URBAN DISTRICT OF NORTHFLEET

Report for the years 1964, 1965 and 1966
on certain matters concerning Public Health

April 1969

To THE CHAIRMAN AND MEMBERS OF THE
URBAN DISTRICT OF NORTHFLEET

Mr. Chairman, Ladies and Gentlemen,

As soon as practicable after the end of each year it is the duty of a medical officer of health to make to the local authority a report for that year on the sanitary circumstances, sanitary administration, vital statistics and on any other matters concerning their district on which he considers it desirable to report. The report that follows is written in compliance with that duty.

The report covers three years which has advantages for an authority of this size. I regret that the completion of the report is so late but being a small department some delay in the preparation is inevitable if we are to include collect and analyse what information is available and spread the work amongst our routine commitments. The practice of compiling our own tables is time consuming but unless we do our own compilation we cannot inform ourselves on details such as quarterly death rates, place of death etc. Whether detailed analysis of local information justifies the time involved is uncertain, we can however hope that it will provide a record for future reference. "However great may be our aversion to figures we cannot escape the conclusion that the solution of most of the problems of clinical or preventive medicine must ultimately depend on them."

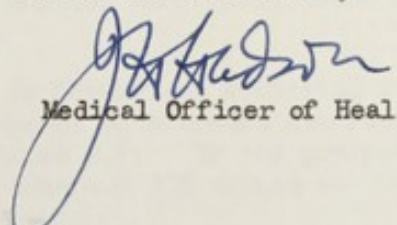

The information in this report contains much material provided by officers of other departments and other authorities or organisations. The progress in certain environmental matters relates to the work of the Council's Public Health Inspectors. The presentation of the statistical material is a product of the patience of the clerical assistant concerned. I thank these colleagues for their co-operation.

On behalf of my colleagues in the public health office and myself I wish to thank the Chairman and Members of the Public Health Committee for their support and interest during the period under review.

I am,

Mr. Chairman, Ladies and Gentlemen,

Your obedient servant,

Medical Officer of Health.

Report for the years 1964, 1965 and 1966
on certain matters concerning Public Health

April 1969

TO THE CHAIRMAN AND MEMBERS OF THE
URBAN DISTRICT OF BIRMINGHAM

Mr. Chairman, Ladies and Gentlemen,

As soon as practicable after the end of each year it is the duty of a medical officer of health to take to the local authority a report for that year on the sanitary circumstances, sanitary administration, vital statistics and on any other matters concerning their district on which he considers it desirable to report. The report that follows is written in compliance with that duty.

The report covers three years which has advantages for an authority of this kind. I regret that the completion of the report is so late but being a small department some delay in the preparation is inevitable if we are to include collect and analyse what information is available and spread the work amongst our routine commitments. The practice of compiling our own tables is time consuming but when we have our own tables we can do a more detailed analysis of local conditions. However, great care may be our greatest asset in that we can see the solution of most of the problems of our district must ultimately depend on them.

The information in this report contains much material provided by officers of other departments and other authorities or organisations. The progress in certain environmental matters relates to the work of the Council's Public Health Inspector. The presentation of the statistical material is a product of the patience of the clerical assistant concerned. I thank these colleagues for their co-operation.

On behalf of my colleagues in the public health office and myself I wish to thank the Chairman and members of the Public Health Committee for their support and interest during the period under review.

I am,

Mr. Chairman, Ladies and Gentlemen,

Your obedient servant,

[Handwritten Signature]
Medical Officer of Health

1964 1965 1966

SUMMARY

By the end of 1966 the upward trend of the population figure had assumed a more gentle gradient and the annual increase was less than the excess of births over deaths.

During 1964-66 the rate of natural increase, i.e. excess of births over deaths was higher than the three neighbouring districts and twice that of the County of Kent.

During 1963-66 the increasing annual number of births kept step with the increase in population so that the birth rate remained constant and above that of England and Wales.

Deaths in 1966 seemed to be unusually large in number. No clear reason for this was discerned.

The causes of death 1964-66 presented the usual pattern.

The death rate from coronary heart disease in Northfleet is significantly less than that of England and Wales or London.

The cancer death rate in Northfleet was akin to that of England and Wales.

The proportion of deaths to cases is greater in lung cancer than in other forms. Although the Northfleet death rate from cancer of the lung is less than that of London the difference may not be significant.

There was one maternal death in 1966. Two sudden infant deaths occurred in 1964 and one in 1965.

Deaths from motor vehicle accidents to residents of Northfleet produced a rate similar to that of England and Wales.

Influenza mildly asserted itself in 1966. Measles appeared at the beginning of 1965 and 1967 in accordance with the biennial cycle.

The number of cases on the tuberculosis register continued to decline.

Vaccination rates for poliomyelitis, diphtheria, whooping cough and tetanus were good. Vaccination rates for smallpox might usefully be improved.

From available statistics blended with conjecture the housing needs of Northfleet are estimated and an assessment of how far they are being met is presented.

In drinking water fluorine remained at an unsatisfactory low level.

The fall out of Strontium 90 continued to decrease, the continuing decline being a consequence of the test-ban treaty.

The problem of dust from cement works is reviewed. That emission figures of individual works are not made available to us is regarded as an omission.

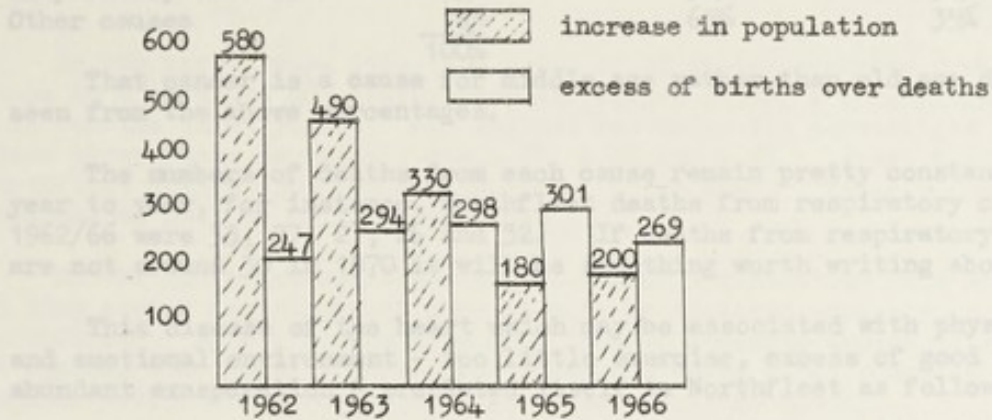

Pollution of the air with products of combustion, as shown by the indices smoke and sulphur dioxide, showed a noteworthy trend of decrease between 1962 and 1967. In regard to Smoke Control Orders the contribution of Northfleet to this satisfactory trend remained limited to its two Orders of 1961 and 1962.

Sanitary administration is reviewed.

COMMENTARY

POPULATION
Table I

Since the last census year of 1961 the annual increase in population has displayed a downward trend to figures which in 1965 and 1966 were below those of the natural increase, i.e. below the excess of births over deaths.

The Registrar General's estimates of population between census years have been shown by each census to be reliable guides. As his estimates are largely derived from statistics of housing occupancy an interpretation of the diminishing annual increase in population may be that the houses acquired by the Council prior to redevelopment were being vacated thus causing the balance of migration to be away from this district.

The rates per thousand population of natural increase for this and neighbouring districts were:

	1964	1965	1966
Dartford R.D.	10.9	10.3	9.5
Dartford Town	9.4	10.1	8.4
Northfleet U.D.	12.5	12.6	11.1
Swanscombe U.D.	11.1	8.8	9.2
England & Wales	7.0	6.9	6.0
Kent A.C.	6.4	6.2	5.8

BIRTHS
Table II

The trend has been:

	1959	1960	1961	1962	1963	1964	1965	1966
Births Northfleet U.D.	356	434	436	479	505	511	515	523
Rate adjusted by C.F.	16.7	18.9	18.3	19.7	20.0	20.0	20.0	20.0
Rate Eng. & Wales	16.5	17.2	17.6	18.0	18.2	18.5	18.1	17.7

DEATHS
Table II

These have been:

	1959	1960	1961	1962	1963	1964	1965	1966
Deaths Northfleet U.D.	208	193	191	232	211	213	214	254
Rate adjusted by C.F.	11.6	10.9	10.4	12.3	11.4	11.4	11.2	12.9
Rate Eng. & Wales	11.6	11.5	11.9	11.9	12.2	11.3	11.5	11.7

The notably high number of deaths in 1966 might be partly linked with the influenza which occurred late in the first quarter which is mentioned below. Otherwise there appears to be no particular season, age group or cause of death associated with the increase of 1966.

Around 50% of deaths continued to be the proportion occurring in hospital compared with 48% in England and Wales, about 60% in Dartford R.D. and 70% in Dartford Town.

The proportion of deaths in Northfleet occurring at age 75 and over continued to be around 37% compared with around 43% for England and Wales, for Dartford Town and for Dartford R.D. If the postponement of death is an objective of public health then our 37% should be 100%.

MAIN CAUSES
Table V

The pattern of the main causes of death in Northfleet continued to be similar to that of England and Wales:

	Approximate percentages		
	All deaths	Before age 75	After age 75
Circulatory disease	37%	50%	50%
Cancer	20%	75%	25%
Vascular lesions of nervous system ("Strokes")	14%	45%	55%
Respiratory disease	13%	50%	50%
Other causes	16%	65%	35%
	100%		

That cancer is a cause for middle age rather than old age death is seen from the above percentages.

The numbers of deaths from each cause remain pretty constant from year to year, for instance, Northfleet deaths from respiratory causes (R.G.) 1962/66 were 33, 27, 27, 26 and 32. If deaths from respiratory causes are not around 30 in 1970 it will be something worth writing about.

Coronary disease

This disease of the heart which may be associated with physical and emotional environment - too little exercise, excess of good food, abundant exasperation - presented itself in Northfleet as follows:

Year	Deaths	Population	Crude Death rate	Comp. factor	Adjusted Death rate
1959	29	20720	1.40	1.16	1.61
1960	27	21580	1.25	1.22	1.53
1961	31	22380	1.25	1.22	1.70
1962	36	22960	1.57	1.27	1.92
1963	30	23450	1.28	1.27	1.62
1964	45	23780	1.89	1.27	2.40
1965	36	23960	1.50	1.24	1.86
1966	40	24160	1.66	1.23	2.04
1959/66	274	182990	1.50	1.23	1.84

In the same years coronary disease presented itself in England and Wales and London as follows:

Year	Deaths per 1000 population	
	England and Wales	London A.C.
1959	1.87	1.89
1960	2.01	2.02
1961	2.07	2.05
1962	2.20	2.26
1963	2.29	2.36
1964	2.24	2.13
1965	2.38	2.27 ^x) *Greater
1966	2.39	2.28 ^x) London
1959/66	2.19	2.16

Let us make a comparison, albeit crude, of our death rate with that of England and Wales and London. To correct for the youngness of our Northfleet population we have used the comparability factor intended for the death rate from all causes.

The thus adjusted death rate will perhaps be on the high side but nevertheless better to use this than the crude rate. To reduce the play of chance the Northfleet death rate has been calculated from the deaths over a period of eight years. The rate that results i.e. 1.84 would have a one in twenty probability of varying by plus or minus 0.20. It would have a one in a hundred probability of varying by plus or minus 0.26. Thus, as the difference between Northfleet rate and the other rates is more than this, it is likely that the difference is due to some other cause than the play of chance. Perhaps it is that the Northfleet population feed less exotically, use their muscles more wholesomely and contain fewer persons in jobs associated with emotional stress.

Cancer

Northfleet deaths from this cause from 1959 to 1966 (R.G.) were: 44, 45, 41, 38, 36, 38, 56, 49 - roughly 45 annually. At the South Metropolitan 1960-62 annual cancer registration rate about 75 cases could be expected annually, thus about 30 Northfleet cases must be being cured annually - or at least not having cancer as a primary cause of death.

Cancer deaths for Northfleet for 1964/66 were 18%, 26% and 19% of all deaths. The percentages for England and Wales were 19.5%, 19.4% and 19.2%. The crude Northfleet death rates for cancer for 1964/66 were 1.6, 2.2 and 2.0. For England and Wales the rates were 2.21, 2.23 and 2.25.

Cancer of the lung

In the three years 1964/66 a total of 37 deaths occurred from this cause in a total of 681 deaths from all causes giving a percentage of 5.4% for the three years. For England and Wales the percentages for these three years separately was 4.7%, 4.8% and 4.8%. About half the Northfleet deaths occurred at the age of 65 or over. Tobacco shortens pensions as well as collecting taxes.

At the South Metropolitan 1960/62 cancer registration rate about 15 lung cancer registrations were then to be expected annually in Northfleet. As the deaths from this 1964/66 averaged around 12 annually, it appears that about 3 Northfleet cases are being cured annually - a smaller proportion of cures than for other forms of cancer.

In the years 1959/66 Northfleet deaths from lung cancer were:

Year	Deaths	Population	Crude Death rate	Comp. factor	Adjusted Death rate
1959	14	20720	0.68	1.16	0.79
1960	10	21580	0.46	1.22	0.56
1961	10	22380	0.45	1.22	0.55
1962	8	22960	0.35	1.22	0.43
1963	6	23450	0.26	1.27	0.33
1964	12	23780	0.50	1.27	0.64
1965	16	23960	0.67	1.24	0.83
1966	9	24160	0.37	1.23	0.46
1959/66	85	182990	0.46	1.23	0.57

In the same years deaths from lung cancer in England and Wales and London were as follows:

Deaths per 1,000 population

Year	England and Wales	London A.C.
1959	0.46	0.64
1960	0.48	0.70
1961	0.49	0.67
1962	0.51	0.68
1963	0.52	0.70
1964	0.54	0.74*
1965	0.55	0.70*
1966	0.56	0.72*
1959/66	0.52	0.68

*Greater London

Our death rate 1959/66 has a one in twenty probability of varying plus or minus 0.12 and as the difference from the England and Wales and London rates is less than this the difference is not significant.

