TO THE CHAIRMAN AND MEMBERS OF THE EDUCATION COMMITTEE.

In presenting his Report for the year 1920 the School Medical Officer is glad to be able to say that the School Medical Department and its arrangements maintain a satisfactory standard.

A new system of getting children to the Dental Clinic has been instituted with good results and inspection of the children at the schools shows clearly the general improved condition of their teeth. A number of children still continue to avoid treatment, there being no sufficient or convenient measures of compelling treatment. Should the Children Act, 1908, be invoked in a bad case, the result is quite unsatisfactory. It will be noted that of the 952 cases not treated, about two-thirds (624) were Dental cases.

The appointment of a Skin Specialist has been amply justified by the results obtained.

19th March, 1921.

## SCHOOL BUILDINGS.

There are eighteen Elementary Schools in the area. With the exception of two, these are of the Central Hall type or variations of this type.

The Ventilation in many of the schools is not satisfactory. In some cases this could be improved by small alterations, such as increasing the number of "hopper" windows. The exchange of air can always be assisted by full use of the means of ventilation provided whatever they are. In the intervals between lessons all openings should be thrown wide.

#### LIGHTING.

Natural Lighting is also poor in many of the schools or classrooms. As far as possible the main light is on the left of the scholar, but in some of the classrooms this is impossible. Artificial lighting is indifferent throughout the schools and in its present state serves really as a makeshift only.

#### WARMING.

On the whole is fairly satisfactory. In a small number of schools the heating system is aided by gas radiators. These are unsatisfactory owing to the fumes which are given off from the gas, being a recognised cause of headache and affecting the throat.

## DESKS.

Many desks in use are of the old pattern and unsuitable. It has been noticed in this connection that scholars are liable to adopt unnatural positions, crouching over the desks when writing.

#### SANITATION.

The type of Closet in use is with one exception the Trough Closet with a flushing cistern, in some cases automatic, in others dependent upon the caretaker to carry out the flushing. One school is equipped with up-to-date water closets, each having its own flushing cistern with a chain release. It has been said that this type proves unsuitable in schools owing to the fact that scholars do not take the trouble to pull the chain after use. In the school where this method is in use, the conditions of the offices were observed to be excellent, no trouble in working is experienced. From the point of view of education this type is to be recommended.

# CLEANLINESS OF SCHOOLS.

Good, with one or two exceptions. The method of "dry" brushing which is carried on each day in some cases is unsatisfactory. Brushing with damp sawdust or other dust-catching material is a satisfactory method.

#### CLOAKROOMS.

This part of the school building is often totally inadequate and wrongly constructed. The number of pegs in many cases is insufficient, the pegs are too close together. There is an attempt in one or two cases to heat these rooms, but usually there is no system of warming or drying the clothes.

#### WATER SUPPLY

In all schools is derived from the Corporation supply. A few mugs are kept for drinking purposes, in some cases these are chained metal mugs. This method has been blamed as a mode of conveying infection from one child to another.

5

# GENERAL REVIEW OF THE FACTS DISCLOSED BY THE MEDICAL INSPECTION.

# PROPORTION OF CHILDREN ACTUALLY INSPECTED.

Out of 2875 children placed on the list for inspection, 90.6 per cent. were inspected; 2.1 per cent. of parents declined to have their children inspected; 27.7 per cent. of the parents attended the inspection of their children.

# PREVIOUS DISEASE.

The common febrile disorders of childhood had affected the children according to the following percentages:—Measles, 62.2 per cent.; Whooping Cough, 35.4 per cent.; Chicken Pox, 25.9 per cent.; Scarlet Fever, 5.3 per cent.; Diphtheria, 1.3 per cent.; Mumps, 2.6 per cent.; Rheumatism, 0.5 per cent.

# VACCINATION.

51.3 per cent. were unvaccinated, the greater part of the deficiency occurring amongst the infants. In addition, 0.2 per cent., though said to have been vaccinated, had no cicatrices.

