REPORT.

To the Right Worshipful the PRESIDENT,
the Worshipful the TREASURER, and the
GOVERNORS of the Royal Hospital of
Bethlem.

MY LORDS AND GENTLEMEN,

THE number of curable patients admitted during the year has been 110 males, and 205 females, making a total of 315. Those who remained in the Hospital at the close of the year very nearly balance those in the house at the commencement.

The number discharged cured, has been 180, consisting of 62 males, and 118 females. This will give 57 per cent., a very considerable ratio, and in itself presenting, independent of every other consideration, a very satisfactory result—especially when we bear in mind the tendency to relapse which occurs in so many hereditary cases, as well as in those who are addicted to intemperate habits, and in many childbearing women; and this amount is somewhat enhanced by the fact, that 27 have been discharged paralytic, and otherwise incapacitated, having never, in fact, been in a fairly curable condition.

If allowance be made for these, the ratio of cures will exceed the amount stated.

UNCURED.

There have been discharged uncured, 31 males and 51 females, making 82.

DEATHS.

There have died, 12 males and 11 females altogether, of every denomination, and their deaths have arisen from the following causes:—

Date.	Sex.	Age.	Class.	Cause of Death.
23d Jan. 1845 -	Male -	58	Incurable -	Internal strangulation of a portion of the intestines over the colon.
24th Jan. -	Female -	24	Curable -	Gradual exhaustion, with consumptive symptoms.
30th Jan. -	Female -	62	Incurable -	Gradual exhaustion.
13th Feb. -	Male -	40	Criminal -	Epilepsy.
10th March -	Female -	45	Curable -	Erysipelas.
23d March -	Male -	46	Curable -	Apoplexy.
12th April -	Male -	52	Criminal -	Diseased lungs.
24th April -	Female -	41	Curable -	Consumption.
24th May -	Female -	37	Incurable -	Protracted diarrhœa.
2d June -	Female -	38	Curable -	Extensive cerebral disease, combined with inflammation of the lungs.
2d June -	Female -	46	Curable -	Gangrene of lungs, and extensive disease of brain.
2d July -	Female -	65	Curable -	Diseased heart and lungs.
12th July -	Male -	49	Curable -	Phthisis.
16th July -	Male -	45	Curable -	Acute Phrenitis.
8th August -	Male -	44	Curable -	Exhaustion after great cerebral excitement.
15th August -	Male -	22	Incurable -	Pulmonary consumption.
17th August -	Male -	48	Curable -	Disease of the heart and pleura.
20th August -	Male -	57	Curable -	Mortification of the hand.
21st August -	Male -	41	Curable -	Chronic inflammation of the membranes of the brain.
13th Sept. -	Female -	20	Curable -	Puerperal mania.
24th Oct. -	Female -	48	Criminal -	Epilepsy.
23d Nov. -	Female -	65	Incurable -	Chronic bronchitis.
12th Dec. -	Male -	29	Curable -	Disease of the heart and lungs.

The health of the establishment has been highly satisfactory. No epidemic has prevailed of any importance. To this happy result, under the Divine blessing, the great cleanliness and complete ventilation of every part of the Hospital have mainly contributed, combined with the prompt attention observed by the Medical Officers in the incipient stages of disease.

Some of the most formidable ailments have been those which the patients have brought with them on their admission, and under which a few have sunk; but it was considered at the moment more important to relieve distress, than strictly to observe that rule which would have excluded them from admission altogether.

GENERAL TREATMENT.

The same uniform kindness has characterised the conduct of all the officers and attendants, this year, which has been so manifest on former occasions.

Patient perseverance, and unceasing endeavours to soften down the asperities of mental suffering, have constituted, as it were, the watchword of the establishment. All cases which may have been introduced under circumstances of unnecessary restraint, have met with some immediate mitigation, if not a total suspension, of coercive measures. The cases have been very few which have required much perseverance of restrictive treatment. One female curable has been peculiarly pertinacious in her attempts to inflict some injury on herself—the padded room has been a means of frustrating this disposition more, perhaps, than any other expedient.

