RALPH NEVILLE, Esq., Butleigh.
WILLIAM H. M. COLSTON, L.L.D., West Lydford.
J. M. CARROW, Esq., Wells.
WILLIAM PINNEY, Esq., M.P., Somerton.
JAMES CURTIS SOMERVILLE, Esq., Dinder.

TREASURER;

CAPTAIN GILES, Stuckey's Bank, Wells.

REPORT

OF THE

VISITING JUSTICES

OF THE

SOMERSET COUNTY PAUPER LUNATIC ASYLUM,

December 31st, 1850.

THE COUNTY LUNATIC ASYLUM has now been opened for the reception of patients three years, and your Commitee can speak from experience of its beneficial effects to that afflicted class of persons for whose good the legislature ordered such buildings to be erected. It is gratifying also to the Committee to believe, that its advantages are appreciated by the public. Many persons from different parts of the County have visited it, and their entries in the Visitors' book show their satisfaction at the comforts afforded to the patients, and the manner in which the establishment is conducted.

The expenditure has been regulated with as much economy as is consistent with the requirements of such an institution, and they are glad to be able to announce a further reduction in the charge to the parishes for their paupers.

The number of the inmates is gradually increasing, while the number of cures and discharges in proportion to those remaining in the house is annually decreasing; proving that the incurable form a large majority, and that eventually they must occupy much of that room which might be more advantageously appropriated to recent cases of disease, in which there might be great hope of recovery under the remedies applied. During the first year 284 were received, of whom 51 were discharged off the books at its close. In the second year, with those remaining and the new patients, the number was 381, of whom 95 had been discharged off the books at the end of the year; and during this year the united number has been 417, of whom 319 are still on the books. This is within 31 of the number, 350, for which the asylum was originally intended. By subsequent arrangements, increased accommodation, without crowding the patients, or diminishing their comforts, can be provided; but if each year brings with it such an access, an addition to the building must be made in the manner pointed out by the architect on first explaining his plan. This may be done at a comparatively little expense, and will, it is hoped, be in a great measure met by the building fund, which is annually augmented by the payments from the foreign or Borough patients. Out of this fund, with the aid of some of the patients, the garden and boundary walls have been advanced, and a cottage has been built for the control of the higher entrance, and superintendence of the weigh bridge, giving additional security to the premises, and lodging rooms to attendants.

A large proportion of the debt has been paid off since the last annual report was printed, leaving still $\pounds 19,000$ of the principal due. A detailed statement will be published in the general report.

C. A. MOODY. F. H. DICKINSON. RALPH NEVILLE. J. HIPPISLEY. J. C. SOMERVILLE.

THIRD REPORT

OF THE

SOMERSET COUNTY PAUPER

LUNATIC ASYLUM,

For the Year 1850.

BY ROBERT BOYD, M. D., SUPERINTENDENT.

PART I.

In again presenting the annual report to the Visitors, the Superintendent is happy to be able to state, that the onerous duties of the institution have been carried on throughout the year in so satisfactory a manner, that there is little to call for any particular observation, increased experience being only required to ensure still further improvement.

It will be unnecessary here to enter into any details of the general mode of treatment, as it has been already fully indicated in the former reports, and the same plan is still pursued, with only such modifications as special cases may require.

The general health of the patients throughout the year has been good, and no epidemic has appeared.

A few patients have been again admitted in the last stage of bodily disease, who might better have been permitted to have died at home, without undergoing the pain and fatigue of a long journey; one of them, aged 83, lived only three weeks after he was transferred to this asylum.

