| Piriton Injection | 5 x 1 ml | 29p   |       |       |

## SELECTED BIRDS OF BRITAIN

### MARSH TIT

*Parus palustris*

The marsh tit, less common than other tits, is resident mainly in England. It is found locally in parts of Southern Scotland. The name is rather misleading; this bird may be seen in hedgerows, bushy woodlands and occasionally gardens, as well as on marshland. Omnivorous, it eats seeds, fruit, also insects, beetles and larvae. Easily confused with the willow tit, but its black cap is glossier. The call is different from the willow tit, being a loud 'pit-chu'. The usual 'si-si-si' of other tits is uttered. Has a high trilling 'schipi-schipi' song. As with most tits, courtship includes a parade by the male, with his feathers puffed, tail erect and wings dropped. The nest is built in a natural hole in a tree. Moss, hair, fur and wool are used for lining. Produces 5-9 white eggs, thinly spotted at the wide end with brownish red. Both sexes reach 4½ inches (13 cm) in length and are alike.
