AN ESSAY
ON
THE TONGUE,
IN FUNCTIONAL DERANGEMENT OF THE
STOMACH AND BOWELS;
WITH SOME OBSERVATIONS ON THE TONGUE'S ASPECT IN
ORGANIC DISEASE OF THE LUNGS.
BY EDWARD WILLIAMS, M.B., CANTAB.,
SENIOR PHYSICIAN TO THE ESSEX AND COLCHESTER HOSPITAL.

LONDON :
SIMPKIN, MARSHALL AND Co.; AND RENSHAW,
COLCHESTER: JOHN TAYLOR, JUN.

1843.

JOHN TAYLOR, JUN., PRINTER, COLCHESTER.

TO

JOHN BALLETT FLETCHER, Esq., M.A.,

THIS IS DEDICATED,

BY HIS FAITHFUL FRIEND

THE AUTHOR.

P R E F A C E.

EXTREME opinions have been maintained, by persons of credit and sagacity, as to the value of the tongue's appearance, for the characterising disease. An undue anxiety has been evinced to view this organ as an invariable monitor of functional derangement, or membranous disunion. A too sanguine expectation has led to disappointment, and to the unmerited neglect of an organ, which presents useful indications.

In reasoning on deranged functions, there is often much difficulty in deciding whether such change is a primary disease, or the effect of sympathetic irritation. The tongue presents no such difficulty, as it is rarely the cause of functional disturbance ; but is altered in appearance by functional aberrations and organic changes.

Observation testifies that the tissues of the tongue undergo various changes, or departures from the healthy standard : from a blanched or pallid aspect, the varying shades may be traced,

till it assumes a bright vermilion hue ; from a clean and anemic condition, till it becomes coated with a foul, ordisorganised epidermis.

“ It would be contrary to all common principles to suppose that the most opposite symptoms could arise from the same pathological state of the digestive organs ; that a deranged state of this function, accompanied with a moist, pale, white, or coated tongue, or with a clean, dry, red appearance of this organ, should emanate from one and the same morbid condition of the digestive apparatus.”* To assume that such diverse changes are not of importance, for the investigating internal actions, would be to neglect a useful index of functional disturbance, and occasionally of organic change.

The tongue, we find, evinces, in its sense of taste, a principle of selection, in accordance with the functions of the stomach, and the necessities of the system. “ Providence hath so wisely arranged the faculty of taste, that a being selects those articles only that are proper ; insomuch that any thing that is grateful to the palate is innoxious to the stomach, nor is aught unpalatable that is adapted for nutrition.”†

It is not unreasonable to presume that a cor-

* Cyclop. Pract. Med., p. 609. † Halleri Physiol., p. 286.

responding sympathy attends variations of the stomach. "Disorder of the stomach is more readily perceived by adverting to the state of the tongue, which often indicates an irritable and unhealthy condition of the stomach, when no manifest symptoms of indigestion occur."* Dr. Beaumont observed, that whenever the stomach was in a morbid condition, a similar appearance of the tongue presented itself; and on the stomach resuming its healthy state, the tongue invariably became clean.†

I might extend to many pages the scattered observations of writers who have described some more prominent feature of the tongue. The want of precision in the language used, the uncertain value of the materials when so compiled, and a total want of arrangement of *facts* on this subject, render unnecessary the task of comparing isolated or casual remarks.

I was induced to enter upon this inquiry from observing that the mucous membrane and papillæ of the tongue presented varying aspects in functional disturbances of the stomach; and from remarking that the different orders of the papillæ were not simultaneously affected.

The papillæ that have chiefly been considered,

*Abernethy on Local Diseases, p. 24. †On Gastric Juice, p. 24.

are the tuberosæ, which are situated on the borders and towards the point of the tongue, characterised by a round top, supported on a short thin pedicle; the pyramidal, which are diffused over the whole of the dorsum of the tongue, being minute and tapering; and the filiform, which are seated on the apex of the tongue.

In selecting the cases, I was careful to avoid inserting any than those in which the tongue was uninfluenced by medicaments, or by disorganization of parts. No case was inserted if there was reason, subsequently, to form an opinion different to that which was previously entertained.

The tabular form of arrangement was preferred, as by such scheme a large mass of extraneous matter was avoided, and the valuable portion of the cases became more available for the purpose of analysis.

The present treatise does not embrace the subject of the tongue's appearance in organic lesions; although I have inserted a few pages relative to such aspects in diseases of the lungs. I have more especially confined myself to estimating the changes presented by the mucous membrane and papillæ of the tongue, during functional disturbance of the stomach and bowels.

CONTENTS.

PART I.

TONGUE OF GASTRIC FUNCTIONAL DERANGEMENT.

CHAP. I.

Filiform papillæ being florid; aspects of the tongue, with the accompanying symptoms.

CHAP. II.

Tuberoze papillæ being florid; aspects of the tongue, with the accompanying symptoms.

CHAP. III.

Tuberoze and filiform papillæ being florid; aspects of the tongue, with the accompanying symptoms.

CHAP. IV.

Tuberoze and filiform papillæ being prominent and anemic; aspects of the tongue, with the accompanying symptoms.

CHAP. V.

Tabular arrangement of the cases in which the papillæ were florid, prominent, and anemic. Also a summary of the symptoms; the papillæ in order of gastric irritation, of headach, and of fugitive pains.

CHAP. VI.

On gastric irritation.

CHAP. VII.

On constipation.

CHAP. VIII.

The different appearances of the tongue, the papillæ being florid or anemic; with the accompanying symptoms. Inference from the same.

CHAP. IX.

Deductions and inferences from the florid, anemic, and prominent state of the filiform and tuberoze papillæ.

PART II.

TONGUE OF INTESTINAL FUNCTIONAL DERANGEMENT.

CHAP. I.

Epidermis of the tongue uniformly furred; with the accompanying symptoms.

CHAP. II.

Epidermis of the tongue covered with a uniform dry fur; with the accompanying symptoms.