On the 31st December, 1849, the number of patients remaining in the house was 286, since then 131 have been admitted; 117 of these have been new cases and 14 re-admissions; 64, discharged, and 34 have died; there are now 319 remaining. Average number in the asylum during the year 294; 136 males, and 158 females. One convalescent patient is out with his friends, for one month, on trial, at the expiration of which time he will be discharged, if his convalescence should continue. Nothing is more conducive to the quietude and order of the establishment than the general employment of those inmates who are able to work ; for this purpose the cultivation and improvement of the land has afforded the most extensive and profitable occupation for the males, and a few of the females have also assisted, during the summer and autumn, in weeding and securing the crops. A great many of the patients are also employed as formerly in assisting the attendants and tradesmen; also in the officers' apartments; in the laundry, kitchen, bake house and dairy; and in making and repairing the bedding, clothing and other articles used by the inmates: employment being an important part of the treatment in the recovery of patients, and in many cases essential to it. Thus the patients and the asylum are mutually benefited.

With the sanction of the Visitors, a new arrangement has been made with regard to the out-door labor; instead of committing the charge of patients to day labourers, three persons have been hired, to reside in the asylum, who perform the duties of attendants and who are employed with and have charge of the patients out of doors during the day. By this means the attendants become better acquainted with the management as well as with the habits and temper of the insane, and have also a greater interest in encouraging them to work. This plan has been in operation for six months, and has been found satisfactory.

The levelling and clearing the ground still engages much time and attention; upwards of one acre has been reclaimed and turned into excellent arable land, making altogether about $8\frac{1}{2}$ acres of arable land, and 6 of grass, in front of the house.

The liquid manure has proved valuable; the crops produced by it having been most exuberant, especially the cabbages, some of them being five feet in diameter and upwards of 40lbs. in weight, the average weight being 26lbs. each, and the quantity at the rate of 56 tons an acre. This food for the cows was found to improve the quality and increase the quantity of the milk. It was ascertained that the quantity consumed by one cow, on each day respectively, for four days, was 150 lbs. of cabbage, 1st day; 160 lbs. of turnips, 2nd day; 40lbs. of hay, 3rd day; and 155 lbs. of mangold wurzel, 4th day.

A pump worked by a capstan with six arms for 24 men, has been erected, by which the liquid manure is to be raised to the garden. The tank which receives the whole of the sewage of this building, containing 360 individuals, is 141 yds. distant from the house, and considerably below its level; the house being on sloping ground is well adapted for drainage, and shows the advantage of choosing such sites for the erection of public buildings. It has not yet been found necessary to cover the tank, no unpleasant smell being perceptible either from it or from the liquid on the land,* except when you are close to it, and then only occasionally. An eminent physician in London has lately referred to my experience having been consulted with regard to a low fever, which prevailed in an establishment, and which was supposed to have been caused by the effluvium from lands on which liquid manure had been used: in that case the nuisance complained of was much nearer to the house, which was on a much less elevated situation.

A new lodge at the north west entrance and in connexion with the new weighing engine has been built entirely by the house mason with the assistance of patients.

The chapel during divine service is now quite filled; upwards of 200 patients attend daily, and increased accommodation will shortly be required. The chaplain also reads prayers twice a week in the infirmaries. From 40 to 50 patients also attend the Church at Horrington, whenever the weather permits.

The weekly charge for county patients has been reduced from 8s. 2d. to 7s. 7d., during the past year; and owing to the additional number of patients, the low price of provisions and the increased produce of the land, may now be reduced to 7s. An agreement has been made with the Boroughs of Bath and Bridgwater, by which their patients are to be maintained at an extra charge of 3s. $2\frac{1}{2}$ d. a week. It has been thought advisable to place this extra charge to a building fund, instead of to a reduction of the maintenance, contrary to the usual custom of calling on the county for an annual grant for repairs, alterations, additions, &c.

