects; when this medicine begins to loſe its effects, then augment the quantity gradually until its advantages are again manifeſt. For a child from *ſix months to two years old*, he adviſes to begin *with gr. i.* which when diffuſed in an ounce and a half of water, may be given in the courſe of one day. From *two years to four years of age, two grains* may be mixed in two ounces of water to be taken in the day. From *four years* upward *to twenty*, the *firſt daily doſe may be increaſed half a grain for each year*. If a liquid form is diſliked, a pill or a bolus may be given; and Dr. Morris declares the moſt ſucceſsful efforts from caſtor one part, and the bark two parts; the doſe from ℈ i. to ʒ ſs. and repeated every four hours.—If there is much fever, the bark is not convenient; expectorants ſometimes ſhould accompany this remedy, and often its efficacy is only advantageous in the decline of the diſeaſe: the fever is no objection to the cicuta.—When there is little or no fever, cantharides have been uſed with advantage. Dr. Lettſom in his Medical Memoirs, from his own as well as other experience, ſays, "From the efficacy of the following compoſition, the action of vomiting is leſs neceſſary to be frequently excited, as the diſeaſe uſually terminates in a few days after the exhibition of this remedy; hence, he adds, I have rarely had occaſion to give the antimonial powder more than two or three times." The compoſition was communicated to the doctor by his friend Mr. Sutcliff, a ſurgeon and apothecary in Yorkſhire. ℞ Tr. cort. Peruv. ſi. ℥ i. ſs. tinct. opii camphoratæ ℥ ſs. Tr. cantharidis, ʒ i. m. This is to be given in ſmall doſes three or four times a-day, and to be gradually increaſed until a ſlight ſtrangury is excited; and then the doſe muſt either be diminiſhed, or repeated at longer intervals. It is then obſerved that the ſtrangury uſually comes on about the third day, and the *kooping-cough* ſeldom continues above ſix days after giving this medicine.

Dr. Cullen conſiders this diſeaſe under two periods: *the firſt* is when the contagion which cauſed it is recent, and continues to act; *the ſecond* when the contagion ceaſes to act and the diſeaſe continues by the power of habit. *The indication of cure under the firſt period* is, to obviate the violent effects of the diſeaſe and its fatal tendency. To this end, in plethoric habits, or where the blood is difficultly tranſmitted through the lungs, bleeding will be neceſſary; but its repetition muſt be admitted with caution. The belly muſt be kept lax. If there is any inflammatory tendency in the lungs, bliſters ſhould be applied to the thorax, and renewed if required. Emetics ſhould be duly repeated; they interrupt the return of the ſpaſmodic affections; and by determining to the ſurface of the body, take off the determination to the lungs.—*The indication of cure under the ſecond period* is effected by antiſpaſmodics or tonics. Of theſe, a variety have been propoſed, and occaſionally with ſucceſs, as caſtor, muſk, hemlock, cupmoſs, opium, Peruvian bark, &c. When neither fever nor difficulty of breathing forbid, opium is powerful in abating, but it is not efficacious in removing the cough. In this laſt ſtage of the diſeaſe, the bark, or ſome proper preparation of it, will be ſingularly uſeful.

In the Med. Comment. of Edinburgh, vol. x. p. 272. it is obſerved that the *kooping-cough* was relieved by vomits and laxatives, till every ſymptom of pyrexia was gone; then the bark, and cold bathing, proved a certain and effectual remedy. The ſame perſon gave the bark and camphor, as a preventive, and obſerves that few were attacked that perſevered in taking it for any length of time.

The late Dr. Rutherford of Edinburgh, obſerves, that when convulſions attend, the application of bliſters will be neceſſary, but as to their ſituation in this caſe, he preſers the ſide of the neck behind the ears, becauſe in that part there is the neareſt communication with the nerves of the glottis.

See Wallis's Sydenham. Huxham de Aër. & Morb. Epid. p. 76, 77. Lond. Med. Obſ. and Inq. vol. iii. p. 281—286. 319—325. a Treatiſe on *Kinkough*, by W. Butter, M. D. Dr. Cullen's Firſt Lines. vol. iii. edit. 4. London Med. Journal, vol. ii. p. 398.

PERUANUS CORTEX. See CORT. PERUVIANUS.

PERUVIANUM BALSAMUM. PERUVIAN BALSAM, or BALSAM of PERU: it is alſo called *hutzechitl, hoitziloxitl, Mexican balſam*; *Indicum balſamum, balſamum Americanum, cabureiba*. The trees which afford it, are the *balſamifera, balſamifera arbor Indica*, and on the authority of Piſo, and Ray, the *carbareiba*, or *carbariiba*. PERUIFERA, vel MYROXYLON PERUIFERUM Linn. There are three kinds of this balſam, viz. the white; it is of a pale yelloviſh colour (though called white); it is the native *balſam*, preſerved as it iſſues out from the tree: this is the beſt ſort, but very rarely met with. The dry *balſam*; this is the white ſort inſpiſſated by the ſun's heat in gourd ſhells, in which it is ſometimes brought to Europe; it is of a reddiſh colour, and a very agreeable ſmell; it is ſeldom to be met with. The common or black *Peruvian balſam*; this is artificially extracted from the bark, branches, and leaves of the tree, by cutting them in pieces, and boiling them in water; it is of the conſiſtence of honey, of a dark black colour in the maſs; but, when ſpread thin, it is of a clear reddiſh or yelloviſh brown, of an agreeable ſtrong ſmell, ſomewhat approaching to that of a mixture of benjamin and ſtorax, and of a bitteriſh pungent taſte, eaſily inflammable, not in the leaſt miſcible with water, nor rendered white nor turbid on being agitated therewith. It is brought from Peru and Mexico.

Diſtilled in a retort with an open fire, it yields a butter like that of benzoin, and ſometimes a conſiderable quantity of concrete ſaline flowers ſimilar to thoſe from the ſame reſin. If this balſam is rubbed with ſugar, the white of an egg, or with the mucilage of gum arabic, it is rendered miſcible with water, but is longeſt ſuſpended with the laſt.

It is uſed for the *cure of wounds in nervous and tendinous parts: it ſtrengthens the ſtomach, is uſeful in aſthmas*, and as *an antiſpaſmodic*; though not ſo immediately uſeful or ſo powerful at preſent as opium, yet it is far more laſting in its efficacy. *It cures*, according to Sydenham, *the colica pictonum*, and a tincture of it in ſpirit of wine is warmly recommended by Hoffman.

See Tournefort's Mat. Med. Lewis's Mat. Med. Neumann's Chem. Works.

PERUVIANUS GRISEUS, vel SPURIUS. See THURIS CORTEX.

PERVERSIO UTERI. See PROCIDENTIA UTERI.

PERVIGILIUM, alſo the *agrypnia* of authors. A WANT OF SLEEP, or rather INTENSE WATCHING. A ſymptom very common in fevers, and always a bad preſage.

PERVINCA MAJOR. See VINCA PERVINCA.

PES. The FOOT. It is divided into the tarſus, metatarſus, and toes. The TARSUS conſiſts of ſeven bones, viz. the *aſtragalus*; it is the ſuperior, and its upper head is received into the cavity of the tibia. The *calcaneum*, or *calcis os*. The *naviculare*, or *naviforme*. The *cuboides*, which is the external of the four anterior. The *cuneiforme externum*. The *cuneiforme medium*. And the *cuneiforme internum*. They follow in reckoning upwards. Theſe bones being convex above, and concave below, make the tread more ſecure, and from their number the ſhock is broke in jumping. A caries happening in theſe bones is dangerous, on account of their ſpongy ſubſtance, ſize, and number. The ſole of the foot is called *peza*; *thenar*, *pedion* or *pelma*; this laſt term is applicable alſo to a ſock.

When children's *feet* are diſtorted at their birth, or turned into a bad poſition, bring them as near as poſſible to a natural one, then with a roller dipped in flour and the white of an egg, roll them from near the knee to the toes, let them be held in a good poſition until the roller is dry, and change the bandage every fortnight.

This term PES is given to many vegetable ſubſtances; as *Pes anſerinus*, ſee CHENOPODIUM.—*Aſininus*, ſee ALLIARIA.—*Capræ Luſitanicæ*, ſee BINTAMBURU ZEYLAN.—*Cati*, ſee GNAPHALIUM.—*Columbinus*, ſee GERANIUM COLUBINUM.—*Leonis*, ſee ALCHIMILLA.—*Leporinus*, ſee LAGOPUS.—*Vituli*, ſee ANUM.

PESSARIUM. A PESSARY, called alſo *balanos*, and *balanocaſtanum*, from its ſhape being formerly like an acorn. Among other external remedies uſed by Hippocrates *peſſaries* were one; they were a kind of ſuppoſitories which they introduced into the exterior neck of the matrix; they were prepared of wool, lint, or linen, mixed with powders, oils, wax, &c. and made round like a finger. *Peſſaries* were in much uſe amongſt the ancients, and were formed of different ingredients, according as the different diſeaſes, &c. of the womb required them. See P. Æginet. lib. vii. c. 24. At preſent their uſe is chiefly confined to the ſupport of the falling vagina or uterus. They are uſeful to women who labour under an incontinence of urine. Sponges of ſuch a ſize as, when expanded, fill up the cavity of the vagina, are very good *peſſaries*; they may be dipped in any liquor that will aſſiſt in the intention of uſing them. They ſupport the uterus; at the ſame time, by putting a ſtring through them, the end of which is to be left hanging out of the os externum, the woman can take them away and apply them herſelf.

Commodious *peſſaries* are deſcribed in Heiſter's Surgery in the article Procidentia Uteri. Dr. Simſon invented one and deſcribed it in the Edinb. Med. Eſſays, vol. iii. p. 313.

Dr. Leake, in the fifth edition of his Medical Inſtructions, aſſerts that the uſe of *peſſaries*, by the pain and irritation they occaſion, are apt to produce the whites. He obſerves, that in caſes of bearing down and deſcent of the womb, to direct the curative method to the ſeat of the diſorder is in every reſpect preferable to the application of thoſe painful and indelicate inſtruments, ſo often made uſe of with bad effect; for inſtead of ſtrengthening the weak part, they lay additional ſtreſs upon it, and conſequently are highly improper. It is evident that *peſſaries* only prevent the deſcent of the womb, by obſtructing the paſſage; therefore, ſo long as a part is kept in a ſtate of continual diſtenſion, it never can be braced up or ſtrengthened by the power of art or nature. If the *peſſary* is introduced too ſmall, it will ſoon be forced away by the firſt fit of coughing, or ſtraining, &c. And if it is too large it will bring on the fluor albus in a high degree; beſide, it generally becomes ſo painful as not to be endured, and being a pernicious application, ought to be rejected from practice. It never can anſwer any good purpoſe; but, on the contrary, will always increaſe the diſeaſe, by overſtraining and weakening that part which was too weak before. As a further diſſuaſive from the uſe of theſe inſtruments, the Doctor gives the two following caſes.

Firſt, A woman advanced in years had worn a *peſſary* for ſome time; ſhe complained of great heat and inflammation at the lower region of the belly, attended with violent colic pains, and frequent but ineffectual endeavours to void her urine; ſhe had much fever, and at laſt became delirious, from want of ſleep and violence of pain, which threatened a mortification in the bowels. The *peſſary* was made of cork, was very large, and cloſely confined by means of the inflammation of the part, conſiderable force was required to extract it, which occaſioned much pain and diſcharge of blood; however, by proper care ſhe recovered and remained well.

Second, A *peſſary* was extracted from the fundament of a woman, after making its way through the vagina into the rectum, by a mortification of the parts.

PESSOLATÆ. See MORPIONES.

PESTILENTIALIS. Belonging to the plague.

PESTIS. The PLAGUE. PARACELSUS calls it *chaoſda*. Many writers have obſerved that the *plague* viſits England once in thirty or forty years; but happily for us this does not happen: a period of more than 120 years has elapſed ſince ſo melancholy and lamentable a viſitation.

Dr. Cullen places this genus of diſeaſe in the CLASS PYREXIÆ, and ORD. EXANTHEMATA, and defines it a typhus, very highly contagious, attended with extreme debility, and ſays that contentions have ariſen among phyſicians, concerning the character of the *plague*, which are eaſily cleared, ſo that the characteriſtic ſigns which occur in every caſe of the *plague*, may be given with perſpicuity; it therefore may be ſufficient to give ſuch as happen in moſt of them. Its varieties are owing to its degrees of violence, hence the ſpecies are the *peſtis benigna, vulgaris, Ægyptiaca*.

The *plague* is the worſt degree of putrid fever, the moſt violent, rapid, and ſuddenly fatal. In the beginning it is ſometimes attended with inflammatory ſymptoms when it happens in cold climes, but it ſpeedily becomes moſt putrid. It is called peſtilential when the patient falls into ſudden weakneſs, and is affected with the worſt ſymptoms, and in the greateſt degree at once. It is called *plague* when the worſt ſymptoms attend, but the loſs of ſtrength is not quite ſo ſudden; and all the other ſpecies are called putrid fevers; they are all of the ſame general nature, but denominated from their moſt remarkable ſymptoms, or other attending circumſtances.

Whatever be the nature of the peſtilential miaſmata, the effects are immediately to diminiſh, and, according to the degree of its power, to extinguiſh the vital heat. It breaks the fibres of the blood, and diſſolves its texture, whence the purple ſpots.

The *plague* approaches with a chilline's and ſhivering; ſoon after, a violent vomiting, a painful oppreſſion of the breaſt, and a burning fever; all which continue till death changes the ſcene, or till the eruption of a bubo or a parotis diſcharges the morbific matter, and cures the patient. If the morbific matter is not thus thrown out upon the ſurface of the body, it proves mortal. Sometimes, though rarely, the diſeaſe is mortal before the ſigns of fever approach; the broad purple ſpots, which denote immediate death, coming out even whilſt the perſon is abroad about his buſineſs: theſe ſpots go in and out before death's approach. Sometimes ſwellings appear, without having been preceded by a fever, or any other conſiderable ſymptom. The breath and ſweat are very offenſive. The pathognomonic ſymptoms are, *the buboes and carbuncles which appear in various parts of the body.*

The *plague* and the eryſipelas ſo reſemble one another, that in time of *plague* they are not always duly diſtinguiſhed at the firſt.

The air does not ſeem capable of carrying infection far. Heat and moiſture aggravate, but cold deſtroys the infectious nature of the *plague*; ſo that in theſe northern climates the infection muſt be received at firſt from ſome perſon, or from ſome ſubject in which it is lodged. The peſtilential ſeminium readily adheres to ſpongy and porous bodies, and thus may be conveyed to a great diſtance, without any loſs of its pernicious quality.

From the general nature of the *plague*, bleeding ſeems to be an improper method for relief; yet it is ſtrongly adviſed by many practitioners of note, and amongſt the reſt Sydenham is one. Great circumſpection is doubtleſs neceſſary with reſpect to this operation; however, if

ſymptoms

ſymptoms of inflammation run high, by leſſening the quantity of blood, the propulſion of the virulent matter to the glands may perhaps be promoted; and this more particularly if the courſe of the blood to the external parts be afterwards aſſiſted by mild ſudorifics. One, two, or at moſt three days, will effect all that is propoſed by taking away blood, ſo that great difficulty will attend the determination, for depriving the patient of what he will ſo ſoon ſtand in the greateſt need.

Mixtures with acids are peculiarly beneficial, and mild cordials ſhould accompany them. The juice of oranges may be ſqueezed in all the patient's drink, ſweet ſpirit of nitre, Clutton's ſeb. ſpt. are very powerful remedies. Perſpiration may alſo be promoted by means of antimonials; as ſoon as the pulſe will admit, the bark ſhould be given.

The air in the patient's room ſhould be as cool as is moſt agreeable to the ſenſations of the patient: his linen ſhould be often changed, and excrements immediately buried.

The earlier the tumors appear on the ſurface of the body, the better; for thus all other ſymptoms are removed. See BUBO and CARBUNCULUS.

When the *plague* is fatal, *ſome* die of a fainting the firſt or ſecond day;—*others* in whom the poiſon is not thrown out upon the external ſurface, or, if thrown off, returning back, brings on a mortification of the nervous coats of the noble parts, as the œſophagus, pleura, ſtomach, inteſtines, &c. whence the corpſe ſwell, and have an intolerable ſtench. Sometimes, when the tumors are too numerous, the patient dies of a ſymptomatic fever, from the inflammation, pain, and heat.

See Mindererus on the *Plague*, Johannes Langius, lib. i. epiſt. 18. Hoffmann, Lobb on the *Plague*, Mead on the ſame ſubject, Fordyce's Elements, part ii. Cullen's Firſt Lines, edit. 4. p. 200. vol. ii. Wallis's Sydenham, vol. iii. and Dr. Ruſſel's Treatiſe of the *Plague*, 4to, London, 1791, which he divides into the SIX FOLLOWING HEADS: 1ſt. *an Hiſtorical Journal of the Plague, at Aleppo*, 1760—61—62;—2d. *Medical Account of the Plague*, in which are inſerted his own practical obſervations;—3d. *Of Peſtilential Contagion*;—4th. *Of Quarantines*;—5th. *Of Lazarettos*, and *Quarantines*;—6th. *Of the Police in the time of the Plague*; to which is added, by way of appendix, *one hundred and twenty caſes of the plague*, and *ſome accounts of the ſeaſons*, &c. at Aleppo.

PETALA. PETALS. The tender fine-coloured leaves, which are generally the moſt conſpicuous parts of the flowers, are thus named, to diſtinguiſh them from the leaves of the plants, which are termed *folia*, from *folium a leaf*. Flowers with one leaf are called monopetalous flowers; with two, bipetalous; with three, tripetalous; with four, tetrapetalous; with five, pentapetalous; with ſix, hexapetalous; with more than ſix, *polypetalous*.

PETALODES. An epithet for the ſediment of urine, importing that it is ſcaly or reſembling leaves. It is ſometimes obſerved when there is an ulcer in the bladder.

In BOTANY, *petalodes* is an epithet for thoſe plants which are furniſhed with flower-leaves or petala.

PETASITES, from πεταω, *to extend*, or from πετασος, *a hat*, or *bonnet*, ; ſo called becauſe the leaves are large, have a hollow in the middle, and extend horizontally round the hollow. It is a ſpecies of tuſſilago, called *tuſſilago major*, *galerita*, PESTILENT-WORT, BUTTER-BUR; and TUSSILAGO PETASITES by Linnæus. It is a perennial plant, found wild by the ſides of ditches and in meadows, producing, early in the ſpring, a thick naked roundiſh ſtalk, with a ſpike of ſmall naked purpliſh floſculous flowers on the top; the flowers and ſtalks ſoon wither, and are ſucceeded about May with very large roundiſh and heart-ſhaped leaves, ſtanding on long pedicles, ſomewhat hollowed in the middle, ſo as to reſemble a bonnet; the root is long, thick, of a dark brown or black colour on the outſide, and white within.

The roots are *aperient*, *alexipharmic*, and promiſe to be of conſiderable activity; they have a ſtrong ſmell and a bitteriſh acrid taſte, of the aromatic kind, but not agreeable, very durable and diffuſive, ſcarcely to be concealed by a large admixture of other ſubſtances. Their virtue is in a reſinous matter, diſtinguiſhed by the eye in the dried root, and which is readily extracted by ſpirit of wine. See Lewis's Mat. Med.

PETECHIÆ. Red or purple ſpots on the ſkin, which frequently appear in the ſmall-pox, &c. The Italians gave them this name from the word *petechio*, becauſe they reſemble the bites of fleas. The French call them *purpuratæ*; the Spaniards call them *taberdillo*; the Germans *lenticulares*.

PETECHIA. Dr. Schotte obſerves, that this word is not Latin, but Italian, ſignifying a ſmall-pox of a purple colour. It originally ſignified ſuch appearances in the ſkin as elevated it, but cuſtom hath now eſtabliſhed its uſe to expreſs thoſe ſpots which are leſs or more diffuſed in the ſkin without ever raiſing its ſurface. Uſually they are reddiſh, purple, or blackiſh ſpots in the ſkin, like ſmall points, but ſoon ſpread and gradually grow broader. Theſe *petechiæ* go by various other names, ſome call them *punctula*, *punctícula*, *punctícularis*, others *lenticulæ*, others call the diſeaſe in which they are one of the ſymptoms, *pulicaris morbus*. They cannot, with any propriety, be called *lenticulæ*, for in Celſus the lenticulæ were pimples or blotches, riſing above the ſkin: he compares the ſcales of the worſt ſort of impetigo with thoſe of the lenticulæ; lib. v. cap. 28. The term *pulicaris*, from their reſemblance to flea-bites, is not very applicable; for a flea-bite is not at all like a *petechia*; the flea-bite cauſes in moſt people, when recently inflicted, a little whitiſh tumor, encircled with red, which riſes above the ſkin; it hath a puncture in the middle, which only is perceptible when cloſely examined; this tumor ſubſides by degrees, and diſappears: the ſecond or third day a ſmall yellow or browniſh ſpot appears in its place, and this is not unlike a *petechia*.

A female patient of Dr. Withers, (ſee his Treatiſe on the Aſthma, p. 421.) after various other complaints, had a violent raſh make its appearance, conſiſting of ſmall red pimples, diſperſed in different places over her body, followed by a great number of purple ſpots, which were evidently *petechial*, attended with bleedings at the noſe and gums, certain ſymptoms of a diſſolution of the blood. The firſt eruption was critical and ſalutary, and followed by an alleviation of other complaints; but the latter was ſymptomatic of the putrid tendency of the fluids. As there was little or no fever along with the *petechial* ſpots, and as all her other complaints were nearly removed, he was not alarmed at this new diſeaſe. Fevers of different ſorts, and intermittents among the reſt, are often obſerved to injure the texture of the blood in this way. (See Pringle's Obſ. p. 287. Monro on the Diſeaſes of Military Hoſpitals, p. 1. Cleghorn on the Diſeaſes of Minorca, p. 147.) though ſometimes indeed *petechial* ſpots, as he has ſeen in ſeveral inſtances, will appear without any evident fever having preceded. (See Duncan's Caſes and Obſ. p. 90.) I had, ſays he, an example of this a few months ago, in a young lady about eleven years of age, in whom there were hundreds of purple ſpots, which all came out nearly in one night. Her noſe too, at times, bled profuſely. Another patient had a great number of *petechiæ* of a very obſtinate nature, when ſhe was pregnant of her laſt child, along with a moſt ſevere pain in one ſide of her upper jaw. This pain returned every four or five minutes both day and night without intermiſſion, although every tooth in the diſeaſed part had been drawn before I ſaw her. She had too a very dangerous diſcharge of blood from her noſe; and at another time a great quantity of the lochia after delivery. The hæmorrhages and *petechial* ſpots aroſe from the diſſolved ſtate of her blood. For the complaint firſt mentioned, I preſcribed a ſtrong decoction of bark, and recommended chiefly a vegetable diet (though as her ſtomach was very weak, and ſhe was accuſtomed to have a little freſh meat at noon, and as it was evident the diſſolved ſtate of her blood did not ariſe from her diet, but from the fever and diminiſhed tone of the fibres, I was not ſtrict in forbidding it, nor perhaps could ſhe have followed my advice if I had), along with the moderate uſe of cordial antiputreſcent liquors. She could not take the bark again in ſubſtance, otherwiſe I ſhould have preſcribed the powder in preference to the decoction. The decoction being at laſt too ſtrong for her, I was obliged to have recourſe to the tincture, which was given her till the cure was completed. She found great benefit in this diſeaſe from being much in the open air. It is worth obſerving, that, one day ſhe was feveriſh, and had a lax upon her, after which there was a freſh appearance of purple ſpots, ſo great was the effect, even of that ſhort return of fever. It was near two months from firſt to laſt, before thoſe purple ſpots were entirely removed; for as ſome died away, others appeared. I have ſeen ſeveral caſes in which they have continued three or four weeks. In ——'s caſe, the petechiæ continued to come and go for years, although ſhe has lived in the country, and uſed the moſt antiputreſcent diet, along with cool freſh air, regular exercite on horſe-back,

back, the bark in ſubſtance, elixir of vitriol, and many other powerful antiſcorbutic remedies." Though moſt *petechiæ* appear to be of a ſcorbutic nature, they may ſometimes probably be of a bilious nature, as was the caſe in a patient, who, after being apparently cured of a tertian fever; had ſtill a laſſitude continued, which encreaſed greatly in eight ſucceſſive days; his legs began to ſwell, and great ſpots and ſtreaks of a dark red colour, inclining to blue, broke out all over his body, but particularly on his thighs and feet; they were not at all painful, of various ſizes, ſome of them very large; and between theſe again there were many brown-black ſpots or ſtreaks, which had perfectly the appearance of *petechiæ*. As his Tongue was very foul, and his pulſe ſmall, he took an antimonial emetic, with which he threw up much bile, was much relieved; the ſwelling of the feet diminiſhed, and the great ſtreaks had partly diſappeared, whilſt thoſe which remained, were leſs marked and diſtinct. He repeated the vomit at the diſtance of about three days betwixt each, three times: after the laſt of which he felt himſelf perfectly recovered; and, to cloſe the cure, the elixir vitrioli mynſichti was exhibited. See GOTTLIEB RICHTER's Medical Obſervations, p. 192.

PETECHIALIS FEBRIS, } The PETECHIAL FE-
PETICULAS. } VER; alſo called *lenticularis febris*. In moſt writers it is treated of as a diſtinct ſpecies; but it is only the low or the putrid fever attended with purple ſpots. The purple ſpots are a ſymptom only, and are very common in putrid diſorders, whether of the acute or chronical kind. See PUTRIDA FEBRIS; Hoffman, Pringle, and Huxham on *Petechial Fevers*.

PETIGO. See LICHEN.

PETOLÆ. See MORPIONES.

PETRÆ OLEUM. See PETROLEUM VULGARE.

PETRIFICATIO. See ANCUBITUS.

PETROLEI OLEUM. The common name for all bitumens, is petroleum; the oil is nothing more than its purer ſubſtance. Of the ſame nature is Britiſh oil, extracted from a ſpecies of ſtone coal. All theſe bituminous liquids are recommended externally againſt rheumatic affections of the chronic kind, and paralytic complaints; they are ſtrongly ſtimulant, and participate much of the nature of the oil of amber, and turpentine. See PETROLEUM BARBADENSE.

—— BARBADENSIS AMMONIATUM LINIMENTUM. See AMMONIA.

PETROLEUM. It is ſo called, becauſe it is an oil which diſtills from rocks. It is the only *bitumen liquidum*, *liquid bitumen* that is known. It is alſo called *callicola*; *terræ oleum*. Neumann reckons the naphtha to be another liquid bitumen; and ſays that, in conſiſtence, next to the naphtha, is the *petroleum*, which is groſſer and thicker than the *naphtha*, of a yellowiſh, reddiſh, or browniſh colour, but very light, ſo as to ſwim on ſpirit of wine; he alſo ſays that the *petroleum* in the ſhops is all fictitious. Mr. Edwards, in his Elements of Foſſilogy, ranks it as a genus in the claſs of inflammables. He deſcribes it as being an inflammable, which, when pure, is in a fluid form; very inflammable, and burning like oil; and generally of ſo little ſpecific gravity, as to ſwim almoſt in all fluids.

PETROLEUM ALBUM. WHITE PETROLEUM. It is nearly colourleſs, almoſt as fluid and limpid as water, of a ſtrong penetrating ſmell, not diſagreeable, ſomewhat reſembling that of the rectified oil of amber. It is found only in the duchy of Modena.

—— BARBADENSE, called alſo *bitumen Barbadenſe*, *piſſæleum Indicum*. BARBADOES TAR. It is of a reddiſh black colour, and a thick conſiſtence, approaching to that of treacle or common tar; it is found in the American iſlands, particularly in Barbadoes, but we rarely have it genuine. It is a ſpecies of *petroleum*.

Theſe different kinds are met with, iſſuing from the clifts of rocks, or are obtained by diſtillation from bituminous ſubſtance, but we rarely meet with any of them genuine. Fine *petroleum* catches fire at the approach of a flame, even without the contact of one with the other, and it burns entirely away; concentrated acids make great conflict on being mixed with *petroleum*, but thus its conſiſtence is thickened, and its fragrance increaſed; it does not readily mix with the ſpirit of wine, but is readily united with the eſſential oil of vegetables.

The finer *petrolea* are more agreeable than oil of amber, and more mild than oil of turpentine, they have been uſed in nervous complaints, and as diuretics, but chiefly in external applications againſt the rheumatiſm, palſy, chilblains, &c. In theſe intentions, the Britiſh oil, and ſuch other productions of our own, are equally efficacious. The Americans uſe the *Barbadoes tar* internally as a ſudorific, and externally as a diſcutient and antiparalytic. On diſtillation, the *Barbadoes tar* yields an empyreumatic oil, which, when placed betwixt the eye and the light, appears of an orange colour, but in other poſitions of a blue one; though by long keeping, it appears yellow in all ſituations.

See Dict. of Chem. Neumann's Chem. Works, and Lewis's Mat. Med.

—— FLAVUM, called *naphtha Italica*, ITALIAN OIL of PETRE, or ROCK OIL, or YELLOW OIL of PETRE. It is of a clear yellow colour, leſs fluid than the white ſort, in ſmell leſs penetrating, leſs agreeable, and more nearly allied to that of the oil of amber. It is found in the duchy of Modena, but does not very materially differ from the white ſort.

—— SULPHURATUM. See SULPHURIS BALSAMUM BARBADENSE.

—— VULGARE, called alſo *petræ oleum*, PETROLEUM *rubrum*, *petroleum Gabianum*, *Gabianum oleum*, COMMON ROCK OIL, RED PETROLEUM. It is of a blackiſh red colour, of a thicker conſiſtence, and a leſs penetrating and more diſagreeable ſmell than either the white or the yellow ſorts. It is found in Italy, and about the village Gabian in Languedoc.

PETRO-PHARYNGÆI. Theſe muſcles riſe from the lower part of the extremity of the apophyſis petroſa, and run backwards, to be inſerted into the linea alba of the pharynx.

PETROSA APOPHYSIS. The rock or harder portion of the temple bones; in children it is eaſily ſeparable from the other parts, viz. the maſtoid, and ſquamous.

PETRO SALPINGO-STAPHYLINI, called alſo *periſtaphylini interni*; *ſalpingo—ſtaphylini interni*. Each of theſe muſcles are fixed by one extremity, partly to the inner ſide of the bony portion of the Euſtachian tube, or to that next the apophyſis petroſa, partly along the cartilaginous portion of the ſame tube; thence it paſſes a little way under the ſoft membranous part, and then turns towards the ſeptum palati. See Winſlow's Anatomy.

PETROSELINUM. See APIUM HORTENSE.

—— MACEDONICUM. See APIUM MACEDONICUM.

—— MONTANUM. See OREOSELINUM.

PETROSUM OS. See TEMPORUM OSSA.

PETUM, } See NICOTIANA.
PETUN. }

PEUCE. See PINUS.

PEUCEDANUM, from *peuce*, *a pine-tree*, which it reſembles in its leaves. It is alſo called *fœniculum porcinum*, *cauda porcina*, *pinaſtellum*, *agrion*, *agriophyllon*, *marathrophyllum*; SULPHUR-WORT, and HOG'S-FENNEL. It is the PEUCEDANUM OFFICINALE Linn. This is perennial, grows wild by the ſea-ſhores, and in moiſt ſhady places, and flowers in July. The roots have a ſtrong fetid ſmell; which being cut when freſh, in ſpring or autumn, yield a conſiderable quantity of yellow juice, which ſoon dries into a ſolid gummy reſin, retaining the taſte, and ſtrong ſmell of the root; and ſtands recommended as an *aperient* and *antihyſteric*. See Lewis's Mat. Med.

PEUCEDANUM SILAUS. See SAXIFRAGA ANGLICA

PEYRI GLANDULÆ. PEYER's GLANDS. See BRUNNEIRI GLANDULÆ.

PEZA. See PES and ASTRAGALUS. According to ſome, it is all parts of the leg under the tibia.

PEZIZA. A ſpecies of fungus; ſometimes it is without pedicles, and ſometimes with them, having its edges divided ſo as to form a remarkable cavity between them. It is of an uniform ſubſtance like the fungoides, and neither diſtinguiſhed by lamellæ nor pores.

PEZIZA AURICULA. See AURICULA JUDÆ.

PHACE, or PHACOS. See LENS.

PHACOIDES. Of the form of a lentil. See OCULUS.

PHACOSIS. A black ſpot in the eye reſembling a lentil.

PHAGEDÆNA, from φαγω, *to eat*. It is an equivocal term: ſometimes it is taken in a latitudinous ſenſe; for every ulcer which eats away the ſound parts which are contiguous, and is called *depaſcens ulcus*; or ſometimes

more limitedly; for a deep tumid ulcer which deſtroys the fleſh underneath, as well as the neighbouring parts. Sometimes it is deſcribed as only deſtroying the ſkin; and, at others, it ſignifies a particular ſpecies of ulcer, called *herpes phagedæna*. Beſides, it is a name applied to a certain affection of the ſtomach, from which an immoderate quantity of food is required; nor can it be ſatiated: hence uſed to expreſs the diſeaſe called canine appetite. See BOULIMUS.

PHALACRA. In Hippocrates they are blunt and ſmooth ſurgical inſtruments, as a probe, or any other, with a button at the end. They are alſo called *calvata*.

PHALACROTIS. See ALOPECIA.

PHALANGIUM ALLOBROGICUM. See LILIASTRUM ALPINUM MINUS.

PHALANGOSIS. According to ſome, it is when there are two or more rows of hairs in the eye-lids. A diſeaſe of the eye-lid turns inwards, ſo that the hairs ſtimulate the eye, ſo ſays P. Ægineta, lib. vi. c. 8. The eye-lid is tumefied or relaxed, ſo as to appear unſeemly or to offend the ſight; it proceeds either from a paralytic diſorder of the muſculus elevator palpebræ, or from the relaxation of the ſkin above; ſometimes an œdematous tumor is formed in the eye-lids, but it ſhould be diſtinguiſhed from that *phalangoſis*, which, when it proceeds from relaxation, requires an exciſion of the relaxed ſkin, though the diſorder ſometimes returns, notwithſtanding the operation. See Hippocrat. lib. de Vict. Rat. in Oculi. and Celſus, lib. vii. c. 7. See PTOSIS.

PHALANGOSIS TRICHIA. See TRICHIA.

PHALANX. See DIGITUS.

PHALARIS, alſo called *Gramen Spicatum*. CANARY-GRASS. Boerhaave takes notice of eight ſpecies. It grows amongſt corn, and is found in many places beſides the Canaries. The ſeeds are *diuretic*. See Raii Hiſt.

PHANTASMA. See PSEUDOBLEPSIS.

PHARMACEIA. Purgation of the belly by the exhibition of a cathartic.

PHARMACEUTICA, PHARMACEUTICS. That part of medicine which gives the deſcription of remedies, and teaches the method of rightly exhibiting them.

PHARMACEUTICE, φαρμακευτικη, *medicine*. The art of healing was carried on down to the time of Herophilus and Eraſiſtratus, in an union of all its branches; and then, Celſus informs us, medicine was divided into THREE PARTS; one cured *by diet*; another *by medicaments*; a third *by manual operation*. The firſt was named in Greek διαιτητικη, the ſecond φαρμακευτικη, the third χειρουργικη; each deriving its appellation from the principal method taken to effect a cure; therefore, as that method which cures chiefly by diet, ſometimes admits medicaments, ſo that which chiefly oppoſes the diſeaſe by medicaments, ought alſo to attend to diet. Celſus's General Preface, and Preface to his Fifth Book. From whence it is evident, that it was a ſeparation in the different branches of medicine, and not in preſcribing diet and medicines, which was intended; for though they had different appellations, each ſect had the whole management in thoſe diſorders which fell properly under their care. Accordingly, if we take a view of the ſeveral chapters in which each of theſe ſubjects are treated, we ſhall diſcover that one ſet of practitioners undertook the cure of internal, and the other of external diſorders; and whether they were of that claſs which cure principally by diet, or principally by medicaments, yet each party took in every neceſſary for his purpoſe, both from diet and medicines. The firſt four books evince that the dietetic branch were to have the entire management of all diſorders, which confined themſelves to the inward parts of the body, and originated internally. Aretæus and Cœlius Aurelianus confined themſelves to this line. The fifth and ſixth books ſhew, that the pharmaceutiſts had the whole direction of diet and medicines in all the external diſorders, where the principal part was not conducted by the hand, whether ariſing from an external or an internal cauſe, being the ſect which are ſaid to have preſcribed medicines; and ſurgeons cured the wounds they had made, both by diet and medicine. Thoſe who cured internal, and thoſe who cured external diſorders, without manual operation, had the appellation of *iatroi* among the Greeks, and medici among the Latins; nor was it intended that they ſhould interfere with each other in their different departments. See MEDICINA, and Kirkland's Inquiry, vol. i. p. 64, &c.

PHARMACITIS. See AMPELITIS.

PHARMACOCHYMIA. *That part of the chemical art* which teaches the preparation of chemical medicines, by way of diſtinction from the *ſpagirical part*, which treats of the tranſmutation of metals.

PHARMACOPŒIA, from φαρμακον, *a medicine*, ποιεω, *to make*. A *Pharmacopœia*, or Diſpenſatory. *Pharmacopœias* are compilations of medicines approved of by medical practitioners. About the middle or the latter end of the fifteenth century, Nicolaus Præpoſitus of Tours wrote a general *Diſpenſatory*, and it was the firſt. The compoſitions in it were principally taken from Meſue, and from Nicolaus de Salerno. The firſt *Pharmacopœia* which was ſet forth by public authority was that of Valerius Cordus, under the ſanction of the ſenate of Norimberg, anno 1542.

PHARMACOPOLÆ. See AGYRTÆ.

PHARYNGÆA, CYNANCHE. QUINSY OF THE ŒSOPHAGUS and PHARYNX. Dr. Cullen adopts the name in his Noſology, and in his Firſt Lines of the Practice of Phyſic, but never having ſeen a caſe of the kind, he refers the ſubject to thoſe who have. See ANGINA. In the Edinb. Medical Commentaries, vol. iii. p. 192. a caſe is mentioned of the *cynanche œſophagea*, and the following very ſhort narrative of it is given. A girl, twenty-two years old, had a pain between the ſternum and the fifth vertebra of the back, but rather nearer the back. That pain was not increaſed by drawing in her breath; but it was very violent when ſhe attempted to ſwallow any thing, and then ſhe referred it ſtill to the ſame place. She had no cough, nor any dyſpnœa; but her pulſe was hard, full, and frequent; ſhe had not the leaſt redneſs nor ſwelling in the tonſils. She was cured by bleeding and the antiphlogiſtic regimen.

PHARYNGÆUM SAL. It is of uſe in quinſies, and thence ſo called. It is thus prepared: ℞ Cryſtal. tart. ſal nitri ää ℥ i. alum. uſt. ℥ ſs. diſſolve in diſtilled vinegar, and coagulate the ſolution. This ſalt is diſſolved in water for gargariſms.

PHARYNGETHRON. See PHARYNX.

PHARYNGO-STAPHYLINI. They are two ſmall muſcles fixed to the lateral part of the muſculi thyro-pharyngæi, as if they were portions detached from theſe muſcles; thence they run up obliquely forward, along the two poſterior half arches of the ſeptum, and terminate in the ſeptum above the uvula, where they meet together; the thickneſs of the poſterior half arches is made up by theſe muſcles. See Winſlow's Anatomy.

PHARYNX. Thus the Greeks name what the Latins call *infundibulum*, alſo *pharyngethron*. It is a muſcular bag, fixed behind to the baſis of the ſkull, laterally to the bottom of the face, and below that to the larynx. See ŒSOPHAGUS. The muſcles of this part are ſufficiently deſcribed by their names, they are the *crico-pharyngæus*, from the cricoid cartilage to the *pharynx*; *thyro-pharyngæus*, from the thyroid cartilage to the *pharynx*; *hyo-pharyngæus*, from the os hyoides to the *pharynx*; *ſtylo-pharyngæus*, from the ſtyloid proceſs to the *pharynx*; *pterygo-pharyngæus*, from the pterygoid proceſs to the *pharynx*; *mylo-pharyngæus*, from the dentes molares to the *pharynx*; *ſalpingo-pharyngæus*, from the Euſtachian tube to the *pharynx*; *cephalo-pharyngæus*, from the baſis of the ſkull to the *pharynx*; *ſyndeſmo-pharyngæus*, from the white ligament to the *pharynx*; *chondro-pharyngæus*, from the cartilaginous appendage of the os hyoides; *gloſſo-pharyngæus*, from the root or upper part of the tongue laterally. Some have reckoned the muſcles of the *pharynx* to be but two or three, whilſt others have multiplied them to thirteen or fourteen on each ſide. Albinus divides them into ſix pair, viz. *Styly-pharyngæus*, which is the ſame as deſcribed by Douglas under that name; *conſtrictor inferior*, i. e. the *crico-pharyngæus*, and *thyro-pharyngæus* of Douglas; the *conſtrictor medius*, i. e. the *hyo-pharyngæus*, the *chondro-pharyngæus*, and *cephalo-pharyngæus* of Douglas; the *conſtrictor ſuperior*, i. e. the *gloſſo-pharyngæus*, *mylo-pharyngæus*, and *pterygo-pharyngæus* of Douglas; the *palato pharyngæus*, i. e. *thyro-ſtaphilinus* of Douglas; and the *ſalpingo-pharyngæus* of Douglas. In their various actions they enlarge and compreſs the gullet, ſo as to forward the aliment into the ſtomach.

The ſpace is all the vacuity behind the velum pendulum palati.

The *pharynx* is made up partly of ſeveral diſtinct fleſhy portions, which are looked upon as ſo many diſtinct muſcles, ſo diſpoſed as to form a large cavity, and partly of a membrane which lines the inner ſurface of this whole cavity, and is a continuation of that of the nares and palate.

late. This membrane is wholly glandular, and it is thicker on the ſuperior and middle portions of the *pharynx*, and on the bottom, or lower portion. Immediately above the firſt vertebræ, it forms ſeveral longitudinal rugæ, very thick, deep, and ſhort, and we generally find therein a collection of mucus, in dead bodies. In the great cavity there are no rugæ, the membrane there adhering, as well as in the upper part, very cloſely to the muſcles. At the lower part where it is the thinneſt, it covers the poſterior part of the larynx, and is very looſe, and formed into irregular folds.

In the Lond. Med. Obſ. and Inq. vol. iii. p. 85, &c. is a caſe, in which, from a dilatation of the *pharynx*, a difficulty of ſwallowing was occaſioned.

PHASEOLUS. The KIDNEY-BEAN, called alſo *bona*; *boona*. It hath a long pod, full of kidney-ſhaped or oval ſeeds; the plant, as to its outward appearance, is flexible, ſcandent, and moſtly trifoliated, or hath its leaves growing by threes. Botaniſts enumerate thirty ſpecies, or more. It is the name of the *kidney-bean* tree.

PHASEOLUS MAJOR, called alſo *ſmilax hortenſis*, *faba major*. FRENCH BEANS, or COMMON KIDNEY-BEANS. They are cultivated in gardens, they flower in July, the pods are uſed as aliment, they are opening, digeſtive, and provoke urine They are leſs nutrient, and leſs flatulent than beans or peas.

PHASEOLUS ZURRATENSIS, } called alſo *phaſeolus*
PHASEOLUS BRASILIANUS, } *pruritus excitans*, *dolichos*, *nai corona*, *cadjuſt*, COW-HAGE, COW-ITCH, and STINKING BEAN. The DOLICHOS URENS, vel DOLICHOS PRURIENS, vel DOLICHOS VOLUBILIS, *leguminibus racemoſis hirtis*, *valvulis*, *ſubcarinatis pedunculis ternis*, Linn. This is a ſpecies of the *kidney-beans*; it is brought from both the Indies. The hairy part upon the pods, if ſcraped off, and mixed with ſyrup to the conſiſtence of a ſoft electary, may be given to children in doſes of a tea-ſpoonful, and two to adults, for deſtroying the long round worms. If ten or twelve pods are ſteeped in a quart of beer, and ℥ iv. of the infuſion are taken every morning, it acts as a diuretic, and gives great relief in dropſies. See Raii Hiſt. Lond. Med. Journal. vol. vi. p. 313. Alſo STIZOLOBIUM, where a different account is given of the cowitch.

PHASEOLUS. See CAJAN FABA MUCUNA GUACU.

PHASIANUS. PHEASANT See ARGUS.

PHAUSINGES. Red circles in the legs, excited by fire. It ſometimes is uſed to ſignify other kinds of ſpots, as well as red ones cauſed by the fire.

PHELLANDRIUM. See MEUM ALPININUM GERMANICUM.

PHELLANDRIUM AQUATICUM Linn. WATER-HEMLOCK, FINE-LEAVED. It is generally called *water-hemlock*, and thus is often confounded with the cicuta viroſa. Withering, in his Bot. Arrang. vol. i. p. 176. deſcribes the *phellandrium aquaticum* as follows: the rundle with many ſpokes; rundlets, the ſame; general fence, none; the empalement, a partial fence of ſeven leaves, ſharp, as long as the rundlet; cup, of five teeth, permanent; the bloſſoms general, nearly uniform; florets, all fertile, individually unequal; petals, five, tapering, heart-ſhaped, bent inwards; chives; threads; five, hair-like, longer than the petals; tips roundiſh; pointal; ſeed-bud beneath; ſhafts two, awl-ſhaped, upright, permanent; ſummits, blunt; ſeed-veſſels, none: fruit egg-ſhaped, ſmooth, crowned with the cup and the pointals, diviſible into two parts; ſeeds, two, egg-ſhaped, and ſmooth. The florets in the centre are ſmaller than the others. The branchings of the leaves are ſtraddling, the ſtem is very thick, hollow, ſcored, and the petals are white.

It is the PHELLANDRIUM AQUATICUM Linn. *Phellandrium*, vel *cicutaria aquatica* quorundam. Ray's Syn. 215. *Cicutaria paluſtris*. Gerard. 1063. *Cicutaria paluſtris* tenuifolia. B. p. 161. SKELETON WATER-WORT; Withering's Bot. Arrang. which laſt author ſays, the ſeeds are recommended in intermittent fevers; the leaves are ſometimes added to diſcutient cataplaſms: the plant is generally eſteemed a fatal poiſon to horſes, occaſioning them to become paralytic; but this effect is owing to an inſect, (curculio paraplecticus) which generally inhabits within the ſtems: the uſual antidote is pig's dung.

PHELLODRYS. The LAUREL OAK; called alſo *cerro*. It grows in Dalmatia and Greece. The leaves, bark, and acorns, agree in virtues with the common oak. See QUERCUS. Raii Hiſt.

PHENION. See ANEMONE.

PHIALA. A glaſs veſſel, with a big belly, and long neck. It is often uſed for chemical coagulations and ſolutions. Alſo the common PHIAL of the apothecaries.

PHILADYNAMOS. An epithet of water, expreſſing the property of it, by which it diminiſhes the ſtrength.

PHILANTHROPOS. The name of a compound anti-nephritic medicine

PHILANTHROPUS. See APARINE.

PHILLITIS. See LINGUA CERVINA.

PHILLYREA. See LIGUSTRUM INDICUM.

PHILONIUM. An opiate ſo called from its inventor Philo. Galen ſays, that the antidote of Philo is one of the oldeſt of its kind, but the mithridate is much older. The *philonium* Romanum is originally a preſcript of N. Myrepſus. There are different preſcriptions for this compound in different pharmacopœiæ: that of London, 1788, is made in the following manner, and now called CONFECTIO OPIATA; *opiated confection*. Take of hard purified opium, powdered, ſix drams; long pepper, ginger, and carraway ſeeds, of each two ounces; ſyrup of white poppy, boiled to the conſiſtence of honey, three times the weight of the whole. Mix the purified opium carefully with the heated ſyrup; then add the reſt rubbed to powder.

PHILOSOPHORUM MERCURIUS, called alſo *arca arcanorum*, and *mercurius metallorum*, MERCURY of METALS, or of THE PHILOSOPHERS, is a pure fluid ſubſtance in form of running mercury, ſaid to be found in all mercury, and capable of being extracted from the ſame. The notion of the mercury of metals was founded on the common ſyſtem of the chemiſts, that quickſilver was the baſis of all metals, and that they are only mercury fixed by a certain ſulphur.

—— OLEUM. See LATER.

—— LAPIS. See ADAMAS.

PHILTRON, from φιλεω, *to kiſs*, called alſo *amatoria veneficia*. A love potion, or a medicine to excite love. It alſo ſignifies the cavity, or depreſſure on the upper-lip, which is ſituated immediately under the ſeptum of the noſe.

PHIMOSIS. It is when the prepuce cannot be drawn over the glans penis, ſo as to uncover it. It is alſo called *capiſtratio*. Dr. Cullen places it as a variety of the phlogoſis phlegmone. See LUES VENEREA. Bell's Surgery, vol. i. p. 528, and White's Surgery, p. 343.

PHLASMA. See CONTUSA.

PHLEBOPALIE. See PULSUS.

PHLEBORRHAGIA, from φλεψ, *a vein*, and ῥηγνυμι, *to break*. A RUPTURE of a *vein*.

PHLEBOTOMIA, from φλεψ, *a vein*, and τεμνω, *to cut*. PHLEBOTOMY. It is the ſame as *venæſectio*. The *cutting*, or opening a *vein*; when more veins than one are opened in a day, the operation is called *neroniana*.

The firſt inſtance of *bleeding* on record, is that of Podalirius's; Hippocrates did not often direct this operation; Aretæus, Celſus, and Galen, uſed it more freely than Hippocrates; but at different periods, and by different profeſſors, it was encouraged, or nearly prohibited. Indeed until the circulation of the blood was demonſtrated, the principles for this practice did not ſeem ſo clear as they are at preſent; and even now, there is great diverſity of opinions reſpecting bleeding in many particulars.

BLEEDING, or the taking away blood, is only proper when there is too much craſſamentum in the veſſels, or when it is to avoid a worſe inconvenience than that of leſſening the already too little quantity of blood. In general, the pulſe is the beſt guide, both as to when to bleed, and the quantity to be taken away. When the pulſe is full, ſtrong, or tenſe, bleeding will always be proper, provided that a plethora be the cauſe, and not rarefaction; indeed, in old people, the pulſe ſeems hard from the rigidity of the coats of the arteries.

Bleeding is not only uſeful when actual inflammation attends, but alſo in ſanguine habits which tend to be plethoric. In the ſmall-pox, if the heat demands, and the pulſe will allow of bleeding, the operation may be performed at any period of the diſorder. In intermitting fevers, when the heat is great, and there is pain in the bowels, or if a delirium comes on, bleed in the interval of the fit, or on the acceſs of the hot fit. In the meaſles, blood for the moſt part ſhould be taken away, both in the beginning and at the decline of the diſorder. In the bilious,

lious colic, blood is taken away in the beginning, to prevent an inflammation in the part where the pain is urgent. In the gout, when the fever runs high, bleeding is found useful; and if the patient is plethoric, or comatous, repeat the operation. In pregnancy, *bleeding* is generally required in the firſt three months, and its repetition in the laſt three. In the hæmorrhoids, where there is a fulneſs of the blood-veſſels, empty them by this operation. When the lochia are ſuppreſſed, *bleeding* is rarely to be omitted. In a concuſſion of the brain from a blow or fall, bleeding is more frequently uſeful than the trepan. In apoplexies from a ſanguine plethora, *bleeding* is the principal means of relief. When *bleeding* is and is not convenient, would require a particular treatiſe to relate; but its proper uſe, or ill effects, are generally noted in theſe ſheets, in treating of each diſeaſe reſpectively. However, it may here be neceſſary to make one obſervation, that though bleeding is one of the moſt noble remedies in the whole art of phyſic, in judicious hands, it often is converted into the moſt dangerous application, when ignorantly, or raſhly adviſed. Therefore great circumſpection in many reſpects is neceſſary in the uſe of this remedy. Where the habit is ſtrong, the pulſe full, hard, and quick, it is *generally right* to take away blood in any diſeaſe with which the conſtitution may be oppreſſed. Where the habit is weak, and the contrary extremes take place with regard to the pulſe, it is *almoſt always wrong*, and in the beginning of fevers, often extremely dangerous. And with reſpect to the quantity of blood to be taken away, as well as the mode by which the operation is to be performed, in order to relieve ſome oppreſſive ſymptoms, which affect the head, lungs, or other of the interior parts, we muſt be regulated by the nature of the conſtitution, and conſider to which of theſe circumſtances it has the greateſt tendency. See CUCURBITULA, and HIRUDINES. On the ſubject of *blood-letting*, ſee Galen de Sang. Miſſion. Botallus de *Venæſect.* M. A. Severinus on *Bleeding*. An Eſſay concerning *Blood-letting*, by R. Butler, M. D. Bell's Surgery, vol. i. p. 63, &c. White's Surgery, p. 167.

PHLEBOTOMUS. A LANCET, or a FLEAM for bleeding with.

PHLEGMA. PHLEGM. GALEN ſays, every humour that is cold comes under this denomination. In HIPPOCRATES this word often ſignifies an inflammation.

In CHEMISTRY the word *phlegm* ſignifies the moſt watery part obtained from bodies by diſtillation or otherwiſe.

PHLEGMASIA. See INFLAMMATIO.

PHLEGMATIA, PHLEGMATITIA. } See ANASARCA.

PHLEGMATORRHAGIA. The name of a diſorder in which a flux of thin phlegm was diſcharged from the noſtrils. See Salmuthus, obſ. 37.

PHLEGMONE, from φλεγω, *to burn*. See INFLAMMATIO.

PHLEGMONE ARTICULI. See ARTHROPUOSIS.

PHLEPS. See ARTERIA.

PHLOGISTICI. Inflammations, and fevers, with a hard pulſe and topical pain.

PHLOGISTON. INFLAMMABLE PRINCIPLE, on which the ignition of all bodies depends. The exiſtence of this element was firſt aſſerted by STAHL, and from him the opinion has been adopted by other chemiſts, but of late a new doctrine has been broached by M. LAVOISIER, who denies altogether the exiſtence of *phlogiſton*.

The greateſt objection to the belief of which principle was, that it could neither be ſeen nor felt by our ſenſes, directly; nor diſcover itſelf indirectly by the weight it communicated to bodies, with which it was united; on the contrary, the latter always became lighter, in proportion to the quantity they contained; ſo that it was imagined, inſtead of being poſſeſſed of any ſpecific gravity of its own, to be a principle of poſitive levity, ſuch as that of heat and light may be ſuppoſed. This objection is now however removed, and *phlogiſton* in the abſtract is found to be no ſubtile principle, capable of eluding our reſearches, but one very common and eaſily met with, being no other than COMMON CHARCOAL.

In proof of the exiſtence of which *phlogiſton*, made evident to our ſenſes, we are preſented with ſeveral experiments by Dr. PRIESTLEY: one the moſt concluſive we ſhall recite.

"By the loſs of one grain of charcoal of copper, formed by the union of ſpirit of wine with that metal, and which like common charcoal was conſumed without having any reſiduum, he reduced four ounce meaſures of *dephlogiſticated air*, till only one ninth remained unabſorbed by water; and again, with the loſs of one grain and a half of charcoal, ſix and a half meaſures of *dephlogiſticated* air were reduced, till five and a half meaſures were pure fixed air." Here then is an abſolute and undeniable evidence, that fixed air is compoſed of *dephlogiſticated air*, and *charcoal* or PHLOGISTON and *elementary fire*. See alſo on this ſubject LAVOISIER's, CHAPTAL's, and FOURCROY's ELEMENTS of Chemiſtry.

PHLOGOSIS. See INFLAMMATIO, and ÆSTUS VOLATICUS.

PHLOMIS. See SALVIA SYLVESTRIS.

PHLYCTÆNÆ, from φλυζω, *to be hot*, or *to boil*, called alſo *holophlyctides*, *olophlyctides*; ſometimes the ſame as *phlyxacion*, or *phlyzacion*. LINNÆUS and VOGEL uſe this term as ſynonymous with *hydatis*; generally what is underſtood by it, are little watery puſtules on any part of the body. Small eruptions of the ſkin, ariſing from an hot acrid humour. Alſo puſtules which appear on the tunica cornea of the eye, of which there are two ſorts, viz. the *ungues* or puſtules, properly ſo called, and *phlyctænæ*. The puſtules are deep, and are filled with purulent matter; when they ariſe in the conjunctiva, they are reddiſh at the firſt, and afterwards white; but when on the tranſparent cornea, they are duſky at the firſt, and, in time, turn white. The *phlyctænæ* are ſmall veſicles, full of a tranſparent humour; they are ſeated on the cornea, and ſometimes on the conjunctiva; their ſeat is uſually under the external coat of the cornea, and hath been cured by taking off ſome of the cornea, and ſo removing the ſtagnating matter. A preceding inflammation is the cauſe of both puſtules and *phlyctænæ*. The only danger is, leſt they become ill-conditioned ulcers. Whether they are puſtules or *phlyctænæ*, dreſs them three or four times a-day with ſix or eight grains of ceruſſa acetata, in aq. roſ. ℥ iii. and when they give way, waſh them with equal parts of brandy and water; but if they neither diſperſe nor break ſpeedily, open with a lancet, and, when opened, dreſs with the aq. ſaphirina.

PHLYXACION, or PHLYZACION. A puſtule, or veſication on the ſkin, excited by fire or heat. Sometimes it is the ſame as *phlyctænæ*.

PHŒNICIUS MORBUS. See ELEPHANTIASIS.

PHŒNIGMOI. See EPISPASTICA.

PHŒNIX. See LOLIUM.

PHOS. LIGHT. See PUPILLA.

PHOSPHORUS, from φως, *light*, and φερω, *to bring*. It is called alſo *authophoſphorus*. It is the name of a collyrium in Galen. It is alſo the name of ſome chemical preparations which ſhine in the dark. The *phoſphorus igneus* differs from other naturally ſhining bodies, in this, that it is nothing but a kind of concealed fire, which diſcovers itſelf by light and ſmoak, but if it is rubbed, it breaks out into a flame. This diſcovery appeared about the year 1677; but was preceded by Baldwin's *phoſphorus*, which is an artificial Bolognian ſtone. After this diſcovery of Baldwin's, one BRAND, a chemiſt in Hamburgh, made a *phoſphorus* of urine, which was firſt called *phoſphorus ingneus*, then *pyropus*, then *phoſphorus*. The matter which fixes and increaſes the *phoſphorus* is alum, which of itſelf is prepared of urine, and yields the ſame acid which *phoſphorus* yields on burning; for upon analyſis, *phoſphorus* appears to be a compoſition of ſtrong acid, and an inflammable matter, exactly in the manner of common brimſtone, and may properly be called animal ſulphur. If *phoſphorus* is burnt under a bell, a ſp. ſulph. per camp. is produced. Phoſphorus though is made of other ſubſtances beſides urine. SCHEELE and GAHN formed it from bones. See the different proceſſes in CHAPTAL's Elements of Chemiſtry, vol. iii. p. 350, &c. See Dict. of Chem. Neumann's Chem. Works.

PHOSPHORUS BONONIENSIS, —— KERCHERI. } See BONONIENSIS LAPIS.

—— LIQUIDUS. LIQUID PHOSPHORUS. Powder one grain of the *phoſphorus* of urine, and ten grains of camphor; then mix them well together by trituration. Theſe diſſolved in the ol. caryoph. make a liquid *phoſphorus*, with which any part may be rubbed without danger of inflammation.

PHOXOS. The ſugar-loaf-ſhaped head.

PHRAGMOS, from φραττω, *to incloſe as with an hedge.*

†

hedge. An anatomical term for the double ſeries of teeth.

PHRASIUM VIRIDE. See ÆRIS FLOS.

PHRENES. See DIAPHRAGMA.

PHRENESIS, or PHRENETIASIS. See PHRENITIS.

PHRENICÆ ARTERIÆ. } See DIAPHRAGMA-
—— VENÆ. } TICÆ ARTERIÆ, and VENÆ.

PHRENISMUS. See PHRENITIS.

PHRENITICI NERVI. The nerves which run in the diaphragm.

PHRENITIS, from φρην, *the mind*, alſo *cephalitis*. The ancients imagined that patients became *phrenetic* in conſequence of an inflammation of the diaphragm; and, for this reaſon, called the diaphragm by the name of *phrenes*, as though it were aſſiſtant to the intelligent parts. It is alſo a PHRENZY, or AN INFLAMMATION IN THE BRAIN, or its membrane, with a continual fierce delirium, and an acute continual fever, and named *cephalalgia inflammatoria*; by the Arabians *karabitus*, alſo *phreneſis*, *phrenetiaſis*, *phreniſmus*, *ſphaceliſmus*. Dr. Cullen places this genus of diſeaſe in the CLASS PYREXIÆ, and ORD. PHLEGMASIÆ, which he defines violent febrile affections, attended with pain of the head, redneſs of the face and eyes, incapability of bearing light and ſound; a pervigilium; fierce delirium, and typhomania.

It is idiopathic, as when the head is primarily affected; and ſymptomatic, then called *deſipientia*, as when the morbid affection is tranſlated to the head from ſome other part; thus, in a pleuriſy, the pain is ſometimes removed from the ſide to the head, whence the *phrenſy* that generally proves mortal. The *idiopathic* and *ſymptomatic* alſo differ thus; the former is inſeparably *accompanied with an acute fever*, the latter is *followed* by the fever.

The idiopathic rarely happens in temperate climes; the ſymptomatic is ſometimes met with, and moſt frequently appears about the criſis of other fevers, attended with a rigor, a tremor of the joints, tenſion of the precordia, coldneſs of the extremities, thin urine, which is diſcharged either in too ſparing or too large a quantity; but becauſe of the weakneſs previouſly induced by the preceding diſeaſe, it proves almoſt always mortal. It is often difficult to determine poſitively, whether the idiopathic, or the ſymptomatic *phrenſy* is the attending diſeaſe. Sometimes the fever begins at the firſt very rapidly, with head-ach deep-ſeated and violent, great redneſs in the face and eyes; light and noiſe prove very troubleſome, watching is conſtant, and delirium furious.

Thoſe in the vigour of life, the paſſionate, the ſtudious, and thoſe with a weak nervous ſyſtem, are ſubject to this diſorder.

THE CAUSES are a too great afflux of blood, from an increaſed action of the veſſels in the ſyſtem: THE MORE REMOTE CAUSES are, exceſſive drinking, anger, an expoſure of the head to the ſun, an inflammatory diatheſis happening at the beginning of a fever, long watching, attention of the mind, any thing that forces the blood up into the head, a ſuppreſſion of natural periodical evacuations, &c.

According to Alex. Trallian, the ſigns of an approaching *phrenitis* are as follow: "Intenſe continual watchings; or if the patient ſleeps, his ſleep is interrupted and troubled; he ſtarts, and is affected with terrible dreams; he ſoon forgets what is ſaid to him; if at any time he returns an anſwer to a queſtion, he appears more fierce and angry than he ſeemed to be juſt before; the pulſe is ſmall and hard, and a pain is conſtantly felt in the occiput; as the diſorder increaſes, the eyes become more fixed and red, tears at the ſame time flowing from both of them." The ſigns of a preſent *phrenitis* are, according to Cœlius Aurelianus, an acute fever; a pulſe hardly perceptible on the ſurface of the body, or if it is, it is low and tenſe; the patient's face is inflated or full; blood drops from his noſtrils; continual watching, or diſturbed ſleep attend; he is ſeized with a kind of turbulent madneſs, a preternatural ſolicitude of mind, and a privation of reaſon; he frequently changes his poſture in bed, and his head is in a continual commotion; he is ſometimes cheerful without any apparent cauſe; his eyes are red; he weeps gently, toſſes his arms about him, but hath no pain in his head; his joints are cold, but without any tremor; his urine is copious, yellow, aqueous, thin, and diſcharged by little and little. Some *phrenetic* patients are afflicted with a noiſe in their heads, a ringing in their ears, an inceſſant head-ach; their looks are fixed and ſtern, and their eyes frequently wink." Aretæus ſays, that theſe patients are rarely thirſty; and this is true; for though the tongue is black, drink is refuſed; an extraordinary throbbing is obſervable in the arteries of the temples and neck in many patients; and, from ſullen ſilence, a ſudden outrage ariſes; except the inflammation ſoon abates, it proves fatal. Sometimes the inflammation ends in ſuppuration, eſpecially if the ſubſtance of the brain is affected; in this caſe, the ſymptoms abate, a ſtupor only being left; but, in time, if the pus is not abſorbed, the whole brain is deſtroyed. The delirium always goes off ſlowly.

The *phrenitis* ſhould be diſtinguiſhed from a mania, and from the deliriums attendant on other acute fevers; alſo from that inconſtancy and fooliſhneſs obſervable after ſome fevers, and that is owing to weakneſs.

Green vomiting, frequent ſpitting, ſhiverings, crude aqueous pale urine, convulſions, and no thirſt, are bad ſigns. When external violence is the cauſe, the diſeaſe is uſually fatal. A conſtant trembling, ſtarting of the tendons, ſuppreſſion of urine, total want of ſleep, conſtant ſpitting, a grinding of the teeth when the inflammation is from the lungs or inteſtines, are generally fatal. The more favourable ſymptoms are, hæmorrhages, the piles coming on, a diarrhœa, a pain in the breaſt or lower parts, a ſtrong cough, free perſpiration, a plentiful diſcharge of urine which drops a copious ſediment.

THE INDICATIONS OF CURE are, to remove the inflammation in the meninges; in order to which, it ſhould be known whether the antecedent cauſe is the repulſion of acrid matter from the ſkin, &c. or obſtructed blood, as in ſuppreſſion of the menſes, &c. or whatever other cauſe may have produced it.

An agreeable friend may be admitted, but, in general, every thing ſhould be guarded againſt by which the imagination can be affected; the room ſhould be kept dark as is convenient. The patient ſhould be as little contradicted as poſſible, and his requeſts ſhould even be complied with, though in a ſmall degree to his hurt.

This inflammation only admits of one ſalutary termination, and that is, *by reſolution*; therefore the moſt powerful means are needful, and that without delay. Bleed as freely as the ſtrength will admit of, and repeat the operation as it may appear requiſite; bleeding from a large orifice, and ſupporting the patient in a ſtanding poſture, that he may ſooner faint with the loſs of blood, will have their advantages. If the jugular vein can be opened, it is uſually preferred; and, if obſtructed menſes or lochia were the cauſe, bleed in the foot, after having taken away a portion of blood as above directed.

As ſoon as the patient is bled, give him a briſk but cooling purge. An infuſion of tamarinds with the natron vitriolatum, or manna with nitre, or cryſtals of tartar; or, if it can be had, the ol. ricini. Repeat the purging medicine, as well as the bleeding, at proper intervals, until the inflammation abates in its violence at leaſt.

In the intervals of purging, give the vin. antim. vel pulv. antim. every two hours, in ſuch doſes as the ſtomach will retain.

Nitre, crude ſal ammoniac, or Clutton's febrifuge ſpirit, may be freely mixed in all that the patient drinks.

Cooling laxative clyſters ſhould alſo be frequently injected, at leaſt let one be adminiſtered every night and morning.

The head may be ſhaved, and cloths dipped in vinegar and water may be laid thereon, as oft as they dry or grow warm.

When thus the ſtrength is ſomewhat reduced, let a large bliſter be applied to the ſhaved head. Sinapiſms may be applied to the feet before bliſters are admitted.

When there is hope of a mild reſolution, opiates may be admitted to abate the watchfulneſs, and then omit the clyſters; indeed, *if the patient is very outrageous*, opiates muſt not be forborn.

Some uſe tepid water for putting the legs into twice a day, and others prefer a bath for the whole body. If a continual *phrenitis* comes on in conſequence of obſtructed menſes, piles, or lochia, and ſpaſms are thereby produced, they are the beſt alleviated by baths.

If the hæmorrhoids ſwell, apply leeches to them.

When the diſorder is ſymptomatic, if the pulſe will bear it, a vein may be opened; but if the patient is too low, leeches may be applied to the temples, bliſters to the head and arms, and ſinapiſms to the feet. Camphor and nitre in proper doſes, well mixed by trituration, or diſſolved together in an emulſion, ſhould be often given.

The *phrenitis* goes off by reſolution, or ſuppuration. Sometimes a diarrhœa, or in women an exceſſive flow of the menſes, carries off the diſorder from the brain. By bad management it ſometimes ends in ſtupidity or madneſs, which continues during life.

See Alex. Trallian, Cœlius Aurelianus, Aetius, Willis's Pathol. Cerebri, cap. x. Hoffmann, Boerhaave, Baglivi, Fordyce's Elements, part ii. Cullen's Firſt Lines, vol. i. p. 272, edit. 4. Bell's Surgery, vol. iii. p. 147.

PHRENITIS APYRETA. See MANIA.

—— INANITORUM. See MANIA CORPOREA.

—— VOGELII. See SYNOCHUS.

PHRICASMUS. See HORROR.

PHRICODES, called alſo *carcaros*, *querquera*. A ſort of fever mentioned by the ancients, in which the patient trembled at the leaſt breath of air. According to ſome it is a kind of ſemitertian fever.

PHRYCTE. See COLOPHONIA.

PHRYGIUS LAPIS. The PHRYGIAN STONE. It is ſo called becauſe the dyers in Phrygia uſed it much. It is produced in Cappadocia; the beſt is pale and ponderous. When calcined, it becomes reddiſh. Its uſes are the ſame as thoſe of the lapis calaminaris.

PHTHARTICOS, from φθειρω, *to corrupt*. DELETERIOUS, DEADLY.

PHTHEIROCTONON, ſo called from φθειρ, *a louſe*, and κτεινω, *to kill*. See STAPHIS AGRIA.

PHTHEIRIASIS, } The LOUSY EVIL, from φθειρ,
PHTHIRIASIS. } *a louſe*, called alſo *morbus pediculoſus*, *pediculatio*. It is a *louſy* diſtemper; children are frequently its ſubjects, and adults are ſometimes troubled with it. The increaſe of *lice*, when in a warm moiſt ſituation, is very great, but a cold and dry one ſoon deſtroys them. On the human body four kinds of *lice* are diſtinguiſhed: 1. The *pediculi*, ſo called becauſe they are more troubleſome with their feet than by their bite. Theſe are in the heads of children, eſpecially if ſore or ſcabby: and often in thoſe of adults, if they are ſlothful and naſty. 2. Crab-*lice*. See MORPIONES. 3 Body *lice*; theſe infeſt the body, and breed in the cloaths of the naſty and ſlothful. 4. A ſort which breed under the cuticle, and are found in the hands and feet; they are of a round form, and ſo minute as often to eſcape the ſight; by creeping under the ſcarf-ſkin they cauſe an intolerable itching; and when the ſkin burſts where they lodge, cluſters of them are found there: ſome authors call them *acari*, CYRONES, and *pedicelli*.

A good diet and cleanlineſs conduce much to the deſtruction of *lice*. When they are in the head, comb it every day; and, after each combing, waſh it with the following: ℞ Staph. agr. vel coc. Ind. contuſ. ℥ i. aq. font. ℔ i. ſs. & colaturæ adde ciner. clavel. ℥ ſs. or, inſtead of this decoction, ſprinkle the pulv. ſem. ſtaph. agr. vel coccul. Ind. among the hairs every night, and confine it with a tight cap.

CODROCHIUS, in his Treatiſe of *Lice*, ſays, that the *powdered coc. Ind.* exceeds all other means, and that it may be mixed in the pulp of apple or in lard, and applied every night to the hair. Some writers aſſert, that if the *pulv. cort. rad. ſaſſafr.* is ſprinkled on the head, and confined with a handkerchief, it deſtroys the lice in one night.

The body *lice* are deſtroyed by any bitter, ſour, ſalt, or mercurial medicine, if applied to the ſkin. See Turner's Diſeaſes of the Skin.

The *black ſoap*, and the flowers called *cardamine* or *lady's ſmock*, are ſaid to be ſpecifics in all caſes of *lice* on the human body. See Sennertus, Codrochius, Mercurialis, and Turner, in his Diſeaſes of the Skin.

PHTHISIS, from φθω, *to grow lean*, *conſumptio*. A CONSUMPTION. The Greek word, *phthiſis*, ſignifies *corruption*; but it is uſed only to expreſs that kind which cauſes a *conſumption* of the whole body; and generally only that *conſumption* of the body which had for its cauſe an abſorption of purulent matter from the lungs: hence it is diſtinguiſhed by the term, *phthiſis pulmonalis*, or *tabes pulmonalis*.

This diſorder is chronical, yet inflammatory; and the only chronical diſeaſe that is ſo. Dr. Cullen does not rank the *phthiſis* as an original diſeaſe, but as a mode of ſome other diſeaſe being terminated, viz. a conſequence of hæmoptyſis; and ſays, it is an emaciation, and debility of the body, attended with cough, hectic fever, and for the moſt part with purulent expectoration. He diſtinguiſhes two ſpecies, or at leaſt two ſtates. 1. *Phthiſis incipiens*, called *ficta* alſo, when there is no purulent expectoration. 2. *Phthiſis confirmata*, or *humida*, when it is attended with expectoration of pus: both theſe vary according to their remote cauſes, and, agreeable to De Haen, the ſecond varies according to the ſource of the purulent diſcharge. But generally, if not always, the purulence is from the lungs only.

Conſumptions are reckoned *phthiſical*, when obſtructions of any kind are the cauſes; and *atrophical*, when produced by an exceſs in any kind of the natural ſecretions, or excretions; and when an ulcer in the lungs gives riſe to it, it is called the *conſumption of the lungs*. Dr. Reid obſerves, that *conſumptions* ariſing from various cauſes, have been differently denominated, ſymptomatic, ſcrophulous, ſcorbutic, aſthmatic, &c. But the *phthiſis pulmonalis* he defines to be, "an expectoration of purulent matter from the lungs, by means of frequent coughing, attended with a fever, having morning ſweats, and remiſſions in the forenoon, occaſioning a waſting of the fleſh and ſtrength.

The ſeat of the true *phthiſis* or *conſumption* is in the lungs; *not in the blood-veſſels* there, but *the air veſſels*. Sometimes one lobe is affected, and ſometimes both. Dr. Cullen ſays, it is only when the matter is poured into the cavity of the bronchiæ, that it properly conſtitutes the PHTHISIS PULMONALIS.

Thoſe are moſt ſubject to a *conſumption* to whom any of the remote cauſes belong.

The REMOTE CAUSES ARE, an hereditary diſpoſition,—weak and flaccid lungs,—laxity of the fibres,—an ill conformation of the breaſt, or its contained parts,—a narrow depreſſed cheſt, with prominent ſcapulæ, protuberant ribs, long necks,—crookedneſs,—a too free uſe of ſpirituous liquors,—obſtructed perſpiration and reſpiration, or the obſtruction of any natural ſecretion,—cold winds,—a vapid putrid air,—a plethora,—a defect of blood—exanthematous, &c. diſorders,—grief,—intenſe ſtudy—a ſedentary life, ſmall and tender blood-veſſels, &c.

The MEDIATE CAUSES are, congeſtions of humours to parts of the lungs already too weak to return by the veins what they received by the arteries; the humours there ſtagnating, loſe their former quality, and become the beginning of tubercles.

It appears in perſons of every age; but moſt commonly from about the age of fifteen, up to that of thirty-five, the fervor of the blood is the greateſt, and then an ill formation of the body, or of the breaſt in particular, and an acrimony in the juices, concurring with the mediate cauſes; the IMMEDIATE CAUSE, which is an ulcer in the lungs, hath every circumſtance favouring its appearance and progreſs. The ulcer is formed by the rupture of the ſuppurated cells in the lobes of the lungs, and the acrimony of the matter lodged there.

Cœlius Aurelianus, in lib. ii. cap. 14, deſcribes a *conſumption* as follows: a *phthiſis* is frequently produced by a previous ſpitting of blood, and ſometimes by a gentle, but long continued catarrh, or cough, by which the lungs are at firſt gently lacerated, and then ulcerated. It is accompanied by a latent fever, which begins in the evening, and is alleviated in the morning, and attended with a violent cough at thoſe times. At firſt a ſmall, but afterwards a large quantity of ſanious ſpit, is expectorated. Thoſe who fall into a *phthiſis*, in conſequence of an hæmorrhage, diſcharge, at firſt, a bloody ſpit, which becomes feculent, and then livid or green, and laſt of all white and purulent, ſometimes ſalt, and at others ſweet; the voice is hoarſe and ſhrill, the breathing difficult, the cheeks red, and the reſt of the body of a cinerituous colour. It is accompanied with a loathing of food, and a preternatural thirſt. Some patients have a ſenſe of a wound in their lungs, and even expectorate fibres of them. The pulſe is weak, hard, and formicular. A *phthiſis* is alſo accompanied with an inflammation of the feet. As the diſorder increaſes, a flux is brought on; and the phlegm diſcharged, when thrown upon a live coal, is of a fetid and diſagreeable ſmell." Dr. Reid deſcribes this diſeaſe as follows: "*The firſt ſtage* of this diſeaſe begins with a cough, which is more or leſs troubleſome at night, uſually dry, cauſing pain and ſtitches in the breaſt, ſides, and head;—ſlight rigors, and ſome degree of feveriſh heat, with pain in the back, joints, and limbs, the uſual effects of taking cold.—Theſe ſymptoms increaſe;—the cough becomes more violent, hard, dry, and inceſſant;—the patients are reſtleſs at night;—the pains in the thorax more lancinating and fixed;—the difficulty and quickneſs of breathing conſiderable;—expectoration

foration little and frothy;—the pulſe quick, hard, and ſometimes like a ſmall cord, at others full and laborious;—the tongue white, and the back part tinged with yellow;—the eyes dull;—the countenance pale and ſickly.—Some difficulty attends the fixing on ſymptoms that may be called ſigns of the firſt ſtage of a *conſumption*; the above ſymptoms, if not ſpeedily removed, may be ſaid to tend to, and too frequently end in it; and as the hard, dry cough, and dyſpnœa, indicate the exiſtence of tubercles, however ſmall, it may be called the inflammatory or firſt period.—In a ſhort time the fever becomes more intenſe, with ſlight remiſſions in the morning; when a ſweat breaks out upon the breaſt and upper parts of the body, which ſenſibly relieves every ſymptom.—The cough continues, and is aggravated in a recumbent poſture, keeping the patient from ſleep till towards morning.—The expectoration increaſes in quantity, is frothy, ſometimes ſtreaked with blood.—During the fever, the cheeks have a circumſcribed ſpot of pure florid red; the lips and tubercles in the canthus of the eyes are alſo brighter than when in health.—The fever is augmented after eating, particularly ſolids, with flushing in the face, and burning heat in the palms of the hands and ſoles of the feet.—As the diſeaſe advances, the fever comes on about the middle of the day, increaſes until the evening, and is violent moſt part of the night, until the ſweat breaks out, and the patient gets ſome reſt. In the morning they find themſelves relieved; but get up languid, pale, and unrefreſhed by their ſleep. Though the pulſe is always quicker than natural, yet there is a remiſſion of the fever for ſome hours in the forenoon.—The expectoration becomes more copious, mixed with pus in ſmall globular maſſes; ſometimes diſagreeable to the taſte; yellow, greeniſh, and, as the diſeaſe advances, of an aſh colour.—The cough becomes leſs hard and looſe; the pains in the cheſt and head abate.—*At this period*, when the hectic fever hath regular remiſſions, when the ſweats come on every morning, and when the patient ſpits up matter freely, *the diſeaſe may be ſaid to be confirmed*. The countenance now gives evident ſigns of waſting, the eyes are hollow and languid,—the cheeks prominent,—the noſe ſharp;—the patient's fleſh wears away, and the ſtrength falls;—the cough is more diſtreſſing in the firſt part of the night;—the breathing ſhort, quick, and offenſive; their ſleep leſs, and diſturbed;—morning ſweats more profuſe and melting; the interval from fever leſs diſtinct.—The ſpitting is more loaded with matter, brought up more eaſily, and in greater quantity, ſometimes a pint in twenty-four hours: *this is the ſecond period of the diſeaſe*; in which there remains ſome degree of ſtrength, and the ſtomach is capable of digeſting food. From the beginning, the body is ſuppoſed to be coſtive, particularly after the morning-ſweats take place. The menſes uſually ceaſe about this time. *The third and laſt ſtage* commences by the appearance of the looſeneſs. From being coſtive, they have frequent motions in a day, which ſoon become a confirmed diarrhœa; every thing taken into the ſtomach, quickly running off by the bowels. The fever, heat, and cough abate of their violence, and the morning-ſweats become leſs profuſe. The diarrhœa increaſes, the ſtrength totally fails; frequent fainting comes on; ſometimes a ſlight delirium ſucceeds; the lower extremities ſwell; and, at laſt, death cloſes the ſcene. When the ſymptoms hurry the patient off quickly, the diſorder is commonly called a *galloping conſumption*. It ſhould not be unnoticed, that the above ſymptoms will be rarely met with exactly in the order above related."

The hectic fever attending the pulmonary *conſumption*, Dr. Reid thinks, is different from that produced by ſuppurations, in or about any part of the body. See HECTICA.

The pulmonary *conſumption*, or true *phthiſis*, ſhould be diſtinguiſhed from all thoſe other diſorders which are denominated *conſumptions*, but in which the lungs are not remarkably affected; ſuch as the *conſumption* from a ſimple gonorrhœa, the fluor albus, the ſcurvy, ſcirrhous indurations in the meſentery, an abſceſs or ulcer in the meſentery, a chronical cough, &c.

It is remarkable that conſumptive patients are often chearful to the laſt, in the intervals of the fever, and flatter themſelves with the hopes of recovery. When the nerves are affected, as in the hypochondriac diſorder, there is always a ſinking redneſs; but, in conſumptions, the muſcular fleſhy parts decay, and ſuffer firſt; and that decay coming on gradually, ſcarce gives the mind notice of it, and thence the patient fancies himſelf in no great danger.

The matter expectorated engages the attention in this diſorder, particularly ſince Sydenham has ſaid, that if in a morning the patient ſpits out the phlegm into water, it will ſink if the lungs are ulcerated, but, if not, it will ſwim. But it may be obſerved, that if a ſmall quantity of mucus is mixed with the matter that is expectorated, it will always ſwim, let the lungs be in whatever ſtate they may. The moſt remarkable ſorts of ſpit are the bluiſh, the ruſt-coloured, the blackiſh, and the cineritious; when any of the three firſt are thrown up, there is a taint in ſome of the viſcera, and the laſt indicates death's approach; it is the leaſt adheſive, and yet the heavieſt of any that ſuch patients excrete. The bluiſh ſpit is never thin, and is increaſed by things that cool the breaſt, as apples, &c. but leſſened by mercurials and ſudorifics.

The prognoſtics are rarely favourable, for it moſtly happens that the diſorder is too far advanced before the patient is ſo incommoded by it as to apply for relief; and often the firſt manifeſtation of the lungs being affected, uſhers in death. ARETÆUS ſays, that *when phthiſical patients begin to grow better* the cough is leſs frequent, a larger quantity of ſanious and more moiſt ſpit is expectorated, much aqueous matter is evacuated by ſtool, the urine is copiouſly evacuated, though, as yet, it hath no ſediment; the voice becomes more clear and ſonorous, the ſleeps are ſufficiently long, the præcordia are much relieved, and the pain remitting, is ſometimes transferred to the ſcapulæ, the difficulty of breathing is gentle and leſs frequent, but accompanied with an aſperity of the voice, and *when theſe things happen the patient recovers*. But beſides the obſcurity of the diagnoſtics in ſome, and the late application of others, it is obſerved by KIRKRINGIUS, WILLIS, &c. that ſome have been thought to labour under a *conſumption* during thirty or forty years, without any evidence of the diſorder having any influence on their lives; but then the ſtate of the caſe hath not been rightly underſtood. WILLIS ſays that it ſometimes happens, that a cavity or two are formed in the lungs, with callous ſides, ſo that matter collected in them is not conveyed to the maſs of blood, but is every day totally expectorated, though its quantity is very large: perſons in this ſituation have only, as it were, a fontanel in their lungs, and, although they ſhould every morning expectorate a large quantity of thick or yellow, and even, as it were, purulent ſpit, and a ſmall quantity of the ſame throughout the day, yet in other reſpects they enjoy ſufficient health, breathe eaſy, eat and ſleep well, have a due quantity of fleſh, or, at leaſt, have a good habit of body, and, at length, this diſcharge from the lungs abating, the patient is cured. So that on the whole, the favourable prognoſtics may only be conſidered as intimations that death is not ſo immediately to be expected, as when the more threatening ſymptoms attend. While the appetite is good, and the ſleep refreſhing, the diſorder does not appear to have made any dangerous progreſs; however in other inſtances this diſorder may be circumſtanced. It does not appear that a *conſumption* of the lungs is in its own nature ſo fatal as it uſually proves to be: wounds in the lungs are healed as ſoon as thoſe of any other of the viſcera; abſceſſes are formed in the lungs, which ſoon diſappear without inconvenience; and inſtances have occurred of patients recovering from all the ſtages of the pulmonary *conſumption*. To neglect, or miſmanagement, or both, for the moſt part, the uſual fatality is to be attributed.—Dr. Geo. Fordyce obſerves, that there are two caſes in which an ulcer of the lungs is ſometimes cured: 1. From an abſceſs in a peripneumony. 2. From a wound in the lungs. But from any other cauſe he fears that it will ever prove fatal; for in an ulcer of the lungs, their conſtant motion, and the quantity of air conſtantly taken into them, prevents it from healing.

The origin of the genuine *phthiſis* pulmonalis may generally be traced from hæmoptyſis; from what is called taking cold; and ſometimes from external injuries. When the diſeaſe hath made a certain progreſs, the ſymptoms may have differed in their incipient ſtate. THE GENERAL INTENTIONS OF CURE are, 1. *To obviate the occaſional cauſes of fever.* 2. *To evacuate the purulent matter from the lungs.* 3. *To palliate the moſt urgent ſymptoms.* 4. *To regulate the air, exerciſe, diet, and paſſions of the mind.*

The diet ſhould be light, nouriſhing, and aceſcent; a little

little may be often taken, but full meals ſhould never be allowed.

When ulcers are formed, and pus diſcharged, mild balſamics conveyed into the lungs with the breath, the bark taken freely into the ſtomach, a good air and proper exerciſe, are adapted for healing the ulcers. The bark, demulcent and aceſcent diet and medicines, are uſeful to prevent putreſcency. The columbo-root both mends the appetite, and blunts the acrimony of the juices; and may be uſed inſtead of the bark, when it does not agree with the patient; myrrh given with the ſaline mixture, and ferrum ammoniacale, has been eſteemed a very beneficial medicine, and is thus formed. ℞ kali pp. ʒ i. ſs. ſucc. limon. q. ſ. ad perfectam ſaturationem, cui adjiciantur aquæ diſtillatæ ℥ v. ſps. N. M. ℥ i. myrrhæ pulv. ʒ i. ferri ammoniacalis gr. xv. kali pp. ʒ ſs. vel potius nitri puriſſimi ℈ ij. ſ. q. ſacchari ℥ ſs. m. ſum. cochl. 4. bis vel ter de die. As to particular ſymptoms, many of them are relieved as follows.

Dr. Fothergill obſerves, that the moſt benefit is obtained from medicine in the very beginning of the diſorder; a cough is firſt excited by acrid ſerum, or by an inflammation; the acrid ſerum, if not ſoon diverted, will cauſe an inflammation; and if this inflammation terminates any other way than by a timely reſolution, though the immediate conſequences are ſeemingly ſmall, they prove inſurmountable, and proceed to a fatal iſſue. Though the inflammation ends in ſmall tubercles, which with much caution may not diſturb for many years, yet ſmall irregularities, and that want of care which is obſerved in moſt, until too late, ſubject them to the worſt effects.

If inflammation and heat are conſiderable, bleeding is uſeful in the beginning, and may prove a principal means of cure; but, in the future ſtages, it only palliates for the preſent, and as it reduces the patient's ſtrength, the diſorder ſoon overcomes him.

Dr. Reid obſerves, that the recent effects of a cold are eaſily removed by bleeding, diluting drinks, abſtinence, and the uſual antiphlogiſtic plan. That when from a bad habit of body, or from neglect, the cough remains obſtinate and dry; with pain in the breaſt; ſtitches in different parts of the thorax, increaſed upon coughing, and attended with a conſiderable degree of heat and fever; bleeding ſhould be occaſionally repeated, in moderate quantities, according as the pulſe, &c. will permit, and until theſe ſymptoms abate. The bowels ſhould be kept lax by means of gentle ſaline purgatives; and if the cough prevents ſleeping, ſuitable doſes of the tinctura opii camphorata may be given in the evening, and repeated in the night if required. But the remedy which he chiefly prefers in every kind of cough, and in every period of the pulmonary *conſumption*, is ſuch a doſe of pulv. ipecac. as will excite vomiting once or twice; this he repeats morning and evening, as the ſtrength of the patient and violence of the complaint may indicate. The Doctor obſerves, that the lungs are peculiarly affected by the ſtomach and its contents, and if the lungs are diſeaſed, they will be the more influenced thereby; further, that if any of the hypochondriac viſcera are in a diſeaſed ſtate, the lungs, if inflamed, will be affected by them. It is well known, indeed, that when the lungs are ſound, acrid matter in the ſtomach and bowels hath cauſed and kept up an obſtinate cough. Hence the advantage of thoſe frequent but gentle emetics. By giving emetics as above recommended, not only the contents of the ſtomach are evacuated, accumulation of the viſcid phlegm and acrid bilious mater prevented; but the lungs being compreſſed during the action of vomiting, whatever mucus and purulent matter are in the ramifications of the aſpera arteria, and air-veſicles, in tubercles or vomicæ, will be forced out and diſcharged; by which means an infinity of laborious coughing is prevented; the patient feels greatly relieved, and the tender lungs remain at reſt, till a freſh accumulation of matter is formed, which requires ſome time. By the univerſal concuſſion and agitation cauſed by vomiting, obſtructions in the liver, biliary veſſels, and in other hypochondriac viſcera, are attenuated and removed: and in all complaints ariſing from theſe cauſes, it is the moſt powerful and certain alterative that can be found in the whole materia medica. Puking once or twice does not fatigue even very enfeebled patients. Through every ſtage of the diſeaſe this method of puking with the ipecac. morning and evening, or every morning at leaſt, may be continued with great advantage. The ſtrength of the patient, and the urgency of the ſymptoms, will determine the frequency of the doſe. In the morning it ſhould be taken faſting, and if the patient is weak, it ſhould be taken in bed, but he muſt not ſleep after it, as that ſometimes prevents its action on the ſtomach. If it is required in the evening, its operation muſt be over before bed-time. Though emetics are ſo peculiarly inſiſted on, there are inſtances in which attention is required before they are adminiſtered, and indeed in which it will be proper to forbid their uſe; e. g. ſome caſes of pregnancy, in which abortion may be endangered; in ſcirrhous affections of the ſtomach, they cannot be allowed of; with others that will occur to the attention of the judicious.

Vapours from demulcent balſamic medicines received into the lungs may be of uſe to moderate the cough, diſpoſe the ulcers for healing, and to aſſiſt expectoration; but the taking of balſamics into the ſtomach, rather counteracts than expedites the uſual intentions of preſcribing them. In applying vapours to the lungs by inſpiration, the ingredients ſhould be adapted to the ſtate of the diſeaſe, and it ſhould be obſerved whether the trachea or its branches are inflamed; whether or no there is an increaſed ſecretion of acrid mucus from the lungs; or whether or not they are ulcerated; in all theſe ſtates, whatever is conveyed into the lungs, muſt be aſſiſted by proper perſpiratives. Antiſeptic, or antiſpaſmodic, attenuant, and balſamic medicines, may all be conveyed by means of vapours into the lungs, and ſo applied immediately to the ſeat of the diſeaſe, and thus principally the attempts to cure ſhould be made. But if the cough is ſo troubleſome as to prevent ſleep, proper opiates will be neceſſary. (See below.) It is eſſentially requiſite to keep the lungs quiet; for the agitation of coughing fatigues the patient, increaſes the inflammation, and haſtens the ſuppuration of the tubercles. Repeated emetics greatly conduce to prevent theſe; but the additional aſſiſtance of anodynes is alſo ſometimes neceſſary. When the cough is prevented, or even conſiderably alleviated, the inflammation will readily diſperſe; the immediate cauſe of its continuance being removed.

Riding is indiſcriminately directed by Sydenham in all conſumptive caſes; and that the beſt phyſician in *conſumptions* is a horſe, and the beſt apothecary is an aſs, is become a common-place witticiſm; but, if a patient is enfeebled, and rides in cold wet weather, he will be rather injured by it: if, in other more favourable ſeaſons, he is fatigued after riding, his breathing is thereby rendered more frequent and difficult, his ſkin parched and dry, the palms of his hands hot, his cheeks flushed, his tongue dry, and if he perceives a greater inclination to drink than to eat, a more gentle exerciſe muſt be uſed; riding on horſe-back muſt no longer be continued. In all caſes riding ſhould be over before dinner. Old people ſhould take longer journeys than young ones. In nervous *conſumptions* it is always uſeful. But in the true *phthiſis*, if in the beginning, eſpecially, if the patient is plethoric, it endangers an hæmoptoë; and when there is a vomica, the briſk motion of a horſe may occaſion an inflammation.—Again, *conſumptive* patients ſhould ride gently, only in a morning, and no longer than whilſt the pulſe continues calm. If after this exerciſe the patient's ſpirits are more gay, his appetite ſomewhat excited, his breathing is eaſy, his ſkin cool and ſoft, he may continue to ride whenever the weather will permit.

The bark is an important medicine after an ulcer is formed in the lungs, and an infuſion of it in cold water is an agreeable method of adminiſtering it. If it affects the breathing, three drams of the balſam of Tolu may be diſſolved with the mucilage of gum arabic, and added to each pint of the infuſion. The *acidum vitriolicum dilutum* may be added to each doſe. Thus the hectic heats, night-ſweats, and every ſymptom that can be attributed to the abſorption of purulent matter, are checked and kept moderate. It may here be remarked that, according to the experiences of different phyſicians, ſucceſs hath been various. Some extol the *bark*, the *vitriolic dilute acid*, &c. whilſt others declare them uſeleſs. It is well known to all, that diſeaſes of the ſame denomination are variouſly circumſtanced in different patients, and hence the ſeeming contradiction in the experiences related. If in one inſtance or more, the hectic fever attending may be produced, as ſuppoſed by Dr. Reid, without the preſence of pus as an agent, in other inſtances the abſorption thereof may be an attendant; beſides the various conſtitutions conſidered as natural, the different accidental diſorders in the habit, producing or accompanying the *phthiſis* pulmonalis, may ſufficiently reconcile the ſeeming diſ-

ferent practices in this complaint, and render each an object not unworthy our attention. In many inſtances *calomel* hath been the principal ſource of relief, according to the relations on this ſubject by Dr. Sims, who ſuſpecting a latent venereal cauſe, very happily proceeded on a mercurial plan, accompanied with ſuch other aids as his judgment in this, and ſagacity in that caſe, enabled him to diſcern to be needful.

From ſmall bliſters, when there is a fixed pain in the breaſts or ſides, increaſed by coughing, that does not yield readily to bleeding, and the antiphlogiſtic medicines uſually given, good effects are often produced, applied upon the part, and repeated as ſoon as the ſkin is healed. This method is better than applying bliſtering ointment to continue the running, which is rarely ſufficiently effectual. But in ſome inſtances neither nitre, the bark, nor bliſters, can be complied with by the patient; in which caſes ſuch other means as the ſagacity of the attending phyſician ſuggeſts muſt be ſubſtituted.

Mercurials are extolled for their efficacy in diſſolving the tubercles which are formed as ſoon as the inflammation terminates that laid the foundation of the diſeaſe. The *hydrargyrus cum creta* given in ſmall doſes as an alterative, is preferred by ſome to all other preparations of this kind.

Milk hath been the diet propoſed in every age, at leaſt ever ſince Hippocrates's time. *Women's milk*, eſpecially if drawn from the breaſt by the patient, is to be preferred to all other; in want of it, *aſſes' milk*, becauſe it abounds with ſweet ſerum, and poſſeſſes but little of the caſeous part with which more nouriſhing milks abound; next to the milk of aſſes, *that of goats* may be uſed; and if *cows' milk* is drank, let it be mixed with an equal quantity of barley water. Milk affords a mild nouriſhment, and blunts the acrimony of the juices. *Whey* is alſo of ſingular advantage: and milk may be mixed with infuſions of ſuch herbs as ſeem ſalutary in theſe caſes.

Columbo-root. It may be ſubſtituted for the bark, if bark purges or otherwiſe offends.

Iſſues. Theſe ſhould never de omitted where there is a ſcrofulous diſpoſition, or a ſaline catarrh: they are moſt effectual if inſerted in the inſide of the lower part of the thigh, above the knee.

A nauſea is often a troubleſome ſymptom, in which caſe two or three grains of *ipecacuanha* may be taken when equired, and worked off with camomile tea.

Night-ſweats are relieved by going early to bed, riſing ſoon in the morning, and taking the bark, as above directed. Frequently *the dilute vitriolic acid* is a uſeful addition; it ſhould be given over-night, and joined with the opiate when that is required. The *ſp. ætheris vitrioſici*, in the quantity of two or three drams to a pint of water, with a little of the ſyr. papav. rubr. is grateful and uſeful, if a glaſs of it is taken as often as is agreeable. As a ſalutary means of relief, in this inſtance, Dr. Sims recommends the wearing of a flannel ſhirt next the ſkin. He ſuppoſes that the morning perſpirations may ariſe, at leaſt in part, from that diſcharge being checked during the day, and nature making a puſh to relieve herſelf, and open the cloſed pores at night. Whatever, therefore, tends to keep up an equable diſcharge, prevents the neceſſity of a ſtruggle. He further adds, that the evening fever and violent paroxyſm of coughing, which commences frequently on the patient's going into bed, may alſo ariſe from the ſame cauſe; the latter however ſeems connected with the expoſure of the ſkin to the air, when the patient throws off his wearing apparel; as, on cauſing a patient to make the experiment, he found that when he went into bed, without taking off his cloaths, he eſcaped the paroxyſm; whereas, whenever he put them off, although the bed was carefully warmed, he always had as violent a one as is ever obſerved in any.

The ſhortneſs of breath is relieved by proper *vapours* received with the breath, amongſt which thoſe from a *mixture of wax and reſin* are uſeful; the wax and reſin may be laid on an iron that is hot enough to ſend up vapours from them. *Sterne's balſamic æther* is much approved for this purpoſe.

Hectic heats are relieved by *moderate bleedings*, a free uſe of *butter-milk*, *milk-whey*, and in the intervals, the *bark with dilute vitriolic acid*. Two or three times a day give the following draught, and at bed-time, add tinct. opii gtt. vi. vel x. to the doſe; ℞ mucil. e ſem. cydon. ℥ i. aq. ammoniæ acetatæ ʒ ii. ſyr. papaveris albi, ʒ ii. m. f. hauſt. Baths of ſoft water, with a little milk, and a ſmall quantity of nitre, are uſeful, and ſhould be daily employed.

Spitting of blood. This ſymptom calls for repeated bleeding until it is overcome; and to prevent returns, continue to bleed at proper intervals, and keep the mind free from all violent agitations.

A diarrhœa may be moderated, perhaps removed, by the decoct. vel extr. Campechenſes, or the pulv. e creta compoſitus cum opio & pulv. trag. c. p. æq. If it is attended with griping pains and bloody ſtools, give the enem. ex amylo, cum opio. *The columbo-root* is ſerviceable in this caſe, and alſo ſmall doſes of the *lythargyrum acetatum*. As this ſymptom uſually attends the laſt ſtages of a *conſumption*; when it is abated, the night-ſweats and hectic heats will be increaſed, and vice verſa; ſo that little good is done by any means.

A vomiting may be generally relieved in the ſame manner as a nauſea; but in caſe of failure, give the tinctura benzoes compoſita, gt. xl. cum tinct. opii, gutt. v. in thea menthæ.

The cough, when attended with pain in the breaſt, requires repeated ſmall bleedings; the pil. ſcillæ. Ph. Edinb. or, when proceeding from ſcorbutic ulcers or ſcrofulous ones in the lungs, are much relieved with the *pulv. hydrolapathi*; but perhaps, in general, the beſt kind of remedy is ſuch doſes of a mixture of the pil. ſapon. pil. ex aloe cum myrrha, as the urgency of this ſymptom may require; the proportion of each may be ſuch as, while the cough is moderated by the opiate, the bowels may be moved by the purgative. In general their proportion may be from one or two parts of the pil. ſapon. to two parts of the pil ex aloe cum myrrha, as a laxative, and almoſt a ſpecific for the cough. Dr. Sims recommends the uſe of *ſulphur*; he obſerves, that it neither heats nor checks perſpiration; and is peculiarly efficacious in relieving, almoſt in the worſt ſtage of the diſeaſe.

Dr. SENTER, in the Philoſophical Tranſactions of Philadelphia, ſays, one of the moſt valuable medicines he ever met with for the tuberculous or glandular phthiſis, was the *vitriolum cæruleum*; he unites it with ipecacuanha, and gives five pills, containing from ſeven to ten grains of each of theſe ingredients in a morning faſting, allowing nothing to be drank to urge the emetic effect. If theſe produce five or ſix plentiful evacuations, in the ſubſequent vomitings, he continues the ſame quantity; if not, he encreaſes the doſe to ſix or more pills of the ſame kind. Theſe emetics he repeats every ſecond or third day, according to the irritability of the ſtomach, and other circumſtances of the ſick: and, in the mean time, gives as much as the ſtomach will bear of the myrrh mixture, above ſpecified; and, by theſe medicines, he aſſerts, that he has reſtored more perſons to health, labouring under a hectic fever, from glandular ſuppurations, than by all other medicines and methods he ever read of, or tried from his own invention.

PHU. See VALERIANA.

PHYGETHLON, from φυω. It is repreſented variouſly: ſome deſcribe it as a broad, but not much elevated, tumor, in which there is ſome reſemblance of a puſtule; it is attended with violent pain, ſo as ſometimes to excite a fever. It is ſlow in ripening, and is not much of it converted into pus. Its general ſeat is in the arm-pits, neck, and groins. Celſus ſays that ſome of his countrymen call it *panus*; and in ſome places, he ranks it among glandular ſwellings. Some fix its ſeat in the glands under the jaw. See alſo ERYSIPELAS.

PHYLACTERIA. See AMULETA.

PHYMA, from φυομαι, *to grow*, or *to be generated from*, or from φυω, *to produce*. All kinds of preternatural tumors from any part of the body, and eſpecially ſuch as affect the ſuperficies of the ſkin, and ariſe without any external cauſe, and are generated, increaſed, inflamed,

and ſuppurated in a ſhort time. See Galen's Com. in 6 Epid.

PHYMATA, are alſo inflammations of the glands, which ſuddenly break forth, and haſten to ſuppuration. Paulus, lib. iii. c. 22. Sometimes by *phymata*, ſome ſort of ſcrofulous tumors met with in children, are thus called; and ſometimes this word ſignifies abſceſs in the inward parts, as when there is a vomica in the lungs, &c. It is ſometimes uſed to ſignify a *tubercle*, *a caruncle*, &c. According to ſome, *phyma* is a diminutive of phygethlon. It is alſo a little ſwelling like a boil, ſomewhat round and flatter.

PHYMOSICA, ISCHURIA. A ſuppreſſion of urine from a phymoſis. See ISCHURIA.

PHYSÁLIS ALKEKENGI. See ALKEKENGI.

PHYSCONIA. A PHYSCONY. It is a hardiſh tumor, occupying a large portion of the abdominal cavities; it increaſes very gradually, is not ſonorous, nor is there any fluctuation obſerved in it. Dr. Aitken defines it to be a *ſcirrhus* of one or more of the abdominal organs. Dr. Cullen places this genus of diſeaſe in the CLASS CACHEXIÆ, and ORD. INTUMESCENTIÆ, which he defines, a tumor, occupying chiefly a certain part of the abdomen, gradually encreaſing, neither ſonorous, nor fluctuating; he makes it a ſynonime with *hypoſarca*; it is alſo called *hyperſerchidios*. He recites, from the works of CUSSON, no leſs than fifteen ſpecies, according to the parts affected, viz. PHYSCONIA *hepatic*,—*ſplenic*,—*renal*,—*uterine*,—*ovarial*,—*meſenteric*,—*inteſtinal*,—*omental*,—*polyſplachnal*,—*viſceral*,—*external*—*lupial*,—*external ſcirrhodal*,—*external hydatidoſe*,--from ſubcutaneous adeps,—from an excreſcence, ſo that ſome tumors on the ſkin, &c. are called by the name, PHYSCONIA. However, this diſeaſe admits not of a cure.

PHYSIOLOGIA. See MEDICINA.

PHYSOCELE, from φυσα, *a flatus*, and κηλη, *a tumor*. See EMPHYSEMA.

PHYSOMETRA. A TYMPANY of the WOMB. Dr CULLEN places this genus of diſeaſe in the CLASS CACHEXIÆ, and ORD. INTUMESCENTIÆ, which he defines a light elaſtic tumor in the hypogaſtric region, from figure and ſituation reſembling the uterus. It is formed by air, &c. which diſtend the womb, and is called alſo *hyſterophyſe*. It may be diſcharged by rendering the os uteri internum pervious.

PHYTOLACCA AMERICANA, called alſo *ſolanum magnum Virginianum rubrum*; *ſolanum racemoſum Americanum*, PORK-PHYSIC, PORK-WEED, POKE-WEED, RED-WEED of VIRGINIA, RED-NIGHTSHADE. It is found every where in North America, from Virginia to New York. It is a large plant, with a ſtrong ſtem: it ſends forth many branches. The leaves are large, ſmooth, juicy, oval, and entire, without indentations on the edge, and placed alternately. The root is large and perennial, runs deep into the ground, and divides into many branches. It is raiſed in our gardens.

The leaves are *anodyne*. The juice of the whole plant is *ſharp* and *corroſive*: it is not uſed inwardly; but inſpiſſated to the conſiſtence of an ointment, by ſetting it in the ſun, it is *applied to cancers* and *to ulcers for removing their calloſity*. The corroſive part is ſo volatile, that, if the juice is quite dry, it is inactive and uſeleſs. If the roots are roaſted and beat into a poultice, then applied to ulcers with hard tumors and calloſities, it diſſolves them. See Med. Muſ. vol. i. p. 85.

The other ſpecies is diſtinguiſhed by its having leſſer fruit, and is alſo called *ſolanum Barbadenſe*.

PIA MATER. Quia cerebrum accurate, ſicut *mater* infantem involvit, ſic ab Arabibus dicta, alſo called *ſcalis membrana*, *meninx tenuis*. The thin membrane which immediately involves the brain. It is ſo thin that it would be inviſible but for its veſſels; where they do not enter, it is quite tranſparent. The brain is divided into lobes, which form convolutions, ſomething of the appearance of the inteſtines. The *pia mater* covers the whole external ſurface, and ſends proceſſes between the convolutions of the brain. The principal veſſels that go to the brain paſs on the *pia mater*: ſo that its uſe is to connect the lobuli of the brain, and to ſupport the veſſels. Some deſcribe a third covering of the brain, and call it *arachnoides*, and place it betwixt the *pia mater* and the dura mater; others make this the external lamella of the *pia mater*, but it is not of that ſignification which it is reckoned. See DURA MATER.

PICA, called alſo picatio, *malacia*, *allotriophagia*, *citta*, *ciſſa*. LONGING. It is a preternatural appetite in pregnant women, and ſome ſick perſons when about to recover. It is called *pica*, from the bird of that name, which is ſaid to be ſubject to the ſame diſorder. The diſorder conſiſts of a deſire of unuſual things both to eat and drink, and in being tired of one and wanting another, particularly things that are accidentally ſmelled. It is called *malacia*, from μαλακια, *weakneſs*. Dr. Cullen places this genus of diſeaſe in the CL. LOCALES, and ORD. DYSORExIÆ, which he defines a deſire of eating things not fit for food. *In pregnant women* it is ſomewhat relieved by bleeding, and in about the fourth month of their pregnancy it leaves them. *Chlorotic girls*, and *men who labour under ſuppreſſed hemorrhoids*, are very ſubject to this complaint, and are relieved by promoting the reſpective evacuations. In general, whether this diſorder is obſerved in pregnant women, in perſons recovering from an acute fever, or in thoſe who labour under obſtruction of the natural evacuations, this craving of the appetite ſhould be indulged.

PICEA. See ABIES, N° 1.

PICELT. See NICOTIANA.

PICROCHOLOS, from πικρος, *bitter*, and χολη, *bile*. A perſon abounding with bitter bile, or a perſon ſubject to anger.

PICINUM OLEUM. See BRUTIA.

PICTONUM COLICA. See COLICA.

PIEDRA DI COBRA. See COBRA DE CAPELLO.

PIERRE NOIRE. See AMPELITIS.

PILA HYSTRICIS. See BEZOAR HYSTRICIS.

—— MARINA. A ſpecies of alcyonium; or a round ſpherical ball found on ſea-coaſts amongſt wrack. Lemery deſcribes it as being about the ſize of a man's fiſt, ſometimes larger, ſometimes leſs: it is lanuginous, of a dark colour, formed by a collection of hairs, ſand, and other impurities of the ſea, united by means of ſome glutinous liquor. It is ſaid to kill worms. Zwelfer tells us that when it is calcined it is uſeful in ſcrofula.

PILEUS. See CUCUPHA. In anatomy it is the coif with which ſome children are born; it is called *pileolus*, *galea*, and *vitta*.

PILEOLUS. See PILEUS; CUCUPHA.

PILMICTIO. A diſcharge of ſubſtances reſembling hairs with the urine.

PILOSELLA MAJOR. See HIERACIUM ALPINUM, and GNAPHALIUM MONTANUM.

PILOSUS. See CAPILLARIS.

PILOTHISMA. Medicines which take off the hair.

PILULA. A PILL, called alſo *catapotium*, *gongylion*. *Pills* are a form well adapted for thoſe medicines that operate in ſmall doſes, and that are offenſive in taking, or ſo heavy that they are not eaſily ſuſpended in, or mixed mechanically with any fluid. They diſſolve the moſt difficultly, and produce the moſt gradual and laſting effects of any other form; this, in ſome caſes, is a diſadvantage, in others an advantage. Emetics, if they are retained long in the ſtomach, uſually paſs off by ſtool; but ſtomachics are proper in this form.

Reſins ſhould be beat up with ſpirituous mixtures, ſuch as the ſyr. alb. ℥ viii. ſp. vini. r. ℥ i. m. gums with water dry powders with the conſ. cynoſb. or mucilag. e gum. arab.

Gold and ſilver leaf do not diſſolve in the ſtomach, and often hinder the *pills* from diſſolving, therefore ſhould never be uſed.

What cannot be included in four or five *pills*, for one doſe, is not fit for this form. It is a term given to ſeveral compounds, many of which will be found under ſome one of the principal ingredients, as *Pilulæ* e gummi. See ASSAFŒTIDA, &c. There is a variety of formulæ of this kind in the Pharmacopœia Chirurgica, which are compoſed of very active ingredients, as different preparations of *quickſilver*, *cantharides*, *cicuta*, *cuprum vitriolatum*, *opium*, *turpentine*, and *vitriolated zinc*, which may be found under the term PILULÆ.

PILUS. See CAPILLUS.

PIMENTA, } See PIPER JAMAICENSIS.
PIMENTO. }

PIMPERNELLA. See ANAGALLIS.

PIMPILIM. See PIPER LONGUM.

PIMPINELLA. BURNET or SAXIFRAGE, and BURNET SAXIFRAGE. It is called *ſaxifraga* becauſe it grows out of the rocks, as if it broke through them; and not becauſe of its efficacy in breaking the ſtone in the human bladder. Boerhaave reckons up eight ſpecies. This is the PIMPINELLA SAXIFRAGA, or PIMPINELLA SANGUISORÆ

GUISORBÆ FOLIO, *foliis pinnatis, foliolis radicalibus ſubrotundis, ſummis linearibus*, CLASS PENTANDRIA; ORD. DIGYNIA. LINN. Gen. Plant. 366. It is called alſo *ſanguiſorba, pimpinella minor, tragoſelinum, ſmaller burnet ſaxifrage*. A perennial umbelliferous plant: grows in dry paſture grounds, and is the POTERIUM SANGUISORBA Linn. Likewiſe it is a name for *agrimonoides*.

PIMPINELLA ALBA GERMANORUM, called alſo *pimpinella ſaxifraga major, gypſophyton*. GREATER OR WHITE BURNET, or SAXIFRAGE. Some of its leaves are deeply cut, the odd one into three ſections. It is common in Germany, but rarely met with in England.

All the ſpecies are joined into one by Linnæus: their qualities are alſo ſimilar. The roots have a hot pungent taſte, which is not durable. When freſh they affect the eyes like muſtard and horſeradiſh. In drying they loſe all their ſubtil matter; water partially extracts their virtue, but ſpirit completely. When diſtilled with water they afford a ſmall portion of oil, which is acrid and fiery. Theſe roots are warm and ſtimulating, aperient and diuretic, and are uſeful when tenacious humours offend. *Bergius* conſiders the PIMPINELLA to be reſolvent, diaphoretic, ſtomachic, and diuretic. Several writers recommend it as a ſtomachic, and in all caſes where *pituitous humors* are thought to prevail, as *aſthmas, catarrhal coughs, hoarſeneſſes*, and what has been called *angina ſeroſa*; and by HOFFMANN, it is ſaid to be an excellent emmenagogue. It has alſo been employed by way of gargle, for diſſolving viſcid mucus, and to ſtimulate the tongue, when that organ becomes paralytic: doſe in powder, ℈ i. in infuſion ℥ ij.

There is a ſpecies which is called *nigra*, from its being externally of a bright black colour, whilſt thoſe of others are whitiſh; it is remarkable for yielding a bluiſh oil: it grows wild in Germany and Switzerland. Whatever has been ſaid of the value of theſe as medicines by Stahl and others, they are not conſidered of any repute in the preſent practice.

—— ANISUM. ANISE. The *aniſeeds* of the ſhops are the ſeeds of the *pimpinella aniſum*, or *pimpinella* Ægyptiaca, foliis radicalibus trifidis inciſis floribus flaveſcentibus. Linn. See ANISUM.

PIMPINELLA foliis agrimon. nonnullis. See AGRIMONOIDES.

PINASTELLUM. See PEUCEDANUM.

PINEALIS GLANDULA, from *pinea, a pine apple*, to which it hath ſome reſemblance. The PINEAL GLAND. See CEREBRUM.

PINEUS PURGANS. See CATAPUTIA MINOR.

PINGUEDINOSA MEMBRANA. The CELLULAR MEMBRANE is called ſo, where the oily matter contained in it almoſt diſſolves ſpontaneouſly. See CELLULOSA MEMBRANA.

PINGUEDO, } See ADEPS.
PINGUIS. }

PINGUICULA. A plant ſo called by Geſner, becauſe its leaves are fat to the touch. See SANICULA EBOR.

PINHONES. See CATAPUTIA MINOR.

PINNA. A WING. The lateral and inferior parts of the noſe are called *pinnæ* and *naſi alæ*; and the ſuperior broad parts of the ears are called pinnæ. See AURICULA.

PINNACULUM FORNICIS GUTTURALIS. See UVULA.

PINON. See BRYTON.

PINUS. The PINE-TREE, called alſo *peuce*. It differs from the fir-tree in having its leaves ſtanding in pairs, thoſe of the firs being ſolitary. The *pine* abounds with the ſame kind of reſinous juice as does the fir-tree. The cones taſte agreeably, and are ſimilar in quality to the ſweet almonds. The reſin of the *pine tree* is called frankincenſe. Some ſay it is the reſin of the pinaſter, which grows in Sweden, Norway, and Germany; others ſay it is only produced in Arabia. It is a ſolid brittle reſin, brought to us in globes of a browniſh colour on the outſide, internally whitiſh, or variegated with whitiſh ſpecks; it hath a bitteriſh acrid taſte, but no conſiderable ſmell: it totally diſſolves in rectified ſpirit of wine, but water ſcarcely affects it. It is a mild corroborant, though rarely uſed, except in plaſters.

There are many ſpecies of *pine-trees*; among the reſt is the *tæda*, which grows in the country of the Griſons.

The bark of all the *pine-trees* is aſtringent, and the tops are antiſcorbutic; but the virtues of all the *pine-trees* ſeem to depend upon the turpentine they contain. See Raii Hiſt.

PINUS INDICA, Nucleo purgante. See GRANA TIGLIA, under CATAPUTIA MINOR. Pinus is alſo a name for ſeveral ſpecies of ABIES. See N° 1, 2, 3, 4, under ABIES.

PIPER. PEPPER. *Arum moſchatum*. It is the ſmall round aromatic fruit of a trailing plant, which grows in Sumatra, Java, and Malabar. There is variety of ſubſtances of this name, which are diſtinguiſhed by particular epithets annexed to the term, viz.

PIPER ALBUM, alſo called *piper maturum decorticatum, leucopiper*, WHITE PEPPER. The *black-pepper*, when ripe, is macerated and decorticated, and then ſold as another ſpecies.

The *black-pepper* is hotter and ſtronger than the *white*; they both ſeem to heat the conſtitution more than ſome other ſpices that are of equal pungency upon the palate; and from theſe ſpices they differ in this, that their pungency does not reſide in the volatile parts or eſſential oil, but in a ſubſtance of a more fixed kind, which does not ariſe in the heat of boiling water. *Pepper* infuſed in water impregnates it very ſtrongly with its flavour, but not with its taſte; by boiling a little while, a little more of its pungent matter is extracted, and its flavour diſſipated. Diſtilled with water, a thin, light, and limpid oil is obtained, which is very mild, for if a drop falls on the tongue, it only excites a grateful moderate warmth. Rectified ſpirit completely extracts the pungent part of the *pepper*; the tincture is hot and fiery, and when evaporated, a ſtill more fiery extract is left behind. The quantity of extract it nearly the ſame from both the ſorts of *pepper*, but that from the white is the weakeſt. Peppers, particularly, black, have been uſed as ſtimulants and aromatics, and ſucceſſfully employed in ſome caſes of vertigo; and in paralytic and the gouty diſorders; given in large doſes, it has been found a remedy for intermittents, though in ſome inſtances it has produced fatal conſequences.

—— INDICUM, called alſo *capſicum, lada chilli*; *capo molago, piper* Hiſpanicum, *piper* Luſitanicum, *ſolanum urens, ſiliquaſtrum Plinii, piper* Braſilianum, *piper* Guineenſe, *piper* Calecuticum, GUINEA PEPPER. It is the CAPSICUM ANNUUM; or CAPSICUM *caule herbaceo, pedunculis ſolitariis*, CLASS PENTANDRIA, ORD. MONOGYNIA. LINN. Gen. Plant. p. 252. It is in long, roundiſh, taper pods, divided into two or three cells full of ſmall whitiſh ſeeds. It is a native of the Eaſt and Weſt Indies. When this fruit is freſh it hath a penetrating acrid ſmell: to the taſte it is pungent and acrid; it produces a painful burning in the mouth, like that from arum-root. Rectified ſpirit takes up its pungency, and if the tincture is evaporated, the remaining extract is exceſſively fiery. This kind of *pepper* is given in ſmall quantities, as one of the higheſt ſtimulants in cold, ſluggiſh, phlegmatic temperaments, in ſome paralytic caſes, in relaxations and inſenſibility of the ſtomach, and for promoting the efficacy of aloetic medicines, and the deobſtruent gums in uterine diſorders. This is without odour, or particular taſte, and is ſo readily diffuſible that it joins agreeably and conveniently with any other condiment or ſauce. It ſeems to ſtimulate the ſtomach, and promote digeſtion; and taken in largely, is certainly the moſt heating of the condiments. Bergius ſays he has very often ſeen long protracted intermittents cured by the following powder, without any relapſe. Six grains of Indian pepper, and two ſcruples of bay berries, in powder, divided into three portions, one of which was given on the approach of the firſt rigor, another the day following, at the ſame hour, and the laſt on the third day. Cullen's Mat. Med. In climates, of which capſicum is a native, we are told, that the free uſe of it is a ſalutary practice, being found to ſtrengthen the ſtomach, aſſiſt digeſtion, and correct the putreſcent colliquation of the humours, ſo common in hot climates: as a ſtimulant of the moſt acrid kind, it may be found efficacious in ſome paralytic and gouty caſes, or to promote excitement where the bodily organs are languid and torpid. In the *cynanche maligna*, it has been ſucceſſfully exhibited, and in what Dr. Mackitrick calls *cachexia Africana* (DUNCAN's Edinb. Diſp. p. 257.) which he conſiders as the moſt frequent and fatal predispoſition to diſeaſe among negroes; doſe from ſix to eight grains. A ſpecies of this is called in the Weſt Indies BIRD-PEPPER, and is the baſis of a powder brought from thence under the name of *Cayenne*, or CAYAN-PEPPER. There are four ſpecies of *Guinea-pepper*, viz.

viz. the *chilchotes*, *chilterpin*, *tenalchiles*, and *chilpelague*. There is a fifth ſpecies, which grows in Peru, and is called *agy*.

PIPER JAMAICENSE, alſo called *piper caryophyllatum*, *cocculi Indi aromatici*; *piper chiapæ*, *amomum*, *caryophyllus aromaticus*, *Americanus*, *pimento*, *piper odoratum Jamaicenſe*, *pimento*, ALL-SPICE, and JAMAICA PEPPER. The Dutch call it, *amomi*, *anomum*. The dried unripe aromatic berry of a large tree, growing in the mountainous parts of Jamaica, reckoned a ſpecies of myrtle, called by Linnæus MYRTUS PIMENTA, or MYRTUS JAMAICENSIS, *fol. oblongo-ovatis glabris alternis, racemis terminalibus & lateralibus, fructu orbiculari*, CLASS ICOSANDRIA. ORDER MONOGYNIA, Gen. Plant. p. 217. This kind of *pepper* is moderately warm, of an agreeable flavour, ſomewhat reſembling a mixture of cloves, cinnamon, and nutmegs, whence its name of *all-ſpice*. Diſtilled with water it yields an elegant eſſential oil, which ſinks in water; it is moderately pungent, in ſmell and flavour approaching to oil of cloves, or rather a mixture of thoſe of cloves and nutmegs; the remaining decoction, inſpiſſated, leaves an extract ſomewhat ungrateful, but not pungent, and the berry itſelf is wholly deprived of its taſte as well as flavour, the warmth of this ſpice reſiding rather in the volatile than in the fixed part. Rectified ſpirit takes up all its virtue, but gives over little or nothing with it in diſtillation. The ſpirituous extract poſſeſſes the whole of the virtues of this *pepper*; it is very warm and pungent, but not fiery, like thoſe of the *black* and *white peppers*.

The *Jamaica pepper* is often ſubſtituted for the black and white ſorts, and may be conſidered as an agreeable aromatic.

Half a pound of this *pepper* is put into three gallons of proof ſpirit, and diſtilled. This water is ſubſtituted for the *aq. aromatica*, and the *mirabilis aqua* of former diſpenſatories.

The London College order a water to be made from half a pound of the berries of *pimento* bruiſed, put into a ſufficient quantity of water to avoid an empyreuma, from which, after maceration for twenty-four hours, one gallon is to be diſtilled, and this is called AQUA PIMENTO. Ph. Lond. 1788.

The oil of *Jamaica pepper* is generally ſubſtituted for the oil of cloves, and is very little inferior to the oil of nutmegs.

PIPER LONGUM, called alſo MACROPIPER, *atapatli*, *catu-tripali*, *pimpilim*. LONG PEPPER. PIPER LONGUM, or PIPER INDICUM LONGUM, *fol. cordatis petiolatis ſeſſilibuſque*, CLASS DYANDRIA. ORD. TRIGYNIA. LINN. Gen. Plant. 43. INDIAN LONG PEPPER TREE. Of this there are three ſpecies: they are produced in the Eaſt Indies. The pods are round, about an inch long, or rather more, with numerous minute grains within them. This is hotter and more pungent than any of the other ſorts of *pepper*; in its pharmaceutic properties it agrees with them entirely. Dr. Cullen ſays it has preciſely the ſame qualities, only in a weaker degree, and therefore thinks the *piper nigrum* ſhould be employed in its ſtead, in various compoſitions where it enters. Mat. Med.

The *black pepper* is moſt agreeable to the palate, and is moſt uſed in food. The *long* is the ſtrongeſt and moſt uſed in medicine: the *white* is weakeſt, and ſeldom uſed in either. Their warmth and pungency reſide chiefly in their reſin; their aroma is an eſſential oil.

The general virtues of all the *peppers* are, they are ſtomachic, carminative, and uſeful in low phlegmatic and leucophlegmatic habits, and heating to the conſtitution; ten grains may be taken three times a day to aſſiſt digeſtion. When aſtringents have failed, a diarrhœa hath been cured by ℈ i. of *pepper* with ʒ ſs. of diacodium, twice a day.

—— LONGUM FOLIORUM NERVIS, &c. See BETLE.

—— MONARDI. See BUYO BUYO.

—— MURALE. See SEDUM.

—— NIGRUM, called alſo *molago-cedi*, *melano-piper*, *lada*, *piper aromaticum*, SPICE, BLACK PEPPER. It is the PIPER NIGRUM, or PIPER ROTUNDUM NIGRUM, *foliis ovatis ſubſeptemnerviis glabris, petiolis ſimpliciſſimis*. Linn. The BLACK-PEPPER TREE.

This is probably gathered before it is ripe; it is the fruit of a plant which grows in Java, Malabar, &c. See PIPER ALBUM. BAUHINE ſays, the immature black-pepper, or rather ſuch as from ſome accident is prevented from ripening, is called *braſma*.

There are other ſpecies of *peppers*, but they are of little note in medicine. See Neumann's Chem. Works. Lewis's Mat. Med.

PIPER CARYOPHYLLATUM. See PIPER JAMAICENSE.

—— CAUDATUM. CUBEBS. See NHANDU, and CUBEBÆ.

—— CHIAPÆ. See PIP. JAMAIC.

—— CUBEBA. See CUBEBÆ.

—— TAVASCI. See CASSIA CARYOPHYLLATA.

PIPERITIS. See LEPIDIUM.

PIRAMIDALIA CORPORA. The ſmall eminences on the lower part of the MEDULLA OBLONGATA, which ſee.

PISCATOR REGIS. See ALCEDO.

PISIFORME, Os. See LENTICULARE, and CARPUS.

PISSÆUM INDICUM. See PETROLEUM. BARB.

PISSASPHALTOS. See BITUMEN.

PISSASPHALTUM. See MUMIA.

PISSELÆUM, from πισσα, *pitch*, and ελαιον, *oil*. OIL of PITCH. *Bitumen Barbadenſe*. It is of the ſame nature as tar. It is prepared by boiling pitch; wool is ſaid to be ſpread over the boiling pitch; and when it is ſoaked with the riſing vapour it is wrung into a veſſel, and this is repeated as long as the pitch is boiling; but the common method of diſtilling to obtain eſſential *oil* is more probably uſed.

PISSELAION. See PIX LIQUIDA.

PISSINUM OLEUM. See BRUTIA.

PISTACHIA LENTISCUS. See LENTISCUS.

PISTACHIUM, } called alſo *terebinthus Indica Theo-*
PISTACIA, } *phraſti*, *Biſtacium*. The SISTIC NUT-TREE, or the PISTACHIO NUT-TREE.

Piſtachio nuts are oblong and pointed, about the ſize and ſhape of a filbert, including a kernel of a pale greeniſh colour covered with a yellow or a red ſkin. They are brought from the Levant. The kernels are agreeable to the taſte, are ſweetiſh and unctuous, and of the ſame general nature as almonds. See Raii Hiſt. Miller's Bot. Off.

PISTILLUM. The PISTIL or POINTAL. It is that column or ſet of columns, which occupies the centre of the flower, riſing on the top of the embryo, and is generally ſurrounded with the chives. They are ſuppoſed by Linnæus to be a continuation of the medulla, or pith. Theſe differ greatly in their form, for in ſome flowers they are roundiſh, in others triangular, oval, or ſquare. According to the ſame author, in his ſyſtem, the piſtillum is the female part of generation, whoſe office is to receive and ſecrete the pollen, and produce the fruit. It conſiſts of three parts; GERM, STYLUS, and STIGMA.

PISTOLOCHIA. See SERPENTARIA VIRGINIANA.

PISUM. The PEA. Of theſe there are various ſpecies, but they are not noted for their medical virtues. They are ſoftening and laxative. They are leſs nutrient and leſs flatulent than the bean, and generally more tender; the ſweeter and more mucilaginous they are, the more nutritive.

—— ARBORESCENS. See CAJAN.

PITUITA. So ſome call the water which comes from the ſtomach of ſome patients while faſting in a morning. See PITUITARIA MEMBRANA.

PITUITA ALBA. See ANASARCA.

PITUITARIA. See DIARRHŒA.

PITUITARIA GLANDULA. The PITUITARY GLAND. It is a ſmall ſpongy body, lodged in the ſella ſphenoidalis, between the ſphenoidal folds of the dura mater: it is of a ſingular ſubſtance, not appearing to be either medullary or glandular; on the outſide it is partly greyiſh and partly reddiſh, and white within. It is tranſverſely oval, and on the lower part, in ſome ſubjects, it is divided by a ſmall notch into two lobes, like a kidney-bean. It is covered by the pia mater as by a bag, the opening of which is the extremity of the infundibulum, and it is ſurrounded by the ſmall circular ſinuſes, which communicate with the ſinus cavernoſi.

—— MEMBRANA. The PITUITARY MEMBRANE. It is that which lines the whole internal nares, the cellular convolutions, the conchæ, the ſides of the ſeptum narium, and, by an uninterrupted continuation, the inner ſurface of the ſinus frontales and maxillares, and of the ductus lachrymales, palatini, and ſphenoidales. It is alſo continued down from the nares to the pharynx, ſeptum palati, &c. It is termed *pituitaria*, becauſe that through the greateſt part of its extent it ſeparates a mucilaginous

laginous lymph, called *pituita* by the ancients. This membrane is of different ſtructures in different parts; ſometimes it is thin, in other places it is thick and ſpungy; it is thickeſt on the ſeptum narium, the lower portion of the inner nares, and the conchæ; in the ſinuſes it is thinner; on the ſide next the perioſteum and perichondrium, it is plentifully ſtored with ſmall glands. See CEREBRUM.

PITUITOSA. See DIARRHŒA.

PITUITOSUS MORBUS. See NERVOSA FEBRIS.

PITYRIASIS. A ſcorbutic diſorder of the head, chin, and eye-brows; called alſo *porrigo*.

PITYROIDES. See FURFURES.

PITYUSA. See TITHYMALUS, ESULA MINOR.

PIX. PITCH, called alſo *burina*, *burnea*.

PIX BURGUNDICA. BURGUNDY PITCH. It is the reſin of ſome turpentine-tree, leſs diveſted of its oil than is the common reſin. Some ſay it is from the mountain-pine. It is alſo called WHITE PITCH. It is from the PINUS ABIES, *foliis ſolitariis, ſubtetragonis, diſtichis, ramis infra nudis, conis cylindraceis*. Hort. Kew. CL. MONOECIA. ORD. MONADELPHIA. LINN. Gen. Plant. 1077. Burgundy pitch is chiefly imported from Saxony, of a ſolid conſiſtence, yet ſomewhat ſoft, of a reddiſh-brown colour, and not diſagreeable in ſmell. In inveterate coughs, affections of the lungs, and other internal complaints, plaiſters of this reſin, by acting as a topical ſtimulant, are frequently found of conſiderable ſervice. Though formerly an ingredient in ſeveral ointments and plaiſters, it is now entirely confined to external uſe. See ABIES.

—— LIQUIDA. TAR. Dioſcorides calls it *piſſelaion*: it is alſo named *alkitram*, *cedrium*. It is the produce of all reſinous trees; it was firſt got from cedar, larch, fir, *pitch*, but now it is chiefly from pine-trees. It is chiefly obtained from the *pinus* foliis geminis rigidis, conis ovato-conicis, longitudine foliorum ſubgeminis, baſi rotundatis. Hort. Kew. CLASS MONOECIA. ORD. MONADELPHIA. LINN. Gen. Plant. 1077. See ABIES. The wood is incloſed in a large oven, which ſtands within another oven; the ſpace betwixt them receives the fire; from the bottom of the inner oven runs a gutter, by which the *tar* is conveyed off in proportion as it melts out from the wood.

Tar differs from turpentine in having received a diſagreeable empyreumatic impreſſion from the fire, and in containing, along with the pungent, bitter, terebinthinate matter, a portion of the acid which is extricated from the wood by the heat, and likewiſe of its gummy or mucilaginous matter: by the mediation of theſe principles, a part of the terebinthinate oil and reſin becomes diſſolvable in watery liquors, which extract nothing from the purer turpentines.

Diſtilled in a common ſtill, it affords the *common black pitch*, an eſſential oil, called, from the name of the tree whence the *tar* is obtained, OL. PINI, or OL. TÆDÆ, and an acid ſpirit. This oil hath the ſame general nature as the oil of turpentine, but is impregnated with the empyreumatic flavour of the *tar*. A leg of mutton, whilſt roaſting, baſted with *tar* inſtead of butter, and a ſharp ſkewer frequently thruſt into its ſubſtance, in order to let out the gravy, affords in the dripping-pan a compoſition which has been ſaid to cure the lepra ichthyoſis, by the body being anointed with it all over for three or four nights ſucceſſively, whilſt, for the ſame time, the ſame body linen was worn. Dr. Cullen has in one inſtance employed it with great ſucceſs. Mat. Medica.

Water in which *tar* hath been ſteeped is an uſeful remedy in many diſorders. It may be drank either warm or cold. In acute diſeaſes it is taken as freely as the thirſt may demand it; and in chronical diſorders, from a pint to a quart may be taken every day, at three or four times, beginning with the firſt draught whilſt the ſtomach is empty. It is a good deobſtruent; it is warming and ſtimulating; it raiſes the pulſe, increaſes perſpiration, and the groſſer evacuations.

Tar-water is made by putting two pounds of Norway *tar* to a gallon of water, ſtirring them well together for two or three minutes; and after ſettling two days, the clear liquor muſt be poured off. Of this a pint or more may be taken every day. Thoſe who are curious to ſee the variety of diſorders againſt which this water is ſaid to be a ſpecific, may conſult the biſhop of Cloyne's Treatiſe on *Tar*-Water. In many inſtances, this preparation, ſays Dr. Cullen, has appeared to ſtrengthen the tone of the ſtomach, to excite appetite, promote digeſtion, and to cure all the ſymptoms of dyſpepſia. At the ſame time it manifeſtly promotes the excretions, particularly that of urine; and the ſame may be preſumed to happen in that of others. From all theſe operations, it will be obvious, that in many diſorders of the ſyſtem, this medicine may be highly uſeful. Materia Medica.

PIX NIGRA, called alſo *pix ſicca*, *pix arida*. COMMON BLACK PITCH, DRY or STONE PITCH, and, by *Dioſcorides*, *palimpiſſa*, becauſe it is prepared of pitch twice boiled.

It is tar dried by heat, or what remains of tar after diſtilling the eſſential oil from it; thus pitch is freed from the greateſt part of the eſſential oil, and the acid and aqueous parts of tar. A ſtimulating plaiſter bearing the name —— EMPLASTRUM PICIS COMPOSITUM, *compound pitch plaiſter*, is ſaid to be full as ſtimulating as the euphorbium plaiſter, and poſſeſſes ſimilar properties. It is made in the following manner:

℞ Picis aridæ ℥ viij. gum. ammoniaci, galbani, āā ℥ iv. liquentur ſimul, deinde adjiciantur, pulveris radicis pyrethri; ſeminis ſinapios; camphoræ, āā ʒi. olei terebinth. q. ſ. ad conſiſtentiam propriam ut fiat emplaſtrum.

UNGUENTUM PICIS ARIDÆ.

℞ Picis aridæ ℥ ix. ceræ flavæ ℥ iv. ſs. olei olivæ ℥ viii. colliquentur. This is efficacious in thoſe ulcers particularly, wherein exiſts an extraordinary degree of ſpaſmodic irritability, diſtinguiſhable by their languid, purple, and glaſſy appearance, in which all terebinthinate ointments are inadmiſſible.

UNGUENTUM PICIS CUM SULPHURE.

℞ Picis liquidæ ℥ viii. ceræ flavæ ℥ ſs. flor. ſulphuris ℥ ij. pix & cera colliquentur, deinde adjiciatur ſulphur. This is applicable to the tinea, and eſteemed very efficacious; but during its uſe, the head muſt be conſtantly ſhaved, and a cloſe green oil-ſkin cap conſtantly worn.

PLACEBO. A common-place method or medicine, calculated to amuſe for a time, rather than for any other purpoſe.

PLACENTA, from πλακοῦς, *a cake*. In BOTANY, it is that part of the pod or huſk of a plant to which the ſeeds are faſtened, and by which they are nouriſhed until they are ripe. In ANATOMY, it is a congeries of blood-veſſels which adhere to the uterus during geſtation, and is called *hepar uterinum*, which, together with the *membranes* and *funis umbilicalis*, is excluded generally after the fœtus; they are all together called the AFTER-BURDEN, the AFTER-BIRTH, and the SECUNDINES. The *placenta* is a round *cake*, thick in the middle, and thinner towards the edges; ſometimes it is oval, at others it is divided into two, as it were, adhering to each other by the membranes. It hath an internal convex ſurface, where the funis is inſerted, and an external concave ſurface, which ſeems compoſed of lobes. When there are two children, there are two *placentæ*; and when they appear as one, they are really two for the moſt part, for they have no communication of veſſels. The *placenta* hath generally been ſuppoſed to ſtick to the fundus, but that is uncertain; it adheres to that part of the uterus which it happens to fall upon. The *placenta* is made up of one vein, and of two arteries, which ramify together, the largeſt being on the internal ſurface; and even the parenchymatous ſubſtance appears by injections to be quite vaſcular. No nerves were ever found in the *placenta*.

In midwifery, many are in a hurry to bring away the *placenta*, (which, when it adheres, is called *deuteria*, *deuterinas*), and to that end introduce their hands into the uterus to ſeparate it therefrom; but, if left to itſelf a little while, freſh pains will ſeparate it, and during their action it is eaſily drawn away by gently pulling at the funis; and again, as by introducing the hand an inflammation in the uterus is ſometimes excited, patience is always to be exerciſed in this affair. It hath long ſince been obſerved, that haſtening the *placenta* was one cauſe of difficulty in delivering it. Many of the moſt eminent practitioners agree, that a flooding only can juſtify the ſpeedy ſeparation of the *placenta*. When neceſſity obliges the practitioner to introduce a hand into the uterus, the back of the hand ſhould be toward the uterus, and the hollow of the hand kept as cloſe to the *placenta* as poſſible

in ſeparating it, that the womb may not be injured. Beſides the publications on the practice of midwifery, ſee Tolver's Preſent State of Midwifery in Paris.

PLACITIS. See CADMIA.

PLACTULÆ. See MORPIONES.

PLADAROTIS. A fungous tubercle in the inſide of the eye-lid.

PLAGÆ. Solutions of continuity, wounds, ſtripes, blows, &c. It is ſynonymous with *locales*.

PLANCUS. See LEIOPODES.

PLANTA. A PLANT OR VEGETABLE. It is an organical body, deſtitute of ſenſe and ſpontaneous motions; it adheres to ſome other body ſo as to draw from it its nouriſhment, propagating itſelf by ſeed. Under this generical name are included trees, ſhrubs, under-ſhrubs, and herbs. Moſt *plants* are hermaphrodite, having the male and female parts in the ſame flower; others bear flowers on the ſame ſtem, ſome of which are male and others female: of this ſort are the melon and cucumber. Some whole *plants* bear flowers, which are never followed by any fruit; whilſt others of the ſame ſpecies bear fruit with flowers, and hence are diſtinguiſhed into male and female *plants*; of this ſort are the hop, hemp, poplar tree, &c. The female flowers are only followed by fruit; the hermaphrodites are reckoned among the female in this reſpect. Inſtances are well authenticated of the fecundating farina, from the male flower, being carried to the female of the ſame ſpecies to the diſtance of fifteen leagues.

Plants can no more exiſt without nouriſhment and air, than animals can. Their nouriſhment is from oil rendered miſcible with water, by the intervention of alkaline ſalts, or alkaline earth: hence all good ſoils contain ſome proportion of one or the other of theſe: and the oily matter is attracted from the air, which is, by putrefactions, exhalations, &c. abundantly ſupplied therewith. The radical fibres attract a part, and the leaves imbibe another portion of nouriſhment; the firſt from the earth, the latter from the air.

To a portion of iron in *plants*, their green colour is attributed; and this opinion is confirmed by all the accidents that happen to them from an excluſion of the ſun and air, or their free admiſſion, from putrefaction, &c.

On the ſtructure and nouriſhment of *plants*, ſee Dr. Grew; and on the ſleep of *plants*, ſee Dr. Hill. Though, in common language, the word PLANT is ſynonymous with vegetable, it is frequently uſed in a more reſtricted ſenſe. By LINNÆUS they are placed in the laſt of the ſeven families, into which he has diſtributed the whole vegetable kingdom, comprehending all that are not *funguſes, algæ, moſſes, ferns, graſſes*, or *palms*. They are, 1. Herbaceous; 2. Shrubs; 3. Trees. In the vegetable kingdom, he has ſunk the word plantæ, and has divided them into *lilia, herbæ, arbores*. MARTYN. It is alſo a name for the *metatarſus*, and ſome vegetable products, viz.

PLANTA MIRABILIS DISTILLATORIA. See BANDURA.

—— ZEYLANICA. See MENTHA PALUSTRIS.

PLANTAGO. PLANTAIN, called alſo *centinervia, polyneuron*. It is a ſmall perennial plant, common in fields, or by road-ſides; the leaves lie on the ground, have naked unbranched ſtalks, bearing on the top a ſpike of ſmall, imperfect, four-leaved flowers, which are followed by little capſules, which opening horizontally, ſhed numerous crooked ſeeds. See BOICININGA. It is alſo a name of *coronopus*, and *pſyllium*.

PLANTAGO LATIFOLIA, called alſo *ſeptinervia, heptapleuron, arnogloſſum*. BROAD-LEAVED PLANTAIN, COMMON GREATER PLANTAIN, WAY-BREAD, LAMB'S-TONGUE. PLANTAGO MAJOR, OR PLANTAGO LATIFOLIA MAJOR, *foliis ovatis glabris, ſcapo tereti, ſpica floſculis imbricatis*, CLASS TETRANDRIA. ORD. MONOGYNIA. LINN. Gen. Plant. 142. It hath oval leaves, ſeven ribs, which are prominent on the lower ſide, running from end to end. It flowers in May.

—— MINOR, called alſo *anguſtifolia, quinquenervia, bipemulla, bipinella, pentaneuron, pentapleurum*. RIBWORT, the GREATER NARROW-LEAVED PLANTAIN. It hath oblong five-ribbed leaves, and ſhort thick ſpikes.

The leaves of both theſe ſorts are ranked among vulneraries, and are mildly aſtringent; they may be uſed indifferently, but they are rarely noticed in the preſent practice. Boerhaave enumerates ſeventeen ſpecies. Peaſants now commonly apply the leaves to freſh wounds, and cutaneous ſores. They have been given in conſumptions, and in various fluxes; in ſpitting of blood, the roots have been recommended by BERGIUS, from three to ſix drams every day, given in the intermiſſions of vernal tertians. An ounce or two of the expreſſed juice, or the like quantity of a ſtrong infuſion may be given for a doſe. In agues, it ſhould be doubled, and taken at the commencement of the fit.

PLANTARES. See POPLITEUS.

PLANTARES VENÆ. The tibialis poſterior, having deſcended to the ſole of the foot, forms theſe veins, by dividing into ſeveral tranſverſe arches, which communicate with one another, and with the ſaphena, and ſend ramifications to the toes.

PLANTARIS ARTERIA EXTERNA. It is one of the diviſions of the poſterior tibial artery. It paſſes on the concave ſide of the os calcis, obliquely under the ſole of the foot, to the baſis of the fifth metatarſal bone, and from thence it runs in a kind of arch toward the great toe, communicating there with the tibialis anterior, which perforates the interoſſeous muſcles. The convex ſide of this arch ſupplies both ſides of the laſt three toes, and the outſide of the ſecond toe, forming ſmall communicating arches at the end, and ſometimes at the middle of each toe, as in the hand. The concave ſide of the arch furniſhes the neighbouring parts.

PLANTARIS ARTERIA INTERNA. It is alſo a diviſion of the poſterior tibial artery. This inner *plantaris* having reached beyond the middle of the ſole of the foot, is divided into two, one of which goes to the great toe, communicating with the branch of the tibialis anterior; the other is diſtributed to the firſt phalanges of the other toes, communicating with the ramifications from the arch already mentioned.

PLANTARIS MUSCULUS. The muſcle whoſe tendon covers the planta, the ſole of the foot. It is alſo called *tibialis gracilis*. It riſes from the outer condyl; it paſſes down between the gaſtrocnemius and the ſoleus, and is united by a cellular membrane to the tendo Achillis. Winſlow thinks that as it is attached to the capſular ligament, it ſerves to keep it from being pinched in the motions of the joint. Dr. Hunter thinks it hath ſome action with which we are not acquainted, ſeeing it is always diſtinct.

PLANTULA MARILANDICA. See GENSING.

PLANUM. See METATARSUS.

PLANUM OS. See ETHMOIDES OS.

PLASTICUS, PLASTIC, from πλασσω, *to form*. Formative, or endued with a faculty of forming.

PLATA. See SCAPULA.

PLATANUS. The PLANE-TREE. The leaves are large and laciniated; the flower is amentaceous, formed in a globular figure, and conſiſting of a multitude of ſtamina. The fruit, which is produced at a diſtance from the flower, is ſpherical, and contains vaſt numbers of long apiculated ſeeds, intermixed with much down. The Oriental ſpecies is called *platanus latus*, becauſe it extends its branches ſo as to cover an hundred men under its ſhade. The leaves cool and repel. See Raii Hiſt.

It is alſo a name for the *muſa, papaya fœminea*, and *acer*.

PLATYOPHTHALMON. See ANTIMONIUM.

PLATYSMA. Any thing which is flat and broad; thus a piece of cloth, of plaiſter, or of metal, is called by this name.

PLATYSMA MYOIDES, from πλατυς, *broad*, and μυς, *a muſcle*, alſo called *myoides, quadratus genæ, detrahens quadratus, tetragonus, ſubcutaneus, depreſſor maxillæ inferioris, cutaneus muſculus*.

This muſcle riſes from the ſkin inſenſibly below the claviculæ, and is inſerted into the baſis of the lower jaw; it then runs up, and joins the triangularis, and is inſerted into the angle of the mouth, and the ſkin of the cheek. It depreſſes the lower jaw.

PLECTANÆ. See CORNUA UTERI.

PLECTRUM. See TEMPORUM OSSA, UVULA, and LINGUA.

PLETHORA, from πλησις, *plenitude*. A *plethora* is when the veſſels are too much loaded with fluids. The *plethora* may be ſanguine or ſerous; *in the firſt*, there is too much craſſamentum in the blood; *in the latter*, too little. *In a ſanguine plethora* there is danger of a fever, inflammation, apoplexy, rupture of the blood-veſſels, obſtructed ſecretions, &c. *in a ſerous*, a dropſy, &c. A rarefaction of the blood produces all the effects of a *plethora*; it may accompany a *plethora*, and ſhould be diſtinguiſhed therefrom. Mr. Bromfield obſerves, that a ſanguine *plethora* may be known by the pulſe. An artery overcharged with blood is as incapable of producing a

ſtrong

ſtrong full pulſe, as one that contains a deficient quantity; in both caſes there will be a low and weak pulſe. To diſtinguiſh rightly, the pulſe muſt not be felt with one or two fingers on the carpal artery; but if three or four fingers cover a conſiderable length of the artery, and we preſs hard for ſome time on it, and then ſuddenly raiſe all theſe fingers, except that which is neareſt to the patient's hand, the influx of the blood, *if there is a plethora*, will be ſo rapid, as to raiſe the other finger, and make us ſenſible of the fulneſs. See his Obſ. and Caſes, vol. i. Linnæus obſerves, that in the ſanguine *plethora* there is a redneſs of the ſkin from the fulneſs of blood, attended with a dyſpnœa. *The ſanguine plethora* is relieved by bleeding; *the ſerous* by purging, diuretics, and ſweating.

PLEURA, } from πλευρα, *the ſide*, called *hypo-*
PLEURON, } *pleurios*. The breaſt is lined with a membrane thus called; it is ſmooth inwardly, but rough outwardly, where it is attached by a cellular membrane to the adjoining parts; it covers the diaphragm, as the peritonæum covers it on the underſide; where it goes to the ſpine, it covers the lungs, and make a complete bag on each ſide, which duplicature forms the mediaſtinum. The uſe of the *pleura* is to give the contained viſcera a ſmooth ſurface, and to confine a lubricating juice, which is ſuppoſed to be ſecreted by the extremities of the arteries; and the mediaſtinum ſerves to keep the heart more fixed in the centre of the body, and prevent wounds of one ſide the thorax from affecting the other. The *pleura* is of a firm texture, and hath many blood-veſſels and nerves running in it. It is ſubject to inflammation and abſceſs. See PLEURITIS and ABSCESSUS, N° 36.

PLEURITICA. A PAIN in the SIDE.

PLEURITIS, from πλευρα. A PLEURISY or INFLAMMATION OF THE PLEURA.

Three kinds of *pleuriſies* are ſpoken of by different writers, viz. *the true* or *inflammatory*, the *falſe*, and the *ſpaſmodic* or *flatulent*. Dr. CULLEN places it as a ſpecies of pneumonia, or inflammation of the contents of the thorax: and defines it, a pleuritic pneumony, attended with a hard pulſe; a pungent pain, for the moſt part, of the ſide, increaſed particularly in inſpiration; a difficulty in lying down on the ſide, a very painful cough, dry in the beginning, afterwards moiſt, and often bloody. He diſtinguiſhes four varieties. 1. *Pleuritides idiopathicæ ſimplices*. 2. *Pleuritides complicatæ*. 3. *Pleuritides ſymptomaticæ*. 4. *Pleuritides falſæ*.

The true *pleuriſy* is when a pain and fever attends an inflammation of the *pleura*.

Some have diſputed whether the ſeat of this diſorder be the *pleura*, or the external coat of the lungs, but it is generally ſuppoſed to begin in the *pleura*, and ſo to extend to the lungs, as, by diſſecting thoſe who die of *pleuriſies*, the outer coat of the lungs is found affected.

Its cauſes are whatever can excite internal inflammation in general: alſo ſuddenly drinking of cold water after being heated with exerciſe.

Aretæus gives the following ſhort, but excellent deſcription of a *pleuriſy*: "An acute pain accompanies it, which reaches to the throat, in ſome to the back, and in others to the ſhoulders; it is ſucceeded by a difficulty of breathing, watching, naufea, redneſs of the cheeks, phlegm, and very yellow and bloody matter. It is worſe if the ſpit be not bloody, or a delirium, or a coma, comes on." The pulſe is remarkably hard, vibrating, and ſtrong; but the *pleuriſy* is principally known to be preſent by the pain in the ſide, with a high fever, a difficulty of breathing, and a cough. The pain is uſually juſt above the ſhort ribs; it is increaſed by inſpiration, and leſſens on expiration; thence the breathing is difficult: if the pain ſhifts its ſeat, a favourable prognoſtic thence ariſes; the inſpirations are ſhort. The cough is ſhort, ſuppreſſed, and ſometimes dry; but at others, a mucus is ſpit up from the lungs; at firſt it is thin, but growing more like pus and bloody. The difficulty of breathing ſometimes ſo increaſes as to check the blood in its paſſage through the lungs; and the patient is preſently ſuffocated. If a mortification takes place, the pain ceaſes ſuddenly, the pulſe as ſuddenly becomes weak and ſmall, though it be quick, and it is often irregular; a delirium and convulſion then preſently come on, and the patient is deſtroyed. If the diſorder does not prove fatal by any of theſe ways, nor yet is relieved by the ſpitting, or by ſome other natural or artificial method, a ſuppuration enſues which is known by an irregular coldneſs and ſhiverings, and the pain becoming a dull one; if the ſuppurated part points externally, a fluctuation may be felt by preſſing it with the finger; and if the pus is emptied into the cavity of the thorax, an EMPYEMA is formed, and is known as remarked in that caſe. Sometimes this ſuppuration is twelve or fourteen days before it is formed; and whether it happens ſooner or later, it is uſually fatal. There is no diſeaſe wherein the critical ſymptoms are more violent, and more ſtrongly marked than in this, and a perfect cure inſtantly follows, when death is often the moſt expected.

The *pleuriſy* ſhould be diſtinguiſhed from inflammation of the lungs, of the diaphragm, of the mediaſtinum, and of the intercoſtal muſcles; from the baſtard-*pleuriſy*, and peripneumony, and from rheumatic pains in the ſide.

If the fever is violent, the heat burning, the cough and tongue very dry, a gangrene may be expected (which does not often happen) if a ſuppuration does not take place. If the ſtitch abates ſuddenly without any manifeſt cauſe, but at the ſame time the countenance changes, grows pale and ſad, the eyes appear dull and heavy, and the pulſe feeble, it denotes a tranſlation to the brain, and is moſtly fatal. If purple ſpots appear, they are rarely other than fatal.

Let the air in the patient's room be cool, but not cold; and, except the heat is very great, let all that is drank be tepid. A ſpoonful of linſeed, unbruiſed, and half an ounce of liquorice root infuſed in a quart of boiling water, is an excellent common drink.

In this, as in all other inflammatory fevers, *bleeding is a principal remedy*. The quantity of blood which may be taken away, and the repetitions of the operation, are beſt determined by the continued hardneſs of the pulſe. A free bleeding at the firſt is always more uſeful than ſeveral leſſer ones afterwards; therefore, as a repetition is not often convenient, bleed at the firſt until the patient faints, or till the pulſe is manifeſtly altered. If, before aſſiſtance is called in, the expectorated matter is bloody, and ſomewhat digeſted, bleeding muſt be forborne.

Bliſters are rarely to be omitted; generally they are applied on the pained part, immediately after a free bleeding; but ſome prefer the application of them to the legs, and that when the violence of the fever is ſomewhat abated. Before a bliſter is applied, bladders of warm water may be tried by laying them over the part complained of; and the volatile liniment may be rubbed thereon. If the pain is obſtinate, when the bliſter on one ſide ceaſes to diſcharge freely, apply another to the other ſide.

Cooling clyſters, frequently injected during the firſt three or four days, render the loſs of much blood leſs neceſſary.

Antimonial preparations, given in ſuch doſes as will keep up a naufea, are of ſingular advantage, both with reſpect to the fever, and to expectoration.

Nitre and *camphor, with ſmall quantities* of opium to moderate the violence of the pain, are powerful aſſiſtants. If the opium ſeems to affect the head, add a little ſal c. c.

If what is ſpit up be yellow, or ſtreaked with blood, the *gum. ammon.* will be a proper addition to the other medicines.

A cooling purge may be given as ſoon as the firſt bleeding is over; and if the heat and inflammation are violent, it may be repeated every ſecond day, notwithſtanding the clyſters; for, if poſſible, *a reſolution of the inflammation muſt be procured*.

If the menſes appear in female patients, they muſt not interfere with the neceſſary repeated bleeding, nor occaſion any alteration in the treatment of the diſeaſe.

If, after taking away blood, the pulſe ſinks and becomes languid, the *ſal c. c.* in doſes of ſix or eight grains may be repeated every three or four hours.

In the very beginning of the diſorder, having premiſed due evacuations, the *decoct. rad. ſenek. is almoſt a ſpecific*. An ounce of the root may be boiled in water to a pint, and two or three ſpoonfuls may be given three or four times a day. If it excites a vomiting, give ſmaller doſes. See PERIPNEUMONIA.

Alſo Wallis's Sydenham; Shebbeare's Theory and Practice of Phyſic; Hoffman's Med. Rat. Syſt. Fordyce's Elem. part ii. Cullen's Firſt Lines, vol. i. p. 311.

THE BASTARD PLEURISY is an inflammation of the intercoſtal muſcles. The cauſes are nearly ſimilar to thoſe of the *true pleuriſy*. The ſymptoms and cure are alſo nearly alike. It differs from the true *pleuriſy* in that the pain is more external; where the pain is, there a ſwelling is perceived; and if the part is touched, the pain

becomes very pungent, and the patient cannot lie on the pained ſide. There is leſs pain on inſpiration, and of conſequence not ſo great a difficulty of breathing. The cough is generally dry, the general inflammation is leſs violent, and the lungs are leſs apt to be affected; a mortification ſeldom takes place, and ſuppuration hath but little danger attending it.

In order to the cure, *bleed* in proportion to the hardneſs of the pulſe; *purge* at proper intervals; *bladders of warm water* may be applied to the part complained of, and it may alſo be rubbed with the *volatile liniment*: ſometimes when the pain is acute *a bliſter* is applied, and the *decoction of rad. ſeneka* given as in a true *pleuriſy*. If a ſuppuration threatens, encourage it by means of fomentations and poultices.

This diſorder ſometimes terminates in a ſweat, and rarely continues more than ſeven or eight days.

See Fordyce's Elements, part ii. Tiſſot's Advice to the People. This term is given to other diſeaſes, viz.

PLEURITIS HEPATICA. A variety of *pleuriſy* called *a falſe pleuriſy*, or an inflammation of the liver, with pleuritic ſymptoms.

—— SPURIA. See RHEUMATISMUS.

—— SPLENICA. See SPLENIS INFLAMMATIO.

PLEURODYNE. Pains in the pleura. Dr. Cullen makes it ſynonymous with RHEUMATISMUS, which ſee.

PLEURODYNE FUGAX. See CRAMPUS.

—— RHEUMATICA. See RHEUMATISMUS.

PLEURON. See PLEURA.

PLEUROPNEUMONIA. A diſtemper conſiſting of a pleuriſy and peripneumony.

PLEURORTHOPNŒA. According to Blancard, it is a pleuriſy, in which the patient cannot breathe without keeping his neck erect.

PLEUROSTHOTONOS. See TETANUS.

PLEXUS. In ANATOMY, is a kind of network, or complication of veſſels, or *plexus* of nerves. See GANGLION.

PLEXUS CARDIACUS, or PULMONARIS. It is formed of the reciprocal ramifications of both trunks of the eighth pair, and their mutual communications with the filaments of the intercoſtal or great ſympathetic nerve. It is ſituated above the lungs, on the foreſide of the bronchia, and it diſtributes to the pericardium, &c.

—— CHOROIDES, alſo called *plexus reticularis*, or *retiformis*. The fornix cut off, and removed, we ſee a vaſcular web, called the *plexus choroides*, with ſeveral eminences which it covers. The firſt two great eminences are called corpora ſtriata, and the other two are called thalami nervorum opticorum. The firſt ſmall eminences are clearly united together, the anterior are called *nates*, and the poſterior *teſtes*. Le Dran explains it to be a folding of the carotid artery in the brain. See CEREBRUM.

—— PAMPINIFORMIS. See SPERMATICA CHORDA.

PLICA POLONICA, } (from *plico, to knit together*,)
PLICA, } PLAITED HAIR, called alſo *helotis, kolto, rhopaloſis*. Dr. Cullen places this genus of diſeaſe under the name of *trichoma*, in the CLASS CACHEXIÆ, and ORD. IMPETIGINES. It is a contagious diſeaſe, wherein the hairs are thicker than uſual, and are ſo matted, and glued together, that it is impoſſible for them to be extricated. This diſorder is only met with in Poland and Lithuania, and conſiſts of ſeveral blood-veſſels running from the head into ſome of the *hairs*, which cleave together, and hang from the head in broad flat pieces, generally about an ell in length, but ſometimes they are five or ſix yards long; one patient hath more or leſs of theſe, up to twenty, and ſometimes thirty. They are painful to the wearer, and odious to every ſpectator. At the approach of winter, an eruptive fever happens to many in theſe countries; the eruptions principally infeſt the head; and when at the height, an ichorous humour flows from them. In this ſtate they are too tender to admit of being touched, and the matter running down the *hairs*, mats them together; the ſkin by degrees breaking, the ramifications of the capillary veſſels following the courſe of the *hair*, or prolonged out of the ſkin, at length are increaſed to a vaſt length. There is a ſpecies called *trica lumborum*, by ſome authors.

No method of relief is known; for if the diſcharge is checked, or the veſſels cut off, the conſequence is an increaſe of more miſerable ſymptoms, and, in the iſſue, death; though ſome aſſert that there is no danger in cutting them off. Sennertus ſays, when all the morbid matter is thrown out of the body, the *plicæ* fall off ſpontaneouſly. He further obſerves, that the only ſafe practice in this caſe is, to ſolicit the peccant matter to the hairs, to which it naturally tends, and that this is beſt anſwered by lotions of *bear's breech*. Some ſay that a decoction of the herb *club-moſs* and its ſeeds, with which the head is to be waſhed, is ſpecific. See Sennertus, Hoffmann de Morb. cert. Reg. propr. Gehema in Epiſt. ad Bontokoe de *Plica Polonica*.

PLICARIA. See LYCOPODIUM.

PLICATIO. A violent ſhock and bending of a long bone without breaking it.

PLINTHIUS LAQUEUS. See CIRCUS QUADRUPLEX.

PLUMBAGO. PLUMBAGE. Called alſo *Molybdæna* and *Galena*. In PHARMACY it is a metallic recrement. The beſt is like litharge, yellow, ſhining, and of a pale red under levigation, but boiled in oil it takes an aſh colour; that which is of a leaden colour is not good. It is generated in the refining furnace of gold and ſilver. There is a foſſil ſort. They are of the ſame nature as litharge.

PLUMBAGO, in the vegetable kingdom, is LEADWORT, or FRENCH DITTANDER. It is a plant whoſe root is fibrous, thick, fleſhy, hot, and perennial; the leaves are alternate and entire; the calyx is very hairy; the flower is monopetalous, and they are placed on ſpikes. Boerhaave mentions two ſpecies of them, and notes the whole plants as being hot and biting like the pellitory of Spain, and as proper ſubſtitutes for it. It is alſo a name of the *dentaria, dentillaria, dentellaria, lepidium Monſpelliacum*.

PLUMBUM. LEAD. Alſo called *ſaturnus, aabam, abartamen, accib, acureb, alabcai, allabor, allarinoc, alooc, alomba, alracas, capricornus, molybdos*. Greek writers often uſe the ſame name for *lead* and tin; and many of their Latin tranſlators interpret κασσιτερος both by *lead* and tin. Geo. Agricola mentions three kinds, viz. *the white*, by which he means tin; *aſh-coloured*, or biſmuth; and *livid coloured*, or *lead*.

Common *lead* is a pale, livid, ſoft, flexible metal, eaſily ductile, not at all elaſtic, or ſonorous, and, if mixed with any metal, prevents its ſound; it is about eleven times ſpecifically heavier than water, fuſible in a ſmall heat, ſoon calcined, and thereby increaſed in its weight; it does not ruſt; if continued in fuſion, it contracts a various-coloured pellicle on the ſurface, and, if kept ſtirring, ſo as that freſh ſurfaces may be expoſed to the air, it changes by degrees partly into a fume, and partly into a duſky-coloured calx; when fuſed, it paſſes through any veſſel yet made to hold it, and with it takes all mixtures except gold or ſilver, or it diſſipates them in vapour, or carries them with it as it is formed into ſcoria, and thrown off at the ſides of the cupel. If the calcination of *lead* is continued ſome time, and the heat is increaſed to different degrees, it becomes yellow, and is called MASTICOT, or *painter's yellow*; afterwards it becomes red and is called MINIUM. Theſe calces, haſtily heated to a conſiderable degree, melt into the appearance of oil, and, on cooling, form a ſoft flaky ſubſtance called LITHARGYRUM, *litharge*, which is yellow, or reddiſh, according as the *lead* was more or leſs calcined. If the calces are urged with a pretty ſtrong fire, they run into a yellowiſh glaſs, which, whilſt in fuſion, corrodes the common crucibles until it hath ſaturated itſelf with their earth. Theſe ſeveral ſubſtances, by the addition of charcoal, iron-filings, or any oily matter, become *lead* again. *Lead* diſſolves moſt in the weaker acids, ſuch as aqua fortis and water, vinegar, &c.

The ores of *lead*, in colour, commonly reſemble the *lead* itſelf, and are of a cubical, or parallelopipedal ſtructure. Sometimes the ore is black, red, yellow-coloured, &c. Engliſh ores are reckoned of three claſſes; that which affords, of good metal betwixt thirty and forty pounds from every hundred weight; that which yields from forty-five to ſixty; and that which gives out from ſixty to eighty. They are called *galena teſſellata*. The metal extracted from the ore by fuſion often contains ſilver enough to pay for its ſeparation from the *lead*. The lighteſt, paleſt, and baſeſt lead is called *biſematum*; waſhed lead, *batamum*.

1. CERUSSA. *White* LEAD. This is called *Dulcedo Saturni, Gerſa, Abit, Aboit, Aſſidra, Albotat, Alfidas, Arſiora, Baiac, Blaſtara, Blanca, Eſſides, Pſymmithion, pſilothrum*.

Put ſome vinegar into the bottom of an earthen veſſel,

and ſuſpend over it very thin plates of lead, ſo that the aſcending vapour may circulate about the plates; ſet the containing veſſel in the heat of horſe dung for three weeks, then ſcrape off the white powder, and expoſe what remains of the plates to the ſteams of the vinegar again, until all the *lead* is corroded.

White *lead* is uſed as a coſmetic, but it ſpoils both the colour and the ſmoothneſs of the ſkin, injures the conſtitution, and makes the teeth carious. It is adulterated with chalk, lime, whiting, &c. The entire flakey maſſes, called *flake lead*, or white flake ſhould be choſen. To diſcover adulterations, compare pieces of equal ſize; the genuine will be the heavieſt; or take an ounce of the ſuſpected ceruſſa; of charcoal-duſt, two drams; any fixed alkaline ſalt, half an ounce; put them in a crucible, and in a heat ſtrong enough to fuſe the *lead*; thus the *lead* will be reduced to its metallic ſtate, which being weighed, diſcovers the proportion of the adulteration, one tenth part being allowed for the corroding acid of the ceruſe.

Pulvis e ceruſſa compoſitus, *collyrium ſiccum*, now called PULVIS E CERUSSA, *powder of ceruſs*, is thus prepared. Take of ceruſſa, five ounces; farcocol, one ounce and an half; tragacanth, half an ounce. Rub them together into a powder. Ph. Lond. 1788.

This is a reformation of the white troches of Rhazi; it is uſed to expel hot rheum on the eyes, and is called ſic. album, and *collyrium ſiccum*.

2. *Acetum Lythargiritis.* VINEGAR *of* LITHARGE.

Take four ounces of litharge, and the ſtrongeſt vinegar a pint. Digeſt in a ſand-heat for three days, ſhaking the mixture now and then.

This vinegar of *lead* is of the ſame nature as ſolutions of ceruſſa acetata. The calces of *lead* diſſolve more freely than *lead* in its metallic ſtate. When a ſaturate ſolution is required, the ceruſe is preferred to litharge. When this vinegar of *lead* is diluted with a large quantity of water, it abates external inflammations, the itching and other uneaſineſſes in cancerous ulcers; and before Mr. Goulard's practice, it was uſed for bathing inflammations in ſcirrhous tumors, to prevent their becoming cancerous. Inflammations and inflammatory tumors in general, are diſperſed by it.

3. *Plumbum Uſtum. Burnt, or calcined* LEAD, called alſo *elas maris.*

Melt *lead* with a gentle fire, and keep it continually ſtirring with an iron ſpatula, until it changes into a powder.

4. MINIUM, alſo *plumbum rubrum. Red* LEAD, called alſo *acaſtum*, ALUMBOTI, *azemafor, cauda vulpis rubicundi.*

Melt any quantity of *lead* in an unglazed earthen veſſel, and keep ſtirring it with an iron ſpatula until it falls into a powder, at firſt blackiſh, then yellow, and at laſt red, taking care not to raiſe the fire ſo as to run the *lead* into a vitreous maſs.

The making of red *lead* is a diſtinct buſineſs, and its makers melt large quantities of *lead* at once upon the bottom of a reverberatory furnace built for the purpoſe, and ſo contrived, that the flame acts upon a large ſurface of the metal, which is continually changed by raking it with an iron rake, drawn backward and forward until the fluidity of the lead is deſtroyed; after which, the calx is only now and then turned. The reverberation of the flame upon the ſurface is abſolutely neceſſary for this effect. Red *lead* is often adulterated with red oker, which is diſcovered by melting it as directed for diſcovering adulterations in white *lead*, only in this the ſalt may be omitted.

5. *Saccharum Saturni. Sugar of* LEAD; now called *Ceruſſa Acetata. Acetated Ceruſe*, alſo *altey plumbi, alki plumbi.*

Take of ceruſe, a pound; diſtilled vinegar, one gallon and an half; boil the ceruſs with the vinegar, until the vinegar is ſaturated; then filter through paper; and after proper evaporation ſet it aſide to cryſtallize. Pharm. Lond. 1788. Afterwards exhale the remaining liquor, and ſet it to ſhoot again, &c. until no more ſalt will ſhoot. The ceruſe ſhould be finely powdered before the vinegar is put to it; and during the boiling, it ſhould every now and then be ſtirred with a wooden ſpatula. The ſtrong acid which remains after diſtilling the diſtilled vinegar, is the moſt proper for this uſe. If the heat is conſiderable in the boiling of the vinegar and *lead* together, the acid will be diſſipated before it can be fixed by its combination with the *lead*; the vinegar may be made hot, and that will ſuffice. When the ſolution is exhaled for cryſtallization, let a ſmall quantity of rectified ſpirit of wine be added to it, and the mixture ſuffered to cool gradually; the ſugar will then concrete into very large tranſparent cryſtals.