The personal care and forbearance exercised by the male and female attendants on each side of the Hospital respectively, cannot be too highly appreciated.

The unwearied kindness of the Matron, on the one hand, and the indefatigable assiduity of the Steward, on the other, can be equalled only by the unvarying attentions and benevolent demeanour of the resident Medical Officer, who has so recently been appointed to fulfil the duties of his arduous post.

It will be gratifying to the Governors to hear, that his predecessor, although crippled by the labours of long service, is enjoying, through their munificence, that comfort and relaxation, which is the solace of declining years, and the support of an impaired constitution.

CLASS OF PATIENTS.

As in the Report of last year, so on this occasion it will appear, that the gates of the Hospital have been open to a large variety of denominations, as regards their places of nativity, their religious persuasion, and their occupation in life. The Statistical Tables accompanying this Report, and which nearly resemble those of last year, will detail all the particulars in connexion with these minor circumstances.

In many instances, the comforts enjoyed are far beyond those which the poorer lunatics have been able to attain during their previous life; while those of a rank a little more elevated, must appreciate, as soon as they are capable of doing so, the fitness and propriety of all the arrangements, and their precise adaptation to the main object in view—their own efficient restoration to a sound and healthy tone of mind.

ATTENDANTS.

The same uniform regularity and kind demeanour pre-

vails among the male and female attendants which characterised the preceding year. The same attention to the night-watches, and the same diligent endeavour on the part of all to lighten the sufferings of those committed to their care. The boys attached to the work-shops have the same opportunities afforded them, under the tradesmen-assistants, of being trained up as attendants, in addition to learning trades, and the duties of domestic servants—the intermixture of youth and experience, of sane direction on the one hand, and submissive patients on the other, is not without its interest.

PUPILS

The attendance of pupils, all things considered, has, during the earlier part of the year, been satisfactory, and some degree of interest excited; but it is to be feared that no regulations or inducements, however liberal, will insure much assiduity, as it is to be regretted that there is no demand for proficiency in this branch of medical knowledge, in any of the examinations of candidates at the great medical institutions.

As long as this is the case, much attention to so peculiar a subject can hardly be expected; and so many other points of general interest occupy the minds of medical pupils, that a cursory view of insanity is by them considered sufficient; and with all advantages offered to medical students by the Governors of Bethlem, the result will induce a conviction, that nothing short of necessity will insure much diligence. The same indifference is too manifest at other institutions; and although the pupils at Bethlem, during the past year, have possessed considerable talent, and large general information, they have not ventured to engage in the production of an essay.

Perhaps the undertaking presented too formidable an aspect—and, indeed, it is hardly to be expected, at the close of an attendance of six months, that the floating notions acquired on so abstruse a subject should be sufficiently matured to enable a youthful observer to arrange his information with any thing like an accurate propriety. Certainly it has not arisen from any deficiency of medical talent on the part of our recent pupils, who have distinguished themselves on other occasions when engaged in more congenial pursuits.

They are well aware that they will not be called upon by the Colleges of Physicians or of Surgeons to undergo any examination, or present any testimonials on the subject of insanity; and as long as this is the case, more absorbing topics will draw away their attention and occupy their minds.

As a matter of medical curiosity, some gentlemen have been induced, from time to time, to enlist themselves as pupils at Bethlem, rather as a fleeting pursuit to fill a vacant hour, or captivated by the novelty of the scene, than as a matter of steady cultivation.

There have been a few splendid exceptions to this rule, and during the lapse of the last thirty years, some distinguished names are to be found among our pupils. The present Physicians of Saint Luke's, and the late lamented Dr. Warburton, are to be enumerated among them, as well as the Medical Superintendents of some of our County Asylums, and other eminent provincial physicians. These, however, constitute rather the exception than the rule. The mental branch of the profession is very limited, and therefore the number of these will be also limited who take up a practice so peculiar. It is, indeed, an arduous department, and involves great responsibilities, as the mental Physician is, in many instances, the arbiter of the

liberty of the subject, and is very apt to be suspected of too much severity on the one hand, if he keep too tight a rein, and of too much laxity on the other if, by the slightest inadvertence, he allow any untoward accident to occur.