CHAP. III.

The tongue being uniformly florid or red; with the accompanying symptoms.

CHAP. IV.

The tongue uniformly clean and atonic; with the accompanying symptoms.

CHAP. V.

The tongue being florid and furred; with the accompanying symptoms.

CHAP. VI.

The apex of the tongue being florid and the surface furred; with the accompanying symptoms.

CHAP. VII.

The edges of the tongue being florid and the surface furred; with the accompanying symptoms.

CHAP. VIII.

Tabular arrangement of the cases in which the tongue was florid, atonic, furred, or clean. Also a summary of the symptoms; and the tongue in order of gastric irritation, of headach, and of fugitive pains.

CHAP. IX.

On headach.

CHAP. X.

On gastric irritation and on fugitive pains.

CHAP. XI.

The different appearances of the tongue when furred or clean; with the accompanying symptoms; and a summary of the same.

CHAP. XII.

Deductions from some appearances of the tongue, the filiform and tuberosæ papillæ not being developed or observable.

CHAP. XIII.

Remarks on defective secretion of the stomach; and suggestions for the treatment.

PART III.

TONGUE OF ORGANIC CHANGE.—THE LUNGS.

CHAP. I.

Preliminary observations.

CHAP. II.

The aspect of the tongue; with the accompanying stethoscopic and other symptoms. Summary of the same.

CHAP. III.

CASE 1. In which the pulmonary tubercular deposit was in zones, and separated from the comparatively healthy portion of lung, by a thin and diaphanous membrane.

CASE 2. Singular instance of symptoms presenting evidence of cardiac disease, but which were, subsequently, found to depend on pulmonary tubercular deposit; showing how general symptoms may prove fallacious, as to the primary affection.

CASE 3. Instance of cutaneous emphysema, caused by a fistulous communication with a tuberculous cavity.

CASE 4. Diabetes subsequent to influenza, and accompanying consolidation of a portion of lung. Also a table of the quantity of urine passed, with its specific gravity.

No report in	2

Headach in	7
Headach with gastric irritation in	13
Gastric irritation alone in	11
No report in	3

GENERAL SYMPTOMS.

Fugitive pains in	5
-------------------	---

With a red or florid appearance of the tongue, and with vascularity of the filiform papillæ, there was present giddiness, headach, and gastric uneasiness.

With an anemic condition of the tongue, the filiform papillæ being florid, headach, accompanied with constipation, seemed to prevail.

When the tongue was covered with a mucous fur, the papillæ being florid, gastric irritation and confusion of the head, amounting sometimes to pain, were observed.

A tremulous tongue, the filiform papillæ being florid, was attended with headach, nausea, and a sensation of sinking.

The head was alone affected in seven cases. The bowels were generally constipated. Fugitive pains were felt in five instances.

The stomach was complained of in twenty-four of thirty-one cases. The general gastric symptoms were described to be, a sinking, nausea, and a gnawing pain; aching, heat, and heart-burn; a feeling of oppression and tightness, with a loss of appetite.

Whether the head was the seat of pain, or the stomach, the symptoms were not urgent.

It is a fact of daily experience of the tongue, and
in the condition of the tongue, there is a
great difference, and a great difference.

It is an interesting condition of the tongue, the
tongue being found in a condition of
alteration, and in a condition.

SUMMARY.

TUBEROSE PAPILLÆ FLORID, OR VASCULAR,

Fifty-eight Cases ; of which

THE TONGUE WAS

Florid in	15
Anemic in	1
Furred with slimy mucus in	38
Tremulous in	11

THE BOWELS WERE

Regular in	10
Costive in	34
Relaxed in	3
Irregular in	1
No report of	10

Headach in	11
Headach with gastric irritation in	21
No report of	9

GENERAL SYMPTOMS.

Fugitive pains in	20
-------------------	----

With a red or florid tongue, and with vascular tuberosae papillæ, the head was chiefly affected, then the stomach, and occasionally fugitive muscular pains were felt.

The tongue being anemic, with florid tuberosae papillæ, gastric pain and pain in the side were felt.

When the tongue was covered with a mucous fur, the gastric symptoms, as pain and occasional nausea, prevailed; in a considerable number there was headach, giddiness, and confusion; and in twenty of fifty-eight cases fugitive pains were observed.

With a tremulous tongue, headach or pain at the stomach, with a sensation of sinking, were experienced; and occasionally palpitation, fugitive pains, and aching of the legs.

The head was alone affected in eleven cases.

The bowels were generally costive. Fugitive pains were felt in twenty instances.

The stomach was complained of in thirty-eight of forty-nine cases. The general gastric symptoms were pain, flatulency, distension or tightness, nausea, sinking, and faintness.

GENERAL SYMPTOMS.

Fugitive pains in	19
-------------------	----

With a florid or vascular tongue, the filiform and tuberosæ papillæ being florid, there seemed to be an equal tendency to head, gastric, and fugitive painful sensations.

When the tongue was anemic and furred, and the papillæ florid, there was pain in the head, stomach, and about the shoulders and scalp.

With a furred state of the tongue, and with florid papillæ, there were gastric pains, with a sensation of nausea and sinking; next in degree were the head symptoms; then fugitive pains.

A tremulous tongue was accompanied with gastric pain, giddiness, or headach; and, in two or three instances, with fugitive pains.

The head was alone affected in four of thirty-seven cases, the bowels being generally constipated. Fugitive pains in nineteen of forty-six cases.

The stomach was complained of in thirty-three of thirty-seven instances. The gastric symptoms were, pain, nausea or sinking, tightness, distension, or fullness.

It is a fact in general surgery, the abdomen and
pelvic organs being such, that it is not to be
regarded as a rule, that the pelvic organs
are not to be touched.

It is the nature of the female and that the
pelvic organs, that are not to be touched,
and about the abdomen and pelvis.

CHAP. VI.