In all the intentions of the *aqua lithargyri acetati*, the ſugar of *lead* may be uſed; of all the preparations of *lead* for external uſe, *ceruſſa acetata* is perhaps ſuperior to any; it hath all the advantages of the others, with this difference, that in it we are much more certain of the exact ſtrength of our preparation than we ever can be with any other. The beſt mode of applying it is as preſcribed by Mr. Bell, in his Treatiſe on Ulcers, edit. iii. p. 43. SOLUTIO SATURNINA: R Ceruſſæ acetatæ ʒ ſs. ſolve in acet. pur. ʒ iv. & adde aq. font. diſtillat. ℔ ii. This may be kept for uſe, and, on all occaſions, ſupply the place of Goulard's extract and water. The Edinburgh College retain the TINCTURA ANTIPHTHISICA, called SATURNINA, by that of London, in their old Pharmacopœia, though rejected from that of 1788, which is made in the following manner:

TINCTURA SATURNINA. *Saturnine Tincture*, called alſo *Antiphthiſica.*

Take of ſugar of *lead*, now called ceruſſa acetata, ſal ferri āā ʒ ij. ſp. vin. rect. ℔ ij. Reduce the ſalt ſeparately into powder, then add the ſpirit, and digeſt them together without heat, afterwards filter through paper. This is conſidered as a very unſcientific preparation. See Edinburgh Diſpenſatory, 1789; and, therefore, the ceruſſa acetata, combined with opium, is eſteemed a much better preparation. It is alſo formed into an ointment. See NUTRITUM UNGUENTUM.

6 *Extractum Saturni. Extract of* LEAD, now called *aqua lithargyri acetati.* Water of acetated litharge.

Take as many pounds of the litharge of gold as quarts of vinegar; ſimmer them together for an hour and a quarter, and often ſtir them during their ſimmering; then taking it from the fire, as ſoon as it is cool enough, pour the clear liquor into bottles to be kept for uſe. If this liquor is made into the common conſiſtence of an extract, it muſt boil yet longer after its ſeparation from the maſs; it will then be of a reddiſh colour. This is Goulard's method of preparing it, on which the ſame things may be obſerved that are related of the acetum lythargiritis. This extract is the baſis of all Mr. Goulard's preparations of *lead*. See Bell on Ulcers, edit. 3. p. 38—48. The College of phyſicians of London prepare it in a different manner, and under a different name. They call it, aqua lithargyri acetati, *water of acetated litharge*; to make which, they order two pounds four ounces of litharge to be mixed with one gallon of diſtilled vinegar, and boiled to ſix pints, conſtantly ſtirring, then to be ſet aſide; and after the fæces have ſubſided, to be ſtrained. Pharm. Lond. 1788.

Of this, a cataplaſm is made by adding of water of acetated litharge ʒ j. to one pint of water, and a ſufficient quantity of bread crumbs, to make into the conſiſtence of a poultice. This is applied in local inflammation; and commended in cancerous and ſcrophulous caſes; likewiſe to improve the ſtate of unhealthy ſores; and is of advantage in milk tumors of the breaſt. Of this acetated litharge, the CREMOR LITHARGYRI ACETATI is formed by adding one dram of the water of acetated litharge to one ounce of cream. This is of ſervice in external ophthalmia, applied to the eye affected, upon linen rags. It is conſidered as powerfully ſedative, and proves an admirable remedy for burns or ſcalds, from the great degree of cold attending its application.

CERUSSÆ INJECTIO COMPOSITA. COMPOUND INJECTION OF CERUSE.

R Pulv. ceruſs. comp. ʒ j. zinci vitriolati gr. vj. aq. roſæ ʒ iv. m. This has been conſidered as a ſuitable injection in the inflammatory ſtage of gonorrhœa.

CERUSSÆ LINIMENTUM CUM SAPONE.

R Solutionis ſaponis ʒ ij. aquæ lithargyri acetati ʒ j m. This is a good application for diſeaſed joints: and for parts bruiſed, where there is deep-ſeated inflammation.

7. *Aqua Saturni. Water of* SATURN.

Mr. Goulard alſo calls this by the name of vegeto-mineral water, and makes it by dropping into a quart of pure water, an hundred drops of the extract of ſaturn, and then adding to them four tea-ſpoonfuls of brandy. This is his ſpecific in external inflammations, particularly of the eye, for waſhing ulcers, cancers, ſcrofulas, contuſions, phlegmons, eryſipelas, piles, chilblains, tetters, gangrenes, &c. A ſolution of the *ceruſſa acetata* will have the ſame effect.

Lead is of ſo poiſonous a quality, that no dog nor cat will come near the place where the ore is waſhed; if they do, they ſoon die. *Lead* is ſo fatal, that all who work in mines, and other places where it is a principal ſubject of their operations, ſuffer much from it. If it is received into the conſtitution, it produces the colic, palſy, general diſorders of the nerves, &c. but externally applied, it is not only ſafe, but powerfully *diſcutient*, *aſtringent*, *antiſeptic* and *ſedative*. It is obſerved that all the preparations of *lead*, and the vapours exhaled from the metal itſelf, or its calces introduced into the body, diſcover a ſedative power extremely noxious to the human ſyſtem. It is therefore difficult to ſay, how far we can employ the aſtringent and tonic operation of this metal, and be at the ſame time ſecure againſt its deleterious powers, eſpecially as the deleterious powers do not always immediately diſcover their operation, and very often only after they have long remained latent, and unheeded in the body. CULLEN'S MATERIA MEDICA. However, ſome of the preparations have been given with ſucceſs, particularly in hæmorrhages, phthiſis pulmonalis, &c. See Medical Commentaries of Edinburgh.

Lead is ſometimes diſſolved in acid liquors to prevent or remove their too great acidity; but thoſe liquors are thereby rendered unfit for internal uſe: to diſcover when this is the caſe, drop into the ſuſpected liquor a few drops of a ſolution of cryſtal, or of common ſulphur, in limewater, and the liquor in which *lead* is diſſolved becomes brown; and if on dropping into this a few drops of the ſpirit of ſalt, this brown colour does not diſappear, it is *lead*, and not any other ſubſtance that is diſſolved in the acid or aceſcent liquor.

See Dictionary of Chem. Neumann's Chem. Works. Lewis's Mat. Med. Goulard's Treatiſe on the Effects and various Preparations of *Lead*. Aitken's Obſervations on the External Uſe of Preparations of *Lead*. Bell on Ulcers, edit. 3. p. 36. London Medical Tranſactions, vol. i. p. 257.

PLUMBUM NIGRUM. BLACK LEAD. It is alſo called *fabrilis nigrica*; *ochra nigra*; *wadt*; *kello*; ſometimes *molybdæna*; *black lead*. It hath none of the properties of common *lead*, except that of colouring in drawing lines. It will calcine, but not fuſe. It is not now uſed in medicine, though formerly it was reckoned drying and repellent. See Dict of Chem. Beſides there are others which bear this name, viz.

—— CANDIDUM. See STANNUM.—CINEREUM. See BISMUTHUM.—RUBRUM. See ADROP and PLUMBUM, N° 4.

PLUMMERI PILULÆ. PLUMMER'S PILLS. Levigate calomel, and the precipitated ſulphur of antimony, of each two drams together; when they are well levigated, add three drams, of the gum-guaiacum, and one dram of the reſin; mix them well, and make them into a maſs, with the balſam capivi, and of each dram form twelve pills.

Their uſes are the ſame as thoſe of the æthiops antimonialis; which ſee.

PLUMULA, a little feather. See CORCULUM.

PNEUMA. *Spirit, air, vapour*, or *the breath*. See ANHELATIO. It is alſo a divine water called *Scythicus latex*.

PNEUMATOCELE, from πνευμα, *wind*, and κηλη, *a tumor, hernia flatulenta; ventoſa; pneumatoſis*. A FLATULENT HERNIA, or WINDY RUPTURE. It is when wind only is the contents of a rupture; but it rarely, if ever, happens. In ſome putrid fevers, in the ſmall-pox, and gangrenes, ſome parts of the ſkin frequently crackle like parchment under the finger. When carcaſes begin to corrupt, air evidently begins to generate in the veſſels and cavities, from which it may be preſumed that, in a very corrupted ſtate of the fluids, the *pneumatocele* may be formed. Mr. Bell obſerves, that the term *pneumatocele* is applied to ſignify a diſtenſion of the ſcrotum by a collection of air. This hath been deſcribed by moſt of the ancient writers as a very frequent occurrence; but there is much reaſon to think, that a great proportion of all the tumors they take notice of as containing air, were either formed by collections of water, or by a protruſion of ſome of the bowels. That ſpecies of hernia, to which young children are liable, is to this day, by our common people termed a wind-rupture; as are all thoſe collections of water in the ſcrotum, with which the new-born infants are affected: but we know well, that none of theſe tumors are formed merely by wind; their contents being of a very different nature. In wounds of the lungs, air is ſometimes extravaſated into the ſurrounding cellular ſubſtance, and in that way paſſes into the ſcrotum, as it does in particular inſtances over the whole body: and in high degrees of putrid diſeaſes, ſo much air may be ſeparated from the blood, as to diſtend the cellular ſubſtance of the ſcrotum, as well as of other parts; *but a real pneumatocele has never, probably, exiſted as a mere local affection of the ſcrotum*. In the caſe of air diffuſed into the cellular ſubſtance of theſe parts, in conſequence of a wound or any other affection of the lungs producing an extravaſation of it, the ſame method of cure will anſwer for its removal that is recommended for anaſarcous ſwellings formed by water, viz. ſmall punctures with the point of a lancet, which are found to be fully ſufficient for evacuating great quantities of air. But whenever the diſeaſe is induced by ſuch a degree of putreſcency in the ſyſtem as is neceſſary for affecting a ſeparation of air from the blood, there can be little reaſon to expect any advantage to reſult from whatever means may be employed for relief; though when the putrid degeneracy of the humors is the cauſe, a plentiful uſe of antiſeptics and corroborants are indicated.

Mr. Pott poſitively aſſerts the *pneumatocele* to be a miſtake. He ſays, *that there is no tumor of this kind, and in this ſituation, in a living animal*: it is indeed particularly deſcribed by many writers, both ancient and modern, and ſaid to be a diſorder to which infants are particularly liable: but the complaint ſo deſcribed, and which nurſes, &c. do ſtill call a wind-rupture, is not what they take it for; neither is it produced by wind; *it is either a true inteſtinal hernia*, or *a ſpecies of hydrocele*. There is no hernia produced by mere wind; the two diſeaſes, which in new born children and infants are taken for, and called wind ruptures, *are a tumor produced by a ſmall quantity of fluid remaining in the lower part of the tunica vaginalis, after its communication above with the cavity of the belly is cloſed; and a true, but ſmall inteſtinal hernia*. The natural communication between the cavity of the tunica vaginalis, and the belly not being ſhut until ſome ſpace of time after birth; it may become cloſe at its upper part, while there is a quantity of fluid on the lower, too large for the abſorbent veſſels to take up immediately; and conſequently that ſuch infant will, until that office be executed, labour under a true hydrocele of the tunica vaginalis teſtis; a caſe which is very frequent, though generally miſtaken for a wind-rupture.

Some late writers miſtake the encyſted hydrocele of the tunica communis which connects the ſpermatic veſſels for the wind rupture; though it differs from the wind-rupture in its ſituation; but unfortunately the encyſted hydrocele of the tunica communis may be accompanied with a hydrocele of the tunica vaginalis, or with a true hernia, and then the caſe is ſomewhat difficult to aſcertain.

See Bell's Syſtem of Surgery, vol. i. p. 496. Pott's Chirurgical Works, quarto edit. Cullen's Firſt Lines, vol. iv.

PNEUMATOSIS. See EMPHYSEMA; PNEUMATOCELE and GASTRODYNIA.

PNEUMATOMPHALOS, from πνευμα, *wind*, and ομφαλος, *the navel*. See HERNIA UMBILICALIS.

PNEUMONIA. In general, an inflammation in the thorax, and of the membrane that lines it: but in particular, an inflammation of the lungs. Dr. Cullen places this genus of diſeaſe in the CLASS PYREXIÆ, and ORD. PHLEGMASIÆ, which he defines a febrile affection, attended with pain in ſome part of the breaſt, difficulty of breathing, and cough. He diſtinguiſhes two ſpecies. 1. *Pneumonia peripneumonia*. See PERIPNEUMONIA. 2. *Pneumonia pleuritis*. See PLEURITIS.

PNEUMONICA. A ſenſe of weight, or a load on the cheſt.

PODAGRA, from πους, *a foot*, and αγρα, *a prey*. See ARTHRITIS.

PODO-

PODOPHILLUM PELTATUM. See ANAPODOPHILLUM.

PODOTHECA. See CHIROTHECA.

POEGEREBA. An American root, uſed in Paris as an aſtringent in dyſenteries.

POHUN WATERS. See SPAÆ AQUÆ.

POINCIANA. FLOWER-FENCE. It is alſo called *frutex pavoninus*; *criſta pavonis*; *acacia orbis Americana*; *erythroxylon*, &c. It grows in the Spaniſh Weſt Indies; its ſeed-pods, infuſed with galls, affords the beſt black ink. See Raii Hiſt.

POLENTA. See ALPHITON.

POLGAHA. See PALMA COCCIFERA.

POLIUM. POLEY. Of this plant, botaniſts enumerate twelve ſpecies: it is the TEUCRIUM, Linn. The two following have been noted in medicine.

POLIUM MONTANUM LUTEUM. YELLOW MOUNTAIN-POLEY; it is alſo called SMALL UPRIGHT POLEY-MOUNTAIN; and POLEY-MOUNTAIN OF MONTPELIER. It is a ſmall plant, with ſquare ſtalks, oblong woolly leaves ſet in pairs, and with labiated flowers.

——CRETICUM, alſo called *roſmarinum ſtæchadis facie*; *teucrium fruteſcens*; TREE-GERMANDER; POLEY OF CANDIA. The leaves are ſet on ſhort pedicles, and are not indented; the flowers ſtand in looſe cluſters, each on ſeparate foot-ſtalks.

Both theſe ſorts have the ſame qualities; the leaves and tops have a moderately ſtrong aromatic ſmell, and diſagreeable bitter taſte. Diſtilled with water, they yield a ſmall quantity of yellow eſſential oil; an extract from the remaining decoction is very bitter. The leaves and tops are *corroborant*, *aperient*, and *antiſpaſmodic*. See Lewis's Mat. Med.

POLLEX. See DIGITUS.

POLLEX PEDIS. The GREAT TOE.

POLLINICIO. See CONDIO.

POLYADELPHIA (from πολυς, *many*, and αδελφος, *brother*). The name of the 18th CLASS in the LINNÆAN SYSTEM; comprehending thoſe plants which bear hermaphrodite flowers, with three or more ſets of united ſtamens.

POLYANDRIA (πολυς, *many*, and ανηρ, *a huſband*). The name of the 13th CLASS of the LINNÆAN SYSTEM, comprehending thoſe plants which bear hermaphrodite flowers, with many ſtamens, from twenty to a thouſand, growing ſingle on the receptacle. The number of the ſtamens diſtinguiſhes this from the firſt eleven claſſes; their ſituation on the receptacle ſeparates it from the 12th claſs, *Icoſandria*; and their ſimplicity avoids all confuſion with the 16th and 18th claſſes, MONADELPHIA, and POLYADELPHIA.

POLYCHRESTUS, from πολυς, *much*, and χρηστος, *uſeful*. An epithet of ſeveral medicines, denoting that they have many virtues. The ſame as *polypharmacos*.

POLYCHRESTUM, from πολυ, *much*, and χρηστος, *virtues*. See GUAIACUM, N° 3.

—— SAL. SALT of many VIRTUES. See NITRUM, N° 4.

POLYDIPSIA. See SITIS.

POLYGALA, alſo called *ambarvalis flos*, *amarella*; COMMON BLUE MILK-WORT. It is a ſmall perennial plant, with the leaves alternate; uncut, and thoſe on the upper parts of the ſtalk larger than thoſe on the lower; the flowers are irregular, tubulous, tripetalous, labiated, ſet in looſe ſpikes on the tops, the cup compoſed of five leaves, the two larger of which continue after the flower hath fallen, and embrace, like wings, a flat bicellular ſeed-veſſel. The ſtalks of this common ſort are procumbent; the lower leaves are roundiſh, the upper are oblong, narrow, or pointed; the flowers are blue, purpliſh, or red; ſometimes white, with a kind of fringed appendix on the lower lip; the roots are ſlender and hard. It grows wild in dry paſtures, and flowers in July. The roots are ſomewhat ſimilar in taſte to the Senegal milk-wort, but much weaker; and in a leſs degree they have the ſame effect in pleuriſies.

POLYGALA SENEGA, and MARILANDICA. See SENEGA.

—— INDICA MINOR. See COLINIL.

—— VERA, called alſo *polygala major maſſiliotica*; *polygala valentina maritima*; *colutea caule geniſtæ fungoſo*. MILK-VETCH.

An infuſion of this herb hath been uſed for increaſing the milk in women's breaſts.

POLYGALON. See ORNOBRYCHIS.

POLYGAMIA (πολυς, *multus*, and γαμος, *nuptiæ*). The 23d claſs in the LINNÆAN SYSTEM, comprehending thoſe plants which bear hermaphrodite flowers, together with male or female flowers, or both. This term, applied to a ſingle flower, regards the intercommunication of the floſculi, which form that flower, as in the 1ſt, 2d, 3d, and 4th orders of the claſs *Syngeneſia*.

POLYGAMIA FRUSTANEA (from *fruſtra*, *to no purpoſe*). The name of the third order in the claſs *Syngeneſia* of Linnæus's artificial ſyſtem, comprehending ſuch of the compound flowers, as have perfect florets in the diſk, producing ſeed, but imperfect florets in the ray, which, for want of a ſtigma, are barren.

—— SUPERFLUA. The name of the ſecond order in the claſs *Syngeneſia*, wherein the florets of the diſk are hermaphrodite, and fertile; and the florets of the ray, though female only, are alſo fertile.

POLYGONATUM, alſo called *ſigillum Solomonis*; SOLOMON'S SEAL. It is the CONVALLARIA POLYGONATUM, or the CONVALLARIA *foliis alternis, amplexicaulibus, caule ancipiti, pedunculis axillaribus ſubunifloris*. CLASS HEXANDRIA, ORD. MONOGYNIA. LINN. Gen. Plant. 425. It is a plant with unbranched ſtalks, oval narrow leaves, ribbed like thoſe of plantain, generally all on one ſide; on the other ſide hang oblong monopetalous white flowers, two or more together, on long pedicles, followed each by a black berry; the root, the part uſed, is white, thick, fleſhy, with ſeveral joints, and ſome flat circular depreſſions, ſuppoſed to reſemble the ſtamp of a ſeal. It is perennial, grows in woods, and flowers in May. Boerhaave mentions ſeven ſpecies. The roots are reſtringent, incraſſant, and corroborant; if bruiſed and applied by way of poultice, it diſſipates blackneſs from contuſions ſpeedily. See Raii Hiſt.

POLYGONUM. KNOT-GRASS, called alſo *calligonum*, *centinodia*, *carcinethron*, *corrigiola*. That uſed in medicine is the POLYGONUM AVICULARE, *floribus octandris, trigynis, axillaribus, foliis lanceolatis, caule procumbente herbaceo*. LINN. Gen. Plant. 495. The root is creeping and fibrous; the ſtalk and branches are full of joints; the ſtalks recline towards the earth, are ſmooth, finely channelled, ſlender, and branched, full of knots or joints, at which grow long oval ſharp-pointed leaves. The root is cooling and binding, and hath been uſed againſt hæmorrhages inwardly, and againſt inflammations outwardly. See Raii Hiſt. It is alſo a term added to many ſubſtances in the vegetable world, viz. POLYGONUM *biſtorta*. See BISTORTA;—*Hydropiper*; and—*perſicaria*. See PERSICARIA.—*Minus*; See HERNIARIA.

POLYMERISMA. Supernumerary limbs or parts.

POLYMORPHOS. MULTIFORM. See SPHENOIDES OS.

POLYNEURON. See PLANTAGO.

POLYOSTEON. That part of the foot which conſiſts of many bones.

POLYPETALUS. MANY-LEAVE. See PETALA.

POLYPHARMACOS. See POLYCHRESTOS.

POLYPODES. See ASELLI.

POLYPODIUM. POLYPODY. It is generally called *polypody* of the oak. The ſpecies uſed in medicine is the POLOPODIUM VULGARE Linn. It is a plant with long leaves iſſuing from the root, divided on both ſides, down to the rib, into a number of oblong ſegments, broadeſt at the baſe; it hath no ſtalk or manifeſt flower; the ſeeds are a fine duſt, lying on the backs of the leaves in roundiſh ſpecks, which are diſpoſed in rows parallel to the rib; the roots are long and ſlender, of a reddiſh brown colour on the outſide, greeniſh within, full of ſmall tubercles, which are reſembled to the feet of an inſect; whence the name of the plant. It grows wild in the cleſis of old walls, rocks, and decayed trees. That produced on the oak is uſually preferred, though no better than the other ſorts. It is found green all the year. The leaves have a weak ungrateful ſmell, a nauſeous ſweet taſte, a roughneſs, and a ſlight acrimony. Its virtues are the ſame as thoſe of fern.

POLYPODIUM TENERUM MINUS, alſo called *dryopteris*, *filix querna repens*. OAK-FERN. It grows in marſhy places. If the root is bruiſed and applied to the ſkin, when the body is in a ſweat, it takes off the hairs.

POLYPODIUM FILIX FŒMINEA. See FILIX FŒMINEA.

—— ANGUSTIFOLIUM, alſo called *lonchitis*, *aſpera filix foliis polypodii*. ROUGH SPLEENWORT. It grows in rough uncultivated places. The root is aperient and diuretic.

POLYPODIUM FILIX MAS. See FILIX MAS.

POLYPUS, from πολυς, *many*, and πους, *feet*, alſo called *multipes*. MANY-FEET. This name is generally applied to a large ſea-fiſh, which hath eight claws or legs which ſerve it to ſwim with, and to convey aliment to its mouth; the four middle claws are the largeſt; the other four are called *brachia*, *crura*, *cirri*, and *barba*. Its mouth is in the middle of its body. It is found in the Adriatic ſea. See Lemery Traité des Drogues.

—— When applied to the human body, coagulations and concretions of blood in the blood-veſſels are thus called, becauſe they ſend off many ramifications into the adjacent veſſels. The true *polypus* is only ſuch a concretion of blood as conſiſts of a whitiſh, fibrous, and pretty compact ſubſtance, and differs widely from grumous or coagulated blood, which, when found, is called the *baſtard-polypus*; it is a ſolid fibrous concretion, formed of the more viſcid parts of the lymph. In Dr. CULLEN's Noſology, it ſtands a ſynonyme with *ſarcoma*.

The ſeat of theſe is in the ſinuſes of the brain, the ventricles of the heart, the jugular veins, the veins in the uterus, and in any artery or vein. According to Dr. Hunter, in his lecture on the blood, this is no diſeaſe in the living body, for the *polypuſes* found in the blood-veſſels are not formed till the body is dying. Thoſe that are the ſubjects of manual operations, their ſeat is in the noſe, the uterus, and the vagina. Theſe are inſtances of the ſarcoma.

The matter of the *polypuſes* is the more weighty fixed viſcid particles of the chyle and lymph.

The remote cauſes of a *polypus* in the blood-veſſels are various; as, a redundance of the blood, or its deficiency, may alike be the occaſional cauſes of this diſorder; a tall ſtature, large draughts of cold water ſuddenly drank after being heated with exerciſe, a too free uſe of acids and of ſpirituous liquors, terror, ſudden frights, and long continued grief, the apoplexy, epilepſy, hyſteric fits, a peripneumony, a ſpaſmodic aſthma, a pleuriſy, and other acute as well as ſeveral chronical diſorders.

If a *polypus* is in the præcordia, *the principal ſign is a long-continued palpitation of the heart, often excited by a ſlight cauſe*; ſuch as the commotions of the mind, flatulent aliment, or ſuch as renders the patient coſtive; *another ſign is, an unequal intermitting pulſe*, which is often accompanied *with fainting, and difficulty of breathing without any manifeſt cauſe, a compreſſion of the præcordia*; and what moſt generally accompanies this, is *a fixt pain about the heart*: each of theſe, *if they are almoſt perpetual, are palpable ſigns, that the circulation of the blood is obſtructed by ſome foreign body.*

The palpitation of the heart, ſo troubleſome and frequent, as alſo the anxiety which ſo often attends, are cauſed by paſſions of the mind, flatulent diet, coſtiveneſs, &c. which, by diſturbing the equable circulation of the blood, produce a greater impetus thereof to the heart, where, being preternaturally congeſted and accumulated, on account of the obſtructing *polypus*, it cannot find a ſufficient ſpace for expanding itſelf: but violently diſtends the heart and its veſſels, ſo produces theſe ſymptoms. *The inequality and intermiſſion of the pulſe* is occaſioned by the bulk of the *polypus* intercepting or preventing the due conſtriction of the heart and other veſſels on which the circulation of the blood depends. *The compreſſion complained of in the præcordia* is owing to ſpaſms there. POLYPUSES happen more frequently in the right auricle and ventricle than in the left, and oftener in the veins than in the arteries: for ſince the chyle, which by means of the ſubclavian vein, is conveyed to the vena cava, and the right ventricle of the heart is full of groſs particles which move ſlowly, it eaſily depoſits its heavy parts, by which the columnæ of the heart, being embraced, one ſubſtance or body, as it were, is produced. Then the blood conveyed to the veins by means of their too weak contractile force, circulated more ſlowly, is of a thicker conſiſtence, and more weighty than the arterial blood: hence it eaſily depoſits its thick parts; but eſpecially when theſe, not being intimately mixed, cohere ſlightly, they, by the force of their gravity, tend moſt to the bottoms and ſides of the veſſels. But it is otherwiſe with the arterial blood; for its courſe is promoted more effectually by the force of the arteries, and by its paſſage through the lungs is freed from a part which was unfit for circulation, if it hath not received ſomething from the inſpired air to fit it more effectually for its progreſs.

POLYPUSES, by intercepting the circulation, are often the cauſes of ſudden death; this may happen either from from their bulk, or from the force of the circulation ſeparating one of them from its ſeat, and forcing it into the mouth of ſome principal veſſel, and fixing it there. POLYPUSES haſten ſome other diſeaſes to an unhappy termination, as is obſerved in peripneumonies, pleuriſies, aſthmas, ſuffocative cartarrhs, conſumptions, &c.

THE INDICATIONS OF CURE are, to prevent their increaſe, and to diſſolve that which is already formed. At beſt, the cure is not leſs difficult than dubious; however, means being uſed, and ſucceſs having followed them, acquits from the charge of neglect, and juſtifies hope.

The patient ſhould avoid entering ſuddenly into vigorous exerciſe, but moderate degrees ſhould frequently be engaged in. Dilute the blood, and reduce its quantity, if redundant. If frights, or other great commotions of mind, ſhould occur, adminiſter ſuch medicines immediately as allay violent commotions, and as render the circulation equable, that are gently reſolvent, and promote perſpiration; let moderate exerciſe alſo be uſed, for thereby the heart is better enabled to free itſelf from the congeſted blood. The bowels muſt always be kept ſoluble. If the habit is robuſt, alcaline ſalts, either fixed or volatile, and bleeding in the foot, ſo as to reſolve the texture of the blood to the greateſt thinneſs that conſiſts with health. Spirituous liquors muſt be avoided; alſo all ſtrong exerciſe, and every diſturbance of mind.

POLYPUS NARIUM. A POLYPUS in the NOSE. It hath been called *noli me tangere, ſarcoma, and hyperſarcoma*: but the *polypus* is always ſoft, and hangs by one or more ſlender roots; the ſarcoma is ſometimes ſoft, but generally hard, and is fixed on a large immoveable baſis.

The *polypus* of the noſe is an excreſcence whoſe branches ſpread among the laminæ of the os ethmoides, and through the whole cavity of one or both noſtrils. See PARACELSUS's opinion under BUCCACRATON. All theſe *polypuſes* ſpread on the laminæ ſpongioſæ, pretty nearly in the ſame manner as the hydatids of the belly in one kind of dropſy do on the ſurface of the liver. They proceed from any part of the noſtrils, or thoſe ſinuſes of the cranium that are lined with the ſame membrane as that with which the noſtrils are; being no other than an enlargement of one or more of the glands thereof.

The cauſes may be external or internal; *the external* are chiefly ſome violence done to the pituitary membrane, the application of ſtimulating drugs thereto, and blows, ſcratches, &c. *Internal cauſes* are, acrid defluxions, frequent or profuſe hæmorrhages, &c.

Different *polypuſes*, and the ſame at different times, appear of different ſizes and conſiſtences; their elongation is ſometimes ſo quick that they appear below the noſtrils in two or three days; for the moſt part they are free from pain, yet ſometimes they are attended with both pain and hardneſs, and then they generally are diſpoſed to a cancer, in which caſe they are of a livid colour, and apt to bleed by the ſlighteſt touch.

When a *polypus* appears ſoft, and of a pale colour, like the ſerum of the blood, being alſo free from pain, it then is the beſt kind, and in the moſt proper ſtate to extract; theſe have rarely more than one attachment, from which they hang, and it is very ſmall; this muſt be brought away with the *polypus*, which commonly happens in the extraction of it, if the forceps take hold high enough. If it is hard, and appears ſcirrhous, it will in general be found to have a broad baſis, and be unfit in every reſpect to middle with: but if it is of that innocent kind juſt mentioned, its attachment is uſually in the anterior parts of the noſe. Let the *polypus* appear where it will, it will be beſt extracted anteriorly, for few can bear the introduction of the forceps up behind the uvula.

Mr. Sharp directs the following method of extracting a *polypus*: "Introduce a pair of forceps, with a ſlit at their extremities, for the better hold, an inch and an half up the noſtril, to ſecure the *polypus* as near the roots as may be; then twiſt them a little from one ſide to the other, and continue this action while you pull gradually downwards; if it breaks, repeat the extraction as long as any remains, unleſs it is attended with a violent hæmorrhage, which is an accident that ſometimes happens, and rarely fails, if the *polypus* is become ſcirrhous; this hæmorrhage is ſoon abated by the contraction of the veſſels, or the application of lint dipped in ſome ſtyptic." It may be known that the *polypus* is removed, 1ſt. By the ſight; 2dly, By the voice; and 3dly, By the freedom of reſpiration through the noſe. In introducing the forceps, it is difficult to avoid the oſſa ſpongioſa; but to ſhun them,

keep

keep the beak of the forceps as near as poſſible to the os palati. When the operator draws away the *polypus*, he may generally bring it away whole, if he draws and moves it very gently. If any of the *polypus* remains, touch it with the lunar cauſtic.

See Poterius, Rulandus, Wedelius, Celſus, Ægineta, Albucaſis, Sennertus, Glendorp, Malpighius, Hoffmann, Levret, Le Dran, Sharp, and Heiſter. Bell's Surgery, vol. iv. p. 90. London Med. Tranſactions, vol. i. p. 407. London Med. Journal, vol. vi. p. 252. Pott's Works, 4to. White's Surgery, p. 253.

POLYSARCIA, from πολυς, *much*, and σαρξ, *fleſh*. *Obeſitas*; *corpulentia*. CORPULENCE. Vogel, to expreſs corpulency, makes uſe of the term *ſteatites*. It may be called a ſpecies of cachexy, for many diſagreeable ſymptoms attend; ſuch as an exceſs of fleſh and fat, ſlowneſs of motion, oppreſſion, weakneſs, difficulty of breathing, ſweating on the leaſt exerciſe, and all the misfortunes that attend voracious animals, or thoſe fattened for uſe, ſuch as inflation, diſtenſion, &c. Dr. Cullen places this genus of diſeaſe in the CLASS LOCALES, and ORDER INTUMESCENTIÆ; and defines it, a troubleſome pinguedinous enlargement of the body.

Dr. Withers, in his Treatiſe on the Aſthma, p. 182, &c. relates, as a ſtriking example of the pernicious effects of *corpulency* in aſthmatical diſorders, the caſe of Mrs. ——, aged 49, of low ſtature, who yet weighed fifteen ſtone. The bones and joints of corpulent people remain nearly in the ſame ſtate, however preposterouſly the other parts may be increaſed in ſize. But if Providence made the bones and joints ſtrong enough to bear with eaſe the weight of ten ſtone, they are ſeldom ſufficient to bear well the addition of ſixty-three pound more, but ſooner or later they will ſink under their burden, and become weak and painful. This patient was very lame and weak in her ankles and knees. The time required to affect the joints is different in different people, according to the natural ſtrength and ſoundneſs of the bones; on which account ſome will be lame much earlier in life than others, though of the ſame degree of *corpulency*. This lameneſs and weakneſs in the joints renders all motion and exerciſe painful and troubleſome, and ſo contributes greatly to increaſe the evil. But as the bones of adults can admit of little or no addition to their ſize, we muſt have recourſe to the other parts of the body to eſtimate the increaſe of weight in *corpulency*: and we find that the chief increaſe of weight is in the additional quantity of blood, and of oily matter or fat which is depoſited in the cellular membrane. The muſcular fibres, it is agreed among anatomiſts, have fixed limitations both in ſize and number. They may, perhaps, be better filled up with the ultimate particles of matter in a ſtate of *corpulency* than in a ſtate of leanneſs; but this will make very little increaſe of bulk; whereas the great increaſe of blood, in corpulent people, is evident to the ſenſes. Morgagni mentions a caſe in which the fat on the muſcles of the belly was above ſix inches in thickneſs, and it was in a proportionate quantity in other parts of the body. Vide Morgagni de Cauſ. & Sed. Morb. The increaſed quantity of blood too, in ſuch caſes, is likewiſe very manifeſt. But the conſequence of ſuch an increaſed quantity of fat and blood muſt be very terrible indeed to the animal frame. In Quincy's Sanct. Aphor. it is obſerved, the greateſt healthy ſtandard the body is capable of, differs from the leaſt, as it more haſtens old age: ſuppoſe one enjoys health at *two hundred*, equally with another of five pound more; the exceſs of the latter has been obſerved to haſten old age five times as faſt.

Now if we examine the ſymptoms which this patient complained of, we ſhall find that the cauſe or increaſe of them may evidently be attributed, in great meaſure, to her corpulent ſtate. "Her head often akes, and feels heavy and dizzy." Theſe are very common effects of *corpulency* and fulneſs of blood; and whenever pain, heavineſs, and giddineſs of the head ariſe from that cauſe, they ought never to be neglected, but always conſidered in the moſt ſerious light by every one who wiſhes to enjoy health and life. From inattention to thoſe ſymptoms, many dangerous complaints occur, ſuch as palſy, apoplexy, epilepſy, inflammation of the brain, &c. "Her nerves are in a very irritable and relaxed ſtate." *Corpulency* and great tenſion of the blood-veſſels generally increaſe irritability; and the want of bodily exerciſe, along with confinement within doors, favours general relaxation. Hence the danger of the caſe is greater; for a ſuperabundant quantity of blood will certainly be more hurtful in an irritable and relaxed, than in a firm and vigorous ſtate of the veſſels. "She is very much ſtuffed in her breaſt, and has a bad cough." How ſeldom do we ſee a very corpulent perſon, who can breathe with eaſe and freedom! Shortneſs of breath and ſtuffing in the breaſt, greatly increaſed by motion, are almoſt conſtant attendants on exceſſive fatneſs. The veſſels of the lungs are greatly overloaded with blood, and a more frequent reſpiration is neceſſary for the circulation of it. The heart, the midriff, mediaſtinum, and large veſſels, are often loaded with an unnatural quantity of fat, which diminiſhes the capacity of the cheſt, conſidered with a view to the dilatation of the lungs and the admiſſion of air into the air-veſſels. Her cough too, which is a very troubleſome ſymptom of the aſthma, is greatly increaſed by the ſame cauſe. Hence, as the caſe proceeds, "ſhe is often attacked ſuddenly with a ſtoppage in her breaſt, with wheezing and great difficulty of breathing, ſo that ſhe is afraid even of inſtant ſuffocation." This is a very dreadful ſymptom of the aſthma, and one which is particularly frequent and fatal to corpulent people. "Her body is much ſwelled with wind. Her nights are uneaſy and diſturbed." Corpulent people, from indulgence in eating or drinking, are very liable to be troubled with wind in the ſtomach and bowels. Their ſleep too is ſeldom natural and compoſed. Many very corpulent people, when aſleep, breathe with ſo much noiſe and difficulty, ſtart ſo violently, and have ſo many ſtoppages and interruptions of reſpiration, that one not accuſtomed to ſee them in that ſtate would ſuppoſe that they were not ſleeping, but threatened with immediate ſuffocation. "She is at times ſubject to a nervous complaint, in which her head trembles and her mouth is drawn to one ſide." This is evidently a dangerous paralytic affection, ariſing in all probability from her corpulent ſtate and the fulneſs of the veſſels of the brain.

Her diet was regulated in ſuch a manner, that it might not be reduced on a ſudden too low, nor yet continued by indulgence to an exceſs, which might increaſe her diſeaſe, and ſoon render it fatal. Very corpulent people, who have long been in the habits of gratifying their appetite, like nothing leſs than to be reſtrained in what they eat and drink. The idea, however, of a natural, or, as it is called, a conſtitutional fatneſs, which (we are taught to believe) comes on and is continued through life, independent of the quantity of nutriment with which the body is daily ſupplied, is a chimera too ridiculous to be ſeriouſly refuted; and indeed nobody was ever ſo abſurd as to ſuppoſe, that the ſame thing could take place in any other living creature. Yet it is readily admitted on all hands, that ſome people will grow fat with a moderate diet, and that others will continue lean though they ſeem to eat immoderately. But this difference ariſes from a better and more perfect digeſtion in the one caſe than in the other. Yet the matter remains equally certain, that the perſon, who grows very fat, takes in more nouriſhment than he ought to do; while the other only follows nature, and prudently endeavours, as far as he is able, to ſupply her daily wants. It is not the *quantity* that we eat and drink, but the *effects* of it on our bodies, which, with a view to the preſervation of health, ought to be chiefly regarded. The juſt proportion of the ingeſted and egeſted ſhould be ſtrictly preſerved. But if what we take in exceeds what paſſes from us by the different outlets of the body, it is manifeſt that we take in more than nature requires. Corpulent people have no chance to diminiſh their *corpulency*, but by *moderating their diet*; for they are ſeldom able to uſe exerciſe ſufficient for that purpoſe. At the ſame time *gentle exerciſe* of all kinds, when it can be admitted, is very adviſeable, and it ought to be increaſed, as they loſe weight and become ſtronger and more active.

See Cœlius Aurelianus, Chron. lib. v. c. 11. Cullen's Firſt Lines, vol. i.

POLYTRICHUM, POLYTRICHON. } See ADIANTHUM.

POLYURICA, ISCHURIA. See ISCHURIA.

POMA AURANTIA. The ORANGE. See AURANTIA HISPANICA.

—— SINENSIS. CHINA ORANGE. See AURANTIA SINENSIS.

POMACEUM. CYDER, called alſo *cicera*, *cidra*. It is the juice preſſed from apples, which hath ſtood to ferment in hogſheads. The more harſh *cyders* are the ſtrongeſt, and keep longeſt. *Cyder* is a uſeful drink in ſcorbutic and melancholic habits; but, if drank to exceſs,

it occaſions drunkenneſs of a longer continuance and more pernicious conſequences, than is produced by wine. It does not intoxicate ſo ſoon as wine, for its ſpirit conveys along with it many viſcous particles, which hinder both its ſpeedy effect and ſudden diſſipation. Moderately uſed, *cyder* is more ſalutary than wine; and whey that is made by turning the milk with *cyder*, is a much more agreeable drink for patients who labour under fevers than that which is made with wine.

POMAMBRA. APPLES of AMBER. They are made of odoriferous powders, to which oils may be added, and theſe powders are made into balls, &c. with wax or mucilage of gum arabic, &c. E. g. take of mace and cinnamon, of each two drams; muſk, civet, and gum arabic, of each one dram; gum tragacanth, two drams. Mix and make into balls. They are agreeable to ſmell to.

POMATICÆ. See COCHLEÆ.

POMATUM. It is the unguentum ſimplex. It was formerly made with lard, ſuet, and a ſpecies of apples called pome-waters; but at preſent it is only lard beat up into a curd, with the addition of a little roſe-water, or other ſweet-water, to give it an agreeable ſcent.

POMIFERA and PRUNIFERA INDICA. See ACAJAIBA.

POMPHOLYX, πομφολυξ. A bubble excited in a liquid ſubſtance by ſome flatulent ſpirit or air contained therein. This name is given to the matter which is found adhering to the covers of the crucibles, &c. in the form of thin cruſts or light downy powder, of a white or whitiſh yellow colour, and is the produce of zinc, which ſublimes from the lapis calaminaris in making of braſs. It is alſo called *nihil album*, *white tutty*, *calamitis*.

POMUM. See MALUM. An APPLE. It is any fleſhy veſſel, containing more ſeeds than one; ſo that all plants which produce ſuch fruit are termed pomiferous, that is, *apple-bearing*. ANAPODOPHYLLUM is called *pomum maiale*, and MOMORDICA, *pomum mirabile Hieroſolymitanum*. See alſo BACCA. It is alſo a term given to the *ſtaphyloma*.

POMUM ADAMI. A name for the LEMON, fructu aurantii; alſo for the protuberance in the fore part of the neck formed by the thyroid cartilage. See ASPERA ARTERIA. This protuberance is thought to receive its name from a whimſical ſuppoſition, that part of the forbidden apple which ADAM eat, ſtuck in the throat, and thus became the cauſe.

POND0, or PONDUS. A WEIGHT. The medical or troy *pound* is leſs than the avoirdupoiſe, but the ounce and the dram are greater. The troy *pound* contains 5760 grains, the avoirdupoiſe *pound* contains 7000 ſuch grains. The troy ounce contains 480 grains; the avoirdupoiſe ounce contains only 437½ grains. The troy dram contains 60, the avoirdupoiſe rather more than 27. So that attention hereto ſhould be had in the making up what is preſcribed with a view to the troy *weights*.

The pound and the pint are called *libra* by the Latins. But there is not any known liquor, of which a pint in meaſure anſwers to a pound in *weight*.

Rectified ſpirit of wine, a pint in meaſure, exceeds a pound *weight* by half an ounce.

PONS VAROLII. Varolius, an Italian anatomiſt, gave this name to a ſort of arch in the cerebellum. He firſt obſerved it. See MEDULLA OBLONGATA.

PONTICA VINA. ACID, FECULENT, and TARTAROUS WINES.

PONTICUM MEL. A ſort of poiſonous honey.

POPLES. The HAM, called alſo *ignys*, *ignys*. The hinder part of the articulation of the knee, or JOINT of the KNEE.

POPLITEA ARTERIA. The *arteria cruralis*, in paſſing the ham, takes the name of *poplitea*, which, whilſt in the ham, is covered only by the integuments. It ends by dividing into the tibialis anterior and tibialis poſterior. Surpriſing as it may appear, it is a fact, that though the artery in the middle of the thigh may be tied with impunity, and the blood be diſtributed as uſual to the leg and foot, yet the *popliteal* artery in the ham never can. An aneuriſm in this artery ſeldom laſts long enough to cauſe a caries in the adjacent bones. When this diſeaſe happens, it admits of no relief, except from amputation of the limb. The artery in this part, when dilated, will increaſe, and at length preſs upon the parts below, ſo as to make them become œdematous, painful, and hard; the conſequence of which will be the deſtruction of the patient, by a mortification of the limb, if amputation is not complied with in time.

—— VENA. The crural vein takes this name, juſt above the ham, and at the lower part of the muſculus popliteus it divides into the tibialis anterior, tibialis poſterior, and peronæa. See CRURALIS VENA.

POPLITEUS. The ſciatic nerve having reached the ham, takes this name: it divides into two branches, which ſpread about the whole leg, called *plantares*.

POPLITEUS MUSCULUS, from *poples*, *the ham*, called alſo *ſubpopliteus*. The place of its ſituation. This muſcle riſes tendinous from the external condyle of the femur, within the capſular ligament; it paſſes tendinous under the ham inwards; plays upon the head of the tibia, and is inſerted into the ſuperior, and inner part thereof, ſerving to turn the toes inwards.

POPULAGO. See CALENDULA PALUSTRIS.

POPULARIS. See ENDEMIAS; EPIDEMIUS.

POPULUS. The POPLAR, called alſo ÆGEIROS. Boerhaave takes notice of five ſpecies.

—— ALBA. WHITE POPLAR, called alſo *albara*; *farfarus*. It grows in moiſt places; a decoction of its bark is given to remove the ſtrangury and the ſciatica.

—— NIGRA, Linn. BLACK POPLAR. It is a tall tree, with dark green, rhomboidal, acuminated leaves, producing imperfect flowers in catkins. In ſome of the individuals called male, the flowers are barren; in others, called female, they are followed by membranous pods, containing a number of ſeeds winged with down. It is indigenous in watery places, and quick of growth. The young buds of the leaves are made into an ointment; they abound with a yellow unctuous odorous juice, which they readily impart to rectified ſpirit of wine. The tincture yields a fragrant reſin, which approaches to the nature of ſtorax. See Raii Hiſt.

—— TREMULA. The ASP, or ASPIN-RREE. Its qualities are ſimilar to thoſe of the black poplar. It grows in woods and marſhy places.

PORCUS. SWINE. In its wild ſtate it is called APER; in Greek ὗς, χοιρος, the ſame which is meant by *ſus*; *ſcropha*; *ſcrofa*; it is called HOG, a well known quadruped, in common uſe as food. Concerning it in this light, and as a medicine, Aldrovandus has written very prolixly, in his Diſſertation on biſulcated Animals. Its fleſh, when prepared for culinary purpoſes, is called PORK. It is not eaſy of digeſtion, and conſidered, by SANCTORIUS and others, to have the ſtrongeſt tendency to retard perſpiration; conſequently in general unwholeſome. Perhaps it is owing to this that the Jews, who were troubled much with eruptive and leprous complaints, were forbid its uſe.

As this animal, called *porcus*, is generally extremely fat, it is conſidered as highly nutritious, to ſuch conſtitutions as can digeſt it eaſily. The fleſh of the young animal of this ſpecies is more readily digeſtible than that of the adult, as its fibres are more tender, and it is top-loaded with fat, ſo that it is an agreeable food to ſome who can by no means attempt to eat thoſe of larger growth.

The name *porcus*, and *porcellus*, is given to ſome fiſhes, particularly the dolphin, and others, becauſe they are ſaid to root up the earth after the manner of ſwine, with their ſnouts. PORCUS alſo, from the Greek word χοιρος, is a name for the PUDENDUM MULIEBRE.

PORI. PORES. It is ſuppoſed that one grain of ſand will cover one hundred and twenty-five thouſand of the *pores* in our ſkin, and that each *pore* is the orifice of a diſtinct gland; but this is only a ſuppoſition, founded on the authority of Lewenhoek, who, with aged eyes and bad glaſſes, ſaw what younger eyes, aſſiſted with better glaſſes than he ever poſſeſſed, could never diſcover. Plants perſpire as well as men; but notwithſtanding the great perſpiration of both, *pores* cannot be diſcovered either in the cuticle of a man, or in the fine membrane that covers the external ſurface of the leaves.

PORRIGO See PITYRIASIS & FURFUROSI.

PORRUM. PORRET, or COMMON LEEK. It differs from garlic only in being weaker. Botaniſts enumerate ſeven or eight ſpecies. Thus are called AGRUMINA.

PORRUS. See SARCOMA.

PORTÆ VENA, vel PORTARUM VENA. The ſplenic, meſenteric, and meſocolic veins, uniting at the root of the meſentery, form the *vena portæ*, called alſo *janitrix*; *ramalis vena*. It may be conſidered as two veins joined endwiſe, and that ſend out branches in oppoſite directions to each other; that one of theſe veins is ramified in the liver, the other lying without the liver, and ſending its branches to the viſcera of the belly; that in the liver may be called *vena portæ* hepatica ſuperior, or minor; the other *vena portæ* ventralis inferior, or major. The particular trunk of the *vena portæ* hepatica forms

what is called the sinus of the *vena portæ*; from this sinus five principal branches go out, which are divided and spread through the whole substance of the liver; the extremities of these branches end in the pulpy friable corpuscules, which seem to be thick villous folliculi. In these folliculi the bile is secreted, and collected by as many vessels of another kind, which again unite in one common trunk; these ramifications are termed pori biliarii, and the trunk *hepaticus ductus*. The *vena portæ* ventralis is situated under the lower, or concave side of the liver, and joined by anastomosis to the sinus of the *vena portæ* hepatica, between the middle and right extremity of that sinus; from thence it runs down from right to left under the trunk of the arteria hepatica, bending behind the beginning of the duodenum, and under the head of the pancreas, its length being about five fingers' breadth. At the head of the pancreas it loses its name, and divides into the *meseraica major* and *minor*, and the splenica. See Winslow's Anatomy.

PORTAIGUILLE. See ACUTENACULUM.

PORTIO DURA, —— MOLLIS. } See NERVUS AUDITORIUS.

PORTORARIUM. The *duodenum*, or the *pylorus*.

PORTULACA, also called *andrachne*; *allium Gallicum*. PURPIE, or GARDEN-PURSLANE. It is chiefly used in the kitchen. Boerhaave enumerates six species; the leaves are cooling, antiscorbutic, and moderately astringent. The seeds are the same.

PORTULACA MARITIMA. See *Halimus*.

PORUS BILIARIUS. The BILE DUCT, from πορος, a *passage*. See JECUR.

—— OPTICUS. It is also called the blind point. It is the point on the retina where no object is seen.

—— RETICULATUS. See ESCHARA.

POSCA. Vinegar and water mixed.

POSSETUM. Posset. Milk curdled with wine, treacle, or any acid. This is by foreigners reckoned peculiar to the English. The serum of a *posset*, called *posset-drink*, is like the whey of milk, only differing with respect to what the means were by which the curd and whey were made to separate.

POSTBRACHIALE. See METACARPUS.

POSTERIOR MUSCULUS AURIS. See ABDUCTOR AURIS, N° 1.

POSTHE. See PRÆPUTIUM.

POSTPOSITIO. POSTPOSITION. When the paroxysm of a fever comes on later than it is expected, it is called the *postposition* of the paroxysm. When it begins sooner, it is called the anticipation.

POTASSA. See CLAVELLATI CINERES.

POTENTILLA REPTANS. See QUINQUEFOLIUM.

POTERIUM. SANGUISORBA. See PIMPINELLA.

POTIO. A POTION. It is a liquid form of medicine, calculated for one dose or draught. *Potions* are distinguished into carthartic, cardiac, and alterative.

POUNXA. See TINCAL.

POUPARTII LIGAMENTUM. See FALLOPII LIGAMENTUM.

PRÆCIPITANTIA. PRECIPITATING MEDICINES, which moderate the motion and heat of the blood, as was supposed, by absorbing and correcting the acid contained therein.

PRÆCIPITANS MAGNUM. See SEPIUM OS.

PRÆCIPITATIO. PRECIPITATION. It is the separating of solid bodies from any fluid menstruum wherein they are dissolved, by the addition of a third body, which having a greater affinity with the menstruum than that already dissolved, causes that solvend to regain its solid form, and to subside in the state of a powder. Or *precipitation* takes place if the solvend has a greater affinity with the third body added than that with which it is already joined.

Precipitation is of two kinds: *first*, where the substance superadded unites with the menstruum, and occations that which was before dissolved to be thrown down. *Secondly*, where the substance superadded unites with the dissolved body, and falls along with it to the bottom. *Of the first* we have an example in the *precipitation* of sulphur from alkaline lixivia by the means of acids; *of the second*, in the *precipitation* of mercury from aqua fortis by sea-salt, or its acid,

When the matter to be precipitated is all at the bottom of the vessel, the fluid being poured off, or filtered, what remains behind is all to be dried in the same manner as levigated powders are,

Precipitation may also be effected by dropping in a liquor specifically lighter than the menstruum by which the precipitate matter was dissolved Thus the spirit of sal ammoniac precipitates plentifully the solutions of metals in acid menstrua; the same is effected by rectified spirit of wine, which also precipitates all salts from water. Acids poured upon heavier acids will precipitate whatever swims in them; thus the spirit of salt precipitates lead, copper, and tin, dissolved in oil of vitriol. *Precipitation* also succeeds if an heavier body be added to the dissolving menstruum: thus acids, or water alone, will carry down all the solid corpuscles which they meet with in tinctures of vegetables extracted by spirit of wine; and the same tinctures extracted by water, or wine, are precipitated by means of acid spirits.

When a third body is added to any solution, for precipitating one part thereof, it produces its effect by uniting with the dissolving liquor, or with the matter which is dissolved: and, as one or the other happens, that which is precipitated is either simple or compound; if the precipitating matter joins with the dissolving liquor, the precipitate is simple, if it unites with the precipitated matter, the precipitate is compound. This should be observed, and the respective precipitates distinguished by the words simple or compound.

Sometimes an advantage may be made of the liquor which remains after the *precipitation* is performed: thus, when fixt alkaline salt is dissolved in water, and sulphur is dissolved in this lixivium, the addition of acid separates and throws down the sulphur, only in consequence of the acid uniting with, and neutralizing the alkali, by which the sulphur was held dissolved; of course, if the *precipitation* is made with the vitriolic acid, and the acid gradually dropt in till the alkali is completely satiated, that is, so long as it continues to occasion any *precipitation* or turbidness, the liquor will yield by proper evaporation and crystallization, a neutral salt, composed of the vitriolic acid and fixed vegetable alkali, viz. *the vitriolated kali*; in like manner, if the *precipitation* is made with the nitrous acid, *a true nitre* may be recovered from the liquor; if with the marine, the salt called *spiritus salis marini coagulatus*; and if the acid of vinegar, *the kali acetatum*. See the Dict. of Chemistry; and also NICHOLSON'S, 1795.

PRÆCOCIA, or PRÆCOQUA. See ARMENIACA MALA.

PRÆCORDIA. See DIAPHRAGMA. Sometimes it signifies the hypochondria. Fernelius, in lib. iv. de Febr. comprehends under this term the region above the stomach, the *diaphragm*, the cavity of the liver and biliary ducts included therein, the pancreas, the stomach in particular, and its upper orifice, with whatever is contained under the inflections of the spurious ribs, towards the foreparts, and the sternum. Some have given this name to the *metatarsus*.

PRÆPARANTIA MEDICAMENTA. Preparing medicines; that is, such as prepare the morbid humours, and dispose them to separate from the healthy, and to pass off by the help of evacuants.

—— VASA. It was formerly supposed that the seed was prepared in them; whence the name. See SPERMATICA CHORDA.

PRÆPARATA VENA. See FRONTALIS VENA.

PRÆPUTIUM, from *præputo, to lop off before*. The PREPUCE or FORESKIN, called by Dioscorides *epagogion, posthe*: when this is wanting the person is called *leipodermos*—when lost, *lipodermus*. See PENIS.

PRÆSAGIA. PRESAGES. Fred. Hoffman observes, that three things are requisite to a right *presage*, viz. 1st. That from due observation we be able to trace and investigate the origins and causes of disorders, in order to oppose them in the beginning, by proper remedies, or give salutary directions. 2dly. That we accurately know the various natures of diseases, and their differences with respect to different constitutions, that we may be better able to give medicines that are capable of removing them. 3d. That we be able to form a right judgment of the operation of medicines, and the event of disorders. This last, though it does not directly obtain the end of the healing art, yet it promotes the certainty of medicine and the reputation of the physician,

PRÆSENTATIO A PRESENTATION. In midwifery it is the manner in which a child offers itself in its passage into the world; and the different *presentations* are denominated, according to that part of the child which is perceived at the mouth of the womb, when a woman begins to be in labour.

In

In a natural labour, the child preſents with its vertex. See PARTURITIO.

The cauſe of wrong *preſentations* is not exactly known; but in different writers in midwifery, various opinions are given.

Preternatural *preſentations* are thus known. The membranes puſh out in a round form, in a right *preſentation*; but when any other part offers, the membranes protrude, for the moſt part, in a lengthened form; and when the pain is off, no part of the child can be perceived, but the membranes only, as in the beginning of labour; after ſome time indeed, from the quantity of water, the membranes have a round form, but then the orifice of the womb is but little opened thereby. *If the head preſents*, it is diſtinguiſhed by bringing the finger round, ſo as to take in a large ſpace of the head; we then feel an uniform hard ſubſtance and often find a ſuture. *When a ſhoulder*, or a *hip preſents*, they have not that uniform hard feel which is obſerved when the head offers itſelf. *If the back preſents*, the vertebræ are felt. *If the belly preſents*, the funis umbilicalis diſcovers it. *The breaſt preſenting*, is known by feeling the ribs. *When the breech offers itſelf*, the private parts are eaſily perceived there, and the meconium is ſqueezed out at each pain. *The hand*, or *foot preſenting*, requires, in order to expedite delivery when proper, that we feel for the heel, that we may determine how to proceed.

1. BOTH FEET PRESENTING: children thus born, are called AGRIPPÆ. When this happens, the toes are generally towards the pubes, inclining a little to the right or to the left; draw the child gently downward whilſt the pains continue to increaſe, and are in their full force; and as you draw the child downwards, gradually incline it to the ſide towards which its toes turn; for when the breech is delivered, the child muſt be turned with its face to the ſacrum of the mother. And if the navel appears, draw down an inch or two of the funis, to prevent its being torn or too much ſtretched; when the body of the child is ſo far delivered, that its ſhoulders check its progreſs, introduce a finger to the elbow of the child; and gently draw the arm down, not perpendicularly, but by inclining it acroſs the breaſt of the child; this done, bring down the other arm with the ſame care. The arms brought down, place the fore and middle fingers of one hand, one on each ſide of the neck, with the thumb in one, and the fingers in the other axilla; then introduce the fore and middle fingers of the other hand into the mouth of the child, pulling the chin of the child cloſe to its breaſt, turn the face into the hollow of the ſacrum, and ſo finiſh the delivery.

2. ONE FOOT PRESENTING.—In this caſe the toes are to the iſchium. If the leg is low in the vagina, ſo that the knee appears, it is too late to bring down the other foot, which may continue until the breech is delivered, and the child's face turned to the iſchium: then proceed as when the breech preſents.

3. BREECH PRESENTING.—When this is the preſenting part, if it is very high, and the os internum ſoft and open, break the membranes, and bring away the child by the feet; but if theſe circumſtances do not attend, leave the buſineſs a while to nature, the pains will puſh forward the preſenting part, and the labour will be as eaſy and ſafe as when the head preſents. In theſe caſes, the face of the child is uſually towards the belly of the mother, but ſometimes it is with its ſides towards her pubes and ſacrum, and as it inclines a little with its face to one or the other, in the courſe of the labour it will turn thereto. As it preſents, ſo let it deſcend, and keep the membranes whole as long as poſſible, for the more eaſy dilatation of the parts. When the hams of the child are from under the pubes, and the perinæum free from the breech preſſing on it, take hold of the child with both hands, and turn it with its face to the mother's back, and then bring down one leg after the other; if the child is very large, the legs muſt be brought down whilſt they are next the os pubis, and then the child's face is to be turned towards the mother's back. When the legs are free, proceed as when both feet preſent. When it is neceſſary to turn the child's face to the back of the mother, do it whilſt the pains are departing.

4. BACK PRESENTING.—When this ſituation is known, and the orifice of the womb is ſufficiently dilated, break the membranes, introduce the hand into the uterus, and carefully ſeek for the feet. When the child is in a lengthened form, and preſents with its back, neck, ſhoulders, or face, if at the ſame time the waters are gone, the caſe may prove a very difficult one. In tranſverſe ſituations of the child, the orifice of the womb does not open ſo ſoon as when the head preſents.

5. BELLY PRESENTING.—In this caſe the child is ſeldom living. The method of delivery is the ſame as when the back preſents. If the feet cannot be reached, get the knees to the belly, and then the feet are ſoon ſecured.

6. AN ARM PRESENTING IN THE VAGINA, and THE MEMBRANES BROKEN.—This is one of moſt difficult caſes that occur in midwifery, eſpecially when the waters are gone, and the uterus contracts upon its burden forcibly. To proceed, puſh up the fore parts of the child towards the fundus uteri with one hand, whilſt with the other the feet are ſought for. But here carefully ſerve, ſhould a pain come on during the effort, ceaſe to act till it is over, leſt the uterus ſhould be hurt, and always rather act from the womb, than againſt it, where poſſible. Thus, if the waters are all run off, begin with ſeeking for the feet; when they are found, draw them gently towards the vagina, at the ſame time puſh up the body of the child. When the feet are brought into the vagina, the caſe becomes the ſame as when the feet preſent. When the arm preſents, and the os internum is very rigid, before any attempts are made, wait for the dilatation of the part by the force of the pains.

In the London Medical Journal, vol. v. p. 64, &c. are related, by Dr. Denman, three caſes of the upper extremities preſenting; and the delivery being partly effected by the ſpontaneous evolutions of the child. In the firſt caſe, the woman had been in labour during the whole night, and one of the child's arms was the preſenting part; on attempting to turn the child, the pains were too violent to admit the introduction of the hand into the uterus. Imagining the child was ſmall, ſo that it might paſs, doubled, through the pelvis, farther endeavours to turn were omitted; and on waiting a little, the breech preſented, and the head was the laſt part that was delivered. In the ſecond caſe, the *preſentation* was the ſame as in the firſt, and it was agreed on to turn the child; but the pains were ſtrong and frequent, ſo that the action of the uterus was ſuch as to forbid all endeavours that way. It was then agreed on to wait for the effect, which a continuance of the pains might produce, or till they were abated, when the child might be turned with leſs difficulty. The pains continued, and propelled the child lower into the pelvis, and in little more than an hour it was born; the breech being expelled, as in the firſt caſe In the third caſe; the arm preſenting, and labour gone on for ſome time, after which attempts were made during ſeveral hours to turn the child, whole ſhoulders ſtrongly preſſed upon the perinæum; at length, by the action of the uterus, the child was doubled, and the breech expelled; after which, the ſhoulders and head were extracted. In all theſe caſes the doctor obſerves, that the women were; the full period of utero-geſtation, and the children were of the uſual ſize. More caſes might be related, but theſe ſufficiently prove the fact, that in caſes in which children preſent with the arm, women will not neceſſarily die undelivered, though they are not aſſiſted by art. With reſpect to the benefit we can in practice derive from the knowledge of this fact, it may be obſerved, *that the cuſtom of turning and delivering by the feet in preſentation of the arm, will remain neceſſary and proper, in all caſes in which the operation can be performed with ſafety to the mother, or give a chance of preſerving the life of the child. But when the child is dead, and when we have no other view but merely to extract the child, to remove the danger thence ariſing to the mother, it is of great importance to know that the child may be turned ſpontaneouſly, by the action of the uterus.* If we avail ourſelves of that knowledge, the pain and danger which ſometimes attend the operation of turning a child, may be avoided. Nor would any perſon verſed in practice, fixing upon a caſe of preternatural *preſentation*, in which we might expect the child to be turned ſpontaneouſly, be involved in difficulty, if, from a defect of the pains or any other cauſe, he ſhould be diſappointed in his expectations. Nor would the ſuffering or chance of danger to the patient be increaſed by ſuch proceeding. About thirty of theſe caſes have lately occurred, in two of which the children were born alive.

Some propoſe bleeding ad deliquium for abating the too ſtrong contraction of the uterus; and, at the moment of fainting, to attempt delivery.

7. THE HEAD LOCKED FAST AT THE BRIM OF THE PELVIS. In this caſe, and the ſeven next following, the membranes are broke, and the uterus is contracted about the body of the child. In this caſe, if the child be living,

a tumor will be formed on its head, which will ſo increaſe, as to reach to the os externum; but when the child dies, this tumor becomes ſoft, and gradually diſappears. Whatever part of the head preſents, it may be locked faſt, though generally the face is towards the ſacrum; care is, however, required to know the part which preſents, and the ſituation of the child In order to delivery, the curved forceps are neceſſary.

8. THE MIDDLE OF THE SAGITTAL SUTURE RESTING ON THE PUBES, AND THE FACE OF THE CHILD TURNED UP TOWARDS THE FUNDUS UTERI. In this caſe the chin is preſſed upon the breaſt. Mr. Levret of Paris directs the following procedure in this caſe. "Before the firſt branch of the forceps is introduced, a fillet muſt be paſſed through the perforated blade, and likewiſe through the ſecond before it is paſſed; and after fixing the handles, tie the ends of the fillets together ſo as to hang down in a nooſe about ſix or ſeven inches; then taking the forceps in the right hand, raiſe the handles, and bearing down at the ſame time with the left hand in the garter, the forceps will be converted into a lever of the third kind, the moving power being between the point of ſupport, or the hand, and the point of reſiſtance, or the head of the child, which will be made to deſcend into the hollow of the ſacrum, and be delivered afterwards with eaſe.

9. THE HEAD PRESENTING WITH THE EARS TO THE PUBES AND OS SACRUM. This is known by the ſagittal ſuture running from iſchium to iſchium, ot oblique. And to know which way the face is turned, the ear ſhould be felt at the pubes. Sometimes the head may be removed from this poſition with our fingers; but when this cannot be done, the forceps muſt be uſed. If the face is to the left ſide, turn the woman on her left ſide; if to the right, lay her on her right ſide. In general, when the ears are to the ſides of the pelvis, and the forceps are to be applied, the woman ſhould be on her back, and her breech over the bed; but when the ears are to the pubes or groin, it is better to lay her on her ſide, and generally on the left. If the blade of the forceps cannot be introduced by the os pubis, the ear lying cloſe to it, introduce the blade a little to one ſide, then ſlip it over the ear under the pubes, and as the blade goes up, withdraw the hand. *Over the ear is the beſt ſituation for the forceps; but if this cannot be, put one blade before one ear, and the other behind the other.*

The forceps ſecured, pull gently when the pains are preſent, until the vertex is as low as the loweſt part of the iſchium; then turn the forehead into the concave part of the ſacrum, and give it a quarter turn more to bring the body into the ſame poſition, or, perhaps, the ſhoulders may catch againſt the pubes; then reverſe the quarter turn, and the forehead will be in its proper ſituation. The delivery will now be finiſhed, as when the head is low, and the pains gone.

10. THE FACE PRESENTING WITH THE CHIN TO THE PUBES. In any ſafe caſe, if the pains are ſtrong, uſe no forceps, but take time, and nature will do her own buſineſs. If the face preſents with the chin to the pubes, if the woman hath had children before, and the pelvis is good, the child will come forward very well by the force of the pains; for when it hath got below the pubes, the fore part of the neck will turn on it as on a fulcrum, and the vertex will riſe from under the perineum, and delivery will be effected without extraordinary difficulty, provided the perinæum is well ſupported.

If called in time, and the os tincæ is dilated, it is uſually recommended to introduce the hand, and bring away the child by the feet; but if the pelvis is diſtorted, it is better to make the vertex preſent, by turning it with the hands. But be the pelvis as it will, if the face preſents with the chin to the pubes, if the waters are run off, the head low, and the pains very languid, apply the forceps. When the chin is cleared the difficulty is over. After the forceps are fixed, be careful to prevent the chin from catching againſt the os pubis.

11. THE FACE PRESENTING WITH THE CHIN TO THE OS SACRUM. When the waters are run off, and the head is ſtrongly detained, delivery is extremely difficult. The head muſt be raiſed and turned with the chin to the pubes before delivery can be effected. In this caſe truſt to nature rather than begin too ſoon with the forceps; when the forceps are applied, force them upwards until you can turn the chin to the os pubis, and then proceed as when the chin at firſt preſented this way.

12. THE FACE PRESENTING, AND THE CHIN TO ONE SIDE. If the woman is laid on her left ſide, the child may often be turned ſo as for the chin to paſs under the pubes. If this cannot be done, introduce one blade of the forceps under the pubes, the other at the ſacrum; then bring the chin under the pubes, and proceed as in that caſe.

13. THE FACE TO THE OS PUBIS. When the fontanel preſents, the face is generally to the pubes. In this caſe, if the pelvis is good, and the parts dilated, the child will paſs by the force of pains; but if the parts are rigid, the perinæum will be endangered. If the child is ſmall, and the pelvis large, pains may ſuffice to deliver the child; but if otherwiſe, as ſoon as the waters are broke, introduce the hand, and deliver by the feet. If this opportunity does not favour us, the forceps muſt be uſed. In order to feel the ear, puſh up the head, that the finger may paſs to the ear, and the forceps follow it; then fixing the other ſide of the forceps, and when the head is pulled ſufficiently low, turn the forehead into the cavity of the ſacrum, and deliver as when the head is low, but pains wanting.

14. THE SHOULDERS LOCKED. In this caſe the head is moveable in the vagina; the face is on one ſide, one ſhoulder reſts on the upper and lateral part of the os ſacrum, the other paſſes over the ſides of the os pubis, ſo that the ſcapulæ and back of the child reſts in the pſoas and iliac muſcles on one ſide, and the knees and elbows preſs the ſame parts on the other ſide. The intention here is, to remove the ſhoulder on the ſide of the ſacrum, to bring them both to the wideſt part of the pelvis; to do this, ſlide a blade of the forceps under the ſhoulder of the child, and as with a lever, raiſe that which reſts on the ſacrum, and carry it over the projections, which when properly executed, the head will deſcend, and the delivery be almoſt ſpontaneous.

15. THE HEAD SEPARATED AND LEFT IN THE UTERUS. In order to delivery, introduce a hand, and turn the chin to the os pubis, then, an aſſiſtant gently preſſing the belly to keep the head from rolling about, the operator muſt introduce the long curved forceps, and fix them on the head; having thus done, draw the head down until it is fixed in the pelvis; turn the handles up to the os pubis, and introduce a pair of ſciſſars; open the head, and deſtroy the ſtructure of the brain; after this, give the forceps a diagonal turn, then proceed as in any other caſe in which the head is ſo ſituated.

16. TWINS.—It is very difficult during pregnancy to know whether or no there will be twins at the birth. When there is but one child, the uterus rarely, if ever, riſes above the brim of the pelvis at an early period; ſo if on the third or fourth month it riſes up to the navel, it is very probable that there are twins. If after the delivery of one child the uterus is contracted into a firm hard ball above the os pubis, it is thereby known that there is not another; if, on the contrary, it is much diſtended, we ſhall find a child yet to come forth; and on examining there is another ſet of membranes. When one child is delivered, tie the funis in two places, then wait for pains coming on, to deliver the next, except it preſents in a bad poſition, in which caſe bring it away by the feet. Except the placenta of the firſt child is looſe, and preſents itſelf for excluſion, leave it until the other child or children are delivered. The placentæ generally adhere to each other, but they are two diſtinct ones; though it ſometimes happens that ſome of their veſſels communicate; whence the neceſſity of tying the cut end of the funis when the firſt child is delivered.

17. MONSTERS.—Theſe are when two children are ſo united as to be one, or when one child hath, in ſome remarkable inſtances, the parts of two, and but one funis and placenta are found. When theſe are ſmall, they ſometimes paſs by the common method of delivery, but when they are large they occaſion ſome difficulty. Rules cannot eaſily be laid down, becauſe of the variety of the ſubjects; the ſagacity and dexterity of the operators muſt here be wholly left to themſelves, both in ſuggeſting the method, and in executing the plan for delivery.

18. THE HEAD LOW AND THE POSITION RIGHT, THE PAINS HAVING CEASED.—The head being long confined in the pelvis, is equally dangerous to the mother and the child, as a mortification may be induced in the firſt, whoſe influence will extend to the laſt, and prove fatal to both. To complete the delivery, the operator introduces one hand into the vagina, and puſhes it on

until the ends of his fingers enter the orifice of the uterus; then with the other hand he paſſes one blade of the forceps between the introduced hand and the head of the child, withdrawing the hand, and holding the handle of the blade ſteady, he introduces the other hand in the ſame manner as the firſt. and after it he introduces the other blade of the forceps, then with both hands he puſhes them up until the locking part is within an inch of the child's head; he then locks and ties them ſo together that they may be ſteady, and proceeds by pulling them gradually from ſide to ſide, reſting a little now and then; when thus the head is brought ſo low as conſiderably to ſtretch the perinæum, and to protrude from under the os pubis, the handles of the forceps muſt be raiſed gradually towards the woman's belly, and thus the head will be completely delivered: this done, and the forceps removed, the procedure will be as when the labour is natural.

19. THE HEAD TOO LARGE OR THE PELVIS TOO SMALL.—In theſe caſes the head being brought as low as the natural pains can force it, its ſize is leſſened by boring into it with a pair of STOP-SCISSARS contrived for that end, and diſcharging the brains; then with the curved crotchets ſecured on the head in the ſame manner as it directed for the forceps; or with a blunt hook introduced into the perforation made with the ſciſſars, the head of the child is brought forward. When the pelvis is diſtorted, the child muſt never be turned with a view of delivering it by the feet; but if it preſents by the feet, endeavours muſt be made to deliver it that way.

20. THE OCCIPUT PRESENTING.—When this happens, ſuppoſe the occiput lies over the os pubis with the face upwards, the operator muſt thruſt up the child, and preſs back the ſacrum, that the vertex may be brought to preſent; but if this cannot be done, fix one ſide of the forceps betwixt the os pubis and the occiput, ſo as that the point may be in the neck of the child, and ſtrive thus to move it; this done, fix the blades on the moſt convenient parts, and deliver. See the authors mentioned under the article OBSTETRICATIO.

In the operative part of delivery, one direction is abſolutely neceſſary; that is, *always to adapt the largeſt diameter of the part to the largeſt axis of the pelvis*; and this obſerved, will expedite the delivery, whether the fault lies in the part preſenting, or the part through which it is to be extracted.

PRANDIUM, alſo *Ariſton*. DINNER.

PRASIUM ALBUM. See MARRUBIUM ALBUM.

PREHENSIO. See CATALEPSIS.

PREMNON. See OCULUS.

PRESBYTÆ, from πρεσβυς, *old*. Thus thoſe are called whoſe eyes are too flat to refract the rays ſufficiently, ſo that unleſs the object is at ſome diſtance, the rays coming from it will paſs through the retina before their union, conſequently viſion is confuſed; old people are uſually the ſubjects of this diſeaſe. In order to remedy, or at leaſt to palliate this defect, the perſon ſhould firſt uſe glaſſes that do not magnify, and from them paſs gradually to more convex ſpectacles, which ſhorten the focus. It is a ſpecies of AMBLYOPIA.

PRESERVATIVA AQUA. See ANTIVENEREALIS AQUA.

PRESSURA. Inflammation of the ends of the fingers, from the effects of cold. It is an inſtance of the *phlogoſis erythema* of Cullen.

PRIAPÆIA. See NICOTIANA MINOR.

PRIAPISMUS, from *Priapus, the heathen god*, whoſe penis is always painted erect. A PRIAPISM. It is an erection of the penis without any concomitant pain, or the conſent of other parts. It is thus called, becauſe the perſon in this ſtate reſembles the lewd god *Priapus*. Cœlius Aurelianus ſays it is a palſy of the ſeminal veſſels, and other nerves diſtributed to the parts about the penis, by the diſtenſion of which this diſorder is produced.

PRIAPUS. See PENIS.

—— VEGETABILIS. See NEPENTHES.

PRIMÆ VIÆ. The FIRST PASSAGES; that is, the ſtomach and inteſtinal tube,

PRIMULA VERIS. See PARALYSIS. For that called ODORATA, ſee AURICULA URSI.

PRINCEPS ALEXIPHARMACORUM. See ANGELICA.

PRINCIPIA. The PRINCIPLES OR ELEMENTS of BODIES. To know the virtues of *bodies*, or how mixed *bodies* ſtand related to the human *body*, either for preſerving, or for reſtoring it, we muſt know the *principles*, and alſo the mixture and proportion of ſuch *principles* in which their virtues conſiſt: ſuch ſimple parts, therefore, as all mixed bodies can be reſolved into, are called *principles* or *elements*.

In analyſing mixed *bodies*, a ſpirit, or mercury as the ancients call it, ſulphur, that is oil, ſalt, water, and earth, are obtained. Modern chemiſts deny that either ſalt or oil are *principles*; for ſulphur and oil may be reduced to ſalt, earth, and water.

On this ſubject, what Beecher hath advanced, though very obſcure, is yet the ſource of many valuable diſcoveries in chemiſtry. Stahl hath improved on Beecher, and by the aid of theſe great men it is demonſtrated, that fire, water, and earth, enter into the compoſition of *bodies*. Sir Robert Boyle and Dr. Hales have as clearly proved that air is a conſtituent of moſt *bodies*. Thus, as Ariſtotle taught, long before chemiſtry furniſhed its aids for the eſtabliſhing this truth, the four *elements*, viz. earth, air, fire, and water, are now ſaid to be the *principles* of all compound *bodies*. However *bodies* are decompoſed, theſe conſtituents are always obtained, and as theſe cannot be decompoſed any farther, they are conſidered as ſimple ſubſtances, and are called primary *principles*, or *elements*. CHAPTAL, ſpeaking of theſe elements, ſays, "But, as ſoon as chemiſtry had advanced, ſo far as to diſcover the principles of bodies, the profeſſors of that ſcience preſumed to mark the number, nature, and character of the elements; and every ſubſtance that was unalterable by the chemical method of decompoſition, was conſidered by them, as a ſimple or elementary principle. By thus taking the limits of analyſis, as the term for indicating the elements, the number and nature of theſe muſt vary according to the revolutions and progreſs of chemiſtry. This has accordingly happened, as may be ſeen, by conſulting all the authors who have written on this ſubject, from the time of Paracelſus to the preſent day. But it muſt be confeſſed, that it is no ſmall degree of raſhneſs to aſſume the extent of the power of the artiſt, as a limit for that of the creator; and to imagine, that the ſtate of our acquiſitions is a ſtate of perfect knowledge.

The denomination of principles, or elements, ought, therefore, to be effaced from chemical nomenclature; or, at leaſt, it ought not to be uſed, but as an expreſſion, denoting the laſt term of our analytical reſults; and it is always in this ſenſe that he uſes the word. CHAPTAL's Elements of Chemiſtry, p. 7. vol. i.

In decompoſing *bodies* that are much compounded, they are not by a firſt analyſis reduced to their primary *principles*; but ſubſtances are obtained from them that are more ſimple than the original one was; and as theſe do the office of *principles* in the compoſition of *bodies* leſs ſimple than themſelves, they have been called *principiate principles*. Moſt chemical agents, as acids, alkalies, &c. are of this kind. *Principiate principles* have very different degrees of ſimplicity, and ſo are diſtinguiſhed into firſt, ſecond, &c. orders. See Nicholſon's Dict. of Chem. 1795.

PRIVATIVI. DIMINUTION of the SENSES. Defect of appetites. It is ſynonymous with *dyſæſtheſiæ* and *dyſorexiæ* in Cullen's Noſology, particularly in the inſtances of deficiency.

PROBOLE. See APOPHYSIS.

PROBANG. A flexible piece of whalebone, with ſponge fixed to the end. See DEGLUTITIO.

PROCARDION. The PIT of the STOMACH.

PROCATARCTICA CAUSA. The PROCATARCTIC CAUSES, from προκαταρχομαι, *antigredior*. The pre-exiſtent cauſe. See CAUSA.

PROCESSUS. A PROCESS, from *procedo, to ſtart out*. In CHEMISTRY, it is a ſeries of operations tending to the production of ſomething new.

In ANATOMY it is a *proceſs*, and is a protuberance or eminence of a bone; called alſo *condylus*. Many bones have *proceſſes* riſing out of them. If the *proceſs* ſtands out in a roundiſh ball, it is called *caput*, and the narrow part is called *cervix*; when the head is rather oblong, and unequally rounded, it acquires the name of a condyle; a rough, unequal protuberance is called a tuberoſity; ſuch *proceſſes* as terminate in a ſharp point, have the name of *corone* or *coronoid*: ſuch as form a longitudinal ridge are called *ſpina*, and ſometimes *criſta*, the *labia* are each ſide of a broad ſpine; ſuch as form brims of cavities are named *ſupercilia*. The uſe of *proceſſes* is to give bones their neceſſary ſhape, and to adapt them for motion; they ſometimes ſerve to give cavities, and generally are uſeful in allowing a greater ſurface for the origin, larger attachment

attachment, and more advantageous direction of muſcles. *Proceſſes* are of two kinds, viz. the APOPHYSIS, and the EPIPHYSIS, which ſee.

PROCESSUS CILIARIS. See CILIARE LIGAMENTUM.

—— MAMILLARES. See OLFACTORII NERVI, and PROCESSUS MAMMIFORMES.

PROCIDENTIA. See PROLAPSUS.

PROCIDENTIA ANI, from *procido, to fall down*, called alſo *prolapſus ani, exitus ani, exania*. The FALLING DOWN of the FUNDAMENT. It is a relaxation of the ſphincter to ſuch a degree that the internal villous or rugous coat of the inteſtine, turneth out and beareth down, making a ſwelling proportionably.

The cauſes are, a weakneſs in the part, which is aggravated by coſtiveneſs, diarrhœas, and particularly a teneſmus: an acrid humour falling on this part, the hæmorrhoides, hard labour, a ſtone in the bladder, or whatever can occaſion a paralyſis of the levatores and ſphincter ani. Hoffmann ſays the cauſe is not in a relaxation of the inteſtine, but of its ligaments.

Infants are the moſt frequent ſubjects of this diſorder, by reaſon of the tenderneſs of their frame and their frequent ſtraining, either from coſtiveneſs, or the *falling down* of a ſharp humour on theſe parts.

The ſigns are evident to the ſight; the inſide of the inteſtine is turned outward; the tumor is of a fleſhy colour, ſometimes it is wrinkled, at others it is ſmooth and ſhining, and is accompanied with an uneaſineſs, and an ineffectual deſire to go to ſtool.

Sometimes this diſorder is miſtaken for the piles; indeed any tumor about the anus, when of a conſiderable ſize, may be miſtaken for the deſcent of the part, and vice verſa; therefore attention is not unneceſſary. Through miſtake, a ligature hath been applied about the prolapſed anus, in order to extirpate it.

The cure is difficult, but leſs ſo in children than in grown people. When coſtiveneſs, a ſtone in the bladder, or labour, gives riſe to this complaint, the cure is ſometimes effected: when a diarrhœa follows it, the cure is very difficult; if ſucceeded by the hæmorrhoids the difficulty is yet greater.

When acrid matter is obſerved to occaſion fruitleſs ſtraining, ſo as to force down the inner coat of the rectum, give a gentle doſe of rhubarb every third or fourth day; and in the intervals of purging give abſorbents and ſtrengtheners, ſuch as chalk, in frequent and ſmall doſes; if pain is conſiderable, give ſmall doſes of the tinct. opii, at proper intervals. *If the habit is coſtive*, give laxatives in ſuch doſes as will procure a ſtool or two every day:—*if a diarrhœa attends*, it ſhould be gradually checked;—*if there are ulcers in the inteſtines*, or *if by the ſharpneſs of the humours the mucus is abraded*, the ſtarch clyſter, with a few drops of the tinct. opii ſhould be now and then injected.—*If a teneſmus comes on*, let a clyſter be injected every night, or oftener, in which is the Venice turpentine diſſolved with yolk of egg.—*If the prolapſed inteſtine is ſwelled*, apply diſcutients; when the tumor gives way uſe gentle aſtringents; then, by gently preſſing the part with your fingers, the whole will return to its proper ſituation; after the reduction the part may be ſuſpended by the T bandage. It is the moſt eaſily reduced by the patient himſelf lying on his back, and writhing himſelf from one ſide to another, croſſing his legs, &c. But, as in all other caſes, let the cauſe be firſt attended to.—*If it goes up and down of its own accord*, there is no occaſion for ſurgery; the beſt method will be to remove the irritation, and ſtrengthen the whole ſyſtem, which is generally in a relaxed ſtate. The irritation is frequently produced by an acrid mucus, which is generally relieved by alkaline medicines. Avoid aſtringents; even omit the bark, if it proves aſtringent.—*Sometimes the inteſtine is not only thruſt forth, but is ſo bound by the ſphincter ani above, that it cannot readily be returned*; in ſuch caſe Mr. Pott adviſes to bleed, to give opium as required, to foment, and wrap up the part in an anodyne and emollient poultice; thus in a little time its ſtate is ſo altered, that it generally is returnable, until which time, the more we handle it the worſe it will be; but now having gently wiped it clean, it may be returned.—*If extirpation proves neceſſary*, it is beſt performed by ligature; exciſion is not to be attempted, for fear of hæmorrhage, which, ſhould it follow, it would be from veſſels that nature muſt ſtop, for art could not reach them.—*If the prolapſus is large*, take a ſtrong needle, double threaded, and paſs it through the inteſtine, tie it above on one ſide, and then below on the other, or above and below properly. *If the prolapſus is ſmall*, paſs a double ligature round its whole diameter; in both caſes leave it to drop off. The pain is allayed by poultices, opium, &c. The ſphincter afterwards does its office, and this moſt troubleſome complaint is entirely got rid of.

When the prolapſus ani is cauſed by ſtone in the bladder, or *other diſeaſe*, it will be reſtored when thoſe complaints are relieved on which it depends: therefore, great care ſhould be taken before extirpation is attempted, that the caſe is ſimply the relaxed *prolapſus*.—*If a gangrene affects the inteſtinal fold*, ſlightly ſcarify the diſcoloured part, apply ſtupes wrung out of warm red wine, or other antiſeptics; repeat them every two or three hours, and betwixt the uſe of theſe continue the catapl. e cumino on the part.—*When the prolapſed part cannot eaſily be kept up in grown people*, Cheſelden recommends to "take away a piece of the prolapſed gut lengthways, for after the cicatrix is formed, the gut will never deſcend." But on this Mr. Pott remarks, "I am ſorry for this, leſt Mr. Cheſelden's authority ſhould tempt any other perſon to make the ſame trial." Gooch, in his Caſes and Remarks, gives the draught of a convenient machine by which the parts may be ſupported. See Turner's, Wiſeman's, and Heiſter's Surgery. Bell's Surgery, vol. ii. p. 268. White's Surgery, p. 380.

PROCIDENTIA OCULI. See MALUM.

—— UTERI. The FALLING DOWN or DESCENT of the WOMB; called alſo *metroproptoſis, ecptoma hyſteroptoſis*. Different ſpecies of this diſorder are thus diſtinguiſhed: 1. RELAXATIO, a BEARING DOWN of the WOMB; it is when the womb deſcends down to the middle of the vagina, or even with the meatus urinarius. 2. PROCIDENTIA; the PRECIPITATION or FALLING OUT of the WOMB: it is when it deſcends to the labia pudendi. 3. The PROLAPSUS; the deſcent, or falling through the labia pudendi. 4. INVERSIO or PERVERSIO, the inſide turning out: and, 5. RETROVERSIO, which ſee.

In the leſſer degrees of theſe diſorders they are diſcovered by the touch, and the greater degrees by the eye. If the woman ſtands upright, and a finger is introduced into the vagina, the bearing down of the womb is diſcovered, and by meeting with the os tincæ the caſe is diſtinguiſhed from a deſcent of the vagina; though, in ſome inſtances, much difficulty attends the diſtinction of theſe accidents. If the woman is pregnant, ſhe finds a weight at the bottom of her belly, and the cervix uteri preſſes ſo low that ſhe cannot walk but with pain and ſtraddling; towards the latter end of pregnancy, the womb ſinks ſo low as to cauſe numbneſs in the hips and ſleepineſs in the thighs, a difficulty of urine and at going to ſtool, by preſſing the rectum and the neck of the bladder; a conſiderable pain is alſo felt in the loins, about the inſertions of the ligamenta lata.—When there is a PERVERSIO UTERI, it appears like a piece of fleſh; and when this is the caſe, it is always attended with a *procidentia veſicæ urinariæ*.

Girls are ſometimes the ſubjects of this diſeaſe, but it moſt frequently happens to women who have had children, in whom it is generally cauſed by hard labour, or getting out of bed too ſoon after delivery, though ſometimes it is owing to a weak relaxed habit. A ſhort funis umbilicalis, and the placenta adhering, may be the cauſe, particularly if force is uſed in delivering them.

If any ſpecies of this diſorder is neglected, the woman ſuffers much pain, with a difficulty in voiding her urine; and ſometimes an inflammation, ulcers, or a cancer, will be formed in the womb.

In general the cure is only palliative, and conſiſts of introducing a peſſary into the vagina, by which the uterus is kept from falling down any lower; ſometimes this proves a means towards a radical cure, by giving the relaxed parts an opportunity of recovering their tone. Sometimes, when a leſſer degree of this diſorder hath happened, the uſual confinement in bed during the next lying-in hath effected a cure; a peſſary ſhould be introduced as ſoon as it conveniently can, after delivery being completed, and worn for ſome time after the woman walks abroad. A round peſſary is the beſt, and ſhould be ſo large as to occaſion ſome uneaſineſs in paſſing it up, or it will be apt to fall down again. See PESSARIUM. *If a lacerated perineum is the cauſe of the womb bearing down*, a peſſary will not be very uſeful; in this caſe a ſort of cuſhion may be placed with its convex ſide to the os externum, and ſecured there by the T bandage.—*If the prolapſus hath been long neglected, ſo that a ſwelling*

and

and inflammation is come on upon the part, bleed, keep the bowels open, and apply fomentations and poultices.—*If a mortification appears*, give the bark, and uſe the juſt named applications, until the ſloughs ſeparate and the parts heal, after which apply a peſſary, if the patient can bear it. Whenever a gangrene or a cancer appears, reduction increaſes the attending ſymptoms, or produces new and fatal ones; *but if there are ulcers*, the part ſhould be reſtored with all convenient ſpeed.

THE INVERSIO is when the uterus not only deſcends, but is turned inſide outward. This never happens but immediately after delivery, the os tincæ then being nearly as large as the fundus; and, beſides this, ſome violence, ſuch as pulling the funis forcibly to bring away the placenta, is uſed, otherwiſe the contraction of the womb, after being freed from its principal burden, the child, would abſolutely prevent all poſſibility of this kind of diſorder. Whatever be the cauſe, the part muſt immediately be reſtored, or the conſequence will ſoon be fatal, for its orifice will contract in this unnatural ſtate, and ſo prevent the needful relief. Firſt empty the bladder, if it contains much urine; then lay the patient on her back with her hips raiſed, and with the hand reſtore the uterus; gently return it into the vagina with three fingers, and then with the whole hand place it in the belly, after which, clench the fiſt, and retain it there, until the uterus contracts upon it; laſtly, ſupport it as in the caſe of a prolapſus.

Dr. Leak, in his Medical Inſtructions, adviſes, that after the parts are reduced, the intention of contracting the relaxed vagina, ſo as to prevent its future deſcent, may be effected by the frequent uſe of the following aſtringent injection. ℞ Alum. r. & vitriol. alb. ää ʒ i. aq. bullient. ℔ j. m. & filtr. per chart. Inject it into the vagina, milk warm, with a womb-ſyringe. At the ſame time endeavour to ſtrengthen the whole bodily ſyſtem by nouriſhing diet, chalybeate waters, and ſuch as the following ſtrengthening mixture. ℞ Cort. Peruv. pulv. ʒ i. cort. aurant. ʒ iii. aq. bullient. ℔ i. colaturæ adde ſpt. lavend. c. ʒ iij. cap. cochl. iv. vel vj. bis in die. If the internal parts are free from decay, the cold bath will give great relief. Though the parts bearing down be ulcerated, return them and inject them with barley-water to keep the ulcer clean. The T bandage may be worn with advantage. Should the deſcent of the tumor prevent the patient from walking about, a fine ſponge wrung out of alum water may be dried in a compreſſed ſtate, and cut into any convenient form, ſo as to be introduced as high as poſſible; this will act by its aſtringency, and by its preſſure, in a gentle and uniform manner: during the uſe of this application, the above aſtringent injection may be uſed twice a day; and the ſponge tent ſhould be made gradually ſmaller as the vagina contracts.

In the Edinb. Med. Commentaries, vol. ii. p. 43. is the following account. A woman of ſingular fortitude, about fifty years of age, was much afflicted with *prolapſus uteri*. After trying many remedies in vain, and being tired out with the continuance of her complaint, ſhe at length cut into the ſubſtance of the uterus with a common kitchen knife. A conſiderable hæmorrhage enſued; after which the uterus gradually contracted, and ſhe had neither a return of the *prolapſus*, nor was ſhe afflicted with any other ſymptoms. Having boaſted of her ſucceſs, many women in the neighbourhood afflicted with the ſame complaint, applied for her aſſiſtance, and by a ſimilar operation were effectually cured.

In the PROLAPSUS VAGINÆ the ſame method of cure is ſtill more ſtrongly recommended.

It is ſuppoſed that ſcarifications may ſucceed, inſtead of inciſions on the *procidentia uteri*; ſee Ruyſch's Obſ. No. 1, 7, 9, 10. and Saviard. Lond. Med. Obſ. and Inq. vol. ii. p. 8—6. Med. Muſeum, vol. i. p. 227—230. Heiſter's Surgery. Hamilton's Midwifery, edit. 2. p. 133, 239. Edinb. Med. Comm. vol. ii. p. 43. Lond. Med. Journal, vol. vi. p. 387. White's Surgery, p. 460. Leake's Med. Inſtruct. edit. 5.

PROCIDENTIA UVULÆ. See HYPOSTAPHYLE.

—— VAGINÆ, BEARING DOWN of the VAGINA; called alſo *colpoptoſis*. The degrees of this diſeaſe are different; but when a part of, or all the vagina appears through the pudendum, it may be called a prolapſus; when it deſcends to the labia pudendi, it may be termed a *procidentia*; and when not ſo far, a *relaxatio*. Widemannus gives a caſe of a *prolapſus vaginæ* which had all the appearance of a prolapſus uteri, and which was not properly diſtinguiſhed until it was too late to afford any relief; *but generally they are known by obſerving the os tincæ, which diſtinguiſhes the womb from all other caſes of a deſcent, and from the inverſio*, by its only happening after labour. When the whole vagina is prolapſed, it appears like crude bloody fleſh. If the prolapſed vagina ſwells violently, and is attended with inflammation, there is immediate danger of a ſphacelus; if the prolapſed part be affected with little or no ſwelling, or if there is no inflammation, the tumor will be very little trouble, and without danger. This diſorder ſhould be diſtinguiſhed from a tumor, a fungus, a ſarcoma, &c. of the part.

The part may be reſtored with the fingers; which when done, the patient ſhould reſt in bed for ſome days, and uſe an injection of warm vinegar and water, or red wine and water; or inject a little water, in which is diſſolved a little ceruſſa acetata. In moſt caſes of procidentia vaginæ, the firſt object ſeems to be ablution, then reduction, and afterwards corroborants, ſuch as cort. Peru. acid. vitrioli dilutum, cold bath, and avoiding at leaſt all ſtrong exerciſe. But if theſe fail, the T bandage muſt be worn.* In the ſecond vol. of the Edinb. Med. Com. p. 46. it is propoſed to make inciſions; or rather ſcarifications in the deſcending vagina. If inflammation, &c. attend, the ſame procedure will be proper as when the like ſymptoms happen to the uterus. See Heiſter's Surgery. Hamilton's Midwifery, edition ii. p. 247.

PROCIDENTIA VESICÆ URINARIÆ. DISPLACED BLADDER. The inverſion of the uterus never happens without the bladder being diſplaced. They get down to the perinæum, and there make a protuberance. The bulb of the bladder being thus prolapſed or forced down, it is now no longer expoſed to the preſſure of the abdominal muſcles as before, and not having force enough in this poſture, to contract and preſs out the urine, the poor woman in this ſtate never makes any water, without firſt ſqueezing the bladder with her hands, or between her thighs. When the bladder is thus diſpoſed, if the catheter is to be introduced, it muſt not be thruſt inward, but downward, the bulb of the bladder being below the meatus urinarius. S[illegible]ond. Med. Obſ. and Inq. vol. iii. p. 1.

PROCONDYLOS, from προ, *after*, and κονδυλος, *finger*. The firſt joint of each *finger* next the metacarpus, ante internodium.

PROCTALGIA, } Alſo *cluneſia*. INFLAMMATION
PROCTITIS. } of the ANUS, with pain. Dr. Cullen places it as a variety of phlogoſis, Gen. 7, Ord. 2, PHLEGMASIÆ. It is alſo called *cyſtitis*. This is diſcovered by a hot and acutely painful tumor at the anus, which is irritated by preſſure; the bowels become coſtive, and often continue ſo for ſome days, and generally a fever comes on. The cauſe is commonly riding; violent blow, or fall; acrid applications; obſtructed piles, &c. It is, though, ſometimes, very difficult to cure; and, if it yields not ſoon to the applications, and modes generally efficacious in other inflammatory complaints, it terminates in abſceſs, and often ſucceeded by fiſtula. See INFLAMMATIO for the mode of cure—ABSCESSUS IN ANO, and FISTULA IN ANO.

PROCTOLEUCORRHŒA. The ſame as *proctorrhœa*, but thus named becauſe of the diſcharge reſembling that called the whites.

PROCTORRHŒA. A flux, that is ſometimes yellowiſh, or ſtreaked with blood; probably from the external hæmorrhoidal veſſels, or perhaps in ſome inſtances from the internal ones; this diſcharge is accompanied with heat and itching about the anus.

PRODUCTIO. See APOPHYSIS.

PRODROMI. See ETESIÆ.

PRŒBIA, PRŒBRA. See AMULETA.

PROEGUMENE, from προηγεομαι, *antecedo*. A PRECEDENT CAUSE; by the Latins, called *antecedens*. See CAUSA.

PROFLUVIA. This forms the 5th ORDER of the 1ſt CLASS of Dr. Cullen's Noſology. A pyrexy, with encreaſed excretion, not naturally bloody, under which he includes two GENERA—*catarrhus* and *dyſenteria*; and ſays, that for the ſame reaſon from which I have placed hemorrhages under the claſs of febrile affections, ſo have I ſome febrile PROFLUVIA. A *catarrh*, indeed, from febrile ſymptoms, and inflammatory diatheſis, is very nearly allied to inflammations; and the *dyſentery* is not only always accompanied with fever, but differs in many points from all other fluxes.

PROFLUVIUM. A FLUX of any kind.

PROFLUVIUM URINÆ. See DIABETES.

PROFUNDA BRACHII VENA, vel PROFUNDA SUPERIOR. It is a branch from the baſilica vena, ſent off from it below the neck of the os humeri; and near the hollow of the axilla; it runs along the ſide of the brachial artery, and ſpreads in the adjacent muſcles.

PROFUNDUS MUSCULUS MANUS. See FLEXOR INTERNODII, TERTII DIGITORUM MANUS.

PROFUSIO. PASSIVE HÆMORRHAGES. Dr. CULLEN places this genus of diſeaſe in the CLASS LOCALES, and ORDER APOCENOSES; and defines it a flux of blood; and diſtinguiſhes it from active hæmorrhages, as not being the effect of fever, but occurring from wounds, leeches, &c.

PROGERMINUS ABSCESSUS. An abſceſs ariſing from a viſcid and almoſt corrupted phlegm.

PROGLOSSIS. See LINGUA.

PROGNOSIS, from *προ, before*, and *γινωσκω, to know*. Some chemiſts, to expreſs this term, uſe the word *erodinium*. PROGNOSTIC. It is the foretelling of what may happen to the patient, either with reſpect to a diſeaſe which will occur, and has not yet affected the habit; or of many things in the progreſs, or the termination, of the diſeaſe, from a thorough acquaintance with the ſigns which are the præcurſors of ſuch circumſtances. In this Hippocrates excelled; his *prognoſtics* are at this day eſteemed; yet it muſt be allowed that ſome of them are fallacious, from the difference of climes and conſtitutions.

In forming *prognoſtics*, attend to, 1. What will be the future event of the diſeaſe. 2. From like diſeaſes having proceeded in the ſame body. 3. And from a knowledge of the preſent ſtate of the vital powers, and a compariſon thereof with the ſtrength of the morbific cauſe.

The ſigns of health, and death, are more fallacious in acute than in chronical diſeaſes.

See the Engliſh tranſlations of Hippocrates's *Prognoſtics* in Acute Diſeaſes; and of Proſper Alpinus's Preſages on Life and Death.

PROHIBENS. See ANTENDEIXIS.

PROJECTIO. PROJECTION. In CHEMISTRY, it is the caſting any ſubſtance to be calcined into a crucible, by a ſpoonful, or a ſmall quantity at a time. *Projection* is alſo an addition of a ſmall quantity of ſomething to a greater quantity of a metal, in order to meliorate the metal. See Wilſon's Chemiſtry.

PROJECTURA. See APOPHYSIS.

PROLABIUM, *pro, before, labium, the lip*. The RED PART of the LIPS. Under the epidermis, which in this part is called *epithelium*, is a collection of fine long villous papillæ, cloſely connected together, and covered not only by the epidermis, but alſo that pelicle which covers the glandulous membrane of the cavity of the mouth: this villous ſubſtance is of exquiſite ſenſibility.

PROLAPSUS. PROCIDENTIA. *Delapſio—exania—proptoma*—PROPTOSIS, which ſee. Dr. Cullen places this genus of diſeaſe in the claſs locales, and order ectopiæ. A *prolapſus*, a procidence, or exany, is the miſplacing of a ſoft part, and ſo that it is generally obvious to the ſight; or, it is a tumor ariſing from the diſlocation of a ſoft part, as a membranous or fleſhy part, as is inſtanced in the bearing down of the rectum, an inteſtinal hernia, &c. See, under PROCEDENTIA, the ſpecific circumſtances.

PRONATIO. PRONATION. When ſpoken of the hand, it is when the thumb is turned towards the thigh; ſo that if the body is laid on its back, the palm of the hand will be downwards.

PRONATOR QUADRATUS. This muſcle is alſo called *tranſverſus*. It ariſes tendinous from the inner part of the ulna, and is inſerted into the inner part of the radius. One end of it is fixed to the lower part of the ulna, and by the other in the concave ſide of the lower extremity of the radius.

—— TERES. } It riſes from the internal in-
—— RADII TERES. } ferior part of the os humeri, and is inſerted into a line at the lower end of the radius. This muſcle is alſo called *obliquus*.

PROPHYLACE. PROPHYLAXIS, from *προ, before*, and *φυλασσω, to preſerve*; called alſo *diaphylactices, diaſoſtica*. The method of preſerving health, and averting diſeaſes.

PROPOLIS, called alſo *ceranthemus*. BEE-GLUE, or BEE-BREAD. It is a wax-like kind of glue, found in the entrance of bee-hives. It ſoftens indurations; but it is not noticed in the preſent practice.

PROPRIETATIS ELIXIR, i. e. *elix. aloes*, and *tinct. aloes, comp.* See ALOE, N° 1.

PROPRIETATIS ELIXIR VITRIOLICUM. See ALOE, N° 2.

PROPTOMA. See PROLAPSUS.

PROPTOSIS, from *προπιπτω, to fall out*. The ſame as *procidentia*; to fall from its natural ſituation. When the eye is ſo enlarged, that the eyelids cannot cover it, it ſometimes burſts; and this diſorder is called *oculus elephantinus*; *oculus bovinus*, and *bubulus*.

In the Medical Communications, vol. i. p. 409, &c. is the following mode of cure of *Hydrophthalmia* or *Proptoſis*.

The cure of the diſeaſe by ſeton is to be adopted only in ſuch caſes as where the viſion is entirely loſt; the intent of the operation being merely to remedy the inconveniencies occaſioned by the increaſed bulk of the eye. Theſe inconveniencies are, frequent pain, inflammation of the diſeaſed eye, head-ach, reſtleſſneſs, difficulty of cloſing the eye-lids, a conſtant effuſion of tears down the cheek, and a great deformity from the bulk of the tumor. The other eye alſo frequently becomes liable to inflammation, and the patient is commonly incapable of reading, &c.

The following mode of cure is not very painful, and may be eaſily performed. To do it with convenience, the ſurgeon and his patient ſhould be ſeated in the ſame manner as for extracting the cataract. The ſeton needle being armed with ſix threads of white ſewing-ſilk, is to be paſſed from the external angle, about a quarter of an inch from the edge of the cornea, through the poſterior chamber of the eye, and brought out at the ſame diſtance from the inner edge of the cornea.

The author of this paper ſays, I have not lately uſed the ſpeculum oculi in this operation, as the pain it cauſes by preſſure ſeems to over-balance the advantage that is gained by its fixing the globe of the eye.

In faſtening the threads, we muſt be cautious not to draw them tight, leſt they ſhould cut through the cornea before the cure is completed.

The external applications ſhould be of the ſedative kind; perhaps we have none more proper than the ſaturnine water of Goulard, applied warm. A certain degree of inflammation and fever come on ſoon after the operation, but I have found that theſe readily give way to a cooling regimen, bleeding, and gentle laxatives. A ſwelling of the eye-lids, and a thickening of the coats of the eye, muſt likewiſe be enumerated among the ſymptoms that follow the operation; but theſe commonly begin to ſubſide about the eighth or ninth day, at which time I uſually take out ſome of the threads, and the ſwelling then gradually ſinking within the orbit, the patient finds a comfortable alleviation of thoſe painful ſymptoms with which he was before affected.

For a month after the operation I keep in ſome of the threads, which, after the firſt inflammation is removed, do not occaſion much irritation. See Lond. Med. Journal, vol. i. p. 346.

PRORA. See OCCIPUT.

PRORÆ SUTURA. See LAMBDOIDES.

PROSARTHROSIS. See ARTICULATIO.

PROSTATA. See SUPPOSITORIUM.

PROSTATÆ, from *προ, before*, and *ιστημι, to ſtand*, from *προσιστασθαι, to be adjacent to*. The PROSTATE GLAND, called alſo *corpus glanduloſum, adenoides*. The *proſtatæ* are ſituated at the neck of the bladder, are ſhaped like an heart, the lower ſurface is the largeſt, and the upper ones are both flat. The membranous part of the urethra runs through it: it is about the ſize of a walnut. When cut open, the eminence called *caput gallinaginis* is ſeen. The vaſa deferentia paſs through its ſubſtance. When the *proſtate gland* is inflamed from a ſuppreſſed gonorrhœa, every means ſhould be uſed to reſtore the diſcharge; for, if this inflammation terminates in ſuppuration, whether the abſceſs breaks into the urethra, bladder, inteſtinum rectum, or perinæum, it will always be attended with diſagreeable conſequences. The ſymptoms of an inflammation or ſwelling of this gland are known from the pain and difficulty of making water; beſides, if we ſhould be doubtful whence they proceed, the finger will clearly teach us. If a ſuppuration has already taken place, we have only to obſerve, that mercury internally and externally will be neceſſary, and afterwards proper injections, the compoſitions of which muſt be left to the judgment of the practitioner. The remedies proper for indurated teſticles or bubœs, will be ſuitable in this caſe;

but eſpecially bliſters repeatedly applied to the perinæum, and internally hemlock in large doſes. If a total ſuppreſſion of urine is feared, bring on the ſuppuration to prevent worſe miſchiefs.

PROTORRUTOUS. See CAPNELÆUM.

PROTUBERANTIA. See APOPHYSIS.

PRUNA. PRUNES. Botaniſts enumerate nine ſpecies of *prune-trees*. *It is a name alſo for carbunculus.* It has alſo different diſtinguiſhing epithets joined with it, viz.

—— DOMESTICA,—Gallica parva ſativa. COMMON or FRENCH PRUNES, called by our gardeners, the LITTLE BLACK DAMASK PLUMB. The PRUNUS DOMESTICA, *pedunculis ſubſolitariis, foliolis lanceolato-ovatis convolutis, ramis muticis*, CLASS Icosandria, ORDO Monogynia. Linn. Gen. Plant. 620.

This ſpecies of plum-tree grows much higher than the prunus ſylveſtris; it is without ſpines, and covered with a ſmooth bark, of a dark brown colour. It is a native of Britain, and flowers in April and May.

Our garden plumbs, when ripe, and eaten of moderately, are a pleaſant and wholeſome food, but unripe they produce colicky pains, diarrhœa, or cholera.—MEDICINALLY they are emollient, cooling, and laxative, particularly the FRENCH PRUNES imported into this country from Marſeilles. Though by drying they loſe ſome of their laxative power, they are more efficacious this way than the other dried fruits. In coſtive habits, they are found often peculiarly uſeful, and are given boiled with ſenna, or other purgatives. This fruit is one of the articles in the Electarium è Senna.

2. —— BRIGNOLENSIA, called alſo *prunello*, or BRIGNOLE PLUM. It is ſo called from Brignole in Provence. It is of a reddiſh yellow colour, and of a very grateful, ſweet, ſubacid taſte.

3. —— DAMASCENA. The DAMASK PRUNE, called DAMSONS, alſo *damaſcena pruna noſtrata*. This ſpecies is generally ſupplied by the common prune. Their general qualities are to cool, quench thirſt, and render the bowels lax. The *prunelloes* quench thirſt more than the others; and the *French prunes* are moſt laxative.

PRUNELLA. See BRUNELLA and BUGULA.

PRUNELLO. See PRUNUS, N° 2.

PRUNUS BRASILIENSIS. See ACAJA.

—— DOMESTICA. See PRUNA, N° 1.

—— PRUNIFERA. See NUX VIRGINIANA.

—— SYLVESTRIS.—*Spinoſa domeſtica agriococcimela.* The BLACK THORN, or SLOE-BUSH. The PRUNUS COMMUNIS, *pedunculis ſolitariis, foliis lanceolatis glabris, ramis ſpinoſis*, CLASS Icosandria, ORDO Monogynia. Linn. Gen. Plant. 620. It is a prickly buſh, very common in hedges, produces an auſtere fruit, which is ſmaller than an ordinary cherry. This fruit is too harſh to be eaten before the froſts have ſoftened them. The juice expreſſed from them before they are ripe, or affected by the froſt, if inſpiſſated by a gentle heat, is called *acacia Germanica*, and is generally ſold for the *acacia Egyptiaca*, from which it differs in being harder, heavier, darker-coloured, and of a ſharper taſte, and yet more remarkable in its giving out its aſtringency in a good meaſure to ſp. vini r. whereas the Egyptian acacia is not at all diſſoluble in ſpirit. This fruit is an agreeable and uſeful aſtringent.

A conſerve is made of the *floes* by ſteeping them in hot water, care being taken that they do not burſt, and when they are ſoft enough to pulp, they are paſſed through a hair ſieve, and to one part of the pulp, three parts of lump-ſugar muſt be added. Pharm. Lond. 1788. *Sloes* have been recommended in diarrhœas, hæmorrhages, in tumefactions of the tonſils and uvulæ, as gargles. Dr. CULLEN conſiders the floe as the moſt powerful of the FRUCTUS ACERBI, and has often found it an agreeable and uſeful aſtringent. The conſerve poſſeſſes theſe properties. The flowers with their calyces are moderately purgative, and for this purpoſe an ounce infuſed in a ſufficient quantity of water, or rather whey, was experienced to be an uſeful and pleaſant laxative. The powdered bark, in doſes of a dram, is ſaid to cure agues. The tender leaves dried, are uſed, and conſidered as the beſt ſubſtitute for tea, that has yet been tried. See ACACIA GERMANICA.

—— LAUROCERASUS. See LAUROCERASUS.

PRURIGO, } A VIOLENT ITCHING, or the ITCH,
PRURITUS. } called alſo *ſcabies*; *pſora*; *dartra*; *libido*; *pavoni* Dr. Cullen names this genus of diſeaſe PSORA, amongſt the ORDER of IMPETIGINES; he places it in the CLASS LOCALES, and ORDER DIALYSES, and defines it puſtules, or ſmall pruriginous ulcers, affecting the hands, which are contagious. Many are the appearances on the ſkin, and various the diſorders that are accompanied with, or manifeſted by an *itching* therein; but the *itch* is a ſkin-diſeaſe, and hath for its cauſe a very ſmall kind of animalcula of a whitiſh colour, and ſhaped like a tortoiſe, each having ſix feet, and a ſharp head, with two ſmall horns on its point. They are very hard, ſo are not eaſily deſtroyed by rubbing them.

This diſorder uſually appears at firſt about the wriſts and fingers, then on the arms, legs, and thighs, but never affects the head. In the evening, when the patient approaches to the fire, or begins to grow warm in bed, the *itching* is moſt troubleſome; in ſome patients there are blotches here and there, in others there is a ſcurfy or ſcaly kind of eruption; this laſt is called the DRY ITCH. The moiſt kind moſt frequently happens to children, and the drier ſort to adults. The humour in the moiſt ſort is ſanious and purulent, and an inflammation is obſervable about the baſis of each eruption; but in the dry kind, the puſtules are of a ſmall ſize, and are filled with a ſerous ichor, which, by irritating the highly tender fibres under the cuticle, occaſion both heat and *itching*.

The moiſt kind of *itch* is more eaſily cured than the dry ſort: this diſorder is obſtinate in old people, and ſtill more ſo in thoſe whoſe viſcera are unſound. There is alſo a kind of *itch* where the ſkin is rough; it is then called *depetigo*.

Whether the cauſe be a morbid ſerum in the blood, or the animalcula above mentioned, ſulphur alone is to be depended on for a cure; it ſhould be taken inwardly, ſo as to keep the bowels lax; but if it agitates the blood, and occaſions eruptions to appear on the ſkin, it may be mixed with the cream of tartar. As to its external uſe, it need not be applied like other medicines to every part of the body; but if rubbed on the palms of the hands, and the ſoles of the feet, it ſuffices: and thus uſed there is leſs objection to the ſmell, and the uncleanlineſs complained of, than when the whole ſkin is anointed.

Dr. Pringle recommends the following ointment to be uſed at four times, each portion to be applied at bed-time; and to prevent any diſorder from too many pores being ſtopped at once, he directs that one fourth part of the body only ſhould be rubbed at once.

℞ Flor. ſulph. ʒ i. p. rad. cleb. a ʒ ii. vel ſal ammon. crud. ʒ ii. axung. porc. ℥ ii. m.

The *ſulphur vivum, in fine powder, is always more effectual than the flowers of ſulphur*; as the ſulphur loſes much of its ſtrength by the proceſs of ſublimation, it ſhould never be employed for any cutaneous eruption.

During the uſe of ſulphureous applications clean linen is neceſſary; it ſhould often be changed, but not worn again before being well waſhed and bleached.

Many other applications have been uſed, and ſtill are preferred by ſome. The following are recommended by eminent practitioners:

℞ Hydrargyri muriati ʒ i. alum. rup. ʒ ii. ſal. prunel. ℥ ſs. aq. calcis ℔ ſs. m. f. lotio.

℞ Hydrargyri muriati gr. x. calc. hydrargyri albi ʒ i. ung. pomat. ℥ i. ſs. m.

℞ Acidi vitriolici ʒ ſs. adipis ſuillæ ℥ j. bene commiſceantur in mortario vitreo.

℞ Hellebori alb. pulv. ℥ j. adip. ſuillæ ℥ iv. m.

℞ Hellebori alb. pulv. ℥ j. aq. diſtill. ℔ ij. ſpt. vin. rect. ℥ ij. coq. helleb. cum aqua. ad lb. j. quando frig. adjiciatur ſp. vini, & f. lotio.

Dr. Turner prefers a ſolution of the kali in the proportion of a dram to an ounce of water: of this a tea ſpoonful is to be taken two or three times a day in any ſmall drink. The body at the ſame time to be waſhed with a weak ley.

The extr. cicutæ hath been found uſeful in ſome obſtinate caſes, which reſiſted all other common methods.

Baths ſhould be uſed in the dry ſpecies particularly; and perſpiratives are uſeful in both ſorts of this complaint.

The venereal *itch* requires the uſe of mercurial alteratives, and the decoction of guaiacum. See Biſs's Eſſays; Turner on the Diſeaſes of the Skin; Barbette's Chirurgia, lib. i. c. viii. Wepfer's Obſ. 214. Philoſ. Tranſ. Abr. vol. iv. Bell on Ulcers, p. 371.

PSALLOIDES. So the ancients called the inner ſurface of the fornix, becauſe it appears as if ſtringed like a dulcimer.

PSELLISMUS, } STAMMERING, or a faulty articu-
PSELLOTIS. } lation of words. Dr. Cullen places this

this genus of diſeaſe in the CLASS LOCALES, and ORDER DYSCINESIÆ, which he defines, a defect in pronouncing words. He diſtinguiſhes ſeven ſpecies. 1. *Pſelliſmus hæſitans*; alſo called *battariſmus*; *iſchnophonia*, when there is difficulty to pronounce the firſt ſyllable or word, which is not effected before repeated trials are made. 2. *Pſelliſmus ringens*; called alſo *blæſitas*; *traulotis*; & *rottaciſmus*, when there is a fault in pronouncing the letter R, which is always aſpirated, and as if doubled. 3. *Pſelliſmus lallans*; *lambdaciſmus*; when the letter L is ſounded improperly, or in the place of the letter R. 4. *Pſelliſmus emolliens*; *traulotes*; when the harſh letters are expreſſed too ſoft, as the letter S is too frequently ſounded. 5. *Pſelliſmus balbutiens*, called alſo *balbuties*; *aranula*; when from a large tongue the labial letters are too much heard, and are often ſounded inſtead of others. 6. *Pſelliſmus acheilos*; *mogilalia*; when the labial letters are difficultly ſounded, or not at all. 7. *Pſelliſmus lagoſtomatum*; *cocatiſmus*; when, from a diviſion in the palate, the guttural letters are not well pronounced,

PSUCHROLUSIS. BATHING in COLD-WATER.

PSEUDES. FALSE or BASTARD. Hence is derived the word *pſeudo*, with which many names begin.

PSEUDO ACORUS. See IRIS PALUSTRIS.

—— ASTHMA. An aſthma excited by an abſceſs, or a vomica in the lungs.

—— BLEPSIS, called alſo *phantaſma*, *ſuffuſio*. FALSE SIGHT; as when a man ſees what does not exiſt, and the things that do exiſt are ſeen differently from what they are perceived by others, whoſe eyes are in a proper ſtate. Dr. Cullen places this genus of diſeaſe in the CLASS LOCALES, and ORDER DYSÆSTHESIÆ. He diſtinguiſhes two ſpecies. 1. *Pſeudoblepſis imaginaria*; in which things that do not exiſt are ſeen, as luminous appearances, ſuddenly paſſing by of various colours, &c. For a variety of this, ſee MARMARYGÆ. 2. *Pſeudoblepſis mutans*; as when any objects in fact exiſting appear changed by ſome means. See DIPLOPIA.

—— BUNIAS. See BARBAREA.

—— BUNIUM. See BUNIAS

—— CADMIA. See ANTICADMIA.

—— CASSIA. See FOLIUM.

—— CHINA. See CHINA OCCIDENT. and SUPPOSITA.

—— CORALLIUM. See CORALLIUM NIGRUM.

—— COSTUS. See PASTINACA OLUSATRA.

—— DICTAMNOS. BASTARD DITTANY. It is alſo called GNAPHALIUM VETERUM. It is a plant which reſembles the horehound in its virtues, but it is not uſed in the preſent practice. Boerhaave takes notice of ſeven other ſpecies, but they are of as little value in medicine as the juſt named.

—— HELLEBORUS. See CALENDULA PALUSTRIS.

—— IRIS. See IRIS PALUSTRIS.

—— LIEN. A name for ſome glands which Ruyſch obſerved near the ſpleen.

—— LOTUS. See GAUJACANA.

—— MELANTHIUM. See NIGELLASTRUM.

—— MOLA. See MOLA.

PSILOTHRA. See DEPILATORIUM.

PSILOTHRUM. See BRYONIA ALBA.

PSIMMYTHION. See PLUMBUM, N° 1.

PSOÆ. The name of two pair of muſcles in the loins, called alſo *alopeces*; *nephrometræ*; *neurometeres*; According to Galen, Pollux, &c. the loins were called ψοαι.

PSOAS, alſo called *lumbalis*, and *lumbaris internus*, *pſoas magnus*. It is placed obliquely on the ſides of the loins, and runs under Poupart's ligament to that thigh on which ſide it is. It riſes fleſhy from the ſides of the upper vertebræ lumborum; and from the roots of their tranſverſe proceſſes paſſes down under Poupart's ligament, and is there joined by the iliacus internus, which lies upon the concave part of the ilium, and takes its origin from the anterior edge of the bone; it runs down before the *pſoas*, and makes one maſs with it; they then run over the head of the bone, and paſs upwards to be inſerted, tendinous, into the little trochanter, and fleſhy into the bone a little below that proceſs. Its office is to bend the femur, by bringing it forwards, partly to rotate it, and to turn the toes out. The kidneys often preſs upon this muſcle, over which runs a nerve; hence thoſe who have ſtones therein often feel a numbneſs in the thigh of that ſide. From the name of this muſcle, abſceſſes happening in the loins have been called

PSOAS, ſeu LUMBORUM ABSCESSUS, PSOADIC, or LUMBAR ABSCESS. It is a ſpecies of ARTHROPUOSIS, in the definition of which, the pſoas abſceſs is involved. See ARTHROPUOSIS. It receives different appellations from different writers. Mr. POTT obſerves, that it receives this name from the matter of it ſliding in its fall upon the ſide of the *pſoas* muſcle, or betwixt that and the iliacus internus; Dr. G. FORDYCE, that between the *pſoas* muſcle and the muſcle of the back, lies a quantity of looſe cellular membranes, from which an inflammation often takes place, which terminating in an abſceſs, forms this diſorder.

Mr. Pott thinks this diſorder originates in the lymphatic glands, near the receptaculum chyli, the vertebræ about which are generally diſeaſed and carious in theſe caſes.

Mr. Abernethy thinks that the *pſoas abſceſs*, being frequently connected with, and often cauſing a caries of the bodies of the vertebræ, is too prevalent an idea. Becauſe, ſays he, the cellular ſubſtance interpoſed between the peritonæum and the loins is the common ſeat of theſe abſceſſes; this ſubſtance is in greater quantity at the ſides, where it connects that membrane to the *pſoas*, and quadratus lumborum muſcles, than in the middle where it attaches it to the ſpine. Where this ſubſtance is moſt abundant, *there* moſt frequently are abſceſſes formed; and this probably is the reaſon why we *generally* find theſe ſuppurations limited to either ſide of the vertebræ, and ſeldom extending acroſs them. If matter was formed in the middle, oppoſite to the bodies of the vertebræ, its gravity and the want of reſiſtance would determine the deſcent to either ſide. As the peritonæum would readily yield to the protruſion of the matter collected behind it; as the cellular ſubſtance connecting it to the vertebræ would be eaſily ſeparated; ſo the preſſure which the collected pus would make againſt theſe bones, would be quite inſufficient for the production of diſeaſe. The matter of ſuch an abſceſs is perfectly mild, and could not ſtimulate except by its mechanical properties. Therefore it is improbable that a caries of the bones ſhould be the conſequence of an ordinary lumbar abſceſs. Dr. Hunter obſerves, that matter is ſometimes lodged in this part at the criſis of a fever, and he hath ſeen inſtances of matter proceeding from the liver into this ſituation, after making its way through the peritonæum. As there is a great quantity of cellular membrane over the *pſoas* muſcle, and a conſiderable way toward the ſkin, the matter ſeldom points outwardly on the back, where it is formed; but running down on the courſe of the muſcle, makes its way into the groin, thigh, ham, the inner condyle of the os femoris, &c. or when on the right ſide, it may penetrate the colon which lays upon it, and thereby occaſion a large diſcharge of matter per anum, and poſſibly a fiſtulous ſore.

The *pſoas* abſceſs often exiſts a conſiderable time before it is ſuſpected.

The ſymptoms in the beginning are ſimilar to thoſe of inflammation of the liver, excepting for the ſituation; its progreſs and termination is like that of the liver too. The pains are ſituated in the back, for the moſt part, rather lower than the region of the kidneys. The pain is but ſlight, and ſo moderate are the ſymptoms for a time, that frequently it hath not been attended to until ſuppuration had taken place. This circumſtance perhaps makes us too little attentive to ſuch complaints from our patients. For when the inflammation has been begun, it may be checked, and by timely care many a lumbar abſceſs might be prevented by early attention, by bleeding, purging, and ſuch other medicines as are proper in other inflammations, aided by local applications; ſcarifications, bliſters, fomentations, and ſetons in the loins, promiſe advantage by deriving inflammation to the ſurface. After the abſceſs is formed, the pain often becomes greater than before; for, the pus fermenting in the cellular membrane ſpreads itſelf, and produces a great degree of general inflammation. This cellular membrane communicates itſelf

ſelf with the cellular membrane in other parts, and the pus ſometimes makes its way through the peritonæum into the cavity of the abdomen, whence ariſe hectic heats; and is fatal. The matter may alſo paſs down the *pſoas* muſcle, and make its exit externally a little further than the inguinal glands, or it may paſs further down the thigh, diſſect the muſcles, and form ſinuous abſceſſes. Sometimes the matter paſſes through the muſcles of the back, but may take its courſe into the cavity of the back part of the pelvis: thus it appears that the pus is capable of paſſing ſeveral different ways, and may communicate with all the parts at once, which makes it a dangerous abſceſs, not ſo much with regard to its ſize, as to the parts which it affects. Uſually the firſt ſymptom that the patient feels in caſes of the *pſoas* abſceſs, is not where the diſeaſe originates, but a pain in the lower part of the thigh of the ſide affected; he ſtands on his toes, &c. and does not complain of the part for ſome time, but by attending to the circumſtances from the beginning, and laying the perſon affected on his back, lifting up his thigh, then, between inſpiration and expiration, carefully examining the part, you will probably feel the tumor near, or in the region where the diſeaſe originates. The leg of the affected ſide ſeems to be ſhorter than the other, but it is not ſo. In ſome caſes the diſeaſe proceeds rapidly, in others very ſlowly; at length it appears in the groin, and the affected ſide; the muſcles of the thigh become exceedingly emaciated, and the whole body waſtes. When it proceeds thus far, the patient rarely, if ever, recovers; the ſymptomatic fever that generally attends cloſes the ſcene.

This diſeaſe is often confounded with the abſceſs of the hip-joint, yet they are very diſtinct and different in their origin, ſeat, and progreſs. The *pſoas* abſceſs originates often in the lymphatic glands near the receptaculum chyli, the vertebræ about which are ſometimes diſeaſed and carious; in other inſtances it originates in or about the loins, if not higher in the abdomen. The firſt ſymptoms mentioned above continue for ſome time. At length the diſeaſe appears in the groin, the limbs waſte, and, indeed, the whole body alſo, &c. *The hip-joint abſceſs* originates in the hip-joint; when it attends, the leg of the affected ſide is ſhorter than the other; the pain begins in the part where the diſeaſe originates, and about the great trochanter. The moſt frequent ſituation of the *pſoas abſceſs* is before, or by the ſides of the pſoas muſcles, from whence the fluid collected ſometimes extends itſelf laterally, and making its way between the three ſtrata of abdominal muſcles, preſents itſelf beneath POUPART's ligament, and elevates the faſcia of the thigh. To diſtinguiſh it from a local external abſceſs, lay the patient on his back, and ſqueeze the tumor; if it be a *pſoas* abſceſs, the matter will be preſſed into the cavity of the belly, but if it be in the part itſelf, no alteration takes place; and further, if there be two lumbar abſceſſes, by compreſſing, one will fill the other. A ſtone in the kidneys hath been taken for this diſeaſe; but there is this difference between them, the ſtone in the kidney will ſometimes produce but ſlight inflammation, but at other times very conſiderable; beſides, the pain reaches from the kidneys down the groin to the bladder, paſſing ſtony concretions, and ſometimes blood with the urine; theſe ſymptoms do not exiſt in the *pſoas* abſceſs. See ABSCESSUS ISCHIATICUS.

If an abſorption take places before the abſceſs hath burſt externally, the patient often dies. It is generally of the ſtrumous kind, but when not, it is often fatal. If a fetid ichor is diſcharged, or the bones are affected, little or nothing is to be hoped for. The matter of this abſceſs ſometimes makes its way from the region of the kidneys down to the bottom of the thigh of the affected ſide, but before this, the miſchief it hath done is not to be repaired; and if an opening is made, the patient is likely to be deſtroyed by the exceſs of the diſcharge.

A ſymptomatic fever generally attends this complaint, and cloſes the ſcene. But what is very remarkable, this fever does not come on during the time the matter is confined, nor to any great degree for forty-eight hours after the matter is let out; this circumſtance is extraordinary, as it cannot ariſe from the abſorption of matter, for that muſt have been greater before the opening; nor from a waſting in conſequence of the evacuation of the matter, as that was before extravaſated, and was an extraneous body with reſpect to the conſtitution; nor from the admiſſion of air, for that in other caſes does not produce ſuch effects: we are therefore at a loſs to know why the ſymptomatic fever does not occur till after the diſcharge of the matter.

This diſeaſe, whilſt in its inflammatory ſtate, is generally neglected or miſtaken; otherwiſe it probably would eaſily be cured, and that principally by bleeding. Dr. Fordyce obſerves, that this diſorder ſhould be treated in the ſame manner as inflammation of the liver, except for the ſituation, both in the ſtate of inflammation and ſuppuration. He further adds, that in all internal ſuppurations, the lungs become affected; hence hectic heats, &c. are produced; thence it is neceſſary, that if the patient reſides in a large town, he ſhould remove into the country for the benefit of air. Correſpondent with this, Dr. Hunter obſerved, in his Lectures, A. D. 1771, that the moſt likely means to prevent the fatal effects of this diſeaſe are, endeavours to keep up the patient's ſtrength ſufficiently to enable him to undergo the diſcharge, which is moſt likely to be accompliſhed by a nouriſhing diet, and clear air, the bark, dilute acid of vitriol, &c. Dangerous as this complaint always is, and fatal as it has generally been conceived to be; Mr. Abernethy has ſupplied ſome caſes, where ſucceſs has attended his endeavours, and to which he was led by the following conſiderations. He obſerves, that whilſt the condenſed cellular ſubſtance, which forms the cyſt of an abſceſs, remains entire, it continues free from inflammation, and the contained pus ſuffers no putrefaction, or evident alteration of quality; but whenever the abſceſs is opened either by ulceration, or the hand of the ſurgeon, a ſudden, and generally conſiderable inflammation, extends itſelf over the whole cyſt; this is followed by a copious diſcharge of frequently fetid pus, which effects cannot but derange greatly and exhauſt the conſtitution of the patient, which is generally irritable, and already much enfeebled by the effort attending the formation of the diſeaſe. It is well known that when we evacuate fluids from the cavities of the body, if we immediately cloſe the aperture through which they were diſcharged, we prevent the inflammation which would otherwiſe enſue; and alſo, that if the matter of an abſceſs is diſcharged, its cavity becomes much diminiſhed by the contraction of the cyſt; which contraction will be greater in a chronic lumbar abſceſs, than in thoſe of a more phlegmonoid nature. From theſe obſervations, it occurred to him, that if, after the evacuation of a lumbar abſceſs, the aperture were directly cloſed, and its immediate union procured, no inflammation of the cyſt would ſucceed, which being now relieved from preſſure, would by its contraction and rarefaction greatly diminiſh the cavity; the pus, though, doubtleſs would readily reaccumulate; yet he thought by repeatedly evacuating this fluid before diſtenſion of the cyſt could happen, the cavity would be ſo much reduced, and the cyſt be made ſo much leſs extenſive that the future admiſſion of air would be productive, comparatively but of little conſequence. The practice founded on theſe principles ſeems to have anſwered the intent, which is purſued on the following plan. The pus is diſcharged by introducing a lancet through the integuments, then paſſing it obliquely for a ſmall diſtance between the ſkin and the faſcia, and by depreſſing the point of the lancet there puncturing the cyſt. The matter ſhould be drawn off in an uninterrupted current, if poſſible; and the abſceſs completely evacuated; then the aperture ſhould be immediately and exactly cloſed, by dreſſing the orifice (made in a longitudinal direction with regard to the thigh) with lint, and bringing the edges into cloſe contact with ſticking plaiſter, as wounds made in bleeding are commonly treated. The ſecond diſcharge of the pus has generally been poſtponed for a fortnight; but if the cavity ſoon fills again, and the newly healed punctures are irritated by the preſſure of the contained fluid, there is an abſolute neceſſity for evacuating the contents of the abſceſs at an earlier period. And in this mode muſt the matter be evacuated from time to time, until the abſceſs becomes ſo ſuperficial as to be treated in the method common on ſuch occaſions.

Elements of the Pract. of Phyſ. part ii. by G. Fordyce, M. D. Abernethy, on Lumbar Abſceſs.

PSOAS PARVUS. When there is a little *pſoas*, it is on the anterior part of the great *pſoas*. It ariſes fleſhy from the upper vertebræ of the loins laterally; is inſerted by a long, flat, thin tendon, into that part of the os pubis where it joins the ilium. Its uſe is to aſſiſt the recti abdominis in drawing the os pubis upwards, as in raiſing ourſelves from a decumbent poſture.

PSOPHOS. Crackling or rattling of the bones.

PSORA. See PRURITUS.

PSORIASIS. SCROTAL ITCH. A ſpecies which affects the ſcrotum, from ψωρα, *ſcabies laboro*. The ſcrotum is alſo unuſually hard.

PSORICA. Medicines for the itch.

PSOROPHTHALMIA. An itchy or ſcurfy diſorder of the eye-lids, which renders them ſore, and ſometimes ſcabby. See TRACHOMA.

PSUCHAGOGICA. Medicines which recall life in an apoplexy or ſyncope.

PSYCHOTRIA EMETICA, vel HERBACEA. See IPECACUANHA.

PSYDRACIA. A ſpecies of puſtule, or of ſmall tubercles on the head, which reſemble puſtules, and corrode the ſkin. Trallian thus deſcribes them, in lib. i. c. 5. Phlyctenæ, or ſmall watery puſtules, when ſeated on the head, are called *pſydracium*. *Pſydracia* a veſpis, ſignifies the humour, &c. from the ſtinging of waſps. Others deſcribe the *pſydracia* as hydatids, or ſanious puſtules.

PSYLLIUM. FLEA-WORT. It is alſo called *pulicaris herba*, by Oribaſius *cryſtallion* and *cynomoia*. It is the PLANTAGO PSYLLIUM Linn. It is an herb of the plantain kind, agreeing with it and the *coronopus*, only the ſtalks are leafy and ramous, or divided into a multitude of branches. It grows wild in the warmer parts of Europe, and is raiſed in our gardens. The ſeeds have formerly been brought from the ſouth of France; they are ſmall, ſmooth, ſlippery, of a ſhining brown colour, of an oblong flattiſh figure, ſuppoſed to reſemble that of a flea, whence the name of the plant.

A dram of the ſeeds renders a pint of water moderately ſlimy, and gently laxative. See Raii Hiſt. Lewis's Mat. Med.

PTARMICA, called alſo *pſeudo-pyrethrum*, *dracunculus pratenſis*, *draco ſylveſtris*, *ſternutatoria*, SNEEZE-WORT, BASTARD PELLITORY. It is the ACHILLEA PTARMICA of Linn. It is a plant with long, narrow, ſerrated leaves, and radiated diſcous flowers, ſet in form of umbels on the tops of the branches. It is perennial, grows in moiſt ſhady grounds, and flowers in June, &c. throughout the ſummer. The roots have a hot biting taſte, much like that of pyrethrum, with which they agree in their pharmaceutic and medical properties. See Lewis's Mat. Mat.

PTERIS. See FILIX.

PTERNA. See Os CALCANEUM.

PTERO-CARPUS. SANTOLINUS. See SANTALUM RUBRUM.

PTERYGION, } A film FILM ON THE EYE, called
PTERYGIUM. } a WEB. See ALBUGO and UNGUIS. In Celſus, lib. vi. cap. 19. it is a diſorder of the fingers, which he thus deſcribes: "In the nails there is a ſpecies of caruncle, accompanied with great pains, which the Greeks call *pterygion*." To theſe a mixture of alum and honey, in equal parts, is applied.

PTERYGODEES. So Hippocrates calls thoſe people whoſe cheſts are narrow and flat, ſo that their ſcapulæ are prominent, like wings. Such perſons are ſubject to conſumptions.

PTERYGOIDEUS EXTERNUS, vel MINOR, called alſo *alare externum*, from taking riſe from the wing like proceſſes of the os ſphenoides. Fallopius firſt deſcribed theſe muſcles. They riſe from the ala externa, and from the neighbouring parts of the os ſphenoides, and are inſerted into the neck of the condyle of the lower jaw, and likewiſe into the cartilage of the condyle, which cartilage is hollowed, to move upon the tuberoſity of the os temporis.

—— INTERNUS, vel MAJOR. It riſes from the cavity between the lamellæ of the proceſſus *pterygoidæus*, and is inſerted into the inſide of the angle of the lower jaw. It lies on the inſide of the lower jaw, almoſt as the maſſeter does on the inſide, being of the ſame figure with it, only it is ſmaller and narrower.

—— PROCESSUS, from πτερυξ, *a wing*, and ειδος, *form*, alſo called *aliformis*. See SPHENOIDES Os.

PTERYGO-PALATINUS. See SPHENO-PTERYGOPALATINUS.

PTERYGO-PHARYNGÆI, from πτερυξ, *a wing*, and φαρυγξ, *the palate*. It is a name of the *cephalo-pharyngæus*. In the edge of the internal alæ of the apophyſes pterygoidæi, theſe muſcles riſe, then run backward, and are inſerted into the linea alba of the pharynx. See PHARYNX.

PTERYGO STAPHYLINUS SUPERIOR. The muſcles which bear this name are only the external portions of the ſpheno-ſalpingo-ſtaphylini.

—— STAPHYLINUS INFERIOR. Theſe muſcles are very ſmall. They are inſerted at one extremity into the uncus pterygoidæus, and by the other into the ſeptum, near the uvula.

PTILOSIS, from πτιλος, a perſon who hath loſt his eye-laſhes. A baldneſs of the eye-laſhes, from a callous thickening of the edges of the eye-lids, ſo that it is a complication of a madaroſis, and a hard lippitude.

PTISANA, vel PTISSANA, from πτισσω, *to decorticate, bruiſe* or *pound*. PTISAN or PTISSAN. Properly it is barley deprived of its hulls; or *pounded* barley, becauſe formerly the barley was *decorticated* by *pounding*, after having ſteeped it a little in water, and then it was dried. After this *pounded* barley was ground into meal, it was made into balls by firſt boiling, and then drying it to a due conſiſtence for this end.

Ptiſan was alſo made of other kind of grain; but then to *ptiſſana* was added the name of the grain from which it was made.

A quantity of theſe *ptiſans* was boiled in from ten to fifteen times their quantity of water, until the meal ſwelled very much; then they added a little vinegar, a little oil, and a ſprinkling of ſalt. The *ptiſan* thus boiled is called *cremor*, the cream, or ſoup of *ptiſan*; the broth, gruel, or juice of *ptiſan*. HIPPOCRATES to this applies the word *adipſon*, becauſe by its glutinouſneſs it prevents or cures thirſt.

PTOSES. Tumors cauſed by protruſion, called alſo *phalangoſis trichia*.

PTOSIS, from πιπτω, *to fall*. It is a diſorder conſiſting in the deſcent of the upper eye-lid, either on account of a palſy of the muſcles which ſhould elevate it, or a flux of humours which depreſs it. It is the *blepharoptoſis genuina* of Sauvages. In the London Medical Journal, vol. iv. p. 340. notice is taken of a patient afflicted with a periodical complaint of this ſort, which returned at irregular intervals. Smoking tobacco never failed to bring it on, and the patient obſerved, that by putting on a pair of ſpectacles he inſtantly got rid of the paroxyſm, and prevented its return, ſo that at laſt he ſeldom went without them. After cleaning the primæ viæ, our author adminiſtered aſſa fœtida and valerian, and at the ſame time directed a bliſter to be applied to the patient's forehead near his eye-brows. After this the complaint never returned. In another caſe, the diſeaſe was occaſioned by an injury done to the muſculus levator palpebræ ſuperioris, ſome of the fibres of which were lacerated, ſo that the patient was unable to raiſe that portion of the eye-lid. The diſeaſe was cured by dividing the lacerated fibres with a knife. In a third inſtance, the complaint was purely ſpaſmodic. The patient was a young woman twenty years of age, who was ſubject to occaſional ſpaſms, not only of her eye-lids but of the other muſcles of her face. In this caſe the affection gave way to muſk and ſmall doſes of emetic tartar.

PTYALISMOS, or PTYALISMUS. A frequent and copious diſcharge of ſaliva; but at preſent is generally underſtood to be a ſalivation excited by mercury. See SALIVATIO. Dr. Cullen places this genus of diſeaſe in the CLASS LOCALES, and ORDER APOCENOSES, which he defines a flux of ſaliva, and ſays, if this is ever to be conſidered idiopathic, it is when it ariſes from relaxation. It is generally ſymptomatical, of which no leſs than nineteen ſpecies are enumerated. A ſingular caſe of a troubleſome *ptyaliſm* being cured, by chewing dry bread, and ſwallowing it, is related in the Lond. Med. Tranſ. vol. ii. p. 34. &c.

PUBA. See CASSADA.

PUBIS INTEROSSEUM LIGAMENTUM. It is a ſtrong triangular membrane, fixed by two of its edges in the inferior branches of theſe bones, all the way up to their common ſymphyſis; the third edge, which is the loweſt, is looſe: and this whole membrane, the middle of which is perforated by a particular hole, is ſtretched very tight between the two bones, and under their cartilaginous arch, to which it adheres very cloſely.

—— OSSA, alſo *epheba̅on*; *epiſchion*; *pecten-cteis*; *pubes*, or SHARE-BONE, *epiſtion*. They are ſituated in the middle, anterior, and internal part of the os innominatum. On their ſuperior part is a ridge, which runs on a continued line with another of the os ilium: it diſtinguiſhes the cavity of the belly from that of the pelvis. Betwixt the *pubes* and iſchium, is the foramen magnum ovale, which

in the recent ſubject is filled up with a ligament. The ſymphyſis of the os *pubis* is a compoſition of two cartilages and one ligament; the two cartilages cover the ſurface of each bone, and the ligament is betwixt them. On this ſymphyſis, ſee Dr. Hunter's Obſ. in the Lond. Med. Obſ. and Inq. vol. ii. p. 333.

As a ſubſtitute for the Cæſarean operation, the ſection of the ſymphyſis of the *pubis* is ſubſtituted by the French, and is thus directed to be performed: the inſtrument uſed on this occaſion, is a common diſſecting knife with a convex edge, a little blunt in the point, leſt it ſhould injure the bladder, and rather thin, becauſe it cuts the better. The proper ſituation for performing this operation, is to place the woman on her back at a height convenient to the accoucheur; the thighs being ſomewhat opened, and the mons veneris being ſhaved, introduce a catheter into the bladder. The inferior part of the integuments muſt be drawn down, and the inciſion begun about two or three lines above the *pubes*, and no higher. The firſt inciſion muſt not be carried further than the middle of the ſymphyſis. Another method may be uſed; viz. take the integuments between the fingers on each ſide the ſymphyſis, and make the inciſion in the middle: this way would be eaſier for the ſurgeon, and leſs painful for the patient: but the tenſion of the integuments makes it difficult. From this firſt inciſion you will have but little hæmorrhage, and the cartilage will be expoſed to the ſight, ſo that you may chuſe exactly where to proceed with the next inciſion. By cutting in the middle of the ſymphyſis, the ſuſpenſory ligament of the bladder will be divided, and in procuring the neceſſary ſeparation, it will be lacerated, which may occaſion an incontinence of urine. There are caſes, in which this complaint can be attributed to no other cauſe than the laceration or relaxation of the ligament of that viſcus; it will therefore be right to avoid cutting in the middle of the cartilage. There are ſeveral advantages from cutting on either ſide: 1ſt. Part of the ſuſpenſory ligament of the bladder will be preſerved; and it is likely by ſo doing, that the bone on that ſide will be touched; the ſhooting out from it will procure a ſpeedy agglutination and reunion: 2dly. The left *pubes* appearing after the ſection to recede more than the right, there will be a greater opening on that ſide: beſides, 3dly. The neck of the bladder being rather more inclined to the right, and the fundus being ſo always, all theſe reaſons ought to determine us rather to chuſe the left ſide. The integuments being cut as far as the middle of the *pubes*, the ſuperior part of the cartilage will be expoſed; you muſt then begin the inciſion, and continue it as far as the ſymphyſis, taking care to direct the catheter to the ſide oppoſite that on which the operation is performed; then finiſh the ſection of the integuments, and afterwards that of the cartilage. As you are in the moſt danger of wounding the bladder in dividing the upper part of the cartilage, it is very important not to be obſtructed by any hæmorrhage. This method, on account of its facility and readineſs, together with its ſucceſs, ſeems hitherto to be the beſt. The moment the ſymphyſis is divided, the *pubes* recedes, and this the more, according as the thighs are kept opened. If the ſeparation is very ſudden and conſiderable, as the poſterior articulations act in the nature of hinges, the interior ligaments which cover them will be diſtended too ſuddenly, which may be of bad conſequence; it is therefore adviſeable to keep the thighs moderately opened during the operation; and afterwards, upon raiſing them, to widen them gradually, until you have obtained the ſeparation neceſſary to finiſh the delivery.

With regard to the delivery, if the child preſents by the head, ſome adviſe to leave it to nature; I hope the following reaſons will induce to a different practice. After the ſection there is an arterial hæmorrhage, but however trifling it is, we ſhould not diſregard it. If, after the operation, we leave delivery entirely to nature, it would probably occaſion pains in the poſterior articulations, irritate and inflame the ſurrounding parts; hence, we ought not to leave the expulſion of the child to nature. As to the forceps, inaſmuch as they are ſuppoſed to diminiſh the ſize of the head, they appear to be of ſome uſe, but their preſſure is often of fatal conſequence, the beſt way is, to turn the child, and deliver it footling; after which the woman's thighs are to be lowered and placed near one another. The integuments which were greatly diſtended during pregnancy, now will ſubſide, ſo as to cover the ſymphyſis. A bladder muſt be fitted to the end of the catheter, in order that the patient may not be obliged to ſtir when ſhe wants to diſcharge her urine, and alſo in caſe the bladder hath been injured, that the wounded part may heal without any inconvenience from urine.

As to the wound, nothing more is neceſſary than dry lint, moiſtened with brandy, beat up with the white of an egg, and diſcutient embrocations upon the poſterior articulations of the pelvis. A bandage muſt be applied, to keep the parts in contact, to which there muſt be two tapes faſtened, to be conveyed between the legs, and tied before. The mother ſhould ſuckle the child for eight or ten days, to prevent bad conſequences from the milk; laxatives, with tonics, may then be directed, according to circumſtances. Care muſt be taken to keep the parts at reſt as much as poſſible, in order to favour a ſpeedy reunion. There is great reaſon to expect, that by obſerving the above directions, the cure may be effected in about three weeks in general, and that without any alarming ſymptoms.

Mr. Sigault, of Paris, is the firſt who propoſed and performed this operation, in which he was aſſiſted by M. le Roy, M. D. of the ſame place. They, with ſome others, obſerve, that the bones of the pelvis are connected by a ſubſtance which, during the latter period of pregnancy, ſwells and ſoftens, ſo that it may very eaſily be cut through; and that by ſuch an inciſion the two fore parts of the *pubes* recede from each other to the diſtance of from two inches to two inches and a half, more or leſs, according to the ſwelling and ſoftneſs in the cartilaginous ſubſtance: thus the capacity of the pelvis is enlarged; for, in proportion to the ſeparation of the *pubes*, they alſo diverge forwards.

When the diameter of the brim of the pelvis from the ſacrum to the *pubes*, meaſures from two inches and a half to three inches and a quarter, this operation is recommended.

See Dr. Le Roy's Practical and Hiſtorical Enquiries, on the Section of the Symphyſis of the *Pubes*.

On this ſubject it may be proper to relate ſomething of what has been attempted in England, with a view to eſtabliſh the practice of it, particularly in ſuch caſes as have hitherto demanded the ſeverer operation called the Cæſarean ſection. To Dr. Leake we are indebted for a caſe, in which the requiſites are afforded, for an encouraging view of this new operation; alſo for anſwers to the objections advanced in oppoſition to it. The reaſons for preferring it are as follow: In December, 1778, a woman died in the Weſtminſter Lying-in Hoſpital about a fortnight after her delivery; after the neceſſary examinations for the cauſe of her death, the *ſection of the ſymphyſis pubis* was performed in order to aſcertain *how much ſpace may be gained between the divided bones*. The cartilage being laid bare, it was cut through with great eaſe, and without wounding the neck of the bladder, or any of the contiguous parts. The *oſſa pubis* immediately receded from each other about one inch, and with very gentle force were ſeparated *two inches and an eighth*. The contents of the pelvis were afterwards removed, and on examination, the internal poſterior ligaments of the bones of the pelvis were neither lacerated, or in the leaſt injured.

The objections, with Dr. Leake's anſwers, are as follow: firſt, that the cartilage at the ſymphyſis of the *pubes* may happen to be oſſified, which would prevent its diviſion with a knife. It is anſwered, that cartilage being a ſubſtance eſſentially diſtinct from bone, is never found oſſified, except in a *præternatural ſtate*; or in *old age*, after the time of child-bearing is paſt, and where there could be no occaſion for the operation. Secondly, the neck of the bladder may be wounded. It is anſwered, the neck of the bladder being only ſlightly attached to the ſymphyſis of the *pubes*, by cellular membranes, and not in cloſe union with the cartilage, there *never can be the leaſt danger of wounding it*, except through ignorance of the ſtructure and ſituation of the parts. Thirdly, that the ſpace gained by the ſection of the *pubes*, may not, in a narrow pelvis, be ſufficient to allow the child's head to deſcend through the cavity. It is anſwered, in the caſe of Mrs. Braſier, M. Le Roy found a ſeparation of *two inches and a half*: and as the caſe at the Weſtminſter Lying-in hoſpital affords inconteſtible proof, that, after the ſection of the cartilage, the bones of the *pubes*, without violence, receded from each other full *two inches and an eighth*; there can be no doubt but ſo much additional ſpace will, in general, be ſufficient to let the child's head paſs, even in a pelvis ſo preternaturally narrow, that no other means but the Cæſarean operation could be deviſed for its birth. It is generally allowed, even by the opponents of this operation, that the ſpace gained by the aperture between the divided bones, is nearly *two inches and a half*, even in the dead body, which

is

is leſs yielding than the living one; and, it may be added, that the ſpace gained from the ſacrum to the *pubes* will be equal to the enlargement of the pelvis from ſide to ſide. Fourthly, that the union of the cartilage may not be effected. It is anſwered, from obſervations and unqueſtionable authority of Petit and De la Faye, we are aſſured, that cartilages will as firmly unite after diviſion as bones after a fracture. But to put this matter out of doubt, Camper, a Dutch phyſician, made experiment upon a quadruped, by cutting through the cartilage of the *pubes*, and after diſſecting the parts, he found they were firmly united. Fifthly, that the internal poſterior ligaments uniting the ſacrum and ilia, may be torn aſunder, by dividing the bones of the *pubes*. It is anſwered, reſpecting this, we may refer to the caſe above mentioned at the Weſtminſter hoſpital, where the ſection of the *pubes* was made in the preſence of ſixteen medical gentlemen, and where, notwithſtanding the ſpace gained was two inches and an eighth, no laceration, or the leaſt mark of violence appeared; but, on the contrary, theſe ligaments were found perfectly firm, and in their natural ſtate.

If a comparative view is taken of the Cæſarean operation, and the ſection of the *pubes*, the advantages are conſiderably in favour of the latter. The ſection of the *pubes*, which allows the child to be born by the natural paſſage, carries not with it thoſe ideas of cruelty which attend the Cæſarean operation, where the patient is, as it were, emboweled alive. No formidable apparatus is neceſſary, the ſection being made with expedition, and without pain or danger; no blood-veſſel, nerve, or other parts, eſſential to life, are wounded: thoſe divided, being only cutis, cellular membrane, and inſenſible cartilage, from which neither hæmorrhage, or ſymptomatic fever are to be apprehended. Theſe are my reaſons for preferring the ſection of the *pubes*, by which the mother and the child may probably *both be ſaved*; but where the mother, at leaſt, to whoſe ſafety our principal attention ſhould be directed, would generally be loſt by the Cæſarean ſection.

See Practical Obſervations on the Child-bed Fever, by Dr. Leake, edit. 5. page 238—255. See alſo Comparatio inter Sectionem Cæſaream & Diſſectionem Cartilaginis & Ligamentorum Pubis in Partu, &c. Auctore, C. C. Siebold, M. D. London Med. Journal, vol. iv. p. 141 Bell's Surgery, vol. vi. p. 143.

Dr. Hunter is leſs ſanguine with reſpect to this operation. He very early ſuggeſted its difficulties and diſadvantages; and ſince that, Dr. Walter, of Berlin, diſputes its uſefulneſs ſo much, as to prefer the Cæſarean operation to it. See his work De Diſſectione Synchondroſeos Oſſium Pubis in Partu difficili.

PUDENDA, the GENITALS, the ſame as ÆDOIA, called alſo *patrimonium*; *naturalia*; by PARACELSUS, *chordæ*. See GENERATIO.

PUDENDI ABSCESSUS. See ALÆ.

—— ARTERIA. See PUDICA ARTERIA.

PUDENDAGRA, from *pudendum*, and ἀγρα, *captura*, alſo called *cedma*. So ſome have called the venereal diſeaſe; *pudenda*, from *pudor*, *ſhame*. Others define it to be, pain or uneaſineſs in the genital parts of men or women, ſomewhat reſembling a diarrhœa, but without a dyſuria. But Dr. Berdoe aſſerts, in his Eſſay on the *Pudendagra*, that it is diſtinct from the venereal diſeaſe, and alſo that it is proper to women. It is an affection of the uterus alone in the beginning, however other parts may ſuffer in time. The prediſpoſing cauſe is a too rigid chaſtity, or a deprivation of the venereal act; the primary cauſe is a morbid affection in the nerves of the uterus; and the more immediate cauſe is an indulgence of the venereal appetite, at times when the uterus is ſo diſordered as to ſuffer thereby. An exceſſive flux of the menſes, and the fluor albus, aggravate the *pudendagra*, which is not properly confirmed until the uterine nerves having entirely loſt their ſenſibility, are no longer capable of diſtributing the menſtrual flux. Exceſſive venery haſtens the inſenſibility of the uterine nerves.

The *pudendagra* may affect the conſtitution many years without ſpreading its influence beyond the limits of the uterus.

In this diſorder there is a diſcharge of a purulent ichorous matter from the uterus, which may produce ſome inflammatory ſymptoms in the penis when a man cohabits with a woman who is thus affected; but though the woman is a great ſufferer, the infection which the man receives is ſoon removed by bleeding, and a few doſes of manna, or other more cooling laxatives.

On diſſecting thoſe who have died whilſt labouring under the *pudendagra*, it hath been obſerved, that the parts leading to the uterus were particularly relaxed, and that the uterus itſelf was enlarged by ſcirrhous and other tumors.

PUDENDORUM CARIES. See CHANCRE.

PUDENDUM MULIEBRE, called alſo by ſome *hortus*; *porcus*; *boubalios*; *byſſus*; *caverna*; by others, though not medical writers, *amphicauſtis*. The external *delta*, the hairs on which are named *gynæcomyſtax*. See GENERATIO.

PUDENDUM VIRILE, called alſo *genitura*. See GENERATIO.

PUDICA vel PUDENDA ARTERIA. It comes out between the pyriform muſcle, and the ſpine of the iſchium; it runs downwards between the two ligaments, the one of which comes from the tuberoſity of the iſchium to the ſacrum, and the other from the ſpine of the iſchium to the ſacrum, on the inſide of the tuberoſity: as it goes on, it gives ramifications to the anus, which are called the *external hæmorrhoidal*, and then goes to the crura penis.

PUDICÆ EXTERNÆ ARTERIÆ. See CRURALES ARTERIÆ.

PUDICÆ EXTERNÆ VENÆ. As the crural vein paſſes from under the ligamentum Fallopii, it ſends out branches to the inguinal glands, the muſculus pectineus, and the parts of generation; theſe are called *pudicæ externæ*, and they communicate with the *pudicæ internæ*.

—— INTERNÆ VENÆ. The veins that ſpread about the parts of generation are thus called. They are branches from the venæ hypogaſtricæ.

PUERITIA. See ÆTAS.

PUERPERA. A LYING-IN WOMAN. Much care is uſually neceſſary when women are in this ſtate, for they are liable to many diſorders. As ſoon as delivery is effected, the woman ſhould have every thing that is wet removed; dry warm linen ſhould be in readineſs for her uſe; and as oft as they become very wet with the uſual diſcharges, freſh ones ſhould be ſupplied. If fainting fits come on after delivery, let the patient be laid with her hips higher than her head. It is generally neceſſary to keep the breaſts warm, by means of flannel cloths, until the milk flows freely. The air in the room ſhould be kept warm or cool, as is moſt agreeable to the ſenſations of the *lying-in-woman*. During the firſt three or four days, the diet ſhould be thin, but yet not ſo as that the ſtrength is not duly ſupported by it. The common allowance is caudle, which is oatmeal boiled in water until it is of the conſiſtence of a thin jelly, and then rendered agreeable to the palate, by the addition of a little ſugar, and as much ale as will make it duly cordial; it is then called BROWN CAUDLE; but if inſtead of ale a quantity of wine is added, it is named WHITE CAUDLE. If the ſtomach is ſubject to windineſs and acidity, the addition of a little brandy is to be preferred. Reſt muſt by every means be promoted; and, if required, opiates may be given for this end. Nor ſhould the neceſſary care to keep up a gentle perſpiration be wanting. Coſtiveneſs ſhould be guarded againſt, notwithſtanding that a diarrhœa at this time would be an unfavourable circumſtance. The child ſhould be applied to the breaſt in about ten or twelve hours after its birth, if the mother intends to ſuckle it; for the ſooner the ſecretion of milk can be promoted, the leſs danger will there be of the fever called a milk-fever.

PUERPERILIS FEBRIS. The PUERPERAL FEVER, or the CHILD-BED-FEVER. A fever happening from any diſeaſe in conſequence of pregnancy, or delivery of a child, and happening during the time of lying-in, may properly be called a *puerperal fever*. This is Dr. Cullen's PERITONITIS OMENTALIS. See PERITONITIS.

The cauſes are various, and ſometimes the diſorder is inflammatory, but it ſoon tends to the putrid kind; it often is from the beginning a putrid fever. The omentum and peritoneal coat of the inteſtines are generally the parts inflamed, but other of the abdominal viſcera may be alſo thus affected; but which ever of them is the ſeat of inflammation, a putrid matter is ſoon abſorbed therefrom, or there is an abſorption of putrid matter from without. But notwithſtanding that in many inſtances the womb hath been found, on diſſecting the deceaſed body, to be free from any appearance of a diſeaſe, *it is moſt probable that the origin of this fever is ſometimes in that viſcus*. Conception is immediately followed with an increaſed ſpaſmodic irritability, which produces the ſymptoms of pregnancy: this irritability is increaſed by labour. In the pregnant ſtate the uterus is more irritable than uſual, and this circumſtance extends itſelf throughout the whole frame, whence pregnant women are violently affected by any cauſe that can increaſe their preſent preternatural ſtate, and hence the taking of cold, being kept too hot, or any

other

other circumſtance that can excite a fever, may now be the cauſe of that which comes under this denomination. —*The occaſional cauſes* may be a ſudden emptying of the womb, when there was a great quantity of water contained in the membranes; for then the blood ruſhing into the emptied parts with too much violence to be returned, excites inflammation there;—coagulated blood lodged in the uterus, after delivery, and becoming putrid by the acceſs of the air;—obſtructed lochia,—a putrid air,—the coming of the milk,—inflammation in the breaſts,—the abſorption of acrid milk, and the retention of the excrements. Dr. Hulme, and many others ſuppoſe, *that an inflammation of the omentum and inteſtines* is always the cauſe of this fever, to which they are prediſpoſed by the preſſure of the gravid uterus.

In the *puerperal* ſtate, the following diagnoſtics, which attend, according as the cauſes are various, ſhew the preſence of this fever. At firſt rigors come on, which are followed by a quick, weak pulſe, thirſt, pain in the head, want of ſleep, ſighing, load at the præcordia, reſtleſſneſs, great weakneſs, dejection of ſpirits, a wildneſs or elſe deſpair in the countenance, and often an inflammation in the eyes;—ſometimes there is a difficulty of breathing, pain in the ſide, the ſkin is dry, the tongue is of a gloſſy brown colour, and alſo very dry;—ſometimes in the advanced ſtage of the fever, if a hand is laid on the patient, one feels the ſame kind of prickling ſenſation in a leſs degree, as is felt after having the fingers in warm putrid blood. There is nothing to be learnt from the urine, as it is mixed with black putrid blood, which is conſtantly drained through the vagina. A diarrhœa ſoon follows the feveriſh ſymptoms, the ſtools are fetid, liquid, and blackiſh; the tongue is browniſh, or of a reddiſh colour; the ſkin is very dry and hot; often there are aphthæ in the mouth; the breaſts are flaccid, and upon drawing them, blood, inſtead of milk, is frequently diſcharged. Milk may indeed appear in the breaſts when the putrefaction is ſeveral days before it takes place, yet they ſoon become perfectly flaccid. Sometimes the belly ſwells during the courſe of the diſeaſe; *but a forenefs and tenderneſs of it, is a never-failing attendant ſoon after the fever begins.* Dr. Hulme obſerves, that as the child ſeems chiefly ſupported in the abdomen, by reſting upon the brim of the pelvis, the greateſt preſſure will commonly be upon the ſmall inteſtines, either on the right or left iliac region, or directly in the middle above the os pubis; and from this circumſtance he accounts for *the pain and tenderneſs of the hypogaſtric region, which is the conſtant and inſeparable companion of this diſeaſe*, and *therefore conſtitutes the chief pathognomonic ſymptom:* a delirium is common through a great part of the diſorder.

It may be obſerved that a tenderneſs and foreneſs in the belly, or flaccidneſs of the breaſts, are not to be feared if there is not a fever at the ſame time.

When an inflammation of the uterus is the cauſe, the pulſe is quick, a fever attends, pains reſembling after-pains, and which ſhoot from the loins and belly into the groin and thighs, without any perfect intermiſſions; ſoon after theſe ſymptoms, the anus and the neck of the bladder ſometimes become very ſenſible; the tongue is white and moiſt; the belly coſtive; the lochia are ſuppreſſed, or only a brown ichor is diſcharged from the uterus. The breaſts are flaccid.

When this fever is produced by inflammation of the abdominal viſcera, a dull weight and pain at firſt is felt in the belly, the pulſe is not very quick, nor the heat very conſiderable; the patient is generally coſtive; but ſometimes the fever runs higher, and a diarrhœa comes on, and in general the patient is affected like thoſe who die of bruiſes in the belly.

If putrid effluvia from without are the cauſes, they at the firſt occaſion ſymptoms of local inflammation, yet the diſorder may be diſtinguiſhed from an original diſorder of the uterus, unleſs the patient is ſeized with an epidemic diſeaſe previous to, or during labour, by the lochia being at firſt regular, and the after-pains, if there are any at the ſame time, unaccompanied with ſymptoms of inflammation.

Theſe ſymptoms are generally more or leſs of them in all theſe fevers, be the cauſe what it will. They vary alſo according to the time of ſeizure, as well as from the difference of cauſes. The pulſe is commonly more quick in *puerperal* than in other fevers, becauſe of the extraordinary irritability attendant on thoſe patients; and in conſequence of the diſcharges during delivery, it will be generally very weak.

The *puerperal fever* ſhould be diſtinguiſhed from the milk-fever, from after-pains, and from colic-pains.

A ſmall degree of fever in lying-in women is more dangerous than in any other ſtate. That ſtate of increaſed irritability, &c. which renders lying-in women liable to ſo many accidents, ſeems to be much abated after the diſcharge of the lochia, and the coming of the milk; whence, after theſe, whatever diſorders attend, their danger will be conſiderably leſſened.

IN ORDER TO THE CURE, if the patient did not loſe much blood in the time of delivery, and the pulſe is full and quick, take away a little; but if the evacuation when delivered was ſufficiently large, though the pulſe is hard, defer bleeding, and proceed with ſuch medicines as the caſe requires. If the patient is coſtive, a clyſter may be given; and after it, a dram of natron vitriolatum every three or four hours, or at greater intervals, according to the effect produced by each doſe; if the ſalt runs too faſt through the bowels, a few drops of the tinct. opii will reſtrain it. If the ſalt is rejected, give two or three grains of calomel, with half a grain of the antimonium tartariſatum. After a few ſtools, antiphlogiſtics and ſudorifics may be uſed, e. g. ℞ Kali acetati, ʒ ſs. vin. antim. gut. xxx. vel antimonii tartariſati, gr. ½ aq. diſtill. ℥ j. ſyr. ſacch. ʒ ij. m. f. hauſt. 4ta vel 5ta quaq. hora. If theſe run off too freely by ſtool, add to each doſe two or three drops of the tinct. opii. If a ſweat comes on, continue theſe draughts; if not, when there ſeems to be no farther need of evacuating the inteſtines, give the following bolus and draught every four or five hours.

℞ Sal ammon. crud. gr. xv. vel ℈ i ſp. ceti & pulv. e. chel. c. āā gr. x. conſ. lujulæ q. f. f. bol.

℞ Aq. ammon. acetat. & aq. menth. ſat. āā ℥ i. m. f. hauſt. theſe produce a ſweat.

The patient's drink may be tepid or cold water, in which toaſted bread is ſteeped.

A mixture of ſpiritus ammoniæ compoſitus and water, in equal parts, may be rubbed on the belly.

Hitherto the diſorder is conſidered in its firſt or inflammatory ſtate;—but if a diarrhœa comes on, THE PUTRID OR SECOND STAGE is commenced. The diarrhœa is not to be immediately or ſuddenly checked, but nature muſt be aſſiſted by rendering the matter leſs active which irritates the inteſtines, by correcting the whole ſtate of the fluids, by leſſening the irritability of the habit, that the materia morbi may have the leſs effect, by giving antiſeptic diuretics, and by defending the nerves of the primæ viæ againſt irritation, ſo that, whatever putrid matter gets into the inteſtines, it may paſs off without acting as a violent purge. The columbo-root with rhubarb may be given as a cordial, to leſſen irritability, and carry off putrid matter from the primæ viæ; and the above purpoſes are anſwered where the pulſe is full, and the heat great, by giving a powder compoſed of the pulv. flor. chamomil. and amyli; this may be repeated every four or five hours with a little ſp. æth. nitroſi, vel acid. muriaticum, in any thing that the patient drinks. But in this ſecond ſtage of the fever, the bark is moſt to be depended on; as ſoon as the pulſe ſinks, and the heat is leſſened, or that the ſtomach will bear it, it hath relieved both the fever and the diarrhœa, by going off in two or three ſtools, and a ſweat; but whilſt the heat is conſiderable, always join a little of the ſp. ætheris nitroſi with every doſe of the bark; and if two or three drops of the tinct. opii are alſo added, the heat is more effectually abated, provided it does not wholly ſuppreſs the purging. If the diarrhœa goes off without the fever abating, inſtead of tinct. opii, give rhubarb with the bark. If the pulſe ſinks, and the nervous oppreſſion comes on, the miſtura camph. will leſſen preternatural irritability, keep the diarrhœa within bounds, and by its immediate action on the nerves, revive and ſupport the ſpirits; an ounce is a ſufficient doſe, and may be repeated every four or five hours. What the patient drinks may be acidulated with the acid. muriaticum.—*When blood pent up in the uterus corrupts there, and gives riſe to this diſorder*, however inflammatory the firſt ſymptoms may appear to be, bleeding muſt be omitted; purging and ſaline medicines are alſo alike improper; the abſorbed matter is more than ſufficiently attenuating, and often cauſes greater diſcharges by ſtool than the patient can bear; in this caſe, give a doſe or two of rhubarb, with the columbo-root, to evacuate the bowels, and then ſupply the patient with antiſeptics as above, of which the chief is the bark.—If the patient is weak, join the rad. ſerp. V. with the bark.—If the fever is cauſed by obſtructed

ſtructed lochia, from inflammation, give antiphlogiſtics, but, if the lochia is obſtructed from the coagulated blood choaking up the os uteri, internal medicines are uſeleſs —If a putrid air produced this fever, the mucus, the bile, &c. in the primæ viæ will be contaminated, and unleſs removed, will be a conſtant fomes to the diſeaſe; in this caſe begin with an emetic, keep the room filled with pure cool air: the emetic ſhould be given before the inflammation of the viſcera comes on. If it does not give way to this treatment, the diſeaſe is deeply ſeated, and an abſorption of putrid matter from the uterus may be ſuſpected to contribute to the diſorder, or that the blood is contaminated and then the above antiſeptics will be required. In the epidemic *puerperal fever*, which ſometimes occurs in hoſpitals, no practice which yet has been recommended has proved ſucceſsful in the cure; but, by way of ſtopping its progreſs, cleaning the wards, white-waſhing them, and purifying the beds and bed-cloaths, by airing them well, and expoſing them to heat, &c. have had the deſired effect; and, when this fever has ariſen in private practice, from ſome accidental cauſe, an early uſe of ſaline purgatives, and warm fomentations, have been, from experience, conſidered as the moſt ſucceſsful method of treatment. See Clark's Paper on the Puerperal Fever. Med. Comment. Edinb. 1790. Dr. Foſter's Principles and Practice of Midwifery. Kirkland, Denman, Holme, Leake, and White, on the *Puerperal*, or Child-bed Fever. London Med. Journal, vol. iii. p. 411.

PUGILLUS. A PUGIL. Called alſo *dragmis*. The eighth part of an handful.

PULEGIUM. PENNYROYAL. It is a plant of the mint kind, differing from the mints ſtrictly ſo called, in the flowers being diſpoſed, not in ſpikes on the tops, but in thick cluſters at diſtances round the joints of the ſtalks, and the upper ſegment of the flower not being nipped at the extremity.

PULEGIUM VULGARE, called alſo *pulegium regale*, *pulegium* latifolium *glechon*. PUDDING-GRASS, COMMON PENNY-ROYAL. It hath oval obtuſe leaves, and trailing ſtalks, which ſtrike root at the joints. It grows wild on moiſt commons, and flowers in June. It is the MENTHA PULEGIUM *floribus verticillatis, foliis ovatis obtuſis ſubcrenatis caulibus ſubteretibus repentibus, ſtaminibus corolla longioribus*. CLASS DIDYNAMIA. ORD. GYMNOSPERMIA. Linn. Gen. Plant. 713.

All the *pennyroyals* are warm and pungent, ſomewhat ſimilar to mint, but more acrid, and leſs agreeable, both in ſmell and taſte. They are leſs proper than mint in the common naufeas, but more efficacious as warm carminatives and deobſtruents in hyſteric caſes and diſorders of the breaſt. This ſpecies is the ſtrongeſt, though the leaſt ungrateful. This plant ſeems to poſſeſs the ſame powers as the menthæ, but in weaker degrees; it has been conſidered as uſeful in the chincough, as an antiſpaſmodic, and emmenagogue, but theſe powers are diſputable. Cullen's Mat. Med. However, HALLER recommends an infuſion of the herb, with ſteel in white wine, for promoting uterine evacuation, which he never knew fail of ſucceſs.