Some applications have been made by their friends, for the admission of persons able to contribute something, but not sufficient to support them in a private asylum. No accommodation was intended here for any but paupers, nor could it be made without materially interfering with their proper treatment and comfort. A few such cases have been admitted here through the parishes: but it is generally found that these patients, as well as those of the completely indigent educated class, being associated in an asylum with paupers (when they have sufficient reason left to distinguish any difference), is attended with evil consequences to both parties, as those educated persons and others who at one time were better off, are apt to become discontented and mischievous, and prone to

^{*} The experiments of Professor Way, of the Royal Agricultural Society, and the practice of the Rev. W. F. Neville, who daily waters the ground surrounding his house with Cow's urine or liquid sewage and experiences no nuisance therefrom, are confirmatory of the above . R. N.

find fault with the food, clothing, &c., provided for the labouring class; and, being unfit to work themselves, their idleness becomes a subject of jealousy or murmuring on the part of those to whom labour is a second nature. The advantages of a separate institution for those who are able to contribute something towards their own support as well as to the indigent of the educated classes has been ably advocated by eminent contemporaries; and the separate accommodation of such cases would no doubt tend greatly to their benefit, as it would also to the quiet, content, and improvement of the poor persons with whom they are at present mixed. It would also be a humane act towards numerous respectable families who are burthened with the charge of such afflicted relatives, which they can ill afford, but who are unwilling, it being perhaps, strictly speaking, also illegal, to make them chargeable as paupers.

The present custom of confining criminal lunatics in asylums erected for the poor of counties, is an evil so obvious that it must strike every one, inasmuch as one object is to afford the inmates as much liberty as possible; and as there is no provision made for separating criminals from others, these asylums are manifestly unsafe places for the detention of public offenders. Many of the insane are also very sensitive and have high moral feelings, and it is very injurious to them to find themselves associated with criminals. Of eight criminal cases admitted here, one was of so dangerous and suspicious a character, that I deemed it my duty to make an application to the Chairman of the Visitors; and, through his representation to the Secretary of State, this case was removed to the criminal wards of Bethlem Hospital. The others were convicted of minor offences; five of them are cases of dementia; they are generally in a feeble state of health, and one of them is a cripple.

The re-admissions during the year, as already mentioned, have been 15 in number; of these 10 were males, and 5 females, and one of these females was re-admitted a second time. A female, who was amongst the earliest of the admissions to the asylum, and upwards of 70 years of age, attributed the cause of her relapse, when convalescent, to poverty, her husband having been ill for a considerable time and unable to work. She has since been discharged recovered. It has been alleged by some of these patients that their relapse had been owing to inability to obtain work. It is desirable that the parish authorities should find employment for their discharged paupers, especially where, as is frequently the case, they have no friends, as their minds, although tranquil, are unequal to much anxiety. More frequently, relapses are caused by the recurrence of the exciting causes, offensive objects, intemperance, &c., as well as by the injudiciousness of friends in recalling to their minds the memory of former grievances.

PART II.

IN THE MEDICAL TREATMENT OF EPILEPSY, benefit has been derived from the use of a tincture of sumbul, which has very much the odour of musk or castor, and has been lately recommended in this disorder. One patient has lately been discharged, who was long subject to most severe and frequent epileptic fits, and had been for many months an inmate of the infirmary; after using this medicine a short time, the fits diminished in frequency, and she had but one very slight attack in the three months preceding her departure from the asylum. At her own earnest solicitation and that of her husband, she was allowed by the Visitors to go home a month on trial: that time has just now elapsed, and she has been discharged relieved. I do not think it likely that she will continue well, as the disorder seemed to be established and constitutional in her case; four out of eight of her children died in convulsions, two of the four now living, are, like the mother, epileptic, and one of them, a daughter, was lately so violent, that her father told me he thought it would have been found requisite to have brought her as a patient to the asylum. The connection in this case, between epilepsy in the mother and convulsions in the children, confirms what I have in former years observed, namely, a hereditary tendency between infantile convulsions, epilepsy, and insanity.* A high medical authority, Van Sweiton states, that persons who have become insane at an early age have been generally first epileptic. Esquirol has come to a similar conclusion. Epilepsy is considered incurable, and the treatment of it in a great measure empirical, unless perhaps when it is symptomatic of disease of the circulating, digestive, or generative organs; a great variety of remedies from all the kingdoms of nature have been recommended, and many of them have long fallen into disuse. In some instances aperients are found to alleviate the severity of the fits, and attention to the diet is also of importance. It is a functional disorder of the brain and spinal cord, and the symptoms, though so severe as to cause death, and that suddenly, often leave no post mortem change from what is considered the ordinary healthy condition of those parts. No doubt changes from the ordinary state are found frequently in the skull, in the membranes of the brain and spinal cord, and in the structure of these nervous centres themselves, in cases of epilepsy ; but the same changes are found in the bodies of those who had never been the subject of epilepsy. The

