BOROUGH OF OSWESTRY.

Mayor: Councillor H.E.Pritchard.

Chairman of the Health Committee: Councillor Emily Rogers.

Members of the Health Committee: The Mayor; Aldermen Byrne and Stone; Councillors Bowcock; Edwards; Hundley; T. Jones; W.G.Jones; Morley; Woodhead.

Health Department,
6, Salop Road,
Oswestry.

September 1947.

To the Mayor, Aldermen and Councillors of the Borough of Oswestry.

Mr. Mayor, Ladies and Gentlemen,

I have the honour to present the Annual Report for 1946. The Minister of Health has directed that the report should be prepared on the lines of that for 1945, so much of the detail contained in reports before the war is omitted.

My thanks are due to Mr. Isaac for his enthusiastic co-operation during the year and for much work in connection with this report.

Your obedient servant,

L. WILSON EVANS

1911

6.

The estimated population shows an increase of 200, and with 195 births and 130 deaths there was a natural increase in the population of 65. On the whole the statistics as far as they can be taken as an indication of the state of health of the Borough are favourable. There were 22 more births and 12 fewer deaths than last year. There were three deaths from diarrhoea in children under 2 years. This is the same number as last year and although the figures are small they are significant in that for years we have had no deaths due to this cause, and it is in keeping with the general tendency indicated in recent years for an increase in cases of illnesses of which the cause is probably food infection. The scrupulous cleanliness in the handling and storage of food necessary to maintain a high standard of purity and wholesomeness is not sufficiently appreciated, nor are flies properly recognised for the dangerous carriers of disease that they are. The prevalence of these pests about food is evidence of uncleanliness and lack of care, whether it is in the restaurant, shop or home, modern knowledge and methods make their eradication a comparatively easy one. Times are difficult, insufficient and untrained staff, shortage of cleansing material such as soap, the effect of fuel restrictions on maintaining a good hot water supply may be contributory causes but it behoves all those in charge of the preparation and storage of food and the housewife to ensure that every possible precaution is taken to prevent contamination of the food either by the human handlers or the maulauding insect. The public should demand clean and wholesome food. The long and continued shortages and the difficulty in obtaining the food they

The enlarged population above an increase of 200, and with 1921 births and 170 deaths there was a natural increase in the population of 30. On the whole the statistics as far as they can be taken as an indication of the state of health of the Borough are favourable.

There were 22 more diphtheria and 12 fewer deaths than last year. There were three deaths from diphtheria in children under 5 years. This is the same number as last year and although the figures are small they are significant in that for years we have had no deaths due to this cause, and it is in keeping with the general tendency indicated in

recent years for an increase in cases of illnesses of which the cause is probably food infection. The scrupulous cleanliness in the handling and storage of food necessary to maintain a high standard of purity and wholesomeness is not sufficiently appreciated, nor are flies properly recognized for the dangerous carriers of disease that they are. The prevalence of these germs about food is evidence of

carelessness and lack of care, whether it is in the restaurant, shop or home, modern knowledge and methods make their eradication a comparatively easy one. Times are difficult, inefficient and untrained staff, shortage of cleansing material such as soap, the effect of fuel restrictions on maintaining a good hot water supply

may be contributory causes but it behoves all those in charge of the preparation and storage of food and the household to ensure that every possible precaution is taken to prevent contamination of the food either by the human handlers or the surrounding insects. The public should demand clean and wholesome food, the food and continued shortages and the difficulty in obtaining the food they

want may have tended to make the vendors careless and casual, and the purchaser less particular than she should be. Clean conditions of storage, cleanliness of the place of preparation, cleanliness of the utensils, cleanliness of the persons handling the food, and most important of all the frequent and thorough washing of the hands must be insisted upon if risks from dangerous diseases are to be avoided. In some parts of the Country investigations in kitchens and places where foods are prepared show that appreciation of the importance of these things is lacking and increased supervision by the Health Authorities is needed to maintain a standard of safety for the public. There was a marked decrease of deaths from Respiratory Tuberculosis, 3 in 1946, 8 in 1945. The number of deaths from Cancer showed a slight decrease. For the third consecutive year there were no deaths of mothers as a result of childbirth. The only figures which compare unfavourably with last year are those for infant mortality. Last year the figures were below the average, this year they are rather above. Five of the eleven infants died within a week of birth, four of them were born in hospital. The most frequent cause of death in the early weeks of life is prematurity and to reduce the mortality in these infants great care in handling is necessary and special precautions against infection is essential. Where the proper facilities and nursing technique are available hospital is the best place for these cases, but if there is any prospect of overcrowding and insufficient air space they probably do better at home.

want may have tended to make the vendors careless and casual, and
 the purchaser less particular than she would be. Clean conditions
 of storage, cleanliness of the place of preparation, cleanliness of
 the utensils, cleanliness of the persons handling the food, and most
 important of all the frequent and thorough washing of the hands must
 be insisted upon if risks from dangerous diseases are to be avoided.
 In some parts of the County investigations in kitchens and places
 where foods are prepared show that approximately the importance of
 these things is lacking and increased supervision by the Health
 Authorities is needed to maintain a standard of safety for the public.
 There was a marked decrease of deaths from Respiratory Infections,
 7 in 1946, 8 in 1945. The number of deaths from Cancer showed a
 slight decrease. For the third consecutive year there were no deaths
 of mothers as a result of childbirth. The only figures which compare
 unfavorably with last year are those for infant mortality. Last
 year the figures were below the average, this year they are rather
 above. Five of the eleven infants died within a week of birth,
 four of them were born in hospital. The most frequent cause of
 death in the early weeks of life is prematurity and to reduce the
 mortality in these infants great care in handling is necessary
 and special precautions against infection is essential. Where
 the proper facilities and nursing techniques are available
 hospital is the best place for these cases, but if there is any
 prospect of overcrowding and insanitation at home they probably
 do better at home.

INFECTIOUS DISEASE.

There were few cases of Infectious Disease during the year, four cases of Scarlet Fever compared with 55 the previous year and other diseases showed a reduction, except Whooping Cough of which there were 25 cases distributed throughout the last seven months of the year with one death. There was again no case of Diphtheria.

There was one case of Typhoid Fever infected in Aberystwyth at the time of the outbreak of the disease there during the Summer caused by consumption of ice cream. Two other families who had

INFECTIOUS DISEASE

There were few cases of Infectious Disease during the year, four cases of Scarlet Fever compared with 25 the previous year and other diseases showed a reduction, except Whooping Cough of which there were 25 cases distributed throughout the last seven months of the year with one death. There was again no case of Diphtheria. There was one case of Typhoid Fever entered in Aberystwyth at the time of the outbreak of the disease there during the summer caused by consumption of ice cream. The other facilities was not

stayed in houses where cases had occurred and also a certain number of persons who were known to have eaten ice cream from the vendor whose ice cream was suspected as being the source of infection were kept under observation. No further cases occurred and the patient made a good recovery.

