SELECTED BIRDS OF BRITAIN

CARRION CROW

Corvus corone

This crow is found all over England, Wales and the southerly parts of Scotland. In contrast to the gregarious rook, the crow is a comparatively solitary creature which can be sighted almost anywhere, but is most common over arable land or amongst trees. It eats any dead animal matter, also eggs, insects and small mammals. The call is the well-known croaking 'krah-krah-krah'. In courtship, the male spreads his wings and bowing, fans out his tail. The birds then pair for life. The nest is built in the stout fork of a tree or on a cliff ledge. Similar to, but more compact than the rook's nest, it is constructed of sticks and lined with hay and wool. Up to 5 (very rarely 7) eggs may be laid. They have a bluish-green background splashed with brown. The male and female are alike, measuring up to 20 in (50 cm).