^{*} Edinburgh Medical and Surgical Journal, No 171. p. 452.

same is also the case with respect to insanity. The changes which are ordinarily described as found in the brains of the insane, I have again and again observed in the brains of persons who had never been insane. Some of those changes, such as thickening and opacity of the membranes with an increased quantity of fluid in the brain, I believe to be a natural decay, which may be premature or the effects of old age, when the brain becomes diminished in size. In epileptics there is sometimes found a partial absorption or diminution in the size of the brain, and on the other hand it is sometimes found enlarged. The last male epileptic who died in the asylum, was a young man aged 23, affected from childhood: previous to his decease a rapid succession of fits came on, which, with some intermission, continued for three days; his respiration was unusually laboured, indeed, almost suspended at times, with frothing from both nose and mouth in large quantity. The greatest peculiarity in the case was the very great size of the brain; it appeared to be almost too large for the skull, and weighed 31b. 6oz. Another rapid case occurred this year in a boy, aged 14, a congenital idiot; he was of a healthy family, the fourth of eleven children; his mother had a fever and was in a bad state of health for six months preceding his birth. At the age of 12, he became violent and dangerous to his younger brothers and sisters, and was sent to the Asylum. He was this year for the first time attacked with epilepsy, and had only two fits at considerable intervals. Previous to the attack which caused his death, on the one day he had twelve severe fits, the following morning he fell into an insensible state and died about noon. The head was unusually large, the forehead large and rather prominent; there was congestion of blood in the vessels of the brain; this was above the average size of an adult's, and weighed upwards of 3lbs.

I may here refer to what I have hitherto observed, and pointed out in former reports, that the average weight of the brain in the insane is above the average weight of the brain in the sane.

Enlargement of the brain, in cases of sudden death in children, was pointed out to me several years ago at the Marylebone Infirmary, by the late Dr. Sims. Several cases of the kind occurred in that institution, when, after a careful examination, no other cause for death could be discovered.

As regards the relative frequency of epilepsy in the sexes, there has been little difference in the asylum. Where the preponderance has been observed greatly in favor of the females, it is probable that cases of hysteria, or other convulsive disorders, to which females are most prone, may have been added to those of epilepsy. There is one thing, however, which has been very remarkable here: as regards the frequency of the fits, the females have had each week more than double and sometimes treble the numbers the males have had. The fits have also observed more regularity in their occurrence in the males; in some they only occur at night, and the symptoms are in most instances less severe.

The male patients are generally more tractable than the females. Notwithstanding the obscurity in which the nature of epilepsy has always been involved, a careful study of it is deserving our utmost attention, as well from its intrinsic importance as in its relations to mental disorder generally being frequently, in the young, the precursor of one or other of the forms of insanity.

The arrangements of the beds for epileptics has been a matter of some difficulty; it has been recommended that they should sleep in associated rooms, in order to guard against accident in the night, as there is danger of their being suffocated whilst in fits. In order to prevent them from disturbing each other as much as possible, partitions have been fixed between some beds, and they are stuffed at the bottoms and sides. They are placed on an inclined plane on the floor, so as to raise the head and shoulders while the bed itself being fixed, there is much less risk of suffocation, and the position is most favourable; and these precautions have hitherto been quite successful here. It has sometimes been found necessary to place those patients who have been likely to injure themselves in a padded room. There have been two or three cases here in which persons not previously epileptic, as far as we could ascertain, have been seized with fits soon after having kindly given their assistance to other patients during their attacks. There may have been predisposition in those cases. But if such were common, the association of persons affected with epilepsy should be guarded against.