The active principle of the *pennyroyals* is their eſſential oil, which is more valuable than that of mint. It comes over at the beginning of the diſtillation with water, and riſes in great part with ſpirit of wine; it taſtes and ſmells ſtrongly of the plant. Its doſe is from gtt. i. to v.

The London College directs a ſimple water, and a ſpirit to be diſtilled from *pennyroyal*, from a pound of which they make a gallon of the aqua and ſpiritus *pulegii*; beſides the eſſential oil, which they order to be procured by diſtillation; but an infuſion of it is equal, if not ſuperior: and the whole virtue of the herb may be thus extracted, either by water or by ſpirit. See Lewis's Mat. Med.

PULICARIA. See CONYZA MINOR, &c.

PULICARIS HERBA. See PSYLLIUM.

—— MORBUS. See PETECHIA.

PULMONARIA. A name for the *muſcus pulmonarius*, and for the *hieracium Alpinum*.

—— MACULOSA, alſo called *pulmonaria* ſymphitum maculoſum, SAGE of JERUSALEM, JERUSALEM COWSLIPS and SPOTTED LUNGWORT. PULMONARIA OFFICINALIS Linn. It is an hairy ſcabrous plant, with leaves of a dark browniſh green colour on the upper ſide, and ſpotted for the moſt part with white; underneath it is of a paler green; the lower leaves are oval, and ſet on broad pedicles; thoſe on the ſtalks are narrower, long-pointed, ſet alternately without pedicles: the flowers are monopetalous, of a purple or blue colour, and ſometimes white, followed each by four ſeeds incloſed in the cup. It is perennial; it grows wild in many parts of Europe, and flowers in April or May. Their virtues are ſimilar to thoſe of the herb *adianthum nigrum*.

PULMONARIS ARTERIA. } See PULMONES.
PULMONARIÆ VENÆ. }

PULMONES. The LUNGS. They are two ſpongy bodies, which are reddiſh in children, greyiſh in adults, and bluiſh in the aged. They are divided into two principal lobes, which Hippocrates calls *hyperchoryphoſes*, which are incloſed in two diſtinct bags, formed of the pleura; ſo that the right and left lobes have not the leaſt communication. On the right ſide, the lobe is divided into three leſſer ones; one inferior, one ſuperior, and one anterior, the loweſt lying upon the diaphragm. On the left ſide, there are two lobes divided by a fiſſure. The ſpace betwixt the *lungs* is filled up by the heart below; above by the thymus and trachea; behind by the œſophagus and ſpine. The *lungs* are narrow above, and broad below, correſpondent to the ſhape of the thorax. The *lungs* are univerſally covered on their external ſurface by the pleura, and an inner lamella of it runs into their ſubſtance, as we find in infants.

The whole maſs of the *lungs* is compoſed of air-veſſels, blood-veſſels, lymphatics, nerves, and cellular membranes.

The air veſſels are very ſmall branches continued from the wind-pipe, with which, in a ſound ſtate, they have a free communication, ſo as, at every inſpiration, to be filled with air. See BRONCHIA. The blood-veſſels are the pulmonary, and the bronchial arteries and veins. The pulmonary artery riſes from the right ventricle, runs upwards to the left of the aorta; on the curvature it divides into two branches, which diviſion lies before that of the trachea, the right branch is longer than the left, for the ſame reaſon as the trachea is ſo: juſt as it is plunging into the *lungs*, it divides into two or three branches. When this artery hath divided into very ſmall branches, they do not anaſtomoſe like the ſmall branches of the aorta, but they join again, and form veins, which uniting together, go to the left auricle of the heart, commonly in four or five trunks. The bronchial arteries. See ARTERIÆ BRONCHIALES. The large veſſels run in the large interſtices, and in the ſmall parts, the branches ſtill run on in the interſtices of ſmaller lobuli, and are connected by a cellular membrane, as in the other part of the body; at laſt the arterial ramifications terminate in a fine net-work, upon the cells called *rete Malph.* where it is ſuppoſed that the blood undergoes the alteration, as there it is neareſt to the air; from this net-work the veins begin, and carry the blood back. The *pulmonary artery* receives and returns the whole maſs of blood which circulates through the *lungs* before it paſſes to the reſt of the body, to the end that ſuch parts of this fluid ſhould be ſeparated, and carried off by reſpiration as they were unfit to be circulated, or unneceſſary in the œconomy of nature. The bronchial arteries are deſtined to the nouriſhment of the lungs. The lymphatic veſſels are diſtributed on the ſurface of the lungs, and convey the lymph which they imbibe to a certain duct, whence it is returned to the maſs of blood. The nerves are from the eighth pair chiefly; they are very ſmall branches. The cellular membrane fills up the intermediate ſpaces between the veſſels. See BRONCHIALES ARTERIÆ.

As to the uſe of the *lungs*, Dr. Rutherford, of Edinburgh, ſays, that the good ſtate of them ſeems to have an influence on ſanguification; he ſays, that they are of more conſequence than any other viſcus for making good blood, and that, whenever their action is weakened, the blood grows thinner in proportion. Many other conjectures are made on this ſubject; among which the moſt important are, that from the air received by inſpiration, a neceſſary principle is imbibed in order to life and health; and that with the air carried out from the *lungs*, a quantity of matter is alſo carried from the blood, which if retained, would either be a redundant load, or otherwiſe injurious. Dr. Prieſtley aſſerts, that a principal uſe of the *lungs* is, to carry off redundant phlogiſton from the blood.

The *lungs* differ from every other part of the body in many reſpects, particularly in the following: their ſubſtance is more vaſcular, and a greater quantity of blood paſſes through them in a given time. The aſpera arteria, minutely ramifying through every part of the ſubſtance, terminating in air-veſicles, is peculiar to them, and

by reſpiration they are kept in a perpetual motion; theſe differences ſubſiſt through life, in ſickneſs and in health. When the *lungs* are diſeaſed, their motion is not only increaſed by the reſpiration being quickened, but they ſuffer, for the moſt part, violent concuſſions by means of coughing. This circumſtance attending no other viſcus, renders ſuch diſorders more difficult to cure; for all authors agree in this, that reſt is abſolutely neceſſary to parts when inflamed. If by any means the cough could be prevented, it is moſt probable that diſeaſes of the *lungs* would be nearly in the ſame ſtate, and admit of a cure as readily as any other internal part, equally inflamed. The increaſed frequency of reſpiration does not appear to be in theſe caſes of great importance, becauſe it is natural and familiar, as it takes place upon any exertion or quick motion of the body.

PULMONIA. See PERIPNEUMONIA.

PULPA. PULP. It is a ſoft ſort of fruit which ſurrounds the ſeeds.

PULPEZIA. See APOPLEXIA.

PULSATILLA. NIGRICANS. Storck, Ph. Edinb. It is the ANEMONE *pratenſis* pedunculo involucrato, petalis apice reflexis, foliis bipinnatis. CLASS POLYANDRIA, ORD. POLYGAMIA. LINN. Gen. Plant. 694. It is a ſpecies of ANEMONE, much reſembling the *pulſatilla* vulgaris, or paſque flower; but its flower is leſs, and of a darker hue. It is a native of the ſouth of Germany, and other neighbouring countries. All the anemones have a conſiderable degree of acrimony; but this ſeems to poſſeſs the largeſt ſhare. The whole plant, when chewed, impreſſes the tongue with a ſharp, burning, durable taſte; the root is milder than the other parts. On diſtilling the plant with water, the liquor which comes over is ſtrongly impregnated with its virtues; and the remaining extract is alſo conſiderably active. From numerous trials, Dr. Storck, of Vienna, celebrates the efficacy of this plant in various chronic diſeaſes of the eye; in venereal nodes and nocturnal pains, in foul ulcers with caries, in ſerpigo, and ſuppreſſed menſes, he relates inſtances of its curing blindneſs of many years continuance, by diſſipating and diſſolving films and obſcurities of the cornea. In theſe caſes, its good effects were firſt indicated by conſiderable pain excited in the eye. The ſenſible operation of the medicine was naufea and vomiting, particularly when the diſtilled water was uſed; an increaſed flow of urine, and ſometimes gripes and looſeneſs, with increaſed pain at firſt in the affected parts. From all theſe circumſtances, the *pulſatilla* ſeems to be endued with very active and penetrating powers; yet ſuch as may be employed with perfect ſafety, if proper caution be uſed. Many German phyſicians have tried the effect of this remedy in diſeaſes of the eyes with ſucceſs; but Schmucker, Bergius, and Richter, bear teſtimony of its inefficacy in theſe diſeaſes, though the doſes were encreaſed beyond what Storck himſelf directed.

Dr. Cullen ſays this plant is an acrid ſubſtance, and therefore capable of being active; and from the ſingular matter reſembling camphor, which water diſtilled from it contains, it may have peculiar powers and virtues. But notwithſtanding from Storck's aſcribing to it ſuch wonderful virtues, it has been hurtt in the opinion of many. Dr. Cullen recommends the trial of it, in that otherwiſe incurable remedy, the amauroſis; as the diſeaſe may depend upon different cauſes, ſome of which may yield to remedies, though others do not. Materia Medica.

The doſes of the diſtilled water to adults is about half an ounce twice or thrice a day; of the extract, reduced to powder, with the addition of ſugar, five or ſix grains. The Edinb. College had adopted the diſtilled water of *pulſatilla*, but has now changed it for the extract. See Lewis's Mat. Med. edit. 3.

PULSUS, alſo *phlebopalie*. The PULSE. This is occaſioned by the reciprocal action of the heart and arteries, the blood being propelled from the left ventricle of the heart into the arteries, ſo as to be diſtributed through the whole machine, and in ſo perceptible a manner, that the diſtenſion of the arterial tube can be felt by the finger. But before the time of HIPPOCRATES, the pulſes were not attended to, and indeed very ſlightly by him, as there are only one or two places in which he makes mention of them, throughout the whole of his works. HEROPHILUS was the firſt who conſidered the pulſe with accuracy, and wrote elaborate treatiſes on it. In CELSUS's time the pulſe was very much attended to, and conſulted, though he calls it *res fallaciſſima*. GALEN, however, wrote moſt voluminouſly and laboriouſly upon this ſubject, a very good epitome of which may be ſeen in PROSPER ALPINUS *de Præſagienda Vita & Morte*. BOERHAAVE in his Inſtitutes, gives an account of all the ancients knew concerning the pulſe in a ſhort compaſs, which is well explained by his commentator, HALLER. Long experience, however, has rather confirmed than contradicted the opinion of Celſus, as moſt publications on this ſubject will ſufficiently prove to an accurate obſerver. For, notwithſtanding the multiplicity of pulſes which have been enumerated, it is to the different degrees of irritability in conſtitutions that the variety of *pulſes* is owing, with reſpect to their being quick or ſlow; every accident that happens to the body, and every affection in the mind, hath an influence on them; ſo that very little can be determined from them whence concluſions may be made in practice.—The *hard* and the *ſoft pulſe* are very often owing to a quantity of fat, or of a cellular membrane being ſituated betwixt the artery and the finger, or from the almoſt total abſence of theſe in this ſituation.—The *full* and the *ſmall pulſes* are owing chiefly to the different diameters of the arteries; and, except the *quick*, the *ſlow*, and *irregular pulſes*, there are none of the kinds which are ſo ingeniouſly diſtinguiſhed by authors, but what will, on proper enquiry, be found to be fallacious.

There are adults in health, whoſe *pulſe* exceeds not *forty* ſtrokes in a minute;—others, whilſt they are at reſt, have a *pulſe* ſo quick that it may be counted to 120, and during the preſence of a fever, *the pulſe* hath been obſerved in ſome inſtances to beat 220 times in the ſame ſhort period.

SCHWALBIUS, of Prague, contented himſelf with three *pulſes*, viz. the *equal* and *unequal*; the *quick* and *ſlow*; and the *ſtrong* and the *weak*.—SYLVIUS reduces *pulſes* to three kinds, viz. the *ſtrong* and *weak*; the *large* and *ſmall*; and the *quick* and *ſlow*.—FERNELIUS obſerves, that "the ordinary affections of the body change the *pulſe*; ſo that without duly adverting to theſe affections, the *pulſe* cannot be certainly underſtood, nor can it be determined how far it recedes from a natural ſtate in conſequence of diſeaſe."

Dr. Heberden hath inſerted ſome obſervations on the *pulſe*, in which it appears how little is to be depended on it alone, or without the conjunction of other ſymptoms; in how few caſes an attention to the *pulſe* is of any conſequence: and as to various diſtinctions concerning *pulſes*, how groundleſs they are.—The QUICK AND THE SLOW PULSES he fixes on, as thoſe on which uſefulneſs and certainty attend, when they are the ſubjects of our remarks, and leaves for our notice the following obſervations, viz. That the *pulſe* of a child under two years old ſhould be felt whilſt it is aſleep, becauſe it is ſo eaſily quickened by every new ſenſation;—that the pulſe of an healthy infant on the day of its birth, and when it is aſleep, is between 130 and 140 in a minute, the mean rate during the firſt month is 120, and rarely, if ever, below 108. During the firſt year, the limits may be from 108 to 120, the ſecond year at 90 and 100, the third year at 80 and 108; the fourth, fifth, and ſixth nearly the ſame as the third, the ſeventh year it is ſometimes at 72, but generally more; the twelfth about 70; in adults it is uſually from a little below 60 to a little above 80.

A full meal quickens the *pulſe* to about 10 or 12 ſtrokes in a minute more than its number of *pulſations* were before the advantage of refreſhment.

If the *pulſe* is quickened, ſo as to exceed the healthy ſtandard by ten *pulſations* in a minute, there is ſome diſorder; but the irritability of a child is ſuch, that a very ſlight fever will make the artery beat 140, or even 160, when no danger attends; and as there is much difficulty in counting the *pulſe* when it is at 180 and upwards, we are better enabled *to judge of the danger of fevers in children by the thirſt, quickneſs of breathing, averſion to food*, and *want of ſleep*, than by the *pulſe*.

A child of two years old will die of an inflammatory fever, though the artery beats only 144 in a minute; yet children of four years ſometimes recover from fevers when the *pulſe* is at 156.

If the *pulſe* of a child be 15 *or* 20 *below the healthy ſtandard at its loweſt limits*, and there be at the ſame time the ſigns of conſiderable illneſs, it is a certain indication *that the brain is affected*, conſequently ſuch a quiet *pulſe* ſhould alarm us with the probability of danger.

In

In adults labouring under an inflammatory fever, the danger is generally not very great, *where the beats are fewer than one hundred. An hundred and twenty shew the beginning of danger*, and they ſeldom exceed this number, unattended with delirioufneſs, and where the caſe does not prove fatal. To this there are two exceptions: firſt, *before ſome critical ſwelling begins to ſhew itſelf in fevers*, then the *pulſe* hath riſen to 150. Secondly, *in acute rheumatiſm, the pulſe riſes to* 120, *without danger*; but in both theſe caſes the appetite, the ſenſes, ſleep, and ſtrength, deviate leſs from their natural ſtate than when the life of the patient is in danger.

When aſthmatic patients are ſeized with a ſudden fit, the *pulſe* ſometimes beats 120 times in a minute, in which caſe danger is great; but if this is exceeded, they rarely recover.

When the *pulſe*, from being very quick, ſuddenly becomes quiet, all other ill ſymptoms continuing, it is a proof not of the decreaſe of the diſorder, but of the leſſened irritableneſs of the patient, the diſeaſe is tranſlated to the brain, and that a palſy, an apoplexy, or death, will be the conſequence.

In an inflamed ſcirrhus ſeated in any of the viſcera, in a cancer, ulcers in the internal parts, a quick *pulſe* is a more certain ſign of danger than a quiet *pulſe* is of ſafety. In hectic and rheumatic patients, the appetite continues, and an ability to take ſmall journies, when the *pulſe* is ſo quick that in an acute fever, with ſuch a quickneſs in the *pulſe*, they would be forced to keep in bed.

In low fevers, and in exhauſted old men, the pulſe will often continue below 100, or even 90; and yet the diſtemper be attended with want of ſleep, delirioufneſs, reſtleſſneſs, and a parched tongue, and end in death, without any comatous or lethargic appearance.

A good *pulſe*, with a loſs of appetite, ſtrength, and ſleep, with thirſt, and a quickneſs of breathing, is a dangerous ſituation; on the contrary, a bad *pulſe*, the appetite, ſleep, and ſtrength not much affected, with moderate thirſt, and the breathing but little affected, is ſafe. See Lond. Med. Tranſact. vol. 2. p. 18, &c.

PULVINAR. See EPITHEMA.

PULVINARIA. Cuſhions made with chaff, in which is mixed ſome medical ingredients coarſely powdered.

PULVIS. A POWDER. This form receives ſuch materials only as may be reduced and kept in this ſtate a ſufficient time without any loſs of their virtues, and yet do not poſſeſs ſuch qualities as render them ſo bulky for a ſufficient quantity to be taken in each doſe, or to render them very diſguſtful to the taſte. Bitters, fetids, acrid medicines, alkaline ſalts, gums, emollients, and mucilaginous ſubſtances, are generally improper for keeping and giving in this form. The doſe of *powders* are from ℈ i. to 3 ſs.

Compound *powders* uſed to be called ſpecies.

—— ALOETICUS. See HIERA PICRA.

—— ANTILYSSUS. See LICHEN CINEREUS.

—— AD GUTTETAM. } See GUTTETA.
—— EPILEPTICUS. }

—— REFRIGERANS FALCK. See DYSURIA.

PUMEX, alſo called *lapis bibulus, lapis ſcyrus*. PUMICE STONE. It is found in volcanos. It hath been uſed as a dentifrice, but, if freely uſed, it wears away the enamel. It is a ſpongy maſs of a ſtony nature, but light and brittle: the beſt is of a white or greyiſh colour.

PUNCTA LACHRYMALIA. LACHRYMAL POINTS. They are two ſmall holes, one on each upper and one on each lower eye-lid, on their inner edge, near the internal angles, where may be ſeen a ſmall eminence. Theſe orifices are ſituated oppoſite to each other. They convey away the tears when they have anſwered their purpoſe on the anterior ſurface of the eye, and carry them into the *ſaccus lachrymalis, lachrymal* ſac, and ſo into the noſe.

PUNCTICULA. PUNCTICULARIS, vel PUNCTULA. See PETECHIÆ.

PUNCTUM AUREUM, } It is when an hernia of
PUNCTURA AUREA. } the inteſtines is reduced, an inciſion is made through the ſkin and membrana adipoſa, quite down to the upper part of the ſpermatic veſſels; then a golden wire is to be fixed and twiſted ſo as to prevent the deſcent of any thing down the tunica vaginalis.

PUNCTURA. A PUNCTURE, or SMALL WOUND. Synonymous with *vulnus*.

PUNICA. See GRANATA MALA.

PUNICA GRANATUM, &c. See BALAUSTINUM.

PUORRHŒA. A purulent diſcharge from the belly.

PUOTURIA. See URINA.

PUPILLA OCULI. The PUPIL of the EYE; called alſo *core*; becauſe it repreſents your image, when looked into, no bigger than the *pupilla*, a *puppet*. The choroides is continued on the inſide of the cornea tranſparens of the eye, and forms the iris, but it is perforated in the middle, and ſo forms the *pupilla*; as the iris contracts or expands, the *pupil* is larger or leſs. The black circle about the pupil is termed *phos*. The uſe of the *pupil* is, to tranſmit the rays of light to the humours of the eye.

PUPILLARIS MEMBRANA. In the fœtus of five, ſix, and ſeven months, there is no pupil, but a fine vaſcular membrane, with large arteries going quite acroſs the part where the pupil is afterwards ſeen. It cannot be ſeen without injecting it; nor is it known what becomes of it after the birth. It is alſo called *velum pupillæ*.

PURGAMENTUM STELLARUM. See CŒLIFOLIUM.

PURGANTIA. PURGATIVE MEDICINES, called alſo *cathartica; catocathartica; catoretica; catasterica; dejectoria; alviduca*. The firſt *purge* on record is Melampus's giving hellebore to the daughter of the king of Argos. *Purging medicines* are thoſe that facilitate, or increaſe the natural diſcharge of the alvine fæces. Thoſe which gently facilitate the natural diſcharge, are called *lenients, laxatives*, or *ſolutives*, and by the Greeks *eccoprotics*. When theſe medicines increaſe the natural diſcharges more powerfully, they are called *purgatives*, or *cathartics*, &c. They are of different degrees of ſtrength and action; the more rugged are called *draſtic*.

Eccoprotics are ſuch as give no diſturbance to the body, and expel but little from it; of this kind are ſoft oils, or they are ſuch as are now called *lenitives*, but by the ancients were called *minoratives*; they do not evacuate much fæces at once, but by degrees: of this ſort is the ol. ricini, which, whilſt it ſtimulates, it alſo lubricates, and its conſiſtence is ſuch as hinders its eaſy paſſage into the lacteals.

Draſtic purges act by a fine cauſtic inflammatory ſalt, which operates much in the ſame manner as poiſons do. The reſinous extracts of *purging* vegetables cauſe vomiting, convulſions, and death; and, on opening the ſtomach and bowels after their uſe, they are found inflamed, and marked with red ſpots, as when arſenic is taken.

For the milder kind of *purgatives*, we are indebted to the Arabians.

Eccoprotics ſhould be uſed in caſe of coſtiveneſs; when women are pregnant, and, in all very irritable habits; for in general *purges* are unfriendly to the ſtomach, and to thoſe whoſe nervous ſyſtem is ſubject to diſorderly motions. But in dropſies, and when there is a torpid ſtate of the inteſtinal fibres, draſtic purges are neceſſary; they ſhould be confined to the hydropic, lethargic, paralytic, apoplectic, and ſuch like.

Purgatives are excellent alteratives. In order to their uſefulneſs when given in this character, let ſuch a quantity as would ſuffice for a *purging* doſe, be divided into leſſer doſes; all which muſt be taken at proper periods, in the ſpace of twenty-four hours.

Diluting drinks are taken during the operation of *purging medicines*, to aſſiſt the increaſed ſecretion of the inteſtinal juice, in waſhing off the ſtimulus, alſo to ſoften the fæces. See Quinſey's Pharmaceutic Lectures, ſect. iii. and iv. Tournefort's Mat. Med. Cullen's Materia Medica.

PURGATORIUM. In Paracelſus it is a name for any diſeaſe.

PURPURA ALBA—RUBRA. See MILIARIS FEBRIS.

PURPURA ALBA. A ſpecies of eruption to which men with a phlegmatic plethora are inclined.

—— SCORBUTICA. It is the *herpes* of Vogel; the *purpura* of Hoffmann; and the true *ſerpigo* of ſome other writers. Hoffmann ſays, it is to be conſidered as entirely the progeny of a *ſcorbutic* diſpoſition. It is diſtinguiſhed by the eruption of exanthemata, of a very peculiar kind on the ſurface. Sometimes it is accompanied with an acute, and even a malignant fever; on other occaſions, it runs its courſe without fever, continuing for a greater length of time, and diſturbing the functions in a more gentle manner. In this diſeaſe, the ſmall papillæ which appear on the ſurface, are ſometimes of a red, ſometimes of a white colour. In the former caſe, there

are veſicles more or leſs broad, containing a fluid; but the latter conſiſts of ſmall knots, fixed as it were deep in the ſkin; theſe are about the ſize and figure of millet ſeed, rough to the touch, and filled with a thick purulent matter. When the eruption firſt appears, it is attended with corrugation, roughneſs and dryneſs of the ſkin; none of the exanthemata are in their nature apt ſo ſuddenly to diſappear and return again. This return of the eruption is in general attended with a ſenſe of heat or coldneſs, of itching or pricking in the part; while other exanthemata appear on every part of the body, the *purpura* is chiefly obſervable on the neck, breaſt, back, and arms, very rarely affecting the inferior extremities.

To prevent this diſeaſe, it is recommended to avoid all kinds of malt liquors. Patients diſpoſed to it are adviſed to uſe for their common drink, either mineral water, or pure water, with a mixture of wine. Exerciſe, change of air, tranquillity of mind, and amuſement, are of great ſervice in the prevention. Avoid all that produces coſtiveneſs, or that leſſens perſpiration. High-ſeaſoned animal food, and pork, are to be avoided. Milk and whey are very ſerviceable. After the diſeaſe hath taken place, the patient ſhould ſleep in a large bed-chamber, of a moderate temperature. He ſhould ſhun great heat in bed, and not lie in it very long together: thus exceſſive ſweats, which aggravate the diſeaſe, are avoided; but though exceſſive ſweating is injurious, a moderate perſpiration is beneficial. The mineral anodyne liquor is here of ſingular efficacy. See Lewis's Tranſlation of Hoffmann.

—— URTICATA. See URTICARIA.

PURPURATÆ. See PETECHIÆ.

PURULENTIA. See SUPPURATIO.

PUS. MATTER. The *matter* which appears on the ſurface of the wounds that are healing; alſo what is met with on opening well-digeſted abſceſſes, is called *pus*. It is unctuous, yellowiſh, nearly of the conſiſtence of freſh cream, without any particular ſmell, and of a mild taſte, which reſembles that of chyle. See Dr. Gaber's Experiments with reſpect to the Nature and Formation of *Pus*, in the Med. Muſeum, vol. iii. p. 269, &c. and the Tentamen Phyſiologicum de Secretione Glandularia of Dr. James Hardy, who endeavours to prove that the concluſions drawn from the experiments of Dr. Gaber are not juſt, and that *pus* is never formed from putrid ſerum. See ABSCESSUS.

When mucus is detained in the lungs for a time, and then ſpit up, it often reſembles *pus*; to diſtinguiſh rightly, if *pus* (or *matter*) is mixed with water, let it be ſlightly agitated with a whiſk, it is eaſily diffuſed, and after ſtanding a few hours falls to the bottom of the veſſel. Mucus is with difficulty diffuſed in water, requiring ſtrong agitation, and then forms with it a permanent ropy fluid. When the *matter* ſpit up by conſumptive patients is agitated in water, it mixes without difficulty; and on ſtanding a ſhort time, a *matter* falls to the bottom, reſembling *pus*; and the fluid above remains ropy, reſembling the mucus and water.

See Bell on Ulcers, edit. 3. p. 55, 72. Kirkland's Med. Surgery, vol. ii. p. 53.

But there is another experiment which is conſidered as more concluſive. When any one wiſhes to aſcertain the compoſition of expectorated *matter*, let it be diſſolved in vitriolic acid, or in cauſtic alkaline lixivium; and then to both ſolutions add pure water. If there be a fair precipitation in each, it is certain that ſome *pus* is preſent. If in neither a precipitation occurs, it is a ſure teſt that the *matter* is entirely mucus; and if it cannot be made to diſſolve in the alkaline lixivium, there is alſo reaſon to believe that it is *pus*. Med. Comment. Edinb. vol. vii. p. 103.

PUSTULA. A PUSTULE, or little pimple, from *pus*, *corruption*, called alſo *ecthyma*; it is very hot and painful; it is called *eczema*; *eczeſma*. Theſe particularly appear in the ſpring, and are of various kinds; for ſometimes a certain roughneſs appears all over the body, reſembling that which is produced by the application of a nettle, or the obſtruction of ſweat, and are called by the Greeks *exanthema*. They are red and white, and of different ſizes. There are alſo *puſtules* of a black, livid, or any other colour; they are produced by cold, fire, or medicine, as the epynictis, &c. Celſus recommends, as the cure of all *puſtules*, a due proportion of exerciſe, and to leſſen the quantity of aliment.

PUSTULA ORIS. See APHTHÆ.

PUTREDO, vel PUTREFACTIO. PUTREFACTION. *Putrefaction* is a ſpecies of fermentation, in which the phlogiſtion and the fixed air of the putrefying ſubject, are ſeparated, and by which a diſſolution of the parts of the ſame body are not only effected, but a fetor is always induced in it. In order to *putrefaction* taking place, it is neceſſary that there ſhould be a degree of heat, moiſture, and of atmoſpheric air; but whenever a ſmall portion of matter is become putrid, it eaſily diffuſes itſelf through a large quantity, like leaven in paſte; this is in nothing more manifeſt than in the human body, wherein a ſmall portion of putrid matter being abſorbed, eaſily and ſoon contaminates the whole.

From *putrefaction* it is that the plague, the ſpotted fever, the true ſcurvy, and other diſorders of the like kind, take place. In all theſe diſorders the ſtrength is diminiſhed, and ſo is the vital heat. In general, if a recovery is within the power of medicine, the bark, acids, fixed air, warm perſpiratives, camphor, &c. are the moſt powerful antiputreſcents, and the moſt ſucceſsful means for removing theſe diſorders.

On this ſubject, ſee the Appendix to Sir John Pringle's Obſervations on the Diſeaſes of the Army; Biſs's Eſſays; Macbride's Eſſays.

PUTRIDA FEBRIS. PUTRID FEVER. Called alſo *frigeraria*, *febris continua putrida*. Under this general name may be included the *plague*, *ſpotted* or *petechial* fevers, *peſtilential*, *malignant*, *camp*, *jail* fever, &c. The more mild inſtances are of the typhus kind. Dr. Cullen obſerves, in the firſt volume of his Firſt Lines, that the ſynochus ſeems not ſo properly a genus as a variety of typhus; that the typhus ſeems to be a genus comprehending ſeveral ſpecies, but that theſe are not well aſcertained by obſervation; and in the mean time we can perceive, that many of the different caſes obſerved do not imply any ſpecific difference, ſeeming to be merely varieties, ariſing *from a different degree of power in the cauſe*;—*from different circumſtances of the climate, or ſeaſon* in which they happen, or *from different circumſtances in the conſtitution of the perſons afflicted*. One effect ariſing from theſe circumſtances is, a putreſcent ſtate of the fluids. From the diſſolved ſtate of the blood, as it appears when drawn out of the veins, or as it appears from the red blood's being diſpoſed to be effuſed, and run off by various outlets, and ſeveral other ſymptoms, we have no doubt that real *putreſcency* of the fluids takes place in *fevers*. This *putreſcency*, however, often attends intermittent as well as continued *fevers*; and of the continued kind, both the ſynochus and typhus, and all of them in very different degrees, ſo that whatever attention it may require in practice, there is no fixing ſuch limits to it as to admit of eſtabliſhing a ſpecies under the title of *putrid*.

Dr. Cullen thinks that in typhus there is always a proneneſs of the humour running into a putreſcent ſtate, but that is in different degrees, ſo that the greater or leſs putrefaction can only vary, not change the diſeaſe; and therefore it is ſufficient to point out thoſe *fevers* which are particularly called *putrid fevers* by the term TYPHI GRAVIORES. See TYPHUS.

Theſe *fevers* are often inflammatory in their beginning, but they ſoon become *putrid*, and they are all of the continued kind. Indeed in ſome caſes, diſorders of a very oppoſite nature, by continuance, degenerate into *putrid* ones.

Thoſe who are weakly, who live poorly, and labour hard, the luxurious, thoſe who ſit up late, people of cold, phlegmatic, or irritable conſtitutions, the penſive, and thoſe who are oppreſſed with grief, are moſt ſubject to *putrid fevers*.

The ſame cauſes which produce the plague, if applied in a leſs degree, produce the other ſorts of *putrid fevers*.

The REMOTE CAUSES are, improper diet, and ſuch as are *putrid* when eaten;—corrupted grain, as well as corrupted animal diet;—a too free uſe of alkaline ſalts, and ſuch other medicines as diſſolve the blood;—a moiſt ſouth wind long continued, eſpecially if much heat attends it;—putrid effluvia;—warm, calm, ſultry weather, with a moiſt atmoſphere.—The PROXIMATE CAUSE is a diſſolution of the blood, which is ſoon produced by *putrid* miaſmata, received either into the lungs by inſpiration, into the ſtomach with the food, or being generated in ſome part, is abſorbed, as from *putrid* ulcers, &c. According to the quantity of *putrid* matter received into the conſtitution, and the different parts which it firſt impreſſed, the ſymptoms excited will be ſomewhat various; if *received from the atmoſphere by the lungs*, as when *putrid* vapours are diffuſed in a country where theſe diſorders are epidemical, or in cloſe confined places, ſuch as ſhips,

ſhips, jails, &c. In this caſe, nervous ſymptoms are firſt produced.—*If the ſtomach is firſt diſordered thereby*, a ſickneſs, vomiting, or great anxiety, is brought on;—*when it enters into the blood by abſorption*, the blood is at firſt diſſolved, then proceed heat, delirium, a diarrhœa, high-coloured fetid urine, &c.

PUTRID FEVERS attack with more violence than the nervous; and Dr. Huxham obſerves, that "the rigors are greater, the heat ſharper and more permanent, yet, at the firſt, they are ſudden, tranſient, and remitting; the pulſe is more tenſe and hard, though ſometimes quick and ſmall, and at others ſlow and regular, then fluttering and unequal. In the beginning it generally happens, that during the firſt twenty-four hours the alternate heat and cold are conſiderable, and ſymptoms of ardency are attendant, but theſe ſoon vaniſh; the *fever* increaſes every evening, and in the ſecond week the patient becomes delirious, and the ſymptoms which at firſt came on, increaſing, prove deſtructive; or gradually decreaſing, about the end of the ſecond week the delirium changes to a ſtupor; and other ſymptoms taking place, the patient, from the end of the ſecond, or beginning of the third week, grows better; but in ſome caſes, and under ſome kinds of management, the *putrid* ſymptoms increaſe from the ſecond week, both in their number and degree, and the patient ſinks under them. In the beginning, the head-ach and vomiting are violent; there is often a pain in the temples, or over the eyes and in the bottom of the orbit; the eyes are full and heavy, yellowiſh, a little inflamed, then the countenance becomes bloated; the temporal arteries throb, though at the ſame time the pulſe at the wriſt is ſmall; there is a ringing in the ears, great dejection of ſpirits and faintneſs, reſpiration is difficult, mixed with ſighing, and the breath is hot and offenſive; pains are complained of in the loins and limbs, an univerſal wearineſs, and often a load at the ſtomach, attended with pain and heat there, alſo a nauſea, and often a diſcharge of blackiſh or bilious matter. In the beginning the tongue is white, then grows drier and darker coloured: in ſome it is livid, in others black, or of a dark pomegranate colour. In the increaſe of the *fever*, the thirſt is the greateſt, but no liquor pleaſes.; moſt things are mawkiſh and bitteriſh to the taſte, but often the ſenſe of thirſt is little or none during the whole of the diſeaſe; the lips and teeth are furred with a black tenacious ſordes; in the beginning the urine is pale and vapid, high coloured in the advance, and at laſt grows very brown and blackiſh, and hath more or leſs of an offenſive ſmell; the ſtools are blackiſh and very offenſive; they often run off inſenſibly; after profuſe evacuations by ſtool, the belly becomes ſwollen and tenſe; livid ſpots appear on the ſkin; hemorrhages, and cold clammy ſweats, in ſome inſtances, on the fourth or fifth day, in others not till the eleventh, but generally they uſher in death.

As it is of great uſe to diſtinguiſh, as ſoon as poſſible, the preciſe nature of fevers in general, but this in particular, we ſhall mark down ſuch ſigns as are conſidered characteriſtic in this fever. The degrees of *debility*, *oppreſſion*, and *nauſea*, are more conſiderable than in any other fever; the *proſtration of ſtrength*, *ſudden* and *violent*, has, for its aſſociates, *extreme deſpondency*, or *inſenſibility*, and *want of apprehenſion to an uncommon degree*, which beſpeaks great danger. The loſs of appetite, or loathing of food, ſickneſs, languor, dull pain of the head, are, in the beginning, always more ſevere than in the *inflammatory*, though ſeldom ſo much ſo as in the *nervous* fever. Beſides the ſmallneſs of the pulſe, the dejection of the ſpirits, the broken texture of the blood, the purple ſpots, and the putrid ſtate of the excrements, diſtinguiſh it from the *inflammatory fever*, whilſt the degree of heat, the very high-coloured urine, the thirſt, the ſpots, and putreſcency, do alſo from the *nervous*. And its formation is rendered perceptible by *coldneſs* and *ſhivering*, accompanied with *nauſea*, *vomiting*, *confuſion of the head*, *an extreme* and *ſudden proſtration of ſtrength*.

Moſt, if not all the ſymptoms, that are obſerved in putrid diſorders, *it is ſaid*, may be accounted for, whether they attack ſanguine or ſerous habits, from the putrid infection both diſſolving the craſſamentum, and repelling the vital heat; as theſe two laſt mutually depend upon each other, ſo that one cannot be injured or deſtroyed, but the other muſt experience in proportion ſimilar effects. Perhaps, if the term *nervous energy* was to ſupply the place of *vital heat*, it would give us a more intelligible and rational conception.

The PROGNOSTICS are generally very uncertain. *A red raſh*, or *an inflamed ſcab below the noſe*, or *about the lips*, are favourable for the moſt part;—*deafneſs at the decline* is frequently, not always, a promiſing ſymptom; but *a change of voice*, —*wild ſtaring eyes*,—*difficulty of ſwallowing*,—*inability to put out the tongue*,—*a conſtant inclination to uncover the breaſt*,—*urine that depoſits a dark or blackiſh ſediment*,—*no thirſt*,—*inflamed fauces*,—*a diarrhœa with a ſwelled belly*,—*bloody ſaliva*,—*purple or livid ſpots on the ſkin*,—*black aphthæ*,—*laborious reſpiration*,—*ichorous and fetid ſtools*,—*cold ſweats*,—*convulſions*, beſpeak very great danger; and if a number of them attend, little can be expected but a ſpeedy diſſolution.

The INDICATIONS OF CURE ARE, to check the *putrefaction*, and to recall the vital heat. In order to which the air in the patient's room, and the linen which is worn by the patient, ſhould be often changed; the ſtools and urine ſhould be immediately conveyed under ground, to prevent their impregnating the air with their morbid qualities. Acid vapours may be diffuſed in the apartments of the ſick, or fumigations of myrrh and other aromatic and antiſeptic ingredients may be uſed. In the adminiſtration of medicines, the doſes ſhould be ſo repeated as to ſupport the heat of the patient in as equal a degree as is poſſible; the medicines and diet may be given in ſmall doſes, and proportionably frequent, and the heat of the patient ſhould be ſupported as near to that of health as may be.

The diet ſhould be *acid* or *aceſcent*. The drink ſhould be *acidulated*, and often mixed *with red wine*; *whey made with muſtard* is both agreeable to ſome and uſeful to moſt. The diluted vitriolic acid, or Clutton's febrif. ſpt. may be uſed for acidulating what the patient drinks. *Beef* that is boiled long enough to extract only its finer parts, is an excellent part of diet in theſe caſes; but it ſhould not be continued boiling until the groſſer parts are drawn out.

As to medicines, in may caſes, the *bark* and *vitriolic acid*, accompanied with the *camphor mixture*, ſucceed without any other aids.

Bleeding is rarely, if ever, to be admitted, for the *putrefaction* ſoon produces all that can be effected by it. Some bleed if the pulſe is quick and tenſe, the pain in the head and back is violent, the breathing difficult, and other ſymptoms of ſtrength appear; but, as the *putrid* miaſmata ſoon produce all that bleeding can effect, and as the greateſt point is to ſupport or to recover the vital heat, bleeding, as a leſſer ill, may probably be ſometimes admitted, but much caution is required before the operation is determined on.

In general, *an antimonial emetic ſhould begin the cure*; or the pulv. ipec. may be given with the antimonium tartariſatum and a cordial draught, or a doſe of the miſtura camph. may immediately ſucceed its operation.

After the emetic and the ſucceeding draught have been taken, give frequent ſmall doſes of the vin. antim. or of the antimonium tartariſatum with proper antiſeptics and cordials. *Neutral ſalts are generally hurtful*, and even *the aq. ammoniæ acetatæ is better omitted*.

The bark is a principal means of relief, and ſhould be given very early in the diſorder: at the lateſt it ſhould be begun with as ſoon as ſymptoms of inflammation or of ardency diſappear; and, if theſe do not attend, begin with it immediately after the operation of the emetic. The bark may be given in ſubſtance, in a cold infuſion with water, and in conjunction with ſaffron, ſnake-root, or other ſuch like medicines, acording to the intention of the preſcriber.

Whilſt the pulſe is quick and full, *bliſters* are not adviſeable; but generally they are uſeful in the early ſtages of theſe *fevers*, and if one is applied as a former one begins to dry, the advantage will be conſiderable in every ſtage. If a delirium approaches, the head or back may be bliſtered, as alſo if the patient is comatous. If, in the earlier ſtage of a *putrid fever*, the patient is delirious, and other ſymptoms ſeem to forbid the uſe of bliſters, ſinapiſms may be applied to the feet.

Clyſters are convenient, both for carrying off *putrid* matter from the inteſtines, and for conveying antiputreſcents there. Though, for ſimply regulating the ſtools, perhaps a little *antimonium tartariſatum and rhub.* may be the moſt proper; and when any purging medicine is uſed for carrying off the contents of the bowels, the patient ſhould be ſupported during its operation with cordial liquors.

Camphor is both uſeful as an antiſpaſmodic and antiſeptic, but is moſt eminently ſerviceable in the beginning of the diſeaſe.

Amongſt the antiſeptics, *fixed air* is found to be peculiarly uſeful, and may be commodiouſly adminiſtered in clyſters.

The vis vitæ muſt be carefully ſupported; the principal means of which are, acids, the bark, red wine, and a ſupine poſture.

If a diarrhœa comes on, give gentle opiates, ſuch as the pulvis e creta com. cum opio, &c. Aſtringents are uſeful, but acids are the moſt ſo in theſe kinds of looſeneſſes, eſpecially if accompanied with perſpiratives.

If the petechiæ ſuddenly diſappear, a delirium will come on, and the pulſe ſink; in this caſe bliſter the head or the inſides of the thighs, or apply ſinapiſms to the feet. Bliſters remarkably relieve the nervous ſymptoms attendant on theſe diſorders.

However deſirable a general diaphoreſis may be, *it ſhould never be forced by the uſe of medicines:* to promote it, when there is the leaſt degree of tendency thereto, and to ſupport it when preſent, ſub-acid diluents, with cordials, may be freely uſed.

When petechiæ appear, give ſtrong red wine negus, well acidulated.

Sometimes *a vomiting continues to afflict the patient, after having emptied the ſtomach by means of an emetic:* if in this caſe the warm opiated cordials, given with the ſaline draught, fail to relieve, apply a cataplaſm of the confectio opiata to the region of the ſtomach.

If a grain or two of the antimonium tartariſatum with a ſmall quantity of rhubarb is given, whenever a diſagreeable taſte is perceived in the mouth, or even without this indication, if it is repeated every two or three days, much putrid colluvies will be carried off, which would otherwiſe prove a pabulum to ſupport the violence of the diſorder.

See Huxham and ſir John Pringle on *Putrid Fevers*. Fordyce's Elements, part ii. An Enquiry into the Cauſes, Symptoms, and Cure of *Putrid Fevers*, by W. Fordyce, M. D. Wallis's Sydenham, p. 201.

PYCNOTICA. See INCRASSANTIA.

PYGÆ. See CLUNES.

PYLORICA ARTERIA. It is a branch of the hepatic artery, which runs and is ramified on the pylorus, and from thence to the cardia, and anaſtomoſes with the arteria gaſtrica dextra, and terminates on the pylorus by an anaſtomoſis with the coronary artery of the ſtomach.

—— VENA. It is a branch from the venæ portæ ventralis. Sometimes it is only a branch of the gaſtrica recta; it paſſes over the pylorus to the ſhort arch of the ſtomach, where it anaſtomoſes with the coronary vein thereof.

PYLORUS, from πυλη, *a door*, and ωρεω, *to guard*. The word ſignifies a *porter*, and thus the Greeks called the right orifice of the ſtomach. It is alſo called *janitor*; *portorarium*, *oſtiarius*,

PYOSIS. See HYPOPYON.

PYRACANTHA. See LYCIUM BUXI FOLIIS.

PYRAMIDALES MUSCULI The PYRAMIDAL MUSCLES of the BELLY, alſo called *ſuccenturiati*, *auxiliarii*. They preſent themſelves next to the aſcending and deſcending oblique muſcles. They were firſt diſcovered by Fallopius. They are ſituated before the extremities of the recti, ariſing from the fore part of the os pubis, cloſe to the ſymphyſis. They grow ſmaller as they proceed: they end in a point, and are loſt in the linea alba. Their figure gives them their name. They pull down the linea alba. Fallopius called them ſuccenturiati, or *auxiliarii*, auxiliary muſcles, from a ſuppoſition that they are only ſupplemental to the recti in their action, the order of their fibres in both agreeing; and theſe being always abſent when the recti are continued fleſhy to the juncture of the oſſa pubis.

PYRAMIDALIA CORPORA. See MEDULLA OBLONGATA, and alſo a name for the SPERMATICA CHORDA.

PYRAMIDALIS NASI MUSC. It is alſo called *triangularis* and *anterior*. One extremity is inſerted in the ſynarthroſis of the os frontis, and oſſa naſi; it runs down the ſide of the noſe, and is again inſerted into the cartilage there.

PYRAMIS. See CONUS FUSORIUS.

PYRETHRUM, from πυρ, *fire*, becauſe of the fiery heat of the root. It is alſo called *buphthalmum Creticum*, *bellis montana putescens acris*; *ſalivaris herba*; PELLITORY of SPAIN. It is the *anthemis pyrethrum*, *caulibus ſimplicibus unifloris decumbentibus*, *foliis pinnato-multifidis*, *radice longe fervida*, *flore bellidis*, CLASS SYNGENESIA; ORD. POLYGAMIA SUPERFLUA; LINN. Gen. Plant. 970. It is a trailing perennial plant, with finely divided leaves like thoſe of fennel or chamomile, and naked thick ſtalks, bearing each a large flower, with a yellow diſk, ſurrounded with petals of a pure white colour on the upper ſide, and of a fine purple underneath. The root ſinks deep in the ground like a carrot, is of a browniſh colour on the outſide and white within. It is a native of the warmer climes, and is brought to us from Italy, but bears the cold of our climate. It flowers from January to May. The roots which grow in England are larger than thoſe from abroad.

The root is hot and pungent to the taſte, but has little or no ſmell. Its pungency is in its reſin, which is of a fixed kind. Water extracts but little of the reſin, ſpirit of wine takes up the whole of it. In diſtillation, neither water nor ſpirit takes up any thing with it. The watery extract is the moſt in quantity, but the ſpirituous contains moſt of the active parts. From the ſtimulating qualities of the pyrethrum united with its aroma, there can be little doubt but that it might be found an efficacious remedy, and equally fitted for an internal remedy, as many others of this claſs now in uſe. It is though chiefly uſed as a maſticatory, and as ſuch preſcribed in toothachs and rheumatic affections of the face, in order to produce ſalivary diſcharge, and it has alſo been recommended as a ſtimulant in lethargic complaints, and paralyſis of the tongue. It has been uſed in the ſame manner as arum root. Doſe, powdered, five grains to ten; Dr. Lewis recommends a decoction of theſe roots with the tinct. aloes in clyſters for the ſaturnine colic. As a ſtimulant gargle, it has been conſidered uſeful; ℞ Pyrethri contuſi ʒ ſs. aquæ diſtillatæ ℔ i. coq. ad dimidium, colaturæ adjiciantur aquæ ammoniæ ʒ ij. m. It is not certain that the *pellitory* of the moderns is the ſame with that of the ancients. See Neumann's Chem. Works; Lewis's Mat. Med.

PYREXIÆ, πυρετικοι, from πυρετος, *febris*. FEBRILE DISEASES. See FEBRIS.

PYRIFORMIS MUSCULUS. It riſes from the lower part of the os ſacrum, where it is joined to the os ilium; it paſſes through the ſciatic notch, and is inſerted into the inſide of the tip of the trochanter major, ſerving as a rotator, an extenſor, or an abductor, according to the direction of the thigh. See alſo QUADRAGEMINI. It is called *pyriformis* from its figure, and *iliacus externus* from its ſituation.

PYRITES. FIRE-STONES. They are alſo called *marcaſita*. They are called *fire-ſtones*, becauſe they ſtrike fire with ſteel. By expoſing them to the air they become vitriolic; ſome are calcined, and then expoſed to the air. They vary much in their appearances, being of different colours, ſhapes, and internal ſtructure. In moſt parts they are found near the ſurface of the earth. They conſiſt chiefly of ſulphur, iron, and unmetallic earth; in ſome there is a little copper; in the yellow ſort there is much ſulphur; in the white there is but little.

When *pyrites* are expoſed to the air, the inflammable part of their ſulphur is diſſipated, the ſtones become powdery, and acquire a vitriolic taſte; the rain now falling on them, waſhes away the remaining acid of the ſulphureous contents, and veſſels are placed underneath to receive it; and from this the green vitriol is generally made.

Pyrites are not uſed medicinally in ſubſtance, but in Saxony they obtain the common ſulphur therefrom; artificial vitriols are prepared from them; and it is ſuppoſed that the chalybeate ſprings receive their impregnation from them. See Lewis's Mat. Med. Dict. of Chem. Neumann's Chem. Works.

PYRIUS PULVIS, from πυρ, *fire*. GUNPOWDER.

PYRMONTANA AQUA. PYRMONT WATER. It is one of the principal of the chalybeate kind.

It is found in the county *Pyrmont*, in the circle of Weſtphalia, in Germany. The ſpring is ſituated at one end of the village of *Pyrmont*: and the water, as it riſes up from the ſprings, ſeems to boil in its baſon, and when taken up in a glaſs, ſparkles like the brighteſt champagne; and Dr. Monro ſays, to him it had ſomething the taſte of old hock, and a ſpirity chalybeate ſmell, but it did not ſtrike the leaſt ſhade of red, or purple, when mixed with ſyrup of violets. It ſeems to yield different quantities of ſolid matter, at different times, when evaporated according to the experiments of Dr. Hoffman, Turner, Rutty, and ſir T. Bergman. Dr. Rutty mentions that the reſiduum which he obtained was of a pale brown colour, had a naſeous bitter taſte, and did not moiſten in the air: and that about one third of it was calcareous nitre, that is, vi-

triolated magnesia, mixed with a pittance of sea-salt, and that the remainder was made up of selenites, calcareous earth, and ochre. Sir T. Bergman says that the Swedish Kanneful, containing 42,351 grains of this water, is sometimes impregnated with ninety cubic inches of aerial acid; though in general the quantity is smaller; which is in the proportion of 130¼ cubic inches from the English gallon of 61,440 grains, and the solid contents on his analyzation, were, from the English gallon of aerated iron, 4½ grains; of aerated lime, 29$\frac{1}{5}$; of vitriolated lime-selenite, 55½; of aerated magnesia, 65$\frac{1}{7}$; of vitriolated magnesia, 36$\frac{1}{7}$; of common salt, 10⅜. At *Pyrmont*, the people generally drink this water by glassfuls in a morning, to the quantity of two, three, or more English pints. Its common operation is by urine, but if taken copiously, it generally proves laxative; and when it has not this effect, and that effect is wanted, they commonly mix with the first glass drank in the morning, from one to five or six drams of some purging salt. Monro's Medical, &c. Chemistry, vol. ii. See AQUÆ CHALYBEATÆ.

PYROLA ROTUNDI-FOLIA. See PARNASSIA.

PYROPUS. See PHOSPHORUS.

PYROSIS. In Scotland this is called the WATER-BRASH: in England, BLACK-WATER. Dr. Cullen places it as a genus of disease in the CLASS NEUROSES, and ORDER SPASMI, which he defines, a burning pain of the epigastrium, with a quantity of aqueous humor, for the most part insipid, sometimes acrid, discharged by the mouth. This disorder is named *pyrosis Suecica* by Sauvages, but Linnæus calls it *cardialgia sputatoria*. Dr. Cullen considers the *pyrosis* as an idiopathic disease, and seems to be the first who hath treated of it in a system. He observes, that it is a disease frequent among people in lower life, but occurs also, though more rarely, in people of better condition. It appears, he says, most frequently in persons under middle age, but seldom in any persons before the age of puberty. When it has once taken place, it is ready to recur occasionally for a long time after, but it seldom appears in persons considerably advanced in life. It affects both sexes, but more frequently the female; it sometimes attacks pregnant women, and some women *only* when they are in that condition. Of other women, it more frequently affects the unmarried; and of the married, most frequently the barren; it frequently happens to women labouring under the fluor albus. The fits of this disease usually come on in the morning and forenoon, when the stomach is empty. The first symptom of it is a pain at the pit of the stomach, with a sense of constriction, and as if the stomach was drawn towards the back; the pain is increased by raising the body into an erect posture, and, therefore, the body is bended forward. This pain is often very severe; and after continuing for some time, it brings on an eructation of a thin watery fluid in considerable quantity; this fluid hath sometimes an acid taste, but very often is without this, and absolutely insipid. The eructation is for some time frequently repeated, and does not immediately give relief to the pain which preceded it, but does so at length, and puts an end to the fit. The fits come on without any evident exciting cause; they attack persons using animal food, but more frequently those who live on milk and farinacea. Cold applied to the lower extremities seems often to be an exciting cause, and so is every considerable emotion of mind. The doctor goes on to observe, that the nature of this affection is not very obvious, but he thinks it may be explained as follows: it seems to begin by a spasm of the muscular fibres of the stomach, which is afterwards, in a certain manner, communicated to the blood-vessels and exhalants, so as to increase the impetus of the fluids in the vessels, while a constriction takes place on their extremities. The increased impetus pours out a larger quantity of fluid than usual, while the constriction upon their extremities allows only the pure watery parts to be poured out, analogous, as I judge, in every respect to what happens in the diabetes hystericus. As to the cure, little can be done. Opium relieves the paroxysm. The vitriolic æther, volatile alkali, &c. are sometimes of service. Linnæus speaks of the nux vomica being useful; but to prevent the returns of this disorder is not easy. See Cullen's First Lines, vol. iv.

It is also the name of a disease in the ear, which affects the patient as if a heat was excited there by a burning coal.

PYROTECHNIA, from πυρ, *fire*, and τεχνη, *art*. See CHEMIA.

PYRUS. The PEAR-TREE, called also *apios*. The tree and fruit are sufficiently known not to need any description. From pears the liquor called perry is obtained by expression.

PYRUS CYDONIA. See CYDONIA; and

—— MALUS. See MALUS SYLVESTRIS.

PYTHON. See OB.

PYULCON, from πυον, *pus*, and ελκω, *to draw*. An instrument to fetch out the matter from the cavity of the breast or any sinuous ulcer.

PYURIA.
PYURIA ARTHRITICA.
—— MUCOSA.
—— VISCIDA.
} See DYSURIA

Q.

QUA

QUADRAGESIMUS DIES. The fortieth day. The ancients fixed on this day as the laſt to which acute diſtempers could extend; calling all thoſe chronical which continue longer. But Dr. James obſerves, that he hath ſeen an acute diſeaſe which continued ſixty days.

QUADRANS. See CYATHUS.

QUADRATI MUSCULI. Four-ſquared muſcles. See OCCIPITALIS MUSCULUS. DEPRESSORES LABII INFERA.

QUADRATUM. See CUBOIDES.

QUADRATUS BUCCAS DETRAHENS. See ADDUCTOR AURIS, N° 2.

QUADRATUS FEMORIS. This muſcle riſes from the outſide of the tuberoſity of the iſchium, and is inſerted into the line between the trochanter major and minor, ſerving to rotate the thigh.

—— GENÆ. See PLATYSMA MYOIDES.

—— LUMBORUM. This muſcle riſes from the ſpine of the ilium, whence it goes to the tranſverſe proceſſes of the four upper lumbar vertebræ, and partly from theſe tranſverſe proceſſes, which part goes to the laſt rib. This muſcle lies between the contained parts of the belly and the erectors of the back, and ſerve to pull the body to one ſide, by bringing the laſt rib down. This muſcle is alſo called *quadrigeminus*, and *lumbaris externus*; underneath it a troubleſome abſceſs is ſometimes formed. See ABSCESSUS LUMBORUM.

QUADRIFOLIUM. See TRIFOLIUM.

QUADRIGA, alſo CATAPHRACTA. A bandage for the ſternum and ribs. It is twenty-four feet long, three or four fingers broad, with two heads; it binds upon the thorax and ſternum more firmly when the ribs are fractured. The middle is placed on one ſide of the body; the two heads are carried ſo as to interſect on the oppoſite ſhoulder; they are brought back to where they begin, and then paſs circularly round the body.

QUADRIGEMINI. A name for the following muſcles taken together, viz. *pyriformis*, *gemini*, and the *quadratus femoris*.

QUADRIGEMINUS. See QUADRATUS LUMBORUM.

QUANTICAMOTLI. See CASSADA.

QUAQUARA. See CHINA ORIENTALIS.

QUARTANA CONTINUA. CONTINUED QUARTAN. The paroxyſm returns every fourth day, after previous pandiculations and horripilations, but does not very exactly obſerve its period; nor when the paroxyſm abates does it totally intermit, but is only milder on the intermediate days than in that in which the paroxyſm happens. The heat is alſo preternaturally intenſe, the pulſe increaſed, the appetite languid, the ſtrength low, the mouth dry, the head giddy, the ſleep reſtleſs, the urine red, thick, and with a high-coloured ſediment.

QUARTANA DUPLEX. A DOUBLE QUARTAN. It is when within four days two ſucceeding paroxyſms happen, in ſuch a manner, that each preſerves its proper type, and peculiar time of acceſſion, alternately correſponding to the preceding paroxyſm, and the third day only being totally free from the fever.

QUA

QUARTANA FEBRIS, vel QUARTANA LEGITIMA. AN AGUE, OF QUARTAN INTERMITTENT FEVER. Dr. Cullen places this genus of diſeaſe in the CLASS PYREXIÆ, and ORDER FEBRES, which he defines, ſimilar paroxyſms within the ſpace of ſeventy-two hours, or thereabouts; the acceſſions coming on in the afternoon. It varies with regard to its type. 1ſt. *The legitimate quartan* hath its paroxyſms every fourth day, on other days not any. 2d. *Duplicated quartan* hath two paroxyſms every fourth day, the other days free. 3d. *Triplicated quartan* hath three paroxyſms every fourth day, not any on the intermediate days. 4th. *Double quartan* hath out of four days only the third free from fever, the paroxyſms being free every fourth day. 5th. *Triple quartan*, occurs every day, the paroxyſms being ſimilar every fourth day. With regard to the ſymptoms, with which it is accompanied, and other diſeaſes with which it is complicated, there is a great variety, and from them it receives different names, viz. quartana comatoſa; quartana ſyphilitica; &c. &c. See Synopſis Noſologiæ Methodicæ CULLENI. A quartan is uſually both more violent and obſtinate than a tertian. It is called ſpurious when the fit begins at any other time of the day than about four or five o'clock in the evening. The cure is as related for intermitting fevers.

—— SPURIA. SPURIOUS QUARTAN. It hath no certain period for its returns, which, however, is in the forenoon generally; the heat alſo is greater, and affects the patient more than the cold fit does.

QUARTARIUS. A meaſure which contains about four ounces.

QUARTATIO, } *Quartation.* It is an operation
QUARTURA. } in chemiſtry, by which the quantity of one thing is made equal to a fourth part of the quantity of another. Thus when gold, allayed with ſilver, is to be ſeparated, we are obliged to facilitate the action of the aqua fortis by reducing the quantity of the former of theſe metals to one fourth part of the whole maſs, which is done by ſufficiently increaſing the quantity of the ſilver, if it be neceſſary. Some extend this name to the operation of parting, called DEPART, which ſee

QUASSI LIGNUM, vel QUASSIA AMARA. QUASSI WOOD, OF BITTER QUASSIA. This wood is ſo called from a negro who was named *Quaſſi*; he lived at Surinam; and uſed it medicinally. He had great ſucceſs by giving it in fevers of the intermittent, malignant, and putrid kinds. It is the QUASSI AMARA, *floribus hermaphroditis, foliis impari-pinnatis, foliolis oppoſitis ſeſſilibus, petiolo articulato alato, floribus racemoſis.* CLASS DECANDRIA, ORDER MONOGYNIA. LINN. Gen. Plant. p. 529. The wood hath no ſmell, is very bitter, and ſtronger and more concentrated than that of any one medicament yet known: it is totally void of ſtyptic-city. As a bitter, it may be uſed as is common with bitters in general; it may be given in the form of pills, powders, or infuſion. *Quaſſi* made a tincture with it in brandy, but an infuſion of it in boiling water ſeems to be the beſt preparation. A dram may be infuſed in a pint of boiling water, and an ounce may be given for one

doſe;

doſe, though ſome infuſe three or four drams of the wood in twelve ounces of water, or give the extract in form of pills; doſe gr. ten to twenty every four or ſix hours, though the infuſion is generally preferred. When the Peruvian bark could not be taken, in the intermiſſion of fevers, the *quaſſi*, with an equal quantity of rad. ſerpent. v. infuſed in boiling water, anſwered every end that was expected from the bark; it allayed vomiting, and appeared powerfully to reſiſt putrefaction. The medicinal virtues aſcribed to quaſſia, are thoſe of a tonic, ſtomachic, anteſeptic, and febrifuge. It has been found very effectual in reſtoring the tone of the ſtomach, expelling flatulency, and removing habitual coſtiveneſs, produced by debility of the inteſtines, and common to a ſedentary life. In *hyſterical atony*, it has been ſaid, that quaſſia affords more vigour and relief to the ſyſtem than Peruvian bark, eſpecially when united with the *vitriolum album*, and ſtill more with the aid of ſome abſorbents. Dr. Lettſom met with ſeveral inſtances of low, remittent, and nervous fevers, wherein bark uniformly aggravated the ſymptoms, though given in intermiſſions, the moſt favourable to its ſucceſs, and wherein quaſſia, or ſnake-root was efficaciouſly ſubſtituted. In ſuch caſes, he obſerved, that there was great congeſtion in the hepatic ſyſtem, and the debility at the ſame time diſcouraged copious evacuations. And in many fevers, without evident remiſſions to warrant the uſe of the bark, whilſt at the ſame time increaſing debility begun to threaten the life of the patient; the doctor found that quaſſia, or ſnake-root, ſingly or combined, upheld the vital powers, and promoted a critical intermiſſion of fever, by which means an opportunity was offered for the bark to effect a cure. See Memoirs of the Medical Society of London, vol. i. p. 150.

Notwithſtanding what has been ſaid in its favour, it is conſidered by the practitioners in Scotland, only as a pure bitter, by thoſe who had much experience in it, and that it will only do what any pure and ſimple bitter will do. Cullen's Mat. Med.

QUASSIA, *ſimaruba*. See SIMARUBA.

QUATRIO. See ASTRAGALUS.

QUERCERA. See EPIALA.

QUERCULA. CALAMANDRINA. See CHAMÆDRYS.

QUERCUS. The OAK-TREE. It is the *quercus robur*, foliis *oblongis glabris ſinuatis, lobis rotundatis, glandibus oblongis*; AITON, Hort. Kew. CLASS MONOECIA, ORD. POLYANDRIA. LINN. Gen. Plant. 1070. The COMMON ENGLISH OAK-TREE. It is a common foreſt-tree, and is known in all parts of Europe. HIPPOCRATES calls it *Balanos* in his Treatiſe de Affectionibus. The bark is a ſtrong aſtringent, moderately bitter, having no particular ſmell; with a ferruginous ſolution it ſtrikes an inky blackneſs. It hath been uſed with ſucceſs in intermittent fevers, for reſtraining hæmorrhages, alvine fluxes, and other immoderate evacuations; and in gleeting gangrenous wounds and ulcers, in which caſes, ſome ſay, its extract is as good as the extract of the bark. Both water, and rectified ſpirit, take up its virtues. It has been much employed as an aſtringent medicine, in decoction, in ſlight tumefactions of the mucous membrane of the fauces; to a prolapſus uvulæ from ſlight cold, and a cynanche tonſillaris, as a fomentation, or lotion in *procidentia ani & uteri*. Alum has been often joined with it, and rendered more efficacious. In powder given to the quantity of half a dram every two or three hours during the intermiſſion of a fever: and both by itſelf, and joined with chamomile flowers, the returns of paroxyſms of intermittents have been prevented. All theſe virtues, in a conſiderable degree, belong to the cupulæ, or ſcaly cup which embraces the bottom of the acorns; theſe are called *glandes*, and *balani*. Cullen's Mat. Med.

The bark is more uſed for tanning than as a medicine, though in the following form it is often exhibited as an aſtringent lotion.—DECOCTUM QUERCUS. ℞ quercus contuſi ℥ j. aquæ diſtillatæ ℔ ii. coquantur ad ℔ i. The virtues of this bark are ſimilar, though perhaps more powerful than thoſe of galls. See GALLÆ.

QUERCUS COCCIFERA. See CHERMES.

—— MARINA. See KALI.

QUERQUERA. See PHRICODES.

QUIETALES. Diſeaſes in which the voluntary and involuntary motions, and the ſenſes, are diminiſhed.

QUINA QUINA. See CORT. PERUV.

QUINCUNX. See CYATHUS.

QUINQUEFOLIUM, alſo called *pentaphyllon*. COMMON CINQUEFOIL, FIVE-FINGERS, or FIVE-LEAVED GRASS. Is the POTENTILLA REPTANS, *foliis quinatis, caule repente, pedunculis unifloris*. CLASS Icosandria, ORDER Polygynia. LINN. Gen. Plant. 634. It is a trailing plant, with ſerrated leaves, ſet five together, on long pedicles. It is perennial, grows wild on clay grounds, and flowers in June. The roots are aſtringent; they give out their virtue to water and to ſpirit. The leaves are of the ſame nature as the roots. See Raii Hiſt.

It was known to Hippocrates and Dioſcorides, and by the former particularly employed in the cure of intermittents. RAY ſays that they are ſtill employed by the peaſantry with this intention. The external or cortical part of the root contains the medicinal quality, and acts ſolely by its aſtringency; conſequently have been chiefly employed *internally* in diarrhœas and other fluxes, and *externally* in gargles, and aſtringent lotions. From the cinquefoil being inferior in efficacy to many other plants of the ſame claſs, it is now rarely uſed, though, in large doſes, ſome are of opinion it will be found no bad ſubſtitute for ſeveral of the other aſtringents. Doſe in ſubſtance, one dram.

QUINQUINA. See CORT. PERUVIANUS.

QUINQUE NERVIA. See PLANTAGO MINOR.

QUINTA ESSENTIA. QUINTESSENCES, called alſo *hæccéitas*. The chemiſts expreſs this by the word *forma*. They are made by adding to any eſſential oil twelve times its quantity of pure alcohol of wine, and ſhaking them ſo together, that the oil may not appear. If theſe are diſtilled in a cloſe veſſel, with a fire of 90 deg. by Fahrenh. therm. the alcohol will riſe with only the preſiding ſpirit of the oil; and if with care the thinner part is ſeveral times ſeparated from the thicker, by repeated gentle cohobation, the alcohol will at length be ſo impregnated with thoſe oily ſpirits as to appear to be almoſt pure ſpirit itſelf, leaving a groſs exhauſted oil behind.

Dry *quinteſſences* are made by diſſolving an aromatic oil in alcohol of wine, then adding to them ten times their weight of ſugar, finely powdered, the placing them in a proper place and veſſel for exhaling the ſpirit from the ſugar, but preſerving it from being loſt. Thus the ſugar will remain dry, but with the virtues of the aromatic oil in it. ℈ i. in a glaſs of wine is a good cordial.

QUINTANA. An AGUE, the paroxyſm of which returneth every fifth day; the ſecond, third, and fourth, are free from fever. This as well as the *ſextana, ſeptana, octana, nonana*, and *decimana*, &c. is generally denominated *erratica*, and is conſidered as belonging to the *quartana intermittens*, and as ſuch treated; therefore to ſpecify or produce the various diviſions would be uſeleſs; they may be ſeen in SAUVAGE's Noſologia Methodica.

QUISQUILIUM. See CHERMES.

QUOTIDIANA CONTINUA. The continued quotidian of Vogel is the continued quartan of Cullen.

—— FEBRIS, *amphemerina, amphemerinos, methemerinos*. A QUOTIDIAN INTERMITTENT FEVER. It intermits, but returns every day, and that generally early in the morning: when the fit approaches at any other time of the day, it is called ſpurious or anomalous. Dr. Cullen places this genus of diſeaſe in the CLASS PYREXIÆ, and ORDER FEBRES, and defines it a *quotidian fever*, wherein ſimilar paroxyſms occur in the ſpace of twenty-four hours: the paroxyſms attacking in the morning. He forms two varieties; 1ſt, When its attack is *general*, returning at the ſame hour in the morning, this is called *ſimple* or *true quotidian*; when it is partial, it then receives the name of the part affected, viz. if of the head, *quotidiana cephalalgica*, &c. &c. 2d, When it is accompanied with any other diſeaſe, as *quotidiana iſchiadica*, &c. &c. The *hyſteric, catarrhal*, and *ſtrangurious*, which have evening paroxyſms, appear to be only ſymptomatic.

In this quotidian intermittent, the blood is more denſe than in any other ſpecies. For the general method of cure, ſee INTERMITTENS FEBRIS.

—— SOPOROSA, vel TERTIANA CAROTICA. A fever of the intermittent tertian kind, attended with comatous affections.

RACHITÆ, or RACHIÆI. The muſcles belonging to the back.

RACHITIS, ſo Dr. Gliſſon called it, from ῥαχις, *the ſpine of the back*, becauſe he ſuppoſes a fault in the ſpinal marrow produces it. The RICKETS. This diſorder is alſo called *cyrtoneſus*. In ſome countries it is called the ENGLISH DISEASE, though it is much more frequent elſewhere; it did not appear in England until about the middle of the ſeventeenth century, from whence it is ſaid to have ſpread all over Europe, and whence it obtained the name of Engliſh. Dr. Gliſſon ſays, that it was firſt obſerved in the Weſt of England, in the counties of Dorſet and Somerſet, betwixt the years 1600 and 1620, and that afterwards it ſpread.

It is a chronical diſeaſe, and a ſpecies of cachexy. Dr. Cullen places this genus of diſeaſe in the CLASS CACHEXIÆ, and the ORD. INTUMESCENTIÆ, which he defines, the head large, and much ſwelled anteriorly; the knees ſwelled; the ribs depreſſed; the abdomen tumid, and the other parts of the body emaciated. He diſtinguiſhes two varieties. 1. *Rachitis ſimplex*; when there is no other diſeaſe. 2. *Rachitis, aliis morbis complicata*, when complicated with other diſeaſes. The whole habit is affected, but more particularly the heads of the bones or joints, with their ligaments and cartilages; and alſo the whole cranium. Bodies that have been diſſected after the death of rickety patients, were found to have pale and flaccid muſcles, ſwelled lungs, enlarged livers, indurated meſenteric glands, ſpongy bones, the nodes on them were ſoft, and the marrow within them like bloody ſerum. Some obſerve, that the top of the ſpinal marrow is uncommonly hard and obſtructed, that water is lodged between the dura and pia mater, and that the brain is large.

Uſually the ſubjects are children from ſix months to ſix years of age, though ſometimes its attack is not before the ſixth year, or even after. Mr. Bromfield gives an inſtance of a woman being afflicted with, and at length dying under this diſorder. See his Chirurg. Obſ. vol. ii. c. 2. Children who cut their teeth late are diſpoſed to this complaint.

THE REMOTE CAUSES are, whatever hinders digeſtion, generates a viſcid chyle, or in general leſſens the vis vitæ. A cold moiſt atmoſphere diſpoſes to the *rickets*, whence the greater frequency thereof in marſhy countries. In Holland, and at Haſle in Saxony, this diſorder prevails very much, on account of their atmoſphere being filled with moiſt, and otherways unſalutary exhalations. Bad nurſing, a too aceſcent diet, &c. are alſo cauſes of this kind. THE IMMEDIATE CAUSES are, ſuch an indiſpoſition of the ſpinal marrow as prevents a due paſſage of the vital heat along it, or renders the nervous energy too weak, whence all thoſe parts which receive nerves therefrom are but poorly nouriſhed; whilſt a redundance of this neceſſary principle is conveyed to the head, whence its extraordinary increaſe, and the florid complexion uſually obſerved in patients thus afflicted; and, as Dr. Hunter obſerves, a deficiency of the oſſeous, or of the earthy matter of the bones.

The chief differences in this diſorder, are from the greater or leſſer number of the following ſymptoms being attendant in one and the ſame patient; and from the different degrees of their violence. Uſually the firſt appearance of this kind is in the eighth or ninth month of the child's age; by degrees, ſeveral parts of the body become diſproportioned, the ſkin grows lax, the belly becomes flaccid, the muſcles wear away, particularly thoſe of the neck, the joints of the hands, arms, knees, and feet grow large, ſo that there ſeems to be excreſcences on the bones of the wriſts and ankles; the bones at length are too weak to ſupport the body, and, as well as the ſpine, they grow crooked; the child walks with more and more difficulty, until it entirely loſes the uſe of its feet; the carotids and jugulars ſwell, but the other blood-veſſels ſeem leſs: the head grows large; the futures are viſible; the fontanel is often membranous; the neck is too weak to ſupport the head ſteadily; the countenance is lively; the child is more ſenſible than is common to children of the ſame age; the breaſt is ſtrait, and compreſſed on its ſide. The ſternum riſes up ſharp, and in a point, and the extremities of the ribs are knotty; the diſeaſe at length increaſing, a fever comes on, which is followed by a cough, a difficulty of breathing, and other ſymptoms which continue during life; the wriſts are knotty and diſtorted, ſo are the ankles; the ribs protuberate, and grow crooked; the hypochondres ſwell; other ſymptoms reſembling the conſumption come on, and at length deſtroy the patient. Children who are old enough to walk, go tottering and waddling along; but they like beſt to ſit ſtill; and as their diſorder increaſes, they would always lie down; the teeth come forward very ſlowly, and with much uneaſineſs, ſoon decay and fall out: and it is remarkable that moſt of this time, the appetite fails not, nor does the patient ſeem to digeſt with difficulty what he eats.

The *rickets* do not often prove fatal; but when an hectic fever, conſumptive ſymptoms, or an aſthma, &c. ſucceed, the patient is carried off by them. If the diſorder continues after the fifth year of the child's age, it proves difficult of cure, and the body uſually continues weakly and deformed for ſome years after. When a faulty air or a bad diet are the cauſe, or if it is ſucceeded by the ſmall-pox, the itch, or other cutaneous eruptions, and is not accompanied with conſiderable incurvation of the bones, and inability to motion, the cure is not very difficult. The bones of the legs, though very crooked, will become nearly and often quite ſtraight during the growth of the child, if it becomes ſtrong and healthy.

THE INTENTIONS OF CURE ARE, to diſſolve the viſcidity of the juices, open obſtructions, and promote a free circulation, and then to increaſe the vital heat and ſtrengthen the ſolids.

The *diet* ſhould be light, cordial, and nutritious; ſuch as broth, in which cray-fiſhes are boiled; this is excellent, or beef broth alone, ſpiced meats are uſeful; rice

with

with wine, and a little cinnamon mixed with it, will be a proper change. *The air* ſhould be dry and warm; *exerciſe*, according to the ability of the child, ſhould be regular, gentle, and frequent. To keep the child dry and clean, conduces much to relief.

Gentle emetics and *lenient purges* ſhould begin the cure, particularly the tinct. aloes and tinct. rhab. mixed in equal parts; theſe may be repeated two or three times: or equal parts of calomel and rhubarb may be given, and repeated ſo as not to ſalivate: after theſe, when the children's bellies are ſwelled, give pills *of the gall of eels*, or *pikes*, as deobſtruents; or, if the patient is emaciated, or the viſcera are not ſound, *ſaponaceous medicines* ſhould be given, particularly the *kali acetatum*.

Liniments may be uſeful both by their efficacy as medicines, and by the friction uſed in the proper application of them. ℞ Ol. palmæ ʒ ii. balſ. Peruv. & ſp. ammoniæ, āā ʒ ii. ol. n. m. per expr. ʒ i. ol. carioph. & ſuccin. āā gut. xx. with this or even with ſp. vini camph. let the ſpine and any of the affected joints be rubbed twice a day. If before the uſe of the liniment, &c. the parts are rubbed before the fire with a large flannel cloth, their efficacy will be more increaſed. *Dry frictions* alone are peculiarly uſeful.

If on trial *cold-bathing* is found to excite a glowing warmth, it may be continued with advantage; if on the firſt uſing the cold bath, the child ſhivers, put it between blankets until it grows warm, or ſweats a little; afterwards uſe *warm water*, and gradually proceed to the uſe of colder.

To warm the conſtitution and ſtrengthen it, nothing excels the *cort. Peruv.* and *ferrum ammoniacale*. The firſt may be given in powder, or in the form of an infuſion, and the latter alſo in ſubſtance or tincture. Inſtead of theſe the *unruſted fine filings of iron* may be mixed with mild aromatics, and waſhed down with any bitter infuſion. Dr. Zaviani gives the ferrum ammoniacale, gr. v. more or leſs, every day for two weeks, interpoſing the pul. rhab. gr. v. once in four or five days; he then omits the medicines during two weeks, after which he repeats them as before. But if the patient is feveriſh, give him the infuſ. cort. Peruv. cum acido vitriolico diluto, inſtead of the iron, or any of its preparations.

The *kali pp.* is highly extolled in this diſeaſe. In the fourth vol. of the Edinb. Med. Comm. is the following account of its efficacy: A boy of ſeven years old, who laboured under *rickets* to a great degree; his inferior extremities were become ſtiff and immoveable; the abdomen flaccid; he was emaciated with a diarrhœa and conſtant ſweatings, and had five fiſtulous ulcers all running at the ſame time. The following was preſcribed: ℞ Decoct. cort. Peruv. ʒ viii. kali pp. ʒ ſs. m. Half of this mixture was taken every day. In the courſe of one month, the patient was ſo far recovered as to be able to riſe from his bed, and to walk with ſome ſupport. At that time the bark was changed for the rubia tinctorum; and in leſs than four months, the boy was ſo recovered as to walk with a crutch, and the ulcers by that time were nearly healed. Many *ricketty* people have been cured by a watery ſolution of the fixed vegetable alkali, without any other means being uſed.

The *oſmunda regalis*, (flowering fern) if given in decoction, powder, or extract, is recommended as of great efficacy in this diſorder.

A glaſs of claret, with a morſel of bread, ſhould be given to the child, an hour before dinner every day, and again in the evening.

See Boerhaave's Aphoriſms; F. Hoffmann's Oper. tom. iii. p. 487, &c. Wallis's Sydenham. Med. Muſ. vol. i. p. 66. 71. Shaw's Practice of Phyſic. Zaviani's Treatiſe on the *Rickets*. Edin. Med. Com. vol. ii. p. 47. Cullen's Firſt Lines, vol. iv.

RACHOSIS. Excoriation of the relaxed ſcrotum.

RADIÆUS. See FLEXOR CARPI RADIALIS.

—— EXTERNUS. See EXTENSOR CARPI RADIALIS.

RADIALIS. The nerve ſo called. See CERVICALES.

RADIALIS, vel RADIÆA ARTERIA. It is a branch of the humeral artery. It runs down the ſide of the radius, covered by the ſupinator longus; at the wriſt it divides into two, one of which paſſing over the palm of the hand, is loſt in the fleſhy part of the thumb; the other paſſes on, and between the metacarpal bone of the fore-finger, and the firſt bone of the thumb, plunges into the palm, and forms a ſort of arch there. In its courſe, it ſends off branches which run on both ſides of the hand, communicate with the cubical branches, and are loſt among the metacarpal bones.

RADIALIS MUSCULUS. See FLEXOR CARPI RADIALIS.

—— EXTERNA VENA. When the cephalica hath reached the bend of the arm, it divides into two principal branches; one is called the *radialis externa*; it ſpreads about and along the fore-arm.

—— INTERNA VENA. It is a long branch from the mediana cephalica.

RADICULA. See RAPHANUS HORTENSIS.

RADIUS. RADIUS, A STAFF OR BEAM. It is one of the bones of the fore-arm, which is ſo called from the reſemblance it bears to the ſpoke of a wheel; called alſo *cercis*; *ſcile*. Its upper extremity is formed into a ſmall circular head, which is hollowed for an articulation by arthrodia, with the tubercle of the os humeri at the ſide of the trochlea and the half of the round circumference of the head, next to the ulna is ſmooth, to be received into the ſemilunated cavity of that bone. The lower extremity of the *radius* is much larger than the ſuperior; it is flattened before, and grooved backwards by the tendons of the muſcles. The extremity of the *radius* is hollowed for the reception of the bones of the wriſt. The reaſon why the fibres of the interoſſeus ligament run obliquely upwards from the ulna to the *radius* is, that as this laſt is very ſlightly articulated to the os humeri, in a fall the force of it would be communicated to its upper extremity, and eaſily diſlocate it, if this ligament was not to take off the force of the fall. The *fibula* is alſo ſo called.

RADIX. A ROOT. It is that part of a plant by which it naturally receives its nouriſhment. Some roots are fleſhy, others are fibrous, and others again are woody.

Roots are divided into different ſpecies. Linnæus divides them into *fibrous*, *bulbous*, and *tuberous*, which are again ſubdivided by other diſtinctions, the chief of which are the following:

RADIX ASPHODELI. ASPHODEL-ROOT. It is that which is compoſed of ſeveral oblong fleſhy knobs. Of this kind are the king's-ſpear, and the day-lily.

—— BULBOSA. The BULBOUS ROOT, ſee plate 3, N° 6, 7, 8, 9, IN THE BOTANICAL PLATES. It is that which is compoſed of ſeveral coats, involving one another, or of ſeveral ſcales lying one over another. The firſt of theſe is called a tunicated root. Of this ſort are onions, &c. The laſt is called a ſquamous, or ſcaly root. Of this ſort are the lily, &c.

—— CARNOSA. FLESHY ROOT. Amongſt botaniſts, the term fleſh is applicable to that part of root, fruit, &c. that may be eaten; hence in roots where this abounds, they are called fleſhy, as the carrot, &c. See plate 3, N°. 4.

—— FISTULARIS. TAP ROOT. It is that part which runs perpendicularly deep into the ground; hence in digging up trees, care ſhould be taken, that it is neither cut, nor broken; and, in planting them, that a hole ſufficiently deep and wide be made proper for its reception, otherwiſe the tree will pine and be deſtroyed. See plate 3, N° 5.

—— FIBROSA. A FIBROUS ROOT. It is one which conſiſts only of ſmall fibres like hairs. Of this ſort are thoſe of GRASS and CORN.

—— GRANULOSA. A GRANULOUS or CLUSTERED ROOT. See plate 3, N° 10. It is a kind of granulous root, conſiſting of many ſmall fleſhy knobs, which reſemble grains of corn. Of this kind is the white ſaxifrage.

—— GRUMOSA. A GRUMOUS PENDULOUS ROOT. It is one which conſiſts in many oblong fleſhy knobs, joined to one centre at the top. Of this ſort is the ranunculus. See plate 3, N° 12.

—— PALMATA. A HANDED ROOT. It is a tuberous root, divided, as it were, into ſeveral fingers, ſo as to reſemble a hand. Of this ſort is the handed-orchis.

—— TESTICULATA. A TESTICULATED ROOT. It is a double tuberous *root*, for it conſiſts of two knobs, reſembling a pair of teſticles. Of this ſort are ſome of the orchis ſpecies.

—— TUBEROSA. A TUBEROUS ROOT Plate 3, N° 11. It conſiſts of an uniform fleſhy ſubſtance, and is generally roundiſh. Of this kind is the ſow-bread. Beſides, the term RADIX is uſed to many other ſubſtances, viz.

R.

RABDOIDES. See SAGITTALIS SATURA.
RABUXIT. See BAXANA.
RACEMUS. A CLUSTER, ſuch as a bunch of grapes, or of ivy-berries, or other fruit which grows in cluſters; or rather a ſtalk divided into ſeveral branches, ſuſtaining each a flower or fruit, ſet thick together, as is ſeen in grapes, &c.

RACHIALGIA. See COLICA.
RACHIALGIA PICTONUM, } See COLICA.
—— METALLICA, }
—— AB ADIAPNEUSTIA, }
—— TRAUMATICA. }

RACHITÆ, or RACHIÆT. The muſcles belonging to the back.

RACHITIS, ſo Dr. Gliſſon called it, from ῥαχις, *the ſpine of the back*, becauſe he ſuppoſes a fault in the ſpinal marrow produces it. The RICKETS. This diſorder is alſo called *cyrtoneſus*. In ſome countries it is called the ENGLISH DISEASE, though it is much more frequent elſewhere; it did not appear in England until about the middle of the ſeventeenth century, from whence it is ſaid to have ſpread all over Europe, and whence it obtained the name of Engliſh. Dr. Gliſſon ſays, that it was firſt obſerved in the Weſt of England, in the counties of Dorſet and Somerſet, betwixt the years 1600 and 1620, and that afterwards it ſpread.

It is a chronical diſeaſe, and a ſpecies of cachexy. Dr. Cullen places this genus of diſeaſe in the CLASS CACHEXIÆ, and the ORD. INTUMESCENTIÆ, which he defines, the head large, and much ſwelled anteriorly; the knees ſwelled; the ribs depreſſed; the abdomen tumid, and the other parts of the body emaciated. He diſtinguiſhes two varieties. 1. *Rachitis ſimplex*; when there is no other diſeaſe. 2. *Rachitis, aliis morbis complicata*, when complicated with other diſeaſes. The whole habit is affected, but more particularly the heads of the bones or joints, with their ligaments and cartilages; and alſo the whole cranium. Bodies that have been diſſected after the death of rickety patients, were found to have pale and flaccid muſcles, ſwelled lungs, enlarged livers, indurated meſenteric glands, ſpongy bones, the nodes on them were ſoft, and the marrow within them like bloody ſerum. Some obſerve, that the top of the ſpinal marrow is uncommonly hard and obſtructed, that water is lodged between the dura and pia mater, and that the brain is large.

Uſually the ſubjects are children from ſix months to ſix years of age, though ſometimes its attack is not before the ſixth year, or even after. Mr. Bromfield gives an inſtance of a woman being afflicted with, and at length dying under this diſorder. See his Chirurg. Obſ. vol. ii. c. 2. Children who cut their teeth late are diſpoſed to this complaint.

THE REMOTE CAUSES are, whatever hinders digeſtion, generates a viſcid chyle, or in general leſſens the vis vitæ. A cold moiſt atmoſphere diſpoſes to the *rickets*, whence the greater frequency thereof in marſhy countries. In Holland, and at Haſle in Saxony, this diſorder prevails very much, on account of their atmoſphere being filled with moiſt, and otherways unſalutary exhalations. Bad nurſing, a too aceſcent diet, &c. are alſo cauſes of this kind. THE IMMEDIATE CAUSES are, ſuch an indiſpoſition of the ſpinal marrow as prevents a due paſſage of the vital heat along it, or renders the nervous energy too weak, whence all thoſe parts which receive nerves therefrom are but poorly nouriſhed; whilſt a redundance of this neceſſary principle is conveyed to the head, whence its extraordinary increaſe, and the florid complexion uſually obſerved in patients thus afflicted; and, as Dr. Hunter obſerves, a deficiency of the oſſeous, or of the earthy matter of the bones.

The chief differences in this diſorder, are from the greater or leſſer number of the following ſymptoms being attendant in one and the ſame patient; and from the different degrees of their violence. Uſually the firſt appearance of this kind is in the eighth or ninth month of the child's age; by degrees, ſeveral parts of the body become diſproportioned, the ſkin grows lax, the belly becomes flaccid, the muſcles wear away, particularly thoſe of the neck, the joints of the hands, arms, knees, and feet grow large, ſo that there ſeems to be excreſcences on the bones of the wriſts and ankles; the bones at length are too weak to ſupport the body, and, as well as the ſpine, they grow crooked; the child walks with more and more difficulty, until it entirely loſes the uſe of its feet; the carotids and jugulars ſwell, but the other blood-veſſels ſeem leſs: the head grows large; the futures are viſible; the fontanel is often membranous; the neck is too weak to ſupport the head ſteadily; the countenance is lively; the child is more ſenſible than is common to children of the ſame age; the breaſt is ſtrait, and compreſſed on its ſide. The ſternum riſes up ſharp, and in a point, and the extremities of the ribs are knotty; the diſeaſe at length increaſing, a fever comes on, which is followed by a cough, a difficulty of breathing, and other ſymptoms which continue during life; the wriſts are knotty and diſtorted, ſo are the ankles; the ribs protuberate, and grow crooked; the hypochondres ſwell; other ſymptoms reſembling the conſumption come on, and at length deſtroy the patient. Children who are old enough to walk, go tottering and waddling along; but they like beſt to ſit ſtill; and as their diſorder increaſes, they would always lie down; the teeth come forward very ſlowly, and with much uneaſineſs, ſoon decay and fall out: and it is remarkable that moſt of this time, the appetite fails not, nor does the patient ſeem to digeſt with difficulty what he eats.

The *rickets* do not often prove fatal; but when an hectic fever, conſumptive ſymptoms, or an aſthma, &c. ſucceed, the patient is carried off by them. If the diſorder continues after the fifth year of the child's age, it proves difficult of cure, and the body uſually continues weakly and deformed for ſome years after. When a faulty air or a bad diet are the cauſe, or if it is ſucceeded by the ſmall-pox, the itch, or other cutaneous eruptions, and is not accompanied with conſiderable incurvation of the bones, and inability to motion, the cure is not very difficult. The bones of the legs, though very crooked, will become nearly and often quite ſtraight during the growth of the child, if it becomes ſtrong and healthy.

THE INTENTIONS OF CURE ARE, to diſſolve the viſcidity of the juices, open obſtructions, and promote a free circulation, and then to increaſe the vital heat and ſtrengthen the ſolids.

The *diet* ſhould be light, cordial, and nutritious; ſuch as broth, in which cray-fiſhes are boiled; this is excellent, or beef broth alone, ſpiced meats are uſeful; rice

with

with wine, and a little cinnamon mixed with it, will be a proper change. *The air* ſhould be dry and warm; *exerciſe*, according to the ability of the child, ſhould be regular, gentle, and frequent. To keep the child dry and clean, conduces much to relief.

Gentle emetics and *lenient purges* ſhould begin the cure, particularly the tinct. aloes and tinct. rhab. mixed in equal parts; theſe may be repeated two or three times: or equal parts of calomel and rhubarb may be given, and repeated ſo as not to ſalivate: after theſe, when the children's bellies are ſwelled, give pills *of the gall of eels*, or *pikes*, as deobſtruents; or, if the patient is emaciated, or the viſcera are not ſound, *ſaponaceous medicines* ſhould be given, particularly the *kali acetatum*.

Liniments may be uſeful both by their efficacy as medicines, and by the friction uſed in the proper application of them. ℞ Ol. palmæ ʒ ii. balſ. Peruv. & ſp. ammoniæ, ää ʒ ii. ol. n. m. per expr. ʒ i. ol. carioph. & ſuccin. ää gut. xx. with this or even with ſp. vini camph. let the ſpine and any of the affected joints be rubbed twice a day. If before the uſe of the liniment, &c. the parts are rubbed before the fire with a large flannel cloth, their efficacy will be more increaſed. *Dry frictions* alone are peculiarly uſeful.

If on trial *cold-bathing* is found to excite a glowing warmth, it may be continued with advantage; if on the firſt uſing the cold bath, the child ſhivers, put it between blankets until it grows warm, or ſweats a little; afterwards uſe *warm water*, and gradually proceed to the uſe of colder.

To warm the conſtitution and ſtrengthen it, nothing excels the *cort. Peruv.* and *ferrum ammoniacale*. The firſt may be given in powder, or in the form of an infuſion, and the latter alſo in ſubſtance or tincture. Inſtead of theſe the *unruſted fine filings of iron* may be mixed with mild aromatics, and waſhed down with any bitter infuſion. Dr. Zaviani gives the ferrum ammoniacale, gr. v. more or leſs, every day for two weeks, interpoſing the pul. rhab. gr. v. once in four or five days; he then omits the medicines during two weeks, after which he repeats them as before. But if the patient is feveriſh, give him the infuſ. cort. Peruv. cum acido vitriolico diluto, inſtead of the iron, or any of its preparations.

The *kali pp.* is highly extolled in this diſeaſe. In the fourth vol. of the Edinb. Med. Comm. is the following account of its efficacy: A boy of ſeven years old, who laboured under *rickets* to a great degree; his inferior extremities were become ſtiff and immoveable; the abdomen flaccid; he was emaciated with a diarrhœa and conſtant ſweatings, and had five fiſtulous ulcers all running at the ſame time. The following was preſcribed: ℞ Decoct. cort. Peruv. ʒ viii. kali pp. ʒ ſs. m. Half of this mixture was taken every day. In the courſe of one month, the patient was ſo far recovered as to be able to riſe from his bed, and to walk with ſome ſupport. At that time the bark was changed for the rubia tinctorum; and in leſs than four months, the boy was ſo recovered as to walk with a crutch, and the ulcers by that time were nearly healed. Many *ricketty* people have been cured by a watery ſolution of the fixed vegetable alkali, without any other means being uſed.

The *oſmunda regalis*, (flowering fern) if given in decoction, powder, or extract, is recommended as of great efficacy in this diſorder.

A glaſs of claret, with a morſel of bread, ſhould be given to the child, an hour before dinner every day, and again in the evening.

RACHOSIS. Excoriation of the relaxed ſcrotum.

RADIÆUS. See FLEXOR CARPI RADIALIS.

—— EXTERNUS. See EXTENSOR CARPI RADIALIS.

RADIALIS. The nerve ſo called. See CERVICALES.

RADIALIS, vel RADIÆA ARTERIA. It is a branch of the humeral artery. It runs down the ſide of the radius, covered by the ſupinator longus; at the wriſt it divides into two, one of which paſſing over the palm of the hand, is loſt in the fleſhy part of the thumb; the other paſſes on, and between the metacarpal bone of the fore-finger, and the firſt bone of the thumb, plunges into the palm, and forms a ſort of arch there. In its courſe, it ſends off branches which run on both ſides of the hand, communicate with the cubical branches, and are loſt among the metacarpal bones.

RADIALIS MUSCULUS. See FLEXOR CARPI RADIALIS.

—— EXTERNA VENA. When the cephalica hath reached the bend of the arm, it divides into two principal branches; one is called the *radialis externa*; it ſpreads about and along the fore-arm.

—— INTERNA VENA. It is a long branch from the mediana cephalica.

RADICULA. See RAPHANUS HORTENSIS.

RADIUS. RADIUS, A STAFF OR BEAM. It is one of the bones of the fore-arm, which is ſo called from the reſemblance it bears to the ſpoke of a wheel; called alſo *cercis*; *ſcelle*. Its upper extremity is formed into a ſmall circular head, which is hollowed for an articulation by arthrodia, with the tubercle of the os humeri at the ſide of the trochlea and the half of the round circumference of the head, next to the ulna is ſmooth, to be received into the ſemilunated cavity of that bone. The lower extremity of the *radius* is much larger than the ſuperior; it is flattened before, and grooved backwards by the tendons of the muſcles. The extremity of the *radius* is hollowed for the reception of the bones of the wriſt. The reaſon why the fibres of the interoſſeus ligament run obliquely upwards from the ulna to the *radius* is, that as this laſt is very ſlightly articulated to the os humeri, in a fall the force of it would be communicated to its upper extremity, and eaſily diſlocate it, if this ligament was not to take off the force of the fall. The *fibula* is alſo ſo called.

RADIX. A ROOT. It is that part of a plant by which it naturally receives its nouriſhment. Some roots are fleſhy, others are fibrous, and others again are woody.

Roots are divided into different ſpecies. Linnæus divides them into *fibrous*, *bulbous*, and *tuberous*, which are again ſubdivided by other diſtinctions, the chief of which are the following:

RADIX ASPHODELI. ASPHODEL-ROOT. It is that which is compoſed of ſeveral oblong fleſhy knobs. Of this kind are the king's-ſpear, and the day-lily.

—— BULBOSA. The BULBOUS ROOT, ſee plate 3, N° 6, 7, 8, 9, IN THE BOTANICAL PLATES. It is that which is compoſed of ſeveral coats, involving one another, or of ſeveral ſcales lying one over another. The firſt of theſe is called a tunicated root. Of this ſort are onions, &c. The laſt is called a ſquamous, or ſcaly root. Of this ſort are the lily, &c.

—— CARNOSA. FLESHY ROOT. Amongſt botaniſts, the term fleſh is applicable to that part of root, fruit, &c. that may be eaten; hence in roots where this abounds, they are called fleſhy, as the carrot, &c. See plate 3, N°. 4.

—— FISTULARIS. TAP ROOT. It is that part which runs perpendicularly deep into the ground; hence in digging up trees, care ſhould be taken, that it is neither cut, nor broken; and, in planting them, that a hole ſufficiently deep and wide be made proper for its reception, otherwiſe the tree will pine and be deſtroyed. See plate 3, N° 5.

—— FIBROSA. A FIBROUS ROOT. It is one which conſiſts only of ſmall fibres like hairs. Of this ſort are thoſe of GRASS and CORN.

—— GRANULOSA. A GRANULOUS or CLUSTERED ROOT. See plate 3, N° 10. It is a kind of granulous root, conſiſting of many ſmall fleſhy knobs, which reſemble grains of corn. Of this kind is the white ſaxifrage.

—— GRUMOSA. A GRUMOUS PENDULOUS ROOT. It is one which conſiſts in many oblong fleſhy knobs, joined to one centre at the top. Of this ſort is the ranunculus. See plate 3, N° 12.

—— PALMATA. A HANDED ROOT. It is a tuberous root, divided, as it were, into ſeveral fingers, ſo as to reſemble a hand. Of this ſort is the handed-orchis.

—— TESTICULATA. A TESTICULATED ROOT. It is a double tuberous *root*, for it conſiſts of two knobs, reſembling a pair of teſticles. Of this ſort are ſome of the orchis ſpecies.

—— TUBEROSA. A TUBEROUS ROOT Plate 3, N° 11. It conſiſts of an uniform fleſhy ſubſtance, and is generally roundiſh. Of this kind is the ſow-bread. Beſides, the term RADIX is uſed to many other ſubſtances, viz.

—— INDICA LOPEZIANA. See RAIS DI JUAN, &c.

—— RHODIA. See RHEDIA.

—— RUBRA. See RUBIA.

RAIFORT. See RAPHANUS HORTENSIS.

RAIS DI JUAN LOPEZ LUSITANIS. It is the *radix Indica Lopeziana*, Pharm. Edinb. Radix Indica, a Joanne Lopez, denominata Gaubii Adverſar. cap. vi. The root of an unknown tree, growing, as ſome ſay, at Goa, others ſuppoſe in Malacca, from whence it is ſometimes brought to Batavia. It is met with in pieces of different thickneſs, ſome at leaſt of two inches diameter. The woody part is whitiſh and very light; ſofter, more ſpongy, and whiter next the bark, including a denſer, ſomewhat reddiſh, medullary part. The bark is rough, wrinkled, brown, ſoft, and as it were woolly, pretty thick, covered with a thin, paler cuticle; neither the woody nor cortical part hath any remarkable ſmell or taſte, nor any appearance of reſinous matter. On boiling in water, no odour is emitted, and the ſtrained liquor, which is of a yellow hue, is almoſt inſipid, only impreſſing the tongue with a very light, obſcure bitteriſhneſs, and without viſcidity. The extract obtained by evaporating the decoction, is equally void of ſenſible activity. Rectified ſpirit is tinged by the root of a brown colour, but acquires no particular taſte. After drawing off the ſpirit from the tincture, a matter remains reſembling balſam, which bubbles and flames in the fire, and has a bitteriſh taſte, like that of opium.

This *root* is regarded in the Eaſt Indies as a medicine of *extraordinary efficacy in diarrhœas*. Gaubius, in his Adverſaria, ſhews ſome experiments made with it, which, in ſome degree, confirm its reputation; it appeared remarkably effectual in abating colliquative diarrhœas, which had reſiſted the uſual remedies, and thoſe attending the laſt ſtage of conſumptions were particularly relieved by its uſe. It ſeems not to act by an aſtringent power, but by a faculty of reſtraining and appeaſing ſpaſmodic and inordinate motions in the inteſtines. Gaubius compares its action to that of ſimarouba, but thinks it more efficacious than this medicine. The powder is given with any proper vehicle, in doſes from fifteen to thirty grains, repeated three or four times a day. A tincture made with common ſpirit is ſaid to be equally effectual with the *root*; of this tincture the doſe was a tea-ſpoonful three times a day. Lewis's Mat. Med. edit. 3.

RAMALIS VENA. See PORTA VENÆ.

RAMEX. See HERNIA.

—— VARICOSUS. See CIRSOCELE.

RAMUS. A BRANCH. It is the ſubdiviſion of a ſtem, or a tree; it is called a BOUGH.

—— INFERIOR. See MAXILLARIS INFERIOR NERVUS.

—— SUPERIOR. See FRONTALIS NERVUS.

RANA. The FROG, or PADDOCK. The ſpawn of *frogs* was formerly uſed for cooling, but now wholly neglected; alſo it is the name of a diſeaſe. See RANULA.

—— RUBETA. See BUFO.

RANGIFER. See CERVUS RANGIFER.

RANINÆ ARTERIÆ & VENÆ, RANULÆ. } See SUBLINGUALIS. Quia nigræ ſunt inſtar ranularum.

RANULA. The name of an inflammatory tumor, ſeated under the tongue; eſpecially in children.—ÆTIUS ſays, particularly in the veins:—it hath been thought to reſemble a little frog, whence the name of *ranula*; though ſome ſay that it is thus named, becauſe it alters the voice of the patient, ſo as to make him croak like a frog. It is alſo called *batrachos*, *hypogloſſus*, *hypogloſſum*, *rana*. This tumor is formed in the ſalivary glands under the tongue, and is ſeated on either ſide of the frænum; it is generally of the ſcrophulus kind. It is defined by VOGEL a folliculous tumor containing a thick, or toſaceous matter. The matter varies much in different inſtances of this diſorder, being ſometimes like the white of an egg, at others it is more ſolid; in ſome inſtances it is purulent, in others it differs from all theſe. It ſometimes grows ſuddenly, impedes both the ſpeech and ſwallowing, and alſo cauſes much pain; but generally its growth is more gradual, and its effects not ſo violent. Inſtances have occurred of theſe tumors having degenerated into cancers. They are all of the encyſted kind, and are with great difficulty either diſperſed or brought to ſuppuration, generally requiring the knife for their removal. If a tumor of this kind is ſeated where the ſalival ducts enter into the mouth, inciſions muſt never be attempted, becauſe of the danger of wounding theſe ducts, with the nerves or blood-veſſels; in this caſe wait until nature opens a paſſage for the contents:—if it is ſeated on either ſide, great care is required, leſt the nerves or the blood-veſſels there ſhould be injured:—however, in ſuch caſes, hold up the tongue of the patient, and make an inciſion tranſverſely into the tumor; the matter being diſcharged, dreſs the wound with honey of roſes acidulated with ſpirit of vitriol, that the cyſt may alſo be deſtroyed. See Heiſter's Surgery. Bell's Surgery, vol. iv. p. 325. White's Surgery, p. 275.

RANUNCULOIDES PRATENSIS. See CALENDULA PRATENSIS.

RANUNCULUS. CROWFOOT. It is a plant with pentapetalous flowers, that are alſo roſaceous; they are ſet in five-leaved cups; they are followed each by a round cluſter of naked ſeeds, and are perennial. Boerhaave enumerates ſixty-nine ſpecies, ſome of which are inert, and others are very cauſtic. It is alſo a name for the *myoſuros*.

—— BULBOSUS, vel *tuberoſus major*; ROUND-ROOTED, or BULBOUS CROWFOOT. It hath a round tuberous root, the ſize of an olive; the leaves are divided commonly into three ſegments, and theſe are further ſubdivided; the ſtalks are erect; the flowers are of a bright gloſſy yellow, their cups turned downwards It is common in paſture-grounds, and flowers in May. This is one of the cauſtic ſpecies.

—— LONGIFOLIUS PALUSTRIS MINOR, called alſo *flammula*, *citrinula*, SPEARWORT, or SMALLER WATER CROW-FOOT, with fibrous roots, long narrow leaves, acuminated at both ends, and leaning on procumbent ſtalks; it grows in watery places or moiſt meadows, and flowers in June. The roots and leaves have no ſmell, but have an acrid fiery taſte. Taken *internally*, they appear to be deleterious, even when ſo far freed from the cauſtic matter by boiling in water as to diſcover no ill quality to the palate. The effluvia of the leſs acrid ſpecies, or varieties, cultivated in gardens, when freely inſpired, have occaſioned head-achs, anxieties, vomitings, and ſpaſms. The leaves applied externally bliſter the part, the roots do ſo too, and as ſuch have been uſed; their pungency is diminiſhed by drying, and deſtroyed by long keeping. See Raii Hiſt. Lewis's Mat. Med.

—— VIRIDIS. The name of a ſpecies of frog; beſides, the term *ranunculus* is given to ſeveral other of the vegetable claſs, viz.

RANUNCULUS *ficaria & vernus*. See CHELEDONIUM MINUS.

—— NEMOROSUS. See MOSCHATELLINA.

—— PHRAGMITIS. See ANEMONOIDES.

—— TRIDENTATUS VERNUS. See HEPATICA NOBILIS.

RAPA. The TURNIP, commonly called the ROUND-ROOTED TURNIP, called alſo *rapum*. It is a plant with a round root, with jagged leaves, yellow flowers, with ſmall round, ſmooth, reddiſh, or blackiſh ſeeds, lodged in long pods. The garden *turnip* is ſuppoſed to be a variety produced by culture from the ſmaller ſort, which grows wild in ſandy grounds in ſome parts of England. It is biennial. Botaniſts enumerate ten ſpecies.

Turnips are uſeful and agreeable food; they are *detergent*, *laxative*, and *diuretic*. They are a watery and tender ſubſtance, and therefore eaſily digeſted, and occaſion little flatulency. They have ſome ſweetneſs, and do not ſeem to contain much nouriſhment in proportion to their bulk. Sugar cannot be extracted from them, and very little amylaceous matter. They are of two kinds, the white and yellow; the latter has a ſweeter and more mucilaginous taſte, and therefore apparently the moſt nutritious, and more hardy in ſuſtaining the winter. Cul. Mat. Med. *The liquor* preſſed from them, after boiling, is taken medicinally *in coughs and diſorders of the breaſt*; the *ſeeds* are alexipharmic and *diaphoretic*; they have no ſmell, but to the taſte are mildly acrid. The female ſpecies, which are longiſh, are thought the beſt; the male ſpecies are round. See Raii Hiſt. Lewis's Mat. Med. This term is alſo applied to the *rapiſtrum*.

RAPHANIA. CRIPPLE DISEASE; called alſo *convulſio ſolanienſis*, *eclampſia typhodes*, *necroſis uſtilaginea*. It is a nervous affection, of the ſpaſmodic kind, in which there is a violent contraction of the joints, with convulſive agitations, and great pain at various periods. Linnæus giveth this name to this diſeaſe, from its ſuppoſed cauſe, viz.

taking the ſeeds of the *raphanus raphaniſtrum*, Linn. i. e. *the baſtard radiſh*, or *charlock*. Dr. Rothman, who wrote on this diſeaſe, ſuppoſes it to be cauſed by the raphanus above named, becauſe of its prevalence when the ſeeds of that plant abounded amongſt the corn. Linnæus alſo having fed ſome birds with the ſeeds of the raphaniſtrum, and finding that they died convulſed, he gave this diſeaſe the name of *raphania*. The Germans call this diſorder, *kriebel krankheit*. Sauvages names it *eclampſia typhodes*; alſo *convulſio raphania*, vel *ab uſtilagine*.

It is defined "a ſpaſtic contraction of the limbs or joints, attended with convulſions, and excruciating periodical pain." Dr. Cullen places it in the CLASS NEUROSES, and ORDER SPASMI.

In the ſixth volume of Amœnitat. Academicæ, Dr. Rothman gives the hiſtory of this diſeaſe, and a full deſcription of it. He obſerves that it had been frequently epidemical in Sweden, notwithſtanding that many phyſicians think it is a new diſtemper: he has traced it in the writings of many authors, from the year 1596 to 1727, by which it appears to have been common in other parts of Europe; he adds, that this dreadful diſtemper ſometimes held the ſick for three or four weeks, and thoſe who periſhed, generally ſunk under a diarrhœa, or died in convulſions. The poorer people were the chief ſubjects of this complaint; they were uſually attacked in autumn, ſoon after eating bread made of new corn.

In order to its relief, valerian, caſtor, camphor, and other ſimilar antiſpaſmodics were given with ſome advantage. See Pulteney's View of Linnæus; Memoirs of the Royal Med. Society, at Paris, A. D. 1779, but particularly Dr. E. Roſen, and Dr. Rothman's Diſſertatio *Raphaniæ*.

RAPHANISTRUM. This plant is ſo called from its likeneſs to the raphanus minor, with which it alſo agrees in its medical virtues. It is alſo a name for MIAGRUM.

RAPHANUS AQUATICUS. See SISYMBRIUM AQUAT.

RAPHANUS HORTENSIS, called alſo *radicula*, *raifort*. COMMON GARDEN RADISH. It is ſufficiently known, not to need a deſcription. Its virtues are ſimilar to thoſe of the cochlearia. The root is attenuating, and occaſionally carminative: all the parts of the plant are antiſcorbutic. The roots are more acrid after drying than they are whilſt freſh, but this acrimony is ſoon diſſipated by boiling. It is commonly eaten with its cortical part, in which its acrimony conſiſts, and this rather ſerves as a condiment to its aceſcent ſubſtance, and which therefore ſeldom proves flatulent.

—— RUSTICANUS, } *Armoracia*, HORSE-RADISH. It
—— MARINUS, } is the COCHLEARIA ARMORA-
—— SYLVESTRIS. } CIA, *foliis radicalibus lanceolatis crenatis, caulinis inciſis, floribus albis*, CLASS. TETRADYNAMIA, ORDO SILICULOSA. LINN. Gen. Plant. 803. Its flowers and ſeeds reſemble thoſe of ſcurvy-graſs, the leaves are large and long, and are indented about the edges. It is found wild about the ſides of ditches and rivulets, but for medicinal and culinary purpoſes it is cultivated in gardens. It is perennial, and flowers in June. It rarely perfects its ſeeds, but is propagated by tranſverſe cuttings of the roots.

The roots impreſs both the noſe and the palate with a quick penetrating pungency; they alſo contain in certain veſſels a ſweet juice, which ſometimes exudes in little drops upon the ſurface. Its pungent matter is a very volatile ſalt, which is all diſſipated in drying, and is carried off in diſtillation, both by water and by ſpirit of wine. As the pungency exhales, the ſweet matter becomes more ſenſible, though this alſo is in a great meaſure diſſipated. It impregnates both water and ſpirit by infuſion or diſtillation very richly with its active matter; in diſtillation with water it yields a ſmall quantity of eſſential oil, exceedingly penetrating and pungent. This root agrees with creſſes and ſcurvy-graſs, and differs from muſtard-ſeed in the volatility of its pungent matter, and its ſolubility in ſpirit. It is properly employed as a condiment with animal food, as it ſtimulates the ſtomach and promotes digeſtion. Whether *externally* or *internally* employed, it proves a ſtimulant, hence a rubefacient uſeful in palſy, and rheumatiſm. Its infuſion formed into ſyrup often cures hoarſeneſs, when it depends, as it often does, on the interrupted ſecretion of mucus. It readily proves emetic, taken in infuſion, and a large portion of warm water taken after it; hence it may be given as, or taken with a vomit. Infuſed in wine, it ſtimulates the nervous ſyſtem, and is thereby uſeful in palſy; and employed in large quantity it proves heating to the body, hence uſeful in chronic rheumatiſm, whether ariſing from ſcurvy or other cauſes. Cut down into very ſmall pieces, without bruiſing, and ſwallowed without chewing, it may be taken in a large quantity, to that of a table ſpoonful. BERGIUS ſays, "taken in this manner for a month together every morning, it has been extremely uſeful in arthritic caſes," perhaps of the rheumatic kind. The matter of *horſe-radiſh* paſſes to the kidneys readily, and proves a powerful diuretic, uſeful therefore in dropſy; and by promoting urine, and perſpiration, it has long been known to be a moſt powerful antiſcorbutic. Held in the mouth it proves a certain and good ſialagogue. The ſyrup of *horſe-radiſh* is made by infuſing one dram of the root in four ounces of water, and forming that into a ſyrup, in a moderate heat, with ſugar. An infuſion of it with bruiſed muſtard-ſeed, either in wine or boiling water, acts as a ſtimulant, and diuretic, and is often preſcribed with ſucceſs againſt dropſical and paralytic complaints. Dr. Withering ſays, that an infuſion of this root in milk, makes one of the ſafeſt and beſt coſmetics.

If the root is kept in a cool place, and buried in dry ſand, its virtues are retained a long time. Dr. Alſton ſays, that it may be ſo dried as to powder, and ſtill to retain an uſeful portion of its virtue.

The London College directs a compound ſpirit, called SPIRITUS RAPHANI COMPOSITUS, COMPOUND SPIRIT OF HORSE-RADISH, to be thus made.

Take *horſe-radiſh* root freſh, the exterior rind of Seville orange dried, of each two pounds; freſh garden-ſcurvy-graſs, four pounds; bruiſed nutmegs, an ounce; proof ſpirit of wine, two gallons; water, a ſufficient quantity to avoid an empyreuma: diſtil two gallons. Ph. Lond. 1788. See Neumann's Chem. Works; Lewis's and Cullen's Materia Medica.

RAPHANUS SYLVESTRIS. See LEPIDIUM.

RHAPHONTICOIDES LUTEA. See BEHEN ALBUM.

RAPISTRUM, called alſo *lampſana*, *miagra*, *ſinapi arvenſe præcox*, *ſemine nigro*, CHARLOCK, CHADLOCK, KEDLOCK, or WILD MUSTARD. This plant is called *rapa*. All the ſpecies, of which ſix are enumerated by Boerhaave, are antiſcorbutic, but their efficacy is too inſignificant to obtain a place in practice.

RAPOCAULIS. See BRASSICA CONGYLODES.

RAPUNCULUS, } Plants which much reſemble the
RAPUNTIUM. } campanula in external appearance. See CERVICARIA.

RASPATORIUM, from *rado*, *to ſcrape*. RASPATORY. A SURGEON'S RASP.

RAUCEDO, vel RAUCITAS. An HOARSENESS. It is a diminution of the voice, ſometimes attended with a preternatural aſperity or roughneſs thereof: the parts affected are, the aſpera arteria, and particularly the larynx. Dr. Cullen obſerves, that it is generally a ſymptom of catarrh, but ſometimes it is a ſpecies of PARAPHONIA, which ſee.

Its cauſes are, a ſort of catarrh, which ariſes from too great acrimony and viſcidity of the lymph: in which caſe a ſmall quantity of horſe-radiſh juice, mixed with honey, may be ſwallowed every morning, with a draught of new milk whey. See RAPHANUS RUSTICANUS. 2. A copious effuſion of thin lymph upon the larynx and parts adjacent; and when from this cauſe, relief may be expected from the pulv. e. trag. c. amylo, terr. Japon. &c. 3. In the ſmall-pox, puſtules in the membranes of the larynx, &c. produce an *hoarſeneſs*, which is relieved by the uſe of attenuants and lubricants, which aſſiſt the variolous matter in its paſſage through the ſkin. 4. A tumor, or inflammation, in or about the larynx: to remove the complaint from this cauſe, let vapours of warm water be received into the throat, or frequently uſe the following gargle: ℞ decoct. fol. vel rad. altheæ lb. i. ſp. ammoniæ compoſiti, gt. 60. m. 5. A dryneſs about the larynx and the muſcles ſubſervient to ſpeech. Here nitrous and acid attenuants, mixed with diluents, are very uſeful. 6. The ſpittle becoming thick or acrid, hence a viſcid tough matter ſticks to, and renders the ſurface of the larynx, &c. unequal, and conſequently the voice *hoarſe*; to remove which cauſe, things that attenuate and dilute the lymph, that render the ſpittle thin, ſoft, and copious, and empty the glands, will be the proper means; ſuch are emollients and expectorants.

In many inſtances the moſt ſpeedy relief is obtained from continuing the feet in warm water, for the ſpace of half an hour, about bed-time.

RAUCITAS. See BRANCHUS, and RAUCEDO.

REALGAR, called alſo ARLADA, or ARLADAR, *auripigmentum rubrum*, *arſenicum rubrum factitium*, alſo *abeſſi*. A compoſition of ſulphur, orpiment, or yellow arſenic, and unquenched lime. It is of a red colour, always gloſſy, but not always tranſparent. See ARSENICUM.

REBIS. The alvine fordes are ſo called by ſome of the more ancient authors: it alſo denotes the hair of choleric and plethoric men. Amongſt gold refiners it means the *ſemen auri*, from whence gold is generated; and is the gold, and its own quickſilver.—It is called by the barbarous name *rebis*, becauſe it is at firſt compoſed of two ingredients, which at length, by long coction, become one in ſpecies and number; by ſome of the more modern authors, the *mercurius duplicatus philoſophicus*, conſiſting of ſolar ſulphur and mercury, is called *rebis*; alſo AZOTH.

RECEPTACULUM CHYLI. The RECEPTACLE of the CHYLE. It is alſo called *receptaculum Pecqueti*, becauſe Pecquet firſt demonſtrated it at Paris, 1651,—1652, *diverſorium*, *ſacculus chyliferus*. Euſtachius and Aſellius were in ſome degree acquainted with it. It lies on the right ſide of the aorta, *at the union of the laſt vertebra of the back with the firſt of the loins*, climbs up between the aorta, and vena azygos, behind the œſophagus. It is a ſort of membranous veſicle, of various ſhapes in human ſubjects. Sometimes it ſurrounds the aorta like a collar. Its coats are very thin. The upper portion is contracted between the aorta and the vena azygos, and forms a particular canal which runs up through the thorax, and is called the DUCTUS THORACICUS, which ſee, alſo MONRO'S OSTEOLOGY.

RECEPTACULUM. In BOTANY. A RECEPTACLE, from *recipio*, to *receive*; by RAY, it is called *ſedes*; by BOERHAAVE, *placenta*; and by VAILLANT, *thalamus*. It is the baſis upon which the other ſix parts of fructification are connected.—1ſt, *Receptaculum commune*; connecting many floſculi, ſo as that taking any of them away would cauſe irregularity. 2. —— *Floris*, a baſis to which are fixed the parts of the flower excluſive of the germen. 3. —— *Fructificationis*, common to the flower and fruit. 4. —— *Fructus*, a baſis for the fruit only. 5. —— *Proprium*, belonging to the fructification only. 6. —— *Seminum*, the baſis on which the ſeeds are fixed within the pericarpium.

RECIPE. TAKE. It is uſually placed at the beginning of preſcriptions, and is generally wrote thus, ℞, or with the character for tin, ♃.

RECTIFICATIO. See DEPURATIO.

RECTOR SPIRITUS. See SPIRITUS.

RECTUM INTESTINUM, called alſo *apeuthyſmenos*, *longanon* or *longaon*, *archos*, *cyſſaros*. In Paracelſus it is called *monocolon*. The laſt of the large inteſtines, called the *rectum*, or the STRAIT GUT, is every where covered by longitudinal muſcular fibres, and hath ſtrong circular ones for expelling the fæces. It is not furniſhed with bands as the colon is, nor is it covered with the peritonæum, as are the other inteſtines. At the lower extremity of the *rectum* are certain cryptæ, which are ſuppoſed to be the ſeat of worms, and certain vaſcular ridges between the cryptæ where the piles are ſituated, which are external or internal, according to their ſituation. This gut is a continuation of the laſt convolution of the colon, which having paſſed below the laſt vertebra of the loins to the inſide of the os ſacrum, is bent backward in the concave ſide, to which it is connected, and having reached the os coccygis, it runs in the direction thereof, and bends a little forward, terminating beyond the extremity of the os coccygis. The inner coat is furniſhed with many glands, which ſeparate a mucus to keep it ſupple. The arteries are from the hæmorrhoidalis interna, the laſt branch of the meſenterica inferior, which communicate with the hypogaſtrica, and particularly with the hæmorrhoidalis externa. The veins are branches from the meſaraica minor, or hæmorrhoidalis interna, which communicate with the hypogaſtrica. The nerves are from the plexus meſentericus inferior, and the plexus hypogaſtricus.

Sometimes, there are hard, ſcirrhous lumps, without pain, ſeated at the bottom of the *rectum* or near the anus; theſe are thruſt out at every effort to void the ſtool, and then indeed is perceived a degree of uneaſineſs; but at no other time, except after handling them. If they have a ſmall baſis, Mr. Pott adviſes to remove them as ſpeedily as poſſible; for, if they continue, they certainly prove fatal. In the inſtances that cannot be removed, the beginning ſymptoms do not give any light into their nature: the firſt ſymptom is felt as if the patient wanted to void a large ſtool; on making the attempt, nothing is voided; this unavailing needing is frequently returning; at length he tries a glyſter; but when the pipe is about to be introduced into the gut, it is obſtructed by a lump there; thus he is alarmed. The judicious ſurgeon, on introducing a finger, ſoon perceives the nature of the caſe, but he only offers a palliative remedy.

Another diſeaſe of this gut, is a fungous or general relaxed ſtate of its whole ſubſtance. When it is extruded through the anus, it is bound by the ſphincter muſcle, and puts on the appearance of a fungus with a narrow baſis; the mere fungus is uniform, and may be got round; it is ſoft to the touch, yet from the irritation of the part this may be as painful as a cancerous one. It is, therefore, proper juſtly to diſtinguiſh them, as the firſt may be cured, but the latter cannot. The cancerous fungus within the *rectum* is ſeldom uniform, but generally unequal, ſpreading from a large baſis, and diſcharges an offenſive ichor or gleet.

RECTUS is the name of ſeveral muſcles, as follow: they are ſo called from the rectilinear direction of their fibres.

RECTUS ABDOMINIS. The recti muſcles of the belly ariſe from the os pubis, are inſerted into the ſternum, and are expanded upon the cartilages of the fifth, ſixth, ſeventh, and ſometimes of the eighth ribs. In their courſe they are divided into four or five portions, by three or four tendinous interſections. They lie on the fore-part of the belly, immediately under the integuments, betwixt the linea alba and the lineæ ſemilunares. The veſſels which paſs underneath the upper parts are the mammary artery deſcending, and its vein aſcending; thoſe of the lower part are the epigaſtric artery aſcending, and its vein deſcending. In this muſcle there are certain white lines and impreſſions perceptible, which VESALIUS calls *perigraphæ*.

—— ANTERIOR. See RECTUS CRURIS.

—— ANTICUS BREVIS. See RECTUS INTERNUS MINOR.

—— ANTICUS LONGUS. See RECTUS INTERNUS MAJOR.

—— ATTOLLENS. See GENIO-HYOIDÆUS.

—— CRURIS. Some call it rectus femoris, and others call it *rectus anterior*. WINSLOW calls it *gracilis anterior*. It riſes by a ſtrong tendon from the anterior and ſuperior proceſs of the ileum, and from the cartilaginous tip of the acetabulum, and is inſerted into the upper part of the patella.

—— DEPRIMENS OCULI. } See DEPRESSOR OCU-
—— INFERIOR OCULI. } LI.

—— EXTERNUS OCULI. See ABDUCTOR OCULI, N° 5.

—— INTERNUS. It riſes cloſe to the edge of the os pubis, where it joins to the iſchium, and runs to the internal condyle. It ſerves to bend the thigh forward. It is alſo called *gracilis internus*.

—— INTERNUS MAJOR, called alſo *flexor capitis*. It lies before the rectus internus minor. It riſes commonly by ſo many tendons from the tranſverſe proceſſes of the fifth, fourth, third, and ſecond cervical vertebræ, and is inſerted into the cuneiform proceſs of the os occipitis, and bends the neck forward. Winſlow calls it RECTUS ANTICUS LONGUS.

—— INTERNUS MINOR, ANNUENTES. Winſlow calls it *rectus anticus brevis*. It is alſo named, *renuens muſculus*, and riſes from the root of the tranſverſe proceſs of the atlas, and is inſerted into the cuneiform proceſs of the os occipitis, juſt behind the groove where the lateral ſinus forms the beginning of the internal jugular. This muſcle gives the head a lateral jerk upon the atlas.

—— INTERNUS OCULI. It riſes from the bottom of the ſocket near the hole by which the optic nerve paſſes into the orbit, paſſes on the ſide of the globe next the noſe, and is inſerted into the ſclerotica. It draws the eye towards the noſe. See ABDUCTOR OCULI, N° 8.

—— LATERALIS. It riſes from the tranſverſe proceſs of the atlas, and is inſerted into the os occipitis and os temporis, near the maſtoid proceſs. It bends the head to one ſide.

—— MAJOR. It riſes from the upper part of the ſpinal proceſs of the dentata; it runs upwards and outwards, and is inſerted near where the os occipitis is joined to the os temporis, ſerving to bring the head backwards.

It

It is alſo partly a rotator of the head, called alſo *capitis poſticus*.

RECTUS MINOR. This riſes from the knob which anſwers to the ſpinal proceſs of the atlas, and paſſes thence, to the head. It can only move the head upon the atlas, called alſo *capitis rectus*; *obliquus minor*.

—— SUPERIOR OCULI. See ELEVATOR OCULI.

RECURRENS. The RECURRENT NERVE. See PAR VAGUM.

REDUC, vel REDUX. A FLUX. It is a powder by which calcined metals, or minerals, are reduced to a reguline form. *Fluxes* are generally either of the vitreous, or of the ſaline kind;—*by the vitreous*, are meant all thoſe that are of themſelves, or that readily aſſume a gloſſy form in the fire; the chief of which are the glaſs of lead, glaſs of antimony, and borax;—*by the ſaline*, all thoſe that are compoſed of ſalt, whether of nitre, or tartar, or the like.—There are *fluxes* of a yet cheaper kind; ſuch are *dried wine-lees*, *dried cow-dung*, *dried horſe-dung*, *dried river-mud*; *fuller's-earth*, *iron-filings*, &c. There are a variety of compound *fluxes*, ſome of which are better adapted for ſome ores than others are, and, indeed, almoſt every operator hath his favourite kind. The common black *flux*, ſee in the article CALCINATIO.

REFECTIVA. See CARDIACA.

REFRIGERATIO. See HORROR.

REFRIGERATORIUM. A REFRIGERATORY. It is the veſſel filled with water, through which the worm paſſes in diſtillations: its uſe is, to condenſe the vapours as they paſs through the worm.

REGALIS REGIS. } See NITRUM, N° II.
REGIA AQUA. }

REGIMEN. The REGIMEN, or the regulation of the diet, with a view to preſerve, or to reſtore health. In chemiſtry it is the regulation of fires.

REGIONALIS MORBUS. See EPIDEMIUS.

REGISTERES. REGISTERS. They are openings in different parts of furnaces, which are to be ſhut occaſionally with ſtoppers or burnt clay. By means of theſe *regiſters* the fire may be governed as we pleaſe, for their heat is increaſed or diminiſhed by the cloſing, or opening of theſe holes. Theſe holes ſhould be from two to four inches wide, if the diameter of the furnace is a foot within.

REGULIS BARBADENSIS vel JAMAICENSIS. See PALMA NOBILIS.

REGULUS. Thus the *chemiſts* have called metallic matters when ſeparated from other ſubſtances by fuſion. *The alchemiſts* firſt invented this name, becauſe they expected to find gold in the metal. At preſent the word is confined to the metallic part of certain ſemi-metals which have no proper name, as the *regulus* of antimony, the *regulus* of cobalt, the *regulus* of arſenic, &c.

RELAXATIO, alſo *chalaſis*. See PROCIDENTIA UTERI, and ATONIA.

REMEDIUM, a REMEDY, called alſo *bocthema*, a medicine by which any illneſs is cured.

REMITTENTES. REMITTING DISEASES. They are when a diſtemper abates, but does not go quite off before it returns again. This moſt frequently happens in thoſe fevers which only go near to a diſtinct intermiſſion, without completely effecting it.

REMORA ARATRI. See ANONIS.

REN, called alſo *nephros*, *a kidney*. See RENES.

RENALES ARTERIÆ, alſo called *emulgentes arteriæ*, are generally two in number, and go out laterally from the lower deſcending aorta, immediately under the meſenterica ſuperior, one to the right hand, the other to the left. The right is ſituated more backward, and is longer than the left, becauſe of the vena cava which lies on the right ſide, between the aorta and the kidney; they run commonly without diviſion, and almoſt horizontally to the kidneys, into the depreſſions of which they enter by ſeveral branches, which form arches in the inner ſubſtance of the viſcera. From theſe arches many ſmall branches go out toward the circumference, or ſurface of the kidneys. Sometimes two arteries go into one kidney. Generally the right renal artery paſſes behind the vena cava, and the renal vein in the other ſide; and the left artery firſt behind, and then before the vein. Sometimes they ſend branches to the glandulæ renales, membrana adipoſa of the kidneys, and even to the diaphragm.

——VENÆ, alſo called *emulgentes venæ*. Theſe ſpring from the inferior vena cava, when it arrives at the kidneys, into which theſe branches are ſent. Theſe are the largeſt veins that go from the vena cava, betwixt the liver and the bifurcation. The right emulgent is the ſhorteſt, becauſe of the ſituation of the kidney; the left is longer, becauſe it hath to croſs the trunk of the aorta. Uſually the left emulgent vein furniſhes the left ſpermatic vein.

RENELIUS. See RHENCOS.

RENES. The KIDNEYS. They are two oblong flattened bodies, extending from the eleventh and twelfth ribs, to the fourth lumbar vertebra. The right *kidney* lies under the great lobe of the liver, and is lower than the left, which is ſituated under the ſpleen. The *kidneys* are ſhaped like a large bean; their circumference is concave on the ſide next the vertebræ, and convex on the oppoſite ſide. The aorta deſcendens, and the vena cava inferior, lie between the *kidneys*, pretty cloſe to the bodies of the vertebræ, and each of them commonly ſend off one capital branch, ſometimes two or three, which enter into the ſinuous part of the *kidney*, and dividing into two or three branches before it enters, ramifies through the whole. With theſe veſſels the nerves enter. The *kidneys* are covered on one ſide by the peritonæum, and the whole ſubſtance is inveſted by a capſula, compoſed of two laminæ connected together by a cellular ſubſtance. The external lamina is thin and ſmooth, and makes the *kidney* uniform. In children we may obſerve this convex ſubſtance is divided into little lobules, and we ſometimes find it ſo in adults. There are two ſubſtances obſervable in the *kidney*, the external or cortical, and the internal, which is called tubular or mamillary, which laſt is made up of a number of pyramidal portions, about twelve in each *kidney*, whoſe points are received into the pelvis, ſo that the cortical part not only lies round the outer ſurface of the *kidney*, but throws proceſſes into the interſtices. The cortical part is quite vaſcular; in minute injections are obſerved certain appendages, called by ſome CORPORA LOBOSA, but which are natural cryptæ, or cells, where the ſmall arteries ſeem to be expanded. Ruyſch ſays they are arteries coiled up in a little ſpace. The veins have none of theſe cryptæ; whence it is plain that they are not extravaſations; beſides, they are uniform, and only in the cortical part. Each mamilla lies in a kind of membranous calix, or *infundibulum*, which opens into a common cavity, called the pelvis, which is membranous like the infundibula, of which it is a continuation. After the infundibula have contracted into a conical form round the apices of the mammillæ, each of them forms a ſmall ſhort tube, which uniting at different diſtances along the bottom of the ſinus of the *kidney*, form three large tubes, which go out from the ſinus in an oblique direction from above downwards, and, immediately after, unite into one trunk, which is called

The URETER: this runs down obliquely, with a ſmall degree of inflexion, to the lateral parts of the inner-ſide of the os ſacrum, and paſſing between the rectum and bladder, it terminates in the latter in its inferior part, near the veſiculæ ſeminales; the ureters perforate each coat diſtinctly in a ſlanting manner; ſo that their oblique inſertion anſwers the ſame end as a valve. The internal ligamentary membrane of the ureter does not end with their inſertion into the bladder, but is continued toward the proſtate gland, where it ſeems to be inſerted; this ligament keeps the lower part of the bladder from ſtretching, and keeps the *ureters* fixed. The ſituation of the *ureter*, with reſpect to the renal artery and vein, is thus: the artery is in the upper part of the ſinus of the *kidney*, and partly before the vein; the vein is about the middle, and between the artery and the *ureter*, which is in the lower part, ſomething behind the vein, and partly ſurrounded by a branch of the artery, whence appears the impoſſibility of nephrotomy, and that the operation, however repreſented, is no other than opening an abſceſs in the loin, through which opening the ſtone paſſes. See NEPHROTOMIA.

RENES SUCCENTURIATI. See CAPSULÆ ATRABILIARIÆ.

RENISUS; ANTITYPUS. RESISTENCE. It properly belongs to hardneſs, which *reſiſts* contact; hence it is always connected with that which is hard. The renitentes corporis diſpoſitiones, are the *reſiſting* powers or diſpoſitions of the body, which do not eaſily permit a paſſage to the morbific miaſma, or contagion; and are with difficulty affected or injured. In theſe ſenſes, Galen and Linden make uſe of the word.

RENOVATIO. RENOVATION. In CHEMISTRY it is the reſtoration of a mineral body to a perfect ſtate, from one which is imperfect.

RENUENS MUSCULUS. See RECTUS INTERNUS MINOR.

RENUNCIATIO. RENUNCIATION, from *renuncio, to declare openly.* By Paré, called *elogium*; an opinion or judgment given by a phyſician or ſurgeon to a magiſtrate or judge concerning the ſtate of the ſick, with reſpect to the mortality of a wound; of poiſon being taken, &c. See Ambroſ. Paræus, Tractatus annexus Chirurgiæ de Renunciationibus.

REPELLENTIA. REPELLENT MEDICINES. By theſe are meant thoſe which prevent ſuch an afflux of a fluid to any part as would raiſe it into a tumor. Whatever other medicines may occaſionally produce the effects of repellents, thoſe only are properly of this tribe, which cool, dry, aſtringe, and ſtrengthen the parts, and enable them to reſiſt the afflux of ſuch matter as is lodged there.

REPULSIO. REPULSION. The cauſe which oppoſes itſelf to abſolute attraction hath been acknowledged by all who were converſant in phyſics, with reſpect to the celeſtial bodies; and it hath been termed *repulſion*, that is, a power as real as attraction, which repels bodies after they have approached each other to a certain point, and prevents their uniting together. This *repulſion*, though a ſecond cauſe, and ſubject to the laws of attraction, is properly inherent in matter; this properly acts conjointly with attraction in the elements of bodies, and in all the operations of chemiſtry. It appears that it is from theſe two effects reunited, and from their different degrees of action, that the variety reſults, which is obſerved in the hardneſs and denſity of bodies. Many have rejected this *repulſion*, which ſir Iſaac Newton had allowed in ſublunary things; but if we juſt glance on many of the operations of chemiſtry, it is impoſſible to help admitting a retropulſive property in bodies.

RES FALLACISSIMA. See PULSUS.

RES NATURALES. The NATURALS. According to Boerhaave, theſe are life, the cauſe of life, and its effects. Theſe, he ſays, remain in ſome degree, however diſordered a perſon may be. See alſo CIRCUMSTANTIÆ.

RESEDA. See BARBAREA.

RESINÆ. RESINS. All ſorts of exudations, from evergreens, as turpentine, tar, &c. are in a general acceptation included under the name of *reſin*. Eſſential oils, indurated by age, or by acids, are called *reſins*. When the eſſential oil of the exudations from ever-green trees is exhaled, the remaining maſs is called *reſin*. As *reſin* conſiſts of oil and acid, it is artificially produced by the admixture of vitriolic acid and ſpirit of wine, or the ſpirit of turpentine. The *reſina alba* of the Pharm. Edinb. Coll. is from the *pinus ſylveſtris*, and the *pinus abies*. The *reſina flava* is alſo from the ſame.

Reſins in general diſſolve in ſpt. vin. r. It is chiefly by this means that they are extracted from the ſubjects in which they are contained. Indeed thoſe parts of vegetables which abound with eſſential oils, and with reſins, and are poſſeſſed of flavours and aromatic qualities, ſhould be reduced into an extract with this menſtruum. RESINS alſo diſſolve in expreſſed oils, and in eſſential ones; and may be united with water by means of the ſame intermedia which render fluid oils miſcible with water. In a heat leſs than that of boiling water, they melt into an oily fluid, and in this ſtate they may be incorporated one with another. In their reſolution by fire, in cloſe veſſels, they yield a manifeſt acid, and a large quantity of empyreumatic oil.

The *acrid reſins* exhibited by themſelves tenaciouſly adhere to the coats of the inteſtines: by their ſtimulating power they irritate and inflame them, and thus produce ſpaſms, inflammations, &c. Theſe inconveniences are remedied by alcaline ſalts, by ſoap, and in a good meaſure by ſugar, if they are triturated with the *reſin*, before the patient takes it. Some rub eſſential oils with *reſins* to correct them, but the oil is ſoon ſeparated therefrom in the ſtomach, and the *reſin* is rendered more active, and ſo becomes more virulent, or, at leaſt, the ſame effects being produced in a degree by the oil which is obtained from the *reſin*, the *reſin* will act with more advantage.

Reſins act principally by irritating the ſtomach and bowels, and by attenuating the fluids; if the irritation is quick they prove emetic; if not ſo ſudden, they paſs off by ſtool. They operate more violently in robuſt conſtitutions than in thoſe of a contrary habit: the veſſels of the former being more tenſe, ſo leſs capable of bearing irritation. The action of theſe medicines is extended beyond the primæ viæ, as is evident from the children being purged by the milk of thoſe nurſes who take them. See Neumann's Chem. Works. Dict. of Chem.

RESINA ANIME. See ANIME.

—— FLAVA. This remains after the diſtillation of oil of turpentine, and is the common roſin of the ſhops: it is chiefly made uſe of in external application. It forms part of the compoſition of ſeveral plaſters, and gives the name of one ointment, unguentum reſinæ flavæ. See BASILICON UNGUENTUM. LEWIS ſays, in taſte it is conſiderably bitter, and ſometimes given as an internal corroborant, in preference to the turpentines themſelves, as being diveſted of their ſtimulating oils. Materia Medica, p. 553. See ABIES.

—— TOSTA, FRICTA, NIGRA. See COLOPHONIA.

RESINÆ FLAV. UNG. See BASIL. FLAVUM.

RESPIRATIO. BREATHING, called alſo *anapneuſis*. It is the action of taking in and diſcharging the air from the lungs, including, therefore, inſpiration and expiration. As ſoon as the child is born, the air ruſhes into its lungs and diſtends them, and as heat rareſies the air, its force is ſo increaſed, that by expanding the lungs the whole breaſt is diſtended: thus the rareſying air, diſtending the lungs every way by its natural ſpring, increaſed by heat, may be conſidered as the firſt mover in the action of reſpiration. By this firſt diſtenſion of the lungs it happens that the blood which had hitherto paſſed by the foramen ovale, whilſt the fœtus continued in the womb, is now obliged to take a different way, and paſs by the pulmonary artery and veins; and the former paſſage, by this means, is rendered uſeleſs. *This makes it neceſſary that reſpiration be continued for ever after during life.*

As the ſpring of the air is increaſed by the heat of the lungs, ſo the ſame air, rareſied by the heat it meets with, becomes lighter than the external air, and is made to reaſcend by the contraction of the diaphragm and intercoſtal muſcles, which are antagoniſt powers to the dilating one of rareſied air.

After the firſt expiration, a portion of the inſpired air remains, which is rareſied by the heat to which it is ſubjected; thus the external or atmoſpherical air again deſcends into the lungs; and as in the firſt inſtance of *reſpiration* the ſame circumſtances follow, ſo inſpiration and expiration continue to ſucceed, until with the laſt expiration death is uſhered in.

Reſpiration is partly voluntary and partly involuntary; but, as we determine this or the other muſcle to action by the influence which our wills have on them, ſo we exert a ſimilar power on the organs of *reſpiration* by the ſame means.

Some aſſert that the elevation of the breaſt by means of the intercoſtal muſcles is neceſſary to inſpiration; but perhaps a due attention to theſe muſcles will diſcover to us that their action is only during expiration, and if ſo their theory falls to nothing.

The uſes of *reſpiration* are many, ſome of which are as follow: by *inſpiration*, air is duly received into the lungs, in order to the exerting of our voices, and to impregnate the blood with a general ſtimulant of the habit, conſidered by ſome as *matter of heat*, by which the circulation of the fluids is ſupported, and the different offices of the animal œconomy performed with regularity: *by expiration* the defect of perſpiration through the ſkin is in a good degree regulated; for much of the perſpirable matter is carried off from the body with the air which is expired; and in cold weather, &c. when the diſcharge is leſſened through the ſkin, there is a proportionable increaſe of the ſame from the lungs.—Again, as the pulſe is accelerated by heat; ſo is the action of the lungs, whence an advantage of inſpiration is, the cooling of the blood by the application of cold to that portion of it which is paſſing through the lungs, as well as by expiration, to carry off a portion of redundant heat along with the matter perſpired. Laſtly, by the action of the parts ſubſervient to *reſpiration*, the progreſs of the aliment through the ſtomach, &c. as alſo of the fæces through the inteſtines, is facilitated and haſtened.

See Haller's Phyſiology, ſect. 10. Hoadley on *Reſpiration*. Shebbeare's Theory and Practice of Phyſic, and PULMONES in this work.

RESTA BOVIS. REST-HARROW. See ANONIS.

RESTAURANTIA, } RESTORATIVES. Medicines
RESUMPTIVA. } ſuited to reſtore loſt ſtrength; but commonly applied to thoſe which reſtore loſt ſtrength

ſtrength depending upon the waſte of fluids, and in that ſenſe nearly the ſame with the nutrientia, and come under the claſs ANALEPTICA. They differ not much from agglutinant corroboratives, and their manner of operation in the ſame way may be accounted for, only that *reſtoratives* are more adheſive and ſubtil, whereby they enter into the nouriſhment of the remoteſt parts. Cordials are known by this name. See CARDIACA.

RETE MALPIGHI. See PULMONES.

—— MIRABILE. It is the name of a congeries of blood-veſſels in the brain, called alſo DICTYOIDES.

—— MUCOSUM. The true ſkin on its whole ſurface is covered with two lamellæ: one is the *rete mucoſum*, the other is the cuticula. The *rete mucoſum* is the principal ſeat of colour in man; in Europeans it is tranſparent, in mulattoes it is brown, and in negroes it is black. One uſe of the *rete mucoſum* is, to keep the papillæ moiſt, which would otherwiſe grow rough and unfit for ſenſation. The *rete mucoſum* is alſo called *corpus mucoſum*, and *corpus reticulare*. Mr. Sheldon thinks that the colour of the *rete mucoſum* depends on the blood, which he ſays is darker in the Africans than in the Europeans: he was informed by a phyſician, on whoſe veracity he had the greateſt dependence, that the bile and ſemen of the Africans are darker than the Europeans. This obſervation contributes in favour of Mr. Sheldon's opinion. Wherever the cuticle thickens, the *rete mucoſum* thickens in proportion; as is exemplified by thoſe laminæ of integuments in the hands and feet of Africans. It is alſo obſerved, that in the fœtus of nine months, the *rete mucoſum* is yellower than the cuticle. In Africans the *rete mucoſum* is more eaſily ſeparated from the cuticle than in Europeans.

RETENTA and EXCRETA. See EXCRETA.

RETICULARIS MEMBRANA. See CELLULOSA MEMBRANA.

RETICULUM, the ſecond ſtomach of a ruminating animal. See ABOMASUM; alſo the *omentum*.

RETIFORMIS, called alſo *amphibleſtroides* is an epithet applicable to any net-like appearance, and is uſed to expreſs the coat of the eye, called *tunica retiformis*, encircling the vitreous humour according to Galen. It is the *choroides*, and forms the plexus choroides, called alſo plexus reticularis vel *retiformis*. See CHOROIDES, and PLEXUS CHOROIDES.

RETINA. Thus the expanſion of the optic nerve on the inner ſurface of the eye is called alſo *amphibleſtroides*. Though this expanſion is ſuppoſed to be a production of the medullary ſubſtance of the optic nerve, which is ſpread like a membrane, and from its reſemblance to a net, is called *retina*; yet by laying open the coats of the nerve, its medullary ſubſtance cannot be clearly traced, as continuing on to form it. This inner coat of the eye is moſt probably the ſeat of viſion, notwithſtanding the objections lately made to this opinion.

RETRAHENS AURICULAM. See ABDUCTOR AURIS, N° 1.

RETROVERSIO UTERI. The RETROVERSION of the UTERUS. See PROCIDENTIA UTERI. This diſorder occurs when the womb ſo falls from its natural poſition, that the urinary bladder is either preſſed by it, or drawn from its uſual place, and the fundus uteri preſſes upon the inteſtinum rectum; or it may be that the fundus uteri is thrown upon the os pubis, and its orifice towards the rectum. Moſt of theſe caſes happen in the early ſtages of pregnancy, ſeldom ſo late as the fourth month; they occaſion firſt a difficulty, then by degrees a ſuppreſſion of urine, and ſoon after, a ſuppreſſion of the inteſtinal diſcharge. For the moſt part the following treatment, where the fundus uteri hath fallen back upon the rectum, which is moſt commonly the caſe, hath been ſucceſsful. Firſt, the urine is to be drawn off by means of the catheter, then a ſtimulating clyſter muſt be injected, that the inteſtines may be duly evacuated; theſe done, place the woman on her knees and elbows, with her head downwards, and by introducing one hand up the vagina, endeavour to draw it forwards, then with two fingers in the anus endeavour to puſh up the fundus uteri. See an account of ſome inſtances of this nature in the Lond. Med. Obſ. and Inq. vol. iv. p. 388, &c. Dr. Hunter's Tables of the Gravid Uterus. Denman on the *Retroverſion of the Uterus*. White's Surgery, p. 163.

REX METALLORUM. See AURUM.

—— VEGETABILIUM. See CROCUS.

RHA VERUM ANTIQUORUM. See RHAPONTICUM.

RHABARBARUM. RHUBARB, alſo called *rheon*; *rheum*; *rhæum*; *barbaria*; *lapathum Orientale*; *lapathum Chineſe*. The Greeks called it *rhabarbarum*, from its growing on the banks of the river Rha, i. e. Wolga, in the barbarous country of Ruſſia. But the latter Greeks are ſaid to have called it *barbaricum*, becauſe it was brought to Barbaria, a country lying on the Sinus Barbaricus, whence it was ſent to other countries.

Rhubarb is a plant of the dock kind. It is the RHEUM PALMATUM, or RHEUM CHINENSE, *foliis palmatis acuminatis ſcabriuſculis, ſinu baſeos dilatato, petiolis ſupra obſolete ſulcatis margine rotundatis*, AITON. Hort. Kew. CL. ENNEANDRIA; ORD. TRIGYNIA; LINN. Gen. Plant. 506. The leaves are ſomewhat heart-ſhaped, acuminated, and ſlightly hairy. The root is the only part in uſe; it is brought from China, and from Siberia, by way of Ruſſia. As good *rhubarb* plants have been raiſed in our phyſic gardens as any that are met with abroad; they grow with vigour in open ground.

Two ſorts of the roots are met with in our ſhops, viz. one from Turkey, or perhaps much of this is from Ruſſia; for in the Ruſſian territories the fineſt *rhubarb* grows in large quantities. The Turkey *rhubarb* is generally in flattiſh pieces, more compact and hard than the Ruſſian; that which grows in Tartary and Siberia is in round lumps, leſs weighty than the Chineſe, but of a finer grain, and always perforated; the reaſon of this difference in weight and form is owing to the different methods of curing them. In China they cut their *rhubarb* into ſlices, and preſs it cloſe before drying; in Ruſſia they hang it up to dry without cutting it into ſlices or preſſing it. The Chineſe pieces are externally of a yellow colour, and within there is a mixture of bright reddiſh ſtreaks with the yellow. The ſecond ſort is brought from the Eaſt Indies; it is in longiſh pieces, harder, heavier, and more compact than that from Turkey. Dr. Alſton thinks this as good as the Turkey ſort. The firſt ſorts muſt be kept dry, or they grow mouldy, or are deſtroyed by worms. The Indian *rhubarb* is not ſo ſubject to theſe inconveniences, and the finer pieces, after being rubbed with the powder of Turkey *rhubarb*, are ſold for it.

Whether *rhubarb* is of the Turkey or of the Eaſt India kind, chuſe that which is of a *lively colour when cut, firm* and *ſolid*, but not hard, that is *eaſily powdered*, and when powdered is of a *bright yellow colour*; that on being chewed imparts to the ſpittle the ſame colour, but that *does not grow ſlimy whilſt in the mouth*; to the taſte it ſhould be ſub-acrid, bitteriſh, and ſtyptic, and its ſmell lightly aromatic.

Rhubarb gives out its purgative quality moſt freely to water; after digeſting it with water it becomes inactive, but after ſeveral digeſtions with ſpirit of wine, it retains ſome of its purgative virtue. The powder purges the moſt; doſe, from ℈ i. to ʒ i. The next to it is an infuſion in water; the ſpirituous tincture purges the leaſt, but hath more of the aroma and of the aſtringency of this root. The watery infuſion, when reduced to an extract, hath its virtue much diminiſhed; the ſpirituous loſes leſs, ſo that ʒ ſs. of it will operate moderately, but not more ſo than an equal quantity of the powder.

The London College directs three tinctures, two of which are ſpirituous, one vinous, and are thus made.

1. TINCTURA RHABARBARI. *Tincture of Rhubarb.*

Take of *rhubarb* ſliced, two ounces; ſmaller cardamom ſeeds, huſked and bruiſed, half an ounce; ſaffron, two drams; proof ſpirit of wine, two pints: digeſt for eight days and ſtrain.

2. TINCTURA RHABARBARI COMPOSITA. *Compound Tincture of Rhubarb.*

Take of *rhubarb* ſliced, two ounces; ginger, powdered, ſaffron, of each two drams; liquorice root bruiſed, half an ounce; diſtilled water, one pint; proof ſpirit of wine, twelve ounces by meaſure. Digeſt for fourteen days and ſtrain.

3. VINUM RHABARBARI. *Wine of Rhubarb.*

Take of *rhubarb* ſliced, two ounces and an half; ſmaller cardamom ſeeds, bruiſed and huſked, half an ounce; ſaffron two drams; Spaniſh white wine, two pints; proof ſpirit of wine, eight ounces by meaſure. Digeſt for ten days, and ſtrain. Pharm. Lond. 1788.

Theſe are intended for ſtomachics and ſtrengtheners, as well as for purgatives. Spirituous liquors excellently

extract that part of the *rhubarb* in which the two firſt qualities reſide. When given in the firſt intentions, a ſpoonful or two is a doſe; but when they are intended as purgatives, from two to three ounces muſt be given.

The Edinburgh College directs an infuſion in water as follows:

4. INFUSUM RHABARBARI.

℞ Rad. rhab. inciſ. ʒ i. aq. bullient. ℔ i. infund. per noct. & colaturæ adde aq. cinnam. ſp. ʒ i. When *rhubarb* is given as a purge, this is one of the beſt preparations.

Whether *rhubarb* is taken in powder or infuſed in water, if the doſe is mixed with a diſh of coffee, the patient will rarely object to its taſte.

The practice of toaſting *rhubarb* is attended with no real advantage; but if it is not removed from the fire as ſoon as it is fit for powdering, it will be injured. If, inſtead of toaſting it, a ſmall quantity of any thing aſtringent is added, the end of toaſting would be better anſwered.

Rhubarb is a mild cathartic, and alſo a mild aſtringent; it ſtrengthens the inteſtines, leaves the belly coſtive, and is hence preferred in diarrhœas and dyſenteries. In the latter of which, it is conſidered though by ſome as diſſerviceable from its aſtringent property. It is often given more with a view to its ſtrengthening than to its purgative quality; in coſtiveneſs, given in the common way, it is of no uſe, but rather hurtful, from its producing oppoſite effects to its purgative power, when that operation is over. If it can be ſerviceable in this caſe, it ought to be only chewed; leſs of its aſtringent and more of its purgative power is obtained by this mode, and in this way it is particularly uſeful to dyſpeptic perſons: from its bitterneſs it fits better on the ſtomach than many other purgatives do. Its operation joins well with thoſe of neutral laxatives, and both together operate in ſmaller doſes than either of them would do ſingly. It has lately been introduced into practice as an application to ulcers, in which caſes it has been attended with much ſucceſs, though it has not yet been explained to what particular ſpecies of ulcers it was beſt adapted, nor on what principle it is ſuppoſed to act: probably from its being a ſtimulant and aſtringent. It is ſprinkled over the wound lightly once a day, and ſometimes twice; but in caſes of great irritability, one part of powdered opium is added to eight of rhubarb. The compound powder of rhubarb, which is formed of equal parts of rhubarb and ipecacuanha, has been employed for the removal of warts. That which is bright, of a light texture, moſt fragrant, and ſound, contains leſs reſin, in proportion to its earthy and ſaline parts, than that which is heavy, tenacious and fetid; and therefore we find it milder in its operation, more grateful to the ſtomach, and better to anſwer the intention of an aſtringent, a diuretic or an alterant; and the other more to naſeate the ſtomach, and to operate more ſtrongly as a purge in the firſt paſſages. *Rhubarb* changes the urine to a yellow colour before it operates as a purge: it is a good ſubſtitute for aloes, when aloes are productive of the piles, which are ſeldom occaſioned by *rhubarb*; at the ſame time, as an attenuant, it is very little inferior to aloes. In acute fevers, when there is apprehenſion of producing a diarrhœa by purging medicines, *rhubarb* is ſafe. In diarrhœas and dyſenteries, *rhubarb* is doubly uſeful; 1ſt, by carrying off the peccant matter; 2dly, by ſtrengthening the bowels againſt a further afflux. A peculiar excellency in *rhubarb* is its evacuating viſcid bile when lodged in the bile-ducts; in this caſe, next to aloes, it is the beſt amongſt purging medicines; and it hath this advantage over aloes, viz. that it may be given where inflammation is attendant, provided bleeding be premiſed. In groſs habits, *rhubarb* is an uſeful aſſiſtant to ſecure the efficacy of the bark, if joined with it. See Lewis's Mat. Med. Neumann's Chem. Works. Cullen's Mat. Med.

Other ſubſtances in the vegetable world receive alſo this name, viz.

RHABARBARUM ALBUM. See MECHOACHANA ALBA.

—— DIOSCORIDIS. See RHAPONTICUM.

—— MONACHORUM. See LAPATHUM HORTENSE.

RHABDOIDES from ῥάβδος, *a ſtrait twig*, and εἶδος, *form*. See SAGITTALIS SUTURA.

RHACHIS See SPINA.

RHACHISAGRA, from ῥάχις, *the ſpine of the back*, and ἄγρα, *a prey*. See ARTHRITIS.

RHACHITÆI, or RHACHITÆ, from ῥάχις, *the ſpine of the back*. The muſcles belonging to the ſpine of the back.

RHACOSIS, alſo *detritio*. Excoriation of the relaxed ſcrotum.

RHAEUM. See RHABARBARUM.

RHAGADES, from ῥήγνυμι, *to break off*. CHAPS, CLEFTS, or FISSURES in the ſkin. If ſeated in the anus, and recent, the patient muſt ſit ſtill and ſit over the ſteam of warm water. The cerat. lapidis calaminaris may alſo be applied. If the lips of theſe fiſſures are callous, cut them, or otherwiſe treat them ſo that they may become new ulcerations. See Turner's, Wiſeman's, and Heiſter's Surgery. *Rhagades* may be cauſed by extenſion, contraction, or acrimony; and are amongſt equivocal ſigns or productions of the firſt infection of the pox. They are ſeated about the anus and various parts of the pudendum muliebre, corners of the mouth, noſtrils, eye-lids, nipples, &c. From theſe chaps iſſue forth ſometimes a thin, ſharp ichor, which is either venereal, or the product of other kinds of acrimony; at times they are very painful. If they are freſh contracted, they are not difficult to remove, but if their lips are deep, callous, and inflamed, difficulty increaſes. See a Treatiſe on the Venereal Diſeaſe, by N. D. Falk, M. D. edit. 2. 1774.

Different from the *rhagades*, in appearance, are the chaps in the palms of the hands, and ſoles of the feet; both proceed from the acrimony of the virus, ſearching as it were for the cuticula, by which it is ſhrunk together.

RHAMNUS, alſo called *ſpina cervina*, *hippophæs*, *ſpina ſolutiva*, *ſpina purgatrix*, *ſpina infectoria*, *cervi ſpina*. BUCKTHORN, and PURGING THORN. It is the RHAMNUS CATHARTICUS, *foliis ovatis, ſpinis terminalibus, floribus quadrifidis dioicis, caule erecto*. CLASS. PENTANDRIA. ORDO MONOGYNIA. LINN. Gen. Plant. 265. It is a prickly buſh, or a low tree, common in hedges, having pointed leaves; in June it produces ſmall green flowers, and in the beginning of October it ripens into black berries, which contain a dark green juice, with four ſeeds in each.

It is uſual to find theſe berries mixed, when brought to the markets, with the berries of the black elder, and alſo of the dog-berry tree; but they are thus diſtinguiſhed; the *juice* of the *buckthorn* berries *is green*; that of the others not ſo, the *buckthorn* berry hath *four ſeeds*, that of the elder hath *but two*, and the dog-berry hath *but one*.

Buckthorn berries have a faint unpleaſant ſmell, and a bitteriſh, acrid, nauſeous taſte; they operate briſkly by ſtool, and have frequently been employed as *hydragogues*, though at the ſame time they occaſion dryneſs in the mouth and throat, with thirſt, and griping in the bowels; but if plenty of warm ſmall liquor is drank during the operation, theſe effects are not ſo much obſerved; they are conſidered as draſtic purgatives. Doſe, twenty of the freſh berries; forty or ſixty in decoction; a dram, or a dram and an half of the dried berries: an ounce of the expreſſed juice, or half an ounce of the rob, or extract, obtained by inſpiſſating the juice; but the juice made into a ſyrup is generally preferred by phyſicians, though it is rarely preſcribed, except in conjunction with other medicines of the ſame claſs in infuſion or tincture. The inner bark of the tree is ſaid to be a ſtrong purgative, and to occaſion vomiting.

The London College order a ſyrup to be made, under the title of SYRUPUS SPINÆ CERVINÆ. *Syrup of buckthorn*, in the following manner. Take of the juice of the berries of *buckthorn*, ripe, and freſh gathered, one gallon; ginger bruiſed, one ounce; pimento in powder, one ounce and an half; ſugar, ſeven pounds. Let the juice ſtand for ſome days, that the fæces may ſubſide, then ſtrain; in a pint of which, macerate the ginger and pimento for four hours, and ſtrain. Boil down the remaining juice to three pints: then add that part in which the ginger and pimento had been macerated, and put to the whole, the ſugar to form the ſyrup. Pharm. Lond. 1788. From one to two ounces are given for a doſe, but it is rarely uſed, on account of its nauſeous taſte and churliſh operation.

Thoſe who fell the juice often mix it with water. See LEWIS's Mat. Med. NEUMANN's Chem. Works. CULLEN's Mat. Med. SYDENHAM by WALLIS.

It is alſo a name for the *paliurus*, *hippophæs*, *alnus nigra*, and *frangula*.

RHAMNUS ZIZIPHUS. See JUJUBA.

RHAPONTICUM. The TRUE RHAPONTIC. It is alſo called *rheon*, RHEUM; RHEUM PONTICUM; *rha verum antiquorum*; *rheum Dioſcoridis*; *rhaponticum Alpini*; *rhabarbarum Dioſcoridis*; *rhab. forte Dioſcoridis*; ENGLISH RHUBARB. It is, as the true *rhubarb*, a ſpecies of dock, with ſmooth, roundiſh leaves, ſomewhat channelled pedicles: it grows wild on the mountains of Thrace whence Alpinus brought it into Europe about the year 1610. It bears the hardeſt winters in our climate. The roots are often mixed with thoſe of the true *rhubarb*, but are detected by their mucilaginous taſte when chewed, and by their not tinging the ſaliva of ſo bright a yellow as the true *rhubarb* does; when the *rhapontic* is cut through, it appears regularly marbled in a radiated manner; it is duſky on its ſurface, and of a looſe ſpongy texture, more aſtringent than the modern true *rhubarb*, and leſs purgative; as a purge, two or three drams are required, but it is a better ſtomachic than the true *rhubarb*. See Raii Hiſt. Tournefort's Mat. Med.

RHAPONTICUM VULGARE, called alſo *rhaponticum folio heleni incano*, *centaurium majus*, *centaurium magnum*, GREAT CENTAURY, COMMON RHAPONTIC. It is the *centaurea centaurium*, Linn. It is a large plant, with leaves compoſed of oblong ſerrated ſegments ſet in pairs on a middle rib, edged in the intermediate ſpaces with a ſerrated margin; the ſtalk divides towards the upper part into ſeveral branches, which bear on their tops round, ſoft, ſcaly heads, from which come forth bluiſh floſculi, followed by down, incloſing the ſeeds. It is perennial, a native of the ſouthern parts of Europe, and raiſed with us in gardens. The root is of a dark black colour on the outſide, it is internally reddiſh, and yields, when freſh, a juice of a deep red. It hath a ſlight ſmell, which is not diſagreeable, and in chewing it diſcovers a viſcous ſweetneſs, and roughneſs, with ſome degree of acrimony. It is reckoned to be an aperient and corroborant, and is ſuppoſed to be particularly uſeful in alvine fluxes. It is very much inferior to the true *rhapontic*. See Raii Hiſt. Tournefort's Mat. Med.

RHENCHOS. SNORING, alſo RHOCHMOS; RONCHUS; *Renelius*. This affection is otherwiſe called *ſtertor*, which is in ſound like that of the *cerchnos*, but greater and more manifeſt. A *ſtertor* is that ſound which is ſuppoſed to be made betwixt the palate and noſtrils, by perſons aſleep, or a rattling in the throat. It is alſo a noiſy reſpiration as in an apoplexy, in which the mucus from the fauces is forced through the noſtrils; *cerchon*, or *cerchnos*, is that bubbling noiſe which is made in reſpiration, from the larynx, or the aſpera arteria. Theſe affections are owing to a weakneſs of nature.

RHEON, and RHEUM. See RHAPONTICUM, RHABARBARUM.

RHENOPHONIA, from ῥινοφωνια, *vox peregeina*. See PARAPHONIA.

RHEUMA, from ῥεω *to flow*. } See CATARRHUS.
—— CATARRHALE. }
—— EPIDEMICUM. }

RHEUMATICA. The RHEUMATIC FEVER.

RHEUMATISMUS. The RHEUMATISM, from ῥεω, *to flow*. It is a painful diſeaſe, affecting the intermediate ſpaces between the joints and muſcles in different parts of the body; ſometimes the viſcera are alſo attacked. It is with or without a fever; when a fever attends, it is called the *acute*, and where there is no fever, it is called the *chronic rheumatiſm*. Dr. Cullen places the acute *rheumatiſm* as a genus in the CLASS PYREXIÆ, and ORDER PHLEGMASIÆ, which he defines, a diſeaſe ariſing from an external, and for the moſt part from a perceptible cauſe, attended with febrile affections; pain about the joints, following the courſe of the muſcles, affecting the knees and larger joints, rather than thoſe of the hands and feet, increaſed alſo by external heat. The varieties of the one ſpecies take their name from the parts affected; as, 1. *Myoſitis*; when the pain is ſeated more in the muſcles that proceed from the joints. 2. *Lumbago*, called alſo *lordoſis*, *nephralgia rheumatica*, and by the Latins *tabes dorſalis*; when the muſcles of the loins are the ſeat of the complaint. 3. *Iſchias*; when the muſcles of the hip are the ſuffering parts. 4. *Pleurodyne rheumatica*, and *pleuritis ſpuria*; when the muſcles of the thorax are attacked.

The *chronic rheumatiſm* is conſidered by Dr. Cullen as generally the mode of an *acute rheumatiſm* terminating, which he ſtyles ARTHRODYNIA, and defines it after the rheumatiſm, ſome violent exertion, or ſubluxation, pains of the joints or muſcles, much increaſed, particularly in motion, more or leſs erratic, and alleviated by the heat of the bed, or other external heat. The joints are weak, rigid, very readily, or ſpontaneouſly growing cold, not attended by any febrile affection, and for the moſt part without any tumefaction.

The LUMBAGO and ISCHIAS are ſometimes acute diſeaſes: but ſeeing that they are often chronic, they for the moſt part belong to this ſpecies. On the ARTHRODYNIA, the doctor makes the following remarks. If, according to the opinion of ſome, the chronic rheumatiſm ſhould be altogether a different genus from the acute; it ought, like every other genus of diſeaſe, to have a ſimple name, and I think I have given it a name not inapplicable. Moreover, ſince I have always eſteemed that rheumatiſm, called chronic, a conſequence of the acute rheumatiſm, or rheumatiſm ſimply ſpeaking, and ſince, betwixt each of theſe diſeaſes, there cannot often be ſet proper limits, I therefore could not arrange the chronic rheumatiſm as a different genus. Still a violent chronic rheumatiſm becomes ſo different in its nature from an acute rheumatiſm, and requires ſo different a mode of cure, it ought juſtly to have a different appellation; and if any one pleaſes, he is at liberty to rank it as a different genus.

Whatever part of the body the *rheumatiſm* affects, or whatever ſpecies of this diſorder is complained of, the cellular membrane is the immediate ſeat thereof.

Perſons of any age may be afflicted with the *rheumatiſm*, but uſually thoſe in the prime of life, and particularly thoſe of an active diſpoſition, are the ſubjects of the acute ſpecies. The cauſes of which are, whatever may conduce to the production of an inflammation in the part affected.

The chronic *rheumatiſm* hath for its principal cauſes, *an irritating acrimony in the juices ſecerned into the parts complained of*.

The ACUTE or INFLAMMATORY RHEUMATISM is attended with a fever, called RHEUMATICA FEBRIS; pains in the limbs, which are generally in the joints, preventing their motion, and are accompanied with heat, redneſs, and ſwelling of the part. When the redneſs is fixed, the fever abates, though with ſome it continues many days, always increaſing in the evening. After ſome days, the pain commonly quits one part and affects another, as from the knee to the foot, from thence to the hip, &c. The knees, hips, loins, nape of the neck, ſhoulders, ſhoulder-blades, arms, and elbows, are the uſual ſeats of the pain; ſometimes the feet, ankles, and wriſts are ſimilarly affected. So great is the tenderneſs of the parts affected, that the patient complains of the leaſt motion, as when violence is uſed. The parts in which the pain is uſually moſt afflictive, are the neck, the loins, and the hips. The violence of the acute *rheumatiſm* ſeldom continues above fourteen days, though a weakneſs and puffineſs, &c. will remain long, ſometimes many months, eſpecially if the diſeaſe attacks the patient in autumn. Some, after the pains are gone off, complain of a laſſitude, which does not leave them till an eruption of ſome kind appears on the ſkin.

The chronical *rheumatiſm*, called *arthrodynia*, is known by the pains, and the abſence of fever, by the long continuance of the pain, and by a few parts only being attacked at once. Generally there is no viſible alteration in the affected part, though ſometimes it is hot, red, and ſwelled.

When the pain is in the hip, and extends down the thigh, it is called *ſciatica*. See ISCHIADICUS MORBUS.

When the ſymptoms of a ſcorbutic habit attend theſe pains, the diſorder is called a *ſcorbutic rheumatiſm*.

When a violent pain is fixed on the loins, reaching ſometimes to the os ſacrum, attended with nephritic ſymptoms, it is called a *rheumatic* LUMBAGO; in this caſe the patient is forced to ſit upright, and to keep his body perpetually forward.

When the *rheumatiſm* is unattended with a fever, it muſt be diſtinguiſhed from the gout; when the loins are the ſeat of the diſorder, care is required to diſtinguiſh it from the gravel, from a ſtone in the kidneys, and from an inflammation in the ureter; alſo from an abſceſs in the parts about the loins. A *rheumatiſm* in the muſcles of the belly muſt be diſtinguiſhed from the colic. One ſpecies of *rheumatiſm* ſhould alſo be diſtinguiſhed from another.

Whilſt the ſeat of the pain is in the external parts, there is not great danger; but *if the internal organs are the ſeat, the danger is great.*—If the brain is attacked, a delirium is the conſequence;—if the lungs are affected, a ſuffoca-

tion

tion diſturbs the patient;—if the ſtomach or the bowels are the ſeat of the diſorder, an inflammation there may be ſoon expected.—If the pain continues long in any joint, its motion will be impaired for life; a wry neck hath ſometimes been the conſequence of preceding *rheumatic pains*. Dr. Rutherford, of Edinburgh, obſerves, that *wherever a rheumatiſm is ſeated, that part never ſweats, and that as ſoon as a ſweat can be raiſed in the pained part, the diſorder will be conquered*; it may alſo be obſerved, that when in either the acute or chronical *rheumatiſm* the ſymptoms vaniſh, and at the ſame time a free perſpiration comes on, and the ſame is obſerved on the parts affected, and the urine is turbid and copious, a cure may certainly be expected.

THE INDICATIONS OF CURE WILL BE, to diminiſh the fever, when attendant, and to moderate the pain; to eliminate the morbid matter, and to ſtrengthen the weak parts.

As to the acute *rheumatiſm*, an obſtructed perſpiration and an inflammatory diatheſis conſtitute the moſt general cauſes. This laſt concurring cauſe muſt be immediately removed; for whilſt it ſubſiſts, a perſpiration is not to be expected, and hence, as in other inflammatory diſorders, we are in general to proceed, and have recourſe to

BLEEDING. By this operation the hardneſs of the pulſe is abated, and though the pains ſtill continue, the patient is not ſo reſtleſs, the tenſion of the veſſels is removed, the fever reduced, and makes room for attenuants and diluents. But, as fizy blood is no rule for bleeding in this diſorder, ſo too free diſcharges this way do but lay a foundation for the *chronic rheumatiſm*. When weakly people are attacked with the *acute rheumatiſm*, much care is required before bleeding is preſcribed; for, if imprudently admitted of, it produces diſorders in them that are not removed but with the greateſt difficulty; in ſuch patients, a cooling but moderately nouriſhing diet ſhould be uſed; whey, for inſtance, may be ſubſtituted inſtead of bleeding. Bleeding is ſafe and uſeful when the ſymptoms are violent and threatening, as when the fever is violent; when the wandering pains ſhift ſuddenly from the extremities to the internal parts, and affect the ſides or the breath.