CONSIDERATIONS AS TO THE DEVELOPMENT OF THE
PAPILLÆ, FILIFORM OR TUBEROSE, BEING A TEST OF
GASTRIC IRRITABILITY.

Gastric irritation was observed in greatest intensity when the filiform and tuberosæ papillæ were prominent and anemic. In nine of ten instances the stomach was the seat of irritation, while only in an individual case did headach appear, or fugitive pains in more than one case of twelve.

The stomach was complained of in one hundred and four of one hundred and twenty-seven instances; whereas head-symptoms existed but in twenty-three of one hundred and twenty-seven, and fugitive pains in forty-five of one hundred and fifty.

Although, with intensity of gastric irritation, there was no corresponding degree of headach, or fugitive pains, yet, when the papillæ were florid, there appeared to be a tendency to fugitive pains; but it must be observed, that there was also a corresponding increase in the number of constipated habits.

It seems to result from these premises, that when the papillæ were prominent, florid, or anemic, the stomach was the seat of the irritation, and this with-

out the apparent sympathy of other parts with such disturbance.

And further, that when gastric irritation was most intense, there was a minimum degree of headache.

Hence, the papillæ, whether florid or anemic, seem to indicate gastric irritation, in proportion to their prominence or elevation.

CHAP. VII.

CONSTIPATION NOT A PROMINENT SYMPTOM WHEN THE PAPILLÆ, FILIFORM OR TUBEROSE, WERE DEVELOPED, WHETHER THEY WERE FLORID OR ANEMIC.

Constipation existed when the papillæ were florid, especially with the florid tuberosæ papillæ; with which latter papillæ fugitive pains appeared to preponderate, considerably, over the similar symptoms produced by the filiform and anemic papillæ.

Again, it appears that fugitive pains were felt only in five of thirty-four cases with the florid filiform papillæ, whereas the bowels were stated to be costive in nineteen of thirty-two. With the anemic papillæ, although the bowels were costive in seven of twelve instances, yet only in one of twelve did fugitive pains coincide.

Hence, it would seem, that constipation was unattended with any well-defined symptoms, when the papillæ were prominent, florid, or anemic.

APPEARANCES OF THE TONGUE WITH A FLORID OR ANEMIC
STATE OF THE PAPILLÆ; AND THE SYMPTOMS OF THE HEAD,
STOMACH, AND THE GENERAL SENSATIONS ACCOMPANYING
THEM.

APPEARANCES OF THE TONGUE WITH A FLORID OR ANEMIC STATE OF THE PAPILLÆ; AND
THE SYMPTOMS OF THE HEAD, STOMACH, AND THE GENERAL SENSATIONS
ACCOMPANYING THEM.

<i>Tongue's appearance.</i>	<i>Head symptoms.</i>	<i>Stomach symptoms.</i>	<i>General symptoms.</i>
TONGUE RED OR FLORID. Filiform papillæ florid Tuberoze papillæ florid Filiform and tuberoze papillæ florid	Giddiness or headach Headach chiefly or Headach	Gastric uneasiness Pain or Pain	Fugitive pains Fugitive pains
TONGUE ANEMIC. Filiform papillæ florid Tuberoze papillæ florid Filiform and tuberoze papillæ florid	Headach	Pain Pain	Constipation Pain in side Pain in scalp and shoulders
TONGUE COATED WITH SLIMY FUR. Filiform papillæ florid Tuberoze papillæ florid Filiform and tuberoze papillæ florid	Confusion or pain Giddiness, confusion or headach Pain or headach	Pain or irritation Pain or nausea Pain, nausea or sinking	Fugitive pains Fugitive pains
TONGUE TREMULOUS. Filiform papillæ florid Tuberoze papillæ florid Filiform and tuberoze papillæ florid Papillæ anemic	Headach Headach Headach or giddiness Headach	Nausea or sinking Sinking Pain Faintness	Fugitive pains occasionally Fugitive pains occasionally
TONGUE TUMID. Papillæ anemic	Headach or	Pain	
TONGUE COATED WITH A DRY FUR. Papillæ anemic	Headach	Sinking or faintness	

With a *red or florid tongue*, the filiform papillæ being florid; head and gastric symptoms were present, but not fugitive pains. The tuberosæ papillæ being vascular; head symptoms prevailed, or alternated with gastric uneasiness, or fugitive pains.

With an *anemic tongue*, and a florid state of the filiform papillæ; there was headach with constipation. The tuberosæ and filiform papillæ being florid; gastric and fugitive pains were experienced.

When the *tongue was covered with a slimy fur*, and the papillæ were florid, the filiform papillæ being vascular; was attended with gastric irritation, or pain, with confusion or headach. Gastric pain, giddiness, confusion, or headach and fugitive pains, coincided with a florid state of the tuberosæ papillæ; or the filiform and tuberosæ papillæ being together vascular.

With a *tremulous tongue*, whether the papillæ were florid or anemic; headach prevailed, accompanied with gastric pain, nausea, or sinking, and occasionally with fugitive pains, especially with the tuberosæ papillæ.

A *tumid tongue* with anemic papillæ; was attended with headach or gastric pain.

The *tongue coated with a dry fur*, and the papillæ being anemic; headach and gastric sinking or faintness were observable.

SUMMARY

OF THE APPEARANCES OF THE TONGUE; AND
INFERENCE.

When the filiform papillæ were florid, whether the tongue was red, anemic, covered with a slimy fur, or tremulous; head and gastric symptoms were only noticed, accompanied with constipation. Fugitive pains were not complained of.

When the tuberosæ papillæ were florid, and the tongue was red, anemic, furred with a slimy mucus, or tremulous; gastric with fugitive pains chiefly prevailed; also occasional giddiness or headach.

When the papillæ were anemic, whether the tongue was tremulous, tumid, or coated with a dry fur; headach and gastric pain, or faintness, were experienced.

Thus we are again led to conclude that a prominent state of the papillæ, filiform or tuberosæ, is an index of gastric irritation; and that the occasional accompanying symptoms are clearly referable to the functional derangement of the *stomach*.

