## REPORT OF THE VISITORS OF THE DEVON COUNTY LUNATIC ASYLUM FOR

#### THE YEAR 1864.

#### PRESENTED AT EPIPHANY SESSIONS LAG

The minutes of our proceedings during the past year do ot record any facts which require especial notice. The state if the Asylum is in all respects satisfactory, and we are radually making such improvements, as will increase the entilation, and particularly as regards the asphalte floors will mitribute to the health and comfort of the Patients.

And more anorganty has been greater than in any previous year wing to the large number of patients sent muo the Asylum a hopeless state; but, we feel thankful in being able to port, that it has been entrely free from any epidemic sorder, which, in consequence of the deficient supply of ater during the long dry season, might have been attended.

Assessesses to the Generatory of water, we reported fully upon that bject to the Court at the last Quarter Sessions, and have termined after much consideration to expend as much as by be required of the sum then granted in the experiment lengthening the pumps in the well, in the hope that it will ove successful, and so prevent the necessity of a considerle outlay in procuring a supply of water from a distance.

We take this opportunity of expressing our best thanks to Earl of Devon and Sir L Palk, Bart, as the owners of it in the neighbourhood, for the kindness and likevality is which they have met us with the view of procuring the ter supply, should the plan of new pumps prove ineffectual. We have been enabled to reduce the weekly rate of mainance from 9s. to 8s. 9d. per week.

22,000 of the Building debt has been paid off, which is

the number of patients in the Asylum on the 31st of cember was 676, namely, 279 males, and 397 females

### REPORT OF THE VISITORS OF THE DEVON COUNTY LUNATIC ASYLUM FOR

#### THE YEAR 1864,

#### PRESENTED AT EPIPHANY SESSIONS, 1865.

The minutes of our proceedings during the past year do not record any facts which require especial notice. The state of the Asylum is in all respects satisfactory, and we are gradually making such improvements, as will increase the ventilation, and particularly as regards the asphalte floors will contribute to the health and comfort of the Patients.

The mortality has been greater than in any previous year owing to the large number of patients sent into the Asylum in a hopeless state; but, we feel thankful in being able to report, that it has been entirely free from any epidemic disorder, which, in consequence of the deficient supply of water during the long dry season, might have been attended. with serious results.

As to the deficiency of water, we reported fully upon that subject to the Court at the last Quarter Sessions, and have determined after much consideration to expend as much as may be required of the sum then granted in the experiment of lengthening the pumps in the well, in the hope that it will prove successful, and so prevent the necessity of a considerable outlay in procuring a supply of water from a distance.

We take this opportunity of expressing our best thanks to the Earl of Devon and Sir L. Palk, Bart., as the owners of land in the neighbourhood, for the kindness and liberality with which they have met us with the view of procuring the water supply, should the plan of new pumps prove ineffectual.

We have been enabled to reduce the weekly rate of maintenance from 9s. to 8s. 9d. per week.

 $\pounds 2,000$  of the Building debt has been paid off, which is now reduced to  $\pounds 14,000$ .

The number of patients in the Asylum on the 31st of December was 676, namely, 279 males, and 397 females.

During the year 82 have died, and 85 have been discharged, of whom 70 had recovered.

From this statement it will be seen, that notwithstanding the additional accommodation afforded during the last few years, the building is still overcrowded; but as the Corporation of the Poor of the city of Exeter have given us notice of their intention to remove their chronic patients about Ladyday next, we hope that the existing Asylum accommodation will be sufficient, and render it unnecessary for us to call upon the county for further additions.

The farm buildings are in a forward state, and we have been anxious to complete a large portion of them during the present year, in order to commence the establishment of a dairy with as little delay as possible; some of the fences of the farm have been removed, and several acres laid down to grass. The cost of the building as it has proceeded has been defrayed out of the Building and Repair fund, the amount of which will be presented with the General Account, at the next Quarter Sessions.

We have to express our entire satisfaction with the manner in which the Medical Superintendent and other Officers of the establishment continue their duties, and to request the Court to appoint the Committee of Visitors for the ensuing year.

#### SAML. TREHAWKE KEKEWICH,

Chairman.

oured was 1844 days.

### NINETEENTH ANNUAL REPORT OF THE MEDICAL SUPERINTENDENT.

The Medical Superintendent has the honour to submit to the Committee of Visitors the Nineteenth Annual Report.