Cancer of the uterus

The Northfleet deaths from this cause 1964-66 were 2, 2, 1. Four occurred at ages 45-64 and one at age 65-74. The figures are given to put the risks cared for by cervical screening in perspective. In the same years seven females died from lung cancer so it seems that females who have the tobacco habit are wilfully accepting a risk of cancer similar in size to the risk which cervical screening is designed to reduce.

Leukaemia

Northfleet deaths 1958-66 have been 1, 0, 3, 1, 2, 3, 1, 0, 5 average about 2. The crude death rate for the nine years is about 0.08. Rate for England and Wales 1965 = 0.06. The probability is high that the difference is due to chance. Leukaemia is of interest in regard to ionising radiations.

RESPIRATORY DISEASE

Deaths from respiratory disease 1964-66 (R.G.) were 27, 26, and 32. For these three years this gives a crude death rate of 1.2. The 1965 England and Wales rate was 1.4 and that of Greater London 1.5.

The percentages of all deaths for each year were 13%, 12% and 11%. For England and Wales in 1966 the percentage was 13%.

DEATHS RELATING TO THE WELFARE OF INFANTS AND MOTHERS

Tables VIII & IX

There was one maternal death in 1966 in hospital from thrombosis.

The infant death rates 1964-66 before and after birth were akin to those of England and Wales and the probabilities were high that the differences that occurred were produced by chance. The 12 deaths in the first day of life 1964-66 gave a rate of 7.7 per 1,000 live births. That for England and Wales was 7.1 in 1964.

All but 6 of the still-births occurred in hospital and of these 6 born at home only 2 might have had a better chance in hospital.

The absence of still-births due to birth injuries compared with 2% in England and Wales might be associated with good local midwifery.

All but 7 of the infant deaths occurred in hospital.

Three deaths were sudden:

Year	Age	Cause
1964	3 months	Ia bronchiolitis
		b bronchopneumonia
1964	3 months	Ia acute bronchiolitis and acute otitis media
1965	2 months	Ia bronchopneumonia
		b otitis media

The causes of two deaths were revealed by coroner's post mortem examinations. Sudden unexplained deaths in infancy are associated with: (1) Early bottle feeding and hypersensitivity to cows milk, (2) risk of suffocation by a pillow, (3) recent infection. The above illustrate the latter.

DEATHS THROUGH INJURY

Northfleet U.D.		Deaths		Population
		Motor Vehicle Accidents E810-/835	All Causes	
Table X	Year			
Motor Vehicle Accidents	1958	2	246	20370
	1959	1	208	20720
	1960	2	193	21580
	1961	3	191	22380
	1962	4	232	22960
	1963	2	211	23450
	1964	6	213	23780
	1965	1	214	23960
	1966	5	254	24160
		<u>26</u>	<u>1962</u>	<u>203360</u>

England & Wales

1965	7515	549379	47763000
1966	7454	563624	48075300

From above:

	Deaths as % of deaths from all causes	Death rate per 1000 pop.
Northfleet U.D. 1958-66	1.3%	0.13
England & Wales 1965	1.4%	0.16
England & Wales 1966	1.3%	0.16

The above Northfleet deaths are not necessarily on Northfleet roads as deaths on the roads are assigned to the district of residence.

The Chief Constable's reports show that deaths 1961-1966 on roads in Northfleet Urban District have been 3, 3, 1, 3, 2, 3 = 15 in a population of 140690 = 0.11 per 1000 population. Dartford Rural District deaths for the same period have been 13, 16, 9, 18, 15, 10 = 81 = 0.24 per 1000 population. The difference in the rates is presumed to be due to the difference in the mileage of roads yet the Urban District despite its lower accident rate is given more scope for road safety than the Rural District.

Northfleet U.D.		Deaths		Population
		Home Accidents E870-E936	All Causes	
Table X	Year			
Home Accidents	1961	1	191	22380
	1962	1	232	22960
	1963	6	211	23450
	1964	4	213	23780
	1965	1	214	23960
	1966	0	254	24160
		<u>13</u>	<u>1315</u>	<u>140690</u>

England & Wales

1965	7017	549379	47763000
1966	7206	563624	48075300

From above:

	Deaths as % of deaths from all causes	Death rate per 1000 pop.
Northfleet U.D. 1961-66	1.0%	0.09
England & Wales 1965	1.3%	0.15
England & Wales 1966	1.3%	0.15
Dartford Town 1961-65	0.9%	0.09
Dartford R.D. 1961-65	0.5%	0.05

The lower rate for the Rural District is seemingly associated with different environmental conditions.

Years of
life lost

This loss is calculated on an assumption that we should each live at least to the age of 85. The details of deaths in this district have been:-

Northfleet U.D.

Age at death in years	Years of life lost
Motor vehicle accidents	
1961 72, 74, 79	13, 11, 6 = 30
1962 20, 62, 72, 82	65, 23, 13, 3 = 104
1963 39, 81	46, 4 = 50
1964 18, 21, 22, 64, 64, 81	67, 64, 63, 21, 21, 4 = 240
1965 19	66 = 66
1966 21, 21, 41, 72, 87	64, 64, 44, 13, 0 = 185
	Total years of life lost 675

Home accidents

1961 87	0 = 0
1962 85	0 = 0
1963 5, 49, 57, 61, 77, 80	80, 36, 28, 24, 8, 5 = 181
1964 1, 6, 9, 77, 81	84, 79, 76, 8, 4 = 251
1965 1	84 = 84
1966 -	0 = 0
	Total years of life lost 516

Thus in Northfleet the number of years of life lost from motor vehicle accidents is more than from accidents in the home. Furthermore, in the latter natural causes in the elderly may have substantially contributed to the death. I mention these facts for them to be considered alongside the frequent statement that there are more deaths from accidents in the home than from accidents on the road.

Suicide
Table X

In the 13 years 1954-66 the number of deaths from suicide in each year was 2, 4, 3, 2, 1, 4, 1, 4, 2, 0, 1, 2, and 1, a total of 27. The aggregate of the population estimates of these years was: 282,400.

The annual death rate from this cause over these years was therefore: $27/282,400 = 9.6$ per 100,000.

The rate for this and neighbouring districts was:

	Deaths 1954-66	Aggregate of population estimates 1954-66	Average population	Annual death rate 1954-66 per 100,000
Swanscombe U.D.	6	117,100	9,000	5.1
Dartford R.D.	38	661,820	50,909	5.7
Northfleet U.D.	27	282,400	21,723	9.6
Dartford Town	66	548,150	42,165	12.1

The Greater London rate for 1966 was 12.5 and that for England and Wales was 10.4.

Suicide
(continued)

I imagine that the amounts by which the suicide rates of Swanscombe U.D. and Dartford R.D. differ from those of Northfleet U.D. and Dartford Town are such that they could occur by chance only rarely. These differences are therefore worthy of attention. The age group which predominated in our deaths from suicide was that of 45 years and over. Mental and physical health and also emotional and physical environment play a substantial part in suicides and there are certain environmental features which pertain to the persons of this age group in Swanscombe U.D. and Dartford R.D. which differ from those in Northfleet U.D. and Dartford Town.

In the former the environment of the lives of this age group has been different from that of the same age group living in neighbouring urban areas. Up to 1926 Swanscombe was a parish of the Rural District and those now of middle age or older in Swanscombe U.D. and Dartford R.D. contain a higher proportion than elsewhere of those who have lived all their lives in the vicinity, have gained their livelihood from the soil or in a few cases the sea and have lived in village-like communities. They have been in competition with nature rather than with man and have enjoyed more social cohesion.

COMMUNICABLE DISEASE

Virus
infections

Influenza The virus of influenza was present in England and Wales in the winters of 1964, 1965 and 1966 but if we use sickness benefit as a guide it was only in 1966 that it had noticeable effect here. As mentioned above this might be considered in searching for the reason for the increased deaths of 1966. The sickness benefit figures are given in the graphs below. The year 1960 was unusual in that there was no influenza in the country, in 1964 and 1965 it was patchy and mild, in 1966 in the south it did not decline until March.

Gravesend District M.N.I. Office

Dartford District M.N.I. Office

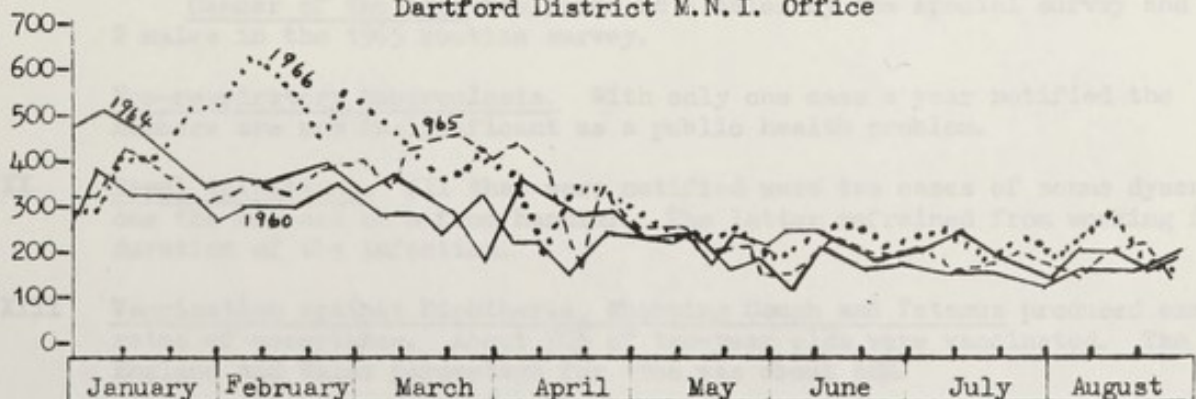

Table XI

Measles. In accordance with the biennial cycle measles was here from the end of 1964 until April 1965 and again from the end of 1966 until April 1967. What was unusual was that it appeared also in a small way in the middle of 1964 a feature also of Dartford Borough and Rural District.

Poliomyelitis. No case occurred. The last was in 1957. In 1966 in England and Wales the number of cases notified was the lowest in post-war years.

Mumps. is not notifiable. The schools informed us of its presence in 1964.

Chicken-pox. is not notifiable. The schools informed us of its presence in 1966.

Table XIII

Vaccination against poliomyelitis. The vaccination records provide vaccination rates which compare favourably with the known rates of England and Wales. That about 60% of school children have received their 4th dose of vaccine means that the community is impregnated with a worthwhile barrier against the introduction and spread of this disease.

Vaccination against smallpox. That around 60% of 1 year olds are receiving primary vaccination is good but not as good as one could expect. That only 11% of school children have immunity illustrates that we condone our population being susceptible to the disease. For financial reasons the records of vaccination are not complete. The picture contains a tinge of public and official hesitiation on vaccination policy. In spite of world unrest there are signs that on a world basis the disease is coming under closer control.

Bacterial
diseases
Table XII

Respiratory tuberculosis. The number of cases on the register continued to decline the 1966 number being only 70% of that of 1961. Of the 17 cases notified 1964/66 11 were infectious and among these were two food handlers and the necessary attention was given to the question presented by their work. Of the 8 cases removed from the register by death chest conditions are given in 5 as the primary cause of death and of these only 2 give tuberculosis as the primary cause although damage to the lung from tuberculosis was the essence of the trouble in all five.

One unregistered case was found only on post-mortem examination which illustrates that tuberculosis is not yet under complete control.

The 17 cases notified 1964/66 in a population 23,780 + 23,960 + 24,160 = 71,900 give a Northfleet rate of 24 per 100,000. The 1966 rate for England and Wales was 26 per 100,000.

The mass x-ray service found no active tuberculosis in the six-monthly examinations of the 1½ thousand males kept under review. In the one routine service in 1965 to the general public the active tuberculosis found was 0.3% compared with the England and Wales 1965 rate of 0.8%.

Cancer of the lung was found in 6 males by the special survey and in 2 males in the 1965 routine survey.

Non-respiratory tuberculosis. With only one case a year notified the numbers are now insignificant as a public health problem.

Table XI

Bowel infections. All that were notified were two cases of sonne dysentery one the husband of a food handler. The latter refrained from working for the duration of the infection.

Table XIII

Vaccination against Diphtheria, Whooping Cough and Tetanus produced excellent rates of acceptance. About 90% of two-year olds were vaccinated. The England and Wales percentage for 1966 was about 68%.

Local need Conjecture on the arithmetic of housing need may be an instructive though exacting exercise. With apologies for their over-simplification and their fancifulness I present the following estimates of new dwellings needed by the population of Northfleet in the six years 1961-66:

Immediate need:

- (a) The 1961 census showed that 155 households were sharing accommodation and that they were occupying 73 dwellings. To relieve this sharing $155 - 73 = 82$ dwellings were then required. To relieve shared accommodation Council-owned dwellings were necessary.
- (b) In addition about 190 households consisted of more than one family, mostly two. Thus to relieve this sharing about 95 dwellings were then required. These also would be Council-owned.

Recurrent need:

- (a) Dwellings are required after marriage or on attaining independence and are vacated after death. The number we require each year is half the annual number of births a score of years before less half the current annual number of deaths. In recent years this has been about $400/2$ less $220/2 = 200 - 110 = 90$ a year.

The 1961 census told us that 46% of Northfleet dwellings were owner-occupied, 28% were rented to tenants by private enterprise and 26% were rented to tenants by Council enterprise. Of the 28% renting private enterprise dwellings assume half have progeny who seek to rent Council dwellings and half have progeny who seek to own private enterprise dwellings.

Then of the 90 dwellings required each year through natural increase of the population $46\% + 14\% = 60\% = 54$ will require to be provided by private enterprise and $26\% + 14\% = 40\% = 36$ will be required to be provided by Council enterprise.