CHAP. IX.

DEDUCTIONS FROM THE FLORID, ANEMIC, AND PROMINENT STATE OF THE FILIFORM AND TUBEROSE PAPILLÆ.

-
1. That a prominent state of the papillæ, whether florid or anemic, was attended solely with gastric irritation.
 2. That the prominence or development of the papillæ was in proportion to the intensity of gastric irritation.
 3. That constipation was not attended with any well-defined symptoms, under such condition of the papillæ.
-

INFERENCES FROM THE APPEARANCES OF THE TONGUE WHEN THE PAPILLÆ, FILIFORM OR TUBEROSE, WERE FLORID OR ANEMIC.

1. With a florid state of the filiform papillæ, whether the tongue was red, anemic, covered with a slimy fur, or tremulous, head and gastric symptoms were only experienced.
2. The tuberose papillæ being florid, and the tongue red, anemic, furred with a slimy mucus, and tremu-

lous, gastric with fugitive pains prevailed; occasionally complicated with giddiness or headach.

3. When the papillæ were anemic, the tongue being tremulous, tumid, or coated with a dry fur, headach and gastric pain were observed.

SUMMARY.

TONGUE COVERED WITH A UNIFORM MOIST FUR,

One Hundred and Forty-one Cases ; of which

THE TONGUE WAS

Florid or red in	1
Anemic in	6
Sodden or tumid in	11
Fissured in	12
Tremulous in	13

THE BOWELS WERE

Regular in	24
Costive in	102
Relaxed in	2
Irregular in	4
No report of	9

Headach in	34
Headach with gastric irritation in	19
Gastric irritation in	49
No report of	39

GENERAL SYMPTOMS.

Fugitive pains in	42
Palpitations in	8

With a florid or red tongue, there was gastric oppression and costive bowels.

When an anemic condition of the tongue was present, we noticed gastric pain, headach, palpitation, and constipated bowels.

Tongue sodden or tumid, was attended with headach, or gastric pain, nausea, acidity, palpitation, fluttering, and costiveness.

Tongue fissured. Headach, occasional gastric pain, or a sinking sensation, bilious feelings and fugitive pains, with costive bowels, were noticed.

Tongue tremulous. The symptoms were headach or confusion, occasional gastric pain, flatulency, a gnawing sensation, and fugitive pains of the lower extremities.

It is to be remarked that fissures were observed in twelve instances, nor elsewhere, excepting when the tongue was coated with a uniform dry fur.

The tongue covered with a uniform mucous fur, was attended with bilious feelings, pains in the duodenal region, hysterical symptoms, flutterings, gnawings, palpitations, and a host of anomalous and indescribable sensations.

It is in this aspect of the tongue that it has been

observed to be chapt, furrowed, fissured, cleft, chinkt, and sulcous ; or coated, crusted, foul, furred, or loaded ; according to the consistency or tenuity of the mucous secretion, with which its surface may be covered.

The head was alone complained of in thirty-four instances ; fugitive pains being felt in forty-two cases of one hundred and forty-one. The bowels were generally costive.

Of forty-eight cases of one hundred and forty-one, in which the head was affected coincidently with the bowels, thirty-three of these were of a constipated habit ; in thirteen of forty-eight the bowels were stated to be regular ; and in two only were they variable.

We find that the stomach evinced local irritation in sixty-eight of one hundred and two cases.

The pain complained of, if felt in the head, was not experienced in the stomach or elsewhere ; this was not invariably the case, yet so frequent as to merit notice.

CHAP. II.

TONGUE COVERED WITH A UNIFORM DRY FUR,

Seventeen Cases ; of which

THE TONGUE WAS

Sodden in	1
Fissured in	3
Tremulous in	1
Anemic in	1
Edges clean in	2
No report of	9

THE BOWELS WERE

Regular in	3
Costive in	10
Relaxed in	1
Irregular in	1
No report in	2

Headach in	2
Headach with gastric irritation in	2
Gastric irritation in	7
No report of	6

GENERAL SYMYTOMS.

Fugitive pains in	12
-------------------	----

It appears that the stomach was affected in nine of eleven cases. That headach alone was felt in two of eleven, but that fugitive pains were observed in twelve of seventeen instances ; showing an excess in the proportion of fugitive painful sensations. The bowels were generally costive.

The papillæ, conicæ or pyramidal, have their points directed backwards ; like the filiform and tuberosæ papillæ, they become erect, and assume a rough aspect ; but they differ from these papillæ, in not presenting a vascular or injected appearance.

The instances in which they were observed to be erect, and coated with a dry fur, were in cases characterized by symptoms of defective secretion, either of the stomach or other organ ; fugitive pains being felt in a most intense degree, but headach was seldom experienced.

SUMMARY.

TONGUE UNIFORMLY RED OR FLORID,

Thirty-nine Cases ; of which

THE TONGUE WAS

Furred with mucus in	5
Furred with a dry coat in	3
No report of	11
Various appearances in	8

THE BOWELS WERE

Regular in	12
Costive in	13
Relaxed in	5
Irregular in	5
No report of	4

Headach in	3
Headach with gastric irritation in	11
Gastric irritation in	17
No report of	8

GENERAL SYMPTOMS.

Pains in	12
Various symptoms in	14
No report of	13

The characteristic symptoms accompanying a red or florid state of the tongue, or of the gastric mucous membrane, were pain after food, or nausea, or vomiting, with a sensation of sinking.

Although fugitive pains were complained of, they could be traced, with few exceptions, to the gastric region.

Headach, uncomplicated, was observed in but three instances ; with gastric irritation in eleven of thirty-nine ; whereas the stomach was affected, or was the seat of uneasiness, in twenty-eight of thirty-one cases.

The bowels varied but little from the healthy standard.

A clean and florid state of the tongue was accompanied with headach, or gastric pain, or nausea, and fugitive pains.

SUMMARY.

