MEDICAL REPORT.

THE following are the particulars in regard to the Aberdeen Asylum, which fall to be reported for 1868, or sixty-eighth year of the Hospital's History.

The number of patients in the house on 1st January, was (398) three hundred and ninety-eight.

During the year, one hundred and thirty-two additional were admitted (132). The total number was, therefore, five hundred and thirty (530), being exactly the same number as for the preceding year.

The highest number resident in the house at one time was four hundred and twenty (420), and the lowest three hundred and ninety-two (392), the average daily number for the year being four hundred and ten (410), an increase of nineteen over that of last year.

Sixty-five (65) patients were discharged recovered; fifteen (15) died, and thirty-eight (38) persons were removed for various reasons; some on probation, and

some for transference to other parts of the country; a large proportion of them being in a materially improved condition, bodily and mentally.

At the end of 1868, four hundred and twelve (412) patients remain in the establishment, of whom a majority of twenty-four are females. One hundred and eleven are private patients, and three hundred and one (301) are paid for by the various parishes of Aberdeenshire. A majority of the private patients are males, and a large majority of the paupers are females, as may be seen from an examination of the second Table in the statistical appendix. Of the whole four hundred and twelve only three hundred or thereby live within what may be distinguished as the Asylum proper; about a hundred being in the various detached buildings within the grounds. No more than thirty-five of the community present a curable form of the disorder, the great bulk of the inmates being the incurable accumulation of a large number of years. Seven of these are paralytic; thirty are epileptic; and most in various stages of dementia or mental decline. Three-fourths are capable of being engaged in exercise, amusement, or some more or less useful employment; and about half of them attend at the house chapel on Sunday, and a considerable proportion on the daily services throughout the week.

The number of admissions in 1868, was less than in 1867, the cases being much of the same character as

during late years; many of them helpless, aged, and In about half of them, some physical or moral cause might be assigned for the disorder; the leading causes being constitutional predisposition combined with some form of intemperance, or of physical depression. The cases of a recent origin mostly presented the aspect of undue excitement or Mania; or of undue depression or Melancholia; only but a small number being restricted simply to the exhibition of some particular morbid fancy or Monomania. At least one half were, from long standing primary cerebral defect, or original nature of symptoms, of a hopeless kind as to chance of benefit from curative In relation to the development of the disease in connection with certain causes or conditions, the leading groups as to number and defined character were, in order of numerical importance, the following-

- 1. The Insanity of Congenital Deficiency.
- 2. The Insanity of Intemperance.
- 3. Epileptic Insanity.
- 4. Paralytic Insanity.
- 5. Senile Insanity.
- 6. Puerperal Insanity.
- 7. Climacteric Insanity.
- 8. Traumatic Insanity (including Injuries of Head and Sunstroke).

The number of deaths during the year was very low, being fifteen, or but 3.6 per cent. on the mean number resident. During the whole sixty-eight years of the Asylum's history only twice has the proportion been less. In the table of causes of death, the diseases are all those of annual occurrence, with the exception of two, viz., Cancer and Hepatic Abscess. The average age was 56, and the average duration of residence, ranging from nearly twenty-two years to only four days, was six and a-half years.

The recoveries although rather fewer than last year are yet in number above the high average of the Asylum, being upwards of 49 per cent., in relation to the admissions of the year. The average residence in the recovered cases was about seven months, ranging from one month to three years in individual cases.

The suicidal complication of the disease, which occurs in so many insane patients, gave this year a more than usual amount of anxiety and trouble, there having been some attempts made of a determined kind. No accident of importance occurred, but several escapes were effected, one of them so far complete as that a new medical examination and legal order would have been required, before recovery could have warranted detention.

The Admissions having overbalanced the removals in an establishment already sufficiently crowded, neces-

sitated the immediate acquirement of some additional accommodation, and the Managers accordingly leased for a period of seven years, a house in Mary Place, adjoining, and capable of being conveniently connected with the Asylum Grounds, in which a selected number of Female patients have been lodged since last June. In the present rather unsettled and unsatisfactory relation of the Hospital with the Parochial Lunacy of the District, such a course was judged more expedient in the meantime than to enter into an extensive enlargement of the Institution.