- (b) If when built a dwelling lasts on average 100 years before demolition then in due course the present 7,000 dwellings of Northfleet will require replacing at the rate of 70 a year. However 100 years ago the number of dwellings in this area would be no more than 2,000 and replacement needs may at present be no more than 20 a year. Mainly Council-owned dwellings would be required as replacements.

Thus in 1961 the need of the Northfleet population was:

Immediate non-recurrent: $82 + 95 = 177$ Council dwellings

Annual recurrent: Private enterprise dwellings $\frac{54}{}$
 Council enterprise dwellings $36 + 20 = \frac{56}{110}$

Based on this conjecture the needs which Northfleet could have expected to meet in the six years 1961-66 were:

Private enterprise dwellings:

Recurrent need 1961-66 $54 \times 6 = 324$

Council enterprise dwellings

Immediate need of 1961 177
 Recurrent need 1961-66 $56 \times 6 = \underline{336}$
 Total dwellings needed 1961-66 $\underline{513}$
 837

... the ... of ...

... the ... of ...

... the ... of ...

Local progress 1961-66

The numbers of dwellings built in Northfleet in these six years were.

Private enterprise	908
Council enterprise	<u>355</u>
	1263

Trend in theory

Private enterprise. Compared with the need of 324 the provision of private enterprise dwellings was abundantly more than necessary for the local 1961 Northfleet population assuming their cost to be appropriate to the local pocket. A large portion of these new private enterprise houses as we know were occupied by new-comers.

Council enterprise. Compared with the need of 513 Council enterprise dwellings provision fell short of need by $513 - 355 = 158$ dwellings. Bearing in mind the 177 Council dwellings estimated as the 1961 need as implied by the census the picture appears to be one of keeping up with the current demand but little ability yet to reduce need accumulated from the past. Nevertheless the figures suggest that if an additional 177 or so dwellings could be purchased by the Council in any of the years subsequent to 1961 the present Council building rate would be abreast of local need and theoretically the waiting list would disappear.

Trend in fact

The trend in fact is similar to that in theory, i.e. a slightly diminishing need as judged by the waiting list. The smallness of the downward trend may be temporary and due to the recent moves towards younger age at marriage (to which there is a limit), towards separate accommodation for the aged and towards increased expectancy of life. Also the recent phase of town redevelopment meant that more than usual dwellings were being vacated prior to demolition and their occupants rehoused

Where fact differs markedly from theory is in the size of accumulated need. Whereas the 1961 census suggested that there were 177 families in shared accommodation the waiting list had 355 and in addition 127 aged persons requiring independent accommodation. I imagine that the waiting list contained applicants in shared accommodation outside Northfleet not included in the census figure and that aged persons were not included in the census as separate households or families.

In the period under consideration the waiting list of applicants for Council dwellings was as follows:

Year	Housing need		Total housing need	Housing preference		Total applicants
	Applicants in shared accommodation	Aged applicants		Applicants desiring better amenities		
1960	362	184	546	330		876
1961	355	127	482	339		821
1962	435	155	690	397		1087
1963	423	203	626	287		1013
1964	347	201	548	341		889
1965	319	223	542	296		838
1966	328	203	531	372		903

In the above discussion shared accommodation is emphasised as the essential housing adversity. Those applicants for Council dwellings who are already in houses fit for habitation but who seek better amenities do not represent a numerical need for rehousing and if they do move they leave a dwelling which another family can occupy.

HOUSING PROVISION IN THE 14 YEARS 1953 - 1966

Local Authority	Population mid 1953	Population mid 1967	Population increase mid 1953 - mid 1967	Dwellings built 1953 - 1966			Dwellings put out of use for habitation					Increase in dwellings available		Increase in population mid 1953 - 1967 per 100 additional dwellings available

HOUSE OWNERSHIP

Local Authority	Census 1961		% houses built 1953-1966 by private enterprise
	Council Tenants	Owner Occupiers	
SWANSCOMBE U.D.	34%	30%	47%
NORTHFLEET U.D.	26%	46%	57%
DARTFORD M.B.	26%	51%	45%
DARTFORD R.D.	24%	54%	76%

Northfleet Urban District and the adjoining Local Authority Districts have different capacities for expansion, different types of need, different proportions of housing in their ownership, different shades of policy regarding allocating tenancies and have different opportunities for redevelopment.

The housing and population changes for the period 1953-66 are given in the accompanying tables. Swanscombe U.D. and Dartford M.B. have had least room for expansion and their populations appear to have depended on natural increase for population growth. In contrast Northfleet U.D. and Dartford R.D. have received substantial numbers of house occupiers from without the district with the result that their population growth is greater. This is already surmised by those familiar with this area.--- Swanscombe is largely a peninsular protruding into the chalk pits and has the greatest proportion of Council owned housing. Dartford R.D. had expansive areas for redevelopment and has the least proportion of houses in Council ownership. The accompanying statistics are an attempt to add precision to what is locally known.

Incidentally the Kent Quinquennial Review informed us that in 1963 in Swanscombe U.D. of households who had been there since before 1952, 4.5% lived in Council property. Of households who had gone to live in Swanscombe U.D. and Stone ward of R.D. since 1951, 60% went from a distance of less than 15 miles. Compared with neighbouring districts a greater percentage went to Swanscombe U.D. because of availability of housing and personal ties.

RADIOACTIVITY

Fall-out of radioactive material was of interest during the period under review as a result of test explosions in the Arctic in 1958 and 1961 and in the Arctic and Pacific in 1962.

During this period the Agricultural Research Council Radiobiological Laboratory kept under observation the position in regard to the food of the country as a whole while in Kent the County Analyst kept local food supplies under observation. Iodine 131 and strontium 90 were the two radioactive materials which required most attention.

The radioactivity of iodine 131 is only short lived and this isotope was therefore not a great food problem except for infants dependent on milk, at the time of the fall-out. Because of its short life iodine 131 need only be kept under observation for a short period after weapon trials. In 1963 and subsequently no iodine 131 was detected except for an unmeasurable trace after the Chinese tests of 1964 and 1965.

The radioactivity of strontium 90 decays only slowly merely half being lost in 30 years. Chemically it is similar to calcium and consequently strontium is deposited in bones where it is an intimate influence on blood forming tissue. To be on the safe side there should be caution should the diet average more than 130 strontium units over a year. It will be seen from Appendix VI that at its worst the strontium 90 in milk reached only about 1/6th of this figure.

The graph of strontium 90 in milk is worth attention because the change from a rising curve to one falling back almost to the 1962 level is a tribute to diplomacy and the test-ban treaty. When the graph was rising people required reassurance although the figures had to rise much further to justify anxiety but now that figures are back to the level which pertained before the bomb tests the hazard is forgotten.

Northwest Urban District and the adjoining local authority
Districts have different aspects for expansion, different types of
need, different proportions of housing in their ownership, different needs
of policy regarding allocating resources and have different opportunities
for redevelopment.

The housing and population changes for the period 1951-55 are given
in the accompanying tables. Swanscombe U.D. and Dartford N.D. have had
least room for expansion and their populations appear to have depended on
natural increases for population growth. In contrast Northfleet U.D. and
Dartford S.D. have received substantial numbers of house completions from
without the district with the result that their population growth is
greater. This is already mirrored by those families with this area —
Swanscombe is largely a post-war area with the bulk built and has
the greatest proportion of Council-owned housing. Dartford S.D. had
expansive areas for redevelopment and has the least proportion of houses
in Council ownership. The accompanying statistics are an attempt to add
precision to what is usually known.

Incidentally the Kent Quinquennial Review informed us that in 1961
in Swanscombe U.D. of households who had been there since before 1951,
45% lived in Council property. Of households who had gone to live in
Swanscombe U.D. and Dartford N.D. since 1951, 60% went from a
distance of less than 12 miles. Compared with neighbouring districts a
greater percentage went to Swanscombe U.D. because of availability of
housing and personal ties.

RADIOACTIVITY

Fall-out of radioactive material was of interest during the period
under review as a result of test explosions in the Arctic in 1958 and
1961 and in the Pacific in 1962.

During this period the Agricultural Research Council Radiochemical
Laboratory kept under observation the position in regard to the food of
the country as a whole while in Kent the County Analyst kept local food
supplies under observation. Iodine 131 and strontium 90 were the two
radioactive materials which required most attention.

The radioactivity of iodine 131 is only short lived and this isotope
was therefore not a great food problem except for infants dependent on
milk. At the time of the fall-out. Because of its short life iodine 131
need only be kept under observation for a short period after weapon trials.
In 1961 and subsequently no iodine 131 was detected except for an untraceable
trace after the Chinese tests of 1964 and 1965.

The radioactivity of strontium 90 decays only slowly nearly half being
left in 30 years. Chemically it is similar to calcium and consequently
strontium is deposited in bones where it is an intimate influence on blood
forming tissue. To be on the safe side there should be caution about the
diet average more than 150 strontium units over a year. It will be seen
from Appendix VI that at the worst the strontium 90 in milk reached only
about 1/10th of this figure.

The graph of strontium 90 in milk is worth attention because the change
from a rising curve to one falling back almost to the 1962 level is a
tribute to vigilance and the test-ban treaty. When the graph was rising
people required reassurance although the figures had to rise much further
to justify anxiety but now that figures are back to the level which
pertained before the bomb tests the hazard is forgotten.

DUST FROM CEMENT WORKS

Previous reports.

In a memorandum of 1956 to the Joint Committee and in my reports to Northfleet U.D. Council for 1958-63 this feature of our environment was discussed. The subjects reviewed included the history of the nuisance, the methods of manufacture of cement, the methods of dust prevention, the nature of the dust including the finer dust not measured by our gauges, the relationship of the dust to health and the question of research. These matters will therefore not be repeated here.

In my report for 1962-63 I recorded the difficulties of the cement industry on the south side of the river due to the deterioration in quality of the estuarine clay then in use. These difficulties increased the emission of dust from the works and the 1954-62 trend lines of the graphs of our gauge readings showed an upward trend in the later years. Remedies however were in hand and by the end of 1963 all except Swanscombe Works were being supplied by the more satisfactory eocene clay. By the end of 1964 all Thames-side works were so supplied.

Gauge readings.

In Appendix VII of this report instead of trend lines for deposit gauge readings histograms have been used for the period 1963-5. The percentages of dust from cement works in the total solids measured for Northfleet, Swanscombe and Horns Cross (pages (iv) and (vii)) provide the most concise guide and from these a downward trend is perhaps detectable.

If Appendix VII serves no other purpose it will perform a service if it illustrates that it is one thing to gather measurements but it is another to interpret them. One of the unproductive discussions one has to witness from time to time is on the deposit collected by gauges during one month compared with that of the previous month when the difference is due merely to a change in the wind direction. Interpreting deposit gauge readings is a tantalising exercise and Appendix VII might be amplified by several more pages on wind direction, wind speed, rainfall, humidity, temperature and atmospheric pressure. Our hope is that we may overcome the vagaries of the weather by looking at averages of periods of a year or more in a survey covering say a decade. The quantity and quality of fuels used is also relevant.

In the meantime the readings to watch are the percentages of dust from cement works in total deposit - the size of the sample varies with the weather but the constituents of the sample vary with the local emissions.

Dust emissions.

However what can give us precision is information on the amount of dust being emitted from the works' chimneys. The Annual Reports of the Alkali etc. Works Inspector provide the following data:

Thames-side Cement Works					
	1963	1964	1965	1966	1967
Average "dust slip" grains per cubic foot	0.4	0.3	0.3	< 0.3	< 0.3
"mass emission" with that of 1964 as 100%	?	100%	87%	76%	59%
Cement production (million tons)					
Thames-side	4.5	?	?	?	decreased
England & Wales	12.9	15.5	15.5	15.3	15.8

In a memorandum of 1956 to the Joint Committee and in my reports to Portland Cement for 1956-57 this feature of our environment was discussed. The subjects reviewed included the history of the industry, the methods of manufacture of cement, the methods of dust prevention, the nature of the dust including the finer dust not measured by our gauges, the relationship of the dust to health and the question of research. These matters will therefore not be repeated here.

In my report for 1956-57 I recorded the difficulties of the cement industry on the south side of the river due to the deterioration in quality of the extraction clay then in use. These difficulties increased the extension of dust from the works and the 1954-55 trend lines of the graphs of our gauge readings showed an upward trend in the later years. Remedies however were in hand and by the end of 1957 all except Swanscombe Works were being supplied by the more satisfactory source clay. By the end of 1957 all Thames-side works were so supplied.

In Appendix VII of this report instead of trend lines for deposit gauge readings histograms have been used for the period 1953-57. The percentages of dust from cement works in the total solids measured for Portland, Swanscombe and Horns Cross (pages (iv) and (v)) provide the most concise guide and from these a downward trend is perhaps detectable.

If Appendix VII serves no other purpose it will perform a service if it illustrates that it is one thing to gather measurements but it is another to interpret them. One of the unproductive discussions has to witness from time to time is on the deposit collected by gauges during one month compared with that of the previous month when the difference is due merely to a change in the wind direction. Inter-posing deposit gauge readings is a tantalizing exercise and Appendix VII might be amplified by several more pages on wind direction, wind speed, rainfall, humidity, temperature and atmospheric pressure. Our hope is that we may overcome the vagaries of the weather by looking at averages of periods of a year or more in a survey covering say a decade. The quantity and quality of fuels used is also relevant.

In the meantime the readings to which are the percentages of dust from cement works in total deposits - the size of the sample varies with the weather but the consistencies of the samples vary with the local extension.