CLYSTERS OR PURGES. A laxative clyſter may be given, and, if the head is uneaſy, repeat the clyſter every night and morning: but, in general, a cooling purge, given every other day, or as may ſeem neceſſary, is preferable to clyſters: when bleeding is required, a purge ſhould be given after each time the blood is taken away. Clyſters with nitre, for moderating the fever, are uſeful; but, for purging, give medicines by the mouth. If purges are duly adminiſtered, leſs blood may be taken away, and opiates can be more freely uſed. Indeed, in conſtitutions that are rather ſerous than ſanguine, purging is more a proper evacuant than bleeding.

NITRE. In the inflammatory *rheumatiſm* this ſalt is peculiary uſeful; it may be diſſolved in every draught of the patient's drink, and given as freely as the ſtomach will admit. In the decline of acute, and in every ſtage of *chronical rheumatiſms*, it may be given to advantage in conjunction with the ſal c. c. Imperial water, ſo called, is an agreeable liquor for common drink, and may be freely taken.

OPIUM. The pains are moſtly increaſed in the night, whence opiates are given, but bleeding ſhould be premiſed, and purges adminiſtered as above mentioned; otherwiſe the advantages from opium will not equal the inconveniences they often occaſion. When this medicine is allowed and excites a ſweat, it ſhould be given rather to moderate the pain than to cauſe ſleepineſs. Hence the compound powder of ipecacuanha is the beſt.

GUAIACUM. The tincture of this gum, in *chronic rheumatiſm*, may be given from ʒ ii. to ℥ ſs. twice a day in any thing that the patient drinks; if it paſſes off too freely by ſtool, add a few drops of the tinct. opii to each doſe.

ANTIMONY. The preparations from this drug which paſs off by perſpiration are never to be omitted; they may be given at proper intervals, betwixt the doſes of ſuch other medicines, as circumſtances may require.

THE BARK. In *old chronic rheumatiſms*, when the blood is poor, the bark is the principal remedy, if given when free from febrile ſymptoms. And in the *acute rheumatiſm*, as ſoon as it puts on the appearance of an intermittent, the bark is neceſſary; and whether it intermits or not, as ſoon as plentiful ſweats break out, and the urine depoſits a copious ſediment, the bark will ſhorten the diſeaſe.

WARM BATHS. They may be made of pure ſoft water, and heated ſo as juſt to produce an agreeable ſenſation in the ſkin. In theſe the patient may be placed for a quarter of an hour, more or leſs, as circumſtances indicate; and then being preſerved from cold, he muſt be rubbed dry, and put between blankets, if poſſible to excite a perſpiration.

BLISTERS, if placed on the part affected are ſometimes uſeful. Dr. Cullen ſays, that they ſeldom fail of ſucceſs if applied before the ſwelling comes on. In chronic *rheumatiſms* their efficacy is more frequently uſeful.

After the cure, the cold bath is beneficial in preventing returns; and the ſtrength ſhould be confirmed by the uſe of bitters, aromatics, and chalybeates.

In *chronical rheumatiſms*, mild mercurials, given in ſuch doſes as not to ſolicit the excretions too much; daily frictions with a flannel cloth, particularly on the parts that are, or were pained; bliſters on or near the ſuffering part; iſſues in the inſide of the lower parts of the thigh; and a decoction of the rad. ſeneka, which is called a ſpecific, are chiefly to be depended on. The tinct. guaiac. in large doſes, is alſo of ſingular efficacy; alſo the ol. terebinth. &c.

If, with *rheumatic* diſorders, there is a ſcorbutic habit, the ſulphureous waters of Harrowgate, &c. ſhould be both drank and bathed in.

In the *lumbago*, apply iſſues and bliſters on the thigh, and then, (having premiſed proper evacuations,) opiates, and mercurial alteratives, if properly perſiſted in, will moſt effectually anſwer the expectations of the patient. See Wallis's Sydenham; Shebbeare's Theory and Practice of Phyſic; Cullen's Firſt Lines, edit. 4. vol. ii. p. 9—37. London Practice of Phyſic, edit. 4. Kirkland's Med. Surgery, vol. i. p. 405.

RHICNOSIS. LEAN and WRINKLED.

RHIGOS. RIGOR. When any ſenſible part of the body is affected with ſpaſms, all the other parts are readily drawn into conſent with it; hence the *horror* and *riger* on the ſurface of the body, the coldneſs, &c. Irritation in the primæ viæ is often the cauſe. Galen ſays, a *rigor* is a ſtrong and urgent ſenſe of a refrigeration of the natural heat. *Rigor* ſometimes ſignifies an inflexible hardneſs and tenſion of the nervous and muſcular parts, but theſe are better expreſſed by the word *rigiditas*. Others define a *rigor*, as being a general chillineſs, with a ſenſe of coldneſs inwardly, and a contraction of the lower jaw. See alſo HORROR.

RHOCAS. See EPIPHORA.

RHOCHMOS. See RHENCHOS.

RHODODENDRON, RHODODAPHNE. See NERION.

RHODODENDRON CHRYSANTHEMUM, foliis oblongis impunctatis ſupra ſcabris venoſiſſimis, corolla rotata irregulari, gemma florifera ferrugino-tomentoſa, CLASS. DECANDRIA, ORDO MONOGYNIA, LINN. Gen. Plant. 548. YELLOW FLOWERED RHODODENDRON, or ſpecies of DWARF ROSE-BAY. This hath been recommended in rheumatic pains, particularly the chronic kind; and other painful affections of the joints; and is now very generally employed in chronic rheumatiſms in various parts of Europe. It has not yet been introduced into Britain; it is a native of Siberia, affecting mountainous ſituations, and flowering in June and July. Dr. Koelpin, of Alten-ſtetin, uſed an infuſion of it in water, kept twenty-four hours in nearly a boiling heat. The proportion was, *from two drams of the leaves and tops of the plant to half an ounce, to ten ounces of water*; THE DOSE TWO OUNCES, to be repeated after a few hours, and continued as required. Dr. Home obſerves, in his Clinical Experiments, &c. that it is aſtringent, and powerfully ſedative; he directs it in infuſion, from half a dram to three drams for a doſe. Dr. Koelpin remarks, with reſpect to the infuſion of this vegetable, that when taken internally, it produces a feveriſh heat, a kind of intoxication, and ſometimes a ſtupor and loſs of the ſenſes; at the ſame time the patient feels a ſingular pricking ſenſation in his limbs, or other parts of his body; the intoxication ſoon goes off, leaving behind it neither head-ach nor naufea. During the heat produced by this remedy, the patient complains of intenſe thirſt, and if

cold water is drank in this ſtate, there enſues a violent but ſalutary vomiting, eſpecially in complaints of the bowels. Beſides the vomiting and purging, this medicine produces a ſweat on the parts affected with the rheumatiſm or gout. Large doſes produce a ſtupor and anxiety. In ſome inſtances the pains grow worſe on the firſt uſe of the infuſion; but this increaſe of diſeaſe is ſoon followed by a remarkable degree of relief; inſtead of quickening the pulſe, it renders it weaker and ſlower. In the inſtances of venereal rheumatiſm, its effects are very conſiderable. Many who drank this infuſion, complained of a heat and conſtriction in the fauces: a proof that the plant poſſeſſes a little acrimony; but this effect ſpeedily paſſes off. In robuſt habits, it operates quickly, and with a degree of violence; in the infirm and feeble, it is very ſlow in its effects, hence in ſuch inſtances the patient ſhould not be uneaſy to increaſe the doſe.

RHOMBOIDES MUSCULUS, from ῥόμβος, *a four-ſquare figure*, and εἶδος, *form*. It riſes from the ligamentum colli, the ſpinal proceſſes of the third, fourth, fifth, ſixth, and ſeventh cervical vertebræ; and the firſt, ſecond, third, and fourth dorſal; and is likewiſe attached below to ſome of the ribs: it runs beneath the latiſſimus dorſi, and is inſerted into the whole length of the baſis of the ſcapula to bring it upwards and backwards. Some divide the *rhomboides* into the major and minor; and, if ſo, the minor is above, the major below.

RHOPALOSIS. See PLICA POLONICA.

RHUS, from ῥέω, *to flow*, becauſe it ſtops fluxes. It is alſo called *obſoniorum*, and *coriariorum rhus*, called alſo *hyrſodepſicon*, *coriaria*. COMMON SUMACH.

It is a ſhrub, or low tree, with oval, pointed, ſerrated leaves, and cluſters of yelloviſh or greeniſh flowers, each of which is followed by a ſmall, red, flattiſh berry, including a roundiſh, reddiſh, brown ſeed. It is a native of the ſouth of Europe, and is cultivated in our gardens. The berries have an acid, auſtere taſte, are cooling and reſtringent. The leaves and young twigs are reſtringent; but it is chiefly uſed by dyers. See Tournefort's Mat. Med. Neumann's Chem. Works.

RHUS, —— SYLVEST. } See MYRTUS BRABANTICA.

RHYAS or RHŒAS, from ῥέω, *fluo*, *to flow*. Though the exiſtence of this diſeaſe is doubted by ſome, ſtill we have deſcriptions of it given by GALEN: he ſays, it is an affection of the eye, diametrically oppoſite to ENCANTHIS, conſiſting of a too great diminution of the lachrymal caruncle, in the larger angle of the eye. RIVERIUS allows the cauſe of it to be a conſuming, exſiccating, or corroſive matter, and ſo it either ſucceeds or accompanies a fiſtula lachrymalis; according to FŒSIUS, eyes thus affected are denominated by AETIUS, ῥυάδες vel ῥωαδες ὀφθαλμοι. WALLIS's Noſologia Methodica Oculorum.

RHYSSEMETA. A WRINKLED FACE.

RIBES RUBRUM, *groſſularia non ſpinoſa*. This is the RIBES *inerme*, *racemis oglabris pendulis*, *floribus planius culis*, CLASS. PENTANDRIA, ORDO MONOGYNIA. LINN. Gen. Plant. 281. RED CURRANT. The different ſorts of fruit which currant trees produce have a cool, acidulous, ſweet taſte, agreeable both to the palate and the ſtomach; they agree in general with the other ſubacid fruits in their medicinal qualities. They have a large proportion of acid, and are eſteemed to be moderately refrigerant, antiſeptic, attenuant, and aperient. They may be uſed with conſiderable advantage to allay thirſt in moſt febrile complaints; leſſen the increaſed ſecretion of bile; to correct a putrid, and ſcorbutic ſtate of fluids, eſpecially in ſanguine temperaments. Hoffmann and Boerhaave had great confidence in the efficacy of theſe fruits in obſtinate viſceral obſtructions. The white currant tree is merely a variety of the red; the fruit therefore poſſeſſes ſimilar properties.

RICÆ, ῥῖκος. A covering on the heads of the Roman and other women during the time of ſacrifices; hence *rica*, *the kerchief*.

Kerchief (*the great*.) The French call it, *le grand couvre chef*. It is uſed after trepanning, &c. It is made of a ſquare cloth, and, when dexterouſly applied, it keeps the dreſſings on. As to the method of applying it, ſeeing and practiſing only can obtain a dexterity therein.

Kerchief (*the triangular*). The French call it, *couvre chef en triangle*. It is a ſquare cloth, folded in the form of a triangle. The middle of the longeſt ſide of which is applied to the forehead, the two ends of the ſame tied behind the head, and the angle, which falls behind the head, ſecured there to the confined ends of this *kerchief*. Its uſe, in general, is to ſecure the dreſſings on the face and head.

ROSA. The ROSE. Miller enumerates no leſs than forty-nine ſpecies of this flower, amongſt which the white, the damaſk, and the red, are in uſe.

White roſes are the weakeſt, ſo that when the damaſk *roſa* pallida vel *roſa* centifolia, Linn. can be had in ſufficient quantities, they only are uſed. They give out their agreeable ſcent both to water and to ſpirit, but moſt ſo to the latter. They do not loſe much by drying, if carefully managed, nor do they ſoon loſe their qualities by keeping. On diſtilling large quantities, a ſmall portion of a fragrant butyraceous oil, of a yelloviſh colour, is obtained; it concretes in a ſlight degree of cold: both the water and the oil are chiefly uſed as perfumes.

The red *roſes* have but little of the fine flavour of the pale ſort; to the taſte they are bitteriſh and ſomewhat aſtringent. The tree is the ROSA CENTIFOLIA germinibus ovatis pedunculiſque hiſpidis, caule hiſpido aculeato petiolis inermibus, CLASS. ICOSANDRIA, ORDO POLYGYNIA. LINN. Gen. Plant. 631. The aſtringency is the greateſt before the flower opens, and this quality is improved by haſty drying in a gentle heat, but by ſlow drying, both the colour and aſtringency are impaired. They give out their virtues to water and to ſpirit. Water they tinge with a deep red, colour and ſpirit with a pale one. The extract from a watery infuſion is auſtere, bitter, and ſubſaline; that from ſpirit more ſo in each of the inſtances. See Lewis's Mat. Med. The chief virtue of theſe flowers is ſuppoſed to be ſlightly aſtringent. The London College have ſeveral preparations of the firſt.

1. AQUA ROSÆ. ROSE-WATER.

Take of the freſh petals of damaſk *roſes*, the white heels being cut off, ſix pounds; water ſufficient to prevent an empyreuma; draw off one gallon.

2. CONSERVA ROSÆ RUBRÆ. CONSERVE *of* RED ROSES.

The leaves of the red *roſes* are here employed, the heels being taken off, and the flowers gathered before the petals have unfolded themſelves, and treated in the ſame manner as the wormwood; ſee ABSINTHII MARITIMI CONSERVA. The virtue of the *roſes* is ſuppoſed to be found in this compoſition, and probably their beſt effect will be produced when given in ſubſtance, and in conſiderable quantity. In phthiſical caſes much has been ſaid in favour of theſe flowers, and it is not improbable that aſtringents internally given, may contribute to the cure of certain ulcers. However, where theſe have been conſidered as uſeful, they have always been joined with a diet of milk, and farinacea, and gentle exerciſe in open air. At moſt, two parts of ſugar to one of *roſes*, would be ſufficient, and afford a better medicine than when mixed with three.

3. A cataplasm is made of the conserve under the title CONSERVÆ ROSÆ CATAPLASMA, and considered as useful in the latter stages of ophthalmy—in which one dram of alum finely powdered is mixed with two ounces of conserve.

4. MEL ROSÆ. HONEY *of* ROSES, *formerly* MEL ROSACEUM.

Take the petals of the red *rose* not yet unfolded, the heels being taken off, first dried, four ounces; boiling distilled water, three pints; clarified honey, five pounds; macerate the petals in the water for six hours; afterwards with the strained liquor mix the honey, and boil the mixture to the consistence of a syrup.

5. SYRUPUS ROSÆ. SYRUP *of* ROSES.

Take of the petals of the *damask roses* dried, seven ounces; purified sugar, six pounds; distilled water boiling, four points; macerate the petals in the water for twelve hours, and strain, evaporate the strained liquor to two pints and a half, and add the sugar to form the syrup. For infants the dose, as an aperient, from half an ounce to an ounce. Though the purgative effect of this is esteemed very inconsiderable.

6. INFUSUM ROSÆ. INFUSION *of* ROSES *formerly called* TINCTURA.

Take the petals of the *red rose* in bud, the heels taken off, half an ounce; diluted vitriolic acid, three drams by weight; boiling distilled water, two pints and a half; purified sugar, one ounce and a half. Pour the water first to the petals in a glass vessel, then add the acid, and macerate them for half an hour; strain the liquor cold, and add the sugar. Pharm. Lond. 1788.

The virtue of this last, though an elegant preparation, is considered to consist more in the vitriolic acid than the *roses*. See Cullen's Mat. Med.

7. The ATTAR, or ESSENTIAL OIL OF ROSES, so much in estimation as a perfume, is acquired from this flower, in the following manner: forty pounds of roses, with their calyces, are put into a still with sixty pounds of water, under which, after the ingredients have been well mixed, a gentle fire is put, and when fumes begin to arise, the cap and pipe are properly luted on; when the impregnated water begins to come over, the fire is lessened by slow degrees, and the distillation continued till 30 lb. of fluid is come over, which generally takes up four or five hours. This water is to be poured upon 40 lb. more roses; 15 or 20 pounds of which are to be drawn off in the manner above directed. It is then to be poured into pans of earthen ware, or tinned metal, and exposed to the fresh air for the night. In the morning the *attar* will be found congealed, and floating upon the surface of the water. The smell of this exactly resembles that of roses. It is only slightly pungent, and has been strongly recommended for its cordial, and analeptic qualities.

ROSMARINUS, } called also *libanotis coronaria*,
RORISMARINUS. } *alchachil*; *dendrolibanus*. COMMON ROSEMARY. ROSMARINUS OFFICINALIS, *corolla inequalis*; *labio superiore bipartito*. *Filamenta longa, curva simplicia cum dente*. Ess. Gen. Ch. CLASS. DIANDRIA, ORDO MONOGYNIA. LINN. Gen. Plant. 38. The flowers are called *anthos* in the Edinburgh Dispensary. *Rosemary* is a large shrubby plant, with long, narrow, stiff leaves, set in pairs, of a dark green colour above, and hoary beneath, with flowers of a pale bluish colour. It is a native of the southern parts of Europe, where it grows wild in dry gravelly ground. It is common in our gardens, where it smells stronger in proportion as the soil is dry and gravelly.

Rosemary hath a warm, pungent, aromatic, bitter taste, and a fragrant smell, approaching to that of lavender, but more of a camphorated kind; the leaves and tender tops are the strongest; next to these the cup and the flowers. The flowers by themselves are much the weakest, but most pleasant; it is chiefly in the cup that the active matter of the flowers resides; for the bluish petalum, carefully separated, hath but little either of smell or taste. The calyces, or the leaves of the plant, especially those at the extremities of the branches, retain the medicinal power in the greatest degree; they are said gently to stimulate and corroborate the nervous system and have therefore been recommended for certain headaches, deafnesses, vertigoes, palsies, &c. and in some hysterical and dyspeptic symptoms which are supposed to proceed from debilities, or defective excitemen of the brain and nerves. The power of rosemary though by Dr. CULLEN it has been supposed to be too weak to reach the sanguiferous system; BERGIUS considers it as an emenagogue, and states it only to be useful in chlorosis. For distillation, the calyces, and leaves are best used in somewhat a dry state.

The leaves and tops give out their virtue completely to rectified spirit, which, when, distilled from them, becomes considerably impregnated with their fragrance, leaving, however, in the extract, the greatest share of both their flavour and pungency.

The active matter of the flowers is more volatile than that of the leaves, the greatest part of it arising with spirit; the Hungary water is a strong spirit distilled from the flowers.

Spiritus RORISMARINI, vel AQUA HUNGARICA. *Spirit of* ROSEMARY, or *Hungary water*.

Take of the fresh tops of rosemary, one pound and an half: proof spirit of wine, one gallon. Distil in a water bath, five pints. Pharm. Lond. 1788. This with the essential oil are the only preparations now kept in the shops, except rosemary being an ingredient in compound spirits of lavender, and some other preparations. A conserve used to be formed of its flowers, though it is now expunged both from the London and Edinburgh Pharmacopœias.

To make the Hungary water in perfection, the spirit must be very pure, the leaves at their full growth, gathered without bruising, and committed to distillation. If the flowers were hung in the still, or retort, in a wicker basket, the spirit being first put therein, and a gentle heat applied just sufficient to make the spirit rise, the vapour, lightly percolating through the flowers, will imbibe their fine parts, and leave their grosser behind.

Pure spirit extracts in great perfection all the aroma of the *rosemary*; but in distillation, it leaves so much behind that the resinous mass left upon abstracting the spirit, proves an elegant aromatic, and very rich in the peculiar qualities of the plant.

Aqueous liquors extract a useful portion of the virtues of *rosemary* by infusion, and elevate them by distillation. Along with the water, arises a considerable quantity of essential oil, which is light, thin, pale, and almost colourless: it hath a cast of a green and yellow.

See Tournefort's Mat. Med. Lewis's Mat. Med. Neumann's Chem. Works. Cullen's Mat. Med.

ROSMARINUM STŒCHADIS FACIE. See POLIUM CRETICUM.

ROS SOLIS, also called *rosa solis*, *rorella*, *sponsa solis*, *rorida*. RED-ROT, SUN-DEW. It is a small low plant, with a little fibrous root, from which spring small, round, hollowish leaves, on foot-stalks of about an inch long, covered with short red hairs, which make the whole leaf appear red. It grows in boggy ground, and flowers in June and July. Some commend it as a cordial, but it is injurious to cattle if they happen to eat it, and is very caustic; so it hitherto hath not obtained a place in practice. See Raii Hist.

ROSTELLUM, a little beak. See CORCULUM.

ROSTRUM LEPORINUM. The piece of flesh which hangs betwixt the division of the hare-lip. See LABIA LEPORINA.

ROTATOR MINOR, }
—— MAJOR, } See FEMORIS OS.
—— NATIS. }

ROTULA. See PATELLA. In pharmacy it is a troche.

ROTUNDA LIGAMENTA. The ROUND LIGAMENTS. On each side of the womb there is one: they are two vascular ropes, composed of arteries and veins, lymphatics and nerves, arising from the fundus uteri, and running under the duplicature of the broad ligaments to the rings of the abdominal muscles, and passing under Poupart's ligament, are lost on the crural vessels, &c. or vice versa: they run in a contorted form, and thus are capable of being lengthened. It is probable that the nerves of these ligaments, being compressed in time of labour between the uterus and abdominal muscles, cause

the

the pain which the patient feels and complains of in the inside of her thighs.

RUBETA. See BUFO.

RUBIA, alſo called *rubia* tinctorum, Linn. *Erythrodanum*, *rubia* major. DYER'S MADDER. RUBIA *foliis annuis caule aculeato*. CLASS TETRANDRIA, ORD. MONOGYNIA. LINN. Gen. Plant. 127. The root is called *radix rubra*.

It is a tough procumbent plant, with ſquare jointed ſtalks, and five or ſix oblong pointed leaves, ſet in form of a ſtar at every joint; on the tops come forth greeniſh yellow flowers, which are followed by two black-berries. The root is long, ſlender, juicy, of a red colour both externally and internally, with a whitiſh woody pith in the middle. It is perennial, and cultivated in different parts of Europe for the uſe of dyers.

The roots are bitteriſh, and ſomewhat auſtere; they have but very little ſmell. They impart to water a dark red tincture; to rectified ſpirit and diſtilled oils a bright red. Both the watery and the ſpirituous tinctures taſte ſtrongly of the *madder*. Taken internally it tinges the urine red and milky; and if fowls, &c. have it mixed with their food, their bones become red and brittle, but the fleſh and the cartilages are no way affected by it. The bones, thus tinged, preſerve their colour, though boiled in water, or ſteeped in ſpirit of wine. The ſubtil parts of which this root is poſſeſſed, render it eminently uſeful as a reſolvent and aperient in obſtructions of the viſcera, particularly thoſe of the liver and kidneys; it has been recommended ſtrongly as an emmenagogue; but, from repeated trials, ſome authors doubt its efficacy: in ricketty affections it has been ſuppoſed to be of uſe.—Doſe in powder ℈ i. to ʒ ſs. or in decoction, two, three or four times a day, in coagulations of blood from falls, in the jaundice, and in the dropſy. It is alſo a name for the *rubeola*; a ſpecies of *croſs-wort*; and of *horſe-tail*.

RUBIA SYLVATICA LÆVIS, alſo called *gallium*, *mollugo*, *anonymos Americana*, MOUNTAIN-BASTARD, or WILD-MADDER. Its virtues are ſimilar to the above kind.

—— CYNANCHICA, called alſo *rubeola*, *cynanchica Lugdunenſis*, *aſperula*, *ſaxifraga*, SQUINANCY-WORT. It hath a black, thick, woody root, which runs deep into the earth, with many capillary fibrils, divided into a multitude of heads, and ſhoots up many ſmooth, ſlender, ungulous ſtalks, a ſpan long or more; at every joint of the ſtalk are four leaves, which are ſhort and broad; the flowers are on the top of the ſtalks and branches, and form umbels of a red colour, and agreeable ſmell, like that of the jaſmine; each flower is followed by two ſeeds, which are rough, and when dry, of a yellow colour.

It is found on chalky grounds, and is ſaid to be of uſe in quinſies, but the preſent practice does not own it.

RUBICAPRA. See CAPRA ALPINA.

RUBINUS VERUS. See CARBUNCULUS.

RUBRICA FABRILIS, ſeu RUBRICA. See OCHRA.

RUBUS. See DUMUS.

RUBUS ALPINUS and PALUSTRIS HUMILIS. See CHAMÆMORUS.

—— IDÆUS. Alſo *batinon*, *moron*. RASPBERRY-BUSH. It is the RUBUS IDÆUS, *foliis quinato-pinnatis ternatiſque*, *caule aculeato petiolis canaliculatis*. CLASS ICOSANDRIA, ORDER POLYGYNIA. LINN. Gen. Plant. 632. This plant is a native of Britain, uſually growing about woods and hedges, rocky mountains, and in moiſt ſituations, producing its flowers in May and June. The raſpberry is (though) commonly cultivated in our gardens, where we frequently obſerve three ſorts; the *red*, *white*, and *ſmooth*. This fruit has a common ſweet taſte, accompanied with a peculiar grateful flavour, on account of which it is chiefly valued: as to its virtues, they conſiſt in allaying heat, and quenching thirſt, and promoting the natural excretions, though theſe it poſſeſſes not in ſo great a degree as ſome other of our ſummer fruits. A ſyrup is made of the juice in the following manner: Take of raſpberry juice, ſtrained after the fæces have ſubſided, two pints; double refined ſugar, by weight, fifty ounces; diſſolve the ſugar that it may form a ſyrup.

RUBUS VULGARIS. The COMMON BRAMBLE; BLACK, or DEW-BERRY BUSH. RUBUS FRUTICOSUS, Linn. called alſo *batos*, *chamæbatos*. It grows wild in hedges and in woods. The berries, called *humirubus*, have a faint taſte, with an agreeable flavour. The leaves are moderately aſtringent. The flowers appear in July, and the fruit is ripe in Auguſt and September; but no part of this buſh, or its productions, are under the preſent practice.

RUCTATIO, } A diſcharging of wind upwards.
RUCTUS. } When a diſeaſe, it is an inſtance of dyſpepſia, and is better relieved by means that help digeſtion than by ſpirituous liquors, and warm carminatives.

RUFI PILULÆ, now PILULÆ EX ALOE cum MYRRHA. ALOETIC PILLS with MYRRH. ℞ Aloës ſocotorinæ ʒ ii. myrrhæ, croci, ää ʒ i. ſyrupi croci quantum ſatis ſit. Let the aloes and myrrh be ſeparately reduced to powder, then beat the whole together into a maſs. For their medicinal power, ſee the article ALOE.

—— SCUTATUS, vel
—— HELVETICUS } LINNÆI. See ACETOSA.
—— AQUATICUS,
—— HYDROLAPATHIUM, } See LAPATHUM AQUATICUM.
—— and RUMEX ACUTUS. See LAPATHUM ACUTUM.

RUONIA. See GUTTA ROSACEA.

RUPICAPRA. See CAPRA ALPINA.

RUPELLENSIS SAL. It is alſo called *ſel de ſeignette*, and ROCHELLE SALT, now *natron tartariſatum*. It is a ſoluble tartar, made with the mineral fixed alkaline ſalt after its being melted by the heat of the fire, by which it forms more eaſily into cryſtals. ʒ vi. to ℥ i. of this *ſalt* is a gentle cooling purge: but like all the other neutral ſaline purgatives, ſhould be mixed with a copious quantity of water.

RUPTURA. A RUPTURE. The word *hernia* is tranſlated by the Engliſh word *rupture* (ſee HERNIA); but this tranſlation was in conſequence of the idea that the peritonæum was ruptured when the abdominal contents protruded through the teguments. The word *ruptura*, or *rupture*, is moſt properly ſpoken of a cartilage, a ligament, or a tendon; when they are divided by violence, then a ſpecies of wound is produced, viz. the part is lacerated.

RUSCUS, alſo called *bruſcus*, *oxymyrrhine*, *oxymyrſine*, *myrtacantha*, *myacantha*, *ſcopa regia*. WILD-MYRTLE, KNEE-HOLLY, BUTCHER'S BROOM. It is the RUSCUS ACULEATUS Linn. It is a low woody plant, with oblong, ſtiff, prickly leaves, joined immediately to the ſtalks; from the middle ribs of the leaves on the upper ſide iſſue ſmall yellowiſh flowers, which are ſucceeded by red berries. The root is pretty thick, knotty, furniſhed with long fibres matted together, of a pale browniſh colour on the outſide, and white within. It grows wild in woods and heaths, is perennial and evergreen; it flowers in May, and its berries open in Auguſt. The root taſtes ſweet, and is ſlightly bitter; it is *aperient* and *diuretic*; its virtues are extracted by water and ſpirit; and on inſpiſſating the tincture, they remain entire behind. The young ſhoots are moſt powerful, and are eaten inſtead of aſparagus. See Miller's Bot. Off.

RUSCUS HIPPOGLOSSUS, or LATIFOLIUS. See LAURUS ALEXANDRINA.

RUTA. RUE. *Ruta* graveolens, or *ruta* ſylveſtris major, fol. decompoſitis, petalis laceris, floribus lateralibus quadrifidis, Linn. LARGE WILD-RUE; called alſo *armala*; *beſaſa*; *peganon*. It is a ſmall ſhrubby plant, with thick bluiſh green leaves, divided into numerous roundiſh ſegments; on the tops of the branches come forth yellowiſh flowers, followed each by a capſule, which is divided into four partitions full of ſmall, blackiſh, rough ſeeds. It is cultivated in gardens, flowers in June, and holds its leaves all the winter.

Rue hath a ſtrong unpleaſant ſmell, and a penetrating pungent bitter taſte; if much handled it is apt to inflame and exulcerate the ſkin. It is commended as a powerful ſtimulant, aperient, antiſeptic, and in ſome degree antiſpaſmodic. In crudities and indigeſtion, and the ill effects of corrupted air, in uterine obſtructions, and hyſteric diſeaſes, its efficacy is ſaid to be conſiderable. It is uſeful in cold phlegmatic habits, or weak hyſterical conſtitutions, ſuffering from retarded and obſtructed ſecretions; for it quickens the circulation, diſſolves tenacious juices, and promotes the fluid ſecretions. Externally it

is diſcutient and antiſeptic, if applied by way of fomentation.

Its virtues are extracted by water and by ſpirit of wine, but moſt perfectly by the latter. On inſpiſſating the ſpirituous tincture, very little of its flavour ariſes with the menſtruum, nearly all the active parts of the *rue* remaining in the extract, which impreſſes the palate with a warm, ſubtile, durable pungency; and in ſmell it is rather leſs unpleaſant than the herb in ſubſtance. This is the beſt preparation of *rue*. Though the principal virtues reſide in the eſſential oil, yet this oil not being very volatile, it reſides in the extract.

Diſtilled with water, a yellowiſh or browniſh eſſential oil is obtained; and if the liquor which remains in the ſtill is inſpiſſated by evaporation, a warm, pungent, bitteriſh extract is obtained.

When *rue*-leaves are diſtilled for their eſſential oil, they ſhould be uſed whilſt freſh, ſhould be gathered when the flowers are ready to fall off; and as the ſeeds and their capſules contain more oil than the leaves, they ſhould be gathered and diſtilled alſo. They all require to be macerated ſome time before they are diſtilled.

Rue is directed in form of an extract, and is alſo a principal ingredient in the pulvis cum myrrha compoſitus, and often given in the form of tea. To it was attributed, by HIPPOCRATES, the power of reſiſting the action of contagion, and other kinds of poiſons; and in this view highly extolled by BOERHAAVE. Notwithſtanding which, it is not now allowed to poſſeſs any ſuch virtues.

For the mode of making which, ſee CHAMÆMELI EXTRACTUM.

See Tournefort's Mat. Med. Neumann's Chem. Works. Lewis's and Cullen's Mat. Med.

RUTA CAPRARIA. See GALEGA.

—— SYLVESTRIS. See HARMEL.

RUYSCHIANA TUNICA. See CHOROIDES.

RYSAGON. See CASSUMMUNIAR.

RYTHMUS, from ῥυθμος, *meaſure*, a term uſed by muſicians, with reſpect to time in muſic; but ſince Herophilus applied it to the pulſe, it is uſed to expreſs the time, motion, or modulation of the pulſe. See ARYTHMUS.

S.

SABADILLA. See CEVADILLA.

SABINA, alſo called SAVINA, *ſabina* ſterilis, *bratbu*, COMMON or BARREN SAVINE. It is the JUNIPERUS SABINA, *fol. oppoſitis erectis decurrentibus oppoſitionibus pyxidatis, ramis ſerratulis*, CLASS DIOECIA; ORD. MONADELPHIA. LINN. Gen. Plant. 1134. It is an evergreen ſhrub, with ſhort narrow leaves, which are ſo ſtiff as to be prickly: when old, and not till then, it bears blackiſh berries, like thoſe of the juniper. It is a native of the ſouthern parts of Europe, and is raiſed with us in gardens. The leaves and tops have a ſtrong ſmell of a diſagreeable kind; of a hot, bitter and acrid taſte. They give out great part of their active matter to watery liquors, and the whole to rectified ſpirit. Diſtilled with water they yield much eſſential oil, which ſmells ſtrongly and taſtes moderately of the *ſavin*: its DOSE is from *two* to *four* drops.

The decoction which remains after diſtilling for the oil, yields an extract, which retains much of the pungency, warmth, and bitterneſs of the plant. On inſpiſſating the ſpirituous tincture, there remains an extract conſiſting of two diſtinct ſubſtances; one is yellow, unctuous, or oily, bitteriſh, and pungent; the other is black, reſinous, tenacious, leſs pungent, and ſub-aſtringent.

Savin is ſtimulant and aperient, uſeful in uterine obſtructions which proceed from a ſluggiſhneſs of the humours and a laxity of the veſſels. It is conſidered as a very powerful and active medicine; it heats and ſtimulates the whole ſyſtem very conſiderably, and is ſaid to promote the fluid ſecretions. It has been proved, by repeated trials, to be an efficacious emmenagogue, and well ſuited to the relaxed and weak habit; but in plethoric habits improper, which ought to be repeatedly bled before it is exhibited. In powder, the doſe is from ℈ i. to ʒ i. twice a day; in ſmaller doſes, it does not prove effectual.

There are ſeveral preparations of this plant, beſides the powder, viz. EXTRACTUM SABINÆ. See CHAMÆMELI EXTRACTUM. Its doſe is from ten grains to thirty grains.

PULVIS SABINÆ COMPOSITUS.

℞ Pulveris foliorum ſabinæ, æruginis pp. ää p. æ. m. This is employed as an eſcharotic, for warts, and excreſcencies, upon which this powder is to be ſprinkled every day. The powdered ſavine alone is uſed for venereal warts very often, foul ulcers, &c. The oil impregnates the urine with its ſmell, and contains the whole of its virtues. See Lewis's Mat Med.; and for the *tinctura ſabinæ compoſita*, ſee ELIXIR MYRRHÆ COMPOSITUM, under MYRRHA.

SABINA BACCIFERA. See CEDRUS CUM FOLYP.

—— GORNSIS. See CEDRUS PHŒNICIA.

SABURRATIO. See ARENATIO.

SACCATA See ŒNUS DIACHŒMENUS.

SACCHARUM. SUGAR. The Arabians call it *ſuchar*, *ſucchar*, *ſutter*, *zuchar*, *zuccara*, and *zozar*; the Greeks called it *ſackchar*, *ſakchari*, *ſalcharion*, and *ſpodion*. It is alſo named *cantion*. That which is put into caſks unrefined, is called *caſſonada*. The plant is the SACCHARUM OFFICINARUM, *floribus paniculatis, foliis planis*, CLASS. TRIANDRIA; ORD. DIGYNIA. LINN. Gen. Plant. 73. COMMON SUGAR-CANE.

Sugar is the eſſential ſalt of the *ſugar-cane*, or of whatever vegetable it is obtained from. It is chiefly the produce of the *arundo ſaccharifera*, C. B. called alſo *arundo viba Braſilienſibus*, which grows ſpontaneouſly in the Eaſt Indies and ſome of the warmer parts of the Weſt, and is cultivated in many of the American iſlands: the beſt canes grow in the Canary and Madeira iſlands. The expreſſed juice of the cane is clarified with the addition of lime-water, &c. and boiled down to a thick conſiſtence; it is removed from the fire, and then the ſaccharine part concretes into brown coloured maſſes: this is the SACCHARUM RUBRUM of the Pharm. Lond. and Edinb. It leaves an unctuous liquor, called *melazzo* or molaſſes, from its being of an honey-like conſiſtence, which with us is called *treacle*. This red *ſugar* is clarified in conical moulds, by ſpreading on the upper broad ſurface ſome moiſt clay, whoſe watery part gently percolating through the maſs, carries with it a large portion of the treacly matter. This is further refined by diſſolving it in water and mixing it with the whites of eggs, then draining off the water, and covering it with clay again in the moulds: this is the SACCHAR. ALB. Ph. Edinb. This proceſs again repeated, it is the SACCHAR. PURISSIM. Ph. Lond. Brown *ſugar* boiled to a proper conſiſtence, is placed in a hot room, to ſhoot into cryſtals upon ſticks placed for the purpoſe, and it is then called *ſaccharum candidum* and *candum*; *canthum*; *ſaccharum cantion*; when powdered, *nabit*, in the Pharm. Edinb. or clarified, and the thinner parts evaporated, ſo that it forms a brittle ſubſtance made into ſmall rolls, it is then called BARLEY SUGAR; both of which have the Arabian name *alphenic*.

Sugar, when it is depurated, boiled in roſe water, and caſt into troches, is called CHRISTI MANUS; when pearls are added, *manus Chriſti perlata*.

By the aſſiſtance of heat, *ſugar* diſſolves in rectified ſpirit of wine, but the greateſt part ſeparates when cold, and concretes into a cryſtalline form. On this foundation ſaccharine concretions are obtained from ſaturated ſpirituous tinctures of ſeveral of the ſweet plants of our own growth, the ſaccharine part ſeparating when the tincture is ſet in the cold, whilſt the reſinous and other matter ſeparated from the plant remains in the ſpirit.

On all trials hitherto made, *ſugar* appears to be perfectly neutral, and unites with moſt kinds of humid bodies without altering their native qualities. It ſerves as an intermedium for uniting together ſome bodies naturally repugnant; in conſequence of this property it is ſuppoſed to unite the unctuous part of our food with our juices. Hence ſome conclude that it increaſes fatneſs, whilſt others ſay it hath the contrary effect by preventing the ſeparation of the oily matter from the blood. Neumann obſerves, that he hath known very lean people who have eaten great quantities of ſugar. Some ſay that it thickens the juices, and makes them ſluggiſh; that it retards the circulation, obſtructs the natural ſecretions, and thus occaſions or aggravates ſcorbutic, cachectic, hypochondriac, and other diſorders; but general experience does not manifeſt that *ſugar* produces any of theſe effects

in a remarkable degree. Its moderate uſe is innocent, and perhaps, of all others, it is the moſt inoffenſive of the ſweets. And when preſent in any unuſual quantity in the maſs of blood, Dr. Cullen ſays, that the medicinal qualities are no other than that of a ſaline mild ſubſtance, that will readily paſs by the excretions, and probably expedite and promote theſe; and that this is the only medicinal virtue he can aſcribe to it.

Sugar preſerves both animal and vegetable ſubſtances from putrefaction, and appears to poſſeſs this power in a much greater degree than the common alimentary ſalt. Animal fleſh hath been preſerved by *ſugar* more than three years from being at all tainted or putrefied. The impure brown *ſugars* are moſt laxative, in conſequence of their oily or treacly matter. The candied *ſugar* diſſolving with difficulty, renders it more fit for gradually melting in the mouth, and thus relieving tickling coughs, and hoarſeneſs. In other reſpects, its principal uſe is to render other medicines more palatable, or to give them a proper form. See Neumann's Chem. Works. Lewis's and Cullen's Mat. Med.

SACCHARUM CANADENSE, and ACERNUM. See ACER.

—— ALUMINIS. See ALUMEN.

—— SATURNI. See PLUMBUM, N° 5.

SACCULI ADIPOSI. The cells of the cellular membrane filled with fat. See CELLULOSA MEMBRANA.

SACCULI MUCOSI. See BURSÆ MUCOSÆ.

SACCULUS and SACCUS. See EPITHEMA.

SACCULUS CHYLIFERUS. See RECEPTACULUM CHYLI.

—— CORDIS. See PERICARDIUM.

—— LACRYMALIS. The LACRYMAL SAC is an oblong membranous bag, by which the tears are conveyed from the ſurface of the eye to the noſtril, on each ſide reſpectively. It receives the tears at the *lachrymal* points, from whence it conveys them to the os turbinatum inferius, where it opens into the noſtril. The body of the bag is in the grooves of the os unguis, and os maxillare, which form the paſſage. See PUNCTA LACRYMALIA.

SACCUS. The INTESTINUM CÆCUM, and ŒNUS DIACHEOMENUS.

SACER MUSCULUS. Winſlow calls this muſcle *tranſverſo-ſpinalis lumborum*. It is compoſed of ſeveral oblique, converging, or tranſverſo-ſpinal muſcles; and lies between the ſpinal and oblique apophyſes of the loins, reaching to the os ſacrum. The loweſt is fixed to the upper lateral parts of the os ſacrum, and to the poſterior ſuperior ſpine of the os ilium; the reſt are fixed to the three loweſt tranſverſe apophyſes, and to the four loweſt oblique apophyſes of the loins, and their lateral tuberoſities, from thence they run up to all the ſpinal apophyſes of the vertebræ.

SACERDOTIS VIRILE. See ARUM.

SACKCHAR, SAKCHARI. See SACCHARUM.

SACRA ARTERIA. It goes out from the back part of the aorta, at the bifurcation, on each ſide reſpectively. Sometimes there are three or four of them, and ſometimes but one. Sometimes they take their riſe ſomewhat higher from the lumbares, or from the iliacæ. They are ramified on the os ſacrum and the neighbouring parts of the peritonæum, rectum, fat, &c, and alſo penetrate into the ſubſtance of the bone.

SACRA HERBA. See VERBENA.

—— TINCTURA, NOW ALOES VINUM. ALOETIC WIE.

Take of Socotorine aloes, ℥ viij. canella alba, ℥ ij. vinum album Hiſpanic. m. ℔ vj. ſpt. vinoſi tenuioris, m. ℔ ij.

Let the aloes and canella alba be reduced to powder ſeparately, then mixed, and pour upon them the wine; afterwards let them digeſt for a fortnight, now and then ſtirring them; and then ſtrain it off. It will be of uſe to prevent the aloes, when moiſtened, from running into concretions, to mix the powders with white ſand, cleared from its foulneſs. Ph. Lond. 1788. This is eſteemed a warm purgative, which will generally prove ſo to adults in doſes from ſix to ſixteen drams. Three or four drams, with a dram of ſpirit of lavender, repeatedly taken about noon, or at bed time, has been of great uſe in caſes of indigeſtion, and headachs: large doſes of this, or the *tinctura aloes*, have been taken to produce the bleeding piles where they have been ſuddenly and injuriouſly ſuppreſſed.

SACRA VASA. The veſſels which belong to the os ſacrum and the adjacent parts, as the arteries and veins.

—— VENA. It ſometimes proceeds from the bifurcation of the *vena* cava, at others from the origin of the left iliaca, and accompanies the artery of the ſame name.

SACRI ACUMEN OSSIS. See ACUMEN.

SACRO LUMBARIS, vel LUMBALIS. This muſcle is one with the longiſſimus dorſi at its origin, but ſoon divides, and is inſerted by digitations into the angle of every rib. The uppermoſt tendon is inſerted into the tranſverſe proceſs of the laſt cervical vertebra.

—— LUMBARIS ACCESSORIUS, called alſo *acceſſorius ſacro-lumbalis*, and *ſacro-lumbaris*; *cervicalis deſcendens*, and *cervicalis dorſi*. It is a continuation of the cervicalis dorſi; it lies on the outſide of the complexus, and coming down from the tranſverſe proceſſes of the lower vertebræ colli, is continued down under the ſacro lumbaris to the ribs, which it depreſſes, as well as the ſacro lumbaris.

—— NERVI. Five or ſix branches of nerves from the ſpine paſs through the os ſacrum, whence their name. The three firſt join the fourth and fifth lumbar nerves to form the ſciatic nerve. The third *ſacral nerve* gives ſome branches to the pelvis.

—— COCCYGÆUS. See COCCYGÆUS POSTERIOR.

SACRUM OS. This bone is thus named from its having been offered in ſacrifices. Some call it *os baſilare*, from its being, as it were, the ſupport of the whole ſpine, alſo called *albagiazi*. This bone is of a ſomewhat triangular ſhape, broad above, narrow below, convex behind, and concave before. In the fœtal ſtate it conſiſts of five diſtinct bones, but in adults they are united into one. On the outſide there is a ridge, which is called the ſpine. On the fore part there are four pair of holes for the tranſmiſſion of the nerves. This bone is connected with the oſſa innominata by ſynchondroſis, and forms the poſterior part of the pelvis. Below the *os ſacrum* it is connected with the os coccygis.

SÆVA LEONIS ORA. See ANTIRRHINUM.

SAFFRAN DE TERRA. See CURCUMA.

SAGAPENUM, alſo called *ſerapinum*, GUM SAGAPEN. It is the gummy reſinous juice of an oriental plant, ſuppoſed to be a ſpecies of ferula. See FERULA MAJOR, ſeu FEMINEA. It is brought from Alexandria either in diſtinct tears, or run together in large maſſes; outwardly it is of a yellow colour, internally it is paler, and clear like horn: but ſometimes of a greeniſh hue. It grows ſoft on being handled, ſo as to ſtick to the fingers. Sometimes pieces of bdellium are ſold for it, but they may be diſtinguiſhed by their weaker ſmell. The ſmell of *ſagapenum* is ſtrong and diſagreeable, like that of the leek, or of a mixture of aſſafœtida and galbanum. To the taſte it is moderately hot and biting. It is one of the ſtrongeſt of the deobſtruent gums; ſuperior to the opoponax, galbanum, and ammoniacum, coming neareſt to the aſſafœtida. As an alterative it may be given from gr. iii. to ℥ ſs. and as a purge, ℥ i. muſt be given for a doſe. It is generally uſed as an attenuant, an expectorant, deobſtruent, and antiſpaſmodic. Neumann ſays it is uſed in the ſame caſes as the ammoniacum. Boiling water diſſolves about ⅘ths of this gummy reſin. Rectified ſpirit takes up about one half. Water brings over with it in diſtillation much of the flavour of the *ſagapenum*, and a ſmall portion of eſſential oil, but the diſtilled ſpirit is moſt flavourleſs. It is an ingredient in the pilulæ gummi. See Lewis's Mat. Med. Neumann's Chem. Works. Tourneſort's and Cullen's Materia Medica.

SAGITTA. ARROW-HEAD. At firſt the leaves of this plant reſemble thoſe of plantain, but afterwards the bearded head of an arrow; the fruit conſiſts of a collection of ſeeds like the ſtraw-berry. It is ſaid to poſſeſs ſimilar virtues with the plantain, but is rarely uſed.

SAGITTALIS SUTURA, called alſo *virgata*, *obelæa*, *rhabdoides*; *rabdoides*. The SAGITTAL or STRAIT SUTURE of the head. It runs from the os frontis to the os occipitis, betwixt the parietal bones.

SAGITTARIA ALEXIPHARMICA, alſo called *agutiguepoobi Braſilienſis*, *malacca radix*, *canna Indica*, *arundo Indica*, ARROW-ROOT, DART-WORT. The root is alexipharmic, and is uſed by the Indians to remove the poiſon which they receive from darts when wounded by them. It is found in the Weſt Indian iſlands, and is two or three inches long, as thick as a man's thumb, jointed and white. See Raii Hiſt.

SAGOU. See PALMA JAPONICA.

SAL. SALT, ACALAI. It is a body that is more or leſs hard, having a remarkable ſavoury taſte; is entirely ſoluble in water, and does not precipitate, unleſs there is more than the water can diſſolve; or, as Geoffroy defines it, "It is a ſolid, friable, pellucid, ſapid, mineral body, ſoluble in water, fuſible by fire, and concreſcible into the form of cryſtals." This definition agrees with ſea-*ſalt*, nitre, vitriol, alum, borax, and *ſal* ammoniac. *Salts* are natural or ſimple, and artificial or compound. The ſimple are the acid and alkaline; the compound the neutral, metallic, and earthy; of the acid kind there are the vitriolic, nitrous, muriatic, vegetable, animal, &c. of the alkaline there are the fixed, both vegetable and foſſil; and the volatile, which laſt are chiefly from animal ſubſtances; they are very rarely found in the mineral kingdom. Indeed the term SALT, which is ſynonymous with ſaline matter, or ſaline ſubſtances, when taken in its moſt general ſenſe, is, of all chemical terms, that which is applicable to the greateſt number of individuals. In fact, the different number of bodies, to which chemiſts allow the character of *ſaline*, or which poſſeſs the principal ſaline properties, is ſo great that they are very far from being known. The enumeration of thoſe which are known, with their ſpecific characters, would be infinitely too numerous for this work. We ſhall therefore only obſerve, that the eſſential properties of all matter, which ought to be conſidered *ſaline*, are *to affect the ſenſe of taſte,—to be ſoluble in water*,—and to have all the principal qualities, as *gravity*, and *fixity, in an intermediate degree, betwixt thoſe of water and pure earth*. See CRYSTALLIZATIO. Tournefort's Mat. Med. Lewis's Mat. Med. Dict. of Chem. Neumann's Chem. Works; Fourcroy's Chemiſtry, and other chemical writers, who have treated pretty diffuſively on this ſubject. BURAC is a name given to all kinds of ſalt.

SAL is alſo a term affixed to ſeveral ſaline ſubſtances, viz. *ſal vol. ſalis ammoniaci*; *ſal c. cervi*. See ACALI VOTATILE; *ſal abſinthii*;—*tartari—ſodæ*; ſee ALCALI; *ammoniacum*; VOLATILE;—*alkalinus ſalis marini*; ſee ANATRON; *cyreniacus*, ſee AMMONIACUS SAL; *foſſilis, rupeus*, ſee GEMMA SAL; *catharticus Glauberi*; *Dauphiny*; *mirabilis*; *admirabilis*; ſee GLAUBERI SAL; *Sennerti*; ſee DIURETICUS SAL; *fuſionis*; *fixionis*; ſee ALEMBROTH; *gemmæ*; *communis*; *marinus*; ſee MARINUM SAL; *alkali fixum*; ſee CLAVELLATI CINERES; *petræ*; *prunellæ*; *polychreſtum*; ſee NITRUM, &c.

SALEP, vel SALEB. See ORCHIS.

SALICARNIA. See KALI.

SALITRON. See ANATRON.

SALIUNCA. See NARDUS CELTICUS.

SALIVA, from σιαλος. It is that fluid by which the mouth and tongue are continually moiſtened in their natural ſtate, and is ſupplied by glands which form it, that are called ſalivary glands. This humour is thin and pellucid, incapable of being concreted by the fire, almoſt without taſte and ſmell. By chewing, it is expreſſed from the glands which ſeparate it from the blood, and is intimately mixed with our food, the digeſtion of which it greatly promotes. In hungry perſons it is acrid and copiouſly diſcharged; and in thoſe who have faſted long it is highly acrid, penetrating, and reſolvent. A too copious evacuation of it produces thirſt, loſs of appetite, bad digeſtion, and an atrophy. See Haller's Phyſiology, in the article of Maſtication. Boerhaave's Inſtitutes. Fordyce's Elements, part i. p. 23.

SALIVALES GLANDULÆ. The SALIVARY GLANDS. They are commonly reckoned three pair, viz. the parotid, the maxillary, and the ſublingual; but Dr. Hunter would reckon the ſublingual of another kind.

SALIVALIS DUCTUS STENONIS. *Ductus Stenonis*. STENO'S SALIVAL DUCT. It is alſo called the UPPER SALIVAL DUCT. It is the *duct* which carries the *ſaliva* from the parotid gland into the mouth. See BUCCINATOR MUSCULUS.

SALIVANTIA. Medicines which excite a ſalivation.

SALIVARIS HERBA. See PYRETHRUM.

SALIVATIO. A SALIVATION. It is that extraordinary diſcharge of ſpitting which is excited by the uſe of mercury; a practice which is now rarely directed, becauſe all the advantages of mercury are obtained by uſing it as an alterative; and that without the trouble and danger which attends this method of promoting an evacuation by it. However, as occaſionally it may be needful to excite a gentle ſpitting, in general it is beſt done by rubbing a proper quantity of the ungt. hydrargyri every or every other night on the thighs. Mr. Clare recommends the application of calomel, gr. iii. vel iv. to the inſide of the cheek; he directs the patient to moiſten his finger with ſaliva, then therewith to take up the calomel, and rub it on and around that place where the parotid duct opens into the mouth. He adds that a grain or two applied behind the preputium, or to the labia, will, when accompanying the application of it to the inſide of the cheek, greatly advance the cure. This muſt be repeated every or every other day according to the degree of its effect. This mode, he obſerves, is leſs diſagreeable than the uſual one of rubbing the unguent. hydrargyri, as is commonly directed. Before the uſe of the calomel, it is proper to waſh the mouth well with warm water, that the mucus ſpread about on the cheeks may not prevent its abſorption. See an Eſſay on the Cure of Abſceſſes, &c. by P. Clare, Surgeon. Mr. Cruikſhank hath added an Appendix to Mr. Clare's publication, well deſerving the attention of every practitioner. The following are ſome of the many valuable inſtances of information communicated in a few pages. He obſerves, that there is no doubt of abſorption taking place on the inſide of the mouth, of the preputium, of the labia, &c. and that any fine powder, capable of being abſorbed there, will be more readily taken up when mixed with a watery fluid, as ſaliva. The particles of the blood, ſeen in the ſimple microſcope, are at leaſt ten times larger than thoſe of the levigated calomel; yet I have often ſeen the abſorbents turgid with red blood. The particles of quickſilver, in the beſt prepared mercurial ointment, appear in the ſame microſcope, as diſtant as the particles of the blood; and it is well known, they are very readily taken up by the abſorbents of the ſkin. The particles of levigated calomel are not much coarſer than thoſe of its precipitate by the volatile alkali; but this precipitate, we are certain, may be abſorbed from the external ſurface of the body; why then may not calomel be abſorbed from the inſide of the mouth? Mr. Hunter hath frequently directed calomel to be rubbed on the ſkin along with the volatile liniment; and ſeen it have the effects of the unguent. hydrargyri. It is very probable that the calomel, mixed with ſaliva, might make a good mercurial ointment. The ſurface on the inſide of the cheek, is a better abſorbing ſurface, than perhaps any other acceſſible to friction in the body. Though every ſurface abſorbs, they do not all abſorb equally. Calomel taken into the ſtomach frequently gripes, &c. but this effect is not obſerved when it is abſorbed by the inſide of the cheek: probably it becomes milder in its operation this way, as it is known that the divided quickſilver becomes milder when abſorbed by the ſkin. Friction with calomel on the inſide of the cheek, is a leſs tedious, leſs laborious proceſs, than the common one of rubbing the ungt. hydrargyri. To rub half a dram of the ungt. hydrargyri every night on the inſide of the thighs for half an hour, is almoſt intolerable; but what then muſt it be to rub in a larger quantity? The proceſs always tires the patient before it is half performed, and often on this account he omits it. From this circumſtance a cure is often miſſed. Let us ſuppoſe fifteen grains of the ungt. hydrargyri equal to one grain of calomel; and that we can go on with the calomel for twelve or fifteen days with ſenſible advantage: we muſt acknowledge that when the unguent. is uſed, it becomes neceſſary long before the end of this period to increaſe the doſe, in order to keep up the effects. Beſides the unguent. being more viſcid than the calomel mixed with ſaliva, will require a larger ſurface and a longer time before it can be ſufficiently rubbed in. The calomel is ſufficiently rubbed in, in a quarter of an hour. The friction of the unguent. hydrargyri on the thighs and arms makes the ſkin look dirty. It hath an offenſive odour whilſt it is rubbed; as it is greaſy, it does not rub in ſo as to be dry, and thence the ſkin is clammy, and ſticks to every thing about it; many ſkins are inflamed by it, which retards the cure this way, by being a cauſe for its omiſſion. Some ſkins are diſagreeably affected with oil, ſo when the calomel is not admitted as above recommended, the quickſilver may be divided with the ſynovia of cows or ſheep inſtead of oil or lard, which in ſome ſkins produce eryſipetalous inflammation, &c. A warm bath may be entered into two or three times before anointing with the unguent. hydrargyri, after which, the patient being kept in a warm room, and having on a flannel ſhirt, the principal

principal care is not to raiſe the *ſalivation* ſuddenly, or to any conſiderable height. A *ſalivation* ſhould riſe very gradually, and ſhould ſubſide as ſlowly; inattention to this hath been productive of many inconveniences. The body ſhould be prepared by a ſpare diet for a few days, and bleeding as well as uſing the warm barth. Except in ſtrong conſtitutions, from a pint to a quart is a ſufficient diſcharge of the ſaliva in twenty-four hours. Support the patient's ſtrength with plenty of light but nouriſhing diet; give him a pint of gruel, or of a decoction of mallows and liquorice in milk and water, almond emulſion, and barley-water, with gum arabic diſſolved in it, &c. repeat the above quantity every two or at the moſt every three hours; and if he is faint with it, give now and then a little wine-whey, maced ale, or mulled wine. If the patient is a woman, and expects her menſes, defer the procedure until they ſettle. If the neceſſary precautions are taken to raiſe and to carry the *ſalivation* on gently, the many bad accidents mentioned by writers on this ſubject will be prevented; and as to avoid inconveniences is better than to remove them, it may here ſuffice to have put the practitioner on his guard againſt ills which otherwiſe muſt occaſion him much trouble and anxiety. From repeated experience, it has, however, been found, that it is very rarely neceſſary, in the cure of the lues venerea, to raiſe a ſalivation; it will be quite ſufficient, if, after ſome time perſiſting in the uſe of mercury, he finds his mouth and gums ſlightly affected; for then we ſhall be aſſured that the medicine has got perfectly into the habit. In order, therefore, to prevent a *ſaliva-tion* coming on during the uſe of mercury, when the patient feels his gums begin to ſwell, his breath to ſmell diſagreeably, his throat painful on the inſide, or when he is obliged to ſpit oftener than uſual, the uſe of mercury muſt be immediately left off till all the ſymptoms diſappear, and then he may again apply to it. In bad weather, the patient ſhould keep himſelf within doors, in a moderately warm room, not covering his head and neck, ſo as to create much warmth: in fine weather he may go abroad; and, ſhould he be of a weakly habit, Peruvian bark may be adminiſtered twice a day; and coſtiveneſs be particularly avoided, by ſuch gentle means as act at the ſame time upon the urinary paſſages, ſuch as neutral ſalts, whey, &c. But notwithſtanding theſe precautions, ſhould a ſalivation come on, as will ſometimes happen in conſtitutions, whoſe ſalivary ſyſtem is very irritable; beſides deſiſting from the uſe of mercury, and keeping himſelf moderately warm, if the conſtitution will bear it, a gentle purgative may be given, and the warm bath be had recourſe to three or four times a week, he ſhould wear flannel next his ſkin; and ſhould inflammatory ſymptoms occur, bleeding will be neceſſary, and drinking freely of diluting mucilaginous liquids; but ſhould there be much debility attendant, a generous nutritious diet, wine, and bark with chalybeates, will be moſt proper, and a country reſidence, carefully avoiding all expoſure to too cold air: if the ſpitting continues undiminiſhed, gently reſtringent gargles may be uſed, ſuch as tincture of roſes, or decoction of bark with tincture of myrrh; of opium, and honey of roſes: boluſes of flowers of ſulphur, or precipitated ſulphur of antimony, may be taken two or three times a day; theſe alſo may be joined with camphor, which failing, a bliſter may be applied, or a ſeton, or iſſue ſet in the neck, and volatile liniment applied to the throat. Oily emulſions may be freely adminiſtered, which ſometimes appeared as efficacious aſſiſtants; and, in deſperate caſes, pouring cold water upon the head and neck, whilſt the patient has been ſitting in the warm bath, has been recommended.

Ptyaliſms ariſe alſo from different cauſes; ſometimes they are occaſioned by obſtructed viſcera. See alſo a caſe of ptyaliſm occaſioned by a diminiſhed ſecretion of urine, in the Med. Communications, vol. i. p. 155.

SALIX. The COMMON WHITE or the DUTCH WILLOW TREE; called alſo *itea*. It is not noticed in general practice; but ſome who have uſed it in agues have ſucceeded by giving a dram of its bark in powder, and repeating it every four hours during the intermiſſions. This ſpecies is diſtinguiſhed from the other by its oblong, pointed, ſerrated leaves, being hoary on both ſides, though moſt ſo on the lower, and in the branches being tough. See Raii Hiſt. Plant. Philoſ. Tranſ. 1763. It is the SALIX FRAGILIS *foliis ſerratis glabris, ovato-lanceolatis, petiolis dentato-glandulosis*. CLASS. DIOECIA, ORD. DIANDRIA. LINN. Gen. Plant. 1098. CRACK WILLOW.

The bark of the branches of this tree manifeſts a conſiderable degree of bitterneſs to the taſte, and is alſo aſtringent; and has been recommended not only in intermittents, but likewiſe in other caſes requiring tonic and aſtringent medicines.

Dr. Cullen ſays it is as valuable a medicine, and as promiſing a ſubſtitute for the bark, as any he knows to have been offered to the public. The trials he has made have been with the *ſalix pentandra*, the bark taken from its branches the third of an inch diameter, and of four or five years growth. Though he adds, Bergius declares, in intermittent fevers, he has always failed with this bark. Materia Medica.

SALPINGO PHARYNGÆUS. It riſes from about the tuba Euſtachiana, and is inſerted into the pharynx. Valſalva and Douglas ſay it is one of the origins of the muſcle of the pharynx. See PHARYNX.

SALPINGO-STAPHYLINUS. This muſcle ariſes fleſhy from the bony part of the tube of the ear, and is inſerted into the baſis of the uvula with its partner muſcle on the other ſide. They draw the uvula upward and backward.

—— STAPHYLINUS INTERNUS. See PETRO SALPINGO STAPHYLINI.

SALSAPARILLA. See SARSAPARILLA.

SALSOLA. See KALI.

SALUTARIS DIGITUS. See DIGITUS.

SALVATELLA VENA, from *ſalus, health*, becauſe it hath been thought that to open this vein, melancholy was cured, called alſo *ſplenitis*. This vein runs on the back of the hand; it comes from the little finger and that next to it; or according to ſome, it proceeds from betwixt the thumb and the fore-finger, and runs up to the ulna.

SALVIA, from *ſalvus, ſound* or *healthy*. SAGE, called alſo *elelisphaces*. Botaniſts enumerate more than twenty ſpecies. It is a low ſhrubby plant, with ſquare ſtalks, obtuſe, wrinkled, dry leaves, and large bluiſh flowers, which are on looſe ſpikes on the tops of the branches. It is a native of the ſouthern parts of Europe, but bears the cold of our clime. It flowers in May and June. Its ſeeds are called *ebel*.

SALVIA BOSCI. WILD or WOOD-SAGE. Taking its name from *boſcum*, or *boſcus, a wood*, the place where it grows.

—— ÆTHIOPIS. See ÆTHIOPIS.

—— HORMINUM. See HORMINUM.

—— MAJOR. GREATER or COMMON GARDEN-SAGE. It is the SALVIA OFFICINALIS, or SALVIA MAJOR, *foliis lanceolato-ovatis integris crenulatis, floribus ſpicatis cæruleis, calycibus acutis*. CLASS. DIANDRIA, ORD. MONOGYNIA. LINN. Gen. Pl. 37. Common green *ſage*. The leaves are nearly oval, but pointed; ſome are green, others red, but both ſorts are on the ſame plant. The leaves and tops are moderately aromatic and corroborant, and are uſed in debilities and relaxations both of the nervous and vaſcular ſyſtem. Their ſmell is ſtrong, but not diſagreeable; their taſte is warm, bitteriſh, and ſub-aſtringent; with a ſolution of chalybeate vitriol they ſtrike an inky blackneſs. This ſpecies is more agreeable, but not ſo ſtrong as the leſſer *ſage*. The flowers of both are weaker but more agreeable than their leaves. The beſt preparations are, the watery infuſion, and a tincture or extract made of rectified ſpirit of wine, theſe contain the whole virtue of the *ſage*. The watery infuſion, acidulated with the juice of lemon or of orange, is an agreeable common drink in fevers. From ʒ ſs. to ʒ i. of a conſerve made with *ſage* leaves, cures weak ſtomachs if repeated twice a day. See alſo SALVIA MINOR By diſtillation with water, a ſmall quantity of eſſential oil is obtained, which only poſſeſſeth the aromatic part of the herb. See Tournefort's Mat. Med. Lewis's Mat. Med.

—— MINOR, alſo called *ſalvia virtutis*. LESSER SAGE, or SAGE of VIRTUE. SALVIA AURICULATA, or SALVIA MINOR AURITA, and NON AURITA, Linn. Its leaves are narrower than thoſe of the greater *ſage*, whitiſh, and never red; they are ſtronger, but not ſo agreeable as the above ſpecies, but in other reſpects their qualities are the ſame.

Sage has been much employed as a ſudorific; and for preventing the recurrence of intermittent paroxyſms, perhaps it may be ſufficiently effectual. But it has alſo been employed for reſtraining improper ſweats, infuſed in ſpirits, or wine, by Van Swieten; alſo the improper continuing of the flow of milk into the breaſts of nurſes, after they had weaned their child, and it is alſo conſidered

as a reſiſter of putrefaction. Cullen's Mat. Med. As poſſeſſing a ſmall ſhare of aromatic and aſtringent power, it may prove a ſerviceable tonic in ſome caſes of debility of the ſtomach and nervous ſyſtem. See alſo SALVIA MAJOR.

SALVIA SYLVESTRIS, alſo called *ſcorodonia*, *ſcordotis*, *chamædrys fruticoſa*, &c. GERMANDER SAGE. WOOD SAGE. TEUCRIUM SCORODONIA, OR TEUCRIUM SYLVESTRE, LINN. It grows in woods and hedges. In ſmell, taſte, and medical virtues, it comes nearer to *ſcordium* than to *ſage*; it is leſs diſagreeable than the former, and more ſo than the latter.

Among the ſpecies of *ſage* is the PHLOMIS, or *yellow ſage*. Boerhaave reckons up eight. It is aſtringent and vulnerary.

SAMBUCUS, alſo called *acte*, *infelix lignum*. COMMON ELDER. SAMBUCUS NIGRA cymis quinquepartitis, floribus umbellatis, caule arboreo. CL. PENTANDRIA, ORD. TRIGYNIA. LINN. Gen. Plant. 372. COMMON BLACK-BERRIED ELDER. It is a tree or ſhrub whoſe branches are full of fungus; it is covered with an aſh-coloured chap bark, under which lies a thinner green one, and under it is a white one. It flowers in May, and ripens its berries in September.

The young leaves, when budding, are ſaid to purge; but the parts which are propoſed for medicinal uſe, are the inner bark, flowers, and berries. The firſt has ſcarce any ſmell, and very little taſte, on firſt chewing, it impreſſes a degree of ſweetiſhneſs, which is followed by a very ſlight, though durable acrimony, in which its powers ſeem to reſide, and which it imparts both to watery and ſpirituous menſtrua. It is recommended as a ſtrong hydragogue. Sydenham directs three handfuls of the inner bark to be boiled in a quart of milk and water to a pint, half of which is to be drank every night and morning, and repeated for ſeveral days: he ſays it operates upward and downward; and, upon the evacuations it produces, its utility depends. BOERHAAVE gave its expreſſed juice from 3 j. to half an ounce for a doſe. In ſmaller doſes it is ſaid to be an aperient and deobſtruent in various chronical diſorders. Some confine theſe effects to the EBULUS, or DWARF ELDER; but they have both been uſed without any remarkable advantage.—An infuſion of the *freſh flowers* is gently laxative, and of the dried ones is perſpirative; hence by promoting the cuticular excretion, it is ſaid to be particularly uſeful in eryſipelatous and other eruptive diſorders. Externally they are uſed in fomentations, &c. The London College of Phyſicians order an ointment to be made in the following manner: UNGUENTUM SAMBUCI. ℞ Florum ſambuci, p. ℔ iv. ſevi ovilli p. ℔ iii. olei olivæ m. ℔ j. Decoque flores in ſevo & oleo donec friabiles ſint, deinde exprime & cola. The juice of the berries, when inſpiſſated to a rob, is a good diſſolvent and aperient, in colds juſt received, and ſundry chronical diſorders; it gently looſens the belly, and promotes urine or perſpiration, or both; it is recommended in dyſpepſy, and debility of the urinary paſſages, in doſes of from one to two, or three drams. See Lewis's Mat. Med. Anatomia *Sambuci* per M. Blockwitz. Wallis's Sydenham.

SAMBUCUS EBULUS; — HERBACEA; — HUMILIS. See EBULUS. — SANAMUNDA. See EMPETRUM THYM. FOL.

SAMPSUCHUM. See ORIGANUM.

SAMPSUCHUS. See MARUM and MAJORANA MAJ. FOL.

SANCTÆ HELENÆ RAD. Alſo called *Cyperus Americanus*. It is a long knotted root, black without and white within; to the taſte it is like the galangal root. It is brought from St. Helena in the province of Florida. It is there uſed againſt pains in the ſtomach and in nephritic diſorders.

SANCTUM SEM. See SANTONICUM.

SANDARACHA. SANDARACH. A name for a ſort of arſenic; alſo a gummy reſin, of a yellowiſh white colour, ſaid to flow from the *cedrus Lycia major* Dodon. It is in ſmall lumps, dry, brittle, of a pleaſant ſmell, of a reſinous and gently acrid taſte: it is brought from Africa. The gum of the juniper tree is generally ſold for it. See JUNIPERUS, and ARSENICUM RUBRUM.

SANDIVER. See AXUNGIA VITRI.

SANGUIFLUXUS. See HÆMORRHAGIA.

SANGUINIS INOPIA. A tabes from loſs of blood. An inſtance of the atrophia inanitorum of Cullen.

SANGUIS; called alſo *dehene*; *hæma*. BLOOD. The fluid which is contained in the arteries and veins is called the *blood*. On a ſlight examination it may appear homogeneous, but it conſiſts of very diſſimilar parts. When *blood* is taken from the body, immediately it loſes its volatile part, which flies off in the form of a vapour, and is of the nature of ſal ammoniac. When this vapour is diſſipated the remaining *blood* quickly congeals into a trembling maſs. The principal part of this coagulated maſs is the *craſſamentum*, which hath the red colour to itſelf, and gives it to the other parts; when this craſſamentum is freed from its watery part, it is wholly inflammable. In a maſs of healthy human *blood* about one half is craſſamentum; in ſtrong laborious people, the ſerum is not much more than one third part. The next part of the *blood* is the *ſerum*; from this is formed what is called the pleuritic cruſt on the ſurface of the *blood*, after taking it from a vein by the uſual method of bleeding; of this polypuſes and artificial membranes are alſo formed. In this ſerum, beſides the albumen, which hardens like the white of an egg, there is much water, and a ſmall quantity of ropy mucus. Beſides theſe parts, a portion of ſea-ſalt is found in the *blood*, and is manifeſt to the taſte, and oftentimes to the microſcope. BY A CHEMICAL ANALYSIS, a *fine chalky earth* is alſo found to exiſt in the moſt fluid parts of the *blood*; a *portion of fixed air*, to the amount of half a ſcruple in every ounce; and alſo a ſmall quantity of *iron*, which the loadſtone will attract. To theſe may be added the *elementary fire*.

The natural elements of the *blood* formed by the animal œconomy are, the albumen, and the globules. The albumen is the immediate matter of growth and nutrition. The globules never paſs the emunctories, except by exceſs or diſeaſe; as for the ſaline, morbid, bilious, and other particles that are found in the circulating *blood*, they are rather heterogeneous than elementary parts of it.

In an healthy ſtate the *blood* is mild and gelatinous, but by ſome diſorders it is rendered very acrid.

On viewing the *blood* with a microſcope, whilſt it circulates in the veins, the globules are obſerved to be elaſtic, ſo as to change and recover their figure. Mr. Hewſon ſays they are not ſpherical, but almoſt flat.

The uſe of the globules in the *blood* ſeems chiefly to be for the preſervation of heat in the body; and that of the ſerum for nutrition, and by the various ſecretions from it to moiſten the ſeveral ſurfaces in the body, to preſerve the flexibility of the ſolids, &c. A due proportion of the reſpective parts of the *blood* is neceſſary to health; a redundance of the globules diſpoſes to acute fevers, inflammations, &c. and their deficiency, to many chronical diſorders.

As to the red colour of the *blood*, Dr. Hunter thinks it is chiefly owing to the degree to which it is condenſed; but moſt writers attribute it to the acid which it receives from the air in the lungs.

Dr. Cullen ſays, that the maſs of *blood* is every where an heterogeneous aggregate, conſiſting chiefly and eſpecially of red globules, gluten, and ſeroſity, and if it ſhould be alleged that there are other matters preſent, that they may be conſidered as portions of theſe three principal parts. See MATERIA MEDICA.

That life is a property of the *blood*, ſee what Mr. J. Hunter hath taught concerning it. And for an enlargement on what is ſaid above, beſides many other particulars reſpecting the *blood*, ſee Mr. Hewſon on the Properties of the *Blood*; Berdoe on the Nature and Circulation of the *Blood*. Fordyce's Elements, part i. Haller's Phyſiology, in lect. vii.

SANGUIS DRACONIS, called alſo *cinnabaris Græcorum*, *draconthæma*, *aſagen*, *aſegen*. DRAGON'S BLOOD. It is a reſin of a red colour, obtained from certain trees like palm-trees in the Eaſt Indies. The Calamus var. Palmijuncus *Draco*. Rumph. Amb. lib. vii. t. 58. f. 1. & Linn. Sp. Pl. 463. The CALAMUS ROTANG. Curtis's Cat. of the Lond. Bot. Garden. From the fruit of this tree, the *ſanguis draconis* is chiefly taken. One ſort is in oval drops, wrapped up in flag-leaves; another ſort is in large maſſes, which are often impure, but ſometimes as good as the firſt.

This reſin is of a deep red colour, and on being powdered is of a crimſon caſt. It readily melts, and catches flame from a candle. It almoſt totally diſſolves by the help of heat in rectified ſpirit of wine, tinging a large quantity of this menſtruum of a dead red colour: it is ſoluble in expreſſed oils; but it gives out little or nothing to water. The beſt pieces break ſmooth, are of a dark red colour, and when powdered changes to crimſon:

they have no remarkable ſmell or taſte, except when diſſolved, and then they ſeem to be ſomewhat acrid. The Dutch often adulterate this reſin with mixtures of gum arabic, Braſil wood, alum, &c. but theſe are diſcovered by their diſſolving in water, or by their crackling and not burning in the fire. It is not much uſed as a medicine, and Cullen thinks it ought to be expunged from the Materia Medica; though it is recommended as a gentle incraſſant, deſiccative, and reſtringent. See Lewis's Mat. Med. and GUMMI RUBRUM ASTRINGENS GAMBIENSE.

SANGUIS DRACONIS HERBA. See LAPATHUM RUBRUM.

—— HERCULIS. See CROCUS.

SANGUI-SOBRA. See PIMPINELLA.

—— SUGA. See HIRUDO.

SANICULA. SANICLE. It is ſo called from *ſanando*, *healing*, called alſo *cucullata*, *dodecatheon*; *ſymphytum petræum*.

SANICULA ALPINA LUTEA. See AURICULA URSI.

—— MAS, alſo called *diapenſia*, *cortuſa*, SANICLE, SELF-HEAL. It is the SANICULA EUROPÆA Linn. It is an umbelliferous plant, with ſhining, dark green, roundiſh ſerrated leaves: the ſeeds are rough and ſtick to one's cloaths. It is perennial and evergreen; it grows wild in woods, on hilly grounds, and flowers in May. It is mildly aſtringent, taſtes roughiſh and bitter; and it hath an acrimony which chiefly affects the throat. Both the watery and ſpirituous extracts poſſeſs the virtues of this plant.

—— EBORACENSIS, called *pinguicula*, *ſanicula montana* flore calcari donata, *viola paluſtris*. BUTTERWORT, YORKSHIRE SANICLE. It is the PINGUICULA VULGARIS, Linn. It is a ſmall plant, with a few gloſſy unctuous leaves which lie on the ground. It is perennial, grows in elevated marſhy grounds, and flowers in ſpring. Its unctuous glutinous juice is uſed by ſome as a liniment for chaps, and as a pomatum for the hair: it is alſo purgative, but none of the *ſaniclas* are much noted in general practice.

SANICULA FŒMINA. See IMPERATORIA NIGRA.

SANIDODES, alſo, but improperly, SANIODES. Where the breaſt is ſtraightened or flattened like (σανιδος, the genitive caſe of σανις, *a table*.) FLAT-CHESTED.

SANIES. See ICHOR.

SANKIRA. See CHINA ORIENTALIS.

SANTALUM. SAUNDERS. There are three ſorts brought from the Eaſt Indies.

SANTALUM ALBUM. WHITE SAUNDERS. It is of the ſame nature as the yellow, but ſo weak that it is now neglected. The *ſantalum citrinum*, called *ſantalum album* by Linnæus, is the medullary part of the ſame tree, of which the *ſantalum album* is the *alburnum*, or outward ſappy part. See ALBURNUM.

—— CITRINUM, alſo called *ſantalum palidum*. YELLOW SAUNDERS. SANTALUM ALBUM, Linn. It is a pale yelloviſh, or browniſh coloured wood, with a cloſe even grain, an agreeable ſmell, and a bitteriſh aromatic taſte, accompanied with a kind of pungency. Diſtilled with water, it affords an oil which thickens into the conſiſtence of a balſam, and ſmells like ambergriſe; the remaining decoction is bitteriſh. Rectified ſpirit extracts by digeſtion more than water does; and an extract from this tincture is ſix times ſtronger than the wood itſelf. Hoffmann ſays its virtues are ſimilar to thoſe of ambergriſe: but he has been too extravagant in his praiſes.

—— RUBRUM. RED SAUNDERS. PTEROCARPUS SANTOLINUS, vel PTEROCARPUS *foliis ternatis ſubrotundis retuſis glaberrimis, petalis crenatis undulatis*, LINN. This is of a dull red colour; it is ſaid to be aſtringent; it hath little or no ſmell, and as little taſte. It is chiefly uſed as a colouring drug; it tinges water with a yelloviſh hue, and rectified ſpirit with a deep red; but it does not diſſolve in expreſſed oil. See Lewis's Mat. Med.

SANTALUS ADULTERINUS. See BRASILIUM LIGNUM.

SANTERNA. See BORAX.

SANTOLINA. See SANTONICUM.

—— CHAMÆCYPARISSUS. See ABROTANUM.

SANTONICUM, alſo called *cinæ ſem. contra vermes femina*, *lumbricorum ſem. ſanctum ſemen*, *zedoariæ ſem. ſementina*, *ſantolina*, *xantolina*. WORM-SEED. The plant from which theſe ſeeds are obtained is the *artemiſia ſantonica* foliis caulinis linearibus pinnato-multifidis, ramis indiviſis, ſpicis ſecundis reflexis, floribus quinqueflo-

floris. CLASS. SYNGENESIA. ORDO POLYGAMIA SUPERFLUA. LINN. Gen. Plant. 945. In the Flora Auſtriaca, it is called *artemiſia Auſtriaca*. In Curtis's Cat. of the Lond. Bot. Garden, it is called *artemiſia Judaica*, and alſo *abſinthium ſantonicum Indicum*; *grenette*; *hagioſpermon*. It is a ſmall, light, oval kind of *ſeed*, of a yelloviſh green colour, with a caſt of brown, eaſily friable. They are generally mixed with ſmall bits of ſticks and leaves. They are brought from the Levant, and are ſuppoſed to be the produce of a ſpecies of artemiſia. Miller ſays it is a ſpecies of wormwood. They give out their virtue to water and to ſpirit; the ſpirituous infuſion is the moſt agreeable. In evaporating the watery infuſion, all the ill-flavour is carried off, and only a ſimple bitter remains. Theſe *ſeeds* are ſeldom met with genuine; they are mixed with the *ſeeds* of ſouthernwood. The marks of goodneſs are, their full body, their greeniſh colour, ſtrong ſmell, their bitter and aromatic taſte. Theſe ſeeds have a ſtrong diſagreeable ſmell, and a bitter ſubacrid taſte. They are eſteemed to be *ſtomachic*, *emmenagogue*, and *anthelmintic*; but it is for this laſt purpoſe they are chiefly uſed, and for their efficacy in this way they have been called *wormſeed*. *For adults*, the doſe is from one to two drams of the powder, twice a day. As a bitter, the watery extract is by ſome eſteemed the beſt preparation; but as an anthelmintic, the ſpirituous extract ſhould be preferred. *For children*, a ſyrup is made of the infuſion, and adminiſtered in this form. See Lewis's Mat. Med. Neumann's Chem. Works.

SAPA, alſo called *apechiliſma*, *ſuccago*, *robub*, *rob*, and *Oenus Siræos*. It is the juice of ſome vegetable boiled up with ſugar, or honey, into the conſiſtence of honey, and then called rob. See EXTRACTIO.

SAPHENA VENA MAJOR, ſo called becauſe it is almoſt σαφης, i. e. *viſible*. About an inch below the paſſage of the cruralis from out of the abdomen, it ſends off a large branch, called *ſaphena*; in all its courſe down to the foot, it is only covered with the integuments. It follows the direction of the ſartorius muſcle, until it arrives at the inner condyle of the thigh bone: it then runs on the inſide of the tibia, ſending off branches as it paſſes along; at the lower part of the tibia, it ſends off a branch, which runs over the joint of the tarſus to the outer ankle. The extremity of the ſaphena paſſes on the fore ſide of the inner ankle and runs betwixt the firſt two metatarſal bones, towards the great toe. See CRURALIS VENA.

SAPHENA MINOR VENA. It is a branch from the *ſaphena* major, and ſeparates from it ſoon after its paſſing from the inguen; it runs down below the ham, and communicates with the *ſaphena major*. Another branch, which proceeds from the cruralis a little above the ham, is thus named: it runs to the outer ankle. Some call it *ſaphena* externa.

SAPHERA. See COBALTUM.

SAPIENTIÆ DENTES, called *cranteres*, *genuini dentes*. The laſt of the *molares* are thus called; they do not appear until after puberty, ſometimes not before the twenty ſixth year, and ſometimes not at all. See DENS.

—— OLEUM. See LATER.

SAPO. SOAP, called alſo *aſabon*. It is a compoſition of oils and fats, with alkaline ſalts, ſo incorporated as to diſſolve together in water, into a milky ſemi-tranſparent liquid. *Soap* may alſo be formed by a combination of oil and acids.

SAPO ALBUS, alſo called *ſapo Hiſpanicus*. HARD, or SPANISH SOAP, It is made in Spain, with olive oil and the Spaniſh barilla, by a like proceſs as is directed for the *ſoap* of almonds. *Soap* is an uſeful mixture with reſinous pills, for it renders them more eaſily ſoluble, and more perfectly miſcible with our fluids; it diſſolves mucous matter in the body, and ſo is uſeful to reſolve obſtructions. It acts in the primæ viæ, as well as in the remote and minute veſſels, and by diſlodging viſcid phlegm from the bowels. Cullen thinks this *ſoap* is not a laxative, and that if ever it is ſo, it is owing to the common ſalt that is in it: and if, upon any occaſion, it comes to be employed in nephralgic caſes, and, by becoming laxative, ſhould thereby limit the uſe; it may be diſſolved in ſpiritus vini rectif. the ſalt will be left undiſſolved, and the diſſolved *ſoap* may, by evaporation, be recovered in a dry form, and ſtill remain as fit for the cure of this diſeaſe as ever; and more uſeful, perhaps, as it may be taken in much larger quantity. Mat. Med. It alſo carries off and deſtroys worms, for which end it may be given either by the mouth or clyſter-wiſe. The aſcarides are ſometimes eradicated by clyſters in which is diſ-

ſolved

ſolved a dram or two of *ſoap*. By the diſſolving quality of *ſoap* it alſo proves diuretic, and is uſeful in gravelly complaints, by lubricating, as well as by its gentle ſtimulus. By Bergius, ſoap is eſteemed detergent, reſolvent, and aperient, and recommended in jaundice, gout, calculous complaints, and in obſtructions of the viſcera. In icterical caſes, it was ſuppoſed to have the power of diſſolving biliary concretions; but from diſſection, the contrary has been proved. But in urinary calculous affections, particularly when diſſolved in lime water, it has proved very uſeful; for it becomes a powerful ſolvent of mucus, which by ſome is ſuppoſed to be the chief agent in the formation of calculi. However it can only be in the incipient ſtate of thoſe diſorders, that theſe medicines can be of any effectual benefit, though they generally abate the more violent ſymptoms where they cannot remove the cauſe. Soap is commonly uſed for forming reſinous ſubſtances into pills, in order to render them more ſoluble in, and miſcible with the juices of the ſtomach; but gum-mucilage is allowed to anſwer the purpoſe better: with ſoap, acids ſhould never be uſed, as they decompound it by mixing with the alcaleſcent part.

The common ſoft *ſoaps* are ſo acrid, that they are only fit for external uſes. The whiteſt of them are made with tallow, fat, or coarſe oils; the blacker or greener ſorts are made of whale oil.

All theſe *ſoaps* diſſolve in water, but more plentifully in proof ſpirit; but thoſe ſpirits have a degree of acidity in them which occaſions a milky hue in the ſolutions of *ſoap*. This may be corrected, as obſerved by Geoffroy, who ſays, that twenty-eight parts of good proof ſpirit, with the addition of one part of ſalt of kali, will diſſolve ten parts of good *hard ſoap* into a perfect limpid liquor.

The College of Phyſicians of London order a CERATUM SAPONIS, *Cerate of ſoap*, made in the following manner. Take of *ſoap*, eight ounces; yellow wax, ten ounces; litharge powdered, one pound; olive oil, one pint; vinegar, one gallon. Boil the vinegar with the litharge, with a ſlow fire, conſtantly ſtirring, until the mixture unites and thickens, then mix in the reſt, and make a cerate. Ph. Lond. 1788. In fractures, this is found to be a very convenient application, and alſo as an external dreſſing for ulcers, from its convenient adheſiveneſs, and being poſſeſſed of the uſual properties of a ſaturnine remedy. LINIMENTUM SAPONIS, SOAP LINIMENT; formerly ſtyled *ſaponaceum*, or *ſpodeldoc*. See LINIMENTUM SAPONACEUM.

SOLUTIO SAPONIS. ℞ ſaponis vulgaris mollis ʒ iv. ſp. vini tenuioris ℔ j. digere ſaponem cum ſpiritu donec ſolvatur. An ounce of camphor added to this, forms the *ſolutio ſaponis camphorata*, ſimilar to the linimentum ſaponis compoſitum of the college of phyſicians, and is a medicine much cheaper and more efficacious.

—— AMYGDALINUS. See AMYGDALÆ.

—— VOLATILIS. VOLATILE SOAP. Of this there are three kinds; one is compoſed of fixed alkalies and *volatile* oils; another of *volatile* alkalies and groſs oils; the the third of ſalt and oil that are both *volatile*: but none of theſe compoſitions, in which either the alkali or the oil is *volatile*, are ſo ſaponaceous as thoſe in which they are both of the fixed kind. See Dict. of Chem. Neumann's Chem. Works. Lewis's Mat. Med.

SAPONARIA, alſo called *ſtruthium*, *lanaria*, *lychnis ſylveſtris*, *ibixuma*. BRUISE-WORT, SOAP-WORT. It is the SAPONARIA OFFICINALIS, *calycibus cylindricis*, *foliis ovato-lanceolatis*. CLASS. DECANDRIA. ORDO DIGYNIA. LINN. Gen. Plant. 564.

It is a ſmooth herb, with plantane-like leaves, and cluſters of red, purple, and whitiſh flowers; the root is long, ſlender, ſpreading to a great diſtance, of a browniſh colour on the outſide, and white within, with a yellowiſh fibre in the middle. It grows in moiſt grounds, and flowers in July.

This plant is called *ſaponaria*, becauſe its juice takes out greaſe from cloaths. The roots and leaves are glutinous and ſweet to the taſte, but in the roots there is alſo a ſlight pungency, and in the leaves a bitteriſhneſs. The ſoapy matter diſſolves either in water or in ſpirit of wine. The Germans uſe the root, and ſay it is preferable to the ſarſaparilla. M. Andry, M. D. of Paris, gives the inſpiſſated juice of the *ſaponaria officinalis*, with great ſucceſs, in caſes of gonorrhœa. The patient takes about half an ounce of this medicine daily; and in general a cure is effected in about a fortnight, without the aſſiſtance of any other remedy. And —— Segey, M. D. of Paris, hath ſucceeded with this plant in the moſt obſtinate caſes of lues venerea. He directs it in the following manner: ℞ rad. *ſaponariæ ſiſſ.* ſicc. ʒ i. ſs. fol. ejuſdem ſicc. ʒ ſs. coque in aq. pur. ℔ vj. ad iv. From two to four pints of this decoction are to be daily taken; and in bad caſes, the patient is to take at the ſame time the plant in powder, or in the form of an extract, or it may be given thus made. ℞ herbæ ſaponariæ recens contuſæ ℔ ſs. aquæ diſtillatæ cong j. decoquantur ad. lb. iv. et colentur. Doſis lb. iij. vel lb. iv. Exhibeantur intra horas viginti quatuor. This is ſaid to be productive of conſiderable good effects in venereal, ſcrophulous, and impetiginous affections. This plant is alſo ſaid to be uſeful when applied externally to venereal ulcers, either in fomentation, or in a dry form, by ſprinkling it in powder over the ſores. See Lewis's Mat. Med. Neumann's Chem. Works.

SAPONARIÆ NUCULÆ, alſo called *baccæ Bermudenſes*, vel *Bermudæ*. SOAP BERRIES. BERMUDAS BERRIES. This is a ſpherical fruit about the ſize of a cherry. Its cortical part is yellow, gloſſy, and ſo tranſparent as to ſhew the ſpherical black part which rattles within, and which includes a white kernel. It is the produce of a ſmall tree in Jamaica, and other parts of the Weſt Indies. The kernel, when ſteeped in water, raiſes a froth like ſoap ſuds.

Theſe *berries* are powerful in removing obſtructions in the liver and ſpleen; they mend an ill habit of body, and are a ſpecific in the chloroſis; they help digeſtion. The beſt preparations are, a tincture made with white wine, a tincture in ſpirit, and the extract from the ſpirituous tincture. See Lewis's Mat. Med. Med. Muſ. vol. iii. p. 538.

SAPPAN LIGNUM. See CAMPECHENSE LIGNUM.

SAPPHIRINA AQUA. See CUPRI AMMONIATI AQUA.

SAPRAN. See MORTIFICATIO.

SARA. See ESSERA.

SARASSAS. See CORALLODENDRON.

SARCOCELE, from σαρξ, *fleſh*, and κηλη, *a tumor*. It is a firm, fleſhy kind of enlargement of the teſticle, or the ſcirrhous teſticle. The *ſarcocele*, or *hernia carnoſa*, Mr. Pott ſays, taken in a general ſenſe, means any induration or diſeaſed *fleſh*, though here confined to the teſticle; and further obſerves that the *ſarcocele*, which is diſtinguiſhed by the ancient writers into the *ſarcocele*, the *hydroſarcocele*, the *ſcirrhus*, the cancer, the *caro adnata ad teſtem*, and the *caro adnata ad vaſa*, are really little more than deſcriptions of different ſtates and circumſtances of the ſame diſeaſe. The *caro adnata ad teſtem* is a ſcirrhus begun in the epididymis. The *caro adnata ad vaſa* is a ſcirrhus of the epididymis ſomewhat increaſed, when it ſeems as if it ſprung from the ſpermatic veſſels. The *hydro-ſarcocele* is when the teſticle is enlarged or hardened; or rather when it is both ſcirrhous and dropſical. See POTT's Works, 4to. The *ſarcocele* is a diſeaſe of the body of the teſticle; and, as the term implies, conſiſts, in general, in ſuch an alteration, made in the ſtructure of it, as produces a reſemblance to a hard fleſhy ſubſtance, inſtead of that fine ſoft, vaſcular texture, of which it is, in a natural and healthy ſtate, compoſed. Many paſs ſeveral years with this diſeaſe, under its moſt favourable appearances, and without encountering any of its worſt; but, on the other hand, there are many, who, in a very ſhort time, run through all its ſtages. Sometimes the firſt appearance is a mere ſimple enlargement and induration of the body of the teſticle, void of pain, without inequality of ſurface, and producing no uneaſineſs, nor inconvenience, except what is occaſioned by its mere weight. And in ſome few inſtances it remains thus for a conſiderable time, without viſible or material alteration; but, in other inſtances, very ſoon after its appearance in this mild manner, it ſuddenly becomes unequal and knotty; and is attended with very acute pains, darting up to the loins and back; but ſtill remains entire; that is, it does not burſt through the integuments. In ſhort, ſuch is the variety of the appearances of this diſeaſe, that deſcription can hardly afford an adequate idea of it. Sometimes the diſorder ſeems to be merely local, that is, confined to the teſticle; at other times there is a pallid or leaden countenance, indigeſtion, naufea, colic pains, ſudden purgings, &c. ſufficiently indicating a vitiated habit and diſeaſed viſcera. The progreſs alſo which it makes from the teſtis upward, is very uncertain; the diſeaſe affecting the ſpermatic proceſs, in

ſome

ſome ſubjects, for a great length of time; while, in others, it totally ſpoils the teſticle very ſoon, and almoſt as ſoon ſeizes the ſpermatic cord.

Amongſt the miſtaken cauſes of a ſcirrhous teſticle, Mr. POTT reckons the *hernia humoralis*. He does not ſay that a *ſarcocele* never follows an hernia humoralis, but that it does not at any time neceſſarily cauſe or produce it.—Mr. BELL, in his Syſtem of Surgery, ſays, that a hardened ſtate of the teſtis and epididymis, produced originally by a venereal taint, does in ſome inſtances degenerate into the worſt ſpecies of *ſarcocele*. However, in general, the hernia humoralis is one of the diſeaſes which ſhould be diſtinguiſhed from the *ſarcocele*. A quantity of water is ſometimes collected in the vaginal coat of a ſcirrhous teſtis, and ſome have ſuppoſed that this water renders the teſtis ſcirrhous; but this not being true, the hydrocele and the ſcirrhous teſticle ſhould alſo be diſtinguiſhed.

The only remedy from which any advantage is expected, is the removal of the diſeaſed parts by extirpation. But before the operation is attempted, a conſideration of the manner of the *ſarcocele*'s having been formed, and the ſtate of the ſpermatic cord from the ring to the teſticle, are objects of neceſſary conſideration. When it proceeds from a blow on the part, ſucceſs is more likely to follow than when it is cauſed by a cancerous or ſtrumous acrimony; when either of theſe laſt is the cauſe, they will generally be found to exiſt on other parts alſo; therefore though the diſeaſed teſticle be removed, yet from the ſame cauſe exiſting in the habit, other parts ſoon after become diſeaſed in the ſame manner. *In ſtrumous habits* the glands of the meſentery, the lymphatics, &c. are generally obſtructed; therefore external applications ſignify very little; but ſuch medicines muſt be uſed as firſt acting on the primæ viæ, and then on the lymphatics; for in children they are ſeldom ſeen with this diſorder without an enlarged belly, which, before any further attempts are made, muſt be leſſened.

Mr. Pott obſerves, that ſome writers direct with reſpect to the ſpermatic cord as follows: firſt, if it is ſoft, and of its natural ſize, caſtration may be ſafely performed; which is right. Secondly, if it is much enlarged, the operation is not vindicable. But this is going too far; for though it may be conſiderably enlarged, yet if it has no unequal feel, is not painful, or manifeſts no tendency to ſcirrhus, its being enlarged is of no conſequence; for obſtruction in a diſeaſed gland will frequently occaſion an enlarged varicous ſtate of its veſſels. Lymphatics alſo, from the ſame cauſe, may be dilated or ruptured, which muſt conſequently occaſion an extravaſation in the cells of the ſpermatic proceſs, both which frequently happen in the *ſarcocele*, and muſt certainly give the ſpermatic cord an enlarged feel; but it is not either of them that can be the leaſt objection to the operation; the ſpermatic cord not being diſeaſed, only enlarged, which is a circumſtance worth regarding; for when it is only enlarged, the operation may be of uſe; but, when in an enlarged ſcirrhous, painful ſtate, too high to be able to make a ligature fairly above the part diſeaſed, the operation can be of no uſe, but is moſt likely to prove fatal. Many adviſe to defer the operation until ſuch ſymptoms come on, as darting pains in the teſticles, pains in the loins, &c. which, in truth, inſtead of being a proper time, is too late; the ſpermatic proceſs becomes affected, when a teſticle is become truly ſcirrhous, ſo as never poſſibly after to be of any uſe to the patient. By carrying ſcirrhi too long, though at firſt the diſorder be local, a ſcirrhous habit will be brought on; for before the ſpermatic proceſs becomes affected with ſcirrhous teſticles, the patient's habit is often found affected, and he is attended with colicky pains and other conſequent ſymptoms.

After a venereal gonorrhœa, Dr. SWEDIAR obſerves, that from improper treatment it ſometimes happens that one or both teſticles grow hard, i. e. become ſcirrhous. In ſome of theſe inſtances the diſorder is accompanied with a ſenſation of a painful preſſure; but frequently without any pain at all. He adds, that, in theſe caſes, mercury given internally, or rubbed in externally into the perinæum and ſcrotum, twice a day, with the conſtant application of a warm poultice made of the root of the *atropa mandragora*, &c. are often uſeful. Alſo that the *cicuta*, applied internally and externally, may be tried, with proſpect of advantage. An emetic has been ſometimes found effectual. The decoction of the bark of the *root of Daphne Mezereum*, internally, and a poultice of it externally, has lately been very much recommended; but whatever means are uſed, it too generally happens that theſe ſwellings remain unaffected, except we can bring on the running again from the urethra; one method of effecting which, is to inoculate the venereal virus by means of a bougie introduced a little way into the urethra. However the ſingularity of this laſt propoſition may ſtrike, Dr. Swediar aſſures us, that ſucceſs hath followed ſuch practice: and we have only to conſider, that an undoubted authority bids us to chuſe the leaſt evil of two that attend.—Mr. BELL ſays that, when a hardneſs of the teſticles does not yield to the means commonly employed, ſuch as moderate evacuations of blood, when theſe are indicated; a ſoft eaſy diet, a lax belly; the uſe of a ſuſpenſory bandage; and eſpecially when mercury, which, on the chance of the diſorder being venereal, is very commonly tried, are all uſed without any effect; we may in ſuch circumſtances always have great cauſe to ſuſpect that the diſeaſe is of a real bad nature; and when to this is joined an acceſſion of more inveterate ſymptoms, and if the diſorder, from the ſtate of an indolent hard tumor, becomes painful, &c. no farther delay ought then to be adviſed: caſtration muſt be proceeded to. See Sharp's Operations. Pott's Chirurgical Works. Bell's Surgery, vol. i. p. 498. Lond. Med. Journal, vol. v. p. 32. Edinb. Med. Comment. vol. ix. p. 336. White's Surgery, p. 335.

SARCOCOLLA. SARCOCOL, or FLESH GLUE. It was thus called, becauſe of its ſuppoſed power of conglutinating wounds. It is a gummy reſinous juice, from the PENÆA MUCRONATA Linn. According to Curtis, in his Catalogue of the London Botanic Garden: and from the *penæa ſarcocolla*, according to Weſton in his Univ. Bot. and is brought from Perſia and Arabia, in ſmall ſpongy grains of a whitiſh yellow colour, and a few of a reddiſh, and ſometimes of a deep red colour; theſe grains, when entire, are about the ſize of a pea. The whiteſt and moſt bitter is preferred as being the beſt. Its bitteriſh ſubacrid taſte is followed by a ſweetiſhneſs; it ſoftens in the mouth, bubbles and catches flame from a candle: it diſſolves freely in water, and a great part of it in ſpirit of wine. Its medical qualities are not much known. See Lewis's Mat. Med. Neumann's Chem. Works.

SARCOEPIPLOCELE. A kind of compound rupture, conſiſting of a deſcent of the epiploon and a ſarcocele. Or a rupture of the indurated epiploon, either umbilical or ſcrotal.

SARCOLOGIA. SARCOLOGY. It includes myology, ſplanchnology, angiology, neurology, and the doctrine of the integuments.

SARCOMA, from σαρξ, *fleſh*. Thus a fleſhy tumor on any part of the body is named; alſo called *porrus*; *ſarcophya*; *nævus*. It is occaſioned by an effuſion of the nutritious juices out of their tubuli. Theſe tumors have no cyſtis; they do not yield to the impreſſion of a finger, nor are they moveable. Dr. CULLEN places this genus of diſeaſe in the CLASS. LOCALES, and ORD. TUMORES, which he defines a ſoft extuberation which is not painful. Extirpation is the only remedy; and if the baſis is narrow, a ligature may be uſed, but if it is broad, the knife will be neceſſary. See Turner's Surgery, vol. i. p. 201. It is alſo a name for *polypus narium*.

SARCOMPHALON, from σαρξ, *fleſh*, and ομφαλος, *the navel*. A fleſhy excreſcence at the navel.

SARCOPHAGUM. See ASSIUS LAPIS.

SARCOPHYIA. See SARCOMA.

SARCOTICA. SARCOTICS, from σαρκοω, *to heal*. Medicines which generate fleſh in wounds.

SARDIASIS, SARDONICUS RISUS, } called alſo *ſpaſmus cynicus*, *gelaſmus*. SARDONIAN LAUGHTER. VOGEL defines it an involuntary laughter, in which the mind is not elated with joy, but affected with pain, and for the moſt part with anger. It is a convulſive involuntary *laughter*, and is thus named from the *herba ſardonia*, which is a ſpecies of ranunculus, and is ſaid to produce ſuch convulſive motions in the cheeks as reſemble thoſe motions which are obſerved in the face during a fit of *laughter*. This complaint is ſometimes ſpeedily fatal. If the ranunculus happens to be the cauſe, the cure muſt be attempted by means of a vomit, and frequent draughts of hydromel with milk. See Aetius Tetrab. iv. ſerm. i. cap. 66.

SARPEDO. See LICHEN.

SARSA, SARSAPARILLA, } alſo called *carivillandi*, *iva pecanga*, *macapatli*, *zarza*, *zarzaparilla*, *ſmilax aſpera Peruviana*, *ſalſaparilla*, *zarcaparilla*.

rilla. It is called *ſarſaparilla* from the Spaniſh words *zarſa*, a *bramble*, and *parilla*, a *little vine*. This plant is a ſmall kind of vine, which reſembles a bramble. Some call it a ſpecies of bind-weed. It is brought from the Spaniſh Weſt Indies; the ſlenderer pale ſort comes from New Spain, the dark and thick from Honduras, the darkeſt and thickeſt from Quito. The ſort moſt eſteemed is the ſmilax aſpera Peruviana, C. B. the SMILAX SARSAPARILLA, *caule aculeato angulato, foliis inermibus ovatis retuſo-mucronatis trinerviis*. CLASS. DIOECIA, ORDO HEXANDRIA. LINN. Gen. Plant. 1120. VIRGINIAN IVY-LEAVED ROUGH BIND-WEED. It is light, white within, but is not eaſily powdered. The root conſiſts of a number of ſtrings, which are as thick as a gooſe-quill, flexible, free from knots, and compoſed of fibres which run their whole length, ſo that they may be ſlipped from one end to the other. On their outſide is a thin, brown, or yelloviſh aſh-coloured ſkin; under this is a thicker, white, friable ſubſtance, and in the middle is a woody pith.

Theſe roots have a farinaceous bitteriſh taſte, and no ſmell. In 1563, the Spaniards brought a parcel of them into Europe, as a ſpecific in the lues venerea, and indeed a decoction of them in water is an excellent auxiliary to mercury; rendering this medicine more efficacious than when mercury is given alone. When children are infected with the pox from their parents or nurſes, the powder of this root may be put into their food. It is reſolvent, attenuant, reſtores the appetite and digeſtion, even when the patient is hectic from a venereal cauſe. It promotes perſpiration, attenuates viſcid humours; it relieves venereal head-achs and nocturnal pains; it is peculiarly uſeful when the bones are carious, or any way diſordered from the venereal diſeaſe. It has been known to cure ulcers, nodes, and other ſymptoms of the lues, which reſiſted the effects of repeated ſalivations. Indeed after the uſe of mercury ſome aſſert, patients have been much ſooner reſtored to the health by this root, than could have been accompliſhed, according to their opinion, by any other medicine with which they were acquainted, eſpecially when employed in powder. But whether given in decoction, or powder, it ſhould be continued in large doſes, and for a conſiderable time.

The beſt preparation is a decoction, as follows: ℞ Rad. ſarſaparillæ inciſæ ℥ vj. aq. diſtillatæ lb. viij. In a heat of about 195 degrees, let it be macerated for two hours; afterwards take out the ſarſaparilla and bruiſe it; then let it be returned into the liquor, and again macerate it for two hours more. Boil the liquor till it is reduced to four pints, then pour off the liquor, preſs the ſarſaparilla, and ſtrain the decoction. This will be more palatable if a little liquorice root is added at the end of the boiling.

The London College alſo order a *compound decoction of this root*. ℞ Radicis ſarſaparillæ inciſæ & contuſæ p. ℥ vj. corticis radicis ſaſſafras p. ligni guaiaci raſi—glycyrrhizæ contuſæ p. ſingulorum ℥ j. corticis radicis mezerei ʒ ij. aquæ diſtillatæ lb. x. Theſe muſt be macerated in a gentle heat for ſix hours, then reduced by boiling to five pints, adding the mezereum during the latter part of the proceſs, and then ſtrain the decoction. Theſe decoctions are given in venereal, ſcrophulous, and hepatic affections. The doſe of the firſt is half a pint four times in twenty-four hours, ſo that one quart may be taken in that time—of the ſecond, half the quantity in the ſame ſpace of time. They muſt be made freſh every ſecond day. It is the long ſtringy part only that is uſeful. See Lewis's Mat. Med. Neumann's Chem. Works. Lond Med. Obſ. and Inq. vol. i. p. 149, &c. The ſarſaparilla forms a principal ingredient in what has been ſuppoſed to be the LISBON DIET DRINK, which is thus made. ℞ Sarſaparillæ conciſæ, radicis chinæ ſing ℥ j. nucum juglandis cortice ſiccatarum, N° xx. antimon. ℥ ij. lapidis pumicis pulverizati ℥ j. aquæ diſtillatæ lb. x. The powdered antimony and pumice ſtone are to be tied looſely up in ſeparate rags, and boiled along with the other ingredients, and this boiling continued till the liquor is reduced to five pints. This appears to be an inferior medicine to the former; for the addition of the antimony, and pumice ſtone can add nothing to the efficacy of the other ingredients. However, notwithſtanding the great virtues above enumerated, and the opinion many authors have had of this root, Dr. Cullen tells us, was he to conſult his own experience alone, he would not give it a place in his Materia Medica; for, tried in every ſhape, he has never found it an effectual medicine in the lues venerea, nor any other diſeaſe. Mater. Medic.

SARSAPARILLA. See ARALIA MECAPATLI.

SARTORIUS. Some call this muſcle *faſcialis*. It is called *ſartorius*, or the TAYLOR'S MUSCLE, becauſe taylors croſs their legs with it. It riſes from the anterior ſuperior part of the os ileum, runs inwards contiguous to the blood-veſſels, and is inſerted into the inner condyle of the thigh-bone. It partly rotates the thigh.

SASSAFRAS, called alſo *ankuiba*. It is the root of a large tree of the bay kind, the *laurus ſaſſafras, fol. integris trilobiſque floribus flavis, baccis cæruleis*. CLASS. ENNEANDRIA, ORDO MONOGYNIA. LINN. Gen. Plant. 503. The SASSAFRAS-TREE. It is light, and covered with a rough and fungous bark, outwardly of an aſh-colour and inwardly of the colour of ruſty iron. It is brought from Virginia and other parts of America. The wood is called *fœniculi* vel *fœniculatum lignum*. It hath a fragrant ſmell, a ſweetiſh ſub-aſtringent aromatic taſte; the bark is ſtronger than the internal woody part, and the ſmall twigs than the larger pieces. Spirit of wine takes up all its virtues, and water extracts a large portion of them. Diſtilled with water it affords an eſſential oil, which is limpid at the firſt, but afterwards grows yellow, or of a reddiſh brown; the remaining decoction, when evaporated, affords a bitteriſh ſubaſtringent extract; but an extract made from a ſpirituous tincture poſſeſſes all the virtues of the root. It is often drank in form of tea, and conſidered ſerviceable in cuticular eruptions. It is an ingredient in the compound decoction of ſarſaparilla, and its eſſential oil is given in doſes of from two drops to ten.

Saſſafras is uſed chiefly in infuſion as a mild diaphoretic and corroborant, in ſcorbutic, catarrhal, and cachectic diſorders; but for theſe purpoſes the ſpirituous extract is the beſt preparation. See Tournefort's Mat. Med. Lewis's Mat. Med. Neumann's Chem. Work. Dr. Cullen has found the watery infuſion of it taken warm, and pretty largely, very effectual in promoting ſweat, but has not been able to determine to what particular purpoſe this ſweating was applicable—MATERIA MEDICA.

SATANUS DEVORANS. See ANTIMONIUM.

SATUREIA SATIVA, alſo called *cunila ſativa, thymus, thymbra*, and SUMMER'S SAVORY. It is the SATUREIA HORTENSIS, Linn. It is a low ſhrubby plant, ſomewhat hairy, with ſmall, oblong, narrow leaves, ſet in pairs. Its flowers are in cluſters in the boſoms of the leaves, and are of a purpliſh colour. It grows wild in the ſouth of Europe, and is ſown annually in our gardens. The leaves are *warm, aromatic*, and to the ſmell are like thyme, but much milder. Rectified ſpirit takes up all their active matter. Water takes up the ſmell but not the taſte. By diſtillation with water, a ſmall quantity of eſſential oil is obtained. They are *heating*, ſomewhat *diuretic*, and *promote the menſes*.

—— MONTANA, alſo called *thymbra*, WINTER SAVORY. Its virtues are much the ſame as thoſe of the above ſpecies. See Raii Hiſt.

SATURNI EXTRACTUM. See PLUMBUM. N° 6.

SATURNI AQUA. See PLUMBUM. N° 7.

SATURNINUM UNGUENTUM. See NUTRITUM UNGUENTUM.

SATURNUS. LEAD. See PLUMBUM, ADORP, ANTIMONIUM.

SATYRIASIS, called by the Arabians *acrai*, alſo *brachuna, ſatyriſmus, araſcon*, and *arſatum*. It is a violent deſire of venery, even ſo that reaſon is depraved by it. Dr. Cullen places it as a genus of diſeaſe in the CL. LOCALES, and ORD. DYSOREXIÆ, which he defines, an unconquerable deſire of venery in males. He diſtinguiſhes two ſpecies. 1. *Satyriaſis* juvenilis, when, beſide the exceſs of deſire, the body is otherwiſe but little diſturbed. 2. *Satyriaſis furens*, when, with the exceſs of venereal appetite, the body is much diſturbed, as with fever, &c. The pulſe is quick, the breathing ſhort, the patient is ſleepleſs, thirſty, and loathes his food; the urine is evacuated with difficulty, and a fever ſoon comes on. The nature and cure are much the ſame as are thoſe of the FUROR UTERINUS, which ſee, and alſo Cœlius Aurelianus, lib. iii. c. 18, acut.

SATYRICA. See ENTACTICA MEDICAMENTA.

SATYRION. A name for ſeveral ſpecies of ORCHIS, which ſee.

SATYRISMUS. See SATYRIASIS.

SAUR KRAUT. See BRASSICA.

SAURURUS. A plant called the LIZARD'S TAIL. Boerhaave mentions four ſpecies. Their virtues are ſimilar to thoſe of arum.

SAVINA. See SABINA.

SAXIFRAGA, from *ſaxum*, *a ſtone*, and *frango*, *to break*. An epithet for medicines which diſſolve or break the ſtone in the bladder. It is called by ORIBASIUS *beſto*. See PARONYCHIA; FILIPENDULA; MEUM LATIFOL. PIMPINELLA, EUBIA SYNANCHICA.

SAXIFRAGA ALBA, alſo called *ſaniculo ſedum*. WHITE SAXIFRAGE. It is the SAXIFRAGA GRANULATA Linn. It is a plant with kidney-ſhaped, yelloviſh green leaves, round, purpliſh, branched ſtalks, on the tops of which are ſhort looſe ſpikes of white flowers. The root is compoſed of ſmall fibres, intermixed with little tubercles. It is perennial, grows wild in ſandy paſtures, and flowers in May. The tubercles of the roots have a ſweetiſh and lightly acrid taſte, and they are aperient and diuretic. See Lewis's Mat. Med.

—— ANGLICA. ENGLISH, or MEADOW SAXIFRAGE. Called alſo *fœniculum erraticum*, *angelica*; *hippomarathrum*. It is the PUCEDANUM SILAUS Linn. It is an umbelliferous plant with winged leaves; the flowers are of a yelloviſh white colour; the root is long, and about as thick as a finger, brown or blackiſh on the outſide, and white within. It is common in meadows and paſture ground, and flowers in June. The root, leaf, and ſeeds, are *diuretic*, *aperient*, and *carminative*, and are far preferable to thoſe of the white *ſaxifrage*. See Lewis's Mat. Med.

—— MONTANA MINOR. See BUNIUM.

SAXUM CALCARIUM. See CALX.

SCABIES. A diſorder of the bladder mentioned by Aetius. If after a painful diſcharge of the urine, branny ſcales appear in it, with plenty of ſlender filaments, which ſubſide, the ancients call it a *ſcabies*, becauſe it indicates a corroſion of the mucous and villous membranes thereof. In order to the cure, Aetius orders an abſtinence from heating things, and recommends milk, broth, &c. In Linnæus's Noſology, it is an order in the claſs of vitia, and ſignifies cutaneous diſeaſes; *alſo* the itch, ſee PRURITUS; and it is the name of a plant, ſee LICHEN.

SCABIOSA. COMMON FIELD SCABIUS. SCABIOSA ARVENSIS Linn. It is a rough hairy plant; it grows wild in paſture-ground; it is of a nauſeous bitter taſte; and flowers in June. It is *aperient*, *ſudorific*, and *expectorant*. Externally it hath been uſed as a cure for the itch, whence its name *ſcabioſa*. Boerhaave enumerates forty-eight ſpecies, but they are not noted for medicinal qualities.

It is alſo a name for ſeveral other plants. As *Echinopus*; SUCCISA.

SCABIOSA INDICA ARBOREA. See CATTU-SCHIRAGAM.

SCADIDACALLI, } See EUPHORBIUM.
SCHADIDACALLI. }

SCALA SACRA. See CLIMAX.

SCALENUS MUSCULUS, (σκαληνος, a figure with three unequal ſides.) Some call it *triangularis*. It takes its origin from the tranſverſe proceſſes of the vertebræ colli; it grows larger as it deſcends, and is then collected into two maſſes, the anterior and poſterior; the anterior is inſerted into the inner edge of the firſt rib; on each ſide of this portion, the ſubclavian vein and artery, and the bronchial nerve paſs out; the poſterior part is attached to the poſterior part of the firſt rib, and partly runs to the ſecond; its office is to raiſe thoſe two ribs, and to move the vertebræ colli to one ſide.

SCALPO. To SCALP. To lay the ſkull bare is called *ſcalping*. The operation is performed by making an inciſion through the integuments and pericranium equally and at once: in doing this, uſe the edge of the knife rather than the point, eſpecially if a fracture is ſuſpected. After making the inciſion raiſe the pericranium a little from the bone with the edge of the knife, and to clear the bone uſe the ſcalprum.

In purſuing a fiſſure, a rectilinear inciſion is the beſt; and in moſt other caſes, an oval one is to be preferred. Arnaud and Gooch both give inſtances of their having made a crucial inciſion upon the temporal muſcle with good ſucceſs, the muſcle ſtill continuing its action. See Gooch's Treatiſe of Wounds, p. 253.

SCALPRUM, from *ſcalpro*, *to raſp*, or *raiſe*. A DENTICULAR, or RASPATORY; it is alſo called a RUGINE. It is any kind of iron inſtrument with which you may raſp or ſcrape a rotten bone, &c. Sometimes the word *ſcalprum* means a little chiſſel for amputating the fingers.

SCAMMONIA MONSPELICA. See PERIPLOCA.

SCAMMONIUM. SCAMMONY. The natives of Aleppo call it *mahmoody*. The beſt is brought from Aleppo, an inferior ſort from Smyrna. It is the CONVOLVULUS SCAMMONIA, *foliis ſagittatis poſtice truncatis, pedunculis teretibus ſubtrifloris, floribus pallidi lutei*, CL. PENTANDRIA; ORD. MONOGYNIA. LINN. Gen. Plant. 215. SYRIAN BIND-WEED, or *ſcammony*. The root is very long, and about three or four inches thick. In the month of June they cut the tops of the roots, as they are in the ground, and from this inciſion there flows a milky liquor, which is received in ſhells, &c. and which growing hard by its thinner parts being exhaled in the warm air, forms the gummy reſin called *ſcammony*.

The gummy reſin is brought to us in light ſpongy maſſes, gloſſy, of different ſhades, from a grey or yellow white, almoſt to a black; when broken it appears bright and ſhining; it eaſily crumbles between the fingers; if it is touched with a wetted finger it becomes milky; and if it is broken, and put into a glaſs of water, it diſſolves into a milky liquor of a greeniſh caſt. An inferior ſort is brought from Smyrna, which burns the mouth more than that from Aleppo. Though different parcels of *ſcammony* vary ſo much in their colour whilſt in the lump, when powdered they are all of them of a browniſh white colour.

Chuſe ſuch as eaſily crumbles between the fingers, is pellucid, grows inſtantly white on being wetted, and that leaves but little fæces when diſſolved.

It is adulterated with wheat-flour, ſand, aſhes, &c. to diſcover which, the beſt method is to diſſolve it in water and let it ſtand a while; thus the *ſcammony* will be ſuſpended in the water, and the impurities will ſink. The ſooner it diſſolves, and the leſs there is of ſediment, the purer it is.

It loſes its virtue by being careleſsly kept.

The Greek and Arabian phyſicians appear to have been well acquainted with *ſcammony*, as they not only employed it internally as a purgative, but externally for tumors, ſcabies, tinea, fixed pains, &c. Since Boerhaave's time it has been conſidered a ſafe though ſtimulating cathartic, and frequently given uncombined with any other ſubſtance, yet neither producing tormina, nor hypercatharſis.

It is a very briſk purge, and uſually given to carry off redundant ſerous humours in cold phlegmatic conſtitutions.

Inflammatory diſorders are increaſed, and very irritable habits are injured by it. It is given from gr. iii. to g. xij. for a doſe. It needs no corrector, though ſome expoſe it to the fumes of burning ſulphur, but thus they render it inert. When it has undergone this operation, or any other mode of preparation, it is called DIAGRYDIUM.—It conſiſts of about equal parts, reſin and gum; whence it diſſolves equally in water and in ſpirit.

The London College directs a compound powder, and an electary; ſee below. See Lewis's Mat. Med. Neumann's Chem. Works. Lond. Med. Obſ. and Inq. vol. i. p. 13, &c. They are thus made,

ELECTARIUM E SCAMMONIO. *Electary of* SCAMMONY; formerly called *elect. caryocoſtinum*.

Take of *ſcammony* in powder, one ounce and an half; cloves and ginger, of each ſix drams; eſſential oil of carraway, half a dram by weight; roſe-ſyrup, as much as is ſufficient. Mix the ſpecies, powdered together with the ſyrup; then add the *ſcammony*; and laſtly the oil of carraway.

PULVIS E SCAMMONIO COMPOSITUS. *Compound Powder of* SCAMMONY, called alſo *cerberus triceps*, *cornachini pulvis*.

Take of *ſcammony*, hard extract of jalap, each two ounces; ginger, half an ounce, powder them ſeparately, and mix them. Beſides this, there is the

PULVIS E SCAMMONIO CUM ALOE. *Powder of* SCAMMONY *with Aloes*.

Take of *ſcammony* ſix drams; hard extract of jalap; ſocotorine aloes of each an ounce and an half; ginger half an ounce; powder them ſeparately and mix them.

PULVIS E SCAMMONIO CUM CALOMELANE. *Powder of* SCAMMONY *with Calomel*.

Take of *ſcammony* half an ounce; calomel, double refined

refined ſugar, of each two drams; rub them ſeparately; powder, and mix them.—Ph. Lond. 1788.

Add to theſe, *ſcammony* is an ingredient in *pulvis e ſenna compoſitus*; *extractum colocynthidis compoſitum*; and in the *pilulæ ex colocynthide cum aloe* of the Edinburgh Pharmacopœia.

SCAMMONIUM ORIENTALE. See GAMBOGIA.

SCAMNUM HIPPOCRATES. See BATHRON.

SCANDIX, called alſo *Acus Paſtoris*, *Peften Veneris*. SHEPHERD'S NEEDLE, or VENUS' COMB. A genus in Linnæus's botany. He enumerates ten ſpecies. It grows in the fields in Europe.—It is oleraceous, and aromatic. Its properties are *antiphlogiſtic*, *diuretic*, and *lactiferous*—given in dropſies, and vertigo.

SCANDIX CEREFOLIUM. See CHÆREFOLIUM.

—— ODORATA. See MYRRHA, and MYRRHIS.

SCAPHA. In anatomy it is one of the cavities of the ear. See AURICULA; and alſo a name for the 6th ſpecies of bandage. See DELIGATIO.

SCAPHOIDES, Os, from σκαφη, a *ſkiff*, or *little veſſel*, and ειδος, *form*. The firſt bone of the firſt row in the wriſt is thus called by the Greeks; the Latins call it *naviculare* and *naviforme*. It is articulated to the thumb. In infants it is wholly cartilaginous; ſome call it *cymbæ os*, and *cymbiforme os*; alſo the third bone of the tarſus. See CARPUS.

SCAPULA. The SHOULDER-BLADE, called alſo *epinotion*; *homoplata*; *omoplata*. It is a triangular bone, ſituated on the outſide of the ribs, extending from the ſecond to the ſeventh; its ſides are unequal; the poſterior ſide or baſis is the longeſt, the inferior coſta is ſhorter, and the ſuperior coſta is the ſhorteſt. The body of this bone is concave towards the ribs, and convex behind, where it is called dorſum. Three proceſſes proceed from the *ſcapulæ*: 1. The COROCOIDES, which ſee. 2. The *ſpina ſcapulæ*, called *intra-ſcapulum*; it ariſes from the poſterior convex ſurface, and divides it unequally; it begins ſmall at the baſe, and becomes higher and broader as it advances. The extremities of it are broad and flat, and hang over the cavity of the os humeri. To this part of the ſpine, which is called *acromion* or *epomis*, the clavicle is articulated. 3. The third proceſs is produced from the neck of the bone; this is hollowed on its anterior part by a glenoid cavity, which hath an acute extremity above, and an acute one below. The cavity in the extremity of the neck of the ſcapula, in which the head of the humerus is placed, is called *omocotyle*.

SCAPULARIA. The SCAPULARY. See DELIGATIO.

SCAPULARIÆ ARTERIÆ. The SCAPULARY ARTERIES. The external *ſcapulary artery*, *muſcularis arteria*, paſſes through the notch in the ſuperior coſta of the ſcapula, to the muſculus ſupra ſpinatus & infra ſpinatus, teres major & minor, alſo to the articulation of the ſcapula with the humerus.

The internal *ſcapulary artery* ariſes from the axillary, near the axilla, and runs backward to be diſtributed to the ſubſcapularis, giving branches to the ſerratus major, the axillary glands, the teres major, &c.

The ſuperior *ſcapulary artery* is a branch from the ſubclavian; it runs downwards to the inſide of the clavicle, follows the tract of that bone, and goes to the adjacent muſcles.

SCAPUS. See CAUDEX.

SCARABÆOLUS HÆMISPHERICUS COCHINELIFER. See COCCINILLA.

SCARABÆUS. See CICINDELA.

SCARIFICATIO, from σκαριφος, *a little knife*. SCARIFICATION, called alſo *apoſchaſis*, *apoſchaſmus*, *encharaxis*. The word generally ſignifies thoſe inciſions that are made with the inſtrument called a *ſcarificator*, and which is uſed in the operation called cupping. See CUCURBITULA, and ANASARCA.

SCARIOLA. See ENDIVIA.

SCARLATINA ANGINOSA. A ſymptomatic kind of QUINSY, called by Huxham *febris anginoſa*. By different writers *angina mucoſa*, *cynanche exanthematica*, *angina eryſipelatoſa*, *amphimerina anginoſa*, *mucoſa*, *cynanche epidemica* ANGINOUS SCARLET FEVER, or MUCOUS QUINSEY.

It chiefly affects young people, and women; ſometimes it attacks the aged of both ſexes. In large families and ſchools, when it begins, it ſeldom paſſes any one there except the robuſt.

In this kind of *quinſy* the tumor is leſs than in the inflammatory *quinſy*; there is great redneſs in the part; when ulcers appear they are very ſlight and free from all the malignant ſymptoms of the putrid ſore throat; it is more of the inflammatory kind than of the putrid, and the inflammation is of the erythematous ſpecies. Dr. Grant obſerves, that uſually the pain in the throat is a very early ſymptom, attending before the rigor, though now and then inſtead of pain in the throat there is perhaps a foreneſs of the tongue, or a degree of ſalivation in the courſe of the diſeaſe; an efflorescence often appears on the arms, but ſometimes they ſwell without the efflorescence. For the moſt part the appearance of ulcerous ſloughs is no more than an inflammatory exudation on the parts about the fauces, and may eaſily be waſhed off. The tongue often appears as if glazed, and is tender, ſwelled, and affected with pain. Uſually it arrives at its height in about ſeven days, and in a fortnight the patient is perfectly recovered.

It ſhould be diſtinguiſhed from a catarrh, from the inflammatory *quinſy*, from the putrid *quinſy*, and from the thruſh.

If the pulſe is large, ſoft, and not above one hundred in a minute, the danger is not conſiderable. The ſalivation is very ſalutary; as ſoon at it is well eſtabliſhed, the danger is over.

This fever is cauſed and kept up by contagious particles; to attempt their expulſion by opening all the natural emunctories is the principal curative intention.

When the habit is good and ſymptoms ſlight, a few doſes of r. rhab. and cr. tart. with a draught now and then of weak wine-whey, is all that can be uſeful. The degree of the diſtemper demands the firſt attention. If inflammation is conſiderable, bleed more or leſs freely, as circumſtances determine; and this at any period of the diſeaſe. Emetics and purgatives are of principal uſe, when the ſeaſon is favourable to bilious and putrid diſeaſes. In the early part of the diſeaſe, a kindly perſpiration is peculiarly ſalutary, which ſhould if poſſible be kept up at leaſt to the fifth day, when it uſually is convenient to open the bowels a little. When the ſalivation commences, improve the diet; a little wine ſhould be added to the ſuppings. Mild antiſeptics are often now required, which may be accompanied with ſome light preparation of the bark; it may be proper to be cautious of an early uſe of the bark, as it checks thoſe diſcharges that are obſerved to be ſo ſalutary, and rather increaſes the ſwelling of the parts affected. At any period of the diſeaſe, if the ſwallowing is difficult, apply a bliſter round the throat.

Sometimes bleeding is improper; when warm ſuppings, moderate diaphoretics, and gentle purgatives are to be preferred. Sometimes the parotid and maxillary glands ſwell, and are hard; if bleeding can be admitted, it may be recommended; if not, repeat proper purging once in two or three days. Sometimes the noſe bleeds; in which caſe, if the head is much affected with pains, the ſkin hot and dry, the breathing difficult, the pulſe hard, and not immoderately quick, bleeding will be a moſt neceſſary ſtep.

When from the ſeaſon, &c. bleeding cannot be prudently encouraged, the antimonium tartariſatum is ſingularly uſeful, given ſo as to vomit and purge. When the pulſe is ſmall and ſoft, the rigor great at the firſt attack, the conſequent heat conſiderable, be careful early to clear the primæ viæ; thus, the pulſe riſes, a kindly perſpiration comes on, which may be ſupported to thirty-ſix or forty-eight hours, or as required; then give a gentle purge as above noticed, when the ſalivation appears.

A relapſe ſometimes approaches with pain in the feet and hands; in which caſe wrap the parts pained in flannels, and promote a gentle perſpiration. Antimonials are efficacious when perſpiratives are required in any period of this diſeaſe: but the aqua ammoniæ acetatæ ſeems generally to deſerve the preference.

Emollient and gently detergent gargles are valuable aids for relieving the uneaſineſs, &c. in the throat.

Bliſters on the throat are often objected to on account of the mark they leave in the ſkin; in thoſe caſes firſt apply a bliſter between the ſhoulders, and when its diſcharge begins to decline, apply one behind each ear, and down the ſides of the neck.

Huxham treats on this diſeaſe, under the name of Febris *anginoſa*. See alſo Dr. Wm. Fordyce's New Enquiry into the Cauſe of Fevers; Dr. Wm. Grant's Obſervations on the *Angina* Maligna Ulceroſa. Cullen's Firſt Lines, edit. 4. vol. ii. p. 187. &c.

SCARLATINA, vel SCARLATINA FEBRIS. The SCARLET FEVER. It is ſo called from the colour of the patient's

patient's ſkin, which appears as if tinged with red wine. Dr. Cullen places this genus of diſeaſe in the CLASS PYREXIÆ, and ORD. EXANTHEMATA, which he defines, a contagious inflammatory fever, in which, on the fourth day of the diſeaſe, the face becomes a little ſwelled, and at the ſame time there is a florid redneſs all over the ſkin, with broad ſpots, running at laſt one into another; after the expiration of three days, forming furfuraceous ſcales, and falling off; to which often an anaſarca ſucceeds. He diſtinguiſhes two ſpecies. 1. *Scarlatina ſimplex*; that is when not accompanied with any ſpecies of quinſy. 2. *Scarlatina* cynanchica; when accompanied with the ulcerated quinſy, it is the *ſcarlatina* anginoſa. SYDENHAM obſerves, that children are its moſt frequent ſubjects, and that when it is epidemical, it is uſually ſo at the cloſe of the ſummer. It begins with a chilline's and ſhivering; after which the whole ſkin is covered with red ſpots, which are more numerous, larger, and redder, but not ſo uniform as thoſe of the meaſles. Theſe ſpots continue two or three days, and after they vaniſh, and the ſkin is ſcaled off, there remains a kind of branny ſcales diſperſed over the body, which fall off, and come again, two or three times ſucceſſively.

It ſeldom requires much aſſiſtance from art, except there is an approach to that putrid ſtate to which it inclines in the advanced degrees. Bleeding is rarely required. The patient may be kept in his room, but not much in bed; his drink may be acidulated with the vitriolic acid, or with Clutton's febrifuge ſpirit; and if a ſtool is required, rhubarb will be the moſt convenient; when the ſkin peels off a more active purge may be given.

Sometimes a coma, or an epilepſy, happens in the beginning of the diſeaſe, in which caſe apply a bliſter to the back. When it is attended with more malignant ſymptoms, its tendency is to the putrid kind of fever, with ulcers, &c. in the throat. Here bliſters, which may be applied to the back and throat, with the bark, are the chief dependencies, and, as in the putrid ſore throat, acids and cordial perſpiratives may accompany the bark. Antimonial preparations, which are ſo generally uſeful in fevers in this caſe are apt to occaſion a purging.

See Wallis's Sydenham. Obſ. on a late particular *Scarlet Fever*, by N. Cotton, M. D. Cullen's Firſt Lines, edit. 4. vol. ii.

SCARLATINA URTICATA. ACUTE NETTLE-RASH. See URTICARIA.

SCELETOS, from σκελλω, *to make dry*. A SKELETON. All the bones of an animal freed from the teguments, veſſels, muſcles, &c. and properly connected, have the general name of ſkeleton. There are two ſorts, the natural, and the artificial; the firſt of theſe is when the bones are kept together by their own ligaments; the ſecond is when they are joined with wire.

SCELOTYRBE. It ſignifies thoſe pains in the legs that generally attend ſcorbutic habits; whence it is frequently uſed for the ſcurvy itſelf, ſee SCORBUTUS; and alſo applied to ſome medicines contrived againſt ſuch diſorders. It is often expreſſive of the *chorea S. Viti*.

SCELOTYRBE FESTINANS. Idiopathic convulſion.

—— VERMINOSA. A kind of ſymptomatic convulſion.

SCHAGRI COTTAM. See CORNI.

SCHISTUS. See HÆMATITES.

SCHÆNANTHUS. See JUNCUS ODORATUS.

SCIATICA. See RHEUMATISMUS and ISCHIADICUS MORBUS.

SCIATICA ARTERIA, It is a branch of the hypogaſtrica; it runs under, and gives branches to the muſculus pyriformis, quadrigemini, and the os ſacrum, and to the inner ſide of the os iſchium; it paſſes obliquely over the ſciatic nerve; and as they both go through the great poſterior ſinus of the os ileum, it detaches ſmall arteries, which are diſtributed to the inner ſubſtances of the nerve: afterwards it runs up in a radiated manner, on the outſide of the os ilium, and is diſtributed to the inner ſubſtance of that bone, and to the muſculi glutæi, eſpecially to the medius and minimus.

—— VENA. When the crural vein hath deſcended to about the upper extremity of the muſculus vaſtus internus, it produces a branch which runs down on the ſide of the trunk, covering the crural artery almoſt down to the ham, where it is again united to the trunk by an anaſtomoſis; and ſometimes it is continued a little way down on the leg. It is called the SCIATIC VEIN, from accompanying the ſciatic nerve.

SCIATICUS NERVUS. See LUMBARES.

SCILLA. The SQUILL, or SEA-ONION, called alſo *ornithogulum*. SCILLA MARITIMA, *foliis lanceolatis ſtrictis, ſcapo longiſſimo multiflora, floribus albis & nudis, bracteis refractis: radice alba*. CLASS. HEXANDRIA, ORD. MONOGYNIA. LINN. Gen. Plant. 419. It is a plant with a large bulbous root, like that of an onion, which is very acrid. The leaves are broad, the flowers are like thoſe of the ornithogalum, and grow in a ſpike before the leaves appear. There are two ſpecies which are uſed indifferently, viz. *the red* and *the white*; Boerhaave mentions a third ſort.

Epimenides taught Pythagoras the uſe of *ſquills*, and the vinegar prepared with them; and Pythagoras made the vinegar into an oxymel.

This plant grows on ſandy ſhores in Spain and the Levant, from whence we have them. Chuſe ſuch roots as are large, plump, freſh, and of a clammy juice. To the taſte they are nauſeous, bitter, and acrid; if much handled, they exulcerate the ſkin. *Internally* they are a powerful attenuant and aperient; in a doſe of a few grains they promote expectoration and urine; indeed when *ſquills* are given as a diuretic, the doſe is a true one that produces not vomiting; though we cannot preſume upon their operation in any manner, without their being given in ſuch a quantity, as to produce nauſea, but ſmall doſes excite expectoration moſt effectually; in larger doſes it is purgative or emetic. *Squills* powerfully diſſolve tough phlegm, and promote its diſcharge; whence their ſingular uſefulneſs in the humoural aſthma; but if the lungs are inflamed, the *ſquills* muſt be omitted until after bleeding and cooling antiphlogiſtics are uſed. *In dropſies*, begin with a ſmall doſe, and gradually increaſe it, but ſo as not to paſs off by ſtool. It is conſidered as producing its good effects by the general ſtimulus with which it is poſſeſſed;—for *in the ſtomach* it proves emetic, —*in the inteſtines* purgative,—*in the lungs* expectorant,—and *in the kidneys* diuretic; but this laſt effect has been ſuppoſed to be promoted by the addition of ſome mercurial preparation;—the leſs purgative of which are beſt adapted to this purpoſe;—the ſolution of the hydrargyrum muriatum, has been thought the moſt proper, becauſe it is the moſt diuretic. So that whichever of theſe purpoſes we want it to produce, we muſt endeavour to regulate its action by directing it as well as we can to the parts we wiſh it to affect, either by proper doſes, or coupling it with ſuch medicines as may aſſiſt in determining it to them; large doſes will anſwer the *firſt* purpoſes, and often the *ſecond* joined with the other purgatives; for producing the *third* and *fourth*, it may, in ſmaller doſes, be joined with expectorants and diuretics. See CULLEN's MAT. MEDICA. Some caution however is neceſſary in the adminiſtration of this very uſeful medicine; for its acrimony is ſo great, that if much handled, it exulcerates the ſkin; and, if given in large doſes, and frequently repeated, it not only excites nauſea, tormina, and violent vomitings, but it has been known to produce ſtrangury, bloody urine, hypercatharſis, cardialgia, hæmorrhoids, convulſions, with fatal inflammation, and gangrene of the ſtomach and bowels. *Squills*, on account of their offenſive taſte, are beſt formed into pills; and to prevent the nauſea which they excite, when not intended either as an emetic or an expectorant, a few grains of ſome agreeable aromatic may be added to each doſe, or it may be made up with the freſh root of elecampane. The beſt form is in powder, freſh, and properly prepared, for age or want of management deſtroys their effect.

Water, wine, proof ſpirit, rectified ſpirit, and vinegar, extract the virtues both of the freſh and the dry *ſquills*; but none of them carry any thing with them by diſtillation; ſo that in the extract made from the decoction, the whole of the active parts are retained. Alkalies abate both their bitterneſs and acrimony; vegetable acids make very little alteration in either, but they improve their expectorating quality.

The College of Phyſicians, London, order ſeveral preparations of *ſquills*, which are made in the following manner:

1. CONSERVA SCILLÆ. *Conſerve of* SQUILL.

Take of freſh *ſquills*, one ounce; double refined ſugar, five ounces. Beat them together in a mortar, into a conſerve. Its doſe to adults is from one ſcruple to 3 ſs. eſpecially when freſh.

2. SCILLA

2. Scilla Exsiccata. *Dried* Squill.

Cut the *squills* transverſely, after the outward ſkin has been taken off, into thin ſlices, and dry it with a gentle heat. It is given in powder as an expectorant and diuretic; to adults, in doſes of from two to ſix grains; four grains of the dried root is equal to twenty of the freſh.

3. Mel Scillæ. *Honey of* Squill.

Take of clarified honey, three pounds; tincture of *ſquill*, two pints. Boil them in a glaſs veſſel to the thickneſs of a ſyrup.

4. Oxymel Scillæ. *Oxymel of* Squill.

Take of clarified honey, three pounds; vinegar of *ſquill*, two pints. Boil them in a glaſs veſſel, with a ſlow fire, to the thickneſs of a ſyrup.

5. Pilulæ Scillæ. Squill-pills.

Take of freſh dried *ſquill*, powdered, one dram; ginger powdered, ſoap, of each three drams; ammoniacum, two drams; ſyrup of ginger, as much as is ſufficient. Beat them together. Doſe, eight to fifteen grains.

6. Tinctura Scillæ. *Tincture of* Squill.

Take of *ſquill* freſh dried, four ounces; proof ſpirits of wine, two pints; digeſt for eight days, and pour off the liquor. Doſe from twenty to ſixty drops or more repeatedly.

7. Acetum Scillæ. *Vinegar of* Squill, formerly called *Acetum Scilliticum.*

Take of *ſquill*, freſh dried, one pound; vinegar, ſix pints; proof ſpirit, half a pint. Macerate the *ſquill* in the vinegar, with a gentle heat, in a glaſs veſſel, for twenty-four hours; then preſs out the liquor, and ſet it by, that the fæces may ſubſide; laſtly pour off the liquor, and add to it the ſpirit. Pharm. Lond. 1788. Doſe the ſame as the tincture.

There is alſo a plaſter of *ſquills* made in the following manner:

EMPLASTRUM SCILLÆ COMPOSITUM. Compound squill plaster.

℞ Galbani, ammoniaci ää ℥ ſs. opii ʒ j. aceti ſcillæ ℥ iij. ſaponis ℥ ſs. emplaſtri lithargyri ℥ ij. The galbanum, ſoap, and litharge plaſter, muſt be melted together; to which are to be added, the opium, vinegar, and ammoniacum, mixed alſo together, and the whole continued over the fire, and ſtirred till they are perfectly incorporated. To indolent tumors this is conſidered as an uſeful application.

SCINCUS. The scink or skink. It is a ſmall amphibious animal of the lizard kind; it is caught about the Nile. The fleſh of this animal hath been in much eſteem as a diuretic, alexipharmic, &c. but it is now neglected. It is alſo called *crocodilus terreſtris.*

SCIO TERRA. See Chia terra.

—— VINUM. See Chium vinum.

SCIRRHUS, from σκίρρος, *to harden.* A *ſcirrhus* is a hard tumor, with little or no ſenſation remaining in it. Galen Comment. in Aph. xxxiv. ſect. iv. Dr. Cullen places this genus of diſeaſe in the CLASS Locales and ORDER Tumores, which he defines, a hard tumor of ſome part, moſt frequently of a gland, not painful, and ſuppurating with difficulty. Dr. Aitkin reckons the *phyſconia*, a genus in Dr. Cullen's ſyſtem, a ſpecies of *ſcirrhus:* the *ſarcocele* he includes as another ſpecies. The ſeat of this kind of tumor is uſually ſome glandular part; not but ſome other may alſo, and ſometimes is thus diſordered. The fluids in the glands being inſpiſſated, increaſe in hardneſs, and form a *ſcirrhus*; or the contents of the lymphatic veſſels in the liver, or other parts coagulating, gradually harden, and form the like. It is probable that *ſcirrhuſes* are formed by too free bleeding; for thus the circulation may be ſo diminiſhed in its force as not duly to affect the ſmaller veſſels, and thus obſtructions may be formed, which end in *ſcirrhi.*

All perſons, and at any age, may be the ſubject of this diſorder; but the ſedentary, and more particularly women, when their menſes decline, and ſometimes indeed at their approach, are moſt frequently thus diſordered.

From the moſt attentive examination, it appears that the matter of theſe tumors is inſpiſſated lymph. They often ariſe without any previous inflammation from the proper fluid ſtagnating in the gland, or extravaſation from contuſion, &c. Sometimes it happens when a gland is the ſeat of an inflammation, and the inflammation terminates without coming to ſuppuration.

Externally they are perceived by the touch. Internally the evidences are obſcure; but if the cauſes of a *ſcirrhus* have occured, and if ſome defects attend, to which may impute a *ſcirrhus* as the cauſe, the exiſtence of one may be ſuſpected.

Though a *ſcirrhus* does not always become cancerous, yet cancers are moſt frequently only *ſcirrhuſes* in their beginnings. The effects of a *ſcirrhus* will be various, and very different, according to the part it affects, and the functions which it injures. *By preſſing on the vena cava*, a mortification in the legs; *on certain nerves*, epileptic fits have been produced.—*If all the glands in the neck are indurated*, thoſe of the meſentery will be ſo too, in which caſe a cure is not to be expected.—A *ſcirrhus in the liver* produces a jaundice, which is difficult, and often impoſſible to cure, and this jaundice is followed by a dropſy.—A *ſcirrhus may ſo preſs upon the thoracic duct* as to occaſion a fatal atrophy. Whether a *ſcirrhus* is ſeated internally or externally, *if it is affected by acrid humours*, or *inflammation*, being thereby heated, it becomes cancerous.

If an attempt is made towards the cure of a *ſcirrhus*, we ſhould be certain that it is recent, and not yet quite hardened, and that it is in its benign ſtate, i. e. that it is free from itching, heat, or pain; for, after the appearance of any of theſe circumſtances, nothing but a palliative cure can be admitted, except the knife can be prudently uſed. In the earlier ſtate of an external *ſcirrhus*, gentle mercurials are uſed internally, but with caution not to irritate; externally, cooling and anodyne applications only are to be employed; ſuch as the aq. ſaturn. of Goulard; the *ſcirrhus* part ſhould be covered with ſoft leather to prevent the cloaths from irritating it; whatever heats, ſoftens, or can tend to produce a ſuppuration, muſt be carefully avoided; a ſolution of ſal ammoniac in vinegar is applied externally as a reſolvent; ſome apply the vapours of vinegar to the tumid part.—If a *ſcirrhus is ſmall*, and continues of the ſame ſize, do nothing;—if *it ſuppurates, increaſes*, and *is detached*, extirpate it with the knife. Some good practitioners adviſe to extirpate theſe tumors as ſoon as they ſeem to reſiſt the effect of gentle means made uſe of for reſolving them, and that before any ſymptoms of their becoming cancerous appear. For correcting the faulty ſtate of the fluids, and for reſolving *ſcirrhous* obſtructions, the hydragyrus muriatus, given ſo as not to ſalivate, contributes much, if the bark and the extr. cicutæ accompany it; their united efficacy is ſometimes ſuch as cannot be produced by any two of them without the third.

What is here ſaid of a *ſcirrhus* in general is applicable to a *ſcirrhus* in any external part; however, as there are ſome peculiarities from their ſituation, it may be proper to take notice of ſome of them.

A scirrhus may affect the sebaceous glands of the skin, particularly about the face and lips, where it is ſo very irritable, that whatever is applied occaſions great pain, and therefore is called *noli me tangere.* Here Mr. Plunket's medicine (ſee Cancer) may do well if the caſe be recent; but it ſhould never be uſed unleſs we can remove the whole tumor. If we cannot effect this, we are at firſt flattered with the hopes of a cure, but the diſeaſe ſoon re-appears in another ſtate, which carries off the patient. In ſhort, *whilſt ſcirrhous tumors are looſe, entirely free from pain*, and *the figure of the tumid gland is unchanged*, whether the cauſtic or the knife are uſed, ſucceſs may reaſonably be expected whether the ſituation of the diſordered gland is in the face, or any where elſe in the reach of thoſe means of relief.

A scirrhus in the breast. Whether the breaſts of women are glandular or not, their ſtructure is ſuch, that indurated tumors are formed in them. Some tumors in the breaſt reſemble a true *ſcirrhus*; but in time they inflame, ſuppurate, and end favourably; and it is not eaſy to give the diſcriminating ſigns with preciſion enough to be depended on in the beginning. It may be obſerved, that a genuine *ſcirrhus* ſeldom occaſions uneaſineſs, except it becomes cancerous; and when an inveterate *ſcirrhus* ſeizes the breaſt, the ſubaxillary glands are generally indurated too. The breaſts are ſometimes rendered *ſcirrhous* by the imprudent application of the ſpirit of wine to them; about the ceſſation of the menſes, the breaſts of many women are thus affected.

A SCIRRHUS IN THE INTESTINES. After an inflammation in theſe parts, a *ſcirrhus* may be formed, in which caſe there will be a ſtupor, a ſenſe of weight, and a conſtant diſtraction perceived where it is ſeated. There will be a leſſening of the cavity of the inteſtines as the bulk of the tumor increaſes; the chyle and the fæces ſtagnate there; at length the iliac paſſion, or ſome other violent ſymptom, puts an end to the patient's miſery. In ſuch a caſe, if any palliative remedy moderates the uneaſineſs and retards the growth of the tumor, that will be all that medicine can effect.

A SCIRRHOUS LIVER. A part of the liver or its whole ſyſtem, may become *ſcirrhous*. Theſe tumors in this part generally are ſmall in their beginning, and are gradually increaſed; when they inflame, they occaſion feveriſhneſs, and the general health is much diſordered; but theſe ſymptoms vaniſh, and for a time the health ſeems to be reſtored; the intervals of theſe inflammations become ſhorter, and then the appetite and fleſh fail, a little cough comes on, and ſometimes a hiccough, and bring on death; in ſome all this happens in a few months; in others it takes up ſeveral years. If the inflammation is in the internal parts of the liver, the pain is ſometimes too little to be regarded; but happening on the external parts, it extends to the diaphragm, or other adjacent parts; and, in this caſe, the patient generally lies on his right ſide. In the advanced ſtate of theſe *ſcirrhi*, the blood will guſh out freely from the noſe, ſtomach, navel, and with the ſtools; in the worſt of theſe caſes, though the countenance is of a leaden colour, yet ſometimes there will not be any ſigns of a jaundice; for this ſymptom does not happen except the ducts are compreſſed by the *ſcirrhus*, ſo as to hinder the paſſage of the ſecreted gall through the common gall-duct. An indurated liver is often very evidently diſtinguiſhable by applying the hand to the region of it. As to other ſigns that attend a *ſcirrhous* liver, they alſo accompany other diſorders, ſo determine nothing in this caſe.

But whether it happens that a *ſcirrhus* is ſeated in the liver, ſpleen, or the pancreas, certainly to diſtinguiſh them ſeems to be of little moment, as little or nothing more can be done towards relief than what the common cure of the hectic fever requires, whether it ariſes from this, or from any other cauſe. In the beginning, and whilſt the diſorder is ſlight, perhaps a free uſe of graſs roots, endive, ſuccory, and whey, uſed as a diet, might be of ſome uſe; but in the more advanced degree, no cures are performed, except by an inflammation ending in ſuppuration, and the abſceſs burſting where the matter can be carried directly out of the body, as when the matter is emptied into the hepatic duct, or through the ſide of the belly, which laſt may happen when the liver adheres thereto. See London Med. Tranſactions, vol. ii. p. 143, &c.

A SCIRRHUS IN THE TONGUE. A tumor of this kind ſometimes happens in this part, and remains many years indolent; in which caſe avoid all attempts to remove it, as it may eaſily be made to become cancerous. If it ſhould become painful, and is moveable, diſſect it out; but if immoveable, cut away a part of the ſound fleſh with it; dreſs the wound with the honey of roſes and balſam of Peru.

A SCIRRHOUS TONSIL. This can no way be managed with advantage, except by means of the ligature, as recommended by Mr. Sharp. See his Operations and his Critical Enquiry.

A SCIRRHOUS WOMB. This is one of the opprobriums of medicine; it always degenerates into a cancer, and deſtroys the patient. In all caſes of ſcirrhoſity, the mild preparations of arſenic might be tried, for they have been in ſome effectual. See ARSENICUM ALBUM. Aretæus de Method. Medend. l. xiv. c. 4. Galen's Meth. Med. l. xiv. c. 5. Abraham Kaau's Diſſert. de Scirrho. Boerhaave's Aph. with Van Swieten's Comment. Heiſter's Surgery. Riverius's Prax. Med. Dr. Heberden's Obſ. in the Lond. Med. SCHISTUS LAPIS, has a great affinity with the lapis hæmatites; ſee HÆMATITES, though it is of a paler colour, and weaker in power: in its own nature it is brittle and friable;—*aluminous*;—*milk*, in which heated ſtones have been extinguiſhed;—the *ſtercus caninum* alſo, or when vinegar is dropt into boiling milk, all bear the ame SCHISTON. *Caſtelli.*

SCLAREA. See HORMINUM.

SCLAREA HISPANICA. See HORMINUM SYLVESTRE.

SCLEROPTHALMIA. See XEROPHTHALMIA, DEPLUMATIO.

SCLEROTICA, } from σκληρος, *hard*. Of the proper
SCLEROTIS, } coats of the eye, the tunica *ſclerotica* is the outermoſt. This, in the poſterior and far greater part of its circumference, is white and opake; but in the anterior is tranſparent, and takes the name of *cornea*. The remarkable whiteneſs which this coat appears to have, is from the expanſion of the tendons of the muſcles, which move the eye over its fore part; this tendinous expanſion, though called tunica albuginea, is not properly a coat of the eye; for it, like the conjunctiva, is only partially ſpread over its forepart. See CORNEA.

SCLOPETOPLAGA, from *ſclopetum*, *a gun*, and *plaga*, *a wound*. A GUN-SHOT WOUND. It is a ſpecies of vulnus, though ſome writers make it a genus of diſeaſe. SAGAR places it as a genus under his CLASS. PLAGÆ, and ORD. SOLUTIONES. This kind of *wound* is a confuſed *wound* in the higheſt degree. The ancients ſuppoſed theſe to be of a malignant poiſonous nature from gunpowder; hence warm antiſeptics, &c. were uſed; but the ill effects of *gun-ſhot wounds* are owing to contuſion, laceration, &c. and require the moſt lenient methods to be purſued; ſuch as relaxing the parts by an emollient cataplaſm; and if there is but one ſmall opening, to enlarge it for a free diſcharge of matter, or to extract foreign bodies, if it can be done eaſily; but if by endeavours to remove them, you are likely to irritate, or give great pain, it will be beſt to wait until the inflammation, &c. is gone, and ſuppuration eſtabliſhed; by which means you will have a larger opening, and extract any extraneous body more eaſily; for, at firſt, the orifice of a *wound* through which a ball hath entered by its contraction, is always exceeding ſmall before ſuppuration commences.

Amongſt the many peculiarities from *gun-ſhot wounds*, ſee a remarkable one in the article FRACTURA, and the diviſion, *a fractured leg*.

Moſt limbs are taken off in the field of battle, and few of them recover. It is beſt to perform as few operations as poſſible in theſe caſes; and, if you can, leave thoſe few until ſome time after they have been wounded, as moſt of theſe, where amputation is performed immediately, die of the operation, as indeed they do in all caſes where it is performed in high health. Limbs ſhould not be amputated in the field if they can poſſibly be avoided. The inflammation ſhould firſt be allowed to go off; and if ever from the nature of the *wound*, the inflammation that we ſuppoſe ſhould attend it, ſhould be imagined to hazard the patient's life, this ſhould not be a ſufficient reaſon for amputation, becauſe the operation will more than hazard his life in ſuch a ſituation, and in ſuch a ſtate, as experience evinces.

The joints having been maſhed by external force, or a ball having paſſed through them, ſeldom do well without amputation, eſpecially if there is a great laceration of the ligaments, and a diſcharge of the ſynovia, with the admiſſion of the external air; for the violent inflammation, ſloughing, and diſcharge, bring on a hectic fever, which with colliquative ſweats, from the abſorption of matter, will carry off the patient.

It may be further obſerved, that injuries from ſmall-ſhot are rarely ſo prejudicial to the bones as thoſe from larger ſhot; from theſe laſt, the bones are generally ſplit or ſplintered, and require that amputation be performed above the joint of the part where the injury is received, if poſſible.

Thoſe who aſſert, that amputation ſhould be quickly performed, when rendered neceſſary from *gun-ſhot wounds*, advance the following reaſons: 1. When the injury is from large ſhot. 2. When violent ſymptoms come on. 3. When violent ſymptoms are overcome by medicines, yet there is ſtill a neceſſity for amputation. Theſe form the three ſtages from this kind of injury: and when it happens that a patient paſſes through the firſt and ſecond, except perhaps one in one hundred, he is taken off in the third ſtage. Bell's Surgery, vol. v. p. 325. White's Surgery, p. 99.

SCLOPETARIA AQUA. See ARQUEBUSADE.

SCOLOPENDRIUM. See LINGUA CERVINA.

SCOLYMUS. See CINARA.

SCOPA REGIA. See RUSCUS.

SCOPULA. A BRUSH. The fleſh *brush* promotes

a brisk circulation, and free perspiration. Persons with weak nerves, the sedentary and paralytic, should supply the want of exercise with half an hour's rubbing every night and morning.

SCORBUTICUS SUCCUS. See SPIRIT. COCHLEARIÆ AUREUS, under COCHLEARIA BRITANNICA.

SCORBUTUS. The SCURVY, called also *gingibrachium*, because the gums and arms, and *gingipedium*, because the gums and legs are affected by it. Hippocrates describes it under the name of the diseases of the spleen, in his work De Intern. Affect. Dr. CULLEN places this genus of disease in his CLASS. CACHEXIÆ and ORD. IMPETIGINES, which he defines—after living on putrid, salted animal food, in a cold country, recent vegetable substances being at the same time wanting, there come on universal debility, attended with fetid breath, loose, spongy, bleeding gums, different coloured spots in the skin, most commonly livid, particularly at the roots of the hair.

The *scurvy* is a chronical disorder of the putrid kind; and when a fever attends it, is called the PUTRID FEVER, which see.

The immediate cause is the same with those that produce the putrid fever, that is, putrescence. The mediate and more remote causes are whatever lessen the vis vitæ, too little or an improper kind of food, a damp air, living in marshy countries, various kinds of acrid matter in the blood, a long use of mercury; in the navy, a solution of copper from want of care to clean the vessels in which their food is boiled; animal diet which is not well preserved with salt; infection, &c.

The presence of this disorder is known by a pale or a yellowish complexion, which gradually grows darker; a melancholy dejection of spirit, a lassitude, a stiffness in the joints, a feebleness in the knees, and on using the least exercise there is great weakness, with a difficulty of breathing; *the gums* soon after begin to *itch*, *swell*, and *bleed on being gently rubbed, and have an unusual livid redness*; *they are soft, spongy, putrid, and fungous*; *this change in the gums*, Dr. Lind seems to think, *is the pathognomonic symptom of the disease*. Hæmorrhages also happen in other parts: the skin feels dry, except in the last stage of the disease, when a cold clammy moisture may be observed on the skin. In some the skin is rough, but generally it is smooth and shining, and covered with many spots, as if bruised; these are of a yellow or reddish colour, and as the disease increases they become blacker. In some the ankles swell towards the evening, and are settled again in the morning. Many other symptoms occur, but they are accidental. If a scorbutic diarrhœa comes on, and there is a pain in the breast, it is generally fatal. Ulcerated lungs are a frequent consequence of the *scurvy*: the stools are very offensive: the urine speedily becomes putrid. *In the second stage*, the patient sometimes loses the use of his limbs, the flexor tendons in the hams are contracted, the patient frequently faints upon the least motion; and on being suddenly moved into the fresh air, it sometimes happens that he expires. Hæmorrhages from the lungs, intestines, &c. now are frequently happening: but the appetite is often good, though the spirits are low. *The third stage* hath many violent, and usually fatal symptoms.

The *scurvy* should be distinguished from the ileum cruentum, the black jaundice, hypochondriac and melancholic disorders, some symptoms of the lues venerea, and scorbutic cachexy.

THE INDICATIONS OF CURE are, to stop the progress of putrefaction, and totally to remove it; *secondly*, to strengthen the habit in general.

If bad waters are the cause, or improper food, they must be changed for that which is more salutary; the air in the patient's room must be regulated by such methods as will render it dry and warm. Fixed air should be communicated to the water which the patient drinks; an infusion of malt given, (see BRASIUM,) as recommended by Dr. Mac Bride; the bark in doses as large as will be easy in the stomach, repeated two or three time a day. The dilute vitriolic acid may be administered frequently in the patient's drink; these and other antiputrescents, or such means as are used in the putrid fever, will be the principal ones here.

If the patient is cold, pale-faced, and hath swelled legs; if his thirst is not great, he may take four or six spoonfuls of the following, three or four times a day: ℞ rad. raph. hort. ℥ iv. fol. cochl. trifol. palud. āā m. ii. salviæ. m. i. vin. alb. lb. vi. m.

If, on the contrary, there is a feverish heat, thirst, some difficulty in breathing, and the gums are putrid: ℞ rad. lapath. acut. ℥ i. crystal. tart. ʒ iii. coq. per horæ ss. in lact. vac. lb. iii. & colaturæ adde mel. Brit. ℥ i. m. cap. ℥ iii. ter die.

The roots of the herba Britannica, or the great water-dock, is much extolled in this disorder.

Particular care is required to promote the discharges through the skin, and by the kidneys. And as to particular symptoms, some of the chief of which are as follow, they may be managed by these or such like methods: *the spongy gums* may be washed with a decoction of the bark acidulated with the muriatic acid;—and *ulcers spread in the mouth*, touched now and then with the mel rosæ acidulated with the same acid.—*If a salivation comes on*, divert it by blisters on different parts of the body, sinapisms to the soles of the feet and hams, and, if possible, excite a perspiration; for the stricture of the skin is the chief cause of this symptom, and here boluses of camphor and some cordial mild opiated electary may be repeated every four or six hours.—*If the legs are œdematous*, use gentle frictions.—*Ulcers in the legs*, &c. may be treated as those in the mouth are.—*In cases of hæmorrhages*, the mineral acids may be given at proper intervals.—*When a fever attends*, the dulcified mineral acids, or Clutton's febrifuge spirit, may be joined with such other medicines as the peculiarity of the case requires. But though some advantages may be obtained by these particular administrations and applications, yet all these and the rest of the symptoms disappear in proportion as success follows the general method of cure.

Dr. George Fordyce observes, that the *scurvy* is taken off or prevented by such food as is capable of being digested properly. Putrefaction of the fluids never produces a disease of itself, but only symptoms depending upon this; for when these symptoms are taken off, the patient recovers; and we sometimes see in putrid fevers, where the patient is considerably weakened, so that in probability he could not survive many hours, yet there hath been a sudden alteration take place; the symptoms of putrefaction immediately subside, and the patient recovers; if then we could give proper food, we might be able to prevent it, and could always cure it, when it hath taken place. In order to the cure, any such loose food that hath no medical property is of great service: and the most powerful are those of the tetradynamia class, such as cabbages, turneps, &c. for, *first*, they produce a fermentation in the stomach, and become acid. *Secondly*, they contain a quantity of essential oil, which makes the matter soon evacuated out of the body. We should then make choice of such food as this.—Besides these, there are native vegetable acids or accescent fruits to be got, which likewise prove useful; but then the difficulty is to find out any vegetable food, that will give a tendency to become acid, that may be kept on board a ship for the use of the sailors: there are but few which we can preserve, and these are oranges, lemons, limes, &c. any of these given with animal food, will be of use, as will also the use of sawr kraut, and infusion of malt. Sugar is an antiputrescent, though not so powerful as the vegetables; but is was much employed with food, &c. before vegetables came into use. These then are the methods to prevent and to cure putrefaction. Many have used remedies as antiputrescents, to stop putrefaction; hence they have given acids, &c. for that purpose, but they will not produce that effect. They have a tendency to prevent the peculiar fermentation taking place in the stomach, as well as to check putrefactive fermentation; hence vegetable food will not stop fermentation, but only tend to alter the mode of the fermentation, and rather tend to convert the substance into an acid than suffer it to putrefy. Another method to relieve from the *scurvy*, is to keep up the strength of the stomach, which has been of considerable service; hence bark, &c. have been used, which are powerful remedies for that purpose.

Sir John Pringle, in his Discourse on the Improvements for preserving the Health of Mariners, says, that to know the nature and cause of the *scurvy*, is an essential step to the knowledge of the cure. That on examining all the articles which of old have been used, and approved of, as well as those which of late have been introduced into the navy, however they vary in their mode of operating, they all some way contribute towards preventing or correcting putrefaction. He directs that the men be put to watch at three watches instead of two; to this end divide the crew into three companies, and put each com-

company upon the watch by turns, four hours at a time; thus every man hath eight hours free, for four of duty: whereas, when half the men take watch every four hours by turns, they can have but broken ſleep; and when expoſed to wet, they cannot get dry before they lay down. 2dly, To preſerve the men from the injuries of the weather, in hot climes defend them by an awning over the deck; in cold ones, allow extraordinary jackets with a hood; and in wet weather proper means for drying and ſhifting themſelves. 3dly, Make a point of cleanlineſs; this guards from putrefaction: keep the men's perſons, cloaths, bedding, and births, clean; review the men, and all things belonging to them, and the ſhip, and ſee that all is as clean as can well be. 4thly, Ships ſhould have the means of a conſtant ſupply of freſh water to waſh the men's linen, for ſalt water neither mixes well with ſoap nor dries readily. 5thly, Dry and air the hammocks, bedding, and all bundles, every day that is fair: by the perſpiration of many men, every thing below deck will in twenty-four hours contract an offenſive ſmell. 6thly, Purify the ſhip; ſcrape and waſh the decks; purify the holds, and wells of the pumps; and where the bilge-water is, with fire as follows: light a good quantity of wood, and put it into a proper grate, then carry it ſucceſſively to every part of the ſhip below deck. Wherever fire is, the air neareſt it being heated, becomes ſpecifically lighter; and, by being lighter, riſes and paſſes through the hatchways into the atmoſphere. The vacant ſpace is filled with the cold air around, and that being heated in its turn, in like manner aſcends, and is replaced by other air as before. Thus by continuing the fire for ſome time in any of the lower apartments, the foul air is in a good meaſure driven out, and the freſh admitted. And probably the acid ſteams of the wood in burning act here as an antiſeptic, and correct the putrid remains of the air. When fire cannot be put down into the well, and carried in other places, it and the ſhips may be fumigated by gunpowder to remedy the corruption of the air; or burning tar, or other reſinous ſubſtances.

Dr. Hulme communicates fixed air to the ſtomach, &c. as follows: ℞ kali gr. xv. aq. puræ ℥ iij. f. hauſt. As ſoon as this is ſwallowed, mix and take the following: ℞ aq. puræ ℥ iij. aciduli vitriol. q. ſ. ad. ſaturat. in hauſt. precedent. Repeat this four times a day.

The *ſcorbutic ulcer* is alſo called the putrid ulcer. Its diſtinguiſhing characteriſtics are: it affords no good digeſtion, but a thin, fetid, ſanious ſtuff, mixed with blood, which at length hath the true appearance of coagulated gore, lying caked on the ſurface of the ulcer, and is with difficulty wiped off. The fleſh underneath the ſlough is ſoft and ſpungy: if theſe ſloughs are removed by eſcharotics, or the knife, they ſoon return; the edges are generally of a livid colour, and puffed up with excreſcences of proud fleſh, ariſing from below under the ſkin. From compreſſion, the fungus is apt to mortify; and the member always becomes œdematous, painful, and for the moſt part ſpotted. As the *ſcurvy* increaſes in the general habit, the ulcer ſhoots out a ſoft, bloody fungus, which the ſailors call by the name of BULLOCK'S LIVER, which indeed it much reſembles when boiled; it often riſes in a night's time to a great ſize, and, if deſtroyed, will be reproduced to the ſame ſize in twenty-four hours. Theſe ulcers do not ſpeedily affect the bones. The ſlighteſt wounds or bruiſes in *ſcorbutic* patients degenerate into ſuch ulcers. By their remarkable putridity, they are eaſily diſtinguiſhed from all other kinds of ſores. In ſome inſtances theſe ulcers are attended with ſoft ſpongy gums.

As an internal medicine, when *ſcorbutic* ulcers attend, Dr. Kirkland highly recommends the muriatic acid given in water, or mixed with the bark.

Mr. Bell, in his treatiſe on ulcers, obſerves, that the cure of the *ſcorbutic* kind depend much upon the correction of the putrid diatheſis in the ſyſtem: for which purpoſe, vegetables, particularly the aceſcent ones, with milk and whey, are almoſt certain remedies. The different ſecretions, particularly thoſe of the ſkin and kidneys, ſhould be gently promoted; for in the *ſcurvy*, perſpiration is almoſt quite checked. Gentle laxatives are of uſe, particularly tamarinds, cryſtals of tartar, &c. The beſt external applications are the ungt. Ægyptiac. vel mel roſar. cum paucul. vitriol. acid dilut.—In the milder inſtances, ſuch as uſually happen in England, the cauſe is more frequently from the want of due nouriſhment; hence what is called the antiſcorbutic courſe will not be required; but in its ſtead, better food and greater plenty of it; a little good wine is a powerful aid. The bark is more uſeful in this than in any other kind of ulcer; it ſhould be given as freely as the ſtomach will admit. As a dreſſing, pledgits of lint dipped in a ſtrong decoction of the bark will be uſeful in correcting the fœtor of the diſcharge, &c. though doubtleſs the carrot-poultice by far excels this decoction as a dreſſing. When the fœtor from the diſcharge is vaniſhed, and the ſloughs only are to be removed, the ungt. reſinæ flav. with hydrargyrus nitratus will be the moſt convenient. Generally the cure is finiſhed by means of gentle preſſure. Sometimes an iſſue becomes uſeful. What is ſaid with regard to the treatment of *ſcorbutic* ulcers, is applicable to all ſuch ſores as are in the leaſt connected with putreſcency of the fluids, from whatever cauſe: thus ſuch as remain after critical abſceſſes that ſucceed to putrid fevers, require the ſame general method of treatment.

SCORDIO ELECTARIUM E. See DIASCORDIUM.

SCORDIUM, alſo called *Triſſago Paluſtris, chamædrys paluſtris allium redolens*; WATER GERMANDER. TEUCRIUM SCORDIUM, foliis oblongis ſeſſilibus dentato ſerratis floribus geminis axillaribus pedunculatis, caule diffuſo, odore allii. CLASS. DIDYNAMIA, ORDO GYMNOSPERMIA. LINN. Gen. Plant. 156. The flowers are like thoſe of the chamædrys, one or two proceeding from the ala of each leaf. The calyx is tubulated, and the ſmell is like that of garlic. The plant is a trailing one; the leaves are hoary. If the leaves are rubbed betwixt the fingers they yield a moderately ſtrong ſmell of the garlick kind; they are bitter to the taſte; by keeping the herb for ſome months the garlick ſmell is diſſipated, and the bitter is much improved. When the leaves are moderately dried they give out their virtue to water or to ſpirit; water is impregnated with this flavour, but no eſſential oil is obtained, though a large quantity of the leaves are committed to the ſtill. An extract made from the ſpirituous tincture is the beſt. The plant is recommended as an alexipharmic and corroborant in putrid diſeaſes. This medicine for many ages was conſidered as remarkably efficacious in all peſtilential and putrid diſeaſes, and ſuppoſed to be poſſeſſed of a peculiar antiſeptic and alexipharmic power. And it has been recorded as ſucceſsful in the plague which raged in Turkey. BERGIUS ſays, it is antiputreſcent, tonic, diaphoretic, diuretic, and reſolvent; and ſome others employ it externally in antiſeptic cataplaſms and fomentations. But notwithſtanding theſe encomiums, as well as its having a bitter joined with ſome volatile parts, it is not thought of conſequence ſufficient to be retained in the practice of the preſent day. See Lewis's and Cullen's Mat. Med. Neumann's Chem. Works. This is alſo a name for *Salvia Sylveſtris*.