AMUSEMENTS.

Much attention has been paid to the amusements of the patients during the past year. The library, and billiard and bagatelle rooms are very generally occupied on the male side by the better classes, and much interest excited by books, cards, and games, enlivened occasionally by some little musical effort on the part of any patient who may happen to be skilled in this art. A few instances of very striking improvement have arisen, apparently from the recreation of the library—in one instance, deep depression has been dissipated—in another, rude loquacity silenced.

In this department, a patient of superior education has taken the helm, and derives much interest and benefit himself from his endeavours to regulate the rest. Some of our best standard works are here to be found, intermingled with periodical publications—Chambers' Journal, and the Illustrated Newspaper, afford many an interesting reminiscence, excited by the engravings, as they happen to hit the fancy, or chime in with the recollections of individual patients in their former sphere of life. Considerable skill is sometimes displayed with the mace and cue at the bagatelle table, and occasionally at billiards, while cards, draughts, and dominos, and frequently chess, give a variety to the scene. In one instance, a very singular set of chessmen has been fabricated by a very ingenious artist in the government department.

Perhaps some accordions and musical-boxes might be introduced with advantage—dissected maps, puzzles, and other ingenious trifles, well calculated to amuse a weary hour in the absence of graver pursuits.

On the female side, we know not whether to class the workroom among the scenes of amusements, but it is a pattern to all workrooms, and rife with all manner of neatness, good order, and comfort; much diligence is there displayed, and an air of cheerfulness visible throughout.

The room within presents many resources which might be extended and multiplied.

The little bazaar of former years, we hope to see restored, as a happy mode of displaying the workmanship and skill of several patients; a few are possessed of sufficient musical talent to use the piano, which is occasionally a source of lively entertainment; books and games are also intermingled here.

We often feel the happy contrast of these apartments with scenes out of doors, which, in point of order and propriety, cannot pretend to compete with the sober regulations of our scenes of amusements and recreation within the walls of Bethlem. This remark may appear to present an aspect somewhat satirical; but it is grounded on truth and observation, and will stand the test of scrutiny.

OCCUPATIONS.

Many sources of employment have been gradually opened, and a very large proportion of patients, amounting, on an average, to 262, are daily engaged in one occupation or another. The garden and the workshops for the males, and the laundry and needlework for the females, fill up a considerable portion of their time. There is

something particularly agreeable in the sight, when numerous parties of men are busily employed in the garden, digging, sweeping, rolling, weeding, or any other department of an innocent character. Many have been employed in the workshops with advantage and without any accident, some as carpenters, others as smiths, coopers, plumbers, masons, and in various other occupations which demand mechanical skill.

The women are very assiduous in the various departments of the laundry, and not only derive considerable benefit and recreation themselves, but bestow very useful labour on the Hospital: in one instance it was highly interesting to see the iron circlets, which had formerly been used as manacles, converted into stands for the irons employed in ironing the linen; and it strongly reminded us of the descriptions of the golden age, when spears were beat into pruning hooks, and battle-axes into ploughshares. The laundry vies with the workroom in neatness and order and the general propriety of its arrangements. In many instances we have felt a reluctance to part with so many respectable and usefully-employed patients, who, on their part, have shared in the reluctance to leave so comfortable an asylum. The general daily cleaning of the galleries, and different apartments, is also conducted on each side of the House by the patients respectively; and in the summer season, many of the males are engaged in an annual whitewashing, which not only preserves the neatness of the superficial appearance, but adds materially to the general health of the household.

One of the incurable males is very constantly engaged in cleaning the windows throughout the establishment, for which he is in the habit of making heavy charges, and is as much amused by the bills he draws out against the Treasurer as by the work itself; and he seems to

exult in a sort of supercilious view of his own merits, and the dismay which must be produced by his heavy demands. In one way or other, the general stir and bustle at certain periods of the day resemble the activity of a beehive, and disseminate throughout an abundance of cheerfulness and good-humour, as far as such properties are likely to co-exist with mental disturbance and eccentric habits.

DIVINE SERVICE.

