Where does Lobak work?

Everywhere!

Muscle pain—regardless of its site—is often accompanied by spasm and mental stress, presenting you with three problems at once. And it is to break this cycle that Lobak has been specially formulated.

Lobak is a logical, synergistic combination of chlormezanone and paracetamol. Chlormezanone works on the polysynaptic reflex pathways. It relieves spasm without affecting voluntary movement and tension without impairing alertness. This helps to restore mobility, while paracetamol takes care of the pain.

So no matter which comes first—pain, spasm or tension—Lobak enables you to break the cycle by treating all three simultaneously. And it solves a host of problems for you and your patients.