During the year 1864, 169 patients were admitted, of whom 82 were men and 87 were women.

During the same period 85 were discharged, of whom 37 were males and 48 were females; of these, 70 were discharged recovered.

The deaths during the year have been 82; males, 42; females, 40.

The total number of patients under treatment during the year has been 843.

The following Table shews the changes which have occurred in the Asylum during the year.

Number of Patients, 31st December,	1863	Males. 276	Females. 398	Total. 674
Admissions during the Year 1864		82	87	169
Total during the year		358	485	843
Discharged		37	48	85
Died		42	40	82
Remaining in the Asylum, Dec. 31st,	1864	279	397	676
Average number resident during the	Year	278	396	674
Number deemed curable on Dec. 31st	, 186	4 19	25	44

The recoveries have been 41.4 per cent. on the admissions. The death rate has been 9.72 per cent. on the total number under treatment during the year, and 12.16 per cent. on the average number resident. The average age at death was 53.

The average residence in the Asylum of those discharged cured was 184<sup>1</sup>/<sub>2</sub> days.

During the year 82 have died, and 85 have been discharged,

In the majority of the patients discharged recovered, the disease was of recent date, and consequently, more amenable to medical treatment. The importance of sending patients to Asylums in the early stages of mental disorder, has long been insisted on by those engaged in the treatment of the insane, but the experience of the past year has shown, that in some instances, recent and *curable* forms of the disease have been allowed to remain at their own homes, until from refusal of food, excitement, and other causes, they have been admitted into the Asylum in a moribund state, and, in spite of careful nursing, and the administration of stimulants, have sunk in a few days.

The recommendation made by the Visitors last year, "suggesting that it is of the greatest importance that no chronic and harmless cases should for the present be sent to the Asylum," has been in many instances disregarded, as many old and feeble patients have been admitted who had lapsed into second childhood, and were suffering from the mental and bodily infirmities incidental to old age. These patients seldom require more than a liberal diet and careful nursing, to make them happy and peaceable; and the question naturally arises, whether it would not have been more economical to the Unions, and at the same time, have been a means of relieving the overcrowding of the Asylum, if a more liberal scale of diet or parochial relief had been afforded patients of this class. Many have been brought in a hopeless state of debility, and have only lived a few weeks.

There are at least 100 harmless chronic patients in the Asylum who might be removed to the wards of Workhouses, where proper arrangements are made for their accommodation, treatment, and diet. The Commissioners in Lunacy in their Eighteenth Report, p. 74, "consider that the following conditions are indispensable, and will in all cases be insisted on, viz.:

(1.) Separate wards for the patients of the respective sexes. The dormitories to be distinct from the day rooms, and the former to afford cubical space per patient of 500 feet, and the latter 400. Single bed rooms to contain at least 600 cubic feet.

(2.) A liberal dietary, analagous to that of the Asylums.

(3.) Ample means of out-door exercise and recreation.

(4.) Due medical visitation.

(5.) Properly qualified paid attendants. bend new object

(6.) Medical and other registers, records similar to those in use in licensed houses." It is a subject for congratulation, that although small pox and other zymotic diseases have prevailed in adjoining districts, there has been an immunity from any epidemic disorder in the Asylum. This was a source of great anxiety to your Medical Superintendent during the Autumn, when the overcrowding was at its height, and the dearth of water was severely felt; during the whole of the summer, the water supply was insufficient for cleaning the wards, flushing the closets, &c.; and ofttimes when the drought was at its maximum, there was an entire cessation at the detached new house, containing 100 patients; and for cooking and general purposes, water had to be drawn in barrels from a distant spring.

The rate of mortality has been unusually high during the year, and, as in former years, the chief causes of death have been phthisis, general paralysis, and senile decay. There is an almost entire absence from the obituary table of any acute and preventible disease.

The following analysis of the obituary table gives at one view the general causes of death, apart from the details. Deaths from phthisis, 15; general paralysis and phthisis, 10; general paralysis, 10; old age, 23, (the average age at death was 70, 2 cases were complicated with gangrene of the foot, 4 with heart disease and bronchitis, 1 with renal disease, 4 with earthy degeneration of the cerebral arteries); cancer of the lung, 1; exhaustion from burn and phthisis, 1; softening of the brain, 3; exhaustion from acute mania with heart disease, 1; diarrhœa with long standing hernia and hydrocele, 1; gangrene of the foot, 1; abscess of the brain and renal disease, 1; exhaustion after melancholia, 1; apoplexy, 2; diarrhœa, 2; cirrhosis of liver, 1; renal disease and bronchitis, 1; hydatids of the brain, 1.

