

Meteorological Register for the years 1826, 1827, 1828, 1829, and 1830, from observations made by the surgeons of the army and others at the military posts of the United States / prepared under the direction of T. Lawson ; ato which is appended, the Meteorological register for the years 1822, 1823, 1824, and 1825, compiled under the direction of Joseph Lovell.

METEOROLOGICAL REGISTER

FOR THE YEARS

1826, 1827, 1828, 1829, AND 1830;

FROM

OBSERVATIONS

MADE BY THE SURGEONS OF THE ARMY AND OTHERS

AT THE

MILITARY POSTS OF THE UNITED STATES.

PREPARED UNDER THE DIRECTION OF

THOMAS LAWSON, M.D.,

SURGEON-GENERAL UNITED STATES ARMY.

To which is Appended, the METEOROLOGICAL REGISTER for the Years 1822, 1823,
1824, and 1825: Compiled under the direction of

JOSEPH LOVELL, M.D.,

LATE SURGEON-GENERAL OF THE UNITED STATES ARMY.

[PUBLISHED FOR THE USE OF THE MEDICAL OFFICERS OF THE ARMY.]

Philadelphia:

HASWELL, BARRINGTON, AND HASWELL,

293 MARKET STREET.

NEW ORLEANS: JOHN J. HASWELL & CO.

1840.

THE MEDICAL REGISTER

FOR THE YEAR

1897, 1898, 1899, AND 1900

AND

OBSERVATIONS

MADE BY THE SURGEONS OF THE ARMY AND OTHER

AT THE

MILITARY POSTS OF THE UNITED STATES

EDITED UNDER THE DIRECTION OF

THOMAS LAWSON, M.D.

MAJOR-GENERAL UNITED STATES ARMY

To which is appended the International Register for the Years 1895, 1896, 1897, 1898, and 1899: Compiled under the direction of

JENNETH LOVELL, M.D.

DEPUTY CHIEF OF THE UNITED STATES ARMY

FOR THE USE OF THE MEDICAL OFFICERS OF THE ARMY

PUBLISHED BY

HARVEY, BARRINGTON, AND HARVEY,

205 MARKET STREET,

NEW ORLEANS, JOHN J. HARVEY & CO.

1899

R E M A R K S .

IN 1819, under the direction of the then Secretary of War, a system of meteorological observations was commenced, and zealously prosecuted by the late Surgeon-General; but as the instruments provided never exceeded a thermometer and a rain-guage, the observations, including those upon the course of winds, and other obvious states of the weather, have necessarily had a limited range. The results are consequently less comprehensive than the present state of meteorological science demands. As temperature is, however, the most prominent, and perhaps the controlling, element in the constitution of climate, and as thermometrical observations have been continuously made for twenty years, it would seem a matter of common right that these at least should be placed within reach of the scientific public.

The Meteorological Abstracts, which have served as the basis of the general conclusions deduced, do not embrace more, perhaps, than a third of the materials collected in the Surgeon-General's office. As the observations presented, however, extend over the entire domain of our States and Territories, it may reasonably be assumed that the results exhibit a fair expression of the general laws of our climate, which further research will ultimately confirm.

As meteorology has now become a subject of general interest, the importance of more extended observations is apparent; and the hope is indulged that the medical corps of the army, more especially as many of the military posts afford an opportunity of making observations in regions still in a state of nature, will ere long be furnished with the means of prosecuting more extensive researches, and of keeping pace with the progress of the science.

To the late Surgeon-General, J. Lovell, M.D., under whose efficient control the Medical Bureau was organized, and improved with a steady pace in its various details, pertains the merit of having established a system of reports, thus rendering it practicable to condense the results of years into the forms now presented.

The unpublished records extend as far back as 1820, the period when regular observations were first instituted. In 1826, the late Surgeon-General published Meteorological Abstracts for the years 1822-3-4-5, embracing positions in every region of the United

States. Tables for 1820 and 1821 were also published; but a want of uniformity in the mode of tabular arrangement, has, in a measure, defeated their object.

By direction of Thomas Lawson, M.D., Surg.-General U. S. A., the papers on file in the Medical Department relative to meteorology have been lately examined and arranged. "Diaries of the Weather," from 1820 to 1830 inclusive, have been condensed into tabular abstracts; the last five years being now presented in monthly results.

The thermometrical observations are confined to the superficial temperature of the places; and as the mean of each month is calculated from 90, and of each year from 1095 observations, the tables, it is believed, will give an approximation to the truth as near as can be realized by ordinary observation, and a mean sufficiently correct for every contemplated purpose.

The climate of the United States may be studied under three grand divisions; each of which contains many sub-divisions or systems of climate, determined by the influence of local causes. 1st. The Northern Division, extending as far south as the 39th degree of latitude, a region characterized by the predominance of low temperature. 2d. The Southern Division, in which a high temperature prevails; and 3d. The Middle Division, which exhibits phenomena vibrating to both extremes. These divisions will be regarded, in a great measure, as arbitrary, and are intended, as well to facilitate description, as to express the operation of general laws.

In reference to the sixty-five tables, embracing a period of five years, it may be necessary to remark, that the first twelve tables of each year give the mean of the observations of each month, and the thirteenth, the mean for the whole year. These tabular abstracts are the condensed results of the observations made at various posts, situated between $27^{\circ} 57'$ and $46^{\circ} 39'$ of north latitude, and between $67^{\circ} 04'$ and $95^{\circ} 43'$ of longitude west of Greenwich; embracing an extent of $18^{\circ} 42'$ of latitude, and $28^{\circ} 39'$ of longitude.

The first general division presents the greatest variety of climate. On the sea-coast of New England, the influence of the ocean modifies the range of the thermometer and the mean temperature of the seasons. Advancing into the interior, the extreme range of temperature increases, and the seasons are violently contrasted. Having come within the influence of the lakes, a climate like that of the sea-board is found; and proceeding into the region beyond the modifying agency of these inland seas, an excessive climate is again exhibited. The variations of the *isothermal* and *isocheimal* curves—the lines of equal summer and of equal winter temperature—thus afford a happy illustration of the equalizing tendency of large bodies of water. Hence the former division of the surface of the earth into five zones, as regards its temperature, has been superseded, in scientific inquiries, by a more precise arrangement; places having

the same mean temperature are connected by isothermal lines—the spaces between them are called isothermal zones.