There have again been several cases of GENERAL PARALYSIS; of those, seven were fatal to males and four to females. In one female the disease appeared to be caused by a fibrous and fatty tumour proceeding from the upper part of the spinal cord. In the other cases, the morbid changes were wasting of the spinal cord, inflammation with softening and induration of its substance, as well as inflammation, preternatural adhesions and thickening of its membranes. These changes were generally connected with similar changes in the brain and its membranes.

A striking example of general paralysis occurred in the last male but one who died. He was a weaver, aged 48. and was admitted into the asylum last June, until which time he had worked at his trade, but had recently spoiled forty yards of cloth, and had become violent in his conduct. His wife stated, that for six months previous to his mental derangement, she observed he rather tottered in walking, that his lips and tongue quivered, and his articulation became indistinct; afterwards he was wont to laugh at trifles, and had the appearance altogether of an intoxicated person. These symptoms gradually increased after he was placed under my care. He was of a ruddy complexion, very cheerful, and in the habit of doing some light out door work, such as hoeing turnips occasionally. A month before his death he had an attack of diarrhœa, of which he soon got better; but ever afterwards his strength failed, and he was confined entirely to the house. Early on the 12th December, he was seized with violent convulsions, principally affecting the right side; these continued without abatement or relief from treatment for four hours, when he died. On examination after death, there was found abundant evidence of chronic inflammation of the membranes of the brain, and of chronic inflammatory softening of the brain and spinal cord. It was observed that the inflammation appeared to have been more intense in the ventricle connected with the spinal cord, than in the ventricles of the brain. The primary symptoms, as stated by his wife, would indicate that in this case the disease had commenced in the spinal cord and extended to the brain.

I find the statements in my former reports with regard to general paralysis have since been corroborated from other sources. The essential morbid changes occurring in this disease have been overlooked on account of the difficulty of exposing the spinal cord, so as to admit of its examination, the instruments in common use not being suitable for the purpose. Those I have been in the habit of using for dividing the spinal column are a common tenon saw, a mallet, and chisel, all the same as I use in opening the skull; and both operations can be performed with equal facility.

Amongst the diseases which have occurred here, I may mention two cases of Scurvy, a disease now comparatively seldom seen in this country, but mentioned by the late Dr. Prichard in his "Treatise on Insanity," page 149, as occurring in lunatics in the advanced stage. One case was that of a male patient, who obstinately refused any other food but bread and cheese and cider; the other, a female, who always begged to have bread and cheese, instead of meat and vegetables for dinner; her other meals being tea or coffee, and bread and butter as usual in the house. The symptoms of scurvy in each case soon appeared, and were soon removed, principally by the use of fresh meat and cabbage, or turnip tops. Cider was supposed to be an antiscorbutic; but in the male patient, if not favourable to the disease, was decidedly ineffectual in preventing it. Both cases show the necessity of attending to the diet of the insane, and also the impropriety of yielding too much to their fancies.

A great improvement has of late taken place amongst the patients of dirty habits, owing to the strict attention of the night attendants to such cases. Five out of nine male patients, and two females, have been brought into habits of cleanliness, and three other females are much improved.

There has been one coroner's inquest during the year, on an old man, who died very suddenly, from excessive enlargement of the heart, and general dropsy.

Since writing the first part of this report, a male patient attempted suicide; he had tied one end of his neckerchief round his throat, and was attempting to place the other end round a gas pipe, when he was observed.

The dietary continues the same as given in the last report. It has been found that fifty of the patients taken indiscriminately who were weighed in October, and the same patients when weighed again eight weeks afterwards in December of the present year, had increased 53lbs., or more than 1lb., in weight each; showing the sufficiency of the food. The mean weight of the 50 patients, when weighed in October was 140.82lbs., and in December 141.88lbs.

The Tables and Obituary annexed to this report will furnish the usual amount of information.