SCORDOTIS, SCORODONIA. } See SALVIA SYLVESTRIS.

SCORPIOIDES. See ORNITHOPODIUM.

SCORPIUS. See GENISTA SPINOSA MAJOR.

SCORZONERA. A plant ſo called from *eſcorſo*, a Catalonian word for a *viper*, becauſe it is ſaid to be effectual againſt the bite of vipers; and not only ſo, but that if a perſon rubs his hands with the root of this plant, and takes a viper in his hands, it cannot hurt him, becauſe of its averſion to it. The plant is alſo called *eſcorzonera, viperaria, ſerpentaria Hiſpanica*. COMMON VIPER-GRASS. It hath large ſharp-pointed leaves, with a large prominent rib in the middle; on the tops of the branches are yellow floſculous flowers, which are followed by oblong, roundiſh ſeeds winged with down: the root is long, ſingle, from the ſize of a gooſe-quill to that of the little finger, of a dark colour on the outſide, and white within. It is perennial, and a native of Spain. It grows in our gardens, but the Spaniſh is far better than ours, and that from the iſland Amagria is better than either. The roots are *alexipharmic, antiſeptic*, and *deobſtruent*. They are only uſed as a nutritive aliment. They are lacteſcent, but

but with a ſingular mildneſs in their juice, which has a little ſweetneſs, but neither by that, nor by any other ſenſible quality, do they give marks of their being very nouriſhing. When boiled, they are ſufficiently tender, and do not prove very flatulent. See Cullen's Mat. Med. Miller's Bot. Off. Lewis's Mat. Med.

SCOTODINE, SCOTODINOS, SCOTOMA, SCOTOMIA. } See VERTIGO. Some writers make *ſcotomia* ſynonymous with *amauroſis*.

SCOTOS. DARKNESS, or DIMNESS of SIGHT.

SCROBICULUS CORDIS. Dim. of *ſcrobs*, a *ditch*. See ANTICARDIUM.

SCROFA. See PORCUS.

SCROFULA. The Latins call it *ſtruma*, and *ſcrophula*, from *ſcropha*, a *hog* or *ſow*; becauſe this diſorder is obſerved in ſwine. And alſo, *choiras*, *chœras*. The French *ecrouelles*. Thoſe ſcrophulous tumors which were encyſted, were by the ancients called *ſtrumæ* & *chœrades*; KING'S EVIL, becauſe Edward the Confeſſor, and other ſucceeding kings, both of England and France, have pretended to cure it by the touch. Dr. Cullen places this genus of diſeaſe in the claſs cachexiæ, and order impetigines, which he defines, tumors of the conglobate glands, particularly of the neck, attended with a ſwelling of the upper lip, and column of the noſe; a florid countenance, ſmooth ſkin, and tumid abdomen. He diſtinguiſhes four ſpecies. 1. *Scrophula vulgaris*, when it is without other diſorders, external and permanent. 2. *Scrophula meſenterica*, when internal, with loſs of appetite, pale countenance, ſwelling of the belly, and an unuſual fœtor of the excrements. 3. *Scrophula fugax*. This is of the moſt ſimple kind; it is ſeated only about the neck, and for the moſt part is cauſed by the reſorption from ſores on the head. 4. *Scrophula Americana*, when it is joined with the yaws.

Almoſt every part of the body may be affected by this diſeaſe; but it is only the lymphatic veſſels in any part that are the immediate ſeat. The lymphatic glands of the meſentery are firſt affected. The conglomerate glands are not affected otherwiſe than by being diſturbed with the diſorder of adjacent conglobate, lymphatic glands. As the diſorder attacks this or the other part, a variety of different ſymptoms are produced; thus, *if the marrow is affected*, the heads of the bones will ſwell, after which ulcers are formed with an oily fœtid diſcharge; *in the eyes* it produces an ophthalmia, which again produces an anchylops and ægilops;—*in the eye-lids* an epiphora and lippitude, with foreneſs and ulcers;—*the globe of the eye* is ſometimes thruſt out by theſe tumors.—*in the canthus of the eye* it produces a fiſtula lacrymalis;—*in the noſe* an ozæna;—*in the lips*, the labriſulcium, or thick pouting tumor, eſpecially of the upper lip, with a fiſſure in the middle;—*in the throat*, tumefied tonſils;—*under the tongue*, a ranula;—*on the wind pipe*, a bronchocele;—*under the chin*, and in the ſides of the neck, the *ſtruma*, properly ſo called, encyſted tumors, &c. The fixed, immoveable, white ſwellings on the joints are of this ſort.

This diſorder ſeems to be hereditary: yet a generation or perhaps two may paſs without its being manifeſted in them, but in the next it again revives. As to the cauſe, it is ſomething that occaſions the coagulable lymph to run into concretions: and very probably ſome kinds of diet, and other as yet unknown cauſes, may produce it. The indurated glands in the necks of children are often the effect of voracity, or bad diet.

Children of *ſcrofulous* habits have uſually a florid complexion, and a fullneſs of the face, more than is common to others; and the uſual appearance of the *king's evil* is that of ſcirrhous tumors chiefly in glandular parts, and which are rarely affected with pain, or brought to ſuppuration. A multiplicity of ſymptoms attend different patients, but only a few of them are obſerved in any individual; but among the moſt frequent, beſides the tumors juſt named, are a ſwelled upper lip, foreneſs in it and about the noſe and cheeks; the tumors ſometimes break and run for a long time before they heal. The eyes are inflamed, and a very ſharp humour runs from them and corrodes the cheeks; in a morning, the eyes are ſo glued that they cannot eaſily be opened; dry cruſty ſcabs form on or near the elbows.

The *ſteatoma*, *atheroma*, *meliceris*, are often companions with the *ſcrofula*, and ſhould be diſtinguiſhed from it.

Mr. John Hunter ſays, that "the *ſcrofula* is a diſeaſe ſo marked that few can miſtake it: that, it is hardly proper to claſs it amongſt poiſons, as it cannot be ſaid to be catching; yet it hath the power of aſſimilating other matter into its own likeneſs. The matter is produced without inflammation. It does not produce any effect on the conſtitution, or on the abſorbents, or on the lymphatic glands; but only a ſingle gland will be affected. Hence the conſtitution is not affected. The pre-diſpoſing cauſe, he ſays, is climate principally; ſuch as cold damps with alternate heats; and between the latitude of forty-five north, and the higher latitudes, are thoſe places where it rages with the moſt violence. In England, and in Germany, it is common; but whether it is found in the ſouthern latitudes, is not known. That cold is a prediſpoſing cauſe of it, is evident from its not being known in the warm, conſtant climates. Perſons are continually affected with it, who come from hot to cold climates; and thoſe are cured who go from cold to warm ones. It is generally ſuppoſed to be hereditary. The weak and debilitated habits are moſt likely to have it; they are the moſt ſuſceptible of its various actions, and the parts the moſt expoſed to it, are the moſt debilitated, as well as the age that is moſt diſpoſed to it is the moſt delicate."

If a ſtrumous humour touches a bone, it becomes carious. Though when this diſorder affects children, it uſually diſappears when manhood arrives; yet, if it appears after the age of forty, the patient rarely recovers; but other diſorders, ſuch as the jaundice, faintings, vomitings, a cough, dropſy, &c. coming on, they uſher in death.—If the tumor ariſes from a caries in the bones of the fingers or hands, the cure is difficult; but if the caries is in the foot, the diſcharge generally exhauſts the patient.—If any of the tumors ulcerate, they cannot be healed whilſt any of the cyſt remains, or any part by which they are nouriſhed; as to extirpating thoſe tumors, there is but little encouragement thereto.—When a ſcrofulous tumor is unequal, it is apt to become cancerous.—If many of the glands of the neck are indurated, thoſe in the meſentery are ſo too. And the greater the number of the diſordered parts, the greater is the difficulty of even alleviating them.

A great variety of alteratives are mentioned in different writers, each of which, in particular inſtances, has been of uſe; but yet none of them are to be depended on in any caſe.—When the blood is poor, and the fibres lax, the *bark* is the beſt known medicine; and though in ſome few inſtances it cannot be preſcribed, yet in moſt it is manifeſtly uſeful. Dr. Lewis thinks its efficacy is improved by the uſe of *aq. calcis oſſr.* in conjunction with it. The bark does not ſucceed where the bones are affected, nor where the ſcrofulous tumor is ſituated ſo as to be attended with much pain, as in the joints, and under the membranous covers of the muſcles; in thoſe caſes it is obſerved that the bark rather increaſed the fever; but, as *opium*, when given as an alterative, hath been very uſeful in ſcrofulous diſorders, ſo its accompaniment with the bark may be followed with advantages not to be obtained by either ſeparately.—*Narcotic plants* that abound with a volatile ſalt are powerful in reſolving the ſcrofulous tumors, and amongſt theſe the *hemlock* hath been found to be eminently uſeful, when applied in the form of cataplaſm, and alſo when the extract hath been taken inwardly; though the internal uſe is more proper in adults than in infancy and youth.—The *hydrargyrus muriatus*, if given as is uſual in the lues venerea, hath been followed by the happieſt effects.—Dr. Smith directs a decoction of the *rad. rub. tinct.* to be drank with it.—Mr. Pott adviſes in all *ſcrofulous* affections, to produce large artificial purulent diſcharges, ſuch as iſſues, and perpetual bliſters. With reſpect to medicines in general, in a *ſcrofula*, advantage is ſlowly obtained. The *bark*, *hemlock*, *ſea-water*, &c. ſhould be given as circumſtances require. Dr. Saunders, in his Lectures on the Practice of Phyſic, recommends, that, when the bark is continued two or three weeks, during which time the patient is much better, and a cure ſeems to advance faſt; but afterwards appears to have no farther effect, the diſeaſe gaining ground upon the patient; in ſuch a caſe, to prevent habit from rendering the bark ineffectual, begin immediately with the cicuta, or with ſea-water, or ſuch other remedy as at that time may appear moſt proper; and continuing it a while, return to the bark; and thus alternate the medicines every two or three weeks, or as their efficacy is perceived to abate.—The force of habit powerfully deſtroys the effect of remedies: it is therefore neceſſary to alternate them. He farther adviſes to avoid all that can ſuppurate; for it is uſeleſs. In general we may ſay that, *to increaſe the*

tone of the fibres, and *to reſolve the tumors*, are the principal endeavours towards a cure; to theſe ends, the *bark*, *chalybeates*, *ſea* and *cold bathing*, *mercury*, *hemlock*, *burnt ſponge*, &c. contribute. In glandular and ſcrofulous tumors, the bark does not promote ſuppuration but reſolution; and there are not many ſymptoms depending on *ſcrofula*, but what give way to it. Gentle *mercurials* are often uſeful as reſolvents in ſcrofulous ſwellings. *Strong purges*, and *whatever enfeebles the habit*, will prove pernicious. Groſs habits will require *frequent* but *gentle purging*. Externals are of little or no uſe. Palliatives ſhould not be omitted, although a cure is not expected. Living in the ſea air, and tepid ſalt water baths, apportioned to the conſtitution of the patient, are highly beneficial—poultices of the quercus marina bruiſed, or ſea-water where the quercus cannot be had, mixed with oatmeal, may alſo be applied to the tumors, and *internally*, the *terra muriata ponderoſa*;—the *decoctum mezerei*,—*dulcamaræ*,—or *ſarſaparillæ compoſitum*,—*electarium cort. Peruv. cum ſal. ſedæ*, may be alſo exhibited. See BARYTES,—LAURUS FŒMINA,—SOLANUM LIGNOSUM,—SARSAPARILLA,—and CORTEX PERUVIANUS.

When tumors burſt, the ſcrofulous ulcer is formed. Theſe never yield a good diſcharge; on their firſt appearance there is a viſcid, glairy, and ſometimes a whitiſh curdled matter, which afterwards is changed into a more thin, watery ſanies. The edges of the ſores are frequently, though not always painful; and are at firſt raiſed or tumefied, but afterwards are much thinner. So long as the ſcrofulous diſpoſition ſubſiſts in the habit, theſe ulcers generally remain a long time without ſhewing any diſpoſition either to heal or to grow worſe. At other times they heal very quickly, and again break out in ſome other part of the body. Some obſerve that ſcrofulous ulcers have their ſurface rather convex, and with an uniform gloſſy appearance. Mr. Bell obſerves, in his Treatiſe on Ulcers, that ſo long as the general morbid diatheſis continues in the ſyſtem, it is commonly in vain to attempt their cure; nor would it indeed often be ſafe, as by drying up the ſores in one part, they very commonly break out elſewhere, and juſt as readily fall upon the lungs, or ſome other organ of conſequence to life, as on any other. Until the *ſcrofula* is removed from the habit, all that ſhould be done to the ulcers which are produced by it, is, to make as free and open vents to the matter as poſſible, without endangering the formation of ſinuſes. The beſt applications are ſaturnine preparations. Mr. Aikin, in his Obſervations on the External Uſe of Preparations of Lead, ſays, that emollient applications of all ſorts are highly injurious when applied to ſcrofulous ulcers: by weakening the ſolids, already too much diſpoſed to relaxation, they prevent all endeavours of nature to bring about a firm incarnation; and by giving the fluids an acrimony, to which in this diſeaſe they are not remarkably diſpoſed, they occaſion a kind of eryſipelatous corroſive ſpreading of the ulcer. The miſchiefs occaſioned by emollient applications are ſtill more clearly ſhown, by the ſpeedy change produced by almoſt every kind of topics of the oppoſite claſſes, the aſtringent and the ſtimulant. The moſt ſimple of the aſtringent and ſtimulant, viz. *cold water*, hath frequently a good effect on throwing aſide every dreſſing, and waſhing the ſore with it. *Water*, with *every kind of ſaline and mineral impregnation*, is alſo uſed to advantage: particularly *ſea-water*, and *Goulard's ſaturnine water*. The greaſy ſaturnine applications are improper in theſe caſes. A continuation of ſuch ſimple dreſſings as theſe is all that, in general, ſhould be attempted, ſo long as any diſorder of the conſtitution may remain; but Mr. Bell obſerves, that in ſome caſes, the ulcers are ſo inveterate as to require other aids alſo; as when they become ſwelled, painful, and diſcharge a corroding, acrid matter: when ſuch appearances occur, a carious bone may frequently be ſuſpected to be at the bottom of the ſore: and then, nature muſt be aſſiſted, by freeing her from ſuch parts of it as are moſt diſeaſed, and that are become looſe. This, in ſome ſituations may be done, but when the complaint is fixed in any of the large joints, art can rarely afford much aſſiſtance; and as amputation is not often adviſable, from the riſk of the diſeaſe returning to ſome other part, nature alone muſt often be truſted to. In ſuch a ſituation, recourſe ſhould be had to a *continued uſe of ſea-bathing*, and the *bark* with *hemlock*; and we ſhould attempt particularly to promote a proper diſcharge from the ſores. And when by a due uſe of the neceſſary means, there is a tendency in the ſores to heal, *iſſues ſhould be formed*, ſo as to produce a diſcharge as nearly equal to that from the ſores as may be; thus the cure is carried on, both more effectually and ſafely. Theſe iſſues are generally required through life. *Gentle compreſſion* is peculiarly uſeful in this kind of ulcer: it particularly prevents and removes that thickneſs in their edges that ſometimes is obſerved. Theſe in general are the means that aſſiſt and are moſt uſeful, when there is a tendency in nature to overcome the diſeaſe: but it being in general an opprobrium medicorum, it is difficult to aſſert with much poſitiveneſs concerning it. See Wiſeman's Surgery. Heiſter's Surgery. Boulton's Surgery. Ferne on the *King's Evil*. Cheyne on the *King's Evil*. Lond. Med. Obſ. and Inq. vol. i. p. 184—200, 303—322. Bell on Ulcers, edit. 3. p. 421. Cullen's Firſt Lines, vol. iv. White on the *Scrofula*. Bell's Surgery, vol. v. p. 507. Kirkland's Med. Surgery, vol. ii. p. 446.

SCROPHULA. See SCROFULA.

SCROPHULARIA. So called, not becauſe of its efficacy in curing the *ſcrofula*, but becauſe its root hath unequal tubercles like thoſe in the *ſcrofula*. Boerhaave mentions fifteen ſpecies. See alſo CRASSULA, CHELIDONIUM MINUS, GUACATANA.

SCROPHULARIA MAJOR, alſo called *ſcroph.* nodoſa fœtida, *ficaria*, *millemorbia*. COMMON KNOBBY-ROOTED FIG-WORT. It is the *ſcrophularia* nodoſa, Linn.

—— AQUATICA, alſo called *betonica aquatica*. WATER-BETONY, GREATER WATER-FIG-WORT. This plant is ſaid to be the ſame as the *iquetaia* of the Braſilians, which is ſo famed for correcting the nauſeous qualities of ſena. Its other virtues are the ſame with the above ſpecies. See Raii Hiſt. Neum. Chem. Works.

SCROTUM. It is the external covering of the teſticles: called alſo *burſa teſtium*, *oſcheus*, *oſcheon*. GALEN calls it *orchea*. It chiefly conſiſts of looſe ſkin and cellular membrane, without any fat. This lax part the Athenians called *laccopedon*. It is compoſed of the cuticula, the cutis, the membrana cellularis, and perhaps the expanded fibres of the cremaſter muſcle on each ſide. Betwixt the cuticle and the cutis is the rete mucoſum, as in other parts of the body. Adjoining to the internal ſurface of the ſkin, is a thin covering of a looſe, hollow texture, void of fat, which is the cellular membrane; next, within this cellular ſubſtance, is an apparently thin, muſcular, or fleſhy body, called by the Greeks, *dartos*: a name which it derives from its raw, or excoriated appearance, and not from its uſe of contracting the *ſcrotum*. Immediately within the dartos, is a ſecond cellular ſubſtance, which is more conſiderable than the firſt-named portion. The membrana cellularis externa *ſeroti* admits of a paſſage to the fleſhy fibres of the dartos muſcle; which fibres are attached to, or connected with, the internal ſurface of the cutis; the dartos likewiſe admits of a paſſage to the filaments of the internal cellular membrane; ſo that the two cellular membranes are obſerved to communicate. Upon the external ſurface of the *ſcrotum* is a prominent line or ridge, termed raphe. The direction or courſe of the raphe is perpendicular or longitudinal, and it is continued from the anus to the extremity of the penis on its inferior part. The raphe divides the external ſurface of the *ſcrotum* pretty nearly into two equal portions. The *ſcrotum* forms two diſtinct bags; one for each teſticle, and its immediate tunics, or coats. Theſe bags are formed by a duplicature of the part called the dartos, and they are ſituated on each ſide of the raphe of the *ſcrotum*. The bags being thus formed, are laterally connected to each other, by the intervention of a cellular membrane. This union or connection of the ſides of the dartos conſtitutes that partition, which by anatomiſts is denominated *ſeptum ſroti*, alſo *diaphragma*. The ſeptum *ſeroti*, on its inferior part, is connected to the internal ſurface of the cutis, immediately under the raphe; on its ſuperior part, this ſeptum is connected to the inferior and external ſurface of the urethra, after having been expanded upwards betwixt the tunica vaginalis of each teſticle. Upon a removal of the ſeveral parts which unite in forming the *ſcrotum*, the tunics or proper coats of the teſticles next preſent themſelves to view.

The *ſcrotum* is liable to inflammation and abſceſs, which ſometimes are attended with a conſiderable degree of fever, and that not without danger of life. If poſſible, endeavour to remove the inflammation without permitting ſuppuration to take place: to this end, *bleeding* and *other antiphlogiſtics* muſt be directed; *diſcutient cataplaſms* applied cold, and renewed as often as they become warm; and, by all means, confine the patient to his bed. The

ſcrotum ſhould be ſuſpended in a bag-truſs, ſo as that it may be kept near the belly; and if it is thought proper to encourage a ſuppuration, let a fomentation be uſed warm, at leaſt twice a day, and after each time of fomenting, a poultice applied warm, and renewed as often as it becomes cool. In this caſe the patient muſt be ſupported with a *generous diet* and *proper cordials*, ſuch as the *cort. Peruv. rad. ſerp. rad. contrayerv.* in ſubſtance or in form of decoction as may ſeem moſt eligible: the *conf. aromatica* is alſo to be added, and, if pain requires it, an opiate occaſionally.

When by the ſize and prominence of the ſwelling, the ſoftneſs of the integuments, their ſhining red colour, the peeling off of the cuticle from the cutis, the mitigation of pain in the part itſelf, an œdematous appearance of the integuments upon being preſſed, but above all, the fluctuation of matter under the fingers, it appears that maturation is perfected, then open the tumor on its moſt depending part. If the tumor be large, and the integuments thin and much diſcoloured, remove an oval piece; thus you will be able more effectually to apply thence the full dreſſings. As ſoon as the matter is diſcharged, *fill the wound with ſoft lint*, and *over it apply the poultice*, or *apply a pledgit of ſoft tow with ſome emollient ointment ſpread on it*. The future dreſſings may be the *ungt. reſinæ flavæ*, or *other digeſtive*. At the end of the two firſt days, the dreſſing ſhould be renewed twice in twenty-four hours, and thus continue on account of the acrimony and quantity of the diſcharge, ſo long as may be thought neceſſary, not forgetting to uſe an emollient fomentation, for the ſpace of ten or fifteen minutes previous to each dreſſing. If the diſcharge is thin, ſanious, or corroſive, *ſprinkle ſome brandy or camphorated ſpirit of wine upon each fomentation cloth*. If after the operation any conſiderable hardneſs of the integuments ſhould ſtill remain, continue to apply the ſuppurating poultice, at each time of dreſſing, over the pledgits of digeſtive, until the hardneſs is removed. The uſe of the *bark* alone, or *with the rad. ſerp. V.* or *rad. contrayerv.* or a decoction of theſe; as alſo the *dilute vitriolic acid*, in the patient's drink, will generally greatly ſupport the patient's ſtrength and alter the matter in its quality.

Another afflictive diſeaſe is too often met with in the *ſcrotum*, viz. the cancer. It ſeems peculiar to chimney-ſweepers; hence it is called CANCRUM MUNDATORUM, the CHIMNEY-SWEEPERS' CANCER, the CHIMNEY-SWEEPER'S WART, and the SOOT-WART. From whatever cauſe it may be, it is evident beyond a doubt that chimney-ſweepers are peculiarly liable to this diſeaſe in this part. Mr. Pott ſeems to be the firſt writer who hath noticed it; he thinks it may be owing to a lodgment of ſoot in the rugæ of the *ſcrotum*, and at firſt not be a diſeaſe of the habit.

He farther obſerves, that it always makes its firſt attack on, and its appearance in, the inferior part of the *ſcrotum*; when it produces a ſuperficial, painful, ragged, ill-looking ſore, with hard and riſing edges. It does not uſually appear before, whence it is often taken both by the patient and the ſurgeon for venereal; and being heated with mercurials, is ſoon and much exaſperated: in no great length of time, it pervades the ſkin, dartos, and membranes of the *ſcrotum*, and ſeizes the teſticle, which it enlarges, hardens, and renders truly and thoroughly diſtempered: from whence it makes its way up the ſpermatic proceſs into the abdomen, moſt frequently indurating and ſpoiling the inguinal glands: when arrived within the abdomen, it affects ſome of the viſcera, and then very ſoon becomes painfully deſtructive.

The only chance of putting a ſtop to, or of preventing this miſchief, *it immediately to remove the part afflicted*, i. e. that part of the *ſcrotum* where the ſore is. If it be ſuffered to remain until the virus hath ſeized the teſticle, it is generally too late, even for caſtration. If ever extirpation bids fair for the cure of a cancer, it ſeems to be in this caſe; *but then the operation ſhould be immediate, and before the habit is tainted. When it reaches the teſticle, it is rapid in its progreſs, and moſt certainly deſtructive in its event: ſo, early to extirpate is the only cure.* Fiſtulous ulcers are ſometimes met with in the *ſcrotum*; if theſe communicate with the urethra, a particular attention thereto will be required in attempting to relieve. The cauſes may be an abſceſs in the *ſcrotum*; a wound made through the *ſcrotum* into the urethra; the venereal diſeaſe firſt affecting the urethra, and from thence producing the ulcer in the *ſcrotum*, &c. The external ſore is generally very ſmall and ſinuous; the lips grow callous; the diſcharge is thin, copious, and almoſt continual; and if there is a communication with the urethra, the urine will more or leſs eſcape through the external wound at the times of making water; it will alſo inſinuate itſelf into the cellular membrane of the *ſcrotum*, and its neighbouring parts, and be therein confined; whence many inconveniences ariſe that cannot be removed until the orifice made through the urethra is healed.

When this diſorder originates in the urethra, it may be known by introducing a catheter or bougie; for an obſtruction will be met with there: when it is cauſed by an abſceſs forming itſelf within the cellular membrane near the urethra, or in the corpus cavernoſum urethræ, there will be little or no reſiſtance met with from the bougie. As to fiſtulous ſores, calloſities, enlargements, and diſtenſions in theſe parts; it is worth remembering, that although the diſeaſe ſhould appear to be not confined to the *ſcrotum*, but that it extends to the perinæum and nates, and there be many external fiſtulous openings through the integuments of theſe parts, yet theſe ſhall in ſome inſtances be diſcoverable only on opening into the urethra; to remove which ſhould be the primary attempt of the ſurgeon, *as the cure of the whole very much depends, if not altogether, upon this very circumſtance*; and of this be aſſured, *that the permanency or the cure of every wound, however circumſtanced, depends upon the roundneſs and firmneſs of its foundation at the bottom.*

When a venereal cauſe gave riſe to this diſorder, the judicious introduction and uſe of bougies, made of proper compoſitions, ſize, and ſtiffneſs, joined with mercurial frictions, applied near to, or immediately upon the diſeaſed parts, in proper quantities, at proper intervals, and continued for a due length of time, joined with ſoft oily purges, occaſionally adminiſtered, and ſoft, diluting drinks, will often render every ſevere operation unneceſſary; though the circumſtances attendant upon the complaint be of a bad and complicated kind.

See Pott's Chirurgical Works. Warner's Caſes in Surgery. Warner on the Teſticles. White's Surgery, p. 61.

SCRUPULUS. A SCRUPLE, called alſo *dibogon*, *gramma*. A weight with us, which is equal to twenty grains; but in France, Germany, &c. it contains twenty-four grains. Three ſcruples, however, are a dram, and eight drams an ounce, in all theſe countries.

SCUTELLARIA. See CASSIDA.

SCUTIFORME OS. See PATELLA.

SCUTUM. See EPITHEMA.

SCYRUS LAPIS. See PUMEX.

SCYTHICUS LATEX, alſo called ὕδωρ, DIVINE WATER.

SEBACEÆ GLANDULÆ, called alſo *miliares*. Many of theſe are about the noſe, where their contents are often hardened, and at the extremities of their ducts there appear black ſpots, and when the matter is ſqueezed out it reſembles a worm with a black head. Theſe glands are ſeated in the cellular membrane, under the ſkin, and in various parts of the body they are enlarged and form encyſted tumors. Theſe glands are called the miliary glands, by ſome. But as to miliary glands diſtinct from theſe, the moderns deny their exiſtence, not being able to diſcover them.

SEBACEUS HUMOR. The *ſebaceous humour* is ſupplied by the *ſebaceous* glands, to preſerve the ſenſibility of the ſkin, and to keep it moiſt by preventing too copious a perſpiration. When this glutinous *humour* is wanting, as in eryſipelas, the ſkin is dry and parched, and little or no ſwelling can be brought on there by inflammation, becauſe the erethiſm of the veſſels is but ſmall, and the morbific *humours* having nothing in their way to retard their egreſs, exhale through the expiring veſſels of the ſkin. All the inner membranes of the body are ſupplied with an *humour* ſimilar to this.

SEBADILLA. See CEVADILLA.

SEBAR. See AGALLOCHUM.

SEBESTEN, SEBESTINA, SEBSTEN, } alſo called *myxa*, *myxara*, *myxas*, *vidamaram*. That uſed in medicine is the *cordia ſebeſtina*, Linn. It is a fruit in the ſhape of a plum, black on the outſide, with a flattiſh wrinkled ſtone. It is produced in Egypt and Aſſyria. It is cooling and moiſtening; but is not uſed as a medicine, though it is ſaid to obtund ſharp humours which fall on the lungs.

SECALE, alſo called *filigo*, *regga*. RYE. It is a kind of grain: it nouriſhes leſs than wheat, and ſome people find that the bread made of it gripes and gently purges them;

them; of all the cerealia it is the moſt readily aceſcent, to which we may perhaps attribute theſe effects. Sometimes this grain is corrupted, and then it occaſions painful and convulſive diſorders, and death. The meal of this grain, mixed with common ſalt, and dried before the fire, then applied to an eryſipelas, is an excellent diſcutient; mixed with honey it becomes a ſuppurative cataplaſm. When grains of rye are diſeaſed and grow like a horn, they are called *clavi ſiliginis*.

SECRETIO, from *ſecerno, to ſeparate*. SECRETION. The various *ſecretions* are all from the blood: but how it happens that each *ſecretory* veſſel at firſt ſeparated a particular part from the general maſs, and always continues to do the ſame, is perhaps not ſo clearly underſtood as is ſuppoſed. See Haller's Phyſiology, ſect. 8. Pemberton's Phyſiology, ſect. 7.

SECUNDINA. SECUNDINES, called alſo *deuterion*. The placenta and membranes. See PARTURITIO and INVOLUCRA.

SEDANTIA. SEDATIVES. Medicines ſuited to diminiſh the motions, and power of motion, in the body. They ſeem to ſtand oppoſed to what irritates, and are the loweſt claſs of antiſpaſmodics, as anodynes are the moſt powerful.

SEDATIVUS SAL. SEDATIVE SALT. The acid of borax hath, until very lately, been unknown as to its peculiar nature and origin. Mr. Hœffer found it in an uncombined ſtate, but diſſolved in the laguni, or lakes of hot mineral water near Monte Rotondo, Berchiaio, and Caſtelnuovo, in Tuſcany, in the proportion of nine grains in one hundred of water. Mr. Maſcagni hath found it adhering to ſchiſtus on the borders of the lakes, of a dirty white, yellow, or greeniſh colour, and cryſtallized in the form of needles. This acid, i. e. the acid of borax is called *ſedative ſalt*, and may be thus procured. Diſſolve eight ounces of *borax* in three ounces of warm water; then add three ounces of the oil of vitriol. Evaporate this mixture until thin plates begin to appear upon the ſurface, which are to be ſwept off with a feather; then let the fire decay, and the veſſel ſtand unmoved, till more cryſtals are formed, which are to be well rinſed with cold water, and dried for uſe. Theſe cryſtals are the famed *ſal ſedativus, which*, GAUBIUS ſays, *will procure reſt in inflammatory fevers when opiates fail*. To this end it is given from gr. viij. to xvj. Dr. MORRIS uſed to give it to maniacs in doſes of two drams to compoſe them. Lemery ſays that two ounces of *borax* afforded him rather more than half an ounce of ſedative ſalt; but he obtained it by ſublimation, which method produces a purer ſalt, but is more tedious. It is obtained by ſublimation thus: put a mixture of nine parts of *borax*, three of the oil of vitriol, and one of water, into a wide-necked retort; place the retort over a fire at firſt gentle, then haſtily increaſed until the veſſel is red-hot; the ſedative ſalt ariſes, and fixes itſelf about the neck of the retort; the liquor that diſtils and falls into the receiver ſhould be poured back as the matter dries which is in the retort, for the ſedative ſalt only riſes while it is moiſt.

After the ſeparation of the ſedative ſalt from the *borax*, by means of the vitriolic acid, what remains is only a combination of this acid, with the mineral alkaline ſalt. The ſedative ſalt, joined to the marine alkali, recompoſes *borax* again.

This peculiar and characteriſtic ingredient of *borax*, the ſedative ſalt, though called ſubacid, from its property of neutralizing alkalies, ſcarcely diſcovers any other mark of acidity. Its taſte is bitteriſh, and rather cool; it makes no change in the colour of blue flowers, nor does it effervеſce either with acids or alkalies; a ſpirituous ſolution of it, if ſet on fire, burns with a green flame. As a medicine it is antiſpaſmodic and anodyne, whence its name ſedative. Though Dr. Cullen, ſpeaking from experience, ſays, that in large doſes it has no effect on the human body. Mat. Med. See BORAX and TINCAL. Kirwan's Elem. of Mineralogy.

SEDATIVUS SAL HOMBERGII. See COLCOTAR (SAL).

SEDENTARIA OSSA. See ACUMEN.

SEDUM. So called from *ſedendo, ſitting*, becauſe of its poſture on walls, &c. where it grows; or from *ſedando*, becauſe it allays when applied to parts that are inflamed. It is alſo called *ſempervivum*, becauſe, as its name expreſſes, it is always green; and *vermicularis*, becauſe its leaves reſemble worms; and *barba Jovis*. In Engliſh it is called SENGREEN and HOUSE-LEEK. Boerhaave mentions twenty-eight ſpecies. The ſort uſed in medicine is the SEMPER-VIVUM TECTORUM, Linn. The GREATER HOUSE-LEEK, called *ſedum majus, æichryſon, æonion, æizoon, craſſula minor, illecebra, æthales, piper murale*. They are ſmall plants, whoſe ſhort and thick ſtalks are covered with little fleſhy conical leaves, ſet thick together in the manner of ſcales; on the tops appear pentapetalous flowers, which are followed by a pod full of ſmall ſeeds. They are annual, grow on old walls and dry ſtony grounds. They flower in June and July.

The leaves have an acrid taſte, but no remarkable ſmell: *applied externally*, ſome of them veſicate the parts; and if *taken internally*, in no great quantity, they are ſtrongly emetic; whilſt the common ſort, and ſome other ſpecies, abate external inflammation; and, if taken inwardly, are emollient and laxative, and have ſomething of acrid, auſtere, and aſtringent; but they are not of any note in the preſent practice.

It is alſo a name for *paronychia*; *craſſula*; *aizoon*.

SEIGNETTE, SEL DE. See RUPELLENSIS SAL. It is thus named from Dr. Seignette, of Rochelle, who invented it.

SELENITES. This name is given to a combination of the vitriolic acid with calcareous earth. See the Dict. of Chem. Neumann's Chem. Works.

SELINUM MONTANUM. STONE PARSLEY. Called alſo *apium peregrinum*,—*daucus peregrinus*,—*ſeſelinum peregrinum*,—and *viſnaga minor*. It hath nothing remarkably different from the common or garden parſley in its medical powers. See APIUM HORTENSE.

SELLA TURICA. } It is a depreſſion be-
—— SPHENOIDALIS. } tween the clinoid apophyſes of the ſphenoid bone; called alſo *ephippium*; *foſſa pituitaria*.

SELTZER WATER. This water is got from a ſpring near to the town of *Nieder Seltzer*, in the biſhopric of Triers, in Germany. It has a briſk acidulous taſte as taken up from the fountain, but loſes it on being expoſed to the air in an open veſſel. HOFFMAN ſays that by ſtanding, it acquired a lixivial taſte, and that he obtained ſeventy-two grains of reſiduum, by evaporating twenty-four ounces of the water, which yielded forty grains of a pure alkaline ſalt; and Dr. Brockleſby, in the fourth volume of the Medical Obſervations and Inquiries, publiſhed in 1771, mentions his having obtained a reſiduum of the ſame nature, but in leſs quantity. Dr. Venel, from different experiments, found that theſe waters contain no volatile acid, and that what has been called their ſpirit, is nothing but a ſuperabundant quantity of fixed air; that it is evident they do not contain any free diſengaged fixed alkali, or even alkaline earth, more than common water; and that it is impregnated with nothing but ſea-ſalt and a large quantity of fixed air; and alſo that the air in theſe and other ſpiritous mineral waters is truly united, diſſolved, and combined with the water in the true ſenſe of the chemiſts, that is, divided into its minuteſt parts, which do not combine while they remain in that ſtate, but that this union with the water, though real, is very ſlight. He propoſes to impregnate water with aerial acid, by ſaturating mild alkaline ſalts with acids in the water itſelf, either in large veſſels cloſe ſhut, or in veſſels which have but a ſmall communication with the external atmoſphere, and by letting the veſſels remain at reſt, without ſhaking; for motion, the doctor ſays, prevents the union, and diſjoins the air from the water that is already united. In this way he imitated the natural Seltzer waters, by ſaturating with the marine acid, in two pounds of common pure water, that quantity of the mild foſſil alkali, which it required to make a quantity of ſea-ſalt, equal to that which two pounds of the natural Seltzer water contained. Sir Tobern Bergman from one hundred cubic inches obtained about one of common air; ſixty of aerial acid, or fixed air; of aerated lime, ſeventeen grains; of aerated magneſia, twenty-nine one-half; of cryſtallized mineral alkali, twenty-four; of common ſalt, one hundred and nine one-half. Theſe waters operate chiefly by urine, ſeldom or never by ſtool. They are powerful antiſeptics, and give a gentle ſtimulus to the nerves; they allay heat and thirſt; and have been much preſcribed in ſcorbutic, phthiſical and nervous caſes. Hoffman recommends them much for correcting the bad habit of the blood and other juices, in arthritical and gouty caſes, and as powerful deobſtruents. They are drank from a pint to three or more in a day. They are often mixed with milk in phthiſical and other hectic caſes, and agree well. See Dr. Monro's Med. and Pharm. Chem. vol. ii. alſo AQUÆ MINERALES.

SEMEIOTICA. See MEDICINA.

SEMEN. SEED; named *carpos*. IN BOTANY, it is a body perfected by the mutual operation of both ſexes, containing the rudiment of ſuch plant as that from which it was taken, ſo may properly be judged to be analogous to the egg of an animal. It is alſo applied to the prolific fluid of animals; and called *genitura*; *gone*. In HIPPOCRATES, when a ſudden or immediate defluxion occurs, he expreſſes it by the word *diipetes*; and when there is an efflux of ſemen, before it receives the conformation of the fœtus, *ecryſis*, to diſtinguiſh it from abortion.

SEMENTINA. See SANTONICUM.

SEMICUPIUM. *Excathiſma*, *inſeſſio*, a HALF BATH, where people are generally immerſed up to the navel. It is uſually formed of warm water, or that impregnated with herbs of different ſorts, adapted to the nature of the complaint, and what are ſuppoſed to be productive of ſome deſired effect. It is conſidered uſeful in *alleviating pain*; *diſpelling flatulent matter*; *ſoliciting a flux of humors downwards*, and *there quickening the circulation*; *ſoftening and relaxing the parts*, and *producing the catamenia*.

SEMIFIBULÆUS. See PERONÆUS SECUNDUS.

SEMILUNARES CARTILAGINES. They are placed upon the upper part of the tibia; they are thick on the outſide, and ſerve to deepen the cavity; they likewiſe ſerve to give ſome degree of rotation to the joint, being moveable and variable, to adapt themſelves to the condyles in the various motions of the joint.

SEMIMEMBRANOSUS MUSCULUS. It riſes tendinous from the poſterior part of the tuberoſity of the iſchium, cloſe to the origin of the muſculus quadratus femoris, and is inſerted into the back part of the internal condyle of the tibia.

SEMINERVOSUS MUSCULUS. It is alſo called *ſemitendinoſus*. It lies upon the outſide of the ſemimembranoſus; at its origin it is one maſs with the head of the biceps; when they have run together a little way, they part, and the *ſemiteadinoſus* runs to the internal condyle and upper part of the tibia, making, conjointly with the ſartorius and the gracilis, a ſort of faſcia.

SEMI-ORBICULARIS. The orbicular muſcles of the lips, if conſidered as two, are called *ſemi-orbicularis ſuperior* and *inferior*.

SEMIRHOMBUS. See HEMIRRHOMBIUM.

SEMIS. See CYATHUS.

SEMISPINALIS. See SPINALIS DORSI MAJOR.

SEMITENDINOSUS. See SEMINERVOSUS.

SEMITERTIANA FEBRIS. The Greeks call it *hemitritæus*. Dr. CULLEN arranges it under his ſection of intermittents, 2d variety, and defines it a quotidian returning every day, with a remiſſion interpoſed more remarkably between the irregular and regular day, than between the regular and irregular day. It is a kind of fever, compounded of an intermitting tertian, and a continual quotidian. Some call it a continual tertian. It is one of thoſe tertians which returns every day. Some rank it as a remittent fever.

There is nothing peculiar in the management of this diſorder which the practitioner will not naturally ſuggeſt from his acquaintance with the nature and general methods of relief in fevers. See Spigelius and Hoffman on the Semitertian Fever, and Lommius's Med. Obſ.

SENEGAL, GUM. See GUM RUBRUM ASTRINGENS.

SENEGA, } Alſo called *ſenekka*, *ſenegaw*. AMERI-
SENEKA. } CAN MILK-WORT, RATTLE-SNAKE ROOT. POLYGALA SENEGA, or *Marilandica*, floribus imberbibus ſpicatis albis, caule erecto ſimpliciſſimo, foliis lato-lanceolatis. CLASS. DIADELPHIA. ORD. OCTANDRIA. LINN. Gen. Plant. 851.

SENEGA, *rattle-ſnake root*. The leaves are pointed, and ſomewhat oval; the ſtalks are upright and branched; the flowers are white; the root is variouſly bent and jointed; it is about the thickneſs of a little-finger, and reſembles the tail of a rattle ſnake; it hath a membranous margin, which runs its whole length on each ſide; outwardly it is of a yelloviſh or a pale browniſh colour, internally white. It is a native of Virginia, Pennſylvania, and Maryland, and is cultivated in our gardens. This root is ſaid to be a ſpecific againſt the poiſon of the rattle-ſnake; the powdered root, or the freſh root beat into a cataplaſm, is applied outwardly, and a decoction is taken inwardly. See BOICININGA. As the poiſon from the bite of a viper is apt to produce difficulty of breathing, cough, hæmoptyſis, a ſtrong quick pulſe, &c. evident ſymptoms of pleuriſy and peripneumony, it was thought that the ſenega might, in diſeaſes of this kind, be an efficacious remedy; which it has proved from repeated experience; though, in many caſes, the uſe of the lancet is to be called in as an auxiliary. It appears to be a general evacuant, producing a plentiful ſpitting, increaſing perſpiration and urine, and frequently purging and vomiting; hence its uſe in inflammatory fevers it promotes perſpiration, and it aſſiſts the expectoration in pleuriſies and peripneumonies; it is cathartic, and often proves emetic, to prevent which, it is given in weak cinnamon water. In pleuriſies, whether inflammatory or ſpurious, in the rheumatiſm, gout, gouty rheumatiſm, and the humoral aſthma, it is ſingularly uſeful. It has alſo been preſcribed with much ſucceſs in dropſies, and thought to have great power in rendering the ſizineſs of the blood more fluid. See PLEURITIS. The powder is preferred to any other preparation, and the doſe is from ℈ i. to ℈ ii. but a decoction of three ounces of the root in water, enough to ſtrain off a quart, is uſually given from two to four ſpoonfuls three or four times a day. See Lewis's Mat. Med. TENNENT's Eſſay on Pleuriſy. Philadelphia, 1736; alſo his Epiſtle to Dr. MEAD; De HAEN, Rat. Medend. P. 4, p. 352, who contradicts the laſt aſſertion by producing a ſtrong fact againſt it.

SENEGA, SENICA, SENEGAL, GUMMI. See GUMMI SENEGALENSE.

SENNA. It is a ſhrub with a roſaceous flower, which is followed with a pod with ſeeds like grape-ſtones. Botaniſts enumerate nine ſorts, but the following is that which is preferred in practice.

SENNA ALEXANDRINA, alſo called *folia Orientalia*, ALEXANDRIAN SENNA, *Caſſia ſenna*, foliis ſejugis ſubovatis, petiolis eglandulatis. CLASS. DECANDRIA, ORDO MONOGYNIA. LINN. Gen. Plant. 514. *Alexandrian acute, ſix-leaved ſenna*. It is called *Alexandrian*, not becauſe it grows there, but becauſe it is from thence chiefly that it is ſent into Europe. The leaves, called *Orientalia folia*, which are the parts in uſe, are of a lively yellow green colour, an oblong ſomewhat oval figure, ſharp-pointed at the end, about a quarter of an inch broad, and not an inch long. Chooſe thoſe which appear bright, freſh, free from ſtalks and ſpots, that are well and ſtrongly ſcented, ſmooth and ſoft to the touch, thoroughly dry, ſharp-pointed, bitteriſh, and ſomewhat nauſeous to the taſte. There are inferior ſorts, but they are generally diſtinguiſhed by their not being pointed, but more or leſs broad at the end.

The Arabians firſt brought theſe leaves into uſe; they are moderately ſtrong, and in general a ſafe cathartic; they *enter the blood* and *attenuate it*. Dr. Alſton preſcribed it in ardent fevers, and frequent experience manifeſts its ſafety and advantage even in the moſt delicate habits; and on the moſt robuſt it operates ſufficiently. Largely diluted, as when a dram of theſe leaves is infuſed in four ounces of ſoft cold water, is the moſt agreeable method of taking it; the addition of acids takes off the nauſea which it excites; and, as the griping quality depends upon its reſin, the dilute infuſions will be the freeſt from this effect. From ℈ j. to 3 j. of the powder is uſually ſufficient for one doſe.

Senna gives out its virtues both to water and to ſpirit. Long boiling deſtroys the purgative quality. If the *ſenna* is infuſed in an infuſion of bohea tea, its nauſeous quality is as well covered as though the famed fig-wort was uſed; and if it is infuſed in a decoction of guaiacum, its purging quality will be increaſed, and the griping which it generally occaſions will be prevented. Coriander ſeeds cover the taſte of the *ſenna*; but cardamom and ginger, or ſome of the warmer aromatics, are more effectual for preventing its griping. When infuſed in the infuſum amarum, a leſs quantity of *ſenna* has produced a ſimilar effect as when a larger one has been given in its own infuſion. The following electary acts pleaſantly as a moderate purgative. ℞ Electarii ſennæ ℥ ij. rad. jalap. pulverizati, cryſtallorum tartari ää ʒ ij. fyr. ſpir. cerv. q. ſ. ut fiat electarium.

The London College directs ſeveral preparations from this article, made in the following modes:

1. ELECTARIUM E SENNA. *Electary of* SENNA, formerly the *Electarium Lenitivum. Lenitive Electary.*

Take of *fenna*, eight ounces; figs, one pound; the pulp of tamarinds, caffia, freſh prunes, of each half a pound; coriander ſeeds, four ounces; root of liquorice, three ounces; clarified ſugar, two pounds and an half. Let the *fenna* and coriander ſeeds be powdered, and paſſed through a fine ſieve to the weight of ten ounces, and boil the remainder with the figs and liquorice in four pints of diſtilled water to two; then preſs off the liquor, and ſtrain. Evaporate the liquor to about one pint and an half, afterwards add the ſugar to make a ſyrup. Add the ſyrup gradually to the pulp; and mix in the powder afterward.

2. INFUSUM SENNÆ SIMPLEX. *Simple Infuſion of* SENNA.

Take *fenna*, an ounce and an half; powdered ginger, one dram; boiling diſtilled water, one pint. Macerate them for an hour in a cloſe-ſtopped veſſel, and ſtrain the liquor. The doſe ℥ i. ſs. to ℥ ij.

3. The infuſum *fennæ* tartarizatum is made of the ſame quantity of *fenna* and boiling water, to which are added two drams of cryſtals of tartar, and half an ounce of coriander ſeeds bruiſed. The cryſtals of tartar are firſt diſſolved by boiling in the water, and this poured upon the other ingredients, and managed in a ſimilar manner as above. The doſe in the ſame alſo.

4. EXTRACTUM SENNÆ. *Extract of* SENNA.

A pound of *fenna* is to be boiled in a gallon of diſtilled water, as in making the other extracts. After the boiling, a little rectified ſpirit of wine is to be added, and the ſtrained liquor reduced to a proper conſiſtence. This is a weaker purge than the powder, but gripes more. The doſe, ʒ ſs. to ʒ ij.

5. PULVIS E SENNA COMP. *Compound Powder of* SENNA.

Take of *fenna*, cryſtals of tartar, each two ounces; ſcammony, half an ounce; ginger, two drams. Powder the ſcammony ſeparately, the reſt together, and mix them. The doſe, gr. 10. to ʒ i.

6. TINCTURA SENNÆ. *Tincture of* SENNA.

TAKE *fenna*, one pound; caraway ſeeds, bruiſed, ℥ i. ſs. leſſer cardamom ſeeds, freed from their huſks, ℥ ſs. raiſins ſtoned, ℥ xvi. proof ſpirit of wine, one gallon; digeſt for fourteen days, and ſtrain. Doſe, ℥ ſs. to ℥ ij. Pharm. Lond. 1788.

See Tournefort's Mat. Med. Neumann's Chem. Work's. Lewis's Mat. Med. Pharm. Londin. 1788.

SENNA PAUPERUM. *Mauritanorum, Europæa*, and *ſpuria*. See COLUTÆA.

—— SCORPIUM. See EMERUS.

SENORIA. See BANANA.

SENSIBILIS. SENSIBLE. It is applied to whatever is capable of making an impreſſion on the ſenſes.

SENSIBILITAS. SENSIBILITY. The quality of being ſenſible, or the perceiving of any viſible thing, affecting or cauſing ſome alteration in the organ of ſenſe. The brain is the only ſenſible part of the body; all other parts are ſaid to be ſenſible, becauſe a portion of the medullary part of the brain is diffuſed over them, but they loſe this quality as ſoon as it is rubbed off or becomes dry. As the brain is the only ſenſible part, except the muſcular fibres, which ſeem to have a peculiar degree of irritability independent of the brain, though their active power appear to be increaſed, and continued by the brain, ſo that the muſcular fibres contract in conſequence of the irritation received by that portion of brain which covers them; theſe fibres are the only parts which perform their office by ſhortening themſelves; and thus it happens that they are the only parts which contract, and which have tremulous motions upon involuntary irritations. Every part of the body is capable of ſenſation in a ſound or in a morbid ſtate. See IRRITABILITAS and INCITABILITAS. See alſo Fordyce's Elements, part i. Medical Commentaries by Dr. Hunter.

SENSORIUM COMMUNE; named alſo *crithetetium*. CARTESIUS, and others, ſay, it is the pineal gland; but WILLIS has demonſtrated it to be where the nerves of the external ſenſes are terminated, which is about the beginning of the medulla oblongata, or top of the ſpinal marrow, in the corpus ſtriatum.

SENSUS EXTERNI. The EXTERNAL SENSES. Theſe are generally reckoned to be the ſenſes of SEEING, HEARING, TASTING, SMELLING, and FEELING, each of which ſee. Theſe five *ſenſes* agree in the following particular; viz. that nothing is perceived until it makes an impreſſion upon the organ of *ſenſe*; but they differ as to our conſciouſneſs of that impreſſion; in *touching, taſting*, and *ſmelling*, we are conſcious of the impreſſion, but not ſo in *hearing* and *ſeeing*; on which account theſe latter are conſidered as more refined; the former ſeeming to exiſt externally at the organ of *ſenſe*, are conceived to be merely corporeal. See Haller's Phyſiology; Shebbeare's Theory and Practice of Phyſic.

SENSUS INTERNI. The INTERNAL SENSES are thoſe affections of the mind which are excited in it by its perception of ideas; theſe are generally reduced under theſe four heads; viz. *imagination, memory, attention*, and *the paſſions of the mind*. Their influence on health is noted in many particulars mentioned in the different parts of this work. See Haller's Phyſiology.

SEPARATORIUM. A SEPARATORY. The name of an inſtrument for ſeparating the pericranium from the cranium; alſo *hypoclepticum vitrum*, a chemical veſſel for ſeparating liquors, but particularly for the ſeparation of the eſſential oil of any vegetable ſubject from the water that is diſtilled therefrom.

SEPIÆ, } Called alſo *præcipitans magnum.*

SEPIUM OS. } CUTTLE-FISH BONE. The *cuttle-fiſh* is a kind of polypus, called *calamary*. It hath two *bones*, one which is like a knife, the other is like a quill; the latter of theſe, when calcined in the ſun, is uſed as a dentifrice ſometimes, but the practice rarely notices it. There is a liniment in uſe, made in the following manner, called LINIMENTUM SÆPIÆ: ℞ Sacch. conditi, offis ſepiæ, ſing. ʒ j. calomelan. pp. ϑ ij. mel. roſ. q. ſ. ut fiat linimentum. The two firſt ingredients are to be finely levigated, mixed then with calomel, and formed into a liniment with the honey of roſes. This is uſed for opacities of the tranſparent cornea of the eye.

SEPOMENEN. See MORTIFICATIO.

SEPTANA. A SEPTENARY FEVER, alſo *ſeptimana*, that is, a fever which performs its period in ſeven days. Alſo an erratic intermitting fever which returns every ſeventh day.

SEPTICA. SEPTICS. Medicines which promote putrefaction; alſo corroſive ones.

SEPTICUS LAPIS. See CAUTERIUM POTENTIALE.

SEPTIFOLIA. See DENTARIA.

SEPTIMANA. See SEPTANA.

SEPTINERVIA. See PLANTAGO LATIF.

SEPTUM CORDIS, vel *ventricularum*, from *ſepes, a hedge*, or *diviſion*. The partition between the two ventricles of the heart. See COR.

SEPTUM LUCIDUM. The thin partition which divides the two lateral ventricles of the brain. It is a kind of duplicature of a continuation of the corpus calloſum. It is united on its lower part with the fornix. See CEREBRUM.

—— NARIUM, called *interſeptum*. The partition betwixt the noſtrils It is formed by the deſcending laminæ of the os ethmoides, and by the vomer, and it is placed in the groove framed by the criſtæ of the oſſa maxillaria, and riſing edges of the oſſa palati. The cartilage which forms the lower part of this *ſeptum*, is joined to the anterior edge of the middle portion of the os ethmoides, to the anterior edge of the vomer, and to the anterior part of the groove formed by the oſſa maxillaria, as far as the naſal ſpines of theſe bones.

—— CONCHÆ. See AURICULA.

—— PALATI. See PALATUM MOLLE.

—— SCROTI. See SCROTUM.

—— TRANSVERSUM. See DIAPHRAGMA.

SEPTUNX. See CYATHUS.

SERAPIAS. See ORCHIS.

SERAPINUM. See SAGAPENUM.

SERAPIONIS GUMMI. See GUMMI ARABICUM.

SERGELIM. See CORALLODENDRON.

SERICUM. SILK. Raw *ſilk*, prepared in the manner of ſponge when it is calcined, excels the ſponge in its medical effects; it alſo yields more volatile ſalt than any other animal ſubſtance yet tried. In Switzerland, the volatile ſalt of raw *ſilk* is called the ENGLISH SALT: they alſo give the ſame name to the volatile ſalt of vipers.

SERIFLUXUS. A ſerous diſcharge, or flux of ſerum.

SERIFOLE BENGALENSIUM. See COVALAM.

SERIOLA. See ENDIVIA.

SERIPHIUM. See SOPHIA.

SERPENS ANGUIS. See ANGUIS.

SERPENS INDICUS CORONATUS. See COBRA DE CAPELLO.

SERPENTARIA. See DRACONTIUM.

SERPENTARIA HISPANICA. See SCORZONERA.

—— MINOR. See ARUM.

—— NIGRA. See ASARUM VIRGINIENSE.

SERPENTARIA VIRGINIANA; called alſo *ariſtolochia, piſtolochia, viperina, colubrina Virginiana, contrayerva Virginiana.* VIRGINIAN SNAKE-WEED, SNAKE-ROOT, BIRTH-WORT. It is the ARISTOLOCHIA SERPENTARIA, *foliis cordato-oblongis planis, caulibus infernis flexuoſis teretibus, floribus ſolitariis: caulis geniculata valde nodoſa. Flores ad radicem.* CLASS. GYNANDRIA, ORD. HEXANDRIA. LINN. Gen. Plant. 1022. It is brought from Virginia and Carolina; it is ſmall, light, buſhy, and compoſed of a number of ſtrings or fibres iſſuing from one head, and matted together, of a browniſh colour on the outſide, and pale or yelloviſh within. It hath an aromatic ſmell, ſomewhat like that of valerian, but more agreeable, and a warm, bitteriſh pungent taſte, not eaſily covered by a mixture with other ſubjects.

Snake-root gives out its active matter to water or to ſpirit. The greateſt part of its flavour is carried off either by water or by ſpirit in diſtillation; and if the quantity diſtilled be large, there ariſes with water a pale-coloured eſſential oil, of a ſtrong ſmell, but not a ſtrong taſte: the greateſt part of the camphorated pungency and bitterneſs of the root remains in the inſpiſſated extract. The ſpirituous extract is ſtronger than the watery, not from its having loſt leſs by evaporation, but from its containing the active parts of the root concentrated in a ſmaller volume, its quantity amounting only to one half of the other.

The *Virginian ſnake-root* is thought to poſſeſs tonic and antiſeptic virtues, and is generally admitted as a powerful ſtimulant, and a warm diaphoretic, of excellent uſe in low and putrid fevers; it raiſes the pulſe, promotes perſpiration, reſiſts putrefaction, and corrects a putrid diſpoſition which is already begun. In ſome intermittent fevers, the bark has been found more efficacious, when joined with ſerpentaria, than when given alone. The ſtimulant power of the *ſnake*-root is eſpecially ſuited to the low and advanced ſtate of the typhus only, and even then it will be more ſafely joined with the bark than employed for its ſtimulant power alone. In the uſe of this medicine, particularly in fevers, much caution is neceſſary. See CONTRAYERVA. Dr. Alſton ſays it reſembles the ariſtolochia in virtues, but that he prefers the ariſtolochia tenuis to the ſerpentaria on all accounts. The doſe may be from gr. x. to 3 ſs. and to a dram or two in infuſion.

The *Virginian aſarum* is ſometimes ſold for the *ſnake-root*, but the aſarum is blacker.

The London College direct a tincture of *ſnake-root* to be made of *Virginian ſnake-root*, three ounces; proof ſpirit of wine, two pints; then digeſted for eight days, and afterwards ſtrained. Ph. Lond. 1788. In this tincture, if the *ſnake-root*, with which it is made, be powdered fine, is the whole virtue of the root. It may be taken from two tea-ſpoonfuls to a table ſpoonful, three times a day. See Lewis's and Cullen's Mat. Med.

SERPENTIS LAPIS. See COLUBRINUS LAPIS.

SERPIGO. This word is uſed both for the *herpes* and *impetigo*. Linnæus ſignifies by it TETTERS and RINGWORMS; alſo ſee LICHEN, and PURPURA SCORBUTICA.

SERPYLLUM; called alſo *gilarum*. Boerhaave takes notice of ſix ſpecies of this plant.

SERPYLLUM CITRATUM, alſo called *thymus citratus*. LEMON THYME. It differs but little from the mother of thyme in its appearance, except that it is upright and buſhy. It is a native of dry mountainous places, common in gardens, and flowers in July. It is leſs pungent than the common *thyme*, and more ſo than the mother of *thyme*, and more grateful than either. Its ſmell is like that of *lemon* peel; diſtilled with water, it yields a larger quantity of eſſential oil than the other ſorts do. This oil contains nearly all the medicinal parts of the plant. Spirit of wine alſo takes up the finer parts.

SERPYLLUM VULGARE MINUS. COMMON MOTHER of THYME, or WILD THYME. THYMUS SERPYLLUM vulgaris minor, foliis planis obtuſis baſi ciliatis, floribus capitatis, caulibus repentibus. CLASS. DIDYNAMIA, ORD. GYMNOSPERMIA. LINN Gen. Plant. 727. COMMON SMALL WILD THYME, called *hyſſopus capitata*. It grows wild on heaths and dry paſture ground; it flowers in June and July; it is an agreeable aromatic, ſimilar to that of the other ſpecies, but milder, and in flavour it is rather more grateful. Its eſſential oil is both in ſmaller quantity, and leſs acrid, and its ſpirituous extract comes ſhort of the penetrating warmth and pungency of that of the common *thyme*.

Theſe two are ſpecies of *thyme*, and poſſeſs nearly ſimilar virtues, though evidently leſs medicinal. See THYMUS.

SERRATUS ANTICUS MAJOR, from *ſerra, a ſaw*. The FORE, or GREATER SAW-LIKE MUSCLE. It riſes by digitations from the nine ſuperior ribs, then paſſes backwards, and is inſerted into the whole length of the ſcapula. Its largeſt portion is inſerted into the lower angle of the ſcapula, which it rotates and brings forwards. Between every portion of this muſcle, there is a quantity of cellular membrane interpoſed, eſpecially about the middle, where it ſeems to divide it into two diſtinct muſcles. If the *pectoralis minor* is called *ſerratus* anticus minor, this muſcle is called major, otherwiſe it is ſimply called *ſerratus* anticus.

SERRATUS ANTICUS MINOR. See SERRATUS ANTICUS MAJOR.

—— POSTICUS SUPERIOR. It riſes by a thin broad tendon, from the two upper vertebræ of the back, and the two lower of the neck, and runs to be inſerted into the ſecond, third, and fourth ribs.

—— POSTICUS INFERIOR. It riſes from the faſcia of the loins, and is inſerted into the three laſt ribs, ſerving to bring them down.

SERTULA CAMPANA. See MELILOTUS.

SERUM. WHEY. The thin part of the blood is alſo called its *ſerum*. The *ſerum* of the blood contains a coagulable matter, which forms what is called the buff upon the blood after taking it from a vein. Dr. Fordyce obſerves, in the firſt part of his Elements, that the *ſerum* is fluid in any degree of heat between thirty and one hundred and ſixty of Fahrenheit's thermometer; that it conſiſts chemically of a coagulable matter and water, in which common ſal ammoniac, phoſphoric ammoniac, and generally common ſalt, and frequently ſelenites, and fixed ammoniac ſalt are diſſolved; that it contains a ſuperfluous water, which may be ſeparated from it by filtration in the body, but that water which is chemically combined with the other parts cannot; that the ſeparation or addition of ſuperfluous water does not affect its viſcidity ſo far as it is of any conſequence in the circulation; but the ſeparation of that water which is in chemical combination, may render it more viſcid; that the water which is chemically combined with it is never ſeparated whilſt it is contained in the blood-veſſels, conſequently this part of the blood is always equally viſcid, ſo far, at leaſt, as its viſcidity can affect the circulation, or the ſecretions; and that it may be coagulated by a juice ſecreted in the ſtomach, or by injections thrown into the blood-veſſels.

SERUM ALUMINOSUM. See ALUMEN.

—— LACTIS. Milk-whey. See LAC.

—— VINOSUM. Wine-whey. See VINUM.

SESAMOIDEA OSSA, from σησαμη, and ειδος. The SESAMOID BONES. Theſe are the little bones moſt frequently found at the articulations of the toes and fingers; thoſe two at the firſt joint of the great toe are much larger than any other, and allow the flexors to ſend their tendons along this joint ſecure from compreſſion, and, beſides, giving them an angle at their inſertion, the force of the muſcle is augmented. They have their name from their ſuppoſed reſemblance to the ſeed of the ſeſamum, yet they are of very different figures and magnitudes. They are generally moſt numerous in old people, and Winſlow thinks they are often formed of the ligaments, or tendons, about the articulations where there is much ſtrong compreſſion on them. Cheſelden obſerves that the *ſeſamoid bones* are reckoned to be forty-eight in number; but that there are commonly found but two under the ball of each great toe, two at the middle joint of each thumb; and

ſome-

ſometimes one at the lower end of each thigh-*bone*, at the beginning of the plantaris muſcle. He adds, that he found, in ſome bodies, the little cartilages at the receiving ends of the bones of the fingers offified; and concludes, that thoſe who enumerate forty-eight *ſeſamoid bones*, have miſtaken theſe offifications for them.

The great toe hath the largeſt *ſeſamoidea*; the inner one is the largeſt. The Arabic name for the ſeſamoid bone of the firſt joint of the great toe is *albadara, alldabaram.*

Dr. James, in his Med. Dict. art. ALBADARA, relates a caſe of frequent fits troubling a young lady, which, after reſiſting various means of relief, were effectually cured by amputating the great toe: this operation was propoſed on a ſuppoſition that the *ſeſamoid bone* there was diſlocated; and from thence the fits were produced. He further adds a caſe that ſeems to have been the object of his own attention, and which he apprehends aroſe from an injury done to the *ſeſamoid bone* of the great toe. On the patient's firſt reception of the hurt, he was ſeized with a fit, and whenever he moved that toe, he fell into another. Theſe fits much reſembled the epileptic kind, except that no froth was diſcharged at the mouth: the injured foot firſt began to be convulſed, then the leg, and from thence a very uneaſy ſenſation aſcended to the head, and then the convulſions began to be univerſal. This caſe proved fatal.

SESAMUM VERUM, alſo called *ſeſamum veterum, digitalis orientalis, gangila.* OILY PURGING GRAIN. The *ſeſamum* Orientale Linn. It is an Egyptian plant, the ſeeds of which afford a great quantity of oil by expreſſion, but hath no right to the title of purging.

SESCUNCIA, SESQUIUNCIA. } See HEMIOLION.

SESELI VULGARE, alſo called *ſiler montanum, liguſticum.* COMMON HARTWORT. It is a ſmall umbelliferous plant, with large leaves ſet in pairs; the root is large, thick, and branched. It is perennial, grows wild in the ſouth of Europe, is raiſed in our gardens, and flowers in June.

All the parts of this plant are aromatic, of an agreeable ſmell, and warm ſweetiſh taſte; the roots are the moſt warm and pungent, the ſeeds are moſt pleaſant and ſweet. A ſpirituous extract of the ſeeds is an elegant aromatic ſweet. See Lewis's Mat. Med.

For that which is called —— PYREN. &c. ſee MEUM LATIFOL. ADULT.

—— MASSILIENSE, called alſo *fœniculum tortuoſum.* ITALIAN HARTWORT, FRENCH HARTWORT, HARTWORT of MARSEILLES. It is the SESELI TORTUOSUM Linn. It is perennial, and a native of the ſouth of Europe, from whence the ſeeds are brought.

The ſeeds are aromatic, warm, and biting to the taſte, more pungent than thoſe of the common *hartwort*, but want their ſweetneſs. See Lewis's Mat. Med.

—— ÆTHIOPICUM. See LASERPITIUM VULGATIUS.

SESELON. See COCHLEÆ.

SETACEUM. A SETON, ſo called from *ſetæ equinæ, horſes hairs*, becauſe horſes hairs were firſt uſed for keeping the wound open; but now thread or cord is uſed, becauſe it is leſs painful: ſometimes it is called *perforatio.* Camanufali, a phyſician of Bagdat, who lived before that city was taken by the Tartars in 1258, mentions a *ſeton* in the cure of a diſorder of the eye. Rhazes alſo ſpeaks very particularly about *ſetons.* Originally, an actual cautery was uſed for making a *ſeton* with. Hollerius firſt made it with a needle unheated.

This operation is performed by elevating the ſkin with the finger and thumb, an aſſiſtant doing the ſame at about an inch from where the operator holds it, and having armed a large broad crooked needle with as many threads as the operator thinks needful, paſs the needle through the ſtretched ſkin, and bring the threads a little way through, and there leave them; rub a little of the thread, as much as will paſs into the *ſeton* at each time of dreſſing, with the ung. reſinæ flav. move the thread forward every morning and evening, and thus the diſcharge will be promoted, and may be continued at pleaſure.

What Mr. Bell hath intimated reſpecting this ſubject well deſerves attention, particularly when tumors in ſome ſituations are large. It empties the ſwellings, he obſerves, of whatever ſize they may be, not ſuddenly, but very gradually; it effectually prevents a free admiſſion of air; it is not commonly attended with near ſo much pain and inflammation; nor is the cicatrix occaſioned by it ever inconvenient, or unſeemly, which it frequently is after a large inciſion. When the patients are otherwiſe in good health, they very commonly do well; and with this additional advantage, that a cure is frequently obtained in little more than half the time uſually found neceſſary after a large inciſion has been employed.

Setons are commended in complaints of the head and eyes; and all diſorders where iſſues are thought adviſeable; and may be ſet in places where iſſues could not ſo conveniently be fixed; otherwiſe iſſues, or perpetual bliſters, are more agreeable, and equally uſeful methods. See Heiſter's Surgery. Bell's Surgery, vol. iv. p. 382. Bell on Ulcers, edit. 3. p. 83, &c. White's Surgery, p. 184.

SETANIUM. See AMAMELIS.

SEUREN. See BOVINA AFFECTIO.

SEVUM OVILLI. See PRÆPARATIO ADIPIS.

SEXTANA. Erratic, intermittent fevers, which return every ſixth day.

SEXTARIUS, alſo called *chiſt.* This term has been uſed both in liquid and ſolid meaſure, and has great variation, concerning which Galen obſerves, that it was not formerly among the Athenians but received by the Greeks, though different from what it was among the Romans. For amongſt them the *ſextarius* included the pound, half pound, and a ſixth, making together twenty ounces; the Athenians conſtituted, though by this a leſs meaſure; by *ſextarius* they meant a pound and a half, i. e. eighteen ounces. It yet alſo meant leſs, a *ſextarius* only weighing three ounces. Rhodius diſtinguiſhes it into ponderal, and menſural; that it contained two heminæ, hence only thirteen ounces. The ſame author aſſerts that the *ſextarius* of dry ingredients was a pound, of liquid half a pound; the *ſexteria* of two heminæ; the Arabian ponderal was half a dram, the Italian eighteen ounces of oil, twenty of wine and water, ſeventeen of honey. The *ſextarium* of wine was alſo ſixteen ounces, and as many ſcruples, of honey five and twenty ounces, according to ſome others. CASTELLI. See alſo CYATHUS.

SEXTANS. See CYATHUS.

SIALOGOGA, from σιαλον, *ſaliva*, and αγω, *duco, to draw forth.* SIALOGOGUES, comprehend all ſuch medicines as produce a flow of ſaliva into the mouth, from the glands named ſalivary, there ſituated. They have been divided by ſome authors into THREE CLASSES. *Firſt*, Such as immediately act upon the ſalivary glands. *Second*, All ſuch as occaſion a flow of ſaliva into the mouth, by intercepting a flux of moiſture into other parts. *Third*, All thoſe ſubſtances which are *ſuppoſed to break down the ſanguinary maſs*, and by that means ſupply the mouth with too great a proportion of fluids, thus diſſolved. At preſent they are divided into *internal*, and *topical.* The only *internal* one of which we make uſe is mercury, and its preparations, which produces its effect when thrown into the habit, by exciting its elective power, and ſtimulating the ſalivary ſyſtem. The *topical* ones are ſuch as promote a flow of ſaliva by external application, viz. ſquills, pellitory, tobacco, cloves, calamus aromaticus, and a variety of ſuch like ſtimulating ſubſtances. See CULLEN's Mat. Med. WALLIS on Diſeaſe and Health.

SIBBENS. This name is given to the venereal diſeaſe in ſome parts of Great Britain. In the year 1773, Mr. Hill, a ſurgeon in Dumfries, publiſhed his Caſes in Surgery; to which he hath added an account of this diſorder, and that with a view to the confutation of a theſis which had been publiſhed, and erroneouſly aſſerted the *ſibbens* to be different from the pox.

SIBCADI. See BULBUS VOMITORIUS.

SICILIANA. See ANDROSÆMUM.

SICULA. See BETA.

SICULUS ALBUS. See BEZOAR.

SICYEDON. A TRANSVERSE FRACTURE.

SICYOS. SINGLE-SEEDED CUCUMBER, called alſo *ſicyos Canadenſis.* It is of the monœcia ſyngeneſia claſs: there are three ſpecies, natives of North America, and the Weſt Indies.

SIDERATIO. An APOPLEXY, which ſee; a ſphacelus, alſo a ſpecies of eryſipelas, which is vulgarly called A BLAST.

SIDERATIO OSSIS. See SPINA VENTOSA.

SIDERITIS. See CHAMÆPITYS; MAGNES; and for that called ANGLICA, ſee PANAX COLONI.

SIDIUM. See GRANATA MALA.

SIGILLATÆ TERRÆ. SEALED EARTHS. There are different kinds of bolar earths made into cakes, upon which

which are put ſome imprints, they are all of them factitious, of no medicinal uſe, and have long been thrown out of practice.

SIGILLUM HERMETICUM. An HERMETIC SEAL. A glaſs veſſel is ſaid to be *hermetically ſealed*, when the glaſs is melted, and the veſſel by this means is cloſed.

SIGILLUM SOLOMONIS. See POLYGONATUM.

—— BEATÆ MARIÆ. See BRYONIA NIGRA.

SIGMOIDES PROCESSUS. See PROCESSUS CORACOIDES. It is called *ſigmoidal* from its reſemblance to the Greek letter *ſigma*. Three valves of the heart have this epithet, viz. of arteriæ pulmonalis, and aorta. The ſemicircular cavity of the cubit, at the articulation of the fore-arm with the humerus, is ſometimes called the *ſigmoidal* cavity; and the cartilages of the aſpera arteria have the epithet *ſigmoidal* applied to them by ſome authors.

SIGNUM, *Signum*, a SIGN. Betwixt ſigns and ſymptoms in ſeveral caſes, though there is a very material difference, ſtill many conſider the two terms as ſynonymous, and as ſuch uſe them indiſcriminately. SYMPTOMS are thoſe particular appearances, which, taken collectively, conſtitute what is termed diſeaſe, in general, as they indicate morbid diſtreſs, or inability in the ſyſtem. But there may be SIGNS which are not ſymptoms, as they will appear without any previous complaint affecting the habit. A perſon having drank a large proportion of weak punch, will very often make a quantity of limpid urine; this cannot be conſidered as a ſymptom, for the perſon ſo making it, is in perfect health; but a patient labouring under hyſteria, will do the ſame, without drinking at all, and that very ſuddenly; this then is an indication of ſome morbid diſtreſs, and as ſuch may be denominated a ſymptom, inaſmuch as it will be accompanied with ſome other nervous affection. All ſymptoms therefore may be ſigns, but all ſigns are not ſymptoms. And this is agreeable to the opinion of ſome of the ancients; who ſay, "That is called a SIGN, by the information of which we can arrive at the knowledge of ſomething before unknown." SYMPTOM ſignifies the conſequence of diſeaſes, and cauſes, including diſeaſes as well as cauſes, and in this ſenſe is nothing more than a præternatural affection which follows diſeaſe, as a ſhadow the body. Hence SIGNS are declaratory of the ſtate of the diſeaſes as well as of ſomething which has happened, or may occur in the machine; SYMPTOMS only of the preſence and nature of the malady itſelf.

Signs are therefore divided into DIAGNOSTIC, PROGNOSTIC, and AMAMNESTIC. The *firſt*, diſcovers the ſtate of the diſeaſe, and enables us to define, and diſtinguiſh it from others—the *ſecond* gives information of the changes which will happen during the continuance of the diſeaſe—the *third*, empowers us to determine what diſeaſe has previouſly affected patients, from which they have recovered.

SIGNETTE, SAL DE. See SAL RUPELLENSIS.

SILER MONTANUM. See SESELI VULGARE.

SILICULA, dim. from *ſiliquæ*. A *ſilicle*, little *pod*, or *pouch*. A two-valved pericarp, having the ſeeds fixed along both ſutures, and the tranſverſe diameter equal, or nearly ſo to the longitudinal. This pericarp varies in ſhape: being orbiculate, ovate, or flatted, entire at the end or emarginate.

SILICULOSA. The name of the firſt order in the claſs TETRADYNAMIA of Linnæus.

SILIGO. See SECALE.

SILIQUA. An ancient weight equal to three grains and one twenty-eighth. Alſo a pod, called *carab*, is that kind of pericarpium which conſiſts of two valvulæ, and in which the ſeeds are fixed alternately to each future. Miller improperly applies this definition to the LEGUMEN.

SILIQUA HIRSUTA. The COWHAGE.

—— DULCIS, } alſo called *caroba*, *carantia*, *ceratia*,
—— EDULIS, } *ceratonia*. The CAROB-TREE. It grows in Sicily and Naples; the fruit called *ceratium*, is cooling, and moderately laxative; the internal ſeeds of the fruit are named *xyloceca*. At Venice they are much uſed.

—— SYLVESTRIS SPINOSA ARBOR INDICA. See CORALLODENDRON.

—— PURGATRIX. It is a large tree, a native of Guinea; its pod is much more purgative than that of the common carob. See Raii Hiſt.

SILIQUASTRUM. It is the JUDAS-TREE, called *Cercis, colytea, Judaica arbor*. Miller ſays there are two ſpecies. It is a genus of the decandria monogynia claſs, *Icthyperia*, a name given by Dr. Hill to the bony palates of fiſhes, which are frequently found foſſile at great depth in the earth, and uſually immerſed in the ſtrata of ſtone, have been called *ſiliquaſtra* by Mr. Lhuyd, from their reſemblance in ſhape to the pods of lupines, and ſome of the other leguminous plants. For that called —— PLINII, ſee PIPER INDICUM.

SILIQUOSA, dim. of ſiliqua. pod. the name of the ſecond order in the CLASS TETRADYNAMIA of Linnæus, containing thoſe plants which have a proper ſiliqua for a pericarp.

SILIQUOSÆ. The name of the fifty-ſeventh order in Linnæus's fragments; of the thirty-ninth in his natural order; and of the twentieth claſs of Ray's method. They are the ſame with the cruciformes of Tournefort.

SILPHIUM. ASSAFŒTIDA, alſo the ſtalk of the plant which affords it, named alſo *laſerpitium*. The root of the ſilphium is named *Magudaris*; the leaves, or according to ſome, the ſtalks are called *maſpeta*, *maſpetum*.

SIMAROUBA, alſo called *cuonymus*, and the BARK, which is the part in uſe, is called *ſimarouba*, *ſimaraba*, and GUIANA BARK. It is the bark of an unknown tree in Guiana. Some think it to be the bark of the piſtachia terebinthus Linn. Mr. JUSSIEU thinks this is the *macer* of the ancients. See MACER. The Edinburgh College, in their Pharmacopœia, ſay, that it is the *quaſſia ſimaruba*, vel quaſſia floribus monoicis, foliis abrupte pinnatis; foliolis alternis ſubpetiolatis, petiolo nudo, floribus paniculatis, Linn. Suppl. 234. Curtis, in his Catalogue of the Medicinal Plants in the London Botanic Garden, calls it *quaſſia diſica*. It is brought to us in long pieces, of a yellow white colour, light, tough, and fibrous. It reſembles that which the ancients deſcribe under the name of macer. It was brought into Europe in the year 1713. Dr. James ſays, in his Medicinal Dictionary, that it is the bark of a Weſt Indian tree, viz. of the tree from which we have the Cayan wood. It is a ſpecific in dyſenteries, particularly the ſeroſo-bilious, bloody, and mucous kinds; it removes theſe diſorders when there is no fever, and when the ſtomach is unhurt, without the uſual inconveniencies of aſtringents; it abates ſpaſms, and hyſteric affections. Moſt authors who have written on this ſubject agree that in fluxes it reſtores the loſt tone of the inteſtines, allays their ſpaſmodic motions, promotes urine and perſpiration, removes that lowneſs of ſpirits attending dyſenteries, and diſpoſes the patients to ſleep; the gripes and teneſmus are taken off, and the ſtools are changed to their natural colour and conſiſtence. In a moderate doſe it occaſions no diſturbance or uneaſineſs, but in large doſes it produces ſickneſs at the ſtomach and vomiting. This though is only ſucceſsful in the third ſtage of the dyſentery, where there is no fever, where too the ſtomach is not hurt in any way, and where the gripes and teneſmus are only continued by the weakneſs of the bowels. Old and obſtinate dyſenteries, and diarrhœas brought from warm climates, have been completely and ſpeedily cured by it.

Dr. Cullen looks upon it only as a pure and ſimple bitter, poſſeſſing nearly the ſame qualities as that of quaſſia, of which he looks upon it to be a ſpecies. If any ſymptoms ſeem to require an emetic, let it precede the uſe of this bark.

The beſt preparation is the following decoction, four table ſpoonfuls of which may be given every three, four, or ſix hours. ℞ Cort. *ſimaroub.* craſſ. contuſ. ʒ i. coq. in aq. font. ℥ xxiv. ad. ℥ xij. & cola.

It hath been obſerved, that if this decoction is made ſtronger, it excites ſickneſs, but in proportion thereto it fails as an antidyſenteric. See Lewis's Mat. Med. Mem. de l'Acad. des Sciences, 1729, par. M. d. Juſſieu. Cullen's Mat. Med.

SIMPLEX OCULUS. It is a bandage for the eye, being only a ſingle-headed roller applied to the cheek, then paſſed over the eye, and the oſſa parietalia, running down behind the head, and paſſing by the nape of the neck, it riſes to the place it began at, and ſo is continued till the whole is taken up. It is called *ſimplex oculus* for both eyes, when it is a little longer, and made to paſs over both eyes; for both eyes it is rolled up into two heads, and the middle is applied to the nape of the neck.

SINANCHICÆ. ITALIAN RUSHY HORSE-TAIL. See JUNCARIA.

SINAPELŒON. OIL of MUSTARD-SEED.

SINAPI. MUSTARD, alſo called *eruca*; *napy*. It is an annual plant, with long rough leaves, divided to the

rib into irregular ſegments, of which the extreme one is the largeſt, producing at the tops of the branches tetrapetalous yellow flowers, followed each by a ſhort, ſmooth, quadrangular pod, divided longitudinally by a membrane, which projects at the ends, containing ſmall roundiſh ſeeds, of a reddiſh brown colour. Both the Colleges of London and Edinburgh order, in their Pharmacopœias, the SINAPIS ALBA, *ſiliquis hiſpidis, roſtro obliquo longiſſimo.* WHITE MUSTARD-SEED. That with the dark brown ſeeds, is the SINAPIS NIGRA, *ſiliquis glabis tetragonis.* CL. TETRADYNAMIA, ORD. SILIQUOSA. Linn. Gen. Plant. 821. Commonly called DURHAM MUSTARD. It is a native of England, but commonly cultivated for dietetic and medicinal uſes. Botaniſts enumerate fifteen ſpecies.

Muſtard-ſeed yields upon expreſſion much oil; this oil is as inſipid as that from olives, the pungency remaining entire in the cake which is left after the expreſſion. For table *muſtard*, this cake is better than the whole *muſtard*. Spirit of wine takes up but very little of the pungency of *muſtard*; but water takes up from the bruiſed ſeeds nearly the whole of their active matter. If *muſtard* is added to boiling milk, the whey will be ſeparated from the curd, and poſſeſs much of the virtue of the ſeeds. Diſtilled with water, they yield a limpid eſſential oil, which is extremly pungent and penetrating both to the ſmell and taſte, and ſo ponderous as to ſink in water. The remaining decoction, on being inſpiſſated, becomes a ſweetiſh, briſk, mucilaginous extract.

Muſtard is one of the ſtrongeſt of the pungent ſtimulating diuretics that operates without exciting much heat. In paralytic, cachectic, and ſerous diſorders, a large ſpoonful of the unbruiſed ſeeds have been taken two or three times a day. It is not heating to the ſtomach in this way, but ſtimulates the inteſtinal canal, and commonly proves laxative, or at leaſt ſupports the uſual daily ſecretion. Bergius hath cured vernal intermittents with it, and has found the bark rendered more effectual by mixing the powder of *muſtard* with it. Cullen Mat. Med. The bruiſed ſeeds prepared as for the table is rubbed with advantage on parts affected with numbneſs, or with rheumatic diſorders. In all diſeaſes where an acid in the primæ viæ attends, *muſtard* ſhould be freely uſed; if eaten plentifully with the victuals it aſſiſts digeſtion; mixed with horſe-raddiſh, it is infuſed in wine as a ſtimulant and diuretic in languid conſtitutions; and when beaten up with vinegar into a cataplaſm, it is applied to the feet to remove deliriums in fevers, and to bring down the gout from the head or the lungs to the feet. Theſe cataplaſms act more quickly than bliſters; they are alſo uſeful applications to the feet for raiſing the pulſe in low fevers, and for relieving the head in thoſe diſorders. If *muſtard* is mixed as for the table, and of this mixture a table-ſpoonful or two is added to a pint of tepid water, and drank on an empty ſtomach, it operates as an emetic; and, if repeated once or twice in a week, is of ſervice in nervous diſorders. *Muſtard*-whey is a uſeful drink in all low fevers. Lewis's Mat. Med. It is alſo a name of the *rapiſtrum*, *ſiſymbrium*; *eryſimum latifolium.*

SINAPISMUS. SYNAPISM is made of powder of *muſtard*-ſeed and crumbs of bread, equal quantities, mixed up into the conſiſtence of a cataplaſm, with a ſufficient quantity of vinegar. See EPISPASTICA.

SINCIPUT. See BREGMA, and ARCUALIA OSSA.

SINE PARI. The vein ſo called, ſee AZYGOS. The empl. *ſine pari*, or matchleſs plaſter. A pompous name for a plaſter, which is now not noticed.

SINGULTUS, alſo LYGMOS. The HICCOUGH. It is a ſpaſmodic affection in the ſtomach, œſophagus, and muſcles, ſubſervient to deglution. Hippocrates ſays, that the ſtomach is its only ſeat; Hoffmann ſays, that the diaphragm is that part principally affected; but others ſince him, aſſert the ſtomach to be the principal ſeat. The diſorder is primary or ſymptomatic. The immediate cauſe is generally allowed to be an irritation in the ſtomach. When attending acute diſorders, it is called the acute; and when a companion of chronical diſorders, it is called the chronical *hiccough*. The occaſional cauſes are errors in diet, a wound or other injury done to the ſtomach, an inflammation there, acrid poiſon, inflammation in the diaphragm, or any of the abdominal viſcera, four juices, and flatulence in the ſtomach, &c.

The ſymptomatic kinds are attended with flatulence, and are uſually relieved by the ſp. vol. fœtid. to which a ſmall quantity of the tinct. opii may be added. The miſtura moſch. is of excellent ſervice. And when this diſorder is obſtinate, muſk ſhould be given in doſes from gr. ten or twenty, made up into the form of a bolus. The ſp. ætheris nitroſ. may be often given in ſmall doſes.

When it happens in weak ſtomachs from a full meal, or hard flatulent aliment, relief is generally obtained by a glaſs of good wine, or of tepid water, with an equal quantity of ſome ſpirituous liquor.

If acid crudities in the ſtomach are the cauſe, give abſorbents and the bark, with warm bitters.

When irritating poiſons are the cauſe, beſides emetics, plenty of warm milk, and frequent doſes of ſweet oil, will be uſeful.

If indigeſted aliment is the cauſe, a table ſpoonful of ſharp vinegar will often relieve.

Emetics and ſternutatories often effect a cure; and bliſters ſometimes are uſeful.

When the diſorder is idiopathic, purgatives mixt with opiates, ſo that a moderate doſe of the compoſition may looſen the belly, are the moſt efficacious.

SINKOO. See AGALLOCHUM.

SINON. SINNON. See AMOMUM.

SINUS. A *ſinus* in a bone is a cavity which receives the head of another bone. In ſurgery, it is a collection of matter with only a ſmall orifice for its diſcharge; and this orifice is not callous. See FISTULA. In anatomy, the vagina is called *ſinus* muliebris, or *ſinus* pudoris, alſo *colpos.*

SINUS COXÆ, i. e. ACETABULUM COXENDICIS. See ACETABULUM.

—— MAXILLARIS. See ANTRUM HIGHMORIANUM.

—— VENÆ PORTARUM. The trunk of the *vena portæ* hepatica ſuperior vel minor.

SIPHILIS. The POX. See LUES VENEREA.

SIRACOSTUM. See ALSIRACOSTUM.

SIRENES. See BOVINA AFFECTIO.

SIRIASIS. A diſtemper to which children are ſubject; it conſiſts of an inflammation of the brain and its membranes, attended with a depreſſure of the fontanella, a cavity of the eyes, a burning fever, a paleneſs and dryneſs of the whole body, and a loſs of appetite. Dr. Cullen ranks it as ſynonymous with phrenitis; it is called ADUSTIO.

SIRII BOA. See BETLE.

SIRONES. See BOVINA AFFECTIO.

SISARUM, alſo ELAPHOBOSCON. SKIRRETS, or their WORTS. PARACELSUS calls the roots *perdetum.* They are well known in our gardens, and are chiefly cultivated for culinary purpoſes. They are conſiderably nouriſhing and not very flatulent, and by boiling become very tender. If plentifully eaten they are diuretic, *Tordillium* ſeems to poſſeſs the ſame properties. Raii Hiſt. Plant. For that called —— MONTANUM, ſee GENSING. —— PERUVIANUM, ſee BATTATAS HISPANICUM.

SISON. See AMOMUM.

SISYMBRIUM. It is a plant with thin pods, of which Boerhaave reckons up thirteen ſpecies. It is alſo a name of ſeveral ſpecies of mint, of water-creſſes, and ſome other plants. See BARBAREA; MENTHA AQUATICA; SINAPI; SOPHIA; NASTURTIUM AQUATICUM.

SISYMBRIUM AQUATICUM, alſo called *raphanus aquaticus, armoracia.* WATER-RADISH. It grows in marſhy ditches, flowers in June and July, and is ſuppoſed to agree with the horſe-raddiſh in its virtues.

SITIOLOGICÆ, from σιτος, *aliment*, and λεγω, *to ſpeak.* That part of medicine which treats of aliments.

SITIS. THIRST. It is excited by a defect of moiſture; a thickneſs of the humours; redundant heat, muriatic, alkaline, ammoniacal ſalts; aromatic, oleous, and rancid acrimony; or from poiſons. When exceſſive, it is called *nedyuſa.* Dr. Cullen terms it *polydipſia*, and places it as a genus in the CLASS. LOCALES, and ORD. DYSOREXIÆ, which he defines a greater deſire for liquids than uſual; but ſeems to think it always ſymptomatic, and varies only according to the variety of the diſeaſes which it accompanies.

Thirſt is beſt allayed by acids; water kept a while in the mouth, then ſpit out, and repeated as required; a bit of bread chewed with a little water, which latter may be gradually ſwallowed; if the perſon is very hot, brandy is the beſt for holding in the mouth, but ſhould be ſpit out again: except in fevers, large draughts of cold water are hurtful.

SIUM,

SIUM, called alſo LAVER. The root is like that of colewort, fibrous and ligneous; the leaves are pinnated, growing by pairs to one rib, and ending with an odd one; the petals of the flowers are bifid, the ſeeds are roundiſh, gibbous, and ſtriated. For that called —— AROMATICUM, ſee AMOMUM; —— ALTERUM, &c. —— MAJUS, &c. and —— ERUCÆ FOLIO, ſee CICUTA AQUATICA.

—— ANGUSTIFOLIUM, alſo called *berula Gallica, laver verum Matth. apium paluſtre foliis oblongis.* COMMON UPRIGHT WATER-PARSNEP. It grows in moiſt wet places, and flowers in June. Its leaves are ſaid to have the ſame effect as thoſe of the *great water-parſnep.*

SIUM LATIFOLIUM, alſo called *paſtinaca aquatica.* GREAT WATER-PARSNEP. It grows in rivers and marſhy places, it flowers in July. The leaves are ſaid to break the ſtone in the bladder, and have other virtues attributed to them, but they are not noticed in the preſent practice.

SIUM NODIFLORUM, *foliis pinnatis umbellis axillaribus ſeſſilibus.* CLASS. PENTANDRIA. ORDO DIGYNIA. LINN. Gen. Plant. 348.—CREEPING-WATER, PARSNEP. This is a creeping, indigenous, wing-leaved plant, growing in hedges and ditches; its leaf reſembles the ſpring leaf of the hemlock drop-wort, which is poiſonous. Its root is perennial; it flowers in July and Auguſt. It is *diuretic* and *antiſcorbutic*, or rather a corrector of acrid humors, when manifeſted by cutaneous eruptions, and tumors in the lymphatic ſyſtem. Dr. Withering gives an account of a young lady ſix years old, who was cured of an obſtinate cutaneous diſeaſe, by taking three large ſpoonful of the juice twice a day; and he has repeatedly given to adults, three or four ounces every morning, in ſimilar complaints, with the greateſt advantage. It is not nauſeous, and children take it readily if mixed with milk. In the doſe which he gave it, it neither affected the bowels nor ſtomach.

SMALTUM. See CORALTUM.

SMECTIS. See CIMOLIA PURPURASCENS.

SMILAX ASPERA. ROUGH BIND-WEED, called alſo *China orientalis* and *occidentalis*. It is cultivated in gardens, and flowers in ſummer. The leaves, tendrils, berries, and roots, are uſed as *perſpiratives, to cure ſkin-diſeaſes* and *pains in the joints.* It is a ſuccedaneum for *ſarſaparilla*, and is celebrated againſt venereal diſorders. See Raii Hiſt. For that called —— *China*, ſee CHINA ORIENTALIS. —— *Peruviana*, ſee SARSAPARILLA. —— *Hortenſis*, ſee PHASEOLUS MAJOR. —— *Indica*, ſee CHINA OCCIDENTALIS. —— *Virginiana*, ſee SARSAPARILLA. —— *Unifolia humillima*, ſee MONOPHYLLON.

SMYRNION. See IMPERATORIA.

SMYRNIUM. See HIPPOSELINUM.

SODA. A burning uneaſineſs in the throat, with rancid or hot eructations, ſee CARDIALGIA. It is ſynonymous with *dyſpepſia*, and *pyroſis*. It is uſed to expreſs the heart-burn; and by ſome, a ſort of head-ach. It is a name for pot-aſh, and for the mineral fixt alkaline ſalt. See ANATRON and CLAVELLATI CINERES.

SOL. See AURUM.

SOLAMEN INTESTINORUM. See ANISUM.

SOLANOIDES. BASTARD NIGHT-SHADE. It hath a roſe-ſhaped flower, which is followed by a ſort of berry. Miller takes notice of two ſpecies, but they are not noted in medicine.

SOLANUM. NIGHT-SHADE. It is a plant with a monopetalous flower, divided into five ſegments, having its cup divided in the ſame manner, with the ſame number of ſtamina in the middle, and followed by a juicy berry. The common ſort is called *nient ſiundla.*

SOLANUM BARBADENSE. See PHYTOLACCA.

—— LETHALE, called alſo *ſolanum maniacum, belladona, ſolanum ſomniferum, ſolanum furioſum, belladona.* DEADLY NIGHT-SHADE. It is called *belladona* from the Italian ladies uſing it, to take away the too florid colour of their faces: THEOPHRASTUS uſed to call it *ſtrychnos.* This plant is the ATROPA BELLADONA, *caule herbaceo, foliis ovatis integris.* CLASS. PENTANDRIA. ORDO MONOGYNIA. LINN. Gen. Plant. 249.

It is one of the poiſonous plants that are indigenous in Great Britain; it is poiſonous in all its parts.

The root is long, large, and creeping. The ſtalks are purpliſh, upright, firm, numerous, branched, and herbaceous. The leaves are egg-ſhaped, entire, very large, ſmooth at the edges, pointed a little at the extremities, and of a beautiful green colour, hairy and ſoft. The flowers ſtand on ſingle foot-ſtalks: they are formed of one petal; bell-ſhaped, and very lightly divided into five ſegments at the edge. Their colour is a dark dead purple. The berries which ſucceed the flowers are globular: they are firſt of a red colour and afterwards become black. This plant flowers in July, and its fruit is ripe about Michaelmas.

It is found in woods and hedges, amongſt lime-ſtone and rubbiſh; and alſo where the ground is rich from manure. The plant hath a faint ſmell, ſomewhat of the poppy kind, which is loſt when it is dry; whether freſh or dry there is no peculiar ſenſation conveyed when the leaves are applied to the organs of taſte.

The ſymptoms produced by taking this plant in too great a quantity, are, giddineſs as if intoxicated, great thirſt, pain in, and tightneſs acroſs the breaſt, difficulty of breathing, raving, but with ſhort intervals of relief, and inſtead of raving, a kind of fooliſhneſs is obſerved to take place, ſtaring, ſlabbering, and giving anſwers foreign to the queſtions aſked. Painful deglutition, and retching followed by furor, ſtridor dentium, and convulſions; the eye-lids are drawn down, the face becomes red and tumid, and ſpaſms affect the mouth and jaws: the general ſenſibility and irritability of the body ſuffer ſuch great diminution, that the ſtomach often bears large and repeated doſes of tartar emetic, even fourteen grains without being brought into action; the pulſe is hard, ſmall, and quick; and twitching of the tendons, riſus, ſardonicus, and coma generally precede death. On diſſection, inflammation has been found in the liver, inteſtines and meſentery. In ſome a violent ſtrangury comes on. The ancients called the diſeaſe brought on, by eating this plant, *ſtrychnomania.* When adults have been injured with this poiſon, they have related that they have felt themſelves as if drunk, but ſaw and underſtood all that was doing, even when they gave the wildeſt anſwers. Some are ſaid to have continued in a ſtate of madneſs for ſome days; others loſe their ſight for a time, the iris being ſo much relaxed as to become paralytic, and dilated to a very conſiderable ſize. In children the belly ſwells, and convulſions ſometimes follow. To children it is generally fatal. When adults die of this poiſon, it uſually proves fatal in leſs than twenty-four hours.

Vinegar liberally drank, has been found very efficacious in obviating the effects of this poiſon; but evacuations ſhould always be firſt promoted; however, in caſes of injury from this plant, uſe the ſame means as are recommended in the article AMANITA, which ſee.

Notwithſtanding the above effects of this *nightſhade*, a prudent uſe of it has been recommended as follows: the leaves applied in the form of a cataplaſm are uſuful for relieving cancers; an infuſion of the leaves is extolled as an internal medicine in cancerous caſes; but on trial it does not appear to deſerve the encomiums that have been paſſed in its favour. The doſes are very ſmall, and their effects various and uncertain; ſometimes it purges, at others runs off by the kidneys, or through the ſkin, and often no evacuation of any kind is obſerved. Thoſe who took the infuſion ſuffered by giddineſs, throbbing pain in the eyes, a diſcharge of tears, and in all there was a dilatation of the pupil. Mr. Gataker obſerves that it is a medicine not ſo much calculated for general uſe, as for particular caſes where the common remedies have failed, and where this ſeems, upon trial, to be free from the principal inconveniencies which ſo often attend the uſe of it.

Dr. Cullen has ſeen a cancer in the lip cured by it, and a ſcirrhoſity in a woman's breaſt removed by it; and alſo great ſervice derived from its uſe in a ſore a little below the eye, which has put on a cancerous appearance. It is poſſeſſed of a narcotic and deleterious power. Doſe to begin with one grain or leſs, which may be gradually increaſed; ſix grains is conſidered a very large doſe

See Gataker's Eſſays. Bromfield on *Nightſhade.* Wilmer's Obſ. on Poiſonous Vegetables. Whithering's Bot. Arrang. Cullen's Mat. Med.

SOLANUM HORTENSE, alſo called *ſolatrum, aguara quiya, ſolanum vulgare, ſolanum officinarum, ſolanum nigrum*, Linn. COMMON, or GARDEN NIGHT-SHADE. Its leaves are oval-pointed, and irregularly indented; the flowers are white, and in cluſters; the berries are black. It is annual, grows in uncultivated grounds, and flowers in Auguſt.

Either of theſe two ſpecies may be indifferently uſed; their leaves have been found to be uſeful in cancerous diſorders, foul ulcers accompanied with pain, obſtinate

pains

pains in particular parts, ſcorbutic and ſcrophulous diſorders. It is ſaid to be particularly purgative of the bile; in theſe caſes it is taken in the form of an infuſion. Its uſefulneſs hath been alſo obſerved as an external application; beat into a poultice, or mixed with the white-bread poultice, it hath abated the violence of inflammations in the eyes, head-achs, pains in the ears, acrid defluxions, inflammations of the venereal kind, pains from ſcirrhous tumors; and thus applied on ſcrophulous and cancerous tumors, it hath been followed with conſiderable advantages.

The moſt common effects obſerved on taking the infuſion of the leaves are, a warmth diffuſed in a few hours over the body, a plentiful ſweat ſucceeding this heat, and a lax belly the next day; if a ſweat did not break out, a conſiderable diſcharge of urine, or looſe ſtools, was the conſequence. One or other of the excretions are uſually increaſed by it; if this does not happen, it ſeldom is of ſervice, and if benefit is not obſerved ſoon, its further uſe will not avail much. In ſanguine habits, bleeding and purging ſhould precede its uſe, and if the ſtomach ſeems affected with crudities, an emetic ſhould be given before the *night-ſhade* is uſed. Feveriſhneſs is no objection to its uſe.

The leaves may be uſed either freſh or dry. Infuſe half a grain in an ounce of boiling water to, be taken at bed time; gradually increaſe the doſe, which may be repeated every night, and continue that quantity, which produces giddineſs, or ſickneſs, or a lax belly, or ſome other ſenſible effect; ſometimes one doſe is enough in two or three days. The doſe hath been gradually increaſed to twelve grains. See Storck on the *Solanum*.

SOLANUM LIGNOSUM, alſo called *dulcamara*, *gycypicros*; *amara dulcis*, *ſolanum ſcandens*, BITTER-SWEET, WOODY NIGHT-SHADE. It is called *bitter-ſweet*, becauſe it is firſt ſweet, then bitter. It is the SOLANUM DULCAMARA, *caule inermi frutescente flexuoſo, foliis ſuperioribus haſtatis, racemis cymoſis*, CLASS PENTANDRIA; ORD. MONOGYNIA. LINN. Gen. Plant. 249. PURPLE FLOWERING, WOODY NIGHT-SHADE. Many of its leaves are deeply cut, or are furniſhed with two ſmall appendages at the bottom. The flowers are in cluſters of a blue colour; the berries are red. It grows on the ſides of ditches, and in moiſt hedges, climbing upon the buſhes with winding, woody, but brittle ſtalks. It is perrennial, and flowers in June and July.

Their ſenſible operation as a medicine is by ſweat, urine, or ſtool. A tincture may be made by digeſting four ounces of the twigs into two pints of white wine, and of this the doſe will be from ʒ ii. to ʒ vi.

This ſpecies is not ſo deleterious as the above two, and it acts more uniformly. Decoctions of it have been ſerviceable in the rheumatiſm, in inveterate caſes of ſcrophula; in cancer, lepra, and other cutaneous affections, and in local anomalous diſeaſes, ariſing from the lues venerea.

DECOCTUM SOLANI LIGNOSI, ſeu DULCAMARÆ.

℞ Stipitum dulcamaræ recentium ʒ ij. coquantur in aquæ diſtillatæ ℔ iv. ad ℔ ij. doſe half a pint in twenty-four hours, mixed with an equal quantity of milk.

Dr. Hulſe ſays it is one of the moſt powerful diſcutients; he directs four handfuls of the leaves, and four ounces of linſeed, to be boiled together in wine, or in hog's fat, to a cataplaſm, and to be applied warm.

Boerhaave enumerates twenty-four ſpecies of *ſolanum*, but theſe are the moſt noted.

For that called ARBORESCENS INDICUM, ſee COLUBRINUM;——DULCAMARA and SCANDENS, ſee SOLANUM LIGN.——FURIOSUM, MANIACUM, and SOMNIFERUM, ſee SOLANUM LETHALE, and STRAMMONIUM.——LYCOPERSICUM and POMIFERUM, ſee AMORIS POMA and CACHOS;——MAGNUM and RACEMOSUM, ſee PHYTOLACCA AMERICANA;——NIGRUM OFFICINALE, and VULGARE, ſee SOLANUM HORTENSE;——POMIFERUM, ſee MELONGENA;——TUBEROSUM, &c. ſee BATTATAS;——URENS, ſee PIPER INDICUM;——QUADRIFOLIUM, BACCIFERUM, ſee HERBA PARIS;——SOLATRUM, ſee SOLANUM HORTENSE.——VESICARIUM, ſee ALKEKENGI.

SOLDANELLA MARITIMA MINOR. See BRASSICA MARITIMA.

SOLEN, *σωλην, a cradle for a broken limb.* Any tube or channel.

SOLIDA. A SOLID. Haller obſerves in his Phyſiology, that the *ſolid* elementary parts of our fibres are a calcareous earth kept together by a gluten. That in a natural ſtate when bones loſe their gluten, this earth falls into powder; and that in this earth there is a portion of iron. In a fœtus the gluten forms about two thirds of the ſubſtance of the bones; and in an adult, nearly half of the bone is gluten. The *ſolids* contain much air, and the more *ſolid* a part is, the more air it contains. The bones contain a quantity, which, when ſet at liberty, is two hundred times the bulk of the bone. Air ſeems to be the primary bond of the elements, for until the air is expelled, the other parts do not ſeparate.

SOLIDAGO VIRGA AUREA. See VIRGA AUREA.

SOLEUS. A muſcle ſo called from its likeneſs to a ſole-fiſh. This muſcle is a biceps, riſing on the outſide from the upper part of the tibia, internally from the outſide of the fibula, it leaves a notch for the paſſage of the veſſels, it joins the gaſtrocnemius to form the tendo Achillis. Brown calls it *gaſtrocnemius internus*.

SOLITARIÆ GLANDULÆ. See INTESTINA.

SOLITARII, diſeaſes affecting only one part of the body.

SOLIS AQUÆ. See BATHONIÆ AQUÆ.

SOLIUM. See METATARSUS, and TÆNIÆ.

SOLSEQUIA. See CALENDULA.

SOLSEQUIUS. See TITHYMALUS HELIOSCOPIUS.

SOLUTIO. SOLUTION. It is the dividing of a ſolid body into particles ſmall enough to ſwim in the menſtruum, without being viſible. The diſſolving fluid is called a *menſtruum*, or *ſolvent*.

Solution is alſo defined to be an union formed by the integrant parts of one body with the integrant parts of another body of a different nature. Thus as a new compound is the reſult of this union, we hence ſee that *ſolution* is nothing elſe than the act of combination.

Solution is an uſeful operation in chemiſtry, and in that art hath various intentions; it is neceſſary for the producing of new combinations, and thereby obtaining new kinds of medicines, as is inſtanced in the union of acid with alkaline ſalt, in making the kali acetatum, the aq. ammoniæ acetatæ, &c. it is uſeful for the purifying and cryſtallyzing of ſalts, &c.

As the nature of ſolvents and things to be diſſolved are different, ſo the manner of effecting *ſolutions* differ. In ſome caſes it is effected by ſimple commixture, and frequent agitation; ſometimes the aſſiſtance of heat is required. There is a kind of *ſolution*, called *ſolutio per deliquium*; it is performed by expoſing the matter to the air, from which attracting water, it collects, in time, enough to diſſolve itſelf; ſome ſubſtances not ſoluble in water will diſſolve when expoſed to the air, and in thoſe inſtances, the proceſs is called *deliquatio*. See Dict. of Chem.

SOLUTIO PER IGNEM. See FUSIO.

SOLUTIONES. In Sagar's Noſology, it ſignifies freſh wounds, whilſt as yet bleeding.

SOLUTIVA. LAXATIVES.

SOMNAMBULISMUS, } alſo, *hypnobates*, *hypnobata-*
SOMNAMBULO, } *ſis*, *noctambulatio*, *noctambulo*, & *ſomnambulatio*. It is a ſpecies of *oneirodynia*.

SOMNIUM, i. e. ſomnambula, but more properly dreams and viſions in ſleep; ſo an inſtance of *oneirodynia*.

SOMNUS. SLEEP. This is eſteemed the grand preſerver and reſtorer of health; ſuch as is well timed, and properly proportioned, for ſome conſtitutions require much more than others. As action is the deſtruction of our frame, ſo ſleep is eſſentially neceſſary for our preſervation, as this is the time, when the ſyſtem is freed from all incumbrances, and undiſturbed by mental reflections; for, thus ſituated, the moving and aſſimilating powers of the body have only that buſineſs by which the parts are renewed to perform, and the veſſels are properly diſpoſed to receive ſuch additions as are required, and co-operate to that end. But, if if the machine is too much indulged in this particular, it becomes much diſpoſed to be corpulent, languid, and weak; it enervates the ſyſtem, renders people hypochondriacal and hyſterical, relaxes the ſolids, diſpoſes the humours to be viſcid or acrimonious, blunts the vital powers, and brings on a diſeaſed and early old age. The time neceſſary for producing the good effects of ſleep, is various in different conſtitutions. Six or ſeven hours are ſufficient for ſome adults, though others require nine or twelve. It is the practice of numbers to

ſleep in the day time; ſome immediately after dinner, under the idea that it promotes digeſtion. In ſome few inſtances, it may be right; but, in general, it creates giddineſs and languor, eſpecially in thoſe addicted to ſtudy,—deadens their thinking faculties,—deſtroys perſpicuity,—and clouds the imagination; but where no ſuch effects are perceived, if people find themſelves recruited, alert, and active, it may be allowed.

See Cheyne on Health, alſo on Regimen. Fordyce's Elements, part the firſt. Haller's Phyſiology. Med. Muſ. vol. i. p. 11—14. Wallis on Health and Diſeaſe.

SONCHUS LÆVIS.——MONTANUS PURPUREUS and REPENS. See CHONDRILLA, N° 5—6, and HIERACIUM MAJUS.

SONUS. SOUND. That air, though concerned in propagating *ſound*, is not *ſound* itſelf, is evident from ſound running almoſt as faſt againſt the wind as with it.

As the diverſity of *ſounds* depends on the different natures and colliſions of ſonorous bodies, *an acute tone* proceeding from a body whoſe parts are ſo diſpoſed as to render them fit for producing only the moſt inſtantaneous vibrations, which they convey to the ambient air,—and a *grave tone* proceeding from a body which is only capable of ſlow and protracted vibrations,—it muſt of courſe follow, that the membrana tympani does, in its various degrees of tenſion and relaxation, adapt itſelf to the ſeveral natures and ſtates of ſonorous bodies; for inſtance, it becomes *tenſe* for the reception of acute *ſounds*, becauſe, in ſuch a ſtate, it is ſuſceptible of quick and inſtantaneous tremulous motions; on the contrary, it is *relaxed* for the admiſſion of grave *ſounds*, becauſe, during ſuch relaxation, it is qualified and diſpoſed for the reception of the more ſlow and languid undulations of the air.

The external air impreſſes the membrana tympani, moves it with the malleus, which moves the incus, and this the ſtapes, which impreſſes the auditory nerve.

Further, in order to *ſound* being perceived, the ſpiral laminæ in the COCHLEA being compoſed of fibres of various lengths and ſizes, each receives the particles ſhaken off from ſounding bodies, which anſwer in uniſon to theſe fibres in the ſpinal laminæ, and the motions in the fibres of theſe laminæ ſhake off the ſame particles which are ſent to them, and thence they paſs to the ſenſorium by the nerves. It is probable that all the different organization of the ear was originally deſigned to put theſe fibres of the ſpinal laminæ in due tenſion, and in tune; and from the different degrees of perfection in the formation of this organ, ariſes the different accuracy which one ear hath above another, in diſtinguiſhing the concord of different inſtruments, or ſtrings of the ſame inſtrument. See AUDITUS.

SOPHIA, called alſo *chirurgorum ſapientia, accipitrina, cardamines, daligthron, thalictrum, naſturtium ſylveſtre, ſeriphium Germanicum, eryſimum, ſiſymbrium.* FLIXWEED. It is the SISYMBRIUM SOPHIA Linn. It is a plant with a hard woody root, full of ſmall fibres at the bottom; the leaves are long, winged, neatly divided, reſembling thoſe of Roman wormwood, and beſet with ſhort hairs; the flowers are at the ends of the branches, and are of a yellow colour; they are ſucceeded by ſlender ſeed-veſſels, of about one inch long; the ſeeds are red. It grows in ſandy ground, amongſt rubbiſh, and bears flowers in June.

The ſeeds only are uſed; in Paris they are ſold under the name of *talitron*. Boerhaave ſays, that their inward uſe aſſiſts the healing of ill-conditioned ulcers. Their taſte is ſomewhat aſtringent, but acrid like that of muſtard; they are alſo ſaponaceous and diuretic. See Miller's B. Off.

SOPOR. See CAROS.

SAPORALES. The SLEEPY VEINS. See JUGULARES VENÆ.

SOPORARIÆ ARTERIÆ. See CAROTIDEÆ ARTERIÆ.

SOPOROSI. Soporoſe affections or diminution of ſenſe and motion.

SORA. See ESSERA.

SORBUS SYLVESTRIS; called alſo *oe, ornus, cotonaſter*. The SERVICE-TREE. That uſed in medicine is the SORBUS AUCUPARIA Linn. It reſembles the pear and the *cratægus* in all reſpects, except that the leaves are pinnated, as in the fraxinus. The fruit is reſtringent before it is ripe, but when ripe it is very agreeable. Raii Hiſt.

SORGO, or SORGHUM. See MILIUM INDICUM.

SORY. It is a mineral that is blackiſh, hard, heavy, of a cavernous ſpongy texture, a diſagreeable ſmell, a nauſeous vitriolic taſte; it is compoſed of vitriol, ſulphur, and an earth. It is found in the mines in Devonſhire. It contains a cupreous vitriol; hence it is emetic. The Greeks uſed it as a depilatory.

SOUDE, alſo called *ſoude blanche*. See ANATRON.

SPAÆ AQUÆ. WATERS of SPA. Theſe are brought from the biſhopric of Liege, in Germany. At *Spa* there are a number of different ſprings, but the waters of two of them are not drank by the company who reſort there; viz. thoſe of *Pohun*, and *Geronſterre*.

They are both of the briſk chalybeate kind, but the laſt is the weaker chalybeate, though briſker and more ſpirituous. It is alleged to have more of a ſulphureous ſmell, to be briſker at the fountain, and more apt to make people giddy than any other of the waters at this place.

The waters of *Spa* have been analyſed by different medical and chemical men, Dr. Lucas, Dr. Rutty, Monſ. Monet, and ſir Tobern Bergman; which laſt ſays, that a gallon contains, aerated iron, 4 grains and above ½; aerated lime, 12 grains and above ½; aerated magneſia, 20°; mineral alkali cryſtallized, 12 grains and above ½; of common ſalt, 1½½ gr. Theſe waters are diuretic, and ſometimes purgative, and like other chalybeate waters, they tinge the ſtools black; they exhilarate the ſpirits much better than wine, or other ſpirituous liquors; and their general operation is by invigorating the ſyſtem, and ſtrengthening the fibres. They are drank by a glaſsful, at repeated times in a morning, for the ſame purpoſes as other chalybeate waters. See AQUÆ CHALYBEATÆ. Theſe waters are eſteemed the beſt of the chalybeate kind in Europe: and externally applied, as well as internally, in ſeveral caſes they have been attended with ſucceſs; as injections in the fluor albus, ulcers and cancers of the womb, and in the gonorrhœa. They are uſeful for waſhing venereal aphthæ and ulcers of the mouth; phagedænic ulcers; the itch; and give relief as gargles for relaxed tonſils; for faſtening the teeth when looſe; and in other caſes of relaxation. Complaints are ſaid to have been relieved by bathing and waſhing, obſerving at the ſame time their internal courſe.

SPANOPOGON. THINLY BEARDED.

SPARAGUS. See ASPARAGUS.

SPARGONOSIS. See ABSCESSUS, N° 31.

SPARTA POLIA. See AMIANTHUS.

SPARTIUM SCOPARIUM. See GENISTA; for that which is called ARBORESCENS, HISPANICUM, ſee GENISTA JUNCEA;—MAJUS, ſee GENISTA SPINOSA MAJOR.

SPASMA, } from σπαω, *to draw*. A SPASM, THE
SPASMUS, } CRAMP, a CONVULSION, a STRAIN. A *ſpaſm* may be ſaid to be preſent when any part of the human body, by the influence of the muſcular, membranous, or nervous fibres, is contracted involuntarily. This ſpaſtic affection particularly affects the nervous and membranous parts, ſuch as the ſtomach, and the whole volume of the inteſtines: whence proceed the hyſteric and hypochondriac paſſions.—A *ſpaſm* is alſo preſent when there is an hæmorrhage, congeſtion of blood, unequal flux of the fluids, anxieties, and ſuppreſſed excretions.—A *ſpaſm* affecting the dura mater conſiderably occaſions contractions of the whole nervous and membranous ſyſtem, whence an epilepſy, or univerſal convulſion.—*Spaſms* in the medulla ſpinalis produce convulſions in particular parts. Many diſorders are the effects of ſpaſms, viz. *obſtructed perſpiration, hæmorrhages, coſtiveneſs, ſtrangury, aſthma*, &c. See SPASMI. Kirkland's Med. Surgery, vol. i. p. 256.

SPASMI. SPASMODIC DISEASES. The term *ſpaſm* hath been variouſly uſed; in the moſt common ſenſe, it hath ſignified any preternatural contraction of any particular part of the body, either without any ſtimulus immediately applied to the part, or which remains after its cauſe is removed. More properly *ſpaſms* are thoſe preternatural contractions, which are attended with conſiderable mobility of the ſyſtem. Dr. CULLEN places it as the third order in the claſs NEUROSES, which he defines violent motions of the muſcles and muſcular fibres, under which he includes the following genera;—*tetanus*;—*convulſio*;—*chorea*;—*raphania*;—*epilepſia*;—*palpitatio*;—*aſthma*;—*dyſpnœa*;—*pertuſſis*;—*pyroſis*;—*colica*;—*cholera*;—*diarrhœa*;—*diabetes*;—*hyſteria*;—*hydrophobia*;—

and under the title of *ſpaſmodic* affections, he includes all the diſeaſes which conſiſt in the preternatural ſtate of the contraction and motion of the muſcular or moving fibres in any part of the body. The *ſpaſmi* have generally been divided into the tonici and clonici, ſpaſtici and motorii, and *ſpaſms*, ſtrictly ſo called, and convulſions. But moſt of the *diſeaſes* called *ſpaſmodic* are, in reſpect to tonic or clonic, of ſo mixed a nature, that it ſeems preferable to arrange *ſpaſmodic* diſorders according as they affect the ſeveral functions, animal, vital, or natural. Cullen's Firſt Lines, vol. iii.

SPASMUS CLONICUS. CLONIC SPASM. In a morbid ſtate, the contraction of the muſcles, or of the muſcular fibres, is involuntary, and excited by unuſual and unnatural cauſes. When the contractions are ſucceeded by a relaxation, but at the ſame time are repeated without the concurrence of the will, or the repetition of the natural cauſes, and are at the ſame time repeated more frequently, and commonly more violently than in an healthy ſtate; diſeaſes of this nature are called *motorii*; and this ſtate of morbid contraction hath been named *clonic ſpaſm*, and is what Dr. Cullen, in his Noſology, names *convulſio*. See Cullen's Firſt Lines, vol. iii.

SPASMUS CYNICUS. See SARDONICUS RISUS.

—— TONICUS. TONIC SPASM. In a morbid ſtate, the contraction of the muſcles, or of the muſcular fibres, is involuntary, and excited by unuſual and unnatural cauſes. When the contractions are to a violent degree, and are neither ſucceeded by a ſpontaneous relaxation, nor readily yield to an extenſion, either from the action of antagoniſt muſcles, or from other extending powers applied; this ſtate of contractions is what hath been called a *tonic ſpaſm*, and what Dr. Cullen names ſtrictly and ſimply, a *ſpaſm*. See Cullen's Firſt Lines, vol. iii.

SPATHA, from *σπαθη*, *corium*, *a ſkin*. The calyx is ſo called, when it opens longitudinally, reſembling a ſheath, and envelopes a ſpadix, which properly means the receptacle of a palm; but this term is generally applied to other plants whoſe flower-ſtalks proceed from a ſheath, as in the narciſſus.

SPATULA FŒTIDA. See IRIS FŒTIDA.

SPECIES. SPECIES. A ſubdiviſion of a general term, and made uſe of in different arrangements; hence it is the fourth diviſion of the term CLASS, and occurs in medicine as well as natural hiſtory; in each, the SPECIES depends upon the *genus*—the GENUS upon the *order*—the ORDER upon the CLASS. See CLASSIS.

SPECIFICA. SPECIFICS. By *ſpecifics* are not meant ſuch medicines as infallibly and in all patients produce ſalutary effects. Such are not to be expected, becauſe the operations and effects of remedies are not formally inherent in them, but depend upon the mutual action and reaction of the body and medicine upon each other; hence the various effects of the ſame medicine in the ſame kind of diſorders in different patients, and in the ſame patient at different times. By *ſpecific* medicines we underſtand ſuch medicines as are leſs fallible than any other in any particular diſorder. *Specifics* may either be conſidered ſuch with reſpect to diſeaſes, or to the machine; both which are much diſputed by many, reſpecting their exiſtence; at leaſt ſome medicines have been named ſo, which act by general, not particular laws, and none that we at preſent know can properly come under ſuch an idea; neither bark nor mercury, if it is to be underſtood that they produce their good effects, by correcting the morbid matter creative of diſeaſe, independent of their action on the machine.

SPECILLUM. A PROBE. Æſculapius is ſaid to have been the firſt who invented its uſe. Quo aliquid ſpecimus, vel obſervamus.

SPECULUM. Called alſo *diaſtomotris*. A PROBE, or an inſtrument for dilating the natural paſſages or cavities with, of which there are the *ſpeculum* ani, (called *catopter*) *ſpeculum* oculi, *ſpeculum* oris, *ſpeculum* uteri. *Speculum* is alſo a name for the *aranea tunica* of the eye.

SPELTA. See ADOR.

SPELTER. See ZINCUM.

SPERMA CETI, improperly called *parmy citty*. Indeed the name *ſperma* is not a juſt one, for this ſubſtance is a kind of matter in an oily ſtate lodged in the head, and ſeems to be the brain of the whale, called *balæna macrocephala*; *cete*, or *cete admirabile*, and which is artificially purified by long boiling with alkaline ley. This fat is found in other parts of this kind of whale; but the beſt is in the head. It differs from other animal fats in not being diſſoluble by alkalies, or combinable with them into ſoap, and in riſing almoſt totally in diſtillation, not in form of a fluid oil, but in that of a butyraceous matter, reſembling the butter of wax. By long keeping it becomes yellow, or rancid; this rancid part, like other fats, diſſolves in alkaline ley, and the remainder is left ſweet and white.

This concrete is without any remarkable ſmell, and hath a butyraceous taſte. It is much uſed in coughs, dyſenteries, eroſions of the bowels, and in ſuch caſes in general as require that the ſolids ſhould be relaxed or ſoftened, alſo in which acrid humours are to be obtunded. It readily diſſolves in oils, and unites with wax, by the aſſiſtance of heat, and thus it is uſed externally. For internal uſe, it may be diſſolved with water, and ſo formed into an emulſion, by the intervention of the mucilage of gum arabic, yolk of egg, or by the help of almonds, which are to be rubbed with it.

Spermaceti is an admirable ſubſtitute for oils, when they do not reſt eaſy on the ſtomach. Sir Richard Mantingham extols the mixture of *ſpermaceti* with diaphoretics in the cure of internal inflammations; and he ſays that when bleeding cannot be prudently ventured on in inflammatory fevers, the *ſpermaceti* mixed with contrayerva root, and the volatile ſalt of hartſhorn, may be depended on, if means can be expected to produce any good effect. The College of London order an ointment to be made of this, called UNGUENT. SPERMAT. CETI; *ſpermaceti ointment*; formerly the linimentum album; by melting ſix drams of *ſpermaceti*, two drams of white wax, and three ounces of olive-oil, together over a ſlow fire, and conſtantly and quickly ſtirring the ſolution till it cools. See Lewis's Mat. Med. Neumann's Chem. Works.

SPERMATICA ARTERIA. The SPERMATIC ARTERY. There is one in each ſide. Each of the *arteries* riſe from the aorta, but are not, as ſome aſſert, ſmall at their origin, and larger in their proceſs, nor do they anaſtomoſe with the *ſpermatic* veins. For the moſt part theſe *arteries* riſe from the anterior part of the aorta, between the emulgent and the inferior meſenteric *arteries*; their courſe is obliquely downwards and outwards, they run upon the ſoas muſcle to the brim of the pelvis, and then through the aperture in the external oblique muſcle; they run behind and contiguous to the peritonæum, and do not lie in the cavity of the belly. They are connected by the cellular membrane to each other, and to their correſponding veins, all which run in a ſerpentine manner, and form the *ſpermatic* cord.

SPERMATICA CHORDA. The SPERMATIC CORD. It is compoſed of the *ſpermatic* artery and vein, of nerves, lymphatics, the vas deferens, the cremaſter muſcle, and aponeurotic membrane, derived from the opening of the external oblique muſcle of the belly: they are all connected by the cellular membrane.

This *cord* is alſo called *corpus varicoſum*, *corpus pyramidale*, *plexus* and *corpus pampiniforme*, *vaſa ſpermatica*, *præparantia vaſa*, *capreolaris*, and *capreolaria*.

SPERMATICÆ VENÆ. SPERMATIC VEINS. A little below the emulgent *veins* the vena cava ſends out the right *vena ſpermatica*. The left *ſpermatic vein* commonly ſprings from the left emulgent *vein*, the reaſon of which is ſaid to be, the avoiding the aorta in its paſſage, by which the motion thereof might be retarded. But this does not ſeem to be the cauſe, as the ſame caution is not obſerved with reſpect to the emulgent.

SPERMATOCELE, from *σπερμα*, *ſemen*, and *κηλη*, a *tumor*, called alſo *epididymis diſtenſa*. It is a morbid diſtenſion of the epididymis and vas deferens, produced by a ſtagnation of *ſemen*. This may be produced by *tumors*, ſtricture, or inflammation, about the caput gallinaginis, or in the courſe of the vas deferens; but there is reaſon to think that it is more frequently induced by the laſt, viz. by inflammation, than by either of the other two.

When an inflammatory affection of the parts is diſcovered to be the cauſe of the diſeaſe, general and topical blood-letting, gentle laxatives, a low cooling diet, and reſt of body, will commonly be found the moſt effectual remedies. And again, when *tumors* are diſcovered to preſs upon the vas deferens, they ought either to be brought to ſuppurate, or their extirpation ſhould be attempted when that can be done with propriety. At other times theſe *tumors* are found to depend on a venereal cauſe; and in ſuch inſtances a well directed courſe of mercury hath been known to remove them.

On ſome occaſions, it is ſaid, that, all the other means having failed, caſtration has at laſt been found requiſite.

But

But this cannot be ſuppoſed to be a very neceſſary ſtep. See Bell's Syſtem of Surgery, vol. i. p. 495.

SPHACELUS. See MORTIFICATIO.

SPHACELUS OSSIS. See SPINA VENTOSA, and CARIES.

SPHACELISMUS. See PHRENITIS.

SPHENOIDES OS, called alſo *azygos*; *papillare os*; *baſilare os*; *polymorphos*. The SPHENOID BONE, from σφην, a *wedge*. It is alſo called *cuneiforme os*. It is an irregular *bone* which runs into the baſis of the ſkull, from one temple to the other. Externally it hath five proceſſes, which are all ſubdivided. The firſt and ſecond are the two lateral apophyſes, called *laterales proceſſus*, the upper part of each of which is called the temporal proceſs; that part of them which jets out towards the inſide, lower than the temporal, and which makes up part of the orbit, is called the *orbitar proceſs*; the loweſt and back part of theſe proceſſes is called the ſpinous proceſs. The two external proceſſes which get out nearly perpendicular to the baſe of the cranium, with each a foſſa behind, are called the *pterygoid proceſſes*. The *azygous proceſs* is that ſharp middle ridge which is in the baſe of the *bone*. See CLINOIDES and SELLA TURCICA.

SPHÆRISTICA. A game, played in the ſphæriſterium, or tennis-court; ſome (though) will have it different from the modern tennis, but it is not known wherein the difference conſiſted. The Mileſians were particularly averſe from this exerciſe; though the Athenians frequently gave the freedom of their city to the *ſphæriſtæ*, or maſters in this art, by way of compliment: the ball with which they played was called *corycus*; and it was alſo the name for balls formed for different purpoſes, particularly of exerciſe. See CORYCUS.

SPHÆROCEPHALA ELATIOR. See ECHINOPUS.

SPHENO-MAXILLARIS ARTERIA. It is the firſt branch of the *maxillaria* interna *arteria*; it goes to the inferior orbitary, or *ſphens-maxillary* fiſſure, and to the orbit, through the foramen *ſpheno*-palatinum.

SPHENO MAXILLARES FISSURÆ. So Winſlow calls the *inferiores orbitares fiſſuræ* formed by the edges of the maxillary notches in the os ſphenoides. They are continued in the maxilla ſuperior, and are there called the inferior orbitary fiſſures.

—— PALATINUS. Theſe muſcles riſe (one on each ſide) from the os ſphenoides, and are inſerted into the ſides of the glandula palati, and back part of the uvula. This alſo is the name of a branch from the upper maxillary branch of the fifth pair of nerves. It is diſtributed to the muſculus pterygoidæus internus, to the back part of the nares, to the ſinus ſphenoidalis, and to the tuba Euſtachiana.

—— PHARYNGÆUS. This muſcle riſes (one on each ſide) from the alary proceſſes of the ſphenoid bone, and runs to the ſides of the pharynx.

—— PTERYGO-PALATINUS. Valſalva diſcovered that this muſcle does not belong to the uvula, but to the tuba Euſtachiana. It riſes from the os ſphenoides, and is inſerted into the fore-part of the palate, called alſo *pterygo-palatinus*.

—— SALPINGO-PHARYNGÆI. Theſe muſcles are fixed by one extremity partly to the ſphenoidal ſide of the bony portion of the Euſtachian tube, partly to the neareſt ſoft portion of the ſame tube; thence it runs towards the external wing of the apophyſis pterygoides, into which one portion of the muſcle is inſerted; the other portion runs to the end of the wing, and turns round to the forked extremity thereof as over a pulley, and is afterwards inſerted in the ſeptum palati near the uvula.

—— SALPINGO-STAPHYLINUS. See CIRCUMFLEXUS PALATI.

—— SPINALIS. See DURÆ MATRIS ARTERIÆ.

SPHINCTER ANI. *Orbicularis*; *aſpidiſcos*; *conſtrictor ani*; *cutaneus*; *cuticuloſus*. The SPHINCTER of the ANUS, from σφιγγω, *conſtringo*, *to ſhut*. The extremity of the *anus* is ſurrounded by the *ſphincter* which ariſes from the bottom of the os coccygis, and, its fibres ſeparating, ſurrounds the *anus*, and terminates in the lower part of the bulb of the urethra.

—— GULÆ. See SPHINCTER ŒSOPHAGI.

—— LABIORUM, called alſo *conſtrictor labiorum*; *orbicularis*; *oſculatorius muſculus*. The SPHINCTER of the LIPS. This muſcle ſurrounds the *lips* with orbicular fibres, and when it acts it corrugates them. It is an antagoniſt to all the other muſcles of the *lips*, keeping them in order, and allowing them an equal balance.

SPHINCTER ŒSOPHAGI, and GULÆ. The SPHINCTER of the ŒSOPHAGUS, or GULA. See ŒSOPHAGUS.

—— VAGINÆ. The SPHINCTER of the VAGINA. Juſt within the *vagina* we obſerve this *ſphincter* muſcle; it is two planes of circular fibres that come partly from the perinæum, and partly from the *ſphincter ani*; they ſurround the *vagina*, and are loſt in the fibres of the crura clitoridis. Its office is to bring the perinæum cloſer to the bones, and ſo embrace the penis in coitu.

—— VESICÆ. The SPHINCTER of the BLADDER is a ſeries of tranſverſe fibres running croſs-wiſe under the ſtraight fibres of the neck of the bladder in a circular manner.

SPICA. A SPIKE, (from σταχυς, Æol. σπαχυς, *an ear of corn*; ſome derive it from *ſpes*, *hope*,) a ſpecies of inflorescence, reſembling an ear of corn, as in the lavendula ſpica. LINNÆUS defines it alternate ſeſſile flowers on a ſimple pedunculus;—when the flowers are all turned one way, it is termed *ſpica ſecunda*;—when they look both ways, *diſticha*. For that called MAS, ſee LAVENDULA LATIFOLIA.—FŒMINA, and VULGARIS, ſee LAVENDULA ANGUSTIFOLIA.—INDICA, and NARDI, ſee NARDUS INDICA.—CELTICA, ſee NARDUS CELTICA.—HORTULANA, ſee STŒCHAS. *Spica* is alſo the name of a bandage, which is of three kinds; and ſo called from their reſemblance to an ear of corn.

—— DESCENDENS. See DELIGATIO, N° 1.

—— INGUINALIS. It is a bandage uſed for the cure of an inteſtinal hernia, a diſlocation of the thigh, and a fracture of the os ilei. It is either ſingle or double headed; the ſingle is twenty-four feet in length, and three fingers broad; the end is placed on the os ilei of the ſound ſide; hence the head of the roller paſſes round the bottom of the belly and the hip, then to the back part of the thigh, comes up between the thighs, and is conveyed to the groin, and ſo over the back where it began; pin the bandage to the compreſs on the groin, and finiſh by a turn or two round the belly. When applied to one groin only it is called *ſpica inguinalis ſimplex*. When the ſimple *ſpica* hath two heads, place the middle part at the perinæum, from whence the heads aſcend obliquely to the hip, from whence they paſs behind and before to the other hip.

—— INGUINALIS DUPLEX. The DOUBLE INGUINAL SPICA. It is uſed when a rupture, &c. is in both groins. It is *double* headed, twenty-four feet long, and three inches broad. Its middle is fixed on the loins, and brought round the belly, where the ends are changed; then they go round the outſide of the thighs, paſs under the buttocks, and aſcend on each groin; there, having ſecured the dreſſing, they aſcend over the oſſa ilii to their beginning, where the heads are again changed and brought round to the belly, where they are again changed, and then they deſcend on each ſide of the ſcrotum, and go round the buttocks to each groin, and ſo to the belly, where they are again changed and, then they aſcend to the oſſa ilii. This direction muſt be repeated often.

—— SIMPLEX. SIMPLE SPICA. It is a bandage, ſo called from its reſemblance to an ear of corn. Some call it *geranium*. It is a common roller, about five ells long, and three fingers in breadth, rolled up with one head. When it is rolled up with two heads, it is called *ſpica duplex*.

SPIGELIA. See ANTHELMIA.

SPINA. See PROCESSUS.

SPINA. The SPINE; alſo RACHIS. It is divided into true and falſe *vertebræ*. The true are twenty-four in number, viz. ſeven of the neck, twelve of the back; the firſt of which is called *lophadia*, or *lophia*; the ſecond *maſchaliſter*; and five of the loins. Each vertebra is compoſed of its body and proceſſes. The body is the thick anterior part, which is convex before, and concave behind, and moſt horizontal and plain both above and below. The ſurfaces of two contiguous vertebræ are covered with a cartilage. There is a ligament, compoſed of concentrical curved fibres, which is firmly attached to the horizontal ſurface of the vertebræ, beſides which there is a ſtrong ligament, which lies between the edges of the vertebræ, whoſe fibres decuſſate each other in the form of an X. From each ſide of the body of each vertebra, a bony ridge is produced backwards and to a ſide, from the poſterior extremity of which one ſlanting proceſs ariſes, and another deſcends: the ſmooth ſide of each of theſe four proceſſes (which are called the oblique) is covered with a cartilage, and the two inferior oblique proceſſes of each vertebra are articulated with the

two

two ſuperior oblique proceſſes of the vertebra below. From between the ſuperior and inferior oblique proceſſes of each ſide, the vertebra is ſtretched out laterally, and forms a proceſs called tranſverſe. From the poſterior root of the two oblique and of the tranſverſe proceſs on each ſide, a broad oblique bony plate is extended backward; where theſe meet, the *ſpinal* proceſs riſes, and ſtands out backwards. Theſe ſeven proceſſes form the poſterior parts of the vertebræ, and are hollow at their anterior middle part, which cavity joined with that on the back part of the bodies, make a great canal which anſwers to another in the vertebra above and below, for the medulla *ſpinalis*. There are two ſemicircular notches belonging to each vertebra, which coincide with two ſimilar notches in the adjoining vertebra; through theſe foramina, (which are placed immediately behind the body of the vertebræ) the *ſpinal* nerves paſs out.

The cervical vertebræ are concave above and convex below; they are flat forward and behind. Their *ſpinal* proceſſes are bifid to allow a more convenient inſertion for the muſcles. The tranſverſe proceſſes are ſhort and generally bifid, the root having a hole for the ſecure paſſage of the vertebral artery and vein. The oblique proceſſes are quite horizontal. The rotatory motions of the head are not entirely performed by the firſt and ſecond vertebræ (as is moſtly imagined), but they are greatly aſſiſted by the reſt of the *ſpine*; for the rotation of any two vertebræ is inconſiderable, yet it is not ſo when we conſider them all together; beſides, if this rotation was betwixt the firſt and ſecond only, as we are capable of rotating the head a quarter of a circle, ſo great a degree of motion would have deſtroyed the *ſpinal* marrow of that part.

The dorſal vertebræ are of a middle ſize betwixt the cervical and lumbal, and are flattened laterally by the preſſure of the ribs, which are inſerted into ſmall cavities in the ſides of theſe vertebræ. The ribs are articulated betwixt two vertebræ, except in the firſt, eleventh, and twelfth, where the cavity for their reception is entirely formed in the ſaid vertebræ.

The lumbar vertebræ are larger than the others; the cartilages between them are thicker, and the *ſpinal* and oblique proceſſes ſtronger, which is neceſſary, as they have a greater quantity of motion, and are the moſt expoſed in injuries offered to the *ſpine*.

The falſe vertebræ are divided into two bones, viz. the os ſacrum and os coccygis.

Upon the *ſpine*, particularly in the cavities of the thorax and abdomen, are found a number of lymphatic veſſels and glands.

SPINA ALBA. The WHITE-THORN TREE, alſo called *oxyacantha*, *meſpilus apii folio ſylveſtris ſpinoſa*, *calcitrapa*. HAWTHORN. It is the *cratægus oxyacantha*, Linn. It is common in hedges: its flowers have an agreeable fragrance, and have been uſeful in ſtrengthening weak ſtomachs by uſing them in the manner of tea or an infuſion. For that called——ACIDA, ſee BERBERIS.

—— ARABICA. See CARDUUS SPINOSISSIMUS.

—— ÆGYPTIACA. See ACACIA.

—— CERVINA, SOLUTIVA, INFECTORIA, PURGATRIX. See RHAMNUS.

—— HIRCI. See GUMMI TRAGACANTHÆ.

—— SCAPULÆ. See SCAPULA.

—— SOLSTITIALIS. See CALCITRAPA OFFICINALIS.

—— BIFIDA, alſo called *hydrops medullæ ſpinalis*; *hydrocele ſpinalis*; *hydrorachitis ſpinoſa*. Sagar ſays, that it is a true dropſy of the *theca ſpinalis*. It is a tumor of the colour of the ſkin, and is ſeated upon the vertebræ of the neck, back, or loins, or on the ſutures of the ſkull. It receives its name from the proceſſes of the ſpine being wanting, where it appears; and is known by its ſituation, its being always there at the birth of the patient, its watery contents, and the palſy, which uſually attends it. Dr. Cullen names it HYDRORACHITIS, a genus of diſeaſe, which he places in the CLASS. CACHEXIÆ, and ORD. INTUMESCENTIÆ, which he defines a ſoft ſmall tumor above the vertebræ of the loins, the vertebræ opening beneath.

This diſorder is incurable. For the moſt part thoſe children on whom theſe tumors are found, die in a day or two. If this tumor is opened, death is ſpeedily the conſequence. Dr. Mackenzie, profeſſor of midwifery in London, gave a drawing which was a caſe of this kind, and with which the child lived four months, but at length died in convulſions. Mr. Warner gives an inſtance of this diſorder in a young man of twenty years old. See his Caſes in Surgery. Bell's Surgery, vol. v. p. 502. Mr. Abernethy, in the cloſe of his account of the lumbar abſceſs, propoſes an attempt at the cure of this malady; for, ſays he, the reaſon of the accumulation of fluid in thoſe diſeaſes beneath the dura mater is not very apparent; nor does the cauſe, producing the ſecretion, appear to be powerful or conſtant; for the water collects very ſlowly at firſt; and, in ſome cures, none has ever been effuſed, and the child has grown up without experiencing any inconvenience. When once the collection has begun, the cauſe of its continuance and increaſe is evident; the collected fluid irritates and diſtends the membranes which ſecretes it, and thus augments the diſeaſe. Beſides, he has ſeen very healthful infants who have been very imperfectly formed with reſpect to the vertebræ whence this diſeaſe originates, whoſe health has ſuſtained but little derangement until the tumor has burſt, when they have periſhed from the inflammation of the medulla ſpinalis, which inevitably enſues. To remedy all which, he propoſes that a gentle degree of preſſure ſhould be made on the tumor from birth, or at its commencement, which might produce the abſorption of any depoſited fluid, and thus prevent the diſtenſion of the unſupported dura mater. But ſhould this have no effect, and ſhould the accumulation of fluid continue to increaſe, as the death of the patient would be inevitable on the ſpontaneous rupture, he thinks it would be vindicable to diſcharge the fluid, by a puncture with a finely cutting inſtrument, and endeavour to heal the wound immediately; and, ſhould this be accompliſhed, to repreſs a future collection, by bandage, and by thoſe topical applications which appear beſt adapted to this purpoſe.

SPINA VENTOSA, called alſo *ſpinæ ventoſitas*, *ſideratio oſſis*, *cancer oſſis*, *gangræna oſſis*, *ſphacelus oſſis*, *teredo*, *fungus articuli*, *arthrocace*, and, by ſome French authors, *exoſteſis*. When children are the ſubjects of this diſeaſe, M. Severinus calls it PÆDARTHROCACE, which ſee. Dr. Cullen makes this a variety of the phlogoſis phlegmone, under the genus phlogoſis, on account of its ſituation, and leaves it to the judgment of the more experienced to determine, whether this complaint, with ſome others he has there enumerated, ſhould be conſidered as a ſpecies of the above genus, or not. With us it is often called a WHITE SWELLING. *Spina* ſeems to have been a term applied by the Arabians to this diſorder, becauſe it occations a pricking in the fleſh like the puncture of thorns, and the epithet *ventoſa* is added, becauſe, upon touching the tumor, it ſeems to be filled with wind, though this is not the cauſe of the diſtenſion. The late Mr. Sharp ſays, that the *ſpina ventoſa* is a *caries* of a bone, attended with an internal corruption of its whole ſubſtance, and generally ariſing from a putrefaction of the marrow, by which the perioſteum and ligaments, as well as the bone, are wholly deſtroyed. See CARIES.

Mr. Pott divides this diſorder into the HYDROPS ARTICULI, the FUNGUS ARTICULI, or thickening of the ligaments of the joint, and the enlargement of the bone. The *firſt* of theſe, or the hydrops articuli, very often comes on ſuddenly, is of ſhort duration, and goes off as ſuddenly; it often happens in a relaxed habit, from a want of lymphatic abſorption, from relaxation, from an obſtruction in the lymphatic circulation in the joint; it ſometimes happens in rheumatic habits. The *ſecond* is generally known by the uniform ſwelling of the parts growing very hard, ſo as to deſtroy all diſtinction; and laſtly, by an inflexibility; this uſually ends in the amputation.

Dr. White, in his preſent Practice of Surgery, page 64, ſays that this diſorder is generally underſtood to be a tumor, which takes its riſe in the internal parts of the bone, and gradually enlarges its ſubſtance. It is frequently hard, and without much pain; ſometimes it appears as if it were puffed up with air, and is attended with ſhooting pricking pains, from which indications it has its name. It gradually extends itſelf to the perioſteum and integuments which cover or lie near the part affected, and, in the end, produces an ulcer of the moſt ſtubborn kind. It is not confined to the cylindrical bones; it affects alſo thoſe of the head, face, neck, back, and cheſt, though the former are the moſt frequent ſeats of the complaint. It is moſt miſchievous when fixed on the heads and proceſſes of bones.

It may be cauſed by a ſcorbutic, ſcrophulous, or venereal acrimony, affecting the lamellæ, or medullary ſubſtance

ſtance of the bone; or by injury done to the correſponding veſſels between the perioſteum, lamellæ, and medulla, from external violence.

In the milder ſpecies of this complaint, when it proceeds from external injury, cold applications, with Goulard's water of acetated ammonia, and the like, in its early ſtage, have been of great ſervice. When it ariſes from acrimony in a moderate degree, an alterative courſe, with mercurial ointment, decoction of ſarſaparilla, or of the woods, together with an aceſcent and milk-diet, have been known to reſtrain its progreſs. Accidents are generally confined to the external lamellæ, and ſeldom produce diſeaſes of great depth in the cylindrical bones, unleſs there is ſome prediſpoſing cauſe in the habit, which is the buſineſs of the ſurgeon to attend to. When the ſuperincumbent parts begin to be diſcoloured, and are troubled with pricking pain and burning heat, an ulcer is certainly forming without the bone: at that time, an opening ſhould be made ſufficient to lay bare the diſeaſed part: if it is of moderate extent, a cauſtic may be applied; otherwiſe, the knife will anſwer better. Perforation, as directed in the carious ulcer, then becomes expedient: and ſuch dreſſings are to be applied, as will tend to abſorb the diſcharge, and reſtrain the fleſh from growing over the denuded bone, until the diſeaſed part is ſeparated, or the diſcharge is dried up. When the whole of the ſubſtance is diſeaſed, particularly in or near a joint, amputation is the only remedy; but it is juſtly obſerved by Monſ. Le Dran, that the operation ſhould not be performed upon the bone which is diſeaſed.

SPINACHIA, } alſo called *olus Hiſpanicum*. COMSPINACIA, } MON SPINAGE. It is only uſed at the table, and conſidered as very tender, containing only a ſmall portion of nutritious matter, but if *freely eaten* it is *laxative*, *diuretic*, and *cooling*. See Raii Hiſt.

SPINÆ VENTOSITAS. See SPINA VENTOSA.

SPINALES COLLI MINORES. See INTERSPINALES MUSC.

SPINALES LUMBORUM. Theſe are ſome faſciculi which run up from the ſuperior falſe *ſpines* of the os ſacrum to the lower ſpinal apophyſes of the loins, which may be looked upon as ſo many *ſpinales lumborum* majores. There are alſo ſome *ſpinales* minores between the ſpinal apophyſes of the loins, and tranſverſales minores, between the tranſverſe apophyſes, which are ſometimes of a conſiderable breadth.

SPINALIS ARTERIA. There are two *ſpinal arteries*, one anterior and one poſterior, both produced by the vertebrales; each of which, as ſoon as it enters into the cranium, ſends out a ſmall branch, by the union of which the poſterior *ſpinalis* is formed. Afterwards the vertebrales advancing to the apophyſis baſilaris of the os occipitis, detach backwards two other ſmall branches, which likewiſe meet, and by their union form the *ſpinalis* anterior. Theſe *ſpinal arteries* run down on the fore and back ſides of the medulla *ſpinalis*, and by ſmall tranſverſe ramifications communicate with thoſe which the intercoſtal and lumbar *arteries* ſend to the ſame part.

SPINALIS COLLI. This muſcle riſes one on each ſide, from the ſpines of the ſeven uppermoſt vertebræ of the back, and is inſerted into the ſpines of the five lower vertebræ of the neck. See SPINALIS MUSCULUS.

—— DORSI MAJOR. It is a long ſlender muſcle lying on the lateral part of the extremities of the ſpinal apophyſes of the back. It is commonly called *ſemiſpinalis*.

SPINALIS DORSI MINOR. Theſe muſcles are of two kinds; ſome go laterally from the extremity of one ſpinal apophyſis to another, being often mixed with the ſhort faſciculi of the *ſpinalis* major; the reſt lie directly between the extremities of two neighbouring ſpinal apophyſes, being ſeparated from their fellows on the other ſide by the ſpinal ligament. See SPINALIS MUSCULUS.

—— MUSCULUS. This muſcle, and its fellow on the oppoſite ſide, riſe tendinous from the ſpinal proceſſes, and run to be inſerted into the tranſverſe proceſſes. It is diſtinguiſhed into *ſpinalis colli*, and *ſpinalis dorſi minor*. It goes in this manner as high as the ſpinal proceſs of the ſecond vertebra.

SPINOSA. See SPINA BIFIDA.

SPINOSUM SYRIACUM. See ALHAGI.

SPIRÆA FILIPENDULA. A ſpecies of DROPWORT. This plant grows wild in fields and marſhy grounds: the root conſiſts of a number of tubercles, faſtened together by ſlender ſtrings; its taſte is rough and bitteriſh; with ſome pungency. It has been recommended as an aſtringent in dyſenteries, immoderate uterine fluxes, &c. alſo as a diuretic by ſome; by others as an aperient, and deobſtruent in ſcrofulous habits. At preſent though it is totally diſregarded in practice.

SPIRITUS. SPIRIT. Any fine volatile ſubſtance which exhales from bodies in a given degree of heat is called *ſpirit*; hence, by a ſort of imaginary analogy, the nervous fluid hath been called *ſpirit*, and is generally termed the *animal ſpirit*. *Spirit* in the human body is ſpoken of under the different characters of natural, vital, and animal. The *firſt* are ſaid to preſide over the digeſtion of the aliment, and the elaboration of chyle, or the natural actions. The *ſecond* over the motion of the lungs and heart, or the vital actions. The *third* over the animal actions, as ſenſation, voluntary motion, &c.

This term *ſpiritus* is alſo added to many products, as ſps. *Ætherеus—Vini Ætherеus*, ſee ÆTHER;—*Camphoræ Tartar.—Vin. Camph.* ſee CAMPHORA, N° 3. 4. *Cochleariæ*, ſee COCHLEARIA;—*Cornu Cervi—Sal. Amm.—Sal. Amm. D.—Sal Ammon. Cauſtic.—Sal. Amm. cum Calce viva—Ammon. compoſit. vice—Vol. Arom.* ſee ALCALI VOLATILE.—*Vini.—Vin. tenuioris.—Vin. rectif.* ſee VINUM ADUSTUM.—*Sal Marin. coag.—Glauberi*, ſee MARINUM SAL.—*Nitr.—Nitr. Glaub.—Dulcis & Ætheri nitroſi*, ſee NITRUM, N° 5. 14.—*Vol. fætid.* ſee ASA FŒTIDA.

In BOTANY it is that volatile part in the eſſential oil of plants to which their peculiar ſmell and taſte is owing. It is alſo called *rector ſpiritus*.

In PHARMACY there are many different ſubjects to which the name of *ſpirit* is given; but they are chiefly the *ſpirits* obtained by fermentation, which ſeem to be the only proper ones; thoſe that are formed of a ſaturate ſolution of volatile alkaline ſalts in water are more properly ſolutions than *ſpirits*. The *fermented vegetable ſpirit*, commonly called *vinous ſpirit*, is water ſo impregnated with the oilineſs of a vegetable, that it will burn all away. See VINUM ADUSTUM.

SPIR. ÆTHER. VITRIOL COMP. See LIQUOR MINERALIS ANOD. HOFFMANNI.

—— MINDERERI. MINDERERUS's SPIRIT, now aqua ammonia acetata. See ALCALI VOLATILE.

SPISSAMENTA. See STYMMATA.

SPLACHNON. See BRYON.

SPLANCHNICA, from σπλαγχνον, *an entrail* or *bowel*. Medicines appropriated to the diſeaſes of the bowels or viſcera.

SPLANCHNOLOGIA. SPLANCHNOLOGY. It treats of all the viſcera in the head, breaſt, or belly.

SPLEN, vel LIEN. The SPLEEN, or MILT. Hippocrates calls it the LEFT LIVER. Ariſtotle calls it the left or BASTARD LIVER. Some of the ancients called it *fomes ventriculi*, fuel to the ſtomach; becauſe they ſay its office and ſituation is to the ſtomach as a furnace to a copper, that it warms the ſtomach. The *ſpleen* is ſituated in the left hypochondrium laterally, in the cavity between the falſe ribs and the ſpine. It is of a long oval figure, about ſeven fingers breadth in length, and four or five in breadth. It is generally of a livid or a black red colour, and very lax. It is compoſed of three ſides; the convex is next the diaphragm; the concave is divided by a longitudinal ſulcus where the ſplenic veſſels enter, and divides the *ſpleen* into an under, anterior, and upper poſterior part. It receives the great extremity of the ſtomach on its concave part. It takes a coat from the peritonæum. At the fiſſure in the inferior edge the veſſels enter variouſly, ſome in the middle and others in the extremities; theſe veſſels ſend branches to the ſtomach; they are called vaſa brevia. Haller ſays that it is compoſed wholly of arteries and veins, and that its uſe is to afford the liver due ſupplies of blood. See Haller's Phyſiology, lect. 26. Caſſerius, Ruyſch and Winſlow.

SPLENALGIA, vel SPLENICA. Pain in the ſpleen, from σπλην, *ſplen*, *ſpleen*, αλγος, *dolor*, *pain*. Hence as in the hepatalgia, the diſeaſe ariſes from ſcirrhoſity and obſtruction. The general ſymptoms are an uneaſy, dull, tenſive ſenſation on the left ſide, the patient being free from that ſpecies of fever which attends the inflammation of the ſpleen. DESCRIPTION. When from the firſt, it is diſcoverable by a hard tumor occupying the ſeat of the ſpleen, and reſembling its figure, attended with a ſenſe of weight—the tumour is ſometimes wonderfully large, ſucceeds a quartan intermittent, and often runs into a dropſy of the belly—the complexion of thoſe labouring under this complaint is of a lead colour—they grow very thin—are oppreſſed with difficulty of breathing—and have a ſenſe of weight, drawing the throat downwards

toward the left ſide—they complain of oppreſſion at the ſtomach after eating—at laſt their feet become paſty, and they ſometimes have ulcers of the legs.

When from the ſecond, it does by no means reſemble the figure of the ſpleen, neither is it hard or circumſcribed—the pain is more acute; which, on the ſcirrhus being formed, becomes dull—attended with a ſenſe of greater weight.

In this there is perceived a load on the left ſide, afterwards ſome acute pain, particularly raiſed in running and walking—the colour of the face changes to one more livid—there is an univerſal laſſitude—difficulty of breathing from exerciſe—ſometims a dry cough—now and then a palpitation of the heart—eruptions break out—the patients become hypochondriac—have ravenous appetite, &c.—and the diſeaſe is extremely obſtinate.

The cure is ſimilar to what has been delivered on pain in the liver from obſtruction. See HEPATALGIA.

SPLENALGIA SUPPURATORIA. Inflammation of the ſpleen, tending to or ending in a ſuppuration.

SPLENIA. COMPRESSES. The ancients called them *ſplenia*, becauſe they often reſembled the ſpleen in ſhape. And they are called compreſſes, becauſe they keep other dreſſings tight and firm. They are made of lint, tow, and folded rags. Their principal uſes are to cheriſh the natural heat of the part, or to keep out the cold: to ſecure the dreſſings under them; to convey liquid remedies to the diſordered part, and to continue them longer thereon; to fill up inequalities and depreſſions, ſo that the dreſſings may be ſecured; and, laſtly, to prevent the ſkin from being irritated by the ſtricture of the bandages.

SPLENICA. See SPLENALGIA.

SPLENICA ARTERIA. The SPLENIC ARTERY paſſes downwards and to the left ſide, behind the upper edge of the pancreas, to which it gives branches; afterwards it divides into ſeveral branches, which enter the fiſſure in the inſide of the ſpleen. Before they enter the ſpleen they give off the *vaſa brevia*, and the epiploica, ſo called from being ſent to the omentum, and the *gaſtrica ſiniſtra*, which is the largeſt of the vaſa brevia.

—— VENA. The SPLENIC VEIN is one of the diviſions of the vena portæ ventralis. It runs tranſverſely from the right to the left, firſt under the duodenum, and then along the lower ſide of the pancreas near the poſterior edge; in its courſe it gives off ſeveral branches. It terminates after by a winding courſe, in which it ſends branches to the ſpleen. Laſtly, it reaches the fiſſure of the ſpleen, which it enters, and runs through its whole length by ſeveral branches, much in the ſame manner as the ſplenic artery.

—— VENA BRACHII. See BASILICA VENA.

SPLENITIS, from σπλην, *the ſpleen*. See INFLAMMATIO SPLENIS vel LIENIS. *Splenitis* is alſo a name for the vein in the left hand, which is called *ſalvatella*, the fellow to which in the right hand is called *ſecoraria*.

SPLENIUM. See ASPLENIUM.

SPLENIUS, called alſo *triangularis*, and *maſtoidæus ſuperior*. See MASTOIDÆUS MUSC. It riſes from the ligamentum colli, a little below the firſt tranſverſe line of the os occipitis, from the lower vertebræ of the neck, and five upper dorſal vertebræ, and is inſerted into the poſterior part and whole length of the maſtoid proceſs, and into the tranſverſe proceſs of the atlas and dentata, ſerving to bend the neck backwards. Albinus divides this into two muſcles, viz. the *ſplenius* capitis, and the *ſplenius* colli; but this diviſion is quite unneceſſary.

SPLENOCELE. A RUPTURE OF THE SPLEEN. It is a hernious diſlocation of the ſpleen, through the relaxed, divided parietes of the abdomen in the left ſide, or its having fallen through the inguinal ring of the ſame ſide. It is diſcoverable from the place at which the hernia ſwells much, i. e. the left ſide of the abdomen under the navel, the protuberance appearing to extend itſelf to the inguinal ring; from examining the ſpleen, which is perceived to extend itſelf from the region of the left hypochondrium into this tumor, from the parenchymatic firmneſs of the protuberance, and from a want of thoſe ſigns which accompany an enterocele, epiplocele, and more particularly a hyſterocele. Of this diſeaſe there are two ſpecies. 1. *Splenocele ventralis*. 2. *Splenocele inguinalis*. See *Noſologia Methodica*. Sauvageſii, vol. i. p. 209.

SPODION. See SACCHARUM.

SPODIUM ARABUM. BURNT IVORY. *Cinerulam, ebur. Ivory* is the tuſks of elephants, which often grow to ſeven feet in length, and at their baſis are as thick as a man's thigh; one of them will ſometimes weigh one hundred and ſixty pounds. The *African ivory* turns yellow with keeping; the *Ceylon ivory* keeps its whiteneſs longeſt. The ſhavings are boiled in water, and thus a jelly is formed, which hath the ſame effects as the jelly of hartſhorn; the *African ivory* abounds moſt with oil and ſalt, the qualities of which are not different from thoſe obtained from hartſhorn. When *ivory* is burnt to blackneſs, it is called *ivory* black and *velvet* black.

Spodium is alſo applied to burnt aſhes, metalline calces, and a compoſition of white lead and oil, called PUTTY, and is likewiſe called *abaiſir*.

SPODIUM GRÆCORUM. See ALBUM CANIS.

SPOLIARIUM. See APODYTERIUM.

SPONDYLIUM. See PASTINACA.

SPONGIA. SPONGE, called alſo *beſacher*. It is ſomewhat like a fungus; it is a plant which grows in the ſea; it is very bibulous, of a ſoft ſubſtance, full of perforations, and elaſtic. It is brought from Smyrna and Aleppo: the beſt is ſaid to be got in the Archipelago. Thoſe pieces which are full of fine perforations are called *males*, and of theſe the hardeſt are called *tragi*; the contrary are called *females*. It is a nidus for ſome ſort of flies. See BESONNA.

It is uſed inſtead of flannels, in applying fomentations, for it keeps the heat longer; for tents to dilate wounds, in which caſe it is dipped in hot bee's wax, then ſqueezed hard until it is cold, after which it is cut into proper ſizes,—for pledgets to be applied over the lint which is laid on the ſtump after amputating a limb. It adheres ſtrongly to the mouths of wounded veſſels, and when retained by proper compreſſion it has prevented conſiderable bleedings, preferable to agaric, or puff-ball; and in ſcrofulous diſorders, and cutaneous foulneſſes, for which end it is reduced, by lightly burning it, to a black powder, which is given in doſes from gr. x. to ℈ i. two or three times a day: its virtues, which render it uſeful in theſe diſorders, depend on a volatile, animal, alkaline ſalt, with which it abounds, and the oil of the *ſponge* united. Its properties are thought merely to depend upon the quantity of natron which it contains; the natron therefore is generally preferred in the preſent practice.

It has been particularly celebrated for removing that large ſwelling of the neck, termed *bronchocele*, and *Derbyſhire throat*, which is probably of a ſcrofulous nature.

When *ſponge* is cut in ſmall pieces and freed from the ſtony matters which are lodged in it, it is burnt in a cloſe earthen veſſel until it is black and friable, and when powdered in a ſtone or a glaſs mortar, it is kept in a cloſe phial for uſe. The burning ſhould be diſcontinued as ſoon as the matter becomes thoroughly black, as the outſide of a large quantity will be ſufficiently burnt before the middle is much affected: the beſt method is, to cut it in ſmall pieces, and keep it continually ſtirring in ſuch a machine as coffee is roaſted in.

Except the bags of the ſilkworm, more volatile alkaline ſalt is obtained from *ſponge* than from any other matter. By boiling the *ſponge* in water, it gives out a portion of ſea-ſalt; by burning it to aſhes, it yields a large quantity of fixed alkaline ſalt, the ſame as is obtained from the ſea-ſalt. See Lewis's Mat. Med. Neumann's Chem. Works.

SPONGIA SOLIS. See BONONIENSIS LAPIS.

SPONGIOSUM OS. A name for the *os ethmoides*. The *oſſa ſpongioſa* inferiora are two oblong bones lying looſe between the anterior and poſterior noſtrils; they are glued to the upper maxillary bones, and are convex towards the ſeptum naſi, while on the oppoſite ſide, which faces the ſinus maxillaris, they are concave. They have each two proceſſes on their upper edge; the poſterior covers part of the maxillary ſinus; the inferior joining with the os unguis, compoſes part of the ductus lachrymalis. The *oſſa ſpongioſa* ſuperiora, ſee ETHMOIDES OS.

SPONSA SOLIS. See ROS SOLIS, and CALENDULA.

SPORADICI. SPORADIC DISEASES. Such *diſeaſes* as reign in the ſame places and time; here and there one or a very few perſons only being their ſubjects. Such diſeaſes are neither endemic, epidemic, or contagious.

SPUMA ARGENTI. See CATHIMIA.

SPUTUM. SPIT. This name is given to whatever comes from the mouth; by that action we call *ſpitting*, or *coughing*. Bloody *ſpit* is when the blood-veſſels in the lungs are eroded, and in this caſe a cough attends. Salt acrid *ſpit* beſpeaks danger of an eroſion in the lungs. Bitter, or ſalt *ſpit*, is from a mixture of bile. Sweet *ſpit* is from concocted phlegm; fetid *ſpit* is from a putrefaction

tion of the humours of which it is compoſed; purulent *ſpit* is from a phthiſis approaching or begun. See Proſper Alpinus's Prælages.

SQUALOR. See AUCHMOS.

SQUILLA CRANGON. See CRANGON.

SQUINANTHUM. See JUNCUS ODORATUS.

STACHYS. See MARRUBIUM VERTICILLATUM. For that called *fœtida*, ſee GALEOPSIS;——paluſtris, ſee PANAX COLONI.

STACTE. See MYRRHA.

STACTICON. See ENSTACTON.

STAGMA. A liquor expoſed to diſtillation; alſo a name for the ACIDUM VITRIOLICUM.

STAMENS—not STAMINA, called alſo by Engliſh writers *chives*. They are thoſe upright filaments, which on opening a flower we find within the corolla ſurrounding the *piſtillum*; and are ſaid by Linnæus to be the male organs of generation, whoſe office it is to prepare the pollen. Each ſtamen conſiſts of the FILAMENT and ANTHERA.

STANNUM. TIN. Alſo called *plumbum candidum*, *diabolus metallorum*, becauſe when incorporated with other metals, they are not reduced but with the greateſt difficulty; and *Jupiter*, *acaleum*, *acazdir*, *allence*, *alnec*; *caldar*; *cydar*; *dikalegi*. It is the lighteſt of all the metals; the leaſt ſimple, being mixed with various heterogene particles, particularly ſulphureous or arſenical, whence the inconveniencies to which its aſſayers are ſubjected; it is leſs fixed in the fire than any other of the metals; it is ſoft, flexible, and malleable, yet it increaſes the elaſticity of ſome elaſtic bodies; it is not ſonorous, yet when mixed with other metals their ſound is increaſed; it melts long before ignition, even with a heat not much exceeding boiling water; in melting it hath this peculiarity, in which it differs from all other metals, that it crackles as it melts; when crude, it diſſolves only in aqua regia; but when freed from its ſulphur, &c. by calcination, it diſſolves even in vinegar. Its ore is found in many parts of the world, but the beſt is the Malacca *tin*, and the next is the Engliſh. When it is pure and refined it has been called *aluach*, or *aluech*.

Tin hath been extolled as a ſpecific in diſorders of the uterus and lungs, and particularly as an antihectic, but experience does not ſupport its character, ſo that it is almoſt thrown out of the preſent practice. Dr. Alſton hath given the filings of *tin* a degree of reputation for deſtroying worms, particularly the flat one; he directs it to be given in treacle, in doſes of from ʒ ſs. to ʒ i. the patient takes it in the morning faſting; the day after three doſes are taken, a purging draught ſhould be taken. Some hath obſerved that *tin* hath been effectual in epilepſies from worms and from frights, and in the chorea ſancti Viti; though not in any other nervous diſorder. In nervous diſorders it ſhould be finely powdered; but as a deſtroyer of worms, the filings are moſt effectual.

If *tin* is heated, it becomes ſo brittle, that by agitation, when juſt ready to melt, it falls into a fine powder. The PULVIS STANNI is made by firſt melting the tin, then pouring it into a box, and ſhaking it about till it is cold; part of the tin will be formed into a fine grey powder, and by a repetition of the proceſs the whole of the metal may be conſumed; but the *tin* is more eaſily powdered by rubbing three parts with one of coralline, and pounding them together. Doſes of this from ten grains to thirty may be given twice a day, and after repeating it for ſix or ſeven days, a briſk purge may be adminiſtered with great advantages in worm caſes. See Lewis's Mat. Med. Neumann's Chem. works.

STAPEDIS MUSCULUS. It lies in a little cavity of the os petroſum, and is inſerted into the head of the ſtapes.

STAPES. The STIRRUP. It is one of the bones in the ear, and is thus named becauſe it is exactly like a *ſtirrup*. It ſtands with its baſis upwards and inwards upon the feneſtra ovalis, and at its narrower part is articulated with the inſide of the long proceſs of the incus. See AURIS.

STAPHISAGRIA, called alſo *pedicularis*, *pedicularia*, *phtheiroctonon*, *delphinium plantaui folio*; *aconitum urens vicini fere foliis flore cæruleo magno*. STAVESACRE, LOUSEWORT, or PALMATED LARK-SPUR. It is the DELPHINIUM STAPHISAGRIA, *nectariis tetraphyllis petalo brevioribus, foliis palmatis; lobis obtuſis*. CLASS. POLYANDRIA; ORDO TRIGYNIA. LINN. Gen. Plant. 681. called by the Arabians *alberas*. It is a plant with large leaves, and blue flowers, which are followed by pods, containing large, rough, triangular, dark-coloured ſeeds. It is a native of the ſouth parts of Europe, from whence the ſeeds are brought to us; but they are moſt plentiful in Dalmatia and Iſtria.

The ſeeds have a diſagreeable ſmell, a nauſeous, bitter, burning taſte. If taken in doſes from ten grains to a ſcruple, *they purge and vomit ruggedly*, and *inflame the throat and ſtomach*; but they are chiefly uſed to deſtroy lice. Their acrimony is partially extracted by water, totally by rectified ſpirit, but not raiſed by either in diſtillation. Decoctions of this have been uſed for curing the itch. The beſt method of uſing them for deſtroying lice, &c. is to ſtrew the fine powder on the part, and to ſecure it with a hankerchief, or other proper bandage; or if a decoction is more convenient, boil an ounce in a pint of water for a few minutes. The powder may be mixed with oatmeal to kill mice and rats. See Neumann's Chem. Works. Lewis's Mat. Med.

STAPHYLINI. Winſlow calls by the names *ſtaphylini*, and *epiſtaphylini*, two fleſhy ropes cloſely united together, as if they were but one muſcle; but in ſome ſubjects they are diſtinguiſhed by a very fine white line. They are fixed by one extremity in the common point of the poſterior edges of the oſſa palati, and from thence they run downwards and backwards along the middle of the ſeptum, and alſo along the middle of almoſt the whole uvula. Morgagni diſcovered them, and they are called by ſome *azygos Morgagni*.

STAPHYLINUS EXTERNUS. See CIRCUMFLEXUS PALATI.

—— GRÆCORUM, and SYLVESTRIS. See DAUCUS VULGARIS.

STAPHYLOMA. This term comprehends two diſorders of the eye; one when the *tunica cornea* is gradually rendered protuberant; the other, when the *pupilla* breaks forth upon the tunica cornea, and deforms the eye with the tumor, like σαφυλη, *a grape*, by which the ſight is deſtroyed. Theſe tumors, from their different forms and ſizes, aſſume different names; as *margarita*, *myocephalon*, *clavus*, *mylon*, *pomum*, *uva*, or *acinus*; according to the reſemblance they bear to the things whence they are named. Sauvages ſignifies by this word a dropſy of the cornea. Not only the cornea, but alſo the ſclerotica, is alſo ſometimes ſwelled, and occaſions great pain and violent inflammation, which frequently ends in a ſuppuration, or a cancer. Monſ. St. Yves propoſes to extirpate the tumor, and then dreſs with lint dipped in brandy and water; after which the artificial eye may be fixed. If the caſe is ſlight, compreſſes of alum-water may be laid on, and the patient ſhould lie continually on his back. If a wound is the cauſe, try to puſh back the tumor with a probe.

For the moſt part, the cure is not undertaken to recover the ſight, but only to remove the deformity and the bad ſymptoms. See Bell's Surgery, vol. iii. p. 313, &c. Wallis's Sauvages' Noſology of the Eye, p. 183. White's Surgery, p. 232. CELSUS, ſays, that ſpecies of ſtaphyloma, called CLAVUS, is a callous tubercle on the white of the eye, and takes its denomination from its figure; he adviſes it to be perforated to the bottom of the root with a needle, to be cut out, and then dreſſed with lenients.

STAPHYLOSIS. A protuberance or protruſion of the choroides of the eye.

STATIONARIA FEBRIS. A STATIONARY FEVER. So Sydenham calls thoſe fevers which happen when there are certain general conſtitutions of the years, which owe their origin neither to heat, cold, dryneſs, nor moiſture, but rather depend upon a certain ſecret and inexplicable alteration in the bowels of the earth, whence the air becomes impregnated with ſuch kinds of effluvia as ſubject the body to particular diſtempers, ſo long as that kind of conſtitution prevails, which after a certain courſe of years declines and gives way to another. Each of theſe general conſtitutions is attended with its own proper and peculiar kind of *fever*, which never appears in any other

STAXIS. See APOSTAXIS.