TONGUE UNIFORMLY CLEAN,

Seventy-one Cases ; of which

THE TONGUE WAS

Sodden or tumid in	18
Tumid in	5
Pale in	4
Dry in	2
Anemic in	7
Tremulous in	8
Glazed in	2
No report of	25

THE BOWELS WERE

Regular in	21
Costive in	25
Relaxed in	3
Irregular in	4
No report of	18

Headach in	16
Headach with gastric pain in	15
Gastric irritation in	16
No report of	24

GENERAL SYMPTOMS.

Rheumatic pains	26
Anomalous symptoms	13
Palpitation in	9
No report of	23

The general symptoms with a uniformly clean tongue were pains in the legs and loins, palpitations, and hysterical feelings.

With a uniformly clean tongue, it being at the same time sodden or tumid, headach, hemicrania or giddiness, were present ; or otherwise, there was gastric pain or nausea, and but a few instances of fugitive pains and hysterical symptoms.

With a pale and white tongue there was headach, alternating with gastric pain or sinking.

The tongue being anemic, giddiness or headach, nausea, and a sinking sensation, were experienced. A few instances of fugitive pains occurred.

With a tremulous tongue there was chiefly fugitive pains, and occasionally an instance of headach and gastric irritation.

This is the anemic, atonic, enervated, flabby, flaccid, sodden and pale, or blanched tongue, described by writers. The system suffers from languor, the muscular structure of the tongue seems flaccid, and the mucous tissue presents the like exsanguined and pallid aspect.

Headach, with fugitive pains, frequently coincided ; also gastric, with fugitive or muscular pains ; but headach, with gastric pains, was less frequently observed.

The bowels were inclined to be costive.

Gastric symptoms were pains, nausea, sinking, or faint sensations.

SUMMARY.

TONGUE UNIFORMLY FLORID AND FURRED,

Twenty-six Cases; of which

THE BOWELS WERE

Regular in	3
Costive in	16
Relaxed in	2
No report of	5

Headach uncomplicated in	7
Headach with gastric irritation in	2
Gastric irritation in	7
No report of	10

GENERAL SYMPTOMS.

Anomalous feelings in	6
Rheumatic pains in	9
No report of	11

A constipated habit especially remarked with a uniformly florid and furred tongue.

Pain was experienced either in the stomach, head, or the lower extremities, as the knees and legs; or fugitive muscular pains about the body.

Gastric irritation complained of only in nine cases of the twenty-six.

The costive state of the bowels seems to be productive of irritation, that induces headach and fugitive pains.

TONGUE'S EDGES FLORID, SURFACE FURRED,

Twenty-two Cases; of which

THE BOWELS WERE

Regular in	4
Costive in	6
Relaxed in	5
Irregular in	2
No report of	5

Headach in	2
Headach with gastric irritation in	5
Gastric irritation in	5
No report of	10

GENERAL SYMPTOMS.

Pains in	10
Anomalous symptoms	6
No report of	6

Edges florid, with a furred surface, were chiefly accompanied with a tendency to gastric symptoms, or with fugitive pains; but the gastric symptoms preponderated.

It appears that when the apex or edges of the tongue are florid, with a furred surface, the stomach is generally the seat of irritation, or fugitive pains are felt; but rarely do head symptoms prevail.

TABLE

Year	1890	1891	1892	1893	1894	1895	1896	1897	1898	1899	1900
Population	1,000,000	1,050,000	1,100,000	1,150,000	1,200,000	1,250,000	1,300,000	1,350,000	1,400,000	1,450,000	1,500,000
Area	100,000	100,000	100,000	100,000	100,000	100,000	100,000	100,000	100,000	100,000	100,000
Population per square mile	10	10.5	11	11.5	12	12.5	13	13.5	14	14.5	15

The following table shows the population of the United States in 1900, by age and sex, and the population of the United States in 1900, by race and color. The population of the United States in 1900 was 150,000,000. The population of the United States in 1900, by age and sex, was as follows: Male, 75,000,000; Female, 75,000,000. The population of the United States in 1900, by race and color, was as follows: White, 100,000,000; Black, 10,000,000; Chinese, 1,000,000; Japanese, 1,000,000; Indian, 1,000,000; Hawaiian, 1,000,000; Other, 1,000,000.

CHAP. IX.

CONSIDERATIONS RELATIVE TO HEADACH BEING A
TEST OF A LOADED STATE OF THE INTESTINAL
PASSAGE.

Headach prevailed chiefly when the tongue was uniformly florid and furred; or when covered with a uniform moist fur; or when it was quite clean. On the contrary, when the apex was florid, attended with a furred surface, not a single instance was observed of sixteen cases of which headach was complained of. Also, when the edges of the tongue were florid, with a furred surface, although gastric irritation existed to an intense degree, headach was rarely noticed. It appears, therefore, that headach is not depending on gastric irritation.

When the tongue was uniformly florid and furred the most prominent symptoms were an exceedingly constipated state of the bowels. Headach was felt next in degree when the tongue was covered with a uniform moist fur; hence it was observed, that of forty-eight cases in which the head was affected coincidently with the bowels, thirty-three of these were of a constipated habit.

Further, in reviewing the cases in which the bowels were stated to be costive, deducting those instances in

which there was no report of their function, we find that the bowels were admitted to be costive in one hundred and eighty cases of two hundred and eighty-five ; being nearly in the ratio of 45 : 71.

It must also be remarked, that the statements of individuals relative to their bowels are generally vague ; for, providing they are not extremely costive, they view this subject with much indifference. It is very probable that the ratio of constipated habits would be greater if the function of the intestines was more carefully regulated.

It seems to result from these observations, that headach, varying in degree of intensity, uniformly accompanied constipation ; and therefore that headach may be considered an index of a loaded state of the intestinal passage.

CHAP. X.

REMARKS ON GASTRIC IRRITATION AND FUGITIVE PAINS.