Percentage of Infants (under 6 years of age) found unvaccinated during the last Eleven Years.

	Boys.	Girls.
1910	 8.3	 9.1
1911	 4.2	 4.7
1912	 23.9	 21.8
1913	 44.0	 45.4
1914	 50.8	 55.7
1915	 53.6	 49.6
1916	 55.6	 50.4
1917	 60.2	 57.5
1918	 63.4	 63.6
1919	 68.8	 67.1
1920	 68.5	 66.7

#### HEIGHT AND WEIGHT.

A comparison of the weights of the Local Children with those in Tuxford and Ashley Glegg's Tables shows in favour of the former. The weights of Local Girls in Elementary Schools, aged 14, are interesting; they doubtless indicate that the selected children have, by that age, left the Elementary Schools either for Secondary School or for some paid employment. The effect of the advance in the age at which a child may leave will be watched with interest.

Table A (1) shows the average heights and weights according to "age last birthday"; and Table A (2) the heights and weights corrected to end of completed year of life.

#### RINGWORM.

Three cases were encountered at the inspection.

With 109 cases discovered in other ways, chiefly by teachers or in the course of Inspection under the Children Act, and 40 cases brought forward uncured at the end of the previous year, 149 cases altogether were met with.

(See "Following-up Return," page 34).

# X-RAY TREATMENT OF RINGWORM.

During the year 1920, seventeen cases have been treated and cured. Of the eight cases carried over from 1919, seven have been cured and one refused treatment. The average period of absence from school for treatment was 38 days.

# CLEANLINESS-STATE OF HAIR.

There were 567 cases of nits in the hair (21.7 per cent.), including 8.8 per cent. of the boys and 36.1 per cent. of the girls.

The following Table shows the percentage of girls found at the Routine Inspection with nits in the hair, during the past five years:—

# NITS IN THE HAIR. (GIRLS ONLY). INSPECTIONS UNDER EDUCATION (Ad. Prov.) ACT, 1907.

SS. Simon & Jude's C.E.					45.6		32.7
St. Teresa's R.C					69.7		60.0
Total	53.5	52.5	49.8	54.9	43.2	37.5	33.2

This shows a decided Improvement.

# CARIOUS PERMANENT TEETH.

24.9 per cent. of the children over six years of age have one or more permanent teeth carious. At leaving the percentage is 36.9 (See "Following-up" Return, page 34.) This demonstrates that the work of the Dentists is largely effecting its object.

## ENLARGED TONSILS AND ADENOIDS.

17.7 per cent. of the children were affected, and of these 110 (4.2 per cent.) were cases requiring removal.

# ENLARGED GLANDS IN THE NECK.

9.0 per cent.; only a small proportion would be tubercular.

#### DEFECTIVE VISION.

177 children (8.4 per cent.) failed to read 6 9 with each eye, and all these are classified as defective.

# EXTERNAL EYE DISEASE.

1.6 per cent. (Squint 0.7 per cent.).

#### EAR DISEASE.

Otorrhœa, 0.8 per cent.

#### DEAFNESS.

205 = 7.9 per cent.; mostly due to wax.

# CARDIAC DISEASE.

12 = 0.5 per cent.

# LUNG DISEASE.

Sixteen cases of fairly definite Bronchitis, one case of Bronchial Catarrh, and one case of Pneumonia, were met with. No child suffering from Phthisis was discovered at the routine inspection.

# NERVOUS DISEASE.

3 = 0.1 per cent.

#### TUBERCULOSIS.

Three cases. (Lupus, Knee, Elbow).

# RICKETS.

21=0.8 per cent. (Mostly very slight).

# LOCAL EDUCATION AUTHORITIES (MEDICAL TREATMENT) ACT, 1909, SECTION 1.

The following is a list of the charges at present made for treatment— Secondary School Children—

Teeth-

 Extraction with gas
 5/ 

 Extractions
 1/6 per tooth.

 Fillings
 2/6 per filling.