STEATITES. See POLYSARCIA; and CIMOLIA ALBA.

STEATOCELE, from στεαρ, *ſuet*, and κηλη, *an hernia*. See HERNIA SCROTALIS.

STEATOMA, from στεαρ, *ſuet*. A ſpecies of tumor, commonly called a wen, ſee NÆVUS, of which it is a ſpecies. Its contents appear like *ſuet*; it does not yield to eſcharotics; but when convenient, is to be removed with a knife.

Mr.

Mr. Hill, in his Cafes in Surgery, p. 56, &c. fays, "So far as I can judge, it is the *ſteatoma* alone (of the encyſted tumors) that can properly be called by that name, i. e. wen, all the reſt having ſomething inconſiſtent with the ideas annexed to that word. The ſebaceous humour generally undergoes no alteration for a great number of years, except a gradual increaſe in ſize. In general, all incyſted tumors, when ſmall and properly ſituated, may be turned out entire, without opening the cyſt, by a croſs cut through the teguments, and by raiſing up the four corners. But when the wen is ſo large that it cannot be diſſected out, another method muſt be followed, of which I ſhall give a few examples. Jan. 18, 1753. By a croſs cut, I turned out entire a wen from the ſhoulder of Mrs. W———. It was as large as a child's head. I clipped off the ſuperfluous teguments, brought the reſt as cloſe together as I could; and they coaleſced in a very ſhort time. She was with child when the operation was performed; has ſince bore a great many children, and lived thirty-eight years after it. July 11, 1769. But the above method could not be attempted with another patient of mine, who was ſeventy-four years of age, and of a weak habit of body. The wen had been increaſing for thirty years, and weighed above three pounds. I made a circular inciſion to the cyſt, round the body of the tumor, and gradually raiſed it up, while I diſſected it out of the teguments which were below. Notwithſtanding this precaution, the ſkin and fleſh returned further than I intended. As ſoon therefore as the dreſſings were taken off, I put two or three ſtitches into the teguments, which haſtened the cure, although the lips were not brought fully into contact. Hence we may learn, that it is not ſufficient to make the inciſion ſome way up on the body of the wen; but it ſhould be preſſed down, and the teguments pulled back as far as poſſible, before the inciſion be made, as is practiſed in amputations; otherwiſe they will not cover the wound. I have had the ſatisfaction to digeſt out ſome wens, when ſo ſituated as not to be extirpated, by running a ſeton cord through the length of them, and continuing it many months. But care muſt be taken to pierce the cyſt at the bottom, otherwiſe the ſeton may cut through the top of the wen, and leave the under part untouched. See Bell's Surgery, vol. v. p. 457, &c.

Dr. Gottlieb Richter recites a caſe of a ſteatomatous tumor, in order to ſhew, that complaints of this ſort may ſometimes be occaſioned by the depoſition of morbific matter from within, and their extirpation in ſuch caſes is often productive of bad conſequences, and occaſions a tranſlation of the morbific matter to other parts. The caſe alluded to was this: a patient had her hand taken off an account of a very large ſteatomatous tumor, which had rendered the bones carious; when the wound was almoſt healed, one of the axillary glands of the arm from whence the hand was amputated, ſwelled, and became very painful. About three weeks after the wound continuing healed, the tumor burſt, and the patient was affected with violent rheumatic pains, particularly in the haunches. An iſſue was made in the ſame arm, and the internal uſe of aconitum and antimony recommended. The patient however grew worſe; an uninflamed indolent tumor appeared about the clavicle, and another on the upper part of the arm. The patient became hectic, was attacked with incipient blindneſs, and frequent cold ſweats, and died very ſoon after emaciated and exhauſted. See Richter's *Medical and Surgical Obſervations*.

STELLA. The name of a bandage uſed in arteriotomy: it is ſo called from its many croſſings on the temples, or from its reſemblance to a ſtar: it ſhould be twenty or twenty-four feet in length, two fingers broad, and double-headed. When this bandage is uſed, cover the wound with proper compreſſes, then place the middle of the roller on the ſound temple, and bring one end round the occiput, and the other round the forehead, until they meet at the part affected; and there croſſing each other, form a kind of knot; carry one end over the vertex, the other under the chin; croſſing again, over the ſound temple, whence they are carried round the forehead and occiput, to the compreſſes on the wound, &c. until all the bandage is taken up.

STELLA MARINA. See ASTER THELASSIUS.

—— TERRÆ. See CORONOPUS.

STELLARIA. See ALCHIMILLA.

STELOCHITES. See OSTEOCOLLA.

STERILITAS. BARRENNESS, called alſo *agone*. In this caſe, if medicines prove uſeful, it is only by reſtoring the general health. But the cauſe is ſo frequently a ſcirrhus in the uterus or other parts ſubſervient to generation, that it rarely happens that the complaint is removed. It is ſynonymous with *dyſpermatiſmus*.

STERNO-CLEIDO-HYOIDÆUS. See STERNO-HYOIDES.

STERNO COSTALES. See TRIANGULARES STERNI.

—— HYOIDES. This muſcle riſes from the inſide of the ſternum and the clavicle, and running over the thyroid cartilage, is inſerted into the baſe of the os hyoides to pull it down. Some call it *ſterno maſtoideus*, but very improperly; alſo *ſterno-hyoidæus*.

—— MASTOIDÆUS, } See MASTOIDÆUS, and
—— MASTOIDES. } STERNO-HYOIDES.

—— THYROIDÆI. The muſcles thus named riſe between the cartilages of the firſt and ſecond rib; run before and cloſe to the *thyroid* gland and the trachæa, and are inſerted into the knobs of the *thyroid* cartilage, pulling the whole larynx down.

STERNUM, from στερνον, *the breaſt*, or *breaſt-bone*, called alſo *pectoris os*. It is the broad, flat *bone*, at the anterior part of the thorax. In adults of a middle age, it is compoſed of three *bones*, but frequently the two lower *bones* are ultimately united. The firſt *bone* is the thickeſt; to this the clavicles and the firſt ribs are articulated, and half the cavity for the reception of the ſecond rib. The ſecond *bone* is longer, narrower, and thinner than the firſt; in the ſides of it are complete cavities for the third, fourth, fifth, and ſixth ribs, and half pits for the ſecond and the ſeventh. The third *bone* is the leaſt, and hath only half of the cavity for the ſeventh rib. The lower part of the ſternum is called *enſiformis cartilago*, and in young ſubjects is always cartilaginous.

STERNUTATIO. SNEEZING.

STERNUTATORIA. See ERRHINÆ and PTARMICA.

STERNUTATORIUS PULVIS. See ASARUM.

STERTOR. See RHENCHOS.

STIBII ESSENTIA. See ANTIMONIALE VINUM.

STIBIUM. ANTIMONY. See ANTIMONIUM. It is a name alſo for the *vitrum antimonium*.

STICADORE. See STŒCHAS.

STIGMA. SCARLET-COLOURED SPOTS, ſuch as happen after a blow. See SUGILLATIO. Alſo particular marks in the face, or any part of the body, commonly called MOLES. See NÆVUS. The ſpots called *vibices* are ſometimes thus named. In BOTANY, it is the top of the piſtil, pubeſcent and moiſt, in order to detain and burſt the pollen, or prolific powder.

STILLICIDIUM. In PATHOLOGY, it ſignifies the ſame as *ſtranguria*. In PHARMACY it ſignifies an inſtillation of liquor upon ſome part of the body: the French call it *la douche*; and we commonly expreſs it by pumping upon.

In pumping upon a diſeaſed part, three things act at the ſame time upon the inſpiſſated and ſtagnating fluids; *firſt*, the falling fluid, which abrades and comminutes the inſpiſſated juices by its force and compreſſion; *ſecondly*, the nature of the water may contribute to this effect, and the fall of it may help it to penetrate; *thirdly*, the heat of the water, which inſinuates itſelf, and warms the part quite through, it aſſiſts, and quickens the motion of the fluids; hence it follows, that a part is tranſpired through the ſkin, and the reſt aſſiſted in its circulation.

Le Dran, in his 93d and 94th Obſ. gives ſome account of this operation in the anchyloſis, and attempts to account for the action of the pumping; but his reaſoning is rather ſpecious than ſatisfactory.

STILLICIDIUM URINÆ. See DYSURIA.

STIMMI. See ANTIMONIUM.

STIMULANTIA. STIMULANTS. All thoſe ſubſtances are conſidered ſuch as increaſe the oſcillatory motion of a fibre, or excite the action of the moving fibres in the living animal. Boerhaave ſays, in order to produce the oſcillatory motion of the fibre, it is required that an increaſe of motion ſhould be given at that particular point, from whence the increaſe of oſcillation begins; and that the cauſe producing this effect is twofold; *firſt* by a particle of matter, not annexed to the veſſel, ruſhing with proper force up a point, or particle, ſo as to force it out of its natural ſituation; but the impulſe of that particle ceaſing, the fibre will immediately contract itſelf, in order that the part ſo impelled from its place may again reſtore itſelf; and that its contraction is by ſo much the more powerful, as the particle has been further removed

removed from its natural ſtate, but that cauſes of this kind do not long continue, therefore the effect ceaſes. *Secondly*, the other cauſe, and whoſe effects are more permanent, may ariſe from a particle being fixed in the ſide of the veſſels, either internally from the circulating fluid, or externally from external cauſes. But this is the doctrine of mechanical reaſoning, and may ſerve to account for the locality of action produced from ſome material ſubſtance in the part ſtimulated. But anger, and ſome other of the active paſſions, cannot act from ſuch cauſes. How ſtimulus increaſes action, we cannot point out the preciſe mode; but this we know, all thoſe things which can increaſe the influence of the vital powers, either diffuſively or partially, are real ſtimulants, and as ſuch muſt be conſidered. Dr. Cullen concludes them of two kinds; "*Thoſe which are indirect*, that is, thoſe which act on the organs of ſenſe, by which means a perception is excited in the ſenſorium commune, which acting there, determines the nervous power to flow more copiouſly into the whole, or a particular part of the ſyſtem;—

"And *thoſe which are direct*, that is, becauſe they are imagined to act directly on the moving fibres." The indirect are the moſt common and univerſal, but ſtimulants do excite motion in the moving fibres themſelves, independent of any connexion with the common ſenſorium, as muſcular action may be promoted by ſtimuli applied to their fibres, when detached or ſeparated from the body. Hence then we may fairly conclude that action is produced in two ways, by *ſympathy*, and *local ſtimulus*. And in many of theſe actions mental power is the firſt cauſe, as may be diſcovered in longings; deſire for food which we ſee others eating with uncommon reliſh: weeping from ſorrow; vomiting and ſickneſs from recollection and reflection, &c. General ſtimulus ſeems alſo to be produced, by all ſuch things as are taken into the ſtomach, and communicate general affection through the ſyſtem, owing to the connection of that organ with every other part of the machine, and indeed the whole which come under this head may be ſaid properly to belong to this diviſion, either from their general mode or elective action. Thoſe which are productive of the firſt effects, are antiſpaſmodics, ſedatives, diaphoretics. Thoſe of the ſecond are errhines, ſialagogues, expectorants, cathartics, diuretics, emenagogues and emetics, though ſome of thoſe laſt have alſo a diffuſive action.

The utility which may be derived from the adminiſtration of *ſtimulants* are ſaid to ariſe *from their affecting the ſtate of the circulation*; by facilitating the paſſage of the blood through parts in which it is morbidly obſtructed, by augmenting the force and celerity of the circulation where it is morbidly ſlow and weak;—*from acting on the powers of ſenſation*; by quickening the ſenſes, where morbidly dull; by rouzing the mental faculties, when in a lethargic ſtate;—by exhilarating a deſpondent condition;—*from their acting on the moving fibres*; by reſtoring the power of motion, where morbidly deficient; by increaſing the ſtrength of motion where morbidly weak: hence have they been divided into

STIMULANTIA TOPICA. As *muſtard*, *cantharides*, *preparations of mercury*.

—— DIFFUSIBILIA. As *volatile alkali*, *electricity*, *heat*.

—— CARDIACA. As *cinnamon*, *nutmeg*, *wine*.

In fine, whatever invigorates the ſyſtem, increaſes the action of the nervous or vaſculous power, locally, or univerſally, comes properly under this head.

STIZOLOBIUM. This is called by the Europeans, *cowhage*, or *cowitch*; by many writers *pharſeolus*; by the natives of Bengal, *cadjuct* from the itching and ſcratching it produces; by Linnæus, *dolichos pruriens*, and by Dr. Browne, in his Natural Hiſtory of Jamaica, STIZOLOBIUM, ſpicis multifloribus pendentibus alaribus, floribus ternatis, purpureis: CLASS. DIADELPHIA. ORDO DECANDRIA. LINN. Gen. Plant. 867. This plant grows in great abundance in warm climates, and on account of the ſpicula, which cover its ſeed-bags, hath been long uſed in South America, and of late has been frequently employed in Britain, in worm caſes. See PHASEOLUS ZURATENSIS. The worms are ſaid to appear with the ſecond or third doſe; and by means of a purge, the ſtools are ſaid to have conſiſted entirely of worms; and in caſes of lumbrici, it is ſaid to produce a ſafe and effectual cure. Thoſe who have uſed it, have never found any inconvenience reſulting from its internal uſe. The ſpicula of one pod, mixed with ſyrup or melaſſes, and taken in the morning faſting, was a doſe for an adult. However, Mr. Chamberlayne who has written a practical Treatiſe on the Efficacy of Stizolobium, uſed to prepare and adminiſter it in the form of an electary, mixed with honey, melaſſes, or ſyrup, without obſerving any exact proportion of the quantity of ſetæ. Of this electary a tea-ſpoonful was a doſe for young children, and to adults one, or even two table-ſpoonfuls in a morning faſting. This he repeated two or three mornings, and afterwards gave a gentle purge of ſome kind or other. See Chamberlayne's Treatiſe on this ſubject; Medical Comment. Edinburgh, vol. ii. part 1. N° 4, p. 82.

STOECHAS. FRENCH LAVENDER, CASSIDONY. It is called *ſtoechas*, from the iſland on which it grew; and *ſtoechas* Arabica, becauſe much commended by the Arabian phyſicians; it is alſo called *ſpica hortulana*, *ſticadore*. It is the LAVANDULA STOECHAS. It is a low ſhrubby plant, with ſmall, oblong, narrow leaves, bearing on the tops of the branches ſhort thick ſpikes, or ſcaly heads, from which iſſue ſeveral ſmall purple labiated flowers, followed each by four ſeeds incloſed in the cup: it is a native of the ſouthern parts of Europe, common in our gardens, where, with a little ſhelter, it bears the hardeſt weather; it flowers in May and June. The flowers which are brought from France and Italy are rarely ſo good as thoſe of our own growth. The heads ſhould be gathered when firm and hard, which is about the end of July.

Diſtilled with water, it yields a conſiderable quantity of a pale-coloured fragrant eſſential oil; but with rectified ſpirit of wine it yields but little. Its virtues agree with thoſe of our *lavender*, but are inferior. Neumann's Chem. Works. Lewis's Mat. Med. See LAVANDULA.

STOLONES. The SUCKERS OF PLANTS. Shoots from the roots of vegetables, by which they may be propagated.

STOMACACE, from στομα, the *mouth*, and κακος, *evil*. It is generally, if not always, a ſymptom of the ſcurvy, diſeaſe of the mouth, or external injury, conſiſting of an roſion and ſpontaneous hæmorrhage of the gums, and for the moſt part, a fœtor of the mouth. It is alſo a name for the ſcurvy. See SCORBUTUS.

STOMACHICA. Medicines ſuited to excite and ſtrengthen the action of the ſtomach. Dr. CULLEN ſays he is at a loſs to determine how far this term, ſo frequently employed, could be properly rejected; but he is perſuaded, that it ought for the ſame reaſon as other too general terms. Mat. Med.

STOMACHICA PASSIO. In this diſorder there is an averſion to food; even the thought of it begets a nauſea, anxiety, cardialgia, an effuſion of ſaliva, and often a vomiting; faſting is more tolerable than eating: if the patient is obliged to eat, he muſt endure a pain that is worſe to him than hunger itſelf; he is troubled to chew, but more ſo to ſwallow his food; there is an averſion to common food, and a deſire to what is unuſual: often, a pain is complained of between the ſhoulders, and it is increaſed after eating; reſtleſſneſs, dimneſs of ſight, a noiſe in the ears, a heavineſs in the head, numbneſs in the limbs, a palpitation in the hypochondria, and a ſpitting of cold watery phlegm: the patient imagines that the ſpine of his back moves towards his legs, and whether ſtanding, or lying, he ſeems to be moved like a reed that is ſhaken by the wind; though not thirſty, he deſires to drink after eating; though drowſy, he keeps waking; is lean, pale, feeble, faint, timid, ſilent, but ſoon angry; he is much diſturbed with black bile, and falls into fits of melancholy; the ſymptoms during a fit, are fainting, a cold numbneſs of the joints, an unuſual heat which runs through the members, and moſt perceived in the palms of the hands, with a dewy ſweat, reſtleſſneſs, jactitation, anxiety, deſpondency, a change of colour, a ſmall, ſwift, weak pulſe, a waſting of the body,—OR, on the contrary, an immoderate appetite, with indigeſtion, and an acrid, acid, or nidorous quality in the contents of the ſtomach; ſometimes the patient is ſpeechleſs, grinds and clenches his teeth; there is always a cold in the head, with a ringing in the ears; ſometimes, though rarely, there is great thirſt; a pain in the præcordia, which extends between the ſcapulæ; and when the inflammation is conſiderable, there is a difficulty of ſwallowing, and a ſtrangulation, which ſome have called a STOMACHIC QUINSY; an hardneſs of the ſtomach without pain, with other ſymptoms, as a windineſs, inflation, borborygmi, &c.

The cauſes are a diſcharge of pus from the belly upon the ſtomach, intenſe thinking, a neglect of proper nou-

riſhment and reſt, ſorrow, taking cold, continual indigeſtion, vomiting, &c.

In order to the cure, the patient's inclinations muſt be complied with; the juice of quinces is recommended; warm ſtimulants, ſuch as pepper and ginger, with aloes and other ſuch like bitters, are found to be uſeful. See Aretæus de Cauſ. Sign. diutin. Morb. lib. ii. cap. vi. Cœlius Aurelianus Morb. Chron. lib. iii. cap. ii. Aretæus de Curat. Chron. Morb. lib. ii. cap. iv.

STOMACHICA TINCTURA. See CARDAMOMUM, N° 2.

STOMACHICI NERVI. See PAR VAGUM.

STOMACHUS, from στομα, a *mouth*, and χεω, *to pour*. Becauſe it ſends the food into the orifice of the guts. The word *ſtomachus* properly belongs only to the upper orifice of the *ſtomach*, though given to the whole viſcus, it is alſo called *ventriculus*, *anocœlia*, *gaſter*, *nedys*. The *ſtomach* is ſituated under the left ſide of the diaphragm, juſt below the leſſer lobe of the liver, paſſing down a little way, and then turning over the ſpine to the right ſide. In ſhape it much reſembles the pouch of a bagpipe; it lies in an oblique direction from left to right, and hath a ſubſtance called meſogaſtrion in its concave part, between the orifices attaching it to the ſubjacent parts; its ſuperior orifice is called the cardiac orifice; it is on the left ſide; the inferior orifice is toward the right ſide, and is called pylorus. The outward coat of the *ſtomach* is from the peritonæum; the ſecond coat is muſcular; the inner or villous coat appears like a pile of velvet, but ſhort and flat, and it is extremely vaſcular; betwixt theſe coats the cellular membrane runs, and, according to ſome, reckoned diſtinct coats; to that betwixt the muſcular and the villous coat, ſome have given the name of nervoſa. The muſcular coat of the *ſtomach* can contract it to a very ſmall ſize, as in vomiting. Dr. Hunter thinks, that the cavity is contracted ſo as not to be larger than the ſize of a nutmeg, when all the contents are thrown out. The arteries are principally the *coronaria ventriculi*, and the *two gaſtricæ*, which ſee; the veins are ramifications from the venæ portæ in general, and, in particular, from the meſeraica major, ſplenica, and hæmorrhoidalis interna; the nerves are from the eighth pair. See DEGLUTITIO.

STORAX, ſee STYRAX. For that called—RUBRA, ſee THURIS CORTEX.

STRABILISMUS, STRABISMUS, STRABOSITAS. } from στραζιζω, and that from στρεφω, *to turn*. SQUINTING, alſo called *diſtortio* and *illoſis*. Dr. Cullen places this genus of diſeaſe in the CLASS LOCALES, and ORD. DYSCINESIÆ, which he defines, the optic axes of the eyes not converging. He diſtinguiſhes three ſpecies. 1. *Strabiſmus* habitualis. When from a cuſtom of uſing only one eye. 2. *Strabiſmus commodus*. When one eye in compariſon with the other, from greater weakneſs or mobility, cannot accommodate itſelf to the other. 3. *Strabiſmus neceſſarius*. When ſome change takes place in the ſituation or figure of the eye or a part of it. It may be cauſed from habit contracted by mocking thoſe who *ſquint*; by viewing many agreeable objects at once; by placing the eye of an infant obliquely to a candle, or a window, &c. or this diſorder may proceed from a fault in the firſt conformation of the eye, or ſome particular part of it, or the weakneſs of one eye may produce this defect in the other; the muſcles of the eye may be too long, or too ſhort, preternaturally relaxed or contracted; a tumor in the orbit, or an adheſion of the eye to ſome part of the eye-lid, may alſo be a cauſe; ſpaſm, or an apoplexy, may alſo produce it.

Thoſe who *ſquint* from ſome accident after they are grown up, ſee double; but when they *ſquint* from their infancy, they do not.

Some attempt to remove this defect in children, by ſetting them to look at their faces in a looking-glaſs, and repeat this attempt for a quarter of an hour, night and morning; and while this method is in uſe, the eyes ſhould be waſhed with Hungary water; to ſtrengthen the muſcles, waſh the temples and the forehead three times a day. See St. Yves on the Diſorders of the Eyes. Wallis's Sauvages' Noſology of the Eyes.

STRAMEN CAMELORUM. See JUNCUS ODORATUS.

STRAMONIUM. THORN-APPLE, called alſo *dutray*, *barryoseccalon*. It is the DATURA, vel DATYRA STRAMONIUM, or DATURA FŒTIDA pericarpiis ſpinoſis erectis ovatis, foliis ovatis glabris. CLASS. PENTANDRIA ORDO MONOGYNIA. LINN. Gen. Plant. 246; the *ſtramonium ſpinoſum* of Gerard; and the *ſolanum maniacum* of Dioſcorides.

The root is long, large, and fibrous. The ſtalk is of a pale green, ſtrong, and near three feet high. The leaves are large, of a lively green, placed on ſtrong pedundles: they are broad, pointed at the extremity, beautifully indented, and are placed without any regular arrangement. At night, the leaves, particularly the upper ones, riſe up and incloſe the flowers. The flower appears in Auguſt, conſiſts of one petal, funnel-ſhaped, tubular, and folded at the border in five parts; they grow at the bifurcation of the branches, are large, and of a milk-white colour, though ſometimes they have a tinge of purple or violet. The ſeed-veſſel is oval, large, and covered with ſhort, ſharp, and ſtrong thorns. The ſeeds are brown. It is a native of America.

The ſeeds and leaves received into the human ſtomach produce a vertigo, and afterwards madneſs. Boerhaave relates that ſome boys who had eaten ſome ſeeds of *thorn-apples*, were ſeized with giddineſs, horrible imaginations, terrors, and delirium: and that thoſe who did not ſoon vomit, died. Some ſay it cauſes convulſions. There is a particular account of a man, ſixty years of age, who by miſtake boiled the capſules of the ſtramonium in milk, and in conſequence of drinking this decoction, was affected with vertigo, dryneſs of the ſauces, anxiety followed with loſs of voice and ſenſe: the pulſe became ſmall and quick; the extremities cold; the limbs paralytic; the features diſtorted, accompanied with violent delirium, continual watchfulneſs, and a total ſuppreſſion of all evacuations; but in a few hours he was reſtored to his former health.

This plant hath a diſagreeable naſeous ſmell, when rubbed between the fingers. According to the relations of ſome, the leaves are ſaid to be cooling, and the ſeeds narcotic; others obſerve, that the ſeeds produce a ſtrange kind of delirium, which continues twenty-four hours; and that the root occaſions uneaſy ſleep and troubleſome dreams. Accounts of its effects may be ſeen in the Edinb. Med. Comm.

In caſe of injury from the ſeeds or any other part of this ſpecies of datura, proceed as in caſes of poiſon by muſhrooms. See AMANITA and VENENUM.

Dr. Storck took *ſtramonium offic.* Linnæi: he preſſed out the juice from the freſh plant, and inſpiſſated it to an extract, and, in different caſes, gave it in doſes from gr. ſs. to ʒ i. in twenty-four hours. In epileptic diſorders, convulſions, and madneſs, it proved to be a medicine of ſingular efficacy; he cured ſeveral patients whoſe diſorders were violent and of long continuance, with it. With other practitioners it does not ſeem to have been ſucceſsful. Though the extract has been uſually given, the powdered leaves, after the manner as directed in the adminiſtration of hemlock, ſeem to be a preparation more certain, and convenient. The leaves of the ſtramonium have been uſed as an external application to inflammatory tumors and burns. See Miller's Bot. Off. Dr. Storck on the *Stramonium*. Withering's Bot. Arrang. Med. Muſ. vol. i. p. 448, &c. Wilmer's Obſ. on Poiſonous Vegetables. Cullen's Mat. Medica.

STRANGALIDES. Hard tumors in the breaſts from milk.

STRANGURIA, from στραγξ, *a drop*, and ουρον, *urine*. A STRANGURY. It is a diſcharge of *urine* by *drops*, attended with pain. See DYSURIA.

STRATIOTES. See MICRO-LEUCO-NYMPHÆA, MILLEFOLIUM, ALOIDES.

STREATHAM WATERS. This ſpring riſes about ſix miles ſouth of London bridge, in the county of Surry; a gallon of this water yielded forty grains of calcareous earth; ſixty of a ſalt compounded of vitriolated magneſia, ſea-ſalt and bittern, according to Dr. RUTTY. It is a weak purging-water, drank from one, two, or more pints in a morning. See AQUÆ CATHARTICÆ AMARÆ.

STREMMA, from στρεφω, *to turn*. A STRAIN. When a membranous or tendinous part is ſtretched beyond its proper limits, it is ſaid to be *ſtrained*. This accident happens chiefly about the joints, occaſions weakneſs and pain there, with ſwelling, and often a total inability to move. A *ſtrain* approaches very nearly to the nature of a contuſion, and, as in contuſions, reſt, with the application of warm vinegar, three or four times a day, will be proper; or the CATAPLASMA ACETI, made of vinegar, oatmeal, and crumbs of bread, may be applied

applied cold: it is, though a ſimple, yet an effectual remedy. It is ſaid alſo to have conſiderable effect in ſtopping the progreſs of ſcrophulous enlargements of the bones; it is alſo of great uſe in bruiſes: when the ſymptoms abate, in proportion thereto, let a little ſpirit be added to the vinegar, which now may be uſed cold, and a bandage may be made uſe of to ſupport the weakened part, until the natural degree of ſtrength returns. Dr. Lobo adviſes the uſe of vinegar, and of rectified ſpirit of wine alternately, firſt rubbing in the vinegar, then, two or three hours after, rub in the ſpirit. Saturnine water is uſeful in theſe caſes.

Cold water is uſed by ſome; but if the ſtrain is deep, it does no ſervice; if there is inflammation, it does harm, ſo that it is only in ſlight and ſuperficial, and theſe muſt be recent caſes too, in which it can be of ſervice. Bell's Surgery, vol. v. p. 446.

STREPSICEROS. See ANTILOPUS.

STRIDOR. GRINDING of the TEETH. Hippocrates obſerves, that in acute diſeaſes this ſymptom is uſually fatal if the patient has not been accuſtomed to it in his childhood.

STRIGIL, } An inſtrument to ſcrape off the ſweat
STRIGILIS. } during the gymnaſtic exerciſes of the ancients; and in their baths: *ſtrigils* were made of metals, horn, or ivory, and were curved; ſome were made of linen.

STRIGMENTUM. The STRIGMENTS, FILTH, or SORDES, ſcraped from the ſkin in baths, and places of exerciſe; ſome of theſe *ſtrigments* were only the ſweat, others were the ſweat mixed with the duſt raiſed in the place of exerciſe, or purpoſely ſtrewed on the bodies of them who were there engaged. *Strigments* were of three ſorts: 1. *Sweat.* 2. *Sweat with the duſt and oil which was rubbed on the bodies of the men.* 3. *Oils and duſt ſcraped from ſtatues*, and which often partook of verdegriſe, from the oil diſſolving the copper.

STRONGYLUS. See VERMES.

STRUMA. See SCROFULA.

STRUTHIUM. See SAPONARIA LUTEA, IMPERATORIA, and LUTEA.

STRYCHNOMANIA. See SOLANUM LETHALE.

STRYCHNOS. So Theophraſtus called the deadly night-ſhade. In Linnæus's Syſtem of Vegetables, it is a genus of plants in the claſs pentandria, and order monogynia. Its two ſpecies are the *ſtrichnos nux vomica*, vel *Indica*, &c. and *ſtrichnos colubrina*. See COLUBRINUM, and NUX VOMICA.

STUM. See MUSTUM.

STUPOR. Loss of FEELING. See ANASTHÆSIA. Or it is a tranſitory numbneſs, ſuch as is occaſioned by accidental preſſure, &c.

STUPOR DENTIUM. An affection of the teeth, in which a certain pain is felt in the membrane which ſurrounds them, and by which ſenſation is in ſome degree deſtroyed. It is produced by taking acid and auſtere ſubſtances into the mouth.

STUPA, } A STUPE. It is a piece of cloth, uſually
STUPPA. } of flannel, dipped in ſome proper liquor, and applied to an affected part.

STYGIA AQUA. See AQ. REGIA, under NITRUM.

STYLIFORMIS PROCESSUS. See STYLOIDES PROCESSUS.

STYLO-CERATO-HYOIDEUS. Stylo, from the *ſtyloid proceſs*, and κερατα, *horns of the hyoides*.—STYLO-HYOID PROCESS, ſee STYLO-HYOIDES.

STYLO-CHONDRO-HYOIDÆUS. So Douglas names one of the muſcles called ſtylo-hyoidæus, becauſe it is inſerted into the cartilaginous appendix of the os hyoides.

—— GLOSSI. From *ſtylus, a pencil*, and *gloſſa*, a *tongue*. Theſe muſcles riſe from the inner part of the ſtyloid proceſs, and go the whole length of the tongue, ſerving to expand it.

—— HYOIDES, vel *cerato-hyoidæus*. It riſes from the proceſſus ſtyloides, and runs to the cornu and baſis of the os *hyoides*. Generally its fibres paſs on each ſide of the tendon of the digaſtric muſcle.

STYLOIDES PROCESSUS, from στυλος, *a pencil*, and ειδος, *form*, called alſo *belemnoides*, *ſtyliformis proceſſus*, THE STYLOID PROCESS.

From under the craggy part of the temporal bone, this proceſs ſtands out obliquely forward. The ſhape is ſaid to reſemble the ancient *ſtylus ſcriptorius*, hence its name. Several muſcles have their origin from this proceſs, and borrow one half of their name from it; *ſtylo-gloſſus*; *ſtylo-hyoideus*; *ſtylo-pharyngæus*, which ſee. This proceſs, even in adults, is not entirely oſſified, but is ligamentous at its root, and is ſometimes compoſed of two or three diſtinct pieces. See TEMPORUM OSSA.

STYLOIDES RADIALIS LIGAMENTUM. It is fixed round the neighbouring tuberoſity of the os ſcaphoides.

—— ULNÆ LIGAMENTUM. It is fixed in the os cuneiforme, and then in the os unciforme, from whence it is a little ſtretched over the fourth bone of the metacarpus.

STYLO-MASTOIDEUM FORAMEN, called alſo *maſtoidæum foramen*. This hole is the orifice of the paſſage for the portio dura of the auditory nerve, which runs behind the tympanum.

—— PHARYNGÆI. Theſe muſcles riſe from the beginning of the ſtyloid proceſſes, and are inſerted into the pharynx, and into the thyroid cartilage. See PHARYNX.

STYMMATA. Theſe are called *Spiſſamenta*. Things added to oils, either on account of their odour, or that confects may be preſerved a long time; hence alſo were the thicker, more ſolid ointments called, which were at the ſame time ſweet-ſcented; they are different from the *hedyſmata*, becauſe theſe were liquids, thoſe ſolids. Linden ſays thoſe things were called *ſtymmata*, which gave conſiſtence or body to ointments; but *hedyſmata* were the juices from whence thoſe were made. Schroder deſcribes *ſtymmata* to be the ſpiſſamentum or ſediment of flowers and other things, which remains when they are macerated in oils and expreſſed.

STYMATOSIS. A bloody diſcharge from the penis.

STYPTICA, from στυφω, *to aſtringe*, called alſo *conſtrictiva*. STYPTICS, or medicines which ſtop hæmorrhages. Of *ſtyptics* for ſtopping hæmorrhages there are few to be depended on; their uſefulneſs is only in very ſlight caſes, and the beſt of them is the *lycoperdon*.

STYPTICUS HELVETII PULVIS. *Helvetius's Styptic Powder*, called alſo by the Germans, *pulvis febrifugus*.

℞. Aluminis rupei ʒ i. ſs. ſanguinis draconis, ʒ ij miſce, fiat pulvis.

This was the *pulvis ſtypticus* of the Edinburgh Pharmacopœia, and was in long repute as an aſtringent. But three drams of the gum kino are judiciouſly ſubſtituted now for the dragon's blood; as being much more powerful, and certain in its aſtringent effect. The chief uſe of this is in hæmorrhages, particularly thoſe of the uterus, and, indeed, in their cure is an excellent remedy; given in doſes of from eight grains to half a dram, coupled with pulvis tragacanthæ, gum arabic, and ſtarch, to prevent its having too painful an effect upon the ſtomach. See ALUMEN.

STYRACIFLUA. See LIQUIDAMBRA.

STYRAX, alſo called STORAX; and becauſe it was formerly brought to us in reeds or canes, it was named *ſtyrax calamita*. Indeed the dry ſort is called *calamita*, to diſtinguiſh it from the liquid. Caſper Bauhine calls the tree that affords it, *ſtyrax* folio mali cotonei, becauſe its leaves are like thoſe of the quince-tree. Ray calls the tree from which the liquid *ſtyrax* is obtained, *ſtyrax* aceris folio, becauſe its leaves reſemble thoſe of the maple. It is the STYRAX OFFICINALE, *foliis ovatis, ſubtus villoſis, racemis ſimplicibus, folio brevioribus. Ait. Hort. Kew.* CLASS. DECANDRIA; ORDO MONOGYNIA. LINN. Gen. Plant. 595. OFFICINAL STORAX.

Storax is the moſt fragrant of the ſolid reſins, and, indeed, of all the vegetable ſubſtances. There are three kinds: 1. The FINE SORT, called the *red ſtorax*; it is the pure native juice which flows from inciſions made into the trunk of the tree; it is not in tears, but in maſſes, ſometimes compoſed of whitiſh, and pale reddiſh brown lumps; ſometimes it is of an uniform reddiſh yellow, or browniſh appearance, unctuous and ſoft like wax, and free from viſible impurities. With this kind we rarely meet. 2. The COMMON STORAX: this is ſuppoſed to be the thinner juice thickened with ſaw-duſt, for it is more fragrant than the pure ſort, both whilſt mixed with the ſaw duſt, and when ſeparated by means of rectified ſpirit of wine; its flavour is alſo of the ſame kind. It is now brought in large pieces, of a reddiſh brown colour, ſoftiſh, and, as it were, unctuous to the touch, yet brittle and friable. This is the only ſort that is generally met with, and its reſin is ordered by the London college. 3. STORAX IN THE LUMP: it is in maſſes of an uniform texture, and of a yellowiſh red or browniſh colour, ſometimes interſperſed with whitiſh grains. This is called STORAX IN THE TEAR.

It is the produce of Syria, Cilicia, and Pamphilia; ſome ſay that true *ſtorax* is alſo a produce of Italy, and the Levant, and is indigenous to ſeveral of the ſouthern parts of Europe, yet the reſinous drug which it produces is only to be obtained in perfection from thoſe trees growing in Aſiatic Turkey. There is a ſort in America, but it differs much from the above. It exudes from the leaves of the trees in the warm climes where it is produced; but is moſt abundantly obtained by making inciſions through the bark thereof.

Neumann ſays, that an ounce of common *ſtorax* gave out to rectified ſpirit of wine ſix drams of reſinous matter, then to water half a dram of gummy, and the reſt was ſaw-duſt; and that on heating another ounce with water firſt, he obtained two drams of gummy, then with ſpirit half an ounce of reſin. Pure ſpirit raiſes but little from the *ſtorax* by diſtillation, but water takes up much of its flavour; and when it is almoſt all drawn off, a fine ſubtil eſſential oil riſes, in the proportion of about ℥ ii. from ℥ xvi. The reſiduum, on being urged with a due degree of heat, afforded ʒ ix. of an empyreumatic liquor, then ʒ ii. ℈ i. of thick butyraceous oil: afterwards ℥ ii. ʒ i. of an empyreumatic oil, which had nothing of the ſmell of the *ſtorax*, along with ʒ v. of an acid ſpirit. On waſhing the butyraceous oil with warm water, then ſetting the water in a cool place, a ſmall portion of ſaline matter ſeparated, which appeared like the flowers of benjamin, and is ſuppoſed to be of the ſame nature with gum benjamin. The ſame ſaline matter is obtained from the pure reſin, by boiling it in water. This ſpirit carries but little from the *ſtorax* in diſtillation: yet if twice its weight of the ſalt of tartar is added, a ſpirit is obtained which is ſtrongly impregnated with both the taſte and ſmell of this reſin. The ſtrongeſt, and the moſt fragrant principle, ſeparable from *ſtorax*, is the ſubtile, ſlightly empyreumatic oil which ariſes firſt in diſtilling it.

It is chiefly uſed as a perfume, ſometimes as a medicine, and that both externally and internally; its qualities are to *reſolve* and ſtrengthen. It has been given in catarrhal complaints, coughs, aſthmas, menſtrual obſtructions, and was alſo preſcribed in ulcerations of the lungs, and other pulmonary complaints, from its affinity to the balſams, which, at that time, were in much eſtimation in the ſediſorders. However, though in nervous debilities, from its ſenſible qualities, it might promiſe to be of ſome ſervice, it is now almoſt totally rejected from practice. See Lewis's Mat. Med. Neumann's Chem. Works.

STYRAX LIQUIDA. LIQUID STORAX, called alſo *liquidambar*. It is a reſinous juice obtained from a tree in Virginia and Mexico, which Ray calls *ſtorax aceris folio*. The juice, called LIQUID AMBER, is ſaid to exude from the leaves of this tree ſpontaneouſly, but more freely from inciſions made in the trunk of it; and the *liquid ſtorax* is ſaid to be obtained by boiling the bark and the ſmall branches in water. This is at firſt of the conſiſtence of thin turpentine; but, by long keeping, grows hard and brittle. It is of a yellow colour, inclining to red, of an hot aromatic taſte, and a fragrant ſmell, not unlike that of ſtorax, heightened with a little ambergreaſe. Formerly it was uſed as a perfume, but now ſcarce known in the ſhops. Two ſorts of *liquid ſtorax* are diſtinguiſhed: but the ſort which is commonly met with, is of a weak ſmell, a grey colour, and is ſuppoſed to be artificial; of which the following experiments are a ſufficient proof: four drams of common liquid ſtorax yielded, with rectified ſpirit of wine, three drams and one ſcruple of reſinous extract; from the remaining two ſcruples, water took up only a few grains; the diſtilled ſpirit ſmelled a little of the reſin. In diſtillation with water, an eſſential oil aroſe, ſimilar in flavour to oil of turpentine, or the oleum pini. By diſtillation in a ſtronger fire, inſtead of a clear empyreumatic oil, what came over was mere pitch. The London College of Phyſicians order it to be purified in the following manner: ſtrain the ſtorax, diſſolved in ſpirit of wine, then diſtil till it is reduced to a proper conſiſtence. Dr. Cullen ſays, that mixed with ſome unctuous ſubſtances in the proportion of one part of *ſtyrax* to two of *ung. baſilicon nigrum*, it has been of remarkable ſervice in paralytic caſes, and particularly in debility of the limbs following rickets; but this he has from an empirical practice. See Neumann's Chem. Works. Philoſ. Tranſ. N° 313. Lewis's and Cullen's Mat. Med. Nicholſon's Dictionary of Chemiſtry, 1795.

—— ALBA. The WHITE PERUVIAN BALSAM.

SUBALARIS VENA, from *ſub*, *under*, and *ala*, the *armpit*. The AXILLARY VEIN.

SUBCLAVIÆ ARTERIÆ, from *ſub*, *under*, and *clavicula*, the *channel-bone*. The SUBCLAVIAN ARTERIES. They are ſo called from their ſituation being under the clavicles. They ariſe from the arch of the aorta, on each ſide of the left carotid, which commonly lie in the middle between them. The origin of the left *ſubclavian artery* uſually terminates the aorta aſcendens. Theſe *arteries* on each ſide terminate at the upper edge of the firſt rib between the lower inſertions of the firſt ſcalenus muſcle, and there, as they go out of the thorax, they take the name of the *arteriæ* axillares.

SUBCLAVIUS MUSCULUS. It riſes by a ſmall tendon from the anterior part of the cartilage of the firſt rib, cloſe to the ſtrong ligament which connects this rib to the clavicle, and runs along the whole under ſide of the clavicle into the coracoid proceſs, where it is articulated to the clavicle. Its uſe is to bring the clavicle upwards and forwards.

SUBCOSTALES. Theſe muſcles are ſituated more or leſs obliquely on the inſides of the ribs near their bony angles, and running in the ſame direction with the external intercoſtals. They are fixed by both extremities in the ribs; the inferior being always at a greater diſtance from the vertebræ than the ſuperior, and ſeveral ribs lying between the two inſertions.

SUBCUTANEUS. See PLATYSMA MYOIDES.

SUBHUMERALIS VENA. See ARTICULARIS VENA.

SUBLIMAMENTUM. See ENEOREMA.

SUBLIMATIO. SUBLIMATION, ſometimes called *elevatio*. It is the condenſing and collecting in a ſolid form, by means of veſſels aptly conſtructed, the fumes of bodies raiſed from them by the application of a proper heat. Fluids are ſaid to diſtil, and ſolids to ſublime. If the ſubliming matter concretes into a maſs, it is commonly called a ſublimate; if into a powdery form, flowers. See Nicholſon's Dict. of Chem. 1795.

SUBLIMATIO URINÆ. See ENÆOREMA.

SUBLIMATUM. See MERC. COROS. ALB.

SUBLINGUALES GLANDULÆ, vel *Bartholinianæ*, vel *Rivinianæ*. The SUBLINGUAL GLANDS. They lie between the mylo-hyoidæi and the genio-gloſſi muſcles, and almoſt always diſcharge their ſaliva in the ſame place with the ſubmaxillary glands under the tongue.

SUBLINGUALIS ARTERIA. The *ſublingual artery* is the ſecond branch from the external carotid; it riſes a little above the ſuperior guttural artery; it runs inwards, upwards, and over the cornu of the os hyoides, and ſinks into the tongue to ſupply all the adjacent muſcles. It is alſo called the *ranina arteria*.

SUBLUXATIO. SUBLUXATION. It is where the head of a bone is not quite out of its ſocket, but reſts upon the brim.

SUBMERSIO. DROWNING. In Dr. Cullen's Noſology it is a variety of the *apoplexia ſuffocata*. Sauvages terms it *aſphyxia immerſorum*. Inſtances have occurred of perſons lying under water for ſix hours, and afterwards been reſtored to life and health, two hours have been employed in the recovery of thoſe who had lain long under water, before any advantage was obſerved from endeavours, and at length ſucceſs hath followed. Strange are the reports on this ſubject. Some modern phyſiologiſts aſſert, that no terreſtrial animal can be recovered, if it continues ſix minutes under water at one time, without breathing. Very little water is ever ſwallowed by drowned perſons; they do not attempt to breathe until they are inſenſible; and then on attempting it, a little water is ſucked in, and a ſmall portion of it paſſes into the lungs. On taking the body out of the water, it muſt not be laid on the cold earth, but on a warm bed, the cloaths that are wet being firſt ſtripped off; or it may be laid in the hot ſun, or any warm place, there to be rubbed with coarſe cloths until a glow is perceived in the ſkin; a ſtrong healthy perſon may blow his warm breath into the patient's mouth to diſtend the lungs; or the ſmoak of tobacco may be conveyed into the patient's mouth, or his throat may be tickled with a feather to excite a vomiting; after which let him be laid before a warm fire, or on any other warm place, until life appears. The jugular veins may be opened, to ſet the circulation forward again; the veins in other parts will rarely bleed; the fumes of tobacco may be thrown up the inteſtines; volatiles and ſtimulants may be applied to the noſe and the tongue; theſe are moſt uſeful after bleeding. If theſe fail, bronchotomy may be performed, (ſee TRACHEOTOMIA;) and warm breath may be blown in at the aperture: this is the beſt and moſt certain way of directing air into the lungs; becauſe the air

air blown into the mouth may pafs only by the œfophagus into the ftomach; and this operation muft be continued until figns of life appear. Indeed, without expanfion of the lungs, little good can be done, for people die, who are drowned, of their being in a collapfed ftate; therefore, the moft effectual means fhould be ufed for the recovery of the action of this organ; not any thing fhould be forced down the throat, but as foon as the patient can attempt to fwallow, give him a draught of warm water, with a table-fpoonful of muftard in it, to drink. Continue thefe means until life feems to be confirmed. Generally, after recovery, an oppreffion, a cough, and a fever follow.

In the firft volume of Dr. Fothergill's Works, Dr. Letfom hath inferted the following method of treatment, found by the Humane Society to be moft fuccefsful on thefe occafions.

I. The body fhould not be rolled on the ground, or over a barrel, nor lifted up by the heels, or be any other way roughly handled, or violently fhook; but be removed to a convenient place, lying as on a bed, with the head a little raifed, in as natural a pofition as poffible.

II. The body, well wiped with a cloth, fhould be placed in a warm bed or blanket; but not too near a large fire. Bottles of hot water fhould be laid to the bottoms of the feet, joints of the knees, and under the arm-pits. A warming-pan moderately heated, or hot bricks wrapped in cloths, fhould be rubbed over the body, particularly along the back. The natural warmth of a healthy perfon, efpecially a child, lying clofe to the body, hath been found very efficacious. The room fhould be kept open and airy, with few perfons in it. The fhirt of an attendant, or fkin of a fheep freth killed and warm, may be ufed to advantage. Should the accident happen in the neighbourhood of a warm bath, brew-houfe, bake-houfe, glafs-houfe, faltern, foap manufactory, or any fabric where warm lees, afhes, embers, grains, fand, water, &c. can be eafily procured, it will be very proper to place the body in any of thefe, moderated to a degree of heat, very little exceeding that of a healthy perfon.

III. The body being placed in one or other of the above advantageous fituations, various ftimulating means fhould be immediately employed. The moft efficacious are, blowing with force into the lungs, by applying the mouth to that of the patient, clofing at the fame time his noftrils; throwing the fmoak of tobacco up the fundament into the bowels, by means of a clyfter-pipe or fumigator; a pair of bellows may be employed until the others can be procured; rubbing the belly, cheft, back and arms, with a coarfe cloth, or dry falt, fo as not to rub off the fkin, or with a flannel dipped in brandy, rum, or gin; applying fpirit of hartfhorn, volatile falts, or the like, to the noftrils, and rubbing them on the temples frequently; tickling the throat with a feather, to excite a propenfity to vomit; and the noftrils alfo with a feather or fnuff to provoke fneezing. The body fhould at intervals be fhaken, and varied in its pofition.

IV. If there be any figns of returning life, fuch as fighing, gafping, twitching, beating of the heart, return of natural warmth or colour, a fpoonful of water may be adminiftered, to try if the power of fwallowing be returned; if it be, a fpoonful or two of warm wine, or of brandy and water, may be given to advantage, but not before.

Early bleeding has been found pernicious, and even fatal; it is not always applicable, though it may fometimes be employed by a perfon of fkill, to remove or prevent fymptoms of inflammation.

The above methods of reftoring life are applicable to various other cafes of apparent fudden death, whether from hanging, apoplectic and convulfive fits, cold, fuffocation by damps or noxious vapours, proceeding from coal mines, confined air of wells, caves, ciftems, or from the muft of fermenting liquors.

See Tiffot's Advice to the people. Med. Mufæum, vol. iii. p. 376, &c. Dr. Cullen's Letter to Lord Cathcart on this fubject.

SUBOCCIPITALES NERVI. So the tenth pair of nerves are called which proceed from the head. They are fmall; they pafs out at the foramen magnum, between the bafis of the fkull, and the tranfverfe procefs of the atlas, where they form a ganglion, and give branches to the adjacent mufcles; after which, forming a fort of arch with an afcending twig of the firft cervical pair, a branch is fent off, which is called the occipital nerve.

SUBORBITARIUS. A branch of the upper maxillary branch of the fifth pair of nerves; it runs on the lower part of the orbit of the eye, &c.

SUBPOPLITEUS. See POPLITEUS.

SUBSCAPULARIS MUSCULUS. See INTRA SCAPULARIS.

SUBSIDENTIA. See EPISTASIS.

SUBSULTUS, from *fub*, *under*, and *falio*, *to leap*; is the fame as fpafmodic, or a convulfion of the clonic kind, from the fenfe of leaping which the tendons give to the hand lying upon them. A TWITCHING of the TENDONS, alfo an involuntary twitching, or fpafmodic contraction of the mufcular parts.

SUCCAGO. See SAPA.

SUCCEDANEA. See ANTEMBALOMENOS.

SUCCENTURIATI MUSCULI. See PYRAMIDALES, MUSCULI.

SUCCHAR. } See SACCHARUM.
SUCHAR. }

SUCCI SCORBUTICI. See COCHLEARIA BRITANNICA.

SUCCINGENS MEMBRANA. See DIAPHRAGMA.

SUCCINUM. AMBER. Various are the appellations given to this fubftance. The Italians and French call it *amber*;—the Arabians *ambar—anbar—ampar*;—Greeks, *amber*, and *harpax*; and the Syrians, *harpaga* SNATCHER, becaufe it fnatches, or attracts ftraws, &c. By AMBRA, the Arabians mean *ambergreafe*; and by AMBER, what the Greeks call *naphtha*.

AMBER alfo bears the names *berenice—carabe—charabe—karabe—ambra—electrum—edes—edets—aurum—elimpium*.—The immature amber, PARACELSUS calls *glaura*. It is found in feveral parts of the world: the moft confiderable quantities are taken up from regular mines in fome of the inland countries belonging to the king of Pruffia; but the fineft forts are thrown up by the fea, particularly in ftormy weather, about Pillau.

There are various conjectures refpecting the origin of amber. The Arabians fay, that the black poplar affords *amber*; the poplar, they call *haur*, and the tear *haurus*, which was changed to *hambrus*, to fignify *amber*; or, according to fome, into *avrum*, or *abrum*, and thence into *ambram*, to fignify the tear of the poplar; and, probably, from the likenefs of the poplar gum and amber, the fame name obtained for both.

LEO AFRICANUS fays, that the whale is called *hambara*, by the inhabitants of Fez and Morocco, which perhaps gave rife to the notion, that *amber* was the dung or fpawn of the whale.

But notwithftanding thefe various conjectures, it is moft probable, that it is inftantly formed by the concourfe of mineral oil, or petroleum, with vitriolic acid. And thus it is eafy to conceive how infects of the moft tender kind, are enveloped, without injuring them, or altering their natural appearances. Some affert that bitumens are effentially mineral; others, and by far the greateft number, that they proceed originally from vegetable fubftances. In favour of the latter opinion, fee Macquer's Chemical Dictionary. Dr. Saunders, in his Lectures on the Theory and Practice of Chemiftry, fays, all foffil inflammable matter is fuppofed to proceed from animal and vegetable matters, altered by time; he further obferves, that fulphur is obtained by mixing vitriolic acid and fpirit of wine rectified, or oil. On the other hand, Dr. Lewis obferves, that the oil of *amber* differs from all thofe of the vegetable kingdom; and agrees with the mineral petrolea, in not being foluble, either in its rectified or unrectified ftate, by fpirit of wine, fixt alkaline lixivia, or volatile alkaline fpirits; the oil, after long digeftion or agitation, feparating as freely as common oil does from water: he further obferves, that mineral bitumens are different in their qualities from the vegetable refins; and, in the mineral kingdom, we find a fluid oil, very different from vegetable oils. The mineral oil is changed by mineral acids into a fubftance greatly refembling bitumen; and the vegetable oils are changed by the fame acids into fubftances greatly refembling the natural refins. From bitumens we gain by diftillation the mineral oil; and from refins, the vegetable oil, diftinct in their qualities as at firft; vegetable oils and refins have been heated with all known mineral acids, but have never yielded any thing fimilar to the mineral bitumens. It feems, therefore, as if the oily products of the two kingdoms were fpecifically and effentially different. The laws of chemical enquiries at leaft demand,

that we do not look upon them any otherwiſe until we are able to produce from one a ſubſtance ſimilar to the other: when this is done, and not before, the preſumption that nature effects the ſame change in the bowels of the earth, will be of ſome weight. See Dr. Lewis's Note in his Tranſlation of Neumann's Chemiſtry, vol vii. p. 3. Neumann ſays, in ſpeaking of *amber*, it is moſt probable that *amber* is generated inſtantly from the concourſe of mineral oil, or petroleum with vitriolic acid, in the form of vapours.

The yellow *amber* ſhould be of a citron yellow, or of a golden colour, bright, tranſparent, eaſily taking fire, and exhaling a pleaſant fragrant ſmell.

In Holland, a vegetable reſin, called GUMMI DE LOOCK is ſold under the name of American *amber*; but it is leſs electric than *amber*, wants the peculiar ſmell thereof when it is burning, diſſolves readily in ſpirit of wine; and, when diſtilled, it does not afford the ſame principles as the *amber* does.

If *amber* is diſtilled in a retort by a ſtrong heat, it yields a phlegm, or oil, which grows thicker and thicker as the diſtilling continues, and a particular kind of ſalt. The *amber* is powdered and mixed with three times its weight of white ſand before it is committed to diſtillation; a retort is half filled with it, and then the fire is gradually increaſed until a phlegm riſes, but not more than to make water boil; after this, the heat ſhould be greater, but gradually increaſed, yet not ſo as to make the *amber* ſmell much; the receiver may be left unluted; thus it can be occaſionally removed, and the ſalt ſwept out, and ſo hindred from melting with the oil that riſes; the diſtillation is continued until no ſalt is ſeen to ariſe. After the diſtillation is ended, gather all the ſalt together, and dry it by preſſing it gently between ſome ſheets of ſpongy paper: then to purify it, boil it in the phlegm that aroſe in the beginning of the diſtillation, which is called the ſpirit of *amber*; or it may be boiled in common water, then ſet to cryſtallize; this may be repeated until it is ſufficiently freed from its oil. When this ſalt is pure, it is of a white colour, of a pungent, penetrating, grateful, acid taſte; it diſſolves in rectified ſpirit of wine with difficulty, though aſſiſted by heat, but readily in water.

The ſalt of *amber* is mixed with ſal ammoniac; but this it diſcovered by an urinous ſmell ariſing on rubbing it with the ſalt of tartar; it is mixed with nitre, but this is diſcovered by the nitrous taſte. When mixed with cream of tartar, it is diſcovered by diſſolving it in water, for the ſalt of *amber* readily diſſolves and leaves the cream of tartar undiſſolved. When it is mixed with the ſalt of coral, it is diſcovered by laying it on a red-hot iron, on which the ſalt of *amber* flies off, but that of the coral remains in the form of a white powder.

This ſalt is given in doſes from gr. iii. to ℈ i. Boerhaave extols it as an antihyſteric, and other phyſicians attribute many other virtues to it. Dr. Alſton of Edinburgh ſays, that when diveſted of the oil, it is no better than common ſalt; Dr. Cullen, that when genuine, and purified, its virtues are little better than that of vegetable acids. At preſent it is uſed, to render the operation of aloetic and reſinous purges more mild, and alſo more certain, and as an antihyſteric and diuretic. Doſe, five to fifteen or twenty grains.

The oil which riſes in diſtillation may be rectified by diſtilling it from pure water. The rectified oil hath a ſtrong bituminous ſmell, and a pungent acrid taſte; it heats the body, and promotes the fluid ſecretions; it is chiefly uſed as an antihyſteric; an aſſiſtant to emmenagogues; in epilepſy, hooping coughs, and other convulſive complaints; in doſes, from five to twenty drops on a lump of ſugar, or mixed up with mucilage of gum arabic into a draught with ſome diſtilled water: externally it is applied to weak, rheumatic, and paralytic limbs, and as a warm ſtimulant to the ſpine, mixed up with a moderate portion of ſweet oil. Obſtinate intermittents are ſaid to have been cured by it. The Swediſh College directs one ounce of *amber* to be digeſted in four ounces of vitriolic æther, and given from twenty to ſixty drops in the ſame complaints the oleum ſuccini is preſcribed for. This oil agrees with the mineral oils in refuſing to mix with vinous ſpirits. The London College order the ſalt and oil to be obtained from two pounds of *amber* placed in a ſand bath, and gradually increaſing the heat, whence an acid liquor, oil, and ſalt mixed with the oil, will come over. To purify the ſalt, they take half a pound of the ſalt, one pint of diſtilled water; the ſalt is boiled in the water, and then ſet by to cryſtallize. In order to purify the oil, they take a pound, and diſtil it three times. Its doſe from five to thirty drops. The Edinburgh College have given ſuperior directions for theſe proceſſes. The oil ſeems to be the only active medicine as an antiſpaſmodic, which power is increaſed by its purity, acquired by repeated diſtillations. It has been found extremely uſeful in cures of epilepſy, hyſteria, and other ſpaſmodic affections, in doſes of from ten drops to thirty.

Several preparations have been made from *amber*, but they are rarely uſed. See Neumann's Chem. Works, Lewis's Mat. Med. Tournefort's Mat. Med. Nicholſon's Dict. of Chem. Cullen's Mat. Med.

SUCCINUM CINEREUM—GRISÆUM. See AMBRA-GRISEA.

SUCCISA, alſo called *morſus diaboli*; *ſcabioſa folio integro*. COMMON DEVIL'S BIT. It is a ſpecies of ſcabius; it grows in meadows and paſture-grounds, and flowers at the end of ſummer. The roots are ſaid to be alexipharmic; the leaves are often ſold for the leaves of common ſcabius; they are alexipharmic, reſolvent, bitter, and of the ſame qualities as the ſcabius for which they are ſold. See SCABIOSA.

SUCCUBUS. See INCUBO.

SUCCUS INDICUS PURGANS. —— LAXATIVUS. See GAMBOGIA.

SUDAMEN. Tranſitory, red, ſtinging ſpots on the ſkin.

SUDAMINA. HEAT PIMPLES, or an eruption of puſtules, which ſucceed an inordinate ſweat. That kind of ſymptomatic miliary fever, that is called BOA, which ſee; alſo DESUDATIO.

SUDATORUM. See ACHICOLUM.

SUDOR. SWEAT. It is that fluid which tranſudes through the pores of the ſkin when we uſe much exerciſe, or ſuch means as may increaſe its diſcharge. It conſiſts of a water, a highly exalted oil, a ſalt, and a terreſtrious matter.

SUDOR ANGLICUS, called alſo *hydrohæſes*, *hydropyretos*, *gargeatio*. The SWEATING SICKNESS. Dr. Cullen thinks it a ſpecies of typhus. See HELODES. This diſorder is thus named from its firſt appearing in this iſland. When Henry VII. firſt landed his ſoldiers at Milford Haven, in the year 1483, it appeared amongſt them. In 1485, it was in London; it ſoon diſappeared, but returned five or ſix times: the laſt return was in 1551. It was remarked that Engliſhmen, whether they reſided at home, or fled into other countries, were attacked, whilſt foreigners in England were unaffected. Different patients are variouſly affected; but ſome on the firſt appearance of the diſorder were ſeized with a pain in the neck, ſcapula, legs, and arms, whilſt others perceived only a kind of warm vapour, or flatulence, running through thoſe parts; and theſe ſymptoms were ſuddenly ſucceeded by a profuſe *ſweat*, for which the patients could not account. The internal parts became firſt warm, and were ſoon after ſeized with an incredible heat, which thence diffuſed itſelf to the extremities. An intolerable thirſt, reſtleſſneſs, and indiſpoſition of the heart, liver, and ſtomach, were the next ſymptoms, ſucceeded by an exceſſive head-ach, a delirium, in which the patient was trifling and talkative, and after theſe a kind of extenuation of the body, and an irreſiſtible neceſſity of ſleeping. In ſome the *ſweat* ſtopped in the beginning, and their limbs became moderately cool; but this evacuation being afterwards promoted, the matter of it was of a diſagreeable ſmell, of different colours, ſometimes more, and ſometimes leſs in quantity, and of a thickiſh conſiſtence. Some were ſeized with a naufea, others with a vomiting; all, without exception, were afflicted with a difficulty of reſpiration. The urine had nothing preternatural, except that it was of a thicker conſiſtence, and tinged with a fainter colour than uſual. The pulſe was rather quicker than natural. In thoſe, however, who breathed in the pureſt air, and had the beſt conſtitutions, the diſeaſe was moſt mild.

The means that were found to be the moſt ſalutary, were to keep up the *ſweat*, after it begun, at leaſt for twenty-four hours, for by that time the diſeaſe terminated. During the *ſweat*, no more aliment was taken than the ſtrength required; ſleep was forbid; and when the *ſweating* was over, the patient was to be cautious in going abroad. Caius and Willis de Eph. Britannica.

SUDORIFICA. SUDORIFICS; called alſo *hidrotica*; *hidrotopſica*. Medicines which excite ſweat. When the ſweat is to be excited, it ſhould be conſidered whether the heat of the body is above or below that degree which admits

mits of this evacuation. The uſual natural heat in different perſons may ſomewhat vary, and for this an allowance is to be made; but whether the degree of heat is in a healthy ſtate, if the perſon is ten degrees hotter by Fahrenh. therm. he cannot be made to ſweat. It is true, that in ſtriving to raiſe a ſweat by the uſe of diluting liquors, heat will be increaſed above this, and the ſweat notwithſtanding, follow; but if the diluting drinks were not uſed, other means would fail. In this caſe cooling methods muſt be uſed, ſuch as cold water for drink, cool air admitted to the body, and cooling medicines given internally. *If the heat is below the ſtandard of health*, warm water and cordials muſt be uſed, the patient muſt be kept in a warm room or in bed. As ſweating greatly cools the body, it ſhould be cautiouſly uſed in low and putrid fevers. When the patient is very hot, to aſſiſt the effects of cold water, and to haſten it through the ſkin, flannel cloths may be wrung out of hot water, and applied round the legs and thighs, and thus a ſweat will be produced very ſpeedily. When the ſweat is once raiſed, the drink ſhould be warm, and ſupplied more or leſs freely, according to the degree and continuance of the ſweating. Sweating is rarely of uſe when bleeding is unſafe; though, in ſuch caſes, a gentle perſpiration may generally prove ſalutary. See Dr. Home's Medical Tracts and Experiments, p. 220. Exp. v. Mr. Alexander's Experimental Eſſays, Exp. iii. and DIAPHORETICA.

SUFFIMENTUM. A SUFUMMIGATION; called alſo *hypocapniſma*. Thoſe made for pleaſure are generally formed of ſuch ſweet ſubſtances as are found to be agreeable, and thoſe which are formed for health are generally calculated to affect the mouth, throat, or other part to which they are to be applied, in ſuch manner as to produce ſome important alteration for the removal of ſome diſeaſe.

SUFFOCATIO STRIDULA, alſo called the CROUP, the CHOCK, the STUFFING or RISING of the LIGHTS. *Angina interna, angina latens & difficilis, angina inflammatoria infantum, angina membranacea, angina perniciosa, angina polyposa, catarrhus ſuffocativus, aſthma infantum, ſpaſmodicum, cynanchi ſtridula, morbus ſtrangulatorius, truculentus infantum.* It is a diſeaſe that hitherto hath only appeared in children, rarely if ever in any after twelve years of age. Dr. Cullen names it CYNANCHE TRACHEALIS, which he defines, a tracheal quinſy, attended with difficult reſpiration, ringing ſound in inſpiration, clangous cough, no tumor commonly appearing in the throat, deglutition a little impeded, and inflammatory fever. He arranges it as the third ſpecies of CYNANCHE.

This diſorder appears to be preſent by a peculiar ſharp ſhrill voice, not eaſily deſcribed; a remarkable freedom from all other complaints, though the hour of death be at hand; the breathing is quick, and more or leſs laborious; the pulſe frequent, ſometimes ſtrong at firſt, but always ſoft and weak towards the end; ſometimes there is a dull pain in the trachea, on ſpeaking, or when it is preſſed with a finger; and, at others, an external ſwelling in the upper part of the ſame tube; the ſenſes are perfect to the laſt; the progreſs of the diſorder is rapid, for generally death ſoon ſteps in to conclude it. The face is generally flushed, though ſometimes it is of a livid colour. Sometimes there is a cough, and when it is attendant, it is ſhort and ſtifled, and not attended with much expectoration. Dr. Cullen deſcribes it as having for its characteriſtic ſymptoms, "*a peculiar croaking ſound of the voice, a difficult reſpiration, a ſenſe of ſtraitneſs about the larynx, and a fever:* or, *a hoarſeneſs with ſome ſhrilneſs and ringing ſound, both in ſpeaking and coughing, as if the noiſe came from a brazen tube.*" He further remarks, that "the thick mucus that fills up the trachea may be eaſily ſeparated, and ſometimes is found ſo; in thoſe inſtances the inner membrane of the trachea is always free from eroſion or ulceration, but uſually ſhews the veſtiges of inflammation, being covered with a matter reſembling pus, and like to that which is ejected by coughing; and very often a matter of the ſame kind is found in the bronchiæ, in conſiderable quantity."

For the moſt part winter is the ſeaſon in which this diſeaſe occurs; long continued catarrhs from the meaſles, hooping cough, or the ſmall pox, are predisponent cauſes; cold and moiſt weather is ſuppoſed to contribute much as cauſes. It is moſt common about the ſea-coaſt, and in low marſhy countries; yet ſometimes met with in midland countries: and its attacks are frequently repeated in the ſame child.

The ſeat of the diſorder is the cavity of the wind-pipe, from a little below the glottis downward; and the diſorder itſelf conſiſts of the mucus ſeparated there, and become thick, ſo filling up the paſſage that the air can no longer paſs freely into the lungs; at firſt it forms a thick membranous cruſt, which thickening fills up the cavity of the trachea. The back part of the trachea where there are no cartilages, ſeems from the inſpection of thoſe who die of this diſeaſe, to be its firſt and principal ſeat; as this morbid membrane is often found there, when it is in no other part; and, indeed, in this part is lodged the greateſt number of glands deſigned for the ſecretion of mucus. Dr. Cullen thinks *that an inflammation of the mucous membrane of the larynx, and trachea, conſtitutes this diſeaſe.* In the mucous glands, in general, this diſtemper ſhould be conſidered as originally ſeated; but from particular uſes, more directed to thoſe of the trachea; where, from the nature of the part, it becomes viſible in a different way from what would diſcover it in any other part.—It is not evidently contagious.

Some diſtinguiſh the *croup* from the catarrhus ſuffocativus of Etmuller; from a ſevere cold; from peripneumonic complaints; and from ſuch ſymptoms as ariſe from extraneous bodies lodged in the trachea: an inſtance of which Dr. Home mentions in his Enquiry into the Nature, &c. of the *Croup*.

There are two different ſituations of this complaint; the firſt is more inflammatory and leſs dangerous; in this caſe the pulſe is generally ſtrong, the face red, the drought great, and evacuations are uſeful; the ſecond is leſs inflammatory and more dangerous; under this the pulſe is quick, ſoft, and weak, the tongue moiſt, the thirſt inconſiderable; there is great anxiety, and death is haſtened by evacuations. If this diſeaſe comes on with an old habitual cough, or by ſlow degrees, the inflammatory ſtage will hardly be perceived. The urine is thin during the inflammatory ſtage; but in the purulent one, it hath a light, ouzy purulent ſediment.

If, on the third or fourth day, after the firſt manifeſt attack, the breathing is much affected, the pulſe is quick and weak, the face red, anxiety great, and the patient toſſes himſelf about, the danger is great; but if it is only on the firſt or ſecond day, the breathing not bad, the pulſe though frequent, yet is ſtrong and firm, and the voice not altered, ſome hope may be entertained of a recovery. The cough becoming ſtronger and leſs dry, is uſually the firſt ſign of amendment.

Though this diſeaſe conſiſts in an inflammatory affection, it does not commonly end either in ſuppuration or gangrene. The troubleſome circumſtance of it ſeems to conſiſt in a ſpaſm of the muſcles of the glottis, threatening ſuffocation. When this diſeaſe is fatal, it is ſo from a ſpaſm ſuffocating, or from matter in the bronchiæ, or the mucus in the larynx.

In the inflammatory ſtate, bleeding ſhould be uſed as freely as the pulſe will admit; the bowels ſhould be kept lax; a bliſter muſt be applied to the throat or round the neck, as ſoon as bleeding and purging have been uſed; though if the caſe is very inflammatory an emollient cataplaſm is to be preferred; ſteams from hot vinegar and water may be received into the throat with the breath. In the purulent ſtate nothing yet attempted ſeems to have any good effect. Upon the firſt attack of the diſeaſe, vomiting immediately after bleeding, ſeems to be of conſiderable uſe; ſometimes ſuddenly removing the diſeaſe. Antiſpaſmodics do not evidently appear to be uſeful. The application of leeches and bliſters to the throat, after general bleeding, ſhould the fulneſs of the habit require it, with general antiphlogiſtic remedies, have been very ſucceſsful. With regard to vomiting, ſome caution is neceſſary, though it has been ſtrongly recommended, becauſe it has been obſerved, in ſeveral inſtances, that after the uſe of emetics, the ſymptoms have been much exaſperated. See Cullen's Firſt Lines, edit. 4. vol. i. p. 292. An Enquiry into the Nature, &c. of the *Croup*, by F. Home, M. D. London Med. Journal, vol. i. p. 217, 226. Edinb. Med. Commentaries, vol. v. p. 6, 7. Alexander *on the Croup*.

SUFFUSIO. See CATARACTA, GLAUCOMA and PSEUDOBLEPSIS.

SUFFUSIO AURIGINOSA. A JAUNDICE.

SUGILLATIO, from *ſugo, to ſuck*. It is an inflammation in a part. Thus a blood-ſhot eye is a *ſugillation* in the eye. It is uſed as ſynonymous with *ecchymoma*, or *ecchymoſis*; but by the word *ſugillatio*, a different cauſe is expreſſed; an ecchymoſis is cauſed by extravaſation;

ſugillation

fugillation by ſuction; as when cupping-glaſſes are applied to a part, which, by removing the preſſure of the air, occaſion the blood to ruſh in and diſtend the veſſels; even into ſuch as do not uſually receive red blood.

Taking the word *fugillation* in the ſame ſenſe with ecchymoſis, this diſorder, when ſeated in the eye, takes the name of blood-ſhot; when the ſkin is in its ſeat, if the colour is livid, ſome writers term it *pelioma*; and, if black, *melaſma*: thus are called black blotches in the legs. Mr. Bell, in the firſt volume of his Surgery, ſays, that in blood-letting, it often happens that a ſmall tumor is raiſed immediately above the orifice in the vein, by the blood inſinuating itſelf into the cellular membrane of the neighbouring parts. Such a tumor (he adds) when round and ſmall, is termed a *thrombus*; and when more diffuſed, an *ecchymoſis*. Linnæus names it *fugillatio*. See ECCHYMOSIS.

SULPHUR. BRIMSTONE; called alſo *abric*; *alcubrith*; *anpater*; *appebriac*; *aquala*; *aquila*; *chibur*; *chybur*; *cibur*. It is a ſolid brittle concrete, of a yellowiſh colour, inclining little to greeniſh, and is in ſome degree gloſſy. It conſiſts of the vitriolic acid, and a ſmall portion of phlogiſton. Mr. Edwards, in his Elements of Foſſilogy, deſcribes it as a genus in the claſs of inflammables, which in cloſe veſſels ſublimes in the form of ſtriæ; in the open air is decompounded by heat into penetrating, acrid, and ſuffocating fumes; and when deflagrated with nitre, leaves vitriolated tartar. It is ſometimes found native, in the earth, in pure, bright yellow, ſemitranſparent maſſes; but more commonly in opake ones, of a greeniſh, greyiſh, or other colours, intermixed with various earthy or ſtony matters. The impure ſorts are called SULPHUR VIVUM, alſo ALKIBRIC, which ſee, where other appellations will be referred to; but of ſome *dubiety*;—*alneric*; *aneric*; *ancrit*; *apyron*; *apyrothium*. The native *ſulphurs* are met with chiefly about volcanos in Italy, alſo in ſome of the German, Hungarian, and Swediſh mines. The largeſt quantities that are brought into England are from Saxony, from whence we receive it in irregular maſſes, which are afterwards melted and caſt into rolls, being firſt mixed with coarſe roſin, flour, and ſuch like, whence its pale colour; for, before it is thus mixed, its colour is deeper. There are *ſulphurs* of a red colour, but they contain a portion of arſenic. *Sulphur* is an ingredient in moſt kind of ores. The mineral from which the greateſt quantity is extracted is the yellow pyrites, plenty of which is found in Saxony, where the *ſulphur* is ſeparated by means of heat, and is received in veſſels placed for it to run into as it melts.

This *ſulphur* is purified by ſubliming it, and then it is called the *flowers of ſulphur*; this operation is performed by perſons who ſublime large quantities in a way of trade, and the *ſulphur* thus ſublimed becomes an article in medicine; when it is perfectly prepared by a proceſs mentioned in the Theatrum Chymicum, it is called *foliata terra*.

The flowers of *ſulphur* are uſed againſt cutaneous eruptions, particularly the itch; and from its uſefulneſs in ſome diſorders of the lungs, it hath been called *anima pulmonum*. Pure *ſulphur* looſens the belly, in doſes of from 3 ſs. to 3 i. and from its gentle action on the great guts, is uſeful when the piles are troubleſome; it promotes perſpiration; it paſſes readily through the whole habit, and tranſpires through the ſkin: in coughs, catarrhs, and aſthmas, it is found uſeful, particularly in ſcorbutic habits.

Sulphur is an active medicine, it reſtrains the activity of ſome other very powerful ones; mixed with quickſilver, the regulus of antimony, they become inert; it alſo renders arſenic leſs poiſonous.

Various are the preparations of *ſulphur*; but, for internal uſe, none excels, nor even equals, the flowers, which may be eaſily contrived for taking, without any diſguſt to the palate: among other modes, the troches, as directed in the Diſpenſatory of the London College, is an elegant one, and are thus made. Take of flowers of *ſulphur*, two ounces; clarified ſugar, four ounces; rub them together, and by the mucilage of quince-ſeed added gradually, let them be formed into troches. Ph. Lond. 1788.

From *ſulphur* the chemiſts obtain the greateſt part of the vitriolic acid which they uſe. The operation is ſaid to be performed in leaden veſſels, ſometimes twenty feet high, and ten broad, with an eighth part of nitre to ſupply the abſence of the external air, and ſome water to condenſe the ſteams; it is concentrated and conſiderably purified by evaporation; it is then colourleſs without ſmell, extremely corroſive, very fixed, and moſt ponderous of all unmetallic fluids. Its ſpecific gravity in its true ſtate is to that of diſtilled water, as 1.850 to 1.000. It is powerfully attractive of water from the air, and in uniting with water produces a great degree of heat. It poſſeſſes the general properties of acids in an eminent degree. On account of its fluidity it is not uſed as a corroſive; blended with unctuous matter in the proportion of one to eight, it is applied in the itch, and other chronic eruptions; and likewiſe as a rubefacient in local palſy and rheumatiſm. Diluted with water, it ſhews conſiderable action on the human calculus out of the body; and therefore has been propoſed internally in that diſeaſe, particularly where lithotomy was improper. As checking fermentation, as well as being aſtringent, and tonic, it is much uſed in morbid acidity, relaxation, and weakneſs of the ſtomach. Its effects are propagated over the ſyſtem; and hence its eſtabliſhed uſe, in paſſive hæmorrhages, gleets, and fevers of the typhous kind. It is alſo uſed internally in itch, and other chronic eruptions; and when given to nurſes, having the itch, it is ſaid both to cure themſelves and their children. As combined with ardent ſpirits with different metallic ſubſtances, &c. it enters ſeveral articles to be found in different pharmacopœias. Edinb. Diſpenſ. edit. 2. 1789. See the Dict. of Chem. Lewis's Mat. Med. Neumann's Chem. Works.

SULPHUR AURATUM ANTIMONII, } See ANTIMO-
—— PRÆCIPITATUM. } NIUM, N° 15.
—— VITRIOLI ANODYNUM MARTIALE. See FERRUM, N° 3.
—— VIVUM. See SULPHUR.
—— ALEUM. See ETHEL.
—— PRÆCIPITATUM. *Lac ſulphuris, præcipitated ſulphur*. Take of ſulphurated kali ſix ounces; diſtilled water, one pound and an half; vitriolic acid, diluted, as much as is ſufficient; boil the ſulphurated kali in diſtilled water, until it is diſſolved; filter the liquor through paper; to which add the vitriolic acid; waſh the precipated powder till it becomes inſipid, by pouring on freſh portions of water. Ph. Lond. 1788. This preparation does not differ in quality from pure *ſulphur*, to which it is preferred, only on account of its colour in unguents, &c. See SULPHUR.

SULPHURIS *balſamum Barbadenſe*, called *petroleum ſulphuratum*. Take of flowers of *ſulphur*, four ounces; oil of olives, ſixteen ounces by weight; boil the flowers with the oil in a pot, ſlightly covered, until they unite. Ph. Lond. 1788.

SULPHURATA AQUA. See GAS SULPHURIS.
SULTANE ALA. See COFFEA.
SUMACH. See RHUS.
SUPERBUS MUSCULUS. See ELEVATOR OCULI.
SUPERCILIA. See PROCESSUS.
SUPERCILIARES MUSCULI. They are fleſhy faſciculi. They ariſe from the ſynarthroſis of the oſſa naſi with the os frontis, and thence run along the direction of the eye-brows, and are loſt in the middle of them. They depreſs the eye-brows, and contract the ſkin over the noſe.
SUPERCILIUM. See VALLUM.
SUPERCILIUM VENERIS. See MILLEFOLIUM.
SUPERFŒTATIO, called alſo *epicyeſis*. SUPERFŒTATION is aſſerted and denied by different phyſicians. In the Lond. Med. Journal, vol. iii. p. 425, &c. are the following accounts.

Haller, in his Opuſcula Pathologica, mentions a lady who died, and was found to have two uteri, each of an oval ſhape, and furniſhed each with its own peculiar vagina. Hence he obſerves, that a woman ſo formed might be liable to one conception upon the back of another.

Similar remarks are made by Dr. Purcell, in his account of a double uterus, publiſhed in the Philoſoph. Tranſact. vol. lxiv.

A caſe of *ſuperfœtation* lately occurred to Dr. Lobſtein, profeſſor of anatomy and ſurgery at Straſburgh, in a woman who was delivered of two children, one a month after the other; he has been able to convince himſelf, that this circumſtance is owing to her having two uteri, each of which has a diſtinct vagina.

SUPERSCAPULARIS INFERIOR. See INFRASCAPULARIS.
SUPERIOR. See SUPRA SPINALIS.
SUPINATOR RADII BREVIS, five MINOR SUPINATOR, becauſe it makes the hand ſupine, i. e. when the palm is upwards. It riſes from the outer condyle

of the os humeri, goes over the capsular ligament, lies under the longus, and is inserted into the internal anterior part of the tubercle of the radius.

SUPINATOR RADII LONGUS, five MAJOR. It rises fleshy from the outer edge of the os humeri, twists round it, goes down the fore-arm all along the radius, covering the artery, and becoming tendinous, where we generally feel the pulse: it is inserted into the anterior internal part of the radius.

SUPPLETA ISCHURIA. A SUPPRESSION of URINE, from excess of other evacuations, which require this defect to supply their loss. See ISCHURIA.

SUPPOSITORIUM, from *suppono, to lay under.* A SUPPOSITORY. The Greeks call it *prostata*, and also *balanos, balanocastanum*, from the similitude of form to an acorn; and likewise *hypostheton*. They are convenient for promoting stools when clysters cannot be administered. The most gentle are made of common salt and honey, which may be boiled to the consistence of a soft pill, and then rolled to the thickness of a goose quill and an inch or little more in length; these are introduced into the rectum where they remain until they are discharged by the effect they produce; aloes, colocynth, and other ingredients, may be added, according to the intention of the prescriber.

SUPPRESSIO MENSIUM. See MENSES DEFICIENTES.

SUPPRESSORII. Diseases arising from or attended with an oppression of the organs and impeded excretions.

SUPPURANTIA. SUPPURATIVES, called also *diapyemata, diapyetica, maturantia.* There is no universal *suppurative.* As a proper external application, to promote suppuration when there is a considerable heat, a poultice of oatmeal, or of bread, with milk, may be applied: when the heat of the part is defective and the temperament habitually cold, add galbanum, onions, and such like materials, to the common bread-poultice.

SUPPURATIO, also *purulentia*, SUPPURATION, or PURULENCE. When matter is formed in any part, the part is said to be suppurated, or purulent; whilst forming, in a state of suppuration, creating abscess.

SUPPURATORIA. SUPPURATORY FEVER, or FEVER of SUPPURATION.

SUPRACOSTALES. See LEVATORES COSTARUM.

SUPRASCAPULARIS. See SUPRASPINALIS.

—— SEMIORBICULARES. They are fibres that increase the breadth of the muscles of the upper lip.

SUPRASPINALIS, } This muscle rises from each side
—— SPINATUS. } between the upper edge of the scapula and the spine thereof, runs under the acromion, and extensors of the scapula, goes across the capsular ligament, and is inserted into the inner tubercle, near the head of the humerus. It is called also *superscapularis superior* and *suprascapularis.*

SURA. A name for the *fibula*; for the *gastrocnemii muscles*; also a sort of wine.

SURALIS ARTERIA. See TIBIALIS.

SURALIS VENA. It is a branch from the beginning of the tibialis posterior.

SURDITAS. DEAFNESS. The causes are, the loss of the external ear, wax or other matter lodged in the external ear, a rupture or a relaxation of the membrane of the drum of the ear, a palsy, or a pressure on the auditory nerve, violent noise, obstruction of the Eustachian tube, cold, inflammation, abscess, the lues venerea, &c. The most frequent of these causes is hardened wax in the meatus auditorius, which may be softened and removed by frequent injections of warm water. For the nosological arrangement, definition, and species, see DYSECOEA.

In case of a relaxation of the membrana tympani, a little warm brandy, or spirit of rosemary, may be dropped into the ear now and then.

If the Eustachian tube is obstructed, relief is sometimes obtained by chewing a crust every morning and evening.

Sometimes sternutatories have relieved when the cause hath not been known.

When a defluxion of humours is the cause, an injection may be made as follows, and used night and morning: ℞ Cerus. acetat. gut. xxv. sp. vin. c. gut. l. aq. purifs. ℔ ss. m.

When the wax hardens on the meatus auditorius, warm water is the best means of dissolving it, and thus forming a cure. See Lond. Med. Obs. and Enquiries, vol. iv.

In the Edinb. Med. Comment. vol. iii. p. 80. is the following case of *deafness* from bathing. A healthy young man, bathing in the sea, on plunging over head, instantly became perfectly deaf. He complained of a violent pain in his head, of a hissing noise in his ears, and looked frightened. After various trials to relieve him, but without success, at last it occurred to me to try what mercury would do, and on being put on a mercurial course, in about a week he told me that he had heard some drums beating, which he never could do, since the day he was in the water. Upon speaking to him very loud, he heard me for the first time, since his admission into the hospital. His mouth was not affected with the mercury until his beginning to hear. The mercurial course, therefore, was continued some time longer. A gentle salivation supervening, his hearing was gradually restored. Bell's Surgery, vol. iv. p. 343, 362. Memoirs of the Medical Society of London, vol. i. p. 94.

SURENGIAN. See HERMODACTYLUS.

SURI. See PALMA COCCIFERA.

SURQUISSE. See INDICUM.

SUS. See PORCUS.

SUSINUM. See CRINOMYRON.

SUSPENSOR. A bandage to suspend the scrotum. The French call it *la bourse.* It is a cloth large enough to contain the scrotum and the dressings; with a fillet on each side to suspend it about the waist, and one before to fasten it to the other two in the fore part of the belly.

SUSPENSORIUM HEPATIS. See LIGAMENTUM LATUM.

SUSPENSORII TESTIUM. See CREMASTER.

SUSURRUS. See PARACUSIS.

SUTTER. See SACCHARUM.

SUTURA. A SUTURE, called also *clavata*; *commissura.* In ANATOMY it is the particular articulation of the bones which is seen in the head. These *sutures* are divided into *common* and *proper.* The *common* are those which join the bones of the cranium with those of the face. The *proper* are those which connect the bones of the cranium; and are the coronal; the saggittal; the lambdoidal; and the two squamous, called *lepidoides suturæ.*

In SURGERY, it is the uniting of the lips of a wound by sewing, of which there are five kinds.

1. The DRY SUTURE. It is made by two pieces of sticking plaster, each the length of the wound, to which very narrow tapes are fixed at due distances. Apply one near one edge of the wound, and the other near the opposite edge; then gently draw the two sides of the wound together, and let the tapes be tied: they should correspond exactly; and the knots must be slip knots. Or, take a slip of plaster, the length of the wound, and cut longitudinal holes in it; then apply one side near the edge of the wound, bring the lips close, and then apply the other. After this kind of *suture* is applied, the uniting bandage is convenient to support it.

2. THE TWISTED SUTURE. It is also called the CIRCUMVOLUTED SUTURE. This is used for the hare-lip, and in a few other instances. It is performed by introducing two or more pins through the whole substance of the lips of the wound, then twisting a waxed thread about them in the form of the figure 8.

3. THE INTERRUPTED SUTURE, also called the KNOTTED SUTURE. It is performed with any needle armed with a waxed thread, by thrusting it through both lips of the wound, then tying the thread in slip knots, making a number of stitches according to the length of the wound, at an inch from each other. The needle should go to nearly the bottom of the wound. Mr. Justamond advises a particular regard to the direction of the longitudinal fibres of muscles in forming this *suture*, and not so much to regard the direction of the wound; for, if we do not pass the ligature in the direction of the fibres, it will be a continual stimulus, it will excite the muscle to action, and occasion a perpetual tugging of the ligature, whence pain, inflammation, &c. will follow. Mr. Bell, in the first volume of his Surgery, advises, in forming this *suture*, to carry the needle and ligature to the bottom of the wound, so as to afford but little chance of matter collecting underneath; and, further, he directs both ends of the thread to be passed from within outwards; which is readily done by using two needles upon each thread instead of one. A needle being put upon each end of the same thread, and each needle being inserted at the bottom of the sore, and pushed outwardly so as to pass out at a proper distance from the edge of the wound, the

needles are then to be taken off, and the threads allowed to remain till all the ligatures are paſſed, which the extent of the ſore ſeems to require. In paſſing the ligatures, pierce the ſkin from near half an inch to near an inch from the lips of the wound; theſe diſtances will include all the varieties in the ſize of wounds. As ſoon as the threads are all paſſed, the lips of the wound ought to be preſſed together and ſupported by an aſſiſtant till all the ligatures are firmly tied.

4. THE QUILLED SUTURE, ſo called becauſe the knots were tied upon quills, which were laid over the dreſſings that immediately covered the lips of the wound.

5. THE GLOVER'S, or UNINTERRUPTED SUTURE, called alſo the SPIRAL or the CONTINUED. It was uſed in wounds of the inteſtines. This conſiſts in a ſeries of ſtitches all connected with one another, and continued in an oblique ſpiral direction along the courſe of the divided parts intended to be kept together. It takes its name from the ſimilarity to that which glovers commonly uſe. See Heiſter's Surgery. Le Dran's and Sharp's Operations. Bell's Surgery, vol. i. p. 1—26. White's Surgery, p. 109.

SYCOSIS, from *συκον, a fig*. It is a tumor on the anus, which only differs in the ſize from the thymus. The Latins call it mariſca. See CONDYLOMA. *Sycoſis* is alſo the name of an ulcer mentioned in Celſus, lib. vi. c. 3. alſo in Vogel's Noſology, which is fungous. See alſo TRACHOMA.

SYMBOLOGICE. That part of pathology which treats of the ſigns and ſymptoms of diſeaſes.

SYMPASMATA. See CATAPASMA.

SYMPATHETICI NERVI MAJORES. See INTERCOSTALES NERVI.

SYMPATHETICI MINORES. See AUDITORIUS NERVUS.

SYMPATHIA, from *συν, together*, and *παθος, ſuffering*. SYMPATHY, called alſo *compaſſio*. Our bodies are, by means of the brain, not only endowed with feeling and a power of motion, but alſo a remarkable *ſympathy*, which is either general or particular. That every part of the body hath a *ſympathy* with the whole, is evident from cold water being thrown on any part of us that is warm; this produces a ſudden contraction of all the veſſels and pores, and thus ſometimes puts a ſtop to ſmall hæmorrhages.—The effluvia of things ſmelled to, often communicate new vigour to the whole body.—The particular *ſympathy* is manifeſt by various inſtances of diſeaſes complained of in one part when the cauſe is in a very remote one; for inſtance, pain in the head occaſions ſickneſs in the ſtomach, and ſo does pain in the uterus, &c. A ſudden bright light entering the eye occaſions ſneezing. Some particular ſounds affecting the ears ſet the teeth on edge. The ſmell of grateful food makes the ſaliva flow into the mouth, &c. &c. &c.

All *ſympathy* ſuppoſes feeling, and therefore muſt be owing to the brain, which is the only means of ſenſation. This further appears, becauſe the changes in the body, occaſioned by the *ſympathy* of the parts, are ſtopped by whatever affects the nervous ſyſtem ſo ſtrongly as to overcome the ſenſations that produced the ſympathetic effects.

Though all *ſympathy* is owing to the brain, it is not eaſy to account ſatisfactorily for all the various inſtances of *ſympathy* in particular caſes; for many of them may depend on ſuch a ſtate of the brain and other parts as do not become the object of our ſenſes.

A diligent attention to this ſubject, whatever difficulties attend it, is followed with conſiderable advantage by enabling us to account for many ſymptoms of diſeaſes, and alſo to proceed ſo certainly to the cure as by any other known method we could not have arrived at. See the authors on irritability and ſenſibility.

SYMPHYSIS, from *συν, with* or *together*, and *φυω, to grow*. In ANATOMY it is a kind of articulation, which is divided into four ſpecies. 1. Synneuroſis, or *ſyndeſmoſis* 2. Synchondroſis. 3. Syſſarcoſis. And, 4. The *ſymphyſis* of oſſification, to which EPIPHYSIS belongs. All which, ſee under their reſpective heads.

In SURGERY it is a coaleſcence of the natural paſſages, as the anus, vagina, noſtrils, &c. It alſo expreſſes the firſt intention of cure when there is a wound, which is to bring together the ſeparated parts, and keep them together.

SYMPHYTUM, from *συμφυω, to conglutinate*. It is a name for moſt ſpecies of comfrey (ſee CONSOLIDA, and PELION), for ſeveral of the pulmonaria, for the yellow alkanet, a ſpecies of bugle, a ſpecies of ſaxifrage, and of ſome other plants.

SYMPHYTUM MINIMUM. See BELLIS MINOR.

—— PETRÆUM. HEATH-PINE. It is a plant which is ranked among the aſtringent and conglutinant medicines, and may be of ſervice in diarrhœas, and dyſenteries, as its root gives out a large proportion of mild mucilaginous juice, more almoſt than any other root, (ſee Cullen's Mat. Med.) It is alſo a name for the *prunella, brunella, ſanicula, virga aurea, coris, hyſſopus vulg.* and ſeveral other plants. For that called *medium*, ſee BUGULA.

SYMPTOMA, from *συμπιπτω, to happen together*. *Caſus* has alſo the ſame ſignification, and *accidens*. See SIGNUM.

SYNANCHE. See ANGINA.

SYNANCHICA. See RUBIA SYNANCHICA.

SYNARTHROSIS, from *συν, with*, and *αρθρον, a joint*. It is that ſpecies of articulation in which there is no motion, and it is of three kinds; the *ſutura*, the *harmonia*, and the *gomphoſis*. See ARTICULATIO.

SYNCHONDROSIS, from *συν, with*, and *χονδρος, a cartilage*. It is that ſpecies of ſymphyſis in which the bones are connected by a *cartilage*, and is either moveable or immoveable; the firſt is inſtanced in the vertebræ of the neck, back, and loins; the ſecond in the os pubis, the two ſides of which are ordinarily immoveable. See SYMPHYSIS.

SYNCHONDROTOMY. So Dr. Siebold names the ſection of the ſymphyſis of the os pubis.

SYNCHYSIS, from *συγχυω, to confound*. A diſeaſe of the eye, conſiſting in a confuſion of the humours, generally proceeding from a violent blow; ſometimes from an inflammation of the uvea, occaſioning a rupture of the veſſels, and an eruption of the humours. Caſtellus.

It is alſo when from the violence of an ophthalmia, the tranſparent cornea is left opaque or corroded, and there is the appearance of confuſion in the humours of the eye. In Cullen's Noſology it is a variety of his ſpecies *caligo pupillæ*. Kirkland, in his Inquiry, vol. i. p. 473, defines it as being a confuſion of the humours of the eye from a violent inflammation, the chemoſis, leaving the cornea opaque, or corroded.

SYNCOMISTON. See COLIPHIUM.

SYNCOPE, from *συνκοπτω, to cut down*. See LIPOTHYMIA.

SYNCRIMATA, SYNCRISIS. See METASYNCRISIS.

SYNDESMO-PHARYNGÆUS. See PHARYNX.

SYNDESMOS. See LIGAMENTUM.

SYNDESMOSIS, from *συν, with*, and *δεσμος, a chain*. See SYNNEUROSIS.

SYNDROME. *Concurſus*, from *συδρεχω, concurro*. This word was introduced by the ſect of empiric phyſicians, to expreſs a concourſe, or congeries of ſymptoms: for inſtance, the concourſe of ſymptoms when diſeaſes ariſing from plethora, are called a PLETHORIC SYNDROME. So may there be a cacochymic *ſyndrome*, and indeed it may be applied leſs generally, as a choleric, phlegmatic, pleuritic, epileptic *ſyndrome*, &c.

SYNECHES. Various are the uſes of this word as applied to fevers. The Greeks uſe it to ſignify the remitting fevers in general.—Some later writers have collected under this word, thoſe inſtances of remittent fevers that are obſcurely deſcribed, of whoſe mode of relief we have no ſatisfactory account.—Dr. Cullen places it amongſt the tertian intermittents.

SYNNEUROSIS. That ſpecies of ſymphyſis in which the bones are connected by ligaments, as in all the joints that are deſigned for motion. See SYMPHYSIS.

SYNGENESIA, (*συν*, and *γενεσις, congeneration*). The name of the 19th Claſs of Linnæus's artificial ſyſtem, comprehending thoſe plants which have the ANTHERÆ, united into a cylinder. The orders are ſix. 1. POLYGAMIA æqualis. 2. Superflua. 3. Fruſtranea. 4. Neceſſaria. 5. Segregata. 6. Monogamia. The five firſt orders contain the compound flowers, and form a claſs truly natural. MARTYN'S Language of Botany.

SYNIZESIS. Blindneſs from an obſtruction of the pupil of the eye, or from a contraction and coalition of it. It is the ſame as the *caligo pupillæ* of Dr. Cullen. For the cure, ſee IRIS.

SYNOCHA. See INFLAMMATORIA FEBRIS.

SYNOCHUS. A CONTINUAL FEVER, whether of the ardent or putrid kind, called *anabatica, acmaſtica*, and *febris continens*; likewiſe a fever compounded of ſynocha, and of typhus, alſo called putrid, and malignant fever. Dr. Cullen places this genus of diſeaſe in the CLASS

PYREXIÆ,

PYREXIÆ, and ORDER FEBRES, which he defines, a contagious diſeaſe. A fever compoſed of a ſynocha and typhus, in the beginning a ſynocha; in its progreſs and towards its termination, a typhus. To which he adds the following obſervation: ſince many fevers are neither altogether inflammatory, nor nervous; neither therefore can they be referred to the ſynocha, nor typhus; the genus of ſynochus whoſe type is frequently ſeen in this country, I have here inſerted: ſtill, between the typhus and ſynocha, I cannot place any accurate limits; and I doubt, whether they ſhould in fact be deemed different genera, or placed differently: to each of them the ſynonymes of authors are to be referred. Sometimes it is uſed for *ſynocha*. It is the *ſynochus* of Sauvages; the *febris lenta* of Linnæus; the *phrenitis* of Vogel; and the *febris continua putrida* of Boerhaave. See PUTRIDA FEBRIS.

SYNOCHUS PLEURITICA. }
—— HIEMALIS. } Inſtances of *Synocha*.
—— RHEUMATIZANS. }

SYNOSTEOGRAPHIA. SYNOSTEOGRAPHY. It treats of a bone, its parts, articulations, the nails, and the number and uſes of the bones.

SYNOVIA, called alſo *hydarthros*, *mucilago*. It is a gluey tranſparent fluid, which readily mixes with water, and partly jellies when expoſed to cold. It is ſecerned from certain glands in the joints, to preſerve their motions eaſy and free. The *ſynovia* is not found to coagulate in any part of a joint, however long the bone may have been diſplaced. When there is a deficiency of *ſynovia*, there is a crackling of the joint, if the perſon moves much.

SYNOVIÆ GLANDULÆ. SYNOVIAL GLANDS. They are ſmall conglomerate *glands*, ſeated in the outer lamellæ of the capſular ligaments of the joints, and ſo as to be more or leſs preſſed, according to the degree of motion. They are alſo called HAVER'S GLANDS, becauſe firſt diſcovered by him. See GENU.

SYPHILIS. See LUES VENEREA.

SYRIÆ OLEUM. See MELISSA.

SYRIACUM UNGUENTUM. See COMMAGENUM.

SYRIGMUS, SYRINGMOS. } See PARACUSIS.

SYRUPUS, from the Chaldean word *ſirpi*, or the Arabic word *ſirab*, *a potion*. A SYRUP. It is alſo called *julapium*. The Arabians firſt invented this form of medicine. A *ſyrup* is a watery or other liquor, ſo boiled with ſugar, that if a drop is let fall upon a marble it will not ſpread. If the quantity of ſugar is not ſufficient, the *ſyrup* will ſoon ferment, and if it exceeds what is needful, the overplus will ſeparate and be formed into cryſtals. Acids ſhould have a proper quantity of ſugar added to them, to make a *ſyrup* with a ſimmering heat, for boiling deſtroys the acid in ſome meaſure; this is alſo to be obſerved when the liquor is flavoured, as that of violets, and ſuch as have a fine colour. *Syrups* are now but little uſed, and indeed the *ſyr.* alb. may anſwer every valuable intention of all others, except the *ſyr.* papav. albi, and ſpinæ cervinæ. Bruno ſays that the Greeks knew not that form of medicine. This term is generally given to the particular ſubſtance of which it is made, and may be found under each ſpecific name, as *ſyrupus* caryophillorum. See CARYOPHILLUS RUBER, &c.

SYSSARCOSIS, from συν and σαρξ, *fleſh*. It is a ſpecies of ſymphyſis of the bones, and is that in which they are connected by *fleſh*, that is, by muſcles, as in the connection of the os humeri with the ſcapula. IN SURGERY, it is the method of curing wounds by the growth of new *fleſh*: it alſo expreſſes the intention of cure, which conſiſts in promoting digeſtion and regeneration of the loſt ſubſtance. See SYMPHYSIS.

SYSTOLE, from συστελλω, *to contract*. See DIASTOLE.

T.

TAB

TABACUM. See NICOTIANA.

TABAUDE. See BRASSICA ITALICA, &c.

TABELLA. See TROCHISCI.

TABERDILLO. See PETECHIÆ.

TABES, from *tabesco, to consume*, or *pine away*. It is often taken for an ulcer in the lungs: sometimes used as synonymous with *atrophia*, but improperly.

Dr. Cullen places the tabes as a genus of disease in the CLASS CACHEXIÆ, and ORDER MARCORES. He defines it to be a wasting with extreme debility and hectic fever. He distinguishes three species, 1. *Tabes purulenta*; from an ulcer either external or internal, or a vomica. 2. *Tabes scrophulosa*; when it happens in scrophulous habits. 3. *Tabes venenata*; when it happens from taking some kind of poison.

TABES COXARIA, vel PHTHISIS ISCHIADICA. A wasting of the thigh and leg from an abscess, or other cause in the hip.

—— DORSALIS, named also *lordosis*; *lumbago*. See RHEUMATISMUS. It is a symptom, of a gleet, and being a principal symptom it gives name to that disorder. Dr. Cullen ranks it a variety of the *atrophia inanitorum*. Hippocrates calls it *tabes effis sacri*. What the ancients supposed to be a wasting of the marrow in the back was nothing more than a gonorrhœa simplex, without any virulency in the running: and the pain that this occasioned, mostly affecting the loins, they therefore judged the marrow to be wasting. At present, by the name of *tabes dorsalis* is understood a wasting of the body, attended at first with pain in the back and loins, and afterwards also in the neck and head, caused by a too early or a too frequent use of venery.

Hippocrates describes the *tabes dorsalis* as follows: "It arises from a disorder in the spinal marrow, and it is principally incident to persons of a salacious disposition, or such as are newly married. The patient is free from fever, eats and digests well; when he is asked with respect to his state, he says he perceives as it were ants falling from the superior parts of his body, his head for instance, into the spine of his back, and when he discharges his urine or excrements, there is at the same time a copious evacuation of liquid semen, in consequence of which he is incapable of propagating his species, or answering the purposes of marriage. He is generally short-breathed and weak, especially after exercise. He perceives a sense of weight in his head, and is affected with a ringing in his ears. The patient is in process of time seized with various species of violent fevers, and at last dies of that kind of fever called *lipyria*." The seminal matter which Hippocrates mentions as discharged with the urine and stools, is mucus, not semen. Besides the symptoms already mentioned, the memory fails, and the spirits are greatly dejected, the sight fails, or an incurable gutta serena comes on.

In order to a cure, particular care is required with respect to the non-naturals. The air should be pure and cool; the diet light, moderately cordial, very nourishing, and frequently supplied in small quantities; sleep should be early sought in the evening, and exercise in a carriage or on horseback may be used. And amongst the different tribes of medicines, cordials, moderately astringent, and such as increase the heat of the body; the bark, steel, dilute vitriolic acid, &c. according as there is more or less of a feverish heat; bitters also and cold bathing have their use towards the end of the cure. This (though) is seldom perfected, because the patients never apply in time, and when they do seek for medical assistance, they will rarely be found to have resolution sufficient to abstain from the excesses which first brought on the disease; and without such abstinence, there will be no possibility of removing the complaint.

If application is made before the febrile symptoms come on, the cure may be attempted by a course of asses milk, with chalybeate waters and the cold bath; but after the hectic heats and colliquative sweating have actually taken place, there is little prospect left of a recovery.

See Hippocrates de Morbis, lib. ii. and vi. Baldwinus Rolfeus in Tract. de Scorbut. epist. 4. Sennertus, vol. ii. Lommius's Med. Obs. Morton's Phthisiologia.

TACAMAHACA. It is a resin obtained from a tree which resembles a poplar-tree. The FAGARA OCTANDRA, Linn. It is a native of the temperate parts of America, and under shelter it bears the cold of our climate. The best resin is collected in gourd-shells; it is unctuous, softish, of a pale yellow or green colour, of a bitterish aromatic taste, and a fragrant smell; but this is seldom met with. The sort which is commonly met with is in transparent globes, of a white, yellow, brown, or green colour, and less grateful than the foregoing. The first is said to exude from the fruit of the tree, the latter from incisions in the trunk. It is chiefly used in fumigations and plasters, to warm, irritate, and gently blister. It dissolves in rectified spirit of wine, and gives to water its smell and taste. The Indians use it for ripening of tumors. See Lewis's Mat. Med. Neumann's Chem. Works.

TACHE BLANCHE. See ALBUGO OCULORUM.

TACTUS. The TOUCH. Hippocrates uses in this sense the word *aphassimensis*; in order to discover any diseases of the pudenda; but the sense of *touch* is, in the proper acceptation of the word, that change arising in the mind from external bodies applied to the skin, but more especially at the ends of the fingers; for by the fingers we more accurately distinguish the tangible qualities of things than by other parts of our body. See Haller's Physiology, sect. xiv.

TADORNA. See VULPANSER.

TÆD

TÆDA. Δας, from δαιω. Castelli says this is an equivocal term, and in BOTANY means a species of pine; afterwards a pharmaceutic signification, and means a certain paste prepared for fumigations, or some composition to be used as a pessary to support the uterus. The term is also made use of by some authors to express certain compo-

sitions

fitions, made up in the form of torches; and alſo torches made by cutting mountain pine in proper lengths for that purpoſe. See alſo CANDELA FUMALIS, and PINUS.

TÆNIÆ. See VERMES.

TAHOW. See ŒNANTHE CHÆROPHYLLI.

TALPA, } called alſo *tapinaria*. A tumor on the
TALPARIA, } ſkin of the head, of the atheromatous kind, is thus named. The tumors on the face, &c. called *teſtudo*; *moles* are alſo thus named, and are a ſpecies of wen. See NÆVUS.

TALUKGHAGHA. See ESULA INDICA.

TALUS. See ASTRAGALUS. The ANKLE BONE.

TAMALAPATHRUM, INDIAN LEAVES. See FOLIUM, and MALABATHRUM.

TAMAR HENDI. } See TAMARINDUS.
TAMARÆA ZECLA. }

TAMARINDUS, alſo called *tamaræa zecla oxyphœnicia, oxyphœnicon, balampulli*. TAMARIND. *Tamarindus* Indica, Linn. The TAMARIND TREE. *Tamar hendi* are Arabian words for Indian fruit. Some call the *tamarind* tree by the name of Indian dates, and others *Indian acacia*: but the tree is of the palm kind, and ſomewhat reſembles an aſh-tree. It grows in Arabia and both the Indies. The tamarindus Indica, uſed by Linnæus, under CLASS TRIANDRIA; but, lately, from the authority of Schreber, and De Louriſo, it is transferred to the CLASS MONADELPHIA; and ORD. TRIANDRIA. SCHREBER Gen. Plant. p. 436; of which is given the following eſſential generic character: cal. quadripartitus; petal. 3; nectarium ſetis 2 brevibus ſub filamentis: legumen pulpoſum. See Woodville's *Medical Botany*. The fruit is a pod like that of a bean, including ſeveral hard ſeeds, together with a dark-coloured viſcid pulp. The Eaſt India *tamarinds* are longer than thoſe of the Weſt, and dark ercoloured; the former contain ſix or ſeven ſeeds in each, the latter only three or four.

The pulp with the ſeeds are brought into England, without the ſhell or pod; the oriental have moſt pulp, the occidental have much ſugar mixed with them.

At Jamaica, tamarinds are prepared for exportation in the following manner: the fruit, or pods, are gathered, in June, July, and Auguſt, when full ripe, which is known by their eaſy breaking on preſſure between the finger and thumb. The fruit, taken from the pod, and cleared of the ſhelly fragments, is placed in layers, in a caſk; and ſyrup, juſt before it begins to granulate, is poured in till the caſk is filled; and, when cool, the caſk is headed for ſale. LONG, who gives this account, ſays a better mode for preſerving this fruit is with ſugar, well clarified with eggs, till a tranſparent ſyrup is formed, which gives the fruit a much pleaſanter flavour; but Dr. Cullen thinks the tamarinds would be of more utility if imported in the pods, as a principal medicinal purpoſe of the pulp depends upon its acidity, which is counteracted by the admixture of ſugar.

The pulp is an agreeable cooling laxative acid; it was firſt introduced into practice by the Arabians: it is uſeful in inflammatory and putrid fevers; it abates thirſt and heat, and corrects putrefaction. As a laxative, the doſe is two or three drams; as a purgative, one or two ounces. If the pulp of *tamarinds* is mixed with the laxative ſweets, ſuch as caſſia and manna, it increaſes their action, and prevents in a degree the flatulence which they occaſion. It is an ingredient in the electarium cum caſſia, elect. e ſenna comp. Ph. Lond. See Tournefort's, Lewis's, and Cullen's Mat Med.

TAMARICE, } alſo called *myrica*. TAMARISK.
TAMARIX, } The TAMARIX GALLICA, Linn.
TAMARISCUS, } It is plentiful in France and Germany. The leaves and bark of this tree are aſtringent, but they are not noticed in the preſent practice. See Raii Hiſt.

TAMNUS. See BRIONIA NIGRA.

TANACETUM, alſo called *tanaſia, athanaſia, parthenium mas*. COMMON TANSY. TANACETUM VULGARE, *foliis bipinnatis ſerratis inciſis*, CLASS. SYNGENESIA; ORD. POLYGAMIA SUPERFLUA. LINN. Gen. Plant. 944. The virtues of tanſy are ſaid to be *tonic, ſtomachic, anthelmintic, emmenagogue*, and *reſolvent*, by Bergius. It is a plant with large leaves, divided to the rib on both ſides into deeply indented ſegments: on the tops of the ſtalks are many gold coloured diſcous flowers, in umbel-like cluſters; the ſeeds are ſmall and blackiſh. It is perennial, grows wild by road ſides, and about the borders of fields; it flowers in June, July, and Auguſt. The leaves and flowers have a ſtrong, not a diſagreeable ſmell, and a bitter aromatic taſte; the flowers are ſtronger, though rather leſs unpleaſant than the leaves. The curled leaved and the ſtriped leaved ſorts are but varieties of this ſpecies. They give out their virtue both to water and to ſpirit, moſt perfectly to the latter. Diſtilled with water, they yield a greeniſh-yellow eſſential oil, which ſmells ſtrongly of the herb; the remaining decoction affords a ſtrong, bitter, ſubſaline extract. The ſpirituous tincture gives over part of the oil in inſpiſſation, a part remaining with the extract.

It is a warm deobſtruent bitter, uſeful in cachectic diſorders, and weakneſs of the ſtomach; it expels worms from the inteſtines, for which the ſeeds are generally uſed. Many other virtues are attributed to *tanſy*, ſuch as its curing ſome colics, and the gout; in which laſt caſe, ſome have ſaid they have been relieved by its uſe from the frequency of the fits of the gout. It is alſo recommended in hyſteria ariſing from menſtrual obſtruction. Doſe, in powder, 3 i. or more; but it is more commonly drank as tea in infuſion. See Lewis's and Cullen's Mat. Med. It is alſo a name for ſeveral other herbs.

TANASIA. See TANACETUM.

TAPIOCA. See CASSADA.

TARACHON. See DRACO.

TARANDUS. See CERVUS RANGIFER.

TARANTISMUS. A DESIRE of DANCING. The diſorder ſaid to be produced by the bite of a tarantula; but this is impoſition. Some expreſs by it a kind of St. Vitus's dance.

TARANTULA. A ſpecies of ſpider met with in Apulia. Its bite is ſaid to produce a ſpecies of madneſs, which is cured by muſic, but not by any other means; but Dr. Cirillo declares that he never could make the *tarantula* bite him, nor any other perſon, though he often had tried to provoke it. So that this affair ſeems to be only a fraud practiſed to obtain money.

TARAXACON, } See DENS LEONIS.
TARAXACUM. }

TARAXIS, from ταρασσω, *to diſturb*. A diſorder of the eye, ſuch as when it is offended by ſmoak, or too hard rubbing. It is when the eye is offended by attrition, ſmoke, duſt, or other ſlight cauſes. Galen, in 6 Epid. Com. 5, ſays, it is a morbid diſpoſition of the eye, preceding an inflammation, and the beginning of an inflammation. Paulus, lib. iii. cap. 22. defines it to be heat and humidity of the eye, attended with a preternatural redneſs, proceeding, not from the body, but ſome external cauſe, as the ſun, ſmoak, duſt, and wind; whence the diſorder is very ſpeedily remedied, by removing the cauſe. Hoffman, in his Practice of Medicine, ſays, the ſlighter ophthalmiæ, occaſioned by duſt, expoſure to cold air, ſun, or other ſlight external cauſes, are inflammations of the tunica adnata only, and attended with little danger. Perhaps the following, noticed by Mr. Ware, in his Remarks on the Ophthalmy, &c. may be included under this name. He ſays, it frequently comes on in the moſt ſudden and unexpected manner, without any preceding or concomitant illneſs. When it happens in this way, the common people call it a BLAST IN THE EYE: and it ſeems to proceed from ſome peculiar property in the air which ſurrounds us: like other epidemic diſeaſes, it often affects the whole neighbourhood at the ſame time; as was the caſe during the ſummer 1778, at Newbery, in Berkſhire, and in ſeveral of the camps, where it was known by the name of the OCULAR DISEASE. In Dr. Cullen's arrangement of the ſpecies and varieties of the ophthalmia, he places this as the leaſt violent, and calls it *ophthalmia taraxis*. See OPHTHALMIA. This kind of inflammation gives way to the gentleſt remedies uſed againſt inflammations of the eyes.

TARCHON. See DRACO.

TAROLI. See CRYSTALLINÆ.

TARSUS, from ταρσος. The CARTILAGINOUS EDGE of the EYE-LIDS. The edge of each eye-lid is principally formed by a thin cartilage, called *tarſus*, which is adapted to the ſhape and roundneſs of the eye. The lower edge of the ſuperior cartilage, and upper edge of the inferior, meet with each other, and are termed the ciliary edges. Theſe cartilages do not terminate in a line, like the ſharp edge of a knife, but rather flat like the back of it; forming two edges, one external, the other internal. When the eyes are ſhut, the external edges meet; but the internal are preſerved at a ſmall diſtance from each other, leaving a gutter, or groove, through which the

tears are ſuppoſed to paſs from the lacrymal gland to the puncta lacrymalia, while we are aſleep. The *cilia*, or eyelaſhes, which when too ſhort are called *rodatio*, ariſe out of the external edge of the termination of this cartilage; and on the internal, at an evident diſtance from them, is a line of ſmall orifices, which are the excretory ducts of ſmall glands that lie in the inner ſurface of the *tarſus*, and are called *ciliares glandulæ*. Alſo the ſpace between the bones of the leg and the metatarſus, is called *tarſus*. See PES.

TARTARUM, alſo called ARGOL, ARGAL, GIRMER, TARTAR, WINE-STONE. PARACELSUS calls it *crepinum*. It it an eſſential acid concrete ſalt of grapes, thrown off from wines, after complete fermentation, to the ſides and bottoms of the caſks; it is of a red or a white colour, and more or leſs droſſy, according to the quality of the wine. Dr Cullen ſays it conſiſts of a great part of the vegetable fixed alkali, ſuperſaturated with a quantity of acid, which, though in the main of the nature of vegetable acid, has however ſomething peculiar, which is not well aſcertained. The white is uſually moſt pure; but in all other reſpects they are the ſame. Chuſe ſuch as is clean, ſound, ſomewhat tranſparent, and hath its outſide covered with ſmall ſhining cryſtals. The Rheniſh white wine *tartar* is the moſt pure. Its virtues as a medicine are thoſe of a cooling laxative; in doſes from ʒ i. to ʒ iii. it is aperient; from ℥ ſs. to ℥ i. it moderately purges.

If *tartar* is diſſolved in water, it effervesces with fixed alkaline ſalts, and ſaturates of the vegetable alkalies near one third of its own weight; the neutral ſalt formed by this union is more purgative than the *tartar* itſelf, as is inſtanced in the *ſoluble tartar*, now called KALI TARTARISATUM, of the London College, for which they order the following proceſs: Take of kali, one pound; cryſtals of tartar, three pounds; diſtilled water, boiling, three gallons. To the ſalt diſſolved in water, throw in gradually the cryſtals of tartar, powdered. Filter the liquor, when cold, through paper: and after due evaporation ſelect a part to cryſtallize. Pharm. Lond. 1788. The *ſoluble tartar* might as well be made with the common white *tartar*, as its impurities are ſufficiently removed by the neceſſary filtration. To ſecure the neutralization of the ſalt, the *tartar* may be made to prevail at the firſt, and the liquor ſuffered to cool a little before filtration, that the redundant *tartar* may concrete and ſeparate from it. The *tartar* diſſolves difficultly in water, and when diſſolved therein, it ſoon concretes again on being removed from the fire, and what the alkali hath not taken up, will remain on the filtre; and, on the other hand, if too much alkali is uſed, it will remain uncryſtallized. The ſoluble *tartar* is a *mild*, *cooling aperient* in doſes from ϑ i. to ʒ i. it is *laxative* in doſes of ʒ ii. or iii. and *purges* if ℥ i. is given; it promotes the operation of reſinous purges, and prevents their griping. It has been particularly recommended as a purgative for maniacal and melancholic patients.

Tartar is very difficultly ſoluble in water: if it is diſſolved in twenty times its weight of boiling water, it continues diſſolved long enough to be paſſed through a ſtrainer; but when ſet in the cool air, it ſoon begin sto run together in the form of cryſtals on the ſides of veſſels; theſe, when collected and dried, are called CRYSTALS OF TARTAR. If this ſolution of *tartar* is ſtrained and boiled until a thick pellicle appears on the ſurface, and this pellicle being ſkimmed off, it is again boiled until another pellicle appears, and is ſkimmed off, &c. until all the *tartar* is obtained, which is when all the water is conſumed, then all theſe pellicles being mixed together, and dried in the ſun, you have the cryſtals of *tartar*. But it is the beſt to have this preparation in the form of cryſtals, as the powder is ſo generally adulterated. Theſe are *laxative*, and *gently cathartic*, and may be given from ʒ j. to ℥ ij. according to the conſtitution of the patients, or the effect wanted to be produced. They are a very uſeful antiphlogiſtic; and in moderate doſes, in evacuating the inteſtines, and in producing all the effects of that, they have all the powers of the neutral ſalts. In large doſes, without any inflammatory ſtimulus applied to the inteſtines, they act like a purgative in exciting the action of the abſorbents in every part of the ſyſtem. Either in ſmall or large doſes, this medicine paſſes the urinary paſſages, and ſometimes promotes the ſecretion of urine very copiouſly, but this more readily by being accompanied by a quantity of watery fluid; hence the moſt eligible mode of adminiſtering the cryſtals is in a liquid form. See ANASARCA; Dr. Home's Clin. Exper. Neumann's Chem. Works Lewis's and Cullen's Mat. Med.

TARTARUM EMETICUM. EMETIC TARTAR. Now ANTIMONIUM TARTARISATUM. It is alſo called *ſtibiated tartar*. It is made by boiling one pound and an half of crocus of antimony, powdered, in two gallons of diſtilled water, in which has been diſſolved two pounds of cryſtals of tartar, in a glaſs veſſel for about a quarter of an hour; then filtered through paper, and the ſtrained liquor ſet by to cryſtallize. Ph. Lond. 1788.

This tartariſed antimony alſo forms a medicated wine under the character of vinum antimonii tartariſati. See ANTIMONIUM. But a more certain preparation is obtained as follows:

Take of powdered mercurius vitæ, waſh it with a little fixed alkali to ſeparate the marine acid from it, then gradually throw it into a glaſs veſſel, in which is a boiling ſolution of the cream of *tartar*; continue the boiling and the addition of the mercurius vitæ, until there is no longer any fermentation from the mixture; after this, filter the liquor, and ſet it to cool, and cryſtals will ſoon be formed. Theſe cryſtals are an *emetic tartar* that is certain in its operation, and equal in its ſtrength. See Neumann's Chem. Works. Lewis's Mat. Med. Dict. of Chem.

Mr. Beaumé affirms from experiment, that the acid of *tartar* may be eaſily ſaturated with the reguline part of antimony; and the glaſs of antimony is the moſt emetic and moſt ſoluble of all the antimonial preparations by fire; it ſhould be preferred for making a neutral antimonial ſoluble *tartar*; yet reflecting on the nature of the glaſs of antimony, it is not always of the ſame ſtrength. It is made by fuſing the grey calx of antimony calcined to an uncertain degree; and we know that if it be too little calcined, we ſhall obtain an opake matter that reſembles the liver more than the glaſs; if it is too much calcined, it cannot be vitrified, nor even fuſed, by the moſt intenſe heat: between the degree of calcination which is ſufficient to give an opake fuſed matter, and the degree in which it begins to be unfuſible, there are many intermediate ones; all of which are ſufficient to produce glaſſes of antimony; but theſe glaſſes differ in the degree of tranſparency, in tenſity of colour, and fuſibility, according as the calcination has been more or leſs complete. We cannot doubt that different glaſſes of antimony muſt be more or leſs emetic, and that perhaps different quantities of theſe glaſſes are required for the perfect ſaturation of the acid of *tartar*; beſides, we are both ignorant of the degree of calcination which renders the glaſs of antimony moſt emetic, and alſo of the method of obtaining it, if we knew it. Hence we are not certain that tartariſed antimony made with glaſs of antimony is equally and conſtantly emetic; therefore, inſtead of the glaſs of antimony, we recommend the PULVIS ALGAROTHI for making the *tartariſed antimony*. Mr. Beaumé further obſerves, that the pulvis Algarothi hath the advantages of the glaſs of antimony, it being convertible into a neutral ſalt, by means of the acid of *tartar*, and is not ſubject, like the glaſs of antimony, to give the *emetic tartar* prepared with it an uncertain degree of ſtrength; though of itſelf it is, like the other calces, uncertain; but it is the beſt preparation of antimony from which to obtain a certain and uniformly effectual medicine. The *pulvis Algarothi* is not ſaline, and from the quantity of marine acid which it contains, it is ſomewhat cauſtic: but when it is waſhed with a little fixed alkali, all the acid is ſeparated, and then it is totally ſoluble by cream of *tartar*, and it is thereby convertible into a ſoluble *emetic tartar*, perfectly neutral; and for which purpoſe, prepare to uſe it as follows: mix an equal quantity of cream of *tartar*, and the powder of algaroth, or as much of the latter as is required to ſaturate the former; throw this mixture gradually into boiling water, and continue the boiling gently, till there is no effervescence, or till the cream of *tartar* is well ſaturated. Filter the liquor, and when this liquor is cool, fine cryſtals will be formed in it, which are ſoluble *tartar*, perfectly ſaturated with the algaroth's powder: as ſoon as the cryſtals are formed, carefully dry them, and keep them in a well-cloſed glaſs veſſel.

In preparing the *antimony tartariſed*, veſſels, &c. of glaſs ſhould be uſed; for iron, tin, lead, and copper decompoſe it, by attracting the acid more ſtrongly than the antimony does; whence one cauſe or inequality in different parcels of this preparation, made at different times. The powder of algaroth is a calx of antimony, conſtantly of the ſame degree of emetic ſtrength; it is emetic becauſe the regulus of antimony, firſt diſſolved by marine acid,

acid, and afterwards ſeparated from that acid, retains the quantity of phlogiſton that is neceſſary to give an emetic quality of the calx of antimony; the quantity of phlogiſton which it retains, and therefore its emetic power muſt always be the ſame; for the marine acid of the corroſive ſublimate, which afterwards becomes the butter of antimony, is always the ſame in quantity, and in its degrees of concentration, and of activity; conſequently the calx of antimony ſeparated from it muſt always contain an equal quantity of phlogiſton, and is therefore much preferable to the glaſs of antimony, which contains ſometimes more, ſometimes leſs phlogiſton. Thus, by uſing the powder of algaroth inſtead of the glaſs of antimony, we obtain an uniform and certain *tartariſed antimony*, uniformly active. Then phyſicians will only have to attend to the ſenſibility or irritability of the conſtitutions of their patients.

In the Hiſtory of the Royal Medical Society at Paris, for the year 1776, M. de Laſſone prefers the above mode of preparing the *tartariſed antimony*: but he ſays there is an objection to it, as well as to all other methods of preparing it, which is, that when diſſolved in a very diluted aqueous vehicle, part of the medicine is conſtantly precipitated, and adheres to the ſides of the phial. As this is owing to its not being ſufficiently ſoluble, he recommends the mixing equal quantities of *tartariſed antimony* and pure ſal ammoniac; and after rubbing them together in a mortar, adding a ſmall quantity, three parts or leſs, of diſtilled water. Thus the two ſalts unite, and are completely diſſolved.

Tartariſed antimony, according to its doſe, is an emetic, and diaphoretic, called by ſome *alterant*. It is a medicine, both ſafe, convenient, and has little taſte. The doſe, as an EMETIC, is from one grain to five; to children it is generally given in ſolution, in the proportion of one grain to one ounce of water, and ſweetened with ſugar; a tea ſpoonful or two may be taken every half hour till the patient vomits. It is thus made to anſwer in fevers, and when the ſtomach is loaded with phlegm, or the lungs with mucus; and it ſhould be repeated according to the neceſſity of the caſe, and the ſtrength of the patient. As a DIAPHORETIC, the doſe is, from one-eighth to one-half a grain, given repeatedly in the beginning of remittent fevers, joined with a few grains of ſugar, and ſome teſtaceous powders, and with ten or more grains of nitre in inflammatory fevers. It is given in moderate doſes, well diluted in ſome aqueous liquid, every half hour, till it acts by vomiting or purging, by the French; and this, particularly at the attack of bilious fevers; at this period they moſt commonly join to it ſome mild purgative, as tamarinds, manna, or purging ſalts, diſſolved in ptiſan, or barley-water, in order to clear the firſt paſſages; and from this mode frequently the diſeaſe is removed in its firſt ſtage.

The tartariſed antimony, properly managed, will anſwer the purpoſes of any other antimonial preparation, and will produce all the good effects of James's powder, ſo called.

TARTARUM SOLUBILE. See KALI.

—— VITRIOLATUM. See NITRUM VITRIOLATUM, N° 6.

TARTARUS REGENERATUS. See DIURETICUS SAL.

TAXIS. See BUBONOCELE.

TEGULA GALLIS. See HIBERNICUS LAPIS.

TELA CELLULOSA. See CELLULOSA MEMBRANA.

TELEPHIUM. See CRASSULA, FABAGO. For that called CHIRONIUM, ſee ORNITHOPODIUM.

TEMPERAMENTUM. TEMPERAMENT, or CONSTITUTION. Various are the diviſions of *temperaments*. The following has maintained its ground ſome time: but it ſeems to be totally ſubſervient to the doctrine of the fluids, and may ſerve the purpoſes of humoral pathology, viz. 1ſt. The ſanguine, or when the habit is full of good blood. 2d. The ſerous or phlegmatic, or when the habit is full of ſerum. 3d. The temperate, or when the red blood and ſerum are in due proportions. 4th. The cacochymic, or when the juices are depraved. Dr. Cullen thinks that the difference of *temperaments* may conſiſt, 1ſt. In the ſtate of the ſimple ſolids. 2d. In the ſtate of the fluids. 3d. In the proportion of the ſolids and fluids in the body. 4th. In the diſtribution of the fluids. 5th. In the ſtate of the nervous power. Mat. Med. In forming, however, our opinions with reſpect to temperaments, the conſtituent parts of the machine ſhould be conſidered, particularly thoſe which are poſſeſſed of moving powers, as it is on their action that every function of the body, nay even life itſelf, depends, and probably the very nature of our fluids, not contaminated with any extraneous materials thrown or abſorbed into the habit. The MOVING POWERS of the habit are the *muſcular fibres*, and *vaſcular ſyſtem*, poſſeſſed of irritability; the *nervous ſyſtem*, of incitability; and the *ſanguinary maſs of fluids*, of the vis animans, and ſervans naturam. Hence, therefore, from theſe principles, do we think temperaments may be formed, for the purpoſe of promoting practical utility, either in preventing, or curing diſeaſe.—Conſiſtent with this ſcheme, CONSTITUTIONS have been divided into ſuch as are SIMPLE and GENERAL; MIXED and GENERAL, and ſuch as are PECULIAR.—The SIMPLE and GENERAL are, 1ſt. *Strong* and *robuſt*. 2d. *Weak*, *relaxed*, and *delicate*. 3d. *Nervous*, or *incitable*. 4th. *Irritable*. 5th. *Torpid*. But theſe may be combined, and form others, viz. The STRONG,—ROBUST,—and *irritable*,—*torpid*, *nervous*, or *incitable*,—though the firſt of theſe is what moſt commonly takes place. The WEAK, DELICATE, and RELAXED, may alſo be ſubject to the ſame combinations.—*Nervous*, or *incitable*,—*irritable*,—*torpid*,—apt to take place in the order here ſet down with regard to the more general mode.—The MIXED and GENERAL are, 1. *Plethoric*. 2. *Hot*. 3. *Cold*. 4. *Conſumptive*. 5. *Acrimonious*; for theſe may be combined with either the *irritable*, *nervous*, or *torpid*, but depend upon the quantity and quality of the blood, and the greater or leſs degree of the irritability or incitability of the vaſcular or nervous ſyſtem.—The PECULIAR are, 1. *Phlegmatic*. 2. *Bilious*. 3. *Coſtive*. 4. *The Lax*. 5. *Flatulent*. 6. *Scorbutic*. 7. *Gouty*. 8. *Rheumatic*. 9. *Scrophulous*. Any of which may be combined with thoſe which are ſimple, and mixed; as a STRONG and ROBUST conſtitution may be alſo *plethoric*, *hot*, *coſtive*, *gouty*; ſo may the WEAK, RELAXED, and DELICATE; though plethora is moſt generally the concomitant of the former. For further particulars on this ſubject, ſee WALLIS on Health and Diſeaſe, 2d. edition.

TEMPERANTIA. TEMPERATING MEDICINES, alſo *contemperantia*. The term is very vague and uncertain; ſometimes it is uſed for medicines ſuited to diminiſh heat, and the activity of the ſyſtem; ſometimes for medicines calculated to correct or cover the matter which gives irritation; and ſometimes for medicines which carry noxious and irritating matter out of the body; hence the temperantia may belong to the refrigerantia,—demulcentia,—and evacuantia;—hence an improper term to be made uſe of from its want of preciſion.

TEMPLINUM OL. i. e. *ol. templinum* verum Germanorum. It is a kind of ol. terebinthinæ.

TEMPORA. The TEMPLES; called alſo CORÆ, CORSÆ, CROTAPHI.

TEMPORALIS ARTERIA. The origin of the *temporal artery* is covered with the parotid gland. It lies behind the meatus auditorius externus, and emerging from the parotid, comes, juſt covered by the ſkin, to the zygomatic proceſs of the os temporis; it crawls up, and divides into two branches, one of which goes to the frontal, the other to the parietal bone. The frontal part anaſtomoſes with the internal carotid, and the other portion with the occipital *artery*. From the root of the temporal, an *artery* paſſes up to the ſcalp behind the ear, and is ſometimes ordered to be opened inſtead of the temporal.

TEMPORALIS MUSCULUS, it is alſo called *crotaphites*. It riſes broad from the region of the temples, particularly from the oſſa frontis, parietalia, temporalis, and ſphenoides, where it ſpreads like a quarter of a circle; then it forms a tendon, which paſſes under the jugum, and is inſerted into the coronoid proceſs of the under jaw. A ligament from the proceſſus zygomaticus braces this tendon down, and imparts ſome of the internal fibres to it. It is covered with a ſtrong tendinous ſheath, which is loſt in the epicranium. When matter is formed under this tendinous expanſion, it is uſually attended with ſo great a degree of fever, from the pain, as to occaſion delirium. The thickneſs of this tendinous part prevents the matter from pointing outwardly, where it was firſt formed; and if left without aid, it runs in the direction of the *temporal muſcle*, and opens into the mouth by the coronoid proceſs of the lower jaw. It is uſual therefore, not to wait for this matter pointing outwardly where it is firſt formed; but, as in other inſtances of matter under the faſciæ of tendons, to make an opening directly to it. See ABSCESS *of the temporal muſcle*.

TEM-

TEMPORUM OSSA; called alſo by ſome *arcualia*, vel *nervalia oſſa*. The TEMPLE BONES are each divided into three parts, viz. the maſtoidea, the ſquamoſa, and the petroſa, which is called *lithoeides*. There are three external proceſſes which ariſe from each of the temporal bones; on the poſterior part is the *maſtoideus proceſſus*, called *mammiformis*, and *mamillaris*; a little more forward is the *zygomaticus proceſſus*; it joins the os malæ, and from the inferior craggy part the *ſtyloides proceſſus* juts out obliquely forward, called *plectrum*. A little below the maſtoid proceſs there is a cavity, whence the digaſtric muſcle of the lower jaw ariſes. At the inner ſide of the root of the ſtyloid proceſs there is a cavity where the internal jugular vein is lodged. Between the maſtoid and zygomatic proceſſes the meatus auditorius externus is ſeated, and between the maſtoid and ſtyloid proceſſes is the aquæductus Fallopii, whence the portio dura of the ſeventh pair of nerves makes its exit. Before the ſtyloid proceſs is a glenoid cavity for the reception of the condyle of the lower jaw, near which cavity is an eminence, upon which the condyle ſometimes moves. In the pars petroſa, near the ſtyloid proceſs, is a canal through which the carotid artery enters, called *alſamach*, or *alſemach*. Near the laſt foramen, on the anterior edge of the bone, is the tuba Euſtachiana. The internal foramen is the meatus auditorius internus.

TENANCHILES. See PIPER INDICUM.

TENDINOSA TUNICA. See ALBUGINEA TUNICA.

TENDO, from τεινω, *to ſtretch*, alſo called *chorda*. A TENDON. See MUSCULUS.

TENDO ACHILLIS, *chorda magna*. This *tendon* is formed by the union of the ſoleus, and gaſtrocnemius muſcles, which are inſerted into the os calcis. Some ſay it is thus named from its action in conducing to ſwiftneſs of pace. Homer deſcribes this *tendon*, which was probably thus named by the ancients, from their cuſtom of calling every thing thus, that had any extraordinary ſtrength or virtue. See GASTROCNEMII.

TENDRIL. See CIRRHUS.

TENESMUS, from τεινω, *to ſtretch*. A *teneſmus* is a continual painful urging to go to ſtool, when little or nothing can be diſcharged. There is a pain in the anus, and a frequent deſire of going to ſtool, whilſt a mucous ſubſtance, which is ſometimes bloody, is diſcharged. The cauſes are, *a ſtone in the bladder, an inflammation in the neck of the bladder, acrid humours falling on the rectum, a diarrhœa, a dyſentery, the piles, pregnancy*, &c.

This diſorder is very troubleſome, but rarely dangerous.

As the cauſe varies, the cure will alſo differ. *If a ſtone in the bladder* is the cauſe, its poſition ſhould be altered by means of a catheter, if putting the patient into a proper poſture will not anſwer the end.—*If an inflammation in the neck of the bladder is the cauſe*, ſuch means will be neceſſary as are directed for removing inflammation there.—*If acrid humours* affect the rectum, they ſhould be gently purged off, and then emollient or balſamic clyſters ſhould be injected, the ol. ricini is particularly uſeful, both by the mouth and clyſterwiſe.—That kind of teneſmus which affects *pregnant women* is relieved by clyſters of ſweet oil, and a little of the tinct. opii mixed with it; in other inſtances, the method of relief will be the ſame as in a dyſentery. See Lommius's Med. Obſ. Lobb on painful Diſtempers.

TENGA. See PALMA COCCIFERA.

TENONTAGRA, from τενων, *a tendon*, and αγρα, *a ſeizure*. See ARTHRITIS.

TENSOR FASCIÆ FEMORIS. See FASCIÆ LATÆ MUSCULUS.

—— MEMBRANÆ TYMPANI, alſo called *mallei muſculus externus* vel *ſuperior*. It lies on the upper-part, above the bony portion of the canal that goes to the noſe, and runs to be inſerted into the inſide of the malleus. It is ſuppoſed to pull the membrana tympani in, and to make it more tenſe.

—— PALATI. See CIRCUMFLEXUS PALATI.

TEPIDUS. TEPID. Warm as milk from the cow.

TEREBELLA. See TREPANUM.

TEREBINTHINA. TURPENTINE; called alſo *albetin*; *albetal*; *betin*; *brutino*; *butino*. The produce of the different ſpecies, &c. of pine-trees, and the piſtachiæ chiefly, if not wholly. The Pharmacopœia of the Edinb. Col. ſays it is the produce of pinus larynx, i. e. pinus foliis faſciculatis obtuſis, Linn.

TEREBINTHINA CHIA, vel CYPRIA. The CHIO, or CYPRIAN TURPENTINE. It is generally about the conſiſtence of thick honey, very tenacious, clear, almoſt tranſparent, of a white colour, with a caſt of yellow or blue; it hath a warm, pungent, bitteriſh taſte, a fragrant ſmell, more agreeable than that of any of the other *turpentines*. It is the produce of the *terebinthinus vulgaris*, C. B. in the iſland of Cyprus, and the ſouthern parts of Europe. The PISTACIA TEREBINTHUS *foliis imparipinnatis foliolis ovato-lanceolatis*. CLASS. DIOECIA, ORDO PENTANDRIA. LINN. Gen. Plant. 1108. This kind of *turpentine* is ſaid to be the leaſt ſubject to be adulterated.

TEREBINTHINA VENETA. VENICE TURPENTINE. It is uſually thinner than the other ſorts, of a pale yellow colour, a hot, pungent, bitteriſh taſte, and a ſtrong ſmell, without any of the fine aromatic flavour of the Chio *turpentine*. It is the produce of the PINUS LARIX, foliis faſciculatis mollibus obtuſiuſculis, bracteis extra ſquamas, ſtrobilorum extantibus. CLASS. and ORD. &c. the ſame as the common *turpentine*, (ſee below)—COMMON WHITE LARCH TREE; and brought from France, Germany, &c.

—— ARGENTORATENSIS. STRASBURGH TURPENTINE. It is of a middle conſiſtence between the two foregoing, more tranſparent, and leſs tenacious than either, of a yellowiſh brown colour, more agreeable to the ſmell than either the common or the Venice; to the taſte it is the bittereſt, but the leaſt acrid. It is extracted in different parts of Germany from the ſilver and the red firs, the *pinus picea*, Linn. by making inciſions through the bark. In ſome places a reſinous juice is collected from certain knots under the bark. This is called *lacryma abiegna*, and *abietanum oleum*. The medical virtues of theſe *turpentines* are ſpecified below, under the

—— COMMUNIS. COMMON TURPENTINE, of the London and Edinburgh Pharmacopœias, is from the PINUS PICEA, *ſilver fir tree*; it is the PINUS *foliis ſolitariis, planis emarginatis pectinatis, ſquamis coni obtuſiſſimis adpreſſis, Hort. Kew.* CLASS. MONOECIA, ORDO MONADELPHIA. LINN. Gen. Plant. 1077. Turpentine, the product of this tree, is about the conſiſtence of honey, of an opake browniſh white colour; the coarſeſt and heavieſt of all the kinds, and its ſmell and taſte are alſo the moſt diſagreeable.

All theſe *turpentines* diſſolve totally in rectified ſpirit of wine, but give out nothing to watery menſtrua; by the mediation of mucilages, the white of egg, or of gum arabic, they mix with water into a milky liquor. Diſtilled with water, they yield a large quantity of a ſubtile, penetrating, eſſential oil, viz. the oil of *turpentine*, which is called alſo the ſpirit of *turpentine*. The oil is difficult of ſolution in ſpirit of wine, though the *turpentine* ſo eaſily diſſolves in it. If this oil is rediſtilled in a retort by itſelf, with a gentle heat, it becomes more ſubtil, and in this ſtate it is called ethereal oil of *turpentine*; the thicker part which remains behind, is called balſam of *turpentine*, and *botin, butino*.

All the *turpentines* are hot, ſtimulating, detergent, and corroborant; they ſtimulate the primæ viæ, and prove laxative; and Dr. CULLEN ſays, that ℥ ſs. or ℥ j. of Venice turpentine, triturated with the yolk of an egg, and diffuſed in water, may be employed in the form of injection, as the moſt certain laxative in colics, and other caſes of obſtinate coſtiveneſs. When carried into the blood-veſſels, turpentine ſtimulates the whole ſyſtem; hence its uſe in chronic rheumatiſm and paralyſis. When inflammatory ſymptoms do not forbid, they are given from ten grains to half a dram, for cleanſing the urinary paſſages, for healing internal ulcerations in general, and in laxities of the ſeminal and uterine veſſels; they ſeem peculiarly to affect the urinary paſſages, and give a violet ſmell to the urine; they diſſolve and diſcharge mucous matter from the urinary paſſages; but if a ſtone is in any of the parts, they are not ſafely adminiſtered. The following electary is given in gleets at ſome of the hoſpitals: ℞ Tereb. vulg. ℥ j. mellis deſpumati ℥ ij. m. Doſis, ʒ j. bis terve de die. Turpentine has alſo been much uſed in fluor albus. Two or three of the following pills, taken twice or thrice a day, are found of ſervice in ſimilar complaints. ℞ Terebinthinæ vulgaris ʒ ij. farinæ tritici, q. ſ. ut fiant pilulæ; e drachma una formentur duodecim.—In violent fits of the ſtone, the following clyſter is often of great ſervice: ℞. Terebinth. vulg. ℥ j. ovi unius vitellum, bene commiſceantur, deinde adjiciatur decocti avenæ ℔ ſs. m. The Venice is moſt diuretic and detergent; the Chio and Straſburg more corroborant; the common is uſed externally, and for diſtilling. What remains, after diſtilling the oil from *turpentine*,

pentine, is the yellow and the black roſins. *Turpentines* not only paſs off by urine, but alſo by perſpiration, and probably by exhalation from the lungs; and to theſe reſpective effects are to be aſcribed the virtues they have in gravelly complaints, ſcurvy, and pulmonic diſorders. In all theſe diſeaſes, however, and eſpecially the laſt, they, as well as gums and balſams of the terebinthinate claſs, by acting as ſtimulants, are productive of miſchief. They are conſidered as rubefacient, and too ſtimulative to be applied to freſh wounds, or when they are in a ſuppurative ſtate.

The oils, both the common and the ethereal, are powerfully ſtimulating, detergent, and diuretic; they are given in doſes from a few drops to half an ounce in rheumatiſms; and ſtrongly recommended as a remedy for the ſciatica, by Pitcairn, and Cheyne; but few ſtomachs are able to bear the doſes they direct. When a large doſe is directed, it is given in the morning, and an opiate at night. Mixt with ſpirit of wine, they are uſed as ſtyptics, to check the diſcharge of blood from wounds. They are uſed for rubbing on parts affected with pains. But if too freely uſed inwardly, they diſpoſe to a diabetes, and weaken the urinary paſſages and the ſeminal veſſels. See Neumann's Chem. Works. Lewis's Mat. Med. Cullen's Mat. Med. Home's Clinical Experiments.

TEREBINTHINA INDICA. See PISTACIA.

TEREBRA, from τειρω, *to bore*. A name of the trepan. See TREPANUM. Alſo a chirurgical inſtrument for perforating bones, or for extracting hard bodies, as bullets, &c. from wounds.

TEREDO. See SPINA VENTOSA, and CARIES.

TERENIABIM MANNA. See ALHAGI.

TERES, vel TERETES. See VERMES.

TERES LIGAMENTUM. It riſes from the bottom of the cavity of the acetabulum, and runs obliquely backwards, to be inſerted into the head of the os femoris. It ſerves to confine the rotation of the thigh.

—— MAJOR. This muſcle riſes from the outer part of the lower corner of the ſcapula, paſſes to the os humeri forwards, joined by the latiſſimus dorſi and its tendon, it is inſerted into the poſterior ridge of the biceps groove, to bring the arm downwards, backwards, and inwards to the body. Brown calls this muſcle *rotundus major*.

—— MINOR, alſo called *brevis* vel *brachys*; *obliquus humeri*; *muſc. Placentini*, becauſe Placentinus added it to the number of muſcles belonging to the arm; *tranſverſalis*. It riſes from the lower coſta of the ſcapula, and runs with the infra ſpinatus, and is inſerted with it alſo.

TERMINALIA BENZOIN. See BENZOINUM.

TERMINTHUS. Galen deſcribes them as being tumors in the ſkin, nearly reſembling the fruit of τερμινθος, *turpentine trees*, of a blackiſh colour, inclining to green. Wiſeman reckons the *epinyctis* to be a ſpecies of *terminthus*, and ſays that they are both of them painful tubercles, or angry puſtules, affecting the ſkin of the arms, hands, and thighs. Cullen places them as a variety of phlogoſis phlegmone, and Sauvages ranks them as a ſort of furunculus. Bleeding, purging, and a regular diet, is all that is required for their cure: it is alſo called *albotis*.

TERNA. See IMPETIGINES.

TERRA. See VENTER.

TERRA. EARTH; called alſo *almiſaruh*. IN CHEMISTRY, *earth* is one of the four ſimple ſubſtances called elements. *Earth* is not found ſo pure as the other elements, fire, air, and water; but it is moſt probable, that as there is only one kind of air, water, and fire, ſo there is but one kind of *earth*, however it may vary, from the different ſubſtances with which it was mixed. The eſſential properties by which earthy ſubſtances differ from the other elements, are their much greater weight, hardneſs, fixedneſs, and inſuſibility; and theſe are moſt eminently united in the vitrifiable kinds of *earth*.

Neumann divides the mineral *earths* into five kinds, viz. the cryſtalline, calcareous, argillaceous, talky, and gypſeous.

Animal earths Dr. Lewis includes under three kinds, viz. that from ſhells, from calcined bones and horns, and from the blood, fleſh, and ſkins of animals.

Vegetable earths are diſtinguiſhed into three kinds by Wallerius, viz. that obtained by burning ſoft, ſpongy, and farinaceous plants; by burning the harder and leſs ſucculent plants; and by burning wood.

The earths that are attended to with a medicinal view are chiefly the inſipid ones, which abſorb acids; whence they are called abſorbent *earths*. Some of the tenacious adheſive *earths* have been uſed, ſuch as the boles, ſealed *earths*, &c. but are now much neglected. See the Dict. of Chem. Lewis's Mat. Med. Neumann's Chem. Works.

TERRA CARIOSA. ROTTEN STONE. It is a ſpecies of non-effervеſcent chalk. For that called—— TRIPOLITANA, *tripolis*, ſee ALANA.

—— JAPONICA. JAPAN EARTH, *cachou*, *faufel*, *cætchu*, *caſchu*, *catechu*, *cadtchu*, *caſhow*, *caitchu*, *caſtjoe*, *cachu*, *cate*, *kaath*. The natives call it CUTT; the Engliſh who reſide there, CUTCH. It is called *Japan earth*, becauſe it was long ſuppoſed to be an earthy ſubſtance from *Japan*; but it is a gummy reſin, obtained by a decoction of ſome vegetable ſubſtance in water. The plant is called *coira*, or *caira*, by the natives of Bahar province in the Eaſt Indies. The natives of Pegu name the tree *kheir*, or *khadira*. It is a ſpecies of the mimoſa of Linnæus. In Dr. Fothergill's Works by Dr. Lettſom, vol. ii. it is called *mimoſa Japonica*: in the Pharmacopœia of the Edinburgh College, it is named from Linnæus, MIMOSA CATECHU, *ſpinis ſtipularibus, foliis bipinnatis, multijugis; glandulis partialium ſingulis, ſpicis axillaribus geminis. f. ternis pedunculatis*, CLASS. POLYGAMIA, ORD. MONOECIA. LINN. Gen. Plant. 1158. In Dr. Fothergill's account of the tree, we are told that the wood is extremely hard and heavy, the interior part varies from a pale brown to a dark red, approaching to black in different plants, but always covered with one or two inches thick of white wood. It is one of the moſt common trees to be met with on the uncultivated mountains of Rotas and Pallamow, diſtricts of Hindoſtan, in the province of Bahar, weſtward of Bengal, and frequent in many other neighbouring parts. From the interior coloured wood is produced the extract erroneouſly called *terra Japonica*. The extract is thus made: after the tree is cut down, all the exterior or white part is pared off and caſt away; the interior coloured wood is cut into chips, with which a narrow-mouthed unglazed earthen pot is filled; to this as much water is added as will riſe to the upper chips; when this is half evaporated by boiling, the decoction is poured into a flat earthen pot, and boiled to one third part: this is ſet in a cool place for one day, and afterwards evaporated by the heat of the ſun, ſtirring it ſeveral times in the day; when it is reduced to a conſiderable conſiſtence, it is ſpread upon a mat or cloth, which had previouſly been covered with the aſhes of cow-dung; this maſs is divided into ſquare pieces by a ſtring, and completely dried by turning them frequently in the ſun, until they are fit for ſale. In making the extract, the pale brown wood is preferred, as it produces the fine whitiſh extract: the darker the wood is, the blacker the extract, and of leſs value. The preparers of this extract are very careleſs in keeping it free from foreign matters; in conſequence of which it hath a conſiderable quantity of aſhes, &c. mixed with it. Mr. Kerr, who collected this account, ſays that he never could learn that the *terra Japonica* was produced from the *areca*, or *betel-nut*, nor indeed does he think it credible that it ſhould, as its price would be far exceeding that of the *terra Japonica*, if the preparation was from the areca. Where the *terra Japonica* is made, it is uſed in dying; for painting chintz and other cloth, joined with vitriolic ſalts, a black colour is produced; mixed with oil, they paint the beams and walls of their houſes, to preſerve them from the deſtructive white ants. The black phyſicians divide diſeaſes into the hot and cold, and thus they divide their medicines; to the hot diſeaſes they oppoſe the cooling medicines, among which the *terra Japonica* is reckoned powerful. For a more particular account of this production, ſee Dr. Lettſom's edition of Dr. Fothergill's Works, vol. ii. p. 191—199. Some ſpecimens of this drug are of a pale reddiſh brown colour, others are of a dark blackiſh brown, or black like bitumen; ſome are ponderous, others light, ſome compact, others porous, ſome more, others leſs aſtringent; and theſe differences happen according to the manner of obtaining them,

&c. This drug is brought from Coromandel, Cambaya, and other parts of the Eaſt Indies. The beſt is of a dark reddiſh brown colour, dry, heavy, gloſſy, and compact; if chewed, it diſcovers, at firſt, a bitteriſh ſtyptic taſte, which is followed by an agreeable ſweetneſs. When pure, it is almoſt totally diſſolved both by water and by ſpirit. An extract made of ſpirit is the moſt agreeable and moſt aſtringent preparation. Where an aſtringent is required, whether for external or internal purpoſes, the ſpirituous tincture, which is called TINCTURA CATECHU, *tincture of catechu*, may be uſed, and is thus made: Take of *Japan earth*, three ounces; cinnamon bruiſed, two ounces; proof ſpirit of wine, two pints: digeſt for three days, and ſtrain. Pharm. Lond. 1788. One, two, or three drams may be taken in red wine, or any other proper vehicle, or the ſpirituous extract is the beſt; for a milder corroborant, the watery tincture or extract may be choſen. In moſt purpoſes where an aſtringent is indicated, provided the moſt powerful be not required, catechu may be employed with advantage. But in *diarrhœas*, which require the uſe of aſtringents, it is conſidered as the moſt beneficial; in *uterine profluvia*, *laxity*, and *debility of the viſcera* in general, in *catarrhal affections*, and various other diſeaſes where aſtringents are neceſſary. A little of the watery extract held in the mouth, and ſuffered to diſſolve leiſurely, is a topical aſtringent for laxities and ulcerations of the gums, for aphthous ulcers of the mouth, and ſimilar affections; gradually ſwallowed, it is uſeful in diſorders of the throat. Though this extract is the baſis of ſeveral fixed formulæ in the Edinburgh Diſpenſatory, and others, ſimple infuſion in warm water, with a proper proportion of cinnamon or caſſia, is one of the beſt forms in which it can be exhibited; for the addition of the aromatic, and its being cleared from its impurities, greatly improves it. The *Japan earth*, as it is called, approaches to alum in its aſtringent virtue, as to the quickneſs and the univerſality of its action. See Neumann's Chem Works. Lewis's Mat. Med.

TERRA PONDEROSA MURIATA ſeu SALITA. See BARYTES.

TERRÆ OLEUM. See PETROLEUM and NAPHTHA.

TERROR. A FRIGHT. The general effects of *terror* are a great contraction of all the ſmall veſſels, and a repulſion of the blood into the large and internal ones; hence the ſuppreſſion of perſpiration, the general oppreſſion, trembling, and anguiſh, from the heart and lungs being overcharged with blood, &c. After great *frights*, perſons rarely recover their uſual vivacity; and epilepſies that are cauſed by *frights* are rarely, if ever, cured. When a perſon is affected with *terror*, or ſudden or great *frights*, the principal endeavours ſhould be to reſtore the circulation to its due order, to promote perſpiration, and to allay the agitation or commotion, in which the patient is obſerved to be. The cuſtom of giving cold water in theſe caſes is bad. Place the affrighted perſon in a quiet ſituation; a little warm liquor, as camomile tea or ſuch like, ſhould be given him to drink; the legs may be put into warm water, and there continue for ſome time; the legs ſhould be rubbed, and the camomile tea repeated every ſix or eight minutes; when the ſkin becomes warm, and there is a tendency to perſpiration, ſleep may be promoted by a gentle opiate.

TERTHRA. The middle and lateral parts of the neck. According to Keil, τερθρον ſignifies the parts about the throat.

TERTIANA FEBRIS. A TERTIAN FEVER. This *fever* is of the intermittent kind; every firſt and third day it is preſent, and the ſecond is free. Its acceſs is about noon. Hippocrates calls it τριτος. The management in this cure is the ſame, in general, as under the article INTERMITTENT FEVER. Dr. Cullen places this genus of diſeaſe in the CLASS PYREXIÆ, and ORDER FEBRES, which he defines, a fever, wherein ſimilar paroxyſms occur about every forty-eight hours; the acceſſions happening at mid-day. IT VARIES *on account of the duration of the paroxyſm*. The paroxyſm of a true tertian does not continue above twelve hours; of a ſpurious tertian, beyond that ſpace.—IT VARIES alſo *on account of the return of the fits*, (ſee below, TERTIANA DUPLEX, &c.); *and, likewiſe with regard to the ſymptoms*, when attended with comatous affection;—ſpaſms and convulſive motions;—with efflorescencies of the ſkin;—inflammation.—IT VARIES alſo as being complicated with other diſeaſes, or may be on account of its principle. See CULLENI Synopſis Noſ. Method.

In intermitting *fevers* Dr. Lind recommends opium as almoſt a ſpecific; he directs it to be given half an hour after the commencement of the hot fit. The draught which he generally preſcribed was as follows: ℞ aq. font. pur. ℥ i. ſs. aq. alex. ſp. ſyr. papav. albi, ää ʒ ii. tinct. opii gt. xv—xx. m. He obſerves, that the effects of opium given in the hot fit of an intermitting *fever*, are, 1ſt, It ſhortens and abates the fit, and this with more certainty than an ounce of the bark is found to remove the diſeaſe. 2dly, It generally gives a ſenſible relief to the head, takes off the burning heat of the *fever*, and occaſions a profuſe ſweat; this ſweat is attended with an agreeable ſoftneſs of the ſkin, inſtead of the diſagreeable burning ſenſation which affects patients ſweating in the hot fit; and is always much more copious than on thoſe who are not under the influence of opium. 3dly, It often produces a ſoft and refreſhing ſleep, to a patient tortured in the agonies of the *fever*, from which he awakes bathed in univerſal ſweat, and in a great meaſure free from all complaints. The Dr. further adds, that the effects of opium are more uniform and conſtant in intermitting *fevers* than in any other diſeaſe, and are then more quick and ſenſible than thoſe of any other medicine. An opiate, thus given ſoon after the commencement of the hot fit, by abating the violence, and leſſening the duration of the *fever*, preſerves the conſtitution ſo entirely uninjured, that where it is given in intermittent *fevers*, a dropſy, or a jaundice rarely follows.—In caſes where opium did not immediately abate the ſymptoms of the *fever*, it never augmented their violence: on the contrary, moſt patients reaped ſome benefit from an opiate given in the hot fit; and many of them bore a larger doſe of opium at that time than at any other. A delirium in the hot fit is not increaſed by opium; though opium will not remove it: hence it is not probable, that many of the ſymptoms attending thoſe *fevers* are ſpaſmodic, but more eſpecially the head-ach. If the patient be delirious in the fit, the adminiſtration of the opiate ought to be delayed until he recovers his ſenſes, when an opiate will be found greatly to relieve the weakneſs and faintneſs which commonly ſucceed the delirium. Opium ſeems alſo in this diſeaſe to be the beſt preparative for the bark, as it not only produces a complete intermiſſion, in which caſe alone that remedy can with ſafety be adminiſtered, but occaſions ſo ſalutary and profuſe an evacuation by ſweat, as generally to render a much leſs quantity of the bark requiſite. When the patient is coſtive, give the opiate in about two ounces of the tinct. aloes, and this particularly if the bark is to be given immediately after the fit: thus at the ſame time, the fit is ſhortened, and the inteſtines cleanſed, previous to the adminiſtration of the bark; the operation of the tinct. aloes not being prevented, though ſomewhat retarded by the opiate. The adminiſtration of an opiate, after an emetic given juſt before the fit, ſhould be poſtponed until the hot fit is begun.

TERTIANA DUPLEX, called alſo DUPLICANA. It is when a *tertian fever* returns every day; but the paroxyſms are unequal, every other fit being alike.

—— DUPLICATA. A *tertian fever* returning every other day; but there are two paroxyſms in one day.

—— TRIPLEX. A *tertian fever* returning every day: every other day there are two paroxyſms, and but one in the intermediate one. For the general mode of treatment, and cure of theſe fevers, ſee INTERMITTENS FEBRIS.

TESTA PROBATRIX. See CUPELLA.

TESTES. The TESTICLES, from *teſtis*, *a witneſs*; they witneſs that we are men; alſo called *didymi*; ſome name them *perin*. They are originally ſeated in the abdomen, juſt beneath the kidneys, then called *cryptorchis*; they gradually deſcend near the time of birth through the ſheath of the ſpermatic cord into the ſcrotum, each carrying along with it a peritoneal coat, which makes the tunica vaginalis, called alſo *erythroides*; *elithroides*; *elythroides*, becauſe it includes them as a ſheath. This diſcovery was made by Dr. Hunter, in the year 1755, aſſiſted by his brother, Mr. John Hunter; and was demonſtrated by the doctor in his lectures that year. Uſually arteries are ſent to glands from ſome adjacent veſſels; however this holds good in the fœtus ſtate, it varies from the general order after the birth of the child, for the ſpermatic veſſels ariſe from the aorta, the vena cava, and the emulgent veins.

Immediately within the tunica albuginea, is the body of the *teſtis*, which is of a yellowiſh white colour, com-

poſed of tubuli, betwixt which the blood-veſſels run. Theſe tubuli are the ſecretory organs of the ſemen: they run in ſhort waves, from the tunica albuginea to the axis of the *teſticles*, and there form larger tubes, then are continued through the tunica albuginea, and unite into one canal, which, by ſeveral windings, forms the epididymis; and thence continuing, form the vaſa deferentia. The *teſticles* have many lymphæducts which diſcharge themſelves into the inguinal glands. The ſpermatic arteries bring blood to the *teſticles*, for the ſeparation of ſpermatic matter, and the ſpermatic veins re-convey the blood to the vena cava. The ſemen, ſeparated in the *teſticle*, is further perfected in the epididymis, and then conveyed by the vaſa deferentia into the urethra.

The *teſticles* are ſometimes detained in the body, or in the groin. See PARORCHIDIUM, and CEREBELLUM.

TESTICULUS CANINUS. See ORCHIS.

TESTUDO. See TALPA.

TETANUS, from τεινω, *to ſtretch*. *Convulſio Indica, holotonicos, rigor nervoſus.* There are ſeveral ſpaſmodic or convulſive diſorders, or at leaſt ſeveral modes of a convulſive diſorder, which are called the *emproſthotonos*, or *epiſthotonos*, in it the body is rigidly bent forward; *pleuroſthotonos*, vel *tetanus lateralis*, in it the body is bent to one ſide; the *opiſthotonos*, in it the body is rigidly bent backward with the head pulled towards the ſhoulders; and the *tetanus*, in which the body is rigidly held in an upright poſture. Dr. Cullen thinks that SAUVAGES' Genus CATOCHUS is by no means natural, as that genus hath united ſpecies altogether diſſonant to nature; that this genus he has omitted, but retained the ſpecies collected under this head, which might depend upon ſpaſtic rigidity, and placed them under tetanus; and indeed very judiciouſly. The ſpecies are *catochus holotonicus*, and *cervinus*, *tonic tetany*, the firſt being an univerſal affection, the ſecond particularly affecting the neck; and the *diurnus*, conſidered as a ſymptomatic tetany. See CULLEN, *Noſologia Method.* Genus 48. SAUVAGES' *Noſologia Method.* p. 545, vol. i.

The doctor places the *tetanus* as a genus of diſeaſe in the CLASS NEUROSES, and ORDER SPASMI. He defines it a ſpaſtic rigidity of almoſt the whole body. Others add, but with ſenſibility remaining and ſometimes increaſed. This diſorder is moſt frequent in hot climes, but ſometimes happens in the milder. The locked-jaw is a kind of *tetanus*. Notwithſtanding Dr. Cullen's arrangement in his Noſology, he, ſince that work, conſiders the *tetanus emproſthotonos*, *opiſthotonos*, and *triſmus* or *locked-jaw*, not as different ſpecies, but variety of *tetani* only; either on account of the remote cauſes, whether it ariſes from an internal ſource, from cold, or a wound; or on account of the part of the body affected. Aretæus, Celſus, and Cœlius Aurelianus, ſay that cold is a principal cauſe, and accordingly direct rubbing the diſordered parts, warm bathing, &c but there are various other occaſional cauſes, ſuch as when diarrhœas or dyſenteries are imprudently checked, and when nervous and tendinous parts are wounded, &c. *The immediate cauſe is a morbid, or preternatural irritation on the nerves.* When it is cauſed by a puncture or other injury of the nerves, it is commonly more violent and more difficult of cure than when proceeding from cold: when it comes on ſuddenly, and advances quickly to a violent degree, it is always more dangerous than that which is ſlower in its proceſs. Accordingly, if the patient paſſes the fourth day, it may be hoped not to be fatal; and every day adds to the favourable proſpect of recovery: not that danger is totally abſent during ſeveral days after the fourth. When its force is conſiderably abated, it is apt to return with its former violence. *In order to the cure*, opium is principally to be depended on as an internal remedy; a grain of opium, or, if required, five grains, may be given every hour, until the ſymptoms abate, and then the doſe ſhould be gradually leſſened; if it cannot be ſwallowed, let large doſes be diſſolved and injected in clyſters until the patient can ſwallow: warm baths much aſſiſt the efficacy of opium; and if a wound or other ſuch like external injury is the cauſe, let the part be dreſſed with the Peruvian balſam. It is juſtly obſerved by Dr. Chalmers, that the quantity of opium can only be limited by the violence of the ſpaſms. Muſk and other antiſpaſmodics have their uſefulneſs in this diſorder: but, without a free uſe of opium, they avail but little. When the cauſe is ſome injury received by a nerve, Dr. Cullen adviſes, if poſſible, to cut off that part from all communication with the ſenſorium, either by cutting through the nerves in their courſe, or by deſtroying, to a certain length, their affected part or extremity.

In the Weſt Indies, mercury is uſed with advantage: they prefer it early in the diſeaſe, and apply it by unction; they endeavour to excite a ſpeedy ſalivation, and keep it up until the diſeaſe is overcome, in its violence at leaſt.

An internal uſe of the piſſelæum Barbadenſe hath been attended with happy effects. See the Lond. Med. Obſ. and Inq. vol. i. p. 51, &c. 87, &c. vol. ii. p. 130, &c. The Lond. Med. Tranſ. vol. ii. p. 39. Lond. Med. Obſ. and Inq. vol. iii. p. 326, &c. Cullen's Firſt Lines, vol. iii. edit. 4. Lond. Med. Journal, vol. vii. p. 424. Edinb. Med. Comment. vol. vi. p. 386. Memoirs of the Medical Society of London, vol. i. p. 65.

TETANUS LATERALIS. See TETANUS.

TETARTOPHIA. Some reckon this fever among the remittents. It is a continued quartan fever. It is rare, and very difficult to diſtinguiſh from the quartan intermittent.

TETRADYNAMIA, (from τεσσαρες, *quatuor*, and δυναμις, *potentia.*) The name of the fifteenth claſs of the Linnæan ſyſtem, comprehending thoſe plants which bear hermaphrodite flowers, with ſix ſtamens, four of them (more powerful) longer than the other two. This is a truly natural claſs, and the ſame with the cruciformes of Tournefort, — the ſiliculoſæ, and ſiliquoſæ of Ray; which laſt are the names of the orders into which the claſs is divided by Linnæus.

TETRAGONIA. See EUONYMUS.

TETRAGONUS. See PLATYSMA MYOIDES.

TETRANDRIA, (τεσσαρες, *quatuor*, and ανηρ, *maritus.*) The fourth claſs of Linnæus's ſyſtem, comprehending thoſe plants which have hermaphrodite flowers with four ſtamina of equal length.

TETRANGURIA. See CITRULLUS.

TETROROS. See ASTRAGALUS.

TEUCRIUM. SPEEDWELL, MOUNTAIN or TREE-GERMANDER. It is alſo a name for the *chamædrys fruteſcens*, *polium*, *ſcordium*, *ſalvia ſylveſtris*, *chamæpitys*, and *marum Syriacum*. It is native in Germany, Italy, and Sicily; but is not in uſe with us, though a powerful antiſpaſmodic and cephalic, becauſe it cannot eaſily be cultivated in this country, nor got perfect from abroad. See THEA.

Pliny attributes the diſcovery of the virtues of *teucrium* againſt obſtructions of the ſpleen, to Teucer, who was one of the Greek heroes in the ſiege of Troy. See Cullen's Mat. Med.

—— FRUTESCENS. See POLIUM.

THALAMI NERVORUM OPTICORUM. The BEDS of the OPTIC NERVES. See CEREBRUM.

THALICTRUM. See SOPHIA.

THAPSIA. DEADLY CARROT. THAPSIA ASCLEPIAS, LINN. The root of this plant operates violently both upward and downward; it is not uſed in the preſent practice; but when imprudently taken, its antidote is vinegar. See Miller's Bot. Off. It is a name alſo for the *ferula glauca*, &c. and for a ſpecies of *laſerpitium*.

THAPSUS. See VERBASCUM.

THEA. TEA, called by the Chineſe *chaa*. It is the leaf of an oriental ſhrub. It does not appear that there are more than one kind of *tea* plant. The variety of *teas* ſeems to be owing to the different ſeaſons in which the leaves are gathered, and the different modes of curing them. The *tea* ſhrub is cultivated in China and Japan, but principally in the provinces of China, and betwixt the latitudes of 24 and 28. The beſt is from Nankin in China, and Fiſien in Japan. THE GREEN TEA, called by the Chineſe BYNG, ſhould be choſen freſh, of a fine colour, not inclining to a yelloviſh, or a browniſh colour, which are marks of too great age; it ſhould be well rolled, conſiſt of entire leaves, be thoroughly dry, of a biteriſh ſubaſtringent taſte, but not ungrateful, and of a pleaſant ſmell; the freſher the *tea*, the greener is the infuſion that is made of it with water; its prevailing ſmell is that of violets, or new hay; but if it is ſtrong of theſe, it is ſo by art. BOHEA TEA, called by the Chineſe *bouï*, is of a blackiſh brown colour; it gives a brown tincture to water, and ſmells of roſes. Of all the ſubſtitutes for *tea*, the *male ſpeedwell* is the moſt celebrated. The green colour of *tea* reſides wholly in its reſinous part; ſo does its aſtringency.

An infuſion of *tea* in water is a grateful diluent in health, and a ſalutary drink in ſickneſs; it promotes the natural

natural excretions, excites an appetite, aſſiſts digeſtion, if drank a proper time after dinner, where it does not diſagree with the ſtomach, as in ſome peculiar conſtitutions, affecting the nerves of that organ, and the ſyſtem of them in general, ſo as to occaſion ſickneſs, tremors, and fainting. Dr. Cullen, ſpeaking of coffee and tea, ſays, "Their effects, in my opinion, are very much mixed, depending on the warm water;—the aſſiſting digeſtion—relieving the ſtomach from a load of aliment—from crudities—alleviating head-achs ariſing from them—promoting the ſecretion of urine, and, perhaps, perſpiration, may all fairly be attributed to the warm water. Theſe are the chief virtues to be attributed to tea and coffee.

"The weakening the tone of the ſtomach by frequent uſe—and the ſyſtem, in conſequence, inducing tremors and ſpaſmodic affections, are the effects of the tea itſelf, though, in ſome meaſure, of the warm water." And, certainly, great miſchiefs are done by drinking them too hot—a very common practice by very delicate conſtitutions; for, by theſe means, the ſtomach is brought into too great a ſtate of relaxation—indigeſtion occaſioned—crude chyle thrown too freely into the habit—obſtructions formed in various parts, and a general ſtate of debility, with a variety of painful conſequences, occaſioned through the whole ſyſtem; checks immoderate ſleepineſs, and relieves the head-ach when cauſed by a debauch. No other plant is known, whoſe infuſion more readily paſſes off by the emunctories, or more ſpeedily excites the ſpirits. When the ſtomach is weak, a moderately ſtrong infuſion of *tea* generally provokes a vomiting. Perhaps the principal inconvenience ariſing from the uſe of *tea*, is its preventing the neceſſary nouriſhment being received from more ſubſtantial food; it ſeems better calculated for a ſupper than for a breakfaſt. It is certainly ſedative, and narcotic, and that in its moſt odorous ſtate, and therefore leſs in the bohea, than green *tea*, and the moſt ſo in the moſt odorous, or what are called the finer kinds of the green. Cullen's Mat. Med. See Lewis's Mat. Med. Neumann's Chem. Works. Lettſom on *Tea*.

THEA GERMANICA. See VERONICA.

THEBAICUM GUMMI. See GUMMI ARABICUM.

THEBESII FORAMINA. See COR.

