You never know what you might find by accident...

The search for knowledge . . . It is said that the discovery of glass was accidental. On the coast of Phoenicia in a very remote age, a group of merchants was camped on the shore near where the river Belus washes fine sand down from the hills. The merchants kindled a fire and used bags of nitre, which they were carrying, to support their cooking vessels over the fire. In time, the fire fused the sand and nitre and their amazed eyes beheld the sight of the first sheet of glass! It is said that the Sidonians acquired wealth and fame by cultivating the art of glass making from this chance discovery.

Diabetic complications all too often become apparent by accident, and too late for effective treatment. By early detection of urinary abnormality, routine urinalysis can assist in the prevention of insidious onset of complications.

The appropriate Ames Diabetic Information System used in the management of either the non-insulin or the insulin dependent diabetics, can provide continuous long term information on the degree of control. CLINISTIX* Reagent Strips for urinary glucose and KETOSTIX* Reagent Strips for urinary ketones provide an excellent system for continuous assessment of non-insulin dependent diabetics. For the insulin dependent patient, CLINITEST* and ACETEST* Reagent Tablets provide the appropriate information.

Good control of your diabetic patients entails more than the prevention of coma. Long term control must be maintained to minimise the sometimes tragic complications of diabetes. Planned urine testing with prescribable reagent strips or tablets, and regular recording of results helps you to help your diabetic patients.