A concise description of the chain of vast lakes or inland seas, which lie in the northern division, may be here properly introduced. The basin of the St. Lawrence is truly a region of "broad rivers and streams," containing, it is estimated, an area of 400,000 square miles, of which 94,000 are covered with water. From the western extremity of Lake Superior to the Gulf of St. Lawrence, the distance is about 1900 miles. These ocean-lakes have been estimated to contain 11,300 cubic miles of water—a quantity supposed to exceed more than half of all the fresh water on the face of the globe. Lakes Huron and Michigan, which have the deepest chasms, have been sounded to the amazing depth of 1800 feet without discovering bottom.

The following table, which gives the mean length, breadth, depth, area, and elevation of these several collections of water, is taken from a recent report made by Douglas Houghton, Esq., State Geologist of Michigan:—

	Mean Length. <i>Miles.</i>	Mean breadth. <i>Miles.</i>	Mean depth. <i>Feet.</i>	Elevation above level of the sea. <i>Feet.</i>	Area in square miles.
Lake Superior	400	80	900	596	32,000
Green Bay	100	20	500	578	2,000
Lake Michigan	320	70	1000	578	22,400
Lake Huron	240	80	1000	578	20,400
Lake St. Clair	20	18	20	570	360
Lake Erie	240	40	84	565	9,600
Lake Ontario	180	35	500	232	6,300
St. Lawrence			20		940
					94,000

Having said that the northern division exhibits four striking inflexions of the isothermal and isocheimal lines on the same parallel of latitude, corresponding to certain systems of climate, the data from which these results are obtained will now be given; and the results of each year will be presented in detail. To illustrate the difference of temperature, more especially as regards its distribution among the seasons, between the sea-board and the interior remote from large bodies of water, a comparison of the following posts will be instituted:

Fort Sullivan, lat.	44° 41'	Fort Snelling, lat.	44° 53'
“ Wolcott, “	41° 30'	Council Bluffs “	41° 25'
Mean East	43° 06'	Mean West	43° 09'

The data given in the following table are contained in the first twelve Abstracts for 1826; and, for brevity's sake, the terms east and west will be used to distinguish the Atlantic and the interior posts, whilst the latitudes given will be regarded as means of the eastern and western posts respectively.—See Table [A] p. 8.

[B]

PLACES OF OBSERVATION.	Latitude.	Mean Annual Temperature.	Range of the Thermometer.	WINTER.				SPRING.			SUMMER.			AUTUMN.		
				Dec.	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	
Fort Mackinac . .	45° 51'	41.67	84 -17 101	23.41	18.93	17.66	26.32	32.85	50.59	61.14	66.74	63.29	54.84	48.63	35.60	
Fort Snelling . .	44° 53'	44.86	92 -23 115	19.15	13.09	16.15	29.60	37.68	66.76	72.05	73.85	70.24	55.32	49.13	35.29	
					20.00		36.59			63.72			46.36			
					16.13		44.68			72.05			46.58			

During the winter, the mean of the east is 8.38 *higher* than the west ; during the spring, 3.53 *lower* ; during the summer, 6.99 *lower* ; and during the autumn, 1.54 *higher*. In the mean temperature for the year there is but a fractional difference. In the extreme range of the thermometer there is a difference of 5° ; but an examination of each month shows the range to be much greater at the interior posts remote from the agency of inland seas.

Lest this striking contrast between the mean temperature of winter and that of summer might be ascribed to the *elevation* of the western posts (being 6 or 700 feet above the level of the sea), a comparison between Forts Mackinac and Snelling, the former situated on the Island of Mackinac, and the latter near the junction of the St. Peters and Mississippi Rivers, will be conclusive upon this point. See Table [B] p. 8.

During the winter, the mean of the former, although 1° north, is 3.87 *higher* than the latter ; during the spring, 8.09 *lower* ; during the summer, 8.33 *lower* ; and during the autumn nearly equal. As these two posts present little difference of elevation above the level of the ocean, and are in comparative proximity, the fact—that the winters are less rigorous and the summers more temperate, on the Great Lakes—is demonstrated to be owing, as on the ocean, to the equalizing agency of large bodies of water.

The Abstracts of 1827 furnish results corroborative of those of the preceding year. In comparing the Atlantic stations with those in the interior remote from inland seas, the following posts are taken:—

Fort Preble, lat. 43° 38'	Fort Snelling, lat. 44° 53'
„ Constitution „ 43° 04'	„ Armstrong „ 41° 28'
Mean East <u>43° 21'</u>	Mean West <u>43° 10'</u>

—See Table [C] p. 10.

During the winter, the mean of the E. is 2.27 *higher* than the W. ; during the spring, 3.85 *lower* ; during the summer, 8.26 *lower* ; and during the autumn, 1.71 *lower*. At the W. the mean temperature of the year is 2.88 *higher* ; and the extreme range of the thermometer is 15° greater.

A comparison between Forts Brady and Snelling, in relation to the influence of the Great Lakes, furnishes results confirmatory of those of the preceding year. See Table [D] p. 10.

During the winter, the mean of the former, although 1° 46' north of the latter, is 1.76 *higher* ; during the spring, it is 8.09 *lower* ; during the summer, 9.84 *lower* ; and during the autumn, 2.37 *lower*. At Fort Snelling the mean annual temperature is 4.64 *higher*, and the extreme range of the thermometer is 14° greater.

					20.14	20.14	38.39	46.48	62.28	72.12	45.05	47.42				

Having demonstrated three systems of climate, viz. ; that of the Atlantic Coast and of the Lakes, which have the extremes of temperature modified, and that of the region beyond the Lakes, characterized by strongly contrasted seasons, it is practicable, this year, by means of the thermometrical observations at West Point, to establish another system of climate. As the climate of the Lakes bears a close similitude to that of the sea-coast, so will this resemble that of the region beyond the Lakes. See Table [E] p. 12.

As West Point, New York, is on the same degree of latitude with Fort Trumbull (New London, Connecticut), and is distant only one and a half degree of longitude, no striking contrast in the results would be, *à priori*, anticipated. It is found, however, that the winters of the former are 4.67 colder, and the summer 1.00 warmer ; and that although the mean annual temperature of Fort Trumbull is 1.56 higher, yet the heat is so equably distributed through the seasons that the difference between the mean temperature of winter and summer is only 35.89, whilst that of West Point is 41.56. It is thus seen that the isothermal and isocheimal lines, on leaving the coast, gradually diverge until they come within the influence of the Lakes, when they again converge ; and that, having passed beyond the controlling power of these inland seas, their inflexions are once more in adverse directions. Hence it is apparent, that although two places may have the same mean annual temperature, and thus be on the same *isothermal* line ; yet, owing to the seasons being nearly uniform or violently contrasted, the climates may be very different.