THECA, from τιθημι, *pono, to depoſit*, or *place*. *Theca* means any caſe or covering, whence botaniſts apply it to ſome parts of particular flowers; Hildanus applies it to a caſe for chirurgical inſtruments: hence, united with the word *ſpinalis*, it means the membranes or covering of the ſpinal marrow. See SPINA BIFIDA.

THELYGONON. See MERCURIALIS FRUTICOSA.

THEOBROMA CACAO. See CACAO.

THERAPEUTICA. See MEDICINA.

THERIACA, from θηρ, *a viper*, or *a wild beaſt*. The medicine called *theriaca*, and all with this name, are intended to cure the bites of venomous animals; they differ from *alexipharmics*, becauſe theſe latter are uſed as remedies againſt poiſon inwardly taken. Dr. CULLEN ſays, "*Theriaca* was a term uſed for medicines ſuited to reſiſt or obviate the effects of poiſons from the bites of venomous animals; a term introduced by the ancients upon a very falſe ſuppoſition, and continued by the moderns upon no better grounds, in the ſame ſenſe as *alexipharmaca*, and *alexiteria*. But, with the abſurd compoſitions which have ſo long diſgraced our pharmacopœias, and to which the term has been applied, the term itſelf ſhould be rejected."

THERIACA GERMANORUM. See JUNIPERUS.

—— LONDINENSIS. See CUMINUM.

—— RUSTICORUM. See ALLIUM.

THERIACALIS BEZOARDICA AQUA. See CHYLOSTAGMA DIAPHORET. MINDERERI.

THERIOMA, from θηρ, *a wild beaſt*. This is applied by HIPPOCRATES, to the moſt ill conditioned and malignant kind of ulcer, according to Celſus's deſcription, who ſays, it is of a livid or black colour, extremely fœtid, abounding with a mucous humor, which is accompanied with inflammation, fever, itching, and pain. Blood ſometimes iſſues from it: indeed it ſpreads, and deſtroys the contiguous parts ſo faſt, that ſome have named it *herpes exedens*. Some would confine the term to malignant ulcers of the lungs, as GALEN recites—and HEURNIUS calls *phthiſis, therioma*. Dr. CULLEN places it as a ſynonyme under *ulcus*.

THERMASMA. See FOTUS.

THERMÆ. See ACIDULÆ and AQUÆ SULPHUREÆ.

THETLATIAN. See GUAO.

THLASPI VERUM. PENNY-CRESS, or TREACLE-MUSTARD. The THLASPI ARVENSE, Linn. It is a plant with roundiſh-pointed leaves, and broad capſules, containing about four ſeeds in each cell. It is annual, grows in fields, and flowers in June.

—— VULGATIUS. MITHRIDATE-MUSTARD. It hath hoary ſharp-pointed leaves, ſhaped like an arrow's head, and only one ſeed in each ſhell of the pod. It is biennial, grows in open clayey ground, and flowers in May.

The ſeeds of theſe two plants have been uſed, but the common *muſtard* ſeed is, in all caſes, preferable.

THOLUS. See ACHICOLUM.

THORA. See ANTHORA.

—— PAROU. See CAJAN.

THORACICÆ ARTERIÆ. The THORACIC ARTERIES. The upper one riſes from the axillary artery, and runs down in the ſides of the thorax, giving out many branches in its paſſage. The inferior one ariſes alſo from the axillary artery, and runs along the inferior coſta of the ſcapula, &c. to ſeveral of the neighbouring muſcles.

THORACICUS DUCTUS. See LACTEA VASA.

THORAX, from θωραξ, *the breaſt* or *cheſt*, ſometimes called *anocœlia*; and in FALLOPIUS, de Aſſib. the barbarous word *cuſſa* is made uſe of for thorax. It is divided into three regions, viz. the anterior, or the *breaſt*; the poſterior, or the back; and the lateral, or the right and left ſides. The *thorax* is lined with the pleura; into the *thorax* deſcends the trachea arteria; behind the ſternum is the thymus gland; the heart is ſeated in the middle of the *thorax*, and on each ſide of it are the lungs. The pericardium immediately covers the heart.

The *thorax* is formed behind of the twelve dorſal vertebræ, on the ſides by the ribs, and before by the ſternum.

THROMBUS. See SUGILLATIO.

THURIS CORTEX, alſo called *elutheria, naſcaphthon, elaterium, caſcarilla, thymiama, ſtorax rubra offic. thus Judæorum, chaeril, chacarilla, elatheria, elaterii cortex, kina-kina aromatica, Peruvianus griſeus ſeu ſpurius*. It is ſuppoſed to be the bark of the elathera of Cateſby, which is plentiful in the Bahama iſlands, particularly on one called Elatheria, alſo of a tree called ILATHERA.

Dr. Brown, in his Hiſtory of Jamaica, ſays, that the tree is frequent in the inland woods there; all the parts of the tree, eſpecially the bark, ſmell ſtrong of muſk; and the powder of the bark is uſed there by the negroes as an emetic. He ſays it is called there by the name of Alligator-wood and muſk-wood. He gives, as its botanic characters, the following, viz.

Pericarpium. Capſula craſſa, ſubrotunda, corticoſa, dura, quadrilocularis, quadrifariam ab apice dehiſcens.

Semina. Nuclei ſolitarii oblongo-ovati.

To his definition, he adds one or two more, as follow:

ELUTHARIA. Arborea; foliis majoribus, ovatis, oppoſitis; petiolis brevibus, ſubtumidis, ganglinoſis.

Lauro affinis arbor foliis latioribus, &c. Sio. Cat. 137. & H. t. 170.

According to the Edinburgh College, it is the CROTON CASCARILLA *foliis lanceolatis acutis integerrimis petiolatis ſubtus tomentoſis, caule arboreo*. CLASS. MONOECIA; ORDO MONADELPHIA. LINN. Gen. Plant. 1083. WILLOW-LEAVED CROTON.

This bark is brought to us in curled pieces, or rolled up in ſhort quills about an inch in width, covered on the outſide with a rough whitiſh matter, and browniſh on the inner ſide, exhibiting, when broken, a ſmooth, cloſe, blackiſh brown ſurface.

This bark hath a light agreeable ſmell, and a moderately bitter taſte, accompanied with a conſiderable aromatic warmth: it is eaſily inflammable, and yields, while burning, a very fragrant ſmell, ſomewhat like muſk; it is bitter, but leſs rough and leſs diſagreeable than the Peruvian bark.

PROFESSOR STISSER found this to be a powerful *diuretic*, and *carminative*, and uſed it with ſucceſs in calculous, aſthmatic, phthiſical, ſcorbutic, and arthritic complaints. Indeed the virtues of the *thuris cortex* are very ſimilar to thoſe of the cort. Peruv. and where the latter is diſagreeable, the former may be ſubſtituted for it.

The

The German phyſicians have experienced its good effects in fevers of the intermittent, remittent, and putrid kind. Notwithſtanding which, the powers of this bark are very little regarded either in this country, or on the neighbouring continent. Still, as it does poſſeſs tonic and aromatic qualities, there is little doubt but it may cure intermittents, and alſo be uſeful in haemorrhages, and various alvine and other fluxes, where an aſtringent is neceſſary, particularly where debility may be conſidered as a cauſe of diſeaſe. It is conſidered by ſome as poſſeſſed of ſlight tonic and ſtomachic powers, but in no reſpect adequate to the bark. The beſt mode of adminiſtering it is in powder, in doſes of fifteen grains to one dram. The College of London have a TINCTURA CASCARILLÆ, *tincture of caſcarilla*, in their Pharmacopœia, made by digeſting for eight days, in a moderate heat, four ounces of caſcarilla in two pints of proof ſpirit of wine, and afterwards ſtraining. DOSE from one to three drams repeatedly, and alſo an EXTRACT, made in a manner ſimilar to that of EXTRACTUM CINCHONÆ. The *doſe*, the ſame as the powder. *In the gout*, and eſpecially *in gouty diſorders*, it may ſupply the place of the radix ſerpentaria, as a perſpirative. *In diſorders of the head*, the *thuris cortex* is bruiſed and mixed with tobacco for ſmoaking.

Water extracts the virtues of this bark, but ſpirits take them up more perfectly. Diſtilled with water it yields a greeniſh eſſential oil. See Lewis's Mat. Med. Hiſt. de l'Acad. Roy. des Sciences. Cullen's Mat. Med.

THURIS LIGNUM. See ASPALATHUS.

THUS. FRANKINCENSE. The Greeks call it *olibanum*, from the mountain Libanus in Syria, whence many ſuppoſe that it grows there; but true *frankincenſe* is not known to grow any where but in Arabia. The common *frankincenſe* of the ſhops is the reſin of the *pine-tree*. See PINUS.

THUS CORTICOSUM, and MASCULINUM. See OLIBANUM.

—— JUDÆORUM. See THURIS CORTEX.

—— MYRTIFOLIA BELGICA. See MYRTUS BRABANTICA.

THUYA, called *cedrus Americanus*, *paradiſaica arbor*, *vitæ arbor*, TREE of LIFE. It is a genus of the monœcia adelphia claſs. Linnæus enumerates four, and Miller two ſpecies, oriental and occidental, the latter of which grows naturally in Canada, and other northern countries, and is uſed for many medical purpoſes. It is good *in rheumatic pains*, applied when formed into an ointment to the part affected, and in a ſhort time gives certain relief.—*Againſt erratic pains, which are violent*, moving up and down the thighs, and ſometimes ſpreading all over the body, eight ounces of the leaves of polypody, and two of the cones of *thuya* reduced into a coarſe powder and made into a poultice with milk-warm water, are recommended to be ſpread on linen, and wrapped round the body, though a cloth is generally laid between that and the body, leſt it ſhould burn and ſcorch the ſkin.—At Saratoga, the decoction of *thuya* leaves is given *in intermittents*, and applied alſo *againſt a cough*. For that called —— MASSILIENSIUM, ſee CEDRUS PHŒNICIA.

THUYÆ GENUS QUARTUM. See CEDRUS, cum FOLIO CYPERI.

THYMALEA MONSPELIACA. SPURGE FLAX. DAPHNE CNIDIUM, Linn. This ſhrub is cloathed with green leaves, which reſemble thoſe of *flax*; it bears white flowers in cluſters on the tops of the branches; the flowers are followed with red berries, called CNIDIA COCCUS, in each of which is one ſeed. This ſeed is ſuppoſed to be the real *cnidia grana*, though the mezereon is taken for it: *coccus* is the whole berry with its ſeed, and *grana* is the ſeed of the berry. Theſe berries are very cauſtic. The ſhrub is a native of the ſouth of Europe. It is alſo called *cneoron* and *cneſtrum*.

THYMBRA. See SATUREIA SATIVA; for that called —— HISPANICA, ſee MARUM.

THYMELÆA LAURI FOLIO. See LAUREOLA MAS, & FÆMINA.

Botaniſts enumerate ſix ſpecies of *thymelæa*: their berries are very cauſtic; they ripen in autumn, but are not in much repute. See ALYPUM.

THYMIAMA. See THURIS CORTEX.

THYMICÆ ARTERIÆ. The ARTERY of the THYMUS. The *arteria thymica*, and *arteria* trachealis on each ſide, are in ſome ſubjects only branches of one ſmall trunk, which ſpring from the common trunk of the right ſubclavian and carotid; they are generally ſmall, ſometimes running ſeparate, and ſometimes partly ſeparate, and partly joined.

THYMICA VENA. The right, when it riſes ſeparately, goes out from the bifurcation, and when it is wanting, the *thymus* gland is furniſhed by the gutturalis, or ſome other neighbouring vein. The left from the ſubclavian.

THYMOXALME. A preparation given by Dioſcorides, of thyme, vinegar, ſalt, and ſome other ingredients.

THYMUS, called alſo *glandium*. The name of a ſmall, indolent, carnous tubercle like a wart, ariſing about the anus, or the pudenda; it reſembles the flowers of thyme, whence its name. They are eaſily extirpated. See CONDYLOMA; and ACROTHYMION. Wiſeman's and Heiſter's Surgery.

It is alſo the name of a gland which Haller ſays is a lymphatic one, of the conglobate kind, but divided into lobes. It lies behind the ſternum, partly within, and partly without the cavity of the thorax. It is peculiar to the fœtus, and is ſhrivelled in adults. This in calves, &c. is called SWEET-BREAD.

IN BOTANY it is named THYME, and a low ſhrubby plant, conſiſting of numerous, ſlender, tough ſtalks, with little roundiſh leaves in pairs, and looſe ſpikes on the tops with purpliſh or whitiſh flowers on the tops; likewiſe a name for *ſaturcia*. For that called —— CITRATUS SERPYLLUS, ſee SERPYLLUM, —— MASTICHINA, ſee MARUM.

THYMUS VULGARIS. COMMON THYME. THYMUS VULGARIS ERECTUS, *foliis revolutis ovatis, floribus verticillato-ſpicatis*. CLASS. DIDYNAMIA, ORDO GYMNOSPERMIA. LINN. Gen. Plant. 727. COMMON BROAD LEAVED, or GARDEN THYME. It hath upright ſtalks, and dark browniſh green, ſomewhat pointed leaves; it is native in the ſouth of Europe, but common in our gardens, it flowers in June and July; is moderately warm, pungent, and aromatic; to water it imparts by infuſion its agreeable ſmell, but only a weak taſte; in diſtillation it gives over an eſſential oil, which poſſeſſes the ſmell of the *thyme*, but leſs grateful; to the taſte it is hot and fiery. Spirit of wine takes up the whole of its active matter by infuſion. The virtues of *thyme* are ſaid to be reſolvent, emmenagogue, diuretic, tonic, and ſtomachic. It is ſaid to afford an agreeable diſtilled water, more durable, but leſs active and penetrating than that of peppermint. An infuſion of it has been ſaid alſo to do wonders in tumors, lowneſs of ſpirits, and headachs, and it has been much recommended for the cure of the night-mare. A conſerve of the leaves, or of the leaves with the flowers, is a good preparation. Indeed, from its aromatic qualities it may be found equally uſeful in ſome of thoſe complaints for which *lavender*, *ſage*, *roſemary*, &c. are uſually employed. See Lewis's Mat. Med. Neumann's Chem. Works.

THYONIANA. See CRINATUM.

THYROIDÆA CARTILAGO. See ASPERA ARTERIA.

THYRO-ADENOIDÆUS. See CRICO PHARYNGÆI.

THYRO-ARYTÆNOIDÆI. Theſe muſcles ariſe from the inſide of the fore-part of the thyroid cartilage, and are inſerted into the *arytænoid*, ſerving to compreſs the glottis. Sanctorini calls theſe muſcles *thyro epiglottici*, becauſe they are partly inſerted into the membrane of the epiglottis.

—— CRICO-PHARYNGÆI. See CRYCO-PHARYNGÆI.

—— EPIGLOTTICI. They are only ſome muſcles of the THYRO-ARYTÆNOIDÆI.

—— HYOIDES. See HYOTHYROIDES.

—— PHARYNGÆI. Theſe muſcles are broad, they riſe from along the outſide of the ala of the cartilago thyroides, between the edge of that cartilage and the oblique line in which the *thyro*-hyoidæi are fixed, and they are a little confounded with the crico-hyoidæi; from thence they run up obliquely backward, and meeting under the linea alba of the pharynx, they ſometimes appear to be but one muſcle, without any middle tendon. See Winſlow's Anatomy; CRICO-PHARYNGÆI, and PHARYNX.

—— PHARYNGO-STAPHYLINI, —— STAPHYLINI. } Theſe are two ſmall muſcles which accompany the *pharyngo-ſtaphylini* very cloſely through their whole courſe, except that their poſterior extremities are fixed in the thyroid cartilages, near the other muſcles. They are inſerted into the ſeptum palati. Theſe two pair may be reckoned one pair, and called *thyro-pharyngo-ſtaphylini*. See PHARYNX.

THYROIDEA vel BRONCHIALIS GLANDULA. The THYROID GLAND. It furrounds the aſpera arteria laterally and before; its uſe is not known; it is larger in women than in men; whence the fore-part of their neck is not ſo hollow as that of men. It is the ſeat of the bronchocele.

THYROIDES, from θυρεὸς, *a ſhield*, and εἶδος, *likeneſs* or *ſhape*. See ASPERA ARTERIA.

THYRSUS. A THYRSE (θύρσος, from θύω, impetu feror, erumpo, to burſt forth. Put for branches or the flame of a lamp, or torch, which have a conical form; hence the ſpear with ivy bound about the head carried in ſacrifices to Bacchus, was called THYRSUS). Linnæus makes it a ſpecies of inflorescence, which may either be *nudus* or *foliatus*, and defines it to be a pannicle contracted into an ovate form, as in the *ſyringa*, and *petaſites*. It differs from a ſpike in having the flowers or fruits ſet more looſely on it, ſo that there are ſpaces viſible between them. Alſo a STALK. See CAUDEX.

THYSSELINUM PLINII. See ŒLSNITIUM.

TIARA. See CYRBASIA.

TIBERIANUM TORMENTUM. See COLICA.

TIBIA. TIBIA, or HAUTBOY, which this bone reſembles, and hence is called by this name. The larger bone in the leg; it is called *ſcile majus*, *arundo major*, *foſſilus*, and from its reſemblance to an old muſical inſtrument, *canna major*, *canna domeſtica cruris*. It is ſituated in the anterior internal part of the leg; its upper extremity is large, and it is divided into two cavities for the reception of the condyles of the os femoris; between theſe cavities is a rough irregular protuberance for the attachment of the ligaments; on the poſterior part is a ſmall cavity for the reception of the fibula, and below the fore part is a large rough tuberoſity, where the ligament of the patella is fixed; the lower extremity is hollow, but ſo as a ſmall tuberoſity riſes in the middle; the internal ſide of this cavity is produced into a proceſs called malleolus internus; the internal ſide of this extremity hath a cavity for the reception of the fibula; the anterior angle of the *tibia* is ſharp, and is called *crea*, the ſpine of the tibia, or ſkin, the forepart of the *tibia cærea*.

It may be proper here to obſerve a proceſs for relief when bones are carious, which may frequently prevent an amputation. If the *tibia* is carious to a conſiderable depth (ſee CARIES), remove the carious part as follows: firſt cut through the ſkin, the whole length of the part we mean to remove, on each ſide, ſaving as much of it as you can; then cut it acroſs the bone above and below. Having done this, diſſect off the muſcular fleſh, as clear as can be admitted from the bone, ſtill preſerving as much as poſſible; then introduce a thin plate of paſteboard, horn, or tin, over the upper part of the bone to be removed, ſo as to ſupport the ſkin. After this clear away the periofteum from the parts on which you apply the ſaw. The ſaw ſhould be ſtrong, and of a circular form, to prevent wounding the adjacent parts. Having divided the bone above, do the ſame on the lower part, taking care to include all that is diſeaſed. The carious part of the bone being removed, the wound will not appear ſo large as may be imagined. To give encouragement to this operation, it ſhould be remembered, that there have been inſtances of oſſeous matter ſhooting and forming a complete bone, when nine inches or more hath been removed.

TIBIALIS. The nerve thus called is the internal branch of the ſciatic nerve, and is ſent off near the ham; it paſſes behind the popliteus muſcle, and behind the gaſtrocnemii, goes through the upper part of the ſoleus, then runs between it and the flexores of the toes, and to the malleolus internus, behind which it runs, and paſſing betwixt the os calcis and the abductor of the great toe, where it divides into the plantaris internus and externus, the firſt of which furniſhes the toe with filaments, and the latter goes particularly to the little toe, and to that next to it.

TIBIALIS ANTICUS. This muſcle riſes from the head of the tibia, and from the outſide of the ſpine of the tibia; it grows tendinous, and winding about the inſide of the foot, is inſerted into the os cuneiforme internum, and ſerves likewiſe to turn the ſole inwards.

—— ARTERIA. As the poplitea ends, it divides into two principal branches, the firſt of which runs between the heads of the tibia and fibula, paſſing from behind forwards on the interoſſeous ligament, where it is called *tibialis* anterior; the ſecond branch divides into two more, the largeſt of which is the innermoſt, and is called *tibialis* poſterior, alſo *ſuralis arteria*. The anterior lies between the *tibialis anticus* muſcles and the extenſors of the toes; it comes forwards between the head of the tibia and fibula; it paſſes on the foreſide of the interoſſeus ligament, then runs down on the ſide of the tibia for about two-thirds of its length, paſſes down before, under the annular ligament, ſtrait on the inſtep, to the ſpace between the firſt and ſecond metacarpal bones, and plunges down into the ſole of the foot, where it anaſtamoſes with the poſterior tibial artery. The poſterior runs between the ſoleus, the *tibialis* poſticus, the flexor digitorum communis, and flexor pollicis, and paſſes between the bone and interoſſeous ligament; in its paſſage it gives branches to the tibia, and to its marrow, through a canal in its poſterior and upper part; it runs behind the inner ankle, communicates with the *tibialis* anterior, and, furrounded by the neighbouring veins, paſſes to the ſole of the foot, between the os calcis and the thenar muſcle, where it is divided into the plantaris interna, which makes a circle like that in the palm of the hand: from this circle branches are ſent to the toes.

The following important circumſtance is recited by Mr. Pott, reſpecting this artery. In the upper part of the calf of the leg, under the gaſtrocnemius and ſoleus muſcles, a ſmall hard tumor is at firſt perceived; it is ſometimes painful, at others not much ſo, but always impeding the patient's exerciſes; it does not alter the natural colour of the ſkin until it hath conſiderably increaſed in the bulk; it enlarges very gradually; it does not ſoften as it increaſes, but continues through the greateſt part of it incompreſſibly hard; and when it hath got to a large ſize, it ſeems to contain a fluid which may be felt towards the bottom, or reſting as it were on the back part of the bones. If an opening is made for the diſcharge of the fluid, it muſt be made very deep, and through a very diſtempered maſs; this fluid is generally ſmall in quantity, and conſiſts of a ſanies mixed with grumous blood: the diſcharge of it produces very little diminution of the tumor; and in the few caſes that have occurred to him, he ſays that very high ſymptoms of irritation and inflammation came on, and advanced with great rapidity and exquiſite pain, ſoon deſtroyed the patient either by the fever which ran high, and was unremitting, or by a mortification of the whole leg. If amputation hath not been performed, and the patient dies after the tumor hath been opened, the mortified ſtate of the parts prevents all ſatisfactory examination; but if the limb was removed without any previous operation, the arteria *tibialis* poſtica will be found to be enlarged, diſtempered, and burſt; the muſcles of the leg to have been converted into a ſtrangely morbid maſs, and the poſterior part of both the tibia and the fibula more or leſs carious. This diſeaſe derives its origin from a ruptured artery, or is always accompanied with it, and is remedied by amputation only. See Mr. Pott's Remarks on the Neceſſity, &c. of Amputation in certain Caſes, &c.

TIBIALIS GRACILIS MUSCULUS. See PLANTARIS.

—— POSTICUS, called alſo *nauticus*, from the uſe which ſailors make of it in climbing. This muſcle riſes from the tibia and fibula cloſe to the ſoleus, and from the interoſſeous ligament, runs through the annular ligament; it plays in a groove of the bone, where it is tied down by the annular ligament, then runs acroſs the foot, and is inſerted into the middle of the os ſcaphoides.

—— VENA. There is one anterior and poſterior; they are diviſions of the poplitea. They accompany their reſpective arteries in their courſe.

TIGILLUM. See CRUCIBULUM.

TIGLIA GRANA. See CATAPUTIA MINOR.

TILBURY WATER. This is found at Weſt *Tilbury* in Eſſex. It has at the well a ſtraw-coloured hue, and covered with a variegated earthy ſcum; but keeps long clear in bottles; it contains a quantity of air; is ſoft and ſmooth to the taſte; though after long agitation in the mouth, it impreſſes a ſmall degree of roughneſs on the tongue. Though authors have differed in their account of the proportion of ſolid matters this water contains, they agree that they conſiſt of earth and alkali, the greateſt quantity of the latter; but Dr. Rutty thinks alſo that they have in them a pittance of oily matter. They operate moſtly by urine, though they purge ſometimes on the firſt drinking. A quart is reckoned a middle doſe, and may be taken in a day, againſt *crudities and acidities in the primæ viæ, alvine fluxes, and other diſorders, from debility of the fibres*. They have been recommended alſo

in

in the *gravel*, *fluor albus*, *immoderate fluxes of the menſes*, and *ſeveral others*. André alledges, that they are as true a ſpecific for diarrhœas, and all kind of fluxes, as the bark for intermitting fevers. See Monro's Medical and Pharmaceutical Chemiſtry, vol. ii. and alſo *aquæ alkalinæ*, under AQUÆ MINERALES.

TILIA. The LIME-TREE, alſo called the LINE or the LINDEN-TREE. It is the TIBIA EUROPEA, Linn. a tall tree and its branches ſpread far; the leaves are heart-ſhaped, ſerrated, ſoft, and hairy; the flowers are whitiſh, followed by a kind of dry berry about the ſize of filberts. This tree is native in England; it flowers in July.

The flowers have an *anodyne* and *antiſpaſmodic virtue*; when freſh they have a moderately ſtrong ſmell, and in this their virtue conſiſts, but it is ſoon loſt in keeping: they have been much eſteemed, but are now neglected in practice. See Raii Hiſt.

TINCÆ OS. See Os INTERNUM.

TINCAL, } BORAX. It comes to Europe from the
TINCAR. } Eaſt Indies in a very impure ſtate, in the form of large, flat, hexangular, or irregular cryſtals, of a dull white or greeniſh colour, greaſy to the touch; or in ſmall cryſtals, as it were cemented together by a rancid, yellowiſh, or oily ſubſtance, intermixed with marl, gravel, and other impurities. In this ſtate it is called brute *borax*, *chryſocolla*, *auricolla*, *amphitone*, *cæruleum*, *montanum*.

It is purified by ſolution, filtration, and cryſtallization; and the cryſtals thus obtained are calcined to free them ſtill further from greaſineſs, and then diſſolved, filtered, and cryſtallized a ſecond time; ſometimes more mineral alkali is added, as it is ſaid that *tincal* contains an exceſs of ſedative ſalt.

One hundred parts of purified *borax* contain thirty-four of real ſedative acid, ſeventeen of mineral alkali, and forty-ſeven of water; but of the mineral alkali only about five parts are really ſaturated, the reſt is unſaturated; and hence in many caſes *borax* acts as an alkali.

It hath been long thought that *borax* was a factitious ſubſtance, but it is now beyond all doubt that it is a natural production, ſince Mr. Grill Abrahamſon ſent ſome to Sweden in the year 1772, in a cryſtalline form; as dug out of the earth in the kingdom of Thibet, where it is called *pounxa*, *my poun*, and *houi poun*. As *borax* is purified alſo in the Eaſt Indies, Mr. Engeſtrom ſuſpects that the *tincal* is only the reſiduum of the mother liquor of *borax* evaporated to dryneſs, and that the greaſineſs ariſes from its being mixed with butter-milk to prevent its efflorescence.

It is ſaid that *borax* hath been found in Saxony in ſome coal pits. See BORAX, and SEDATIVUS SAL. Kirwan's Elements of Mineralogy.

TINCTORIUS FLOS. See GENISTA TINCTORIA.

TINCTURA. A TINCTURE. *Tinctures* differ from diſtilled waters, becauſe waters take out only the lighter parts that will aſcend in vapour; but *tinctures* take up all ſuch parts as are capable of being ſuſpended in a menſtruum. *Tinctures* differ from elixirs; *tinctures* are watery, ſpirituous, or other liquors impregnated with the active parts of ſome one ſimple;—*elixirs* contain the active parts of more than one ingredient, ſo are compound *tinctures*. Watery extracts from vegetables are indeed called *infuſions* or *decoctions*, according as they are prepared by macerating, or by boiling the plant in water; the ſpirituous are named *tinctures*, *eſſences*, and *elixirs*, according as the ingredients are numerous, or the menſtruum ſaturated with the virtues thereof; when the *tincture* is of a thickiſh conſiſtence it is called a *balſam*.

Though a number of the *tinctures* take this name from the materials which form their baſes, and are to be found under their ſpecific appellations, yet ſome there are which cannot be ſo diſcovered, viz. *tinct. Amara*, ſee GENTIANA; —— THEBAICA, ſee OPIUM, &c.

FINEA, ABAS. This ulcer eats like the *tinea* or moth. Dr. Cullen places the *tinea* as a genus in his CLASS LOCALES, and ORDER DIALYSES, and defines it, in the ſkin of the ſcalp at the roots of the hair, little ulcers oozing out an humor which forms a white friable ſcab. Bell, in his Treatiſe on Ulcers, ranks it as a variety amongſt cutaneous ulcers. For the mode of treatment, ſee ACHOR.

TINNITUS AURIUM, from *tinnio*, *to ring*. Hippocrates calls it *echos*. A NOISE in the EAR, like that of a bell; all other kinds of *noiſes* in this organ have the ſame appellation. Hoffman attributes this diſorder to ſpaſmodic affections in the inner membranes of the *ears*. It is the ſpecies of depraved hearing, which Dr. Cullen calls *paracuſis imaginaria*. And Heiſter propoſes for the cure to give diaphoretics inwardly, and outwardly to fumigate the meatus auditorius externus with the vapours of hot wine, in which are roſemary-leaves and thoſe of lavender, and to put the feet into warm water. Etmuller obſerves, that when this is the effect of chronical diſorders it is difficult to cure. See Du Verney on the Ear, and its Diſorders.

TIPIOCA. See AMBAIBA.

TISSUE CELLULAIRE, & MUQUEUX. See CELLULOSA MEMBRANA.

TITHYMALO CYPARISSÆ SIMILIS. See ESULA MINOR.

TITHYMALUS. SPURGE. *Euphorbia paluſtris*, Linn. A plant with ſmall ſmooth leaves, round ſtalks that are full of a milky juice, which is called *hippomanes*, *pityuſa*, *peplion*; the flowers are in umbel-like cluſters; each flower is followed by a capſula, in which are three ſeeds. Botaniſts enumerate fifty ſpecies.

TITHYMALUS HELIOSCOPIOS, alſo called *ſolſequium*, *eſſula ſoliſequa*, SUN SPURGE, WART-WORT, and COMMON WATER-SPURGE.

—— MARITIMUS, vel SPINOSUS, alſo called *eſula marina*, *hippophaës*. SEA SPURGE.

The juice of theſe, and of moſt of the other ſpecies, are very acrid, and therefore not uſed, except externally, for deſtroying warts, &c. See Raii Hiſt. Lewis's Mat. Med. For that called —— *Aizoides*, ſee EUPHORBIUM; —— *Magnus*, &c. —— *Paluſtris*, &c. ſee ESULA MAJOR; —— *Foliis Pini*, ſee ESULA MINOR; —— *Latifolius*, ſee CATAPUTIA MINOR; —— *Orientalis*, ſee ESULA INDICA.

TITILLARES VENÆ. See ILIACÆ VENÆ.

TITILLICUM. The ARM-PIT. See AXILLA.

TODDA PANNA. See PALMA JAPONICA.

TOLACAPOLIN. A ſort of cherry. See CAPOLIN MEXICANI HERNANDEZ.

TOLÆ. TOLES, and TOLLES. See TONSILÆ. M. A. Severinus applies this word to glandular abſceſſes in the limbs.

TOLUIFERA. See TOLUTANUM.

TOLUTANUM BALSAMUM. The BALSAM TOLU. It is a reſinous juice, flowing from inciſions made in the bark of a tree, of which we have various accounts. Neumann ſays it is a kind of a fir-tree, which is called *tolu*, and that grows in the province of *Tolu*. It is the TOLUIFERA BALSAMUM, or the TOLUIFERA CARTHAGINENSIS, *foliis ceratiæ ſimilibus*, *flore luteo*. CL. DECANDRIA. ORD. MONOGYNIA. LINN. Gen. Pl. 524. The balſam is brought to us in gourd-ſhells, or ſmall callibaſhes; it is of a yellowiſh brown colour, inclining to red; its conſiſtence is uſually thick and tenacious; by age it grows hard and brittle, without loſing any of its odoriferous parts. Its ſmell ſomewhat reſembles that of lemons, particularly if rubbed on the hand; it hath an agreeable warm, ſweetiſh, glutinous taſte: it is ſlightly pungent, and without any mixture of a nauſeous reliſh. Its virtues are in general the ſame with thoſe of the balſ. Copaiba, and balſam of Peru, differing only in being milder and more grateful to the palate and in the ſtomach.

This balſam totally diſſolves in rectified ſpirit of wine. In diſtillation with water it impregnates the liquor with its fragrance, and if the quantity committed to diſtillation be large, a ſmall proportion of very fragrant eſſential oil is obtained. If diſtilled in a retort without addition, it ſometimes yields a ſaline concrete like the flowers of benjamin. With reſpect to the medical qualities of this balſam, they are ſimilar in general to thoſe of the *amyris gileadenſis*, and *balſamum Peruvianum*, though leſs heating and ſtimulating, and therefore in many caſes may be employed with more ſafety. It has been chiefly recommended as a pectoral, and is ſaid to be, in gleets and ſeminal weakneſſes, not an inefficacious corroborant. Doſe from five to twenty grains or more, in the ſame manner, and for the ſame purpoſes as the balſam of Peru.

The London College order a ſyrup and tincture of this balſam.

SYRUPUS TOLUTANUS. SYRUP *of* TOLU.

Take eight ounces of *balſam* of *Tolu*, three pints of diſtilled water; boil them for two hours; when cold, to the ſtrained liquor add ſugar to form it into a ſyrup.

TINCTURA

TINCTURA BALSAMI TOLUTANI. TINCTURE *of* BALSAM *of* TOLU.

Take of *Balſam* of *Tolu* ℥ i. ſs. rectified ſpirit of wine, one pint: digeſt till the *balſam* is diſſolved and ſtrain. Ph. Lond. 1788. DOSE one or two tea-ſpoonfuls, adminiſtered in the ſame complaints as the balſam of Peru. It poſſeſſes all the virtues of the balſam, and mixed with ſimple ſyrup, it forms a ſyrup far preferable in virtue and effect to that above preſcribed.

TOM. See HYBOUCOUHU AMERICANUS.

TOMENTUM. NAP. COTTON. SHORT WOOL, or FLOCKS. (Some derive it from τεμνω, *fæco*; others from *tumeo, to ſwell up*, being uſed to ſtuff pillows, bolſters, &c. ſome from τομος, *fruſtum, a fragment*, becauſe it is ſeperated by cutting.) It is properly the ſhort wool that is not carded and ſpun; and was applied to the nap on the leaves of ſome plants which were uſed for the ſame purpoſe. Hence TOMENTOSUS is uſed to expreſs the ſtem and leaf, when they are covered with hairs, ſo interwoven, as ſcarcely to be diſcernible; and is a ſpecies of pubeſcence, generally white, as on ſea plants, and ſuch as grow in expoſed ſituations; calculated to defend their ſurface, in ſome degree, from the violence of the wind.

TONICUS. TONIC. Every veſſel, membrane, and muſcle, with every fibre in ſenſible parts, have a natural tendency to ſhorten themſelves, and this is their *tonic* power. Hence, by the word TONE, *applied to the ſyſtem*, we mean the ſtrength and activity of the moving powers of the conſtitution; and, to *medicines*, all ſuch are conſidered as tonics which encreaſe the action and firmneſs of the ſolid parts of the machine; and are, therefore, ſomething more than aſtringents, though uſed by ſome authors ſynonymouſly in that ſenſe.

TONICI. Diſeaſes from tonic ſpaſm. See SPASMUS TONICUS.

TONSILLÆ. The TONSILS, called alſo *amygdalæ*, or ALMONDS; *amygdalia*; *antiades*; *pariſthmia*; ſo alſo are diſorders of them named TOLÆ, TOLES, and TOLLES. Theſe glands are ſeated on each ſide, at the lower part of the ſpace which is left between the lateral half arches of the palatum molle; they are of a reddiſh colour, and externally have many holes, which communicate with an irregular cavity in their inſide, and which contains a viſcid fluid, which is gradually diſcharged from the holes into the throat.

TOPHUS. A TOPH. See GUMMA. Alſo the concretions in the joints of gouty people, called *epiperoma*.

TOPICA, from τοπος, *a place*. TOPICS, or local applications.

TOPINARIA. See TALPA.

TORCULAR. The TOURNIQUET. It is a kind of bandage uſed to check hæmorrhages after wounds or amputations. The moſt ſimple of theſe is a fillet, long enough to encircle the wounded limb, with a ſmall ſtick to twiſt it round with, and a ſmall bolſter to preſs upon the principal veſſel. The fillet muſt be tied looſely above the orifice of the veſſel; under this fillet, and over the artery, the bolſter muſt be placed, and then the fillet muſt be twiſted by means of a ſtick, until it is ſufficiently tight. If a *tourniquet* is applied on the arm, place it near the armpit, for there the artery is moſt ſuperficial. The firſt account of this inſtrument is in a treatiſe written by Mr. Lowdham, an Engliſh ſurgeon, and publiſhed in 1679; that improved by Mr. Crane, of Bartholomew's-hoſpital, is the moſt complete. Bell's Surgery, vol. i. p. 26, &c.

TORCULAR HEROPHILI. See CEREBRUM.

TORDILIUM. It is a plant, of which Boerhaave mentions ſeven ſorts; the roots of ſome of them poſſeſs the ſame qualities as thoſe of ſkirret, but they are not much noted in medicine. See SISARUM.

TORMENTILLA, alſo called *heptaphyllum, conſolida rubra*, SEPTFOIL, TORMENTIL. TORMENTILLA ERECTA, *caule erectiuſculo, foliis ſeſſilibus*. CLASS. ICOSANDRIA, ORD. POLYGYNIA. LINN. Gen. Plant. 635. UPRIGHT SEPTFOIL, or *tormentil*. It is a plant with ſlender upright ſtalks, oblong indented leaves, which uſually ſtand ſeven at a joint. The flowers are ſmall, and of a yellow colour; the root is crooked and knotty, of a dark brown and blackiſh colour on the outſide, and reddiſh within. It is perennial, grows wild in woods and on commons, and flowers in June.

The root is a ſtrong and almoſt flavourleſs aſtringent; what flavour it hath is highly aromatic. It gives out its aſtringency both to water and to ſpirit, but moſt perfectly to rectified ſpirit of wine. It may be adminiſtered in powder from 3 ſs. to 3 j. for a doſe, though it is uſually given in a decoction, an ounce and a half of the root being boiled in three pints of water to a quart; at the end of the boiling about a dram of cinnamon is added. Three or four table ſpoonfuls of this decoction is a doſe. Both by itſelf and joined with gentian, it hath cured intermittent fevers, but it muſt be given in ſubſtance, and in large quantities. It is one of the ſtrongeſt of the order ſenticoſæ amongſt the vegetable aſtringents. Where fluxes are attended with any conſiderable degree of fever, in conſtitutions very irritable, and eaſily heated, as it contains a very inconſiderable degree of reſin, it ſeems more particularly adapted to thoſe caſes and habits than any other medicines of the ſame claſs which is heating and ſtimulant.—Dr. RUTTY ſpeaks very highly of it in the following terms: *Boiled in wine*, or *water*, and waſhing or cleanſing chronic and putrid ulcers with the decoction, it cures them. *Boiled in wine*, it is very detergent and corroborant in ſcorbutic ulcers of the mouth, throat, and ſauces, and alſo in relaxed and bleeding gums. In caſe of loſt appetite, its decoction is efficacious, reſtoring the tone of the ſtomach, and clearing away the ſordes. Some people in epidemic dyſentery hold it in their mouth to prevent the infection taking place,—in a flux of blood,—fluor albus,—and involuntary micturition it is of ſervice. —The powder of the tormentil root is an ingredient in the *pulvis cum creta compoſitus*. See BOLUS. This root and that of baſtort are ſo ſimilar, that they are uſed for one another. See Lewis's Mat. Med. Cullen's Mat. Med. Rutty's Mat. Med.

TORMENTUM. See ILIACA PASSIO.

TORMINA. GRIPES. A DYSENTERY. See DYSENTERIA.

TORNADO. From the Spaniſh; a HURRICANE, a WHIRLWIND. Dr. Schotte gives the following account of the *tornados*, which happen at Senegal. The rainy ſeaſon there begins about the middle of July, and ends about the middle of October: during this time, the wind is generally between the points of eaſt and ſouth, the quarter from which the *tornados* come. A *tornado* is preceded by a diſagreeable cloſeneſs and weight in the air, which ſeems to be much hotter than the thermometer ſhews it to be; and it is known to come on by the riſing of the clouds to the ſouth-eaſt, which, by joining, grow darker, ſo as to make the horizon look quite black, accompanied with lightning and thunder, at a diſtance. The breeze dies away by degrees, as the *tornado* advances, and an entire calm ſucceeds; the air grows yet darker; animals and birds retire and ſhelter themſelves; every thing is ſilent, and the aſpect of the ſky, from whence the *tornado* approaches, is moſt dreadful. A violent ſtorm comes on all at once, which is ſo cold as to occaſion the thermometer to fall ſeven or eight degrees in a few minutes, and ſtrong enough to overſet negro huts, veſſels, or drive the latter from their anchors, and throw them on ſhore. The ſtorm abates, and heavy rain follows, accompanied with much lightning and ſtrong claps of thunder. Sometimes *tornados* happen without rain, or at leaſt a very little, but then the ſtorm is more violent, and laſts longer. It hath been imagined by ſome, that this kind of ſtorm brings ſome peſtiferous quality with it, becauſe they had obſerved that out of a number of people, ſeveral fell ſick in one night after a *tornado*. Dr. Schotte thinks, that no ſuch ill quality is thus produced by it; and that the juſt named phenomenon may be attributed to the change it produces on the air, and of conſequence on the body; it may therefore be conſidered as the occaſional cauſe of a diſorder to which the body was predifpoſed long before. Schotte's Treatiſe on the Synochus Atrabilioſa.

TORPEDO. See ANGUILLA.

TORPOR. VOGEL defines it ſenſation and motion, in a fleſhy part, diminiſhed beyond the healthful ſtandard. GALEN ſays it is a ſort of intermediate diſorder between a palſy and health. It is a numbneſs, or deficient feeling and motion. Applied to the habit, as it very often is, it means a ſluggiſhneſs and inactivity in the moving powers of the machine; hence may it be general or partial, as the whole or part of thoſe powers may be affected.

TORTIO. A STRAIN in a JOINT.

TORTURA. A WRY MOUTH.

TORTURA ORIS. See TRISMUS.

TORTICOLLIS. TORTURA. The WRY NECK. An inſtance of contractura.

TOTA BONA. See MERCURIALIS.

TOUT-

TOUT-SAIN. See ANDROSÆMUM.

TOXICODENDRON, from τοξικον, *sagittarius*, and δενδρον, *a tree*, called alſo *Edera trifolia*. The POISON-TREE, or POISON-WOOD. It is the RHUS TOXICODENDRON, foliis ternatis, foliolis petiolatis angulatis pubeſcentibus. CLASS. PENTANDRIA, ORD. TRIGYNIA. LINN. Gen. Plant. 369. This tree is extremely noxious: it poiſons either by handling it, or the ſmell. Many people have been poiſoned by the ſmell of the tree when cut down; many while burning in their fires: they are often ſwelled and choaked up in a wonderful manner; by handling it, people have been made blind for many days. It does not act alike on all; for on many it will not produce any effect. The poiſon of the tree is never mortal, but goes off of itſelf in a few days; *ſallad oil* and *cream, rubbed upon the parts*, expedite the removal of its effects. The firſt ſymptoms of its action are a violent itching in the ſkin, ſo great as to provoke ſcratching and rubbing; then ſucceed inflammation and ſwelling of the part. Sometimes the whole body is ſwelled and poiſoned in this manner; ſometimes only a particular part, as the legs; and, in this caſe, they often diſcharge a conſiderable quantity of water, and then grow well. The chief uſe that is made of the juice of this plant is for dying linen of a black colour. See Philoſoph. Tranſ. vol. xlix. 1755.

TOXITESIA. See ARTEMISIA.

TRACHEA ARTERIA, from τραχυς, *rough*. See ASPERA ARTERIA.

TRACHEALIS ARTERIA. It runs up from the ſubclavia in a winding courſe, along the aſpera arteria to the glandula thyroidea and larynx, detaching ſmall arteries to both ſides, one of which runs to the upper part of the ſcapula. —— VENA, ſee GUTTURALIS VENA.

TRACHEÆ. See VAS.

TRACHELIUM. See CERVICARIA.

TRACHELO MASTOIDEUS. See COMPLEXUS MINOR.

TRACHELOPHYMA, TRACHEOCELE. } See the BRONCHOCELE.

TRACHEOTOMIA. TRACHEOTOMY. It is the making an opening into the trachea. This operation is alſo called *bronchotomia*, and *laryngotomia*. This operation is made by inciſion, or by puncture, betwixt the third and fourth ring of the trachea; or if this place cannot be choſen, the opening may be made a little lower. When the ſkin is cut through, a ſmall inciſion may be made into the wind-pipe, and then a ſhort but crooked canula may be fixed for the air to paſs through. See Sharpe's Operations. Bell's Surgery, vol. ii. p. 403. White's Surgery, p. 294.

Mr. Sheldon obſerves, that it is very happy both for the ſurgeon and the patient, that this operation is very rarely required. When it is attempted, he adviſes to perforate below the thyroid gland; to cut cautiouſly between the two ſterno-maſtoid muſcles longitudinally, being careful to avoid wounding the vein of the thyroid gland, as it will bleed plentifully. Care muſt alſo be taken that no blood is permitted to fall into the larynx, as it will undoubtedly ſuffocate the patient. Laſtly, when the trochar is introduced, let it not touch the back part of the larynx, becauſe of the irritability of its membrane. It is a difficult operation, but it is beſt performed on thoſe who have thin long necks.

TRACHOMA, from τραχυς, *rough*; called alſo *Daſymma*, if tettery; TYLOSIS, if callous; and SYCOSIS, if the puſtules ſhould be thicker, or ſcabrous. It was epidemic after the earthquake and faſt at Rome. In Cullen's Noſology it is a variety of the OPHTHALMIA TARSI. A roughneſs of the eye-lids, particularly their internal parts. This roughneſs is from a ſort of ſcabs, which differ much in their appearances in different inſtances. Theſe complaints are attended with a weight and heavineſs in the eye, a ſwelling in the eye-lids, a pain and itching, a heat and redneſs in the corners, and in the conjunctiva, a viſcid humour mixed with pungent tears flowing from the ulcers, which, when very glewy, cloſes the eye-lids together. If this complaint continues long in old people, the lower eye-lid grows thick, and turns downwards, ſo that the cartilage reſembles raw fleſh. *The original cauſe* is a ſaline humour, which is thrown on the eye-lids; the *immediate cauſe* is little ulcers there. *A cure* is ſometimes performed by touching the part with a cauſtic; but the cauſtic is no ſooner applied than the pain which it occaſions muſt be allayed by waſhing with warm water. Apply the cauſtic twice a week. St. Yves on the Diſorders of the Eyes.

Mr. Ware calls this diſorder the *pſorophthalmia*, and deſcribes it as follows. The ducts of the ciliary glands are ulcerated; when it happens that the oily ſoft fluid, ſecreted by theſe glands, being mixed with the diſcharge from the ulcers, is changed into an acrid humour, which quickly inſpiſſates into an hard adheſive ſcab. This ſcab, lodging on the orifice of the ducts, ſpreads the complaints, by the irritation which it occaſions over the whole internal edge of the eye-lid; and prevents the poſſibility of its being relieved, until the local remedies are applied, to prevent the formation of the ſcab, by curing thoſe ulcers which ſerved to produce it. This inflammation of the eye-lids being attended with an ulceration of their edges, a glutinous matter iſſues out; and when they have been ſome time in contact, as during ſleep, they become ſo cloſely connected, as to require painful efforts for their ſeparation. Uſually, the ulcers are confined to the edges of the eye-lids, but ſometimes they ſpread over the whole external ſurface, and even excoriate the greater part of the cheek: in caſes of the latter kind, the inflammation which accompanies, has often much the appearance of an eryſipelas. This diſorder is ſometimes attended with a contraction of the ſkin of the lower eye lid; in conſequence of which it is drawn down, and the inner part turned outward, ſo as to form a red, fleſhy, and very diſagreeable appearance.

To form a clear idea of this diſeaſe, it ſhould be remembered, that on the inſide, and near the edges of the eye-lids, is ſituated a number of ſmall glands, ſecreting a ſebaceous fluid, which is excreted by a row of ducts opening immediately on the inner edges of their border. Theſe ducts, and ſometimes the glands themſelves, appear to be the parts principally affected; and the fluid which is ſecreted by them, inſtead of being moiſt and mild, ſerving as a defence againſt the acrimony of the tears, is changed into a ſharp, acrid, and adheſive humour, which cauſes a conſtant irritation of the eye and eye-lids, ulcerates the inner edges of the latter, and, for want of proper attention, has often perpetuated the diſorder for a great number of years. Monſ. St. Yves obſerves, in his chapter on the ophthalmy, ſubſequent to the ſmall-pox, that "the puſtules on the edge of the cartilage of the eye-lids, which penetrate between the cilia and their inner ſurface, do not cicatrize, by reaſon of the acrimonious ſeroſity, which inceſſantly humects the eye; hence follow ulcers, which laſt ſometimes ſeveral years, and even during life, if they be not remedied." But though the ſmall-pox and meaſles are frequent cauſes of this complaint, they are not the only ones; *an inflammation of the globe of the eye*, in itſelf but ſmall, will ſometimes affect the lids, ſo as to cauſe them to ſwell and become red; in conſequence of which, there will be an adheſion of one to the other, and often an univerſal ulceration of their edges. The *ſmall puſtules* alſo, which form on the outer margin of the ciliary edge, where the laſhes grow, and *are known by the name of* STYES, have, in ſome inſtances, brought on an inflammation, which has been continued to the ſebaceous glands, and produced all the conſequences above deſcribed. This diſorder is often ſpoken of as ſymptomatic, and the effect of ſcrophula, ſcurvy, or lues venerea; *but it is very often, if not moſt frequently, a local complaint*; it cannot be known to be any other, except by ſuch ſymptoms as evidence the preſence of theſe diſorders. Yet, though this diſeaſe moſt commonly takes place without any other complaint, at leaſt, as far can be diſcovered, it is yet neceſſary to be obſerved, that it is ſometimes accompanied with the plaineſt marks of a ſcrophulous conſtitution, and ſeems evidently to ariſe from it.

Thoſe ulcerations that appear to be ſuperficial, are not generally tedious to remove; but if they are deep, they are much more difficult to cure than thoſe attended with fungous fleſh.

IN ORDER TO THE CURE, it hath been the general cuſtom to touch the edges of the eye-lids, where the ulcers were ſpread, with the lapis infernalis, perhaps two or three times a week; but to moderate the ſeverity of this method, the part was preſently waſhed with pure water. However, the pain excited by this application ſeems much to have deterred from its uſe; and Mr. Ware hath propoſed a method of relief, equally effectual, but by far leſs exceptionable. He directs, when this kind of inflammation extends over the whole ſurface of the eye-lid,

Remarks on the Ophthalmy, &c. diſtinguiſhes, as follows, betwixt the inverſion of the upper and under eye-lids, both as to the cauſe and cure. And ſpeaks,

FIRST, *of the inverſion of the upper lid.*

The upper lid and its ciliary edge, he obſerves, are preſerved, both in motion and reſt, in their natural ſituation, by the equal, though contrary, actions of the muſculus orbicularis, and levator palpebræ ſuperioris. The ſkin of the upper lid is always very thin, flaccid and folded. When therefore the *trichiaſis* affects the upper lid, it appears to be produced by a relaxation of the levator palpebræ ſuperioris, and a contraction of the ſuperior part of the orbicularis. The cure, either in the upper or lower lid, is *palliative*, or *radical*. It is only *palliative*, when, in order to relief, the eye-laſhes are extracted by their roots. *The radical cure is effected by detracting the ciliary edges, and preſerving them in their natural ſituation. The cauſe being a relaxation of the levator palpebræ ſuperioris muſcle*, an inciſion muſt be made through the integuments of the upper eye-lid, from the inner angle of the eye to the outer; then the fibres of the orbicularis muſcle muſt be ſo ſeparated, as to denudate the expanded fibres of the levator muſcle, as near to their termination in the edge of the lid as poſſible; which being done, apply a ſmall cauteriſing iron, adapted to the convexity of the globe of the eye, made pretty warm, by paſſing two or three times over the tendino-carneous fibres. Thus, by producing a ſlight irritation, which occaſions the ſame effect, as is often obſerved to happen after burns, particularly in the hands, after which the fingers often contract, and in many inſtances have remained contracted ever after, a cure may be expected.

SECONDLY, *of the inverſion of the lower lid.*

The lower lid, whoſe motion is very ſmall in compariſon with that of the upper, is preſerved in its natural ſtate by the equal action of the orbicular fibres ſpread over it, and the thickneſs and renitency of the ſkin which covers it. When therefore a *trichiaſis* is produced in the lower lid, it can only ariſe *from a relaxation of the ſkin*, and a *contraction of the inferior part of the orbicularis. The cure will neceſſarily be effected by increaſing the renitency of the ſkin to ſuch a degree, as to prevent the contraction of the muſculus orbicularis.* When the caſe is recent, a cure hath ſometimes been effected, by forming a fold in the ſkin before the inverted lid, to draw its edge from the eye, and preſerving the ſkin in that ſtate by the application of ſticking plaſter; or, by means of an inſtrument ſimilar to that contrived by Bartiſchius, and repreſented by Heiſter, plate 14. fig. 20. to pinch up a ſmall portion of the ſkin, and hang thereby on the cheek; which, by its weight, anſwers the ſame purpoſe as the plaſter, and is leſs liable to loſe its hold. In ſlight caſes, the ſkin may recover its tone by theſe means; but in others, it will be neceſſary to cut off a ſmall tranſverſe portion of the looſe ſkin below the edge of the lid, and afterwards confine the ſides of the wound together by means of a future.

GOTTLIEB RICHTER, *in his Medical and Surgical Obſervations*, recites the caſe of a boy cured of an entropium by the performance of the operation uſed in thoſe caſes; but remarks, that he had often performed the operation, and had, for the moſt part, found, that however much ſkin he had cut away, he ſtill had not cut enough; and conſequently, that he had only leſſened, not cured the complaint. The external ſkin of the eye-lid is ſo extenſible, that he adviſes every one to cut more; and, indeed, much more of the external ſkin of the eye than appears neceſſary.

Sometimes there are inſtances in which none of the above methods will ſuffice; as, where the ciliary edges are not only inverted, but likewiſe contracted or ſhortened in their length. In this caſe, the circumference of the ciliary edges muſt be enlarged either by an inciſion at the outer angle, or by a complete diviſion of the cartilage, called tarſus, in the middle. The firſt of theſe operations is no more than a ſimple ſtraight inciſion, which may be made with a ſharp-pointed curved biſtory. The laſt, which is ſeldom neceſſary, will be beſt performed by the ſame inſtrument; only obſerving, that the point be carefully introduced between the globe and eye-lid, and carried below the cartilage, that is about ¼ of an inch; whence it is to be puſhed outward in a horizontal direction, till it hath cut its way through the lid. The cartilage being thus entirely divided, each portion will recede towards the angles, and a ſeparation be left between them, which will not only take off the complaint at preſent, but prevent its return for the future. Bell's Surgery, vol. iii. p. 275. Ware on the Ophthalmy. Wallis's Sauvages' Diſorders of the Eyes, p. 1, 18. White's Surgery, p. 247.

TRICHIASIS is a term for an affection of the urine, in which ſomething like hairs is ſeen floating. In Erotianus, it ſignifies fiſſures, or a roughneſs in the ſkin of the breaſt, though he calls an abſceſs in a woman's breaſt thus.

TRICHISMOS. This is a ſpecies of fracture of the cranium, which appears like a hair almoſt imperceptible to the ſight, hence it is ſometimes the cauſe of death, becauſe it does not readily diſcover itſelf. From its minuteneſs it derives its name. It is called by the Latins *capillatio*.

TRICHOMA. See PLICA POLONICA.

TRICHOMANES. See ADIANTHUM NIGRUM.

TRICORNES. So muſcles are called which have three terminations.

TRICUSPIDALES VALVULÆ. See COR.

TRIENS. See CYATHUS.

TRIFOLIA SPICA. See CAAPONGA.

TRIFOLIUM. TREFOIL. QUADRIFOLIUM, TRINITAS. Boerhaave takes notice of thirty-ſix ſpecies, ſeveral of which are called *clover*, and are uſed for feeding cattle only. See Raii Hiſt.

TRIFOLIUM ACETOSUM. See ACETOSELLA. N° 3. under ACETOSA.

TRIFOLIUM PALUDOSUM. MARSH TREFOIL, or BUCKBEAN. MENYANTHES TRIFOLIATA *latifolia foliis ternatis*. CLASS. PENTANDRIA; ORDO MONOGYNIA. LINN. Gen. Pl. 202. It is a plant with large oval leaves, pointed at each end like thoſe of the garden bean; ſet three together on long pedicles, which embrace the ſtalk to ſome height, and there parting, leave it naked to near the top, where iſſues forth a ſhort ſpike of pretty large reddiſh white monopetalous flowers, each of which is cut into five ſegments, hairy on the inſide, and followed by an oval ſeed-veſſel. It is perennial, grows wild in marſhy places, and flowers in May. The leaves are of a penetrating bitter taſte, which they impart both to watery and to ſpirituous menſtrua, without any remarkable flavour. They are uſually infuſed in water, with the addition of ſome grateful aromatic, ſuch as orange peel, or the canella alba. ℔ i. of this infuſion ſhould be drank in a day; it paſſes off by urine, and renders the belly lax. See Lewis's Mat. Med. Great have been the virtues attributed to this plant, as poſſeſſed of a conſiderable ſhare of medical activity, tonic properties of a bitter, and aſtringency. Hence by various authors, has it been ſaid to be ſingularly ſucceſsful in many chronic caſes; as ſcurvy, dropſy, jaundice, aſthma, periodical head-ach, intermittents, hypochondriaſis, rheumatiſm, ſcrophula, worms, gout, cachexy, catamenial obſtructions, palpitations of the heart: and in infuſion, it has proved a good waſh in the impetigo, ſcabies, and tinea according to the report of Dr. FRANCUS.

It has been greatly recommended as an antiſcorbutic, and uſed as a ſtrengthening bitter. Monro's Pharmaceutic Chemiſtry. Dr. Cullen conſiders it a very pure bitter, of a ſtrong kind, not loſing its ſtrength by drying, and has had ſeveral inſtances of its good effects in ſome cutaneous diſeaſes of the herpetic and ſeemingly cancerous kind, taken by infuſion in manner of tea. Materia Medica. In impurities of the humors, and ſome rheumatic and hydropic caſes TREFOIL has of late years come into common uſe as an alterative and aperient; and, as a deobſtruent, there can be little doubt of its being a good auxiliary to other medicines in the jaundice, and other viſceral obſtructions. The leaves may be given in powder from ʒ i. to ʒ ij. for a doſe, two or three times a day; but a ſtrong infuſion of them joined with ſome grateful aromatic is perhaps preferable.

For that called —— *Arvenſe*, ſee LAGOPUS; —— *Aureum* and *hepaticum*, ſee HEPATICA NOBILIS; —— *Odoratum*, ſee LOTUS URBANA; —— *Caballinum*, and *Melilotus*, ſee MELILOTUS.

TRIGEMINI NERVI, called alſo *innominati*. The fifth pair of nerves, large, riſing from the annular proceſſes, where the medullary proceſſes of the cerebellum join, in the formation of that tuber, to enter the dura mater near the point of the petrous proceſs of the temporal bones; and then ſinking cloſe to the receptacula, at the ſides of the ſella Turcica, each becomes in appearance thicker, and goes out of the ſkull in three great branches;

great branches; *Opthalmicus*, *Maxillaris ſuperior* and *inferior*.

TRIGEMINUS MUSCULUS. See COMPLEXUS.

TRIGONELLA. See FOENUM GRÆCUM.

TRIGYNIA (τρεις, *tres*, γυνη, *mulier*). The name of the third order in the firſt thirteen claſſes of the Linnæan ſyſtem, except the firſt, fourth, and ſeventh, including thoſe plants which have three piſtils in each flower.

TRINITAS. See TRIFOLIUM.

TRIOECIA (τρεις, *tres*, and οικος, *domus*). The name of the third order in the claſs polygamia, in the Linnæan ſyſtem, and ſignifying that there are hermaphrodites male and female flowers of the ſame ſpecies, on three indiſtinct individuals.

TRIORCHIS. A perſon with three teſticles.

TRIPASTRUM APPELLIDIS. An ancient ſurgeon, imitating the invention of *Appellides* who framed a machine for launching ſhips, conſtructed a machine for ſetting fractured limbs on ſimilar principles, which, becauſe it was worked by three cords, was called *tripaſtrum Appellidis* ſeu *Archimedis*, as theſe two laſt laid equal claim to the invention of launching ſhips.

TRIPLEX MUSCULUS. See TRICEPS.

TRIQUETRA OSSA. They are alſo called *Wormiana*, from Wormius, who firſt obſerved them. They are ſmall irregularly ſhaped pieces, principally betwixt the parietal and occipital bones, and are joined by true ſutures to their adjacent bones.

TRISMUS, (from τριζω, ſtrideo), called by Vogel, *caſpiſtrum*, *tortura oris*, LOCKED JAW. Dr. Cullen conſiders this as a ſpecies of tetanus, and defines it a ſpaſtic rigidity, particularly of the lower jaw; he has arranged it under the term tetanus, and makes it the ſecond variety; of this he conſiders two kinds; 1. *Triſmus naſcentium*, which ſeizes infants within the two firſt weeks from their birth. 2. *Triſmus traumaticus*, of all ages, from a wound, or cold; to this belong the *angina ſpaſmodica*, *convulſio a punctura nervi*; *triſmus catarrhalis*. The fifteen other ſpecies of Sauvages, he conſiders ſpurious, or falſe; either becauſe they do not depend upon ſpaſm, but ſome other defect of the muſcles; or becauſe they are rather convulſive than ſpaſmodic; or laſtly, becauſe they are affections of the muſcles of the face, rather than of the lower jaw. See Synop. Noſol. Meth. vol. ii. p. 214. For the mode of treatment of this complaint, ſee TETANUS.

TRISSAGO. See CHAMÆDRYS, alſo SCORDIUM.

TRISTITIA. GRIEF or SORROW. *Grief* relaxes the ſolids, ſlackens the motion of the fluids, and deſtroys the health; it particularly weakens the ſtomach and inteſtines, occaſions flatulence and every ſymptom of weakneſs. Opiates, if not given in large doſes, are good cordials in this caſe.

TRITÆOPHYA, TRITÆOS, TRITÆUS, from τριταιος, *a tertian*, and φυω, importing *ſimilitude of nature*, or *original*: it is an epithet of a fever, much of a nature with a tertian, and taking its riſe from it. This ſort of fever is almoſt continual, its intermiſſions are obſcure or ſhort. Linnæus calls it a continued tertian. Erotianus, and ſome others, ſay it is a fever which gives ſigns of its approaching paroxyſms, but whoſe intervals are regular, as it never arrives at perfection; and that it takes its name from its great reſemblance of a tertian; and that it is called a ſmall ſemitertian. See James's Med. Dict. art. TRITÆOPHYES. Dr. Cullen conſiders it a remittent fever, and claſſes it under the ſecond ſection in his firſt order of his 1ſt Claſs FEBRES.

TRITICUM. WHEAT; called alſo *frumentum*. It is the *triticum Hybernum*. Linn. Whether in the form of flour, or of ſtarch, it is the moſt glutinous of the farinacea. In Italy they make vermicelli of the fineſt flour of wheat.

This is the farinaceous food moſt generally uſed by the better ſort of people over the whole of Europe, excepting the very northern parts in which it cannot be produced: but even there it is imported. It has this advantage, that it can be formed into a more perfect kind of bread than any other of the cerealia yet known. See PANIS, and Cullen's Materia Medica.

For that called —— *Repens*, ſee GRAMEN CANINUM; —— *Vaccinum*, ſee MELAMPYRUM.

TRITORIUM. See DEPURATIO.

TRITURATIO, from *triturare*, to threſh, of *tero*, to rub or grind. TRITURATION. The act of reducing a ſolid body into a ſubtile powder, alſo of comminuting, bruiſing, and dividing of humid matters into little parts; likewiſe applied to denote the diviſion that is made of ſeveral bodies together to unite them with each other.

TROCAR. The name of an inſtrument uſed to diſcharge the water with, in an aſcites. The word *trocar* is a corruption of the French word *un trois quart*, *a three quarters*, from the three ſides with which the point is made.

TROCHANTERES. Two proceſſes of the thigh-bone, one of which is larger than the other. See FEMORIS OS. From τρεχω, *to run*, becauſe ſeveral muſcles that move the thigh are inſerted into them.

TROCHISCI. TROCHES. *Artiſcus*; *tabella*; *bacilli*, called alſo *paſta regia*; *paſtillias*; *cyclifci*; *dactylios*; *morſellus*; *morſulus*. It is a form agreeable enough for children, and thoſe who object to every thing that is not a ſweetmeat, and a preparation from the confectioner. *Troches* are alſo called tablets and cakes. They are made by mixing the medicine with a proper quantity of ſugar, and the mucilage of gum tragacanth; and when formed into a ſtiff paſte, it is cut into proper portions, and dried. See COLLIX.

TROCHISCI CYPHEOS. See CYPHI.

TROCHITÆ. See ENTROCHUS.

TROCHLEA. τροχλια, *a pulley*. A kind of cartilaginous *pulley*, through which the tendon of one of the muſcles of the eye paſſes.

TROCHLEARES. See PATHETICUS.

TROCHLEARIS MUSCULUS. See OBLIQUUS MAJOR OCULI, or SUPERIOR AMATORIUS.

TROCHOIDES, from τροχος, *rota*, and ειδος, *forma*, ſimilar to a wheel; named alſo *axea commiſſura*. It is an epithet to an articulation, or juncture of bones, when one is inſerted into the other like an axletree, which has the motion of a wheel, as appears in the firſt and ſecond vertebræ of the neck.

TROISIEME, LE, MUSCLE DU TRICEPS. See ADDUCTOR FEMORIS, TERTIUS and MAGNUS.

TROMPA. See CETE ADMIRABILE.

TSIAM PANGAM. See CAMPECHENSE LIGNUM.

TSIANAKUA. See COSTUS.

TSJERU-CANSJAVA. See BANGUE.

TUBA ARISTOTELICA, TUBA EUSTACHIANA, called alſo *aquæductus*, *aquæductus Fallopii*, *meatus cæcus*, *duſtus auris palatinus*, *meatus a palato ad aurem*. It was firſt diſcovered by Alcmenon, a diſciple of Pythagoras; he called it the auditory paſſage. Euſtachius claims the firſt diſcovery, and from him it hath its preſent name. Fallopius calls it the aquæduct; ſome call it *duſtus auris palatinus*. This tube paſſes from the fore part of the drum of the ear, to the back part of the noſe, above the root of the velum pendulum palati, and allows the air to paſs inwards. See AUDITUS.

TUBÆ FALLOPIANÆ. Theſe tubes will receive a hog's briſtle from out of the uterus, where they begin; they then proceed in a tortuous manner, and terminate at the ovaria, in an irregular round jagged extremity, where their diameter is about a third of an inch; this fringe is called *morſus diaboli*, or *foliaceum ornamentum*, and is hung upon a membrane like the meſentery, between the doublings of which the veſſels run to the tubes. Fallopius diſcovered them. Rufus Epheſius called them *paraſtatæ varicoſæ*.

TUBÆ NOVUS VALSALVÆ MUSC. See CIRCUMFLEXUS PALATI.

TUBERA. Tumors of the ſolid parts, not dropſical, as hardened glands, &c. ſee alſo AMANITA.

TUBERCA CERVINA. See AMANITA.

TUBERCULA MAMILLARIA. See PAPILLÆ MAMILLARES.

TUBERCULUM. A TUBERCLE, or little tumor, called alſo *epanaſtaſis*, the ſame as PHYMA. See VOMICA.

TUBERCULUM LOWERI. See COR.

—— ANNULARE. See MEDULLA OBLONGATA.

TUBULI LACTIFERI. See LACTIFERI DUCTUS.

TUBULOSUM FOLIUM. See FARCTUS.

TUBULUS DENTALIS, ſee DENTALIUM; —— *Marinus*. See ANTALIUM.

TUGUS. See AMOMUM.

TUMIDOSI. See INTUMESCENTIÆ.

TUMIDUM. See BRONCHOCELE.

TUMOR. A TUMOR. The Arabian word was *bothor* for tumors in general, &c. which ſee, alſo called *epanaſtaſis*. It is a diſeaſe in which the parts of the body recede from their natural ſtate by an undue increaſe of

their bigneſs. In Dr. Cullen's Noſology, *tumores* are the ſixth ORDER in his CLASS LOCALES, and defined a morbid enlargement of a part, without being cauſed by inflammation. *Tumors* receive different names, according to their ſituation, figure, contents, &c. and there are but few general names but what are again divided into different ſpecies, e. g. when pus is the contents of a *tumor*, it is called *an abſceſs*;—if an abſceſs is in the lungs, it is called *a vomica*;—if in the finger end, it is called *whitlow*, &c. all theſe ſee in the article ABSCESSUS.—When the matter is contained in a bag, the *tumor* is called *an encyſted tumor*; and theſe take different names according to their contents, as *atheroma*, *meliceris*, *ſteatoma*, &c. and theſe are to be extirpated whilſt ſmall, if ſituated where the knife can be ſafely uſed; though when their contents are ſoft they may be ſeparated and diſcharged by an opening, then the cyſt is to be deſtroyed by eſcharotics. *Œdema* or *ædematous tumors* generally depend on ſome other diſeaſes, and on the removal thereof theſe kind of *tumors* uſually diſappear.—*Scrofulous tumors* are only relieved by removing the habit on which they depend, ſee SCROFULA;—and for other *tumors*, ſee the reſpective articles under which each of them is treated, as the ANEURISM, the VARIX, and the different kinds of HERNIAS, &c. See Bell's Surgery, vol. v. p. 368.

TUNBRIDGE WATER. See AQ. CHALYBEATÆ.

TUNICA. See CARYOPHYLLUS RUBER.

TUNICA FILAMENTOSA. See DECIDUA.

—— VAGINALIS TESTIS. See TESTES and ELYTHROIDES.

TURBINATA OSSA. See ETHMOIDES OS.

TURBINATUM. See CEREBRUM.

TURBITH, alſo called *turpethum* and *turpetum*. It is the cortical part of the root of a ſpecies of *convolvulus Indicus*, which is met with in the Eaſt Indies; the CONVOLVULUS TURPETHUM, Linn. It is in oblong pieces, of a brown, or an aſh-colour on the outſide, and whitiſh within. The beſt is ponderous, not wrinkled, eaſy to break, and diſcovers to the eye a large quantity of reſinous matter. The bark is cathartic, but ſo unequal in its ſtrength, that it is now neglected in practice. See Neumann's Chem. Works. Lewis's Mat. Med. It is alſo a name of ſome kinds of ſeſeli.

TURIO, *quaſi terio—quia facile teratur*. The tender ſhoots of plants which come up in ſpring, as in the aſparagus, and hop. Such are called aſparagi; the tender ſhoots of any herb from the ground. RAY.

TURPETHUM, and TURPETUM. See TURBITH.

TURPETHUM MINERALE. See MERC. EMET. FLAV.

TURUNDÆ. TENTS. They are uſually made of lint, and introduced into deep wounds. They are uſed, 1. To convey medicines to the bottom of a wound. 2. To hinder the external part of a wound from healing before the bottom. 3. The better to clean wounds from what ſhould not be retained in them. But they ſhould be very ſoft, that they may neither obſtruct the diſcharge of matter, nor hinder the healing of the wound in general. *Tents* are made of ſponge, for dilating the orifices of wounds; they are alſo made of the dried roots of gentian, turneps, comfrey, calamus aromaticus, &c.

TUSSILAGO, alſo called *bechium*, *bechion*, *calceum equinum*, *chamæluie*, *filius ante patrem*, *farfara*, *farfarella*, *ungula caballina*. The Gauliſh name, in Marcellus Empiricus, is *calliomarcus*. COLT'S-FOOT. TUSSILAGO FARFARA, *foliis ſubcordatis angulatis denticulatis*, *ſcapo imbricato uniflora*, *floribus radiatis*. CLASS. SYNGENESIA, ORDO POLYGAMIA SUPERFLUA. LINN. Gen. Plant. 952. It is a low plant, producing, early in the ſpring, ſingle ſtalks, each of which bears a yellow floſculous flower, followed by ſeveral ſeeds winged with down; the leaves, which ſucceed the flowers, are ſhort, broad, angular, ſlightly indented, green above, and hoary underneath. It is perennial, and grows wild in moiſt grounds. The leaves and flowers are mucilaginous, bitteriſh, and roughiſh; they have little or no ſmell; infuſions of the leaves are ſweetened with liquorice or honey for a common drink, when a troubleſome cough attends: but if any conſiderable advantage is expected, a ſtrong decoction ſhould be made, and uſed freely. The leaves have been held in high eſtimation, and conſidered as poſſeſſing demulcent and pectoral powers; conſequently eſteemed efficacious in pulmonary conſumptions, coughs, aſthmas, and in various catarrhal ſymptoms. Every writer almoſt on the Materia Medica might be cited as ſpeaking much in its favour, except Dr. CULLEN, who ſays, "This plant, he is afraid, has little virtue, as he has often employed it, but never found it either evidently demulcent, or expectorant. However he has employed it in ſcrofulous caſes, and in ſeveral with ſeeming ſucceſs. The expreſſed juice of the freſh leaves was taken to ſome ounces every day, and occaſioned the healing up of ſcrofulous ſores; and even a ſtrong decoction of the dried leaves, employed as Fuller propoſes, has ſeemed to anſwer the ſame purpoſe: however in ſome caſes they both have failed, or have not been ſufficiently effectual. See Cullen's Mat. Med. Lewis's Mat. Med. For that called —— *major*, ſee PETASITES.

TUSSIS. BEX. A COUGH. It is a violent expulſion of ſome ſort of matter from the bronchia of the lungs, by means of a convulſive force in them, accompanied with a violent expiration. Dr. Cullen obſerves that it is generally a ſymptomatic catarrh. See CATARRHUS.

The ſeat of every *cough* is in the breaſt generally, but the remote cauſe is variouſly ſituated. The diverſity of this cauſe produces a variety in the ſpecies of this diſorder. The principal ſeat is the aſpera arteria, and the bronchia; theſe are irritated, or the morbid irritation may be in ſome part adjacent, as the diaphragm, the ſtomach, the œſophagus, the pleura, the external ſurface of the lungs, &c. What in the ſtomach cauſes a vomiting, in the bronchia will cauſe a coughing. Vellications may be produced in the bronchia by conſent of parts, as happens when *coughs* attend in pleuriſies, wounds about the neck, inflammation of the liver, &c.—Exhalations which float in the air, &c. are ſometimes a cauſe;—defluxions of rheum, or an acrid mucus falling from about the head, may irritate the aſpera arteria, and excite a *cough*.—Acrid matter in the ſtomach, or in the duodenum, is a frequent cauſe of this complaint.—Spaſmodic diſorders are often attended with a *cough*, the lungs ſuffering either by conſent from the ſeat of the ſpaſm, or becoming in their turn the ſeat of that which produced the ſpaſm in ſome diſtant part; but, *perhaps, of all the cauſes, there are not any ſo frequent as that of defective perſpiration.*

A dry cough generally becomes a moiſt one; which, if of long continuance, deſtroys the appetite, weakens digeſtion, induces a cachectic habit, and a hectic fever. Lommius obſerves, that a *cough* paſſing into one of a dry kind, and leaving a ſenſe of weight in the breaſt, ſubjects the patient to a putrid or to a hectic fever.—*Coughs* which ſucceed a ſcirrhus in any of the viſcera, are generally incurable. It often happens that when a *cough* uſhers in a diſeaſe, it ceaſes as the approaching diſorder is more manifeſt. A moderate heat in the night, an equable moiſture all over the body, a copious diſcharge of urine, a due ſolubility of body, tranquil ſleep, and an eaſy expectoration, are ſure ſigns that the cough is in a fair way to be removed.

Coughs are generally dry ones at the firſt, and, whilſt in this ſtate, they may uſually be cured by chewing, immediately after every fit of coughing, about a ſcruple of the bark; the belly muſt be kept lax, and the feet warm, and perſpiration muſt be promoted. Dry *coughs* generally become moiſt by ſpoiling the digeſtion; though it is proper to obſerve, that in hypochondriac, and ſome other habits, the cough is uſually dry, and in phlegmatic relaxed habits it is moiſt.

If the bronchia are obſtructed with viſcid phlegm, the beſt reſolvents are the *rad. ſcillæ*, *gum. ammon.* or *rad. allii.*

Thin acrid humours are beſt carried off by incraſſating medicines, ſuch as the *rad. glycyrrh. gum. trag. ſpermaceti*, &c.

When catarrhous coughs are habitual, and *accompanied with loſs of appetite*, there is danger of a conſumption; and the cure muſt be attempted by *aſſes-milk whey*, *Seltzer water*, &c.

When there is a defluxion and congeſtion of ſerum about the lungs, it is neceſſary to derive the ſerum from thence, partly by the anus, and partly by the ſkin. *In all coughs, perſpiration muſt be promoted, and the belly kept ſoluble.* As a purge, *manna*, or the *ol. ricini*, ſhould be preferred; and to allay the *cough* in the night, let the following pill be given a little before bed-time. ℞ Pil. ſtyrac. gr. vi. pil. ex aloe cum myrrha, gr. x. m. *As a perſpirative*, many of the antimonial preparations are peculiarly uſeful.

When the cough abates, ſtomachic bitters ſhould not be neglected.

Theſe general methods, with a due attention to the non-naturals, will, with ſuch peculiarities as circumſtances ſuggeſt

ſuggeſt to the practitioner, prove generally efficacious to relieve, and always prove palliative in this violent diſorder.

Sweet and oily medicines ſhould rarely be admitted of, though ſo frequently recommended. The *tinctura opii camph.* is an excellent anodyne, and aſſiſts perſpiration if taken at bed-time. When a bliſter cannot eaſily be complied with, *a plaſter of Burgundy pitch* may be ſubſtituted for it, a freſh one being uſed as ſoon as the old one begins to ſeparate from the ſkin.

When a bad digeſtion is the cauſe, or *acrid matter in the ſtomach*, a vomit may be directed; and after it, a mixture of tinct. rhab.—aloes, of each equal parts, may be taken ſo as to keep the bowels lax, until the diſorder is removed.

Spaſmodic coughs are removed by *opiates*, and *nervous medicines*, with the bark. See Celſus, Hoffman, Wallis's Sydenham, Brookes's and the London Practice of Phyſic.

TUSSIS CATARRHALIS, ſee a CATARRH from cold, in CATARRHUS.

—— FERINA.
—— EPIDEMICA. See INFLUENZA.

TUTENÁG. A name for zinc, alſo for a white metal which is compounded in China, and is called alſo Chineſe copper. See ZINCUM.

TUTIA. TUTTY, called alſo *cadmia factitia, cadmia fornacum, alfuſa, capnitis.* It is an argillaceous ore of zinc, found in Perſia, formed in cylindrical moulds into tubulous pieces like the bark of a tree, and baked to a moderate hardneſs. It is generally of a browniſh colour, full of ſmall protuberances on the out-ſide, ſmooth and yellowiſh within, but ſometimes whitiſh, then called *pompholyx*, and at others of a bluiſh caſt.

When *tutty* is finely levigated, it is drying and cicatriſing; it is uſed in collyriums to repel ſlight inflammations in the eyes. See Lewis's Mat. Med.

TUTSAN. See ANDROSÆMUM.

TYLOSIS. See TRACHOMA.

TYLLOMA. A CORN. See CLAVUS.

TYMPANI MEMBRANA. See AUDITUS.

TYMPANITES. A TYMPANY, called alſo *meteoriſmus*, and FLATULENT DROPSY. Notwithſtanding what is aſſerted by many eminent authors and practitioners, there are others who diſpute the exiſtence of the diſorder deſcribed under this name. Dr. Cullen places this genus of diſeaſe in the CLASS CACHEXIÆ and ORDER INTUMESCENTIÆ; which he defines a tenſe, elaſtic, ſonorous intumeſcence of the abdomen; the habit coſtive, with an emaciation of the reſt of the parts. He diſtinguiſhes two ſpecies; 1. *Tympanites inteſtinalis*, when there is a tumor, often irregular, of the abdomen, and frequent rejection of air, which alleviates the tenſion and pain. 2. *Tympanites abdominalis*, when the ſounding noiſe is more evident, the tumor more regular, and the emiſſion of wind more rare, and leſs alleviating. Its immediate cauſe is ſaid to be flatulencies, which are pent up in the colon, or in the rectum, according to ſome, and in the ſmaller inteſtines according to the deſcription of others. Some ſay that the matter is partly water and partly wind.

However opinions may vary in other reſpects, it is generally agreed that the belly is diſtended principally with flatus; and as in ſuch circumſtances the CHIEF INTENTION IS TO DISCHARGE THE FLATULENCIES BY THE ANUS, *antiſpaſmodics*, *anodynes*, and *laxatives*, will be indicated to relieve, and *aromatic corroborants* to prevent a relapſe. The *firſt intention* will be probably anſwered by means of the ſp. ætheris nitroſi cum tinct. opii, and ſuch doſes of the pil. ex aloe cum myrrha as may be required, without purging too freely; *the ſecond intention* will be effected by a proper uſe of the rad. zedoar. cort. aurant. ſummit. centaur. minor. and other ſtrengthening carminatives, rubbing the belly, ſwathing it with a broad flannel belt, and riding exerciſe. What is advanced here reſpects the firſt ſpecies. But as the ſecond ſpecies generally ſucceeds the putrefaction of water or other fluids pent up in the cavity of the abdomen, or may enſue from the corruption or mortification of different viſcera, all ſuch caſes muſt have a fatal termination. See Celſus, Junker, Hoffman, Heiſter, Mead, &c. Cullen's Firſt Lines, vol. iv. Wallis's Sydenham.

TYMPANUM. See AUDITUS.

TYPHA AROMATICA. See CALAMUS AROMATICUS.

TYPHODES, τυφωδης, alſo *helodes*. The Arabians called this *lactica*. A particular kind of fever attended with colliquative ſweats, which hath at the ſame time the tongue dry and hard.

TYPHOMANIA, } from τυφος, and μανια. In Galen's
TYPHONIA, } Exegeſis, it is ſaid to be, "A diſorder complicated of a phrenſy and a lethargy," in which the patient is delirious, and labours under a ſleepy coma. This affection, thus complicated of a phrenſy and lethargy, may be called a lethargic madneſs or delirium, or a mad and delirious lethargy, according to the author of the Definitiones Medicæ.

Dr. Cullen conſiders it as a ſymptomatic apoplexy, occurring in intermittent and continued fevers, alſo in worm caſes; hence the different ſpecies, viz. TYPHOMANIA *febricoſa*;—*continua*; *agrypnocoma*;—*verminoſa*. See Synopſis Noſolog. Method. vol. ii. p. 184, 191, 192.

TYPHOS, τυφος. The Arabians called this *lactica*. Hippocrates ſays there are five ſpecies of this diſorder.

FIRST. A legitimate continual fever, which reduces the ſtrength; is attended with pains in the belly; heat in the eyes, which hinders the patient from looking ſteadily on any object; the pain prevents him from anſwering any queſtions, though he begins to ſpeak, and fix his eyes on any object, when he is at the point of death.

SECOND. A tertian or a quartan fever, ſucceeded with pain in the head; ſaliva and worms are copiouſly diſcharged by the mouth; the eyes ſuffer great pain; the countenance is pale, ſo are the feet, and the whole body is ſometimes ſeized with ſoft ſwellings; the breaſt and back are now and then painful, the belly rumbles, the eyes are fierce, the ſaliva adheres to the throat, and renders the voice hoarſe.

THIRD. There are intenſe pains in the joints, and ſometimes all over the body: the blood is hot, and ſtagnates in the limbs; ſome bile retained in the joints becomes indurated there, and produces lameneſs.

FOURTH. There is violent tenſion, elevation, and heat of the belly, ſucceeded by a diarrhœa, which ſometimes terminates in a dropſy, and is ſometimes attended with fever.

FIFTH. There is paleneſs and a ſort of tranſparency of the whole body, as if it was a bladder full of water, though without any inflation; on the contrary, the body is weak and extenuated. The patient winks his eyes, and feels the bed cloaths as if he wanted to catch ſomething on them, &c.

TYPHUS. See NERVOSA FEBRIS. Thoſe called *carceris* and *caſtrenſis*, are the gaol and camp-fever, ſeverer kinds of the Typhus. See AMPHEMERINA HUNGARICA, BILIOSA FEBRIS, PUTRIDA FEBRIS.—Dr. CULLEN, in his note to the term TYPHUS, ſays, it can be by no means right to aſſign different names to diſeaſes which vary only in degrees of violence; but ſince, in modern times, it has been the cuſtom amongſt phyſicians, to give to a certain fever, as if differing from ſome other, the appellation of NERVOUS; conforming, in ſome degree to this cuſtom, I have, under the title of TYPHUS MITIOR, collected the nervous fevers of various modern authors; but, in this matter, I will not ſay that I have been accurate, becauſe they cannot, by any means, be accurately limited.

Yet, I have been leſs inclined, agreeable to the opinion either of the ancients or moderns, to collect any thing under the name of putrid fever amongſt the genera of fevers. In every typhus, I think there is a propenſity of the humors to run into a ſtate of putreſcency; but that happens in different degrees; ſo that a greater or leſs degree of putrefaction may vary, but can, on no account, change the ſpecies. It will be ſufficient then, that thoſe fevers, which particularly are called *putrid*, have been pointed out under the title of TYPHUS GRAVIOR, as will be apparent from the appoſite appellations of different authors.

TYROSIS. A diſorder of the ſtomach proceeding from milk coagulated therein.

U.

U L C

ULA. See GINGIVÆ.

ULCERA SERPENTIA ORIS. See APHTHÆ.

ULCUS. An ULCER, called alſo *cambuca*, or *cambuca membrata*, *exulceratio*. It is a ſolution of continuity in a ſoft part made by eroſion. Wounds degenerate into *ulcers*, when, by a fault in the humours, there is a further loſs of ſubſtance. A loſs of ſubſtance in the bones, from eroſion, is called a CARIES; though, when an abſceſs is opened for the diſcharge of its contents, it is uſually ſpoken of as an *ulcer*. Dr. Cullen places this genus of diſeaſe in the CLASS LOCALES and ORDER DIALYSES. He defines it to be a purulent or ichorous ſolution of a ſoft part.

Ulcers receive different names from their cauſes, figure, the parts they affect, &c.

External *ulcers* are diſcerned by the eye, but when they are internal they are diſcovered by what is diſcharged in one or other of the excretions.

Their danger will be judged of by the quality of the *ulcer*, the part affected, and the ſtrength of the patient.

The ſymptoms which attend and retard the healing of *ulcers* are inflammation, pain, a fluxion of morbid humours, a ſpongy fleſh, &c. The callous tumid lips of ulcers, or ulcers which are difficult to heal, are termed *ochthodes*.

Mr. Sharpe obſerves, that, except the CALLOUS and the SINUOUS *ulcer*, and the ULCER *with a caries in the bone*, the cure of all the other kinds depends chiefly on that of the morbid habit of the body in general. If the body is free from every degree of cacochymy, the healing of an *ulcer* is the work of nature, and all that topical applications have to effect, is the maintenance of the fibres in ſuch a moderate ſtate betwixt laxity and rigidity, as will render them moſt able to carry on this natural operation. While an inflammatory hardneſs exiſts, an emollient poultice laid over the dreſſings will relieve, after which dry lint generally ſuffices, or at the moſt it may be moiſtened in ſome mild aſtringent, to give a tone to the new fleſh. When a too great laxity, or a ſponginеſs is obſerved in *ulcers*, gently ſtimulating and bracing applications take place.

The three kinds of *ulcers* which Mr. Sharpe mentions as more particularly depending on external management, are ſo frequently joined with, or ariſe from a morbid habit of body, that regard is firſt to be had thereto; and when this kind of obſtacle to healing is removed, apply emollients to the callus on the edge of the *ulcer*; or in many inſtances ſucceſs will follow the uſe of a mixture of ung. reſinæ flavæ, with a little finely powdered precipitate. See Heiſter's Surgery. Sharpe's Operations, in the Introduction.

Mr. Bell, in his Treatiſe on *Ulcers*, divides them into two claſſes, viz. 1. *Such as are merely local, and that do not depend upon any diſorder of the ſyſtem.* 2. *Such as are the conſequence of, or connected with, any diſorder of the conſtitution.*

The ſpecies belonging to the firſt claſs, are, 1. *The ſimple purulent ulcer.* 2. *The ſimple vitiated ulcer.* 3. *The fungous ulcer.* 4. *The ſinuous ulcer.* 5. *The callous ulcer.*

U L C

6. *The carious ulcer.* 7. *The cancerous ulcer.* 8. *The cutaneous ulcer.*

The ſpecies belonging to the ſecond claſs are, 1. *The venereal ulcer.* 2. *The ſcorbutic ulcer.* 3. *The ſcrophulous ulcer.*

It hath generally been ſaid, that *ulcers* are not to be healed, if they have been of long continuance, when they appear to have had any effect, either in carrying off, or preventing, any diſorder to which the conſtitution may have formerly been liable. It has always been conſidered as dangerous to attempt their cure, if of long ſtanding; it is true, all at once to heal old ſtanding *ulcers* will be imprudent: but, with a ſmall degree of caution, the cure of every *ulcer* may be attempted by the introduction of ſome drain or other, by means of a pea iſſue, or of a cord. See FONTANELLA, and SETACEUM.

The SIMPLE PURULENT ULCER is a local affection; it hath the ſymptoms common to all ſuch diſorders, as pain and inflammation, in a very inconſiderable degree, while the diſcharge afforded is always of a mild purulent nature, and of a proper conſiſtence; the granulations which ariſe in it are of a firm, freſh red, healthy appearance. This *ulcer* is the moſt ſimple that can occur, both in its ſymptoms and method of cure; and it is to its ſtate, that all others muſt be reduced before a permanent cure can be expected. In the cure of this ſpecies of *ulcer*, as there is very little inflammation, and no preternatural ſwelling ſuppoſed to take place, but merely a vacuity, either from a real loſs of ſubſtance, or from a retraction of parts ſimply divided, the diſcharge at the ſame time being of a mild purulent nature, the only indications that appear neceſſary are, 1ſt. TO DIMINISH, AS MUCH AS POSSIBLE, ANY VACANCY THE ULCER MAY HAVE OCCASIONED; 2d. TO INDUCE THE FORMATION OF A CICATRIX; to accompliſh the firſt of which, the formation of new granulations, and the decay of ſuch parts as lie immediately contiguous to the *ulcer*, are requiſite. To effect the formationof new granules, inflammation and acrimony muſt be removed, and pledgets of lint ſpread thinly with the ung. cereum Ph. Edinb. may be applied, every twelve or twenty-four hours, to the ſurface of the ſore. If inflammation attends the *ulcer*, moderate it by the application of warm emollient cataplaſms; but as ſoon as this inflammation ſubſides, omit the cataplaſms, leſt an exceſs of laxity be produced. Thus, by mild dreſſings, irritation is prevented, and by preſerving a proper degree of heat in the part, a good matter will be produced and firm granulations. To diminiſh or deſtroy the parts about the *ulcer*, ſuch as fungous fleſh, as ſoon as the inflammatory ſtate is over, and good matter is induced, flight compreſſion, by means of a roller, may be immediately applied, and ſhould be continued during all the remainder of the cure. The roller ſhould be applied ſo as not only to act as a gentle preſſure upon the parts immediately ſurrounding the *ulcer*, but likewiſe to ſerve as a ſupport to the ſkin, and other teguments, ſo as to prevent their retraction, which otherwiſe, in large *ulcers* eſpecially, is very ready to happen. 2dly. TO INDUCE THE FORMATION OF A CICATRIX. This is frequently effected by nature alone; but, in many caſes, when every deficiency appears to be

even thoroughly ſupplied, yet ſtill a cure is tedious in accompliſhing; the ſurface of the ſores remaining raw, and, at the ſame time, diſcharging conſiderable quantities of matter. In ſuch caſes, the ointment uſed for the preceding part of the cure muſt be laid aſide, and dreſſings of a more drying nature ſubſtituted in its ſtead. In this view, the ung. e ceruſſ. a. &c. is preferable to the cerat. lapidis calamin. Sometimes the cicatrization will be ſoon perfected, by dabbing the part or parts, twice a day, with aq. calc. ſim. and ſtill dreſſing with the ung. e ceruſſ. If the cicatrization is prevented by ſpongy granulations, or even firm ones ariſing above the ſkin, they may be checked by dry lint applied to them, or perhaps a gentle compreſs may alſo be required; ſometimes a ſlight application of the vitriol. Roman. may be neceſſary to check the luxuriancy. It is very rare that a cauſtic is required. Bell on *Ulcers*, edit. 3. p. 161, &c. White's Surgery, p. 29.

The SIMPLE VITIATED ULCER differs from the ſimple purulent *ulcer*, chiefly *in the appearance and nature of the diſcharge afforded*. The moſt common appearances of ſuch deviations, in the matter afforded by *ulcers*, from the more natural ſtate of purulent matter, are *ſanies*, *ichor*, or *ſordes*. In every *ulcer* diſcharging any of theſe matters, in conſequence of the acrimony that ſubſiſts in them, the parts, inſtead of filling up with firm granulations, waſte away more and more, and inſtead of a reddiſh complexion, have either a dark brown, or a blackiſh, rough, ſloughy appearance. The pain in all of them is more or leſs conſiderable, according as the matter is more or leſs corroſive. As the ſimple purulent *ulcer* happens moſt frequently in the fleſhy parts, where the cellular membrane affords a fluid moſt plentifully that is proper for the formation of pus; ſo the ſimple vitiated *ulcer* is moſt frequently ſeated near the tendons or aponeurotic expanſions of the muſcles, from theſe parts not naturally affording that ſpecies of ſerum neceſſary for the formation of ſalutary pus. *Accidental inflammation about the ulcer*, or *a general ill habit of body*, may alſo be occaſional cauſes of this ſpecies of *ulcer*, even in parts beſt diſpoſed to produce the matter formed in the mildeſt kind of ſores. In order to moderate the ſymptoms peculiar to this kind of *ulcer*, and reduce it to the ſtate of the ſimple purulent one, the principal endeavours will be, to eaſe pain, and to abate irritation; to which end, warm emollient fomentations and cataplaſms are effectual; they ſhould be continued until all appearances of inflammatory tendency are removed. The part may be fomented three or four times a day, for half an hour each time, with an emollient decoction; and then a pledgit ſpread with the ung. cereum Ph. Ed. may be applied, as the pain is more or leſs: ſo a more free uſe of opiates inwardly will be neceſſary to remove irritation.—*The habit of body demands attention alſo*; if too much exalted, it muſt be lowered; if too low, it muſt be ſupported and raiſed; and generally it is in this latter inſtance that theſe *ulcers* are met with. Here a free but prudent uſe of the cort. Peruv. is ſingularly beneficial; ſometimes 3 j. is required ſix or eight times a day: in plethoric habits and in inflammatory conſtitutions, great caution is required in the uſe of this medicine. If any general diſeaſe attends, its removal muſt be duly attended to, in order to the cure of this as well as every other *ulcer*. This *ulcer* now reduced to the ſtate of a ſimple purulent *ulcer*, proceed as in that caſe directed. Sometimes more difficulty attends the cicatrization of theſe *ulcers*, when they have been of long ſtanding; but, beſides the method propoſed for cicatrizing the ſimple purulent *ulcer*, an iſſue, inſerted in a proper ſituation, will generally finiſh the cure. Some have extolled the efficacy of nitre, in this ſpecies of *ulcer*. Bell on *Ulcers*, edit. 3. p. 216, &c.

The FUNGOUS ULCER, by ſome, called the SPONGY ULCER. Fungous excreſcences frequently occur in different ſpecies of *ulcers*. By the term fungous, are underſtood ſuch preternatural riſings of the parts in ſores, as are more ſoft and ſpongy than ſound healthy granulations are: and, though ſoft at firſt, by continuance they acquire an extraordinary hardneſs. Theſe excreſcences are ſometimes very painful alſo. In young and healthy habits, the new granulations which ariſe in *ulcers*, often advance too quick, and preſently are above the ſurface of the neighbouring parts; and in other inſtances, for want of care, wounds and *ulcers* are permitted to fill up without being ſound at their bottoms; whence this ſort of *ulcer* generally occurs. In order to a cure, the two juſt named cauſes are to be regarded. If the fungous appearance ariſe from luxuriance of health merely, its ſurface may be ſlightly touched with the argentum nitratum, once in two or three days; and immediately after, a pledgit of dry lint may be applied. If the baſis of the fungi is narrow, it may be beſt removed by a ligature. The fungi removed, proceed as in caſes of the ſimple purulent *ulcer*. When the fungous fleſh is of that kind which happens when the bottom of the *ulcer* is not ſound, it riſes quickly, and is not ſo firm as the firſt mentioned ſort; in this caſe, firſt give a free vent to any impacted matter, and then attend to the progreſs of healing from the bottom. This fungous fleſh is ſoft, and waſtes away in the progreſs of the cure, without requiring eſcharotics. Bell on *Ulcers*, edit. 3. p. 232.

The SINUOUS ULCER. See FISTULA.

The CALLOUS ULCER, called alſo the VARICOUS ULCER, from a miſtaken opinion that they proceeded from and were nouriſhed by matter from the ſwelled veins, which ſeem to open into them. An *ulcer* is ſaid to be callous, when its edges, inſtead of contracting, and ſo diminiſhing the ſize of the ſore, are kept at a ſtand, turned ragged, and at laſt, by acquiring a preternatural thickneſs, often riſe conſiderably above the level of the neighbouring parts: and as it is generally from neglect or improper treatment that *ulcers* do turn callous, the diſcharge afforded by them is commonly a thin vitiated matter. It is in this ſpecies of *ulcer* chiefly that varicous veins occur as a ſymptom, eſpecially when the complaint is ſettled in the lower extremities. This ſeems to be owing chiefly to the ſtricture occaſioned by the calloſities on the courſe of the different veins, a circumſtance, which, in extenſive ſores of this kind, muſt, no doubt, have a conſiderable influence. Eſcharotics have generally been uſed to deſtroy calloſity on the edges of *ulcers*: but as they tend to increaſe the diſeaſe by the continual inflammation they excite, they are now much laid aſide, and, in their ſtead, emollients with the aſſiſtance of warmth are ſubſtituted. By the uſe of a warm emollient poultice, and a reclined poſture, *ulcers* have been healed; though, on adopting this method, their ſtate was very unpromiſing. Yet ſometimes the calloſities are ſo hard, as to require their deſtruction either by the knife, or the cauſtic; and if the laſt is preferred, the argentum nitratum is the beſt; with this the hardened parts may be touched, every two or three days, and when they are duly waſted, the *ulcer* will probably be reduced to the ſtate of the ſimple purulent one, and, like that, may then be treated. To ſtrengthen and reſtore the veins, that were rendered varicous about the calloſities, a tight ſtocking, or a ſpiral bandage will be uſeful, but not before their having been continued for a long time. Calloſity frequently attends venereal and cancerous *ulcers*: in theſe caſes the ſtate of the conſtitution in general muſt be adverted to. Bell on *Ulcers*, edit. 3. p. 254.

The CANCEROUS ULCER. See CANCER.

The CARIOUS ULCER. By this term is intended that ſpecies of the diſorder which is connected with a local affection of a bone. If ſuch an accident happens, as bruiſes, lacerations, and injuries of the perioſteum, it ſometimes terminates in a caries; in ſuch a caſe, by the end of three, four, or five days, the bone begins to loſe the natural healthy appearance, turns firſt of a pale white, then gets a ſlight tinge of a yellow complexion; and whenever this begins to appear, there cannot be a doubt of what will be the conſequence. Sometimes it will continue in this ſtate for many days, and by degrees acquires a more deep tallow-like appearance, in which way it commonly remains for a longer or a ſhorter time, according to the violence of the inflicting cauſe, and afterwards goes through the ſtages of brown, light, dark, &c. until it hath acquired a darkneſs of the deepeſt dye. The diſcharge from ſuch *ulcers* is never of the conſiſtence of good pus; it is generally thinner, and from the firſt appearance of caries, acquires a moſt diſagreeable fœtor, which always increaſes, as the different ſtages of the diſorder advance; at laſt it appears blackiſh, as well as the bone underneath; and the diſcharge at this time is exceedingly acrid. As the ſeveral degrees of blackneſs go on, ſmall holes are formed in the diſeaſed parts, and by degrees increaſe conſiderably, until even the moſt ſolid bones acquire a kind of ſpongy appearance. In this ſituation, the mortified portion of the bone generally becomes looſe, and when preſſed upon, a quantity of greaſy like matter, with a moſt diſagreeable fœtor, is generally forced out; this matter ſo taints the whole diſcharge from the *ulcer*, and gives it ſuch a peculiar ſmell, as to render it ſcarce poſſible, after

once ſeeing an inſtance, ever to miſtake it again. This laſt circumſtance alone is a certain characteriſtic of a carious *ulcer*. Further, in *ulcers* attended with a carious bone, the fleſhy parts never have a healthy appearance, are ſoft and more flabby than in their natural ſtate, and, inſtead of a florid red, have rather a dark brown, together with ſomewhat of a glazed complexion. The granulations puſh forwards too quickly and too far, if they are not prevented by art, which is always neceſſary to be done, until the diſeaſed part of the bone is either caſt off by nature's proceſs, or cut out by the ſurgeon, ſo as that the cure may take place with certainty, from the bottom of the ſore. And when neglected for any conſiderable time, theſe ſoft productions in carious *ulcers* frequently increaſe ſo remarkably as to form very large and troubleſome excreſcences. Theſe appearances happen, whether a portion of the bone, or its whole ſubſtance is carious. When the whole bone is affected, the progreſs and its various ſymptoms are more rapid, and the whole bone muſt be removed: whereas, when a part of the bone only is affected, perhaps a ſingle lamina, to the extent of the diſeaſed part, is all that will be ſeparated and removed. So long as the caries remains, it effectually prevents the *ulcer* about it from healing: if by chance it appears to be healed, it ſoon breaks out again. When a probe can be introduced at any opening, and admiſſion can be got thereby to the bone, if a roughneſs of its ſurface is diſcovered, the caſe becomes then altogether evident. Though the bone cannot be reached by the probe, for want of an opening, the appearances of the *ulcer*, and the kind of diſcharge, will rarely fail to determine what kind of *ulcer* it is; for, if the bone is carious, the *ulcer* is flabby, and, inſtead of a regular ſurface, the new granulations ſprout up in different cluſters of the ſize of ſmall nuts, and, inſtead of a healthy ſtrong appearance, have uſually a dark-brown complexion; the diſcharge is thin, dark-coloured, and greaſy; there is alſo more or leſs of the peculiar fœtor above named. Before this *ulcer* can be cured, the carious parts muſt be ſeparated and taken out. In order to this, make a number of ſmall perforations all over the ſurface of the diſeaſed bone, to ſuch a depth as to give the patient a very little pain, and no farther. This operation being, in different parts, renewed every third or fourth day, the diſeaſed portion of the bone, in the courſe of a ſhort time, not only loſes the cohefion of its own parts, but a gentle inflammation is, by the ſame means, raiſed and kept up till free ſuppuration is produced. Theſe perforations are made by a pin or perforator. If the caries goes deeper than the ſecond lamella of the bone, then a ſmall head of a trepan may be uſed, and carried juſt as deep as to give the patient a very little pain. Thus, by converting, as it were, a large caries into ſo many ſmaller diſeaſed parts, their ſeparation from the ſound bone comes to be more eaſily effected. As ſoon as any of the parts looſen at the edges, their final ſeparation may be haſtened, by daily inſinuating below them the end of a ſpatula, ſo as to preſs their edges a very little upwards. The head of a common trepan is often uſed for taking out a piece entirely when bones happen to be carious through their whole ſubſtance. After the uſe of the above inſtruments, dreſs the *ulcer*; and as long as any of the carious bone remains, the fœtor of the matter demands attention; and to moderate it, dreſs daily with a ſtrong decoction of bark and walnut-tree leaves: to this end alſo, a ſolution of camphor in weak brandy powerfully corrects the fœtor of morbid bones. The carious part of the bone ſhould be dreſſed with ſoft lint ſoaked in either of theſe, while the reſt of the ſore is treated as is directed for ſimple purulent *ulcers*. Lime-water powerfully corrects the putrid diſcharge from carious *ulcers*, and the exfoliation of bones is much promoted by bathing the part with it. The bark is almoſt the only medicine which in caſes of caries, ſhould ever be given internally; but in ſome inſtances the ſoft parts which cover the carious bone, become ſo ſwelled and painful, that opiates are found to be neceſſary. After the removal of the carious bone, the remaining ſore muſt be treated in the ſame manner as directed for that ſpecies of *ulcer*, to which, at the time, it appears to belong. See CARIES; alſo Bell on *Ulcers*, edit. 3. p. 262.

The SCROPHULOUS ULCER. See SCROFULA.

However ſimilar the general practice may be, there are ſome peculiarities proper to *ulcers* on particular parts, ſome inſtances of which are as follow.

An ULCER in the BLADDER. It ſhould be diſtinguiſhed from an *ulcer* in the kidneys, which ſee. *Ulcers* are not ſo frequent in any of the urinary paſſages as they ſeem to be thought; they are often ſuſpected from a ſlimy diſcharge, which is of a yelloviſh colour, and proceeds from weakneſs. When an *ulcer* is formed in the bladder, there is a diſcharge of fetid matter, or blood; and ſometimes a ſort of ſcales, or a membranous pellicle, are ſeen in the urine. There is alſo a continual dyſuria, and a pain in the urinary paſſages. The means of relief are ſimilar to thoſe for an *ulcer* in the kidneys.

An ULCER with a CARIES never heals firmly before the cure of the faulty bone; and, that accompliſhed, the *ulcer* becomes a ſimple one, and ſoon filling up with common fleſh, is healed. See CARIES.

An ULCER in the KIDNEYS. Dr. Hunter obſerves, that though the kidneys are often found waſted, they are hardly ever ſeen ulcerated. Cheſelden obſerves, that it is very rarely that an ulcerated bladder is met with in the bodies that are obtained for diſſection. Oribaſius obſerves, that an *ulcer* in the kidneys may be diſtinguiſhed by the following circumſtances, from the ſame diſorder in the bladder: 1ſt, When the bladder is affected, the pain is felt in the pubes, and the bottom of the belly; but when the kidneys ſuffer, the pain is in the back-part of the loins. 2dly, When the bladder is the ſeat of the diſeaſe, there is a difficulty, if not a ſuſpenſion of urine; but when the kidneys are in fault, the urine paſſes freely. 3dly, From the bladder there are voided membranous ſcales, but from the kidneys fibrous pieces of fleſh are voided. 4thly, A violent pain is felt in the bladder when it is ulcerated; but when the *ulcer* is in the kidneys, the pain is of a dull kind.

The urine looks like milk when it is firſt made from an ulcerated kidney, but is not fetid; but, on ſtanding a while, the white matter falls: when the pain is conſiderable in the kidneys, it occaſions a nauſea, and ſometimes a vomiting.—When an *ulcer* is ſuſpected in the kidneys, the patient ſhould abſtain from acrid, ſour, and ſalt diet; he ſhould live on mild mucilaginous aliments, ſuch as the broths of young animals, whey, milk, ſweet butter-milk, &c. Violent exerciſe muſt be avoided, chalybeate waters ſhould be drank a long time, and ſolutions of the mildeſt balſams may be taken now and then.

ULCERS in the LEGS. In theſe caſes a confinement in bed is uſually demanded as neceſſary in order to the cure. In ſome inſtances amongſt labouring people, ſome advantage is obtained from reſt: but, in general, theſe *ulcers* are moſt firmly healed when moderate exerciſe is continued during the cure. Some are afraid of healing *ulcers* in this part, leſt an aſthma, or other complaint, ſhould follow; but if the general health is not defective, or if it can be reſtored, there will rarely, if ever, any ill conſequences ariſe from the healing of them. On this ſubject, Mr. Bell obſerves, in his Treatiſe on *Ulcers*, that it has been almoſt univerſally recommended never to attempt the cure of ſuch as have been of long ſtanding, as, from the very acrid matters which they are frequently known to diſcharge, it has been commonly imagined that drying up ſuch ſores might prove dangerous to the conſtitution. But he is of opinion, that no ſuch acrid matters, as are frequently obſerved to be diſcharged from *ulcers*, ever ſubſiſted in the blood. The acrimony, which, in ſuch caſes, occurs, is produced, he thinks, in a great meaſure, by ſome particular affection of the organs which ſeparate thoſe fluids from the blood, from which the matter, by its remora in the cavities of *ulcers*, is afterwards formed. He further obſerves, that *ulcers* are hurtful or beneficial to the conſtitution, not by the quality of matter diſcharged, but by the quantity; hence he ſays, *the cure of every ſore, of whatever continuance, may be rendered perfectly ſafe by the previous introduction of an iſſue*, which diſcharges a quantity of fluids, equal to the diſcharge occaſioned by the ſore to be healed up. He aſſerts, from extenſive experience, that no inconveniences ever reſult from the practice; and hence concludes that the cure of every *ulcer* may be attempted. The general intentions in the cure of *ulcers* being attended to, and a tight ſtocking worn over the dreſſings, ſuch other means may be directed as the experience of the practitioner, and the circumſtances of the caſe, may ſuggeſt. Mr. Underwood obſerves, that, in the cure of an *ulcer*, the firſt object is, to bring it to diſcharge a laudable pus; and this, he aſſerts, the moſt inveterate *ulcers* on the legs may

may be brought to afford as freely, as fores ſeated any where elſe. He recommends the merc. nitrat. r. finely levigated, as one of the beſt applications for this purpoſe. He adds, that this powder muſt not be lightly ſprinkled on the fore, when its ſurface is ill conditioned, but the *ulcer* muſt be filled with it. This writer ſpeaks of a ſpecies of *ulcer* which is uſually ſmall, and particularly affects the parts about, and ſometimes below the ancle; it is exquiſitely painful. In this caſe, as in others, he aſſerts that reſt is not neceſſary to the cure; but, inſtead of confinement, he carries the roller ſeveral times over the ancle and foot, ſo as to leave no part but the point of the heel uncovered; and thus a tolerable compreſſion is made below the *ulcer*. He further adds, that caſes of this ſort are often found attended with conſiderable puffings, and a tetterous appearance of the ſurrounding ſkin, accompanied with a thin acrid diſcharge, which renders the parts additionally tender; whilſt the little ulcer is almoſt perfectly dry, and cannot eaſily be brought to ſuppuration, until the complaint of the ſkin is removed; which is moſt ſpeedily effected by drying applications, ſuch as bol. armen. alumin. pulv. ungt. rub. defic. and, in more obſtinate caſes, a ſolution of the ceruſſa acetata, and zincum vitriolatum purificatum, with one or two ounces of the ſp. vini c. in a pint of water. If the ſore does not ſoon change its complexion, on the diſappearance of the affection of the ſkin, he adviſeth to fill the *ulcer* with precipitate, diſſolved argentum nitratum, or any ſimilar eſcharotic, and, when the ſlough is come out, to repeat it. Here he ſays that theſe cauſtics are only to be uſed, after active digeſtives, aided by proper bandages and exerciſe, prove ineffectual. Laſtly, he recommends in the healing of *ulcers* in the legs, particularly thoſe of long ſtanding, that the ſurgeon proceed ſlowly and cautiouſly, avoiding the too early uſe of drying applications, and gradually weakening the digeſtive. It may be laid down as a general maxim, that the ſore ſhould rather be ſuffered than invited to ſkin over. When the ulcer is healed, temperance, a continuance of the bandage for ſome time, and occaſional purgatives will be neceſſary. On this particular ſpecies of *ulcer*, ſee the Lond. Med. Obſ. and Inq. vol. iv. p. 347, &c. and Rowley's Eſſay on the Cure of ulcerated Legs. Underwood's Treatiſe upon *Ulcers* of the Legs.

ULCER on the TONGUE. As it has been obſerved, that ulcers in different parts of the noſe, noſtrils, &c. have had ſuch bad appearances, and been ſo obſtinate they might have been called carcinomatous, yet they have been cured by ſolutive neutral ſalts, and repeated emetics, and purgatives; hence has it been thought, that they have ariſen from irritations in the præcordia alone; and alſo, that many ſuch ulcerations have been touched with the knife, and cauſtics, which might have been cured merely by medicines which clear the bowels. At this aſſertion we cannot be ſurpriſed, when we conſider, how frequently eruptions of the lips accompany gaſtric diſeaſes. A caſe, recorded by Gottlieb Richter, is much in favour of this opinion. A patient had an ulcer on his tongue, which was extremely painful, and emitted a very fetid ſmell; the edges of the ulcer were ſwelled, and hard; he, at the ſame time, complained of a cough, a ſtitch in his left breaſt, bad taſte in his mouth, and every ſymptom which indicates impurities, acrimony, and obſtruction in the abdomen. He was ordered ſoluble tartar, and extract of graſs; and, on the third day, a vomit, which evacuated a great quantity of bilious ſlime, and gall, with great relief, and diminution of all his complaints. Theſe medicines were repeated with good effects, and he was perfectly free from all, except the ulcer; this was frequently moiſtened with fifteen grains of white vitriol in ſix ounces of ſage tea. In eight days, the ulcer became quite clean, all the hardneſs vaniſhed, and new firm fleſh roſe from the whole ſurface. A waſh of the decoction of the Peruvian bark and alum ſoon dried it up; and in about one month, or rather leſs, he perfectly recovered; and the point of the tongue, which had been deſtroyed, was completely regenerated.

ULCERS in the TONSILS. This diſorder is far leſs frequent than is ſuppoſed. Dr. Hunter obſerves, that the tonſils open over all their ſurface, by ſmall orifices which emit a ſlimy mucus; and that when they are inflamed, the mucus being purulent and white, and the ſurface irregular, there is the appearance of ulceration, when in reality there is none. Not to be deceived in this caſe, deſire the patient to waſh his mouth and throat well with ſome proper fluid, before you determine whether or no *ulcers* are here. When *ulcers* are formed, they may be touched with mixtures of honey, alum, borax, muriatic acid, &c. according as their cauſe, or attending circumſtances, may require.

ULCERS in the WOMB. Whilſt a viſcid, yellow, or bloody humour is evacuated, the *ulcer* is in a mild ſtate; but when it becomes ſanious, fetid, and is attended with pain, a cancer is for the moſt part attendant, and then palliatives only can be propoſed. In the milder kind keep the belly lax with manna, tamarinds, and ſuch like cooling purgatives, and inject an infuſion of elder-flowers in milk and water. When the caſe is cancerous, demulcent and lenitive medicines, with anodynes to moderate the pain, are all that can be propoſed. See CANCER *in the Womb*.

On *ulcers*, beſides the different ſyſtems of ſurgery, as Heiſter's, Turner's, Wiſeman's, Bell's, Kirkland's, Pott's, &c. ſee Bell's Treatiſe on *Ulcers*, edit. 3. p. 123—434.

ULCUS DEPASCENS. See HERPES, Sp. 5.

ULMUS. The ELM-TREE. The ULMUS CAMPESTRIS, *foliis duplicato-ſerratis, baſi inæqualibus*, CL. PENTANDRIA; ORD. DIGYNIA. LINN. Gen. Plant. 316. It is a tall tree covered with a rough, chapt, brownish, brittle bark, under which lies a white, ſmooth, tough, coriaceous one. In the ſpring, before the leaves appear, it produces imperfect flowers, which are followed by flat roundiſh capſules, containing each a ſingle ſeed. The inner tough bark hath no ſmell, but on being chewed, it diſcovers a copious ſlimy mucilage; the outer brittle bark is leſs ſlimy. The complaints in which the bark of this tree is recommended, are thoſe of the cutaneous kind allied to HERPES, or LEPRA.

Dr. Monro has given this to a great number of patients for cutaneous complaints, in conjunction either with antimonial, mercurial, ſaline, or other medicines; and often made his patients go into the tepid bath twice a week. Many were cured; but eruptions of the true leprous kind ſeldom were completely, though they were greatly mitigated; nay, ſometimes ſeemingly removed; yet returned within the ſpace of a month, or, at the longeſt, a year.

Dr. Lyſons of Bath relates his ſucceſs, by the uſe of a decoction of the inner bark of *elm*, in ſeveral caſes, in which obſtinate eruptions appeared on the ſkin, ſome of which approached very near to, if they were not of a leprous kind. He made the decoction as follows: ℞ Cort. interioris *ulmi* recent. ℥ iv. coq. in aq. font. ℔ iv. ad ℔ ii. Ph. Lond. 1788. He obſerves that if this bark is rich of the juice, and is boiled too long, the decoction will be mucilaginous and not quite agreeable, but that otherwiſe it hath an agreeable, mild, aſtringent taſte. As the decoction was uſed during the ſpring and autumn ſeaſons only, the bark was taken from the trees as it was required; in the ſpring it was ſtripped from the ſmall, but not the ſmalleſt branches; and in autumn from the branching roots, as being at thoſe ſeaſons the fulleſt of ſap. Half a pint of this decoction is to be taken every evening and morning, and continued as long as the eruptions may require it. On the firſt uſe of this medicine, this diſorder ſeems to be ſomewhat aggravated. In what Dr. Lettſom ſuppoſes to be the LEPRA ICHTHYOSIS of Sauvages, he has found the elm-bark decoction very effectual, ſucceeding in the cure after all the medicines, uſually had recourſe to in ſuch caſes, had failed. Nitre may be occaſionally joined along with it, and gentle purgatives now and then interpoſed.

Banau propoſes the uſe of the elm bark in various other caſes, as *fluor albus*, *rheumatiſm*, *old ulcers*, *cancerous*, and *ſcrophulous affections*, *tinea capitis*, *ſcurvy*, &c. See Lond. Med. Tranſ. vol. ii. p. 203. Monro's Pharmaceutical Chemiſtry. Medical Memoirs, n. 152. Journ. de Paris, 1783, n. 255; and LEPRA ICHTHYOSIS in this Work.

ULNA, from ὠλένη, *the cubit*. It is one of the bones of the fore-arm: it is alſo called *cubitus*; *focile*. At its upper extremity it hath two proceſſes: the poſterior, called olecranon, is the larger. Its concave ſurface moves upon the trochlea of the os humeri: into its upper-part, all the extenſors of the cubit are inſerted. The anterior proceſs is not ſo large, nor does it reach ſo high, but is ſharper at its extremity, and therefore named coronoid. Between theſe two proceſſes, a large ſigmoid cavity is left, adapted to the trochlea of the os humeri; on the other part is a cavity, where the extremity of the radius moves. The lower extremity of the ulna terminates in a very ſmall head, which internally is received into the ſemilunar cavity

ty of the radius, whilſt from its external ſide a proceſs juts out called the ſtyliform, from which a ſtrong ligament is extended to the os pififorme and unciforme of the carpus.

ULNARIS ARTERIA. See CUBITALIS ARTERIA.

—— EXTERNUS. See EXTERNUS CARPI RADIUS.

—— GRACILIS. See PALMARIS LONGUS.

—— INTERNUS. It is a long muſcle, ſituated on the outer part of the ulna; it is fixed by its upper part in the back ſide of the long or internal condyle of the os humeri, in that part of the olecranon which is next the condyle, along the upper half of the ulna very nearly, and to the middle common tendon of the profundus; it ends by a long tendon on the os pififorme of the carpus, reaching alſo to the os unciforme.

ULON. See GINGIVÆ.

ULVA. See ALGA.

UMBILICALIA VASA. UMBILICAL VESSELS. There are four ligamentary ropes called by this name; the uppermoſt runs from the navel to the fiſſure between the two lobes of the liver, and is the remains of a vein, which, in the fœtus ſtate, anaſtomoſed with the vena cava hepatica, covered with the falciform proceſs. The urachus is another of the ligamentary ropes. The other two ligamentary ropes are the extremities of the umbilical arteries, which at the top of the bladder approach each other, and join the urachus.

UMBILICALIS REGIO. As comprehending the navel. It is the middle external region of the belly in its fore part; it reaches from an imaginary line drawn betwixt the loweſt falſe ribs, to another imaginary line drawn betwixt the two criſtæ of the os ilium. This region is divided into three parts, viz. the middle, which is properly the umbilicalis, and the two lateral, called flanks.

UMBILICALIS ARTERIA. It is a continuation of the HYPOGASTRIC ARTERY, which ſee. It aſcends on the ſide of the bladder, and from thence to the navel. It is ſhrivelled in the adult ſtate, being only of uſe to the fœtus.

UMBILICUS. The NAVEL, quaſi umbo ilium, called alſo *omphalos*. The middle of the loins.

UMBILICUS MARINUS, called alſo *Operculum cochleæ cælatæ*. This is a ſmall oval body of a ſhelly matter, reſembling the human navel; it is properly the operculum of a ſhell-fiſh, ſerving to cloſe up the aperture of the ſhell, in the buccinum, and other turbinated ſhells; and for that purpoſe it is fixed to the anterior extremity of the body of the animal, ſo that when it retracts its body into the ſhell, this naturally fills up the mouth of it. It is convex on one ſide, and flat on the other; the convex ſide is plain, and white; the flat is yelloviſh, or reddiſh, and marked with a ſpiral line. It is conſidered as an abſorbent, and aſtringent, but not in preſent uſe. See alſo ANDROSACE, and COCHLEÆ.

—— VENERIS. See COTYLEDON.

UNCIFORME OS. The fourth bone of the ſecond row in the wriſt. It hath an apophyſis ſhaped like a claw, whence its name. See CARPUS.

UNEDO PAPYRACEA. See ARBUTUS PAPYRACEA, and AMATZQUITL.

UNGUENTARIA. See NUX MOSCH.

UNGUENTUM. An OINTMENT. It differs from a plaſter only in its conſiſtence; if as much oil is added to a plaſter as reduces it to the conſiſtence of ſtiff honey, it forms an ointment. It is uſual to boil the freſh leaves of plants in lard, and other greaſy and unctuous matters: but they retain very little of the virtue of the plants, nor indeed do freſh herbs give out much of their virtue to greaſy and unctuous ſubſtances. Ointments in general take their names from the ſubſtances of which they are formed, except ſome few. For UNGUENTUM *liliorum*, ſee CRINOMYRON; —— *Apoſtolorum*, ſee APOSTOL. UNG. —— *Martiatum*, ſee MARTIATUM UNGUENTUM; —— *ad veſicatoria*, ſee CANTHARIDES, N° 2. —— *Hydrarg. nitrati*, ſee TRACHOMA.

UNGUES. The NAILS. They are continuations of the epidermis. Their ſubſtance is like that of horn; they are compoſed of ſeveral planes of longitudinal fibres united together; theſe ſtrata end at the extremity of each finger, and are all nearly of an equal thickneſs, but of different lengths. The principal uſe of the *nails* is to ſtrengthen the fingers and toes.

UNGUIS, and UNGULA is a collection of matter in the pupil of the eye, in the ſhape of a man's nail, whence the name. Some deſcribe this diſorder as a film formed on the external part of the eye, extending over the pupil; and when it hath a red appearance, they call it *pannus*; and in order to its removal, the veſſels which run into it being divided near the great angle of the eye, it ſhrivels, and may then be ſeparated; hence named *pterygion*;—when its puts on the appearance of a white ſpeck, it is called *albugo*;—when puſtules appear on the cornea of the eye, it is not called *unguis*, but *phlyctænæ*, which ſee, becauſe there are two ſpecies. See Bell's Surgery, vol. iii. p. 300.——So the ancients named that ſort of articulation which we call ſuture. In botany, it is the white and inferior part of the leaves of roſes, and of ſome other flowers.

UNGUIS OSSA, called alſo *lacrymalia oſſa*. Theſe are two thin bones, very brittle, placed at the inner canthi of the eyes, covering ſome of the ſinus ethmoidalis, and are really part of the os ethmoides: their ſurface is ſmooth and hollow, and is divided by a ridge; the hind cavity forms a portion of the orbit, the fore-part is a perpendicular canal which contains the lacrymal ſac and duct.

UNGULA. See UNGUIS.

UNGULA CABALLINA. See TUSSILAGO.

UNICORNU, called alſo *ceratitis*, *cornu unicornu*, *cornu* and *ebur foſſile*, *alicornu*, *monoceros*. There have been very different opinions relative to the ſubſtance which takes this name; by ſome it has been thought to be a bony prominence of the animal called *unicorn*, poſſeſſing ſome medical virtues; but of this there are great doubts:—ſome think it a lax, and ſpongy terrene ſpar, found of various ſizes, and regular forms, from an inch to three feet long, in Germany and other parts of the world; and it is in great eſteem as a ſudorific, and aſtringent, and given in fevers attended with diarrhœa, with great ſucceſs.—Dr. EBRENS gives a particular account of this foſſile; he ſays, that it is dug up of different ſhapes, ſometimes like a ſtraight horn, ſkull, jaw-bone, ſhoulder-blade, &c. and other bones of men, and beaſts; and ſometimes like an unſhaped maſs, or lump of ſtone, having no reſemblance to bone. CONRIGNIUS, and OTTO GUERICK have maintained that this foſſile is petrified bone; — SENNERTUS, SCHRODER, BAUSCHIUS, &c. reckon it amongſt the minerals;—LIBAVIUS and others think it a bituminous earth; whilſt ſome ſay it is a kind of agate. But Dr. EBRENS apprehends that it is formed of a clay, or fattiſh earth, called *marga*, or *marl*, hardened by petrifying water, and aſſuming different ſhapes and ſizes, according to the ſituation in which this earth lies under ground. It operates, he ſays, like the terra ſigillata, as an abſorbent, aſtringent, and perſpiratory, and produces good effects, unleſs coſtiveneſs forbids its uſe. *Externally* it ſerves in puſtulary eruptions, and eroſions about the pudendum and ſundament in children, and in eye-waters. For a more particular account of this ſubſtance, ſee Chambers's Encyclopædia, by Rees.

UNIFOLIUM. See MONOPHYLLON.

UNIONES. See MARGARITÆ.

UPMINSTER WATERS. This is a ſtrong ſulphureous water, ſituated near to Brentwood in Eſſex, about 22 miles from London. It is clear and bright, and Dr. Rutty ſays it remained ſo, and kept its ſtrong ſulphureous ſmell, and other ſulphureous properties, after being carried to Dublin in bottles. The Doctor evaporated this water, and got 132 grains of ſolid matter from one gallon, compoſed of inſoluble matter, vitriolated magneſia, and natron: the proportion of each he does not mention.

This water is purgative and diuretic in its operation, and is adminiſtered in a morning, from one pint to ſome quarts. Monro's Pharmaceutical Chemiſtry.

UPOSTASIS. See EPISTASIS.

UPSILOIDES. See OS HYOIDES.

URACHUS, from ουρον, *urine*, and εχω, *to have*, or *contain*. In the fœtus ſtate the urine paſſes from the bladder into the allantois, through the *urachus*; but after the birth, it is ſhrivelled and becomes a ligament.

URANOSCOPUS, from ουρανος, *cælum*, and σκοπεω, *video*, *to look at heaven*; called alſo *cæli ſpectator*. It is the name of a ſea-fiſh, whoſe eyes are placed naturally upon the head, by which it looks directly up to the ſky, from which particular power it is called *callionymus*, not from the beauty of its form, for it does not poſſeſs any ſhare, but is rather diſagreeable and painful to look at. It has bile more plentiful than any other fiſh, which is by GALEN recommended in affections of the eyes and ears. Caſtelli.

URCEOLA, URCEOLARIS, URCEOLI VITREI. See PARIETARIA.

UREDO. A BLAST. Alſo the name of a particular head-ach, an inſtance of which is related in the Philoſ. Tranſ. June 1668. It is the URTICARIA, which ſee.

URETERES. URETERS. From οὐρέω, *urine*. See RENES.

URETERICA. A *ſuppreſſion of urine* from inflammation in the ureter.

URETEROLITHICA. A ſuppreſſion of urine from a ſtone in the ureter.

URETEROTHROMBOIDES. A ſuppreſſion of urine from grumous blood in the ureter.

URETEROPHLEGMATICA. A ſuppreſſion of urine from pituitous matter in the ureter.

URETEROPYICA. A ſuppreſſion of urine from purulent matter in the ureters.

} See ISCHURIA.

URETEROSTOMATICA ISCHURIA. A ſuppreſſion of urine from obſtruction in the lower orifice of the ureter. See ISCHURIA.

URETHRA, from οὐρέω, *urine*, called alſo *meatus urinarius*. The inner membrane of the *urethra*, or paſſage for the urine from the bladder, is a continuation of that which lines the bladder; it is very ſmooth and ſenſible; in it are ſeveral lacunæ, which are the ſeat of the clap. In women the *urethra* is wider than in men, and its length is only from an inch to an inch and an half. Sometimes a ſtone is fixed in ſome part of the *urethra*. ſee CALCULUS. This produces pain, then inflammation, tumefaction of the parts, and always a partial, and frequently a total ſuppreſſion of urine. In ſome inſtances, when the diſorder is long neglected, this ſuppreſſion and conſequent tumefaction terminate in a rupture of the *urethra*; in conſequence of which, the urine eſcapes into the contiguous cellular ſubſtance, and very troubleſome ſwellings are produced, not only in the body of the penis, but frequently in the ſcrotum, and through the whole courſe of the perinæum. When a ſtone has been long fixed at one particular part without yielding in any degree, and when the pain and inflammation produced by it are conſiderable, a chirurgical operation ought to be immediately employed for removing it; but, in the incipient ſtages of this diſorder, other means of a more gentle nature ſhould be firſt put in practice. In order to ſolicit the paſſage of the ſtone, one important endeavour is, to remove ſpaſm; with this view, if the patient is plethoric, bleed; if he is thin and emaciated, a proportionable quantity of blood ſhould be taken by means of leeches, directly from the part affected. A quantity of warm oil ſhould be repeatedly injected into the *urethra*, to lubricate the paſſage; the patient ſhould alſo be immerſed into a warm bath; and a full doſe of the tinct. opii ſhould be at the ſame time given. A proper quantity of blood having been diſcharged; the patient having remained for a ſufficient length of time in the warm bath; and the opiate having begun to operate, the parts will thus be as completely relaxed as poſſible: and this is the period when ſome attempt ſhould be made for extracting the ſtone. To this end, inſtead of any of the inſtruments recommended for this purpoſe, which often do harm by increaſing irritation, the ſurgeon ſhould at firſt endeavour by very gentle preſſure to puſh the ſtone forward along the courſe of the *urethra*: in this manner large ſtones may be brought off, for the removal of which, a very painful operation might otherwiſe be neceſſary. When the ſtone fills up the *urethra*, or, notwithſtanding the uſe of means as above, it will not paſs, it will be neceſſary to proceed to the operation, which is performed by cutting upon the ſtone, and extracting it either with a ſcoop, or with a pair of ſmall forceps. When the ſtone is fixed in the *urethra* near the neck of the bladder, lay the patient on a table, ſecure him as for the operation of lithotomy: an aſſiſtant ſuſpending the ſcrotum and penis, the ſurgeon, after oiling the firſt and ſecond fingers of his left hand, ſhould introduce them into the anus, and by means of them ought to preſs firmly upon the parts immediately behind the ſtone; which will not only enable him to lay it bare with more eaſe, but will be the ſureſt method of preventing it from being puſhed into the bladder by the neceſſary preſſure of the knife; this being done, an inciſion ought to be made through the common integuments and *urethra*, ſo as to lay the ſtone completely bare; which may now be turned out by a due degree of preſſure applied with the fingers in the rectum; or, if this is not found to be ſufficient, it may be taken out either with a ſcoop or with a pair of forceps. The after-treatment is the ſame as after the operation of lithotomy. When the ſtone hath paſſed further into the *urethra*, in order to extract it, the ſkin ſhould be drawn as much as poſſible paſt it, either in a backward or a forward direction; and the ſtone being now ſecured in its ſituation by preſſure, a longitudinal cut ought to be made directly upon it through the *urethra*, of a ſufficient ſize to allow of its eaſy extraction either with the ſcoop or the forceps. The edges of the wound are now to be completely cleared of fabulous particles, and the ſkin allowed to regain its natural ſituation; by which means, if the operation has been properly done, the wound in the *urethra* will be entirely covered by ſkin that has not been injured; a circumſtance which tends to render this operation by far leſs exceptionable than otherwiſe it would be; for thus the wound uſually heals by the firſt intention. If the ſtone fixes near the point of the yard, as it ſometimes does, if it is ſo near as to be obſerved by the eye, it may be frequently taken out with a pair of ſmall diſſecting forceps: and in order to facilitate the extraction, when it cannot be otherwiſe effected, the *urethra* may be ſomewhat dilated from its extremity with the point of a ſcalpel. But if ſucceſs ſtill fails us, an inciſion muſt be made upon the ſtone as where the *urethra* is covered with ſkin. Soft dreſſings ſhould be applied to the wound; and when the cure is nearly completed, a hollow bougie, a ſhort ſilver tube, or a ſmall catheter of the elaſtic gum, ſhould be introduced into the *urethra*, in order to preſerve it of a proper ſize. The worſt ſituation in which a ſtone can be fixed in the *urethra*, is juſt below the ſcrotum; for if the ſtone either makes its way into the ſcrotum, or if it is neceſſary to make an opening into it with a ſcalpel, ſuch large collections of urine are apt to occur, as commonly occaſion much diſtreſs. To obviate this, ſo ſoon as a ſtone is diſcovered in this ſituation, the greateſt attention ought to be given, either to get it carried farther into the *urethra*, or, if this cannot be effected, to puſh it back into the perinæum, by means of a ſtaff. If either of theſe is impracticable, and it is neceſſary to extract the ſtone, an inciſion muſt be made into the *urethra*, by beginning the cut at the under part of the ſcrotum immediately to one ſide of the ſeptum, and continuing it upwards till the ſtone is diſtinctly felt, when it is to be laid bare and extracted as above directed. In applying the dreſſings after the operation, conduct them ſo as that the ſore may heal firſt at the bottom; if this is not duly attended to, the parts below will be filled with matter, or perhaps with urine, and thus very troubleſome ſinuſes may be formed. In females, the *urethra* is ſhort, and dilates readily, ſo that ſtones rarely are detained in it: but when they are, they generally may be turned out by paſſing the end of a blunt probe behind them, and then pulling forward: or if this does not ſucceed, the end of the *urethra* may be ſlit a little way ſo as to admit the introduction of a pair of forceps by which the ſtone may be extracted. Beſides this, there are obſtructions formed in the *urethra* from many other cauſes, ſuch as caruncles, ſtrictures, &c. See Bell's Surgery, vol. ii. p. 140—188.

URETHRELMINTHICA ISCHURIA. A ſuppreſſion of urine from worms in the urethra.

URETHRITICA. A ſuppreſſion of urine from inflammation in the urethra.

URETHROHYMENODES. A ſuppreſſion of urine from a membrane obſtructing the urethra.

URETHROLITHICA. A ſuppreſſion of urine from a ſtone in the urethra.

URETHROPHLEGMATICA. A ſuppreſſion of urine from mucus obſtructing the urethra.

URETHROPYICA. A ſuppreſſion of urine from pus obſtructing the urethra.

} See ISCHURIA.

URETHROTHROMBOIDES. A ſuppreſſion of urine from grumous blood obſtructing the urethra. See ISCHURIA.

URINA. The URINE, called alſo *adſamar*, *albor*, *alcolita*. It is a fluid which is ſecreted from the blood by the kidneys, conveyed by the ureters to the bladder, and from thence it is diſcharged from the body through the urethra. It is ſo acrid and diſpoſed to putrefy, that, if retained long in the bladder it endangers the patient's life. When ſuppreſſed, it has been known to paſs through the pores of the ſkin. The ſudden diſcharge of ſome fluids after ſwallowing them hath cauſed ſome to imagine that

there is ſome ſhorter paſſage to the bladder than through the kidneys; but though difficulties attend this circumſtance, ſome of the moſt eminent in their profeſſion are of opinion that all the *urine* is ſecreted by the ſame veſſels.

Many are the ſigns which different authors have pointed out in the *urine*, by which to judge of the different ſtates of the body; but Dr. William Heberden well obſerves that this excretion affords the practitioner but little uſeful information.

The appearances, obſerved in the *urine* at the criſis of acute diſeaſes, are generally included in the three following, viz. the *nubes*, or *nubecula*: it is when a cloud, as it were, is diffuſed through the *urine* after it hath ſtood a while in a glaſs; the *enæoremata*, or, as the Latins call them, the *ſublimationes*, *ſuſpenſa*, or *ſublimia*, which is, when the cloud ſinks a little, leaving the *urine* above, ſomewhat tranſparent; and laſtly, the *hypoſtaſis*, or, as the Latins name it, the *ſubſidentia*, *ſubjecta*, or *ſedimenta*, which is when the whole cloud falls and makes a thick ſediment at the bottom. When it drops a white mucus, or purulent ſediment, it is then named *puoturia*.

Urine contains a peculiar ſalt, called *microcoſmic ſalt*, and which is found no where but in *urines*; *marine ſalt*; and if diſtilled in a retort, it yields not only the *volatile ſalt*, and *empyreumatic oil*, common to animal matters, but alſo a *peculiar kind of phoſphorus*. *Urine* is uſed in ſundry arts.

See Haller's Phyſiology, ſect. 32. Fordyce's Elements, part i. p. 16—18. Proſper Alpinus's Preſages. Neumann's Chem. Works. Lewis's Mat. Med.

The *urine* is ſometimes too copiouſly diſcharged, ſee DIABETES; it is alſo ſometimes difficultly paſſed or totally ſuppreſſed, ſee ISCHURIA; it is ſometimes mixed with blood, and in ſome inſtances it is involuntarily diſcharged; hence

BLOODY URINE. *Hæmaturia*, from αἷμα, *ſanguis*, and οὖρον, *urina*. Hippocrates obſerves that if pure blood is copiouſly and ſuddenly diſcharged without pain, it flows from the vaſcular ſubſtance of the kidneys; but when the quantity of blood is ſmall, of a blackiſh colour, and eſpecially if there is pain, or heat, or both, during or after the diſcharge, it proceeds from the bladder. *When ruptures of the veſſels in the bladder* happen, the ſymptoms are ſevere, ſuch as intenſe pains, fainting, difficulty of breathing, a low, ſmall, frequent pulſe, nauſea, anxieties of mind, and cold ſweats.—*If a rough ſtone wounds the ureters*, the pain is felt in the back, and there is a difficulty in making water.—*A ſtone in the bladder* ſometimes cauſes this diſorder; and in the Edinb. Med. Eſſays, vol. vi. is an inſtance of a worm in the bladder ſometimes producing this diſeaſe.—Cœlius Aurelianus ſpeaks of a *ſpecies of hæmorrhoids diſcharging blood with the urine*: and it is ſometimes obſerved both in young and aged men that, on a *ceſſation of the hæmorrhoids*, blood paſſes with the *urine*. —Hoffmann obſerves that ſometimes an hæmorrhage happens *from the veſſels of the bladder*, or *rather of its ſphincter*, diſtended and opened, in the ſame manner as from the hæmorrhoidal veſſels: in this caſe, the flux is periodical, a retention of the blood occaſions a pain about the pubes, the blood drops away ſometimes without *urine*, and is never equally mixed with the *urine*, as that always is which comes from a higher ſource. *Some aged women, who live luxuriouſly after the* ceſſation of their menſes, have their *urine* often mixed with blood.—*Strong purges, too forcing diuretics*, or *other cauſes of ſpaſms in the belly*, are alſo cauſes of bloody *urine*. *Bloody urine* is always ſymptomatic. It is for the moſt part a ſymptom of a calculus in the kidney; ſometimes of putrid fevers from a diſſolution of the blood.—When from the bladder, it is moſt frequently from a ſtone, rarely from any other diſeaſe of that organ.

The *urine* ſometimes appears to be bloody when there is no blood diſcharged with it; this is known by ſtraining it through a linen cloth; for if it is bloody, the cloth will be tinged, but otherwiſe not.

Bloody urine ſhould be diſtinguiſhed from bloody diſcharges in a gonorrhœa, from that ſpecies of piles which flow into the urinary paſſages; and critical diſcharges of the blood in the urinary paſſages ſhould be diſtinguiſhed from thoſe that are not ſuch.

When *bloody urine* is mixed with pus, there is an ulcer ſomewhere in the urinary paſſages. All diſcharges of *bloody urine* are to be feared, though thoſe from hæmorrhoids the leaſt ſo; but the moſt dangerous are thoſe from ulcers and from wounds of the kidneys or bladder. Hæmorrhages from the kidneys, and from the ſphincter of the bladder, are often critical and ſalutary, and return at certain intervals. In plethoric men, both young and old, from the omiſſion of cuſtomary venæſection, or from hæmorrhoidal obſtructions in women of eighty, who were hale and of high life, who had neglected to ſupply by bleeding, the evacuations which nature had made formerly from the uterus, theſe diſcharges continue for a conſiderable time, in no ſmall quantity, without any ill-conſequence: yet, though at firſt they may appear ſalutary, from their ſupplying other evacuations, they are far from being without danger, from gradually waſting the ſtrength, &c.

When the patient is plethoric, or when a ſuppreſſed ſanguine excretion is the cauſe, *bleed*, and *keep the bowels lax*.—If there is any tendency to, or actual inflammation, *frequent draughts of an infuſion of linſeed may be taken*, and *ſmall portions of nitre* may be diſſolved in each draught juſt before it is drank.—The uva urſi is eſteemed a ſpecific, but other medicines of the aſtringent kind ſhould not be ventured on.—The *natron vitriolatum* may be repeated in proper doſes, to procure gentle evacuations, every or every other day.—When *a ſtone in the bladder* is the cauſe, reſt ſhould be indulged; as much manna may be taken twice a week in a pint of whey, as will paſs off readily by ſtool, and, if need be, an anodyne may be taken after the operation.—*When the diſcharge is from the kidneys or the ureters*, an infuſion of the ſeeds of wild carrot is of ſingular benefit. See DAUCUS CRETICUS.—*If ſuppreſſed hæmorrhages produce this diſorder*, bleed and give aloetics. *When a putreſcence in the blood* and *juices* is attendant, the bark with the dilute vitriolic acid will be the neceſſary means of relief.—*When ulcers are ſuſpected in any of the urinary paſſages*, give ſuch medicines, and direct ſuch liquors for the common drink, as ſheathe acrimony. See Hoffman's Rat. Med. Syſt. Cullen's Firſt Lines, vol. iii. p. 67. edit. 4. London Med. Journal, vol. iv. p. 282. Wallis's Sydenham.

INCONTINENCE OF URINE. This is termed by noſologiſts, ENURESIS, (from ἐνουρέω, *urinam non contineo*). Dr. Cullen places this genus of diſeaſe in the CLASS LOCALES, and ORDER APOCENOSES, and defines it, "an involuntary flux of urine without pain." He diſtinguiſhes two ſpecies; 1. *Enureſis atonica*, when ſome other diſeaſe has injured the ſphincter of the bladder; 2. *Enureſis irritata*, when it ariſes from compreſſion, or irritation of the bladder.—When from paralytic affection, it is conſidered as ſymptomatic. This diſorder may be occaſioned by pregnancy, a palſy in the ſphincter of the bladder, a weakneſs in the ſphincter of the bladder from hard labour, or from a violent extraction of a ſtone through the urethra, perforation in the bladder, a ſtone in the bladder, wounds on the head, a laceration, or a relaxation of the ſuſpenſory ligament of the bladder, &c.

The moſt frequent cauſes are, a *weakneſs* or *palſy in the ſphincter of the bladder*, in which caſes a bliſter is generally a ſucceſsful remedy; it ſhould be placed on the lumbar vertebræ and the os ſacrum, and may be kept open ſome days by means of the ung. cantharidis. If the ſphincter of the bladder is relaxed from the extraction of a ſtone, it uſually recovers ſpontaneouſly; however, ſome mildly aſtringent medicine may be applied.—*When this diſorder is obſerved in children*, it is ſometimes relieved by drinking an infuſion of ſtrawberry leaves, and rubbing the pubes with rectified ſpirits of wine.—*When pregnancy is the cauſe*, the patient muſt wait until after delivery.—*When a ſtone in the bladder* produces this diſorder, lithotomy ſometimes relieves, but cannot be truſted to, for ſometimes it proves a cauſe of this diſorder, when, before, it had no exiſtence. See Hoffman's Rat. Med. Syſt. Lond. Med. Obſ. and Inq. vol. ii. and iii. Bell's Surgery, vol. ii. p. 163. London Med. Journal, vol. vi. p. 417. vol. vii. p. 416. White's Surgery, p. 378.

URINÆ STIMULATORES. See ACCELERATORES URINÆ.

URINARIA. See LINARIA; DENS LEONIS.

URORRHŒAS. The urine paſſing from the urethra through ſome eroſion of the perinæum.

URTICA, *ab urendo dicta*, becauſe it excites puſtules ſimilar to fire. The COMMON NETTLE, called alſo *acalephe*; *adice*; *enide*, by Dioſcorides. It is the URTICA DIOICA *foliis oppoſitis oblongo cordatis, racemis geminis, amentis cylindricis*. CLASS. MONŒCIA, ORDO TETRANDRIA. LINN. Gen. Plant. 1054. Boerhaave mentions eight ſpecies; but none of them obtain in the preſent practice. However it has been long uſed for medical and œconomical purpoſes. It was uſed againſt hæmorrhages,

morrhages, and has been ſaid to be diuretic, and uſeful in calculous complaints, ſcurvy, gout, jaundice, &c. When young, it is found to be a good ſubſtitute for greens, and other pot herbs. In ſpring, the young ſhoots are boiled and eaten by the common people, inſtead of cabbage greens. When applied to the ſkin, they produce ſtrong irritation, and hence they have ſometimes been uſed externally to ſtimulate paralytic limbs, in order to recover ſenſe and motion, and alſo in other caſes of torpor or lethargy. The COMMON NETTLE. For that called *—alba,—iners,—mortua*, ſee LAMIUM ALBUM; *—iners magna fœtidiſſima*, ſee GALEOPSIS; *—lactea*, ſee LAMIUM MACULATUM.

URTICA MARINA. SEA BLUBBER. It ſwims on the water, being a round compreſſed pellucid ſubſtance, reſembling jelly, with red veins interſperſed.

URTICARIA, } Called alſo *febris urticata*; *uredo*,
URTICATA. } *purpura urticata*. The ACUTE NETTLE-RASH. Dr. Cullen places this genus of diſeaſe, in the CLASS LOCALES, and ORDER EXANTHEMATA, which he defines—febris amphemerina, in which red ſpots reſembling the ſtinging of nettles break out on the ſecond day, commonly diſappearing in the day-time, and returning at night with fever, and after a few days falling off totally in very minute ſcales. This is the *ſpecies altera eryſipelatis* of SYDENHAM, and the *ſcarlatina urticata* of SAUVAGES. Dr. Cullen ſays that there is a diſeaſe called by the Engliſh, the NETTLE RASH, which is by ſome agreed to be the *urticaria*; but the *nettle raſh*, as deſcribed by the very learned Dr. HEBERDEN in the London Medical Tranſactions, and ſuch as I have often ſeen, is totally different from the urticaria of noſologiſts; for it is chronical without fever, and rather belongs to the claſs of impetigines;—and that in a former edition of his Synopſis he had ſaid that the urticaria was contagious; but that opinion he now reſcinds, from his own experience, though he cannot remember the author from whence he took the idea. He obſerves that all agree that it is a mild diſeaſe, ſeldom requiring the uſe of remedies. It is generally ſufficient to obſerve an antiphlogiſtic regimen, and to keep the patient in a temperature that is neither hot nor cold. Cullen's Firſt Lines, edit. iv. vol. ii. p. 252.

URUCU. See ACHIOTL.

USTIO. See CALCINATIO.

UTERARIA. UTERINE or HYSTERIC MEDICINES. Medicines ſuited to cure diſeaſes of the uterus. A term much too general to be admitted.

UTERIFORMIS ABSCESSUS. See ŒDEMASARCA.

UTERUS. The WOMB; called alſo *gone*; *ager naturæ*; *hyſtera*; *matrix*; *metra*; *utriculus*; *delphys*; *gaſter*; and, becauſe it is fertile, *eugeos*: and thus alſo is named the *hymen*. The *uterus* is ſituated between the bladder and the rectum; it is covered with the peritonæum, which comes from the back part of the bladder, aſcends up the fore part of the *uterus*, from thence over the fundus, down the poſterior ſide, and ſo to the rectum. On each edge of the *uterus* this poſition of the peritonæum forms a broad duplicature, which is extended on each ſide, more or leſs directly, to the adjoining lateral parts of the pelvis, forming a ſort of membranous partition between the anterior and poſterior halves of the cavity of the pelvis; and then is continued looſely with the peritonæum on the ſide of the pelvis; theſe two duplicatures are called the ligamenta lata: the laminæ of which are connected by a cellular membrane, and contain the tubæ Fallopianæ, the ovaria, and part of the ſpermatic veſſels, and thoſe which go to the *uterus*, alſo the ligamenta rotunda, and the nerves. The *uterus* is rather triangular in its ſhape, the fundus is almoſt a ſtrait line, the two ſides approaching each other, makes it narrow where the cervix begins, then it grows larger, then narrow again at the os tincæ, which is received into the vagina. Where the uterus grows broad beyond the neck, MOSCHION calls it *omos*. The inſide of the *uterus* is ſmooth; at the upper part, the *uterus* is very vaſcular; at the ſides and below, it is white. The cervix *uteri*, on each ſide, is divided into two lateral parts by a ridge, whence the fibres go off in the manner of a feather. At each angle of the fundus we may introduce a briſtle into the beginning of the Fallopian tubes, which go in a tortuous manner, and terminate at the ovaria in an irregular round jagged extremity, where their diameter is about one third of an inch; this fringe is called morſus diaboli, and is hung upon a membrane like the meſentery, between the doublings of which, the veſſels run to the tubes. The tubes are not ſmooth internally, but there are innumerable longitudinal rugæ placed cloſe upon one another. See OVARIA and TUBÆ FALLOPIANÆ. The *uterus* is furniſhed with blood-veſſels from the hypogaſtrics and the ſpermatics. The ſpermatics riſe as in the male, and when they get to the ſoas muſcle, they paſs upon the ligamenta lata, and go to the tubæ Fallopianæ, the ovaria, and the *uterus*. On the ſides of the *uterus*, the hypogaſtrics paſs to the vagina, &c. and theſe anaſtomoſe with the ſpermatics; they run in a ſerpentine manner. The ſpermatics are moſtly above, and the hypogaſtrics below.

See De Graaf de Mulierum Organis Generationi inſervientibus. Winſlow's Anatomy. Haller's Phyſiology, lect. 34 and 35.

UTRICARIA. See BANDURA.

UTRICULUS. See UTERUS and VAS.

UTRIFORMIS ABSCESSUS. See ŒDEMOSARCA.

UVA. See STAPHYLOMA.

UVA GRUINA. CRANE BERRIES. They are brought from New-England, and are reckoned antiſcorbutic.

—— URSI. BEAR'S WHORTLE BERRY, BEAR'S WHORTS, or BEAR'S BILBERRIES. It is the ARBUTUS UVA URSI, *caulibus procumbentibus, fol. integerrimis*. CL. DECANDRIA, ORDO MONOGYNIA. LINN. Gen. Plant. 220. The BEAR-BERRY STRAWBERRY-TREE, or TRAILING ARBUTUS. It is alſo called *vaccaria, vaccinia*. The plant is an evergreen, trailing, ſhrubby one; it hath many ſmall, oblong, oval leaves, monopetalous white flowers, with a fleſh-coloured edge, cut into five ſections; the berries are red. It greatly reſembles the common red wort-buſh, from which it may be diſtinguiſhed by the leaves being more oblong, and by the flower having ten ſtamina, and the berry five ſeeds; whereas the flower of the common whortle hath only eight ſtamina, and the berry often twenty ſeeds. It is found on the ſnowy hills in Auſtria and Styria, but more plentifully in Sweden, and it is cultivated in gardens in England; it is alſo found in Scotland.

The leaves have a bitteriſh aſtringent taſte, without any remarkable ſmell, at leaſt when dry: they are celebrated by Dr. Haen, in nephritic and calculous complaints, and ulcers in the urinary paſſages, in which caſes 3 ſs. of the powder was taken faſting, or two or three times in a day. It is very uſeful to many in moderating the pain which often attends calculous complaints; but in other reſpects hath not yet been attended with thoſe advantages in England, for which it is ſo ſtrongly recommended by the juſt named profeſſor. Dr. Cullen has found it very powerful for relieving the ſymptoms of calculus. It has alſo been recommended in cyſtorrhœa, diabetes, &c. and almoſt every other complaint to which the urinary organs are liable. *In powder* it is commonly given from fifteen grains to thirty, two or three times a day. *In decoction*, or *infuſion*, one to two drams, in a pint of water, daily. Mat. Med. See Med. Muſ. vol. i. n. 13.

—— PASSA. A grape dried in the ſun, or *raiſin*, called alſo *aſtaphis*; *paſſulæ*. When the grapes dry on the vines, they are called *patetæ uvæ*, or *patetheiſæ*; the fruit of the *vitis vinifera* Linn. See VITIS. For that called *criſpa*, ſee GROSSULARIA; —— *Lupina*, ſee HERBA PARIS.

UVEA, named alſo ACINIFORMIS, or ACINOSA TUNICA. So the poſterior lamina of the iris hath been called; ſome called the *choroides* by the name of *uvea*, and the coloured part they called iris. The ancients called it *uvea*, becauſe they obſerved it to be of the colour of an unripe grape in grazing animals, for they chiefly diſſected brutes. Mr. Pott calls the iris a circular muſcle.

UVERO. See GUAIBARA.

UVULA. It is alſo called *cion*, by ARETÆUS; *gargareon, columella, columna oris, gurgulio, interſeptum, pinnaculum fornicis gutturalis, plectrum*; ſometimes *caruncula*. From the middle part of the palatum molle, the *uvula* hangs down into the throat, acting as a valve, by means of whoſe different actions we can breathe either through the mouth or the noſe. It is of an irregularly conical ſhape, and is glandulous. See CRASPEDON.

UVULARIA. See LAURUS ALEXANDRINA.

UXOR. See ADAMUS.

UZIFUR. See ADROP.

V.

VAG

VACCA MARINA. See MANATI.

VACCARIA. See UVA URSI.

VACCINIA. A name for ſeveral ſorts of the *vitis Idæa*, alſo of the *uva urſi*; for that called—*nubis vulgaris*,—*vaccinium Loncaſtrenſe nubis*, ſee CHAMÆMORUS.——*Paluſtris*, ſee OXYCOCCUS.

VAGA. An erratic kind of intermitting fever, returning at more than ten days from each fit.

VAGINA. In BOTANY, it is the ſheath or covering of a bud, or membrane inveſting a ſtem; hence

VAGINALES. The name of the 27th order in Linnæus's Fragments of a Natural Method in his *Philoſophia Botanica*.

VAGINALIS, in ANATOMY, called alſo *cauſis*. It is the paſſage from the external pudenda to the mouth of the uterus. Its courſe is upward and backward; its inſide is very vaſcular and villous, and the villi are very full of veſſels and nerves. The *vagina* is contracted at its orifice by the ſphincter *vaginæ*, and in its whole length by the levator ani. Each ſide of the anterior portion of the *vagina* is covered externally by a thin broad expanſion of veſſels called the plexus retiformis; theſe two planes run down each ſide of the clitoris behind the nymphæ, and likewiſe cover the urethra like a collar before they are ſpread on the *vagina*; this plexus is capable of being erected, and in coitu it is compreſſed by the ſphincter *vaginæ*, which is contrived for the greater pleaſure. The *vagina* is a fleſhy membranous tube, which lies immediately before the rectum, is incurvated, hath the turn of the bones as the uterus hath, is collapſed and compreſſed between the bladder and the rectum. The ſtructure of the *vagina* is very vaſcular; on its inſide it is very rugous. It is commonly reckoned muſcular. The *vagina* is ſometimes too narrow; this may be either natural, from original conformation; or accidental, in conſequence of diſeaſe. Cicatrices may be formed from a laceration after ſevere labour; in conſequence of ulceration, eroſion, &c. Preternatural conſtrictions may be induced from the uſe of ſtyptic applications, or fumigations. The cure may be attempted by emollient fomentations, as by the ſteams of warm water directed to the parts; and by introducing a ſmall tent of compreſſed ſpunge. If theſe fail, recourſe muſt be had to the knife: though, in the ſimple contraction of the cavity of the *vagina*, this expedient is ſeldom neceſſary, and the attempt is often attended with the utmoſt danger; therefore ſhould never be determined on until every other method hath failed. The dilatation which was previous to impregnation, has very often been accompliſhed by labour pains. Sometimes there is a natural defect, ſo that the *vagina* is either imperforated altogether, or a foramen only remains ſufficient to tranſmit the menſtrual blood. If, from a coalition of the parietes of the *vagina*, the paſſage be entirely ſhut up, an attempt to force it would be vain. The orifice, in the latter caſe, will afford a proper direction for the knife; but the operator muſt be cautious not to miſtake the urethra for the paſſage into the *vagina*. When the *vagina* is impervious altogether, the uterus has been ſometimes found wanting.

Fleſhy, fungous, or polypous tumors ariſe from all

VAL

parts of the *vagina*. They happen to women at every period of life, but moſt frequently towards the decline. They generally proceed from an obſtruction of the ſmall glands of the parts, and are leſs or more difficult to diſcover or remove, as their origin is low or high in the *vagina*. Their texture is various; ſometimes they are tender and mucilaginous, like thoſe in the noſe; at other times firm and ſolid, like a wen; ſometimes their baſes are very conſiderable; though they generally adhere by a ſmall neck. They ſometimes, like ſcirrhi, continue indolent for many years; and are alſo liable to degenerate into ſcirrhus and cancer. In their mildeſt ſtate, they are attended with perpetual ſtillicidium from the *vagina*, and ſometimes with profuſe and dangerous floodings. Carefully diſtinguiſh betwixt theſe tumors, and hernæ, or prolapſus uteri, &c. Polypi, when curable by an operation, may generally be removed by ligature; a ſafer method than cutting, as they are often ſupplied with large blood-veſſels. For fixing the ligature, the fingers of the operator will be ſometimes ſufficient. When this method fails, Dr. Hunter's needle, or M. Levret's double canula, for applying and fixing the ligature over the tumor, are the moſt ſimple and ſucceſsful expedients. Mr. Levret's inſtrument is a piece of flexible gold or ſilver wire, paſſed through a double hollow probe in the form of a nooſe: this is to be conveyed into the *vagina*, and carried over the tumor, till it reaches the baſe. The ends of the wire muſt be gently drawn, or it muſt be twiſted round as tight as the patient can eaſily bear; the canula muſt afterwards be fixed to the thigh, and the wire tightened every day as it ſlackens. Thus the circulation in the tumor is ſtopped, and in two or three days the polypus will drop off. In fixing the ligature, the operator muſt be cautious not to miſtake the tubercle of the os tincæ for the polypous tumor. See Hamilton's Outlines. This name *vagina* is given to other parts of the body, as to the *capſula Gliſſonii*, which is called *vagina* portæ. A coat of the teſtes is called *vaginalis tunica* (ſee TESTES); and this name is given alſo to a coat of the œſophagus and of the ſpinal marrow.

VAGINA PORTÆ. See CAPSULA COMMUNIS GLISSONII.

VALANIDA. See FAGUS.

VALERIANA. VALERIAN. Boerhaave enumerates thirteen ſpecies. In warmer countries, the ſort diſtinguiſhed by the name of SETWALL, or of GREAT GARDEN-VALERIAN, is preferred; but in colder climates the beſt is the *valeriana ſylveſtris major* of Caſp. Bauhine; it is alſo called *phu Dioſcoridis*, and GREAT WILD VALERIAN. VALERIANA OFFICINALIS, *foliis omnibus pinnatis, floribus triandris*. CLASS. TRIANDRIA, ORDO MONOGYNIA. LINN. Gen. Plant. 44. GREAT WILD VALERIAN. It is a plant with channelled ſtalks, the leaves in pairs; each leaf is compoſed of a number of long, narrow, ſharp-pointed ſegments, indented about the edges, of a dull green colour, ſet along a middle rib, which is terminated by an odd one; producing on the tops of the ſtalks umbel-like cluſters of ſmall monopetalous flowers, which appear in May, June, and July, each of which is followed by a ſingle naked ſeed, winged with down; the root conſiſts

of

of tough ſtrings, with numerous ſmall threads matted together, iſſuing from one head, of a duſky browniſh colour approaching to olive. It is perennial, and grows wild in dry mountainous places.

Valerian roots when dry have a ſtrong and grateful odour, rather a diſagreeable, warm, bitteriſh, ſubacrid taſte; the ſtrength of their ſmell and taſte is the only mark of their genuineneſs and goodneſs. The roots have often a diſagreeable ſmell from the urine of cats: and ſometimes there is a mixture of the roots of a ſpecies of crowfoot among them; but on chewing them they are ſomewhat cauſtic, and thus they are diſcovered. Theſe ſhould be taken up at a proper ſeaſon, and properly preſerved, or they become inert.

The powdered root, digeſted in water or in ſpirit of wine, impregnates both menſtrua ſtrongly with the ſmell and taſte; water diſtilled from it ſmells ſtrong of the root, but no eſſential oil ſeparates, though ſeveral pounds are committed at once to the ſtill. The watery extract is ſtrong, diſagreeably ſweetiſh, and a little bitter; the ſpirituous extract is agreeable, and much reſembles the root.

As a medicine, theſe roots are an excellent antiſpaſmodic in nervous diſeaſes, and take a place amongſt the mildeſt of the fetids. The powder hath been extolled in epilepſies; for which end, from ℈ ij. to ʒ ij. of it are given three times a day; indeed it hath been given to the extent of two ounces in the day without effect.

Dr. Cullen has found it uſeful in epileptic, hyſteric, and other ſpaſmodic affections. It ſeems moſt uſeful when given in ſubſtance, and in large doſes; ſeldom ſo in infuſion. It has been given with ſucceſs in many nervous caſes, particularly thoſe produced by increaſed mobility, and irritability of the nervous ſyſtem. It is conſidered as poſſeſſing *antiſpaſmodic*, *diaphoretic*, and *diuretic* powers, and as being an emmenagogue and anthelmintic; as an antiſpamodic, it may be chiefly conſidered, and may, in ſpaſmodic and convulſive complaints, be a good auxiliary to other more powerful medicines of that claſs; indeed, in this view, it is chiefly employed, and more particularly in the *hemicrania*.

The root is the beſt preparation, and when its flavour diſguſts, the mixture of a little mace renders it more agreeable. Next to the powder, a ſtrong tincture made with a proof ſpirit is to be choſen. The College of Phyſicians of London order two tinctures of *valerian* made in the following manner:

TINCTURA VALERIANÆ. *Tincture of Valerian.*

Take of the root of wild *valerian* in coarſe powder, four ounces; proof ſpirit of wine, two pints; digeſt with a gentle heat for eight days, and ſtrain. Doſe, one or two tea-ſpoonfuls, in nervous languors, ſinking in the præcordia, &c. If to lb. i. of this tincture, ʒ ii. of the diluted vitriolic acid be added, it proves an uſeful remedy in thoſe headachs which affect the ſtudious, it ſtrengthens the ſtomach, and relieves many flatulent and ſpaſmodic ſymptoms.

TINCTURA VALERIANÆ VOLATILIS. *Volatile Tincture of Valerian.*

Take of the root of wild *valerian*, four ounces; compound ſpirit of ammoniac, two pints; digeſt for eight days, and ſtrain. Pharm. Lond. 1788. This tincture, made doubly ſtrong with the root, is an excellent remedy in the above caſes, and acts ſuddenly, and effectually: from twenty to ſixty drops may be given for a doſe. See Neumann's Chem. Works. Lewis's Mat. Med. Med. Muſ. vol. i. n. vii. Cullen's Mat. Med. It is alſo a name for the *lactuca agnina*; a ſpecies of *polemonium*, of the *nardus celtica*.

VALERIANA CAMPESTRIS INODORA MAJOR. See LACTUCA AGNINA.

—— CELTICA. See NARDUS CELTICA.

VALERIANELLA. See LACTUCA AGNINA.

VALGUS. BOW or BANDY-LEGGED, alſo *bleſſus*. The legs bending outward. Some children are *bow-legged* from their birth; others become ſo from ſetting them on their feet too early. The tibia of ſome is crooked, the knees of others are diſtorted from a fault in the ancle; the feet of ſome are turned inwards: theſe are called *vari*; and in others they turn outwards: they are called *valgi*. The beſt method of preventing theſe diſorders in weakly children, is to exerciſe them duly, but not violently, by dancing or toſſing them about in one's arms, and not ſetting them much on their feet, at leaſt not without properly ſupporting them: if the diſorder attends at the birth, or increaſes after it is begun, apply emollients, then boots of ſtrong leather, wood, &c. as required, to diſpoſe the crooked legs gradually to a proper form; or other inſtruments may be uſed inſtead of boots, which, when not too coſtly, are uſually to be preferred. Slighter inſtances of theſe diſorders yield to careful nurſing, without inſtruments. See Hildanus, Le Clerc, Solingen, and Heiſter's Surgery. Alſo the word CYLLOS.

VALLUM. A ſpecies of bandage, alſo *ſupercilium*, the eye-brow, the moſt prominent part of which, by a metaphor, is called *geiſon*, which is applied to the eaves of houſes.

VALVA, from *valvæ*, *folding doors*. A VALVE. It is any thing that opens and ſhuts over the mouth of a veſſel. In ANATOMY it is a membrane which opens certain veſſels to admit the blood or other fluid, and which ſhuts again to prevent its returning.

VALVULA NOBILIS. See COR.

VALVULA CŒCI;—COLI;—ILII. See COLON.

VALVULA MAGNA SYLVII. See CEREBELLUM.

VALVULA is the outer coat, ſhell, or covering of a capſular, or other pericarp; or the ſeveral pieces which compoſe it. If a pericarp is entire, it is ſaid to be univalve; if it is divided, according to the number of pieces or diviſions, it is called bivalve, or trivalve. The leaflets, compoſing the calyx and corolla in graſſes, are alſo named valves; as are alſo the ſubſtances or ſcales, which cloſe the tube in ſome flowers. See alſo CAPSULA.

VALVULA PALATI. See PALATUM MOLLE.

VALVULÆ CONNIVENTES. They are looſe circular folds, chiefly in the ſmall inteſtines towards the ſtomach, and are productions inwards of the villous coat; their uſe is to mix the chyle with the bile and pancreatic juice, and to retain the chyle that it may not eſcape the lacteals.

VANILLA, alſo called *banilia*, *banilas*, *aracus aromaticus*. VANELLOES. They are the fruit of a climbing plant in the Spaniſh Weſt Indies. They are not only uſed to give an agreeable flavour to chocolate: but they are greatly extolled for their efficacy in cheering the ſpirits of melancholy perſons. See Med. Muſ. vol. iii. p. 342, &c.

VARICELLA. The CHICKEN-POX, called alſo *variola lymphatica*. Dr. Cullen places this genus of diſeaſe in the CLASS PYREXIÆ and ORDER EXANTHEMATA. He defines it to be a ſynocha. After a ſlight fever of ſhort continuance, ſpots break out, which ſomewhat reſemble the puſtules of the ſmall-pox, but hardly advance to ſuppuration; theſe eruptions, after a few days, dry away in ſcales, without leaving any mark behind them. In common, this diſeaſe proceeds in the manner following. The pocks break out in ſome without any illneſs or previous ſign; in others they are preceded by a little degree of chilline ſs, laſſitude, cough, broken ſleep, wandering pains, loſs of appetite, and feveriſhneſs for three days. On the firſt day of the eruption, they are reddiſh; on the ſecond, there is on the top of moſt of them a very ſmall bladder, about the ſize of a millet ſeed. This is ſometimes full of a watery, and colourleſs, ſometimes of a yellowiſh liquor, contained between the cuticle and ſkin. On the ſecond, or at the fartheſt on the third day from the beginning of the eruption, as many of theſe pocks as are not broken, ſeem arrived at their full maturity; and thoſe which are fulleſt of that yellow liquor, very much reſemble what the genuine ſmall pox are on the fifth or ſixth day, eſpecially when there happens to be a larger ſpace than ordinary, occupied by the extravaſated ſerum. It happens to moſt of them, either on the firſt day that this little bladder ariſes, or on the day after that its tender cuticle is burſt by accidental rubbing of the cloaths, or by the patient's hands, to allay the itching which attends this eruption. A thin ſcab is then formed at the top of the pock; and the ſwelling of the other part abates, without its ever being turned into pus, as it is in the ſmall pox. Some few eſcape being burſt, and the little drop of liquor, contained in the veſicle at the top of them, grows yellow and thick, and dries into a ſcab. On the fifth day of the eruption, they are almoſt all dried, and covered with a ſlight cruſt. Remedies are not likely to be wanted much, in a diſeaſe attended with hardly any inconvenience, and which in ſo ſhort a time is cured of itſelf. The principal marks, by which the chicken-pox may be diſtinguiſhed from the ſmall pox, are 1ſt. The appearance on the ſecond or third day from the eruption of that veſicle, full of ſerum upon the top of the pock. 2d. The cruſts which cover the pocks on the fifth day,

at which time thoſe of the ſmall pox are not at the height of their ſuppuration. See Med. Tranſ. vol. i. art. xvii. Cullen's Firſt Lines, edit. 4, vol. ii. p. 171.

VARICIFORMES PARASTATÆ. They are contiguous to the epididymides, and are veſſels ſo called becauſe they appear full of flexures and contortions, like the varices, for the better elaboration of the ſemen.

VARICOCELE. See CIRCOCELE.

VARICULA. A diminutive of *varix*. Thus M. A. Severinus calls an intumeſcence of the veins in the tunica adnata of the eye, when it is cauſed by black blood.