Gastric irritation was remarked when the apex of the tongue was florid and its surface furred ; no headach accompanied this intensely irritable state of the stomach. Gastric irritation was noticed in ten of twelve cases when the edges of the tongue were florid, and its surface furred, and in but two of twelve instances did headach accompany such irritation.

It seems that when the gastric irritation was most intense there was a minimum degree of headach. Also, when the tongue was covered with a uniform dry fur, the stomach was affected in a large proportion of the cases.

Whenever the stomach evinced intense irritation fugitive pains prevailed, in proportion to the intensity of gastric uneasiness, and appearing to coincide with the gastric derangement.

Fugitive pains were chiefly remarked when the tongue was covered with a uniform dry fur, a state of tongue in which the pyramidal papillæ seem erect, giving a rough appearance to its surface ; in those instances the cases were characterised by symptoms of defective secretion.

We, therefore, infer that fugitive pains indicate gastric irritability, or defective secretion of the stomach, or other organ.

CHAP. XI.

APPEARANCES OF THE TONGUE WHEN COVERED WITH A
UNIFORM MOIST OR DRY FUR, OR WHEN CLEAN; WITH
THE SYMPTOMS OF THE HEAD AND STOMACH, AND THE
GENERAL SENSATIONS ACCOMPANYING THEM.

APPEARANCES OF THE TONGUE WHEN COVERED WITH A UNIFORM MOIST OR DRY FUR,
OR WHEN CLEAN; WITH THE SYMPTOMS OF THE HEAD AND STOMACH, AND THE
GENERAL SENSATIONS ACCOMPANYING THEM.

<i>Tongue's Appearance.</i>	<i>Head Symptoms.</i>	<i>Gastric and</i>	<i>General Symptoms.</i>
TONGUE RED OR FLORID. Covered with uniform moist fur	_____	Oppression _____	Constipation _____
TONGUE ANEMIC. Covered with moist fur	Headach	Pain	Constipation and palpitation Fugitive pains
Covered with a dry fur	Headach or giddiness	Nausea or sinking _____	Fugitive pains occasionally _____
Uniformly clean	_____	_____	_____
TONGUE SODDEN OR TUMID. Covered with a moist fur	Headach	Pain, nausea, acidity	Constipation, palpitation, flutterings
Covered with a dry fur	Headach, hemicrania, or giddi- ness	Pain or nausea	Palpitation, dyspnea
Uniformly clean	_____	_____	Fugitive pains, hysterics _____
TONGUE FISSURED. Covered with a moist fur	Headach	Pain or sinking	Bilious sensations, fugitive pains
Covered with a dry fur	_____	Gnawing or tension _____	Fugitive pains _____
TONGUE TREMULOUS. Covered with a moist fur	Headach, confusion	Pain or gnawing	Fugitive pains in extremities
Covered with a dry fur	Confusion	Heat	Fugitive pains
Uniformly clean	Headach	Pain	Fugitive pains

A *red or florid tongue*, covered with a uniform moist fur, was accompanied with gastric oppression.

An *anemic tongue*, covered with a uniform moist fur, was attended with headach, gastric pain, costiveness, and palpitation.

Covered with a uniform dry fur, fugitive pains only were noticed.

When uniformly clean, giddiness or headach, nausea or sinking, and occasional fugitive pains, were felt.

The tongue *sodden or tumid*, and covered with a uniform moist fur, headach, pain, or nausea, with palpitations, flutterings, and costiveness, were present.

With a dry fur, there was palpitation and dyspnœa.

When uniformly clean, head, gastric, fugitive, and hysterical symptoms prevailed.

Tongue *fissured*, and covered with a moist fur, headach, gastric pain, or sinking, attended with bilious feelings and fugitive painful sensations.

When coated with a uniform dry fur there was gastric gnawing, or tension, together with fugitive pains.

With a *tremulous tongue*, being coated with a moist fur, and with a dry fur, or when clean, there was head-ach or confusion, with gastric heat or pain ; but fugitive pains chiefly prevailed.

We find that when the tongue was coated with a moist fur, whether red, anemic, sodden, fissured, or tremulous, constipation, or symptoms attributable to such a state, was observed.

When coated with a dry fur, the tongue being anemic, sodden, fissured, or tremulous, there was a tendency chiefly to fugitive pains.

With a clean and moist tongue, whether anemic, sodden, or tremulous, there seemed to be an equal tendency to head, gastric, and fugitive pains.

CHAP. XII.

DEDUCTIONS FROM SOME APPEARANCES OF THE TONGUE; THE FILIFORM AND TUBEROSE PAPILLÆ NOT BEING DEVELOPED OR OBSERVABLE.

1. That the pyramidal papillæ, when erect or apparently elongated, indicate defective secretion of the stomach or other organ.
2. That fugitive pains indicate gastric irritability, or defective secretion of the stomach or other organ.
3. Constipation especially remarked when the tongue was uniformly florid and furred.
4. That headach, varying in degree of intensity, uniformly accompanied constipation; and that headach may be deemed an index of a loaded state of the intestinal passage.
5. That with a tongue covered with a moist fur, whether red, anemic, sodden, fissured, or tremulous, constipation was generally indicated.
6. When the tongue was covered with a dry fur, whether anemic, sodden, fissured, or tremulous, fugitive pains were chiefly present.
7. That with a clean and moist tongue, whether anemic, sodden, or tremulous, there was an equal tendency to head, gastric, and fugitive pains.

CHAP. XIII.

REMARKS ON DEFECTIVE SECRETION OF THE STOMACH; AND SUGGESTIONS FOR THE TREATMENT.

When a gland becomes checked in its function of secretion, the usual consequence is congestion, or distension. As in consumptive cases, when the expectoration is suddenly checked, dyspnœa, followed by death, is usually observed, and a congested state of the lungs is noticed. Similarly, when the function of the skin is abruptly repressed, symptoms of congestion of some internal organ frequently present themselves: this congestion, or distension, is accompanied with a feeling of sinking, or of weight over the gland, according as the organ may be solid or hollow; a sinking sensation being characteristic of repressed secretion of hollow organs, as the uterus and stomach; while an oppressive sensation is experienced when the kidneys or liver are deranged in their functions.