However what can give us precision is information on the amount of dust being emitted from the works' chimneys. The Annual Reports of the Alkali etc. Works Inspector provide the following data:

Year	1957	1956	1955	1954	1953
Average "dust slip" grains per cubic foot	0.3	0.3	0.3	0.3	0.4
"mass extension" with that of 1954 as 100%	75%	75%	75%	100%	100%
Cement production (million tons)	Decreased	?	?	?	4.5
England & Wales	12.8	12.3	12.5	12.5	12.9

We are grateful for the foregoing useful information on emissions but it has the following short-comings:

(a) Dust "slip" in grains per cu. ft. pays no regard to the method of manufacture. The semi-dry process of manufacture creates a smaller volume of flue gas than the wet process and therefore grains per cu. ft. "slip" represent less emission of dust with the semi-dry process than with the wet process. Less important may be the possibility that with old plant adventitious air may gain entry and cause dilution to the flue gases or variations in the volumes of air used for combustion may cause dust concentration to be erroneously represented.

(b) Emission is created by production and therefore we should have the related figures of local production. These latter figures are not given. Without any change in efficiency mass emission could be reduced by a reduction in production.

(c) The data for individual works are not given. They do not tell us therefore where there is scope for lessening the dust nuisance.

(d) The data for individual months are not given and therefore they cannot be easily related to monthly gauge readings or periods of exceptional weather.

Dust/
clinker
ratio.

In certain other industries we can observe an individual chimney and compare the darkness of the particulate emission, i.e. smoke, with a shade chart and by recording also the length of time of emission we can assess the efficiency of the works in avoiding smoke nuisance. We can then assess the scope for improvement.

With the cement industry the particulate emission is light grey and is masked by steam so that one cannot by observing the chimney emission assess the efficiency of a works in reducing dust nuisance. However an index of efficiency in an individual works does exist. It is the ratio, expressed as a percentage, borne by the dust emitted from the chimney in a given period to the clinker produced by the kiln in that same period.

This index is not made available to us. The Member of Parliament for Dartford in 1963 kindly pressed the Minister of Housing and Local Government for this dust/clinker ratio to be provided for individual works but the Minister would only agree to have average figures for all Thames-side works included in the Annual Reports of the Chief Alkali Inspector and these I have given above. They do not include the dust/clinker ratio for which we asked.

The reasons for not giving us the figures for individual works are that the Ministry are given them in confidence.

At the end of last century the confidential nature of the information that a person was suffering from infectious disease was the reason for opposing the notification of such disease to the public health authorities. By making notification a statutory duty of both the head of the household as well as the attending medical practitioners this objection was met.

With this analogy in mind it would not seem unreasonable to make it a statutory duty for both the cement industry as well as the Alkali etc. Works Inspectorate to keep local authorities informed on clinker production and of the results of emission sampling at each cement works in their district. Certain large County Boroughs have been given responsibilities under the Alkali etc. Works Act for the industries in their areas. It would of course be out of the question for an Urban District of the size of Northfleet to have such involved technical responsibilities. Nevertheless not only should the best practicable means be taken to avoid dust nuisance but they should be seen to be taken and there seems no technical reason why a local authority however small should be denied the information of emissions from individual works.

Range of
Dust
control.

Without this information we have to rely on conjecture. The roofs of houses in Stone, Swanscombe and Northfleet are indicators of the effectiveness of dust control for the individual works in the vicinity. In Stone the roofs show most evidence of dustiness, while in Northfleet the roofs show least. The cement works at Stone have the lowest chimneys and they are in two groups. I imagine the Stone works have the oldest plant. The cement works at Swanscombe for several years now have emitted their effluent mainly from one high chimney. The cement works at Northfleet since 1959 have been provided with a high chimney (another low one albeit still in use), have been equipped with electro-static precipitators that are up-to-date and have had in use a semi-dry process of manufacture.

It thus appears that in Stone emission from the works is greatest and dispersion is least, while at Northfleet emission is least and dispersion is greatest.

As seen from the reports of the Alkali etc. Works Inspectorate the average "slip" at Thames-side is 0.3 grains per cubic foot. As the Alkali etc. Works Inspector disapproves of emissions of above 0.5 grains per cubic foot I imagine that to produce an average of 0.3 the range of emissions at Thames-side is 0.1 to 0.5 grains per cubic foot. If this is so the likely figure for the Stone works is 0.5 while that for the works at Northfleet is 0.1. One can surmise therefore that there is substantial technical scope for improvement at Stone but little at Northfleet.

This surmise could be tested by the provision of figures relating to dust control at each individual works and such indices would be useful to those with amenity and planning responsibilities.

Level of
Dust for
complaint

Many industries have reduced atmospheric pollution by more efficient combustion of fuel but this contribution to the cleaning of the air has been assisted by the added incentive of fuel economy. No such incentive assists the desire of the cement industry to reduce dust emission which duly involves expenditure that is entirely unproductive. Furthermore we can presume that the nearer the industry gets to perfection the more expensive further improvement becomes. Although the cement industry is notorious for their dust emission it is not the only industry causing dust nuisance.

I have already outlined the need for precision in the information we are given regarding dust emission. To complement this we also need precision in regard to the amount of dust that is acceptable in the district and can be received without complaint. Such a figure might be flexible and by being linked with weather conditions could justify variation of dust arrestment with the weather.

Directly or indirectly the population of the district has a vested interest in the prosperity of the industry but some housewives have a greater interest in reducing the housework the dust creates. Those who have the welfare of the housewife in mind should have some guidance on how much of the industry's resources they can expect to be devoted to dust arrestment. Complete dust arrestment is impossible and may be unnecessary - what degree of perfection should the industry strive to attain?

Future
production.

The above observations are in part the product of chair-borne contemplation of the reports of the Alkali etc. Works Act Inspectorate. The technicalities of the local cement industry are of course beyond the range of my practical experience. Nevertheless I submit these observations as a means of seeking consideration for this subject. It is a tug o' war between housewives and cement economics. At the time of writing it has become evident that the cement industry will increase its production in Northfleet within the next decade and here the proximity of that industry to residential development is unique.

The first part of the report deals with the general situation of the country and the progress of the work done during the year. It then goes on to discuss the various departments and the work done in each of them. The report concludes with a summary of the work done and a statement of the progress made.

The second part of the report deals with the financial statement of the year. It shows the income and expenditure of the various departments and the total result for the year. It also shows the balance sheet at the end of the year.

The third part of the report deals with the work done in the various departments. It gives a detailed account of the work done in each of the departments and the progress made in each of them. It also shows the results of the work done and the progress made.

The fourth part of the report deals with the work done in the various departments. It gives a detailed account of the work done in each of the departments and the progress made in each of them. It also shows the results of the work done and the progress made.

The fifth part of the report deals with the work done in the various departments. It gives a detailed account of the work done in each of the departments and the progress made in each of them. It also shows the results of the work done and the progress made.

The sixth part of the report deals with the work done in the various departments. It gives a detailed account of the work done in each of the departments and the progress made in each of them. It also shows the results of the work done and the progress made.

The seventh part of the report deals with the work done in the various departments. It gives a detailed account of the work done in each of the departments and the progress made in each of them. It also shows the results of the work done and the progress made.

The eighth part of the report deals with the work done in the various departments. It gives a detailed account of the work done in each of the departments and the progress made in each of them. It also shows the results of the work done and the progress made.

Page 11

POLLUTION WITH PRODUCTS OF COMBUSTION

Winter averages. Appendix VII

Pollution is at its worst in winter when space-heating demands increased emissions from domestic, commercial and industrial premises. It is expedient therefore to assess the local position from the winter measurements made by the Council's Public Health Inspectors.

As a means of indicating the coldness and the space-heating required each winter I have given the "degree days" which are detailed in Appendix VII.

Smoke.

In my report for 1962-63 I gave for comparison the readings of Islington 1 a site in inner London among high density housing with industry, and Sheffield 60 (Redmires) a site in open country 5 miles west of the city centre. The winter of 1962-63 was exceptionally severe and authorised fuels in many places including Northfleet were in such short supply that Smoke Control Orders were suspended. In these 3 sites a distinct downward trend has since been recorded with the result that in the winter of 1966-67 all 3 gauges showed no more than half the concentration of the winter of 1962-63. This displays in figures what anybody with a memory of 10 years ago can see with their eyes when looking over the house tops in London.

Downward trend.

The concentrations have been:

Winter	1962-63	1963-64	1964-65	1965-66	1966-67
	microgrammes per cubic metre				
Northfleet Code X	119	118	82	76	63
Islington 1. Code A2	269	188	178	142	102
Sheffield 60 (Redmires) Code O1	92	71	59	51	38
Degree days	4111	3574	3296	3111	2880

Because we in Northfleet have least scope for improvement our downward trend has the least proportional fall but in 1966-67 Northfleet retained the same relative position thus our concentrations remained below those of inner London and higher than those in the open country of the coal-burning North.

From Appendix VII one can see that from here to Swanley Northfleet appears to share with the neighbouring gauge sites the benefit of nearby expansive open space the exception being the Dartford site which has a more congested urban environment.

Incentives.

None of the local gauge sites is in a smoke control area and it may be conjectured that the downward trend locally is due to the downward trend nationally. The downward national trend has followed not only the improvements initiated under the provisions of the Clean Air Acts but also the changes due to choice made spontaneously in the general population. More people are preferring to use oil, gas or electricity for reasons of convenience and there is continuing improvement in the efficiency of combustion of the fuels used by industry. The air of the nation has become cleaner and Northfleet has shared this benefit. Northfleet has contributed to this improvement by its two Smoke Control Orders. The contribution could be greater but proposals for a third Smoke Control Area did not survive scrutiny of its economic aspects in 1966.

Pollution is at its worst in winter when space-heating demands increased emissions from domestic, commercial and industrial premises. It is essential therefore to assess the local pollution from the winter measurements made by the Council's Public Health Inspectors.

Winter averages
Appendix VII

As a means of indicating the coldness and the space-heating required each winter I have given the "degree days" which are detailed in Appendix VII.

In my report for 1966-67 I gave for comparison the readings of Lillingston 1 a site in inner London where high density housing with industry, and Bealfield 60 (Bedalway) a site in open country 5 miles west of the city centre. The winter of 1966-67 was exceptionally severe and untraced fumes in many places including Northfleet were in such short supply that Smoke Control Orders were suspended in these 3 sites a distinct downward trend has since been reported with the result that in the winter of 1966-67 all 3 gauges showed no more than half the concentration of the winter of 1965-67. This displays in figures what anybody with a memory of 10 years ago can see with their eyes when looking over the houses tops in London.

Books

The concentrations have been:

Winter	1962-63	1963-64	1964-65	1965-66	1966-67
Northfleet Code X	119	118	85	76	63
Lillingston 1 Code AS	269	188	178	142	102
Bealfield 60 (Bedalway) Code O1	92	71	59	51	38
Degree days	4111	3574	3096	2111	2880

Downward trend

Because we in Northfleet have least scope for improvement our down wind trend has the least proportional fall but in 1966-67 Northfleet retained the same relative position thus our concentrations remained below those of inner London and higher than those in the open country of the coal-burning North.

From Appendix VII one can see that from here to Bealway Northfleet appears to share with the neighbouring gauge sites the benefits of nearly expansive open space the exception being the Bedford site which has a more congested urban environment.

None of the local gauge sites is in a smoke control area and it may be conjectured that the downward trend locally is due to the downward trend nationally. The downward national trend has followed not only the improvements initiated under the provisions of the Clean Air Act but also the changes due to choice made spontaneously in the general population. More people are preferring to use oil, gas or electricity for reasons of convenience and there is continuing improvement in the efficiency of combustion of the fuels used by industry. The air of the nation has become cleaner and Northfleet has shared this benefit. Northfleet has contributed to this improvement by its two Smoke Control Orders. The contribution could be greater but proposals for a third Smoke Control Area did not survive scrutiny of its economic aspects in 1966.

Incentives

Sulphur dioxide.

Since the winter of 1962-63 concentrations have been:

Winter	1962-63	1963-64	1964-65	1965-66	1966-67
	microgrammes per cubic metre				
Northfleet Code X	190	125	164	152	127
Islington 1. Code A2	326	322	297	278	231
Sheffield 60 (Redmires) Code O1	115	94	93	84	65
Degree days	4111	3574	3296	3111	2880

Downward trend.

Thus there is also a downward trend in the SO₂ figures but the gradient is less marked than with the smoke figures. The Clean Air Act can reduce and nearly eliminate smoke but up to 1967 it could only disperse SO₂ through high chimneys.

For some reason unexplained the local gauges together with others in the South East showed a noticeable drop below the trend-line in the winter ending March 1964. The smoke figures did not show this feature so mild weather and diminished space-heating were not responsible for the diminished SO₂ pollution observed. It may have been due to a recession in industry calling for less fuel consumption for power or perhaps the weather was conducive to the dispersal of the SO₂ from industry's high chimneys. I don't know.

Locally the gauge at Horns Cross (Stone) has had the lowest winter readings which is no doubt associated with the sparseness of the housing there and perhaps with the fact that the cement industry emits an alkaline effluent.

Smoke/
SO₂
ratio.

In warm weather the heat of the ground expands the adjacent polluted air, gives it bouyancy causing it to rise, disperse and be replaced by air from elsewhere. Thus dilution and dispersal of pollution is related to temperature and if we wish to follow the trend of pollution we should use an index which is as far as possible unaffected by season.

Its value.

In an area like Northfleet one substantial portion of pollution is emitted by industry, is constant and is mainly SO₂. The other substantial portion is from domestic coal fires, is variable and contains more smoke than SO₂. The weather decides how much pollution is contained in air drawn into each gauge. The variable domestic pollution determines the proportions of the constituents of the mixture that enters. Thus the smoke/SO₂ ratio gives us an index of domestic coal-burning pollution less influenced by weather than the absolute measurements. In Appendix VII page 75 this is further explained.

The ratios for the Northfleet gauge suggest that its environment in recent years in the periods April to September has contained about 20% domestic coal-fired pollution and in the periods October to March has contained about 40% domestic coal-fired pollution. From 1962-63 winter onwards the Northfleet ratios have not been incompatible with the downward trend.