The Commissioners of Lunacy visited twice in the course of the year, on each occasion making a prolonged and particular investigation into the general state of the house, the accommodation afforded, the diet, the treatment of patients, the condition of Registers, the validity of the legal orders for admission, &c. In their Reports they remark on the small rate of mortality and healthy condition of the inmates, the rare employment of seclusion, the tranquil state of the departments, and notice unfavourably the crowded state of the day-rooms.

Appended to the present Report will be found a short document addressed to the General Board of Lunacy on the medical treatment of Insanity as carried out in the Aberdeen Asylum, and also the usual series of statistical tables, which have been drawn up by

Drs. J. H. Smith and J. A. Phillip, who acted as medical assistants during the year, and whose excellent services and exemplary conduct in that capacity I gladly take the opportunity of acknowledging.

ROBERT JAMIESON, M.D.

APPENDIX.

Copy of Letter, to the Secretary of the General Lunacy Board, Edinburgh.

SIR,

In reply to the request in the Board's letter of 5th September, 1868—I beg to send the following Statements:

I. Removal -Removal from the place and circumstances under which Insanity has developed itself is, in cases in which it can be carried out, often of prime importance. Indeed, it may be held to be so in all cases, with the exception of many of puerperal mania, and the insanity which sometimes marks the decline of life. The change need not, and should not, be to an asylum in some cases, but, probably, in all occuring in the poorer class, it is both the most convenient, and the best thing that can be done. Very often the transference is such a transformation of poverty, discomfort, insobriety, foulness, and unhealthy labour, into comfort, quiet, fullness, and relief from care, as to be of itself effective as a means of cure. Even, where not so important merely in the view of change, removal acts as a leading remedy in the way of disassociation from causes which may have tended to occasion or to foster the disorder, and is advantageous to the patient, as also, a beneficial change to all interested in him, whether by regard or relationship. And it is not only in indigent cases, as supposed above, that removal to an asylum itself cures the disease, for sometimes it so suddenly and effectually stimulates self-control in cases of mania of a moral or of a hysterical type, as to restore the proper mental balance without other interference. Removal from friends need not be persevered with in cases proved incurable, and still less need seclusion in an asylum be prolonged, when other circumstances than those merely medical do not recommend the continuance of such retirement. There is no advantage to the insane in being associated with each other, and often much good to individual patients to be had, particularly in partial insanity, by companionship with one of sound mind and wise conduct.

2. Medical Treatment.—Medical treatment in the wider sense is proper in all cases, and treatment involving the administration of drugs is applicable to the great majority; and and essential in a considerable number. As the treatment indicated is most frequently what is called tonic in its character, it is most appropriate and efficacious in the mental disorders of the indigent. As adjuvant to the general regimen of the Hospital, and to a conservative aim in medical interference, I think I have seen ground for holding that there is advantage in the employment of certain articles of the Materia Medica—such, according to the particular circumstances, as—

Preparations of Iron (particularly the saccharine carbonate), simply, or in combination with certain other remedies—as Rhubarb, Aloes, Cantharides, &c.

Vegetable Tonic Infusions—in combination with Acids, Alkalies, Purgatives, &c.

Purgatives—Senna, Castor Oil, Croton Oil, Rhubarb in ordinary combinations, Sulphur with Bitartrate of Potass, Aloes, &c.

Saline Mixtures and Solutions—of Sulphate of Magnesia (with Sulphate of Iron, Nitrate of Potash, &c.,) Hydriodate of Potash, Bromide of Potassium, &c.

Narcotics—mostly Opium, but occasionally Hyoscyamus, &c. Analeptics—as Cod Liver Oil, Wine, &c.

Depressants and Sedatives, unless in so far as involved in the employment of Cold Baths, Tepid Baths with the application of cold to the head, or the effects directly or indirectly of the action of some of the Medicines above specified, may be said to have scarcely been in use in the Aberdeen Asylum for many years.

Blisters and Setons may be mentioned, in relation to the subject of the employment of drugs, as being occasionally used; the former frequently as stimulant, and the latter now and then with a view of being beneficially adjuvant in the prevention or removal of cerebral disease.