The Abstracts of 1828 furnish the usual results in regard to the equalizing influence of the Ocean and the Lakes. In the following table, a comparison is made between the same stations as in the prior year. See Table [F] p. 12.

During the winter, the mean of the Atlantic posts is 8.70 higher than that of Forts Snelling and Armstrong ; during the spring, it is 2.43 lower ; during the summer, 6.90 lower ; and during autumn 0.80 higher. In the mean annual temperature, there is but a fractional difference ; but the extreme range of the thermometer is 23° greater in the West.

The results obtained from a comparison of Forts Brady and Snelling, confirm the conclusions of prior years. See Table [G] p. 13.

During the winter, the mean temperature of the former is 3.47 higher than the latter ; during the spring, it is 2.75 lower ; during the summer, 12.61 lower ; and during the autumn, 3.08 lower. At Fort Brady the difference between the mean temperature of winter and summer is 40.79, whilst at Fort Snelling it is 56.87.

Between West Point and Fort Trumbull the comparison is found also to quadruple with the general law.

[H]

PLACES OF OBSERVATION.	Latitude.	Mean Annual Temperature.	Range of the Thermometer.		WINTER.			SPRING.			SUMMER.			AUTUMN.			
			98	6	92	Dec.	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.
West Point . . .	41° 22'	54.96	98	6	92	39.67	33.42	39.39	41.77	47.72	61.76	73.85	75.41	76.58	68.64	55.99	45.03
Fort Trumbull .	41° 22'	56.89	86	18	68	45.66	41.86	44.33	43.20	48.86	59.43	70.10	74.57	74.84	69.30	58.04	51.54
							37.49		50.42			75.28			56.55		
							43.95		50.50			73.20			59.63		

During the winter, the mean of the latter is 6.46 higher than the former; during the spring, it is 0.08 higher; during the summer, 2.08 lower; and during the autumn, 3.08 higher. At West Point, the range of the mercury is 24° greater than at Fort Trumbull.

The Abstracts of 1829 next come under notice. It will be seen that the data of this year lead to the same unvarying conclusions as in all former calculations. See Table [I] p. 15.

During the winter, the mean of the E. is 7.55 higher than the W.; during the spring, 5.41 lower; during the summer, 8.38 lower; and during the autumn 0.33 higher. On the ocean the range of the thermometer is 28° less than in the opposite locality.

The meteorological report from Fort Brady being imperfect, the usual comparative views are precluded. The establishment of a new post, however, at Houlton, in the interior of Maine, allows a more extended inquiry into the system of climate peculiar to the region lying between the sea-coast and the Lakes. The following posts constitute the points of comparison:—

Fort Preble, Maine	$43^{\circ} 38'$	Hancock Barracks, Me.	$46^{\circ} 10'$
“ Constitution, N. H.	$43^{\circ} 04'$	West Point, N. York,	$41^{\circ} 22'$
Mean lat.	$43^{\circ} 21'$	Mean lat.	$43^{\circ} 46'$

—See Table [K] p. 15.

During the winter, the mean of the coast is 4.32 higher than the interior; during the spring, 1.49 lower; during the summer, 0.90 lower; and during the autumn, 1.73 higher. On comparing the posts separately, the difference between the summer and winter temperature becomes more apparent. Thus, at Hancock Barracks, it is 47.49, and at Fort Preble 41.66; and at West Point 41.14, and at Fort Constitution 36.55. The extremes of temperature are also indicated by the range of the thermometer; for, whilst the thermometer at Hancock Barracks rises in the summer to 92° , and sinks in the winter 24° below zero, it attains at the Atlantic posts but the same height, and sinks no lower than 6° minus 0.

Lastly, the Abstracts of 1830, (which year constitutes the limit of the present investigation,) come under review. On a comparison of the Atlantic region with the interior beyond the Lakes, using the data of the same posts as in the preceding year, no variation is presented in the results. See Table [L] p. 16.

During the winter, the mean of the E. is 3.23 higher than the W.; during the spring, 5.60 lower; during the summer, 9.67 lower; and during the autumn, 3.01 lower. At the west, the range of the mercury is 14° greater; and, whilst the difference in the mean temperature of summer and winter is $53^{\circ} 63'$, it is but 40.77 on the Atlantic coast.

Resuming the comparison between Forts Brady and Snelling, the deductions of former years are confirmed. See Table [M] p. 16.

PLACES OF OBSERVATION.	Latitude.	Mean Annual Temperature.	Range of the Thermometer.	WINTER.				SPRING.			SUMMER.			AUTUMN.		
				Dec.	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	
Fort Brady	46° 39'	43.38	93 -26 119	24.66	13.19	18.67	27.92	46.18	48.48	59.35	71.00	62.33	55.22	49.50	44.08	
Fort Snelling	44° 53'	48.60	94 -26 120	15.64	14.18	23.60	34.00	51.77	59.70	70.31	81.66	73.21	58.70	54.74	42.79	
					18.84			40.86		64.23			49.60			
					17.81			48.39		75.06			52.08			

During the winter, the mean of the former is 1.03 higher than the latter,—a difference, which would be much increased were November instead of February taken as a winter month; during the spring, the mean is 7.53 lower; during the summer, 10.83 lower; and during the autumn, 2.48 lower. It thus appears that although Fort Brady, situated at the Sault St. Marie, near the outlet of Lake Superior, is $1^{\circ} 46'$ north of Fort Snelling, at the junction of the St. Peter's and the Mississippi, yet there is a difference of nearly 11° in their isothermal lines.

Of the four subdivisions in the northern region of the United States, two are characterized as *modified* climates and two as *excessive*. With the view to test the accuracy of this proposition in a general comparison, one post has been so selected from each system of climate, that the mean latitude shows a difference of but 15'. Thus, the following stations constitute the points of comparison in the subjoined table:—

Fort Brady, $46^{\circ} 39'$	Hancock Barracks, $46^{\circ} 10'$
“ Wplocot, $41^{\circ} 30'$	Fort Armstrong, $41^{\circ} 28'$
Mean lat. $44^{\circ} 04'$	Mean lat. $43^{\circ} 19'$

—See Table [N] p. 18.