 Scalding
 1/- to 2/-.

 Ear Syringing
 3/6.

Secondary School and Elementary School Children—

Operation for Tonsils and Adenoids..... 7/6.

It is probable that an attempt to enforce charges on every parent of an elementary school child for treatment would have the effect of reducing the amount of treatment carried out to a small fraction of the cases requiring it. This remark bears especially on the matter of dental treatment. It has taken years of patience to secure the present percentage of defects "cured" in this town, and in my opinion it amounts to a certainty that if the parents are to be charged for the work they will not continue to send the children to the clinic. The difficulties met by practical people in getting an elementary school child to the dentist seem sufficient of themselves to overcome without the parent having to object on account of the cost. Furthermore, any amount collected from the parents will be more than swallowed up by the clerical and collection charges.

One cannot escape the reflection that in these latter days an individual charge to each patient treated savours somewhat of the retrograde. Some scheme might surely be devised, if indeed a charge has to be made at all, whereby a small annual or quarterly payment on the lines of the Insurance scheme might meet all the necessities of some contribution from the parents. For instance, a charge of 3d. per child here, annually, would amount to £100. Probably no parent would object to this or something like it, and the amount got would exceed anything collected by an individual charge.

#### SCARLET FEVER.

The importance of mild a-typical cases of Scarlet Fever as sources of continued infection is borne out by the following account of a small epidemic in one of the Elementary Schools. It also demonstrates the infectivity of the early case, usually regarded as low; common experience attributes the greater danger to the disease in its ultimate stages.

A teacher of one of the infant classes complained of Tonsillitis on Thursday, October the 7th, and was off duty for the week-end. She returned on Monday, October 11th, and was again absent on the 12th and 13th; returned again on the 14th, and was present at school on Friday, the 15th; on the Monday, the 18th, was again absent, and remained so for the whole week. She returned to school again on Monday the 25th, and on the 27th was sent for examination; the hands were "peeling," and there was no doubt that the had been suffering from a mild attack of Scarlet Fever, her symptoms being confined to those associated with Tonsillitis, followed by peeling about 18 days later.

Four cases of Scarlet Fever of a mild type were reported from children attending this class. The interesting point lies in the fact that these cases developed consistently a few days after each date that the teacher returned to her class, her presence accounting with nicety for the incidence of each successive case within the incubation period:—

Oct. 7th and 8th.—Miss X present at the school suffering from Tonsillitis.

- ,, 9th and 10th.—Miss X absent.
- ,, 11th.—First case of Scarlet Fever occurs, and Miss X returns.

Miss X

School.

absent from

- ,, 12th and 13th.—Miss X again absent.
- ,, 14th.—Miss X returns.
- ., 15th.—Second case of Scarlet Fever occurs.
- " 18th.-
- ., 19th.—Third case of Scarlet Fever.
- ., 20th.—
- ,, 21st.—Fourth case of Scarlet Fever.
- .. 22nd.—
- .. 23rd.—
- ,, 24th.—
- ,, 25th.—Miss X returns.
- ,, 27th.-Miss X seen by School Medical Officer and excluded.

No more cases occurred.

#### DIPHTHERIA CARRIER.

At the routine examination one child was found to have a discharge from one of the crypts of the left tonsil. On examination of the discharge the Bacillus of Diphtheria was found to be present and the child was excluded, with local treatment for six weeks.

This condition cleared up, two subsequent examinations were negative, and the child re-admitted to the school.

# METHODS EMPLOYED OR AVAILABLE FOR TREATMENT OF DEFECTS.

# THE WORK OF THE SCHOOL CLINICS.

# (a) DEFECTIVE VISION.

All cases of Defective Vision, including Squint, found at the Routine Inspection, were referred to the Ophthalmic Surgeon for further examination, as were also some cases discovered in other ways. During the course of the year there were 1320 attendances at the Clinic, with the following results:—

Mydriatic given	451
Glasses prescribed	284
Glasses obtained	211
Can manage with present glasses	63 } 274
Glasses not required	174
External Eye Disease	847
Strabismus	37
Slight operation—needling	1
Treated by private Medical Practitioner	32
Left School or Town	58
Refused Treatment	27

24 necessitous cases were assisted by the Education Committee. The Committee spent £9 18s. 0d. on the provision of spectacles, but of this sum £3 18s. 6d. was afterwards collected from the parents of the children concerned.