Since the winter of 1962-63 concentrations have been

Winter	1962-63	1963-64	1964-65	1965-66	1966-67
Northwest Code X	190	185	164	155	137
Lainington J. Code AS	356	363	337	338	331
Bedford 60 (Bedford) Code O1	112	94	93	84	83
Degree days	4111	3374	3398	3111	3880

Thus there is also a downward trend in the SO₂ figures but the gradient is less marked than with the smoke figures. The clean air act can reduce and nearly eliminate smoke but up to 1967 it could only disperse SO₂ through high chimneys.

For some reason unexplained the local gauges together with others in the South East showed a noticeable drop below the trend line in the winter ending March 1964. The smoke figures did not show this feature so mild weather and disturbed space-heating were not responsible for the diminished SO₂ pollution observed. It may have been due to a recession in industry calling for less fuel consumption for power or perhaps the weather was conducive to the dispersal of the SO₂ from industry's high chimneys. I don't know.

Locally the gauge at Horns Cross (2) has had the lowest water readings which is no doubt associated with the exposure of the housing there and perhaps with the fact that the cement industry emits an alkaline effluent.

In warm weather the heat of the ground expands the adjacent polluted air, gives it buoyancy causing it to rise, disperse and be replaced by air from elsewhere. This diffusion and dispersal of pollution is related to temperature and it is wish to follow the trend of pollution we should use an index which is as far as possible unaffected by season.

In an area like Northwest one substantial portion of pollution is emitted by industry, is constant and is mainly SO₂. The other substantial portion is from domestic coal fires, is variable and contains more smoke than SO₂. The weather decides how much pollution is contained in air drawn into each gauge. The variable domestic pollution determines the proportions of the constituents of the mixture that enters. Thus the smoke/SO₂ ratio gives us an index of domestic coal-burning pollution less influenced by weather than the absolute measurements. In Appendix VII page 75 this is further explained.

The ratios for the Northwest gauge suggest that its environment in recent years in the periods April to September has contained about 50% domestic coal-fired pollution and in the periods October to March has contained about 40% domestic coal-fired pollution. From 1962-63 winter onwards the Northwest ratios have not been incompatible with the downward trend.

Smoke/SO₂ ratios

Downward trend.	Winter	1962/63	1963/64	1964/65	1965/66	1966/67
	Northfleet	0.70	0.94	0.50	0.50	0.50
	Islington 1	0.83	0.58	0.63	0.51	0.45
	Sheffield 60	0.80	0.76	0.64	0.61	0.58

An incidental feature of the Smoke/SO₂ ratio is the hunch that smoke by itself is perhaps harmless, that SO₂ by itself is harmless in the quantity possible but that, when mixed, smoke and SO₂ are harmful and the smaller the ratio the less the capacity for harm.

Peak concentrations.

If one has been mindful of the effects of pollution on health in contemplating the above paragraphs it would be in relation to the effects of pollution over numerous years on the texture of the organs inside the chest, i.e. the increased incidence of chronic bronchitis with subsequent over-burdened heart and increased incidence of lung cancer.

There is another aspect to consider which is a feature of the acute exacerbations of the pollution experienced in time of fog. Such times of peak concentrations are hazardous to those with established chest disease, i.e. the chest cripples.

The Greater London population in 1952 experienced 4,000 deaths accelerated by the December fog and 10 years later experienced 700 deaths accelerated by a similar fog in 1962.

As mentioned in my report for 1962-63 the Medical Officer of Health of the London County Council subsequently concluded at that time "The level of pollution (in London) begins to exert a marked effect upon mortality when the daily concentration reaches 2000 micrograms of black suspended matter and 1150 micrograms of acidic gases per cubic metre of air..." (Scott Med. Off. 16.10.59).

The maximum concentrations of Winter 1962-63 were those of the December fog namely:

	Smoke micrograms per cubic metre	SO ₂
Northfleet	1055	1068
Islington 1	3974	3303
Sheffield 60	371	492

In contrast with the above in the period April 1963 to March 1967 the highest smoke reading in Northfleet was 534 in February 1964 and the highest sulphur dioxide reading was 562 in December 1965. Thus at the time of the 1962 fog Northfleet did not experience concentrations of pollutants lethal to chest cripples and in subsequent years peak concentrations have been substantially less.

Winter	1952/53	1953/54	1954/55	1955/56	1956/57
Northfleet	0.70	0.54	0.50	0.50	0.50
Ilfracombe	0.85	0.58	0.65	0.51	0.45
Sheffield 60	0.80	0.76	0.64	0.64	0.58

An incidental feature of the Smoke/CO₂ ratio is the range that smoke by itself is perhaps narrower, that CO₂ by itself is narrower in the quantity possible but that, when mixed, smoke and CO₂ are harmful and the smaller the ratio the less the capacity for harm.

It has been stated in the effects of pollution on health in contemplating the above paragraphs it would be in relation to the effects of pollution over numerous years on the texture of the organs inside the chest, i.e. the increased incidence of chronic bronchitis with subsequent over-burdened heart and increased incidence of lung cancer.

There is another aspect to consider which is a feature of the acute exacerbations of the pollution experienced in time of fog. Such times of peak concentrations are hazardous to those with established chest disease, i.e. the chest origin.

The Greater London population in 1952 experienced 4,000 deaths associated by the December fog and 10 years later experienced 700 deaths associated by a similar fog in 1962.

As mentioned in my report for 1962-63 the Medical Officer of Health of the London County Council subsequently concluded at that time "The level of pollution (in London) begins to exert a marked effect upon mortality when the daily concentration reaches 2000 micrograms of black suspended matter and 150 micrograms of acidic gases per cubic metre of air..." (Scott Med. Off. 16.10.62).

The maximum concentrations of Winter 1962-63 were those of the December fog namely:

Northfleet	Ilfracombe	Sheffield 60
1055	774	371
1068	2303	492

In contrast with the above in the period April 1963 to March 1967 the highest smoke reading in Northfleet was 524 in February 1964 and the highest sulphur dioxide reading was 562 in December 1965. Thus at the time of the 1962 fog Northfleet did not experience concentrations of pollutants fatal to chest origin and in subsequent years peak concentrations have been substantially less.

ADMINISTRATION

Hindrances to administrative evolution

Those who serve on district public health committees are motivated by the need to improve amenity and promote public welfare but the association of these motives with public health is now less close than in the past. Housing and planning have been and are expeditiously administered but biological health being a long term project with benefits which need a memory to discern has not received and is not receiving the nurture required for administrative evolution. With the passage of changeless years our local government pattern of district health management has become obsolete.

Two fighting wars, two slumps and one cold war have not helped public health evolution in the districts. On biological public health as opposed to amenity we expend but little of the community's resources and as the administrative wastefulness is expressed by diminished opportunity to serve it is not evident from without.

It is not expedient to discuss here the deficiencies of the position of your district medical officer of health as re-organisation is now on the horizon and the tide of events will we hope bring in the necessary readjustments.

District Public Health duties

I will outline a possible shape of these readjustments.

A large portion of the work of a district public health department concerns the improvement and management of amenity which responsibility is eminently appropriate for the lesser local authorities in which sphere they have some most wholesome qualities.

The remaining portion of the work is the task of acquiring information on all matters likely to affect the health of the district and this is a task appropriate to large authorities.

For brevity I omit discussion on the management of outbreaks of disease, in these Nature is our ally. I have in mind the hazards of man-made environment demanding man-made control. For these, objective opinions based on population studies will be the influences which will initiate future long-term public health action.

The gathering and management of statistical material will constitute a substantial part of the work and sizeable populations will be appropriate as gathering grounds of data. The computer will take over from the slide-rule.

Future administrative evolution

Clues for the future re-organisation may be found in the following:

- 1) Work to improve amenity to be separated from work to improve public health;
- 2) Amenity work to remain with local government;
- 3) Executive side of public health to be the province of the national health service through area health boards;
- 4) The advisory side of public health work to be provided by a local office of health information linked with the organisation of the Registrar General;
- 5) This local office be directed by a medical actuary who would have the responsibility of guiding the management of all local health and sickness records, would be free to initiate or assist in any statistical inquiry he deems wise, would have authority to require relevant information to be provided to him.

JHH/CEK.

Those who serve on district public health committees are motivated by the need to improve sanitation and promote public health but the association of these motives with public health is now less close than in the past. Housing and planning have been and are expeditiously administered but biological health being a long term project with benefits which need a memory to discern has not received and is not receiving the nature required for administrative evolution. With the passage of one or two years our local government pattern of district health management has become obsolete.

Two fighting wars, two plagues and one cold war have not helped public health evolution in the districts. On biological public health as opposed to sanitary we expand but little of the community's resources and as the administrative wastefulness is expressed by diminished opportunity to serve it is not evident from without.

It is not expedient to discuss here the deficiencies of the position of your district medical officer of health as re-organization is now on the horizon and the tide of events will we hope bring in the necessary readjustments.

I will outline a possible shape of these readjustments.

A large portion of the work of a district public health department concerns the improvement and management of sanitary which responsibility is eminently appropriate for the lesser local authorities in which sphere they have some most wholesome qualities.

The remaining portion of the work is the task of securing information on all matters likely to affect the health of the district and this is a task appropriate to large authorities.

For brevity I omit discussion on the management of outbreaks of disease, in these matters is our ally. I have in mind the hazards of man-made environment demanding man-made control. For these, objective opinions based on population studies will be the influence which will initiate future long-term public health action.

The gathering and management of statistical material will constitute a substantial part of the work and statistical populations will be appropriate as gathering grounds of data. The computer will take over from the slide-rule.

Lines for the future re-organization may be found in the following:

- 1) Work to improve sanitary to be separated from work to improve public health;
- 2) Sanitary work to remain with local government;
- 3) Executive side of public health to be the province of the national health service through river health boards;
- 4) The advisory side of public health work to be provided by a local office of health information linked with the organization of the Registrar General;
- 5) This local office be directed by a medical authority who would have the responsibility of guiding the management of all local health and sick case records, would be free to initiate or assist in any statistical inquiry he deemed wise, would have authority to require relevant information to be provided to him.

TABLE I.

SOCIAL CONDITIONS
Northfleet U.D.

Area (acres)		3,770
Population (Census 1931)		16,223
" (Census 1951)		18,921
" (Census 1961)		22,092
Mid-year home population 1964	(Registrar General's estimate)	23,780
" " " " 1965	" " " "	23,960
" " " " 1966	" " " "	24,160
Number of domestic and agricultural dwelling houses assessed to rates:		
	31.3.64	7,496
	31.3.65	7,662
	31.3.66	7,715
Rateable value:	31.3.64	£1,339,876
	31.3.65	£1,385,723
	31.3.66	£1,408,298
Sum represented by 1d. rate:	31.3.64	£5,514
	31.3.65	£5,660
	31.3.66	£5,727

POPULATION. Growth of the population is due to natural increase (i.e. excess of births over deaths) and immigration, both being related to new houses built.

Year	1959	1960	1961	1962	1963	1964	1965	1966
Est. mid-year home population	20,720	21,580	22,380	22,960	23,450	23,780	23,960	24,160
Increase on previous year	+350	+860	+800	+580	+490	+330	+180	+200
Excess of births over deaths	148	241	245	247	294	298	301	269
Immigration or emigration	+202	+619	+555	+333	+196	+32	-121	-69
Houses built	376	73	150	295	193	160	168	297

COMPARABILITY FACTORS. When local crude birth and death rates are multiplied by the area comparability factors they are comparable with the rate for England and Wales or with the adjusted rate for any other area. In the last eight years the factors for births (governed by the proportion of women aged 18-44 years) and for deaths (governed by the proportions of all age groups) have been as follows:-

Year	1959	1960	1961	1962	1963	1964	1965	1966
Births	0.97	0.94	0.94	0.94	0.93	0.93	0.93	0.93
Deaths	1.16	1.22	1.22	1.22	1.27	1.27	1.24	1.23

UNEMPLOYMENT. The number unemployed aged 18 years and over of Gravesend and district registered in the first half of December with the Employment Exchange were:

	1959	1960	1961	1962	1963	1964	1965	1966
Males	342	268	309	525	473	223	181	541
Females	145	76	85	134	101	85	65	115
Persons	487	344	394	659	574	308	246	656

TABLE I - (continued) Northfleet U.D.

POPULATION OF YOUNG PERSONS. A guide is necessary to the young population in the district in order that we may form an idea from vaccinations done of the proportion who have been given immunity to certain diseases. A rough estimate can be made from the births which have occurred in the district in the past. This assumes a stable population and does not take into account deaths after one year of age or the balance of those coming into the district over those leaving.

Year	Births	Infant deaths	Infants surviving to 1 year	Age Dec. 31st			Approximate Population		
				1964	1965	1966	Age Dec. 31st 1965	1964	
1966	523	30	483	-2	-1	0	0-4 yrs = 2,423	0-4 yrs = 2,367	0-4 yrs = 2,285
1965	515	11	504	-1	0	1			
1964	511	29	482	0	1	2			
1963	505	14	491	1	2	3

TABLE XIII - VACCINATIONS

Northfleet U.D.

Virus Diseases

(a) POLIOMYELITIS

For the years 1957 to 1960 the figures provided by County Hall for vaccination against poliomyelitis for each year gave the number of persons born in each of stated years who had received vaccination in each year under review. When we had figures in this detail we could assemble them in a way which demonstrated the size and pattern of the immunity barrier ready to oppose the spread of poliomyelitis. For 1961 the figures we received related to persons in age groups each of several years of birth. For 1962 similar groupings were also used but the groupings of years of birth were slightly different. For 1963 the groupings were the same as 1962 and we were able to manage the figures concisely enough for example to give the following in our 1963 report:-

Percentage of young population vaccinated 1959-1963

Born	Estimated population	No. had 2nd dose	% of population	*No. had 3rd dose	% of population
1957-1963	2827	1741	62%	2108	74%
1943-1956	4300	673	16%	3095	72%
1943-1963	7127	2414	34%	5203	73%

*For footnote see 1963 report, it explains why more 3rd doses than 2nd doses.

