PREFACE.

The only important changes in the present edition of the Hospital Pharmacopœia are such as are necessary to make it accord with the British Pharmacopœia of 1898.

In the latter, where the strength of Preparations has been altered, it has been done, for the most part, with the object of arranging for greater uniformity of dose.

In order to render this uniformity more striking to the eye and more easily remembered, the alphabetical order of the Posological Table is partially broken through in the case of the Extracts, the Liquid Extracts, and the Tinctures, which are separated into divisions.

The Extracts are printed in two divisions:—

1. Those with the usual dose not exceeding 1 grain.
2. Those with the usual dose above 1 grain.

THE only important changes in the present edition of the Hospital Pharmacopœia are such as are necessary to make it accord with the British Pharmacopœia of 1898.

In the latter, where the strength of Preparations has been altered, it has been done, for the most part, with the object of arranging for greater uniformity of dose.

In order to render this uniformity more striking to the eye and more easily remembered, the alphabetical order of the Posological Table is partially broken through in the case of the Extracts, the Liquid Extracts, and the Tinctures, which are separated into divisions.

The Extracts are printed in two divisions:—

1. Those with the usual dose not exceeding
1 grain.
2. Those with the usual dose above 1 grain.

The Liquid Extracts in three divisions:—

1. Those with the usual dose less than 5 minims.
2. Those with the usual dose between 5 and 15 minims.
3. Those with the usual dose from $\frac{1}{2}$ to 1 fluid drachm.

The Tinctures in two divisions:—

1. Those with dose not usually exceeding 15 minims.
2. Those with dose usually from $\frac{1}{2}$ to 1 fluid drachm.

The information thus conveyed, together with the notes as to the Alkaloidal Strengths in certain cases, will probably be found of more value to the Prescriber than a comparison of the present doses with those of a past and obsolete Pharmacopœia.

METRIC SYSTEM OF WEIGHTS AND MEASURES.

The Unit of Length is the Metre.

The ten-millionth part of the estimated length of a quarter of a terrestrial meridian.

The Unit of Capacity is the Litre.

The volume of a cube, the length of whose edge is one-tenth of a metre.

The Unit of Weight is the Gramme.

The weight of the volume of distilled water (at 4° C., when its density is greatest) contained in a cube the length of whose edge is one-hundredth of a metre.

Decimal fractional parts are indicated by prefixes derived from the Latin:—

Deci. Centi. Milli.

Decimal multiples are indicated by prefixes derived from the Greek:—

Deka. Hecto. Kilo.

Thus—

*Millimetre	...	=	$\frac{1}{1000}$	or	·001	metre.

Relation between English Measures and Weights and those of the Metric System.

1 Metre ...	=	39.37079	inches.