During the winter, the mean of the former is 4.12 higher than the latter; during the spring, it is 3.97 lower; during the summer, 4.30 lower; and during the autumn there is but a fractional difference. Between winter and spring the modified climate shows a mean difference of 18.49, whilst that of the excessive climate rises to 26.52; and between winter and summer, it is in the former 41.17 and in the latter 49.59. The table indicates little difference in the extreme range of the thermometer; but, on reference to Abstract No. XIII. for 1830, it will be found that Fort Armstrong, the most *southern* post, exhibits the *highest* range. This phenomenon, which is owing to the circumstance that the position is farthest removed from the agency of large seas, shows that latitude alone constitutes a very uncertain index of the character of climate.

The investigation of the northern division will be now concluded, by giving several abstracts, showing the mean result of the five years' observation. The following table affords a condensed view of all the comparisons instituted between the sea-board and the region beyond the Lakes. See Table [O] p. 18.

During the winter, the mean of the former is 6.05 higher than that of the latter; during the spring, 4.13 lower; during the summer, 8.71 lower; and during the autumn, 0.40 lower. As the winters are colder and the summers warmer in the latter region, it is also shown that the extreme range of the thermometer is 12° greater.

Deeming it unnecessary to give the course of the winds and other states of the weather for each year, an abstract for the whole period is now presented.* See Table [P] p. 20.

The ratios between the seasons on the Atlantic coast and the interior remote from large bodies of water, based on five years' observation, have been thus reduced to numerical expressions. Although fair weather prevails in both regions, a marked difference obtains in regard to the relative proportion. On the sea-coast, the annual ratio of fair days is 202, and in the opposite locality 240; the cloudy days are as 108 to 77; the rainy days are as 45 to 31; and those of snow are as 9 to 16. These ratios, far from being accidental, result from the operation of fixed laws. As the annual quantity of rain depends upon the amount of evaporation, it increases, as a general rule, in proportion as the equator is approached; and in regard to the seasons, the greatest amount falls when the mean monthly temperature is highest. As this augmented quantity in warm maritime countries falls at a particular season, and in a shorter space of time, than in colder regions, the annual number of dry days, particularly in inland districts, is proportionally increased. On the contrary, in the cold or temperate maritime localities now under consideration, different results follow. Although much less in annual quantity than in warmer regions, the rain descends much more frequently, but in slighter showers; and hence, a ready explanation is afforded of the fact, that the number of wet and foggy days on the New England coast is one-half greater than in the dry and cold region beyond the Lakes. Humboldt has given the following table as the proportional quantity of rain in different latitudes:—

Lat.			Mean annual depth of rain.
0	.	.	96 inches
19	.	.	80 "
45	.	.	29 "
69	.	.	17 "

In regard to a particular locality, much will also depend upon the prevailing winds; for it has been observed that the number of days in a year during which the winds blow from a certain point of the compass, at a given place, preserves a constant ratio. This follows from the fact that the force and direction of winds depend on general causes, such as the declination of the sun, the configuration of the coast, and the position of neighbouring continents. This fact is illustrated throughout the Abstracts generally. By way of example, the results of three years' observation at Fort Gibson, are annexed. See Table [Q] p. 20.

* As the proportion of winds and weather, throughout all the Abstracts, is calculated for the average of a month, the result for a year may be readily determined.

Comparing the seaboard with inland localities remote from Lakes, the contrast in the seasons of winter, spring, and summer, is very remarkable; and the influence of this difference of climate upon the animal economy and the vegetable kingdom, is no less striking; for, as Baron Humboldt remarks,—“a summer of uniform heat excites less the force of vegetation, than a great heat preceded by a cold season.”

The following abstract furnishes a condensed view of the numerical results obtained from the preceding annual comparisons between localities in the interior,—the one being under, and the other without, the equalizing influence of inland seas. See Table [R] p. 22.

Fort Snelling, near the junction of the St. Peter's and the Mississippi, constitutes the latter place of observation, and the other point is a mean between Forts Brady and Mackinac, the former situated near the outlet of Lake Superior and the latter on the island of Mackinac. Three years' observations were made at the former and one at the latter. Although the latitude on the Lake is $1^{\circ} 34'$ north of the other, and presents a mean annual temperature 4.25 lower, yet the mean winter temperature is 2.54 *higher*; during the spring, the mean temperature is 6.65 *lower*; during the summer, it is 10.40 *lower*; and during the autumn, 2.04 lower. These ratios show a contrast in the seasons no less striking than that exhibited on a comparison with the Atlantic coast. No objection can be urged against this comparative view on the ground of relative elevation, as Fort Brady is 595 feet, and Fort Mackinac 728 feet,* and Fort Snelling 780 feet above the level of tide water.

The following tabular statement of the course of the winds and the state of weather, based on the same years of observation as the abstract just given, will determine whether the agency of the Lakes induces the same meteorological relations, in this respect, as the ocean. See Table [S] p. 22.

On the Lakes, the annual ratio of fair days is 117, and in the opposite locality, 215; the cloudy days are as 127 to 73; the rainy, as 63 to 46; and the snowy as 45 to 29. In the former, the prevailing weather is cloudy, and in the latter it is fair. The ratio of cloudy days is even higher on the Lakes than on the Atlantic coast. As it is of great importance to determine the annual quantity of rain which falls on any point of the earth's surface, it is much to be regretted that more extensive observations have not been made at these posts on the pluviometer.†

* Fort Mackinac is elevated 150 feet above the surface of the Lake.

† Vide Note at end of “Remarks.”

The meteorological phenomena of Canada, Nova Scotia, New Brunswick, and Newfoundland, according to the observations of the British Army Surgeons, are in perfect harmony with the laws just illustrated. In Canada, the climate exhibits such sudden alternations of temperature that the mercury at Quebec has been known to fall 70° in the course of 12 hours. Cold weather sets in as early as November, from the end of which month till May the ground remains covered with snow to the depth of three or four feet. When the winds blow with violence from the North-east, the cold become so excessively intense, that the mercury congealed in the thermometer serves no longer to indicate the reduction of temperature. During winter, the general range is from the freezing point to 30° below zero. The seasons do not, as in more temperate regions, glide imperceptibly into each other. In June, July, and August, the heat, which often attains 95° of Fah., is frequently as oppressive as in the West Indies.