The superintendent again respectfully returns thanks to the Visitors for their continued support and encouragement in the discharge of his duties.

31st December, 1850.

ANALYSIS OF THE TABLES.

Of the 39 recoveries in the 1st table, 18 were in persons who had been sent to the asylum within four weeks of the first appearance of their disorder, of whom 7 were males and 11 females; the aggregate time occupied in their treatment to effect recovery was 108 months, or an average of exactly 6 months for each : for the 21 remaining, 11 of whom were males and 10 females, who were sent at a later period than four weeks, the time occupied in their treatment to effect recovery was 188 months, or an average of almost 9 months for each. This is a further confirmation of what has been before stated, that it is important, both in an economical and benevolent point of view, to bring patients to the asylums on the first appearance of the disorder. The greatest number of recoveries were cases of mania. The principal causes of the disorder were previous bodily illness in 8, hereditary predisposition in 7, destitution in 5, and intemperance in 3.

It appears by the 2nd *table*, that 71 per cent. of those admitted were brought from their own homes, the remainder in nearly equal proportions from the union workhouses, and from other asylums or the prisons; six criminal lunatics were received under the warrant of the Secretary of State. The discharges, relieved and recovered, were more than 12 per cent. and the deaths 9 per cent. on the admissions for the year.

According to the 3rd table, the fewest admissions occurred in the first three months, and the most during the last three months of the year; the greatest number of recoveries were in the first three months; the greatest number of deaths were in the first and last quarters of the year; the number in each quarter being the same. Of the epileptics there has been a larger proportion of males than of females; and the fits among the females have continued. to be much more frequent than among the males. The number of violent, dirty, and destructive patients in each month has diminished, and the quantity of glass broken has been very much less this year, as may be seen by referring to the corresponding table in last years report. The number in seclusion has also been less this year than last. About one fourth of the patients have been under medical treatment, several were old and infirm. About two-thirds of the total number of the patients regularly attend chapel, and the same proportion are also capable of being employed.

It will be seen by the 4th *table*, that insanity was most prevalent in persons in the prime of life, or from 30 to 50 years of age. More than one half were married persons, one tenth were widowed, and of these more than two thirds were females. Upwards of two thirds of those admitted laboured under a first attack of their disorder.

The previous occupations of the patients admitted during the year, is shown by the 5th *table*. Six were criminals.

By the 6th *table* it appears that the greater number of those admitted were in bad or in indifferent health, so many as 61 per cent. being in that state; and that 53 per cent. of those remaining are still in a similar condition.

The religion and degree of education are shown in the 7th *table*: more than two thirds were of the Established Church: there were only 33, or about one fourth, who were totally without education.

The 8th *table* shews that the physical causes of insanity were most numerous, being nearly two thirds of the whole; the moral causes one third: among the former, hereditary disposition, previous illness, and intemperance were the most frequent causes.

The forms of the disorder are shown in the 9th *table;* and as mentioned in former reports, mania has been the most common form.

In the 10th *table* it appears that the duration of the existing attack in 69, or more than half the number admitted, was of less than three month's duration; 11 of these have since been discharged recovered, 3 not improved, and 5 have died, leaving 40 remaining: of the other 62 cases of more than three month's duration, only 5 have been discharged recovered, 3 relieved, 1 not improved, and 7 have died, leaving 56 remaining.

The 11th *table* shows the numbers admitted of each sex, during each year, the numbers discharged, recovered, relieved, not improved, and dead, and the numbers remaining at the end of the year, distinguishing those of each year since the opening of the asylum to the present time. The ratio "per cent" of the above, is also shown. OBITUARY.-MALES.

SUMMARY OF THE OBITUARY.

The deaths during the year have amounted to 34, of these, 21 were males, and 13 females; 3 males and 7 females died in the first quarter, 4 males and 3 females in the 2nd, 6 males and 1 female in the 3rd, and 8 males and 2 females in the 4th quarter. The mortality was greatest in the first and last quarters, being 10 in each; it was also the same in the second and third quarters, being 7 in each. The time under treatment in the asylum varied in the males from 9 to 996 days; in the females from 13 to 796 days; the average duration for the males was 302 days, and for the females 241 days.