# (b) TONSILS AND ADENOIDS.

Dr. Courtenay Yorke, the Committee's Nose and Throat Specialist, has continued his valuable work during the year 1920, with very satisfactory results.

Consultation Cases	224
*Operation performed at Clinic	194
Operation not required	44
Treated by Private Doctor or Infirmary	25
Refused treatment	89
Left school or town	20

<sup>\*</sup>Some of these cases consulted Dr. Yorke during 1919.

The condition of the Children's mouths shows a marked improvement, attributable to the more frequent inspection and treatment, and also to the more general use of the tooth brush.

#### X-RAYS.

X-Ray treatment of Tuberculous glands of the neck and other parts is often of great value.

Where the skin over the glands is sound and unbroken, a course of "X-Ray" exposures will often cause glands of large size to shrink and disappear. If the disappearance is not complete the glands may be reduced considerably in size and transformed into a harmless hard and fibrous mass.

The possible dangers of surgical interference, viz.:—Unsightly scarring and the infection of the skin with tubercular disease may be avoided by this method of treatment.

In advanced cases where the glands are broken down—sinuses have formed and are discharging pus, and puckered and unsightly scars exist, the transformation which may be brought about by a course of "X-Ray" exposures is most dramatic. Glands shrink in size, sinuses dry up and close, ulcerated surfaces heal, and old scar tissue is rendered soft and pliable. Such cases are the despair of the Surgeon but are welcomed by the Radiologist, because the results obtained by "X-Ray" treatment are so gratifying.

#### RINGWORM OF THE SCALP.

Which is a most intractable disease when treated by ointments, lotions, etc., may be cured by a single exposure to the "X-Rays," the hair falling out and leaving the scalp clean and free from infection after a lapse of three weeks from the time the exposure is given.

The child may then safely attend school.

W. C. ORAM, M.D., D.C.,

Hon. Radiologist, Liverpool Stanley Hospital.

# (d) TUBERCULAR GLANDS.

X-Ray method, with very satisfactory results. The average period of treatment was 19 weeks. Fortunately no case of broken down and discharging glands has been found during the year.

#### MISCELLANEOUS.

A Course of Physical Training is being given to about 17 children, specially requiring it, by Mr. A. Alexander, of the Southport Physical Training College, to their very great advantage.

No Child with Phthisis was treated during the year at the Corporation Hospital. Two cases received treatment in the Children's Convalescent Home, West Kirby, with very satisfactory results. The period of treatment was seven months, and three years, two months, respectively.

The National Society for the Prevention of Cruelty to Children has been occasionally invoked, and its efforts are successful in securing alleviation in certain refractory cases.

# ACTION TAKEN TO DETECT AND PREVENT THE SPREAD OF INFECTIOUS DISEASE.

The practice of having all children who have suffered from Scarlet Fever examined by the School Medical Officer before their return to School has been continued; since it was begun no School within the area of the Authority has required closure on account of an outbreak of Scarlet Fever.

# REPORTED TO MEDICAL OFFICER OF HEALTH FROM SCHOOL CLINICS:—

Chicken Pox	14
Whooping Cough	8
Rubella	4
Scarlet Fever	1
Lobar Pneumonia	1
Ophthalmia Neonatorum	1
Sleeping Four, or more, in one room	426

(a) See Table C. \* Children younger than 6 years NOT included in these percentages.

In this Table, and in Table C, an infant means a child under the age of 6. Percentages are calculated on the number actually inspected, except in the cases of "Number actually inspected," and "Parent refused inspection," which are calculated on the number listed for inspection.