DIPHTHERIA IMMUNISATION.

The figures for immunisation against Diphtheria are about the same as last year. The percentage of children between 5 years and 15 years is very high, and though that for the children under 5 years is considerably less it is slightly higher than the average for the County. All the various means of bringing the information about the necessity for protection of young children against this serious disease, and the means by which parents could have their children immunised were used and there can be very few, if any, parents not aware of the need or the means of taking this safe and simple precaution to save their children from this easily preventable disease. Those parents who do not like their little ones taken to a crowded clinic or school can have them done by their own doctors, so every facility is offered to them.

The number of children who had had complete treatment during the year was as follows:-

Under 5 years of age.

No. of children who received immunising injections January 1st to December 31st, 1946.	116.
---	------

Percentage of child population under 5 years of age considered immunised at December 31st, 1946.	53%

Percentage of child population under 5 years of age
considered immunised at December 31st, 1946.

116.

222

5-15 years of age.

No. of children who received immunising injections January 1st to December 31st, 1946.	57.
Percentage of child population 5-15 years of age considered immunised at December 31st, 1946.	96%

DIPHTHERIA ANTI-TOXIN ORDER.

A supply of Diphtheria Anti-toxin is available for cases residing in Oswestry in accordance with the provisions of the above Order. This is obtainable from the Health Offices, 6, Salop Road, Oswestry or after office hours from Mr. H. T. Isaac, Grenston, Croeswylan Lane, Oswestry. None was used during the year.

VENEREAL DISEASES.Facilities for Treatment.

These are available at the Dispensary, Lower Brook Street, Oswestry and are administered by the Salop County Council.

The Medical Officer attends on Thursdays the hours being:-

Men 1 p.m. to 2p.m. Women 2 p.m. to 3 p.m.

SCABIES.

During the year 20 cases of Scabies were brought to the notice of the Health Department. These cases occurred in 12 families as follows:-

- 8 families with one case in each family.
- 2 families with two cases in each family.
- 1 family with three cases.
- 1 family with five cases.

Benzyl Benzoate lotion with instructions in the method of carrying out the treatment was supplied to those not having treatment. There were a few more cases of Scabies than last

5-15 years of age.

No. of children who received immunizing injections
January 1st to December 31st, 1944.

27.

Percentage of child population 5-15 years of age
considered immunized at December 31st, 1944.

see

DIPHTHERIA ANTI-TOXIN ORDER.

A supply of Diphtheria Anti-toxin is available for cases residing

in Oswego in accordance with the provisions of the above Order.

This is obtainable from the Health Officer, 6, Selig Road, Oswego

or after office hours from Mr. H. T. Isaac, Chemist, Greenway Lane,

Oswego. None was used during the year.

VENEREAL DISEASES.

Facilities for Treatment.

These are available at the Dispensary, Lower Brock Street, Oswego

and are administered by the Selig County Council.

The Medical Officer attends on Thursdays the hours being:-

Men 1 p.m. to 2 p.m. Women 2 p.m. to 3 p.m.

GONORRHOEA.

During the year 20 cases of gonorrhoea were brought to the notice of

the Health Department. These cases occurred in 12 families as

follows:-

6 families with one case in each family.

2 families with two cases in each family.

1 family with three cases.

1 family with five cases.

Bonyl Benzene lotion with instructions in the method of

carrying out the treatment was supplied to those not having

treatment. There were a few more cases of gonorrhoea than last

year but the measures taken effectively prevented the spread of the disease where it did occur.

TUBERCULOSIS.

NUMBER OF CASES NOTIFIED DURING THE YEAR.

New Cases	Respiratory.		Non-respiratory.		Total.	
	M.	F.	M.	F.	M.	F.
Civilian Cases	3	1	3	2	6	3
Service Cases	-	-	-	-	-	-

	Respiratory.		Non-respiratory.		Total.	
	M.	F.	M.	F.	M.	F.
Deaths	1	4	-	-	1	4
Admitted to Sanatorium	3	1	-	-	3	1

The number of cases on the Register at the end of 1946 was:-

Males.		Females.		Total.
Respiratory.	Non-respiratory.	Respiratory.	Non-respiratory.	
44	21	25	22	112

There was a considerably reduction in the number of new cases of Respiratory Tuberculosis, slightly less than a third of last years figures. There were markedly fewer deaths among the men.

WATER SUPPLY.

The water has been satisfactory in quality except for the presence of lead which has been found in small quantities in samples after the water had been standing in the pipes for some hours, and, with the additional supply provided by the Liverpool Corporation, in quantity.

To obviate this plumbo-solvency permission has been received

Sample T/NW/74 continued.

This sample is reasonably clear and bright in appearance, and has faint colour. It is acid in reaction, soft in character, deficient in alkalinity and a corrosive tendency towards metals would be anticipated. The water contains comparatively little saline matter in solution, is of passable organic quality and of satisfactory bacterial purity.

These results are consistent with a wholesome water suitable for drinking and domestic purposes.

Sample of water taken from tap after standing in lead service pipe for 24 hours 19.3.45. T/NW/75.

Number of Bacteria growing on Agar per cc or ml. in	1 day at	2 days at	3 days at
	37°C 1	37°C 4	20°C 2

Presumptive Coliform Reaction	Present	-	Absent 100 cc.
Bact. Coli	Present	-	Absent 100 cc.
C. Welchii Reaction	Present	-	Absent 100 cc.

This sample is clear and bright in appearance and has faint colour. The water is acid in reaction, soft in character and contains comparatively little saline matter in solution. It is of passable organic quality, satisfactory bacterial purity and in these respects is considered wholesome in character. The water is, however, unwholesome and unsuitable for drinking purposes on account of the presence of lead.

Sample of water from Reservoir taken 6.11.45. U/ET/73

Number of Bacteria growing on Agar per cc. or ml. in	1 day at	2 days at	3 days at
	37°C 4	37°C 90	20°C 450

Presumptive Coliform Reaction	Present 20cc	Absent 10 cc.
Bact. Coli Type I	Present 20cc	Absent 10 cc.
Cl. Welchii Reaction	Present 100cc	Absent 10 cc.

This sample has faint opalescence and slight deposit but is not unduly turbid. The water is acid in reaction, soft in character and deficient in alkalinity. A corrosive tendency towards metals and plumbo-solvent action would be anticipated.

It has a relatively low content of mineral constituents in solution and is free from metals apart from a minute trace of iron. The water has distinct colour and organic content due chiefly to matter of vegetable origin and it shows bacterial impurity including organisms of excremental type.