A few cases may be selected from the obituary table which are of sufficient interest to deserve a brief notice.

W. T., No. 2642, admitted on January 29th, 1863, with the symptoms of general paralysis marked in more than an ordinary degree, viz., tremors of tongue and facial muscles, inequality of pupils, hesitancy of speech, unsteady gait, and characteristic delusions of an ambitious and exalted nature. He fancied himself a millionaire, and cargoes of gold were constantly shipped for him, his ribs were of silver, and his inside was lined with gold, &c. He gradually became weaker, and more demented. On the 11th of April, a large carbuncle formed on the nape of his neck. He became much emaciated and exhausted, and but slight hopes were entertained of his recovery. By the administration of stimulants and careful nursing, he gradually rallied and recovered his usual strength. After a short residence, he lost his delusions, became strong and robust, and worked on the farm ; there was an entire freedom from tremulousness either of the tongue, or of the muscles of the extremities, and he was discharged *apparently* cured, on the 18th July, 1863. He was re-admitted into the Asylum on the 20th of April, 1864, in the last stage of general paralysis, with dementia ; from his history it appeared that, soon after his discharge, he relapsed into his former state, and gradually became worse. He died seven weeks after his re-admission.

This case is cited here, as it tends to throw doubt on the so-called "crises" in the progress of general paralysis, and the permanent benefit, which, according to some French physicians, they are supposed to exert. This crisis has been described as consisting of an eruption on the skin, or of boils, or carbuncle. If this patient had been lost sight of, he might fairly have been added to the list of curables, but his history is confirmatory of the opinion held by most English psychologists, that general paralysis, as met with in Asylums, is an incurable form of mental disease.

S. R., No. 1084. This patient, a chronic maniac, had been an inmate of the Asylum for 11 years, and suffered from heart disease of long standing, and emphysema. She was subject to occasional attacks of bronchitis. On February 28th, she was laid up with bronchitis, the breathing was distressed, and the face and head were much congested and livid from the imperfect arterialization of blood in the lungs, and faulty action of the heart. On March 1st, when she was recovering from her chest affection, she became suddenly paralyzed on the right side, with coma and stertorous breathing. The ordinary remedies failed to arouse her, and she succumbed to the disease on the sixth day of her illness. At the post-mortem examination, the aorta was found to be much dilated; the inner coat had undergone atheromatous degeneration, and was in spots studded with earthy plates, which projected somewhat from the surface. Fibrinous clots of recent formation were adhering to these projections; they were slightly coloured and consistent, but could be peeled off with slight force. On tracing up the vessels from the aorta, the left carotid, at its point of division, was found to be plugged with a firm coagulum, which extended into both the internal and external branches of the common carotid. On opening the artery, the clot was firm and spindle shaped, about the size and shape of a common leech; it was fibrinous and pale, and completely plugged the orifices of both vessels. The internal coat of the artery was roughened from atheromatous deposit, and was stained with blood pigment deposited from the plug. The brain was much congested, and the vessels at the base were diseased.

In this case, no doubt owing to the imperfect and sluggish flow of blood through the lungs, and the feeble action of the heart, the blood in passing over the roughened surface of the aorta, deposited a portion of its fibrin, which coagulated. A small piece of this coagulum was next washed off into the current of blood, and carried up the left carotid, until its progress was arrested at the point of division of the vessel where its calibre becomes much smaller. It thus formed a nucleus, around which more fibrin was deposited, until the supply of blood to the left side of the brain was cut off, and paralysis of the opposite side was the result.

Such a well marked case of embolism does not often occur in the practice of the Asylum, but it is probable that embolism is a not uncommon cause of paralysis and death among our patients. May not embolism of the pulmonary artery and other vessels be an occasional cause of the sudden death, which is usually attributed to syncope, of patients suffering from acute mania? And again, may not thrombosis of the cerebral sinuses or embolia, be found in epileptics who die suddenly?