Four males and 1 female were under 30 years of age, 8 males and 4 females from 30 to 50 years, 9 males and 8 females were upwards of 50 years.

Epilepsy was most fatal to the males, it was combined with mania in 5, and with other forms of the mental disorder in 3 cases. Mania was the most frequent form of the disorder, it occurred in 4 males and 6 females. General paralysis existed in 7 males and 4 females; melancholia in 2 males and 2 females; dementia in 2 males and idiocy in 3 males. The bodily condition at the time of admission was good in 1 male, indifferent in 6 males and 4 females, and bad in 14 males and 9 females.

The duration of the disorder was less than 3 months in 2 males, from 3 to 6 months in 4 females, from 6 to 12 months in 3 males and 2 females, from 1 to 2 years in 5 males and 1 female, from 2 to 8 years in 5 males and 4 females, from 8 to 11 years in 3 males and 1 female, from childhood in 3 males and 1 female.

The assigned cause of death in 1 male was apoplexy, in 1 male congestion of the brain and spinal cord, in 7 males and 3 females inflammation of the membranes of the brain or spinal cord or both combined, inflammation of the brain in 1 male and 2 females, softening of the brain and spinal cord in 4 males and 4 females, a tumor in the brain in 1 male and 1 female, enlargement of the brain in 3 males, pneumonia in 7 males and 4 females, pulmonary consumption in 2 males and 2 females, dysentery in 2 females, inflammation of the intestines in 1 male, cancer of the liver in 1 male, erysipelas in 1 male, cachexy in 5 females, enlarged heart and dropsy in 11 male, (a sudden death and inquest case.)

APPEARANCES AFTER DEATH, AND WEIGHT OF THE ORGANS.

Head and Spine: Thickening of the scalp occurred in 1 female; thickening of the skull in 3 males and 2 females; unusual thinness of the skull in 1 male; preternatural adhesions or thickening and opacity of the membranes of the brain in 9 males and 3 females; congestion of blood in the vessels of the brain in 7 males and 3 females; redness of the medullary structure of the brain in 5 males and 2 females; a larger quantity of fluid than natural in the cerebral ventricles, base of the brain, and spinal canal in 11 males and 7 females; roughness of the lining membranes of the ventricles, especially of the 4th, from depositions of crystals, in 4 males and 2 females; general wasting of the cerebral convolutions in 2 males, partial wasting of them in 1 male and 1 female; wasting of the left optic nerve in 1 male who was long blind of the left eye; induration of the brain in 2 males and 2 females; atheroma of the basilar artery in 1 male; pus at the base of the brain in 1 female; cerebral softening in 5 males and 1 female; enlargement of the brain in 7 males and 2 females; wasting of the brain in 1 male and 2 females. Congestion or inflammation of the membranes of the spinal cord in 5 males and 4 females ; softening of the spinal cord in 5 males and 2 females ; induration of the cord in 1 male and 2 females. The weight of the brain varied from 38 to $57\frac{3}{4}$ ounces in the male, and from $36\frac{1}{2}$ to $55\frac{3}{4}$ ounces in the female; the average weight being: in the male 47.9, and in the female 43.3 ounces. The brain in these cases, as in those in both previous reports, being heavier than in the normal state.

Chest: Congestion of the lungs existed in 3 males and 3 females; ædema of the lungs in 4 males and 1 female; the results of inflammation of the lungs or pleura in 10 males and 9 females; pulmonary tubercles in 3 males and 2 females; emphysema in 1 male; dropsy of the chest and pericardium in 1 male; thickening of the valves of the heart in 2 males and 1 female; enlargement of the heart in 8 males and 2 females, heart small in 2 males and 1 female. The thymus body was present in 1 male. The right lung varied in weight from $10\frac{1}{4}$ to 46³/₄ ounces in the male, and from 8 to 30 ounces in the female; the average weight in the male being 26.7, and in the female 17.6 ounces. The left lung varied in weight, in the male from 9 to 46 ounces, and in the female from $8\frac{1}{2}$ to 50 ounces,-the average weight in the male being 22.7, and in the female 18.8 ounces. The heart varied in weight from 5 to 191 ounces in the male, and from $5\frac{1}{4}$ to 14 ounces in the female, the average weight in the male being 11.3, and in the female 8.7 ounces.