Treatment is therefore required to render the water suitable for public supply purposes.

from the Ministry of Health to proceed with the installation of a plant for the correction of the pH value of the water. This plant is still awaited. The necessary adaptation for the installation has been made.

Results of analyses.

Chemical Results in Parts per 100,000

Appearance.

Sample of unfiltered water A/W/41.
Light opalescence with very slight flocculent deposit of mineral and organic debris. Very few bacteria and many ciliates present.

Sample of filtered water A/W/42.
Bright with very few particles of mineral debris.

Sample of unfiltered water from reservoir A/W/43.
Very faint opalescence with very slight flocculent deposit of mineral and organic debris. Many diatoms and few infusoria present.

Sample of filtered water from res. A/W/44.
Clear and bright.

Sample of unfiltered water from reservoir B/W/13.
Bright with slight flocculent deposit of light yellow brown mineral and organic debris. Very few diatoms and whitefishes present.

Sample of filtered water from res B/W/14.
Clear and bright.

Cl. Welchii Reaction Present in 100c.c. Absent from 10.c.c.

This sample has faint opalescence and a trace of matter in suspension including low forms of life normal to surface water but the turbidity

is not marked. The water is practically neutral in reaction but it is soft in character and has a low content of alkalinity. It contains comparatively little mineral constituents in solution and is free from metals apart from a minute trace of iron. The water has very distinct colour and is of a low grade of organic quality. It shows slight bacterial impurity indicative of contamination by matter of excremental origin since Bact. Coli are present in appreciable number. Treatment is therefore required to render the water suitable for public supply purposes.

Bact. Coli	Present in -	Absent from 100 cc.
Cl. Welchii Reaction	Present in 100cc.	Absent from 10 cc.

*Due to Coliform Bacteria of Intermediate Type II and Aerogenes Type I.

This sample is practically clear and bright in appearance and free from metals apart from a negligible trace of iron. The water is almost neutral in reaction but it is soft in character and has a low content of alkalinity; a corrosive tendency towards metals would be anticipated. It has comparatively small amount of mineral constituents in solution. Compared with the raw supply the water shows only a small reduction in organic content and it retains distinct colour. It is not of a high standard of bacterial purity since coliform organisms are present and, although, in the absence of bacteria of excremental type, the water may not be unwholesome, it is not of the high standard required in a public supply.

The water is practically neutral in reaction but it is soft in character and has a low content of alkalinity. It contains comparatively little mineral constituents in solution and is free from metals apart from a minute trace of iron. The water has very distinct colour and is of a low grade of organic quality. It shows slight bacterial activity indicative of contamination by matter of experimental origin since Bact. Coli are present in appreciable number. Treatment is therefore required to render the water suitable for public supply purposes.

Present in 100 cc.	Absent from 10 cc.		Fact. Coli Type I
			Col. Weibull Reaction

This sample has faint opalescence and a trace of matter in suspension, indicating low degree of life normal to surface water, but the turbidity is not marked. The water is practically neutral in reaction but it is soft in character and has a low content of alkalinity; a corrective tendency towards nitrate would be anticipated. It has a comparatively low content of mineral constituents in solution and it is free from nitrate apart from a minute trace of iron. The water has very distinct colour and is of a low grade of organic purity. It shows bacteriological purity since fact. Coli are present in small numbers being indicative of slight contamination by water of environmental origin. Treatment is therefore required to render the water suitable for public supply purposes.

Present in -	Absent from 100cc.	Absent from 100cc.	Reaction
Present in 100cc.	Absent from 100cc.		Fact. Coli
			Col. Weibull Reaction

This sample is bright and clear in appearance and free from nitrate apart from a minute trace of iron. The water is on the acid side of neutrality, is soft in character and has a low content of alkalinity. It contains a corrective tendency towards nitrate would be anticipated. It contains a comparatively small amount of mineral constituents in solution. Compared with the raw sample the water retains distinct colour and shows only a small reduction in organic content. It is, however, of very satisfactory bacteriological purity. These results are consistent with a wholesome water suitable for drinking and domestic purposes.

Sample of water B/W/15, Distilled

Bact. Coli Type I	Present in 100 ml.	Absent from 50 ml.
Cl. Welchii Reaction	Present in 100 ml.	Absent from 10 ml.

* False Presumptive Reaction.

This sample is bright in appearance and contains only a trace of matter in suspension. The water is practically neutral in reaction, it is very soft in character, has a low content of alkalinity and a corrosive tendency towards metals would be anticipated. It has a comparatively low content of mineral constituents in solution and it is free from metals apart from a negligible trace of iron. It shows distinct but not excessive colour and is of satisfactory organic quality for a surface supply. The water shows slight bacterial impurity since Bact. Coli and Cl. Welchii are present in minimal number, but the degree of contamination is not marked. The water should be readily amenable to treatment for the production of a public supply.

Sample of water B/W#14. Filtered.

	1 day at 37°C	2 days at 37°C	3 days at 20°C

The houses without a piped water supply are isolated dwellings on the outskirts of the town and some considerable distance from

the mains.

I am indebted to the Water Engineer for the following notes on the water supply.

The Corporation gathering ground and impounding reservoir at Penygwely together with the storage reservoirs at Mount Road provide a sufficient supply for the normal requirements of the Town during seasons of average rainfall. This supply can, at any time, be augmented by drawing 250,000 gallons per day from the Liverpool Corporation Lake Yyrnwy Aqueduct, this latter supply being obtained under powers granted by an Act of Parliament. The treatment given consists of an average period of seven days storage followed by rapid filtration and chlorination by the Chloramine system. The water supply to all parts of the Town is constant and more than 99% of all dwelling houses have direct supplies or stand pipes within easy reach.

THE FOLLOWING IS THE VETERINARY OFFICER'S REPORT FOR THE YEAR.

During the year two inspections were made, one in May-June, the other November-December. At each clinical inspection 1,095 cows were examined, 181 of which were housed inside the Borough, the others, 914, were housed outside the Borough Boundary, but whose milk was sold retail in Oswestry.

Despite the food shortage the animals were in a good state of health, and the cleanliness of the premises especially those inside the Borough boundary was quite satisfactory. About 40 samples were taken from animals showing abnormality of the udder and those were examined microscopically but in no case was

the mine.

I am indebted to the Water Engineer for the following notes on the water supply.

The Corporation gathering ground and impounding reservoir at Ferryway together with the storage reservoir at Mount Road provide a sufficient supply for the normal requirements of the town during average of average rainfall. This supply can, at any time, be augmented by drawing 250,000 gallons per day from the Liverpool Corporation Lake Ferryway Aqueduct, this latter supply being obtained under powers granted by an Act of Parliament. The treatment given consists of an average period of seven days storage followed by rapid filtration and chlorination by the Chloramine system. The water supply to all parts of the town is constant and more than 95% of all dwelling houses have direct supplies or stand pipes within easy reach.

