Vaccine for Calves  
and Breeding Cows.

We are also  
Sole Concessionaires for  
the Veterinary Vaccines  
of the  
Laboratoire des Vaccins  
Pasteur, Paris, Institut de  
Serotherapie de Toulouse,  
and Laboratoire de Bac-  
teriologie de Laigle.

September 1925.

Dear Sir,

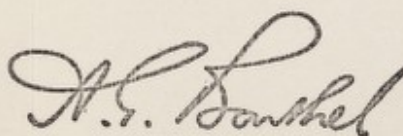

In submitting the enclosed Seventh Detoxicated Vaccine Bulletin for the favour of your perusal, we should like especially to call your attention to the new constituents of our Detoxicated Coryza and Influenza vaccines.

In 1920 Olitsky and Gates at the Rockefeller Institute, New York, discovered a filter passing Organism which was named Bacterium Pneumosintes, and this germ is now generally accepted as the true cause of Influenza. Since that date, however, great difficulties have been experienced in the cultivation of this organism, but the Pickett-Thomson Research Laboratory has now been successful in discovering a suitable media which enables it to be grown in sufficient quantities for detoxication.

This organism therefore, together with a certain number of new species of bacteria which have been recently discovered in cases of bronchial and nasal catarrh, has been added to our Detoxicated Coryza vaccine, and it also constitutes an addition to the anti-Influenza variety. In view of this, we feel confident that these two vaccines will consequently effect a better all-round protection than heretofore.

Trusting the foregoing and the brochure will prove of interest, and should you desire any further particulars these will be gladly supplied upon request.

We are, dear Sir,  
Yours faithfully,  
for GENATOSAN LIMITED,

MANAGER.