Abdomen; Dropsy in 2 males, inflammation of the peritoneum in 5 males and 1 female; congestion, inflammation or ulceration of the intestines, in 3 males and 3 females. Cancer of the liver and absence of the gall bladder in 1 male; ulceration of the gall bladder in 1 male; fatty degeneration of the liver in 1 male and 1 female; enlargement, diminution or softening of the liver in 10 males and 6 females. The spleen differed from the natural state in 4 males and 2 females. There was an example of horse shoe kidney in 1 male; cysts in the kidneys in 1 male; and the pelvis of the left kidney was distended with pus, and weighed 31 lbs. in 1 male. The liver varied in weight from 13 to 81 ounces in the male, and from 241 to 57 ounces in the female,-the average weight in the male being 54.5, and in the female 41.5 ounces. The spleen varied in weight from 2 to 8 ounces in the male, and from 2 to 5 ounces in the female,-the average weight being in the male 4.9, and in the female 3.5 ounces. The stomach varied in weight in the male from $2\frac{3}{4}$ to 10 ounces, and in the female from 4 to 61 ounces,-the average weight in the male being 5.6, and in the female 4.9 onnces. The pancreas varied in weight in the male from $1\frac{3}{4}$ to 7 ounces, and in the female from $1\frac{3}{4}$ to 5 ounces,—the average weight in the male being 4.1, and in the female 3.1 ounces. The right kidney varied

in weight in the male from $1\frac{1}{4}$ to 7 ounces, and in the female from 3 to $5\frac{1}{3}$ ounces,—the average weight in the male being 4.3, and in the female 3.8 ounces. The left kidney varied in weight in the male from $1\frac{1}{3}$ to $7\frac{1}{3}$ ounces, and in the female from 3 to $5\frac{1}{3}$ ounces,—the average weight in the male being 5.4, and in the female 4 ounces. The uterus varied in weight from $\frac{3}{4}$ to 2 ounces, the average weight being 1.5 ounces.

The weight of the body varied in eighteen of the males from 54 to 1881bs., and in nine of the females, from 52 to 1071bs.,—the average weight in the males being 107.71bs., and in the females 74.61bs. The height varied in fifteen males from 5 to 5 feet 11 inches, and in six females, from 4 feet 11 inches to 5 feet 3 inches,—the average height of the males being 5 feet 8 inches, and of the females 5 feet $1\frac{1}{2}$ inches.

Articles Repaired 8403.

M. A. CASWELL, Matron.

Cr.

The quantity of Needlework* done is greater than in the previous year, and estimate at the same rate would amount to about $\pounds 80$.

Seventeen female patients have been generally employed in the Laundry, the amount of their labour is estimated as equal to that of seven hired washerwomen, which at rate of 5s. a week for each, would amount to £91.

The services of the female patients engaged in the kitchens and in house cleaning may be valued at $\pounds 55$. The total value of the labour of the female patients has been about $\pounds 226$.

* The work done for the Bazaar under the direction of the Head Female Attend is not included in this calculation.

It is shown by the above return that there has been a considerable increase in the quantity of york done, by the male patients during the year.

Taking the value of the labour at a reduced rate of 12s. instead of 15s. a week for artisans, and 8s. instead of 9s. a week for labourers, it shows an increase of one third over the previous ear.

The value of the artisans labour being £97 16s. and of the labourers £264 16s. the total value £362 12s. or an average of £4 3s. 4d. per each patient employed.