THE FOLLOWING IS THE VETERINARY OFFICER'S REPORT FOR THE YEAR.

During the year two inspections were made, one in May-June, the other November-December. At each official inspection 1,025 cows were examined, 181 of which were housed inside the Borough, the others, 844, were housed outside the Borough boundary, but whose milk was sold retail in Oswestry.

Despite the food shortage the animals were in a good state of health, and the cleanliness of the premises especially those inside the Borough boundary was quite satisfactory. About 40 samples were taken from animals showing abnormality of the udder and these were examined microscopically but in no case was

Tubercle Bacilli found in the milk. Most of the samples showed the presence of Streptococci and in all cases the animals were isolated and were not allowed to re-enter the herd until treatment had been applied and the mastitis cleared up. In addition two animals which although showing no sign of tuberculosis of the udder had a chronic cough with a sputum positive to Tubercle Bacilli. These were taken under the Tuberculosis Order and at post mortem showed lesions of Tuberculosis in the thoracic cavity and glands.

There are now eleven of the biggest herds tuberculin tested producing almost 50% of the total milk retailed in the Borough, this being a great improvement in the production of a clean healthy supply.

GEORGE WYSE, M.R.C.V.S.

Routine sampling of milk for the presence of Tubercle Bacilli was commenced in 1931.

The cows which supply milk to the Borough are also examined at half yearly intervals by the Veterinary Inspector employed by the Council for this purpose.

The following figures show the results of these examinations.

Year.	No. of Samples Taken.	No. showing presence of Tubercle Bacilli.	No. of cows found to be Tubercular at Bi-annual Veterinary Inspection.

Milk.

The Veterinary Inspector's statement that 50% of the milk retailed in Oswestry is from Tuberculin Tested Herds is of great importance; in addition a considerable proportion of the remaining milk supply is pasteurised or heat treated, so most of the people in Oswestry are in the happy position of knowing that there has been a big step forward in ensuring them a safe milk supply.

HOUSING.

In the Sanitary Inspector's report the housing situation has been set forth. There is little further than can be said on this subject. Some relief has arrived with the temporary bungalows, more appears to be on its way as the houses on the new site slowly progress to completion. The shortage continues to be acute and the housing conditions of many families in the Town is pathetic and for the majority the hope of anything better seems remote and even likely to recede.

The reference in the Sanitary Inspector's report to the appointment of a Housing Manager reminds me that I mentioned the advantages of such an appointment in my Annual Report for 1931. I suppose any member of the Council who may have read those remarks has long

Milk

The Veterinary Inspector's statement that 50% of the milk retained in Guernsey is from Friesian-bred herds is of great importance. In addition a considerable proportion of the remaining milk supply is pasteurized or heat treated, so most of the people in Guernsey are in the happy position of knowing that there has been a big step forward in ensuring them a safe milk supply.

Welfare

In the Dairy Inspector's report the housing situation has been set forth. There is little further that can be said on this subject. Some relief has arrived with the temporary hangers, but reports do not say as the houses on the new site slowly progress to completion. The work is continued to be done and the housing conditions of many families in the town is stable and for the majority the hope of anything better seems remote and even likely to recede.

The reference in the Dairy Inspector's report to the appointment of a Housing Officer reminds me that I mentioned the advantages of such an appointment in my Annual Report for 1954. I suggest now a number of the Council who may have found some interest has been

forgotten them; there may be some melancholy satisfaction in being only 16 years in advance of the event. The Health Department wishes the new Housing Manager well, he will no doubt relieve it of some of its worries, and at least a proportion of the heartrending tales to which we have listened with much sympathy but with frustrating impotence for some years will now be poured into his ears.

THE CENTRAL SLAUGHTERHOUSES.

The improvements in the slaughterhouses mentioned in the Meat Inspector's report had not materialised at the end of the year, though some progress was evident in the New Year. There is considerable room for improvement in the conditions under which animals are slaughtered and dressed and in the matter of containers for offal, the disposal of the stomach contents, skins etc., better protection from flies, and amenities for the washing of hands, tools, cloths, and for better sanitary accommodation.

SANITARY INSPECTOR'S REPORT.

HOUSING.

During the year a contract was signed for the erection of the first 102 permanent houses, 82 houses and 20 flats. The building of the houses started in October. It was unfortunate that owing to various reasons the commencement of the building was delayed until late in the year, the chief reason being that when the tender was originally advertised there was no response owing to the fact that the Federation of Master Builders had decided that none of their members would tender for any contract unless it was based upon bills of quantities. This meant securing the services of a quantity surveyor

forgot them; they may be even voluntarily abstention in being
 only 15 cases in advance of the event. The Health Department wishes
 the new Housing Manager will, as with no doubt believe it to be
 the worst, and at least a proportion of the best, and also
 which we have discussed with much sympathy but with illustrating
 instances for some years will now be paid into his care.

THE CURRENT SITUATION

The improvement in the district has resulted in the fact
 Inspector's report has not materialized at the end of the year
 though some progress was evident in the last year. There is
 considerable room for improvement in the districts under which
 analysis are investigated and traced and in the matter of complaints
 for relief, the disposal of the sewage, skins etc.
 better protection from flies, and measures for the washing of hands
 toilet, cinema, and for better sanitary accommodation.

SANITARY INSPECTOR'S REPORT

HOUSING

During the year a constant vigilance for the erection of the first
 105 permanent houses, 32 houses and 20 flats. The building of the
 houses started in October, but the unfortunate that owing to various
 reasons the commencement of the building was delayed until late in
 the year, the chief reason being that the contractor was originally
 ordered there was no response owing to the fact that the
 objection of Master Builders and Council that some of their members
 would object for any contract which it was based upon bills of
 quantities. This matter was the subject of a committee

and readvertising the contract, thereby incurring a delay of two months. Owing to the lateness of the start progress was inevitably slowed down as a result of unfavourable weather conditions which were worse than usual so there was complete cessation of work for 6 or 7 weeks, consequently the prospect of having the 102 houses for 1947 has receded and the most that can be hoped for is about 50, and even this is doubtful. The negotiations referred to in my last report have been completed and the purchase of the further 51 acres has been approved of by the Ministry of Health. As regards the project of the St. Oswald's Housing Society for the building of houses, it may be said that up to the present the Minister of Health has withheld his sanction until more progress is made by the Council with their own scheme. The Council has agreed to renew the Whittington Road to Shrewsbury Road sewer, the first portion to be carried out from Shrewsbury Road to Middleton Road. This will enable the Council to proceed with the 2nd, 3rd, and 4th stages of its housing programme and also the St. Oswalds Housing Society's Scheme referred to in my last report. Detailed proposals of this sewerage scheme have been prepared and submitted to the Ministry for approval which is now awaited. With reference to the second stage of the programme the Architect has been instructed to prepare plans for approximately 160 houses, 30% of which are to be of the duplex type. This will provide further accommodation for approximately 200 families. In view of the fact that there is a large percentage of applicants who are 2 to 4 in family and mostly living in rooms it was decided to fix on 30% to meet this need, the object being to rehouse as many

