The unique  
absorption of

**ARMYL**

Brand of Lymecycline

With many broad-spectrum antibiotics, a substantial proportion of the dose fails to be absorbed and passes uselessly, even harmfully, into the large intestine.

Armyl avoids this enteric wastage because it is highly soluble, and therefore exceptionally well absorbed. This means prompt, high blood levels with assured therapeutic effect. It is achieved with a low antibiotic dosage—which minimises the incidence of side-effects. Since little of the antibiotic reaches the lower intestine, there is hardly any interference with normal flora, and consequently less risk of inducing superinfection.

# ARMYL

Brand of Lymecycline

## **Superior absorption**

Dose for dose, Armyl gives higher blood levels than other tetracyclines.

## **Rapid effect**

The antibacterial effect is rapidly achieved and well sustained.

## **Good tissue penetration**

Armyl diffuses well into tissues to ensure full action at the site of infection.

## **High urinary excretion**

High urinary concentration is attained, for effective control of urinary tract infections.

## **Ready response to dosage increase**

Increase in dosage is followed by an almost parallel increase in blood level—facilitating treatment of stubborn infections.