The raw figures for this current report were provided to us in yet a different form. For 1964 they were in age groups which differed from those of 1963 and the figures 1965-1966 not only differed in their age groups from those of 1964 but in addition were limited to age groups under sixteen years of age.

The above difficulties explain some of the short comings in the presentation of the figures that follow:-

Completed courses of primary vaccination (3 doses or equivalent) Northfleet U.D. 1958-65 (no 3rd doses before 1958)

1949-60	210 ^x	1949-57	35 ^x		
1933-48	-				
Others	-				

^xWhen dead vaccine had been previously given by injection 4th doses by injection or by oral route were given around the year of school entry. Most of these latter doses must therefore have been given at ages from 5 to 8. By 1965 the practice followed was to give three oral doses in infancy followed by a fourth oral dose on starting school.

Percentage of children aged 5 - 11 who have had 4 doses

(a) Year	(b) Birth years	(c) Est. Pop.	(d) No. receiving 4th dose	School leavers		(g) School leavers immune	(h) Col. (d) cumulative	(i) Col. (g) cumulative	(j) No. with 4th dose at end of year (h)-(i)	(k) % with 4th dose at end of year j/c x 100

Year	Revaccinated					Total
	Under 1 year	1 year	2 - 4	5 - 14	15 or over	
1966	?	?	?	2)	?	?
1965	?	?	?	1) Age	?	?
1964	?	?	?	5-7	?	?
1963	-	?	?	9) years	?	?
1962	-	1	43	267	578	889
1961	-	-	-	2	2	4
1960	?	?	?	?	?	?
1959	-	-	-	-	4	4

INFANT VACCINATION RATE. Up to the end of 1961 most infants who were vaccinated were vaccinated in the first year of life but in 1962 more infants than in former years were vaccinated at a later age. In 1963 the second year of life was advocated as an age for vaccination. The percentage of the number of births in a year of those vaccinated while under one year of age in that year is used here as a vaccination rate up to 1962.

Year	No. of live births	No. vaccinated under 1 yr.	% of births of those vaccinated
1966	523	?	?
1965	515	?	?
1964	511	?	?
1963	505	?	?
1962	479	283	59%
1961	436	263	60%
1960	434	?	?
1959	356	226	64%

SECOND YEAR VACCINATION RATE. With practice changing to vaccination in the second year of life the County no longer record vaccinations at ages under 1 year, consequently the expedient rate is now the vaccinations done as a percentage of infants surviving to the age of one year.

Year	Infants aged 1 year approx.	Vaccinations done at age 12 - 23 months	% of those eligible vaccinated
1966	504	291	58%
1965	482	311	65%
1964	491	285	58%
1963	463	105	23%
1962	427	37	9%
1961	422	24	6%

SCHOOL CHILD IMMUNITY DECEMBER 1965. When records of vaccination and revaccination of all young age groups were available it was feasible to make an estimate of school child immunity. Records are now incomplete and this is no longer feasible. However vaccination and revaccination of children of school age is now minimal and the immunity is mainly that from the vaccinations and revaccinations done in 1962 when smallpox was in the country. Our 1963 report estimated 489 or 16% of those born 1949-58 to have this legacy in December 1963. 302 and 245 = 547 left this age group by December 1965, i.e. 16% 547 = 88 left who were immune, therefore 489 - 88 = 401/3235 = 12% of school children had some immunity in December 1965. A further 294 left this age group by December 1966, i.e. 16% 294 = 47 left who were immune, therefore 401-47 = 354 with immunity remained. The 5-14 population December 1966 was 3368. Thus roughly 354/3368 = 11% of school children had some immunity in December 1966.

Bacterial Diseases

Northfleet U.D.

NEW DWELLINGS

The following dwellings (a) WHOOPING COUGH (continued) last six years:-

PRIMARY VACCINATIONS

Year Born	Age Dec. 31 1966	Vaccinated in year ending December 31st										Est. Pop.	% vaccinated at age 0-4 years				
		1958	1959	1960	1961	1962	1963	1964	1965	1966	1958-66						
1966	0	Not born / Aged 5+								224	224	483	46%				
1965	1									228	213	441	504	88%			
1964	2									193	242	12	447	482	93%		
1963	3									184	226	7	3	420	491	85%	
1962	4									164	213	18	2	4	401	463	87%
1961	5									171	147	11	5	4	338	427	79%
1960	6									154	179	14	5	3	355	422	84%
1959	7									130	142	19	3	1	295	349	84%
1958	8									113	106	16	14	4	253	339	75%
1958-66	0-8									113	236	312	383	332	414	445	483
% 0-8 age group vaccinated		3%	6%	8%	10%	8%	10%	11%	12%	12%	80%	100%					

REINFORCING VACCINATIONS. As since 1960 combined vaccine has been used for whooping cough, diphtheria and tetanus and reinforcing vaccinations at 18-21 months are done with the combined vaccine the number of reinforcing vaccinations at this age for whooping cough is similar to that for diphtheria.

(e) TETANUS

1965 was the first year for which we had figures for tetanus vaccination.

	Age 31st December	Primary vaccinations	Reinforcing vaccinations
1966	0 - 4	458	326
	5 - 7	4	270
	8 - 16	-	4
1965	0 - 4	489	331
	5 - 7	2	253
	8 - 16	-	-

In view of the introduction of the combined vaccine in 1960 the numbers of primary vaccinations against tetanus in years 1960-64 can be assumed to be almost identical with those of diphtheria vaccination.

(f) TUBERCULOSIS

Children in close contact with patients suffering from tuberculosis are, if necessary, vaccinated with B.C.G. The vaccinations carried out at the Chest Clinic are given in Table XII. Vaccination of school children is carried out by the School Health Services. These children are skin tested and those who do not react are vaccinated. Those who do react are referred to the Chest Physician for further investigation. Figures are not available for this district.

APPENDIX I.

HOUSING

Northfleet U.D.

NEW DWELLINGS

The following dwellings have been completed in the last six years:-

	1961	1962	1963	1964	1965	1966	1961/66
By Council enterprise	53	41	86	78	42	55	355
By Private enterprise	<u>97</u>	<u>254</u>	<u>107</u>	<u>82</u>	<u>126</u>	<u>242</u>	<u>908</u>

APPLICANTS FOR COUNCIL HOUSES

At the end of March in the years 1963 to 1966 the waiting list for housing applicants has been as follows:-

	Young and Middle-aged Applicants	Aged Applicants
1963	810	203
1964	688	201
1965	615	223
1966	700	203

FAMILIES REHOUSED BY THE COUNCIL

During the years ending in March the numbers rehoused have been:-

1963	82	1964	81	1965	116	1966	90
------	----	------	----	------	-----	------	----

COUNCIL TENANTS TRANSFERRED

The following families were transferred to accommodation more suitable to their requirements:-

1963	46	1964	47	1965	68	1966	47
------	----	------	----	------	----	------	----

HOUSING PRIORITY ON MEDICAL GROUNDS

In 1964, 1965 and 1966 there was no precise scheme for the purpose of allocating priority in rehousing on medical grounds.

IMPROVEMENT GRANTS

	Number of dwellings improved:		Cost to the public purse:	
	With discretionary grants	With standard grants	Discretionary grants	Standard grants
1964	23	12	£7,858	£1,232
1965	11	30	£1,030	£8,627
1966	25	14	£8,504	£1,806

UNFIT HOUSES MADE FIT

	By Owner			By Council		
	1964	1965	1966	1964	1965	1966
After informal action by local authority	96	101	162	-	-	-
After formal notice under						
(a) Public Health Acts	29	38	74	-	-	-
(b) Sections 9 and 16 Housing Act, 1957	-	-	-	-	-	-
Under Section 24, Housing Act, 1957	-	-	-	-	-	-

RENT ACT, 1957

	1964	1965	1966
Applications received for Certificates of Disrepair	1	1	-
Notices issued to landlords (Form J)	1	1	-
Undertakings received from landlords (Form K)	-	1	-
Certificates of Disrepair issued (Form L)	1	-	-

OVERCROWDING

In 1964, 1965 and 1966 there were no proceedings to abate statutory overcrowding.

APPENDIX I. (continued)

HOUSING (continued)

Northfleet U.D.

REPAIRS: The following are the details of repairs initiated by the Council's Public Health Inspector's:-

	1964	1965	1966
Ceilings repaired or renewed	17	17	33
Walls, brickwork damp-proofed	33	153	210
Walls, internal plaster repaired	16	31	41
Doors and frames repaired or renewed	10	10	19
Firegrates repaired or renewed	1	5	4
Fireplaces, brickwork and plasterwork repaired	-	-	2
Floors repaired or relaid	7	21	18
Windows, woodwork of frames, sashes or sills repaired or renewed	42	49	112
Sash lines provided	2	19	14
Chimney flues repaired	1	1	-
Sinks repaired or renewed	3	2	6
Water supply, pipes etc., repaired	1	4	4
Electric lighting provided	-	-	2
Water closets:			
External structure repaired	5	9	38
Internal structure repaired	3	18	20
Flushing cistern repaired or renewed	3	9	7
Pedestal pan and traps repaired or renewed	2	3	8
Roofs repaired	26	35	75
Rain-water pipes repaired or renewed	3	2	19
Eaves gutters repaired or renewed	9	15	30
Chimney stacks repaired or rebuilt	-	2	16
Valley gutters repaired or renewed	5	3	-
Walls, external, repaired	5	19	36
Yard surfaces repaired or relaid	-	8	4
Dustbins provided	3	2	15
Fences repaired or renewed	1	1	3
Miscellaneous	-	23	6

HOUSES DEMOLISHED OR CLOSED - HOUSING ACT, 1957

	1964	1965	1966
Unfit houses demolished:			
In Clearance Areas (Part III)	9	10	-
Not in Clearance Areas (Part II)	2	-	2
Unfit houses closed (Part II)	2	-	1
Houses acquired under Part V	88	82	22
demolished for redevelopment or vacated	74	63	12

ADDRESSES OF HOUSES DEMOLISHED OR CLOSED

Year	Clearance Areas	Section 17, etc.	Part V
1964	Carters Road, 8, 9, 10, 11 and 12 Lawn Road 3, 4, 5 and 6	Dover Road 29 (Closed*) Newmans Road, 1 Samaritan Grove, 14 Upper Ave., Noakes Cottage	
1965	Dorset Place, Lawn Road, 21, 22, 23, 24, 25, 26, 27, 28, 29 and 30	Nil.	
1966	Nil.	Alfred Place, 21 Dover Road, 29 (*Demolished) Wycliffe Road, 24	

APPENDIX I. (continued)

CARAVANS. The following are the details of licences issued during 1964, 1965 and 1966 under the Caravan Sites and Control of Development Act, 1960:

	1964	1965	1966
Site licences in force at end of year	2	2	2
Number of caravans permitted	12	12	12

In addition to the above, 4 showman caravans not requiring licences have been stationed in the district in these 3 years for the winter periods.

APPENDIX II - WATER

QUANTITY. The supply has always been sufficient for domestic and drinking purposes.

QUALITY. In the following analyses the results of sampling are summarised by use of the following indicators:

Bacteriological: Number of E. coli (type 1) per 100 ml.

Chemical: Albuminoid ammonia expressed as nitrogen in parts per million.

Bacteriological Analyses

Samples by Medway Water Board

	1964		1965		1966

	1965	4	None	4, 2,100, 0, 0.
	1966	None	-	-

FLUORIDE CONTENT

Standards vary with local conditions. Too small to measure. A general guide the standard asked for at our position along the river Thames is less than 31 p.p.m. suspended matter and less than 21 p.p.m. S.O.D.

In addition to the 208 dwellings connected to the sewer in 1962 and 1963, 102 dwellings were connected to the sewer in 1964, 1965 and 1966. These latter dwellings were in Barnfield Close, Fawkham Avenue, Festival Avenue, The Laurels, Longfield Avenue, Nurstead Avenue, Walnut Hill Road and Woodland Close. The 625 houses built in 1964, 1965 and 1966 were connected to the sewer. The position at the end of 1966 was approximately as follows:-

	Dec. 1966
Dwellings with water-closets discharging into the sewer	8,019
" " " " " into septic tanks	3
" " " " " into cesspools	41
" " chemical closets	1
Dwellings and shops with private dwelling accommodation: 31.3.67	<u>8,064</u>
(Abstract of Accounts)	

The following are the details of the work initiated by the Council's Public Health Inspectors during 1964, 1965 and 1966:-

	1964	1965	1966
Drains repaired or reconstructed	9	7	6
Drains cleared	6	8	10
Gully traps repaired or renewed	4	-	5
Drainage works inspected	88	41	49
Tests applied to drains (excluding Council houses)	84	5	5

SEWAGE DISPOSAL WORKS. Results of samples taken from the effluent were:-

Samples taken by Northfleet Urban District Council

Year	No. of Samples	Suspended solids	Parts per million following information		
			Albuminoid nitrogen	Oxygen absorbed in 4 hrs @ 27°C	Oxygen absorbed in 5 days @ 20°C B.O.D.
1964	Nil	-	-	-	-
1965 2nd qr.	1	64	?	?	More than 75
	1	33	5.3	28.0	65
1966 1st qr.	1	38	?	20.9	53
	1	90	?	34.0	160

Samples taken by Port of London Authority
Average readings

Year	Quarter	No. of Samples	Suspended solids	Albuminoid nitrogen	Oxygen absorbed in 4 hrs @ 27°C	Oxygen absorbed in 5 days @ 20°C B.O.D.
1964	1st qr.	2	117	6.9	38.0	145
	2nd qr.	3	169	7.3	44.4	166
	3rd qr.	2	49	6.3	21.9	60
	4th qr.	2	45	3.9	22.4	53

	2nd qr.	1	67	3.8	20.0	38
	3rd qr.	3	102	4.0	20.4	53
	4th qr.	6	48	6.1	26.5	86
1966	1st qr.	6	60	6.2	27.9	86
	2nd qr.	8	44	5.3	26.4	76
	3rd qr.	10	27	4.2	20.7	49
	4th qr.	7	37	3.9	20.9	71

Standards vary with local circumstances but as a general guide the standard asked for at our position along the river Thames is less than 31 p.p.m. suspended matter and less than 21 p.p.m. B.O.D.