and re-arranging the contents, thereby incurring a delay of two months. Owing to the lateness of the start progress was inevitably slowed down as a result of unfavourable weather conditions which were very usual so there was complete cessation of work for 3 or 4 weeks. Consequently the prospect of having the 100 houses for 1947 has been and the cost that can be hoped for is about 50, and even this is doubtful. The negotiations referred to in my last report have been completed and the purchase of the further 50 houses has been approved of by the Ministry of Health. As regards the project of the B.C. Housing Society for the building of houses, it may be said that in the present the Minister of Health has withheld his sanction until more progress is made by the Council with their own scheme. The Council had agreed to allow the distinguished Lord to draw up the first portion to be carried out then Burslem had to withdraw from this. This will enable the Council to proceed with the 50, 50, and the matter of the housing programme and also the B.C. Housing Society's scheme referred to in my last report. Detailed proposals of this coverage scheme have been prepared and submitted to the Ministry for approval which is now awaited. With reference to the second stage of the programme and architect has been instructed to prepare plans for approximately 100 houses, 50 of which are to be of the duplex type. This will provide further accommodation for approximately 300 families. In view of the fact that there is a large percentage of applicants who are in a family and newly living in houses is considered to be of 50% to meet this need, the object being to reduce the cost.

families as possible in the shortest time. There were approximately 750 applicants for Council Houses at the end of 1946 of which over 50% are families of 2 and 3 persons, i.e. Man and Wife or Man, Wife and 1 child.

Prefabricated Houses.

About March 1946 it was decided to allocate the 50 temporary houses (Aluminium Type) on a points system. This system worked with commendable success. In some instances there has been an increase in the families which necessitates their removal to a larger house. The highest proportion of families occupying these houses are families of 4. In view of this tendency to increase, the Council will probably have to consider some policy of transfer. The condition of the houses and gardens reflects creditably upon their occupiers. Complaints were received and investigated of excessive dampness in some of the houses. This was due to condensation. The matter was attended to and generally the results are satisfactory.

House Management.

The Council has decided upon the appointment of a qualified Housing Manager. The duties of this appointment include the organisation and control of a separate Housing Estates Office, the collection of rents, investigation of requests for repairs and the issuing of instructions where necessary, and the maintenance of a link between the Council and the Council tenants, this last duty being a very important one in promoting an interest for the comfort and well-being of the tenants.

families as possible in the shortest time. There were approximately 150 applicants for Council Houses at the end of 1946 of which over 50% are families of 2 and 3 persons, i.e. Man and Wife or Man, Wife and 1 child.

Reallocated Houses

About March 1946 it was decided to allocate the 50 temporary houses (Aluminium Type) on a points system. This system worked with commendable success. In some instances there has been an increase in the families which necessitates their removal to a larger house. The highest proportion of families occupying these houses are families of 4. In view of this tendency to increase, the Council will probably have to consider some policy of transfer. The condition of the houses and gardens reflects creditably upon their occupants. Complaints were received and investigated of excessive dampness in some of the houses. This was due to condensation. The matter was attended to and generally the results are satisfactory.

House Management

The Council has decided upon the appointment of a qualified Housing Manager. The duties of this appointment include the organization and control of a separate Housing Estates Office, the collection of rents, investigation of requests for repairs and the issuing of instructions where necessary, and the maintenance of a link between the Council and the Council tenants, this last duty being a very important one in preserving an interest for the comfort and well-being of the tenants.

Overcrowding.

Under the present conditions there has to be a certain amount of tolerance with regard to overcrowding in view of the shortage of accommodation and the greater demand in the Town. Firm action was necessary in a few cases where the overcrowding was glaring and there was no reasonable excuse. The return of demobilised ex-service men somewhat aggravates the condition, nevertheless it can be said that already the Council has shown a great leaning towards this section of the community in the allocation of houses and there is little doubt that this policy will continue in the future.

Squatters.

The Council had decided that their policy was to be that when a licensed condemned house had served its purpose for providing temporary accommodation for families whose homes had been destroyed by enemy action and the families had vacated, it was to be closed and no longer used for human habitation. In September there was a wave of squatting in the Town and during the month 6 empty condemned houses and 2 huts formerly occupied by the Military were taken over by squatters. In all cases the persons were ex-service men who were living under overcrowded conditions or paying excessive rents for furnished rooms. At the end of the year all empty condemned houses were occupied bringing the total number of squatters in these houses up to 14.

House Repairs.

During the last few years the shortage of men and materials seems to have been justified in some cases for owners of property not

Overcrowding

Under the present conditions there has to be a certain amount of overcrowding with regard to overcrowding in view of the amount of accommodation and the greater demand in the town. This action was necessary in a few cases where the overcrowding was giving and there was no reasonable excuse. The return of demobilized ex-service men somewhat aggravated the condition, nevertheless it can be said that already the Council has shown a great interest towards this question of the community in the allocation of houses and there is little doubt that this policy will continue in the future.

Shelters

The Council had decided that their policy was to be that when a license certificate holder had served his sentence for providing temporary accommodation for families whose homes had been destroyed by enemy action and the families had vacated, it was to be closed and no longer used for human habitation. In September 1945 a wave of evacuees in the town and during the month of empty cottages houses and flats formerly occupied by the military were taken over by shelters. In all cases the persons were ex-servicemen and the more living than overcrowded conditions of packing excessive tents for furnished rooms. At the end of the year all empty cottages houses were occupied bringing the total number of properties in these houses up to 14.

Homelessness

During the last few years the number of men and women who were homeless has been small. In some cases the excess of property has

carrying out house repairs. At present while the shortage still exists it has eased and the Health Department has experienced little difficulty on the whole in getting the necessary work done, but it may be mentioned that only essential work is carried out and that under licence.

INFESTATIONS.

Bug Infestation.

Methods Used.

Gaseous disinfection after removal of wall papers, releasing picture rails, skirtings, including space under roof.

The houses are sealed and the whole subjected to as high as possible a concentration of "Fumoids" for 6 to 8 hours plus a thorough spraying with a D.D.T. insecticide.

All dilapidated upholstered furniture and mattresses are burned and such articles known to be infested and practically useless.

The work of disinfection is usually carried out by the Local Authority under the supervision of the Sanitary Inspector.

The measures taken by way of supervision or education of tenants to prevent infestation or re-infestation after cleansing:-
They are advised to report immediately the first evidence of any infestation and are warned to be careful in the purchase of second hand upholstered furniture and bedding.