The climate of Nova Scotia, although in similar latitudes, exhibits a striking contrast to that of Canada. The temperature is not only modified by its insular position, but the interior of the peninsula "is so much intersected by lakes and bays, that nearly one-third of its surface is under water." The thermometer seldom rises above 88° in summer, or sinks lower than 6° or 8° below zero in winter. Were it practicable to obtain the requisite data, it would be interesting to institute a comparison between the seasons of this region and those of Canada.

The climate of Newfoundland is similar to that of Nova Scotia. The summers, however, owing to the meeting of the icebergs on the coast, are less warm, of shorter duration, and subject to more sudden vicissitudes.

Having illustrated rather minutely the several systems of climate pertaining to the northern division, the necessity of similar details in reference to the other two divisions is superseded. It is the more unnecessary, as Abstracts A, B, C, appended to these "Remarks," will enable one at a glance to trace out the meteorological relations of any region of the United States. The first exhibits the mean temperature of each month, each season and the whole year; the second shows the difference between the mean temperature of each month and season; and the third contains the annual and monthly ranges of temperature. It will be found that the same laws prevail in the middle region of the United States as in the northern, viz., that the seasons grow less uniform in proportion as we recede from the sea-coast. Thus, Washington City and Fortress Monroe, on the one hand, show less difference between the mean temperature of summer and winter than Jefferson Barracks and Fort Gibson on the other; and in examining the annual range of the thermometer and the mean of the monthly ranges, similar contrasts are revealed. No reference was made to the latter mode of comparison in investigating the four systems of climate of the northern division. On applying the rule, however, it

will be found that every principle in relation to modified and excessive climates is happily confirmed. On approaching the southern coast, climate undergoes a striking modification. The seasons glide imperceptibly into each other, exhibiting no great extremes; thus, at Fort Snelling the difference between the mean temperature of the warmest and coldest month is $61^{\circ} 18'$, whilst at Cantonment Brooke, it is no more than $17^{\circ} 68'$. The Peninsula of Florida, however, is wholly peculiar in this respect; the course of vegetable life is unceasing: wild flowers spring up and flourish in the month of January; and so little is the temperature of the lakes and rivers diminished during the winter months, that one may almost at any time bathe in their waters.

The most prominent features of climate exhibited throughout the United States have thus been referred to in a general way. As these systems of climate consist of numerous subdivisions, which can be determined only by observation, a *comparative* view of them remains a desideratum; but the hope may be indulged, from present indications, that materials will in a few years be furnished for the composition of a complete meteorological chart, in which they may be systematically arranged.

The following tabular statement shows the mean annual temperature of various places, and the number of years upon which the results are based, with their locality, latitude, longitude, and height above the level of the sea. The table extends over a period of eleven years, but it does not perhaps embrace a moiety of the results that may be obtained from the observations of the same period. The elevation of some interior posts above tide-water, could not be ascertained, whilst the heights of those given are merely approximations:—

* These degrees of latitude and longitude are in most cases merely approximations.

A reference to abstracts A, B, C, giving the ratios of the mean temperature of months and seasons, and to the tables comparative of positions on the Atlantic, the Lakes, and in the interior remote from such agencies, will illustrate pretty fully the diversities of our climate.

Although the extremes of annual temperature may occur at our most northern and southern posts, yet we do not there find the extremes of heat and cold. The tabular statement exhibiting the hottest and coldest day in each year, from 1820 to 1830, inclusive, given below, establishes this position. See table [U] p. 27. As the western posts, Snelling, Gibson, Council Bluffs, &c., remote from inland seas, are remarkable for extremes of winter and summer, so do they exhibit the hottest and coldest days and the greatest range of the thermometer. Forts Brady and Mackinac, the most northern stations, show, by a lesser range of the thermometer, the equalizing influence of the Lakes; whilst the Atlantic posts illustrate the controlling power of the ocean. In elucidation of the same law, we find that the mean summer temperature is greater at Augusta, Ga., than at St. Augustine or Tampa Bay, Florida. A reference to the subjoined tabular review, and to Abstracts A, B, C, showing the numerical ratios of the mean temperature of each month and season, and the annual and monthly ranges of temperature, will exhibit in strong contrast the diversities in these *particular systems* of climate. In Africa, the mercury is sometimes seen at 125° , and in British India it is said to have been as high as 130° . In the table of the highest temperature observed in different climates, as given by M. Arago, it is noted at 130° in the Oasis of Mourzouk. In our own Diaries, it is marked at 116° , on the 15th August, 1834, at Fort Gibson.* As no register-thermometers have been used at our posts, the range throughout the 24 hours may be greater than that given in the Diaries. The interior posts remote from Lakes, are denoted in the subjoined table [U] by an asterisk; whilst those on lakes, or the sea-board and its vicinity, are without any sign.

This table confirms the position that extremes of temperature are found as we approach the interior of a continent, unless modified by inland seas. Even along our southern coast the extreme of heat is less than on our more northern sea-board. The United States, it has been seen, present numerous *systems of climate* in which the division of the annual heat among the different seasons exhibits remarkable diversity.

* According to Assistant Surgeon J. B. J. Wright.

* Observations made with the Register Thermometer.

NOTE.

It is found, upon a further examination of the "Diaries of the Weather," that the observations upon the rain-guage have been sufficiently extensive to warrant a tabular arrangement of the data. The following abstract exhibits the observations made within the last four years, condensed into annual results.

To determine the quantity of rain that falls upon any point of the earth's surface, is an important element in meteorology. The table now given affords evidence of the valuable information to be derived from this source. The data, however, are not sufficiently extensive to authorize general conclusions.

APPENDIX.

METEOROLOGICAL REGISTER

FOR THE YEARS

1822, 1823, 1824, AND 1825,

FROM

OBSERVATIONS

MADE BY THE SURGEONS OF THE ARMY,

AT

THE MILITARY POSTS OF THE UNITED STATES.

PREPARED UNDER THE DIRECTION OF

JOSEPH LOVELL, M.D.,

METEOLOGICAL REGISTER

FOR THE YEARS
1891, 1892, AND 1893

OBSERVATIONS
MADE BY THE PERSONS OF THE ARMY
THE MILITARY FORCE OF THE UNITED STATES

ISSUED BY THE SURVEYOR GENERAL
JOSEPH H. LOVELL, M.D.