Pasteurized	3	Ultra heat treated	1	
Sterilized	17	Pasteurized and sterilized	15	Total: 37
Untreated	-	Pasteurized, sterilized and u.h.t.	1	

FOOD PREPARATION. Food premises inspected by the Council's Public Health Inspectors were:

	1964	Premises 1965	1966
Bakehouses	3	3	3
Butchers	14	14	14
Cafes, restaurants, canteens etc.	30	30	29
Confectioners	24	23	23
Fish fryers and fishmongers	5	5	5
Greengrocers	14	14	14
Grocers	64	63	62
Ice-cream premises	60	60	59
Licensed premises (non-catering)	27	27	25
The number of inspections were	317	256	309

The figure for ice-cream premises is the number of premises registered most of which were also the premises of grocers or confectioners.

REGISTERED PREMISES. Section 16 of the Food & Drugs Act, 1955 requires certain premises to be registered. Those registered in 1964, 1965 and 1966 were:

	1964	1965	1966
Sausage making and cooked meats	13	13	13
Curing and preservation of fish	5	5	5
Ice-cream storage and sale	60	60	59

Visits to these premises are included in the figures tabulated above.

NOTICES. As a result of the foregoing inspections the following informal written notices were served or complied with:

Informal written notices served:		Informal written notices complied with:	
1964	14	1964	22
1965	4	1965	3
1966	4	1966	4

The following summarises the defects remedied:

	1964	1965	1966
Premises and equipment cleansed, repaired or improved	16	2	3
Provision of first aid or facilities for cleanliness	5	-	1
Protection of food from risk of contamination	2	2	2
Repair or cleaning of sanitary accommodation	5	-	1
Miscellaneous	2	-	-

Certain notices were verbal and not written.

MILK. Regulations require this Council to register (a) dairies not being dairy farms and (b) distributors, i.e. dairymen other than dairy farmers.

The following are the figures for registrations:

	1964	1965	1966
Distributors registered	40	37	37
Dairies registered	-	-	-

Milk sold must be designated and distributors must be licensed by the Food & Drugs Authority to use the designations. Licenses issued by Dec. 1966 were:-

Pasteurised	3	Ultra heat treated	1	
Sterilised	17	Pasteurised and sterilised	15	Total: 37
Untreated	-	Pasteurised, sterilised and u.h.t.	1	

APPENDIX IV - FOOD HYGIENE (continued)

Northfleet U.D.

FOOD REGARDED AS UNFIT FOR CONSUMPTION.

Seizure of suspected food by the Council's Officers: Nil.

Surrender of suspected food by traders:

	Meat and Fish		Other Foods	
1964	Canned meat	38 lbs.	Canned veg. and fruit	42 lbs.
	Canned fish	14 ozs.	Canned milk	3 lbs.
			Canned soup	1 lb.
1965	Liver	26 lbs.	Fruit	11 lbs.
	Canned meat	36 lbs.	Canned vegetables	9 lbs.
			Canned milk	1 lb.
			Lemonade	11 ozs.
1966	Frozen meat	7 lbs.	Canned veg. and fruit	28 lbs.
	Fresh meat	330 lbs.	Canned milk	3 lbs.
	Canned meat	14 lbs.	Dried fruit	3 lbs.
	Canned fish	6 ozs.	Canned soup	5 lbs.
	Frozen fish	6 lbs.		

Submission of suspected food by complaining customers:

		1964	1965	1966
Tainted, "off" or old:	Confirmed	-	2	-
	Not confirmed	2	1	-
Moulds:	Confirmed	-	1	2
	Not confirmed	-	-	-
Dirt:	Confirmed	-	-	1
	Not confirmed	3	1	3
Mineral oil:	Confirmed	-	2	1
	Not confirmed	-	-	-
Insects or their larvae:	Confirmed	-	-	1
	Not confirmed	-	-	-
Total:	Confirmed	-	5	5
	Not confirmed	5	2	3

Unfit food found by sampling: Nil

Meat rejected by slaughterhouses: Nil

There is no slaughterhouse in this district. One slaughterman was licensed in 1964-66 but he does this work only occasionally and outside this district.

LEGAL PROCEEDINGS. Mainly by Food and Drugs Authority.

	Food	Offending substance.	Action taken.
1964	Nil	-	-
1965	Bread	Fabric and mineral oil	Fined £20 plus 5 guineas costs.
	Bread	Iron and mineral oil	Manufacturers warned.
1966	Milk	Sediment	Suppliers warned.
	Pork pie	Mould growth	Proceedings discontinued.
	Bread	Fabric and mineral oil	Fined £10 plus 5 guineas costs.
	Bread	Mould growth	Manufacturers warned.

APPENDIX IV - FOOD HYGIENE (continued)

LABORATORY EXAMINATIONS.

Ice cream. Samples obtained and examined for cleanliness by the methylene blue test were:

Methylene blue decolourised in:	Provisional Grade	1964	1965	1966
Over 4 hrs. @ 37°C.	I	16	23	28
2½ - 4 hrs. " "	II	15	9	3
0 - 2 hrs. " "	III	2	2	2
Pre-incubation period (17 hrs. @ 20°C.)	IV	-	-	2
		<u>33</u>	<u>34</u>	<u>35</u>

Suggested standard. About 50% of samples to fall into Grade I, 80% into Grades I or II, not more than 20% into Grade III, and none into Grade IV.

Milk. All milk sold must be designated milk and must satisfy prescribed tests. Sampling for these tests is done by the Food and Drugs Authority. The results of sampling were:

	Satisfactory			Unsatisfactory		
	1964	1965	1966	1964	1965	1966
Pasteurised	8	28	13	0 (3 void)	0	0
Sterilised	0	1	1	-	0	0
Untreated	0	0	0	-	-	-

APPENDIX V - FOOD CONTENT

SAMPLING. Samples taken by the Food and Drugs Authority in Northfleet U.D. were:

	1964	1965	1966
Milks	35	35	11
Drugs	6	6	6
Spirits etc.	5	8	5
Other food	<u>35</u>	<u>32</u>	<u>45</u>
	<u>81</u>	<u>81</u>	<u>67</u>

Of the above samples all were satisfactory except:

LEGAL PROCEEDINGS etc.

	Offending substance	Action taken
From sampling:		
1965	Ginger beer contained sediment	Manufacturers informed.
1966	Stewed steak with 62% meat	Production discontinued.
Items submitted by customers:		
1964	Wire nail in loaf	Caution to bakers.
	Bolt in tin of corned beef	No action. Foreign origin.
	Brown bread in white bread	No action.
	Cornflakes with charred cereal	No action.
	Hair in mincemeat	No action.
1966	String in pie	Fined £10 costs £5.5.0d. (Case heard 1967)

Note. In regard to appendices IV and V, affairs relating to the fitness of food are included in Food Hygiene and affairs relating to quality are included in Food Content. The distinction is desirable as, briefly, unfit food may cause loss of health whereas poor quality food causes loss of money. E.g. unfit food = lead in cider; poor quality food = water in milk.

APPENDIX VI (continued)

POLLUTION WITH DUST

INDUSTRIAL. Complaints regarding dust nuisance were as follows:-

	1964	1965	1966
Paper manufacture	2	2	1
Electricity (pulverised fuel ash)	11	9	8
Building operations	-	1	-
Cement works	Continued to attract comment as a nuisance.		

MEASUREMENTS. There are 25 gauges measuring dust for the local authorities of the Thames-side areas. Only 7 of these gauges are in the area covered by Dartford M.B., Dartford R.D., Northfleet and Swanscombe U.D's. Their readings 1963-66 are on pages i to vii that follow.

One main cause for the difference between the reading of a gauge for one month from that of another month is the change of weather. We have no refined mathematical resources to adjust for changes in weather although we do have certain meteorological data which can assist in interpretation. It also assists if we can see the proportional changes of each gauge alongside the proportional changes of the other gauges in the area. If all the gauge readings, for instance, change in the same proportion in one direction in a given month the one common factor may be the weather, some data of which we possess. It could also be a change in emission.

We can compare the proportional change of each and every gauge by using the logarithmic vertical scale as explained diagrammatically on page viii.

A means of compensating for the influence of weather on the deposits of dust from cement works is to assume that dust from other sources is emitted in constant amounts and observe the percentage of dust from cement works in total dust collected by the gauges.

POLLUTION WITH PRODUCTS OF COMBUSTION

DOMESTIC. By the end of 1966 the number of dwellings in the Smoke Control areas 1 and 2 created in 1961 and 1962 were 1,400 and 407 respectively.

INDUSTRIAL. Complaints regarding smoke nuisances were as follows:-

	1964	1965	1966
Paper manufacture	1	-	2
Shipping and wharves	1	2	1
Building firm's chimney	1	4	1
Cement works boiler house chimney	1	-	-
Locomotive	-	1	-
Burning corn stubble	-	1	-
Ice cream (fumes from van)	-	-	1
Bonfires (garden)	6	3	3

MEASUREMENTS. Readings of the volumetric gauges follow on pages 72, 73 and 74.

SMELLS

Complaints of oil smells from oil storage facilities of the cement industry were 1964, 2; 1965, 1; 1966, 1.

One complaint was received in 1965 of oil smells from an ice cream van.

POLLUTION WITH DUST

INDUSTRIAL - Complaints regarding dust nuisance were as follows:-

1964	1965	1966	
1	2	2	Paper manufacture
8	7	11	Electricity (hydroelectric fuel ash)
-	1	-	Building operations
-	-	-	Cement works

Continued to attract comment as a nuisance.

MEASUREMENTS - There are 25 gauges measuring dust for the local protection of the Triana-also areas. Only 7 of these gauges are in the area covered by District No. 2, District R.D., Northwest and Vancouver U.D. Their readings 1965-66 are on pages 1 to 117 that follow.

The main cause for the difference between the reading of a gauge for one month from that of another month is the change of weather. We have no refined meteorological resources to adjust for changes in weather although we do have certain meteorological data which can assist in interpretation. It also assists if we can see the proportional changes of each gauge during the proportional changes of the other gauges in the area. If all the gauge readings, for instance, change in the same proportion in one direction in a given month the one common factor may be the weather some date of which we possess. It could also be a change in emission.

We can compare the proportional change of each and every gauge by using the logarithmic vertical scale as explained diagrammatically on page 117.

A means of compensating for the influence of weather on the deposits of dust from cement works is to assume that dust from other sources is emitted in constant amounts and observe the percentage of dust from cement works in total dust collected by the gauges.

POLLUTION WITH PRODUCTS OF COMBUSTION

INDUSTRIAL - By the end of 1966 the number of facilities in the Smoke Control areas 1 and 2 created in 1961 and 1962 were 1,400 and 107 respectively.

INDUSTRIAL - Complaints regarding smoke nuisance were as follows:-

1964	1965	1966	
1	-	1	Paper manufacture
1	2	1	Shipping and wharves
1	1	1	Building firm's chimney
-	-	1	Cement works boiler house chimney
-	1	-	Locomotive
-	1	-	Burning down stables
1	-	-	Ice cream (trucks from van)
1	1	6	Boilers (garbage)

MEASUREMENTS - Readings of the volumetric gauges follow on pages 121, 122 and 123.

SMELLS

Complaints of oil smells from oil storage facilities of the cement industry were 1964, 2; 1965, 1; 1966, 1.

The complaint was received in 1965 of oil smells from an ice cream van.

PORT FROM CEMENT WORKS - PERCENTAGE OF TOTAL SOLIDS

Use of logarithmic scale to compare or fall in readings of differing substantially in the compactness of the ability to depict trend compared It does not represent any

diagrammatically the percentage rise different gauges collecting deposits amount. This diagram is to illustrate logarithmic scale (below) and its with the arithmetical scale (above). actual readings.

POLLUTION WITH PRODUCTS OF COMBUSTION

The Volumetric Gauges

The nature of the sites of the gauges needs consideration if one is to study the records of the whole area. Up to the end of 1967 none of the gauges was in a smoke control area.

The Northfleet gauge is on the 2nd floor of Northfleet Council offices. In the immediate vicinity is residential housing of medium density. Open country begins within $\frac{1}{4}$ mile to the South. Within $\frac{1}{2}$ mile to the North and North-East is an industrial area with a cement works, paper factory and electricity generating station dominating the environment. To the North beyond is the open space of the River Thames.

The Swanscombe gauge is in the precincts of the Swanscombe Council offices in a small park amongst medium density housing with open space within $\frac{1}{4}$ mile to the South and to the North. Cement works lie $\frac{2}{3}$ mile to the North and a mile beyond is the River Thames and its open space.

The Horns Cross (Stone) gauge is in the A.P.C.M. research laboratory which again is in park land beyond which is medium density housing in the West and North-West. $\frac{2}{3}$ mile to the North are two cement works.

The Dartford gauge is in the public health office in the commercial centre of the town set back 10 yards from a traffic laden street and with a park in the vicinity to the South and industry to the North.

The Swanley gauge is in the public health office which is one of numerous separate well-spaced buildings in their own grounds on central heating by oil or electricity. Medium density housing lies to the North-East round to the South-West. Elsewhere there is open space.

Three gauges - Northfleet, Swanscombe and Horns Cross (Stone) have cement works in the vicinity. These might be kept in mind as the dust from these works will modify the darkness of the smoke stain and it is possible that it might diminish the acidity from which the SO_2 readings are assessed.