Bug infestation is one of the most difficult and humiliating of all infestations which comes under the control of the Health Department. With the exception of cottage property where their existence has been known for some years cases of infestation arise through the purchase of second hand furniture and bedding and upholstery. Owing to the difficulty of purchasing new furniture occupiers of good class houses have had this humiliating experience. These infestations could be minimised if the matter is immediately reported to the local sanitary authority and the public is warned especially in these times to be cautious in the purchase of second hand upholstered furniture and bedding.

VERMINOUS PERSONS.

No person was dealt with during the year.

There is no cleansing station for verminous persons in the Borough nor a disinfectant for bedding etc.; an arrangement however exists whereby verminous persons may be cleansed at the Public Assistance Institution Morda.

RATS AND MICE.

Private Dwellings-Special Scheme 1946-1947.

It was considered by the Ministry of Food in a circular letter dated May 10th, 1946 sent to all local authorities that the cost of systematic rat control carried out by them at private dwellings should be borne by national and local rate funds and was not to be charged to the occupiers for special reasons. A conference was held at Shrewsbury to discuss the practical means of administering the scheme when Sanitary Inspectors of the County were predominant.

RATS AND MICE

Private Sanitation-Central Scheme 1944-45.

It was considered by the Ministry of Health in a circular letter

dated May 10th, 1944 sent to all local authorities that the cost

of systematic rat control carried out by them at private dwellings

should be borne by national and local rate funds and was not to be

charged to the occupiers for special reasons. A conference was

held at Brixton in 1944 to discuss the practical means of administering

the scheme and Sanitary Inspectors of the Council were present.

An urgent appeal was made for an all out drive for the eradication of rats and mice especially in view of the damage to foodstuffs and the loss sustained throughout the Country.

In consequence of this a complete survey was made of the Town by the Sanitary Inspector and his assistant under the terms and conditions of Circular N.S.12 and completed by November 4th, 1946. Owing to the consistent attention given to this subject over a number of years the work of the survey was made very much lighter. While the survey was in progress the Sanitary Inspector was available to confirm all suspected and doubtful cases and where there was evidence of the presence of rats the particulars were noted with remarks as to the relationship to other infested premises and their past history etc. An advertisement was inserted in the Local Press preceeding the survey requiring the public to assist in the carrying out of the scheme by reporting immediately the presence of rats and also emphasising the fact that the local authority would make charges and endeavour to recover the cost from householders whose neglect caused infestation. The survey has shown that the only type of infestation in Oswestry is the Minor Secondary Type as defined in I/R/363 Memo. J.S.C.C.1. issued by the Infestation Control Branch of the Ministry of Food. The operation of pre-baiting and poisoning immediately followed and according to the terms of the scheme will continue for a year. The County Council has under contract all the Council's refuse tips and premises adjacent and also private shops and blocks of buildings known to have been infested from time to time. In addition the sewers have had attention and

An urgent appeal was made for an all out drive for the eradication of rats and mice especially in view of the damage to foodstuffs

and the loss sustained throughout the Country.

In consequence of this a complete survey was made of the Town

by the Sanitary Inspector and his assistants under the terms and

conditions of Circular S.S.12 and completed by November 1st, 1945.

Owing to the constant attention given to this subject over a

number of years the work of the survey was made very much lighter.

While the survey was in progress the Sanitary Inspector was advised

to examine all suspected and doubtful cases and where there was

evidence of the presence of rats the particulars were noted with

reference as to the relationship to other infested premises and their

past history etc. An advertisement was inserted in the local press

proceeding the survey reporting the public to assist in the carrying

out of the scheme by reporting immediately the presence of rats and

also emphasizing the fact that the local authority would make charges

and endeavour to recover the cost from householders whose neglect

caused infestation. The survey has shown that the only type of

infestation in Gwent is the Minor Secondary type as defined in

W.S.G. Memo. J.S.G.C.I. issued by the Infestation Control Branch

of the Ministry of Health. The operation of pre-baiting and poisoning

immediately followed and according to the terms of the scheme

will continue for a year. The County Council has under contract

all the Council's refuse tips and premises adjacent and also

private shops and blocks of buildings known to have been infested

from time to time. In addition the Council have had extensive and

the procedure as laid down in the Ministry of Food Local Authority Circular N.S.13 is being carried out. From observations made it would appear that the special scheme has had beneficial results.

CINEMAS AND PLACES OF ENTERTAINMENT.

The two cinemas in the Town are visited at frequent intervals during times of entertainment. Other places of entertainment are also visited from time to time. No complaints were received during the year. On the whole they were found to be conducted in an orderly and satisfactory manner. This reflects very creditably on the managements concerned because at times the influx of patrons was considerable. Strict attention was paid to lavatory accommodation, ventilation and other items which add considerably to the comfort and enjoyment of the patrons and the efficient running of the respective places. At one place however the provision of adequate means of escape in case of fire was not fully realised and the notice of the owner was drawn to this fact and the matter rectified.

LICENSED HOUSES.

During 1946 an inspection was made of the 38 licensed houses in the Town. With the new legislation and the advance of Public Administration wider scope is given to deal with these matters. It is good that proprietors of such places realise that the Sanitary Inspector's duties embrace every aspect of hygiene in relation to public health. It must be said however that the licensees are only too willing to carry out suggestions made by the Department. Practically every house required some attention. The defects included in many cases antiquated pipes and pumps; inadequate drip sinks deficient

the products as laid down in the Ministry of Food local authority
Circular K.S.17 is being carried out. From observations made it
would appear that the special scheme has had beneficial results.

GIMMERS AND PLACES OF ENTERTAINMENT

The two cinemas in the town are visited at frequent intervals during
times of entertainment. Other places of entertainment are also visited
from time to time. No complaints were received during the year. On
the whole they were found to be conducted in an orderly and satisfactory
manner. This reflects very creditably on the management concerned.
Because at times the influx of patrons was considerable. Better
attention was paid to lavatory accommodation, ventilation and other
items which add considerably to the comfort and enjoyment of the
patrons and the efficient running of the respective places. As one
place however the provision of adequate means of escape in case of
fire was not fully realized and the notice of the owner was drawn
to this fact and the matter rectified.

LICENSED HOUSES

During 1946 an inspection was made of the 36 licensed houses in the
Town. With the new legislation and the advance of Public Administration
wider scope is given to deal with these houses. It is good that
proprietors of such places realize that the Sanitary Inspector's
duties embrace every aspect of hygiene in relation to public health.
It must be said however that the licensees are only too willing
to carry out suggestions made by the Department. Practically
every house required some attention. The defects included in many
cases antiquated pipes and gurgles; inadequate deep sink detritus

of hot and cold running water and insufficient ventilation etc. to cellars. With regard to sanitary conveniences some of the houses had no satisfactory provision for both sexes.