METEOROLOGICAL REGISTER.

REMARKS.

ON the question whether in a series of years there be any material change in the climate of a given district of country; and if so, how far it depends upon cultivation of the soil, density of population, &c. the most contradictory opinions have been advanced. While one contends, that as population increases and cultivation extends the climate becomes warmer, another is equally convinced that it becomes colder, and a third, that there is no change in this respect. These opinions are for the most part founded on a comparison of the climate of Europe at the present day with what it is supposed to have been two thousand years ago; and their great discrepancy may in some measure be accounted for from the circumstance, that the facts are few and the period of observation remote; while the changés, if any, have been exceedingly slow, and their ratio to the alleged causes exceedingly uncertain.

The United States, however, appear to offer an opportunity of bringing the question to the test of experiment and observation. For here within the memory of many now living the face of whole districts of country has been entirely changed; and in several of the States two centuries have effected as much as two thousand years in many parts of Europe. In this respect, the "Landing of the Pilgrims" in 1620 is as remote a period as that of the invasion of Gaul or of Britain by Julius Cæsar.

The time for improving this opportunity, however, like that for recording the history, language, manners, and customs of the aborigines of the country, is fast passing away; and in a few generations, both these sons of the forest and the interminable wilderness they inhabited will, for all useful purposes, be as though they had never been. As, therefore, the military posts within the United States afford every convenience for making numerous observations over an extensive district of country, and regular diaries of the weather have for some years past been kept at most of them, the following tables have been prepared in the form that appears best calculated for reference, in order to preserve the facts thus collected.

The first twelve tables for each year give the mean of the observations at the several posts for each month, and the thirteenth, the mean for the whole year. The last, or general table gives the average of all the observations at the several stations, and also the average for the several years, calculated in the manner stated in page 104. Should it be practicable to obtain similar observations for eight or ten years, it is proposed to collect, if possible, such as may have been made at an early period after

the settlement of the country, in order to ascertain what changes, if any, have taken place, either in the mean temperature, the range of the thermometer, the course of the winds, or the weather, in the Atlantic States.

The posts at which these observations were made are situated between $27^{\circ} 57'$ and $46^{\circ} 39'$ of north latitude, and between $67^{\circ} 04'$ and $94^{\circ} 43'$ of longitude west from Greenwich; embracing an extent of $18^{\circ} 42'$ of latitude, and $28^{\circ} 39'$ of longitude. The elevation of the north western, or interior, stations above those on the Atlantic coast has not been accurately ascertained; the following however is believed to be near the truth. Fort Brady, situated at the outlet of Lake Superior, is 595 feet above the level of tide water; Fort Howard, at the southern extremity of Green Bay, which empties into Lake Michigan, 600 feet; Fort Crawford, at Prairie du Chien, near the junction of the Wisconsin and Mississippi rivers, 580 feet; Fort Snelling, near the junction of the St. Peters and Mississippi rivers, 780 feet; Council Bluffs, a few miles above the junction of the Platte and Missouri rivers, 800 feet. Baton Rouge, on the Mississippi, 120 miles above New Orleans, and Cantonment Jesup, near the Sabine river, 25 miles from Natchitoches, are in Louisiana; Cantonment Clinch near Pensacola, Cantonment Brooke near Tampa Bay, and St. Augustine, in Florida. Fort Moultrie is in the harbour of Charleston, South Carolina; Fort Johnston near Smithville, North Carolina; Fort Severn at Annapolis, in Maryland; Fort Mifflin in the Delaware, 6 miles below Philadelphia; Fort Columbus in the harbour of New York; Fort Wolcott in the harbour of Newport; and Fort Sullivan near Eastport, in the state of Maine. The observations at the city of Washington are introduced by way of comparison, as the latitude of this city is very nearly the same with that of the centre of the several military posts. They were made by the Rev. Mr. Little, by whom they were very politely furnished for the present purpose.

Although from the circumstances under which these observations were made at several of the posts, they may not be as accurate as could be wished, yet they are, perhaps, sufficiently so for the purpose of general abstracts; for the mean of each month being deduced from 90, and of each years from 1095 observations, occasional errors would not materially affect the general result.

The chief object at present being to record facts, the following remarks are premised merely for the convenience of those who may be curious in these matters without wishing the trouble of tedious calculations. In order to ascertain the means for the several years, as given in the last table, the extreme stations are taken, and as many intermediate ones, at the north and south respectively, as are found to be equi-distant from them, or nearly so. Thus in 1822, Fort Snelling is the extreme northern, and Cantonment Clinch the extreme southern, post; Council Bluffs is $3^{\circ} 28'$ south of the former, and Fort Johnston $3^{\circ} 36'$ north of the latter, &c. The aggregate of these should give the mean of the centre of the district of country in which the observations were made; and the result appears to be near the truth. For the latitude of the city of Washington is $38^{\circ} 53'$, and the average mean temperature is 56.56; the centre of the several stations at which these observations were made is in latitude $38^{\circ} 13'$, and the average mean temperature is 56.52. In comparing the eastern and western posts, those in about the same latitude are of course taken; thus, Council Bluffs is $24^{\circ} 25'$ west, and but $0^{\circ} 05'$ north,

of Fort Wolcott; Fort Snelling is $26^{\circ} 04'$ west, and but $0^{\circ} 09'$ north, of Fort Sullivan. To prevent the constant repetition of the terms East and West, the numbers only are stated; it being always understood that the first relates to the East and the second to the West; thus, in January, 1822 the means are stated to be 22.20 and 16.25, that is, 22.20 at the East, and 16.25 at the West.