The new dome presents a handsome elevation, and its interior contains a very enlarged chapel, capable of accommodating 220 persons. During its construction, temporary arrangements were made for divine service, and any material interruption has been sedulously avoided. The average attendance of males has amounted to 33, and of females to 87, making together 120, exclusive of criminals.

CLASSIFICATION.

Every opportunity of subdivision has been attended to. The new convalescent galleries will be a further means of subdivision, and they are proceeding fast towards completion. They are very well lighted and ventilated, and have free communication with the body of the house, and are accessible by separate stone staircases. The more select residence of convalescents together will tend gradually to wean them into the quieter duties of life, and to separate them from ruder scenes and stricter discipline.

The only difficulty in carrying out this excellent theory, will be the natural repugnance felt by many of the patients to quit their old haunts and former associates. This re-

luctance sometimes goes very far—and we find some of the most tranquil and orderly patients still manifesting a preference for their companions in the basement, and separated with difficulty from them.

This attachment may probably arise in part from a regard for particular attendants, naturally resident in particular galleries; and in this point of view much credit is reflected on these attendants, from the mere fact of their having thus won the regards of those committed to their care. In some individual instances this feeling has been very strong, and sufficient to overcome every consideration of other advantages. However numerous the subdivisions of classification, something will always remain to be desired, and we must not expect to attain any thing like a perfect arrangement.

RESTRAINT.

Great pains have been employed to reduce the ratio of restraint as far as possible, compatibly with the safety of the patients, and those about them. The proportion which appeared in the last General Report to have been

in 1839 — $11\frac{3}{5}\frac{3}{2}$	1842 — 3
1840 — $13\frac{2}{5}\frac{0}{2}$	1843 — $3\frac{4}{5}\frac{4}{2}$
1841 — 9	1844 — $1\frac{3}{5}\frac{5}{2}$

stands in the year 1845 at $1\frac{2}{5}\frac{0}{2}$.

The canvass muffler, which sometimes wears a grotesque appearance, is nevertheless very serviceable, as it prevents any undue action of the limbs, and yet does not gall or irritate as closer modes of coercion are apt to do. The padded rooms have been employed occasionally, and with some advantage, although the material is scarcely soft enough to prevent some inconvenience. Were it, however, more soft and pliable, other objections would arise,

such as the greater absorption of urine, and the more easy abrasion and destruction of the material itself. One female patient in the latter part of the year, whose peculiar tendency has been to strike her head forcibly against the wall or the floor, has here found a congenial apartment, and her attempts have been materially frustrated.

No instance whatever of suicide has occurred during the year, nor have any cases arisen which have rendered inquests necessary—a circumstance peculiarly satisfactory to the officers of a public institution.

INCURABLES.

On the 31st of December, the number of patients of this class, was 40 males, and 49 females—total, 89—being 2 more as compared with last year. During the year there have been admitted 5 males and 2 females, and there have died 2 males and 3 females. They are always selected from the dangerous and mischievous patients, either to themselves or others, who have passed through their year in the curable wards, and the Hospital is to them an asylum and refuge for the remainder of their days, as has been very remarkably exemplified in the case of one very aged female, who has been fifty-three years in the Hospital, and of another who recently died after forty years' residence. There now remain only 3 males and 2 females of those patients who were removed in August, 1815, from the old Hospital in Moor Fields—the relics of thirty years. They all enjoy the same comforts with the curable patients. There is a general disposition to be clamorous and talkative among many of them, and especially on the female side. Some are employed in making toys, and others in nursing dolls as carefully as their own

children. On the male side, one patient is very skilful in constructing patchwork coverlids.

They each contribute a small weekly payment; and we hear with satisfaction some latent intention of placing this part of our establishment on a footing which will do away with all subsidiary aids of this kind.

CRIMINALS.

There have been admitted during the present year 7 males and 4 females—and there have been discharged, under the warrant of the Home Secretary, 1 male and 2 females. There have died 2 males and 1 female.

We beg leave to subscribe ourselves,
with every sentiment of respect,

Your most faithful Servants,

(Signed) EDWARD THOS. MONRO, M.D.
ALEX. MORISON, M.D.