M. W. No. 2644, an epileptic, had been in the Asylum 13 months, she was subject to slight epileptic fits at night, and on two occasions she had a severe series of fits with coma, which scarcely intermitted for thirty-six hours. In the intervals she complained of pain in the head, and weakness of sight. On her admission, she had a delusion that her food was poisoned. She died in an epileptic fit on Feb. 9th, 1864.

At the post mortem examination, the surface of the brain was dotted with echinococcus cysts, ten or more in number, and varying in size from that of a hazel nut to the size of a pigeon's egg. The cysts were semi-transparent and homogeneous in structure; they were filled with a serous looking fluid, in which floated a number of flocculent bodies. By careful dissection of the sac, the head of the worm with its short body, was found adhering to the germinal membrane, and by the aid of the microscope the row of cephalic hooklets and suctorial disks were clearly demonstrated. This form of parasitism, fortunately, is of rare occurrence, though in less important parts of the body, the liver and other viscera, it is by no means uncommon. The disease is strictly analagous, both in its nature, and in the effects it produces, to the "sturdy" or "staggers" in sheep, which is caused by an allied form of parasite, the *cenurus ccrebralis*.

The best clinical history of hydatids in the brain, with illustrative cases gathered from various and scattered sources, is to be found in Davaine's *Traité des Entozoaires*, &c., Paris, 1860.

No. 1912, whose death was caused by a burn and phthisis, is interesting only from its novel origin. She was exercising as usual, in the airing court, on the 6th of October, when a large burning flake of soot from the central kitchen chimney fell on her linen dress and ignited it, the wind blowing strongly at the time. The inner side of the right arm and right side of the body were much burnt. The attendants were, fortunately at hand, or the results might have been much worse. The burns progressed favourably, and were healing rapidly, and but for the existence of phthisis a reasonable hope of recovery might have been anticipated.

For some time past the thermometer has been employed in the daily medical practice of the wards, and its use has fully justified the belief, that the results give important indications in the diagnosis and treatment of mental, as well as of the more ordinary bodily diseases met with in Asylums. Physicians engaged in the treatment of the insane have unusual difficulties to encounter, both in diagnosis, and in carrying out the subsequent treatment; this arises mainly from the frequent inability and unwillingness of the patients to give any information about themselves or their complaints. In this respect, the treatment of the bodily infirmities of the insane bears a close resemblance to that of children, who are unable to make their wants and sufferings known; the physiognomy is often the key to the interpretation of the nature of the disease. Of the various acquirements of an alienist physician, there is none of greater importance than an intimate knowledge of the physiognomy of bodily as well as of mental disease. An illustration, not uncommon, may be mentioned, that at the daily visits in the wards, patients, though uncomplaining, or perhaps even asserting that they were never better, are suspected of having, e.g., pneumonia, bronchitis, or phthisis, and the opinion formed at first sight, is verified by subsequent examination. It is often difficult to make a satisfactory physical examination of the

state of the lungs and heart, owing to the patient's obstinacy or excitement; they frequently hold their breath when told to do otherwise, or make noises which mask the natural breath sounds, and perform other vagaries which are familiar to most practitioners, and it is only by calling to one's aid every means which may throw any light on the nature of the disease, that a correct conclusion can be arrived at.

The clinical use of the thermometer is of comparatively recent introduction, but there is no doubt that it will in future take its place among the older and more tried instruments of our art—the stethoscope, test tube, and microscope. A series of experiments, carefully conducted, and extending over a considerable period, would be of great value and interest, and, no doubt ere long, observations on this subject will be forthcoming from some of our Asylums, of the typical curves of temperature in mania and other diseases, similar to those published by Wunderlich in Germany, and by Parkes and Ringer, on fevers, pneumonia, and phthisis, in our own country.

A cursory view only, can, in the present place, be taken of the value of thermometry in Asylum practice; it will prove to be of great service in the prognosis and treatment of acute mania, especially in those cases which partake of the typhoid type of the disease, with sleeplessness, excitement, gradual wasting, and tendency to death from exhaustion; the temperature of the body is often from three to five degrees above the natural standard, and in proportion to the departure from this average (98° F.) is danger to be feared. Both the wasting of the body and the high temperature in such cases are due to the same cause,---viz., the rapidity with which retrograde metamorphosis, and the disintegrating processes are going on within the body, and are at all times certain indications for the employment of stimulants, or, in more homely phraseology, the combustion going on within must be fed with strong fuel from without.