It seems, also, that the susceptibility of organs to irritation, within certain limits, is increased by the repetition of impressions. It is observed that on the slightest defective secretion of the mucous covering of the stomach, that the nerves of sensation are exposed, and become acutely impressed by the articles of diet that are taken; and, as irritation from any cause induces

defective secretion of contiguous glands, it follows that so long as the irritable excitement continues the natural action of the secreting apparatus will be imperfect, and congestion, more or less intense, will appear, accompanied with a sensation of sinking. Whatever may have been the primary cause of aberrated mucous secretion, so long as the nerves are exposed, will the unnatural susceptibility continue, and become aggravated by the persistence in improper aliment. Hence the necessity for strict attention to dietetic discipline, and for avoiding such things as tend to induce irritation.

JOURNAL OF ORLANDO CHAPMAN
THE DOGS

CHAP. I.

PRELIMINARY DISSERTATION.

As the mucous membrane of the lungs differs from that of the stomach, in not being endowed with similar papillæ, but simply a continuation of the like membrane that is prolonged from the tongue, through the stomach and intestinal tube, we may anticipate a florid state of the lingual mucous membrane when the lungs are inflamed or irritated, without the papillæ on the tongue's surface being affected. By the same reasoning, as the tongue has on its surface papillæ similar to those in the stomach, we may justly infer that when the gastric papillæ are functionally disturbed the same order of parts situated on the lingual surface will evince sympathetic irritation.

The tongue was uniformly florid and clean in twenty-two instances: it was florid wholly, or partially, in forty-three of the fifty cases. By this we may reasonably infer that the tongue, from continuity of structure, indicates a diseased condition of the mucous membrane, either of the stomach or lungs.

In four instances the tongue was streaked on the right or left half, the fur extending from the base to the apex; while the corresponding side was intensely florid,

but not coated. I am not prepared to conclude that there is any necessary connexion between one lung being structurally altered, and a florid or coated half of the tongue : such aspect of the tongue has not frequently presented itself. I have observed in several instances that the tongue was highly injected at the time when the pulmonary disease commenced, and afterwards became more natural in appearance. In one of these instances fistula in ano formed, and in another profuse leucorrhœal symptoms ensued.

It would be an interesting subject to trace the progressive changes in the apparatus of the lungs, as they become gradually disorganized in phthisis, with the corresponding attempts made by other organs, or tissues, to maintain the balance of the pulmonary function.

When tubercular solidification occurs at the apex of either lung, irritation is established, and increases as the function of aeration becomes circumscribed ; the volume of blood becomes diminished, so as to accommodate itself to the abridged portion of healthy or permeable lung : hence, atrophy of the muscular system, and general anemia of the body : hence, anasarca and internal effusions, when there exists no outlet of relief by the bronchiæ : hence, dyspnœa and oppression of the heart. If the liver becomes enlarged or contracted, as in scirrhus, we have general or local dropsy. By analogy, if a portion of lung becomes solidified, a similar effect of impeded circulation may

ensue, thus aggravating the dyspnœa by the pressure of the effused fluid on the diaphragm, or on the healthy lung. It is in such cases that diarrhœa and perspirations so frequently occur, as though the skin and bowels tended to relieve the oppression by carrying off the extraneous fluid. It was remarked by Louis, that the perspirations coincided with the diarrhœa, when the alvine evacuations were numerous; and that the diarrhœa seemed to be an alteration of secretion, and not depending on ulceration of the mucous membrane. If so, diarrhœa may be viewed as a test of the presence of such effusion. Hence the skin, kidneys, and bowels, may assume a supplemental function to relieve the oppressed lungs; nor are such symptoms to be considered otherwise than as signs of impeded circulation.

Those cases of consumption which possess an outlet of relief are less apt to terminate so speedily as those which present no means of maintaining the balance of circulation; in this latter class the general symptoms are more urgent, and terminate in a shorter period. When the system is relieved by the skin, kidneys, or bowels, or, as with females, by other secretions, the period of existence depends on the means employed for meeting urgent symptoms: and whether the patient may exist few or many years must often depend on the skill of the attendant in selecting and adapting appropriate treatment.

The remaining healthy portion of lung has been found highly congested, or the cells gorged with serous fluid, such state of parts appearing to have been the immediate cause of death. How far stimulating the kidneys and cutaneous exhalants, to carry off the excess of fluid, may tend to prevent internal congestion, or effusion, is a point of practice not yet satisfactorily determined. It may be observed that the treatment hitherto pursued and recommended has consisted in medicines that influence these organs.

When the air-cells of a portion of lung have become distended, or consolidated with tuberculous secretion, it is possible that the system may accommodate itself to such abbreviated function; and, providing no further deposition occurs, life may be prolonged to an indefinite period.

I have appended a case in which the pulmonary deposit was in zones, and separated from the comparatively healthy portion of lung by a thin and diaphanous membrane; showing that the attempt to define and limit disease sometimes happens. I have added an instance to show how delusive general symptoms may prove as to the primary disease. Also a case of cutaneous emphysema, caused by a fistulous communication with a tuberculous cavity. And an interesting case of Diabetes, depending on pulmonary tubercular disease.

CHAP. III.

CASE 1.

In which the pulmonary tubercular deposit was in zones, and separated from the comparatively healthy portion of lung by a thin and diaphanous membrane.

DANIEL SHARPE, aged twenty-three, admitted into Hospital with consolidated lung on the right side. The subsequent symptoms were œdema of the lower extremities, copious perspirations, and occasional rigors; during the last month of his existence there was present diarrhœa and expectoration.

The lungs were so extensively tubercled and solidified that the function of respiration must have been abridged to a space of healthy lung not exceeding two-fifths of the whole viscus; showing to what a remarkable extent an organ may be changed in its structure, yet still be enabled to maintain its function. Cavities were present at the apex of either lung. Both the thorax and abdomen were charged with fluid; the abdominal viscera appearing exsanguined.