DEGREE DAYS

A "degree day" is a concise way of expressing a difference of 1° F between outside temperatures (when lower) and 60° F maintained for 24 hours. Figures kindly provided by the Gas Council.

	Average 1947-67	1962-63	1963-64	1964-65	1965-66	1966-67

APPENDIX VII. - AIR HYGIENE (continued)

POLLUTION WITH PRODUCTS OF COMBUSTION (continued)

Number of days when readings have exceeded 500 but not 1,000 microgrammes per cubic metre. Such readings only occurred in winter. Highest daily readings given alongside.

	Winter	Smoke	Sulphur-dioxide
NORTHFLEET	1963/4	3 534(Feb)	4 542(Feb)
	1964/5	0	0
	1965/6	0	1 562(Dec)
	1966/7	0	1 556(Jan)
SWANSCOMBE	1963/6	no readings	no readings
	1966/7	0	0
HORNS CROSS (STONE)	1963/4	2 873(Nov)	0
	1964/7	0	0
DARTFORD	1963/4	5 837(Feb)	11 785(Jan)
	1964/5	0	7 734(Dec. see below)
	1965/6	0	1 533(Nov)
	1966/7	0	4 542(Jan)
SWANLEY	1963/4	3 619(Dec)	4 786(Jan)
	1964/5	0	3 730(Dec)
	1965/7	0	0

Only one reading exceeded 1000 microgrammes per cubic metre, namely 1106 for SO₂ at Dartford in November 1964.

CLASS CODE (NATIONAL SURVEY SITE CLASSIFICATION)

In the national survey of which these readings form part each gauge site is given a code number as a concise way of classifying the surroundings of each site. The code numbers of the sites here are as follows:

Site	Class Code
NORTHFLEET	X
SWANSCOMBE	B2
HORNS CROSS (STONE)	X
DARTFORD	D2
SWANLEY	B3

The meanings of the code are as follows:

- B2 Residential area with medium-density housing, typically an inner suburb or housing estate, surrounded by other built-up areas but interspersed with some industrial undertakings.
- B3 Residential area with medium-density housing surrounded by or interspersed with areas with low potential A.P. output (parks, fields, coast), or any residential area with low-density housing.
- D2 Small town centre; limited commercial area mixed with old residential housing and possibly minor industry.
- X Unclassified site, or mixed area.

SMOKE CALCULATIONS

These are by use of the British Standard Smoke Calibration Curve.

DEPARTMENT OF THE INTERIOR

MINERAL RESOURCES ACT, 1923

1. This Act may be cited as the Mineral Resources Act, 1923.

2. In this Act, unless the context otherwise requires, the following definitions shall apply:—

(a) "Mineral" means any substance in its natural state, whether solid, liquid or gaseous, which is capable of being mined or extracted from the earth, and which is not a precious metal or a gemstone.

(b) "Mineral rights" means the rights in and to minerals, whether or not they are actually mined or extracted from the earth.

(c) "Mineral lease" means a lease granted by the Crown in fee simple, or for any term of years, or for any other estate or interest, in and to minerals, whether or not they are actually mined or extracted from the earth.

(d) "Mineral leasehold" means a leasehold estate in and to minerals, whether or not they are actually mined or extracted from the earth.

(e) "Mineral leaseholder" means a person who is entitled to the benefit of a mineral lease, whether or not he is actually mining or extracting minerals from the earth.

(f) "Mineral leaseholder's interest" means the interest of a mineral leaseholder in and to minerals, whether or not they are actually mined or extracted from the earth.

(g) "Mineral leasehold interest" means an interest in and to minerals, whether or not they are actually mined or extracted from the earth, which is held by a mineral leaseholder.

(h) "Mineral leasehold interest holder" means a person who is entitled to the benefit of a mineral leasehold interest, whether or not he is actually mining or extracting minerals from the earth.

(i) "Mineral leasehold interest holder's interest" means the interest of a mineral leasehold interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

(j) "Mineral leasehold interest holder's interest holder" means a person who is entitled to the benefit of a mineral leasehold interest holder's interest, whether or not he is actually mining or extracting minerals from the earth.

(k) "Mineral leasehold interest holder's interest holder's interest" means the interest of a mineral leasehold interest holder's interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

(l) "Mineral leasehold interest holder's interest holder's interest holder" means a person who is entitled to the benefit of a mineral leasehold interest holder's interest holder's interest, whether or not he is actually mining or extracting minerals from the earth.

(m) "Mineral leasehold interest holder's interest holder's interest holder's interest" means the interest of a mineral leasehold interest holder's interest holder's interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

(n) "Mineral leasehold interest holder's interest holder's interest holder's interest holder" means a person who is entitled to the benefit of a mineral leasehold interest holder's interest holder's interest holder's interest, whether or not he is actually mining or extracting minerals from the earth.

(o) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest" means the interest of a mineral leasehold interest holder's interest holder's interest holder's interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

(p) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder" means a person who is entitled to the benefit of a mineral leasehold interest holder's interest holder's interest holder's interest holder's interest, whether or not he is actually mining or extracting minerals from the earth.

(q) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest" means the interest of a mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

(r) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder" means a person who is entitled to the benefit of a mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest, whether or not he is actually mining or extracting minerals from the earth.

(s) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest" means the interest of a mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

(t) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder" means a person who is entitled to the benefit of a mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest, whether or not he is actually mining or extracting minerals from the earth.

(u) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest" means the interest of a mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

(v) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest" means the interest of a mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

(w) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest" means the interest of a mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

(x) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest" means the interest of a mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

(y) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest" means the interest of a mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

(z) "Mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest" means the interest of a mineral leasehold interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder's interest holder in and to minerals, whether or not they are actually mined or extracted from the earth.

POLLUTION WITH PRODUCTS OF COMBUSTION

INTERPRETATION OF SMOKE/SO₂ RATIOS. In 1965 in England and Wales 0.90 million tons of smoke were emitted from domestic coal-fire chimneys with 0.70 million tons of SO₂. From the chimneys of efficient fuel combustion i.e. industry, electricity generating stations etc. 0.25 million tons of smoke were emitted with 5.62 million tons of SO₂. (Investigation of Atmospheric Pollution 1956-66 tables 1 and 2). The smoke/SO₂ ratios of these emissions were thus 90/70 = 1.29 and 0.25/5.62 = 0.05. Ratios resulting from different proportions by volume might be expressed thus:

Domestic coal burning ratio = 1.29	Sources of efficient combustion industry, electricity generating etc. ratio = 0.05	Smoke/SO ₂ Ratio of mixture
100%	0%	$\frac{\text{Smoke}}{\text{SO}_2} = \frac{1.29 \times 100 + 0.05 \times 0}{1 \times 100 + 1 \times 0} = 1.29$
90%	10%	$\frac{\text{Smoke}}{\text{SO}_2} = \frac{1.29 \times 90 + 0.05 \times 10}{1 \times 90 + 1 \times 10} = 1.16$
80%	20%	$\frac{\text{Smoke}}{\text{SO}_2} = \frac{1.29 \times 80 + 0.05 \times 20}{1 \times 80 + 1 \times 20} = 1.04$
70%	30%	$\frac{\text{Smoke}}{\text{SO}_2} = \frac{1.29 \times 70 + 0.05 \times 30}{1 \times 70 + 1 \times 30} = 0.92$
60%	40%	$\frac{\text{Smoke}}{\text{SO}_2} = \frac{1.29 \times 60 + 0.05 \times 40}{1 \times 60 + 1 \times 40} = 0.79$
50%	50%	$\frac{\text{Smoke}}{\text{SO}_2} = \frac{1.29 \times 50 + 0.05 \times 50}{1 \times 50 + 1 \times 50} = 0.67$
40%	60%	$\frac{\text{Smoke}}{\text{SO}_2} = \frac{1.29 \times 40 + 0.05 \times 60}{1 \times 40 + 1 \times 60} = 0.55$
30%	70%	$\frac{\text{Smoke}}{\text{SO}_2} = \frac{1.29 \times 30 + 0.05 \times 70}{1 \times 30 + 1 \times 70} = 0.42$
20%	80%	$\frac{\text{Smoke}}{\text{SO}_2} = \frac{1.29 \times 20 + 0.05 \times 80}{1 \times 20 + 1 \times 80} = 0.30$
10%	90%	$\frac{\text{Smoke}}{\text{SO}_2} = \frac{1.29 \times 10 + 0.05 \times 90}{1 \times 10 + 1 \times 90} = 0.17$
0%	100%	$\frac{\text{Smoke}}{\text{SO}_2} = \frac{1.29 \times 0 + 0.05 \times 100}{1 \times 0 + 1 \times 100} = 0.05$

The above is an oversimplification. There are sites in U.K. giving ratios much greater than 1.29 but I imagine that these have exceptional sources of pollution or perhaps features which remove SO₂.

Summary of Results

The following table shows the results of the investigation into the effect of temperature on the rate of reaction between hydrogen peroxide and potassium iodide. The rate was measured by the volume of oxygen gas evolved in a given time.

Temperature (°C)	Volume of O ₂ (ml)	Time (min)	Rate (ml/min)
10	10	10	1.0
15	15	10	1.5
20	20	10	2.0
25	30	10	3.0
30	45	10	4.5
35	70	10	7.0
40	100	10	10.0
45	150	10	15.0
50	220	10	22.0
55	300	10	30.0
60	400	10	40.0
65	550	10	55.0
70	750	10	75.0
75	1000	10	100.0

The graph shows that the rate of reaction increases rapidly with temperature. This is due to the fact that as temperature increases, the kinetic energy of the molecules also increases, leading to a higher frequency of effective collisions between the reactants.

FACTORIES ACT. The Council enforces the provision of sanitary conveniences in all factories. In factories without mechanical power the Council also enforces the provision of adequate cleanliness, temperature, ventilation and drainage and freedom from overcrowding. The Council keeps a register of outworkers.

	1964	1965	1966
Factories without mechanical power on register	1	1	1
" with " " " " "	54	51	50
Other premises in which provision of sanitary accommodation is enforced by L.A. e.g. Building sites	20	16	15

OFFICES, SHOPS AND RAILWAY PREMISES ACT.

In May 1964 Sections 29 (2) 46 and 49 of the Offices, Shops and Railway Premises Act came into force. These sections deal with certain fire precautions, certain exemptions, and the notification of employment of persons. In August 1964 all other sections of the Act came into force with the exceptions of Sections 24-26 relating to first aid, Section 29, requiring an annual report to Parliament by the Minister, and Section 83 (2) which applies provisions to the Crown. In January 1965 all provisions of the Act came into operation.

Visits under the Offices, Shops and Railway Premises Act are for enforcement in regard to cleanliness, overcrowding, temperature, ventilation, lighting, sanitary conveniences, washing facilities, supply of drinking water, accommodation for clothing, sitting facilities, seats for sedentary work, eating facilities, floors, passages and stairs, fencing of exposed parts of machinery and first aid.

	1964	1965	1966
Number of premises registered at end of year	97	100	101
Number of premises receiving general inspection	97	68	101
Number of visits by Public Health Inspectors	192	174	199
Number of defects found	6	8	1

Premises inspected were:

Offices	17	10	18
Retail shops	67	45	70
Wholesale shops and warehouses	2	2	2
Catering establishments open to public, and canteens	9	9	9
Fuel storage depots	2	2	2
	<u>97</u>	<u>68</u>	<u>101</u>

SHOPS ACT. In 1964 the Council became directly responsible for the provisions of the Shops Act. Previously they had these duties by delegation from the County Council.

There are some 224 shops and 30 public houses in Northfleet. The total number of inspections for the purpose of ensuring compliance with the Shops Act, 1950 by the Council's Public Health Inspectors were:

	1964	48	1965	81	1966	64
Industrial premises					6	5
Barking dogs						1
Ice cream vendor's shires					7	
Domestic: radios, parties, etc.					1	7
Bird scarer					1	

Northwest U.D.

FACTORIES ACT. The Council enforces the provision of sanitary conveniences in all factories. In factories without mechanical power the Council also enforces the provision of adequate cleanliness, temperature, ventilation and drainage and freest from overcrowding. The Council keeps a register of outbreaks.

SHOPS ACT. In 1964 the Council became directly responsible for the provisions of the Shops Act. Previously they had these duties by delegation from the County Council.

There are some 224 shops and 30 public houses in Northwest. The total number of inspections for the purpose of ensuring compliance with the Shops Act, 1950 by the Council's Public Health Inspectors were:

1964	1965	1966
48	81	64

APPENDIX 1X - DISINFECTION, DISINFESTATION & RODENT CONTROL

Northfleet U.D.

DISINFECTION

Northfleet Urban District Council have an arrangement with Swanscombe Urban District Council whereby facilities for disinfection and disinfection of persons and articles are provided by us on a rechargeable basis. Transport for the articles is provided by Northfleet.

In 1964, 1965 and 1966 these facilities were used as follows:-

	Northfleet			Swanscombe		
	1964	1965	1966	1964	1965	1966
Tuberculosis	1	-	-	-	-	-
Scabies	-	-	-	-	-	-

DISINFESTATION

The following were the number of occasions when advice was given or disinfection carried out:-

	1964	1965	1966
Wasps	3	29	11
Gooseberry mites	1	-	-
Maggots and flies	-	-	5
Bees	2	3	6

APPENDIX XI - PUBLIC CLEANSING

The Council's Refuse Collection and Disposal Service was under the direction of the Council's Chief Public Health Inspector. The Joint Scheme for controlled tipping at the Vale Road quarry was continued during 1964, 1965 and 1966. It serves Gravesend Borough, Northfleet and Swanscombe Urban Districts. The following amounts of refuse were collected and disposed of:

1964 12,456 tons 1965 12,494 tons 1966 12,580 tons.

Cesspool emptying became the responsibility of the Surveyor's Department in July 1964.