A large proportion required repair and cleansing and other should be pulled down and reconstructed on approved sites. Many of the licensed rooms required cleansing and redecorating. Some progress has been made especially with the more urgent requirements and while owners have been prepared to carry out the requirements to the full the question of priorities has retarded progress for the time being.

INSPECTION AND SUPERVISION OF FOOD.

Milk Supply.

Number of registered producers in the Borough.....	7

Number of accredited retailers in the Borough.....	Nil.
Number of T.T.retailers in the Borough.....	3

There is one licensed Pasteurising Plant in the Borough.

Visits were made at regular intervals during the year to the farms and dairies. In some instances there was cause for complaints but they were of a minor character and were remedied, excepting perhaps the abnormal number with reference to dirty milk bottles. While much has been accomplished by visits to the dairies to minimise this evil, it may be said that the root of the evil rests with the housewife or otherwise people who retain these bottles for indefinite periods or, as has been known, in many cases to use the bottles for other purposes than that intended. A safe remedy would be for the trade to adopt the following slogan and act on it namely, "No Bottles!NoMilk!".

of hot and cold running water and inefficient ventilation etc, to
wellness. With regard to sanitary conveniences some of the houses
had no satisfactory provision for both sexes.

There is one licensed Restaurant in the Borough.

Visits were made at regular intervals during the year to the farms
and dairies. In some instances there was cause for complaint but
they were of a minor character and were remedied, excepting perhaps
the structural matter with reference to dirty milk bottles, while
much has been accomplished by visits to the dairies to minimize
this evil. It may be said that the root of the evil rests with the
housewife or suburban people who retain these bottles for
infantile purposes or, as has been known, in many cases to use the
bottles for other purposes than those intended. A safe remedy
would be for the trade to adopt the following slogan and act on it

namely, "No Bottles, Milk".

The bulk of the milk retailed in the Borough is produced outside the Town. Out of the 7 producers in the Borough 3 are designated two of them being Tuberculin Tested farms and the other accredited. Samples of milk retailed in the town were taken during the year and tested at the Health Department laboratory for specific gravity, fat and non-fatty solids. These were found to be satisfactory. Other samples were sent to the Pathological Laboratories, Shrewsbury for methylene blue and phosphatase tests and these too were satisfactory. It is a routine practice to take samples of milk supplied to homes where cases of non-respiratory Tuberculosis are notified. Such samples as were taken in 1946 were negative.

HEAT TREATMENT OF MILK.

At present three classes of milk are retailed in the Town, i.e. Heat Treated, Tuberculin Tested, and Ordinary. Two local firms produce and supply the Heat Treated milk. These are the two largest retailers so it is safe to assume that the greater proportion of the population is getting this Heat Treated milk. Milk sold as such undergoes a process conforming with official regulations. It destroys, if scrupulously controlled, bacteria which may otherwise constitute a potential menace to Public Health and at the same time it leaves the product assured of a greater keeping quality than would occur in similar milk if left untreated. It is encouraging to note that samples taken of this milk have shown that it has reached the standard required by official regulations.

No. of samples tested at Health Department laboratory for Specific Gravity, Fat and Non-fatty solids.....	30
No. satisfactory.....	30

The bulk of the milk retained in the borough is produced outside the town. Out of the 7 producers in the borough, 5 are designated as of whom being Tuberculin tested farms and the other accredited. Samples of milk retained in the town were taken during the year and tested at the Health Department Laboratory for specific gravity, fat and non-fat solids. These were found to be satisfactory. Other samples were sent to the pathological laboratory, laboratory for methylene blue and phosphate tests and these too were satisfactory. It is a routine practice to take samples of milk supplied to houses here cases of non-respiratory Tuberculosis are notified. Such samples as were taken in 1945 were negative.

HEALTH OF MILK

The present three classes of milk are retained in the town, i.e. best treated, Tuberculin tested, and Ordinary. The local farms produce and supply the best treated milk. These are the two largest retailers as it is able to account for the greater proportion of the population by getting this best treated milk. Milk sold in such a process containing with official regulations. It is desirable to keep the population which may otherwise constitute potential menace to public health and at the same time it leaves the product assured of a greater keeping quality than would occur in similar milk if left untreated. It is accordingly to note that samples taken of this milk have shown that it has reached the standard required by official regulations.

In addition 106 lbs of beef, 121 lbs of mutton, 28 lbs of pork and 28 lbs of veal were condensed.

The total number of animals inspected during the year by the Borough Meat Inspector was 6670. The remaining animals slaughtered during the year were the responsibility of the Oswestry Rural District Sanitary Inspector.

The arrangements for inspection and distribution remain unchanged, the two private slaughterhouses in Willow Street still functioning for the slaughter and distribution of meat including frozen and tinned meat for the Borough, Oswestry Rural District and part of Montgomeryshire under the direct control of the Ministry of Food. The inspections are carried out by the Borough and Rural District Sanitary Inspectors, the latter doing the inspections one week in every three. Since the centralisation of slaughtering in Oswestry which has continued since 1940 the need for the provision of a Public Abattoir has become even more apparent. There is a growing interest and demand for a Public Abattoir in Oswestry particularly on the part of the butchers who at one time were opposed to the measure. The Ministry of Food has realised this and made provisional arrangements for alterations and additions to the two slaughterhouses used by them in Willow Street. These alterations and additions while improving the conditions at these places do not do away with the main causes of complaints and locally nothing short of the provision of an up-to-date abattoir will do this.

OTHER FOODS.

Food inspection in its multiple and varied branches takes up a considerable proportion of the Inspector's time. Damage in transit and certain deteriorating effects through storage have been the chief causes of complaint. Much of this is due to careless handling

The total number of animals inspected during the year by the Borough
Meat Inspector was 6570. The remaining animals slaughtered during
the year were the responsibility of the Oswestry Rural District
Sanitary Inspector.

The arrangements for inspection and distribution remain unchanged, the
two private slaughterhouses in Willow Street still functioning for the
slaughter and distribution of meat including frozen and tinned meat
for the Borough, Oswestry Rural District and part of Montgomeryshire
under the direct control of the Ministry of Food. The inspections
are carried out by the Borough and Rural District Sanitary Inspectors
the latter doing the inspections one week in every three. Since the
centralisation of slaughtering in Oswestry which has continued since
1940 the need for the provision of a Public Abattoir has become even
more apparent. There is a growing interest and demand for a Public
Abattoir in Oswestry particularly on the part of the butchers who at
one time were opposed to the measure. The Ministry of Food has
realised this and made provisional arrangements for slaughtering and
addition to the two slaughterhouses used by them in Willow Street.
These alterations and additions while improving the conditions at
these places do not do away with the main causes of complaints and
locally nothing short of the provision of an up-to-date abattoir
will do this.