In general paralytics, whose nutritive processes are carried on sluggishly and imperfectly, the temperature is often one or two degrees below the average, but on the access of maniacal excitement, to which they are frequently subject, the temperature immediately rises, and again recedes as they lapse into their former quietude. During their congestive attacks, when epileptiform fits or complete coma suddenly comes on, there is generally a considerable elevation of temperature. In the case of a general

paralytic patient, who died recently, the temperature of the body for some time remained at 96°, two degrees below the healthy standard, but an hour after one of these congestive attacks with twitchings of the extremities, the temperature rose to 105°, and on the following day to 106°; thus, in less than thirty-six hours, the temperature rose ten degrees. In this case, the temperature indicated great danger, and the patient died thirty-six hours from the conmencement of the attack. In the investigation of the bodily diseases ordinarily met with in Asylums, thermometry is of great service in the diagnosis of phthisis and tuberculosis. The latent form of the disease is frequently met with, with an absence of the ordinary symptoms of cough, &c., and even on making a physical examination of the chest, it is at times difficult to make a satisfactory diagnosis : but if the thermometer be employed daily, and the evening temperature be constantly two or more degrees above the average, we may safely conclude that the patient has phthisis. It is, of course, assumed that every source of error has been eliminated, with an absence of other diseases, and that this indication be taken in conjunction with the general evidence. The diagnosis of the early stages of phthisis is of the more importance, as it is only in this stage, that in the overcrowded wards of Asylums, we can hope to benefit our patients to any extent. In pneumonia also, its indications are of importance, as patients who occasionally oppose obstacles to a careful auscultation of the chest will seldom object to allow the bulb of a thermometer to be placed in their axilla; and it has the additional advantage that they can exert no control over its accurate readings.

A greater number of male patients have been employed on the farm during the past year, in making the necessary alterations and improvements on the land recently purchased. The farm buildings now in course of erection, have afforded an ample source of daily employment. The whole of the excavations, and much of the masonry and carpentry, have been done by Asylum hands.

The average weekly cost of maintenance, medicine, clothing and care of patients during the year has been 9s.

The amusements continue as in former years, with a few additions from time to time. The weekly dances are a great source of innocent enjoyment; the Christmas and New Year's balls have been attended with great success.

During the winter, your Superintendent has given weekly readings to the patients, and occasional lectures on popular subjects. The subjects selected have been from the works of popular authors, and have comprised readings from Dickens' Pickwick Papers, Oliver Twist, English versions of some of Molière's Comedies, The Ingoldsby Legends, &c. The lectures have been of a simple nature; on the History of Newspapers, with an account of Paper Making, Printing, &c.; Iron, an account of the operations of roasting, blasting, casting, rolling, wire manufacture, &c. Your Superintendent has been pleasurably rewarded for his efforts to amuse and instruct the patients, by the great interest they have taken at these weekly meetings, the pleasure with which they anticipate them, and, he is glad also to add, that it has given many something to think and talk about during the week, and the hope may be expressed that it has been the means of arousing some from a state of apathy and listlessness.

The most important alteration in the central Asylum buildings during the year, has been the fitting up of the old workroom as a dormitory, containing 12 beds, and the conversion of the gardener's seed, root, and tool rooms into a workroom for needlewomen (32 ft. by 20), with an adjoining storeroom and room for the attendant needlewoman. At the North Cottage a cheerful, light and airy day room, with pantry and wash house adjoining, supplementary to the dormitory above mentioned, has been obtained by converting a lumber room, little used, with adjoining nurse's room, &c. The whole of the work was done by the patients, and our staff of artizans; the whole expense of flooring, plastering, papering, &c., did not exceed £150, which was defrayed out of the Building and Repair Account. These rooms are among some of the pleasantest in the Asylum. Of minor improvements may be mentioned, the removal of the wire blinds in the dormitories, and in No. 6 Gallery; the removal of the screen in No. 6 Gallery; the painting of several of the galleries, and papering and colouring of some of the dormitories, which have enlivened the appearance of the wards, and exercised a beneficial influence on the patients. Much remains to be done in this respect, and it is hoped that when the labour now concentrated on the farm buildings is no longer required, further improvements will be carried out in the Asylum; among which may be especially mentioned, the removal of the objectionable asphalte flooring, and its substitution by wooden flooring, in all the galleries and day rooms. These alterations would conduce greatly to the health and comfort of the patients.