In 1822 the aggregate mean temperature of the year was 57.06; the highest degree 108; the lowest -29 ; and the range 137. The proportion of winds was N. 5.07, S. W. 4.95, N. W. 4.93, S. 4.60, S. E. 3.39, W. 3.10, N. E. 2.67, E. 1.71. The proportion of weather, Fair 18.90, Cloudy 5.03, Rain 5.63, Snow 0.85. At Fort Snelling, the most northern station, the mean for the year was 44.32; the highest degree 92, the lowest -29 , and the range 121. At Cantonment Clinch, the most southern station, the mean for the year was 68.97, the highest degree 93, the lowest 20, and the range 73. On comparing the eastern and western posts, it appears that at the former the mean temperature of the winter months is much higher, and that of the summer months much lower, than at the latter. Thus in January it is 22.20 and 16.35, February 27.40 and 26.40, March 35.52 and 41.10, April 42.31 and 46.53, May 55.21 and 62.60, June 62.63 and 72.10, July 68.33 and 77.54, August 66.52 and 75.02, September 63.54 and 64.19, October 51.25 and 45.84, November 42.49 and 32.96, December 29.55 and 8.03. During the six winter months the means are 34.73 and 28.44; being 6.26 *higher* at the east, and during the summer months they are 59.76 and 66.33; being 6.67 *lower* at the east than at the west; making but a fractional difference for the year, which was 47.24 at the east and 47.38 at the west. The highest degrees were 88 and 108, the lowest -9 and -29 , the ranges 97 and 137; and it was greatest at the west, not only for the year, but also for every month except July and August, when it was about the same. The course of the winds was N. 3.54 and 5.08, N. W. 6.29 and 7.25, N. E. 1.91 and 3.08, E. 1.21 and 0.96, S. E. 1.79 and 3.63, S. 5.04 and 3.04, S. W. 7.37 and 5.37, W. 3.26 and 1.96. Weather, Fair 18.34 and 19.75, Cloudy 7.37 and 4.17, Rain 4.00 and 4.33, Snow 0.34 and 2.16. Prevailing winds at the east, S. W., N. W. and S. at the west, N. W., S. W. and N. The proportion of fair weather and rain was nearly equal; of cloudy weather much more, and of snow much less, at the east.

In 1823 the aggregate mean temperature of the year was 55.22; the highest degree 100; the lowest -38 ; and the range 138. The proportion of winds was S. W. 7.22, N. E. 4.84, S. E. 4.10, N. W. 3.85, S. 3.19, N. 3.15, W. 2.29, E. 1.65. Weather, Fair 16.48, Cloudy 6.16, Rain 5.98, Snow 1.77. At Fort Brady, the most northern post, the mean of the year was 39.66; the highest degree 90; the lowest -30 ; and the range 120. At Cantonment Clinch, the most southern station, the mean was 68.25; the highest degree 94; the lowest 11; and the range 83. On comparing the eastern with the western posts, the mean of the winter months for this year also is *higher*, and of the summer months *lower*, at the east. Thus in January it is 24.12 and 21.05, February 21.90 and 15.52, March 32.65 and 32.42, April 42.41 and 48.82, May 51.19 and 57.02, June 64.60 and 72.50, July 66.76 and 75.36, August 66.65 and 72.89, September 58.79 and 60.14, October 49.92 and 49.12, November 35.79 and 35.67, December 32.05 and 23.77. During the winter months the means are 32.73 and 29.61, being 3.12 *higher* at the east; and during

the summer months 58.40 and 64.45, being 6.05 *lower* at the east. The means for the year are 45.50 and 47.03, being 1.53 higher at the west, where the winter was comparatively warmer than in 1822. The highest degrees were 90 and 102, the lowest -10 and -30; the ranges 100 and 132. Course of the winds, N. 3 and 2.03, N. W. 7.50 and 2.79, N. E. 2.83 and 6.87, E. 1.24 and 1.87, S. E. 1.83 and 2.23, S. 5.08 and 3.20, S. W. 5.95 and 9.50, W. 2.95 and 1.83. Weather, Fair 15.12 and 18.41, Cloudy 9.62 and 7.95, Rain 4.16 and 2.40, Snow 1.50 and 1.58. Prevailing winds at the East N. W., S. W. and S.; at the West S. W., N. E. and S. The proportion of fair weather was considerably less, of cloudy weather and rain considerably greater, at the east; the proportion of snow about the same.

In 1824 the aggregate mean temperature of the year was 55.56; the highest degree 96; lowest -33; and the range 129. The proportion of winds, S. 5.33, S.W. 4.73, N.W. 4.65, N. 3.85, S.E. 3.83, W. 3.40, N.E. 2.84, E. 1.79. The proportion of weather, Fair 17.55, Cloudy 5.03, Rain 6.29, Snow 1.49. At Fort Brady, the most northern post, the mean temperature was 40.94; the highest degree 89, the lowest -33; and the range 122. At Cantonment Clinch, the most southern station, the mean temperature was 69.10, highest degree 95, lowest 24, range 71. On comparing the eastern and western posts, the means for January were 27.22 and 25.82, February 26.62 and 22.70, March 33.45 and 28.45, April 44.12 and 44.78, May 50.61 and 58.43, June 60.77 and 66.28, July 67.49 and 74.49, August 65.61 and 71.53, September 60.44 and 62.00, October 49.96 and 46.91, November 38.50 and 30.28, December 32.41 and 26.53. During the winter months the means were 34.69 and 30.11, being 4.58 *higher* at the east; and during the summer months 58.17 and 62.92, being 4.75 *lower* at the east. The means for the year 46.43 and 46.51, a difference of but 0.08. The highest degrees were 86 and 103, the lowest -19 and -21, the range 105 and 124. Course of the winds, N. 3.16 and 4.45, N.W. 6.83 and 1.20, N.E. 2.58 and 6.70, E. 1.50 and 1.00, S.E. 1.70 and 1.87, S. 4.28 and 6.78, S.W. 6.33 and 8.12, W. 3.45 and 0.36. Weather, Fair 16.58 and 18.04, Cloudy 8.50 and 7.04, Rain 4.70 and 3.33, Snow 0.70 and 2.08. The prevailing winds at the east were N.W., S.W., and S.; at the West S.W., S., and N.E. The proportion of fair weather was less, and of cloudy weather and rain greater, at the east, the proportion of snow much less.