While examining the tubercular mass of lung, at about two inches from the apex, a thin streak or line seemed to traverse the lung transversely; and at about the same distance below this was a repetition of the like appearance.

The whole lung, from the summit to the second line, was solidified; beneath this boundary the lung was only partially obstructed by collections and points of tubercular deposition, interspersed among the permeable air-cells. On tracing the lower line with the point of the scalpel I separated the transparent laminae of a thin tissue, one lamina adhering to the disorganised portion of lung, and the other lamina being connected to that which was permeable, but in a state of arterial engorgement.

CASE 2.

Singular instance of symptoms presenting evidence of cardiac disease, but which were subsequently found to depend on pulmonary tubercular deposit; showing how general symptoms may prove fallacious as to the primary affection.

MARY PAGE, aged fourteen, presented herself at Hospital, complained of extreme debility, palpitations, and epigastric pain. The lips were venous, and the right auricle gave a dilated impulse; a few days after her admission the lips became florid and the countenance flushed, accompanied with a small pulse, night perspirations, and an occasional slight cough, but with little or no expectoration. Latterly the cough became more troublesome and dry, the face swelling, a fearful sensation of sinking in the cardiac region was experienced, and death rapidly ensued. General emaciation was observed; the lungs were consolidated and

honeycombed with numerous cavities, and excepting a small portion at the base, they were a mass of tubercular degenerescence; strong adhesions of the pleural surfaces were noticed.

The cavities of the heart were distended with coagulated blood, the valves being natural. The liver presented large venous trunks, which were turgid with their contents.

CASE 3.

Instance of cutaneous emphysema, caused by a fistulous communication with a tuberculous cavity.

JAMES SMITH, aged thirty, was admitted into Hospital, stating that he had been ill seventeen weeks.

There was cutaneous emphysema on the right side, extending across the thorax, and upwards to the neck and head. The cellular tissue on the right half of the body was crepitous on pressure; the respiration being diaphragmatic, and the features pinched or sharpened.

A fortnight after his admission, the emphysema began to disappear, and on the right side of the sternum an ulcerous opening formed, followed by an escape of purulent secretion; air passing through the aperture on coughing.

His symptoms became daily aggravated ; diarrhœa, increased discharge from the external opening, and the colliquative perspirations, combined in reducing the system to the extreme of debility. He became suddenly worse, with urgent dyspnœa, tracheal rhonchus, and a falling pulse.

The external opening was situated on the right from the centre of the sternum, being about two inches in diameter. On making an incision from the top of the sternum to the os pubis, and dissecting away the integuments from the thorax, on the left side a large opening was seen, situated between the first and second ribs, and extending for two inches to the left of the sternum. A cavity in the lung was perceptible, which contained a quantity of sero-purulent fluid ; the surface of the cartilages were partially absorbed. A fistulous communication extended the whole of the left clavicle, and underneath it.

The left lung was a mass of softening tubercles ; strong pleural adhesions existed ; superiorly, the ulcerative process had extended through the intercostal muscles, between the first and second ribs : hence was seen the cause of the emphysema and the passage for the sero-purulent discharge.

On the right side the integuments were separated from the whole of the pectoral muscle, and the sero-purulent fluid had made its way as far as the fifth rib,

denuding the costal cartilages their whole length, and extending beyond their junction with the ribs.

The superior lobe of the right lung was filled with tubercles and numerous small cavities, but crepitant at the anterior edges, and exsanguined in appearance. The middle lobe was free from disease. The inferior lobe at its upper portion being loaded with tubercles, towards the base it was permeable, but congested.

CASE 4.

Diabetes accompanying consolidation of a portion of lung, subsequent to Influenza.

A. B., aged seventeen, had been ill for several months; which sickness was attributed to a severe attack of influenza.

On examining the state of the chest, the right lung was found to be consolidated. The symptoms complained of were profuse secretion of urine, uneasiness in the lumbar region, gradual emaciation, and extreme weakness. The tongue was uniformly florid, the papillæ not being developed. The bowels were constipated. The quantity of urine that was passed from nine p. m. to nine a. m., or in twelve hours, was seventy ounces before the course of medicine commenced. Under the influence of opium, which was given

freely, the quantity of urine was reduced to eight ounces during the same space of time, and varied between twelve and twenty-four ounces for several months. During the last forty-eight hours of her existence it increased to thirty-two ounces.

The specific gravity of the urine varied from 1.036 to 1.052, by Prout's urinometer. It may be remarked, that healthy urine, and of an amber colour, is about 1.026, by the same instrument: hence the density exceeded that of natural urine at the minimum by ten, and at the maximum by twenty-six, degrees.

Sixteen ounces of urine was inspissated: it weighed, with the evaporating dish, two and a half ounces and fifty grains; but the dish weighed one ounce and a quarter and seventy-six grains; therefore the weight of the inspissated fluid was one ounce, a drachm, a scruple, and fourteen grains. It was of the colour, taste, and consistency of treacle, and measured five drachms.

The quantity of opium taken from the 31st of May to the 14th of September was twelve hundred and twenty-three grains; averaging twelve grains in the twenty-four hours. The relief obtained from the use of this drug was thus expressed in a communication from the gentleman who attended the case with me: "I cannot refrain from expressing my opinion of the beneficial effects derived from the large doses of

opium, not only in palliating the cough, which latterly became troublesome, but also in preventing that exhaustion of the system under such irritating circumstances."

The tongue continued florid and moist till within a few days of her death, when it became white and dry and brown; the mouth also being aphthous. Latterly the pulmonary symptoms were more apparently developed, but the expectoration was scanty; an irritating cough being chiefly complained of, with œdema of the lower extremities, and occasional night perspirations.

The case was commenced on the twenty-eighth of March, and terminated on the fourteenth of September.

TABLE OF THE QUANTITY OF URINE PASSED.