VARIETAS. In Botany, VARIETY. The fourth ſubdiviſion in the Linnæan ſyſtem; it comprehends the various appearances obſervable in plants produced from the ſame kind of ſeed. The cauſes of this variety are the differences of climate, ſituation, or ſoil; and the difference of their appearance is either in magnitude, plenitude, ſhape, colour, taſte, or ſmell. In NOSOLOGY, when a diſeaſe is poſſeſſed of the characteriſtic marks by which its ſpecies is diſtinguiſhed, with ſome peculiarity added to them, this conſtitutes the VARIETY.

VARIOLA. The SMALL POX, by the Arabians, called *Bothor*. Dr. CULLEN places this genus of diſeaſe in the CLASS PYREXIÆ and ORDER EXANTHEMATA, which he defines, a contagious inflammatory fever attended with vomiting, and pain upon preſſing the epigaſtric region. On the third day an eruption of inflammatory pupulæ begins, and is finiſhed on the fifth, which in the ſpace of eight days, run into ſuppuration, and at length forms ſcabs, often leaving behind them depreſſed cicatrices, or pits in the ſkin. Of this he forms TWO SPECIES; 1. VARIOLA DISCRETA, DISTINCT SMALL POX, where the puſtules are few, diſtinct, round, and circumſcribed, and turgid; the fever, upon the eruption being made, immediately ceaſing. 2. VARIOLA CONFLUENS, CONFLUENT SMALL POX, when the puſtules are numerous, confluent, irregular at their baſis; flaccid, elevated only a little; the fever continuing after the eruption. The ſmall pox then is an acute, eruptive, infectious diſeaſe, of its own kind; it is accompanied with inflammation, which terminates by ſuppuration, in cuticular puſtules; it is, in a natural way, uſually completed by three diſtinct, continual, ſymptomatic fevers, viz. the fever of depuration, which is nervous; of ſuppuration, which is ardent; and of retroceſſion, which is putrid. The firſt account we have of this diſorder was written by Rhazes, about the end of the ninth, or the beginning of the tenth century, and his deſcription of it was ſo complete, that little or nothing was added to it for five hundred years after: he alſo uſed the cool method in the management of it. Rhazes ſays that AARON, an Alexandrian phyſician, was the firſt who deſcribed it, and that he wrote A. D. 622. The next to Rhazes was SYDENHAM; he obſerved that the flower the eruption, the more favourable the diſeaſe was; he admirably deſcribes it, and improved the management of it in the firſt period, that is, to the ſixth or ſeventh day, when the ſecondary fever came on; at this period he obſerved that on a ſudden the pulſe became regular, and all the puſtules were out all over the body, the urine was well coloured, or thick, the eyes cool and free from the fiery luſtre which was obſervable before; that the ſecondary fever came on by degrees at the firſt, but ſoon the eyes are inflamed and watery, a delirium comes on, the urine is pale, the pulſe quick and hard, throat ſore, &c. and here he takes the patient out of bed, and orders cool air; the patient's feet to be put into warm water, and an opiate to be given, and repeated as required until the rage is abated.—The next was HELVETIUS, who obſerved the uſefulneſs of purging when the fatal ſymptoms came on, which Sydenham had remarked in the laſt ſtage; and Dr. FREIND introduced the practice in England. BOERHAAVE ſtill advances, with reſpect to the nature and management of the *ſmall-pox*; he ventured to reſtrain the too ſudden eruption of the puſtules, and commends the attempt to cure the *ſmall-pox* without permitting the ſuppuration to come on.—The next to Boerhaave was Dr. THOMPSON; he obſerves the propereſt method of reckoning the time of the eruptions' continuance, their ſuppuration, and that, as circumſtances attend, theſe vary; alſo that the ſwelling of the face, and the ſpitting at the turn, are beſt kept up by moderating the fever. Many other judicious and uſeful obſervations have alſo appeared, but they are almoſt ſuperſeded by the practice of inoculation.

When the *ſmall-pox* is epidemical, it uſually begins about the vernal equinox. Sydenham obſerves, that when it is irregular and dangerous, it begins ſooner, as in January or February. Boerhaave ſays, that if it ariſes in a place where it hath been ſix years abſent, and makes its appearance in January or February, the following ſummer will be attended with a fatal kind; but if it firſt appears in May, it will be of a gentle kind.

SYDENHAM divides the *ſmall-pox* into the diſtinct and the confluent kinds; *ſee above*. Dr. MEAD divides them into the ſimple and malignant: the ſimple is when the ſymptoms are mild, the ſuppuration kindly, and at laſt the puſtules fall off in dry ſcabs;—the malignant is when the fever is great, the puſtules advance but ſlowly, and do not ſuppurate well, and the other ſymptoms are violent.

VARIOLA DISCRETA. THE DISTINCT SMALL-POX begins with a chilline ſs and ſhivering, which is immediately followed by extreme heat, violent pain in the head and back, *vomiting*, and in adults a tendency to ſweat; this laſt is not obſerved in children; *pain juſt under the ſcrobiculus cordis, if it is but gently preſſed with the hand*, ſleepineſs and ſtupor, particularly in children, and ſometimes convulſions, which laſt, if they happen after dentition is completed, you may always ſuſpect the *ſmall-pox* to be juſt approaching; and the eruptions appearing in a few hours afterwards generally verify the prognoſtic; ſo that, for inſtance, if a convulſion fit attacks a child over night, as it uſually happens, the *ſmall-pox* appears in the morning following; and it frequently happens that the *ſmall-pox* immediately ſucceeding ſuch fits, throws out large eruptions, but they are of a mild kind, and rarely confluent. Theſe are almoſt all the ſymptoms that accompany this diſeaſe in the beginning, and they generally precede the eruption of the puſtules; but where the blood is of a looſer texture, and ſo eaſily admits of a change, it ſometimes happens that the ſeparation is performed by degrees, without any conſiderable ſickneſs, before the expulſion of the matter ſhews itſelf by the eruption of the puſtules.

The diſtinct *ſmall-pox* comes out moſtly on the fourth day, incluſive, from the beginning of the illneſs, and ſometimes a little later, but ſeldom ſooner, at which time the ſymptoms are uſually much abated, or even go quite off, ſo that the patient thinks himſelf pretty well; but grown perſons are ſo inclined to ſweat, that it can hardly be prevented, however lightly they are covered; and this diſpoſition continues until the puſtules begin to ripen, and then vaniſhes ſpontaneouſly; this ſweating foreſhews a diſtinct ſort. The eruptions proceed nearly as follows: pale red puſtules, as large as the head of a ſmall pin, ſhew themſelves here and there on the face firſt, or on the neck and breaſt, afterwards on the body, and during this ſtage of the diſeaſe the thoat is affected with a foreneſs, that increaſes as the puſtules ariſe, which growing every day fuller, inflame the ſkin and fleſh of the neighbouring parts; for about the eighth day from the beginning of the diſeaſe, the ſpaces between the puſtules, that appeared before of a pale white, begin to grow red, and ſwell in proportion to the number of the puſtules, with a throbbing pain of thoſe parts, which, continually increaſing, occaſions the inflammation and ſwelling above mentioned, ſo that in the progreſs of the diſeaſe, the eye-lids are ſo filled and diſtended, as ſometimes to make the patient blind; and this tumor looks like a ſhining inflated bladder drawn over them. The blindneſs comes on ſooner if a great number of puſtules fix on the eyes at the beginning of the eruption; immediately after the face, the hands, and fingers ſwell, in proportion to the number of the eruptions. The puſtules on the face, that until this day were ſmooth and red, now grow rough and whitiſh, which indeed is the firſt ſign of a beginning ſuppuration, and they likewiſe gradually diſcharge a yellow matter, in colour reſembling a honey-comb. The inflammation of the hands and face, in the mean time, come to its height, cauſes the ſpaces between the eruptions to look of a pretty florid colour, like a damaſk roſe; and the more mild and genuine the *ſmall-pox* is, ſo much more the eruptions and their intermediate ſpaces approach this colour. As the puſtules in the face appear rougher and yellower every day as they ripen; ſo, on the contrary, thoſe of the hands, and other parts, appear ſmoother, and not ſo white. On the eleventh day, the inflammation and ſwelling manifeſtly abate, and the eruptions, both of the face and the reſt of the body, being come to their maturity and juſt bigneſs, which is nearly the ſize of a pea, they dry and ſcale off, and, in this kind of *ſmall-pox*, uſually quite diſappear on the four-

teenth or fifteenth day; but the eruptions on the hands being generally more obſtinate than thoſe of the other parts, and yet freſh and white, remain a day or two longer. Thoſe on the face and body dry and ſcale off, but thoſe on the hands burſt, and ſo vaniſh. The puſtules on the face are ſucceeded by a ſcurf, or branny ſcales, and thoſe ſometimes by pits, or marks; for when the puſtules firſt fall off, the ſkin is ſmooth, but thoſe ſcales coming on and falling off alternately, do at length make thoſe pits; yet it often happens that this diſtinct ſort leaves no marks behind.

VARIOLA CONFLUENS. THE CONFLUENT SMALL-POX, called by ſome *veſiculæ Divæ Barbaræ*, *variola Japonica*, is attended with the ſame ſymptoms in common with the diſtinct ſort; but they are all more violent, particularly the fever, anxiety, ſickneſs, vomiting, and the pain in the back, by which you may foretel that the confluent ſort are approaching. The patient is not ſo ready to ſweat in this ſort, but a looſeneſs ſometimes precedes, and continues a day or two after the eruption, which is not ever obſerved in the diſtinct kind. The confluent ſort generally comes out on the third day, ſometimes earlier, but rarely later; and the ſooner the puſtules come out before the fourth day, the more they run together: however, though to ſpeak in general, the confluent kind ſcarce ever appear ſo late as the fourth day, yet ſometimes the eruption may be deferred by ſome violent ſymptoms to the fourth or fifth day; e. g. 1ſt. *Sometimes a ſharp pain in the loins reſembling a fit of the ſtone.*—2d, *A pain in the ſide like that in a pleuriſy.*—3d, *A pain in the limbs like that in a rheumatiſm.*—4th, *A pain in the ſtomach, attended with ſickneſs and vomiting.* In theſe caſes, which indeed rarely happen, the ſpots are retarded, and they alſo foretel great danger. Though the ſymptoms, accompanying this diſeaſe in the beginning of the diſtinct kind, go off immediately after the eruption, it nevertheleſs happens much otherwiſe in the confluent kind, in which the fever, and other ſymptoms, afflict the patient for ſeveral days after the puſtules appear. Sometimes this ſort comes out like the eryſipelas, and ſometimes like the meaſles, from which it is next to impoſſible directly to diſtinguiſh them by external appearances; but by attending to the different time of the eruption in theſe diſeaſes, and other circumſtances, which from their reſpective hiſtories will be found to differ greatly, you will be able to diſtinguiſh them. As the diſtemper increaſes, the puſtules, eſpecially thoſe of the face, do not riſe ſo high as thoſe of the diſtinct kind, but, running together, appear at firſt like a red bladder, covering the whole face, and making it ſwell ſooner than in the diſtinct ſort, and at laſt they appear like a thin white pellicle cloſely adhering to the face, and riſing a little higher than the ſurface of the ſkin. After the eighth day, this pellicle grows gradually tougher, as appears by the touch, and inclines to a brown, and not to a yellow colour, as in the diſtinct kind. The roughneſs and colour of the ſkin daily increaſes, until at length the pellicle falls off in large ſcales; but when the diſeaſe hath been ſevere, it uſually ſticks to ſome parts of the face till after the twentieth day. The more violent the *ſmall-pox* proves, the nearer the eruptions, as they ripen, incline to a dark brown colour, and the longer they are in falling off, if left to themſelves; whereas, on the contrary, the leſs they run together, the yellower they grow, and the ſooner they ſcale off. When the pellicle, which covers the face, firſt falls off, it leaves no roughneſs behind, but it is immediately ſucceeded by branny ſcales of a very corroſive nature, which not only make larger pits than the diſtinct kind generally do, but alſo much diſfigure the face with unſeemly ſcars: and in the confluent kind, if the diſeaſe hath been very violent, the ſkin of the ſhoulders and back ſometimes ſcales off, leaving theſe parts bare. In the confluent *ſmall-pox*, the eruptions on the hands and feet are larger than thoſe of the other parts, and are gradually leſs, as they approach the body. Peculiar to the confluent *ſmall-pox* is a ſalivation in adults, and a looſeneſs in children; the former never fails to attend, the latter rarely. *The ſpitting begins as ſoon as the eruption appears*, and *ſometimes a day or two after*; the matter is at firſt thin, and eaſily and plentifully expectorated; but towards the eleventh day the ſaliva becomes viſcous, and is raiſed with difficulty; the patient is thirſty, coughs often while he drinks, and the liquor flies out of his noſtrils; and from this day the ſalivation generally ſtops; though ſometimes, but very rarely, after it hath ceaſed entirely for a day or two, it returns again. On the ſame, i. e. the eleventh day, the ſwelling of the face, and the ſpitting, begin to abate, but then the hands commonly ſwell, or at leaſt ought ſo to do. *A looſeneſs does not ſeize children ſo ſoon as a ſalivation does*; but whenever it begins, if it is not ſtopped by art, it attends throughout the diſeaſe. In both the diſtinct and the confluent ſort, the fever rages moſt from the beginning to the time of the eruption, after which it abates, and continues much more moderate, until the ſuppuration begins; which being finiſhed, it goes off entirely. Again, when the diſeaſe proves violent, the patient hath a kind of fit towards the evening; at which time eſpecially, the moſt dangerous ſymptoms ariſe, and rage moſt ſeverely.

As to the prognoſtics of this diſorder, it is uſually obſerved, *that the danger is proportioned to the number of the puſtules on the head, and particularly on the face.* If many puſtules are on the body, and but few on the face, the danger is ſmall; but though few are on the body, if there are many on the face, the danger is great. If the pain in the head and eyes, which attends in the beginning, but uſually goes off at the appearance of the eruption, continues through the ſeveral ſtages of the diſtemper, it leaves a diſorder in the head after the *ſmall-pox* diſappears, and ſometimes a gutta ſerena is the effect. *Bloody urine, and a diſcharge of blood from the lungs, are uſually fatal ſymptoms*; but a convulſion fit preceding the eruption in children, and a ſweating coming on in adults, are tokens of the diſtinct and mild ſort.

THE PRINCIPAL INDICATION IN THE MANAGEMENT OF THE SMALL-POX is, to prevent the too haſty aſſimilation of the *variolous* matter in the beginning of the diſeaſe; but as the greateſt advantages attend the treating of patients who labour under this diſorder from natural infection, as thoſe are treated in whom it is artificially introduced, the reader is referred for direction therein to the management of the inoculated *ſmall-pox*, and to the authors referred to in the concluſion of this article.

VARIOLA INCISA, SMALL-POX BY INOCULATION. SYDENHAM practiſed in the preſent cool method of treating the *ſmall-pox*, and writ in defence of the ſame.—BOERHAAVE propoſed, as already obſerved, to cure the *ſmall-pox* without permitting a ſuppuration.—In 1713, DR. WOODWARD received a letter which gave an account of the ſucceſs of inoculating the *ſmall-pox* in Conſtantinople.—In 1721, George I. king of Great Britain, conſented that a trial ſhould be made on ſeven condemned criminals; and ſucceſs attending the experiment, ſome of our nobility were inoculated, and, in 1722, ſome of the royal family followed their example.—In three years after, 447 people were inoculated in England, of whom only nine died.—In 1727, NEUMANN writ in the German language on the *ſmall-pox* by inoculation; but ſome favoured and others oppoſed its progreſs; and the practice was but little encouraged, until the intrepidity of Mr. Sutton led him into the preſent improved method of communicating the *ſmall-pox*, and of treating thoſe who are the ſubjects of it. But that benevolence which accompanied the ſagacity in doctor (now baron) Dimſdale, led him to teach the world the art of relieving themſelves from the terrors of that diſeaſe which Sydenham deſcribes as above. His preſent method of inoculating for the *ſmall-pox* is the ſtandard of practice, and his plan is here purſued as the moſt complete on the ſubject.

It hath been queſtioned by ſome, whether or no the genuine *ſmall-pox* was conveyed by inoculation? But there is in reality much more difficulty in conceiving, that a contagious ſubſtance ſhould propagate, inſtead of its own, another diſeaſe. Dr. De Haen, amidſt all his oppoſitions to inoculation, never ſuppoſed that the matter of the *ſmall-pox* produced any diſeaſe but the *ſmall-pox* itſelf.

As to whether the matter for inoculation be from patients labouring under this diſorder received in the artificial or in the natural way, experience does not manifeſt any difference; nor does it ſignify whether the matter is taken from a mild kind, or from the more virulent ſort. The crude matter, received from the place of inoculation before the patient ſickens, ſuffices for this operation. The advantage of inoculation depends more on the diſpoſition of the conſtitution than on the kind of matter which may be conveyed by it; and the next advantages to a proper habit are, the mode of the diſorder's being communicated, and the manner of treating the patient whilſt it is preſent.

The principal advantages of inoculating the *ſmall-pox* are, *that the puſtules can be made to be fewer in the face*; *the*

the marks on the face are not ſo deep from the inoculated as from the natural ſmall-pox; *the ſecondary fever* rarely follows inoculation; *meaſures can be taken to provide againſt the violence* of the future fever, and other ſymptoms; the *loathſomeneſs* and the *difficulty of managing this diſeaſe* is greatly leſſened, from thoſe which attend in the natural *ſmall-pox*. It is probable that the infection being received in a vital part in the natural way may have more violent effects than when communicated by the extremities.

The ſubjects of inoculation are thoſe of every age. If an exception is admitted againſt any, it is during the firſt two years after the birth of infants, or until they have cut their teeth; for until then their irritable frames render them ſuſceptible of violent effects from ſlight cauſes. Old age is no objection: the aged are uſually moſt ſecure from danger. Infants are proper ſubjects, from their birth to the time that their teeth begin to trouble them; and when dentition is over, the vigour of the child's health will always determine for or againſt the operation.

Conſtitutions of moſt kinds admit of inoculation with ſafety. The ſcrophulous, ſcorbutic, arthritic, the corpulent, and even the intemperate, all do well. Thoſe who labour under acute or critical diſeaſes, or in whom are ſymptoms of great debility, ſhould be treated with proper means for the recovery of health previous to their being inoculated.

In general, the temperate ſeaſons are preferred; but the only exceptionable one is the hot months in ſummer; though cold conſtitutions are ſafely inoculated in the warmeſt weather. When inflammatory or putrid diſeaſes prevail, they are unfriendly; and, during their continuance, inoculation ſhould not be admitted.

THE BEST PREPARATION is, to *produce a healthy ſtate of the body*. If the health is perfect, preparation is uſeleſs; if defective, it muſt be reſtored. That peculiar diſpoſition on which a mild *ſmall-pox* depends is yet unknown; an healthy one comes the neareſt to it; and could that be aſcertained, perhaps that is the quid deſideratum.

In the *ſmall-pox* the inflammatory ſymptoms are uſually the principal ſource of our care, and that method which reduces and maintains the vis vitæ near, or rather below the medium of perfect health, whilſt it guards againſt danger, ſupports the patient's vigour, and enables him to ſurmount the morbid attack.

Before the patient is inoculated, a due regard muſt be had to the ſtate of his body, and to the removal of ſuch ſymptoms, &c. as may embarraſs or endanger. The diet ſhould be of the cooling vegetable kind, and ſuch as tends to keep the bowels lax, and promotes the urinary diſcharge. Whatever is the particular diet, full meals are not to be allowed until ſuppuration begins, and then, as well as after the eruptions are fallen off, a gradual return to the uſual diet is moſt proper. Animal food and cordial liquors are only to be uſed if needful for ſupporting the ſtrength and ſpirits of the patient, and, when admitted, great care is required not to exceed theſe intentions in their uſe.

The patient conſidered as a proper ſubject, inoculate him, and in the evening give as much *calomel* mixed with 1-16th part of the *emetic tartar* as will gently move the belly, and in the morning aſſiſt its operations with as much *natron vitriolatum*, or other ſuitable purging medicine, as will procure three or four evacuations: repeat theſe every ſecond night and morning, until the ſymptoms of eruption appear. Mercury ſeems to be eſteemed, by ſome, ſpecific in the *ſmall-pox*, and may be given ſo freely as to affect the gums and excite a general ptyaliſm. When infants at the breaſt are inoculated, the nurſe may take the medicines above preſcribed. When the inflammation at the puncture is too little, increaſe the doſe of calomel, for then it both promotes the inflammation there and accelerates the general eruption.

To communicate the infection, the *variolous* matter muſt be introduced into a ſenſible part; and, as the ſmalleſt ſenſible quantity of *variolous* matter ſuffices to produce the *ſmall-pox*, the point of a needle, or of a lancet may be dipped in the ſerum that oozes from a puncture made in any patient for producing the *ſmall-pox*, or in a *variolous* puſtule, and then introduced into the ſkin, juſt deep enough to wound it; but it is not neceſſary that blood ſhould be diſcharged. Though the needle, or lancet, dipped in the *variolous* matter, will ſuffice ſeveral days after for communicating the infection; ſtill, the ſooner it is made uſe of, the better, as it acts quicker upon the part, and more early diſcovers ſymptoms of the matter having taken effect where the puncture was made. One puncture may ſuffice, but generally one is made in each arm, any where above the elbow.

Inflammation about the puncture is a ſure ſign of infection having taken place; but this cannot be diſcerned if either an inciſion is made, or any dreſſings are applied where the infection was communicated: therefore, the puncture being made, leave it to heal, or to whatever may occur in conſequence of the infectious puncture. By making a puncture only, we may obſerve the progreſs of the infection and ſubſequent diſeaſe; beſides, no ſore, abſceſs, nor mortification, follows the puncture, as is obſerved when inciſions are made.

If a perſon happens to receive the infection by inoculation and in the natural way at the ſame time; that which was received by a wound, operating ſooneſt, deſtroys the diſpoſition in the body to be affected by the natural infection. The progreſs of the infection is obſerved as follows: about the punctured part, and from thence, a juſt prognoſtic is uſually formed of the future ſtate of the diſtemper, and thus future inconveniences may be guarded againſt; ſometimes the effect of the infection is obſerved in a few hours after the patient is inoculated, by ſharp pains darting up the ſhoulder, when the puncture is made in the arm, a ſhivering through the body, a red tumor on the arm, or a ſmall riſing where the matter was applied; but moſt frequently it obſerves the ſubſequent order. Suppoſe the infection to have been communicated in the morning, though it takes effect, nothing is obſerved on that day. On the ſecond day, if the puncture is viewed with a lens, an orange-coloured ſtain is obſerved about its edges, and they ſeem to contract; ſometimes the puncture inflames on the firſt or ſecond day, and then vaniſhes without any further effect; in this caſe, if the patient had not the *ſmall-pox* before, except the punctured part becomes tumid as well as inflamed, and alſo ſuppurates, or is attended with uneaſineſs in the axillary glands, the efficacy of the infection remains doubtful, and, after a few days, the operation may be repeated. On the fourth or fifth day, an hardneſs may be perceived where the puncture was made, an itching is felt there, and generally a ſlight inflammation is alſo obſerved. On the ſixth day, there is generally a *pain and ſtiffneſs felt in the axilla, which continues until the tenth or eleventh day. This is a favourable ſymptom*; it foretels the near approach of the eruption, and denotes a favourable progreſs through the whole of the diſeaſe. *Pain in the head and limbs, with ſtiffneſs under the arms, are among the certain proofs that the infection hath taken place*. On the ſeventh or eighth day, the eruptive ſymptoms appear, ſuch as ſlight remitting pains in the head and back, ſtiffneſs in the arm-pits, tranſient ſhiverings, alternate heats, &c. which continue more or leſs until the eruption is completed: the inflammation in the arm ſpreads, and little puſtules are begun there, which increaſe in ſize as the diſeaſe advances. On the tenth or eleventh day an efflorescence ſurrounds the puncture, and ſometimes extends half way round the arm; the larger this efflorescence is, the fewer are the puſtules uſually; when it accompanies the eruption, the fever and other uneaſy ſymptoms ſubſide, and all difficulty and danger is at an end. As ſoon as the eruptive ſymptoms are perceptible, give a doſe of *calomel with the emetic tartar* as above, and a few hours after give a doſe of the *natron vitriolatum*: and thus for the moſt part all is done that is required from medicine.

It ſometimes happens that none of the ſymptoms on the arm appear before the eighth day, and then the inflammation, &c. about the puncture riſe ſuddenly: this late appearance of ſymptoms is generally regarded as foretelling an untoward diſeaſe, but this is not always the caſe. Mr. Sutton repeats the evacuations from the time of infection to this time, ſo as that no longer appearances of the rigid fibre remain; and obſerves, that when the ſkin is hot and dry, repeated doſes of ſalts do much better than the mercurial medicine.

Among the favourable ſymptoms are, an orange-coloured ſtain about the edges of the puncture on the ſecond day, an itching there in two or three days, a kind of veſication, without much inflammation, on the third or fourth day, a pain and ſtiffneſs in the axilla, the ſooner the better, but if on the ſixth day, it is well; the large efflorescence about the puncture on the tenth or eleventh day, or ſooner; an hardneſs which ſpreads from the puncture as from a centre, and to the touch forms ſtar-like points, and

when

when the part inflamed on the arm rifes as it were to an apex with a little dry fcab on it.

The leſs favourable ſymptoms are, a purpliſh inſtead of a red-coloured inflammation about the puncture, a narrow deep red circle ſurrounding the puncture, and when the incruſtation about the puncture becomes depreſſed and concave in the middle.

The firſt ſymptoms of a fever being manifeſt, a doſe of *calomel* and the *purging ſalts* muſt be given. The higher the fever, the more numerous are the eruptions; at this time, if the fever runs high, give the *febrifuge ſpirit in cold water*, as directed in the article FEBRIS, or *give the ſtibiated nitre in water*, for common drink, and let the patient's thirſt determine the quantity; expoſe the patient to the cool air. As ſoon as by the above means, or by the uſe of other acidulated, or cooling liquors, a perſpiration appears on the ſkin, let the drink be *tepid baum tea*, or *other agreeable ſmall liquors*. This cooling method muſt be urged more or leſs according to the conſtitution of the particular patient. In this ſituation, though the patient is not able to walk, he may be carried out into the air, whatever be the weather, and this though he be ſhivering in a rigor: cold water muſt be given for drink if the patient requires it; the aged and feeble may be allowed white wine whey. Thus either alarming ſymptoms or a large crop of puſtules are prevented. As to the heat or cold to which the patient is ſubjected, that degree which is moſt agreeable to his ſenſation is the proper one. In caſe of great ſickneſs, languor, delirium, eſpecially if attended with a weak pulſe, cordials may be allowed; repeat them as the pulſe and other circumſtances require.

When the eruption is completed, and the ſtate of maturation is begun, allow the patient a little broth, veal, mutton, or jelly, and now and then a glaſs of ſome ſmall vinous, or malt liquor. Some tender conſtitutions indeed require at this time to be kept in bed, and to be ſupplied with a cordial and nouriſhing diet.

Whether the cooling or the cordial method is purſued, the heat of the body ſhould be kept as nearly as may be to that of health; the languid may require to have more heat preſerved than is neceſſary in the robuſt; and it may be obſerved that, as the cool method is to prevent the too great abundance of eruptions being formed on the ſkin, ſo, when they are determined there and fixed, a moderate heat is required to perfect them; ſo a regard to heat, according to the ends expected from it, is to be the rule of management.

During the ſtate of maturation, opiates are not neceſſary, except there are great pain and reſtleſſneſs; and if an opiate is adminiſtered, a clyſter ſhould accompany it: for during the whole courſe of the *ſmall-pox*, a lax belly, and a free diſcharge by urine, are eſſentially neceſſary.

Whether the *ſmall-pox* is produced in the natural or the artificial way, the violent and dangerous ſymptoms are from either an ardent or a putrid fever attending; and an attention to the methods propoſed in thoſe diſorders, as they are applicable here, will enable the practitioner to proceed properly when they attend this complaint.

On the *ſmall-pox*, ſee Wallis's Sydenham. Stack's Tranſlat. of Mead's Diſc. on the *Small-pox*. Huxham on the *Small-pox*. Thomſon's Enquiry into the Origin, &c. of the *Small-pox*. Tiſſot's Practical Obſervations on the *Small-pox*. Brookes' Practice of Phyſic. And on the inoculated *ſmall-pox*, ſee Kirkpatrick and Dimſdale. For particular obſervations, ſee Percival on the Advantages and Diſadvantages of Inoculating Children. Blake's Letter to a Surgeon on Inoculation. Alſo Baker, Burges, Matty, Watſon, Glaſs, Bromfield, Gatty, Chandler, Cullen's Firſt Lines, edit. 4. vol. ii. White's Surgery, p. 423.

VARIOLA CHOLERICA. See MORBILLI.

—— LYMPHATICA. See VARICELLA.

VARIUM, os. See BUBOIDES.

VARIX, called alſo *Ixia*, by Dioſcorides, *bidella*, *curſos*. A preternatural diſtenſion of parts of the veins is called *varices*. Dr. Cullen places this genus of diſeaſe in the CLASS LOCALES, and ORD. TUMORES, and defines it, a ſoft tumor not pulſating above a vein. Sometimes *varices* are formed in the legs, and are ſo large and troubleſome as to require being cut away. See Gooch's Treat. on Wounds, p. 188. Pregnant women frequently have them in their legs, and ſo have thoſe in whom the liver is ſcirrhous. Generally a tight ſtocking, or ſpiral bandage, is all that is needful for relieving the inconveniences occaſioned by this complaint. See Heiſter's Surgery. Bell on Ulcers, edit. 3. p. 260. White's Surgery, p. 125.

VARUS. A PIMPLE, called alſo *coſſi*; by the Latins, *Ionthos*. See GUTTA ROSACEA. It alſo ſignifies the bending inward of the legs. See VALGUS,—CYLLOS.

VAS, a VESSEL, called alſo *entale*; *alkalia*; *angos*. In ANATOMY, thoſe canals are called VESSELS, through which the fluids of the machine are circulated, or by which ſome of them are abſorbed,—ſecreted, and excreted; hence have they been divided into *circulatory*,—*abſorbent*,—*ſecretory*, and *excretory* veſſels.—In CHEMISTRY, there are a variety of inſtruments for performing operations in, which are called VESSELS, and receive peculiar names, according to the purpoſes they are intended to anſwer;—the forms, &c. viz. ALEMBICS,—ALUDELS,—WORM STILL,—RECEIVERS,—CUCURBITS,—SAND BATHS,—CONES,—RETORTS,—PELICANS, &c. See plate, Chemical Apparatus.—In BOTANY, veſſels mean the component parts of vegetables, which are at leaſt of three ſpecies, viz. 1. *Vaſa ſucoſa*, which convey their juices. 2. *Utriculi*: theſe preſerve their juices. 3. *Tracheæ*: theſe attract the air like the lungs of animals.

VAS URINALE. See CUCURBITA.

VASA BREVIA. See SPLENICA ARTERIA.

—— LYMPHATICA. See LYMPHÆ DUCTUS.

—— SPERMATICA. See SPERMATICA CHORDA.

—— SUCCOSA. See VAS.

VASTUS EXTERNUS. } The *crureus*, the *vaſtus*
VASTUS INTERNUS. } *externus*, and the *vaſtus internus*, may be conſidered as one muſcle, whoſe outer part riſes from the external part of the femur, the inner part from the internal part, and the middle from the anterior part, in ſuch a manner as to ſurround the whole thigh, except the linea aſpera, taking its origin likewiſe from the ſurface of the bone: theſe muſcles join the tendons with their rectus. See CRUREUS.

VECTIS, the SCOOP, or SIMPLE LEVER. The purpoſe of this may be anſwered by the ſingle blade of the forceps. Dr. Hamilton ſays it may be employed where a ſlight ſtimulus is ſufficient to rouſe the pains, or where little force is neceſſary to alter the poſition of the head, by introducing it in the ſame manner, and with the ſame precautions, as a blade of the forceps, either at the lateral parts of the pelvis, under the arch of the pelvis, or diagonally; but, as there is great hazard of bruiſing the parts of the mother, by the reſiſtance of the inſtrument, unleſs managed with ſo much dexterity, *that the hand of the operator is the fulcrum or ſupport on which its action turns*; and as it can *only be uſed when the head is ſufficiently protruded for applying the forceps*, which are preferable both for ſafety and ſucceſs, we conſider the ſimple lever as a dangerous expedient in the hands of a young practitioner.

VEGETABILIS. VEGETABLE. *Vegetables* are thoſe natural productions in the terraqueous globe which have life and growth, but not ſenſe, as trees, herbs, &c. The bodies of *vegetables* are of a regular organic ſtructure, analogous in ſome degree to that of animals: they are furniſhed with a variety of veſſels, for receiving, tranſmitting, and perſpiring different fluids; with organs too, by which the aliment they imbibe from the earth, water, or air, is changed into new forms, into juices peculiar to particular plants. See VAS. The ſubſtances naturally contained in *vegetables*, and ſeparable from them by art, are *gum*, *reſin*, *a ſubtil oil*, *camphor*, *a groſs oil*, *a ſaline matter*, *phlegm*, and *an earth*: theſe are called the NATIVE PRINCIPLES of *vegetables*; *native*, becauſe they naturally exiſt in plants; and *principles*, not as being ſimple, but as it is by theſe that one plant differs from another, and that each exerts its ſpecific power; and as they cannot be further reſolved without totally deſtroying their peculiar qualities.—Various are the diviſions into which *vegetables* are diſtinguiſhed, whether conſidered as the ſubjects of botany, or of medicine, &c. and numerous alſo are the preparations they afford to pharmacy and other branches of art, as may have been already obſerved from what is delivered in the preceding ſheets. Amongſt a variety of other preparations of the *vegetable* kind, by fermentation we obtain inflammable or vinous ſpirit, ether, malt liquors, wines, vinegars, tartar, &c. by fire, or burning, are procured empyreumatic oils, fixed *vegetable* alkaline ſalts, &c.

On the culture, nutrition, &c. &c. &c. of *vegetables*, see Linnæus, Malpighi, Grew, Hill, &c.

VELAMENTUM BOMBYCINUM. The interior ſoft membrane of the inteſtines, from *bombyx, a ſilk-worm.*

VELUM PENDULUM PALATI. See FAUCES.

—— PUPILLÆ. See PUPILLARIS MEMBRANA.

VENA. A VEIN. A thin ramifying elaſtic tube, which ariſes in the extremities of the body, and terminates in the heart or in the liver. The blood is diſtributed all over the body by two arteries, the aorta, and the pulmonary artery; and it is returned by three kinds of *veins*, viz. the *vena* cava, the pulmonary *veins*, and the *vena* portæ.

In general the arteries have their correſpondent *veins*; ſo the courſe of one is known by that of the other.

Veins begin where the arteries end, and proceed from the branches to the trunk, making a conoid figure, in the ſame ſenſe that the arteries have been ſaid to do.

The extremities of the arteries in the brain are continued into their *veins*, whoſe trunks vary much in their continued poſition from the arteries, theſe entering the brain at its baſis, and diſtributing themſelves as noted in ſpeaking of them; whereas the trunks of the *veins* are extended on the ſurface of the brain, and diſcharge their blood into the longitudinal ſinus; nor do the *veins* of the brain accompany their arteries at their ingreſs as in other parts, and as the arteries and *veins* of the dura mater do.

The *veins* which are ſubject to frequent compreſſion from the action of the muſcles, have valves which open towards the heart; in all the veins alſo which are perpendicular to the horizon, excepting thoſe of the uterus and portæ, there are valves with their mouths towards the heart; theſe valves prevent the return of the blood in the *veins*.

Beſides the deep ſeated *veins* which accompany the arteries in the extremities, there are other *veins* more ſuperficially ſeated, the reaſon of which is, to prevent the circulation being interrupted by the action of the muſcles compreſſing the internal *veins*.

The coats of the *veins* are the ſame as thoſe of the arteries, but they are thinner: being compoſed of fibres in all directions, they bear ſtretching better than the artery, whoſe chief ſtrength is in the circular fibres; the coats of the *veins* are thicker in the extremities than among the viſcera: particularly in the ſaphena, they are of a remarkable thickneſs.

The capacity of the *veins* is much larger than the arteries, except in the pulmonary veſſels, where the four *veins* taken together are not equal to the artery. See Winſlow's Anatomy. Haller's Phyſiology of the *Veins*.

Moſt of the *veins* will be found under the reſpective names which they bear—ſome not, viz. for thoſe called *Splenica brachii, mediana baſilica*, ſee BASILICA VENA; —*Vena Medinenſis*, ſee DRACUNCULI.—*Sine pari* and *jugo*, ſee AZYGOS VENA.

VENÆ LACTEÆ. See LACTEA VASA

VENÆ-SECTIO. See PHLEBOTOMIA.

VENENUM. POISON. This word ſeems to be a relative term only; what are called *poiſons*, have, in their reſpective inſtances, ſalutary effects; they injure by miſapplication. The ancients made no diſtinctions between *poiſons* and medicines: they went both by the ſame name. In our day we are uſed to conſider thoſe articles which have not been employed with any ſalutary effect, as abſolute *poiſon*; but in this we do not think properly. Again, we annex the idea of *poiſon* to thoſe things which produce their ill effects in very ſmall quantities, and of whoſe form and action we are little or not at all acquainted. When any thing acts mechanically, though it deſtroys, we never rank it with *poiſons*. *Things that kill unavoidably, though not mechanically; things that are of a ſpecific nature, and produce ill effects; thoſe injurious things whoſe effects are relieved by ſpecifics; and thoſe for which we have no cure, are all called poiſons.* In ſhort, it is difficult to give a definition of the word *poiſon*, perhaps impoſſible. Surely that alone could be properly called a *poiſon*, or be conſidered as abſolutely a *poiſonous* ſubſtance, which at all times, in any quantity, and on all occaſions of applying it, would without exception be deſtructive. Such a ſubſtance is unknown. CHARLTON, in his pathology, ſays, *poiſon* properly and commonly means any thing which, communicated to the machine, by any way, attacks and injures in an incomprehenſible manner, and with unconquerable violence, the univerſal, or ſome particular functions, and principles of the greateſt conſequence to life; and corrupts, coagulates, deſtroys the ſpirits and humors, particularly the blood and balſam of the nerves; and afterwards, ſooner or later, brings on a corruption alſo of the ſubſtance of the ſolid parts, and thus throws life into the greateſt danger.

To ſpeak in the uſual phraſe, *poiſons* are the produce of the animal, vegetable, and mineral kingdoms. Their action is either mechanical, chemical, or on the principle of life.

The ANIMAL POISONS act chiefly on the living principle; they are *natural* or *morbid*. The *natural* are found in particular animals for ſome uſe or benefit to the individual in which they are lodged: *the natural poiſons* do not, like the morbid ones, produce more of their own kind. The natural *poiſons* firſt affect the part to which they are applied; then, either by abſorption, or by ſympathy, the whole habit ſuffers. THE MORBID ANIMAL POISONS are various, and many of them appear without our being able to diſcern the cauſe of their production. The virus producing the ſmall-pox, meaſles, &c. is of this claſs; the cancer alſo, and the hydrophobia too; all which ariſe ſpontaneouſly. MORBID POISONS are produced from a ſimilar diſeaſe before affecting, as the ſmall-pox, &c. or they ariſe ſpontaneouſly, from ſome morbid actions of the parts endowed with life, as the cancer, &c. And theſe, when produced, have the power of increaſing and forming freſh matter of the ſame kind, and propagating their own ſpecies. The morbid animal *poiſons* are leſs active than the natural ones; they do not produce their effects ſo rapidly.

Mr. Wilmer, in his Obſervations on the *Poiſonous* Vegetables found in Great Britain, ſeems to claſs them into, 1ſt, *Thoſe from which the maniacal ſymptoms are to be expected, or the various nervous affections, from a vertigo to a fatal apoplexy.* In this claſs he includes the ſoporiferous plants. Of theſe there are the following, very generally met with in our iſle, viz. HYOSCYAMUS NIGER,—SOLANUM LETHALE,—ACONITUM,—MERCURIALIS SYLVESTRIS,—STRAMONIUM,—CICUTA MAJOR FŒTIDA,—AGARICUS MUSCARIUS,—AGARICUS PIPERATUS, which ſee.

And, 2dly, *Thoſe which produce epileptic ſymptoms; a loſs of underſtanding, ſpeech, and all the ſenſes, will take place in a few minutes after theſe poiſons are in the ſtomach:* the muſcles will be convulſed, and death will cloſe the ſcene in a few hours. Of theſe there are found in moſt parts of Great Britain, the following, viz. ŒNANTHE CHÆROPHYLLI FOLIIS,——CICUTA AQUATICA,—— LAUROCERASUS, which ſee.

The danger of theſe laſt is very great; they do not offend the palate, ſo may paſs unſuſpected into the ſtomach; when there, they do not produce any ſickneſs, ſo are not likely to be diſcharged without the aſſiſtance of art; and they are ſo quickly active that they ſcarcely admit of an opportunity for that aſſiſtance to be given.

Mr. Wilmer further obſerves, that *poiſonous vegetables* appear to act by an oppreſſion upon the nervous ſyſtem, rather than by an inflammation of the ſtomach and duodenum, which from the beginning produce thoſe other intervening ſymptoms that uſually end in death. He very judiciouſly obſerves, that theſe *vegetable poiſons*, in different conſtitutions, will have various and ſometimes oppoſite effects. The moſt contrary ſymptoms are produced in different perſons who have taken the ſame *poiſon*. They gave proofs that both the utmoſt irritation, and appearances which indicated that the office of the nerves was deſtroyed, might ariſe from the ſame cauſe, working its effects in different conſtitutions.

Mineral poiſons are acrid or corroſive, as arſenic, cobalt, and muriated quickſilver; or they are ſedative, as the preparations of lead, &c. Mineral *poiſons* act mechanically, chemically, and on the principle of life.

As to the prognoſtics, when *poiſonous* ſubſtances are taken, in general it may be obſerved, that, as to thoſe of the animal kind, little more can be ſaid than to refer to the particular inſtances thereof.—Thoſe of the vegetable world have uſually but little effect after being ſpeedily evacuated.—The mineral *poiſons* are ſometimes carried off by vomiting; but uſually ill effects follow notwithſtanding that diſcharge.

In order to relief, when mineral *poiſons* are taken, if a vomiting does not follow, attempt the expulſion by any quick emetic; zincum vitriolatum purificatum, gr. x. vel vitriolum cæruleum, from gr. i. to iii. aſſiſted by copious draughts of warm water, and milk, or oil; then endeavour to decompoſe the *poiſonous* article by means of the fixt

alkaline

alkaline ſalts, diluted in large quantities of water. Thus, whether the hydrargyrus muriatus, arſenicum, ceruſſa acetata, antimonium tartariſatum, or any metallic ſalt be taken, the ſame method may be purſued. If the emetic is worked off with a ſolution of the fixt alkaline ſalt, the effects may be expected as more agreeable to our diſtreſs. In ſhort, what ſteps appear to be the moſt eligible in caſe of arſenic being ſwallowed, are the ſame in caſe of any other *poiſon* of the mineral kinds. Theſe kinds of *poiſons* act *mechanically* and *chemically*.

In moſt inſtances of the *vegetable poiſons*, their firſt powerful action, when ſwallowed, is on the ſtomach; an emetic therefore begins the cure. When theſe *poiſons* are evacuated, the danger is over, which is not the caſe with the minerals; diſcharge them then with the utmoſt ſpeed. After due evacuation upwards, vinegar ſeems to be the beſt known antidote; in want of it, give the crude juice of acid fruits; but as vinegar is leſs ſharp and contracting, it can be uſed in larger quantities, and is therefore preferable. *Vegetable poiſons* act on the nervous ſyſtem, and attack the principle of life. If opportunity hath not favoured a diſcharge by vomiting very ſoon after this kind of *poiſon* has been ſwallowed, beſides an emetic let a laxative by the mouth or clyſterwiſe be adminiſtered; then give frequent draughts of cyder, perry, ſouriſh ſmall beer, or vinegar and water: ſome practitioners of the firſt rank extol the efficacy of the ſaline draughts, if given in the act of fermentation. If paralytic ſymptoms remain, apply ſinapiſms, bliſters, &c. Unhappily, thoſe vegetable *poiſons* which produce epileptic ſymptoms, ſo affect the ſtomach as generally to prevent evacuation either upward or downward; on this account there is leſs hope from the above means; however, they are the only known reſources; and, if any diſcharge is procured, a favourable hope may be indulged.

Animal *poiſons* act very variouſly, and in order to a proper management in any inſtance of the kind, ſee HYDROPHOBIA, VARIOLA, &c. all which are inſtances of this kind.

After all, this ſubject of *poiſons* is very difficult to inveſtigate; abſtruſe in its nature, and important in its conſequences. Many have written on this ſubject, but very little hath been ſaid from which any thing ſatisfactory can be derived. See Mead on *Poiſons*. Grevinus de *Venenis*. Bell's Surgery, vol. v. p. 312. London Med. Journal, vol. iv. Houlſton on *Poiſons*. Wilmer on *Poiſons*. Edinb. Med. Comm. vol. iii. p. 121.

VENTER, κοιλια, *the belly*. In the moſt extenſive ſenſe it is taken for a remarkable cavity, in which any one of the principal viſcera is contained; in this reſpect the whole body is divided into three venters, viz. the head, the breaſt, and belly. See ABDOMEN. Hippocrates uſes the word κοιλια ſometimes to expreſs only the cavity of the breaſt and lower *belly*, and ſometimes he calls the thorax the upper, and the abdomen the lower *belly*. But the term *venter*, or κοιλια, *cœlia*, is moſt generally underſtood for the lower *belly* only. But various are the ſignifications of this word, as the ſtomach, the colon, the excrements of the *belly*; it is alſo a name of the firſt ſtomach in ruminating animals; and amongſt the chemiſts, *venter* is the ſame as *terra*, and *venter equi* is HORSE-DUNG.

VENTRICULI MORBUS. See CŒLIACA PASSIO.

VENTRICULOSI. See CŒLIACA PASSIO.

VENTRICULUS. The STOMACH. Diminutive of *venter*. See STOMACHUS.—*Succenturiatus*, ſee DUODENUM.

VENUS, called alſo *aphrodite*. The name of the goddeſs of beauty and love; it alſo ſignifies *venery*. On a due regulation of this appetite, much of the vigour of conſtitutions depends; and a too great continency is often productive of diſorders ſimilar to thoſe that ariſe from an exceſs of indulgence in this inſtance; though, in ſome conſtitutions, plethoric and inflammatory ſymptoms are the reſult. The delicate and tender ſhould be very cautious in their venereal engagements, as ſmall degrees of exceſs very ſenſibly injure them. It is alſo a name for copper. See Æs.

VERATRUM ALBUM. See HELLEBORUS ALBUS.

—— For that called *nigrum*, ſee HELLEBORUS FŒTIDUS.

VERBASCUM. MULLEIN. It is alſo called *candela regia*, *candelaria*, and *lanaria*, and is a large, white, woolly plant. Boerhaave mentions eleven ſpecies. The Edinburgh College orders the VERBASCUM THAPSUS, *foliis decurrentibus utrinque tomentoſis, caule ſimplici*. CL. PENTANDRIA, ORDO MONOGYNIA. LINN. Gen. Plant. 243. The GREAT BROAD-LEAVED MULLEIN, HIGH TAPER, or COW'S-LUNG-WORT. This plant is biennial, met with by the road ſides, and under hedges. It is clothed with oblong, oval, ſoft downy leaves, all over white, and woolly, with a ſingle woolly ſtalk, and produces long ſpikes of yellow monopetalous flowers in July. The leaves have an herbaceous, bitter, ſubaſtringent taſte, but no peculiar ſmell; upon being chewed, they manifeſt a mucilaginous quality; hence recommended, both internally and externally, as emollients. They are an uſeful application, by way of fomentation and cataplaſm, to hæmorrhoidal tumors; alſo for promoting the reſolution or ſuppuration of glandular indurations. The plant has been held in eſteem, in conſumption and catarrhal coughs, and been recommended ſtrongly in dyſenteric affections. Dr. Home tried it in catarrh, and diarrhœa; but it only ſucceeded in the laſt. From thence it is concluded that the decoction of verbaſcum is uſeful in diminiſhing diarrhœas of long ſtanding, and often in eaſing the pains of the inteſtines, by the emollient, and probably the gentle aſtringent qualities of the plant. The decoction is made of two ounces of the leaves to 1 quart of water.

Doſe, four ounces every three hours.

VERBASCULUM. See PARALYSIS.

VERBASINA. See BIDENS.

VERBENA, VERBENACA. } verbena mas & cœrulea, *ſacra herba*, *hierobotane*, *cephalalgia herba*, *menſa Jovis*. COMMON VERVAIN. In Wales it is called *cas gangythreb*. It is the VERBENA OFFICINALIS LINN.

The roots are fibrous, of a light brown colour, hard, bitteriſh, and irregular; they ſend up many ſtalks half a yard high, ſquariſh, ſolid, roughiſh, of a purpliſh green colour, and branched; the leaves ſtand on the ſtalks in capſules oppoſite to each other, they are hairy on both ſides, wrinkled and jagged, with deep cuts, and wide at the ſtalk end, ſomething like oak leaves when half grown, of a deeper green above than below; the flowers are ranged in long ſpikes, of a pale purple colour, divided into five parts at the top, ſucceeded by four ſmall longiſh ſeeds joined together; they blow in July, &c. to October.

This herb is found in highways, in chalky, gravelly, and uncultivated grounds. It has been celebrated for a number of virtues, for which its ſenſible qualities afford little or no foundation. It has no remarkable ſmell, and hardly any taſte. However the root is hung at the pit of the ſtomach, and a freſh piece is placed there twice in a year, as a cure for the ſcrofula. An ointment made by boiling the whole plant in lard, as is directed for the green ointment of elder, is recommended as uſeful in ſcrofulous ulcers. See Raii Hiſt. Lewis's Mat. Med.

VERBENA FŒMINA. See ERYSIMUM.

VERBESINA, ſee BIDENS: for that called *verbeſina acmella*, and—*lavenia*, ſee ACMELLA.

VERMES. Worms, called alſo *elminthes*. The moſt frequent ſeat of worms in the human ſpecies is the inteſtinal tube; but occaſionally they have been found in almoſt every other part of the body.

In the ſtomach and inteſtines are the following ſpecies of *worms*: 1. The round *worms*, called *lumbrici*, alſo *teres* or *teretes*, and by Hippocrates *ſtrongylus*. 2. The tape-*worm*. 3. *Aſcarides*.

The LUMBRICI, round *worms*, are about a ſpan long, round and ſmooth: they are ſeated for the moſt part in the upper ſmall inteſtines, but ſometimes they are lodged alſo in the ſtomach, and in any part of the inteſtines, even to the rectum.

TÆNIÆ. GOURD, FLAT or TAPE-WORMS, called alſo *ceria*, or *ceriæ*. INTESTINORUM LUMBRICI LATI. Of all the *worms* that infeſt the human body, this is the moſt troubleſome and dangerous. The roots of the male and female ferns have long been famed for their efficacy in deſtroying and expelling this ſpecies of *worms*. The doſe of theſe roots in powder is to half an ounce, to be taken in honey and water, or mead; and if it is accompanied with ſcammony enough to purge, its efficacy will be greater. The French phyſicians order over-night a clyſter of milk and honey, and a quantity of panada for ſupper; in the morning the powdered fern-roots are given to detach the *worm*, of which the patient is ſaid to be ſenſible, by a ceſſation of the pain in the ſtomach, and by a weight that is felt in the lower belly. Two hours after this, the purgative is given to evacuate the looſened *worm*. The tape-*worms* are from two to forty feet long, according to the teſtimony of Platerus; they generally poſ-

ſeſs the whole tract of the inteſtines, but eſpecially the ileum: they very much reſemble a tape in their appearance, whence their name of tape-*worm*.

ASCARIDES, from ασκαριζω, *ſalio*. A ſort of worms ſo called from their continual troubleſome motion, which cauſes itching. They are very ſmall, white, and have ſharp pointed heads. They are generally lodged in the rectum; but ſometimes are alſo higher up, even in the ſtomach.

The ſymptoms, by which it is known that worms are exiſting in the body, are the ſame in general, whatever be the ſpecies of them; but an itching in the anus is the almoſt conſtant ſign of the *aſcarides* being in the rectum. They occaſion ſuch uneaſineſs in ſome people as to make them faint; and generally are ſo troubleſome in the night as to deprive them of ſleep. Sometimes there is ſo much heat in the inteſtine, as to cauſe a ſenſible tumor about the anus; but as theſe worms are voided in the ſtools, their preſence is moſt certainly known by ſeeing them there; for there is no one ſign but what is wanting in ſome patients.

Though this ſort of worms are as difficult to deſtroy as any other, they are leſs dangerous.

Theſe little worms are ſo enveloped in mucus, that great difficulty attends the deſtruction of them. The beſt known remedy is the Harrowgate water, if drank at the ſpring: the flower of brimſtone, taken with treacle, in ſuch a quantity as to gently purge the patient every day, is perhaps the next in efficacy to the Harrowgate water. The fumes of burning tobacco injected clyſterwiſe into the rectum are of ſingular efficacy; ſuppoſitories of cotton dipped in the gall of an ox may be tried; a decoction of ſavin in water hath been often uſed with ſucceſs, when taken for ſome time; and perhaps repeated doſes of rhubarb may anſwer as well as any other remedy.

Worms are rarely found but in perſons with weak ſtomachs, or where digeſtion is ill performed. As to certain aliments producing *worms*, it is objected that all we eat may be expected to generate them, as well as thoſe articles uſually ſpecified. It is ſaid that they cannot be hatched in a healthy inſide, for the gall in particular would deſtroy them; in children the gall is generally as inert as it is redundant; and in caſes of indigeſtion, when adults are the ſubjects of theſe vermin, the gall is alſo defective in its quality, and probably hence is the mediate cauſe of *worms* in the human inteſtines.

Numerous are the ſigns of *worms*, ſuch as colicky pains, a copious diſcharge of ſaliva when faſting, a diſagreeable breath in the morning, itching in the noſe, an irregular appetite, a ſwelled and hard belly, troubleſome ſleep, grinding the teeth during ſleep, palſies in the limbs, thirſt, and feveriſhneſs: but as theſe and all other ſigns are common to this and to other diſorders, the only one to be depended on is their being diſcharged; and this may be obſerved with reſpect to the *round*, the *tape-worm*, and thoſe called *aſcarides*.

Amongſt the variety of remedies propoſed for the deſtruction of *worms*, none ſeem more to be depended on than thoſe which purge briſkly, in conjunction with thoſe that ſtrengthen the chylopoetic organs. Various are the ſpecifics for deſtroying them, but their efficacy may be attributed to their purging or corroborating quality, or to both. *Mercury*, *rhubarb*, *aloes*, *Indian pink*, *ſea-ſalt*, *ox gall*, are thus efficacious; *water in which a portion of quickſilver is boiled*, is ſuppoſed to receive its efficacy from a portion of arſenic which it takes up from this mineral; *tin*, as recommended in the Edinburgh Medical Eſſays, is ſuppoſed to deſtroy the *worms* by its mechanical action on them, though, more probably, the arſenic in the tin is that to which the benefit is to be attributed. Dr. Biſs extols the *baſtard black hellebore* as a moſt certain deſtroyer of the round *worm*; but purging, by leſſening the ſlime, always relieves; and probably the *worms*, that are not forced away by this quickened motion of the inteſtines, may, for want of ſlime, languiſh and die. It does not appear that one kind of purge is preferable to another, let the kind of worms be what they will; the *worms* being always defended from the immediate action of the medicine by the ſlime; and therefore purges which act briſkly, and of which a frequent repetition can be borne, are the beſt. Of this ſort are *purging waters*, particularly *the ſulphureous*, *jalap*, &c. Dr. Stork ſays that he hath deſtroyed all ſorts of *worms*, viz. the round, the aſcarides, and the tape-*worm*, by the following mixture, repeated, as here directed. ℞ Sal. polychreſt. pulv. rad. jalap. & rad. valer. ſilv. pulv. ää ʒ i. ox. ſcillit. ʒ iv. m. exhibeatur adultis quater per diem ʒ ſs. junioribus vero ʒ i. aut ʒ ii.

See Andry, Linnæus, Doeveren, Coulet, on *Worms* in general; and ſee Van Phelſum on the Aſcarides, and Beddoe on the Tape-*worm*. See Edinb. Med. Comment. vol. iv. p. 283, &c. Dr. Lewis's Tranſlation of Hoffman's Practice of Medicine, vol. i. p. 353. 483. vol. ii. p. 156.

VERMINOSA FEBRIS. The diſorder called the WORM-FEVER, Dr. Muſgrave obſerves, is generally confined to children: and, as it too frequently baffles the beſt endeavours, he gives the following account of the diſorder, with the method of treating it, which in his practice hath been moſt ſucceſsful. The difficulty of curing what is called a *worm-fever*, ariſes, according to this author, from its being frequently attributed to *worms*, when the cauſe of the diſorder is of a quite different nature. He does not deny that the irritation cauſed by them doth ſometimes produce a fever; but he apprehends theſe caſes to be much more uncommon than is generally imagined, and that great miſchief is done by treating ſome of the diſorders of children as *worm*-caſes, which really are not ſo. Dr. Hunter, it is obſerved, was of the ſame opinion on this point, and he has diſſected great numbers of children who have been ſuppoſed to die of *worm*-fevers, and whoſe complaints were of courſe treated as proceeding from *worms*, in whom, however, there appeared, upon diſſection, to be not only no *worms*, but evident proofs of the diſorder having been of a very different nature. The ſpurious *worm*-fever, as Dr. Muſgrave calls it, has, in all the inſtances he has ſeen of it, ariſen evidently from the children having been indulged with too great quantities of fruit; though a poor cold diet may, he thinks, occaſionally give birth to it. Every ſort of fruit eaten to exceſs will probably produce it; but *an immoderate uſe of cherries ſeems to be the moſt common cauſe of it*. The approach of this diſorder has a different appearance, according as it ariſes from a habit of eating fruit in rather too large quantities, or from an exceſſive quantity taken at one time. In the former caſe, the patient gradually grows weak and languid; his colour becomes pale and livid; his belly ſwells and grows hard; his appetite and digeſtion are deſtroyed; his nights grow reſtleſs, or at leaſt his ſleep is much diſturbed with ſtartings, and then the fever ſoon follows; in the progreſs of which, the patient grows comatoſe, and at times convulſed; in which ſtate, when the event is not favourable, he dies. The pulſe at the wriſt, though quick, is never ſtrong or hard; the carotids, however, beat with great violence, and elevate the ſkin ſo as to be diſtinctly ſeen at a diſtance. The heat is at times conſiderable, eſpecially in the trunk; though at other times, when the brain is much oppreſſed, it is little more than natural. It is ſometimes accompanied by a violent pain in the epigaſtric region, though more commonly the pain is ſlight, and terminates in a coma; ſome degree of pain, however, ſeems to be inſeparable from it, ſo as clearly to diſtinguiſh this diſorder from other comatoſe affections. Where a large quantity of fruit has been eaten at once, the attack of the diſorder is inſtantaneous, and its progreſs rapid; the patient often paſſing, in the ſpace of a few hours, from apparently a perfect health, to a ſtupid, comatoſe, and almoſt dying ſtate. The ſymptoms of the fever, when formed, are in both caſes nearly the ſame, except that, in this latter ſort, a little purulent matter is ſometimes diſcharged, both by vomit and ſtool, from the very firſt day. The ſtools, in both caſes, exhibit ſometimes a kind of curd, reſembling curdled milk; at other times a floating ſubſtance is obſerved in them, and ſometimes a number of little threads and pellicles, and now and then a ſingle *worm*.

Strong purgatives, or *purges frequently repeated*, in this diſorder, are greatly condemned by Dr. Muſgrave, as they in general not only aggravate the ſymptoms already preſent, but are ſometimes the origin of convulſions.—*Blood-letting* is not to be thought of in any ſtage of the diſorder. But although frequent purging is not recommended, yet a *ſingle vomit* and *purge* are adviſed in the beginning of the diſorder, with a view to evacuate ſuch indigeſted matter and mucus as happen to remain in the ſtomach and bowels. Theſe having operated properly, there is ſeldom occaſion for repeating them; and it is ſufficient, if the body be coſtive, to adminiſter, every ſecond or third day, a clyſter compoſed of aloe opt. ʒ ſs. & infuſ. flor. chamæm. ʒ v. The principal part of the

cure, however, depends upon external applications to the bowels and ſtomach; and as the cauſe of the diſorder is of a cold nature, the applications muſt be warm, cordial, and invigorating; and their action muſt be promoted by conſtant actual heat. In this caſe, ℞ Fol. abſ. & rutæ, āā p. æq. aq. pur. q. ſ. f. decoct. ſaturatiſſimum, quo calide foveantur regio ventriculi et abdomen, 4ta vel 5ta quaque hora, per horæ quadrantem. Magma ex herbis coctis, poſt fotus uſum, iiſdem partibus perpetuo appoſitum teneatur, et quoties refrixerit, aliud calidum apponatur. For internal uſe ℞ Spts. cinnam. & aq. cinnam. āā ℥ ſs. ol. amygd. d. ℥ ſs. ſyr. Tol. ʒ iij. m. et tempore uſus fortiter concutiantur in phiala: capiat pro ratione ætatis, ʒ ij. ad ʒ vj. tertia quaque hora. When any nervous ſymptoms come on, or remain after the diſorder is abated, they are eaſily removed, by giving a pill of four grains of aſſafœtida, once or twice a day.

When *worms* really infeſt the bowels, Dr. Muſgrave obſerves that their diagnoſtics are very uncertain; but that in real *worm* caſes, the treatment above recommended would, he imagines, be much more efficacious than the practice commonly had recourſe to. As *worms* either find the conſtitution weakly, or ſoon make it ſo, the frequent repetition of purges, particularly mercurials, he aſſerts, is injurious. Fomenting the belly, night and morning, with a ſtrong decoction of rue and wormwood, is much recommended; for, by invigorating the bowels, it has thereby a conſiderable influence in rendering them capable of expelling ſuch *worms* as they happen to contain. After the fomentation, he adviſes to anoint the belly with a liniment, compoſed of one part of eſſential oil of rue, and two parts of a decoction of rue in ſweet oil. Of internal medicines, the beſt is aſſafœtida, with an aloetic pill or two at proper intervals. The diet of children diſpoſed to *worms*, he adds, ſhould be warm and nouriſhing, conſiſting, in part at leaſt, of animal food, which is not the worſe for being a little ſeaſoned. Their drink may be any kind of beer that is well hopped, with now and then a ſmall draught of porter or negus. A total abſtinence from butter is not ſo neceſſary as is generally thought. Poor cheeſe muſt be wholly avoided, but ſuch as is rich and pungent may be moderately allowed, for it is peculiarly uſeful. It is equally an error to feed children too well with rich food, rich ſauces, and a very free uſe of wine; and to confine them to too ſtrict or too poor a diet, which weakens their digeſtion, and renders them liable to diſorders in the bowels.

Dr. Butter, in his Treatiſe on the Infantile Remittent Fever, which he ſays is the *worm*-fever of authors, aſſerts, that there is not the ſmalleſt rational ground for regarding *worms* in the cure of this fever; that, though the exiſtence of *worms* be a ſign of diſeaſe in children, yet, in his judgment, they are properly neither cauſe nor ſymptom of ſuch diſeaſe; and therefore ought not to influence, in any reſpect, medical practice. It hath long been known that fevers deſtroy *worms*. As a definition, he ſays, that the infantile remittent fever is diſtinguiſhed by drowſy exacerbations, wakeful remiſſions, pain of the head and belly, total loſs of appetite, little thirſt, and ſlimy ſtools. In his deſcription he obſerves, that this fever is accompanied with a great many ſymptoms, but they ſeldom all occur in the ſame caſe. Theſe ſymptoms he arranges under three different heads, conſtituting ſo many varieties of the diſeaſe. Theſe varieties he names the acute, the ſlow, and the low infantile remittent fevers; as cauſes, the doctor points out irritability and indigeſtion; this fever may be accelerated by cold, fatigue, &c. but the principal cauſes *are crude accumulations in the firſt paſſages, which, with a very irritable prediſpoſition, draw the inteſtinal canal into ſpaſm, which is ſoon communicated to the reſt of the body, conſtituting the fever.* The two ſymptoms commonly attributed to *worms*, he refers to debility as their cauſe; theſe ſymptoms are the loſs of voice, and of ſpeech. In order to the cure, Dr. Butter propoſes *but one indication to be regarded*, viz. *the removal of the febrile irritation.* This irritation is owing to a ſpaſmodic affection of the inteſtinal and other membranes of the body, ſupported by morbid accumulations in the firſt paſſages. The means preferred are, reſt, quietneſs, and ſtillneſs. The bed-room ſhould have but little light admitted into it. Diluting and nouriſhing drinks ſhould be frequently given, ſuch as ſmall broth, gruel, and barley-water. Solid food ſhould not be allowed. The neutral ſalts, particularly the ſal polychreſt. is uſeful by its abating the inteſtinal ſtricture, and rendering the bowels rather lax. For a child of five years old, a dram of the ſalt may be diſſolved in four ounces of water, ſweetened with any convenient ſyrup, or with ſugar; and two table ſpoonfuls may be given every four hours. This mixture ſhould be given ſo as to keep the bowels open; in general when the fever is low, one ſtool ſhould be produced every day, two in the ſlow, and three or four in the acute kind. When the bowels are rendered ſoluble, nitre may be uſed inſtead of the ſal polychreſt If a looſeneſs attends, the neutral ſalts muſt not be given, but, in their ſtead, the following mixture, in the ſame manner as the above with ſal polychreſt. In four ounces of water diſſolve five grains of the extr. cicutæ, and add to it a dram of ſugar. In the ſlow kind of this fever, the mixture with the extr. cicutæ is to be preferred to that with the ſalt. A grain for every year of the patient's age may be given, diſſolved in water as already directed. If required to keep the belly lax, when the extract is uſed, the ſal polychreſt. may be given twice a day, or as much rhubarb may be given every night as may be required. The general treatment takes place in the beginning of the low fever; but after the ſymptoms of the lowneſs abate, the treatment varies a little. In caſe of coſtiveneſs, half a dram of the ſal polychreſt. may be given, diſſolved in two ounces of water ſweetened, the one half at night, the other in the morning. If the child hath a ſtool daily, the nitre may be uſed inſtead of the ſal polychreſt. Four drops of the acidum vitriolicum dilutum may be given every four hours in the patient's drink. Small wine-whey ſhould be uſed inſtead of barley-water, by turns with the gruel and broth; ſometimes a little wine may be added to the gruel. If this low fever is complicated with looſeneſs, the extr. cicutæ, given as above, ſhould be the only medicine employed, except a drop or two of the tinct. opii, after each ſtool. To relieve the vociferation and reſtleſſneſs, foment the belly with flannel cloth wrung out of a decoction of chamomile, agreeably warm, and repeated as required. See Medical Tranſactions, vol. i. p. 45—59.

VERMICULARES. See LUMBRICALES MUSCULI.

VERMICULARIS. See SEDUM.

VERMIFORMIS. A prominence of the cerebellum, ſo called from *vermis*, *a worm*, and *forma*, *ſhape*.

VERMIS REPENS, —— MORDICANS. See HERPES

VERNIX. See JUNIPERI GUMMI.

VERONICA, called alſo *betonica Pauli*, *thea Germanica*; *chamædrys anguſtifolia ſpuria*; *chamædrys latifolia Europæa*, FLUELLIN, and MALE SPEEDWELL. VERONICA OFFICINALIS. It is a low, hairy, trailing plant, with firm leaves ſet in pairs. From the joints ariſe ſlender pedicles, bearing ſpikes of blue monopetalous flowers, each of which is divided, as is the cup, into four ſegments, and followed by a flat bicellular captule, which opens at the upper broad part, and ſheds ſmall brown ſeeds. It is perennial, grows wild on ſandy grounds and dry commons. It flowers in June.

The leaves have a weak, but not diſagreeable ſmell, which in drying is diſſipated, and which they give over in diſtillation with water, but without yielding any ſeparable oil; to the taſte they are bitter and rough. They give out their virtue to water and to ſpirit, but moſt perfectly to the latter.

An infuſion of the leaves drank as tea is diuretic, and conſidered as very ſalubrious in many diſorders, particularly thoſe of the breaſt; the water diſtilled from them is called European tea, and by ſome is preferred to the Aſiatic. Both the infuſion in water, and the diſtilled water, poſſeſs all the virtues of the Aſiatic tea, and have the ſame good effects. See Francus on the virtues of *veronica*.

VERONICA AQUATICA, &c. ſee BECCABUNGA.

VERRICULARIS TUNICA, from *verriculum a net*, ſee AMPHIBLESTROIDES.

VERRUCÆ. WARTS. A *wart* begins in the cutis, and ſeems to be either an efflorescence of the ſerum hardening on the ſkin, making a dry tumor, or a ſmall luxuriancy of the little arteries of the cutis, making a little ſarcoma, or ſoft *wart*. When it ariſes with a broad baſis, it is called *verruca ſeſſilis*. Sometimes a few capillaries putting out together, after they are grown to a ſmall length, enlarge themſelves into a greater compaſs, and make the penſile tumor called *acrochordon*.

Dr. Cullen places this genus of diſeaſe in the CLASS LOCALES and ORDER TUMORES; and defines it, an extuberation harder than a ſarcoma, and rough.

Warts are generally removed by incision, or by the uſe of cauſtics, the juice of *celandine*, of *eſula*, *the gall of the pike*, or of *the eel*, the *mineral acids*, the *lunar cauſtic*, or *an actual cautery*, after which laſt they are ſaid never to return.

When *warts* are on the knuckles they are difficult to be ſeparated, without hurting the tendons, and are generally to be left to themſelves. Heiſter obſerves, that on the face, lips, or eye-lids, there are ſometimes a ſort of livid and bluiſh *warts*, which in their tendency are next to a cancer. Theſe are beſt let alone; for if they are diſturbed, they degenerate into a cancer. See Heiſter's Surgery. Tiſſot's Advice to the People. Bell's Surgery, vol. v. p. 532. White's Surgery, p. 80.

VERSICARIA VULGARIS. See ALKEKENGI.

VERTEBRÆ, from *verto*, *to turn*. See SPINA.

VERTEX, from *verto*, *to turn*. The CROWN of the HEAD, ſo called becauſe the hairs turn there, called alſo *coryphe*.

VERTIGO, from *vertendo*, in which the head ſeems to turn, or at leaſt all things about the patient ſeem to do ſo, called alſo *dinos*, *ilingos*. It is always ſymptomatic. When a miſt is alſo before the eyes, it is called *ſcotodine*, or *ſcotodinos*. When a giddineſs, with only a dimneſs of the ſight, or a ſparkling before the eyes, attends, it is called *ſcotomia*. Etmuller divides it into three kinds: 1. A ſimple *vertigo*, in which there is only a tranſient and ſhort continued gyration of objects. 2. A dark *vertigo*, or *ſcotomia*, when the eyes are darkened, or ſo affected, as if ſeveral colours were before them. 3. The *vertigo* called *caduca*, in which the patient preſently falls down.

The cauſes are a compreſſion on the brain from a depreſſion of the ſkull; an extravaſation of matter on the membranes of the brain, &c. in acute diſeaſes, preſſure on the brain from the larger veſſels being diſtended with blood, either from its unuſual quantity or its rarefaction. Any cauſe that can preſs, diſtend, or contract the arteries, ſuch as ſudden ſurpriſe, ebriety, voracity, &c. by which the regular influx of the ſpirits, and their reflux into the optic nerves, are prevented. An acid or other acrimony in the ſtomach may affect the nerves, and, by conſent of parts, produce this diſorder of the head. Dr. de Meza obſerves that *vertigo* may proceed from ſix different cauſes, viz. 1. From a ſanguineous plethora. 2. From a foulneſs in the primæ viæ. 3. From debility in conſequence of exceſſive evacuations. 4. From compreſſion. 5. From poiſons of different kinds; as opium, mercury, fumes of charcoal, &c. And, 6. From a ſerous colluvies, in conſequence of a ſtoppage of iſſues, ulcers, or any other habitual drains.

In a *vertigo*, there is generally an apparent rotation of external objects, though ſometimes all things ſeem to aſcend, and ſometimes they ſeem to have a contrary tendency. As the diſorder increaſes, the objects appear of various colours, and ſoon after follows a tottering of the whole muſcular frame; the patient begins to be afraid of falling, and catches hold of every thing near him, to ſuſtain himſelf; the diſorder increaſing, there comes on a dimneſs, then a loſs of ſight, then the nerves fail all at once, and the patient falls to the ground. If the diſorder proceeds further than this, it terminates in a lipothymy, epilepſy, or apoplexy. When a loſs of ſight attends a *vertigo*, there is alſo a ringing of the ears.

If the diſorder is recent, happens ſeldom, the patient young, the cure is eaſy;—if it is original and confirmed, happens frequently, or if it ſeizes old perſons, and is accompanied with a great dimneſs of ſight, and inability to ſtand, the cure is difficult;—if the ringing of the ears proceeds from a diſorder of the brain, it is often troubleſome for many years, and forebodes an epilepſy, or an apoplexy.

If there is a ſanguine plethora, bleeding will be neceſſary, and the taking of blood from the temporal artery hath ſucceeded, when for a long time all other methods have failed.—*If there is a nauſea, or other diſorder of the ſtomach*, an emetic is generally to be preſcribed.—This diſorder is moſt frequently ſymptomatic; and then purging with the tinct. aloës, or the pil. ex aloë cum myrrha, is amongſt the moſt effectual remedies. To theſe may be added mild chalybeates, and ſuch nervous medicines as the peculiarity of the conſtitution in general, or ſymptoms in particular, may require. When a ſymptom of the gout, &c. the original diſorder being removed, the ſymptomatic will of courſe follow. See Wallis's Sydenham, Etmuller, Mead, Hoffman, Heiſter, &c.

VESANIÆ, alſo *dementia*. DEFECT OF JUDGMENT, as in delirium, madneſs, idiotiſm, &c. ALIENATIONS OF THE MIND. Dr. Cullen makes this the fourth ORDER of his CLASS NEUROSES—and ſays, it is where the functions of the mind in judging are injured, unattended with pyrexia, or coma.—Under this order he arranges the AMENTIA—MELANCHOLIA—MANIA—and ONEIRODYNIA. See Noſolog. Synopſ. Meth. For the particular account of the different genera, and the mode of cure peculiarly adapted to each, the reader is referred to the ſpecific terms in this Dictionary.

VESICA URINARIA. The URINARY BLADDER, called alſo *cyſtis urinaria*. It is of an oblong form, its fundus lies againſt the os pubis, and its neck upon the os ſacrum, and coccygis. The neck does not come out at the end of the *bladder*, but at the flat and moſt depending ſide, through the proſtate gland, which lies flat upon it, ſo that there is properly no neck, being nothing of that ſhape. The fundus is the ſmalleſt end; the erect attitude ſeems to be the principal reaſon of this difference between this ſhape and that of quadrupeds. The *bladder* of a fœtus is very ſimilar to that of a quadruped. The ureters enter into the *bladder*, near the veſiculæ ſeminales. The coats of the *bladder* are, 1ſt, a partial one from the peritonæum. 2d, A muſcular coat, the greateſt part of the external fibres of which are longitudinal, ariſing from the proſtate gland. Under theſe is a ſtratum principally circular, under which, on the inſide, is a very complex net-work of fibres, running in all directions, by which diverſity, and being fixed to the proſtate gland, they, in motion, bring all parts towards the gland, for the expulſion of the urine, and to contract the *bladder*, lying looſe when empty. The inner coat is a very thin tranſparent membrane, of a very denſe texture, which prevents the tranſudations of urine. Many deſcribe another coat, but it is nothing more than the cellular membrane. The ligamentous remains of the urachus upon the fundus of the *bladder* are never pervious. The ureters have ſmall oblique orifices, and paſs obliquely through the coats; which hath the effect of valves. The urethra ariſes from the flat ſurface of the *bladder*. The arteries are from the hypogaſtric, or internal iliac, being branches of the arteria ſciatica, epigaſtrica, and umbilicalis, on each ſide. The nerves are from the crurales, and the ſympathetici maximi, by means of their communication with the crurales; ſome branches are from the plexus meſentericus inferior. See Haller's Phyſiology, in the article RENES. Winſlow's Anatomy.

VESICÆ RARUS MORBUS, Hoffm. It is a copious diſcharge of mucus with the urine. It is an inſtance of the *dyſuria mucoſa*.

VESICÆ DISTILLATORIÆ. See CUCURBITA.

VESICANTIA, } See EPISPASTICA.
VESICATORIA, }

VESICARIA MARINA NIGRA. See ALCYONIUM, FARRAGO.

VESICATORIA EMPLASTRA. See CANTHARIDES, N° 3—5.

VESICATORIUM. See CATAPLASMA, EPISPASTICA.

VESICULA, vel FOLLICULUS FELLIS. The GALL-BLADDER. Under the great lobe of the liver, a little to the right, we ſee the *gall-bladder*. It is ſituated in a ſulcus on the under ſide of the great lobe, in the fiſſure between the two lobes, and being attached to the liver, hath a coat from the peritonæum. In a ſtanding poſture, it lies forwards and downwards. Its fundus is raiſed by a fulneſs, and depreſſed by the emptying of the ſtomach; whence that uneaſy ſenſation which attends hunger. Its coats are like thoſe of the inteſtines, the inner is not villous, nor papillous, but a net-work of plicæ in all directions. The hepatic and cyſtic ducts run almoſt parallel, and quite contiguous, not as repreſented in the figures; and uniting, form the ductus communis choledochus, which going on, joins the ductus pancreaticus, and opens into the duodenum, in the moſt depending concave part of the inteſtine. See Winſlow's Anatomy. Haller's Phyſiology, in the article JECUR.

VESICULÆ DIVÆ BARBARÆ. See VARIOLA CONFLUENS.

VESICULÆ GINGIVARUM. The THRUSH. See APHTHÆ.

—— MALPIGHIANÆ. See ASPERA ARTERIA.

—— SEMINALES. They are two membranaceous cellular tubes, lying on each ſide between the bladder and the rectum, on the outſide of the vaſa deferentia; they are about three fingers' breadth long, and one broad; they are convoluted like the inteſtines, and kept in their ſituation by a ligamentous membrane, the internal fibres of which

are

are muſcular. The inſide of the veſiculæ ſeminales is cavernous, and of a villous appearance.

VESTIBULUM. It is an irregular round cavity, not quite ſo large as the tympanum, and ſituated rather more inward and forward. The veſtibulum and tympanum are, as it were, ſet back to back, with a partition between them, and communicating near the middle of the feneſtra ovalis.

VESTIGIUM. See METATARSUS.

VETERNUM. See ANASARCA.

VETERNUS. See LETHARGUS, under CAROS.

VETONICA. See CARYOPHYLLUS RUBER; for that called—CORDI, ſee BETONICA.

VIA LACTEA. See GALAXIA.

VIBEX. *Purple* ſpots, and WHEALS UNDER THE SKIN, of a *ſcarlet* colour. Sometimes called STIGMA.

VIBURNUM, called alſo LANTANA, *camara*. PLIANT MEALY TREE, WAYFARING-TREE. Boerhaave mentions nine ſorts. It is an arboreſcent ſhrub; its wood is fungous; the leaves reſemble thoſe of alder; the flowers grow in umbellas, ſmall like elder flowers, are white, and conſiſt of five petals; the flowers are ſucceeded by berries which are green, then red, and at laſt black; they are ſweet and viſcous. This ſhrub is found in hedges, and clayey uncultivated grounds. The leaves and berries are aſtringent. See Raii Hiſt.

VICIA. The TARE or VETCH, called alſo BICION, *Cræca major*. The pod is full of roundiſh or angulated ſeeds, the leaves are numerous, pinnated, and generally conjugated by pairs to a rib which ends in a tendril. Boerhaave enumerates twenty-two ſpecies. The TARES, or VETCHES, are heating and aſtringent. Decoction of vetches with raiſins, figs, and liquorice, has been partly taken in the ſuppurative ſtate of the ſmall-pox, under the ſuppoſition of filling the pocks, and creating good pus.

VICTORIALIS. See OPHIOSCHORDON.

VIDAMARAM. See SEBESTEN.

VINCA PERVINCA, called alſo *clematis*, *pervinca major*. The GREATER PERIWINKLE or PERVINKLE. From a ſtringy, creeping, fibrous root, ſpring ſmooth ſlender ſtalks that are long and creeping. The flower is monopetalous, and is followed by two pods, in which are oblong, ſulcated, and almoſt cylindrical ſeeds.

This plant grows on banks at the ſides of ditches. An infuſion of the leaves is commended againſt the fluor albus, hæmoptoë, hæmorrhoids, and exceſſive menſes. See Raii Hiſt.

VINCETOXICUM. SWALLOW-WORT. See ASCLEPIAS.

VINI SPIRITUS TENUIOR & RECTIFICATUS. See VINUM ADUSTUM.

VINUM. WINE, called alſo *Bacchus*. For different kinds of wine, ſee ŒNUS. The juice of ſweet fruits, ſuch as grapes, currants, apples, &c. is called *wine* when fermented; but the name is more particularly applied to the fermented juice of the grape. One and the ſame kind of grape proves greatly different in taſte and flavour, according to the climate and expoſure to the ſun. Thoſe *wines* which have ſcarcely been at all fermented, and are boiled, are called MUST, and BOILED WINES. It is the thin watery juices that are extremely prone to ferment, and in which fermentation, when once begun, can ſcarcely be ſuppreſſed, until it hath run beyond the vinous ſtate, that are thus treated. By boiling, the fermentative quality are reſtrained, the liquor becomes richer, and continues fit for drinking at leaſt a year or two; but it is not ſo wholeſome as the fermented *wine*. MUST relaxes the conſtitution; and if drank immoderately, it is apt to produce dangerous fluxes; on the contrary, *perfect wine* conſtringes and corroborates. Another claſs of *wines* is thoſe which have undergone fermentation, but not a complete one; of theſe there are two kinds, 1ſt, *The thin ſweet wines* which are only muſt, partially fermented, or whoſe fermentation is checked before the ſweetneſs is gone off; theſe *wines* can ſcarcely be kept a year. 2d, *The ſtrong full-bodied wines* that are rich and ſweet; theſe are generally a mixture of fermented and inſpiſſated muſt, the latter being added to increaſe the richneſs of the liquor, and prevent the fermentation from running beyond its due limits. Theſe *wines* heat the conſtitution, and ſhould be ſparingly drank; of this kind are Malmſey, Canary, &c. 3d, *Thoſe which have been completely fermented*, and *have thrown off their groſs matter*. Theſe are the moſt perfect, and the moſt ſalutary.

The goodneſs of *wines* is judged of by their being bright and clear in the glaſs, of an agreeable reviving ſmell and taſte, leaving, when in the mouth ſome time, a ſlight ſenſe of aſtringency, being moderately ſtrong and ſpirituous, paſſing freely by urine, exciting appetite, producing a gentle ſweat in the night, and keeping the body open next day, without being followed by any headach, heavineſs of the limbs, or other uneaſineſs.

The PRINCIPLES, of which *wine* conſiſts, are *water*, *inflammable ſpirit*, *a fine ſaline matter which ariſes in diſtillation immediately after the ſpirit*, called by Becher *media ſubſtantia vini*; *a groſſer ſalt called tartarus*, which ſeparates on ſtanding, and adheres to the ſides of the caſks; *a gummy or mucilaginous ſubſtance*; and *a groſs unctuous or reſinous kind of matter*. WINE is conſidered to contain in general *three* different matters,—1ſt, A portion of MUST, or unaſſimilated matter. 2d, A portion of a proper WINE, in which, by the fermentation, a quantity of alcohol is produced; and 3dly a portion of VINEGAR produced by a too active, or a too long protracted fermentation.—Theſe different matters will appear more or leſs copiouſly at the different periods of the fermentation. Thus in new *wine* the muſt will be moſt abundant; as the fermentation advances, the portion of genuine *wine* will be more conſiderable; and if fermentation has all along been properly managed, a vinegar will not appear but in very old *wine*; and from the proportion of theſe ſeveral matters, the qualities of *wine*, depending upon the period and ſtate of fermentation, may be properly aſcertained.

With us the five following kinds of *wine* only are ordered for pharmaceutic and medicinal uſes, viz. 1ſt, The *vin. alb. Hiſpanicum*, or mountain *wine*. 2d, *Vin. alb. Gallicum*, or French white *wine*. 3d, *Vin. Canarinum*, Canary or ſack. 4th, *Vin. Rhenanum*, or Rheniſh *wine*. 5th, *Vin. rubrum*, or red Port and claret. The *firſt* are generally ſtrong and ſweet, conſiſting of half-fermented *wine* and muſt. The *ſecond* are moderately ſpirituous, grateful to the ſtomach, and paſs freely by urine, but ſome of them affect the head. The *third* are very rich and ſtrong, their effects are more durable than the thinner, and they are nutritious. The *fourth* are the moſt acid, and are alſo the moſt diuretic; they alſo render the bowels lax. The fifth are the moſt aſtringent and ſtrengthening.

The general effects of *wine* are to ſtimulate the ſtomach; exhilarate the ſpirits; warm the habit; promote and quicken circulation; and in large quantities to prove intoxicating, and powerfully ſedative.

Conſidered as a medicine, *wine* is a valuable cordial in languors and debilities, more grateful and reviving than the common aromatic infuſions and diſtilled waters; it is particularly uſeful in the low ſtage of malignant and other fevers; it raiſes the pulſe, ſupports the ſtrength, promotes a diaphoreſis, and reſiſts putrefaction, and in many caſes, proves of more immediate advantage than the Peruvian bark. Delirium, which is the conſequence of exceſſive irritability and a defective ſtate of nervous energy, is often entirely removed by the free uſe of wine. It is an obſervation of long experience, that thoſe who indulge in the uſe of wine, are leſs ſubject to fevers both of the malignant and intermittent kind. In the putrid ſore throat, in the ſmall pox verging to putreſcency, where there is great debility, in gangrenes and the plague, wine is to be conſidered a principal remedy. And in almoſt all caſes of languors, and great proſtration of ſtrength, wine is experienced to be a more grateful and efficacious cordial than can be ſelected from the whole claſs of aromatics. *Uſed dietetically*, it is beneficial to the weak and aged, and to thoſe who are expoſed to a warm and moiſt air, or to a corrupted one. Uſed *externally*, it cools, ſtrengthens, and reſiſts putrefaction. Dr. Harris, in his Diſſert. Chirurg. ſays, that ulcers ſhould be waſhed with warm *wine*; external inflammations are removed by it. In an eryſipelas, and eryſipelatous pains in wounds, warm *wine*, and fomentations with the ſpirit of *wine*, are the moſt uſeful. There are three other ſubſtances of great uſe produced from wine, viz. tartar, cryſtals of tartar, and vinegar. For their medicinal properties, refer to the ſpecific terms in theſe ſheets. Where wine itſelf may be proper as a cordial, it ſometimes may be conſidered as too heating; if then, to an equal proportion of milk and water, as much wine is added as will occaſion the coloſtrum to ſeparate by boiling, and then ſtrained and ſweetened, a whey will be formed, called SERUM VINOSUM, WINE WHEY, which will be mildly cordial, and diaphoretic, and often given with good effect; or water may be added

to wine for the same purposes; besides, wine and water makes the best common beverage, water alone, and good small beer, excepted. See Neumann's Chem. Works. Dict. of Chem. Lewis's Mat. Med. Cullen's Mat. Medica. Nicholson's Dictionary of Chemistry, 1795.

VINUM ADUSTUM, called also *vinum ardens*, *spiritus vini*. Vinous, inflammable, and vegetable fermented spirit, SPIRIT OF WINE, which last is the general name when it is rectified, called also *cuculatum majus*; *æneaflagma*. When this *spirit* is brought to the highest degree of purity from phlegm and oil, it is called ALCOHOL.

This *spirit* is obtained by distillation of fermented liquors. In FRANCE it is all drawn from wines; in ENGLAND and GERMANY from malt liquors. Some is drawn from melasses; and in AMERICA it is distilled from sugar, after fermenting it, and is there called RUM. This *spirit*, whatever be the subject from which it is obtained, if freed from its phlegm and gross oil, is found in every trial to be the same.

When this *spirit* is first drawn from any fermented vegetable liquor, it contains much of the phlegm thereof, and of the essential oil of the respective vegetable which afforded it; it is therefore rectified, or purified, by redistilling it with a very gentle heat; and when on adding a small quantity of this *spirit* to a little cotton, and setting it on fire, it burns away so perfectly, as that at last the cotton also takes fire, and flames also, it is called rectified *spirit of wine*. If equal measures of this rectified *spirit* and of pure water are mixed, it will be what is called *spiritus vini tenuior*, of the strength of brandy or PROOF SPIRIT. If to the rectified *spirit*, as much well dried and yet warm alkaline salt be added, as that a part of it remains undissolved at the bottom, it will absorb the remaining aqueous humidity, and the *spirit* may be poured from its surface. After which, if a little calcined vitriol, or burnt alum be added to this dephlegmated *spirit*, and it be again distilled, it will arise pure and free from either superfluous phlegm, or any of the alkaline salt that may be detained therein. The *spirit* after this treatment is called alcohol. The college of physicians direct alcohol to be made by the following process. Take of rectified *spirit of wine*, one gallon; kali made hot, one pound and an half; pure kali, one ounce: mix the *spirit* with the pure kali; and afterwards add one pound of the hot kali: shake them and digest for twenty-four hours. Pour off the *spirit*, to which add the rest of the kali, and distil in a water-bath. It is to be kept in a vessel well stopped. The specific gravity of the alcohol is, to that of distilled water, as 815 to 1000. Pharm. Lond. 1788.

Pure *spirit*, even after brought to the state of alcohol, is no other than an intimate combination of water with an oil which hath been highly subtilised by the process of fermentation, and a small portion of acid. From the best rectified *spirit* somewhat more than one half of its quantity of water may yet be extracted.

This *spirit* is of extensive use in chemistry; it separates the medicinal parts of vegetable and animal substances from the inactive matter: it extracts their flavour and colour; it dissolves resins and oil for varnishes, &c. and extracts them from woods which contain them; it preserves animal and vegetable bodies from corruption; it dissolves all vegetable resins and distilled oils, the subtil oils of aromatic herbs, flowers, seeds, fruit, woods, and roots; it dissolves empyreumatic oils; it mingles with water, and produces much heat by being mixed therewith; it coagulates milk, blood, and the white of egg, and most animal juices, except the urine and bile; it mingles with all acids concentrated or diluted, whether of the mineral or vegetable kingdom; on mixing it with the concentrated mineral acids, a strong ebullition and heat ensues, the acidity is obtunded or destroyed, and the compound proves a subtil, volatile, fragrant fluid, and thus produces the dulcified acid *spirits*.

As a medicine, *spirit of wine*, when externally applied, strengthens the vessels, and thickens the juices in them, and thus restrains hæmorrhages; it instantly contracts the extremities of the nerves, and deprives them of sense and motion; thus it eases their pain, but destroys their use; if received into the stomach in an undiluted state, it produces the same effects as when externally applied; and if the quantity taken is considerable, a palsy or apoplexy follows, and soon proves mortal. Proof *spirit*, and such as is diluted below the strength of proof, when externally applied in conjunction with corroborant, anodyne, and antiseptic fomentations, is of considerable efficacy; if it is inwardly taken in small quantities, it strengthens lax fibres, incrassates thin fluids, and warms the habit. A moderate internal use of this *spirit* is the most serviceable to those who are exposed to heat and moisture, to corrupted air, or other causes of colliquative and putrid diseases. See Neumann's Chem. Works. Dict. of Chem. Lewis's Mat. Med.

VINUM. WINE. This term, besides those already specified, is added to several products, and compositions, which chiefly take their names from the principal material of which they are formed—as *Vinum rhabarbari*, &c. which may be found under RHABARBARUM, &c. but for that called—*Hordeaceum regionum septentrionalium*, see ALLA—*Falernum*, see AMINÆUM VINUM;—*Emeticum*;—*Benedictum*, see ANTIMONIALE VINUM;—*Chalybeatum*;—*Ferri*, see FERRUM;—*Ardens*, see VINUM ADUSTUM;—*Hippocraticum*, see CLARETUM.

VIOLA. The VIOLET, called also *ion*. Boerhaave takes notice of eighteen sorts; but it is only the sweet scented purple kind that is in use with us. VIOLA ODORATA, acaulis, foliis cordatis, stolonibus reptantibus, CLASS. SYNGENESIA; ORDO MONOGAMIA. LINN. Gen. Plant. 1007. THE SWEET VIOLET. The flowers have a very agreeable smell, and a weak mucilaginous bitterish taste. If taken to the quantity of two drams, they are gently laxative; and, according to Bergius, and some others, they possess an anodyne and pectoral quality; the seeds are somewhat more laxative, and also gently emetic. They are also said to be strongly diuretic, and useful in gravelly complaints. The flowers give out to water both their virtues and fine colour, but scarcely impart any tincture to rectified spirit of wine, though they impregnate the spirit with their fine flavour.

A syrup is made with the blue flowers, and found certainly useful in some chemical investigations, to detect an acid, or an alcali; the former changing the blue colour to a red; the latter to a green. It is said also to be a laxative for infants: the sugar, of which the syrup consists, perhaps, may produce that effect, but little dependence can be had on the activity of the violets.

SYRUPUS VIOLÆ. *Syrup of Violet.*

Take of the fresh petals of violets, ℔ ii. boiling distilled water, three pints; macerate them for twenty-four hours; afterwards strain the liquor through a fine linen rag without expression, and add the clarified sugar to make a syrup. Ph. Lond. 1788. But both the flowers and the syrup lose their fine colour by long keeping. See Lewis's Mat. Med.

VIORNA. See ATRAGENE.

VIPEBA. See CASSADA.

VIPERA. The VIPER. The COLUBER BERUS, i. e. COLUBER *scutis abdominalibus* 146, *squamis caudæ* 39. LINN. It is a viviparous reptile, about an inch or less in thickness, and from twenty to thirty inches in length. It is distinguished from the snake by an undulated black line on its back, and the smallness of its tail. It is found in the heat of summer under hedges, and in winter it retires into holes in the earth. Its poison is at the basis of its fangs, or long teeth, through which it is emitted by a slit when the animal bites. A small portion of this poison, when communicated to the blood by a wound, produces dreadful effects, though when taken into the stomach it is inoffensive. If a *viper* bites itself or another *viper*, they die as speedily as any other animal which hath suffered the same accident. The famed cure, when the *viper's* poison is received by a wound, is immediately to rub the fat of *vipers* into the wounded part, and the patient must take as much vinegar in all he drinks for some time after the accident, as is at least agreeable to the palate. See also the famed cure for the bite of a rattle-snake in the article BOICININGA.

As a medicine, the flesh of *vipers* does not appear to excel that of eels. Notwithstanding the opinion of Dr. Mead, on the efficacy of this reptile as a nutrient, Dr. Cullen does not allow it to have any peculiar powers as an aliment, nor does he admit that there is the slightest foundation for allowing them as a medicine. He considers such a supposition of their virtues existing in any uncommon degree, as a mark, among many others, of the weakness and folly of the ancients, and equally of their

their modern followers.—See Cullen's Mat. Med. Mead on Poiſons. Lewis's Mat. Med. For that called—*Indica*; *Pileata*, ſee COBRA DE CAPELLO.

VIPERARIA. See SCORZONERA.

VIPERINA. See SERPENTARIA VIRGINIANA.

VIRGA AUREA, alſo called *doria herba*, *conyza*, *ſymphytum*, *petræum*, *elichryſum*, *conſolida Saracenica*, *Jacobæa paluſtris*. COMMON GOLDEN ROD. It is the SOLIDAGO VIRGA AUREA, Linn. It is a plant with long, and ſomewhat oval leaves, pointed at both ends, ſlightly, or not at all indented, with upright ſpikes of ſmall yellow flowers, which are followed by ſmall ſeeds, winged with down. It is perennial, grows wild in woods and on heaths, and flowers in Auguſt. The leaves and flowers are corroborant, aperient, and diuretic; they communicate all their virtues to water and to ſpirit. They have a moderately aſtringent bitter taſte, and hence are conſidered, as ſerviceable in debility and laxity of the viſcera, and diſorders proceeding from that cauſe. The extracts are the beſt preparations. See Lewis's Mat. Med. For that called——*major*, ſee CONYZA MAS THEOPHR.

VIRGATA SUTURA. See SUTURA SAGITTALIS.

VIRGINIANUM RUBRUM. See PHYTOLACCA AMERICANA.

VIRIUM LAPSUS. See LIPOTHYMIA.

VIRIDE ÆRIS. See ÆRUGO ÆRIS.

VIRILIS ÆTAS. See ÆTAS.

VIS CONSERVATRIX. The preſerving power, or the exertion of the plaſtic power as far as it maintains organization.

VIS GENERATRIX. The generative power, or the generative exertion of the plaſtic power.

—— MEDICATRIX. The healing power or the plaſtic power employed in extinguiſhing diſeaſe and reſtoring health. This is often expreſſed by the words Nature, and Natural Cure.——See VIS VITÆ, CALIDUM INNATUM.

—— PLASTICA. The PLASTIC POWER. See PLASTICUS.

VIS VITÆ. See CALIDUM INNATUM.

VISCARIA. See MUSCIPULA.

VISCERA. The BOWELS. The *viſcera* in the head are the brain, eyes, ears, noſe, mouth, tongue, &c. In the breaſt, they are the heart, lungs, larynx, trachea, pleura, mediaſtinum, pericardium, thymus gland, diaphragm, &c. In the belly, they are the peritonæum, omentum, œſophagus, ſtomach, inteſtines, meſentery, liver, ſpleen, pancreas, kidnies, ureters, bladder, and parts of generation.

A knowledge of the ſituation of the abdominal viſcera is of great advantage to the medical practitioner. The abdomen may be conſidered as divided into three regions, the ſuperior, the middle, and inferior. In the firſt are comprehended thoſe parts that are bounded by the diaphragm and ribs; the ſecond extends from the ribs to the pelvis; and the pelvis itſelf conſtitutes the laſt. Theſe three regions form one large cavity, in which are contained all the viſcera of the lower belly; the extent, however, of theſe different diviſions varies in different ages, in different ſubjects, and is altered likewiſe by diſeaſe. In new-born infants, the diſtance between the ſternum and the pelvis is near to a third of their whole length; in adults, the length of the abdomen does not extend to a fifth of the whole. In children of three feet in height, the abdomen meaſures nearly one foot; and it is not found to exceed that, in adults five feet high. This difference with reſpect to the abdomen in infants and in adults is confined entirely to the middle region, which, in children, is not only much longer, but, in proportion, much more extenſive in every reſpect, than in people come to their full ſize. In the former, it is wider from before backwards, in children the ſpine being almoſt entirely ſtraight, whereas, in adults, it becomes conſiderably crooked. In children too it is much wider from one ſide to the other than in adults, as in them the ribs bend more outwards than they do in the latter. Although this middle abdominal region, however, is in children ſo extenſive, yet both the ſuperior and inferior diviſions are not proportionally ſo; nay, they are even ſmall, in compariſon to thoſe of adults. The pelvis is incomparably ſmaller in the fœtus than in adults; in the former, the under extremity of the os ſacrum bends conſiderably over towards the pubes. The horizontal branch of the pubes is both ſhort and flat, and the tuberoſities of the iſchia are turned backwards. Every circumſtance, therefore, concurs to ſhorten the cavities of both the inferior and ſuperior abdominal regions; inſomuch that, in young children, all the *viſcera* of the lower belly are contained in what we have termed the middle diviſion, and remain there, until, by degrees, they inſinuate themſelves into the other two regions, as theſe, in courſe of time, come to be enlarged. Before treating, however, of the changes the *viſcera* undergo in point of ſituation from the infantine ſtate to that of adults, it will not be improper firſt to give a more particular deſcription of their ſeveral ſituations in the former. The ſtomach in infants, inſtead of being ſituated tranſverſely, as is the caſe in adults, hangs almoſt perpendicularly. It extends from what is commonly called the epigaſtric region, to the umbilical, inclining a very little to the left above, and to the right ſide below; having its convex ſide or great curve turned to the left, and the ſmall curvature towards the right. In conſequence of this ſituation of the ſtomach, the omentum, which is always attached to its great curvature, lies more towards the left than the right ſide; and, from want of knowledge of this circumſtance, practitioners have often treated, as diſeaſes of the colon, ſuch complaints in children, as, on opening the bodies after death, have been found ſeated in the omentum only. The liver is very large in the fœtus, in proportion to its ſize in adults, and is ſituated almoſt entirely in the middle region of the abdomen; it appears to the touch externally, indeed, much nearer the linea alba than it is ever found to be in a more advanced age. At this period the duodenum is placed almoſt entirely behind the ſtomach. The ſpleen in infants is always eaſily diſcovered by the touch immediately below the falſe ribs; this, in adults, never can be done, but in a diſeaſed ſtate of that viſcus. In the former, a conſiderable part of it is ſituated in the middle region of the abdomen; whereas, in the latter, its ſeat is always in the left hypochondrium. In very young ſubjects, the urinary bladder is ſituated entirely without the pelvis, is remarkably large in proportion to the other parts, and extends to within a very ſmall diſtance of the navel; when full of urine, it makes a very evident prominence near about the middle and inferior part of the abdomen. This poſition of the bladder, above the os pubis, ought to be particularly attended to; for, when, in infancy, it is neceſſary to have recourſe to lithotomy, the high operation ſhould always be preferred to thoſe where the opening is made in the perinæum. This operation, however, has never been favourably looked upon. But, as the ſhorteſt and eaſieſt paſſage to the bladder is, in lithotomy, a principal object, it ought certainly, in children, to be preferred to every other, the bladder in them lying ſo near to the external teguments above the pubes. In young girls, the womb, with its two ovaria, are conſiderably raiſed above the os pubis; and when ſwelled, a circumſtance, which, at this age, ſeldom occurs, it can eaſily be diſtinguiſhed by the touch externally.

Such are the ſituations of the *viſcera* in childhood. In a more advanced age, they are entirely changed; the ribs become leſs crooked, the diaphragm more vaulted, and the liver gets a higher ſituation, inſomuch that, about the fifteenth year, it is almoſt entirely covered under the ribs, when the perſon is in an horizontal poſture. This change of ſituation in the liver occaſions a manifeſt alteration likewiſe in the poſition of the ſtomach. By degrees it deviates from the perpendicular horizontal line; and according as it changes its ſituation, the omentum recedes entirely from the left ſide, and proceeds to occupy the middle part of the lower belly. Although the horizontal lobe of the liver can be diſtinguiſhed by the touch in adults, yet never by any means ſo evidently as in children; it is ſituated almoſt upon the under extremity of the œſophagus, ſo that, when it becomes preternaturally enlarged, it compreſſes that canal ſo entirely as to prevent the entrance of the aliments into the ſtomach: in which caſe, the perſon ſuffers greatly from very violent vomitings with which he is attacked ſome time before death. In the mean time, the pelvis becomes every way larger; the pubes turns conſiderably longer, and acquires a greater height; the os ſacrum ſtretches farther back, and the tuberoſities of the iſchium puſh outwards, and to a greater diſtance from the os coccygis. Such a conſiderable augmentation in the cavity of the lower part of the abdomen gives riſe to ſuch changes in the poſition of the different *viſcera*, as deſerve, from practioners, very particular attention. Thoſe which, from their make and nature, have been accuſtom-

ed to float in the middle region of the abdomen, now fall down into the pelvis; this is particularly the caſe with the bladder, which, in falling down, has its ſuperior part carried forward, and the urachus, which had been attached to the fundus, is torn away, and never again connected with it. This fact was firſt taken notice of by Mr. Lieutaud, and is not as yet believed by many anatomiſts. The ſame cauſe which produces the change of poſition in the bladder, occaſions alſo that of the uterus. The womb, which, in childhood, had been placed above the pubes, by degrees falls into the pelvis, inſomuch that in adult women who are not pregnant, it is always, in a ſound ſtate at leaſt, entirely ſunk into it. Both the bladder and the uterus acquire an oblique ſituation in the pelvis, owing to the deſcent of the inteſtines; this obliquity, that becomes in a manner natural to both theſe *viſcera*, was obſerved by Gunzius, and Camper.

See Edinb. Med. Com. vol. ii. p. 152, &c. from M. Portal's paper in l'Hiſtoire de l'Academie Royale des Sciences de Paris, année 1771, 4to. Paris.

VISCUM. BIRD-LIME.

VISCUS, called alſo *boxus*. MISSELTOE. VISCUM ALBUM, Linn. It is a buſhy evergreen plant, which bears imperfect white flowers, that are followed by tranſparent whitiſh berries. It grows only on the trunks and branches of trees. Formerly BIRD-LIME was made of the berries, by boiling them in water until they burſt; then they were well beat in a mortar, and after that waſhed in water, until all the branny huſk was waſhed away; but now bird-lime is made from the holly-buſh. See AQUIFOLIUM. The miſſeltoe hath been famed for its medicinal virtues. Superſtition, in former ages, held it in veneration, and hung it about the neck to prevent the effects of witchcraft, and gave it internally to expel poiſons. As a ſpecific in epilepſies, palſies, &c. it has been recommended; but it is not much noticed in the preſent practice. See Raii Hiſt. Plant. Sir John Colbatch's Treatiſe on the Miſſeltoe.

VISIO. The SIGHT. The light we have in our atmoſphere proceeds either from that of the ſun, or from ſome other lucid body; from whence the rays ſpread every way, as from a centre, to all points of a large ſphere, ſo as to fall upon the ſurface of bodies, from whence again they are reflected into the eye from the enlightened ſurfaces, in angles equal to that of their incidence, ſo as to render the bodies from whence they thus flow to the eye, both viſible, and of ſome colour. The rays of light fall upon the cornea of the eye, where they are refracted, and paſs on to the cryſtalline humour, where they are ſtill more refracted; then proceeding through the vitreous humour, by which they are directed to the retina, where they form the image of the object ſeen. It is called the FOCAL POINT, where the images of objects are formed by the cryſtalline humour on the retina, and there the image of the object ſeen is painted in an inverted poſition, or, as it were, upſide down, though perceived by the mind according to the ſituation of the object of *ſight*. See Boerhaave's Med. Inſt. Haller's Phyſiology, ſect. xviii. Prieſtley on Viſion, &c.

VISNAGA, alſo called *gingidium Hiſpanicum*. SPANISH PICKTOOTH. It is an annual plant, growing in Italy, remarkable for the agreeable ſcent and ſtiffneſs of the pedicles of the flowers, which are made uſe of for picking the teeth only. In other reſpects the virtues of the plant are ſimilar to thoſe of fennel. See FŒNICULUM, and Raii Hiſt.

VISNAGA MINOR. See SELINUM MONT.

VISUS DEBILIS; HEBETUDO. See AMBLYOPIA.

VITÆ LIGNUM. See GUAIACUM.

VITÆ ARBOR. See THUYA and CEREBELLUM.

VITÆ AFFECTIONES. } See EPITEDEUMA.
VITÆ PROPOSITA. }

VITELLUS. The YOLK of EGG. It contributes to nouriſh the chick, only in preparing the white for the purpoſe, or almoſt becoming like the white. In PHARMACY it is uſed as a medium for uniting balſams, &c. with water. It is, as an aliment, nutritious; as a medicine, anodyne, maturating, digeſtive, and relaxing, and hence it is often uſed in clyſters.

VITIA. Linnæus expreſſes by this word, his claſs of cutaneous, external, or palpable diſeaſes. *Vitia* is a ſynonyme with Cullen's locales in his Noſology.

VITIATUM OS. See CARIES.

VITILIGO. A ſpecies of WHITE-LEPROSY. See ALPHUS.

VITIS. The VINE-TREE. The VITIS VINIFERA, *foliis lobatis ſinuatis nudis*. CLASS. PENTANDRIA, ORD. MONOGYNIA. LINN. Gen. Plant. 284. Of the *vine-tree*, botaniſts have enumerated above twenty ſpecies, and there are almoſt twenty of its productions in uſe. Its leaves are aſtringent, and were formerly uſed in diarrhœas, hæmorrhages, and other diſorders, requiring refrigerant and ſtyptic medicines. The vine leaves were called PAMPINI, and the tendrils CAPREOLI. The juice and ſap of the vine, named LACRYMA, have been recommended in calculous diſorders, and are ſaid to be an excellent application to weak eyes, and ſpecks of the cornea. The unripe fruit has a harſh, rough, ſour taſte; its expreſſed juice, called VERJUICE, was much eſteemed by the ancients, but is now ſuperſeded by that of lemons; for external uſe, however, particularly in bruiſes and ſprains, verjuice is ſtill employed, and conſidered to be a very uſeful application. The dried fruit, called *uvæ paſſæ majores*, and *minores*, or raiſins and currants, (the latter is only a variety of the former), or the fruit of the vitis Corinthiaca ſeu apyrena of C. B. are uſed as agreeable lubricating aceſcent ſweets in pectoral decoctions, and for obtunding acrimony of other medicines, and rendering them grateful to the palate and ſtomach. They form part of the *decoctum hordei compoſitum*, *tinctura ſennæ*, and *tinctura cardamomi compoſita*. If the trunk is wounded in ſpring, it affords a watery juice, which hath been uſed as a diuretic refrigerant. The flowers have a grateful ſmell, which is elevated with water in diſtillation. Along with the water a ſmall portion of eſſential oil ariſes, which poſſeſſes the flavour of the flowers in great perfection. The unripe fruit is called *agreſtæ*, they are ſour and harſh, and from them is expreſſed the *omphacium*, which is cooling and aſtringent. The ripe fruit are called *uvæ*; the largeſt kind *damaſcenæ paſſulæ*, *ſeu uvæ*; they afford wine called *paſſum*, whence we have inflammable ſpirit, vinegar and tartar. When the *uvæ*, or grapes, are dried in the ſun, they are called *uvæ paſſæ*, or *paſſulæ*. See Lewis's Mat. Med.

VITIS ALBA, vel SYLVESTRIS. See BRYONIA ALBA.—IDÆA, ſee VACCINIA and OXYCOCCUS.

VITISALTUS. See CHOREA SANCTI VITI.

VITRARIA. See PARIETARIA.

VITREA TUNICA. See ARANEA.

VITRIOLICUM *acidum*, called alſo *oleum vitrioli*, *ſtagma*, *acidum primogenitum*. See ACIDA and SULPHUR.

VITRIOLI COLCOTHAR, COLCOTHAR of VITRIOL, called alſo *chalcitis officin. colica*, *colcotar*. This is the ſubſtance which remains after the vitriolum martiale has been calcined and diſtilled for a long time by an intenſe fire; and by that means reduced to the redneſs of blood. But Mr. Le Fevre propoſes an eaſy method of acquiring this preparation; he mixes two parts of filings of iron with one of ſulphur, and a little water. After the acid of ſulphur has diſſolved the iron, he expoſes the paſte to the air, and it changes into colcothar. It is uſed in poliſhing glaſs, and other ſubſtances, by artiſts, and called *crocus*, ſeu *crocus martis*. Nicholſon's Dictionary of Chemiſtry, 1795.

VITRIOLUM. In the chemical alphabet, this is expreſſed by the letter D. the beſt ſpecies of which is called *lonchoton*. Vitriol alſo bears the names *calcadinum*, *calcatar*, *calcetar*, *calcanthos*, *calcanthum*, *calcitea*, *alec*, or *alech*, *altinuraum*, *aſagi*, *aſamaz*, *azeg*, *colcotar*, VITRIOL. Combinations of metals with the vitriolic acid are called *vitriols* of thoſe metals. It ſeems as if the metallic part of all *vitriols* had been formerly ſuppoſed to be copper only; for even the ferruginous *vitriols* have the name of copperas, which is expreſſive of copper: the *vitriol* of zinc is alſo called white copperas.

There are three neutral *vitriolic* ſalts, with metallic baſes; or three *vitriols* of three metallic bodies, produced ſpontaneouſly, or with very little aſſiſtance from art, viz. thoſe of iron, called green *vitriol*; of copper, called blue *vitriol*; and zinc, called white *vitriol*. The factitious *vitriols* are eſſentially the ſame as the native. Some chemiſts have endeavoured to generalize the term vitriol, by applying it to all combinations containing vitriolic acid. Thus, they would ſay, vitriol of copper—of iron—or of lime; but this method has never been generally adopted. It is uſual, however, to call the metallic ſalts vitriols, which contain vitriolic acid. Nicholſon's Dictionary of Chemiſtry, 1795.

Vitriols are prepared in Sweden, Germany, England, and

and in many other countries, where there are plenty of pyrite ſtones.

VITRIOLUM ABORTIVUM. See OCHRA.

—— VENERIS. See ÆRUGO ÆRIS.

—— VIRIDE. GREEN VITRIOL. The Latins call it *atramentum ſutorium, melantoria*, becauſe it is uſed for blacking leather.

The method of preparing it is as follows: the pyrite ſtones are ſpread about in a large area, the height about three feet, and there they lie expoſed to the air, but are now and then turned, that they may all be alike expoſed thereto; thus they are reduced to a *vitriolic* earth, which being well waſhed with rain water, the liquor is conveyed by pipes into ciſterns: then it is boiled to a due conſiſtence in large leaden veſſels, throwing in a quantity of old iron, which is ſoon conſumed by the lixivium; at laſt the liquor is ſet to cool in other veſſels, in which are placed ſticks for the *vitriol* to cryſtallize upon.

On analyſing the beſt *green vitriol*, it appeared that ℥ xvi. contained ſomewhat more than eight of water, ſix of iron, and one and a half of pure acid. The Engliſh *vitriol* is purely ferrugineous, but there is ſcarcely any other without ſome admixture of copper. Sixteen ounces of Goſlarien *vitriol* were found to contain ℥ vii. of water, ʒ iii. of acid, ℥ v. ʒvii. and ℈ i. of iron, and nearly ʒ ii. of copper; but it often contains much leſs of the acid.

The *vitriol* of iron diſſolves in about twice its weight of water, and on evaporating the ſolution, and ſetting it to ſhoot, concretes again into thick rhomboidal cryſtals. A ſolution of *vitriol* in water depoſits, upon ſtanding, a part of its metallic baſis; the precipitation is greatly expedited by boiling heat, by which more of the metal ſeparates in a few minutes, than by ſtanding without heat for a year. The further the cryſtals of *vitriol* are freed from their metal, the more eaſily do they part both with their water and with their acid.

It is from this kind of *vitriol*, as being the cheapeſt, that the vitriolic acid, called OIL OF VITRIOL hath been uſually extracted by diſtilling this calcined in earthen long necks, with a ſtrong fire continued for two days. The diſtilled ſpirit appears of a dark blackiſh colour; and contains a quantity of phlegm, greater or leſs according as the vitriol has been more or leſs calcined. On committing it a ſecond time to diſtillation in a glaſs retort placed in a ſand-heat, the phlegmatic parts riſe firſt together with a portion of the acid, the remaining ſtrong acid loſes its black colour, and becomes clear; and this is the uſual mark for diſcontinuing the rectification; but at preſent this acid is extracted from ſulphur, which ſee. The reſiduum, after calcination and diſtillation for a long time, forms COLCOTHAR.

The medicinal uſes of *green vitriol* are the ſame as thoſe of the other preparations of iron, but the pure ſort only muſt be uſed. See SAL MARTIS, under FERRUM, N° 10. The acid of *vitriol* retards fermentation and putrefaction, but in a leſs degree than the nitrous and marine acids do; when it is largely diluted with water, it is employed for preventing a putrefactive diſpoſition, correcting bilious acrimony, abating heat, quenching thirſt, ſtrengthening the ſtomach, &c.

VITRIOLUM CŒRULEUM. BLUE VITRIOL, alſo called ROMAN VITRIOL, VITRIOL OF COPPER, CYPRIAN VITRIOL, *cæruleus lapis, dehenez.*

It is prepared in Sweden, Germany, &c. from the pyrite ſtones and copper. It contains much leſs water than is in the *vitriol* of iron, and requires about four times the weight thereof for its ſolution. This has proved an uſeful tonic continued for ſome time in certain caſes of epilepſia and hyſteria; on ſome occaſions it has proved alſo diuretic, and others anthelmintic. Its doſe is from a quarter to half a grain according to the age of the perſon, twice a day, increaſed to what the ſtomach will bear without vomiting, but ſhould be puſhed till a naufea or ſickneſs is occaſioned.—But, if in the courſe of a month it ſhews not its good effects, we ſhould deſiſt from its uſe, as large quantities of copper introduced, may, like lead, prove hurtful to the body. Dr. Cullen therefore, in caſes of periodic epilepſy, after giving the medicine conſtantly during one interval, if the diſeaſe ſtill continues, gives it only for ſome days before an expected acceſſion, and has in this way had ſucceſs. This medicine ſeems entirely to reſt in theſe caſes on its tonic and aſtringent powers. In the beginning of fevers it has been given in naufeating doſes, and as a diuretic in dropſies; but as an emetic, it ſeems not to be preferable to the antimonium tartarizatum but is much more unmanageable. As an eſcharotic it has been ſufficiently known, and very lately the Doctor found it in an ill-conditioned ſpreading ulcer bring on a good digeſtion, when both mercurials and arſenic were unſucceſsful. It has alſo been uſed for reſtraining hæmorrhages, and for removing films from the eyes externally applied. It has alſo been given as a cure for obſtinate intermittents, and a general tonic. Doſe, quarter of a grain, or more, with from five to ten grains of extract of bark, two or three grains of aromatic powder, three times a day during the intermiſſion. See Lewis's and Cullen's Materia Medica.

VITRIOLUM ALBUM, called alſo *gilla vitrioli, calcadis.* WHITE VITRIOL, or VITRIOLATED ZINC. *Zincum vitriolatum.* The metallic part of this kind of *vitriol* is zinc; its other conſtituents are the vitriolic acid and water. Sometimes it contains iron, and then it hath an ochry appearance on its ſurface. It diſſolves in twice its weight of water. It is ſometimes given as an emetic, and, as ſuch, it is ſpeedy in its effect, and, in debilities of the ſtomach, is preferred to other emetics; it is principally uſed externally in collyria againſt heat, defluxion, and inflammation in the eyes; it is a powerful and ſafe errhine, uſeful in obſtructions of the noſtrils from indurated mucus. It is conſidered as an aſtringent tonic; has been given in ſmall doſes, and ſucceeded in ſome caſes, as effectually as the flores zinci. From ten to twenty grains, diſſolved in water, operates mildly and quickly as an emetic; and is an uſeful remedy, where poiſon has been ſwallowed, from the quickneſs of its operation. In the chincough, and other ſpaſmodic complaints, it has been ſaid to have been adminiſtered with good effect, in doſes from half a grain, to one or two grains. In the proportion of ʒ i. to a pint, it is uſed as an injection in fluor albus, gleets, and ſeminal weakneſſes. It is alſo applied in form of liniment externally, and internally, in form of pills.

LINIMENTUM ZINCI VITRIOLATI.

℞ Zinci vitriolati, optime pulverizati, ℈ i. adipis ſuillæ pp. ℥ ſs. bene commiſceantur, ut fiat linimentum. This is uſeful in the cure of chronic inflammation of the eyelids to which old people are very ſubject.

PILULÆ ZINCI VITRIOLATI.

℞ Zinci vitriol. ʒ ij. terebinth. vulg. q. ſ. ut fiant pilulæ lx. ſum. una vel duæ, nocte maneque. They are found to be of ſervice in gleets, gonorrhœas, &c. See Neumann's Chem. Works. Dict of Chem. Lewis's Mat. Med. Cullen's Mat. Medica.

VITTA. See PILEUS.

VITRUM PRÆPARATUM. PREPARED GLASS. Glaſs muſt be rubbed down to an impalpable powder, in a mortar that will reſiſt the mechanical action of its particles. This, and all ſimilar powders, are wholly confined to the treatment of opacities of the tranſparent cornea of the eye; and are moſt conveniently applied when mixed with a ſmall portion of honey or mucilage.

VITRUM ANTIMONII; alſo *ſtibium*. See ANTIMONIUM VITRIFICATUM.

VOLIATICA. See LICHEN.

VOLSELLA. *Little forceps*, from *vello*. See FORCEPS.

VOLUTTA See MANDARU.

VOLVULUS. See ILIACA PASSIO; COLICA.

VOMER. The PLOUGH-SHARE. It forms the poſterior and inferior part of the ſeptum naſi, and is placed between the oſſa ſphenoides and palati. It receives at its ſuperior part the ſpine of the body of the os ſphenoides, and the perpendicular plate or naſal lamella of the ethmoid, and below the cartilaginous part of the ſeptum.

VOMICA PULMONUM, ſometimes called, by HIPPOCRATES and CELSUS, ABSCESSUS PULMONUM. ABSCESS OF THE LUNGS. This diſorder often grows without any previous complaint, and, rupturing ſuddenly, is the death of the patient. The unburſt vomica is called occult; that which is burſt, open. The cauſes are many, particularly colds, inflammations, metaſtaſes of matter from other parts, &c. That an *abſceſs* is formed in the lungs, is evident, if, after an inflammation there, ſhiverings are frequent, the cough grows troubleſome on exerciſe, and after eating; if the patient can only ſleep on the diſeaſed ſide; if he frequently cannot lie down at all, but ſits up without daring to lean to one ſide for fear of

of the cough and oppreſſion; he cannot ſleep, has a continual fever, and frequently an intermittent pulſe, a ſort of anguiſh at intervals is felt, and in the night there are ſweats, particularly on the breaſt and forehead, and ſudden hot fluſhings appear at times in the face; the urine is reddiſh, and then grows oily: ſome have a diſagreeable taſte in the mouth, and fall away very manifeſtly; others are thirſty, their mouths and lips are parched, the voice grows weak and hoarſe, the eyes are hollow, and there is a kind of wildneſs in the looks. When a vomica is formed, the ſymptoms increaſe, the whole ſide of the lungs becomes a bag of matter, compreſſes the ſound ſide, and creates great anguiſh, which ends either with a rupture of the *abſceſs*, and a diſcharge of its contents, or with the loſs of life. Hippocrates, in his book of Prognoſtics, deſcribes this caſe very well. Aretæus particularly obſerves that the patient is hoarſe, breathes ſhort, ſpeaks in a deep tone, the thorax is enlarged, yet ſeems too narrow for the redundant phlegm; the black of the eye is ſhining, and the white is extremely white, as if it was fat, the cheeks are red, and the veins of the face very prominent.

If the *abſceſs* is not deeply ſeated in the lungs, it burſts into the cavity of the breaſt, and forms an empyema; but if it is deep, the rupture will be into the bronchia; if the orifice is ſmall, ſo that but little matter is diſcharged at once, or if the quantity of all the matter is inconſiderable, and at the ſame time the patient is ſtrong, he coughs up what is contained in the lungs, and is ſenſibly relieved; but if the *abſceſs* is large, or its orifice wide, and a large quantity of pus is thrown out at once; or if the patient is weak, he dies the moment it breaks, and that is moſtly when it is leaſt expected.

As a diſcharge into the bronchia is the ſafeſt, the aſſiſtance of art is beſt uſed to ſolicit the matter this way; and, to effect it, the patient ſhould continually receive the vapours of warm water into his lungs. After this method is expected to have in ſome degree ſoftened the lungs, let the ſtomach be conſtantly kept filled with any agreeable emollient liquor: thus the reſiſtance to the lungs being conſiderable on that ſide, the *abſceſs* and its contents will be preſſed toward the wind-pipe, as there it will meet with leſs reſiſtance, the fulneſs of the ſtomach will incline the patient to cough, which may concur to produce a good event. At a proper time, the cough may be excited by ſnuffing a little vinegar up the noſe, or injecting a little into the throat; ſhouting, reading loud, or laughing, may anſwer the ſame end; or by jolting in a carriage, when the ſtomach is full, the *abſceſs* may burſt. If on the evacuation of the offending matter the patient faints, the ſharpeſt vinegar ſhould be held to his noſe. If the diſcharge is thin, brown, green, yellow, bloody, or of an offenſive ſmell, and at the ſame time the pulſe is quick and weak, the prognoſtic is unfavourable; but if the pus is well conditioned and white, if the fever and cough abate, if the ſweats go off, and the patient is, and continues to grow eaſier, if the expectoration gradually diminiſhes, and urine appears of a more healthy colour, a good hope may be formed of a cure being accompliſhed by due care and perſeverance.

In the cure it is uſual to adminiſter the warmer balſamics, but they heat and irritate too much; inſtead of theſe, let the patient be frequently ſupplied with barley, or with rice cream; if the matter is tough, give the ox. ſcil. to aſſiſt the expectoration; a milk diet ſhould ſteadily be perſiſted in; the bark may be given in ſmall doſes, gradually increaſing them; and gentle but conſtant exerciſe, at firſt in a carriage, and then on horſeback. After all, it ſometimes happens, that when all ſeems well, the *abſceſs* fills again; and though it emptieth itſelf by the bronchia, yet a ſucceſſion of moderate and of ill health fills up the remains of life. See Lommius's Obſervations.—Dr. Cullen, in his Firſt Lines, obſerves that an abſceſs is formed in ſome part of the pleura, and moſt frequently in that portion of it inveſting the lungs. He conſiders it as a conſequence of pneumonia, and deſcribes it, 'after a pneumony, not terminated by any reſolution, the difficulty of breathing and cough continuing, lying down with difficulty on the ſound ſide, and a hectic fever.' Dr. Reid obſerves, in his Eſſay on the Phthiſis Pulmonalis, that *tubercles* are found, on diſſection of thoſe who have died of this diſeaſe, of all ſizes; from the ſmalleſt granules, to the bigneſs of a horſe-bean, and commonly in cluſters. On cutting into them, he ſays, they appear of a white, ſmooth, cartilaginous ſubſtance. In the ſmalleſt, no cavity or opening appears; in thoſe farther advanced, on the out ſurface we diſcover ſmall pin-holes; in thoſe ſtill larger, are one or more cavities containing a fluid like pus; which being cleared off, in the bottom are perceived ſeveral ſmall openings or holes, through which, on preſſing the tubercle, matter iſſues, ſimilar to that contained in its cavity. The larger tubercles, when emptied of their contents, appear like a ſmall capſula, into which entered a branch of the aſpera arteria. When the tubercles increaſe, they are termed *vomicæ*. Theſe are alſo of various ſizes, from half an inch to two or three inches diameter; and are uſually oviform. When found entire, their contents are whitiſh, yellow, aſh-coloured, greeniſh, and ſometimes fetid matter; and when ruptured, more or leſs reddiſh. Several branches of the aſpera arteria are found opening into theſe *vomicæ*, and they alſo communicate with others that lie contiguous; the apertures of the latter are ragged and irregular, of the former, round and ſmooth. The larger *vomicæ* are uſually found empty, but on preſſing the lungs, matter iſſues into the bronchia. The branches of the pulmonary artery and vein running upon the *vomicæ*, are found much contracted; and ſometimes filled up with a fibrous ſubſtance; their pendulous ends hanging looſe in the cavities of the *vomicæ*, completely ſhut up and covered with a thick ſlough. By this we ſee the reaſon why hæmoptoë does not more frequently happen, when ſo great a part of the ſubſtance of the lungs is deſtroyed; and alſo, when it does take place, in what manner the mouths of the bleeding veſſels are ſhut up again. The parts of the lungs contiguous to the *vomicæ* are found inflamed, more or leſs ſolid, and impervious to air blown into the trachea; for when the other parts are thus diſtended, they remain depreſſed; nor is air admitted into the *vomicæ*, or at leaſt in very ſmall quantities. Wherever tubercles or *vomicæ* are found, they firmly adhere to the particles of the lungs near them; by which means a communication, between their cavities and that of the thorax, is entirely prevented. It is farther obſerved, that it ſeems probable that the ſmall pin-holes, perceived in the ſubſtance of the tubercles, are the apertures of the exhalant veſſels; and that the pus found in them, and iſſuing out upon preſſure, is the lymph changed into that fluid. There is no abſolute criterion by which we can determine when tubercles are firſt formed in the lungs. They are to be ſuſpected, when the cough is violent, continued with ſhort intermiſſions, particularly at night; and viſcid phlegm is expectorated with difficulty. But when the cough is accompanied with coldneſs, ſucceeded by fever, and matter ſpit up, which precipitates in water, there is every reaſon to believe that *vomicæ* are completely formed.

Dr. Withers obſerves, in his Treatiſe on the Aſthma, p. 117, and 120, that a cough may be ſuſpected to ariſe from tubercles, when it does not occur from evident cold; when it does not begin with ſtuffing in the head, hoarſeneſs, or any diſcharge of mucus from the noſe and throat; when it not only occurs in the ſpring, autumn, or winter, but alſo in the ſummer; when it is attended with ſhortneſs of breath, particularly on motion; when it is not full and violent, but often trifling, ſo as even to be denied by the patient; and when it does not go off in a few weeks, but continues many months. Our ſuſpicions are rendered much ſtronger, if the lungs have been ſeverely injured by the meaſles, local inflammations, or other complaints; and they are altogether confirmed, if, with the above circumſtances, the patient be of a thin ſcrofulous habit, of a fine delicate complexion, with ſwelled lips, glandular ſwellings in the neck, and a hectic fever. We may add two ſymptoms of the ſcrofulous affection in the meſentery, ſuch as a tumid body, frequent diarrhœas, griping pains, emaciation, &c. which will ſtill render our ſuſpicion of tubercles in the lungs ſtronger and more indiſputable. Tubercles are often ſcrofulous, depending on the conſtitution, accompanied with ſymptoms of an inflammatory nature, and often occur prior to the aſthma, or immediately appear to exiſt along with it. They are particularly dangerous to the young, whoſe cheſts are narrow, and where there is a conſumptive tendency in the family. In this caſe, there is often great danger of a conſumption, and therefore an early and cautious treatment in the intervals of the aſthma is highly requiſite, to avert the impending evil.

As this ſubject is too extenſive to admit here of a full diſcuſſion, we muſt content ourſelves with mentioning only the moſt important parts of the cure. The firſt

and

and principal requiſites in the treatment, are to obviate and remove the inflammatory ſtate of the conſtitution, leſt the tubercles ſhould inflame, and end in ſmall ulcers in the lungs, which would ſoon degenerate into a deep pulmonary conſumption. A diet conſiſting chiefly of *milk* and *vegetables*, is of the utmoſt conſequence, and ſhould be ſteadily perſevered in. *Regular gentle exerciſe* is of the greateſt importance, and affords moſt evident relief, ſuch as *riding, walking, &c. The eaſy motion too of ſailing, or travelling in a carriage*, is very ſerviceable. *Country air* is ſtrongly to be recommended, both in winter and in ſummer, and along with it the utmoſt caution in avoiding *exceſs* of *artificial external heat*. If the conſtitution be full of blood, and there be a ſtrong hard pulſe with pains in the breaſt, *repeated bleedings*, according to the patient's ſtrength and the urgency of the ſymptoms, are requiſite and highly beneficial. *Mild cooling laxatives*, ſuch as the *neutral ſalts, cream of tartar, rhubarb, lenitive electary, caſtor oil, tamarinds*, &c. are adviſable, to obviate coſtiveneſs, and keep the body open. *Gentle emetics* are ſafe and uſeful; and likewiſe *antimonial medicines*, ſuch as *tartariſed antimony* and *James's powder*, may be very advantageouſly preſcribed in ſmall doſes as alteratives. *Oily* and *mucilaginous* medicines are given, along with nitre, the diuretic ſalt, and the ſaline mixture. *Acids*, both *vegetable* and *mineral*, are cooling and uſeful, but particularly the firſt. *Bliſters* and *iſſues* have often been found productive of good effects in theſe caſes. When the cough is troubleſome in the night, and prevents the patient from reſting, a gentle *opiate* is very ſerviceable; and if there be any feveriſhneſs, a ſmall doſe of *tartariſed antimony* or *James's powder* may be added to it, which will determine to the ſurface, and tend to remove any conſtriction of the cutaneous veſſels. Other antiſpaſmodics, after the removal of plethora, may be preſcribed; and if the cough be violent, and of the convulſive kind, the *flowers* of *zinc* have been found very ſerviceable. See Percival's Obſervations, p. 223.

VOMICA LIQUORIS ÆTERNI. See ARGENTUM VIVUM.

VOMITORIA. See EMETICA.

VOMITUS. VOMITING. It is a diſorder of the ſtomach. A *vomiting* and nauſea ſeem to be ſpaſmodic retrograde motions of the muſcular fibres of the œſophagus and ſtomach, attended with convulſions of the muſcles of the belly and the diaphragm, which, when gentle, creates a nauſea; when violent, a *vomiting*. *Vomiting* is moſtly an inſtance of dyſpepſia.

The matter diſcharged gives different denominations to this diſorder; a mucous chylous diſcharge of the reliques of undigeſted food is called a PITUITOUS VOMITING; a congeſtion of bilious matter evacuated this way, conſtitutes what is called a BILIOUS VOMITING;—blackiſh, corrupt, green, æruginous, porraceous, &c. are accidents of colour, &c. in the contents of the ſtomach that are diſcharged;—when black blood is thrown up, it is called THE BLACK DISEASE; and when the cauſe is in a part diſtant from the ſtomach, as when a ſtone paſſes the ureter, &c. it is called a SYMPTOMATIC VOMITING.

The cauſes are various, viz. pregnancy, poiſons, hurts on the brain, inflammation of the diaphragm or other abdominal viſcera, the motion of a ſhip, or coach, &c. the quantity or the quality of the food, irritation of the gula, the tranſlation of the morbific matter of ſeveral diſorders to the ſtomach, worms, a ſtone in the ureters, a congeſtion of blood about the ſtomach, &c. *The proximate cauſe is a ſtimulus of the nervous fibres of the ſtomach, gullet*, or *duodenum*.

Crudities in the primæ viæ are known by pituitous *vomiting*, and a preſſive pain about the region of the ſtomach;—*a laxity of the biliferous ducts*, by bilious, chronical and periodical *vomiting*;—*an injury*, or *a ſcirrhus in one of the viſcera*, by chronical *vomitings* of long ſtanding, and in which the food is thrown up before it is digeſted. *A ſtone in the kidney* or *the ureter* may be ſuſpected, if there is a pain in the loins, and a diminution of urine.—*Worms* are probably attendant if the countenance becomes pale, and if there are pains and a gnawing ſenſation in the inteſtines, with an unuſual ſpitting and itching in the noſtrils.

All critical vomitings are ſalutary.—Symptomatic vomitings are bad when excited by a ſubtil cauſtic acrimony;—*violent bilious vomitings* threaten an inflammation; *vomiting from worms* is often a dangerous ſymptom;—*fetid vomitings are often fatal*;—a conſtant or very frequent *vomiting* for ſeveral months gives a ſuſpicion of an ulcer in he ſtomach;—*when a pain attends in the ſoles of the feet*, hard drinking is generally the cauſe.

THE DIFFERENT CAUSES INDICATE DIFFERENT METHODS OF RELIEF. *When pregnancy produces this diſorder*, bleeding at proper intervals, and gentle laxatives to keep the bowels eaſy; though, in thoſe inſtances where bleeding endangers a miſcarriage, the plethora ſhould be removed by frequent gentle purges: when theſe methods fail, and the patient is greatly fatigued, ſhe may take the pulv. ipecac. gr. ii. vel iii. an hour before the *vomiting* comes on, and repeat it as it is required. A light breakfaſt, before the ſickneſs comes on, relieves in ſome inſtances; and in others, the columbo-root, in mint or pepper-mint water, is moſt uſeful.

Sometimes violent vomiting precedes or *accompanies a fit of the aſthma*, and Floyer has obſerved, that cold water has afforded the moſt relief, in many caſes of obſtinate *vomiting*, from different cauſes and in different diſorders: Dr. Withers ſays, in his Treatiſe on the Aſthma, he found cold water the moſt grateful and beneficial to the patient; and all warm liquors evidently detrimental, by exciting pain and increaſing the ſickneſs. But if the ſtomach is inflamed, cold liquors are very hurtful.

When the vomiting proceeds from a weakneſs, or irritability of the ſtomach, or *acrid matter lodged there*, in conſequence of the gout, &c. affecting this viſcus, the columbo-root, in conjunction with aromatics, the bark, chalybeates, and magneſia or rhubarb, will give the moſt effectual relief.

When the diſorder is ſymptomatic, the original diſorder being relieved, this of courſe ſubſides.

When bilious vomitings produce ſpaſms in the ſtomach and biliary ducts, the acrimony of the bile muſt be corrected by diluents and dulcified mineral acids, with brandy and water, or negus, for the common drink; and, if required, give a little laudanum.

When a copious and pungent acid prevails in the ſtomach, let the patient drink plentifully of weak mutton-broth, to excite the diſcharges, until what is thrown up is without any change in its taſte; after which give magneſia alba in doſes, from ʒ ſs. to ʒ i. and repeat it as often as any uneaſy ſymptoms may require it. When the ſtomach is appeaſed, the bark, bitters, and chalybeates may be uſed.

When hard drinking produces frequent vomiting, after a gentle emetic, give the bark, with bitters, and the dilute vitriolic acid. Light chalybeates, particularly the Bath-water, may be uſed as a finiſh to the cure.

In any of the above caſes, to palliate the *vomiting*, the ſaline draughts given in the act of fermentation, the tinct. benzoës comp. with the dilute vitriolic acid, or a few drops of the tinct. opii may be now and then repeated. The ſp. ætheris nitroſus relieves when theſe fail.

Sometimes when wounds inflame, the ſtomach, though diſtant from the injured part, will be rendered ſo irritable as to eject its contents; in this caſe warm oil being poured on the inflamed wound, by removing irritability there, relieves the ſtomach alſo.

Bilious *vomitings* are powerfully relieved by gentle antimonial emetics, or with ſmall doſes of the tartariſed antimony with rhub. after which, bitters, particularly the columbo-root, and cordials, &c.

VOMITING OF BLOOD, OR HÆMATEMESIS, is known by dark coloured clotted blood being thrown up from the ſtomach: it is uſually mixed with much phlegm. This diſcharge is always ſymptomatic. A *vomiting* of blood is uſually preceded by a tenſive pricking pain in the ſtomach or the left hypochondrium, and the eruption itſelf is almoſt always attended with a nauſea, anxiety of the præcordia, and a compreſſing pain, as alſo a kind of tightneſs on the ſame ſide; a fainting, too, often attends. In this caſe there is no cough, as happens when the lungs are the ſeat of the diſorder.

BLOODY VOMITING is the effect of an indurated ſpleen, a varicous ſtate of the *vaſa brevia* in the upper left portion of the ſtomach, or of other veſſels thereabout;—*women* are particularly ſubject to this ſymptom about the time of the eruption, or on a ſuppreſſion of the menſes, from paſſion, frights, grief, pregnancy, &c. It happens *in men* from ſuppreſſed hæmorrhoids.

There is danger from the extravaſated blood lodging in the bowels, and becoming putrid; by which means a dyſentery, or a putrid fever, may be produced. The bloody *vomitings* which happen about the middle of pregnancy, in ſome plethoric habits, are rarely injurious.

The ſame happening during labour, or even in child-bed, if the quantity be ſmall, is not often hurtful. If there is no fever, if the habit is plethoric, if any uſual evacuation is obſtructed, hope may be indulged; but if a fever attends, if the blood diſcharged be very black and fetid, or if the cauſe is an enlargement of the ſpleen, an induration of the liver, or if faintings are conſiderable, there is but little hope.

Diſtinguiſh the pain and heat in the ſtomach, from an inflammation there, and from blackiſh hæmorrhoidal excretions.

Until the diſcharge by the mouth is ſtopped, abſtain from purging medicines; let the diet be cooling, and in ſmall quantities; except there is manifeſt inflammation or plethora, omit bleeding; aſtringents muſt not be adminiſtered, for they ſtimulate the ſtomach; but opiates, ſuch as the tinct. opii may be given to four or five drops two or three times a day, or give the following draught as the ſymptoms, viz. pains and ſpaſms, may require it.

℞ Nitri puriſſ. ℈ i. aq. diſtill. ℥ ii. ſyr. e mecon. ℥ ii. m.

If the patient is hot, and the circulation hurried, give ſal nitri ʒ i. in every pint of water that is drank. Emollient clyſters with nitre relieve the ſpaſmodic affections in the ſtomach. If ſuppreſſed menſes are the cauſe, give mild emmenagogues by the mouth, bleed according to the ſtrength, &c. of the patient, and adminiſter frequent emmenagogue clyſters. If the cauſe is eroſion from acrid ſubſtances in the ſtomach, abſorbents and demulcents will be proper.

When the *vomiting* ceaſes, and the patient ſeems griped from the ſtagnant blood, give him a gentle purge or two. See Meibomii Diſſert. de Vomitu. Hoffman's Pract. of Med. Cullen's Firſt Lines, vol. iii. p. 51—66. edit. 4.

VOX ABSCISSA. See Abscissio.

VULNERARIA, called alſo *traumatica*, VULNERARIES. Medicines ſuited to promote and favour the cure of wounds. Dr. Cullen ſays, as the cure of wounds muſt be entirely an operation of nature, the ſurgeon has hardly any other employment in this buſineſs, than to avoid or remove the circumſtances which might impede the operation of nature. When ſuch circumſtances occur with reſpect to recent wounds, it is very doubtful whether any internal medicine can be of uſe to obviate or remove them; and, at leaſt, it is not probable, that the medicines given under the title of *vulneraries* can have any effect to this purpoſe. It is indeed poſſible, that the Peruvian bark, and other analogous ſubſtances, may, in ſome caſes, be of uſe in mending the weakneſs of the ſyſtem, and, therefore, the flaccidity of the parts affected; and perhaps, in other caſes, ſome internal medicines may be of uſe; but they ſhould be mentioned, as anſwering a particular indication, and by no means under the indefinite term of *vulneraries*. Mat. Medica.

VULNERARIA AQUA. See Arquebusade.

VULNUS. A WOUND, ſynonymous with *punctura*. Boerhaave gives the following deſcription of a *wound*. A *wound* is a recent bloody ſolution of continuity in the ſoft parts, made by a hard, ſharp inſtrument. But it may be obſerved, that obtuſe inſtruments *wound*, and ſharp ones cut into the bones: when a wound is lacerated, it is called LACERATA. Dr. Cullen places this genus of diſeaſe in the CLASS Locales, and ORDER Dialyses, which he defines a recent ſolution of continuity, bloody, of ſome ſoft part, occaſioned by ſome violence done to the part.

Wounds that are ſuperficial, when cleaned from the blood, &c. are perceptible to the ſight; but when they are too deep to be ſeen into, it is better to examine them with the finger than with the probe; and, where the *wound* is too ſmall for the finger, a bougie is better than a probe, on account of its flexibility, eſpecially where it is winding. In examining a *wound*, we ſhould know the attitude of the patient when he received it, the kind of weapon, how far it penetrated, how it was directed, with what force the blow was given; it ſhould alſo be obſerved, what kind of fluid diſcharges do or did flow from the *wound*. The knowledge of theſe, with the knowledge of our frame, the uſe, &c. of each part, enable us to judge rightly of the nature of the *wound*, its cure, and conſequences.

The danger of the *wound* is, as the ſize of the veſſels that are divided, and the importance of the injured part with reſpect to life.—The nearer a *wound* is to a vital part, the more dangerous it is.—*Wounds* in the joints are healed with difficulty; ſo are thoſe that are ſituated in any part ſubject to conſtant motion, as in the lungs or belly.—The attending ſymptoms render a *wound* more or leſs dangerous.—The age, conſtitution, cuſtoms, habits, and the inconveniences that may be expected, though the patient does not die, ſhould be pointed out, or hinted at, at leaſt.—Dividing a principal artery in a limb, endangers mortification; a principal nerve, inſenſibility, and an atrophy thereof.—Separation of a tendon deſtroys as much motion as depends on that muſcle.—A *wound* in the medulla ſpinalis cauſes a palſy, or a mortification in the lower parts.—An immoderate ſuppuration in a deep *wound*, by abſorption, may cauſe a hectic fever, and conſume the patient in a maraſmus.—Great loſs of blood endangers a dropſy.—A *wound* in the breaſt and lungs, when healed, may be the occaſion of a phthiſis pulmonalis; and in any other conſiderable organ, an ulcer may remain, and prove the ſource of a hectic fever, or of a conſumption; but great caution is neceſſary in determining the prognoſtics of *wounds*, particularly thoſe which penetrate into the breaſt or belly, on account of the different ſituation of the viſcera, of which we have no ſign during life. Van Swieten ſays, that he hath met with many ſuch caſes. See inſtances of this kind in the Lond. Med. Obſ. and Inq. vol. i. p. 26—35.

The different ſtates of a *wound* are included under thoſe of *digeſtion*, or the *diſcharge of matter*;—*incarnation*, or *filling up with fleſh*;—a *cicatrization*, or *ſkinning over*.

In order to the cure of wounds, eſpecially when they are conſiderable, the non-naturals demand our particular attention. The *air* ſhould be dry and moderately warm, but not hot; the *diet* ſhould be moderate, though it may be neceſſary to allow for cuſtom, and regard ſhould be had to the preſent habit of body; *reſt* is generally neceſſary, but *motion* hurts the ſuperior parts leſs than it does the inferior: *as to the excretions*, ſtrong purges, &c. are injurious, but coſtiveneſs muſt be carefully guarded againſt; the affections are to be well regulated; if they are exceſſive in their degree, or if long continued, though but moderately excited, they will be injurious.

When extraneous bodies are extracted, if it can be done prudently, the hæmorrhages ſuppreſſed, all morbid tenſion in the wounded part removed, and the lips of the *wound*, where this is required, brought properly together, the dreſſings may be pledgits of ſoft lint covered with one of tow, ſpread with ſome digeſtive ointment, and large enough to cover the whole; theſe may be ſecured by means of ſuch bandages as the ſituation of the *wound* beſt admits of: the firſt dreſſings uſually remain two or three days, or until the diſcharge of matter renders the ſeparation of them eaſy.—After the firſt dreſſings are removed, the dreſſing may be repeated every twelve or twenty-four hours, according as the diſcharge is more or leſs abundant or acrid.—If after the firſt dreſſing a warm digeſtive is required, add to the ung. reſinæ flav. a little of the ol. tereb. vel bal. capiv. Theſe applications need not be warmed, except when very cold: after ſpreading the pledgit, its ſurface may be juſt warmed by holding before the fire; each time that the ſurface of the *wound* is cleanſed, it ſhould be performed by dabbing it gently with ſoft lint, and not wiping it, leſt the tender granulations ſhould be deſtroyed; the ſurface of the *wound* ſhould not be made quite dry, but is better for being left ſomewhat moiſt, for thus the digeſtion is leſs interrupted.

Mr. Sharp obſerves, that the principal interruption to the healing of a *wound* made with a ſharp inſtrument is the fungus, and this he would have ſuppreſſed by dry lint and a proper compreſs upon it; or if it advances above the ſurface of the ſkin, to touch its edges only with ſome gentle eſcharotic; but it ſometimes happens that an obſtruction to healing is the flabbineſs of a *wound*, which is generally removed by dabbing it at each dreſſing with the following or ſome ſuch application: ℞ Aq. calcis ſim. ℔ ß, ſs. tinct. cor. Peruv. ſim. ℥ ii. tinct. myrrh. ℥ i. m. Thus, if an ill conſtitution or bad habit of the body is no impediment, *wounds* on the exterior parts are generally ſoon healed.

When the *wound* is filled up with fleſh, pledgits of the *cerate of lapis calaminaris* uſually effect the laſt intention of cure, or the cicatrizing of the *wound*.

There are many accidents which occaſionally are attendants on *wounds* in one ſtage or another, ſuch as *fever*, *inflam-*

inflammation, a *callus*, &c. the management of which will be learned from what is already ſaid under the different articles in which they are noticed.

When a ſmall artery is wounded, if it is divided, it retracts, and the hæmorrhage is ſoon ſpontaneouſly reſtrained; *if it is punctured*, or *partially divided*, if it can conveniently be come at, it may be wholly divided, or the *wound* enlarged, and then the artery may be tied, if proper preſſure proves ineffectual.—*When a large artery is punctured or divided*, it muſt be taken up and ſecured with the needle and ligature.—*Wounds in the axillary artery, and alſo of the femoral*, if near the body, generally demand an amputation of the limb.

Wounds ſometimes penetrate the cavity of the breaſt and belly, and ſometimes injure one or more of the viſcera; the firſt are known by the probe, the latter by the diſcharge that iſſues from them; if the ſymptoms attending a *wound* that penetrates into the cavity of the breaſt or belly are favourable, and there is no diſcharge from any of the viſcera, we may conclude that they are ſafe as the viſcera are unhurt; in which caſe, after excluding the air that may have ruſhed into theſe cavities, treat them as ſimple *wounds*. The air may be excluded as follows: make the patient inſpire ſtrongly, keeping the *wound* cloſely covered: then uncover it after this full inſpiration, and let the patient at the ſame time make a full and powerful effort as in expulſion of the fæces; thus the included air will be driven out at the orifice; repeat this proceſs as often as it may ſeem neceſſary. If any of the viſcera have protruded and are unhurt, return them with all ſpeed; but if wounded, uſe the glover's ſuture, leaving three or four inches of the ligature out of the *wound*. If the protruded viſcera have been expoſed to the air, it may be neceſſary, before the return of them, to uſe a fomentation of warm milk and water, with a little ſweet oil. In all theſe caſes flannel is the beſt bandage, becauſe it gives way and retreats as the breath doth require.

Wounds in the principal internal blood-veſſels are all deemed mortal; but blood is ſometimes diſcharged from ſmaller veſſels into the cavity of the breaſt or of the belly; if this happens in the breaſt it occaſions a difficulty of breathing, which difficulty is worſe when the patient is in an erect poſture; though, if blood is diſcharged into both the cavities of the breaſt, the patient can only lie on his back, and ſtand in an erect poſture. To diſcharge this blood, if the *wound* is in the lower part of the breaſt, lay the patient on the wounded ſide, and with a probe puſh back the lungs, that the blood may paſs out; if the *wound* is in the upper part of the breaſt, an opening muſt be made at the back part thereof, allowing the other to cloſe; the proper place for this aperture is between the third and fourth of the falſe ribs, counting from below upwards, and about five inches from the ſpine. But, until the hæmorrhage appears to have ceaſed, which may be judged of by the ſtrength and equality of the pulſe, and the warmth of the patient's extremities, the operation will be uſeleſs. When the opening is made, the expulſion of the matter is aſſiſted by the efforts of reſpiration, as already hinted at, for the diſcharge of air. In theſe caſes the patient muſt be kept ſtill, mild aſtringent balſamic injections may be uſed, and gentle opiates given if a cough attends. If blood is poured into the belly, here will ſoon be laborious breathing, anxiety, and intermitting pulſe, &c. If the diſcharge of blood is ſmall, the patient ſometimes recovers, but, if conſiderable, it generally proves fatal.

When a nerve is wounded, a variety of alarming ſymptoms comes on in proportion to the fineneſs and tenſeneſs of the part it is attached to, and the peculiar irritability of the conſtitution; when the pain occaſioned thereby is extreme, it ſometimes is relieved only by dividing the nerve: this accident is ſoon diſcovered by the ſharp ichor which diſtils from the part, and its excoriating the circumjacent parts. When a tendon is wounded, the ſame ſymptoms follow as when a nerve is injured, but only they do not ſo ſuddenly appear. The moſt common applications to wounded nerves and tendons have been the ſubtil ſpirituous ſorts, ſuch as the ol. tereb. &c. but they are productive of the worſt ſymptoms; inſtead of theſe, put the limb into the eaſieſt poſition, keep the wounded part free from cold air, avoid ſpirituous and hot applications, and in their ſtead, apply a warm bread poultice, having firſt covered the *wound* with lint; or inſtead of the poultice, cloths may be applied after dipping them in warm oil, or warm oil and vinegar mixed in equal parts; warm fomentations may be uſed before the application of the poultice, if inflammation attends, or ſeems to be approaching.

Wounds in the joints, when they are inflicted with cutting inſtruments, or with heavy weapons falling on them, are attended with danger. Though the *wound* is ſmall, its conſequences are often grievous, from irritation, from deſtruction of the ligament, from the loſs of ſynovia, &c. Much depends on the habit; from a large *wound* in the ancle, cauſed by a fracture, nothing remarkable hath followed; and fatal conſequences have been the reſult of a ſmall one. However favourable appearances may be, a guarded prognoſtic ſhould always be given. Large *wounds* of the joints almoſt always require amputation. The ligament of the patella being divided by a ſharp-edged inſtrument hath frequently been followed by a loſs of the leg. The tibia being broken from the aſtragalus, and attended with laceration, makes an amputation adviſable. A mere inciſed *wound* into a joint, from letting in air and injuring the ligamentous parts, has often proved fatal, when a timely amputation would have ſaved the patient. In contuſions of the joints from heavy bodies cruſhing them, if a gangrene is waited for before amputation is performed, it will be left until it is too late: the patient ſeldom lives until the mortification begins to ſeparate; but is taken off by the fever and local malady. The two great conſequences to be avoided in *wounds* of the joints are inflammation and pain; the firſt is to be attempted by bleeding and purſuing the antiphlogiſtic plan; the latter, by the poſition of the limb and by opiates. The moſt relaxed poſition of the limb is the beſt. If no tumefaction comes on, emollient applications are not wanted, but repellents and preventives; if tumefaction, tenſion, &c. appear, immediately apply emollients. There is a ſymptomatic fever generally attendant, excluſive of any other circumſtances, and this is ſometimes attended with ſuch a diſcharge as to reduce the patient greatly; and on this account amputation becomes neceſſary. Where the joint is ſpoiled by preſſure, or by gun-ſhot, the injuries of the bone require attention as well as thoſe of other parts, and the diſcharge of the ſynovia: theſe ſeldom do well under the greateſt care.

Gun-ſhot *wounds*. See SCLOPETOPLAGA.

WINTERANUS CORTEX. WINTER'S BARK; called alſo *cort. Magellanicus, cortex antiſcorbuticus, cinnamomum Magellanicum, laurifolia Magellanica.* The tree is called *Magellanica aromatica arbor, baccifera arbor, laurifolia aromatica fructu viridi caliculato racemoſo*, THE WILD, or WINTER'S CINNAMON-TREE. In Dr. Letſom's edition of Dr. Fothergill's works, is given a drawing of a branch from the tree with the flowers, and there the tree is named *Winterana aromatica.*

Captain Winter was the firſt who made the bark of this tree known in Europe: he brought it from the Streights of Magellan in the year 1579. Cluſius deſcribes this bark in his Exot. p. 75, and calls it by the name of its firſt importer; hence the name of *cortex Winteranus* or *Winter's bark.* It has rarely been brought amongſt us, and hath been ſo little known, that Pomet, in his Materia Medica, deſcribes the canella alba for it; others have copied him, and cuſtom hath eſtabliſhed the uſe of the canella inſtead of the *cort. Winteran.* the canella is alſo generally called *cort. Winteranus.* In 1691, Mr. George Handaſyd brought ſome ſpecimens of branches, &c. from this tree, and gave them to ſir Hans Sloane, who drew up an account of the tree, and it was inſerted, with a figure, in the Philoſ. Tranſact. for 1693. But a more perfect deſcription hath been obtained by the joint aid of captain Wallis, ſir Joſeph Banks, and Dr. Solander, who, in the year 1766, were in thoſe parts where it is indigenous. It is only the bark of this tree that is of any value; and that is deſcribed as being of different degrees of thickneſs, from a quarter to three quarters of an inch, of a dark cinnamon-colour; if it is rubbed it hath an aromatic odour, and to the taſte is pungent, hot, and ſpicy: its effect on the palate is ſlowly imparted, but durable when given out.

WOR

Dr. Morris inſerted in the fifth vol. of the Lond. Med. Obſ. and Inq. ſome experiments on the *Winter's bark*, by which it appears to be a peculiar kind of aſtringent; alſo, that though it gives its virtues very freely to rectified and to proof ſpirit, yet water diſſolves its ſoluble parts moſt freely. The Doctor recommends this *bark* as excellent for covering the diſagreeable taſte of ſena and ſome other drugs, not more agreeable to the taſte.

When captain Winter firſt brought this *bark* from the Streights of Magellan, the ſailors uſed it as a ſpice, and afterwards found it uſeful in the ſcurvy; for which laſt it hath been extolled; but unhapily its ſubſtitute, the canella alba, hath been almoſt always uſed. The *Winter's bark* is much more powerful as a ſtimulant than the canella alba; it is uſeful to promote digeſtion, alſo as a ſtimulant in paralytic and dropſical diſorders; in which laſt, when the ſecretions may probably be promoted by a ſtimulus, the *Winter's bark* deſerves to be preferred. In ſome inſtances of remitting and intermitting fevers, it hath been given with advantage, as a ſubſtitute for the Peruvian bark; whence the canella alba muſt evidently be a very improper ſubſtitute.

The *Winter's bark* is in larger pieces than the canella alba, of a more rugged ſurface, a deeper colour, more agreeable ſmell, a warmer taſte, is more pungent, and leſs bitter. The canella alba is in rolls, ſomewhat thicker than cinnamon, and is the double bark of the tree from whence it is taken.

It is alſo called *ſclerophthalmia*, from σκληρος, *hard*, and οφθαλμος, an *eye*. A *ſcler-*

XER

ophthalmia, or HARD LIPPITUDE, is an inflammation of the *eye*, attended not only with a hardneſs and ſlowneſs of motion, but with a pain and redneſs. The eye-lids, in this affection, are *hard* and *dry*, never effuſing any moiſture, with ſmall, writhed, dryiſh, mucous concretions in their corners, and a difficulty of opening them after ſleep, on account of their dryneſs. The *xerophthalmia* is ſaid to be a leſſer degree of the ſclerophthalmia. James's Med. Dict.

In Dr. Cullen's Syſtem of Noſology, this is a variety of the ſpecies called *ophthalmia tarſi*, and is ſynonymous with Sauvages' *ophthalmia ſicca.* Dr. James obſerves that it is a kind of inflammation, whoſe general characters are

pain

pain and redneſs, but it differs from an inflammation in a property peculiar to itſelf, which is dryneſs. See OPHTHALMIA.

YAW

YABACANI. See APINEL.

YAWS. FRAMBOESIA. This genus of diſeaſe, doctor Cullen places under the CLASS LOCALES, and ORD. IMPETIGINES, to which he affixes no definition, and mentions two varieties, that of GUINEA and AMERICA. It is a diſtemper endemial to Guinea and the hot climates in Africa. The people there have it only once in their lives.

At firſt it is unattended with pain or ſickneſs; it makes its firſt appearance in little ſpots on the cuticle, not bigger than a pin's point, which increaſe daily, and become protuberant like pimples; ſoon after the cuticle frets off, becomes white, and then inſtead of pus or ichor, there appears a clear lymph which dries into white ſloughs or ſordes, under which is a red fungus; theſe increaſe gradually; ſome to the ſize of a ſmall wood-ſtrawberry; others to that of a raſberry; others again exceed the largeſt mulberry, which in ſhape they much reſemble; they are on all parts, but moſt in the genitals, anus, arms, and face; when they are large they are few, when ſmall there are many. The black hair, in the *yaws*, turns white and tranſparent.

This diſorder is not dangerous if ſkilfully managed. It is infectious.

As ſoon as the patient is obſerved to be infected with this diſeaſe, he muſt be confined to a place where he may remain alone; then give the quantity of a nutmeg of the following electary, morning and evening, with forty or fifty drops of the antimonial wine in a draught of a decoction of ſarſaparilla.

℞ Hydrargyri cum ſulphure ʒ i. ſs. antim. crud. ppt. & theriac. androm. āā ʒ i. ſyr. alb. q. ſ. f. electar.

YUC

When the diſeaſe ſeems to be at a ſtand, give calomel, ſo as to excite a ſalivation, to the quantity of a grain and a half or gr. ii. in twenty-four hours; let the diſcharge then decline gradually, purge gently, and give the decoct. ſarſaparil. The ulcers may be touched with the following ſolution:

℞ Hydrargyri muriati, ʒ i. ſp. vin. r. ℥. ii. m. f. ſolutio.

If the ſalivation in its progreſs ſeems ineffectual to ſtop the ſpreading of the diſeaſe, deſiſt, and give alteratives, ſuch as are recommended in the lepra, and dreſs the part with the following:

℞ Ungt. reſinæ flav. ℥ i. hydrarg. nitrat. rub. levigat. ʒ i. alum. uſt. ʒ ſs. m.

Then cicatrize with the epulotic cerate mixed with a little burnt alum.

The ſolution of the hydrarg. muriat. in ſp. vin. is ſometimes given as an internal. When nodes attend, the diſeaſe is incurable. If after the cure of this diſeaſe a pain is fixed in the feet, in this caſe warm bathing, paring the callous ſkin, and the uſe of an eſcharotic ointment, will be found very effectual.

ZEDOARIA, called alſo *gedwar*, *geid*, *geidwar*; *malankua*; *colchicum Zeylanicum*, *haronkaha*, *arnabo*, ZEDOARY. It is the root of an Eaſt Indian plant. According to Weſton, in his Univ. Botaniſt, &c. it is *coſtus Arabicus*, or coſtus ſcapo veſtito, floribus ſpicatis albis, bracteis ovalibus, fructu in pediculo ſingulari. Linn. Arabian *zedoary*. But according to the Pharmacopœia of the Edinb. college, it is the *amomum ſcapo nudo, ſpica laxa truncata*. Berg. Mat. Med. p. 4. Mr. Curtis, in his Catalogue of Medicinal, &c. Plants in the London Botanic Garden, ſays, it is the KÆMPFERIA ROTUNDA, *foliis lanceolatis petiolatis*. CLASS. MONANDRIA, ORDO MONOGYNIA. LINN. Gen. Plant. 7. It is brought chiefly from Bengal, in oblong pieces, about the thickneſs of a little finger, and two or three inches long; or in roundiſh ones, called *zerumbet*, about an inch in diameter, of an aſh colour on the outſide, and white within. The long and the round are the roots of the ſame plant, the body of which is round, and the protuberances long.

Chuſe ſuch as is denſe, ſolid, of a fine taſte and ſmell, bitteriſh, moderately acrid, and that emits an aromatic flavour in powdering or chewing, and ſuch as is large, and not wrinkled, nor perforated. It ſhould be kept dry.

It impregnates water with its ſmell and a light bitteriſh taſte. The ſpirituous tincture ſmells weaker than the watery, but it taſtes ſtronger; diſtilled with water, it yields a ponderous eſſential oil, which is hot and pungent.

This root is a *warm ſtomachic*; its ſpirituous extract is the beſt preparation.—*In colics*, attended with a diarrhœa and pain in the inteſtines, ℈ i. of the powder, taken three times a day, gives great relief.—*In flatulences* it is very uſeful, eſpecially if joined with opium. Simon Pauli ſays that it excels in diſpelling wind. In general, the doſe is from gr. v. to ʒ ſs. Dr. Monro ſays it is a good medicine and may be given with advantage where a warm cordial bitter is indicated. Dr. Cullen aſſerts he is clear it might be omitted in our Materia Medica, notwithſtanding the extravagant commendations of Cartheuſar, who conſiders it as a general remedy for moſt of the chronic complaints with which humanity is afflicted; though CULLEN allows it may have ſome virtues as containing camphire. It has however ſtill a place in the confectio aromatica of the London Pharmacopœia. See Cullen's Mat. Med. Lewis's Mat. Med.

ZERNA. An ulcerated impetigo. Some expreſs by it lepra. See LICHEN.

ZIN

ZERTA. See CAPITO ANDROMACHUS.

ZERUMBET. See ZEDOARIA. It is alſo a ſpecies of ginger; amomum ſcapo nudo, ſpica oblonga obtuſa. Linn. BROAD-LEAVED WILD GINGER.

ZIBACH. QUICKSILVER. See ARGENT. VIVUM.

ZIBETHUM. CIVET, alſo called *civeta* or *civetta*, *algatia*. It is an unctuous odoriferous ſubſtance, about the conſiſtence of honey or butter, of a whitiſh, yelloviſh or browniſh colour, ſometimes blackiſh. It is brought from Brazil, the coaſt of Guinea, and the Eaſt Indies. It is found in bags, ſituated in the lower part of the belly of an animal of the cat kind, called *animal zibethicum*. The bag hath an aperture externally, by which the *civet* is extracted. Its ſmell is fragrant, and too ſtrong to be agreeable, except it be diluted. It hath an unctuous and ſubacrid taſte, and is uſed in perfumes. It does not diſſolve in ſpirit nor in water, but unites with oils both expreſſed and diſtilled, and with animal fats. Water by diſtillation is impregnated with its odour, and ſpirit by digeſtion. Rubbed with mucilage, it mixes with water.

The black ſort from the Eaſt Indies is not ſo good as the American; but this latter is often adulterated. The chief uſe of this drug is as a perfume: it rarely, if ever, is employed for any medicinal purpoſes. See Neumann's Chem. Works. Lewis's Mat. Med.

ZIMENT. See CŒMENTUM CUPREUM.

ZINCUM, alſo called ZINCHUM, ZINCTHUM, TUTENAG, SPELTER, BLENDE, BLACKJACK, and ZINC.

Zinc is a ſemi-metal, of a bluiſh white colour, ſomewhat brighter than lead, of conſiderable hardneſs, and ſo malleable as not to be broken with the hammer, though it cannot be much extended this way. It is called a metalline marcaſite, ſomewhat reſembling lead. Stahl firſt explained what it was: ſee his Metallurgia.

Zinc crackles during the bending of it, and quickly breaks, though it is ſomewhat ductile. It is about ſeven times ſpecifically heavier than water; it begins to melt in a moderate red-heat, and very ſlowly calcines on a continuance of the fire. In a moderate white heat it flows thin, burning, fulminating, with a bright deep green or bluiſh green flame, and ſubliming into white light flowers, which concrete about the upper part of the veſſel into thin cruſts, or ſoft looſe filaments, like down or cobwebs, called PHILOSOPHER'S WOOL.

It is extracted from a ſort of *lapis calaminaris*, which is its ore. In its metallic form, and in that of a calx, it diſſolves readily in all acids, and precipitates from them almoſt all the other metallic bodies.

The white vitriol is made from pure *zinc*, by diſſolution in the diluted vitriolic acid, and cryſtallization. The calx, commonly called FLOWERS OF ZINC, was formerly kept under the names of *pompholyx*, and of *nihil album*. They are now ordered to be thus made by the College of Phyſicians, London.

ZINCUM CALCINATUM. *Calcined* ZINC, formerly called *Flores Zinci*.

Take of *zinc* broken into ſmall pieces, eight ounces; caſt them at different times into an ignited large and deep crucible, placed declining or half upright, putting upon it another crucible, in ſuch a manner that the air may have free acceſs to the burning *zinc*. Take out the calx as ſoon as it appears, and ſift its white and lighter part.

ZINCUM *Vitriolatum purificatum, purified vitriolated* ZINC.

Take of white vitriol one pound; vitriolic acid one dram by weight; boiling diſtilled water three pints. Mix and filter through paper: after a proper evaporation, ſet it aſide in a cold place to cryſtallize. Ph. Lond. 1788.

The preparations of *zinc* are employed in external applications, as ophthalmias, particularly againſt thin defluxions of rheum, and as aſtringents, which effect they have (if the *zinc* is finely levigated) without acrimony or irritation. Taken internally they prove emetic. The following ointment is uſed for the ſame purpoſes as that calld PELLIER's ointment, which ſee under ophthalmia. ℞ Zinci uſti ʒ j. unguenti ceræ alb. ʒ vj. m. See VITRIOLUM ALBUM.

The flowers of *zinc* were firſt uſed as an internal medicine by the celebrated chemiſt Glauber, but were little known in practice till Dr. Gaubius, of Leyden, gave an account of their virtues in his Adverſaria. They have ſince been much employed in convulſive and ſpaſmodic diſeaſes, and ſometimes with good effects. Even obſtinate epilepſies have been rendered much leſs violent by their uſe. Some think they have proved an uſeful auxiliary to the Peruvian bark in intermittents. Like all other medicines, however, in diſeaſes of this claſs, their good effects are often only temporary, and they often fail altogether. When the flowers are genuine, a grain or two generally at firſt excite a nauſea or ſickneſs; but by degrees a conſiderable doſe may be taken with little or no ſenſible effect. As they are liable to be adulterated, it may be proper to mention, as teſts of their purity, that they make no efferveſcence with acids; and that, when expoſed to a ſtrong heat, they become yellow; but, on cooling, turn white again.

By a mixture of *zinc* with copper, in different proportions, are made the compound or artificial metals, called BRASS and PRINCE'S METAL. See Neumann's Chem. Works; Dict. of Chemiſtry; Lewis's Mat. Med. edit. 3. Nicholſon's Dictionary of Chemiſtry, 1795.

ZINGI. See ANISUM INDICUM.

ZINGIBER. *Ginger.* The character for this is Z z. Alſo called *zinziber, gingihil fæmina, chilli Indiæ orientalis, iris latifolia tuberoſa, mangaratia.* It is the root of a reed-like plant, growing ſpontaneouſly in both the Indies, in China, &c. It is brought to us in knotty, branched, flattiſh pieces, freed from the outer bark, of a pale colour, and fibrous texture. It is diſtinguiſhed into white and brown, but they are both the ſame root; the former is cleaned and dried, the latter is ſcalded, more ſhrivelled, and rendered leſs aromatic. That which is the leaſt fibrous is reckoned the beſt. It is the AMOMUM ZINGIBER, *ſcapo nudo, ſpica ovata* Linn. COMMON, or NARROW-LEAVED GINGER. CLASS MONANDRIA, ORDO MONOGYNIA. LINN. Gen. Plant. 2.

This root is warm and aromatic, but not ſo heating as one would expect from its penetrating heat, and the pungency of its taſte, as well as from the fixedneſs of its principles; but Dr. Cullen thinks, that there is no foundation for this remark. It gives out all its virtues to rectified ſpirit of wine, and the greater part of them to water. In diſtillation water raiſes its whole flavour, but ſpirit leaves it nearly all behind.

Ginger is uſed in cold and flatulent diſorders with ſome advantage; alſo when there is a laxity, or debility of the ſtomach and inteſtines, and in torpid and phlegmatic conſtitutions, to excite briſker vaſcular action. It is alſo a good corrector of purgative medicines, for which purpoſe it is often uſed. Its effects are more durable than thoſe of the peppers. The London College orders a SYRUPUS ZINZIBERIS, *ſyrup of ginger*, to be made by macerating four ounces of bruiſed ginger for four hours in three pints of boiling water; then ſtrained; and made into ſyrup with the addition of clarified ſugar. Ph. Lond. 1788. See Lewis's Mat. Med.