In 1825 the aggregate mean temperature of the year was 58.27; the highest degree 102; the lowest -25; and the range 127. The proportion of winds, S.E. 5.52, N.W. 4.81, N.E. 4.72, W. 3.24, N. 3.23, S.W. 3.09, S. 2.79, E. 1.45. The proportion of weather, Fair 16.91, Cloudy 5.67, Rain 6.49, Snow 1.32. At Fort Brady, the most northern station, the mean for the year was 40.60; highest degree 89; lowest -25; range 114. At Cantonment Brooke, the most southern station, the mean for the year was 72.37; the highest degree 92; the lowest 40; range 52. On comparing the eastern and western posts, the means in January were 26.34 and 17.63, February 27.67 and 29.58, March 36.89 and 38.31, April 45.12 and 57.32, May 53.37 and 63.94, June 65.04 and 71.86, July 70.98 and 75.42, August 68.12 and 74.83, September 59.86 and 63.60, October 51.94 and 50.36, November 41.13 and 38.50, December 31.65 and 19.26. During the six winter months the means were 35.94 and 32.27, being 3.67 *higher* at the east; and during the summer months

60.41 and 67.83, being 7.42 *lower* at the east. The means for the year were 48.17 and 50.05, being 1.88 warmer at the west; the highest degrees were 94 and 102, the lowest -5 and -25, the ranges 99 and 127. The course of the winds was N. 2.91 and 4.03, N.W. 6.25 and 5.74, N.E. 3.50 and 2.16, E. 1.54 and 1.50, S.E. 1.62 and 4.58, S. 3.62 and 5.29, S.W. 7.83 and 4.37, W. 3.54 and 2.66. Weather, Fair 16.53 and 16.25, Cloudy 9.62 and 6.62, Rain 3.62 and 6.12, Snow 0.60 and 1.41. Prevailing winds at the East S.W., N.W., and S.; at the West N.W., S., and S.E. The proportion of fair weather was about the same; of cloudy considerably greater, and of rain and snow much less, at the east.

By the last table it appears that the aggregate mean temperature was highest in 1825 and lowest in 1823, there being however but a fractional difference between this and the following year. The average of the whole period is 56.52, being about one degree lower than at Bourdeaux in latitude 44° 50'. The range was greatest in 1822 and 1823, and nearly equal; and several degrees less in 1824 and 1825, being least in the latter year. The N., N.W., and W., and E. winds are most uniform in the several years; the rest are more variable. The prevailing winds are S.W., N.W., and S.E. The proportion of fair weather was greatest in 1822 and least in 1823, which however differed but little from 1825. The proportion of cloudy weather, rain, and snow, is pretty equal, except that there was much less snow in 1822. The aggregate mean for the whole period was, Fair 17.46, Cloudy 5.47, Rain 6.10, Snow 1.36.

In 1822 the mean temperature at the east and west was nearly equal. In 1823, 1.74 lower at the east, and but 0.33 lower at the west, than in the previous year; the winter being comparatively milder at the west. In 1824, the mean temperature was again nearly the same, but about one degree lower than in 1822. In 1825, it was higher than in any previous year, and 1.88 higher at the west than at the east. The average for the four years was 46.83 and 47.74, being 0.91 higher at the west. In 1822, the range was 40° greater at the west; in 1823 it was 32° greater; in 1824, 19°; and in 1825, 25°. The greatest proportion of fair weather, both at the east and west, was in 1822; with rather the most at the west. In 1823, there was much less at the east and somewhat less at the west, than in the former year. In 1824, there was rather more at the east and about the same at the west as in 1823; and in 1825 it was about the same at the east and considerably less at the west, than in the previous year. The proportion of rain was nearly the same at the east during the four years, but somewhat less in 1825. There was a great difference at the west, being much greater in 1825, than in any other year, and much less in 1823. The proportion of snow was much the greatest at the east in 1823, and least in 1822; at the west it was greatest in 1822 and 1824, and least in 1825. The average for the four years was, Fair 16.64 and 18.11, Cloudy 8.86 and 6.44, Rain 4.12 and 4.04, Snow 0.78 and 2.05; being rather more fair and less cloudy weather, with about the same proportion of rain, and much more snow, at the west.

The following table may serve to compare the annual mean temperature at some of the military posts in the United States, with that at several places on the other side of the Atlantic, and shows that it is considerably greater at the latter, and especially in the higher latitudes.

PLACES.	North Latitude.	Longitude.	Mean Temperature.
Petersburg - - - -	59 56	30 24 E.	38 80
Stockholm - - - -	59 20	18 00 E.	42 39
Edinburgh - - - -	55 57	3 00 W.	47 70
Berlin - - - -	52 32	13 31 E.	49 00
Leyden - - - -	52 10	4 32 E.	52 25
London - - - -	51 31	- - -	51 90
Rouen - - - -	49 26	1 00 W.	51 00
Paris - - - -	48 50	2 25 E.	52 00
Vienna - - - -	48 12	16 22 E.	51 53
Nantes - - - -	47 13	1 28 E.	55 53
Poitiers - - - -	46 39	0 30 E.	53 80
Fort Brady - - - -	46 39	84 43 W.	41 37
Padua - - - -	45 23	12 00 E.	52 20
Fort Snelling - - - -	44 53	93 08 W.	45 00
Bourdeaux - - - -	44 50	0 26 W.	57 60
Fort Sullivan - - - -	44 44	67 04 W.	42 44
Fort Howard - - - -	44 40	87 00 W.	44 50
Marseilles - - - -	43 19	5 27 E.	61 80
Fort Crawford - - - -	43 03	90 53 W.	45 52
Fort Wolcott - - - -	41 30	71 18 W.	51 02
Council Bluffs - - - -	41 25	95 43 W.	50 82
Pekin - - - -	39 54	116 29 W.	55 50
Washington - - - -	38 53	76 55 W.	56 56
Algiers - - - -	36 49	2 17 E.	72 00
Fort Johnston - - - -	34 00	78 05 W.	66 68
Cantonment Clinch - - - -	30 24	87 14 W.	68 77
Grand Cairo - - - -	30 00	31 23 E.	73 00
St. Augustine - - - -	29 50	81 27 W.	72 23

From this it appears that in the higher latitudes the average difference for the same degree of mean temperature is $14^{\circ} 30'$, and in the lower ones $7^{\circ} 30'$, the mean of which is 11° . Thus the mean temperature at Stockholm, in latitude $59^{\circ} 20'$, is about the same as at Fort Sullivan, in latitude $44^{\circ} 44'$; while that at Rouen, in latitude $49^{\circ} 26'$, is about the same as at Fort Wolcott, in latitude $41^{\circ} 20'$; and at St. Augustine, in latitude $29^{\circ} 50'$ it is but 0.77 lower than at Grand Cairo, in latitude 30° .

JOS. LOVELL.

Washington, September, 1826.