The Medical treatment, as distinct from the moral treatment and the influence of the general regimen of the Institution, has consisted very much in the prescription of certain of the above remedies. That their employment has been curative or useful appears satisfactory to my own mind, and seems to be confirmed by the application of the statistical test, which in regard to the experience of the Aberdeen Asylum, shows that the average duration of the disease, in the cases successfully brought to a termination, is certainly shortened when drugs have been judiciously administered. In 220 recoveries, in cases consecutively and recently treated, the average residence was under five months in those treated medicinally, and above five months and a-half in those treated without any material aid from pharmacy.

As every case has to be dealt with individually and not merely by some formula applicable to it as one of a classified group, little can be said on the subject of the special action of particular remedies in the several species of mental disease. Still, certain of these seem not unfrequently to be indicated, and also to be employed with satisfactory effect, under conditions which very often present themselves in patients sent to a Lunatic Asylum. For example, ferruginous tonics, in the Ancemic forms of Insanity; Bromide of Potassium in Epileptic varieties of mental disturbance; Opium in conditions of sleeplessness, pain, despair, and exhaustion; the Sulphur electuary in morbid depression, associated with abdominal congestion, torpor, and obstruction; the prolonged tepid bath with cold to the head in some states of maniacal restlessness, &c., &c. I have certainly seen frequently marked benefit, and also recovery, consequent on the employment of these in such cases, and where I have had little doubt that neglect of medical treatment or incompetent interference would have rendered the disorder incurable.

3. Supply of Physical Comforts, &c.—The adequate supply of food, clothing, warmth, shelter, and other comforts, acts very powerfully in improving the bodily condition and mental contentment of a large class in public Asylums; and assists materially in the cure of insanity; particularly in the pauper and indigent class of patients. It is mainly to the comparatively less influence of such agencies that a smaller proportion of cures is to be looked for, as we advance higher in the social scale. The necessity for a degree of comfort above, what either from his position or his feebleness in providing, the

patient has been accustomed to, is commonly well marked. I find that a liberal diet suitably varied is indicated in all curable cases of Insanity; and in not a few an allowance of wine, a proper addition. Low diet and low temperature lengthen the time of treatment, increase the tendency to Dementia, and develope restlessness, noisy behaviour, destructiveness, and other difficulties of management.

4. Moral Treatment.—The moral treatment of the Insane, as it is called, by classification, direction, occupation, exercise, religious influences, &c., is undoubtedly of great importance in many cases, if well managed; but is quite as liable as the medical treatment can be, to misdirection and error. I do not consider it as of itself usually adequate to cure. It is apt to form a field for the mischievous interference of quackery and pretension, but its administration is in reality but a proper adjunct to the domain of the psychological physician.

Employment is of immense advantage in the treatment; it is preservative of the muscular powers, where they have begun to suffer from disease or perversion; and by restoring attention and diverting it from morbid directions, tends gradually to enfeeble and uproot delusion. Active open-air occupation is the best mode; next, artistic labour; and the least profitable, that which approaches simple mechanical routine. Voluntary employment sufficiently persevered in, is the only agency that I have observed to be curative, or of much advantage, in established Monomania. In the form of bodily labour, employment, however, may be unduly depressing, and always requires, in the insane, to be used cautiously and in recognised limitation of degree. In many, occupation is most beneficial in the shape of amusement merely, and particularly if of such a sort as to encourage conversation and social co-operation.

In the moral treatment of the Insane the individual is not to be lost sight of in squad classification, and, while economy of aggregate management and supervision is recognised, the hurtful attractiveness of barrack-like entext and arrangement is to be guarded against, and its approaches in the shape of large dining halls, big dormitories, long galleries, and general uniformity resisted.

Although firmness and method are of much use, harshness and severity never are, in dealing with Lunatics. Mechanical restraint of the person is seldom if ever beneficial, and possible to be done without, at least in Asylums. Not to lengthen this statement further by detail, I shall conclude by observing that the application of the non-coercive system of treatment, with the harmonious ameliorations and improvements in practice gradually associated with it, has reduced the average mortality in the Aberdeen Asylum from 8 to 5 per cent, and raised that of recovery from 40 to 48.

I am, &c.,

ROBERT JAMIESON,

PHYSICIAN AND SUPERINTENDENT.

ABERDEEN LUNATIC ASYLUM, 9th Nov., 1868.