OTHER FOODS.

Food inspection in its multiple and varied branches takes up a
considerable proportion of the Inspector's time. Items in various
and certain deteriorating effects through storage have been the

in transit and the proportion of bulged and broken tins is considerable. However where possible the maximum quantity is salvaged. The markets have received regular inspections. The present improvised accommodation in Church Street has served a useful purpose but the return to the Cross Market will be eagerly looked forward to.

Foods other than meat condemned during the year included:-

34 tins beans; 51 tins peas; 21 tins fruit; 247 tins milk; 162 tins meat; 50 lbs. dried fruit; 31 lbs. tomatoes; 15 lbs. margarine; 34 lbs. macaroni; 147 lbs. fish; 47 tins fish; 88 tins mixed vegetables; 17 tins soup; 95 lbs. jam; 30 lbs. sweets; 72 lbs. dried egg; 78 lbs. bacon; 14 lbs. suet; 1 case oranges; 69 lbs. almond substitute; 21 lbs. cheese; 100 oxo cubes; 40 lbs. oats; 17 packets cereals.

ICE CREAM.

Since the ban on the manufacture of ice cream was lifted a vigilant eye has been kept on this trade. Samples of the product have been taken from all vendors of ice cream in Oswestry. With one exception the samples taken were of a satisfactory bacteriological standard. The necessary action was taken and the sale of the ice cream in this case was stopped. The case was followed up by taking samples of the ingredients and it was found that milk used in the manufacture of the ice cream was heavily contaminated. It may be stated that the milk in question was produced outside the district and the necessary action was taken to deal with it. The normal products for the manufacture of ice cream, namely, milk, cream, butter or vegetable fat and sugar which are the bases, are not now available to the trade thereby reducing the ice cream in value as a food and all that can be claimed for it is that it is a pleasant and palatable confection.

There is no legal standard for ice cream but pressure is being brought to bear to establish this. While a large proportion of this confection is manufactured in other towns and retailed in Oswestry, it is more satisfactory from the standpoint of the Health Department that all ice cream sold in the Borough should be under the supervision of the local Food Inspector, especially in regard to the premises used, equipment, manufacture and personal cleanliness.

SHOPS.

Shop assistants in Oswestry form a large part of the working community. The administration of the Shop Hours Act and conditions of employment have caused very little trouble and where infringements have occurred interviews with the employers have put matters right. There were a few occasions where action had to be taken. Provisions under the Shops Act 1934, i.e. sanitary conveniences etc. and matters pertaining to the health and comfort of employees have been closely observed. Inspections have shown that employers are conscious of their obligations.

FACTORIES ACT 1937.

The administration of the above Act relating to the provision and maintenance of sanitary conveniences at factories, also the provisions regarding cleanliness, overcrowding, temperature, ventilation and drainage of floors has received attention during the year. New factories are developing in the Town and while these buildings will be constructed on modern lines and should conform with all requirements of the Act, some of those already in existence fall short of the standard required. Inspections have been made and the attention of the occupiers drawn to such matters as deficiency of sanitary conveniences and general repair. During the war years there has

There is no legal standard for the cream but pressure is being brought to bear to establish this. While a large proportion of this production is manufactured in other towns and retained in Gwent, it is more satisfactory from the standpoint of the Health Department that all the cream sold in the Borough should be under the supervision of the local Food Inspector, especially in regard to the premises used, equipment, manufacture and personal cleanliness.

SHOPS.

The assistance in Gwent is given to a large part of the working community. The administration of the shop hours Act and conditions of employment have caused very little trouble and where infringements have occurred interviews with the employers have put matters right. There were a few occasions where action had to be taken. Provisions under the Shop Hours Act, 1937, relating to conveniences etc. and matters pertaining to the health and comfort of employees have been closely checked. Inspectors have shown that employers are conscious of their obligations

FACTORIES ACT 1937.

The administration of the above Act relating to the provision and maintenance of sanitary conveniences at factories, also the provisions regarding cleanliness, overcrowding, temperature, ventilation and drainage of floors has received attention during the year.  These witnesses included objections to driving, defective ...
 and defects to horses. Visits of inspectors were made in all cases
 and all received the attention of the persons concerned.
 No. of visits in connection with these complaints.....

DISINFECTION

During the year the number of disinfections carried out after
 infectious diseases was.....
 Hoses from schools and libraries were disinfected at the Health
 Department, ... and District Hospital were also
 disinfected.

LEGAL PROCEEDINGS

During the year it was necessary to institute legal proceedings
 in four cases in order to enforce orders served by the Department.
 1. The defendant was charged with a contravention of Section 60 of
 the Housing Act 1936 by retaining the dwelling house in question

to become overcrowded. The overcrowding was abated before the time of the Court and the summons was withdrawn, the defendant paying the costs of the Court.

2. The defendant was charged with keeping a dwellinghouse in such a manner as to be prejudicial to health and a nuisance. The Magistrates made an order that the nuisance was to be abated within 28 days and that the defendant was to pay the costs of the Court. It was necessary at a later Court to charge this person with non-compliance of the Magistrates Order. At this Court she was given further time to abate the nuisance and this time the Order of the Court was complied with.

3. In this case the defendant was charged with keeping pigs in such a manner as to be prejudicial to health and a nuisance. He was ordered to abate the nuisance within 28 days.

4. The defendant was charged with non-compliance with a notice of the Local Authority to provide 5 dwelling houses with adequate waterclosets under Section 44 of the Public Health Act 1936. The Magistrates made an Order that the work was to be carried out within 56 days. The defendant failed to do this and was further charged with non-compliance with a Magistrates Order. In this case he was fined £2 and ordered to do the work within 28 days.

The overruling was stated before the time of the Court and the answer was withdrawn, the defendant paying the costs of the Court.

2. The defendant was charged with keeping a dwellinghouse in such a manner as to be prejudicial to health and a nuisance. The Magistrate made an order that the nuisance was to be abated within 14 days and that the defendant was to pay the costs of the Court. It was necessary at a later Court to charge this person with non-compliance of the Magistrate's order. At this Court she was given further time to abate the nuisance and this time the Order of the Court was complied with.

3. In this case the defendant was charged with keeping a dog in such a manner as to be prejudicial to health and a nuisance. He was ordered to abate the nuisance within 14 days. 4. The defendant was charged with non-compliance with a notice of the local authority to provide a dwelling house with adequate ventilation under Section 44 of the Public Health Act 1936. The Magistrate made an Order that the work was to be carried out within 14 days. The defendant failed to do this and was further charged with non-compliance with a Magistrate's order. In this case he was fined £2 and ordered to do the work within 14 days.
